A vulnerability exists in KisMAC, which potentially can be exploited by malicious people to compromise a user's system. Analysis: The vulnerability is caused due to a boundary error in the "WavePacket:parseTaggedData()" function when parsing the Cisco vendor tag for additional SSIDs in a received 802.11 management frame. This can be exploited to cause a stack based buffer overflow and potentially allows arbitrary code execution. Successful exploitation requires that the user is e.g. tricked into opening a malicious pcap file containing special crafted management frames, or via raw management frames that are sent onto the wireless network while the user is performing a passive network scan. Vulnerable software: KisMAC 0.x. Solution: Update to version R73p: http://kismac.de/download.php The vulnerability has also been fixed in developer version 113.

2006-04-03 **IEEE 802.11w wireless standard security improvement**

DHS IAIP Daily; http://www.networkworld.com/news/tech/2006/040306−80211w−wir eless−security.html 23

IEEE 802.11W FILLS WIRELESS SECURITY HOLES.

IEEE 802.11i, the standard behind Wi-Fi Protected Access and WPA 2, patched the holes in the original Wired Equivalent Privacy specification by introducing new cryptographic algorithms to protect data traveling across a wireless network. Now, the 802.11w task group is looking at extending the protection beyond data to management frames, which perform the core operations of a network. Traditionally, management frames did not contain sensitive information and did not need protection. But with new fast handoff, radio resource measurement, discovery and wireless network management schemes, new and highly sensitive information about wireless networks is being exchanged in these non-secure frames. IEEE 802.11w proposes to extend 802.11i to cover these important frames.

24.7 SWDR (Software-defined radio)

Category 24.7 *SWDR (Software-defined radio)*

2000-12-07 **software-defined radio vulnerability**

NewsScan, San Jose Mercury News
http://www.mercurycenter.com/svtech/news/breaking/merc/docs/071981.htm

Called "software-defined radio," an emerging technology allow wireless devices to download new software to add capabilities or perform different functions, thereby enabling a single product to switch, for example, from serving as a cell phone to receiving FM radio broadcasts or providing Internet access — all without requiring new hardware. Seeing this innovation as offering a better way of managing the nation's airwaves, the Federal Communications Commission is developing new rules for approving equipment that can be altered. The technology makes it possible to switch the part of the airwaves on which the gadget can operate and seek out less crowded frequencies that are not being used. (AP/San Jose Mercury News 7 Dec 2000)

Category 24.7 *SWDR (Software-defined radio)*

2002-11-11 **software defined radio SDR frequency spectrum overload**

NewsScan

SDR CAN SOLVE WIRELESS GADGET OVERLOAD
Software defined radio (SDR) technology may hold the key to developing a single standard for the numerous portable devices now on the market, thereby unlocking new opportunities for wireless communications. As the line between "smart" phones and PDAs blurs, the multifunctional devices are becoming cluttered with software designed for each specific activity. "You could have your cell phone going, be using a Bluetooth headset and at the same time use GPS to check where you are," says Mark Cummings, an SDR proponent who notes that without SDR, that scenario would require cramming three separate radio circuits into a single handset. John Watson, VP of marketing for QuickSilver Technology, says SDR software would enable handset design that's more flexible and able to respond to changing market demands. "Right now, you have to do electronics design a couple of years ahead of time" before bringing new equipment to market. "The only thing you know is you're going to be wrong. What you really want is to be able to design it at the last minute." (Wired.com 11 Nov 2002)

2004-11-08 **P2P peer-to-peer Internet radio music sharing copyright**

NewsScan; http://news.com.com/Music+sharing+thats+free+and+legal/2100-1027_3-5441036.html

P2P RADIO IS LATEST TWIST IN MUSIC SHARING

Now there's a new way to share music that's free and perfectly legal -- the trick involves marrying peer-to-peer technology with Internet radio. Pioneers in the field include Apple, Virgin Digital, and startups Mercora and Live 365, which offer tools that automatically stream users' private playlists over the Web while in some cases storing them in a searchable database for later retrieval. Mercora operates a Web-based network of about 8,000 "broadcasters" who serve up their playlists to somewhere between 175,000 and 200,000 listeners worldwide. "We're doing for music what Google did for the Web," says Mercora CEO Srivats Sampath. The company reasons that by using an Internet broadcast network model, it can take advantage of lower copyright fees, which are set by the U.S. Copyright Office rather than the record labels. As a result, Mercora can afford to pay the fees on behalf of broadcasters and offset the costs through advertising sales. "The big nut we had to crack is how to do this legally," says Sampath. "The law says you can broadcast as long as you pay. Fine, we will pay you." And if listeners happen to download a song? Technically, if the legally broadcast song is for personal use only, that's okay. "It's like a tape recorder," says Sampath. However, the downloader runs into legal trouble only when she tries to sell a track or transfer it to another person. (CNet News.com 8 Nov 2004)

2005-02-16 **P2P peer-to-peer RIAA radio Internet broadcast legal law**

NewsScan; http://online.wsj.com/article/0

'PEER-TO-PEER' RADIO PASSES RIAA SCRUTINY

With the pressure on peer-to-peer file-sharing networks to stop enabling illegal musicswapping, several companies are trying to find ways to squeeze P2P technology into a legal framework. Mercora offers users a way to create playlists of their favorite songs and then "broadcast" them over the Internet to fellow users. When the "broadcasters" aren't online, neither are their "radio stations." America Online offers a similar service called Shoutcast, and Live365 charges amateur broadcasters a fee to upload their music to a central server, which then sends the music out to listeners' PCs. A London Web site, Last.fm, takes an "affinity sharing" approach, using a list of each user's favorite music to find "neighbors" with similar tastes. It then creates a customized broadcast for each listener, based on what their neighbors are listening to. Because in these cases the music files are temporarily "streamed" to listeners' PCs instead of taking up residence permanently on their hard drives, the Recording Industry Association of America has given its blessing and is working with some of the companies to ensure they stay within legal boundaries. KEXP executive director Tom Mara says traditional radio stations can learn a lot from these grassroots efforts. "It's no longer a case of a person in a booth broadcasting to people anonymously. Now we need to figure new modes of interaction -- not only between the listener and the station, but between listeners." (Wall Street Journal 16 Feb 2005)

2003-10-29 **Macintosh Operating System X @Stake systemic flaws buffer overflow exploitable Apple patches released**

NIPC/DHS

October 29, ZDNet Australia — Three flaws discovered in Mac OS X.

Security-research company @Stake has warned of three vulnerabilities affecting the Mac OS X operating system. The first details "systemic" flaws in the way OS X handles file and directory permissions, while the second details a kernel level vulnerability that does not affect default installations of the operating system. The third involves a buffer overflow condition that may be remotely exploitable. Apple has not yet released patches for the security issues. Mac users are advised to upgrade to the latest Apple operating system, which is not vulnerable to the flaws, for a fee. The full advisories are available online: http://www.atstake.com/research/advisories/2003/

2003-11-24 **Apple OS X security patch vulnerability exploit fix Jaguar**

NIPC/DHS

November 20, Macworld.co.uk — Apple releases security patches.

Apple Computer Inc. has released security updates for Mac OS X Panther 10.3.1 client and server systems and Mac OS X Jaguar 10.2.8 client and server operating systems. The Panther update includes the following updated components: OpenSSLzlib "gzprintf()" function, an update to the open-source lossless compression library used by Darwin, the kernel of Apple's OS. The Jaguar update improves a number of components, including document formatting system, groff; Unix macro processor component, gm4; and Mail w/CRAM-MD5 authentication (used to debug common authentication services). It also improves OpenSSL (a robust, commercial-grade, full-featured, and open-source toolkit with a general-purpose cryptography library that implements the Secure Sockets Layer); Personal File Sharing; QuickTime for Java; and the zlib "gzprintf()" function. Both updates are available for download from Apple's Website:
http://www.info.apple.com/support/downloads.html

2003-12-24 **patch fix flaw vulnerability Apple Mac OS X DHCP Jaguar buffer overflow**

NIPC/DHS

December 22, CNET News.com — Apple issues patch for Mac OS X hole. Apple Computer has issued a security update that, among other fixes, closes a hole in Mac OS X that could have allowed hackers to take control of a computer under particular circumstances. The patch essentially changes the default settings for connecting to a Dynamic Host Communication Protocol (DHCP) server on Mac OS X 10.2.8. (aka "Jaguar"), Mac OS X 10.3.2 (aka "Panther") and the corresponding server versions of these operating systems. A DHCP server assigns a TCP/IP address to a computer and, under the earlier default settings, a Mac running one of the above-listed OSes would accept data from DHCP servers found on a local area network. If a hacker inserted a malicious DHCP server on a local network, he or she could then exploit Apple's earlier default setting to embed malicious software on a computer or use the computer as a drone for coordinated attacks on other systems. Apple's security update also fixes a buffer overflow vulnerability in a file system, plugs another vulnerability in Panther that could cause denial-of-service requests and in general improves the security features of the affected OSes. Additional information available on Apple's Website:
http://docs.info.apple.com/article.html?artnum=61798

2004-03-02 **vulnerability hole flaw patch fix file sharing Mac OS X**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1540556,00.asp

February 27, eWEEK — File sharing vulnerability discovered in Mac OS X.

A security issue that could result in stolen passwords and data on Friday, February 27, was revealed for Apple Computer Inc.'s Apple Filing Protocol (AFP), a component of Mac OS X 10.3.2. In a posting to the SecurityFocus BUGTRAQ list, Chris Adams, a system administrator, noted that while users could request secure connections, the system will not issue any alert or indication if an SSH connection is unavailable and then defaults to a non-secure connection. The only indication was a negative one--users must be aware that an alert "Opening Secure Connection" did not appear. This could result in users sending unencrypted passwords over an insecure connection. Adams said that any such activity would only come as the result of an active attack. "OS X does warn you before using unencrypted passwords and AFP does prevent passive password collection by encrypting the log-in process to protect the password on its way to the server. This problem allows you to trick it into sending the unencrypted password to you instead of the intended server," he said. Though his BUGTRAQ warning provided workarounds, such as manually configuring a SSH tunnel or using SFTP instead, Adams suggested that SSH should be enabled by default for both client and server and the user interface modified to clearly warn when the system is unable to establish an SSH tunnel. Additional information is available on the SecruityFocus Website:

2004-05-04 **Apple Mac OS X vulnerability patch issued**

DHS IAIP Daily; http://www.esecurityplanet.com/prodser/article.php/3349191

May 04, eSecurityPlanet — Apple issues patch for Mac OS X.

Apple Computer has rolled out a major security update to plug several vulnerabilities in its flagship Mac OS X server and client versions. The patch, which is being described as "highly critical," addresses security issues with the AFP Server, CoreFoundation and IPSec and also integrates a previously issued patch which contained bugs, Apple said. The latest flaws, discovered by researchers at @Stake, could lead to system hijack, security bypass, manipulation of data, privilege escalation, denial-of-service attacks and system access. The most serious flaw was found with AppleFileServer and can be exploited to compromise a vulnerable system. The vulnerability is caused due to a boundary error within the password handling and could allow attackers to cause a buffer overflow by passing an AFP "LoginExt" packet with a string in the "PathName" field. Apple also confirmed the existence of an unspecified vulnerability within the CoreFoundation when handling environment variables. This may potentially be aprivilege escalation vulnerability. Another flaw in RAdmin when handling large requests was also pinpointed. Secunia warned that this issue could potentially lead to system compromise problems. Security update information: http://docs.info.apple.com/article.html?artnum=61798

2004-05-17 **vulnerability MAC OS X security issue critical update issued**

DHS IAIP Daily;
http://www.techworld.com/security/news/index.cfm?newsid=1574

May 17, Techworld — Mac OS X hit with another serious security issue.

A "highly critical" hole has been found in Apple's Mac OS X operating system, which will allow remote system access by getting someone to visit a malicious Website. Lixlpixel has reported a vulnerability dealing with how basic Internet elements are addressed in the OS' help facility that allow arbitrary local scripts to be executed on a user's machine. It is also possible to place files in a known location on a system by asking users to download a ".dmg" disk image file. A default browser option in Internet Explorer and Safari will mean a single user click is enough to drive the whole process. The combination of the two holes, tested and confirmed by security experts Secunia, can therefore allow system access to be achieved "very simply" according to Secunia CTO Thomas Kristensen. The holes affect Safari 1.x and Explorer 5.x. The solution is to change browser options and rename the help URI handler. More details are 11 available on Secunia's Website: http://secunia.com/advisories/11622

2004-05-25 **Apple OS X Mac vulnerabilities run file IM e-mail virus**

DHS IAIP Daily;
http://news.com.com/Mac+OS+fix+fails+to+plug+security+hole/2 100−1002_3 −5220285.html

May 25, CNET News.com — Mac OS fix fails to plug security hole.

A security hole still threatens Mac OS X users after a patch issued by Apple Computer last week failed to fix the underlying problem, security experts say. The security issue could allow an attacker to transfer and then run a malicious program on a Mac, if the Mac's user can be enticed to go to a fake Web page on which the program has been placed. Two other software companies have confirmed the issue. Security information company Secunia raised its rating of the potential risk to "extremely critical" after determining that the vulnerability is more widespread than Apple apparently first thought. The vulnerability actually involves two flaws. One allows a website to place a file on the Mac's hard drive when a user clicks on a uniform resource locator, or URL, specifically designed to bypass Mac OS X's security. The other gives an attacker the ability to run a file on another user's computer, provided the location of the file is known. Used together, the flaws constitute a major security hole that could result in a potential instant-messaging or e-mail virus.

2004-08-10 **Apple Mac OSX 10.3.5 vulnerability PNG phishing attack**

DHS IAIP Daily; http://www.esecurityplanet.com/patches/article.php/3392971

August 10, eSecurity Planet — Apple plugs OS X vulnerabilities.

Apple Computer has rolled out a major security update for its Mac OS X Panther client platform. The patch addresses security flaws that put users at risk of sensitive data leakage, Denial of Service attacks and system access. The Mac OS X 10.3.5 update corrects multiple vulnerabilities in libpng that can be exploited by malicious hackers to compromise a user's system. The U.S. Computer Emergency Readiness Team (US-CERT) has previously issued a warning that bugs in libpng, the reference library that supports the Portable Network Graphics (PNG) image format, could allow a remote attacker to commandeer a vulnerable machine. Also patched are specific vulnerabilities in Apple's Safari Web browser. The upgrade plugs a hole that could open the door to phishing attacks and addresses a flaw that could be used by a malicious Website to steal sensitive information from forms. The original advisory is available here: http://docs.info.apple.com/article.html?artnum=25631

2004-08-16 **Apple Safari Web browser vulnerability Mac OS X HTTP GET POST URL**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/128414

August 16, US-CERT — Vulnerability Note VU#128414: Apple Safari fails to properly handle form data in HTTP redirects.

Apple Safari is a web browser available for the Mac OS X operating system. A vulnerability exists in the way Safari handles web form data. When a web form is submitted to a server using the POST method and the server returns an HTTP redirect to a GET method URL, Safari may re-POST that data to the GET method URL. It has been reported that this condition occurs when the forward/backward buttons are used. As a result, a user's form data could be disclosed to a remote server. Apple has released a patch to address this vulnerability: http://docs.info.apple.com/article.html?artnum=61798

Category 24.8 *MAC OS*

2004-09-07 **Apple Mac OSX operating system flaws vulnerabilities fixes patch Kerberos authentication Jaguar Safari browser**

DHS IAIP Daily;
http://news.com.com/Apple+fixes+15+flaws+in+Mac+OS+X/2100−10 02_3− 5350010.html?tag=nefd.top

September 07, CNET News.com — Apple fixes 15 flaws in Mac OS X.

Apple Computer released an update to its Mac OS X operating system on Tuesday, September 7, to fix 15 security issues in the software. Many of the problems are flaws in the operating system's underlying open-source software, including a critical flaw in the Kerberos authentication system--software that can act as a gatekeeper for computer networks. The patch is available for Mac OS X 10.3.5 and Mac OS X 10.3.4, and also fixes issues in Mac OS X 10.2, known as "Jaguar." The patch, available through automatic updates or from the company's website, fixes software flaws that could enable an attacker to crash or freeze the Apache 2 Web server, run software by utilizing Apple's Safari Web browser or expose the password store used by the network. Apple's advisory, with details of the update, is available at: http://www.apple.com/support/

2004-12-22 **Apple Tiger suit data leakage BitTorrent intellectual property non-disclosure agreement NDA**

NewsScan; http://news.bbc.co.uk/1/hi/technology/4117465.stm

APPLE SUES 'TIGER' TESTERS OVER LEAKS

Apple has sued three members of the Apple Developer Connection for releasing preview versions of its latest Mac OSX, code-named Tiger, onto file-sharing sites. "Members of Apple Development Connection receive advance copies of Apple software under strict confidentiality agreements, which we take very seriously to protect our intellectual property," said Apple in a statement. The Apple Development Connection is a group of software programmers who have access to text versions of Apple software in order to tweak their own applications to work with Apple systems. The Tiger software was apparently leaked onto sites that use BitTorrent technology, which does not actually host the files being shared, but rather hosts a link that points users toward others who have the file sought. Last week, the Motion Picture Association of America launched a legal campaign against such sites, noting that they've been used for illegal sharing of movie files. (BBC News 22 Dec 2004)

2005-08-16 **Apple MAC OS X patches security update**

DHS IAIP Daily; http://www.techtree.com/techtree/jsp/article.jsp?article_id=5484&cat_id=582

APPLE RELEASES OS X PATCHES

Apple has released a security update for Mac OS X, which addresses several potential vulnerabilities in the operating system. The update incorporates patches for AppKit, which prevent malicious users from executing malware stored in carefully crafted, rich-text files. The Bluetooth code is modified, to ensure that devices' requirement for an authenticated connection is reported correctly. The security update also fixes "algorithmic complexity attack" vulnerabilities in the OS' CoreFoundation code. The update includes patches for the Directory Services code as well. Kerberos has been updated to version 5.5.1, which prevents multiple buffer overflows resulting in remote compromise of a KDC or denial of service. The Loginwindow application which handles user accounts, has been repaired to prevent a local user who knows the password for two accounts, from being able to log into a third account without knowing the password. Safari is patched to prevent arbitrary command execution, as also sending of information submitted in a form to the wrong Website. As of now, two updates are available, one for Mac OS X 10.4.2 and the other for 10.3.9. Both are further sub-divided into server and client versions. 2006-01-26 **Apple Intel microprocessor OS X exploit**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1915923,00.asp 23

APPLE'S SWITCH TO INTEL COULD ALLOW OS X EXPLOITS.

The recent move by Apple Computer to begin shipping Macintosh computers that use microprocessors from Intel could open the door to more attacks against computers running the company's OS X operating system, security experts warn. The change could put more pressure on Apple to build security features into OS X. In an e-mail statement, the company said that the security technologies and processes that have made Mac OS X secure for PowerPC remain the same for Intel-based Macs. However, using the Intel x86 platform pulls Macintosh systems onto the same platform used by Microsoft's Windows computers, a prime target of the hacking community for years. "Attackers have been focused on the [Intel] x86 for over a decade. Macintosh will have a lot more exposure than when it was on PowerPC," said Oliver Friedrichs, a senior manager at Symantec Corp. Security Response. There are many more malicious hackers who understand the x86 architecture in-depth than understand the PowerPC. And attackers have access to hundreds of documents and examples of how to exploit common vulnerabilities on x86, whereas exploits for PowerPC are far fewer, Friedrichs said.

2006-03-07 **Mac OS X vulnerability patch scrutiny new flaw hole**

DHS IAIP Daily; http://news.com.com/Mac+OS+X+patch+faces+scrutiny/2100 −1002_ 3−6046588.html?tag=cd.top 23

MAC OS X PATCH FACES SCRUTINY.

An Apple Computer patch released last Wednesday, March 1, that doesn't completely fix a high-profile Mac OS X flaw, leaving a toehold for cyber attacks, experts said. The update added a function called "download validation" to the Safari Web browser, Apple Mail client, and iChat instant messaging tool. The function warns people that a download could be malicious when they click on the link. Before that change, clicking on a link could have resulted in the automatic execution of code on a Mac. But Apple failed to address a key part of the problem; the fix should be at a lower, operating system level, experts said. It is now still possible for hackers to construct a file that appears to be a safe file type, such as an image or movie, but is actually an application, they said.

2006-03-08 **Mac OS X hacking contest shut down too easy**

DHS IAIP Daily; http://www.informationweek.com/security/showArticle.jhtml?ar ticleID=181502078 23

HACK-MY-MAC CHALLENGE LEAVES SYSTEM SHIPSHAPE.

Dave Schroeder, a University of Wisconsin systems engineer who said a Swedish Hack-My-Mac contest was too easy, closed down his own challenge Tuesday, March 7. The machine ran Mac OS X 10.4.5 with the latest security updates and had two local accounts. In addition, Schroeder left both SHH and HTTP open. The mini garnered attention and lots of traffic, said Schroeder, who logged 4,000 attempts. The machine weathered two denial-of-service attacks, various Web exploit scripts, SSH dictionary attacks, and untold probes by scanning tools, he added.

2006-03-08 **University of Wisconsin-Madison computer hacking contest Mac OS X stopped**

EDUPAGE; http://news.com.com/2100-7349_3-6047735.html 23

WISCONSIN HACKER CONTEST OUT OF BOUNDS

Officials at the University of Wisconsin-Madison have pulled the plug on a Mac OS X hacking contest started by a systems engineer at the university. The engineer, Dave Schroeder, connected a Mac computer to the university's network and invited hackers to try to compromise the machine within five days. Schroeder did not, however, clear the contest with his superiors, and when the institution's CIO learned of it, the computer was removed from the network and the contest was over. Brian Rust, spokesperson for the university, said the contest "was not an activity authorized by the UW-Madison." Rust noted that the institution's "primary concern is for security and network access for UW services," saying that during the time of the contest the university "was able to handle the traffic, and there were no compromises to university systems." Rust said that although Schroeder was "well-meaning," he will have to conduct such experiments in the future on his own, "not using university systems."

2006-03-14 **multiple vulnerability fixes Mac OS X update**

DHS IAIP Daily; http://secunia.com/advisories/19129/ 23

MAC OS X SECURITY UPDATE FIXES MULTIPLE VULNERABILITIES.

Apple has issued a security update for Mac OS X, which fixes multiple vulnerabilities. Analysis: Under certain circumstances, it is possible for JavaScript to bypass the same origin policy via specially crafted archives. A boundary error in mail can be exploited to cause a buffer overflow via a specially crafted e-mail. This allows execution of arbitrary code on a user's system if a specially crafted attachment is double clicked. An error in Safari/LaunchServices can cause a malicious application to appear as a safe file type. This may cause a malicious file to be executed automatically when visiting a malicious Website. Solution: Apply Security Update 2006-002. Mac OS X 10.4.5 (PPC): http://www.apple.com/support/dow...yupdate2006002macosx1045p pc.html Mac OS X 10.4.5 Client (Intel): http://www.apple.com/support/dow...006002macosx1045clientint el.html Mac OS X 10.3.9 Client: http://www.apple.com/support/dow...rityupdate20060021039clie nt.html Mac OS X 10.3.9 Server: http://www.apple.com/support/dow...rityupdate20060021039server.html

DHS IAIP Daily; 23
http://www.techweb.com/wire/security/184429499;jsessionid=TX
CXZFKVJIOF0QSNDBOCKH0CJUMEKJVN

MAC USERS MAY MEET WINDOWS THREATS.

Users installing Windows XP on Intel-based Macs face some special security issues, a security expert said Thursday. By applying Apple Computer's just-released Boot Camp, Mac owners can now create a dual-boot system that runs either Mac OS X or Windows XP. It's the latter that worries Ken Dunham, the director of the rapid response team at security intelligence firm iDefense. "When a Mac is booted into Windows, it can be attacked by the same [exploits] that threaten any Windows PC," said Dunham. "If you're running an unpatched version of Windows XP on any box, it'll be hacked pretty quickly." But it's not the vulnerability of Windows that concerns Dunham; it's the fact that the Mac will have multiple operating systems on its hard drive. Typically, argued Dunham, people are less diligent about updating their secondary system.

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1958180,00.asp 23

RESEARCHERS CHART LEAP IN MAC VULNERABILITIES.

The volume of security vulnerabilities discovered in Apple's Macintosh platform has increased significantly over the last several years, according to a new report released by McAfee's Avert Labs. The security software maker contends that the number of flaws found in the Mac operating system has increased by 228 percent since 2003. While the researchers said the number of serious vulnerabilities isolated in the latest version of Apple's operating system software, Mac OS X, is dwarfed by the quantity of problems unearthed in Microsoft's rival Windows during the same period, McAfee maintains that as Apple's products have become more popular, a larger number of glitches are being identified. Perhaps even more disturbing, based on how closely Apple can tie its current wave of success to hot-selling consumer multimedia products, McAfee said that many of the reported issues have actually been related to the company's iPod devices and iTunes download service. 2006-05-12 **US Computer Emergency Readiness Team US CERT alert Apple Mac product multiple vulnerabilities**

DHS IAIP Daily; http://www.uscert.gov/cas/techalerts/TA06−132A.html 23

US-CERT TECHNICAL CYBER SECURITY ALERT TA06-132A: APPLE MAC PRODUCTS AFFECTED BY MULTIPLE VULNERABILITIES.

Apple has released Security Update 2006-003 to correct multiple vulnerabilities affecting Mac OS X, Mac OS X Server, Safari Web browser, Mail, and other products. The most serious of these vulnerabilities may allow a remote attacker to execute arbitrary code. Impacts of other vulnerabilities include bypassing security restrictions and denial of service. Systems affected: Apple Mac OS X version 10.3.9 (Panther) and version 10.4.6 (Tiger); Apple Mac OS X Server version 10.3.9 and version 10.4.6; Apple Safari Web browser; Apple Mail. Previous versions of Mac OS X may also be affected. Please see Apple Security Update 2006-003 for further information. Apple Security Update 2006-003 resolves a number of vulnerabilities affecting Mac OS X, OS X Server, Safari Web browser, Mail, and other products. Further details are available in the individual US-CERT Vulnerability Notes: VULNERABILITY#519473: http://www.kb.cert.org/vuls/id/519473 Solution: Install Apple Security Update 2006-003: http://docs.info.apple.com/article.html?artnum=303737 This and other updates are available via Apple Update: http://docs.info.apple.com/article.html?artnum=303737 For additional protection, disable the option to "Open 'safe' files after downloading," as specified in "Securing Your Web Browser": http://www.us-cert.gov/reading_room/securing_browser/#sgeneral

1997-05-23 **penetration hacking Web**

Reuters, Newsbytes

Koichi Kubojima (or "Kuboshima"), a 27-year-old computer engineer, was arrested in Tokyo and charged with replacing weather pictures by pornography on the Asahi Broadcasting Co. web pages. He was the first person to be charged under the 1987 anti-hacking law and faces up to five years in jail because of stiff penalties added to the law in 1992. According to Martyn Williams of Newsbytes, "Police tracked down Kuboshima by gaining access to the records of an Internet service provider that he reportedly used to carry out the hack. Local press reports said the account was opened with a false credit card number and name." The site was taken out of service within 10 minutes of the hack at 10:00 and was back on air by 13:00.

Category 24.9 *Peer-to-peer networking*

1997-05-29 **Web hack vandalism penetration**

UPI, OTC

UPI reported that the Los Angeles Police Department Web page was hacked and satirical content substituted for the normal texts. However, investigation by revealed that the tale was itself an error that spread like wildfire through the Net. It seems that someone did post a lampoon of the LAPD's page at a completely separate site <www.dis.org/se7en/hacktrash/lapd/index.html> and it did include disrespectful language. However, no one broke into the real LAPD site.

On the other hand, claims that Universal Studios' Web hack was a deliberate publicity stunt by the Studios were vigorously denied by spokespersons, who pointed out how pointless it would be to put a fraudulent hack up for all of five hours — from 03:00 until 08:00. The key points in the rant published by Glen Lipka were that the graphics were too good and that date stamps on the graphics files preceded the stamps on the original Web page; neither observation leads unavoidably to the conclusion of fraud. Good graphics packages are available to everyone; and date stamps mean nothing when it's PCs that stamp the files.

New York Times

The US Information Agency's Web site was severely damaged in January by vandals who installed Trojan Horse software.

Category 24.9 *Peer-to-peer networking*

1999-02-12 **Web server write-protect switch hardware**

RISKS 20 21

Electrical engineer Ian Cargill asked in RISKS why Web servers couldn't have hardware-based switches to prevent writing on the disks without authorization. It turns out that some hard disks do indeed have a write-protection jumper that could easily and cheaply be wired to an external switch. However, Nigel Rantor replied in the following issue that there were several problems with such a scheme: (1) Most Web sites have dynamic content that resides on the Web server (in part because many Web managers have no idea how to implement a back-end to a database on another server) and must therefore be in write-permit mode all the time; (2) many Web servers are hosted at third-party locations; asking for someone to flip a switch many times a day would be unacceptable. Mr Rantor also pointed out that even if the available methods for write-protection (firewalls, ACLs) are perfectly implemented, there are other ways of harming Web sites, such as denial-of-service attacks.

Category 24.9 *Peer-to-peer networking*

1999-04-01 **information warfare Web vandalism hacktivism April Fool's**

OTC

In a tasteless April Fool's joke (what other kind is there?), radio personality Art Bell's site on the Web claimed to have been hacked. The supposedly damaged site included text reading, "The Yugoslav Citizens' Message To Nato World Criminals" and urged worldwide protests against the NATO bombing campaign. Actually the site was altered by its owners in a stupid display of insensitivity toward people on both sides of a dreadful war.

1999-08-06 **criminal hacker Web penetration vandalism**

AP

Someone using an IP address in Russia vandalized the anti-hacker AntiOnline site on 2000-08-05 by taking advantage of an unusual feature of the site. AntiOnline provides links to discussions taking place on other sites. Someone put executable code in a message that allowed the perpetrator to alter some links in the "Eye on the Underground" on the AntiOnline site. While the sabotage was unrepaired (about an hour), visitors clicking on the damaged link were shunted to a Web site showing an eye and the message, "Expensive security systems do not protect from stupidity." It was unclear whether the author of the message was making a self-reference or criticizing John "JP" Vranesevich, who had recently announced his intentions to aid law enforcement authorities in tracking and prosecuting criminal hackers.

Category 24.9 *Peer-to-peer networking*

1999-08-10 **international conflict information warfare INFOWAR hackers vandalism penetration Web sites governments**

Wall Street Journal, Reuters

China and Taiwan extended their conflict over national identity into cyberspace in 1999, with hackers on both sides of the Taiwan Strait attacking each country's Web sites. Mainland hackers attacked Taiwanese Web sites with Chinese and English messages such as "Taiwan is indivisible part of Chinese territory and will always be! The Taiwanese government headed by Lee Teng-hui cannot deny it!" Taiwanese hackers penetrated Web sites of the China Securities Regulatory Commission and a Shaanxi government agency where they posted Taiwan's national flag and national anthem and messages such as "Go to the mainland to fight the Communists."

1999-10-26 **criminal hackers vandalism government Web damage Windows NT phreak.nl**

NEWSBYTES NEWS NETWORK

A criminal hacker or hacker group calling itself "phreak.nl" has been attacking US Web sites in the last week of October 1999. According to a Newsbytes article by Bob Woods dated 1999-10-26, the criminals damaged Web sites of NASA's JPL, the US Army's Redstone Arsenal's Program Executive Office and the National Defense University. All these sites were described by a hacker-publicity group, "attrition.org" as running WindowsNT servers. The defacements consisted of the usual puerile sneers and insults in the peculiar spelling affected by the criminal hacker subculture. One common theme was the notion that "phreak.nl" was engaged in "a game ... called hack the planet." In addition to these attacks, "phreak.nl" also damaged sites for All Timeshare, Pet GBets and WPYC. Anyone wishing to see copies of the damaged sites can do so at <http://www.attrition.org> but readers are urged to use caution when visiting any such site. Don't run active content, don't allow cookies and use a firewall on your workstation to preclude unauthorized activity.

1999-11-16 **Web vandalism attack penetration defacement court conviction sentencing**

Straits Times (Singapore)

In September 1999, someone calling him/herself "mistuh clean" vandalized the Web site of Mediacity, part of the Television Corporation of Singapore's network. Evidence suggested that the criminal hacker might not be a local but rather a foreigner, possibly a Canadian resident. The criminal contacted Victor Keong, a Canadian security consultant using e-mail to inform him of the vandalism, and Mr Keong called Mediacity to warn them of the tampering.

In November 1999, eighteen-year-old student Edwin Lim Zhaoming admitted having broken into the Television Corporation of Singapore (TCS) website on 15 June with the help of a Burmese confederate aged 15. Among other damage, the vandals renamed the site "Mediashity." The juvenile confederate who told him about an easy user-ID and password to penetrate the site was sentenced to 12 months probation and 100 hours of community service. The attack consisted of replacing the TCS Web site with a page larged with vulagarities and abusing Bill Gates; the company estimated that the site was down for 10 hours, took 80 person-hours and cost S$13,000 to recover .

2000-02-18 **peer-to-peer networking risks**

KTSL http://www.ktsi.net/whsecurityp2p.html 20 76

"Security Concerns for Peer-to-Peer Software" by Mike Petruzzi <mpetruzzi@ktsi.com>, Rob Sherwood, John Dunnivan, Rob Chavez and Pat Holley of Key Technologies and Security, Inc. reviews the security implications of programs such as Napster, Gnutella and their possible variants.

The following extracts (slightly reordered) from their well-written paper are reprinted with the kind permission of my old friend and colleague, Fred Tompkins, Senior Vice President of KTSI.

Peer-to-peer (hereafter referred to as P2P) communication software allows individual computers to share and swap various types of files. Recently, P2P software has been much in the news due to current and potential lawsuits. Napster, the company that makes software for exchanging MP3s (encoded music files), is being sued for copyright infringement; the recently re-released Gnutella has the potential for exchanging all types of files and may therefore be embroiled in litigation even more quickly than Napster was.

P2P software takes the idea that the Internet is for sharing to new levels. P2P has been described as "an anarchistic threat to the current Internet" (David Streitfeld, The Washington Post, July 18, 2000) and Marc Andreesen has called P2P software the most important thing on the Internet in the last six years (when Netscape was first released) and a "benevolent virus." Ian Clarke, the creator of FreeNet, says, "People should be free to distribute information without restrictions of any form."

Even protected code is not safe. Programs like AOL Instant Messenger, or any other P2P software, can be reverse engineered and released as Open Source software. These programs can then be released for any operating system platform. This also gives malicious hackers the ability to change the software code so that it can be used for other purposes. This requires a great deal of programming knowledge and skill, but can still be done.

The first obvious concern is the liability of copyright infringement. Even though all of the companies that produce and release P2P software issue warnings regarding the illegalities of downloading copyrighted materials, simply releasing the software makes those illegal acts possible. Some P2P software contains security warnings during the installation of the software and enables default settings to protect the naïve consumer and their computer. But armed with some simple knowledge of the Internet and its protocols, even a beginner criminal hacker can cause many security risks to users of this class of software.

More important than any copyright concerns are the potential security concerns for corporations and consumers. For corporations, P2P software threatens:
• bandwidth consumption
• liabilities and acceptable use violations
• undermining of security policies
• Trojan Horse and virus distribution
• disclosure of IP and MAC addresses
• telecommuters.

For individual consumers, P2P software represents:
• disclosure of IP and MAC addresses
• disclosure of connection speed
• file sharing
• Trojan horse and virus distribution.

I hope that readers will go to the KTSI Web site and read the entire article for themselves. The URL is < http://www.ktsi.net/whsecurityp2p.html >.

2000-03-07 **intellectual property copyright theft customer relations hostility generation gap**

NewsScan, New York Times
http://www.nytimes.com/library/tech/00/03/biztech/articles/07net.html

The popular Napster software, which enables users to find and copy a wide array of digitized songs as well as share collections with others, is changing the way younger people think about copyrighted music as intellectual property, and the industry fears things may never be the same again. "There's an incredible disconnect out there between what is normal behavior in the physical world versus the online world," says Carey Sherman, general counsel for the Recording Industry Association of America. "There are people who think nothing of downloading entire CD collections on Napster who wouldn't dream of shoplifting from Tower Records. There's just a massive education program that's needed here for people to understand what goes into the creation of music." The RIAA has filed a lawsuit against Napster, which argues that it is not liable for music piracy because it doesn't keep any of the pirated files on its own servers. But punishing the individual consumer is a losing proposition: "One of the fastest ways to turn potential customers off is to say they're all a bunch of thieves," says a copyright expert at UC-Berkeley. "You start hating your customers and your customers are going to start hating you back, and that doesn't bode well for your ability to attract them to buy more stuff from you. It makes them more inclined to infringe rather than buy." (New York Times 7 Mar 2000)

Colleges and universities are split on "the Napster issue." Some are blocking Napster, some are not. Among the ones that are not are Georgia Tech, Michigan, Stanford, Duke, and the University of California at Berkeley. A Georgia Tech official says: "We are an educational institution and we will err on the side of unfettered access to information. Once you start down that road ... well, we could tie up an awful lot of staff people and resources trying to evaluate Web sites' content, and we don't want to get into that." Among the ones that are blocking Napster are Yale, Indiana, Southern California, Texas, Ohio State, Northeastern, and Canisius. The first three in this group made their decisions after being sued by two rock groups and the Recording Industry Association of America; the second two chose to block Napster on the grounds that Napster traffic clogged their computer networks; and the last two cited legal and ethical reasons for rejecting Napster and similar programs. A Canisius official explained: "It's not free for you to steal books from the public library, and it's not free to download music you haven't paid for." (AP/San Jose Mercury News 1 Oct 2000)

2000-03-24 **peer-to-peer networking file exchange**

NewsScan, Los Angeles Times
http://www.latimes.com/business/2000324/t000027817.html

Some enterprising computer hackers have come up with a variation on Napster software that helps people search and swap any type of computer file — not just MP3 music files. The variation, dubbed "Wrapster," uses Napster's servers to exchange everything from games and movies to software and spreadsheets by tricking them into thinking the files are in the MP3 format. Napster holds patents on some components of its technology and the company's VP of engineering says it hasn't decided "whether we're going to turn a blind eye to it or actively try to disable it." Napster is currently developing its own systems that would enable other types of files to be traded. (Los Angeles Times 24 Mar 2000)

2000-05-09 **intellectual property copyright violation theft lawsuit ruling**

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000509/t000043641.html

The Recording Industry Association of America claimed initial victory in its lawsuit against Napster after U.S. District Court Judge Marilyn Patel rejected Napster's argument that it is a "mere conduit" for pirated music files. The RIAA is hoping for a repeat performance of its recent win over MP3.com. A federal judge in that case ruled that MP3.com violated copyright law with its database that allows users to store music and then access it from any computer connected to the Internet. The RIAA is seeking statutory damages ranging from $500 to $100,000 per sound recording downloaded using Napster's software. Analysts estimated the total could approach hundreds of billions of dollars. (Reuters/Los Angeles Times 9 May 2000)

2000-06-05 **music sharing intellectual property copyright permission legal authorized fair use streaming**

NewsScan

Pointera, a Palo Alto-based startup that launches today, says its service is unique in that it enables portals and users to share files, including digital music files, legally through a standard Web browser. The service is conceptually similar to Napster and Gnutella, but rather than copying the desired files, the user "shares" the file, which remains on the original computer. "We enable the streaming of media files as opposed to people just downloading," says CEO Manish Vij. "What this means is you can just hit play from your hard disk instead of hitting copy. If you're simply playing that's the same as going to someone's house and watching a movie and is still covered by fair use under the copyright laws." The Pointera Search Engine enables portal servers to work directly with individual PCs for file-sharing. "The real issue here is that the technology essentially moves beyond MP3," says Gartner Group's Chris Le Tocq. "The Pointera technology is a business application, which we've never had before. Groups of people can exchange files and work together... The interesting thing here is that this an instant process, it allows for peer to peer architecture. This is very different than the hierarchical architecture found on the Web today." (Internet.com 5 Jun 2000)

2000-06-16 **intellectual property music theft trafficking lawsuit litigation**

NewsScan, San Jose Mercury News
http://www.sjmercury.com/svtech/news/breaking/ap/docs/91264l.htm, New York Times
http://partners.nytimes.com/library/tech/00/06/biztech/articles/16music.htm

[In June,] The Recording Industry Association of America . . . asked a federal judge to grant an injunction preventing Napster, the online service that allows individuals to swap music collections without necessarily observing copyright laws, from "facilitating or assisting others in, the copying, downloading, uploading, transmission or distribution of copyrighted musical works." The request was supported by the Motion Picture Association of America and by MP3.com. MPAA president Jack Valenti . . . [said]: "If Napster can encourage and facilitate the distribution of pirated sound recordings, then what's to stop it from doing the same to movies, software, books, magazines, newspapers, television, photographs or video games?" (AP/San Jose Mercury News 13 Jun 2000)

Defending itself against a copyright lawsuit against the Recording Industry Association of America for making it possible for over 10 million computers users to share copyrighted files, the Internet music distribution company Napster.com . . . [said in June] that it should not be sued just because it is operating on a large scale. Napster's position is that the RIAA would never sue a single individual for copying a song or movie and giving it to a friend, and so it should not be suing Napster just for facilitating such behavior on a large scale. Without conceding that it is lawful for users to share music one-on-one, the recording industry . . . [said] that "there can be no question it is unlawful when done on a large scale, as with Napster." (New York Times 16 Jun 2000)

PEER-TO-PEER NETWORKING MOVES TO WALL STREET [9 Feb 2001]
Peer-to-peer networks have already proven their popularity for swapping music files, and now the same technology is invading Wall Street, with a number of startups "poised to revolutionize the investment management industry," according to an analyst at research firm TowerGroup. Two types of peer-to-peer models are emerging: one resembles Napster, in which computers share the files directly, and the other pools the resources of lots of computers to maximize the processing power. The first type enables Wall Street brokerages to deliver targeted information to clients and provides a platform for money managers to trade stock among themselves without the use of a broker. Meanwhile, distributed peer-to-peer computing networks can process complex calculations in record speed. The investment community "is a space that does not need religion when it comes to distributed computing," says Datasynapse CEO Peter Lee. "Every one of our clients was already doing it in some way, shape or form" through their own internal networks. (Investor's Business Daily 9 Feb 2001)
http://www.investors.com/editorial/tech01.asp?v=2/9

PEER-TO-PEER MOVES INTO THE MAINSTREAM [13 Jun 2001]
Many people think "Napster" when they hear about "peer-to-peer" computing, but the technology, which enables users to share files and collaborate by linking their computers over the Internet, is moving into corporate America. A variety of companies, including Intel, GlaxoSmithKine, Raytheon, Ernst & Young, and First Union, are finding that peer-to-peer technology allows their workers to do business faster, better and cheaper. Employees can hold online meetings from any location, bypassing the bottleneck of corporate servers, and freelance workers and contractors can join an online group without compromising the company's security system. "The way people get things done is by working together in small or large groups," says a Garner Group research director. "With peer-to-peer, we move from personal to interpersonal computing." Garner estimates that by 2003 nearly one in three corporations will use peer-to-peer technology to distribute files among employees. (New York Times 13 Jun 2001)

PEER-TO-PEER SCREENSAVERS [1 Aug 2001]
DALiWorld, a new peer-to-peer software program that debuted this week, is one of the first examples of how file-sharing technology is emerging as a foundation for a new generation of online games. "Traditional peer-to-peer software like Napster or Gnutella is just about moving files," says DALi CEO Todd Pappainoannou. "What we're talking about is shared, networked entertainment -- people interacting in the same virtual world from wherever they are." For the moment, DALi's major creation is software that allows you to create a virtual aquarium on your computer housing your own artificially intelligent fish, as well as others created by other users. Users can right-click on any fish swimming by to see where they've come from. Future plans call for evolving DALiWorld into a complex universe where players can create their own creatures, communicate with players from around the world, forage for food and even fiddle with the biochemistry of the virtual environment. 'PARASITIC' COMPUTING [30 Aug 2001]
Researchers at the University of Notre Dame have demonstrated "parasitic" computing -- using other people's servers to do your own processing. Although several projects have harnessed the power of distributed computing for a common research goal, the difference here is that the Notre Dame researchers didn't ask the other server owners' permission. The methodology exploits technical protocols that ensure reliable communication by, in effect, turning the Internet into a distributed computer. Servers can then be harnessed to perform computations on behalf of an uninvited users, solving complex mathematical problems while engaging in standard communications. (InfoWorld 30 Aug 2001)

USER WEB HABITS TRACKED BY SOME MUSIC-SWAPPING PROGRAMS
The Web surfing habits of people who used the LimeWire, Grokster and KaZaA music-sharing programs were surreptitiously tracked because those programs were linked to an online sweepstakes game called ClickTillUWin, in which players pick numbers and win cash prizes. The company that operates the sweepstakes game says it told outside distributors to get users' permission before installing the software, but in these cases that action was not taken. The three companies have posted new versions of their software without the tracking component, and LimeWire has issued an apology. (AP/USA Today 4 Jan 2002)

GOOGLE TACKLES DISTRIBUTED COMPUTING
Google has invited 500 users to try out a new version of its toolbar that enables them to donate their excess processing power to a Stanford University research project aimed at discovering how genetic information is converted into proteins. The Google Compute project follows the lead of other distributed computing endeavors that have sought to find everything from extraterrestrial life to cures for cancer and anthrax. "The main motivations were to try to leverage Google's expertise with large computer systems and to try to give something back to science," says Susan Wojcicki, head of Google Compute. The company likely will expand the program to include other scientific projects in an effort to boost its search business, says Wojcicki, but she doubts it will ever become a source of revenue in itself. "You never want to say never, but the goal now is to contribute something to science. We have enough fish to fry in our current businesses." (CNet News.com 22 Mar 2002)

PEER-TO-PEER SITES MULTIPLY DESPITE LEGAL PROBLEMS
The number of peer-to-peer Web sites has increased more than five-fold in the past year, according to a study by Websense, despite heightened efforts by record companies, movie studios and software makers to shut them down. According to the survey, the number of file-swapping sites totals nearly 38,000, up 535% in the last year. Meanwhile, the recent surge in file-swapping is beginning to affect the workplace, as employers struggle to deal with the issues surrounding workers who use the speedy corporate networks to download songs and software -- a potentially illegal activity. "Companies that look the other way many have copyright violations occurring in the workplace, and lawsuits are a potential outcome of such activity," says one attorney. (Reuters/CNN.com 29 Apr 2002)

2002-06-10 **P2P peer-to-peer networks file sharing vulnerabilities privacy penetration hard drive e-mail financial information compromise honeypot**

RISKS 22 12

Nathan Good of the Information Dynamics Lab at HP Laboratories posted a note in RISKS:

We have just finished a study that shows how user interface design flaws allow users on Kazaa to share their personal files without their knowledge. In a laboratory user study, only 2 out of 12 subjects were able to correctly determine that Kazaa was sharing their entire hard drive. We looked at the current Kazaa network and discovered that many users are sharing personal information such as email and data for financial programs such as Microsoft Money.

To see if other users on Kazaa were aware of this and taking advantage of users ignorance, we ran a Kazaa client for 24 hours with dummy personal files. During this time, files named "Inbox.dbx" and "Credit Cards.xls" where downloaded from our client by several unique users.

The tech report can be accessed here:
http://www.hpl.hp.com/shl/papers/kazaa/KazaaUsability.pdf
or from our lab web page at

2003-03-29 **US military peer-to-peer P2P technology battlefield Iraq**

NewsScan

P2P GOES TO WAR
The U.S. military is using peer-to-peer technology to plan battlefield operations in Iraq and coordinate humanitarian aid to that country. Microsoft's NetMeeting software and programs from Groove Networks and Appian Corp. are part of the Defense Department's shift away from massive central computer servers toward more flexible systems that enable users to work on joint projects and share information. For instance, commanders in the Persian Gulf use collaboration software to chart their progress, drawing on one another's maps during videoconferences several times a day, says J.P. Angelone, who heads the enterprise capabilities center at the Defense Information Systems Agency. One advantage is that data are kept on individuals' computers — when a participant disconnects from the network, he can keep working on his personal version of the material. Logging in again automatically sends the updated material to other participants. "It's helpful because you reduce the physical distance to connect. If you've got a command or a tactical unit in the area of responsibility, there's no sense coming all the way back to tap into a server," says Angelone. The Defense Information Systems Agency has installed basic collaboration tools at more than 63 sites worldwide, and the trend toward P2P use likely will continue because such systems are more resistant to attack and can be faster and easier to use than traditional, server-based systems. ALTNET AND KAZAA PUSH LEGIT P2P NETWORK
Sharman Networks' Kazaa and Brilliant Digital Entertainment's Altnet are teaming up to launch a new phase of peer-to-peer networking, harnessing the capacity of tens of millions PCs to swap authorized copies of games, songs and movies. Giving people an incentive to trade in legitimate files could create a powerful new business model for the entertainment industry and reduce file-swapping networks' role as hubs of online piracy, says Altnet CEO Kevin Bermeister. "The minute you begin shifting unauthorized files out of people's shared folders, the peer-to-peer networks (as sources of copyright infringement) begin to disappear. Lawsuits are the stick approach. This is the carrot." Customers who sign up for the new service will agree to install high-security file-swapping software and host files that are authorized for distribution through the network. "Peer Points" will be awarded each time someone uploads a file, with the points redeemable for a variety of bonuses ranging from free access to paid content to sweepstakes entries for big-ticket items such as cars or cash. The new Altnet service and a revamped version of the regular Kazaa file-swapping software are expected to be released in test form later this week. (CNet News.com 1 Jun 2003)

2003-10-10 **P2P peer-to-peer networking Simson Garfinkel MIT technology copyright infringement**

NewsScan

P2P: SALVATION OR SCOURGE?
Internet gadgeteer and author Simson Garfinkel says peer-to-peer technology may have gained a bad name in recent years, but it could solve many of the current Internet's traffic congestion and security problems. "Peer-to-peer could overcome many of the fundamental problems that are facing the Internet today — problems of centralized control, vulnerable servers, and the difficulty that most organizations have scaling. On the other hand, peer-to-peer could also make the Internet's security problems worse, by allowing hackers to create large-scale attack networks. Peer-to-peer could be a boon for the artists and the recording industry, giving them a way of publicizing and distributing their intellectual property for far less than they do now. Yet better peer-to-peer systems could further hurt the recording companies — and not just through copyright violations... The real threat that peer-to-peer poses to the record labels is that it could make them obsolete. At the end of the day, peer-to-peer technology is about increasing the reliability and the redundancy of Internet-based systems. That's why the recording industry is afraid of it — because peer-to-peer can be used to create networks that the industry can't shut down. But peer-to-peer can also be used to create networks that earthquakes, wars and terrorists can't shut down. Ultimately, I think that we're better off trying to strengthen the Internet rather than trying to make it weaker." (MIT Technology Review/Wall Street Journal 10 Oct 2003)

2003-12-09 **hackers pirates theft Trojan horses peer-to-peer P2P Kazaa**

NIPC/DHS

December 08, New York Times — Hackers steal from pirates, to no good end.

Rogue programs known as "Trojan horses" are used by hackers to mask their identities by using unwitting people's computers as relay stations. It had been assumed that investigators could ultimately shut down a system by identifying the server computer used as the initial launching pad. But computer expert Joe Stewart has said that a program called Backdoor.Sinit uses the commandeered machines to form a peer-to-peer network like the Kazaa program used to trade music files. Each machine on the network can share resources and provide information to the others without being controlled by a central server machine. When there is no central machine, "these tactics make it impossible to shut down," he said. Rings of infected computers have been used to send spam, present online advertisements for pornographic Websites, or trick people into giving up information like credit card numbers. "Sinit appears to have been created as a money-making endeavor," Stewart said. "This Trojan is also further evidence that money, not notoriety, is now the major driving force behind the spread of malware these days." On Websites frequented by hackers, spammers and people who identify themselves as practitioners of credit card fraud, the remote-access networks, or "radmins," are offered openly.

2004-01-22 **virus threat peer-to-peer network P2P file music sharing**

NIPC/DHS; http://news.bbc.co.uk/1/hi/technology/3409187.stm

January 20, BBC News — Viruses turn to peer-to-peer nets.

Virus writers are setting up peer-to-peer networks to help their malicious creations spread. The networks are being used to control thousands of innocent PCs that some virus programs have infected. The tactic is being used because peer-to-peer networks are hard to disrupt, making viruses using this technique hard to stop spreading. One of the first viruses to set up a peer-to-peer network to help it spread was the Slapper worm that was aimed at the Linux operating system. A Windows virus called Sinit appeared in late 2003 that turned every machine infected by the malicious program into a member of a peer-to-peer network. It was expected that Sinit's creator would issue commands to infected computers via this network. In the past some creators of Trojan programs, that open up a backdoor into an infected PC, have used net chat channels as a way to issue commands. Often thousands of computers were enrolled in these remote controlled networks that have been dubbed "bot nets." Finding and shutting down the chat channels would effectively cut a virus writer off from his network of slave machines. But shutting down a distributed network would be much more difficult because no one machine is in charge. It also is much more difficult to trace where commands were being inserted and find the network's controller.

2004-02-02 **peer-to-peer P2P music file sharing intellectual property rights lawsuit Grokster Morpheus**

NewsScan

P2P CASE HEADS BACK TO COURT

A federal appeals court in California will review a lower court ruling made last spring that held distributing P2P software tools such as Grokster and Morpheus was legal and absolved the parent companies of responsibility for copyright infringement occurring on those networks. That ruling was a surprise setback for the entertainment industry, which had prevailed in previous efforts to shut down Napster and other file-swapping sites. In his decision last April, Judge Stephen Wilson wrote: "Defendants distribute and support software, the users of which can and do choose to employ it for both lawful and unlawful ends. Grokster and Streamcast are not significantly different from companies that sell home video recorders or copy machines, both of which can be and are used to infringe copyrights." In its appeal, the recording industry will argue that Wilson's analysis was flawed, citing earlier decisions in the Napster case, in which judges said that the VCR analogy (known as "substantial noninfringing use" in legal circles) does not apply if a company knows its products are being used for illegitimate purposes. "We believe (Grokster and Streamcast) are operating just like Napster and fall under the Napster ruling that the court handed down three years ago," says an attorney for the Motion Picture Association of America. "They do have one thing Napster lacked, and that is a good business model. They are making millions of dollars off of content that is not theirs." (CNet News.com 2 Feb 2004)

NewsScan; http://news.com.com/Super-powered+peer+to+peer/2100-1032_3-5397784.html

P2P GETS A BOOST

Streamcast Networks, owner of the Morpheus file-swapping software, is releasing an updated version that incorporates technology called Neonet to speed up the search process on peer-to-peer networks. Neonet, authored by a pair of former Harvard students, uses "distributed hash tables," which are essentially a way of taking a snapshot of where every file on the network is at a given moment and scattering bits of that information around the entire network. To find a specific file, a user's search request bounces from computer to computer across the P2P network, with each hop revealing a little more information about where the file can be found. Usually just three or four hops are necessary before the file is located for downloading. "The main benefit is that it allows you to search the entire network instead of just a local area," says Jed McCaleb, chief programmer for eDonkey, which also uses Neonet technology. "It's probably faster than the way Gnutella works, and it's definitely technically superior." Neonet creators Ben Wilkin and Francis Crick say the technology also holds promise for newer applications such as Net calling. "It can be used for all sorts of distributed computing tools, and that's where we're going to go with it," says Wilkin. "It really eliminates the need to have any centralized infrastructure."

P2P GROWING LIKE A WEED

Peer-to-peer file-sharing networks, the scourge of the music industry, can also be used to promote music through software programs like Weed, which allows fans to download a song and play it three times before they're prompted to pay for it. Songs cost about a dollar and can be burned to an unlimited number of CDs, passed around on file-sharing networks and posted to Web pages. "We're trying to take the problem of unauthorized music sharing and turn it into an opportunity for everyone to participate in the music business," says John Beezer, president of Shared Music Licensing, which markets the Weed software and channels payments to the artists and distributors. Weed also encourages sharing by offering a commission to users who pass a song onto a friend who then buys it. Under the distribution scheme, the copyright owner gets 50%, Weed gets 15%, and the fan who passes the music along gets 20%. [Note: The article failed to mention where the other 15% goes.] Weed is also a participant in the P2P Revenue Engine project sponsored by the Distributed Computing Industry Association, which seeks to demonstrate to entertainment firms how they can use P2P services to make money. 2004-12-06 **peer-to-peer P2P Napster Shawn Fanning Snocap**

NewsScan; http://www.zdnet.com.au/insight/software/0

NAPSTER FOUNDER SINGING A NEW TUNE

Shawn Fanning, of Napster fame, is launching a new venture called Snocap that offers technology to identify songs as they are moved around on the Net and prompt users for payment before they listen. The idea is to transform peer-to-peer music sharing into a profit-making venture for the artists and record labels through a comprehensive content registry and "fingerprinting" technology. "We're trying to build something that facilitates a high-quality service. Respecting rights holders is important, but it's all working under the assumption that everyone is trying to make as much content available as possible. The business is built on the premise that a peer-to-peer service ought to be able to launch a successful authorized system and have the breadth of content that they had available previously, or close to that," says Fanning, who adds that his technology could also be used to police file-sharing of video games, software, movies and other P2P network content. "The fingerprint technology is music specific, but fingerprinting can apply to video, etc. The rule-sets are specific to music, but those are also very easily adaptable. So our system in a general sense is very extensible, and we believe that once the music space begins to adopt the Snocap system, there will be a demand for this kind of architecture to provide content in other forms." (ZDNet 6 Dec 2004)

2005-01-21 **P2P peer-to-peer BBC Hollywood music video control business models**

NewsScan; http://news.bbc.co.uk/1/hi/technology/4191581.stm

THE FUTURE OF P2P

While Hollywood and the music industry has spent the last few years demonizing peerto- peer networks, big business is eyeing the technology's potential for "commoditization" (translation: $$$). "Old media always tries to stop new media. When they can't stop it, they try to control it. Then they figure out how to make money and they always make a lot of money," says StreamCast Networks president Michael Weiss. P2P networks can be used to share any type of file -- photos, software, licensed music and other digital content. The BBC has already embraced the technology, and will be using P2P to offer most of its programs for download this year. Even some commercial entertainment companies are working on business models that would enable them to make money off of it, such as paid-for-pass-along, in which firms receive money each time a file is shared. MICROSOFT CREATES VIRTUAL 'VAULT'
Microsoft, bowing to pressure to make its Windows operating software more secure, is developing a new security feature called "Palladium" that acts as a virtual "vault" for conducting electronic transactions and storing sensitive information. In order to use the new feature, consumers will have to buy new computers equipped with ultra-secure computer chips from Intel, Advanced Micro Devices, among others. Microsoft says the new technology won't be available for at least 18 months, and company officials have said they don't expect to see Palladium-enabled products hit the mainstream market for at least five years. Supporters of the technology say it will be capable of weeding out viruses and other malicious computer code and that personal information such as financial or medical records will be encrypted and inaccessible, even from other software running on the computer. Critics say Palladium could end up being just one more means for Microsoft to dominate the world's software markets, and that using the software will require changes to video and keyboard technologies requiring billions of dollars in new equipment upgrades by consumers, corporations and governments. (AP 25 Jun 2002)

INTEL'S 'LEGRANDE' VISION FOR SECURE CHIPS
Intel is planning to build security features into its microprocessors next year, in a move aimed at thwarting computer viruses and malicious hackers. The technology, dubbed LeGrande, initially will be included in Prescott, the code name for a new Pentium chip due out the second half of 2003. The idea of using secure chips, in addition to software, isn't new, but gained wider attention this summer when Microsoft announced its Palladium security initiative, which it hopes to develop in conjunction with Intel and chip rival Advanced Micro Devices. Unlike Palladium, however, the LeGrande technology will work with operating systems other than Microsoft Windows. The technology works by partitioning off areas of the computer's hard drive into protected areas called "vaults," and protecting the pathways between the vaults and keyboards, monitors and other peripherals. (Wall Street Journal 10 Sep 2002)

2002-11-04 **trusted computing hardware chips processors**

NewsScan

IT'S YOUR DATA; WHOM DO YOU TRUST WITH IT?
The major information technology companies, including Microsoft, Intel, IBM, Hewlett-Packard and 170 others, are developing an approach to data security called "trusted computing," which hardwires security into silicon chips and related software, rather than relying strictly on software to achieve security. Intel software manager Narendar Sahgal says, "This is a fundamentally new approach as opposed to taking a software-only approach." (At Intel trusted computing is called LaGrande; at Microsoft it's called Palladium.) In the trusted computing approach, each communication transaction (such as an e-mail message or an online purchase) is required to interact with secure and uniquely identified hardware through "trusted agents." Not all technologists are happy with the trend. Cambridge University security researcher Ross Anderson says, "I don't think the kind of trustworthiness they seek to deliver is at all desirable. It's not security for me. It's security for them." (AP/San Jose Mercury News 3 Nov 2002)

2004-02-22 **buffer overflow hardware microprocessor fix chip manufacturers**

NewsScan

CHIPMAKERS RACE TO PLUG THE BUFFER OVERFLOW PROBLEM

The next generation of microprocessors will plug the gaps that have resulted in "buffer overflow" vulnerabilities, causing Microsoft to issue repeated "critical security alerts." The buffer section of computer memory stores a finite amount of data. To exploit the flaw, hackers cause more data to be sent to the buffer than it can hold, forcing it to overflow into the next chunk of buffer memory, where they then deposit their malicious code. This leaves the computer open to attack, as demonstrated by the devastating Slammer and Blaster worm invasions in 2003. "Buffer overflows are the largest class of software vulnerabilities that lead to security flaws," says the head of one security company. The new chips will be designed to block this avenue of attack, although security experts predict that determined hackers will find other ways to insert computer viruses — for example, by making a program jump to a subsection of its own code at the wrong time, perhaps to open a data port to a hacker. (New Scientist 22 Feb 2004)

Category 24.A *Secure processors*

2004-04-12 **portable computers cell phones encryption security firmware chip**

NewsScan

INTEL CHIPS WILL INCLUDE HARD-WIRED SECURITY

Intel's PXA27x processors — that company's next generation of chips for cell phones and handheld computers — will include hard-wired security by means of a security "engine" placed on the same piece of silicon but separated from the area where general processing takes place. Intel wireless security manager Dave Rogers says, "Carriers want to be able to identify the handset on the network. They want to make sure nobody is doing anything malicious with that handset." Some industry-watchers remain skeptical. Gartner research analyst Michael King says of Intel's wireless plans: "They're at an early place in this marketplace. Being able to dictate standards requires that you have a commanding position and I don't think they're there yet." (AP/Los Angeles Times 12 Apr 2004)

2005-04-29 **computer keyboard equipment dirty filthy infected bacteria culture sanitize disinfect**

RISKS 23 87

COMPUTER KEYBOARDS A VECTOR FOR BACTERIAL INFECTION IN HOSPITALS

Ken Knowlton reported on new findings about a different sort of infection risk in computer equipment:

"Computers are making hospitals more dangerous, new research suggests. Computer keyboards fester with colonies of bacteria, which can easily spread from the medical personnel who use them to the patients they treat. Some hospitals now have computers in every patient room, creating even more opportunities for contamination. Researchers at Northwestern Memorial Hospital in Chicago found that the types of bacteria commonly found in hospitals -- some resistant to antibiotics -- could survive on a keyboard for 24 hours. Simply cleaning the computers with soap and water didn't make a difference. Using a strong disinfectant did kill the germs -- but it also damaged the computers. 'The difficulty with keyboards is you can't pour bleach on them,' Dr. Allison McGreer of Toronto's Mount Sinai Hospital tells The Canadian Press. 'They don't work so well when you do that.' Because it's nearly impossible to keep keyboards sterile, researchers say, the onus is on doctors and nurses to wash their hands vigorously and often." [Excerpted from *The Week*, 29 May 2005]

[MK notes that there is a tremendous market here for an enterprising company to manufacture sterilizable computer equipment, much as some manufacturers make military-grade field equipment. Sterilization could involve special materials in combination with special disinfectants especially chosen to be safe both for people and for the computer gear.]

RISKS; http://www.spectrum.ieee.org/aug05/1699 24 01

ROBUST SYSTEMS DESIGN FOR THIRD-WORLD APPLICATIONS

There is an interesting article in the August 2005 issue of _IEEE Spectrum_ [by G. Pascal Zachary] on the above subject. [Hermann] Chinery-Hesse runs a very successful software business in Ghana. Some of the high points:

* Software that is lean and efficient, so it runs well on old PCs such as 386/486. These are affordable in Ghana.
* Software design for robustness under third-world conditions. For example, frequent writes to disk to minimize work lost of the power goes off, as it frequently does.
* Rather extreme measures to protect proprietary software, such as updates installed in personal visits by software company employees. This to cope with conditions in a country where any sense of ethics is practically nonexistent.
* Shunning of open source software, on the grounds that having the source makes it too easy for unscrupulous users to modify the code so as to line their own pockets.

This last item could well be criticized as security through obscurity. Surely the incentives are there for users to make a considerable effort to tamper with closed source proprietary software. One could argue that open source software would be easier to audit for unauthorized modifications. But then who audits the auditors? And how can they be sure that the code actually running in the machine is accurately represented by the source code they can see.

This suggests a larger research topic: how can we make computer systems that are guaranteed to "work right" when they are to be installed in a den of thieves? Seems like this has applicability to the problem of electronic voting systems in the U.S.

[Abstract and comments by J. H. Haynes]

1997-04-16 **RFI cancer cell phone**

AP, AAP; RISKS 19 39

Medical experts at a conference in Sydney, Australia presented epidemiological evidence that electromagnetic radiation from cellular phones is associated with cancer and a number of other diseases. In separate research, a few hundred specially-bred mice highly susceptible to spontaneous lymphoma were exposed to cell-phone radiation for 18 months. Cancer rates doubled. It is not yet known if these results can be extrapolated to normal mice and to other species. The results were published in the journal _Radiation Research_ in May. Not incidentally, the results were announced with much hoopla at a press conference held by Microshield, a manufacturer of a phone cover claimed to reduce radiation from the devices. Motorola, a major manufacturer of cell phones, responded by threatening a lawsuit if the claims by Microshield were not withdrawn.

Category 25 *Computer remote control & disruption*

1998-04-01 **RFI EMI radio-frequency interference**

RISKS 19 64

In a long and detailed article published in the _New York Review of Books_ and available at <http://jya.com/twa800-emi.htm>, writer and Harvard Professor of Philosphy Elaine Scarry analyzed the possibility of electromagnetic interference as a precipitating cause in the crash of Flight TWA 800 in 1997. However, a subsequent commentator in RISKS 19.65 described the study as "far from a rational, scientific review of the evidence." Peter Ladkin debunked Scarry's arguments in a scathing attack published in RISKS 19.66. [So with a bow to Dr Neumann's penchant for punning, we can conclude that this scary story by Scarry has been scarified by experts.]

Category 25 *Computer remote control & disruption*

1998-04-16 **RFI EMI radio-frequency interference jamming cell phones**

RISKS 19 68

Steven Slatem, writing from Prague, reported that many gas stations in the Czech republics now bar the use of cellular phones because of reported interference with data transfers for checking credit cards. Another correspondent noted that in the UK, mobile phones must not be used near petrol stations because of the risk of sparking an explosion.

Category 25 *Computer remote control & disruption*

1998-04-23 **cell phone availability information warfare blocking jamming**

EDUPAGE, RISKS

Everyone knows about the problem caused by cell phones in public places such as concert halls, lectures, hospitals, and places of worship. This problem is particularly bad in Israel, where the military had to ban cell phone use by soldiers on active duty because the chatterboxes were inadvertently revealing sensitive military data. In my own synagogue in Montreal (writes editor Mich Kabay) our congregation was startled when a shrill tweedling interrupted the rabbi's Dvar Torah (sermon) in the middle of a service. Well, Israeli company Netline Technologies announced C-Guard, a system for suppressing unwanted cell phone calls in any given area by low-power jamming of communications with local base stations. Yasher koach (go in strength), as we say in Hebrew.

Category 25 *Computer remote control & disruption*

1998-04-28 **RFI EMI jamming quality assurance QA testing**

RISKS 19 70

The Newport, NY facility of the US Air Force Research Lab Information Directorate started a brief test of antenna emission patterns on 30 Dec 1997; the test involved 5-watt broadcasts at many Global Positioning Satellite frequencies. Unfortunately, the tests did not stop at the end of the automatic sequence, causing disruption of GPS signals used by commercial aircraft in a 300 km diameter zone defined by the FAA. The problem was not discovered until 12 January, when AF staff happened to notice complaints about GPS signal failures. [The tale of the Sorceror's Apprentice often comes to mind when I read about such cases of unplanned continuation of what were supposed to be temporary processes.]

Category 25 *Computer remote control & disruption*

1998-10-21 **RFI EMI radio-frequency interference certification**

RISKS 20 4

The casual assignment of electromagnetic frequencies is becoming perilous, wrote Peter Neumann in RISKS. "Patriot defenses and Predator unmanned aerial vehicles reportedly cannot work properly in certain foreign countries (Germany, Japan, South Korea and Bahrain are particular instances) because of frequency clashes. For example, Patriot missile system radios, radars, and data-link terminals clash with Korean cellular phones; U.S. force pages clash with Japanese aeronautical systems; crib monitors used on U.S. bases clash with German telephone service. In Bahrain, SPS-40 and SPS-49 radars are unusable because of interference from the national telecommunications services."

Category 25 *Computer remote control & disruption*

1999-01-29 **denial of service cellular phone signals control channel**

RISKS 20 18

In Crystal River, FL an innocent user unknowingly blocked all other cellular calls in his area whenever he used his new cell phone. The outages lasted 10 days while GTE tracked the problem down to his phone, which they replaced. [This case illustrates the vulnerability of the highly computer-dependent cellular-phone system to disruption — accidental in this case but possibly deliberate in an information warfare attack.]

MediVIEW and Medically Oriented Operating Network (MOON) from Sabratek Corp. allow intensive remote medical intervention such as alterations of automated flow control devices for drug administration. The initial press releases included no sign that anyone was concerned about security issues in this system. [The risks of system error and hacking now become life-threatening.]

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

1998-07-17 **Windows vulnerability probe remote administrationTrojan RAT criminal hacker**

Cult of the Dead Cow, news wires, RISKS

The Cult of the Dead Cow (cDc) announced Back Orifice, a tool for analyzing and compromising MS-Windows security (such as it be). The author, a hacker with the L0PHT group, described the software as follows: "The main legitimate purposes for BO are remote tech support aid, employee monitoring and remote administering [of a Windows network]." However, added the cDc press release, "Wink. Not that Back Orifice won't be used by overworked sysadmins, but hey, we're all adults here. Back Orifice is going to be made available to anyone who takes the time to download it [read, a lot of bored teenagers]." The product featured image and data capture from any Windows system on a compromised network, an HTTP server allowing unrestricted I/O to and from workstations, a packet sniffer, a keystroke monitor, and software for easy manipulations of the victims' Internet connections. BO's description qualified it as a Trojan that allowed infection of other applications and used stealth techniques to erase its own visibility once loaded into memory. Security experts pointed out that the key vulnerability allowing BO to contaminate a network was the initial step — running a corrupted application that would load the parasitic code into memory. Users should not download software from unknown sites or execute attachments to e-mail without assurance of their legitimacy. All the major firms offering anti-malicious-code software issued additions to their signature files to identify the Trojan code.

Apparently 15,000 copies of Back Orifice were distributed to Internet Relay Chat users by a malefactor who touted a "useful" file ("nfo.zip")that was actually a Trojan infected by Back Orifice.

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

1999-07-12 **criminal hacker remote control penetration Trojan tools**

Canberra Times (Australia)

David Hellaby of the Canberra Times (Australia) published a good review of remote-control software used by criminal hackers. Some of the dangerous applications are BackOrifice, BackOrifice 2000, DeepThroat 1, 2 and 3, EvilFTP, ExploreZip.worm, GateCrasher 1.2, GirlFriend 1.3, Hack'a'Tack, NetSphere 1.30,phAse Zero, Portal of Doom, and SubSeven (aka BackDoor-G). These programs are usually integrated into otherwise harmless and useful vector programs to create Trojans that are downloaded from the Net or shared among hapless victims. Symptoms of remote control sound like a nightmare from a paranoid schizophrenic's worst crisis: "your CD draw begins opening and closing, your web browser starts on its own, strange messages appear on your screen, and your PC seems to be haunted." The author warned his readers to be very careful about opening attachments to e-mail messages.

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

1999-07-12 **criminal hacker penetration tool Trojan version WindowsNT**

AP

The Cult of the Dead Cow released BackOrifice 2K (B02K), the newest version of its 1998 penetration tool, BackOrifice (named as a lampoon of the BackOffice product of Microsoft). BO2K, usually installed illegally on victim machines through a contaminated vector program that has been thereby transformed into a Trojan horse, allows complete remote control and monitoring of the infected PCs. BO2K was noteworthy because it attacks WindowsNT workstations and servers and thus has even more serious implications for INFOSEC. Anti-virus companies worked feverishly immediately after the release of the tool to update their virus-signature files. A criminal hacker calling himself Deth Veggie insisted that the CDC is involved in guerilla quality assurance — their penetration tools, he argued, would force Microsoft to repair the "fundamentally broken" Windows operating systems. Jason Garms, lead product manager for Windows NT security, disagreed strongly: "I certainly categorize what they're trying to do as being malicious. This program they have created has absolutely no purpose except to damage users." He added, "You can't walk down the street and pick up a rock and throw it through someone's window. You'd be arrested. But there are people on the Internet that would argue that it's good behavior because that window should have been stronger. In the real world you can't say 'You should have bulletproof glass on your windows."

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

2000-05-31 **remote control radio frequency interference RFI hacking vulnerability risk design**

RISKS 20 90

The General Motors OnStar system will allow not only geographical positioning data, local information, and outbound signaling in case of accidents: it will also allow inbound remote control of features such as door locks, headlights, the horn and so on — all presumably useful in emergencies. However, Armando Fox commented in RISKS,
>If I were a cell phone data services hacker, I'd know what my next project would be. I asked the OnStar speaker what security mechanisms were in place to prevent your car being hacked. He assured me that the mechanisms in place were "very secure". I asked whether he could describe them, but he could not because they were also "very proprietary". *Sigh*<

2000-10-20 **remote control laboratory equipment Internet hacking**

RISKS 21 10

A gateway sold by National Instruments allows instruments equipped with the standard IEEE-488 bus to be connected to the Internet — completely without any security provisions — and thus controlled remotely by total strangers. The usual dangers to the electronic equipment are exacerbated, wrote Stephen D. Holland in RISKS, because laboratory equipment is often used to control mechanical devices.

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

2000-12-22 **remote control reconfiguration firmware upgrade automatic modification control integrity error QA quality assurance design**

RISKS 21 17

In the early 1990s, certain tape drives were criticized for allowing uncontrollable automatic firmware upgrades if a "firmware-configuration tape" was recognized. The problems occurred when the tape drive "recognized" a tape as such even if it wasn't. A decade later, the same type of feature — and problem — has been noted in Dolby digital sound processors for the audio tracks of 35mm film: any time anything looking like a firmware-reconfiguration data stream is encountered, the device attempts to reconfigure itself, regardless of validity of the data stream or the wishes of the operator. A German contributor to a discussion group about movie projectors noted (translation by Marc Roessler), "The trailer of "Billy Elliott" has got some nasty bug: If the trailer is being cut right behind start mark three, the CP500 will do a software reset with data upload as the trailer runs through the machine. Either Dolby Digital crashes completely or the Cat 673 is set to factory default, which means setting the digital soundhead delay to 500 perforations, i.e. the digital sound lags 5.5 seconds behind the picture. . . ."

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

2000-12-27 **remote control upload update firmware device**

RISKS 21 18

Andrew Klossner noted in RISKS that home electronics such as DVDs are being reprogrammed using automatic firmware upgrades from media (e.g., DVDs). The correspondent writes, "When the authoritarian software forbids me to skip past a twenty-second copyright notice, it makes me nostalgic for the old 12-inch laser disks."

[MK notes: This poses additional sources of troublesome problems when the software doesn't work right. Even if it isn't broke, someone at a distance may try to fix it anyway.]

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

2001-01-12 **automated firing computer control weapons system military aircraft quality assurance**

RISKS 21 20

Daniel P. B. Smith reported in RISKS that a new airborne laser is being designed to shoot down missiles. Smith quotes an article at < http://www.cnn.com/2001/US/01/12/airborne.laser/index.html> as follows:

>No trigger man
>
>No human finger will actually pull a trigger. Onboard computers will decide when to fire the beam.
>
>Machinery will be programmed to fire because human beings may not be fast enough to determine whether a situation warrants the laser's use, said Col. Lynn Wills of U.S. Air Force Air Combat Command, who is to oversee the battle management suite. The nose-cone turret is still under construction
>
>"This all has to happen much too fast," Wills said. "We will give the computer its rules of engagement before the mission, and it will have orders to fire when the conditions call for it."
>
>The laser has about only an 18-second "kill window" in which to lock on and destroy a rising missile, said Wills.
>
>"We not only have to be fast, we have to be very careful about where we shoot," said Wills, who noted that the firing system will have a manual override. "The last thing we want to do is lase an F-22 (fighter jet)."

[MK: Readers are invited to decide if, given the current state of software quality assurance worldwide, they would be willing to entrust the safety of their family to an automobile equipped with analogous control systems.]

Category 25.1 *Remote control, RATs, reprogramming, auto-updates*

2001-01-19 **remote control automobile speed governor**

RISKS 21 22

Steve Loughran noted in RISKS that the British government has sponsored tests of computer-controlled speed governors for automobiles; the system would rely on a GPS to locate the vehicle and an on-board database of speed limits. Loughran commented, "Just think how much fun you'll be able to have by a UK motorway in five years time from jamming the GPS signals. Or how much a 'chipped' database or speed limiter will be worth. A more rigorous trial would be to place the speed limited vehicles in the hands of well known violators of the speed laws to see how much effort it takes to disable -- the UK home secretary himself, for example." In addition, the prospect of being unable to take evasive action in an emergency should cause grave concern. Furthermore, given the dismal state of software quality assurance, few RISKS readers would be happy with such a system.

2001-01-26 **remote control reprogramming smart cards access token**

RISKS 21 22

Jeremy Epstein wrote an interesting report for RISKS on remote reprogramming: "DirecTV has the capability to remotely reprogram the smart cards used to access their service, and also to reprogram the settop box. To make a long story short, they were able to trick hackers into accepting updates to the smart cards a few bytes at a time. Once a complete update was installed on the smart cards, they sent out a command that caused all counterfeit cards to go into an infinite loop, thus rendering them useless."

2001-04-09 **home appliance hacking remote control wireless**

RISKS 21 35

Appliance hacking has been a subject of speculation for years, but more and more manufacturers are interested in controlling their domestic appliances at a distance. According to a report in RISKS, "IBM and Carrier, an air-conditioning manufacturer, said they plan to offer Web-enabled air conditioners in Europe this summer that can be controlled wirelessly. Financial terms of the collaboration were not disclosed. Owners of the newfangled air conditioners will be able to set temperatures or switch the units on or off wirelessly using a website called Myappliance.com < http://www.wired.com/news/business/0,1367,42918,00.html >. The press release quoted in RISKS indicates that the system will log information about device utilization and allow remote maintenance operations.

2001-09-06 **remote control encryption Windows PC access authorization**

NewsScan

NEW SERVICE OFFERS REMOTE CONTROL OF YOUR PC
A new Web-based service called GoToMyPC enables users to control their desktop PCs in their homes or offices using any other Windows PC anywhere in the world that has Internet access. The service, a brainchild of Expertcity Inc., costs $10 a month. Instead of lugging a laptop along on a trip, a user could sit down at an Internet café PC and access all files, e-mail, etc. on his or her PC at home. Alternatively, if a worker found that the file he or she needed over the weekend was on the computer at work, it could be retrieved using the service. The company says the system is highly secure and requires two passwords -- one to log onto the service and another to gain access to each target PC. All of the data exchanged in each remote-control session is encrypted and Expertcity says the service will operate through many corporate firewalls. (Wall Street Journal 6 Sep 2001)

2001-10-01 **remote control airliners airplanes interception impersonation**

RISKS 21 68

Steve Bellovin contributed an item to RISKS about remote control of airplanes:

"The Associated Press reported on a test of a remotely-piloted 727. The utility of such a scheme is clear, in the wake of the recent attacks; to the reporter's credit, the article spent most of its space discussing whether or not this would actually be an improvement. The major focus of the doubters was on security:

But other experts suggested privately that they would be more concerned about terrorists' ability to gain control of planes from the ground than to hijack them in the air.

I'm sure RISKS readers can think of many other concerns, including the accuracy of the GPS system the tested scheme used for navigation (the vulnerabilities of GPS were discussed recently in RISKS), and the reliability of the computer programs that would manage such remote control."

2001-12-20 **remote control telemedicine telesurgery hacking vulnerability interception disruption availability interruption**

NewsScan

TELESURGERY REVOLUTION, PART III [20 Dec 2001]
In a discussion of "the telesurgery revolution" in The Futurist magazine, surgeon Jacques Marescau, a professor at the European Institute of Telesurgery, offers the following description of the success of the remotely performed surgical procedure as the beginning of a "third revolution" in surgery within the last decade: "The first was the arrival of minimally invasive surgery, enabling procedures to be performed with guidance by a camera, meaning that the abdomen and thorax do not have to be opened. The second was the introduction of computer-assisted surgery, where sophisticated software algorithms enhance the safety of the surgeon's movements during a procedure, rendering them more accurate, while introducing the concept of distance between the surgeon and the patient. It was thus a natural extrapolation to imagine that this distance--currently several meters in the operating room--could potentially be up to several thousand kilometers." A high-speed fiber optic connection between New York and France makes it possible to achieve an average time delay of only 150 milliseconds. "I felt as comfortable operating on my patient as if I had been in the room," says Marescaux. (The Futurist Jan/Feb 2002)

EXPLODING CHIPS COULD FOIL THIEVES
Researchers at the University of California in San Diego have developed a way to blow up silicon chips using an electric signal -- an innovation that could be used to fry electronic circuitry in devices after they're stolen or fall into the wrong hands. The American spy plane that was impounded in China last year is an example where such technology would have proven handy in destroying its secret electronics systems. Similarly, if a cell phone were stolen, the owner could alert the wireless carrier, which would send a signal to trigger a small explosion in the phone's chip, rendering it useless. The techniques uses a small amount of the oxidizing chemical gadolinium nitrate applied to a porous silicon wafer. (New Scientist 16 Jan 2002)

2003-03-10 **Windows root kit remote administration back door penetration stealth exploit**

NIPC/DHS

March 05, SecurityFocus — Windows root kits a stealthy threat.

A Windows root kit called "ierk8243.sys" was discovered on the network of Ontario University last January. It has since been dubbed "Slanret", "IERK," and "Backdoor-ALI." A root kit is an assembly of programs that subverts the Windows operating system at the lowest levels, and, once in place, cannot be detected by conventional means. Also known as "kernel mode Trojans," root kits are far more sophisticated than the usual batch of Windows backdoor programs. Greg Hoglund, a California computer security consultant, believes intruders have been using Windows root kits covertly for years. He says the paucity of kits captured in the wild is a reflection of their effectiveness — not slow adoption by hackers. Once Slanret is installed on a hacked machine, anti-virus software won't pick it up in a normal disk scan. That said, the program is not an exploit — intruders have to gain access to the computer through some other means before planting the program. Despite their increasingly sophisticated design, the current crop of Windows root kits are generally not completely undetectable, and Slanret is no exception. Because it relies on a device driver, booting in "safe mode" will disable its cloaking mechanism, rendering its files visible. And in what appears to be an oversight by the kit's author, the device driver "ierk8243.sys" is visible on the list of installed drivers under Windows 2000 and XP, according to anti-virus company Symantec Security Response. Hoglund says future Windows root kits won't suffer from Slanret's limitations. And while he says the risk can be reduced with smart security policies — accept only digitally-signed device drivers, for one — ultimately, he worries the technique may find its way into self-propagating malicious code.

2004-01-14 **Microsoft security bulletin patch flaw vulnerability fix buffer overflow overrun remote control**

DHS/IAIP Update

MICROSOFT SECURITY BULLETIN MS04-003: BUFFER OVERRUN IN MDAC FUNCTION COULD ALLOW CODE EXECUTION (832483).

Microsoft Data Access Components (MDAC) is a collection of components that provides the underlying functionality for a number of database operations. When a client system on a network tries to see a list of computers that are running SQL Server and that reside on the network, it sends a broadcast request to all the devices that are on the network. Because of a vulnerability in a specific MDAC component, an attacker could respond to this request with a specially-crafted packet that could cause a buffer overflow. An attacker who successfully exploited this vulnerability could gain the same level of privileges over the system as the program that initiated the broadcast request. For an attack to be successful an attacker would have to simulate a SQL server that is on the same IP subnet as the target system. A target system must initiate such a broadcast request to be vulnerable to an attack. An attacker would have no way of launching this first step but would have to wait for anyone to enumerate computers that are running SQL Server on the same subnet. Also, a system is not vulnerable by having these SQL management tools installed. Code executed on the client system would only run under the privileges of the client program that made the broadcast request. Microsoft has assigned a severity rating of "Important" to this issue.

2004-01-14 **Microsoft security bulletin patch flaw vulnerability fix remote control buffer overflow**

DHS/IAIP Update

MICROSOFT SECURITY BULLETIN MS04-001: VULNERABILITY IN MICROSOFT INTERNET SECURITY AND ACCELERATION SERVER 2000 H.323 FILTER CAN ALLOW REMOTE CODE EXECUTION.

A security vulnerability exists in the H.323 filter for Microsoft Internet Security and Acceleration Server 2000 that could allow an attacker to overflow a buffer in the Microsoft Firewall Service in Microsoft Internet Security and Acceleration Server 2000. An attacker who successfully exploited this vulnerability could try to run code of their choice in the security context of the Microsoft Firewall Service. This would give the attacker complete control over the system. The H.323 filter is enabled by default on servers running ISA Server 2000 computers that are installed in integrated or firewall mode. ISA Servers running in cache mode are not vulnerable because the Microsoft Firewall Service is disabled by default. Users can prevent the risk of attack by disabling the H.323 filter. Microsoft has assigned a severity rating of "Critical" to this issue.

2001-11-21 **RFI radio frequency interference jamming cellular mobile phones hospital medical electronics**

RISKS 21 78

Russell Stewart caught what appeared to be an interesting paradox about attempts to stop people from using mobile phones in hospitals: seems a Hong Kong company is offering radio-frequency jamming devices. As Mr Steward pointed out, "Hospitals? Now, I admit I know very little about jamming technology, but I know that, at the very least, it requires transmitting radio energy on the same frequency as the signal you are trying to jam. Presumably, it involves transmitting at a considerably higher power than that of the target signal. Now, as I understand it, hospitals' no-cellphone policy is based on the fear that the phones' radio transmissions might interfere with hospital equipment. Are we to understand, then, that they intend to combat the problem by installing a device that, by definition, must transmit on the same frequencies at the same or considerably greater power?"

However, Markus Kuhn immediately responded to the list explaining that mobile-phone jamming does _not_ send a signal that competes with the phone-to-base-station signal; instead, one james cellular phones by competing with the base-station-to-phone signal, which is orders of magnitude weaker. In addition, wrote Mr Kuhn, "The no-cellphone policies in hospitals are today mostly based on the fear that clueless phone users might operate phones in the immediate vicinity (with a couple of centimeters) of critical equipment. As soon as the mobile phone is a few meters away, field strength will drop well bejond the 3 V/m levels against which medical equipment has to be EMC immunity tested by the manufacturers (EN 50082, IEC 601-1-2)."

2003-09-11 **jamming phone cameras iceberg systems safe have technology picture cell picture imaging capabilities**

NewsScan

TECHNOLOGY JAMS CELL PHONE CAMERAS
A new product from Iceberg Systems, dubbed Safe Haven, is designed to block a camera cell phone's ability to snap pictures. The imaging system is then reactivated when the cell phone leaves the Safe Haven-protected area. The product uses hardware transmitters with a small piece of control software loaded into a camera phone handset to disable the imaging capability, and Iceberg Systems managing director Patrick Snow says his company is in talks with handset manufacturers interested in testing the technology. Safe Haven could prove popular with businesses that operate secure sites — Samsung and LG Electronics have already barred employees from using camera phones in research and manufacturing facilities for fear sensitive data could be stolen. Snow says the system could also be tweaked to eliminate other annoying cell phone intrusions, such as loud ringtones in a theater or text-messaging in school. Meanwhile, analysts predict there will be some 1 billion camera phones in use within five years. (CNet News.com 11 Sep 2003)

2004-05-17 **Wi-Fi wireless PDA jamming PDA denial of service DoS**

DHS IAIP Daily; http://www.newscientist.com/news/news.jsp?id=ns99995000

May 17, New Scientist — Wi-Fi networks can be jammed from PDAs.

Wi-Fi networks can be jammed using nothing more sophisticated than a PDA and an off-the-shelf wireless networking card, the Australian Computer Emergency Response Team (AusCERT) has warned. Wi-Fi networks are becoming common in workplaces and elsewhere and it was known that they are vulnerable to jamming. It was thought that this would require the use of large, powerful and expensive equipment, but students at the Queensland University of Technology have now proved this wrong. AusCERT says attacks will be hard to foil because the problem exploited is inherent in the Wi-Fi protocol. However, such an attack can only deny access to the network--it will not enable hackers to access user's data or computers. The problem stems from how the Wi-Fi networks allocate transmission channels. As in many other networks, Wi-Fi nodes check to see if other devices are transmitting on the same frequency band before they begin sending data, to avoid "collisions" that occur when two or more devices talk simultaneously. Like a conversation among a group of people, this works well as long as all devices are well-behaved. But it breaks down if one person or one device insists on talking loudly and continually. In essence, the Wi-Fi jamming is a denial of service attack.

2004-05-18 **attack spy camera wireless vulnerability PDA Quennsland University**

NewsScan

ATTACK JAMS SPY CAMERAS

An electronic invisibility cloak generated by nothing more than an off-the-shelf PDA would allow intruders to elude wireless security cameras using vulnerabilities in the most common wireless technologies. There is no defense against such a Mission Impossible-style attack, which can be used to knock out wireless networks and possibly transfer unwitting users to a spoofed wireless network. Accidentally discovered last year by PhD students at the Queensland University of Technology's Information Security Research Centre, the exploit presents obvious applications for terrorism and espionage. The vulnerability is "trivial" to exploit and only took 30 minutes to master, says Associate Professor Mark Looi. "It just uses off-the-shelf hardware and you don't need to write specific software, you just need to know the correct commands to use with the software that's supplied. On a difficulty rating of 1 to 10, it's probably a 2." (The Age 18 May 2004) Rec'd from John Lamp, Deakin Univ.

2005-11-04 **radio frequency interference RFI controls garage-door openers military**

RISKS; http://tinyurl.com/7mva3 24 09

RADIO SIGNAL KEEPS OTTAWA GATES AND GARAGE DOORS CLOSED

Apparently garage doors and embassy gates are refusing to work because something in Ottawa is broadcasting on their radio controlled opener devices' frequencies and swamping them. No one seems to know who/what is doing it and some fingers point to the military use of that same frequency…. This is, of course, a common problem as we run out of available radio bandwidth and try to cram more and more users into limited space. There is a possibility that the U.S. Embassy or the U.S. Military stationed at the Embassy is responsible. Time will eventually tell.

[Abstract by R. S. Heuman]

[MK adds:] The CBC article has additional details of interest (all quotations):

* It affects a 25-mile radius.

* Two companies that have plotted the reported problems on maps say they appear to cluster in the Byward Market area just east of Parliament Hill, and a corridor leading southeast from there.

* The Door Doctor has received more than 100 calls from irate customers who can't operate their doors using the usual remotes.

* The signal is transmitted on the 390-megahertz band, which is used by virtually all garage door openers on the continent. That's the same frequency used by the U.S. Military's new state-of-the-art Land Mobile Radio System.

* …[O]perators have already been warned of this phenomenon by service updates from U.S. manufacturers, who started seeing the same problem around military bases last summer. The strong radio signals on the 390-megahertz band simply overpower the garage door openers.

RISKS, Canadian Broadcasting Corporation 20 91
http://cbc.ca/consumers/market/recalls/reclfull/2000/06jun2000b.html

According to an article on the CBC Web site, Ford Explorers are subject to radio-frequency interference with their central computer, resulting in non-responsive on/off switches. Alex Wiebe wrote in RISKS, "the result is anything ON will stay ON, anything OFF will stay OFF." Wiebe noted that the headline for this article referred to air-bags whereas the body did not; if air bags were affected by electronic noise, the danger to drivers and passengers could be severe.

Category 25.3 *RFI, HERF, EMP/T*

2000-09-06 **RFI radio frequency interference avionics crash theory**

RISKS, NY Review of Books 21 04
http://www.nybooks.com/nyrev/WWWfeatdisplay.cgi?20000921092F

A report in the New York Review of Books by Elaine Scarry entitled "Swissair 111, TWA 800, and Electromagnetic Interference" suggested that two flights that took off from JFK airport at the same time on Wednesday nights and then crashed may have been affected by strong radio-frequency interference from military installations nearby. However, Professors Peter Ladkin and Willi Schepper of the University of Bielefeld, Germany, published a strong refutation of Scarry's speculations in a paper published on their Web site at < http://www.rvs.uni-bielefeld.de/publications/Papers/Scarry-refutation.pdf >. These scientists pointed out that the radio-frequency flux would have to be at least 6.8M times greater than anything available in order to trigger explosions inside the plane. Instead, their analysis leads them to focus on the possibility of defective wiring in both planes.

Category 25.3 *RFI, HERF, EMP/T*

2000-12-26 **RFI radio frequency interference avionics navigation**

RISKS, The Times of London http://www.thetimes.co.uk/article/0,,2-58265,00.html 21 17

David Kennedy summarized a case of radio-frequency interference for RISKS (quoting his summary verbatim):

ROYAL AIR FORCE pilots will stop using a bad-weather navigation system from January 1 because new commercial radio frequencies have made it unreliable, the Ministry of Defence said yesterday. Pilots of military planes and helicopters fitted with the Instrument Landing System (ILS) will not be allowed to use it to land in poor weather in the new year. Instead they will have to ask air traffic controllers to talk down their flights.
* Commercial FM growth cited as cause.

* Commercial ILS on different frequencies has not been affected.

* Affected aircraft are Nimrod reconnaissance and search and rescue helicopters. RAF transport a/c have already been upgraded and tactical aircraft do not use ILS.

"There is no operational impact whatsoever," a ministry of Defense spokeswoman said. "It is a worldwide problem which affects all countries." "New landing assistance systems use more reliable technology, such as global positioning satellites, which are not affected by radio frequencies. ILS can also be disrupted by signals from mobile telephones."

FCC STEPS UP SEARCH FOR MORE SPECTRUM
A shortage of airwaves is hampering the U.S. wireless industry, and analysts say a major spectrum expansion is critical if the industry is to avert an erosion in the quality of cell phone service or a financial meltdown in the next two years. Although wireless companies are spending nearly $10 billion this year to expand calling capacity and provide new high-speed data services, revenue per minute has dropped to 14 cents, down from 52 cents in 1992. "There's a basic rule of economics: If you sell something for $1 that costs you $1.05, you can't make money," says one telecom consultant. In an effort to alleviate the problem, the FCC announced last week it would auction 740 wireless licenses beginning next month, but those licenses are for spectrum now in use by television broadcasters, and some wireless operators have opposed the auction because carriers would be forced to spend hundreds of millions of dollars on spectrum that's not immediately available. "The wireless revolution is becoming a victim of its own success," says FCC wireless bureau chief Thomas Sugrue. "The simple truth is that as our society grows increasingly dependent on wireless technology and services, spectrum demand is stressing that supply, and that has made spectrum management difficult for government." (Los Angeles Times 5 Jul 2002)
http://www.latimes.com/technology/la-fi-wireless5jul05

PLAN SHIFTS SPECTRUM FROM GOVERNMENT TO WIRELESS USE
The National Telecommunications and Information Administration has unveiled a plan to shift 90 megahertz of spectrum from government to commercial use in an effort to provide the additional airwaves the wireless industry says it needs for so-called third-generation (3G) wireless services. At least half the spectrum will come from the military, with the remainder coming from airwaves controlled by the Federal Communications Commission. Congress is expected to introduce legislation that would transfer the revenue from the auctioned spectrum to the military to cover the costs of buying new equipment and transitioning to different airwaves. Wireless companies could bid on the new spectrum as early as 2004, but wouldn't be able to use it until 2008, which is the earliest the military was willing to make the move. Analysts cautioned that the proposal is not entirely good news for the wireless industry, which has long complained it needs more spectrum to deliver advanced services. The 90 megahertz is less than half the 200 megahertz sought by the industry, and the two chunks are not contiguous, which will make it more expensive to use them. There's also the risk that the military might renege on the agreement down the road, arguing it needs the spectrum for national security requirements. (Wall Street Journal 24 Jul 2002)

PENTAGON AND INDUSTRY IN TUG-OF-WAR OVER RADIO SPECTRUM
The U.S. Defense Department, citing national security reasons, is seeking new limits on wireless Internet technology such as the Wi-Fi systems increasingly found in airports, homes and offices, and places like Starbucks. The Pentagon says that the low-power radio emissions may jam as many as ten types of military radar systems. Industry powerhouses such as Intel and Microsoft insist, however, that military and civilian uses of wireless communications technology can coexist peacefully, and that in Europe there are smart wireless Internet devices that can sense the nearby use of military radar and automatically yield the right of way. Wireless industry executive Rich Redelfs of Atheros says: "The idea is to get the world on a single page, and Europe is way ahead of the U.S. in understanding these interference issues." However, Defense Department officials consider the technology unproven and want the Federal Communications Commission to delay releasing for civilian use additional radio frequencies in the 5-gigahertz range. (New York Times 17 Dec 2002)

PACT PREVENTS WIRELESS INTERFERENCE WITH MILITARY CHANNELS
The U.S. Defense Department and a group of high-tech manufacturers have struck a deal aimed at preventing future interference with military radar from next-generation wireless devices. Under the compromise, wireless device makers will build in technology to detect and actively avoid military radars that operate on similar frequencies. In return, Defense officials will support proposals to nearly double the amount of wireless spectrum available, particularly that used for "Wi-Fi" computing. Ed Thomas, chief engineer for the Federal Communications Commission, called the pact "good for the Department of Defense and good for the industry." (Wired.com 3 Feb 2003)

NewsScan

RSA SECURITY's PLANS FOR RFID BLOCKING TECHNOLOGY
RSA Security has developed a blocking technique that disrupts the transmission of information contained in RFID tags and prohibits data collection. The technique is still in the drawing board stage, but the company plans to make prototype chips and see if any manufacturing groups are interested in making the processors, according to chief RSA researcher Ari Juels. Juels says the RSA technology would enable the RFID tags to be used, but that the blocking feature would allay the privacy concerns that have derailed recent deployment plans. "This is not meant to be a hostile tool. It balances consumer privacy and retail use in a profitable way. Tags are too useful to completely disable them." (CNet News.com 27 Aug 2003)

RISKS; Chaos Computer Club https://events.ccc.de/congress/2005/wiki/RFID-Zapper(EN) 24 26

RFID ZAPPERS

The Chaos Computer Club of Germany had a discussion of RFID Zappers at its 22nd Chaos Communication Congress in December 2005 in Berlin. Al Mac provided a summary:

…[S]ome hobbyist has come up with what it takes for a paranoid person to obliterate any RFID tags that might be on consumer merchandise, or where not expected or wanted….

I imagine that there will be a consumer market for this.

People who want one but do not have the personal what it takes to build stuff in their garage with assurance the contraption works right, and that they not injure themselves before getting it completed. Call this a niche industry that will attract a lot of imitators. To be profitable it needs mass production like on a circuit board assembly line.

* Then the next market needed will be some way to assure purchasers that the RFID Zapper that THEY got really works.
* Then the next society development will be that objects where RFID was inserted for purposes of identification, like in ID cards, Passports etc. Will malfunction because someone had used the RFID Zapper on them, rendering those people's ID unusable for the intended purposes.
* Then stores, and other institutions, will have to institute rules that people are not allowed to enter their premises carrying an RFID Zapper, so as to prevent unauthorized usage on the store merchandise.
* Then the next result might be that RFID Zappers will get declared to be illegal … although I expect this will be a few years away … the effort to illegalze RFID Zappers may get a lot more attention from the general public than the usual illegalization of technology tools.

There have been several problems with RFID deployment so far.
* There is the mass public panic over conspiracy theories, leading to a ton of Urban Legends, of which there is a glimmer of validity at the fringes. There are in fact some risks of abuse, but they are relatively small risks compared to the frenzy of claims out there.
* There's recent threads on the notion that el cheapo implementation can lead to security holes, where RFID is no exception to that risk, such as susceptibility to malware.
* Spread of the RFID Zapper into society and its effects will become problem area # 3.

Al Mac also pointed to the CAUTION section, which he described as" = ROFL." That section follows, idiosyncratic spelling and all.

>Caution

(This part of this article probably will be longer than the equivalent part in the german article, since english-speaking peoble seem to be more concerned with safety matters and less careful with electric devices ;-)

* Poldi kindly informed us, that having a RFID-Zapper with you when checking in to a plane might cause trouble or even get you arrested (he almost was). RFID-Zappers are basically some kind of pocket-EMP. Although we doubt that it has the capacity to cause any trouble aboard an airplane, we seriously recommend against testing it, for reasons of your own health as well as that of others.

* RFID-Zappers don't comply with the FCC-rules.

* Modifying a single-use-camera into a RFID-Zapper isn't completely free of risks. If the capacitor is still charged fully or partly, you might catch yourself an electric shock. If you are a healthy, young person, this is probably only going to hurt a lot, but if you should have any kind of problems with your heart and/or circulation, you definetly want to properly decharge the capacitor first. If you use a bigger capacitor, the risk increases.

* Soldering irons are known to be unpleasantly hot at the tip.

* We also recommend against using the RFID-Zapper on RFID-Tags found within electrical devices, for these are likely to suffer damage too. You also shouldn't use RFID-Zappers too near to electric devices, especially if they are expensive. You also shouldn't use it near any magnetic data storage, like floppy disc, MCs, hard discs, credit cards, streamer-cartridges and so on. And don't try it near your grandpa's pacemaker or other sensitive medical equipment either!

* We don't think that the RFID-Zapper is a strong source of what is known in Germany as Elektrosmog, which means some kind of smog caused by electromagnetic fields. But if you are concerned about it, you might want to be careful. Unfortunately we can't tell you wether wearing a hat of aluminium helps or not.

* The RFID-Zapper might cause you to feel armed against companies or governments trying to compromise your privacy. You might even experience euphoria, especially when destroying RFID-Tags. This could lead to dangerous behavior, like speaking your mind, using freedom of speech, fighting for your rights, all of which are bound to ultimately lead to the communist world revolution ;-)
* Shoplifting: No. This tool was not constructed as a burgular tool and is not to be used as. Besides, shops do not use RFID-Chips for eletronic theft prevention. However, it may be considered as such as a result of unknowledge.<

2006-04-26 **electromagnetic inteference EMI personal electronic devices PEDs cell mobile phones aircraft control systems avionics fly-by-wire interference real-time control systems**

RISKS 24 26

PERSONAL ELECTRONIC DEVICES ON COMMERCIAL AIRCRAFT

Prof Peter Ladkin summarized the current state of knowledge about personal electronic devices (PEDs) on aircraft in a report for RISKS. He began with a summary of the problem:

"There has been plenty of discussion of the risks of operating personal electronic devices (PEDs) such as mobile telephones, gameboys and computers on board commercial transport aircraft. In the U.S., the use of mobile telephones on board flying aircraft is forbidden by the Federal Communications Commission, inter alia because such a phone would be within receiving range of many cells simultaneously and the technology is neither designed nor implemented to accommodate such cases. However, there is also the possibility of interference with the aircraft avionics."

His review of the literature strongly supports the aviation industry's concerns about electromagnetic interference (EMI) with avionics and points to widespread ignorance on the part of passengers about why PEDs are to be turned off during flight.

FTC SUES SELLERS OF CELL PHONE "RADIO SHIELD" [20 Feb 2002]
The Federal Trade Commission is suing two companies for selling devices purporting, without good evidence, to shield people from harmful radiation emitted by their cell phones. The small metallic devices were sold under such names as WaveShield 1000, NoDanger, and SafeTShield. The FTC said that by claiming that their products could "block up to 97% to 99%" of electromagnetic radiation," the companies were actually "using a shield of misrepresentation to block consumers from the facts." Among the facts missing in company sales materials is any mention of a 2001 General Accounting Office report indicating that "scientific research to date does not demonstrate that the radio frequency energy emitted from mobile phones has adverse health effects, but the findings of some studies have raised questions indicating the need for further investigation." NewsScan; http://www.msnbc.msn.com/id/6493299/

HEAVY COMPUTER USE LINKED TO GLAUCOMA

Researchers at the Toho University School of Medicine in Tokyo have found that long hours spent in front of a computer screen may increase the risk of glaucoma in nearsighted people. Glaucoma, which is caused by damage to the optic nerve, results in blind spots or visual impairments that can lead to blindness. The research is based on a study of 10,000 workers in Japan who were tested for the disease, with results correlated to data on how many hours were spent on the computer and also preexisting visual problems, such as myopia. Scientists said they believe the optic nerve in myopic people might be more vulnerable to computer-caused stress than in normal eyes. "Computer stress is reaching higher levels than have ever been experienced before. In the next decade, therefore, it might be important for public health professionals to show more concern about myopia and visual field abnormalities in heavy computer users," says the report published in the British Journal of Ophthalmology. PHONE RECYCLING GETS A BOOST
With more than 128 million cell phone users in the U.S. upgrading their handsets every 18 months on average, a record number of obsolete devices are hitting incinerators and landfills. That has environmentalists concerned because the phones contain toxins such as lead, cadmium and mercury that "accumulate in the environment and can cause damage to the ecosystem," says Eric Most, director of INFORM's Solid Waste Prevention Program. By 2005, INFORM predicts that 130 million cell phones weighing about 65,000 tons will be "retired" annually in the U.S. But now users have the option of donating their old phones to nonprofit groups or developing nations, or sending them off to be recycled in environmentally safe ways. "The simple act of recycling your cell phone can have profound ramifications," says Seth Heine, president of Collective Good (www.collectivegood.com), which runs a cell phone collection program. "The money can be used for immunization to keep a child from dying from a disease, or you can save 1,000 square feet of rain forest forever." People can also donate phones through www.donateaphone.com, operated by the Cellular Telecommunications and Internet Association's Wireless Foundation. Phones can be dropped off at Radio Shack, The Body Shop and Sprint PCS stores. (Reuters 26 Oct 2002)

U.S. TECH COMPANIES RANK LOW IN RECYCLING EFFORTS
The Silicon Valley Toxics Coalition (SVTC) has released its annual Computer Report Card comparing the environmental records of 28 high-tech firms, and reports that most U.S. companies lag behind their Japanese competitors when it comes to recycling equipment and safe disposal of hazardous substances used in the manufacturing process. Of the companies surveyed, only Fujitsu received a passing grade. It's one of a handful of Japanese companies that has sought to eliminate toxic chemicals by developing and using lead-free products. "The leadership continues to be by and large the Japanese companies, and the U.S. companies tend to be far behind," says SVTC founder Ted Smith. "A lot of (U.S. manufacturers') initiatives are piecemeal and not really designed to address the vast majority of consumer concerns. There is still an enormous amount of computer waste being exported to China." The Computer Report Card notes that some U.S. companies use a double standard when it comes to recycling. Divisions located in Europe and Japan, where safe recycling is mandated by law, have implemented programs but their U.S. operations have not. Meanwhile, Congressman Mike Thompson (D-Calif.) has introduced a bill that would require the EPA to create grants for private and governmental organizations to develop computer recycling programs and the National Electronics Product Stewardship Initiative is working on a nationwide plan for recycling obsolete electronic devices. 'REVERSE PRODUCTION' SYSTEM RECYCLES ALL
A study underway at Georgia Tech could offer a model for responsible recycling of electronic waste. Researchers have developed a "reverse production" system that enables every raw material contained in e-waste — metals such as lead, copper, aluminum and gold, as well as plastics, glass and wire — to be recovered and reused. Scientists say such "closed loop" manufacturing offers a win-win situation for manufacturers and consumers, and the project is generating buzz abroad, with officials in Taiwan and Belgium expressing interest in the system. Key to the process is chemical engineer Matthew Realff's design for a means to separate metals, as well as different qualities of plastics from crushed, ground-up components. From this work, new industries could be created to recover value not only from e-waste, but also from automobiles and other durable goods, says Realff. (Science Daily 4 Mar 2003)

2004-11-11 **nanotech EPA environment risks threats dangers biology medicine nanotubes**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A43763-2004Nov11.html

STUDYING NANOTECH RISKS

The Environmental Protection Agency has awarded $4 million in grants to a dozen universities to study the biological and medical implications of nanotechnology, which has already yielded such products as carbon "nanotube" electrical wires; cages of atoms that can capture pollutants in water and soil; and catalysts that reduce manufacturers' dependence upon caustic chemicals. Recognizing that these materials are small enough to enter the lungs (and perhaps even be absorbed through the skin and travel to the brain and other organs), EPA official Paul Gilman explained: "This emerging field has the potential to transform environmental protection, but at the same time we must understand whether nanomaterials in the environment can have an adverse impact." Barbara Karn of the EPA's Office of Research and Development says the projects funded by the new grants will do "infinitely more" on nanotech safety than has ever been done previously. 2005-01-07 **recycling Intel eBay toxic electronics disposal heavy metals cadmium mercury chrome**

NewsScan; http://apnews.excite.com/article/20050107/D87F998O2.html

RECYCLING ELECTRONIC GADGETS

EBay and Intel have developed a recycling program that encourages Americans to safely dispose of their discarded computers and other electronic devices. Gartner, the marketing research firm, estimates that U.S. consumers decommission 133,000 personal computers every day, and eBay chief executive Meg Whitman says that the user's quandary is, "You don't want to throw them out, and you don't know what to do with them." If not properly disposed of, discarded electronic devices can leak lead, cadmium, chromium, mercury and other toxins into the environment. The new eBay- Intel "Rethink" recycling program will only endorse recyclers who promise not to dump machines in landfills in developing nations. (AP 7 Jan 2005)

2005-01-21 **toxic waste electronics China US international Basel Convention treaty**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A24672-2005Jan20.html

E-WASTE IS PILING UP

Consumers' penchant for constant upgrades -- new cell phones, a sleeker laptop -- is causing havoc in the environment, and with technology products now accounting for as much as 40% of the lead in U.S. landfills, e-waste has become one of the fastestgrowing sectors of the U.S. solid waste stream. The International Association of Electronics Recyclers estimates that Americans dispose of 2 million tons of electronic products a year -- including 50 million computers and 130 million cell phones -- and China, which has served for years as the final resting place for Americans' unwanted TVs and computers, is becoming overwhelmed by the volume. Some high-tech companies are taking matters into their own hands -- Hewlett Packard and Dell job out their e-waste handling to environmentally sensitive recyclers such as RetroBox -- but such efforts are still quite limited and unable to cope with a problem that's reaching crisis proportions. Meanwhile, the U.S. is the only developed country not to have ratified the 1992 Basel Convention, the international treaty that controls the export of hazardous waste. "There's a real electronics-waste crisis," says Basel Action Network coordinator Jim Puckett. "The U.S. just looks the other way as we use these cheap and dirty dumping grounds." NewsScan

MOBILE PHONES CUT SPERM COUNT

Men who regularly carry a mobile phone could have their sperm count reduced by as much as 30% according to a new study by Hungarian researchers. Those who place their phone near their groin, on a belt or in a pocket, are at greatest risk. The research findings are the first to suggest that male fertility could be affected by the radiation emitted by mobile phones, also long suspected of causing cancer. The study found the sperm that did survive exposure to mobile phone radiation showed abnormal movements, further reducing fertility. But experts are advising men not to panic yet. 2006-02-10 **mobile cell phone driving risks dangers distraction concentration automobile**

The Straight Dope http://www.straightdope.com/columns/060210.html

DON'T DRIVE WHILE USING CELL PHONES

Cecil Adams, author of the popular "THE STRAIGHT DOPE" column, summarized the case against driving while talking on cell phones as follows:

Accumulating evidence suggests gabbing on the phone while driving is definitely dangerous, probably more so than other distractions. What's more, hands-free phones don't solve the problem. What gets you into trouble, it seems, isn't so much fumbling with the phone (though that doesn't help) as the apparent fact that driving and conducting a conversation at the same time consumes more mental processing power than most people can spare. A few data points:

Cell phones are involved in a lot of crashes. Best evidence: investigations of actual incidents. One study of 456 accidents in Australia requiring a hospital visit (McEvoy et al, BMJ, 2005) found that in nine percent of cases (40 crashes) the driver had been talking on a cell phone during the ten minutes prior to the accident, based on phone records. The authors conclude, "A person using a mobile phone when driving is four times more likely to have a crash that will result in hospital attendance." A 1997 study of 699 accidents in Toronto (Redelmeier and Tibshirani, New England Journal of Medicine) came to a comparable conclusion.

In another study, researchers at the Virginia Tech Transportation Institute installed cameras, sensors, and data recording equipment in 100 cars, then watched what happened over the ensuing 12 to 13 months. They recorded 69 crashes, 761 near crashes, and 8,295 lesser close calls. Of driver distractions that may have contributed to these incidents, use of cell phones was by far the most common, occurring in close to 700 cases. The distant runner-up was passenger-related activities, presumably including conversation, with fewer than 400 instances. Of the cell-phone-related distractions, 87 involved dialing a handheld phone and 466 talking or listening.

Hands-free phones don't help much. Although laws restricting cell phone use in cars typically make an exception for the hands-free variety, numerous studies show such phones aren't markedly safer. Dialing does make you take your eyes off the road, but as suggested above most cell-phone-related accidents seem to happen while the driver is merely conversing.

Drivers using cell phones have slower reaction times and miss important visual cues. Studies using driving simulators have found that drivers brake slower, fail to see pedestrians and traffic signals, and otherwise pay less attention to the road while on the phone. Some experts compare driving while phoning to driving while drunk, but a study by folks at the University of Utah (Strayer et al, 2004) suggests that in certain respects drunks actually do better behind the wheel than phone users--they seem to stay closer to the speed limit and brake faster in response to braking vehicles ahead. All in all, there's solid evidence that talking on the phone is among the more dangerous things you can do while driving.

2000-02-21 **QA quality assurance source code scanner database**

RISKS, http://www.rstcorp.com/its4/ 20 81

John Viega announced release of an open-source vulnerability scanner for C and C++ source code. ITS4 uses a database of vulnerabilities and is open to refinements by its users to identify increasingly subtle security flaws in code. The Web site described the product as follows:

"ITS4 Software Security Tool

The Software Security Group at Cigital designs, analyzes and tests security-critical software. We developed ITS4 to help automate source code review for security. ITS4 is a simple tool that statically scans C and C++ source code for potential security vulnerabilities. It is a command-line tool that works across Unix and Windows platforms.

ITS4 scans source code, looking for function calls that are potentially dangerous. For some calls, ITS4 tries to perform some code analysis to determine how risky the call is. In each case, ITS4 provides a problem report, including a short description of the potential problem and suggestions on how to fix the code.

ITS4 and its source code are provided here to the security community for any use that does not compete with Cigital's consulting practice."

2003-09-12 **vulnerability scada systems grid electric hacker shut down North America back doors**

NewsScan

VULNERABILITY OF ELECTRIC GRID SYSTEM
Researchers say that "back doors" in the digital relays and control room technology managing direct electricity flow in North America is vulnerable to computer viruses and hackers. Cybersecurity researcher Eric Byres of the British Columbian Institute of Technology in Vancouver says: "I know enough about where the holes are. My team and I could shut down the grid. Not the whole North American grid, but a state, sure." He's frustrated because he's contacted a well-known manufacturer — whom he declined to name for security reasons — and urged that the weakness be fixed before hackers found it. Gary Seifert, a researcher with the Energy Department's Idaho National Engineering and Environmental Laboratory, defines the problem this way: "We have a plethora of intelligent electrical devices going into substations and power stations all over the United States. What's to keep somebody from accessing those devices and changing the settings?... We're still going to have back doors no matter how hard we try. You can't keep them out but you hope to slow them down." (AP/USA Today 12 Sep 2003)

2005-04-14 **rootkits security problem antivirus vendor warning malicious actions lack of statistics information**

DHS IAIP Daily;
http://informationweek.com/story/showArticle.jhtml?articleID=160900692

ROOTKITS COULD POSE A SERIOUS SECURITY PROBLEM

The hacker equivalent of a cloak of invisibility may cause serious problems for users and anti-virus vendors, a security expert said Thursday, April 14. Rootkits are tools used by hackers to cover their tracks. Rootkits can hide the existence of other malware on a computer by modifying file data, Windows registry keys, or active processes, all of which are used by malicious code detection software to spot worms, viruses, and spyware that's been installed on a PC. They're commonly used by spyware writers, but they're now gaining popularity among virus writers, say some security analysts. According to Panda Software's research director, rootkits for Windows are proliferating. "Even though they're not new, rootkits have re-emerged as a kind of malware that could let hackers discreetly carry out numerous malicious actions," said Luis Corrons. "We've seen that they're being used in combination with backdoors to take remote control of computers." But Ken Dunham, the director of malicious code research for iDefense, is not as convinced as others that rootkits for Windows are that big of a deal. "I think it's a growing trend, but it's really hard to identify [the scope]. There just aren't a lot of stats."

2005-07-07 **Vulnerability AIX FTP server ephemeral data ports IBM hosts protocol utilize memory sockets**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/118125

AIX FTP SERVER MAY NOT PROPERLY TIMEOUT EPHEMERAL DATA PORTS

IBM AIX includes an FTP server, ftpd, which allows files to be transferred between hosts with the FTP protocol. This server is vulnerable to a condition where an attacker may be able to utilize all available ephemeral ports on the system. When the ephemeral port range is exhausted, no more ports are available for the system to use for an indefinite period of time, resulting in a system-wide network-based denial of service. Additionally, the memory usage caused by the sockets in use by ftpd may also create a local denial of service condition by limiting system resources available to other processes. AIX 5.1, 5.2, and 5.3 are affected. A remote, authenticated user may be able to limit system and network resources and cause a denial-of-service condition. If anonymous FTP access is allowed, anonymous users are considered to be authenticated and may cause the same denial-of-service conditions. Users should contact IBM or their vendor for information on resolutions, workarounds, updates, and fixes.

2005-07-08 **Secunia phpSecurePages vulnerability compromise system Input parameter external local resources**

DHS IAIP Daily; http://secunia.com/advisories/15994/

PHPSECUREPAGES "CFGPROGDIR" FILE INCLUSION VULNERABILITY

A vulnerability has been discovered in phpSecurePages which can be exploited by malicious people to compromise a vulnerable system. Input passed to the "cfgProgDir" parameter in "phpSecurePages/secure.php" isn't properly verified, before it is used to include files. This can be exploited to include arbitrary files from external and local resources. Successful exploitation requires that "register_globals" is enabled. The vulnerability has been confirmed in version 0.28 beta. Other versions may also be affected.

Category 27.1 *Vulnerability assessment*

2005-07-08 **PunBB SQL Injection PHP vulnerabilities system Input array template avatar**

DHS IAIP Daily; http://secunia.com/advisories/15990/

PUNBB SQL INJECTION AND PHP CODE EXECUTION VULNERABILITIES

Vulnerabilities have been discovered in PunBB which can be exploited by malicious people to conduct SQL injection attacks and compromise a vulnerable system. 1) Input passed to the "temp" array parameter in "profile.php" isn't properly sanitised before being used in a SQL query. This can be exploited to manipulate SQL queries by injecting arbitrary SQL code. Successful exploitation requires that "register_globals" is enabled. 2) An error in the template system can be exploited to include arbitrary local files via e.g. the "redirect_url" parameter. This can further be exploited to execute arbitrary PHP code by referencing a specially crafted avatar image containing PHP code. The vulnerabilities has been reported in version 1.2.5 and prior. Original Advisories: http://www.hardened-php.net/advisory-082005.php and http://www.hardened-php.net/advisory-092005.php

Category 27.1 *Vulnerability assessment*

2005-07-08 **Linux format flaw compression format Linux Unix hackers BSD bug zlib DoS library Danish Secunia vulnerability dire ranking**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?articleID=165701026

LINUX COMPRESSION FORMAT FLAW FOUND

A critical flaw in a compression format widely used in Linux and Unix can give hackers a way into machines, security experts said Friday, July 8. A patch for the zlib library isn't available, but several Linux and BSD distributors have rolled out fixes of their own. The bug, which affects the current version of zlib, 1.2.2, can be exploited to create a denial-of-service (DoS) attack, which could crash any application using the library or let the attacker plant code of his own remotely, according to an alert by Danish security firm Secunia. The company rated the zlib vulnerability as "Highly critical," its second-most dire ranking.

Category 27.1 *Vulnerability assessment*

2005-07-11 **MMS Ripper MMST streams overflow vulnerability arbitrary commands flaw IDs**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1043

MMS RIPPER (MMSRIP) MMST STREAMS HEAP OVERFLOW VULNERABILITY

A vulnerability was identified in MMS Ripper, which could be exploited by attackers to execute arbitrary commands. This flaw is due to a heap overflow error in the "mms_interp_header()" function when handling multiple stream IDs, which may be exploited via a malicious server to compromise a vulnerable system. Users should upgrade to MMS Ripper version 0.6.4 or later: http://nbenoit.tuxfamily.org/projects/mmsrip/

2005-07-13 **WebEOC US-CERT crisis management application gather coordinate disseminate emergency operations URIs**

DHS IAIP Daily; http://www.kb.cert.org/vuls/

MULTIPLE VULNERABILITIES IN WEBEOC

The US-CERT has released serveral vulnerability notes to address issues in WebEOC is a web-based crisis information management application that provides functions to gather, coordinate, and disseminate information between emergency personnel and emergency operations centers (EOC). According to VU#258834, in numerous places in a WebEOC system, resources are requested via URIs. An attacker may be able exploit this design by crafting a URI that will directly access a resource, thus elevating that attacker's privileges. According to VU#491770, WebEOC uses weak algorithms to encrypt sensitive information. A remote attacker could recover or derive a private encryption keys, or apply simple cryptanalytic techniques to decipher an encrypted message. According to VU#138538, WebEOC contains multiple cross-site scripting 12 vulnerabilities. A remote attacker may be able to execute arbitrary script using a vulnerable WebEOC site. In addition, that attacker may be able to retrieve sensitive data from WebEOC site. According to VU#956762, WebEOC does not restrict the size of files that an authenticated user can upload into a back-end database. An authorized attacker may be able to consume a large amount of system resources. As system resources are exhausted, system operation may be disrupted resulting in a denial-of-service condition. According to VU#372797, a remote attacker may be able to execute SQL queries on a server, possibly with elevated privileges. As a result, attackers may be able to view or modify the contents of a WebEOC database. According to VU#165290, WebEOC insecurely stores sensitive information in easily accessible application components. Sensitive information may be easily accessible to untrusted parties.

Category 27.1 *Vulnerability assessment*

2005-07-13 **MIT Kerberos KDC US-CERT unauthenticated attacker code execution**

DHS IAIP Daily; http://www.kb.cert.org/vuls/

VULNERABILITIES IN MIT KERBEROS 5

Kerberos is a network authentication system which uses a trusted third party (a KDC) to authenticate clients and servers to each other. Several vulnerabilities have been reported. According to US-CERT Vulnerability Note VU#259798, an unauthenticated attacker can cause MIT krb5 Key Distribution Center (KDC) to overflow a heap buffer by one byte, possibly leading to arbitrary code execution. Patch details are available in MIT krb5 Security Advisory 2005-002. According to US-CERT Vulnerability Note VU#623332, an unauthenticated attacker can cause krb5_recvauth() function to free a block of memory twice, possibly leading to arbitrary code execution. Patch details are avilalbe in MIT krb5 Security Advisory 2005-003.

2005-07-13 **Oracle Products Vulnerabilities Critical insecure consequences Apache Java Sun Microsystems**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA05−194A.html

ORACLE PRODUCTS CONTAIN MULTIPLE VULNERABILITIES

Oracle released a Critical Patch Update in July 2005 that addresses more than forty vulnerabilities in different Oracle products and components. The Critical Patch Update provides information about which components are affected, what access and authorization are required, and how data confidentiality, integrity, and availability may be impacted. Public reports describe vulnerabilities related to insecure password and temporary file handling and SQL injection. The impacts of these vulnerabilities vary depending on product or component and configuration. Potential consequences include remote execution of arbitrary code or commands, information disclosure, and denial of service. An attacker who compromises an Oracle database may be able to gain access to sensitive information. US-CERT strongly recommends that sites running Oracle review the Critical Patch Update, apply patches, and take other mitigating action as appropriate. Oracle HTTP Server is based on the Apache HTTP Server. Some Oracle products include Java components from Sun Microsystems. According to Oracle, the July 2005 Critical Patch Update addresses previously disclosed vulnerabilities in Apache and Java. Oracle also notes that Oracle Database Client-only installations are not affected by vulnerabilities listed in the July 2005 Critical Patch Update.

DHS IAIP Daily; http://secunia.com/advisories/16074/

SEAGULL PHP FRAMEWORK PEAR XML_RPC PHP CODE EXECUTION

A vulnerability has been reported in Seagull PHP Framework, which can be exploited by malicious people to compromise a vulnerable system. The vulnerability has been reported in version 0.43. Prior versions may also be affected.

Category 27.1 *Vulnerability assessment*

2005-07-14 **Sophos Anti-Virus BZip2 vulnerability denial setting failure scans EM library**

DHS IAIP Daily; http://www.securityfocus.com/bid/14270/info

SOPHOS ANTI-VIRUS BZIP2 ARCHIVE HANDLING REMOTE DENIAL OF SERVICE VULNERABILITY

Sophos Anti-Virus is prone to a remote denial of service vulnerability when it is configured to 'Scan inside archive files'. This is not a default setting. The issue exists due to failure of the software to adequately sanitize 'Extra field length' values contained in BZip2 archives. Ultimately this vulnerability may be exploited to conduct a denial of proper service for legitimate users. Attackers may leverage this issue to prevent the software from completing file scans, for files received subsequent to an attack. This may allow the attacker to bypass Anti-Virus scans. The vendor has released updates to address this issue. These updates may be automatically applied by customers that are using the EM Library or manually from Sophos.

Category 27.1 *Vulnerability assessment*

2005-07-16 **Microsoft Security Advisory vulnerability Remote Desktop Services RDP**

DHS IAIP Daily;
http://www.microsoft.com/technet/security/advisory/904797.ms px

MICROSOFT SECURITY ADVISORY (904797): VULNERABILITY IN REMOTE DESKTOP PROTOCOL (RDP) COULD LEAD TO DENIAL OF SERVICE

Microsoft is investigating new public reports of a vulnerability in Remote Desktop Services. There are no reports of attacks that try to use the reported vulnerability or of customer impact at this time. The initial investigation has revealed that a denial of service vulnerability exists that could allow an attacker to send a specially crafted Remote Desktop Protocol (RDP) request to an affected system. The investigation has determined that this is limited to a denial of service, and therefore an attacker could not use this vulnerability to take complete control of a system. Services that utilize the Remote Desktop Protocol are not enabled by default, however if a service were enabled, an attacker could cause this system to restart.

Category 27.1 *Vulnerability assessment*

2005-07-18 **Xerox Vulnerabilities Microserver Web HTTP**

DHS IAIP Daily;
http://www.xerox.com/downloads/usa/en/c/cert_XRX05_007.pdf

VULNERABILITIES IN THE XEROX MICROSERVER WEB SERVER

There are multiple vulnerabilities in the web server code that could allow unauthorized access to the web server including vulnerabilities that could bypass authentication; specially constructed HTTP requests can cause denial of service or allow unauthorized file access on an attacked machine; and cross-site scripting allowing contents of web pages to be modified in an unauthorized manner. If successful, an attacker could make unauthorized changes to the system configuration. Customer and user passwords are not exposed. A patch is available. This patch is a cumulative patch that incorporates the security patches documented in Security Bulletins XRX04-002 (P4), XRX04-007 (P10), XRX04-009 (P17) and XRX05-005 (P21) for the products listed below.

Category 27.1 *Vulnerability assessment*

2005-07-18 **CERT VU#973635 SSH Tectia Server Windows hostkey Sexure Shell Servers DNS hijacking**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/973635

SSH COMMUNICATIONS SECURITY SSH TECTIA SERVER ON WINDOWS ALLOWS LOCAL ACCESS TO HOST IDENTIFICATION KEY

SSH Tectia Server for Microsoft Windows creates the hostkey with permissions that allow any user to read the file. As a result, any user logged into the system can read the private SSH hostkey. Previous versions of SSH Tectia Server were known as SSH Secure Shell for Windows Servers. The hostkey is used to authenticate the server to the client. This defends against redirection attacks, such as DNS hijacking that cause the client to connect to a malicious server. In such cases, clients that know the public hostkey can verify that the server has the private hostkey, thereby verifying the server is correct. If an attacker copies the private hostkey of a server, they can configure a server with the same private key as the legitimate server. Such a server would appear valid to clients if another attack, such as DNS hijacking, was used to trick the client into connecting to the attacker's server.

Category 27.1 *Vulnerability assessment*

2005-07-20 **FrSIRT arbitrary vulnerability Greasemonkey error malicious web page contents directories**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1147

GREASEMONKEY FIREFOX EXTENSION ARBITRARY FILE DISCLOSURE ISSUE

A vulnerability was identified in Greasemonkey, which could be exploited by remote attackers to read arbitrary files on a vulnerable system. This flaw is due to a design error when using insecure "GM_*" functions (i.e. GM_xmlhttpRequest, GM_getValue, or GM_getValue), which could be exploited via a malicious web page to read any file on a vulnerable system or list the contents of local directories. User should upgrade to Greasemonkey version 0.3.5 : https://addons.mozilla.org/extensions/moreinfo.php?applicati on=firefox&id=748

2005-07-25 **FTPLocate vulnerability sanitization data commands executed context unauthorized hosting Web server**

DHS IAIP Daily; http://www.securityfocus.com/bid/14367/discuss

FTPLOCATE REMOTE COMMAND EXECUTION VULNERABILITY

FtpLocate is prone to a remote arbitrary command execution vulnerability. This issue presents itself due to insufficient sanitization of user-supplied data. An attacker can supply arbitrary commands and have them executed in the context of the server. This issue may facilitate unauthorized remote access to the computer running the hosting Web server. Currently Security Focus is not aware of any vendor-supplied patches for this issue.

Category 27.1 *Vulnerability assessment*

2005-07-25 **PHPFirstpost file vulnerability susceptible PHP code priveledges**

DHS IAIP Daily; http://www.securityfocus.com/bid/14371/info

PHPFIRSTPOST BLOCK.PHP REMOTE FILE INCLUDE VULNERABILITY

Phpfirstpost is susceptible to a remote PHP file include vulnerability. This issue is due to a failure in the application to properly sanitize user-supplied input. An attacker may exploit this issue to execute arbitrary PHP code on an affected computer with the privileges of the Web server process. This may facilitate unauthorized access. Currently Security Focus is not aware of any vendor-supplied patches for this issue.

Category 27.1 *Vulnerability assessment*

2005-07-25 **Clam AV heap Antivirus complete control SMTP SMB HTTP FTP bugs TNEF CHM FSG**

DHS IAIP Daily; http://www.rem0te.com/public/images/clamav.pdf

CLAMAV LIBRARY REMØTE HEAP OVERFLOWS SECURITY ADVISORY

ClamAV Antivirus Library is vulnerable to buffer overflows allowing attackers complete control of the system. These vulnerabilities can be exploited remotely without user interaction or authentication through common protocols such as SMTP, SMB, HTTP, FTP, etc. Specifically, ClamAV is responsible for parsing multiple file formats. At least four of its file format processors contain remote security bugs. Specifically, during the processing of TNEF, CHM, & FSG formats an attacker is able to trigger several integer overflows that allow attackers to overwrite heap data to obtain complete control of the system. These vulnerabilities can be reached by default and triggered without user interaction by sending an e-mail containing crafted data. Successful exploitation of ClamAV protected systems allows attackers unauthorized control of data and related privileges. ClamAV 0.86.1 (current) and prior are affected. Users should upgrade to Clam Antivirus (ClamAV) version 0.86.2 : http://sourceforge.net/project/showfiles.php?group_id=86638& release_id=344514

2005-07-26 **FrSIRT FtpLocate vulnerability arbitrary flaw input validation error filter pipe character**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1217

FTPLOCATE "FLSEARCH.PL" REMOTE COMMAND EXECUTION VULNERABILITY

A vulnerability was identified in FtpLocate, which may be exploited by remote attackers to execute arbitrary commands. This flaw is due to an input validation error in the "flsearch.pl" script that does not properly filter a specially crafted "fsite" parameter, which may be exploited by remote attackers to execute arbitrary commands via the pipe character. FtpLocate version 2.02 and prior are affected. The FrSIRT is not aware of any official supplied patch for this issue.

Category 27.1 *Vulnerability assessment*

2005-07-26 **Security Focus SPI Dynamics WebInspect application script injection vulnerability data content Internet Explorer COM installation execution**

DHS IAIP Daily; http://www.securityfocus.com/bid/14385/info

SPI DYNAMICS WEBINSPECT CROSS APPLICATION SCRIPT INJECTION VULNERABILITY

WebInspect is vulnerable to a cross-application script injection vulnerability. This issue is due to a failure of the application to properly sanitize user-supplied data prior to including it in content rendered in an Internet Explorer COM object. This vulnerability allows attackers to execute arbitrary script code in the context of the vulnerable application. By exploiting the knowledge of predictable files on the targeted system, attackers may also cause arbitrary script code to be executed in the "Local Machine" zone, facilitating remote machine code installation and execution. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 27.1 *Vulnerability assessment*

2005-07-26 **Security Tracker Apache buffer overflow vulnerability processing CRLs child printing LogLevel**

DHS IAIP Daily; http://www.securitytracker.com/alerts/2005/Jul/1014575.html

APACHE MOD_SSL OFF-BY-ONE BUFFER OVERFLOW IN PROCESSING CRLS MAY LET REMOTE USERS DENY SERVICE

A vulnerability was reported in Apache mod_ssl in the processing of certificate revocation lists (CRLs). A remote user may be able to cause denial of service conditions. A remote user can create a specially crafted CRL that, when processed by the Apache mod_ssl callback function, will trigger an off-by-one buffer overflow. A remote user can cause the Apache server child process to crash. The vulnerability can be triggered when printing CRL information at the 'debug' LogLevel. The vendor has issued a source code fix, available via SVN.

Category 27.1 *Vulnerability assessment*

2005-07-26 **IBM Access Connections Shared Section permissions vulnerability insecure memory attackers**

DHS IAIP Daily; http://www.securityfocus.com/bid/14387/info

IBM ACCESS CONNECTIONS SHARED SECTION INSECURE PERMISSIONS VULNERABILITY

IBM Access Connections utilizes Shared Sections in an insecure manner.
It creates a Shared Section memory region with insecure permissions allowing local attackers to gain inappropriate access to it. Attackers may read the data stored in the memory region, gaining access to potentially sensitive information. They may also write arbitrary data to the shared memory segment, potentially crashing the processes using the segment and denying service to legitimate users. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 27.1 *Vulnerability assessment*

2005-07-26 **FTPShell denial vulnerability prone service failure problem opens closes terminate exploit**

DHS IAIP Daily; http://www.securityfocus.com/bid/14382/info

FTPSHELL SERVER DENIAL OF SERVICE VULNERABILITY

FTPshell server is prone to a denial of service vulnerability. This issue is due to a failure in the application to handle exceptional conditions. The problem presents itself when an attacker opens and closes, without using the 'quit' command, a connection to the application multiple times. This will cause the application to terminate. An attacker can exploit this vulnerability to deny service to legitimate users. Security Focus is not currently aware of any vendor-supplied patches for this issue.

Category 27.1 *Vulnerability assessment*

2005-07-27 **eMule Kad Packets Zlib vulnerabilities buffer overflow error library streams**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1238

EMULE KAD PACKETS REMOTE DENIAL OF SERVICE AND ZLIB VULNERABILITIES

Multiple vulnerabilities were identified in eMule, which could be exploited by remote attackers to cause a denial of service or execute arbitrary commands. The first issue is due to a buffer overflow error in the Zlib library when decompressing specially crafted data streams, which could be exploited, via a malformed stream embedded within network communication, to execute arbitrary commands. The second vulnerability is due to an unspecified error when processing malformed Kad packets, which could be exploited by remote attackers to cause a denial of service. eMule version 0.46b and prior are affected. Users should upgrade to eMule version 0.46c

CISCO IOS UNSPECIFIED REMOTE HEAP OVERFLOW VULNERABILITY

A vulnerability was identified in Cisco Internet Operating System (IOS), which could be exploited by remote attackers to execute arbitrary commands. This flaw is due to a heap overflow error when processing specially crafted packets, which could be exploited by an unauthenticated attacker to execute arbitrary code and compromise a vulnerable device. Cisco IOS version 12.x and 11.x l are affected. It is reported that the vendor has addressed this vulnerability in an April firmware release.

2005-07-27 **FrSIRT Sophos Antivirus vulnerability malware overflow malformed e-mail**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/

SOPHOS ANTIVIRUS PRODUCTS REMOTE HEAP OVERFLOW VULNERABILITY

A critical vulnerability was identified in multiple Sophos AntiVirus products, which may be exploited by remote attackers or malware to execute arbitrary code. This flaw is due to a heap 9 overflow error when analyzing malformed files, which may be exploited by an unauthenticated remote attacker to execute arbitrary commands by sending an e-mail containing a specially crafted attachment to a vulnerable system. No further details have been disclosed. The following products are affected: Sophos Anti-Virus versions prior to 3.96.0 (on Windows, Unix, NetWare, OS/2, OpenVMS); Sophos Anti-Virus versions prior to 4.5.4 (on all platforms); and Sophos Anti-Virus Small Business Edition Sophos Anti-Virus Small Business Edition will be updated by July 29. Users should upgrade to Sophos Anti-Virus version 3.96.0 or 4.5.4: http://www.sophos.com/support/updates

2005-07-27 **Security Focus Novell GroupWise Client buffer vulnerability post office malicious**

DHS IAIP Daily; http://www.securityfocus.com/bid/14398/discuss

NOVELL GROUPWISE CLIENT REMOTE BUFFER OVERFLOW VULNERABILITY

Novell GroupWise Client is affected by a remote buffer overflow vulnerability. Specifically, this vulnerability arises when a user attempts to log in to a GroupWise post office that contains a malicious 'GWVW02??.INI' file. This can facilitate unauthorized access in the context of the user. This issue affects all versions of Novell GroupWise 6.5 client dated prior to July 15, 2005. Novell has released Technical Information Documents TID10098314 and TID2971927 including GroupWise 6.5 SP5 Client rev 6 to address this issue.

Category 27.1 *Vulnerability assessment*

2005-07-27 **FrSIRT Ethereal Multiple Protocol Dissector Zlib vulnerabilities buffer error string null LDAP AgentX PER DHCP BER MEGACO GIOP SMB WBXML H1 DOCSIS SMPP HTTP DCERPC CAMEL RADIUS Telnet NCP**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1237

ETHEREAL MULTIPLE PROTOCOL DISSECTOR AND ZLIB VULNERABILITIES

Multiple vulnerabilities were identified in Ethereal, which could be exploited by remote attackers to cause a denial of service or execute arbitrary commands. The first issue is due to a buffer overflow error in the Zlib library when decompressing specially crafted data streams, which could be exploited, via a malformed stream embedded within network communication, to execute arbitrary commands. Various buffer overflow, format string, and null pointer vulnerabilities were identified in the LDAP, AgentX, 802.3, PER, DHCP, BER, MEGACO, GIOP, SMB, WBXML, H1, DOCSIS, SMPP, HTTP, DCERPC, CAMEL, RADIUS, Telnet, IS-IS LSP and NCP dissectors, which could be exploited by attackers to compromise a vulnerable system or cause the application to crash. Ethereal versions 0.8.5 through 0.10.11 are affected. Users should upgrade to Ethereal version 0.10.12: http://www.ethereal.com/download.html

Category 27.1 *Vulnerability assessment*

2005-07-27 **Mozilla Suite Firefox script vulnerabilities security JavaScript protocol URIs code installation execution malicious**

DHS IAIP Daily; http://www.securityfocus.com/bid/13641/info

MOZILLA SUITE AND FIREFOX MULTIPLE SCRIPT MANAGER SECURITY BYPASS VULNERABILITIES

Multiple issues exist in Mozilla Suite and Firefox. These issues allow attackers to bypass security checks in the script security manager. Security checks in the script security manager are designed to prevent script injection vulnerabilities. An attacker sending certain undisclosed JavaScript in 'view-source:', and 'jar:' pseudo protocol URIs, may bypass these security checks. These vulnerabilities allow remote attackers to execute script code with elevated privileges, leading to the installation and execution of malicious applications on an affected computer. Cross-site scripting, and other attacks are also likely possible. The vendor has released an advisory, as well as upgraded versions of Mozilla Suite, and Mozilla Firefox to resolve these issues.

2005-09-28 **FrSIRT IBM AIX buffer vulnerability priveleges parameters**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/1877

IBM AIX "GETCONF" COMMAND LOCAL BUFFER OVERFLOW VULNERABILITY

A vulnerability has been identified in IBM AIX. This can be exploited by local attackers to obtain elevated privileges. This issue is due to an unspecified error in the "getconf" command that does not properly handle specially crafted parameters,. This vulnerability could be exploited by malicious users to execute arbitrary commands with "root" privileges.

Category 27.1 *Vulnerability assessment*

2005-10-07 **IBM HTTP Server PCRE byte vulnerabilities DoS**

DHS IAIP Daily; http://secunia.com/advisories/17036/

IBM HTTP SERVER PCRE AND BYTE-RANGE FILTER VULNERABILITIES

IBM has acknowledged two vulnerabilities in IBM HTTP Server. These vulnerabilities can be exploited by malicious people to cause a DoS (Denial of Service), or by malicious, local users to gain escalated privileges via a specially crafted ".htaccess" file.

Category 27.1 *Vulnerability assessment*

2005-10-10 **imapproxy string vulnerability flaw format server compromise IMAP**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/2014

IMAPPROXY "PARSEBANNERANDCAPABILITY" FORMAT STRING VULNERABILITY

A vulnerability has been identified in imapproxy, which could be exploited by remote attackers to execute arbitrary commands. This flaw is due to a format string error in the "ParseBannerAndCapability()" [main.c] function that does not properly handle a specially crafted banner/capability line received from the server, which could be exploited by remote attackers to compromise a vulnerable system by convincing a user to connect to a specially crafted IMAP server. The FrSIRT is not aware of any official supplied patch for this issue.

Category 27.1 *Vulnerability assessment*

2005-10-10 **Linux Kernel vulnerabilities trigger denial of service memory**

DHS IAIP Daily; http://www.securityfocus.com/bid/15049/references

LINUX KERNEL MULTIPLE SECURITY VULNERABILITIES

Linux kernel is prone to multiple vulnerabilities. These issues may allow local and remote attackers to trigger denial of service conditions or disclose sensitive kernel memory. Linux kernel 2.6.x versions are known to be vulnerable at the moment. Other versions may be affected as well. Various patches are available to address these issues:
http://www.securityfocus.com/bid/15049/references

Category 27.1 *Vulnerability assessment*

2005-10-10 **Kaspersky Engine CHM parser buffer overflow vulnerability context**

DHS IAIP Daily; http://www.securityfocus.com/bid/15054/info

KASPERSKY ANTI-VIRUS ENGINE CHM FILE PARSER REMOTE BUFFER OVERFLOW VULNERABILITY

Kaspersky Anti-Virus Engine is prone to a remote buffer overflow vulnerability. This issue presents itself when an attacker sends a maliciously crafted CHM file to an affected computer and this file is processed by Kaspersky's CHM file parser. This vulnerability allows attackers to execute arbitrary machine code in the context of the affected application. Attackers may gain privileged remote access to computers running the affected application. The vendor has released a signature update to address this issue. Users with updated signatures released after July 2005 are not vulnerable.

Category 27.1 *Vulnerability assessment*

2005-10-10 **Computer Associates iGateway buffer vulnerability flaw buffer overflow error HTTP GET debug**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/2028

COMPUTER ASSOCIATES IGATEWAY REMOTE BUFFER OVERFLOW VULNERABILITY

A vulnerability has been identified in various Computer Associates products, which could be exploited by remote attackers to execute arbitrary commands. This flaw is due to a buffer overflow error in the iGateway component that does not properly handle specially crafted HTTP GET requests (port 5250) when debug mode is enabled, which could be exploited by remote attackers to execute arbitrary commands and compromise a vulnerable system. No solution is currently available.

Category 27.1 *Vulnerability assessment*

2005-10-10 **PHPMyAdmin vulnerability script code Web access**

DHS IAIP Daily; http://www.securityfocus.com/bid/15053/info

PHPMYADMIN LOCAL FILE INCLUDE VULNERABILITY

phpMyAdmin is prone to a local file include vulnerability. An attacker may leverage this issue to execute arbitrary server-side script code that resides on an affected computer with the privileges of the Web server process. This may potentially facilitate unauthorized access. phpMyAdmin 2.6.4-pl1 is reported to be vulnerable. Other versions may be affected as well. There are no vendor-supplied patches currently available for this issue.

Category 27.1 *Vulnerability assessment*

2005-10-10 **Shorewall MACLIST vulnerability Netfilter Firewall Client version**

DHS IAIP Daily; http://www.securiteam.com/unixfocus/6F00C00EAM.html

SHOREWALL MACLIST SECURITY VULNERABILITY

The Shoreline Firewall, "more commonly known as 'Shorewall', is a high-level tool for configuring Netfilter. You describe your firewall/gateway requirements using entries in a set of configuration files". A problem has been reported in the Shorewall Firewall that enables a Client accepted by MAC-Filter to bypass any other rule. This Issue doesn't apply to any Shorewall Version before 2.2.0. Users of any version before 2.2.5 are encouraged to update to a newer version (at least 2.2.5, better 2.4.1) of Shorewall. Shorewall Version 2.0.x is still supported, but Users of 2.0.x are encouraged to upgrade to a newer version.

Category 27.1 *Vulnerability assessment*

2005-10-11 **SGI IRIX design vulnerability runpriv Silicon Graphics Inc binary directory**

DHS IAIP Daily;
http://www.idefense.com/application/poi/display?id=312&type=
vulnerabilities&flashstatus=true

SGI IRIX RUNPRIV DESIGN ERROR VULNERABILITY

Local exploitation of a design error vulnerability in the runpriv command included in multiple versions of Silicon Graphics Inc.'s IRIX could allow for arbitrary code execution as the root user. Exploitation requires an attacker to have access to an account which has been granted usage of a binary in the /usr/sysadm/privbin directory. As root must explicitly allow such privileges, the impact of this vulnerability is lessened significantly. Exploitation does not require any knowledge of application internals, making exploitation trivial, even for unskilled attackers. Vendor patch 7004 for IRIX 6.5.27 and 6.5.28 is available at: http://support.sgi.com/

Category 27.1 *Vulnerability assessment*

2005-10-11 **Linux Kernel memory denial of service vulnerabilities crash**

DHS IAIP Daily; http://www.securityfocus.com/bid/15076/solution

LINUX KERNEL MULTIPLE MEMORY LEAK LOCAL DENIAL OF SERVICE VULNERABILITIES

Two local denial of service vulnerabilities affects the Linux kernel. These issues are due to a design flaw that creates memory leaks. These vulnerabilities may be exploited by local users to consume excessive kernel resources, likely triggering a kernel crash, denying service to legitimate users. These issues affect Linux kernel versions prior to 2.6.14-rc4. The vendor has released version 2.6.14-rc4 to address these issues.

Category 27.1 *Vulnerability assessment*

2005-10-11 **Alert Microsoft Windows Internet Explorer Exchange Server vulnerabilities denial of service control**

DHS IAIP Daily; http://www.us−cert.gov/cas/alerts/SA05−284A.html

MICROSOFT WINDOWS, INTERNET EXPLORER, AND EXCHANGE SERVER VULNERABILITIES

Microsoft has released updates that address critical vulnerabilities in Windows, Internet Explorer, and Exchange Server. Exploitation of these vulnerabilities could allow a remote, unauthenticated attacker to execute arbitrary code or cause a denial of service on an affected system. Exploitation of these vulnerabilities may allow a remote, unauthenticated attacker to execute arbitrary code with SYSTEM privileges or with the privileges of the user. If the user is logged on with administrative privileges, the attacker could take complete control of an affected system. An attacker may also be able to cause a denial of service. Updates are available on the Microsoft Update site: http://www.microsoft.com/technet/security/bulletin/ms05-oct. mspx

Category 27.1 *Vulnerability assessment*

2005-10-11 **WinRAR string overflow vulnerabilities Two compromise system diagnostic error filename encoded**

DHS IAIP Daily; http://secunia.com/secunia_research/2005−53/advisory/

WINRAR FORMAT STRING AND BUFFER OVERFLOW VULNERABILITIES

Two vulnerabilities in WinRAR can be exploited by malicious people to compromise a user's system. 1) A format string error exists when displaying a diagnostic error message that informs the user of an invalid filename in an UUE/XXE encoded file. This can be exploited to execute arbitrary code when a malicious UUE/XXE file is decoded. 2) A boundary error in UNACEV2.DLL can be exploited to cause a stack-based buffer overflow. This allows arbitrary code execution when a malicious ACE archive containing a file with an overly long file name is extracted. Users should update to version 3.51.

Category 27.1 *Vulnerability assessment*

2005-10-12 **VERITAS NetBackup string vulnerability Java command**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2005/2072

VERITAS NETBACKUP BPJAVA-MSVC REMOTE FORMAT STRING VULNERABILITY

A vulnerability has been identified in VERITAS NetBackup servers and clients. This could be exploited by remote attackers to execute arbitrary commands. The vulnerability is due to a format string error in the Java authentication service "bpjava-msvc" that does not properly handle a specially crafted "COMMAND_LOGON_TO_MSERVER" command (port 13722), which could be exploited by remote attacker.

Category 27.1 *Vulnerability assessment*

2005-10-12 **Microsoft Windows FTP transversal vulnerability input corruption malicious**

DHS IAIP Daily; http://www.securityfocus.com/bid/12160/solution

MICROSOFT WINDOWS FTP CLIENT DIRECTORY TRAVERSAL VULNERABILITY

Microsoft Windows FTP client is prone to a directory traversal vulnerability. This issue is due to a failure of the application to properly sanitize user supplied input. This vulnerability may cause a remote attacker to place files in an arbitrary location on a vulnerable computer. This can lead to data corruption or creation of potentially malicious files on a vulnerable computer.

Category 27.1 *Vulnerability assessment*

2005-10-13 **Cisco IOS firewall proxy buffer overflow vulnerability exploitation denial of service arbitrary code security FTP Telnet protocols**

DHS IAIP Daily; http://www.securityfocus.com/bid/14770/references

CISCO IOS FIREWALL AUTHENTICATION PROXY BUFFER OVERFLOW VULNERABILITY

Cisco IOS Firewall Authentication Proxy is prone to a buffer overflow condition. Successful exploitation of this issue could cause a denial of service or potential execution of arbitrary code. This feature allows network administrators to apply specific security policies on a per user basis. This issue affects the FTP and Telnet protocols, but not HTTP.

2005-10-17 **Lynx NNTP buffer overflow vulnerability headers URIs Exploitation execution**

DHS IAIP Daily; http://www.securityfocus.com/bid/15117/references

LYNX NNTP ARTICLE HEADER BUFFER OVERFLOW VULNERABILITY

Lynx is prone to a buffer overflow when handling NNTP article headers. This issue may be exploited when the browser handles NNTP content, such as through 'news:' or 'nntp:' URIs. Exploitation may result in code execution in the context of the program user.

Category 27.1 *Vulnerability assessment*

2005-10-18 **Technical Cyber Security Alert Snort Back Orifice buffer overflow modular ping UDP root SYSTEM**

DHS IAIP Daily; http://www.us−cert.gov/cas/techalerts/TA05−291A.html

SNORT BACK ORIFICE PREPROCESSOR BUFFER OVERFLOW

Snort preprocessors are modular plugins that extend functionality by operating on packets before the detection engine is run. The Back Orifice preprocessor decodes packets to determine if they contain Back Orifice ping messages. The ping detection code does not adequately limit the amount of data that is read from the packet into a fixed-length buffer, thus creating the potential for a buffer overflow. The vulnerable code will process any UDP packet that is not destined to or sourced from the default Back Orifice port (31337/udp). An attacker could exploit this vulnerability by sending a specially crafted UDP packet to a host or network monitored by Snort. A remote attacker who can send UDP packets to a Snort sensor may be able to execute arbitrary code. Snort typically runs with root or SYSTEM privileges, so an attacker could take complete control of a vulnerable system. An attacker does not need to target a Snort sensor directly; the attacker can target any host or network monitored by Snort. Sourcefire has released Snort 2.4.3: http://www.snort.org/dl/ Additional information is available in US-CERT Vulnerability Note VU#175500: http://www.kb.cert.org/vuls/id/177500

2005-11-10 **computer security threats networked peripheral devices**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,123483,00.asp

ANY NETWORKED OFFICE GEAR CAN BE VULNERABLE TO ONLINE ATTACKERS

On Tuesday, November 9, at a two-day Office Document Solutions conference in Boston, MA, a number of presenters implored makers of printers, copiers, scanners, and other such devices to start thinking about security threats to office gear beyond just computers. According to Jim Joyce, senior vice president for office services at Xerox Global Services, "Network-connected output devices are becoming an absolute primary target of people, foreign and domestic, who are penetrating networks...The reason for that is many of them are large devices with large disk drives, with a fair amount of memory and are network connected and are not secure." Joyce said that Xerox has poured some $20 million in recent years into technologies to better manage office and document systems and is putting a particular emphasis on security. He noted that some machines, such as multifunction devices, might have several operating systems in them that could provide security holes if not protected.

2005-11-22 **patching deployment fix IT department faster vulnerability assessment**

DHS IAIP Daily;
http://www.computerweekly.com/Articles/2005/11/22/213048/ITd
epartmentsgetfasteratpatchingsystems.htm

IT DEPARTMENTS GET FASTER AT PATCHING SYSTEMS

IT departments have significantly reduced the time they take to patch their systems when new security vulnerabilities, viruses, or worms become public. The average time taken for IT departments to patch half of their external-facing systems has fallen to 19 days, down from 21 days a year ago, and from 30 days two years ago, according to IT security supplier Qualys. IT departments have reduced the time taken to patch half of their internal systems from 52 days to 48 days, according to an analysis of 32 million vulnerability scans of Qualys systems. However, the research showed that 80% of security exploits appear before companies patch half of their systems. Similarly, it showed worms cause most damage within the first 15 days of an outbreak.

SECURITY EXPERT FINDS PORT SCANS NOT TIED TO HACK ATTACKS

Port scanning, the practice of sniffing for computers with unprotected and open ports, isn't much of a harbinger of an attack, a University of Maryland researcher said Monday, December 12. Michel Cukier, an assistant professor at the College Park, MD,-based school, said that contrary to common thought, few port scans actually result in an attack. In fact, only about five percent of attacks are preceded by port scans alone. "But when you combine port scans with other kinds of scans, particularly vulnerability scans, there's a much higher probability of an attack," said Cukier. Nearly three-quarters of the attacks prefaced by some kind of scan came after both a port and a vulnerability scan were run against the exposed PCs, noted Cukier's report. Through his research, Cukier expected to see a higher correlation between port scanning and attacks, but the analysis also showed that it was relatively easy to spot the difference between a port scan and a more dangerous vulnerability scan simply by counting up the number of data packets received by the PC. Cukier and his researchers concluded that there seems to be no link between port scans and attacks. Cukier's research paper: http://www.enre.umd.edu/faculty/cukier/81_cukier_m.pdf

2006-04-24 **hacker toolkit attack unpatched vulnerable computers Internet Explorer IE Firefox browsers**

DHS IAIP Daily; http://www.informationweek.com/news/showArticle.jhtml?articl 23
eID=186700539

HACKER'S TOOLKIT ATTACKS UNPATCHED COMPUTERS.

A dirt-cheap, do-it-yourself hacking kit sold by a Russian Website is being used by more than 1,000 malicious Websites, a security company said Monday, April 24. Those sites have confiscated hundreds of thousands of computers using the "smartbomb" kit, which sniffs for seven unpatched vulnerabilities in Internet Explorer and Firefox, then attacks the easiest-to-exploit weakness. For $15 to $20, hackers can buy the "Web Attacker Toolkit," said San Diego-based Websense in an online alert. The tool, which uses a point-and-click interface, can be planted on malicious sites -- or on previously-compromised computers -- to ambush unsuspecting users. "It puts a bunch of code on a site that not only detects what browser the victim is running, but then selects one of seven different vulnerabilities to exploit, depending on how well-patched the browser is," said Dan Hubbard, senior director of security and research at Websense. Websense Informational Alert: Web attacker sites increase: http://www.websensesecuritylabs.com/alerts/alert.php?AlertID =472

Category 27.2 *Port scans*

1999-10-11 **scanning probing proxies**

SANS http://www.sans.org/newlook/resources/ringzero.htm

Widespread port scans were reported in late September to the System Administration, Networking, and Security (SANS) Institute, which coordinated the effort to analyze the problem. Results: someone has probably distributed a Trojan Horse running under Windows that scans ports 80, 8080 and 3128 (and sometimes other ports in the 8000 range) for proxies. SANS advised system administrators to watch for outbound traffic for the target ports. Admins should also either disable unused ports or set firewalls to preclude proxies from being used by outsiders.

Category 27.2 *Port scans*

2000-10-17 **worm penetration port scan infection counterattack response revenge retaliation infection**

RISKS 21 09

A correspondent called "Jeremy" noted in RISKS that the number of netbios probes went up by an order of magnitude in September and October. He pointed out that these systems are presumably infected with a worm or virus and are doing the bidding of the malware writers; however, the infected systems are also announcing all over the Net that they have poor security. "Jeremy" postulated that there could be three types of active response to these probes by anyone interested:
* sterilizing the infections remotely;
* planting another virus or worm;
* disabling the infected machine.

1999-04-10 **security product coordination intrusion detection error firewalls reporting paging alerts warnings**

OTC

Network Associates announced a product for handling trousers: "Event Orchestrator, a security technology that enables products and tools from third-party vendors to coordinate responses to security breeches." Oh wait, that's probably not trousers; they meant security _breaches_. According to the puffery, Event Orchestrator is an object technology based on the Component Object Model that maps a company's security policies to actions," says Zachary Nelson, VP and general manager for Network Associates' Service Desk product line. It picks up alerts from security tools, checks the events against company policies, then takes appropriate action based on the level of risk. For example, if Network Associates' CyberCop Monitor detects a hacker attack, Event Orchestrator can order the ports on a firewall closed to block access rather than page a network administrator to do the same. "Properly configured, Event Orchestrator can react far faster than I can," says Christopher Ward, director of corporate security for Pagemart Wireless Inc., a wireless paging company in Dallas. The system can help to make different components of the security architecture work more smoothly together, especially when the configuration of one device, such as a firewall, can have an effect on others, such as anti-virus products.

CyberSafe Corporation announced Centrax v 2.2 intrusion detection software they describe as "the first and only product to integrate host-and network-based intrusion detection, vulnerability assessment, and policy management under a single, easy-to-use interface." See <http://www.cybersafe.com> for more details.

Category 27.3 *Intrusion detection systems*

1999-06-14 **slow port scan bypass intrusion detection criminal hacker data diddling deletion malicious penetration password file Linux**

Computerworld

In early 1999, a criminal hacker called "Moof"went on a rampage against Linux servers in a wide range of ISPs and colleges in the US, the UK and Canada. The cracker was using a "slow port scan" in which a probe packet gets sent one port at a time — one port every three hours. Such slow scans are not picked up by intrusion-detection systems, which tend to roll over their detection stacks every 10 minutes or so. In addition, the criminal uses different source addresses for different packets to make it even harder to detect the port scan. Once "Moof" had identified vulnerabilities, (s)he attacked the vulnerable system, installed back doors and used the compromised system to launch more slow scans for new victims. Finally, the criminal erased crucial file system entries on the latest victim, making the system crash.

1999-08-14 **information warfare surveillance intrusion detection penetration analysis government FBI FIDNET**

National Journal

Neil Munro published a thorough review of the politics of the FIDNet (Federal Intrusion Detection Network) proposal in the _National Journal_ on 1999-08-14. The furore over the monitoring plans included opponents not only from the civil liberties camp but also, in an unlikely combination, representatives of high-tech firms. Companies expressed horror at the thought of mandatory reporting of computer crime because they mistrust the government's ability to safeguard their information and fear of ridicule and embarrassment if the truth were to be revealed to the public. In addition, people with libertarian tendencies just plain dislike government regulation of _anything_.

Category 27.3 *Intrusion detection systems*

1999-08-29 **information warfare surveillance intrusion detection penetration analysis government FBI FIDNET**

New York Times, Washington Post, Wired

The privacy community was not pleased when the Clinton Administration and the FBI announced their FIDNET initiative in July 1999 to monitor network intrusions not only on government systems but also critical infrastructure components such as banking, communications and transport. House Majority Leader Dick Armey (R-TX) attacked the FIDNET proposal and the House Appropriations Committee removed funding for the project from its versions of the relevant appropriations bills. In August, one of FIDNET's main architects spoke out in defense of the plan. Richard Clarke, National Coordinator for Security, Infrastructure Protection and Counterterrorism, explained that fears of an "electronic Pearl Harbor" (a term popularized by Winn Schwartau of <infowar.com> in the early 1990s) led to Presidential Decision Directive 63 and that FIDNET was one of the first major computer-security programs proposed in response to the Directive. He assured skeptics of minimal involvement of the FBI and said that FIDNET would be managed by the NIPC (National Infrastructure Protection Center), not the Department of Justice. The system would not intrude on personal or corporate privacy, he said. On 27 Sept, Rep. Armey sent another challenge to the Dept of Justice demanding clarification of critical elements of FIDNET. In January 2000, the Administration tried again, bundling FidNET into anti-cybercrime proposals presented by the Department of Commerce.

NIPC/DHS; http://www.fcw.com/geb/articles/2004/0119/web−florida−01−20−04.asp

January 20, Federal Computer Week — Florida governor seeks IT funding overhaul.

Florida Governor Jeb Bush on Tuesday, January 20, outlined a 2004-2005 budget that calls for several changes at the State Technology Office (STO), including consolidating its funds to gain better control of cross-sector initiatives. This year, the STO's Information Technology Security Office is developing a statewide intrusion detection service, or Cyber Center, using funding from a federal grant. That service "will move the office into an expanded role to provide physical monitoring of the state's IT infrastructure to detect, prevent and minimize cybercrime," according to budget documents. Governor Bush requested almost $1.1 million of the state's money to continue the security office's work. The new budget also reflects the STO's shift from legacy systems to Web-based services. Over all of this, the budget proposes a complete reorganization of the STO's programs into a single budget. "This realignment of budget authority within a single budget entity will provide the necessary flexibility for the State Technology Office to meet the needs of its IT partners and customers as needed, while also maintaining the requisite level of budgetary accountability."

2004-10-23 **neural networks University of Florida**

NewsScan; http://www.wired.com/news/medtech/0,1286,65438,00.Html

NEURAL NETWORK AT THE CONTROLS

Researchers at the University of Florida have created a neural network made up of 25,000 disembodied rat neurons and hooked it up to a flight simulator on a desktop computer. The neurons, which are growing on top of a multi-electrode array, are fed information about the simulated F-22's horizontal and vertical movements by stimulating the electrodes, causing them to fire in patterns that are then used to control the aircraft. "It's as if the neurons control the stick in the aircraft, they can move it back and forth and left and right," says UF professor Thomas DeMarse. "The electrodes allow us to record the activity from the neurons and stimulate them so we can listen to the conversation among the neurons and also input information back into the neural network." Thus far, the network has "learned" how to control the fighter jet's pitch and roll in a broad range of weather conditions, but DeMarse plans to improve the system by having the "brain" use a horizon to judge how well it's controlling the aircraft. The goal is to find out how the neurons communicate with each other and eventually translate that knowledge into the development of a novel computing architecture. (Wired.com 23 Oct 2004)

COMPROMISE-DETECTION TEST FOR PERSONAL-INFORMATION DATABASES

Pekka Pihlajasaari wrote from South Africa about an excellent method for detecting compromise of personal-information databases:

Many articles documenting the risks of exposure of personally identifiable information bemoan the possibility of compromise. There seems to be very little quantitative information on the number of cases where the information is used inappropriately.

If a selection of unused social security numbers were identified as probes, these could be used by credit bureaux and other large databases as proxies for compromise. Any use of these numbers would be positive confirmation of breach of the related database, and an indication of the rate at which harvested numbers are utilised. While this does pollute the datasets with incorrect data, this provides an in-band mechanism to detect misuse. The practise has been in use by mailing list rental companies to count the number of times a list is used.

The low occurrence of the probes makes wholesale harvesting easy to detect and difficult for the harvester to protect themselves against. This risk, of course, is that the list of probe numbers is compromised!

[MK notes that criminals' creation and fraudulent use of fake SSNs that happened to match the probes would trigger false positives in this system, but that problem does not invalidate the method proposed as a useful tool.]

2005-07-14 **Apple OS X fixes crash data firewall filtering 10.4 Tiger widgets Dashboard warning install**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2139781/apple−issues−two−s ecurity

APPLE UNVEILS OS X SECURITY PATCHES

Apple has released two security fixes for bugs in its OS X operating system. The first patch plugs a hole that could allow hackers to crash a system by sending a specially crafted data packet. The flaw effectively opens up the system for a denial of service attack. A security notice on Apple's Website says that the flaw affects only the 10.4 versions of OS X and will not harm computers that sit behind a 12 firewall or are otherwise protected through packet filtering. The other patch targets a bug in the 10.4 Tiger operating system that allows users inadvertently to overwrite standard widgets in Apple's Dashboard application. The update provides a warning when a user attempts to install a widget that has the same name as an existing one. Previously the new widget would run instead of the system widget, effectively making the original one inaccessible to the user. This latest update moves OS X 10.4 to version 10.4.2.

2005-10-04 **network attack tracking intrusion detection academic campus Internet comparison intelligence project Columbia University**

EDUPAGE; http://chronicle.com/daily/2005/10/2005100401t.htm

RESEARCH PROJECT WILL TRACK NETWORK ATTACKS

A research project will collect regular snapshots of computer networks from as many as 10 colleges and universities in an effort to improve protections from and responses to Internet attacks. The Information Security in Academic Institutions project, an initiative of the Columbia University Teachers College, uses monitoring technology called Dshield and has already been tested at three institutions. The other institutions in the project have yet to be named, and the system may eventually be widely available. The system will give network administrators data about the state of networks, allowing them to gain a better understanding of Internet attacks by comparing data from before, during, and after an attack. Steffani A. Burd, executive director of the project, described it as "a 360-degree view of what's going on." The system will also pool data collected from participating institutions and make it available anonymously on the Web. This aggregation of data will allow a comparison between activity on the Internet generally and what's happening at campuses. Chronicle of Higher Education, 4 October 2005 (sub. Req'd)

1999-11-17 **virtual private network HTTP tunnel bypass firewall**

Network News, GNU

The NoCrew hacker group presented the world with HTTPTunnel, a tool to create an encrypted bi-directional data path that can elude firewalls and break policy on connections into and out of corporate networks. Writing in a firewalls discussion list, Stevin Bellovin wrote, "Firewalls are based on two fundamental assumptions: that anyone on the outside may be bad, and that all actors on the inside are good. If the latter assumption is false, your firewall is useless. Once upon a time, the inside "actors" referred to people. In an era of mobile code — mobile in the sense of both Java/ActiveX and in reference to outside code that is installed — the word refers to the such programs as well."

He continued, "Here we have a piece of `malware' — code designed to subvert administrative policy. Although perhaps in theory it could be installed by, say, a Makefile in some popular package, or by a Trojan horse in something you run, most likely it would be deliberately installed by someone who doesn't like the firewall. But the difference isn't that important — what matters is that either is a bad actor on the inside. The precise tunnel chosen isn't that interesting, either. . . . *Any* bidirectional channel can be used as a tunnel — and if your users are hell-bent on getting around your firewall, they're going to. *Maybe* you can use traffic analysis to find such things, but then you're in a serious arms race. You can't use technical means to enforce a stricter security policy than your organizational culture will support, though human means, such as a chat with management, may work."

2002-04-25 **firewall proxy servers US military DoD Department of Defense US Army**

Security Wire Digest 4 32

*ARMY INSTALLS WEB PROXY SERVERS
The Army has set up proxy servers for its public Web sites to help prevent the actual sites from being attacked. The practice is common in the corporate world, where proxy servers allow public access to company information without providing crackers direct means to access the Web server. Gartner Group security analyst John Pescatore told Federal Computer Week that Web sites' susceptibility to defacement decreases from 67 percent to less than 5 percent with good application-level firewalls, which are similar to the proxy server system being used by Army sites. The server setup is part of a broader program called Web Risk Assessment Cell, created in 1999 to monitor Department of Defense Web sites and maintain the security of sensitive data accessible on public Web sites.

2004-02-20 **personal firewall ZoneAlarm vulnerability e-mail attack buffer overflow**

DHS IAIP Daily; http://www.eweek.com/article2/0,4149,1530946,00.asp

February 20, eWeek — ZoneAlarm bug bares system to e-mail attack.

Security vendor Zone Labs has disclosed that several versions of its personal-firewall products are vulnerable to a buffer-overflow attack. ZoneAlarm, ZoneAlarm Plus and ZoneAlarm Pro 4.0.0 versions; ZoneAlarm Pro 4.5.0; as well as Zone Labs Integrity Client 4.0.0 are vulnerable. ZoneAlarm users are advised to upgrade to Version 4.5.538.001. The problem was described by eEye Digital Security on the BugTraq mailing list. The firewalls process SMTP (e-mail) traffic sent to or from the system. According to the description, a sufficiently large value in the SMTP "RCPT TO" command can overflow a stack-based buffer in the TrueVector Internet Monitor (vsmon.exe) process. According to Zone Labs, "If successfully exploited, a skilled attacker could cause the firewall to stop processing traffic, execute arbitrary code, or elevate malicious code's privileges." An attacker with local access and restricted privileges could invoke the attack by sending an e-mail with the overflowed RCPT TO command. The user could elevate his privileges to SYSTEM level, and a remote user could invoke the attack by manipulating the system into sending an e-mail with the overflow value. Additional information available here: http://download.zonelabs.com/bin/free/securityAlert/8.html

2004-03-31 **new security hacking toolkit Cisco warning threat vulnerability**

DHS IAIP Daily;
http://www.computerworld.com/securitytopics/security/story/0,10801,91748,00.html

March 29, IDG News Service — Cisco warns of new hacking tool kit.

Cisco Systems Inc. has warned customers about the public release of computer code that exploits multiple security vulnerabilities in Cisco products. Using exploits for nine software vulnerabilities, the program could allow malicious hackers to compromise Cisco's Catalyst switches or a wide variety of machines running versions of the company's Internetwork Operating System (IOS). Called the Cisco Global Exploiter, the program appears to give users a menu of choices, depending on the system they are trying to crack. It offers, for example, the "Cisco 677/678 Telnet Buffer Overflow Vulnerability" or the "Cisco Catalyst 3500 XL Remote Arbitrary Command Vulnerability," according to the Web site, www.k-otik.com. Computer code for a program matching the description in the Cisco security notice was posted on the French-language computer security exploit site yesterday. While many of the exploits can be used only to shut down affected Cisco devices in denial-of-service attacks, at least one enables remote attackers to run malicious code on the affected system without needing a username or password, according to the Cisco security notice. Customers should patch software vulnerabilities exploited by the program.

2004-08-19 **Cisco Internetwork Operating System IOS vulnerability OSPF packets denial-of-service DoS**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/989406

August 19, US-CERT — Vulnerability Note VU#989406: Cisco IOS fails to properly handle malformed OSPF packets.

Cisco Internetwork Operating System (IOS) is a very widely deployed network operating system. IOS provides support for the Open Shortest Path First (OSPF) protocol. There is a denial-of-service vulnerability in the way OSPF packets are processed by IOS. By sending a specially crafted OSPF packet to an affected device, a remote, unauthenticated attacker could cause the device to reload. Repeated exploitation of this vulnerability could result in a denial-of-service condition. In order to exploit this vulnerability, an attacker would need to know several parameters. These parameters include the OSPF area number, netmask, hello, and dead timers, which are configured on the affected device. Information about upgrading is available on the Cisco Website: http://www.cisco.com/warp/public/707/cisco-sa-20040818-ospf. Shtml

2004-08-27 **Cisco Internetwork Operating System IOS telnet denial of service DoS vulnerability**

DHS IAIP Daily;
http://www.cisco.com/en/US/products/products_security_advisory09186a00802a
cbf6.shtml#summary

August 27, Cisco Security Advisory — Cisco telnet denial of service vulnerability.

A denial-of-service vulnerability exists in Cisco's Internetwork Operating System (IOS). This vulnerability could allow remote attackers to prevent new connections to remote management services on a vulnerable device. This vulnerability allows specially crafted TCP packets sent to the telnet or reverse telnet service to cause the device to refuse subsequent connections to these management services. There are reports of this vulnerability being actively exploited. Patches and workarounds are available through the Source link below.

Category 27.4 *Firewalls & other perimeter defenses*

2004-11-11 **Cisco Internetwork Operation System IOS vulnerability DHCP protocol exploit denial of service DoS attack**

DHS IAIP Daily; http://www.kb.cert.org/vuls/id/630104

November 11, US-CERT — Technical Cyber Security Alert TA04-316A: Cisco IOS Input Queue Vulnerability.

There is a vulnerability in the way Cisco IOS processes Dynamic Host Configuration Protocol (DHCP packets). Exploitation of this vulnerability may lead to a denial of service. The processing of DHCP packets is enabled by default. The Dynamic Host Configuration Protocol (DHCP) provides a means for distributing configuration information to hosts on a TCP/IP network. The Cisco Internetwork Operating System (IOS) contains a vulnerability that allows malformed DHCP packets to cause an affected device to stop processing incoming network traffic. By sending a specially crafted DHCP packet to an affected device, a remote, unauthenticated attacker could cause the device to stop processing incoming network traffic. Repeated exploitation of this vulnerability could lead to a sustained denial-of-service condition. In order to regain functionality, the device must be rebooted to clear the input queue on the interface. Cisco is tracking this issue as CSCee50294. US-CERT is tracking this issue as VU#630104. A solution is to upgrade to fixed versions of IOS available at: http://www.cisco.com/warp/public/707/cisco-sa-20041110-dhcp. Shtml

2004-11-19 **ZoneAlarm advertising blocking vulnerability denial of service DoS**

DHS IAIP Daily; http://secunia.com/advisories/13244/

November 19, Secunia — ZoneAlarm advertising blocking denial of service vulnerability.

A vulnerability has been reported in ZoneAlarm Pro and ZoneAlarm Security Suite, which can be exploited by malicious people to cause a DoS (Denial of Service). The vulnerability is caused due to an error in the Ad-Blocking feature (disabled by default) when processing JavaScript and can be exploited by tricking a user into visiting a malicious Website containing specially crafted JavaScript. Update to version 5.5.062 or later via the "Check For Update" feature.

2005-01-19 **Cisco Internetwork Operating System IOS call processing solutions telephony vulnerability denial of service DoS attack update issued**

DHS IAIP Daily; http://www.cisco.com/warp/public/707/cisco−sa−20050119−itscm e.shtml

VULNERABILITY IN CISCO IOS EMBEDDED CALL PROCESSING SOLUTIONS

Cisco Internetwork Operating System (IOS®) Software release trains 12.1YD, 12.2T, 12.3 and 12.3T, when configured for the Cisco IOS Telephony Service (ITS), Cisco Call Manager Express (CME) or Survivable Remote Site Telephony (SRST) may contain a vulnerability in processing certain malformed control protocol messages. A successful exploitation of this vulnerability may cause a reload of the device and could be exploited repeatedly to produce a Denial of Service (DoS). Vendor solution available through Source link below.

2005-01-26 **Cisco Internetwork Operating System IOS Border Gateway Protocol BGP packet reload vulnerability denial of service DoS attack update issued**

DHS IAIP Daily; http://www.cisco.com/warp/public/707/cisco−sa−20050126−bgp.s html#software

CISCO IOS MISFORMED BGP PACKET CAUSES RELOAD

A Cisco device running IOS® and enabled for the Border Gateway Protocol (BGP) is vulnerable to a Denial of Service attack from a malformed BGP packet. Only devices with the command bgp log-neighbor-changes configured are vulnerable. The BGP protocol is not enabled by default, and must be configured in order to accept traffic from an explicitly defined peer. Unless the malicious traffic appears to be sourced from a configured, trusted peer, it would be difficult to inject a malformed packet. Solution available through Source link below.

2006-03-09 **Zone Labs ZoneAlarm Security Suite privilege escalation vulnerabilities**

DHS IAIP Daily; http://www.securiteam.com/windowsntfocus/5IP012KI0K.html 23

EIGHTEEN WAYS TO ESCALATE PRIVILEGES IN ZONE LABS ZONEALARM SECURITY SUITE.

A locally exploitable security vulnerability in Zone Labs ZoneAlarm Security Suite allows normal users to elevate their privileges. Analysis: Instead of using the full path to the DLL during the load process only the name of the DLL is used. This causes several instances of Windows PATH trolling where Windows tries to locate the DLL in the directories listed in its PATH environment variable on behalf of the vsmon.exe process. This PATH trolling is what makes the vsmon.exe process vulnerable to several privilege escalation techniques. Vulnerable product: Zone Labs ZoneAlarm Security Suite build 6.1.744.000. Patches/Workarounds: The vendor was notified several times but there was no response.

Category 27.4 *Firewalls & other perimeter defenses*

2006-03-13 **ZoneAlarm personal firewall software TrueVector Service local privilege escalation vulnerability no solution**

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/0947 23

ZONEALARM TRUEVECTOR SERVICE LOCAL PRIVILEGE ESCALATION VULNERABILITY

A vulnerability has been identified in ZoneAlarm, which could be exploited by malicious users to obtain elevated privileges. Analysis: The error in the TrueVector service ("VSMON.exe") that loads certain Dynamically Linked Libraries (DLL) in an insecure manner, which could be exploited by local attackers to execute arbitrary commands with SYSTEM privileges by placing a malicious DLL in a specific directory. Affected product: ZoneAlarm versions 6.x. Solution: The FrSIRT is not aware of any official supplied patch for this issue.

2003-02-03 **exposed vulnerable server high attack rate honeypot**

NIPC/DHS

January 29, Silicon.com — Exposed server is a magnet for hack attacks.

The amount of hacking activity on the Internet has been revealed after one company set up an anonymous 'dummy test' server —and found it was maliciously attacked 467 times within 24 hours of being installed. The server, which contained no data and had no public profile, was attacked every single day over the next three weeks. PSINet Europe ran the test on an unprotected server at its Internet Data Center in Amsterdam, and registered a total of 626 malicious attacks over the three week period. A significant number of attacks originated from broadband or cable ISPs. PSINet's report into the experiment says that: "High bandwidth links do not only provide end users with faster download times—they also allow hackers to attack a wider target audience with a wider array of tools." PSINet also found that the bulk of the attacks originated from the United States and Western Europe and not in the most commonly expected areas of the former Eastern Bloc countries. Within Europe, Germany, Italy, the Netherlands and the UK were the most popular locations, while the countries most associated with attackers —Russia, Bulgaria and Romania—did not even feature. The findings of the PSINet Europe test are backed up by figures from the Gartner Group, which reported that 90 per cent of security breaches occur as a result of networks being incorrectly configured and managed.

2002-03-10 **worldwide virus worm infection data top ten infectors malware**

Trend World Virus Tracking Center

The new Trend World Virus Tracking Center < http://wtc.trendmicro.com/wtc/ > shows the top ten viruses observed in the wild through "actual virus infections detected by HouseCall, our free on-line virus scanner for PCs, and by the Trend Virus Control System (TVCS), our central management solution for network administrators." Viewers can easily select geographical areas and time periods of the last 24 hours, 7 days, or 30 days as well as details of each virus or worm. For example, as of 10 March 2002, the top ten infectors worldwide in the previous 30 days were as follows (showing the number of infected computers logged in parentheses) and a brief description of some of the malware types from Trend Micro's links to its comprehensive Virus Encyclopedia:

PE_NIMDA.A-O (233,321) [This is a fast-spreading Internet worm and file infector in pure and original form. It arrives as an embedded attachment, README.EXE file, in an email that has an empty message body and, usually, an empty subject field. It does not require the email receiver to open the attachment for it to execute. It uses a known vulnerability in Internet Explorer-based email clients to execute the file attachment automatically. This is also known as Automatic Execution of Embedded MIME type. The infected email contains the executable attachment registered as content-type of audio/x-wav so that when recipients view the infected email, the default application associated with audio files is opened. This is usually the Windows Media Player. The embedded EXE file cannot be viewed in Microsoft Outlook.]

WORM_SIRCAM.A (113,409) [This Worm is a high-level program created in Delphi that propagates via email using SMTP commands. It sends copies of itself to all addresses listed in an infected user's address book and in temporary Internet cached files. It arrives with a random subject line, and an attachment by the same name. This Worm also propagates via shared network drives.]

PE_NIMDA.A (74,724) [

PE_MAGISTR.B (64,199) [This variant of PE_MAGISTR.A has polymorphic capabilities. It obtains email addresses from *.WAB, *.DBX, and *.MBX files found in the infected system's disk and then sends emails with its infected files as attachments. It may also include non-viral files such as .DOC, .GIF, and .TXT files as attachments to the emails it sends out.This destructive variant trashes the Hard Drive and deletes certain files.]

PE_FUNLOVE.4099 (56,146) [This virus infects all Win32 type Portable Executable (PE) files such as .EXE, .SCR, and .OCX in both Windows 9x and Windows NT 4.0. platforms. It searches for all Shared Network Folders with write access and then infects the files within them. To infect NT system files, the virus patches the integrity checking.]

PE_NIMDA.E (46,722)

PE_MAGISTR.A (37,346)

WORM_BADTRANS.B (36,157) [This memory-resident Internet worm is a variant of WORM_BADTRANS.A. It propagates via MAPI32, has a Key Logger component, and arrives with randomly selected double-extension filenames. It does not require the email receiver to open the attachment for it to execute. It uses a known vulnerability in Internet Explorer-based email clients (Microsoft Outlook and Microsoft Outlook Express) to automatically execute the file attachment. This is also known as Automatic Execution of Embedded MIME type.]

JS_EXCEPTION.GEN (31,733) [This Java Script (JS) Trojan changes the infected user's Internet Explorer startup page. One of this Trojan's samples (Coolsite samples) is a mass-mailer. It exploits security vulnerabilities in the Microsoft Virtual Machine. Some variants have non-destructive payloads that change the button caption, modify the appearance of Internet Explorer, and redirect links to a certain Web site.]

WORM.KLEZ.E (28,057) [This destructive mass-mailing worm propagates copies of itself across network drives. Upon execution, it drops two executable files, WINK*.EXE and WQK.EXE, in the Windows System folder. It also creates registry entries that allow it to run at system startup.

This worm terminates processes, and occasionally deletes files associated with certain antivirus programs. On the sixth (6) day of every odd-numbered month (January, March, May, July, September, November) it overwrites files with the following extensions: TXT, HTM , HTML , WAB , DOC , XLS , CPP , C , PAS , MPEG , MPG , BAK , MP3 , JPG.]

2002-07-18 **antivirus malware homeland defense**

NewsScan

BE PATRIOTIC -- UPDATE YOUR PC SECURITY SOFTWARE!
Keeping your home computer's anti-virus software isn't just good maintenance -- it's downright patriotic, says Richard Clarke, computer security adviser to President Bush. "Every American relies upon cyberspace and every American has to do something to secure their part of cyberspace," says Clarke, who's planning to unveil a national plan to protect cyberspace on Sept. 19. The plan, which is being hashed out among government officials with input from technology firms, will serve as the Internet component of the overall national strategy for homeland defense. It will include recommendations in five categories: home and small-business users; major corporations; "sectors" like banking, utilities and government; national issues; and global Internet users. 2002-11-01 **adaptive response anti-malware quarantine database prototype**

NewsScan

SOFTWARE REPAIRS DAMAGE WHILE SYSTEMS WORK
Researchers at Pennsylvania State University have developed software that can quarantine malicious commands and repair any damage that's been done to a system, while the database continues to process transactions. "We can't prevent attackers from getting in, but with this technology, the database can heal itself on the fly? The database can adapt its own behavior and reconfigure itself based on the attack," says Dr. Peng Liu, who heads up the Penn State team. The Cyber Security Group and the U.S. Air Force are testing a prototype of the software, which is not yet commercially available. Several large database vendors have begun offering self-healing systems, but analysts say the Penn State effort is the most advanced so far. "There are various tools that can detect anomalies, but they simply generate a report or display that calls someone's attention to it," says an IDC analyst. "The interesting part of the (Penn State) research? is the ability to automatically respond to the attack." (CNet News.com 31 Oct 2002)

2002-11-26 **antimalware control bandwidth reduction throttle limitation spread response time worm e-mail**

NewsScan

ANTIVIRUS TOOL THROTTLES DOWN ON INFECTION RATE
Matthew Williamson, a researcher at the Hewlett-Packard labs in the UK, has developed a new approach to battling computer viruses. It slows down the infection rate significantly by limiting the number of connections at any one time by an infected computer. "The major problem with computer viruses is that because they spread so quickly and our response is so slow, they cause so much damage," says Williamson. "We are tackling the fundamental nature of a virus? When your machine gets an e-mail virus, it sends lots and lots of e-mail messages at a much higher rate than you would normally send them. So if I put a limit on the rate of e-mail messages that you can send in every 10 minutes, then a virus trying to send 100 or 200 messages will very quickly get delayed." Williamson found that using the "throttle" technique has a negligible impact on the day-to-day performance of his computer. (BBC News 26 Nov 2002)

2004-06-18 **hack-back systems retaliations iSIMS Symbiot Security**

NewsScan

ATTACKING THE ATTACKERS: MAYBE NOT A GOOD IDEA

A company called Symbiot Security has created "Intelligent Security Infrastructure Management Systems" (iSIMS) that not only provide traditional defensive measures against viruses, worms, and other kinds of network vandalism -- but also offer the victims of vandalism a gradual escalation of
retaliation measures. These include the ability to flood the attacking computers with data. However, some experts say that retaliatory actions could be a very bad idea. Adrian Vanzyl of the security firm Seclarity comments: "So you are in effect breaking into each of those systems as you follow this person back. Are you legally liable for that? It's a very, very good question." And Dorothy Denning, professor of defense analysis at the Naval Postgraduate School, warns: "We've seen worms that have had major impact like causing delays in airline schedules, shutting down ATM machines, 911 systems and so on. Putting any kind of worm out there would be dangerous." (AP/San Jose Mercury News 18 Jun 2004)

2005-01-14 **Microsoft anti-virus malware Stephen Cobb Chey Cobb**

NewsScan;

SAFE & SOUND IN THE CYBER AGE

"Microsoft the Security Company?"
by Stephen Cobb and Chey Cobb

Ever wonder why car companies don't make tires? A new Porsche doesn't come with Porsche tires even though Porsche engineers are some of the smartest in the world. We recently bought an almost-new Nissan and it came with the original tires, made by Goodyear. Of course, there are close relationships between car companies and tire companies, and they all have to work together on a variety of constantly evolving standards to make sure that the rubber that meets the roads fits the wheels on the wagon, so to speak. What has this got to do with computer security? Some alert NewsScan readers will have guessed already: Microsoft has planted its feet firmly in the computer security business. Now think of Microsoft as the GM of computing (actually a closer approximation of Microsoft's position in the IT world would be a mega-GM that had absorbed Ford, Toyota, Honda, and Daimler Chrysler). In other words, Microsoft makes most of the world's operating system software and most of the world's application software, which together make up the "cars" we are talking about. The safety of those cars, the rubber on the road in our analogy, is currently entrusted to a wide range of companies, big and small, companies like Symantec, Computer Associates, McAfee, Trend Micro, ZoneAlarm, Sygate, Grisoft, et al. These companies make their money selling products that help us to use Microsoft's products without skidding, crashing, or otherwise going off the virtual highway. For the most part they manage to perform this function without negatively impacting performance or the usability of our systems, while constantly evolving to meet new threats, many of which arise from defects in the very car they ride on, Microsoft's Windows OS and Office applications. However, through a series of recent announcements, Microsoft has indicated that it would like a slice of the revenue these security companies earn from protecting users of Microsoft products. Some Wall Street analysts have declared that this is a good move for Microsoft, and bad news for all those security companies that will lose market share to Microsoft. Given the slavish, sheep-like manner in which some investors follow the words of Wall Street analysts, it could indeed be good news for Microsoft, a sort of self-fulfilling investment prophecy, until the world wakes up to what a bad idea it is for Microsoft to make the tires for its cars. The last time Microsoft tried this, the results, for users, were dismal. Of course, these days it is hard to find a Wall Street analyst with a memory longer than the last four quarters, so you probably won't see many references to Microsoft's 1993 vintage Anti-Virus for DOS in current discussions of Microsoft's security ventures (but you can find a very detailed critique of the product, written about ten years ago by the late Yisrael Radai of the Hebrew University of Jerusalem, at cobb.com/pclan, or just Google "MSAV"). We would like to quote from the first paragraph of this review: "The very fact that such software [Microsoft AV] is supplied with DOS makes it likely that it will become one of the most widely used AV packages in the world and the de facto standard, regardless of its quality. Precisely for this reason, it will be specifically targeted by virus writers. If there are any weaknesses whatsoever in the software, they will be ruthlessly exploited by these people." In fact, Microsoft's implementation of anti-virus back then was so bad it never gained traction in the market place, but that does not undermine the serious implications of Mr. Radai's very astute observations. During the last ten years Microsoft has become more effective at forcing its software on users -- flaws and all (you will know this if you have ever tried to remove Internet Explorer from your Windows computer). Of course, today's malicious code writers frequently target products by Symantec, McAfee, et al. But the very fact that there is still an "et al." provides a depth of protection that will be eroded by any further expansion of Microsoft into the security arena. Perhaps the best outcome will be a repeat of the Firefox phenomenon, in which increasingly sophisticated users decide that the best way to deal with systemic security flaws in Microsoft's browser is to use a different browser. This has already produced a significant decline in market share for Internet Explorer. Heck, with Apple now selling a very powerful Mac for less than $500, complete with cool applications like Garage Band and Appleworks, some people may decide to drive the Internet highway in a completely different vehicle, on tires of their own choosing. [Chey Cobb, CISSP, wrote "Network Security for Dummies" and has provided computer security advice to numerous intelligence agencies. Her e-mail address is chey at soteira dot org. Stephen Cobb, CISSP, wrote "Privacy for Business" and helped launch several successful security companies. He can be reached as scobb at cobb dot com.]

2005-02-08 **Microsoft acquire antivirus maker Sybari Software viruses worms threats security Romanian company GeCAD Software Giant Software Company business technology**

EDUPAGE; http://www.nytimes.com/2005/02/09/technology/09soft.html

MICROSOFT TO ACQUIRE ANTIVIRUS MAKER

Microsoft has announced plans to acquire privately held Sybari Software, maker of software that protects against viruses, worms, and other threats. Microsoft has purchased other companies as part of its efforts to increase security, including a Romanian antivirus company, GeCAD Software, in 2003 and antispyware maker Giant Software Company in December of last year. Mike Nash, corporate vice president in Microsoft's security business and technology unit, said that with the latest purchase, Microsoft will begin offering stand-alone antivirus products. He said the company would soon offer a product based on Sybari technology and geared toward business customers. Other products designed to protect PCs from Web-based attacks will follow, though Nash did not provide a time frame for those applications.

2005-02-16 **Bill Gates IE anti-spyware conference security Microsoft Internet Explorer browser flaws operating systems**

EDUPAGE; http://online.wsj.com/article/0,,SB110848565696255359,00.html

GATES PROMISES NEW IE, FREE ANTISPYWARE

Speaking at a computer-security conference in San Francisco, Microsoft Chairman Bill Gates outlined a number of steps the company will take to address growing security concerns over its products. This summer, Microsoft will release a test version of Internet Explorer 7, the first major update of its browser in four years. Microsoft's browser has been the target of strong criticism for its security flaws. Gates said IE 7 will include antispyware tools for no extra cost, though other officials from Microsoft said the company would offer a paid subscription service to help consumers "manage" antispyware efforts. Gates also said the company would offer a range of antivirus products by the end of the year, which is later than many analysts had expected. Officials from competing computer-security companies said Microsoft's offering similar products by itself is not a source of great concern; rather, it is Microsoft's ability to bundle such tools with its operating systems that worries them. Gregor Freund, chief technology officer at Check Point Software, said if Microsoft bundles spyware with Windows, it is "playing a game that no one else can play." MAJOR DAMAGE CAUSED BY BAD UPDATE FILE FOR TRENDMICRO ANTIVIRUS

TrendMicro released a defective antivirus update file on 23 Apr 2005 that was picked up automatically by many users in Japan. The bad file caused a CPU loop that consumed 100% of the processor time on Windows XP SP2 and Windows 2003 Server systems. Effects reported to RISKS by Chiaki Ishikawa included (as examples of many others)

- JR railway reservation division could not check the reservation status (fed via network to PCs?) and so diverted (telephone) inquiring customers to manned counters at railway stations;

- Kyodo wire service could not send out automatic wire service news for a few hours, and so resorted to send out important news via FAX (I believe that the initial news articles from Kyodo was sent in this manner);

- Osaka subway system saw its computer to distribute accident information to its stations failed to reboot; and

- Toyama city's election committee could not handle advance voting for its mayoral and city alderman elections on their computer and had to resort to manual processing.

SECURITY TOOLS FACE INCREASED ATTACK ACCORDING TO RESEARCH GROUP

As the pool of easily exploitable Windows security bugs dries up, hackers are looking for holes in security software to break into PCs, Yankee Group analysts said in a research paper published Monday, June 20. According to the Yankee Group, software makers of ubiquitous antivirus products have not yet been forced to acknowledge and fix potential problems in their code. Microsoft's Windows operating system has been a favorite target of hackers, but new security flaws are being discovered in security products at a faster rate than in Microsoft's products, the analysts wrote. Symantec, F-Secure and CheckPoint Software Technologies are among the vendors that have seen a rise in the number of security issues that affect their products in the past years and the Yankee Group predicts a "rising tide" of vulnerabilities will soon be found in security products. Yankee Group findings: http://www.yankeegroup.com/public/news_releases/news_release_detail.jsp?ID=PressReleases/news_06202005_FearandLoathing_P R.htm

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2144149/rootkits−turn−prof essional

ROOTKIT CREATORS TURN PROFESSIONAL

Security experts are reporting a surge in the level of professionalism and commercialization in the creation of rootkits, a tool that helps worm authors slip past malware detection tools. Antivirus vendor F-Secure has reported that it has detected a new rootkit designed to bypass detection by most of the modern rootkit detection engines. Traditionally a rootkit would be designed to evade only one security product, such as Symantec's or F-Secure's antivirus scanners. Allen Schimel, chief strategy officer at StillSecure, a developer of intrusion detection, vulnerability management, and network access control applications, says "These rootkits just cranked it up a notch in their ability to evade multiple antivirus products." Schimel also warns that if these tools are effective in penetrating a computer's defenses, more worm authors are likely to start using them. The version of the rootkit detected by F-Secure is called Golden Hacker Defender.

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4669304.stm 23

FIVE COMPANIES COOPERATE AGAINST SPYWARE

A group of computer security companies is cooperating on an initiative to help consumers combat the growing problem of spyware, which is estimated to be increasing by 50 to 100 percent per year. ICSA Labs, McAfee, Symantec, Thompson Cyber Security Labs, and Trend Micro will initially offer tools that will help users identify spyware on their systems and effectively remove it. That effort will involve developing a common naming scheme for malicious programs and a coordination of various removal tools. Later, the five members of the group will work on tools that can help users avoid spyware in the first place. A related effort called Stop Badware was announced recently by Google, Sun Microsystems, the Berkman Center for Internet and Society, and the Oxford Internet Institute.

NEW SAFETY NET FOR WEB SURFERS.

A fresh approach to "safe surfing" has been dreamt up by a group of Massachusetts Institute of Technology engineers involved in a crusade to make the Internet a safer place for their friends and families. The result of their labors is a product called SiteAdvisor which labels particular Websites with a color-coded security rating to help users identify those that might contain spyware, spam, viruses, and online scams. The millions of Websites on the Internet are trawled using sophisticated computer "robots" that can intelligently analyze the safety of a given destination. The tool then presents its findings alongside search engines such as Google, Yahoo! or MSN and labels results as either green, yellow or red. SiteAdvisor: http://www.siteadvisor.com/preview/

MCAFEE ANTIVIRUS UPDATE WREAKS HAVOC.

A faulty antivirus update from McAfee Inc. that mistakenly identified hundreds of programs as a Windows virus has resulted in some companies accidentally deleting significant amounts of data from affected computers. The McAfee update (DAT 4715) released on Friday, March 10, was designed to protect computers against the W95/CTX virus. But because of a programming error, the update also incorrectly identified, renamed and quarantined hundreds of legitimate executables. For companies that had configured their McAfee antivirus program to automatically delete bad files, the error resulted in the loss of hundreds, and in some cases even thousands, of files on systems in which the update had been installed, said Johannes Ullrich, chief technology officer at the SANS Internet Storm Center in Bethesda, MD. McAfee released a new patch (DAT 4716) updating the earlier one, five hours later.

2006-04-21 **Symantec Scan Engine multiple vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/archive/1/431734 23

SYMANTEC SCAN ENGINE MULTIPLE VULNERABILITIES.

Three vulnerabilities have been discovered in the Symantec Scan Engine. The Scan Engine is a TCP/IP server and programming interface that enables third parties to incorporate support for Symantec content scanning technologies into their proprietary applications. This gateway-level product should not be confused with Symantec's desktop product. Analysis: The Symantec Scan Engine fails to properly authenticate Web-based user logins. Anyone with knowledge of the underlying communication mechanism can control the Scan Engine server. Symantec Scan Engine uses a static private DSA key for SSL communications. This key cannot be changed by end users and is easily extracted. This opens the product to a potential man-in-the-middle attack. Products affected: Symantec Scan Engine 5.0. Solution: Symantec Engineers have verified these issues and have added fixes to the latest product update (5.1). Symantec strongly recommends all customers immediately apply the latest updates for their supported product versions to protect against these types of threats. Symantec Scan Engine updates are available through the Platinum Support Website for Platinum customers or through the FileConnect-Electronic Software Distribution Website for all licensed users. Platinum Support Website: https://www-secure.symantec.com/platinum/login.html FileConnect: https://fileconnect.symantec.com/licenselogin.jsp Symantec April 21, 2006 advisory: http://www.symantec.com/avcenter/security/Content/2006.04.21 .html

U.S. DOE SAYS COOKIES AREN'T BAD FOR YOU
The U.S. Department of Energy's Computer Incident Advisory Capability has issued an information bulletin stating that privacy advocates' fears over the use of cookies — a popular technique for tracking Web site visitors — are unfounded. The claims that Web cookies may be used to gather information on "passwords, credit card numbers, and a list of the software on your computer" is not even "close to the truth," according to the bulletin. In fact, information that is gathered via cookies — usually a user's numerical Internet address, browser type and operating system — can also be recorded in a Web server's log files. "Cookies just make it easier. [A server] cannot find out your name or e-mail address, or anything about your computer using cookies," says the bulletin. (TechWeb 16 Mar 98)

PRIVACY FOUNDATION SLAMS "WEB BUGS"
The Denver-based Privacy Foundation . . . [said] that documents created with software that uses a hotlink shortcut to include images stored on a remote computer could be rigged to "phone home" to another computer and report where and how often a document is read. The technique, known as a "Web bug," is used in Microsoft word processing and spreadsheet applications, but is also found in other companies' software that uses automatic links to Web pages. "Because a linked Web image must be fetched from a remote Web server, the server is in a position to track when a Word document is opened and possibly by whom," says Privacy Foundation chief technology officer Richard Smith, who adds that there is no evidence anyone has exploited the arrangement. Web bugs can be as small as a single pixel, making them nearly invisible, says Smith. "In most cases, the reader of a particular document will not know that the document is bugged, or that the Web bug is surreptitiously sending identifying information back through the Internet." Microsoft program manager Eric Schultze says, "These [concerns] are not in any way specific to Microsoft or any other vendor, they are Internet issues. This could happen on any Web-enabled application or on any vendor's operating system." (Reuters/San Jose Mercury News 31 Aug 2000)

SPYWARE SECURITY BILL RESURFACES
U.S. Senator John Edwards (D-NC) has reintroduced legislation that would protect the privacy of individuals from software that monitors their surfing habits. The Spyware Control and Privacy Protection Act was originally filed in October 2000, but Congress failed to take action on it. The Act mandates that companies that use codes to track the activities of Internet users would have to notify Web site visitors of their surveillance actions in plain language. Businesses that gather data would be required to let users know what information has been gathered, provide a way to correct errors, and safeguard the data against unauthorized access by hackers. THE COLORS OF PRIVACY
Be careful what you ask for: you may just get it (more or less). Privacy advocates put continuous pressure on Microsoft to pay careful attention to privacy concerns, but many Web publishers are now unhappy with Microsoft's implementation of the Internet Explorer 6.0 browser, which seeks to discourage third-party tracking abuses by blocking third-party "cookies" unless the third party's privacy policy meets strict standards. Third parties are required to put their policy into the P3P ("platform for privacy preferences") protocol specified by the World Wide Web Consortium, but there are vastly different levels of compliance with that standard, and there is worry that publishers will put a great deal of work into complying with Explorer's implementation of the standard, and then learn that Microsoft has decided to change the standard with the next software release. Carl Fischer of iVillage says, "Our legal department has been working on this for months. And Microsoft can just change its standards down the line. They're imposing a one-size-fits-all rule for hundreds of different privacy policies. Why should that be up to Microsoft?" (New York Times 14 Oct 2002)

2003-11-19 **Spyware UK ThreatLab Clearswift recording confidential data anti-spyware Ad-Ware Pest Patrol**

NewsScan

SPYWARE IN THE CROSSHAIRS
After several years of mounting concern, worries over "spyware," which surreptitiously deposits information-stealing software on computers, are coming to a head. Last summer, a corporate IT manager's nightmare came true when an e-mail sent to a British credit card and finance company carried a secret software program capable of recording confidential corporate data and sending it over the Net. "The good old days of script kiddies and geeks are well gone," says Pete Simpson, manager of the ThreatLab division of U.K. security firm Clearswift. "These are criminal gangs, and the motive is clearly profit." In response to the growing threat, legislation has been introduced in Congress that would outlaw both corporate spyware and the annoying kind that comes bundled with free software programs such as Kazaa and is used to deliver advertising. But in a report released Tuesday, the Center for Democracy and Technology argued against any legislation that specifically targets spyware, noting that most of the worst software-spying practices are already illegal. Rather, consumers would be better served by a broad-ranging privacy bill that would force all software programs to give clear notice when they are collecting information and give consumers the option to turn them off or easily uninstall them. Meanwhile, the Consortium of Anti-Spyware Technology Vendors, led by the creators of the spyware-battling Ad-Aware and Pest Patrol software programs, is developing standard definitions of "spyware," "adware," and other annoyances in an effort to present "best practices" recommendations to companies hoping to avoid being blocked by their software. 2004-02-04 **spyware insidious software detector Trojan horse SpyBan**

NewsScan

DOUBLE-AGENT SPYWARE

It turns out that at least one spyware program purporting to identify and delete unwanted advertising software actually installs its own spyware software on the unsuspecting user's computer. SpyBan has been singled out for such nefarious behavior by several competing anti-spyware companies: "I classified SpyBan as a Trojan Horse, since it gives the impression that it will protect your privacy, but does the opposite — it installs spyware," says a spokesman for Sweden-based Kephyr.com. The software allegedly leaves behind a program called Look2Me, which has been identified by Symantec as a spyware application: "Look2Me is a spyware program that monitors visited Web sites and submits the logged information to a server." The SpyBan Web site was shut down after reporters started snooping into its activities, but a trace of the company's domain name indicated the site was hosted at the same address as NicTech Networks. Experts say spyware and adware software can be difficult to track down because it's designed to "hide" on the user's PC. "I doubt anyone knows precisely what these things do, apart from the authors," says a researcher for PestPatrol, a legitimate anti-spyware outfit. "They are really complex. Viruses are easy compared to these things." (CNet News.com 4 Feb 2004)

2004-03-02 **anti-spyware bill SPYBLOCK**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A23307-2004Mar2.html

SENATE BILL TARGETS SPYWARE

U.S. Senators Ron Wyden (D-Ore.), Conrad Burns (R-Mont.) and Barbara Boxer (D-Calif.) are backing a bill dubbed the "SPYBLOCK" Act, which would make it illegal to use the Internet to install software on people's computers without their consent, and would require companies that offer software downloads to provide more information about what the programs do and what information they collect. The bill also would require ads generated by spyware or adware programs to be clearly labeled as such. "Computer users should have the security of knowing their privacy isn't being violated by software parasites that have secretly burrowed into their hard drive," says Wyden. Spyware has been around for years, but as its sneaky code has reached out to touch more users, the tide of public sentiment has now turned against it. "The major concern here is user control and transparency," says Ari Schwartz, associate director for the Center for Democracy and Technology. "We've found that many consumers do not understand what they're getting themselves into when they download software." Some skeptics say this latest effort is likely to be every bit as effective as the preceding CAN-SPAM Act, which many computer experts say has done little to curb the deluge of spam flooding consumers' in-boxes. "If you apply the mailbox test, the spam law hasn't had a significant effect. It would be nice to see the spam law working as intended before we say we want to follow the same route with spyware," says one attorney. (Washington Post 2 Mar 2004)

2004-03-04 **legislation US Senator spyware insidious software SPYBLOCK act law**

NIPC/DHS

March 02, Washington Post — Senators try to smoke out spyware.

Three U.S. senators are tackling the growing problem of "spyware," software programs that track what people do online, alter their Web browser settings and turn their computers into unwitting Internet advertising generators. The "SPYBLOCK" Act, which was introduced late last week, would make it illegal to use the Internet to install software on people's computers without their consent, and require companies that offer software downloads to provide more disclosure about what the programs do and what information they collect. The bill also would require Internet ads generated by the software to be clearly labeled. The bill would allow states to sue violators in federal court and would call on the Federal Trade Commission to impose fines and civil penalties under consumer protection laws. The bill probably will not cut down on the worst kinds of spyware -- programs that exploit computer security flaws to hijack Internet connections or install "dialer programs" that force the computer to call expensive online 1-900 adult services -- said Stewart Baker, an attorney in Washington, DC. In that sense, Baker said, it is a lot like the CAN-SPAM Act, which many experts said has done little to combat the problem of unsolicited bulk e-mail since it became law in January. The commission is scheduled to hold a public workshop on spyware, adware and other software on April 19.

Category 28.1 *Spyware, Web bugs & cookies*

2004-03-25 **spyware insidious software spam e-mail definition US Senator Kazaa**

NIPC/DHS

March 23, Reuters — Senators struggle to define computer spyware.

Programs that secretly track computer users' activities are becoming an online scourge rivaling "spam" e-mail and should be outlawed before they prompt consumers to abandon the Internet, members of the Senate communications subcommittee said Tuesday, March 23. But a bill sponsored by committee members will need to define the problem precisely to avoid outlawing pop-up ads and other annoying but essentially harmless technologies, consumer and business advocates said. Like the congressional debate about "spam" e-mail last year, much rests on the definition of what constitutes legitimate marketing activity and what should be outlawed. Some online advertisers and song-swapping networks like Kazaa place programs on users' computers to monitor their activity, or harness their processors for other activities. Other programs secretly track users' keystrokes to lift passwords and credit-card numbers, or sell "fixes" for software problems they create. A bill sponsored by Sen. Conrad Burns (R-MT) would require companies to obtain permission before installing a piece of software on a consumer's computer, and provide an easy way for the consumer to remove the software if he wished.

CHALLENGE TO UTAH'S NEW ANTI-SPYWARE LAW

A new Utah law called the Spyware Control Act (banning the practice of imposing pop-up ads on Internet users as they surf the Web) is being challenged in a federal lawsuit filed by the New York advertising company WhenU.com Inc., which argues that the law violates a constitutionally protected right to advertise. WhenU provides users with free software such as games and screen savers that come with a separate program, SaveNow, that tracks Web traffic and matches a user's surfing habits with particular advertisers. WhenU says its software is installed only with permission and doesn't invade privacy. (AP/San Jose Mercury News 13 Apr 2004)

2004-04-13 **home user PC infested spyware insidious software**

DHS IAIP Daily; http://news.bbc.co.uk/2/hi/technology/3633167.stm

April 16, BBC News (UK) — PCs 'infested' with spy programs.

Internet provider EarthLink says it uncovered 29.5 million examples of spyware on over one million computers scanned between January and March. These are parasite programs sometimes come attached to software downloaded from the Web. The details are often included in the license agreement small print that most users click through without reading. But sometimes they do not even need your permission to download, but just bury themselves on a hard drive as you browse the Internet. EarthLink said the most common type of spyware it found was adware. These are programs that displays ads on an infected computer and also sends data about surfing habits. But it also found examples of more insidious spyware. "It's disturbing that over 300,000 of the more serious system monitors and Trojans were uncovered," said Matt Cobb of EarthLink. System monitors can surreptitiously watch what you do, steal personal information and despatch it across the web, while Trojans can allow malicious hackers to get access to a computer and steal information.

2004-04-18 **spyware targetted Federal Trade Commission FTC**

NewsScan

FTC TARGETS SPYWARE

The Federal Trade Commission, which championed the anti-spam legislation recently enacted by Congress, now has another Internet scourge in its sights: spyware. The agency is sponsoring a workshop today to study technical and regulatory responses to spyware, but officials caution that legislation is unlikely to be passed this year. Adware (the most common type of spyware) usually piggybacks on other programs -- most notably music file-sharing or screen-saver software -- and then tracks users' Web surfing habits, relaying that information to ad companies that then bombard the user with pop-up ads. More malicious versions of spyware track keystrokes in order to steal credit card information or identity. House and Senate bills would require users' clear consent before downloads, but FTC bureau director Howard Beales says such approaches could prove cumbersome: "The question is whether there's a way to draw a workable line. If you download a set of (updates) for Windows, it comes with a bunch of different programs. You don't want to have to go through this every time." (USA Today 18 Apr 2004)

2004-04-19 **spyware legislation slowed market-based solution insidious software user unaware**

NewsScan

A GO-SLOW APPROACH TO SPYWARE LEGISLATION

Spyware (the generic term for software that is surreptitiously downloaded onto PCs when users are engaged in some activity such as instant messaging or surfing for music or games) comes in two major varieties: the relatively innocuous "adware" that places advertisements on people's computers, and the more insidious kind that capture user keystrokes in order to steal passwords or other private information. The Internet security firm McAfee says the number of "potentially unwanted programs" on its customers' computers grew from 643,000 in September 2003 to more than 2.5 million in March. Still, Commissioner Mozelle Thompson, a member of the Federal Trade Commission, warns against trying to solve the problem with hurried and ill-conceived legislation: "There are some kinds of practices that we may consider unfair or deceptive that we already have existing power to pursue." His alternate solution is for technology companies to develop standards for downloads that would distinguish them from spyware. Marc Rotenberg of the Electronic Privacy Information Center scoffs: "To expect that market-based solutions are going to protect the consumers, I think, is to misunderstand the problem." (Washington Post 19 Apr 2004)

2004-04-19 **Federak Trade Commission FTC industry solutions spyware**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3342471

April 19, eSecurity Planet — FTC urges industry solutions to spyware.

The Federal Trade Commission (FTC) says the solution to the invasive programs generally known as spyware is more likely to be found in better technology solutions and intensive consumer education than in either state or federal legislation. Spyware is vaguely defined and often confused by consumers with adware, which are usually legal and legitimate applications. Consumer and privacy advocates attending Monday's FTC Spyware Workshop were concerned about the growing number of programs that often surreptitiously piggyback on downloaded files; they report back Internet traffic patterns to advertisers and generate unwanted popups. Even when consumers delete the downloaded file, spyware often remains and continues to monitor the user's browsing habits. FTC Commissioner Mozelle Thompson asked industry Internet provider leaders to produce a set of best practices for the use of adware, including disclosure statements to consumers regarding what they are about to download.

2004-05-13 **spyware state laws combating Utah New York California**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A24746−2004May 13.html

May 13, Washington Post — States speed up spyware race.

State lawmakers' eagerness to crack down on Internet "spyware" could force the federal government to move sooner than expected to pass its own law. Only one state--Utah--has an anti-spyware law, but New York and California both are considering proposals. If enough states pass similar laws, businesses say the resulting "patchwork" of conflicting statutes would be almost impossible to obey, adding further pressure on Congress to act. "If the states are busy writing laws and particularly if they're writing inconsistent laws or laws that strongly interfere with certain markets, that certainly would strengthen the case for federal legislation," said Howard Beales, the Federal Trade Commission's top consumer protection official. At an April FTC hearing on 13 spyware, witnesses testified that computer users often don't know how the programs got onto their machines or how to remove them. Any national spyware law probably would preempt various state laws, much like the federal Can-Spam Act preempted tougher anti-spam laws in California and Washington. Beales said that Congress should not let the threat of state laws goad it into passing a poorly written bill.

DHS IAIP Daily; http://www.webuser.co.uk/news/57657.html

August 23, Webuser — Virus spies on surfers.

A new virus, Rbot-GR, that can spy on computer users through their webcam is circulating across the Internet. The Rbot-GR worm, which spreads through shared networks, gives hackers access to the hard drive and secret passwords, as well as the ability to spy on people in their homes and workplaces through their webcams or microphones. Graham Cluley, senior consultant for Sophos said "This takes hacking to a whole new level. If your computer is infected and you have a webcam plugged in, then everything you do in front of the computer can be seen and everything you say can be recorded." Sophos believes that the worm is evidence of a growing trend in spying on innocent computer owners and poorly protected businesses. Users are advised to keep their PC's protected against the latest threats with anti-virus software and firewalls, and unplug their webcam when not using it.

2004-09-02 **Microsoft Windows XP operating system Service Pack 2 SP2 spyware interference update**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A57501−2004Sep 2.html

September 02, Associated Press — Microsoft warns spyware could bungle update.

Microsoft is warning users of the Windows XP operating system to check for spyware before downloading the free massive security update, called Service Pack 2. Barry Goff, a group product manager at Microsoft, said some spyware could cause computers to freeze up upon installation of the update. Spyware, which typically piggybacks with downloaded software such as file-sharing programs, tracks behavior, triggers pop-up ads and can otherwise cause problems on computers. Microsoft recommends that users clean their PCs of spyware and back up their data before turning on the auto update feature that automatically downloads Service Pack 2 (SP2). People who download SP2 also may need to check whether legitimate programs, such as third-party security software, need to be updated. Research firm IDC estimates that about 260 million copies of Windows XP have been sold.

NewsScan; http://news.com.com/From+spam+king+to+spy+master/2100-1032_3-5406348.html

SPYWARE IN FTC'S CROSSHAIRS

The Federal Trade Commission is launching an aggressive new strategy to prosecute "spyware" perpetrators, and last week filed a civil lawsuit against former spam-king Sanford Wallace and his companies, Seismic Entertainment Productions and SmartBot. Wallace, who was once dubbed "Spamford" for his earlier misdeeds, operates the PassItOn.com Web site, which requires visitors to click through multiple pop-up windows in order to exit. In an interview with CNet last year, Wallace defended his practice of collecting personal information from people who visited his site: "We don't violate anybody's privacy; everything is disclosed. We're giving something away for free in exchange for consumers' permission to use private information. It's no secret. Publishers Clearinghouse has been doing this type of thing for years." However, an FTC investigator says Wallace's actions go far beyond informationgathering, by changing the home page of her Internet Explorer browser and using programming code to pop open the CD drive in her computer while displaying a message saying, "If your cd-rom drive opens… you desperately need to rid your system of spyware pop-ups immediately." Of course, the site then offers to sell a product called Spy Deleter. Anti-spyware activist Ari Schwartz says the FTC has "built a good case. This fits into the kinds of cases where FTC could get their feet wet on this issue."

2004-10-18 **spyware adware proxy servers blocking installation prevention screening**

NewsScan; http://online.wsj.com/article/0 (sub req'd)

NEW SOLUTIONS TO SPYWARE INVASION

Two companies have just released software programs aimed at eliminating the scourge of spyware. Blue Coat Systems, which specializes in proxy servers, is enhancing its security service with spyware- and adware-blocking software. It estimates that its product can prevent 98% of such unwanted programs from being installed. Webroot Software boasts a similar success rate with its anti-spyware software, which is installed directly on users' PCs. These two new products are notable because, while there are many products on the market that can remove spyware and adware from users' PCs, these two prevent their installation in the first place. Meta Group analyst Peter Firstbrook predicts that what ultimately will evolve is a "layered" defense system that combines centralized screening tools plus desktop software, similar to what's happened in the antivirus software market.

NEW AD SERVICE TRACKS SURFING HABITS, MAINTAINS PRIVACY

Tacoda, based in New York, is touting its new online marketing service, which directs ads to Web site visitors based on their surfing history. No personal information is sought or collected -- AudienceMatch simply traces the path of a single computer through its network of 60 Web sites, using a cookie. "This is different than what DoubleClick was trying to do," says Tacoda CEO David Morgan. "This system uses no personally identifiable information, and no data is shared between publishers. Privacy is one of the biggest issues that will drive the success of this." Tacoda's Web network comprises 60 publishers that are visited by some 100 million people monthly, or about 75% of the U.S. Internet audience. Morgan compares AudienceMatch to Google's AdSense program, which allows marketers to bid for the right to position their text messages next to stories that have a related "theme." With AudienceMatch, however, advertisers bid not on keywords, but on preset groups, like "gadget geeks," or "car buyers." Gartner analyst Denise Garcia says AudienceMatch "enables advertisers to reach a lot more people with targeted ads, which, for them, is the next big wave." (New York Times 15 Nov 2004)

ONLINE MARKETER AGREES TO HALT SPYWARE DURING LITIGATION

Alleged spyware kingpin Sanford Wallace has agreed to stop distributing spyware pending the resolution of charges filed against him and two of his companies by the Federal Trade Commission (FTC). In October, the FTC charged Wallace with deceptive trade practices, saying that Wallace's companies, Seismic Entertainment Productions and SmartBot.Net, distributed software that was secretly installed on users' computers. The software would cause problems on computers where it was installed and would then display pop-up ads for programs to remove the spyware. Under an agreement filed with the U.S. District Court in New Hampshire, Wallace, who does not admit guilt, does agree to halt the practice of secretly installing spyware while the litigation is proceeding. Wallace and his companies are still allowed to display pop-up ads.

SPITZER FILES SUIT AGAINST MARKETING FIRM FOR SPYWARE

New York Attorney General Eliot Spitzer has filed suit against California-based Intermix Media for installing spyware on millions of computers. The marketing company, which conceded that previous owners indeed distributed spyware, is accused of violating state laws concerning false advertising, deceptive business practices, and trespassing. The state is seeking injunctions barring the company from distributing any more spyware; an accounting of revenues the company realized from the spyware; and fines of $500 for each act of installing spyware. A statement from the company said that it voluntarily stopped installing spyware recently and that no personal information was ever collected with the secretly installed software. The statement hinted at trying to reach a settlement with New York, a resolution that observers said is a typical outcome of situations like this one. DHS IAIP Daily; http://www.nytimes.com/2005/04/29/nyregion/29internet.html

NEW YORK SUES CALIFORNIA INTERNET COMPANY ON USE OF SPYWARE

A broad investigation into Internet abuses led the New York attorney general to file a lawsuit on Thursday, April 28, accusing a California company of clogging computers across the nation with secretly installed spyware and adware, which can vex users and impede the flow of commerce on the Web. The attorney general, Eliot Spitzer, sued Intermix Media, a large Internet marketing firm, accusing it of embedding "several types of invasive and annoying" programs on its Web domains that can pop up, route users to unwanted sites or link them to Intermix's services and clients. In recent years, companies have tried to sneak what consumer advocates call parasitic software into computers that tracks users' browsing habits, but government inquiries into such practices have been rare, said Ben Edelman, a Harvard University researcher who studies spyware. An official with Intermix, in a statement posted on Thursday on the company's Website, said that the company neither promoted nor condoned spyware, and that many of the practices being challenged by Mr. Spitzer began under the company's previous leadership.

DHS IAIP Daily; http://tech.nytimes.com/cnet/CNET_2100−7349_3−5750601.html

SPYWARE AND ADWARE IN BITTORRENT DOWNLOADS

Purveyors of the applications that produce pop-up ads on PC screens and track browsing habits have discovered BitTorrent as a new distribution channel. BitTorrent has grown into one of the most widely used means of downloading files such as movies or software. According to observers of the trend, videos and music that hide adware and spyware are increasingly being offered for 11 download on various BitTorrent Websites. Both spyware and adware are known to hurt PC performance because they use PC resources to run. Alex Eckelberry, president of Sunbelt Software, a maker of anti-spyware software stated: "[This] is a major concern. It is going to riddle your system with pop-ups, slow your system down and potentially cause system instability." The downloaded files typically were self-extracting archives that would also install the unwanted software, said Chris Boyd, a security researcher who runs the Vital Security Website. In most cases, users would be presented with a dialog box advising that the extra software was about to be installed and given the impression that the install was needed to get access to the desired content, he said.

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1829174,00.asp

DRIVE-BY DOWNLOAD SITES CHAUFFEUR SPYWARE

Increasingly, spyware is making its way onto users' systems through so-called drive-by-download sites using nefarious methods that circumvent disclosure. One example is iFrameDollars.biz, which claims to be a Website affiliate company just for drive-by sites, using a model similar to aboveboard affiliate networks such as Commission Junction and LinkShare. The Website's "Terms" page says that iFrameDollars.biz pays 55 cents per install or $55 for 1,000 unique installs of a three KB program that "changes the homepage and installs toolbar and dialer." Website operators interested in joining the iFrameDollars.biz network must submit a URL for their Websites, an estimate of their daily traffic and the account number for an online payment service such as E-gold. In exchange, they are sent a small piece of HTML code containing the iFrame exploit, which the site owners are expected to attach to their pages. Web surfers who visit those pages using vulnerable versions of Windows or Microsoft Corp.'s Internet Explorer Web browser have iFrameDollars.biz's programs silently installed. In addition to distributing malicious code and adware through its affiliates, iFrameDollars.biz uses pop-up messages to tempt users into buying nonexistent software programs, taking a cut of any sales.

2005-07-12 **spyware Anti-Spyware Coalition definition**

EDUPAGE; http://news.com.com/2100-1029_3-5783926.html

COALITION TO RELEASE SPYWARE DEFINITION

The recently created Anti-Spyware Coalition is set to release a definition of spyware. According to officials from the group, the first step toward dealing with the growing problem of spyware and adware is to define very clearly what it is. The group's proposed definition, which the public can comment on until August 12, identifies spyware as software that is installed without adequate notification and that monitors computer users' activities. The group also proposes a broader definition that would include software that interferes with users' abilities to properly control their systems. Critics of the group's definitions argue that makers of spyware and adware stand to benefit the most from such a definition because it clearly delineates what they could do and get away with. After the comment period is closed, officials of the Anti-Spyware Coalition will incorporate the best suggestions into the final definitions. CNET, 12 July 2005

RISKS; http://www.theregister.co.uk/2005/07/25/spyware_screening/ 23 95

SPYWARE GETTING WORSE: VOLUME & STEALTH INCREASING

Outbound spyware transmissions from infested machines accounted for up to eight per cent of total outbound web traffic in pilot tests of a new managed spyware screening service. UK web security firm ScanSafe said the volume of traffic observed during a 10-week pilot test of its Spyware Screening service showed that spyware applications are becoming stealthier in their ability to hide their outbound 'covert' channels among normal web traffic. That's bad news because data sent when spyware "calls-home" can include confidential and even privileged information.

Spyware now accounts for around 20 per cent of web-based threats, which includes other malware such as worms and Trojans, and is still on the increase, according to ScanSafe. The firm said malware such as CoolWebSearch, which hides on an infected client using newly developed root-kit architecture, often evades detection.

2005-10-05 **FTC Odysseus Marketing spyware malicious insidious software distribution anonymous file trading Google Yahoo lawsuit Kazanon**

EDUPAGE; http://msnbc.msn.com/id/9598897/

FTC SUES FOR ALLEGED SPYWARE

The Federal Trade Commission (FTC) has sued Odysseus Marketing, accusing the company of engaging in distributing spyware. Odysseus distributed an application called Kazanon, which supposedly allowed users to trade files anonymously, without fear of being identified by record companies. According to the FTC, users who downloaded the application also got a range of adware programs that fed advertisements to those users' computers and added items to the search results pages of popular search engines, including Google and Yahoo. The added items, which were indistinguishable from those supplied by the search engine, directed users to companies that paid Odysseus for the placement. Further, the software did not offer users a simple option to uninstall it. Walter Rines, owner of Odysseus, disputed all of the FTC's claims. He noted that the user agreement informs consumers of what will be installed when they download the Kazanon program. He also said an uninstall tool is available and that his company's software did not remove any search results but merely added to the list. Rines also said the lawsuit was "moot" because his company stopped distributing adware several weeks ago. MSNBC, 5 October 2005

2005-10-27 **anti-spyware malicious insidious software coalition guidelines**

EDUPAGE; http://news.com.com/2100-7348_3-5918113.html

ANTI-SPYWARE COALITION RELEASES GUIDELINES

The Anti-Spyware Coalition has released a definition of what constitutes spyware, as well as guidelines for dealing with spyware. The group's definition says that spyware is an application installed without sufficient consent of the user and that interferes with the user's ability to exert control over such things as security, privacy and personal information, and system resources. Critics had cautioned that a definition of spyware would allow developers of unwanted software to simply sidestep the characteristics included in the definition, thereby legitimizing their applications. The Anti-Spyware Coalition said it understands that concern and drafted a definition with enough latitude to avoid that problem. The group also identified good practices for how organizations should identify and prevent spyware. Included in the resources is guidance on how to rate the severity of particular spyware applications. The group will accept public comments on the newly released documents until November 27 and will release final versions in early 2006. CNET, 27 October 2005

FEDERAL TRADE COMMISSION SHUTS DOWN SPYWARE OPERATION

An operation that uses the lure of free lyric files, browser upgrades, and ring tones to download spyware and adware on consumers' computers has been ordered to halt its illegal downloads by a U.S. District Court at the request of the Federal Trade Commission (FTC). The court also halted the deceptive downloads of an affiliate who helped spread the malicious software by offering blogs free background music. The music code downloaded by the blogs was bundled with a program that flashed warnings to consumers about the security of their computer systems. Consumers who opted to upgrade by clicking, downloaded the spyware onto their computers. The FTC complaint alleges that the Websites of the defendants and their affiliates cause "installation boxes" to pop up on consumers' computer screens. In one variation of the scheme, the installation boxes offer a variety of "freeware," including music files, cell phone ring tones, photographs, wallpaper, and song lyrics. In another, the boxes warn that consumers' Internet browsers are defective, and claim to offer free browser upgrades or security patches. Consumers who download the supposed freeware or security upgrades do not receive what they are promised; instead, their computers are infected with spyware.

2005-12-01 **Adware company lawsuit high risk label Zone Labs**

EDUPAGE; http://news.zdnet.com/2100-9588_22-5979179.html

ADWARE COMPANY QUIBBLES WITH LABEL

A company that makes and distributes adware has filed a lawsuit against a computer security company that identifies the adware company's products as "high risk." The adware purveyor, 180solutions, contends that Zone Labs erred in saying that some of 180solutions's applications try to monitor mouse movements and keystrokes. Although some of its applications employ a technology that could be used in such a manner, those applications do not in fact work that way, according to 180solutions. Representatives from 180solutions said they tried to explain the situation to Zone Labs but were forced to file the lawsuit when Zone Labs refused to remove the applications in question from its list of high-risk tools. Eric Howes, a spyware researcher at the University of Illinois, said that despite its protestations, 180solutions remains "a perfectly legitimate target for anti-spyware companies." According to Howes, security professionals continue to "find unethical and illegal installations of 180's software." ZDNet, 1 December 2005

E35TOIAV2AUQSNDBECKH0CJUMEKJVN

SITES INSTALLING SPYWARE VIA ZERO-DAY INTERNET EXPLORER BUG,

A still-unpatched Internet Explorer vulnerability that's been used by attackers since late November to compromise Windows PCs is now being used by large numbers of malicious Websites to plant spyware and adware, a security company claimed Thursday, December 8. San Diego-based Websense said in an alert that it's detected thousands of sites connecting to a main malicious URL that's "actively exploiting this vulnerability to execute malicious code," according to the warning. All it takes is a visit to one of the sites with Internet Explorer running on Windows 98, Windows Me, Windows 2000, or Windows XP, to compromise a computer, the warning noted. A bogus warning that the machine is infected with spyware appears and a so-called "spyware cleaning" application launches. That application then prompts the user to enter a credit card number. What's actually installed, however, is real spyware, which then connects to a URL in the .biz domain to download and run more than 10 other programs that install without the user's consent. According to Websense, the .biz domain Website is real, but has been compromised by hackers. It's hosted in the U.S., and is currently still online.

EDUPAGE; http://www.internetnews.com/bus-news/article.php/3575421 23

FTC WINS SETTLEMENT FOR BOGUS ANTISPYWARE SCHEME

The operators of two supposed antispyware products agreed to pay nearly $2 million to settle complaints by the Federal Trade Commission (FTC) that the products amounted to nothing more than a scam. Last year, the FTC charged the operators of Spykiller and Spyware Assassin with running similar schemes to defraud consumers. According to the FTC, both companies used pop-up ads and e-mail to draw consumers to the companies' Web sites, where users could supposedly receive free scans of their machines. After the scans reported spyware, which frequently did not exist, users were offered a spyware-removal service for around $30-40. The removal also did not do what was advertised, said the FTC. In addition, many of the e-mail messages violated provisions of the CAN-SPAM Act. The makers of Spyware Assassin agreed to pay $76,000, which represents the amount the FTC spent on its investigation. Makers of Spykiller will pay $1.9 million.

DHS IAIP Daily; http://www.usatoday.com/tech/news/computersecurity/2006−01−2 5−spyware_x.htm 23

FREE WEBSITE TO LIST PROGRAMS WITH SPYWARE.

A free Website, StopBadware.org, launched Wednesday, January 25, plans to provide a list of programs that contain spyware and other malicious software. It will also identify companies that develop the programs and distribute them on the Internet. Consumers can then decide if a program is safe to download. "For too long, these companies have been able to hide in the shadows of the Internet," says John Palfrey, who heads the Berkman Center of Internet & Society at Harvard Law School and is spearheading the project. "What we're after is a more accountable Internet." The initiative is being run by Harvard and the Oxford Institute and is backed by high-tech heavyweights including Google and Sun Microsystems. Consumer Reports' WebWatch is serving as a special adviser. In addition to spyware, the hit list of the StopBadware coalition includes malicious "adware" programs that serve up onslaughts of pop-up ads or software that contains hidden viruses and worms. By checking StopBadware.org, its organizers say, consumers can choose, in the first place, not to download a program containing the malicious software. The coalition is encouraging consumers to visit the Website to log their experiences with harmful programs. StopBadwar.org Website: http://www.stopbadware.org/

2006-01-25 **new Website malicious software program maker identification Harvard Oxford**

EDUPAGE; http://www.nytimes.com/2006/01/25/technology/25spy.html 23

NEW SITE AIMS TO IDENTIFY MAKERS OF MALICIOUS PROGRAMS

Researchers at Harvard Law School and Oxford University are launching a Web site that will identify organizations that distribute spyware, adware, and other unwanted computer programs, as well as the tactics they employ to intall their applications. StopBadware.org was financed initially by companies including Google, Lenovo, and Sun Microsystems. The site will also include an area where consumers can submit testimonials about their experiences with different software they have downloaded. John G. Palfrey Jr., executive director of the Berkman Center for Internet and Society at Harvard, said, "We want to turn the spotlight on the bad actors, but also give ordinary users a place to go and get an early warning before they download something that might harm their computer." According to the Pew Internet & American Life Project, 59 million U.S. adults said their computers were infected with spyware last year. Data from Consumer Reports indicate that despite consumer spending of $2.6 billion over the past two years on antivirus and antispyware tools, users still spent $3.5 billion in damages over the same period due to unwanted software.

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1963097,00.asp 23

RESEARCHERS WARN OF FAKE ANTI-SPYWARE.

The latest report issued by Finjan's Malicious Code Research Center highlights the growth of several emerging breeds of cyber-attack, including the increasing popularity of so-called "ransomware" and viruses that are being spread via fake anti-spyware applications. The anti-virus software maker's research arm said in its Web Security Trends Report, issued on May 16, that the growth of "rogue anti-spyware" and the emergence of hackers looking to hold stolen corporate data up for ransom are two of the fastest growing trends in the security threat landscape. Virus rootkits continue to pose one of the most prevalent and challenging obstacles for IT administrators to overcome, according to the study. In these attacks, hackers disguise the malware in programs advertised online as free anti-spyware applications. Once downloaded onto a user's computer, the applications may deliver their own payloads of malicious code or expose affected machines to subsequent attacks. In some cases, the false anti-spyware tools even run fake computer security scans that claim to find existing spyware programs on infected devices. The software then directs the computer's user to a Website where the user is encouraged to purchase a full version of the free application already on the PC. To download report, follow link and click on “Security Trends Report”: http://www.finjan.com/Content.aspx?id=827#SecurityTrendsReport

2001-05-23 **scumware unauthorized modification editing changes invisible data corruption integrity arrogance word processing spreadsheet office software design flaw arrogant public relations dismissive**

RISKS 21 42

Jonathan Arnold reported with outrage to RISKS about yet another scumware feature in MS Office XP. "When you type a hyperlink in FrontPage 2002, Word 2002, Excel 2002, PowerPoint 2002, or Outlook 2002 (using Word as your email editor), the Office application will alter what you've typed, without notifying you or giving you an opportunity to undo the "correction." In fact, in most cases, you can't override the 'correction' at all: you're stuck with FP, Word or Excel's version of what you typed."

Specifically, Microsoft describes as a "feature" the fact that it silently and irremdiably removes double slashes from all hyperlinks typed in its Office XP suite. The descriptor is left as intended, but the underlying hyperlink is modified. Challenged with this bizarre behavior, Microsoft responded essentially that no one should be using double slashes anyway and that its unauthorized changes are in the interest of "cleanliness and consistency."

Quoting Peter Deegan, the correspondent adds, "The company has gone too far in compulsory changes to the link with no warning to the user or any workaround to fix the Autocorrect. Adding injury to insult, there's no documentation on these changes in the help file. Microsoft has declined to provide details of any other compulsory changes made to hyperlinks in Office XP nor have they suggested any workaround for those affected, or some way to switch off this behavior. The Microsoft arrogance shows through: it's not a problem, so why bother fixing it? The fact that Microsoft has declined to detail what changes are arbitrarily made to links makes us even more concerned. Office XP users don't know what compulsory changes will be made to their links. Chances are they'll find out the way I did - the hard way."

NewsScan

TOOL WRAPS E-MAIL MESSAGES WITH SPAM
Admail, a new technology marketed by Australian online marketing firm Reva Networks, enables advertisers to intercept e-mail messages as they enter the mail server and "wrap" them in advertising content tailored to the recipient's demographic profile. Reva Networks CEO Robert Pickup says the concept has proven more effective than other forms of online advertising. "Because the advertising is embedded within a regular e-mail and not a separate e-mail message from an advertiser, users are more likely to open the message and hence be exposed to the advertising offer." Pickup says he doesn't think consumers will be annoyed by the ads "as long as it's relevant to them." But Australian Consumer Association IT policy officer Charles Britton says he doesn't think that consumers will passively accept advertising with their personal e-mail: "Without some incentive, why would you want advertising in your e-mail?" (ZDNet Australia 22 Jun 2001)

MICROSOFT OFFERS NEW VERSION OF ITS OFFICE SOFTWARE [31 May 2001]
Microsoft today is announcing Office XP, sixth version of the software it introduced ten years, and which now has been integrated with the Internet for interactive information retrieval and collaboration. For example, a word processing feature called "Smart Tags" will allow documents to link automatically to Internet databases, and Microsoft Word will be able to recognize an address, a parcel shipping number, or a flight number, etc., and look up further information about it. Some of these retrieval functions will be free from company Web sites but others (such as legal searches in the Lexis-Nexis database) will cost money. (New York Times 31 May 2001)
http://www.nytimes.com/2001/05/31/technology/31SOFT.html

MICROSOFT PULLS CONTROVERSIAL SMART TAG FEATURE [28 Jun 2001]
Bowing to a wave of criticism, Microsoft says it will kill plans to include a Smart Tag feature in its forthcoming Windows XP operating system. The feature would have allowed Internet Explorer to turn any word on any Web site into a link to Microsoft's own sites and services, or to a site of Microsoft's choosing. The company continues to defend Smart Tags in principle, and plans to work toward including it in a future version of Windows or Internet Explorer, but group VP Jim Allchin said the decision was made to remove the Smart Tags because "we got way more feedback than we ever expected." Although many people view the public reaction against Smart Tags as excessive, Wall Street Journal columnist Walter Mossberg says, "...Microsoft's dominant Internet Explorer browser is like a television set, or a digital printing press, for the Web. Its function is to render -- accurately and neutrally -- all Web pages that follow standard programming... Microsoft has a perfect right to produce and sell its own Web content with its own points of view. But it is just plain wrong for the company to use the browser to seize editorial control and to steal readers from other sites." (Wall Street Journal 28 Jun 2001)

2001-11-09 **scumware Microsoft Visual Basic programming language undocumented modification unauthorized inconsisten stupid arrogant swine detestable reprehensible disgusting nauseating**

RISKS 21 74

John Sullivan noted yet another example of the questionable design philosophy of programmers and product managers at Microsoft. His report in RISKS demonstrates that Visual Basic (VB6 SP5) alters dates without permission, without notification, and inconsistently.

Part of his report reads, ". . . I'd entered the start date as a literal date of the form #2001-11-08#. . . . When I came back to it today, I noticed it read #11/8/2001#. . . . Retyping it showed that the date was changed in front of my eyes:

#2001-11-08# becomes #11/8/2001# (2001-11-08)
#11/8/2001# becomes #11/8/2001# (2001-11-08)
#8/11/2001# becomes #8/11/2001# (2001-08-11)
#15/11/2001# becomes #11/15/2001# (2001-11-15)

It changes as soon as the cursor left the line. So you type it, check it, find it correct, go off somewhere else, blam! The first has reduced the comprehensibility of the code. The second and third give no feedback that they're not conforming to the current locale. The last two show that VB is not even being consistent in its parsing."

Nick Brown replied in a later RISKS that perhaps the algorithm is as follows:

- Find a number which could only be the month
- Find a number which could only be the day
- If there is ambiguity, assume the user typed the date in mm/dd order

2001-11-14 **scumware copyright content intellectual property advertising TV commercials moral rights consumers tampering alteration**

NewsScan

TV 'TIME MACHINE' SPARKS CONTROVERSY [14 Nov 2001]
A machine that "squeezes" television programming so that broadcasters can fit in extra commercials is stirring controversy in the industry. The Time Machine is being marketed by Prime Image for $93,000 and so far, 120 have been sold to local stations in the U.S., with another 70 going to stations in Mexico. The patented technology shears seconds off of programming by editing out repetitive video frames in real time. With most TV shows running at 30 frames per second, a missing frame here or there is undetectable to viewers, but the accumulated time enables a station to insert an addition 20- to 30-second commercial. People in the TV industry say there is nothing controversial about using such a device during a local news show, for instance, but the problem arises when the station is airing programming from an outside source, such as a professional sports organization, that has strict limits on local commercials. Many Hollywood execs aren't happy with the Time Machine's ability to tinker with content in order to beef up advertising. "Adding more commercials that take away from content is the wrong direction for the industry to go," says Gary Newman, president of News Corp.'s 20th Century Fox Television. RISKS 21 82

Arnold Weissberg was practically spitting with outrage in his note to RISKS about yet another example of having Microsoft engineers tell the rest of the world how to type:

"I typed my last name into a document. I thought something funny had happened because it came out with one "s." I never misspell my last name. There was a line under the "W". Holding the mouse on this line I got the following choices:
1. Change back to "Weissberg"
2. Stop Automatically Correcting "Weissberg"
3. Control AutoCorrect Options

Now this is, as my grandmother would have said, real chutzpah. Telling me how to spell my own name! Talk about arrogance--what's next, "anglicizing" it? Like, auto correcting it to "Whitehill?" And if I try to change it back will it say, "I'm sorry, Arnold, I can't do that"? I think in this little example we can learn a lot about Microsoft's corporate attitudes toward the rest of the world--that is, no one is smart enough even to be trusted to spell their own name right. Much less choose what software they'd like to use."

[MK notes: Hey, this is progress -- at least you get to turn off the correction!]

2001-12-07 **scumware Microsoft Office Windows XP sensitive information debugging memory dump program crash document**

RISKS 21 82

David Farber noted yet another threat to sensitive information from Microsoft Office XP and Windows XP. Writing in RISKS, he contributed the following summary:

PROBLEM: Microsoft Office XP and Internet Explorer version 5 and later are configured to request to send debugging information to Microsoft in the event of a program crash. The debugging information includes a memory dump which may contain all or part of the document being viewed or edited. This debug message potentially could contain sensitive, private information.

PLATFORM:

* Microsoft Office XP
* Microsoft Internet Explorer 5.0 and later
* Windows XP
* Microsoft has indicated that this will be a feature of all new Microsoft products

DAMAGE: Sensitive or private information could inadvertently be sent to Microsoft. Some simple testing of the feature found document information in one message out of three.

SOLUTION: Apply the registry changes listed in this bulletin to disable the automatic sending of debugging information. If you are working with sensitive information and a program asks to send debugging information to Microsoft, you should click Don't Send.

USER WEB HABITS TRACKED BY SOME MUSIC-SWAPPING PROGRAMS
The Web surfing habits of people who used the LimeWire, Grokster and KaZaA music-sharing programs were surreptitiously tracked because those programs were linked to an online sweepstakes game called ClickTillUWin, in which players pick numbers and win cash prizes. The company that operates the sweepstakes game says it told outside distributors to get users' permission before installing the software, but in these cases that action was not taken. The three companies have posted new versions of their software without the tracking component, and LimeWire has issued an apology. (AP/USA Today, 4 Jan 2002)

2002-01-11 **scumware Lotus Notes unauthorized undocumented data modification corruption diddling arrogance stupidity criminal negligence design flaw bug error expletive deleted**

RISKS 21 88

Erling Kristiansen posted a note in RISKS discussing undocumented, unannounced data loss in Lotus Notes. The author's examples follow verbatim:

* I printed a mail message before I sent it. Some of the cc: addresses were quietly and permanently removed. (Did anybody say buffer overflow recently? Maybe it is more like buffer truncation, but certainly member of the same family)

* Trying to reply to a mail I received, I discovered that 3 out of the about 10 cc: addresses in the incoming message had been truncated, rendering them invalid. No addresses were lost completely, but the amount of truncation that occurred suggests that a short address might be "truncated into extinction" if it is in the right place in the list of addresses. I checked the original RFC-822 header that is accessible. It was correct.

By the way, correcting the addresses in place and re-sending had a very strange effect: The corrected addresses, and only those, were turned into an X.400-like address with a number of attributes pointing to my local environment. I had to remove and re-type the "sick" addresses to have them accepted.

* I copied and pasted about 100 addresses from a spreadsheet into the bcc: field of a mail. Everything looked OK, the pasted addresses appeared neatly in the address window, I could scroll through them, etc. But the message was only sent to the first address. No warning of any kind appeared that a good hundred addresses had been discarded. I only discovered the error because I had asked for delivery notification, and got very few. Had I not discovered this, only a handful of people would have been invited to a presentation. (there were a few other addressees that had not been pasted in - those worked OK even though some were entered AFTER the skipped addresses).

* Notes allows you to format messages, with facilities more or less equivalent to an HTML editor. If a message is sent outside the Notes domain, ALL formatting is removed, even things like indentation and paragraph numbers. So a nicely formatted message may become rather unreadable, even ambiguous (indentation may imply a lot about the meaning of a text). No warning is given that formatting information is being removed.

The RISKS correspondent concludes, "The RISK of all this is that Notes accepts instructions to do something, does not complain about the input, and then goes ahead and does something else than what could reasonably be expected. You can obviously check for any of these events, but they are rare enough, and different enough, that you don't really know when to expect a problem, and what to look for in order to make sure everything went as expected."

Category 28.2 *Scumware*

2002-01-18 **scumware Microsoft Excel unauthorized undocumented data modification corruption diddling arrogance stupidity criminal negligence design flaw bug error expletive deleted**

RISKS 21 88

Geoffrey Brent, writing in RISKS, identified yet another Microsoft undocumented, unauthorized data modification. If you open two MS-Excel files and copy a cell containing a number and paste it into a cell in the other file, everything works fine. For example, 1.2345 gets copied as 1.2345 regardless of how many figures are showing in the cell. However, if you open file A, copy a number, _close file A_, and then paste the number into file B, you get a value that is identical to what was _visible_ rather than to what was entered in the original cell. Thus in the example above, 1.2345 in the source becomes 1.23 in the destination worksheet. [MK note: I tested this myself in Excel 2000 and it's true.]

2002-01-28 **scumwarescumware unauthorized modification editing changes invisible data corruption integrity arrogance word processing spreadsheet office software design flaw arrogant public relations dismissive**

RISKS 21 90

Bear Giles reported that Microsoft Outlook has an erroneous algorithm for recognizing UUENCODED text within the body of a message. The designers incorrectly assumed that any line beginning with the word "begin" must be the start of UUENCODED text. The algorithm does not bother to check for any other evidence that this assumption is correct, with the result that perfectly ordinary text is relegated to an attachment and may easily be lost. In addition, malware writers have already figured out that they can send ordinary text messages and have Outlook obligingly convert embedded malicious code into an attachment _after_ it has gone through a firewall or e-mail filtereven if users don't permit attachments to get through.

Microsoft's breathtakingly arrogant workaround (not solution) for their own design error was to recommend that everyone on the planet either stop using the word "begin" or use the capitalized form "Begin" in all e-mail messages sent to Outlook users or potentially forwarded to Outlook users -- that is, in effect, in all e-mail messages the world over.

2002-02-12 **scumware Google search engine periods removed data modification corruption e-mail address bounce**

RISKS 21 91

Google appears to remove some periods even in e-mail addresses that appear in the summary lines for hits. Robert Marshall reported this problem to RISKS as follows (quoting verbatim):

I was searching for the work e-mail address for a friend using google. Let's say the name was Paul Consultant. Google gave me a hit with the correct company and the web page was such that his e-mail appeared in the google summary. So I cut and pasted it directly without having to visit the company web site. It appeared as PR.Consultant@relations.com.

When the e-mail bounced I investigated and the company web page has the mail as P.R.Consultant@relations.com, as does google's cache. It looks as if google is trying to cut down on the synposis by removing redundant '.'s

Unfortunately they aren't always redundant. Fortunately my e-mail bounced rather than going to an unrelated recipient.

DHS IAIP Daily;
http://www.techweb.com/wire/security/173602071;jsessionid=BH
YE2POHHTY0IQSNDBOCKH0CJUMEKJVN

SONY SUSPENDS CD COPY PROTECTION

On Friday, November 10, Sony BMG Music Entertainment announced that it would stop producing CDs with its XCP copy-protection technology. The move came just a day after nearly every major security firm put out alerts that a Trojan horse was using the XCP (eXtended Copy Protection) software to hide malicious files. A wave of lawsuits has been filed or are about to be filed against Sony for installing the hacker-style "rootkit" on users' PCs without their permission. On Thursday, November 9, Sony BMG posted a news release on its Website that linked to a patch download and the site where consumers are to request help with uninstalling the copy-protection software.

2005-12-04 **spyware scumware Sony rootkit XCP security vendors**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,106759,00.html

SONY ROOTKIT PROBLEM RAISES QUESTIONS FOR SECURITY VENDORS

Sony BMG Music Entertainment has been lambasted for shipping its spywarelike XCP software on music CDs over the past year, but an important question has gone largely unanswered: Why didn't security vendors catch the problem sooner? Though one security vendor, Finland's F-Secure Corp., was aware of the problems surrounding Extended Copy Protection (XCP), none of the major anti-spyware or antivirus vendors had any idea that something was amiss, according to representatives from Symantec Corp., McAfee Inc., and Computer Associates International Inc. There were two things about XCP that presented challenges for the big security vendors. The first was Sony's use of rootkit techniques to cloak XCP and make it harder to circumvent its copy-protection capabilities. A second problem is that the software was distributed by a trusted company: Sony. Sony has sold an estimated two million CDs containing the copy-protection software, which used special rootkit techniques to hide itself on PCs. Rootkit software runs at a very low level of the operating system and is designed to be extremely difficult to detect. Ultimately, XCP's cloaking ability was used by hackers to write malicious software, a development that prompted Sony to recall its XCP CDs.

DHS IAIP Daily; http://news.com.com/New+Sony+CD+security+risk+found/2100−100 2_3− 5984764.html?tag=cd.lede

NEW SONY CD SECURITY RISK FOUND

Sony BMG Music Entertainment and the Electronic Frontier Foundation (EFF) digital rights group jointly announced Tuesday, December 6, that they had found, and fixed, a new computer security risk associated with some of the record label's CDs. The danger is associated with copy-protection software included on some Sony discs created by a company called SunnComm Technologies. The vulnerability could allow malicious programmers to gain control of computers that have run the software. The issue affects a different set of CDs than the ones involved in the copy-protection gaffe that led Sony to recall 4.7 million CDs last month. The announcement is the latest result of the detailed scrutiny applied by the technical community to Sony's copy-protected discs, after a string of serious security issues were found to be associated with the label's anti-piracy efforts. Following those revelations, the EFF asked computer security company iSec Partners to study the SunnComm copy protection technology, which Sony said has been distributed with 27 of its CDs in the United States. iSec found the hole announced Tuesday and notified Sony, but news of the risk was not released until SunnComm had created a patch. 2003-02-10 **spying keystroke logger criminal prosecution case Boston College**

NIPC/DHS

February 06, CNET News — Ex-student accused of spying on campus.

A former Boston College student was indicted on Thursday for allegedly installing keystroke-recording software on more than 100 campus computers and accessing databases containing personal information on other students, staff and faculty. The case may be the first criminal prosecution of a person accused of unlawfully installing a key-logging device, which is designed to capture and record what a computer user types, including passwords and other private information. "I am very concerned about (key-logging software) given the enormous number of public access computers at schools, copy shops and libraries," said John Grossman, chief of the Massachusetts attorney general's corruption, fraud and computer crimes division. According to the attorney general's office, Boudreau began to install key-logging software around April 2002 and used intercepted information to add money to a stored-value card used in the campus dining and bookstore system. Boudreau is not, however, accused of misusing credit card numbers or profiting from selling any private information he allegedly gleaned. Universities have grown more worried about the possibility of key-loggers monitoring their systems, with the University of Illinois at Urbana-Champaign warning that the "Secret Service has advised us about several nationwide computer intrusions/hacking incidents." The charges against Boudreau include unauthorized access to a computer system, wiretapping, and breaking into a building at night "with intent to commit a felony." The last charge alone carries a penalty of up to 20 years in state prison.

2003-05-12 **Fizzer stealth worm KaZaA file-sharing P2P crackers Vxers anti-virus PC update Europe**

NIPC/DHS

May 12, The Register — Fizzer stealth worm spreads via KaZaA.

An Internet worm called "Fizzer" is spreading through the KaZaA P2P file-sharing network and as an executable file via e-mail. Reuters reported Monday that businesses in Asia were the first to report the attack, followed by reports of tens of thousands of infections in Europe. Fizzer is especially dangerous because it installs a keyboard-logging program that intercepts and records all keyboard strokes in a separate log file. To transmit this information, Fizzer loads a backdoor utility that allows crackers/VXers to control a computer via IRC channels. Additionally, the worm regularly connects with Web page located on the Geocities server from which it attempts to download updated version of its executable modules. In an attempt to foil detection, Fizzer also attempts to shut down an array of widely used anti-virus programs that might be running on a victim's PC. Computer users should keep their anti-virus software updated.

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,289142,sid14_gci963348,00.html

May 11, SearchSecurity.com — 'Whispering keyboards' could be next attack trend.

Eavesdroppers can decipher what is typed by simply listening to the sound of a keystroke, according to scientist Dmitri Asonov at this week's IEEE Symposium of Security and Privacy in Oakland, CA. Each key on computer keyboards, telephones and even ATM machines makes a unique sound as each key is depressed and released, according to the paper titled "Keyboard Acoustic Emanations." All that is needed is about $200 worth of microphones and sound processing and PC neural networking software. Today's keyboard, telephone keypads, ATM machines and even door locks have a rubber membrane underneath the keys. "This membrane 11 acts like a drum, and each key hits the drum in a different location and produces a unique frequency or sound that the neural networking software can decipher," said Asonov. Asonov found that by recording the same sound of a keystroke about 30 times and feeding it into a PC running standard neural networking software, he could decipher the keys with an 80% accuracy rate. He was also able to train the software on one keyboard to decipher the keystrokes on any other keyboard of the same make and model. Good sound quality is not required to recognize the acoustic signature or frequency of the key. In fact, Asonov was able to extract the audio captured by a cellular phone and still decipher the signal.

2005-11-28 **report keyloggers programs malicious software rampant Internet download**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1893515,00.asp

MALICIOUS KEYLOGGERS RUN RAMPANT ON NET

Keylogging programs are the epitome of online stealth, and they're also a mushrooming problem on the Internet. Reports of new keylogging programs soared higher this year, as part of a wave of multifunction malware with integrated keylogging features, according to VeriSign Inc.'s security information company iDefense Inc. The programs often evade detection by anti-virus tools and can be difficult to detect once installed, experts warn. More than 6,000 keylogging programs will be released by the end of this year, according to projections by iDefense. That's an increase of 2,000 percent over the last five years, company officials said. Keyloggers have been around for years and are also sold as legitimate applications -- often as monitoring tools for concerned parents or suspicious spouses -- according to Ken Dunham, director of malicious code at iDefense, in Reston, VA. Malicious keyloggers are increasingly part of modular programs that contain Trojan horse, spamming and remote control features, as well, Dunham said. Anti-virus companies have developed signatures that will stop many of those programs before they can be installed, but new programs with unique signatures are readily available from malicious code download sites.

KEYLOGGERS, SPYWARE CONTINUE TO STRIKE ENTERPRISES.

Nearly one in five enterprises have had workers' PCs infected with keyloggers, the worst kind of spyware, a survey released Monday, May 15 said. Keyloggers are a type of spyware, and are used to record keystrokes (and sometimes mouse movements as well) to capture information such as usernames and passwords. They're often planted on consumers' PCs by identity thieves, but are becoming a corporate problem, too. The poll, conducted by Harris Interactive for San Diego-based security vendor Websense, found that 17 percent of IT administrators said that one or more employees had launched a keylogger on their network. In last year's survey, only 12 percent of administrators had acknowledged that keyloggers infected their domains. Bots are also a major problem for corporations, as they are for consumers, the survey showed. Just over a third of administrators (34 percent) were confident that they could keep bots from infecting workers' PCs when those machines weren't connected to the company's network, while almost one in five (19 percent) said that they have had employees' work desktops or laptops hit by a bot.

Federal Bureau of Investigations director Louis J. Freeh wants the Senate Appropriations Committee to write legislation requiring phone companies to provide law enforcement officers the precise location of cellular phone users suspected of committing a crime. The officers would not even need a court order in the case of an "emergency" (such as suspicion of a felony, pursuit of a fugitive, or danger to human life). Current technology allows phone companies to get location information on any cellular phone that is turned on and operating within the cellular network — even if the user is not actually engaged in a phone call. The FBI plan is opposed both by the telecommunications industry, which says it would cost billions of dollars to implement, and by civil liberties groups, which consider it a dangerous and unconstitutional invasion of privacy. 2004-08-18 **cell mobile phone clone tracking device South Korea electronic serial number ESN Find-Friend service**

DHS IAIP Daily;
http://english.chosun.com/w21data/html/news/200408/200408180 039.html

August 18, The Chosum Ilbo (South Korea) — Cloned cell phones used to trace personal locations.

The Ministry of Information and Communication (MIC) in South Korea has said that a total of 1,940 cloned phones were detected since last November. According to the MIC, cloned cell phones might help an unscrupulous person register himself as a friend of a targeted phone owner to trace his whereabouts. Every cell phone has a unique factory-set electronic serial number (ESN) and a cloned phone is one illegally programmed to have the identical ESN to the legitimate phone. After cloning, both the legitimate and the fraudulent phones have the same ESN and phone number, and cellular systems cannot distinguish the cloned cell phone from the legitimate one. This enabled the start of the Find-Friend service, a location-based service (LBS) provided by the nation's mobile operators, which was possible only after being explicitly agreed to by legitimate phone owners. Fraudulent phone holders are able to give their consent to mobile operators.

2004-10-04 **mobile cell phone hacking attack vulnerabilities spying eavesdropping**

DHS IAIP Daily; http://news.bbc.co.uk/1/hi/technology/3712816.stm

October 04, BBC News — Latest mobiles open to attack. The latest generation of mobile phones is vulnerable to hackers, security experts have warned.

The warning was at an international conference on computer security in the Malaysian capital, Kuala Lumpur. According to the meeting's organizer, Dylan Andrew, loopholes in the software could allow hackers to scroll through a phone's address book by remote control and even eavesdrop on conversations. The mobile industry is aware of these security issues, said Sal Viveros, director of wireless security at McAfee. "I don't think people need to be too alarmed, but they should start asking their mobile operators to provide them with protection," he said.

01,103125,00.html

CELL PHONE SERVICE DISABLED IN NEW YORK TUNNELS AFTER LONDON ATTACK

Cellular phone service has been shut off in four busy New York commuter tunnels since last week's deadly blasts in London, officials said Monday, July 11. No specific reason was given for the move, but cell phones have been used to trigger bombs in the past. Cell phone service is disabled in the Holland and Lincoln tunnels that connect Manhattan to New Jersey under the Hudson River, the Midtown Tunnel to the city's Queens borough and the Battery Tunnel to Brooklyn, officials said. The move came immediately after the bombings in London on Thursday, according to a spokesperson for the Port Authority of New York and New Jersey, which oversees operation of the Lincoln and Holland tunnels. In March 2004, bombs in Madrid that killed 191 people on trains were fitted to mobile phones, using the alarms as timers. Police in London have said they believe the subway bombs there were detonated by timers. A spokesperson for the New York Police Department said officials would weigh the benefits of disabled service against allowing cell phone service in the tunnels so the public could report suspicious packages or individuals.

2005-09-19 **data leakage countermeasure photography illicit surreptitious digital camera privacy**

INNOVATION

PHOTO-BLOCKING TECHNOLOGY

Paparazzi, beware! Researchers at Georgia Tech have come up with a way to prevent digital cameras and camcorders from taking surreptitious photos or video. The technology can detect the presence of a digital camera up to 33 feet away and then shoots a targeted beam of light at the lens, neutralizing the recorded image. The neutralizing light continues until the camera lens can no longer be detected. The group has developed a lab prototype consisting of a digital projector with a modified video camera mounted on the top, but team members say they're working on a design that could be commercially manufactured and sold. With the rise in cell phone cameras and other intrusive camera technology, they see the technology as a first step toward ameliorating privacy concerns that are escalating in the face of shrinking camera size, and anticipate that businesses, conferences and exhibit halls with no-photography rules will constitute a ready-made market. CELL PHONES AS TRACKING TOOLS

Companies that use cell phones to track people have seen significant increases in business in the past few years. In Britain, firms such as Followus and Verilocation frequently work with employers who want to keep tabs on staff, despite concerns that the service infringes on individuals' civil rights. Kevin Brown of Followus noted that his company's service requires the consent of those being tracked. Users must agree to having their cell phones tracked, and periodic messages are sent randomly to users reminding them that their movements are being followed. Officials at Verilocation pointed to such events as the bombings in London last summer as times when being able to locate all of your employees is highly valuable. Experts on business processes said being able to track employees can allow companies to provide better service to customers by, for example, letting them know exactly where a technician is and when he will arrive at a customer's home. Officials from Liberty, a civil rights group, were unconvinced, saying that employees' rights in the workplace have been eroded and that there is a significant risk that businesses will misuse tracking data.

DHS IAIP Daily; http://www.frsirt.com/english/advisories/2006/1045 23

MOTOROLA PHONES BUFFER OVERFLOW AND SECURITY DIALOG SPOOFING VULNERABILITIES.

Two vulnerabilities have been identified in various Motorola cell phones, which could be exploited by attackers to execute arbitrary commands, bypass security restrictions, and disclose sensitive information. Analysis: The first issue is due to a buffer overflow error when handling an overly long OBEX "setpath()" sent via the OBEX File Transfer service, which could be exploited by an attacker to crash a vulnerable handset or potentially execute arbitrary code via a paired device. The second flaw is due to an input validation error when handling incoming connection to the "Headset Audio Gateway" on Channel 3 from a remote Bluetooth device, which could be exploited by attackers to spoof the device name displayed in security dialogs and convince a user to accept an incoming connection. Affected products: Motorola PEBL U6 and Motorola V600. Solution: The FrSIRT is not aware of any official supplied patch for this issue.

1999-01-22 **privacy chip serial identifier processor e-commerce**

Washington Post, San Jose Mercury News, New York Times, AP, New York Times 20 19
http://www.nytimes.com/library/tech/99/04/biztech/articles/29chip.html; RISKS

A storm of protest erupted when Intel innocently announced what it thought would be a useful feature: software-accessible microprocessor serial numbers. Apparently unaware that minicomputer and mainframe manufacturers have provided such a feature for decades, privacy activists — including in particular the Electronic Privacy Information Center <http://www.epic.org> — appealed to the FCC to stop what they perceived as a nefarious plan to invade consumer's privacy. Intel's Pentium III chip includes a software-accessible serial number, just like LAN interface cards and many other kinds of processors long used in industry. Civil libertarians protested that such a unique identifier would allow detailed tracking of an individual's usage of the Internet. Bowing to protests, the company later agreed to set the default for this feature to "off." Critics than insisted that the mere availability of the feature would put pressure on consumers to turn it on; as Deirdre Mulligan of the Center for Democracy and Technology said, "If everybody's demanding it, it's going to be hard for a consumer to say no." Later in February, Junkbusters Corp. and EPIC (Electronic Privacy Information Center) appealed to the Federal Trade Commission for a ruling forbidding the chip from being released. The FTC declined to cooperate. The situation was inflamed by the discovery in late February that the software switch could be activated remotely, without permission of the PC owner. In late February, a German magazine, Computer Technology, published reports that the feature could be hacked to change the unique identifier, thus allowing a breach of authenticity by altered computers. Pentium determined that the problem lay in the software it had released.

MICROSOFT TO RID WINDOWS OF TRACKING NUMBERS
Issue: Privacy
Richard M. Smith, a computer programmer, compares it to a Social Security number being stamped on every document a person creates on a computer operating with the Microsoft Windows 98 operating system. "It" is a unique 32-digit serial number that is generated in the latest version of Windows and planted within electronic documents. It could be used to trace the author's identity. Microsoft officials said they are investigating whether the company is collecting the serial numbers from customers even if they explicitly indicate they didn't want them disclosed. "If it is, it's just a bug," said Robert Bennett, Microsoft's group product manager for Windows. "If it is indeed happening, we'll absolutely fix that." Bennett said Microsoft will create a software tool to let customers remove the Windows number, which he said is meant to help diagnose problems for customers who call with technical problems. Privacy activist Jason Catlett of Junkbusters said, "This is going to be a cleanup job larger than the Exxon Valdez oil spill." [Bug...or feature?] [SOURCE: Washington Post (A8), AUTHOR: Ted Bridis (Associated Press)] <
http://www.washingtonpost.com/wp-srv/business/feed/biztop920897272397.htm>

MICROSOFT RESPONDS TO PRIVACY ISSUE
Reacting to a controversy started when a programmer in Brookline, Mass., discovered Windows 98 generates a unique serial number that is implanted in every electronic document and that can be used to trace the identify of its author, Microsoft said it will create a software tool to allow customers to remove the number, which was created to help support specialists diagnose problems for customers who call with questions. Jason Catlett, who lobbies on privacy issues, says, "This is going to be a cleanup job larger than the Exxon Valdez oil spill. There are billions of tattooed documents out there." (AP 8 Mar 99)

MICROSOFT OFFERS PRIVACY FIX
Microsoft Corp. has two free software programs on its Web site that will strip out the identifying number that could be used to trace the authorship of some electronic documents. One program removes the number from existing documents and the other prevents it from being embedded in new documents. The number feature was included as part of Windows 98, but privacy advocates complain that the feature makes it technically possible for the company to trace documents to a specific computer, even if the author wishes to remain anonymous. Microsoft says the numbers originally were intended to support a feature to link documents over a network, but it was never fully developed. See <
http://officeupdate.microsoft.com/Articles/privacy.htm > (AP 19 Mar 99)

1999-04-29 **Pentium serial number Trojan diagnostic Intel vulnerability**

New York Times

INTEL GOES TO BATTLE AS ITS EMBEDDED SERIAL NUMBER IS UNMASKED
Intel tried to resolve issues about the controversial serial number embedded in its Pentium III processors by providing software meant to hide the number, but a researcher has discovered that the number can be made visible even with the software. A researcher at Canadian software company Zero-Knowledge Systems found that the serial number could be made visible again without the Pentium III user's knowledge. Zero-Knowledge then placed a program on its Web site to demonstrate the software's flaw to the public. Intel responded to Zero-Knowledge's program earlier this month by telling Symantec, which makes the Norton Antivirus software, that the program was "hostile code." Zero-Knowledge says Symantec's virus warning on its Web site damaged its business, and maintains that Intel should not have used a serial number to protect user security. (New York Times 04/29/99)

WOZNET: APPLE COFOUNDER COMES BLAZING BACK
Beginning with an interest in finding a way to track his lost dogs, Apple co-founder Steve Wozniak developed location-monitoring technology using electronic tags and designed to help people keep track of their animals, children or property. The new company, Wheels of Zeus, is touting WozNet as a simple and inexpensive wireless network that uses radio signals and global positioning satellite data to keep track of a cluster of inexpensive tags within a one- or two-mile radius of each base station. Its low-power network will complement rather than compete with other wireless technologies such as radio-frequency I.D. tags used in stores and factories and higher speed Wi-Fi and cellular data networks. WozNet, with data rates of no more than 20,000 bps, will be able to transmit a very small amount of digital information even through environments subject to radio interference, and will be able to location information from global positioning system (GPS) satellites. 2003-07-25 **Intel Alzheimer RFID patient tracking artificial intelligence system**

NewsScan

INTEL, ALZHEIMER'S ASSOCIATION TEAM UP ON PATIENT CARE
Intel has formed a consortium with the Alzheimer's Association to fund research on new ways to improve the care of Alzheimer's patients, such as using a combination of sensors and wireless technologies to monitor the patient, thereby freeing up the caregiver to tackle some chores. "If you are a caregiver, this is really empowering technology," says Eric Dishman, director of proactive research at Intel. Intel says it is also investigating the use of radio frequency identification (RFID) tags on items that the patient uses every day, such as a coffee cup or plate. The tags could track activity patterns for each object, and a link to an artificial intelligence system could generate prompts via the radio or TV on what to do with it (i.e., instructions for making coffee or washing a dish and putting it away). The Everyday Technologies for Alzheimer Care will fund more than $1 million worth of new research. (San Jose Mercury News 25 Jul 2003)

IBM AND PHILIPS TEAM UP ON RFID TAGS

IBM and Philips Electronics are moving ahead on an emerging computer-based logistics system that is expected to help retailers reduce their inventory-tracking costs. Philips will manufacture the RFID (radio frequency identification) tags that can be attached to items ranging from clothes to milk cartons, while IBM will provide the computer services and system. Analysts predict that in a few years' time, RFID tags will come down in price to just a few cents apiece or less, and will be capable of storing information such as a product description, packaging and expiration dates, color and price. Research groups say that excess inventory of consumer goods and retail items valued at $40 billion is in the supply chain at any given time and they estimate that use of advanced tracking systems such as RFID could help reduce theft and excess inventory levels by 25%. According to Applied Business Intelligence, the RFID market could reach $3.1 billion by 2008, while IDC estimates that retail demand alone will be $1.3 billion within four years. FDA CALLS FOR RFID TAGS TO TRACK DRUGS

A report released last week by the U.S. Food and Drug Administration calls RFID (radio frequency identification) tags as the most likely technology to spur "mass serialization" of prescription drugs, which it describes as "assigning a unique number (the electronic product code or EPC) to each pallet, case and package of drugs and then using that number to record information about all transactions involving the product." A unique number would act as an "electronic pedigree," guaranteeing information on the drug's authenticity, where it was intended for sale and whether it was previously dispensed. The agency has presented plans to test and adopt RFID tracking throughout the prescription drug industry, with feasibility studies slated for this year and full scale rollout at the case and pallet level by 2007. Wal-Mart stores plans to get a head start, using RFID tags to track all controlled substance medications dispensed by its pharmacies this year. (Computerworld 19 Feb 2004)

2004-03-02 **currency security features RFID urban myth hoax microwave explode burn**

RISKS; http://www.prisonplanet.com/022904rfidtagsexplode.html 23 24

RFID TAGS IN $20 BILLS? EXPLODING IN MICROWAVES?? WHO KNOWS???

A controversy, ah, exploded in March 2004 when "prisonplanet.com" published an article from two anonymous contributors claiming that new $20 bills from the US Treasury contain an RFID tag positioned in the image of Andrew Jackson's right eye. Carrying a stack of such bills sets of RFID detectors in stores, said the letter; wrapping them in aluminum foil prevented detection. Microwaving the bills in a stack in a microwave caused all the RFIDs to explode.

Skeptics pointed out that the publisher had to back off and write, "We want to make it clear that $20 bills will only 'pop' or 'explode' in certain microwaves." Critics suggested that the image shown on the Web site seems to consist of _old_, not new, $20 bills (that is bills not containing the security features described in < http://www.globalsecurity.org/security/library/news/2003/10/sec-031009-usia02.htm >).

The discussion then devolved into name-calling and insults.

[MK comment: this debacle could have been avoided by running controlled trials with old used $20 bills, old unused $20 bills, new used $20 bills and new unused $20 bills. Microwaving some used and unsused dollar bills might have provided useful information too. Comparing the effects of stacks of such different sorts of bills on RFID detectors would not have exceeded human capabilities either.]

2004-10-14 **RFID radio freqency identifier Vatican books library anti-theft inventory**

NewsScan;
http://www.cnn.com/2004/TECH/10/14/spark.rfid.vatican/index.html

VATICAN TAPS RFID TECHNOLOGY TO TRACK BOOKS

The Vatican Library has tagged about 30,000 of its books with RFID (radio frequency identification) tags since last year, and says plans call for tagging 2 million of the 40- million piece collection in the near future. That would enable the staff to complete the library's annual inventory in less than a day -- a task that previously forced it to close for a whole month. Emilia Di Bernardo, VP of Seret, the company that installed the RFID system, says initially the Vatican staff were interested only in an efficient inventory process. "But we came up with something that is not only an inventory but a way to manage the books. This way staff always know where all the books are." Di Bernardo says it is relatively inexpensive to maintain the system and the technology does not harm the books in any way. "The most expensive part is the tags and the hardware." The RFID tags cost between five and 10 cents each, but Texas Instruments, which manufactures the tags, anticipates the costs coming down. "It's robust and as the price comes down, you will see it being used more and more, including in bus ticketing and concert ticketing," says a TI spokesman.

2004-10-21 **RFID radio freqency identifier passport**

NewsScan; http://www.wired.com/news/privacy/0,1848,65412,00.html

U.S. PASSPORTS GET CHIPPED

Beginning in January, diplomats and U.S. State Department employees will be issued passports containing embedded RFID chips that will contain the individual's name, address, date and place of birth, and a digital photo. Ordinary citizens applying for new passports will get the high-tech version starting in the spring. Civil liberties advocates have called the new passports a "privacy horror," and point out that even if the data were encrypted (and it's not), it would still be very easy to steal. "If 180 countries have access to the technology for reading this thing, whether or not it is encrypted, from a security standpoint, that is a very leaky system," says Electronic Frontier Foundation attorney Lee Tien. "Strictly from a technology standpoint, any reader system, even with security, that was so widely deployed and accessible to so many people worldwide will be subject to some very interesting compromises." Meanwhile, a travel privacy expert says that in addition to identity thieves, commercial travel companies, including hotels, will capture the data when people check in or exchange currency. Intel RFID expert Roy Want says those fears are overblown, but acknowledges some theft is possible: "In principle someone could rig up a reader, perhaps in a doorway you are forcing people to go through. You could read some of these tags some of the time."

MAKE INCISION HERE: RFID TAG USED IN SURGERY

The U.S. Food and Drug Administration has approved use of radio frequency ID (RFID) tags to ensure that physicians perform the right surgery on the right patient. Manufactured by SurgiChip Inc., the radio tag is encoded with the patient's name and the site, type, and date of the surgery; the patient helps stick the adhesive-backed tag near the site of the surgery and workers in the hospital's operating room scan the tag to compare that information with the patient's chart. 2005-02-10 **RFID radio freqency identifier elementary school ACLU track surveillance privacy civil liberties**

NewsScan; http://apnews.excite.com/article/20050210/D885RJD81.html

CONTROVERSIAL USE OF RFID TECHNOLOGY IN ELEMENTARY SCHOOL

Brittan Elementary School in rural Sutter, California, is requiring students to wear radio frequency identification (RFID) badges that can track their movements in order to simplify attendance-taking, curtail vandalism, and improve student safety. But civil libertarians are alarmed, and ACLU representative Nicole Ozer warns, "If this school doesn't stand up, then other schools might adopt it. You might be a small community, but you are one of the first communities to use this technology." Angry parent Michael Cantrall, who alerted the ACLU to the school's decision to use RFID technology, which is also used to track merchandise, says: "There is a way to make kids safer without making them feel like a piece of inventory. Are we trying to bring them up with respect and trust, or tell them that you can't trust anyone, you are always going to be monitored, and someone is always going to be watching you?" Each student is required to wear identification cards around their necks with their picture, name and grade and a wireless transmitter that beams their ID number to a teacher's handheld computer when the child passes under an antenna posted above a classroom door. But the IDs have been welcomed by some parents, such as one who notes: "This is not Mayberry. This is Sutter, California. Bad things can happen here." (AP 10 Feb 2005)

NO RFID TAGS FOR SCHOOL KIDS -- AT LEAST FOR NOW

The InCom company, which developed Radio Frequency Identification (RFID) tags to monitor the whereabouts of school children, has pulled out of a deal with Brittain Elementary School in Sutter, California. School principal Earnie Graham says, "I'm disappointed… I think I let my staff down. Nobody on this campus knows every student." Dawn Cantrall, the parent who objected to the system and brought the ACLU in to stop its implementation, remains skeptical: "I'm not convinced it's over. I'm happy for now that kids are not being tagged, but I'm still fighting to keep it out of our school system. It has to stop here." The system was conceived as a way of simplifying attendance-taking, reducing vandalism, and keeping students safe. (San Francisco Chronicle 16 Feb 2005)

RFID TAGGING ELEMENTARY SCHOOL CHILDREN

Peter Coffin and Peter Neumann summarized a new application for RFID tags:

The only grade school in Sutter, California is requiring students to wear radio frequency identification badges that can track their every move. Some parents are outraged, fearing it will rob their children of privacy. The badges introduced at Brittan Elementary School on 18 Jan 2005 rely on the same radio frequency and scanner technology that companies use to track livestock and product inventory.

While similar devices are being tested at several schools in Japan so parents can know when their children arrive and leave, Brittan appears to be the first U.S. school district to embrace such a monitoring system.

Civil libertarians hope to keep it that way.

I trust no one reading RISKS has any troubles imagining many ways to foil this system. "Karen, I wanna ditch. Carry my tag in your backpack?"

2005-08-02 **identification authentication I&A Social Security Number SSN card RFID radio frequency identification device identity theft legislation proposal Congress**

RISKS 23 96

MISSING THE POINT: RFID TAGS IN SOCIAL SECURITY CARDS

Geoff Kuenning analyzed a misguided application of RFID tags:

I just received an e-mail from my Congressman, David Dreier, touting his efforts to put RFID chips in Social Security cards. Dreier, never noted for clear thinking, writes:

>There is a common sense solution to thwarting identity theft and the fraudulent use of Social Security cards: the cards must be made counterfeit-proof… H.R. 98…improves the integrity of the Social Security card by adding a digitized photo of the cardholder. These Smart Cards will also contain a unique electronic encryption code that will allow employers to verify each applicant's work eligibility prior to hiring. Smart Cards will decrease Social Security information theft and prevent illegal immigrants from using fake or stolen Social Security information to get a job.<

Note that HR 98 doesn't do anything to actually address identity theft, which isn't performed using Social Security cards in the first place. Sensible measures, like making the Social Security Number self-checking, decoupling it from identification, and penalizing corporations who fail to protect SSNs or who misuse them, are notably absent. Instead we have yet another case of technology as a panacea.

But in the current hysterical climate, and with the popular fascination with overhyped technology, I have no doubt that the bill will pass. I also have no doubt that it will have no effect on its true target, illegal immigration, since it will be easy to find low-paid insiders to help forge the "impossible to forge" cards.

STUDY SAYS CHIPS IN ID TAGS ARE VULNERABLE TO VIRUSES.

A group of European computer researchers have demonstrated that it is possible to insert a software virus into radio frequency identification tags (RFIDs), part of a microchip-based tracking technology in growing use in commercial and security applications. In a paper entitled, "Is Your Cat Infected With a Computer Virus?," to be presented Wednesday, March 15, at an academic computing conference in Pisa, Italy, the researchers plan to demonstrate how it is possible to infect a tiny portion of memory in the chip, which can hold as little as 128 characters of information. Until now, most computer security experts have discounted the possibility of using RFID chips to spread a computer virus because of the tiny amount of memory on the chips. Ultimately, by their research, they have introduced a series of worrisome prospects, including the ability of terrorists and smugglers to evade airport luggage scanning systems that will use RFID tags in the future.

BUSINESS BLOGGING GOES MAINSTREAM

Major technology companies such as Microsoft and IBM are endorsing blogging as a means of enhancing companies' communications channels while at the same time eyeing them as potential profit-boosters. At a recent conference held at the University of California Berkeley's Haas Business
School, IBM Almaden Research Center director James Spohrer outlined his company's plans for integrating blogging into its employee communication strategies: "It's about decreasing social space between employees, and increasing the amount of knowledge shared between people." An example might contain some of an individual's educational background and work experience, as well as information on product development strategies that colleagues and customers can access around the clock. This sharing of information could spur feedback on efforts to produce new products and improve business processes, said Spohrer. Meanwhile, some analysts are looking at the marketing potential inherent in blogging. "Blogs are a way to put a human face on the company," because of the continuous interaction and relationships that employees can develop with blog-readers, says Forrester Research analyst Charlene Li. 1998-08-30 **Internet culture psychology depression false wrong**

EDUPAGE

The NSF funded a $1.5M study over two years at Carnegie Mellon University to understand the effects of Internet usage on users. Their startling finding was that increased Internet usage (e-mail, chat rooms, newsgroups and so on) decreased social interactions in the real world and caused an increase in depression. This study was severely criticized on methodological grounds within a week of its publication; one problem was the small sample size (169) and doubts about the applicability of the data drawn from a non-random sample in a single city, Pittsburgh.

1998-12-14 **Internet addiction women depression**

Reuters

According to a study of 445 Internet users by the British psychologists Drs Helen Petrie and David Gunn of the University of Hertfordshire, "Women seemed to be more addicted to the Net than men were. They showed more positive feelings about using the Net and higher usage of the Net than men." The results were presented to the December meeting of the British Psychological Society in London. "Addicted" people spent an average of about 55 hours a week surfing, compared with self-described non-addicts, who spent half that amount (about 28 hours a week). Although the study did show a correlation between measures of depression and the amount of use of the Net, it was not possible from this study to ascertain the existence of a causal link; possibly depressed people liked to use the Net more or possibly using the Net more resulted in depressing people.

1999-09-27 **geek nerd computer fanatic hacker syndrome psychology**

LA Times

Gary Chapman published an interesting article in the LA Times suggesting that some fanatical users of computers calling themselves "geeks" or "nerds" (or maybe "hacker") may in fact have symptoms of clinical syndromes similar to some forms of autism. Specifically, writes the author, "Unlike classic autism, which often involves mental retardation and a lack of verbal skills, Asperger's syndrome is at the `high functional' end of the spectrum of autistic behavior, experts say. People with Asperger's syndrome have normal or above-average IQs and may even display savantism, or exceptional abilities in a specific skill. What they lack is human empathy, a deficiency sometimes called `mind-blindness,' which shows up as a distinct inability to read routine human nonverbal cues of attitude such as kindness, anger or love. Asperger's syndrome patients, who usually develop their traits at a young age, often have these tendencies: excellent rote memory; fascination with fantasy worlds and arcane facts; facility with math and science; physical awkwardness or clumsiness and sometimes an unusual gait; hyperactivity but with an ability to focus on interesting problems for hours at a time; poor social understanding; hyper-verbal activity but without the ability to make contextual connections in conversations; and an appearance of insensitivity and eccentricity. They are commonly victims of teasing in school. And, apparently, some can do well in the computer world." However, some experts in the field claim that such interpretations are bunk, pointing out that most Asperger's Syndrome kids are severely debilitated.

Chemicals from computer screens can provoke allergies, according to a Swedish study published . . . [18 Sep] in the journal Environmental Science and Technology. Researchers from Stockholm University say the chemical compound triphenyl phosphate, a flame retardant widely used in the plastic of video monitors and computers, can cause allergic reactions such as itching, nasal congestion and headaches. The problem arises when the temperature of the screen or video monitor begins to rise, says the study's lead author. "We have focused our interest on this compound since it has been proven to be a contact allergen to man and due to the fact that a number of workers in Sweden have acquired health problems related to computer work." Significant levels of the compound were found in more than half of the 18 computer brands tested by researchers, who recommend lots of ventilation to alleviate the problem. 2000-10-02 **socioeconomic factors digital divide availability bandwidth access knowledge skills**

NewsScan

As many as 50 million U.S. adults are at risk for becoming functionally illiterate in the coming years because they're technologically deprived, according to a Gartner Group study. "The Internet will soon be so pervasive that not having access to the technology or not knowing how to use it will be the equivalent of not knowing how to read or write," . . . [said] Gartner CEO Michael Fleisher. The report confirms the existence of a "digital divide" that denies 65% of "lower socioeconomic-status" Americans access to the Internet, compared with only 17% in the top income bracket. But beyond simple access, a second "experience gap" separates people knowledgeable enough to tap the benefits of the Internet from those who are not. Meanwhile, a third divide is developing between those with high-speed, broadband access and those stuck with straight dialup accounts. "As broadband access reaches higher penetration rates, we can expect to see a gap in broadband adoption that mirrors today's gaps in (personal computer) ownership. This will be the equivalent of having the moderate and upper classes in IMAX theaters while the underprivileged are still watching silent movies," says Fleisher. (Reuters/MSNBC 2 Oct 2000)

INFORMATION OVERLOAD IS A STATE OF MIND
A new study titled "The Next Big Thing" found surprising anecdotal evidence that people who receive the greatest volume of electronic information reported a greater ability to cope, while the group that feels the most overwhelmed has the least amount of data to deal with. "We went into the survey expecting to find people were really struggling. We were surprised to find they were thriving," says the study's publisher, Josh Clark. "Anecdotally, there are people out there who are feeling overwhelmed, but practice makes perfect. The people who are most comfortable practice dealing with high volumes of information, and they are coping beautifully." The study's authors caution that because their response group was predominantly male with 42% working in the technology sector, its results cannot be extrapolated to the entire U.S. population. Nevertheless, the comparatively high response rates for the study mean the results are meaningful, and the results bear out what previous studies and empirical evidence has shown -- that simplicity is the key to success in the technology age. COMPUTER GAMES BOOST KIDS' ABILITIES
Computer games can boost children's coordination and ability to concentrate, putting them on a par in those categories with top-level athletes, according to a study by the UK government's Economic and Social Research Council. "People who play games regularly seem to develop a mental state that we have seen before only in serious athletes or professionals such as astronauts, whose life depends on concentration and coordination," says Jo Bryce, who led the research. "Their minds and bodies work together much better than those of most other people." Bryce found that although a minority of gamers become obsessive, the majority have a healthy mix of other interests and varied social lives. "Our subjects were averaging about 18 hours a week on computer games, which sounds a lot, but they were spending similar amounts of time reading and doing sport or socializing," says Jason Rutter of the Center for Research on Innovation and Competition at Manchester University. A recent study by Britain's Home Office also showed that those who regularly played computer games when young were more likely to be intelligent, to attend a university, and to get a better-than-average job. GRIEFERS RELISH THE DARK SIDE OF CAMELOT
Griefers — online game players who focus on the indiscriminate slaughter and ridicule of other gamers — have caught the attention of game makers such as Sony, Microsoft and Electronic Arts, who worry that these bad sports will jeopardize the rise of online games by scaring away customers willing to spend $10 to $14 a month to subscribe to the online gaming experience offered by titles such as "EverQuest" and "Dark Ages of Camelot." These games offer players rich, immersive, fantasy worlds where they can acquire virtual jobs, adopt pets, marry and own property. Rather than a shining city on a hill, however, the online Camelot has quickly descended into anarchy, where stealing, killing, taunting and other forms of bullying are used to torment novice players. For a griefer, this is what it's all about — not the killing, but the misery they inflict afterward. "Griefers feed on the negative reactions of the people they kill," says one self-proclaimed bully. "There's nothing sweeter than when you kill someone and they spout insults at you for hours. That's when you know you got him. It sounds really cruel, but it's fun." And while game makers have tried to isolate anti-social behavior by setting up safe zones where players can't be harmed and filters that reject obscene and graphic names, the griefers continually find ingenious ways to get around them. The result is a cat-and-mouse game that has become tremendously costly for game developers at the same time they are planning to significantly expand their online offerings. "We're trying to take a whole new generation of players online who have never been there before," says the director of content services for Microsoft's Xbox. "We want to make sure everyone has a good experience." The griefer's response? "Everybody needs a bad guy." (Los Angeles Times 2 Sep 2002)

NEWS SITES SERVE UP 'ADDICTIVE' CONTENT
Workers who surf on the job report that they visit online news sites more often than pornography, gambling, or even online auction sites, and that they consider news one of the most addictive types of content available on the Web, according to a survey by Websense. "Initially we saw the most abuse in pornography and gambling sites, now we are seeing more time spent on shopping and news sites," says Websense CTO Harold Kester. Twenty-three percent of those surveyed cited news as the most addictive Web content, compared with 24% who chose shopping, 18% who picked pornography, 8% for gambling and 6% for online auctions. Meanwhile, employers don't seem too perturbed over their workers' penchant for current events. Sixty-seven percent said there were no restrictions in the office on reading news online. That compared with 37% who allowed access to shopping and auction sites, and a slim 2% who didn't mind if their employees visited gambling and porn sites while on the clock. Workers reported spending 8.3 hours a week — 20% of their worktime — on Internet sites that had no relation to their jobs, and most said they would rather give up coffee than the Internet. COMPUTER GAMES ARE GOOD FOR YOU
Playing computer games can be beneficial, say researchers studying the complex social interactions inherent in the popular online multiplayer shoot-em-up Counter-Strike. Professor Talmadge Wright and colleagues at Loyola University in Chicago say that Counter-Strike is much more than just racking up "kills," with the strategies and tactics used by many regular players approaching the complexity of those used in chess. And although much of the banter reflects the typical trashtalk of teenage boys, it's a mistake to dismiss the gamers as misguided misanthropes. "The most common emotion when people are playing is laughter," says Wright. In fact, games like Counter-Strike that rely on trust and cooperation give rise to strong communities and friendships, he adds. "It gives people an option of actively participating in some kind of fantasy role they could not do in real life that allows them to play with their own feelings. It is an area that's bricked off from everyday life that you can enter and leave at will. It offers you a way to play with things you may be scared of in a safe way where there are very few consequences." For these reasons the games are good for players, says Wright, who suggests that many studies of game-playing have been skewed by hidden agendas. "There's a cultural motif that underlies the critiques that go on around this, the idea of mindless activity is given short shrift in culture where productivity is given the highest praise." COFFEE CAN WAIT -- GIVE ME MY NET!

Given the choice between going online or enjoying a morning cup of coffee, almost half of workers polled (49%) say they'd forgo the java, according to a survey by Websense. But the response signals trouble ahead for employers, who fear that productivity is suffering as a result of workers' Net addiction. While 51% of employees surveyed said they spent only about two hours a week on personal Web surfing, IT managers pegged the number at a far higher six-plus hours a week. IT managers also expressed concern over network security when employees took their laptops home with them. "Some employees take their laptops home and use their own time to download a movie. They may access a site where there's spyware or a virus and then they bring their laptop back to work and don't realize they've exposed people on their network," says Kian Saneii, VP of marketing at Websense. AMERICANS FLOCK TO GRAPHIC WAR IMAGES ONLINE

About one in four American Internet users sought out graphic war images that were deemed too gruesome to display in conventional media such as newspapers and television, according to new research by the Pew Internet Project. The results were drawn from a telephone survey conducted between May 14 and June 17 -- a period that encompassed such disturbing events as the murder and dismemberment of American contract workers in Fallujah, the exposure of prisoner abuse at Abu Ghraib, and the capture and beheading of U.S. civilian Nicholas Berg. Survey respondents reported mixed feelings after viewing the images -- 51% said they felt they'd made a good decision to access the images, but a third said they wished they hadn't seen them. "Millions of Internet users want to be able to view the graphic war images and they see the Internet as an alternative source of news and information from traditional media. But many who do venture outside the traditional and familiar standards of the mainstream news organizations to look at the images online end up feeling very uncomfortable," says report co-author Deborah Fallows. Women in particular seemed more troubled over the entire issue of graphic online images, while younger adult Internet users tended to approve their availability. JUST A MINUTE -- MY BRAIN IS BOOTING UP

Increasingly, college students are toting their laptops to class and using them as retrieval mechanisms for information they haven't yet managed to store in their carbon-based brain cells. The phenomenon was predicted 40 years ago by Marshall McLuhan, who suggested that people's senses were extending outside of their bodies, in the way a book was an extension of the eye and a car was the extension of a foot. Internet researcher Sherry Turkle has documented this latest evolutionary trend in her book "Life on the Screen" where she describes a typical college student's study habits -- the text book is open, the CNN news ticker is flickering across the TV screen, the headphones are pumping out the latest alternative rock, and the student's fielding IM messages as he/she surfs the Web. "Real life is just one more window," says one multitasking student. (CNN.com 2 Aug 2004)

A SICK TRADE

The phenomenon of weborexics first became apparent about three years ago with the emergence of so-called pro-ano, or pro-anorexia, Web sites. But they've taken a sinister turn, with several sites cashing in by selling pro-ano merchandise, including teddy bears, "ana" bracelets and tank tops with slogans such as "nothing eaten, nothing gained." Pro-anos are one of the more disturbing online communities because of their promotion of anorexia as a lifestyle choice and badge of honor. The Web sites typically contain a weight-loss weblog, a how-to guide with tips on starving and purging, and "trigger pictures" of thin celebrities. Many of the homepages and forums have been disabled but a plethora of sites can still be easily found. Anorexics can now go online and for between $3 and $25 buy a red-beaded "ana" bracelet -- a symbol of solidarity that identifies them to the rest of the community. The bracelets are designed to help anorexics resist their hunger by being worn on the hand used to eat with. (The Age 7 Aug 2004) rec'd from John Lamp, Deakin U.

TECHNOLOGY CAUSING 'FRANTIC LIFE SYNDROME'

Working women in the U.K. think new technology makes their lives even more hectic, according to a new report. The advent of mobile phones and e-mail have left women feeling under greater pressure to juggle work and home commitments, leaving less time for themselves. As a result, a growing number of career women are suffering from what has been dubbed "frantic life syndrome." Research conducted for Good Housekeeping magazine found 30% of working females had regularly been driven to exhaustion by work and home commitments. The problem is even more acute for those living in London, where the figure rises to 47%. Some of the biggest gripes are on the subject
of technology designed to make life easier. (The Age 9 Aug 2004) Rec'd from J Lamp

TECHNOLOGY KEEPS U.K. KIDS AWAY FROM FAMILY LIFE

British children are interacting less and less with their families and spending more time in their bedrooms watching television or playing computer games, according to a study published on Friday. Three-quarters of Britain's 11-14 year-olds have a television in their bedroom, almost two-thirds a DVD player or video recorder, and a quarter have a computer in their room, market research firm MINTEL said. Two-thirds of those surveyed said they played computer games in their rooms, and one in three said they only ever played the games alone. "Many of today's children now seem to be
experiencing greater isolation from family life," MINTEL consumer analyst Jenny Catlin said. "Sadly, it does seem that in many cases modern technology has now replaced the family unit, so that everyone does whatever they want, when they want, even if it means doing it on their own." (The

GET UNPLUGGED

Enough is enough, say experts who think young people need to get a life beyond the Internet. Psychologists Michelle Weill and Larry Rosen write, "It's like being lost in space. You get lost in the world of the Internet, games or multiple instant-message chats." Dave Greenfield, another psychologist specializing in high-tech issues argues: "Until technology gets 'stupid simple,' equivalent to turning on a light or a television set, it's going to eat time and energy. Do I have the right adapter? Or the right battery? Or cable?" Noting that many people buy the latest high-tech gizmos whether they need them or not, Greenfield says: "It points to a larger theme in our culture -- that new things are good and better, and that more is better, and faster is better. And that's not always the case." He's the author of a book called "Virtual Addiction." (AP/Los Angeles Times 9 Dec 2004)

http://www.securityfocus.com/print/news/11330

GOOD GRIEF: GAMING VANDALS AS CYBER-TERRORISTS

The vandals called _griefers_ who infest computer-based role-playing games took advantage of a new feature called "corrupted blood" in the popular World of Warcraft game community. The feature was originally supposed to be limited to characters in a specific dungeon but the griefers teleported the infected characters into cities and infected pets. As a result, entire cities were depopulated as the plague spread from character to character. The Blizzard Entertainment programmers running the game -- presumably the equivalents of gods -- issued patches that shut down the pandemics. Robert Lemos, writing in SecurityFocus, quoted a game-playing security consultant, Brian Martin, as saying, "Giving it the ability to propagate at all beyond a limited environment definitely reminds us that self-propagating code is likely to bite us in the ass without careful consideration and planning. . . . This also underscores the fact that adequate testing is a requirement for software, as this--and thousands of other bugs--would have easily been discovered and hopefully fixed had the testing been more thorough."

NewsScan; http://www.nytimes.com/2005/01/11/health/psychology/11secr.html

'ON THE INTERNET, NO ONE KNOWS YOU'RE A DOG'

Psychologists believe that secret role-playing may be good or bad, depending on the circumstances. Harvard psychology professor Daniel M. Wegner says: "In a very deep sense, you don't have a self unless you have a secret, and we all have moments throughout our lives when we feel we're losing ourselves in our social group, or work or marriage, and it feels good to grab for a secret, or some subterfuge, to reassert our identity as somebody apart." The Internet is famous for accommodating people with multiple personalities, and MIT sociologist and author Sherry Turkle says, "It used to be you'd go away for the summer and be someone else, go away to camp and be someone else, or maybe to Europe and be someone else" -- whereas now many people now use online interactive games to set up families they wish they had or to play out alternative versions of their own lives. "I think what people are doing on the Internet now has deep psychological meaning in terms of how they're using identities to express problems and potentially solve them in what is a relatively consequencefree zone." In further defense of secret lives, New York clinical psychiatrist Jay S. Kwawer says, "Contrary to what many people assume, quite often a secret life can bring a more lively, more intimate, more energized part of themselves out of the dark." (New York Times 11 Jan 2005)

A MODERN VALENTINE'S DAY FABLE

A budding romance between a Jordanian man and woman turned into an ugly public divorce when the couple found out that they were in fact man and wife, state media reported on Sunday. Separated for several months, boredom and chance briefly reunited Bakr Melhem and his wife Sanaa in an internet chat room, the official Petra news agency said. Bakr, who passed himself off as Adnan, fell head over heels for Sanaa, who signed off as Jamila (beautiful) and described herself as a cultured, unmarried woman -- a devout Muslim whose hobby was reading, Petra said. Cyberlove blossomed between the pair for three months and soon they were making wedding plans. To pledge their troth in person, they agreed to meet in the flesh near a bus depot in the town of Zarqa, northeast of Amman. The shock of finding out their true identities was too much for the pair. Upon seeing Sanaa-alias-Jamila, Bakr-alias- Adnan turned white and screamed at the top of his lungs: "You are divorced, divorced, divorced" -- the traditional manner of officially ending a marriage in Islam. "You are a liar," Sanaa retorted before fainting, the agency said. (The Age 7 Feb 2005)

EDUPAGE; http://www.nytimes.com/2005/03/14/education/14gamble.html

INTERNET FUELS GAMBLING AMONG COLLEGE STUDENTS

Gambling is seeing a significant upsurge among college students in the United States, a trend many attribute to the combination of television coverage of glitzy poker tournaments and the availability of gambling Web sites. Poker tournaments are showing up on campuses including Columbia University and the University of North Carolina, with waiting lists of students hoping to participate. A poker society at the University of Pennsylvania receives hundreds of responses during the first 30 minutes after a tournament is announced, according to the group's president. Some students, such as Princeton University senior Michael Sandberg, have made large amounts of money--in the past six months, Sandberg has won $30,000 in Atlantic City and another $90,000 playing cards online--and have come to regard gambling as an attractive and lucrative career option. Keith S. Whyte, executive director of the National Council on Problem Gambling, commented that university administrators are not working to raise awareness of the risks of gambling, nor are they offering resources for how to get help, which they do for issues such as substance abuse or date rape. WHEN YOU COME TO A DIGITAL DIVIDE, LEAP OVER IT
And how do you do leap over the digital divide? By concentrating not so much on computer literacy -- but rather on computer power. In 1993, with money from Intel, MIT Media Lab professor Mitchel Resnick helped establish the first site of what is now an international network of 50 Computer Clubhouses, which are places where boys and girls 8 to 18 can "really feel in charge of the technology." Resnick says, "Access is not enough. Access is just a starting point. It's not about playing games, but about making your own games. It's not about surfing the Web, but it's about making your own Web pages. It's not just about downloading MP3 music files, but doing your own music composition." The clubhouse network has a $32 million commitment from Intel through 2005, in addition to hardware, software and services donated from Adobe, Macromedia, HP, Autodesk, and other companies. The network extends throughout the world, and includes such countries as Ireland, Israel, India, Germany, the Netherlands, and the Philippines. (New York Times 18 Jul 2002)

2002-09-04 **digital divide international technology telecommunications Internet Africa report**

NewsScan

NewsScan editors John Gehl and Suzanne Douglas published an interesting report from their special correspondent Wilcliff Sakala, who is based in Zambia, on information technology in Africa. Some highlights:

* Africa is progressing on the road to integrate Information and Communication Technologies.

* In East Africa, the IT market value is set to expand at a compound annual growth rate (CAGR) of 21 per cent between 2000 and 2004.

* Tanzania will lead the growth rate in East Africa, with a forecast 28 per cent ($135 million) CAGR by 2004.

* Uganda will follow, registering a 25 per cent CAGR in the same period, totaling $63 million.

* Since 1991, telephone penetration in Least Developed Countries (LDCs) has risen from 0.3 to 1.1 per 100 people.

* Nigeria is drastically expanding its telecommunications infrastructure with the development of a more democratic government.

* Zimbabwe's three cellular providers have a subscriber base of more than 300,000, and the private operators have more lines than the State's fixed phone network.

* South Africa has the largest number of Internet subscribers in Africa, accounting for more than 80 per cent of the continent's estimated 2.6 million Internet users.

* Poverty presents another big challenge towards efforts to provide communication facilities to the majority of people in Africa. Innovative products include pre-paid packages, and phone shops that services previously under-serviced high-density and rural areas.

* Since 2000, Tunisia's mobile penetration has more than tripled, recording 4.01 per cent at the end of 2001 from 1.2 per cent. Meantime, mobile phone subscribers rose from 119,075 in 2000 to 404,202 by March, 2002.

* In Kenya, it is the tourism and non-traditional sectors, such as horticulture, that are driving e-commerce. A 1999 study by Kenya Association of Tour Operators showed that 10 per cent of membership had an Internet presence and conducted business on-line.

2002-09-24 **broadband cable access digital divide ISP Internet service provider survey**

NewsScan

BROADBAND'S AVAILABLE, BUT HAS FEW TAKERS
Almost every U.S. household has potential access to a high-speed Internet connection, but only 10% subscribe to such a service, lower than the rate in Taiwan, South Korea, Hong Kong or Canada. About half of U.S. families have some type of Internet access at home. A report from the U.S. Commerce Department's Office of Technology Policy cites a need for more compelling content in order to boost the adoption of broadband: "New applications and services that consumers want and businesses need will provide the tipping point for broadband demand and usage." The report credits Napster, along with PCs, CD-ROM writers and larger hard drives, for promoting the use of broadband access. Along with lack of content, the report says the relatively high cost of high-speed access is another obstacle to wider usage. Broadband access costs about $50 a month vs. $20 a month for dialup connections. An August 2002 Yankee Group survey indicated that more than 70% of dialup users cited cost as the main barrier toward upgrading to faster access. (AP 23 Sep 2002)

MORE UNDERSERVED CHILDREN ARE GETTING ONLINE
Almost two-thirds of American children between the ages of 2 and 17 logged onto the Net last year, with a whopping 205% increase among African-American children, according to a new report from the Corporation for Public Broadcasting. The disparities between higher and lower income children still exist, but the study found that 58% of African American children and 50% of Hispanic children now use the Internet from some location — either home, school or the local library. The study, based on a series of surveys conducted last year by technology market research firm Grunwald Associates, also found that digital media use among children ages 6-17 is now approaching parity with television viewing. According to the report, children spend 3.1 hours per day watching TV and 2.9 hours a day surfing the Web, playing video games or using the computer for non-Internet activities. Among teenagers, computer use actually outstrips TV viewing — 3.5 hours vs. 3.1 hours per day. An electronic version of the report "Connected to the Future" is available at cpb.org/ed/resources/connected. (Corporation for Public Broadcasting 19 Mar 2003)

2003-07-15 **MIT search engine poor countries e-mail connectivity**

NewsScan

A SEARCH ENGINE FOR THE WORLD'S POOR
Researchers at MIT are designing a search engine geared to the needs of computer users in the world's disadvantaged countries, most of whom have only sporadic access to the Web at what are often less-than-optimal bandwidths. "Let us assume you are in Malawi," says professor Saman Amarasinghe of MIT's Laboratory for Computer Science, "and the computer lab does not have access to the telephone line all the time. If you want to find some new information about malaria, you are prompted with a message that says 'we are going to send a query through e-mail, is it OK?'. At night, when the phone line is available, the teacher can dial out and send the queries." The request is routed to computers at MIT, which then perform the search and filter the results, choosing the most relevant. These results are then sent back to the computer in Malawi. "Next morning the teacher can connect, download that e-mail and when the students arrive, they can browse through those pages the way they would if they had full Internet connectivity." Amarasinghe says most search engines are geared toward Western users who are cash-rich but time-poor. "The idea is that developing countries are willing to pay in time for knowledge. In the West when we surf we want the information in the next two seconds. We are not willing to wait." (BBC News 15 Jul 2003)

2003-12-19 **internet illiteracy language non-english population technology**

NewsScan

GLOBAL INTERNET USE LIMITED BY LANGUAGE, ILLITERACY
According to the International Telecommunication Union, about 70% of the world's Internet users live in countries that make up only 16% of the world's population — statistics that reinforce complaints aired at last week's U.N World Summit on the Information Society that despite the Internet's global reach, most of the material is inaccessible to the vast non-English-speaking population of the world. And while international development efforts have included linking villages and schools in developing nations to the Internet, once people are connected, there must be compelling information available in native languages and in accordance with local customs. "Getting the technology into people's hands is one thing. Getting people to use it is key," says Daniel Wagner, director of the University of Pennsylvania's International Literacy Institute. The solution involves more than just translating Web sites into other languages. To address the problem of population illiteracy, South Africa is developing speech recognition, text-to-speech and other voice technologies, starting with Zulu. Bulgaria, South Korea and other countries are producing government sites in native languages. And the Canadian government is looking at adapting its internal search engine to include materials in Inuktitut, the Inuit language, as well as French and English. "The point is to produce more content that is useful," says Bernardo Sorj, an advisor to Brazilian urban assistance group Viva Rio. "If people go on the Internet and do not find good content for themselves, then they go to pornography." (AP 19 Dec 2003)

2004-02-19 **Internet rural usage technology cyberspace**

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/02/18/hln.wired.rural.internet/ index.html

February 19, CNN — Rural Internet use on the rise.

More rural Americans are surfing through cyberspace than ever before. Fifty-two percent of rural adults were connected in 2003, up from 41 percent in 2000. Despite the growth, rural users still lag more than 10 percentage points behind their urban and suburban counterparts, according to the latest report from the Pew Internet and American Life Project, "Rural Areas and the Internet." Why the gap? First, it's typically easier to get online in urban and suburban communities, and users have more choices when it comes to accessing the Internet. Other factors include lower income levels and the fact that rural users are often older than urban and suburban users. The majority of the analysis from the "Rural Areas and the Internet" report came from random phone surveys conducted between March and August 2003. The report is availalble online:

RULES TO CHANGE IN 'YOUNG MAN'S' IT GAME

A new report by Australia's Swinburne University researchers has highlighted the under-representation of older people working in the IT industry, with figures showing that workers aged 45 years and over made up only 23% of the IT workforce in 2001. The study shows that only 5% of IT workers were aged between 55 and 64 (compared with 21% in the business and property services industry), and that younger males were the most likely group to work full-time in permanent employment, while women aged over 45 years were the least likely. Libby Brooke of Swinburne thinks that the dramatic drop-off in the number of people in the IT industry after the age of 45 could be attributable to a range of issues (including the recent soft jobs market and the "constantly changing skills base" within the IT industry) and says that the main question is: "How can older workers continue to be skilled and supported in the workplace?" (The Age, 28 Apr 2004)

2004-07-25 **computer usage minimum age study debate technology proliferation**

NewsScan

COMPUTER KIDS: HOW YOUNG IS TOO YOUNG?

There's a growing debate about whether children should be exposed to technology when they are still infants. Author Jane M. Healy opposes the practice and says, "Mental ability is gained from manipulating the three-dimensional world at that age and managing your own mind and not
having it managed by an electronic machine"; she recommends that kids stay off computers until age 7. David Elkind, professor of child development at Tufts University, has similar concerns: "Children miss out on all these basic learning experiences if they are so attuned to the virtual world." But other scholars hold the opposite view: Yong Zhao, a professor of educational psychology at Michigan State University, bought his daughter an iMac before she turned 1 and allowed her to simply bang on the keyboard to learn how the banging led to changes on the screen. And still other technology experts say the right answer lies somewhere in the middle of those two positions. Peter
Grunwald, whose consulting firm specializes in kids and technology, says: "Kids need a good balance in their lives and a mix of experiences"; his position is that computers can help kids develop hand-eye coordination and other skills, but shouldn't be used as robotic baby-sitters that shield a
child from the real world. (AP 25 Jul 2004)

2004-10-28 **survey politics Internet digital divide sociology diversity**

NewsScan; http://www.pewinternet.org/

INTERNET BROADENS VOTERS' POLITICAL HORIZONS

More than 40% of U.S. Internet users have gotten news and information about this year's presidential campaign online, and 31% of broadband users now cite the Net as their primary source of campaign news -- about the same number as those who rely on newspapers (35%). And while some pundits had expressed concern that wider use of the Internet would result in a decreased exposure to viewpoints that conflict with users', it turns out that Internet users have a greater overall exposure to political arguments, including those that challenge their preferences. "People are using the Internet to broaden their political horizons, not narrow them," says Kelly Garret, coauthor of a new report from the Pew Internet & American Life Project. "Use of the Internet doesn't necessarily diminish partisanship, or even zealotry. But it does expose online Americans to more points of view, and, on balance, that is a good thing." One surprise coming out of the survey -- about 20% of Americans say they actually prefer news sources that challenge their point of view, and nearly 10% are *more* aware of arguments that oppose their candidate than arguments in favor. (Pew Internet & American Life Project 28 Oct 2004)

2005-02-24 **World Bank digital divide organization United Nations World Summit Information Security democracies poverty mobile phones**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7731166

WORLD BANK SAYS DIGITAL DIVIDE CLOSING FAST

The World Bank has released a report contending that the digital divide is closing fast, putting the organization at odds with the United Nations (U.N.), which asserts that the divide is a problem that still needs to be addressed. The U.N. is hosting the World Summit on the Information Society in Geneva, where attendees are expected to call for increased funding to provide access for poorer countries to digital technologies. The U.N. believes that increasing such access will help poorer countries build stable democracies and deal with problems such as poverty. The World Bank cited statistics, however, that seem to contradict the need for ongoing funding to shrink the divide. The group's report said, for example, that in 2002, Africa had 59 million fixed-line or mobile phones, far more than some other estimates. The report also said half the world's population now have access to a fixed-line phone and 77 percent have access to a mobile phone.

2005-06-15 **Internet access rural India villages World Bank thin client technology bridge digital divide**

EDUPAGE; http://www.nytimes.com/2005/06/16/technology/16compute.html

BRINGING THE INTERNET TO RURAL INDIA

As many as 5,000 villages in rural India may soon be connected to the Internet, thanks to efforts of an international group of companies and organizations, including the World Bank. Many rural Indians do not have easy access to business or government functions, and the project is designed to fill that gap for villages with more than 5,000 residents in the Indian state of Karnataka. The computer centers or kiosks will connect to the Internet either through wired networks or by satellite and will have between 5 and 10 "thin client" computers. In addition to the World Bank, partners in the project include Comat Technologies, an Indian Internet service provider; ICICI Bank, a commercial bank in India; and California-based Wyse Technology, maker of computer terminal equipment. 2006-04-26 **digital divide shrink IBM _The Economist_ study worldwide**

EDUPAGE; http://news.com.com/2100-1034_3-6065240.html 23

DIGITAL DIVIDE SHRINKING

According to a study conducted by IBM and "The Economist" magazine, although the digital divide remains considerable for some countries, the gaps are shrinking. The study assessed both availability and use of technology in 68 countries and assigned each an "e-readiness" score on a scale of 1 to 10. The gap from the top of the list (Denmark, 9.00) to the bottom (Azerbaijan, 2.92) is indeed significant, but in certain regions of China and India, connectivity rivals that of developed nations, according to Peter Korsten, European director at IBM's Institute for Business Value. The study noted that nearly every country's score improved from last year but that countries nearer the bottom of the list saw greater gains than those in the upper tiers, indicating a shrinking digital divide overall. Beyond the issue of connectivity lies the question of what efforts each country makes to use technology. As Korsten said, "It's up to governments to take advantage with education and other initiatives."

2000-01-18 **internet online voting study report state government task force**

California State Government http://www.ss.ca.gov/executive/ivote/

The California Internet Voting Task Force issued its "Report on the Feasibility of Internet Voting." A key section from the Executive Summary: "
The implementation of Internet voting would allow increased access to the voting process for millions of potential voters who do not regularly participate in our elections. However, technological threats to the security, integrity and secrecy of Internet ballots are significant. The possibility of "Virus" and "Trojan Horse" software attacks on home and office computers used for voting is very real and, although they are preventable, could result in a number of problems ranging from a denial of service to the submission of electronically altered ballots.

Despite these challenges, it is technologically possible to utilize the Internet to develop an additional method of voting that would be at least as secure from vote-tampering as the current absentee ballot process in California. At this time, it would not be legally, practically or fiscally feasible to develop a comprehensive remote Internet voting system that would completely replace the current paper process used for voter registration, voting, and the collection of initiative, referendum and recall petition signatures."

2000-10-20 **electronic voting workshop**

RISKS 21 10

The Internet Policy Institute (IPI) held a workshop on October 11 & 12, 2000 to examine the issues associated with conducting public elections via computer networks. Sponsored by the National Science Foundation (NSF) and chaired by C.D. Mote, Jr., president of the University of Maryland, this workshop was in response to a request by the White House to study the feasibility of Internet voting. Avi Rubin participated in the workshop and wrote in RISKS:

"Panels were held discussing issues such what e-voting means, whether or not e-voting would improve accessibility, whether it would widen the digital divide, and whether more people would vote. On the technical side, there were panels about the security requirements, the current state of security on desktops as related to voting.

The mandate was to cover the following issues:

* How to ensure the security and reliability of the voting process;
* How to protect the privacy of voters;
* How to authenticate voter identity;
* How to achieve broad and equitable access to online voting systems;
* How to assess the impact of online voting on representative democracy and community; and
* How to ensure that online voting systems are convenient, flexible, and cost-effective."

2000-11-07 **voting computers proprietary software Trojans QA quality assurance open source fraud**

RISKS 21 10

Douglas W. Jones, the chair of the Iowa State Board of Examiners for Voting Machines and Electronic Voting Systems, wrote an essay for RISKS in which he expressed concern over the growing use of proprietary software for voting machines and other forms of electronically-mediated voting. He pointed out that such software makes it much easier to insert Trojan code than, say, open-source software.

He ended his essay as follows: "The time has come for computer professionals to press for a change to the guidelines for voting machines, asking that all software included in such machines be either open source, available for public inspection, or at least open to inspection by a third party independent testing authority. There are no technical obstacles to this! Linux, Free BSD and several other fully functional operating systems are available and will run on the hardware currently being incorporated into modern voting machines!

But, this is not the end of the problem! How do you prove, after the fact, that the software in the voting machine is the software that was approved by the board of examiners and tested by the independent testing authority? No modern machine I'm aware of makes any real effort to allow this proof, although several vendors do promise to put a copy of their source code in the hands of an escrow agency in case a question arises".

2000-12-19 **online voting automated teller machines ATM ABM**

RISKS 21 15

David Jefferson wrote a thoughtful analysis of proposals for using automated teller machines (ATMs) for voting. Although such machines are often equipped with security measures, Jefferson showed major disadvantages that preclude using them for elections. In summary, his objections to using the ATM networks for voting were as follows:
* Private voting, like absentee balloting, is subject to voter intimidation, coercion and vote-selling;
* Voter authentication is problematical, since vote-sharing (voting by proxy) is illegal;
* Reliability of electronic voting using banking networks would be problematic;
* Independent oversight by election officials would be complicated if the privately-owned ATM networks were used for voting;
* The security of the banking networks would be equally compromised if election officials had access to financial systems;
* It is unthinkable that banks would turn over complete control of their systems to public officials even for a single day, let alone for the time required "to build, debug and certify such a system. . . ."
Therefore, concludes Jefferson, "the suggestion to use the ATM network for voting is a complete nonstarter."

2001-03-16 **online elections voting problems report analysis**

RISKS 21 28

Terry Carroll summarized in RISKS a recent report on online voting. "The National Science Foundation recently released a study that it commissioned from the Internet Policy Institute on problems associated with Internet voting. The NSF's press release on the study may be found at < http://www.nsf.gov/od/lpa/news/press/01/pr0118.htm>. The IPI has a page devoted to the study (including a link to the report itself) at <http://www.internetpolicy.org/research/results.html>."

According to Carroll, "The NSF highlights the following findings with respect to the feasibility of Internet voting:
- Poll site Internet voting systems offer some benefits and could be responsibly deployed within the next several election cycles;
- The next step beyond poll-site voting would be to deploy kiosk voting terminals in non-traditional public voting sites;
- Remote Internet voting systems pose significant risk and should not be used in public elections until substantial technical and social science issues are addressed; and
- Internet-based voter registration poses significant risk to the integrity of the voting process, and should not be implemented for the foreseeable future.

Another item in the same issue of the RISKS Digest noted an amusing glitch in an online election. Sarr Blumson reported, "The college I attended is running the election for alumni appointed trustee with a Web voting option through election.com. So I went to cast my vote, and got in response:

Microsoft OLE DB Provider for SQL Server error '80040e14'

The log file for database 'electnet' is full. Back up the transaction log for the database to free up some log space.
/dartmouth2001/confirmation.asp, line 92

It's happened twice. It let me vote successfully a few hours later; I'm assuming/hoping it only recorded my vote once. . . ."

2001-03-29 **online Internet voting standards**

RISKS 21 33

David Marston reported on a move by The Organization for the Advancement of Structured Information Standards (OASIS, http://www.oasis-open.org) to address online voting by developing standards. He provided the following excerpt from published documents on that site:

"A new OASIS technical committee is being formed. The Election and Voter Services Committee has been proposed by Gregg McGilvray, election.com (chair); Oliver Bell, Microsoft; and Ed McLaughlin, Accenture.

Purpose: To develop a standard for the structured interchange of data among hardware, software, and service providers who engage in any aspect of providing election or voter services to public or private organizations. The services performed for such elections include but are not limited to voter role/membership maintenance (new voter registration, membership and dues collection, change of address tracking, etc.), citizen/membership credentialing, redistricting, requests for absentee/expatriate ballots, election calendaring, logistics management (polling place management), election notification, ballot delivery and tabulation, election results reporting and demographics.

Implementation: The standard under development by election.com, Inc. will be made available for review and revision and can be expanded upon as necessary. A phased approach will be used to implement the standard due to the number of aspects being considered by the standard."

2002-01-26 **online court proceedings judgements Web**

RISKS 21 89

Tony Ford summarized a new official self-service litigation system available in England & Wales in a brief article in RISKS (quoted verbatim below):

Today's Daily Telegraph (a quality UK broadsheet newspaper) carries a *potentially* disturbing report describing a new service, "Money Claim Online", whereby individuals and law firms (solicitors) can issue most simple legal proceedings (where a sum less than UK pounds 100,000 is claimed, = USD 140K)) and enforce judgments via a Web browser. The new service has been set up without publicity by the Lord Chancellor's Department, which runs the courts system in England and Wales. It seems that the system is accessible to the public now, although it has not been officially launched.

People using the service are (oddly) referred to as "customers" .... and there is a Customer Help Desk ...

The newspaper report is also viewable at this Daily Telegraph link on-line:
http://www.telegraph.co.uk/news/main.jhtml?xml=/news/2002/01/26/nsue26.xml&sSheet=/news/2002/01/26/ixhome.html

The service can be seen on-line at: https://www.moneyclaim.gov.uk/csmco/index.html

No details are apparent of what measures are taken to validate the identity of the claiming party or prevent other gross miscarriages of justice .... but it would appear that the potential exists for significant trouble .... even though the site warns that "vexatious litigants" are not allowed to us it (these are people who have abused the litigation system in the past to such an extent that they have been declared "vexatious litigants", restricting their ability freely to issue legal proceedings).

PS: I am a lawyer myself, although I don't practise in this area .. but do work in-house for a large IT company ... these comments are offered purely in a personal capacity.

Category 29.4 Online & electronic voting

2002-01-30 **online voting touchscreen COTS insider fraud penetration intrusion audit trail tampering data diddling QA quality assurance**

RISKS 21 90

David E. Price reported that "officials in Florida's Miami-Dade County have approved a $24.5 million contract to replace the county's punch-card voting system with touchscreen equipment, in time for Nov 2002. The touchscreen machines make it impossible to vote for more than one candidate in each race, known as overvoting, and alert voters if they fail to select any candidate, or undervote. Two other counties that were at the heart of the controversy -- Palm Beach and Broward -- also plan to use touchscreens."

Peter G. Neumann added, "And as we have noted here before, today's touchscreen systems provide essentially ZERO hard evidence that your vote is counted as cast, and not for someone else or for no one. With just a little insider fraud, what a remarkable opportunity for rigging elections!"

A couple of weeks later, Alan Brain added the following concise commentary:

"The risks for vote-rigging on COTS systems [include]:

a) Someone tweaks the BIOS of the voting machines. b) Someone tweaks the OS of the voting machines. c) Someone tweaks the applications code d) Someone tweaks the compiler.

a) Can best be dealt with via physical security only - have non-flashable BIOSes, and disallow unauthorised access.

The rest require both a publicly available Open Source codebase, and physical security to make sure that what you think is on the machine, actually is. And that the right OS has been installed, and the right compiler used."

He added, "Conversely, if the voting is being done with machines where the OS, Applications Sourcecode and Compiler aren't Open Source, then security is problematic."

2002-02-20 **onnline voting fraud countermeasures COTS commercial off-the-shelf software**

RISKS 21 92 FF

The RISKS Forum was the locus of a vigorous discussion of online voting hazards. The following collates contributions from various contributors:

[Alan Brain] The risks for vote-rigging on COTS systems [include]:

a) Someone tweaks the BIOS of the voting machines.
b) Someone tweaks the OS of the voting machines.
c) Someone tweaks the applications code
d) Someone tweaks the compiler.
e) Someone tweaks the compiler of the compiler of the …. [Mike Nelson]

a) Can best be dealt with via physical security only - have non-flashable BIOSes, and disallow unauthorised access.

The rest require both a publicly available Open Source codebase, and physical security to make sure that what you think is on the machine, actually is. And that the right OS has been installed, and the right compiler used.

[Lee Barstow] With physical access to voting machines and/or the software used to control them, the only sure way to provide security is a paper record.

Especially with OpenSource software, it becomes possible to recompile (and hence alter) any electronic-only record. Closed Source software isn't any better - it lacks public accountability and scrutiny. Someone could always create a new ROM, OS, or software image if given sufficient knowledge, bypassing any security system that has been put in place.

So: Print an OCR paper record when the voter finishes his vote. He gets to check the paper copy and put it in a standard secured voting box. The best parts are:

(a) Since it's printed on demand, only the voter's candidate appears on the printout - the voter sees only who or what he voted for, or that he made no vote, and can easily check the paper before dropping it in the box.

(b) Using OCR, independent auditing becomes easy. The auditor needs little in the way of custom hardware or software to do the job; they only need to tweak their OCR readers. Auditors could be chosen by mutual agreement of the candidates after the vote is completed (and only if a candidate determines he wants to have a recount), removing any temptation to bribe the auditing firm.

TREND TOWARD ELECTRONIC VOTING
More and more companies are allowing shareholders the option of Internet voting, motivated as much by reductions in postage costs as anything else. Mary Ann Butera of ADP Investor Communication Services says an Internet vote costs a company only about 3 cents, compared to a paper proxy which costs a company 34 cents. "It doesn't sound like much, because you're talking about pennies. When you multiply that over thousands of investors, it does add up." And of course there's the matter of pride of being on top of technology developments. Tom Newston of EquiServe notes: "A small company that only has hundreds of shareholders, or a few thousand shareholders, may not see the cost savings as a big number. But at the same time, they may want to be thought of as a forward-thinking, cutting-edge company." In the U.S., 85% use "traditional" voting methods: 70% of proxy voters mail their votes and 15% use the phone. (Tampa Tribune/San Jose Mercury News 15 May 2002)

E-Voting (1): Not Ready Yet

by M. E. Kabay, PhD, CISSP
Associate Professor, Computer Information Systems
Norwich University, Northfield VT

Electronic voting has been proposed in a number of precincts in the USA. One of the most extensive archives of discussions about this issue is the RISKS FORUM DIGEST edited by Peter G. Neumann of SRI Intl. Entering "vote" as a keyword in the search engine available through at < http://catless.ncl.ac.uk/Risks/ > brings up 303 entries starting with Volume 1 Number 1 [henceforth notated as "v(n)" for the volume and number] in 1985; additional articles can be found using other related keywords such as "voting" and "election."

One of the most recent contributions comes from Jonathan Kamens, writing in RISKS 22(39) (23 Nov 2002). He describes a system that allows a voter to mark a paper ballot and then feed it in through an electronic reader. Kamens points out that the card-reading voting system proposed for Boston MA has fundamental problems:

* There is no way for a voter to verify that the system is correctly registering the voter's choices on the ballot.

* If the card reader indicates that a card has not successfully been registered, a voter can be given a second card -- but the invalid one goes straight into a locked ballot box. If there's a recount, someone could get both their ballots counted.

In general, e-voting systems can include any or all of the following functions, each requiring increasing degrees of security:

* Automatic reading and tallying of votes made on paper ballots;

* Accepting votes using electronic input devices such as electric pens, touch-screens, and keyboards;

* Remote voting at a distance.

E-voting systems need to include at least the following security characteristics:

1) Remote voting requires identification, authentication and authorization PLUS guarantees of complete privacy as well as measures to prevent fraudulent exclusion of valid voters and fraudulent acceptance of repeated votes by individuals.

2) Electronic data entry should include all the measures developed in the last 40 years of data processing to reduce the likelihood of user error; such measures include

a) feedback to the user to be sure that what was entered was what was recorded;

b) error checking and alerts to prevent obvious blunders such as voting for two people for the same position if that is not permitted;

c) provision of overrides so that voters can deliberately spoil their ballot if that's what they want to do;

3) Fail-safe redundancy so that no single point of failure or even widespread denial-of-service attacks could wipe out voter's intentions;

4) Cryptographically strong local and remote audit trails to keep multiple independent records of all votes; such files could include checksums that are calculated using the preceding record's checksum as input to the hashing algorithm (to reduce the ease of fraudulent tampering with the records).

One of the most serious questions raised about e-voting is independent of security: it's the issue of equal access. Will widespread e-voting lead to increased disparity between the voting patterns of richer and poorer people among the electorate? Will e-voting be yet another example of what has been called the "digital divide?"

* * *

In the next article in this two-part sequence, I will look at some detailed analyses of e-voting with special attention to security.

E-Voting (2): Security Analyses

by M. E. Kabay, PhD, CISSP
Associate Professor, Computer Information Systems
Norwich University, Northfield VT

In the first of these two short articles, I've been introducing e-voting. In this part, I summarize some key analyses of the security issues surrounding remote voting via the Internet.

In a July 2002 article posted on the BBC Web site, commentator Bill Thompson comments on a recent Green Paper proposal by Robin Cook, Leader of the House of Commons. Cook includes two methods for increasing the involvement of the public in government decision-making: "For the government, the two strands that make up e-democracy are ways to enhance participation (e-participation) and electronic voting (e-voting)." Thompson argues that the vulnerabilities of any e-voting system built in the next few years should preclude any use of such insecure technology. He writes that the consequences of fraud would be so serious that large amounts of investment would be profitable if they swayed the direction of an election. For example, "If we all use trusted processors then why not set up a production line to manufacture your own hacked chips? It would only cost a few tens of millions of euros. If all code has to be signed by some digital authority, why not spend a few million bribing the senior staff?"

A much longer and more detailed analysis of e-voting is from the respected scientist Avi Rubin of AT&T Labs. Rubin neatly summarizes the issues as follows [I have added the asterisks as bullets and slightly changed the punctuation]: "There are many aspects of elections besides security that bring this type of voting into question. The primary ones are

* coercibility – the danger that outside of a public polling place, a voter could be coerced into voting for a particular candidate.

* vote selling – the opportunity for voters to sell their vote.

* vote solicitation – the danger that outside of a public polling place, it is much more difficult to control vote solicitation by political parties at the time of voting.

* registration – the issue of whether or not to allow online registration, and if so, how to control the level of fraud."

Rubin then analyses the voting platform, the communications infrastructure, social engineering, and specialized devices (by which he means "tamper-resistant devices, such as smart cards." He discusses in some detail how programmatic attacks (viruses, worms, denial-of-service [DoS] attacks) could easily alter election results. Just imagine the consequences of, say, carefully-written Trojan horse programs, targeted DoS attacks on particular precincts on election day; Rubin writes, "In some close campaigns, even an untargeted attack that changes the vote by one percentage point could sway the election." According to the notes in the source HTML for the document, that sentence was written a few weeks before the contested US presidential election of 2002. I strongly recommend Dr Rubin's paper as foundation reading for anyone interested in e-voting.

Finally, I direct your attention to the immensely valuable annotated bibliography on electronic voting prepared by Rebecca Mercuri, PhD, Professor of Computer Science at Bryn Mawr College. Dr Mercuri has a distinguished record of contributions to the technical analysis of electronic voting; her Web site (see below) has many pages of news, essays, pointers to other e-voting sites, lists of her own and other scholarly works on the subject, and even pointers to e-voting humor.

* * *

I hope that these two short articles will increase readers' interest in the trustworthiness of e-voting and that some of you will be able to contribute to a more informed discussion of this critically important issue in the future of representative democracy. I'm sure that I will be hearing from e-voting technology vendors clamoring for attention; if possible, I'll write a follow-up column with some of their remarks.

2003-02-03 **electronic e-voting security risk debate**

NIPC/DHS

January 30, SecurityFocus — E-voting security debate.

Some respected computer scientists and security experts in California's Silicon Valley say the risks posed by malicious hackers, equipment failure or subtle programming errors make fully-electronic voting systems a bad idea. "There's no voter-validated record, so Trojan horses or accidents can happen without any evidence that anything has gone wrong," correctly," says Peter Neumann, a scientist at SRI International, a non-profit research institute. Electronic voting systems usually featuring touch screens and simple ATM-like interfaces. By some estimates one out of five votes were cast electronically last November. The systems are not connected to the Internet; instead, voters' ballots are typically stored on an internal hard drive until the polls close. Then they're copied a portable disk or a non-volatile memory card and taken to a central counting facility. It's the paperless nature of the transaction that bothers critics. "The problem is that…it's really up to the company that wrote the software to say that there were no errors or deliberate tampering that interfered with the vote," says David Dill, a computer science professor at Stanford University. The computer scientists say they'd be happier, but not convinced, if companies making the electronic voting systems released their code for public review. On Friday they are going to attempt to persuade Santa Clara County to embrace a system in which electronic voting stations print a hard copy of the voter's ballot. The voter can then review the printout before manually depositing it in a ballot box.

2003-02-24 **online voting**

NewsScan

LORRIE CRANOR ON INTERNET VOTING
In an interview with John Gehl for the ACM online weekly publication Ubiquity, Dr. Lorrie Faith Cranor of ATT Labs-Research, an expert on technology policy issues, says: "I am afraid that Internet voting will be a reality, and I think it's a bad idea, which surprises people. Usually people think that because I have done Internet voting work, I must be excited that Internet voting is progressing. It's one of those things that the more you know about, the less you like it." What does she dislike about Internet voting? "For one thing, there are huge security risks, especially when people are talking about Internet voting from home or from work as opposed to, say, going to a polling place that happens to be connected to the Internet. That's no fun. If we have to go to the polling place it really doesn't matter if it's connected to the Internet or whatever because we still had to go to a polling place. So when people, especially in the press, talk about Internet voting they're talking about voting from anywhere; from home in your pajamas is the classic example. That means voting over the existing insecure Internet using the existing insecure computers in my house that might have viruses or mis-installed software on them. I think that it is really dangerous, especially in elections where there's something really important at stake." (Ubiquity Feb 2003)

2003-07-12 **e-voting security experiment 2004**

NewsScan

INTERNET VOTING IN 2004
The Secure Electronic Registration and Voting Experiment, which involved only 84 voters in 2000, is set to balloon next year when as many as 100,000 citizens in the military and living abroad will have the option of casting their votes via the Internet. The Pentagon-run SERVE program will be limited to eligible voters from South Carolina and Hawaii, as well as residents from selected counties in Arkansas, Florida, Minnesota, North Carolina, Ohio, Pennsylvania, Utah and Washington. If the test proves successful, the $22-million program could be expanded to include 6 million voters in the military and their dependents, as well as nonmilitary citizens living abroad. Some observers have voiced security concerns over electronic voting, however. "It wouldn't take much for some smart hacker to send around a virus that lays in wait for someone to issue a vote," says a project manager for the Center for Public Integrity. Meanwhile, Polli Brunelli, director of the Pentagon's Federal Voting Assistance Program, says her office is taking unprecedented security measures to ensure system integrity. "With this population, we have made the casting of the Internet ballot as safe, if not safer, than with the mail-in ballots. If we reach a point where things are vulnerable and we can't guard against that, we won't go forward." (AP 12 Jul 2003)

NewsScan

SERIOUS FLAWS IN ELECTRONIC VOTING SYSTEMS
Johns Hopkins University experts say that high-tech voting machine software from Diebold Election Systems has flaws that would let voters cast extra votes and allow poll workers to alter ballots secretly. Aviel D. Rubin, technical director of the Information Security Institute at Johns Hopkins, led a team that examined the Diebold software, which has about 33,000 voting machines operating in the United States. Adam Stubblefield, a colleague of Rubin's, said that "practically anyone in the country — from a teenager on up — could produce these smart cards that could allow someone to vote as many times as they like." Diebold has not seen the Institute's report and would not comment on it in detail, but a company spokesman said: "We're constantly improving it so the technology we have 10 years from now will be better than what we have today. We're always open to anything that can improve our systems." Peter G. Neumann, an expert in computer security at SRI International, said the Diebold code was "just the tip of the iceberg" of problems with electronic voting systems. [Side note: see the interview of Peter Neumann by John Gehl in the archives of the ACM online publication Ubiquity: [http://www.acm.org/ubiquity/interviews/p_neumann_3.html.] (New York Times 24 Jul 2003)

2003-09-11 **electronic voting glitch faulty system fraud Diebold Election Systems Inc.**

NewsScan

DEBATE OVER ELECTRONIC VOTING
During California's March 2002 primary, absentee vote tallies from one county seem to have been sent to an Internet site operated by Diebold Election Systems Inc., the company that manufactured the voting machines used in the election. Activist critics of electronic voting systems say the glitch is new evidence that the technology is intrinsically faulty, but Diebold executive Deborah Seiler says that Diebold engineers may have published the results as part of a test performed days, weeks or months after the county primary (regardless of the time stamp shown): "These activists don't understand what they're looking at." Seiler insists that the company has a system of checks and balances to safeguard against fraud, but that explanation doesn't satisfy Kim Alexander, president of the California Voter Foundation, who charges: "In our quest to deliver faster, more accurate election results, we've left the voting process wide open to new forms of attack and mismanagement." (AP/San Jose Mercury News 11 Sep 2003)

SHARPTON CALLS INTERNET VOTING A 'HIGH-TECH POLL TAX'
Democratic presidential candidate Al Sharpton has protested a Democratic Party plan that would, for the first time, allow Internet voting in Michigan's presidential caucus — and is challenging front-runner Howard Dean to stand with him. Sharpton wrote to Dean: "Perhaps it is due to the fact you governed a state with virtually no people of color living within its borders that you are unaware that this is a racially biased proposal." (Vermont is nearly 98% white.) A Dean spokesman said that Dean supports the concept of Internet voting or anything that will people to the polls "as long as it's coupled with the need to insure access to African Americans and others when it might not be available." Calling the scheme a "high-tech poll tax," Sharpton explained: "A grandmother in a housing development is going to have to go downstairs and walk five blocks to vote. Who do you think is going to get more of the vote? Democracy is about equal access. This is not equal access. It really is a high-tech poll tax." (AP/USA Today 12 Sep 2003)

RISKS; http://www.labour.ie/press/detail.tmpl?SKU=20031103143251 23 1

Irish Labour Party urges suspension of e-voting until flaws addressed

Eamon Gilmore TD, a spokesman for the Irish Labour Party, said in a press release that the party "has called for the suspension of plans to extend electronic voting until the e-voting system has been changed." The decision resulted from a study of electronic voting systems by two IT experts in the Labour Party. Deputy Gilmore said that this report "identifies a number of major flaws and deficiencies in the electronic voting system…" He lists the major defects in local electronic voting systems. He points out that many of these defects are caused by electronic voting's lack of transparency--a voter "is expected to have blind trust in the technology." Then Depute Gilmore lists some of the Labour Party's proposals to reform local electronic voting. He ends, "It is essential for continuing confidence in the electoral system that the proposed electronic voting be changed. The Government should suspend plans for the extension of electronic voting until the reforms proposed by the Labour Party have been implemented."

RISKS; http://www.washingtonpost.com/wp-dyn/articles/A1397-2003Nov5.html 23 1

A new risk for electronic voting

Jeremy Epstein wrote a summary of electronic voting risks he observed (quoting his RISKS article):

The RISKS of electronic voting have been discussed often enough in this forum that I won't repeat them further (cf. Rebecca Mercuri's piece in RISKS-22.96). Last week's election in Fairfax County (Virginia) had a new risk I haven't seen covered before. They use WinVote machines, made by Advanced Voting Solutions of Frisco, Tex. These are essentially Windows laptops with a touchscreen and an 802.11 wireless net. (More about that in another RISKS article one of these days.) Seems that during the election, at least eight of the machines failed (out of almost 1000 in use county-wide), and were taken out of the polling places to a central repair facility, and then brought back after some form of "repair" was made (a reboot at the polling place did not solve the problem). The seals were broken, but the voting officials in the precincts were told to resume using them. The result was a lawsuit by the Republican party seeking to invalidate the votes from those machines. There aren't enough votes at stake that it would change any of the election results. Of course, the real problem is that without any sort of physical (paper) record, it's impossible to prove what really happened when the machines were being "repaired". In addition, the "hi tech" vote counting (which was supposed to occur by uploading the results from every precinct to a central computer over a dial-up line) overloaded the servers, and "More than half of precinct officials resorted to the old-fashioned telephone to call in their numbers or even drove the results to headquarters, elections officials said. A handful of precincts went back to paper ballots." The only thing that's surprising here is that the election officials were surprised. See

RISKS; http://www.ss.ca.gov/executive/press_releases/2003/03_100.pdf 23 3

More on Diebold installing uncertified software in California

Peter Neumann discusses an article in the LA Times about Diebold's Accuvote touchscreen voting machines. The article was titled, "Secretary of State Orders Audit of All Counties' Voting Systems: Review of upgraded touchscreen software leads to discovery that two registrars installed it without state's OK." In this article, LA Registrar Conny McCormack says that registrars had long been making changes to their counties' voting system software without state approval. He adds that California Secretary of State Kevin Kelley had known this all along. In this case, Peter Neumann worries about weak Federal Election Commission e-voting standards. He also fears the possibility of Trojan Horse code being inserted in secret changes to e-voting software as in the above case. In a follow-up article, contributor Lillie Coney noted that California Secretary of State Kevin Shelley could ban Diebold selling voting machines in California altogether.

2003-11-25 **worm virus Nachi Diebold Automatic Teller Machines ATM Windows XP embedded**

RISKS; http://www.theregister.co.uk/content/55/34175. html 23 4

Diebold ATMs hit by Nachi worm

Steve Summit writes about Diebold ATM running Windows XP Embedded becoming infected by the Nachi worm. Even though the ATMs were not on the public Internet, the worm is thought to have penetrated firewalls to reach private internets. Commenting that this incident was part of a larger trend, Steve Summit worries about "critical functions" being "implemented using less-than-rugged components such as "consumer grade" operating systems." In a follow-up article, contributor Lillie Coney quotes some security experts' reactions to the above incident. For example, Bruce Schneier said: "Specific purpose machines, like microwave ovens and until now ATM machines, never got viruses. Now that they are using a general purpose operating system, Diebold should expect a lot more of this in the future." Steve Grzymkowski, a senior product marketing manager at Diebold was paraphrased: "Diebold switched from using IBM's OS/2 on its ATMs because banks were requesting Windows." In a different article, contributor Drew Dean describes a scenario in which "[I]t's both faster and cheaper for the bank's data center to remotely patch the ATMs from a central location." So he maintains that solving ATM-worm-infection problem by gravely limiting ATM network connectivity will negatively affect manageability, and introduce new threats. Tim Panton disagrees with Drew Dean's angle on ATM patching. Panton feels that ATMs--unlike "fully autonomous systems, like weather stations or unmanned space craft"--require human contact for replenishing cash. Therefore, forcing only remote ATM patching is not the best practice.

Voter-verified breadcrumb trail?

Contributor Dave Brunberg vents, "Why not just admit that e-voting cannot be made secure without adding in so much complexity that it becomes prohibitively expensive or self-defeating?" He opines that although a paper printout of an e-ballot is a necessary step in e-voting security, it could be "a serious insecurity of the false-sense-of-security type." He goes on to raise some still-unanswered questions about e-voting security, such as: "What guarantee is there that no alterations occurred between the touchscreen station and the recording station?", "Once you get out of the actual voting station and the printer, what, if anything, guarantees that votes aren't swapped or dropped?", "And, for areas where physical intimidation may be a factor, how can the voter be assured of anonymous voting when the printer spits out the name of their selections for anyone to see?" Peter Neumann responds to Dave Brunberg in three points. First, he says that paper ballots, not e-ballots, should be the ballots actually counted. E-ballots could "appease the media only for an UNOFFICIAL PRELIMINARY count." Second, he feels that the appearance of discrepancy between paper- and e-ballots from a voting machine should result in the deactivation of that voting machine "for the duration of the election." Third, he affirms that Brunberg's question of why we need e-voting machines at all is valid. In a following article, William Ehrich points out that a paper trail for e-voting is much like having "the voter simply mark the piece of paper with a felt marker." He recommends using paper ballots and electronic-ballot-counting machines. He concludes that using computers where they're not requisite "can do more harm than good." In another article, contributor Russ Cooper attempts to answer the question, "Why have electronic voting machines at all?" He feels that remote electronic voting may encourage greater voter participation: it takes lesser time to cast an e-ballot from one's own home than to do the same by visiting a polling station. In a different article, Finn Poschman refutes Russ Cooper's argument. He says that the costs of "achieving a reasonably fair and verifiable e-vote-from-home" are heavy while the benefits are few. Sander Tekelenburg has a different rebuttal to Russ Cooper: "Voting from the privacy of your home would make it even easier for people to force each other to vote for candidate x than the 'regular' abuse within the sacrecy of the home that's already happening on a grand scale. A public voting station, with secret voting, avoids that RISK."

SECURITY CONCERNS ABOUT VOTING MACHINES
Diebold and other companies that make electronic voting machines are joining forces to make the case that electronic voting technology is sufficiently secure to withstand intrusion by hackers. A number of computer experts have argued that the new machines have security problems, and that they should be equipped to provide companion paper records for auditing purposes. Paper printers could add $500 to the cost of each machine. (Washington Post 8 Dec 2003)

2003-12-26 **electronic e-voting principles Australia procedure**

RISKS 23 10

Elections Down Under

Responding to discussions in RISKS about e-voting in the United States, Peter Williams outlines how elections are conducted in Australia: Elections are managed by the AEC, an independent federal organization affiliated with no political party. All balloting is done by hand--voters rank the candidates in order of preference. Though ballots are hand-counted, the results are available within a few hours of an election. Voting is mandatory for everyone over age 18, and any adult not voting is fined. Peter Williams also lists his suggestions for computerized voting system. First, he says that the "specifications, source code, test procedures and results" of a computer-voting system should be freely available for public scrutiny. Second, he suggests using secure, well-configured, minimalist operating systems to run the voting software. Next, he recommends a voter paper trail that is also available to election officials to verify electronic votes. Finally, he suggests extensive logging and auditing to so that results can be checked "confidently". In a follow-up article, Mark Newton clarifies the mandatory-voting-if-over-18 aspect of Australian elections. Newton points out that voting in Australia is not compulsory. However, it is compulsory to register to vote if you're over 18 and to show up at a polling station during elections. At the polling station, after checking yourself off for attending, you can choose to either vote or not vote. In another follow-up article, contributor Eric Ulevik corrects some misinformation in earlier posts about the Australian electoral system. Ulevik observes that "[S]imply getting your name checked off and leaving," like Mark Newton had written, "may result in the Electoral Commission staff recording a failure to vote." This, in the Australian state of New South Wales, would cost you a $120 fine. If you refuse to pay this fine you could lose your driver's license. Because avoiding elections altogther in Australia carries penalties, if you don't want to vote there, Eric Ulevik suggests casting a "'donkey' vote." He casts his 'donkey' vote by giving his "preference by order on the ballot (which is determined randomly)." Ulevik concludes: "The clear risk here is that attempting to enforce democratic principles increases the influence of random chance on the final results."

RISKS; http://www.msnbc.msn.com/id/3825143 23 10

VoteHere reports computer break-in

An article on MSNBC.com said that federal authorities were investigation a network intrusion at VoteHere, a secure e-voting company. VoteHere's founder Jim Adler thought that the intrusion may have been politically motivated. The MSNBC article noted: "Adler's revelation came amid a deepening debate over e-voting and its vulnerability to election fraud -- and a controversy over surreptitious methods to get information about how e-voting software works." RISKS moderator Peter Neumann added that VoteHere later knew who the intruder was. In a follow-up article, contributor Rebecca Mercuri questions VoteHere's trustworthiness as a secure e-voting system maker in the wake of such a network intrusion: "VoteHere is selling an Internet voting product but they apparently aren't capable of protecting their own network from attack and their sensitive files from theft." As a result of the VoteHere network break-in, Mercuri says she actually feels better that VoteHere's proprietary source code could be examined by the intruder and his "pals".

INTERNET VOTING DISPUTE

An Internet-voting program written for the Pentagon by Accenture eDemocracy Services for use by men and women serving overseas is being fiercely criticized by security experts Avi Rubin of Johns Hopkins University and retired IBM researcher Barbara Simons. Rubin says, "It's not possible to create a secure voting system with off-the-shelf PCs using Microsoft Windows and the current Internet. History has shown that when people have the opportunity to tamper with an election they do." On the other side of the issue, R. Michael Alvarez, co-director of the CalTech-MIT Voting Technology Project says: "The chance of a security threat has to be weighed against the knowledge gained and the improved voting access for those people. There's a widespread perception that Internet voting is going to happen at some time. As scientists, we'd like to lay out some kind of rational path that leads from punch cards and lever machines to that logical future." (Washington Post 21 Jan 2004)

2004-01-23 **electronic e-voting discourage analysis hacking fraud error quality assurance**

NIPC/DHS; http://www.gcn.com/vol1_no1/security/24681−1.html

January 22, Government Computer News — Security analysts recommend scrapping online voting plans.

A group of security analysts who have evaluated Department of Defense (DoD) plans for an online voting pilot have recommended that the plan be scrapped because its security cannot be ensured. The analysts concluded "Internet voting presents far too many opportunities for hackers or even terrorists to interfere with fair and accurate voting." The DoD, however, said it has no intention of stopping the program. "Security was our Number One priority when we started on this concept," DoD spokesman Glenn Flood said. The Secure Electronic Registration and Voting Experiment (SERVE) is a DoD program being operated by the Federal Voting Assistance Program (FVAP) to ease absentee voting procedures for U.S. citizens living or serving overseas. A 10-member Security Peer Review Group put together by FVAP evaluated the system. A minority report was issued by four members of the group. The report said inherent flaws in proprietary software, the Internet and PCs from which votes would be cast make the process too risky to be used in a real election. Threats include insider flaws, denial-of-service attacks, spoofing attacks, and malicious code. Flood said weaknesses in the Internet infrastructure were taken into account in designing SERVE.

PENTAGON CANCELS E-VOTING PLANS

Because of security concerns, the Department of Defense has canceled plans to use an electronic voting system that would have been used by Americans overseas to cast their votes next November; the system is called Secure Electronic Registration and Voting Experiment (SERVE). Deputy Defense Secretary Paul D. Wolfowitz said in a memo: "The department has decided not to use SERVE in the November 2004 elections. We made this decision in view of the inability to ensure legitimacy of votes, thereby bringing into doubt the integrity of the election results." Wolfowitz goes on to say that the system will continue to be used for testing and development purposes. Meg T. McLaughlin, president of Accenture eDemocracy Services, says the decision to continue testing the system will provide "an opportunity to demonstrate that the Internet is viable, valuable and secure enough to use for filing absentee ballots. We are confident that sending absentee ballots via the Internet is just as secure and reliable as sending them by mail." (New York Times 6 Feb 2004)

Securing Vote Tallies

by M. E. Kabay, PhD, CISSP
Associate Professor, Computer Information Systems
Norwich University, Northfield VT

Vermont has a tiny population; we have about 600,000 people in the entire state. Because of this small population, people here have many ways of becoming involved in civic affairs. Our state house in Montpelier (the smallest state capital city in the US, with 8,000 people) is open to the public, as are committee meetings. State officials such as the governor often walk about in town where ordinary citizens can chat with them in a friendly and very personal way.

I was recently invited to address the Government Operations Committee as they discussed a pending bill which would require any wholly electronic voting mechanism to be equipped with a means of producing a paper ballot that could be inspected by the voter and which would then be stored safely for official recounts. Given the importance of safeguarding the vote in our nation, I thought it might interest readers to step outside the confines of network security for a moment to consider the security implications of wholly electronic voting.

Today, there are three different forms of voting in place in use in the USA (I won't discuss remote, Internet-based voting in this column): one can mark a piece of paper by hand and have it read by people; one can mark a piece of paper by hand or machine and have it read by an optical-mark reader which tallies the results automatically; or one can use a wholly-electronic system with an input device such as a touch-sensitive screen which stores the results in a database and produces automatic tallies.

Normally, paper ballots, whether read by people or tallied by machines, are stored in sealed containers and can be opened with a court order in cases of judicially-approved recounts when election results are challenged.

In Vermont, the Secretary of State's office allows optical-mark readers to be used for elections; only one such machine is required per voting location, most of which have at most a few thousand voters registered per location. However, most locations still use manual counting of ballots under the supervision of representatives of the various political parties involved in the election.

In my testimony before the Government Operations Committee, I stressed the following points:

* Any system of vote counting that relies on completely proprietary (secret) programs is potentially vulnerable to abuse. The underlying computer programs controlling how marks on ballots are counted in Vermont are proprietary (they are owned by Diebold Corporation), but the technicians who prepare the configuration tables relating a position on a ballot to a particular name work for an independent consultancy in Massachusetts and their configuration tables are open for inspection.

* Every optical tabulator is tested to see if it reads ballots correctly before the election begins.

* Passing a law that allows the Secretary of State to order a random check on the accuracy of machine tallies in any voting district will help prevent systematic fraud. The tallies in a manual recount must match the machine tallies to within an acceptable error rate (to allow for the inherent difference between machine tallies and human counting methods: machine reject incorrectly-marked ballots whereas people can agree on the intention of the voter).

* Wholly-computer-based voting systems have far more vulnerabilities to tampering than optical-mark sensors. We know that even companies such as Microsoft have allowed Easter Eggs (unauthorized, undocumented code such as flight simulators) to escape quality assurance and be delivered to customers in software such as MS-Excel. We know that microprocessors have been tampered with to cheat clients and evade testing (e.g., gas pump meters in the Los Angeles district were designed to overcharge customers by 10% -- unless they noticed one- or five-gallon deliveries, which were the volumes typically used by inspectors when checking accuracy). We know that production code has been profoundly flawed for years without being caught (e.g., the Colorado lottery's not-very-random-number generator that produced only numbers from zero to eight but never any nines). We know that data stored in databases without careful attention to chained cryptographic checksums involving timestamps, sequence numbers and the previous record's checksum can be modified to misrepresent election results.

* For all these reasons, we should resist the use of wholly-computerized voting machines until there is software that is entirely open to inspection.

* Any wholly-electronic voting machine should be required to produce a paper ballot showing the voter's choices for inspection by that voter (only). The voter should then be required to place the ballot in a ballot box for use in judicial recounts and random testing of the accuracy of the computerized voting system.

2004-02-25 **e-voting physical security tampering fraud hacking**

RISKS 23 20

PHYSICAL SECURITY OF ELECTRONIC VOTING TERMINALS

Tobin Fricke reported in RISKS on sloppy security for e-voting equipment: "A cart of Diebold electronic voting machines was delivered today to the common room of this Berkeley, CA boarding house, which will be a polling place on Tuesday's primary election. The machines are on a cart which is wrapped in plastic wrap (the same as the stuff we use in the kitchen). A few cable locks (bicycle locks, it seems) provide the appearance of physical security, but they aren't threaded through each machine. Moreover, someone fiddling with the cable locks, I am told, announced after less than a minute of fiddling that he had found the three-digit combination to be the same small integer repeated three times.

One wonders whether paper ballots would be handled differently, how the terminals are stored between elections, what checks are done for tampering before the use of the terminals, and what physical security features are built into them."

TOUCHY (AND UNCLEAR) SUBJECT

Supporters of the new touch-screen voting machines promise paperless elections cheaper and faster to administer, but there are plenty of skeptics. David Jefferson, a computer scientist at the Lawrence Livermore National Laboratory, warns: "Once a ballot is cast, you can't pull it back out. After the fact, you cannot recover from problems. It's not like a financial system, where you can take reasonable risks; in voting, you just can't." MIT computer science professor Ted Selker, more optimistic about the machines, says: "There are things that are scary that don't happen. And the versions of the software have been such that somebody with nefarious goals would be as confused as the rest of us if they tried." CalTech political scientist R. Michael Alvarez agrees with Selker, but adds: "The issue of voting systems has gotten very politicized in the last year. The overriding issue now is that there's an enormous amount of uncertainty election administrators have about what technological change is happening and what's going to be permitted under the law, and it's not entirely clear that we're going to have the technology to meet the requirements that have been put out there." 2004-04-13 **electronic voting**

http://www.dissidentvoice.org/April2004/Landes0413.htm

As the battle over voting machines rages across the country, the U.S. Commission on Civil Rights met on 9 Apr 2004, to examine the "Integrity, Security and Accessibility in the Nation's Readiness to Vote." Two scientists and four representatives of civil rights organizations were invited to brief the Commission.

But, before the panelists had a chance to share their views, three Republican commissioners and one (notably conservative) Independent commissioner walked out, ostensibly over a personnel dispute. But, others are not so sure.

It appears that voting technology is a topic that the Republican leadership wants to tightly control. It is without doubt that Republicans own most of the companies that manufacture, sell, and service voting machines. And President Bush and the Republican Congress appear determined to control and limit oversight of the elections industry. The Bush Administration has stacked the Election Assistance Commission with supporters of paperless voting technology, while the National Institute of Standards and Technology's (NIST) got walloped with a $22 million budget cut in fiscal 2004, which means that NIST will have to cut back substantially on its cyber security work, as well as completely stop all work on voting technology for the Help America Vote Act.

2004-04-24 **electronic e-voting legislators wary Diebold concern**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A38997−2004Apr 24.html

April 24, Associated Press — Legislators wary of electronic voting.

Computer scientists have long criticized touchscreen voting machines as not being much more reliable than home computers, which can crash, malfunction and fall prey to hackers and viruses. Now, a series of failures in primaries across the nation has shaken confidence in the technology installed at thousands of precincts. At least 20 states have introduced legislation requiring a paper record of every vote cast. On Thursday, April 22, a California panel unanimously recommended banning a Diebold Inc. paperless touchscreen model. Secretary of State Kevin Shelley, who said Diebold glitches "jeopardized the outcome" of the March 2 primary, has until April 30 to decide whether to decertify Diebold and possibly other touchscreen terminals in California. The bipartisan U.S. Election Assistance Commission, formed in January to develop technical standards for electronic voting, will conduct a May 5 public hearing in Washington, DC. Computer scientists say paperless systems made by Sequoia Voting Systems Inc. and other competitors also expose elections to malicious attack, software glitches and mechanical errors that could delete or alter millions of ballots.

Category 29.4 Online & electronic voting

2004-04-29 **Diebold electronic paperless voting machines vulnerabilities hacking perversion distortion election**

http://www.nytimes.com/2004/05/03/technology/03vote.html?th=&pagewanted=print&position=

Professor Aviel Rubin, Technical Director of the Information Security Institute of Johns Hopkins University, demonstrated the vulnerability of paperless electronic voting systems to hacking in a classroom demonstration in April. As John Schwartz of the New York Times wrote, "The fix was in, and it was devilishly hard to detect. Software within electronic voting machines had been corrupted with malicious code squirreled away in images on the touch screen. When activated with a specific series of voting choices, the rogue program would tip the results of a precinct toward a certain candidate. Then the program would disappear without a trace."

Professor Rubin published an analysis of 49,000 lines of the bold voting machine code in July 2003. the security implications were grim, as he and his colleagues wrote: "Our analysis shows that this voting system is far below even the most minimal security standards applicable in other contexts. We conclude that, as a society, we must carefully consider the risks inherent in electronic voting, as it places our very democracy at risk." in a report on his experience as an election scrutineer, he wrote, "I started realizing that some of the attacks described in our initial paper were actually quite unrealistic, at least in a precinct with judges who worked as hard as ours did and who were as vigilant. At the same time, I found that I had underestimated some of the threats before…. I continue to believe that the Diebold voting machines represent a huge threat to our democracy."

Category 29.4 Online & electronic voting

2004-05-06 **Diebold voting machines security problems lawsuits**

NYT Circuits

David Pogue of the New York Times wrote a blistering editorial criticizing Diebold and other electronic-voting machine manufacturers. He wrote,

>Remember how, a few months back, I expressed my horror that Diebold's touch-screen voting machines, which one in five Americans will use in this fall's elections, were failing every security test? Its technicians make changes to the machines' software AFTER inspection by local election boards. The machines' software is not made available for public inspection — an unacceptable situation in what's supposed to be a democracy. And incredibly, these machines produce no paper record of the votes.

They're also buggy. During California's presidential primary in March, machines in more than half of San Diego County's precincts malfunctioned.

I'm happy to report that the nation is finally waking up. Many states, as well as Federal lawmakers, are considering legislation that requires voting machines to leave a paper trail. Better yet, California Secretary of State Kevin Shelley had the guts to ban or decertify tens of thousands of Diebold machines across California. He's even considering filing criminal or civil charges against the company.

My guess is that if the defiant, unhelpful Diebold doesn't start showing some humility, fixing its work and letting the public see what it's doing under the hood, California will be only the first state of many to get wise.<

2004-05-24 **e-voting electronic voting concerns Virginia study**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A51595−2004May 24.html

May 24, Washington Post — E-voting woes prompt Virginia study.

Virginia General Assembly leaders say they will soon appoint members of a new commission that will study the security and reliability of electronic voting machines, a response to growing concerns that new-generation voting technology may be riddled with problems. Commission members could be announced as soon as this week, though the final list may not be named until the end of June. The commission will be composed of six members of the General Assembly and five private citizens. They will study how voting equipment is certified and tested and how the equipment should be handled before, during and after it is used. The panel ultimately could propose a statewide system for verifying electronic voting machine accuracy, according to lawmakers and other officials involved in the commission's creation. Lawmakers, academic experts and citizen-activists across the country are urging changes in how the machines work, proposing that electronic voting machines produce paper receipts for each vote. Another proposal is to require the software that powers new voting machines to meet certain standards set by public officials. California and Ohio currently require that electronic voting machines have verifiable paper trails by 2006.

E-VOTING OVERSEER WANTS 'MORE RESEARCH' ON PAPER BACKUP BALLOTS

DeForest B. Soaries, the head of the federal Election Assistance Commission, says he wants election officials to be able to analyze software source code in the electronic systems they purchase. Some vendors have resisted providing source code, on the ground that it is proprietary information. As for requiring that the systems produce paper copies of votes cast electronically, Soaries is undecided: "If there was unanimity among scholars and scientists on the paper issue it would be a more compelling case. All of the research, all of the testimony we've received, all the writings that I've read argue for more research." (AP/Los Angeles Times 8 Jun 2004)

E-VOTING CONCERNS

California's Secretary of State has won a victory in federal court and new agreements from counties with touch-screen machines to make extra security arrangements. U.S. District Judge Florence-Marie Cooper denied requests by disability rights activists and four California counties to
overturn the Secretary's conditional April 30 ban on touch screens for the November election. In the suit, disability groups argued that banning electronic voting will deny hundreds of thousands of people the right to vote in private, but the judge ruled the Americans With Disabilities Act requires only that disabled voters be given the opportunity to vote. 2004-07-12 **Diebold electronic e-voting systems manufacturer whistleblower lawsuit fraud California**

NewsScan

"WHISTLEBLOWER" LAWSSUIT FILED AGAINST DIEBOLD

Opponents of electronic voting are suing Diebold Inc. under a California whistleblower law, accusing Diebold of defrauding the state by providing shoddy balloting equipment that exposed California elections to vandals and to software bugs. The individuals who filed the suit are Jim
March, a programmer, and Bev Harris, an activist. Under the whistleblower statute, the two could collect up to 30% of any reimbursement. March says: "This is about money now -- a case of the capitalist system at work. The laws on voting products and processes are unfortunately unclear. But the law on defrauding the government is really, really clear. Going after the money trail is cleaner than going after proper procedures." But some critics of Diebold are equally critical of March and Harris. One of them says, "I would like to see people support a real solution rather than just try to cash in. There are a lot of people who could be a tremendous asset, but they're grandstanding and reveling in the expose." (San Jose Mercury News 12 Jul 2004)

2004-08-05 **Hack the Vote challenge Defcon 12 Rebecca Mercuri abandon e-voting systems 2004 elections**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,117261,00.asp

August 05, PC World — Can you hack the vote?

E-voting technology expert Rebecca Mercuri, a Harvard research fellow, has issued a "Hack the Vote" challenge, trying to illustrate what she calls their unreliability and vulnerability. She unveiled the so-called Mercuri Challenge at the recent Black Hat Briefings and Defcon 12 security conferences. Mercuri suggests electronic voting machines be hacked during their preelection testing, so officials will abandon them before an actual election. As part of her challenge, Mercuri is calling on e-voting system vendors VoteHere and Advanced Voting Solutions to supply any challengers "full specifications" of their voting system for review. The first person to undetectably change vote tallies can claim $10,000 from a separate challenge. Tom Mereckis, head of marketing for VoteHere, says VoteHere makes full specifications of its voting systems available to anyone. Conversely, the president of Advanced Voting Solutions says he has no intention of ever releasing the proprietary workings of its voting systems.

2004-08-06 **electronic e-voting Defcon 12 security experts skeptical**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0,10801,95094,00.html

August 06, Computerworld — Public, security experts' e-voting views differ sharply.

Security experts are substantially more skeptical about e-voting than the public, but their greatest worry is system and programming errors, not malicious hacker attacks, according to a survey released last week by the Ponemon Institute. The study, conducted in July and early August, aimed to measure public opinion about electronic voting systems and then compare the results with those of security experts--both IT pros and hackers. The Tucson, AZ-based institute collected 2,933 usable responses nationwide from the public, both online and by postal mail, and surveyed 100 attendees at the Black Hat and Defcon hacking/security conferences. Six out of 10 Black Hat/Defcon attendees had an unfavorable view of e-voting, while only 17% of the public did. Twenty percent of the experts cited system and programming errors as their top concern, followed by attempts to influence the outcome of an election. A potential breach of security by hackers and cybercriminals ranked third as a potential e-voting worry among the Black Hat/Defcon attendees. Among the public, the top worry was a decline in voter turnout because of fear or distrust of e-voting systems, followed by human errors and privacy violations.

2004-08-10 **electronic e-voting petition Maryland Diebold security question**

DHS IAIP Daily; http://www.computerworld.com/governmenttopics/government/policy/story/0,10801,95162,00.html

August 10, IDG News Service — Maryland voters file petition against e-voting system.

Eight Maryland voters have asked an appeals court to force the Maryland State Board of Elections (SBE) to address alleged security risks in a Diebold electronic voting machine system and provide a voter-verified paper trail during elections. The plaintiffs, some representing advocacy group TrueVoteMD.org, accuse the SBE of ignoring scientific and government studies that question the security of the Diebold e-voting machines and of ignoring a Maryland legislative requirement to include a voter-verified paper trail with an e-voting system. Such a paper trail would allow voters to check their electronic votes against paper printouts, which can then be used to audit the election results, said Linda Schade, director and cofounder of TrueVoteMD.org.

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/biztech/08/23/evoting.labs.ap/index.html

August 23, Associated Press — E-vote machine certification criticized.

Although up to 50 million Americans are expected to vote on touchscreen voting machines on November 2, federal regulators have virtually no oversight over testing of the technology and critics allege that the three companies that certify the nation's voting technologies operate in secrecy, and refuse to discuss flaws in the ATM-like machines. Federal regulations specify that every voting system used must be validated by a tester. Yet it has taken more than a year to gain approval for some election software and hardware, leading some states to either do their own testing or order uncertified equipment. The election directors' voting systems board chairman, former New York State elections director Thomas Wilkey, said the testers' secrecy stems from the Federal Election Commission's refusal to take the lead in choosing them and the government's unwillingness to pay for it, leaving election officials no choice but to find technology companies willing to pay. A 2002 law, the Help America Vote Act, created a four-member, bipartisan committee, headed by U.S. Election Assistance Commission chairman DeForest Soaries Jr., to oversee a change to easier and more secure voting. Soaries said there should be more testers but the three firms, CIBER and Wyle Laboratories in Huntsville, AL, and SysTest Labs in Denver, CO, are "doing a fine job with what they have to work with."

/ap/20040828/ap_on_hi_te/voting_by_e_mail&sid=95573501

August 30, Associated Press — E-mail voting prompts security concerns.

Missouri will allow members of the military stationed overseas to return absentee ballots via e-mail, raising concerns from Internet security experts about fraud and ballot secrecy. State and federal officials insist safeguards, such as signature verification and tracking numbers, are in place to protect the ballots from tampering, duplication or other forms of fraud. However, some critics warn that e-mail is fundamentally insecure. "E-mail is subject to all kinds of tampering," said Bruce Schneier, co-founder of Mountain View, CA-based Counterpane Internet Security Inc. Missouri appears to be the first state using the e-mail option, but other states also could adopt it. About half of states permit electronic transmission of voted ballots, generally by fax, and could follow Missouri's lead, according to the Pentagon's Federal Voting Assistance Program. Ballot secrecy is not available with e-mail and sending such a message is akin to sending a postcard, with its content easily viewable in transit using widely available software. Military personnel are told upfront that their e-mailed ballots won't be secret and that they can mail them in instead. Because of security concerns, the Pentagon earlier this year canceled an Internet voting plan that would have allowed as many as 100,000 military and overseas citizens from seven states to cast votes in November through a Web browser.

2004-09-07 **electronic e-voting paper trail audit Nevada elections 2004 example US states legislation**

DHS IAIP Daily; http://securityfocus.com/news/9461

September 07, The Associated Press — Nevadans to become first to use touch-screen voting that produces a paper trail.

In what could become a model for other states, Nevada voters on Tuesday, September 7, became the first in the nation to cast ballots in a statewide election on computers that printed paper records of electronic ballots. Nevada's $9.3 million voting system includes more than 2,600 computers and printers deployed in every county. California, Washington and Illinois recently passed laws requiring a paper trail for electronic ballots, and at least 20 others are considering similar legislation. The system aims to address concerns that paperless touchscreen votes cannot be properly audited or recounted. As many as 50 million Americans will cast ballots in the November presidential election on electronic machines that do not produce a paper receipt of the vote.

2004-10-18 **survey online ratings reliability trustworthiness accuracy authenticity**

NewsScan; http://www.pewinternet.org/

ONLINE RATING RANKS HIGH WITH ONE IN FOUR INTERNET USERS

Twenty-six percent of adult Internet users in the U.S. have participated in "reputation systems" -- those online rating systems used by Amazon, eBay and others to assist other users in deciding whether a product or service is trustworthy, worthwhile or enjoyable. Men are slightly more likely to offer their opinions than women (29% vs. 22%) and Generation Yers are more likely than Baby Boomers to have posted a rating (30% vs. 23%). In addition, those from wealthier households (income above $75,000) are more likely to participate in rating than those who live in households with an income below $30,000. The findings provide evidence that the trend toward using the Internet for two-way communication among online communities is increasing. "Internet users see these systems as a way to help them figure out what information and people they can trust online," says Paul Hitlin, a research associate at the Pew Internet Project, which conducted the study. "People also see the Internet as a place where they can voice their own opinions. Online they can recommend a CD, warn about a dishonest salesperson, or even defend their high school history teacher."

NewsScan; http://apnews.excite.com/article/20041027/D85VOSTG1.html

E-VOTING COMPANIES DIVULGE *SOME* SOFTWARE CODE

Electronic voting equipment makers Diebold Election Systems, Election Systems & Software, Hart InterCivic and Sequoia Voting Systems have agreed to submit millions of lines of software code to the National Software Reference Library, but have refused to include their most valuable data -- their proprietary source code. They also say they might not provide the library with copies of software patches and updates. The companies acted at the request of the U.S. Election Assistance Commission, whose chairman noted that although the data submitted was far from complete, he hoped the companies' ongoing submissions would eventually result in making election software more transparent. A number of scientists have called for "open source" voting software that could be independently verified, but many computer security experts remain pessimistic because no technology exists today that would allow an election official who suspects fraud to check software code on a voting machine and compare with the code stored in the library. Avi Rubin, technical director of the Johns Hopkins Information Security Institute, called the code-sharing program "meaningless." (AP 27 Oct 2004)

2005-07-13 **electronic voting machines optical scanners vote tampering vulnerabilities hack Diebold report analysis flaws**

RISKS; http://www.blackboxvoting.org/BBVreport.pdf 23 94

DIEBOLD OPTICAL SCAN VOTING MACHINE SUSCEPTIBLE TO TAMPERING

Bruce O'Dell provided an extensive summary of a thorough analysis of the Diebold Optical Scan systems used to tally 25M votes in the 2004 elections in the US. Here are excerpts.

>Harri Hursti, an independent security consultant - with the consent of election officials in Leon County, Florida - was able to take full control of the Diebold optical scan device and manipulate vote totals and audit reports at will.

The Diebold Precinct-Based Optical Scan 1.94w device accommodates a removable memory card. It had been believed that this card contained only the electronic "ballot box", the ballot design and the race definitions; astonishingly enough, the memory card also contains executable code essential to the operation of the optical scan system. The presence of executable code on the memory card is not mentioned in the official product documentation. This architecture permits multiple methods for unauthorized code to be downloaded to the memory cards, and is wide open to exploitation by malicious insiders.

The individual cards are programmed by the Diebold GEMS central tabulator device via a RS-232 serial port connection or via modem over the public phone network. There are no checksum mechanisms to detect or prevent tampering with the executable code, and worse yet, there are credible exploits which could compromise both the checksum and executable. The report notes that this appears to be in violation of Chapter 5 of the 1990 Federal Election Commission Standards for election equipment, and therefore should never have been certified for use.

The executable code is written in a proprietary language, Accu-Basic. Accu-Basic programs are first compiled into ASCII pseudocode, which is then executed by an interpreter residing in the optical scan device. Hursti located an inexpensive device capable of reading and updating the memory cards advertised on the Internet, and using a publicly-available version of the Accu-Basic compiler (found on the Internet, along with Diebold source code and other documents, by Bev Harris in 2003) was able to exploit these vulnerabilities - and publicly demonstrated the ability to modify vote totals and audit reports at will.

According to the report:

"Exploits available with this design include, but are not limited to:

"1) Paper trail falsification - Ability to modify the election results reports so that they do not match the actual vote data

"1.1) Production of false optical scan reports to facilitate checks and balances (matching the optical scan report to the central tabulator report), in order to conceal attacks like redistribution of the votes or Trojan horse scripts such as those designed by Dr. Herbert Thompson.(19)

"1.2) An ingenious exploit presents itself, for a single memory card to mimic votes from many precincts at once while transmitting votes to the central tabulator. The paper trail falsification methods in this report will hide evidence of out-of-place information from the optical scan report if that attack is used.

"2) Removal of information about pre-loaded votes

"2.1) Ability to hide pre-loaded votes

"2.2) Ability to hide a pre-arranged integer overflow

"3) Ability to program conditional behavior based on time/date, number of votes counted, and many other hidden triggers.<

After discussion of the demonstration that all of these vulnerabilities can be exploited, Mr O'Dell added, "The affected Diebold optical scan equipment should be immediately withdrawn from use in any election until independent recertification is achieved, or a secure alternative is obtained. All other election equipment - manufactured by Diebold or by other vendors - should be examined, and if subject to the same vulnerability, should also be withdrawn. An investigation to determine how equipment with such serious vulnerabilities to insider manipulation could ever have been certified should also be launched, and certification and oversight procedures enhanced."

He ended his report with these words: "Good people died to gain and defend our right to vote. Election administration must not be exempt from industry best practices for security, audit and control."

RISKS; http://josephhall.org/nqb2/index.php/2005/10/03/desi_nc 24 06

NORTH CAROLINA DOCUMENTS REVEAL DIEBOLD VOTING MACHINE VULNERABILITIES

1. In one city, Dallas, NC, a bug appears to have prevented the downloading of 11,945 votes which wasn't caught for seven days. At which point, it appears the county compared paper print-outs from the precinct with the totals reported by the tabulation server. A DESI technician reproduced the bug twice and then decided to forgo usual DESI protocol and loaded the flash-based memory packs directly into the central (GEMS) server to retrieve the votes from the memory pack.

2. In another case, another memory pack "failed to download" and the DESI technician got approval to send a back-up file electronically to DESI technicians who then e-mailed the results back. After writing this data to a memory pack, the on-site technician loaded them into the central server via a tabulator unit.

3. Finally, the document describes hand-entering of "three to five" ballots. DESI claims as a "check and balance" this process doesn't allow the technician to enter more votes than the total vote count (that is, the number of valid plus spoiled ballots). This would implicate that one would be prevented from entering more than a certain number of votes, but, of course, does nothing to constrain what votes are entered. A human looking over the technician's shoulder is the only other constraint.

[Summary by Joseph Lorenzo Hall]

2005-11-15 **electronic voting glitches errors flaws fraud problems data integrity audit trails**

RISKS; http://josephhall.org/nqb2/index.php/2005/11/11/2005_glitches 24 10

VOTING GLITCHES FROM THE 7 NOV 2005 ELECTION

Joseph Lorenzo Hall provided an extensive list of voting glitches on his Web site. He provided excerpts on RISKS:

* San Joaquin County, California - S.J. County has election night déjà vu

San Joaquin County workers misplaced a memory cartridge for an optical-scan machine. They rescanned the ballots and but haven't found the cartridge. In this story, an official says that the new Diebold TSx DREs that they want to use will make things work more smoothly… although the official doesn't recognize that misplacing the memory cartridge in a paperless DRE would not be as easily recoverable (although I believe you'd still have the ballot images resident in memory, no?).

* Cumberland County, Pennsylvania - Software error forces recount in close race for district judge

Two candidates in a race were both mistakenly listed as being from same party. Straight-ticket votes counted both candidates and initially resulted in over-votes. After this was corrected for, the race was down to a 2-vote margin (1703 to 1701 votes).

* Harwinton, Connecticut - Voting machine snafu may lead to challenge in Harwinton

One candidate was endorsed in a race by both Republican and Democratic parties and was listed twice in a choose 2 out of 3 race. This candidate, due to being listed twice, got twice as many votes as the other two candidates in the same contest.

* Pasquotank Co., North Carolina - In Elizabeth City, a 14-vote gap has one candidate calling for a recount

Selecting a certain candidate in the only contest on the ballot resulted in a write-in candidate box being selected instead. The margin in this race was 14 votes. Also, 60 blank ballots were cast (recall that there was only one race for this election).

* Lucas Co., Ohio - State plans to investigate voting chaos; Tuesday's problems are latest for Lucas County

This one is mysterious: "workers accidentally 'set an option [on the five machines] that prevented the results from being transported onto the memory card.'" Also, massive labor shortage resulted in chaos as election was highly understaffed and a system of "rovers" didn't function correctly (where one elections worker would travel to five polling places to get aggregate totals from machines).

* Montgomery County, Ohio - Vote count goes all night

Various problems resulted in having to download votes from 2000 memory cards instead of from one card each from the 548 precincts. However, during this process, 186 memory cards were found to be missing. After looking through bags of precinct materials ("I voted" stickers, signs, etc.) they had found 171 cards. The remaining 15 cards were only found after rousing pollworkers from bed at 3 am so they could return to the polling place to get the cards either left in machines or lying around the polling place.

* Wichita County, Texas - Human errors hamper voting

35 precincts neglect to perform zeroing out process before election. This resulted in the vote data being impossible to download from the DRE (ES&S) with PEB device. ES&S technicians were able to open the machines, remove the removable memory cards and read the data from there.

* Montgomery County, Ohio - 'Human error' creates doubt about failed vote in Carlisle

77 "phantom votes" found to have been cast in an election where a bond measure was defeated by a margin of 146 to 79. ("Phantom votes" are when there are more votes counted than there are registered voters that could have cast votes) In this case, there were only 148 registered voters that could have cast votes in this race.

RISKS; http://www.siliconvalley.com/mld/siliconvalley/13361799.htm 24 12

EFF E-VOTING CERTIFICATION LAWSUIT

Peter Ludemann reports that the North Carolina is being sued by the Electronic Frontier Foundation (EFF) for improper certification of voting machines:

>North Carolina law requires the Board of Elections to rigorously review all voting system code "prior to certification." But last week the state's Board of Elections certified voting systems from Diebold Election Systems, Sequoia Voting Systems, and Election Systems and Software without bothering to do so…. "This is about the rule of law," said EFF Staff Attorney Matt Zimmerman. "The Board of Elections has simply ignored its mandatory obligations under North Carolina election law. This statute was enacted to require election officials to investigate the quality and security of voting systems before approval, and only approve those that are safe and secure. By certifying without a full review of all relevant code, the Board of Elections has now opened the door for North Carolina counties to purchase untested and potentially insecure voting equipment." Keith Long, a North Carolina voting systems manager, defended the state's decision, telling News.com that reports from "independent testing authorities" were sufficient for certification. But that comes as poor reassurance. Because if the "independent testing authorities" to which Mr. Long refers are as impartial as he is, North Carolina is in big trouble. Long, you see, worked for Diebold Election Systems as recently as Oct. 1, 2004. And between 1983 and 1992 he worked for Sequoia.<

Mr Ludemann adds cogently, "So by 'independent' you mean 'independent of any public oversight,' right?"

2005-12-16 **Florida lawsuit drunk driving breathalyzer source code disclosure electronic e-voting relation**

RISKS; http://online.wsj.com/article_print/SB113470249958424310.html 24 13

FLORIDA BREATHALYZER SOURCE-CODE DISCLOSURE CASE

Contributor Danny Burstein refers to the following clip from _The Wall Street Journal_:

"A court fight in Florida over the software used in the instruments that detect alcohol in breath could threaten the ability of states and localities to prosecute drunk drivers.

"The battle is over the source code of breath analyzers made by CMI Group, a closely held maker of breath-alcohol instruments. Defense lawyers have challenged the use of the device and asked to see the original source code that serves as its computer brain, saying their clients have the right to examine the machine that brings evidence against them.

"Last February, a state appeals court in Daytona Beach ruled that Florida had to produce 'full information' about the test that establishes the blood-alcohol level of people accused of driving under the influence, or DUI. Otherwise, the court said, the evidence is inadmissible…"

Mr. Burstein exclaims, "Imagine if this logic followed through to the equipment being slid into election vote counting!"

http://www.computerworld.com/printthis/2006/0,4814,107881,00.html

E-VOTING SYSTEMS TESTER SEES 'PARTICULARLY BAD' SECURITY ISSUES

Herbert Thompson tested Diebold AccuVote optical scanning equipment used for vote-counting in Leon County, FL. Marc Songini interviewed Dr Thompson for an article in Computerworld and discussed the issues. Dr Thompson and his colleagues were able to alter voting results by tampering with the device's memory card. The results could twist the vote-count to favor a preselected candidate. Diebold officials strongly criticized the test methodology, saying that the memory cards were normally sealed precisely to prevent such tampering and that the tests were equivalent to complaining about poor security by deliberately disabling protection and then complaining about security breaches. They also complained that the tests themselves may have violated the terms of Diebold's licensing agreements and intellectual property rights.

2006-03-31 **electronic voting software bug corruption election cancelled voided quality assurance QA**

RISKS; Wisconsin State Journal http://tinyurl.com/napdn 24 23

E-VOTING SOFTWARE GLITCHES RUINS UNIVERSITY ELECTION

Computer problems caused the University of Wisconsin-Madison Student Council to throw out online votes cast this week for campus offices, but retained votes cast for two referendums on the same ballot. The cause of the problem may have been a "little-used, multiple-name tool has worked in prior elections but may have been corrupted by a database upgrade several months ago." The main risk appears to be the lack of testing of the voting system prior to the vote (along with no testing after a major software upgrade).

The parallels with the world of voting machines are obvious: the voting system needs to be tested and certified BEFORE voting occurs.

Critical Thinking and Disintermediation

by M. E. Kabay, PhD, CISSP
Associate Professor, Computer Information Systems
Norwich University, Northfield VT

One of the battlespaces of information warfare is the cognitive domain: knowledge, perception, attitudes and mood. For example, military campaigns have long used propaganda and misinformation to influence both the military decisions of the enemy and to discourage soldiers and civilians. In the Second World War, for example, the Nazis used radio broadcasts into Britain to spread false information about the progress of the war; conversely, the Allies broadcast to the peoples of the Axis powers to blame the governments, but not the population, for the war, thus attempting to drive a wedge between civilians and their regimes. In more recent years, there was a scandal in the USA in October 1986 about a reputed disinformation campaign during the Reagan administration in which government officials were accused of misleading the press to convey false information to Libyan dictator Qaddafi about an imminent attack. And of course currently there's a major division in the USA between those who argue that the administration deliberately misled the American people into a pre-emptive attack on Iraq versus those who suggest that the decision was based on incorrect information (or, for that matter, was correct despite the failure to find corroborative evidence of weapons of mass destruction).

Prof. Daniel Kuehl, PhD, is the distinguished Professor and Director of the Information Strategies Concentration Program at the Information Resources Management College of National Defense University in Fort McNair, Washington DC. A frequent contributor to scholarly analysis of information warfare, Dr Kuehl was the keynote speaker on Thursday the 11th of March 2004 at the 17th Annual Meeting of the Federal Information Systems Security Educators' Association at the University of Maryland University College. After his lecture, we got into a discussion about the information warfare implications of a couple of trends in modern society: disintermediation and the lack of critical thinking in the population at large.

Disintermediation in general is defined by the Webopedia as "Removing the middleman. The term is a popular buzzword used to describe many Internet -based businesses that use the World Wide Web to sell products directly to customers rather than going through traditional retail channels. By eliminating the middlemen, companies can sell their products cheaper and faster. Many people believe that the Internet will revolutionize the way products are bought and sold, and disintermediation is the driving force behind this revolution."

Disintermediation in the distribution of news is the phenomenon of reducing gate-keepers in the flow of information from provider to user. For example, Matt Drudge is free to spread unsubstantiated rumors to a huge audience without having to bother with the fact-checking that is customary in responsible news media such as reputable newspapers or magazines and some television or radio programs.

Critical thinking is the ability to analyze information skeptically rather than gullibly. For example, people who open unexpected attachments in e-mail from friends are failing to distinguish among different targets of trust:

* Trust in the authenticity of the FROM line of an e-mail message (which may not, in fact, correctly identify the source);

* Trust in the technical competence of the sender to evaluate the quality of the attachment (which may not, in fact, correlate with how loveable and friendly Aunt Gladys is);

* Trust in the authenticity of the labeling of the attachment (which may not, in fact, really be a document at all but may be an executable);

* Trust in the description and safety of an attachment (which may not, in fact, be a screen saver with frogs).

Now couple disintermediation with a lack of critical thinking. Consider the likely effects of a concerted campaign to, say, spread a number of rumors about major publicly-traded companies. We know that pump 'n' dump schemes have successfully manipulated stock values to the benefit of criminals; why not expect terrorists to apply the same techniques to manipulating the entire stock market? If people are willing to believe and act upon stock tips e-mailed to them by total strangers using spam (even though tiny print clearly states that the junk mailer has been paid to distribute the information), why wouldn't uncritical thinkers cheerfully act on "advice" spread by enemies of the nation?

Similarly, the phenomenon of flash crowds worries me: training people to assemble on command in large numbers at, say, shoe stores, piano showrooms or restaurants for no good reason other than the fun of being part of a huge crowd is a perfect setup

for creating an army of willing, mindless drones who will congregate on command at the site of a terrorist attack or at places where their presence will interfere with response to criminal or terrorist activities. Want to rob a bank in peace and quiet? Set up a conflict between two instant crowds to draw the police to an instant riot.

I think that all of us in the IT, network and security fields are used to critical thinking. We have to be to keep up with the flood of technical information and distinguish marketing exaggerations from realistic information. We are used to writing and reading product comparisons, strategy evaluations and management recommendations as part of our work. Let's use our skills to foster critical thinking throughout the educational system. Let's work as volunteers on school boards, in the classroom and in social organizations to introduce critical thinking to children and adults who haven't learned how to distinguish reality from propaganda. Push for curriculum changes to accompany lessons on how to use the Internet with lessons on how to weigh the information found through e-mail and on the Web.

Let's make sure that we're not patsies for an information warfare attack rooted in disintermediated propaganda.

THE WIKI WAY TO COMMUNICATE

A wiki (the Hawaiian word for 'quick') is a type of Web site that many people can revise, update and append with new information. Whereas blogs are essentially designed for personal expression, wikis are designed for collaboration. The concept was pioneered in the mid-1990s by programmer Ward Cunningham, who called it the WikiWikiWeb and intended it to serve as a platform for freewheeling collaboration in software and engineering projects. Ross Mayfield of the Silicon Valley startup called Socialtext says: "People have tried very hard to take fragmented knowledge within
corporations and put it somewhere that it can be used, but it's been an uphill effort. Our focus is literally to get everyone on the same page." And New York University communications professor Clay Shirky explains that "people are realizing that perhaps the most human value actually occurs in
smaller groups." (Wall Street Journal 29 Jul 2004)

NewsScan

VIOLENCE AT CALIFORNIA'S CYBERCAFES

Episodes of violence at several businesses in southern California have prompted a number of municipal crackdowns -- the latest of which is taking the form of a Los Angeles ordinance requiring that the city's 30 Internet cafes enforce the city's long-standing curfew for minors, pay for in-store
surveillance cameras, enforce limits on how many computers each business can operate, and obey prohibitions against dark window coverings. But Ernest Miller, a spokesman for iGames, which represents about 500 PC gaming parlors in the U.S. and abroad, insists that there's nothing particularly violent about cybercafes: "A haven for gang activity can be any location where people gather -- corner liquor stores, pool halls or cinemas." MADISON AVENUE WAKES UP TO WEB LOGS

Advertising agencies and communications professionals are testing the effectiveness of using blogs to create forums for discussion about ideas within their industries, with topics ranging from video game marketing to the art of client service. However, the biggest agencies are still holding out, noting that the potential risks still outweigh the benefits. "Blogs are in fashion, and it is easy to hop on the bandwagon and say that every company should have one," says an executive with Deutsch, a unit of the Interpublic Group of Companies. "The questions any smart marketer should be asking are, 'Does this provide a platform to connect with their most relevant audiences and how will this address business objectives?' That's not to say we would never enter blogland, but there is a fine line between being timely, topical and keeping current while making sure that we are doing what's best for our business long term." The biggest risk, say many experts, is an uncontrolled message slipping out and damaging the company. But it's clear that as blogging evolves into a corporate tool, it's also losing those qualities that made it such a hit in the first place: attitude, irreverence and a penchant for kicking up a ruckus. 2006-02-23 **report study outsourcing fears exaggerated ACM US computer science academia hurt**

EDUPAGE; http://www.nytimes.com/2006/02/23/technology/23outsource.html 23

REPORT SAYS OUTSOURCING FEARS EXAGGERATED

A new report from the Association for Computing Machinery (ACM) argues that fears of a wholesale migration of high-tech jobs away from the United States are not supported by the data so far. Representing a year's work by a study group, the report predicts continued offshoring of 2 to 3 percent of IT jobs each year for the next decade, but it notes that the number of high-tech jobs continues to grow and already exceeds the number at the height of the dot-com boom. Although the report acknowledges losses to lower-wage markets and notes that the marketplace for technology is tightening, "the notion that information technology jobs are disappearing is just nonsense," according to Moshe Vardi, computer scientist at Rice University and cochair of the study group. David Patterson, president of the ACM and computer science professor at the University of California, Berkeley, said that exaggerated fears of outsourcing have hurt the U.S. market by discouraging college students from pursuing careers in IT, which, in turn, will lead to fewer qualified members of the U.S. IT workforce.

1998-01-05 **macro virus infection Japan**

Nihon Keizai Shimbun via COMLINE News Service

According to the Japanese Ministry of Posts and Telecommunications, Japan experienced its worst year of virus infections in July 1997, with 353 reported incidents, of which 66% were due to macro viruses.

Category 31 *The state of information security & technology*

1998-02-19 **survey computer crime reporting UK**

EDUPAGE

In the UK, a report from the Audit Commission stated that 45% of its respondents reported "computer misuse" such as fraud or use of pirated software in 1997. The reporting rate rose from 36% in 1994.

Category 31 *The state of information security & technology*

1998-03-23 **criminal hackers motivation profit money studies surveys**

Communications Week

The long-standing belief that internal attacks outweigh external threats in computer security is finally starting to crumble. Tim Wilson reported in Communications Week that "WarRoom Research LLC found that the vast majority of Fortune 1000 companies have experienced a successful break-in by an outsider in the past year. More than half of those companies have experienced more than 30 system penetrations in the past 12 months. Nearly 60 percent said they lost $200,000 or more as a result of each intrusion." In addition, the 1998 Computer Security Institute / FBI survey showed that "520 U.S. companies reported a total loss of $136 million from computer crime and security breaches in 1997-an increase of 36 percent from the year before. The Internet was cited by 54 percent of the respondents as a frequent point of attack — that's about the same percentage of respondents that cited internal systems as a frequent point of attack."

Category 31 *The state of information security & technology*

1998-03-24 **breaches break-ins surveys estimates crime**

EDUPAGE

Studies released by the Computer Security Institute (with support from the FBI) and by War Room Research both indicated that computer intrusions and cybercrime in 1997 were up from 1996 levels — 36% at $135M according to the former report. Losses from individual breakins at Fortune 1000 companies ran around $200,000 per incident in 60% of the cases reported — and more than half of the respondents admitting to 30 or more breaches within a single year.

1999-04-07 **survey study computer crime costs defenses prevention**

Detroit News; http://www.gocsi.com/prelea990301.htm

The Fourth Annual Computer Security Institute / Federal Bureau of Investigation Computer Crime and Security Survey demonstrated yet again that computer crime is a growing problem for US companies, financial institutions and government agencies. Losses amounted to hundreds of millions of dollars, much of it resulting from industrial espionage. Key findings:
* 26 percent reported theft of proprietary information.
* System penetration by outsiders increased for the third year in a row; 30 percent of respondents reported intrusions.
* Those reporting their Internet connection as a frequent point of attack rose from 37 percent of respondents in 1996 to 57 percent in 1999.
* Unauthorized access by insiders rose for the third straight year; 55 percent reported incidents.
* More companies - 32 percent compared with 17 percent in the past three years - are reporting serious cyber crimes to law enforcement.

1997-08-05 **statistics data reporting crime break-ins attacks networks**

American Banker

The American Bankers Association announced a new, voluntary system for banks to report attacks on their computer systems. According to the ABA, this voluntary system would provide reassurance to a nervous public and reduce pressures from law enforcement and government officials who have been moving towards legislated reporting mandates. Data would be shared among participating banks and with some government officials. One commentator wrote, "This action displays everything wrong with the current state of the information systems intrusion tracking. Their focus is to prove that break-ins are rare and not identify problems and threats, nor do they plan on sharing the data with law enforcement or intelligence community. When individuals forget they are part of a society with shared problems and goals then we no longer have a society. It will take cooperative effort to track this threat, and this effort will only make them more vulnerable."

2000-01-27 **electronic survey Web privacy policy implementation lacunae holes enforcement Web commerce intrusion monitoring government future**

EPIC Alert 7 01

The Electronic Privacy Information Center (EPIC) released an interesting survey of the state of privacy on the Web using a sample of 100 prominent sites. The summary was depressing: "_Surfer Beware III_ found that few of high-traffic websites offered adequate privacy protection. In fact, not a single one of them fulfilled important elements of Fair Information Practices investigated in the survey. Fair Information Practices serve as basic guidelines for safeguarding personal information. Also alarming was the significant proportion (35 out of 100) of shopping sites that allowed profile-based advertising networks to operate. These advertising networks present a stealthy and invasive way in that third parties — companies that display banner advertisements — are tracking online behavior without the knowledge of the Internet user."

2000-02-22 **e-commerce survey**

NewsScan, CNet http://news.cnet.com/news/0-1007-200-1554830.html

A Forrester Research survey last summer [1999] of 17,000 households in Germany, France, Sweden, the Netherlands and the U.K. indicates that less than 10% of respondents were interested in shopping online. In Sweden, where e-commerce was most popular, 14% of households were connected to the Web and 7% had ordered goods. At the other end of the scale, only 7% of French households were linked to the Net, and only 2% had bought anything. However, a third of French homes subscribe to Minitel, which has offered shopping and information services for 17 years, and presents a strong challenge to Internet-based e-commerce in that country. Most respondents cited privacy concerns and the inability to actually see what they were buying as the major impediments to e-shopping. (Reuters/CNet News.com 22 Feb 2000)

2000-03-22 **CSI FBI annual survey computer crime costs losses trends study**

Reuters, CSI http://www.gocsi.com/prelea_000321.htm, NewsScan, Los Angeles Times http://www.latimes.com/business/20000322/t000027053.html

The annual CSI / FBI computer crime survey was released in March 2000. The self-selected response group included 273 organizations and 643 security practitioners in US corporations, government, finance, health-care, and academia. Total reported losses were $265M. About 90% of the respondents experienced breaches of information security in the preceding 12 months; the top three problems were computer viruses, laptop theft and employee net abuse. However, 70% of the respondents also reported other types of breach: theft of secrets, financial fraud, outsider penetration of security perimeters, denial of service, and sabotage of data or networks. In addition, 74% acknowledged financial losses — higher than in the 1998-1999 survey. Some 59% of the respondents rated Internet connections as a more frequent point of attack than internal systems (38%). As usual, there were many other interesting questions and responses in the survey.

2000-05-25 **e-mail productivity appropriate use restrictions improvements education spam**

NewsScan

Ferris Research . . . released the results of a study designed to quantify the costs and benefits of e-mail, and estimates that the overall benefit in terms of increased productivity equals about $9,000 per employee. Rather than treading into the murky area of nonquantifiable benefits, such as improved decision-making, Ferris attempted to focus on items that delivered a tangible benefit, like time not spent on addressing snail mail envelopes, operating postage and fax machines, etc. It derived a 15% to 20% productivity improvement, with an overall increase of 326 hours per employee on the average. Ferris then attempted to quantify those hours, giving them a value of $13,000. Then came the downside: Ferris found that employees waste on an average 115 hours dealing with nonproductive e-mail, translating to a loss of about $4,000 per worker a year. Subtract the loss from the gain, and the result is an overall benefit of $9,000 per employee, or a 15% productivity gain. Ferris says that rate can be raised to 20% by more actively managing company e-mail systems: discouraging personal e-mail, shortening e-mail distribution lists, and helping workers identify and trash spam. 2000-05-25 **intellectual property copyright infringements violations theft music sales**

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000525/t000049387.html

A [highly controversial] study of music sales commissioned by Reciprocal Inc., a digital rights management company, shows that sales of recorded music have declined in the vicinity of college campuses in the last two years, while rising elsewhere. Music sales were up 12% during the first three months of 2000 over the same time period in 1998, but at stores within five miles of a college campus — which account for about half of all music purchased — sales were down 4%. Music industry officials attribute the dip to use of Napster, which has been especially popular among college students. Some colleges have banned the music downloading software from campus computer systems because heavy use was clogging their networks. (AP/Los Angeles Times 25 May 2000)

2000-06-15 **intellectual property copyright theft survey purchase ethical downloading**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB961025291366759846.htm

A new survey, . . . [released in June] by the Digital Media Association, indicates that Internet users who download music to sample are likely to follow up by purchasing CDs in stores or online. The new poll contradicts the findings of previous studies that found digital music downloading via Napster made a significant dent in bricks-and-mortar music store sales, especially in areas around college campuses. This latest survey, conducted by market research firm Yankelovich Partners, says 66% of all consumers said that listening to a song online has at least once prompted them to later buy a CD or cassette featuring that song. Most people who downloaded music (92%) listened to it on their desktop computers, while 10% used a portable device and 14% used their home stereo. More than 60% of them used the Internet to get to music they couldn't find on radio. According to Media Metrix, 22.8 million people visited the top 30 Internet music sites in April, up 19% from November 1999, the most recent number available. Paid digital music downloading is expected to hit $1.1 billion in sales by 2003, according to estimates by Forrester Research. (Wall Street Journal 15 Jun 2000)

2001-01-04 **survey CIO confidence security law enforcement**

NewsScan

CIOs: "WHAT, ME WORRY?"

A national poll of 1,400 CIOs reveals that 90% have confidence in their network security, despite estimates that billions of dollars are lost every year to cybercrime. The survey, conducted by RHI Consulting, has raised eyebrows among security experts who point out that it's generally in a CIO's best interest to keep quiet when security breaches occur. A recent survey conducted by the Computer Security Institute indicated that more than half of the respondents said they did not report the intrusions to law enforcement out of fear of negative publicity or that rival companies would use the information to competitive advantage. In addition, many CIOs may feel that they must live with a "buffer of acceptable risk." "Just as credit card companies accept some level of loss as a cost of doing business, so some CIOs are saying, 'if I do a really solid job of protecting my systems, then I can live with the low-level pain that some break-ins cause,'" says one expert. Meanwhile, a 1999 survey found that Fortune 1000 companies lost more than $45 billion in thefts of proprietary information that year. 2001-01-12 **computer crime statistics exaggeration inflation**

RISKS 21 21

S. Harris contributed an interesting analysis to RISKS of how very large figures get reported for losses due to industrial espionage. In response to another correspondent's question about how companies estimate the costs of breaches of confidentiality, he wrote the following:

>I can give a first hand account of a $2 billion theft of proprietary information to illustrate how these exaggerated figures get manufactured. Back in 1989 I worked at a Toronto software development company that did lots of work with the Unix operating system, and licensed the Unix source code from AT&T for about $60,000 a year.

Night after night someone was logging in to the computers from a dialup line to download chunks of the Unix source code. Somebody at the company noticed this, called in the police, who traced the connection to an ex-employee, raided his house and seized his home computer. Apparently the ex-employee, a software development manager, who had recently left the company, missed having access to the Unix source code and wanted to grab a copy of it for personal study. Satisfied that the source code had been recovered, and that this wasn't a case of espionage or sabotage, the company would have been happy to let the matter drop.

But the cops insisted on laying charges and it appears that they leaked the story to the media. All three Toronto newspapers (Toronto Sun, Toronto Star, and the Globe & Mail) reported that the police had foiled a $2 billion theft!

Why wasn't this as a $60,000 theft of a commercial source code license? Or at the very most a $500 theft of an educational license, since the ex-employee's intended use was only to study it?

Well it seems that the police had called up AT&T and asked them "How much is Unix worth?" The answer was $2 billion. AT&T gave Unix an asset value of $2 billion on their books. The police equated a little mischief to the cost of acquiring total ownership of AT&T's Unix System Laboratories and all its intellectual property!

In this case, the large corporation gave an accurate estimate to a bogus question. It was law enforcement (and sloppy fact checking by the media) that twisted the story.

But you know, even the $2 billion asset value seems suspect to me now because AT&T sold Unix to Novell in 1993 for just $270 million (see http://www.att.com/press/0693/930614.ulb.html). Novell in turn sold it to SCO in 1995 for a paltry $54 million (6M SCO shares at about $9 each is $54M, see http://www.novell.com/company/ir/96annual/mandis.html). But if AT&T overestimated by tenfold, the police still exaggerated by 4 million fold.<

NewsScan

ONLINE KIDS READY TO TELL YOUR SECRETS
Three out of four children are perfectly willing to divulge private family information online in exchange for incentives such as prizes, products or cash, according to a new report by eMarketer. Fifty-four percent of the children surveyed were willing to disclose the name of their parents' favorite store, while 26% were willing to tell e-tailers about their parents' weekend activities. According to the study, the information typically given by children online tends to be marketing oriented, rather than financial. "The information is not the really serious information like credit card or Social Security numbers," says eMarketer analyst Rob Janes. "It's more stuff that's of value to a marketer, such as product information, family activities, etc... Children and teens were very casual about revealing family information. It can't be extrapolated accurately to the entire population, but it's a good strong indicator of how kids will respond to information online. It's an issue that parents should address." 2001-02-12 **online gambling survey predictions**

NewsScan

ONLINE GAMING TAKES OFF IN U.S.
Forty million households will be engaged in online gaming by 2004, up from 25 million in 2000, according to new research from IDC. Fueling the growth will be faster Internet connections, the arrival of next-generation game consoles, and new, nontraditional gaming platforms. Most online gaming business models are based on advertising revenue, but sites are seeking ways to create different types of advertising opportunities or to migrate free subscribers to a paid model. Meanwhile, NetValue reports that in Europe, the U.K. leads Germany, France, Spain and Denmark in online gaming, with one in five British Internet users visiting a game site in December. Spanish gamers spent an average of 27 minutes on each site, Danish and U.K. users 23 minutes, French and German users just 14 minutes, while U.S. users stayed online an average of 38 minutes. The most visited game site in the U.S. was uproar.com, while in the U.K., gamers flocked to gamesdomain.com. (NUA Internet Surveys 12 Feb 2001)

CERT/CC Summaries

The CERT/CC Summaries Web page < http://www.cert.org/summaries/ > lists (and links to) the following regularly-scheduled overviews for January 2001 through March 10, 2002:

CS-2002-01
February 28, 2002
Topics in this regularly scheduled CERT Summary include multiple vulnerabilities in SNMP, a buffer overflow vulnerability in Microsoft Windows UPnP, vulnerabilities in SSH implementations, and the W32/BadTrans Worm.

CS-2001-04
November 20, 2001
Topics in this regularly scheduled CERT Summary include the W32/Nimda Worm and active exploitation of vulnerabilities in SSH1 CRC-32 Compensation Attack Detector and in Microsoft DNS servers.

CS-2001-03
August 28, 2001
Topics in this regularly scheduled CERT Summary include self-propagating worms, active exploitation of vulnerabilities in Solaris in.lpd, BSD telnet daemon, and Microsoft IIS by intruders. We have also seen an increase in intruder activity directed at home users.

CS-2001-02
May 29, 2001
Topics in this regularly scheduled CERT Summary include a significant increase in reconnaissance activity, a number of self-propagating worms, and active exploitation of vulnerabilities in snmpxdmid, BIND and IIS by intruders

CS-2001-01
February 28, 2001
Topics in this regularly scheduled CERT Summary include multiple vulnerabilities in BIND, compromises via "ramen" toolkit, input validation problems in LPRng, and VBS/OnTheFly (Anna Kournikova) malicious code. There is also mention of the new Vulnerability Notes Database.

STUDENTS WILLING TO PAY FOR MUSIC
More than a third of students who download music from the Internet would be willing to pay $8.50 a month for the privilege, according to a survey of 1,800 students on campuses ranging from Harvard to the University of Southern California. The typical student is interested in singles, live tracks, international music and new artists, and spends more time listening to tunes on his or her computer than on the radio. Boosting these figures is the fact that the typical student also has access to fast Internet connections and high bandwidth. "As broadband grows, more people will use computers for music and other entertainment," says an analyst with Mercer Management Consulting, which conducted the poll in conjunction with the National Association of Recording Merchandisers. "We don't feel this is going to erase CD purchasing completely. This is a new opportunity. There's a whole other batch of music record labels could sell to people... One of the biggest surprises to some of the retailers is that people sample music on Napster and then go out and buy it." (InformationWeek 9 Apr 2001)

CHILD PRIVACY LAW BEING EVADED [28 Sep 2001]
A study of the effectiveness of the rules the Federal Trade Commission issued to implement Children's Online Privacy Protection Act (COPPA) has found that most Web sites have failed to do what the law requires. One of its requirements is for sites must obtain "verifiable parental consent" involving any use of data from children under 13; another is that the privacy policy of the sites be clearly explained. The new study, which was authored by Joseph Turow of the University of Pennsylvania's Annenberg Public Policy Center, says that a large number of sites are skirting the intent of those requirements, and that most of the site policy statements were so long and complex that it took an average of 9.4 minutes to reach policy in search of its COPPA statements. (San Jose Mercury News 28 Sep 2001)

NewsScan

SURVEY REVEALS EPIDEMIC OF BATTERED PCs
A survey by British PC maker Novatech, intended to take a lighthearted look at techno-glitches, instead revealed the darker side of computing. One in every four computers has been physically assaulted by its owner, according to the 4,200 respondents. "The incidents of willful neglect have always been high," says the owner of a New York computer repair shop. "We've always had to deal with computers damaged by people who dumped their refreshing beverage on the computer's keyboard, or got tangled up in the cords, bringing the computer crashing down off their desk." But recently, more instances of intentional abuse are cropping up -- broken keys "from people smacking down on the keyboard with an open hand or sometimes a fist," and more commonly, "a sharp slap delivered to the monitor or the hard drive case. If you smack a machine when the hard drive is spinning, you can kill the hard drive." Most likely to provoke abuse by British users were "oops" moments, like when sensitive e-mail is sent to the wrong recipient, or a cache of previously visited porn sites is revealed at the wrong time. But an Italian repair specialist said it was all part of the culture: "People here tend to express themselves very emotionally. It is not uncommon for them to hit their televisions, their scooters and their computers... And sometimes a fast smack does fix the problem, you know." A retired psychology professor from Budapest sums it up: "We treat our machines as if they are persons. We talk to them, we name them, we even somachine. And when the little god turns out to be evil we beat the machine to purge the demon." (Wired.com 5 Jun 2001)

WORKPLACE PRIVACY "A CONTRADICTION IN TERMS"
A study by the American Management Association (AMA) has found that three out of four of the 1600 U.S. businesses it surveyed electronically monitor their employees in one way or another. Internet connections were monitored by 63%, telephone use by 43%, computer use (time logged on or keystroke counts) by 19%, video security surveillance by 38%. Although federal law generally prevents employers from monitoring of live conversations, it does not apply when the communication is stored and retrieved, such as through voice mail, e-mail, or Web monitoring. The director of the AMA study said: "Workplace privacy is a contradiction in terms. It's an oxymoron. I know the illusion of privacy is there, but you are not using your own stuff. The phone, the keyboard, the connections, the job itself -- they don't belong to you; they belong to the company, legally." (San Jose Mercury News 9 June 2001)

INTERNET FRAUD KEEPS GOING AND GOING
The National Consumer League says that the average loss from Internet fraud rose from $310 a person in 1999 to $427 last year, when total losses from Internet fraud reached $3.3 million. New York City's consumer affairs commissioner Jane Hoffman warns: "Internet fraud runs the gamut from work-at-home scams to bogus travel and vacation schemes, to securities fraud and investment scams... For many consumers the Internet can be a virtual nightmare when it comes to fraud." Hoffman says the five most common Internet scams are: Web auctions (mainly in the form of goods not delivered as promised, inflated prices, or fake bids to puff up prices); travel and vacation schemes with hidden costs; theft of ID numbers, bank data, or passwords; and investment schemes promising -- but of course failing to deliver -- huge profits. NETWORK SECURITY PROBLEMS AT COMMERCE DEPARTMENT
The General Accounting Office has prepared a report critical of the U.S. Commerce Department's computer security measure: "Individuals, both within and outside Commerce, could gain unauthorized access to these systems and read, copy, modify and delete sensitive economic, financial, personnel and confidential business data. Moreover, intruders could disrupt the operations of systems that are critical to the mission of the department." Many users of Commerce systems were found to have easily-guessed passwords and to have greater network access than justified by their 'need-to-know' level. (AP/San Jose Mercury News 3 Aug 2001)

CONSUMERS NOT READY TO PAY FOR ONLINE MUSIC
Consumers are resistant to the idea of purchasing and downloading music from the Web and are likely to remain so, according to a poll of 4,000 Internet users by GartnerG2. Less than 50% of respondents listened to CDs on their computers, and only 25% had listened to music downloads on their PCs. Only 6% reported purchasing digital music downloads in the last three months. "The percentage of Internet music buyers is not likely to increase with new Internet services being developed by the big five music companies unless they make their copyright protection systems more flexible to entice consumers," says a Gartner analyst. "Digital distribution needs to be brain-dead simple for consumers, and any DRM solution deployed should work with all music software and hardware. In order for this to happen, the Big 5 need to work together, and that doesn't look hopeful before 2002." (Reuters 28 Aug 2001)

LET THERE BE MUSIC, LET THERE BE LOVE, LET THERE BE VULGAR ROYALTIES
Soundscan, a company that tabulates retail sales of recorded music, has reported that the number of albums sold last year dropped 2.8% from previous-year's sales, the first decline since the company began a decade ago. One record company executive warns, "We have to rethink our business, and it may not be the record business anymore." Concurring with that assessment, Michigan congressman John Conyers Jr., the senior Democrat on the House Judiciary Committee, says: "Technology is forcing the record labels and the artists and the writers and the composers to come together. The Internet says to the industry that you folks are yesterday's news, you're following outdated models, your business strategies don't work anymore, and your profit motive is showing rather vulgarly." And Eben Moglen, a Columbia University law professor and general counsel of the Free Software Foundation, pleads for a return to the spirit of "music before Edison" -- a time when (he believes) music was not a commodity but a form of love. Alluding to the music-swapping experiments that take place on the Internet, Moglen argues that "everything that can be shared will be shared. But people make music because they love it, and they'll pay for it because they love it." (New York Times 10 Jan 2002)

CONSUMERS WANT M-COMMERCE 'SIMPLE AND SMALL'
Consumer enthusiasm for mobile commerce -- buying goods and services via cell phones -- has dwindled since 2000, with only 1% of mobile users surveyed worldwide in January saying they intend to use Internet-enabled phones for any type of transaction. That's down from 12% a year earlier and 32% in June 2000. "The more they have used it, the less they have liked it," says a consultant at A.T. Kearney in London. However, 44% of the 5,600 wireless customers polled said they would be interested in finding out more about "m-cash" -- systems that allow users to make small purchases by dialing a number on the mobile phone and then having the charge included on the monthly phone bill. Companies already experimenting with m-cash include Pepsi, which has launched an m-cash program for distributors in the U.S. Cingular Wireless and Vodafone have also initiated limited m-cash services. Despite consumer interest, enthusiasm risks being derailed by the technical difficulty of installing the necessary hardware infrastructure to accommodate m-cash transactions. "It's convenient from a consumer perspective because it removes the need for small cash," says a marketing manager for Visa International. "But if you're going to retrofit every vending machine just to have people zap it with their mobile phones, I don't think there's a business case for that." Additional questions arise over the willingness of wireless carriers to act as the collector of other companies' debts. "There's a substantial credit risk related to this," says a Scandinavian banking expert. (Wall Street Journal 20 Mar 2002)

COMPUTER CRIME WAY UP, SAYS FBI
Eighty-five percent of respondents report having been victims of computer crime, costing them millions of dollars, according to a survey by the Computer Security Institute and the FBI. The study, which polled 583 computer security experts in business, government agencies, medical institutions and universities, concluded that the most serious losses stemmed from theft of proprietary information. In addition, almost all of the organizations had suffered from computer virus attacks last year, and 90% said they had been victims of Web site defacement in 2001, up from 64% a year earlier. "Organizations that want to survive in the coming years need to develop a comprehensive approach to information security, embracing both the human and technical dimensions," says Patrice Rapalus, director of the Computer Security Institute. In response to the growing threat of cybercrime, the FBI has set up the National Infrastructure Protection Center and has formed regional Computer Intrusion Squads in several offices throughout the U.S. (BBC Online 8 Apr 2002)

DATA DYSPEPSIA
The quantity of information flowing into your office on a daily basis has reached an officially indigestible level, says Gartner, which reports that 90% of companies are suffering from data overload to the point where it's affecting their productivity. Gartner estimates that businesses will spend as much as $30 billion this year alone on information management systems in the hope of digging out, but it still may not be enough to improve the signal to noise ratio in most offices. Surprisingly, Gartner found that the most useful information employees receive comes from personal contacts, contact with friends and colleagues and e-mails, rather than the corporate Intranet. The company has therefore recommended that businesses encourage more social interaction -- in cafeterias, lounges and around the water cooler -- while at the same time implementing workflow tools that can help stem the tide of useless information. E-COMMERCE SITE DESIGN IS *SLOWLY* IMPROVING
A new study by the Nielsen Norman Group that examined 15 e-commerce Web sites, including those of Martha Stewart, L.L. Bean and Office Depot, indicates that their usability quotient is increasing, but only slightly. A similar study conducted two years ago concluded that the sites met an average of 45% of the group's usability guidelines; that percentage is now 49%. "If we continue at this rate for the next 15 years, we will reach a level that we really want to be at," says Jakob Nielsen. "Fifteen years is a long time to wait to get good services on the Internet, but in the big picture, this is a new technology, and whenever anything else was invented, it took awhile to get it right." Among the sites studied this year, L.L. Bean came in on top, meeting 66% of the 207 usability guidelines. The guidelines cover everything from whether a site's product search engine can handle misspellings to whether a site requires a customer to select a state as part of their information profile -- something foreign visitors can't do. 2002-06-06 **survey financial costs QA quality assurance software testing research report**

RISKS; http://www.nist.gov/director/prog-ofc/report02-3.pdf 22 11

NIST engaged the Research Triangle Institute (RTI) to assess the cost to the U.S. economy of inadequate software testing infrastructure. Inadequate testing is defined as failure to identify and remove software bugs in real time. Over half of software bugs are currently not found until downstream in the development process leading to significant economic costs. RTI identified a set of quality attributes and used them to construct metrics for estimating the cost of an inadequate testing infrastructure. Two in depth case studies were conducted. In the manufacturing sector, transportation equipment industries were analyzed. Data were collected from software developers (CAD/CAM/CAE and product data management vendors) and from users (primarily automotive and aerospace companies). In the service sector, financial services were analyzed with data collected again from software developers (routers and switches, financial electronic data interchange, and clearinghouse) and from users (banks and credit unions). …. [T]he annual cost to these two major industry groups from inadequate software infrastructure is estimated to be $5.85 billion. Similarities across industries with respect to software development and use and, in particular, software testing labor costs allowed a projection of the cost to the entire U.S. economy. Using the per-employee impacts for the two case studies, an extrapolation to other manufacturing and service industries yields an approximate estimate of $59.5 billion as the annual cost to the nation of inadequate software testing infrastructure.

MAIL-ORDER/E-TAIL HYBRIDS LEAD E-COMMERCE INTO THE BLACK
Online retail sales rose 21% last year to $51.3 billion and are expected to grow by 41% to $72.1 billion this year, with mail-order catalogue companies racking up the most revenues. "What was remarkable to me is that the online portion of retail continued to grow, not at the same pace as in the past, but still solid improvement in a pretty dismal year," says Elaine Rubin, chairman of Shop.org, which commissioned the study by Boston Consulting Group and Forrester Research. The report predicts that the Internet retailing category as a whole will break even on an operating basis for the first time this year. Catalogue companies, like L.L. Bean and Lands' End, are leading the pack, showing a 6% operating margin last year, excluding interest and taxes. Meanwhile, bricks-and-mortar retailers showed a -5% operating margin last year, while Web-only companies had a -13% operating margin. Online retailing as a whole continues to represent only a sliver of total retail sales -- 2.4% last year and an anticipated 3.2% this year. However, in specific markets, such as computer hardware and software sales, e-tailing has made significant inroads, accounting for 17.9% of those sales last year, rising to a projected 23.4% this year. PC SALES HIT THE 1 BILLION MARK
Approximately 1 billion PCs have been shipped worldwide since the mid-1970s, according to a new Gartner report, which predicts the next billion sales won't take nearly as long. Thanks to declining prices, the growth of the Internet, and the rapid adoption of computers in the developing world, the number of PCs shipped likely will double by 2007 or 2008. In addition, broadband proliferation is expected to boost shipments, with studies showing that broadband subscribers in the U.S. use their PCs more often and for more functions than do consumers with dialup accounts. "This demand exists because of the power of the PC to leverage intellectual capital, unlocking the capabilities of individuals to succeed and companies to profit," says the report. "However, expanding the market will require that PCs become smaller and even less expensive than they are today, while delivering greater functionality and performance," says the study. About 80% of the computers shipped to date have been desktop models, while notebooks have accounted for 16% of sales. (CNet News.com 30 Jun 2002)

BLAME THE ECONOMY, NOT PIRACY, FOR WEAK CD SALES
A Forrester Research report released Tuesday [Aug 13] says that the true threat to record labels' profits is the sagging economy, and that downloadable music could actually prove to be the industry's salvation rather than its scourge. According to the report's findings, people who download music from the Internet more than nine times a month -- a relatively small percentage of the overall market -- say they'll decrease their album purchases by 2%. At the same time, 39% of downloading enthusiasts said they bought more CDs, because they found new music that they wanted to purchase through their file-swapping activities. Meanwhile, it turns out that consumers who rarely or never download music account for more than two-thirds of CD sales in the U.S. With music sales slumping nearly 10% this year so far, report author Josh Bernoff says the true culprits are limited radio playlists, high-priced CDs and a general economic recession. The Forrester report suggests that record labels should offer more flexible pricing and online access to their entire music back-catalogues in order to make online music-buying more consumer-friendly. The predicted payoff (which some view as excessively optimistic) could amount to a boost of $937 million in album downloads, $805 million in singles downloads and $313 million in subscription fees by 2007. SMALL BUSINESSES SHORE UP THEIR CYBERSECURITY DEFENSES
A Computer Economics survey of 233 U.S. corporations by has found that since September 11 about 77% of businesses have improved their defenses against network vandals, viruses and other cyberattacks. Although smaller firms typically have the most reluctance to hire full-time security professionals, Computer Economics says that companies with less than $1 million in annual revenue represent the biggest proportion of companies that have improved their security with anti-virus programs and backup equipment during the past year. LABELS CLAIM DOWNLOADING CUTS INTO CD SALES
In contrast with the findings of a recent Forrester Research study [see entry for 2002-08-14], the Recording Industry Association of America has unveiled its own study that claims Internet users who say they are downloading more music are also buying fewer CDs. "Among people who said their downloading from file-sharing services had increased over the past six months, 41% reported purchasing less music now than six months ago, compared to only 19% who said they were purchasing more music," the RIAA said in a statement. Jonathan Potter, executive director of the Digital Media Association, downplayed the utility of studies such as the RIAA's. "The way to defeat illegal music distribution services is to offer comprehensive, innovative, fairly priced legal services. Until the record companies offer their content ubiquitously in a consumer-friendly way, studies like this are useless." In response to record labels' complaints that it's unfair to expect them to compete successfully in selling a music subscription service when fans can get the same songs for free, Potter says, "I'd like to introduce the recording industry to something called bottled water? The point is if there were a high-quality product that was affordable and available across multiple services, they would be able to defeat the free services." (Reuters/CNet 26 Aug 2002)

NewsScan

ONLINE RETAIL SOARS 24%
Online retail sales jumped 24% in the second quarter in year-over-year results from the same period in 2001, according to a report from the U.S. Census Bureau that defies the conventional view of e-commerce as a struggling sector. In fact, while online retail grew 24%, total retail grew by only 2.5%, year-over-year. Leading the numbers, which did not include sales from online travel, finance and ticketing sites, were books and apparel. Aggressive moves by Amazon and Barnes & Nobles to offer free shipping have boosted online book sales and J.Crew recently reported that it continued to take in more revenue through its Web site than it did over the phone -- a milestone reached last February. "It wasn't a blip," says a Jupiter Media Metrix analyst Ken Cassar. And what's ahead? With the threat of recession looming, third quarter sales are expected to taper off a bit, but the fourth quarter -- traditionally the strongest -- is expected to be huge. According to Jupiter, the percentage of consumers' holiday purchases bought online is growing every year. (Business 2.0 26 Aug 2002)

ATTITUDES ABOUT RESTRICTIONS OF INFORMATION ON THE WEB
An opinion survey conducted by the Pew Internet and American Life Project found that two-thirds of Americans think it's appropriate for government agencies to exclude some information from their Internet postings, and about half think it's all right for government to monitor Web and e-mail activities. David Greene of the First Amendment Project in Oakland, California, worries: "It certainly is significant that our society which has always prided itself on open access of information is now so scared of what open access to information means. People think, 'I'm not going to poison the water system, so what do I need to know about the water supply system?' But if all of a sudden they are part of an effort to restrict development of a watershed and need that data ... all of a sudden it's important." (AP/San Jose Mercury News 5 Sep 2002)

NEW INSTITUTE EXAMINES INTERNET'S IMPACT
The Oxford Internet Institute opened its doors last week — one of the world's first research centers dedicated to studying the Internet and its social consequences. The Institute is structured as a multidisciplinary organization that will house its own teaching staff, carry out its own research, and act as a collection point and clearinghouse for Internet research projects. Institute director Bill Dutton notes that the Internet is already profoundly changing many social relationships: "The fundamental implication of changes in information technology is that it reconfigures access. Not just in terms of the digital divide but also who you know, what you know and what you get access to and use." Meanwhile, Eli Noam, professor of economics and finance at Columbia University, warns against simply assuming that the Net is a force for good all by itself and needs no outside guidance. He notes that rather than flattening social structures and breaking down barriers, today's Internet is concentrating information in the hands of smaller groups. "We need academics to be leaders, not cheerleaders. We must save the Internet from its founding myth that it is good for democracy and is open and cannot be regulated." (BBC News 1 Oct 2002)

SOFTWARE PIRACY IN ASIA
Microsoft senior corporate attorney Katherine Bostick says that software piracy is increasing throughout the world and especially in Asian countries such as China, Taiwan, Hong Kong, Malaysia and Indonesia. "It involves organized crime," says Bostick. "When you are dealing with high-end counterfeits, you are talking about organizations that have a full supply chain, a full distribution chain, full manufacturing tools all in place, and it is all based on profits." How bad is the situation? "Two out of five business software applications were pirated in 2001, which is the second consecutive year that the piracy rate has increased." And why is it happening? "Right now, the cost of violating intellectual property rights is not that high. There is really no penalty for that major person and they will be right back in business the next day or the next month." (Reuters/San Jose Mercury News 23 Oct 2002)

GLOBAL NET USE CONTINUES TO BOOM
Despite the current economic gloom and the sharp contraction of the technology industry over the past couple of years, global use of the Internet continues to soar and e-commerce is expanding at a robust pace, according to this year's "E-Commerce and Development Report" issued Monday by the U.N. Conference on Trade and Development. The annual study predicts that the value of goods and services sold over the Net could reach as high as $2.3 billion this year, a 50% rise from last year, and could go as high as $3.9 billion by the end of 2003. Meanwhile, m-commerce is forecast to generate revenues of almost $50 billion in 2002, with Western Europe and North America leading that market for the next three years. The report cites SMS, or text messaging, as the dominant driver of m-commerce revenues, followed by micro-payments, financial services, logistics, information services and wireless customer relationship management. However, concerns over security and difficulties in making electronic payments are "limiting the conduct of m-commerce," warns the report. (PCWorld.com 21 Nov 2002)

SURVEY DEBUNKS MYTH OF THE E-MAIL DELUGE
The latest study from the Pew Internet and American Life Project indicates that reports of massive e-mail volume swamping workers and sapping their productivity are greatly exaggerated: in fact, 60% of Americans who use e-mail at work receive 10 or fewer messages on the average day, and three-quarters reported spending an hour or less daily dealing with e-mail. Only 6% reported receiving more than 50 e-mails a day, and among those, only 11% said the volume posed a problem. Most workers who receive a lot of e-mail have devised ways to manage the load, such as using filters to automatically sort the mail into folders. "All of the anecdotal evidence you hear from people out there is, 'I'm so overwhelmed by the volume of e-mail. The perception comes from the people who are talking most loudly about it, those few who are most overwhelmed," says Pew senior research fellow Deborah Fallows. The pattern is different for power users, typically those in high-level managerial positions at large corporations. Many of them spend at least two hours daily on e-mail, with the task often stretching out to four or more hours. Meanwhile, the study found that younger users (those under 30) are more likely to use e-mail for personal use while at work, often sending gossip, jokes and chain letters while on the job. DSL GROWTH SURGES TO RECORD HIGH
The number of consumers signing up for DSL (digital subscriber line) service increased nearly 20% between July 1 and September 30 over the previous three-month period — an unprecedented growth rate, according to a DSL Forum survey. Findings indicate there are now about 30 million DSL users globally, although in the U.S. cable modem users still outnumber DSL subscribers about 2 to 1. "In the U.S., (cable modem providers) are beating the hell out of us," says DSL Forum chairman William V. Rodey. "But globally, we're beating the hell out of them." Outside the U.S. there are only about 5 million cable modem customers, while foreign DSL subscribers number about 22.5 million. Tops in DSL subscriber numbers is the Asia-Pacific region (with South Korea ranking highest), followed by Europe (thanks to strong growth in Germany, Norway and Croatia), with the U.S. coming in third. 2003-01-28 **cellular mobile telephone driving danger attention study**

NewsScan

CELL PHONE USE CAN IMPAIR VISION WHILE DRIVING
Researchers at the University of Utah have found that drivers using cell phones, even hands-free devices, experience a decrease in the ability to process peripheral vision, creating a potentially lethal "tunnel vision." This "inattention blindness" slows reaction time by 20% and resulted in some of the 20 test subjects missing half the red lights they encountered in simulated driving. "We found that when people are on the phone, the amount of information they are taking in is significantly reduced," says associate professor David Strayer. "People were missing things, like cars swerving in front or sudden lane changes. We had at least three rear-end collisions." The Utah study is only the latest investigation into the effects of driving and cell phone use, and most of the others have also demonstrated some degree of impairment. And while most studies have focused on the distractions of dialing or holding a phone, the Utah research tried to focus on the distractions caused by having a conversation. New York is the only state to have instituted laws against the practice, but 30 more states have similar legislation pending. (CNet News.com 27 Jan 2003)

2003-02-03 **criminal hacker attacker vulnerabilities survey study**

NewsScan

CYBER ATTACKS DOWN, VULNERABILITIES WAY UP
The level of cyber attacks dropped for the first time in the second half of 2002, falling by 6%, according to Symantec's Internet Threat Report. But at the same time the number of vulnerabilities shot up significantly, with 2,524 new vulnerabilities reported in 2002, 81.5% over 2001. Power and energy companies saw the highest level of hacking and cracking attempts over the last six months of last year, with financial companies second. South Korea was cited as the source of many of the attacks, both because of the increased use of broadband Internet access in the country, as well as its usefulness as a hopping-off point for hackers. Hacking incidents from South Korea grew 62% between July and December last year. (The Register 3 Feb 2003)

2003-02-04 **cyber attacks hacking Internet vulnerability report**

NIPC/DHS

February 03, eWeek — Cyber attacks decline; vulnerabilities surge.

The number of attacks on Internet-connected machines decreased over the past six months while the number of software vulnerabilities continued to skyrocket, according to a new report. This supports the conventional wisdom that most attackers search for a few vulnerabilities to exploit and will abandon their efforts if these vulnerabilities are unavailable," the report concludes. The report, published by Symantec Corp., of Cupertino, Calif., is based on data from more than 400 companies. The company said it recorded more than 2,500 newly identified vulnerabilities in various software products during all of 2002, an 81.5 percent increase over the previous year. Several factors may have contributed to this increase, including the huge jump in recent years in the number of researchers looking for vulnerabilities. Once again, attackers in the United States were by far the most eager to exploit those vulnerabilities and accounted for more than 35 percent of all of the attacks during the reporting period. South Korea, China, Germany and France rounded out the top five. However, the South Koreans appear to have the most attackers per capita among countries with the largest online populations, launching 23.7 attacks per 10,000 Internet users. The U.S. is not in the top 10 on this list.

2003-02-11 **cyber terrorism cyberspace threats infrastructure protection international**

NIPC/DHS

February 07, Medill News Service — Don't underestimate cyberterrorists, experts warn.

The Internet is becoming a new battleground for warfare, according to experts concerned about the potential of a cyberattack to cripple the public infrastructure. The recent Slammer worm, which blocked Internet traffic and crippled some corporate networks for most of a weekend, is just a watered-down version of a cybercrisis that could disrupt everything from banks to water supplies, critics say. In the Mideast conflict, pro-Palestinian hackers have successfully taken down Web sites of the Israeli Parliament, the Israeli Defense Force, the Foreign Ministry, the Bank of Israel, the Tel Aviv Stock Exchange, and others, according to a report by Dartmouth College's Institute for Security Technology Studies. Dartmouth's study charts how political cyberattacks often precede physical attacks. Cyberattacks after U.S.-led military action are "extremely likely" and could possibly be catastrophic, according to the report. Information systems—like electrical infrastructures, water resources, and oil and gas—should be considered likely targets, it warns. While cyberattacks can take a variety of forms and may originate from terrorist groups or targeted nation states, they are more likely to be launched by sympathizers or thrill-seekers, according to the institute's report.

2003-03-07 **survey forecast US firms disaster recovery business continuity unprepared calamity**

NIPC/DHS

March 04, eSecurity Planet.com — Survey says U.S. Firms unprepared for disasters.

A large percentage of U.S. companies are unprepared to face business and IT outages caused by a severe calamity, according to the results of a survey released by research firm Gartner Dataquest Tuesday. The survey found that one third of U.S. businesses face the loss of critical data or operational capability in the wake of a disaster, unless investments toward disaster preparedness planning are made. Tony Adams, principal analyst for Gartner Dataquest's IT Services group, said "Preparation is the key, and without adequate investment for protection of critical systems, the repercussions of disasters will be lengthier and more costly." But cost is one of the primary reasons many of the companies surveyed cited for not having a disaster preparedness plan. "IT managers are not investing appropriately in disaster plans because they do not have a budget to accomplish their needed readiness," Adams said. Most disaster preparedness experts say that sophisticated real-time remote backup capabilities are the foundation of disaster recovery plans. In other words, it's all about redundancy. In the wake of September 11, 2001, Lee Clarke, associate professor of Sociology at Rutgers University — and an expert in organizations, technology and disasters — told Internetnews.com that the redundancy must be "meaningful." For instance, Clarke noted that many of the organizations in the World Trade Center had their disaster facilities in one of the other towers or buildings that were part of the complex.

2003-03-17 **NIST NSA security configuration IT profile document**

NIPC/DHS

March 10, Government Computer News — NIST and NSA draft safe-IT profiles.

The National Institute of Standards and Technology (NIST) has partnered with the National Security Agency (NSA) to draw up Protection Profiles-basic security recommendations for 10 hardware and software areas. NSA also is developing implementation guides for configuring operating systems securely. A 2,000-page guide for Microsoft Windows 2000 is finished, and a guide for Windows XP is in beta evaluation, said William Billings, chief of operational network evaluation for NSA's Systems and Network Attack Center. In addition, the Defense Information Systems Agency's (DISA) soon-to-be-released Gold Disk tool will apply security configurations to operating systems. The Gold Disk is part of DISA's Security Technical Implementation Guidelines (STIGs), which parallel the NSA guides. Profile development, which began about two years ago, already is complete for OSes, firewalls, intrusion detection systems, tokens and public-key infrastructures. Profiles should be ready by mid-2003 for wireless systems, browsers, databases, virtual private networks and biometric products.

2003-03-25 **cyber security lack United States US infrastructure protection**

NIPC/DHS

March 24, Federal Computer Week — States need cybersecurity focus.

A Zeichner Risk Analytics LLC study released today found 36 state governments have failed to prepare, adopt and implement acceptable cybersecurity policies, which could have damaging consequences to citizen services, communication systems and critical utilities if the nation were to undergo cyberattacks. Following a yearlong review, the study found that only 14 states and the District of Columbia are in full compliance with the Gramm-Leach-Bliley Act of 1999, which requires federal agencies and states to prepare cybersecurity guidance for financial institutions. Fourteen other states have pending legislation and/or regulations for compliance, while 22 states have little or no cybersecurity activity. The study recommended that: 1) States adopt the National Association of Insurance Commissioners nationwide proposal, which provides an approach similar to that of states in compliance with the Gramm-Leach-Bailey Act; 2) States create a single, nationwide process for developing cybersecurity laws and policies; 3) A single public-private "focal point is badly needed" to coordinate strategy.

2003-04-03 **critical infrastructure protection challenges Homeland Security**

NIPC/DHS

February 28, General Accounting Office — Critical Infrastructure Protection: Challenges for Selected Agencies and Industry Sectors.

The General Accounting Office has released report GAO-03-233 titled "Critical Infrastructure Protection: Challenges for Selected Agencies and Industry Sectors." With computer interconnectivity comes a threat: both physical and cyber assets are potentially vulnerable to computer-based attack. In response, Presidential Decision Directive 63 (PDD 63, May 1998) called for a range of actions to improve the nation's ability to detect and respond to serious infrastructure attacks. GAO examined four specific agencies—the Departments of Health and Human Services, Energy, and Commerce, and the Environmental Protection Agency—and found that the agencies have made progress in implementing several PDD 63 requirements. However, none of the agencies has fully implemented all requirements. GAO also examined private-sector groups known as Information Sharing and Analysis Centers (ISACs) for five specific industry sectors—information technology, telecommunications, energy, electricity, and water supply. ISACs serve as clearinghouses for their sectors to share information. For other suggested activities, such as establishing baseline statistics on computer security incidents, progress is mixed. Both the agencies and the ISACs identified challenges and obstacles to undertaking CIP activities. Agency-identified challenges included coordinating security efforts for critical assets with the General Services Administration, which may often be responsible for protecting agency facilities that house critical assets. The ISACs identified obstacles to information sharing, both between the sectors and the government and within the sectors. In particular, they noted concerns that information reported to the government could be subject to public release under the Freedom of Information Act.

2003-04-07 **warning survey study Web server Microsoft Internet Information Server vulnerability HTTP Netcraft**

NIPC/DHS

April 02, Security News Portal — 75% of all web servers running MS IIS 5.0 are vulnerable to exploitation.

Three-quarters of web sites running Microsoft's Internet Information Server 5.0 software to serve web pages have the WebDAV protocol enabled and thus remain open to a serious vulnerability which was announced by Microsoft last month, the latest web server survey from Netcraft says. Microsoft issued a security alert on March 17 regarding a buffer overflow vulnerability which allows attackers to execute arbitrary code on Windows 2000 machines. The survey found 767,721 IPs running IIS 5.0 and offering WebDAV and 273,496 IPs running IIS 5.0 with the protocol turned off. The monthly survey looks at web server software usage on internet-connected computers, collecting and collating as many hostnames as can be found providing an HTTP service. Each is systematically polled with an HTTP request for the server name. The March survey received responses from 39,174,349 sites. Additional information may be found on the Netcraft Website: http://news.netcraft.com/archives/2003/03/

2003-04-09 **Internet fraud crime triples**

NewsScan

INTERNET FRAUD COMPLAINTS TRIPLE
Complaints about fraudulent schemes perpetrated over the Internet tripled in 2002 from the previous year, with the most common grievance being auction fraud, followed by non-delivery of promised merchandise, credit card fraud and fake investments. According to a report from the Internet Fraud Complaint Center, which is run by the FBI and the National White Collar Crime Center, the 48,252 complaints referred for prosecution in 2002 represent only a fraction of the crimes authorities believe are occurring. The center also received almost 37,000 other complaints that did not constitute fraud, but involved such things as spam, illegal child pornography and computer intrusions. The report says 80% of known fraud perpetrators and about 71% of complainants are male. Fraud complaints originated in all parts of the country, with a third coming from California, Florida, Texas and New York. One of the most persistent scams described in the report is the infamous "Nigerian letter," which urges victims to pay an upfront fee (characterized as a bribe to the government) in order to receive non-existent funds from the "Government of Nigeria." There were 16,000 complaints related to that scam in 2002, up from 2,600 in 2001. (AP 9 Apr 2003)

Category 31.1 *Surveys, studies, audits of security*

2003-04-10 **critical infrastructure protection information security progress report**

NIPC/DHS

April 08, The General Accounting Office — Information Security: Progress Made, But Challenges Remain to Protect Federal Systems and the Nation's Critical Infrastructures.

On April 8, the General Accounting Office (GAO) published report GAO-03-564T titled "Information Security: Progress Made, But Challenges Remain to Protect Federal Systems and the Nation's Critical Infrastructures." Significant information security weaknesses at 24 major agencies continue to place a broad array of federal operations and assets at risk of fraud, misuse, and disruption. Although recent reporting by these agencies showed some improvements, GAO found that agencies still have not established information security programs consistent with the legal requirements. For example, periodic testing of security controls is essential to security program management, but for fiscal year 2002, 14 agencies reported they had testing the controls of less than 60 percent of their systems. Further information security improvement efforts are also needed at the governmentwide level, and these efforts need to be guided by a comprehensive strategy in which roles and responsibilities are clearly delineated, appropriate guidance is given, adequate technical expertise is obtained, and sufficient agency information security resources are allocated.

2003-04-14 **Federal Bureau Investigation FBI technology investment return Interner crime fraud thwart security privacy**

NIPC/DHS

April 10, National Journal — FBI director says tech investments are paying off.

FBI Director Robert Mueller on Thursday highlighted the bureau's success in thwarting terrorist attacks, counterintelligence operations and confronting cyber crime in his budget presentation to the Senate Commerce, Justice and State Appropriations Subcommittee. After counterterrorism and counterintelligence, Mueller said that tackling cyber crime was the bureau's third priority area. "Unfortunately, we are seeing explosive growth in cyber crime-both traditional crimes such as fraud and copyright infringement that have migrated online, and new crimes like computer intrusions and denial of service attacks," he said. Over the past six years, the number of such cases grew from 113 to 2,300. The FBI's Cyber Program would "focus on identifying and neutralizing: 1) individuals or groups conducting computer intrusions and spreading malicious code; 2) intellectual property thieves; 3) Internet fraudsters; and 4) online predators that sexually exploit or endanger children," he said. The agency has been consolidating those operations into a new Cyber Division at its headquarters, and its total budget request for fiscal 2004 is $234 million to protect against cyber-based attacks and high-tech crimes, including 77 new agents.

2003-04-17 **Internet Insecurity Index RSA study survey statistics mathematics**

NIPC/DHS

April 15, AtNewYork.com — "Internet Insecurity Index" unveiled at conference.

Online encryption firm RSA Monday launched its "Internet Insecurity Index" — a simple one-to-ten scale that measures how secure electronic data is each year. Given the amount of attacks, Jim Bidzos of RSA currently ranks 2003 at about a 6 and a half. Bidzos pointed to more than 62,000 hacking incidents last year as a rally cry for better safeguards. In addition to commonplace server strikes, Bidzos said ATM and wireless networks are the new target of hackers. "Part of the price is not having security designed in the first place," Bidzos said. "We found 30 percent of ISPs have no info security plans in place with 33 percent deciding that online security is not a priority." The threat index also identifies last year's $59 billion in data theft as a major impact on how safe the Internet is. The one bright area, according to RSA's index report was the U.S. government. Bidzos said the creation of the Department of Homeland Security and a national strategy to secure cyberspace marked a turning point in how the government is dealing with online threats. California's move to require companies to publicly disclose security breaches may also have a major impact on how well companies secure their networks and data.

2003-05-27 **OMB federal IT security Office Management Budget systems progress agencies GISRA**

NIPC/DHS

May 27, Government Computer News — OMB: federal IT security's better but still not good enough.

Agencies have made progress in evaluating and securing systems, but serious and pervasive problems persist, according to the Office of Management and Budget (OMB). OMB released its second report to Congress last month under the Government Information Security Reform Act. The report compares the performance of 14 departments and 10 independent agencies in fiscal 2002 with baseline data collected in 2001. Despite across-the-board improvements in eight areas, more than a third of federal systems overall still have not been assessed for risk and lack up-to-date security plans, and less than half have been certified and accredited for use. The 2001 GISRA report identified government-wide areas of weakness: lack of performance measures and senior management attention, poor security education and awareness, failure to include security in IT capital planning, failure to ensure security of contractor services, and poor information sharing.

2003-05-29 **cyber-attack survey companies organizations authorities FBI computer crime negative publicity**

NIPC/DHS

May 29, eWEEK — Cyber-attack costs down, says survey.

The percentage of organizations that detected unauthorized use of their systems fell to 56 percent from 60 percent a year earlier, according to the latest "Computer Crime and Security Survey" from the Computer Security Institute and the FBI. The 2003 survey also shows that companies are still failing to report most of their intrusions and attacks to law enforcement. Only 30 percent of the survey's respondents said they had contacted the authorities after an attack, a drop from 34 percent a year ago. Negative publicity and fear that competitors would use the information to their advantage were the top two reasons organizations cited for failing to talk to law enforcement after an attack. Among the most frequently seen attacks, viruses, laptop misuse and unauthorized access by insiders continued to lead the way, according to the survey. The 530 organizations surveyed reported $201.8 million in losses this year; in 2002, 503 respondents lost $455.8 million.

2003-05-30 **technical errors government sites web bug Business Internet Group San Francisco applications server blank pages content Keynote Systems internal**

NIPC/DHS

May 30, Government Computer News — Study finds technical errors in government sites.

A survey of 41 federal Web sites found that 68 percent will present some sort of bug within the first 15 minutes of a visit, according to the Business Internet Group of San Francisco. Most glitches were application server and Web server errors such as blank pages, embedded content errors and the 500 internal server error, the survey found. Diane Smith, the group's research director, said she selected the sites because they are used in the Keynote Government Internet Performance Index from Keynote Systems Inc. of San Mateo, Calif. The index includes sites of 10 Cabinet departments, the White House, both houses of Congress and several large agencies. Smith said she visited each Web site for up to 15 minutes and explored as if she were unfamiliar with the agency. She stopped exploring at the first error, even if the 15 minutes were not yet up. Twenty-five of the buggy sites had blank pages and internal server errors. Smith said she found three other sites with data errors, such as a wrong page link or bad data returned from a database query.

2003-06-02 **Software piracy 2002 vietnam russia ukraine indonesia china BSA pirate piracy illegal copy**

NewsScan

SOFTWARE PIRACY DOWN IN 2002
Global business software piracy declined slightly last year, thanks to increased education efforts and more aggressive tactics by the software industry, according to a report released Tuesday by the Business Software Alliance. The study estimates that 39% of business software installed on computers worldwide in 2002 was not legally obtained, with the most common violation being purchasing a single legal copy and installing it on several computers, said Robert Holleyman, president and CEO of the BSA. To combat that scenario, the alliance is continuing to circulate brochures on piracy and is conducting amnesty campaigns urging businesses to pay for additional copies without threat of prosecution. In addition, companies like Microsoft have instituted new restrictions, requiring special activation codes for its software that are tied to a single computer. It's too early to tell how well these strategies have worked in reducing piracy, said Holleyman. The country with the largest percentage of illegal software was Vietnam (95%), followed by China (92%), and Indonesia, Russia and the Ukraine, all at 89%. (AP/Wall Street Journal 2 Jun 2003)

NewsScan

BROADBAND BROADENS RISK AS WELL AS PERFORMANCE
A study of 120 broadband users conducted by the National Cyber Security Alliance (a group of business and government entities) has found that although 77% think their systems are protected from outside hackers, fewer than 60% had installed firewalls to keep their systems safe. "The disconnect means we have to do more to educate people," says Alliance spokesman Keith Nahigan, who is also a consultant to the national Office of Homeland Security. Despite the vulnerability of their systems, 86% of broadband users keep sensitive information on their computers. Broadband systems are "always-on" and Nahigan notes: "When you have your connection open all day and all night, it's easier for hackers to get in." (New York Times 4 Jun 2003)

NewsScan

KIDS GET SPAMMED, TOO
A new study by Applied Research probably won't surprise anyone, but it does highlight the consequences of the current spam-run-amok Internet culture. According to the research, which was commissioned by Internet security firm Symantec, more than 80% of kids (aged 7 to 18) get "inappropriate" unsolicited commercial e-mail on a daily basis, and their spam looks just like yours: sweepstakes offers (80%), "relationship-related" e-mail (62%), financial come-ons (61%), weight-loss ads (55%), pharmaceutical ads (51%), and, of course, p*rn (47%). Symantec has characterized spam as a new summer hazard, right up there with sunburns and insect bites. Almost half of the 1,000 respondents said they were online more than two hours a day in the summer, compared with only 23% during the school year. (CNet News.com 9 Jun 2003)

2003-06-12 **spam hackers symantec virus threats**

NewsScan

COMPANIES WORRY MORE ABOUT SPAM THAN HACKERS
Businesses are far more concerned about the rising flood of spam that's engulfing their networks than they are about run-of-the-mill hackers, according to a survey of 2,800 silcon.com readers. But the biggest worry is over virus attacks, with 71% of respondents citing viruses as the biggest threat to their businesses. Symantec's Kevin Chapman says he's not surprised by the results. "Spam has now gone way beyond the quick and easy 'hit the delete button and it's gone' solution. It's now a really big problem. From the employees' point of view it is about productivity and the sheer annoyance of dealing with all these e-mails. For the employer it is about bandwidth and other network resources issues." But aside from productivity and bandwidth concerns, there's another consequence that could be lurking out there, says Martino Corbelli, marketing director for SurfControl. "Some of these spam e-mails have completely inappropriate content which can create serious problems for the employer on a legal basis. There may be somebody who feels they should be protected from p*rnographic content, for example, and in some cases they may be prepared to sue their employer if they feel they are being exposed to offensive material on the company's network." 2003-07-07 **security major universities 80% policy importance hijack school computers launch attacks EDUCAUSE**

NIPC/DHS

July 07, Network World — University net execs face variety of security challenges.

A recent Emory University survey of 13 major U.S. universities found that 80% agreed that network security policies are very important, but only half of them are taking steps to combat the growing flood of security breaches. Staffing and budgeting were cited as the main obstacles. A new worry is the legal liabilities created for a university when someone hijacks a school computer and uses it to launch attacks against networks and computers elsewhere on the Internet. "Desktops and laptops are not professionally administered," says Rodney Petersen, of EDUCAUSE, a nonprofit group focused on advancing higher education through IT. "The freedom to allow faculty, staff, and students to alter system configurations and install software make PCs particularly vulnerable," he says.

IDENTITY THEFT: A CRIME THAT PAYS?
The number of victims that have fallen prey to identity thieves is severely underreported, according to a study by Gartner Research, which estimates that 3.4% of U.S. consumers — about 7 million adults — have suffered ID theft in the past year. Moreover, identity thieves generally get away with it — arrests are made in only one out of every 700 cases. "The odds are really stacked against consumers," says Gartner VP Avivah Litan. "Unfortunately, they are the only ones with a vested interest in fixing the problem." Typically, victims of ID theft learn of the crime a year or more later after it happens — long after the trail has gone cold. "It is different from payment fraud, where the thief takes a credit card number and consumers are innocent until proven guilty. With identity theft, it is the opposite: Consumers are thought to be guilty until proven innocent," says Litan. "There is a serious disconnect between the magnitude of identity theft that innocent consumers experience and the [financial] industry's proper recognition of the crime. Without external pressure from legislators and industry associations, financial services providers may not have sufficient incentive to stem the flow of identity crimes." (CNet News.com 21 Jul 2003)

NewsScan

COLLEGES MORE VIGILANT AGAINST VIRUSES
Reeling from the recent rash of computer viruses, U.S. colleges and universities are taking unusually aggressive steps against further infection by returning students. University of North Texas technicians report they're eradicating viruses from about 10 PCs every hour, charging students a mandatory $30 cleaning fee for the service. Students cited for infectious computers must show proof they've been fixed before they can log back onto the campus network. Vanderbilt University reports about 25% of returning students have infected computers and Oberlin College IT director John Bucher says his department found viruses on nine out of every 10 Windows-based PCs owned by students. Meanwhile, some schools managed to avert catastrophe by filtering e-mails and using antivirus software. Duke University computer security officer Christopher Cramer says his school filtered out 2.5 million infected e-mail messages, limiting the damage to only a few dozen PCs, and Temple University's mandatory use of Symantec's antivirus software kept the infection rate down to about 400 PCs out of 35,000 students. "If it had been 10-fold, it would have crashed the network," says Temple chief information security officer Ariel Silverstone. (AP 4 Sep 2003)

NIPC/DHS

September 11, IDG News Service — Study: ISPs should block 'Net attack ports.

Internet service providers (ISPs) should block access to communications ports on their customers' computers which are commonly exploited by Internet worms and other malicious programs, according to a report by Johannes Ullrich of the SANS Institute Inc. Leaving the ports open offers little to customers, while needlessly exposing them to infection and making it more likely that ISPs will be overwhelmed by future virus outbreaks, the report said. Many ISPs already block some or all of the ports named, while others offer customers free personal firewall software to install on their home computers. However, home Internet users often lack the technical knowledge necessary to install and configure a firewall, Ullrich said. The report is available on the SANS Institute Website:

NewsScan

IM-ING HABITS DIFFER IN U.S., U.K.
Using Instant Messenger at work to flirt with colleagues, complain about the boss and gossip about co-workers are among the most common IM themes — at least in the U.K., where 65% of survey respondents say they use IM for personal purposes during work hours. "If you're leaning forward and typing away at your machine, who's to know what you're typing about," says Nigel Hawthorn, whose cybersecurity firm, Blue Coat Systems, conducted a poll of some 300 firms in the U.K. and the U.S. Half the British respondents admitted to spicing up their IMs with abusive language; 40% used IM-ing to conspire with colleagues during conference calls; and nearly a third confessed to "making sexual advances" via IM. U.S. respondents, meanwhile, were much more circumspect in their IM habits, with fewer than one in five using IM to comment on senior management or to flirt. The difference, says Hawthorn, is probably attributable to the Big Brother syndrome. While nearly 60% of Brits were pretty sure their bosses couldn't monitor their IM activities, 71% of U.S. respondents believed — correctly — that their IM messages could be traced back to them. 2003-09-17 **europe download movie music free file sharing spending money in CDs**

NewsScan

EUROPE'S DOWNLOADERS ARE DIFFERENT
Unlike most Internet downloaders in the U.S., who tend to be teenagers trolling for free tunes, European downloaders are avid music and video fans, as well as regular shoppers who don't mind spending money on CDs in stores. "They are more likely to listen to digital radio and visit artist Web sites," says Jupiter Research analyst Mark Mulligan. "There is compelling evidence that this group is the bedrock community for those willing to pay for legitimate (online) music services in the future." And unlike the U.S. situation, where record labels are waging an all-out war on music swappers, in Europe, labels are pursuing a gentler approach, promoting industry-backed services and educating consumers that downloading copyrighted material is illegal. Europeans also tend to download more videos than their U.S. counterparts — 15% said they downloaded a movie every month from a free file-sharing service with Spain topping the list at 38%. In contrast, about 12% of U.S. Internet users download a video file each month. Mulligan says Hollywood should take note and avoid the hardline tactics of the music industry. "I think there's definitely an opportunity for television companies and movie studios alike to harness an emerging pattern of consumption here." (Reuters 17 Sep 2003)

2003-10-22 **Spam hurt e-mail use messages block millions businesses web list link attachment Pew American Life Project**

NIPC/DHS

October 22, Reuters — Spam beginning to hurt e-mail use, report says.

Half of all Internet users say "spam" e-mail messages has made them less trusting of all e-mail in general, according to a report released Wednesday, October 22 by the Pew Internet and American Life Project. One in four say they now use e-mail less because of spam. The group's June survey of 1,400 Internet users found that most feel they can do little to block the billions of unwanted pitches that arrive in their inboxes on a daily basis. Spam now comprises roughly half of all e-mail messages, according to several estimates, costing businesses billions of dollars in wasted bandwidth and lost productivity. Most respondents said they did not post their e-mail addresses to Web sites in an effort to keep off spammers' lists, and many said they used filters to block spam at work or home. But others admitted to behavior likely to perpetuate the problem. Some 7% said they had bought a product or service that was offered in an unsolicited e-mail, while one-third said they had clicked a link to get more information. Two-thirds said they had clicked a link to be removed from a spammer's e-mail list, an activity consumer advocates say is likely only to generate more spam.

2003-10-23 **Kansas Health Department Environment High Risk Information Systems Protection fraud disruption bioterrorism password-cracking tools 11 hours 90 percent cracked anti-virus software**

NIPC/DHS

October 23, The Lawrence Journal (Kansas) — Kansas Department of Health and Environment computers at 'high risk'.

The Kansas state agency in charge of protecting the public's health and safety is having trouble protecting its own computers and information system, according to an audit released Wednesday, October 22 by the Legislative Division of Post Audit. Operations of the Kansas Department of Health and Environment (KDHE) "were at an extremely high risk of fraud, misuse or disruption," the auditors concluded. KDHE is a large regulatory agency that collects records and information about Kansans. The agency is the leader for dealing with hazardous wastes, epidemics, immunizations and, most recently, the state's bioterrorism program. Using a standard password-cracking software, auditors were able to determine more than 1,000 employee passwords, which is about 60 percent of the total, in three minutes. Ninety percent of the passwords were cracked within 11 hours. During a lunch hour, auditors easily walked into empty offices where computers were logged on to the network and unlocked. The audit also revealed that many agency computers were infected with computer viruses that could send files and passwords to computer addresses outside the agency, and some 200 computers had no anti-virus software installed. After meeting with auditors, KDHE officials "acted strongly and swiftly to address these problems," according to the audit report.

2003-12-17 **virus worm cleanup expense Britain UK study**

NIPC/DHS

December 16, SearchSecurity.com — Cost of virus cleanups goes up in Britain. Malicious code attacks are costing enterprises in the UK four times as much as they did in 2002, according to a recent study by Britain's Corporate IT Forum. The forum, an organization of IT professionals from some of the UK's largest blue-chip companies, estimates that each incident costs an average of $213,000 in man-hours and related costs. In contrast, a 2002 survey conducted by Britain's Department of Trade and Industry (DTI) and PricewaterhouseCoopers put the per-incident price tag at $52,000. Three quarters of the administrators recently surveyed reported an average of 365 man-hours lost. Of those, one-third reported an average of 3,080 man-hours lost. The report determined that enterprises with sturdy incident-response teams and procedures suffered fewer malicious code outbreaks and were able to trim costs. Most infections, it was determined, came from systems integrated with business partners and contractors.

2004-01-20 **IP network attack easy report survey estimate infrastructure protection**

DHS/IAIP Update

January 15, CNET News — Report: IP networks easy prey for cyberattackers.

The increasing use of Internet Protocol (IP) technology in power stations, railroads, banks and other critical infrastructure could spell big trouble, and soon, according to analysts. Although an actual act of cyberterrorism or cyberwarfare has never been recorded, the potential exists and is being facilitated by an increasingly connected world, according to a report released on Wednesday, January 14, by market-research firm Gartner. Cyberwarfare could be a reality by 2005, the company said. Technologies such as VoIP and the trend towards voice and data convergence give benefits cost and flexibility to businesses, but they also expose vital telecommunications networks to traditional forms of Internet attack, such as worms and viruses, according to the report. Gartner claims that, unlike traditional circuit-switched networks, VoIP networks have an inherent weakness when it comes to latency--any delay to the packets carrying the voice traffic disrupts communication. A massive denial-of-service attack could "degrade call performance by slowing voice packet arrival at a given destination" and effectively cut off voice communication, the report says. Other weaknesses flagged include the Supervisory Control and Data Acquisition interfaces used to connect a significant portion of critical infrastructure elements such as dams, railroads, electrical grids and power stations.

GAO REPORT WARNS OF AIRLINE SECURITY SHORTCOMINGS

In its report (released on 13 Feb 2004), a General Accounting Office study notes that CAPPS II (intended to pick out potential terrorists from among millions of air passengers) has run into "significant challenges" posing "major risks" to its deployment and public acceptance. Problems include overall system reliability and false positives, and resolving the rights of those falsely identified. Passenger-provided information would be outsourced to government contractors for analysis, the government would check supposedly validated identities against a watch list, and the result would be a green, yellow, or red risk rating for each would-be passenger. Allegedly only about 4% would be rated yellow, and "an average of only one or two people a day" would be rated red. [Remember that even a 1% false positive rate would mistakenly identify tens of thousands of travelers.]

"But the GAO report found that the agency has not adequately addressed seven of eight concerns raised by Congress. These include preventing abuses, protecting privacy, creating an appeals process, assuring the accuracy of passenger data, testing the system, preventing unauthorized access by hackers and setting out clear policies for the system." GAO investigators concluded that, though the agency was making advances in all these areas, progress was incomplete.

2004-02-25 **Hotels broadband Internet access vulnerability STSN Windows file sharing**

DHS IAIP Daily; http://edition.cnn.com/2004/TRAVEL/02/25/biz.trav.security/

February 25, CNN — Hotel networks face hacker threat.

Many hotels have added high-speed wireless connections for executives to surf the Internet or access corporate data on the road. However, with security software available on the Internet from sites like www.insecure.org, hackers can explore unsecured hotel networks and tap into a guest's laptop computer. "Most hotels claim to offer secure broadband services, but most do not know enough about security issues to ask their providers the right questions," David Garrison of STSN, a broadband security firm told CNN. The biggest problem is that many laptops using Microsoft Windows have a default setting that enables you to share files or communicate with other computers. Unfortunately, unless this is turned off hackers can easily get in when you log on to a wireless network. The key thing is to ask your hotel about security before booking a room and to only use those that use reputable security systems. Personal firewalls can be used as a deterrent. These are software-based and simple versions can be downloaded for free online. There are a few other steps executives can take to boost their security while using VPNs on the road, according to Garrison. "Install an anti-virus program, turn off file-sharing capabilities and make sure you have the latest security updates for your operating system," he explained.

2004-03-29 **music piracy study survey RIAA industry claims wrong**

NewsScan

STUDY CONTRADICTS MUSIC INDUSTRY'S PIRACY CLAIMS

Two university researchers have released a study that indicates online music piracy has no negative effect on legitimate music sales, and in fact boosts sales in some cases. "Consumption of music increases dramatically with the introduction of file sharing, but not everybody who likes to listen to music was a music customer before, so it's very important to separate the two," says Felix Oberholzer-Gee, an associate professor at Harvard Business School, who co-authored the study. Oberholzer-Gee and his colleague, University of North Carolina professor Koleman Strumpf, say their "most pessimistic" statistical model indicates that only 2 million CD sales were lost due to illegal file-sharing in 2002, whereas CD sales declined by 139 million units between 2000 and 2002. "From a statistical point of view, what this means is that there is no effect between downloading and sales," says Oberholzer-Gee. The study's results contradict the recording industry's assertions that their financial decline is attributable in large part to music piracy, citing several studies that have supported that claim. However, some other research groups said the Harvard-UNC study conclusions appeared to mirror their own research findings. "While some people seemed to buy less after file sharing, more people seemed to buy more," says Jupiter Research analyst Aram Sinnreich, who conducted similar studies in 1999 and 2002. 2004-04-13 **IT professionals grade vendor software standards poorly**

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0412/web−survey−04−13−04.as p

April 13, Federal Computer Week — IT pros see vendor mediocrity.

Six hundred federal information technology professionals surveyed in January graded the performance of manufacturers, integrators and resellers they do business with at about a C+ average, according to the survey from Market Connections Inc. The report, released this week, states that on 15 performance factors, no one factor got an average score higher than a B-. Forty-six percent of the respondents reported using a credit card to purchase IT products online, with an average purchase under $2,500 for more than half of those surveyed. The survey found that the respondents believe IT security and information sharing among agencies will be the most important initiatives in the immediate future to help agencies fulfill homeland security missions.

2004-04-13 **browser attacks increase CompTIA survey**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3339731

April 13, eSecurity Planet — Browser-based attacks surging.

The Computing Technology Industry Association (CompTIA), a global trade association based in Oakbrook Terrace, IL, reports that a new survey of 900 organizations shows that browser-based attacks are surging, and may pose the 'next significant security threat' to enterprise networks. The study reports that 36.8 percent of the companies surveyed suffered a browser-based attack in the last six months. That number is up 25 percent from when the same study was conducted last year. These attacks, which are related to the recent spate of phishing scams, use a browser and user system permissions to allow an attacker to gain access to the computer to steal or destroy critical information. The attacks generally occur when a user visits a Website that, on the surface, appears harmless, but contains malicious code that convinces the browser to execute commands designed to sabotage the machine or lift proprietary data or personal financial information. The Computing Technology Industry Association also reports that while incidents of browser-based attacks are on the rise, computer viruses and worm attacks still far outweigh them. The survey shows that 68.6 percent say viruses and worms are the most security threat they have to deal with.

2004-04-16 **Cisco security warning IPSec VPN PKI threat**

DHS IAIP Daily; http://news.com.com/2100−7355_3−5193521.html?tag=nefd.top

April 16, CNET News.com — Cisco issues another security warning.

Cisco Systems warned customers on Thursday, April 15, of what security experts are calling a "minor security issue" in its IPSec-based VPN 3000 Concentrator. The problem, which is present in both Linux and Microsoft versions of the IPSec client, occurs when customers configure the VPN (virtual private network) concentrator to accept group passwords rather than digital certificates for authentication. Typically, a group password is encrypted when used for authentication. But on VPN 3000 Concentrator clients, the password can be extracted from memory, making it available to anyone using a device with the Cisco software client. People who have gained knowledge of a group password may use it to hijack connections or gain knowledge of sensitive information when these are used as pre-shared keys during authentication. Cisco recommends that customers deploy PKI (Public Key Infrastructure) instead of a Group Password based authentication scheme. Additional information is available on the Cisco Website:

2004-04-28 **survey study UK business vulnerable security IT skills lacking**

DHS IAIP Daily; http://www.vnunet.com/News/1154752

April 28, vnunet.com (UK) — UK businesses still vulnerable to security breaches.

A lack of IT security skills is leaving UK businesses vulnerable to security breaches, according to research. The Department of Trade and Industry Information Security Breaches Survey 2004 suggests that 89 per cent of companies say staff have no formal IT security qualifications. The study, by PricewaterhouseCoopers (PwC), says there is an average of one security incident per month in UK firms, but one a week in large companies. Three-quarters of UK companies, and 94 per cent of large organisations, suffered a security incident in the last year. Human error is the cause of most problems, but only a third of businesses have a security policy in place. Security spending has increased since the last survey in 2002, but only slightly from two per cent to three per cent of the annual IT budget. The report says this is well below the five to 10 per cent benchmark level. The study is available online:

2004-05-18 **financial sector external threats**

DHS IAIP Daily; http://continuitycentral.com/news01223.htm

May 18, Continuity Central — Financial institutions struggling to fend-off escalating security threats.

The majority of global financial institutions have had an external attack on their information technology systems within the last year and many of these breaches resulted in financial loss, according to Deloitte's 2004 Global Security Survey. However, even with security attacks on the rise, the largest number of respondents (some 25 percent) reported flat security budget growth. According to the survey, the vast majority (83 percent) of respondents acknowledged that their systems had been compromised in the past year, compared to only 39 percent in 2002. Of this group, 40 percent stated that the breaches had resulted in financial loss to their organization. The survey also finds that companies are sliding backwards when it comes to the use of security technologies. While more than 70 percent of respondents perceived viruses and worms as the greatest threat to their systems in the next 12 months, only 87 percent of respondents had fully deployed anti-virus measures. This result is down from 96 percent in 2003. Report: http://www.deloitte.com/dtt/research/0,2310,sid%253D1013%252 6cid%253D48978,00.html

2004-05-18 **kids downloading music internet access copyiright computer viruses songs**

NewsScan

SURPRISE — KIDS ARE STILL DOWNLOADING MUSIC

Fifty-six percent of American children ages eight to 18 with Internet access are continuing to download music, even though 88% of the respondents polled indicated they were familiar with music copyright restrictions, according to a new survey by Harris Interactive. The survey noted that more kids worry about downloading computer viruses with their songs than about getting in trouble with the law. The Harris poll was commissioned by the Business Software Alliance, which said the responses indicate a need for the software and entertainment industries to step up their efforts to dissuade kids from file-sharing. "It's a very good sign that a lot of kids and youth understand that creative works are protected by copyright law. [But if] they're still doing the wrong thing, that's not good," said a BSA spokeswoman. A spokesman for the Recording Industry Association of America, which has led an aggressive campaign against illegal music downloading, said the latest numbers show that "education is important, but without an enforcement component, it can only do so much to influence behavior." Meanwhile, the executive of a P2P networking company suggested it would be more productive to find ways for the two sides to cooperate rather than clamp down on music distribution. 2004-05-24 **online crime cybercrime scams phishing identity theft**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A53042−2004May 24.html

May 24, The Washington Post — Study: Online crime costs rising.

Online criminals are attacking corporate and government networks more frequently, costing businesses an estimated $666 million in 2003, according to a survey of computer security executives released Monday, May 24. The survey was conducted by CSO [Chief Security Officer] magazine in cooperation with the U.S. Secret Service and the CERT cybersecurity center. More than 40 percent of 500 executives polled said hackers have become the greatest cybersecurity threat to business and government networks. Computer systems falling prey to ever more sophisticated attacks are increasingly essential to the daily operations of businesses and government agencies, said Harris Miller, president of the Information Technology Association of America (ITAA). ITAA has long warned that many companies have not devoted enough time and money to cybersecurity. A taskforce reported to the Department of Homeland Security in April that most corporations fail to take cybersecurity seriously at the top levels of management. The report did not recommend that the government make cybersecurity a requirement for the private sector, but said that auditing firms should include cybersecurity readiness as part of the criterion for determining whether companies have adequate internal and financial safety controls.

2004-05-25 **authors source of viruses Russia organized crime denial of service DoS extortion**

DHS IAIP Daily; http://www.infoworld.com/article/04/05/25/HNrussianviruses_1 .html

May 25, IDG News Service — Viruses nip Russia after the Cold War.

For all its disadvantages, the former Soviet Union had one hugely overlooked advantage: it kept hackers, crackers and virus writers confined inside the country by restricting their access to the Internet. A decade later, Internet penetration is booming in the region, particularly in Russia, and viruses are epidemic. Russians are linked to some of the nastiest viruses the IT world has ever experienced: Bagel, MyDoom and NetSky, to name just a few. Security experts warn that the situation is likely to worsen as hacking, cracking and virus writing shift from being a mischievous hobby of young kids to a lucrative occupation of skilled professionals working hand-in-hand with hardened criminals. The motive is obvious: money--in some cases, big money, which fuels other traditional Mafia activities, such as drug smuggling and prostitution. Today, hundreds or even possibly thousands of skilled Russians desperate for cash are scouring the Internet looking for security vulnerabilities in the computer networks of companies, particularly in the U.S. and Europe. They are creating worms and Trojans for stealing credit card and other financial information, or turning inflected computers into zombie hosts to establish illegal spam farms, or extorting money by threatening companies with a distributed denial-of-service attack if they don't pay.

2004-09-03 **CIO Council federal managers information security privacy guidelines**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/0830/web−fea−09−03−04.asp

September 03, Federal Computer Week — CIO Council releases info-sharing guide.

Federal managers received new policy guidelines this week to help them minimize risks when sharing sensitive information online. The guidelines, issued by the federal Chief Information Officers Council, are supposed to help federal decision-makers balance the often-conflicting demands to guarantee information security and privacy and against demands to carry out their agencies' missions. For federal managers who are developing new information systems, the guidelines urge thinking about data privacy and data security as early as possible and at the highest levels possible. In an era of extensive information sharing, "information assurance specialists by themselves can no longer be charged to protect enterprise resources," the guidelines state. If agency managers follow the guidelines, they will find security and privacy controls affecting all aspects of information systems development and operations, including how they measure their systems performance, engineer workflow, design directory information, achieve interoperability and exchange data.

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0
,10801,95705,00.html

September 06, Computerworld — Federal audit raises doubts about IRS security system.

Software performance and functionality problems continue to plague the Security Audit and Analysis System (SAAS) designed to detect hacking and other unauthorized activities on computers at the Internal Revenue Service, according to auditors within the U.S. Department of the Treasury. The problems are limiting the ability of business managers and IT security workers at the IRS to identify improper uses of new applications that provide online tax services and information about refunds, the auditors said in a report issued last month by the Office of the Treasury Inspector General for Tax Administration. "Not having an effective audit-trail review process is a significant security weakness that should weigh heavily on whether to accredit future modernization applications," the report said. Daniel Galik, chief of mission assurance for the IRS, said that the system met all defined requirements and passed all tests before it was accepted. Galik wrote that the IRS is taking steps to correct the system problems and expects all the major components of SAAS to be fully functional by the end of October.

2004-09-20 **online atacks rise study survey Internet Security Threat Report Symantec botnets spammers vulnerabilities**

NewsScan

INTERNET ATTACKS JUMP SIGNIFICANTLY THIS YEAR

The semiannual Internet Security Threat Report, which is based on monitoring by computer security firm Symantec, indicates that in the first six months of 2004 there were at least 1,237 newly discovered software vulnerabilities and almost 5,000 new Windows viruses and worms capable of
compromising computer security. The numbers represent a dramatic increase over the same period in 2003. Even more troubling was the sharp rise in the number of "bot," or robot, networks, which comprise a large number of infected PCs that can then be used to distribute viruses, worms, spyware
and spam to other computers. The survey notes that in the first half of 2004, the number of monitored botnets rose from fewer than 2,000 to more than 30,000. The botnets, which range in size from 2,000 to 400,000 "zombie" machines, are often "rented out" to commercial spammers who use
them to distribute junk e-mail while concealing their identities. E-commerce was the industry most frequently targeted for attacks, accounting for 16% of the total, and report authors note that phishing
scams are responsible for pushing up the numbers in that category. "We're seeing a professional hand in development that was pretty startling in terms of malicious code," says Alfred Huger, senior director of engineering for security response at Symantec. The report's findings mirror those of
recent government-supported research. (New York Times 20 Sep 2004)

NewsScan;
http://news.com.com/Plague+carriers+Most+users+unaware+of+PC+infections/2100-1029_3-5423306.html

CYBERSECURITY LARGELY IGNORED BY INDIVIDUAL USERS

A new study by America Online and the National Cyber Security Alliance indicates that about 80% of home PCs are infected with spyware, but most users aren't even aware of it. And while 85% of users had installed antivirus software, two-thirds of those had not updated it in the past week. In addition, about 20% had an active virus on their machines and two-thirds did not have a firewall installed. AOL chief trust officer Tatiana Gau says the results highlight just how vulnerable the average online user is to malicious hackers. "No consumer would walk down the street waving a stack of cash or leave their wallet sitting in a public place, but far too many are doing the exact same thing online. Without basic protections like antivirus, spyware and firewall software, consumers are leaving their personal and financial information at risk." (CNet News. com 24 Oct 2004)

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A60199−2004Oct 25.html

October 25, Associated Press — Security for Internet users deemed weak.

Internet users at home are not nearly as safe online as they believe, according to a nationwide inspection by researchers. They found most consumers have no firewall protection, outdated antivirus software and dozens of spyware programs secretly running on their computers. The study released Monday, October 25, by America Online (AOL) and the National Cyber Security Alliance (NCSA) found that 77 percent of 326 adults in 12 states assured researchers in a telephone poll they were safe from online threats. When experts visited those same homes to examine computers, they found two-thirds of adults using antivirus software that was not updated in at least seven days. Two-thirds of the computer users also were not using any type of protective firewall program, and spyware was found on the computers of 80 percent of those in the study. The survey participants all were AOL subscribers selected in 22 cities and towns. NCSA, a nonprofit group, is backed by the Homeland Security Department and the Federal Trade Commission, plus leading technology companies. Study: http://www.staysafeonline.info/home-news.html

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/1025/web−dhsig−10−28−04 .asp

October 28, Federal Computer Week — Report: DHS has 'significant deficiency' in info security.

The Homeland Security Department's (DHS) inspector general (IG) has completed an information security audit of the agency, which shows DHS officials are still struggling with internal cybersecurity issues. The report, released Wednesday, October 27, highlights areas in which DHS officials have improved the department's information security practices and policies. But the overall tone of the report is negative. The report cited the chief information officer's lack of authority to manage DHS' departmentwide information technology programs and spending as a significant factor in the department's struggle to secure its information systems. Steven Cooper, DHS' CIO, stated that while he generally concurred with the IG's findings, DHS officials have begun a comprehensive inventory of general support systems and major applications and will review data captured in the agency's automated systems. 2004-11-01 **laptop portable security concern lax Europe survey lack of policy**

DHS IAIP Daily;
http://www.techworld.com/security/news/index.cfm?NewsID=2517

November 01, Techworld — Lax laptop policies create security concerns.

A new Europe-wide survey has revealed that laptops returning to company networks after their travels are now one of the biggest security hazards faced by many companies. Despite this, 70 percent of companies questioned offered no written guidance to employees on the use of their machines, and only a quarter imposed technological restrictions. The survey of employees in 500 companies across Europe on behalf of Websense, uncovered the tendency of many employees to treat laptops as unofficial personal possessions. As an absolute minimum, companies should start asking employees to sign up to reasonable use guidelines, while IT staff should treat any laptop connecting to the company network after returning from its travels as a major security risk.

2004-11-05 **e-governance e-voting UK Ireland Uganda**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A27612-2004Nov5.html?nav=headlines

E-GOVERNANCE FACES CHALLENGES ABROAD

Many overseas e-governance projects are failing, due to poor planning, political interference and bureaucratic bungling, according to World Bank information technology specialist Robert Schware. E-governance refers to efforts by governments to use Internet and computer technology to provide services to citizens and businesses. Schware notes that about 35% of all such projects in developing countries are a washout, with an additional 50% failing in some respect, leaving only about a 15% success rate. Schware cites $63 million spent by Ireland's government to test electronic voting technology before the project was abandoned due to doubts about its accuracy and privacy concerns. Uganda spent $22 million on an e-voting system, which performed poorly at the polls in 2001. And the U.K. pursued a $23.5 online university project that attracted only 900 students. One problem, says Schware, is that politicians sometimes want to speed up the timeline of the e-voting projects in order to win votes -- a process that usually ends up hurting the project. 2004-11-16 **hackers getting better attack boom Internet security VeriSign**

DHS IAIP Daily; http://www.techweb.com/wire/security/53200186

November 16, TechWeb News — Better hackers behind attack boom according to Internet security firm.

Security events in the third quarter jumped 150 percent over the same period last year, fueled by more sophisticated hackers writing better code who are more interested in dollars than creating computer disasters, said Internet security firm VeriSign in a new report issued Tuesday, November 16. Hackers are not only getting bolder, but they're getting better at their "jobs," said Mark Griffiths, VeriSign's vice president of security services. "Viruses written to be malicious didn't need to be written very well, but now that their primary aim is money, they're writing better code," Griffiths said. That has had a direct impact on not only the sophistication of attacks, but also their number. Sample exploits, notes VeriSign in the report, once were of such poor quality that only a skilled programmer could edit the code to produce a working attack. In the past quarter, however, exploit code has been surprisingly simple to make work, which gives less technically-astute hackers a much better chance of wrecking havoc themselves as they massage the exploit code into a working worm or virus. 2004-12-17 **Department of Homeland Security DHS cyber security lagging report NIST guidelines NSA recommendations**

DHS IAIP Daily; http://www.securityfocus.com/news/10148

December 17, SecurityFocus — Report: DHS cyber security lagging.

The U.S. Department of Homeland Security (DHS) is having some homeland cyber security issues on its systems providing remote access to telecommuters, according to a newly-released report by the DHS Inspector General's office. Earlier this year security auditors spent five months probing hosts, attacking passwords and war dialing the Department. They found that some of the hosts designed to allow home workers and other trusted users access to DHS networks by modem or over the Internet lacked the authentication measures called for by official NIST guidelines and recommendations by the National Security Agency. The Inspector General's report recommends that DHS update the DHS Sensitive Systems Handbook to include implementation procedures and configuration settings for remote access to DHS systems, ensure that procedures for granting, monitoring, and removing user access are fully implemented, and ensure that all necessary system and application patches are applied in a timely manner. While Department CIO Steve Cooper concurred with the recommendations, he said some of the auditors' concerns were overstated: The systems suffering known vulnerabilities were waiting for patches to come out of testing, and any genuine effort at password hacking would be hobbled by the Department's policy of limiting failed login attempts. 2005-01-10 **poll attack Internet power grid P2P peer-to-peer**

NewsScan; http://www.pewinternet.org/PPF/r/145/report_display.asp

NO SURPRISES HERE -- A BIGGER ROLE FOR THE INTERNET PREDICTED

A majority of the 1,286 experts polled by the Pew Internet & American Life Project and Elon University believe that at least one devastating attack on either the networked information infrastructure or the U.S. power grid will occur in the next 10 years. Other areas of general agreement: The Internet will become more deeply integrated in our physical environments and high-speed connections will become more commonplace. When examining the impact of these trends, 59% agreed that government and business surveillance activities likely will increase as computing devices become embedded in appliances, cars, phones and even clothes; 57% said virtual classes will play a greater role in formal education, with students occasionally grouped by skill level or interest, rather than by age; 56% predicted a continued blurring of the line between work and leisure thanks to the expansion of telecommuting, and resulting in a changing family dynamic; and 50% thought P2P music file-sharing would still be available a decade from now. Schools came in for sharp criticism, with many of the experts noting how little educational institutions had changed, despite all the hype over "school wiring" during the past decade. And it was generally agreed that the "digital divide" was alive and well, with low income, rural and poorly educated people having significantly less access to the Internet than their wealthier, better educated and more metropolitan counterparts. 2005-01-13 **national cybercrime survey Department Homeland Security DHS Justice DoJ 36000 businesses**

DHS IAIP Daily; http://fcw.com/fcw/articles/2005/0110/web−survey−01−13−05.as p

CYBERCRIME SURVEY PLANNED

In what they hope will become the premier measure of national cybercrime statistics, officials at the Department of Homeland Security (DHS) and the Department of Justice (DOJ) plan to survey 36,000 businesses this spring to examine the type and frequency of computer security incidents. Officials from both departments said there are currently no surveys that do what they envision the Computer Security Survey will do annually: provide statistically relevant national data on cybercrime across all U.S. businesses, especially those in critical infrastructure sectors. Patrick Morrissey, deputy director for law enforcement and intelligence in DHS' National Cyber Security Division, said no one really knows if the problem is getting better or worse or what sectors cybercriminals may be targeting. Better data could help form policy and improve resource allocation for government and the commercial sector, but few datasets are available on the national level.

2005-01-24 **Internal Revenue Service IRS information technology IT security plan improvement corrective action**

DHS IAIP Daily; http://informationweek.com/story/showArticle.jhtml?articleID=57703333

IRS NEEDS BETTER IT SECURITY PLAN, INSPECTOR GENERAL SAYS

The Internal Revenue Service isn't doing enough to assure the security of its IT systems, according to a Treasury Department Inspector General's report made public last week. The report says the IRS has prepared action plans and milestones to track program-level and system-level weaknesses, as required by the White House Office of Management and Budget. But the process the IRS employs to identify weaknesses and report progress is flawed and ineffective, the report states. That means the information the IRS provides Treasury and has been inaccurate and misleading. To ensure an effective system is established to monitor security weaknesses, the Inspector General's office recommends that the IRS chief of mission assurance and security services coordinate with the department's CIO and business-unit owners to develop plans that specifically identify all known security weaknesses. The IRS chief of mission assurance and security services agrees with the inspector general's recommendations, and has initiated a number of corrective actions. 2005-02-01 **Virtual Private Networks VPN weakest security link three year study report NTA Monitor**

DHS IAIP Daily; http://www.vnunet.com/news/1160912

VIRTUAL PRIVATE NETWORKS (VPNS) ARE OFTEN THE WEAKEST SECURITY LINK, STUDY SAYS.

A three-year research project by security firm NTA Monitor has concluded that nine out of 10 virtual private networks (VPNs) have exploitable vulnerabilities. Most of the companies that had their VPNs tested as part of the project thought that they were invulnerable to hackers, but researchers found the same types of flaw repeated across the whole product range. The report stated that, in some cases, VPNs were actually the weakest security link in an organization. The most widespread flaw involved the hacking of user names. Other vulnerabilities center around password cracking. Report: http://www.nta-monitor.com/news/vpn-flaws/index.htm

SPYAUDIT REPORTS GROWTH IN MALWARE

Monty Solomon reports:

The most malicious forms of spyware, system monitors and Trojans, increased in the last three months of 2004, according to the quarterly SpyAudit report, the nation's next-generation Internet Service Provider, and Webroot Software, a producer of award-winning privacy, protection and performance software. The report also documents the complete SpyAudit results for 2004, which tracked the growth of spyware on consumer PCs since the report's inception on January 1, 2004. It shows the instances of system monitors rose 230 percent, while the instances of Trojans rose 114 percent from October 2004 to December 2004. Trojans, keystroke loggers and system monitors are capable of capturing keystrokes, online screenshots, and personally identifiable information like your social security number, bank account numbers, logins and passwords, or credit card numbers.

The number of SpyAudit scans performed during the fourth quarter also rose with an increase of 72 percent from October 2004 through December 2004. In total for 2004, more than 4.6 million scans were performed, discovering approximately 116.5 million instances of spyware, adware or potentially unwanted software. An average of 25 traces were found per SpyAudit scan for 2004. The complete report is available at http://www.earthlink.net/spyaudit/press . …

DHS IAIP Daily; http://www.networkingpipeline.com/showArticle.jhtml?articleID=59301819

SURVEY SAYS INSIDERS, NOT HACKERS, ARE MAIN CAUSE OF DATA BREACHES

Most network security breaches are caused by insiders, rather than by hackers, viruses, or worms, according to a new study released by the think tank Ponemon Institute. In the study, 69% of companies reported that their data security breaches were the result of either malicious employee activities or non-malicious employee error. The leading single cause of data security breaches was non-malicious employee error, at 39%. Only 16% of serious data leaks were linked to hackers or break-ins. Of the 163 companies surveyed, 75% reported that a serious security breach had occurred within the past year.

EDUPAGE; http://chronicle.com/prm/daily/2005/02/2005020903n.htm

SURVEY PREDICTS SLIDE IN HIGHER ED IT SPENDING

A recent Market Data Retrieval survey of IT officials at more than 1,400 two- and four-year colleges and universities suggests a decline of 4 percent in IT spending this year compared to last year, itself a decline over the previous year. Analysts at the research firm said the decline is likely a result not only of tight budgets overall but also of increased performance of hardware, allowing lower costs for some investments. The overall drop of 4 percent is the net of a 13 percent slide in investments at public institutions and a 28 percent increase at private institutions. Private institutions continue to significantly outpace their public counterparts on IT spending per student, spending an average of $553 per student versus $203 at publics. The survey also found slightly lower rates of distance education offerings, down from 67 percent to 64 percent, and an increase in wireless networks, rising from 70 percent last year to 79 percent this year.

test%20News

SC MAGAZINE — CYBERSECURITY BOOSTS BOTTOM LINE

Companies that make cybersecurity a priority say it increases their efficiency and gives them a competitive advantage in the market, according to a survey of information security professionals. The joint survey by the Business Software Alliance (BSA) and the Information Systems Security Association (ISSA) queried 850 ISSA members online between December 2004 and January 2005. The members represent large to small businesses. Seventy-six percent of the companies said raising security as a priority gives them a competitive advantage. Their systems are down less often, they're not losing customers due to lack of trust, and their brand is not threatened, said Robert Holleyman, BSA president and CEO. The survey also showed that in the last 12 months, more companies have raised security to the senior management level - 44 percent in 2004 versus 39 percent in the previous 2003 survey. DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/35066−1.html

CIOS SAY CONSOLIDATION AND CYBERSECURITY TOP PRIORITY LIST.

CIOs and IT managers will focus on systems consolidation and security through the end of the fiscal year. That's the chief finding from a new survey of CIOs from civilian, Defense Department, legislative and top-level executive offices. The driving factors behind IT consolidation are cutting costs and improving network cybersecurity, respondents said in the 15th annual Federal CIO Survey. CIOs also identified risk management, integrating physical and IT security, and assessing the vulnerabilities of less crucial systems as among their top priorities. The survey, conducted by the IT Association of America, found that CIOs want to reduce the number of e-mail, file and print servers in use as well as cut the number of data centers. 2005-02-16 **federal government cybersecurity report card cyber attack**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A30342-
2005Feb16.html

FEDERAL AGENCIES GET FAILING GRADES ON CYBERSECURITY

At least half of all federal agencies received a grade of "D" or worse on the House Government Reform Committee's annual cyber-security report card. Agencies that received failing marks include the departments of Agriculture, Commerce, Energy, Health and Human Services, Housing and Urban Development, and Veterans Affairs. A grade of "D" was awarded to the departments of Defense and Treasury, as well as the National Aeronautics and Space Administration and the Small Business Administration. Committee Chairman Tom Davis (R-VA) was encouraged by the fact that the scores of the 10 agencies, as poor as they were, have actually improved since last year, but he warned they must still do better: "I hope it won't take some kind of major cyber-attack to wake everybody up." EDUPAGE; http://news.com.com/2100-1002_3-5579014.html

COMPANIES POINT TO EDUCATION FOR POOR SECURITY TRAINING

In a panel discussion at the Secure Software Forum in San Francisco, a number of major software makers pointed to inadequate security training at colleges and universities as a main reason software continues to be plagued with security flaws. Mary Ann Davidson, chief security officer at Oracle, said, "Unfortunately, if you are a vendor, you have to train your developers until the universities start doing it." Although other problems were identified, including a lack of sophisticated, automated tools to identify flaws, representatives of other software companies included in the panel agreed that at least some of the blame falls on colleges and universities for not providing graduates with sufficient understanding of security issues. Fred Rica, a partner in PricewaterhouseCoopers' Threat and Vulnerability Assessment Services, disagreed, saying that "Functionality still trumps security." When companies must decide how to allocate development money, he said, they choose new features over security for existing applications. A study by Gartner noted that although companies cite lack of skills among developers as a significant problem, those same companies put relatively little funding into training programs.

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2005/0214/web-aea-02-16-05.asp

AMERICAN ELECTRONICS ASSOCIATION FEARS I.T. DECLINE

A report from the American Electronics Association warns that the decreasing focus on science and technology inside the United States will weaken the country's competitive advantage. The trade group's report notes that federally sponsored research and development funding for information technology has declined during the past decade and a half as priorities have shifted to life sciences. Authors of "Losing the Competitive Advantage?" also argued the U.S. educational system fails to provide the math and science skills needed to compete in the workforce, while higher education does not graduate enough scientists and engineers to keep up with the high-tech industry's growth. Bob Cohen, a senior vice president at the Information Technology Association of America (ITAA), said ITAA members agree that some indicators suggest U.S. leadership in high technology may be at risk, if the country does not sharpen its competitiveness in global markets. NewsScan; http://www.boston.com/business/technology/articles/2005/02/16/agencies_earn_d_plus_on_computer_security/

'D' IS FOR 'DISMAL' U.S. GOV'T CYBERSECURITY

Despite widespread agreement that computer security should be a top priority of U.S. government agencies, the latest cybersecurity progress report from Congress rates overall government efforts a D-, with seven of the 24 largest agencies earning a failing grade -- including the departments of Energy and Homeland Security, which, ironically, houses the National Cyber Security Division. "Several agencies continue to receive failing grades, and that's unacceptable," says Rep. Tom Davis (R-Va.), chair of the House Government Reform Committee. But on the bright side, says Davis, "We're also seeing some exceptional turnarounds." Those include the departments of Transportation (up from a D+ to an A-), Justice (up from an F to a B-) and the Interior (up from an F to a C+). Davis notes that problem areas include lax security at federal contractor computers; a lack of contingency planning for broad system failures; and scant training opportunities for employees responsible for computer security. 2005-03-04 **White House government auditors information technology IT report security improvement indication Congress presentation**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?artic leID=60405791

WHITE HOUSE REPORT SHOWS IMPROVEMENT IN IT SECURITY

Government auditors certified and accredited 77% of the federal government's 8,623 IT systems after undergoing risk assessments and security-control testing last fiscal year, up from 62% in fiscal year 2003, according to a White House report to Congress made public Friday, March 4. Several agencies, notably the departments of Labor and Transportation, showed remarkable improvements, with Transportation certifications rocketing to 98% from 33% and Labor accreditations leaping to 96% from 58%. Karen Evans, administrator for E-government and IT in the White House Office of Management and Budget, said at a press briefing that she was pleased with the progress, but the government must be diligent even when all systems are eventually certified. "You can't be 100% secure," she said. Report: http://www.whitehouse.gov/omb/inforeg/2004_fisma_report.pdf

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,100397,00.html

STUDY: EUROPEAN IT MANAGERS HAVE FALSE SENSE OF SECURITY

Many European IT managers find their jobs extremely stressful, and even those who feel they have done as much as they can to protect their companies against emerging threats are operating under a false sense of security, according to a study released today. These conclusions were detailed in Websense Inc.'s "Stress in Security" survey of 500 IT managers across Europe. Although 91% of the managers said they believe their companies have good IT security, 70% said they leave gaps open to common Internet threats, according to the study. Many known Web-based threats are being overlooked, and a majority of respondents said they have no measures in place to protect against internal hackers or phishing attacks. "The biggest problem is that they are being reactive rather than proactive," said Websense spokesperson Rebecca Zarkos, who worked on the report. Eight percent of the European companies surveyed said they have no security measures beyond a basic firewall and an antivirus product in place. A possible reason behind the lax security is that IT managers aren't delegating enough responsibility to end users, and too few security policies are enforced, Websense said. 2005-03-25 **cybersecurity regulations challenge study report Department of Homeland Security DHS regulatory power**

DHS IAIP Daily; http://www.fcw.com/article88407−03−25−05−Web

STUDY SAYS CYBERSECURITY REGULATIONS WOULD BE CHALLENGING TO IMPLEMENT

Some lawmakers, concerned about the nation's vulnerability to cybercrime and possible cyberterrorism, are considering whether a larger federal government role in dealing with the problem is feasible. But a recent study by the Congressional Research Service, which conducts public policy studies, suggests that congressional leaders will face significant challenges if they try to create a regulatory framework to strengthen the nation's cyberdefenses. The report cites two possible models for greater government involvement in cybersecurity. One is the government response to the year 2000 computer crisis. The Securities and Exchange Commission set rules requiring companies to report on their Year 2000 preparedness, and Congress passed liability protections for companies that complied with the rules. The other is a food safety or environmental regulation model in which federal agencies set regulations and use inspectors to monitor compliance. But the report raises questions about the feasibility of either model. Despite being inconclusive, the report lays out several legislative options. The strongest option, according to the report, would be for Congress to provide the Department of Homeland Security or another agency with regulatory authority over cyberspace industries. 2005-04-04 **higher education colleges universities computer security below average**

EDUPAGE; http://www.nytimes.com/2005/04/04/technology/04data.html

HIGHER ED FARES BELOW AVERAGE FOR COMPUTER SECURITY

A recent spate of computer-security incidents at colleges and universities has drawn attention to the apparent tension between concerns over academic freedom and the need to protect sensitive information. Stanton S. Gatewood, chief information security officer at the University of Georgia, which suffered a security breach last year, noted that higher education is "built on the free flow of information and ideas," saying that college and university networks are designed based on that ideal. The result, however, is a tempting target for information thieves. According to the Office of Privacy Protection in California, colleges and universities in that state have accounted for more data incidents since 2003--close to 30 percent--than any other group. Although some states now prohibit using Social Security numbers as identifiers in many databases, their continued prevalence makes changing structures difficult. The University of Michigan, for example, spent seven years weaning itself off Social Security numbers. Because testing agencies and other organizations continue to use them, however, the university finds it still has to track them. New York Times, 4 April 2005 (registration req'd)

BUSINESSES SUFFER MORE DOWNTIME FROM VIRUSES

Damage to business IT systems caused by viruses continues to grow, and businesses are getting hit by more viruses, according to a new survey. IT systems were hit with 50% more viruses in 2004 than they were in 2003, reaching 392 incidents per 1,000 machines, according to a survey of 300 companies and government agencies sponsored by McAfee, Microsoft, Trend Micro, and other vendors, and conducted by ICSA Labs, a division of Cybertrust Inc. The Virus Prevalence Survey indicates that when 25 or more PCs or servers are infected, system downtime increased by 12% in 2004 compared with a year earlier. The amount of time it took in 2004 to recover from the infections increased by seven person days, year over year, and the actual costs of recovery averaged $130,000. Both of those figures were 25% higher than in 2003. Survey details: http://www.cybertrust.com/pr_events/2005/20050405.html

2005-04-07 **Government Accountability Office information security report testimony FISMA 2002 devastating consequences**

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−05−483T

INFORMATION SECURITY: CONTINUED EFFORTS NEEDED TO SUSTAIN PROGRESS IN IMPLEMENTING STATUTORY REQUIREMENTS (TESTIMONY)

For many years, the Government Accountability Office (GAO) has reported that poor information security is a widespread problem that has potentially devastating consequences. This testimony reports on the federal government's progress and challenges in implementing the Federal Information Security Management Act of 2002 (FISMA) as reported by the Office of Management and Budget (OMB), the agencies, and Inspectors General (IGs). In its fiscal year 2004 report to the Congress, OMB reports significant strides in addressing long-standing problems, but at the same time, cites challenging weaknesses that remain. Fiscal year 2004 data reported by 24 major agencies generally show increasing numbers of systems meeting key statutory information security requirements compared with fiscal year 2003. Nevertheless, challenges remain. For example, only seven agencies reported that they had tested contingency plans for 90 to 100 percent of their systems, and six of the remaining 17 agencies reported that they had tested plans for less than 50 percent of their systems. Opportunities also exist to improve the usefulness of the annual FISMA reporting process. In addition, a commonly accepted framework for the annual FISMA mandated reviews conducted by the IGs could help ensure the consistency and usefulness of their evaluations.

2005-04-25 **survey study steep rise Website defacements 2004 hacktivism**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4480689.stm

SURVEY SHOWS STEEP RISE IN WEB SITE DEFACEMENTS

Attacks on Web sites jumped 36 percent in 2004, totaling nearly 400,000 incidents, according to Zone-H, an organization that tracks malicious Web activity. Of the attacks recorded by the organization, Web site defacements--in which a bogus Web page is substituted for a Web site's home page--constituted the vast majority of attacks. Roberto Preatoni of Zone-H pointed out, though, that "the techniques used by defacers are the same techniques used by serious criminals to cause more serious damage." According to the group's report, more than half of the successful hacks took advantage of a known weakness or careless administration, such as easily guessed passwords or unprotected systems. Zone-H reported that the frequency of attacks rises over the Christmas holidays and drops when schools reopen each year after summer break. BBC, 25 April 2005

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml;jsessionid=ZWPITNXHXNCIMQSNDBCSKH0CJUMEKJVN?articleID=161502434

UNPATCHED MACHINES SEEN AS MAJOR SECURITY THREAT

Hackers will keep developing exploits that take advantage of known software vulnerabilities because, although patches are available, a minority of machines are fixed, security vendor McAfee said Monday, April 25. In releasing its quarterly security analysis, McAfee's "AVERT" virus research team noted that exploited vulnerabilities are becoming a dominant threat to both consumers and enterprises. According to AVERT's estimates, half or more of the computers connected to the Internet aren't properly patched or updated. Not good, especially when the number of vulnerabilities spotted in the first quarter of 2005 was up six percent over the same quarter last year. While traditional viruses may be on the way out, other threats, such as phishing, have stepped in to fill the gap said Vincent Gullotto, the vice president of AVERT. "I think we'll see a reduction in the number of traditional phishing sites that entice people to divulge information," he said. "Instead, we'll see programs that are pure spyware that can directly target the clientele they want, to get the data they need." STUDY SHOWS HACKERS WIDENING FOCUS

Online criminals turned their attention to antivirus software and media players in the first three months of 2005 as they sought new ways to take control of users' computers, according to a survey released on Monday, May 2. While hackers continued to poke new holes in Microsoft's Windows operating system, they increasingly exploited flaws in software made by other companies as well, the nonprofit SANS Institute found. As more Windows users agreed to receive security upgrades automatically, hackers looked to take advantage of other software programs that might not be patched as frequently, the head of the cybersecurity training and research organization said. "Operating systems have gotten better at finding and fixing things and auto-updating, so it's less fertile territory for the hackers," said SANS Chief Executive Alan Paller. More than 600 new Internet security holes have surfaced in 2005 so far, SANS found. Report: http://www.sans.org/top20/Q1-2005update

2005-05-13 **US Government Accountability Office GAO emerging cybersecurity issues report FISMA**

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−05−231

INFORMATION SECURITY: EMERGING CYBERSECURITY ISSUES THREATEN FEDERAL INFORMATION SYSTEMS (REPORT)

Spam, phishing, and spyware pose security risks to federal information systems. The blending of these threats creates additional risks that cannot be easily mitigated with currently available tools. Most agencies were not applying the information security program requirements of the Federal Information Security Management Act of 2002 (FISMA) to these emerging threats. Pursuant to FISMA, the Office of Management and Budget (OMB) and the Department of Homeland Security (DHS) share responsibility for the federal government's capability to detect, analyze, and respond to cybersecurity incidents. However, governmentwide guidance has not been issued to clarify to agencies which incidents they should be reporting, as well as how and to whom they should report. The Government Accountability Office (GAO) recommends that the director, OMB, ensure that agencies address emerging cybersecurity threats in their FISMA-required information security program and coordinate with DHS and the Department of Justice to establish guidance for agencies on how to appropriately address and report incidents of emerging threats. OMB representatives generally agreed with GAO findings and conclusions and indicated their plans to address the recommendations. Highlights: http://www.gao.gov/highlights/d05231high.pdf

leavi ng−networks−wide−open

LAX SECURITY LEAVES NETWORKS WIDE OPEN

Lax firewall security is leaving companies open to the installation of malicious software on their internal networks, a newly published Harris poll has warned. Fewer than half of companies block executable files from the Internet, and the same percentage fail to prevent such software coming in via instant messaging. Some 40 percent do not even block executables in email, the major cause of virus infections. The phishing threat was highlighted in the research as a major problem. Over 80 percent of those questioned indicated that their company had received phishing emails, and 45 percent said that employees had clicked through to the bogus websites. Lack of awareness is key to this problem, according to the poll. Two thirds of employees claimed not to know what phishing is, and half of all companies admitted to having no Internet security training.

2005-05-19 **Juniper Network study Internet Protocol IPv6 interest lagging**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?artic leID=163105617

INTEREST IN IPV6 LAGGING

Although it has been in the works for a decade, the next-generation Internet protocol IPv6 has failed to excite the interest of key decision makers in the federal government and private sector, according to a survey by equipment vendor Juniper Networks. Juniper's Federal IPv6 IQ Study found that less than 7% of respondents consider IPv6 "very important to achieving their IT goals," despite the fact that the protocol is designed to address, among other things, many of the quality of service, security, and network management issues that concern them. The Federal government is particularly indifferent to IPv6 and lags well behind the private sector in migration planning and awareness. Published by the Internet Engineering Task Force in RFC2460 in 1995, IPv6 provides a larger IP address space and provides native support for packet encryption, header authentication, Ipsec virtual private networking, multicasting and dynamic address configuration. DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,102155,00.html

STUDY: U.S. INTERNET USERS AT RISK FOR ONLINE EXPLOITATION

U.S. Internet users are dangerously ignorant about the type of data that Website owners collect from them and how that data is used, according to a new study by the University of Pennsylvania's Annenberg Public Policy Center. The lack of awareness makes U.S. Internet users vulnerable to online exploitation, such as misuse of personal information, fraud and overcharging, the study said. Titled "Open to Exploitation: American Shoppers Online and Offline," the study involved 1,500 adult U.S. Internet users who were asked true-or-false questions about topics such as Website privacy policies and retailers' pricing schemes. Respondents on average failed the test. According to the authors, some alarming findings include: seventy-five percent of respondents wrongly believe that if a Website has a privacy policy, it won't share their information with third parties and that almost half of the respondents couldn't identify "phishing" scam e-mailmessages. To address the problems identified by the study, the authors proposed replacing the term "Privacy Policy" with "Using Your Information," teaching consumer education and media literacy taught in elementary, middle and high schools in the U.S., and requiring online retailers to disclose what data they have collected about customers. 2005-06-08 **US Army Fort Hood base information security problem consolidation**

DHS IAIP Daily; http://www.fcw.com/article89132−06−08−05−Web

CYBERSECURITY PLAGUES FORT HOOD ARMY BASE

Fort Hood, TX, the largest Army base in the world and home of the 4th Infantry Division -- the service's first digitized force -- has a huge information security problem, said Major General Dennis Moran, the Army's director of information operations, network and space in the Office of the Chief Information Officer. He spoke June 8 at the Army Information Technology Conference sponsored by the Army Small Computer Program. Some Army IT leaders think the best way to solve the information security problem at Fort Hood is to operate IT as an enterprise. For example, the base has 96 domains on the military's unclassified network. Consolidating e-mail, servers and storage systems would improve network management, operations and security, Moran said. But Fort Hood technology workers resisted the consolidation idea. The Army's IT leaders must resolve the tension between the Army's need to operate IT as an enterprise and IT workers' unique requirements at bases, Moran said.

DHS IAIP Daily; http://news.com.com/Browser−based+attacks+increase+as+viruse s+decrease/2100−7349_3−5747050.html

BROWSER-BASED ATTACKS INCREASE AS VIRUSES DECREASE

As the threat to IT operations by viruses and worms dips, browser-based attacks are increasing, according to a technology trade organization. The Computing Technology Industry Association, or CompTIA, on Tuesday, June 14, released its third annual report on IT security and the work force. The survey of nearly 500 organizations, found that 56.6 percent had been the victim of a browser-based attack, up from 36.8 percent a year ago and a quarter two years ago, CompTIA said. Browser-based attacks often take advantage of security flaws in Web browsers and other components of the user's PC such as the operating system. The attackers' objective can be to sabotage a computer or steal private data, and the attacks can be launched when a person visits a Web page that appears harmless but contains malicious code. Still, viruses and worms continue to be the number one IT security threat, though the number of these attacks has dipped slightly. Two-thirds of organizations reported they had experienced such attacks in the past year, down slightly from 68.6 percent a year ago. DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/content/article/2005/06 /15/AR2005061500175.htm

POLL: MOST AMERICANS WANT U.S. GOVERNMENT TO MAKE INTERNET SAFE

Most Americans believe the government should do more to make the Internet safe, but they don't trust the federal institutions that are largely responsible for creating and enforcing laws online, according to a new industry survey. People who were questioned expressed concerns over threats from identity theft, computer viruses and unwanted "spam" e-mails. But they held low opinions toward Congress and the Federal Trade Commission, which protects consumers against Internet fraud. The FBI scored more favorably among Internet users in the survey but still lower than technology companies. The survey was funded by the Washington-based Cyber Security Industry Alliance. "There are some mixed signals here," said Paul Kurtz, the group's executive director and a former White House cybersecurity official. "There is definitely a desire to see government provide more leadership, but there is some anxiety about what ultimately might come out." The survey said 71 percent of people believe Congress needs to pass new laws to keep the Internet safe. DHS IAIP Daily; http://news.bbc.co.uk/1/hi/business/4618691.stm

COMPUTER PASSWORDS 'UP FOR GRABS' ACCORDING TO IT SECURITY FIRM

Half of IT managers employed by large-sized companies believe it would be relatively easy to gain the core passwords for their computer systems. That is the warning of a survey by IT security firm, Cyber-Ark. It said that ten percent of firms never changed their central administrative passwords. A further five percent did not even bother altering the manufacturer's default password that came with the system. The survey also found one IT boss who kept all passwords on his mobile phone. Less than a third of IT managers store key passwords digitally, the survey of 175 IT professionals revealed. The remainder continued to keep paper copies, stored everywhere from locked cabinets to safes. About 25% of IT staff could, as a result, access the core passwords without official permission, the survey said. The survey found that IT managers estimate 19% of general staff in their firms still keep their passwords on notepaper beside their computers. SECURITY EXECUTIVES: UNDER PRESSURE AND UNDER-PREPARED

A new survey of corporate security executives shows that their jobs are more difficult to handle than just a year ago, and they're not prepared to handle some significant security issues. Nearly 100 percent of CSOs say they are well prepared to handle spam, malware, denial-of-service attacks, and hacker attacks, according to a survey by CSO Interchange at a conference held last week in Chicago, IL, for chief security officers. However, 88 percent say their organizations are least prepared to handle inadvertent loss of data, social engineering and inappropriate use. The survey also shows that sixty-four percent of CSOs are more concerned about compliance this year than they were last year, and 38 percent report their budget for compliance solutions grew during the past year; seventy-four percent say their organization must comply with more than five laws and regulations; sixty-eight percent say their security budget is less than 10 percent of their total IT budget; eighty-three percent outsource less than 10 percent of their security, and 40 percent do not outsource security processes at all, and seventy percent say they do not receive sufficient early warning for cyber attacks. DHS IAIP Daily; http://www.gao.gov/new.items/d05845t.pdf

IPv6: FEDERAL AGENCIES NEED TO PLAN FOR TRANSITION AND MANAGE SECURITY RISKS (TESTIMONY)

For its testimony, GAO was asked to discuss the findings and recommendations of its recent study of IPv6 (GAO-05-471). In this study, GAO was asked to (1) describe the key characteristics of IPv6; (2) identify the key planning considerations for federal agencies in transitioning from IPv4 to IPv6; and (3) determine the progress made by the Department of Defense (DOD) and other major agencies in the transition to IPv6. DOD has made progress in developing a business case, policies, timelines, and processes for transitioning to IPv6. Unlike DOD, the majority of other major federal agencies reported that they have not yet initiated key planning efforts for IPv6. In its report, GAO recommended, among other things, that the Director of the Office of Management and Budget (OMB) instruct agencies to begin to address key planning considerations for the IPv6 transition and that agencies act to mitigate near-term IPv6 security risks. 2005-07-05 **study malicious code spike 2005 Sophos professional crimes Trojan horses**

EDUPAGE; http://news.com.com/2100-7349_3-5774841.html

MALWARE MUSHROOMS TO NEW LEVELS

Incidents involving malicious computer code have spiked this year, according to computer security firm Sophos, which attributes the sharp rise to growing numbers of professional criminals who are using the Internet to make money. The company said it has tracked nearly 8,000 new varieties of malware in the first six months of the year, an increase of 60 percent over the same period last year. Graham Cluley, senior technology consultant at Sophos, noted that the trend in malware has been toward Trojan horses and away from viruses and worms. Trojan horses can allow hackers to access information on a compromised system or to take over the system completely. It is these Trojans, said Cluley, that criminals are using to make money from unsuspecting users. Although Microsoft products remained at the top of the list of most frequently targeted applications, Cluley said malware is also being written to take advantage of Linux, UNIX, and Mac systems. GAO REPORT SLAMS US ARMY'S FUTURE COMBAT SYSTEMS NETWORKS PROJECTS

The major communications programs that will support the Army's transformational Future Combat Systems initiative are in jeopardy of failing to meet technical challenges and an accelerated schedule, according to the Government Accountability Office. GAO found that each of the communications pillars of the Army's Future Combat Systems (FCS) program - two Joint Tactical Radio System (JTRS) clusters, the Warfighter Information Network-Tactical (WIN-T) program and the System of Systems Common Operating Environment (SOSCOE) - would likely fail to meet aggressive schedules due to immature technologies.

"As currently structured, the JTRS, WIN-T and SOSCOE programs are at risk of not delivering intended capabilities when needed, particularly for the first spiral of FCS," according to GAO. "They continue to struggle to meet an ambitious set of user requirements, steep technical challenges and stringent time frames."

FCS is designed to link 18 manned and unmanned weapons systems via a common computer network known as WIN-T and the System of Systems Common Operating Environment.

The Army restructured its FCS program last year into spirals, with officials announcing the first spiral would happen in fiscal 2008. But GAO said the first spiral may not demonstrate key networking capabilities.

GAO found the FCS program faces network, developmental and financial challenges that continue to slow progress. FCS' information network is dependent on the success of JTRS, WIN-T and SOSCOE - programs that are not included in FCS costs.

"Because JTRS, WIN-T and SOSCOE all rely on significant advances in current technologies and capabilities and must be fully integrated to realize FCS, there are substantial risks to this effort," wrote Paul L. Francis, GAO's director of acquisition and sourcing management, in the report.

2005-07-18 **study cyber attack damages drop CSI FBI**

EDUPAGE; http://www.theregister.com/2005/07/18/csi_fbi_security_survey/

STUDY SHOWS DROP IN DAMAGES FROM CYBER ATTACKS

A new study shows a significant drop in the amount of damage caused by cyber attacks as well as a shift in the kinds of attacks that are most commonly reported. Researchers from the University of Maryland conducted the Computer Crime and Security Survey on behalf of the Computer Security Institute (CSI), with consultation from security experts at the FBI. The survey questioned IT security officials at 700 private companies, governmental agencies, and universities and found that the average cost per security incident was $204,000, down from $526,000 a year earlier. Viruses remain the most frequent type of attack (32 percent), but unauthorized access rose to second on the list at 24 percent. Chris Keating, director of CSI, noted that schemes to steal individuals' identities are a growing concern. The survey, he said, indicates "more financial damage due to theft of sensitive company data," a trend that should press network managers to ensure the security of enterprise systems. The Register, 18 July 2005

DHS IAIP Daily;
http://www.computerweekly.com/Articles/2005/07/19/210901/Mob

MOBILE PHONES OF LITTLE USE IN CRISIS

The London bombing highlighted important gaps in business continuity plans, according to security experts. Many firms discovered, to their cost, that their business continuity plans relied on being able to communicate with key staff via mobile phone networks, which were out of action or unreliable for most of the day the bombs exploded. Others found themselves in difficulty when key staff were unable to make it into work, said Andy Tomkinson, a director at the Business Continuity Institute. In the aftermath of the explosions police invoked a system called Access Overload Control, which shuts down large swathes of the mobile network, to free-up communications for the emergency services. Corporate e-mail systems also came under strain, which in some cases caused severe disruption to businesses. Some companies instructed staff to send text messages rather than make mobile phone calls--a lesson learned from the central London power cut two years ago. Analyst firm Gartner said that the attacks showed that organizations need to have viable, tested business continuity plans, which are focused on people, not just business assets.

2005-07-25 **study report SANS hacker new targets vulnerabilities patch update**

EDUPAGE; http://online.wsj.com/article/0,,SB112224497897894400,00.html

HACKERS FINDING NEW TARGETS

According to a new report from the SANS Institute, the number of computer hacking incidents is rising, and the targets of such hacks are increasingly software applications rather than operating systems. The organization found that the number of vulnerabilities reported was up
11 percent from the first quarter of the year to the second, and up nearly 20 percent from a year earlier. Alan Paller, SANS's research director, said the situation is getting worse. As operating systems become more secure, hackers are turning to applications, such as Apple's iTunes and RealNetworks's RealPlayer. Hackers are also focusing efforts on backup systems, particularly those of Computer Associates and Veritas Software. Because backup systems typically contain vast amounts of confidential corporate data, they represent an attractive target. SANS noted that the best way to avoid such hacking threats is to install all software patches, keep antivirus tools up to date, and be prudent in opening e-mail attachments. DHS IAIP Daily;
http://www.techworld.com/security/news/index.cfm?NewsID=4150
&Page=1&pagePos=2

KEY MANAGEMENT HOLDING BACK ENCRYPTION

Businesses are keener than ever to roll out data encryption, but are still struggling with the complexity of key management, a new survey has concluded. The survey was carried out by UK encryption specialist nCipher, sampling 237 "decision makers" at large enterprises across the globe. The main problem appears to be key management with nine percent of those surveyed having more than 10,000 keys on servers, and 11 percent having the same number on desktops. Further down the scale, 16 percent had 1,000 keys on servers, with almost a quarter having the same number of desktops. Underscoring this issue, 31 percent of managers with 500 or more keys in their organizations admitted they knew little or nothing about available key management systems. The survey found that encryption is rapidly becoming a mainstream technology, with its use now mandated across a wide range of applications. Drivers included government legislation, and private sector date protection standards developed by groups such as the Payment Card Industry. Survey: http://www.ncipher.com/crypto2005

2005-09-01 **study colleges higher education university computer security concerns vulnerabilities**

EDUPAGE; http://www.csmonitor.com/2005/0901/p12s02-legn.html

COLLEGES DEALING WITH COMPUTER SECURITY CONCERNS

As the number of computers on college campuses rises, and as IT becomes increasingly rooted in campus activities, higher education officials find themselves facing expanding numbers and kinds of threats to vulnerabilities in computer security. According to the Privacy Rights Clearinghouse (PRC), 50 million people have been involved in data breaches over the past seven months, including more than 30 incidents on U.S. college and university campuses. Complicating the challenge to IT security staff is the historically open nature of academic settings, a characteristic often at odds with strong computer security. Another factor making life difficult for IT staff are the computers that students bring to campus with them, often with inadequate or poorly configured security features. Jack Suess, vice president of information technology at the University of Maryland Baltimore County, however, noted that of the 11,000 to 12,000 computers on his campus this year, "there's probably only 200 or 250 I'm really worried about." Christian Science Monitor, 1 September 2005

2005-09-06 **online banking e-commerce stalling hacker cracking survey study**

EDUPAGE; http://news.com.com/2100-1038_3-5851061.html

GROWTH OF ONLINE BANKING STALLS AMID HACKING FEAR

A new survey by Ipsos Insight shows that the number of people who use the Internet for banking has reached a plateau, but that those who do their banking online are conducting growing numbers of transactions. According to the survey, roughly 39 percent of Americans use the Internet for personal banking--the same number as a year ago. Concern over online security for personal information was identified as a leading reason why more people are not turning to the Web for banking. Survey respondents expressed concerns about the possibility of hackers stealing sensitive information, about online scams that dupe users into revealing personal data, and about the practice among some banks of selling customers' personal information to third parties. Of those who conduct banking online, most are using the Web for growing numbers of financial transactions, including paying bills and managing retirement accounts, according to the survey. 2005-10-14 **peer-to-peer P2P activity colleges survey network administrators security concern ResNet organization**

EDUPAGE; http://chronicle.com/daily/2005/10/2005101402t.htm

RESULTS OF RESNET SURVEY RELEASED

The ResNet Organization has released results from a survey it conducted earlier this year of those responsible for residential networks at 224 colleges and universities. The leading concern among network administrators is security, with P2P activity coming in at a distant second. Administrators also put security at the top of the list of issues they expect to take significant amounts of time and resources over the next couple of years, with wireless networking coming in second and P2P issues falling to seventh. David G. Futey, associate director of academic computing at Stanford University and a member of the ResNet Organization, said the survey provides new insight into "determining what a res-net service area is at institutions, the level of services it provides, and the technology supported through it." Futey commented that he was surprised to see that of the respondents to the survey, nearly half had not installed wireless networks. The survey also indicated that more than half of responding institutions charge technology fees but that at about half of those that charge a fee, no part of the fee supports residential networks. 2005-10-24 **IT planning bird flu pandemic threat outbreak businesses Companies laptops virtual network connections office**

DHS IAIP Daily; http://www.computerweekly.com/Articles/Article.aspx?liArticleID=212598&PrinterFriendly=true

IT PLANNING VITAL TO MEET BIRD FLU PANDEMIC THREAT

To prevent a loss of IT functionality in the case of a pandemic, Gartner analyst Dion Wiggins says that it is imperative that companies start planning for a potential outbreak and to look at ways they could use IT to help their businesses continue to function. Companies are encouraged to sign contracts to ship in laptops for staff at short notice, and to provide them with secure virtual private network connections to access office systems. In addition, firms that are heavily reliant on their IT departments should split key IT staff into shifts to maintain consistent coverage. Jim Norton, senior policy adviser at the Institute of Directors, says businesses that invest in broadband and e-commerce technologies are better placed to cope with a pandemic. Business continuity experts said a flu pandemic could cause far more disruption to businesses than the last major flu outbreak in 1968, when businesses were less dependent on a small number of staff with key skills and the smooth running of the transport system for just-in-time deliveries. 2005-11-04 **survey IT executives insider threat worry concern security**

DHS IAIP Daily; http://www.esecurityplanet.com/prevention/article.php/3561761

INSIDER THREATS GIVING IT EXECS NIGHTMARES

Sixty-nine percent of 110 senior executives at Fortune 1,000 companies say they are 'very concerned' about insider network attacks or data theft, according to a study by Caymas Systems, a network security technology firm. Only 13 percent says they are not worried at all. Sanjay Uppal, a vice president at Caymas Systems, claims 30 percent of people who come in and work on your average network every day are temporary workers. And that brings up specific threat concerns. But he also says that IT and security administrators should not forget about permanent workers and the havoc they can wreak. Uppal says insider security threats definitely need to be dealt with quickly. Uppal recommends that workers should be limited as to what parts of the network they can access. Someone working in production shouldn't be able to access financials. And someone working in the financial department, should be able to access personnel records and reviews.

2005-11-07 **study survey computer problem carelessness cause virus worm hacking data loss**

EDUPAGE; http://chronicle.com/daily/2005/11/2005110701t.htm

CARELESSNESS CITED AS FACTOR IN COMPUTER PROBLEMS

An in-depth study of more than 300 computer and network problems at 36 colleges and universities identified carelessness of students and staff as one of the leading causes of such problems. Despite widespread perceptions that issues such as viruses and loss of confidential data are largely the result of malicious behavior, those involved in the study found that careless actions by students or staff were the primary cause for 40 percent of the incidents studied. Virginia E. Rezmierski, adjunct associate professor at the University of Michigan at Ann Arbor and leader of the research, said she was surprised to learn that external factors didn't play a larger role in computer problems. Primarily, she said, the problems resulted from inadequate training to help computer users avoid trouble and from insufficient policies to deal with problems that do arise. Rezmierski said the results support her contention that many colleges and universities moved too quickly to implement IT systems without necessary "rules and policies about how we want to operate in a shared-resource environment." 2005-11-09 **survey study online banking e-commerce security consumer worry**

EDUPAGE; http://news.com.com/2100-1029_3-5941531.html

CONSUMERS WORRYING OVER ONLINE BANKING

Even as federal regulators insist on tighter security controls for online banking, some consumers are deciding that the convenience is not worth the risk. Results of a survey announced this week at a forum on identity theft indicate that nearly one in five Americans who have conducted banking transactions online have limited or ended their online banking due to security concerns. The Federal Financial Institutions Examination Council, which includes the Federal Reserve and the Federal Deposit Insurance Corporation, recently issued guidelines requiring banks to add a second level of authentication for online banking transactions. That level could include smart cards, password tokens, or biometric identification. According to the Federal Trade Commission, 10 million Americans are victims of identity theft each year, and federal data estimate that each victim spends about 90 hours and $1,700 fixing matters. The survey also indicated that 94 percent of consumers would accept added online security, though 81 percent said they would not want to pay for such extra measures. CNET, 9 November 2005

2005-11-17 **security study telecom consolidation disaster recovery network reliability DHS**

DHS IAIP Daily; http://www.zra.com/docs/ZRAPR.pdf

STUDY FINDS TELECOM CONSOLIDATION WILL AID NETWORK RELIABILITY DURING DISASTERS

The current consolidation occurring in the telecommunications industry is a step toward ensuring network reliability following threats to our nation's security, according to a study released by homeland security expert Lee Zeichner. The study, entitled "State Public Utility Commissioners: Homeland Security & National Preparedness Responsibilities," concludes that state public utility commissioners' current review of major telecom mergers must address traditional regulatory issues as well as issues like network reliability and resilience. According to the study, "Telecommunications regulators can affect state and local government response to catastrophic disasters in profound and meaningful ways, directly impacting consumers as well as small to large-sized corporations." The study states that with multiple carriers and multiple networks, there is no comprehensive communications infrastructure map to guide disaster planning and response. "A certain amount of consolidation…is critical to support delivery of essential citizen services in the aftermath of a disaster." The study offers recommendations for state public utility commissioners to emphasize network reliability and resiliency while maximizing traditional regulatory issues. These include the need to consider issues related to communications resiliency during their deliberations and the adverse impact of divestiture requirements on resiliency during merger proceeding. They should also commit to resolving operational impediments. Study: http://www.zra.com/docs/UC&CR.pdf

MARKET FOR INFORMATICS REACHES ONE BILLION PER YEAR

According to a report from C.E. Unterberg, Towbin Inc. of New York and business incubator Chesapeake Innovation Center of Annapolis, MD, intelligence and security informatics IT is now one billion a year. Since 9-11, the urgent need for homeland security and an increase in available government funding have been driving the market for advanced anti-terrorism IT. Sales of counterterrorism analytics and software for both private and public companies are expanding at an estimated 20 percent a year and have accounted for two billion in mergers and acquisitions in the last 18 months, according to a news release about the report. 2005-11-21 **survey business continuity data recovery disasters NIST new technology**

DHS IAIP Daily; http://www.gcn.com/24_33/tech−report/37577−1.html

DATA DISASTER: WHEN CONTINUITY-OF-OPERATIONS PLANS AREN'T ENOUGH

Disasters -- both natural and man-made – require that agencies ensure that data held on IT systems and devices remain accessible in order to support mission-critical operations. Continuity-of-operations plans—those that keep government going in the face of emergencies—are important, but far from foolproof. In a recent survey by Asigra Inc. of Toronto, 75 percent of respondents said their organizations had lost backed-up data because of unreadable, lost, or stolen media. Almost two-thirds of the respondents had run into unreadable backup tapes when trying to recover data. New data-handling techniques not designed for disaster recovery could apply to agencies trying to reconstruct critical information. One application being created by the National Institute of Standards (NIST) and Technology for courtroom investigations is high-resolution images of magnetic data that can tell an investigator when data has been written, erased or altered, said physicist David Pappas, project lead at NIST. The technique, called second harmonic magnetoresistive microscopy, uses powerful magnetic readers designed for server drives to image the fields on other magnetic media, such as tapes and disks. "You're actually taking a picture of the magnetic field above it, rather than just scanning it really fast and averaging the data," Pappas said.

2005-11-22 **report study SANS cross-platform applications network operation system hacker targets**

EDUPAGE; http://www.fcw.com/article91516-11-22-05-Web

SANS REPORT SHOWS DIRECTION OF HACKERS

A new report from the SANS Institute identified cross-platform applications and network operating systems as emerging targets for hackers. The applications cited include backup software, antivirus software, database software, and media players; operating systems for routers and other network devices were also singled out. The report, "20 Most Critical Internet Security Vulnerabilities in 2005," noted that 13 of the top 20 were in these two types of technology, which are among the least protected computer assets in many organizations. In the 2004 SANS report, neither category of technology was identified among the worst threats; the 2005 report indicates that these types of attacks account for 65 percent of the worst threats. Alan Paller, director of research at the SANS Institute, commented, "Six years ago, attackers targeted operating systems." Since then, makers of operating systems have improved protections and implemented automatic patching. "Now," he said, "the attackers are targeting popular applications, and the vendors of those applications do not do automated patching. Here we go again." Federal Computer Week, 22 November 2005

2005-11-22 **survey study SANS cyber criminal target popular applications network systems**

DHS IAIP Daily; http://www.sans.org/top20/ Source: http://fcw.com/article91516−11−22−05−Web

CYBERCRIMINALS TARGETED POPULAR APPLICATIONS, NETWORK SYSTEMS IN 2005

According to the SANS Institute's latest update to its 20 Most Critical Internet Security Vulnerabilities in 2005 report, cybercriminals have launched massive attacks on two largely undefended fronts in cyberspace, leaving government and industry more vulnerable than they have been in years to data theft and security breaches. Ten of the vulnerabilities were in cross-platform applications installed on millions of systems, including backup software, antivirus software, database software, and media players. Three affected network operating systems that control routers, switches, and other devices. Alan Paller, director of research at the SANS Institute, stated: "The bottom line is that security has been set back nearly six years in the past 18 months. Six years ago, attackers targeted operating systems, and the operating system vendors didn't do automated patching. In the intervening years, automated patching protected everyone from government to grandma. Now the attackers are targeting popular applications, and the vendors of those applications do not do automated patching." Since 2003, attackers have infiltrated Defense Department networks by exploiting vulnerabilities in hardware and software.

DHS IAIP Daily;
http://www.computerworld.com/hardwaretopics/storage/story/0,
10801,106641,00.html

HURRICANES PROMPT MORE COMPANIES TO STORE DATA OFF-SITE

The number of companies making copies of data to protect it has dramatically risen in the wake of Hurricanes Katrina and Wilma this year, but most of those companies are keeping that duplicate data locally where it's still vulnerable to disasters, according to a survey released Wednesday, November 30, by Gartner Inc. The September survey of 104 North American IT managers showed that 45 percent of respondents back up or replicate data to another disk, up from just six percent who did so in 2004. But 70 percent of the respondents who make backups do so to a local device. Adam Couture, an analyst at Stamford, CT-based Gartner, said that if companies hope to truly protect their data, they have to electronically copy it to an off-site facility either owned by the company or a service provider. The Gartner survey also showed that IT managers are more comfortable considering managed storage services to copy data off-site. Over the past two years, Couture said, surveys have shown that between 30 percent and 40 percent of IT managers would never use a third-party service provider. But in the most recent survey, that number had plummeted to just six percent.

2005-12-06 **study report computer security threats 2005 increase worms viruses Trojan horses**

DHS IAIP Daily; http://www.techweb.com/wire/security/174901293

SECURITY THREATS INCREASE IN 2005

The number of new worms, viruses, and Trojan horses jumped 48 percent in 2005, a security company said Tuesday, December 6, as it detailed the year's security woes. United Kingdom-based Sophos detected nearly 16,000 new threats from January to November, 2005, a major bump from the 10,724 during the same period in 2004. Every month in 2005 posted larger-than-last-year numbers, but November, which was marked by the debut of a strong Sober.z worm, outpaced all others. By Sophos' records, 1,940 new viruses, worms, Trojans, and spyware threats were spotted last month, its largest-ever monthly increase. If that pace were to continue, the next 12 months would see 23,000 threats. Topping Sophos' top-10 chart was the long-running Zafi.d, a mass-mailed worm that made itself known almost a year ago: It accounted for 16.7 percent of all threats detected during the first 11 months of 2005. Netsky.p took second place, with 15.7 percent, while the new Sober.z came in at third, with six percent. "Given more time, Sober.z would have dominated the chart, but its emergence in late November prevented it from taking pole position," said Graham Cluley, senior technology consultant at Sophos.

2005-12-06 **technology return-on-investment ROI study academia industry difficult complex problem management issues**

EDUPAGE; http://www.fcw.com/article91625-12-06-05-Web

ACADEMY AND INDUSTRY STUDY ROI

A group of academic and industry researchers will work together on an initiative to create a methodology that organizations can use to study the return on investment (ROI) of technology projects. Governments are increasingly asked to demonstrate the value of taxpayer dollars invested in IT projects. Led by the Center for Technology in Government (CTG) at the State University of New York at Albany and SAP, the effort will include researchers from Harvard University's John F. Kennedy School of Government, Accenture, Gartner Research, Cisco Systems, and North American and European government agencies. Anthony Cresswell, deputy director of CTG, said that calculating ROI for IT projects "has been a complex and difficult problem." He said the new effort will "produce results that will make a major contribution to the ability of governments of all types to enhance the political, social, and economic value they obtain from IT investments." Federal Computer Week, 6 December 2005

2005-12-08 **study malicious software malware rootkits Sony BMG XCP**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2147301/rootkits−storm −mal ware−chart

ROOTKITS STORM MALWARE CHART

The most common rootkit is a spyware application known as Apropos, according to data collected by security experts at F-Secure. Apropos collects system information and data on a user's browsing habits and sends the information back to the application's creators. It is also capable of recording keystrokes and launching a denial of service attack, and can download and install additional software on an infected computer. Rootkits have become a mainstream phenomenon ever since Sony BMG was caught bundling one as part of the XCP anti-piracy technology on some of its audio CDs. Sony used a rootkit to hide the technology, preventing users from uninstalling the application. Hackers originally started using rootkits to build backdoors into computers, but the technology has caught a second wind in recent months as malware creators use rootkits to hide worms and spyware from antivirus and anti-spyware software. In F-Secure's ranking Apropos surpassed the Sony BMG rootkit in the number of infections.

DHS IAIP Daily; http://www.theregister.co.uk/2005/12/15/mcafee_internal_security_survey/

GEEKS, SQUATTERS AND SABOTEURS THREATEN CORPORATE SECURITY

Workers across Europe are continuing to place their own companies at risk from information security attacks. This "threat from within" is undermining the investments organizations make to defend against security threats, according to a study by security firm McAfee. The survey, conducted by ICM Research, produced evidence of both ignorance and negligence over the use of company IT resources. One in five workers let family and friends use company laptops and PCs to access the Internet. More than half connect their own devices or gadgets to their work PC and a quarter of these do so every day. Around 60 percent admit to storing personal content on their work PC. One in ten confessed to downloading content at work they shouldn't. Most errant workers put their firms at risk through either complacency or ignorance, but a small minority are believed to be actively seeking to damage the company from within. Five percent of those questioned say they have accessed areas of their IT system they shouldn't have while a very small number admitted to stealing information from company servers.

2005-12-28 **Criminals viruses security Windows outbreaks Symantec malicious wares inbox programs Sophos firms**

DHS IAIP Daily; http://news.bbc.co.uk/2/hi/technology/4521844.stm

CRIMINALS TARGET VIRUSES FOR CASH

At first glance, 2005 looks like it was a quiet year for computer security because there were far fewer serious Windows virus outbreaks than in 2004. According to figures gathered by security firm Symantec, there were 33 serious outbreaks in 2004. In 2005, there were only six such incidents. "We're talking about a substantial decrease in worldwide pandemics," said Kevin Hogan, senior manager in Symantec's security response team. This decline is taking place because virus makers have largely stopped spreading their malicious wares with mass-mailers that try to infect as many people as possible via their inbox. Instead, virus creators are cranking out more versions of malicious programs than ever before. Year-end statistics from Finnish anti-virus firm F-Secure show that there were 50 percent fewer virus outbreaks in 2005 but the number of malicious programs has grown by, on average, 40 percent for the last two years. Similarly Sophos reported that it found 1,940 new malicious programs in November 2005, the largest increase since records began. Security experts say this explosion in variants is partly driven by a desire to overwhelm anti-virus firms.

DHS IAIP Daily; http://www.securitypipeline.com/news/175800842 23

DECEMBER INSTANT MESSAGING ATTACKS JUMP 826 PERCENT OVER 2004

Attacks against public instant messaging (IM) networks soared over 800 percent in December 2005, compared to the same month last year, a security company announced Tuesday, January 3. According to IMlogic's Threat Center, December 2005's instant message exploits jumped 826 percent over December 2004, just the latest proof of the expanding threat facing IM users throughout the year. December, however, was slightly off the previous two months. The year's last month saw 241 new threats, said IMlogic, down from the 307 in November and the 294 in October. Combined, the three months showed a 13 percent increase in IM threats over the third quarter of 2005. IM attacks not only continue to grow in number, but also keep gaining in sophistication, said IMlogic chief technology officer Jon Sakoda. MSN was the most heavily-hit IM network in December, added IMlogic, and accounted for 48 percent of the total threats launched. America Online's AIM, meanwhile, tallied 41 percent, while Yahoo's instant messaging network came in a very distant third, with 11 percent. IMlogic year-end results of its IM tracking effort: http://www.imlogic.com/im_threat_center/index.asp

2006-01-10 **study survey instant messaging IM attacks increase 2005**

DHS IAIP Daily; http://news.com.com/Study+Instant−messaging+attacks+rose+in+ 2005/2100−7349_3−6025226.html?tag=cd.top 23

INSTANT MESSAGING ATTACKS ROSE IN 2005

Security attacks over instant-messaging (IM) networks became more prevalent in 2005, according to a new study. Microsoft's MSN network experienced the largest number of IM security incidents in both 2004 and 2005, while year-on-year incident growth rates were largest on AOL's AIM network, according to the report, published Monday, January 9, by IM security vendor FaceTime Communications. In 2005, MSN had a 57 percent share of the attacks, AOL had 37 percent and Yahoo had six percent, FaceTime said in its "Impact report: Analysis of IM & P2P Threats in 2005." While the incidence rate of attacks over IM is still low compared with e-mail-borne attacks, the rate appears to be increasing rapidly. There were 778 incidents recorded in the fourth quarter of last year compared with 59 in the first quarter, according to the report. Worms and rootkits were at the heart of the main incidents in 2005, said Chris Boyd, security research manager at FaceTime who also warned of the growing danger of cross-network attacks. FaceTime said that exploits can jump networks through IM "consolidation" applications, such as Trillian or Gaim, which let people combine contacts from multiple IM networks on one list. FaceTime's report is available by request: http://www.facetime.com/forms/impact_report2005.aspx

2006-01-11 **study survey Europe IT spending decline shrink**

DHS IAIP Daily; 23
http://www.channelregister.co.uk/2006/01/11/it_spending_shrinks/

EUROPEAN IT SPENDING SHRINKING

IT spending across Europe is under even more pressure and budgets will grow by just 1.6 percent in 2006, compared to 2.9 percent last year. Researchers from Forrester found that more than half of European firms plan to reduce IT budgets this year. The main priority across Europe is for spending on security, anti-virus and host intrusion detection. For IT services price pressure is the main concern, with nearly half of European firms saying that cutting costs is an important or critical priority for the year ahead. Miguel Angel Mendez, associate analyst at Forrester Research, said the caution on IT spending was at odds with people's more optimistic view of their own industries -- 60 percent of respondents expect the coming year to be good or okay for their industries. The feeling in the United Kingdom seems slightly more optimistic -- British firms expect to increase IT spending by 2.3 percent, but only 20 percent of this will go on new developments. Big technology brands such as Cisco, HP, IBM, Microsoft, SAP and Oracle get the lion's share of purchasing preferences.

2006-01-11 **FBI computer crime survey study attacks succeeding despite security investments**

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,28914 23
2,sid14_gci1157706,00.html

FEDERAL BUREAU OF INVESTIGATION SAYS ATTACKS SUCCEEDING DESPITE SECURITY INVESTMENTS

Despite investing in a variety of security technologies, enterprises continue to suffer network attacks at the hands of malware writers and inside operatives, according to an annual Federal Bureau of Investigation (FBI) report released Wednesday, January 11. The 2005 FBI Computer Crime Survey was taken by 2,066 organizations in Iowa, Nebraska, New York, and Texas late last spring, which survey organizers deemed a good sample of enterprises nationwide. The report is designed to "gain an accurate understanding" of computer security incidents experienced "by the full spectrum of sizes and types of organizations within the United States," the FBI said. The 23-question survey is not the same as the CSI/FBI Computer Crime and Security Survey. The survey addressed such issues as the computer security technologies enterprises used, what kinds of security incidents they've suffered and what actions they've taken. Among the findings: 1) Security software and hardware failed to prevent more than 5,000 incidents among those surveyed; 2) A common point of frustration came from the nonstop barrage of viruses, Trojans, worms and spyware; 3) Use of antivirus, antispyware, firewalls and antispam software is almost universal among those who responded. But the software apparently did little to stop malicious insiders. FBI 2005 Computer Crime Survey: http://www.fbi.gov/publications/ccs2005.pdf

2006-01-19 **denial of service DoS zombie PC survey study**

DHS IAIP Daily; http://news.bbc.co.uk/1/hi/technology/4625304.stm 23

ZOMBIE PCS TARGET VULNERABLE SITES.

Recently, denial-of-service (DoS) attacks by criminals who recruit so-called zombie PCs and use their net addresses to deluge sites with data, have become increasingly more prevalent. According to security firm CipherTrust, high profile websites are ripe for this cyber-crime, largely due to the ease with which attacks can be launched. Criminals intent on bringing down sites recruit mostly Windows PCs by infecting them with viruses or worms. They then use the net addresses of these zombie PCs to deluge targeted websites with a huge amount of data, causing the servers to fall over and forcing the website offline. CipherTrust has seen an alarming rise of nearly 50 percent in the number of infected machines being recruited over the past six months. The middlemen in these attacks tend to be home users. This is largely a result of the Sober virus which hit PCs around the world at last year. It estimates that 250,000 new machines are infected every day. "China has the most zombie PCs at the moment and the U.S. is regularly number two, with Germany at number three and the UK, with just three percent of infected machines, at number 10," said David Stanley, managing director of CipherTrust.

2006-01-23 **UK banks increase online security FSA study customers concern**

EDUPAGE; http://news.bbc.co.uk/2/hi/business/4637226.stm 23

U.K. CALLS ON BANKS TO INCREASE ONLINE SECURITY

The Financial Services Authority (FSA), a financial watchdog organization in Britain, has called on the country's banks to increase online security. According to the FSA, losses to online banking fraud tripled in the first half of 2005 compared to a year earlier. A study conducted by the FSA revealed that half of online banking customers are concerned about security and that three-quarters would stop banking online if they are forced to bear the costs of fraud. The group acknowledged that part of the responsibility lies with consumers, who need to understand the risks and the steps they can take to minimize them. Banks, however, must do more to increase security and to educate users, said the FSA. Some banks are piloting projects aimed at increasing online security. Lloyds TSB issued 30,000 electronic security devices that users must have to access their accounts. The devices generate new ID codes every 30 seconds and must be used in tandem with existing security measures.

2006-01-26 **prediction BIOS rootkits insider attacks**

DHS IAIP Daily; http://www.securityfocus.com/news/11372 23

RESEARCHERS: ROOTKITS HEADED FOR BIOS.

Insider attacks and industrial espionage could become stealthier by hiding malicious code in the core system functions available in a motherboard's flash memory, researchers said on Wednesday, January 25, at the Black Hat Federal Conference. A collection of functions for power management, known as the Advanced Configuration and Power Interface (ACPI), has its own high-level interpreted language that could be used to code a rootkit and store key attack functions in the Basic Input/Output System (BIOS) in flash memory, according to John Heasman, principal security consultant for UK-based Next-Generation Security Software. The researcher tested basic features, such as elevating privileges and reading physical memory, using malicious procedures that replaced legitimate functions stored in flash memory. "Rootkits are becoming more of a threat in general -- BIOS is just the next step," Heasman said during a presentation at the conference. "While this is not a threat now, it is a warning to people to look out." The worries come as security professionals are increasingly worried about rootkits. While some attacks have attempted to affect a computer's flash memory, the ability to use the high-level programming language available for creating ACPI functions has opened up the attack to far more programmers.

2006-01-30 **study ID theft decrease cost increase**

EDUPAGE; http://online.wsj.com/article/SB113858617249559658.html 23

NUMBER OF ID THEFTS DROPS, COSTS RISE

According to a new report from Javelin Strategy and Research and the Better Business Bureau, the number of individuals victimized by identity theft has fallen in recent years, but the amount of money lost to such malfeasance is climbing. Researchers found that about 8.9 million people suffered identity theft last year, compared to 9.3 million the year before. In 2003, the Federal Trade Commission estimated that identity thieves successfully targeted 10.1 million individuals. Experts said the decline in the number of victims indicates heightened awareness and better tools to combat identity crimes. Even as the number of victims has dropped, the total losses to such crimes has risen from $53.2 billion in 2003 to $56.6 billion last year. "Criminals are building up more expertise," said James Van Dyke, founder and principal analyst of Javelin, "and they have to soak victims for more money."

2006-02-24 **Gartner research study cell phone threats increase**

DHS IAIP Daily; 23
http://news.com.com/Is+your+cell+phone+due+for+an+antivirus+ shot/2100−
7349_3−6042745.html

SECURITY EXPERTS: THREATS TO CELL PHONES ARE LIKELY TO INCREASE.

Programs that fight viruses have become a necessary evil on Windows PCs. Now the antivirus industry is turning its attention to mobile phones -- but it's running into reluctance from cell service providers, who aren't so sure that the handset is the best place to handle security. Verizon Wireless doesn't see a need for its customers to install antivirus software on cell phones. "At this point, that is absolutely not required by individual customers," spokesperson Jeffrey Nelson said. But makers of security software are eager to get their products onto handsets, a huge potential market. About 812 million mobile terminals -- such as cell phones and smart phones -- were sold in 2005, according to market researcher Gartner. That compares with an estimated 219 million PCs in the same period. The market research firm expects annual mobile device shipments to exceed one billion units for the first time in 2008. While the number of threats to cell phones is low, security experts and analysts agree that situation is likely to change. Gartner suggests a widespread attack could surface by the end of next year.

2006-02-27 **RSA security conference attendees report security breaches push improvement safeguard prevent accidental data leaks**

DHS IAIP Daily; 23
http://www.computerworld.com/printthis/2004/0,4814,109007,00.html

BREACHES PUSH COMPANIES TO IMPROVE INTERNAL SAFEGUARDS; SECURITY MANAGERS SHIFT FOCUS TO PREVENTING ACCIDENTAL DATA LEAKS.

After spending years implementing controls to protect network perimeters from external threats, companies are now guarding against internal data lapses, according to attendees at RSA Conference 2006 this month. Driving the trend are concerns about accidental data leaks or thefts resulting from internal miscues, a rash of recent data breaches caused by the mishandling of information, and regulations that require companies to exercise greater control over data they handle. "Even up to last year, there was a huge focus on strengthening the perimeter to make sure the hacker from outside didn't get in," said Stuart McIrvine of IBM. "Everyone was concerned about malware penetrating the perimeter." More recently, though, "there's been a big shift in focus to what's going on inside the enterprise," McIrvine said. Gene Fredriksen of Raymond James Financial Inc. said "Traditional information security has been very good at protecting structured data." But now, he added, there's a whole class of unstructured data in spreadsheets, Web forms, and other formats.

2006-02-27 **Internal Revenue Service IRS computer information security needs to improve tighten TIGTA**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/38341−1.html 23

IRS NEEDS TO TIGHTEN SECURITY SETTINGS.

The IRS has not consistently maintained the security settings it established and deployed under a common operating environment (COE), resulting in a high risk of exploitation for some of its computers, according to the Treasury Department's inspector general for tax administration (TIGTA). The IRS has adopted a common operating environment for security configurations on all of its workstations. The IRS has installed the master COE image on 95 percent of its computers, TIGTA said in its report released Monday, February 27. Of 102 computers tested, only 41 percent continued to be in compliance; 59 percent were not or contained at least one high-risk vulnerability that would allow the computer to be exploited or rendered unusable. Almost one-half of the compliant computers contained at least one incorrect setting that could allow employees to circumvent security controls established by the common operating environment. Also, at the time of the audit, the COE security settings had not been installed on more than 4,700 computers. Without them, computers were missing security patches and at high risk for viruses. 2006-02-28 **study virus British UK businesses biggest security problem**

DHS IAIP Daily; http://news.bbc.co.uk/2/hi/technology/4755492.stm 23

VIRUSES PLAGUE BRITISH BUSINESSES.

Computer viruses are the single biggest cause of security problems for UK businesses, a survey by the Department of Trade and Industry (DTI) shows. Almost 50 percent of the biggest security breaches in the last two years were due to malicious programs. Viruses crippled key systems such as e-mail for more than a day while companies cleaned up, and the worst outbreaks sometimes took up to 50 days to fix. The survey revealed that the number of firms affected by viruses had dropped by almost one-third since 2004. This reduced infection rate is due to the of use anti-virus software. The survey found that firms that do get caught tend to get infected far more often; some were being infected once a day. Almost 25 percent of those surveyed said they had no defenses to protect them against spyware. As a result one in seven of the most serious incidents were caused by machines infected with spyware. The DTI survey questioned more than 1,000 businesses. The full results of the survey will be released in April.

2006-03-07 **study computer viruses concern UK companies infection worst security incidents**

DHS IAIP Daily; http://www.businessweekly.co.uk/news/view_article.asp?articl e_id=10229 23

COMPUTER VIRUSES A GROWING CONCERN FOR UK COMPANIES.

Infection by viruses was the biggest single cause of the worst security incidents for UK companies in the past two years, accounting for roughly half of them, a new survey shows. Two-fifths of these were described as having a serious impact on the business, according to findings from the 2006 Department of Trade and Industry's biennial Information Security Breaches Survey, conducted by a consortium led by PricewaterhouseCoopers. The research showed that virus infections were more likely to have caused service interruption than other incidents. In addition, a quarter of UK businesses are not protecting themselves against the threat caused by spyware. The full results of the ninth, biennial survey will be published at the Infosecurity Europe exhibition and conference in London, April 25-27. REPORT: CYBER CRIMINALS STEPPING UP TARGETED ATTACKS.

Cyber criminals are stepping up smaller, more targeted attacks as they seek to avoid detection and reap bigger profits by stealing personal and financial information, according to a report issued on Monday, March 6. Symantec Corp.'s Internet Security Threat report said during the second half of 2005, attackers continued to move away from broad attacks seeking to breach firewalls and routers and are now taking aim at the desktop and Web applications. The latest report said threats such as viruses, worms and Trojans that can unearth confidential information from a user's computer rose to 80 percent of the top 50 malicious software code threats from 74 percent in the previous six months.

2006-03-08 **computer security attacks rise money risk theft fraud Symantec report study**

EDUPAGE; http://news.yahoo.com/s/nf/20060308/tc_nf/41987 23

ATTACKS ON THE RISE, WITH MORE MONEY AT RISK

In a new report, computer security firm Symantec says the number of Internet attacks is rising and that the motive for such attacks is increasingly money. The report is based on data gathered from 40,000 security devices from around the world and covers Internet mischief ranging from spam and adware to network attacks and phishing scams. Although many hackers formerly plied their trade merely to demonstrate what they could do, Internet scams such as phishing are designed to put money into the hands of online thieves. Symantec noted that the tools used to launch Internet attacks are becoming very sophisticated, and the report also highlights the fact that many networks remain poorly protected despite simple means to increase security against such threats. Javier Santoyo, development manager at Symantec Security Response, said, "Just letting users know about configuration management and maybe installing heuristics-based solutions on desktops goes a long way."

2006-03-16 **cybercrime more costly physical crime IBM survey**

DHS IAIP Daily; 23
http://www.theregister.co.uk/2006/03/16/ibm_cybercrime_survey/

CYBERCRIME COSTS BUSINESSES MORE THAN PHYSICAL CRIME.

Cybercrime is more costly to businesses than physical crime, according to a recent IBM survey of 600 U.S. businesses. Lost revenue, wasted staff time dealing with IT security attacks and damage to customer goodwill were rated as a bigger problem than conventional crime by 57 percent of firms in the healthcare, financial, retail and manufacturing industries. Of the respondents in the U.S. finance industry, 71 percent were the most concerned about the threat of cybercrime. According to the IBM survey, 83 percent of U.S. organizations believe they have safeguarded themselves against organized cybercrime but most concentrated on upgrading virus software, improving firewall defenses and implementing patch management systems. IBM said these procedures are a necessary first step but fail to go far enough.

2006-03-16 **federal agencies network security no improvement D+ average grade government efforts law enforcement homeland security**

EDUPAGE; http://www.fcw.com/article92642-03-16-06-Web 23

NO IMPROVEMENT FOR FEDERAL AGENCIES IN NETWORK SECURITY

The House Government Reform Committee has once again issued a failing report card on computer security at federal agencies. Despite the fact that five federal agencies were graded A+, overall, agencies earned a D+, the same grade as last year. The grades are based on performance metrics from the Office of Management and Budget. Agencies on "the frontline in the war on terror" were uniformly terrible, according to Rep. Tom Davis (R-Va.), chairman of the committee. The Department of Homeland Security's grade stayed the same this year as last: F. Meanwhile, the grade for the Department of Defense fell from a D to an F, the State Department went from a D+ to an F, and the Department of Justice dropped from a B- to an F. Representatives from federal agencies appeared before the committee, and many of those with failing grades offered explanations about why their scores have remained low. Members of the committee were generally dismissive of the explanations, however, saying that the agencies were simply making excuses.

GOVERNMENT REPORT ON BALLISTIC MISSILE DEFENSE SYSTEM SECURITY FLAWS

Bob Brewin reported in Federal Computer Week for March 16, 2006 that "The network that stitches together radars, missile launch sites and command control centers for the Missile Defense Agency (MDA) ground-based defense system has such serious security flaws that the agency and its contractor, Boeing, may not be able to prevent misuse of the system, according to a Defense Department Inspector General's report." The results section of the report's Executive Summary was as follows:

"Missile Defense Agency officials had not prepared a System Security Authorization Agreement for the Ground-Based Midcourse Defense Communications Network. Additionally, available security documentation did not properly reflect current operations of the network. Missile Defense Agency officials also had not fully implemented information assurance controls required to protect the integrity, availability, and confidentiality of information in the Ground-Based Midcourse Defense Communications Network. Specifically, the Missile Defense Agency program office for the Ground-Based Midcourse Defense Communications Network did not provide information assurance awareness training to prior to being granted access, conduct reviews for unauthorized access, properly implement or document user access procedures and controls, and prepare contingency and incident response plans. Further, a Plan of Action and Milestones designed to assist managers in correcting security weaknesses had not been prepared. As a result, Missile Defense Agency officials may not be able to reduce the risk and extent of harm resulting from misuse or unauthorized access to or modification of information of the Ground-Based Midcourse Defense Communications Network and ensure the continuity of the network in the event of a disruption. Additionally, the Missile Defense Agency Chief Information Officer and the Designated Approving Authority may not be able to make appropriate management-level decisions relating to the security of the Ground-Based Midcourse Defense Communications Network if required key documents are not prepared, updated, or tested."

The report was removed from the government Web site shortly after publication of the news story.

EDUPAGE; http://news.com.com/2100-7350_3-6050875.html 23

SURVEY HINTS AT CYBERCRIME LOSSES

A recent survey conducted by IBM of CIOs in manufacturing, financial, health-care, and retail industries shows the growing threat of cybercrime on organizational resources. Of the 600 U.S. CIOs in the survey, 57 percent said cybercrime costs their companies more than conventional crime. About 75 percent said the threat from cybercrime comes in part from within their companies. Moreover, 84 percent said hackers are increasingly part of organized crime, not simply individuals working alone. Results from international CIOs in the survey closely followed those of the U.S. companies for most measures, but they diverged on several key points. Among U.S. CIOs, 83 percent said they were prepared to face the threats of cybercriminals, compared to just 53 percent of internationals.

2006-03-23 **GAO report IRS needs strengthen information security controls**

DHS IAIP Daily; http://www.gao.gov/highlights/d06328high.pdf Source: http://www.gao.gov/cgi−bin/getrpt?GAO−06−328 23

GAO-06-328: INFORMATION SECURITY: CONTINUED PROGRESS NEEDED TO STRENGTHEN CONTROLS AT THE INTERNAL REVENUE SERVICE (REPORT).

The Internal Revenue Service (IRS) has a demanding responsibility in collecting taxes, processing tax returns, and enforcing the nation's tax laws. It relies extensively on computerized systems to support its financial and mission-related operations. Effective information security controls are essential for ensuring that information is adequately protected from inadvertent or deliberate misuse, disruption, or destruction. As part of its audit of IRS's fiscal year 2005 financial statements, the Government Accountability Office (GAO) assessed (1) the status of IRS's actions to correct or mitigate previously reported information security weaknesses at two sites and (2) whether controls over key financial and tax processing systems located at the facilities are effective in ensuring the confidentiality, integrity, and availability of financial and sensitive taxpayer data. GAO recommends that the IRS Commissioner take several actions to fully implement an information security program. In commenting on a draft of this report, IRS concurred with our recommendations.

EDUPAGE; http://chronicle.com/daily/2006/03/2006032301t.htm 23

SURVEY SUGGESTS WIDESPREAD PRIVACY VIOLATIONS

A study conducted by Bentley College and software company Watchfire indicates that nearly three-quarters of colleges and universities in California fail to comply with a state law concerning the collection and use of personal information. The California Online Privacy Protection Act of 2003 requires organizations that collect such information online to clearly post privacy policies on their home pages and on every page from which personal information is collected. According to the study, which examined the Web sites of 236 institutions, only 28 percent had privacy policies linked from their home pages. Moreover, every one of the 236 institutional Web sites had at least one page that collects personal data without encrypting it. Mary Culnan, management professor at Bentley and author of the report, said she hopes these results serve "as a wake-up call to students, alumni, and prospective students."

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−06−408 23

GAO-06-408: INFORMATION SECURITY: SECURITIES AND EXCHANGE COMMISSION NEEDS TO CONTINUE TO IMPROVE ITS PROGRAM (REPORT).

The Securities and Exchange Commission (SEC) has a demanding responsibility enforcing securities laws, regulating the securities markets, and protecting investors. In enforcing these laws, SEC issues rules and regulations to provide protection for investors and to help ensure that the securities markets are fair and honest. It relies extensively on computerized systems to support its financial and mission-related operations. Information security controls affect the integrity, confidentiality, and availability of sensitive information maintained by SEC. As part of the audit of SEC's fiscal year 2005 financial statements, the Government Accountability Office (GAO) assessed (1) the status of SEC's actions to correct or mitigate previously reported information security weaknesses and (2) the effectiveness of the commission's information system controls in protecting the confidentiality, integrity, and availability of its financial and sensitive information. GAO recommends that SEC Chairman direct the Chief Information Officer to fully implement an agency-wide information security program. In providing written comments on a draft of this report, SEC said that GAO's recommendations are appropriate and actionable, and that it is focusing on fully implementing the recommendations. EDUPAGE; http://www.pcworld.com/news/article/0,aid,125291,00.asp 23

REPORT ESTIMATES EXTENT OF IDENTITY THEFT

According to data from the National Crime Victimization Survey, which is conducted by the U.S. Department of Justice, identity theft affected an estimated 3.6 million households--with losses totaling $3.2 billion--in the first six months of 2004. The survey contacts a random sample of 42,000 households every six months and follows them for three years. The new data are from the first instance of the survey to specifically address identity theft. The most common types of theft were from unauthorized use of credit cards. Households with annual incomes of more than $75,000 and those headed by individuals between 18 and 24 years old were more likely to suffer identity theft, though the survey did not investigate the possible reasons behind these trends.

EDUPAGE; http://news.zdnet.com/2100-1009_22-6057000.html 23

PROBING WHY PHISHING REMAINS SUCCESSFUL

A new paper published by three academics tries to explain why, after all the press about phishing scams, so many computer users continue to fall for them. "Why Phishing Works," written by Rachna Dhamija of Harvard University and Marti Hearst and J. D. Tygar of the University of California at Berkeley, points out that despite a general awareness of phishing rackets, most users are unable to discern the difference between a legitimate Web site and one spoofed to look like the site of a bank or other financial institution. In one exercise, the researchers created a fake bank site that fooled 91 percent of subjects participating in the experiment. Similarly, 77 percent misidentified a legitimate E*Trade e-mail as fraudulent. Experts attribute some of the problem to ignorance and some to users' not taking simple precautions, such as looking closely at the address bar of Web pages. Bernhard Otupal, a crime intelligence officer for high-tech crime at Interpol, noted that in one recent phishing scam, a number of users went to a site pretending to be that of a prominent bank and entered personal information even though they were not even customers of that bank.

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4875142.stm 23

FILE SHARING COSTS BRITISH MUSIC INDUSTRY NEARLY $2 BILLION

The British Phonographic Industry (BPI) estimates that illegal file sharing has cost nearly $2 billion (U.S.) over the past three years, and the International Federation of the Phonographic Industry (IFPI) has filed lawsuits against another 2,000 individuals suspected of file trading in 10 countries. The targets of the new lawsuits are said to be uploaders, those who make copyrighted music available to others for download. The lawsuits are extending to countries such as Portugal, which had not previously been included in such suits. In previous lawsuits, those found guilty of infringement or who settled with the IFPI paid several thousand dollars in fines. The IFPI also pointed out that parents are responsible for the actions of their children and can be made to pay damages on their behalf. Despite the legal action against file sharers and the emergence of legal online music services, data from research firm XTN indicate that in the United Kingdom, illegal downloading has risen 3 percent since September, now representing 28 percent of all music downloads.

2006-04-05 **junk fax FCC government enforcement audit report failures problems**

http://www.gao.gov/docdblite/details.php?rptno=GAO-06-425

WEAKNESSES IN PROCEDURES AND PERFORMANCE MANAGEMENT HINDER JUNK FAX ENFORCEMENT

The Telephone Consumer Protection Act of 1991 prohibited invasive telemarketing practices, including the faxing of unsolicited advertisements, known as "junk faxes," to individual consumers and businesses. Junk faxes create costs for consumers (paper and toner) and disrupt their fax operations. The Junk Fax Prevention Act of 2005 clarified an established business relationship exemption, specified opt-out procedures for consumers, and requires the Federal Communications Commission (FCC)--the federal agency responsible for junk fax enforcement--to report annually to Congress on junk fax complaints and enforcement. The law also required GAO to report to Congress on FCC's enforcement of the junk fax laws. This report addresses (1) FCC's junk fax procedures and outcomes, (2) the strengths and weaknesses of FCC's procedures, and (3) FCC's junk fax management challenges.

FCC has procedures for receiving and acknowledging the rapidly increasing number of junk fax complaints, but the numbers of investigations and enforcement actions have generally remained the same. In 2000, FCC recorded about 2,200 junk fax complaints; in 2005, it recorded over 46,000. Using its procedures to review the complaints, FCC's Enforcement Bureau (EB) issued 261 citations (i.e., warnings) from 2000 through 2005. EB has ordered six companies to pay forfeitures for continuing to violate the junk fax rules after receiving a citation. The six forfeitures totaled over $6.9 million, none of which has been collected by the Department of Justice for various reasons. EB officials cited competing demands, resource constraints, and the rising sophistication of junk faxers in hiding their identities as hindrances to enforcement. An emphasis on customer service, an effort to document consumers' complaints, and an attempt to target enforcement resources efficiently are the strengths of FCC's procedures; however, inefficient data management, resulting in time-consuming manual data entry, data errors, and--most important--the exclusion of the majority of complaints from decisions about investigations and enforcement, are weaknesses. FCC's guidance to consumers does not provide them with all of the information they need to support FCC's enforcement efforts. FCC faces management challenges in carrying out its junk fax responsibilities. The commission has no clearly articulated long-term or annual goals for junk fax monitoring and enforcement, and it is not analyzing the junk fax data. Without analysis, FCC cannot explore the need for, or implement, changes to its rules, procedures, or consumer guidance that might help deter junk fax violations or give consumers a better understanding of the junk fax rules. Most important, without performance goals and measures and without analysis of complaint and enforcement data, it is not possible to explore the effectiveness of current enforcement measures.

DHS IAIP Daily; http://www.informationweek.com/news/showArticle.jhtml;jsessionid=3ISV1FYRRBVOWQSNDBGCKHSCJUMEKJVN?articleID=184429007 23

MICROSOFT: SOCIAL ENGINEERING IS JUST AS DANGEROUS AS SOFTWARE VULNERABILITIES.

Attacks that rely on "social engineering" tricks to fool users into visiting malicious Websites are just as dangerous as any that exploit software vulnerabilities, Microsoft security researcher Matt Braverman, argued. According to Braverman, a program manager with Microsoft's Anti-Malware Technology Team, data from the group's February update of its Malicious Software Removal Tool discovered an unusually high number of Alcan.b worms on users' PCs. "Alcan.b does not exploit any software vulnerabilities. Instead, it spreads through popular peer-to-peer applications and its prevalence is likely due to effective social engineering...Threats like this reinforce the idea that malware that exploits user weakness can be as dangerous as those threats which exploit software vulnerabilities," claimed Braverman.

MALICIOUS-SOFTWARE SPREADERS GET SNEAKIER, MORE PREVALENT.

At the height of his powers, Jeanson James Ancheta felt unstoppable. From his home in Downey, CA, the then-19-year-old high school dropout controlled thousands of compromised PCs, or "bots," that helped him earn enough cash in 2004 and 2005. But Ancheta got caught. In the first case of its kind, he pleaded guilty in January to federal charges of hijacking hundreds of thousands of computers and selling access to others to spread spam and launch Web attacks. In separate cases, federal authorities last August also assisted in the arrest of Farid Essebar, 18, of Morocco, and last month indicted Christopher Maxwell, 19, of Vacaville, CA, on suspicion of similar activities. The arrests underscore an ominous shift in the struggle to keep the Internet secure: Cybercrime undergirded by networks of bots -- PCs infected with malicious software that allows them to be controlled by an attacker -- is soaring. Bot networks have become so ubiquitous that they've also given rise to a new breed of low-level bot masters, typified by Ancheta, Essebar and Maxwell. Tim Cranton, director of Microsoft's Internet Safety Enforcement Team, calls bot networks "the tool of choice for those intent on using the Internet to carry out crimes."

2006-04-25 **study report progress hackers Department of Trade and Industry computer attacks**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4939386.stm 23

STUDY SAYS BUSINESSES MAKING PROGRESS AGAINST HACKERS

A survey conducted by PricewaterhouseCoopers for the Department of Trade and Industry indicates that British businesses are making strides in their efforts to thwart computer attacks. Overall, the number of U.K. businesses to suffer computer incidents dropped from 74 percent in 2004 to 62 percent in 2005, according to the Information Security Breaches survey. By far the largest drop was seen in computer viruses, which fell by one-third, while other sorts of attacks and accidental data loss stayed relatively steady, said Chris Potter, who led the survey. He noted that the reduction of incidents follows an increase in security spending in the business sector, which now spends between 4 and 5 percent of technology budgets on security, compared to just 3 percent in 2004. Still, said Potter, many businesses, particularly smaller ones, continue to leave themselves vulnerable to computer attacks. In fact, the survey showed that the number of computer incidents affecting small businesses has risen by 50 percent since 2004.

2006-05-01 **SANS safe technology list Mac OS X vulnerabilities rank number one**

DHS IAIP Daily; http://www.darkreading.com/document.asp?doc_id=93759 23

SANS EXPOSES 'SAFE' TECHNOLOGIES.

For the first time, Mac OS X vulnerabilities ranked number one in the SANS Institute's quarterly Top 20 Internet Security Vulnerabilities report, which was published Monday, May 1. Experts at the SANS Institute said the vulnerabilities clarify an important point about non-Windows systems. "There's a difference between 'safer' and 'more secure,'" says Ed Skoudis, director of the SANS "Hacking Exploits" course curriculum and a senior security analyst at Intelguardians. "There are fewer users on systems like the Mac or Mozilla, which makes them less of a target for attackers, and therefore safer. But there's nothing inherent in those systems that makes them more secure." SANS Top 20 Internet Security Vulnerabilities report: http://www.sans.org/top20/2005/spring_2006_update.php

2006-05-02 **top ten malware threats hoaxes Sophos report April 2006 businesses**

DHS IAIP Daily; 23
http://www.sophos.com/pressoffice/news/articles/2006/05/topt enapr06.html

TOP TEN MALWARE THREATS AND HOAXES REPORTED TO SOPHOS IN APRIL 2006.

Sophos has revealed the top ten malware threats and hoaxes causing problems for businesses around the world during the month of April 2006. The report, compiled from Sophos's global network of monitoring stations, reveals that Netsky-P, which recently celebrated its second birthday, has returned to the top of the virus chart, replacing Zafi-B. However, as a proportion of all malware, e-mail viruses and worms continue to decline -- 86 percent of the threats reported to Sophos during April were Trojan horses used by hackers to download malicious code, spy on users, steal information or gain unauthorized access to computers. The top ten viruses in April 2006 were as follows: W32/Netsky-P; W32/Zafi-B; W32/Nyxem-D; W32/MyDoom-AJ; W32/Netsky-D; W32/Mytob-FO; W32/Mytob-C; W32/Mytob-Z; W32/Dolebot-A; W32/Mytob-AS.

Investigators struggling to find the people behind [the early-February] attacks on major Web sites note that, if nothing else, the assaults jarred people out of their complacency. Months ago, a Carnegie Mellon University team issued a warning about attacks like those that have occurred this week, but the public reacted with a collective yawn. Over New Year's weekend, the FBI posted free software on its site that would let PC owners detect if denial-of-service tools had been secretly placed on their machines. Few showed any interest. "This week's events did more than we have ever been able to do with white papers and posting fixes on our Web site to alert the private sector to the dangers out there," said a spokesman for the attorney general's office. The Clinton Administration this week sought $37 million to set up 10 regional computer labs and train state and local officers as computer response experts. (AP/San Jose Mercury News 10 Feb 2000)

2000-02-11 **estimates market value security industry**

NewsScan, WP http://www.washingtonpost.com/wp-dyn/business/A37615-2000Feb10.html

[The early-February] cracker attacks have served as a wake-up call to the e-marketplace, and as a boon to security software firms that represent the best line of defense against further incidents. Online ventures have spent big to gain name recognition and build their reputations for service. But if customers can't get through, or if the security of their transactions isn't protected, they will abandon ship, and quickly. Suddenly, many e-businesses are realizing that the reputations they've carefully built can be wiped out by one intruder with an attitude. Shares of security software manufacturers surged for a second day Thursday, up as much as 36% for the week. "It's definitely a reaction to the news stories on hackers," said one analyst. "E-commerce and security go hand in hand. You can't have e-commerce without security." (Washington Post 11 Feb 2000)

2000-09-11 **information warfare penetration industrial espionage proprietary information intellectual property IP survey study losses estimate**

NewsScan, MSNBC http://www.msnbc.com/news/457161.asp

Teenage hackers who deface government sites or steal credit card numbers attract a lot of attention, but experts say the real problem of cybercrime is corporate-sponsored proprietary information theft committed by professionals who rarely get caught. According to the American Society for Industrial Security, Fortune 1000 companies sustained losses of more than $45 billion last year from thefts of proprietary information, and a survey by the Computer Security Institute indicates over half of 600 companies polled said they suspected their competitors were a likely source of cyberattack. "Your competitors no longer have to be across town, or even across the country; they're in other countries that have different laws and business ethics," says Richard Power, who conducts the annual CSI survey. "Culpability is much less. There is a lawless frontier in terms of theft of trade secrets." Experts agree that while juvenile hackers often leave calling cards enabling them to be traced, professional information thieves are almost impossible to catch. What's even more frustrating is that many firms never know their systems have been breached. "It's difficult for people to see the theft of information," says the owner of a security firm. "Information is the only asset that can be copied or stolen but nothing can appear to be missing. You can still have the information... but have lost the value of that information." 2000-10-04 **security software sales**

NewsScan, E-Commerce Times
http://www.ecommercetimes.com/news/articles2000/001004-1.shtml

Sales of security software are taking off, fueled by an epidemic of hacker attacks and vicious viruses, according to a study by Gartner Group's Dataquest division. Spending will soar from $2.5 billion in 1999 to more than $6.7 billion in 2004, as management software vendors, such as Computer Associates, IBM/Tivoli and Hewlett-Packard, increasingly focus on security in their core software offerings. According to the report, the top security software seller is antivirus protection, with 31% of the current market. According to the FBI, 9 out of 10 companies have reported computer security breaches — including hacking, viruses, fraud and sabotage — since March 1999. That study was based on a survey of 600 companies and government agencies. (E-Commerce Times 4 Oct 2000)

Technical and procedural glitches could cost e-tailers as much as $15 billion in lost sales this holiday season, warns a new report by Creative Good. "The Holiday 2000 Online Shopping Report" concludes that nearly half of all would-be online shoppers will leave Web sites without making a purchase, and without contacting customer service. "If sites can simply make the buying experience easier, they stand to gain huge increases in revenue and a larger customer base who will return to shop after the holiday season is over," says a Creative Good analyst. "The sites that cannot convert shoppers to buyers this holiday season are likely to shut down in 2001." The survey, which looked at Gap.com, LandsEnd.com, Amazon.com, Barnesandnoble.com, BestBuy.com, Buy.com, eToys and KBKids.com, found that 43% of shoppers who visit a site intending to buy abandon their efforts due to frustration. Many of them then flee to bricks-and-mortar stores. The No. 1 reason for leaving the Web, cited by 40% of shoppers who changed their minds, was a cumbersome checkout process. Additional problems included slow-loading pages and inability to find the desired merchandise. (E-Commerce Times 17 Oct 2000)

2001-01-29 **spam junk unsolicited bulk e-mail costs fees**

NewsScan

ONLINE MARKETERS WILL SOON HAVE TO PAY TO SPAM
Online marketers soon will have to pay for the privilege of sending promotional e-mail to consumers, says Jupiter Research, which predicts that 268 billion advertising messages will be sent in 2005 -- 22 times the number sent in 2000. The trend will open up a substantial new revenue stream for portals, ISPs and Web-based e-mail services, but will raise the costs of e-mail marketing campaigns significantly. Jupiter says that sending solicitation messages to a user's "bulk" e-mail in-box likely will still be free, but that marketers will have to pay a premium for profiled delivery, based on individual usage behavior. The research firm suggests marketers should be working now to establish strategic partnerships with major e-mail service providers in the hope of securing reduced rates in the future. 2001-03-27 **junk unsolicited bulk e-mail spam international cooperation**

NewsScan

EC STUDY TARGETS JUNK E-MAIL
A new report issued by the European Commission predicts that unsolicited e-mails could in the future cost about US$10 billion a year to download, and calls on governments to coordinate efforts to stem the tide. Fueling the growth in unsolicited mail will be a sharp increase in legitimate, non-spam messages sent by companies with which the recipient might already have a business relationship. According to Jupiter Media Metrix, the number of commercial e-mails received each year by the average U.S. consumer will grow from 40 in 1999 to 1,600 in 2005. Meanwhile, Forrester Research is predicting that more than 200 billion e-mail messages will be sent by marketing companies in 2004, an average of nine per household every day. And while U.S. companies rely on consumers to "opt out" of receiving unwanted mail, European authorities are moving in the opposite direction. Five countries -- Austria, Denmark, Finland, Germany and Italy -- have legislated for an "opt in" system that prohibits sending e-mail to consumers unless they've indicated they wish to receive them. Marketing experts on both sides of the Atlantic say it will be difficult to resolve the differences between the two systems, and some have urged a differentiation between straight spam, mail sent by third parties, and mail sent to a company's existing customer database. ONLINE MUSIC CUTS INTO MUSIC SALES IN U.S.
The U.S. record industry is blaming online music and the economic slowdown for a drop in music sales. Annual figures from the International Federation of the Phonographic Industry show sales of singles fell by 38% in the U.S., and cassettes by 46%. "The downturn in the USA brought down the overall sales figures," says a spokesman for the IFPI. "We also saw the first evidence of the impact of free online music, as well as damage done by unauthorized CD-R copying in some major markets." France, Italy and Germany also reported lower sales, which they attributed to illegal copying. Meanwhile, the bright spot was the UK, where a 6.2% increase in unit sales helped boost the European market overall. (Ananova 19 Apr 2001)

2001-05-21 **software piracy copyright intellectual property theft losses survey study guesswork estimate**

NewsScan

37% OF PROGRAMS USED IN BUSINESS ARE PIRATED
Software piracy grew in 2000 for the first time in more than five years, according to the Business Software Alliance, which estimates that 37% of all software programs used by businesses worldwide are illegal copies. The Asia-Pacific region -- where more than half of all software in use last year was stolen -- tops the list in terms of dollars (an estimated $4 billion) lost to piracy. Meanwhile, Eastern Europe has the highest piracy rate, with 63% of its software illegally copied in 2000. In the U.S., 24% of programs are pirated copies. Although progress is being made in some regions, BSA director of enforcement Bob Kruger takes little comfort. "That's kind of like saying that I'm having fewer heart attacks than I used to. But the damage that's being caused by piracy is still devastating. It can be counted in the thousands of jobs and billions of dollars lost." (AP 21 May 2001)
http://news.excite.com/news/ap/010521/07/software-piracy

Analyses in the RISKS Forum Digest 21.44 were highly critical of the methodology of this study. Critics pointed out, among other criticisms, that many assumptions were used in projecting piracy from the numbers of computers sold versus expected numbers of software licenses sold. Contributors also noted that the BSA has a vested interest in inflating such estimates and that members of the BSA were consulted during analysis of the results before publication.

THE DEVIL IS IN THE DETAILS (AND ON THE WEB) [6 Feb 2001]
Law enforcement officials in the U.S. and elsewhere are saying that international terrorists are increasingly used encrypted files on the Web to hide terrorist communications on sites supposedly devoted to pornography, sports, or other activities. Defense expert Ben Venzke says that encrypted terrorist information could be hidden in images that might "look no different than a photograph exchanged between two friends or family members," and notes: "There is a tendency out there to envision a stereotypical Muslim fighter standing with an AK-47 in barren Afghanistan. But Hamas, Hezbollah and bin Laden's groups have very sophisticated, well-educated people. Their technical equipment is good, and they have the bright, young minds to operate them." (USA Today 6 Feb 2001)
http://www.usatoday.com/life/cyber/tech/2001-02-05-binladen.htm

TERRORISTS MAY BE HIDING MESSAGES IN DIGITAL PHOTOS [30 Oct 2001]
Terrorists may be hiding messages in digital photos sent over the Internet, using a process called "steganography" (from the Greek for "hidden writing") to embed secret messages in graphic or audio files to make them undetectable to the unaided human eye or ear. George Mason University professor and steganography expert Neil F. Johnson says that in the past two years, the number of steganography tools available over the Internet has doubled: "It's 140 and growing." He adds, "I have no reason to think that Al Qaeda is not using steganography." French law enforcement authorities who recently apprehended a man planning to blow up the U.S. embassy in Paris learned that the terrorist group of which he is a member had been instructed by a bin Laden associate to conduct all of its communications through pictures posted on the Internet. HOME PCs -- THE NEXT HACKER TARGET
Computer hackers are turning their sights to the humble home PC, which is now faster, more powerful and less secure than ever before. Fueling the onslaught are several factors, including the trend toward home-based DSL or cable connections that are "on" all the time, and the lackadaisical attitudes of most home PC owners who generally don't keep up to date with the latest antivirus and firewall software. In addition, many home users are naïve about the potential threat and willingly click on unsolicited e-mails that could be infected with malicious programs. "Home users have generally been the least prepared to defend against attacks," warns Carnegie Mellon's Computer Emergency Response Team Coordination Center. "In many cases, these machines are then used by intruders to launch attacks against other organizations." Antivirus firm Message Labs reported that it detected one virus per 370 e-mail messages in 2001, double the rate of the previous year. Meanwhile, Amit Yoran of computer security firm Riptech says the advent of wireless networking will increase the risk of attack significantly: "The standard itself is insecure What we're faced with is the widespread adoption [of wireless networks] throughout corporate America and throughout consumer markets and people haven't really thought through how to protect." 2002: THE YEAR OF THE COPYRIGHT? "The recording industry has vowed to make 2002 the year of the copyright," says columnist Patti Waldmeir. To further that goal, record labels are experimenting with CDs that include technology that prevents them from being copied, even by owners for their own use, and several online music subscription services set to launch this year will be engineered to prevent unauthorized reproduction. If the technology is successful, it could be the year of ascendancy for copyright holders, who will find themselves wielding more power than was ever intended under U.S. copyright law or the constitution, says Stanford University law professor Lawrence Lessig. Lessig argues that by extending the term of copyrights 11 times in the last 40 years, Congress has exceeded its constitutional authority, granting copyright holders terms that extend long beyond a human lifetime. Lessig argues that these over-lengthy terms violate the constitution's command to "promote the Progress of Science and the useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries." Under today's technology, the copyright on a locked CD may expire, but the CD would remain locked. In Lessig's recent book, "The Future of Ideas: The Fate of the Commons in a Connected World," he recommends a radical revision of copyright law: copyright protection should be cut to five years, renewable 15 times. If a copyright is not renewed, the work would enter the public domain. (Financial Times 10 Jan 2002)

PHILIPS SAYS COPY-PROTECTED CDs WON'T LAST LONG
Philips Electronics, which invented the compact disc, says the controversial attempts by the recording industry to market "copy protected" CDs will fail because consumers just don't like it. As inventor of the CD standard and the industry's licensing body, Philips says it could refuse to license the new discs as genuine CDs or pursue some kind of legal action, but thinks the copy-protected CDs will disappear on their own as consumers reject them. "Any kind of legal action would take years and we don't expect these [discs] to last that long," says Gary Wirtz, general manager of the Philips Copyright Office. "At the moment we are trying to reason with people rather than sue them. [The technology is] not going to work, because any hacker can still make copies. It's only going to affect legitimate consumers and we know there have already been considerable complaints." Philips opposes the technology because it can make legitimate CDs unplayable in some older players and in-car audio systems. Critics maintain that the technique used to block copying can also impair the quality of a disc's audio content over time. (New Scientist 11 Jan 2002)

PRO-ISLAMIC GROUPS ENGAGE IN 'HACKTIVISM'
UK security firm mi2g says there's mounting evidence that individual hacker groups with a pro-Islamic agenda are working together to disrupt Web sites in India, Israel and other target countries. "Political motivation is an increasingly rising factor in digital attacks," says mi2g CEO DK Matai. "The primary reason why Web attacks are increasing is political tensions between Israel and Palestine, India and Pakistan, and China and Taiwan." Israel has suffered a barrage of attacks since the beginning of the latest Palestinian uprising in September 2000, and during the recent tensions between India and Pakistan over Kashmir, several groups (including Unix Security Guards, Anti-India Crew and World Fantabulous Defacers) have carried out hundreds of attacks on Indian educational and business Web sites. Despite the increase in attacks, the total number of new viruses has actually been decreasing, says mi2g, following a peak in 1997. However, each new virus is capable of causing more trouble because of the large number of computers that are now networked together. "When one catches a cold the entire global organization catches it," says Matai. (BBC News 19 Jun 2002)

IN-FLIGHT INTERNET GETS ANOTHER BOOST
Boeing's efforts to bring in-flight high-speed Internet access to airline passengers received a major boost when it announced British Airways as its second trial customer. Up until now, Lufthansa has been the only other airline signed on for Connexion's pilot project. Boeing is struggling to keep the project on track following the decision of three U.S. airlines -- American, United and Delta -- to back out of plans to take an equity stake in the venture following last September's terrorist attacks. British Air marketing director Martin George says he's confident the trial will be a success: "What our customers are saying to us is we would like the option (of broadband access) onboard. This is the future of in-flight entertainment. I would like this in the cabin of all our long-haul aircraft as soon as possible." The Connexion system eventually will supply live TV and can also be used to transmit data about the aircraft back to the ground. (Financial Times 13 Jun 2002)

MITSUBISHI, BOEING TEAM UP ON IN-FLIGHT INTERNET SERVICE
The Mitsubishi Electric Corporation will manufacture antennas for an in-flight Internet service that Boeing Aircraft will offer as "Connexion by Boeing," with tests of the service beginning in next January [2003]. Boeing's announcement was enthusiastic, with an executive proclaiming that the service is "about choice. It's about tomorrow. It's about a good partnership we're excited about. We can't imagine a better partner." (AP/San Jose Mercury-News 21 Jun 2002)

2002-07-02 **click-through e-mail ads spam study survey estimate**

NewsScan

ONLINE ADS FAIL TO CLICK WITH VIEWERS
Consumers are tired of online ads, according to a recent study by eMarketer, which estimates that the average click-through rate on e-mail ads is a paltry 1.8%. That's down from 3% last year, and reflects what eMarketer senior analyst David Hallerman calls a radical shift in consumer psychology: people are so overwhelmed with the daily avalanche of e-mail advertisements, that they just aren't as curious about what they're selling as they used to be. The findings are consistent with recent estimates from DoubleClick, which pegged the average click-through rate for all online ads in June at 0.84%. During the heyday of online advertising, companies could expect a click-through rate as high as 15% for some promotions. Unfortunately, the technology's success is what's leading to its demise -- companies will blast consumers with more than 430 billion e-mail ads this year; by 2006 it's expected to rise to more than 960 billion. "The same thing happened to paper-based direct mail when it first became popular in the early 1980s," says a Forrester analyst. "By the mid-1980s, scores of companies were doing it, and everyone's mailboxes were jammed so they began standing over their trash baskets making the quick decision. Today, they are opening their e-mail boxes and often they are just hitting the delete key." (Wall Street Journal 2 Jul 2002)

NewsScan

BROADBAND: GROWING BUT SLOWING
The research firm In-Stat/MDR predicts is predicting that the number of broadband subscribers worldwide will increase by 50% this year, reaching about 46 million). That's quite a change from the period 1999 to 2001, when the growth rate exceeded 100% annually. The company also says that in the U.S. there were 7.12 million cable modem subscribers at the beginning of 2002, compared with 4.6 million subscribers for DSL; and it predicts that DSL will take the lead in the U.S. market by 2004. AUTO INDUSTRY RETHINKS ITS INVOLVEMENT WITH E-COMMERCE
Just three years ago, automakers GM, Ford, and DaimlerChrysler seemed frantic to get on the e-commerce train before it left the station. All of them committed millions of dollars to online sales efforts and created whole new divisions to support those efforts. But now it's quiet time, and automakers are resisting new online ventures until they feel completely sure that those ventures will generate profit. So the current situations is quite a contrast from the old, old e-commerce days (1999 or so). Karen Francis, Ford's former e-commerce chief, explains what it was like then: "You didn't know what you didn't know. You had to get in. You had to place a bet because the initial hype was such that this was going to provide unprecedented, fill in the blank, and no company wanted to be caught with their competitors having an unprecedented advantage." But that was then, this is now: time for taking a rest and closing the eyes. (AP/USA Today 6 Aug 2002)

MCNEALY PREDICTS 30% ANNUAL GROWTH IN LINUX USERS
Addressing participants at the Linux World Conference and Expo, Sun Microsystems CEO Scott McNealy predicted Tuesday that the number of Linux users will grow by 30% a year for the next several years, and urged companies to embrace the open-source software movement. Documenting his own company's commitment, McNealy noted that Sun has at least 400 full-time employees dedicated to Linux and pledged to abide by the ethical standards of the Linux community, which is made up of thousands of grassroots enthusiasts worldwide who collaborate on software projects. "We're going to share in the lifestyle and be a capitalist," said McNealy. "We'll share our thoughts but we don't think it's broken so we're not going to try to fix it," he said, referring to fears that companies could take the open source code and factionalize it by creating competing proprietary versions. NewsScan

ONLINE BANKING SLOW TO GO
A report from the Federal Reserve Bank of New York says that the acceptance of online bill-paying has been "very slow, falling far short of initial projections," because of a chicken-or-egg dilemma in which billers are reluctant to adopt electronic payment systems until they're confident they can sharply reduce their traditional paper-based systems, and customers are reluctant to put themselves in a situation in which they have to maintain both electronic and traditional methods of paying their bills. It has been estimated that the total cost of processing an individual check can range between $1 and $5, compared to less than one dollar for a fully electronic payment. WIRELESS USE TO DOUBLE IN THE U.S. BY 2006
The number of monthly minutes of wireless use in the U.S. is expected to nearly double by 2006 from 2001 levels, according to a study by the Yankee Group. "Although only 3% of U.S. consumers use their mobiles as their only phone? 26% of mobile users' minutes are already being displaced from wireline to wireless and 45% of mobile users indicated at least some substitution," says the research firm, citing survey results. Analyst Keith Mallinson says he sees a strong demand for wireless services in the future, with the number of subscribers increasing to nearly 200 million by 2006 as 70% of Americans become mobile phone users, up from nearly 50% today. However, the industry's current stagnation could derail these predictions, Mallinson warns: "Buoyant market demand for mobile services? is in danger of being wrecked by a stalemate on the supply side. Limited scope for differentiation in the national marketplace has resulted in a price war, with too much capital and too many competitors resulting in anemic financial performance." HITS & MISSES IN HIGH-TECH PROGNOSTICATIONS
MIT Media Lab founder Nicholas Negroponte admits that he's missed the mark a few times in his predictions about the future of the high-tech industry, but he's got plenty of company — Novell CTO Alan Nugent and Negroponte both thought people would be conversing with their computers years ago. Nugent also predicted that computers would be able to emulate human thought, but so far the only example of that ability is IBM's chess-playing computer, which still falls short of Nugent's expectations. Accenture chief scientist Glover Ferguson said his worst prediction was that the future of programming would focus on computer-aided software, and Concept Labs director Peter Cochrane said he mistakenly thought that voice-over-IP technology would be a dud. Michael Earl, dean of Oxford University's Templeton College said he greatly overestimated the ability of e-commerce to become a mainstream profit center, but that he's ready to predict that the future focus of the Internet will be much more on information than transactions. Meanwhile, Negroponte and Cochrane are betting that there will be a grassroots movement to supplant some of the services now offered by traditional telecom companies. The growth of Wi-Fi networks in the U.S. and the movement in Europe by local municipalities and universities to build and operate their own telecom networks will change the way telecom services operate forever, says Negroponte. "Telecom could invert itself and become a bottom-up phenomenon." (Wall Street Journal 27 Sep 2002)

U.N. REPORT PREDICTS BIG JUMP IN ROBOT USE
The World 2002 Robotics Report, compiled by the U.N. Economic Commission for Europe, predicts that sales of all kinds of robotic devices for domestic use, excluding toys and games, will jump from 21,500 in 2001 to more than 700,000 during the 2002-2005 period. "Prices are going to come down just as they did for personal computers. When PCs started to be used by private people, they were pretty expensive," says Jan Karlsson, a UNECE expert who worked on the report. Sales of robots for all uses fell sharply last year, primarily as a result of plummeting demand in Japan and a depressed U.S. economy. But over the long haul, sales will soar and could even help alleviate a predicted worker shortage due to aging populations. The report forecasts a 50% jump in robot use in Europe by 2005, and a 30% rise in North America over the same period. (Reuters 3 Oct 2002)

BROADBAND THREATENS ASIAN ANTIPIRACY EFFORTS
Broadband technology is undermining efforts by software and entertainment companies to combat copyright piracy in Asia, say industry executives. "As broadband becomes more accessible and home PCs become more pervasive, the Internet is evolving as a whole new canvas for piracy," says Sanjay Mirchandani, Southeast Asia president for Microsoft. According to IDC Asia Pacific, 19% of South Koreans and 11.5% of Hong Kong residents have access to broadband, and these countries are among the worst offenders, says Harry Hui, Southeast Asia president for Universal Music. "Countries with broadband see the most downloads" of music from illegal Web sites, says Hui. Compounding the problem are the burgeoning number of illegal optical-disc factories in countries such as China, Malaysia and Indonesia. According to the Business Software Alliance, 50% of all business software used in Asia is copied or counterfeit, with China, Vietnam and Indonesia some of the worst offenders. STORAGE INDUSTRY MAXING OUT ON GREEK SUPERLATIVES
Having made short work of "mega" ("megas" is Greek for great), "giga" (giant) and "tera" (monster), the computer storage industry is scrounging around for new prefixes to describe the ever-increasing numbers of bytes it manages. In the near term, companies will be dealing with petabytes (from Greek "penta") and exabytes ("hexa"), but rapidly growing e-mail volumes and the increased value of e-mail will demand novel solutions. "We are already dealing with petabytes of data with video clips, and new services such as instant messaging will serve only to push demand further," says Veritas CTO Greg Valdez. "Companies must have a strategy for managing all of this data. If you don't have a strategy you are just going to keep adding more and more storage on the back of the e-mail servers." Valdez says future storage management software will be "smarter": "You need a smart file system to make it easier to access archives. Traditional file systems operate only at the block level and this is no longer enough. You must be able to manage it right down to the transaction level." Meanwhile, some software suppliers, like KVS, use data compression techniques to keep data volumes down. At least so far, no one's yet talking about "hepta" and "octa" bytes. CYBERTERRORISM THREAT OVERHYPED, SAYS REPORT
A new report by the British firm mi2g says despite the scare-mongering tactics of government officials warning against "cyberterrorist" attacks, actual numbers of such attacks on government networks are declining worldwide. In the U.S., reported intrusions into government networks fell from 386 in 2001 to 162 in the first 10 months of 2002. Worldwide, such attacks have declined by a third — from 2,031 last year to a projected 1,400 in 2002. The report was issued just a day after the U.S. Congress approved a $903 million bill for beefing up government computer security and the Justice Department indicted a British cracker for breaking into military and NASA computer systems. Meanwhile, the overall number of computer attacks has doubled, from 31,322 in 2001 to 64,408 this year — a trend that doesn't surprise Lawrence Walsh, editor of Information Security magazine: "Most of the attacks today are made by unsophisticated 'script kiddies' using off-the-shelf tools. What's the incentive for them to go after government systems? There are more rewards available from attacking small and medium-sized businesses — like credit card information and financial data. And these networks are typically not as well-defended." (Wired.com 14 Nov 2002)

FIGHT AGAINST INTERNET FILE-SWAPPING CALLED HOPELESS
Four Microsoft researchers (speaking only for themselves) have told an ACM workshop that the attempt to stop people from using digital file-swapping services is entirely futile; they believe that the technology is moving too fast to be stopped, and explain that previous services (such as Napster) could be forced out of business only because relatively few people provided most of the material. In contrast, the newer services such as Kazaa are attracting too many contributors to keep a rein on. The researchers (Peter Biddle, Paul England, Marcus Peinado, and Bryan Willman) argue that the only way the music and video industries can compete with Kazaa and similar services is to make music and video products much less expensive and much easier to obtain. IDC'S CRYSTAL BALL SEES CYBERTERROR IN THE FUTURE
Research firm IDC has released its list of prognostications for 2003, and high on its list is a prediction that a major cyberterrorism event will occur, disrupting the economy and crippling the Internet for a day or two. "The war with Iraq will galvanize hackers," says John Gantz, chief research officer for IDC. On the sunnier side, IDC forecast: a 6% rise in spending on information technology and telecommunications, a rebound in sales of midrange server computers; and a boost in Linux's market share at the expense of Unix. "We're saying that Linux will eat Unix," says Gantz. Other predictions include: a stagnant or shrinking IT services market as companies scale down project size and turn to IT outsourcing; a booming wireless LAN market, which will delay the introduction of so-called third-generation wireless communications networks; and a 27% increase in online messaging, with the total number of e-mail messages sent each day rising 30% to 40 billion a day. "There will be more spam in your life," says Gantz. (CNet News.com 12 Dec 2002)

KEEP THE INTERNET NEUTRAL, SAYS LESSIG
Stanford Law School professor Lawrence Lessig says the time is ripe for regulators to take a stand on ensuring that access to the Internet remain neutral, and preventing access providers from controlling how consumers use the network. The Internet is essentially an "end-to-end" design, comparable to the electrical grid or the highway system, says Lessig. All the innovation comes from people using, not from the network itself. "But increasingly, U.S. broadband companies are trying to ensure that they have the power to decide which applications and content can run. Under such a regime, if Microsoft wants to sell Xboxes to run on the broadband network then it will have to pay the network providers for that privilege. Or if Disney wants to stream movies on the Internet, it too will have to pay the network tax," says Lessig. And while some people may think taxing Microsoft and Disney is not such a bad thing, the precedent it sets would stymie the growth and potential for innovation on the network. "It might seem strange that this lesson in preserving the original values of the Internet should come from Microsoft and Disney — two companies that have suffered a great deal of criticism from network activists. But on this issue both deserve praise. Policymakers must see that what makes innovation possible on the Internet is the freedom to innovate without the permission of a network owner." (Financial Times 13 Dec 2002)

2003-01-07 **cyber terrorism threat estimate overrated national security**

NIPC/DHS

January 07, Computerworld — Think Tank says the threat of cyberterrorism is overrated.

A research paper released last month by the Center for Strategic &International Studies (CSIS), a Washington-based Think Tank, argues that computer networks and critical infrastructures are distinct entities and that the threat from cyberterrorism is far less serious than the government and the media contend. "While many computer networks remain very vulnerable to attack, few critical infrastructures are equally vulnerable," argues James A. Lewis, a CSIS analyst. "Computer network vulnerabilities are an increasingly serious business problem, but their threat to national security is overstated." However, Brenton Greene, deputy director of the National Communications System, an executive-branch agency responsible for maintaining and restoring communications during times of national crisis, said the physical and cyber aspects of critical infrastructure protection can't be separated. Major physical events will have digital ramifications and vice versa, said Greene. That's also the conclusion of the recently released annual report of the Advisory Panel to Assess Domestic Response Capabilities for Terrorism Involving Weapons of Mass Destruction, led by former Virginia Governor James S. Gilmore. "Cyberspace has been isolated and specialized, thus limiting its perceived relevance to day-to-day outcomes and even its relevance to what are viewed as clear and present homeland security threats," the commission stated.

2003-01-07 **outsourcing concern secure coding vulnerablities threat**

NIPC/DHS

January 06, New York Times — Experts see vulnerability as outsiders code software.

As American companies increasingly move their software development tasks out of their own offices to computer programming companies here and abroad, new concerns are being raised about the security risks involved. The companies providing outsourcing services say that they take all necessary precautions to limit risk. But the question of whether the booming business in exporting high-tech jobs is heightening the risk of theft, sabotage or cyberterrorism from rogue programmers has been raised in discussions at the White House, before Congress and in boardrooms. "I can't cite any examples of this happening - but what that means is we haven't found any," said James Lewis, director of the technology program at the Center for Strategic and International Studies in Washington. While operations in some countries, like the United States, Britain and India, are considered generally safe for such software outsourcing, nervousness is beginning to grow at companies and in the government about the possibility of abuse by hackers, organized crime agents and cyberterrorists in nations like Pakistan, the Philippines and Russia. It is easy to see why companies find the economics of outsourcing compelling; cost savings can be 25 to 40 percent. Forrester Research of Cambridge, Massachusetts, predicted in a recent report that the acceleration in outsourcing would result in 3.3 million American jobs' moving offshore by 2015. Forrester estimates that 70 percent of these jobs will move to India, 20 percent to the Philippines and 10 percent to China.

BRACE FOR ONSLAUGHT OF NEW VIRUSES
Computer users will be plagued with a host of new viruses this year, particularly worms deployed into instant messaging systems, predicts a senior technology consultant with UK-based Sophos. "Virus writers are most interested in creating the next super Windows worm, spread by e-mail or instant messaging, as these mass-mailing viruses carry the greatest impact," says Graham Cluley. "We expect more executable e-mail-aware worms this year, while more viruses are written which use instant messaging services." Sophos also expects to see an increase in the number of so-called "Backdoor Trojans," which can open up holes in operating systems so that crackers can control them from a remote location. Windows users are particularly at risk, as nine out of 10 of last year's top viruses were spread via e-mail on Windows platforms, with the most prolific being the Klez worm. So far, PDAs and mobile phones have remained largely free of virus problems, says Cluley. "There is no indication yet that we will see an avalanche of new viruses affecting mobile devices — virus writers are not interested in targeting the mobile phone until it becomes more developed and has a bigger, common platform." MORE LIFE IN MOORE'S LAW
Moore's Law, which predicts that the number of transistors on a chip will double every two years, will "slow down" a bit in the coming years, says Intel co-founder Gordon Moore, for whom the law is named. "You really get bit by the fact that the materials are made of atoms." Alternatives to conventional chipmaking techniques, such as nanotechnology, are still in development, but haven't evolved to the point that they can take on silicon, says Moore, who notes that crafting single transistors is one thing, but "housing a billion of them on a chip is another." Still, scientific ingenuity has overcome conventional thinking in the past: "I remember we didn't think we could go beyond 1 micron because of optical lithography." (CNet News.com 9 Jul 2002)
http://news.com.com/2100-1001-942671.html?tag=fd_top

MOORE'S LAW GOOD FOR ANOTHER 10 YEARS
Moore's Law — the theory espoused by Intel co-founder Gordon Moore that the number of transistors on a computer chip would double every 18 months or so — is still valid, says Moore, who sees "no apparent roadblocks" for at least another decade. "It gets complicated and expensive, but the technological solutions seem to be there? Even if we get to the point where we can't squeeze any more [transistors] in there, we'll be putting billions of transistors on a chip. It's certainly not the end of creativity in the industry." Moore predicted that growth in the semiconductor industry would equal growth in the world's gross domestic product by 2017 if the industry continues at its current pace. (AP 10 Feb 2003)

2003-02-12 **National Infrastructure Protection Center NIPC global hacking advisory**

NIPC/DHS

February 11, NIPC — Advisory 03-002: National Infrastructure Protection Center "Encourages Heightened Cyber Security as Iraq - US Tensions Increase".

The NIPC is issuing this advisory to heighten the awareness of an increase in global hacking activities as a result of the increasing tensions between the United States and Iraq. Attacks may have one of several motivations: 1) Political activism targeting Iraq or those sympathetic to Iraq by self-described "patriot" hackers; 2) Political activism or disruptive attacks targeting United States systems by those opposed to any potential conflict with Iraq; 3) Criminal activity masquerading or using the current crisis to further personal goals. Regardless of the motivation, the NIPC reiterates such activity is illegal and punishable as a felony. The U.S. Government does not condone so-called "patriotic hacking" on its behalf. Further, even patriotic hackers can be fooled into launching attacks against their own interests by exploiting malicious code that purports to attack the other side when in fact it is designed to attack the interests of the side sending it. During times of potentially increased cyber disruption, owners/operators of computers and networked systems should review their defensive postures and procedures and stress the importance of increased vigilance in system monitoring.

NIPC/DHS

February 11, Newsday — In cyber-attack, the system bends, doesn't break.

Experts met last weekend at the annual CyberCrime convention in Mashantucket, CT to model a scenario where cyber-terrorists decide to strike first in a potential cyber-war against unspecified enemies. Richard Hunter of Gartner, the research firm that proposed and conducted the high-tech war games, says the "significant" threat to the Net is not its collapse, but the possibility that terrorists could build an undetectable control network on top of it to monitor and filter Internet traffic. Then, Hunter said, the terrorists could "subvert the Internet and take it for their own purposes." At the same time he noted that diligent maintenance of computer networks in the private and public sector would prevent 90 percent of those attacks, and suggested a seat-belt law-like model could prod slackers into cleaning up their network acts. As it turns out, the greatest potential threat against the country's infrastructure is one against the nation's financial networks — an attack that requires little technical savvy, Hunter said. Terrorists with clean credentials could buy or even start a bank and get access to the financial clearing house. Done the day after Thanksgiving, the biggest shopping day of the year, and also the day when Social Security checks and half of private corporation paychecks are processed, the terrorists could then introduce a massive onslaught of fraudulent bills into the system, causing it to choke on all the unacceptable volume.

2003-02-24 **cyber terrorism alert United Kingdom UK**

NIPC/DHS

February 20, The Times — Firms in the United Kingdom warned of IT terrorists.

Terrorist groups may try to infiltrate the computer systems of some of Britain's biggest companies, government departments and emergency services if a war is launched against Iraq, the Home Office of the United Kingdom has cautioned. Stephen Cummings, director of the National Infrastructure Security Co-ordination Centre (NISCC), said key IT systems were under threat of cyber attack by Islamic extremists. He said: "There will be groups attacking U.S. Government and defense websites and similar groups carrying out activity against the websites of any country involved in military action." Cummings urged businesses to step up security ahead of a possible war in the Gulf. He gave warning that terrorist groups might try to infiltrate activists into the IT departments of leading firms. "My view is that terrorist groups have identified the potential value in having people inside organizations rather than just responding passively as they have done in the past. There are already non-cyber examples of this," he said. Since NISCC was set up three years ago to monitor the threat of electronic attack against the UK, the number of digital attacks on "critical" organizations has soared. Cummings said that "there have been companies perceived to be in line with U.S. support for Israel in the past which have been attacked by pro-Palestinian groups. We could expect to see the same thing again from different sources."

2003-02-28 **mobile phone handheld device hacking spread**

NIPC/DHS

February 26, ZDNet (Australia) — Experts say mobile phone hacking may spread.

United States-based security company @stake has released a security advisory detailing a Denial of Service (DoS) vulnerability in the Nokia 6210 GSM mobile phone. "This is a good example of why all newly introduced product functionality should be reviewed to ensure that no new security vulnerabilities will also be introduced. A cursory source code audit would find an error of this type," the advisory said. The vulnerability is not serious — affected users can simply "reboot" their phones — but it could be a sign of worse things to come. John Papandriopoulos, a wireless communications researcher based in Melbourne, Australia, says that current generation handsets are not necessarily a popular target because there's little that can be done even if an attacker is able to compromise them. "I think it's more likely that the motivation would be to inconvenience people," he said. As for a mobile phone worm, spreading by sending itself to phonebook entries, John says this isn't likely to happen for some time. However, as standardized client software becomes a standard feature on mobile handsets it's only a matter of time before malicious hackers start paying more attention to wireless worms, according to security consultant Daniel Lewkovitz of Sydney, Australia.

2003-03-17 **cyber crime India infrastructure threat Central Bureau of Investigation CBI FBI**

NIPC/DHS

March 14, SiliconIndia.com — Cyber crime a threat to Indian infrastructure.

The director of the Central Bureau of Investigation (CBI) in India said that cyber crime and organized corruption have assumed serious proportions. "Cyber crimes like hacking, e-mail fraud and other information security breaches linked to computers are turning out to be very serious problems," P.C. Sharma told journalists during a visit to Assam, India. Fears have been expressed that a new breed of criminals could damage telecommunications or rail links, disrupt power supplies and harm other important parts of India's infrastructure using cyber tools. The CBI has launched a massive drive to tackle the threat, honing the skills of its elite officers and modernizing the agency's computer network. Experts from the U.S. Federal Bureau of Investigation (FBI) visited India last year and trained policemen in dealing with cyber offences.

2003-03-19 **Department Homeland Security DHS system threat attack forecast warning Iraq war**

NIPC/DHS

March 18, Government Computer News — DHS warns about systems threats as war looms.

The Department of Homeland Security (DHS) on Tuesday reminded Internet users to be vigilant for cyberattacks in light of the ultimatum President Bush issued Monday that Iraqi President Saddam Hussein leave his country or face military invasion. The department and other federal agencies are monitoring "the Internet for signs of a potential terrorist attack, cyberterrorism, hacking and state-sponsored information warfare," a Homeland Security statement said. "Industry and public Internet users are reminded of the importance of employing sound security practices and reporting unusual activity or intrusion attempts to DHS or local law enforcement."

2003-03-19 **CERT CC Internet net attack forecast warning**

NIPC/DHS

March 17, eWEEK — More net attacks loom, CERT says.

The recent rash of Internet worms has produced an army of hundreds of thousands of compromised machines that could ultimately be used to launch a massive distributed-denial-of-service attack at any time, according to security officials. Officials at the CERT Coordination Center said the organization is monitoring at least five large networks of compromised machines installed with so-called bots. The bots connect compromised PCs or servers to Internet Relay Chat servers, which attackers commonly use to execute commands on the remote systems. At least one of these networks has more than 140,000 machines, officials said. CERT's dire warning is underscored by last week's emergence of the Deloder and Code Red.F worms. While neither worm does any immediate damage to infected machines, both install back doors that enable attackers to use compromised machines for future, much more damaging operations, such as DDoS attacks. At the heart of this new trend, according to security experts, are poor security practices. But more important is the mistaken belief by corporate IT that once crises such as those caused by Code Red or SQL Slammer die down, the trouble's over. In fact, after an initial flurry of advisories, warnings and patches, there are often months or years of sustained infections and residual DDoS attacks, Marty Lindner of CERT said. Also problematic are the many affected machines belonging to home users, few of whom do any logging of the activity on their PCs. As a result, attackers can easily hide their tracks by using these anonymous computers, according to the experts.

2003-03-28 **music piracy downloading file-sharing recording industry**

NewsScan

INTERNET VS. RECORDING INDUSTRY
Media analyst Eric Garland of Big Champagne has told California lawmakers that the growth of music file-sharing on the Internet is "fundamentally unstoppable," because 61 million Americans and millions more worldwide are already downloading music and only 9% of them think they're doing something wrong. "We see only one trend. More people are downloading more copyrighted material." Garland's advice for the recording industry is to embrace digital distribution rather than institute lawsuits or education campaigns, but such advice is not well-received by industry executives, who are routinely urged by Internet enthusiasts to accommodate to technological realities. Phil Corwin, a lobbyist for Internet music service Kazaa, told the same group of state legislators: "The record business, in the digital revolution, has been a day late and a dollar short." [A dollar may not be the final figure.] The fight goes on. (AP/San Jose Mercury News 28 Mar 2003)

2003-04-02 **Chinese criminal hacker attack hacking US UK Websites vandalism defacement Iraq war prediction warning forecast**

NIPC/DHS

March 31, Washington Post — DHS: Chinese hack attacks likely.

Chinese hacker groups are planning attacks on U.S.- and U.K.-based Web sites to protest the war in Iraq, the Department of Homeland Security (DHS) warned in an alert Monday. The hackers are planning "distributed denial-of-service" attacks, which render Web sites and networks unusable by flooding them with massive amounts of traffic. They also are planning to deface selected Web sites, according to the alert, though the government said it did not know when the attacks would occur. The DHS said it got the information by monitoring an online meeting that the hackers held last weekend to coordinate the attacks.

2003-04-15 **cyber attacks physical damage repercussion virtual network bank account idea**

NIPC/DHS

April 14, New York Times — Cyberattacks with offline damage.

Most experts think of cyberattack as something that will happen in the virtual world, with effects on computer networks or access to bank accounts. But in a new paper, Aviel D. Rubin of the Information Security Institute at Johns Hopkins University, describes cyberattacks involving the use of online tools against the offline world. Using tools that have been published by search engines like Google that allow programmers to automate searches on a large scale, the paper describes a relatively simple program that could set the victim up to receive catalogs from hundreds of thousands of Web sites that have sign-up forms. Rubin's attack could be enormously disruptive to the target, and could paralyze the local post office that has to deal with the onslaught. As the report notes, the exploit could be used as a diversion to accompany a deadly terrorist act, like mailing an envelope containing anthrax spores. The paper can be found at www.avirubin.com/scripted.attacks.pdf

2003-04-21 **warning threat security RSA conference**

NIPC/DHS

April 18, CNET News.com — New attack may draw government intervention.

Security experts warned Thursday that business executives need to take network protection more seriously before a major cyberattack results in government intervention. Although the Bush administration has indicated it doesn't intend to dictate how companies should handle security, another Code Red or Nimda incident could change that stance, Roger Cressey, president of Good Harbor Consulting, said during a panel discussion this week at the RSA Conference in San Francisco. "If we do have a major cyberincident, there will be a critical mass of pressure for regulation, and (Congress) will take out a sledgehammer when a scalpel is needed," Cressey said. Two months ago, the Bush administration released the National Strategy to Secure Cyberspace, a document that mainly suggested solutions for protecting the Internet and critical infrastructure. The only mandates in the document were directed at government agencies. That's the correct approach, Lawrence Dietz of Symantec said at the panel. Instead, Dietz said, the government should wield its wallet and put restrictions on companies that want to do business with federal agencies.

2003-04-29 **security terrorism uncertainty Department Homeland Security DHS cost-benefit analysis**

NIPC/DHS

April 25, Computerworld — Lack of terrorist activity leads to complacency.

The changing of the cybersecurity guard at the Department of Homeland Security (DHS), coupled with complacency on the part of some corporate executives, has put a higher premium on information-sharing and cooperation between the private sector and the government. Michael Hershman of Virginia-based security consulting firm Decision Strategies LLC says companies have started to slow their efforts to boost security because there has been no terrorist activity recently. "I'm afraid that they may be drawing back into complacency," he said last week at a U.S. Chamber of Commerce conference in Washington that addressed the roles and responsibilities of the government and private sector in homeland security efforts. "Corporations in America have spent billions of dollars for security, with very little cost-benefit analysis," said Hershman.

2003-05-05 **security offshore coding U.S. software companies economy rish India Pakistan Russia China Techo-Security Conference**

NIPC/DHS

May 05, Computerworld — Offshore coding work raises security concerns.

IT professionals are raising questions about the U.S. software industry's reliance on overseas software developers, arguing that the practice puts companies and the U.S. economy at risk. A recent study by Gartner Inc. predicts that by 2004, more than 80% of U.S. companies will consider outsourcing critical IT services, including software development, to countries such as India, Pakistan, Russia and China. But some users at last week's Techno-Security Conference in Myrtle Beach, S.C., said the trend needs to be reconsidered in light of recent changes in the global security environment. Of particular concern is the work that is being sent to China. While not yet a major provider of outsourcing services, China has a significant economic espionage program that targets U.S. technology, the users noted. Also of concern are countries in Southeast Asia, particularly Malaysia and Indonesia, where terrorist networks are known to exist.

2003-05-05 **Nemertes Research IT security government regulations companies corporate real-world requirements**

NIPC/DHS

May 05, Network World — Corporate security spending not in line with real-world requirements.

Technology research firm Nemertes Research last week released its "Effective Security Solutions" report, which says the average 2% to 3% of the overall IT budget that companies allocate for security will not adequately prepare most of them for government regulations, new applications and/or Web services architectures. Johna Till Johnson of Nemertes Research says companies must spend at least 5% of their overall IT budgets on security to comply with government regulations passed in the past eight years or so. The security requirements in legislation such as the Health Insurance Portability and Accountability Act of 1996 (HIPAA), the Gramm-Leach-Bliley Financial Modernization Act of 1999, the Sarbanes-Oxley Act of 2002 and ongoing Department of Homeland Security initiatives, represent a significant concern for companies currently underspending, says Johnson. "The fine print in these pieces of legislation has the CEO or the security officer potentially going to jail if found in violation of these acts," she says.

2003-05-07 **emergency backup systems information data FEMA Federal Management Agency WTC World Trade Center Pentagon attacks**

NIPC/DHS

May 07, National Journal — IT officials emphasize need for emergency backup systems.

Many government offices must do better at backing up their information systems to preserve important data and ensure "continuity of operations" in the event of a terrorist attack, several federal technology officials said on Tuesday at a homeland security conference sponsored by the Armed Forces Communications and Electronics Association. FEMA's continuity-of-operations plan for many other systems typically amounts to "a pile of tapes" containing archived data, said Robert Coxe, deputy CIO of the Federal Emergency Management Agency (FEMA). Redundant communications and information systems proved invaluable after the attacks on the World Trade Center and the Pentagon, according to Lt. General Harry Raduege of the Defense Information Systems Agency. He recalled that one military agency avoided major data losses during the Pentagon attack because its computer systems had "double backup" capabilities. But he said officials in another Pentagon organization had stored "everything they had" on only one system that was destroyed in the attack. "They lost every bit of that data," he said.

2003-05-15 **e-mail instant message GoToMyPC.com impression management idle bankruptcy**

NewsScan

THE NEW WHITE-COLLAR CRIME: TECHNO-SLACKING
It's getting easier than ever to convince your customers, supervisors and employees that you're hard at work — firing off e-mail messages and opening files on your office PC while you're really attending your kids' soccer game or sleeping in. Services like GoToMyPC.com enable users to manipulate their office computers by remote control — even going so far as to move the cursor on the screen, open documents and print them on the networked office printer. E-mail timers allow workers to compose messages during the day and then queue them to be sent hours after they've gone to bed, giving the impression that they're up burning the midnight oil. Instant Message software can be reconfigured so that the "idle" message that pops up signaling inactivity is disabled, making users look perpetually available. And BlackBerry aficionados can change their settings to make on-the-road e-mail look like it came straight from the office PC. Psychologists call these activities "impression management," but other see signs of a disturbing trend: "If you're out playing golf, and you look like you've spent four hours in the office… If everybody does that, the company goes bankrupt," says Stuart Gilman, director of the Ethics Resource Center in Washington. A recent survey conducted by the Society for Human Resource Management found that 59% of HR professionals had personally observed employees lying about the number of hours they'd worked, and 53% said they'd seen employees lying to a supervisor, a jump of eight percentage points in six years. 2003-06-03 **digital pearl harbor Carnegie Mellon SEI software engineering institute disgruntled insiders foreign terrorsits greatest cuyber security threat terrorism Al-Qaeda steganography**

NIPC/DHS

June 03, National Journal — Computer security officials discount chances of 'digital Pearl Harbor'.

The notion that the cyberterrorism against the United States could create a "digital Pearl Harbor" is fading three computer-security experts said Tuesday. Casey Dunlevy of Carnegie Mellon's Software Engineering Institute (SEI), and Richard Hunter of Gartner Group, said disgruntled insiders, not foreign terrorists, pose the greatest cybersecurity threat to companies. "But could [cyber terrorism] be a force multiplier in terrorist attacks" by, for example, disabling all traffic lights after a bombing? "I think we have to consider that," said Dunlevy. He said computers recovered from Afghanistan demonstrated al Qaeda's use of steganography, a technique for embedding secret data within pictures or text. "We will eventually see a cyber element to terrorist activity," Dunlevy said. But both he and Hunter said terrorist groups also are likely to continue to engage in money laundering and cybercrime as a means of purloining resources.

2003-06-12 **security software viruses Trend Micro**

NewsScan

SECURITY SOFTWARE BUSINESS DUE FOR A SHAKE-UP
As the nature of computer viruses changes, the business of selling security software is changing, too, says Steve Chang, head of antivirus software firm Trend Micro. With viruses morphing into ever-more-complex forms, antivirus firms will need to shift from selling software to selling security services aimed at minimizing customers' downtime. Chang says the security software industry used to compare itself to the pharmaceutical business, developing new antidotes for each virus that cropped up. But the ubiquity of the Internet and the advent of such virulent viruses as Nimda, Slammer and Bugbear have changed all that. Now, the ability of a company to avoid infection depends as much on the security measures taken by other companies it does business with and employees working in their home environments as on its own vigilance. That means companies increasingly are seeking an ongoing service which, in addition to protecting them from malicious attacks, speeds up the recovery time following a security breach so that everyone can get back to work. "You buy a drill because you want a hole," says Chang, "not because you want a drill. Customers do not want a security product. They just want to improve their productivity without downtime." (BBC News 12 Jun 2003)

2003-08-04 **country coded computer worms Jonath Wignall information warfare internet protocol**

NIPC/DHS

August 04, New Scientist — Country-coded computer worms may be ahead.

Jonathan Wignall of the UK's Data and Network Security Research Council highlighted techniques that worm creators might use to make their code spread more effectively during a presentation at the security conference Defcon 11 in Las Vegas, NV, on Sunday, August 3. One of these techniques could also limit a worm's geographic range, which would turn a computer worm into an effective weapon for information warfare, he said. Instead of attacking internet-connected computers at random it could be used to attack a specific country. After infecting a host computer, a worm normally scans randomly for further machines that could be infected. But Wignall says a worm could download a prepared list of internet protocol (IP) addresses to attack from a single server or a group of machines. This would prevent duplicate requests being sent to each machine, a common cause of bottlenecking with existing worm design. Nicholas Weaver, a computer scientist at the University of California in Berkeley says this is just one way that a worm could, in theory, be used to target a specific country. Another way is to avoid computers running a particular language, he says.

2003-08-28 **computer viruses anti-virus worms predictions propagate Sobig.F Microsoft Windows operating systems target fight**

NIPC/DHS

August 28, Washington Post — Fight against viruses may move to servers.

Computer viruses are becoming so aggressive and sophisticated that they may soon be able to elude anti-virus programs installed on individual computers, according to many in the security industry. Analysts say the speed with which viruses and worms now propagate require technologies that predict outbreaks before they happen. Such predictive systems require intensive computing power beyond the capacity of desktop machines. Computer worms and viruses are getting more sophisticated, are spreading faster and are capable of doing more damage than those of the past. Viruses such as Sobig.F can change during their attacks by receiving updates and new instructions from other computers. Some analysts point out that while no software or hardware is perfect, it's much easier to spread viruses when so much of the computing world depends on the Microsoft Windows operating system. Advocates of the Unix, Linux, Macintosh and other operating systems argue that they are more secure than Windows, but others note that those systems simply have not been targeted as much.

2003-09-01 **Digital vandalism internet government computer virus attachs security experts breaches terrorist damaging**

NIPC/DHS

September 01, New York Times — Digital vandalism spurs a call for oversight.

The Internet is not subject to government oversight, and many see the Internet's openness as crucial to its success as a platform for innovation. But the increasing severity of computer virus attacks may have muted the antiregulatory reflex. Some security experts now advocate direct regulation, in the form of legislation that makes software companies liable for damage caused by security flaws in their products. Advocates of increased regulation say a California law that requires companies conducting business in the state to disclose computer security breaches if they result in unauthorized access to residents' personal information could serve as a model. A survey released Sunday, August 31, by the Pew Internet and American Life Project said that nearly 60 percent of Internet users say they favor the government's requiring American corporations to disclose more information about their vulnerabilities. Half of those surveyed said they worried about terrorists damaging the Internet.

2003-09-11 **unpatched holes Internet Explorer Microsoft new vulnerabilities Thor Larholm former black hat heighten security**

NIPC/DHS

September 11, Sydney Morning Herald (Australia) — Thirty unpatched holes in IE, says security researcher.

As Microsoft releases details of new vulnerabilities, it is yet to tackle the 30 unpatched holes in Internet Explorer which have been documented by well-known security researcher Thor Larholm. Larholm, a former black hat and now a senior security researcher with a private company, said on Friday, September 12, that seven more vulnerabilities had been added to the list he maintains, all of them having been discovered by Chinese researcher Liu Die Yu. "One of these new vulnerabilities exploits a new attack vector that has surfaced in IE lately, namely misdirecting user input," Larholm said. According to Larholm, "This allows you to redirect a user's mouseclick to (for example) the OK button on a dialog asking for security confirmation by moving the browser window prior to the mouse being released. This resurrects the debate on whether to disable some core functionality to heighten security. Similarly, several of the vulnerabilities that remain unpatched are known to be under active investigation by the Microsoft Security Response Center, and I am confident that a secure patch is being prepared for prompt release."

2003-09-29 **spam estimates marketing filtering masking blocking**

TechWeb http://www.techweb.com/wire/story/TWB20030929S0020

Gartner Group estimated that spam would be 50% of all e-mail on the 'Net by the end of 2003 and 60% by mid-2004. They also found that permission-based, well-designed, targeted e-mail could produce as much as a 15% response rate — much higher than the 1% for banner ads and the fraction of a percent for broadcast print mail advertisements.

David Legard, writing in Network World, summarized the Gartner findings as follows (quoting):

* E-mail marketers no longer have to comply with 36 state laws and, although the bill requires a valid opt-out mechanism, it does not make clear who should be responsible for implementing the unsubscribe or do-not-contact request.

* Businesses, ISPs and vendors filtering inbound e-mail will have to develop increasingly sophisticated technology and practices to decide between legitimate advertising material and spam, both of which will have to carry the 'ADV' tag in the subject line

* Disreputable spammers will ignore the legislation and if they feel under threat, will use offshore ISPs beyond the reach of U.S. jurisdiction to send material.

2003-10-01 **virus threat damage Microsoft software Symantec report**

NewsScan

NEW VIRUSES USE 'BLENDED THREATS' TO WREAK DAMAGE
Computer viruses are increasing in frequency, speed and sophistication, according to the latest Internet Security Threat Report from Symantec, adding that hackers are using "blended threats" that combine various types of viruses to carry out their attacks. Not surprisingly, the target of most of these attacks is Microsoft software, says Tony Vincent, Symantec's lead global security architect. "There's a continued focus by the bad guys on vulnerabilities based on Microsoft's Web server product and Internet Explorer." The report also cites a narrowing gap between the discovery of a potential vulnerability and the launch of a virus designed to exploit it. "The speed of propagation of blended threats is also increasing. Symantec expects to see greater worm propagation resulting in overloads to network hardware, crippling network traffic, and seriously preventing both individuals and businesses from using the Internet." 2003-10-19 **cyber crime Bucharest Romania litigation defraud US**

NewsScan

CYBERCRIME HOTSPOT: BUCHAREST
There now exists a loosely organized network of young Romanians conspiring with other accomplices in Europe and the U.S. to defraud consumers through bogus Internet purchases, extort cash from companies after hacking into their systems, and release worms and viruses. Romanian lawmaker and former programmer Varujan Pambuccian says: "We want a good name for our country. I'm very angry that Romania is so well-known for ugly things — for street dogs, street children and hackers." Mihai Radu, a computer security expert in Bucharest, believes that Romania's law enforcement officials are not up to the job of defeating the vandals: "The Romanian police aren't qualified. They don't have the tools, the skills, the software." (AP/San Jose Mercury News 19 Oct 2003)

2003-12-02 **worm network cell phone handset vulnerability Internet enabled**

NIPC/DHS

November 28, New York Times — Beware the worm in your handset.

As more consumers begin surfing the Web and sending e-mail messages on cellphone and hand-held devices, along comes a new worry: worms and viruses spread via Internet-enabled handsets. The problem is still small, with only a few cases reported globally. But as operating systems in cellphones become standardized, hackers will probably begin focusing on vulnerabilities in those systems as they have with personal computers. And as cellphones and personal digital assistants connect to the Internet at ever faster speeds, more users will be able to download files with attachments—some of which may be infected. Asia, where high-speed networks and text messaging on mobile phones are common, is the most vulnerable to these threats. As carriers in Europe and North America adopt similar technology, they will confront the same kinds of hazards. Telecommunications companies currently spend as much as $8 billion a year fixing handsets with programming errors, faulty mechanics and other problems. Now some are scrambling to prevent virus attacks that could cost carriers millions of dollars more in repairs and lost business.

2003-12-04 **computer virus crime authors successful Microsoft piracy**

NIPC/DHS

December 03, Reuters — Web virus authors 'winning battle' — Microsoft.

Creators of computer viruses are winning the battle with law enforcers and getting away with crimes that cost the global economy some $13 billion this year, a Microsoft official said Wednesday, December 3 at a cybercrime conference in Germany. Counterfeit centers are shifting from California and Western Europe to countries including Paraguay, Colombia and Ukraine said David Finn. In Asia, pirate plants have emerged in Vietnam, Macao, and Myanmar (Burma) in addition to more established facilities in Indonesia, Malaysia and Thailand. "So far they are getting away with it...Very few have been identified or prosecuted or punished," Finn said. He cited estimates by Business Week that financial damage this year from bugs like the Blaster worm and the SoBig.F e-mail virus, which crashed systems and disrupted Internet traffic around the world, would total some $13 billion. The cost of protecting networks against such cyberattacks was put at $3.8 billion. Finn said "we shouldn't be surprised" if terror organizations were looking to recruit computer expertise. Len Hynds, head of the National High-Tech Crime Unit in Britain, said gangs were recruiting people with IT skills not only to help them commit cybercrime but to secure their own communications networks and avoid detection. He said companies needed to recruit more carefully.

2004-01-20 **IP network attack easy report survey estimate infrastructure protection**

NIPC/DHS; http://news.com.com/2100−7349−5141386.html?tag=cd_top

January 15, CNET News — Report: IP networks easy prey for cyberattackers.

The increasing use of Internet Protocol (IP) technology in power stations, railroads, banks and other critical infrastructure could spell big trouble, and soon, according to analysts. Although an actual act of cyberterrorism or cyberwarfare has never been recorded, the potential exists and is being facilitated by an increasingly connected world, according to a report released on Wednesday, January 14, by market-research firm Gartner. Cyberwarfare could be a reality by 2005, the company said. Technologies such as VoIP and the trend towards voice and data convergence give benefits cost and flexibility to businesses, but they also expose vital telecommunications networks to traditional forms of Internet attack, such as worms and viruses, according to the report. Gartner claims that, unlike traditional circuit-switched networks, VoIP networks have an inherent weakness when it comes to latency—any delay to the packets carrying the voice traffic disrupts communication. A massive denial-of-service attack could "degrade call performance by slowing voice packet arrival at a given destination" and effectively cut off voice communication, the report says. Other weaknesses flagged include the Supervisory Control and Data Acquisition interfaces used to connect a significant portion of critical infrastructure elements such as dams, railroads, electrical grids and power stations.

2004-01-20 **virus worm damage cost expense Trend Micro**

DHS/IAIP Update / Reuters

TREND MICRO SAYS 2003 VIRUSES CAUSED $55 BILLION DAMAGE.

Trend Micro Inc. said on Friday, January 16, that computer virus attacks cost global businesses an estimated $55 billion in damages in 2003, a sum that would rise this year. Companies lost roughly $20 billion to $30 billion in 2002 from the virus attacks, up from about $13 billion in 2001, according to various industry estimates. "The economic and financial impact of virus attacks will continue to climb in 2004," Lionel Phang, Trend Micro's Managing Director. Spam threats and network viruses will likely become more prevalent in 2004, he said. Blended threats also will remain the standard way to attack networks, where one virus file will create four to five different activities within the system." Viruses can also gain entry into computer networks via instant messaging channels, Phang added. "Spammers are going to put viruses and worms in email attachments, so (junk email) will become more than just a nuisance," said Natasha David, an analyst with International Data Corp. Analysts said the number of attacks between January and June 2003 exceeded 70,000, which is about twice the rate for 2002. "About 20 to 40 new and variant virus threats were reported to Trend Micro on a daily basis worldwide in 2003," Phang said.

2004-02-01 **outsourcing India globalization Wired**

NewsScan

INDIA: THE NEW FACE OF THE SILICON AGE

An interesting long article in the new Wired magazine gives a good picture of India as it becomes the "new face of the Silicon Age." Journalist Dan Fink writes of Indian engineers doing outsourced programming work: "What begins to seep through their well-tiled arguments about quality, efficiency, and optimization is a view that Americans, who have long celebrated the sweetness of dynamic capitalism, must get used to the concept that it works for non-Americans, too. Programming jobs have delivered a nice upper-middle-class lifestyle to the people in this room. They own apartments. They drive new cars. They surf the Internet and watch American television and sip cappuccinos. Isn't the emergence of a vibrant middle class in an otherwise poor country a spectacular achievement, the very confirmation of the wonders of globalization — not to mention a new market for American goods and services? And if this transition pinches a little, aren't Americans being a tad hypocritical by whining about it? After all, where is it written that IT jobs somehow belong to Americans — and that any non-American who does such work is stealing the job from its rightful owner?" (Wired Feb 2000)

NewsScan

SHOPPERS SPOOKED BY SPAM

Spam is putting a damper on e-commerce, according to a survey published by the Transatlantic Consumer Dialogue, which indicates that 52% of respondents are shopping less on the Internet or not at all because of concerns that information disclosed in such transactions will generate more junk e-mail. "It is very clear that the majority of citizens are very troubled by unsolicited commercial e-mails. It is also very clear that bona fide businesses are losing money because the disreputable image of spam is making consumers uneasy about engaging in e-commerce." The results were released at an anti-spam summit held by the Organization for Economic Co-operation and Development (OECD), which is calling for international cooperation in tackling the scourge of spam and restoring consumer confidence in electronic commerce. "Most governments do view the Internet as a key to global economy. Spam certainly has the capacity to interfere with that," says Peter Ferguson, chairman of the OECD working party on information security and privacy. (Reuters/Washington Post 2 Feb 2004)

2004-04-23 **grammar poor technology sociolinguistics SMS instant messaging IM**

NewsScan

TECHNOLOGY MARCHES AHEAD, GRAMMAR GETS WORSE

Text messages, e-mail and the push for faster and more efficient communications are taking their toll on grammar, language experts believe. Queensland University of Technology sociolinguistics lecturer Jo Carr notes that people using e-mail and SMS text messaging are unconcerned about grammar and punctuation: "Grammar rules used to be an indication of social class and literacy in the past but today's society are doing things differently because language today serves the purpose of speed and social interaction." Macquarie Dictionary editorial committee member Sue Butler says grammar and punctuation are increasingly underused in Australia and around the world. "We now do get a failing in standards of punctuation that can be disconcerting," she notes. Media such as television advertisements and public billboards often sacrifice grammar and punctuation to engage audiences in the most efficient, shortest time possible, and correct grammar also is a low priority on live radio and television when politicians and news presenters make mistakes because they have to think and speak faster, says Butler. 2004-05-19 **companies accountable vulnerable software corporations 150 lobbying unsecure Business Roundtable**

NewsScan

CORPORATE EXECS BLAST TECH INDUSTRY FOR SHODDY PRODUCTS

The Business Roundtable, a trade group for executives of 150 large U.S. corporations, has launched a lobbying campaign to make technology companies accountable for software that they say is vulnerable to hackers and overly complex to use. The group is urging tech firms to improve software design, make software easier to manage, and to continue tech support for software products that have been superseded by newer versions. "Up until now, the IT suppliers have deflected criticism and redirected criticism to end users… We would challenge the software industry to create products that are easier to use, where security is a default component of the software. It shouldn't require somebody with a technology degree to manage a home computer," says a Roundtable spokeswoman. The Roundtable's complaints mirror those made by some consumer groups and security experts, but were met with skepticism by technology representatives. "Cybersecurity is everybody's responsibility, including the vendors, the users, enterprises and government agencies," says a spokesman for the Information Technology Association of America. "No serious commentary will say that the user has no responsibility. We all have responsibilities to lock our doors in our homes and to buckle up when we get in cars." (AP 19 May 2004)

2004-08-03 **security spending prediction forecast increase 2005 decrease 2006**

DHS IAIP Daily;
http://www.itweb.co.za/sections/business/2004/0408031150.asp
?A=SEC&S=Security&O=FPT

August 03, ITWeb — Security spending to hit high in 2005.

Next year will be the high mark in corporate IT security spending, after which spending will drop to around 5% of IT budgets, says Gartner analyst Rich Mogull. "The reason for this will be because corporations would have to build more secure networks to protect the enterprise," Mogull said at the Gartner Symposium/ITxpo Africa being held in Cape Town this week. According to Gartner's predictions, by 2006, information security spending will drop to 4% or 5% of IT budgets on average as enterprises improve security management and efficiency. The lowest-spending 20% of organizations, the most efficient ones, will safely reduce the share of security in the IT budget to between 3% or 4% in two years. However, Mogull said security managers should include estimates of measurable security improvement with every request for spending. Business units should include security spending in all IT project requests. "The myth that software has to have flaws is only true if you use flawed software," he said. Mogull's list of security technologies that companies will need includes quarantine/containment, security audit capabilities and automated password management. Security technologies that would probably not be needed include personal digital signatures, quantum key exchange, and 500-page security policies.

2004-11-19 **research development R&D needed information security President committee US PITAC report**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27979−1.html

November 19, Government Computer News — More funding needed for security R&D, IT committee says.

The government has shortchanged basic research into cybersecurity and should at least quadruple the money available for civilian research, a subcommitee of the President's IT Advisory Committee (PITAC) said in a draft report presented Friday, November 19. The government plays a key role in supplying the intellectual capital to improve the security of IT systems, said F. Thomas Leighton, chairman of the PITAC subcommittee on cybersecurity. "The government has largely failed in this regard," he said. In addition to being underfunded, government research efforts are becoming increasingly classified and focused on short-term results, the committee found. The subcommittee identified ten critical areas for future research including securing fundamental networking protocols, end-to-end system security, and cyberforensics tools. The subcommittee expects to present a final draft report at the next PITAC meeting on December 5.

2004-12-03 **information technology IT spending six percent growth 2005 prediction**

DHS IAIP Daily;
http://www.computerworld.com/managementtopics/management/its
pending/story/0,10801,98040,00.html

December 03, InfoWorld — IT spending to grow six percent in 2005.

In making its annual predictions for the upcoming year, IDC said it expects worldwide IT spending to grow 6.1% for 2005, a year that will be marked by "enormous turbulence" and significant consolidation and realignment in several key sectors. The 6.1% growth, a slight improvement over the 5% growth rate expected for 2004, means the IT market will exceed $1 trillion in overall spending. What will spur some of this higher growth will be the migration by larger IT shops toward more dynamic IT environments, those that innately offer greater efficiency and better business responsiveness. IDC predicted that there would be a concerted quest for "business value" that will force an increasing number of infrastructure players to partner and acquire technologies and companies that can help them zoom to the upper stack of dynamic IT environments. IDC also predicted the continued rise of open-source software, including the Linux operating system and compatible middleware applications.

2005-01-03 **information technology IT spending fall 2005 poll security spending increase**

DHS IAIP Daily; http://www.internetnews.com/stats/article.php/3453831\

POLL: IT SPENDING EXPECTED TO FALL

IT spending in 2005 is expected to fall somewhat according to a new poll from CIO magazine. However, there are certain sectors, including security and storage, that are reportedly expected to rise. The magazine conducted the poll during a one-week period in December that garnered 243 responses from a cross section of industries. Only 6.7 percent of poll respondents indicated that they expected IT spending to increase in 2005, which was a decline of 1.7 percent from the poll's November results (8.4 percent). IT security spending is on the upswing with 60.9 percent of poll respondents indicating that they were planning on increasing spending over the next 12 months. The expected growth in security spending represents a 7.7 percent increase over November expectations (53.2 percent). A number of different studies in 2004 painted a very vivid picture of enterprises' attitudes toward IT security spending. A September Ernst & Young report noted that only 17 percent said spending would increase significantly, and 52 percent thought it would increase only slightly. In July, research firm IDC reported that 59 percent of its survey base indicated that IT security spending would increase.

http://news.com.com/Computer%2C+physical+security+expected+t
o+merge/2100−7348_3−5534312.html

COMPUTER, PHYSICAL SECURITY EXPECTED TO MERGE

Companies will increasingly integrate physical and computer security systems in 2005, spending over $1 billion in the United States and Europe, according to a report released this week from Forrester Research. Companies have generally treated physical security as part of the facilities department and computer security as part of the information-technology group. But employee information has increasingly become integrated, allowing businesses to link the two systems, Steve Hunt, an analyst with Forrester Research, said in the report. "Locks, cameras, entry systems, and even guard desks will be upgraded to work with the same computing systems that control computer and network sign-on, identity management and security incident management," he said in the report. Government projects to integrate physical and network security will make up the lion's share of the money being spent, Forrester predicted. DHS IAIP Daily; http://sys−con.com/story/?storyid=48190&DE=1

IBM SECURITY REPORT PREDICTS MOBILE/SATELLITE ATTACKS IN 2005

According to IBM, results from its 2004 Global Business Security Index Report show mobile devices becoming targets of viruses and worms. IBM, looking at potential security threats in 2005, said this may be the year for the aggressive spread of viruses and worms to handheld devices, cell phones, wireless networks, and embedded computers, which include car and satellite communication systems. The report, written by IBM's Global Security Intelligence Services team, said e-mail-based worms and viruses wreaked havoc on corporate networks in 2004. E-mail worms such as Bagle, Netsky and Mydoom led the pack in the number of variants and overall impact. During the latter part of 2004, a growing number of viruses aimed at PDAs and other mobile devices, such as the Cabir worm, were released. Such worms will likely be used by copycats and may start an epidemic of viruses aimed at mobile devices.

DHS IAIP Daily; http://www.washingtonpost.com/ac2/wp−dyn/A17721−2005Mar8?lan guage=printer

U.S. TECHNOLOGY LEADERS WARN OF LOSING COMPETITIVE ADVANTAGE.

Leaders of high-tech companies said Tuesday, March 8, the United States risks losing its competitive edge without significant new investments in education, research and development and the spread of broadband technology. TechNet, which represents about 200 high-tech leaders, including Microsoft, Intel Corp., Cisco Systems, and Hewlett Packard, made its annual lobbying trip to Capitol Hill on Tuesday. TechNet officials cited some troubling indications that the U.S. is falling behind in high-tech development: the percentage of U.S. households with broadband access lags behind other highly-developed countries; U.S. investment in research and development has stayed flat for the last three decades, while it has grown significantly in competitor countries; and students in the U.S. are behind their counterparts in other countries in math and science. Among other recommendations, the group called on Congress to increase basic research funding, make permanent a research and development tax credit, and promote cybersecurity initiatives.

2005-03-23 **study user blame encouraging spam bad e-mail behavior**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4375601.stm

STUDY BLAMES USERS FOR ENCOURAGING SPAM

A new report lays much of the blame for the ongoing problem of spam at the feet of computer users who open spam messages and even buy products or services advertised in spam. According to the survey, conducted by Mirapoint and the Radicati Group, nearly one-third of users have opened such messages, and one in ten has made a purchase. The report calls such actions "bad e-mail behavior" and said it encourages not just marketers but con artists to continue sending vast amounts of spam. Many adult-themed e-mail messages lure computer users into visiting Web sites that then install spyware or other malicious code. Graham Cluley, senior technology consultant for security firm Sophos, agreed that users bear much of the responsibility for spam's continued presence.
"If no one responded to junk e-mail and didn't buy products sold in this way," he said, "then spam would be as extinct as the dinosaurs." BBC, 23 March 2005

SOFTWARE 2015 REPORT FROM CNSS

Jim Horning noted:

>There's a recent report by the Center for National Software Studies that does not seem to have been adequately publicized, and hence has not received the attention it deserves: "SOFTWARE 2015: A National Software Strategy to Ensure U.S. Security and Competitiveness"

Risks loom large in the discussion, including
* Risk of critical infrastructure failures
* Risk of sudden and severe economic loss
* Risk of loss of life and limb
* Risk of loss of public confidence
* Risk of loss of our technological edge and leadership

I've posted excerpts from the Executive Summary at both
http://bayosphere.com/node/554
and
http://horning.blogspot.com/2005/06/software-2015.html

2005-06-21 **security study Gartner research malicious software impact mobile devices 2007**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?artic leID=164901703

MALICIOUS SOFTWARE NOT LIKELY TO HAVE LARGE IMPACT ON MOBILE DEVICES UNTIL 2007

Mobile phone and PDA users have more than two years to get ready for a quick-spreading worm, John Pescatore and John Girard, analysts at Gartner research. Client-side anti-virus software meant for cell phones and PDAs "certainly work", but vendors aren't selling them said Pescatore. In part that's because the threat of a fast-spreading malicious worm or virus has been overblown by security vendors. In fact, the conditions for a real threat-one that has the ability to infect more than 30 percent of mobile devices used in the enterprise-simply don't exist. The three factors that must exist before a Slammer- or MSBlast-style attack hits mobile devices, said Pescatore, are the large-scale adoption of smart phones, ubiquitous uses of wireless messaging to exchange executable files, and the convergence of operating systems to the point where one enjoys a majority share of the market. According to Pescatore and Girard, those three conditions won't co-exist until around the end of 2007. Furthermore, they believe that end-point security solutions for smart phones, cell phones, and PDAs are a waste of time because they often fail to block the most damaging viruses.

2005-06-22 **port sniffing attack warning TCP 445 SMB protocol Windows XP SP2 Gartner research**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/s tory/0,10801,102687,00.html

INCREASED PORT 'SNIFFING' COULD HERALD ATTACK, RESEARCHER WARNS

An increase in "sniffing" activity on TCP Port 445 associated with a recently patched Microsoft vulnerability may be the signal of an impending attack attempting to exploit the flaw, according to an alert from analyst firm Gartner. The flaw in question is a remote code execution vulnerability associated with the Microsoft Windows Server Message Block (SMB) Protocol. Attackers who exploit this vulnerability could take complete control of affected systems. An increase in activity on TCP Port 445, which is associated with the SMB protocol, may be a signal that attackers are attempting to exploit the hole, Gartner analyst John Pescatore said in an alert posted Tuesday, June 21. Officials at Symantec also spotted increased activity on Port 445, but they downplayed any immediate threat. Alfred Huger, senior director of engineering at Symantec, said his company noted a " significant spike" in activity last Friday, June 17. Since then, activity levels have gone back to normal. "Activity targeting Port 455 is very common. It's almost like background noise," Huger said. Companies that have installed Microsoft's Windows XP SP2 should also be protected against the flaw because it closes off access to Port 445 by default, Huger said.

2005-06-28 **US-CERT warning scanning activity port 445 TCP Server Message Block SMB**

DHS IAIP Daily; http://www.us−cert.gov/current/current_activity.html#smb

SCANNING ACTIVITY ON PORT 445/TCP

US-CERT has seen reports indicating an increase in scanning activity of port 445/tcp. This port is used by Server Message Block (SMB) to share files, printers, serial ports and communicate between computers in a Microsoft Windows environment. Scanning for port 445/tcp has been active for a number of years. In 2004, Microsoft released a bulletin (MS04-011) describing a vulnerability in the Local Security Authority Subsystem Service (LSASS). Since this time a number of exploits have been published that take advantage of this vulnerability. More recently, Microsoft published two security bulletins (MS05-011 and MS05-027) that describe vulnerabilities in the Server Message Block (SMB). The LSASS and SMB services utilize RPC for communications. Ports configured to support RPC (i.e., port 445/tcp) may be scanned to locate vulnerable hosts. Scanning for port 445/tcp could be a result of attempts to exploit any of the vulnerabilities referenced above or attempts to authenticate to Microsoft Windows systems through brute force password attacks. More recently, an exploit was released that attempts to take advantage of the vulnerability described in MS05-011. While reports of successful system compromises using this vulnerability have not been confirmed, US-CERT strongly recommends that users patch their systems as soon as possible.

2005-08-03 **warning SANS Internet servers attack risk DNS cache poisoning**

DHS IAIP Daily; http://news.com.com/DNS+servers−−
an+Internet+Achilles+heel/2 100−7349_3−5816061.html?tag=nefd.lede

INTERNET SERVERS AT RISK OF ATTACK

In a scan of 2.5 million so-called Domain Name System machines, which act as the White Pages of the Internet, security researcher Dan Kaminsky found that about 230,000 are potentially vulnerable to a threat known as DNS cache poisoning. "That is almost 10 percent of the scanned DNS servers," Kaminsky said in a presentation last week at the Black Hat security event in Las Vegas, NV. The motivation for a potential attack is money, according to the SANS Internet Storm Center, which tracks network threats. Attackers typically get paid for each spyware or adware program they manage to get installed on a person's PC. Information lifted from victims, such as social security numbers and credit card data, can also be sold. Additionally, malicious software could be installed on a PC to hijack it and use it to relay spam. The DNS servers in question are run by companies and Internet service providers to translate text-based Internet addresses into numeric IP addresses. The cache on each machine is used as a local store of data for Web addresses.

2005-11-29 **cyber crime attack threat risk prediction security expert warning DHS Scott Borg**

DHS IAIP Daily;
http://www.infoworld.com/article/05/11/29/HNmoreattacks_1.html

SECURITY EXPERT: MORE SOPHISTICATED ATTACKS LIKELY

The cyber attacks of recent years have been relatively unsophisticated and inexpensive compared to the potential of organized attacks, a cybersecurity expert said Tuesday, November 29. Organized attacks by teams of hackers that have members with expertise in business functions and processes -- as well the rudimentary access and coding expertise that many current attackers have -- could have a huge impact on a nation's economy, said Scott Borg, director of the U.S. Cyber Consequences Unit, an agency supported by the U.S. Department of Homeland Security. "We will probably see terrorist groups, criminal organizations putting together combinations of talent," Borg said at the E-Gov Institute's Security Conference in Washington, DC. While past cyber attacks have done relatively small amounts of damage, coordinated attacks on important targets such as the U.S. electrical grid, the banking and finance industry, or the telecommunications and Internet industries could potentially cause many billions of dollars in damage, he said. Most viruses and worms knock out company networks for two or three days at most, but costs would multiply quickly for any coordinated attack on a critical U.S. industry that knocked out service for more than three days, said Borg, an economist.

2005-11-29 **RSS Really Simple Syndication security threat risk prediction Trend Micro expert Microsoft Internet Explorer IE**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1894232,00.asp

TREND MICRO: REALLY SIMPLE SYNDICATION IS WORM BOT'S NEXT TARGET

Security researchers at Trend Micro Inc. have pinpointed Really Simple Syndication (RSS) technology as a lucrative target for future bot worm attacks. David Sancho, senior anti-virus research engineer at Trend Micro, warned that RSS feed hijacking will become commonplace when Microsoft Corp. ships Internet Explorer 7 (IE7), a browser refresh that will feature built-in RSS support. In a white paper titled "The Future of Bot Worms," Sancho said the IE7 release "will open some interesting possibilities to worm creators." "The easy way of taking advantage of the popularity [of RSS] is to hijack the existing configured feed clients to automatically download new copies of worms and other threats to the infected computers. This is accomplished by pointing the already-configured client to different and malicious Web content," Sancho wrote. "The way this would work is checking if the system has any automatic feed download configured. If it does, it would just add or change an existing one to point to the malicious Website," he added. Sancho predicts that RSS feed hijacking attacks will serve as a passive download point that could easily bypass personal firewalls and other security barriers. David Sancho's white paper: http://www.trendmicro.com.au/global/products/collaterals/whi te_papers/BotsWP.pdf

2005-12-07 **FBI report terror groups lack denial-of-service Internet attack capability**

DHS IAIP Daily; http://abcnews.go.com/Politics/wireStory?id=1383901

FEDERAL BUREAU OF INVESTIGATION: TERROR GROUPS LACK ABILITY TO MOUNT CRIPPLING INTERNET-BASED ATTACKS

Al Qaeda and other terror groups are more sophisticated in their use of computers but still are unable to mount crippling Internet-based attacks against U.S. power grids, airports and other targets, the Federal Bureau of Investigation's (FBI) top cyber crime official said Wednesday, December 7. Investigators keep a close watch on terror groups' use of computers but have not detected any plans to launch cyber attacks against major public institutions in the United States, FBI assistant director Louis M. Reigel said. The government has conducted simulated terrorist attacks on computer, banking, and utility systems, and Reigel said his division of around 1,100 agents treats seriously the prospect of such a strike. FBI cyber experts have noticed progress in the technical mastery suspected terrorists have shown online, he said. Terrorists also have made only infrequent use of stenography, the practice of hiding a text message in another kind of file, typically a picture, Reigel said.

2005-12-12 **Sober worm attack prediction January 2005 effect mitigation strip infections**

DHS IAIP Daily;
http://news.zdnet.co.uk/internet/security/0,39020375,39241437,00.htm

PREPARATION SYSTEMS ADMINISTRATORS CAN MITIGATE THE EFFECTS OF THE UPCOMING SOBER WORM ATTACK, SAY EXPERTS

Security administrators need not worry about the effects of the predicted Sober attack on January 5, as long as they take precautions and strip infections from their systems, security experts said on Friday, December 9. The impact of the upcoming attack can be mitigated by rooting out the problem at source, according to McAfee. Because a machine needs to be already infected with a variant of the virus for the update to take effect, machines can be prevented from downloading the updated virus by having the current version removed before January 5. "The effects can be mitigated by updating antivirus software, and scanning for normal versions of the variant," said Greg Day, security analyst at McAfee. McAfee said that administrators had a relatively large time frame in which to scan machines. However, McAfee warned that systems professionals should not underestimate the scale of the problem, and should be aware of the potential strain on their mail servers when the virus update is released.

2005-12-14 **AT&T security chief opinion Internet carrier predict prevent cyber attacks**

DHS IAIP Daily; http://www.techweb.com/article/showArticle.jhtml?articleId=1
75002779&pgno=1

AT&T SECURITY CHIEF SAYS CARRIERS SHOULD PREDICT, PREVENT ATTACKS

A centralized military presence would be more effective in warning a neighborhood of incoming attacks than if each family sent grandpa up to their roof with field glasses. AT&T Chief Security Officer Ed Amoroso used that analogy to explain his company's strategy for fighting cyber attacks. "Every one of you is fighting the same cyber war," said Amoroso, a keynote speaker Wednesday, December 14, at Interop in New York City. Carriers have the power to detect problems by observing activity with a broad view. That, he said, puts them in a position to detect and prevent attacks of all kinds, rather than requiring each subscriber to individually erect firewalls and take redundant precautions against attacks. Though software creators need to improve their methods and reach for higher security standards, carriers must also take responsibility in providing much-needed improvements, he said. Amoroso said that evolving applications need to be better integrated and better protected, especially with broadband leaving computers more vulnerable.

2005-12-21 **McAfee Avert Labs warning mobile cell phone user alert 2006 threat predictions**

DHS IAIP Daily;
http://www.techworld.com/security/news/index.cfm?NewsID=5051
&Page=1&pagePos=9&inkc=0

SECURITY COMPANY WARNS MOBILE USERS TO BE ALERT IN 2006

Rising threat levels for mobile users should come as no surprise, but McAfee's Avert Labs division has marked 2006 down as a potential turning point in the spread of malware to these platforms. Keylogging Trojans, adware, bots and backdoor programs will all hit users with greater frequency in 2006, with smartphone and "converged" users witnessing damage much greater than that seen on PCs because few currently bother to protect themselves. "Consumers are less likely to install mobile security versus PC security because the perceived risk from mobile threats is much less," a company release said. According to McAfee, mobile malware has grown ten times more rapidly than PC threats over any period of one year, and that in general "potentially unwanted programs" (PUPs) have grown by 40 percent in 2005 alone. The problem appears to be the increasing usefulness of Smartphones and PDAs. Having spent years as technological curiosities, they are now being sold to perform a variety of useful but risky operations such as mobile banking.

2005-12-28 **Instant messaging threats MessageLabs malicious target infect enterprises spam Trojan attacks report phishing emails**

DHS IAIP Daily; http://www.scmagazine.com/uk/news/article/533780/firm−im−
thr
eats−increase−next−year/

INSTANT MESSAGING THREATS TO INCREASE NEXT YEAR

MessageLabs warned that malicious users will increasingly target instant messaging (IM) in the next year, calling it a "widening backdoor" to infect enterprises with spam and trojan attacks. In a year-end report, the company said, "Spammers will diversify further into the IM ecosystems, as business adoption of IM increases and as the 'big three' IM protocols begin to standardize in 2006 and onwards." The report also noted a considerable increase in phishing emails sent this year, representing 13 percent of malicious emails intercepted during 2005, with a high of 27 percent in January. In total, more than 62.5 million phishing emails were intercepted by MessageLabs since Saturday, January 1, an increase of 238 percent from the 18 million caught the year before. The company also predicted more attacks on mobile devices: "Criminals will continue to attempt to gain access to users' mobile devices as the proliferation of wireless technologies like Wi-Fi spreads to airplanes, trains, and other public locations." Analysts found targeted attacks on specific industries became more common in 2005. Over all, MessageLabs reported one in every 36.15 emails sent this year contained a virus or Trojan. The report noted that cybercriminals chose more specific targets during 2005.

2006-01-04 **estimate prediction Sober worm time bomb under control**

DHS IAIP Daily; 23
http://news.com.com/Experts+Sober+time+bombs+under+control/2 100−7349_3−6018012.html?tag=cd.top

EXPERTS: SOBER TIME BOMB'S UNDER CONTROL

The Sober attack expected later this week is unlikely to have much effect on company systems, antivirus experts predicted. As reported last month, machines that were infected by Sober in November have the potential to download malicious code from certain Websites and then launch a new wave of viruses on Thursday, January 5, or Friday, January 6. But experts from antivirus companies F-Secure, Websense and MessageLabs all agreed on Wednesday, January 4, that this Sober attack is unlikely to cause many problems, because systems administrators and antivirus companies have had time to prepare for it. F-Secure raised the possibility that there might not even be an attack, as Internet service providers could block access to the malicious Websites. Websense agreed that the Sober attack likely won't have a major effect. The worm time bomb is contained in a variant of Sober that hit systems in November, clogging e-mail servers and stalling messages sent to Microsoft's Hotmail and MSN e-mail services.

2006-01-19 **cybercrime price FBI estimate $67 billion**

EDUPAGE; http://news.com.com/2100-7349_3-6028946.html 23

PUTTING A PRICE ON CYBERCRIME

A study by the FBI estimates that yearly losses to computer crimes exceed $67 billion. The study is based on the results of a survey of more than 2,000 organizations, of which 90 percent reported having suffered some form of computer attack in the previous 12 months, and 64 percent said they suffered a financial loss due to those attacks. The average financial loss was $24,000 per company. In estimating total losses, the FBI multiplied the average loss by just 20 percent of U.S. organizations because survey results are often skewed when reporting problems. Even with the significant reduction in the number of affected businesses, the total estimate was an enormous amount of money, far exceeding the $1 billion in losses each year to telecommunications fraud. Because of the relatively large sample size, Bruce Verduyn of the FBI said he believes the estimate is more accurate than other studies that have attempted to quantify losses to cybercrime.

2006-01-24 **spammer innovation ISP prediction Internet Service Providers**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,124408,00.asp 23

SPAMMERS WILL INNOVATE, MORPH, AND ADAPT IN 2006.

Representatives at several ISPs say they are gearing up for new challenges in 2006, when they expect spammers to grow more sinister. AOL spam fighters say that 2006 will be the year of the zombie networks. Zombie PCs are computers that have been infected by malicious code that allows spammers to use them to send e-mail. AOL also says that in 2006 there will be more "special-order" spam, in which phishers play off of your security concerns, especially the fear that your identity has already been stolen. Viruses and worms that take advantage of security holes in Microsoft's Outlook and Internet Explorer are a given for 2006, say experts. Richi Jennings, analyst at Ferris Research, says the recent Windows Metafile Format flaw is a perfect example. Also experts predict a new spam theme this year. In 2005 spam pitches ranged from cable descramblers to "free" iPods. But in 2006 spammers will be promoting things like investment opportunities and pumping penny stocks instead of pushing products. This is likely because it's extremely hard to differentiate a real stock tip from your broker as opposed to a fake one from a spammer, AOL says.

2006-02-15 **Homeland Security DHS online threat prediction 2006**

DHS IAIP Daily; http://www.informationweek.com/news/showArticle.jhtml?articleID=180202429 23

HOMELAND SECURITY SPELLS OUT COMING ONLINE THREATS.

The top Internet threats for 2006 will include more attacks through instant messages and cell phones, as well as a boost in identity hacks against online brokerage accounts, the Department of Homeland Security (DHS) and the National Cyber Security Alliance (NCSA) predicted Wednesday, February 15. By joining forces, DHS and NCSA hope to give consumers time to put additional protection in place on their PCs. Calling instant messaging networks "extremely vulnerable" and noting that cell phone malware is on the rise, the federal agency and the non-profit also predicted more "spear phishing," or targeted phishing attacks. Other threats to expect, include an increase in brokerage account break-ins.

2006-02-16 **DHS NCSA cyber threat predictions 2006 IM virus worms phishing cell-phone PDA viruses**

EDUPAGE; http://news.yahoo.com/s/nf/20060216/tc_nf/41677 23

PREDICTIONS OFFERED ON CYBERTHREATS

The Department of Homeland Security (DHS) and the National Cyber Security Alliance (NCSA) have issued a set of warnings about the kinds of cyberthreats the two organizations anticipate will be on the rise in 2006. Officials involved said the list of predictions is intended to raise awareness of computer threats in the hope that users will better protect themselves. "Arming consumers with a list of emerging threats is just the first step to educating consumers about the ever-evolving online security environment," said Ron Teixeira, executive director of the NCSA. The four areas identified in the list are instant-messaging viruses and worms, phishing, cell-phone and PDA viruses, and attacks on online brokerage accounts. Included with the warnings was acknowledgment that many computer crimes are not reported, complicating the task of tracking them. The agencies provided a number of strategies consumers can use to minimize their risks of being victimized.

2006-04-07 **estimate security risk Web services ignored Ajax Xquery**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0,10801,110321,00.html 23

RESEARCHER: SECURITY RISKS IN WEB SERVICES LARGELY IGNORED.

In their rush to implement Web services, some companies may be exposing themselves to new security risks that they may not fully understand, a security researcher said on Thursday, April 6. During a presentation at the CanSecWest/Core06 Conference, researcher Alex Stamos outlined how a number of Web services technologies, including AJAX and the XQuery query language, could be exploited by hackers to attack systems. Stamos described an attack whereby a user could enter malicious code into a Web form and then get that code to run by calling up the company's customer service number and tricking a representative into inadvertently executing it. Stamos also showed how Web services requests could be used to conduct denial-of-service attacks.

2006-04-20 **Linux desktop malware activity prediction estimate warning**

DHS IAIP Daily; 23
http://www.computerworld.com/softwaretopics/os/linux/story/0
,10801,110710,00.html

LINUX DESKTOP GROWTH COULD SPUR NEW MALWARE ACTIVITY.

Besides Linux's low cost, its relative immunity from viruses, spyware, worms and other malware has long been one of the open-source operating system's key attractions to potential desktop users. But experts warn that could change if Linux begins to win a mass audience on the desktop, bringing in millions of users who are less proficient technically and less security-conscious than today's typical Linux user. The number of viruses that has so far targeted Linux remains small compared with the thousands of viruses and billions of dollars in estimated damage and lost productivity caused by Windows viruses. Some experts argue that because Linux, with its Unix heritage, was created from the ground up as a multi-user system with built-in access controls and privileges, it is fundamentally more secure than Windows. The relatively small number of Linux users spread among different versions of Linux has long hindered the growth of new software by creating a lower reward/effort ratio. That has also driven away virus creators, said Ed Metcalf, product marketing manager at McAfee Inc. Regardless, some Linux users, while reluctant to install antivirus software on client computers, are starting to take more safety measures.

DGNYAZCAXS2QSNDBGCKH0CJUMEKJVN

MICROSOFT VISTA'S SECURITY WILL BE HIGHLY ANNOYING: YANKEE GROUP ANALYST.

Windows Vista's new security features will so annoy users that Microsoft won't meet its goal of 400 million copies in two years, Yankee Group's Andrew Jaquith said Monday, May Although Microsoft touts Vista as its most secure operating system ever, Jaquith sees it as somewhat of an albatross. "Anytime you put in a new security system, you're asking users to make changes," he said. But the shift in Vista, which Jaquith characterized as the first major security modifications since Windows NT, will require a huge alteration in how people interact with Windows. "In the Windows world, there are few limits on what a user can do," says Jaquith. That's part of the problem, says Microsoft, which has instituted a feature in Vista dubbed "User Account Control" (UAC) which takes a least-privilege approach to changes made to the OS and will require a user password for many common chores, including software installation.

VIRGINIA OFFICIAL DISCUSSES THE FIGHT AGAINST CYBERCRIME.

Gene Fishel, assistant attorney general in the state of Virginia's Attorney General's office, delivered the keynote address during Ziff Davis' Tuesday, May 9, "Enterprise Applications Virtual Tradeshow," where he provided some prime examples of computer crime, and what IT shops can do about it. Because two of the United States' Internet powerhouses are headquartered in Virginia -- AOL and MCI -- Fishel said that about 80 percent of the traffic on the Internet passes through Virginia at some point. This little-known fact is actually what provides the Virginia Attorney General's office with jurisdiction over many criminal computer crimes. "It allows us as a state to test computer crime laws before they go federal," said Fishel. "Spam is a good example of that." The Virginia Attorney General's office was the first in the nation to criminalize spam with its anti-spam law; there's now a federal law in place modeled on Virginia's efforts.

DHS IAIP Daily; 23
http://www.betanews.com/article/Report_Search_Engines_Spread
_Malware/1147449437

REPORT: SEARCH ENGINES SPREAD MALWARE.

Security software company, McAfee said Friday, May 12 that the epidemic of spyware and viruses could be linked to search engines. According to research from the company, even seemingly benign search terms could bring up sites loaded with nasty payloads. The study, "The Safety of Internet Search Engines," looked at the five major search engines -- Google, Yahoo, MSN, AOL, and Ask -- and covered a period from January through April. Researchers found that in every search engine, popular keywords returned sites that could be potentially dangerous.

2006-05-14 **US computer network attack cyber threat business dangerous Cyber Consequences Unit**

DHS IAIP Daily; http://www.networkingpipeline.com/showArticle.jhtml?articleID=187202905 23

CYBER THREATS TO U.S. BUSINESS GROW MORE DANGEROUS.

Attacks on U.S. computer networks could escalate from mere inconveniences to disasters that ruin companies or even kill people, according to the head of a cyber-security unit working with the U.S. government. Scott Borg, director of the Cyber Consequences Unit, or CCU, a Department of Homeland Security advisory group, said increasing intelligence "chatter" was pointing to possible criminal or terrorist schemes to destroy physical infrastructure such as power grids. The CCU is considering how to prevent attacks beyond ubiquitous e-mail hoaxes or computer viruses, with concerns rising about plots to cause power blackouts, tamper with pharmaceutical products or reprogram machinery to build dangerously defective products. Borg's CCU, a small independent unit funded by Homeland Security, spends its time trying to imagine how technology could be used to cripple the United States. It also holds cyber-security exercises for U.S. corporations and investigates reports of attacks on computer systems. A major crisis could be triggered, for instance, by shutting down critical computer systems for as little as four days.

NewsScan

IBM PUTS A METER ON SOFTWARE USE
IBM is introducing a new service called Linux Virtual Services that enables customers to run a wide variety of software applications on IBM mainframes located in company data centers, and pay rates based largely on the amount of computing power they use. This metered payment system marks a major shift from the more conventional outsourcing and Web hosting arrangements typical today. IBM executive James Corgel touted the new service, saying "we see a huge opportunity going forward. Our best estimate is that in five years, 10% to 15% of the $1 trillion IT market will be in the form of on-demand computing," with utility computing a significant part. Industry analysts remain a little more cautious about the prospects for metered computing. "We know customers are interested in doing this, but we don't know how many will," says one market researcher. Another added that "the pricing is still very complicated. It's not like electricity or even phone service." (Wall Street Journal 1 Jul 2002)

SPINTRONICS SHRINKS DATA STORAGE TO NANOSCALE
Researchers at the University at Buffalo in New York have developed a nickel-based, magnetic sensor, measuring only a few atoms in diameter, that could increase data storage capacity 1,000 times through the use of spintronics -- a field that takes advantage of electron spin as well as charge. Current technology used in data-reading sensors is based on giant magnetoresistance (GMR), where sensor resistance changes in a magnetic field. The new sensor developed at UB creates an effect called ballistic magnetoresistance (BMR), which uses an electrical conductor only a few atoms in size. Researchers say the technology could ultimately make it possible to store 50 or more DVDs on a hard drive the size of a credit card, or enable military personnel to carry supercomputers the size of a wristwatch into the field. RACE IS ON BETWEEN QUANTUM ENCRYPTION AND COMPUTING
Dozens of labs around the world are working to develop the first viable quantum computer, but scientists note that the tremendous boost in computing power that these tiny machines will deliver could lead to chaos, as the majority of encryption schemes now used on banking, e-commerce and government Web sites would become instantly obsolete. Conventional encryption codes rely on the premise that the amount of time it would take for a computer to factor a multi-bit key makes them an unattractive target. "Now we have the challenge of turning quantum computation into an engineering reality," says MIT professor Isaac Chuang. "If we could perform this calculation at much larger scales -- say the thousands of qubits required to factor very large numbers -- fundamental changes would be needed in cryptography implementations." Quantum encryption is already being deployed on a limited basis in some military and intelligence applications, and in response, companies like MagiQ Technologies are working to develop quantum encryption products for commercial release. "Between the intrinsic weaknesses of classic cryptography and the advanced research and development -- both commercial and academic -- that is being conducted around the globe, quantum encryption will be a widespread security tool sooner than you may think," says MagiQ Technologies spokesman Andy Hammond, who predicts his company will have a "commercially available solution" in 2003. NEW TECHNOLOGY REVS UP WIRELESS TRANSMISSIONS
The latest technology aimed at souping up wireless transmissions is Orthogonal Frequency Division Multiplexing (OFDM). Flarion Technologies, which is adapting OFDM for use on wireless networks, claims that in theory, at least, OFDM could enable a consumer to download an MP3 music album in eight minutes, compared with an hour and a half or more using today's technology. The OFDM technology faces an uphill battle to commercial adoption, however, because industry heavyweights have already invested billions of dollars in other standards such as GSM and CDMA. "It's not necessarily the best technology that wins," says a Yankee Group analyst. Meanwhile, OFDM will get its first trial run on a small section of Nextel's network, and Verizon, which tested Flarion gear in its labs last year, says it is monitoring the development as a possible way to improve the high-speed services it launched in January. Verizon said it was also keeping an eye on other OFDM developers, including BeamReach Networks, Malibu Networks and Broadstorm Telecom. (Reuters 14 Jul 2002)

INTEL AIMS FOR LARGE-SCALE PRODUCTION OF NANOSCALE CHIPS
Intel is taking the wraps off a new technology that it says will enable it to produce the world's smallest transistors in large-scale production. This latest innovation is the result of Intel's $12.5-billion spending spree over the last two years to improve manufacturing technologies and signals its intention to get a jump on rivals to be better positioned when the economy improves. The company's 90-nanometer production process entails a proprietary system for creating transistors whose key features are just 50 nanometers, or 1/2,000th of the width of a human hair. In addition, Intel is implementing a technology that effectively stretches the atoms apart in a silicon wafer to allow electrical current to flow faster, boosting performance, and is moving forward with plans to shift over to the 12-inch (300-milimeter) silicon wafer standard, up from the current eight inches. 2002-08-19 **laptop computers fuel cells portable digital divide international development**

NewsScan

THE EVER-EVOLVING LAPTOP
Laptop computers are making significant inroads in the computer market, with notebook growth pegged at 6% in the second quarter, despite a decline in overall sales. And while desktop machines are not likely to change much in style over the next few years, the laptop of the future will be smaller, lighter, and may even run on methane. PolyFuel, a spinoff of SRI International, is developing fuel cells that break down methane molecules into protons, electrons and carbon dioxide. While the protons pass through a special membrane, the electrons are maneuvered into a wire that powers the laptop. The replacement fuel cartridges initially will last two to three times longer than conventional batteries but eventually will last 10 times longer. Other companies are seeking to expand battery life by supplementing them with supercapacitators, which store energy at the chip level. "Supercapacitators hold more electricity than capacitators and transfer and recharge faster than batteries," says Anthony Kongats, CEO of supercapacitator startup Cap-XX. Batteries can be completely removed and the notebook will continue to run for about five minutes. Supercapacitator-enhanced notebooks could begin hitting the shelves in 2004 and notebooks powered by fuel cells could be available by late 2004 to 2005. Other likely laptop improvements include wireless capability that can switch effortlessly between WiFi and cellular networks, as well as low-power screens and new types of heat-dissipation techniques. INTEL BETS BIG ON WI-FI
Intel is investing $150 million in companies involved in developing Wi-Fi technology, in the chipmaker's latest strategy to stimulate markets that could boost demand for its chips. Intel plans next year to introduce a chip technology for mobile computing — code-named Banias — that offers built-in Wi-Fi capability. The top three areas targeted for investment by Intel will be: companies helping to expand the number of Wi-Fi-equipped locations or otherwise helping to improve wireless infrastructure; companies working to solve some fundamental problems associated with the technology; and companies that improve the basic capabilities of the technology. The company plans to allocate the money for wireless investments from an existing $500 million communications fund. (Wall Street Journal 22 Oct 2002)

MOBILE PC SALES Another note on Intel's interest in Wi-Fi:
Melissa McVicker, the company's Asia Pacific regional manager, says that sales of mobile PCs are set to grow at a compounded rate of 15% to more than 50 million units by 2006 (compared to 30 million in 2002), and nine out of ten of them will make use of Wi-Fi or other wireless network technology. She says that "countries like Japan and Korea have about 50% of their PC purchases in mobile PCs, and there are a few others in Asia that are moving up quickly." Global demand for mobile PCs such as laptops and notebooks will soon outpace demand for desktop systems. (Reuters/San Jose Mercury News 22 Oct 2002)

MOTION-CAPTURE TECHNOLOGY REWRITES THE SCRIPT
Robert Zemeckis's new film project, "The Polar Express," is pushing the envelope in film-making technology, creating a live-action movie without filming any true "live" action. All of the scenes will be shot with a digital camera in front of a blank screen, with the sets to be filled in later by computers. The actors will be wired with motion-capture sensors that will store each movement digitally, to be used later as a guide for the animators who will create the actual film footage. Unlike other digitally animated movies like "Shrek," "The Polar Express" animators are striving to create images that actually look like the actors who will "star" in the film. The film will also combine characters based on real and virtual people — for instance, the child version of Tom Hanks' character will be backward engineered using photos of Hanks as a youth and 3D digital representations of his current facial and muscle structure. "This is an ambitious, exciting project for us. We've seen the early tests, and it's like nothing I've ever seen," says Martin Shafer, chairman and CEO of Castle Rock Entertainment, which is making the movie. (Los Angeles Times 2 Dec 2002)

NewsScan

BROADBAND: FAST BUT PRICEY — APPARENTLY TOO PRICEY
Although 70% of U.S. households now have the technical option of subscribing to broadband services, only15% actually do, because many people are intimidated by the high cost of broadband: typically $40-50 a month, whether it is acquired through cable company or phone company. The problem is an upscale corollary of basic theorem of the digital divide, and is illustrated by the fact that whereas 28% of households with income above $100K a year have broadband access, a mere 4% of families with household incomes under $35K a year have such access. The industry is trying to reconcile itself to the basic facts of economic life; analyst Daryl Schoolar of the InStat/MDR research firm says: "We're working with a model of broadband adoption that is long and steady, rather than a big revolutionary pop." Which means that most network users will still be using dial-up connections a long, long time from now. Professor Andrew Odlyhzko of the University of Minnesota says all this is not too surprising: "There is hardly anything more ludicrous than the fax machine, but it is still around." FORGETFUL BOOMERS SPAWN MARKET FOR MEMORY AIDS
A stream of new products is hitting the shelves, aimed at solving one of life's daily annoyances: locating everyday objects such as keys or glasses that always seem to go missing just when you're in a hurry to leave. The products range from a FINDIT keychain that beeps after the user claps three times to the Sharper Image's "Now You Can Find It!" — a collection of plastic tags that can be attached to potentially elusive items, and then beep when users hit a button on the central device (of course, for it to work, users must make sure not to misplace the central device). The device and tags communicate with each other via radio frequency waves, and require that the user be within several meters of the hidden object's location. A handful of companies are also marketing GPS-enabled "kid finder" watches and pagers, and plans are underway to put homing devices on everything from luggage to pacifiers. Most ambitious of all, perhaps is the DIPO device, made by a French company of the same name, that not only finds an object but notifies the owner if it is about to be left behind. The central device — the size of a small cell phone — checks every few seconds to ensure that all tagged objects are within a certain radius — say, five meters. If it notices that the tag on the Palm Pilot, for instance, has moved outside the radius, it will beep or vibrate to remind the user to take it along. DIPO started out as the brainchild of the company's absent-minded CEO, Bruno Enea, who says, "I kept losing my credit card. I always forgot my passport. I realized I had to do something about this problem." (Wall Street Journal 15 Oct 2002)

RADIO FREQUENCY IDENTIFICATION (RFID) TAGS READY TO GO
A number of new consumer products from companies such as Gillette, Procter & Gamble, and Prada will come with embedded RFID (radio frequency identification) "tags" (actually, tiny computer chips), that will contain scannable information such as the product's serial number. The goal is to dramatically improve inventory processes, and other big companies poised to join the RFID movement are Johnson & Johnson, Coca-Cola, Pepsi, Home Depot and Target. Within a year or two RFID tags will be included in all kinds of products, including Michelin and Goodyear tires (to tell where a tire was made). Privacy groups are expressing fears that thieves will buy or make chip scanners that can crack security controls to scan shoppers' bags and know what they bought. (USA Today 28 Jan 2003)

NewsScan

IBM ZEROES IN ON AUTONOMIC COMPUTING IBM has established a new Autonomic Computing group, which will focus on R&D and product development in self-diagnosing computers that can take steps to fix themselves. The goal is to free up users from routine maintenance and repair tasks so that they can concentrate on other things. "The end game is to deliver a computing environment that is online all the time as a utility," says Nick Donofrio, senior VP of technology and manufacturing at IBM. "It sounds far-fetched right now, only because it's a lot of hard work." But ultimately, says Donofrio, "for consumers it means incredibly available data and a much richer (online) environment." IBM has been working on autonomic computing for more than a year, and has already incorporated the technology in several products, such as its newest DB2 Version 8 database software. The Autonomic Computing group hopes to expand use of the technology in IBM's products and create open standards for an autonomic computing architecture that would apply across computing platforms and manufacturers. (CNet News.com 20 Oct 2002)
http://news.com.com/2100-1001-962623.html?tag=fd_top_1

AUTONOMIC COMPUTING
IBM says it has developed software that allows networked computer systems to automatically adjust to unexpected demand surges by turning on additional computers on the network. This kind of capability is known as autonomic computing, which IBM also calls "on-demand" computing. As an example of on-demand computing, IBM says that if an airline is hit by a flood of customer responses to a special fare sale, it would take the system only a minute to note the changing load requirements and add another computer to handle the new demand. E-MAIL TRAFFIC PATTERNS SIGNAL WHO'S IN CHARGE
A new technique developed at Hewlett-Packard's research labs in Palo Alto can quickly identify online communities and the key people in them. "If the CIA or another intelligence agency has a lot of intercepted e-mail from people suspected of being part of a criminal network, they could use the technique to figure out who the leaders of the network might be," says researcher Joshua Tyler. Tyler and his colleagues analyzed communications patterns using the lab's log of nearly 200,000 internal e-mails sent by 485 employees over a couple of months. They plotted lines between people who had exchanged at least 30 e-mails with each other, and found the grid included 1,110 links between 367 people. The researchers then used a computer algorithm that looks for critical links that form bridges between separate groups, which revealed 66 communities within the lab. To identify the leader in each community, they plotted the same network of e-mails using a standard algorithm that tries to arrange the connections in the least tangled way. This step identified the managers, who tended to cluster in the middle. "This approach puts in the middle the people who have the most diverse range of contacts in the organization — and these tend to be the leaders," says Tyler, who adds that the technique could be used to identify the ringleaders in criminal or terrorist gangs. NIPC/DHS

April 17, Government Computer News — Data management system gets new analysis tool.

An automated data analysis tool will power a new FBI counterterrorism database, letting bureau analysts easily pore through more than 1 billion documents. The tools, ClearTags and ClearResearch, will draw patterns from terrorism-related intelligence collected from several sources into a centralized data mart that's part of the agency's modernized Trilogy network. The applications are intended to ease information sharing between the FBI and organizations at the CIA and Department of Homeland Security. The tools will also give intelligence officers a quicker method for scanning various databases at the Bureau of Alcohol, Tobacco and Firearms, Defense Department, Drug Enforcement Agency, State Department, and state and local agencies.

MICROSOFT TARGETS DIGITAL NEWSPAPERS
Microsoft is developing software geared toward delivering digital newspapers, said chairman Bill Gates at the Newspaper Association of America's annual convention Tuesday. The new software will enable newspapers also to provide services like video messaging and bill-payment to readers across a variety of devices. Publishers who continue to view their Web sites as an add-on feature of their print operations are ignoring the next generation of readers, said Gates. "We see the online newspaper as one where it takes all the strengths [of current newspapers] and then adds in new capabilities." Readers not only will be able to read about an upcoming concert, but also will have the ability to hear audio clips and purchase tickets, added Gregg Brown of Microsoft's e-periodicals team. 3RD-GENERATION PRIVACY PROBLEMS
In Australia, that country's Royal Life Saving Society (a lifesaving and lifeguarding organization) intends to ban 3rd-generation image-capable cell phones from swimming pool changing rooms: "We, as operators and as providers of guidelines to the industry in this particular case, we just want to make sure that people are aware. We make every reasonable step to make sure that the privacy of individuals and, as I say, the private parts of individuals are not exposed where they don't want them to be exposed," says a spokesman for the Society. The potential for mischief with the new technology is apparent from the remarks of a student who reported: "One of my mates who's got one actually, as a joke, said that you could stand on the elevators and take photos up girls' skirts, which I thought was a bit much. He was only joking, he wasn't being serious, but, sure enough, the potential is there." Australia's privacy commissioner, Malcolm Crompton, says: "We need the social debate to make sure we use these technologies the way we want them to be used, we need to demand that technologies are developed the right way, we need laws in place, as appropriate, to back up those social norms." 2003-09-10 **internet control VoIP voice phone PC household equipment 802.11 wireless**

NewsScan

VINT CERF ON THE FUTURE OF VOIP
Vint Cerf, senior VP of Internet Architecture and Technology for MCI, talks about the next-generation phone services based on VoIP (voice over Internet protocol) that are now being rolled out: "You can show up at a hotel and register your normal telephone number — as long as you can plug in your PC to an Internet service. What that means is your visibility in the communications world is now portable. Wherever you are, your communications are (there also). You can control where things go. If someone's trying to send a fax, you can vector that to your e-mail as an attachment or vector it to a different fax machine. There's an incredible amount of interaction over what had been completely separate services." Looking to the future, Cerf says the most important next-generation service is the ability to use the Internet as a household control system. "If you're like me, you have consumer equipment with remotes around the house. I can't figure out which one's which. And once I get the right one, the batteries are dead. Why not Internet-enable everything? Then it's possible to just have a single radio-based device, maybe 802.11-enabled, that lets you interact with all those appliances. You don't even have to be home. Obviously there are some security issues involved. You need strong authentication to make sure some 15-year-old next door won't reprogram your house." 2003-10-02 **security risk overlook telephone VoIP voice over IP**

NewsScan

OVERLOOKED SECURITY RISK: THE TELEPHONE
As corporate phone systems become increasingly complex and computerized, criminals are finding new ways to infiltrate company networks, and the problem becomes magnified as businesses turn to IP-based phone systems. "This is the first time that a computer virus can stop your telephones from working," says PricewaterhouseCoopers senior manager Mark Lobel. "There is a whole new class of attacks that can occur. The essence of the problem is that everyone is looking at this as a new technology for voice — the way we're sending voice communications is absolutely new. But the data is still riding on the same infrastructure that was pounded by recent problems like SoBig." To counteract the threats, phone system administrators need to be much more vigilant about password management and may even consider locking out certain country codes. "In fact, you should probably consider the risk associated with VoIP systems to be as high as the threats to your organization's most sensitive data. If someone in your IT department gets paged when your firewall goes down, they should also be paged when 40 new voicemail boxes mysteriously appear on your IP system," says Lobel. Gone in a Flash

by John Bumgarner, MA, CISSP, GCIH, IAM, SSCP
& M. E. Kabay, PhD, CISSP

In the movie "The Recruit," (Touchstone Pictures, 2003) an agent for the Central Intelligence Agency (played by Bridget Moynahan) downloads sensitive information onto a tiny USB flash drive. She then smuggles the drive out in the false bottom of a travel mug. Could this security breach (technically described as "data leakage") happen in your organization?

Yep, it probably could, because most organizations do not control such devices entering the building or how they are used within the network. These drives pose a serious threat to security. With capacities currently ranging up to 2 GB (and increasing steadily), these little devices can bypass all traditional security mechanisms such as firewalls and intrusion detection systems. Unless administrators and users have configured their antivirus applications to scan every file at the time of file-opening, it's even easy to infect the network using such drives.

Disgruntled employees can move huge amounts of proprietary data to a flash drive in seconds before they are fired. Corporate spies can use these devices to steal competitive information such as entire customer lists, sets of blueprints, and development versions of new software. Attackers no longer have to lug laptops loaded with hacking tools into your buildings. USB drives can store password crackers, port scanners, key-stroke loggers, and remote-access Trojans. An attacker can even use a USB drive to boot a system into Linux or other operating system and then crack the local administrator password by bypassing the usual operating system and accessing files directly.

On the positive side, USB flash drives are a welcome addition to a security tester's tool kit. As a legitimate penetration tester, one of us (Bumgarner) carries a limited security tool set on one and still has room to upload testing data. For rigorous (and authorized) tests of perimeter security, he has even camouflaged the device to look like a car remote and has successfully gotten through several security checkpoints where the officers were looking for a computer. So far, he has never been asked what the device was by any physical security guard.

This threat is increasing in seriousness. USB Flash drives are replacing traditional floppy drives. Many computers vendors now ship desktop computers without floppy drives, but provide users with a USB flash drive. Several vendors have enabled USB flash drive support on their motherboard, which allows booting to these devices. A quick check on the Internet shows prices dropping rapidly; Kabay was recently given a free 128 MB flash drive as a registration gift at a security conference. The 2 GB drive mentioned above can be bought for $849 as this article is being written; 1GB for $239; 512 MB for $179; 256 MB for $79; and 128 MB for $39.

In the next part of this two-part series, John and I will look at preventive measures for safe use of these devices.

* * *

In the last column, security expert John Bumgarner and I looked at the potential for data leakage introduced through the use of small portable USB flash drives.

To counter the threats presented by USB Flash drives organizations need to act now. Organizations need to establish a policy which outlines acceptable use of these devices within their enterprises.

* Organizations should provide awareness training to their employees to point out the security risk posed by these USB Flash drives.

* The policy should require prior approval for the right to use such a device on the corporate network.

* Encrypting sensitive data on these highly portable drives should be mandatory because they are so easy to lose.

* The policy should also require that the devices contain a plaintext file with a contact name, address, phone number, e-mail address and acquisition number to aid an honest person in returning a found device to its owner. On the other hand, such identification on unencrypted drives will give a dishonest person information that increases the value of the lost information – a bit like labeling a key ring with one's name and address.

* Physical security personnel should be trained to identify these devices when conducting security inspections of inbound and outbound equipment and briefcases.

Unfortunately, the last measure is doomed to failure in the face of any concerted effort to deceive the guards because the devices can easily be secreted in purses or pockets, kept on a string around the neck, or otherwise concealed in places where security guards are unlikely to look (unless security is so high that strip-searches are allowed). That doesn't mean that the guards shouldn't be trained, just that one should be clear on the limitations of the mechanisms that ordinary organizations are likely to be able to put into place.

Administrators for high security systems may have to disable USB ports altogether. However, if such ports are necessary for normal functioning (as is increasingly true), perhaps administrators will have to put physical protection on those ports to prevent unauthorized disconnection of connected devices and unauthorized connection of flash drives.

Because without appropriate security, these days your control over stored data may be gone in a flash.

* * *

John Bumgarner < mailto:john.bumgarner@cyberwatchinc.com > is President of Cyber Watch, Inc. < http://www.cyberwatchinc.com >, a security consulting firm based in Charlotte, NC. John has a rich background in national security and international intelligence and security work.

NewsScan

COPY-MANAGED CD BOOSTS SALES FIGURES
BMG Entertainment is cautiously optimistic about its latest experiment in discouraging music copying. The new Anthony Hamilton album, "Comin' From Where I'm From," hit the shelves in late September on a CD with built-in "copy management" technology. Buyers were limited to making three copies of the CD, and BMG says so far, the Hamilton album has experienced a slower-than-average sales drop-off — 23% vs. the typical 40-60% after the first week. "I know my science well enough to know that correlation does not mean causation," says Jordan Katz, senior VP of sales at BMG's Arista label. "I would not go out on a limb and say this was the only reason [sales] were down only 23%. However, I would say it was a contributing factor." The CD also allows users to e-mail songs to friends, who can download and play them on their computers for 10 days before they expire. A lack of buyer backlash against the technology has prompted Katz to put the copy management software on at least two more upcoming releases. (Washington Post 30 Oct 2003)

2004-02-09 **Google hacking hobbyist technology uncover sensitive documents information Internet**

NewsScan

GOOGLE-HACKING TAKES OFF

Google is increasingly becoming a hacking tool for techno-hobbyists who seek out sensitive documents using Google's powerful search capabilities. "There's a whole subculture that's doing this," says Chris O'Ferrell, chief technology officer of security consultancy Netsec, who notes that Google is the search tool of choice for these folks because of its effectiveness. "The reason Google's good is that they give you more information and they give you more tools to search." Companies, organizations and government agencies could block Google from accessing documents by setting up a digital gatekeeper in the form of a robots.txt file that dictates which pages are accessible to Google, but many don't bother, leaving such sensitive information as medical records, bank account numbers, students' grades and the docking locations of 804 U.S. Navy ships, submarines and destroyers open to viewing. Search strings with "xls," or "cc" or "ssn" often bring up spread sheets, credit card and social security numbers linked to a customer list. "It's the easiest point-and-click hacking — it's fun, it's new, quirky and yet you can achieve powerful results," says security consultant Edward Skoudis. "This concept of using a search engine for hacking has been around for awhile, but it's taken off in the last few months." Companies are urged to be more careful about what they put on the Web in the first place, because thanks to caching technology, "Once it is placed online, it's very hard to get the digital horse back in the electronic barn," says Marc Rotenberg, executive director of the Electronic Privacy Information Center. (Washington Post 9 Feb 2004)

2004-02-10 **VPN virtual private network Georgia state deployment**

DHS IAIP Daily; http://www.fcw.com/geb/articles/2004/0209/web−georgia−02 −10− 04.asp

February 10, Federal Computer Week — Georgia to build state VPN.

The Georgia Technology Authority this week released a request for proposals for a new statewide virtual private network (VPN). The new Multiprotocol Label Switching (MPLS) VPN would replace the existing frame relay network used by state, county and municipal government organizations. That includes schools, libraries and law enforcement agencies. It is expected to be cost at least $10 million). The MPLS VPN will allow administrators to ration and prioritize bandwidth for mission-critical applications. New security and privacy requirements - including federal mandates and common business needs - are also taking agencies beyond the existing network's capabilities. Initially, the network will provide data and video, including videoconferencing for distance learning and telemedicine. The architecture must, however, support the inclusion of voice over IP a year after the initial deployment. One of the biggest advantages to the new network will be the support for mobile workers, allowing users to connect via Digital Subscriber Line, cable modem or dial-up. In addition to standard telework environments, the mobile access will be key for public safety, family and children services site visits, and staff working in state parks.

2004-03-01 **cell phone security telephone network attack RSA conference**

NIPC/DHS

February 27, Knight Ridder Newswire — Cell phone security.

Computer-security experts say cell phones could be the next carriers for computer-network attacks. Computer-security experts in San Francisco this week at the annual RSA Conference swapped stories about attacks and discussed the possible next big threat. Experts generally agree that 2004 will bring more worms and viruses that can spread among computers with increasing speed. But as computer users grow more savvy about protecting their machines from attack, hackers could turn their focus to the growing number of cell phones and other handheld devices. With more memory and faster processing power than before, these devices are mini-computers, connecting to the Internet and running many of the same programs as desktop machines. But they don't have anywhere near the same levels of protection from cyberattacks. "They are in growing numbers susceptible to the same types of attacks that we've seen on traditional wired machines," said Carey Nachenberg, chief architect with the research labs of the antivirus company Symantec. "The reason why we probably haven't seen any real worms for these platforms is they are not nearly as pervasive as the other platforms. That will change."

NEW SENSOR MONITORS HARD DRIVE HEALTH

Researchers at Carnegie Mellon University have developed a new heat-sensitive sensor that can alert computer users to imminent hard drive failure. "Essentially what we are trying to do is save the life of the computer hard drive. Hard drives get hot and the sensor is designed to pick up the slightest temperature variation," says CMU scientist Michael Bigrigg. The researchers predict that by using the dime-sized sensor they may be able to extend the lifespan of a computer hard drive beyond its 3.1 year average by tracking how much daily heat a hard drive endures. 2004-04-30 **bar codes people tracking surveillance school Long Island**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/25816−1.html

April 30, Government Computer News — Long Island school tests bar codes for emergencies.

An elementary school on Long Island is trying out bar codes as a way to keep track of students during emergency evacuations. Bretton Woods Elementary School in Hauppauge, NY, held a drill on the morning of April 23. Overseen by Hauppauge Schools security director Edward Spear, the faculty evacuated about 800 children onto 16 school buses, which took them to a nearby high school. Stickers with bar codes were placed on the backs of the children's shirts as they left classrooms. When the students stepped off the buses, their bar codes were read by four people holding bar code readers and transmitted to a notebook computer for comparison against an attendance list. Each sticker held a Portable Data File 417 two-dimensional bar code. Although most of the tags were readable without problems, a few proved difficult to scan because they were wrinkled during transit, Spear said. The tags could be placed on identification cards or book bags as an alternative to placing them on clothing.

2004-05-17 **remote control transportation trains reliance on technology**

DHS IAIP Daily; http://jacksonville.com/tu−online/stories/051504/bus_1561500 2.shtml

May 17, The Times-Union (Jacksonville, FL) — Remote-control locomotives safer, federal report shows.

Switching railcars using remote-control locomotives instead of engineers results in improved safety, according to a preliminary report issued Thursday, May 13, by the Federal Railroad Administration. Such locomotives are increasingly popular with railroads, including CSX Transportation and Florida East Coast Railway, but their use is criticized by the main engineers union, which says they result in increased accidents and injuries. The injury rate of railroad workers in rail yards across the country dropped 57.1 percent with remote-control locomotives, according to the study, which reviewed 2003 data from May 1 through November 30. When the locomotives are equipped with remote control, the engineer's job is eliminated, leaving the train to be run by a two-person team including a conductor equipped with a belt pack. Having fewer employees reduces railroads' labor costs. The Brotherhood of Locomotive Engineers and Trainmen fired back at the positive numbers with a statement saying they were derived solely from data provided by the railroads. It referred to a March AFL-CIO resolution calling for an end to the use of remote-control locomotives. The resolution said that without proper safeguards, it "places all rail workers at risk of injury and death."

2004-07-23 **China national technology standards DVD Centrino Windows**

NewsScan

CHINA GOES IT ALONE ON HIGH-TECH STANDARDS

DVD? China's trying to do it one better -- with a technology called EVD. CDMA? The digital cell phone standard is so 2003, the Chinese say. Give TD-SCDMA a try instead. Intel's Centrino and Microsoft's Windows? If you're doing business with Beijing, better bone up on WAPI and Red Flag Linux, too. These days, China's dominant message is this: We'll embrace the world -- but on our terms. And nowhere is this more evident than in the realm of high technology, where behind the acronyms is a battle of standards that could have global repercussions. Pushed by their government, Chinese firms are shunning technological protocols invented abroad and developing their own.
They want Chinese-made video discs to run on Chinese-invented players, and they want Chinese consumers linking up with China-developed mobile gadgets. (The Age 23 Jul 2004) Rec'd from John Lamp.

NewsScan

A PC FOR THE MASSES

Carnegie Mellon University professor Raj Reddy is working with researchers at the Indian Institute of Science, the Indian Institute of Information Technology and the University of California Berkeley to develop a low-cost wireless PC designed for users in developing countries, particularly those with large populations who cannot read. The $250 PCtvt is controlled by a simple TV remote control and can function as a television, DVD player, telephone and videophone. Reddy sees his project not only as a philanthropic effort, but one that may even produce profits. "I kept asking myself, 'what would the device have to do for someone on the other side of the digital divide to be desirable?'" The result is a simple device that offers a seductive combination of connectivity and
entertainment. "Entertainment is the killer app, and that will smuggle something that is a lot more sophisticated into the home," says Tom Kalil, special assistant to the chancellor for science and technology at Berkeley. (New York Times 16 Aug 2004)

2004-11-29 **surveillance software SAME see anywhere map anywhere Vincent Tao Canadian inventor**

DHS IAIP Daily; http://www.reuters.com/audi/newsArticle.jhtml?type=technology News&storyID=6946893

November 29, Reuters — Canadian inventor lets everyone be an armchair spy.

New Internet-based technology could soon turn regular computer users into armchair spies, a Canadian inventor said on Monday, November 29. Vincent Tao, an engineer at Toronto's York University said he has invented a mapping and surveillance tool called SAME (see anywhere, map anywhere), that produces images so sharp that geographic co-ordinates typed into a Website can reveal the make of a car parked on the street -- the resolution is two feet. Tao said the potential applications are broad, including defense, emergency response and environmental monitoring. He added that the technology could become widely available as early as next year.

2005-01-04 **blogs Pew Internet and American Life Project RSS aggregators compile news sources told election**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4145191.stm

2004 A GREAT YEAR FOR BLOGS

According to a new survey by the Pew Internet and American Life Project, readership of blogs jumped significantly in 2004, as did the use of RSS aggregators. The survey indicated that blog readership rose 58 percent last year, with 32 million Americans now reading blogs. Eight million Americans have created a blog, according to the survey. RSS aggregators, which compile information from blogs and other online news sources based on user preferences, also saw significant increases, with six million Americans now using those tools. The increased use of such immediate tools as blogs and RSS in 2004 is attributed in part to close following of the U.S. presidential election. Those who have created blogs were found--on average--to be young, male, college-educated, and Web-savvy. Although many blog readers fall into similar demographic categories, much of the rise last year was among women and minorities. Despite the higher profile of blogs and increased use, more than 60 percent of those surveyed said they had not heard of blogs.

2005-01-24 **machine learning cognitive science artificial intelligence pattern recognition intrusion detection logic programming**

DHS IAIP Daily; http://www.newscientist.com/article.ns?id=dn6914

MACHINE LEARNS GAMES "LIKE A HUMAN;" COULD POTENTIALLY DETECT INTRUDERS.

A computer that learns to play a 'scissors, paper, stone' by observing and mimicking human players could lead to machines that automatically learn how to spot an intruder or perform vital maintenance work, say UK researchers. CogVis, developed by scientists at the University of Leeds in Yorkshire, UK, teaches itself how to play the children's game by searching for patterns in video and audio of human players and then building its own "hypotheses" about the game's rules. In contrast to older artificial intelligence (AI) programs that mimic human behavior using hard-coded rules, CogVis takes a more human approach, learning through observation and mimicry. Chris Needham, a member of the CogVis team, says the system's visual processor analyzes the action by separating periods of movement and inactivity and then extracting features based on color and texture. Combining this with audio input, the system develops hypotheses about the game's rules using an approach known as inductive logic programming.

2005-03-30 **grid computing network security threats large scale deployment confidentiality**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1780849,00.asp

GRID COMPUTING CAN ALLOW SECURITY THREATS

Security experts on Wednesday, March 30, recommended that IT administrators clearly identify and understand the security risks associated with large-scale grid computing deployments. During Ziff Davis Media's Enterprise Solutions Virtual Tradeshow, the pros and cons of grid computing and safe data storage took center stage, with panelists stressing the importance of using best practices to protect the confidentiality of information passed over corporate grid systems. Lenny Mansell, senior security consultant at Triad Information Security Services LLC, warned that greater sharing of information and resources across traditional trust boundaries will result in increased risks that must be addressed as a matter of urgency. Mansell recommends that businesses deploying grid systems identify critical assets and the threats to those assets. Mark Teter, chief technical officer of Advanced Systems Group LLC, said the highly automated manner in which resources are allocated on a grid can be used by a malicious attacker to steal sensitive corporate data. Grid computing is the concept of using computers in the way that utilities use power grids to tap the unused capacity of a vast array of linked systems. Users can then share computing power, databases and services online.

2005-06-07 **quantum computer cryptography security guarantee wireless link Massachusetts Harvard Boston University DARPA**

DHS IAIP Daily; http://www.newscientist.com/article.ns?id=dn7484

QUANTUM CRYPTOGRAPHY NETWORK GETS WIRELESS LINK

The world's first quantum encryption computer network has been expanded to include a wireless link that uses quantum communications codes. The wireless connection was added to the Defense Advanced Research Projects Agency (DARPA) Quantum Network, a quantum fiber-optic network buried beneath the ground in Massachusetts. The network was built by BBN Technologies with funding from DARPA. It now links ten different sites, including BBN's offices, Harvard University and Boston University. Most modern cryptography rests upon the difficulty of solving very complex mathematical problems used to encrypt data. This makes it theoretically vulnerable to being hacked using dramatic mathematical or computing breakthroughs. By contrast, quantum cryptography near guarantees communications security, using quirks of quantum physics to thwart eavesdropping attempts. Quantum cryptography guarantees security by encoding information as polarized photons which can be sent down a fiber optic cable or through the air. Intercepting these photons disturbs their quantum state, alerting both sides to an eavesdropper's presence.

2005-08-01 **car computer systems MP3 Bluetooth protocol risk viruses**

DHS IAIP Daily;
http://www.cnn.com/2005/TECH/08/01/viruses.cars.reut/index.html

CAR COMPUTER SYSTEMS AT RISK TO VIRUSES

Car industry officials and analysts say hackers' growing interest in writing viruses for wireless devices puts auto computer systems at risk of infection. As carmakers adjust on-board computers to allow consumers to transfer information with MP3 players and mobile phones, they also make their vehicles vulnerable to mobile viruses that jump between devices via the Bluetooth technology that connects them. The worst that could happen is that the computer's control of engine performance and emissions, navigation and entertainment systems cease to function. That would probably mean an annoying trip to the repair shop or having to reboot the system. Companies so far have seen no reports of viruses in auto systems, and studies have shown it is not easy to transplant a virus into a car, but carmakers say they are taking the risk seriously. The first mobile phone virus, Cabir, has spread to over 20 countries, ranging from the United States to Japan and from Finland to South Africa, using only Bluetooth. Bluetooth is used in car electronics interfaces for monitoring and service. Carmakers say they use the most sophisticated protection for safety equipment such as airbags or motor controls, whereas infotainment systems so far have less stringent safeguards.

EDUPAGE; http://news.zdnet.com/2100-1009_22-5865318.html

SOUND OF KEYBOARD CLICKS REVEALS WHAT IS TYPED

Researchers at the University of California at Berkeley have demonstrated that an audio recording of someone typing on a computer keyboard can reveal with surprising accuracy exactly what they have typed. Using commercially available recording equipment, the researchers captured audio of typing and analyzed the sounds using an algorithm they developed. Because keys make different sounds, the system is able to make educated guesses about what key was pressed in what order. The application then applies some linguistic logic, including spelling and grammar checks, to refine the results. After three rounds of revisions, the application was able to identify 96 percent of the individual characters typed and 88 percent of the words. The application was effective even with background noise, such as music or cell phones ringing. Doug Tygar, UC Berkeley professor of computer science and information management and a principal investigator of the study, said the project should raise concerns about the security risks of such a technology. "If we were able to figure this out," he said, "it's likely that people with less honorable intentions can--or have--as well." ZDNet, 14 September 2005

2005-10-10 **nanotechnology research NSF funding ethical privacy questions security biomedicine**

EDUPAGE; http://chronicle.com/daily/2005/10/2005101005n.htm

NSF FUNDS NANOTECHNOLOGY RESEARCH

Researchers at several universities have received grants from the National Science Foundation (NSF) to study the social implications of nanotechnology. Until now, most funds for nanotechnology projects have supported efforts to develop the technology itself rather than to study its potential effects. Over the next five years, Arizona State University at Tempe and the University of California at Santa Barbara will receive $6.2 million and $5 million, respectively, to study the possible societal side effects of manipulating matter at the atomic level to create new substances and extremely small devices. The University of South Carolina and Harvard University will receive smaller grants to support existing projects. Among the speculative uses of nanotechnology is an idea to create tiny sensors that could reside within a human body and monitor its health. Such sensors would presumably spawn a host of ethical and privacy questions. Moreover, the prospect of creating new types of compounds at the atomic level raises concern about possible risks to the environment. Research at Arizona will focus on security, privacy, and biomedicine; at Santa Barbara, research will address social perceptions of the risk inherent in nanotechnology. MIT DEBUTS $100 LAPTOP

At the World Summit on the Information Society in Tunisia, Nicholas Negroponte, director of MIT's Media Lab, will show an early version of a $100 laptop that he announced in January. Negroponte has said that such a device would bring the fruits of technology to millions of schoolchildren in developing nations, spanning the digital divide and spurring economic development. According to those involved with the project, a number of countries have expressed interest, including Brazil, China, Egypt, Nigeria, Thailand, and South Africa, though development remains before orders can be placed. In addition, the governor of Massachusetts has called on his state to provide the new laptops to every middle and high school student. Critics of the program argue that people in developing nations often need more basic supplies, such as food and clean water, and some also note that the educational value of laptops for every student has not been proven. The devices use the Linux operating system and flash memory; they do not include cameras or DVD-ROM drives, as originally planned. They run on C batteries that can be recharged using a hand crank attached to the device. Chronicle of Higher Education, 16 November 2005

DHS IAIP Daily; http://www.networkworld.com/news/2005/121405−att−security.html

AT&T LAUNCHES 24-HOUR SECURITY NEWS SERVICE

AT&T Wednesday, December 14, turned on a 24-hour security news service that streams to customers of the carrier's Internet Protect service. The always-on Webcast includes regular programming that is interrupted by security alerts that AT&T deems important enough to let customers know about right away. "We're building a security geek channel," said AT&T CSO Ed Amoroso during his keynote address at Interop New York, during which he announced the service. Programming includes lectures on technologies, interviews with corporate CIOs as well as twice-daily news updates. The alerts will call attention to worms and viruses and suggest ways to deal with them, Amoroso says. These supplement the existing alerts that AT&T would send along as part of Internet Connect. Amoroso acknowledged that most threats come from inside corporate networks, and he characterized badly written software as the biggest threat to network security, but he said AT&T's service could help deal with threats coming from outside.

2005-12-14 **MIT $100 laptop production Quanta Taiwan manufacturer One Laptop per Child OLPC Nicholas Negroponte**

EDUPAGE; http://hardware.silicon.com/desktops/0,39024645,39155040,00.htm

QUANTA TO PRODUCE MIT'S $100 LAPTOPS

Computer maker Quanta has been chosen to manufacture the $100 laptops that are the brainchild of MIT's Nicholas Negroponte and supported by the One Laptop per Child (OLPC) organization. Based in Taiwan, Quanta is the world's largest maker of laptops, building the devices for companies including Dell and HP. Some believe that supplying the developing world with inexpensive computer technology will be a boon for educational and economic development of those nations, and the notion of an inexpensive laptop is part of that vision. Previous attempts to build and deploy similar technology have failed, and detractors argue that the $100 laptop program doesn't stand much of a chance. Nevertheless, recruiting a major hardware manufacturer signals the level of support that the project enjoys. Of the announcement, Negroponte said, "Any previous doubt that a very-low-cost laptop could be made for education in the developing world has just gone away." Silicon.com, 14 December 2005

DHS IAIP Daily; http://www.computerworld.com/developmenttopics/development/story/0,10801,108320,00.html 23

MACHINE-LEARNING TECHNIQUES TO CREATE SELF-IMPROVING SOFTWARE ARE HITTING THE MAINSTREAM.

Attempts to create self-improving software date to the 1960s. But "machine learning," as it's often called, has remained mostly the province of academic researchers, with only a few niche applications in the commercial world, such as speech recognition and credit card fraud detection. Now, researchers say, better algorithms, more powerful computers and a few clever tricks will move it further into the mainstream. Computer scientist Tom Mitchell, director of the Center for Automated Learning and Discovery at Carnegie Mellon University, says machine learning is useful for the kinds of tasks that humans do easily, but that they have trouble explaining explicitly in software rules. In machine-learning applications, software is "trained" on test cases devised and labeled by humans, scored so it knows what it got right and wrong, and then sent out to solve real-world cases. Mitchell is testing the concept of having two classes of learning algorithms in essence train each other, so that together they can do better than either would alone. Mitchell's experiments have shown that such "co-training" can reduce errors by more than a factor of two. The breakthrough, he says, is software that learns from training cases labeled not by humans, but by other software.

May 10, Canadian Press — Bank of America plans to hire hundreds in India in outsourcing expansion.

Bank of America Corp. may hire 1,500 people at its subsidiary after it opens in southern India this month, 50 percent more than previously disclosed, and the bank has reserved land that would allow for even more expansion. Late last year, the bank said it eventually expected to have 1,000 people at its Continuum Solutions subsidiary in Hyderabad, but wouldn't give specifics about work intended for the center. Executives with the Charlotte, NC-based financial giant said that Continuum employees will initially work with corporate accounts drawn from London operations and later from the bank's offices worldwide. In the future, Indian workers are likely to work with consumer information. The Indian startup is Bank of America's latest step in moving work abroad, part of a cost-cutting trend called offshoring or foreign outsourcing.

DHS IAIP Daily;
http://www.infoworld.com/article/05/03/07/HNterroristsindia_ 1.html

TERRORISTS TARGET INDIA'S OUTSOURCING INDUSTRY.

India's software and services outsourcing industry is a likely target for a terrorist group operating in the country, local police warned on Sunday, March 6. But Indian outsourcing and software companies said they are prepared to cope with the threat. Documents seized from three members of the Lashkar-e-Toiba (LeT) terrorist group killed in an encounter with the police on Saturday, March 5, revealed that they planned to carry out suicide attacks on software companies in Bangalore, Karnal Singh, joint commissioner of police in Delhi, told reporters. LeT is demanding independence for the Indian state of Jammu and Kashmir. "The terrorists planned to hit these companies in an effort to hinder the economic development of the country," Singh said. IBM, Intel, Texas Instruments, Accenture, Wipro, and Infosys Technologies are among those with operations in Bangalore. Most of the technology companies in the city have already set up disaster recovery plans and special disaster recovery sites that could be used in the event of a terrorist attack, according to Kiran Karnik, president of the National Association of Software and Service Companies in Delhi.

1997-01-16 **Internet regulation availability**

Reuters

Experts argue that the Internet is unstoppable and that governments will try, but fail, to control its use. Neil Winton, writing for the Reuter news agency, reported in January on his interviews with leading thinkers about government control over cyberspace. Some of the key findings:
* "Governments which seek to restrain the freedom of speech and tax the vast electronic commerce spawned by the Internet will almost certainly be wasting their time, experts say."
* "Dr Bob Glass of the U.S. technology leader Sun Microsystems Inc said any attempt by governments to curtail any of this would be a waste of time. Not even the most powerful computers will be able to effectively patrol the world's telephone lines. Individual computer experts will always be one step ahead."
* Attempts to force Internet users to pass through proxy servers to limit their access to the Net fail when users use the public switched telephone network to access uncontrolled ISPs.
* Even if governments attempt to monitor all telephonic communications through their land lines, low-orbit satellite telephony will defeat their interference.

Category 32 *Censorship, indecency laws, 1st amendment (law)*

1997-01-17 **censorship hate**

Reuters

The German government filed charges against Angela Marquardt, the 25-year-old, blue-and-purple-haired deputy leader of the communist Party of Democratic Socialism, for linking from her Web page to a banned issue magazine called _Radikal_. The issue of _Radikal_ was banned because it included detailed instructions on how to sabotage railway lines. According to the public prosecutor, "It has nothing to do with censorship. Criminally relevant materials are subject to classification by the district attorney or criminal prosecutors." In early June, the court hearing opened and adjourned after an hour so the magistrates could arrange for expert testimony to explain the Net and the Web when the case reconvened toward the end of June. On June 30, the court ruled that maintaining a hyperlink to objectionable material is not tantamount to publication of that material.

Category 32 *Censorship, indecency laws, 1st amendment (law)*

1997-01-19 **censorship NY**

EDUPAGE

New York's recently-passed online-decency law barring computer-based distribution of indecent materials harmful to minors was challenged by the ACLU and 14 other organizations. EDUPAGE summarized their case: >The ACLU argues that New York's law "does not define the relevant 'community' for purposes of determining what is 'patently offensive' in the global medium of cyberspace," nor does it distinguish between what might be harmful to young children and vs. what might be harmful to teenagers. Finally, the lawsuit says the statute violates the Commerce Clause because it attempts to regulate communications that take place outside New York, poses an unreasonable burden on interstate and foreign commerce, and subjects interstate use of the Internet to inconsistent regulations. (BNA Daily Report for Executives 15 Jan 97 A13)<

1999-09-01 **government censorship law COPA Child Online Protection Act**

Wired via PointCast; EDUPAGE

The ACLU and other lobbyists for freedom of speech on the Net won an injunction against the Child Online Protection Act (COPA) passed in the closing days of 1998. US District Judge Lowell A. Reed Jr. ruled on 1 Feb 1999 that the law was too broad and must not be enforced. He also wrote in his memorandum that he considered the Act an unconstitutional violation of First Amendment rights of free speech: "Despite the Court's personal regret that this preliminary injunction will delay once again the careful protection of our children, I without hesitation acknowledge the duty imposed on the Court and the great good such duty serves. Indeed, perhaps we do the minors of this country harm if First Amendment protections, which they will with age inherit fully, are chipped away in the name of their protection." In September, COPA opponents including publishers, Internet
companies, and trade associations filed an amicus brief in the Third Circuit Court of Appeals supporting the view that COPA was unconstitutional.

1999-10-27 **pornography censorship filtering academic universities state employees sexual content college ACLU**

Washington Post

Half a dozen die-hard civil libertarians challenged the State of Virginia once again over its ban on state employees' accessing sexually-oriented materials from the Internet on computers in their places of work. The six professors, supported by the ACLU, argued that this law (ruled unconstitutional in early 1998 but reinstated in early 1999) violates the First Amendment. The State argues that because there is an exception for research approved by a professor's dean, the law is permissible.

1999-10-29 **Internet Web broadcasting authority government regulation control censorship pornography harm filtering**

Australian Broadcasting Authority
http://www.aba.gov.au/about/public_relations/newrel_99/101nr99.htm

The Deputy Chairman of the Australian Broadcasting Authority delivered a stirring call to government action on Internet regulation in the 1999 Spry Memorial Lecture in Vancouver, Canada. He called for national governments to exercise strict controls on Internet just as they control the airwaves for broadcasting. Oddly, he described the Net as "a means of mass communication of a particularly intrusive nature." He warned, "They [i.e., broadcast media and the Internet] enter our homes and workplaces, [and] exercise important influences on public life and national cultures. Their content has been and remains. . . of considerable concern to the public who wish to see national cultures preserved and enriched and to see young people protected from inappropriate material." He added later in his speech, "Whereas in the United States the US Constitution First Amendment allows the free speech lobby to dominate discussion about self-regulation, other countries with healthy democratic systems and vibrant processes of open expression are able to seek a more appropriate balance between the right to free expression and the right of communities to nurture national and local cultures and to protect children from harmful content."

1999-11-30 **censorship FBI police intimidation fraud lies**

http://www.freedomforum.org/speech/1999/11/29closing.asp

In mid-November, the president of an ISP in Michigan, BECamation, removed a satirical video from a user's Web site after FBI agents allegedly intimidated him by threatening legal action if he failed to act. In fact, the agents had no legal basis whatsoever for their demands. The video by New York artist Mike Zieper pretended to show an FBI training film discussing possible violence in Times Square because of putative Y2K problems. The FBI denied that any intimidation was involved.

2000-02-23 **filtering software censorship Internet library public filter shield**

AP

Voters in the Republican primary in Michigan on 2000-02-23 voted 4,379 to 3,626 against forcing the local public library to install censorware on their free public-access Internet terminals. The battle began when a child typed in "chocolate chip cookies" and the search returned pornographic pictures. Advocates of the filtering software were outraged that pornography was so easily accessible in a public institution; opponents said that filters are only 85% effective whereas the current strict policies of supervision ensure 99.9% compliance with the rules precluding visits to inappropriate sites. Library board members said they would rather shut down the library than install filters. Proponents of filtering worked closely with evangelical Christian organizations such as the Mississippi-based American Family Association, which contributed $35,000 to the campaign.

2000-02-23 **content filtering law library censorship**

NewsScan, San Jose Mercury News

The city of Holland, a conservative 30,000-population town in the western part of Michigan, has defeated (with about a 55% margin) a proposal that would require the local public library to install filtering software on library computers so that children would be unable to access pornographic, violent, and hate sites on the Web. Apparently Holland is the first city to put this issue on the ballot, though it's been debated in many other places. One supporter of the defeated proposal said: "I just think that children really don't know what's for their own good. It may not be a really big problem at the library right now or in the future, but why take a chance?" An opponent of software filtering explained its defeat by saying: "I think free speech brought out a number of voters." (AP/San Jose Mercury News 23 Feb 2000)

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000911/t000085464.html

A . . . study released [in September] by the General Accounting Office has exposed widespread deficiencies in computer security in government agencies ranging from the Department of Interior to the U.S. Treasury. The report comes nine months after the President Clinton called on federal agencies to beef up security in his "National Plan for Information System Protection." That plan proposed that Congress boost federal spending for computer security and research by $280 million to $2.3 billion in 2001, but agencies say they need the money now. Government computer managers point to the tight labor market for computer security experts and say it's difficult to retain good personnel. The GAO report found that some agencies have failed to take even the most rudimentary steps to increase security, such as encrypting password files and limiting physical access to sensitive computers. In addition, agencies have been less than diligent about blocking access for independent contractors and former employees after they've left the government. In one agency, 7,500 of 30,000 users were not deleted after 160 days of inactivity. "The federal government, outside the defense area, is worse than the private industry because good computer security is about regular maintenance and housekeeping — and that's not one of the government's strong points," says Stewart Baker, a Washington, D.C. technology lawyer. SUPREME COURT TO HEAR CASE ON COMPUTER-GENERATED CHILD PORN
The U.S. Supreme Court has agreed to hear a case that challenges the 1996 federal "Child Pornography Prevention Act," which makes engaging in child pornography a crime even when the images depicting minors engaging in sexually explicit acts are generated entirely by computer, without the participation of real children. A lower court overturned the law, ruling that it "criminalizes the use of fictional images that involve no human being" and are "entirely the product of the mind." However, both Congress and the U.S. Justice Department have taken the position that the law protects real children by reining in a pornography industry that desensitizes viewers and thus puts children at risk of exploitation. (New York Times 23 Jan 2001)
http://partners.nytimes.com/2001/01/23/national/23SCOT.html

COURT TO REVIEW "VIRTUAL PORNOGRAPHY" CASE [29 Oct 2001]
Tomorrow the U.S. Supreme Court will begin reviewing arguments in a case about "virtual" pornography, and will be required to answer the question whether child pornography is child pornography even when the "minors" shown engaging in sex are not real children but rather computer-generated images that only appear to be children. The Free Speech Coalition, backed by the American Civil Liberties Union, considers the case a "no-brainer," and FSC lawyer Louis Sirkin insists that "when "you don't have a child, you don't have a crime. It'd be like charging someone for murder by turning on a computer and making something that looked like murder." The government, however, maintains that the law restricting virtual child pornography is needed to protect real children from pedophiles and others seeking to harm them. Robert Flores, an attorney in favor the law, says: "If the Supreme Court does not uphold the statute, it will negatively impact on all child pornography investigations. It's just not the case that the First Amendment protects all fantasy." (San Jose Mercury News 29 Oct 2001)
http://www.siliconvalley.com/docs/news/svfront/pornlw102901.htm

COURT HEARS ARGUMENTS ON "VIRTUAL" CHILD PORNOGRAPHY [31 Oct 2001]
The U.S. Supreme Court heard arguments yesterday to decide whether "virtual" child pornography could be outlawed because it "conveys the impression" that it depicts real children engaged in sex acts, even though the images of sex acts are created entirely through computer video graphics. Government lawyers took the position that virtual child pornography was as effective as actual child pornographer in putting children at danger from predators. Lawyers defending computer-generated pornographer as an exercise of Constitution-protected free speech said the Child Pornography Prevention Act would have "radical and tragic consequences," in that "visual messages of adolescent sexuality will be barred regardless of their artistic or scientific merit." Justice Scalia asked: "What great works of art would be taken away from us if we couldn't see minors copulating?" When the attorney offered the movie "Lolita" as an example, Scalia said, "With all due respect, this is not the Mona Lisa or the Venus de Milo." (New York Times 31 Oct 2001)

LIBRARIANS SUE OVER NET CENSORSHIP
The American Library Association says it plans to sue the U.S. over the legality of the Children's Internet Protection Act, which was signed into law December 21, 2000. The ALA says the law, which requires schools and libraries to install content filters on computers as a condition for U.S. government funding, infringes on First Amendment free-speech rights. Specifically, the ALA is alleging that the new filtering rules would serve to widen the so-called digital divide, which separates those with the means to access the Internet through their own household PCs from those who must rely on public-access machines. Even with the filter options turned on, says the ALA, there is no filtering software that "differentiates constitutionally protected speech from illegal speech on the Internet." That argument was successfully upheld in 1998 in a similar court case in Loudon County, Virginia. "The filters blocked so much constitutionally protected material that had absolutely nothing to do with pornography or anything like that," says Larry Ottinger, senior staff attorney at People for the American Way, the civil rights group that fought the Loudon restrictions. Among the sites blocked in that instance were the Yale University graduate school of biology, a Quaker Web site, Have an Affair Catering, and a beanie babies Web site. CHALLENGE TO LAW RESTRICTING KIDS' ACCESS TO PORNOGRAPHY [21 May 2001]
The U.S. Supreme Court has agreed to hear a challenge to the constitutionality of a 1998 law passed by Congress imposing criminal penalties on operators of Web sites that expose children to commercially offered "indecent" material. The law does not cover e-mail or chat rooms. The issue is whether the attempt to shield children ends up abridging constitutional rights to freedom of speech. A supporter of the law says: "We're talking about material that would be harmful to minors. That is a test we have applied for years in the real world. If you walk into a bookstore, the pornography is wrapped, or behind a blinder or will be in a place where it is difficult for young people to reach it." An American Civil Liberties Union official who opposes the law counters that it "would send adults to prison for commercial speech that is unquestionably protected for them." APPEALS PANEL SEEKS ANSWERS ON COMPUTER CODE AS FREE SPEECH [11 May 2001]
A three-judge appeals panel has asked both sides in the case testing the constitutionality of the 1998 Digital Millennium Copyright Law to answer a list of 11 questions focusing on whether computer code can qualify as free speech. The case pits the major Hollywood studios against Eric Corley, the publisher of online magazine 2600. A federal judge previously issued an injunction blocking Corley from distributing a computer code that can break the security lock on a DVD. Corley's appeal argues that the injunction violates his right to free speech. "I've never seen this happen before," says one of Corley's attorneys. "What's clear is that neither Judge Kaplan's decision nor the briefs nor the oral arguments have given them the answer to the questions they think are most important." The questions suggest that the judges are looking beyond Corley's case to how the ruling might apply more generally. One question raised is whether software code is more like a list of instructions -- traditionally protected by free speech -- or a machine that simply happens to be built with speech, which would not fall under the scope of the First Amendment. (New York Times 11 May 2001)
http://www.nytimes.com/2001/05/11/technology/11CODE.html

COURT RULES AGAINST USE OF PROGRAM THAT UNLOCKS DVD ENCRYPTION [29 Nov 2001]
The Motion Picture Association of American (MPAA) has prevailed in the U.S. Court of Appeals against a computer hacker publication's claim to have the right to publish a program that used reverse-engineering to unlock the copyright protection system of DVDs. At issue was the constitutionality of the Digital Millennium Copyright Act (DMCA) of 1998, which was challenged by programmer Eric Corley, who publishes the hacker magazine 2600. Corley and his supporters, which include the Washington-based civil liberties group called the Electronic Frontier Foundation, believe that the DMCA gives too much power to copyright-holders and violates First Amendment rights of researchers and consumers. LEGAL CHALLENGE TO CHILDREN'S INTERNET PROTECTION ACT
A coalition of libraries, Web sites and other interested parties has begun offerings testimony in court hearings on the constitutionality of the Children's Internet Protection Act of 2000, which requires public libraries that accept federal financing or technology discounts to install software filters to protect children from adult material on the Internet. In the words of Senator John McCain (R-Ariz.), the law passed by Congress is intended to allow "local communities to decide what technology they want to use, and what to filter out, so that our children's minds aren't polluted." Coalition members include the American Library Association, the American Civil Liberties Union, and one Republican lawmaker who had originally supported the legislation but changed his mind about it when he discovered that his own campaign site was blocked out by one popular filtering program. (New York Times 25 Mar 2002)
http://partners.nytimes.com/2002/03/25/national/25LIBR.html

PROTECTING CHILDREN OR ABRIDGING FREE SPEECH?
A second week of testimony has begun [April 2, 2003] in Philadelphia in a federal district court that is hearing a case to decide a constitutional challenge to the Children's Internet Protection Act (CIPA), signed by President Clinton in 2000 and intended to protect children from violence and pornography without abridging the free-speech rights of adults. Shown a ring binder filled with pornographic images and asked by a government attorney, "Is it your testimony that I have the right to look at these Web pages?" librarian Candace Morgan said "Yes, it is," and added later: "We have sex manuals with similar pictures to this one." Another witness, Chris Lemmon, said he found pornographic sites involving elderly women "disturbing." The plaintiffs in the case are arguing, among other things, that CIPA relies on technology that can not distinguish between protected and unprotected speech. The government's position is that libraries that don't want to use software filters to protect children can simply refuse to accept federal subsidies since CIPA applies only to institutions that receive government funding.

http://www.washingtonpost.com/wp-dyn/articles/A47070-2002Apr1.html

COURT OVERTURNS LAW REQUIRING SOFTWARE FILTERS
A three-judge federal panel in Philadelphia struck down a provision of the Children's Internet Protection Act (CIPA) requiring public libraries to install software on library terminals to filter out pornographic material. The law applied to libraries that received federal technology funding, and supporters of the law had maintained that Congress has the right to decide what it does or doesn't want to fund. But the Court ruled that the legislation was fatally flawed because there currently exists no software that can with complete precision filter only the targeted material -- and nothing else by accident. The case is likely to be appealed to the U.S. Supreme court. (San Jose Mercury-News 1 Jun 2002)

LIBRARY NET PORN CASE WILL BE APPEALED REGARDLESS OF OUTCOME
A decision from the three-judge federal appeals court in Philadelphia hearing the dispute over the constitutionality of the Children's Internet Protection Act (CIPA) will be handed down next month [May 2002], but is certain to be appealed to the Supreme Court, no matter how the judges decide. One of the judges observed, "We're stuck right in the heart of the First Amendment when we're talking about libraries." Another judge, concerned that decisions on what constitutes pornography were being left to "nameless and faceless" people in software filtering firms, asked "What right does the government have to require this kind of filtering system?" (CIPA requires libraries that accept federal funding to use such systems to protect children from pornography and violence.) Critics charge that the software filters are blunt instruments that cannot reliably discern the difference between pornography and constitutionally protected information. An ACLU lawyer calls the law "a sham," since "everybody knows you can't comply with its terms." A Justice Department lawyer sees the issues differently: "There is no constitutional right to immediate, anonymous access to speech, for free, in a public library." And then adds: "Even if you assume that libraries have a right to provide unfettered access to the Internet, they don't have a right to do so with a federal subsidy. The crux of this matter is whether or not Congress has the power to decide how to use its money." (Reuters/USA Today 4 Apr 2002)

FTC SCRUTINIZES 'MATURE' VIDEO GAMES
The Federal Trade Commission has requested information on sales of mature-themed video games to minors, as a precursor to an expected June report on media violence. In December, the FTC issued a report that offered four suggestions for the movie, music and games businesses: establish industry standards on advertising in places where the primary audience is under 17; develop better labeling of ratings within ads; improve self-regulation with regard to retailer compliance; and implement industry sanctions for non-compliance with sales and advertising sanctions. Since the video game rating system was instituted in 1994, more than 7,000 games have been rated, with some 500 earning an "M" (mature) rating, meaning they are not intended to be played by children under 17. COURT SAYS THAT TO HAVE CHILD PORNOGRAPHY YOU NEED A CHILD
The U.S. Supreme Court has ruled that portions of the Child Pornography Prevention Act of 1996 are unconstitutional because they infringe on First Amendment free-speech rights. (In U.S. law, images have traditionally been considered a form of "speech.") The 1996 law banned "virtual" pornography that uses computer-manipulated images rather than real children to portray children engaged in sex acts. Justice Anthony M. Kennedy wrote in the majority opinion that the government "has shown no more than a remote connection between speech that might encourage thoughts or impulses and any resulting child abuse. The mere tendency of speech to encourage unlawful acts is not a sufficient reason for banning it." (New York Times 17 Apr 2002)

CHILD ONLINE PROTECTION ACT SURVIVES REVIEW (JUST BARELY)
The Child Online Protection Act, passed by Congress in 1998 and intended to impose prison sentences for posting material "harmful to minors" on a Web site to which minors could have access, survived a lower court ruling that had declared it unconstitutional. The lower court's decision hinged on its rejection of a clause in the Act defining "objectionable" material as material that did not meet "contemporary community standards," a definition which the lower court said would give veto power over the Internet to "the most puritan of communities." The appellate court thought that point settled the matter, but the Supreme Court sent the case back to Federal District Court with instructions to think through all of the relevant issues before making a decision. Court-watchers expect that the Act will eventually be declared unconstitutional by the Supreme Court, when the lower court is finished reconsidering it. (New York Times 14 May 2002)

SCOTUS: ASHCROFT v. AMER. CIVIL LIBERTIES UNION (05/13/02 - No. 00-1293)
The Child Online Protection Act's (COPA) use of "community standards" to identify what material "is harmful to minors" does not by itself render the COPA statute substantially overbroad under the First Amendment.

OF DOOM, GLOOM, FUN AND GAMES
Video games and their designers are all grown up, ready to take on darker, mature themes. The change hasn't slowed their popularity with fans, but it has given lawmakers pause. . . Earlier this month, a federal judge in St. Louis upheld a county law that criminalized the sale of "Mature"-rated video games to anyone under 17, despite the lack of similar laws that would punish the sale of R-rated movies or CDs with parental warnings to those same kids. "I think the root of the problem is that most observers do not yet appreciate the fact that video games are artistic achievements every bit as worthy and creative as a film, a song or a painting," said Douglas Lowenstein, IDSA's president.

UNDER FBI PRESSURE, SITE REMOVES PEARL MURDER VIDEO
Saying it was under pressure from the FBI, a Web site that specializes in gruesome images has removed video footage recorded during Wall Street Journal reporter Daniel Pearl's murder. The operator of the Ogrish.com site and the president of its Web hosting company told Newsbytes the FBI ordered the video taken down under threat of a lawsuit, but a spokeswoman for the FBI said the bureau merely made a "courtesy request" on behalf of Pearl's family.

SOLVING KID PORN'S 'REAL' PROBLEM
In the aftermath of a U.S. Supreme Court ruling that computer-generated images of minors engaged in sexual acts are not illegal and are in fact protected by the First Amendment, some prosecutors and police investigators have found themselves at a loss for how to proceed in child porn cases. More suspects are claiming that the seemingly illicit pictures and videos found on their hard drives are ersatz, police say. And an Illinois man who had already pleaded guilty to possessing 2,600 images of kiddie porn was freed from jail when a judge ruled that the state's law was unconstitutional because it failed to distinguish between real and fake porn. http://www.wired.com/news/business/0,1367,52945,00.html

THE FILTER WARS
Arguing that "intellectual development is one of the fundamental human rights and it's also a right that people under 18 have," programmer Bennett Haselton has made a reputation as a foe of software filters designed to shield children from pornography and violence. He's created an organization called Peacefire.org, which offers free downloads and details methods for getting around filtering software. Haselton says, "This is something that practically nobody else is working on, and only a couple of people in the world actually know as much about the blocking software issue." One of Haselton's many critics, Marc Kanter of Solid Oak Software, which makes the popular CYBERsitter filtering program, says of him: "He's being totally irresponsible. When he started Peacefire, he was a kid himself. Basically he was enticing minors into his beliefs and activities, which was to undermine parents' rights. As an adult now, he should know better than that." (AP/USA Today 17 Jun 2002)

CONGRESS GETS READY TO CONTINUE FIGHT AGAINST KID PORN
If at first you don't succeed, try, try again, and the House Judiciary Committee is trying once again to write legislation that will not only ban virtual child pornography but also pass Supreme Court muster. The new, more narrowly drafted bill would outlaw child pornography involving any prepubescent child, including computer images of such a child if the images were indistinguishable from actual photos. New York Democrat Jerry Nadler argued against the bill, on the grounds that it would criminalize protected speech, but fellow Democrat Adam Schiff, a Californian, insisted: "If we only go after pornography using real children we will effectively preclude any real prosecution of child pornography." SUPREME COURT TO REVIEW INTERNET FILTER LAW
The U.S. Supreme Court has agreed to consider the constitutionality of the Children's Internet Protection Act, which requires that libraries receiving federal funding for Internet access must install software filters to prevent children from being exposed to pornography and excessive violence. A coalition of libraries, library users and Web sites successfully challenged the law at the appellate level, where the court ruled that filters were "blunt instruments" that would suppress not only pornography and violence but constitutionally protected speech presented on legitimate sites. It is now being argued that the lower court was wrong when it viewed the case as a first amendment case, and should instead have treated it as one involving the government's broad discretion to decide whether material is sufficiently worthwhile for the government to required to support it with public funds. The government argues that to assert otherwise is to argue that public libraries engage in prior restraints when they fail to provide pornographic magazines or XXX videos to their patrons." (New York Times 13 Nov 2002)

SOFTWARE FILTERING CASE GOES TO SUPREME COURT
Tomorrow the U.S. Supreme Court will hear arguments in a case challenging the constitutionality of the Children's Internet Protection Act of 2001, which requires any library that receives federal money to block access to online pornography and obscenity. In support of the Act, U.S. Solicitor General Ted Olson says that libraries are being asked merely to use the same kind of discretion they've always used in managing their print collections: "Public libraries have broad discretion to decide what material to add to their collections. The use of filtering software to block access to online pornography falls well within the permissible limits of that discretion. (USA Today 3 Mar 2003)

2003-04-16 **free speech censorship hacking information techniques lecture**

NIPC/DHS

April 14, CNET News.com — Court blocks security conference talk.

Washington D.C.-based education software company Blackboard convinced a Georgia state court to block a pair of students from presenting information at a security and hackers' conference on how to break into and modify a university electronic transactions systems. Blackboard argues that the restraining order blocked the publication of information gained illegally, which would have harmed the company's commercial interests and those of its clients. But organizers of the Interz0ne conference in Atlanta contend that Georgia Institute of Technology's Billy Hoffman and University of Alabama's Virgil Griffith's free speech rights were abridged. The information set to be presented was gleaned after one of the students had physically broken into a network and switching device on his campus and subsequently figured out a way to mimic Blackboard's technology, the company told the judge. Because that alleged act would be illegal under the federal and state laws, publication of the resulting information should be blocked, it argued. A hearing on a permanent injunction against publication or presentation of the work will be held in Georgia state court Wednesday.l

SUPREMES TO REVIEW CHILD ONLINE PROTECTION ACT

The Supreme Court will do a new review of the free-speech ramifications of Congress' latest version of the 1998 Child Online Protection ACT (COPA). The Justice Department's position is that "there is a compelling government interest in protecting minors from the effects of material that is not obscene by adult standards but that is nonetheless harmful to minors... Minors today can search the Web as easily as they can change television channels. Thus, in the seclusion of their homes or those of friends, unsupervised minors can, with the click of a mouse, visit one pornographic site after another." The American Civil Liberties Union (ACLU) says the law violates the Constitution's First Amendment guarantee of free speech: "COPA's bludgeon suppresses an enormous amount of speech protected for adults and is unnecessary and ill-tailored to address the government's interest in protecting children from sexually explicit content." SENATORS SEEK TO PUT CHILDREN'S DATA OFF LIMITS

U.S. Senators Ron Wyden (D-Ore.) and Ted Stevens (R-Alaska) have introduced the Children's Listbroker Privacy Act, which would limit the sale of personal data on children under 16 without their parents' consent. The bill is part of a larger package of legislation aimed at helping parents fight back against a deluge of commercial messages aimed at their children. Currently companies spend about $12 billion annually on marketing to children, often using lists from brokers like the Student Marketing Group that reveal the child's name, address, age, ethnicity, religious affiliation, sports activities, hobbies and family income level. "Many large companies see childhood as a commercial free-fire zone. But some things shouldn't be for sale, and our children's personal information is one of them," says Gary Ruskin, executive director of Commercial Alert. (Wired.com 4 Mar 2004)

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A63872−2005Mar 24.html

FEDERAL ELECTION COMMISSION OFFICIALS WEIGH LIMITED INTERNET ACTIVITY RULES.

Federal Election Commission (FEC) officials on Thursday, March 24, took their first steps in extending campaign finance controls to political activity on the Internet, asking for public input on limited regulations for the freewheeling medium. Commissioner Ellen Weintraub, who took the lead on drafting proposals with vice chairman Michael Toner, described the steps as "restrained." The commission emphasized a hands-off approach to bloggers, or authors of Web logs, among the loudest and unruliest voices online. The draft guidelines suggest applying limits that exist in other media to certain political advertising on the Web and political spam e-mail. The commission said it was exploring Internet regulation reluctantly - ordered to do so by a court - and with the lightest touch possible, exempting everything except certain kinds of paid political advertising. But the Center for Individual Freedom, a nonprofit advocacy group, said any regulation is too much. FEC Website: http://www.fec.gov/

EDUPAGE; http://www.internetnews.com/bus-news/article.php/3582016 23

MICROSOFT OUTLINES BLOG CENSORSHIP POLICY

Microsoft has announced details of a new policy on censoring the content of blogs maintained by its customers. According to the new policy, blog content will only be blocked to comply with local laws and with the terms of use of MSN Spaces, the company's blog application. In order to have content blocked, a local government must demonstrate that it violates local laws. Moreover, the content will only be blocked in areas where those laws apply; users in other parts of the world will still be able to see the content. In cases where content is blocked, users will be notified and told that the reason is a government restriction. Microsoft's announcement follows criticism of its decision to comply with requests of Chinese authorities to remove the blog content of an individual the government considered a threat. The announcement also comes on the heels of Google's plan to filter the content of its search results to comply with local laws in China. Both companies said their decisions are based on the belief that it is better to have a presence in countries like China, even if that requires limiting access to certain online content.

Financial Times http://news.ft.com/news/industries/infotechnology

[In August,] France, where it is illegal to exhibit anything that incites racism, . . . [took] legal action against Yahoo! Inc. because its sites have been used for the sale of Nazi medallions, swastikas, etc. Yahoo has withdrawn customer postings of such items on its French site, fr.yahoo.com, but says it is not technically feasible to keep French users off of sites in other countries. In the U.S., extremist ideas are protected by the First Amendment of the Constitution, which guarantees the right of freedom of speech. (AP/San Jose Mercury News 11 Aug 2000)

[In November, a] Paris court . . . ordered Yahoo! to block French users from accessing Nazi memorabilia on its U.S. sites, citing French anti-racist laws. The ruling . . .[gave] Yahoo! three months to implement some type of system that would accomplish its objective and . . . [imposed] a FFr100,000 (US$13,000) per day fine if it . . . [failed] to comply. Yahoo! had agreed to block the sale of such items on its French language portal following an earlier ruling, but had argued that the ban could not be extended to the U.S. site, both on U.S. constitutional grounds and because it was technically infeasible. But three court-appointed international experts concluded that a system to check the nationality of users, combined with password checks, would identify 90% of French citizens seeking to buy Nazi memorabilia. Industry groups are "deeply concerned" over the implications of the ruling: "Despite the obnoxious nature of the [Nazi] material, this ruling sets a very bad precedent for the future development of services on the Internet," says the head of the e-business unit at the Confederation of British Industry. (Financial Times 21 Nov 2000)

Internet experts Vint Cerf and Ben Laurie . . . [criticized] the decision of a French court to order Yahoo's U.S. portal site to prevent its customers from seeing auctions of Nazi memorabilia. Cerf, who is often described as the "Father of the Internet," . . . [said] that "if every jurisdiction in the world insisted on some form of filtering for its particular geographic territory, the World Wide Web would stop functioning." (BBC News 29 Nov 2000)

2001-05-31 **virtual child pornography violent video games legislation proposal**

RISKS 21 45

Marcus de Geus reported on proposals to ban virtual child pornography in the Netherlands:

"The Dutch Minister of Justice, Korthals, has announced measures that will make it illegal to produce or possess child pornography created by means of electronic image manipulation. The proposed legislation appears to be aimed at preventing the production and possession of artificially rendered images that could be interpreted as representations of children involved in sexual acts. Current Dutch law states that the production or possession of pornography is a criminal offence if it involves the physical (ab)use of (real) persons under a certain age. [Based on a report in an e-mail message from Radio Nederland Wereldomroep.] "

The correspondent noted that on the same basis of reasoning (child porn is bad therefore virtual child porn should be banned), it would be possible to ban violent video games (wholesale slaughter is bad therefore virtual wholesale slaughter is bad).

[MK adds: PLEASE don't shower me with abuse for _reporting_ this line of argument.]

LAND OF THE CENSOR: CHINA
A study by Harvard Law School researchers finds that China is the country with the world's most oppressive censorship of what its citizens can view on the Internet. Chinese authorities block access to 19,000 sites, and also delete individual links or Web pages of which they do not approve. Most of the disapproved sites are political in nature. When it comes to blocking pornography, China (at least for now) cedes the first-place prize to Saudi Arabia: China blocks fewer than 15% of sexually explicit Web sites compared to Saudi Arabia's blocking of 86%. (New York Times 4 Dec 2002)
http://partners.nytimes.com/2002/12/04/international/asia/04CHIN.html

CENSORSHIP IN CHINA: WHAT ARE THEY THINKING?
We've previously reported that Chinese officials have the most stringent Internet censorship program in the world, but haven't remarked on the broad scope of it. It blocks out not only pro-democracy content but also a bit of just about everything else. Jonathan Zittrain and Benjamin Edelman, two Harvard Law School researchers who have been studying international Internet filtering, say that in addition to Taiwanese and Tibetan pro-democracy sites the Chinese also block health sites, U.S. university sites, and sites devoted to comic books, science fiction, etc. Human rights worker Greg Walton comments: "The study's an interesting insight into the Chinese censor's head. If I was a psychologist and I had China's censor on the couch, I'd ask, 'Why are you repressing these things?'" (Wired News 4 Dec 2002)

THE AUSTRALIAN APPROACH TO SPAM
Clive Hamilton, the head of an Australian public think tank, thinks that Australia's method of Internet regulation, managed by the Australian Broadcasting Authority, is essentially useless. Referring to a survey finding that 84% of boys ages 16-17 are exposed to pornography on the Internet, Hamilton complained: "The Internet industry has convinced the government that there is little that can be done to prevent pornography coming in from overseas. But this is false. Mandatory filtering by Internet service providers (ISPs) would severely restrict the availability of pornography." Labor information technology spokeswoman Kate Luncy disagrees: "The cost this would place on ISPs would be prohibitive and Internet speeds would be significantly reduced. The end result for consumers would be a slower, more expensive Internet." (The Age 4 Mar 2003)

CHINA SHUTS DOWN 8,600 INTERNET CAFÉS IN 3 MONTHS

Chinese authorities say they have shut down more than 8,600 unlicensed Internet cafés in the last three months in their latest campaign to bring the communication channel under tighter political control. Ostensibly, the crackdown is to protect teenagers from long Internet benders playing combat games and the like. The case of two middle school pupils in Chongqing, who fell asleep on a railway line and were run over on March 31 following a 48-hour interactive gaming session, is being cited. But preventing customers from gaining access to "unhealthy information online" is also a concern behind the drive against unauthorized public Internet venues, which was launched in February and will run until August, says the agency that licenses Internet cafés. Preventing anonymous access to the Internet from cafés has been one prong of Beijing's drive to squelch the Internet's political power for the past 18 months, although the excuse has always been the fire risk and protecting juveniles from abuse. August 04, Associated Press — Cyber cops to monitor Internet in Vietnam.

A new police unit will start cracking down on Internet criminals next month as communist Vietnam works to maintain control over its growing number of online users. The special unit will focus on crimes such as credit card fraud, hacking, gambling and posting banned information online, the Vietnam News reported Wednesday, August 4. Although the unit will take action against those who post anti-communist messages, it will mainly focus on financial abuses, said Nguyen Tu Quang, director of Hanoi's Technology University Network Security Center, which trained the cyber officers. The cyber police unit will work in collaboration with Internet service providers, universities, banks, former hackers and other security forces, Quang said. About two million of Vietnam's 81 million people access the Web. The number of users is expected to triple by next year, the paper said.

STUDENT SHUTS DOWN BLOG AFTER THREAT FROM SINGAPORE

Chen Jiahao, a graduate student in chemical physics at the University of Illinois at Urbana-Champaign, has shut down his personal blog and issued two apologies after an agency of the government in Singapore threatened to sue Chen for defamation. A*Star, the agency in Singapore dealing with science and research, accused Chen, who is from Singapore, of libelous statements that "went way beyond fair comment." The agency demanded a public apology but said Chen's first apology was insincere and insisted on another. A*Star said it welcomes various opinions and perspectives, but many in the journalism community rejected that claim. Singapore has long had a reputation for using tactics including lawsuits to silence critics. Organizations including the Committee to Protect Journalists and Reporters without Borders have decried Singapore's threats to Chen and journalists. "Chen criticized some of A*Star's policies," said Julien Pain, head of Reporters without Borders' Internet freedom desk, "but there was nothing defamatory in what he wrote." Reuters, 9 May 2005

2006-01-24 **Google censorship search results China laws regulations Reporters Without Borders**

EDUPAGE; http://news.com.com/2100-1028_3-6030784.html 23

GOOGLE TO CENSOR SEARCH RESULTS IN CHINA

Google will launch search and news sites in China this week that will block access to information the Chinese government considers objectionable. Chinese officials have a long track record of censoring speech and ideas, and, according to Andrew McLaughlin, senior policy counsel for Google, the new sites "will comply with local Chinese laws and regulations." Search results from which content has been excluded will notify users that not all results are being displayed. Google said that the decision to offer its services even if they are censored reflects the belief that limited access to Internet resources is better than no access, which would be the alternative if Google did not comply with local legislation. "We must balance our commitments," said McLaughlin, "to satisfy the interest of users, expand access to information, and respond to local conditions." Reporters Without Borders, an organization that advocates for freedom of the press, was highly critical of the decision, saying, "The new Google version means that even if a human rights publication is not blocked by local firewalls, it has no chance of being read in China."

RISKS 24 15

COMPLEXITY OF SEARCH ENGINE COMPLIANCE WITH LOCAL LAWS

Lauren Weinstein, founder of People for Internet Responsibility < http://www.pfir.org >, wrote a thoughtful analysis of the problems search engine companies such as GOOGLE face in meeting conflicting standards in different nations. For example, GOOGLE recently cooperated with the Chinese government in blocking access to certain materials that frighten certain elements within that totalitarian regime; on the other hand, GOOGLE also refused to cooperate with US federal law enforcement requests for records of user searches because of privacy concerns. Weinstein wrote, "The situation highlights the minefield of issues that Google and other Internet companies now face, and the desperate need for proactive approaches to dealing with the ways that these technologies affect individuals and society."

He also pointed to initiatives in the US Congress that would have significant implications for international relations: "Congressman Tim Ryan has announced a hearing of the Congressional Human Rights Caucus (16 Feb is the date that I've heard) to explore the potential drafting of laws that would limit or otherwise control U.S.-based Internet companies from complying with the censorship demands of foreign countries. Emotions were clearly exasperated by Google's launching of the 'dot-cn' Chinese version of Google search that blocks links as per Chinese government directives, though Google is not alone in this regard among U.S.-based Internet companies."

For a streaming video of a one hour lecture by Lauren Weingstin touching on these issues and other of interest, see < http://neon.vortex.com/lauren-google-2006-01-24.asx >.

INTERNET JIHAD: TACKLING TERROR ON THE WEB.

Nearly 18 months ago, Babar Ahmad, a British citizen, was arrested on an extradition request to the U.S. Charged with running Websites hosted in the U.S. that promoted and supported Islamic militancy, Ahmad remains in British custody. He has appealed the extradition order and Britain's High Court will hear the case on Monday, February 20. The proceedings will test the ability of Western governments to put on trial Islamic radicals who use the Internet as a key recruiting and organizational tool. But while the U.S. government pursues those who operate Websites that allegedly encourage terrorism, some argue that the authorities should instead concentrate on shutting down the sites themselves as soon as possible to limit their impact. Ahmad's case illustrates how seriously the U.S. is taking such Websites. His extradition warrant accuses him -- among other things -- of helping to run azzam.com, one of the earliest and most high profile English-language pro-jihad Websites, which for a time was run by an Internet Service Provider (ISP) headquartered in Connecticut. A federal grand jury in the U.S. indicted Ahmad in October 2004 on four charges. If found guilty, he faces life imprisonment.

U.S. STATE DEPARTMENT LAUNCHES INTERNET FREEDOM TASK FORCE.

The U.S. State Department on Tuesday, February 14, established a task force to investigate the problems posed to the Internet by repressive regimes, a move that followed a call for help by Google Inc., Microsoft Corp. and Yahoo Inc., which have been criticized for censoring information in China. The task force would consider how the use of technology to restrict access to political content has impacted U.S. companies. The panel would also investigate the use of technology to track and repress dissidents and efforts to modify Internet governance structures in order to restrict the free flow of information. The task force is expected to draw upon the department's expertise in international communications policy, human rights, democracy, business advocacy, corporate responsibility and relevant countries and regions, Shiner said. Besides working with U.S. companies and non-governmental agencies, such as human rights groups, the task force will seek help from the European Union and other governments facing similar problems with Internet censorship.

EDUPAGE; http://www.nytimes.com/2006/05/09/world/asia/09internet.html 23

CHINESE STUDENTS POLICE INTERNET

In China, a government initiative known as "Let the Winds of a Civilized Internet Blow" aims to ensure that online content conforms to government expectations. Students at some Chinese universities are a key part of the effort. At Shanghai Normal University, 500 students serve as Internet monitors, participating in online discussions and trying to steer conversations away from topics considered objectionable. Unknown to most of the other students on campus, the monitors also report some content to campus officials, who delete it. One student monitor said, "Our job consists of guidance, not control." Critics argue that the practice amounts to nothing more than the censorship common to other areas of Chinese life. Chinese officials acknowledged that more than two million images and 600 online forums have been deleted for being "unhealthy." Some students dismissed the efforts, saying that with the Internet, you can always go elsewhere to share your opinions. "It's easy to bypass the firewalls," said one student, "and anybody who spends a little time researching it can figure it out."

In Nevada, sending junk e-mail may soon become a misdemeanor. Other states currently considering such laws include CA, VA and CT.

Category 33 *Policies, risk analysis, risk management*

1997-05-07 **spam ISP VAN**

Wired

In early May, junk e-mailer Cyber Promotions suffered a number of blows. CompuServe won a permanent injunction against all further harassment of its members without explicit permission for junk e-mail by each recipient plus legal costs. Then Earthlink won the right not only to bar Cyer Promotion's spewing e-mail engines but also to forbid the use of its services to mask the origin of the junk; in addition, it demanded $3M in compensatory damages. These ISPs join Prodigy and AOL in their successful attack on the deceitful practices of the premier junk e-mailer in the world. In an unrelated development, vigilantes flooded the Cyber Promo site with millions of _arp_ requests for hardware configuration information, bringing the spammer's servers down.

A few weeks later, Earthlink announced a zero-tolerance policy for spammers and those who use the Earthlink name in fraudulent return addresses. It named eight companies: three companies offering Internet and financial services: Creative Finance Alternatives; Internet Communications; and New York Internet Center; and the other five — Sexy Girls Publishing, LCGM, Real Time Entertainment, S. Maddie Productions and Prosperity Books — that offer pornography. These spammers sent 200,000 messages through Earthlink and generated 16,673 complaints (8%).

1997-07-29 **spam junk unsolicited commercial e-mail**

AP

Several US law-makers expressed interest in stemming the tide of junk e-mail. Sen. Frank Murkowski (R-AK) proposed a law to require marketers to identify themselves, their telephone number, physical and electronic address, and to clearly label their messages as advertisements. Sen. Robert Torricelli (D-NJ) proposed a bill that would prohibit junk e-mailers from disguising their identity, from using automated programs to gather e-mail addresses from USENET groups, mailing lists and chat forums, and from ignoring REMOVE messages. Rep. Chris Smith (R-NJ) wants an all-out ban on spam by br.oadening existing telecommunication laws to extend the ban on transmission of unsolicited ads through telephone lines to Internet messages.

The ACLU (American Civil Liberties Union) and CDT (Center for Democracy and Technology) argue that government interference with junk e-mail would be in violation of First Amendment protection on speech. Many free-speech advocates support the use of civil law to sue junk e-mailers for damages and to apply cease-and-desist orders. The Direct Marketing Association expresses horror at the thought of government intervention. Chet Dalzell of the DMA says, "When you have any new technology, you'll find there are people who'll push the parameters. But all indications are that marketplace forces will drive development of technology to protect consumers without government regulation."

1997-10-03 **spam unsolicited commercial e-mail ISP denial of service**

Newsbytes, PR Newsbytes, ZDNET

Apex Global Internet Services (AGIS) sadly had to reconnect Cyber Promotions back to the Internet as a result of a court ruling forcing the ISP to give the junk-e-mail sender 30 days notice before cutting off their service to reduce attacks on AGIS' network by anti-spam vandals. The disgusted ISP had cut off Cyber Promotions and several other spammers in late September after going down under a barrage of pings apparently directed at harassing the spammers. Later in October, Sanford "Spamford" Wallace was quoted in the New York Times as saying that his firm would not be much affected by being thrown off AGIS because they now serve the other parasites who send junk e-mail by supplying consulting services.

Category 33 *Policies, risk analysis, risk management*

1997-10-06 **spam unsolicited commercial e-mail**

TechWeb

Some USENET veterans banded together to re-establish the style of trusted interactions that characterized the USENET before know-nothing scum flooded the Net with unsolicited commercial postings. According to some studies, 80% of the total traffic on the current USENET is now garbage. USENET2 would establish a new top-level domain called net.* and would require all participants to guarantee they would govern their users to prevent spam. In addition, participating ISPs would block all postings with forged headers.

Category 33 *Policies, risk analysis, risk management*

1997-10-19 **junk e-mail regulation**

PR Newswire, EDUPAGE

Apex Global Internet Services, Inc (AGIS) of Dearborn, MI, demanded that all members of the Internet E-Mail Marketing Council (IEMMC) stop sending bulk e-mail through the AGIS network. The chief culprits in the ongoing spam wars, Cyber Promotions, Cybertize E-mail, Integrated Media Promotions, ISG, and Quantum Communications, agreed to stop using AGIS for their junk e-mail as of 97.05.25. The IEMMC proposes to serve as a voluntary watchdog for the junk e-mail industry; however, it is entirely unclear how voluntary agreements among members of the IEMMC could possibly influence non-members, such as the amateurs who use high-volume junk e-mail generators in pursuit of hare-brained and usually fraudulent get-rich-quick schemes. In October, AGIS terminated all services to Wallace's company, but he said it no longer mattered to him — he now serves primarily as a consultant.

Category 33 *Policies, risk analysis, risk management*

1997-10-20 **spam free speech unsolicited commercial e-mail**

COMTEX Newswire (Newsbytes)

Rebecca Vesely stepped into a cross-fire in October when, writing in Wired, she announced that unsolicited commercial e-mail (UCE, "spam", "junk e-mail") is protected speech under the 1st Amendment to the Constitution of the United States and therefore there's nothing anyone can do about it. Wrong, said critics: just because commercial speech is protected against government interference in a public place it does not mean that private resources such as our e-mail accounts can be used with impunity by spammers.

Category 33 *Policies, risk analysis, risk management*

1998-02-08 **spam wars**

EDUPAGE

In February, the FTC initiated actions against spammers with over 1000 letters to people who were sending unsolicited commercial e-mail involving what appeared to be fraudulent activities. Failure to obey the instructions to stop could result in court orders and seizure of the spammers' assets.

Category 33 *Policies, risk analysis, risk management*

1998-02-15 **spam bulk e-mail junk**

EDUPAGE

Spam is facing competition from more ethical bulk e-mailers who send advertisements exclusively to people who request them using a profile of their interests. Some operators hope that their service will help provide an alternative that allows legislators to make junk e-mail illegal — if anyone can define junk e-mail sufficiently tightly for legal applications.

1999-04-29 **privacy e-mail corporate policy dishonesty evidence**

Guardian (London)

Michael Simmonds, head of marketing for the Tory party, leaked a document to the press using e-mail. A copy of the document was found in his electronic out-box and he was fired. Simon Waldman's _Guardian_ article warned that contrary to people's uninformed impressions, e-mail is far from transient; on the contrary, it has a permanence that can exceed that of paper documents. Backups, log files, reconstruction of erased files — any number of mechanisms can make e-mail available to the owners of corporate computer systems. If you don't feel comfortable making an e-mail communication available to your employer, don't write it on corporate computers. In addition, some people's marriages have been wrecked through indiscreet e-mail messages that later came to light; these documents have been introduced into court cases much to the embarrassment of the guilty mates.

Category 33 *Policies, risk analysis, risk management*

1999-06-14 **spam survey study**

USA Today

GartnerGroup surveyed 13,000 e-mail users around the world about their experience with spam. The results were appalling:
* 90% of the respondents received at least one junk e-mail per week;
* 96% of those online for 4 years or more received junk e-mail at least once a week;
* 33% got 6-10 junk messages a week;
* ISPs lose ~7% of their new users every year because of disgust with spam;
* 40% of the respondents agreed that spam should be banned;
* 25% said that spam should be regulated;
* 25% despaired of solving the problem and simply deleted it;
* 3% of the respondents enjoyed it to some extent.

1997-06-05 **appropriate use net filter productivity Internet Web**

EDUPAGE

A recent thesis on employee use of the Web for entertainment while being paid for work suggests at least a couple of hours of productivity per week down the tubes. Other more informal estimates range from 5% to 40% lost time. In addition, such goofing-off consumes network resources; pornography and games take up a lot of bandwidth.

2000-02-19 **e-mail privacy policy openness awareness conflict monitoring ownership**

InformationWeek

Thomas York summarized the state of e-mail privacy in an article for InformationWeek in February 2000. He cited a case that made news in November 1999 when the New York Times fired 23 workers in its Norfolk, VA support office for distributing offensive jokes through corporate e-mail. Despite the cries of protest from free-speech advocates, corporate America is increasingly making it clear to employees what has always been true: that corporate e-mail systems and the message that flow through them are company property. However, observers comment that it is unreasonable to bar all personal messages from the systems, especially when employers are glad to see staff working unpaid overtime. The essential rule is that employees must be aware that their communications are being monitored. In addition, employees can use outside e-mail systems (assuming they can get through company firewalls) for more privacy.

2000-03-10 **appropriate use management policy tools**

NewsScan, MSNBC http://www.msnbc.com/news/380471.asp

As employers increasingly worry about how to maintain control over workers' use of the corporate network for personal activities, such as e-shopping, or pornography perusal, a half-billion-dollar industry is taking off. Dubbed EIM, or employee Internet management, the new field comprises companies that make everything from Web filtering software to programs that track a worker's every keystroke. According to a new International Data Corp. white paper, Internet access control software was a $63-million market last year, and is expected to evolve into a $562-million EIM market by 2004. Currently, "660,000 companies are interested in buying these products," says IDC research director Chris Christiansen. Among those companies is Marriott International, whose senior technical analyst Scott Davis says, "Streaming medias are chewing up a lot more bandwidth than the HTTP protocol did in the past, and we have the HR departments and the corporate policy departments coming to us and telling us the (Internet) policy to implement." Policing those policies is increasingly difficult without adequate EIM software, he adds. (ZDNN/MSNBC 10 Mar 2000)

2000-04-25 **e-mail expectation of privacy monitoring intrusion employers employees labor relations government board regulations laws**

NewsScan

Many companies now monitor their employee's e-mail and Web activities, assuming they have the inalienable right to ban personal or inappropriate use of office PC. But rebellious workers are now fighting back, using the National Labor Relations Act, a Depression-era law that sired the National Labor Relations Board (NLRB). The quasi-judicial NLRB, which protects workers' rights to organize and communicate freely with each other about work terms and conditions, has weighed in on the employee's side in several recent cases involving workplace electronic monitoring activities. In one case, an employee fired for not apologizing over an e-mail he wrote criticizing a new vacation policy was granted back pay and a chance to rejoin his old firm (he took the pay but refused the job). In another, Pratt & Whitney was forced to back off a total ban on using the office e-mail system for non-business purposes. "The way people work is changing dramatically," says NLRB associate general counsel Barry Kearney. To keep up with the times, the NLRB is now asking branch offices to forward to Washington headquarters any cases involving e-mail or Web use by employees. (Wall Street Journal 25 Apr 2000)

Universities are struggling over the issues posed by Napster software, which allows people to make unauthorized copies of music. At a University of Southern California forum yesterday, attorney Cara Burns took a dim view of the idea of letting students use university facilities to steal copyrighted material: "There are certain cases when the university has to act as Big Brother. Is that what you send your kids to university for — to download music? ... I am for new technology, but I'm also for artists and artists' right. Napster to me has more to do with stealing. Artists have the right to control their music." Taking a difference approach, USC chief information officer Jerry Campbell argued: "There is a serious principle involved here. We do not censor access... Trying to solve the problem in the courts is just stalling for time. Technology will not be rolled back by any law." (AP/San Jose Mercury News 20 Jun 2000)

A report by the Gartner Group . . . [said] 17 out of 50 — about a third — U.S. colleges and universities surveyed have banned students from using Napster on their campuses. Gartner says the song-swapping service is raising a number of moral and legal issues for school administrators, who are hurrying to establish policies regarding digital music sharing before campuses open for the fall session. Among colleges still allowing Napster use are Columbia, Harvard and Stanford, while New York and Kent State universities have instituted bans. (Los Angeles Times 31 Aug 2000)

Colleges and universities are split on "the Napster issue." Some are blocking Napster, some are not. Among the ones that are not are Georgia Tech, Michigan, Stanford, Duke, and the University of California at Berkeley. A Georgia Tech official says: "We are an educational institution and we will err on the side of unfettered access to information. Once you start down that road ... well, we could tie up an awful lot of staff people and resources trying to evaluate Web sites' content, and we don't want to get into that." Among the ones that are blocking Napster are Yale, Indiana, Southern California, Texas, Ohio State, Northeastern, and Canisius. The first three in this group made their decisions after being sued by two rock groups and the Recording Industry Association of America; the second two chose to block Napster on the grounds that Napster traffic clogged their computer networks; and the last two cited legal and ethical reasons for rejecting Napster and similar programs. A Canisius official explained: "It's not free for you to steal books from the public library, and it's not free to download music you haven't paid for." (AP/San Jose Mercury News 1 Oct 2000)

2000-12-20 **covert channel confidentiality unaware social engineering detailed information auto-reply abuse danger vulnerability**

RISKS 21 16

Dan Birchall wrote an excellent piece for RISKS about the dangers of inadvertently revealing too much information by creating an overly-explicit auto-response for e-mail when one is away from the office. As he pointed out, a detailed message may be OK for close colleagues but wholly inappropriate for publication; for example, "I will be away from [government laboratory] from [departure date] and will return on [return date]. If you need to reach someone from the IT Security staff, Please contact [coworker] at [number] or e-mail to [address]." Such a message is far too revealing for strangers, some of whom may be interested in competitive intelligence (e.g., which conferences you are going to) and others who may be hackers or industrial spies interested in social engineering. Subscribers to e-mail distribution lists may not realize that their autoresponder messages are going to total strangers. Birchall concluded, "send something like this:
>I am currently away from work. If you need to reach someone, please contact John <jsmith> at 555-1212.<
The logic, of course, is that an authorized person already knows where you work, what you do, your e-mail domain, and your area code. Nobody needs to know how long you'll be gone, if there's someone else who can help them."

WASHINGTON FLOODED WITH E-MAIL
U.S. lawmakers last year received 80 million e-mail messages from constituents and special-interest groups, most of which were routinely ignored, according to new study by the Congress Online Project. The number of e-mail messages to Congress has more than doubled in two years, says the group, with senators receiving as many as 55,000 messages per month. And while millions of the messages originate from constituents concerned about Medicare reform, tax cuts and other issues, the study attributed the e-mail explosion in large part to advocacy groups and corporations that increasingly use the Internet to lobby lawmakers day and night, overloading congressional computers and staff. "Rather than enhancing democracy--as so many hoped--e-mail has heightened tensions and public disgruntlement with Congress," says the report. "A growing number of citizens are increasingly frustrated by what they perceive to be Congress' lack of responsiveness to e-mail. At the same time, Congress is frustrated by what it perceives to be e-citizens' lack of understanding of how Congress works." The study urges grassroots lobbyists to adopt a "code of conduct" to curb mass e-mailings to lawmakers and also suggests the federal government to provide lawmakers with additional resources so they can buy new software and hire staff to answer electronic messages. According to the study, it could cost each office $50,000 or more for hardware and software. (Reuters/CNet 18 Mar 2001)

RECORD NUMBER OF OFFICE WORKERS ACCESS STREAMING MEDIA
A record number of U.S. office workers took advantage of their corporate networks' high-speed Internet connections to access streaming audio or video media last month, including media from foreign countries. In most cases, people were trying to follow news related to last month's terrorist attacks. More than half (55.8%) of all employees who logged on from work last month watched or listened to streaming media, up from 50% in August, according to Nielsen/NetRatings. The previous record was set in November 2000, when 52.8% of office employees accessed streaming media while at work. Among the three formats available for streaming media, the most popular was RealNetworks' RealPlayer, followed by Microsoft's Windows Media and Apple's QuickTime. "What we saw starting with (Sept.) 11th was an unprecedented amount of ... live usage and an unprecedented amount of broadband-video usage" that continued through the month, said RealNetworks media manager Ben Rotholz. MONITORING THE MESSAGE BOARDS [18 Nov 2001]
With the U.S. at war with terrorism, various Web services are choosing to decline submissions from people saying the country "deserved" to be attacked or making other comments along those lines. Stephen Killeen of Terra Lycos U.S. says that, in the past, "we would err on the side of `If it's distasteful, let it stay.' Now, we err on the side of `If you want to post this kind of information, you don't have to do it here.' The sentiment in the United States changed on Sept. 11 about what's acceptable and what's not in terms of what you can say." Of course, people are free to set up Web sites of their own and post whatever they want, just as private companies are free to accept or reject anything they want. UCLA law professor Stuart Biegel says, "In times of war, there has been a willingness among Americans to give up some rights -- to honor curfews, martial law, and even restrictions on speech. The filtering of Internet message boards is part of all this." (San Jose Mercury News 18 Nov 2001)

CALIFORNIA CASE PITS SPEECH RIGHTS VS. PROPERTY RIGHTS
The California Supreme Court has agree to review a case involving a disgruntled Intel employee who sent 30,000 e-mail messages to company employees at their places of work. The employee, backed by the American Civil Liberties Union and the Electronic Frontier Foundation, sees the case as one raising fundamental free speech rights denied to an individual who wished to circulate his opinion; in contrast, the lower courts have viewed it as a property-rights case, since the messages were sent not to employees at their homes but to their company e-mail addresses. The appellate court's majority ruled that "Intel is as much entitled to control its e-mail system as it is to guard its factories and hallway." A dissenting opinion argued that it could be considered a property-rights case only if Intel had shown that its property had actually been harmed, and there was no such showing. COMPANIES LAX ON ANSWERING E-MAIL
Companies' efforts to shift customer relationship management to the Web and e-mail may backfire unless they institute a prompt response mechanism, says a new study by Jupiter Research. Only half of the companies surveyed responded to a customer's question or issue within 24 hours, while a third took three days or longer. "That lack of response could drive consumers back to more costly channels such as the telephone," says Jupiter analyst David Daniels. "Consumers are definitely concerned about this." And while self-service is catching on with consumers savvy enough to navigate their way through a Web site, companies should be cautious about relying on it too heavily. "Self-service really lends itself to commodity goods categories (like books or CDs). When it gets up into more complicated situations, such as computing products or wireless phones, consumers absolutely said they want a real-time solution. Those frequently-asked-question lists are not necessarily specific enough to meet their needs," says Daniels. (CNet News.com 29 Aug 2002)

CRACKDOWN ON OFFICE SURFING COULD AFFECT WEB PROFITS
Office workers with corporate broadband networks have long enjoyed high-speed access to online entertainment, shopping and other personal pursuits, but a widespread crackdown on non-work-related Internet use may be looming, driven by cost-cutting efforts and increased scrutiny of workers' surfing habits. "I think it was an issue of productivity — people were spending too much time on these sites. I know people who were bidding on eBay all day long," says one office worker who admits to logging on to online dating sites several times a week. According to Websense, an estimated $85 billion in productivity is lost annually to workers wasting time on the Net. But the corporate backlash is bad news for Web sites courting broadband users at a time when nearly 87% of people accessing the Net from work are using a broadband connection, compared with about 28% from home. Companies that stand to lose from the crackdown include game sites like "The Sims," e-commerce hot spots like eBay, online dating sites like Matchmaker.com, and news and entertainment outlets offering rich media formats such as video and audio clips. "Given that about 40% of the activity (in many of these areas) is coming from work, if (blocking) became a pervasive practice in the workplace, it would impact the business," says a Bear Stearns analyst. A network performance analyst at a Fortune 10 company argues that companies have to take steps to protect their network resources: "If you're looking at a company with an $82 million IT budget, and 10% of the network is going to nonwork uses, you're saving $8 million if you can stop it." INTERNET BOOKENDS: #1, KAHN ON COPYRIGHT
Internet co-founder (with Vint Cerf) Bob Kahn is head of the Corporation for National Research Initiatives (CNRI), which he founded in 1986. In an interview with John Gehl for the ACM online publication Ubiquity, Kahn talks about the state of the Internet, including the need for more education about copyright law: "We [at CNRI] have been promoting copyright and, more generally, intellectual property protection in the network probably as much as anybody in the research world. CNRI built a system for the U.S. Copyright Office to manage the registration of copyright claims and the attendant submission of copyright information and digital objects online; the system is called CORDS (cords.loc.gov). In my view, one of the problems that has not been satisfactorily dealt with in this country is the widespread lack of respect for the value of intellectual property. People think that they can do anything they want with intellectual property just because they themselves don't happen to see any cost associated with accessing it on the net and, perhaps sending it to others or otherwise using it. I think this is clearly an educational issue as much as it is a constitutional issue." (Ubiquity 13 Mar 2003)

RECORD LABELS WARN COMPANIES OF 'SIGNIFICANT LEGAL DAMAGES'
The Recording Industry Association of America has sent letters to about 300 companies, informing them that their computers were being used by workers for illegal file-swapping and threatening "significant legal damages" for employers and employees alike. The new tactic is the RIAA's first systematic effort to tackle digital music piracy that occurs using corporate networks, following a similar effort to enlist universities in the fight against illegal file-sharing. Copyright law experts said companies might be liable for piracy on their networks if they know about it and don't intervene, but it's unclear whether companies have an obligation to police their networks and remove unauthorized copies of songs without being asked to. "I think what they're trying to do is get people thinking 'Gee, I'm in this gray area, and I don't want to be the guy who gets fingered for the test case,'" says one intellectual property attorney. "As a corporation, do you really want to be in the news defending the right of your employees to have pirated music on your network?" About 35% of the letters went to information technology companies, 20% to healthcare firms, 20% to manufacturers, and the rest to miscellaneous industries. (Los Angeles Times 18 Mar 2003)

LIBRARY PORN CASE GOES TO TRIAL

A group of librarians in the Minneapolis library system has filed a federal lawsuit against that system, alleging that administrative failures have created an intimidating, hostile and offensive workplace. "We were living in hell, and they were unwilling to acknowledge the problem," says one librarian. The dispute arose in 1997, soon after the Minneapolis libraries installed Internet access, and a number of library visitors began displaying on publicly accessible computer images of "virtually every imaginable kind of human sexual conduct." PENN STATE PULLS THE PLUG ON STUDENTS' ACCOUNTS
Pennsylvania State University has suspended the Internet accounts of about 220 students after investigations showed they were using the school's broadband network to trade in "publicly listed copyright infringing materials." The school said connections will be restored once the copyrighted files have been removed from the systems. The move came about a month after the school had issued a warning to its 110,000 students, alerting them that illegal trading of copyrighted materials was against the law, and just weeks after the Recording Industry Association of America slapped four students at Rensselaer Polytechnic Institute, Princeton University and Michigan Technological University with lawsuits. 2003-09-12 **state workers e-mail privacy publicity pubilc documents private business venture first amendment advocates**

NewsScan

STATE WORKERS' PRIVATE E-MAIL IS PRIVATE
The Florida Supreme Court ruled Thursday that state workers' private e-mails cannot be treated as public documents just because they are created or stored on government computers. The ruling came in a case brought by the St. Petersburg Times, which had sued the city of Clearwater for access to the e-mail records of two city employees who had exchanged messages regarding a private business venture. The city allowed the workers to determine which e-mails should be made public, a decision challenged by the newspaper and First Amendment advocates. Florida Attorney General Charlie Crist expressed disappointment with the ruling: "If the taxpayers pay for the computers, they ought to have the right to see what's on them." St. Pete Times attorney George Rahdert noted that the 1967 law covering public records was written before electronic communications were commonplace. "The problem is public records law is kind of paper-bound. It doesn't really account for the way that people are communicating important information." (St. Petersburg Times 12 Sep 2003)

U. OF FLORIDA PULLS THE PLUG ON P2P USERS
Students returning to the University of Florida this fall have discovered a new utility on the school network: Icarus (Integrated Computer Application for Recognizing User Services), a open-source program developed by campus personnel to thwart students' obsession with peer-to-peer file-sharing. Last spring, the university received about 40 notices of copyright violations per month and at peak times 90% of all the traffic on the housing network was P2P. "We needed something to stem the flow. We were spending too much time tracking people down," says Robert Bird, supervisor of network services for UF's housing department, who reports that the debut of Icarus has reduced P2P use by 90%. When students first register on the UF network, they must pledge not to share copyright files. Icarus then scans their computer, flags any worms, viruses or file-sharing software, and gives instructions on how to disable those programs. First-time offenders receive a pop-up warning and are disconnected from the campus network for 30 minutes, but a repeat performance results in being disconnected for five days. Third-time violators are subject to the school's judicial process and are cut off form the network indefinitely. The new system has some students grumbling, but most seem resigned to the new restrictions. "While file-sharing is nice, it's not worth risking college or your future," says one. NewsScan

PERSONAL SURFING AT WORK CAN BE A GOOD THING
Here's a new book that turns conventional wisdom about personal surfing on company time on its head. Claire Simmers and Murugan Anadarajan have co-authored a human resources guide to worker Web use that indicates a looser attitude toward personal surfing can yield some beneficial side effects. "Personal Web usage in the workplace has a negative perception, especially among administrators who often see it as inefficient and creating a decrease in work productivity," says Simmers. But according to the authors' research, personal surfing at work can result in better time management, lower stress levels, improved skill sets and a happier balance between work and personal life. NewsScan; http://australianit.news.com.au/articles/0

WORK MP3s ARE A $AU60M PROBLEM

Office workers downloading files to build music and video collections cost Australian businesses $AU60 million a year, a new survey has found. Exinda Networks, a Melbourne-based supplier of network management and monitoring systems, collated recent data from the Australian Bureau of Statistics and one of the nation's largest private Internet service providers, covering around 10,000 online users. Australian businesses, which spend a total of $AU450 million a year in Internet costs, were forking out an estimated $AU4.9 million a month for employees' music and video files, the study found. This was the equivalent of one million MP3 files daily and does not include lost productivity costs. (The Australian 25 Oct 2004)

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A15511-2005Feb10.html

BLOGGING WHILE YOU WORK: MAYBE NOT A GOOD IDEA

Using the pseudonym "Sarcastic Journalist," reporter Rachel Mosteller of the Durham (N.C.) Herald-Sun newspaper wrote this entry on her personal blog one day last year: "I really hate my place of employment. Seriously. Okay, first off. They have these stupid little awards that are supposed to boost company morale. So you go and do something 'spectacular' (most likely, you're doing your JOB) and then someone says 'Why golly, that was spectacular.' then they sign your name on some paper, they bring you chocolate and some balloons... Okay two people in the newsroom just got it. FOR DOING THEIR JOB." The day after her posting, Sarcastic Journalist was fired (even though it did not identify the newspaper in her posting). Lee Rainie, director of the Pew Internet & American Life Project, comments: "We all complain about work and our bosses. And the ethos of the blogosphere is to be chatty and sometimes catty and crude. Even in an era of casual Fridays, that is not what companies want to be portrayed by the world." And labor lawyer Gregg M. Lemley notes: "In most states, if an employer doesn't like what you're talking about, they can simply terminate you." (Washington Post 11 Feb 2005)

2006-03-10 **employment law file deletion company laptop undelete secure wipe lawsuit criminal hacking unauthorized**

RISKS; CNET news.com http://tinyurl.com/ne3xx 24 20

USING SECURE WIPE UTILITY LEADS TO LAWSUIT FOR HACKING

Declan McCullagh summarized an interesting interpretation of law that occurred in the US Court of Appeals for the 7th Circuit in March 2006. It seems that Jacob Citrin used to work for International Airport Centers. He quit and returned his laptop computer to them. They prepared to sue him for allegedly violating his employment contract by going to business for himself in the same field. When they searched his hard drive looking for juicy files to undelete as part of their preparation for the civil case, they discovered that he had wiped files rather than deleted them: the old files were unrecoverable. So they accused him of violating 18 USC §1030, the Computer Fraud and Abuse Act of 1986.

McCullagh wrote:

>That law says whoever "knowingly causes damage without authorization" to a networked computer can be held civilly and criminally liable.

The 7th Circuit made two remarkable leaps. First, the judges said that deleting files from a laptop counts as "damage." Second, they ruled that Citrin's implicit "authorization" evaporated when he (again, allegedly) chose to go into business for himself and violate his employment contract.

The implications of this decision are broad. It effectively says that employees better not use OS X's Secure Empty Trash feature, or any similar utility, because they could face civil and criminal charges after they leave their job. (During oral argument last October, one judge wondered aloud: "Destroying a person's data--that's as bad as you can do to a computer.")

Citrin pointed out that his employment contract permitted him to "destroy" data in the laptop when he left the company. But the 7th Circuit didn't buy it, and reinstated the suit against him brought by IAC.<

1998-12-21 **spam civil lawsuits ISP win**

http://news.com.com/2100-1023-219361.html?legacy=cent

In December of 1998, AOL announced that it had won lawsuits against three spammers and started nine more lawsuits in five states. Full details of the all the settlements were not released, but the courts ruled in AOL's favor on grounds of trademark violations, and copyright violations. The losing defendants included LCGM of Madison, Wisconsin; Prime Data Systems of Bowling Green, Kentucky; and a company called IMS (location not specified).

The report by Jim Hu of CNET News.com continued with the following list of upcoming lawsuits (quoting directly from the article):

Virginia
• AOL takes on Power Promo and Mr. Forrest Dayton for "prolific" spamming of its members, and selling software to circumvent antispam filters.

• AOL also takes action against GreatDeal.Net for spamming AOL members.

California
• AOL takes on Virtual Girlfriend for peddling a fraudulent software package and being associated with other of fraudulent email offers sent to AOL members.

• AOL also takes action against Michael Persaud et.al., alleging that Persaud sent millions of emails to AOL members under false names--even after receiving a cease and desist order.

• AOL files suit against USA Home Employment for continuing to peddle its "get rich quick" schemes despite being issued a cease and desist request from AOL.

Iowa
• AOL takes on National Health Care Discounts, alleging that the company used spammers to generate sales leads.

Florida
• AOL takes action against Global Marketing Solutions for spamming AOL members and attempting to circumvent AOL's antispam filters.

• AOL also takes on First Class Advertising for spamming AOL members and attempting to circumvent AOL's antispam filters.

New York
• AOL files suit against the Christian Brothers, alleging that they spammed members trying to sell apricot seeds as a "miracle" cure for cancer and used the AOL.com domain name to give the impression that the products were affiliated with AOL.

2000-01-19 **pornography unsolicited commercial e-mail junk spam pornography fraud deception hyperlink source**

RISKS 20 77

Pornography-promoters have taken to inserting innocuous labels for URLs such as links to electronic postcards but actually linking to hard-core sites. One RISKS correspondent noted that linking to such sites at work can cause difficulties for employees. MORAL: do not link to URLs from people you don't know without checking the actual destination.

Category 33.2 *Spam, spim, spit & splogs*

2000-01-24 **spam unsolicited commercial bulk e-mail advertising**

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000124/t000007408.html

A study by Ernst & Young had depressing news for anti-spam activists. About 14% of US consumers who receive junk e-mail actually click on the URLs in the messages (although it wasn't clear whether they were trying to complain or actually interested in the products). Apparently this rate of click-through was 3 to 10 times higher than for banner ads. Brace yourselves for continued onslaughts of garbage from unscrupulous low-lifes sending out millions of unwanted messages so as to trap a few victims in their web of greed. [Aw, come on — tell us how you really feel, Mich.]

Category 33.2 *Spam, spim, spit & splogs*

2000-02-16 **mailstorm junk unsolicited commercial e-mail closed list**

RISKS 20 79

Junk e-mailers were reportedly using closed e-mail lists as a form of spam relay for unauthorized mail. Using a forged header including the desired target's e-mail address as the REPLY-TO or FROM address, the criminal sends the junk e-mail to a closed list which bounces the entire message to the victim along with notification that the victim is not authorized to post to the list. Recommendations [from MK]:

A) Turn off automated notification of rejection altogether on all closed lists; or if you feel that the notification messages are important, then

B) Configure the listserv to send back only the title of a rejected message, not the complete text; or if you feel like addressing the potential vulnerability head-on,

C) Design a check of a log file so that the listserv for a closed list can quickly identify a mailstorm and stop it by turning off automated notification of rejection when it is being abused.

2000-04-11 **spam unsolicited commercial text junk advertising unscrupulous creeps jerks idiots sociopaths**

NewsScan

Spammers have started using the text-messaging services on some cell phones to send unsolicited messages, probably by simply trying consecutive numbers until they find valid ones. An executive of a company called Plugout.com, which sends unsolicited text messages about its products, says: "What better way to reach your target market? [The company sells cell phone accessories.] We look at it as if we're doing these people a favor if they're looking for these kinds of products." One irate AT&T Wireless customer replied: "Clearly the sender knows it's going to interrupt somebody's day... They're not doing me any favors by soliciting me over my cell phone." (Washington Post 11 Apr 2000)

Category 33.2 *Spam, spim, spit & splogs*

2000-05-19 **spam filter pornography QA quality assurance design flaws false positives rules criteria**

RISKS 20 89

Gary Cattarin analyzed the antispam filters in MS-Office 2000's Outlook program. The assumptions behind MS engineers' spam-identification rules resulted in false positives (non-spam being identified and filed as spam). For example, the rules included >Body contains ",000" AND Body contains "!!" AND Body contains "$"< and therefore caught an inoffensive non-spam message from Cattarin to one of his friends. Analysis of the porn filters for Outlook 2000 revealed the following rules as described by the correspondent (material between > and < is a direct quotation):
>Subject contains " sex"
Subject contains "free" AND Subject contains "sex"
The first is set up with a leading space to only accept the *word* "sex", so those of us who live here in Middlesex county don't lose any local-related mail. But the writer of the second wasn't so careful — what if the Middlesex News offers free subscriptions? That's Spam, yes, but not porn (I guess that's why that newspaper changed its name...).

(2) Don't address your dear friend as such — note the rule:
Body contains "Dear friend"
My golly! I can't send some good old-fashioned heartfelt feelings to my dear friends!! (oops, double "!!" — I got excited!)<

[Peter G. Neumann decided to print the entire analysis of the filtering rules in a separate issue (20.89x) for fear that the normal issue of the RISKS Digest would be blocked because of the key words and phrases in the report itself.]

WILL INSTANT MESSAGING DRAW INSTANT SPAM?
Online marketers are salivating at the prospects for combining the power of instant messaging with peer-to-peer networks to create a new wave of Web advertising that some critics charge is more invasive than spam. When people sign onto file-swapping networks like Napster, many expose their instant messaging handles and entertainment tastes, opening up a new channel for targeted advertising. "It's a chilling thought," says Jason Catlett, president of Junkbusters. "The songs that make you visible to the world on Napster say a lot about you. Many people don't realize that when they're using these P2P services they are becoming publishers of their personal collections -- it's like putting your CD collection in the window fronting the street." In a sign of things to come, online ad agency L90 last week inked a deal with peer-to-peer network Aimster in one of the first exclusive partnerships to promote goods to consumers via instant messaging. Aimster plans to start an IM advertising campaign, featuring clients such as Aerosmith, Microsoft and Columbia Tristar. "Essentially, it's the next wave of commercialization of the Net," says Aimster CEO Johnny Deep. "Instant messaging is the delivery vehicle for everything in the same way the Web used to be the delivery vehicle. Now we're using IM for everything, for MP3s, sending movie trailers, software, text." (CNet News.com 16 Feb 2001)

SPAM COMES IN SHORT MESSAGES, TOO [28 Mar 2001]
Millions of Americans who now have short-messaging service (SMS) capability on their cell phones are discovering the dark side of the service -- they are being bombarded with unwanted commercial messages. Cell phone companies say they are powerless to stop the abuse. The problem stems partly from the fact that the account numbers for short-messaging phones are easily identifiable (usually they're just the user's cell phone number plus the name of the service provider). The practice is raising the ire of cell phone users because most get charged for receiving SMS messages, and the FCC says the legal status of cell phone spam is murky. Meanwhile, the number of phones capable of sending or receiving SMS messages is expected to increase to 110 million in 2002 from 37 million in 1999, according to the Yankee Group. (Wall Street Journal 28 Mar 2001)

AD FIRMS TARGET ASIAN CONSUMERS WITH SMS [8 Oct 2001]
Ogilvy Interactive, part of the UK's WPP Group, has designed an outreach campaign for the Love Singapore coalition of more than 150 churches based on wireless short messaging (SMS). Consumers who've registered to receive them find messages like "Thank me it's Friday. Signed, God." on their mobile phone screens. Another SMS ad campaign touted a new Coca Cola fruit juice called Qoo so effectively that within nine weeks, Qoo became the No. 1 juice drink in Singapore. The company sent a picture message showing a blue-skinned animated Qoo character to 500 young people in the hope they would send it on to their friends. About half a million mobile users in Singapore have now received the character. "We knew we wanted to target teenagers with this brand," says a Coca Cola spokeswoman. "I think SMS speaks to this group of people especially when traditional methods like TV campaigns are less effective." About 5.6 billion text messages are sent a year in Asia, according to market research firm Mobile Streams. (Wall Street Journal 8 Oct 2001)

2001-10-26 **spam unsolicited commercial bulk e-mail techniques countermeasures remote control modem**

RISKS 21 72

[Greg Searle provided RISKS readers with an excellent overview of the technical measures being used by spammers to get their material through to their victims. What follows is the complete text of Mr Searle's essay, which ends with a brief summary of the fundamentals of antispam origin-tracing.]

Here's the bag of tricks that many spammers are using to keep you from finding out who really sent you the spam:

1. The obvious - find an open e-mail relay, and use it for "e-mail laundering". Forge the e-mail headers, and the e-mail becomes untraceable. All you see is the IP for the open relay, and whatever the spammer wants you to see afterward. The "From" header is always forged, and complaining to the ISP behind the "From" address is pointless. The most you can do is complain to the company that owns the open relay, and hopefully they will close it. Unfortunately, new mail servers appear on the net every day, and many IT "professionals" setting up these systems are just not aware of the open relay problem. There are many web pages which have the sole purpose of finding and listing these open relays.

2. Include a "relay" URL in the spam for potential customers. This URL is typically a "throwaway" account opened on one of the many free webpage services (tripod, geocities, angelfire, etc.) with false credentials. The spammer only expects this URL to exist for a day or two, as the provider will quickly terminate the page once complaints start coming in. The URL typically points to a file or page that will redirect the customer to the true page.

3. There are some businesses that are specifically set up to relay URLs for spammers. One of these is 1freesite.net (G Stubberfield Enterprises). Spammers hire the business to set up a relay page on their server, so they can include this page in their e-mails.

4. Obfuscate the URL in an attempt to make it untraceable. Do you know that IP addresses can be expressed as a single, decimal digit? Browsers will accept this digit and translate it into a valid IP address. Encoding the URL in hex is another trick. Browsers will convert two-digit hex digits that are preceded by a percent sign into a valid character. The URL specification also allows usernames and passwords in a URL. This can be used to mislead. For instance, the URL http://www.webservice.com:www.server.com@192.168.10.10/spampage.html seems to point to "webservice.com", but the piece of the URL before the second colon is really the "username", the piece before the at sign is the "password", and the real web server is the IP after the at sign! Most web servers simply ignore the user name and password if they don't need it. These techniques can be combined to make a URL really hard for a person to decode.

5. Compose the relay webpage in JavaScript. Encrypt the "real" web page and any URL's, and have a JavaScript function decode it.

6. Ask customers to respond to the message. Include a valid "Reply To" header that is different from the "From" header. The e-mail client will recognize this and send any responses to the "Reply To" address. The e-mail account set up to receive these messages is usually a "throwaway" address set up on a free mail service with false credentials.

7. Include an unlisted phone number, which is protected by the telephone company and is untraceable.

8. Included an executable at the URL enclosed in the message. This executable is typically compressed to obfuscate its contents from prying binary file editors. The executable then forwards the customer's computer to the business's true URL. Anybody who opens this executable file is too ignorant to know any better.

All of these methods, except for the telephone number and the reply-to address, are completely reversible to expose the company behind the e-mail. If the computer can get to the final page, then so can the person operating the computer, given enough knowledge of the technology involved. There is one particularly nasty spammer, hosted at sexmansion.com and web69.com, that includes a doubly-compressed executable in the page that they set up on a "throwaway" site. Their extremely explicit e-mailings point to this executable's URL. This executable is a dialer application that redirects the user's modem to an offshore telephone number and sends their browser to one of the above mentioned domains. This appears as a charge on their telephone bill. This business was rather clever with the obfuscating technology used to hide their presence, but the same technology can be used to unravel the obfuscation and find the business behind it.

2001-11-13 **e-mail address harvesting interception eavesdropping confidentiality harvesting sale contract violation insider crime danger spam unsolicited commercial bulk e-mail forged IP headers SMTP bounce rejection messages**

RISKS 21 76

In an interesting RISKS sequence of messages, Nickee Sanders reported that an e-mail bounce message appeared to indicate that someone had sent spam using her e-mail address as the source. Andrew Klossner responded to her puzzled account by explaining, "That 'original message' was never sent. The 'bounce notification message' was forged by the spammer. And it worked -- you paid close attention to it."

Allan Hurst then provided a detailed experimental analysis of what happened to e-mail addresses which were never made public (they were used only for test purposes). He wrote, "Within two months of opening the Yahoo! Mail account, it started receiving spam, none of it from Yahoo. Within three days of opening the HotMail account, it started receiving spam, in amounts far larger than the Yahoo account." Given that he explicitly opted out of any e-mail address sharing, then "Either Yahoo Mail and HotMail are lying about not publishing or selling addresses, or someone's harvesting e-mail addresses by sniffing packets. (Hence the subject of this message.) As much as I'd like to bash the vendors . . . I strongly suspect the answer is that someone's found a way to harvest e-mail addresses. (Keep reading.)"

His next test involved an e-mail address on MyRealBox.com, where he was very confident that the Internet service provider "do NOT sell the MyRealBox accounts, nor use them for marketing purposes of any kind." After about six months of completely spam-free existence of this new address, "Suddenly, I was flooded with everything from 'failed delivery' messages to angry missives threatening me with bodily harm for spamming them." Mr Hurst wondered exactly where the spammers picked up his e-mail address? And how could such abuse be stopped?

Several other contributors chimed in with evidence that unused e-mail addresses were nonetheless being addressed by spammers.

The next wave of responses suggested that the spammers were likely using a dictionary or brute-force attack on the ISPs: trying out every possible alphanumeric combination to find valid e-mail addresses (those that did not bounce). Although this might seem like a lot of work, Walter Dnes explained, "With today's fast computers and broadband, the above is feasible."

AOL TREATS HARVARD ACCEPTANCE LETTERS AS JUNK MAIL: WHY? [28 Dec 2001]
AOL's spam-filtering software thwarted Harvard College's attempt to use e-mail to give applicants the joyous news that they'd been accepted. An AOL spokesman was unable to explain why this happened. [Presumably the messages contained no objectionable words or graphics, but of course very few people can be certain of that, since very few people actually received them.] An AOL spokesman said: "We fight a daily battle against spam at the server level, where we filter it out. Spam is our No. 1 problem. But it's hard to say what would have caused the system to filter e-mail from Harvard." [Question to AOL: What about e-mail from NewsScan? We promise to be good, or at least better.] (Boston Globe/Atlanta Journal-Constitution 28 Dec 2001)

VIRAL MARKETING GOES MAINSTREAM
Viral marketing is set to invade your in-box, say advertisers who are looking to this upstart marketing method to boost their outreach efforts. "At the moment, say 'viral marketing' and you still think teens and fashion brands -- cool things for cool people distributed via e-mail. But the principles that make viral marketing work should be taken on board by any brand-owner wanting to target any age group," says marketing consultant David Nichols. "Grown-up viral marketing is about involving people in things they love as a way of introducing a dialogue between brand and consumer." E-based marketing will become more prevalent, say many experts, but also will become increasingly permission-based. "I'm not convinced there is a future for viral marketing involving messages thrown out to hundreds of people in the hope someone will pass it on," says Tim Patten of marketing group HHCL Digital Solutions. "But I do believe there is value where people agree to receive messages, then -- on the strength of the value of that message -- decide to pass it on." Key to the success of these marketing efforts will be companies' willingness to participate in a true dialogue with their customers: "Too many marketers still believe when they speak consumers will listen. The enthusiasm amongst marketers for developing new ways of pushing information at consumers has not been matched by an enthusiasm to listen to what consumers say." says Mark Curtis, a partner at marketing consulting group Fjord. 2002-01-10 **spam filters false positives reliability program design bounce**

RISKS 21 84ff

In January 2002, AOL's spam filters rejected Harvard University's admissions-department e-mail. In the absence of any information from AOL (policy precludes their revealing any explanation of their anti-spam policies) analysts speculated that simply sending large numbers of similar messages to AOL members was enough to trigger false-positives in the filters. In discussion on the RISKS Forum, correspondents pointed out that e-mail reliability is still nowhere near that of the U.S. Postal Service. The problem was exacerbated by the lack of a bounce message to the originators; thus neither sender nor recipient could be expected to know that the messages had been discarded. Some commentators snidely suggested that using AOL as an e-mail service might be a legitimate basis for rejecting applicants. . . .

NewsScan

THE SPAM WARS
There has been a 16-fold increase in the number of unsolicited commercial e-mail messages in the past two years (according to the spam-filtering company Brightmail), and little progress has been made in fighting it, although sporadic lawsuits have sometimes yielded (very) small (and often uncollectable) cash judgments against the spammers. The president of the anti-spam Junkbusters Corporation has compared such lawsuits to "mopping up an oil spill with a toothbrush." Yet some anti-spammers feel the effort is worthwhile, and Bennett Haselton, who recently won four judgments of $500 each in Washington state, plans to publish a how-to guide for the spam-perplexed, hoping that if [more] people "get in the habit of taking legal action if they get spammed, then it's going to become so expensive that spammers have to get out of business." 2002-01-24 **antispam excess algorithm wrong bad error false positive reject verification**

RISKS 21 89

Jonathan Kamens reported his frustration at trying to reach another RISKS contributor whose Internet service provider blocked his e-mail for spurious reasons. It happened that Mr Kamens was unable to send his e-mail through his usual DSL line, so he sent his message via his ISP's SMTP server. The intended recipient's mail server rejected the message because, as Mr Kamens explained it, ". . . this site's system administrators have decided to block all E-mail for which the host name in the envelope address can't be matched up obviously (using a simple string comparison) with the host name of the mail server sending the message. In other words, if you have your own domain name, but you send E-mail through your ISP's mail server, you simply can't send E-mail to this site."

When he tried again, this time via his restored DSL service, his mail was rejected because his mail server was incorrectly labeled as a spam relay.

Although the site claimed that they would correct mistaken assignments to the rejection list, Mr Kamens found it particlularly irritating that the administrators of this picky site did not provide any way to reach them online. [MK adds that presumably, even if they had, the explanation or complaint would never make it to their e-mail inbox if it came from the affected mail server.]

2002-04-10 **P2P peer-to-peer AI artificial intelligence anti-spam filter e-mail signature content inspection**

NewsScan

INTELLIGENT SPAM FILTER
A new spam-filtering technology code-named Folsom uses a combination of peer-to-peer communications and machine learning to intercept nearly all unwanted e-mail, according to its creators. The peer-to-peer part of the technology enables a user to identify a message as spam mail, which the program then assigns a "signature" based on its content. The signatures are sent to one of numerous distributed servers where they're automatically downloaded by other members of the network and used to block copies of the same message. The machine learning part of the equation targets new spam by looking at the words and phrases in previously identified spam messages and making a judgment about the new mail. The developers say in tests of e-mail streams containing 40% to 60% spam mail, Folsom managed to reduce the percentage to "near zero" with very few "false positives." "It's a very interesting concept," says a spokesman for the Coalition Against Unsolicited Commercial Email. "Spam is getting worse, both in terms of raw volume and percentage." 2002-09-09 **spam wireless LAN local area networks ISP Internet service provides wardriving hijacking penetration**

NewsScan

DRIVE-BY SPAM ATTACKS HIT WIRELESS LANs
The proliferation of unsecured corporate wireless networks is fueling a surge in drive-by spamming, a security expert warned attendees of the First International Security Users Conference in London. "These people simply drive up to a building armed with their pornographic e-mail, log into the insecure wireless network, send the message to 10 million e-mail addresses and then just drive away," said Adrian Wright, managing director of Secoda Risk Management. With more ISPs instituting no-spamming rules, these unsecured networks have become easy targets for would-be spammers. All they have to do is find an unprotected SMTP (simple mail transfer protocol) port on a company's server and then pose as legitimate users of the network — the mail server can't tell the difference. Wright warned that between 60% and 80% of corporate wireless networks are unsecured, often because managers fail to change default settings when they install a wireless LAN. The security hole has led to the new phenomenon of "wardriving" — driving around a city until you find an unsecured wireless LAN — which leads to "warchalking" — drawing a symbol in chalk on a wall or pavement to mark the presence of a wireless networking node. And the practice isn't just confined to metro areas, said Wright, producing a photo of a warchalking symbol drawn on a buoy floating at sea. (CNet News.com 6 Sep 2002)

NewsScan

E-MAIL ADDRESS CHURN GIVES E-TAILERS HEARTBURN
Almost a third of U.S. Internet users change their e-mail addresses each year, costing businesses millions in potential sales, according to a new study by NFO WorldGroup. Reasons cited for changing e-mail addresses include changing jobs, switching ISPs, or evading spam. Recently, 87% of total respondents had changed a personal e-mail address and 35% had changed a work address. At least 16% said the change was intended specifically to shake off spammers whose tactics have become increasingly aggressive and subject matter increasingly offensive. The high turnover rate has caused headaches for legitimate businesses, however, who lose contact with customers who may have volunteered their e-mail addresses as part of the business relationship. "It's too much of a hassle to update their personal information with the sites," says an NFO marketing manager. "They look at it and think if they have to go through this process with 20 Web sites, it's too much trouble. Whereas with contacting 20 friends, that's a different thing." Return Path, an e-mail change-of-address company, estimates that e-mail churn cost businesses between $3 billion and $4 billion in 2000 due to lost sales, wasted e-mail acquisition marketing and unnecessary e-mail delivery costs, with those losses rising to $10 billion to $20 billion in five years. SPAM ARCHIVE PROJECT SEEKS CONTRIBUTIONS
CipherTrust wants your spam, including every e-mail come-on for Viagra, "free" pornography, and adult services. But they aren't masochists — they're hoping to build an archive of spam (www.spamarchive.org) that programmers and researchers can use in the never-ending fight against unsolicited e-mail. The company hopes to collect at least 10 million spam samples within a year, and is already well on its way to meeting its goal. "This should eliminate one of the big bottlenecks for people who want to make anti-spam tools," says one programmer who has developed mail-filtering programs. "You can write all the code you want, but it won't do a whole lot of good unless you have a large amount of spam to test your algorithms on." CipherTrust says it will use the archive to help its technicians improve "IronMail," its proprietary anti-spam product. Still, even the best junk e-mail filters won't stop determined spammers, says programmer and open source enthusiast Eric Raymond: "It's like a whack-a-mole game: you shut down (spam e-mail) servers in one place, and the same spammers pop up again in another place running a shoestring operation out of their basement. But in a weird way, that sort of highlights one of the Internet's strengths, that it's very hard to lock someone out of communication or suppress speech." (Washington Post 26 Nov 2002)

SURPRISE — MOST E-MAIL USERS HATE SPAM
In an anticlimactic finding, a Harris Interactive poll released Friday reveals that 96% of the 2,221 respondents find unsolicited commercial e-mail annoying, and nearly three quarters of those favor making spam illegal. Pornographic spam messages were deemed most troublesome, according to 90% of respondents, while 79% cited mortgage and loan come-ons as objectionable. Less annoying (but not by much) were investment opportunity and real-estate spam. Meanwhile, consumers needn't look for a break from spam mail any time soon — despite a recent crackdown by the Federal Trade Commission on fraudulent schemes advertised on the Internet, the incidence of spam continues to grow. According to anti-spam software maker Brightware, unsolicited messages made up 40% of all e-mail in November — up from 13% a year earlier. The Senate Commerce Committee passed a bill last May to set guidelines for unsolicited e-mail, but no further action has been taken by the full Senate. (Wall Street Journal 3 Jan 2003)

NewsScan

THE IETF APPROACH TO SPAM
The Internet Research Task Force — loosely affiliated with the Internet Engineering Task Force standards group — has formed an Anti-Spam Research Group, which will focus on the problem of spam proliferation and make suggestions on ways to change basic e-mail technology to foil the bulk e-mailers. "Once considered a nuisance, spam has grown to account for a large percentage of the mail volume on the Internet," says the group's Web site. "The purpose of the [research group] is to understand the problem and collectively propose and evaluate solutions to the problem." First steps will include classifying different kinds of spam and antispam proposals, and studying ways to track down spammers, who are often difficult to identify. A first meeting is set for March 20 at the IETF's San Francisco gathering. (CNet News.com 6 Mar 2003)

NewsScan

NEW ANTI-SPAM SYSTEM BEING DEVELOPED

A California start-up company created by well-known software designer Phil Goldman (formerly of Apple, General Magic, WebTV and Microsoft) has designed an e-mail service that takes a "challenge-response" approach to blocking spam. When a user receives a bulkmail message from an unknown source the system intercepts the message and requires the sender to give indication (by filling out a form) that the message is not an instance of spam. The service will cost $9.95 a year, so Forrester Research analyst Jim Nail note skeptically: "It's a really nice product, and it's pretty easy to use. The question is how big a market. Do people want to pay anybody anything for these features?" (New York Times 24 Mar 2003)

NewsScan

THE BEAUTY OF SPAM IS IN THE EYE OF THE BEHOLDER
Brightmail, which makes spam-filtering software for corporations and Internet service providers, says that 45% of the mail it now sees is spam (unsolicited bulk-distributed messages), and AOL says 2 billion spam messages are sent to its 35 million customers each day, accounting for more than 70% of the total AOL incoming traffic. But the spam creators are getting tired of having figures like these flouted as though spam was a bad thing. Bob Dallas of an e-mail firm in Ohio says, "We have allowed these spam cops to rise out of nowhere to be self-appointed police and block whole swaths of the industry. This is against everything that America stands for. The consumer should be the one in control of this." E-mail marketer Alyx Sachs thinks the same way Bob Dallas does: "These antispammers should get a life. Do their fingers hurt too much from pressing the delete key? How much time does that really take from their day?" (New York Times 22 Apr 2003)

HOW TO HIDE FROM SPAM-MONGERS
Researchers at the Center for Democracy and Technology have competed a study that seeks to answer the question: how do spammers find you? They found that e-mail addresses posted on Web sites or in newsgroups attract the most spam, because spam-mongers use harvesting programs such as robots and spiders to collect e-mail addresses listed in those places. So if you've ever provided your e-mail address as part of an eBay transaction, or responded to an online job listing, or participated in a discussion board, it's likely that your e-mail address is now making the rounds on junk e-mail lists. One way to avoid the harvesting in the first place, says the team, is to replace characters in an e-mail address with human-readable equivalents — for example jane@domain.com would become jane at domain dot com. Another successful evasion technique is to replace the characters in an e-mail address with the HTML equivalent. Over the course of the six-month study, 97% of the spam was sent to addresses that had been posted on public Web sites, especially those that were linked to major portals such as AOL and Yahoo. CONSORTIUM OF ONLINE MARKETERS ANNOUNCES ANTI-SPAM INITIATIVE
The E-mail Service Provider Coalition (ESPC), a consortium of online marketers such as DoubleClick and iMakeNews, is launching what it calls Project Lumos, which will provide a way for high-volume e-mail senders to have their mailings certified by ESPC to ensure they follow ethical practices. Under Project Lumos there will be four levels of accountability: certification to ascertain the mailer's identity; standardization of all sender info including identification and trackability; proof of sender ID in the SMTP message header; and various performance monitoring activities. The project seeks to accommodate the interests not only of the receivers of commercial e-mail, but also those of the senders of such mail. According to ESPC, "E-mail is indeed a killer app and has been a major component in the productivity and efficiency gains of the digital economy. But those gains will be lost if e-mail becomes unreliable as a communications tool. Businesses will not be able to use e-mail if they cannot have a reasonable assurance that their messages will be delivered." (ComputerWorld 24 Apr 2003)

2003-04-29 **spam zombies relay junk e-mail Trojan horses proxy crime**

NIPC/DHS

April 25, SecurityFocus — Rise of the spam zombies.

Pressed by increasingly effective anti-spam efforts, senders of unsolicited commercial e-mail are using Trojan horses to turn the computers of innocent netizens into secret spam zombies. One of those programs, popped up last week. "Proxy-Guzu" arrives as a spam, and when executed by an unwitting user, the Trojan listens on a randomly-chosen port and uses its own built-in mail client to dash off a message to a Hotmail account, putting the port number and victim's IP address in the subject line. The spammer then routes as much e-mail as he or she likes through the captured computer, knowing that any efforts to trace the source of the spam will end at the victim's Internet address. "As a general rule it's legal to send someone an e-mail even if they don't want it," says Mark Rasch, a former Justice Department computer crime attorney. "But once you break into their computer and get their computer to send e-mail to someone else, then you're violating federal and state computer crime laws."

NewsScan

SPAMMERS USE VIRUSES TO HIJACK COMPUTERS
As efforts to tackle junk e-mail ramp up, unscrupulous spammers increasingly are hiding their identities by taking over innocent users' accounts using e-mail messages that resemble computer viruses. Like many other viruses, these programs exploit weaknesses in Microsoft's popular Outlook e-mail package. One of the first hijacking programs to emerge was called "Jeem," which contained a hidden e-mail engine that enabled it to route messages via the infected computer. Another, called Proxy-Guzu, comes as a spam message with an attachment. When the unsuspecting recipient clicks on the attachment, the computer contacts a Hotmail account and transmits information about the infected machine, making it possible to route e-mail through that machine. "Spammers are beginning to use virus-like techniques to cover themselves," says Larry Bridwell, content security programs manager at ICSA Labs. "Spam is one of the two things that the security industry is going to be asked to deal with. The other is adware or spyware." (BBC News 30 Apr 2003)

NewsScan

SPAM HEADING FOR CELL PHONES
The spam that now accounts for as much as three-quarters of total e-mail volume is heading for a cell phone near you, according to a panel of telecom experts at a forum on spam held Thursday. Federal law prohibits most telemarketers from dialing cell phones, but there are no laws preventing them from sending text messages to addresses like 2025551212@cellphonecarrier.com. Because many text messaging services carry a per-message charge, the cost to consumers could mount quickly. Text messaging has yet to catch on in the U.S., and it may never happen if spammers start exploiting it, said phone-company officials. Wireless spam is already a problem in Japan, where text messaging has been a popular feature for years. "As data traffic over wireless networks continues to grow, so will spam," warned an NTT executive. (Reuters 1 May 2003)

2003-05-20 **hacker hijack computer remotely spam e-mailers messages bounce AOL KaZaA virus software computer**

NIPC/DHS

May 20, New York Times — Hackers hijack computers remotely in new surge of spam.

As spam has proliferated many mass e-mailers have become more clever in avoiding the blockades by aggressively bouncing messages off the computers of unaware third parties. In the last two years, more than 200,000 computers worldwide have been hijacked without the owners' knowledge and are currently being used to forward spam, according to AOL and other Internet service providers. Last Thursday, 17 law enforcement agencies and the Federal Trade Commission issued a public warning about some of the ways spammers now commandeer computers to evade detection. Mostly, the spammers are exploiting security holes in existing software, but increasingly they are covertly installing e-mail forwarding software, much like a computer virus. In the last six months, an increasingly common trick has been for spammers to attach rogue e-mail-forwarding software to other e-mail messages or hide it in files that are meant to emulate songs on music sharing sites like KaZaA.

2003-05-27 **spam cure disease Cnet blocking software death e-mail**

NewsScan

SPAM'S CURE COULD BE WORSE THAN THE DISEASE
CNet columnist Declan McCullagh worries that the proliferation of spam-blocking software incorporating challenge-response technology could lead to the death of e-mail. Challenge-response systems require the human sending a message to perform a simple task such as clicking on a link or typing a special password to get past the barrier. The problem is, says McCullagh, that many challenge-response systems are poorly designed, and could causes big headaches for administrators of legitimate e-mail newsletters (such as NewsScan Daily) that go out to large numbers of people. "Big corporations may be able to afford to hire someone to sit in front of a computer and spend all day proving they're not a spam bot, but nonprofit groups, individuals and smaller companies probably can't," says McCullagh. Earthlink has already announced its intentions to make a challenge-response system available to subscribers by the end of May, and other ISPs may follow suit — a scenario that has veteran list operators concerned. Dave Farber, a computer scientist at the University of Pennsylvania who runs the "interesting people" list, says: "If I start getting a flood of challenges from Earthlink IPers that require my response I will most likely declare them spam and you will stop receiving IP mail. I fully expect this to be the case for almost all the legitimate mailing lists you are on and count on." Meanwhile, editors at the popular Macintosh newsletter TidBits, have told readers: "Be warned that we will not answer any challenges generated in response to our mailing list postings. Thus, if you're using a challenge-response system and not receiving TidBits, you'll need to figure that out on your own." (CNet News.com 27 May 2003)

NewsScan

THE COSTS OF SPAM (NOT INCLUDING BLOOD PRESSURE MEDS)
Spam costs senders almost nothing, but takes a heavy toll on those who receive it. Ferris Research says the cost of spam is $10 billion in the U.S.; Nucleus Research pegs the figure at $87 billion. Is the problem being overblown? Wharton School marketing professor Peter S. Fader says: "I am deeply skeptical that these crude top-down methods are accurate. Hitting the delete key is far more efficient than carrying your physical mail from the mailbox over to the trash can." And he even sees an upside: "Spam, although it is a bad thing per se, is fostering the growth of the e-mail infrastructure." But that new infrastructure also comes with a price: Ferris Research says corporations will spend $120 million this year on antispam systems, and The Radicati Group claims the correct figure is closer to $635 million. Ah, what to do, what to do? America Online now discards, each day, nearly 2 billion e-mail messages flagged as spam — but then has to contend with complaints [including NewsScan] about "false positives" (mail falsely treated as spam). Ferris Research says: "We think companies lose $3 billion dealing with false positives." (New York Times 28 Jul 2003)

2003-09-02 **Spammer spiders chain letters collect e-mail addresses U.S. DoE Department Energy hoax advisory website web search usernames Spamfire**

NIPC/DHS

September 02, CNN — Spammers turn to chain letters to collect addresses.

While not as efficient as "spiders" which automatically crawl the Web in search of addresses, computer experts warn that some spammers are using chain letters to collect e-mail usernames. "Chain letters are the ideal place to collect addresses. I've seen several hundred on one e-mail," said Bill Orvis, who maintains the U.S. Department of Energy's hoax advisory Web site. "Just by forwarding a message to a dozen friends, it only takes a few generations before you fill the network with messages," he said. Michael Herrick, whose Spamfire software helps individual users filter junk e-mail, doesn't think spammers are using chain letters in this way. Herrick, however, admits that the practice could be a good way to bypass e-mail filters which block messages from senders who are not known to the recipient. Spammers could use chain letters to discover the addresses of people with whom you frequently communicate. Spam purporting to be from someone in your address book would sneak by filters.

2003-09-15 **anti-spam pay stop fighting Global Removal do-not spam list**

NewsScan

ANTI-SPAM EFFORT WOULD PAY SPAMMERS TO STOP
A new anti-spam service, called Global Removal, is taking a different approach to fighting spam — it's proposing to pay spammers for cooperating with their effort. Internet users fed up with junk e-mail would pay a $5 lifetime fee to have their e-mail addresses put on a Global Removal do-not-spam list. Addresses on the list would be cross-referenced and deleted from mailing lists maintained by Global's partners, which include more than 50 known spammers and an equal number of legitimate e-mail marketers. These partners would be rewarded for their diligence through an affiliate program, which would pay $1 for every new subscriber that they bring to the service. In order to avoid a new flood of spam touting Global Removal's service, the spammers would be allowed to send only one message to their purged mailing lists. "Despite the urban legend, these guys don't really want to keep these names on their lists if they know that the people aren't going to be receptive to advertising," says Global CEO Tom Jackson. "They can make more money for less effort through our program." Critics say the flaw in Global's sales pitch is that subscribers would still receive junk e-mail from spammers not affiliated with Global and that Global's spammers could always renege on their deal and go back to their old lists. One intellectual property lawyer says, "It's a little like paying protection money to mob bosses. There's precious little assurance about the comprehensiveness of the protection, or that the prices won't go up at the whim of the 'bosses.'" Still, if spammers "could be assured some minimum bit of income by not sending me mail, it's a better deal for them and a relief to me." (Wired.com 15 Sep 2003)

2003-10-09 **spam elude antispam cracker unsolicited e-mail new methods**

NewsScan

NEW BREED OF 'SPACKERS' ELUDES ANTISPAMMERS
Computer crackers have joined forces with spammers to devise new ways of defrauding hapless Internet users. The latest technique enables spammers to create Web sites that are virtually untraceable, making it impossible for antispammers to shut down those sites by conventional means. Typical of the scam is a group in Poland currently advertising "invisible bulletproof hosting" for $1,500 a month, which provides its clients protection from network sleuthing tools such as 'traceroute' and 'whois' by routing traffic through thousands of hijacked computers (most of them home computers running Windows and having broadband connections). The technique is effective. "You're not going to have much success trying to follow IP addresses through hacked hosts," says one security researcher. "About all you can do is follow the money — sign up for whatever it is they're selling and try to figure out who's behind the whole thing." Fueling the new tactics is an influx of "engineers who have been laid off or fired, and people who really know what they're doing with networking and DNS," says Steve Linford, head of the Spamhaus Project. "Hackers used to detest spammers, but now that spamming has become such a big business, it's suddenly cool to be a spammer." (Wired.com 9 Oct 2003)

2003-10-21 **spam decoy Yahoo mail Address Guard base name junk**

NewsScan

YAHOO DEPLOYS E-MAIL DECOYS
Yahoo now offers its e-mail customers a new way to evade spam — its AddressGuard feature allows subscribers to create a fictitious "base name" and then up to 500 variations on that name that can be used in online shopping and banking transactions as well as online community discussions. If an address starts to draw spam, it can be discarded and another one selected. Yahoo's anti-spam arsenal also includes new spam-blocking software along with the option to receive e-mail only from known sources. Yahoo has also changed its rule on viruses, now requiring users to scan all attachments before downloading them. Yahoo VP Brad Garlinghouse says the company has to keep tweaking its technical defenses because legal battles can't do the job alone. "Legislation and litigation, it's something of a whack-a-mole problem," he says, referring to the arcade game where players are challenged to hit an ever-increasing number of pop-up figures. An August survey of Yahoo users found that 77% said they would rather clean a toilet than sort through the junk e-mail in their in-box. (Reuters 21 Oct 2003)

2003-11-09 **spam fraud blacklist lawsuits investigation blocking spoofing DDoS zombie**

NYT
http://www.nytimes.com/2003/11/09/business/yourmoney/09spam.html?th=&pagewanted=print&position=

The Spamhaus Project <http://www.spamhaus.org/> was profiled in a New York Times article by Saul Hansell in November 2003. One of the best indications that the group of volunteers running this project have been effective is that they have often been assaulted by spammers using DDoS attacks.

Notes from the Web site:

* Spamhaus tracks the Internet's Spammers, Spam Gangs and Spam Services, provides dependable realtime anti-spam protection for Internet networks, and works with Law Enforcement to identify and pursue spammers worldwide.

* The Spamhaus Block List (SBL) is a realtime blocklist of spam sources and spam services. The SBL can be used by almost all modern mail servers, by setting your mail server's anti-spam DNSBL feature (sometimes called "Blacklist DNS Servers" or "RBL servers") to query sbl.spamhaus.org. Use of the SBL is free for users with normal mail servers (but networks with heavy email traffic should see DataFeed).

* The Spamhaus Exploits Block List (XBL) is a realtime database of IP addresses of illegal 3rd party exploits, including open proxies (HTTP, socks, AnalogX, wingate, etc), worms/viruses with built-in spam engines, and other types of trojan-horse exploits.

* The Register Of Known Spam Operations (ROKSO) database collates information and evidence on the known spammers and spam gangs, hard-line spam operations that have been terminated by a minimum of 3 consecutive Service Providers for serious spam offenses. ROKSO assists ISP Abuse Desks and Law Enforcement Agencies.

The section on ROKSO has the following information:

200 Known Spam Operations responsible for 90% of your spam.

90% of spam received by Internet users in North America and Europe can be traced via redirects, hosting locations of web sites, domains and aliases, to a hard-core group of around 200 known spam operations, almost all of whom are listed in the ROKSO database. These spam operations consist of an estimated 500-600 professional spammers loosely grouped into gangs ("spam gangs"), the vast majority of whom are operating illegally, and who move from network to network seeking out Internet Service Providers ("ISPs") known for lax enforcing of anti-spam policies.

These are the spammers you definitely do NOT want on your network.

Many of these spam operations pretend to operate 'offshore' using servers in Asia and South America to disguise the origin. Those who don't pretend to be 'offshore' pretend to be small ISPs themselves, claiming to their providers the spam is being sent not by them but by their non-existent 'customers'. Some set up as fake networks, pirate or fraudulently obtain large IP allocations from ARIN/RIPE and use routing tricks to simulate a network, fooling real ISPs into supplying them connectivity. When caught, almost all use the age old tactic of lying to each ISP long enough to buy a few weeks more of spamming and when terminated simply move on to the next ISP already set up and waiting.

ROKSO is a "3 Strikes" register. To be listed in ROKSO a spammer must first be terminated by a minimum of 3 consecutive ISPs for AUP violations. IP addresses under the control of ROKSO-listed spammers are automatically and preemptively listed in the Spamhaus Block List (SBL).

For Law Enforcement Agencies there is a special version of this ROKSO database which gives access to records with information, logs and evidence too sensitive to publish here.

ALL I WANT FOR CHRISTMAS IS… MORE SPAM?
While you're decking the halls with boughs of holly, spammongers are cooking up their own holiday plans, which (surprise!) involve sending even more spam than usual! Net filtering firms report that spammers are already altering their messages in an attempt to cash in on the festive season, offering more single products and high-tech gadgets such as DVD burners as potential gifts. Oh, and of course — more cheap loans to pay for it all! "Not only are spammers developing more and more cunning ways of getting around e-mail filtering technology, but their marketing strategy is clearly up to scratch, too," says Alyn Hockey, research director at Clearswift, a spam filtering firm. Clearswift reports that the number of spam e-mails offering cheap loans aimed at Christmas shoppers doubled in October as a percentage of overall spam. (BBC News 11 Nov 2003)

SPAM CLOGS BLOGS

Most weblogs are designed to allow readers to post comments on entries, but that capability is being abused by spammers, who leave remarks like "Sounds great!" submitted by names like "Generic Viagra," complete with links to questionable sites. Howard Rheingold, a futurist who touts the power of online communities, worries that the recent invasion could derail the revolution in public discourse just as it's gathering steam. "It forces you to either turn off the comments and lose some of the value of the medium, or spend your time deleting spam," says Rheingold. Meanwhile, some inveterate bloggers are taking matters into their own hands. Adam Kalsey, who's run his own blog for the past three years, has penned a "Comment Spam Manifesto," which warns spammers: "What you failed to understand is that bloggers are smarter, better connected and more technologically savvy than the average e-mail user. We control this medium that you are now attempting to exploit. You've picked a fight with is and it's a fight you cannot win." Kalsey tracks spammers down and reports them to their ISPs and domain registers in an effort to get their accounts canceled. "The blog immune system does seem to be responding," he says, noting that he receives help from other bloggers in his spam-slamming activities. (AP 13 Nov 2003)

Human Error Leads to AT&T's Anti-Spam Gaffe

After seeing a rush of spam, and brainstorming possible remedies, AT&T sent out a mass e-mailing to business partners and customers asking for the IP addresses of all outbound SMTP servers (to be used for a white list), threatening to cut off e-mail access of nonresponders. Subsequently, they sent a follow-up apology, with a request to disregard the first e-mail, claiming that the original notices went out as a result of "human error". GETTING SOME RAGE OUT: MAN THREATENS MURDER AFTER GETTING SPAMMED
A few months ago 44-year-old Charles Booher, a self-described non-violent person, went bonkers after receiving too much spam, and sent a series of e-mail messages threatening to kill the spammer. Now Booher's been charged with 11 violations of interstate communications, for which he could be sentenced to five years in prison and a $250,000 fine if found guilty. His current thoughts: "If I could go back, I wouldn't have done it. I would have realized sooner that I needed to shut my Web site down, to shut down my e-mail, and to re-evaluate the way I was using the Internet." In one of the messages he told the spammer: "I will locate you, disable you using a quick 22 calibre shot to your lower spine and then duck tape... I am going to cut into the left side of your brain using a power drill and an ice pick." Reflecting on the messages he sent to the spammer, Booher now says: "It felt like I was just getting some rage out." (San Jose Mercury News 22 Nov 2003)

SPAMMERS TARGET ANTI-SPAM GROUPS WITH E-MAIL WORM

Virus experts say a new worm, dubbed W32/Mimail-L, has been unleashed by a vengeful spammonger intent on paralyzing anti-spam groups via a crippling barrage of data — a so-called denial of service attack. "It's the third Mimail variation to come after us, except this one is trying to do more," says Steve Linford, founder of the Spamhaus Project. The nasty worm comes as an attachment to an e-mail from "Wendy" who describes an erotic encounter and then offers photos. Clicking on the attachment launches the worm. In a new twist, a follow-up e-mail is sent to the infected user announcing that an order for a CD containing child pornography images will be sent to their mailing address. Virus experts say the impact of this latest worm has been minimal, compared with the problems caused by last summer's plague of viruses, "but what this shows is that there is more evidence that virus writers and spammers are now colluding," says Sophos senior technology consultant Graham Cluley. GET READY FOR SPIM

Instant messenger spam, dubbed "spim," is increasingly clogging users' computers, popping up with the real-time regularity of instant messages and annoying users who complain they're now receiving several messages a day. Users can either accept or decline the spim, which often contains a link to — what else? — a pornography site. Ferris Research estimates about 500 million spim messages were sent in 2003, double the number sent in the previous year. And while instant-messenger spam "isn't nearly the industry that e-mail spam is,… it's starting to increase," says the CEO of an antispam consulting firm. Experts warn that the recent crackdown on conventional spam may push illicit marketers to explore new avenues, including instant messaging. "The irony is that focusing like a laser on our No. 1 concern — spam — has painted e-mail spammers into a corner like never before and incited them to find other ways to try and reach our membership online," says an AOL spokesman. 2004-01-19 **phishing SPF senders permitted from DNS e-mail servers authentication anti-spam**

RISKS; http://spf.pobox.com/ 23 16ff

SPF = "SENDER POLICY FRAMEWORK" OR "SOME PROBLEMS to FACE"?

Andrew Rose posted a note in RISKS alerting readers to a new project called SPF (Sender Policy Framework, <http://spf.pobox.com>) that uses "SPF records" to be published in the domain name system (DNS). E-mail sent with fraudulent headers would be identified because the sender would not match an authorized SMTP server registered in the DNS by means of these records. Rose wrote, "The technical work on SPF is now complete and adoption has started. Several thousand domains have published SPF records including some very large domains such as aol.com. Plugins exist for most of the popular MTAs - the only notable exception being MS Exchange." [MTA = Message Transfer Agent]

In a sharply worded riposte in RISKS 23.18, Markus Fleck-Graffe attacked the whole idea of SPF, pointing to these failings among others:

1) All forwarded e-mail must be rewritten (e.g., mailing lists must destroy the original header to substitute their own authorized domain);

2) Forwarded e-mails require a database of reverse mappings to allow bounce messages to reach the original sender;

3) Spammers will subvert the system by establishing their own SPF-enabled infrastructure using temporary domain names;

4) Worms will use the authentic e-mail addresses of their infected host PCs.

Also in RISKS 23.18, Ian Jackson criticized the SPF group for not using the IETF RFC mechanisms to stimulate discussion and improvements of the proposal but rather, "going for a publicity campaign to `bounce' people into adoption."

In RISKS 23.19, Lawrence Kestenbaum detailed the misery caused by spammers and worms that use his e-mail address in FROM lines, causing thousands of bounce messages to arrive at his address daily. He wrote in exasperation, "The critics of SPF suggest that spammers would simply find or invent other addresses to use. Frankly, I don't care about that, so long as they stopped plastering my personal address on hundreds of thousands of fraudulent and disreputable spam messages and viruses, and clogging my server's net connection with vast piles of misdirected bounces."

In RISKS 23.21, Ben Rosengart recommended doing away with the SRS (Sender Rewriting Scheme) part of SPF, leaving forwarded e-mail with the original header unchanged. Peter da Silva pointed out that "Implementing SPF would do nothing for the people receiving thousands of bounces (myself included). It would simply add another filter that bounced messages back to us because `we' weren't using the right server."

Dmitri Maziuk added to the conversation with the observation that "We know that slapping a band-aid onto implementation to fix deficiencies in design doesn't work and creates more problems…." He wrote, "We already have directory servers, we already have digital signatures. All we need is a way to query Domain Name Service for directory server of a domain, and a standard directory query-response for an e-mail address and associated public crypto key." He also darkly suggested that there would be resistance to this scheme from political forces who actually support spam for their own purposes: "…all "anti-spam" legislations are really there to legalize it. Ergo, all you're going to achieve by implementing SPF, blocklists, blacklists, whatever, is to open yourself to lawsuits from `legal' spammers."

In RISKS 23.23, Jonathan de Boyne Pollard bitterly points out that SPF is a short-term move in an arms race and that it fails to solve the underlying problems of SMTP (which include failure to authenticate message origins). He ends, "perhaps the fact that widespread adoption of SPF will do serious damage to the SMTP mail architecture is a good thing. In the battle against unsolicited bulk mail, we've concentrated upon the wrong problem time after time, with mechanisms that address the wrong thing and that don't address the actual "unsolicited" and "bulk" qualities of undesirable mail. SMTP has become less usable, more patchy, and more balkanised with each new bodge, yet continues to bend and not quite break completely. Perhaps the adoption of SPF will turn out to be the straw that finally breaks the camel's back, and that thus finally forcibly weans us off this bad habit of addressing the wrong problem."

2004-01-27 **spam history culture documented**

NewsScan

THE CULTURE OF SPAM

Who would ever have thought that spam would someday be chic, the subject of an avant-garde show titled "Reimaging the Ordovician Gothic: Fossils from the Golden Age of Spam." The display considers how future historians would view today's culture if all they had to go on was a vast collection of junk e-mail. A classification scheme sorts the spam into such categories as Real Estate, Urgent Messages, Work at Home, Goods and Personal Appearance, and the artists have scrawled representative excerpts from each on the walls of a gallery stairwell and packed suitcases with diet pills, house blueprints and some of the other wares frequently hawked online. Just as paleontologists have a hard time recreating the real Ordovician period, which ended about 443 million years ago, the perceptions about modern culture drawn from spam are quite misleading (and humorous): "Little is known of the physiology of the Ordovician body, but the outward appearance was greatly enhanced by drugs which shaped one to look more like those celebrated in Ordovician PORNOGRAPHY. These pills occasionally took the form of patches and other accessories. It is believed that, for a time, these patches took on significance as ultimately ceremonial jewelry," reads one of the plaques in the show. The display is on view at the Spaceworks Gallery in Manhattan through Feb. 7. (AP 27 Jan 2004)

NewsBits; http://zdnet.com.com/2100-1104_2-5149613.html
http://www.washingtonpost.com/wp-dyn/articles/A57681-2004Jan28.html

FTC proposes adult spam labels

The Federal Trade Commission on Wednesday proposed a mandatory tag for commercial e-mail that contains pornographic material--a stipulation of the new federal antispam law enacted this month. The FTC, which is charged with enforcing the Can-Spam Act, short for Controlling the Assault of Non-Solicited Pornography and Marketing, proposed a rule that would require senders of adult-related e-mail to include the phrase, "Sexually-Explicit-Content:" in messages. That way, recipients would be able to recognize and easily filter such e-mail before viewing it, according to the FTC and backers of the law.

NewsScan

PENNY A MESSAGE?

Microsoft and Yahoo are giving new life to the debate over whether imposing a small charge on senders of bulk e-mail messages would be the best way to defeat spam. Yahoo executive Brad Garlinghouse says that requiring electronic stamps for e-mail would force mailers to send only those offers a significant number of people might accept. "All of a sudden, spammers can't behave without regard for the Internet providers' or end users' interests." The idea doesn't sit well with everyone. Carnegie Mellon University professor David Farber, who runs a popular e-mail list focused on technology policy, warns: "I suspect the cost of postage will start out small and it will rapidly escalate." But the Internet Service Providers are more receptive to such plans, and Linda Beck of EarthLink says: "Sending large volumes of e-mail involve costs that are paid for by the ISPs and eventually by consumers. Should there be some sort of financial responsibility borne by the originators of these large-volume programs? I think there should." On the other hand, Charles Stiles, the manager of America Online's postmaster department, suggests that the plan simply won't do what it's meant to do, and reminds everyone that "it is the spammers who are the ones with the big pockets." WHAT'S IN A NAME?

Ever wonder how spammers come up with all those weird aliases they use to pepper your inbox with unwanted messages? Names like Elfrieda Billman and Beiderbecke P. Sawhorse? One possible source is a Web site run by August Kleimo, who built a random name-generator (www.kleimo.com/rand/name.cfm) using all the surnames from the 1990 U.S. census (free on the Census Bureau's Web site). Kleimo says he gets about 3,000 visitors a day, many of them hunting for unusual names to use for fantasy gaming characters, but admits it's possible that spammers are picking up some ideas from his site also. Other name-generator sites include one by Mike Campbell, a software developer and amateur etymologist. Behind the Name (www.behindthename.com/random.html) allows visitors to generate names in various languages, from Icelandic to classical Greek. Chris Pound, who works in the IT department at Rice University, has written more than 40 name generators, one of which merges names from the worlds of Harry Potter and Dickens (www.ruf.rice.edu/~pound). Security experts say it's difficult to outsmart spammers who use randomly generated names that can slip under the radar of so-called Bayesian filters, which target common words used in spam, like Viagra. A human might detect an obviously fake name, but "a filter can't really see the irony of Tupperware J. Smithington," says ePrivacy Group's chief privacy officer. (New York Times 5 Feb 2004)

2004-02-24 **e-mail sender authentication Caller ID spoofing spam**

http://www.microsoft.com/mscorp/twc/privacy/spam_callerid.mspx

In February 2004, Microsoft announced the "Caller ID for E-Mail Technical Specification." The Microsoft announcement included the following text:

"Caller ID for E-Mail: The Next Step to Deterring Spam" is the Microsoft draft specification to address the widespread problem of domain spoofing. Domain spoofing refers specifically to the use of someone else's domain name when sending a message, and is part of the larger spoofing problem, the practice of forging the sender's address on e-mail messages.

Caller ID for e-mail would verify that each e-mail message originates from the Internet domain it claims to come from. Eliminating domain spoofing will help legitimate senders protect their domain names and reputations, and help recipients more effectively identify and filter junk e-mail.

• Send your comments. We are circulating this initial technical specification for comment because we believe that your feedback can help make it stronger. Before sending a response, please make sure that you have reviewed and that you agree to the terms and conditions outlined in the specification. Please send your questions, suggestions, and comments to LessSpam@microsoft.com.

• Implement the Caller ID for E-Mail specification. For instructions on how to protect your domain name from spoofing using Caller ID for e-mail, please see "Protecting Domain Names from Spoofing: A Guide for E-Mail Senders."

If you're interested in implementing this specification in software, please review the terms of the Caller ID for E-Mail Implementation License before you begin, as the patent license expands upon the rights that Microsoft would grant you or your organization.

The site includes links for two documents: "Caller ID for E-Mail: The Next Step to Deterring Spam" and "Protecting Domain Names from Spoofing: A Guide for E-Mail Senders" which are both available as PDF documents.

2004-03-12 **electronic e-mail junk spam anti-spam ISP lawsuit litigation**

NIPC/DHS

March 10, Associated Press — ISPs sue over spam e-mails.

Some of the nation's largest Internet providers, in an unusual joint effort, said Wednesday, March 10, they filed six lawsuits against hundreds of people who were accused of sending millions of unwanted e-mails in violation of the new U.S. law against "spam." The legal actions represent the first major industry actions under the "can spam" legislation that went into effect January 1. The lawsuits were filed in federal courts in California, Georgia, Virginia and Washington state. The companies said the defendants include some of the nation's most notorious large-scale spammers. The Internet providers--collectively with tens of millions of subscribers--said they shared information, resources and investigative information to identify some of the defendants. Dozens of those named in the lawsuits, however, were identified only as "John Doe" defendants who were accused of e-mailing unwanted pitches for prescription drugs, herbal potions and weight loss plans. The "can spam" legislation requires unsolicited e-mails to include a mechanism so recipients could indicate they did not want future mass mailings. The law also prohibits senders of unsolicited commercial e-mail from disguising their identity by using a false return address or misleading subject line, and it prohibits senders from harvesting addresses off Websites.

2004-03-15 **mobile cell phone spam control Federal Communications Commission**

NIPC/DHS

March 11, Washington Post — FCC sets sights on mobile phone spam.

The Federal Communications Commission (FCC) today took its first steps toward banning spam that targets mobile phones and other wireless devices. The FCC said it will ask the public to submit comments on the best ways to prevent the growth of mobile phone spam, a problem that is still uncommon in the United States though experts agree that it--along with instant messaging spam--is getting worse. The commission is required to develop the rules because of a recently enacted federal law that tries to stop the expanding spam problem. Signed into law by President Bush last December, the Can-Spam Act mostly targets e-mail spam but recognizes that cellphones and other wireless devices are prime targets for unsolicited advertising. The law gives the FCC less than a year to draft rules to allow consumers to prevent spammers from contacting them on their wireless devices. The commission also is seeking public comment on whether commercial messages should be clearly labeled and whether mobile phone service providers have to get authorization from their customers before sending them commercial messages.

2004-03-22 **anti-spam struggle ISPs consumer corporate problem**

NewsScan

ISPs STRUGGLE TO FIND FIX FOR SPAM

Unless you've been hibernating the last six months, you know that spam not only is a consumer headache — it's turning into a corporate nightmare. U.S. companies spend an estimated $1 billion a year in extra security, human resources and lost productivity thanks to this cyber-plague, which comprises anywhere between 50-90% of all e-mail. Despite universal agreement on the problem, major ISPs have not been successful in devising a coordinated approach to fight it, relying instead on lawsuits that at best will be only marginally successful at stemming the flow. Yahoo reportedly is moving toward implementing a DomainKeys system that's used to verify the identity of an e-mail sender, while AOL has recently begun testing a DNS-based system called Sender Policy Framework (SPF). Meanwhile, Microsoft has developed its own system called Caller ID for E-mail and several other efforts, such as the Trusted E-Mail Open Standard, are also available. Experts agree that the balkanization of ISP efforts to deal with spam will delay any final solution, and they're looking to the IETF (Internet Engineering Task Force) to come up with a solution that incorporates the best features of these disparate systems. "Sooner or later, we are going to see what is going to be a compromise proposal that includes elements from the more workable proposals being put forward — DomainKeys and SPF, for example," says the CTO for Outblaze, an e-mail service provider. AUSTRALIAN JUNK E-MAIL LAWS TAKE EFFECT

Hard-core spammers will be the main target when Australia's communications watchdog begins to enforce anti-spam legislation beginning this Saturday. While penalties of $1.1 million a day will be reserved for prolific spammers, most complaints about spamming will be treated with a simple phone call, according to the Australian Communications Authority. The ACA's focus will be on compliance, says Anti-Spam team manager Anthony Wing. "We are really targeting, in the first instance, the hard-core spammers. As long as people are trying to comply in the first instance, if we get a complaint it will result in a phone call." Wing says reducing the amount of spam that hits Australia's borders is a "longer program" that requires international co-operation. (The Age 6 Apr 2004)

2004-04-08 **anti-spam dot mail domain white list certified spam free**

NewsScan

ANTI-SPAM GROUP PROMOTES DOT-MAIL DOMAIN

Anti-spam organization Spamhaus is proposing a new "dot-mail" domain that would act as a "white list," guaranteeing that all mail sent from it would be spam-free. Companies with dot-mail addresses would be required to ask e-mail recipients for their permission to send mail as well as a confirmation upon receipt. Spamhaus has offered to review all dot-mail applicants to ensure that they are legitimate, but would charge a hefty fee of $2,000 to do so. One big uncertainty is whether ICANN will approve the new domain, which is under consideration along with dot-tel, dot-travel and dot-xxx, among others. E-mail marketers have expressed interest in the idea, although there's concern over how it would be managed. "There doesn't seem to be any process built in for how to get yourself one of these dot-mail names if they don't choose to give it to you," says a Direct Marketing Association spokesman. The biggest hurdle, however, will be convincing the major ISPs to go along, says Al DiGuido, CEO of bulk e-mailer Bigfoot Interactive. "This idea is stillborn until that happens. Unless Yahoo, MSN or AOL gets behind them, it's going to be a real uphill battle." (Washington Post 8 Apr 2004)

FTC DEMANDS EXPLICIT LABELING OF EXPLICIT SPAM

If you can't stop them, label them. The Federal Trade Commission is requiring pornspam e-mail messages to have an explicit warning on the subject line so that Internet users can easily filter them out. Beginning the 19th of next month, such messages will have to bear a label reading "SEXUALLY-EXPLICIT:" and the messages themselves will be prohibited from containing graphic material. This new federal standard will supersede state laws requiring such labels as "ADV:ADULT" for pornspam. (Reuters/USA Today 14 Apr 2004)

2004-04-29 **spam spammers criminal charges California junk e-mail illegal CAN-SPAM Act**

NewsScan

FOUR SPAMMERS FACE CRIMINAL CHARGES

Four California men face criminal charges for sending millions of junk e-mail messages, becoming the first spammers to be charged under the recently enacted federal CAN-SPAM Act. Christopher Chung, Mark Sadek and Daniel and James Lin are accused of secretly hijacking proxy servers -- systems that relay e-mail from any point on the Internet -- owned by unsuspecting businesses such as Ford Motor Co., Unisys and Amoco, and government agencies, including the Administrative Office of the U.S. Courts and the U.S. Army Information Center. The use of proxy servers is a favorite trick among spammers to disguise their identity. "This has been a problem that's plagued the Net for years, and the fact that corporations and government agencies still have open mail servers is scandalous," says one security consultant. "Somebody dropped the ball." If convicted, the men face up to five years in prison for violating the anti-spam law, as well as up to 20 years for mail fraud for distributing an allegedly fraudulent weight loss skin patch. The group also sent spam mail hawking male organ enlargement pills and Viagra. Terence Berg, the assistant U.S. attorney handling the case, warns that this lawsuit is a harbinger of more to come: "This is just a start. There will be many more prosecutions like this. The government is determined to do something about the flood of spam that is polluting the Internet." (Detroit Free Press/SiliconValley.com 29 Apr 2004)

2004-04-30 **US new anti-spam law CAN-SPAM act charge**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1578981,00.asp

April 30, Associated Press — U.S. Charges four under new anti-spam law.

Federal authorities say they managed to pierce the murky underworld of Internet spam e-mails, filing the first criminal charges under the government's new "can spam" legislation. Court documents in the landmark case in Detroit, MI, describe a nearly inscrutable puzzle of corporate identities, bank accounts and electronic storefronts in one alleged spam operation. At one point, investigators said, packages were sometimes delivered to a restaurant, where a greeter accepted them and passed them along to one defendant. Officials at the Federal Trade Commission told U.S. postal investigators they had received more than 10,000 complaints about unwanted e-mails sent by the defendants. Court records identified the defendants as Daniel J. Lin, James J. Lin, Mark M. Sadek and Christopher Chung of West Bloomfield, MI. They were accused of disguising their identities in hundreds of thousands of sales pitches for fraudulent weight-loss products and delivering e-mails by bouncing messages through unprotected relay computers on the Internet. The "can spam" legislation, which went into effect January 1, requires unsolicited e-mails to include a mechanism so recipients can indicate they do not want future mass mailings.

2004-05-14 **spam club fighting forum gatecrash Spamhaus techniques IRC DDoS**

DHS IAIP Daily; http://www.theregister.co.uk/2004/05/14/spam_club/

May 14, The Register — Spam fighters infiltrate spam clubs.

Spam fighters are gaining vital clues in the battle to keep in-boxes clean of junk mail by infiltrating spammer clubs. Online spammer forums like the Pro Bulk Club the Bulk Club and bulkmails.org have been gatecrashed by activists from organizations like Spamhaus. Steve Linford of Spamhaus said spammers know this already but they don't know who amongst their number is working for the other side. In theory invitation to the members-only forums of these sites is only by invitation and only to individuals who have a proven track record in spamming. Apart from playing with the paranoia of spammers, the undercover investigation cast light on the latest spammer techniques. Instead of using open mail relays or unscrupulous hosts, spammers are using compromised machines to get their junk mail out. Viruses such as My-Doom and Bagle surrender the control of infected machines to hackers. This expanding network of infected, zombie machines can be used either for spam distribution or as platforms for DDoS attacks, such as those that many online bookies have suffered in recent months. Trade in machines for DDoS attacks normally happens in more in more anonymous IRC channels but spammers are tapping into the same resource.

DETECTIVES FOLLOW THE MONEY TRAIL TO TACKLE SPAM

It seems like spammers have been working overtime since the federal antispam legislation took effect Jan.1, and the government is now turning away from technical fixes offered by software engineers in favor of private investigators' expertise to boost their efforts to stem the deluge of unsolicited e-mail. In an unusual arrangement, the Direct Marketing Association has paid $500,000 to hire 15 investigators to work alongside the FBI agents and other government officials in a program known as Project Slam-Spam. The project has built a case against 50 spammers, mostly by
following the money trail and relying on informants. "Spammers are more than willing to rat each other out," says Microsoft investigator Sterling McBride. "The most useful information is who pays for various aspects of the spam operation," says attorney David Bateman, who represents Microsoft
in spam cases. "To spam, you need four or five things -- a hosting service, a domain name, mailing software, mailing lists and so on. Each one you have to purchase from someone." Microsoft has filed 53 civil cases against spammers in the last 15 months, based on the work of its investigation
team. "The real key is trying to figure out how to connect the virtual world" with "someone you can hold responsible for this," says McBride. Once you've nailed that down, "you can use all the tools of a normal investigation." (New York Times 31 May 2004)

DHS IAIP Daily;
http://news.com.com/Wireless+spam+draws+regulators%27+wrath/ 2100−1028_3−5296649.html?tag=nefd.top

August 04, CNET News.com — Wireless spam draws regulators' wrath.

The Federal Communications Commission (FCC) on Wednesday, August 4, said that commercial e-mail messages to cell phones or handheld computers would not be permitted unless the recipient had asked to receive the correspondence in advance. But the FCC's decision not to restrict unsolicited text messages sent through mechanisms like SMS, which stands for short message service, creates a potentially huge regulatory loophole affecting tens of millions of Americans. Wireless providers often charge a few pennies per text message received. Verizon Wireless subscribers exchanged 2.3 billion text messages last quarter, up from 2.1 billion during the previous quarter. Cingular Wireless reported 1.4 billion text messages were sent during its last quarter. The FCC's rules permit mobile providers to register their Internet domain names in a master database that spammers are supposed to honor. That database will include only domain names like attwireless.com and t-mobileusa.com, and not individual e-mail addresses of subscribers.

2004-08-13 **Federal Trade Commission FTC CAN-SPAM spam definition junk unsolicited commercial e-mail**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/26907−1.html

August 13, Government Computer News — FTC proposes definitions for spam.

The Federal Trade Commission (FTC), as the primary enforcer of the CAN-SPAM Act, was required by Congress to define the criteria for determining the primary purpose of an e-mail. If the primary purpose is commercial, the e-mail is subject to the act. CAN-SPAM, which went into effect January 1, prohibits unsolicited commercial e-mail from using misleading subject lines or phony "from" addresses, and requires them to include a valid postal address and a working e-mail address for opting out of future messages. In a notice of proposed rulemaking published Friday, August 13, in the Federal Register, FTC proposed three criteria for different types of messages. The three proposed criteria are based on a single principle: "Determining the primary purpose of an e-mail message must focus on what the message's recipient would reasonably interpret the primary purpose to be. " FTC is accepting public comment on the proposal through September 13. Electronic comments should be submitted through the online form available at https://secure.commentwork.

DHS IAIP Daily; http://www.newscientist.com/news/news.jsp?id=ns99996292

August 19, New Scientist — DNA technique protects against 'evil' e-mails.

A technique originally designed to analyze DNA sequences is the latest weapon in the war against spam. The algorithm, named Chung-Kwei, is based on the Teiresias algorithm, developed by the bioinformatics research group at the Thomas J. Watson Research Center in New York. Instead of chains of characters representing DNA sequences, the research group fed the algorithm 65,000 examples of known spam. Teiresias identified six million recurring patterns in this collection. Each pattern represented a common sequence of letters and numbers that had appeared in more than one unsolicited message. The researchers then ran a collection of known non-spam through the same process, and removed the patterns that occurred in both groups. Incoming e-mail was given a score based on how many spam patterns it had. The Chung-Kwei correctly identified 64,665 of 66,697 test messages as being spam or 96.56 percent. Its rate of misidentifying genuine email as spam was just one in 6000 messages.

SOME VICTORIES AGAINST SPAMMERS AND OTHER ONLINE CRIMINALS

Attorney General John Ashcroft will announce today that federal and state law enforcement agencies have arrested or charged dozens of people for crimes related to spam, identity theft, online credit card fraud, and other criminal uses of computers and networks. Much of the funding for the
operation came from the Direct Marketing Association, whose former president says: "We felt that the key to the new law was enforcement. We want spammers to realize that spam is not a free game for them and that they face real penalties if they continue." Steve Linford, director of the U.K.-based
anti-spam organization called Spamhaus Project, is cautiously optimistic: "Spammers believe that they will never be caught. If they [law enforcement officials] get 10, 20, 30 well-known spammers, the rest of the spam community will start to notice. Any spammers who can be made to give up because they think the F.B.I. is getting too close is very good for us." On the other hand, Linford fears that a victory in one place just sets up a new challenge somewhere else: "Next year and the year after we are going to see Russia as the main spam problem." 2004-09-08 **anti-spam technology subverted SPF Sender Policy Framework authentication MX Logic**

NewsScan

SPAMMERS TAKE ADVANTAGE OF SENDER VERIFICATION PROTOCOL

A new study by MX Logic indicates that about 16% of spam mail senders are using a protocol known as Sender Policy Framework (SPF), which has been touted as a spam-blocking tool, thanks to its sender authentication capabilities. "Authentication (with SPF) by itself is not a spam cure-all.
SPF -- as it relates to having an impact on spam -- will hurt only those who spoof domains. You are still going to need content filtering to see if the message was unsolicited," says MX CTO Scott Chasin. Chasin maintains that SPF is only part of the answer to the spam problem: "SPF is great at
combating fraud such as phishing. Phishing attacks are all about spoofing someone's domain name." Chasin says rather than relying on SPF to cut spam, ISPs should be looking into services that could provide subscribers with some kind of measure of the e-mail sender's reputation by certifying some servers as belonging to "good" e-mail senders. "The e-mail filters could then let through legitimate e-mail. It would be 'guilty until proven innocent,'" says Chasin. (CNet News.com 8 Sep 2004)

2004-09-17 **e-mail junk unsolicited spammer arrest hunt search bounty Federal Trade Commission FTC America Online AOL objections**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A27220−2004Sep 16.html

September 17, Washington Post — Cash bounties for spammers win limited FTC backing.

The Federal Trade Commission (FTC), on Thursday, September 16, gave limited endorsement to offering cash rewards to people who help track down e-mail spammers, suggesting that such bounties might work but in fewer circumstances than had been pushed by some anti-spam activists. Congress asked the FTC to study two possible techniques as part of the first federal anti-spam law passed late last year. In June, the FTC recommended against the first technique, a do-not-spam registry, saying it would not work and might lead to more spam. The notion of bounties drew particular credence when it was pushed by Lawrence Lessig, a Stanford University law professor and one of the country's foremost thinkers on cyberspace law and policy. But the major Internet providers, who have their own spam-fighting operations, counseled the FTC against the idea. An America Online Inc. spokesperson, Nicholas J. Graham, said the use of bounty hunters can create its own set of legal problems that could complicate prosecutions. The commission estimates that rewards would need to be in the range of $100,000 to $250,000, which Congress would need to fund because those amounts are unlikely to be covered by damages won in court.

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A18746-2004Nov2.html

POLITICAL E-MAIL SMACKS OF SPAM

An online survey of 1,000 U.S. Internet users indicates that unsolicited e-mail supporting both the Bush and Kerry presidential campaigns were common in the past few weeks, and about 20% of recipients said the messages may have affected their votes. "The cat's out of the bag," says Anne Bonaparte, president of MailFrontier, which commissioned the study. "E-mail is a powerful communications tool and it has vulnerabilities that are being exploited by people who have a point to make." Engaging in political spam does entail the risk of backlash, however, says Jonah Seiger, cofounder of Connections Media. "Spam is a tactic of snake oil salesmen. I don't see an advantage for a group or a candidate associating themselves with this technique." Meanwhile, Larry Purpuro, president of Republican online consulting group RightClick Strategies disagrees: "In the 2004 election, political e-mail is a tactical nuclear weapon. It is to a large extent under the radar screen, but its ability to target and to penetrate the attention of individuals makes it an extremely effective communications tool." Spam advocating a political position is free speech, protected by the First Amendment, and is not considered illegal under the law. (Washington Post 2 Nov 2004)

SPITTING MAD AT SPAM

Spam over Internet telephony, known as SPIT, will become commonplace as more people make phone calls over the Internet. Internet researcher Michael Osterman warns that Web-based phone systems attacked by spam will "trash voice-mail systems," and explains: "You can easily delete 100 spam text messages. But try to weed through a voice-mail system filled with 100 unsolicited pitches. That's a pain." Spam is already appearing frequently on instant messages, cell phones, and blogs, and one executive of an Internet service provider admits: "As everything gets connected, there are more ways to spam consumers. Spam is everywhere." (USA Today 9 Nov 2004)

CYBERSPACE ACTIVISM

The German-based Web portal Lycos Europe is offering a screensaver program that chokes spam servers by flooding them with junk traffic. The company argues that what it's doing is perfectly legal, but former FCC chief technologist David Farber comments: "You don't stop a bad thing by being bad yourself. The idea of somebody coming and hitting you and you hitting back, you both end up very hurt. It just aggravates an already serious problem." And noted computer security expert Dorothy Denning, a professor of defense analysis at the Navy Postgraduate School, points out that cyberspace activism of the kind offered by Lycos Europe is likely to have only minimal impact on spam because "the cost of adding extra bandwidth may be worth the reward" that spammers get from their activities. She adds: "The interesting question is whether or not that company [an anti-spam activist company] might be liable under some law, and would probably be liable, certainly, at least under a lawsuit by the spammers." 2004-12-20 **spam judgement federal judge RICO Iowa racketeering damages**

NewsScan; http://online.wsj.com/article/0

JUDGE SLAMS SPAMMERS WITH $1-BILLION JUDGMENT

A federal judge in Iowa has awarded a small ISP more than $1 billion in damages in what's believed to be the largest judgment ever against spammers. The case was brought by Robert Kramer, whose company provides e-mail service to about 5,000 customers, and who filed suit after his inbound mail servers were jammed with as many as 10 million spam-mails a day in 2000. Citing federal racketeering laws (RICO) and the Iowa Ongoing Criminal Conduct Act, U.S. District Judge Charles R. Wolle ordered AMP Dollar Savings of Mesa, Ariz., to pay $720 million; Cash Link Systems of Miami, Fla., $360 million; and TEI Marketing Group, also of Florida, $140,000. "It's definitely a victory for all of us that open up our e-mail and find lewd and malicious and fraudulent e-mail in our boxes every day," said Kramer, who is unlikely to ever collect on the judgments. 2004-12-28 **America Online AOL report spam decline 2004 legislation CAN SPAM act**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A30433−2004Dec 27.html

December 28, Washington Post — America Online reports decline in spam in the past year.

America Online (AOL) said Monday, December 27, that it has seen a substantial decline in unsolicited e-mails this year, though some anti-spam experts said the company may be the only Internet provider experiencing such a drop-off. The average number of so-called spam e-mails that AOL blocked daily dropped from a peak of 2.4 billion in 2003 to 1.2 billion late this year. AOL credited anti-spam legislation, such as the federal Can-Spam law, as well as its own spam-filtering software tools, for the decline. AOL remains the largest Internet service provider, with 29 million subscribers worldwide. But an anti-spam expert said AOL's apparent success may not mean that the rest of the Internet is seeing fewer bulk e-mail spam. John Levine, chairman of the Anti-Spam Research Group said, "There are a lot of spammers who specialize in AOL" because the company has such a large subscriber base. Levine said some bulk e-mailers may have backed down from assailing AOL subscribers as a result of the company's aggressive legal actions against spammers. Other Internet providers reported that they have not seen much change in the volume of spam traffic on their networks.

2005-01-11 **adult e-mails CAN-SPAM ACT FTC memberships**

EDUPAGE; http://www.wired.com/news/politics/0,1283,66240,00.html

ADULT E-MAILS SHUT DOWN BY CAN-SPAM ACT

The Federal Trade Commission (FTC) has won an injunction against six companies accused of sending thousands of spam messages that failed to meet the requirements of the CAN-SPAM Act. According to the FTC's complaint, the companies sent e-mail that directs recipients to adult Web sites but did not include the phrase "sexually explicit" in the subject line, as required by the antispam law. The e-mails also did not provide opt-out functions to recipients and falsely promised free memberships with the Web sites involved. The temporary injunction issued by a court in Las Vegas marks the first time the requirements of the CAN-SPAM Act regarding adult content have been used. The FTC will ask the court to make the injunction permanent. In addition, those who operate the Web sites that benefit from unlawful spam can be held accountable under the CAN-SPAM law.

FTC SHUTS DOWN X-RATED SPAMMERS

The Federal Trade Commission has won a preliminary injunction against six companies accused of profiting from sexually explicit junk e-mail. The injunction, granted by U.S. District Court Judge Philip M. Pro, will last the duration of the FTC's civil suit against the companies. The case marks the first time the FTC has taken action under a rule included in the last years "Can Spam" Act that requires a label identifying sexually explicit e-mail in the subject line. The law also holds liable Web site operators who benefit from fraudulent pornographic spam. "It's not just the people who push the buttons to send spam" who are liable," notes FTC marketing practices division director Eileen Harrington. Named in the FTC complaint are Global Net Solutions, Open Space Enterprises, Southlake Group and WTFRC Inc., all of Nevada; Global Net Ventures of London; and Wedlake Ltd., which is based in Riga, Latvia. EDUPAGE; http://news.com.com/2100-1030_3-5536356.html

TEXAS TARGETS NOTORIOUS SPAMMERS

The attorney general of Texas has filed a civil lawsuit against two individuals believed to be responsible for millions of illegal e-mail solicitations. Ryan Samuel Pitylak, a student at the University of Texas, and Mark Stephen Trotter of California operate two companies, PayPerAction and Leadplex. Spamhaus.org, a watchdog group that monitors spam, has identified the two companies as being among the top five spam operations worldwide. Prosecutors allege that the e-mails sent by the two companies violate state and federal laws, including the CAN-SPAM Act, by including misleading subject lines and fraudulent information in the body of the messages. The defendants, who are also accused of violating Texas trade practices, face millions of dollars in fines, though no criminal charges were filed against them. An attorney for the defendants said his clients' businesses are in full compliance with all applicable laws, including the CAN-SPAM Act. CNET, 14 January 2005

2005-02-04 **new spamming technique Internet service provide ISP computer exploitation spammer technique sophistication**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A61901−2005Feb 3.html

NEW SPAMMING TECHNIQUE USES ISP COMPUTERS.

An advanced spamming technique could push the volume of unwanted e-mail to new heights in coming months, straining the integrity of the online communication system, according to several top experts who monitor the activity of spam gangs around the world. Illegal bulk-mailers have been able to deploy massive blasts of spam by routing it through the computers of their Internet service providers (ISPs), rather than sending it directly from individual machines, the experts said. The result is that "blacklists" of known spamming computers -- which other network operators rely upon to block mail from those machines -- are no longer effective. To block spam coming directly from an ISP's computers, all mail from that ISP would be have to be blocked, which would cripple electronic communication. The new method of attack reflects the evolving sophistication and efficiency of top spamming groups, a community of people who support each other by trading intelligence, products and services. Some ISPs have been able to make dents in the amount of spam reaching the inboxes of computer users, but spam traffic over the Internet continues to rise and to exact steep costs on network operators, businesses and consumers.

2005-02-04 **blacklists ISP Internet service provider open spam relay e-mail technique cost estimates**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A61901-2005Feb3.html

SPAMMERS TRY A NEW TACK

Tired of being blocked by "blacklists," spammers are turning to a new technique -- routing it directly through the computers of their Internet service providers, rather than sending it from individual machines. The result poses a dilemma: to block spam coming directly from an ISP's servers would mean blocking all its mail, crippling the system. "From what we've seen, the volumes of this type of spam are going up dramatically," says Steve Linford, who heads up the Spamhaus Project. "We're really looking at a bleak thing" if ISPs don't quickly deploy countermeasures, he adds. Such measures could include more aggressive monitoring and limiting how much mail is being sent from individual machines on their networks. In addition, ISPs should beef up efforts to authenticate mail they pass on through their own computers, says Linford. A study released yesterday estimates that deleting spam costs nearly $22 billion per year in lost productivity, based on a survey of 1,000 adults who said they spend about three minutes per day trashing spam when they check their e-mail. 2005-02-09 **wireless domain spam free Federal Communications Commission FCC regulations working list disclosure**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,119620,00.asp

LIST OF WIRELESS DOMAINS THAT CANNOT RECEIVE SPAM.

The U.S. Federal Communications Commission (FCC) took a major step this week toward fighting unwanted e-mail messages sent to wireless phones and pagers by publishing a list of wireless mail domain names. The FCC, which published the list late Monday, February 7, has ruled that starting in early March, it will be illegal to send most commercial messages to users of wireless phones with addresses that include any of the published domain names. Wireless spam, still limited in the U.S., has generated significant customer complaints in other countries including Japan and India. Senders who violate the FCC rules and send commercial e-mail to the wireless mail domains on the list face fines of up to $11,000 per violation. Scott Chasin, chief technology officer at MX Logic, an antispam software vendor said that the FCC list has one potential downside--it provides spammers with a working list of wireless mail domains. The list is available at: http://www.fcc.gov/cgb/policy/DomainNameDownload.html

2005-02-21 **instant messaging spim statistics**

NewsScan; http://www.pewinternet.org/PPF/p/1052/pipcomments.asp

BATTLING THE SPIM-MEISTERS

Almost one in three instant-messaging users in the U.S. have received some kind of "spim" (unsolicited commercial instant messages), according to a survey by the Pew Internet & American Life Project. Results indicate that users age 30 and younger are more likely to get spimmed, compared with the next older age cohort (31-49). Other than the age discrepancy, however, no other demographic trends were discernible, says Pew: "Instant message users in all income brackets and in all racial and ethnic groups are equally likely to receive spim. Somewhat surprisingly, broadband users at home are no more likely than dialup users to receive spim, even though, presumably, those with always-on broadband connections keep their instant message programs running for longer periods of time than dialup users." The survey found that 52 million Americans -- 42% of the online population -- use instant messaging, and among the 30- and-under age group, it's 66%. NewsScan; http://news.com.com/U.S.+makes+first+arrest+for+spim/2100-7355_3-5584574.html

FIRST SPIMMER ARREST

An 18-year-old New York teenager has become the first person to be arrested on suspicion of spimming. Anthony Greco allegedly sent 1.5 million messages hawking pornography and mortgages to users of MySpace.com's IM system, and was arrested in a sting operation in the Los Angeles Airport last Wednesday following an extortion attempt on his part. Greco believed he was flying to LA to seal a deal with the president of MySpace.com, whom Greco had threatened with publicizing his spim techniques if he were not granted an exclusive marketing arrangement that would have legitimized his spimming activities. Assistant U.S. Attorney Brian Hoffstadt says that while Greco's case marks the first criminal prosecution of instant message spamming, there may well be more to come: "We're just beginning to get the tip of the iceberg. This could be a new wave as online communities start up." (CNet News.com 21 Feb 2005)

SPAMMERS STRIVE FOR ORIGINALITY TO DECEIVE ANTI-SPAM FILTERS

Dan Wallach reported on his detailed analysis of how spammers are defeating sophisticated anti-spam filters: they are using attributes of normal mail and avoiding obvious characteristics of spam.

>Recently, I've gotten a number of spams that have perfect spelling and vanilla plain text (as opposed to the insane HTML ov3rki!! Variety). If you look at the mail headers, there's some evidence of zombie machines being used to transmit the spam (i.e., received lines not matching up to the From or Sender line) but otherwise the headers are quite clean. For the message in front of me right now, the user agent is even listed as Mozilla on Linux. DSPAM has a clever feature where it will tell you what factors in the message it used to make its decision. In this case, DSPAM latched onto the User-Agent string and other Mozilla-esque headers as having a very low probability of being spam. This outweighted a few strings that otherwise should have tipped it off (e.g., "credit history" or "secure, private").<

He concluded,

>In some sense, this is exactly what Paul Graham predicted would eventually happen in "A Plan For Spam". My hope is that I can eventually untrain DSPAM of its love for Mozilla headers; we'll see how well it does. My fear is that there will always be an avenue of attack for a "contrarian spammer" who engineers spam to be unlike all the other spams out there.<

DHS IAIP Daily;
http://www.boston.com/business/technology/articles/2005/05/12/judge_orders_spammers_websites_shut/

JUDGE ORDERS SPAMMERS' WEBSITES SHUT

A Massachusetts state Superior Court judge Wednesday, May 11, issued an emergency order to shut down dozens of Websites, as Massachusetts investigators working with Microsoft Corp. moved against what they described as a Boston-based ring of Internet spammers responsible for one of the world's most prolific spam operations. In a civil suit filed with the court Wednesday, state Attorney General Tom Reilly accused Leo Kuvayev and six other defendants with violating state and federal consumer protection laws by masterminding a global network of spammers who have sent hundreds of millions of e-mail messages directing recipients to Websites with names like oemcd.biz or genericpharmacies.biz. The messages, and the Websites, seek to lure consumers into buying low-interest mortgage loans, pirated software, knockoffs of designer watches, pornography, and counterfeit drugs of prescription brand names. Massachusetts and Microsoft officials said the spammers, whom they dubbed the "Internet Spam Gang," unleashed the largest volume of e-mail they've seen from one group. State officials have not brought criminal charges against the seven defendants.

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2139427/spam−supremo−smith −sued

SUSPECTED SPAMMER SMITH SEIZED

Suspected spammer Christopher Smith, nicknamed the Rizler was arrested at a Minneapolis, MN airport shortly after stepping off a flight from the Dominican Republic, where he had been operating since a U.S. federal judge in May shut down his companies, Burnsville Internet and Xpress Pharmacy Direct, and ordered him to stop selling drugs online. Smith had since set up similar operations in the Dominican Republic, through which he is alleged to have sent more than a billion spam emails either to AOL email addresses or through AOL email accounts. The FBI claims that Smith has already made about $18 million this year. Federal authorities raided Xpress Pharmacy and Smith's home on 10 May, seizing his passport and $4.2m in assets, including a $1.1m house and luxury cars worth $1.8m. At the same time the FBI closed down his 85-employee company. Investigators concluded that Smith had been selling medicines to customers without proper prescriptions, and selling drugs without a licence. The U.S. Attorney's office claims that Smith had broken court orders and is recommending that he be held in criminal contempt and jailed for six months.

2005-07-27 **anti-spam content filtering censorship political bias**

RISKS 23 95

ARE SOME ANTI-SPAM SERVICES CENSORING MAIL FOR POLITICAL REASONS?

Pete Klammer voiced concern over possible interference in the political process by corporations running anti-spam services.

>In the run-up to the 2004 election, I found activist messages about (against) Arnold Schwarzenegger were being screened by ACM's e-mail screening service controlled by Postini. I was only able to verify this, and retrieve my messages, because I had chosen the "quarantine" option, and checked the quarantine area soon enough, before the messages were permanently expunged.

Now we hear that messages regarding the Downing Street memos have been blocked from Comcast.net customers (one of the largest high-speed cable internet providers in the U.S.), based on content of the message -- a URL -- rather than subject line or sender address or domain.

The potential for (mis)information manipulation by large and powerful corporations is frightening, particularly as U.S. Law exempts them from "common carriage" legal requirements. We would never (I hope!) stand for our telephone company to redirect our flight-reservation phone call to a different airline "partner" company; why must we tolerate such distortion on the Internet?<

* * *

In a a follow-up response in RISKS 23.96, Craig A. Finseth expressed skepticism about Klammer's hypothesis: "Probably because you asked them to: Postini is an anti-spam service which provides mechanisms for you to control what is filtered (as well as a heck of a lot of stuff that they do for you). My ISP uses it and offers me full control over the amount of filtering done, including complete disabling."

2005-08-04 **spam anti-spam efforts litigation ruling University of Texas White Buffalo Ventures student e-mail addresses CAN-SPAM Act**

EDUPAGE; http://insidehighered.com/news/2005/08/04/ut

COURT UPHOLDS UNIVERSITY BLOCK ON SPAMMER

A federal appeals court ruled in favor of the University of Texas (UT) in its dispute with White Buffalo Ventures over thousands of spam e-mails sent by the company to students of the institution. In 2003, White Buffalo, which operates an online dating service geared toward UT students, began sending thousands of messages to student e-mail addresses it had obtained through public records. After receiving many complaints from students, the university blocked White Buffalo's e-mails, a move the company said infringed on its First Amendment rights and its rights under the CAN-SPAM Act. A federal judge disagreed with White Buffalo, and the current ruling supports that decision. The three-judge panel of the appeals court found that the institution is within its rights to place restrictions on commercial speech if such restrictions can be shown to legitimately benefit constituents--in this case, UT's students. Observers noted that the court's rejection of White Buffalo's CAN-SPAM argument is important in that it presents a significant roadblock to organizations that would try to use the law to make it easier, rather than more difficult, to send unsolicited e-mail. TOP SPAMMER SCOTT RICHTER SETTLES ON $7M PENALTY TO MICROSOFT

Microsoft has reached a settlement with Scott Richter, a man once described as one of the top three spammers in the world. Efforts by Microsoft and New York Attorney General Eliot Spitzer in 2003 resulted in the collection of 8,000 e-mail messages containing 40,000 fraudulent statements sent by Richter's company, OptInRealBig. Richter earlier agreed to pay New York State $50,000; under the new settlement, Richter will pay Microsoft $7 million. According to Bradford L. Smith, chief counsel for the software giant, $5 million would be used to "increase our Internet enforcement efforts and expand technical and investigative support to help law enforcement address computer-related crimes," while another $1 million will be spent on improving computer access for the poor in New York State. The settlement also requires Richter to comply with state and federal laws governing e-mail and to submit to oversight of his company's operations for three years. DHS IAIP Daily; http://www.usatoday.com/tech/news/computersecurity/2005−
10−2
5−holiday−spamalanche_x.htm

PROJECTED INCREASE IN SPAM, SPIM & SPLOGS WILL PLAGUE PC USERS

Internet security experts are warning consumers of a wave of unwanted commercial e-mail in the weeks leading up to Thanksgiving, when the amount of spam could double as marketers try to reach holiday shoppers. The increase in spam is also due to the fact that more viruses are being spread by instant-messaging (IM) services that infect PCs and then turn them into zombies - machines that are remotely controlled by hackers to spread spam and more viruses. According to Andrew Lochart, director of product marketing at e-mail security company Postini, attacks on IM services increased 350 percent, to 541, in the second quarter from the previous quarter. Spammers are resorting to IM attacks because consumers use software to defend PCs from e-mail-based viruses, and "there isn't much in terms of anti-virus software for IM," he says. In addition, spammers are sending more e-mail in shorter bursts to overwhelm spam defenses. Blogs have also been penetrated by spammers to create "splogs," which are fake blogs with ads. According to Blake Rhodes, CEO of blog search engine IceRocket.com, about ten percent of the blogs created each day are considered splogs.

RISKS; http://tinyurl.com/9498r 24 09

SPAM, SPIM, SPIT AND NOW -- SPLOGS!

Spam, long the scourge of email users, rapidly has become the bane of bloggers too.

Spammers have created millions of Web logs to promote everything from gambling Web sites to pornography. The spam blogs -- known as "splogs" -- often contain gibberish, and are full of links to other Web sites spammers are trying to promote. Because search engines like those of Google Inc., Microsoft Corp. And Yahoo Inc. Base their rankings of Web sites, in part, on how many other Web sites link to them, the splogs can help artificially inflate a site's popularity. Some of the phony blogs also carry advertisements, which generate a few cents for the splog's owner each time they are clicked on.

The phony blogs are a particular problem for Google, Microsoft and Yahoo because each offers not only a Web search engine focused on providing the most relevant results for users but also a service to let bloggers create blogs.

Just this past weekend, Google's popular blog-creation tool, Blogger, was targeted in an apparently coordinated effort to create more than 13,000 splogs, the search giant said. The splogs were laced with popular keywords so that they would appear prominently in blog searches, and several bloggers complained online that that the splogs were gumming up searches for legitimate sites….

MICROSOFT HUNTS FOR ZOMBIE SPAMMERS

Microsoft is investigating 13 spam operations it believes sent millions of junk mail messages through a single PC that the company purposefully set up as a "zombie," the company said Thursday, October 27. Tim Cranton, the director of Microsoft's Internet Safety division said, "By inserting ourselves in the spammers' path and looking upstream, we have been able to see things we have never been able to see before." The action was coordinated in conjunction with the Federal Trade Commission (FTC) and Consumer Action, a San Francisco-based advocacy group, to identify spammers. Spam operators working in the U.S. could be prosecuted under the federal CAN-SPAM Act. Cranton said, "Hopefully, we'll be able to turn over the results of our investigation for criminal prosecution under CAN-SPAM…We need to take a few more steps, but in the next two to three months, I think we can name these spammers." A new federal Website can be accessed for consumers to access information on protecting their PCs. Website: http://onguardonline.gov/index.html

2005-11-23 **lawsuit litigation anti-spam Verizon Wireless unsolicited text messages**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1892707,00.asp

VERIZON WIRELESS SUES ANOTHER SPAMMER

Unwanted text messages from a Florida-based travel company were sent recently to 98,000 Verizon Wireless customers, according to a new lawsuit filed by the operator. Even though cell phone spam is still relatively limited, it's nonetheless forcing operators to get a handle on it since their subscribers often pay a fee for each incoming message. "Electronic attacks upon the Verizon Wireless interstate text messaging network will continue; indeed the latest attack was just weeks ago," Verizon attorneys wrote in the suit filed Monday, November 21, in a U.S. District Court in New Jersey. In this particular case, Verizon Wireless alleges that Passport Holidays LLC, of Ormond Beach, FL, sent unsolicited text messages to about 98,000 Verizon Wireless subscribers in the latter part of October. The lawsuit accuses Passport Holidays of using an automated dialer to send the text messages to phones in three East Coast area codes.

FEDERAL TRADE COMMISSION: SPAM E-MAIL FILTERS GETTING BETTER

E-mail spammers are aggressive as ever but Internet providers are getting better at blocking junk messages before they reach users' inboxes, according to a U.S. Federal Trade Commission (FTC) study released on Monday, November 28. The FTC found that spammers continue to "scrape" e-mail addresses from the Web using automated programs that look for the telltale "@" sign. But up to 96 percent of those messages were blocked by the two Web-based e-mail providers used by the FTC in its test. The FTC did not say which providers it used in its study. "This encouraging result suggests that anti-spam technologies may be dramatically reducing the burden of spam on consumers," the report said. The FTC noted that Internet providers still must bear the burden of filtering out those messages. DHS IAIP Daily; http://www.press− citizen.com/apps/pbcs.dll/article?AID=/2006 0105/NEWS01/601050310/1079 23

IOWA COMPANY WINS $11 BILLION SPAM JUDGMENT

A Clinton, IA-based Internet service provider was awarded an $11.2 billion judgment against a Florida man for sending millions of unsolicited e-mails advertising mortgage and debt consolidation services. The lawsuit, filed in 2003 by CIS Internet Services owner Robert Kramer III, also prompted earlier judgments against companies in Florida and Arizona worth more than one billion. The most recent judgment was issued Friday, December 23, against James McCalla of Florida, who is also barred from accessing the Internet for three years. The lawsuit claimed that McCalla sent more than 280 million illegal spam e-mails into CIS's network, which provides Internet connections in Eastern Iowa and parts of Illinois. Kramer's lawsuit initially named numerous defendants, many of whom were dropped from the lawsuit the last couple years. John Mozena, co-founder and vice president of Coalition Against Unsolicited Commercial E-mail (CAUCE), said Kramer's lawsuit will likely not solve the spamming problem. He said, "There have been regulatory actions and even criminal actions against spammers, but it has not made much of a dent in the total volume of spam we see...Spam is still roughly two-thirds of all e-mail on the Internet."

ANTI-SPYWARE GROUP DEFINES DETECTION GUIDELINES

The Anti-Spyware Coalition (ASC), an alliance of software companies, security firms and consumer organizations, has agreed a set of guidelines on detecting invasive finalized spyware. The final draft of the ASC's "risk-modeling description" aims to give an objective criteria on whether a program is malign. A draft of this description was thrown open for public comment in October and the final version that's emerged is essentially an expanded and polished version. The group defines spyware and other potentially unwanted technologies as deployed without appropriate user consent and/or implemented in ways that impair user control over: material changes that affect their user experience, privacy, or system security; use of their system resources, including what programs are installed on their computers; and/or collection, use, and distribution of their personal or other sensitive information. In addition, ASC finalized the list of speakers for its first public meeting which is due to take place on Thursday, February 9, at the Hyatt Capitol Hill in Washington, DC. Federal Trade Commission (FTC) Chairman Deborah Platt Majoras will keynote at the single day event, which will also feature federal regulators, and top state technology and law enforcement officials.

2006-01-24 **Bill Gates spam predictor inaccurate anti-spam solution**

DHS IAIP Daily; http://www.techweb.com/wire/security/177103408;jsessionid=F3 33FC31KIRIQQSNDBGCKH0CJUMEKJVN 23

BILL GATES' SPAM PREDICTION MISSES TARGET.

On January 24, 2004, Bill Gates told a group at the World Economic Forum that "two years from now, spam will be solved." During the talk, Gates pinned his prediction on the creation of an authentication scheme to verify senders' identities, as well as the hope that some kind of micropayment structure could be created for levying fees on e-mail. "We have a long way to go before we solve the spam problem," said Scott Chasin, the chief technology officer for Denver, CO-based e-mail security firm MXlogic. Neither of the proposals Gates mentioned two years ago have made much headway. Although Microsoft uses its own Sender ID authentication protocol for the company's Web-based Hotmail service, neither Sender ID nor the competing DomainKeys from Yahoo have anything like broad acceptance by ISPs or enterprises. And the micropayment concept for e-mail is as dead now as it was two years ago. Microsoft may take the position that "solving" the spam problem means containing spam with filtering technology, Chasin said, but even using that definition, spam remains a huge problem.

2006-01-30 **study small businesses four times more spam**

DHS IAIP Daily; http://www.smallbizpipeline.com/showArticle.jhtml?articleID=177105260 23

SMALL BUSINESSES GET FOUR TIMES THE SPAM OF LARGER ENTERPRISES.

Small companies were sent almost 50 spam e-mails per day per user in 2005, up from 36 in 2004. This represents four times the number that employees at large companies were sent daily on average last year (12 per user per day in 2005 versus three in 2004). This is according to an annual report by Postini, a provider of message management solutions. The reason for this is that smaller businesses are more prevalent in targeted industries such as publishing, advertising, legal, and real estate, according to Andrew Lochart, senior director of marketing at Postini. "These are industries where you have 100 percent white collar workers whose e-mail addresses are very well known in the world," said Lochart. Another theory is that spammers may presume that larger companies are able to afford strong anti-spam measures, and may not try to infiltrate them as frequently, said Lochart. "What makes it a problem, regardless of why, is that smaller companies are the ones who have fewer defenses in place," said Lochart. "There are no large dedicated IT staffs in place, or large budgets for technology, so it's a double whammy." 2006-03-28 **MIT 2006 Spam Conference e-mail problems security antispam CAN-SPAM**

EDUPAGE; http://news.com.com/2100-7348_3-6055171.html 23

MIT CONFERENCE ADDRESSES E-MAIL PROBLEMS

Attendees at the 2006 Spam Conference at MIT agreed that filters and other technologies designed to prevent spam from reaching its intended targets merely address the symptoms without doing anything about the underlying problem. Many were similarly dismissive of proposals to charge a fee to senders of e-mail, saying that such an approach runs counter to the fundamental tenets of the Internet. Phil Raymond of Vanquish Labs compared a fee system to having first class and cattle cars on a train, suggesting that "some of [the cattle] cars will be left behind completely." Presenters at the conference instead urged adoption of economic incentives that would encourage users to be good e-mail citizens. Raymond, for example, proposed a system under which bulk e-mailers would be required to post a bond, against which recipients of those e-mails could make claims if they deemed messages to be spam. Opinions were mixed, however, about the CAN-SPAM Act. Jon Praed of the Internet Law Group said the legislation has done little to discourage spammers while placing new burdens on legitimate e-mail marketers. In contrast, Aaron Kornblum, a member of Microsoft's antispam legal team, said the law was the basis for 70 civil lawsuits that Microsoft has filed against spammers since January 1, 2004.

2006-03-30 **spam spamming trick tactic filter evasion joe-job**

DHS IAIP Daily; http://www.theregister.co.uk/2006/03/30/joe_job_twist/ 23

JOE-JOB SPAMMERS SHIFT TACTICS TO EVADE FILTERS.

Spammers are applying a new twist to joe-jobbing -- a trick used to get around e-mail filters. Instead of forging the sender's e-mail, as done in conventional joe-jobbing, address spammers are deliberately sending their messages to an invalid e-mail address at a high profile company using a forged "From" address at a target company. Because of this, the IP address and the e-mail domain address now match and the junk e-mail message may be able to bypass e-mail filters.

DHS IAIP Daily; http://www.smh.com.au/news/breaking/spammer−identifies−do −not−spam−addresses/2006/05/04/1146335837392.html 23

SPAMMER IDENTIFIES 'DO NOT SPAM' ADDRESSES.

One spammer has managed to identify e-mail addresses on Blue Security's Blue Frog "do-not-spam" list, taking advantage of an obvious flaw with such lists and prompting critics to wonder what took so long. The lists are generally encrypted so spammers can't mine them for new addresses. However, John Levine, co-author of Fighting Spam for Dummies, said spammers merely have to run their lists, see what's been removed and compare that with the original to find out the addresses on the "do-not-spam" lists.

MICROSOFT PUTS A LOCK ON CORPORATE COMMUNICATIONS
Alarming organizations that encourage employee whistle-blowing on corporations engaged in wrongdoing, Microsoft has developed new technology called Windows Rights Management Services, which lets a company restrict which of its employees may access, download, print, or forward "company-sensitive" e-mail or Web material. Based on the XrML programming language, the software was created within Microsoft's Trustworthy Computing initiative focused on improving the security and privacy of information. But corporate accountability watchdogs are appalled. Joanne Royce of the nonprofit Government Accountability Project says, "It sounds to me like just another way to restrict the free flow of information. In a way it sounds like it won't hinder whistleblowers per se, because they won't even get to see this stuff." Michael Kohn of the National Whistleblower Center in Washington, D.C., calls the new technology "ludicrous" and warns, "You create a whole secret society within a corporation. Anyone who is within that circle is unlikely to be a whistleblower." (AP/USA Today 21 Feb 2003)

NIPC/DHS; http://www.gcn.com/vol1_no1/daily−updates/24622−1.html

January 12, Government Computer News — Intelligence community seeks protection from inside threats.

A team of companies is building a tool to help the intelligence community keep tabs behind its firewalls. The Voltaire system will integrate existing technology to identify suspicious activity by insiders with legitimate access to sensitive information. Voltaire is intended to make it easier for agencies to share sensitive and classified information by providing a tool to enforce access policy and prevent misuse. The goal of Voltaire is to detect and stop the kind of activity that FBI turncoat Robert Hanssen got away with for years. Hanssen gathered and sold information about FBI counterintelligence activities by browsing through computer files to which he had access. Although he had no legitimate need to see much of the information, investigators found he was able to access it over a period of years without raising any flags. A demonstration version of Voltaire is expected to be ready for testing by summer. Feedback from intelligence agencies will then be implemented into a final product.

2004-01-26 **NIST IT security draft report guidelines safeguards standards advice risk management**

DHS/IAIP Update

January 23, Federal Computer Week — NIST releases telnet, IT security drafts.

Federal agencies desiring to minimize work disruptions from outside intrusions can begin with simple safeguards, such as preventing unauthorized users from using the telnet protocol to gain access to a server, according to officials at the National Institute of Standards and Technology (NIST). Draft documents on computer security released Thursday, January 22, by the NIST give an example of how unauthorized telnet users simply identify themselves as a guest to gain access to sensitive government files. The Risk Management Guide for Information Technology Systems suggests that disabling telnet is about a 10-hour procedure. Practical advice in the 58-page document includes other ways that agencies can develop standards for safeguarding sensitive but unclassified information in federal computer systems. As applied to information systems, the guide says, risk management is a responsibility of executive managers to be shared with technical managers, and not a technical manager's sole responsibility. Engineering Principles for Information Technology Security, a 33-page document also released this week, offers an overview of accepted principles and practices for security information technology systems. Additional information can be found on the NIST Website:

SEVERAL US BANKS STILL REFUSE HTTPS FOR LOGON PAGES

Brad Hill noted a serious lapse of risk management in several banks' online systems:

>I was actually rather shocked to find that U.S. Bank (http://www.usbank.com/), Chase (http://www.chase.com) and Bank of America (http://www.bankofamerica.com) all still *force* users to enter their login and password on an insecure page. This exposes account holders to a great risk of their credentials being stolen. The login forms on their genuine home pages are submitted to a secure site, as they claim. The problem is that you need security *before* you enter your data. If DNS, a router or a proxy server anywhere along the path to their server were compromised, the login page could be substituted for one that submits to another site or injected with JavaScript that sends info elsewhere, asynchronously, before it goes to the real destination. Without an SSL certificate chain there is no way to verify that the insecure page with the form came from a trusted source and no way short of exhaustive code inspection to tell where the form data is actually going.

BankOne, Wells Fargo, Citi, Washington Mutual, Bank of the West, Key Bank and Sun Trust all offer SSL versions of their login page, but for some reason, U.S. Bank, BofA and Chase redirect to an insecure site or return an error when trying to connect with SSL. You *can't* log in securely, even if you try. The existence of this kind of obvious and fundamental security mistake after all the publicity about this category of attack (note that all these banks *do* have a user education page on phishing/fraud prevention!) is definitely something to keep in mind when choosing a bank.<

RISKS 23 83

RISK MANAGEMENT: GOOD VS STUPID RESPONSES TO DISASTERS

Michael "Streaky" Bacon published an excellent analysis of good vs stupid public response to disasters or near disasters:

Air disasters receive widespread press coverage. Crashes often cause people to cancel bookings with the affected airline. The share price often dips, sometimes severely, in the aftermath of an air accident.

This is also true for many other major incidents involving corporations (i.e., not 'natural' causes).

One thing often stands between a 'crisis of confidence' and 'business as usual', and that is the credibility of the organisation's spokespeople.

On 3 April, a Phuket Air 747 was twice forced by passenger action to abort a take-off from the UAE when fuel was seen flowing from the wing over an engine as the plane accelerated down the runway. A UK-based spokesman for the airline told the media that no-one had been in any danger and claimed that passengers had "panicked". He is also reported to have said that passengers were not qualified to judge what was safe or not. He said that the wing tanks had been "over-filled".

Whilst I do not comment upon the accuracy or otherwise of the spokesman's comments, I will comment on their advisability and I do suggest that this is not a good way to manage risk.

It is reported that many passengers have now refused to fly any further with the airline.

A contrast in risk management is provided by one British airline that suffered two 'incidents' with the same type of aircraft some nine years apart. In the first, the aircraft crashed with tragic loss of life following the (erroneous) shutdown of one engine and loss of power on the other (faulty) engine during an emergency landing. The Chairman of the airline was interviewed at the scene and with tears in his eyes promised to find out what had happened and to take every possible step to prevent its recurrence. The share price was not much affected, neither were bookings. The second incident concerned the loss of oil pressure in both engines shortly after take-off - leading to the shut-down of both engines and a successful 'dead-stick' landing. The loss of oil was caused by a maintenance failure. The airline put the 'Director of Engineering' (or similar title) in front of the media, and he attempted to explain away the incident as a problem with their maintenance company. It was reported at the time that passengers subsequently canceled bookings and the stock price fell.

The 'what', the 'way' and the 'how' of the Chairman were believable, those of the Director were not.

The RISK is in getting the wrong person to say the wrong thing. Effective crisis management involves the right thing by the right person at the right time in the right way to the right people.

2005-05-01 **risk management legacy systems denial of service failure software quality assurance replacement system failure**

RISKS; http://www.cio.com/archive/050105/comair.html 23 87

COMAIR EXECUTIVES DELAYED REPLACING LEGACY SYSTEM THAT FAILED

Stephanie Overby, writing in CIO magazine, analyzed the COMAIR disaster of December 2004. "[T]he legacy system [for managing flight crews] failed, bringing down the entire airline, canceling or delaying 3,900 flights, and stranding nearly 200,000 passengers. The network crash cost Comair and its parent company, Delta Air Lines, $20 million, damaged the airline's reputation and prompted an investigation by the Department of Transportation."

The details were as follows:

"As it turned out, the crew management application, unbeknownst to anyone at Comair, could process only a set number of changes—32,000 per month—before shutting down. And that's exactly what happened. On Christmas Eve, all the rescheduling necessitated by the bad weather forced the system to crash. As a result, Comair had to cancel all 1,100 of its flights on Christmas Day, stranding tens of thousands of passengers heading home for the holidays. It had to cancel nearly 90 percent of its flights on Dec. 26, stranding more. There was no backup system. It took a full day for the vendor to fix the software. But Comair was not able to operate a full schedule until Dec. 29."

All of this trouble could have been avoided had the warnings dating back to 1997 been heeded about the need to upgrade the then-11-year-old system, which was running on outdated hardware. The rest of the article goes into extensive detail about the management failures responsible for the debacle.

Category 33.4 *Risk analysis & management*

2005-09-11 **emergency management communications frequency bands risk analysis vulnerability politicians stupid pronouncements lack experience naïve elementary mistakes denial of service DoS vulnerability bandwidth saturation jamming disaster**

RISKS 24 04

POLITICIANS USUALLY AMATEURS AT EMERGENCY MANAGEMENT

It is sad that politicians start to believe that they know how to solve technical problems. One such sad case was Rudy Giuliani's pronouncement today that a single frequency (then frequency band) for all emergency services would make things work better. Now I am hardly the world's leading expert on radio frequency spectrum allocation, but I do have some small amount of experience in understanding radio communications and emergency response, and I was startled, well not all that startled, perhaps bemused at the lack of understanding displayed by people who are not risk management professionals. Of course it seems that a lot of political folks think that they can do as good a job as risk management professionals, and likely that is why we are in such a sad state as a nation state at handling emergencies. I haven't done a complete assessment of the suggestion, but here are some initial thoughts.

The idea is that communications will work better if everyone can talk to each other and therefore a single frequency band would allow them to do so and improve emergency communications. Sounds sensible, however…

1) It means that in order to disrupt ALL emergency communications I only need to jam one frequency band.

2) Different natural and artificial phenomena interfere with RF communications in different frequency bands, so by using a relatively limited portion of the available bandwidth, there is a guarantee that in some places no communications will work.

3) If I want to listen into your communications, it makes it a lot easier if I know the frequencies being used, and if everyone has to talk to each other, then anyone can listen to everyone else. Encryption won't solve this of course for the same reason.

4) If there is a big emergency and everyone is on a small subset of the bands available, there will be a lot of interference, reducing communications effectiveness.

5) Certain weather and other human induced conditions wipe out portions of the frequency band for periods of time, making ALL communications fail simultaneously (see 1 above).

6) Interference between jurisdictions means that dispatchers in one jurisdiction might end up talking over those of their neighbors, causing confusion and more traffic problems as well as increasing the potential for phony messages going on the air.

You all get the idea by now. Of course the last assessment I did that involved a radio communications system for a local government was several weeks back, and we were a bit concerned that they only had 3 redundant ways to communicate via RF - Car radios that talk to towers in redundant locations - hand-held radios on a different frequency range that could talk to the towers, the cars, and each other independently of the other tower system, and cellular telephones that they could use when the other systems failed. They also reported problems of interference on rare occasions with the frequencies used by neighboring jurisdictions (see 6 above), but only in certain locations where they could communicate over quite a long distance because of weather-related signal bounces off of clouds.

Different frequency bands are used for different things for good reasons, and there are good reasons that a single frequency band for emergency response would be a bad thing. Perhaps we should put Rudy in charge of FEMA and see if things get better or worse… after all, the last political appointee there with no expertise in emergency management worked out so well…

2006-03-21 **business data center lack risk management plan study**

DHS IAIP Daily; http://www.securitypipeline.com/news/183701727 23

MANY DATA CENTERS STILL HAVE NO RISK MANAGEMENT PLAN.

Business technology managers are facing tough challenges as data centers grow larger and more complex. More than 75 percent of all companies have experienced a business disruption in the past five years, including 20 percent who say the disruption had a serious impact on the business, according to a recent survey of data center managers. Despite the critical nature of data center operations to business, nearly 17 percent reported they have no risk management plan, and less than 5 percent have plans that address viruses and security breaches. The results, which were announced Tuesday, March 21, at the Data Center World conference in Atlanta, are part of survey of nearly 200 members of AFCOM, a leading association for data center managers. Some of the predictions: Within the next five years, one out of every four data centers will experience a serious disruption; by 2015, the talent pool of qualified senior-level technical and management data center professionals will shrink by 45 percent; and over the next five years, power failures and limits on power availability will halt data center operations at more than 90 percent of companies.

1998-11-11 **hate speech filter censor software**

Wired
http://www.wired.com/news/print_version/email/member/culture/story/16197.html

The Learning Company, makers of the porn-filtering software CyberPatrol, worked with the Anti-Defamation League to create and release HateFilter, a similar tool for blocking access to hate-mongering sites. The ADL national chairman said, "We are engaged in a full-blown battle against high-tech hate. Bigots are seducing our children with online messages presented in full-color animation with music and video.... Parents should be able to protect their children from hate by keeping bigotry and prejudice out of their homes." Naturally, there were protests (including the usual use of the phrase "slippery slope") from anti-censorship organizations and from some of the blocked sites. The American Family Association, in particular, was blocked by CyberPatrol lists in June 1998 because of its homophobic content — which it stoutly defended as legitimate points of view, not hate-speech. Some critics pointed out that the new filter was not the first of its kind; the Church of Scientology developed filters for its members to prevent them from reaching Web sites critical of the CoS.

Category 34 *Net filters, monitoring (technologies)*

1999-01-26 **censorship filtering parental controls restrictions porn**

TechWeb

The RuleSpace Company announced a new pornography filter using the Intelligent Content Recognition Technology they claimed would make more reasonable distinctions about the content of sites using words such as "breast." The company said it opposed the use of filtering software in public schools and libraries and aimed its product at parents.

Category 34 *Net filters, monitoring (technologies)*

1999-04-06 **pornography cryptography encryption communications**

Business Wire

In an ugly development, pornography sites are providing strong encryption for their wares, making it difficult for investigators searching for evidence on data storage devices to accumulate evidence of illegal activity such as the use of child pornography. Encrypted porn is also impossible for filtering software to identify. The availability of NovaStor on the Web means that people can encrypt and decrypt files freely using the "Secret Service" function that simulates a safe using the company's DataSAFE software.

1999-04-08 **filter censorship restriction pornography lists keywords**

New York Times

Cybersitter and Clickchoice, makers of censorware, that favorite bugaboo of prepubescents everywhere, got into a legal battle over dirty words. Cybersitter accused Clickchoice of reverse engineering its proprietary list of filthy keywords and said it was considering a lawsuit. This situation may be fallout from the widespread cracking of censorware Naughty-Naughty lists; Cybersitter, in particular, was cracked in 1997 by Bennett Haselton, founder of the anti-censorware group Peacefire. The Index Verborum Prohibitorum was posted all over the Net within days, no doubt to the delight of the same prepubescents who didn't like the original product.

Category 34 *Net filters, monitoring (technologies)*

1999-09-25 **Web Internet ISP censorship rating pornography**

New York Times, Guardian (London)

The Internet Content Rating Association (ICRA) will try to create the first world standard based on RSACi, a rating system developed by the Recreational Software Advisory Council (www.rsac.org), a non-profit body in the United States. At a private meeting in Paris in mid-April, the major worldwide ISPs discussed how to help parents, schools and employers filter out objectionable materials more effectively than current methods. At present, the voluntary rating systems have managed to classify only about 1% of the world's sites; the new initiative would include better standards and more widespread publicity to encourage users to put pressure on providers to rate their sites. In addition, plans included spot checks to verify accuracy of the ratings.

2000-07-20 **workplace monitoring surveillance controls civil liberties employees employers covert law proposal legislation**

NewsScan,

A group of bipartisan lawmakers . . . introduced legislation that would require companies to disclose their workplace monitoring activities to employees when they are hired, and to update them on an annual basis. Under the bill, employers could still secretly monitor an employee if there is "reasonable" suspicion that illegal activity is taking place, but workers could not be routinely monitored without their knowledge. The American Management Association reports that 45% of companies with 1,000 or more employees snoop on workers in some way, but Sen. Charles Schumer (D-NY), a co-sponsor of the bill, says the figure is closer to 75%. "We would never stand for it if an employer steamed open an employee's mail, read it and put it back," says Schumer. "It is the same thing with an employee's e-mail." The bill has attracted a wide range of supporters, from the left-leaning American Civil Liberties Union to the conservative Eagle Forum. (MSNBC 20 Jul 2000)

2000-03-16 **pornography libraries access children censorship filtering monitoring audit trail debate argument study research**

NewsBytes

In the endless debate between supporters and opponents of Internet filtering (censorware) to prevent kids from seeing pornography, the extreme right-wing Family Research Council endorsed a study by David Burt (Dangerous Access, 2000 Edition: Uncovering Internet Pornography in America's Libraries) claiming to show that children do in fact access pornography on public library computers. The official position of the American Library Association (ALA) is that very few children access pornography on library computers (the ALA's director has said that "only one child out of a trillion billion might use library computers to seek out pornography" — this despite objections from some working librarians who have come to dread helping users of their terminals for fear of confrontation with various forms of nastiness online. On the other hand, to put things in perspective, the FRC supports homophobia, opposes abortion, objects to First Amendment protection for art museum exhibits, argues that a woman's place is in the home, and describes feminism as having an "unrealized and ironic relationship to the cheapening of life and the value of womanhood, the growth of an overbearing government, and the decline in family and marital stability."

A LITTLE BIT OF ANTI-PORN FILTERING CAN GO A LONG WAY
"A little bit of filtering is O.K., but more isn't necessarily better," says Vicky Rideout, vice president of the Henry J. Kaiser Family Foundation, which conducted a study showing that when anti-pornography Internet filtering software is set at a low level of restriction, it's just as effective as when it is set a high level, and is far less likely to prevent searchers from reaching bona fide health sites. But some observers, such as Judith F. Krug of the American Library Association, think that filters are such blunt instruments that they should not be used at all in public institutions: "Filters are just fine for parents to use at home. They are not appropriate for institutions that might be the only place where kids can get this information." The filtering programs generally block any references to sex-related terms; examples given by the report include such subjects as safe sex, condoms, abortion, jock itch, gay, and lesbian. (New York Times 11 Dec 2002)

COURT UPHOLDS LAW REQUIRING SOFTWARE FILTERS IN LIBRARIES
The U.S. Supreme Court, in a 6-3 opinion, has upheld provisions in the Children's Internet Protection Act that require public libraries to install anti-pornography software filters, if those libraries are to receive federal grants and subsidies. All nine justices agreed that there was no constitutional problem in a decision to restrict children's access to pornographic material, and that software filters are blunt instruments that inevitably block more material than the statute contemplates; still, the majority did not view this over-blocking as an infringement of the First Amendment rights of adult library patrons. To the argument that adults might be embarrassed by having to ask librarians to unblock pornographic sites for their viewing, Chief Justice Rehnquist wrote that "the Constitution does not guarantee the right to acquire information at a public library without any risk of embarrassment." http://www.nytimes.com/2004/05/27/technology/circuits/27stat.html?ex=1400990400&en=7f1caf6facfff153&ei=5007&partner=USERLAND

AUTOMATED CENSORSHIP

The RCA DRC232N DVD player includes ClearPlay technology that blocks out violence, sexual language, nudity, crude language, cursing, profanity, ethnic slurs, references to drug use and "vain or irreverent reference to G-d or a deity" — automatically. The scene-skipping software is based on profiles downloaded to the player; the profiles are defined by the human operators at ClearPlay. Investigation of the pattern of censorship reveals that the standards of the censors are "wildly inconsistent" (in the words of the New York Times' David Pogue). Pogue points out that "ClearPlay's most ridiculous assumption, however, is that excising only the split second of central violence somehow makes the overall scene less traumatic." In general, reports Pogue, the system seems remarkably tolerant of violence, for all its claims to transform movies for family viewing.

In February, Northwest Airlines succeeded in getting a subpoena allowing their investigators to seize computers from the homes of 21 named employees whom the company accused of organizing and staging a "sick-out" that forced cancellation of many flights. Investigators copied data from hard drives, including private e-mail, and also searched computers at the offices of Teamsters Union Local 2000 in Bloomington, MN. Many advocates of free speech protested the action.

Juniper Networks is shipping a new processor called Internet Processor II, a souped-up version of an earlier filtering technology that scans data flowing through a network to detect suspicious traffic. The Internet Processor II is capable of filtering 20 million packets of data a second, compared with older security software that could handle only 200,000 data packets per second. The older software slowed networks down so much that ISPs were reluctant to implement it. (News.com 18 Apr 2000)

FILTERING FIRM ABANDONS PLANS TO SELL DATA ON KIDS
Under heavy pressure from privacy groups, the company N2H2, a maker of the "Bess" Internet filtering software, has decided to stop selling marketing research companies its "Class Clicks" list that reports the Web usage patterns of school children. The Bess software is used by 14 million students in the U.S. Company executive Allen Goldblatt says that no personally identifiable data on children were ever collected or sold and that "we never would, never have, and never will jeopardize anyone's privacy." Although characterizing the controversy as "a distraction for us," Goldblatt added: "I think any time you have a great public debate about privacy issues, ... this is a good thing." FEDERAL COURT RULES IN FAVOR OF COOKIES
U.S. District Court Judge Naomi Reice Buchwald has dismissed a class-action suit against online advertiser DoubleClick accusing that company of privacy-related violations of three federal laws. The judge concluded that DoubleClick had not violated those laws through its use of "cookies" (techniques for automatically tracking the movements of Web surfers), and ruled that Web sites could be considered DoubleClick's real "users" and could therefore give consent to monitoring of the transactions with individual customers who visited those cites. Privacy expert Paul Schwartz of Brooklyn Law School offers a different view: "The court said the Web site is the 'user' of the electronic service and can give consent to DoubleClick. So what are the individual consumers, chopped liver?" (New York Times 6 Apr 2001)

NEW CORPORATE SOFTWARE SEARCHES EVERYWHERE -- EVEN PERSONAL HARD DRIVES
New productivity software from AltaVista will allow companies to collect data from anywhere in the organization: including not only corporate networks but also individual e-mail accounts and employee PCs. The software is able to search through more than 200 different computer applications and recognize 30 different languages. Privacy advocates are worried. Attorney Gregg Williams says: "This could open a real Pandora's Box. There are some private things on office computers that you really don't want to know about." And Richard Smith of the Privacy Foundation says the software is "really dangerous" and warns that it "would hurt both companies and their employees by damaging morale." But Dana Gardner of the Aberdeen Group has little use for such concerns: "For every person that gets a little embarrassed because some personal information gets passed around the office, there are going to be more people who are able to find important information that helps them close a sale with an important customer or build a better mousetrap." NEW SOFTWARE SPIES ON INSTANT MESSAGING
New software from Ascentive Inc. enables parents to record their children's instant-messaging chats just like a VCR records a television program, allowing the PC owner to view frequent screen shots of actual conversations and to search and view IM logs for certain words. ChatWatch, a feature included in Ascentive's BeAware PC monitoring software, is more effective than filtering, says Ascentive CEO Adam Schram: "Filters give you too many false positives and negatives -- they block breast-cancer sites but not all porn sites." Instant messaging has soared in popularity over the past few years, with IM use up 34% at work and 28% at home this year. (Wall Street Journal 11 Dec 2001)

THE CASE OF THE HORRIFIED SPY
The man who conceived and wrote the software thinks of himself as a privacy lover and says that what his program does is "horrifying": "Every time I add a feature into it, usually it's something that I've fought for a long time." But he's sold more than 200,000 copies of his $99 downloadable Investigator software, which can read every e-mail message, instant message and document someone sends and receives, and will take pictures from a Web cam, save screen shots, and read keystrokes in numerous languages. The program is hidden on the target's computer, as are the files containing the information it gathers. Ari Schwartz of the Center for Democracy and Technology concedes that the surveillance technology is a valuable tool in fighting fraud or child pornography, but thinks that companies need to resist using it too readily because "we think morally there are some very large issues" raised when employers track the personal habits of their workers. COMPANIES START TRACKING WORKERS' INSTANT MESSAGES
Employees have known for several years that their bosses are keeping an eye on their telephone and e-mail habits, but new technology now makes it possible to monitor instant messaging exchanges as well. Privacy advocates say they know of no major instances where employees have been disciplined for IM abuse, but that it's probably just a matter of time. As of last year, only 20% of all IM accounts belonged to business users, but that percentage is expected to rise to 50% by 2004, according to the Radicati Group. Meanwhile, some companies have reported more diligent workers after they installed e-mail monitoring software on their corporate systems. "It changed the employee behavior. Their productivity went up," says one marketing director. "They were a little bit more careful with their communication. It will be the same with IM," she predicts. (AP 12 Apr 2002)

COMPUTER FORENSICS TARGETS DISGRUNTLED EMPLOYEES

"There's a growing acknowledgment among executives that insiders can do more damage than the smartest outside hacker," says a Manhattan systems administrator. With that in mind, computer forensics software is targeting employee habits and behavior in an effort to stop corporate crime before it happens. Products like Savvydata's RedAlert collect, consolidate and analyze employee information to determine an individual's threat to the organization, based on what files employees accessed, the contents of their e-mails, and which company policies they violated. That information can then be combined with RedAlert's subscription-based Intelligent Information Dossier service, which allows corporate IT folks to research workers' criminal histories, credit information, financial asset details, friends and associates. Some IT workers think RedAlert goes too far: "RedAlert totally freaked me out," says a systems administrator for a Wall Street firm. "I understand why you'd need something like this if you are the CIA, but for standard biz use? I just don't think I'd work at a company that used these sorts of tools." Meanwhile, other products such as EnCase Enterprise Edition scour the network to see if any workers possess "unauthorized information" in order to prevent problems such as fraud, future lawsuits and other issues. NEW WAY TO FOIL DATA THIEVES
Researchers at the State University of New York at Buffalo are developing software that tracks and analyzes how each computer user performs his or her routine tasks, such as opening files, sending e-mail or searching archives, to create individual profiles. The "user-level anomaly detection" software then alerts network administrators if a worker's behavior deviates from his or her profile so that they can monitor that employee's activities more aggressively. "The ultimate goal is to detect intrusions or violations occurring on the fly," says head researcher Shambhu Upadhyaya. "There are systems that try to do this in real time, but the problem is it results in too many false alarms." Some rival computer-security products also feature user profiling, but it's based on huge amounts of data flowing through entire networks. Upadhyaya says such detection systems are usually 60% to 80% reliable, whereas simulation tests indicate the new software would be up to 94% accurate. One information specialist says, "Other intrusion techniques require something like looking at audit logs after the damage has already occurred. The advantages offered by this approach is an intruder with malicious intent can be identified very early and a system operator can contain the damage, repair it in real time and shut out the intruder. This means that systems that have been attacked by an intruder maliciously might not necessarily be brought down." (Wired.com 20 Jan 2003)

TECHNOLOGY TARGETS P2P PIRATES
A new technology, provided by Audible Magic, has been tracking file-swapping traffic on the University of Wyoming's network for the past several months, quietly noting every trade of an Avril Lavigne song or a "Friends" episode. The technology isn't yet blocking file trades, but that could come next, say university administrators who complain their networks are sometimes overwhelmed with file-swapping activity. "I don't really want to be looking that closely at what people are doing, and you'd probably just as soon not have me looking either," says a University of Wyoming network specialist who's helping to manage the Audible Magic project. "But it's getting to be the only way to control our bandwidth." Audible's technology goes beyond the conventional port-blocking and digital rights management efforts now used to control file-swapping. It allows a network operator to see exactly what files are being transferred by creating a copy of all the traffic flowing on a network, identifying those bits that are using FTP (file transfer protocol) or Gnutella technology, and then re-creating those files to identify them. The resulting reports give university network administrators a good look at what students are trading and in what quantities, and future steps could include selectively blocking such trades. "We believe that what this does is transform network devices to be content-intelligent," says Audible CEO Vance Ikezoye. "That will be important. You can't just say, 'Let's block peer-to-peer.'" COMPUTERS TO WATCH YOU WHILE YOU WORK
With today's computer users increasingly overloaded by a combination of e-mail, instant messages and phone calls, researchers at the Human Media Lab at Queen's University in Ontario are designing technology that will enable a PC to gauge their user's attention level and sort out which messages and phone calls are important. "Today's digital lifestyle has the unfortunate side effect of bombarding people with messages from many devices all the time, regardless of whether they're willing, or able, to respond," says Human Media Lab director Dr. Roel Vertegaal. "We now need computers that sense when we are busy, when we are available for interruption, and know when to wait their turn — just as we do with human-to-human interaction." Techniques used to evaluate PC users' availability include an eye contact sensor that enables the PC to determine whether the user is present and whether he or she is looking at the screen. SOFTWARE WATCHES WHILE YOU WORK

Security firm 3ami and storage specialist BridgeHead Software have teamed up to create a network security system that can log computer keystroke activity, store it and retrieve the files within minutes. The developers say the system represents a breakthrough in the way data is monitored and stored, but privacy advocates worry that such monitoring not only is overly intrusive but can be damaging to employees' morale. However, 3ami managing director Tim Ellsmore counters: "That is not the case. It is not about replacing dialogue but there are issues that you can talk through but you still need proof. People need to recognize that you are using a PC as a representative of a company and that employers have a legal requirement to store data." The software was developed in response to the Freedom of Information Act's requirement for companies to store all data for a specified period of time, and is designed to monitor the downloading of pornography, the use of inappropriate language and the copying of applications for personal use. It also potentially could enable employers to track stolen files and identify whether they'd been e-mailed to a third party, copied, printed, deleted or saved to a CD, floppy disk, memory stick or flash card. EDUPAGE; http://www.wired.com/news/technology/0,1282,68480,00.html8/

STUDENTS FACE PUNISHMENT FOR COMPUTER TAMPERING

Thirteen high school students in the Kutztown Area School District in Pennsylvania face felony charges of tampering with computers after defeating security measures on laptops issued to them by the school district. The laptops included Internet filters and an application that allowed district administrators to see what students did with the computers. The 13 used administrator passwords--which, for unknown reasons, were taped to the backs of the computers--to override the filters and download software such as iChat that the district policy forbids. The students also modified the monitoring program so that they could see what the administrators did with their computers. The students and their parents argued that the felony charges are unwarranted, but, according to the district, students and parents signed acceptable use policies that clearly state what activities are not allowed and that warn of legal consequences if the policy is violated. The students continued to violate district policies for use of the computers even after detentions, suspensions, and other punishments, according to the district. Only then did school officials contact the police. Wired News, 9 August 2005

35 DNS conflicts, trademark violations (Net, Web)

Category 35 *DNS conflicts, trademark violations (Net, Web)*

1997-02-12 **Internet DNS domain names**

AP

In February, the International Ad Hoc Committee proposed seven new top-level domains:
.store — businesses offering goods,
.info — information services
.nom — personal sites
.firm — businesses or firms
.web — entities emphasizing the World Wide Web
.arts — cultural groups
.rec — recreational or entertainment activities.

These proposals were greeted with expressions of horror and outrage by members of the Association for Interactive Media and the Open Internet Congress, whose heated press release termed the proposals "an attempted takeover." In a Question and Answer section, the opponents of the IAHC write, "The Internet is likely to break apart on October 15, 1997. That is the date that the coup leaders intend to re-route the Internet to be under their control against the advice of those who keep things running smoothly today. When they rip the essential root servers off the Internet backbone, the entire system may begin to fragment. Your email will be returned and your Web site visitors will be turned away. These organizations have refused to recognize the validity of the registries that ensure that traffic is successfully delivered to .com, .org, and .net addresses. Serious concern has arisen over the possibility of malicious viruses and Trojan Horses being hidden in the software that runs the Internet."

1998-02-01 **DNS domain name system law regulation**

EDUPAGE

The Clinton Administration announced a Green Paper outlining how the US government proposes to regulate the DNS. A new non-profit, private corporation would be set up by the end of September 1998 and would regulate registration of domain names. European ISPs and government agencies expressed dismay over private ownership of the high-level domains. In April, the White House announced plans for coordination with the European Union over governance of the Internet.

1998-02-10 **DNS domain name system fraud impersonation**

EDUPAGE

The Educom consortium offered to take responsibility for allocating addresses in the .edu top-level domain when Network Solutions' contract expires in March 1998. The consortium expressed concern about the currently unregulated state of .edu registrations, with fraudulent operations tricking victims by using the spurious credibility of such a domain name.

Category 35 *DNS conflicts, trademark violations (Net, Web)*

1998-02-10 **DNS domain name system pornography**

EDUPAGE

The Clinton Administration expressed dismay that a pornographer has registered whitehouse.com and is using that domain name to host a pornographic Web site. The Presidential attorney, Charles F. C. Ruff, wrote, "However distasteful your business may be, we do not challenge your right to pursue it or to exercise your First Amendment rights, but we do challenge your right to use the White House, the president, and the first lady as a marketing device... As your own online disclaimer implicitly acknowledges, the foreseeable result of your use of the White House domain name is that children will access your Web site inadvertently. Your customers will understand such a result is unconscionable, and so, we submit, should you." The pornographer sneered that the government has no trademark on "white house" or related words. [The Lewinsky affair and the Starr report rendered the White House complaints about pornography problematical.]

1999-01-05 **DNS spoofing interception Web site e-mail vulnerability**

PR Newswire

Men & Mice, an Icelandic software developer <http://www.menandmice.com/>, warned of a serious vulnerability of many sites on the Internet. Using their DNS Expert analysis tool, they found that one-third of all the sites on the Internet were vulnerable to DNS spoofing. Using known vulnerabilities, criminals can send e-mail purporting to come from the victimized site, causing potential embarrassment and even legal liability in cases of mail-bombing attacks or widespread spam. Even worse, it would be possible to corrupt DNS tables to redirect connections to pirate sites; one scenario sketched out by the DNS expert Cricket Liu (of Acme Byte and Wire) ran as follows: "To picture the potential damage, envision visiting your bank's web site to transfer funds from one account to another. Unfortunately, the web site seems to be having problems: After entering your account information and PIN, you still can't access your account data. The web site reports a 'temporary failure' and invites you to try again later. What you don't realize is that the web site you see is actually a near-exact replica of your bank's web site — startlingly easy to create — and that you've just sent your account number and PIN to hackers in another part of the world. Though you entered the correct URL, your local name server had been spoofed into believing that the bank's domain name corresponded to the address of a web server run by hackers." On their own Web site, the company posted extensive information about how to combat DNS spoofing. Acme Byte and Wire also posted Cricket Liu's presentation, "Securing Your Name Server" at <http://www.acmebw.com/securing/index.htm>.

1999-02-17 **trademark Web site copyright lawsuit DNS conflict squatters**

THE TIMES; Boston Globe

Jason Drummond, owner of VirtualInternet.net in England, helps companies protect themselves against cybersquatters who register domain names to take advantage of companies just getting started on the Net. Drummond was interviewed by John Kavanagh for The Times of London; he recommended that companies register as many variations on their trademarks as they can think of — with hyphens, underscores, abbreviations, acronyms, even likely misspellings. In another article, Jerry Ackerman wrote in the Boston Globe that some cybersquatters are getting rich on their claims; e.g., Compaq paid U$3.3M for the rights to <altavista.com>. Speculators also watch for mergers attentively. Ackerman wrote, "For example, six days before Exxon Corp. and Mobil Oil Corp. announced merger plans last Dec. 1, and continuing for a week afterward, five speculators - from Japan, South Korea, Singapore, Canada, and the United States - laid claim to 11 Internet addresses that joined the names of the two oil-industry giants."

1999-04-23 **DNS domain name system ownership ISP conflict**

Network World Fusion http://www.nwfusion.com/news/1999/0423domain.html

One of the nastier side-effects of ICANN's monopoly busting decentralization of domain name registrations is that individual registrars could theoretically keep ownership of domain names they issue. Change registrar and you could find that someone else owns your trademarked domain. Such loss of control could be disastrous, forcing companies to change letterhead, business cards, and their entire Web sites. In addition, some ISPs are planning to offer domain-name services bundled into their contracts. Writing in Network World, Sandra Gittlen and Denise Pappalardo urged, "customers should check the fine print of their contracts to make sure that they retain rights to their
online brands if they switch ISPs."

1999-10-05 **DNS ICANN domain name system Web**

TBTF http://tbtf.com/archive/1999-10-05.html

ICANN, NSI and the Department of Commerce came to agreement in October over many elements of the new regime for naming Internet domains. According to Keith Dawson, editor of the always-useful TBTF newsletter (see < http://tbtf.com/archive/1999-10-05.html >), the key issues were as follows (direct quote from TBTF):
- NSI assents to ICANN's authority and agrees to sign a modified Registrar Agreement.
- Commerce takes over operation of the InterNIC.
- The fee NSI charges to competitive registrars drops from $9 to $6.
- NSI agrees in principle to a per-name fee to fund ICANN's operations, provided that NSI does not owe more than $2M under such a program. NSI hands over $1.5M to ICANN immediately.
- NSI continues to run the authoritative root server for at least four years. Even after its eventual transfer to ICANN, Commerce continues to assert policy authority to direct this server. [MK: I wonder what the EU thinks of this provision.]
- NSI must totally separate its registry and registrar functions-. If it accomplishes this within 18 months then it can hold onto the root server for an additional four years.
- NSI effectively gives up the claim that it owns the intellectual property represented by the .com/.org/.net database.

1999-10-26 **DNS hijacking search engines pornography criminal hacker**

Computer Currents 17 i20

Web hijacking can occur by copying legitimate Web sites, indexing them with search engines, then redirecting browsers to alternate — often pornographic — pages. The perpetrator can charge advertisers for all the unwilling hits on their sites. One villain who was shut down by the FTC even ran Java applets that disabled the "back" arrow in browsers and deleted the ability to close the browsers. People trapped in porno-hell had to reboot their computers to get out. Experts recommend that everyone keep an eye on the actual URL that appears in their browser window; any discrepancy between the visible URL and the actual URL should alert one to the possibility of fraud. In addition, consider running a personal firewall to block Java applets from unknown or untrustworthy sites.

2001-11-13 **DNS domain name system cybersquatting extortion pornography**

RISKS 21 76

Malcolm Pack, writing in RISKS, gave a startling explanation of why so many sites have been converted to pornographic content. He suggests, ". . .[The] presence of pr0n on the 'hijacked' site is a blackmail tool, which would explain why so many domain names obviously targeted at children become (apparently inexplicably) pr0n sites. I'd never thought of pr0n as a weapon. . . ."

[Mr Pack uses "pr0n" as a substitute for "porn" presumably to avoid triggering e-mail content filters.]

Dan Fandrich confirmed that extortionists are indeed buying expired domain names and installing porn in order to embarrass former domain owners and extort high repurchase prices. He wrote, ". . . [P]ornographers bought up close to 2000 expired domains . . ., including domains owned by respectable organizations with hundreds of inbound links, such as the TCL Consortium, XIII International AIDS Conference, Evian, Universal ADSL Working Group, and Craig's List. I tracked down the original owners of about 60 of these sites with the most inbound links and warned them of the problem . . . . Five months later, only three of those 60 sites have done anything about their former domains, either buying them back from the extortioners or getting links changed to their new sites."

Mr Fandrich offers some thoughtful advice to anyone thinking about letting a domain name registration lapse: "Some of the former owners I talked to seem to have trouble seeing that their web sites did not stand in isolation, that people outside their organization had links to their web site and others had bookmarks and those links attached to their names were now serving up porn. I got responses to the effect of «We have a new domain name now, so we don't care what happens to the old one.» One certainly takes a RISK in letting one's domain name expire, but when the gamble fails and what must be about the worst case scenario occurs, the indifference I've seen surprised me. I find it hard to believe that so many people have so little respect for their viewers and customers."

LYING FOR TRUTH

Some unknown person or group has created a Web site called www.reedcollegis.com intended to fool people looking for Reed College (www.reed.edu) and send them an anti-abortion site called www.abortionismurder.com. Reed College chief technology officer Martin H. Ringle says, "We've paid for 'reed.com' and 'reed.org,' and so on, in an effort to pre-empt cybersquatting. But it's impossible to imagine every variation of the name and how it could be used -- although in hindsight, reedcollegis.com was an obvious one." The site abortionismurder.com is maintained by a Florida man, Thomas P.A. Fitch, who denies involvement with or knowledge of the creation of reedcollegis.com, but does admit to owning an address similar to that of the College Board. His aim is to attract college applicants to his anti-abortion site to expose "to the truth" students who are "going to run this country in fifteen years... I'd say our tactics are not dishonest. They're creative, they're on the edge, they're bold. Thank you for the publicity because it's only helping our cause." Sheldon E. Steinbach of the American Council on Education says of use of the name reedcollegis.com to divert unsuspecting surfers from their intended goal: "This is the first instance, to my knowledge, that a university or college name has been hijacked for seemingly a political purpose." (Chronicle of Higher Education 15 Feb 2002) http://chronicle.com/free/2002/02/2002021501t.htm

INTERNET SCAM ARTIST FINED $1.9M

In May 2002, John Zuccarini of Andalusia, Pa., was ordered to pay $1.9 million in restitution to victims of his URL-misspelling scam, in which he registered more than 5,500 Web sites with names similar to celebrities and popular organizations such as the Backstreet Boys, Bank of America, Victoria's Secret, and The Wall Street Journal. In particular, Zuccarini registered 15 variations on the name of the Cartoon Network site and 41 versions of Britney Spears' name. The scam worked by forcing accidental visitors into click-through advertisements and disabling their ability to leave the site; sometimes the back and close buttons were inoperative. Another deceptive technique involved a "stealth page" concealed under the task bar, usually at the bottom of the screen. This window activated a timer that popped up yet more ad windows at the beleaguered viewer.

Money came from advertisers who were also being cheated, since most of the clickthroughs were in fact from unwilling victims of the scam. By October 2001, Zuccarini had already been sued by 63 groups in the two years and lost 53 times. He had been subjected to 56 arbitration proceedings and lost rights to about 200 of his misspelled domains, yet he continued to rack up profits using his schemes. The US Federal Trade Commission (FTC) filed a complaint against Zuccarini, "doing business as The Country Walk, JZDesign, RaveClub Berlin, and more than 22 names incorporating the word "Cupcake," including Cupcake Party, Cupcake-Party, Cupcake Parties, Cupcake Patrol, Cupcake Incident, and Cupcake Messenger." Unfortunately, Zuccarini remained at large despite attempts of law enforcement officials to locate him.

ICANN PROPOSES RULES TO FIGHT CYBERSQUATTING
The Internet Corporation for Assigned Names and Numbers (ICANN) says it's close to adopting new procedures that would make it easier for individuals and businesses to avoid extortion by cybersquatters, and would establish a waiting list for coveted domains that become newly available to the public. The first measure would establish a 30-day grace period for domain name owners to renew their contracts -- a move intended to prevent speculators from swooping in and registering an expiring domain name before the owner has time to renew. "ICANN receives a large number of complaints for inadvertently deleted domains It affects churches, schools, businesses," says an ICANN spokesman. "We get a lot of complaints from people who wake up to find their domain has expired and now has porn on it, or it's linked to a casino site. Then, they'll ask for a ransom to get it back." The waiting-list proposal would allow a bidder to pay a fee to get first dibs on any newly available domain names. That proposal has run into opposition from registrars who say the $28 that VeriSign has proposed charging them for the service is too high. (Reuters/Wired 27 Jun 2002)

WHAT WAS A DOT-COM LAND GRAB, DADDY?
Cybersquatting is virtually (no pun intended) a thing of the past -- and cyber "real estate" is definitely losing value. The number of dot-com, dot-net, and dot-org names has declined by more than 11% in the first five months of this year, and industry analysts are saying that the dot-com land grab is over. This is quite a change from those heady days, not so long ago, when desirable dot-com names could fetch hundreds of thousands of dollars from companies eager to project just the right image to customers. Now, companies like Johnson & Johnson are saying: "It's become clear that we've already registered as many domain names to protect our trademarks as we need. We haven't needed to buy any more this year." So what will cybersquatters do now? One knowledgeable observer of the scene says, "Speculation is gone. The days of hunting out a real business opportunity are here." Maybe the cybersquatters will actually get a real job. That would be nice. (Los Angeles Times 29 Jul 2002)

SEX.COM RULING COULD OPEN FLOODGATES ON REGISTRY LAWSUITS
A federal appeals court has asked California's Supreme Court to rule on whether Network Solutions Inc., the largest U.S. domain registry, must face a multimillion-dollar damage claim from the rightful owner of the sex.com domain name. The ruling could lead to a flood of lawsuits against domain registries, particularly NSI, from hundreds of people who claim their domain names were also stolen. The current case stems from a lawsuit filed in 1998 by Gary Kremen who registered the sex.com name with NSI in 1994. In October 1995, NSI received a letter purportedly from Kremen asking that the name be reregistered to a company headed by Stephen Cohen. NSI complied without attempting to verify the validity of the request, and then refused to undo the transfer when alerted to the fraud. Meanwhile Cohen, who was using the domain name for a lucrative porn business, fled the country before Kremen's lawsuit against him went to trial in 2001. Kremen, who is now using sex.com for his own porn business, was awarded $65 million in damages from Cohen for fraud (which he'll probably never collect) and is now requesting an additional $30 million from NSI for allowing the fraudulent transfer. 2003-02-11 **.gov domain hijacking government Access One Network Northwest AONN**

NIPC/DHS

GSA PULLS SUSPICIOUS .GOV SITE

The General Services Administration (GSA), which runs the .gov registry, pulled the plug on a .gov Web site pending an investigation into the authenticity of the organization that controlled it. Until January 24, the AONN.gov Web site contained information about an agency calling itself the Access One Network Northwest (AONN), a self-described cyberwarfare unit claiming to employ more than 2,000 people and had the support of the U.S. Department of Defense. No federal agency called AONN appears to exist, and no agency with that name is on the official list of organizations maintained by the U.S. National Institute of Standards and Technology. The action could point to the first case of a .gov domain name hijacking. Cybersquatting, or registering a domain to which you may not be entitled, is hardly uncommon among the multitude of .com and .net domains. But there are no known cybersquatting incidents involving a governmental domain, according to the GSA. Claiming credit for the deleted .gov site is a man who calls himself Robert L. Taylor III. Taylor declined to explain how or when he secured a .gov domain for the group, calling AONN's operations "classified." A Pentagon representative said that AONN has no affiliation with the U.S. military and he had no knowledge of the organization. According to the official .gov registration rules, only organizations that appear in an official list of government agencies qualify for a .gov domain—and AONN is not on it. Registering a .gov domain name involves writing an authorization letter, printing it out, and then sending it to the ".GOV Domain Manager" in Reston, Virginia.

S*X.COM RESTORED TO RIGHTFUL OWNER
The U.S. Supreme Court has rejected an appeal from cybersquatter Stephen Cohen, who had hijacked the lucrative s*x.com domain name from its original owner Gary Kremen, putting an end to six years of legal wrangling. The ruling, which upheld a lower court's award of $65 million in damages to Kremen, is viewed by legal experts as a landmark case because it holds domain registrar VeriSign accountable for allowing the ownership transfer to take place, based on a forged letter from Cohen. The case is also expected to set a precedent for treating an Internet address as legal property — a designation disputed by VeriSign, which could face fines of up to $200 million if found liable. Kremen now faces an uphill battle to claim his award, because Cohen is now a fugitive in Mexico. (BBC News 13 Jun 2003)

RISKS; http://www.panix.net/hijack-faq.html 23 69

DON'T PANIX

The DNS entry for the Panix ISP was hijacked in January 2005. Cyrus R. Eyster reported to RISKS on the case and quoted the Panix Website:

Panix's main domain name, panix.com, was hijacked by parties unknown. The registration of the panix.com domain was moved to a company in Australia, the actual DNS records were moved to a company seemingly in the United Kingdom (but with servers in Canada and corporate registration in Delaware), and panix.com's mail was redirected to servers in Canada. None of the systems exploited to perform this hijacking were under Panix's control.

It's not supposed to be possible to transfer a domain name from one registrar to another without notifying both the current registrar and the current domain owner, but that's what seems to have happened.

As the hijacking occurred over the weekend, we had great trouble reaching responsible parties at the other companies involved. The domain was not returned to us until the beginning of the business day in Australia on Monday. None of the companies involved had support numbers that were available over the weekend, or even emergency contact numbers.

EDUPAGE;
http://today.reuters.com/business/newsArticle.aspx?storyID=nN78398318

GOOGLE WINS TYPOSQUATTING CASE

Google has the rights to several misspellings of its domain name, according to a decision by the National Arbitration Forum (NAF). Google had filed a complaint against Sergey Gridasov, a Russian man who had registered domain names of googkle.com, ghoogle.com, gfoogle.com and gooigle.com, saying that he was profiting from Google's name with the domains, which are common mistypings of google.com. Gridasov reportedly used the domains to redirect Web surfers to sites that would download various kinds of malware to their computers. Because Gridasov did not respond to the complaint, the NAF was compelled to accept the allegations in Google's complaint. According to the NAF, Gridasov is not entitled to use the domains, which are confusingly similar to Google's.

INTERNET REGISTRAR TO CHALLENGE NAME CLAIMS [15 Aug 2001]
In response to widespread criticism, Afilias -- the company that runs the new ".info" domain -- says it will challenge some of the more shaky claims made on the most desirable names. The situation arose when Afilias allowed businesses to claim their trademarks before registration was opened up to the general public. Many of those claims were made on common dictionary words, with registrants providing little or no trademark documentation. Afilias rules allowed would-be challengers to register their complaints, but charged them $295 to begin the process. Even if they were successful, challengers were refunded only $220 of that fee. More than 25,000 .info names have been claimed since preliminary registration opened July 25, and Afilias exec Roland LaPlante says his company expects to file hundreds of challenges with arbiters at the World Intellectual Property Organization. Some of the names already claimed include books.info, consumers.info and business.info. (AP 15 Aug 2001)

2000-06-14 **DNS domain name system registrar invoice bill**

RISKS 20 92

Peter G. Neumann summarized an embarrassing lapse of DNS registration: "J.P. Morgan & Company (worth $21 billion) lost its Internet connectivity on 13 Jun 2000 because they failed to pay their $35 bill from Network Solutions for their jpmorgan.com domain: three bills ignored over six weeks. All of their Net customers were affected. (Last year Microsoft failed to reregister a domain name necessary for Hotmail service, although a computer consultant bailed them out by paying the fee for them.) "

In a follow-up contribution to RISKS, Peter Sleggs reported that he has experienced difficulties with Network Solutions' billings. On occasion, he failed to receive paper invoices for one of the two domains he has registered. In addition, his payments for one of the domain failed to be registered correctly. [Comment by MK: at this point, DNS registration is becoming a critical issue for businesses; perhaps a few good tort lawyers could do some good to encourage DNS registrars to shape up and recognize the importance of their operations.]

Similarly, Arthur J. Byrnes reported in RISKS that Network Solutions Inc. claimed that they would send a snail-mail and e-mail warning 30 days before the renewal deadline; they did neither. He very sensibly wrote, "So, my personal experience makes me wonder where the blame actually lies in these stories. I know that if I worked for a dot.com, I'd be checking all of my employer's domains expiration dates."

2000-07-23 **policy statement DNS domain name service politics**

RISKS, PFIR http://www.pfir.org/statements/policies 20

Lauren Weinstein and Peter G. Neumann, co-founders of the new group "People for Internet Responsibility" (PFIR, < http://www.pfir.org >) published a manifesto entitled "Statement on Internet Policies, Regulations, and Control." The Executive Summary follows:

>It is increasingly clear that the Internet, as embodied by the World Wide Web and a wide variety of other Net-based services and technologies is rapidly becoming a critical underpinning and foundation to virtually every aspect of our lives, from the very fundamental to the exceedingly mundane. It is likely that few aspects of commerce, education, communications, government, entertainment, or any other facets of our daily existence will be unaffected by this exceedingly rapid change that is sweeping the globe far more rapidly than would have been anticipated only a few years ago.

These global and interconnected developments, unprecedented in human history, suggest that decisions regarding policies, regulation, control, and related Internet activities will be of crucial concern to the *entire* world's population. Consequently, the proper representation of many varied interests regarding such activities must be respected.

It is our belief that the current mechanism for making many key decisions in this regard, as embodied in The Internet Corporation for Assigned Names and Numbers, "ICANN" (http://www.icann.org), is proving to be inadequate to the task at hand. We believe that this is the result primarily of structural and historical factors, not the fault of the individuals directing ICANN's activities, whom we feel have been genuinely attempting to do the best possible job that they could with highly complex, contentious, and thankless tasks.

We are convinced that the Internet's future, and the future of humanity that will be depending upon it to ever increasing degrees, would be best served by consideration being given to the establishment of a new, not-for-profit, voluntary, international organization to coordinate issues of Internet policies and related matters. This organization would be based on a balanced representation of private-sector commercial and non-commercial interests, and public-sector interests including governmental bodies and organizations, educational institutions, and other enterprises.

Although the proposed course of action is expected to be difficult, the risks of inaction are enormous and likely to increase dramatically in the coming years.<

In November, VeriSign, the company in charge of dot-com, dot-net, and dot-org Internet domain names . . . began accepting Chinese, Japanese, and Korean characters for those suffixes, an action expected to dramatically accelerate Internet globally. Arabic and other non-English languages will be added later. Doug Wolford, the general manager of Network Solutions Inc., VeriSign's registration arm, said: "There's a whole world out there that has really not been able to use the Web. Hundreds of millions of people have to use English to find their native language Web site. It's an absurdity, an artifact of history long outgrown." (AP/San Jose Mercury News 9 Nov 2000)

However, [t]he Internet Society . . . warned that proceeding with the sale of multilingual domain names will harm the stability of the Internet Domain Name System, and asked that the initiative be postponed until the Internet Engineering Task Force can develop a proposed standard for internationalized domain names. Internet Society VP David Maher admits that it's unusual for the group to issue such a strongly worded statement. "This is very significant... We think this will absolutely hurt the DNS and inevitably lead to conflicts as people claim to have the rights to certain names because of this test bed... Real problems come from the fact that there are conflicting proposals for how internationalized domain names should be handled. This automatically ensures there will be serious problems. It's like different companies selling telephone numbers or seats on the same flight." (Infoworld.com 8 Nov 2000)

m

[In November, the] Internet Corporation for Assigned Names and Numbers (ICANN) . . . [announced that it would] add seven new top-level domain names for Internet addresses:.info, .biz, .name, .museum, .aero, museum, and .coop. The first two will be for general use, with biz expected to relieve the pressure for businesses to find a unique name within the popular .com domain, which now has 20 million sites; .pro is intended for professionals, such as doctors and lawyers; .name will be used to designate personal Web sites; .museum will be restricted to museums; .aero for airline groups; and .coop for business cooperatives. ICANN did not give its approval to other domain names that had been proposed to it, including .web, .kids, .xxx, .union, .health, .travel, and .geo. The new names will not be put into effect no sooner than next Spring. (New York Times 17 Nov 2000)

The Geneva-based World Health Organization (WHO) . . . issued a statement expressing strong displeasure at ICANN's decision not to include a top-level domain name designated .health, and stating that the organization will "begin immediately to explore ways of recourse." WHO had proposed creation of a .health domain to be used strictly for sites providing information and services which met the quality standards of WHO and public health organizations, consumer groups, and academic institutions. (Reuters/San Jose Mercury News 17 Nov 2000)

[However, it] turns out that the seven new domain names chosen by ICANN may do little to broaden the possibilities for picking an Internet name. Many of the companies tapped to administer the new names are planning to restrict who can buy them by charging hefty registration fees and vetting those that apply. Neulevel, the company that will be administering the .biz domain, reportedly is planning to charge $2,000 for each domain name and $150 a year to renew it. It's also planning to make the .biz names available only to established companies in an effort to prevent cybersquatting squabbles. Many of the other organizations chosen to run the new domains are thinking about imposing similar restrictions. (BBC News Online 21 Nov 2000)

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB975524587449438763.htm

VeriSign's recent initiative to register Chinese-language Internet domain names has unleashed a maelstrom of conflict, with a Chinese government affiliate immediately launching its own rival, and incompatible, system. The result could be two separate Internet routing systems, causing major headaches for Chinese-speaking Internet surfers. "The risk is balkanization of the Internet, dividing the Internet up into islands of connectivity," says Pindar Wong, who until recently served as vice chairman of ICANN. "Global connectivity is the most precious aspect of the Internet. Anything that might potentially jeopardize that needs to be considered very carefully." The battle exemplifies Beijing's efforts to both embrace the Internet's development potential while at the same time attempting to control it. Critics say the system operated by the government-affiliated China Internet Network Information Center is as isolating as if China decided it would use its own system of telephone numbers. "It's a classic case of China trying to develop the Internet the way it suits them rather than what suits the rest of the world," says a senior analyst for IDC. (Wall Street Journal 30 Nov 2000)

ICANN DEFENDS NAME CHOICES
ICANN chairman Vinton Cerf acknowledges that the group may have rejected qualified proposals when it approved seven new domain names last year, but says that the goal "was not to have a contest and pick winners." ICANN purposely kept the pool of new names small, so that it could test whether the additions caused any problems with the overall system. Domain names, he says, have never been added "in the context of the Internet as it exists today. We want to do so without endangering the utility of what has become a global medium for communications and commerce." (AP/Washington Post 8 Feb 2001)

LAWSUIT CHALLENGES .BIZ 'LOTTERY' [26 Jul 2001]
A class-action lawsuit filed in Los Angeles Superior Court this week alleges that NeuLevel, the operator of the new ".biz" domain, is running an illegal lottery by charging customers just for a chance to register a .biz name. There is no guarantee that a customer will be awarded a desired name, as more than one customer may pay for a chance on the same name. The suit names as co-defendant the Internet Corporation for Assigned Names and Numbers (ICANN) and several registrars, including VeriSign and Register.com, which have been licensed to sell .biz and other Internet domain names to the public. The plaintiffs argue that NeuLevel's "lottery enterprise" is not only illegal, but unfair because it allows those with larger financial resources to increase their odds of getting a name by buying multiple chances. ICANN CONSIDERS REDUCING PUBLIC ROLE IN INTERNET MANAGEMENT [6 Nov 2001]
The At-Large Membership Study Committee of ICANN, the nonprofit international organization responsible for developing policies for Internet address assignment and management, is recommending that special fees be charged to members of the public who want to participate as at-large directors in ICANN's decision-making processes. Former Swedish Prime Minister Carl Bildt, who heads the Committee, says that existing and other proposed methods for picking at-large directors are unworkable: "You can have all sorts of visionary schemes but we living in the reality of today. ICANN needs stability. This is not the time for experiment." Last year's at-large elections allowed voting by e-mail, and suffered from technical and administrative difficulties. REGISTRARS REJECT VERISIGN'S 'PAY-TO-WAIT' PROPOSAL [21 Jan 2002]
Internet domain name registrars overwhelmingly oppose VeriSign's proposal to create a pricey waiting list for registered domain names, calling it too expensive and anti-competitive. VeriSign has suggested charging registrars $40 for first dibs on a registered domain name. A subscriber would be guaranteed first-refusal rights to the name if it becomes available, but would still have to pay even if the current owner decided to renew its subscription. VeriSign said the waiting list would provide a new source of revenue and discourage speculation in domain names by raising the cost. Other registrars complained that instead of solving the cybersquatting problem, the proposal would just shift the action to the waiting list. In addition, some expressed suspicions that VeriSign would use the waiting list to hoard all the best names for itself, but Chuck Gomes, VP of policy and compliance for VeriSign's Global Registry Services, said his company maintained a strict "firewall" between the two sides of the business: "I ensure that day by day we're not advantaging any registrar I understand the mistrust, but it's unwarranted." ICANN PRESIDENT WANTS MORE GOVERNMENTAL PARTICIPATION
Stuart Lynn, president of the nonprofit Internet Corporation for Assigned Names and Numbers, says the organization he heads needs to be restructured to obtain more governmental participation: "I am now convinced that the original desire to avoid a totally governmental takeover ... led to an overreaction -- the choice of a totally private model." Such a model is unworkable, Lynn says, because it leaves ICANN "isolated from the real-world institutions -- governments -- whose backing and support are essential." His recommendation calls for the next ICANN board to have 15 members -- one-third nominated by governments, one-third selected through a committee process, and the remaining consisting of the group's president and appointments by four policy and technical groups. ICANN REJECTS BOARD MEMBER ELECTIONS
ICANN, the international nonprofit group that sets policy for the Internet's "domain-naming" (i.e., addressing) system, has decided against electing its board members by general elections, at least for the time being. In an ICANN meeting in Ghana, board chairman Vinton Cerf said, "It is obvious to all of us after carefully examining the issues that we're not doing elections now" -- and ICANN chief executive Stuart Lynn said the reason for the decision was that most board members feared general elections could be marred by fraud and dominated by special interests. Board member Karl Auerbach dissented vehemently from the group's decision: "ICANN made a great leap backwards. It repudiated the compact on which it was formed -- an agreement that ICANN would, being a public and tax-exempt entity, allow the public to meaningfully participate." The acronym ICANN stands for the Internet Corporation for Assigned Names and Numbers. (AP/San Jose Mercury News 14 Mar 2002)

ICANN UNDER NEW ATTACKS
ICANN — the Internet Corporation for Assigned Names and Numbers — is one of those organizations apparently destined for continuous controversy. The organization recently eliminated five sitting board members from the 18-person directorate, leading to new charges of its running a closed and "illegitimate" organization. Hans Klein, chairman of the Computer Professionals for Social Responsibility, says of ICANN's leaders: "I think legitimacy matters, they don't. If you kill the legitimacy of an organization, you put the organization at risk. ICANN has decided that legitimacy doesn't matter; it's done away with many of the mechanisms that insured its legitimacy. If people start leaving the organization, it will be ruined." And Michael Froomkin, another ICANN critic, says: "What's outrageous is that because the ICANN staff can't stand to have its actions questioned, it's making sure it never has to face the user community in an election again. In fact, in the new 'reform' plan, ICANN's insiders have put themselves in charge of the process that will select their successors." (Internet News 30 Oct 2002)

ICANN TO CREATE THREE MORE 'SPONSORED' DOMAINS
ICANN, the nonprofit Internet Corporation for Assigned Names and Numbers, is planning the creation of three new "sponsored" (or narrowly focused) Internet address domains, which, like dot-museum (for the museum community) or dot-coop (for employee-owned co-op organizations), will be reserved for specific audiences (as contrasted with, say, dot-com, which is open to all potential registrants). The reason for this strategy, says ICANN president Stuart Lynn, is to avoid a gold-rush environment that characterized the creation of new domains in the past. But ICANN board member Karl Auerbach, who is also a long-time critic of the organization, accuses Lynn of "making a down-and-out decision about who can be in business on the Internet and who cannot"; he thinks ICANN is creating an artificial scarcity of domain names, to benefit businesses that sell existing domains. ICANN HEAD FAVORS MEMBERS-ONLY DOMAINS [10 Jan 2002]
ICANN president M. Stuart Lynn says he favors creating new members-only suffixes, such as .edu and .museum, over unrestricted domains such as .biz and .info. "A lot of the problems surrounding the new (top-level domains) are less (common) in a sponsored environment," he said, echoing sentiments expressed by ICANN chairman Vint Cerf at a meeting in December. Problems such as cybersquatting disputes would be greatly diminished in a more tightly regulated domain, said Lynn. "It may be that a number of these cybersquatting or trademark disputes are going to be less because there's a lot of careful evaluation to make sure that someone really is using them for their announced" purpose. Lynn and Cerf have both emphasized that their opinions are their own and not those of ICANN, but that they've talked with many people who agree with them. "More people I talk to think it's the more likely direction," said Lynn. (Reuters/CNet 10 Jan 2002)

2003-04-04 **forecast warning domain name system DNS work Internet future extension**

NIPC/DHS

April 04, Electronic Times — DNS pioneer warns of Internet security.

When it comes to the Domain Name System (DNS), the database architecture at the heart of the Internet infrastructure for the last 20 years, "the majority of the work to be done still lies ahead of us," said Paul V. Mockapetris who co-invented DNS in 1983. Mockapetris received the 2003 IEEE Internet Award for his pioneering work on DNS on Tuesday. Mockapetris warned that efforts need to be made to improve its security especially since the October 2002 attacks on 9 of the Internet's 13 DNS root-name servers that contain the master domain list for DNS and the March 27th 2003 hacker attacks on the al-Jazeera network, part of which were DNS-based. Despite attacks that portend graver security breaches, Mockapetris noted that The Internet Engineering Task Force has not yet hammered out a standard after nearly a decade of work. With a security model for DNS in place, extensions could be built onto DNS that would relate to creating greater opportunities on the Internet including phone numbers for IP telephony, distribution of security keys and certificates, and no-call lists for telemarketers. But without it, there is a "real opportunity for fraud" as the hacker community climbs the technology ladder and puts the 30 million people with web domains at risk, according to Mockapetris.

NON-ENGLISH DOMAIN NAMES COMING SOON
The Internet Corporation for Assigned Names and Numbers (ICANN), is poised to approve technical standards that will enable registration of Internet domain names in Chinese, Arabic and other languages. "A great deal of progress has been made this week and I hope we will see progress as the weeks go by," said ICANN chairman Vinton G. Cerf at this week's meeting in Rio de Janiero. "The technical standards are ready. Now the policy work has to be done… The languages that are most advanced are Japanese, Chinese and Korean. Those groups have done a tremendous amount of work to translate their scripts into domain names." Currently, the core computers that handle online addresses understand only the 26 English letters, 10 numerals and a hyphen, along with a period for splitting addresses into sections. How soon users will be able to obtain domain names in other languages depends largely on the extent to which technicians using those languages have translated their alphabets into Internet protocol, said Cerf. (AP 27 Mar 2003)
