ICANN PLANS TO OPEN THE DOORS
The Internet Corporation for Assigned Names and Numbers (ICANN) has long been accused by critics of being a closed organization, but a reform movement begun under outgoing president Stuart Lynn (and continued by his successor, Paul Twomey) will allow organization of the individual Internet user community for informed participation in the organization. Applications will be accepted from groups seeking designation as "At-Large Structures." In a separate discussion, the group tried to wrestle with the question of how much personal data collected by Internet domain administrators should be publicly available. Twomey said, "Although no definitive policy was formed, a lot of healthy dialogue took place paving the way for future policy development." (Internet News 27 Jun 2003)

NETWORK SOLUTIONS MAY BE LIABLE FOR SEX.COM SWITCH
A U.S. appellate court has ruled that Web registry Network Solutions may be liable for damages for its part in transferring the domain name "sex.com" from its rightful owner, Gary Kremen, to convicted forger Stephen Michael Cohen. In his ruling, Judge Alex Kozinski said that domain names should be treated as property, despite their virtual nature, comparing them to "a plot of land." "Exposing Network Solutions to liability when it gives away a registrant's domain name on the basis of a forged letter is no different from holding a corporation liable when it gives away someone's shares under the same circumstances. The common law does not stand idle while people give away the property of others," wrote Kozinski, who returned the case to the U.S. District Court in San Jose to be tried again. "This was a major victory, no doubt about it," said Kremen, who won a $65 million judgment against Cohen, but has been unable to collect because Cohen has fled the country. The case, which may garner landmark status for equating domain names with tangible property, likely will be retried within a year. (CNet News.com 25 Jul 2003)

ICANN ASKS VERISIGN TO SHELVE SITE FINDER SERVICE
ICANN (Internet Corporation for Assigned Names and Numbers) has issued a statement voicing "widespread expressions of concern" over the technical repercussions possible from VeriSign's recently launched Site Finder service. Site Finder steers Web users who make typographical errors while entering URLs to a site operated by VeriSign. Critics say the technical process by which VeriSign "hijacks" users could disrupt e-mail delivery as well as impair the ability of ISPs to block "spam" sent from non-existent Internet addresses — a common technique for reducing the volume of junk e-mail. In self-defense, some ISPs and software groups have developed patches that prevent the Site Finder software from working on their networks. (Wall Street Journal 22 Sep 2003)

VERISIGN AGREES TO SUSPEND SITE FINDER SERVICE
VeriSign and ICANN reached a temporary truce Friday, with VeriSign acquiescing to ICANN's demand that it suspend its controversial Site Finder service pending further technical review. ICANN could have fined VeriSign as much as $100,000 or even revoked its contract to manage the master list of .com and .net Internet domain names. Critics have charged VeriSign with undermining the collectivist culture of the Internet with the preemptive launch of its service, which redirects Web users who mistype a URL to the VeriSign Web site. "In the past when you made a dramatic change to the network structure that was the least bit potentially damaging, you went out through the community and you exposed what you were going to do and got reaction," says Carnegie Mellon computer science professor David Farber. VeriSign "just broke the whole process." In its defense, VeriSign executives say they notified ICANN of their plans ahead of time, but admitted that they sidestepped ICANN's lengthy approval process because it's too slow. In response, ICANN says it's "sympathetic to concerns" about its process and has proposed a more streamlined procedure for reviewing new services such as Site Finder. WILL THE U.N. TAKE OVER THE INTERNET?
Some of the developing countries want to put management of the Internet under United Nations control. U.N. officials expect governments to continue talks on Internet governance with the aim of reaching accord by 2005. Brazil, India, South Africa, China and Saudi Arabia are dissatisfied with the current Internet regulator, the semi-private California-based ICANN (the Internet Corporation for Assigned Names and Numbers), and argue that the Internet is a public resource that should be managed by national governments and by intergovernmental organizations. But both the United States and the European Commission are standing behind the ICANN model, in the belief that to turn Internet regulation over to governments could threaten the existence of the borderless Internet. 2003-12-10 **Internet domain name system DNS politics control ICANN**

NIPC/DHS

December 10, Washington Post — UN sets aside debate over control of Internet.

In a last-minute meeting this weekend before the start of this week's World Summit on the Information Society in Geneva, Switzerland, representatives set aside a debate over whether national governments, rather than private-sector groups, should be in charge of managing and governing the Internet around the globe. UN member states instead will ask Secretary General Kofi Annan to put together a panel of experts from government, industry and the public to study the issue and draft policy recommendations before the high-tech summit reconvenes in Tunisia in 2005. Leaders had planned to wade into a debate over the way Website and e-mail addresses are doled out, standards are set for Internet security and the thorny question of how Internet-based transactions are taxed, among other things. Some developing nations have complained that the world's most visible Internet governance body — the U.S.-based, nonprofit Internet Corporation for Assigned Names and Numbers (ICANN) — hasn't adequately represented non-U.S. interests, and should be replaced with a governmental group overseen by the United Nations. ICANN has managed the Internet's global addressing system since 1998 under an agreement with the U.S. government.

VERISIGN SUES ICANN

VeriSign has filed a federal lawsuit against ICANN, the regulatory body, charging that ICANN has unfairly prevented VeriSign from developing new services for Internet users. According to the suit, ICANN "has overstepped its authority by trying to become the regulator of the Internet." ICANN (the Internet Corporation for Assigned Names and Numbers) is a nongovernmental organization empowered by an agreement with the U.S. government, whereas VeriSign is a private-sector corporation. The lawsuit alleges that ICANN improperly prevented the company from maintaining an online search service, 'SiteFinder', that redirected mis-typed Internet addresses to an advertising-supported search service operated by VeriSign. A VeriSign executive said that ICANN had no authority to force it to shut down Site Finder, and complains: "Working the ICANN process is like being nibbled to death by ducks." But critics of VeriSign say that SiteFinder, by redirecting attempts to access non-existent Web sites, would force the rewriting of hundreds of programs and devices across the Internet. 2004-03-12 **Internet Corporation Assigned Names Numbers ICANN domain wireless registry**

NIPC/DHS

March 10, International Herald Tribune — New domain is proposed.

Nine technology and telecommunications companies joined Wednesday, March 10, to announce their application for a mobile-specific domain. The application, submitted to the Internet Corporation for Assigned Names and Numbers (ICANN) the overseer of the Internet's address system, calls for a new, for-profit joint venture set up by the companies to manage the mobile registry. Names purchased from the company would explicitly point to wireless-focused domains, making the registry a new type of electronic postal code on the Internet. The companies could require any name registered under the new address heading to have a mobile-specific purpose. By contrast, names registered for use with .com, .net and other generic endings need not have any specific thematic purpose. After ICANN's current application round closes on March 16, independent evaluators will examine the proposals. The technology and telecommunications group expects the application process to take three to six months, and services based on the new address, if approved, might arrive by the first half of 2005.

DEAL OF THE CENTURY — 100-YEAR DOMAIN SERVICE

Responding to frustration over the current Internet domain name registration renewal process, Network Solutions says it will offer a 100-year registration option for $1,000 per name. "We've had a number of customers who have allowed high-value domain names to lapse," says Network Solutions CEO Champ Mitchell, citing Microsoft's failure to renew its Passport.com address in 1999 and the Washington Post's temporary lapse in renewing its washpost.com domain name earlier this year. Mitchell agreed that most domain owners won't want to pony up $1,000 for something that costs $40 per year, but predicted that there might be up to 10,000 potential takers for the 100-Year Domain Service. But Wayne State University law professor Jonathan Weinberg says the deal may not be a bargain for customers. "Just as you wouldn't want to be locked into your phone company for the next hundred years, even if they offered you a really good deal on a phone, it doesn't make a lot of sense to be locked in with a domain registration company for the next hundred years. If Network Solutions should go bankrupt 30 years from now or 70 years from now, you're up a creek." (Washington Post 24 Mar 2004)

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A60758-2004Oct25.html

'.NET' UP FOR GRABS '

.Net,' the world's fourth largest Internet domain, is looking for a new operator, and experts say the stakes are high. The winner, to be chosen by ICANN, could earn as much as $30 million a year, but if the domain were to fail, huge e-mail networks like those operated by Comcast and Earthlink, would go down with it. "It's the most important decision ICANN has ever had to make," says Tom Galvin, VP of government relations for VeriSign, which has operated the .net domain up until now. About 30% of all e-commerce traffic and more than 150 billion e-mail messages a year travel through .net. The handover is the culmination of a deal that VeriSign cut back in 2001, when it agreed to relinquish control over .net in favor of near-permanent ownership of the more lucrative .com domain. VeriSign is permitted to bid on the new .net contract, but will not be given preferential treatment. One likely rival will be Dublin-based Afilias, which in 2003 took over technical management of the .org domain. "There's no question that .net helps underpin the Internet," says Afilias CTO Ram Mohan. "The one [assertion] that strikes me as incongruous is that if you touch .net, everything will fall apart." NewsScan; http://apnews.excite.com/article/20041028/D860EHTG0.html

NEW WEB DOMAINS ON THE WAY

Two new Internet domain names -- ".post" and ".travel" -- have received preliminary approval from ICANN, which says they could be in use as early as next year. Talks are now scheduled to hammer out the details on creating and running the domain names, a process that could take months. ICANN is also considering proposals for additional domains, including ".asia," ".jobs," and ".xxx," but the oversight group said the .post and .travel names were different from most existing names because they would be set aside for specific industries and interest groups. The Universal Postal Union in Switzerland wants .post for national postal services, local post offices, business partners and stamp collectors. Private delivery services such as FedEx and UPS would also be eligible. The UPU envisions establishing up to 650,000 virtual post offices to enable users to access their local postal functions anywhere in the world. The Travel Partnership Corp., a New York trade group, wants to make .travel available to travel agents, hotels, airlines, B&B operators, tourism bureaus and others in the travel industry. It hopes that having a specific domain will encourage more travelrelated businesses to put their information on the Web. (AP 28 Oct 2004)

NewsScan; http://theage.com.au/articles/2004/11/10/1100021855873.html

NEW DOMAIN RULES 'WILL MAKE HIJACKING EASIER'

New rules for domain transfers will come into effect on Friday, making it easier for people to hijack domains, according to the security and network services company Netcraft. The new rules, set by the Internet Corporation for Assigned Names and Numbers (ICANN), will mean that requests for transferring a domain will be automatically approved in five days unless they are denied by the owner of the domain. Currently, the ownership of a domain and the nameservers allotted are not altered if a request for a transfer evokes no response. Domain owners who do not manage their records carefully face problems under the new regime. If the contact addresses given in the records are incorrect, then a request for transfer would go to a wrong address and after five days of no response, the transfer would become effective. DHS IAIP Daily; http://www.newscientist.com/article.ns?id=dn7357

GOOGLE BLACKOUT LINKED TO INTERNET INFRASTRUCTURE

A brief blackout at Internet search giant Google has drawn attention to the addressing system that underpins the Web. The Google search page disappeared from view for about 15 minutes late Saturday night, May 7. Some users reported being redirected to an alternative search service called SoGoSearch, but Google has strongly dismissed suggestions that its servers were compromised in any way. Google spokesperson David Krane told the Associated Press that the problem was related to the Domain Name System (DNS), which maps Web names to the numerical Internet Protocol (IP) addresses used by computers. There are thousands of individual DNS servers dotted around the Internet that report back to 13 "root" servers holding master records for DNS mapping. It remains unclear whether the outage at Google was the result of a malfunction in one particular server or the wider system. The outage has drawn attention to widespread reliance of many Web users and services on Google and highlights existing concerns over the stability of DNS infrastructure. In March 2005, the National Academies National Research Council issued a report criticizing the current state of DNS infrastructure. EDUPAGE; http://news.zdnet.com/2100-9588_22-5770937.html

U.S. WILL KEEP CONTROL OF INTERNET ROOT

Despite previous statements from U.S. officials that the country would cede its control over the Internet to the Internet Corporation for Assigned Names and Numbers, a set of principles outlined this week by the Bush administration states that no such transfer of control will take place. The United States maintains control of the "root" system that determines which domains will function, including not just generic domains such as .com and .org but also country-specific domains. The principles, which were announced unexpectedly at a conference in Washington, D.C., are seen by many as a snub of the world community in general and of certain of its critics in particular. Pakistan and Brazil, for example, have long complained that the United States has too much control over the Internet and should give the world's poorer countries the opportunity to be equal participants. UN REPORTS ON CONTROL OF INTERNET

A working group created by the United Nations (UN) to draft a recommendation about the future oversight of the Internet has come up with four options. The Working Group on Internet Governance (WGIG) was created in 2003 following the failure of the UN's World Summit on the Information Society (WSIS) to agree on an Internet governance structure. Three of the WGIG's proposals would take control of the Internet away from the Internet Corporation for Assigned Names and Numbers (ICANN), which is currently run by the United States. Many developing nations have complained that final oversight of the Internet should not rest with U.S. officials. The fourth option would leave control with ICANN but create a forum for debate on Internet issues that face all countries. The four options will be presented to the 2005 WSIS meeting in November, where delegates will choose one. Earlier this month, the United States stated that it would not relinquish control of ICANN or the Internet. BBC, 18 July 2005

EDUPAGE; http://www.nytimes.com/2005/11/14/business/14register.html

UN MEETING TO ADDRESS CONTROL OF INTERNET

The United Nations (UN) is hosting an international conference this week in Tunisia to address concerns about U.S. control of the Internet. The Internet Corporation for Assigned Names and Numbers (ICANN) was set up in 1998 to oversee the Domain Name System, which reconciles Web addresses and directs Internet traffic to proper destinations. Despite an understanding that ICANN would become independent of any national ties, the Bush administration this year rejected such a move, and the organization still operates under the authority of the U.S. Department of Commerce. This situation has left many other countries complaining that the United States holds the power over a global resource, and nine different proposals for putting ICANN under the guidance of an international body will be addressed at the meeting in Tunisia, which will host as many as 15,000 delegates. Some individuals who were part of the work that led to the Internet have said that concerns over ICANN are misguided. Leonard Kleinrock, computer scientist at UCLA, said, "Everyone seems to think that the D.N.S. system is a big deal, but it's not the heartbeat of the Internet." Robert Kahn, one of the developers behind TCP/IP, said of ICANN, "There is nothing in there to control, and there are huge issues that the governments of the world really do need to work on." EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4482292.stm

INTERNATIONAL GROUP SUES OVER .COM MANAGEMENT

The World Association of Domain Name Developers has filed a lawsuit in a California court against the Internet Corporation for Assigned Names and Numbers (ICANN) and VeriSign over a deal recently reached between the two organizations. After resolving a dispute over VeriSign's Site Finder service, which directed users who mistyped URLs to VeriSign's Web site, ICANN agreed to an extension of the contract that allows VeriSign to manage the .com and .net domains. Although the extension runs from 2007 to 2012, the lawsuit filed by the developers association contends that the contract "provides for the automatic renewal of the agreement and thereby precludes competitors from ever entering the .com and .net domain name registration market," thereby establishing a monopoly for the domains. The only means for another company to bid on the work, according to the suit, is if VeriSign goes out of business or fails to meet the terms of the contract. A statement from ICANN said the lawsuit is intended to divert attention away from an ICANN meeting currently being held in Vancouver. BBC, 29 November 2005

DHS IAIP Daily; http://news.zdnet.com/2100−9588_22−6044629.html 23

CHINA CREATES OWN INTERNET DOMAINS.

China has created three of its own top-level domains that will use the domain names .cn, .com and .net, in Chinese. The domain names were launched Wednesday, March 1, by the Chinese Ministry of Information Industry. The creation of Chinese character domain names has led to speculation that China could break away from the Internet Corporation for Assigned Names and Numbers completely, and undermine the global unity of the Domain Name System, the network of servers that resolves domain name requests. Internet experts are concerned that this move will see China administrating its top-level domains with its own separate root servers, which could cause a split in the Internet.

2006-04-24 **DNS message decompression remote denial-of-service DoS vulnerability solution update**

DHS IAIP Daily; http://www.securityfocus.com/bid/13729/discuss 23

MULTIPLE VENDOR DNS MESSAGE DECOMPRESSION REMOTE DENIAL-OF-SERVICE VULNERABILITY.

Multiple DNS vendors are susceptible to a remote denial-of-service vulnerability. This issue affects both DNS servers and clients. Analysis: Under certain circumstances, it is possible to cause both DNS servers and DNS clients to terminate abnormally by sending it malformed messages. The text portions of DNS messages are specified by first giving the character count, followed by the characters themselves. For example to specify 'test.test.com', the message would look like '0x04test0x04test0x03com0x00' using 16-bit numbers. From RFC1035, Section 4.1.4, "Message Compression" specifies a way to create smaller messages so that they can easily fit into a DNS UDP packet. Hence if the top two bits of the label length byte are one, the remaining 14 bits specify an offset from the beginning of the text on where the remaining characters can be found. This way, redundant information can be removed and hence create a smaller message. For a complete list of vulnerable products: http://www.securityfocus.com/bid/13729/info The following versions are not affected by this issue; users are advised to upgrade: DeleGate 8.10.3 and subsequent versions; dnrd 2.18 and subsequent versions; PowerDNS 2.9.17. Solution: Cisco has released advisory cisco-sn-20050524-dns to address this issue. For further information: http://www.securityfocus.com/bid/13729/references

2006-05-02 **vulnerability issues Domain Name System DNS implementation**

DHS IAIP Daily; http://www.securiteam.com/securitynews/5IP020KIKU.html 23

VULNERABILITY ISSUES IN IMPLEMENTATIONS OF THE DOMAIN NAME SYSTEM PROTOCOL.

The vulnerabilities described in this advisory affect implementations of the Domain Name System protocol. Many vendors include support for this protocol in their products and may be impacted to varying degrees, if at all. Analysis: If exploited, these vulnerabilities could cause a variety of outcomes including, for example, a denial-of-service condition. In most cases, they can expose memory corruption, stack corruption or other types of fatal error conditions. Some of these conditions may expose the protocol to typical buffer overflow exploits, allowing arbitrary code to execute or the system to be modified. The following vendors have provided information about how their products are affected by this vulnerability: Cisco Systems, Inc MyDNS; Delegate pdnsd; Ethereal Sun; Hitachi Wind River; ISC; Juniper Networks; Microsoft. Refer to source advisory for further detail on vendor vulnerabilities.

1998-12-07 **information warfare criminal hackers retaliation attack**

InternetWeek http://www.techweb.com/internet/story/TWB19981207S0003

Rutrell Yasin reported in InternetWeek on the apparently-growing trend for corporate security departments to take vigilante action in fighting computer intrusions. She cited _Corporate America's Competitive Edge_ <http://www.warroomresearch.com/ResearchCollabor/CorpAmerica.htm> an 18-month study of 320 Fortune 500 companies by the WarRoom Research firm <http://www.warroomresearch.com/> which suggested that 30% of the respondents had already installed software designed to counterstrike at attackers. This strategy could easily backfire if the sites attacked in retaliation turned out to be innocent victims of IP spoofing.

Category 36 *Responses to intrusion*

1999-01-12 **information warfare criminal hackers retaliation attack**

CNN http://cnn.com/TECH/computing/9901/12/cybervigilantes.idg/index.html

When "The Electronic Disturbance Theater" criminal hackers attacked Pentagon systems in September 1998, the Pentagon retaliated by flooding the attackers with high-volume traffic, crashing the attacking systems. According to Winn Schwartau, some corporate security operations are taking the law into their own hands; he claims that one group actually located the headquarters of an attacking hacker group, broke into their facility, and stole the cybervandals' equipment. The corporate vigilantes apparently left a note saying, "See how it feels?" The same group also claims to have resorted to baseball bats to intimidate hackers.

1999-04-20 **spam legal civil litigation settlement prevention damages**

TechWeb, ZDNet

Virgin Net, a UK Internet Service Provider, sued Adrian Paris, an alleged spammer whom they accused of sending 250,000 junk e-mail messages from one of their accounts in violation of their terms of service. In addition, the ISP was blacklisted by the Realtime Blackhole List, which provides participating ISPs with "kill lists" to block further e-mail from sites originating spam. The ISP received 1,500 complaints as a result of the abuse and sued the scumbag filthy disgusting spammer for breach of contract.

In a similar case, another UK ISP, Bibliotech, sued Sam Khuri and his Atlanta-based company, Benchmark Print Supply, after the American slimeball sent out junk e-mail with forged headers pointing to the innocent ISP; as a result, the enraged staff at Bibliotech were subjected to a "torrent of rejected, unsolicited commercial e-mail." In addition to damages, Bibliotech demanded that Khuri and his co-conspirators refrain from repeating their stupid trick with anyone else. In the USA, forged e-mail headers are currently illegal in Washington, Massachusetts and Virginia.

1999-08-01 **criminal hackers sociology psychology harm morality ethics reasoning**

PC Magazine

John Dvorak wrote a blistering challenge to the nonsense spouted by criminal hackers when he wrote his column in PC Magazine on 2000-08-01. He provided a point-by-point rebuttal of the tired arguments of criminals that their depredations are actually socially useful. As Dvorak pointed out about the people who use Trojans to install back doors on victims' systems, "There's nothing good or noble about these Trojan horses or the people who use them. Eventually people will get on the systems of individual users, hack their online banking, and transfer money to themselves. Make no mistake about it, what appear to be harmless pranks today will be serious crimes tomorrow. As more and more people are adversely affected by these guys, the sympathy for them will fade to oblivion. The sooner the better." Dvorak's column made an excellent addition to the reading list for computer-ethics courses aimed at young people (and a slap in the face to the older fools who support criminal hacking).

NewsScan, USA Today http://www.usatoday.com/life/cyber/tech/cti560.htm

In response to criticisms, the Justice Department has agreed to find "more precise" language for the following passage on its Web site answering the question "What is a cyber crime?" with the explanation: "Recently, tools have surfaced that allow Web users to download and save music from the Internet for free — music that is copyrighted by artists and sold in stores. Taking tracks from the Internet is no different from stealing a CD or tape from a music store." Consumer Electronics Association president Gary Shapiro complains: "I'm offended the DOJ would fund a Web site which is telling millions of Americans they are committing a crime when they are not. This is wishful thinking by the (music industry). The fact is, my son is not a criminal; 20 million Napster users are not criminals." The position of American University professor Peter Jaszi, a Napster supporter, is: "There is a real question about what we should teach about copyright," Jaszi said. "Do we want to be telling people the whole story, which is a complicated story, which is all about rights and balances, or are we going to tell them a simplified story that they aren't going to believe or accept? If you try to simplify the message you are going to lose credibility." (USA Today 22 Sep 2000)

MORE NEEDED TO GET WORKERS, STUDENTS INTO SECURITY
Congress needs to do more to encourage students and government employees to specialize in information security if cyberterrorism laws, such as the [U.S.A.P.A.T.R.I.O.T.] Act, are to succeed, say members of a network security symposium last week. Panelists at the Computing Technology Industry Association and Infrastructure Security Dialog said better trained infosecurity personnel are needed to make recently approved anti-terrorism measures work as intended. That's prompted several bills focused on security education, including the Homeland Security Education Act introduced by Sen. Richard Durbin (D-Ill.). That proposal and a similar bill for federal workers would offer financial incentives, such as fellowships and student loan repayment, to college students and government professionals who specialize in computer security.

For more information on the Homeland Security Education Act and its companion, the Homeland Security Federal Work Force Act, go to:

2002-06-06 **education students technical support reliability maintenance hands-on budgets funding**

NewsScan

STUDENTS PROVIDE BULK OF TECH SUPPORT IN SCHOOLS
Fifty-four percent of U.S. schools rely on students to provide technical support for their computer systems, according to a report titled "Are We There Yet?" (http://www.nsbf.org/thereyet/index.htm), released yesterday by the National School Boards Foundation. In 43% of the 811 districts surveyed, students troubleshoot for hardware, software and other problems, and 39% of the districts, students are tasked with setting up equipment and wiring. Nearly as many districts also report that students perform technical maintenance. The fact that students are providing so much hands-on assistance is viewed as a "win-win" situation by John Bailey, director of education technology for the Department of Education. Their tech savvy helps compensate for a dearth of tech support funding in school budgets and teachers who are "unevenly prepared for using technology as a tool for teaching and learning," according to the NSBF, which reports that 69% of the survey respondents rated new teachers as average or novices in computer skills. The role reversal signals a shift in the relationship between teachers and students as online lessons become integrated into the school curriculum, says Anne Bryant, executive director of the National School Boards Association: "Teachers become the guide on the side, instead of the sage on the stage." JUSTICE OFFICIAL CALLS NET 'THE WORLD'S LARGEST COPY MACHINE'
The U.S. Justice Department is gearing up to prosecute peer-to-peer pirates, warned Deputy Assistant Attorney General John Malcolm on Tuesday. Malcolm said Americans should realize that swapping illicit copies of songs and movies is a criminal offense punishable by prison terms. "A lot of people think these activities are legal, and they think they ought to be legal," Malcolm told attendees at the Progress and Freedom Foundation's annual meeting. "There does have to be some kind of a public message that stealing is stealing is stealing, whether it's done with sleight of hand by sticking something in a pocket or it's done with the click of a mouse." A few weeks ago, some members of Congress pressured the Justice Department to invoke the 1997 No Electronic Theft (NET) Act against P2P users who swap copyrighted files without permission. Under the Act, it is a federal crime to share copies of copyrighted products, such as software, movies or music, worth more than $1,000 with anyone -- even friends or family members. Violations are punishable by one year in prison and by "not more than five years" in prison for works valued above $2,500. "Most parents would be horrified if they walked into a child's room and found 100 stolen CDs? However, these same parents think nothing of having their children spend time online downloading hundreds of songs without paying a dime," said Malcolm. Meanwhile, Gary Shapiro, head of the Consumer Electronics Association, said there should be a distinction drawn between stealing real property and copying intellectual property. "When you copy intellectual property, there may or may not be harm. They assume that every copy made is a copy lost. That's not always the case." (AP 20 Aug 2002 & CNet News.com 20 Aug 2002)

r_nb=1&title=COLUMN

WHAT'S UP NEXT FOR E-LEARNING?

"Colleges, universities and the military will outpace corporations in rolling out innovative and effective learning programs. Computer games will increasingly be viewed as a new type of scalable content that will raise the bar on engagement and enable new types of skills to be taught," predicts author Clark Aldrich, author of "Simulations and the Future of Learning," in a collection of expert prognostications assembled by eLearn Magazine editor Lisa Neal. Among the contributors are Don Norman, co-principle of the Nielsen Norman Group, who forecasts the rise of adult educational tools: "I expect language tutors for adults. Why not combine handheld dictionaries, phrase translators, and CD-ROM courses into a portable device?" And Indiana U. professor Curt Bonk sees a bright future for open-source courseware: "Jumping on the open-source bandwagon may mean supporting innovative pilot projects, funding code enhancements and joining the Sakai community." But as emerging technologies such as blogs, wikis and podcasts draw the attention of major commercial players like Microsoft, Yahoo and Google, look for a new bout of legal wrangling, says Canada's National Research Council's Stephen Downes: "But as grassroots technologies are appropriated for commercial objectives, conflicts over rights and use emerge, and competing standards extensions create genuine difficulties for users. Expect, for example, patent claims and threats of lawsuits over aspects of content syndication technology, lawsuits regarding unauthorized use of RSS feeds… Behind the scenes (and mostly unnoticed), the Web is beginning to fracture. Some time in the next three years the first case of URL-piracy (releasing the address of a resource without authorization) will be heard." (eLearn Magazine Jan 2005)

NewsScan

MUSIC ARTISTS SLAM DOWNLOADING
Record labels are using the talents of dozens of big-name recording stars, including Madonna, Sting and Britney Spears, in a multi-million-dollar ad campaign designed to shame people out of illegally swapping their songs. "Would you go into a CD store and steal a CD?" asks Spears. "It's the same thing — people going into the computers and logging on and stealing our music." The new ad campaign is one facet of a multipronged approach aimed at quashing illegal file-swapping. The Recording Industry Association of America has also sued several file-swapping sites, threatened to crack down on companies and individual file-swappers, and lobbied for legislation that would mandate anti-copying technology in new products. Meanwhile, a KPMG study recently released said that instead of fighting Internet piracy, the recording industry would be better served by devoting more time to developing new Internet business models. 2005-03-21 **high school K-12 fight stop hacker hacking school network denial of service DoS attack report education**

DHS IAIP Daily; http://www.nwfusion.com/news/2005/032105−hacker−kids.html

K-12 SCHOOLS FIGHT TO STOP STUDENT HACKERS

When today's K-12 students act up, they increasingly are going high-tech by using the school's network to launch denial-of-service attacks, sending harassing e-mails or breaking into databases to try to change their records. With public schools now widely equipped with LANs and high-speed Internet access, IT administrators have to cope with many cyber incidents. Some infractions, such as attempts to get to pornography sites, might force administrators to temporarily yank a child's network access as punishment. But some types of incidents, such as hacking and e-mail threats, even end up with students being booted out of school or in trouble with the law. Philip Scrivano, management analyst at Fiscal Crisis & Management Assistance Team (FCMAT), agrees. Scrivano says that in his role as adviser, he's seen students expelled for installing a keylogger on the teacher's PC and changing grades or breaking into a server. Some troublemakers are spending inordinate amounts of time planning break-ins - sometimes 50 to 100 hours for one attack. The hard part is making teenagers understand that what they're doing is a crime. Department of Education's "Internet Access in U.S. Public Schools and Classrooms: 1994-2003" report:

PROGRAM TEACHES HACKING TO RAISE AWARENESS

The University of La Salle in Barcelona has begun a program to raise awareness of computer hacking and to teach teens how to protect themselves. Sponsored by the Institute for Security and Open Methodologies (ISECOM), the Hacker High School invites students from local high schools to the La Salle campus to expose them to the ins and outs of hacking. Pete Herzog, managing director of ISECOM, said the program shows participants how computer hacking is accomplished so that they can understand the concepts behind what computers do, how to clean them, how applications can compromise computers, and the implications for personal privacy. According to one official from the program, the goal is to provide experiences for students to learn how hacking happens so that they will become "ethical hackers, good hackers, knowing what they do and what the limits are." School officials believe having skills as an ethical hacker could be beneficial when students go looking for jobs later. BBC, 8 April 2005

DHS IAIP Daily; http://www.wired.com/news/wireservice/0,70396−0.html?tw=rss. Index 23

HIGHSCHOOL STUDENTS LEARN ABOUT CYBERSECURITY VIA PILOT PROGRAM.

A group of students at Rome Catholic School in Rome, NY, are learning how to become the future defenders of cyberspace through a pilot program that officials say is the first of its kind in the country. The program teaches students about data protection, computer network protocols and vulnerabilities, security, firewalls and forensics, data hiding, and infrastructure and wireless security. Most importantly, officials said, teachers discuss ethical and legal considerations in cyber security. The pilot program was developed with help from computer experts at the U.S. Air Force's Research Lab in Rome, who four years ago created a 10-week Advanced Course in Engineering Cyber Security Boot Camp for the military's Reserve Officers Training Corps, said Kamal Jabbour, the lab's principal computer engineer. The material covered in the course is subject matter that college students typically don't receive until their junior year.

EDUPAGE; http://www.wired.com/news/wireservice/0,70396-0.html 23

PROGRAM TEACHES HIGH SCHOOLERS ABOUT COMPUTER SECURITY

High school students at a Catholic school in Rome, New York, are the first to participate in a computer-security course developed by the school, the U.S. Air Force's Research Lab in Rome, and Syracuse University. The 20-week course, which covers topics including data protection, network protocols and vulnerabilities, firewalls, data hiding, and wireless security, is based on a 10-week course developed at the Research Lab. Kamal Jabbour, principal computer engineer at the lab, said the new course was designed in part to encourage students to pursue college degrees and careers in computer security. Eric Spina, dean of Syracuse's engineering and computer science programs, said the program is considerably different from the kind of computer course available in many high schools today. This course, he said, exposes high school students to material not seen by many college students until their junior year. "A high school student with this kind of background," said Spina, "would be an asset anywhere they went." Starting next year, the course will be available statewide and could be offered nationally by 2008.

2003-03-15 **digital forensics AS associate BSc bachelor baccalaureate online major**

http://digitalforensics.champlain.edu/

Champlain College officially approved a new major called Digital Forensics Technology. Commencing in the 2003-2004 academic year, Champlain College offers Associates of Science (A.S.) and Bachelor of Science (B.S.) degrees in Computer & Digital Forensics. This major combines aspects of computer and network technology, criminal justice, digital forensics methods, and other related fields. Individuals interested in the technical content of the Computer & Digital Forensics curriculum but who do not want to obtain a B.S. degree (such as those individuals who are pursuing a degree in another discipline or who already have a Bachelors degree) would be able to take a subset of the courses and earn a Professional Certificate. More information can be found in the program information sheet.

All of the courses for this curriculum are available on-line. For more information about the program, contact program director Gary Kessler.

NewsScan

VIRUS WRITING 101
The University of Calgary is drawing fire for its decision to offer a class next fall in "Computer Viruses and Malware," giving students the opportunity to perfect their virus-writing skills. Ken Barker, head of Calgary's computer science department, defends the decision, saying the class will enable students to better understand the motivations of crackers who are responsible for the proliferation of malicious attacks against corporate networks and personal computers. "Somebody who is suggesting we are doing enough really has their head in the sand," says Barker. In response to concerns that the students' work could lead to more cracking incidents, school officials say they've taken extra precautions, with plans to use a closed network and prohibitions on students removing disks from the lab, which will be secured 24 hours a day. But it's the financial consideration that likely will keep students focused on preventing viruses rather than proliferating them, says Barker. "They are not really employable as virus writers," he notes. (CNet News.com 27 May 2003)

2003-06-01 **Cyber Corps education Department of Defense's Information Assurance Scholarship Program stipend tuition students**

NIPC/DHS

June 01, Information Security — Cyber Corps' failing grades.

Federal administrators are overhauling Cyber Corps because conflicting policies and management structures are making it increasingly difficult to place graduates of the infosec training program in government jobs. University coordinators say getting the first 50 Cyber Corps graduates into federal jobs proved extremely difficult. Federal agencies were unwilling to hire inexperienced security admins when more senior infosec positions went unfilled. Complicating the situation is the Office of Personnel Management (OPM), which is responsible for placing students but has little authority to compel placements. Officials are still working on details, but it has already been decided to reorganize Cyber Corps based on the Department of Defense's Information Assurance Scholarship Program. The government launched Cyber Corps in 2001 under the scholarship for service model. Students receive tuition and a stipend in exchange for serving in a summer internship and working at a government agency for up to two years. Cyber Corps has distributed nearly $30 million to upgrade university infosec programs and fund scholarships for 200 students at 13 universities certified as Centers for Academic Excellence by the National Security Agency.

2004-01-16 **virus writing class students professor university publicity consortia industry protest ethics education**

http://chronicle.com/free/v50/i19/19a03301.htm

COLLEGE COURSE USES VIRUS-WRITING AS TOOL

A storm of criticism washed over a University of Calgary Professor in early summer of 2003 when he announced his intention to teach a fall course entitled "Computer Science 599.48: Computer Viruses and Malware." Assistant Professor John Aycock shocked the antivirus world by including his intention to have his undergraduate students write some malicious code. Many experts objected on the following grounds:

* Writing malicious code was unnecessary in teaching how viruses, worms and Trojan horses work or how to fight them;

* Keeping the malicious code contained within the class of laboratory would be difficult or impossible;

* Some students would take the wrong message home about the ethical implications of creating malicious code;

* Students with experience writing malware would be on unemployable by antivirus firms, always concerned about the widespread rumor that they engage in writing viruses for profit.

Supporters of the course scoffed at these arguments, assuring critics that the Laboratory would be well secured and insisting on the pedagogical value of such exercises. In addition, they stressed that virus writing would be only a small part of the course, which would also teach students about the history of malware, economic consequences of these programs, countermeasures, legal and ethical considerations, and wider principles of computer and network security.

After the course was over, there appeared to have been no breaches of security and University spokespersons insisted that they would offer the course again despite their critics.

Bachelor's Program in Information Assurance

by M. E. Kabay, PhD, CISSP
Associate Professor, Computer Information Systems
Norwich University, Northfield VT

Norwich University is proud to present a completely new Bachelor of Science in Computer Security and Information Assurance (BSIA for short). The program has been designed from the bottom up; unlike most IA undergraduate degrees, it is not an add-on to a computer science degree. Instead, the BSIA has been built to include a wide range of interdisciplinary studies that will contribute to a sound management approach to information assurance.

As part of the team that designed the program and as the program director, I was particularly concerned to complement the many find programs already in existence that focus on highly technical aspects of information assurance. Because Norwich is a small school, our division (of Business and Management) decided to emphasize our strengths. The program, unusually for IA undergraduate degrees, includes such topics as criminal law, psychology (especially social psychology), management, finance, statistics, operations management, humanities courses and technical writing as well as the expected mathematics, programming, data structures, databases, systems engineering, cryptography, and networking. There's also room for such courses as computer forensics and special research projects.

While we wait for information to be posted on our University Web site about the new BSIA and also about the revised minor in information assurance programs, I have prepared documentation and placed it online at

http://www2.norwich.edu/mkabay/bsia

On that page you will find the following documents:

* Short description of the BSIA (Major)

This one-page summary describes why you might be interested in registering for the Bachelor of Science in Computer Security and Information Assurance at Norwich University. HTM PDF

* Summary of Courses in BSIA (Major)

This one-page sheet lists all the required courses and available options in the BSIA program. HTM PDF

* Complete Rationale Justifying the BSIA

This document was prepared for the Norwich University Curriculum Committee and provides the complete background for the decision to create the BSIA program. Because of the formatting and footnotes, this document is provided only in Acrobat PDF format.

* Minor in IA

This one-page summary lists the required courses and their prerequisites for the minor in information assurance. HTM PDF

I hope that you and any students you know or counsel will find this information helpful. I'd appreciate your help in making this information known to any young people who are interested in an IA career.

Please inform me of all errors you find on the Web page and in the documents posted there so I can correct them quickly.

DECLINING NUMBERS OF COMPUTER SCIENCE MAJORS

The Computing Research Association says that the number of newly declared computer science and computer engineering majors in the U.S. and Canada fell last year 23% from the year before. The explanation is fairly straightforward: since the dot-com bust a computer science degree no longer seems the key to instant riches. But Peter Lee, an associate dean of computer science at Carnegie Mellon University, is unworried by the falloff in applications: he thinks today's students are often of higher quality, because they're motivated not by money but by love of technology. (USA Today 8 Aug 2004)

2004-10-13 **National Security Agency NSA information assurance roadmap IA curriculum program colleges**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27627−1.html

October 13, Government Computer News — NSA: Global grid will have data assurance.

The National Security Agency (NSA) is revising its two-month-old, 2,200-page information assurance (IA) roadmap for the Defense Department's Global Information Grid (GIG), NSA's Daniel G. Wolf said Thursday, October 13, at the Microsoft Security Summit East in Washington. After incorporating feedback from government and industry, NSA will release a three-phase architectural plan for secure worldwide data sharing among and across military and intelligence agencies over the next two decades. It spells out no specific solutions at this point, but it will ensure that IA is "baked in" by authenticating credentials, security clearances, roles and situational awareness throughout the GIG, he said. NSA has also recruited 59 colleges and universities to set up an IA curriculum and teach safe programming practices. The Homeland Security Department has joined the Defense Department as a joint sponsor of the IA curriculum program.

2005-02-02 **college online education fraud Department Education diploma mills online fraud**

NewsScan; http://www.wired.com/news/culture/0

DATABASE DOCUMENTS DIPLOMA MILLS

The U.S. Department of Education has launched a searchable database that prospective online students may browse to determine whether a particular distance learning institution is accredited by organizations sanctioned by the government. The white-list enables students and prospective employers to distinguish between Hamilton College, a small, distinguished (and accredited) New York college, and Hamilton University, a diploma mill in Wyoming. And while Hamilton University is licensed by the state of Wyoming, using a degree from that school for employment in other states, such as Oregon or New Jersey, could lead to jail time for fraud. The database was created following calls for action from Congress last year, after some high-level government officials were discovered to have purchased questionable degrees to beef up their resumes. 2005-02-06 **academic university course spyware spam ethics**

RISKS 23 70

UNIVERSITY OF CALGARY TEACHES STUDENTS TO WRITE MALWARE

Rob Slade comments on the University of Calgary's penchant for teaching students how to write malicious code:

The University of Calgary is back at it again.

Http://www.cbc.ca/story/canada/national/2005/02/05/email-course050205.html
http://pages.cpsc.ucalgary.ca/~aycock/
aycock@cpsc.ucalgary.ca, barker@cpsc.ucalgary.ca

(Interesting that his homepage is entitled "Unfettered by Content." He certainly seems to be unfettered by logic.)

This time they are adding spam and spyware to the curriculum.

I can vaguely see a dim advantage to having students write viruses in order to understand them (rather inefficiently, in terms of time spent), but getting them to write a spamming program in order to understand how to fight spam seems even less effective.

As previously noted, John Aycock doesn't seem to have any credentials in security or malware (no papers published prior to the virus course, nobody in the field seems to know him), so why he, and the university, chose to do this, other than pure self-promotion, is completely beyond me.

I am somewhat relieved by the fact that the paper submitted to EICAR shows that a modicum of thought was given to the security of the laboratory. The irrelevance of the measures undertaken is no great surprise. The bibliography is interesting: Lugwig's second edition is there, along with Mitnick's "19 chapters of gotcha," but on the AV side Cohen's 1994 edition stands alone with Skoudis' rather pathetic work. I would have thought that anyone with even a pretence of academic intentions would have consulted Ferbrache, and possibly Nazario's pompous but flawed attempt at worm analysis. Given Aycock's involvement in a rather banal crypto lab, I'm a bit surprised that he hasn't tried to create Young and Yung's proposed crypto-nasties.

In a follow-up response in RISKS 23.71, someone called "Hendrik" retorted that studying malware is essential for development of effective countermeasures. Some of his comments follow:

>….In 1992 I found a small book in a bookstore in Saudi Arabia, that had been published by the German "Kaos Computerclub". In this book the authors explained how viruses worked, from an angle of approach of how to write viruses (at that time we had to deal mostly with DOS boot sector viruses). The authors further described how they had approached major software companies with this information, none of whom was the least bit interested in the information or in any cooperation with people who knew how to write viruses. Some of the approached companies had furthermore warned the authors against publishing the information about viruses they had on hand.

I am not impressed, to say the least, that 13 years after the Kaos Computerclub had the right idea, in a world awash in viruses, worms, and spam, with a world-wide deployed home computer OS that seems to have less security than the front door of my house, we still have not made any progress in regards to how we deal with knowledge about malware.

In the the CBC article that Rob Slade refers to, Aycock (the "virus teacher" at UofC) is quoted as saying "[S]ome companies have said they're not going to hire [our] graduates because they don't like the perception of having someone on board who has written viruses."

Well, I imagine reading the following in Time Magazine: "The White House official said, 'We are not going to hire body guards who have been trained at school X because we don't like the perception of having someone on staff who has been trained to kill.'" Would you forgive me for laughing?

Rob Slade further writes: I can vaguely see a dim advantage to having students write viruses in order to understand them (rather inefficiently, in terms of time spent), but getting them to write a spamming program in order to understand how to fight spam seems even less effective.

Not all approaches to learning something are equally effective, and in an area where something is being pioneereed, the first steps may not be quite in the right direction or not as effective as future approaches. But that alone is not a good reason to abolish a certain curriculum. My question would be "What would make this training more effective?"

….I hope one day we will see malware courses in all university computer science programs - then I would have reason to be more optimistic that the "security mess" we are finding ourselves in might be cleaned up. Creativity, more than anything else, is what we need to deal with the future, and anybody who fosters and harnesses such creativity has my vote.<

Matthew Holmes pointed out in RISKS 23.71 that contrary to Slade's dismissive comments, Aycock does in fact publish technical articles:

>I did survey Aycock's professional literature, much of which is available on-line, and I notice that a great deal of it centers on reverse-engineering methodology, compiler/parser theory, etc. These are in fact the tools of the virus writer - the real ones, not the script kiddies and buffer-overflow people.<

2005-02-08 **University Calgary course spam spyware viruses malicious code ThreatLab grades prosecution**

EDUPAGE; http://software.silicon.com/security/0,39024655,39127703,00.htm

UNIVERSITY OF CALGARY OFFERS COURSE ON SPAM, SPYWARE

The University of Calgary, which gained attention in 2003 when it began offering a course on writing viruses, has now introduced a course devoted to writing spyware and spam. Although the virus-writing course prompted strong criticism, response to the new offering has been warmer. Some members of the computer-security community noted that such a course could give students a strong understanding of how to combat malicious computer code in practice. "If we're looking for an engineer to [fight] spam, then we'd rather have somebody who has already been taught about these things and who knows how they work," said Steve Purdham, CEO of SurfControl. Mark Murtagh of Websense echoed those comments. He compared computer security to a game of chess, saying, "You need to be completely up to date on what's available to ensure you understand your opponent's potential next move." Pete Simpson, ThreatLab manager at Clearswift, disagreed, however, saying that such arguments "really [fall] flat for spamming tools." He said the course will tempt students to put their skills to harmful use. Students who do so risk failing grades and prosecution, according to the university.

2005-02-16 **software vendor quality assurance blame college security education secure programming responsibility NSA DoD**

DHS IAIP Daily;
http://news.com.com/Software+firms+fault+colleges+security+e ducation/2100−
1002_3−5579014.html

SOFTWARE FIRMS FAULT COLLEGES' SECURITY EDUCATION.

In a panel session Tuesday, February 15, at the Secure Software Forum in San Francisco, Oracle, Microsoft and other software makers attempted to analyze why flawed software is still overwhelmingly the rule and not the exception in the industry. A major contributor, the companies said, is college students' lack of a good grounding in secure programming. Many software makers believe that better training of computer science graduates is a key step toward improving software quality, but some security researchers have criticized the industry, pointing out that industry demand for programmers generally does not give preference to those trained in secure programming. To influence curricula, private industry has established scholarships at universities. Also, several federal agencies, including the Department of Defense and the National Security Agency, have named several college programs as National Centers of Academic Excellence in a variety of security disciplines. However, some panel members laid the blame for the problems squarely at the feet of software makers. Until companies are willing to foot the bill for security, applications will not get better, said Fred Rica, a partner in PricewaterhouseCoopers' Threat and Vulnerability Assessment Services.

2006-04-18 **National Security Agency NSA Cyber Defense Exercise CDX US Naval Academy network security test**

DHS IAIP Daily; http://www.news.navy.mil/search/display.asp?story_id=23208 23

NATIONAL SECURITY AGENCY SPONSORS CYBER DEFENSE EXERCISE

The U.S. Naval Academy joined forces with fellow service academies in the sixth annual Cyber Defense Exercise (CDX) held Monday-Friday, April 10-14, at the Academy in Annapolis, MD. Sponsored by the National Security Agency, CDX brings Midshipmen and their peers together to create a computer network they must then defend against attack from hackers. The service academy that best defends its portion of the network from attack wins the competition. Results will be announced between late April and early May. The hackers in the exercise tested the security of the network, observed how long it took the students to become aware of the attacks, and assessed how they responded.

2003-04-23 **cyberspace war games Internet warfare education US military academies**

NIPC/DHS

April 18, Monterey Herald — Cyberspace games teach real world lessons.

On Thursday, 39 students at the Naval Postgraduate School (NPS) ended four days of mock Internet warfare that pitted a team made up of NPS, the Air Force Institute of Technology, and the U.S. Military, Naval, Air Force, Coast Guard and Merchant Marine academies against a team made up of the Army's Land Information Warfare unit and the Air Force's 92nd Aggressor Squadron. The object of the exercise is for each side to try to penetrate the other's computer systems, aiming to infect them with viruses, shut them down or take them over. The mock war in cyberspace draws students "who are interested in what a real-world situation is," said Marine Corps Capt. Eric Walters who led the Navy school team this year. Some of the team members are military officers enrolled in various information technology classes, others are civilians enrolled in the National Science Foundation's federal Cyber Service Corps scholarship program, which began in 2001. That program offers a two-year, full-ride scholarship in a computer science master's degree program aimed at safeguarding computer systems. Graduates are expected to serve two years with a U.S. government agency as specialists in safeguarding computer systems.

2005-12-13 **online Internet higher education e-learning for-profit seven times music industry**

EDUPAGE; http://chronicle.com/daily/2005/12/2005121305n.htm

ONLINE EDUCATION BOOMING

Analysts speaking at a conference on the business of higher education this week argued that the market for online learning, though often downplayed relative to other topics, is thriving and represents the future of for-profit education. Online music, for example, receives a lot of hype in the media, according to one analyst, but the market for online education is seven times larger than that for online music. Douglas L. Becker, CEO of Laureate Education Inc., which operates a network of international universities, said that in many parts of the world the demand for higher education far outstrips the supply. Moreover, while for-profit colleges enroll less than 5 percent of all college students, more than a third of all students taking an online course are enrolled at a for-profit institution. The conditions are ripe for online education to lead to significant growth in for-profit colleges in the coming years, according to analysts. Chronicle of Higher Education, 13 December 2005 (sub. req'd)

2006-04-17 **University of Pennsylvania graduate students NSF grant telephone wiretap quality research network security**

DHS IAIP Daily; http://www.gcn.com/online/vol1_no1/40428−1.html 23

UNIVERSITY OF PENNSYLVANIA STUDENTS RESEARCH WIRETAP VULNERABILITIES.

A team of graduate students from the University of Pennsylvania working with a National Science Foundation grant set out to determine just how trustworthy the most common types of telephone wiretaps used by police and intelligence agencies are, said Professor Matt Blaze. The results of these taps are accepted uncritically by courts, Blaze said at the 2006 International Conference on Network Security being held in Reston, VA. “It turns out, it can fail in all sorts of unexpected ways,” he said. The techniques exploit vulnerabilities in the single signaling and audio channel used in analog telephone systems. Blaze said the project was an attempt to establish some baselines for network security by assessing how easy it is to conduct reliable eavesdropping on the century-old protocols used in analog voice phone systems.

DHS IAIP Daily;
http://news.com.com/Science%2C+engineering+Ph.D.+numbers+buck+downturn/2100−1008_3−5489359.html?tag=nefd.top

December 13, CNET News — Science, engineering PhD numbers rise.

U.S. universities awarded 25,258 science and engineering doctorates from July 1, 2002, to June 30, 2003, according to data published this month by the National Science Foundation (NSF). That's a 2.8 percent rise from the 24,571 doctorates awarded the previous year, reversing a downward trend that began after a 1998 peak of 27,278. Production of science and engineering doctorates in the United States is seen by some as vital to the country's technological leadership, given the way fundamental research can translate into new products and even industries. A more recent worry centers on a decline in enrollment of international graduate students in the United States. Foreigners historically have earned a large percentage of technology-related doctorates. According to NSF data, foreign students with temporary visas comprised 55 percent of the 5,265 engineering PhDs last year. Not everyone thinks the number of PhDs awarded is critical to the country's global competitiveness. Some observers argue that the country already has plenty of doctorates and that a drop in foreign students isn't cause for alarm.

2004-05-17 **broadband access social implications**

DHS IAIP Daily; http://www.itu.int/newsroom/press_releases/2004/12.html

May 17, ITU Press Release — Global support for information society targets.

Targets set for improving access and connectivity to information and communication technologies (ICT) by 2015 at the first phase of the World Summit on the Information Society (WSIS) have received strong support in a global International Telecommunication Union (ITU) survey. The Summit approved a Declaration of Principles and Plan of Action that set forth a roadmap to bring the benefits of ICT to underserved economies. The Summit was organized by ITU under the patronage of UN Secretary-General Kofi Annan to ensure that social and economic development, which is increasingly driven by ICTs, will result in a more just, prosperous and equitable world. The survey shows overwhelming support for the belief that if the information society is to be one in which all citizens throughout the world can equally access and use information resources for sustainable economic and social development, that cyberspace should be declared a resource to be shared by all for the global public good. This opinion was held by more than 94% of survey respondents.

DHS IAIP Daily; http://abcnews.go.com/Business/wireStory?id=158551

October 12, Associated Press (India) — India, U.S. experts discuss cybersecurity cooperation.

At a New Delhi security conference, U.S. Under Secretary of Commerce Kenneth Juster urged India to tighten its laws to protect intellectual property rights and ensure that sensitive information stays out of the hands of tech-savvy criminals. Juster said India must protect the privacy of personal and financial data as an increasing number of American companies rely on Indians to handle their technical operations and other software work. He cited Europe's efforts as a good example.

2004-10-21 **hacker technology fair Italy security privacy implications**

DHS IAIP Daily;
http://www.reuters.com/audi/newsArticle.jhtml?type=technologyNews&storyID=6572719

October 21, Reuters (Milan, Italy) — Beat hackers and learn to spy at Italy tech fair.

Fingerprint sensors, gadgets to pry open doors and transmitters to spy on unsuspecting targets were among the wizardry on show at the opening of Italy's biggest technology fair on Thursday, October 21. This year a large chunk of the fair was devoted to security in its forms reflecting a growing fear of crime and militant attacks. One of the most popular exhibitors was a company called Global System from the tiny city-state of San Marino teaching people how to spy. Global System offers clients tools to pick locks as well as micro transmitters hidden in watches, baseball caps and phones.

2005-03-17 **Cellular Telecommunications Internet Association CTIA Wireless 2005 homeland security cooperation**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/recover y/story/0,10801,100458,00.html

CTIA: EXPERTS CALL FOR HOMELAND SECURITY, WIRELESS INDUSTRY COOPERATION

To bolster the value of wireless voice and data communications for U.S. homeland security purposes, industry and government officials need to work closer together, security experts at Cellular Telecommunications & Internet Association (CTIA) Wireless 2005 said last week. The consensus among experts from the Federal Communications Commission and Department of Homeland Security who took part in a panel discussion was that wireless technologies have improved since the September 11, 2001, terrorist attacks. But they said much remains to be done to set up effective warning systems in the event of a terrorist or natural disaster and to improve interoperability of wireless devices for emergency responders. The toughest issue for police, firefighters and other emergency responders may be the widespread lack of interoperability between public safety networks and devices, experts said. Several panelists called for development of emergency warning systems to notify a large group of people of an emergency, similar to one county officials use in Arlington, VA. That system is used by police and fire officials to call residents over wired or wireless phones, or the Internet, to warn them of traffic disasters or crimes. CTIA: http://www.ctia.org

2005-03-21 **information technology IT physical perimeter security manager responsibility Business Continuity Expo London**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,3919183 9,00.htm

PHYSICAL SECURITY BECOMING AN IT PROBLEM.

The proliferation of technologies such as identity management mean more IT managers are having to take responsibility for physical security, according to a panel of leading IT security managers. Speaking at the Business Continuity Expo in London's Docklands, IT security experts from the Royal Mail Group, Proctor & Gamble and Barclaycard acknowledged that their companies are increasingly merging systems used to authenticate employees' entry to physical facilities with those used to control access to computing resources. David McCaskill, manager for global security solutions at Proctor & Gamble, explained that the pharmaceutical giant had also integrated its physical and IT authentication systems. "Before, if you forgot your passcard to access the building that wasn't a major problem, but now it is." Companies have generally treated physical security as the responsibility of the facilities department and computer security as that of IT. But employee information has increasingly become integrated, allowing businesses to link the two systems, said Steve Hunt, an analyst with Forrester Research.

DHS IAIP Daily; http://www.iowastatedaily.com/media/paper818/news/2005/11/18 /News/Students.Fight.It.Pros.In.Hacker.Competition−1110048.s html?norewrite&sourcedomain=www.iowastatedaily.com

STUDENTS FIGHT IT PROS IN HACKER COMPETITION

Students at Iowa State University competed in the university's second-annual Cyber Defense Competition on Friday, November 18 through Saturday, November 19. During the event, several student teams competed against a group of Internet technology professionals whose job it is to hack into and disrupt each team's network. Thad Gillispie, a graduate student in electrical and computer engineering, said that the students had a chance to see what they really know about network security as well as learn more. It also provides the students with an opportunity to see Internet security from a point of view that is not often represented and helps them start to appreciate Internet services being there when they want them, Gillispie said.

2004-05-25 **government Websites Web content posting schedule**

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0524/web−web−05−25−04.asp

May 25, Federal Computer Week — Agencies to inventory Web info.

By the end of the year, agencies are expected to have an inventory and posting schedule for information they plan to publish online. The requirement is part of draft recommendations released in April by the Web Content Standards Working Group of the Interagency Committee of Government Information (ICGI), which outlines standards for common information that should be on all federal Web sites to make them more user-friendly. By December, agency officials must make the schedules available for public comment, said Sheila Campbell, co-chairwoman of the working group. "We're hoping this guidance gets out soon" to help agency officials to comply with this recommendation, Campbell said at the FedWeb conference in Arlington, Va. "It's going to take a little bit of effort here." By next month, OMB officials expect to recommend ways to establish a public domain directory and policies to improve agencies' repositories for research and development funds, Womer said. By the end of the year, OMB officials hope to recommend standards for categorizing and indexing government information.

"THE MOTHER IS BACK!" ANNOUNCING "DAYTHINK" AUDIO FEATURES

Lauren Weinstein of the Privacy Forum wrote:

Greetings. I'm pleased to announce "DayThink" -- a new series of very brief (one-minute) MP3 audio features illuminating a wide range of relevant and important topics. Each day's feature will focus on one specific issue affecting our lives -- issues definitely worth thinking about. Many of these segments will deal directly with the impacts of technology on individuals and society.

DayThink features can be accessed via the DayThink main page at:
http://daythink.vortex.com

The debut segment is titled: "The Mother is Back!"

and looks at the current round of telecom mergers and what they may mean for us all.

A notification mailing list has been established that will send out a brief message to subscribers as each new feature becomes available (never more than one per day), including the segment title, a brief description, and a link to the feature audio itself that can be played at one's leisure.

Subscriptions to that list can be established via:
http://lists.vortex.com/mailman/listinfo/daythink

or by simply sending a note (no subject or body necessary) to: daythink-subscribe@vortex.com

I hope that these features will be of some value in helping folks wade through the maze of many important issues.

Thanks very much.

2005-05-19 **privacy data theft confidentiality breaches personal information control databases summary**

RISKS 23 88

PRIVACY JOURNAL LISTS DATA LEAKAGE & DATA THEFTS IN 1Q2005

Robert Ellis Smith, publisher of the _Privacy Journal_, published a summary of some of the major losses of control and confidentiality in the first quarter of the year 2005:

To appreciate THE CUMULATIVE EFFECT, Privacy Journal newsletter in its May issue compiled the following list of breaches of sensitive personal information, disclosed just since January. It's not an atypical list for a three-month period, but breaches are obviously getting more press attention.

* Tepper School of Business at Carnegie Mellon University reported that a hacker had access to Social Security numbers and other sensitive personal information relating to 5000 or more graduate students, staff, and alumni. Another department at the university is responsible for receiving complaints of Internet breaches and solving them.

* Tufts University notified 106,000 alumni, warning of "abnormal activity" on its fund-raising computer system listing names, addresses, phone numbers, and, in some cases, Social Security numbers and credit-card account numbers.

* ChoicePoint, the insurance and employment investigative company and "information broker" based in Georgia, sold personal data on from 100,000 to 500,000 or more persons to fraud artists posing as legitimate businesses. (Still, the State of California plans to award a $340,000 contract to the Equifax-created company to gather information on suspected criminals and terrorists, according to The Sacramento Bee.)

* DSW Shoe Warehouse experienced a hacking incident involving access to an estimated 1.4 million credit-card numbers and names, 10 times more than investigators estimated at first, as well as driver's license numbers and checking-account numbers from 96,000 transactions involving other customers.

* A computer system breach at an unnamed retailer involved at least 180,000 customers, perhaps more. HSBC North America, which issues GM's MasterCard, urged all customers to replace their cards as quickly as possible because the personal data was compromised. The Wall Street Journal identified the retailer as Polo Ralph Lauren Corp., but the company insisted that in fact no information was leaked, although a computer flaw was discovered and fixed.

* Ameritrade Holding Corp., the online discount broker, informed about 200,000 current and former customers that a back-up computer tape containing their account information was lost when a package containing the data was damaged during shipping.

* Canadian Imperial Bank of Commerce, CIBC, one of Canada's leading banks, "failed to recognize" that misdirected confidential faxes sent to outside parties over a three-year period were a breach of customers' privacy that could have been prevented, according to a finding by the federal Privacy Commissioner in Canada. Bank of Montreal, Royal Bank of Canada, Scotiabank, TD Bank, and National Bank have also misdirected faxes with customer information.

* Motor vehicle departments in four states have lost personal data. The Texas Department of Public Safety mailed to 500 to 600 licensed drivers renewal documents that pertained to other persons. In March, burglars rammed a vehicle through a back wall at a Nevada Department of Motor Vehicles facility near Las Vegas and drove off with files on about 9000 people, including Social Security numbers. In April police arrested 52 people, including three examiners at the Florida Department of Motor Vehicles, in a scheme involving the sale of more than 2000 fake driver's licenses. Also, Maryland police arrested three people, including a DMW worker there, in a plot to sell about 150 fake licenses.

* A Boston-based storage company named Iron Mountain Inc., lost Time Warner Inc.'s computer back-up tapes with Social Security numbers and names of 600,000 current and former employees and dependents. This is the fourth time this year that Iron Mountain has lost tapes during delivery to a storage facility, according to The Wall Street Journal.

* Someone gained access to the personal information of 59,000 current, former, and prospective students at California State University, Chico, the university revealed in March.

* A laptop that contains about 100,000 Social Security numbers of students and personnel at the University of California, Berkeley was stolen from the school's campus.

* Someone hacked into a database at the Kellogg School of Management at Northwestern University, possibly exposing data pertaining to 21,000 individuals at Northwestern.

* More than 1600 parents discovered in January that records in the Colorado State Health Department relating to an autism study were lost. A laptop computer left in a health department employee's automobile was apparently stolen last October.

Mr Ellis kindly added this invitation:

RISKS; http://www.owasp.org/software/webgoat.html 24 04

WEBGOAT 3.7 - APPLICATION SECURITY HANDS-ON LEARNING ENVIRONMENT

The *only* way to learn application security is to test applications "hands on" and examine their source code. To encourage the next generation of application security experts, the Open Web Application Security Project (OWASP) has developed an extensive lesson-based training environment called "WebGoat".

WebGoat is a lessons based, deliberately insecure web application designed to teach web application security. Each of the 25 lessons provides the user an opportunity to demonstrate their understanding by exploiting a real vulnerability. WebGoat provides the ability to examine the underlying code to gain a better understanding of the vulnerability as well as provide runtime hints to assist in solving each lesson. V3.7 includes lessons covering most of the OWASP Top Ten vulnerabilities and contains several new lessons on web services, SQL Injection, and authentication.

WebGoat 3.7 is available for free download from: < http://www.owasp.org/software/webgoat.html >.

Simply unzip, run, and go to WebGoat in your browser to start learning.

The OWASP Foundation is dedicated to finding and fighting the causes of insecure software. Find out more at < http://www.owasp.org >.

GARY MCGRAW ON SOFTWARE SECURITY

Gary McGraw (2006). Software Security: Building Security In.
Addison-Wesley (ISBN 0-321-35670-5)

This book is a "hands-on, how-to guide for software security" for software security professionals. It completes a trilogy together with McGraw's Building Secure Software (Addison-Wesley, 2001) and Exploiting Software (Addison-Wesley, 2004), but it also stands alone as a useful book. It considers best practices for software security in detail, as a fundamental part of the development lifecycle. It is very much in the spirit of what RISKS has promulgated in the past 20.5 years.

2000-01-12 **privacy book review study survey overview**

EPIC Alert; NetworkWorld Fusion

Respected author Simson Garfinkel published his new book, _Database Nation: The Death of Privacy in the 21st Century_ and received rave reviews from privacy activists. The Electronic Privacy Information Center (EPIC) published this brief summary in the EPIC Alert 7.01: "Fifty years ago George Orwell imagined a future in which privacy was vanquished by a totalitarian state that used spies and video surveillance to maintain control. In 2000 we find that the threats to our privacy are not coming from a monolithic "Big Brother", but — even harder to grapple with — hundreds of sources, not seeking to control us, merely to market to us, track us, count us, or streamline paperwork. The result, though, is still as chilling as _1984_. _Database Nation_ explores the many threats to privacy in the Twenty First century and warns its readers, as Orwell's 1984 did before, that the cost of inaction will be the loss of freedom." The article continued with references to the book's own Web site, < http://www.databasenation.com >. Sandra Gittlen, writing in NetworkWorld Fusion on 2000-03-22, said, "From its first pages, it grips you and makes you realize that the onus for privacy is not just on companies. You, too, have to take some responsibility for how much information you hand out. After all, Garfinkel contends, pretty soon every database could be hooked into every other database, creating a huge Web of information about you." Ralph Nader wrote, "Database Nation by Simson Garfinkel is a graphic and blistering indictment of the burgeoning technologies used by business, government, and others to invade the self — yourselves — and restrict both your freedom to participate in power and your freedom from abuses of power. The right of privacy is a constitutionally protected right, and its erosion or destruction undermines democratic society as it generates, in one circumstance after another, a new kind of serfdom. This book is one that you're entitled to take very personally." Peter Neumann of SRI, the moderator of the RISKS Forum, wrote, "You will find this book very much in tune with what you have been reading in RISKS and in Lauren Weinstein's PRIVACY FORUM all these years. Simson has brought it all together very nicely in a highly readable book."

TRACKING ACTIVITY ON THE WEB
Another privacy-related story: Lycos, Geocities and NBC's Videoseekers are among the major Web sites that will participate in a new service, called Engage, that was developed to track what people are looking at on the Internet, so that advertisers can target their marketing efforts. David S. Wetherell, the chief executive of CMG Information Services, the company behind Engage, gives this example of how the service would be used: "If someone comes to your bookstore for the first time, you can find out if they are interested in mountain climbing, organic gardening and tennis; you can present them books related to their interests immediately." Mr. Wetherell adds: "We took the highest road you could possibly take with respect to privacy. We think you can learn a lot more about someone from their behavior than from their name and address." The system will keep information on age, sex, income, zip code and number of children; it will not collect information on sexual or health related topics and will not store individual names, addresses, and birthdays. Privacy consultant Jason Catlett says: "Engage has done many good things to protect privacy, but my worry is that they are firing the starting gun in the race for the bottom. The worst actors will be left to use the most sophisticated surveillance techniques as they please." (New York Times 16 Aug 98)

1999-03-01 **credit card fraud prevention profiling**

RISKS 20 23

A diner's credit card was refused because (1) he and his wife had bought expensive tableware that was charged in two lots at the store; (2) the credit-card company's profile of habitual purchase patterns was tripped by the unusual pattern; (3) a hold was put on the credit card; and (4) no one bothered to inform the user. [Moral: if you're going to impose security profiles on a system, you have to follow through all the way. Half a security measure can be worse than none.]

1999-04-16 **privacy browser bookmark Web**

Wired

Kevin Cooke, Development Manager at Wired Magazine, discovered that Microsoft's Internet Explorer version 5.0 sends information to a Web site when the user bookmarks the site's URL. Chris Oakes of Wired reported: "This is one of those things where we did not see the privacy issue when we were creating the feature," said Microsoft product manager Mike Nichols. "The feature doesn't pose a super-huge risk. But Microsoft is looking at ways of modifying this feature in future releases." Apparently the feature was designed to allow a Web site to supply an icon to be stored on the user's system so any "Favorite" would be "branded" with that icon.

1999-11-03 **privacy monitoring playlist music recording interest aggregate data mining policy disclosure scandal**

Wired, RealNetworks
http://www.real.com/company/pressroom/pr/99/updateadvisory.html

RealNetworks admitted that it had been collecting information about exactly what its users of RealJukebox player had been listening to. The company did not inform its users of the monitoring and got hammered by its competitors, privacy advocates and many users. The company immediately changed its public privacy statement to let people know about the data collection function and its spokesperson swore that the data had been aggregated so that no one could trace the specific interests of any one user. The company immediately apologized to the public for the concerns it had caused and provided a patch to disable detailed reporting. The company's statement included the following text:

This RealJukebox update causes the following changes to the product:

The RealJukebox globally unique identifier (GUID) is now disabled, and is set to zeros for all users. As a result, GUIDs cannot be associated with any personal registration information (such as name and e-mail) that you may have given RealNetworks.

Since the RealJukebox GUID is disabled and set to zeros, it no longer contains any reference to the network card MAC address of the user's computer.

The following information will no longer be sent during the Get Music service update:
- Encoding options
- Portable devices
- Total song tracks in music database (recorded and downloaded)
- Total recorded song tracks in music database (recorded only)
- User option to receive automatic music downloads (set to blank)
- Genre preference A unique RealJukebox ID will no longer be sent during requests for CD information.

2000-01-28 **Web privacy identification tracking monitoring shadow spoof restriction access-control**

Wall Street Journal, Reuters, Wired

Using the IP addresses of visitors to their Web sites, some Webmasters are programming their sites to show different faces to different people. In a kind of weird intrusion-detection mechanism, companies are restricting access so that competitors or known hackers cannot enter. DoubleClick openly admitted that they use cookie-tracking to tailor ads on certain sites so that viewers see a subset based on the sites they previously visited. Many commentators argued that this process violates browsers' privacy, and DoubleClick provided an opt-out feature. Nonetheless, lawyers for Hariett Judnick in California filed suit in January 2000 stating that the company was unlawfully obtaining and selling private information about consumers.

2000-03-03 **consumer privacy compilation data mining targeted advertising marketing**

ZDNet http://www.zdnet.com/zdnn/stories/news/0,4586,2428392,00.html, Los Angeles Times http://www.latimes.com/business/20000215/t000014627.html

DoubleClick got into a public-relations quagmire when it announced in late January 2000 that it would compile information about visitors to numerous Web sites and feed the browsing data to an engine for selection of specific banners ads likely to be more interesting than usual. Many privacy advocates protested that this Abacus Alliance (formed in November 1999) would be too intrusive. DoubleClick executives protested that individual client identification would be protected — only the shopping and browsing patterns would be stored and used for ad selection.

[In mid-February] DoubleClick [announced] plans to launch a massive ad campaign as part of its "five-point privacy initiative" designed to ameliorate concerns over the advertising firm's online data collection practices. The New York-based company recently was targeted with lawsuits and complaints alleging it violates consumers' privacy by tying Internet users' surfing habits to their names in its massive database. The company also says it plans to hire a "chief privacy officer" and enlist PricewaterhouseCoopers to perform periodic audits of its data collecting procedures. The ad campaign will steer consumers to a new Web site, www.privacychoices.org, which will house information on how the company collects consumer data and how to opt out of that process. Privacy advocates call DoubleClick's efforts too little, too late: "They're launching a major ad campaign because they're trying desperately to avoid legislation," says the director of the Electronic Privacy Information Center, a plaintiff in one of the lawsuits. (Los Angeles Times 15 Feb 2000)

The attorney general of Michigan . . . filed a "notice of intended action" against DoubleClick, charging the Web advertising firm with "failing to disclose to Internet users that DoubleClick is systematically implanting electronic 'cookies,' or electronic surveillance files, on hard drives of users' computers without their knowledge or consent." In addition, the notice criticizes DoubleClick's recent attempts to combine its tracking data with personal data such as names obtained through its acquisition of Abacus Direct last year. Michigan's filing, which is preliminary to a lawsuit, is the third action taken against DoubleClick this week — the Federal Trade Commission and the New York attorney general earlier launched separate inquiries into the company's business practices. (Financial Times 18 Feb 2000)

The online advertising agency DoubleClick, under pressure from privacy advocates, has put aside its plan to integrate the anonymous data it collects about consumer online purchasing patterns with personal information about millions of consumers in the databases of Abacus Direct Corporation, a company DoubleClick purchased last year. DoubleClick chief executive Kevin O'Connor says, "I made a big mistake. It was wrong to try to match that information in the absence of industry or government standards, so until that there's agreement on it, will not... Now we're just happy to get this behind us and move on." (New York Times 3 Mar 2000)

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000508/t000043365.html

If you buy event tickets online, you'll have noticed an increase in associated merchandise and memorabilia offered by the ticketseller at the same time. Online ticketing companies like Ticketmaster's Internet partner and Tickets.com are scrambling to come up with new revenues over and above the price of the tickets to offset the 20% to 50% more it costs them to sell electronically rather than through traditional channels. Ultimately, online ticketers say their services will lead to increased convenience for customers and a profitable bottom line, but right now, they're struggling to cover hefty marketing, infrastructure and customer service expenditures. Ticketmaster Online-CitySearch lost more than $121 million last year, and Tickets.com recorded losses of $66.6 million. Meanwhile, ticketsellers are reaping the benefits of a new resource — more information about their customers. By requiring a bit of demographic data from would-be buyers, they're building valuable databases. "One of the realities about Springsteen is that 200,000 people will try to buy tickets when we only have 20,000 seats," says Ticketmaster.com president Tom Stockham. "We used to know nothing about 180,000 of those people." (Los Angeles Times 8 May 2000)

2001-06-07 **consumer profiling GPS geographical positioning system law enforcement surveillance personal information privacy accident emergency vehicle**

RISKS 21 46

Chris Norloff contributed an interesting essay to RISKS about the implications of having GPS on automobiles:

"You just can't outrun a satellite. A Merced, California, man took his fully equipped 2001 SUV out onto some nearby country roads, navigating swiftly and confidently with the optional OnStar Global Positioning System. When he got into an accident, he decided to run for it. But the guidance system had already notified OnStar headquarters of the accident, specifying where it had happened and giving a complete description of his vehicle to the California Highway Patrol. The officers followed a trail of coolant about a mile into an orchard, where they found and arrested the driver. [Source: *Road & Track* magazine, July 2001; PGN-ed]"

Norloff continued, "What constitutes an "accident"? (Air bags seem to go off quite easily, taking out the windshield and dashboard [$$$] in a fender-bender). Will GPS-reported accidents become like household burglar alarms - sending out mostly false alarms? Who will hack into the OnStar system to falsely report accidents? Who will use the OnStar system to efficiently dispatch lawyers to accident sites? How soon until OnStar sells accident records so used-car purchasers can learn the vehicle's history?"

AMAZON CHANGES ITS TUNE ON PRIVACY POLICY
E-commerce giant Amazon has bowed to the wishes of a coalition of state attorneys general and is changing its privacy policy to make it more consumer-friendly. The changes mean the online retailer will provide consumers with information on what specific personal data is being collected, as well as examples of how it might be used. In addition, Amazon says it will not sell its customer database to marketers and will close some loopholes in its policy. Massachusetts Attorney General Thomas Reilly, who spearheaded the group of 16 states and the District of Columbia, said of the changes: "It's extremely important for all companies — especially Internet sellers — to handle consumer data carefully and confidentially." However, Junkbusters president Jason Catlett dismissed the changes as mostly cosmetic and called for an independent audit of Amazon's practices. Meanwhile, a report by Forrester Research estimates that consumers' concerns over privacy cost online retailers $15 billion in lost sales in 2001. "It's still right up there on the front of consumers' minds, so anything Amazon and others can do to soothe those fears is important," says Forrester analyst Christopher Kelley. TV ADVERTISING EXECS IN DENIAL OVER TIVO DATA

Television advertising has long relied on Nielsen ratings, which indicate how many viewers are watching a particular TV show, but not whether they're sticking around for the commercials, or heading off to the kitchen for a snack or channel-surfing to check on the baseball score. But the data service recently launched by TiVo offers a much more complete vision of what's happening in the home when the TV's on. It can track what viewers record, what they watch, when they change the channel and which commercials they skip. This ability to pinpoint viewer behavior has received a less than enthusiastic reception from advertisers. "This kind of information is the holy grail for marketers. But it's not the holy grail for advertising agencies and media companies, which have built an industry around the idea of getting a shallow message to a broad audience rather than a tailored message to a narrower one," says the chief strategy officer for interactive ad agency Avenue A. According to the TiVo data, genres like big-budget situation comedies (think "Friends") tend to have the lowest commercial-viewing rates because couch potatoes record them and skip through the commercials when they watch. Reality TV, news programs such as "60 Minutes" and "event" programming such as the Academy Awards do significantly better. With Forrester Research predicting that by 2007, more than half of American households will have either a personal video recorder such as TiVo or other on-demand services, advertisers will be forced get their heads out of the sand and come with a new business strategy. 2003-06-29 **privacy black box car data event recorders speed limit**

NewsScan

IS YOUR PRIVACY INVADED BY THE 'BLACK BOX' IN YOUR CAR?

A recent survey found that most people are unaware that many later-model automobiles are equipped with "black box" recording devices (called "data event recorders") which are capable not only of triggering the release of accident airbags but also of recording driving data (such as speed of the car) in the last few seconds before a crash. Such information is increasingly being used as evidence in criminal and civil cases related to the accident, as part of "normal reconstruction" of what happened. But civil libertarians are balking. Defense attorney Bob Weiner calls the black boxes "a tremendous invasion of privacy," and David Sobel, general counsel for the Electronic Privacy Information Center, say: "The real issue is one of notice, and the problem arises from the fact that information is being collected about people's driving behavior without them knowing. If drivers knew about the device, they could at least then begin asking questions." (USA Today 29 Jun 2003)

GO STAND IN THE CORNER AND WATCH THE WEBCAM

A public school in Mississippi is apparently the first to use webcam technology to make sure that students being punished for bad behavior don't miss out on what's happening in class. Cameras document everything that takes place in the classroom, good and bad alike. But Barry Steinhardt of the American Civil Liberties Union worries that the cameras could have a "chilling effect" on students and teachers by making them "feel under constant observation" and affecting "the willingness of teachers to be creative or to introduce unpopular topics." NewsScan

WHO'S SAYING WHAT TO WHOM: WEBFOUNTAIN KNOWS

Hundreds of computer servers at IBM's Almaden Research Center in San Jose, CA, each week gathers 250 million new Web pages and the data (512,000 gigabytes of it) to software called WebFountain designed to capture what everybody is saying about something. IBM has begun licensing the WebFountain technology to corporations to create "buzz reports" developed by scouring every part of the Internet (Web logs, chat rooms, newspaper stories, and so forth) to find out consumer reaction to some new product. In contrast to standard search engines that just match patterns, WebFountain takes a subject and does detailed analyses of what it finds, taking special note of how often someone's name is associated with someone else's with reference to a particular topic. 2004-05-13 **e-mail disk storage advertising profiling**

http://www.nytimes.com/2004/05/13/technology/circuits/13stat.html

GMAIL SECURITY ISSUES

When Google announced its new free Gmail service, many people protested in shock at the idea that Google would scan their e-mail messages and introduce tailored advertisements at the bottom of the e-mail. However, as David Pogue of the New York Times pointed out,

* no human being reads the e-mail;
* a file-storage capacity of 1GB per user will radically change how people use the service
* there's a good spell-checker
* address book
* autocomplete for addresses
* ability to specify a different REPLY-TO address
* online help
* keyboard shortcuts for frequent functions
* automatic spam filters
* 9 month persistence of the account after the last use.

[MK adds: one suggestion is that the 1GB storage capacity would allow users to store files as a kind of universal flash drive. From a security perspective, one should remember that (a) transfer to the remote Gmail server would be unencrypted; (b) any data on that site would, at least in theory, be accessible by Google staff running the servers. I don't think it is likely that this would in practice pose a serious threat, but anyone concerned with critically sensitive data should encrypt them before storing them on the server.]

2004-08-23 **radio listening habits tracking privacy concern Navigauge Arbitron**

NewsScan

NEW SERVICE TRACKS CAR RADIO LISTENING HABITS

Wake up, Arbitron -- a new service offered by Navigauge is combining global positioning technology with continuous tracking of the radio dial to measure radio audiences in cars. While Arbitron has long been the dominant audience information supplier, relying on paper diaries filled out by consumer volunteers, Navigauge executives are betting there's room for improvement. "For a long time, the radio industry itself has lamented the fact that it gets a large percentage of consumers' media consumption but a disproportionately small share of advertising revenue," says Navigauge CEO Tim Cobb. "That's based on the fact that they cannot articulate to advertisers the value that they are delivering." Navigauge is hoping that its capacity to track participants cars through GPS technology will add new layers of useful information for marketers. For example, the company will be able to tell marketers where drivers stop for lunch and whether radio commercials change people's destinations or driving habits. The system can also be used to measure the amount of traffic moving past billboards, assisting the outdoor ad industry in determining its signage exposure. (New York times 23 Aug 2004)

2004-10-25 **radio monitoring MobilTrak Washington advertising sensing marketing**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A60013-2004Oct24.html

ADVERTISERS TRACK RADIO LISTENING HABITS

In 14 locations around the Washington area, a company called MobilTrak has installed sensing devices on utility poles that pick up the electronic signals from cars' antennas as they speed by and record which station they're listening to. The monitoring process gives businesses a welcome insight into the listening habits of their target audience and helps them decide how to allocate their advertising budget, says MobilTrak managing partner C. David Boice: "It's all about precision marketing. It's about giving marketers real-time data about what's happening in certain areas at certain times so they don't waste their advertising dollars." The most enthusiastic adopters have been car dealerships, who generally believe that 80% of their business comes from people who live or work within 10 miles of their location. One dealer found that the two stations he'd been investing in -- a talk-personality station and a contemporary music station -- didn't even rank in the top 10 for in-car radio listeners driving by his dealership. "It was a real eye-opener," he says. Currently, MobilTrak picks up only FM signals, but the company says it plans to introduce technology that picks up AM and satellite station signals next spring. 2004-10-28 **fMRI functional magnetic resonance imaging neuromarketing consumer profiling**

NewsScan; http://www.siliconvalley.com/mld/siliconvalley/10040162.htm

GETTING INSIDE YOUR HEAD

Brain scanning technology (long used to detect conditions such as Alzheimer's and autism) is now being used to understand how people make choices and how they react to such things as religious experiences, Coke versus Pepsi marketing, and Democrat versus Republican political campaigns. Known as functional magnetic resonance imaging (fMRI), brain scans measure blood flow. During an fMRI, active regions of the brain can be seen lighting up on a computer monitor, indicating either empathy or opposition to what (or whom) the subject is being asked to think about. But the technology is raising strong ethical concerns about "neuromarketing" from critics such as Gary Ruskin of the nonprofit organization Commercial Alert: "This is a story of the corruption of medical research. It's a technology that should be used to ease human suffering, not make political propaganda more effective." (AP/San Jose Mercury News 28 Oct 2004)

2004-10-31 **spyware epidemic AOL Microsoft helpdesk support costs performance widespread**

NewsScan; http://apnews.excite.com/article/20041031/D862JARG0.html

SPYWARE EPIDEMIC THREATENS TO STALL COMPUTER INDUSTRY

Computer makers say that their technical support lines are lit up by consumers frustrated over sluggish performance and increasingly they're tracing the problems back to one culprit: spyware. Companies are concerned about the cost of the calls, but they're even more worried that that customers will wrongly blame them for performance deficiencies. Russ Cooper, senior scientist with TruSecure Corp., says now that spyware has become epidemic, it's time for Microsoft and other technology companies to launch a public education campaign along the lines of the old "Only *you* can prevent forest fires" concept. The industry's incentive is pure survival, says Cooper. Microsoft officials blame rogue software for up to a third of applications crashes on Windows XP computers and AOL estimates that just three such programs together cause about 300,000 Internet disconnections per day. Forrester Research analyst Jonathan Penn says spyware-related customer support can cost $15 to $45 per phone call, but it's worth it. "Security is a component of loyalty. People, they want all these various services, but they expect security to come with it." (AP 31 Oct 2004)

2005-01-28 **Marketscore ire campuses institutions students security risk spyware data names passwords credit card numbers confidential IT**

EDUPAGE; http://chronicle.com/prm/weekly/v51/i21/21a03701.htm

MARKETSCORE RAISES IRE AT SEVERAL CAMPUSES

Officials at a number of U.S. institutions are warning students about what they consider a security risk posed by Marketscore software, which promises those who install it significantly greater Internet connection speeds. Unlike applications more commonly referred to as spyware, Marketscore requires users to accept its terms and conditions before installing it. Once loaded, the software routes all of a users Web traffic through Marketscore servers, which then sell usage data to various clients. In monitoring traffic, however, the Marketscore servers also monitor encrypted information, such as user names and passwords, credit card numbers, and other confidential information. Cornell University and the University of Notre Dame have decided to completely block Marketscore from campus networks. Steven J. Schuster, director of IT security at Cornell, called the company's handling of encrypted traffic "absolutely criminal." Officials from Columbia University opted to block Marketscore from what they called its "critical servers," and students who use Marketscore to access other servers at the university receive e-mail warnings about the risk to personal data. At Notre Dame, students who try to use Marketscore receive a warning explaining the risk. Executives from Marketscore defended their products and said they make every effort to explain to users what they do with collected information.

2005-11-20 **libraries services retailers personal privacy concern USA PATRIOT Act**

EDUPAGE; http://www.nytimes.com/2005/11/20/weekinreview/20cowan.html

LIBRARIES FOLLOWING RETAILERS' LEAD

Libraries increasingly find themselves in a quandary between growing expectations among patrons for personalized services and libraries' traditional stance as a strong advocate for personal privacy.
Commercial enterprises such as Amazon and Netflix typically make suggestions to customers based on previous purchases and can notify users when certain products are available. The library at North Carolina State University is implementing a program that offers students similar services based on past usage. To offer such services, however, the library must keep more-detailed patron records than many libraries keep, given the authority of government officials under the USA PATRIOT Act to subpoena those records. Officials from the university report that students are comfortable trading some measure of privacy for the convenience of personalized services. Another program at the University of Notre Dame offers similar suggestions to users, which, according to its developer, should simplify research for many students. Michael Golrick, the city librarian in Bridgeport, Conn., said that the large numbers of immigrants in his community would not be so willing to trade privacy for convenience. Many of them, he said, "came to this country to avoid the kinds of surveillance and persecution we're seeing tinges of today."

2006-01-19 **Apple response iTunes user privacy infringement complaints**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4627214.stm 23

APPLE CHANGES ITUNES IN RESPONSE TO COMPLAINTS

Responding to complaints that its iTunes software infringed on user privacy, Apple has made changes to the application. At issue is a feature called MiniStore, which recommends songs to users based on what they are listening to. When the new feature was released earlier this month, some users discovered that the feature transmitted information about iTunes users to Apple with unique identifiers. Those ID numbers exposed the users of the service to violations of their privacy because the iTunes software did not alert users to the feature and how it works. Critics also pointed out that Apple did not disclose what exactly it does with the data that is transmitted to the company. Apple has changed the software to include a pop-up that tells users about the feature and allows them to turn it off. Apple also said that it has not done anything with the data it has collected. Kirk McElhearn, one of the users who first reported the concerns about MiniStore, commended Apple for its response, saying it had "done the right thing."

1998-01-27 **confidentiality spamming ISPs privacy**

EDUPAGE

In December 1997, U.S. sailor Timothy R. McVeigh (not the Oklahoma City bomber) was accused of revealing that he is homosexual by including the word "gay" in his AOL member profile (a violation of the controversial "Don't ask, don't tell" rule). Civil libertarians were incensed that someone at AOL revealed the man's full name to Navy investigators without a subpoena or other legal instrument. Even though the members profile is a public document available to all AOL members, the sailor used only his nickname, Tim but identified him as a US sailor. According to attorneys, this unauthorized release of private information may constitute a violation of the 1986 Electronic Communications Privacy Act. In January, in a curious twist, the sailor lost his AOL account because he sent appeals for help to other AOL members with "gay" in their profiles. AOL apologized for the leak, saying that the Navy had misled their staff into violating corporate policies. Later that month, U.S. federal judge Stanley Sporkin stayed the dismissal because of the legal irregularities in collecting evidence pending resolution of the issues in court.

FTC SAYS WEB SITE LIED ABOUT PRIVACY ASSURANCES
The Web site Geocities, accused by the Federal Trade Commission of falsely assuring two million subscribers that their personal information was not being disclosed to others, has agreed to post its privacy policy on the site and to discourage children under 13 from using the site without parental permission. The new privacy statement, which admits that the company releases personally identifiable information on its subscribers, is reachable from a link on the Geocities home page. (Washington Post 14 Aug 98)

FREE E-MAIL SERVICES COME WITH HIDDEN COST
Online companies seeking to become "portals" to the Internet, such as Juno and GeoCities, may offer free e-mail as a come-on to consumers, but at a hidden cost. The free services generally are available only after the user has answered a series of questions about age, income, education level and personal interests. That information can turn into a gold mine once it's made available to advertisers seeking to target specific audiences. "If you care about your privacy, the free e-mail and Web sites probably aren't worth it," says the editor of Privacy Times. Last Thursday, GeoCities was accused by the Federal Trade Commission of lying to its two million customers when it said it would not give away the personal information it collected from them. The company has now agreed to post a privacy notice on its Web site that tells customers how the information they divulge will be used. International Data Corp. estimates that there will be 40 million registered free e-mail boxes by the end of the year, up from 14 million last year. (Washington Post 21 Aug 98)

YEAR LATER, SAILOR IN AOL CASE REMAINS A SYMBOL
Issue: Privacy
Tim McVeigh will be honored at an Out magazine ceremony noting the year's biggest newsmakers. Last year, the 18-year Navy veteran became the center of two fights — over gays in the military and the right to privacy online. Using a private email account to organize a toy drive, Mr McVeigh was turned in by a colleague who noticed that his America Online screen name list McVeigh's marital status as "gay." The Navy investigated and AOL voluntarily confirmed that McVeigh's screen name belonged to the sailor. The Navy then started proceedings to oust McVeigh. After building a website and sending out email asking for help, McVeigh was aided by Servicemembers Legal Defense Network [1], a group that helps homosexuals in the military, and the Electronic Privacy Information Center (EPIC) [2] in actions against both the Navy and AOL. "I did win my case — the military had to keep me. The downfall was the military wasn't going to give me an equivalent job," McVeigh said recently. "Even though there was a ruling by a federal judge that they had to return me, the judge didn't have the power to restore my job." [SOURCE: CyberTimes, AUTHOR: Lisa Napoli] [3]

CALIFORNIA SELLS BIRTH DATA TO PRIVATE WEB SITE, 'RAISES RED FLAG' [29 Nov 2001]
The State of California has sold the birth data of California residents to a privately operated genealogy Web site that can now be used to retrieve such personal data as someone's place of birth or mother's maiden name -- information frequently used as identifying information for purposes of accessing bank accounts and making various kinds of financial transactions. State Senator Jackie Spier (D, San Mateo) warns: "The time has come for us to recognize that identity theft has become a big problem. The fact that this information is public should raise a red flag." (San Jose Mercury News 29 Nov 2001)
http://www.siliconvalley.com/docs/news/svfront/037140.htm

ASK AND YOU SHALL BE REMOVED ... BUT YOU'VE GOT TO ASK [30 Nov 2001]
Responding to complaints by consumers and privacy advocates who protested California's legal sale to the Web genealogy company RootsWeb.com of public information containing such personal data as people's birth dates and their mothers' maiden names, the company now says it will remove from its Web site the names of anyone who makes a specific request. A spokesman for the company said: "The mission of our company is to create places to help people reconnect with their families. We're not in any way doing anything except helping our customers and if a customer is concerned about it, it doesn't do any good to leave them up on the site." A legal council for the Electronic Privacy Information Center says that California's sale of data to the genealogy Web site "a situation where all the residents of California have now been exposed to a new risk of identity theft." (San Jose Mercury News 30 Nov 2001)
http://www.siliconvalley.com/docs/news/svfront/priv113001.htm

CALIFORNIA GOVERNOR HALTS SALES OF BIRTH & DEATH RECORDS [7 Dec 2001]
California Gov. Gray Davis has issued an order placing a 45-day freeze on the state's sale to Web sites of records containing such personal data as mothers' maiden names of state residents. Critics of the sale of this kind of information are afraid it could be used for identity theft and other fraudulent purposes, while defenders of the practice say there's no evidence that the sites are actually being used like that. The general counsel for the California Newspaper Publishers Association says: "I'm an eighth-generation Californian and the fact that my ancestors were born here and died here is pretty much basic historical information. That has always been accessible in California and I'm not sure what new emergency there is that would warrant this executive order." (San Jose Mercury News 7 Dec 2001)
http://www.siliconvalley.com/docs/news/svfront/trade120701.htm

According to several reports to RISKS (see for examle issue 21.81), as of at least 1 December 2001, the entire CA and TX birth records databases were removed from the MyFamily.com, Ancestry.com and RootsWeb.com Web sites.

DO ME A FAVOR, OPEN THE DOOR, AND LET 'EM IN, OOH YEAH
So just who is that knocking that door and ringing that bell? In Hamilton County, Ohio, trouble has flowed from the decision of the clerk of courts to make all public records freely available on the Web. (They were already available to anyone who would go to the county courthouse.) The official explained: "It was the natural progression of technology. Everything we get is scanned and available. It was very easy to open the door to the public." And so now anyone can look on the Web to see anyone else's state tax liens, arrest warrants, bond posting, etc. People are searching the records to find out the dirt on their neighbors - or just to get copies of the floor plans of their houses. Bank executive Jim Moehring says, "You do kind of feel like Big Brother because you can look right in and get into what everyone's doing." The clerk of courts says ruefully: "We didn't realize we were walking into a hornet's next until after we were under way. " (New York Times 5 Sep 2002)

THE GOOGLING OF AMERICA
The search engine Google is changing the kind of information Americans can find out about each other — information that once was the purview of private investigators or the extremely nosy. Now with one click, potential employers, salespeople, and just about anyone can find out every publicly reported detail of your past life, says Boston Globe columnist Neil Swidey. "Now, in states where court records have gone online, and thanks to the one-click ease of Google, you can read all the sordid details of your neighbor's divorce with no more effort than it takes to check your e-mail. 'It's the collapse of inconvenience,' says Siva Vaidhyanathan, assistant professor of culture and communication at New York University. 'It turns out inconvenience was a really important part of our lives, and we didn't realize it.'" (Boston Globe 2 Feb 2003)

WHO OWNS YOUR PERSONAL DATA ANYWAY?
Harvard Business School professor John Deighton says that instead of relying on regulators to protect their privacy through contrivances such as the "Do Not Call" list, consumers should capitalize on the value of their personal information and get something in return for allowing businesses to use it. With companies doing a brisk business in selling and reselling your data, it's time for individuals to get into the act, demanding rewards such as better customer service, price discounts or maybe just plain money. "The challenge is to give people a claim on their identities while protecting them from mistreatment. The solution is to create institutions that allow consumers to build and claim the value of their marketplace identities and that give producers the incentive to respect them. Privacy and identity then become opposing economic goods, and consumers can choose how much of each they would like to consume" says Deighton. (HBS Working Knowledge/CNet 1 Sep 2003)

NewsScan

TEXT-SEARCHING OR TEXT-MINING?
Whereas Google and other Web search engines retrieve information and display links to documents that contain certain keywords, text-mining programs dig deeper in order to categorize information, make links between seemingly unconnected documents, and provide visual maps that lead down new pathways of exploratory learning. Unlike data mining, text mining works on unstructured data — such as e-mail messages, news articles, internal reports, phone call transcripts, and so on. A good example of the problem it seeks to solve is suggested by the comment of researcher Randall S. Murch, who says: "I was an FBI agent for 20 years. And I have yet to see anyone who is able to model the way an agent thinks and works through an investigation." And a good example of the solution offered by text-mining is its use in the 1980s University of Chicago information scientist Don R. Swanson in studying the medical literature on migraines. Starting with the word "migraine," he downloaded abstracts from 2,500 articles from Medline and noticed a reference to a neural phenomenon called "spreading depression" — which prompted him to look for articles with that term in their titles, which in turn led him to the discovery that magnesium was often mentioned as preventing this spreading depression. Thus, as a result of text-mining he was able to hypothesize a link between headaches and magnesium deficiency — a link that was later confirmed by actual experiments. (New York Times 16 Oct 2003)

PRIVACY ADVOCATES TARGET GOOGLE'S GMAIL STORAGE POLICY

Privacy advocates are voicing concern over Google's data retention plans, following the search company's splashy launch of its free Gmail service last week. Google's Gmail privacy policy tells users: "The contents of your Gmail account are also stored and maintained on Google servers in order to provide the service. Indeed, residual copies of e-mail may remain on our systems, even after you have deleted them from your mailbox or after the termination of your account." The fact that e-mail records potentially could be combined with Google search cookies, designed to index users' searches through 2038, and an Orkut cookie that contains personal identification information, is what has privacy watchdogs worried. "Once users register for Gmail, Google would be able to make that connection, if it chose to," says Pam Dixon, head of the World Privacy Forum. "And if Google ever compared the two sets of data, there are some people who would be chilled and embarrassed." Archivist Daniel Brandt adds: "While Google brags that no humans will read your e-mails, the entire Gmail program will involve extensive automated profiling of you as an individual. Google will be sharing non-identifiable portions of your profile with anyone they choose. If the ownership of Google changes, or there is a merger, the entire personally-identifiable profile will be available to the new owners or partners." (The Register 3 Apr 2004)

2005-03-15 **privacy central federal government database identification authentication sabotage corruption integrity**

RISKS 23 79

CENTRALIZED PRIVACY RIGHTS MECHANISM RAISES SECURITY QUESTIONS

Curt Sampson contributed useful pointers and serious questions about a proposal for a central registry for protecting information privacy:

>Bruce Schneier, on his blog recently, mentioned the paper "A Model Regime of Privacy Protection" by Daniel J. Solove & Chris Jay Hoofnagle. His link and discussion is at
http://www.schneier.com/blog/archives/2005/03/ideas_for_priva.html

The paper's abstract and a link to download it can be found at
http://papers.ssrn.com/sol3/papers.cfm?abstract_id=681902

There are a lot of good ideas in this paper, but one in particular struck me as potentially unwise, and certainly underdeveloped:

In conjunction with the universal notice, the FTC shall develop a centralized mechanism for people to exercise their rights with respect to their personal information. Such a mechanism would mimic the Do Not Call website, which allows individuals to opt-out of telemarketing and verify their enrollment by visiting a single website.

Many interesting RISKS are raised by this. How do you identify the people in the opt-out registry? How do you authenticate requests to deny distribution of certain information? (A malicious person might try to cause difficulties for someone by forging a request to deny all credit data to potential lenders.) How do you determine who may or may not search the registry or read information in it? How do you keep this from acting as the "central key" to all the information on a person, effectively moving us closer to having One Central Database, with all of the problems that brings?

There's a huge can of worms here waiting to be opened.

Personally, my first instinct would be to avoid such a central registry and instead make it the responsibility of the data collectors to contact each individual with information about what they're collecting and how they're using it, and solicit permission to do so, as well as offer the ability to review the information. This avoids any centralized system, and also avoids certain types of error. For example, if I'm contact regarding a file that appears to have nothing to do with me, I can point that out, rather than have a company mistakenly believe that this file does correspond with my life. (Or I might just say it does, and use the information for identity theft. Who knows?)<

EDUPAGE; http://www.insidehighered.com/news/2005/03/23/unit

CRITICISM MOUNTS FOR FEDERAL STUDENT DATABASE

The U.S. Department of Education has proposed creating a national database of college students, but the idea has drawn heavy criticism for its use of Social Security numbers to identify individuals. The current system for reporting student progress, the Integrated Postsecondary Education Data System, reports aggregate data for institutions and cannot accurately track students who start at one college or university and transfer to another. The proposed database would track individuals, offering more accurate data for graduation rates and other statistics, but some argue that those gains would come at the expense of student privacy. David Baime, vice president of government relations for the American Association of Community Colleges, said that despite the benefits to community colleges in particular from such a system, his organization opposes the plan "primarily due to privacy concerns, expressed to us by our members." David L. Warren, president of the National Association of Independent Colleges and Universities, said, "The proposal takes us down the slippery slope toward Big Brother oversight of college students, and of those same citizens beyond their college years." RISKS 23 93

DoD MILITARY RECRUITMENT DATABASE INCLUDES SSN

The Defense Department has begun working with BeNow Inc, a private marketing firm, to create a database of high school students ages 16 to 18 and all college students to help the military identify potential recruits in a time of dwindling enlistment in some branches.

The program is provoking a furor among privacy advocates. The new database will include personal information including birth dates, Social Security numbers, e-mail addresses, grade-point averages, ethnicity and what subjects the students are studying.

Chris Jay Hoofnagle, West Coast director of the Electronic Privacy Information Center, called the system "an audacious plan to target-market kids, as young as 16, for military solicitation." He added that collecting Social Security numbers was not only unnecessary but posed a needless risk of identity fraud. Theft of Social Security numbers and other personal information from data brokers, government agencies, financial institutions and other companies is rampant. "What's ironic is that the private sector has ways of uniquely identifying individuals without using Social Security numbers for marketing."

The Pentagon statements said the military is "acutely aware of the substantial security required to protect personal data," and that Social Security numbers will be used only to "provide a higher degree of accuracy in matching duplicate data records."

2005-06-23 **Department of Defense DoD student database EPIC civil liberties privacy concerns trade in consumer information**

EDUPAGE; http://www.insidehighered.com/news/2005/06/23/database

DEFENSE DEPARTMENT TO CREATE VAST STUDENT DATABASE

Officials at the U.S. Department of Defense (DoD) have proposed the creation of a database containing information on virtually every college student in the country, as well as many high school students. Intended as a tool to aid recruitment efforts, the database would include names, phone numbers, Social Security numbers, addresses, birth dates, ethnicities, grade point averages, and other data. The DoD's database bears similarities to another database proposed by the Department of Education. That database would track individual students through their college careers, providing a clearer picture of graduation rates than current records, which track only aggregate rates from institutions. The Education Department's proposed database has drawn criticism from privacy advocates, who see it as a potential risk to privacy. The DoD proposal has similarly elicited complaints from groups such as the Electronic Privacy Information Center (EPIC). According to EPIC, the database would be a "bad idea," putting tools of direct marketers in the hands of government officials but without affording consumers the same protections from government that they enjoy from marketers. Inside Higher Ed, 23 June 2005

EDUPAGE; http://www.nytimes.com/2006/01/27/business/27choice.html 23

CHOICEPOINT SETTLES WITH FTC

Data broker ChoicePoint has reached a $15 million settlement with the Federal Trade Commission (FTC) following the company's disclosure a year ago that it had turned over sensitive personal data for about 150,000 people to bogus customers. The FTC alleged that ChoicePoint did not have adequate procedures in place to prevent such fraud and that the company ignored what should have been red flags about the identity of the customers requesting data, including credit reports. ChoicePoint, which has over the past year taken steps to address the problems that led to the incident, said it disagrees with some of the FTC's findings but supports the settlement. The settlement covers a $10 million fine, the largest ever meted out by the FTC, and $5 million that will be held in an account and used to reimburse consumers who can demonstrate losses due to the ChoicePoint incident. Sen. Charles Schumer (D-N.Y.), who introduced tough legislation to regulate the data-brokerage industry after the ChoicePoint scandal, said he thinks the fine was too low and will encourage others to see such penalties as "just the cost of doing business."

WEBSITES HAWKING PHONE RECORDS SHUT DOWN.

Following a wave of negative publicity and pressure from the government, several Websites that peddled people's private phone records are calling it quits. "We are no longer accepting new orders" was the announcement posted Wednesday, February 8, on two such sites, locatecell.com and celltolls.com. The Federal Trade Commission (FTC) this week conducted a sweep of 40 sites known to have been selling private phone records. According to the FTC's Lydia Parnes, more than 20 sites have recently shut down or stopped advertising for new business. The agency has sent letters to about 20 other sites, warning them that they may be violating the law and should review their business practices, said Parnes, director of the FTC's Bureau of Consumer Protection. While some sites appear to be closing up shop, others have seen a boom in business with the recent media attention, said Marc Rotenberg, executive director of the Electronic Privacy Information Center. Rotenberg urged lawmakers to ban a practice known as "pretexting," in which data brokers or others call a phone company, impersonate a customer and then persuade the company to release the calling records.

IRS PLANS TO ALLOW TAX-PREPARERS TO SELL CLIENT DATA

Chris Hoofnagle reported in RISKS on news that the IRS was pushing for new rules allowing commercial tax preparers to sell information from tax returns. "If consent is given, the FULL RETURN can be given to other entities for marketing purposes, and the tax preparer does not have to even ensure that these other entities are legit or following the preparer's privacy policy."

Jeff Gelles of the Philadelphia Inquirer wrote, "The change is raising alarm among consumer and privacy-rights advocates. It was included in a set of proposed rules that the Treasury Department and the IRS published in the Dec. 8 Federal Register, where the official notice labeled them 'not a significant regulatory action.' IRS officials portray the changes as housecleaning to update outmoded regulations adopted before it began accepting returns electronically. The proposed rules, which would become effective 30 days after a final version is published, would require a tax preparer to obtain written consent before selling tax information. Critics call the changes a dangerous breach in personal and financial privacy. They say the requirement for signed consent would prove meaningless for many taxpayers, especially those hurriedly reviewing stacks of documents before a filing deadline."

Media watchdog MediMatters For America reported that "On the CBS Evening News, Washington correspondent Bob Orr characterized a recent Internal Revenue Service (IRS) regulations proposal allowing tax return preparers to sell information from returns to third parties as spelling out a 'loophole of sorts' that has 'been around for more than 30 years.' In fact, in permitting sales to third parties, the new proposal would allow tax preparers to do something they are not currently permitted to do; under current law, they can pass on such information only to affiliates."

The US Public Interest Research Group (U.S. PIRG) established a Web site to cover this developing issue. < http://www.uspirg.org/uspirg.asp?id2=24620 >

1999-06-22 **advertising marketing privacy policy Web**

AP

MICROSOFT TO REQUIRE PRIVACY PACTS
Microsoft on Wednesday is expected to announce that it will no longer buy ads on Webs sites that fail to provide sufficent privacy safeguards for consumers. Microsoft, the leading Web advertiser, is following the lead of IBM, the Web's second largest advertiser, which less than three months ago made a similar announcement. Microsoft has lobbied against federal privacy legislation, and offers a free toolkit for users designed to limit the amount of information Web sites collect. Microsoft's new privacy policy will take effect beginning next year; the company spent about $30 million last year on Web ads, still a small fraction of the $2 billion that was spent overall on Web ads. Although recent surveys show a major improvement in the privacy practices of Web sites, the FTC is studying what recommendations it plans to make to Congress regarding new privacy laws. 2000-03-31 **Web privacy consumer profiling FTC investigation**

NewsScan

Yahoo Inc. has notified the Securities and Exchange Commission that it had volunteered to cooperate with an inquiry by the Federal Trade Commission into how Web sites gather and use personal information. Insisting that it takes its privacy policies seriously, the company says that the discussions have "nothing to do with advertising profiling" but has declined to elaborate on the scope of those discussions. Most Web sites gather personal data about their visitors not to collect information about individuals but to determine broad demographic characteristics that will attract advertisers who want to target their messages to prescreened audiences. 2000-06-07 **privacy consortium industry self-regulation organization consortium**

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000607/t000053796

A seven-member coalition of leading high-tech companies . . . [proposed] a new system aimed at protecting consumers from online fraud and privacy intrusions in cyberspace. The group, which includes America Online, AT&T, Dell, IBM and Microsoft, has developed voluntary guidelines that would require merchants to clearly spell out the terms and conditions of a sale, make reasonable efforts to protect consumer privacy, and provide for "fair, timely and affordable" dispute resolution. The move is seen as a strategy to allay consumers' fears and ward off further intervention by government regulators at a time when the Federal Trade Commission is pushing for expanded powers to regulate industry Web sites, and several bills in Congress seek to increase consumer protections against cyberscams and privacy abuses. Although . . . [fewer] than 20% of Web sites post privacy policies, polls have found that privacy is the No. 1 concern of online users. (Los Angeles Times 7 Jun 2000)

ELLISON PROPOSES NATIONAL IDENTIFICATION SYSTEM [23 Sep 2001]

Oracle chief executive Larry Ellison says that America needs to create a national identification card system, and is offering to donate Oracle's database software to make such a system possible: "We need a national ID card with our photograph and thumbprint digitized and embedded in the ID card. We need a database behind that, so when you're walking into an airport and you say that you are Larry Ellison, you take that card and put it in a reader and you put your thumb down and that system confirms that this is Larry Ellison." Asked about privacy concerns, he responded: "Well, this privacy you're concerned about is largely an illusion. All you have to give up is your illusions, not any of your privacy. Right now, you can go onto the Internet and get a credit report about your neighbor and find out where your neighbor works, how much they earn and if they had a late mortgage payment and tons of other information." Ellison argues that shoppers now have to disclose more information to make a purchase at a shopping mail than they do to get on an airplane, and poses the following question: "Let me ask you. There are two different airlines. Airline A says before you board that airplane you prove you are who you say you are. Airline B, no problem. Anyone who wants the price of a ticket, they can go on that airline. Which airplane do you get on?" (San Jose Mercury News 23 Sep 2001)

2001-12-10 **corporate privacy policy P3P Platform for Privacy Preferences legal liability Microsoft MS browser IE6 Internet Explorer**

RISKS 21 82

Attorney Ben Wright noted in RISKS that the new defaults in MS Internet Explorer version 6 may pose a problem for corporations:

"The filters force administrators to post new privacy policies for their Web sites, coded in a technical language called P3P. The filters punish administrators who fail to publish properly coded P3P privacy policies by blocking or impeding their cookies.

The P3P coding language raises, for any corporation, government agency or other institution that uses it, a lawsuit danger. A privacy policy written in it exposes the organization to liability, with little or no escape.

A privacy policy, even one written in computer codes, can be legally enforceable like a contract. In lawsuits filed in 1999, plaintiffs forced US Bancorp to pay $7.5 million for misstatements in a privacy policy posted on its Web site.

Web administrators face a dilemma. They want to satisfy IE 6's technical requirement for P3P codes, but they also want to sidestep liability. See Webserver Online Magazine article: < http://webserver.cpg.com/news/6.12/n5.shtml>

One solution is to deploy dummy P3P codes, with an extra legal code that disavows any liability for the codes, as explained at < http://www.disavowp3p.com>."

2002-03-05 **anonymizer quality assurance QA compromise vulnerability design flaw analysis**

RISKS, http://www.cs.bu.edu/techreports/pdf/2002-003-deanonymizing-safeweb.pdf 21 93

David Martin of Boston University reported on his group's analysis of the SafeWeb anonymizer service (which went out of business in December 2001 but whose technology was licensed to other firms). The analysis showed that the service did protect anonymity. However, despite the company's assurances about security, in fact the service opened users to serious compromise through errors in the service's design.

The simplicity of the errors is startling. Martin summarizes the situation as follows (quoting):
>First a quick SafeWeb overview: a SafeWeb user types in a URL. It goes to safeweb.com within an SSL connection; SafeWeb sanitizes the requested content and delivers it back to the browser. The origin server Web site only sees a connection from safeweb.com, and eavesdroppers near the user only see an encrypted connection to safeweb.com On-screen, SafeWeb uses frames to separate the SafeWeb controls from the requested content. Let's call them the "control" and "content" frames.

Now let's meet the protections:
(1) simultaneously open windows or frames can only communicate with each other if they're from the same domain,
(2) scripts stop running when a new page is displayed, and
(3) cookies are available only to the domain that set them.

The problem is that both of SafeWeb's frames are served from the same tunnel (https://www.safeweb.com/) even though their content comes from radically different sources: the trusted SafeWeb site on the one hand, and the untrusted third party site on the other. Since both frames come from the same domain, the Web browser exposes each Document Object Model to the other: protection #1 is gone.

Since the control frame is basically static, it's a great place for an attacker to tuck away any code that needs to persist throughout the browsing session -- like spyware. So protection #2 is gone too.

SafeWeb also wanted to support pseudonymous persistent cookies. Since the content frame is always associated with a single privacy domain, they aggregated all of the pseudonymous cookies from sites a user might visit through SafeWeb into one "master cookie" associated with the fixed domain safeweb.com. That way, the individual cookies all get stored on the user's computer in a slightly different form, and SafeWeb doesn't have to maintain any persistent state on their servers (and users don't have to log in to SafeWeb, etc.). But this approach discards protection #3 as well.

To exploit these lost protections, an attacker has to take control of one of the frames: the content frame is the obvious choice. That turns out to be not too hard. SafeWeb *requires* that JavaScript be enabled in the browser. Recognizing the risk, SafeWeb tried to sanitize scripts delivered to the content frame, but they didn't go nearly far enough. The result? By choosing to use this privacy enhancing system, users become vulnerable to having their IP address revealed, *all* of their cookies stolen, and the remainder of their privacy-"enhanced" browsing session silently transmitted to an attacker in spite of the layer of SSL protection. This is not speculation; we have tested several effective exploits against the system.<

[MK comments: You would think that the designers would have asked for outside analysis before implementing these designs, no?

GATES: ORWELL GOT IT BACKWARDS
"Orwell's vision didn't come true, and I don't believe it will," Microsoft chairman Bill Gates said this week in a speech commemorating the 100th anniversary of the birth of George Orwell, the English author whose works included the dystopian novel "1984." That novel described a repressive society of the future dominated by a figure called Big Brother, whose image was displayed on screens throughout the land. Gates said that, contrary to Orwell's fears, "This technology can make our country more secure and prevent the nightmare vision of George Orwell at the same time... At a time of increased uncertainty about homeland security, computers must be available wherever and whenever we need them... Not so long ago, most people paid little attention to cybercrime, but today there's a broader recognition that IT security is vital to homeland security. We must build higher walls and stronger vaults, and government must continue to step up the priority given to this kind of crime while protecting the privacy of consumers." APPEALS COURT STRIKES DOWN RIAA STRONGARM TACTICS
A U.S. appeals court has ruled that the strongarm tactics used by the Recording Industry Association of America to track down music downloaders are illegal. The RIAA had sought to force Internet service providers, including Verizon, to divulge the names of subscribers suspected of downloading copyrighted music files without permission. Verizon argued that existing copyright law does not give the recording industry the authority to enforce its subpoenas and said the RIAA's actions violated Verizon customers' privacy. A lower court had earlier upheld the RIAA's actions, but this latest ruling sided with Verizon: "In sum, we agree with Verizon that [the 1998 copyright law] does not by its terms authorize the subpoenas issued here," wrote Chief Judge Douglas Ginsburg. EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7217100

EBAY TO DISCONTINUE PASSPORT

Online auction site eBay has announced it will discontinue support of Microsoft's Passport service later this month. The service offers registered users a single location to store personal information including names, addresses, and credit card numbers. When shopping at online vendors participating in the service, users can access their profiles for transactions with just a single login. Since its debut in 1999, however, Passport has failed to live up to expectations, in part due to competition as well as to security concerns among consumers. In addition, retailers were slow to sign up for fear that Microsoft might begin charging fees to retailers for the service. A spokesperson from eBay said that the percentage of its customers who regularly signed in using Passport was "very small." Despite losing one of the largest online retailers in eBay, Microsoft said the Passport service will continue.

EEPI - ELECTRONIC ENTERTAINMENT POLICY INITIATIVE

Long-time privacy advocate Lauren Weinstein wrote:

I'm pleased to announce "EEPI" (http://www.eepi.org), a new initiative aimed at fostering cooperation in the areas of electronic entertainment and its many related issues, problems, and impacts.

I've teamed with 30+ year recording industry veteran Thane Tierney in this effort to find cooperative solutions to technical, legal, policy, and other issues relating to the vast and growing range of electronic technologies that are crucial to the entertainment industry, but that also impact other industries, interest groups, individuals, and society in major ways.

There are many interested parties, including record labels, film studios, the RIAA, the MPAA, artists, consumers, intellectual freedom advocates, broadcasters, manufacturers, legislators, regulators, and a multitude of others.

The issues cover an enormous gamut from DVDs, CDs, and piracy issues to multimedia cell phones, from digital video recorders to Internet file sharing/P2P, from digital TV and the "broadcast flag" to the Digital Millennium Copyright Act (DMCA) and "fair use" controversies.

Working together, rather than fighting each other, perhaps we can all find some broadly acceptable paths that will be of benefit to everyone.

For more information, please see the EEPI Web site at:

http://www.eepi.org

A moderated public discussion list and an EEPI announcement list are now available at the site.

Public participation is cordially invited. Thank you very much.

GOOGLE PRIVACY POLICIES NEED REFINEMENT

Lauren Weinstein published an open letter berating Google (and Sun Microsystems) for Google's lack of privacy policies. Among other sins, he cited these [MK quoting liberally from LW's letter]:

* Google keeps records of your searches, and can tie them to other activities via cookies. Google scans the e-mail you send and receive through Gmail. Google collects a variety of information on your other browsing activities through various optional toolbars and services.

* Google wants to make copies of copyrighted books without paying for them. Arguments about how they might make "snippets" of such materials available in "Google Print" aside, the internal R&D value alone of that collection to Google would presumably be immense, and all without sending a dime to the copyright holders.

* When CNET ran a story using Google to research data on Google's chief exec, Google reacted like an enraged and petulant child.

* Now, with the new Sun Micro deal, if hosted versions of word processing and related applications are developed and deployed by the joint Google and Sun team, Google could quite possibly be tied into your document editing and other Office-like activities if you use such services.

* Google refuses to hire a privacy officer (after all, they're the "Trust us -- First do no evil" company, and they're smarter than everyone else about… well… everything, right?)

* Google refuses to detail their data retention policies or the extent to which they make that growing corpus of data available to outside entities.

*…Sun's Scott McNealy … has famously said: "You have no privacy, get over it" and … suggested that consumer privacy is a "red herring" issue.

Weinstein urged Google and Sun to consult with the privacy community and personally offered to help. However, he wrote, "I won't be holding my breath waiting for their call."

2006-01-30 **industry vendor effort anti-spyware TrendMicro Symantec McAfee ICSA Thompson Cyber Security Lab sharing**

DHS IAIP Daily; http://www.theregister.co.uk/2006/01/30/spyware_testing/ 23

SECURITY VENDORS OPEN ANOTHER FRONT AGAINST SPYWARE.

The three biggest anti-virus vendors have teamed up with testing labs to develop standards for spyware detection. Trend Micro, Symantec and McAfee are joining forces with ICSA Labs and Thompson Cyber Security Labs in a bid to standardize methods for sharing spyware samples and testing anti-spyware products and services. The effort is aimed at curtailing a possible source of user confusion before it becomes a problem, as well as driving up standards for detection across the anti-spyware industry. Spyware testing, modeled on schemes the anti-virus industry has been running for years, will also make it easier to compare the efficacy of various anti-spyware products, at least in theory. The group's anti-spyware testing methodology and best practices can be viewed at Spywaretesting.org. The initiative is one of a number of cross industry efforts aimed at coordinating the fight against spyware -- the invasive programs that track user's surfing habits or, in the worst cases, steal their personal information, such as credit card or Social Security numbers. 2006-02-10 **EFF warning Google Desktop remote information file storage hacker target**

DHS IAIP Daily; 23
http://security.ithub.com/article/EFF+Dont+Use+Google+Desktop/171267_1.aspx

EFF: DON'T USE GOOGLE DESKTOP.

A high-profile privacy watchdog group has a terse warning for business and consumer users: Do not use the new version of Google Desktop. The nonprofit Electronic Frontier Foundation (EFF) said a new feature added to Google Desktop on Thursday, February 9, is a serious privacy and security risk because of the way a user's data is stored on Google's servers. The new "Share Across Computers" feature stores Web browsing history, Microsoft Office documents, PDF and text files on Google's servers to allow a user to run remote searches from multiple computers, but, according to the EFF, this presents a lucrative target to malicious hackers. Google said users can use a "Clear my Files" button to manually remove all files from its servers or a "Don't Search These Items" preference to remove specific files and folders from the software's index.

2000-03-14 **EC European Commission Privacy Directive international agreement Safe Harbor**

NewsScan, CNet http://news.cnet.com/news/0-1007-200-1571726.htm

The European Union and the U.S. have agreed on regulations covering personal data collected electronically, following months of negotiations aimed at reconciling the disparity in privacy protection laws in the two regions, and giving a boost to trans-Atlantic e-commerce. The new regulations, which require U.S. companies to comply with European rules, are expected to go into effect in June or July. Failure to comply will be considered a deceptive business practice and a prosecutable offense. U.S. companies can cooperate in one of four ways: by reporting to a data authority in Europe, by agreeing to be monitored by U.S. authorities; by joining a self-regulatory body, which will be monitored by the FTC; or by agreeing to rules set by a European panel of data privacy officials. The U.S. Commerce Department will keep a list of industry self-regulators and will provide oversight to ensure they comply with privacy rules. (Bloomberg/CNet 14 Mar 2000)

NewsScan

U.S. WEB SITES FALL SHORT OF GLOBAL PRIVACY STANDARDS
A survey of 75 U.S. corporate Web sites found that none were in compliance with a set of international privacy guidelines developed by the U.S. and the European Union last year. The guidelines require companies to: notify consumers how their personal data is used; use the information only for its stated purpose; allow consumers to examine and correct data collected about them; give consumers an option to forbid sharing that data for marketing purposes; store the data in a secure manner; and provide recourse for consumers whose privacy has been violated. The survey, conducted by Andersen, found that travel and leisure companies scored the best on notice and security provisions, while financial services firms were most likely to offer adequate choice. U.S. companies must make progress on revamping their Web privacy standards or "Disruption to the conduct of business is a real risk," says Andersen principal Kerry Shackelford. (Reuters 16 Aug 2001)

2003-02-12 **European cybersecurity agency proposal cope cyber crime co-ordination**

NIPC/DHS

February 10, IDG News Service — European cybersecurity agency proposed.

The European Commission Monday proposed the creation of a Europe-wide network and information security agency. The European Network and Information Security Agency is to serve as an advice center for the fifteen member states on matters relating to cybersecurity, such as computer viruses, Erkki Liikanen, commissioner for the information society, said. Until now, viruses have largely been propagated by young individuals and amateurs, but in the post-September 11 era there is a risk of worse attacks, he said. Mobile Internet connections, through mobile phones in particular, are expected to increase the risk of serious attacks, Liikanen said. The Commission has earmarked a ï¿½24.3 million ($26.3 million) budget for the agency over a five-year period, with an additional $9 million planned to include the 10 new member states, mainly from Central Europe, in May 2004. Individual member states have already established crisis units (known as Computer Emergency Response Teams) in an effort to cope with increasing cyber crime. However, the current system lacks central coordination. The agency is due to start operating next January. The governments of the 15 member states will decide on a location later this year, Liikanen said.

NewsScan

BATTLE IS BREWING OVER NET MANAGEMENT
Two camps with opposing views on Internet management are emerging, setting the stage for discord at the upcoming UN-backed World Summit on the Information Society in December. "Some governments are arguing that the management of things like (Internet protocol) addressing, global domain names and privacy should be done by an intergovernmental organization because the feel the Internet is a public resource, and they have responsibility over public resources," says Mohammed Sharil, chairman of the government advisory committee for ICANN (the Internet Corporation for Assigned Names and Numbers). "Then there are some governments who feel that the Internet should be managed by an international body. International by definition means everyone is involved, from governments to private sector and civil society. Whereas intergovernmental gives an indication that only governments are involved and not necessarily people." Sharil says many countries in the Asia-Pacific region prefer an independent international managing body, whereas some in Europe and the Middle East favor an intergovernmental organization. The issue is currently under debate as the wording of a key article to be adopted at the summit is hammered out. "Positions are shifting all the time," says Sharil, who adds that ICANN will not take a position on the subject. (Reuters/CNet 16 Sep 2003)

December 07, — Cybercops and robbers growing trickier on World Wide Web.

When the World Summit on the Information Society convenes in Geneva, Switzerland, December 10 to 12, leaders will seek to build on their success in developing better cross-border guidelines to fight online crime. Investigators say organized crime rings and terror groups are using the Internet to expand their reach and exploit the Web's anonymity to stay one step ahead of the law. Internet experts are particularly concerned about the potential for "cyber terrorism" in which the Internet is used to shut down computer networks, potentially disabling vital infrastructure at banks, airports and emergency services. "It is not at all unusual for a regional conflict to have a cyber dimension, where the battles are fought by self-appointed hackers operating under their own rules of engagement," said Dorothy Denning, a cyber terrorism expert at the Naval Postgraduate School in Monterey, CA. "A rash of cyber attacks have accompanied the conflict between Israel and the Palestinians, the conflict over Kashmir, and the Kosovo conflict, among others." Denning said that for now, at least, studies indicated that anything more than irritating cyber attacks were still difficult for most extremists to mount — although the future could hold more technically savvy terrorists.

2004-02-02 **Federal Trade Commission FTC server secure e-mail open proxy spam relay routing**

DHS IAIP Daily; http://www.ftc.gov/opa/2004/01/opsecure.htm

February 02, Federal Trade Commission — FTC and international agencies announce "Operation Secure Your Server".

The United States Federal Trade Commission (FTC) and 36 agencies in 26 countries announced "Operation Secure Your Server " on Thursday, January 29, an international effort to reduce the flow of unsolicited commercial e-mail by urging organizations to close "open relays" and "open proxies." As part of the initiative, the participating agencies have identified tens of thousands of owners or operators of potentially open relay or open proxy servers around the world, and the agencies are sending letters urging the owners and operators to protect themselves from becoming unwitting sources of spam. Open relays and open proxies are servers that allow any computer in the world to "bounce" or route e-mail through servers of other organizations, thereby disguising the real origin of the e-mail. Spammers often abuse these servers to flood the Internet with unwanted e-mail. Their abuses not only overload servers, but also could damage an unwitting business' reputation if it appears that the business sent the spam. The FTC and 10 agencies in Albania, Argentina, Australia, Canada, Brazil, Bulgaria, Canada, Chile, Colombia, Denmark, Ecuador, Finland, Hungary, Jamaica, Japan, Lithuania, Norway, Panama, Peru, Romania, Serbia, Singapore, South Korea, Switzerland, Taiwan, and the United Kingdom are sponsoring this initiative.

RUSSIA CALLS FOR UNITY TO FIGHT INTERNET CRIME.

The world should unite against online criminals because they could cause as much harm as deadly weapons, Russia's interior minister said on Wednesday, April 19. Russian hackers are notorious, and the country is often identified as a center for extortion from Internet bookmakers, banks and other businesses. Several damaging viruses are believed to have originated in Russia. Interior Minister Rashid Nurgaliyev said the frequency of such attacks was increasing, with potentially catastrophic consequences.

EDUPAGE

EUROPEAN PRIVACY RULES WILL CHALLENGE U.S. PRACTICES
The European Union Data Protection Directive, which takes effect October 1998, will force U.S. companies doing business in Europe to change the way they handle routine data collection procedures. For instance, companies will need to get consent from their European employees before including them in corporate e-mail or phone directories, and in extreme cases, it may become illegal to carry a laptop computer containing a database with personal information on Europeans to the U.S. or other countries that are deemed to lack "adequate" guarantees of privacy protection. The directive mandates that any personal data obtained by a company may be used only for the purposes for which it was collected unless consent is granted by the consumer for broader usage. If the data is misused in any way, governments will be able to seek injunctions, fines, and even criminal sanctions, and the individuals affected may sue for damages. (CIO Enterprise 15 Feb 98

EDUPAGE

EUROPE, U.S. CLASH OVER INTERNET PRIVACY ISSUES
Disagreement between European and U.S. government officials over how online consumers divulge information about themselves and how that information is used has led to a stalemate over technical standards now under consideration by the World Wide Web Consortium. The Privacy Preferences Project (P3P) and the Open Profiling Standard (OPS) both enable computer users to determine how much personal information they are willing to make available to Web sites, but are not stringent enough in their controls to comply with the European Privacy Directive, which restricts the ability of businesses to collect information from individuals without their permission. A European Union technical committee issued a draft opinion June 16 criticizing the technologies, and saying that "a technical platform for privacy protection will not in itself be sufficient to protect privacy on the Web." The EU is pushing for a new set of laws protecting privacy and worries that if either standard is adopted, it will mislead European companies and individuals into thinking that they have adequate privacy protection on the Web. 2000-04-14 **data privacy legislation government regulation international EC European Common EU European Union**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB955657595353654 5.htm

The latest European Union data privacy legislation is in the process of being ratified, and will change the way that companies doing business in Europe collect information on their customers. At issue is the EU's opt-in principle, which requires that each customer give permission for personal data to be shared — in contrast, the U.S. relies on an opt-out policy, which means personal information can be gathered and passed on unless specifically prohibited by a customer. " Before, processing was authorized unless forbidden," says a lawyer for Belgium's Sabena Airlines. "Now it will be forbidden unless authorized." The EU law also gives individuals the right to correct inaccurate data, to delete any information to which they object, and to collect damages for suffering caused by illegal data processing. A number of U.S. companies are objecting to the new law, saying that little consideration was given to the cost of compliance or the technological feasibility of implementing EU privacy standards. (Wall Street Journal 14 Apr 2000)

[In May,] The European Union . . . passed a landmark e-commerce directive that it hopes will streamline member country decision-making and pave the way for agreement on further initiatives, including ones on copyright, online financial services, and revision of the Brussels convention on contractual law. The new directive spells out rules governing electronic contracts, the information an online merchant must give a customer, what e-mail ads must disclose about the sender, discounts and other promotions, as well as the limits on the liability of intermediaries for unlawful material on their Web sites. Analysts predict that the European e-commerce market will top US$300 billion by 2003, out of a world total of US$1.25 trillion. "If we hesitate too long, we will never be able to make up the digital divide, notably with the U.S.," says Frits Bolkestein, internal market commissioner. "Member states need to follow up their words with concrete measures to facilitate the growth of e-commerce." (Financial Times 5 May 2000)

NewsScan

EU PROPOSES NEW DIGITAL COPYRIGHT LAWS
Ministers from the 15 European Union member nations adopted a copyright directive yesterday aimed at updating copyright laws for the digital age. Member nations now have 18 months to ratify and implement the new regulations, which, according to the EC, will provide a "secure environment for cross-border trade in copyright protected goods and services, and will facilitate the development of electronic commerce in the field of new and multimedia products and services." Under the proposed law, online swapping of copyrighted music files for free would be outlawed, but consumers would be allowed to make a limited number of copies for private use. The EU directive is comparable to the 1998 U.S. Digital Millennium Copyright Act, but differs in that it does not provide for "fair use" of copyrighted material for the purposes of scholarship and research. In contrast, the EU doctrine includes a laundry list of optional exceptions that allow copying for technical reasons, personal use and archival purposes. Member states may make their own decisions as to which exceptions to adopt. (E-Commerce Times 10 Apr 2001)

EUROPEANS DEBATE PRIVACY RIGHTS ON THE INTERNET [30 Nov 2001]
Two different institutions, the European Parliament and the Council of Ministries, are in disagreement over a proposed Europe-wide law requiring Internet service providers to extend the length of the time customer "traffic data" be kept available for use in investigations by law enforcement officials. The Council's pro-law-enforcement position has hardened since the terrorist attacks of September 11, but the European Parliament is resisting changes that would make it easier for authorities to gain access to personal data. Erkki Liikanen, the Finnish commissioner who has the job of revising Europe's data-protection laws for the digital age, says: "We must look at the world differently after September 11. We must be careful to ensure that law enforcement officials do have the powers they need, but I believe it is possible to reach a balance between this and citizens' rights to privacy." GROUP WARNS OF EU SURVEILLANCE
Statewatch, a U.K. group dedicated to protecting civil liberties on the Internet, is warning that European governments are planning changes to the 1997 EU Directive on privacy in telecommunications that would require phone companies, mobile network operators and ISPs to store details of their customers' Web use, e-mails and phone calls for between one to two years. Current law states that traffic data may be retained for billing purposes only and then must be deleted. "EU governments claimed that changes to 1997 EC Directive on privacy in telecommunications to allow for data retention and access by the law enforcement agencies would not be binding on member states -- each national parliament would have to decide. Now we know that all along they were intending to make it binding, compulsory across Europe," says Tony Bunyan, editor of Statewatch. The changes may include the provision that police would need a judicial order before accessing traffic data, but Statewatch warns that such conditions have been sidestepped before. TOUGH EU PRIVACY RULES INFLUENCE U.S. WEB PRACTICES
Europe's strict approach to consumer data protection is forcing many U.S.-based companies to follow suit in order to continue serving their European customers. "Europeans are extremely concerned about the use of data about people," says Rockwell Schnabel, the U.S. ambassador to the European Union. "The data privacy issue is a huge issue over there. American partners have to live with those rules, and they can't do with it what they can with American data." A case in point is Microsoft's Passport online ID service that enables users to log in once and then move from one secure Web site to another. Consumer and privacy groups had accused Microsoft of not taking adequate steps to protect consumers' personal information and in a settlement earlier this month, Microsoft admitted no wrongdoing, but agreed to government oversight of its consumer privacy policies for the next 20 years. A separate Passport investigation by the EU is still pending. "The EU directive raised the bar on the practices by U.S. companies for U.S. consumers," says Marc Rotenberg, head of the Electronic Privacy Information Center. "Passport is a good example of that, because Microsoft is very much aware that its products are going to have to meet EU privacy standards." EU standards specify that data may be collected only for "specified, explicit and legitimate purposes, and to be held only if it is relevant, accurate and up to date." Citizens may access any data about themselves, find out its source, correct inaccuracies, and pursue legal recourse for misuse. (San Jose Mercury News 29 Aug 2002)

UK DATA PROTECTION LAWS AND THE LAW OF UNINTENDED CONSEQUENCES

Contributor Richard Pennington notes two cases of loss of life resulting from misunderstanding and misapplication of the UK Data Protection Act. In the first case, a school in Cambridgeshire hired an applicant from Humberside for a janitor's job. Background checks with Humberside police had shown the applicant to be 'clean'. Later, this new janitor murdered two schoolchildren. An inquiry showed that the janitor had been investigated in Humberside for indecent assualt. Humberside police stated that they were forced by the UK Data Protection Act to destroy the suspect's records when "investations ended without a trial." So, the suspect's history was not circulated in Humerside, and never reached Cambridgeshire. In the second case, in August 2003, British Gas stopped supplying an elderly couple gas due to bill nonpayment. This couple was discovered to have perished from hypothermia during the winter. British Gas cited the UK Data Protection Act for not contacting local Social Services because "they did not have the written permission of the couple to disclose their financial records." In a follow-up article, the same contributor noted that, at that time, the Data Protection Registrar had been renamed the Information Commissioner. In another follow-up article, contributor Dave Harris, referring to the first case above, said that the killer Ian Huntley had not actually worked at the school where the two children were murdered. Huntley had come "into contact with them through his girlfriend (who did work at their school)."

2005-09-15 **Holland Netherlands Dutch Ministry of Health citizen tracking permanent government agencies**

EDUPAGE; http://www.wired.com/news/privacy/0,1848,68866,00.html

DUTCH TO TRACK ALL CITIZENS, FOREVER

Beginning in 2007, the Dutch Ministry of Health will begin tracking all citizens of the country in a single database from their births to their deaths. Each person will be added to the database at birth, with health and family information included. As people in the database age, information from schools, doctors, and the police will be added. In an effort to protect privacy, no individual will be permitted to see any person's complete file. Various governmental agencies, however, will be able to add "red flags" to a file if they notice something that might be cause for concern, according to Jan Brouwer, spokesperson for the Health Ministry. Brouwer suggested that someone at child protection services might find that for an individual, red flags had been added by the police, the school, and a doctor, which would likely indicate a problem that should be addressed. Truancy is often correlated with criminality, for example, and the new database will allow tracking such patterns. Wired News, 15 September 2005

2005-09-26 **Europe EU data retention plans criticism terrorism anti-terrorism Convention on Human rights civil liberties Internet phone logging**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/12746814.htm

EU DATA-RETENTION PLANS DRAW CRITICISM

Peter Hustinx, data protection supervisor for the European Union (EU), has voiced his criticism of two antiterrorism proposals for their stance on data retention. Neither the proposal by the European Commission nor one drafted by EU governments makes a compelling case for holding on to sensitive data as part of antiterrorism efforts, said Hustinx. The EU proposal, he noted, would allow for the retention of information such as times of phone calls for up to three years. Hustinx said that any measures put forth should comply with the European Convention on Human Rights. Those that do not are "not just unacceptable but illegal." The chair of the EU negotiations, British Home Secretary Charles Clarke, is urging European governments to forgo some measure of civil liberties in return for broader authority for law enforcement to investigate suspected terrorists. EUROPE URGED TO IMPROVE WEB SECURITY.

Europe must work harder to make the Internet more secure as the nature of online threats becomes increasingly criminal across the 25-nation bloc, a senior EU official warned Thursday, February 9. "We are still far from achieving the goal of secure and reliable networks that protect confidential and reliable information," said Viviane Reding, the EU's media commissioner, at a conference on trust in the Internet. Almost 80 percent of EU citizens are concerned about Internet security and half do not engage in electronic commerce because they worry about having their personal financial data stolen on the Web, she said. Speaking via video link from Brussels, Reding stressed the importance of international cooperation in promoting user trust in the Web and said she would soon announce a "strategy for enhanced security."

Network Week (UK)

According to an article by Alex Straunik in Network Week in December, the UK Cyber Rights & Cyber Liberties association "called on Internet users to demand clear answers from their service providers as to what privacy policies they had in place and what co-operation they had agreed to with the Association of Chief Police Officers in Britain." The Secretary General of the Internet Service Providers Association (ISPA), Nicholas Lansman, reportedly told the ISPA members to ignore the letter, but others in ISPA said they would respond. The problem identified by the privacy advocates was rooted in British laws allowing police to obtain detailed information about telephone and ISP subscribers without a court-issued warrant. However, wire-tapping or surveillance of e-mail still required a warrant.

1999-03-03 **privacy wireless communications eavesdropping law**

EDUPAGE; tele.com

CONGRESS EXTENDS PRIVACY PROTECTION TO DIGITAL WIRELESS
The U.S. House of Representatives last week passed The Wireless Privacy Enhancement Act of 1999, which extends the privacy protection afforded to analog wireless devices to digital ones. The bill, which passed on a vote of 403 to 3, closes some loopholes in an earlier Privacy Act, which excluded digital technology. It also cracks down on eavesdropping on a cellular phone call, stipulating punitive measures such as fines, warnings, and possible imprisonment for such actions. In addition, the bill requires the Federal Communications Commission to ban scanners that can intercept cellular and digital calls and asks the FCC to evaluate the idea of requiring warning labels to be placed on such scanning receivers. 1999-04-08 **privacy legislation bill proposal US law regulation**

PC WORLD DAILY

In April, Congressional Rep. Ed Markey (D—MA) announced his bill to establish a national privacy policy, bringing the US up at last with nations around the world who established such policies — and Privacy Commissioners or Privacy Ombudsmen — years ago. Writing in _PC WORLD DAILY_, Niala Boodhoo summarized the issues as follows: "The proposed policy boils down to three basic principles: the individual's right to know what personal information is being gathered; the right to know whether gathered information may be used for other purposes; and the right to refuse to provide information."

1999-05-04 **privacy proposal bill Administration fraud banking transactions sharing**

Washington Post http://www.washingtonpost.com/wp-srv/business/daily/may99/privacy4.htm

PRIVACY PROPOSAL
A Clinton Administration proposal to protect individual financial and medical records includes a request for more than $5 million to fund an increase in online surveillance and to train law enforcement officials in ways to combat security fraud. Congressman Jay Inslee (D-Wash.) explained the problem to his colleagues by writing: "Do you believe your banking transaction experiences are private? You may be surprised to learn that with certain exceptions, financial institutions may legally share all of the information about you and your bank account activity with affiliated businesses or even third parties." (Washington Post 4 May 99)
http://www.washingtonpost.com/wp-srv/business/daily/may99/privacy4.htm

WHITE HOUSE TARGETS ONLINE TRADING FRAUD
The Clinton administration has pledged to crack down on fraudulent Internet stock trading, with Securities and Exchange Commission Chairman Arthur Levitt announcing plans to double the number of SEC Cyberforce attorneys to 250 in the coming year. He also plans to ask for a "significant" increase in funding for the agency's fraud unit in next year's budget. More than 7 million Americans now trade stocks online, and their trades make up 25% of all trades made by individual investors. (Financial Times 5 May 99)

1999-10-07 **online privacy seals certification complaints investigation Web**

ZDNet

FTC WILL BACK ONLINE PRIVACY GROUPS
The FTC announced at Internet World that it will take the consumer complaints it receives from online privacy seal groups and send them directly to investigators, bypassing the normal channels of complaint. The new policy will give stronger support to third-party privacy seals and will help ensure compliance with privacy policies, according to David Medine, associate director for financial practices at the FTC's bureau of consumer protection. Still, Medine questioned whether companies are "doing the right thing" in terms of protecting user privacy. Former FTC Commissioner Christine Varney was among the participants in an online privacy panel. The panelists called on businesses to spell out their privacy policies, give users greater control over their data, and provide Web site visitors with a plan of recourse to resolve privacy violations. Varney says Congress is unlikely to pass wide-ranging privacy laws any time soon. "Without a specific catastrophe, I'd say it's unlikely you'll see specific broad-based privacy legislation." (ZDNet 10/07/99)

FTC ACCUSED OF WITHHOLDING PRIVACY DATA
The Electronic Privacy Information Center, a nonprofit that favors stiff privacy laws, has filed a lawsuit against the Federal Trade Commission in an effort to win the release of hundreds of consumer complaints about possible privacy violations. The center's director, Marc Rotenberg, says the group will analyze the records to test how thorough the FTC has been in enforcing consumer privacy complaints. Rotenberg says he expects to find that the FTC has been negligent in effectively dealing with thousands of privacy complaints. The Electronic Privacy Information Center asked for the records June 10, but the FTC failed to respond in a timely manner, according to Rotenberg. The FTC disputes Rotenberg's assessment of the situation. "All of the complaints we get are either responded to by staff members or forwarded to the appropriate people," says the FTC's Victoria Streitfeld. The FTC must first ensure that it strips away data that could be used to identify users before releasing the complaints, Streitfeld says. (Los Angeles Times 10/13/99)

1999-10-21 **children privacy parental approval authorization data collection Web**

New York Times

NEW PRIVACY RULES FOR CHILDREN'S WEB SITES
Privacy advocates are giving high marks to the FTC for passing new rules governing Web sites' collection of personal information from children. The FTC voted 4-0 to implement the rules, which complement the Children's Online Privacy Protection Act and will become effective in April. All Web sites must receive "verifiable parental consent" before collecting personal data from children, according to terms of the law. The FTC rules define parental consent on a "sliding scale" that permits Web sites to use postal mail, fax, credit card, or digital signatures to get consent when children will be using chat rooms or parting with personal data that will be made available to affiliates. The rules also state that an e-mail from parents, and a follow up confirmation by the online company, is sufficient enough consent to collect data from children — so long as that data is only used internally. 2000-01-13 **privacy government states driving license personal data sale**

Edupage, Washington Post, EPIC Alert 7 01

The Supreme Court of the United States upheld the 1994 Drivers' Privacy Protection Act and refused to allow states to sell drivers' personal information without permission. Several states had opposed the Act because their bureaucrats and politicians saw the sale of drivers' information as a lucrative source of revenue for their governments. Edupage editors wrote, "Privacy and civil liberties advocates reacted with joy yesterday after the Supreme Court decided to uphold the 1994 Driver's Privacy Protection Act, which bars states from selling drivers' personal data without their knowledge. The ruling came as some surprise, as recent court decisions have favored states' authority over such laws. The ruling could establish a precedent that encourages federal lawmakers to pass laws restraining the widespread dissemination of personal data over the Internet, privacy advocates and members of the direct-marketing industry said. In making its decision, the Supreme Court reversed the ruling of the U.S. Court of Appeals for the 4th Circuit, which found the law unconstitutional because it forced states to enforce a federal regulation. The Supreme Court ruled differently, stating that the law `does not require state officials to assist in the enforcement of federal statutes regulating private individuals.' "

INTERNET PRIVACY
Sen. Ernest Hollings (D-S.C.) has introduced an online privacy bill that would require companies to obtain explicit permission from people before collecting and sharing their personal information. The Online Personal Privacy Act reflects some components of the recently ratified European Union privacy directive, requiring that individuals "opt-in" to any collection, use or disclosure of "sensitive information." Sensitive information is defined as relating to any financial, medical, ethnic or religious affiliation, sexual orientation or political data. In addition, the bill would require businesses to provide an "opt-out" option when collecting nonsensitive information, such as that related to online clothing purchases. "Privacy fears are stifling the development and expansion of the Internet as an engine of economic growth," says Hollings. (CNet News.com 18 Apr 2002)

PoliTech, http://www.aclu.org/news/2002/n061202a.html

An ACLU press release began as follows in June 2002:

NEW YORK--The American Civil Liberties Union today congratulated the people of North Dakota for defending their privacy by rejecting a ballot measure that would have allowed banks to share customers' information without their permission. "This vote was a stunning defeat for the powerful financial companies who were trying to bamboozle the citizens of North Dakota into acting against their own interests," said Jennifer Ring, Executive Director of the ACLU of the Dakotas. ...

"The results in North Dakota are significant not just in that state but nationally," said Barry Steinhardt, Director of the ACLU's Technology and Liberty Program. "If the voters in a small midwestern state vote for privacy by more than a three-to-one margin despite an intense media campaign urging them not to, then politicians in Washington and Sacramento and Albany ought to be listening."

"The pro-privacy campaign was waged by a group of citizen-volunteers led by Charlene Nelson, a homemaker and mother of three working out of her home in Casselton. Until a last-minute $25,000 contribution by the ACLU for radio ads, the privacy forces had reported donations of just $2,450."

EDUPAGE

CAMPUS E-MAIL EXPOSED TO PUBLIC SCRUTINY

Many states identify administrators and professors at public colleges as state employees, potentially exposing their letters, documents, and e-mail to public scrutiny under freedom-of-information laws. Some institutions have begun to update policies to safeguard personal e-mail or warn professors to be careful what they write. Open-records laws don't specify clearly whether professors' research notes, lecture notes, or regular mail would qualify as public records, but most states assume that state employees' e-mail messages are public records, even when the law is ambiguous. Employees at private colleges can be exposed as well, although not through open-records laws; a person would need to obtain a court order or a subpoena, requiring involvement in litigation against the college. CALIFORNIA GETS NEW PRIVACY LAW

California has just passed privacy legislation aimed at preventing banks, insurance companies and other institutions from sharing their personal information, and Gov. Gray Davis said: "Most Californians are stunned to learn that financial corporations trade their names for money. That is wrong, and when I sign this bill, that practice will stop." The law will require permission from a customer before financial institutions share any information on that customer with an unaffiliated company or an affiliated firm in a different line of business. SPEECH, PRIVACY, AND DO-NOT-CALL: 'I WANT TO BE ALONE'
Privacy and free speech are conflicting values in the current controversy over "Do Not Call" legislation aimed at curtailer commercial telemarketing calls (while continuing to allow calls made for political or philanthropic purposes). David Sobel, general counsel for the Electronic Privacy Information Center, says: "The telemarketers have some First Amendment rights to disseminate information. But the consumer also has some rights to control unwanted information coming into the home." Telemarketers argue that their own free-speech rights are being violated by the FTC's attempt to establish a Do-Not-Call list, and UCLA law professor Eugene Volokh explains: "When it comes to residential privacy, the Supreme Court has suggested that content-based discrimination is illegal. The FTC is setting up content-based discrimination." Some legal experts think the government could legally expand the registry to all telemarketers, with a registry that just says, like Greta Garbo, "I want to be alone." Attorney Bruce Johnson, an expert in First Amendment law, says: "I don't think it's restricting political or religious speech. The registry just says that I don't want to hear from anybody." NewsBits; http://news.com.com/2100-1028_3-5137488.html

Treasury breaks word on e-mail anonymity

The U.S. Treasury Department plans to publish nearly 10,000 e-mail addresses on the Web, violating its privacy promise to Americans who used e-mail to comment on a government proceeding. In March 2003, the Treasury Department's Alcohol and Tobacco Tax and Trade Bureau (TTB) asked for e-mail comments about a proposal that could raise the price of malt beverages like Bacardi Breezer and Smirnoff Ice. At the time, the department said that the text of comments would be made public--but assured people that e-mail addresses, home addresses and other personal information of individuals would be removed first.

PANEL URGES MORE PRIVACY PROTECTIONS IN FEDERAL 'DATA-MINING'

The Technology and Privacy Advisory Committee, a panel created by U.S. Defense Secretary Donald Rumsfeld to scrutinize Pentagon programs in the wake of criticism over the ill-fated "Total/Terrorism Information Awareness" program, is urging Congress to pass laws protecting citizens' civil liberties from overly intrusive federal data mining activities. "The Department of Defense should safeguard the privacy of U.S. persons when using data mining to fight terrorism," says the panel's report, which notes that privacy laws lag far behind current capabilities in information and communications technology. A key recommendation suggests federal agencies should be required to obtain approval from a special federal court "before engaging in data mining with personally identifiable information concerning U.S. persons." Former FCC Chairman Newton Minow, who headed up the panel, acknowledges that the proposals would "impose additional burdens on government officials," but maintains that the requirements would improve national security while enhancing personal privacy: "Good privacy protection in the context of data mining is often consistent with more efficient investigation." COURT RULES E-MAIL EAVESDROPPING OKAY

In a surprise decision, a federal appeals court has ruled that it was acceptable for a company that offered e-mail service to peruse messages sent by its subscribers. The case stems from 1998 when it was discovered that Interloc, a now-defunct literary clearinghouse, surreptitiously copied messages sent to its subscribers by rival Amazon in order to "develop a list of books, learn about competitors and attain a commercial advantage." An Interloc executive was later indicted on an illegal wiretapping charge, but yesterday's ruling upheld a federal judge's dismissal of that charge on the
grounds that the e-mails were copied while in "electronic storage" (during the process of being routed through a network of servers to recipients). The Wiretap Act prohibits unauthorized eavesdropping on messages that are not stored -- such as a real-time telephone conversation -- but does not afford the same protection to stored messages. In a dissenting opinion, Appeals Court Judge Kermit Lipez wrote that the ruling unravels "decades of practice and precedent regarding the scope of the Wiretap Act" and essentially renders the act "irrelevant to the protection of wire and electronic privacy." In a concurring statement, the Electronic Frontier Foundation said that yesterday's ruling "dealt a grave blow to the privacy of Internet communications." (AP 30 Jun 2004)

2004-08-28 **Federal Communications Commission FCC telephone outage information kept private**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A40329−2004Aug 27.html

August 28, Washington Post — FCC cuts public line to phone outage data.

The Federal Communications Commission (FCC), citing concerns about national security, has abandoned a 10-year-old policy and will no longer give the public access to information about past telephone network outages. The decision has angered consumer advocates and some state regulators who say the data are a critical tool in evaluating phone service reliability around the country. Large companies use the information to make decisions about where they build their own networks and to plan for key facilities such as data centers. While the FCC limited the amount of information it is making public, it has expanded the amount of information it collects from the wireless and satellite industries. Under the new rules, wired, mobile and satellite carriers must report an outage that affects 900,000 user minutes or more. Although the FCC will not make the information it collects about the outages public, the companies are free to keep the public informed about outages as they are occurring.

WHAT THE WORLD NEEDS IS MORE LAWYER-BOTS

Mark Rasch, founder and former head of the U.S. Justice Department's computer crimes unit, says that the increasing trend toward lengthy, tiny-font policy "agreements" that users must click on before they can access a Web site are generating the need for more legal oversight. "Increasingly, companies have been putting some pretty nasty things into their clickwrap agreements -- such as that they can collect and sell your detailed personal information or install software that will capture your every keystroke … This is not legal boilerplate, the kind that everybody assents to when renting a car or buying a ticket to a ball game. It affects the privacy, security, and operability of all of the information you access online." Rasch says what's desperately needed is a law robot -- "a browser-based automaton that could be adjusted to match your tolerance for legal mumbo-jumbo… Once you establish privacy settings, your browser would transfer personal data (after prompting you) only to sites that conform with your privacy requirements." Rasch says such technology would go a long way toward eradicating such online nuisances as porn spam and spyware. "We will never fully automate the reading of contracts or agreements online. Nor would we want to -- after all, Internet lawyers need jobs, too. But by automating the vetting of clickwraps or implied agreements we could make everybody sleep a little easier."

WHO GETS TO DECIDE WHAT JOURNALISM IS?

A California court will soon decide whether bloggers have the same legal protections as journalists under "shield" laws that protect reporters from revealing their sources. Electronic Frontier Foundation attorney Kurt Opsahl, who represents two bloggers targeted by Apple for leaking information about new company products, maintains that if the bloggers are forced to give up their sources "the public will lose out on a vital outlet for independent news, analysis, and commentary." An opposing view is offered by University of Iowa law professor Randall Bezanson, who says that simply expressing opinions to a tiny audience isn't journalism -- because if it were "then I'm a journalist when I write a letter to my mother reporting on what I'm doing. I don't think the free-press clause [of the U.S. Constitution] was intended to extend its protections to letters to mothers from sons." (USA Today 2 Feb 2005)

NewsScan; http://www.usatoday.com/tech/news/2005-02-08-video-voyeur_x.htm

VIDEO VOYEURS

Prosecutors across the country have been finding that loopholes in state laws make it difficult to convict individuals who shoot voyeuristic "upskirting" or "downblousing" videos of teenagers at public places like the local mall. Most states with video voyeurism laws prohibit unauthorized videotaping or photographing of people who are in private areas, such as dressing rooms, or in situations where they have "a reasonable expectation of privacy" -- but public places pose a different problem. One Virginia state delegate says, "It's certainly immoral, it's certainly wrong, but under the code, it's just not a written offense. We're trying to tighten the code so some pervert isn't able to do that." But attorney Lawrence Walters counters: "Certainly it's a good idea to stop perverts from filming down women's blouses or up little girls' skirts. But we have to step back as a society once we get past that visceral reaction and think this through." Mary Lou Leary of the National Center for Victims of Crime suggests that the problem is the public's diminished expectation of a right to privacy: "We're used to the notion that if you're in a public place, you can take pictures and you can be photographed." NewsScan; http://news.com.com/Court+Wife+broke+law+with+spyware/2100-1030_3-5577979.html

WIFE BROKE LAW IN USING SPYWARE

A Florida appeals court has ruled that a suspicious wife, who installed spyware on her husband's computer to secretly monitor and record his electronic interactions with another woman, violated Florida's wiretapping law. The law says anyone who "intentionally intercepts" any "electronic communication" commits a criminal act. The wife had argued that her use of Spector spyware should be viewed as similar to reading a stored file on her husband's computer. But Judge Donald Grincewicz wrote that "because the spyware installed by the wife intercepted the electronic communication contemporaneously with transmission, copied it and routed the copy to a file in the computer's hard drive, the electronic communications were intercepted in violation of the Florida Act." 2005-03-15 **privacy concerns data information disclosure identity ID theft Social Security Number use restrictions lawmakers laws**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7911154

U.S. CONSIDERS RESTRICTIONS ON SOCIAL SECURITY NUMBERS

Following recent incidents that exposed personal information on more than 175,000 individuals, U.S. lawmakers are considering placing new restrictions on companies that gather and sell such information. Relatively few regulations apply to companies such as ChoicePoint and LexisNexis that collect data about driving records, financial records, and other sensitive information. Social Security numbers appear to be at the crux of the issue: because they are unique, data companies rely on Social Security numbers to distinguish individuals, but the numbers are also a powerful weapon in the hands of identity thieves, who can use them to access confidential records, open new accounts, and wreak havoc with a person's privacy. At separate hearings in the House and the Senate, legislators discussed laws that would require data companies to notify any individual before they sell that person's Social Security number. Other suggestions included requiring disclosure of any incident that exposes sensitive information. Don McGuffey, vice president of ChoicePoint, which recently sold 145,000 records to identity thieves, told a Senate hearing that personal information had been compromised by his company in "a handful" of other incidents that were not made public. EDUPAGE; http://www.pcworld.com/news/article/0,aid,120168,00.asp

FEDS ORDER BANKS TO DISCLOSE BREACHES

Four federal agencies have released regulations requiring banks and other financial institutions to notify customers when a security breach presents a risk that their personal information may be misused. The Federal Reserve, the Federal Deposit Insurance Corporation, the Office of the Comptroller of the Currency, and the Office of Thrift Supervision deliberated for 18 months on how federal legislation, including the Fair and Accurate Credit Transactions (FACT) Act, should be interpreted. The resulting "guidance" stipulates that when personal information is accessed without authorization and misuse of that information has occurred or is reasonably possible, institutions must notify affected customers "as soon as possible." In all cases, even those that do not meet the standard set for notifying customers, institutions must notify their primary federal regulators of the breach. Delays in notifying customers are permissible if such notification is determined to jeopardize an investigation into the breach. PCWorld, 24 March 2005

EDUPAGE; http://chronicle.com/prm/daily/2005/04/2005042901t.htm

HEARINGS FOCUS ON LIBRARY PROVISIONS OF USA PATRIOT ACT

Amid both House and Senate hearings on whether to renew certain portions of the USA PATRIOT Act, supporters and critics of Section 215, which authorizes law enforcement to obtain records from libraries and other institutions, have lined up to voice their opinions. Section 215 allows gaining access to various types of records with only the approval of a secret court. Further, those whose information has been collected are barred from disclosing that fact, even to attorneys. Representatives of the American Civil Liberties Union (ACLU), which has been highly critical of the legislation, said they could support its renewal if several concessions were made, including limiting the authority to investigate only "agent[s] of a foreign power" and eliminating the gag order for those under investigation. Groups including the American Library Association said they supported the ACLU's recommendations. Rep. Howard Coble (R-N.C.) defended the law as it stands, saying there has been much "misinformation" about Section 215 and how it has been used. Kenneth L. Wainstein, U.S. attorney for the District of Columbia, said that the law has not been used to obtain records from libraries, though he acknowledged that it could be used that way in the future. EDUPAGE; http://www.wired.com/news/privacy/0,1848,67880,00.html

HOUSE VOTES TO LIMIT PATRIOT ACT

The U.S. House of Representatives has voted 238-187 to impose limits on the powers of the U.S.A.P.A.T.R.I.O.T. Act. Sponsored by Rep. Bernard Sanders (I-Vt.), the measure would eliminate federal authority granted by the U.S.A.P.A.T.R.I.O.T. Act to compel libraries and bookstores to disclose information about books their patrons have checked out or bought, without first obtaining a search warrant; the measure would preserve the right for government officials to obtain Internet search records from libraries.
Although Attorney General Alberto Gonzales recently told Congress that federal authorities have never invoked the power, a number of libraries have begun deleting patron records to preempt the possibility of having to turn them over. Sanders called the vote "a tremendous victory that restores important constitutional rights to the American people." Rep. Tom Feeney (R-Fla.) defended the powers, saying that federal authorities need tools to help them identify planned terrorist activities and prevent attacks before they happen. The measure has not been introduced by the Senate, and President Bush has promised to veto the bill if it passes. Wired News, 15 June 2005

2005-07-15 **GAO Information Security rely tampering disruptions operations fraud disclosure account FISMA GAO**

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−05−552

INFORMATION SECURITY: WEAKNESSES PERSIST AT FEDERAL AGENCIES DESPITE PROGRESS MADE IN IMPLEMENTING RELATED STATUTORY REQUIREMENTS (REPORT)

Federal agencies rely extensively on computerized information systems and electronic data to carry out their missions. The security of these systems and data is essential to prevent data tampering, disruptions in critical operations, fraud, and inappropriate disclosure of sensitive information. Concerned with accounts of attacks on systems via the Internet and reports of significant weaknesses in federal computer systems that make them vulnerable to attack, Congress passed the Federal Information Security Management Act (FISMA) in 2002. In accordance with FISMA requirements that the Comptroller General report periodically to the Congress, GAO's objectives in this report are to evaluate (1) the adequacy and effectiveness of agencies' information security policies and practices and (2) the federal government's implementation of FISMA requirements. GAO recommends that the Director of the Office of Management and Budget (OMB) implement improvements in the annual FISMA reporting guidance. In commenting on a draft of this report, OMB agreed with GAO's overall assessment of information security at agencies but disagreed with aspects of our recommendations to enhance its FISMA reporting guidance.

EDUPAGE; http://news.com.com/2100-7348_3-5808894.html

CONGRESS GETS SERIOUS ABOUT DATA PRIVACY

Ahead of its August recess, Congress moved data-security measures to the top of its agenda, with various House and Senate committees considering three different bills dealing with the protection of sensitive information. The broadest legislation being considered is the Personal Data Privacy and Security Act, which would place new restrictions on how personal information may be used and imposes criminal penalties for those found to have violated it. The bill would limit the sale and publication of Social Security numbers, require notification of consumers in the event their personal data is compromised, and restrict the authority of the states in writing their own regulations for data protection. Other bills working their way through the Senate include similar requirements that consumers be notified of data breaches, but they only include civil penalties. The other measures, including one passed by the Senate Commerce Committee, place oversight and enforcement authority with the Federal Trade Commission (FTC). Critics of the proposed legislation argue that it is being rushed through without proper discussion. CNET, 28 July 2005

2005-08-26 **civil liberties privacy concerns USA PATRIOT Act government surveillance Supreme Court decision Connecticut library FBI investigation ACLU lawsuit litigation**

EDUPAGE; http://www.nytimes.com/2005/08/26/politics/26patriot.html

FBI SEEKS LIBRARY RECORDS

According to the American Civil Liberties Union (ACLU), the FBI is using one of the powers granted by the USA PATRIOT Act to demand the records of a library in Connecticut. Because the USA PATRIOT Act also forbids disclosure of details surrounding such investigations, the name of the library in question is being kept confidential, though it is known to be a member of the American Library Association. At issue is the authority to subpoena library records using something called a national security letter, which does not require a judge's approval. The ACLU has filed a federal lawsuit on behalf of the library, saying "it should not be forced to disclose such records without a showing of compelling need and approval by a judge." Anthony D. Romero, executive director of the ACLU, said, "This is a prime example of the government using its U.S.A.P.A.T.R.I.O.T. Act powers without any judicial oversight to get sensitive information on law-abiding Americans." The FBI did not comment on the lawsuit, but the agency's national security letter noted that it was seeking the library records as part of an investigation "to protect against internal terrorism or clandestine intelligence activities." NO DECISION YET FROM JUDGE ON PATRIOT ACT CASE

U.S. District Court Judge Janet C. Hall has postponed deciding whether a Connecticut library may publicly disclose its identity as the institution whose records have been sought by the FBI under the PATRIOT Act. The act forces any organization whose records have been subpoenaed to be silent about the investigation, but the library in question and the American Civil Liberties Union have filed a suit, alleging that such restrictions are unconstitutional. Hall heard arguments from both sides this week but declined to issue a ruling until she hears more from the FBI. Observers noted that Hall seemed dubious of the government's claim that identifying the library would threaten the investigation. She said the FBI must demonstrate that risk, which it so far has not done. Pointing out that controversial provisions of the PATRIOT Act are under review by Congress, Hall suggested that allowing the public to see how the law is being applied could be an important factor in deciding whether the act will be extended. EDUPAGE; http://www.fcw.com/article90869-09-21-05-Web

ITAA CALLS FOR NATIONAL DATA-BREACH NOTIFICATION LAW

The Information Technology Association of America (ITAA) has called on Congress to pass federal legislation that would specify the conditions under which companies and government agencies would be required to notify consumers regarding breaches of data security. According to Greg Garcia, vice president of information security programs and policy at the ITAA, 17 states have passed such laws, 8 of which have gone into effect. The ITAA recommends a federal law that would provide clear definitions of data breaches, identify circumstances under which notification would be required, and detail the ways in which notification must take place. Furthermore, the ITAA said a federal data-breach law should take precedence over state laws that might otherwise weaken the federal law. Both houses of Congress have taken up the topic of requiring notification, but so far only one bill, sponsored by Sen. Dianne Feinstein (D-Calif.), has been introduced. CONGRESS EXAMINES CONTROVERSIAL PORTIONS OF PATRIOT ACT

Members of a Congressional committee this week took up discussions of the USA PATRIOT Act, including two highly controversial sections of the law. Several provisions of the law are scheduled to expire this year, and the committee is charged with reconciling House and Senate proposals to extend those provisions. Expected to be the focus of the discussions are Sections 215 and 505, which greatly expand federal authority to obtain information such as phone and library records on individuals and which prevent those under investigation from revealing, even to their attorneys, that they are under investigation. Advocates for civil liberties have been pressing federal officials for details on how these key sections of the law have been applied, including a letter recently sent by five U.S. Senators to Attorney General Alberto Gonzales, demanding data on how many so-called national security letters have been issued since the PATRIOT Act was enacted. Although federal officials have revealed few specifics, supporters of the legislation argue that "vigorous oversight by congressional committees has uncovered no instances of abuse," according to Sen. Pat Roberts (R-Kans.). Rep. John Conyers (D-Mich.) noted, "The very act of surveilling citizens who aren't even suspected of wrongdoing is an abuse in itself." 2005-11-18 **privacy concerns USA PATRIOT Act extension opposition US government surveillance bill law House Senate terrorism anti-terrorism**

EDUPAGE; http://chronicle.com/daily/2005/11/2005111801t.htm

REACTION TO EXPECTED EXTENSION OF PATRIOT ACT PROVISIONS

Groups opposed to two provisions of the USA PATRIOT Act up for review expressed disappointment at a tentative plan to extend both. The proposed extension was written by a conference committee charged with reconciling House and Senate versions of a bill covering the parts of the act that will otherwise expire at the end of the year. Under the plan, the provision that allows the government to issue so-called national security letters without a judge's approval would be made permanent and would allow for criminal prosecutions of individuals who reveal that they have received such a letter. The plan does not make changes to the second section of the act at issue, the library provision, that were included in the Senate bill. Those changes included requiring the government to demonstrate a connection between terrorists and individuals whose records were sought. The Senate bill also called for another review of the library provision in four years; under the proposal, it would not be reviewed for seven years. The plan does include limited concessions. Those who receive national security letters would be allowed to discuss them with their attorneys, and the government would be required to disclose certain details about how the national security letters are used. 2005-12-06 **California law bill data security standards privacy protection state government efforts**

EDUPAGE; http://chronicle.com/daily/2005/12/2005120601t.htm

CALIFORNIA LAW SETS NEW DATA-SECURITY STANDARDS

California has passed a new data-protection law that may serve as a model for other states, despite the reaction of academic researchers, many of whom see it as an obstacle to their efforts at conducting research efficiently. The new law is intended to safeguard individuals' personal information when it is used by any research organization. Under the law, before any state agency may release personal data, the state's Committee for the Protection of Human Subjects must assess the research and determine whether it would adequately protect the requested data. Researchers seeking data from state agencies must show that the data are necessary; ensure that data are destroyed or returned when the project is completed; and, when possible, use information other than Social Security numbers as unique identifiers for subjects. Academic researchers largely object to the new law, saying it will impede some aspects of their research. Chronicle of Higher Education, 6 December 2005 (sub. req'd)

2005-12-15 **Internet policing privacy FTC act spam control foreign governments**

DHS IAIP Daily; http://news.zdnet.com/2100−9588_22−5996703.html

SENATE PANEL APPROVES MORE INTERNET-POLICING POWERS

The Federal Trade Commission (FTC) would gain expanded policing powers and could share information about spammers and other miscreants with foreign governments under a bill approved Thursday, December 15, by a U.S. Senate panel. Called the Undertaking Spam, Spyware, and Fraud Enforcement with Enforcers Beyond Borders Act of 2005, the proposal is nearly identical to legislation pushed by the FTC itself two years ago that drew concerns from civil liberties groups and was never enacted. In essence, the bill would expand existing FTC powers so that the agency could go after any "unfair or deceptive practices" that are likely to cause "foreseeable injury" on U.S. soil or involve conduct in the United States. Intended by its sponsors to help combat such menaces as spam, spyware and telemarketing fraud carried out on international turf, the bill would allow the FTC to collaborate with foreign law enforcement agencies and swap information on a reciprocal basis. Further detail on this Act can be found at: http://thomas.loc.gov/cgi-bin/bdquery/z?d109:s.01608:

SENATE PANEL PROPOSES NEW FTC POLICING POWERS

A bill approved by a U.S. Senate panel would give the Federal Trade Commission (FTC) increased policing power and the authority to share with foreign governments information about spammers and others suspected of illegal acts. Called the Undertaking Spam, Spyware, and Fraud Enforcement with Enforcers Beyond Borders Act of 2005, the proposal mimics legislation requested by the FTC two years ago that roused objections from civil liberties groups and was not enacted. Collaboration with foreign law enforcement agencies would permit the commission to address problems such as spyware and telemarketing fraud that cross national borders. It has yet to be debated by the full Senate and U.S. House of Representatives. ZDNet, 15 December 2005

DHS IAIP Daily; 23
http://news.com.com/Politicians+call+for+better+phone+record +privacy/2100−1036_3−6031916.html?tag=cd.top

POLITICIANS CALL FOR BETTER PHONE RECORD PRIVACY.

In response to disclosures about phone records being sold on the Internet, politicians want federal regulators to verify that the biggest service providers are adequately protecting their customers' information. According to a letter sent by the chairmen of the U.S. House of Representatives Energy and Commerce Committee, all telecommunications providers must "certify annually" with the Federal Communications Commission (FCC) that they are in compliance with the federal rules. The politicians asked the FCC to turn over the latest certifications from the five largest wireless and wireline providers, along with statements from the companies describing "how their internal procedures protect the confidentiality of consumer information." Citing their ongoing investigation about the matter, the legislators imposed a Monday, January 30, deadline. The House returns from its winter recess Tuesday, January 31. The issue of the illicit brokering of phone records has drawn attention recently, with carriers such as T-Mobile, Verizon Wireless and Cingular Wireless and also the state of Illinois filing suits against third-party brokers accused of the practice. On Monday, January 23, T-Mobile landed a temporary restraining order, which prohibits at least two companies from directly or indirectly obtaining its customers' information. Letter sent by the chairman of the U.S. House of Representatives Energy and Commerce Committee: http://markey.house.gov/docs/privacy/iss_privacy_ltr060123.pdf

2006-02-01 **Congress hearing cell-phone customer privacy wiretapping data disclosure theft**

EDUPAGE; http://news.zdnet.com/2100-1035_22-6033688.html 23

CONGRESS HOLDS HEARINGS ON CELL-PHONE CUSTOMER PRIVACY

A Congressional hearing this week will address cell phone companies' efforts to protect the privacy of their customers. The hearing comes after recent revelations that a number of data brokers have been able to con cell phone companies into disclosing data about customers and their calling habits, which was then sold to third parties. The premise is that certain individuals, such as attorneys, might want details of cell phone calls, and data brokers supply that data. Cell phone companies and some members of Congress, however, object to the methods that data brokers use to obtain that information, including posing as people they are not and using information such as Social Security numbers without authorization. Some critics have pointed to weak policies and practices among cell phone companies for protecting such data as the root of the problem. Rep. Joe L. Barton (R-Tex.), chairman of the House Energy and Commerce Committee, said in a statement that he intends to make the practice of fraudulently obtaining such data "very illegal."

http://computerworld.co.nz/news.nsf/scrt/F03EF851B098CED6CC25710900776B50

MICROSOFT AND WASHINGTON STATE SUE SPYWARE COMPANY.

Microsoft and the Washington state attorney general have filed lawsuits against antispyware software vendor Secure Computer, alleging that the company's Spyware Cleaner software not only fails to remove spyware as advertised, but makes changes to users ' computers that make them less secure. The attorney general's lawsuit is the state's first to be filed under Washington's 2005 Computer Spyware Act. Washington's 16-count lawsuit was filed in U.S. District Court in Seattle and follows investigations by both Microsoft and the Attorney General's high tech fraud unit. The state's lawsuit also names Secure Computer president Paul Burke and Web domain owner Gary Preston, both of New York state, as defendants. It further charges Zhijian Chen, of Portland, OR; Seth Traub, of Portsmouth, NH; and Manoj Kumar, of Maharashtra, India, in connection with the advertising of the product. Microsoft has also sued Secure Computer, alleging that the company's Spyware Cleaner e-mail and pop-up advertisements falsely suggested that Microsoft endorsed the product, says Nancy Anderson, vice president and deputy general counsel with Microsoft.

EDUPAGE; http://news.com.com/2100-1030_3-6039645.html 23

COURT SAYS UNENCRYPTED DATA OKAY

A federal judge in Minnesota has dismissed a case alleging that a student loan company was negligent in not encrypting customer data. The case was filed by Stacy Lawton Guin after a laptop containing unencrypted data on about 550,000 customers of Brazos Higher Education Service was stolen from an employee's home in 2004. Although he was not harmed by the loss of his personal information--indeed, there have been no reports of any fraud committed with the stolen information--Guin argued that the Gramm-Leach-Bliley (GLB) Act required Brazos to encrypt the data. Judge Richard Kyle rejected that claim, noting that the legislation does not specifically require encryption. The law states that financial services companies must "protect the security and confidentiality of customers' nonpublic personal information," but, according to Kyle's decision, "The GLB Act does not prohibit someone from working with sensitive data on a laptop computer in a home office."

RISKS; Slashdot http://yro.slashdot.org/article.pl?sid=06/03/06/1736234 24 18

NEW JERSEY BILL WOULD HAVE BANNED ANONYMOUS POSTINGS

A firestorm broke out on Slashdot and other Internet-centric discussion sites after someone posted the following announcement: "The New Jersey legislature is considering a bill that would require operators of public forums to collect users' legal names and addresses, and effectively disallow anonymous speech on online forums. This raises some serious issues, such as to what extent local and state governments can go in enacting and enforcing Internet legislation."

Vigorous discussion ensued, including this cogent posting by "orthogonal":

MR. JUSTICE Hugo Black, writing for the Supreme Court of the United States in Talley v. California, 362 U.S. 60 (1960), declaring unconstitutional a California ordinance requiring that handbills and pamphlets be signed:

>Anonymous pamphlets, leaflets, brochures and even books have played an important role in the progress of mankind. Persecuted groups and sects from time to time throughout history have been able to criticize oppressive practices and laws either anonymously or not at all. The obnoxious press licensing law of England, which was also enforced on the Colonies was due in part to the knowledge that exposure of the names of printers, writers and distributors would lessen the circulation of literature critical of the government. The old seditious libel cases in England show the lengths to which government had to go to find out who was responsible for books that were obnoxious [362 U.S. 60, 65] to the rulers. John Lilburne was whipped, pilloried and fined for refusing to answer questions designed to get evidence to convict him or someone else for the secret distribution of books in England. Two Puritan Ministers, John Penry and John Udal, were sentenced to death on charges that they were responsible for writing, printing or publishing books…. Before the Revolutionary War colonial patriots frequently had to conceal their authorship or distribution of literature that easily could have brought down on them prosecutions by English-controlled courts. Along about that time the Letters of Junius were written and the identity of their author is unknown to this day. Even the Federalist Papers, written in favor of the adoption of our Constitution, were published under fictitious names. It is plain that anonymity has sometimes been assumed for the most constructive purposes.

We have recently had occasion to hold in two cases that there are times and circumstances when States may not compel members of groups engaged in the dissemination of ideas to be publicly identified. Bates v. Little Rock, 361 U.S. 516 ; N. A. A. C. P. v. Alabama, 357 U.S. 449, 462 . The reason for those holdings was that identification and fear of reprisal might deter perfectly peaceful discussions of public matters of importance. This broad Los Angeles ordinance is subject to the same infirmity. We hold that it, like the Griffin, Georgia, ordinance, is void on its face. [362 U.S. 60, 66]<

[MK notes that by June 2006, the NJ legislature's Web site no longer had any reference to the proposed bill.]

2006-03-24 **US legislation data-protection bill DATA identity theft**

EDUPAGE; http://www.internetnews.com/bus-news/article.php/3594136 23

LEGISLATORS AGREE ON DATA-BREACH TERMS

Members of a House committee have agreed on compromise language in a data-protection bill intended to provide increased protections for sensitive consumer information. The Data Accountability and Trust Act (DATA) includes definitions of when organizations must report a data breach to customers and requires companies that handle such information to meet minimum standards for protecting sensitive data. In its original form, the bill only required disclosure if an event carried a "significant risk" of identity theft. The compromise language mandates notification if a "reasonable threat" exists. The bill requires data stewards to take "reasonable" precautions against data theft and to perform periodic assessments to verify that data has not been compromised. Rep. Joe Barton (R-Tex.), chair of the Energy and Commerce Committee, said the existing statutes for data protection "are so flimsy they're laughable." Rep. John Dingell (D-Mich.) said the DATA bill "focuses on strong security systems, notice to consumers of breaches, and tough enforcement."

EDUPAGE; http://news.com.com/2100-7348_3-6071441.html 23

CONGRESS DEBATES SSN RESTRICTIONS

Members of Congress have vowed to enact legislation by the end of the year that will restrict use of Social Security numbers (SSNs), which have become a prime target of identity thieves. Several bills are before Congress now, including one introduced by Edward Markey (D-Mass.) and another by Clay Shaw (R-Fla.). Joe Barton (R-Tex.) said the current practice of allowing data brokers to sell SSNs to anyone able to pay for them should be banned outright. Federal Trade Commissioner Jon Leibowitz said SSNs are "overused" and "underprotected." Officials from financial services institutions cautioned, however, that appropriate use of SSNs is invaluable for sectors such as theirs. Oliver Ireland, representing the Financial Services Coordinating Council, said SSNs "are critical for fraud detection."

2006-05-12 **data breach legislation discuss Consumer Data Protection Act**

EDUPAGE; http://www.internetnews.com/bus-news/article.php/3605666 23

DATA-BREACH LEGISLATION ON THE AGENDA

Rep. James Sensenbrenner (R-Wis.), chairman of the House Judiciary Committee, has introduced the Cybersecurity Enhancement and Consumer Data Protection Act of 2006, which would require notification of government officials--but not of those affected--any time a computer breach exposes data for 10,000 or more individuals. Data-breach bills have previously been introduced by the House Financial Services Committee and the House Commerce Committee, with varying requirements for notification. In the Senate, two bills have been introduced in the Judiciary Committee and a third in the Commerce Committee. Some observers are concerned that the competing federal legislation, which would likely supersede any state laws concerning data-breach disclosure, risks being reconciled into a law that would be worse than if no law were passed. Susanna Montezemolo of the Consumers Union expressed support for one of the Senate bills, the Personal Data Privacy and Security Act, which has been approved by committee and is waiting for a vote in the full Senate.

SSNs AS BOTH IDENTIFICATION AND AUTHENTICATION

Jeremy Epstein noted in RISKS that politicians do not necessarily understand security fundamentals. In congressional testimony from the American Financial Services Association, the spokesperson said, ""The Social Security number is the only unique identifier in our country that enables a credit grantor, or a credit bureau, or a bank, or an insurance company, or an investment firm to be sure that the consumer they are doing business with [is legitimate]." Epstein explained, "In other words, they're using it as both an identifier and an authenticator." He also wrote, "Switching to a different number … that is used for both purposes will have the same problem."

His final words were important: "Until Congress understands the problem, there's not much hope of solving it through legislation."

NewsScan, New York Times
http://www.nytimes.com/library/tech/00/01/biztech/articles/27china.html

The mainland Chinese government announced yet more of its usual stream of draconian prohibitions against free speech and free thought when it barred anyone from posting "state secrets" on the Internet or via e-mail. A state secret in the People's Republic of China is any information that has not been officially approved for distribution; examples include but are not limited to news of natural disasters, reports of bureaucratic corruption, outbreaks of disease, and worker protests. However, experts predicted that the regulations would ultimately be futile; even now, the sheer volume of e-mail and chat-room communications precludes monitoring more than a tiny percentage of the traffic. As the number of Internet users in China rises, the task will be even greater for the tyrants attempting to control the most popular country in the world.

ROUTINE E-MAIL MONITORING BANNED IN UK OFFICES
A new code defining workers' privacy rights prohibits British employers from routinely monitoring e-mail and Internet usage in UK offices, even when there is "reason to believe" that they are personal and sent or received on a work computer during business hours. The code reflects the standards on monitoring that the Information Commission, the UK's data protection watchdog, says must be met in order to comply with the country's Data Protection Act. The commission has threatened to take action against companies that violate the new code. Industry groups have protested the code, with one human resources manager saying that "It's overly concerned with the employee's privacy it is still far too prescriptive and just not realistic." EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7698536

SINGAPORE PLANS COORDINATED CYBERSECURITY EFFORT

Government officials in Singapore announced that the country will spend $23 million over three years on a centralized program to increase cybersecurity. Singapore is one of the world's most wired countries, with a residential Internet access rate of 50-60 percent. The country also has some of the strictest regulation of computer systems, including a law that allows government monitoring of all computer activity. The law also allows preemptive action by the government to prevent anticipated cybersecurity threats. The new initiative, the National Cyber-Threat Monitoring Center, will monitor networks, looking for evidence of hacking or other cyber threats. The center, which is expected to be running by the second half of 2006, will work with similar centers in countries including the United States and Australia. Deputy Prime Minister Tony Tan, who is also Singapore's Coordinating Minister for Security and Defense, said, "Infocomm security is as important in protecting Singapore as is physical security at our borders."

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB954197317969930664.htm

An automatic surveillance system that would monitor for online securities fraud is running into trouble before it gets off the ground. The system, which would be operated by the Securities and Exchange Commission, would employ a Web "crawler" to survey public Web sites, message boards and chat groups, looking for key phrases like "get rich quick" and "free stock," and then analyze and index the information for later retrieval by SEC investigators bringing civil proceedings against scam perpetrators. In addition to sparking privacy concerns, the SEC may find itself up against giant Internet operators who consider their chat rooms to be proprietary. AOL, for instance, says it routinely bans outsiders from harvesting information from its chat rooms and message boards, in order to protect its customers' privacy. In addition, the SEC announcement comes at a time when the Federal Trade Commission and many states are working to increase privacy protections for citizens. Congress recently awarded the SEC an additional $12.5 million this year, primarily for Internet enforcement activities. (Wall Street Journal 28 Mar 2000)

FACE-RECOGNITION SYSTEM RECOMMENDED FOR AIRPORT SECURITY [24 Sep 2001]
A government committee appointed to review airport security procedures will recommend to Transportation Secretary Norman Y. Mineta the employment of face-recognition systems that create a digital map of a person's face and translate it into mathematical formulas claimed to be as uniquely distinguishing as a fingerprint. Privacy advocates like David Sobel regard this as a "potentially invasive technology" whose use will eventually expand to other purposes and endanger the civil liberties of ordinary people. The president of FaceIt Systems, one of the best-known manufacturers of face-recognition systems, says he shares privacy concerns and asserts that the answer is to have rules governing whose photos can be included in a database of suspects or criminals for comparison with mere passers-by. WASHINGTON POLICE EXPAND USE OF SURVEILLANCE TECHNOLOGY [13 Feb 2002]
Noting that people in the United Kingdom have "easily adapted" to pervasive public surveillance and that "there has not been an outcry about privacy there," Washington, D.C. police officials are busy expanding the public use of surveillance cameras. A police department spokesman says, "In the context of September 11, we have no choice but to accept the greater use of this technology." MIT emeritus sociology professor Gary T. Marx concedes that "almost all of the surveillance innovations are easily justifiable" but worries that "the major concern is: where is it leading?" (Wall Street Journal 13 Feb 2002)

GUILT-BY-ASSOCIATION?
Law enforcement officials in Wilmington, Delaware are being criticized by privacy advocates for putting digital photos and other information into a database of associates of suspected drug dealers rounded up in rough neighborhoods. A Wilmington public defender calls it "guilt by association" and Barry Steinhardt of the ACLU charges: "They are stopping, searching and putting into a database photographs of people whose only crime is being in the wrong place at the wrong time. It's bad law enforcement, and it's bad for civil liberties." Police Chief Michael Szczerba's response is: "If you come into our city to take in a ballgame or dine at a restaurant or go to a theater, you likely won't know about these corner patrols. But if you come to sell drugs or drink alcohol on the corner or just be a general nuisance, you're going to see us." (USA Today 4 Sep 2002)

HOMELAND SECURITY GIVES GOV'T NEW POWERS
Provisions of the legislation to create the U.S. Department of Homeland Security bill would allow Internet service providers to give the government more information about their subscribers and give police new Internet wiretap powers. The Electronic Privacy Information Center and other civil liberties groups say the bill's language lets Internet providers reveal subscriber information to any government officials, not just investigators. Another section of the bill gives U.S. authorities new power to trace e-mails and other Internet traffic during cyber attacks without first obtaining even court approval in the event hat there occurs "an immediate threat to national security" or an attack against a "protected computer." NIPC/DHS

July 07, The Register — FTC calls privacy claims to account.

Most online businesses promise they'll protect customer data as if it were their own. Now the government is holding them to it. United States Federal Trade Commission has indicated its intention to actively pursue companies that obtain personal information by promising a level of security, and then not delivering it. Almost every company that does business in cyberspace has a security and privacy policy, typically buried at the bottom of a home page, under "legal notice" or "privacy policy." The FTC concluded that data that is collected under false pretenses is a "deceptive trade practice."

Minnesota CriMNet shutdown

Steven Hauser wrote the following report in RISKS:

Minnesota has a large database of millions of records of police activity and incident data compiled on its citizens. The data is not owned by the government but an extra-legal private entitity, the Minnesota Chiefs of Police Association. This alone is scary, no recourse for inaccuracy, no way to assure data is not leaked or used for political or commercial purposes. News articles show it may have been used in political demonstrations to target citizens. Good "death squad" database. It was also hacked by an unidentified whistleblower who gave State Representative Mary Liz Holberg supposedly private data about herself. The cops are pressuring the Representative to turn over the whistleblower for prosecution, but the Representative has not yet squealed. This incident caused the system to be shut down. Google search on CriMNet or MJNO to get more articles. [The Internetted system is of course thought to be secure because it is password protected! There's a LONG article by Patrick Howe. High-tech microscopes expose Americans' private lives

In USA Today, Don Campbell writes about a new threat to Americans' privacy: MATRIX, or Multistate Anti-Terrorist Information Exchange. This 20-billion-record database is said to be "the largest database on the planet" by its creator Seisint. With $12 million in federal funding, Seisint is collaborating with the Florida Department of Law Enforcement (FDLE) "with the objective of compiling an electronic dossier on every citizen in the nation." In addition to being used as an anti-terrorism tool, MATRIX is said to become useful "when it comes to catching kidnappers and child molesters."

DHS IAIP Daily; http://news.com.com/2100−7352_3−
5157282.html?tag=nefd_top

February 11, CNET News.com — Feds step up push to wiretap VoIP calls.

The Bush administration plans to ask the Federal Communications Commission to order Net telephony providers to comply with a law that would permit police to wiretap conversations carried over the Internet. In a series of letters made public Tuesday, February 11, the Justice Department said it is "currently drafting a request" that would invoke the 1994 Communications Assistance for Law Enforcement Act (CALEA). That law requires telecommunications carriers to rewire their networks to government specifications to provide police with guaranteed access for wiretaps. It is debatable whether CALEA's decade-old definition of "telecommunications carrier," crafted long before the Internet era, applies to Voice over Internet Protocol (VoIP) providers. If the FCC rules that CALEA's definitions are not a close enough fit for the fast-growing and somewhat amorphous VoIP sector, then the Bush administration could ask Congress to rewrite the law. Until earlier this month, the FBI had tried to block the FCC from considering VoIP's regulatory structure until the wiretap issue was resolved. But last week, the two agencies said they had reached an agreement allowing a vote on VoIP regulations to take place on Thursday.

DHS IAIP Daily;
http://www.reuters.com/newsArticle.jhtml?type=internetNews&s toryID=5873014

August 04, Reuters — FCC: Net phone calls must be able to be tapped.

Internet phone carriers such as Vonage should set up their systems so U.S. law enforcers can monitor suspicious calls, the Federal Communications Commission (FCC) tentatively ruled on 12 Wednesday, July 4. By a vote of 5-0, the FCC said "voice over Internet protocol," or VoIP, providers should be subject to the 1994 Communications Assistance for Law Enforcement Act, which ensures that law enforcers will be able to keep up with changing communications technologies. VoIP service is likely to replace much traditional phone service over the coming years, the commission said. The Justice Department, FBI and Drug Enforcement Administration have argued that they must be able to monitor suspicious calls no matter how they are made. Technology advocates have worried that the fast-growing service, which promises to slash costs by routing phone calls over the Internet, could be harmed by excessive regulation. The ruling does not affect other regulatory questions surrounding VoIP service, such as how it should be taxed, FCC Chairman Michael Powell said.

EDUPAGE; http://www.fcw.com/article89670-07-22-05-Web

GAO SAYS TSA CLEANING UP SECURE FLIGHT

According to the Government Accountability Office (GAO), the Transportation Security Administration (TSA) has adequately addressed concerns raised by the GAO over privacy violations in the Secure Flight program. The program is designed to safeguard the nation's air travel system by identifying suspected terrorists and preventing them from boarding planes. During a test of the program, TSA collected commercial information on air passengers, violating its privacy policy, according to the GAO. TSA used the commercial data in conjunction with passenger information to increase the reliability of the Secure Flight system, but the result was that air passengers were unable to know what information about them was being collected and how it was being used.
In a report, the GAO said that after being notified of the problems, TSA acted immediately to address the issues raised. Aside from not using commercial data in the Secure Flight program, TSA also said its chief privacy officer and general counsel would ensure that activities related to the Secure Flight program would be explicitly detailed in its privacy notices. EDUPAGE; http://chronicle.com/daily/2005/10/2005100601t.htm

MORE HINTS POINT TO IDENTITY OF CONNECTICUT LIBRARY

The American Library Association (ALA) has filed a court brief in the ongoing wrangling over a provision of the USA PATRIOT Act that prevents organizations under investigation from publicly speaking about the investigation. Under the terms of that law, federal authorities had sought information from a Connecticut library group, which has been forced to keep its identity secret. An article in the New York Times, though, said the Library Connection Inc., of Windsor, Conn., is the probable target of the investigation. According to the ALA's brief, because the Library Connection has refused to confirm or deny the story in the Times, it is clear that the speculation is correct. Further, because the identity has been guessed, keeping the group from speaking about the investigation is pointless, according to the brief. The brief states: "If the reporting is accurate, the information the government seeks to suppress has already been revealed, and the gag order serves no interest but that of silencing a citizen." Last month a judge ordered that the gag order be lifted, but an appeals court has reimposed the gag order pending its review of the case. Chronicle of Higher Education, 6 October 2005 (sub. req'd)

2005-10-23 **Colleges upgrade Federal Communications Commission Internet networks law monitor Internet Philadelphia San Francisco**

DHS IAIP Daily; http://www.nytimes.com/2005/10/23/technology/23college.html

COLLEGES PROTEST CALL TO UPGRADE ONLINE SYSTEMS

The Federal Communications Commission is requiring hundreds of universities, online communications companies and cities to overhaul their Internet computer networks to make it easier for law enforcement authorities to monitor e-mail and other online communications. This order extends the provisions of a 1994 wiretap law to universities, libraries, airports providing wireless service and commercial Internet access providers and municipalities that provide Internet access to residents, such as Philadelphia and San Francisco. The action, which the government says is intended to help catch terrorists and other criminals, has unleashed protests and the threat of lawsuits from universities, which argue that it will cost them at least $7 billion while doing little to apprehend lawbreakers. The Justice Department requested the order last year, saying that new technologies like telephone service over the Internet were endangering law enforcement's ability to conduct wiretaps "in their fight against criminals, terrorists and spies."

1999-10-12 **privacy medical information identification authentication I&A doctors Internet remote telemedicine HIPAA**

EDUPAGE; Wall Street Journal

INTEL AND AMA FORM SERVICE TO IMPROVE SECURITY OF ONLINE MEDICAL INFORMATION
Intel and the American Medical Association (AMA) are teaming to offer a service that will boost the online security of medical data. The service, which becomes available in the first quarter of 2000, will use "digital credentials" to prove the identities of doctors who are sending and accessing medical information over the Internet. The service launches Intel's "Internet Authentication Services" initiative, which permits the identification of parties at both ends of online transactions. The digital credential service, which is portable, is a big improvement over digital certificate security measures, according to Intel and the AMA. The use of the Internet for medical transactions will not reach mainstream levels unless security is improved. "This is important if the use of the Internet for health care is to go to the next level," says Jim Klein of the Gartner Group. (Wall Street Journal 10/12/99)

Contingency Plan For HIPAA Oct. 6, 2003

Message from Feds to all health-care companies that won't meet the Oct. 16 deadline to have their electronic transactions compliant with the Health Insurance Portability and Accountability Act: Stop sweating. You'll still get paid from Medicare and Medicaid, as long as you're making a good-faith effort to become compliant. That's the word from the Centers for Medicare and Medicaid Services, which has issued a contingency plan for the "thousands" of health providers it expects won't meet HIPAA's deadline. Among processes covered by HIPAA's regulations are claim-status tracking, remittance, and coverage eligibility; the most significant transaction is claims processing for Medicare and Medicaid patients. CMS had said Medicare and Medicaid wouldn't pay claims sent in electronic formats not compliant with HIPAA standards after Oct. 16. However, as of last week, fewer than 20% of claims being electronically sent to CMS were HIPAA compliant.

2003-12-15 **HIPAA medical information security privacy cost compliance**

http://www.informationweek.com/news/showArticle.jhtml?articleID=16700402

COMPLIANCE DRIVES HEALTH-CARE CHANGES

"Health-care costs are on the rise, but why? As companies in the health sector struggle to comply with stringent government regulations such as the Health Insurance Portability and Accountability Act, related costs are being passed along to policyholders. This is necessary because investment in personnel, IT systems, and security are chipping away at profits.

Hospitals and doctors continue to rely on inefficient paper trails to manage patient records. As compliance with HIPAA takes hold, many find it necessary to move to electronic operations. HIPAA's guidelines regarding information sharing, patient privacy, and information security are presenting other changes, too."

AMA Complains WebMD Mishandling HIPAA Claims Jan. 27, 2004

Problems with WebMD's handling of claims leads to hundreds of thousands of dollars worth of delayed and denied payments, and caused some doctors to revert to paper.

The American Medical Association has sent a letter to WebMD Corp.,likely the medical industry's most powerful player in electronic insurance-claims processing, complaining that it has mishandled claims submitted by doctors resulting in "hundreds of thousands of dollars" in delayed and denied payments, InformationWeek has learned. WebMD acknowledges there have been problems, but attributes them to implementing a new process. According to the letter dated Jan. 8, sent to WebMD CEO Roger Holstein and signed by the AMA and seven other medical associations, the frequency of physicians' complaints about WebMD has risen since the Health Insurance Portability and Accountability Act standards went into effect Oct. 16.In addition to setting standards regarding the privacy of patient information, HIPPA is intended to simplify and encourage electronic claims processing. But WebMD's efforts at HIPAA compliance appear to be having the opposite effect, according to the letter, a copy of which was obtained by InformationWeek. WebMD attributes any problems to the early stages of a new process.

Category 38.9 *Medical information & HIPAA*

2004-01-29 **HIPAA medical information security privacy WebMD delay**

NIPC/DHS

Doctors Dependent on WebMD Despite Alleged Problems Jan. 29, 2004

Because of complexities with claims-processing and new requirements under HIPAA, doctors rely on WebMD and other clearinghouses to handle the work. The maturing field of Web-services technologies has the potential to let physicians' offices file medical claims directly to insurance companies using inexpensive Internet connections, eliminating the need for claims-processing clearinghouses. Yet some are convinced physicians will continue to depend on clearinghouses such as WebMD Corp., the biggest in the industry, because of the complex nature of electronic-claims processing. Doctors' offices "could use Web services" such as XML documents and the Simple Object Access Protocol to directly upload claims to insurance companies, says David Wroten, assistant executive VP of the Arkansas Medical Society. "But when a doctor's office tries, it immediately runs into little problems with different browsers," says Wroten, as Netscape Navigator and Microsoft Explorer each present the form differently. Rather than immerse themselves in technical details, offices rely on a clearinghouse to resolve problems and format the claim correctly. The majority of urban doctors' offices were using a clearinghouse before HIPAA was implemented Oct. 16. and have been reluctant to change since the new regulations went into effect, he says. But complaints about WebMD's inaccurate processing or lost claims were voiced in a Jan. 8 letter from the American Medical Association to WebMD CEO Roger Holstein. The letter said "thousands or hundreds of thousands of dollars" in delayed payments to some offices have resulted from mishandled claims.

Category 38.9 *Medical information & HIPAA*

2004-02-09 **HIPAA medical information security privacy compliance regulation insurance cost cut**

NIPC/DHS

New Claim Game Feb. 9, 2004

Insurance companies want doctors to bypass clearinghouses and submit claims directly. The move could cut costs and complexities from the system.

On March 1, Harvard Pilgrim Health Care Inc. will take a drastic step to realize the savings intended by the federally mandated Health Insurance Portability and Accountability Act, which went into effect four months ago. The insurance company will no longer pay "click charges" of about 35 cents per transaction to WebMD Corp., the industry's largest medical-claims-processing clearinghouse, which handles a third of the 10 million claims Harvard Pilgrim pays out every year.

In addition to establishing rules to ensure patient privacy, HIPAA set standards for the electronic exchange of information that in theory should ease connection problems between health-care providers and insurance companies, while reducing costs associated with manually processing paperwork.

Do clearinghouses provide a valuable service or merely add unnecessary costs? The industry has long depended on them to aggregate claims coming from physicians' offices and send them in batches to the correct payers, at a cost of about $414 million a year to insurance companies, according to Forrester Research. As the largest claims processor, WebMD is stumbling in its efforts to convince the industry that its clearinghouse adds value.

HIPAA undoubtedly is creating complexities in health care. For one, it specifies different formats for different functions, such as eligibility inquiries versus remittance responses. Claims also must be compliant in their content, which creates problems when a physician uses an old or rudimentary practice-management system for patient records and billing information. Fixing that can require intensive technical work between the physician's office and the clearinghouse and between the clearinghouse and the claim payer. But companies like Harvard Pilgrim don't see any savings being realized if WebMD becomes that dictator. Clearinghouses only add costs, Grose says. "It's a philosophical issue. WebMD just happens to be the one we disagree with most."

AUTOMATED MEDICATION WORSE THAN THE DISEASE?

A report from U.S. Pharmacopeia (USP), a nonprofit group that sets standards for the drug industry, says that as more hospitals have implemented automated systems for administering drugs the number of errors associated with them has risen. USP vice president Diane Cousins says, "It would seem logical that applying computer technology to the medication use process would have a significant positive impact in preventing medication errors. Yet, depending on the computer's design or user competence, new points of potential errors can emerge." Kenneth Kizer of the National Quality Forum agrees with Cousins: "Technology offers great opportunity to reduce errors, but it's not a panacea. You can't just throw a computerized system in and expect that everything's fixed. It has to be done right. The technology is only as good as the people who use it." (Washington Post 20 Dec 2004)

2005-01-19 **national health medical network recommendations policy financing standards interoperability**

NewsScan; http://www.nytimes.com/2005/01/19/technology/19health.html

ROAD MAP LAYS OUT THE ROUTE TO DIGITAL HEALTH RECORDS

A group of 13 health and information technology organizations have presented the Bush administration with recommendations for a "national road map" for development of a national health information network. The 54-page document borrows heavily from the technical and policy approach of the Internet, suggesting that the federal government limit its involvement to initial financing and endorsement of basic technical standards. A separate "standards and policy entity" would then take over management of the proposed system. The report concluded that a national health network should not include a central database of patient records, nor should it require people to carry "health ID cards." Patients would control their own records, and the optimal design of the network would use open, standard technology for maximum interoperability of disparate systems. Many medical groups have begun investing in creating local networks that connect electronic patient records and the study warns that failure to move swiftly to establish open communications standards between these networks may result in a large savings opportunity lost. "If we're not careful, we'll have little islands of excellence that don't talk to each other," says Jan Walker, lead author of a separate article on the subject recently published in Health Affairs. PREPARING FOR A DIGITAL HEALTH NETWORK

Eight leading high-tech companies -- IBM, Microsoft, Intel, Oracle, Accenture, Cisco, Hewlett-Packard and Computer Sciences -- have agreed to adopt open, nonproprietary technology standards as the software building blocks for a national health information network, which the Bush administration hopes will improve care and reduce costs by moving to a digital system for handling patient records, clinical research, claims and payments. IBM executive Neil de Crescenzo says, "The challenge is to turn a call for change in the nation's health care system into actual change. We got together to try to speak with one voice to the federal government and other stakeholders, and say this is an approach we will all stand behind." (New York Times 26 Jan 2005)

2005-02-04 **Canada privacy medical outsource USAPATRIOT Act data mining leakage confidentiality ChoicePoint immigration customers employees activists**

NewsScan; http://www.wired.com/news/privacy/0

CANADIANS UP IN ARMS OVER HEALTH INFO PRIVACY

Activists with the British Columbia Civil Liberties Association say that plans to outsource storage of Canadian citizens' health records to a U.S. company places that sensitive information in jeopardy. They fear that putting the data in the hands of Maximus Can, a subsidiary of U.S.-based Maximus, could lead to data-mining exercises, such as those that involved passenger records from JetBlue and other airlines. Or, as in the case with data on Latin American citizens purchased in 2003 by ChoicePoint that was then sold to U.S. immigration authorities, it could be used to prevent British Columbians with serious health issues, such as AIDS, from entering the U.S. Under the U.S.A.P.A.T.R.I.O.T. Act, U.S. companies can be forced to reveal information while prohibited from telling customers or employees that it has been shared. Activists fear that reach will extend to subsidiaries of U.S. companies operating outside its borders. "There really isn't a database of cross-referenced information that you could consider to be more personal… The potential for this information to be used and misused is great," says Michael Vonn, policy director for the British Columbia Civil Liberties Association. DRUG-ERROR RISK AT HOSPITALS TIED TO COMPUTERS

Monty Solomon and Peter Neumann summarized a serious problem in hospitals:

Hospital computer systems widely touted as the best way to eliminate dangerous medication mix-ups can actually introduce many errors, according to the most comprehensive study of hazards of the new technology. The researchers, who shadowed doctors and nurses in the University of Pennsylvania hospital for four months, found that some patients were put at risk of getting double doses of their medicine while others get none at all. 22 types of mistakes were identified, such as failing to stop old medications when adding new ones or forgetting that the computer automatically suspended medications after surgery. The findings underscore the complexity of improving safety in US hospitals, where the Institute of Medicine estimates that errors of all kinds kill 44,000 to 98,000 patients a year.

A related story recounts similar findings from a different study.

HOSPITAL COMPUTERS MAKE THINGS WORSE

Reports over the past few years of increasing numbers of patient injuries and deaths due to medical errors sent hospital administrators scrambling for computerized solutions. But two new studies suggest that, in many cases, these high-tech systems have left doctors and nurses increasingly frustrated while providing little evidence of real benefit to patients. In fact, one widely used system actually helped foster medication errors, researchers found. See the 9 Mar 2005 issue of the Journal of the American Medical Association.

COMPUTERIZED PHYSICIAN ORDER ENTRY SYSTEMS STILL TROUBLESOME

Charles J. Wertz provided abstracts for two interesting articles:

The 9 Mar 2005 issue of the *Journal of the American Medical Association* contains two articles and an editorial that should be of interest to Risks readers.

ROLE OF COMPUTERIZED ORDER ENTRY SYSTEMS IN FACILITATING MEDICATION ERRORS discusses a variety of issues including poor interface design requiring a physician to look at as many as 20 screens to see all the information about a patient, misleading and frequently misinterpreted dosage information, dosage change requires adding the new and deleting the old, poor integration of multiple systems, poor handling of discontinuation and resumption of medications, loss of orders and others. This article appears to be the result of a well done comprehensive study at one specific hospital.

The Editorial, COMPUTER TECHNOLOGY AND CLINICAL WORK: STILL WAITING FOR GODOT makes a number of good points such as, "The misleading theory about technology is that technical problems require technical solutions; ie, a narrowly technical view that leads to a focus on optimizing the technology. In contrast, a more useful approach views the clinical workplace as a complex system in which technologies, people, and organizational routines dynamically interact." Anyone interested in systems design will find this interesting.

The other Article, EFFECTS OF COMPUTERIZED CLINICAL DECISION SUPPORT SYSTEMS ON PRACTITIONER PERFORMANCE AND PATIENT OUTCOMES: A SYSTEMATIC REVIEW provides a comprehensive review of the topic.

RISKS 23 79

COMPUTERS IN HOSPITALS BLAMED FOR HUMAN ERROR

In response to several articles about how awful biomedical informatics systems are, Bob Morrell retorted that administrators readily blame computers for errors committed by their staff:

>Recent coverage of a JAMA article on the patient errors (cited by R. Akerman in RISKS-23.78) caused by computers will likely be cited by those who resist the movement towards an electronic medical record. This despite the fact that all acknowledge that the current mixed state of computerized and non-computerized medical systems is abysmal. My perspective on this is that we often miss the core truth of most medical mistakes: they are caused by humans, not computers. In the 1990's I developed several programs designed to find medical mistakes. As such, I spent a lot of time analyzing mistakes, and dealing with defensive reactions by physicians and nurses to the mistakes found. The most common mistake, at its core, was raw human misunderstanding: conceptual misunderstanding leading to misinterpretation of medical data (surgeons who thought the higher the bacterial MIC number, the better the antibiotic, when the reverse is true, and therefore put the patient on an antibiotic guaranteed to be ineffective). A close second was communication failures, where a key report was pocketed, lost or otherwise not communicated to others who would understand its importance.

However, in all these cases, the typical hospital political hierarchy sought to turn each of these medical errors into a computer error, lest a human (particularly a Doctor human) be found at fault. While I was grumpy about this at first, I soon realized that there was at least some truth in it, in that more easily understood medical reports, that highlighted and provided some interpretation to key information, and were more widely distributed were in fact improvements worth making to medical systems, and certainly would prevent far more errors than my mistake finding programs would ever find. The problem was however, that as the concept of the electronic medical record began taking shape, resistance to it often cited the end of incident analysis that blamed the computer, rather than the physician or nurse who was primarily at fault. The JAMA cases certainly sound like real problems with the human/computer interface, but they sound suspiciously like the final reports we used to end up on real mistakes made by real humans.

The medical environment is extremely complex, understaffed and wrought with automated and semi automated systems that all can fail or conflict whether they are computerized or not. I routinely saw problems with continuation of standing order dosing long before those standing orders were computerized. Blaming the computer misses the point, even if it does point out how the computer system could be made better.

The risk is one I often see in The Risks Digest: problems with computerized systems seem to get more attention than the usually much greater problems in the existing non-computerized systems.<

2005-11-20 **United Kingdom UK data sharing privacy concerns medical research**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4455306.stm

BRITISH ORGANIZATION URGES DATA SHARING

In the United Kingdom, a report from the Council for Science and Technology calls on the government to share information among its various agencies while keeping a close eye on privacy concerns. Due to the sheer amount of data that the government collects and stores, pooling that data can facilitate improved public services, as happens already with health-related data. Mark Walport, head of medical charity at the Wellcome Trust and author of the report, said such data sharing in medical research has uncovered links between health problems and social factors and can allow researchers to closely track the effectiveness of various treatments over time. Walport suggested that similar benefits could be derived from governmental sharing of other types of data, which is currently not being used effectively. Walport said he believes that with adequate creative thinking, the government could see significant benefits from sharing data while ensuring protection for personal privacy. BBC, 20 November 2005

2005-12-02 **medical blunders risks information systems certification CAP links**

RISKS; http://tinyurl.com/ayf5m 24 11

RISKS OF MEDICAL BLUNDERS

RISKS moderator Peter Neumann summarizes reports of some serious medical blunders involving bad data:

* In 1999, a 47-year-old woman was diagnosed with breast cancer in Magee-Womens Hospital (part of the U. Pittsburgh Medical Center), and underwent a mastectomy. It was later discovered that the hospital lab had switched biopsy specimens. Ten cases against the hospital are now pending in state courts, even though the hospital has passed federal inspections. Similar lawsuits and complaints name other medical centers.

* In Maryland, a hospital lab sent out hundreds of HIV and hepatitis test results despite data showing that the results might be invalid and mistakenly lead infected patients to believe they were disease-free. The same laboratory had just received a top rating from CAP inspectors.

* In Yakima, Wash., eight emergency room doctors walked off their jobs to protest hospital deficiencies they said included lab mistakes, such as mixed-up blood samples. CAP had declared the lab "in good standing" the year before.

* At the famed Mayo Clinic in Minnesota, an allegedly misdiagnosed gall bladder cancer case led to revelations of a close relationship between the clinic and CAP. A Mayo pathologist serving on a CAP advisory panel twice sought and obtained accreditation renewals despite unacceptable lab practices cited by CAP inspectors.

RISKS; http://news.bbc.co.uk/1/hi/england/cambridgeshire/4521608.stm 24 13

CAMBRIDGE HOSPITAL BUSINESS CONTINUITY PLANS WORK

RISKS correspondent Paul Bennett reports the following story about medical systems security and disaster recovery:

A computer system at a Cambridge hospital used for patient information such as admissions and discharges experienced some problems because of a fire at the Buncefield oil depot in Hertfordshire. A company providing some IT services to Addenbrooke's Hospital was based at the industrial park near the depot and was destroyed in the fire. It was expected to take a week to get the computer system up again, although reportedly no medical services were affected.

[Abstract by Peter G. Neumann]

Another UK correspondent, Peter Mellor, follows up:

The explosion and fire at the fuel depot near Hemel Hempstead, Hertfordshire:
http://images.thetimes.co.uk/TGD/picture/0,,250768,00.jpg

Connection with computers? Well, several nearby installations were wrecked (amazingly, no-one was seriously injured), one of which contained the electronic patient records of Addenbrooke's Hospital, Cambridge. The hospital reported that it would have to rely on paper records for several
days until the computer files could be restored.

On the positive side, at least they had back-up. On the other hand, their disaster recovery planning seems to be a bit slack.

[Summary by Karthik Raman]

2000-10-12 **decryption distributed computing international cryptanalysis**

NewsScan, New York Times
http://partners.nytimes.com/2000/10/12/technology/12R-CODE2.htm

A team of Swedish computer enthusiasts has succeeded in deciphering 10 increasingly difficult codes presented by author Simon Singh in his bestseller, "The Code Book." Singh, who has a doctorate in physics at Cambridge University in the U.K., took two years to develop the brain teasers with Dr. Paul Leyland, who works for Microsoft in Cambridge. The codes, which took the Swedes the equivalent of 70 years of computer time to decrypt, ranged from ciphers dating back to ancient Greece through the famed Nazi Enigma code machine used in World War II. The team was awarded a check for $15,000 for their efforts. Team leader Fredrik Almgren said the task was extremely daunting and that he and his fellow scientists were tempted to abandon the effort several times: "The first stages were very simple but at one point we thought we wouldn't get any further than stage eight. When you do come to the 10th stage it is a question of heavy mathematics and rather difficult algorithms that I don't even claim to understand myself." (Reuters/New York Times 12 Oct 2000)

2001-08-07 **decryption cracking law enforcement police investigation forensics swap file data remanence rubber-hose cryptanalysis**

RISKS 21 58

A report on the cryptography mailing list republished in RISKS included the following information about a police investigation that used cryptanalysis against a disk encryption program:

The German encryption program Safeguard Easy has been broken by the Danish police. Today the police from the city Holstebro in Jutland presented evidence in court, that was provided after breaking the encryption on five out of sixteen computers that where seized april 25 this year.

All 16 computers were protected with Safeguard Easy from the german encryption provider Utimaco. It is not known whether DES, 128-bit IDEA, Blowfish or Stealth was used as algorithm on the computers. All four algorithms are built in Safeguard Easy. Details are sparse. It is not known how the encryption was broken, whether it was brute forced or flaws in the program was exploited.

In followup correspondence, commentators suggested that since only some of the encrypted systems were cracked, perhaps the forensic analysis was able to locate passwords in the Windows swap file.

However, it turned out that actually the cryptanalysis was based on password guessing.

NewsScan; http://www.newscientist.com/news/news.jsp?id=ns99992273

SMART CARDS REVEAL ALL DURING CAMERA FLASH
A flash of light can cause sensitive information stored on a smart card microprocessor to be revealed, say UK researchers at Cambridge University, who've found that firing light from an ordinary camera flash at parts of a smart card chip can assist a thief in determining the sensitive information stored on the card, including the cryptographic key used to secure financial transactions. The attack is described as "semi-invasive," as only part of a chip's protective covering must be removed in order to "flash" it. Meanwhile, another group at Cambridge has developed a microchip design that would resist this technique, using a more complex "asynchronous" microprocessor that would not respond in the same way to light interference. (New Scientist 13 May 2002)

2003-07-22 **crypanalysis password cracking Windows fast**

NewsScan, NIPC/DHS

NEW METHOD CRACKS PASSWORDS IN SECONDS

A senior research assistant at the Swiss Federal Institute of Technology's Cryptography and Security Laboratory has published a paper outlining a way to speed up the process of cracking alphanumeric Windows passwords to only 13.6 seconds on average. The previous average time was 1 minute, 41 seconds. The new method uses massive lookup tables to match encoded passwords to the original text entered by a person, thus reducing the time it takes to break the code. "Windows passwords are not very good," says researcher Phillippe Oechslin. "The problem with Windows passwords is that they do not include any random information." The only requirement for the cracker is a large amount of memory in order to accommodate the lookup tables. The larger the table, the shorter the time it takes to crack the password. Users can protect themselves by adding nonalphanumeric characters to a password, which adds another layer of complexity to the process. Any cracker would then need more time or more memory or both to accomplish the break-in. For more information on Oechslin's method, check out http://lasecwww.epfl.ch/php_code/publications/search.php?ref=Oech03
(Cnet News.com 22 Jul 2003)

[NIPC/DHS:]
July 22, CNET News.com — Cracking Windows passwords in seconds.

Swiss researchers from the Cryptography and Security Laboratory of the Swiss Federal Institute of Technology in Lausanne (EPFL) released a paper on Tuesday, July 22, outlining a way to speed the cracking of alphanumeric Microsoft Windows passwords, reducing the time to break such codes to an average of 13.6 seconds from 1 minute 41 seconds. The method involves using large lookup tables to match encoded passwords to the original text entered by a user, thus speeding the calculations required to break the codes. Called a time-memory trade-off, the situation means that an attacker with an abundance of computer memory can reduce the time it takes to break a secret code. Users can protect themselves against the attack by adding non-alphanumeric characters to a password. Philippe Oechslin, one of the researchers, said he hadn't notified Microsoft of the issue before publishing the paper.

2003-11-12 **cryptanalysis crack password Kansas auditor IT poor planning**

NIPC/DHS

November 07, Government Computer News — Kansas auditors crack 1,000 passwords.

The Kansas Health and Environment Department has serious IT security and disaster recovery problems, the state's legislative auditor has found. The auditors said they used password-cracking software to decipher more than 1,000 of the department's passwords-including several administrative passwords-or 60 percent of the total, in three minutes. The department began fixing the security weaknesses and other problems found in its systems as soon as it learned of them, department secretary Roderick L. Bremby said in response to the report. "The department's anti-virus system was badly flawed, allowing computers to become infected with a large number of different viruses, worms and Trojan horses," said the report. "The department's firewall was poorly configured, creating several large holes in and out," the report said. Auditors found that the department lacked or failed to enforce many basic security policies, such as procedures for incident response, physical security, configuration documentation and former-user account deletion. They also found several major problems with security planning.

2005-05-17 **hyperthreading multiprocessor architecture shared cache decryption cracking timing attacks encryption weakness cryptanalysis**

RISKS; http://www.daemonology.net/papers/htt.pdf 23 88

HYPERTHREADING AND SHARED CACHE ALLOW TIMING ATTACKS ON ENCRYPTION KEYS

Olin Sibert reported on public announcements about an unexpected consequence of hyperthreading multiple Intel Pentium 4 processors using shared cache:

Security researcher Colin Percival recently (13 May) announced a security vulnerability caused by the combination of the Hyperthreading and shared cache features of Intel Pentium 4 processors. By carefully measuring the time required for instructions to execute in one thread while the other thread is performing a cryptographic calculation, the secret key can be determined.

. . . .

Sibert concluded, "The RISK here is a classic example of relying on underlying abstractions (the hardware memory model) to behave in an ideal manner, rather than understanding their implementations. Many security flaws result from the adversary breaking the veil of abstraction to look at the soft, juicy parts inside. Even when the higher-level model is perfect (or formally verified), the mapping to implementation can hide a multitude of sins."

>This vulnerability was also announced by Adi Shamir during the Cryptographer's Panel at RSA in February 2005. I thought it was the most interesting item in all the keynotes (although the hash function announcements were a close second), but it got essentially no press coverage (unlike this time, where it is being widely reported). Adi subsequently told me that he had a working implementation and planned to present it at the Eurocrypt rump session next week. The two attack implementations (Colin's and Adi's) are apparently quite different, but yield the same result, underscoring the severity of the problem. It's also similar to Paul Kocher's classic timing attacks.

The problem is particularly bad for processors with simultaneous multithreading ("Hyperthreading"), since that allows context switches to take place at a granularity of individual instructions, and thus allows very fine-grained time measurements. However, the same basic problem is present in any computer with a cache that is physically shared by processes in different security domains.<

1997-06-19 **cryptanalysis DES brute force parallel**

PR Newswire

The 56-bit DES encryption standard, long claimed adequate by the U.S. Government, was shattered in early June using 14,000 computers; the winning key was found by Michael K. Sanders, an employee of iNetZ, a Salt Lake City, Utah-based online commerce provider using an ordinary Pentium PC. Sanders was part of a loosely organized group of computer users responding to the "RSA $10,000 DES Challenge." The code-breaking group distributed computer software over the Internet for harnessing idle moments of computers around the world to perform a "brute force" attack on the encrypted data. The cracking effort required four months to decrypt a single message. The key happened to be about 25% of the way through the keyspace; on average, such a crack would be expected to run through half the keyspace. RSADSI's Jim Bidzos interpreted the exercise as a triumph: "We've been saying for a long time that DES is no longer secure and here is the proof." Other observers suggested that four months and 14,000 computers running in parallel to decipher a single message seems like evidence of pretty effective encryption — as long as the confidentiality of the message were to evaporate within a few months.

Category 42 *Crypto algorithms (weakness, brute-force attacks, implementation flaws)*

1998-02-27 **brute force cryptanalysis crypto DES cracking parallel**

RISKS 19 60

The 56-bit DES-II-1 challenge thrown down by RSA Data Security Inc. was completed by a massively-distributed array of computers coordinating their brute-force attacks via the distributed.net "organization." The cleartext was "Many hands make light work." The participants collectively examined 6.3 x 10^16 keys — fully 90% of the entire keyspace — in about 40 days. Conclusion: "56-bit DES is no longer sufficient for protecting valuable information" according to David McNett, a project leader. The estimated collective computer power in distributed.net was roughly equivalent to 41,712 Intel Pentium 166 MHz processors.

1998-04-14 **encryption flaw cellular phone**

EDUPAGE

The new GSM digital cell phones turned out to be vulnerable to cryptographic attack if the attacker has access to the smart card ("SIM", for Subscriber Identification Module) required to operate the phones. In a spirited rebuttal, the North American GSM Alliance, LLC (the eight largest GSM network operators in the United States and Canada) provided the following assertions (with explanations that reassured this reader, at least):
1. GSM phones are not vulnerable to cloning (digital network software precludes multiple concurrent use of the same identifier).
2. There is no risk to subscribers.
3. There is no risk of over-the-air eavesdropping (the encryption algorithms are strong).
4. The ability to copy a SIM card is nothing new (and useless anyway because of the single-use algorithms).
5. The key code which protects a subscriber identity is not "fatally flawed." (Among other arguments, the authentication code broken by the cryptanalysts is not the algorithm used for encrypting conversations.)

Category 42 *Crypto algorithms (weakness, brute-force attacks, implementation flaws)*

1998-06-28 **cryptanalysis cracking SSL secure sockets layer**

EDUPAGE

Lucent Technologies, the business unit broken out of AT&T and including Bell Labs, announced that a staff scientist had cracked the Secure Sockets Layer. SSL is the protocol used for linking a Web browser securely to a Web server. The attack requires a physical connection to the targeted server and involves bombarding the server with about a million specific different messages and analyzing the responses. Patches appeared within days. In August, IBM announced that two researchers had invented a defensive mechanism, the Cramer-Shoup method, to defeat these "active" attacks.

Category 42 *Crypto algorithms (weakness, brute-force attacks, implementation flaws)*

1998-07-17 **cryptanalysis DES weakness keyspace 56-bit brute force**

RISKS 19 87

Matt Blaze offered a prize of "56 bits" ("2 bits" = $0.25 for you non-USAns) or $U7.00 for locating a DES key that would convert a ciphertext with a repeating pattern into a plaintext with a repeating pattern: "In particular, I wanted a DES key such that some ciphertext block of the form <XXXXXXXX> decrypts to a plaintext block of the form <YYYYYYYY>, where X and Y represent any fixed eight-bit byte value repeated across each of the eight bytes of the 64 bit DES codebook block." Blaze explained, "Finding a key of this form would require either computational effort approximately equal to searching the DES keyspace or discovering a new cryptanalytic technique against DES. Knowing such a key would therefore demonstrate that it is feasible to mount an exhaustive search against the DES keyspace or that there is some weakness in DES that allows keys to be found analytically." The prize was won by John Gilmore of the EFF, working with Deep Crack, the multiprocessor parallel computation array in a few days of search. The solution was, "With a (parity-padded) key of 0E 32 92 32 EA 6D 0D 73, the plaintext of 8787878787878787 becomes the ciphertext 0000000000000000".

Category 42 *Crypto algorithms (weakness, brute-force attacks, implementation flaws)*

1998-07-19 **cryptanalysis brute force parallel array supercomputer DES**

EDUPAGE

John Gilmore, Paul Kocher and a dozen other scientists created a massively parallel array of 1500 special-purpose DES-cracking processors for about $250K and set it to work cracking a message encrypted using the DES. It took them only 56 hours to scan about a quarter of the keyspace and locate the correct key to decrypt the ciphertext established by RSA Data Security Inc. as the object of the latest cryptanalysis contest. The EFF supported the effort financially and estimates that with the fruits of research in hand, the next parallel array would cost only about $50K.

1999-01-20 **cryptanalysis parallel processing crack DES challenge**

RISKS 20 17

The latest RSA challenge on cracking a message encrypted using the 56-bit DES algorithm was solved in about 22 hours by John Gilmore and the EFF's Deep Crack massively-parallel computing system and with the help of almost 100,000 volunteers around the world who attacked different parts of the keyspace. The EFF reported that the average search speed was 240 billion keys per second. Cryptographers agreed that the 56-bit DES is now inadequate as a method for securing data transmissions. The EFF won the grand prize of $10,000 for the feat.

1999-02-15 **PKI public key infrastructure dirty pair private criminal hackers**

INTERNETWEEK; Cylink http://www.cylink.com/library/white/sterilize.htm

According to scientists at Cylink, a network security vendor, it is possible for criminal hackers to develop "dirty" public/private key pairs to trick users of e-commerce. The scam would create keypairs that would allow different messages to have the same digital signature block; a criminal could thus spoof an authentic message by working backwards from the signature block, send the fraudulent message to the intended victim, and cause the public key cryptosystem to report a valid signature. The company recommended that proposed public keys be "sterilized" by a certification authority that would insert randomized data into the keys and provide mechanisms for legitimate users to modify their private keys accordingly.

1999-12-04 **encryption crack algorithm weakness DVD unlock movie**

Newsbytes

IBM, Intel, Matsushita Electric, and Toshiba, the member of the 4Cs industry group (the 4C Group soon became the 5C Group with the addition of Hitachi), chose a digital watermark standard for DVD-audio in June. However, in early November, the DVD Content Scrambling System (CSS) was cracked. The CSS was supposed to protect digital video disks against unauthorized duplication through a set of interlocking encryption keys and algorithms on the disks and in the players. The free DeCSS program, widely circulated on the Net, completely bypasses the encryption system. According to Mike Musgrove, writing for Newsbytes, "XingDVD Player, a program from Xing Technologies, a subsidiary of RealNetworks Inc., reportedly left this CSS software unscrambled — somewhat like leaving an extra set of car keys on the passenger seat. A small team of computer programmers in Norway used this vulnerability to design the DeCSS software. A spokesman for RealNetworks did not have a comment at press time."

In December, Matsushita Electric Industrial Co. and JVC announced a six-month delay in releasing their DVD-audio players because of concerns over protection of intellectual property. This was described in the press as the first case in which a cracked encryption scheme delayed a significant consumer-electronic product release. However, some sceptics noted that the music industry had already expressed reservations about supporting the CSS2 (the Content Scrambling System version used in protecting audio tracks), which was felt to be insecure.

[MK comments: This case demonstrates the foolishness of not posting cryptographic algorithms in public for strong analysis and testing. As Dorothy Denning said years ago , the security of an encryption algorithnm must not depend on its obscurity.]

1999-12-06 **cellular phone encryption algorithm cryptanalysis flaw bug weakness vulnerability**

Wired http://wired.lycos.com/news/print/0,1294,32900,00.html

Alex Biryukov and Adi Shamir of the Weizmann Institute in Israel published a paper showing how a simple PC was able to break the A5/1 encryption algorithm used in the GSM cryptosystem for cell phones in less than a second. Estimates were that more than 230 million cellular phones made by Ericsson, Motorola, Nokia, Siemens and other popular brands were vulnerable to such decryption. However, manufacturers pointed out that no one has ever demonstrated an ability to intercept a GSM phone call in real time, so the ability to decrypt the calls remains of academic interest. This assertion was challenged immediately by experts who pointed to easily-available, inexpensive scanner devices that successfully intercept GSM communications. Other spokespersons for the industry said that they would move to using published algorithms rather than relying on proprietary, secret algorithms for future encryption standards in the industry.

Category 42 *Crypto algorithms (weakness, brute-force attacks, implementation flaws)*

2000-02-28 **encryption algorithm implementation broken cryptanalysis weakness DVD**

Crypto-gram 99 11

In late 1999, the DVD content-protection scheme called CSS (Content Scrambling System) was cracked and software to do so made available freely on the Internet. Cryptographer Bruce Schneier published a cogent summary of the situation in his Crypto-gram newsletter 99-11 < http://www.counterpane.com/crypto-gram-9911.html >. He explained that the problem lay in the fundamental model. Each DVD player has one of 400 different unlock keys. Every DVD has a decryption key that is required to read the data. The decryption key is encrypted 400 times — once with each of the unlock keys that could be present on any given DVD player. Unfortunately, this scheme fails because the computer must be able to put those keys into memory— and once in memory, a specially-crafted program can necessarily snaffle the decryption key. Schneier comments, "It might be a bitter pill for the entertainment industry to swallow, but software content protection does not work. It cannot work. You can distribute encrypted content, but in order for it to be read, viewed, or listened to, it must be turned into plaintext. If it must be turned into plaintext, the computer must have a copy of the key and the algorithm to turn it into plaintext. A clever enough hacker with good enough debugging tools will always be able to reverse-engineer the algorithm, get the key, or just capture the plaintext after decryption. And he can write a software program that allows others to do it automatically. This cannot be stopped." The only way protection can work in such a scheme is to put the algorithm into the hardware, he wrote — and it would have to extend to the monitor itself.

2003-04-14 **cryptography history award scientists future trends fundamentals**

ACM; NWF http://www.nwfusion.com/newsletters/sec/2004/0503sec1.html

The famous cryptographers Leonard Adleman, Ronald Rivest, and Adi Shamir - the developers of the RSA encryption code - received the Association for Computing Machinery's 2002 Turing Award "for their seminal contributions to the theory and practical application of public-key cryptography." Their Turing Award lectures, given last June, are available online.

Rivest, Shamir and Adleman implemented public-key cryptography in the 1970s following the landmark work of Whitfield Diffie, Martin Hellman and Ralph Merkle. They then founded RSA Security, which became one of the most respected security companies in the world.

The distinguished scientists' lectures are available online in a variety of formats at:
http://www.acm.org/awards/turing_citations/rivest-shamir-adleman.html

It was exhilarating to listen to these brilliant people speaking to us, and I hope some of you will have an hour to spare to enjoy their lectures.

Category 42.1 *Crypto algorithm weaknesses*

1997-03-20 **cryptanalysis eavesdropping cellular phone**

NYT

Cryptanalysts David Wagner (University of California at Berkeley), Bruce Schneier and John Kelsey (both of Counterpane Systems) announced that they had successfully cracked the proprietary encryption incorporated into the new generation of digital phones. The cryptographers strongly criticized industry for trying to secure systems without opening their algorithms to public scrutiny. Said famed author Schneier, ""Our work shows clearly why you don't do this behind closed doors. I'm angry at the cell phone industry because when they changed to the new technology, they had a chance to protect privacy and they failed." An additional criticism of the way the cell-phone industry incorporated encryption was that it deliberately adopted a weak standard to comply with U.S. government regulations forbidding the export of strong cryptography. John Markoff, writing in the New York Times, quoted James X. Dempsey, senior staff counsel for the Center for Democracy and Technology as saying, "This should serve as a wake-up call. . . . This shows that Government's effort to control encryption technology is now hindering the voice communications industry as well as the data and electronic communication realm."

Category 42.1 *Crypto algorithm weaknesses*

1997-03-20 **cellular-phone crypto**

RISKS 18 92

Bruce Schneier and colleagues at UC Berkeley announced in March that the most advanced digital cellular phones in use today have a flawed cryptographic algorithm, the Cellular Message Encryption Algorithm (CMEA), that can allow an eavesdropper with a PC to crack the conversations in minutes. The scientists blame the flaw on the closed-door, secret process in which the algorithm was implemented and make a plea for open analysis of cryptographic algorithms. They criticize pressure from the US government that they argue pushed the developers into the closed-door development.

2000-03-27 **encryption algorithm weakness decryption e-commerce**

RISKS 20

Stephen King's electronically-distributed book, _Riding the Bullet_, was released in encrypted form on the Web; decrypted formats quickly appeared. As Peter G. Neumann commented in RISKS, the incident provided " stark evidence of security weaknesses in PC-based eBook distribution systems" and "The episode has irked the companies developing such systems, who complain that export restrictions have kept them from using more powerful encryption techniques."

Category 42.1 *Crypto algorithm weaknesses*

2000-03-31 **e-book electronic book cryptography crack**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB954465411569087773.htm/t000030180.html

Computer hackers cracked the software code that was designed to prevent multiple downloads of Stephen King's "Riding the Bullet" novella, confirming publishers' worries over the dangers inherent in electronic publishing. The e-book's publisher, Simon & Schuster, confirmed that at least two hackers downloaded the software necessary to read the book from Glassbook Inc., one of the Web companies given rights to distribute the book, and managed to break the encryption code that prevented more than one customer from having access to each electronic copy sold. Pirated copies of the book were then distributed to about six Web sites and chat groups. The publisher contacted many of the Internet service providers hosting the sites and had them shut down. "All the publishers are well aware there is no perfect technical solution to this problem," says Glassbook president Len Kawell. "We will do our best with technology; the rest is a matter of patrolling." (Wall Street Journal 31 Mar 2000)

2000-07-21 **cryptanalysis cracking DVD scrambling hackers free speech litigation lawsuit**

Edupage, EE Times, NewsScan, New York Times, Los Angeles Times
http://www.latimes.com/business/20000818/t000077486.html

Over the course of 1999, several groups posted information about flaws in the Content Scrambling System (CSS) developed for DVD video players by the 4C group (IBM, Intel, Matsushita, Toshiba). The DeCSS software posted on the Net led to cancellation of the planned December 1999 launch of DVD-audio players (which use a related encoding scheme called CSS2) and postponed release of the new devices until mid-2000. Respected cryptographer Bruce Schneier pointed out that any decoding scheme suffers from a fatal weakness: the decoded data stream must be available somewhere to be able to display pictures or generate sound. Even the decryption keys, he argued, are available in cleartext in memory. ". . . [S]oftware content protection does not work. It cannot work," he said. Nonetheless, in January 2000, the Motion Picture Association of America (MPAA) sued the criminal-hacker support publication 2600.com and several Web site owners to get DeCSS program allegedly written by Norwegian teenager Jon Johansen off the Net. Free-speech advocates at the Electronic Frontier Foundation (EFF) argued that the copy-protection scheme should not be granted legal protection; 2600 called for street protests. The organization's Web site claimed that A missive on the 2600.com Website, meanwhile, claims that the issue was "whether you have the right to play DVDs on the computer of your choice and whether you should be able to see DVDs from other countries." The plaintiffs argued that the tool was promoting outright theft of their intellectual property.

[In July,] Eight movie studios . . . [went] to court charging that Eric Corley, who publishes the computer hacker magazine and Web site called "2600," has violated the law by distributing software that breaks the code used to encrypt DVDs. An attorney for the studios warned: "The threat of world copying is here and the process has begun. It will become an avalanche unless this court acts." A warning of a different kind came from the defendant's attorneys, who argued that a decision for the plaintiff would mean the end of "fair use," the concept that allows for limited and prescribed exceptions to general copyright rules. (New York Times 18 Jul 2000)

The Norwegian teenaged programmer Jon Johansen, who with two colleagues created the DeCSS software that breaks the encryption coding of DVD files, was called as a witness in the New York trial in which Hollywood studios are suing Long Island-based programmer Eric Corley for distributing the DeCSS software on the Internet, thereby encouraging illegal use of copyrighted movies. Corley's lawyer and the Electronic Frontier Foundation are defending his actions as an exercise of the Constitution's First Amendment right to freedom of speech. They argue that Corley never used DeCSS to pirate a movie, and that in fact to use the software to pirate movies would be impractical. (New York Times 21 Jul 2000)

[In August,] A federal judge ruled . . . against [the publisher of 2600, The Hacker Quarterly,] who posted software code that could be used to disable the electronic locks on DVDs, ordering defendant Eric Corley to remove the code from his 2600.com Web site as well as all links to other sites that post the DeCSS decryption code. The ruling came as a sweeping vindication of the entertainment industry's ongoing battle against piracy of copyrighted works. ". . . [The] landmark decision nailed down an indispensable constitutional and congressional truth: It's wrong to help others steal creative works," said Jack Valenti, chairman of the Motion Picture Association of America. The Electronic Frontier Foundation, which funded Corley's legal expenses, expressed surprise that the judge had also banned the links to other sites in his decision. "He is carving out a new exception for software under the 1st Amendment," said an EFF spokeswoman. (Los Angeles Times 18 Aug 2000)

Category 42.1 *Crypto algorithm weaknesses*

2000-08-09 **intellectual property IP DVD encryption algorithm crack**

NewsScan, Washington Post http://www.washingtonpost.com/wp-dyn/articles/A58594-2000Aug8.html

Fearful that increasing numbers of pirated movies will be swapped on the Internet, Hollywood studios and the DVD industry have taken legal action against a Norwegian teenager who wrote code to break the encryption of DVD files. The suit also names as defendant the hacker magazine that posted the code on its Web site, as well as dozens of other Web sites that reposted it. Jack Valenti of the Motion Picture Association of America says: "We're putting a stake in the ground and saying you can't do this. You can't break this code, you can't put the code on the Internet, you can't have file-sharing with movies the way you do with music. We're going to protect our copyright." Duke University law professor James Boyle sees the MPAA position as a novel use of copyright law, since it targets the medium rather than the message: ""People think of copyright as prohibiting certain actions. You can't copy too much of something, you can't perform something without permission. What the content companies are starting to do is use copyright to regulate devices and research and communication. So now you can't communicate about a computer code." (Washington Post 9 Aug 2000)

Category 42.1 *Crypto algorithm weaknesses*

2001-07-26 **cryptography weakness wireless protocol WEP 802.11 eavedropping cracking known-ciphertext attack**

RISKS 21 55

Famed cryptographer Adi Shamir (the "A" in "RSA") announced a new paper on weaknesses in WEP (Wired Equivalent Privacy):

"WEP is the security protocol used in the widely deployed IEEE 802.11 wireless LAN's. This protocol received a lot of attention this year, and several groups of researchers have described a number of ways to bypass its security.

Attached you will find a new paper which describes a truly practical direct attack on WEP's cryptography. It is an extremely powerful attack which can be applied even when WEP's RC4 stream cipher uses a 2048 bit secret key (its maximal size) and 128 bit IV modifiers (as proposed in WEP2). The attacker can be a completely passive eavesdropper (i.e., he does not have to inject packets, monitor responses, or use accomplices) and thus his existence is essentially undetectable. It is a pure known-ciphertext attack (i.e., the attacker need not know or choose their corresponding plaintexts). After scanning several hundred thousand packets, the attacker can completely recover the secret key and thus decrypt all the ciphertexts. The running time of the attack grows linearly instead of exponentially with the key size, and thus it is negligible even for 2048 bit keys."

Peter G. Neumann wrote, "Matt Blaze . . . put Adi's paper at < http://www.crypto.com/papers/others/rc4_ksaproc.ps >. . . ."

Rubin and colleagues published another relevant paper a week later; in RISKS, Rubin wrote the following:

Using the Fluhrer, Mantin, and Shamir Attack to Break WEP by Adam Stubblefield, John Ioannidis, and Aviel D. Rubin

We implemented an attack against WEP, the link-layer security protocol for 802.11 networks. The attack was described in a recent paper by Fluhrer, Mantin, and Shamir. With our implementation, and permission of the network administrator, we were able to recover the 128-bit secret key used in a production network, with a passive attack. The WEP standard uses RC4 IVs improperly, and the attack exploits this design failure. This paper describes the attack, how we implemented it, and some optimizations to make the attack more efficient. We conclude that 802.11 WEP is totally insecure, and we provide some recommendations.

http://www.cs.rice.edu/~astubble/wep/

2001-08-06 **cryptographic algorithm weakness e-commerce Passport single signon**

RISKS 21 58

David P. Kormann and Aviel D. Rubin, Risks of the Passport Single Signon Protocol, IEEE Computer Networks, volume 33, pages 51-58, 2000.

. . .

Abstract:

Passport is a protocol that enables users to sign onto many different merchants' web pages by authenticating themselves only once to a common server. This is important because users tend to pick poor (guessable) user names and passwords and to repeat them at different sites. Passport is notable as it is being very widely deployed by Microsoft. At the time of this writing, Passport boasts 40 million consumers and more than 400 authentications per second on average. We examine the Passport single signon protocol, and identify several risks and attacks. We discuss a flaw that we discovered in the interaction of Passport and Netscape browsers that leaves a user logged in while informing him that he has successfully logged out. Finally, we suggest several areas of improvement.

2001-08-15 **encryption algorithm cracked weakness decryption video chilling effect lawsuits DMCA HDCP**

RISKS 21 60

Monty Solomon wrote in RISKS that a video crypto standard was reported cracked:

"Noted cryptographer Niels Ferguson says he's broken Intel's vaunted High-bandwidth Digital Content Protection (HDCP) Digital Video Encryption System, but fear of U.S. law is keeping him silent on the details. HDCP connects digital cameras, high-definition televisions, cable boxes, and video disks players. [Source: Article by Ann Harrison, 13 Aug 2001, PGN-ed; http://www.securityfocus.com/news/236]"

Peter G. Neumann added: [Intel has not threatened him, but he can still be sued by the U.S. Govt under DMCA, or by the motion-picture industry. His comments are at < http://www.macfergus.com/niels/dmca/index.html >. Knowledge that it is (or might be) breakable is likely to result in other folks doing it, and perhaps posting it anonymously in some non-US Web site. The globalization of the Internet is clearly going to be an increasingly difficult problem for industries trying to defend information supposedly protected under flawed standards. . . .]

Niels Ferguson wrote an essay in RISKS 21.60 entitled, "Censorship in action: why I don't publish my HDCP results ." Some excerpts:

I have written a paper detailing security weaknesses in the HDCP content protection system. I have decided to censor myself and not publish this paper for fear of prosecution and/or liability under the US DMCA law.

Introduction

My name is Niels Ferguson. I'm a professional cryptographer. My job is to design, analyse, and attack cryptographic security systems, a bit like a digital locksmith. I work to make computer systems and the Internet more secure. You would think that people would be in favour of that, right?

Computer security and cryptography are hard. It is easy to make mistakes, and one mistake is all it takes to create a weakness. You learn from your mistakes, but there are too many mistakes to make them all yourself. That's why we publish. We share our knowledge with others, so that they don't have to repeat the same mistake. Take a look at < http://www.macfergus.com/niels/dmca/index.html../pubs/publist.html> my publications. You will see a mixture of new designs, analyses, and attacks. This is how we learn and how we improve the state of the art in computer security.

HDCP

Recently I found the documentation of the < http://www.digital-cp.com> High-bandwidth Digital Content Protection (HDCP) system on the Internet. HDCP is a cryptographic system developed by Intel that encrypts video on the DVI bus. The DVI bus is used to connect digital video cameras and DVD players with digital TVs, etc. The aim of HDCP is to prevent illegal copying of video contents by encrypting the signal.

HDCP is fatally flawed. My results show that an experienced IT person can recover the HDCP master key in about 2 weeks using four computers and 50 HDCP displays. Once you know the master key, you can decrypt any movie, impersonate any HDCP device, and even create new HDCP devices that will work with the 'official' ones. This is really, really bad news for a security system. If this master key is ever published, HDCP will provide no protection whatsoever. The flaws in HDCP are not hard to find. As I like to say: "I was just reading it and it broke."

[Later in the paper, Ferguson pens a cogent attack on the very premise of the DMCA (Digital Millennium Copyright Act):]

The DMCA imposes a serious restriction on the freedom of speech. The DMCA makes it illegal to talk about certain security systems. The equivalent law for non-digital protection systems would make it illegal to warn people about a cheap and very weak door lock being installed on their houses because criminals could also use that same information.

In western society we restrict the freedom of speech only for very serious reasons, and after careful consideration. For example, it is illegal to shout "fire" in a crowded theatre, or to ask someone to commit a murder. The DMCA restricts the freedom of speech because the movie industry is afraid of losing money. Below I will argue that the DMCA does not achieve that goal, but that aside: do we really want to sell our freedom of speech for money?

The DMCA is a scary development. Next time that commercial interests clash with the freedom of speech, the industry will point to the DMCA and claim they need equivalent protection. They might outlaw the publication of a report detailing bad safety features in a car, or of flaws found in a particular brand of tires. After all, those publications harm industry too. Where will it stop?

[I encourage everyone interested in the DCMA to read the entire text of this essay, which is available at < http://www.macfergus.com/niels/dmca/index.html >. -- MK]

2002-02-15 **wireless networks Wi-Fi 802.1x WEP vulnerabilities implementation man-in-the-middle attacks interception session hijacking**

RISKS 21 92

From an article by Ephraim Schwartz in InfoWorld, Thursday, February 14, 2002 as reported in RISKS by Monty Solomon:

Researchers Claim to Crack Wi-Fi Security; Proponents deny wireless networking spec is vulnerable to hijack, authentication attacks.

A University of Maryland professor and his graduate student have apparently uncovered serious weaknesses in the next-generation Wireless Fidelity security protocol known as 802.1x. In a paper, "An Initial Security Analysis of the IEEE 802.1X Standard" funded by the National Institute of Standards, Professor William Arbaugh and his graduate assistant Arunesh Mishra outline two separate scenarios that nullify the benefits of the new standard and leave Wi-Fi networks wide open to attacks. The use of public access "hot spots" are particularly vulnerable to session hijacking because these locations do not even deploy the rudimentary Wired Equivalent Privacy protocol. "This problem exists whether you use WEP or not, but it is trivial to exploit if not using WEP," said Arbaugh.

Flaws Described

Dubbed "session hijacking" and "man-in-the-middle," both attacks basically exploit inherent problems in Wi-Fi as well as exploiting how the new 802.1x standard is designed. "Here's how session hijacking works. The hacker waits for someone to finish successfully the authentication process. Then you as the attacker send a disassociate message, forging it to make it look like it came from the AP [access point]. The client [user] thinks they have been kicked off, but the AP thinks the client is still out there. As long as WEP is not involved you can start using that connection up until the next time out, usually about 60 minutes," said Arbaugh. [...]

2002-03-10 **weak encryption vulnerabilities ICAT CVE**

ICAT Metabase

The ICAT Metabase < http://icat.nist.gov/icat.cfm > for the Common Vulnerabilities and Exposures (CVE) database reported 10 vulnerabilities involving weak encryption out of a total of 1241 for the period from 1 Jan 2001 to 10 Mar 2002. This represents about 1% of all vulnerabilities logged for that period. Overall, for the entire period since the CVE began recording vulnerabilities in 1995, weak encrytion is named in 51 of the 3677 vulnerabilities or about 1% of the total. The vulnerabilities listed for 2001 and up to 10 Mar 2002 are as follows:

CAN-2001-1005: Starfish Truesync Desktop 2.0b as used on the REX 5000 PDA uses weak encryption to store the user password in a registry key, which allows attackers who have access to the registry key to decrypt the password and gain privileges. Published Before: 8/31/2001 Severity: Medium

CAN-2001-1003: Respondus 1.1.2 for WebCT uses weak encryption to remember usernames and passwords, which allows local users who can read the WEBCT.SVR file to decrypt the passwords and gain additional privileges. Published Before: 8/31/2001 Severity: Medium

CAN-2001-0983: UltraEdit uses weak encryption to record FTP passwords in the uedit32.ini file, which allows local users who can read the file to decrypt the passwords and gain privileges. Published Before: 8/31/2001 Severity: High

CAN-2001-0618: Orinoco RG-1000 wireless Residential Gateway uses the last 5 digits of the 'Network Name' or SSID as the default Wired Equivalent Privacy (WEP) encryption key. Since the SSID occurs in the clear during communications, a remote attacker could determine the WEP key and decrypt RG-1000 traffic. Published Before: 8/2/2001 Severity: High

CAN-2001-0352: SNMP agents in 3Com AirConnect AP-4111 and Symbol 41X1 Access Point allow remote attackers to obtain the WEP encryption key by reading it from a MIB when the value should be write-only, via (1) dot11WEPDefaultKeyValue in the dot11WEPDefaultKeysTable of the IEEE 802.11b MIB, or (2) ap128bWepKeyValue in the ap128bWEPKeyTable in the Symbol MIB. Published Before: 7/21/2001 Severity: Medium

CAN-2001-0382: Computer Associates CCC\Harvest 5.0 for Windows NT/2000 uses weak encryption for passwords, which allows a remote attacker to gain privileges on the application. Published Before: 6/18/2001 Severity: High

CAN-2001-0133: The web administration interface for Interscan VirusWall 3.6.x and earlier does not use encryption, which could allow remote attackers to obtain the administrator password to sniff the administrator password via the setpasswd.cgi program or other HTTP GET requests that contain base64 encoded usernames and passwords. 2005-02-16 **Chinese researchers break compromise SHA-1 secure hash algorithm SHA-256 SHA-512 NIST recommendations**

DHS IAIP Daily; http://www.eetimes.com/article/showArticle.jhtml?articleId=60401254

CHINESE RESEARCHERS CLAIM TO HAVE COMPROMISED SHA-1 HASHING ALGORITHM.

A team of three Chinese researchers claim to have compromised the SHA-1 hashing algorithm at the core of many of today's mainstream security products. Top cryptographers said users can still rely on today's SHA-1-based systems and applications, but next-generation products will need to move to new algorithms. In a panel discussion at the RSA Conference on Tuesday, February 15, Adi Shamir, a celebrated cryptographer and professor at Israel's Weizmann Institute of Science, said he received an e-mail that morning containing a draft technical paper from the research team of Xiaoyun Wang, Lisa Yiqun Yin, and Hongbo Yu who have links to Shandong University in China. The paper described how two separate documents could be manipulated to deliver the same SHA-1 hash with a computation of lower complexity level than previously believed possible. Shamir and others said they believe the work of the Chinese trio will probably be proven to be correct based on their academic reputations, although details of the paper are still under review. Perhaps anticipating the news, the National Institute of Standards and Technology issued a recommendation earlier this month that developers move to SHA-256 and SHA-512 algorithms by 2010.

Channel4000.com http://www.channel4000.com/news/stories/news-20000217-164727.html

In Minneapolis, David Thomas Bell (33) was charged with 15 felony charges of unauthorized computer access, theft of trade secrets, attempted theft of trade secrets, computer theft, and possession of burglary tools. Nicole Lin Brelje (28) was charged with four felony counts. The defendants were accused of stealing a client list from Bell's former employer so they could take their business to Bell's and Brelje's new employer; the victim estimated the value of that list at $2.5M. Investigation also suggested that Brelje had helped Bell run L0phtCrack, a password-guessing program, on their new employer's system. Bruce Schneier commented in his Crypto-Gram for 2000-03-15 < http://www.counterpane.com/crypto-gram-0003.html > that the interesting aspect of the case was the charge that using L0phtCrack constituted possession of burglary tools.

GM TO LINK IBM UNIX MACHINES INTO SUPERCOMPUTER
General Motors is buying 10 high-performance Unix computers from IBM and plans to link them together to form one of the world's most powerful supercomputers. GM plans to use the supercomputer to run a range of simulations, from crash tests to noise measurements, and said the new system will quadruple its supercomputing capacity. GM's new system is "a fairly dramatic deployment of technology," says a senior marketing analyst, who notes that using supercomputers to simulate automobile performance is much quicker and cheaper than building prototypes. It will also make it easier for GM to "engage in limited production-run products" for specialty cars. (Wall Street Journal 29 Aug 2002)

TIME MACHINES FOR A NEW CENTURY
Wolfgang Grentzsch of Sun Microsystems thinks that grid computing (which links large numbers of computers into a giant grid-like single system) should be thought of as "time machines," because they will speed up our perception of the world — just as the steam engine and the internal combustion engine speeded up travel and our sense of time. "On the grid, you can do things much, much faster, and you can do things you never were able to do before." Things like virtual tests of new drugs, which could change all the current equations in the nation's health care delivery system. IBM's Dan Powers says that the longer-term vision of grid computing is basically about "the virtualization of information technology." (Reuters/USA Today 29 Aug 2002

GRIDS ARE THE 'JET-AGE' MODEL OF COMPUTING
Grid computing, which links individual computers into a network that harnesses the power of surplus processing cycles and applies them to new tasks, is gaining wider acceptance. Computer scientist Larry Smarr of the University of California at San Diego explains: "Today's Internet could be thought of as a Polynesian model, where you have all these islands, and people use canoes to get from one to another. We're changing that to a jet-age model, where you can get from one city to another traveling at speeds far greater than what you travel at once you get into the city itself." Smarr and colleagues in Illinois are building an "OptIPuter" — a computing grid to connect the University of San Diego with Illinois universities. The OptIPuter project is buying an optical-switching router made by a Texas company called Chiaro Networks. Smarr says: "University researchers can generate some market demand for these products and help get companies like Chiaro through the desert until the commercial economy picks up again." (KRT/San Jose Mercury News 18 Dec 2002)

IBM GRIDS UP FOR BATTLE
Looking at developing new markets that will generate big computer-services business, IBM is launching ten new grid computing initiatives targeted at niche markets where grid technology is being welcomed by early adopters. (Grid computing salvages the unused processing cycles of large numbers of networked computers to allow massing sharing of data storage and computer power.) As part of the initiatives IBM has formed alliances with Toronto-based Platform Computing and New York-based DataSynapse, as well as with Avaki, Entropia, and United Devices. RISKS; http://www.theregister.com/2005/01/31/rfid_crypto_alert/ 23 69

KERCHOFF RULES

Chris Leeson summarized the predictable failure of a proprietary encryption algorithm:

According to an article in *The Register*, the security on RFID devices used in car keys and petrol pump payment systems has been broken (the article actually says "Researchers have discovered cryptographic vulnerabilities in the RFID technology…"

The encryption uses "an unpublished, proprietary cipher that uses a 40-bit key".

The researchers managed to reverse-engineer the system and program a microchip to do the decoding in 10 hours. Using 16 of the chips in parallel reduced the search time to 15 minutes. At about $200 per chip that's not an expensive brute force attack.

The article notes that although potential criminals could make fraudulent petrol charges and deactivate vehicle immobilisation systems, they would still have top get past physical locks in the car.

Provided that the car has them, of course.

I can't resist quoting from the last two paragraphs:

> "The team recommends a program of distributing free metallic sheaths to cover its RFID devices when they are not being used in order to make attacks more difficult.
>
> The company that markets ExxonMobil's SpeedPass system has said it has no knowledge that any fraudulent purchases have ever been made with a cloned version of its device."

The Risks? Well, apart from the fairly obvious security/fraud issues, it does seem to me that this is using technology for technology's sake. When I want to disarm the alarm on my car, I point the remote at it and press the button. I don't need an "always on" control…

SECRET SERVICE BUILDS DISTRIBUTED NETWORKING ATTACK TOOL FOR CRYPTANALYSIS

Faced with the increasing prevalence of encrypted evidence on computers seized in criminal investigations, the Secret Service has created a massively parallel computing array using 4,000 "of its employees' computers into the 'Distributed Networking Attack' program." Brian Krebs, writing in the Washington Post and abstracted by Peter G. Neumann of RISKS, reported that "The wide availability of powerful encryption software has made evidence gathering a significant challenge for investigators. Criminals can use the software to scramble evidence of their activities so thoroughly that even the most powerful supercomputers in the world would never be able to break into their codes. But the U.S. Secret Service believes that combining computing power with gumshoe detective skills can help crack criminals' encrypted data caches. Taking a cue from scientists searching for signs of extraterrestrial life and mathematicians trying to identify very large prime numbers, the agency best known for protecting presidents and other high officials is tying together its employees' desktop computers in a network designed to crack passwords that alleged criminals have used to scramble evidence of their crimes -- everything from lists of stolen credit card numbers and Social Security numbers to records of bank transfers and e-mail communications with victims and accomplices."

2005-11-10 **password cracking service hackers online brute force rainbow tables**

EDUPAGE; http://www.theregister.co.uk/2005/11/10/password_hashes/

NEW SERVICE CRACKS PASSWORDS

Three computer hackers have set up a Web site that offers access--for a fee--to so-called rainbow tables, which are said to allow cracking of most passwords. Computers use codes, or hashes, to conceal user passwords. The creators of the RainbowCrack Online Web site spent two years generating hashes for virtually all possible passwords and storing them in vast tables. With the tables, breaking a password becomes as simple as looking up the hashes and working backwards to the password. Developers of RainbowCrack said the service is not intended for malicious uses but as a tool for network administrators to improve the security of their systems. Security expert Bruce Schneier disagreed, saying he doesn't see any "legitimate business demand" for the service. Philippe Oechslin of Swiss firm Objectif Securite said that system designers can easily incorporate elements into password schemes that add sufficient complexity as to make rainbow tables ineffective in cracking passwords. Schneier said that although such changes are not difficult, very few systems are designed to use them. "A lot of systems are weak," he said. The Register, 10 November 2005

2001-03-20 **cryptanalysis public key cryptosystem weakness private key cracking**

RISKS 21 28

David Kennedy, CISSP summarized a report about a major problem with OpenPGP: with access to a PGP user's private keyring, it is possible to obtain the private key and then use it to forge PGP signatures. Kennedy pointed to research by Czech cryptologists published at < http://www.i.cz/en/onas/tisk4.html >. The quoted material included this description of the cryptanalysis: "A slight modification of the private key file followed by capturing a signed message is enough to break the private key. These tasks can be performed without knowledge of the user's passphrase. After that, a special program can be run on any office PC. Based on the captured message,the program is able to calculate the user's private key in half a second. The attacker can then sign any messages instead of the attacked user. Despite of very quick calculation, the program is based on a special cryptographic know-how."

In a later posting to RISKS, Kennedy wrote, "Hal Finney has a succinct analysis posted to the Open-PGP list archived at:
http://www.imc.org/ietf-openpgp/mail-archive/msg04767.html
My [DK's] summary of Hal's analysis:
1. Attackers have to diddle the secret key.
2. Does *not* work with commercial PGP 7.0.3 w/RSA keys (unknown about earlier).
3. Does work with all DSA keys and RSA keys in GPG."

2001-11-09 **cryptography hardware software weakness vulnerability cracking penetration decryption abuse insider crime confidentiality passwords bank automated teller machines**

RISKS 21 74

Andrew Brydon, writing in RISKS, summarized the findings of research on automated banking machine security in Britain: "A serious weakness has been discovered in the methods used by banks to protect the number that lets you get money from a cash machine. Researchers from the University of Cambridge have found that the computer systems which check that these numbers are valid are easy to defeat. They warn that unscrupulous insiders could exploit these weaknesses to raid customer accounts. The researchers have called on banks to revise their security arrangements and use more open procedures to protect customers' cash. . . . The physical construction of the cryptoprocessors is certified to a high standard to ensure that the boxes cannot be forced to give up the keys they use to scramble data. Any physical tampering with the box makes them destroy the keys they use. [However,] security researchers Michael Bond and Richard Clayton have found serious weaknesses in the software cryptoprocessors use to handle the encryption keys as they talk to different programs. ... using the clues provided by the leaky software, the cracking time can be reduced to just 24 hours."

2002-07-12 **PGP plugin encryption flaw bug**

NewsScan

PRETTY POOR PRIVACY FROM NETWORK ASSOCIATES
A computer security company has uncovered a flaw in PGP (Pretty Good Privacy) -- a freely distributed, public key encryption system that's used to scramble e-mail messages -- that could allow malicious users to unscramble sensitive messages. The flaw is found only in PGP plug-ins for Microsoft Outlook users distributed by Network Associates. "The PGP vulnerability enables an attacker to send a specially crafted e-mail to any Outlook address enabled with the PGP plug-in, which will in turn give them access to that system," says eEye Digital Security, which discovered the problem. EEye chief hacking officer Marc Maiffret says the flaw allows an attacker to do "anything a user of that machine could do -- copy files, delete files, install a backdoor." Gartner research director for Internet security John Pescatore says, "This vulnerability means people using [the affected] version of PGP actually are less secure than if they weren't using security at all. It's always a really, really bad thing when a security product has a bug." (NewsFactor Network 11 Jul 2002)

2003-02-24 **e-mail code crack Secure Sockets Layer SSL Swiss Federal Institute Technology**

NIPC/DHS

February 20, Reuters — Swiss crack e-mail code, but minimal impact seen.

Professor Serge Vaudenay of the Swiss Federal Institute of Technology in Lausanne, Switzerland, found a way to unlock a message encrypted using Secure Socket Layer (SSL) protocol technology, according to a posting on the research institute's Web site. However, U.S. cryptography experts said it was not the version of security that most consumers use to shop online. Rather, it is a version that only affects e-mail, is limited in scope, and not widely used, said Professor Avi Rubin, who is technical director of the Information Security Institute at Maryland's Johns Hopkins University. In addition, an attacker would have to be in control of a network computer located in the middle of the two people communicating over which the messages were flowing, he said. ``It's possible, but it has limited applicability," he said. He said patches are already available to fix the hole, which affects one particular mode of OpenSSL. Like all co-called ``open source" software, OpenSSL is free software created by developers who can modify it at any time. Bruce Schneier, chief technical officer at network monitoring firm Counterpane Internet Security, agreed. Besides the mitigating circumstances which lessen the likelihood that attackers would be successful, Schneier said SSL is irrelevant to security because attackers can more easily get at secret information while it is stored on computers and servers at the sending and receiving ends. ``SSL protects the communications link between you and the Web" server, he said. ``Nobody bothers eavesdropping on the communications while it is in transit."

2003-07-25 **Windows passwords cryptography salt implementation flaw**

http://www4.gartner.com/DisplayDocument?doc_cd=116510

Gartner analyst Ray Wagner wrote,
"According to news reports published on 23 July 2003, Swiss technology researchers have issued a report that describes how Windows computers protected by alphanumeric passwords can be quickly and easily cracked — in less than 14 seconds — by using precalculated data stored in look-up tables. Such ease of cracking, suggest the researchers, is due to Microsoft not using "salt" (a standard security mechanism applied to encrypted passwords) in its Windows operating system. Other computer operating systems, such as Linux, Mac OS X and Unix, do use salt in their password encoding technologies, which can deter or delay password breaches."

TRIPLE DES UPGRADES EXPOSE BANK ATM NETWORKS TO COMPROMISE

Redspin, Inc., an audit firm, published a white paper analyzing the unexpected effects of a combination of security upgrades to bank automated teller machine (ATM) networks. In brief, although the original intention of the industry plan was to upgrade DES encryption to Triple DES, additional changes included switching to TCP/IP networks instead of dedicated communications lines. The auditors discovered that the data being sent through the wider bank internal networks includes unencrypted data (except for the PIN): "The card number, the expiration date, the account balances and withdrawal amounts, they all go across the networks in cleartext…." The company's press release stated, "Our biggest concern is that not many bank managers know this," says John Abraham, the company's president. "They assume that everything is encrypted. It's not a terrible assumption, so it's no wonder that most bank managers we've talked to are unhappy to discover this after spending $60,000 to upgrade an ATM."

"Fortunately," continues Abraham, "prevention isn't that complicated, as long as bankers are aware that there is a potential problem. ATM machines need to be kept separate from the rest of the bank's computer network, to try to recreate that direct line to the processor. Also, Redspin is developing a tool to help bankers determine their level of vulnerability. This white paper is all about raising awareness."

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A5693-2004Jun1.html

ARE PASSWORDS PASSÉ?

Scandinavian countries are at the forefront of a movement to ditch conventional asswords in favor of so-called two-factor authentication. These "password-plus" systems use things like disposable cards with scratch-off codes in conjunction with the usual four-digit PIN for online banking and other secure transactions. Each code is used once, and the bank replenishes the supply by sending a new card when the customer is running low. "A password is a construct of the past that has run out of steam," says Identix CEO Joseph Atick. "The human mind-set is not used to dealing with so many different passwords and so many different PINs." Other "password-plus" options include Vasco Data Security International's pocket-sized device that issues a random second code each time you type your regular password in. Or MasterCard International's system, which requires swiping your "smart" credit card through a special reader and entering your PIN to obtain a single-use password good at Office Max, British Airways and a dozen other merchants. And while U.S. banks are well aware of the perils of password theft, they're "all afraid of making the first step," says a Gartner analyst. "They don't want consumers going to other banks because it's too hard." (AP/Washington Post 1 Jun 2004)

PENTAGON ROLLS OUT SMART CARD ID
The Defense Department has taken the wraps off its new high-tech security badge, designed to control access to DoD buildings and computer networks. The new ID badge, dubbed a "common access card," features a magnetic strip and two bar codes, and will function as the standard ID for about 4 million people, including active duty military, selected reserve forces, civilian Pentagon employees and eligible contractors. The badge will also include a stored "certificate" that will enable the cardholder to sign digitally such things as e-mail and deployment orders. Although the badges are being hailed by DoD for their ability to enhance privacy through encryption, privacy advocates have voiced fears that the Pentagon could be laying the groundwork for the introduction of a national ID card in the U.S. "The military is frequently used as guinea pigs for proposals that would be too controversial to try among civilians," says David Banisar, senior fellow at the Electronic Privacy Information Center. "Ultimately, the danger is that people could be routinely tracked. Their records could be routinely used for purposes other than those originally intended." (Reuters/New York Times 10 Oct 2000)

NewsScan; http://apnews.excite.com/article/20020108/D7GTF1H01.html

'SMART' DRIVERS' LICENSES UP AHEAD
The U.S. Transportation Department is working with the states to develop a new generation of drivers' licenses that contain electronically stored information such as fingerprints or retinal scans. Privacy advocates say the move toward "smart" licenses is really a backdoor way to establish federal ID cards -- an idea that has gained popularity among government officials following the Sept. 11 terrorist attacks. "The debate after Sept. 11 showed that Americans are instinctively suspicious of a single federally issued card, but they might be more sympathetic to identifications issued by businesses or perhaps states," says Jeffrey Rosen, a law professor at George Washington University. "What you're seeing here is a sort of a hardening of the driver's license that could lead to development of a national ID system without creating a national ID card," says Marc Rotenberg, who heads up the Electronic Privacy Information Center. NEW SMART CARD COULD KNOW EVERYTHING
A San Francisco company called PrivaSys has developed a battery-powered smart card that could be used to replace all the individual credit and debit cards a consumer might carry. The internal chip on the card will be able to store "loyalty" accounts (such as Frequent Flyer data) for a number of different vendors. The company has struck a deal with First Data, but will have to form additional alliances with other credit-processing companies to achieve its plan to make its card the only one you'll need in your purse or wallet. CHIP ID IS ONLY SKIN-DEEP [19 Dec 2001]
Applied Digital Solutions, based in Palm Beach, Florida, is making headlines with plans to become the first company to sell microchips designed to be implanted into humans. One initial target market is likely to be people with artificial limbs and organs -- a user could have up to 60 words of relevant medical information embedded in the chips, which could then be read by medical personnel if the patient were brought unconscious into an emergency room. With rollout in South America scheduled in about 90 days, another potential market is potential kidnap targets who could use the chips in combination with GPS devices to alert security personnel to their whereabouts. Future plans call for ordinary people to use the chips as the ultimate ID, supplanting the functions now performed by passwords and keys. "I'd be shocked if within 10 years you couldn't get a chip implanted that would unlock your house, start your car and give you money," says Chris Hables Gray, author of "The Cyborg Citizen." And lest you think it unlikely that you'd want to try something like this out, futurist Paul Saffo reminds us, "As some people wring their hands about the invasion of privacy and civil liberty, a whole other generation is going to go, 'Cool! I've always wanted to embed technology in my body.' It's going to be fashion. One sure sign that teenagers will love it is if it terrifies their parents." (Los Angeles Times 19 Dec 2001)

CHIP IMPLANT COMPANY SEEKS FDA APPROVAL [27 Feb 2002]
A Florida company that has developed a computer ID chip suitable for implanting in the human body has applied to the Food and Drug Administration for approval of its product. The VeriChip, as it's called, can be used to store information, such as medical records, which could be accessed by emergency medical personnel in the event of an accident. Applied Digital Solutions says it plans to limit its marketing of the VeriChip to companies that ensure its human use voluntary. A person or intermediary company would buy the chip for about $200 and have it encoded with the desired information. The person seeking the implant would then take the chip -- about the size of a grain of rice -- to a doctor, who would insert it under the skin with a large needle device. Meanwhile, privacy advocates have expressed doubts about the VeriChip: "The problem is that you always have to think about what the device will be used for tomorrow. It's what we call function creep. At first a device is used for applications we all agree are good but then it slowly is used for more than it was intended," says Lee Tien, an attorney for the Electronic Frontier Foundation. 2002-03-21 **identification and authentication I&A terrorism national security**

Technology Review http://www.technologyreview.com/articles/garfinkel0402.asp

Simson Garfinkel wrote a penetrating analysis of the tenuous link between I&A (identification and authentication) and national security. The driver's license has become a _de facto_ form of I&A, used by banks, airlines, bars and innumerable other organizations. Various state governments and non-governmental groups have proposed adding biometric authentication to the usual picture. But Garfinkel concludes his analysis with the following sensible comments: "Like the FBI, which tucked a laundry list of new powers into the [U.S.A.P.A.T.R.I.O.T.] Act of 2001, the American Association of Motor Vehicle Administrators and the Department of Transportation are using the terrorist attacks as a convenient excuse for deploying a national identification system that would have been politically untenable this time last year. Remember, even if the September 11 terrorists had been carrying smart-card-enabled driver's licenses with biometric authenticators, they still would have been allowed to board their flights. American Airlines knew Richard Reid's identity-it just didn't know that he had plastic explosives concealed in his shoes. Forcing every American to carry a new state-issued identification card may cut down on illicit drinking and make things easier for police at traffic stops, but it is simply not a rational way to deal with the specter of terrorism. Better identification systems won't do much to stop people who have evil in their hearts but not in their history."

NewsScan; http://www.siliconvalley.com/mld/siliconvalley/2955860.htm

'SMART CARD' FOR FREQUENT FLIERS
EDS, Maximus, and other high-tech companies are racing to capture the emerging market for "smart cards" that will allow frequent fliers to speed through air security checkpoints after they submit to retina or hand scans. Promoters of the systems believe that "trusted traveler" programs like these not only add to customer convenience but also enhance security, by providing (in the words of an EDS executive) "better knowledge of the people getting on the airplane." Civil libertarians are skeptical, and Barry Steinhardt of the American Civil Liberties Union worries that the use of such systems would "encourage security personnel to put their guard down" and that terrorists would just obtain phony documents. But Rachel Rowland of Maximus says, "It's far easier for someone to get a fake driver's license. With these cards, nobody else is going to have the same digital map of your fingerprint." CAN YOU TRUST A "TRUSTED TRAVELER"?
One proposal for improving airport security has been the creation of hard-to-counterfeit "trusted traveler" ID cards for frequent travelers, but software developer Richard P. Eastman asks the obvious question: "What makes a trusted traveler? The guy who travels all the time; who travels on business; who has a reason to travel. Does that mean the terrorist can't penetrate that group? Of course he can." Beyond objections of that sort, civil libertarians have been arguing that ID cards for travelers will set a dangerous precedent. Barry S. Steinhardt of the American Civil Liberties Union predicts, "Quickly enough, policy makers are going to say, 'If this works, let's require everyone to go through background checks before they get on a plane.'" WIRELESS SECURITY SYSTEM FOR AIRPORT RAMP AREAS
The new federal Transportation Security Agency is giving $1 million in R&D funds to the Hackensack, NJ company ID Systems, to determine whether a wireless surveillance-and-control system designed for tracking vehicles in car factories can be adapted for airports. "You can't have an airline employee walk around with 200 keys, for all the 200 vehicles," says the head of ID Systems -- so the company has developed a vehicle control system called Wireless Asset Net. To use an airport vehicle on the tarmac, an employee would have to enter an ID card into a reader to obtain authorization from a central computer. (New York Times 8 Aug 2002)

QUIZID TARGETS DIGITAL AUTHENTICATION
U.K. firm Quizid Technologies has launched a credit-card-sized device that is being heralded as a major breakthrough in the search for greater security for Internet-based transactions. Users are issued a card and a personal code, based on a set of color keys on the card. Each time the user wants to complete a transaction, he or she punches in the color code and a random number is generated. The card works in conjunction with the Quizid vault — a bank of computers that can process 600 authentications per second. Security experts welcomed the new device: "Without an architecture of trust more sophisticated than a PIN or password, the U.K. is definitely not in danger of becoming a first-world knowledge-based economy," says security analyst Simon Moores. (BBC News 17 Oct 2002)

FDA APPROVES IMPLANTABLE ID CHIP
In a surprise move, the Food and Drug Administration okayed the use of implantable ID chips in humans, providing they are used for "security, financial and personal identification or safety applications." The FDA has still not ruled on whether the VeriChip, made by Applied Digital Solutions, can be used for medical purposes, however. The company has promoted the device in the U.S. for its ability to provide detailed medical history data in cases where the patient is unable to communicate with emergency room personnel. Applied Digital president Scott Silverman says he's happy with the FDA's decision: "We'll now go into high gear with our sales, marketing and distribution plans in the U.S.," adding that the company will focus on the security and ID aspects of the chip, at least for the time being. Meanwhile, Leslie Jacobs, whose family volunteered to "get chipped" last May, says she's still hoping the FDA will approve the VeriChip for medical use. Both her husband and son have ongoing health problems. (Wired.com 23 Oct 2002)

HIGH-TECH PASSPORTS ARE NOT WORKING

Yves Bellefeuille reports on an article in _The Economist_:

The usual arguments are made -- the technology isn't reliable, there will be too many false positives, and so on -- but there's also a new argument I hadn't seem before:

"The data on these chips will be readable remotely, without the bearer knowing. And -- gain at America's insistence -- those data will not be encrypted, so anybody with a suitable reader, be they official, commercial, criminal or terrorist, will be able to check a passport holder's details...

"Passport chips are deliberately designed for clandestine remote reading. The ICAO [International Civil Aviation Organisation, a UN agency] specification refers quite openly to the idea of a "walk-through" inspection with the person concerned "possibly being unaware of the operation"."

Apparently, the only country that's ready for the US requirements is Belgium. It's really the *only* country: the US itself won't be able to deal with the passport requirements it's imposing on others by the November 2005 deadline!

FINGERPRINTS AS PASSWORDS: TWITCHING TO TAKE HOLD IN INDUSTRY

Fingerprint scanning technology should be gradually implemented by the banking industry as a means of verifying identity, says Identix CEO Randall Fowler. Identix, a leader in image scanning technology, produces biometrics products capable of distinguishing between an actual fingerprint and a photo of one. Fowler stresses the need for fingerprint scanning technology, noting that financial transactions no longer occur face to face, but "between two strangers with a piece of silicon in between them." He says, "Somebody has to give the silicon the ability to recognize who it's dealing with, particularly in the banking industry." In line with providing this technology, Identix and Motorola recently formed a partnership to develop biometrics devices that will eliminate the need to use PIN numbers in accessing a banking network. Motorola's Digital DNA unit has reduced the size of its CMOS-chips that store fingerprint optics, so the chips can be attached to the side of phones, cash registers, ATMs, and other devices. Fowler says financial institutions are likely to adopt biometrics technology slowly, as they replace computer systems. (Future Banker 07/99)

Musicrypt.com and Net Nanny Software are teaming up to market an advanced "biometric" identification technology that would block would-be cyberpirates from distributing music free over the Net. In a new twist, the software identifies individual music listeners by the way they tap out letters on computer keyboards. This information is then used to protect songs against unauthorized distribution and use. The companies are hoping that music labels or online retailers will insert the technology into downloaded music, so that only a person who buys a given song would be able to play it on a computer. Identifying the buyer by these keystroke patterns is far more secure than using passwords, which can be passed on to thousands of people, the companies say. "What we're doing with (this software) is making the user the key," says John Heaven, Musicrypt's chief executive. One biometrics industry analyst notes that the keystroke technology is less accurate than other technologies such as fingerprinting or retinal scans, but it makes up for that weakness in its relative ease of use: "I would say that biometrics in general are ready for the consumer level. I wouldn't have said that two years ago. It would have been a disaster then." (News.com 13 Jun 2000)

THE FACE-RECOGNITION SOFTWARE MARKET
Since the September 11th terrorist attacks, face-recognition technology has been given a much friendlier reception than it did when it was introduced at the last Super Bowl game or at Tampa early this year. Now, Visionics and Viisage, the two major companies in that industry, are engaged in fierce competition for dominance in a market expected to grow from $200 million in revenue this year to $2 billion in 2004. Face-recognition systems compare digital translations of a person's facial characteristics to images in a database of suspected terrorists and criminals. Critics of the technology insist that its use is likely to be expanded into uses beyond the apprehension of evil-doers, and argue that it is not always accurate. In response, advocates for the technology admit that it is "not as precise as fingerprints" but insist that occasional "false positives" can easily be resolved by local authorities. (Washington Post 1 Nov 2001)

HONG KONG TO USE DIGITAL ID CARDS

Hong Kong is planning to introduce an identity card with an embedded digital chip containing a replica of the cardholder's thumbprint, for matching against an optical reader at border crossings into China. "You don't have to have an immigration officer there to look at the card," says an immigration official in Hong Kong. "It's just a self-service kiosk." Besides verification of identity, the chip could be made to include medical, financial, and other data on an individual, but at least for now the card will contain only basic information. Sin Chung-kai, a pro-democracy member of the Hong Kong legislature, says: "We're not opposed to people having to carry ID cards. The crux of the controversy is how much information should be stored on the card... If I were a film star and I had some kind of disease, I wouldn't want it to be on my ID card. I also wouldn't want the ID to be my cash card. I don't want my spending traced." (New York Times 18 Feb 2002)

'GUMMY' FINGERS FOOL FINGERPRINT SECURITY SYSTEMS

A Japanese engineering professor has managed to trick biometric security systems using artificial fingers made with gelatin. In addition to creating a fingerprint by pushing a finger into a malleable plastic mixed with gelatin, the researchers were able to create credible fingers using fingerprints lifted from a glass. First, the latent print was hardened, using glue that sticks to the ridges of the fingerprint. The hardened print was then photographed, using a digital camera, and enhanced using Adobe Photoshop software to create heightened contrast between the ridges and gaps. The image was then transferred to a photosensitive sheet, etched into copper and used to create another mold. Both methods resulted in a fake finger that was able to fool a variety of biometric readers 80% of the time. Security experts say the experiments cast serious doubt on any claims that this type of biometric system can be made fully secure. (BBC News 17 May 2002)

BIOMETRICS FAIL STICKY TEST
Biometrics companies found themselves in a sticky situation recently when a Japanese researcher demonstrated how a fake finger formed with gelatin fooled fingerprint readers an average 80 percent of the time. Tsumtomu Matsumoto, a graduate student at Yokohama National University, presented a study at an IT conference last week showing scanners' vulnerability. Using the same ingredients found in Gummi Bear candies, Matsumoto created a fake fingerprint modeled after an authorized user's in less than an hour. Though that method requires the user's permission, the researcher demonstrated another by lifting a legitimate user's print off a surface, digitally enhancing it on a computer and printing it on a transparent sheet. The imprint is then etched to create a fingerprint impression later filled with gelatin, which when cooled creates the same impression as the earlier gummy finger. Both types fooled 11 different detectors 70 to 90 percent of the time.

2002-05-24 **homeland security facial recognition biometrics surveillance I&A identification authentication privacy surveillance**

PoliTech

A press release from Visionics Corp in May 2002 included the following description of a trial of their facial recognition equipment:

>Visionics Corporation (Nasdaq: VSNX), the worldwide leader in identification technologies and systems, announced today that its latest FaceIt® ARGUS surveillance system will be used to augment security measures at the Battery Park Screening Facility in the ferry embarkation area to Ellis Island and the Statue of Liberty in the New York harbor during this Memorial Day holiday weekend.

The state of the art system is on loan from Visionics to the United States Park Police for the holiday weekend and is part of a series of stepped up security measures that will be visible at New York City landmarks.

Major Thomas H. Wilkins of the United States Park Police commented, "Since the tragic events of September 11, our agency has been focused on preventing future attacks while ensuring everyday life remains as uninterrupted as possible. Ellis Island and the Statue of Liberty are potent symbols of our country's freedoms and it is our mission to make these landmarks safe for visitors and tourists."

The installation of FaceIt® ARGUS at Battery Park Screening Facility will encompass the security portal area that precedes the ferry boarding planks. The system will automatically scan all faces passing through the entryway and compare them against a database of known terrorists compiled by federal authorities. The installation will be in compliance with Visionics' privacy principles---signage informing the public that the system is in use is posted in corresponding areas and all non-matches are automatically deleted from the system.<

ACLU BLASTS USE OF FACE RECOGNITION SYSTEMS
The American Civil Liberties Union (ACLU) has issued a stinging criticism of the use of computer-based face recognition systems to aid in the war against terrorism. ACLU official Barry Steindardt says: "To have such a system in place near the Statue of Liberty -- our nation's beacon of liberty -- is both ironic and disheartening. It may be a good sales stunt for the manufacturer, but it is an insult to the American people and to those in law enforcement who truly know how to keep us safe." The ACLU's position is that the system has a high rate of "false positives" that wrongly match people with photos of others, thereby subjecting people to "being pulled aside for intrusive searches and security checks." ONE-FINGER CHECKOUT AT GROCERY STORES
At various locations around the country grocery store chains are testing new technology that allows shoppers to pay for purchases simply by putting a finger on a screen that records not a full fingerprint but a digital image, or template, of certain key elements of that fingerprint, such as where lines intersect or end. The encrypted information is then matched to the customer's credit card, debit card or checking account information, as well as to any frequent-shopper "loyalty" card. Shoppers so far seem to be accepting the new technology (and feel that it provides an additional level of security), but Carlene Thissen of Retail Systems Consulting fears a possible consumer backlash over privacy concerns: "Like iris scans, retinal scans or even voice recognition, when it's attached to your body like that, there might be more of a reaction." If the new finger payment technology proves itself in grocery stores, you can expect to see it eventually used by fast food chains, video rental companies, pharmacies, and airline and hotel check-in desks. MILITARY ID GOES HIGH-TECH

The U.S. Defense Department is developing high-tech identification cards that will encode information about the bearer's fingerprints and other unique physical characteristics, such as hand shape, iris pattern, or voice print. The next-generation cards would add another level of security by requiring computer users to log in using their ID card and password and then undergo an additional biometric scan to verify their identity. Current ID cards that are used to log on to military computer systems contain a computer chip that holds the owner's name, rank and serial number. (AP 28 Jul 2002)

FACE SCANNING TECHNOLOGY GOES 3D
A pair of identical whiz-kid twins in Israel have developed a face-scanning system that can even tell them apart. Unlike the two-dimensional scanning technologies now in use in some cities and airports, the 3D system maps the surface of a person's face by scanning it with a series of light patterns and stores the data as a three-dimensional image in a computer. The system uses a mathematical algorithm to measure the distances between a number of sample points on the facial surface, and the distances are then reconfigured as straight lines in a 3D space, creating a new and abstracted image based on precise mathematical calculations. "One of my students calls it sculpting in numbers," says Ron Kimmel, a professor at the Technion Institute in Haifa. "This kind of mapping makes it all invariant, or it is not influenced by our expressions. If we smile a little bit or we change our face a little, it will still be mapped into the same signature, the same kind of surface." Analysts say facial signatures could be embedded in credit cards, building entry permits, or even ATM cards. The facial recognition project began as an assignment in Kimmel's class, where he promised the twins that if they developed a system that could distinguish them, he'd give them a grade of 100. BIOMETRICS TECHNOLOGY: NOT YET READY FOR PRIMETIME
Gartner Research director Anthony Allen told guests at the launch of European Biometrics Forum that while widespread use of biometrics was likely by 2008, the technologies still had some kinks to be ironed out. Biometrics, which includes technologies used for voice, face, iris and fingerprint identification systems, is virtually useless without adequate back security measures and databases, said Allen, and current systems have several fallibilities that must be corrected. For instance, evidence shows that wearing eyeglasses can fool an eyescanner, prosthetic makeup can confuse face scanners, a sore throat can change a voice print and breathing heavily on a fingerprint scanner can make prints unrecognizable. However, newer generations of technology are beginning to rectify some of these shortcomings; the latest fingerprint scanners now incorporate methods of detecting body heat and blood flow and can scan below the surface later, making it more difficult to deceive. BIOMETRIC SCANS FOR U.S. VISITORS
Biometric face and fingerprint scans for travelers will become routine security measures for foreign visitors next year. By October 2004 the 27 countries whose citizens can travel to the U.S. without visas must begin issuing passports with embedded computer chips with the traveler's facial identification. Civil libertarian Marc Rotenberg of the Electronic Privacy Information Center opposes the mandate: "Our government has forced on European governments the obligation to adopt biometric identifiers though most in the U.S. still oppose such systems." But Kelly Shannon of the State Department argues that is not only "more secure for other countries, it's more secure for us. The idea is that it is contingent on reciprocal treatment for United States citizens." And Denis Shagnon of the International Civil Aviation Organization adds: "What was required was a globally interoperable biometric — one biometric that could be used worldwide and can be read worldwide." He regards the biometric techniques as "very user-friendly" and "unobtrusive." (New York Times 24 Aug 2003)

'NOT YOUR FATHER'S FINGERPRINT'

The biometrics industry — spurred on by heightened terrorist concerns — has rolled out a variety of new ways to identify people, ranging from retina and iris scans to mapping voice patterns or walking styles, but there's a clear winner among the competing technologies — the old-fashioned fingerprint. "They are looking for proven technology that's stable and familiar," says Joseph J. Atick, CEO of biometric firm Identix. "It's not about technology. It's about lowering your deployment risk." But these aren't your father's fingerprints — today's equipment does away with messy ink in favor of digital records, created by software when fingers are pressed against an electronic pad or sensitive photoplate. And often as not, the fingerprints are then combined with some other form of biometric ID, such as facial recognition. Meanwhile, growing use of passports, drivers' licenses and employment ID cards embedded with ID-data microchips is spawning a new business for data processing giants such as IBM, Unisys and Siemens. "The technology (to integrate ID data with public records) is advancing rapidly. The big growth will be in 2005 and 2006," says a Unisys official. (New York Times 29 Dec 2003)

2004-05-19 **biometric transportation aviation**

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−04−785T

May 19, General Accounting Office — GAO-04-785T: Aviation Security: Challenges in Using Biometric Technologies (Testimony).

The term biometrics covers a wide range of technologies that can be used to verify identity by measuring and analyzing human characteristics—relying on attributes of the individual instead of things the individual may have or know. Since the September 11, 2001, terrorist attacks, laws have been passed that require a more extensive use of biometric technologies in the federal government. In 2002, the General Accounting Office (GAO) conducted a technology assessment on the use of biometrics for border security. GAO was asked to testify about the issues that it raised in the report, the current state of the technology, and the application of biometrics to aviation security. The GAO found that three key considerations need to be addressed before a decision is made to design, develop, and implement biometrics into a security system: 1. Decisions must be made on how the technology will be used. 2. A detailed cost-benefit analysis must be conducted to determine that the benefits gained from a system outweigh the costs. 3. A trade-off analysis must be conducted between the increased security, which the use of biometrics would provide, and the effect on areas such as privacy and convenience. MICROSOFT POINTS TO PASSWORD SOLUTION

Microsoft has a solution for those who have difficulty keeping track of all the passwords and usernames required by many Web sites today. Its Fingerprint Reader hooks up to PCs running the XP operating system and scans the unique skin patterns of the user's finger. The software then stores the image and uses it as a reference to restrict access to secure Web sites. Microsoft warns that the Fingerprint Reader is not intended to protect sensitive data, such as financial information, but informal testing showed it did a pretty good job of keeping non-authorized users out, and also withstood attempts to fool it using Silly Putty and Scotch tape. However, the company emphasizes that its Fingerprint Reader is all about convenience, rather than security. The device will hit the stores in mid-November, priced at $54.95, and Microsoft is also incorporating the Fingerprint Reader in a new keyboard and wireless mouse. (AP 9 Sep 2004)

LET YOUR FINGERS DO THE TALKING

Fingerprint technology appears to be the biometric identification method of choice, surpassing competing systems such as retina scanning, handprint geometry and facial recognition. "Fingerprints will be dominant for the foreseeable future," says Don McKeon, product manager for biometric security at IBM. One reason for its popularity is falling prices for fingerprint readers: Microsoft recently introduced a stand-alone model for $54 and earlier this year American Power Conversion rolled out a model for PCs priced at $45. Meanwhile, IBM said last week it would begin selling laptops with built-in fingerprint readers and Microsoft is marketing a fingerprint reader-keyboard and -mouse. International Biometric Group predicts sales of fingerprint readers will rise 86% to $368 million this year, up from $198 million last year, spurred by user rebellion against the myriad passwords computer users must now memorize. "Our parents didn't deal with the problem of remembering 20 passwords, and our grandkids won't even know what they are," predicts McKeon.

BIOMETRIC PAYMENT SYSTEMS IN SUPERMARKETS

Monty Solomon extracted an interesting item on biometric I&A from an article by Jo Best:

A supermarket has given its customers the choice of paying by fingerprint at a store in the state of Washington--and has found them surprisingly willing to use the biometric system. U.S. chain Thriftway introduced the system, which uses technology from Pay By Touch, in its store in the Seattle area in 2002. It said it now sees thousands of transactions a month using the payment method. Once people have enrolled in the Pay By Touch system, they have their fingerprint scanned as verification of identity at the checkout. They then choose which credit card they want to pay the bill with, having already registered the credit cards with the store.

Thriftway President Paul Kapioski said rather than shying away from the technology because of concerns about protecting their privacy, customer demand ensured that the biometric payment system made it past the pilot stage. …

CARJACKERS SWIPE BIOMETRIC MERCEDES, PLUS OWNER'S FINGER

A Malaysian businessman has lost a finger to car thieves impatient to get around his Mercedes' fingerprint security system. Accountant K Kumaran, the BBC reports, had at first been forced to start the S-class Merc, but when the carjackers wanted to start it again without having him along, they chopped off the end of his index finger with a machete.

The fingerprint readers themselves will, like similar devices aimed at the computer or electronic device markets, have a fairly broad tolerance, on the basis that products that stop people using their own cars, computers or whatever because their fingers are a bit sweaty won't turn out to be very popular.

They slow thieves up a tad, many people will find them more convenient than passwords or pin numbers, and as they're apparently `cutting edge' and biometric technology is allegedly `foolproof', they allow their owners to swank around in a false aura of high tech.

And that is exactly where the risks lie, high-tech does not necessarily mean high-security!

At least in sci-fi, fingerprint systems check for a heartbeat or pulse!!!

[`Cutting edge', eh? Wow! Incidentally, for many years I've been citing the concept of an amputated finger as a hypothetical way of defeating a poorly designed fingerprint analyzer. It's no longer hypothetical. PGN]

U.S. GRANTS ANOTHER EXTENSION TO BIOMETRIC PASSPORTS

In a concession to nearly half of the countries in the Visa Waiver Program, officials from the United States have again extended the deadline for the addition of biometric data to passports. The program allows citizens of 27 countries to visit the Unites States using a passport only--without applying for a visa--for up to 90 days. In an effort to increase security, U.S. authorities said they would require that biometric information be added to passports in participating countries by October 26, 2005. After 13 of the countries in the program said they would miss the deadline, which had already been delayed once, U.S. security officials said countries would have another year to comply with the new regulation. The United States will, however, require participating countries to add digital photographs by the October deadline. The United States stood to lose potentially billions of dollars spent by tourists and business travelers from those countries if the deadline had not been extended. CNET, 15 June 2005

2005-12-02 **DHS federal identification fingerprint images biometrics templates**

DHS IAIP Daily; http://www.fcw.com/article91576−12−02−05−Web

FEDERAL IDENTIFICATION CARDS MAY GET FASTER, SAFER

By the end of December, the federal government is expected to pick a new storage standard for fingerprint data on its new Personal Identity Verification cards, a Department of Homeland Security (DHS) official said Friday, December 2. The cards are expected to use a mathematical template of fingerprint images of cardholders' two index fingers, instead of compressed images of the prints themselves, said Kevin Crouch, portfolio manager for Homeland Security Presidential Directive 12 implementation at DHS' Joint Office of Interoperable Communications. The switch breaks the nearly year-long deadlock over whether the PIV cards should use images or templates, said Walter Hamilton, chairman of the International Biometric Industry Association and vice president and general manager of biometric solutions at Saflink. The decision marks a victory for the biometrics industry, which supports using templates. Templates require less data and processing time and protect the privacy of data better than images do, Hamilton said. The National Institute of Standards and Technology supported using compressed images because the template technology is less tested than image technology.

DHS IAIP Daily; http://www.pcpro.co.uk/news/81257/researchers−crack−
biometri c−security−with−playdoh.html

RESEARCHERS CRACK BIOMETRIC SECURITY WITH PLAY-DOH

Using fake fingerprints, researchers in New York have managed to break nearly all the biometric identification systems they tested. Headed by Clarkson University associate professor of Electrical and Computer Engineering Stephanie C. Schuckers, they used fake fingers made by taking casts of live fingers and using the molds to create copies in Play-Doh. The 60 fake fingers were then tested and were successfully authenticated by the combination of the fingerprint readers and their accompanying software in nine out of every ten attempts. "Digits from cadavers and fake fingers molded from plastic, or even something as simple as Play-Doh or gelatin, can potentially be misread as authentic," Schuckers explained. The team subsequently developed a technique for distinguishing live digits by detecting changing moisture patterns and reduced the false detection rate to less than 10 percent. "Since liveness detection is based on the recognition of physiological activities as signs of life, we hypothesized that fingerprint images from live fingers would show a specific changing moisture pattern due to perspiration but cadaver and spoof fingerprint images would not," Schuckers explained.

2005-12-16 **NIST standard biometric minutia HSPC-12 DHS PD 12**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/37790−1.html

NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY CHOOSES MINUTIA FOR HSPD-12 BIOMETRIC STANDARD

After nearly a year in the making, the National Institute of Standards and Technology (NIST) has been convinced that minutia is an acceptable way to store fingerprint biometric data on smart cards. Amid pressure from industry, agencies and the administration, NIST Thursday, December 15, released the biometric specification for Federal Information Processing Standard 201, Personal Identity Verification under Homeland Security Presidential Directive 12, calling for agencies to store two index fingerprints on the smart card using the International Committee for Information Technology Standard 358 for minutia. Each fingerprint template shall be wrapped in the Common Biometric Exchange Formats Framework structure, NIST said in Special Publication 800-76. NIST originally wanted to store fingerprints using a digital image because it is more entrenched, while minutia is still new and the standard hasn't been tested enough. During the past 11 months, the indecision caused the White House to get involved in the final decision. Agencies, vendors and other interested parties have until January 13, 2006, to comment on this latest draft. NIST then will issue a final version about a month later. Federal Information Processing Standards Publication on Personal Identity Verification of Federal Employees and Contractors:

2006-01-05 **US-VISIT US government DHS fingerprint biometric identification authentication I&A**

EDUPAGE; http://www.fcw.com/article91877-01-05-06-Web 23

US-VISIT WANTS ALL 10 FINGERS PRINTED

Officials at the Department of Homeland Security (DHS) have announced a plan to begin requiring visitors to the United States to have all 10 of their fingers to be printed to be admitted to the country. Currently, the U.S. Visitor and Immigrant Status Indicator Technology (US-VISIT) program requires prints of two fingers; the change to 10 will reportedly increase both security and privacy and will decrease the number of visitors who must undergo a second inspection to enter or leave the country. DHS said biometric technology such as fingerprinting is already reliable, but the agency is working with technology vendors to develop products that are more accurate, faster, and more mobile.

RESEARCHERS CLAIM ADVANCES IN USING FINGERPRINTS TO SECURE NETWORKS.

University of Buffalo, NY, researchers say they have found a way to improve security of wireless handheld devices and Websites. The research specifies how big a keypad sensor needs to be and how big a fingerprint image should be, as a key shortcoming of biometric systems now is that sensors often only can take partial fingerprints, says Venu Govindaraju, a University of Buffalo professor of computer science and engineering, and director of the school's Center for Unified Biometrics and Sensors (CUBS). The researchers' work has been published in the journal Pattern Recognition.

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/s tory/0,10801,109276,00.html 23

RESEARCHER HACKS MICROSOFT FINGERPRINT READER.

A security researcher with the Finnish military has shown how they could steal your fingerprint, by taking advantage of an omission in Microsoft Corp.'s Fingerprint Reader, a PC authentication device that Microsoft has been shipping since September 2004. Although the Fingerprint Reader can prevent unauthorized people from logging on to your PC, Microsoft has not promoted it as a security device. Hoping to understand why Microsoft had included the caveat about sensitive data, a researcher with the Finnish military, Mikko Kiviharju, took a close look at the product. In a paper presented at the Black Hat Europe conference last week, he reported that because the fingerprint image taken by the scanner is not encrypted, it could be stolen by hackers and used to inappropriately log in to a computer. Because the fingerprint image is transferred unencrypted from the Fingerprint Reader to the PC, it could be stolen using a variety of hardware and software technologies, called "sniffers," that monitor such traffic, said Kiviharju. Kiviharju's report: http://www.blackhat.com/presentations/bh-europe-06/bh-eu-06-Kiviharju/bh-eu-06-kiviarju.pdf.

EDUPAGE

PASSWORD-SHARING THWARTS WEB REVENUES
Web entrepreneurs who charge subscription fees for accessing their Web sites are finding their customers are passing along their passwords to friends, relatives, etc., thus diminishing Web operators' potential for making their venture pay off. "Everybody on the Internet who sell subscriptions has this problem to one degree or another," says a producer for SportsZone. A technical fix is possible, but Web site operators are reluctant to make things more difficult for legitimate subscribers to log on. Meanwhile, Internet Billing offers software that allows Web sites to limit how many times the same password may be used each day — a solution that would probably keep some of the piracy down, but runs the risk of alienating paying customers who just want to log on a lot. (Wall Street Journal 21 Feb 97)

NewsScan

CREDIT CARD COMPANIES DEVELOP NEW PASSWORD SYSTEMS
To give customers an added feeling of security when they provide their credit card numbers to make purchases over the Internet, Visa and Mastercard will offer new password systems. The Visa system is being launched today as a optional feature, and will invite cardholders to link their cards to an additional password, beyond the information on the card itself; the Mastercard system, still in development, will require the user to download a small program. Amazon is one of the merchants that has declined to participate in the system, because "it would turn one-click ordering into four-point, three-click ordering." Dell, on the other hand, has already signed up for the system, not so much because of its own concerns about fraudulent purchases but because "we want to give customers more confidence in buying online," even though cardholders are not actually liable for fraudulent purchases made on their accounts. Credit card fraud is not a major problem for most companies, and Visa says that just 7 cents out of every $100 is lost to fraud. (New York Times 3 Dec 2001)

2004-04-19 **password management policy awareness survey study**

http://www.securitypipeline.com/news/18902074

Mitch Wagner of securitypipeline.com wrote a summary of an informal man-in-the-street survey in London concerning attitudes and behavior with respect to passwords. Sample size was small: 172 people replied to the questions. Results were not good.

Quoting from Wagner's report:

>• 53 percent of users said they would not give their password to a telephone caller claiming to be calling from their IT department.

• Four out of 10 knew their colleagues' passwords.

• 55 percent said they'd give their password to their boss.

• Two thirds of workers use the same password for work and for personal access such as online banking and web site access.

• Workers used an average of four passwords, although one systems administrator used 40 passwords, which he stored using a program he wrote himself to keep them secure.

• 51 percent of passwords were changed on a monthly basis, 3 percent changed passwords weekly, 2 percent daily, 10 percent quarterly, 13 percent rarely and 20 percent never.

• Many workers who regularly had to change their passwords kept them on piece of paper in their drawers, or stored on Word documents.<

Other findings:

* ~¾ of the respondents said they would reveal their password in return for a chocolate bar [MK asks: but how would you know if they were telling the truth? They could get a chocolate bar in return for any old word.]

* Many respondents explained in that there passwords were based on partners, children, football teams, and pets.

* The most common password was "admin."

* Most people said they would steal confidential information when changing jobs.

* Most of the respondents admitted that they would not protect the confidentiality of salary information if the data were accidentally revealed to them.

2004-08-11 **password authentication weak I&A easy-to-guess**

NewsScan

MOST PASSWORDS ARE EASY TO GUESS

Most Internet users choose easy-to-guess passwords such as their pet's name, according to a survey by Visa Europe. More than three-fourths of those polled said they choose passwords relating to friends, family and memorable dates. The favorites are nicknames (21%), birthdays and anniversaries (15%), pet names (15%), family members' names (14%) and memorable dates such as the Battle of Hastings and England's World Cup victory (7%). Two percent even reported using "password" as their password. "It is not surprising that loved ones and pet names top the most popular list as often people struggle to remember random characters or designated log-in codes and opt to choose their own. Of course, it is important that our passwords are personal and meaningful to us, but also that they are difficult to decipher and not easily guessed," says Visa Europe VP Hugo Bottelier. When choosing a password, Visa suggests avoiding words that appear in the dictionary, as well as words relating to personal information that could be inferred or guessed. The most preferable type of password would have random letters, numbers and punctuation. And for heaven's sake, don't write it down and leave it by your credit card or PC! (Silicon.com 11 Aug 2004)

2004-08-11 **easy to use passwords Internet users**

DHS IAIP Daily; http://www.silicon.com/0,39024729,39123066,00.htm

August 11, silicon.com — Internet users still choosing easy to guess passwords.

Despite increased awareness about the need for secure passwords, internet users are still leaving themselves vulnerable to hackers by choosing easy to guess subjects such as their cat or partner's name. Over three-quarters choose passwords relating to friends, family and memorable dates, according to research into 1,000 internet users by Visa Europe. The favourites are nicknames, birthdays and anniversaries, pet names, family members' names, and memorable dates. All of those are details that basic social engineering techniques would uncover relatively quickly. To make matters worse a third of respondents said they use the same password for all their log-ins, while a quarter using it nearly all or most of the time. But the message about choosing hard to guess passwords does seem to be getting through to some people with 22 per cent opting for random letters.

2004-08-18 **password authentication graphical user picture drawing USENIX security Draw-A-Secret scheme**

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,28914
2,sid14_gci1000783,00.html

August 18, SearchSecurity.com — Graphical passwords still far from picture perfect.

Given the explosion of data now held in devices, and the fact many employees still use easily guessed words to access them, more companies are eyeing graphical password schemes. New research suggests a major weakness in current graphics-based password programs, whether self-drawn or computer-generated, remains people picking obvious choices. This raises the success of brute-force attacks launched by illegal dictionary tools. In a study of the password scheme Draw-A-Secret, in which users make a picture in a grid that's then replicated for access, users typically draw symmetrical, identifiable objects in the middle of the grid. 9 According to research by Julie Thorpe, a Canadian scholar who presented during last week's Usenix Security Symposium in San Diego, CA, and her partner Paul van Oorschot, it takes only six days for a computer to run through all of the most common choices. Add 999 more machines and the time narrows to 8.7 minutes. One way to up the odds would be for organizations using this program to require a minimum number of strokes (five or greater) and more unique drawings, such as disjointed or off-centered objects, Thorpe said.

2005-08-10 **unauthorized use administrator passwords students policy felony charges monitoring**

RISKS; http://www.wired.com/news/technology/0,1282,68480,00.html 24 02

ADMIN PASSWORDS TAPED TO BACKS OF LAPTOPS; STUDENTS FACE FELONY CHARGES

Thirteen high-school students in the Kutztown Area School District (Pennsylvania) face felony charges of tampering with computers after defeating security measures on laptops issued to them by the school district. They used administrator passwords (taped to the backs of the computers) to override Internet filters and download software such as iChat that the district policy forbids. The laptops included an application that allowed district administrators to see what students did with the computers. However, the students modified the monitoring program so that they could see what the administrators did with their computers. The students and their parents argued that the felony charges are unwarranted, but, according to the district, students and parents signed acceptable use policies that clearly state what activities are not allowed and that warn of legal consequences if the policy is violated. The students continued to violate district policies for use of the computers even after detentions, suspensions, and other punishments, according to the district. Only then did school officials contact the police.

TUNING INTO PASSWORDS

Many people have heard of keyboard sniffing, in which someone sneaks software into your computer and monitors e-mail or documents. There is a new security threat that researchers are warning: keyboard listening. A graduate student in computer science at the University of California-Berkeley, developed a way of making audio recordings of keyboard strokes to see if words and phrases could be deciphered accurately. Using a microphone plugged into a laptop running generic speech recognition and spell-check software, the team was able to associate the sound of individual keys on a keyboard with specific letters and thus figure out what was being written with 96 percent accuracy.

INSECURE APC BIOPOD ILLUSTRATES PROBLEMS WITH UNTRAINED STAFF

Gabe Goldberg provided a depressingly believable tale of wooden-headed stupidity in the face of his analysis of a design flaw in the APC "BioPod" password vault. The device provides biometric access control with or without a password. The password is derived automatically from the Windows password -- and Mr Goldberg correctly pointed out to the company that it accepts a null Windows password without warning the user that there is therefore no master password loaded on the device. Nothing he could say to the technical support person he spoke to could overcome the stock repetition of the very flaw he was trying to report. In the infuriating display of stubborn denial that characterizes very stupid people, the agent simply kept repeating the presumably written description of exactly what was wrong as if it were an explanation. Perhaps the best line in the entire dialog was "Officially the BioPod is not advertised as a security device, but a password manager, so it is not designed to increase the security of your computer, but provide a safe way to manage and store your passwords."

[MK adds: this design flaw also raises questions about the security experience of the people who designed the software.]

43.4 Kerberos

Category 43.4 *Kerberos*

2000-03-15 **Kerberos identification authentication I&A standards proprietary interoperability**

Cryto-Gram 2000 03-15

Microsoft integrated Kerberos into its authentication scheme for Windows 2000; however, the company altered the protocol by using the "data authorization" field in a non-standard way. Microsoft ignored the rules for making changes to an IETF protocol and rendered their version non-interoperable with standard implementations of Kerberos. Bruce Schneier wrote, "On the surface, this is just nasty business practices. If you're a company that has invested in a UNIX-based Kerberos authentication system and you want to support Windows 2000 desktops, your only real option is to buy a Windows 2000 Kerberos server and pay for the integration. I'm sure this is what Microsoft wants.

My worry is more about the security. Protocols are very fragile; we've learned that time and time again. You can't just make changes to a security protocol and assume the changed protocol will be secure. Microsoft has taken the Kerberos protocol — a published protocol that has gone through over a decade of peer review — and has made changes in it that affect security. Even worse, they have made those changes in secret and have not released the details to the world. Don't be fooled. The Kerberos in Windows 2000 is not Kerberos. It does not conform to the Kerberos standard. It is Kerberos-like, but we don't know how secure it is."

Category 43.4 *Kerberos*

2003-03-20 **Kerberos authentication protocol vulnerability leak**

NIPC/DHS

March 17, eWEEK — Details of Kerberos vulnerability leaked.

There is a serious weakness in MIT's Kerberos v4 authentication protocol that allows an attacker to impersonate any principal in a given realm. The Kerberos development team at MIT said the contents of an unpublished paper with details of this vulnerability have been leaked on the Internet. Using these details, an attacker familiar with Kerberos could easily exploit the vulnerability. Kerberos v4 tickets-or credentials-do not have a cryptographic hash of the encrypted data, random padding or a random initial vector. As a result, using a chosen plaintext attack, an attacker could fabricate a ticket. An attacker who controls a Kerberos cross-realm key would be able to impersonate any principal in the remote realm to any service in that realm. This attack could lead to a root-level compromise of the Kerberos key distribution center as well as any other hosts that rely on the KDC for authentication. Kerberos, developed at the Massachusetts Institute of Technology, is among the most widely deployed authentication protocols on the Internet. It is implemented in dozens of software applications, as well, including Windows 2000. However, Windows 2000 uses Kerberos v5 and Microsoft officials said that, while they're still researching the issue, they don't believe that operating system is vulnerable. Additional information may be found on the MIT Web site: http://web.mit.edu/kerberos/www/advisories/MITKRB5-SA-2003-0 04-krb4.txt

1999-07-21 **single sign-on identification authentication I&A passwords**

Computer Reseller News Online
http://www.crn.com/search/display.asp?ArticleID=7653

NOVELL TO ADD SINGLE SIGN-ON
Novell this week will release Single Sign-on 1.0, new software that allows users to log on to multiple networks with a single password. The software will relieve end-users of having to manage multiple passwords, and will free IT managers of the task of redundant password administration. With Single Sign-on, the password is stored in NDS, which sends the password to the application, and the end user never sees a password dialog box. It will also support Lotus Notes, PeopleSoft, Entrust, and some host emulator products. IT organizations will enjoy the ability to spread network and service security over multiple databases, experts say. (Computer Reseller News Online 07/21/99)

1999-10-12 **medical informatics confidentiality HIPAA identification authentication I&A**

EDUPAGE; Wall Street Journal

INTEL AND AMA FORM SERVICE TO IMPROVE SECURITY OF ONLINE MEDICAL INFORMATION
Intel and the American Medical Association (AMA) are teaming to offer a service that will boost the online security of medical data. The service, which becomes available in the first quarter of 2000, will use "digital credentials" to prove the identities of doctors who are sending and accessing medical information over the Internet. The service launches Intel's "Internet Authentication Services" initiative, which permits the identification of parties at both ends of online transactions. The digital credential service, which is portable, is a big improvement over digital certificate security measures, according to Intel and the AMA. The use of the Internet for medical transactions will not reach mainstream levels unless security is improved. "This is important if the use of the Internet for health care is to go to the next level," says Jim Klein of the Gartner Group. (Wall Street Journal 10/12/99)

2002-04-04 **SSO single signon I&A identification authentication market analysis**

Yankee Group, Security Wire Digest 4 26

Yankee Grouop issued a market report on single-signon (SSO) systems and found significant progress throughout enterprise security and e-commerce applications. In a summary for Security Wire Digest, reporter Anne Saita wrote, "Microsoft's Passport, which got a huge boost in use once incorporated into the .Net initiative, is leading the field in the consumer SSO market with more than 3.5 billion monthly authentications worldwide. But Microsoft can expect stiff competition down the road from AOL, which simultaneously is developing its own SSO applications within an identity management system code-named 'Magic Carpet' and funding the Liberty Alliance, a business consortium spearheaded by Sun Microsystems that will compete head to head with Passport.

Computer Associates, IBM Tivoli and Novell also have made inroads in the legacy and client-server SSO space, as have SSO vendors that intersect the Web and legacy client-server applications markets, such as RSA Security, Entrust and Protocom, according to the report. The current lock these software giants and security companies have will make it difficult for newcomers in both the consumer and enterprise markets."

RISKS 23 22

E-MAIL ROBBERY, THE EASY WAY

Ralf Ertzinger analyzed the unfortunate decision by T-Online on user identification and authentication:

"T-Online is Germany's largest Internet provider, and while this in itself is not a risk, T-Online has always used a unique approach towards POP3 mail delivery. When being connected via T-Online, one does not have to provide a username or password to connect to the T-Online POP3 server in order to fetch mail, since the user is identified by his IP address.

Combine this with the growing number of (unsecured) WLAN access points and DSL routers and you get to read other people's mail just by driving along the streets. T-Online is aware of the problem, and provides information to secure WLAN access points on their web site, but changing the POP3 identification system (which was introduced long before anyone thought of broadband Internet, connection sharing and wireless LAN) seems to be almost impossible, having millions of customers."

2005-08-05 **General Services Administration GSA identity management plan single sign-on framework**

EDUPAGE; http://www.fcw.com/article89823-08-05-05-Web

GSA CALLS FOR COMMENTS ON IDENTITY MANAGEMENT PLAN

The General Services Administration (GSA) has called for comments on its plan for decentralized identity management. The system would permit secure single sign-on for users of online government services. A common network would link government or commercial entities that provide identity management services with the agency applications using those services. The program, called the E-Authentication Service Component, would employ this federated approach to avoid having government agencies develop their own e-authentication frameworks. Agencies could purchase and integrate a product from a government-approved provider list. The plan also calls for an E-Authentication Portal. Comments may be submitted through September 6, 2005. AOL ACQUIESCES TO MICROSOFT SENDER ID AUTHENTICATION SCHEME

America Online reversed itself and now says it will adopt Microsoft's Sender ID e-mail authentication technology. Sender ID is a hybrid of earlier Microsoft technology and the technology that AOL initially championed, Sender Policy Framework (SPF). Sender ID works by checking records in the central domain-name system to check whether the sender's computer is authorized to use the domain name on the message, eliminating the annoying tactic of "spoofing," or forging, return e-mail addresses. AOL says it will begin testing Sender ID on inbound e-mail by year's end, while at the same time continuing to test other e-mail authentication technologies, including Domain Keys from Yahoo, plus to Cisco Systems technologies. (Wall Street Journal 26 Oct 2004)

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A41460-2004Nov10.html

AUTHENTICATION WON'T END SPAM, SAY EXPERTS

Panelists at a forum sponsored by the Federal Trade Commission warned that criminals are already one step ahead of major e-mail authentication initiatives planned by major ISPs, including AOL, Microsoft, Yahoo and EarthLink. The ISPs are still testing and backing several different plans, but the basic idea is that the e-mail system would check that the block of Internet addresses assigned to an e-mail provider includes the specific numeric address of a message sender. If the numeric address of the sender doesn't correspond with addresses assigned to the purported mail service, a red flag would be raised. The problem with that scheme, said the panelists, is that a majority of spam is now launched by "zombie" machines controlled by remote spammers. E-mail from a zombie PC looks as if it is coming from a legitimate source -- because it is. In the first half of this year, it's estimated that an average of 30,000 computers a day were turned into zombies, according to Symantec. But despite these discouraging statistics, the experts still insisted that authentication is a vital first step, to be followed by a system that evaluates the "reputation" of senders, perhaps using a process that marks good e-mail with an electronic seal of approval. (Washington Post 11 Nov 2004)

2005-04-18 **e-mail secure transfer delivery receipt confirmation smart card reader electronic digital signature certificate authority**

RISKS; http://www.ynetnews.com/articles/0,7340,L-3073923,00.html 23 84

ISRAELIS TO RECEIVE SECURE E-MAIL ADDRESS TO BE USED FOR CONTACTS WITH AUTHORITIES

Shoshanah Forbes expressed skepticism about the proposed "secure e-mail" initiative in Israel:

"The Social-Economic Cabinet approved Sunday a plan put forth by Finance Minister Benjamin Netanyahu to expand Israel's *approachable Government* program. The government also approved the *safe deposit box* program, a system of secure e-mail boxes that would allow government offices to send official permits, signed forms, receipts and messages to businesses and individuals. [...] At first, the system will support forms in text format (TXT, PDF, RTF, HTML, XML), the last two without Active Script. The `safe' will require the recipient to send a `proof of receipt' to the sender. Each sent message will be coded to identify the sender, to allow the recipient to forward the message to a third party, and an expiry date. [...] In order to use the system, individuals and businesses will be required to obtain a smart card, a card reader (estimated cost: NIS 55 or about USD 12), and to register an electronic signature (approximately NIS 20 or about USD 4.5)."

In addition to all the usual RISKS such a scheme brings up, I should note that to this date, the bill paying website (http://www.mybill.co.il) works only with Win/IE, so I won't be surprised if the above setup will also be Win/IE only.

DHS IAIP Daily; http://news.com.com/Danger+Authenticating+e−mail+can+break+i t/2100−7349_3−6062953.html?tag=nefd.lede 23

DANGER: AUTHENTICATING E-MAIL CAN BREAK IT.

The promise of e-mail authentication is too good to ignore, but if it is implemented incorrectly it will break a company's mail system instead of fixing it, experts have cautioned. "Deploy smart. Don't just do it," Erik Johnson, a secure messaging executive at Bank of America, said in a presentation at the Authentication Summit Wednesday, April 19. "If you just do it, you may just break it." For the past two years, the technology industry has been advocating the use of systems to guarantee the identity of e-mail senders. It sees such authentication as key to the fight against spam and phishing, as it should help improve mail filters and make it harder for senders to forge their addresses. The industry also likes to advertise that these systems have practically no cost. The key problem for large companies is figuring out all the systems that send e-mail on their behalf, said Paul Judge, chief technology officer at e-mail security company CipherTrust. "If you are a large multinational organization, you may have e-mail gateways in 10 countries, you may have marketing companies that send e-mail on your behalf," he said.

1997-07-08 **crypto algorithm**

EDUPAGE

SCIENTISTS PROPOSE NEW ENCRYPTION SCHEME

Two scientists at the IBM Almaden Research Center in San Jose, Calif. Have developed a new approach to public key cryptography based on mathematical constructs called lattices. The system would be based on a particular set of hidden hyperplanes that constitute the private key and a method of generating points near one of those hyperplanes for the public key. The security of the system rests on the computational difficulty of finding the "unique" shortest line segment (or vector) that connects any two points in a given lattice — a task that's fairly easy in two or three dimensions, but much more difficult in a 100-dimensional lattice. The researchers are working to turn their theory into a marketable product, and see applications in creating digital signatures and other security and authentication schemes. (Science News 5 Jul 97)

[MK adds: This approach appears to have the advantage not only of generating key pairs that are incredibly difficult to find using brute-force cracking but also of ensuring continued employment for professors of cryptography who will have to explain the inconceivable to the next generations of computer science students.]

U.S. UPGRADE OF ENCRYPTION PUTS BANKS IN PIVOTAL ROLE [EDUPAGE]
The National Institute of Standards and Technology (NIST) last week named five finalist algorithms as candidates to replace the federal Data Encryption Standard (DES). NIST has been working since 1997 to develop a standard to replace DES, and a final algorithm may not be chosen for another year. The new Advanced Encryption Standard (AES) will have a key length of at least 128 bits, compared with DES' 56-bit key length. Experts say unscrambling strings of 128 bits or more could take billions or trillions of years. However, even after the adoption of AES, privacy issues and questions of data encryption and digital certificates in e-commerce will remain. After May 15, NIST will "study all available information and propose the AES, which will incorporate one or more AES algorithms selected from the finalists," according to the NIST Web site. NIST aims for universal adoption of AES. (American Banker 08/16/99)

2001-02-12 **encryption stream cipher**

NewsScan

VANISHING ENCRYPTION
Harvard computer science professor Michael Rabin and his doctoral student Yan Zong Bing have developed a way of sending messages using an encryption scheme that can not be broken, because the code is created from a stream of random numbers that are never stored in the computer's memory and in effect vanish at the same time a message is coded or decoded. Dr. Richard Lipton of Princeton and Georgia Tech says: "It's like in the old 'Mission Impossible,' where the message blows up and disappears." But some computer scientists, such as Professor Dorothy Denning at Georgetown, say that the technique is impractical for large messages, while Dr. Peter G. Neumann at SRI International suggests that cryptography's role in protecting privacy is more cosmetic than real: "If you think cryptography is the answer to your problem, then you don't know what your problem is." 2003-06-06 **hack-proof communications cryptography bacnk government Quantum research Toshiba Cambridge**

NIPC/DHS

June 06, vnunet.com — 'Hack-proof' cryptography goes quantum.

Researchers have developed new technology that could allow companies to implement hack-proof communications in three years. The technology, based on quantum cryptography, was demonstrated by UK-based Toshiba Research Europe last week working over distances of 100km for the first time. Research laboratory group leader Andrew Shields explained that the technology will be applicable for large organizations such as banks and government departments needing highly secure links between local sites. Quantum cryptography allows users on an optical network to guarantee security by encoding each transmitted bit with a single particle of light. Commercial products could be available in less than three years, according to Shields. The Department of Trade and Industry (DTI) in London, England, is partially funding further research into the technology by Toshiba, the University of Cambridge and Imperial College, London.

2004-05-17 **quantum cryptography European Union EU response Echelon**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,93220,00.html

May 17, Computer World — EU seeks quantum cryptography response to Echelon.

The European Union (EU) plans to invest $13 million during the next four years to develop a secure communication system based on quantum cryptography, using physical laws governing the universe on the smallest scale to create and distribute unbreakable encryption keys, project coordinators said on Monday, May 17. If successful, the project will produce the cryptographer's Holy Grail -- absolutely unbreakable code -- and thwart the eavesdropping efforts of espionage systems such as Echelon, which intercepts electronic messages on behalf of intelligence services. "The aim is to produce a communication system that cannot be intercepted by anyone, and that includes Echelon," said Sergio Cova, a professor from the electronics department of Milan Polytechnic and one of the project's coordinators. "We are talking about a system that requires significant technological innovations. We have to prove that it is workable, which is not the case at the moment." Major improvements in geographic range and speed of data transmission will be required before the system becomes a commercial reality, Cova said.

2004-05-17 **key exchange quantum cryptography NIST speed of light**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/25948−1.html

May 17, Government Computer News — NIST doing crypto key exchanges at the speed of light.

The National Institute of Standards and Technology (NIST) is pushing the speed limit on cryptographic key exchanges on its new quantum communications test bed. The May 3 issue of Optics Express, the online journal of the Optical Society of America, described a demonstration of NIST's quantum key distribution system that delivered usable bits in the form of individual photons at the rate of 1Mbps. The process involves sending individual photons—elemental particles of light—in different polarizations and orientations to represent individual bits. The laws of physics declare that observing an elemental particle such as a photon changes it, making eavesdropping essentially impossible. "Detecting a photon involves its destruction," said Charles Clark, chief of the Electron and Optical Physics division. "If someone tried to eavesdrop, they would induce an error rate that would be so high it would be noticed." The system does not encrypt data; it only exchanges bits that can be used for an encryption key.

DHS IAIP Daily; http://news.com.com/Crypto+researchers+abuzz+over+flaws/2100 −1002_3− 5313655.html?tag=nefd.lede

August 17, CNET News.com — Crypto researchers abuzz over flaws.

News that mathematical functions embedded in common security applications have previously unknown weaknesses have recently surfaced in encryption circles. French computer scientist Antoine Joux announced Thursday, August 12, that he had uncovered a flaw in an algorithm called MD5, often used with digital signatures. Then four Chinese researchers released a paper that reported a way to circumvent MD5 and other algorithms. Eli Biham and Rafi Chen, researchers at the Technion institute in Israel, reported some early work toward identifying vulnerabilities in the SHA-1 algorithm at the Crypto 2004 conference in Santa Barbara, CA on Tuesday, August 17. SHA-1 is embedded in popular programs like PGP and SSL. It is certified by the National Institute of Standards and Technology and is the only signing algorithm approved for use in the U.S. government's Digital Signature Standard. The MD5 and SHA-1 algorithms are known to computer scientists as hash functions. They take all kinds of input, from an e-mail message to an operating-system kernel, and generate what's supposed to be a unique fingerprint. If a malicious attacker could generate the same fingerprint with a different input stream, the cloned fingerprint -- known as a hash collision -- would certify that software with a back door is safe to download and execute. It would help a crook who wanted to falsely sign an e-mail instructing that someone's bank account be emptied.

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2005/0207/web−hash−02−07−05. asp

NIST PLANNING TO CHANGE WIDELY-USED CRYPTOGRAPHIC HASH FUNCTION

Federal agencies have been put on notice that National Institute of Standards and Technology (NIST) officials plan to phase out a widely used cryptographic hash function known as SHA-1 in favor of larger and stronger hash functions such as SHA-256 and SHA-512. The change will affect many federal cryptographic functions that incorporate hashes, particularly digital signatures, said William Burr, manager of NIST's security technology group, which advises federal agencies on electronic security standards. "There's really no emergency here," Burr said. "But you should be planning how you're going to transition — whether you're a vendor or a user — so that you can do better cryptography by the next decade."

2005-02-20 **new cryptographic protocol secure wireless network delayed password disclosure Indiana University source code release 2005**

DHS IAIP Daily; http://www.newscientist.com/article.ns?id=dn7037

NOVEL CRYPTOGRAPHIC PROTOCOL COULD HELP SECURE WIRELESS COMPUTER NETWORKS.

Markus Jakobsson and Steve Myers of Indiana University demonstrated a new security scheme, dubbed "delayed password disclosure," at the American Association for the Advancement of Science meeting in Washington, DC, on Saturday, February 19. Existing security protocols focus on securing the link between two machines to counteract eavesdropping. But making sure that a computer is connected to a legitimate access point in the first place is also important. If a hacker uses his computer as a fake access point and then relays the messages on to a real one, the information can be stolen covertly. The delayed password disclosure protocol counteracts this threat by allowing both parties to use a pre-arranged password or pin for authentication, but prevents this from being revealed during communications. Jakobsson adds that the scheme would be not be noticed by users, as they are only notified when the wireless link seems suspicious. Computer code for the protocol will be released in the next couple of months and a version for mobile phones should also be ready by the end of 2005.

1998-10-22 **nanotechnology chip lock restriction logon encryption**

EDUPAGE, http://www.mdl.sandia.gov/micromachine/

EDUPAGE editors summarized some interesting developments on the nanotechnology front.

LOCK-ON-A-CHIP
Researchers at Sandia National Laboratories have developed a way to build a microscopic mechanical lock into computer chips, blocking hackers from accessing whatever information that chip is handling, including data on the hard drive. The lock's tiny gears are created as part of the chip-making process, and only by typing a combination of six letters selected by the computer owner will the chip turn on. The chip lock design, which will cost only about a dollar more per chip, will be perfected and brought to market in about two years, say the researchers. (Wall Street Journal 22 Oct 98)

1999-05-15 **encryption algorithms tools kits**

Crypto-gram, http://www.eskimo.com/~weidai/cryptlib.html 99 05

Crypto++ v3.1 was released in May 1999. According to the notes on < http://www.eskimo.com/~weidai/cryptlib.html >, "Crypto++ is a free C++ class library of cryptographic schemes. Currently the library consists of the following, some of which is other people's code, repackaged into classes:
* a class hierarchy with an API defined by abstract base classes
* AES candidates: RC6, MARS, Rijndael, Twofish, Serpent
* other symmetric block ciphers: IDEA, DES, Triple DES, RC2, RC5, Blowfish, Diamond2, TEA, SAFER, 3-WAY, GOST, SHARK, CAST-128, Square
* generic cipher modes: CBC padded, CBC ciphertext stealing (CTS), CFB, OFB, counter mode
* stream ciphers: ARC4, SEAL, WAKE, Sapphire, BlumBlumShub
* public key cryptography: RSA, DSA, ElGamal, Nyberg-Rueppel (NR), BlumGoldwasser, Rabin, Rabin-Williams (RW), LUC, LUCELG, Elliptic Curve Cryptosystems
* padding schemes for public-key systems: PKCS#1 v2.0, OAEP, PSSR, IEEE P1363 EMSA2
* key agreement schemes: Diffie-Hellman (DH), Unified Diffie-Hellman (DH2), Menezes-Qu-Vanstone (MQV), LUCDIF
* one-way hash functions: SHA-1, MD2, MD5, HAVAL, RIPEMD-160, Tiger
* message authentication codes: MD5-MAC, HMAC, XOR-MAC, CBC-MAC, DMAC
* cipher constructions based on hash functions: Luby-Rackoff, MDC
* pseudo random number generators (PRNG): ANSI X9.17 appendix C, PGP's RandPool
* Shamir's secret sharing and Rabin's information dispersal scheme
* DEFLATE (gzip compatible) compression/decompression
* fast multi-precision integer operations
* prime number generation and verification
* various miscellaneous modules such as base 64 coding and 32-bit CRC
* A high level interface for most of the above, using a filter/pipeline metaphor
* benchmarks and validation testing.

1999-09-28 **encryption standard e-commerce wireless telephony public key infrastructure**

EDUPAGE; Financial Times (London)

IT COMPANIES PROMOTE NEW STANDARD FOR PHONE SECURITY
EDS, France's Gemplus, Sonera, and Ericsson have founded a forum called "Radicchio" to promote a world encryption standard. Known as "public key infrastructure," the technology provides security for mobile phone-based electronic commerce transactions. The technology can be embedded into a silicon chip that is located inside typical GSM handsets. Analysts believe that the mobile commerce market could reach $66 billion in the next four years, but forum founding members are concerned that security issues could impede the emerging market. The European initiative is currently pursuing new members, such as industry players and governments. Members of Radicchio say there could be 600 million mobile phones connected to the Internet by 2004, and easing security fears could go a long way toward making electronic transactions ubiquitous. (Financial Times 09/28/99)

1999-10-07 **encryption confidentiality privacy e-mail temporary**

EDUPAGE; AP, USA Today

'SELF-DESTRUCT' E-MAIL OFFERS VIRTUAL PRIVACY [EDUPAGE]
The problem of e-mail being stored on computers on both the sending and receiving end as well as along the networks they travel long after being erased by sender and recipient — and sometimes coming back as evidence, as in the Iran-Contra and Microsoft antitrust cases — could become a thing of the past after the introduction of a new system from San Francisco-based startup Disappearing. The Disappearing system creates a temporary "key" for sender and recipient to encrypt and decrypt messages. After a certain amount of time set by the sender, the "key" will be destroyed at Disappearing's site and the e-mail message will no longer be readable. The system should be available in the first part of 2000. (USA Today 10/07/99)

[MK adds: However, anyone who keeps a copy of the decrypted text of the self-destructing e-mail would be able to keep that indefinitely.]

2002-06-01 **PGP Corporation**

PGP Corporation FAQ < http://www.pgp.com/company/faqs.html >

Was PGP Corporation once owned by Network Associates?
PGP technology has been in use for more than 10 years. PGP Inc., a private company, was formed in 1991 and acquired by Network Associates in 1997. Network Associates lacked a technology vision for the PGP product line and sold it to a newly formed, independent PGP Corporation in June 2002.

How was PGP Corporation formed?
PGP Corporation was incorporated in June 2002 by a management team composed of technology industry veterans and former PGP executives, developers, and patent holders. The group raised $14 million of venture funding from DCM-Doll Capital Management and Venrock Associates, two highly respected venture capital firms, to purchase assets, upgrade existing products, and develop new technology.

What is "new" about the new PGP Corporation?
The new PGP Corporation was founded on a completely new vision of securing digital assets. Although existing desktop products are technically excellent and extremely secure, they are impractical for universal deployed because they rely on users to learn how to use the security products and to follow policy by remembering when they must use security. The new PGP Corporation has taken the same trusted core cryptographic product and, through innovative technology, made it transparent to users. With the new PGP Universal product line, email security is now practical to deploy with all users because email is secured, and policy enforced, automatically by the network.

2004-01-16 **Internet browser security VPN VLAN SSL IPSec business**

DHS/IAIP Update

January 14, CNET News — Browser security takes off in VPNs.

Corporations are embracing a simpler, cheaper way of connecting remote workers to their networks -- Secure Sockets Layer (SSL) encryption. SSL is a significant step forward in Virtual Private Network (VPN) ease-of-use as an alternative to Internet Protocol security (IPSec). SSL technology has been embedded in most standard Web browsers for years. SSL VPNs enable access from virtually any Web browser, so they're a natural fit for remote access and extranet applications. For most Web-based applications, users don't have to use a client, making it easier to give access to the network. IPSec VPNs require the installation and configuration of software on all clients and can be clunky when it comes to remote access, often meaning interoperability issues that can leave many frustrated and stranded without access to critical network information. Most experts agree that the technologies are complementary. Though SSL VPN has many benefits, it also has its downside. One important element is end-point security. SSL VPN allows people to enter corporate networks via any Web browser, socompanies need to make sure that it has strong authentication to verify that users are authorized. It also needs strong policy management to ensure that people only access applications for which they have approval. As people can use any Web-enabled device for access, viruses from those machines can be transmitted to the corporate network.

2004-08-24 **quantum encryption cryptology security improvement NIST optical test bed**

DHS IAIP Daily; http://www.eet.com/article/showArticle.jhtml?articleId=30000
032

August 24, EE Times — Quantum encryption poised to tighten data security.

Quantum cryptology is starting to move out of the labs and into commercial systems that leverage advanced optical-networking technology. Three companies, Quantique SA of Geneva, Switzerland, MagiQ Technologies Inc. of Somerville, MA, and Tokyo-based NEC Ltd. have brought out encryption systems for optical networks that rely on fundamental physical laws to block eavesdropping. Also, a group based at Austria's University of Vienna is quickly moving toward a commercial quantum-encryption system. In a real-world experiment, a commercial bank and Vienna City Hall were connected via a fiber optic link that was run under the streets. The system was able to generate identical random sequences of bits at both ends of the fiber, and the key was used to send a secure bank transfer. However, some quantum-information experts, including experts at the National Institute of Standards and Technology (NIST), question whether quantum-encryption schemes are the absolute barrier to data theft claimed by proponents of the approach. NIST has a large effort in the area of data security and is attempting to stay ahead of the quantum-encryption game with a sophisticated optical testbed.

2005-02-15 **instant messaging IM off-the-record OTR private encrypted chat no trace Gaim plugin AOL proxy University California Berkeley**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,39187934,00.htm

INSTANT MESSAGING GETS PERFECT FORWARD SECURITY

Two researchers at the University of California at Berkeley have created an add-on to instant messaging (IM) that they claim will enable the participants to identify each other and have a secure conversation without leaving any proof that the chat occurred. The result, dubbed off-the-record (OTR) messaging by security researchers Ian Goldberg and Nikita Borisov, is a plug-in for the Gaim open source instant-messaging client that enables encrypted messages that do not leave a key that could be used to verify that the conversation happened. That attribute, known in cryptography as perfect forward security, also prevents snoopers from reading any copies of the conversation. In order for a secure and deniable IM conversation to occur, both parties need to have the off-the-record program installed on Gaim or use America Online's Instant Messenger with a server set up to be a proxy with software also developed by Goldberg and Borisov.

2005-05-03 **quantum cryptography single photon light beam stop hackers interception key**

DHS IAIP Daily; http://www.reuters.com/newsSciTech.jhtml;jsessionid=QT1GT4CX50JBYCRBAEZSFFA

SCIENTISTS CLAIM DEVELOPMENT OF CODE TO STOP HACKERS

Australian scientists believe they have developed an unbreakable information code to stop hackers, using a diamond, a kitchen microwave oven and an optical fiber. Researchers at Melbourne University used the microwave to "fuse" a tiny diamond, just 1/1000th of a millimeter, onto an optical fiber, which could be used to create a single photon beam of light which they say cannot be hacked. Photons are the smallest known particles of light. Until now, scientists could not produce a single-photon beam, thereby narrowing down the stream of light used to transmit information. "When it comes to cryptology, it's not so much of a problem to have a coded message intercepted, the problem is getting the key (to decode it)," said university research fellow James Rabeau, who developed the diamond device. "The single-photon beam makes for an unstealable key."

PHIL ZIMMERMANN TACKLES VoIP SECURITY

First there was PGP e-mail. Then there was PGPfone for modems. Now Phil Zimmermann, creator of the wildly popular Pretty Good Privacy e-mail encryption program, is debuting his new project, which he hopes will do for internet phone calls what PGP did for e-mail. Zimmermann has developed a prototype program for encrypting voice over internet protocol, or VOIP, which he will announce at the BlackHat security conference in Las Vegas this week.

Like PGP and PGPfone, which he created as human rights tools for people around the world to communicate without fear of government eavesdropping, Zimmermann hopes his new program will restore some of the civil liberties that have been lost in recent years and help businesses shield themselves against corporate espionage.

2006-02-22 **new security technology quantum cryptography photonic decoys foil hackers**

DHS IAIP Daily; http://www.networkworld.com/news/2006/022206−quantum− cryptography.html 23

STUDY SHOWS HOW PHOTONIC DECOYS CAN FOIL HACKERS.

A University of Toronto professor and researcher has demonstrated for the first time a new technique for safeguarding data transmitted over fiber-optic networks using quantum cryptography. Professor Hoi-Kwong Lo, a member of the school's Center for Quantum Information and Quantum Control, is the senior author of a study that sheds light on using what's called a photonic decoy technique for encrypting data. Quantum cryptography is starting to be used by the military, banks and other organizations that seek to better protect the data on their networks. This sort of cryptography uses photons to carry encryption keys, which is considered safer than protecting data via traditional methods that powerful computers can crack. Quantum cryptography is based on fundamental laws of physics, such that merely observing a quantum object alters it. Lo's study is slated to appear in the Friday, February 24, issue of Physical Review Letters.

IBM ADDS SECURITY TO HARDWARE

IBM has developed technology that adds hardware-level encryption to data on a range of electronic devices. Researchers at the company said that the technology, called Secure Blue, encrypts and decrypts data as it passes through a processor. Data are encrypted in RAM, as well, resulting in a high level of security for devices such as personal computers, cell phones, digital media players, and electronic organizers. The flip side to the protection that Secure Blue provides to users is a new level of control offered to other owners of content, such as media companies. Digital rights management (DRM), which dictates how content may be used, could be bolstered by IBM's new technology, allowing music producers, for example, another tool to restrict unauthorized usage of their intellectual property. Secure Blue has been demonstrated with IBM's PowerPC processor and is said to be compatible with processors from Intel and Advanced Micro Devices, though IBM said it is not currently in talks with those companies to add the technology to their chips.

STEGANOGRAPHY

The term "steganography" has come to mean the practice of hiding messages within graphics or music files. Fabian Hansmann of the German software maker Steganos explains: "Steganography has one big advantage -- that is you cannot prove that information exists. If you just use encryption, you will always see that there is a file that carries encrypted information." Hansmann characterizes his company's $60 security software suite as a "paranoid option" for advanced users who have the time and interest to hide their data. But Steganos products are under constant scrutiny by law enforcement officials. Hansmann says, "We regularly have inquiries from government agencies of all kinds, from foreign secret services to local police departments in Germany." (Reuters/USA Today 30 Jun 2004)

2004-08-15 **cyberspace Internet café Al Qaeda refuge terrorism Homeland Security steganography**

DHS IAIP Daily;
http://news.yahoo.com/news?tmpl=story&u=/latimests/20040815/ts_latimes/cyberspacegivesalqaedarefuge

August 15, Los Angeles Times — Cyberspace gives al Qaeda refuge.

Since Osama bin Laden and his followers were driven from their bases in Afghanistan, the al Qaeda terrorist network has demonstrated an increasing ability to exploit the Internet. Independent al Qaeda cells and the network's loose hierarchy use easily available encoding programs and simple techniques to exchange virtually undetectable messages between Internet cafes in Karachi and libraries in London. Messages can be embedded in image, sound or other files transferred over the Internet through a process called "steganography." The files cannot be distinguished without a decoding tool. The al Qaeda operatives are often people with everyday skills who have harnessed the Internet in a campaign against the United States and its allies. In an effort to gather information on potential recruits and donors, U.S. law enforcement agencies operate Websites that are set up to resemble extremist Islamic sites. Visitors leave an electronic trail when they enter the site. On the other side, al Qaeda can transmit false information to determine whether its members are being monitored by law enforcement.

2005-10-21 **steganography printer identification tracking surveillance criminal investigation identification originator**

RISKS; http://tinyurl.com/d9axy; http://www.eff.org/Privacy/printers/docucolor/ 24 08

PRINTER STEGANOGRAPHY

Many color printers (Xerox, HP, etc.) add barely visible yellow dots that encode printer serial numbers and time stamps (down to the minute). Intended primarily to combat counterfeiters, the purportedly "secret" steganographic code in color printer copies has now been decoded by four people at the Electronic Frontier Foundation. (The encoding is straightforward, and includes no encryption.) There are of course various slippery-slope privacy issues.

[Abstract by Peter G. Neumann]

[MK adds: Such tracking information may be helpful in criminal investigation of threats sent through printed documents or frauds involving such documents. In countries with repressive regimes, it may be used by authorities to track down publishers of samizdat (unauthorized newsletters). In corporations, it may be used to identify anonymous whistleblowers.]

GOV'T TESTING PUBLIC KEY INFRASTRUCTURE STANDARDS
The U.S. government is sponsoring public key infrastructure pilot projects in 10 federal agencies in an effort to determine which technologies should be adopted as standards. Agencies currently using encryption employ either the Digital Signature Standard (DSS) or the Digital Encryption Standard (DES). In considering other standards, the government is primarily interested in technologies that are royalty-free and that do not expose digital signatures when encrypting data for confidentiality. The pilot projects will enable the government to test a variety of technologies to determine what will work best before it spends large amounts of money on any particular technology. 1999-05-15 **encryption trust management public key infrastructure PKI software tools**

Crypto-gram, http://www.cis.upenn.edu/~angelos/keynote.html 99 05

Matt Blaze, Joan Feigenbaum et al. released version 2 beta of KeyNote, a small toolkit for implementing trust relationships. The description at < http://www.cis.upenn.edu/~angelos/keynote.html > includes the following text from RFC 2704:
Trust management, introduced in the PolicyMaker system [BFL96], is a unified approach to specifying and interpreting security policies, credentials, and relationships; it allows direct authorization of security-critical actions. A trust-management system provides standard, general-purpose mechanisms for specifying application security policies and credentials. Trust-management credentials describe a specific delegation of trust and subsume the role of public key certificates; unlike traditional certificates, which bind keys to names, credentials can bind keys directly to the authorization to perform specific tasks.

2000-06-13 **e-commerce digital signatures contracts confirmation e-mail legislation proposal amendments**

NewsScan

Proposed legislation on electronic contracts . . . attracted the attention of tinkerers in Congress, who . . . inserted a number of changes in the past few weeks, with one addition requiring Internet users to send a number of repeated e-mails reconfirming their consent to the contract at every stage of a transaction, as well as demonstrating that they had absorbed every bit of legal boilerplate. That change drew protests from the financial community, which viewed it as overly cumbersome, but the extra consumer measures also gave pause to Phil Gramm, chairman of the Senate banking committee. Gramm is less worried by brokerages than by the tendency among his fellow lawmakers to apply the old regulatory culture to the new online frontier, pointing out that the new bill goes beyond anything that already applies in contract law. "What happened to 'Let the buyer beware?'" he asks. "Common law and a thousand years of paper contracts established duties and responsibilities for people participating in commerce. You don't want to change that relationship so that e-commerce undermines contracts and commerce." The bill underwent further change yesterday to remove some of the obstacles, but as one financial expert said, "We have gone from having two different versions of a bill that would have been an A or an A minus, to a low B at best." (Financial Times 13 Jun 2000)

2001-03-22 **digital certificates software authenticity fraud bogus impersonation quality assurance revocation list risk management security model**

RISKS 21 29

Many correspondents reported the issuance of bogus digital certificates assigned to Microsoft by Verisign. Jeff Savit's summary was as follows:

"Spoofing hazard: Verisign gave digital certificates under Microsoft name to an individual not from Microsoft. Microsoft issued a bulletin at < http://www.microsoft.com/technet/security/bulletin/MS01-017.asp > that describes the risk of running code that erroneously appears to be signed by Microsoft (eg: ActiveX controls), and discusses the risks due to not having a proper revocation mechanism.

Note that the certs were made available January 30th, so who knows what code has been accepted and executed since then. Microsoft is a victim in this particular instance."

Later contributions to RISKS and BUGTRAQ provided more details of the security breach.
Roy Sinclair pointed to a paragraph from the Frequently Asked Questions at < http://www.microsoft.com/technet/security/bulletin/MS01-017.asp >:

"The update is needed because of a characteristic of VeriSign code-signing certificates. Every certificate issuer periodically generates a Certificate Revocation List (CRL), which lists all the certificates that should be considered invalid. A field in every certificate should indicate the CRL Distribution Point (CDP) - the location from which the CRL can be obtained. The problem is that VeriSign code-signing certificates leave the CDP information blank. As a result, even though VeriSign has added these two certificates to its current CRL, it's not possible for systems to automatically download and check it. "

Sinclair continued, "The first question I have after seeing that is how many of the rest of the 500,000 certificates that Verisign says they have issued also do not have this CRL Distribution Point field properly filled in. In the lack of any information to the contrary I would hazard to guess that it's probably that none of the 500,000 certificates issued by Verisign have supplied the information that should be in this field. If this is truly the case then we have yet another problem of much wider scope than the improper issuance of two certificates, there are a great number of valid certificates which could be stolen or misused and even if Verisign were to add them to their CRL the certificates themselves don't point to the CRL so they won't be properly rejected. Two things need to be done, one is that software which checks certificates must be changed to warn users that certificates lacking a CRL are much more suspect and Verisign needs to re-place all certificates that currently lack this critical information with new certificates that have this field properly filled in. Additional questions that come to mind is how many other certifying agencies have also failed to fill in the information in this field and what percentage of the certificates being used today are unverifiable?"

Michael Sinz pointed to the well-known fallacy of confusing authentication with quality or trustworthiness.: "So, lets see - Microsoft says that ActiveX is secure as long as the software (ActiveX thing) is not from an 'evil' source. To prevent bad software from being used, they use digital signatures to identify the person or company who made the software such that you could either trust them or know who to go after when it does something bad. The OS and system infrastructure does not try to enforce anything other than to check these certificates and warn you based on your settings as to if you want to run unsigned software or any software signed by company 'X' or a number of other possible combinations of warnings. There is no built in security beyond that point. Once you say 'Yes, run it' you are opening up your system to complete control by the ActiveX control. Ok, in a perfect world, with no one wishing to do harm or rob you blind, such a mechanism would work just fine. The Internet is not such a world."

2004-01-13 **VeriSign certificate absence confusion insecure transaction connection**

NIPC/DHS; http://verisign.com/support/vendors/exp-gsid-ssl.html

January 11, The Register — VeriSign dead cert causes net instability.

The expiration of one of VeriSign's master digital certificates on Wednesday, January 7, created confusion for Net users and glitches to the operation of some applications, notably Norton Anti-Virus (NAV). After the cert VeriSign used to sign other certs expired, the chain of trust was broken, leaving some aps unable to set up a secure connection. These apps then defaulted to trying to access Verisign's certificate revocation list server which, faced with a huge extra load, buckled under the pressure. Essentially, where there are problems, traffic needs to be directed to a new Global Server Intermediate Root CA. Users of Java aps and older IE browsers were affected by the issue but NAV users were worst affected. NAV Users saw their computers slow to a crawl and Microsoft office applications not starting properly because of the problem.Verisign has posted an advisory on the problem at the following Website detailing server updates needed to resolve application instability: http://verisign.com/support/vendors/exp-gsid-ssl.html.

2004-01-16 **public key infrastructure PKI implementation government security**

NIPC/DHS; http://www.gao.gov/highlights/d04157high.pdf

January 15, Government Accounting Office — GAO-04-157: Status of Federal Public Key Infrastructure Activities at Major Federal Departments and Agencies (Report).

The federal government is increasingly using online applications to provide access to information and services, and to conduct internal business operations. As such, strong security assurances are necessary to properly safeguard data. The Government Accounting Office (GAO) found that Public Key Infrastructure (PKI) and its associated hardware, software, policies, and people can provide greater security assurances than simpler means of authenticating identity, such as passwords. Twenty of the 24 agencies reported that they are undertaking a total of 89 PKI initiatives, now in various stages of development. Agencies continue to face challenges, however, in PKI implementation, many of which are similar to those faced in GAO's 2001 report on the issue. Policy and guidance is often lacking or ill-defined, including in technical standards and legal issues. Insufficient funding for the high cost of PKI technology also is a challenge. Interoperability continues to be an issue, as integrating PKI with other systems at times requires significant change or even replacement. Another challenge is the administrative burden of training personnel for use and management of PKI.

2006-03-23 **VeriSign Managed PKI input validation flaw vulnerability cross-site scripting attack**

DHS IAIP Daily; http://securitytracker.com/alerts/2006/Mar/1015813.html 23

VERISIGN MANAGED PKI INPUT VALIDATION FLAW IN 'HAYDN.EXE' PERMITS CROSS-SITE SCRIPTING ATTACKS.

A vulnerability was reported in VeriSign's Managed PKI. A remote user can conduct cross-site scripting attacks. Analysis: The 'haydn.exe' script does not properly filter HTML code from user-supplied input before displaying the input. A remote user can create a specially crafted URL that, when loaded by a target user, will cause arbitrary scripting code to be executed by the target user's browser. The code will originate from the site running the Managed PKI software and will run in the security context of that site. As a result, the code will be able to access the target user's cookies (including authentication cookies), if any, associated with the site, access data recently submitted by the target user via Web form to the site, or take actions on the site acting as the target user. Affected version: 6.0. Solution: The vendor indicates that, as a solution, a default HTML file must be constructed by creating a blank html file in the '/htmldocs/' directory labeled 'fdf_noHTMLFile.html'.

TOP BANKING SITES VULNERABLE: RESEARCHER

The Web sites of three of Australia's four big banks are susceptible to cross-site scripting attacks, according to a British tech professional who gained prominence last year when he discovered a URL spoofing flaw in Microsoft's Internet Explorer browser. Sam Greenhalgh, who recently tested the Web sites of several British financial services companies and found many of them susceptible to the same kind of attacks, said the flaw resulted from sites not "sanitizing" information the user submits before displaying the information on the page: "If the information contains HTML, those HTML tags will be included on the site. Among other things this allows an attacker to include a tag that instructs the page to load a JavaScript file from another Web site." Greenhalgh provided demonstrations of injecting HTML on the sites using scripts he wrote himself. (The Age 2 Aug 2004) Rec'd from John Lamp, Deakin U.

[Note: "cross-site scripting:" Causing a user's Web browser to execute a malicious script. One approach is to hide code in a "click here" hyperlink attached to a URL that points to a non-existent Web page. When the page is not found, the script is returned with the bogus URL, and the user's browser executes it. -- from the Computer Desktop Encyclopedia, v18.2. See < http://www.computerlanguage.com >]

1999-08-05 **e-commerce micropayments credit card phone company ISP Internet service provider**

Wall Street Journal

NEW WAVE OF FIRMS BETS CONSUMERS ARE RIPE FOR INTERNET 'MICROPAYMENTS'
Several new companies are offering ways for consumers to make "micropayments" online, with the aim of encouraging consumers to spend more freely on small items. For example, iPin will announce a plan Monday to enable consumers to roll small purchases onto their monthly ISP bills. Consumers who sign up with iPin will give the company their e-mail address and select a personal identification number. IPin says the use of PINs will be faster than using credit card numbers and will encourage impulse spending. IPin, which has already formed deals with a few small ISPs, is now testing its technology with AT&T's WorldNet Service. Retailers will pay iPin a lower processing fee than they would pay to credit card companies. IPin will then share these retailer fees with ISPs. Using a similar strategy, eCharge includes small purchases on consumers' phone bills. The company has a partnership with AT&T, through which it has access to most U.S. phone users. ECharge collects a fee from retailers, which it splits with AT&T and the local phone company involved. (Wall Street Journal 08/05/99)

2002-11-26 **bandwidth metering spam file sharing copyright violations piracy swapping**

NewsScan

HIGH-SPEED ISPs CONSIDER PUTTING ON THE BRAKES
Many of the largest high-speed ISPs are considering capping the amount of bandwidth that their subscribers can use each month in an effort to put the brakes on rampant file-swapping. "Every major broadband provider is seriously weighing pros and cons of bandwidth consumption caps," says Michael Harris, president of research firm Kinetic Strategies. Leading the way is Bell Canada, whose DSL service has already instituted caps on bandwidth use, charging subscribers about 80 cents for each extra 100 megabytes used. The concept is controversial for several reasons: it requires ISPs to set up a traffic-monitoring system for each account and it forces the subscriber to self-ration bandwidth — a foreign concept to people accustomed to an all-you-can-eat approach to Internet use. Critics note that unwanted content, such as pop-up ads and pornographic spam, could waste subscribers' bandwidth, but Bell Canada says its policy has been a success so far. The company offers tiered levels of service allowing 2GB, 10GB and 20GB of monthly traffic, and the percentage of customers exceeding their allotment in any given month is small — between 6% and 8%. Cable companies are eyeing the Bell Canada experiment with interest, as their subscribers in particular are adversely affected by "bandwidth hogs." Meanwhile, the president of file-swapping company Grokster dismisses the efforts, saying, "They only thing they're going to accomplish is to make their customers angry." (CNet News.com 26 Nov 2002)

MICROPAYMENTS MORPHING INTO A MEGABUSINESS

The news that micropayment firm BitPass has just raised $11.75 million in venture capital and attracted former American Express Chairman James Robinson III to its board is signaling a resurgence in interest in micropayment systems that facilitate payment for digital content.
Jumpstarting the move -- following a series of crash-and-burn dot-coms like Flooz and DigiCash -- is the notable success of Apple's iTunes, which last week announced it had sold 125 million music downloads at 99 cents each. A recent study by TowerGroup indicates that the total market for Internet and wireless micropayments -- fueled by demand for digital content -- will increase by 23% annually over the next five years to $11.5 billion by 2009. "What it comes down to is that there simply must be a viable transaction model for smaller-cost products to make a dollar off e-commerce sales, but I think with what we've seen already in digital media, it's clear that people are figuring out how to make it work," says a Jupiter Research analyst. 1997-07-12 **hackers onlin banking Internet Web**

Guardian Weekly

The Chartered Institute of Bankers in the United Kingdom commissioned an analysis of online-banking risks. The authors, Drs Anthony Gandy and Chris Chapman, pointed out that banking is already practically virtual today: many customers rarely visit their branch and carry on all their transactions using direct-deposit, credit-cards, debit cards and checks. Rational risks analysis would compare the risks of interception and data diddling to real-world risks resulting from widespread user errors such as keeping PINs near one's debit card, losing sight of one's credit card in restaurants, and giving out credit card numbers freely over the phone.

RISKS 19 31

Jerome Svigals, writing in RISKS, criticized the SET process because of three major vulnerabilities: "However, the SET process has three serious exposures - confirmed with IBM and HP/Verifone. The process does NOT know who is presenting the certificate. The process does NOT know if merchant employees have redirected the certificate through another merchant. All of the critical software is directly accessible by the card users, merchant employees and bank employees. Historically, these individuals have been the prime source of fraud in credit card transaction systems."

However, Phillip M. Hallam-Baker retorted that "The purpose of financial cryptography is to control, not eliminate, risk." He also pointed out that future revisions of SET would likely increase security step by step.

1999-06-14 **online purchase buy e-commerce electronic wallet**

EDUPAGE; Wall Street Journal

COMPANIES AGREE ON SINGLE STANDARD FOR ONLINE 'WALLET'
Microsoft, Sun Microsystems, AOL, and IBM have agreed on an electronic-commerce modeling language (ECML) standard for electronic wallets, which simplify online transactions for consumers. Credit card companies Visa International and MasterCard International will support ECML, and several retailers, including Nordstrom, have also agreed to endorse the format. For years, technology companies have been trying to gain widespread support for proprietary electronic wallet software, which retailers refused to embrace because of the need for special software or the reprogramming of a site. ECML will eliminate the need for retailers to require consumers to re-enter personal information for each purchase. Instead, personal information will be stored on the consumer's Web browser or on an Internet server. (Wall Street Journal 06/14/99)

Event marketers like Ticktmaster.com, Tickets.com and Admission Network are moving quickly to implement technology that will enable customers to print their own tickets to rock concerts, sports events, and movies, but authentication of those do-it-yourself tickets is still an issue. Accordingly, they're turning to online postage sellers E-Stamp and Stamps.com to tap into their encryption technology and bar code techniques for secure online document printing. In response, Stamps.com, with backing from Paul Allen's Vulcan Ventures and some other investors, has formed EncrypTix Inc. to handle sales of event tickets, travel services and financial products like travelers checks. Forrester Research says of the three billion event tickets sold in the U.S. last year, about 10% were sold online — a figure that's expected to grow significantly once the print-your-own model is ready for primetime. (Wall Street Journal 17 Feb 2000)

In a related article, G2 Computer Intelligence's "The Online Reporter" said, "Stamps.com posted an operating loss of $41.8 million for the first quarter on revenues that rose 470% sequentially to $2 million."

The U.S. Postal Service is teaming up with CheckFree to allow customers to pay their bills electronically. The move pits the Postal Service directly against financial institutions like Bank of America and Citibank, which offer electronic bill-paying services, as well as Internet portals, such as Yahoo. Although banks will pose stiff competition to the new USPS service, because customers like to view their account balances before making payments, the postal service is likely to be favored over portals. "The advantage for the post office is the trust and comfort it brings to the table," says a securities analyst. "The post office may get a lot more customers than a Yahoo, which is viewed as fun and frolicky, but perhaps not a place to pay bills." IDC last month predicted that the electronic bill market will grow to $1 billion by 2004. (News.com 5 Apr 2000_)

LIBERTY ALLIANCE SEEKS LIBERTY FROM WHOM?
The 43-member Liberty Alliance -- whose membership includes American Express, AOL Time Warner, General Motors, Nokia, Sony, and United Airlines -- is sometimes suspected of being simply an anti-Microsoft coalition, because it seemed to be formed as a way of resisting Microsoft's plans to use its ".Net Passport" technology to get a lock on Internet commerce. But the Alliance denies that motivation, and has clarified its objectives. The Liberty Alliance says its main goal is to develop open technical standards to allow Web sites and companies to share data when they have customer permission to do so. Different sets of credentials will be used for different purposes (the way, by analogy, an individual's wallet might contain a driver's license, credit cards, library cards, etc.). (New York Times 3 Jun 2002)

INDUSTRY GROUP TO UNVEIL NEW WEB ID STANDARDS The Liberty Alliance, which includes companies like Sun Microsystems, AOL Time Warner, Sony, American Express, MasterCard and Bank of America, is set to unveil new standards for identity authentication that could make memorizing long lists of Web site passwords a thing of the past. The standard makes it easy to surf between various secure sites -- from e-commerce sites to online banking, for instance -- without having to repeatedly type in password information. A competing standard from Microsoft, the Passport system, currently runs on about 200 Web sites. Microsoft and Liberty Alliance members have discussed the idea of joining forces, but no deal has been struck and some Alliance members have voiced their distrust of Microsoft's motives for wanting to cooperate. Several critics, including Sun and AOL, have suggested that the software giant has a history of "breaking" competing technology standards so they don't work as well as Microsoft's. NewsScan; http://theage.com.au/articles/2004/10/15/1097784019869.html

AUSTRALIAN FIRM IN PUSH TO CUT CARD FRAUD

A Queensland-based firm has begun a push to market a locally developed application, which it says can significantly reduce or eliminate credit card fraud. The Credit Card Scanning Protection System runs on the server of the financial institution. Each user is served a page where he or she can set personal parameters -- the type of credit card, level of alert and any additional data that needs to be input in order that a transaction can be completed. For example, apart from merely having a username and a password for gaining entry to one's account, a user can also set up his or her preferences so that a transaction does not go through unless the specified rules are met. Regular debits, and outlets to which regular payments are made can also be specified. And any time a transaction goes through, the customer can receive an alert, either by SMS or email, to a variety of devices.

NewsScan; http://www.nytimes.com/2005/01/10/technology/10cellphone.html

CELL PHONES COULD DOUBLE AS CREDIT CARDS

In Asia, cell phone handset makers are already marketing phones with embedded memory devices (a chip or magnetic strip) that can be swiped against credit or debit card readers in much the same way consumers now use plastic, and trials are underway to bring the technology to the U.S. Details are still being worked on important issues such as security -- consumers may be required to punch in an authorization code each time they charge something -- and in two trials users experienced difficulty in aiming their cell phones at the right angle for the card reader to pick up the data. "People got very upset. Pointing your cell phone at a target is very difficult," says Jorge Fernandes, CEO of cellphone software firm Vivotech. That issue will probably be resolved by switching from infrared to low-level radio signals, but the biggest obstacle is likely to be a dearth of card readers able to interact with the phones. "The phones are exciting, but it's going to be a long time" before a widespread base of U.S. merchants and consumers are equipped to use them, says Visa International VP Sue Gordon-Lathrop. Network World Fusion http://www.nwfusion.com/newsletters/sec/0103sec1.html

Jim Reavis of SecurityPortal wrote a good overview of developments in digital watermarking for the Network World Security Newsletter in January 2000. He summarized the basic requirements for this image- and music-authentication technology: invisibility, accessibility, and resistance to modification. He also reviewed tools for creating and validating digital watermarks as well as developing services such as watermark-tracking, where a firm scans the Web looking for copyrighted works and reports on where they have been found.

NewsScan, Financial Times http://news.ftcom/news/industries/media, CNet http://news.cnet.com/news/0-1005-200-3583337.html http://news.ft.com/news/industries/media

The Secure Digital Music Initiative, a forum of 175 companies in the music, electronics, information technology and telecommunications industries dedicated to developing a secure framework for the digital distribution of music, . . . [offered] a reward of up to $10,000 to the first person to crack its codes. In an open letter to the "alternative" press, SDMI executive director Leonardo Chiariglione challenged hackers to "show off your skills, make some money, and help shape the future of the online digital music economy." SDMI has about 10 different proposals for "watermarking" technology that could be embedded in a digital music file. Portable music players complying with the SDMI standard would only work if the watermark — an inaudible signal — is present. SDMI has also issued the challenge to the technology departments at the University of California at San Diego, MIT, Virginia Tech and Stanford University. "The proposed technologies must pass several stringent tests: they must be inaudible, robust and run efficiently on various platforms, including PCs... So here's the invitation: Attack the proposed technologies. Crack them. By successfully breaking the SDMI protected content, you will play a role in determining what technology SDMI will adopt," said Chiariglione. (Financial Times 13 Sep 2000)

In November, [t]he Secure Digital Music Initiative (SDMI) . . . [said] that three out of five music-protection schemes tested withstood hacker attacks. . . . In announcing the results, SDMI executive director Leonardo Chiariglione refuted an earlier report by Salon.com that said all five technologies had been broken. "I'm an engineer, which means I deal with facts. We conducted all the tests that were planned and did not change the rules as we progressed. We came to the conclusion that not all the (technologies) had been hacked." The group is giving no details on which technologies prevailed, other than to say that both watermark and non-watermark proposals had passed the test. 2000-10-24 **criminal hackers scientists contest vulnerability ethics watermark intellectual property IP music video movies encryption cracking vulnerabilities**

NewsScan, Associated Press/MSNBC http://www.msnbc.com/news/480521.asp

A team of computer scientists at Princeton and Rice Universities and the Xerox Palo Alto Research Center (PARC) has been able to remove the invisible "watermarks" used by the 200-company Secure Digital Media Initiative (SDMI) to protect digital music files from pirates. SDMI had offered a prize to anyone who could defeat its various security measures, four out six of which make use of watermarks. SDMI's Tala Shamoon said, "I expected some would have fallen. This is part of an empirical process to get the best technology."

Professor Ed Felten and colleagues at Princeton University defeated all four of the schemes under test.

2000-11-21 **intellectual property watermark copyright violations**

NewsScan, ZDNet http://msnbc.com/news/493231.asp

Music subscription site EMusic.com has started using "acoustic fingerprint" technology, which it says can spot any of its 140,000 songs that are being illegally traded by Napster users. If such song-swapping is detected, EMusic will send an e-mail warning, asking that the swapping cease. Napster has apparently agreed to block the perpetrator's account if illegal trading persists, and if the user finds a way back into Napster through a different IP address, EMusic says it will try to block that person' Internet access. An analyst with Webnoize says, "This is a warning shot. They are saying they have the technical ability to track their music." He adds that the situation could lead to a lawsuit that would pit the two pioneers — Napster and EMusic — against each other. (ZDNet 21 Nov 2000)

IBM UNVEILS NEW COPYRIGHT TECHNOLOGY
IBM has added new features to its Electronic Media Management System, which is used by copyright holders to control under what circumstances their music is distributed. "We announced two fundamental enhancements," says IBM VP Steve Canepa. "One is superdistribution, which allows for peer-to-peer file distribution. Once the file gets to the consumer, whether it's on a PC or a PDA or whatever, it can now be passed along. A track has a set of usage criteria that can follow it wherever it goes." Translated, that means that fans who buy a music track encoded with EMMS can pass it along to a friend, but the friend may then have to buy the track. The second enhancement provides more choices for rules set by the content owner. For instance, downloadable tracks could expire on the album's release date in one country, but never expire in another country. Music files can also be tracked so that the content owner knows where each copy is, who acquired it and how, and whether it was passed along to others. (Hollywood Reporter 23 Jan 2001)

DIGITAL WATERMARKING DISPUTE DELAYS DVD STANDARD [8 Nov 2001]
The adoption of a technical standard for DVD copy-protection will suffer delays as Verance and Digimarc, two of the lead digital watermarking companies, head to court over their long-standing intellectual property dispute. Digital watermarking places a unique bit of code into a sound or image file that makes it difficult to play without permission from copyright holders. Verance has now filed a lawsuit charging Digimarc with violating antitrust and unfair competition laws, alleging that Digimarc illegally submitted Verance's digital watermarking technology to a standards group. The suit "is going to delay an adoption of a standard for DVD copy-protection," says a Raymond James Financial analyst. "The longer they hash it out in the Portland courts, the longer it's going to take for the industry to (accept a) solution and get some compliant software out there." Digimarc is a member of the Video Watermarking group, a coalition of consumer electronics companies that includes Hitachi, Macrovision, NEC, Philips Electronics, Pioneer and Sony. The group hopes to set a digital watermarking standard that will allow film studios to distribute content online securely. (CNet News.com 8 Nov 2001)

CONGRESS TO TACKLE DIGITAL TV IN THE FALL
Rep. Billy Tauzin (R-La.), head of the House Energy and Commerce Committee, says he's drafting legislation that he hopes will resolve many of the questions surrounding digital TV. Congress has set a 2006 deadline for television broadcasters to complete switching over to digital signals, but some have dragged their feet, fearing that they could suffer the Internet-based piracy that's plagued the music industry for several years. Meanwhile electronics makers have worried that they could be forced to produce DVD players and other devices laden with so many restrictions that consumers will shun them. The two sides have been working to develop a "broadcast flag" that would allow consumers to record shows for personal use but prevent them from sharing those recordings over the Internet. "It will come down to, 'What are the rules?'" says Gary Shapiro, president of the Consumer Electronics Association. Meanwhile, there are several details still to be hammered out, such as whether consumers should be able to transfer broadcast recordings to vacation home or office computers, or whether new restrictions will disable existing DVDs and other devices. RECORD LABELS SEEK TO BLOCK WEBCASTING PIRACY
The Recording Industry Association of America is asking computer and electronics manufacturers to develop an "audio performance flag" similar to the "broadcast flag" technology now under development to protect digital television programs. The flag would act as a marker that would prohibit content that had been digitally recorded from an Internet radio station from being redistributed over the Internet. Internet radio is not a significant source of piracy today, in part because of its lower quality compared to CDs, but the combination of increased broadband connections and lower broadcasting costs is expected to push webcasters toward higher-fidelity feeds. RIAA senior VP Mitch Glazier called the talks "very limited, preliminary discussions." (Los Angeles Times 18 Jul 2002)

SENATOR CRITICIZES COPYRIGHT BILL
Sen. George Allen (R-Va.) is pulling his support for the proposed Anticounterfeiting Amendments of 2002 because of last-minute changes made to the legislation before it came to a committee vote. The bill originally targeted large-scale operations that counterfeit "physical features" such fake Windows holograms or the special packaging used to certify software, CDs or DVDs as authentic. But the revised version covers "any feature" used to guarantee authenticity, including technology used in digital rights management. "Opening this legislation to the digital realm has caused the virtually unanimous industry support behind it to evaporate, and it has raised a host of troubling liability issues that cause substantial harm to Internet service providers," says Allen, who chairs the Senate Republican High Tech Task Force. Companies now opposing the bill include Verizon, Microsoft, Apple, eBay and Yahoo, all of whom have voiced their concern over a section that prohibits "trafficking" in or redistributing files that contain compromised digital watermarks. They fear the new language opens up ISPs to prosecution if their subscribers send such files. The revised version has "divided the community, so to speak, the industry, and went far afield from the original intent of the bill," says an Allen spokesman. The bill is set for a full Senate vote, which could come at anytime. (CNet News.com 5 Sep 2002)

GATEWAY LEADS TO DIGITAL MUSIC
Gateway and Pressplay, the online music subscription service backed by Vivendi Universal and Sony, are teaming up to offer PC buyers a new line of computers already bundled with 2,000 preloaded hit songs. Buyers will receive one to three months of Pressplay's service for free, but will have to pay at least $9.95 a month thereafter to maintain access to the songs. The goal is to make it easy for consumers to sample and buy music without going to the trouble of downloading it from the Internet for free. The preloaded music will be constrained by the digital rights management software that Pressplay uses to deter piracy, however, and users will have to spend an extra $1 per song if they want to move the file to a portable device or copy it onto a CD. "I can't say it's the be-all, end-all distribution model that's going to make people flock to buy access to 2,000 songs," says Gartner analyst P.J. McNealy. "This is interesting, but the portability piece is more important." (Los Angeles Times 6 Dec 2002)

CONTENT LOCKS ON DIGITAL BROADCASTS
An ongoing policy debate has been swirling around a "broadcast flag" being promoted by the TV industry to protect copyrighted content. The flag would consist of a few bits of information accompanying a digital transmission to signify whether and under what rules the transmitted content (e.g., a movie) may be viewed and copied. Supporters of the flag insist that it will be used merely to restrict redistribution of copyrighted material to large numbers of other people, in violation of existing laws; the idea, they say, is that the flag will "keep people honest." In rebuttal, critics like Cory Doctorow of the Electronic Frontier Foundation charge: "When they say 'This keeps honest people honest,' they mean 'This keeps honest people in chains.'... It addresses a nonexistent problem with an insufficient technical measure at great expense to liberty and innovation." (AP/San Jose Mercury News 22 Dec 2002)

SUPER DIGITAL WATERMARK IN THE WORKS
SunnComm Technologies is working with Stealth MediaLabs to develop a kind of super-watermark that could be embedded inside digital music files and would be robust enough to withstand digital compression, or being recorded off the radio or rerecorded through an analog connection. The technology, originally developed at the University of Miami, could also be used to embed other information. "The intention was for protecting the security of intellectual property. Adding pictures and liner notes inside a song is kind of a byproduct," says SunnComm COO Bill Whitmore. The technology works by encoding binary data inside the stereo audio signal itself, taking advantage of acoustical properties and human hearing characteristics to make it imperceptible to the listener. Because the signal is embedded in the sound itself, the data is hard to remove without significantly changing the sound of the song. SunnComm plans initially to market the super-watermark technology to record labels, which could use it to detect which recipients of advance discs are putting songs online before the albums' official release dates. "With that anonymity gone, people will be less willing to put advance songs on file-sharing networks," says Whitmore. (CNet News.com 20 Mar 2003)

PROTECTION AGAINST CD 'RIPPING'
Macrovision, a company known for helping Hollywood moviemakers prevent their videocassettes and DVDs from being copied, is joining with Microsoft in a project that will allow music companies to make CDs that consumers can copy for themselves but not "rip" them for sharing with others. Because standard CDs are fairly easy to copy, the music industry has seen increasingly declining sales (down 2.5% in 2001 and 8.7% in 2002), and industry analyst Richard Doherty of the Envisioneering Group says fear that such declines will continue has made some music labels "willing to risk consumer playback problems and increased customer wrath." In Europe copy-protected disks have met with strong consumer resistance because some CDs don't play in all playback devices and some get stuck in computers. (USA Today 23 Apr 2003)

FILTERING TECHNOLOGY COULD PUT AN END TO ILLEGAL FILE-SWAPPING

Audible Magic has been making the rounds on Capitol Hill, touting the capabilities of its technology, which it says can block the swapping of copyrighted music. It works by identifying the "psycho-acoustical" properties of a piece of music — essentially the computer equivalent of listening to the song itself — which enables it to recognize all versions of a song, despite variations in recording qualities or other subtle differences. The company has attracted the attention of the Recording Industry Association of America, which is backing Audible's technology as one possible solution to illegal downloading. In past months, peer-to-peer executives have repeatedly told Congress that is technologically impossible or infeasible to install such filtering systems on their networks, but with the advent of Audible, some are backpedaling on those statements, saying that even if it works, mandating the use of such technology would be a mistake. Requiring filters "would amount to the anointment of a specific technology as the winner in what the (recording) industry has made a file-sharing war," says Adam Eisgrau, executive director of P2P United, a file-swapping trade association. Eisgrau says his group has asked for a demonstration of the Audible Magic technology, and RIAA chief executive Mitch Bainwol says he's happy to oblige: "The peer-to-peer community has said they are serious about filtering. But they've said they can't filter. We're saying, well, the good news is that you can." (CNet News.com 3 Mar 2004)

http://www.nytimes.com/2004/03/08/technology/08music.html?th=&pagewanted=print&position=

The RIAA publicized a new technology from AudibleMagic to identify copyrighted materials during transfer and block it. John Schwartz of the New York Times wrote, "Audible Magic executives say that their software can be used in devices that attach to computer networks, or it can be written into the file-sharing software from companies like Kazaa and Grokster. . . . File-sharing companies have argued that they cannot control copyright infringement on their networks. . . . Record industry executives, who have said that they are against government-ordered technology fixes for copyright problems, said that they are not asking Congress to act, at least at this time. Instead, Mr. Bainwol said, his industry would like to see the 'peer-to-peer' companies add the software to their wares." Two universities had already signed up to examine the new technology at the beginning of March 2004.

APPLE ACCUSES REALNETWORKS OF USING HACKER TACTICS

Apple has accused RealNetworks, a provider of digital-media services, of offering software that lets online music buyers play on a variety of devices songs intended for use only on Apple's iPod devices. Apple says that it's "stunned that RealNetworks has adopted the tactics and ethics of a
hacker to break into the iPod." The RealNetworks software in question is called Harmony, which Real describes as "the world's first digital-rights-management translation system that music buyers can use to transfer music from one secure music device to another. It supports devices made by Creative, iRiver, palmOne, RCA, Rio, Samsung, and others. Legal experts seem to think that unless Apple can prove that RealNetworks reverse-engineered Apple's iPod software, a case under the Digital Millennium Copyright Act (DMCA) would be very hard to win. But Mark Rasch, former head of the U.S. Department of Justice's computer crimes unit (and now senior VP of security services firm Solutionary Inc.) says: "The problem with the DMCA is that it gives more protection than copyright law and it allows companies to skew the market with a form of protectionism. It allows technological protectionism to be legally adopted, and it works to prevent people from coming to market with cheaper compatible products." (InformationWeek 29 Jul 2004) Rec'd fr. John Lamp

THE NEW MEANING OF OWNERSHIP IN THE DIGITAL AGE

When you buy a CD from a store, you "own" that music, and as long as you don't bootleg it or charge lots of people money to listen to it, it's yours. But if you purchase that same playlist online, in most cases you're purchasing the "rights" to the content which is "locked" by some type of
digital rights management software. Not only that, but those rights may change over time, dictated by the whims of the music company you get them from. For instance, Apple Computer recently upped the number of computers on which its iTunes music files can be concurrently installed from three to five, but there's nothing stopping it from making its DRM more restrictive in the future -- although the company says that's unlikely. Meanwhile, customers of RealNetwork's Rhapsody music service "rent" their songs for a monthly fee but can play them only on their PCs, not their MP3 players. All these variables mean that consumers will need to be better informed in the
future about what it is they're actually getting for their money, says Alan Davidson, associate director of the Center for Democracy and Technology: "DRM underscores the point that consumers are going to have to become a lot more sophisticated about what they're buying." (Wall Street Journal 16 Aug 2004)

WATERMARK TECHNOLOGY SEEKS TO STAMP OUT FILM THIEVERY

Scientists at Sarnoff Labs have developed a "watermarking" technology called iTrace aimed at reducing video piracy perpetrated by moviegoers who secretly tape new films with handheld video cameras in the movie theater. Sarnoff's Jeffrey Lubin used his background in perceptual psychology to devise a watermark that not only would be invisible to the movie viewer, but would also survive several generations of crude copying. "The Holy Grail example is someone takes a camcorder into a movie theater and pirates a movie, and then compresses it on a digital file and puts it on the Internet," says Lubin. The iTrace watermark emerges gradually, over a 5-second interval, to exploit the tendency of human vision to compensate and ignore images that change slowly, he says. The watermark is actually a sequence of shifting blobs that get either lighter or darker and endure throughout the film. Each copy has its own unique watermark that enables studios to track the origin of a pirated copy. "The applications for watermarking are not just for the final result, but it also gives us freedom to move images around during production so that if they get into the wrong hands, they can be traced back to the last rightful owner," says Larry Birstock, executive VP of postproduction firm Post Logic Studios. CONSUMER ELECTRONICS GIANTS UNITE AGAINST PIRACY

Some of the biggest names in consumer electronics, including Sony, Samsung Electronics, Philips Electronics and Matsushita Electric Industrial, have teamed up with Intertrust Technologies to form the Marlin Joint Development Association, which will coordinate their efforts to develop standard specifications for antipiracy software. The motivation behind the united effort is to impose some kind of uniformity on the consumer electronics industry, thereby avoiding the confusing array of digital rights management software options currently being used by computer hardware and software makers. "The CE industry has been pretty quiet," says Intertrust CEO Talal Shamoon. Now, they're "detonating their DRM." Intertrust was jointly purchased in 2003 by Sony, Philips and other investors. The Marlin effort comes on the heels of an earlier venture called the Coral Consortium, which was designed to ensure that different DRM programs were interoperable. (Wall Street Journal 19 Jan 2005)

BRITISH LIBRARY WORRIES ABOUT ACCESS TO ELECTRONIC CONTENT

In comments submitted to the All Party Parliamentary Internet Group, which is investigating digital rights management (DRM) technologies, the British Library has expressed strong concerns about the long-term viability of electronic resources. Content producers increasingly use DRM to limit unauthorized access to electronic materials, but officials from the library said the protections also threaten legitimate uses of content. Use of materials held by libraries constitutes an important exception to copyright laws, according to Clive Field, the British Library's director of scholarships and collections, but DRM tools inadvertently upset the balance between appropriate exceptions and the rights of content owners. Moreover, long-term access is at risk. Even when copyright expires for a work, the DRM tools applied to its electronic version will still be in place. If the owner cannot be contacted, there might be no way to unlock materials that are no longer covered by copyright. "This will fundamentally threaten the longstanding and accepted concepts of fair dealing and library privilege," according to the British Library's statement, "and undermine...legitimate public good access."

2006-02-09 **Fraunhofer Institute German research MP3 anti-piracy tool development**

EDUPAGE; http://www.pcworld.com/news/article/0,aid,124676,00.asp 23

CREATORS OF MP3 DEVELOP TOOL TO COMBAT PIRACY

A German research group that developed the MP3 format in the late 1980s has developed a watermarking technology that it says will help curb illegal file sharing. Officials from the Fraunhofer Institute said that their technology is better than digital rights management (DRM) tools in that it does not require special hardware to play protected files and is less susceptible to hacking. Instead, the institute has developed a method of watermarking MP3 files and software to track those files. The result is that rather than identifying individuals who download protected files, the application tracks who has uploaded files that have been marked. According to Michael Kip, a spokesperson for the institute, "If, for instance, you purchase and download a CD, burn a copy, and give it to a friend, and that person puts it on a file sharing network, our system will trace that music back to you." That scenario, said Kip, could result in legal action against the person who originally bought the CD, depending on that person's country of residence and applicable copyright laws.

MARYLAND RESEARCHERS UNVEIL DRM TECHNOLOGY

Researchers at the University of Maryland's A. James Clark School of Engineering have developed digital rights management (DRM) technology that they say is highly resistant to the dilution that afflicts other DRM tools when many users collude on piracy. With most DRM technology, if 100 users work together to create a pirated copy of a movie, for example, the digital "fingerprint" is diluted 100 times, making it very difficult to identify those responsible. According to Assistant Professor Min Wu at the Clark School, with the new technology, if a group of users collude to copy a protected file, the researchers can identify all of those who participated. The new DRM technology can be used to protect movies, songs, images, and other documents. Sony BMG, which was recently involved in a brouhaha over attempts to add its own DRM protection, has expressed interest in the technology, as has the U.S. Department of Defense.

David Randolph, a correspondent for RISKS, reviewed a paper entitled "Facing the Smart-Card Security Issue" from _Card Technology_ magazine; the key point was that smart card security can be cracked in a few days or a few hours once the system were in place. Randolph wrote, "Based on that, I believe that the challenges to smart cards are very real and that the cost of breaking a smart card is low enough to make it worth while for organized crime to use."

Category 45.6 *Smart cards and other e-commerce security measures*

1997-03-27 **network computer access control smartcard e-commerce**

EDUPAGE

"SMART CARD" STANDARD FOR NETWORK COMPUTERS
IBM, Netscape, Oracle, Sun and Network Computer Inc. have formed an alliance to develop products using a "smart card" technology called OpenCard Framework designed to give people the ability "to access any network computer with any smart card, regardless of the (type of) computer or smart card they're using." Instead of carrying around a laptop computer, a person would just carry the smart card for insertion into any computer that has been adapted for the new technology. To address security concerns, the new technology scrambles the information being transmitted; a person would have to have a personal identification number, or PIN, to use the card. In contrast with a similar project announced last year by Microsoft, Hewlett-Packard, Groupe Bull and Schlumberger, this alliance is targeted to network computers (NCs) rather than personal computers. ADMINISTRATION FAVORS HANDS-OFF APPROACH TOWARD INTERNET
The Clinton administration is working on a White Paper outlining its position on electronic encryption and Internet commerce issues, says Ira Magaziner, senior advisor to the president for policy development. A number of principles will be articulated in the White Paper, including:
* The Internet should be a tax- and duty-free zone; governments of the world should agree to avoid regulating electronic payments systems;
* Private sector consortia, rather than governments, should set technical standards;
* a uniform commercial code should be developed;
* protection of intellectual property on the Internet is important;
* voluntary ratings and filtering systems should be used rather than government-imposed censorship of indecent material on the Internet; and
* a market-oriented approach to privacy is Preferable to government regulation.

2000-12-01 **e-commerce litigation jurisdiction fraud complaint lawsuit regulation legislation**

NewsScan, The Standard
http://www.thestandard.com/article/display/0,1151,20526,00.html

European justice ministers passed a law on Thursday that allows online shoppers to pursue disputes with e-commerce merchants in their own countries, rather than having to incur the expense and aggravation of dealing with a foreign legal system. The law, dubbed the Brussels I regulation, is essential to help get e-commerce off the ground in Europe, argued the justice ministers and the European Commission, which drafted the legislation. "A lack of consumer confidence is the main thing holding up the development of e-commerce here," said an EC spokesman. But industry representatives say this approach will create problems for smaller e-tailers: "For large companies it isn't a problem, because they have offices and lawyers in all EU countries. The SMEs (small and medium-sized enterprises) would be burdened with substantial legal and insurance costs if they took protection against litigation from outside their home market," says Wim Mijs, VP of EU affairs at Dutch bank ABN Amro. "As a result, venture capitalists might be a little more cautious about investing in a European Web venture." The EC regulation preempts less-stringent cross-border legislation currently under debate at the Hague Convention. (The Standard 1 Dec 2000)

INTERTRUST SUES MICROSOFT FOR PATENT INFRINGEMENT [27 Apr 2001]
InterTrust Technologies, which makes copyright-protection technology, has sued Microsoft for patent infringement, alleging that the software giant's Windows Media product violates a patent issued to InterTrust in February. The case focuses on digital rights management (DRM) technology, which typically is used in conjunction with downloadable music and other intellectual property to limit access to paying customers. DRM can also be used to enforce any rules set by copyright holders, for instance, allowing a customer to listen to a song three times for free and then cutting off access until a credit card number is submitted. InterTrust has tried unsuccessfully to get Microsoft to license its technology, but Microsoft has continued to ship its own DRM software as part of Windows Media. "InterTrust has invested quite heavily in its patent portfolio," says an InterTrust division president. "We believe we've made seminal investments that relate to the digital-rights management space." A Microsoft spokesman said the company is reviewing the complaint, but that it had been developing its own content-protection technology for years. 2002-01-10 **e-commerce magnetic stripes counterfeit fraud**

RISKS 21 86

Tim Christman was reading an article about the magnetic-stripe cards being used as gift certificates by some retailers when he realized that they are subject to easy fraud. He wrote,
>Ideally, the purchase of a gift card would result in a database being updated to reflect the balance associated with the card's unique account number.

Some retailers are using sequential account numbers and have no provisions to protect against a thief using a mag-stripe reader/writer to re-program a stolen card or small denomination card so that it matches the account number of a larger valued card purchased by someone else. Many retailers even provide a convenient 1-800 number so that the thief, knowing many valid account numbers, can "shop" for a card of significantly greater value.

The RISK: A form of fraud, difficult to trace, involving a minimal investment in equipment by the thief. Also note that the thief only requires the ability to query the back-end database (through the toll-free number), not the ability to manipulate the records. Perhaps more ominously, the risk is angry family members who find a zero balance on their gift cards!<

Christman recommended adding bar codes to the cards and adding check digits to the magnetically-encoded account numbers but not to the visible account numbers.

2002-05-21 **intellectual property copyright music copy-protection CD magic marker**

NewsScan; FindLaw Download This 86

HI-TECH CDs YIELD TO LOW-TECH FELT-TIP MARKER TRICK

Sony's elaborate "Key2Audio" CD copy-protection technology has succumbed to a decidedly low-tech felt-tip marker used to scribble around the rim of a disc. Internet postings say that tape or even a sticky note can be used to cover the security track, typically located on the disc's outer edge. The technology prevents users from playing the CDs on a computer by adding a track that contains bogus data. Because computer drives are programmed to read data files first, the PC tries to play the bogus data file over and over again and never gets to the music files elsewhere on the disc. The result is a CD that will play on standard CD players, but not on CD-ROM drives, some portable devices and even some car stereo systems. Sony has shipped more than 11 million copy-protected CDs in Europe, with the largest number going to Germany -- a market executives say is a hotbed of illegal CD-burning. (Reuters 20 May 2002)
http://www1.excite.com/home/technology/tech_article/0,2109,237089

CD CRACK: MAGIC MARKER INDEED
London -- Technology buffs have cracked music publishing giant Sony Music's elaborate disc copy-protection technology with a decidedly low-tech method: scribbling around the rim of a disk with a felt-tip marker. Internet newsgroups have been circulating news of the discovery for the past week, and in typical newsgroup style, users have pilloried Sony for deploying "hi-tech" copy protection that can be defeated by paying a visit to a stationery store.

2004-05-03 **smartcard smart card ID Transportation Security Authority TSA Florida**

DHS IAIP Daily;
http://www.thetrucker.com/stories/05_04/0503_smart_card.html

May 03, The Trucker — Prototype 'smart card' ID developed in Florida.

The Transportation Security Administration (TSA), the Florida Trucking Association and Florida state agencies are cooperating on a prototype "smart card" ID to be used at all 14 of the Sunshine State's deep-water ports and eventually by truckers and other transportation workers across the country. In 48 to 72 hours from the time a trucker applied, he or she would get the card containing his or her embedded fingerprints and a chip that could be activated for each port, according to Sandra Lambert, director of the division of driver's licenses for the Florida Department of Highway Safety and Motor Vehicles. The card would be issued after a background check that would include sending pertinent information such as Social Security number, date of birth, and criminal background if any to the FBI in Washington, who would then return the data to local officials who would create and ultimately activate the card unless the driver had committed certain felonies, which would prohibit use of an access card.

2004-05-16 **virtual account numbers credit card protection one-time hash temporary account e-commerce**

http://www.nytimes.com/2004/05/16/business/yourmoney/16cred.html?th

Users of credit cards from Citibank, MBNA America (which sponsors some 5,000 different affinity cards) and Discover can ask for temporary credit-card numbers that are linked to their real account but expire after a single use. Users can either download software to generate these one-time cryptographic hashes of their account number or they can visit their supplier's Web site to obtain one on demand. In addition to preventing fraudulent misuse of their credit-card number, these temporary card numbers can also stop retailers from unauthorized renewals of subscription services.

SINGLE-USE CREDIT CARDS
To combat identity theft, credit-card issuers sometimes issue virtual account numbers, which you typically obtain by signing up at the company's Web site and then download software to your computer to get a new disposable account number before each purchase you make. The number can only be used at one merchant, whether for a single purchase or for a service with a recurring monthly charge. MNBA executive Jim Donahue says, "It certainly has yet to capture the majority of cardholders, but those who use it are very loyal to it." However, since account holders normally don't have to pay for fraudulent purchases made to their accounts, many of them see no personal advantage to going through the extra step of obtaining a virtual account number. MATSUSHITA'S SMART CARDS

Japanese electronics company Matsushita Electric Industrial is adding smart-card capabilities to its memory cards, in which an integrated-circuit (IC) chip inside the card connects wirelessly with a special reader-machine to enable cashless payments, open locks, and read personal IDs. In a demo of the card's capabilities, Matsushita showed how a soccer-game ticket could be downloaded to a memory card on a personal computer, transferred to a cell phone, and then used at the stadium gate to get in instantly.

NewsScan; http://apnews.excite.com/article/20041007/D85IJ5C80.html

ALL-IN-ONE MEMORY CARDS

Matsushita Electric Industrial Co., which makes Panasonic brands, is now developing memory cards that can be used for a variety of purposes -- from making cashless payments to opening locks. In Japan, people are already using smart cards to board commuter trains, and cell phone models enable users to buy drinks from vending machines, pay restaurant bills and play games at a Tokyo arcade. Matsushita's smartSD Card features 128-megabytes of memory, compared with Sony's FeliCa smart cards, which have only 32 kilobytes of storage. The enhanced Matsushita model will enable users to download movies or music and provide secure storage for documents, says Matsushita director Masaki Akiyama.

STATES TAKE MAJOR STEP TOWARD NET SALES TAX
More than 30 U.S. states have approved the Streamlined Sales Tax Project, giving a boost to efforts aimed at creating a system to impose state and local sales tax on items sold via the Internet. The agreement sets unified definitions of products, which previously had varied from region to region, and also requires participating state and local governments to impose only one statewide tax rate for each type of product by 2006. "This is the end of the beginning," said Frank Shafroth, head of state and federal relations at the National Governors Association. "The next step is doing the heavy lifting and getting the state legislatures to actually enact legislation." According to estimates from the Institute for State Studies, state governments could lose some $45 billion in revenue in 2006 and $55 billion in 2011 if online vendors continue to be exempt from collecting taxes on sales to consumers in states where the e-tailer has no physical presence. Detractors of the plan, including the Direct Marketing Association, charge that the agreement is flawed, and could double the number of tax rates to 15,000 rather than reduce them to 200, as claimed. SALES TAXES CREEP ONTO THE WEB
Internet sales traditionally have been exempted from sales taxes, providing the buyer lived in a different state than the e-tailer they purchased from. But a collective push by states to institute Internet sales taxes is gaining momentum, and several big-name retailers — including Marshall Fields, Target and Wal-Mart — are cooperating. The retailers say they're simply streamlining bookkeeping to accommodate situations where customers purchase on the Web and then return or exchange those items at their physical stores. But according to washingtonpost.com, the retailers have ulterior motivations. In return for collecting the taxes, "38 states and the District of Columbia agreed to absolve the retailers for any liability for taxes not previously collected on Internet sales." And while the stakes are high for states — a University of Tennessee report estimated that states could collectively lose more than $45 billion in Internet sales tax revenue in 2006 — there's no groundswell of opposition from consumers. Jupiter Research yesterday released a study that indicates most online shoppers are indifferent to the issue, with most online shoppers unaware that they can shop around on different sites to avoid the extra charge, and some respondents saying they wouldn't choose one retailer over another just because there was no sales tax. 2004-11-09 **e-commerce shopping carts flash usability utility ease-of-use user resistance frustration abandon give up quit**

NewsScan; http://online.wsj.com/article/0

FLASH-BASED SHOPPING CARTS AIM TO CLOSE E-SALES

A recent study by DoubleClick shows that for every dollar spent on e-commerce sites, $4.10 is left in abandoned shopping carts, and now a handful of e-shopping sites are taking steps to recapture some of those sales. The key is a streamlined checkout process that allows the shopper to perform more functions -- from changing the color of a clothing item to filling out credit card information -- without leaving the page. Proponents of the new systems say that by preventing shoppers from jumping from screen to screen in the final stages of a purchase, consumers are less likely to become frustrated and quit. And while the new checkout screens look just like a Web page, they're actually small software programs written using Macromedia's Flash software that dynamically update the bottom line -- including tax and shipping costs -- as the customer adds or deletes items. Billing and other information is verified as it is entered to prevent customers from moving forward in the process without valid data. The Flashbased carts are being used by TJX Companies, owner of the T.J. Maxx and HomeGoods chains, and by PC Connection, among others. "This technology is very much in keeping with our sense of wanting to make it convenient for customers to shop our stores," says TJX VP Sherry Lang. "Even in our stores, we have a bank of cash registers so customers are able to check out very easily." (Wall Street Journal 9 Nov 2004)

Sun Microsystems got around the stupid US cryptography-export laws by contracting with Russian programmers for cryptographic code to be included in software for overseas customers. According to John Fontana, writing in _Communications Week_, "the product Sun will OEM is Secure Virtual Private Network for Windows. Developed by Moscow-based ElvisPlus Co., the product will be sold through Sun channels under the name PC SunScreen SKIP E+. The software is based on Sun's Simple Key Management for IP (SKIP) encryption and key management technology. It will ship with algorithms for 56- and 64-bit DES, two- and three-key triple DES and 128-bit ciphers for both traffic and key encryption."

Category 46 *Cryptography exports from US; Key escrow*

1997-05-22 **crypto export key escrow recovery**

EDUPAGE

A committee of 11 respected cryptographers and computer security experts released a report condemning the proposed US regulations tying permission for export of strong cryptography to implementation of key-recovery technology. See <http://www.cdt.org> for the full text of the report. William Reinsch, Bureau of Export Administration in the Department of Commerce, retorted that the computer scientists were demolishing a straw man and that the Administration has no intention of mandating a centralized key-recovery system. Instead, said Reinsch, the intention is to require individual organizations to maintain their own key-recovery systems; these could then be used under court order to satisfy the requirements of law enforcement agencies.

1997-06-18 **crypto key escrow recovery US**

NYT

The Clinton administration began ten pilot projects to create key-recovery systems for its own use. As predicted by critics of key escrow policies, the plans quickly abandoned a centralized escrow agency because the different parts of government wanted no one who had access to their particular encryption keys. Furthermore, none of the internal key-recovery systems under development would store the private keys used to authenticate documents with digital signatures; they would store only the temporary "session keys" used to encrypt specific documents in transit.

1997-08-26 **Crypto export policy law controls free speech**

EDUPAGE, UPI, Reuter, MSNBC, AP, CNN

At the start of the year, Professor Daniel Bernstein's lawyers demanded that the US government not enforce its new export restrictions until they have been examined in a court of law to establish their constitutionality. In June, the federal judge whose ruling on the unconstitutionality of the Computer Decency Act in 1996 presaged the Supreme Court's rulings in the same matter said that she expected to rule in favor of plaintiff Daniel Bernstein, a Professor at University of Illinois in Chicago. Prof. Bernstein is furious that current cryptography export regulations have interfered with his ability to publish encryption algorithms in international journals and to teach classes in cryptography to foreign students at his University. In August, Judge Marilyn Patel of the U.S. District court in San Francisco ruled against the Export Administration Regulations, saying that the US governments rules lack all logic in allowing printed source code to be exported but interfering with electronic versions. The government quickly obtained a temporary stay of the judgement pending appeal.

1997-09-08 **crypto law key escrow back door trap policy**

RISKS 19 37

Congress' proposed legislation to ban domestic US encryption unless the algorithm includes a back door allowing decryption on demand by law enforcement authorities moved famed Ron Rivest to satire. Writing in RISKS, the co-inventor of the Public Key Cryptosystem and founder of RSA Data Security Inc. wrote, "Congress is apparently considering legislation that would make it illegal to post portions of the Bible on the Internet. FBI Director Louis Freeh wants to make it illegal to use secret codes on the Internet that the FBI can't break, and some members of Congress have been drafting legislation in support of Freeh's position. However, such a law might have startling consequences." He explained his _cryptic_ remark with, "A recent best-selling book, "The Bible Code," claims that the Bible is full of secret messages and codes. These messages are only partially decoded so far. If true, the proposed legislation would make it illegal to post the Bible on the Internet, unless someone provides the FBI with a way to decode all of these secret messages contained within the Bible. In addition, perhaps "smiley faces" would have to be registered, as would the sale of all computers, since they are universally devices ". . .that can be used to encrypt communications or
electronic information. . . ."

1998-06-10 **key recovery escrow cryptography export law encryption**

RISKS 19 80

The updated report on "The Risks of Key Recovery, Key Escrow, and Trusted Third Party Encryption" originally published in May 1997 by the luminaries known as the "11 Cryptographers" was put on the Web at <http://www.crypto.com/key_study>. The preface includes the following trenchant observations: "One year after the 1997 publication of the first edition of this report, its essential finding remains unchanged and substantively unchallenged: The deployment of key recovery systems designed to facilitate surreptitious government access to encrypted data and communications introduces substantial risks and costs. These risks and costs may not be appropriate for many applications of encryption, and they must be more fully addressed as governments consider policies that would encourage ubiquitous key recovery."

Category 46 *Cryptography exports from US; Key escrow*

1998-07-07 **key escrow cryptography regulation government FIPS**

RISKS 19 84

The Administration's continuing attempt to develop key-escrow rules for domestic applications of encryption hit another barrier in June when, according to Alan Davidson of the Center for Democracy and Technology: The 22-member U.S. Government Technical Advisory Committee to Develop a Federal Information Processing Standard for the Federal Key Management Infrastructure (TACDFIPSFKMI) has failed in a two-year effort to design a federal computer security system that includes "back doors," a feature that would enable snooping by law enforcement agencies. Addressing Commerce Secretary William Daley, the panel wrote that it "encountered some significant technical problems that, without resolution, prevent the development of a useful FIPS. ... Because the focus of this work is security, we feel that it is critically important that we produce a document that is complete, coherent, and comprehensive in addressing the many facets of this complex security technology.. The attached document does not satisfy these criteria." However, said the chair of TACDFIPSFKMI (say that one severa times quickly), given that the report was not ready for publication, it was wrong to characterize the decision as a failure. "In the letter," he wrote, "the committee noted that it had made significant progress in its efforts and that committee members were willing to continue work on the document. Many expressed a belief that the document could be successfully completed.

1999-06-24 **encryption relaxation restriction bill legislation proposal law**

BENTON, Senate of the US http://www.senate.gov/~commerce/press/106-82.htm

In the US Senate, the Committee on Commerce, Science, and Transportation passed S.798, the PROTECT Act, a bill to promote electronic commerce. According to the press release (quoting directly), [t]he bill would do the following: 1) Direct the National Institute of Standards and Technology (NIST) to complete the establishment of an advanced encryption standard by January 1, 2002; 2) Allow for immediate exportation of encryption of key lengths of up to 64 bits; 3) Permit the exportation of non-defense encryption (above 64 bits) to responsible entities and governments of North Atlantic Treaty Organization (NATO), Association of Southeast Asian Nations (ASEAN), and Organization for Economic Cooperation and Development (OECD); 4) Allow for liberalization of export controls for encryption by creating an Encryption Export Advisory Board to review applications for exemption of encryption of over 64 bits and give recommendations to the Secretary of Commerce. The board would be made up of 12 members: the Under Secretary of Commerce for Export Administration, seven individuals appointed by the President (one from the National Security Agency, one from the Central Intelligence Agency, one from the Office of the President, and four representatives from the private sector who have experience in information technology), four representatives appointed by Congress (one by the Majority Leader of the Senate, one by the Minority Leader of the Senate, one by the Speaker of the House, and one by the Minority Leader of the House); 5) Give the Secretary of Commerce 15 days to respond to recommendations. If he rejects a recommended exemption, his decision is subject to judicial review; 6) Reaffirm presidential authority to veto a recommended exemption for national security purposes, and to establish terrorist and embargo controls; 7) Authorize increased funding to law enforcement and national security agencies to upgrade facilities and intelligence; and 8) Give the Secretary of Commerce the authority to prohibit the exportation of particular encryption products to an individual or organization in a foreign country identified by the Secretary.

The bill was then passed by the full Commerce Committee. According to the press release, there were several constraints on exports of encryption: "In approving the bill today, the Committee adopted — all by voice vote — a number of amendments improving the bill. The Committee approved several amendments offered by Mr.Oxley (R-OH); one that allows the Secretary of Commerce to deny the export of encryption products to specific groups and organizations if it would be used to harm national security, used to sexually exploit children or used for illegal activities by organized; another amendment clarifies that despite a company's ability to export a product through encryption capabilities, the Secretary of Commerce may prohibit that product's export for other reasons; and a third amendment requires the Secretary of Commerce to consult with the Secretaries of State and Defense, Director of Central Intelligence and the Attorney General when conducting a technical review of an encryption product for export. The Committee also approved an amendment offered by Mr. Dingell (D-MI) that requires a comparable encryption product be available in a foreign country in order for a U.S. company to export similar encryption technology to that country. The Committee also approved two amendments offered by Mr. Stearns (R-FL); one that prohibits U.S. companies from exporting products to portions of China, specifically to the People's Liberation Army or the Communist China Military; the second amendment requires that if a person has been served a subpoena for access to encrypted information and if the person has the capability to decrypt the information but does not, then that person will be subject to additional criminal penalties."

1999-07-20 **encryption relaxation restriction bill legislation proposal law**

POLITECH, ITI, Newsbytes

The President of the Information Technology Industry Council (ITI) urged the US House Armed Services Committee not to gut the SAFE bill. Another constituency supporting the SAFE Act was a group of former prosecuting attorneys in Congress. They wrote, "If US encryption continues to be restricted. . . foreign products will soon dominate the worldwide market, hindering our ability to gather intelligence against terrorists and criminals. . . . If cryptography can protect the trade secrets and proprietary information of businesses and thereby reduce economic espionage (which it can), it also supports in a most important manner the job of law enforcement. If cryptography can help protect nationally critical information systems and networks against unauthorized penetration (which it can), it also supports the national security of the United States." Despite the begging, though, the Committee did in fact ruin the bill from the point of view of its sponsors.

1999-08-20 **privacy warrant decryption encryption law enforcement**

Washington Post http://www.washingtonpost.com/wp-srv/business/daily/aug99/encryption20.htm

In August, the Department of Justice proposed the Cyberspace Electronic Security Act, which would allow law enforcement, under warrant, to install software that would disable encryption on personal computers in suspects' homes and offices. The Computer & Communications Industry Association (CCIA) joined with civil liberties organizations in immediately condemning the proposal as a covert intrusion into private homes and offices. [Seems to me that requiring a warrant for installation of the systems and requiring another warrant to read the data provides a pretty strong protection of the citizen. How is this process any weaker than getting a warrant to use binoculars in collecting evidence of wrong-doing?]

1999-09-04 **Windows software key NSA controversy overblown rumor jumping conclusions**

Various sources including Washington Post, , New York Times, NTBUGTRAQ.
RISKS

Andrew Fernandes of Cryptonym, a Canadian security firm, seems to have gone off half-cocked when he found a signing key for integrating cryptographic modules into Windows that was labeled "NSA Key." He and other conspiracy buffs interpreted this label to mean that there was somehow a back door into Windows that would allow the National Security Agency to integrate its own cryptographic modules into the operating system yet have the version check out using digital signature verification. Such manipulations could generate versions of Windows with a back door for the NSA. Microsoft denied this interpretation (Aha! Told you!) and claimed that the key was "compliant with the NSA's technical standards." A particularly clear discussion by Russ Cooper <Russ.Cooper@RC.ON.CA> on NTBUGTRAQ pointed out that the conspiracy theory was farfetched but warned that it would be indeed be possible for anyone to insert their own cryptographic modules into Windows and sign them using their own digital key, thus allowing foreign cryptographic code to run under Windows even without signature by Microsoft or approval by the US Dept of Commerce under the Export Administration Regulations.

1999-11-24 **cryptography regulations restrictions Department of Commerce limitations export license controls**

New York Times

In mid-November, the Clinton Administration began circulating its proposed new cryptographic export controls. However, according to critics and proponents of unregulated crypto exports, the actual proposals were far less liberal than original indications back in September. In particular, the export regulations continued to enforce license reviews for sales of cryptographic software and hardware to governments overseas.

Category 46 *Cryptography exports from US; Key escrow*

1999-11-24 **encryption relaxation restriction bill legislation proposal law**

EDUPAGE, Washington Post

In September 1999, the Clinton Administration announced its intentions to liberalize encryption exports even further than the changes to the EAR that came into effect in January 1999. By late November, the Administration released another draft for comment, with final regulations due by December 15, 1999. The EDUPAGE editors summarized the situation as follows: "The proposed rules permit the export of retail encryption products with no restrictions on key length. In addition, the draft proposes looser export laws for open source software such as Linux. However, the rules might not apply to encryption software that is part of another program, and full bans would still exist for Cuba, Iran, Iraq, Libya, North Korea, Sudan, and Syria. Some high-tech firms objected to the draft's unequal treatment of different types of encryption, saying tougher laws would apply to encryption that is built into hardware or software components."

2000-01-13 **encryption export restrictions laws regulations**

NewsScan, San Jose Mercury News

In January 2000, the Clinton administration finally gave up on the US government's futile attempts to restrict exports of strong encryption. Henceforth, only crypto sales to foreign governments or military would require US government authorization. What the State Department terms "rogue nations" would still be on the forbidden list (Iran, Iraq, Libya, Syria, Sudan, North Korea, and Cuba).

Category 46 *Cryptography exports from US; Key escrow*

2000-01-15 **encryption relaxation restriction bill legislation proposal law**

Crypto-gram http://www.counterpane.com/crypto-gram-0001.html; PoliTech, Wired http://www.wired.com/news/print/0,1294,33672,00.html 00 01

In January, the newly relaxed encryption export restrictions took effect. The main improvements were that all ordinary "retail" encryption products could be exportable once some paperwork was filled out — except to a list of forbidden terrorist countries. Any product with 65-bit keyspace could be exported without paperwork. Posting source code on the Internet was no longer restricted at all. Famed encryption expert John Young tested the new regulations by posting the binaries for PGP freeware v 6.5.2a for Windows and for Macintosh. The Department of Commerce published a response via Declan McCullagh's POLITECH list stating that in fact there was no problem with such posting.

Category 46 *Cryptography exports from US; Key escrow*

2000-01-15 **encryption export regulations**

Crypto-Gram http://www.counterpane.com/crypto-gram-0001.html 00 01

In January 2000, Bruce Schneier summarized the new cryptography-export regulations as follows: >On the plus side, "retail" encryption products — like browsers, e-mail programs, or PGP — will be widely exportable to all but a few countries "regardless of key length or algorithm." On the minus side, the new regulations are complex (an unending stream of work for the lawyers) and will still make it difficult for many people to freely exchange encryption products. They also do not address the Constitutional free speech concerns raised by encryption export controls.<

He listed major features of the new regulations as follows:
>
* "Retail" encryption products are be exportable, regardless of key length or algorithm, to all but the designated "T-7" terrorist nations. In order to export you need to fill out paperwork. You need to get a retail classification, submit your product to a one-time technical review, and submit periodic reports of who products are shipped to (but not necessarily report end users).

* Export of encryption products up to 64 bits in key length is completely liberalized.

* "Non-retail" products will require a license for many exports, such as to foreign governments or foreign ISPs and telcos under certain circumstances.

2000-02-02 **Export Administration Regulations EAR restrictions regulations government Commerce**

NewsScan, MSNBC 1 Feb 2000 http://www.msnbc.com/news/364870.asp

The Clinton administration has eliminated restrictions on exporting high-performance computers with speeds below 12,300 MTOPS (millions of theoretical operations per second) to all countries except so-called rogue nations (Iraq, Libya, North Korea, Cuba, Sudan and Syria). Companies exporting computers to "Tier III" nations (including China, Russia, India, Israel and Pakistan) would have to notify the Commerce Department 10 days prior to shipment of any computer operating above 12,500 MTOPS. Exports to "Tier II" countries (South Korea, much of Central and South America and most of Africa) will require licensing above 30,000 MTOPS (previously the threshold was 20,000 MTOPS). Clinton also called for Congress to shorten from six to four months the review period for adjusting export controls, noting the change is needed to "keep up with the rapid pace of technological advance."

2000-02-25 **encryption export restriction litigation**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB951422940442620073.htm

In an about-face, the U.S. government [said] it will allow computer scientist Daniel Bernstein to post the source code for Bernstein's Snuffle encryption software on his Web site. The change of heart came following a district court ruling that in light of the new, liberalized encryption software export restrictions implemented in January, Bernstein should be able to post his code. Bernstein and his lawyer are considering pursuing his lawsuit against the government, however, because "there's an area of ambiguity that remains": the new rules don't address "mirror sites," which copy and publish Web pages automatically to provide speedier access for users in other countries. The rules also require that the source code may be posted as long as residents of countries suspected of supporting terrorism won't have access to the material — an administrative nightmare for any Web operator. (Wall Street Journal 25 Feb 2000)

NewsScan

HACKING BY ANY OTHER NAME
A new debate in Congress over legislation proposed by Howard Berman (D-Calif.) will have to struggle to find a definition of the word "hacking." Berman's bill would give the recording industry the right to use network software to inspect people's personal computer files to make sure they do not contain copyrighted music. The congressman says there is "no question" that the "vast majority" of peer-to-peer downloads constitute copyright infringement, but opponents of the Berman bill say it goes too far in invading the rights of individuals. Wayne State University professor and computer security expert Jessica Litman says of the proposed legislation: "What it seems to say is that if the copyright owner doesn't impair the integrity of files, it gets a complete free pass, and if it does impair the integrity of files, it gets a qualified cheap pass." Stan Lebowitz, a management professor at University of Texas-Dallas, comments: "Spoofing seems like a legitimate technique for them to use. Hacking, however, seems to go to far" — and notes that what the bill allows "would still qualify as hacking, under most laws and in most people's minds." (USA Today 25 Sep 2002)

2003-01-08 **California law online Internet business computer security breaches notify customers e-commerce**

NIPC/DHS

January 06, Security Focus — California disclosure law has national reach.

A new California law requiring companies to notify their customers of computer security breaches applies to any online business that counts Californians as customers, even if the company isn't based in the Golden State. So warned Scott Pink, deputy chair of the American Bar Association's Cybersecurity Task Force, in a conference call Monday organized by an industry trade group, Information Technology Association of America, and attended by approximately 50 representatives of technology companies and law firms. The law, called "SB 1386," is intended to combat identity theft. It was passed last September and will take effect on July 1, 2003. To trigger the law, a breach must expose certain type of information: specifically, customers' names in association with their social security number, driver's license number, or a credit card or bank account number. After such an intrusion, the company must notify the effected customers in "the most expedient time possible and without unreasonable delay." The disclosure only needs to be made to California residents. But as a practical matter, Pink said, online businesses may find it easier to notify everyone impacted by a breach, rather than trying to cherry-pick Californians for special treatment. Companies that ignore the law face potential exposure to class action lawsuits. The law addresses a chronic problem in e-commerce - companies that are hacked are often reluctant to go public for fear of bad publicity or civil liability. But in forcing companies to come clean, the California law takes the opposite approach of the Bush administration's emerging cyber security policies, which encourage secret disclosure to government officials, rather than public warnings.

2003-01-16 **criminal hacker sentence term length federal rules**

NIPC/DHS

January 13, Security Focus — Federal government to seek public input on hacker sentencing.

Last week the presidential-appointed commission responsible for setting federal sentencing rules formally asked the public's advice on the formula used to sentence hackers and virus writers to prison or probation. The United States Sentencing Commission's (USSC) Federal Sentencing Guidelines set the range of sentences a court can choose from in a given case, based on a point system that sets a starting value for a particular crime, and then adds or subtracts points for specific aggravating or mitigating circumstances. Though they're called "guidelines," the rules are generally binding on judges. Computer crimes currently share sentencing guidelines with larceny, embezzlement and theft, where the most significant sentencing factor is the amount of financial loss inflicted. But in a congressional session that heard much talk about "cyberterrorism," lawmakers became convinced that computer outlaws were more than common thieves. Consequently, one of the provisions in the Homeland Security Act passed last November requires the USSC to review the cyber crime sentencing guidelines to ensure they take into account "the serious nature of such offenses, the growing incidence of such offenses, and the need for an effective deterrent and appropriate punishment to prevent such offenses." The USSC's "Issue for Comment" is available on the Commission's Website:
http://www.ussc.gov/. The public comment period ends on February 18th.

2003-03-26 **state law legislation S-DMCA encryption VPN e-mail proxy server firewall ISP anonymity identification tracking prosecution**

http://www.freedom-to-tinker.com/archives/000336.html

Prof. Ed Felten < http://www.cs.princeton.edu/~felten/ >of the Secure Internet Programming (SIP) Laboratory at Princeton University posted a warning on his law & technology Web site < http://www.freedom-to-tinker.com/ > about state legislation being called the "Super DMCA" or S-DMCA. These laws are so poorly written that they would make the use of firewalls, proxy servers, and VPNs illegal. The lawmakers, under pressure by the Motion Picture Association of America (MPAA), lack the technical knowledge to understand the implications of the following clauses:

SECTION 6.
(a) A person commits an offense if the person intentionally or knowingly manufactures, assembles, imports into the state, exports out of the state, distributes, advertises, sells, or leases, or offers for sale or lease:
(1) a communication device with an intent to:
(B) conceal from a communication service provider, or from any lawful authority, the existence or place of origin or destination of any communication;

It would appear that an unintended consequence of this legislation would slap criminal penalties on innocent people who set their firewalls at high security levels to preclude responses to pings or other mechanisms for identification of their IP connections. Users connecting to a corporate site via virtual private network to send e-mail could theoretically be in trouble because even the SMTP headers are encrypted on their way to the corporate e-mail server, thus precluding the ISP in the middle from identifying the nature of the traffic or its destination.

The EFFhas taken on the responsibility to keep track of this legislation. Web site is

2003-04-30 **war driving insecure network wireless Wi-Fi New Hampshire legal**

NIPC/DHS

April 29, Wired — Licensed to war drive in New Hampshire.

New Hampshire could become the first in the United States to provide legal protection for people who tap into insecure wireless networks. House Bill 495 defines an operator's failure to secure a wireless network as a form of negligence. According to the proposed amendment, "the owner of a wireless computer network shall be responsible for securing such computer network." What's more, if an alleged intruder can prove he gained access to an insecure wireless network believing it was intended to be open, the defendant may be able to get off the hook using an "affirmative defense" provision of the existing law. As a result, some legal experts contend that New Hampshire's proposed amendment to its computer laws could make it harder to throw the book at criminals who take advantage of insecure wireless systems.

2003-05-05 **anti-piracy law overly broad smart cards free satellite cable internet service MPAA Motion Picture Association of America intellectual property VPN**

NewsScan

WILL NEW ANTI-PIRACY LAWS STIFLE INNOVATION?
According to some critics, several of the newly enacted or proposed state laws to outlaw software for downloading movies without paying or unauthorized use of smart cards to get free satellite, cable or Internet service, will not only stifle innovation but might also be interpreted as outlawing such common devices as video recorders and music players. The Motion Picture Association of America (MPAA) says that some state laws are vague on piracy techniques (e.g., smart cards altered to unscramble transmissions). Robin Gross of IP Justice, a civil liberties group focused on intellectual property, says: "These laws are really talking about trying to regulate what somebody can do with the services they have already paid for." Supporters of such legislation see it differently, and insist that people "are seeing demons in these bills, where there are no demons." But critics are adamant, and say they fear the concealment provisions in new legislation could be used to ban security firewalls, encrypted virtual private networks for telecommuters and systems designed to preserve anonymity and protect privacy. 2003-10-23 **Senate Governmental Affairs Committee security P2P bill network systems personal information financial defense law enforcement public health citizens business**

NIPC/DHS

October 23, eSecurity Planet — Senate committee approves P2P security bill.

The Senate Governmental Affairs Committee approved a bill mandating federal agencies to develop and implement security plans to protect their network systems from the risks posed by peer-to-peer (P2P) file sharing on Wednesday, October 22. Earlier this month, the U.S. House of Representatives approved the same legislation. Both the House and the Senate have already implemented security measures against P2P security threats through both technical and non-technical means, including firewalls and employee training. The Government Network Security Act of 2003 would give Executive Branch agencies six months to take similar steps. The federal government uses and stores a wide variety of classified and sensitive information, including information vital to national security, defense, law enforcement, economic markets, public health, and the environment. Government computers also contain personal and financial information of U.S. citizens and businesses. Installation of P2P software on government computers can expose this sensitive information to the public. The House Committee on Government Reform issued a staff report in May showing how through a "couple of simple searches" of the most popular P2P programs, personal information such as tax returns, medical records, and confidential legal documents and business files were found.

2004-05-24 **identity theft insider theft punishments laws**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?articleID=20900519

May 24, InformationWeek — Feds want tougher penalties for insider identity theft.

A federal proposal to combat identity theft takes a particularly hard line on people who abuse insider access to information to commit the crime. The House Judiciary Committee earlier this month passed a bill, the Identity Theft Penalty Enhancement Act, that would establish a new crime of aggravated identity theft and increase applicable penalties. The bill also includes an amendment that directs the U.S. Sentencing Commission to revise its guidelines to include stronger punishment for those who abuse a position of trust to commit insider identity theft. According to "Predator Profiles," a forthcoming report from Michigan State University's (MSU) identity-theft research center, at least half of identity theft now results from the theft of personal information stored on business databases. Noting that her organization's research has since been corroborated by two other studies, MSU researcher Judith Collins says that at least 50%, and potentially as much as 70%, of identity thefts originate in the workplace by employees or people impersonating employees. "Our research also showed that the majority of those identities were stolen first and foremost from health-care-related institutions, and secondly from financial institutions," said Collins.

2006-01-25 **bogus spyware tool maker lawsuit Washington State Microsoft Secure Computer**

EDUPAGE; http://news.zdnet.com/2100-1009_22-6031108.html 23

LAWSUITS TARGET MAKER OF BOGUS SYPWARE TOOLS

The State of Washington and Microsoft have filed separate lawsuits against Secure Computer, a company they accuse of running a bogus antispyware racket. According to the complaints, Secure Computer used pop-up ads and other tools to tell computer users that their computers were infected with spyware and to offer a service, Spyware Cleaner, that would remove the unwanted software for $49.95. Microsoft and Washington Attorney General Rob McKenna said that the scan that supposedly revealed spyware was bogus and that the removal service in fact left computers more vulnerable to spyware. Moreover, the complaints contend that Secure Computer's messages implied that the service was in some way connected to or endorsed by Microsoft. The lawsuits allege that Secure Computer violated a recently enacted Washington Computer Spyware Act and three other laws. An attorney representing Secure Computer said the company was shocked at the legal action and would respond shortly.

2006-01-27 **legislation criminalization social engineering**

DHS IAIP Daily; 23
http://www.theregister.com/2006/01/27/schumer_phone_records/

NEW LEGISLATION WOULD CRIMINALIZE SOCIAL ENGINEERING.

New legislation proposed by Senator Chuck Schumer (D-NY) and backed by both major parties, seeks to criminalize both the practitioners and the dupes of "social engineering." Social engineering is a way of smooth-talking someone out of information they shouldn't normally impart, but it has been the most effective technique for scammers, hackers and private eyes over the years. Schumer's bill, the proposed Consumer Telephone Records Protection Act of 2006, makes disclosing a subscriber's phone records an offense. It specifically outlaws making false statements or providing phony documentation to a phone provider in order to obtain the records, and accessing an account over the Internet without the subscriber's authorization. According to the Electronic Privacy Information Center, over 40 Websites including celltolls.com and locatecell.com have been trading in a black market in call records.

YAHOO CALLS FOR EFFECTIVE CYBERCRIME LAWS.

Yahoo on Thursday, March 30, called for "effective" legislation combined with industry self-regulation, to deal with online fraud, child abuse, and other cybercrime. The Internet services giant called on policy makers to concentrate on defining illegal use of technology, rather than how an action breaks the law. "The lack of global legislation adds to the complexity of the situation. It's not realistic 17 to have global legislation, but we do need international consistency," said Robin Pembrooke, director of product operations for Yahoo Europe. Pembrooke advocated a combination of legislation and self-regulation of Internet businesses in order to combat cybercrime.

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 23
,10801,110762,00.html?SKC=security−110762

NEW YORK COUNTY ENACTS WIRELESS SECURITY LAW.

Westchester County, NY, last week enacted a new law that requires local businesses to implement "minimum security measures" for protecting their wireless networks. The law, which is believed to be the first of its kind anywhere in the country, applies to all commercial businesses that collect customer information, such as Social Security numbers, credit card or bank account information, and that also have a wireless network. Also covered by the law are businesses that offer public Internet access. The mandate was introduced as a measure to protect consumers against identity theft and other types of computer fraud, according to a statement posted on the county's Website. Businesses that collect, store and use personal information have 180 days to comply with the law.

1997-03-28 **crypto key escrow UK**

RISKS, COMPUTING/I.T. 18 95

Ross Anderson, famed British cryptographer and civil libertarian, sounded a warning when the Department of Trade and Industry of the UK government posted proposals for imposing licensing on the use of encryption tools. The preamble included the familiar language of those prepared to restrict encryption in the name of public safety: "These proposals - aimed at facilitating the provision of secure electronic commerce - are being brought forward against a background of increasing concern, not about the technology, but about the security of information itself. In a world where more and more transactions are taking place on open electronic networks like the Internet, there has been a growing demand from industry and the public for strong encryption services to help protect the integrity and confidentiality of information. These proposals have been developed to address those concerns, but at the same time are aimed at striking a balance with the need to protect users and the requirement to safeguard law
enforcement, which encryption can prevent." Anderson summarized the key issues (with supporting quotations) as follows:
* Licensing will be mandatory;
* The scope of licensing is broad;
* Total official discretion is retained;
* Encryption keys must be escrowed, and delivered on demand to a central repository within one hour;
* Government access to private keys, even if used only for _authentication_, is proposed.

A week later, Cyber-Rights and Cyber-Liberties (UK) and 16 other civil liberties organizations world-wide issued a critical report damning the proposals.

In June, the European Electronic Messaging Association (EEMA) issued a blistering attack on the proposals.

1998-12-22 **Wassenaar treaty encryption restrictions international**

Wired http://www.wired.com/news/print_version/politics/story/16999.html

In December, the Internet Architecture Board and the Internet Engineering Group protested the signing of the Wassenaar Arrangement <http://www.wassenaar.org/> in which 32 countries joined the U.S. in restricting the free use of strong encryption. The Wassenaar Arrangement would weaken the Internet and interfere with progress towards a more secure mechanism for TCP/IP. Signatories to the treaty would agree to enforce key-escrow or decryption back-door mechanisms in commercial encryption products to permit law-enforcement access to the cleartext of encrypted communications. Meanwhile, human rights activists protested the Wassenaar Arrangement on grounds that crypto restrictions play into the hands of totalitarian regimes.

1999-01-19 **cryptography laws rules restrictions France government**

Crypto-gram; Slashdot http://slashdot.org/articles/99/01/19/1255234.shtml 99 02

In January, the French government relaxed its restrictions on commercial cryptography. The announcement ended the insistence on key escrow and allowed keylengths jumped to 128 bits for single-key encryption algorithms. The US reportedly tried to put pressure on the French through the Wassenaar Arrangement that tries to force strong export controls on encryption among all the signatories. As Bruce Schneier and many other critics of this policy have noted, "This only makes sense if the U.S. is the only source of strong cryptography. But it isn't — overseas security software is now just as good as work done by U.S. programmers. . . ."

1999-03-11 **DNS domain name system WIPO law Internet**

RISKS 20 24

Prof. Michael Froomkin (U. Miami) published a blistering attack on the proposals for controlling the DNS (domain name system) put forth by the WIPO (World Intellectual Property Organization); see <http://www.law.miami.edu/~amf/quickguide.htm>. According to Froomkin, the main problems with the WIPO plan are as follows (numbering and some punctuation added):
"(1) Bias. The plan is biased in favor of trademark holders;
(2) Enabling censorship. The WIPO plan fails to protect fundamental free-speech interests including parody, and criticism of corporations;
(3) Zero Privacy. The WIPO plan provides zero privacy protections for the name, address and phone number of individual registrants;
(4) Intimidation. The WIPO plan creates an expensive loser-pays arbitration process with uncertain rules that will intimidate persons who have registered into surrendering valid registrations;
* Tilts the playing field. The WIPO plan would always allow challengers to domain names registrations to appeal to a court, but would often deny this privilege to the original registrant;
* Smorgasbord approach to law. Instead of directing arbitrators to apply applicable law, WIPO proposes using additional, different, rules it selected — rules that will often disadvantage registrants.

2000-01-25 **crypto registration international law regulations**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB948739893578536271.htm

The Chinese government tried to get all foreign companies to register the type of encryption they were using. New rules also forbade Chinese companies from using foreign cryptographic software. Interpreted narrowly, such rules would hamper further development of Internet commerce in that country. However, NewsScan's John Gehl and Suzanne reported, "If everyone covered by China's new regulations on encryption registration had complied, about nine million Internet users would have shown up in one tiny government office to hand-deliver a form specifying what kind of encryption they used on their computers. Instead, only a handful of people showed up. Chinese officials have said there will be no extension of the deadline, but apparently have not yet decided what to do about the companies that missed it — a group that includes virtually every Chinese and foreign company doing business in China. COPYRIGHT ACQUITTAL COULD SPUR CHANGES IN LAW
A Norwegian court's recent acquittal of Jon Johansen on charges of writing a software tool that can be used to circumvent DVD anticopying technology may spark a wave of tougher copyright law enactment in Europe, Canada, Australia and Central and South America, where such legislation is proposed. Critics of the U.S. Digital Millennium Copyright Act (DCMA) say the DCMA's tendency to protect content owners at the expense of consumers is flawed and the Norwegian court's action should serve as the basis for further debate over the shortcomings of the U.S. law. "The acquittal is a great development. The whole notion of prohibiting acts of circumvention or circumvention devices when it's not directly tied to infringing conduct is the wrong approach. The point is, there may be lawful reasons why someone would want to circumvent a technology," says intellectual property attorney Jonathan Band. Meanwhile, Hollywood has mounted an aggressive drive to win greater global conformity in copyright law, using the precepts of the DCMA as a bargaining chip with potential trade partners. The European Union has begun implementing such legislation and U.S. negotiators are pushing for similar laws as part of the pending Free Trade Area of the Americas (FTAA) treaty, which would encompass most of North, Central and South America. Meanwhile, foot-dragging on the part of South Korea and Canada has irritated the U.S. entertainment industry: "The (WIPO) treaty was effectively negotiated a decade ago, and for a country like Korea, or Canada, to say now that they need to start examining these issues is crazy," says Neil Turkewitz, executive VP for international issues at the Recording Industry Association of America. AUSTRALIAN STALKER AMENDMENTS CONCERN ISPS

Tough amendments proposed to Australian federal laws designed to slam the lid on pedophiles and Internet stalkers could leave ISPs carrying the can for "menacing, harassing or offensive" behavior by subscribers. The move -- part of Australia's Crimes Legislation Amendments (Telecommunications Offences and Other Measures) Bill -- adds the weight of criminal law to the Internet content regime, which uses a takedown system to remove offensive material. Internet lobby groups have warned the amendments could force ISPs to make decisions on removing content subject to complaints without an independent review. The amendments have not yet been introduced to Parliament. The proposal to hold ISPs liable for offensive content is a sticking point in the omnibus legislation, which also criminalizes mobile-phone cloning, making death threats online, transmitting child pornography and "grooming" or procuring children. Although the legislation indemnifies ISPs if they are not aware of offensive content, it requires them to remove content they have been made aware of. (The Australian 13 Apr 2004)

PROPOSED ANTI-TERROR LAW IN FRANCE SEEKS TO CURTAIL TERRORIST ACTIVITY CARRIED OUT ON THE INTERNET

One provision in the proposed law extends the period for which cybercafes have to keep records of Internet connection data. One method of cyber-jihad is the "dead letter box" system, wherein someone creates an e-mail account, gives the password to several members of a group and communicates by saving messages in a draft messages folder without sending them. This type of communication often cannot be monitored because government systems for tracking e-mails work only if someone sends an e-mail. Rebecca Givner-Forbes, an intelligence analyst at the Terrorism Research Center states that those behind some Websites promoting terrorism "…often use Japanese and Chinese upload Web pages because they don't ask for an e-mail address or any information from the person uploading a file." She says the most common method used by terrorist Websites is password-protected online message boards that only members can use. According to Givner-Forbes, "Most recently they have been leveraging the net more and more to circulate terrorist tactical instructions, training manuals, explosives recipes."

TELECOM COMPANIES REQUIRED TO SAVE LOGS OF E-MAIL, PHONE CALLS UNDER EUROPEAN UNION ANTI-TERROR PLANS

European Union (EU) justice and interior ministers agreed Friday, December 2, on plans that would require telecommunications companies to retain records of phone calls and e-mails for a minimum of six months for use in investigations of terrorism and other serious crimes. Britain's Home Secretary Charles Clarke, who chaired the meeting, said the deal among the 25 European Union nations allowed governments to decide how long telecom companies in their nations should retain the data, as long as it was between six and 24 months. "We have agreed to a system which gives flexibility to member states who want to go further," Clarke told a news conference. Clarke said terrorist groups, drug dealers and people-trafficking gangs would better be targeted under the new rules. Clarke said he was optimistic the European Parliament would adopt the bill later this month -- meaning it could come into force next year. The data-tracking plan was among 12 priority measures EU governments are pushing through in the wake of July attacks on London's transportation system.

EUROPEAN UNION PARLIAMENT APPROVES RULES ON ANTI-TERRORISM DATA

The European Parliament on Wednesday, December 14, adopted new rules drawn up by the European Union (EU) to store phone and Internet data for up to two years to fight terrorism and other serious crime. The measure was approved in record time after being proposed by the European Commission in September, and is part of the 25-nation bloc's response to the terrorist attacks in Madrid in 2004 and in London this year. Britain, holder of the rotating EU presidency, hailed the adoption as a step forward in the fight against terrorism and organized crime. Europe's telecoms and Internet industries issued a joint statement, saying the new rules raised major concerns about technical feasibility and proportionality. "This directive will impose a significant burden on the European e-communications industry, impacting on its competitiveness," the statement said. The industry also said only 20 percent of e-mails would be covered since many service providers were based outside the bloc.

EUROPEAN PARLIAMENT REJECTS SOFTWARE PATENT DIRECTIVE

Pete Mellor writes, "On 6 July 2005, the European Parliament decisively rejected the directive of the European Commission, which would have brought software into the patent system.

For those like me who have followed the argument about software patents over the last many years, this comes as a relief. I was first alerted to the potential damage of software patents many years ago when I heard Richard Stallman talk. He gave another set of seminars in London around two years ago. I find his arguments against software patents totally convincing."

EDUPAGE; http://news.zdnet.com/2100-3513_22-6030879.html 23

MICROSOFT TO LICENSE SOURCE CODE

In an effort to avoid a stiff fine issued by the European Commission, Microsoft has agreed to license some of its source code. European antitrust regulators have found Microsoft guilty of abusing its monopoly power and have insisted on changes to the company's practices to address the violations, including offering a version of its operating system without the Microsoft Media Player and providing access to its source code to rivals so they can develop software that will properly interoperate with Windows computers. Microsoft met the first condition, but commissioners last month said that if the company continued to deny access to competitors, it would face a fine of nearly $2.5 million per day, retroactive to December 15 of last year. Microsoft is appealing the rulings against it but has said that while those appeals are pending, it will license the source code for its Windows Server System. The European Commission will review Microsoft's proposal before deciding whether to fine the company.

2006-01-27 **British Phonographic Industry BPI illegal file sharing UK trial ruling**

EDUPAGE; http://news.bbc.co.uk/2/hi/entertainment/4653662.stm 23

BRITISH COURTS FIND IN FAVOR OF RECORDING INDUSTRY

In the first two cases of illegal file trading that went to trial in the United Kingdom, the High Court has ruled against two men, ordering them to pay damages to the British Phonographic Industry (BPI). The two defendants and three other individuals were accused of illegally sharing nearly 9,000 songs over the Internet. One defendant argued that there was no evidence against him. The court rejected that position and ordered him to make an initial payment of 5,000 pounds; his fine is expected to rise to at least 13,500 pounds. The other defendant said he did not know that what he was doing was illegal and pointed out that he sought no profit. A judge said that "Ignorance is not a defense" and ordered the man to make an initial payment of 1,500 pounds. The other three individuals have refused to settle and are awaiting trial. Officials from the BPI said the rulings were a "massive step forward" in their efforts to curb illegal file trading. Many of the other defendants in BPI lawsuits have settled out of court, but more than 50 cases remain outstanding. The BPI has given those individuals a deadline of January 31 to avoid court action.

2006-03-16 **French legislation penalties copyright violation infringement intellectual property rights**

EDUPAGE; http://news.yahoo.com/s/afp/franceinternet 23

FRENCH OUTLINE PENALTIES FOR COPYRIGHT VIOLATIONS

Legislators in France have passed a law that criminalizes copyright violations stemming from bypassing copy protections. Some in the government had argued that making such copies should be allowed and that a tax added to the cost of CDs and DVDs could be used to compensate artists. Currently, an estimated 8 to 10 million computer users in France regularly download copyrighted songs and movies. That proposal was rejected in favor of a law that mirrors a directive issued in 2001 by the European Union. Under the new law, those found guilty of supplying software that allows users to bypass copy protections will face six months in prison and a fine of about $37,000. Those found guilty of using such software are subject to fines of between about $1,000 and $4,000.

2006-03-21 **Creative Commons license Holland Netherlands court ruling precedent copyright intellectual property rights issues**

EDUPAGE; http://news.com.com/2100-1030_3-6052292.html 23

COURT AFFIRMS CREATIVE COMMONS LICENSE

A Dutch court has ruled that a publisher who used photographs protected by a Creative Commons license is subject to the terms of that license, marking what is likely the first case law pertaining to the Creative Commons. Former MTV VJ Adam Curry had posted photographs of his daughter on Flickr and assigned one of the Creative Commons license levels to those photos. A Dutch gossip magazine published those photos without Curry's permission, in violation of the terms of the license. The magazine argued that the licensing terms were unclear and that information about how to obtain further information about the license was not obvious. The court rejected that argument, saying the onus is on users of copyrighted content to understand the applicable license and obtain necessary permissions. According to Creative Commons Canada, the ruling sets an important precedent in that it affirms the Creative Commons licenses, which are a relatively new program for specifying usage rights, and that it holds users of protected content liable "even without expressly agreeing to, or having knowledge of, the conditions of the license."

EDUPAGE; http://online.wsj.com/article/SB114302628720105056.html 23

MICROSOFT TO SUPPORT COMPETITORS

In its latest effort to comply with a March 2004 ruling by the European Commission (EC), Microsoft announced it would provide free, unlimited technical support to software companies developing products to work with Microsoft's server software. The 2004 antitrust ruling requires Microsoft to make its code available to rivals that want to develop products that run on Windows machines and compete with some of Microsoft's applications. Microsoft had previously offered 500 free hours of technical support and said it has also extensively updated the documentation for its products. In its latest announcement, Microsoft said the improved documentation along with unlimited support should address the EC's concerns. Jonathan Todd, spokesperson for the European Union (EU), said that the technical documentation appears to remain insufficient, noting that it should provide competitors with all the information they need and that they "should not be forced to rely on help from Microsoft staff." The EU, which is expected to issue a ruling some time in the next two weeks about Microsoft's compliance, could impose a fine of nearly $2.5 million per day, retroactive to December 15.

2006-03-22 **French legislation music monopoly Apple iTunes music piracy increase**

EDUPAGE; http://news.com.com/2100-1028_3-6052058.html 23

FRENCH LEGISLATORS TRY TO AVERT MUSIC MONOPOLY

Lawmakers in France's National Assembly, the country's lower house, have passed a bill that would require purveyors of digital music technologies to share access to those technologies, allowing cross-operation among files and players. The most obvious target of the legislation is Apple Computer, whose iPod device and iTunes music format are linked. Under the bill, users would be able to play iTunes songs on non-Apple music players, and iPods could be used to play music files in other formats, such as those from Sony or Microsoft. Apple responded to the move by saying that if passed by France's Senate, the law will only serve to increase music piracy. A spokesperson from Apple said if the law is passed, "music sales will plummet just when legitimate alternatives to piracy are winning over customers." Others noted that the law could slow innovation because it does not offer strong protections for intellectual property. French officials countered by saying the law would in fact increase sales of online music and that they hope other countries pass similar legislation.

2006-03-24 **Russian bill lawmakers anti-piracy intellectual property rights issues**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/14178447.htm 23

RUSSIAN BILL UPSETS ANTIPIRACY GROUPS

A bill being considered by Russian lawmakers has antipiracy groups up in arms, saying it would worsen the country's already terrible record of enforcing intellectual property rights. Russia's current laws include protections for rights holders, but enforcement of those laws is poor. Antipiracy groups say music and software piracy in Russia costs U.S. businesses $1.8 billion annually. The new bill would replace all existing statutes covering intellectual property. Olga Barannikova of the Coalition for Intellectual Property Rights said the bill is rife with problems and will lead to even more piracy rather than aid the country's antipiracy enforcement. "They may seem like small changes," she said, "but they will cause chaos." Barannikova faulted lawmakers for drafting the bill without consulting businesses or groups representing intellectual property rights.

EDUPAGE; http://news.bbc.co.uk/1/hi/technology/4902976.stm 23

CHINA ADOPTS NEW RULE TO ADDRESS SOFTWARE PIRACY

Following trade talks with the United States, Chinese authorities have issued a new guideline requiring PC manufacturers to load a licensed operating system on all computers before they leave the factory. Although an official from the State Copyright Bureau in China denied that the new regulation is in response to foreign pressure--insisting it was implemented for "the country's economic development"--China has long been seen as a haven for software pirates, with piracy rates as high as 90 percent. Under the new rule, computer makers must install legally licensed operating systems on all systems, and retailers who sell imported computers must do the same. Furthermore, computer manufacturers and vendors of operating systems must report the numbers of computers made and operating systems installed each year to the country's Ministry of Information Industry (MII). The MII also stated that software makers should provide "favorable pricing and qualified service" to computer manufacturers.

1999-11-19 **privacy communications wiretapping law enforcement interception monitoring**

EPIC

On November 19th, EPIC and the ACLU issued a press release that began as follows:
The Electronic Privacy Information Center (EPIC) and the American Civil Liberties Union (ACLU) today asked a federal appeals court to block new rules that would enable the FBI to dictate the design of the nation's communication infrastructure.

The challenged rules would enable the Bureau to track the physical locations of cellular phone users and monitor Internet traffic. In a petition to the U.S. Court of Appeals for the District of Columbia Circuit, the groups say that the rules — contained in a Federal Communications Commission (FCC) decision issued in August — could result in a significant increase in government interception of digital communications.

The court challenge involves the Communications Assistance for Law Enforcement Act ("CALEA"), a controversial law enacted by Congress in 1994, which requires the telecommunications industry to design its systems in compliance with FBI technical requirements to facilitate electronic surveillance. In negotiations over the last few years, the FBI and industry representatives were unable to agree upon those standards, resulting in the recent FCC ruling. EPIC and the ACLU opposed the enactment of CALEA in 1994 and participated as parties in the FCC proceeding.

ACLU UPSET ABOUT HIGH-TECH SURVEILLANCE AT SUPER BOWL [2 Feb 2001]

The American Civil Liberties Union has written to Tampa, Florida's mayor protesting the surveillance procedures used by Tampa's police department at last week's Super Bowl football game. In attempt to identify any well-known criminals or terrorists in the stadium, the police set up hidden video cameras that took pictures of thousands of fans and transmitted the images to computers at a central command post for comparison with file photographs. In the letter, ACLU executive Howard Simon wrote: "The ACLU believes this activity raises serious concerns about the Fourth Amendment right of all citizens to be free of unreasonable searches and seizures," Simon wrote to Tampa Mayor Dick Greco. "Aside from the constitutional issues raised by the developing use of surveillance technology, we believe the public should be given an opportunity to ask -- and have answered -- the many questions raised by this practice." (USA Today 2 Feb 2001)
http://www.usatoday.com/life/cyber/tech/2001-02-02-super-bowl-surveillance.htm

CONSERVATIVE AND LIBERAL AGREEMENT: NO HIGH-TECH SURVEILLANCE [12 Jul 2001]
Dick Armey, the conservative House Majority Leader, and the left-leaning American Civil Liberties Union (ACLU) have issued a joint statement deploring the growing use by law enforcement agencies of high-tech surveillance tools to monitor ordinary people in public places. Recent news stories have revealed attempts in Tampa and Virginia Beach to use face-recognition software to identify passers-by on city streets. An Armey spokesman calls that trend disturbing, and says that "the American public doesn't want Big Brother looking over its shoulder." (Newsbytes/USA Today 12 Jul 2001)

FACE-OFF: SURVEILLANCE SYSTEMS VS. PRIVACY ADVOCATES [1 Aug 2001]
U.S. federal agencies have committed millions of dollars to the improvement of facial-identification systems that lets cameras scan faces in a crowd and automatically compare them to stored images. An example of this technology is the FaceIt system (developed by Visionics), which has been used in Israel to manage the flow of individuals entering and exiting the Gaza strip and in Tampa, Florida to taking photos of individuals walking in an entertainment district and matching the photos with digital mug shots of known criminals. The Visionics system and systems developed by its competitors have been funded by such agencies as DARPA, NSA, and the U.S. Justice Department. George Washington University law professor Jeffrey Rosen, a privacy advocate who is critical of these developments, warns: "America now faces a choice about how far we want to go down the road to being a surveillance society." 'SMART' TECHNOLOGY EYED FOR POSTAL SECURITY [19 Dec 2001]

Rep. Henry Waxman (D-Calif.) has proposed a "smart" suggestion for improving the security of the U.S. Postal Service. He's pushing a two-dimensional barcode "stamp" that would contain the sender's ID as well as the date, time and place the postage was paid. Meanwhile, Maynard H. Benjamin, president of the Envelope Manufacturers Association, has suggested that the agency consider "fiber fingerprinting," which identifies correspondence by the unique characteristics possessed by each piece of paper. Privacy experts say that traceable mail would stifle whistle-blowers and government critics, and that the security measures might not be effective anyway. "You'll have the same fraudulent problems that you have with IDs and credit cards now," says Lauren Weinstein, moderator of the Privacy Forum. "The bottom line is that the bad guys are going to find a way around it. What if they steal your stamps, and you get framed for something you didn't send?" (Wired 19 Dec 2001)

ACLU SEES A GROWING 'SURVEILLANCE MONSTER'

In a new report called "Bigger Monster, Weaker Chains," the American Civil Liberties Union says that there is a rapidly growing "American Surveillance Society" brought about by "a combination of lightning-fast technological innovations and the erosion of privacy protections" threatening "to transform Big Brother from an oft-cited but remote threat into a very real part of American life." This "surveillance monster" includes, among other things, cameras monitoring public spaces, proposals for databases filled with personal information on U.S. citizens, and anti-terrorist legislation allowing the government to demand that libraries turn over reading histories of their patrons. Yet the report asserts that these monsters don't even have to be real for them to be terrifying: "It is not just the reality of government surveillance that chills free expression and the freedom that Americans enjoy. The same negative effects come when we are constantly forced to wonder whether we might be under observation." (AP/USA Today 16 Jan 2003)

2003-01-24 **TIA Total Information Awareness monitoring surveillance law enforcement government privacy**

NewsScan

O BIG BROTHER, WHERE ART THOU? (EVERYWHERE)

In order to monitor the U.S. civilian population in its effort to detect terrorists, the government's Total Information Awareness program will rely almost completely on data collection systems that are already in place — e-mail, online shopping and travel booking, ATM systems, cell phone networks, electronic toll-collection systems and credit card payment terminals. Technologists say that what the government plans to do in data sifting and pattern matching in order to flag aberrant behavior is not very different from programs already in use by private companies. For instance, credit card companies use such systems to spot unusual spending activities that might signal a stolen card. The early version of Total Information Awareness uses a commercial software collaboration program called Groove, which was developed in 2000 by Ray Ozzie, inventor of Lotus Notes. Groove enables analysts at various government agencies to share intelligence data instantly, and links programs that are designed to detect suspicious patterns of behavior. However, some computer scientists question whether such a system can really work. "This wouldn't have been possible without the modern Internet, and even now it's a daunting task," says cryptology expert Dorothy Denning, a professor in the Department of Defense Analysis at the Naval Postgraduate School. Part of the challenge, she says, is knowing what to look for. "Do we really know enough about the precursors to terrorist activity? I don't think we're there yet." (New York Times 23 Dec 2002)

SENATE DELAYS FUNDING FOR PENTAGON SURVEILLANCE PROGRAM

The U.S. Senate voted yesterday to block funding of the Defense Department's Total Information Awareness (TIA) program, which when developed would use "data mining" techniques to scan for patterns in worldwide communications activity and use those patterns to identify terrorist threats. Calling TIA "the most far-reaching government surveillance program in history," Senator Ron Wyden (D-Ore.) said that by blocking R&D funds the Senate thereby "makes it clear that Congress wants to make sure there is no snooping on law-abiding Americans," even if the purpose of the activity is to prevent terrorist attacks against the United States. U.S.A.P.A.T.R.I.O.T. - II ACT WOULD PUNISH CRIMINALS WHO ENCRYPT

Draft legislation circulating in the Justice Department would impose stiffer prison sentences for scrambling data in commission of a crime — something encryption specialists say would have little effect on fighting terrorism and will only hurt legitimate uses of cryptography. "Why should the fact that you use encryption have anything to do with how guilty you are and what the punishment should be?" asks Stanton McCandlish of the CryptoRights Foundation. "Should we have enhanced penalties because someone wore an overcoat?" The measure, which would add up to five years to a sentence for a first offense and 10 years after that, is backed by police and intelligence agents who worry that encryption will hamper their ability to fight crime. "If you went the extra step to keep us from getting evidence, you should pay an extra price," says a former computer crimes investigator with the New York Police Department. But many question whether such a law would have its intended effect: "You have to be intentional about using encryption, and that's a tricky thing to prove. I do see this provision as largely symbolic rather than effective," says a former National Security Agency counsel. The new proposal is part of legislation dubbed [U.S.A.P.A.T.R.I.O.T. II], a sequel to the 2001 [U.S.A.P.A.T.R.I.O.T.] Act. (AP 31 Mar 2003)

PRIVACY ADVOCATES DOUBT PENTAGON PROMISES ON SPYING

The Pentagon has changed the name of its planned anti-terrorist surveillance systems, but critics say the fundamental program remains the same and would risk violating citizens' privacy if fully implemented. Now renamed the Terrorist Information Awareness program (from Total Information Awareness), the system would broaden government surveillance activities to encompass passport applications, visas, work permits, driver's licenses, car rentals and airline ticket purchases as well as databases including vast amounts of personal information, such as financial, education, medical and housing and identification records. Sen. Ron Wyden (D-Ore.), a major opponent of the TIA, says, "What most Americans don't know is that the laws that protect consumer privacy don't apply when the data gets into government's hands. Lawfully collected information can include anything, medical records, travel, credit card and financial data." Testing of the system is already underway, raising privacy advocates' concerns about "false positives" based on erroneous data. "If TIA is relying on personal information contained in databases to determine whether someone is a suspect, what recourse does that person have whose information has been entered incorrectly?" says a spokeswoman for the Free Congress Foundation, which estimates that an error rate as small as .10% could result in more than 30,000 Americans wrongly being investigated as terrorists. PRIVACY APPLIANCES TO GUIDE TIA PATTERN-RECOGNITION SEARCHES

Data security expert Teresa Lunt, working at PARC (Palo Alto Research Center), has developed a "privacy appliance" intended to help prevent the Pentagon's Terrorism Information Awareness (TIA) project from inadvertently violating individual rights. Privacy appliances (which filter out personal identifying information) include such built-in protections as an unalterable log of what information is returned and to whom — and the software in such devices would be smart enough to adjust results based on what has previously been released and whether individuals can be identified through inference. Lunt says people have the mistaken idea that TIA would remove data sources from private hands and include them in a government database. But that's not the way it works, and in fact there's nothing new about it; the fact is, marketing companies routinely use data mining techniques to look for customer patterns that would support corporate sales programs, and under TIA those existing techniques would merely be applied to the relatively new problem of identifying and monitoring potential terrorist operations. 2004-05-05 **handhelds federal government surveillance**

DHS IAIP Daily; http://www.fcw.com/geb/articles/2004/0503/web−derby−05−05−04 .asp

May 05, Federal Computer Week — Officials take surveillance STEPs.

At this year's Kentucky Derby, local, state and federal law enforcement and emergency management officials were keeping an eye on Churchill Downs using handheld devices, wireless connectivity, and a geospatial application that tapped into surveillance cameras. In the joint operations center, officials could access information and view maps through a geospatial application called Spatial Templates for Emergency Preparedness, or STEPs. The software collects geographic information system (GIS) data from disparate databases and makes it accessible through a Web portal. With STEPs, officials could monitor weather from their computers, access digital map data previously available only in hardcopy form and use 3-D visualization software to see the infield and stage emergency response personnel or vehicles, Langley said. Agencies involved included local police, emergency officials and homeland security personnel; Kentucky state police and the National Guard; and agents from several federal agencies such as the FBI, the Bureau of Alcohol, Firearms, Tobacco and Explosives, the U.S. Marshals Service and the Secret Service. Users as far away as Washington, DC, could also access the portal.

2004-05-24 **ID tracking passport foreign visitors**

DHS IAIP Daily; http://news.com.com/2100−7348−5219101.html

May 24, New York Times — U.S. nearing deal on way to track foreign visitors.

The Department of Homeland Security is on the verge of awarding the biggest contract in its young history for an elaborate system that could cost as much as $15 billion and employ a network of databases to track visitors to the United States long before they arrive. The program, known as US-Visit and rooted partly in a Pentagon concept developed after the terrorist attacks of 2001, seeks to supplant the nation's physical borders with what officials call virtual borders. Such borders employ networks of computer databases and biometric sensors for identification at sites abroad where people seek visas to the United States. With a virtual border in place, the actual border guard will become the last point of defense, rather than the first, because each visitor will have already been screened via a global web of databases. Visitors arriving at checkpoints, including those at the Mexican and Canadian borders, will face "real-time identification"--instantaneous authentication to confirm that they are who they say they are. American officials will, at least in theory, be able to track them inside the United States and determine if they leave the country on time.

2004-09-09 **Chicago surveillance network cameras emergency suspicious behavior**

NewsScan

CHICAGO PLANS NEW SURVEILLANCE NETWORK

Chicago mayor Richard Daley says his city's going to install a network of more than 2,000 surveillance cameras to alert authorities to suspicious behavior or emergency situations. Daley says, "Cameras are the equivalent of hundreds of sets of eyes. They are the next best thing to having police officers stationed at every potential trouble spot." Software would be used to detect unusual activity, such as a bag being abandoned in a stairwell or movement in an off-limits area. Daley dismisses privacy concerns, on the grounds that cameras will be installed only in public places (where a police officer would have a perfect right to check what's going on). NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A25272-2004Oct11.html

U.S. GOVERNMENT FUNDS CHAT ROOM SURVEILLANCE

The U.S. government is funding a year-long study by a Rensselaer Polytechnic Institute computer science professor aimed at developing mathematical models to identify patterns in the chaotic traffic generated by online public forums that might reveal "hidden communities" of terrorists. RPI professor Bulent Yener will download data from selected chat rooms while tracking the times that messages were sent in order to create a statistical profile of the traffic. For instance, if QTpie and RatBoi consistently send messages within seconds of each other in a crowded chat room, it might be inferred that they are "speaking" to each other, camouflaged by the "noise" of the chat room environment. "For us, the challenge is to be able to determine, without reading the messages, who is talking to whom," says Yener. The $157,673 grant to conduct the study comes from the National Science Foundation's Approaches to Combat Terrorism program, which works in concert with U.S. intelligence agencies to make its selections. However, some scholars doubt the concept has much merit: "In a world in which you can embed your message in a pixel on a picture on a home page about tea cozies, I don't know whether if you're any better if you think chat would be any particular magnet," says Harvard Law School Internet scholar Jonathan Zittrain.

NewsScan; http://news.com.com/From+high-tech+drivers+licenses+to+national+ID+cards/2100-1028_3-5573414.html

'SMART' DRIVER'S LICENSES A TROJAN HORSE?

A move by Congress to endorse a Republican-backed measure that would compel states to redesign their driver's licenses by 2008 to comply with standards for making them electronically readable has critics questioning government's motives, saying it gives the Department of Homeland Security carte blanche to do nearly anything "to protect the national security interests of the United States." Rep. Ron Paul (R-Texas) says, "Supporters claim it is not a national ID because it is voluntary. However, any state that opts out will automatically make nonpersons out of its citizens. They will not be able to fly or to take a train." Proponents of the Real ID Act say it reflects the recommendations of the 9/11 Commission and will help in the battle against terrorism and efforts to identify illegal immigrants. But Paul says, "In reality, this bill is a Trojan horse. It pretends to offer desperately needed border control in order to stampede Americans into sacrificing what is uniquely American: our constitutionally protected liberty." (CNet News.com 14 Feb 2005)

2005-04-01 **US government DHS tracking foreign international students visas US-VISIT privacy concerns surveillance**

EDUPAGE; http://www.fcw.com/article88459-04-01-05-Web

FEDS SET TO CHOOSE METHOD FOR TRACKING EXITING STUDENTS

Officials at the Department of Homeland Security are expected to issue a decision soon about the required procedure for foreign students who are leaving the United States. The US-VISIT program, which tracks visiting scholars and is designed to prevent terrorists from entering the country on student visas, lacks a consistent process for keeping tabs on individuals who leave the country. One proposal would require individuals to visit a kiosk at the airport, where they would be fingerprinted and photographed. Under another proposal, screening officers would take fingerprints and photos at airport gates and check them against the US-VISIT database. The third proposal would combine elements of the other two. The department is conducting a study of the three options, and a report is expected in a few weeks identifying which method will provide the greatest level of security without excessively interfering with convenience or impinging on privacy. 2005-05-06 **unit record database Department of Education personal information disclosure security break civil liberties privacy concerns**

EDUPAGE; http://chronicle.com/prm/weekly/v51/i35/35a03701.htm

PROPOSED DATABASE WORRIES SECURITY EXPERTS

Amid a rash of corporate and institutional data breaches recently, security experts are questioning whether a "unit record" database proposed by the Department of Education could be kept secure. Currently the department collects aggregate data on college students and graduation rates. A unit record database would track individual students through their college careers, presenting what some see as an extremely tempting target for hackers. The current system would force a hacker to "compromise several databases," according to Eugene Spafford, professor of computer sciences and electrical and computer engineering at Purdue University, whereas with a database like the one proposed, "it's possible to attack it from any point in the system." Barbara Simons, former president of the Association for Computing Machinery, was also concerned about a unit record database, suggesting that it might not be the safest way to accomplish the department's goals. Grover Whitehurst, director of the Institute of Education Sciences at the Education Department, said the agency is investigating security options for the proposed database and welcomes suggestions. He noted that the system might not use Social Security numbers as identifiers and said that if the information in the system were limited in scope, it would not be very appealing to hackers. 2005-11-23 **Center Disease Control Prevention US government agency federal regulation passenger tracking proposal surveillance privacy concern**

EDUPAGE; http://govhealthit.com/article91532-11-23-05-Web

CDC PROPOSES TRACKING PASSENGERS TO PREVENT PANDEMICS

The Centers for Disease Control and Prevention (CDC) proposed federal regulations to electronically track more than 600 million U.S. airline passengers a year traveling on more than 7 million flights through 67 hub airports. The proposed regulations are posted on the CDC's Web site and will be available for a 60-day comment period in the Federal Register starting November 30. They would require airlines, travel agents, and global reservation systems to collect personal information beyond that now collected by the Transportation Security Administration or the Homeland Security Department. The same rules would apply to passengers on international cruise lines and ferries that dock at U.S. ports. The CDC said that frustrations with attempts to track the SARS outbreak prompted the proposal, which is intended to allow the CDC to respond quickly to signs of a new pandemic. GOVERNMENT KEEPING TABS WHEN IT SHOULDN'T

Despite a federal directive forbidding the use of Web-tracking technologies for federal agencies, recent reports have shown that the majority of agencies do in fact employ permanent cookies or other tools that track users. The technologies can be used to identify repeat visitors to federal Web sites and sometimes to track users' surfing on nongovernmental sites. Last week, the Associated Press found that the National Security Agency was using permanent cookies (temporary cookies are allowed), a practice it has since discontinued. Separately, reporters at CNET News.com looked at the Web sites of all agencies listed in the U.S. Government Manual and evaluated what tracking tools they were using. Results showed dozens of agencies using tools that appear to contravene the directive, including sites for the military, cabinet departments, and election commissions. When contacted about the tracking tools, officials at many agencies reportedly said they were unaware that their sites used such technologies. Peter Swire, law professor at Ohio State University, who participated in the drafting of an earlier Web-tracking policy for the Clinton administration, said, "It's evidence that privacy is not being taken seriously."

EFF SUES AT&T OVER COOPERATION WITH NSA

The Electronic Frontier Foundation (EFF) has filed suit against AT&T for allegedly cooperating with the National Security Agency (NSA) in eavesdropping on individuals without a warrant. President Bush ordered the wiretaps following the terrorist attacks of 2001 and has vigorously defended them, saying the Constitution and Congressional resolutions allow them. Civil liberties groups and others reject that, saying that the wiretaps violate existing laws on surveillance. The EFF said it identified AT&T as one company involved in the activities and has filed suit "to stop this invasion of privacy, prevent it from occurring again, and make sure AT&T and all the other carriers understand there are going to be legal and economic consequences when they fail to follow the law." The EFF alleges that AT&T provided the NSA with access to its network, which carries both voice and data, and to its vast databases that store information on phone calls and Internet activity. AT&T refused to comment on the litigation.

2006-02-08 **legislation bill forbid unnecessary data storage**

EDUPAGE; http://news.zdnet.com/2100-9595_22-6036951.html 23

BILL WOULD FORBID UNNECESSARY STORING OF DATA

A bill introduced by Rep. Ed Markey (D-Mass.) would require operators of Web sites to delete information about the site's users unless the site had a "legitimate" need to preserve that data. Information covered by the bill includes names, addresses, phone numbers, e-mail addresses, and other data, and all Web sites would be subject to the legislation, including those operated by individuals and nonprofits. According to Markey, the Eliminate Warehousing of Consumer Internet Data Act of 2006 is intended to address two issues: identity theft and government subpoenas of Internet data from Web sites including Google and Yahoo. Markey said personal information about Internet users "should not be needlessly stored to await compromise by data thieves or fraudsters, or disclosure through judicial fishing expeditions."

[MK note: but see later developments which work towards the exact opposite of this initiative.]

U.S.A.P.A.T.R.I.O.T. ACT GETS NEW LIFE

After a filibuster led to additional measures designed to protect civil liberties, the House and Senate have approved a renewal of the U.S.A.P.A.T.R.I.O.T. Act that President Bush is expected to sign before it expires this Friday. In all, the legislation renews 16 provisions of the bill passed in 2001 to help combat terrorism. Since its original passage, however, civil libertarians have criticized the law for sacrificing individuals' rights in the pursuit of information about terrorists. Supporters of the law argue that no evidence has been brought forth indicating that the powers of the legislation have been misused. The bill that is being sent to the president renews the federal authority to obtain usage records through National Security Letters, but the bill includes language that specifically exempts most libraries from the demands of the letters. Another change to the law allows those under investigation to formally challenge the part of the law that prevents them from revealing that they are under investigation.

2006-03-15 **US Department of Justice Google lawsuit search data disclosure government privacy concerns**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/14104319.htm 23

JUDGE GIVES GOVERNMENT SOME OF WHAT IT SOUGHT

The judge hearing the case between the U.S. Department of Justice and Google has indicated he will require the search company to supply the government with a portion of the data it was seeking. Government officials had subpoenaed one million Web addresses and a week's worth of search queries, alarming Google as well as privacy advocates that the government was exerting too much control over data that most presume to be private. During negotiations, however, the government reduced its request to just 50,000 Web addresses and 5,000 searches, a reduction that went a long way toward defusing the standoff. U.S. District Judge James Ware said that given the changed terms of the government's request, he would likely support the subpoena but would make sure individuals' rights are not compromised by data that must be turned over. Observers said that the changed terms of the subpoena mean the case is unlikely to resolve the issue of government access to search records. Orin Kerr, law professor at George Washington University, said, "It...will have very little legal consequence in the long term." Lauren Gelman, associate director of Stanford's Center for Internet and Society, said, "It's something we're going to see come up again and again."

http://news.yahoo.com/s/ap/20060331/ap_on_hi_te/internet_blocking

JUSTICE DEPARTMENT CASTS A WIDE NET FOR INFORMATION

Subpoenas obtained through the Freedom of Information Act indicate that the U.S. Justice Department is seeking Internet usage data from at least 35 companies in its efforts to defend the 1996 Child Online Protection Act (COPA) against court challenges. One of the subpoenas sparked a legal showdown between the government and Google, which challenged the request for millions of records of Internet searches. In that case, the government significantly scaled back its request, which the judge ruled was allowable. Other companies that received similar subpoenas are Comcast, EarthLink, AT&T, Cox Communications, Verizon Communications, Symantec, and other makers of computer security products. The Supreme Court has ruled twice that COPA is likely unconstitutional, and the government will go to trial in October to defend it. David McGuire, spokesman for the Center for Democracy and Technology, expressed concerns echoed by other critics that the government is seeking large amounts of information to defend a questionable law.

EDUPAGE; http://www.nytimes.com/2006/04/13/nyregion/13library.html 23

LIBRARY GROUP WINS DISPUTE WITH FBI

Following a recent change in terms of the U.S.A.P.A.T.R.I.O.T. Act, federal authorities said they will end their efforts to prevent a library organization from identifying itself as a part of an antiterrorism investigation. Last year, the FBI sent a so-called national security letter to the Library Connection, an organization of 26 libraries in Connecticut, seeking patron records and e-mail messages. As it was originally enacted, the U.S.A.P.A.T.R.I.O.T. Act authorized the letters and forbade recipients from disclosing that they had been sent the letter. The group protested, saying the gag order violated their First Amendment rights, and last September a federal judge agreed. Ironically, it was during those proceedings that the government inadvertently identified the group in question as the Library Connection when attorneys for the government filed court documents with the group's name not redacted. Congress has since revised the U.S.A.P.A.T.R.I.O.T. Act, which now grants the government discretion to allow some recipients of national security letters to identify themselves. Kevin O'Connor, the United States attorney in Connecticut, said that in light of the changed legislation, the government would end its appeal of the decision to allow the Library Connection to come forward.

EDUPAGE; http://news.zdnet.com/2100-9588_22-6061187.html 23

LEGISLATORS GET BEHIND ISP TRACKING

A number of government officials, including state and federal legislators, have endorsed the notion of requiring ISPs to keep detailed records of users' activities online. A data retention would force ISPs to collect and store some data that they currently do not capture and to keep other records far longer than they currently do. Officials including Rep. Ed Whitfield (R-Ky.), head of a Congressional subcommittee on oversight and investigations, have said that such a law would aid law enforcement. Michael Chertoff, secretary of homeland security, has also voiced support for such legislation. Critics of the idea have questioned whether storing such records would genuinely benefit law enforcement; raised concerns about who would have access to such records; and noted that it's not clear who would have to pay for such data warehouses.

2006-04-29 **privacy legislation law bill proposal Congress Internet Service Providers ISPs log file records retention browsing consumers confidentiality control**

RISKS; CNET news.com http://tinyurl.com/gb663 24 27

PROPOSAL TO FORCE DATA RETENTION BY ISPs

Rep. Diana DeGette (D-CO) has proposed legislation to force Internet Service Providers to store log files with complete records of all Internet activity by their customers until at least one year after closure of their accounts -- or indefinitely for people who continue their subscriptions. The proposed rationale for this extraordinary burden was that "America is the No. 1 global consumer of child pornography, the No. 2 producer. This is a plague we had nearly wiped out in the seventies, and sadly the Internet, an entity that we practically worship for all the great things it has brought to us, is being used to commit a crime against humanity." Declan McCullag, writing for CNET news.com, said, "For their part, Internet providers say they have a long history of helping law enforcement in child porn cases and point out that two federal laws already require them to cooperate. It's also unclear that investigations are really being hindered, according to Kate Dean, director of the U.S. Internet Service Provider Association."

Lauren Weinstein commented in RISKS,

>It was only a few months ago that people were screaming bloody murder about DoJ demanding Search Engine records -- a demand that apparently only Google had the backbone to appropriately resist, noting the sensitivity of the data involved. This controversy triggered calls (including in some legislative quarters) for a law mandating the destruction of much related data after some reasonable, relatively short interval, with appropriate designated exceptions for R&D, business development, and the like.

Now, by waving the red flag of fighting child pornography, seemingly intelligent and usually well-meaning legislators appear ready to create the mother of all big-brother database laws, a treasure trove of personal data that will ultimately be available for every fishing expedition under the sun.

For those persons who trust the government not to abuse such data, I hasten to note that these kinds of infrastructures, once in place, tend to be self-perpetuating, and will be available to *future* governments as well, including administrations who might not be as "benign" as the current one.<

In a later posting, Weinstein added,

>The irony of the situation relating to proposals for required data retention … is that many incredibly bad and dangerous concepts -- like government-mandated data retention of this sort -- will virtually always be linked to laudable ideas (like fighting child abuse) that we all agree are important goals. A cynical view would be to assume that this is done purposely to push "evil" laws using "noble" hooks. This clearly does happen sometimes.

But I believe that in the majority of these cases we're dealing with legislators and others who genuinely believe in their causes, and either don't have the will or background to recognize or understand the horrible collateral damage that their proposals would do.

Casting such persons as being purposefully evil is probably unproductive and unfair. Instead, we need to help them see the "big picture," rather than just the narrow focus of their good intentions.

For after all, the road to hell still does indeed remain paved with good intentions.<

And in RISKS 24.31, Weinstein wrote:

>If Internet users must live in fear that their actions on the Net are subject to retrospective analysis -- not only based on today's criteria but potentially on tomorrow's as well -- the effects on how we view and use the Net will be drastic, with vast unintended negative consequences that strike to the heart of our democracies.

This issue is ultimately more important than network neutrality, Internet governance, or most (if not all) of the other technically-related concerns that we bandy about here in IP or in most other forums, because it strikes to the very core of basic privacy concerns and personal freedoms.

Government-mandated Internet data retention could be the most potent single technological move in recent history toward enabling future tyranny against both individuals and groups.<

2006-05-22 **warrantless wiretapping surveillance NSA FISA Foreign Intelligence Surveillance Act TSP Terrorist Surveillance Program**

Wikipedia http://en.wikipedia.org/wiki/NSA_warrantless_surveillance_controversy

NSA WARRANTLESS SURVEILLANCE CONTROVERSY

The NSA warrantless surveillance controversy is a dispute about an eavesdropping and data mining program carried out by the National Security Agency (NSA) that the administration now refers to as the Terrorist Surveillance Program. Under the program, the NSA conducts surveillance on international and domestic phone calls, without Foreign Intelligence Surveillance Act (FISA) court authorization, which the text of FISA defines as a felony. [1] The Bush administration argues that the program is in fact legal on the grounds that FISA is an unconstitutional violation of the President's "inherent powers" and/or that FISA was implicitly overridden by other acts of Congress. Many legal scholars outside of the administration find these arguments unconvincing. In addition to the legality of the program, the controversy extends to questions of the duties of Congress, the press's role in exposing a classified program and the legality of telecommunications companies cooperating with the program.

The presidential authorization creating the Terrorist Surveillance Program is classified and only select members of the Congressional Intelligence committees and leadership were (partially) briefed. The existence of the program was not known to the American public until December 2005, when the New York Times, after learning about the program more than a year earlier, first reported on it.[2]

2000-02-28 **communications intelligence COMINT surveillance interception international cooperation**

Crypto-gram http://www.counterpane.com/crypto-gram-9905.html ; EU Parliament http://www.iptvreports.mcmail.com/ic2kreport.htm 99 05

The European Parliament accepted a report on the ECHELON (and other) spy networks in May 1999. See < http://www.iptvreports.mcmail.com/ic2kreport.htm > for the full report. Key findings concerning the state of the art in Comint include:
* Comprehensive systems exist to access, intercept and process every important modern form of communications, with few exceptions (section 2, technical annexe);
* Contrary to reports in the press, effective "word spotting" search systems automatically to select telephone calls of intelligence interest are not yet available, despite 30 years of research.
* However, speaker recognition systems - in effect, "voiceprints" - have been developed and are deployed to recognise the speech of targeted individuals making international telephone calls;
* Recent diplomatic initiatives by the United States government seeking European agreement to the "key escrow" system of cryptography masked intelligence collection requirements, and formed part of a long-term program which has undermined and continues to undermine the communications privacy of non-US nationals, including European governments, companies and citizens;
* There is wide-ranging evidence indicating that major governments are routinely utilising communications intelligence to provide commercial advantage to companies and trade.

BEWARE THE 'PREDATORS OF DIGITAL FREEDOMS'?

Reporters Without Borders, an international media-rights group, has accused several Western democracies of becoming "predators of digital freedoms" in their efforts to increase surveillance on the Internet as part of their fight against terrorism. "A year after the tragic events in New York and Washington, the Internet can be included on the list of 'collateral damage,'" said the group in a report. "Cyber-liberty has been undermined and fundamental digital freedoms have been amputated." The report cites recent moves to weaken individual privacy laws in the U.S., Britain, France, Germany, Spain, Italy and Denmark, as well as the European Parliament, that risk turning ISPs and telecommunications operators in those countries "into potential branches of the police." The report's findings mirror those in another report earlier this week issued by the Electronic Privacy Information Forum and Privacy International, which note that governments worldwide have made it easier for authorities to eavesdrop on telephone and online conversations in order to fight terror. UK GOVERNMENT PLANS CELL PHONE TOWER TRACKING SYSTEM

The government of the U.K. is funding secret radar technology research that uses mobile phone masts to enable security officials to watch vehicles and people in real time almost anywhere in Britain. The Celldar technology, which works wherever there is cell phone coverage, "sees" the shapes made when radio waves emitted by the towers meet an obstruction. Signals bounced back by immobile objects, such as buildings and trees, are filtered out by the receiver, and what's left on the screen are images of anything that moves. When combined with technology that allows individuals to be identified by their mobile phone handsets, the Celldar system would enable security officials to locate and track a specific person from hundreds of miles away. An individual using one type of receiver, a portable unit a little bigger than a laptop, could even create a "personal radar space" around his or her location for security purposes. Researchers are also working on an "X-ray vision" feature that would enable the devices to "see" through walls and look into people's homes. UK Ministry of Defence officials are hoping to introduce the system as soon as resources allow, but civil liberties advocates have been quick to complain: "It's an appalling idea. The government is just capitalizing on current public fears over security to introduce new systems that are neither desirable nor necessary," says Simon Davies, director of Privacy International. POLAND'S SPIES EXPOSED ONLINE

A leaked list containing the names of about 240,000 people who allegedly spied for Poland's former communist regime has overtaken sex as the hottest search item on the Net in Poland. "This thing is huge. We have recorded around 100,000 Internet searches a day for the list, which is 10 times the number looking for sex," Piotr Tchorzewski, who works at Poland's biggest Internet portal Onet, told Rzeczpospolita Daily. The list, which contains in alphabetical order the names of alleged agents and collaborators of the communist-era secret service, mixed together with the names of those who were allegedly spied on, has also been put up for auction on the Internet, but its bid price late today -- 2.99 zlotys (about $AU1.25) -- was hardly breaking records. E-TAGS FOR AUSTRALIAN PEDOPHILES

Dangerous pedophiles could be electronically tagged and subjected to strict curfews after their release from jail under new laws before the Victorian parliament. Under the scheme, child sex offenders considered risks can be put under supervision orders administered by the adult parole board. The supervision conditions can include electronic bracelets allowing the offenders to be tracked, restrictions on where they live, curfews, and restrictions on movements to block their access to children. "We take the view that protecting the community, particularly vulnerable children, has to be our highest priority," Police Minister Tim Holding said. "We think these laws are an effective and appropriate way of protecting Victorians from serious child sex offenders who show a real likelihood of re-offending," he said. (The Australian 23 Feb 2005)

UK CELLPHONE OPERATORS CAN INSTALL SURVEILLANCE SOFTWARE ON HANDSETS

We're always a little wary of that very blurry line between protection of the general public and infringements on basic civil liberties, but it would appear that according to the Financial Times by way of the Guardian, at least one UK cellphone carrier not only has the power (and mandate) to remotely install software over the air to users' handsets that would allow for the kind of monitoring we thought only perverts and paranoiacs had access to: picking up audio from the phone's mic when the device isn't on a call. While don't think the backlash on this one has really gotten underway yet, and though we do hate to rock a cliché, we can't help but be reminded of that classic Benjamin Franklin quote, ``They that can give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety.'' What's worse, a cellphone carrier and The Man are gonna take it from us without our permission on the sly?

RISKS; Wikipedia 24 17
http://en.wikipedia.org/wiki/Greek_telephone_tapping_case_2004-2005

GREEK GOVERNMENT PHONES TAPPED ILLEGALLY

More than 100 mobile phone numbers belonging mostly to members of the Greek government and top-ranking civil servants were found to have been illegally tapped for a period of at least one year. The details of the case were presented at a press conference given by three government ministers on Thursday February 2, 2006. The phones tapped included those of the Prime Minister Costas Caramanlis and members of his family, the Mayor of Athens, Dora Bakoyannis, most phones of the top officers at the Ministry of Defense, the Ministry of Foreign Affairs, and the Ministry of Public Order, members of the ruling party, the Hellenic Navy General Staff, the previous Minister of Defense (at the time a member of the opposition party), one phone of the American Embassy. Moreover, the mobile phones of former National Defence Minister Giannos Papantoniou and businessmen of Arab descent were also at the foresight of the wiretapping ring, as well as of former governemnental officials from the Panhellenic Socialist Movement (PASOK).

Prime minister Costas Caramanlis has known of this surveillance since March 11, 2005, lifting concerns about his reasons of not previously revealing it. Greek medias suspected the United States of having organized the wiretaps, as an anonymous important official quoted by the AFP declared that "it is evident that the wiretaps were organized by foreign intelligence agencies, for security reasons related to the 2004 Olympic Games." Leader of the PASOK socialist opposition George Papandreou said that the Greek governement itself had pointed towards the US as responsible of the wiretaps by giving up the zone of listening range, in which the US embassy was included.

2006-02-09 **Yahoo China censorship aid identify prosecute political crimes journalists local law compliance**

EDUPAGE; http://www.internetnews.com/xSP/article.php/3584191 23

GROUP SAYS YAHOO AIDED CHINESE AUTHORITIES

For the second time recently, Yahoo has been accused of helping the Chinese government identify and prosecute individuals accused of political crimes. In 2005, Yahoo was criticized for providing information that helped Chinese authorities prosecute journalist Shi Tao, who was convicted of revealing state secrets. Reporters Without Borders said that another case has surfaced in which the ISP provided information to the Chinese government that led to the conviction of Li Zhi. According to the group, Li was found guilty of "inciting subversion" after he posted comments online critical of local officials and was sentenced to eight years in prison. Mary Osaka, a spokesperson from Yahoo, said that at the time the company was unaware of the nature of the investigation. In addition, she reiterated the company's position that it is better for Yahoo to have a presence in the country, "providing services we know benefit China's citizens," even if that requires compliance with local laws that run counter to U.S. beliefs and values.

1997-06-03 **privacy electronic commerce Web**

AP, PR

Microsoft proposed its own alternative to the Open Profiling Standard offered by Netscape and five dozen other companies to protect the privacy of browsers on the World Wide Web. The World Wide Web Consortium's Platform for Privacy Preferences, or P3, backed by Microsoft and by the Center for Democracy and Technology, is an extension of the existing standard for communicating meta-data between Web site and Web browser. P3 would extend the Platform for Internet Content Selection (PICS) to include limitations on what kind of information about the user could be stored by a Web site or passed on to others. A third alternative for protecting privacy is eTrust certification, supported by the Electronic Frontier Foundation; it would certify what kind of privacy safeguards a given site implements and would periodically audit compliance with the stated standards. The term "eTrust" was soon changed to "TRUSTe." See <http://www.truste.org/> for details.

Category 4A *Evolution of Net law: framing, pointing, linking, jurisdiction, neutrality*

1997-06-12 **privacy standards Web**

AP

On March 21, 1996 the Web site for _Business Week_ posted an article entitled, "The Fall of the Wizard of Wall Street." The next day, the magazine published the article in its paper edition. On March 24, 1997, Julian H. Robertston Jr sued the publishers for $1B in damages for libel. The date his suit was filed was a year and a day after the online publication date (excluding a weekend in the way). New York's libel law has a 1 year statute of limitation, so the lawyers for _Business Week_ asked the trial judge to dismiss the suit, claiming that its online posting constituted publication. The plaintiffs argue that the clock was reset by the paper publication.

Category 4A *Evolution of Net law: framing, pointing, linking, jurisdiction, neutrality*

1997-11-27 **Copyright Web**

RISKS 18 78 ff

The Shetland Times case continued in 1997, when a British judge ruled in favor of an interim interdiction of the use of direct linkages to the Times' Web page by its competitor, The Shetland News. Lord Hamilton of the Outer House of the Court of Session, agreed that, at least until the case comes to full trial, the fact that users of the News Web site could branch directly to the Times' stories without passing through the Times' home page — and therefore missing Times advertising — constituted prima facie evidence of damage to the plaintiff. Some observers interpreted the interim ruling as applying purely to the use of the headlines, as copyrighted materials, without permission; these observers argue that the judgment does not, in fact, bear on whether the hot links point to the original Times articles or to something else. In November, the feuding editors agreed to an out-of-court settlement. They agreed that the News is entitled to link directly to stories in the Times by means of headlines, provided that each link to any individual story carry the legend, "a Shetland Times story" beneath the headline. Additionally, the agreement requires the News to insert, adjacent to each Times headline, a "button" or icon showing the Shetland Times logo. The button and the legend would be linked to the home page of the Shetland Times. The headlines would be linked directly to a Times article. However, the News editor pouted that he wouldn't link to the Times site at all under those circumstances: Nyah!

C|NET

The three judges of the California Court of Appeal for the Second District ruled that the mere physical presence of servers hosting a Web site does not constitute grounds for defining jurisdiction. The case was Rambam vs the Jewish Defense Organization; plaintiff argued that because the JDO used California-based GeoCities and Xoom.com servers to host their Web site, therefore he should be able to sue defendant in California.

NewsScan

Cosmetics giant Estee Lauder has won a lawsuit filed in Germany against Excite Inc. and New York-based iBeauty, with a Hamburg District Court agreeing that Excite's sale to iBeauty of certain Estee Lauder trademarks, such as Estee Lauder, Clinique and Origins, amounted to unfair competition under German law. The trademarks were used by the companies to trigger banner ads for [other] beauty products on Web sites. Similar lawsuits have been filed by Estee Lauder in federal court in New York and in France. A Jupiter Communications analyst says the case "has major implications for many sites across the Web," because keyword-based ads generate hundreds of millions of dollars in revenue. He calls the German decision "at least a first precedent out there in cyberspace related to this type of conflict." (Wall Street Journal 9 Mar 2000)

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000329/t000029415.html

A federal judge has ruled that it is not illegal for an online company to provide a link on its Web site to that of a competitor. The ruling came in response to a lawsuit filed by Ticketmaster Online-CitySearch against Tickets.com. In dismissing four counts of Ticketmaster's lawsuit, the judge said that "deep linking by itself... does not necessarily involve unfair competition," as long as it is clear whose site a customer is on when they click through. Ticketmaster says it will file an amended complaint and attempt to reinstate the dismissed charges. "If we spend substantial money to build up a site why should they be able to take that and build their business on the backs of our hard work?" says Ticketmaster attorney Robert Platt. Tickets.com attorney Daniel Harris replies, "They have an open site and are a member of the free Internet community. They have to live by the rules of that community as it has grown up." NewsScan

WHAT DOES "TRESPASS" MEAN IN CYBERSPACE?
Recent court cases have used the ancient law of "trespass" to rule against companies that used software robots to search the public Web sites of other companies to capture sales leads for mass marketing purposes. However, the original idea of trespass is that trespasser causes some kind of harm (such as crashing the site being trespassed upon). But what if there is no harm - crash or traffic gridlock or anything else? The recent decisions do not seem to require that a plaintiff allege real harm, and some legal observers are concerned that the decisions will have bad unintended consequences. Dan L. Burk, a University of Minnesota law professor, warns: "If I don't like your linking to my site, or searching my site, even though it is open to the public, and I say, 'Stop,' you have to stop... whether you are actually hurting me or not." 'DEEP LINKING' COMES UNDER FIRE
StepStone, a UK online recruitment company, has obtained an injunction in Germany preventing Danish rival OFiR -- a media firm that owns online recruitment portals in the UK, Germany, Denmark and France -- from linking to StepStone Web pages. The move is one of the few cases to test the law on "deep linking" -- links between sites that bypass home pages and therefore miss the advertising on them. "It is not, of course, every case of hypertext linking which is unlawful -- the Internet would grind to a halt," said Adrian Lifely, an attorney for Osborne Clark, the law firm advising StepStone. "But the courts in Europe do have power to intervene where linking is extensive and prejudicial to the site involved." The law firm said OFiR was using the link to StepStone's database to boost the number of job offerings it claimed to provide. The ruling in favor of the injunction was based on new European laws regulations on database and copyright protection, said Lifely. (Financial Times 18 Jan 2001)

DANISH PUBLISHERS PROTEST DEEP LINKING
The Danish Newspaper Publishers' Association is suing a news Web site that provides links directly to news stories, without going through the site's home page. Newsbooster editor-in-chief Nicolai Lassen says linking directly to the story saves the reader time: "From the home page down to the actual story you want to read can be a very, very long way. By using a technology such as Newsbooster, you save a lot of time." Newsbooster charges users a subscription fee to send links to news items containing user-designated keywords, and the Danish Newspaper Publishers' Association believes that it should either shut down or negotiate to share those fees. "We consider it unfair to base your business upon the works of others," says the group's managing director. But to Internet purists, the whole point of Web is to create linkages between relevant pages. If the Web's creators hadn't wanted linking, "they would have called it the World Wide Straight Line," says one Web site operator. In the U.S., early court decisions have sided with deep-linking, except in cases of framing, where a site tries to make information created by other sites appear to be its own. "It was one of those issues that people thought was more or less settled. For whatever reason, these last couple of months, a spate of new disputes have come up," says an Internet legal expert. NewsScan

OECD REACHES CONSENSUS ON WEB TAXES
The Organization for Economic Cooperation and Development, which represents 30 leading industrialized nations, says its members have reached a landmark agreement that defines how countries should tax business conducted over the Internet. Tax experts say the deal marks an important milestone, but that wealthy nations need to hold further talks to develop a comprehensive approach to e-commerce taxation. The OECD's committee on fiscal affairs ruled that doing business through a Web site would not leave a company liable to taxation in the country from which the Web site had been accessed. The exemption from liability applies even if the company's Web site is hosted by a third party, such as an ISP. But the committee ruled that a company should generally pay tax in countries hosting servers through which the business was conducted. A company would be liable for paying tax if the server were performing functions that formed a core part of the business activity, such as downloading software. Jacques Sasseville, head of the OECD's tax treaty unit, said the consensus marked an interim solution and that more clarification would be necessary. (Financial Times 11 Jan 2000)

NAZI MEMORABILIA CASE GETS SECOND LOOK IN U.S. COURTS [11 Feb 2002]
About a year ago a French court decided that Yahoo had violated French law by allowing French citizens to view auction sites displaying Nazi memorabilia and ruled that Yahoo pay $13,000 a day in fines; however, in the U.S. (where the auction sites are located), a federal judge ruled that the French judgment can not be enforced in this country. That ruling is now being appealed by the two original plaintiff groups, The International League Against Racism and Anti-Semitism and the Union of French Jewish students. Alan Davidson, an attorney for the Washington, D.C.-based Internet civil liberties group Center for Democracy and Technology, warns that the French ruling "really puts free expression and communication in jeopardy on the Net," by reducing online speech to the lowest-common denominator of what is permissible as dictated by the most repressive nations. Taking a contrary point of view, University of Chicago law school professor Jack Goldsmith says that countries have the right to choose for themselves what is lawful within their own borders: "That is the essence of territorial sovereignty." (New York Times 11 Feb 2002)

HOW DO YOU SUE A COMPANY YOU CAN'T FIND?
The Internet music-swapping firm KaZaA, which has assumed the successor role to now-defunct Napster, is being sued in a federal court in Los Angeles by the Recording Industry Association of America for copyright violations, but the RIAA has several problems to overcome. First, there is a question of geography, since KaZaA is everywhere and nowhere: its distributor, Sharman Networks, is incorporated in the South Pacific island nation of Vanuatu, it is managed from Australia, its computer servers are in Denmark, and its developers can't be found. Second, there is an issue of jurisdiction: Sharman's lawyer says, "What they're asking is for a court to export the strictures of U.S. copyright law worldwide. That's not permitted. These are questions of sovereignty that legislatures and diplomats need to decide." And third, there is the question of whether giving people the tools (KaZaA's service) to break the copyright law is itself a copyright violation, even if KaZaA itself did not misappropriate copyrighted music. (New York Times 7 Oct 2002)

KAZAA CASE TO DECIDE REACH OF U.S. COPYRIGHT LAW
A federal judge in Los Angeles has agreed to rule on the question whether American media companies can hold a non-U.S. Internet music file-swapping service liable for breaches of U.S. copyright law as long as a very large number of the file-swapping service's customers are in the U.S. The service in question is Kazaa, which is owned by the Austrian company Sharman Networks, and which has 21 million users. Judge Stephen Wilson has not yet decided the issue, but says he is "inclined" find that his court has jurisdiction: "I find the argument about providing the service to so many California residents compelling." An attorney for the media companies says: "This is important because it shows that you cannot escape U.S. justice by setting up shop outside the United States" — whereas an attorney for Sharman argues that a decision to make companies liable to courts in other countries could lead to a judge "in communist China" to rule against U.S. companies that operate online. VA. COURT THROWS OUT INTERNET LIBEL SUIT
Three days after Australia's highest court ruled that an Australian businessman may sue Dow Jones & Co. for an article posted in New Jersey but accessible in Australia, a federal appeals court threw out a Virginia prison warden's lawsuit against two Connecticut newspapers, saying the articles posted on their Web sites were not aimed at a Virginia audience. The latest ruling reversed a lower court's decision that found prison warden Stanley Young could sue The Hartford Courant and The New Haven Advocate on the grounds that they falsely depicted him as racist in articles about alleged mistreatment of Connecticut inmates sent to Virginia to alleviate overcrowding. "The facts in this case establish that the newspapers' Web sites, as well as the articles in question, were aimed at a Connecticut audience," wrote Judge M. Blane Michael in the unanimous opinion. "The newspapers did not post materials on the Internet with the manifest intent of targeting Virginia readers." Both courts based their decisions on targeting, but differed in how they defined it, said Michael Geist, a professor at the University of Ottawa who tracks such rulings worldwide. "We have U.S. courts that looked largely at a commercial presence and the intended presence, while you got the Australian court more concerned about where the harm was felt." (AP 13 Dec 2002)

NAZI MEMORABILIA DECISION SEEN AS VICTORY FOR FREE SPEECH

The 9th U.S. Circuit Court of Appeals announced it will rehear some arguments in a 5-year-old lawsuit against Yahoo by two French human rights groups that want to ban the sale of Nazi-related items on any Internet site viewable in France. Since French law bars the display or sale of racist material, the groups had won a French court order requiring the company to block Internet surfers in France from auctions selling Nazi memorabilia there, but Yahoo kept such memorabilia on its popular U.S.-based site, yahoo.com. The two-sentence ruling Thursday does not explain how the judges came to their decision but compels both sides to argue their cases again in front of an 11- judge panel. Yahoo attorney Mary Catherine Wirth says, "If American companies have to worry that foreign judgments entered against them might be enforceable, it could end up with companies censoring their Web sites, but Richard Jones, who represented the French organizations, called the decision "meaningless."(AP/USA Today 11 Fe 2005)

San Jose Mercury News
http://www.sjmercury.com/svtech/news/breaking/ap/docs/36278l.htm

The Justice Department is investigating whether eBay's block on "shopping bots" and "crawlers" constitutes anticompetitive behavior. At issue are software programs used by two aggregator sites that compile lists of thousands of sales across a number of auction sites. Bidder's Edge and AuctionWatch have been meeting with Justice officials to discuss the filtering actions taken by eBay that block their ability to search its site. EBay does allow shopping bots from other sites to search its database, but only after they sign a licensing agreement to do so. It has called unauthorized listings of its wares "trespassing and stealing," but Bidder's Edge CEO James Carney says, "What's at stake here is the architecture of commerce on the Internet, whether you can freely search others' sites or whether you have to have their permission. (EBay's tactics) threaten to break down the openness that made the Internet great." (Wall Street Journal 4 Feb 2000)

[In April,] A federal judge . . . [said he was] planning to issue an injunction against Bidder's Edge, one of several so-called aggregators of online auction listings that compile and compare information on eBay, Yahoo, Amazon and other auction operators. The ruling comes in response to a lawsuit filed by eBay, which charges that Bidder's Edge violated the federal Computer Fraud and Abuse Act by using information gleaned from eBay's site. Legal scholars say such a ruling could set new standards in a debate over what is considered copyrightable intellectual property. "Decisions like this are disturbing because if extracting information off a site like eBay's is trespass, then it's going to be difficult for consumers to have the benefit of services that do price comparisons," says a University of California, Berkeley law professor. (Wall Street Journal 17 Apr 2000)

[In May,] Saying that the law recognizes no right to use another's personal property, U.S. District Judge Ronald Whyte . . . ruled that the Internet firm Bidder's Edge trespassed against auction firm eBay when it used "spider" software to crawl through eBay's Web site acquiring information that had been amassed by eBay. Bidder's Edge . . . [claimed] that the issue is "about the openness of information on the Internet," but eBay argues that the judge's ruling was "important for all Internet entrepreneurs who hope to create businesses based on databases without fear that trespasses will come in and steal the fruits of their labor." (AP/San Jose Mercury News 25 May 2000)

FLOODING A COMPANY'S MAIL SYSTEM: FREE SPEECH ISSUE OR PROPERTY ISSUE? [12 Dec 2001]
An appellate court in California has ruled that an ex-Intel employee had no right to send e-mail messages criticizing the company to 30,000 Intel employees. The ex-employee argued that the company's e-mail system is entitled to the First Amendment protections of a public forum; a divided court disagreed, with the majority saying that "Intel is as much entitled to control its e-mail system as it is to guard its factories and hallways." An appeal is expected. (San Jose Mercury News 12 Dec 2001)

EARTHLINK MOVES TO BLOCK POP-UP ADS
EarthLink, in a move to differentiate itself from rival ISPs, says it will offer subscribers free software to block those annoying pop-up ads that clutter the screen. The Pop-Up Blocker software uses technology from FailSafe Technology in Salt Lake City, and by taking the initiative to offer it EarthLink hopes to reinforce its image as an ISP that's more receptive to user needs than many of its competitors. Meanwhile, advertisers are already hard at work on new formats and strategies to outsmart the ad-blockers. And the race continues? (Wall Street Journal 19 Aug 2002)

AOL SMACKS DOWN POP-UP ADS
In an effort to revitalize its online service, AOL is pulling the plug on those annoying pop-up ads that clutter users' screens. Although the company officially stopped selling pop-ups on Tuesday, the ads will continue to appear on the site for several more months, because it must still honor existing advertising contracts, says CEO Jonathan Miller. Also, AOL is reserving the right to run pop-ups on behalf of AOL and other AOL Time Warner divisions. Consumers generally don't like pop-up ads, according to a November 2001 study by Dynamic Logic. In fact, only telemarketing was considered more annoying than pop-ups in that study, which looked at consumer responses to TV commercials, direct mail, and print ads in newspapers and magazines. According to a Nielsen/NetRatings report issued last month, fewer than one in 10 of all companies advertising online use pop-up ads. Meanwhile, Microsoft's MSN service says it will continue to run pop-ups, although with a low frequency, and Yahoo plans to continue using pop-ups on a limited basis, mostly for surveys after a consumer completes a shopping purchase or related to movie ads. (Wall Street Journal 16 Oct 2002)

EARTHLINK DERIDES AOL'S POP-UP ADS
Earthlink has launched a two-week ad campaign in the New York Times and USA Today to try to woo current AOL subscribers who are unhappy with AOL's practice of using pop-ads. One ad asks mockingly, "What can you expect now that AOL only allows pop-up ads from AOL Time Warner businesses?" Another sneers: "It took AOL 8.0 tries to figure out people don't like pop-up ads?" AOL seems to be trying to shrug its rival off, and a spokesman for that company said condescendingly: "It must be frustrating for competitors in the online industry who have lost this wedge issue with customers." (Atlanta Journal-Constitution 1 Nov 2002)

AOL DELIVERS USERS FROM 'POP-UP PURGATORY'
America Online is giving its subscribers some relief from the annoying pop-up ads that seem to be proliferating at an alarming pace across the Web. In response to complaints from users, AOL will automatically install its Web Pop-Up Controls onto the desktops of its 33 million subscribers during the next two weeks. Many AOL users had listed pop-up advertising as one the most annoying features of surfing the Web. "AOL's new Pop-Up Controls will allow our members to explore the Web without being trapped in pop-up purgatory," says an AOL spokesman. The latest move mirrors one made by rival Earthlink several months ago, and comes as the world's largest Internet provider is struggling with stagnant subscriber growth over the past year. NET CONVERSATION: OPEN, CASUAL... AND ETERNAL
Privacy advocates haven't been expressing much concern about the creation by the Internet search Google of its "archive of human conversation," which allows the searching of archived postings of the Usenet bulletin boards (http://groups.google.com). Devorah Pierce, a lawyer for the Electronic Frontier Foundation, a noted advocacy group for privacy on the Internet, says that contributors to Usenet discussions shouldn't expect too much privacy because "if that's not a public forum I don't know what is." But she and others worry that people don't expect their casual conversations to follow them forever. Another privacy advocate, Bruce Koball, says: "People can be rightfully mortified when the come back five years from now and see a post that they made. And now it's enshrined in magnetic media for time immemorial." (New York Times 7 May 2001)

THIRD-PARTY ARCHIVING COMES UNDER FIRE [15 Aug 2001]
Public companies have embraced Internet technology to offer investors access to live webcasts of once-private meetings, where company officials discuss quarterly results and business outlooks. But in some cases, creating a historical record can become a headache when that record is archived on other companies' Web sites. In one of the highest-profile disputes, R.J. Reynolds has demanded that financial news provider Bloomberg stop archiving the tobacco firm's conference calls, saying that the information exchanged in those calls belongs to the company. Bloomberg has responded that it's not violating any copyright restrictions because it records the calls itself, rather than using recordings produced by another company. Reynolds' policy is to make each call available on its Web site for just seven days, saying that investors could be confused if information exchanged in the call is taken out of context, but Bloomberg has refused to take the calls off its own site, saying it is valuable for shareholders to be able to go back and listen to officials' reasoning for making a business decision. One copyright expert says it would be difficult for a company to sue for unauthorized use of a conference call unless it is registered with the copyright office, especially when the call includes outside analysts as interviewers. Bloomberg records and archives between 500 and 1,000 conference calls each quarter, and customers pay $1,285 a month for the company's flagship Bloomberg Professional service. 2002-01-22 **Internet Web archives legal implications lawsuit trial judgement ruling**

RISKS 21 88

Roger Needham wrote in RISKS that a judge thinks that archiving news stories may violate the integrity of a criminal prosecution. "It is a principle in many jurisdictions that a jury should not know about prior charges or convictions of the accused. In a Scottish court a man was accused of a particularly revolting crime, he having been acquitted of a similar offence on a technicality a number of years ago. The judge ruled that the editor of a newspaper was in contempt of court by leaving reports of the earlier trial on line in his archive, because he had made it too easy for jurors to find out what they were not meant to know. The judge apparently believed that the greater ease of access of the on line archive as compared to a paper archive was a difference not of degree but of kind."

EDUPAGE; http://chronicle.com/prm/daily/2005/03/2005030307n.htm

NEW YORK PUBLIC LIBRARY UNVEILS ONLINE ARCHIVE

The New York Public Library this week unveiled an online archive of 275,000 images, available to the public for free. The project, called the NYPL Digital Gallery, is supported by a $7 million grant from The Atlantic Philanthropies and includes Civil War photographs, illuminated manuscripts, Japanese prints, early American maps, and photographs of New York City buildings and streetscapes. Paul LeClerc, president and chief executive officer of the library, noted that while other libraries are digitizing texts, few are putting materials such as photographs and maps online. Images in the collection are either in the public domain or are owned by the library and can be downloaded and used for noncommercial purposes. The NYPL Digital Gallery project, which is unrelated to the library's arrangement with Google to digitize content, is expected to add another 225,000 images to its database in the coming months. ANONYMOUS HARASSMENT ON NET ELUDES FLORIDA LAW
Two Florida men who had been arrested for anonymous harassment on the Internet have now been released. A chief assistant state attorney in Florida explains: "It's simply not criminal under statute in the state of Florida. I'm not condoning this activity. All I'm saying is that I'm left powerless to do anything about it." The two men are 19-year-old former high school students who had used a Web site to allege that a teacher and student at their school were engaging in homosexual relations. The statute cited in the men's arrest prohibits anonymous publication of material that holds a person up to ridicule or contempt; however, the Florida state attorney's office concluded that the statute is an unconstitutional infringement of the right to free speech. 1997-08-31 **journalism libel hoax**

EDUPAGE, AP, ZDNN

DRUDGING UP CRITICISM
Gossip columnist Matt Drudge, whose newsletter is distributed via America Online and the World Wide Web, has been taking a drubbing for two recent stories he — one about President Clinton and another about White House adviser Sidney Blumenthal. Blumenthal is considering a libel suit and the New York Times has lamented editorially that Drudge's work is an example of the kind of shoddy journalism encouraged by what it called "www.anarchy.net." And Newsweek investigative reporter Michael Isikoff says that Drudge is "a menace to honest, responsible journalism. He's clearly willing to go with anything, whether he's got any legitimate sourcing, anything approaching legitimate verification. He doesn't conform to any journalistic standard or convention that I'm aware of. And to the extent that he's read and people believe what they read, he's dangerous." (New York Times 15 & 17 Aug 97)

DRUDGE'S APOLOGY DOESN'T STOP BLUMENTHAL'S LIBEL SUIT
A White House spokesman has acknowledged that President Clinton and Vice President Gore approved of Presidential aide Sidney Blumenthal's decision to file a $30 million libel suit against online gossip columnist Matt Drudge. Drudge had reported that Blumenthal "has a spousal abuse past that has been effectively covered up," but when Blumenthal vehemently denied the allegation, Drudge quickly issued a retraction. But Blumenthal wasn't mollified, and proceeded with his lawsuit. In his August 29th "Drudge Report," Drudge says he is "disappointed that this lawsuit was filed even after I retracted my original report and publicly apologized for it. The fact that Mr. Blumenthal's 137-page complaint seeks to recover $30 million from me has no relation to anything that I have done — unless the White House views me as a reporter who should not be in business. The extraordinary admission at the August 28 White House press briefing that both the President and Vice President told Mr. Blumenthal they would support him in this action suggests this White House simply lacks respect for basic principles of free speech and the First Amendment guarantee of a free press. What the White House is doing in supporting this lawsuit should arouse grave concern among all those who cherish our Constitution." Drudge has been widely criticized by mainstream journalists, who have accused him of practicing shoddy journalism. (Edupage 17 Aug 97, Reuter 28 Aug 97, Drudge Report 29 Aug 97)

LIBEL IN CYBERSPACE [9 Aug 2001]
A trial court judge in California has interpreted federal law to mean that a person who re-posts libelous information on the Internet is protected against libel suits. The ruling stands a dramatic contrast to traditional libel law, which holds that someone who carelessly or recklessly circulates a defamation may be just as guilty as the originator of the libel. The judge in this case gave a broad interpretation to a federal law passed to protect Internet service providers and news group operators from being held responsible for postings made by third-party individuals. The plaintiffs, who will appeal the judge's decision, charge that "what this ruling does is open the door for any number of wrongdoers to just basically take something that's libelous, republish it and claim immunity." ONLINE JOURNALISTS HAVE SAME PROTECTIONS AS PRINT [11 Dec 2001]
Online journalists enjoy the same free-press protections against libel charges as those accorded to print, radio and TV reporters, according to a recent ruling in the New York State Supreme Court. The case, National Bank of Mexico v. Narconews.com, was initiated when the Bank of Mexico -- now part of Citigroup -- sued the drug-war investigative reporting Web site, charging that reports linking the Bank's then-president with narcotics trafficking were false and libelous. A 1964 U.S. Supreme Court decision -- New York Times v. Sullivan -- had established that defamation cases brought against journalists must meet a "higher standard," and that journalists can only be found guilty of libel if their actions are deemed malicious. "This court finds that Narconews is a media defendant and is entitled to a heightened protection under the First Amendment," wrote New York Supreme Court Justice Paula Omansky, citing the NYT v. Sullivan precedent. Al Giordano, editor and publisher of Narconews, said the decision should encourage online journalists to take on more hard-hitting news assignments. "The case law that comes out of Judge Omansky's decision is a miracle for online news sites like my own and online journalists like myself. It establishes that an online news provider now has the same rights as The New York Times or any other newspaper or magazine in the eyes of the law." (Wired.com 11 Dec 2001)

TO AVOID MORE JAIL TIME, ANGRY MAN SHUTS DOWN WEB SITE
After spending 111 days in jail for contempt of court, a 68-year-old Seattle man has won his release by shutting down a Web site he'd created to attack the retirement home in which he lived -- charging it violated federal housing laws, allowed neighbors to keep him up at night, and employed a manager who had a sexual dysfunction. The judge called him "a mean old man who becomes angry and vicious when he doesn't get his own way," while his lawyer was more supportive: "He had a choice between being pulling it and being put in jail by a judge who doesn't understand some of the fundamental precepts of constitutional law. 2005-05-13 **blogging blog entry libel defamation lawsuit St. Lawrence University anonymous attack**

EDUPAGE; http://www.insidehighered.com/news/2005/05/13/lawrence

UNIVERSITY SEEKS NAMES OF BLOGGERS

Officials at St. Lawrence University are trying to obtain the names of individuals responsible for a blog that includes content the university finds inappropriate. Included in the blog, whose stated goal is to fight a "right-wing assault" on the university, are pictures of and harshly derogatory comments about students and faculty whom the blog's contributors see as conservative. Other blog posts criticize university policies and administrators, but Macreena Doyle, a spokesperson for St. Lawrence, said the institution is most concerned about the anonymous attacks on students. "If these were posters attacking students on campus," said Doyle, "we would take action." The university has filed "John Doe" court actions with Time Warner Cable, whose service was used to make postings to the blog, demanding information that would identify the blog's contributors. Google disclosed IP addresses from which blog postings came after being ordered to do so by the courts, but it is not clear whether Time Warner will do the same. Inside Higher Ed, 13 May 2005

1997-05-22 **spam law US**

RISKS 19 18 ff

Two proposals were introduced in the US Congress. The House bill from Chris Smith (R-NJ) was called the "Netizens Protection Act of 1997." The Senate bill was the "Unsolicited Commercial Electronic Mail Choice Act of 1997" from Sen. Murkowski (R-AK). The House bill would extend legislation restricting junk fax; the Senate bill would require junk e-mail to include "ADVERTISEMENT" as the first word of the subject line. ISPs would be required to move toward providing filtering software to bar such tagged e-mail. Critics pointed out that the Senate bill had serious flaws, including no provision for interdicting non-commercial spam. In addition, the proposal for allowing filtering does not deal with the underlying problem: the floods of junk would still enter the Internet and travel to their unwilling recipients before being discarded.

Category 4A7 *Spam*

1997-06-29 **junk spam unsolicited commercial e-mail law legislation**

AP

Donna Murphy Weston, writing for AP at the end of June, summarized several bills in the U.S. federal legislatures in June. "Sen. Robert Torricelli, D-N.J., has proposed a bill that would prohibit junk e-mailers from disguising their identity, continuing to send messages to those who ask to be taken off their list, and using automated programs to cull e-mail addresses from news groups and chat forums." Another proposal, by Sen. Frank Murkowski (R-Alaska), would require labelling of unsolicited commercial e-mail to allow victims to filter the junk out manually or electronically. In the House, Rep. Chris Smith (R-Robbinsville, NJ) wants to ban junk e-mail outright by extending existing telecommunications law (in particular The 1991 Telephone Consumer Protection Act, which protected consumers against abuse of their fax machines) to include computers explicitly "in a ban on transmission of unsolicited ads through telephone lines." Some free-speech advocates object to any government regulation of e-mail at all. Chet Dalzell, speaking for the Direct Marketing Association, claimed, "When you have any new technology, you'll find there are people who'll push the parameters. . . .[b]ut all indications are that marketplace forces will drive development of technology to protect consumers without government regulation."

2000-03-24 **spam unsolicited commercial e-mail law court judgement ruling decision first amendment**

NewsScan

For the fourth time in three years, a federal or state judge has ruled against a state-level attempt to legislate Internet spamming, on the grounds that is in violation of the Constitution's commerce clause, which specifies that a state cannot pass a law concerning activity within its borders if the law's local benefits are outweighed by the burden it imposes on the interstate flow of goods, services, or information. The most recent decision comes from a Washington state Superior Court in Seattle. Professor Jack Goldsmith of the University of Chicago Law School predicts that the issue will ultimately be decided by the U.S. Supreme Court: "It's going to be fascinating," he predicted. "The current justices tend to be pro-states' rights, and they're going to be sympathetic to some of these state regulations. On the other hand, many people think state regulations of the Internet are a drag on the development of the Net, and the Court has shown a broad sympathy to that point of view, too." 2001-02-12 **anti-spam legislation**

NewsScan

CONGRESS EYES ANTI-SPAM MEASURE
Legislation designed to block spam has been reintroduced in the U.S. House of Representatives by the same representatives who sponsored the legislation in the last Congress. Representatives Heather Wilson (R-NM) and Gene Green (D-Texas) resubmitted the Unsolicited Commercial E-Mail Act, which had passed the House last year by a vote of 427-1. The bill stalled in the Senate last year after being introduced late in the session, but "we are optimistic that we will have success this year," says a spokesman for Wilson. The legislation would give consumers the power to block unwanted e-mail and provide ISPs with the legal right to block those who dump unwanted messages onto their networks. It would require e-mail marketers to provide accurate return addresses on unsolicited commercial e-mail; make it illegal to continue sending e-mail after someone has requested to be removed from a distribution list; require unsolicited commercial e-mail to be labeled; and require ISPs to allow their customers to opt out of receiving junk e-mail if the ISP profits from allowing it on their system. ISPs would be allowed to sue spammers for $500 per message if they violate their anti-spam policy. (InfoWorld.com 14 Feb 2001)

VERIZON SILENCES SUPER-SPAMMER
Verizon has reached a legal settlement that bans Alan Ralsky, whose company Additional Benefits LLC is considered to be one of the world's largest sources of bulk e-mail, from sending messages to its 1.64 million Internet access customers. Verizon had filed its lawsuit against Ralsky in March 2001 after several incidents in which Verizon customers were inundated with millions of e-mail solicitations for online casinos, diet pills, credit repair services, etc. The complaint said Ralsky broke federal and Virginia laws by, among other things, clogging its network with illegitimate e-mails. Ralsky must also pay an undisclosed fine, but apparently remains unfazed the recent action, stating that he has lists of 150 million e-mail addresses, so the Verizon case will eliminate only a small portion of those. ANOTHER ANTI-SPAM LAW PROPOSED
At least 26 states already have anti-spam laws on the books, without much to show for them, but California state senator Debra Bowen is trying again, this time by proposing a bill making it a crime to send unsolicited commercial e-mail to accounts in California. Bowen says that spam "is really turning the Internet into a tool of questionable value. I had someone write to me say, 'Spam is turning the Internet into an open sewer, and as the Romans discovered, open sewers are a bad thing.'" However, Jupiter Research analyst Jared Blank says it will take technology rather than legislation to get spam under control. But filtering technology can also be a problem, and the E-mail Service Providers Coalition hopes people will report missing and legitimate e-mail caught in "spam traps." [Good idea. Be sure to do that if you find some befuddled programmer is depriving you of your NewsScan Daily for one silly reason or another, hurting our feelings by confusing us with Spam. DIRECT MARKETERS JOIN FIGHT AGAINST SPAM
An unlikely ally has joined the battle against unsolicited commercial e-mail — the Direct Marketing Association announced it is now backing the push for federal legislation to restrict spam. The DMA previously had urged self-regulation, but now says the spam problem has gotten totally out of hand: "The volume is so great that we have to have some sort of government intervention," says DMA senior VP Jerry Cerasale. The group says that legitimate marketers should still be allowed to use e-mail, but plans to suggest that marketers who violate consumers' requests to be removed from mailing lists should pay stiff penalties of $11,000 per incident (per unsolicited message). Spam now comprises 41% of all e-mail, according to Brightmail, and accounts for $4 billion a year in lost productivity, according to a Ferris Research study. (Wall Street Journal 25 Feb 2003)

NewsScan

INTEL VS. HAMIDI: FREE SPEECH CASE OR PRIVATE PROPERTY CASE?
The California Supreme Court will soon be reviewing a lawsuit first brought five years by chipmaker Intel against a terminated employee whom it charges violated its private property rights by bombarding its e-mail system with messages to Intel employees. The ex-employee, Ken Hamidi, has portrayed the dispute as a freedom of speech case, whereas Intel says the issue is not about the content of Hamidi's messages but about the fact that he used Intel's own systems without its permission. Intel says, "For us, it's not a First Amendment issue and never has been. Ken has been very persistent and creative in exercising his right to speak out. But our view is that, in exercising his rights to free speech, he needs to protect the property fights of Intel, including our e-mail system." On the other hand, Stanford law professor Jennifer Granick argues that there was no violation of Intel's property rights because there was no actual damage to Intel property: "There is no harm to Intel's servers — it's the communication of the message that Intel considers the harm. That's not the kind of harm the courts should be in the business of protecting people from. It undermines the nature of the Internet as a place to exercise free speech rights."(San Jose Mercury News 30 Mar 2003)

2003-04-15 **spam lawsuits AOL America Online**

NewsScan

AOL SUES SPAMMERS
AOL has filed five federal lawsuits against alleged distributors of mass junk-mail, seeking damages of more than $10 million plus an end to the messages. The case comes in response to about 8 million individual spam complaints registered by AOL subscribers, most of whom used a "Spam Report" feature introduced on the Web site last fall. Most of the defendants are referred to as "John Doe," meaning that AOL could not determine their true identities, but the suits also name Michael Levesque of Issaquah, Wash., and George A. Moore Jr. of Linthicum, Md., both of whom had listed false phone numbers in their domain name registrations. By filing the lawsuits, AOL gains additional authority to subpoena Internet service providers and others trying to track down the other spammers. Meanwhile, AOL has also begun targeting spammers who use residential broadband services such as Comcast and RoadRunner, which is owned by AOL Time Warner. (AP 15 Apr 2003)

2003-05-27 **federal law legislation private lawsuits opt-out industry lobbyists direct marketing**

PCWorld http://www.pcworld.com/resource/printable/article/0,aid,110881,00.asp

By the end of May 2003, there was a great deal of activity in the US Congress concerning Federal legislation to control spam. Antispam activists severely criticized the majority of the measures and even the concept of using laws as a defense against spam on the following grounds:

* The very definition of spam remains ambiguous;
* Most bills would explicitly supersede more severe state antispam laws, reducing pressure on spammers;
* Many of the laws preclude civil litigation for damages against spammers;
* Most of the laws are based on opting out of spam, allowing potentially huge numbers of unwanted e-mail messages to be sent to victims;
* The laws would essentially legalize spam and place the burden of stopping it on the recipients;
* Offshore spammers would be unaffected by any legislation;
* Litigation against criminal spammers using false identification would remain difficult.

NewsScan

June 11, CNET News.com — FTC seeks broad powers to fight spam. The Federal Trade Commission (FTC) Wednesday asked Congress for sweeping new powers that would let it cooperate closely with governments abroad and prosecute domestic and overseas spammers more readily. The International Consumer Protection Enforcement Act (ICPEA), a 13-page proposal drafted by the FTC, would turn the agency's investigators into virtual spam cops, granting them the power to serve secret requests for subscriber information on Internet service providers, peruse FBI criminal databases and swap sensitive information with foreign law enforcement agencies. "A recent study by the commission found that 66 percent of spam contained obvious indicia of falsity," the FTC's five commissioners said in a joint statement to Congress released Wednesday. "Moreover, a significant portion of spam is likely to be routed through foreign servers."

2003-06-17 **spam civil lawsuit litigation harvesting addresses deceptive subject lines pornography children**

http://www.microsoft.com/presspass/features/2003/jun03/06-17SpamEnforcement.asp

In May and June of 2003, Microsoft launched an assault again spammers by filing 13 civil suits in US and two in the UK. The lawsuits included complaints about deceptive subject lines and harvesting e-mail addresses. Tim Cranton, a senior attorney at Microsoft, said in an interview, "We're focusing our efforts on the type of spam that troubles our customers the most: consumer deception and unsolicited pornography. Deceptive spam includes e-mail that uses misleading information — either about who sent the e-mail or what the e-mail is regarding — to trick the recipient into opening the mail because they think it's something that it isn't. These often come in the form of get-rich-quick schemes, adult services or purported health offerings. An FTC study found that an estimated 66 percent of spam has some type of false information, so this is a huge problem that must be addressed. Another significant customer concern is unwanted, sexually explicit material that may reach children or that is otherwise offensive to recipients who did not request to receive such material."

NewsScan

FEDERAL ANTI-SPAM BILLS WON'T DO THE TRICK
The legal counsel of the Consumers Union, which publishes Consumer Reports, has told a U.S. House subcommittee that the anti-spam legislation Congress is considering is insufficient, because it places too much burden on consumers: "Thus far, the bills proposed, including H.R. 2214, have an 'opt-out' as part of their core solution. In other words, an Internet service provider must first pass on the spam to consumers, consumers must then read the spam, and then they can exercise their right to stop receiving messages from that particular sender... This puts too much burden on consumers to block spam and makes it too difficult to hold spammers legally accountable for their inappropriate interference with consumers' e-mail." (TechWeb 9 Jul 2003)

WHY ARE SPAMMERS BACKING SPAM-CONTROL LAWS?
Bigtime spam-mongers and junk-mail proponents like the Direct Marketing Association are backing proposed antispam legislation, while consumer and public-interest groups, almost without exception, oppose the bills. What's going on? "It's a sign of who benefits from these bills and who doesn't," says a spokesman for the Coalition Against Unsolicited Commercial Email. "When you see some of the biggest spammers in the country backing legislation that is allegedly antispam, you really need to wonder about what these bills actually do." The answer is that rather than banning all unsolicited e-mail outright, as many consumer groups wish, they legitimize spam, as long as the perpetrators adhere to certain rules, such as using accurate subject lines and valid return addresses, and allowing recipients to opt out of future mailings. Two bills are currently making their way through Congress and a variant of thereof is expected to pass overwhelmingly and be signed into law later this year. (Wall Street Journal 18 Jul 2003)

SENATORS INTRODUCE ANTI-SPAM BILL
Senators Conrad Burns (R-Mont.) and Ron Wyden (D-Ore.) have introduced legislation that seeks to cut down on junk e-mail by requiring Internet marketers to provide legitimate return addresses on their e-mail and to honor consumers' requests to be taken off e-mail distribution lists. "This bill will help to keep legitimate Internet traffic and e-commerce flowing by going after those unscrupulous individuals who use e-mail in annoying and misleading ways," said Wyden in a statement. The bill would not allow individuals to sue spammers directly, but would require that state attorneys general sue on their behalf. The Federal Trade Commission could also fine violators, and ISPs could block spammers from their networks. The average U.S. Internet user received more than 2,200 spam messages last year, according to Jupiter Research, and the UK government said last month that spam now accounts for 40% of global e-mail traffic. A similar bill sponsored by Burns and Wyden cleared the Commerce Committee last year, but was not taken up for a vote in the Senate. "Now it's time to move forward. This legislation has been on hold for too long," says Burns. (Reuters 10 Apr 2003)

SENATE VOTES TO CAN SPAM
The U.S. Senate has unanimously approved the "Can Spam" bill, sponsored by Sens. Conrad Burns (R-Mont.) and Ron Wyden (D-Ore.), which would ban the sleaziest techniques used by spammers to spew out millions of junk e-mail messages each day. Under the provisions of the bill, senders of unsolicited e-mail would be prohibited from disguising their purpose by using a fake return address or misleading subject line, and would no longer be allowed to harvest e-mail addresses off the Web to bulk up their lists. In addition, junk e-mail would be required to include a legitimate "opt out" function that recipients could use to get off lists. A provision proposed by Sen. Charles Schumer (D-N.Y.) authorizes the Federal Trade Commission to establish a "do-not-spam" list, similar to the recently implemented "do-not-call" list that blocks telemarketing calls. "Kingpin spammers who send out e-mail by the millions are threatening to drown the Internet in a sea of trash, and the American people want it stopped," said Wyden, who urged foreign countries to adopt similar measures. CONGRESS PASSES ANTI-SPAM BILL
Congress has passed anti-spam legislation that would supplant tougher anti-spam laws already passed in some states. The bill encourages the Federal Trade Commission to create a do-not-spam list of e-mail addresses and includes penalties for spammers of up to five years in prison. The legislation would prohibit senders of unsolicited commercial e-mail from disguising their identities by using a false return address or misleading subject line, and would require them to let recipients say they do not want future mass mailings. (Los Angeles Times 9 Dec 2003)

NewsScan

December 09, Associated Press — New anti-spam legislation compels consumers to hit 'reply' to e-mails. As the deluge of unsolicited pitches worsened during the Internet's growth, experts have cautioned computer users against doing what comes naturally: Reply to unwanted e-mails to demand an end to them. The reason? Unscrupulous spammers deem each such demand a verification that someone actually received their e-mails—and promptly sent dozens more to the same address. But the "can spam" legislation that Congress approved Monday requires unsolicited e-mails to include a mechanism so recipients could indicate they did not want future mass mailings. The legislation also will prohibit senders of unsolicited commercial e-mail from disguising their identity by using a false return address or misleading subject line, and it will prohibit senders from harvesting addresses off Websites. President Bush has indicated he intends to sign the measure into law. Indeed, the White House revamped its own e-mail system this summer over a flood of so-called spam. The anti-spam bill encourages the Federal Trade Commission to create a do-not-spam list of e-mail addresses and includes penalties for spammers of up to five years in prison in rare circumstances.

FIRST INDICTMENTS UNDER VIRGINIA ANTI-SPAM LAW
The state of Virginia has lodged criminal indictments against two people charged with making unsolicited mass e-mailings; it's the first case to be brought under a new antispam law in that state. Prosecutors say that in a one-month period last summer more than 100,000 AOL subscribers clicked a "report spam" button to complain about messages sent by the two defendants. The e-mail messages, sent with fake return addresses, contained information about stock-picking methods, mortgages and "Internet history eraser" software for deleting evidence that a user had visited pornographic sites. BUSH SIGNS NATIONAL ANTI-SPAM LAW
A new law signed by President Bush will attempt to rid the Internet of unsolicited commercial e-mail ("spam") — though many technology experts believe it will not be impossible for legislation passed by a single country to eliminate spam, because it is a global problem. However, supporters of the legislation say it gives state and federal law authorities the tools needed to track down and prosecute the largest and best-organized spammers. Democrat Senator Ron Wyden of Oregon, a coauthor of the CAN-SPAM bill, explains: "Our message is the fight has just begun and enforcement has got to be tough, tough, tough." NEW YORK, MICROSOFT TARGET SPAMMERS
New York Attorney General Eliot Spitzer has filed a civil lawsuit against three top spam firms, threatening to seek penalties so large it would drive the companies out of business: "We will drive them into bankruptcy. Therefore, others will not come into the marketplace because they will see there is no viable business model here." The companies under fire are OptInRealBig, of Westminster, Co.; Synergy6, a New York marketing firm; and Delta Seven, a Dallas mailing company whose co-owner has already filed for bankruptcy protection. In addition to spewing spam, prosecutors have accused Delta Seven of obscuring the messages' origin by breaking into computers owned by others — including an elementary school in Korea and the Kuwaiti ministry of finance — to send the mail. Meanwhile, Microsoft has jumped on the anti-spam bandwagon with its own suit filed in Washington State seeking $18.8 million in damages caused by overloading its Hotmail service with junk e-mail. "Any money that is left over after the attorney general's suit, we will happily go after," says Microsoft general counsel Bradford L. Smith. (New York Times 19 Dec 2003)

ANTI-SPAM LAW ENACTED — SO WHAT'S ALL THIS JUNK IN MY IN-BOX?

The new federal anti-spam law went into effect Jan. 1, but consumers report their inboxes are more cluttered than ever — what's going on? Critics say the new law doesn't actually ban spam but rather provides guidelines for sending junk e-mail legally. "Now we have a green light for what would come to be called 'legal spam,'" says ePrivacy Group CEO Vincent Schiavone. John Levine, a board member of the Coalition Against Unsolicited Commercial E-Mail, concurs: "Basically, it's a bill of rights for companies that want to send junk e-mail." In addition, the federal law supercedes stricter laws recently passed in several states, such as California. "Everyone was planning for this California law, which was so draconian," says a California lawyer who defends accused spammers. "Once the federal government passed the federal law, everyone was kind of relieved." And while technology firms are eagerly pursuing new ways of blocking spam, skeptics say the ultimate solution won't be technological or legal, but will depend on developing more savvy users. Mary Youngblood, abuse team manager at EarthLink, suggests putting numbers in the middle of your e-mail address to make it more difficult to guess and using a separate address for online shopping and newsgroup postings. ANTI-SPAM LAW LARGELY IGNORED

The new federal anti-spam law ("Can Spam") doesn't seem to being changing the practices of the largest spammers: most of the largest bulk e-mailers are continuing to send illegal mass mailings for porn, get-rich-quick schemes and miracle drugs. The spam-filtering company Brightmail says that about 58% of e-mail monitored in January has been spam, in defiance of the new law, which took effect at the beginning of this month. The only real impact of the law seems to have been felt by small businesses, many of which have decided to discontinue e-mail marketing. One business, calculating that it would cost $100,000 a year in personnel and technology to make its e-mail system comply with the law, decided to switch its advertising campaigns to Microsoft MSN and Yahoo. FTC WARNING PUTS ONUS ON COMPUTER USERS

The Federal Trade Commission and regulatory agencies in 26 countries have sent out letters to hundreds of thousands of computer users, warning them that spammers are lurking in cyberspace, waiting for the opportunity to hijack their servers and route junk e-mail through them. Spammers often use unsecured computers to disguise the origin of their messages. "Recipients may think the spam comes from your system," said the FTC's e-mail message. "Securing your server will help you protect your system from being misused." Don Blumenthal, coordinator for the FTC's Internet lab, admitted the agency did not attempt to verify that each computer targeted by the warnings was actually vulnerable to hacking, but said the message urged recipients to visit the FTC Web site for more information on properly configuring their software. Can CAN-SPAM Can Spam?

By M. E. Kabay, PhD, CISSP

On January 1, 2004, The CAN-SPAM Act of 2003 took effect in the United States. The Act is formally entitled, "Controlling the Assault of Non-Solicited Pornography and Marketing Act of 2003" and was introduced as S. 877 (passed Nov 25, 2003) and accepted by the House on Dec 8, 2003 [1].

Critics have consistently attacked the law as inadequate to control spam on the following grounds [2]:

1. The Act is based on an opt-out philosophy. Anyone can send one junk e-mail message legally as long as they offer an opt-out procedures. However, it is widely believed that many or most of the people who send spam value opt-out replies because they validate addresses. They then sell those addresses to other spammers. As a result, many people will be reluctant to use opt-out mechanisms. In any case, there are more than 20 million businesses in the USA today [3], so if every one of them chose to send a user exactly one message per year at random, a user could expect an average of over 54,000 messages requiring an opt-out response per day. If only 1% of these businesses chose to send out junk e-mail, the daily average would be 500 or more new junk messages requiring an opt-out.

Section 5(a)(3)(A) requires spammers to provide an opt-out mechanism, but describes these mechanisms broadly as including "a manner specified in the message, a reply electronic mail message or other form of Internet-based communication. . . ."

As pointed out by blogger Ed Foster, this section means that a spammer could create an opt-out mechanism requiring an unwilling recipient to log on to a Web site and search for opt-out instructions, possibly while being bombarded by pop-up ads [4]. Can you imagine having to log on to Web site after Web site to unsubscribe from drivel you never asked for and detest on sight? Think of the time involved. Furthermore, Web-based opt-out instructions permitted under this law will make it difficult for automated systems to unsubscribe victims of spam using such mechanisms. [Note from MK: I remember one spammer who demanded that his victims _solve a puzzle_ in order to be freed from his waves of, ah, e-xcrement.]

2. Section 9 of the Act mandates a Do-Not-E-Mail Registry for no later than July 2004 but provides no details on how such a registry would be created and updated, how it would be protected against abuse by spammers, which government agency would control it or how it would be used to limit spam.

3. The Act defines "commercial electronic mail message" as "any electronic mail message the primary purpose of which is the commercial advertisement or promotion of a commercial product or service (including content on an Internet website operated for a commercial purpose)." This definition thus permits spam from politicians, political groups, religious organizations, charities, hate groups, hobbyists, cranks, and anyone else so long as the content cannot be construed as "commercial" (which is itself not defined in the Act).

4. CAN-SPAM overrides more restrictive state laws, weakening the range of legal countermeasures against spammers in the USA.

5. Nothing in the Act resolves the problem of spam directed against US residents but originating outside the boundaries of the USA.

By mid-January, anti-spam campaigners were confirming their pessimistic impression of the law's effectiveness. According to Jan Libbenga of _The Register_, "The NANAS sightings newsgroup (a large collection of spam, updated continuously) doesn't contain one spam message that is CAN SPAM compliant." [5]

Let's hope for some successful prosecutions of spamming soon with some stiff penalties. Until then, I'm sorry to say that I doubt that this law will have any helpful effect on spam.

Can Laws Block Spam?

by M. E. Kabay, PhD, CISSP
Associate Professor, Computer Information Systems
Norwich University, Northfield VT

I just read a new White Paper from Montreal-based Vircom, developer of Modus secure messaging solutions, on recent international anti-spam legislation efforts. Entitled, "Can Laws Block Spam?" the paper uses interviews with five experts on spam:
* Lindsay Barton, Manager, Online Policy at the National Office for the Information Economy of Australia;
* Anne P. Mitchell, Esq., President/CEO, Institute for SPAM and Internet Public Policy and Professor of Law, Lincoln Law School of San Jose, California;
* Michael D. Osterman. President and Founder, Osterman Research
* Troy Rollo, Chairman of the Coalition Against Unsolicited Bulk Email in Australia and Executive Director of the International Coalition Against Unsolicited Commercial Email
* Neil Schwartzman, Editor & Publisher spamNEWS, Chair, Canadian Coalition Against Unsolicited Commercial Email

The paper analyzes the CAN-SPAM act in reasonable detail, but this column has already pointed readers to that legislation and analyses of its weaknesses. More interesting here is the analysis of the European Community Directive on Privacy and Electronic Communication Regulation 2003. This legislation provides for opt-in (not opt-out) restrictions on sending junk e-mail. Much as with fax messaging, no one may initiate e-mail marketing without prior permission or prior business relationship – and there must be an easy way to refuse future junk e-mail at the time of initial data collection about an individual. In addition to enforcement actions initiated by the Information Commissioner in law courts, victims of spam may also sue for damages of up to £5,000 in cases heard before a judge (unlimited if heard before a jury). However, critics point out that the law does not regulate business-to-business spam, including spam sent to employees via their business e-mail addresses.

Another section covers the Australian Spam Act of 2003, which includes not only e-mail spam but also SMS (Simple Message System) junk messages. This law also uses an opt-in strategy, in contrast with the US approaches that depend on opt-out methods. There are also clauses dealing with proper (accurate) origination addresses and restrictions on harvesting e-mail addresses automatically. Penalties are potentially much higher than in the US or in Europe: "Civil penalties under the Act will be assessed according to a sliding scale for repeat offenders. An individual could be liable for up to a total of A$44,000 … for contravention on a single day, while an organization could be fined up to $220,000 AUD in a day. Offenders with a prior record will be penalized up to a maximum of A$220,000 … for each day of spamming by an individual, and A$1.1million … per day for organizations."

Although the Australian law has many admirable features, it founders on the reef of international spam. As commentators note in the White Paper, national laws will inevitably fail to control spam sent from outside their borders. According to a UNCTAD (United Nations Conference on Trade and Development) report on the origins of spam in 2003, the sources were
58.4% USA
5.6% China
5.2% UK
4.9% Brazil
4.1% Canada
21.8% Other

[On a side note, I have been receiving the most amazing junk e-mail from China lately – ads in comically bad English for everything from inflatable dolls the size of buildings to industrial flooring components and chemicals. Given that China has one quarter of the world's population and an economy that is growing at 9-11% per year, this trickle bodes very badly for the future of our inboxes.]

I think Michael Osterman summed up the situation well in his commentary: "Spam legislation, while well intended, will not control spam alone. The only answer is to fight spammers with the same weapon they use: technology. The problem with spam will be better faced by IT staff then by legislators. To control spam, it must be rendered economically non-viable. Now that is difficult to achieve because it costs virtually nothing to send; however, if we can increase the cost of sending a spam message, we can make it nonviable and the only way we can do that is through the increased use of anti-spam tools. . . . When anti-spam filters are effective they can eliminate 95% or more of the incoming spam, "...If an anti-spam filter can stop 95% of the spam that reaches an end user, the cost to the spammer of reaching that potential customer has risen by 20 times. Increasing the effectiveness of these filters to 97% increases the cost to the spammer by 33 times. The hope is that the potential revenue available to spammers drops by a corresponding amount, and equilibrium is reached."

SPAMMERS FACE CRIMINAL PENALTIES IN VIRGINIA TRIAL

Virginia prosecutors have brought to trial three North Carolina defendants in what's being billed as the nation's first felony anti-spam case. The Virginia law toughening penalties for sending junk e-mail took effect last year; if convicted, each defendant could face up to 15 years in prison and $2,500 in fines. The prosecutors allege the defendants used falsified or forged return Internet addresses to send bulk e-mail hawking penny stocks and work-at-home schemes through a server in Loudon County, Virginia, where America Online is headquartered. The defense attorneys have argued their clients were simply "marketing via the Internet," which "may be annoying to you. It is not a crime." However, anti-spam activists say the prosecution is a step in the right direction. Spammers "are folks who are fairly comfortable with playing … on the fringes of legitimacy and reality," says the general counsel for the Coalition Against Unsolicited Commercial E-mail. "But if you can attach serious jail time, they would think twice." (Washington Post 27 Oct 2004)

CAN-SPAM LAW GETS MIXED REVIEWS

The Can-Spam Act, signed into law on Dec. 16, 2003, was touted as a major weapon in the arsenal aimed against spam-mongers, but after a year the law has been used against only a few spammers and recent surveys show that Internet users face more spam than ever. In November, a Virginia jury recommended a nine-year jail term for a North Carolina man who earned the dubious distinction of being the first person convicted of felony spamming. (The case had been brought under Virginia's spam law, which is similar to Can-Spam but allows stiffer penalties.) However, despite this minor victory, experts agree that during the past year spam e-mails represent an everincreasing portion of users' e-mail -- up to 75% to 80% now, according to anti-spam firm Postini. The trend has resulted in most major ISPs turning to technology rather than litigation to stem the flow, and each of the four major U.S. e-mail providers is involved in a nationwide effort to develop e-mail "authentication" technology that would make it more difficult for spammers to disguise their messages. "You've got to stop [spam] from getting to the customers' machines," says Dave Baker, VP of law and public policy at Earthlink. "If you're suing a spammer, you're going after them for damage that's already been done. The biggest single element remains technology solutions. None of these companies are relying solely on litigation." (Washington Post 3 Jan 2005)

OOPS: 'CAN SPAM ACT' SEEMS TO BE NO-CAN-DO

The Can Spam Act went into effect in January of last year, yet unsolicited commercial e-mail on the Internet is now estimated to account for at least 80% of all e-mail sent -- a figure up from 50-60% percent of all e-mail before the law went into effect. A number of critics of the law had argued that it would make the spam problem worse by effectively giving bulk advertisers permission to send junk e-mail as long as they followed certain rules. Steve Linford, the founder of the UK-based Spamhaus Project, says the law "legalized spamming itself." The law's chief sponsor, Senator Conrad Burns (R- Montana) says the problem isn' t the law but the ineffective enforcement of the law: "As we progress into the next legislative session, I'll be working to make sure the FTC utilizes the tools now in place to enforce the act and effectively stem the tide of this burden." Anne Mitchell of the Institute for Spam and Internet Public Policy comments: "Most people say it's a miserable failure, but I see it as a lawyer would see it. To think that law enforcement agencies can make spam stop right away is silly. There's no such thing as an instant fix in the law." (New York Times 1 Feb 2005)

DHS IAIP Daily; http://news.com.com/Florida+files+multimillion−
dollar+spam+s uits/2100−1030_3−5653662.html

FLORIDA FILES MULTIMILLION-DOLLAR SPAM SUITS

The Florida Attorney General's office has filed its first claims under the state's antispam law, charging two men with masterminding a scheme that marketed fraudulent online businesses via e-mail. Florida Attorney General Charlie Crist charged two Tampa residents accused of running an operation that generated over 65,000 deceptive e-mails since 2003, including 48,000 messages sent after the Florida Electronic Mail Communications Act took effect on July 1, 2004. The defendants face up to $24 million in fines. Like the federal Can-Spam Act, the Florida law prohibits the distribution of unsolicited commercial e-mail that contains false or deceptive subject information, or that is sent from invalid e-mail addresses. Under the law, violators face a penalty of up to $500 for every illegal e-mail message they send to Florida residents. "Spam is a pervasive and growing threat to unsuspecting computer users everywhere," Crist said in a statement. "The spam itself is illegal, but it is made even worse when it seeks to rip off Florida consumers. Florida's antispam law was adopted precisely to stop operations such as this one."

FLORIDA WINS INJUNCTION AGAINST SPAMMERS

The state of Florida won its first victory against spam e-mail when a judge granted an injunction against two men accused of running mass e-mailing operations, the state prosecutor said Tuesday, April 12. Florida Attorney General Charlie Crist said the injunction preventing the men from sending any more deceptive e-mails was part of his department's first prosecution under an antispam law passed by the state legislature last year. The e-mails took recipients to Websites that Crist said were engaged in fraudulent or illegal activities, such as selling pharmaceuticals and cigarettes online or providing a platform for the illegal downloading of copyrighted movies. A national antispam law took effect at the start of 2004 but has done little to curb the flood of spam clogging e-mail in-boxes. Spam is estimated to account for more than 80% of all e-mail traffic, costing businesses billions a year in lost productivity and bandwidth.

2006-01-05 **phone records sale Internet pretexting privacy law enforcement criminals**

DHS IAIP Daily; http://www.suntimes.com/output/news/cst−nws−privacy05.html 23

PHONE RECORDS ARE FOR SALE VIA ONLINE DATA BROKERS

The Chicago Police Department is warning officers their cell phone records are available to anyone -- for a price. Dozens of online services are selling lists of cell phone calls, raising security concerns among law enforcement and privacy experts. Criminals can use such records to expose a government informant who regularly calls a law enforcement official. Some online services might be skirting the law to obtain these phone lists, according to Sen. Charles Schumer (D-NY), who has called for legislation to criminalize phone record theft and use. In some cases, telephone company insiders secretly sell customers' phone-call lists to online brokers, despite strict telephone company rules against such deals, according to Schumer. And some online brokers have used deception to get the lists from the phone companies, he said. According to Schumer, a common method for obtaining cell phone records is "pretexting," involving a data broker pretending to be a phone's owner and duping the phone company into providing the information. "Pretexting for financial data is illegal, but it does not include phone records," Schumer said.

2006-01-05 **spammer fine Florida $11.2 billion anti-spam**

EDUPAGE; http://www.wired.com/news/politics/0,69966-0.html 23

SPAMMER HIT WITH $11.2 BILLION FINE

A court has slapped a Florida spammer with an $11.2 billion fine, setting a new precedent for fines against spammers, though the ruling is unlikely to have much effect on the volume of spam. Internet service provider CIS Internet Services, which provides Internet service to parts of Iowa and Illinois, had sued James McCalla for sending more than 28 million e-mail solicitations that fraudulently used the CIS domain as the return address. In addition to the fine, McCalla is forbidden from accessing the Internet for three years. Robert Kramer III, owner of CIS, welcomed the ruling, calling it the "economic death penalty," though he acknowledged that he does not expect to receive any of the money awarded. John Mozena, co-founder and vice president of the Coalition Against Unsolicited Commercial E-mail, said this and other rulings against spammers have not had a significant effect on the total volume of spam, which he estimated continues to be about two-thirds of all e-mail traffic. What is needed, he argued, rather than current laws, which only forbid deceptive or fraudulent spam, is a prohibition against all spam.

EDUPAGE; http://www.wired.com/news/politics/0,69981-0.html 23

HIGH COURT PASSES ON UT E-MAIL CASE

The U.S. Supreme Court has refused to hear a case involving the University of Texas (UT) and White Buffalo Ventures, which operates a dating Web site focused on UT students. In 2003, UT officials blocked 59,000 e-mails from LonghornSingles.com, saying that they violated the university's antispam policy. According to officials at the school, the overall volume of spam messages was crippling the institution's servers, and the administration had also received complaints specifically about the LonghornSingles.com e-mails. White Buffalo Ventures had ignored a cease-and-desist letter, prompting the university to block all of its messages. White Buffalo took UT to court, said that its messages complied with all provisions of the CAN-SPAM Act, and argued that the federal law should take precedence over any UT policy. In August, the 5th U.S. Circuit Court of Appeals rejected that argument, saying that the university was within its rights to block the e-mails.

SUSPECT IN FEDERAL SPAM CASE PLEADS GUILTY

The main defendant in America's first prosecution under a 2004 federal anti-spam law pleaded guilty Tuesday, January 17, to three felony charges, federal prosecutors said. Daniel J. Lin of West Bloomfield Township, MI, faces nearly five years in prison and a fine of up to $250,000, the U.S. Attorney's Office in Detroit said. Two of the counts are fraud charges involving millions of unsolicited spam e-mails sent to computer users. The other is possession of a firearm by a felon, for guns discovered when authorities raided Lin's suburban Detroit home. He is scheduled to be sentenced May 16 in U.S. District Court in Ann Arbor, MI. Lin and three other West Bloomfield Township men were identified in court documents as being part of the massive illegal spam scheme. Court papers described a complex web of corporate identities, bank accounts and electronic storefronts used to send hundreds of thousands of e-mail sales pitches for fraudulent products. The Federal Trade Commission said angry consumers forwarded to authorities more than 490,000 e-mails from the operation from January 2004 to April 2004 -- more than from any other spam outfit worldwide during the same period.

2006-01-27 **Maryland spam law New York e-mail marketer ruling**

DHS IAIP Daily; http://www.siliconvalley.com/mld/siliconvalley/news/editorial/13728469.htm 23

MARYLAND SPAM LAW CAN BE ENFORCED, JUDGE RULES.

Spam e-mails offering home financing deals or other offers can violate Maryland law, even if they're sent from another state, a state appeals court has ruled. Court of Special Appeals Judge Sally D. Adkins sided with a law student who argued that he could sue a New York e-mail marketer who had sent him advertising messages. The decision, issued Thursday, January 26, overturns a lower court ruling that Maryland's 2002 Commercial Electronic Mail Act was unconstitutional because it sought to regulate commerce outside state borders. Adkins, in a 60-page decision, blasted the marketer's claims that he should not be punished for violating Maryland law because he had no way of knowing whether his e-mails would be opened in Maryland. "This allegation has little more validity than one who contends he is not guilty of homicide when he shoots a rifle into a crowd of people without picking a specific target, and someone dies," the judge wrote. Maryland was one of the first states to try to control junk e-mail through legislation, and its 2002 law predates the 2004 federal CAN-SPAM Act. The federal law superseded most state laws unless they specifically addressed deceptive or fraudulent e-mail, which Maryland's does.

2003-08-29 **liability due diligence worm Slammer telco lawsuit**

Maine Today; http://business.mainetoday.com/yourbusiness/030829yourbiz.shtml

When the SQL Slammer worm hit the Verizon ISP in Maine in January 2003, the company shut down access to some of its Internet services as part of its emergency response. Unfortunately, the shut down also triggered penalties for violating its performance standards as regulated by the
Maine Public Utilities Commission (PUC). The judgment hinged on Verizon's failure to apply critical patches that would have prevented the infection

In August, the PUC rejected horizons request for a waiver of penalties for its failure to meet its contractual performance standards and put the company at risk of paying more than $40,000 in rebates to its customers in Maine. Frank Jaffe and Jon Stanley, writing in _Maine Today_, commented, "This decision is one of the first anywhere in the world to define a legal duty requiring the prevention of damage and losses from new types of 'foreseeable' computer security incidents. This same logic could be applied to preventing losses from viruses, or most configuration or programming errors that lead to Web site or system security problems."

In a similar case, the Guess company was fined $11,000 in federal proceedings because the Slammer infection reduced security measures on its web site and compromised customer data.

In both cases, concluded the writers, much of the damage resulted from inadequate preparation for computer incident response.

2005-02-24 **liability software GM General Motors responsibility cost repairs patches tort lawasuit**

NewsScan; http://online.wsj.com/article/0

THREAT OF THE 'L' WORD MAKES SOFTWARE MAKERS SHUDDER

Major technology customers are fed up with spending millions to fix shoddy software and are starting to challenge software makers to assume at least some responsibility for costly repairs. So far, it's just a low rumble, but even the thought of the dreaded "L" word -- liability -- sends shivers through the software industry. One leading proponent is GM, whose chief information-security officer says: "Can you imagine if GM produced a vehicle and said, 'We did a pretty good job of engineering this. It worked in the laboratory. Here it is, consumer, you go crash-test it.'" GM is pushing for penalty provisions in new contracts that could hold vendors liable if they fail to meet security requirements. Other customers are seeking to add liability clauses to their "service level agreements" with outsourced technology providers that would limit the number of times their systems can go down. Meanwhile, some companies are taking matters into their own hands: BJ's Wholesale Club last year filed suit against IBM for providing software that allegedly allowed thousands of BJ's customers' credit-card information to be stolen by an organized crime ring. And even the Business Roundtable, a Washington association of CEOs, last year issued a call for "shared responsibility" between technology users and suppliers. (Wall Street Journal 24 Feb 2005)

2006-03-15 **Internet Net neutrality tiered Google Yahoo big bandwidth opposition**

DHS IAIP Daily; http://news.com.com/Debate+heats+up+over+Net+neutrality/2100 −1037_3−6049863.html?tag=nl 23

DEBATE HEATS UP OVER NET NEUTRALITY.

Speculation that the two biggest phone companies in the country, AT&T and Verizon Communications, are planning to create a tiered Internet system that would require big bandwidth users like Google or Yahoo to pay more for their access has become a hot-button issue in the tech industry. Increasingly, it's also an issue on Capitol Hill, where some lawmakers are developing rules to maintain so-called Net neutrality and prevent the emergence of a tiered system. At the Voice over the Net conference at the San Jose Convention Center on Tuesday, March 14, companies on both sides of the bandwidth aisle debated how much Internet regulation is needed. CEOs from network owners AT&T and Verizon Communications have made comments suggesting they plan to create a system where some companies would have to pay more for their data-intensive use of the Net, which, they argue, slows access for regular customers. On the other side of the debate are companies such as Google, eBay and Yahoo, which are against any companies taking on the role of "IP traffic gatekeeper." They support the idea of federal rules that would further restrict network owners from blocking or restricting traffic.

2006-04-26 **net neutrality amendment bill killed House Energy Commerce Committee**

EDUPAGE; http://news.zdnet.com/2100-9595_22-6065465.html 23

COMMITTEE KILLS NET NEUTRALITY BILL

The House Energy and Commerce Committee has killed an amendment designed to guarantee net neutrality. The amendment would have prevented Internet service providers from delivering different content at different speeds based on content providers' having paid extra fees. Supporters of the amendment, including Microsoft, Amazon, and Google, argued that the Internet was built on ideas antithetical to the notion of paying fees to have content available to consumers. They called on Congress not to drop the issue but to "enact legislation preventing discrimination" against certain content providers. Opponents of the amendment, including cable and phone companies, suggested that the landscape of online content, including such material as movie-quality video, could be available to consumers if content providers paid a surcharge for it. Joe Barton (R-Tex.), chairman of the committee, commented that net neutrality is "still not clearly defined" and that he doubts the dire predictions of the amendment's supporters.

2006-05-20 **net neutrality Internet Service Providers ISP tiered pricing differential bandwidth allocation speed preferential treatment contracts consumers customers availability accessibility visibility usability**

RISKS; NYT http://www.freepress.net/news/15726 24 30

NET NEUTRALITY DEBATE HEATS UP

Sir Tim Berner-Lee, inventor of the World Wide Web, publicly critized proposals to move to a multi-tiered Internet in which high-paying corporate clients could receive preferential allocations of bandwidth while non-profits and individuals might stagnate in a mire of slow -- or no -- access. Writer Adam Cohen presented a summary of the issues in a New York Times article on May 29, 2006. Key points:

* ISPs and large corporations are pushing for permission to discriminate among content providers by charging for bandwidth. More fees, more speed.

* A growing movement is organizing to push the US Congress to block such attacks on "net neutrality."

* Breaking down net neutrality could permit open censorship of content providers -- for example, blocking or interfering with access based on political preferences.

* Fees for higher bandwidth could curtail new developments such as shared images from cellphones that could generate three-dimensional images of news events.

* Tiered pricing may harm even the ISPs because users may reject paying for services that they expect to be free (once their ISP subscriptions are paid).

1997-08-22 **lawsuit defamation copyright industrial espionage theft**

Reuters

In August, the conflict between arch-rivals McAfee and Symantec hit a new high (or low) when McAfee sued Symantec for defamation and asked the courts for $1B in damages. Earlier in the year, Symantec had sued McAfee for alleged copyright violations found in the source code of McAfee's VirusScan. In August, McAfee issued a press release asserting that a programmer had downloaded the 100 lines of code in question from the Internet — and that they were thus not stolen by McAfee from Symantec. The next morning, some enthusiastic hack at Symantec announced in _their_ press release that "McAfee confirms that VirusScan contains misappropriated Symantec code." Within hours, the happy lawyers at McAfee had launched their client's lawsuit for defamation.

1997-10-03 **intellectual property law**

Wired

Evan Brown used to work for DSC Communications of Texas. He thought up a neat method for reserve engineering executable code by decompiling it into higher-level languages. DSC started off offering him a partnership, but then withdrew the offer and inisted on his giving them his idea for free, citing his employment agreement. Brown argued that his idea was thought up off company premises on his own time and has nothing to do with his job or his (now former) employer's business. They were off to court in Novermber.

Category 4B *Intellectual property: patents, copyrights (law)*

1997-10-09 **intellectual property law Web**

Wired

Intellectual property lawyers have been chasing down amateur Web sites where fiction refers to characters from copyright works. The "fan fiction" tradition takes well-known characters such as the crew of the Millennium Falcon from Star Wars and places them in new fiction, some of it good, some of it bad. The owners of the copyrights generally dislike this uncontrolled use of their creations, so many fans have been getting lawyers' letters telling them to cease and desist. The information-wants-to=be-free crowd protests this rigid interpretation of the existing laws, urging owners to give up their rights for the public good.

1998-05-10 **intellectual property copyright fair use law bill US**

RISKS 19 73

The WIPO Copyright Treaties Implementation Act (H. R. 2281) was introduced in the US Congress. Supported by the Administration, the bill would define a new crime, "circumvention," consisting of any attempt to bypass copy-protection schemes. One possible implication of such a law would be that supplying false information on Web forms in order to access free information would become a criminal offense. Another issue is reverse engineering, which would also be made illegal — with unknown consequences for the software industry. This bill, also known as the Digital Millennium Act, was approved unanimously by the House Commerce Committee on 7 July. The House Judiciary Committee was evaluating a different version of the same bill.

A related bill, the Collections of Information Antipiracy Act (H.R. 2652) would allow compilers of information to copyright the facts themselves, something currently impossible under copyright law. For different views on these issues, see the Digital Future Coalition's (opponents') site at <http://www.dfc.org/> and the Creative Incentive Coalition (proponents') site at <http://www.cic.org/>.

1999-07-29 **software license restrictions antivirus virus copyright reverse engineering testing commercial law shrink-wrapped contract law bill proposal**

Red Rock Eater News

In July, the National Conference of Commissioners on Uniform State Laws (NCCUSL) approved the controversial UCITA (Uniform Computer Information Transactions Act) proposal that would create common licensing rules for software and other IT transactions. The law applies to product
licenses and covers all aspects of modern IT, including data, databases, multimedia files, online transactions and software licenses. Among other protections for vendors, the UCITA provides for
* rigid enforcement of shrink-wrapped licenses even though the buyer may not see or agree to the terms until after the software has been purchased;
* banning reverse engineering of proprietary software;
* allowing vendors to shut down software remotely if they suspect a violation of the licensing terms;
* easier disclaimer of written warranties.
On 1999-06-10, the Business Law Section of the American Bar Association issued a blistering attack on the proposal. Staff of the Federal Trade Commission also submitted a brief opposing the UCITA on grounds of consumer protection and potential damage to competition. The ACM strongly opposed the proposal, and its President commented that theoretically, the UCITA would make anti-virus software illegal because viruses, which are automatically copyrighted by their authors, could no longer be reverse engineered. The Newspaper Association of America and the Magazine Publishers of America also formally opposed the UCITA, saying that the proliferation of different state rules on intellectual property would make their operations unwieldy by distinguishing between print and online media.

NewsScan, CNet http://news.cnet.com/news/0-1007-200-2419316.html

The new Stephen King novel, published on the Web with a request that at least 75% of downloaders send the author $1 for the privilege, may well change the way all sorts of intellectual property is marketed, says R. Polk Wagner, a Penn law school professor. "Traditional intellectual property theory holds that producers (that is, King) won't produce unless they have the ability to restrict the access of others to their goods. Here King is doing two significant things: First, he's only asking 75 percent of the people to pay him, thereby engaging in an unusual form of price discrimination where only those who feel the moral pressure to contribute will do so. That is, King acknowledges that not everyone will pay. Second, he's explicitly asking people to pay for his future services. The traditional theory of intellectual property would not consider this possibility. Classic intellectual property theory holds that producers must get paid for the works they've already created, not works they've yet to produce." The result could be troubling for publishers, who depend on the sacredness of intellectual property for their livelihood. "If Stephen King, one of the 'poster boys' of the intellectual property industry, doesn't need intellectual property (protection) anymore, what does that mean for intellectual property generally?" (Knowledge@Wharton 3 Aug 2000)

2000-08-04 **intellectual property IP royalties Web publishing freelance writers**

NewsScan, Hollywood Reporter
http://www.hollywoodreporter.com/archive/hollywood/current/webwatch/webwatch06.asp

The National Writers Union's executive board . . . reached an agreement with Contentville, an online reseller of text-based "content," that will give freelance writers a 30% cut of the fees paid by Contentville customers. Royalties would be distributed through the NWU's Publication Rights Clearinghouse. Contentville sells, for a small fee, "books, magazines, e-books, academic works, transcripts, archived articles, scripts or anything else that qualifies as brain food." The truce signals a new desire on the part of Internet publishers to settle the messy issue of electronic posting of written works that were created under agreements that did not expressly provide for e-publication. The issue has rankled the freelance community as many heavy-handed media companies have for the last few years required freelancers to sign contracts that allow electronic republication of their work without additional compensation. Last September, a U.S. federal appeals court ruled that publishers can't include work by freelance writers in their electronic databases without the writers' permission. Among the companies that had fought the federal case were The New York Times Co., Newsday, Time Inc. Magazine Co., University Microfilms International and Mead Data Central Corp. The Times and Time Inc. have said they will appeal the decision to the Supreme Court. (AP/Hollywood Reporter 4 Aug 2000)

The sale of Press Association virtual newscaster Ananova to wireless operator Orange for $143 million signals a new era for virtual reality, in which electronic virtual assistants, or EVAs, are poised to assume the roles of customer service representatives, celebrity spokespersons and shopping assistants. Digital Animations Group, the Scottish creators of Ananova and her successor, TMmy, is gearing up to market similar EVAs to online businesses that want to present a more "human" front. "It is our belief that virtual characters are going to dominate as personal assistants, presenters and even games celebrities," says Digital Animations CEO Mike Hambly. Meanwhile, U.K.-based Stratumsoft believes that EVAs based on real people have more potential. One possibility cited is supermodel Claudia Schiffer: "We could create a body scan of her, then produce an EVA based on her personality. As a marketing device, you would then have a celebrity available 24 hours a day on the Web site to 'chat' to fans and promote your product as part of your advertising campaign." What's not yet clear in all this is who would own such characters — the brand or the "real" celebrity? (Financial Times 17 Aug 2000)

Music industry officials say the only way to combat music piracy is to develop their own universal platform for selling music online. "We need an open system where all our music is available; we can't leave it to Napster or Gnutella," says Rudi Gassner, a board member for Germany's Edel Music. According to BMG Entertainment exec Thomas Stein, within five years, Internet sales will account for 50% of the music retail business, compared with 3.4% today. Meanwhile, Bertelsmann CEO Thomas Middelhoff says music companies need to digitize their back catalogues, secure the legal rights to sell their music online, and synchronize their technical standards. "We have to sit down — without the entertainment lawyers — and come to an agreement." (Hollywood Reporter 21 Aug 2000)

2000-09-05 **intellectual property IP licensing copyright royalties government proposal law regulation tax**

NewsScan

The German government is considering levying a fee on manufacturers of computer and telecommunications equipment that can be used to duplicate protected works. The fee would be used to compensate authors and other copyright holders. Included under the amendment would be such devices as CD burners, computer printers, hard drives and high-speed modems that facilitate large file downloads. Such fees are already levied on copy machines. Industry officials have denounced the plan, which they say would raise the price of such devices by 30% in Germany. A Hewlett-Packard executive told the Berliner Zeitung that many companies would simply move their operations out of Germany if the tax is passed. (AP/San Jose Mercury News 5 Sep 2000)

2000-10-27 **copyright intellectual property ruling limitations libraries filtering censorship censorware**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB972602565773912484.htm

In a step toward revamping traditional copyright law to reflect the realities of the digital age, the federal Copyright Office has issued a ruling backing companies' rights to limit access to their content when it is made available on the Internet. The decision came as part of new federal law that makes it illegal for Web users to hack through software that copyright holders use to protect books, films, music and other digital content. Congress had left it to the Copyright Office to create any exemptions that might be needed to facilitate access by libraries and universities. The two exemptions allowed are minor in scope: one enables users of filtering software to access the lists of Web sites being filtered, and the other gives people the right to bypass malfunctioning security features of software and other copyrighted goods they have purchased. The decision came as a blow to libraries and universities because it gives copyright holders a whole new level of protection, which they fear could limit their ability to use materials in digital format. An American Library Association official said the decision will "significantly impede efforts for libraries to continue to provide information in the digital age." (Wall Street Journal 27 Oct 2000)

2000-12-11 **intellectual property copyright fees music government regulations broadcasting Webcasting**

NewsScan, Hollywood Reporter
http://www.hollywoodreporter.com/music/index.asp?ee

[In late November, the] U.S. Copyright Office. . . [began] considering whether radio stations must pay record companies when the stations use their Web sites to offer music over the Internet. The radio industry . . . [was] not happy about the possibility. Dennis Wharton of the National Association of Broadcasters said: "What the music industry is trying to do is saddle broadcasters with new fees that Congress has always exempted us from paying. It could cost broadcasters millions of dollars and would probably cripple or seriously impair the streaming of radio signals over the Internet." (Bloomberg/New York Times 27 Nov 2000)

[In early December, the] recording industry won a victory . . . when the U.S. Copyright Office ruled that Webcasting by radio broadcasters constitutes a second performance of artists' copyrighted works and does not merit the same exemption from royalty payments accorded to traditional over-the-air programming. "Transmissions of a broadcast signal over a digital communications network such as the Internet are not exempt from copyright liability," the Copyright Office wrote. Broadcasters had argued that their Webcasts were exempt because they are "nonsubscription" transmissions licensed by the FCC that serve local communities, but the Copyright Office rejected that argument, pointing out that, in fact, Webcasts exceed "the geographic limits established for broadcast under the FCC license." The decision could mean millions of dollars in royalty fees that companies like Bertelsmann, Universal and Warner Bros. would collect from broadcasters. (Hollywood Reporter 11 Dec 2000)

EUROPEAN PARLIAMENT OKAYS PRIVATE COPYING OF DIGITAL WORKS
The European Parliament has issued a preliminary decision to extend, with some limitations, the private copying permissible in the analog world to digital media. New-media companies, consumer-electronics makers and citizens' rights groups applauded the decision to reject all but 16 of a record 197 proposed amendments to the EU's Copyright Directive, which faces a full vote next week. Among the amendments approved was a provision allowing copyright owners to employ technical protection measures, such as encryption, to prevent their works from being pirated. Copies could, however, be made "by a natural person for private use and for ends that are neither directly nor indirectly commercial." Fair practice lobbyists said the final version represented a reasonable compromise: "Everybody gained something and everybody lost something," said the head of the European Digital Media Association. The music industry, however, was more critical of the decision: "Private copying really has to be fore the private circle," said the European regional director of the Federation of Phonographic Industries. EUROPEAN PARLIAMENT BLOCKS SONG SWAPS
The European Parliament has okayed rules that will block companies such as Napster from operating in the 15-member bloc without authorization from recording artists. Wednesday's ruling compromised between extreme measures suggested by both sides on the issue, and seeks to ease record companies' concerns over piracy while at the same time allowing individuals to continue making a limited number of copies for personal use. Publishers and music and film producers will, for the first time, be allowed to use "technical protection measures," including encryption, to prevent unauthorized copying. Enrico Boselli, who guided the legislation through the parliament, noted that the Copyright Directive was badly needed "to set clear rules for consumers, consumer-electronics manufacturers, Internet service providers and others. Copyright owners now have wider protection here than in the U.S." (Wall Street Journal 15 Feb 2001)

E-MAIL SHARING BANNED BY LAW IN AUSTRALIA
Forwarding e-mail to friends, family or colleagues without permission from the sender is now illegal in Australia, thanks to a new law that took effect yesterday. Penalties for violation could be as much as five years' jail time or fines of AU$60,000 (US$31,400). The motivation behind the law is copyright protection for the sender of the original e-mail. But in addition to material that already has copyright protection, such as excerpts from books or song lyrics, the new measure also affects personal messages. "It's quite possible that the forwarding of an e-mail could be a technical infringement of copyright," says a legal advisor for Australia's attorney general. "E-mailing something is a 'communication' under the Digital Agenda Act and so is putting something up on a Web site." This new interpretation means a simple e-mail about office gossip or holiday plans also carries personal copyright protection. It is estimated that 5 million or more e-mail messages are forwarded around Australia every day. (The Sunday Telegraph 4 Mar 2001)

COPYRIGHT BATTLE ERUPTS OVER E-BOOKS [6 May 2001]
Bertelsmann's Random House and startup Rosetta Books will square off this week in a court battle that could have as much influence on the future of publishing as Napster had on the music industry. Random House is pursuing its claim that authors who sign over the rights to publish their works in "book form" before the existence of the Internet also granted the rights for e-publications. Rosetta Books had contracted directly with a group of authors, including William Styron and Kurt Vonnegut, for the electronic publishing rights to some of their Random House titles, which it says are not included in the print contracts. E-books are poised to become the third branch of online copyright disputes, which are already causing upheaval in the music and film industries. The music industry has pressured Napster to add filters to its popular file-sharing service, and the film industry last week announced plans to go after Gnutella users who traffic in pirated movies. (CNet News.com 6 May 2001)

RADIO STATIONS HALT STREAMING OVER ACTOR DISPUTE [21 Apr 2001]
Hundreds of commercial radio stations have put a stop to Internet broadcasts, prompted by a dispute with the actors on commercials who want to be paid extra to have their voices streamed online. The American Federation of Television and Radio Artists (AFTRA) says the stations have known for months that they were responsible for paying the actors, and are shutting down to avoid paying record labels and artists, who also want extra payments for streamed broadcasts. Four of the largest U.S. commercial radio companies -- Clear Channel, Citadel Broadcasting, Emmis Communications and Jefferson Pilot Communications -- ended their real-time audio feeds last week. "We are working hard to resolve outstanding issues with all concerned parties," says Clear Channel CEO Kevin Mayer. "It is our intention to put the streams back up when it makes legal and financial sense." Mayer says his company is looking into technology that could strip the commercials out of the streams. (AP 21 Apr 2001)

COURT BACKS ONLINE RADIO RULING [2 Aug 2001]
The broadcasting industry suffered a setback Wednesday when a U.S. district judge threw out a challenge to the U.S. Copyright Office, which ruled last year that radio stations must pay additional royalties to stream music over the Internet. The National Association of Broadcasters responded that the ruling would upset a long-standing, mutually beneficial relationship between the broadcasting and recording industries. "Broadcasters currently pay in excess of $300 million annually in music licensing fees to compensate songwriters and music publishers. Any additional fee to compensate record companies would be unfair and unreasonable," said NAB president and CEO Edward O. Fritts. The ruling was hailed as a victory by the Recording Industry Association of America. "Any licensing fees that these companies would be paying would pale in comparison... to the cost to stream their signal over the Internet," said RIAA senior VP Steven M. Marks. (AP 2 Aug 2001)

US REGULATORS FOCUS ON ONLINE MUSIC COPYRIGHT LAW [30 Aug 2001]
Questions on copyright laws for online music have been raised by Web companies, which contend that vague rules have enabled music publishers to seek multiple royalty payments that could stymie their fledgling industry. Currently, music publishers get paid in two ways: once when songs are performed and once when they are recorded. Some publishers have argued that they should be paid in both ways whenever Web users choose to hear a song online. The U.S. Copyright Office has therefore asked Congress to pass legislation that stipulates payment rules. The Copyright Office says online music services shouldn't have to pay royalties on "buffer" copies of songs that enable smoother audio streaming, and contends that when Web companies sell music downloads, they shouldn't have to pay a performance fee. The Digital Media Association characterized the Copyright Office's stand as a "home run," but music publishers were concerned that the recommended rules "may not adequately protect creators or copyright owners." ONLINE USE OF FREELANCE WORK TO BE DECIDED BY COURT [28 Mar 2001]
The U.S. Supreme Court is hearing a case about whether freelance authors are entitled to receive additional compensation when their articles are incorporated into electronic databases and commercial CD ROMs. On the side of the writers: organizations such as the American Library Association and the Association of Research Libraries. On the publisher side: the New York Times, Newsday, Time, AOL Time Warner, the Washington Post, Gannett, Lexis/Nexis, and UMI. The central issue is whether a published article entered into an archival database is a mere "revision" of the original work (in which case the publisher wins, since it has already paid for the work once), or whether the article must be considered an entirely new product (in which case the author wins). The writers argue that the search capabilities of databases give publications completely new and separate lives, for which the authors should get completely separate compensation. (Washington Post 28 Mar 2001)
http://washingtonpost.com/wp-dyn/articles/A1815-2001Mar27.html

FREELANCE WRITERS VS. PUBLISHERS [28 Mar 2001]
The U.S. Supreme Court heard oral arguments yesterday in a case that will decide what rights freelance writers have when their work is incorporated into electronic databases. Representing the publishers, Laurence H. Tribe insisted that an article is not made into something new just by being incorporated into a database, it is a mere "revision" of the original article that the publisher has already paid for and shouldn't have to pay for again. Representing the freelance writers, Laurence Gold argued that when publishers put articles into the "undifferentiated mass" of an electronic database they "are creating a quite different work." (New York Times 29 Mar 2001)
http://partners.nytimes.com/2001/03/29/technology/29WRIT.html

COURT SIDES WITH WRITERS OVER COPYRIGHT DISPUTE [26 Jun 2001]
In a blow to big media firms, the U.S. Supreme Court ruled Monday that freelance writers may control whether articles they write for print publication can then be reproduced in electronic form. Large publishers have argued that if they have to renegotiate over electronic publication rights, they probably will remove a substantial amount of material from their electronic databases. "Historians, scholars and the public lose because of the holes in history created by the removal of these articles from electronic issues of newspapers such as the Times," said New York Times chairman Arthur Sulzberger Jr. The ruling will affect primarily content written before the mid 1990s, which most publishers updated their contracts to include electronic as well as print publishing rights. The National Writers Union, however, estimates a range of potential liabilities between $2.5 billion and $600 billion. The decision in this case could have broad ramifications in similar disputes in the book and music publishing businesses. (Wall Street Journal 26 Jun 2001)

LIBRARIANS LEFT TO CLEAN UP ELECTRONIC DATABASES [29 Jun 2001]
In the wake of the recent Supreme Court ruling over freelancers' right to control distribution of electronic versions of their work (Tasini et al. vs. the New York Times et al.), publishers are deleting tens of thousands of freelance articles spanning decades. And who gets stuck with the job? "The librarians, of course," says Tim Rozgonyi, assistant technology systems editor for the Pittsburgh Post-Gazette. "The librarians will save the publishers' bacon by cleaning up the data... [The] Tasini [decision] is the closest thing to a lifetime employment guarantee for news librarians that you will ever see." Meanwhile, some newspapers are turning back to microfilm, which is exempt from the ruling, to digitize a complete archive of their collections. But microfilm could prove another source of legal contention in the future. "The royalty potential [of digitizing over 100 years of microfilm] is massive," says Tampa Tribune archive and research manager Jody Habayeb. Some archivists have suggested that publishers could post citations only, rather than the full text of articles that don't comply with the Tasini ruling, but others argue that most users don't want to have to go through a third party to find an article online. "I hate to see it go that way, but it's an option," says Habayeb. "The beauty of the Internet is the immediacy of it." (Wired.com 29 Jun 2001)
http://www.wired.com/news/culture/0,1284,44905,00.html

NY TIMES "SOLUTION" NOT WHAT FREELANCE WRITERS HAD IN MIND [6 Jul 2001]
A Pyrrhic victory for freelance writers? Maybe. After the U.S. Supreme Court ruled last week that the New York Times (and two other publishers) had violated the rights of freelancers by not paying them new compensation for old material made accessible in electronic databases, the Times decided simply to remove the disputed material entirely. Characterizing the newspaper's action as a "complete violation of the spirit of the Supreme Court decision," the writers are insisting that "there is no need to delete articles" and are filing a new lawsuit. They say they want their works to remain in the databases, and merely want to be receive what they consider appropriate compensation. (New York Times 6 Jul 2001)
http://partners.nytimes.com/2001/07/06/technology/06WRIT.html

JOURNALISTS WIN ANOTHER CONTEST OVER DIGITAL RIGHTS [10 Oct 2001]
The U.S. Supreme Court has refused to hear an appeal by National Geographic after an appellate court sided with a photo journalist who sued the publication for including his work in CD-ROM form without his permission and without offering him additional payment. The freelancer's photographs had appeared in the National Geographic over three decades. (San Jose

Mercury News 10 Oct 2001)
http://www.siliconvalley.com/docs/news/svfront/072212.htm

GROUPS REACH TENTATIVE DEAL ON WEBCAST ROYALTIES [17 Dec 2001]
Attorneys representing radio broadcasters, record labels and music artists have signed a tentative settlement in an ongoing dispute over whether radio broadcasters owe additional royalty payments when they put their stations' programming online. If the deal is finalized, it could be an important step toward resolving the tangle of legal issues surrounding online music. Radio companies currently do not pay recording firms royalties on songs they broadcast over the airwaves and have argued that the exemption should apply to online "Webcasts" as well. That issue is now on appeal. The current agreement depends on the U.S. Copyright Office to support arbitration to resolve the question of a royalty rate to be paid by Internet-only Webcasters who offer music online but don't own any radio stations. HOLLYWOOD, HIGH-TECH CLASH OVER PIRACY PROTECTION [1 Mar 2002]
The heads of several media and high-tech companies squared off yesterday before a panel of Washington lawmakers, presenting conflicting views of what should be done about digital copyright protection. The hearing was focused on legislation to be sponsored by Senate Commerce Committee Chairman Ernest Hollings (D-S.C.) that would require computer makers and consumer-electronics manufacturers to imbed copyright-protection technology in all of their products. The bill is backed by content providers, such as Walt Disney and News Corp., who accused the high-tech industry of hypocrisy in their opposition to technical safeguards for entertainment content. "They work hard to protect their own intellectual property. I would just like them to work modestly to protect the intellectual property of another industry," said Disney CEO Michael Eisner. Meanwhile, computer makers said it was unfair to place the burden of developing and installing copyright protection technology on them, warning that such technology could make it more difficult for consumers to legally record TV shows or music. "The focus in this debate needs to change from content protection to consumer protection," said Intel executive VP Leslie Vadasz. (Wall Street Journal 1 Mar 2002)

DIGITAL COPYRIGHT TREATY GOES INTO EFFECT
A landmark international copyright treaty, negotiated by the World Intellectual Property Organization in 1996, takes effect today [March 6, 2002] amid controversy over whether tougher copyright rules encourage or inhibit intellectual creativity in cyberspace. A companion treaty specifically protecting digital music goes into effect in May. Both treaties outlaw attempts to circumvent encryption and other techniques used to prevent unauthorized copying and to ensure royalty payments. The treaties have been criticized by civil liberties advocates who claim the prohibitions will stymie freedom of speech on the Net, but their views have met little sympathy either in the U.S. or abroad. WIPO Director General Kamil Idris says the treaties will provide a secure platform for creators to further exploit the Internet with confidence. (Financial Times 6 Mar 2002)

AMAZON, BARNES & NOBLE SETTLE 1-CLICK DISPUTE
Amazon and Barnesandnoble.com have settled their long-running patent infringement lawsuit. Terms of the settlement were not disclosed. The lawsuit, filed by Amazon in 1999, alleged that Barnesandnoble.com used a customer checkout procedure that violated Amazon's patent on its "1-Click" checkout technology. The lawsuit was assailed at the time by critics who opposed "business method" patents granted for overly broad and unoriginal concepts. "Patents such as yours are the first step in vitiating the Web, in raising the barriers to entry not just for your competitors, but for the technological innovators who might otherwise come up with great new ideas that you could put to use in your own business," said technical publisher Tim O'Reilly in a letter to Amazon CEO Jeff Bezos. Bezos eventually suggested that business method patents should be limited to a three- to five-year life span, rather than the standard 20 years for patents. (Wall Street Journal 7 Mar 2002)

E-PUBLISHER WINS ROUND TWO IN COURT
E-publisher RosettaBooks won a second legal round against Random House when a three-judge panel unanimously upheld an earlier ruling rejecting Random House's request for a preliminary injunction against Rosetta. RosettaBooks is selling electronic versions of Kurt Vonnegut's "Cat's Cradle" and seven other old Random House titles. RosettaBooks had reached contractual agreements with the authors or their representatives regarding the rights to electronic publishing, but Random House has argued that electronic rights are not implicit because e-books are simply another version of a paper book. A RosettaBooks victory in the case would open the doors for hundreds of old titles to become available in electronic versions. (AP 11 Mar 2002)

HOLLINGS OFFERS BILL TO STOP ILLEGAL MUSIC AND VIDEO SHARING
Senator Ernest Hollings (D., SC) has introduced legislation that would require computermakers and Hollywood producers to agree on a technical standard that can be used to prevent computers and other devices from playing copyrighted digital files without permission. Media companies (such as Disney) favor the legislation, which protects their intellectual property, but computer and equipment companies (such as Intel) oppose it because it would restrict the functionality of new products. A Hollings aide says that the legislation respects traditional "fair use" rights for personal use. (Reuters/USA Today 22 Mar 2002)

KAZAA JUDGMENT OVERTURNED BY DUTCH COURT
A Dutch appeals court has ruled that KaZaA, which makes software that enables users to download music, videos and other copyrighted material, is not liable for copyright infringement. The decision overturns a judgment rendered last November, which found KaZaA guilty of violating copyright law. The appellate court ruling maintains that it's the users of KaZaA's Media Desktop software who are the infringers, and adds that Media Desktop was not exclusively designed to pirate copyrighted works. RISKS 22 05

A chorus of protest arose over comments by television industry officials who criticized viewers who skip over commercials on TV (this was in connection with the TiVo digital recording device which allows such shocking behavior). Analogies included suggestions that anyone failing to read all the advertisements in a newspaper or magazine should be prosecuted; that deep linking should be outlawed and everyone should have to start at a home page and navigate according to the Web owners' intentions; and that blocking or even ignoring pop-up ads should also be criminalized.

A 'CREATIVE COMMONS' FOR INTELLECTUAL PROPERTY
A new nonprofit organization called "Creative Commons" is being formed by a group of law and technology scholars who want to encourage owners of intellectual property to donate some of their material to the public domain. Their first goal is to create a set of licenses that would clearly state the terms under which the public would be invited to copy a particular work and to make such works easy to identify and search for on the Web. The chairman of Creative Commons is Stanford law professor Lawrence Lessig, an intellectual property expert. (New York Times 13 May 2002)

WEBCASTERS SPARED EXTRA ROYALTIES
Associated Press / Wired

The Librarian of Congress has rejected proposed royalty rates that would have charged Internet broadcasters based on each Web user that listens in. Librarian James H. Billington will issue a final decision setting the new rates by June 20, the U.S. Copyright Office said Tuesday. The Copyright Office ruled in December 2000 that organizations distributing music and other radio content over the Internet must pay additional fees to record companies that hold song copyrights. In February, an arbitration panel proposed rates based on each person who is receiving a broadcast sent online. The rates ranged from .07 of a penny per song for a radio broadcast to .14 of a penny for all other copyrighted audio sent on the Internet.

NETWORKS REALLY WISH YOU'D WATCH THE COMMERCIALS
A survey from NextResearch reports that 20% of the people who own digital video recorders (DVR) from TiVo or Replay TV never watch any commercials -- a finding that is scaring the advertising and broadcasting industry. Jamie Kellner of Turner Broadcasting warns that if DVR technology destroys the economics of paid advertising, the result will be the rapid expansion of pay-TV: "The free television that we've all enjoyed for so many years is based on us watching these commercials. There's no Santa Claus. If you don't watch the commercials, someone's going to have to pay for television and it's going to be you." And Daniel Jaffe of the Association of National Advertisers concurs: "You start losing marginal dollars when people who you thought you were buying are not viewing. This is not just a theoretical problem that might be happening somewhere down the line. This is happening now." What should advertisers do? Mollie Watson, a product manager for Best Buy, thinks their only hope is to do a better job and "put advertisements out there that people are actually going to choose to watch." Apparently there are such things. (New York Times 23 May 2002)

COMCAST SUED OVER WEB RECORDINGS
Comcast Corp., the nation's third-largest cable company, is being sued in U.S. court in Michigan over accusations it violated a federal privacy law when it recorded the Web browsing activities of each of its 1 million high-speed Internet subscribers. Lawyer Steven Goren of Bingham Farms, Mich., filed a class-action complaint against Comcast and its cable subsidiary Tuesday. Goren, who predicted "months or years" of litigation, is seeking attorney's fees plus damages of at least $100 per day for every Comcast subscriber during the period from December to Feb. 13, when Comcast pledged to stop the practice.

WEB RADIO ROYALTY RATE CUT IN HALF
Librarian of Congress James H. Billington has reduced the proposed royalty rate to be paid by Internet-only radio stations to 0.07 cents per song per listener -- half of the rate proposed by arbitrators last February. The rate now matches that proposed for traditional radio stations that also put their broadcasts on the Web. It will remain in effect only until the end of this year, when a new, as-yet-undetermined rate is supposed to take effect. The new, reduced rate came under fire from both sides, with Webcasters complaining it was still too high, and the Recording Industry Association of America arguing that it meant that "artists and record labels will subsidize the Webcasting businesses" of big Internet and radio companies, and that the fee "simply does not reflect the fair market value of the music as promised by the law." On the other side of the issue, the National Association of Broadcasters said the rate "places a prohibitive financial burden on radio-station streaming and will likely result in the termination of this fledgling service to listeners." (Wall Street Journal 21 Jun 2002)
http://online.wsj.com/article/0,,SB1024608353756633200.djm,00.html

EDUPAGE editors added the following information:

WEB RADIO FEES SET
A final schedule of fees that radio stations must pay record companies for playing music online has been released by James Billington, the Librarian of Congress. College radio stations claim that the fees are too high and will put them out of business, while the Recording Industry Association of America say they are too low and don't fairly recompense artists and recording studios. The fees are two-hundredths of a cent per listener per song for noncommercial stations and seven-hundredths of a cent for commercial radio stations. A minimum fee of $500 per year will be assessed on all radio stations that play music online, and the fees are retroactive to October 1998, when the Digital Millennium Copyright Act took effect. PUBLISHERS SUE WEB SITE FOR MISAPPROPRIATING THEIR ADS
A group of major U.S. publishing companies, including the Washington Post Company and the New York Times Company, is suing Gator Corp., a Web site operator based in Redwood City, California, for taking ads on the publishers' Web sites and reselling them on Gator sites without authorization. The publishers say the misappropriation amounts to unfair competition with them, since Gator's competing offer to advertisers makes it harder for publishers to sell ads themselves. (Washington Post 27 Jun 2002)
http://www.washingtonpost.com/wp-dyn/articles/A52132-2002Jun26.html

PUBLISHERS WIN ONE AGAINST GATOR
Federal Judge Claude Hilton on Friday granted a motion for a temporary injunction that will force software firm Gator to stop displaying pop-up advertising over Web publishers' pages without permission. The ruling came in response to a lawsuit filed last month by The Washington Post, The New York Times, Dow Jones and seven other publishers, which alleges Gator's ads violate their copyrights and steal their revenue. The suit seeks a permanent injunction against Gator's ads and monetary damages for any advertising revenue derived from the publishers' Web pages. Gator develops software that manages passwords and fills out forms for about 10 million Web surfers who often download the application unwittingly through other popular file-sharing programs. Bundled in the software is a program called OfferCompanion that monitors the user's surfing habits and delivers targeted pop-up ads based on that information. For instance, if a surfer visits Toyota.com, Gator might launch a pop-up ad for Ford Motor. According to the lawsuit, Gator is "essentially a parasite on the Web that free rides on the hard work and the investments of plaintiffs and other Web site owners. In short, Gator sells advertising space on the plaintiffs' Web sites without their authorization and pockets the profits from such sales." (CNet News.com 12 Jul 2002)

DIGITAL ALTERATIONS IN 'SPIDER-MAN' OKAYED AS FREE SPEECH
A federal judge in New York has thrown out a lawsuit filed by billboard and building owners against Sony and other companies involved in making and distributing the movie "Spider-Man," saying that digital alterations of the billboards in Times Square for the movie are protected free speech. "What exists here is for artistic purposes a mixture of fictionally and actually depicted Times Square? this has First Amendment protection," ruled Judge Richard Owen. In the "Spider-Man" movie and trailers, ads for companies such as Cingular Wireless and USA Today were superimposed over those of Samsung and NBC. The judge also rejected claims that Sony's use of lasers to digitally film the buildings amounted to trespassing: "Light beams bounce off the plaintiff's three buildings day and night in the city that never sleeps," said Owen. The practice of altering real-life scenes for the purpose of film artistry or to satisfy marketing deals is becoming more common as digital technology makes it easy to do so. USA Today said it didn't pay for the advertising, but Cingular said it has a marketing deal with Sony tied to the film. (CNet News.com 6 Aug 2002)

WEB RADIO STATIONS OBJECT TO PAYING ROYALTIES
Told last month by a federal court that they would have to pay seven one-hundredths of a cent in royalties to record companies every time one of its listeners hears a copyrighted song transmitted over the Web, a group of radio stations led by the National Association of Broadcasters (NAB) and Clear Channel Communications is appealing that ruling to a higher court. The appeal challenges the right presumed right of the Copyright Office to set the royalty rates. (Bloomberg/New York Times 17 Jul 2002

ROYALTY FEES MAY BE THE DEATH OF INTERNET RADIO
All kinds of radio stations — both Web-based and traditional over-the-air broadcasting stations — have to pay copyright royalties to songwriter associations, but only the Web stations are required to pay a new performer's fee that goes to record companies. At a rate of seven-hundredths of a cent per song per listener, the fee is expected to undo the economic viability of almost all of the 10,000 Web radio stations now in existence. The 200 stations that have already ceased operations include nonprofit stations at UCLA, NYU, and other colleges and universities, and people seem to be punching different calculators to attack or defend what's going on: Congressman Rick Boucher (D, VA) is introducing a bill in support of small Webcasters and says its goal is "to make sure that Webcasters who measure their revenues in the tens of thousands are not put out of business by a copyright payment requirement in the hundreds of thousands."; using a different calculator, Hilary Rosen of the Recording Industry Association of America (RIAA) says that most college stations won't owe more than $500 a year, and adds, "Given our problems with digital piracy on university servers, it is almost comical that they have the nerve to complain about $500." (USA Today 21 Jul 2002)

WEBCASTERS LOBBY AGAINST ROYALTY ASSESSMENTS
Internet-radio proponents swarmed Capitol Hill Thursday to urge Congress to delay or lower the royalties they will have to begin paying record labels beginning Oct. 20. The webcasters have argued that the rates are too high for a new medium and are planning to appeal the rate of 0.07 cent per song per listener, which was set last June by the Librarian of Congress. The music companies are also appealing the rates, which they say are too low. The two groups are engaged in discussions in an effort to head off dueling lawsuits, but so far the talks have not produced a settlement. Some Internet radio firms and broadcasters have already shut down their webcasting operations, at least in part because of the upcoming royalty payment. "It was purely an economic decision," says the CEO of Jefferson-Pilot Corp.'s radio operations, which has stopped streaming 15 of its 17 stations online because of the fees. NEW COPYRIGHT BILL WOULD GIVE POWER TO THE PEOPLE
Rep. Rick Boucher (D-Va.) and Rep. John Doolittle (R-Calif.) have introduced legislation aimed at restoring specific fair use rights to copy digital works that were lost under the 1998 Digital Millennium Copyright Act, as well as bestowing "circumvention" rights to bypass copy protections when done "solely in furtherance of scientific research." The Digital Media Consumers Rights Act has drawn support from a broad coalition of electronics and computer interests, consumer groups and academics. "It's just time," said Consumer Electronics Association president Gary Shapiro. "Consumers have been pushed up against the ropes. This is the first time in 20 years in which consumers are going on the offense rather than on the defense." Meanwhile, entertainment groups bemoaned this latest development in the battle over digital media rights. "If this bill were to be enacted, content owners would be left with two unhappy choices: Protect their valuable works by not making them available in digital formats such as DVD, or lose all control over unauthorized reproduction and distribution," said Jack Valenti, president of the Motion Picture Association of America. The bill has no chance of passage this year, but will set the stage for debate in the next session of Congress. (Wired.com 4 Oct 2002)

COURT TO REVIEW COPYRIGHT EXTENSION LAW [20 Feb 2002]
The U.S. Supreme Court announced it will review a challenge to a 1998 law that extends by 20 years the lifetime of all existing copyrights and increases the lifetime of future copyrights from 50 to 70 years after the death of the creator. The legislation, called the Sonny Bono Copyright Term Extension Act, was named after the late Sonny Bono, congressman and former entertainer. Stanford University law professor Lawrence Lessig, an attorney for one of the groups seeking to declare the legislation unconstitutional, says the case is important "so that the next Walt Disney can do to Disney what Disney did to Grimm's fairy tales" — entirely transform material taken from the public domain. But the court likely will focus not on the substance of the law but on the issue of whether the law extends a copyright's duration far longer than what was envisioned by the framers of the Constitution. Wayne State University law professor Jessica Litman argues: "It's important for the Supreme Court to reassert that there's no copyright exception in the Constitution that Congress can do whatever it pleases. Congress has limited powers." Lawyers for the government insist that there are no legal precedents barring Congress from enacting the legislation. (Washington Post 20 Feb 2002)
http://washingtonpost.com/wp-dyn/articles/A35750-2002Feb19.html

COURT TO REVIEW COPYRIGHT-EXTENSION LAW [10 Oct 2002]
The U.S. Supreme Court has accepted the first copyright case in decades — a constitutional challenge to the Sony Bono Copyright Term Extension Act, which Congress passed in 1998 to extend copyright protections an additional 20 years. Under the law, creative works by an individual (such as Ernest Hemingway) are protected for 70 years after the person's death, and works by a corporation (such as the Disney Corp.) are copyright-protected for 95 years from the date of their creation. Stanford University law professor Lawrence Lessig told the court: "Just at the time that the Internet is enabling a much broader range of individuals to draw upon and develop this creative work without restraint, extensions of copyright are closing off this medium to a broad swath of our common culture." In rebuttal, the Solicitor General's position is that the issue is one that should be addressed to the legislature, not to the courts. (San Jose Mercury News 9 Oct 2002)

FILE-SHARING'S FATE HANGS ON BETAMAX RULING
Like the previous lawsuits that shuttered Napster and Aimster, the latest lawsuit brought by the major record labels against peer-to-peer file-swapping networks will hinge on a legal precedent set in 1984 when the Supreme Court ruled that Sony wasn't liable for copyright infringement because its Betamax VCRs had "substantial" legitimate uses as well as illegal ones. That argument proved insufficient in the earlier cases, in part because Napster and Aimster kept central directories of the files on users' computers, and were therefore in a better position to know what their users were doing. The companies now under fire — Morpheus, Kazaa and Grokster — don't maintain any central directories, and their lawyers say that means they have no way to monitor or control what their users do. However, to bolster their case, the companies behind Morpheus, Kazaa and Grokster are now encouraging copyright owners to use file-sharing technology as a legitimate promotional or distribution tool — for instance, by offering independent musicians the means to disseminate sample songs. In a joint brief Monday, however, the record companies indicated they're not fooled by that tactic and have reiterated their position that the companies should be held accountable for widespread piracy on their networks. "The Supreme Court in deciding the Sony case couldn't have intended to permit a massive system of infringement to be called exempt from the copyright law. It just defies reason to think otherwise," says one copyright expert. (Los Angeles Times 10 Sep 2002)

COURT HEARS ARGUMENTS AGAINST FILE-SWAPPING FIRMS
A federal court is scheduled to hear arguments by entertainment attorneys today, urging the judge to grant a "summary judgment" in their lawsuit against the Morpheus and Grokster file-swapping networks. The defendants have responded by asking that the case be dismissed and that they be allowed to distribute their software unmolested. If the case does go to trial, it will be the first time that any of the peer-to-peer companies have made it that far in the legal process — Napster and Madster (formerly Aimster) fell into bankruptcy before a full trial could be held. Legal experts agree that the copyright holders' case is potentially more influential than the suit against the now-defunct Napster, and that a full trial would set an important legal precedent for the technology community. Meanwhile, the file-swapping software remains popular: according to Download.com, Morpheus was downloaded nearly 400,000 times last week and Grokster 112,000 times. Kazaa, which the entertainment groups are hoping to add to the current lawsuit, remained the most popular, with more than 3.4 million downloads last week. (CNet News.com 2 Dec 2002)

RANDOM HOUSE, ROSETTA END QUARREL OVER E-BOOKS
Random House has settled its lawsuit against RosettaBooks over Rosetta's sales of electronic versions of eight popular titles, including Kurt Vonnegut's "Cat's Cradle" and William Styron's "Sophie's Choice." Rosetta will continue to publish the disputed works and will work with Random House on bringing additional titles to the e-book market. "We are very glad to be able to put our differences behind us and to now work collaboratively rather than combatively to enhance RosettaBooks' and our commitment to electronic publishing," said Random House senior VP Katherine J. Trager. The case has been watched closely by other publishers, but Wednesday's settlement leaves the core issue in the lawsuit unresolved — whether the rights to publish electronic versions of books are implied and therefore covered in contracts signed with authors in pre-Internet days. "The settlement seems neutral about rights ownership; it doesn't move things forward or back," says Paul Aiken, executive director of the Author's Guild, which represents thousands of published authors. EU COPYRIGHT LAWS SPAWN 'FREE-SWAPPING ZONE' FOR OLDIES
European and Canadian copyright protections for audio recordings last just 50 years, compared with 95 years in the U.S., a disparity that has spawned a boomlet in legitimate sales of golden oldies from 1950s artists, ranging from Miles Davis to Elvis Presley. The expiration of music copyrights overseas just adds one more piece to an antipiracy puzzle that is growing increasingly complex. "There are some implications for enforcement, creating an additional wrinkle," says Neil Turkewitz, executive VP for international affairs at the Recording Industry Association of America. "But it doesn't affect the legality of a U.S. user accessing a foreign hard drive and downloading a file." Record industry officials say they are keeping an eye out for the emergence of Web sites that offer archives of material that is in the public domain in a foreign country but still illegal to trade freely in the U.S. If a Web-based service comes online, it may be possible to block access to the site from the U.S. by going through ISPs, says Turkewitz. Trying to shut down peer-to-peer services would be more difficult, however, he acknowledges. That's part of the reason that the RIAA has been pressuring European policy-makers to extend their copyright protections to match those of the U.S., but so far those efforts have met with little success. TECH FIRMS, HOLLYWOOD HEADED TO NEGOTIATING TABLE
About 20 lobbyists representing technology and entertainment companies are headed for a closed-door meeting today to try to hammer out some of their differences in the long-running squabble over digital copyright. Companies and trade associations represented at the meeting will include: Microsoft, Verizon, the Business Software Alliance, AOL Time Warner, the Motion Picture Association of America and the Fox Entertainment Group. "We're pleased that so many people who are important players in this debate are willing to sit down with us to discuss the consumer perspective on digital copyright," says Alan Davidson, deputy director of the Center for Democracy and Technology, which is sponsoring the series of meetings. "We don't know what the outcome will be, but we're hopeful that we can make progress in representing what has been an underrepresented voice — consumers." Political tension between the two groups has increased significantly in the last year, which has resulted in an impasse. (CNet News.com 21 Nov 2002)

MUSIC, TECH GROUPS REACH COMPROMISE ON COPYRIGHT ISSUES
The Recording Industry Association of America, the Business Software Alliance and the Computer Systems Policy Project have hammered out a compromise agreement that they say will protect copyrights on music and movies without the need for further government intervention. The pact is intended to head off efforts by Congress to legislate the inclusion of government-approved copy restriction technology in all new "digital media devices." This latest agreement, described by participants as a "landmark consensus," politically isolates the powerful Motion Picture Association of America, which was noticeably absent from the negotiations. MPAA has aggressively advocated new government requirements for built-in locking controls on new devices, such as DVD players. (AP 14 Jan 2003)

2003-01-23 **copyright law intellectual property fair use**

NewsScan

COPYRIGHT LAW IS A TWO-WAY STREET
Robin Gross, head of the new watchdog group IP Justice and former Electronic Frontier Foundation attorney, says copyright holders are taking unfair advantage of new technologies to restrict use of their content: "Sure, (digital technology) makes it easier for people to copy and share works, but digital technology also makes it easier for copyright holders to restrict what people can do with their works. So it's not fair to say that this technology is very harmful to these industries because it's actually providing them with more power than they've ever had before to control what people can do with their works. That point is often overlooked — that they're controlling it to the point that they're taking away from the public side of the copyright bargain. So while it's not fair for consumers to copy and distribute copyright works in a fashion that doesn't compensate the creators, it's also not fair for the creators to use digital technology to take away the rights of the public. For example, making sure these works fall into the public domain at some point, or making sure that consumers are able to exercise their fair-use rights. It's simply not fair for the copyright holders to take all of the rights and have none of the responsibilities associated with copyright law." (CNet News.com 23 Jan 2003)

HIGH-TECH GROUP BATTLES HOLLYWOOD ON COPYRIGHT ISSUES
The Alliance for Digital Progress (ADP) — a new Washington, D.C.-based lobbying group whose members include Microsoft, Dell, Motorola and the Information Technology Association of America (ITAA) — will fight Hollywood's positions on access to digital music, movies, and books, and the entertainment industry's efforts to require anti-copying technology in digital entertainment devices. ITAA president Harris N. Miller says sarcastically that Hollywood leaders "would have organized to burn down Gutenberg's printing press, if they were alive during that period of rapid change and innovation." HOLLYWOOD THREATENED BY CONTENT-CLEANSING SOFTWARE
The entertainment industry is taking aim at new technology that has spawned a growing business dedicated to cleaning up movies and TV programs. On one side are a chain of video rental stores and a number of software companies that cater to an audience sick of gratuitous sex, violence and foul language in today's Hollywood offerings. On the other are film studios and the Directors Guild of America (DGA). The two groups are at legal loggerheads over software, such as MovieMask and ClearPlay, which filter out objectionable content, either by skipping certain frames entirely, or by substituting new dialogue, or in some cases by clothing naked actors or turning steel swords into light sabers. Last August, the owner of a Colorado "CleanFlicks" video store, which rents sanitized video tapes, fired the first volley by suing the DGA and asking a federal judge to declare the editing practices protected under federal copyright law. The following month, DGA filed a countersuit against CleanFlicks as well as the software companies that do the editing. Eight Hollywood studios have now joined DGA's fight, alleging that the companies violated trademark law when they rent or sell an altered movie in the original packaging. Meanwhile, moviemakers warn that the same software used to sanitize content could also be used to spice up G-rated fare. "It's a double-edged sword," says Jack Valenti, head of the Motion Picture Association of America. "If there are people who want to do it for benign reasons, that's one thing. But they can take 'Spider-Man' and make it into a pornographic movie, and that's a problem." A hearing on the CleanFlicks case is scheduled for Feb. 14. (AP 3 Feb 2003)

2003-02-21 **copyright intellectual property music P2P peer-to-peer swapping piracy international court ruling**

NewsScan

MUSIC INDUSTRY THREATENED BY DUTCH RULING
A court ruling in the Netherlands last March appears to provide legal protection for businesses that enable peer-to-peer services, where users can swap copyrighted songs and movies for free. The Dutch decision is being appealed, but the ruling demonstrates the breadth of the challenge facing music companies and other owners of copyrighted works as more P2P providers move their operations overseas. Still, record-label officials maintain that the Netherlands ruling was an aberration that will be reversed in the appeals process, noting that courts in South Korea and Japan have ruled against P2P services in copyright cases. "We intend to enforce our rights not just in the United States, but worldwide," says Cary Sherman, president of the Recording Industry Association of America. Meanwhile, when U.S. courts side with the music industry, as in last month's federal ruling against Sharman Networks, which is based in Vanuatu and offers Kazaa file-swapping software, the question of enforcement looms large. "How are they going to enforce" the judgment, questions one of Sharman's lawyers. And even in the Netherlands case, a U.S. judgment isn't automatically enforced, says Tim Kuik, director of Brein, a Dutch foundation that deals with copyright enforcement, but would probably have to go through a separate Dutch court proceeding. (Wall Street Journal 21 Feb 2003)

2003-03-11 **intellectual property copyright copying consumer rights bill proposed legislation**

NewsScan

BILL AIMED TO PROTECT CONSUMERS' DIGITAL MEDIA RIGHTS
New legislation called the "Digital Choice and Freedom Act" is being introduced in Congress by Zoe Lofgren (D-Calif.) to ensure that consumers may legally copy CDs, DVDs, and other digital works for their personal use, just as they do now with TV shows and audio tapes. Paula Samuelson, a law professor at University of California-Berkeley's Boalt Hall, says: "Lofgren's bill aims to restore what Congress thought it was doing [when it passed the 1998 Digital Millennium Copyright Act] — preserving fair use for people who have lawful rights to use stuff. The Lofgren bill offers meaningful protections for a number of ordinary activities by consumers that should be lawful under copyright law but about which the law is presently ambiguous." (San Jose Mercury News 1 Oct 2002)

LEGISLATION TO ESTABLISH DIGITAL COPYING RIGHTS
Rep. Zoe Lofgren (D, CA) is reintroducing legislation called the Balance Act, intended to give people the right to make back-up copies of copyrighted digital works for use on other devices (such as car CD players) and to protect consumers who break technological locks in order to view DVD movies on their computers. Lofgren says, "Most people — at least, most adults — don't expect to get content as a freebie. But when people pay good money to buy something and then can't use it in the way they've become accustomed to, it makes them mad." The Motion Picture Association of America (MPAA) and the Business Software Alliance (BSA) strongly oppose the proposed legislation, which is thought to have just a long-shot chance of being passed. Arguing that such legislation "would provide safe harbor for pirates," Jack Valenti of the MPAA said, "As drafted, this legislation essentially legalizes hacking." (San Jose Mercury News 11 Mar 2003)

2003-03-27 **copyright Internet download peer-to-peer P2P issues PDF**

NewsScan

WHEN IS A FREE DOWNLOAD NOT?
It seemed like a good idea at the time — author Glen Fleishman reasoned that by offering his book, "Real World Adobe GoLive 6," as a free download, he might be able to kickstart sales, which were languishing. Rather than taking the time to download the 922 pages of the PDF file, maybe readers would decide to buy a hard copy on Amazon or elsewhere. It turns out that instead of the few hundred downloads that Fleishman was anticipating, the book was downloaded 10,000 times in just 36 hours, racking up a bandwidth bill of $15,000 (Fleishman's provider, Level 3, charges incrementally for bandwidth used). "It's a financial catastrophe. I'm a working stiff with a mortgage… I never suspected the penalty would be so high for giving something away… It's like living in Singapore and getting 15 years in jail for chewing gum… I was aware I would be charged a fortune for high bandwidth. But I never suspected we would have topped a few hundred downloads." Fleishman could have made use of file-sharing networks like Kazaa or Gnutella, which require users to bear the cost, says sci-fi author Cory Doctorow, who recently released his first novel, "Down and Out in the Magic Kingdom," as a free download. Alternatively, Fleishman could have released the book under an open Creative Commons license, which would have allowed it to be posted to the Internet Archive and other open content Web sites, says Doctorow. "It doesn't make any sense to be the sole point of distribution for a file like this. It highlights the design flaw in the client-server Internet. The more popular a file becomes, the more of a penalty people pay to get it. I think the lesson is 'Use P2P networks.'" (Wired.com 27 Mar 2003)

2003-03-27 **music webcasting copyright issues reform held**

NewsScan

PANEL PUTS WEBCAST ROYALTIES REFORM ON HOLD
A House subcommittee has indefinitely postponed deliberation of a new bill, titled the Copyright Royalty and Distribution Act, which calls for the Library of Congress to hire a full-time judge to settle disputes over "reasonable" copyright royalty fees for webcasts. The measure, sponsored by Reps. Lamar Smith (R-Texas) and Howard Berman (D-Calif.), had been expected to receive a favorable reception at today's hearing. Fees for streaming music via the Internet have been a bone of contention since the enactment of a 1998 copyright law in which Congress required webcasters to pay record labels and artists a royalty fee for playing their music online. Under the Smith and Berman bill, the appointed judge would be required to consider a "fair income" for the copyright holder and could adjust rates for inflation. (CNet News.com 27 Mar 2003)

2003-05-14 **dvd copying court District Court 321 studios Digital Millennium Copyright Act's anti-circumvention**

NewsScan

BATTLE OVER DVD-COPYING HEADS TO COURT
U.S. District Court Judge Susan Ilston in San Francisco will be overseeing a case that analysts say will have important ramifications not only for software developers and the movie industry, but also for consumers who want to make back-ups of the DVDs they buy. Seven major movie studios have filed suit against software startup 321 Studios, seeking to prohibit it from shipping its DVD X-Copy and DVD Copy Plus software programs. The lawsuit invokes the 1998 Digital Millennium Copyright Act's "anti-circumvention" provision, which bans the sale of products that can "get around" copyright protection measures. Legal experts say this case is of particular interest because Judge Ilston is being asked to clarify whether the law prevents all circumvention, or whether there are cases in which circumvention is legal. "That's a big open issue that this will help define," says an intellectual property lawyer, who adds, "This is one of the first tough cases" to address this issue. Courts in the past have allowed copyright exemptions for personal use, such as using a VCR to record a TV show for later viewing, but up until now those exemptions have not extended to digital media. "The court is going to have to come up with a new, nuanced interpretation of the statute," says 321 attorney Daralyn Durie. "What's at stake here is the ability to engage in fair use in a digital environment." (CNet News.com 14 May 2003)

U.S. Rep. Lamar Smith (R-Texas), chairman of the House subcommittee overseeing copyright law, urged the Federal Communications Commission to ensure that future regulations involving digital TV do not "have an adverse effect on how consumers may legitimately use lawfully acquired entertainment products." Smith voiced his firm opposition to legislation introduced last year that would require consumer electronics makers to implant mandatory copy-protection technology in PCs and other devices. "I am skeptical of government mandates on the technology industry… Until evidence shows otherwise, I believe existing copyright law is adequate," said Smith. He also urged greater cooperation on the part of colleges and universities in disciplining perpetrators of peer-to-peer music piracy, noting that research shows 16% of files available on Kazaa are located on their networks. "It's unlikely that this amount of file-sharing activity is in furtherance of class assignments," he said. (CNet News.com 10 Jun 2003)

2003-07-09 **Google search engine caching copyright intellectual property concern**

NewsScan

GOOGLE CACHING FEATURE SPARKS COPYRIGHT CONCERNS
A caching feature on the Google search site sometimes enables users to call up snapshots of archived Web pages that for whatever reason are either restricted or no longer available at the original source, such as newspaper articles that require user registration to access or those that "expire" after a certain number of days. The feature has raised the ire of some publishers. "We are working with Google to fix that problem — we're going to close it so when you click on a link it will take you to a registration page," says a New York Times Digital spokeswoman. "We have established these archived links and want to maintain consistency across all these access points." Google says its caching feature benefits Web surfers trying to access a site that's experiencing technical difficulties, but some copyright experts say they expect the issue will end up in court: "Many of us copyright lawyers have been waiting for this issue to come up: Google is making copies of all the Web sites they index and they're not asking permission. From a strict copyright standpoint, it violates copyright," says Electronic Frontier Foundation attorney Fred Lohman. Most search engines make a statistical record of a Web page when they "spider" it, or use "robots" to scan the page's content for meaning or context, but Google goes one step beyond by snapping a digital picture of pages and making them available to users. The picture exists on Google's site until the next time it crawls that particular page, whether it's a few days or six weeks or more. Web sites can block the caching feature, but some publishers are reluctant to do so because they fear losing favor in the company's powerful search rankings, even though Google has assured them the "no cache" tags do not affect search results. 'PRE-OWNED' DIGITAL TUNE HITS AUCTION BLOCK
George Hotelling is pushing the envelope in digital music with his attempt to auction off a song that he purchased on Apple's iTunes Music Store. Hotelling says he's not concerned about recouping his 99-cent investment in Devin Vasquez's rendition of "Double-Dutch Bus," but he's interested in probing the murky legal ground surrounding digital copyrights. "I'd just like to know that if I buy something, whether it's physical or intellectual property, that I'll have my right of 'First Sale,'" says Hotelling. The terms of service contract that accompanies iTunes songs doesn't say much about the rules that guide resale of songs but does stipulate that the songs are only for "personal, noncommercial use." One nagging question concerns the lack of legal guidelines governing the rights of an owner of a second-hand digital song, says Fred von Lohmann, senior staff attorney at the Electronic Frontier Foundation. "If you were to win that auction and get that song, you have no relationship with Apple. You didn't agree to the terms of service. What governs that song after you've repurchased it?" (CNet News.com 3 Sep 2003)

JUDGE SAYS POP-UP ADS DON'T VIOLATE COPYRIGHTS
A federal judge in Virginia has ruled that pop-up ads for rival companies' products that obscure the original Web site's offerings do not violate trademark or copyright laws, potentially giving a green light to more aggressive online advertising tactics. The pop-ups — distributed mainly by Gator and WhenU.com — often divert online shoppers to competitors' offers, an action that infuriates Web site operators. According to Judge Gerald Bruce Lee's reasoning, however, consumers have accepted these ads when they agree to download Gator's and WhenU's free programs, such as screen savers or games, which piggyback on software that tracks users' Web surfing habits and then delivers ads based on their apparent interests. In the case brought by U-Haul International, Lee ruled that when WhenU's software delivers a competitor's ad to a Web surfer perusing U-Haul's Web site, it doesn't "copy or use U-Haul's trademark or copyright material" and therefore can't be accused of infringing on them. "Computer users, like this trial judge, may wonder what we have done to warrant the seizure of our computer screens by pop-up advertisements for secret Web cameras, insurance, travel values and fad diets," the judge wrote. But he argued that people "invited" those ads when they downloaded the free software, and that "(u)ltimately, it is the computer user who controls how windows are displayed on the computer desktop." The legal battle isn't over however — U-Haul lawyers are contemplating an appeal, and similar suits have been filed by several Web-site operators, including Hertz Corp. DISABLING CD LOCK IS EASY AS PRESSING THE SHIFT KEY
A Princeton University student has posted instructions for disabling the copy-protection "lock" incorporated into the latest CD released by soul artist Anthony Hamilton on the BMG label. The anti-copying software, developed by SunnComm Technologies, is automatically loaded onto a Windows PC whenever the Hamilton CD is played in its CD drive, but graduate student John Halderman found that he could prevent the software from being loaded simply by holding down the shift key for awhile. The discovery was confirmed by BMG and SunnComm, but they downplayed its significance. "This is something we were aware of," said a BMG spokesman. "Copy management is intended as a speed bump, intended to thwart the casual listener from mass burning and uploading. We made a conscious decision to err on the side of playability and flexibility." SunnComm's technology is one of the most flexible on the market, and includes "pre-ripped" versions of songs on the CD, which buyers are free to transfer to a computer, burn to a CD several times, or transfer to a variety of portable devices. The Anthony Hamilton CD is the first release to come with these "second session" tracks designed for use on a computer, but holding down the shift key prevents access to that feature. 2003-10-27 **MIT file-swap copyright infringement workaround analog transmission music**

NewsScan

STUDENTS CREATE A FILE-SWAP WORK-AROUND
Two students at MIT have discovered a way to give their fellow attendees free dorm-room access to a library of 3,500 CDs without breaking copyright laws. Keith Winstein and Josh Mandel developed software that routes the tunes over the school's cable TV network, making it an analog transmission. Unlike digital copies swapped over the Internet, analog transmissions are not exact copies, which makes the likelihood of prosecution much more remote since most universities already have licenses to "perform" analog music. "I think it's fascinating. As a copyright lawyer, I think they've managed to thread the needle," says Electronic Frontier Foundation legal counsel Fred Von Lohmann. "They've basically managed to cut the record labels out of the equation altogether." The students managed to circumvent the Recording Industry Association of America completely by purchasing MP3 versions of the CDs from Seattle-based Loudeye under license from the National Music Publishers Association. "The students get access to a broad array of music, and the copyright owners get paid. This is where we should all be heading. I hope the record industry takes not and realizes this is a whole lot more promising than suing people," says Von Lohmann. (AP 27 Oct 2003)

2003-11-04 **anti-piracy digital broadcast flag stop copying hard drive internet information**

NewsScan

DIGITAL ANTI-PIRACY MEASURE
In a 5-0 vote, the Federal Communications Commission has approved a requirement that some personal computers and other consumer electronic devices be equipped with technology to help block Internet piracy of digital entertainment. The movie industry is happy with the FCC's decision, but consumer advocates are worrying that the move will force people to buy new equipment, will result in new regulation of how computers are designed, and will hinder the copying of programming that's not entitled to industry protection (e.g., shows no longer covered by copyright). Under the new rules, a piece of digital code known as a "broadcast flag" could be embedded into a piece of program content, which then could only be copied by a digital recording device equipped with technology that recognizes the flag. A computer could not copy the file to its hard drive or send it over the Internet. (Washington Post 4 Nov 2003)

NewsScan

UNIX COPYRIGHT BATTLE HEATS UP
Novell has thrown a monkey wrench into SCO Group's plan to extract hundreds of millions of dollars in licensing fees and damages from IBM and other companies using the Linux operating system, which SCO says violates its copyright and license because it includes some Unix code. In the past few months, Novell has quietly registered for the copyrights on many of the Unix versions claimed by SCO, which says it acquired them through a transfer from Novell back in 1995. SCO has reacted with outrage, calling Novell's recent move a backdoor attempt to reclaim code that is rightfully SCO's. "We see this as a fraudulent attempt by Novell to get something they don't have," says SCO president and chief executive Darl C. McBride, who added that Novell's actions were probably prompted by IBM, the lead Linux seller in the corporate market. "It's not just Novell. It's an attack by IBM." Meanwhile, Novell executives maintain they have full ownership of the copyrights in question: "Novell believes it owns the copyrights in Unix, and has applied for and received copyright registrations pertaining to Unix consistent with that position. SCO has been well aware that Novell continues to assert ownership of the Unix copyrights," said the company in a statement. (New York Times 23 Dec 2003)

2003-12-24 **SCO Linus Torvalds Linux intellectual property rights code unix**

NewsScan

SCO OR LINUS? WHO'S RIGHT?
The Utah-based SCO Group, which owns the rights to the Unix operating system, claims that Linux creator Linus Torvalds violated its intellectual property rights. To buttress its case, SCO provided the court a list of Linux files that "have been copied verbatim from our copyrighted Unix code and contributed to Linux." But Torvalds, who created the kernel of Linux while still a student in Finland, said in a message to a reporter that he wrote the code in those files all by himself and now feels "a bit ashamed" because some of the program macros he wrote are "so horribly ugly that I wouldn't admit to writing them if it wasn't because somebody else claimed to have done so ;). I can show, and SCO should have been able to see, that the list they show clearly shows original work, not copied." But SCO chief executive Darl C. McBride insists: "As a social revolutionary, Linus Torvalds is a genius. But at the speed the Linux project has gone forward something gets lost along the way in terms of care with intellectual property." (New York Times 24 Dec 2003)

U.S. WARNS SOUTH KOREA ON INTELLECTUAL PROPERTY VIOLATIONS

The Bush Administration is warning South Korea that it's not doing enough to stop the pirating of U.S. movies and music; U.S. Trade Representative Robert B. Zoellick says: "The pirating of U.S. intellectual property robs Americans and hurts those countries whose economies rely on innovation, technology and investment. Open markets and the protection of intellectual property are critical to the continued growth of our economy, and we'll vigorously press our trading partners to follow the rules." The South Korean response to the complaint was that the U.S. action was "very disappointing and regrettable." An executive of the Recording Industry Association of America (RIAA) says: "Online piracy of recorded music is rampant in Korea and has had a devastating impact on our industry already, significantly decreasing sales for international and local repertoire alike. Incomprehensibly, Korea has thus refused to provide the legal tools necessary for the recording industry to fight back." (Washington Post 8 Jan 2004)

FREE THE MUSIC

The Electronic Frontier Foundation is proposing legalization of online file-sharing through a voluntary music license that would compensate artists. EFF lawyer Fred von Lohmann says: "Everyone agrees that file-sharing does a better job distributing music than anything else out there. It gives people a much broader selection of software to choose from. And, of course, it's better-priced. The problem is that artists and copyright holders aren't being compensated." But music industry people say the EFF plan has little chance of success without the support of the major music labels, and Mitch Glazier of the Recording Industry Association of America (RIAA) says: "We've got a new, dynamic marketplace with Napster announcing its 5 millionth download. ITunes is just starting to get corporate partners. That's not failure at all. That's experimentation. Why the government should come in and take over a marketplace that's starting to develop is conceptually flawed in my mind." Wayne Rosso of the company that created Blubster and Piolet file-swapping services says: "I think it's one of several solutions that all reasonable men could probably understand and accept. The only problem is we're not dealing with reasonable men." (San Jose Mercury News 26 Feb 2004)

MEMO TO COPYRIGHT ENFORCERS: SLOW DOWN, TAKE A BREATH

A report from the policy group called Committee for Economic Development warns against efforts to support copyrights by preventing digital TV from being transmitted online. Called "Promoting Innovation and Economic Growth: The Special Problems of Digital Intellectual Property," the report concludes: "We are sympathetic to the problems confronting the content distribution industry. But these problems — perfect copies of high-value digital works being transmitted instantly around the world at almost no cost — require clear, concentrated thinking, rather than quick legislative or regulatory action." Not everyone is likely to agree with that recommendation. Jack Valenti, the president of the Motion Picture Association of America, has been highly critical of the notion that his industry is trying to place unfair burdens on consumers. "They say it will stifle innovation — that's malarkey. If all of this digital property is free, who is going to invest 50 to 60 million dollars to make a movie?" The report from the Committee for Economic Development has called for a two-year moratorium on changes to copyright laws and regulations: "Our first concern should be to 'do no harm.'" CONGRESS REVISITS 'FAIR USE' RESTRICTIONS IN COPYRIGHT ACT

A House subcommittee on consumer protection heard arguments yesterday on proposed amendments to the 1998 Digital Millennium Copyright Act, which imposed broad restrictions on bypassing technological "locks" on DVDs and some music CDs and software programs. The amendments, sponsored by Rick Boucher (D-Va.) and John Doolittle (R-Calif.), would reinstate the provision for "fair use" of such materials, even if circumvention of copy-protection software were necessary for such use. The sale of pirated DVDs and other forms of copyright infringement would remain illegal. "Without a change in the existing law, individuals will be less willing to purchase digital media if their use of the media within the home is severely circumscribed," says Boucher. "In addition, manufacturers of equipment and software which enable circumvention for legitimate purposes will be reluctant to introduce the products into the market." It's unclear whether the Boucher-Doolittle bill has much momentum behind it — so far, it has only 15 co-sponsors in the House, and there is no companion Senate bill as yet. FRIST AND DASCHLE UNITE AGAINST ILLEGAL FILE-SWAPPING

Senate majority leader Bill Frist and minority leader Tom Daschle have joined up in attack against online music and video file-sharing services and have co-introduced legislation to make anyone who "induces" illegal copying just as liable for breaking copyright law as the person who makes the copies. Wayne State University law professor Jessica D. Litman says she finds the bill "sort of scary" because it's "worded so broadly" and could be used against devices and technologies that have non-infringing as well as infringing uses, and Gary Shapiro of the Consumer Electronics Association says: "The VCR would not be a legal product; TiVo would not be a legal
product. I'm surprised the leadership would jump on this bill without hearing from the other side." But Emery Simon of the Business Software Alliance argues that such legislation is needed: "We have a huge piracy problem. Current law makes it difficult" to go after all the infractions." Canada's Supreme Court has ruled 9-0 that Internet service providers do not have to pay royalties to composers and artists for music downloaded by Web customers, since companies providing wide access to the Web are merely "intermediaries" who aren't bound by Canadian copyright legislation. At issue was an effort by the Society of Composers, Authors and Music Publishers of Canada (SOCAN) to force Internet service providers to pay a tariff. SOCAN also wanted to extend Canadian copyright law beyond the country's borders and apply it to offshore Web sites that serve Canadians.
Opposing the effort was the Canadian Association of Internet Service Providers. (The Australian 1 Jul 2004) Rec'd from John Lamp, Deakin U.

DHS IAIP Daily;
http://www.computerworld.com/governmenttopics/government/legalissues/story/0,10801,95045,00.html

August 05, IDG News Service — Source code stolen from U.S. software company in India.

Jolly Technologies, a division of U.S. company Jolly Inc., reported Wednesday, August 4, that an insider at its research and development center in Mumbai, India, stole portions of the source code and confidential design documents relating to one of its key products. As a result, the company has halted all development at the center. A recently hired software engineer used her Yahoo e-mail account to upload and ship the copied files out of the research facility. Most U.S.-based software companies require their employees to sign an employment agreement that prohibits them from carrying the company's source code out of a development facility or transferring it in any way. Though the Indian branch of Jolly Technologies requires employees to sign a similar employment agreement, the sluggish Indian legal system and the absence of intellectual property laws make it nearly impossible to enforce such agreements, the company said.

CHANGES TO NEW COPYRIGHT BILL URGED

The Consumer Electronics Association and the American Library Association, along with other technology and consumer groups, have recommended changes to the controversial Inducing Infringement of Copyrights Act (SB 2560), which is intended to discourage illegal file-sharing. The bill, sponsored by Sens. Orrin Hatch (R-Utah) and Patrick Leahy (D-Vt.), is supported by the record labels and Hollywood studios, who complain that illegal file-sharing is ruining their livelihood. But
consumer groups recommend amending the legislation so "only someone who distributes a commercial computer program that is 'specifically designed' for wide-scale piracy on digital networks would be held liable for copyright violations," according to a press release. The proposed change would absolve ISPs, venture capitalists, credit card companies, banks, advertising agencies, IT help desks and librarians from liability. Emily Sheketoff, executive director of the American Library Association's Washington office, says she worries that SB 2560 "will quash innovation and
creativity and the fair use of these technologies. The answer to protecting copyright is not to stop developing new technologies. The answer is to educate people on how to use these technologies properly and encourage people to use these technologies properly. There are many legal, legitimate
file-sharing activities." (Wired.com 25 Aug 2004)

NewsScan; http://www.nytimes.com/2004/10/12/technology/12share.html

HOLLYWOOD PETITIONS SUPREME COURT ON FILE-SHARING

The entertainment industry is fighting back against peer-to-peer (P2P) file-sharing, petitioning the U.S. Supreme Court to overturn a federal appeals court decision reached in August that upheld file-sharing companies' right to distribute their software regardless of whether that software is later used to violate copyrights. That decision drew heavily on the precedent established by the 1984 Sony-Betamax case, which gave electronic device makers legal protection against claims of copyright infringement. This latest petition, which targets P2P purveyors Grokster and Streamcast Networks, cites a conflicting ruling reached in 2003, which upheld an injunction against P2P service Aimster on the grounds that it facilitated copyright infringement. However, critics say even the Aimster case upheld the basic tenets of the Sony-Betamax case. "They want to argue that there's some sort of national emergency here. But Betamax is the law of the land and it's not undermined by either of these two decisions," says Susan Crawford, a professor of Internet law at Cardozo School of Law in New York.

NewsScan;
http://knowledge.wharton.upenn.edu/index.cfm?fa=viewArticle&id=1066

MUSIC INDUSTRY ON THE WRONG COURSE

Wharton business professor Joel Waldfogel says the music industry is mistakenly pursuing a short-term strategy in backing the Inducing Infringement of Copyrights Act of 2004, which would hold liable any entity that "intentionally aids, abets, induces or procures" copyrighted material. Rather than fighting technological advances through litigation, the music industry must come up with new business models -- for instance, taking advantage of the Internet to slash its distribution costs. "Instead of putting out CDs and shipping them on trucks, they can send them directly at a very low cost. That does suggest a very different business model than charging $15 or $20 for a CD. It might be a much more attractive way to do things. Stuff that is easy to distribute wants to be free. Given that force, I think [the recording industry] needs to come up with a new model for generating income," says Waldfogel. (Knowledge@Wharton Oct 20-Nov 2 2004)

2005-01-04 **appeals court RIAA Digital Millennium Copyright Act Internet identities subpoenaing**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/10565129.htm

APPEALS COURT TURNS DOWN RIAA AGAIN

The Recording Industry Association of America (RIAA) this week lost the same court battle for a second time, in a different court. Echoing a December 2003 decision by the U.S. court of appeals in Washington, the appeals court in St. Louis rejected the trade group's argument that the Digital Millennium Copyright Act compels Internet service providers to reveal the identities of their customers who are accused of trading copyrighted songs. The court said in its 2-1 decision that in order to obtain users' identities, the RIAA must file "John Doe" lawsuits against those individuals. Filing such lawsuits, which the RIAA has been doing since the Washington ruling, is more costly and time-consuming than its earlier practice of simply subpoenaing identities of suspected illegal file traders. Despite losing its argument a second time, the RIAA said it will continue to seek prosecution of copyright infringement and that its "enforcement efforts won't miss a beat." Circuit Judge Diana E. Murphy, who wrote the dissenting opinion in the St. Louis court, called the process of filing individual lawsuits "cumbersome and expensive" and said the courts' rulings impose unnecessary hurdles to the protection of copyrighted material.

Apple filed a lawsuit Jan. 4 against ThinkSecret.com and its unnamed tipsters, charging: "Apple is informed and believes that Defendant Nick dePlume is an individual who uses the pseudonym 'Nick dePlume' but whose true name and identity cannot be confirmed at this time." Apple, known for its highly secretive culture, says it believes ThinkSecret obtains its information by illegally soliciting information about unreleased Apple products from individuals who violate their confidentiality agreements. In fact, on Dec. 28 the site correctly predicted Apple's debut of its $499 Mac Mini and a low-cost iPod. In response to Apple's accusations, Ciarelli replies, "I didn't do anything wrong. My reporting practices are the same that any journalists use. I talk to sources, I confirm details, I follow up on tips and leads that I get." It will be difficult for Apple to prove that Ciarelli's coverage has violated its trade secrets, says an intellectual property attorney, noting that trade secrets usually refer to the formula behind products, not simply the details about their release. (Wall Street Journal 14 Jan 2005)

2005-01-14 **scholarly republishing Cornell University articles journals Emarald**

EDUPAGE; http://chronicle.com/prm/weekly/v51/i19/19a03102.htm

NEW QUESTIONS ARISE OVER SCHOLARLY REPUBLISHING

A librarian at Cornell University has uncovered evidence that academic publisher Emerald has for many years republished articles in its journals without acknowledging previous publication. Philip M. Davis first noticed republished articles dating back to 1989 in online archives maintained by Emerald. Davis then broadened his search to include paper copies of Emerald journals going back to 1979 and said he found many more examples of such republished articles. Davis said some articles were published more than once in the same journal, several years apart, and noted that as a result libraries may have spent money on material they already owned. A spokesperson from Emerald said the company does not have a practice of republishing, though in some cases Emerald officials who thought a particular article especially valuable would republish it "to make it available to another audience." Davis said, "It's clearly unethical to republish materials without attribution."

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7428570

BROAD COALITION FILES BRIEFS IN FILE-TRADING CASE

A broad group of organizations has filed legal briefs siding with the entertainment industry in its upcoming Supreme Court case over whether P2P services should be held liable for illegal file trading on their networks. Groups including the National Football League and the Christian Coalition of America joined with the U.S. government and 40 states and territories in calling for the court to overturn lower court rulings and find companies such as Grokster and Morpheus liable for P2P music piracy. A brief submitted by the Justice Department, the Copyright Office, and the Patent and Trademark Office said P2P companies have built their businesses on "massive copyright infringement." Adam Eisgrau, executive director of the P2P United trade group, said that a ruling against P2P companies would suppress technological innovation and would punish a technology that simply is not mature. According to Eisgrau, "If the standard for a technology in its relative infancy is whether at that instant it is used more for ill than for good, then we will almost never foster the development of breakthrough technologies." The case will be presented to the Supreme Court in March; a decision is expected in June.

2005-01-26 **MPAA lawsuits illegally copyrighted movie hubs BitTorrent eDonkey DirectConnect networks Parent File Scan**

EDUPAGE; http://news.com.com/2100-1030_3-5551903.html

ROUND TWO OF MPAA SUITS

The Motion Picture Association of America (MPAA) has filed a second round of lawsuits against an undisclosed number of U.S. users suspected of illegally trading copyrighted movie files. The group first filed lawsuits against individuals in November, followed by legal action against Web sites that function as file-trading hubs, including BitTorrent, eDonkey, and DirectConnect networks. MPAA Chief Executive Officer Dan Glickman said, "We cannot allow people to steal our motion pictures and other products online, and we will use all the options we have available to encourage people to obey the law." The MPAA also released a software tool called Parent File Scan that identifies file-sharing software on a computer, as well as movie and music files that might be protected by copyright. The software does not differentiate between legal and illegal files, and it does not monitor or block any downloads. Rather, it identifies files of a wide range of formats and leaves decisions about which are legitimate up to users, most of whom presumably will be parents.

2005-01-28 **court reimburse music industry copyright violations Napster MP3 Web**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4216551.stm

COURT ORDERS MAN TO REIMBURSE MUSIC INDUSTRY

The Supreme Court of Norway has ordered Frank Allan Bruvik to pay 100,000 kroner (about $16,000 U.S.) to the country's music industry for copyright violations stemming from a Web site he operated. The Web site that Bruvik set up when he was a student, napster.no, was not associated with Napster but offered links for users to locate MP3 files on the Web. Bruvik's site was only online for about four months in 2001, and it did not host any music files. Nevertheless, a court ruled in 2003 that Bruvik was liable for copyright violations that his site facilitated. An appeals court overturned that ruling, but the Supreme Court has decided against Bruvik. In its ruling, the court said that Bruvik's actions did violate copyright law in that he abetted an illegal act and that his actions were premeditated. The music industry in Norway said it was pleased with the ruling, saying it demonstrates the court will not tolerate copyright violations.

2005-02-07 **Google copyright volumes libraries scan academic publishers permission**

EDUPAGE; http://chronicle.com/prm/daily/2005/02/2005020703n.htm

DOES GOOGLE FACE COPYRIGHT TROUBLES?

Google's recently announced plans to scan millions of volumes in several libraries has some wondering if the project is at risk of running into copyright limitations. Google will scan books that are in the public domain and make those texts available online; the company will also scan copyrighted books and offer short excerpts of a few lines each. Some publishing groups argued that putting even small pieces online will violate copyright and that the company should seek explicit permission from copyright owners. Critics also expressed reservations about copyright determinations for books that might, for example, be in the public domain in one country but not in another. Sally C.L. Morris, chief executive of the Association of Learned and Professional Society Publishers, said that although the sheer number of academic publishers represents a powerful disincentive to obtaining permissions from all of them, "that doesn't mean there's not a legal requirement to do it." For its part, Google insists that its actions are acceptable. Google spokesperson Steve Langdon said, "In every case, Google's presentation of the works to the public will keep authors and publishers in mind and be well within the bounds of copyright law."

2005-03-11 **file sharing illegal downloading UK British ISP BPI identity disclosure intellectual property rights violation copyright infringement**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7877847

BRITISH ISPS TOLD TO TURN OVER FILE TRADERS

A British court has ruled that ISPs in that country must disclose the identities of alleged copyright violators to the British Phonographic Industry (BPI). The BPI had sought the names of about 30 individuals suspected of uploading significant numbers of songs to file-sharing networks. The court has given the six ISPs named in the suit 14 days to turn over the requested identities, which are known currently only by their IP addresses. The BPI will then contact those individuals and offer to settle the charges against them outside court. The British music industry has recently reached its first round of settlements with alleged copyright infringers, a process that Geoff Taylor, general counsel of the BPI, said showed the organization that "people from all walks of life are engaged in this activity." EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7882727

SWEDEN RAIDS ISP FOR FILE TRADING

Police in Sweden raided the Stockholm offices of Bahnhof, the country's largest and oldest Internet service provider (ISP), long suspected of facilitating rampant copyright violations. According to John Malcolm of the Motion Picture Association of America (MPAA), which had urged Swedish authorities to carry out such a raid, Bahnhof operated some of the largest and fastest servers in Europe. Of the four servers seized in the raid, one is thought to be the largest pirate server in Europe, according to the MPAA. Malcolm said the raid uncovered evidence not only of organized piracy in Sweden but also of such activity throughout Europe. Equipment seized in the raid reportedly contained 1,800 digital movies, 5,000 software files, and 450,000 audio files. Reuters, 11 March 2005

2005-03-14 **Holland Netherlands file sharing illegal downloading warning intellectual property rights violation copyright infringement**

EDUPAGE; http://www.usatoday.com/tech/world/2005-03-14-dutch-download_x.htm

DUTCH ISPS ISSUE WARNINGS TO FILE TRADERS

Five Internet service providers (ISPs) in the Netherlands have agreed to send notices from the Brain Institute, the antipiracy arm of the country's entertainment industries, to subscribers suspected of illegally trading copyrighted music, movies, and software. The ISPs did not go so far, however, as agreeing to disclose the identities of those users to entertainment companies. Maaike Scholten, spokesperson for two of the five ISPs, described the move as "a service, a warning to clients that they are doing things that are against the law." In 2003, the Dutch Supreme Court ruled that file-sharing applications are legal, leaving copyright owners the option of pursuing individuals who use such applications for copyright violations, as in the United States. Tim Kuik, director of the Brain Institute, said his organization hopes to reach settlements with illegal file traders but anticipates it will be forced to file civil lawsuits against some. 2005-03-16 **Microsoft lawsuit Windows XP Office academic discount eBay sale David Zamos intellectual property rights violation**

EDUPAGE; http://chronicle.com/prm/daily/2005/03/2005031606n.htm

MICROSOFT AND STUDENT SETTLE OVER SOFTWARE RESALE

Microsoft and David Zamos have reached a settlement in their dispute over Zamos's sale on eBay of Microsoft software he purchased while a student at the University of Akron. After Zamos bought Windows XP Pro and Microsoft Office from the university bookstore, he found he was not permitted to return it, though it was unopened. Zamos, who paid about $50 for both products because of deep educational discounts, decided to sell the software on eBay, where he sold each for about $100. The sale prompted Microsoft to file a lawsuit alleging that Zamos improperly benefited from academic pricing, in violation of company policies. Zamos argued that such policies were not explained on the packaging, and he countersued the company, alleging that because of Microsoft's actions and policies, obtaining a refund for software is virtually impossible. Although both parties expressed their satisfaction with the resolution, a confidentiality agreement covering the settlement prevents disclosure of any details. A statement from Microsoft did note, however, that the company will "continue its commitment to protecting those intended to benefit from its academic program,"
suggesting it will continue to look unfavorably on anyone reselling academic purchases. Chronicle of Higher Education, 16 March 2005 (sub. req'd)

2005-03-18 **John Wiley and Sons publisher lawsuit selling guidebooks online intellectual property rights violation copyright infringement cheating**

EDUPAGE; http://www.insidehighered.com/news/2005/03/18/cheating

STUDENTS SUED FOR SELLING GUIDEBOOKS ONLINE

Publisher John Wiley and Sons has filed lawsuits against a number of individuals for selling guidebooks online that include answers to tests and assignments in certain of the company's textbooks. The publisher also said it has reached settlements with about 150 individuals, most of them students, after investigating sales of the guidebooks--which the company does not sell but provides only to professors--on eBay. No faculty have been implicated so far. Those named in the suits did not respond to the publisher when it contacted them about the illicit sales. According to Roy S. Kaufman, legal director of Wiley, illegal copies of the text are still widely available online, despite the company's efforts. "This is a new form of cheating and copyright violation," said Kaufman, "with a Malthusian growth cycle." Inside Higher Ed, 18 March 2005

EDUPAGE; http://news.com.com/2100-1047_3-5632119.html

APPLE SETTLES WITH MAN ACCUSED OF LEAKING CODE

Apple Computer has settled a lawsuit against Doug Steigerwald of North Carolina for leaking the company's upcoming Macintosh operating system, called Tiger. As part of the Apple Developer Connection (ADC) program, Steigerwald, a recent graduate of North Carolina State University, had prerelease access to the operating system. The ADC program allows software developers to create products that will operate with a new operating system before it is released to the public, and participants in the program are required to sign a contract that prohibits disclosure of information about Apple products before they are launched. In a statement, Steigerwald admitted distributing prerelease copies of Tiger over the Internet in violation of the ADC contract he signed. Specifics of the settlement were not released, but a statement from Apple said, "While Apple will always protect its innovations, it is not our desire to send students to jail." The statement also expressed the company's satisfaction that Steigerwald took responsibility for his actions. CNET, 24 March 2005

2005-03-29 **media companies class-action lawsuit freelance writers electronic database inclusion fees**

EDUPAGE; http://www.wired.com/news/politics/0,1283,67063,00.html

MEDIA COMPANIES SETTLE WITH FREELANCERS

A settlement has been reached in a class action lawsuit between media companies and freelance writers over stories included in electronic databases. The class action suit was the combination of three separate suits and represented defendants including the American Society of Journalists and Authors, the Authors Guild, the National Writers Union, and almost two dozen freelance writers. Defendants in the suit, including Time, Knight Ridder, Reed Elsevier, and The New York Times Company, agreed to pay between $10 million and $18 million for works originally published between August 1977 and December 2002. Under the terms of the settlement, writers who did not sign away electronic publishing rights can apply for payments of as much as $1,500 for works that have been added to electronic databases. Although many payments will be significantly smaller than that, "some freelancers … will make six figures under this settlement," according to Jim Morrison, one of the negotiators of the settlement and a past president of the American Society of Journalists and Authors. 2005-04-07 **University of California electronic reserves Fair Use exceeded publishers complaint intellectual property rights violation copyright infringement**

EDUPAGE; http://chronicle.com/prm/daily/2005/04/2005040701t.htm

UC ELECTRONIC RESERVES RANKLE PUBLISHERS

A system that handles electronic reserves at the University of California (UC) in San Diego has prompted complaints from publishers that the university has far exceeded the bounds of fair use. With the system, materials that faculty put on reserve are made available electronically, allowing students to access and even print them from outside the university library. The Association of American Publishers objected, saying that electronic access substantially changes the traditional terms of reserve materials and deprives publishers of sales. Publishers have previously won legal challenges to the production of coursepacks, which the courts said do not fall under the terms of fair use. The publishing group insisted the same applies to electronic resources. Representatives of UC disputed the claims, saying the reserve system does not infringe on sales of texts. Jonathan Franklin, associate law librarian at the University of Washington, noted that the fair use law is not clear and commented that if the disagreement is ultimately settled by the courts, such a resolution might provide needed clarification for all concerned. EDUPAGE; http://chronicle.com/prm/daily/2005/04/2005041302t.htm

ENTERTAINMENT INDUSTRY TARGETS INTERNET2 USERS

Organizations representing record companies and movie studios announced this week they will begin filing copyright infringement lawsuits targeting users of i2hub, a file-sharing system that lets users exchange data over Abilene, Internet2's high-speed research network. Because of the network's speed--and a belief among some users that their actions on i2hub could not be detected by the entertainment industry--students on a number of Internet2 campuses have engaged in widespread illegal file trading, according to Cary Sherman, president of the Recording Industry Association of America (RIAA). The RIAA said it will file suits against 405 of what it described as the most egregious violators at 18 campuses. The trade group also sent letters to the presidents of 140 other colleges and universities, indicating what it sees as rampant abuse of the Internet2 network for trading copyrighted songs and movies and asking those institutions to work to limit activities that "violate the law and [their] own Acceptable Use Policies." The Motion Picture Association of America also said it will file similar suits but declined to say how many. Officials from
Internet2 acknowledged that trading unlicensed material over its network violates its policies and those of its member institutions. Greg Wood, spokesperson for Internet2, said the group has been working with member institutions on technologies that support effective and legal uses of the network. The University of Wyoming has insisted that a student remove copies of old tests from his Web site. Aaron Narva, a senior at the university, had posted the tests online and initially sold them to other students. Later, Narva gave the tests away for free. Narva said that old tests are a useful study aid, noting that the athletics department as well as sororities and fraternities make copies of tests available to their members. Dane Ciolino, professor of copyright law at Loyola University, said that Narva's comparison fails because by posting the tests online, he is making many more copies available. Ciolino also noted that fair use cannot apply if Narva was charging money for the tests. Narva is charged with violating university policies and will have a hearing at the university later this month. CNN, 15 April 2005

EDUPAGE; http://www.theregister.com/2005/04/19/bpi_p2p_lawsuits/

BRITISH COURTS ORDER FILE SHARERS TO BE IDENTIFIED

A British judge has ordered five ISPs to disclose the identities of 33 individuals accused by the British Phonographic Industry (BPI) of sharing more than 72,000 music files over the Web. The ruling is the latest win for the BPI in its efforts to combat illegal file sharing. ISPs have previously been forced to reveal the identities of another 57 individuals, all of whom were targeted for copyright violations. A recent study by research group TNS estimated that illegal file sharing cost the music industry more than 650 million pounds over the past two years. TNS also found that nearly 20 percent of people in the United Kingdom between the ages of 12 and 74 download music on the Internet, though the study did not distinguish between legal and illegal downloads. Representatives of the BPI contend that their efforts are working, noting that nearly 85 percent of those who do not currently download music said they would not do so illegally and that 15 percent of those who download illegally said they will begin to pay for music online. EDUPAGE; http://chronicle.com/prm/daily/2005/04/2005042001t.htm

STUDENTS AT CORNELL DEBATE FILE SHARING WITH INDUSTRY

A recent colloquium at Cornell University pitted representatives of the entertainment industry against critics who say the copyright system is too restrictive and stifles innovation. Cary Sherman, president of the Recording Industry Association of America, and Fritz Attaway, executive vice president and general counsel of the Motion Picture Association of America, debated with Fred von Lohmann, lawyer with the Electronic Frontier Foundation, and Siva Vaidhyanathan, professor of communications at New York University, in front of a lively audience of about 200 students. Tracy Mitrano, policy adviser to Cornell's Office of Information Technologies, commented that the presence and participation of so many students indicated their earnest concern over legal and ethical issues surrounding file sharing. Though not the direct subject of the debate, Cornell is currently running a pilot program of the legal music-download service Napster, and participants on both sides offered their perspectives. A representative of Napster called the program a success, pointing to the large percentage of students who use the service regularly. On the other hand, von Lohmann said that the service is not a good deal for universities. "It feels free," he said, "but one way or another, you're paying for it." 2005-04-28 **US intellectual property rights copyright anti-piracy law Family Entertainment and Copyright Act stiffer penalties violations**

EDUPAGE; http://networks.silicon.com/webwatch/0,39024667,39129955,00.htm

U.S. STRENGTHENS COPYRIGHT LAW

President Bush this week signed into law the Family Entertainment and Copyright Act, which allows for stiffer penalties for copyright violations. Under the law, individuals found guilty of possessing one or more copyrighted movie, music, or software files that have not been released to the public face a fine and prison term of up to three years. The law also criminalizes using a camcorder to record movies in theaters. Copyright holders supported the measure. Dan Glickman of the Motion Picture Association of America thanked Congress for what he called "their strong advocacy for intellectual property rights." Although some consumer groups opposed the law, some observers described it as a relatively minor expansion of existing law. Eric Goldman, professor of copyright law at Marquette University Law School, said he expects the Justice Department to use its new authority responsibly. Silicon.com, 28 April 2005

2005-05-23 **Google book scanning digitize Library Project Association of American University Presses intellectual property rights violation copyright infringement**

EDUPAGE; http://chronicle.com/free/2005/05/2005052301t.htm

GOOGLE UNDER FIRE FOR LIBRARY PROJECT

The Association of American University Presses has become the latest group to voice objections to Google Print for Libraries, a project in which the search engine is scanning some or all of the books in five university and public libraries in the United States and Britain. In a letter to Google, the organization questions the notion that copyright law allows Google to scan copyrighted works into its database, even if only small portions of those texts are available online. Peter Givler, the group's executive director, said that copyright law fundamentally applies to making copies, regardless of what is done with them. The Publishers Association, which represents publishers in England, has also objected to the project, raising many of the same objections as the Association of American University Presses. For its part, Google said it is working with publishers to address their concerns and to make the project beneficial to them as well. Hugh P. Jones, copyright counsel of the Publishers Association, said he has been in contact with Google but that so far the two groups have failed to agree. Chronicle of Higher Education, 23 May 2005

2005-06-20 **Google book scanning digitize Library Project University of Michigan Ann Arbor contract sharing Harvard Stanford New York intellectual property rights violation copyright infringement**

EDUPAGE; http://chronicle.com/prm/daily/2005/06/2005062001t.htm

MICHIGAN SHARES GOOGLE CONTRACT

In an effort to address concerns that have arisen over Google's project to digitize vast numbers of books from several libraries, the University of Michigan at Ann Arbor has made its contract with Google available online. Google has entered into agreements with libraries at Michigan, as well as Stanford University, Harvard University, the University of Oxford, and the New York Public Library, to scan most or all of their books, including those still protected by copyright. Books in the public domain will be made available on the Web; for those under copyright, only short excerpts will be online. Critics have contended that simply making digital copies of copyrighted books is a violation of copyright protections. The contract states that if either party becomes aware of copyright infringement, it will be quickly addressed. The contract also indicates that, aside from compensation for costs of transporting books, the university will receive no money for its participation in the project. John P. Wilkin, associate university librarian at Michigan, said he hopes that by making the university's contract publicly available, critics will see that there is nothing sneaky going on between Google and the library. 2005-06-27 **music file sharing intellectual property rights violation copyright infringement Supreme Court decision precedent peer-to-peer P2P Grokster StreamCast**

EDUPAGE; http://online.wsj.com/article/0,,SB111927666876564101,00.html

SUPREME COURT RULES FOR ENTERTAINMENT INDUSTRY

In a long-awaited decision, the U.S. Supreme Court ruled unanimously that providers of file-sharing services can be held liable for copyright infringement that takes place on their networks. The decision overturns a lower-court ruling that companies including Grokster and StreamCast were not liable for such infringement because their P2P services have legitimate, legal uses as well. Citing the Betamax ruling of 1984, which permitted technology to videotape movies and television, the Ninth Circuit found in favor of the file-sharing companies. That decision was appealed to the Supreme Court by entertainment companies, which argued that file-sharing services are built on a model of facilitating infringement and that the companies charged have gone so far as to "disable mechanisms that would prevent the very infringement that sustains their businesses." The Supreme Court agreed, saying, in part, that "one who distributes a device with the object of promoting its use to infringe copyright … is liable for the resulting acts of infringement by third parties." Wall Street Journal, 27 June 2005 (sub. req'd)

HARVARD PROF CHANGES MIND, SIDES WITH ENTERTAINMENT INDUSTRY

Although he previously filed a brief supporting the defendants in the Grokster case recently decided by the Supreme Court, Harvard Law Professor Charles R. Nesson said he now believes the court decided appropriately in finding for the entertainment industry. Nesson, who specializes in technology law and serves as the faculty codirector of the Berkman Center for Internet and Society, said that during oral arguments in the case, which were held in March, he was convinced that file-sharing businesses that cater to individuals who violate copyright should be held accountable. "It is a good decision," he said, "because it says you can't be a total predator." In his earlier brief, Nesson had highlighted his concern that a ruling in favor of studios would inhibit plans to establish a digital library at the Berkman Center. Because the center is a nonprofit, however, and because the center would take demonstrable steps to limit copyright violations, Nesson said the courts would be unlikely to apply similar standards of liability to the digital library. 2005-07-14 **Australian copyright infringement music piracy link lawsuit ISP intellectual property rights violation**

EDUPAGE; http://news.com.com/2100-1030_3-5788344.html

AUSTRALIAN MAN AND ISP FOUND GUILTY OF LINKING TO PIRATED MUSIC

A court in Australia has found Stephen Cooper guilty of copyright infringement, as well as his Internet service provider (ISP) and several of its employees. Although Cooper did not provide copyrighted music files for download, he did create a Web site that directed users to sites that offered pirated music. Record companies had alleged that Cooper conspired with individuals at Comcen, the ISP named in the suit, to use the site to drive traffic to the ISP, thereby increasing opportunities for advertising revenue. The court agreed, marking the first time in Australia that someone has been convicted for the act of linking to pirated material online. The judge in the case has not yet determined damages. After the verdict, Michael Kerin, general manager of Music Industry Piracy Investigations, hailed the ruling as an important victory in the fight against piracy. "The verdict showed that employees of ISPs who engage in piracy can be seen in the eyes of the court as guilty," he said. CNET, 14 July 2005

2005-08-12 **Google book scanning digitization Library project intellectual property rights violation copyright infringement AAP**

EDUPAGE; http://chronicle.com/free/2005/08/2005081201t.ht

GOOGLE MODIFIES LIBRARY PROJECT

Google has announced some changes to its Library Project following vocal criticism from a number of publishers. Under the terms of the project, Google made arrangements with five major libraries to scan some or all of their books, posting at least a portion of each book in an online repository for public access. Publishers complained that making such electronic copies of copyrighted works--regardless of whether they are put online--violates the rights of the copyright holder. Google now says it will not scan any book that a publisher specifically asks to be exempted, and it will not scan any copyrighted books until November, giving publishers time to review titles they might want excluded. Publishers appeared unmoved, however, with the Association of American Publishers (AAP) saying that Google's new plan "places the responsibility for preventing infringement on the copyright owner rather than the user." Peter Givler of the Association of American University Presses echoed the AAP's dissatisfaction with the changes to the project. He was glad that Google is trying to address publishers' concerns but said of the new policy that it "doesn't seem to me that it gets us very far." Chronicle of Higher Education, 12 August 2005

2005-08-25 **file movie sharing peer-to-peer P2P illegal downloading logs MPAA lawsuit BitTorrent intellectual property rights violation copyright infringement**

EDUPAGE; http://news.com.com/2100-1025_3-5843082.html

MOVIE STUDIOS USE P2P SERVER LOGS AGAINST FILE TRADERS

The Motion Picture Association of America (MPAA) has filed 286 lawsuits for copyright infringement against individuals it identified from the server logs from file-trading services. MPAA efforts have resulted in the closure of a number of such services, many of which used BitTorrent technology. Information on file traders from those sites led to the "John Doe" lawsuits filed this week, marking the first time P2P logs have been used to seed such lawsuits. Indeed, Bram Cohen, who created BitTorrent to streamline downloading of very large files, said that using the technology for illegal file trading would be a "dumb idea" because it was never designed to conceal the identities of users. A statement from MPAA Senior Vice President John Malcom warns those who illegally download copyrighted movies, "You have no friends in the online community when you are engaging in copyright theft." EDUPAGE; http://www.internetnews.com/xSP/article.php/3531221

GOOGLE PRESSES FORWARD SCANNING BOOKS

Google is moving ahead with its plans to digitize vast numbers of books and make them available online. The search engine this week expanded its book search service to 14 countries, including the United Kingdom, Canada, India, New Zealand, South Africa, and Australia, where users can now search English-language books. Although laws in each country dictate small differences in how the service works, according to Jim Gerber, director of content partnerships, in all countries the service offers three types of results: for books in the public domain, the entire text is available online; copyrighted works whose publishers have signed agreements with Google are available to the extent that those agreements allow; for copyrighted books whose publishers have not made agreements with Google, only selected portions will be available online. This last group of results has raised the ire of publishers, who argue that Google has no right to display any part of copyrighted works without permission. Google has offered publishers the opportunity to identify specific titles that will be excluded from the service, but most publishing groups have said that approach is inherently backwards, giving Google blanket authority until and unless publishers complain. 2005-09-02 **lawsuit litigation intellectual property rights violation copyright infringement graduate student paper sale vendor Website**

EDUPAGE; http://www.insidehighered.com/news/2005/09/02/papers

STUDENT SUES ONLINE TERM-PAPER VENDORS

A graduate student has filed a lawsuit charging three online vendors of term papers with selling a paper she wrote without her permission. Blue Macellari is currently pursuing graduate degrees at Johns Hopkins University and Duke University. The paper in question, which was written when she was a student at Mount Holyoke College, was posted on Macellari's personal Web page in 1999 but turned up for sale on DoingMyHomework.com, FreeforEssays.com, and FreeforTermPapers.com, all of which are owned by an Illinois company called R2C2. Macellari said she did not give her permission to use the paper, which itself could violate honor codes at Johns Hopkins and Duke. John Palfrey, law professor at Harvard University and executive director of the Berkman Center for Internet and Society, said that the defendants will have difficulty prevailing if Macellari's complaint is accurate. On the question of whether the action would have an appreciable effect on the sale of papers online, Palfrey was less optimistic. Comparing Macellari's lawsuit to similar actions to limit spam, he noted that spam continues to grow unabated. "It's hard to bring enough spam lawsuits to make a big difference," he said. KAZAA FOUND GUILTY OF COPYRIGHT VIOLATIONS IN AUSTRALIA

An Australian court this week ruled in favor of the Recording Industry Association of America (RIAA) in its lawsuit against the developers of the Kazaa file-sharing service for copyright violations. The ruling is the second major blow to file traders this year, after the U.S. Supreme Court in June found Grokster liable for the copyright violations of its users. The court in Australia said that Sydney-based Sharman Networks, which owns and operates Kazaa, is well aware that its network is widely used to illegally trade copyrighted files and has done little to curb the practice other than adding warnings on the site. Those warnings, as well as an end user agreement that users must sign, "are ineffective to prevent, or even substantially to curtail, copyright infringements by users," said Judge Murray Wilcox in his ruling. Wilcox ordered Sharman to install filters on Kazaa to limit copyright violations within two months or discontinue the service. Wilcox also ordered Sharman to pay the majority of the RIAA's legal costs, and later this year a hearing will be held to assign damages that Sharman must pay to the entertainment industry. EDUPAGE; http://news.com.com/2100-1030_3-5867085.html

RIAA TARGETS MORE P2P SERVICES

Following its Supreme Court victory against Grokster in June, the Recording Industry Association of America (RIAA) has sent cease-and-desist letters to seven unnamed providers of P2P services. In the Grokster case, the Supreme Court unanimously ruled that operators of P2P services are in part liable for the copyright infringements of their users and bear some responsibility for trying to prevent illegal file trading on their networks. The new cease-and-desist letters mention the Grokster case, saying the newly targeted companies are subject to similar legal standards, and invites those companies to contact the RIAA if they are interested in "pre-litigation resolution of these claims against you." Although the RIAA did not name the P2P providers who received the letters, likely candidates include eDonkey, LimeWire, Kazaa, BearShare, WinMX, and Free Peers. According to an RIAA spokesperson, "Companies situated similarly to Grokster have been given ample opportunity to do the right thing." CNET, 15 September 2005

2005-09-19 **peer-to-peer P2P file sharing intellectual property rights violation copyright infringement Grokster Supreme Court shut down acquisition Mashboxx**

EDUPAGE; http://online.wsj.com/article/0,,SB112709561414344552,00.html

GROKSTER IN TALKS TO BE ACQUIRED

Following a Supreme Court defeat this summer, P2P service provider Grokster is reportedly considering being acquired by Mashboxx, a provider of legal downloads that is expected to start operating in the next few months. The Supreme Court's decision opened the door to record studios' suing Grokster and its codefendant Morpheus for damages from copyright violations taking place on their networks. The Recording Industry Association of America (RIAA), which brought the suit and has since notified other P2P providers of its intention to force them to limit copyright violations, is reportedly considering dropping its complaint against those providers that agree to adopt a business model of legal downloads. Indeed, the RIAA has already reached a settlement with iMesh, though the organization declined to comment on any discussions with Grokster. Wayne Rosso, cofounder of Mashboxx and formerly the president of Grokster, said his current company will talk to any P2P provider that wants to transition to a legitimate, legal service. Mashboxx has signed a deal with Sony and is negotiating deals with other major record labels. Wall Street Journal, 19 September 2005 (sub. Req')

EDUPAGE; http://news.com.com/2100-1030_3-5875384.html

AUTHORS GUILD TAKES GOOGLE TO COURT

The latest challenge to Google's Print Library Project has come in the form of a lawsuit from the Authors Guild. Since Google announced its initiative to scan millions of books in several academic and public libraries and put those materials--or portions of them--online, the search engine has been roundly criticized by publishers and others who say the entire project represents copyright infringement. Nick Taylor, president of the Authors Guild, said, "It's not up to Google or anyone other than the authors, the rightful owners of these copyrights, to decide whether and how their works will be copied." Google continues to assert that it respects copyright and that the project does not violate copyright laws. Moreover, Google contends that the project will be a boon for publishers due to the broad exposure that scanned books will have online. Plaintiffs, who are seeking class action status for their suit, are asking the courts for damages and an injunction against scanning the texts in question. CNET, 21 September 2005

EDUPAGE; http://online.wsj.com/article/0,,SB112725336407246620,00.html

BAIDU TO APPEAL RULING IN COPYRIGHT CASE

Chinese search engine Baidu said it will appeal a ruling by a Beijing court that found the company guilty of copyright violations for providing access to sites that offer illegal music downloads. Baidu has a dedicated MP3 search feature that has been extremely popular, but with the search engine's success has come criticism from record companies, some of which are said to have initiated legal action against the company, though Baidu's lawyer did not comment on that. The Beijing court ordered Baidu to stop providing access to the illegal downloads and to pay copyright owners damages of about $8,500 for each of 34 copyrights that were allegedly violated. Li Decheng, Baidu's lawyer, said the verdict hinges on a misunderstanding of what the search engine's technology actually does. Wall Street Journal, 21 September 2005 (sub. req'd)

WIKIBOOKS ENTERS TEXTBOOK PUBLISHING FIELD

The Wikimedia Foundation launched the Wikibooks project to create a kindergarten-to-college curriculum of textbooks based on an open source development model. Material written for the new texts can be short or long and easily modified, and the resulting Wikibooks would be freely licensed. The goal is to produce thousands of books and smaller entries on a range of topics by employing a worldwide community of writers and editors. Any reader or student could create a personalized book or edit an existing title. Wikibooks currently contains more than 11,000 submissions from volunteers (professionals in many fields, college and graduate students, and professors). The project is still in the early stages and faces competitors such as Google's digital library project, which has run into copyright issues.

EDUPAGE; http://www.internetnews.com/xSP/article.php/3552651

RIAA CONTINUES TO SUE SWAPPERS, MANY ON CAMPUS

The Recording Industry Association of America (RIAA) has filed a new batch of 757 John Doe lawsuits against users of P2P networks, accusing them of copyright violations. Included in the new suits are cases against individuals at 17 college and university campuses accused of illegally trading songs over Internet2's high-speed network using a file-sharing application called i2hub. The current action is the third time the RIAA has targeted users of i2hub and brings to 39 the number of campuses where students have been accused of copyright infringement using the application. Cary Sherman, president of the RIAA, invoked this summer's Supreme Court ruling against Grokster in a statement he issued with the new lawsuits. "The authority of the Supreme Court's unanimous ruling in the Grokster case," he said, "should not be ignored by students returning to campus this fall with sights set on free music." Sherman praised efforts at some campuses to educate users and restrict their ability to illegally trade copyrighted material on university networks. Internet News, 29 September 2005

EDUPAGE; http://chronicle.com/free/2005/10/2005100301t.htm

YAHOO ANNOUNCES BOOK-SCANNING PROJECT

Yahoo has announced a plan to scan large collections of texts into an online digital archive, though officials said their approach differs in important ways from Google's similar venture, which has drawn extensive criticism and legal action. Yahoo's initiative, called the Open Content Alliance (OCA), represents a partnership with the University of California, the University of Toronto, the Internet Archive, and several other companies and organizations. Unlike Google's project, they will not scan any copyrighted work without explicit permission. Organizers of the project said the goal is to digitize and make freely available as much of what is in the public domain as possible. In addition, the archive will not be restricted to users of Yahoo. David Mandelbrot, Yahoo's vice president for search content, said the texts will be online in such a way that other search engines will be able to locate them. Much of the scanning for the OCA will be done by the Internet Archive, which has already been working with the University of Toronto on scanning several thousand books in its collection. 2005-10-07 **Google intellectual property rights violation copyright infringement book scanning project**

EDUPAGE; http://chronicle.com/daily/2005/10/2005100701t.htm

AUTHOR AND PUBLISHER PULL BOOKS FROM GOOGLE

Google's controversial program to scan millions of books has run afoul of a very prolific author and his publisher. Jacob Neusner, a research professor of theology at Bard College, has written more than 900 books. Calling Google's book-scanning project a violation of copyright, Neusner requested that his books not be included in the database. Google's response was that Neusner must submit a separate form for each book he wanted excepted from the project. Siding with Neusner, the Rowman & Littlefield Publishing Group, which has published many of Neusner's titles, then told Google it wanted all of its titles excluded from the project as well. Calling the scanning project "unfair and arrogant," Jed Lyons, president of Rowman & Littlefield, said, "[W]e don't want to do business with an organization that thumbs its nose at publishers and authors." Lyons said representatives from Google are trying to persuade the publisher to change its decision. Chronicle of Higher Education, 7 October 2005 (sub. Req'd)

2005-10-11 **intellectual property rights Copyright Clearance Center permissions Blackboard higher education**

EDUPAGE; http://www.insidehighered.com/news/2005/10/11/copyright

SECURING COPYRIGHT PERMISSIONS GETS EASIER

The Copyright Clearance Center is launching a program to link its services with the Blackboard course management system. The center was created by Congress in the late 1970s to help businesses and academics obtain appropriate permissions from copyright holders. The new Copyright Permissions Building Block will allow users of Blackboard, which is implemented on about 1,200 campuses, to tie directly into the Copyright Clearance Center when creating a course. Many faculty are unsure about when permissions are needed to use copyrighted material in a course and when they are not, exposing themselves and their universities to possible copyright violations. The new tool will protect faculty and their institutions from such risks while ensuring that the rights of copyright holders are respected. Officials from the Copyright Clearance Center said they hope to add the functionality to other vendors' course management systems. Inside Higher Ed, 11 October 2005

2005-10-25 **Microsoft Yahoo book project Internet archive intellectual property rights copyright Open Source Alliance**

EDUPAGE; http://news.zdnet.com/2100-9588_22-5913711.html

MICROSOFT JOINS YAHOO BOOK PROJECT

Microsoft has said it will participate in a recently announced book-scanning project led by Yahoo and the Internet Archive. Unlike Google's much-maligned project, the Yahoo initiative, called the Open Content Alliance, will only scan books that are in the public domain or for which explicit permission has been granted by the copyright holder. In contrast, Google will scan copyrighted books unless copyright holders specifically request that their books be excluded, though only small portions of copyrighted books will be available online. For its part, Microsoft will finance the scanning of about 150,000 books, while Yahoo will pay for about 18,000 books to be digitized. The Open Content Alliance also differs from Google's project in that all of the content from the alliance will be available from a database to any search engine; Google will be the only means to access the content of its project. Microsoft will create an MSN Book Search service next year, though the business model for particular services and fees has not been set, according to Danielle Tiedt, general manager of search content acquisition at MSN. 2005-10-29 **intellectual property rights violation copyright infringement Google book scanning project lawsuit litigation court damages**

EDUPAGE; http://news.bbc.co.uk/2/hi/business/4358768.stm

MORE SUITS TARGET GOOGLE'S BOOK SCANNING PROJECT

After failing to reach an agreement during several months of negotiations, a group of five publishers has filed a lawsuit against Google over its book-scanning project. The project has come under fire since it was announced, with publishers and copyright holders arguing that scanning their texts constitutes a violation of their copyright, regardless of whether the digital copy is made available online in its entirety. Penguin, McGraw-Hill, Pearson Education, Simon and Schuster, and John Wiley and Sons have sued Google, seeking to have the project cancelled. The publishers are asking for Google to pay court costs but not damages. All five are members of the Association of American Publishers, which had been in talks with Google for months. Last month, an organization representing writers sued Google over the book-scanning project. Google continues to maintain that it respects the rights of publishers and copyright holders and that the project will bring wider exposure for the scanned text. BBC, 19 October 2005

EDUPAGE; http://www.iht.com/articles/2005/11/07/business/bit.php

BITTORRENT USER SENTENCED FOR TRADING MOVIES

A court in Hong Kong has sentenced a citizen there to three months in prison for illegally distributing movies online. Chan Nai-ming was found guilty of making three movies available on his computer with BitTorrent tools and then, under the name Big Crook, of notifying Internet users that the movies were available for download. The case is the first in which a user of the BitTorrent technology has been found guilty of copyright infringement, and the case also represents Hong Kong's stepped up efforts to prosecute file-sharing crimes. The country is seen by many as a haven for intellectual-property crimes, a reputation the Hong Kong government hopes to shed. Government officials applauded the verdict and the sentence, saying they would deter others from committing similar crimes. Chan's lawyer said his client would appeal the verdict. Chan remains free on bail while the legal action continues. International Herald Tribune, 7 November 2005

2005-11-10 **intellectual property rights violation copyright infringement protection Attorney General Alberto Gonzalez BSA RIAA**

EDUPAGE; http://news.com.com/2100-1028_3-5944612.html

FEDS PUSH FOR STRICTER COPYRIGHT PROTECTIONS

According to Attorney General Alberto Gonzales, the Justice Department recently submitted a package of legislative proposals to Congress that would broaden the scope of laws to protect copyright and would strengthen law enforcement powers to investigate such crimes. Among the proposals are recommendations to allow enforcement of copyrights, regardless of whether they are registered; to hold those found guilty of infringement liable for compensation to the victims; and to allow the seizure and destruction of counterfeit goods, equipment used to make such goods, and property acquired with the profits from such goods. The proposals would also make it a crime to "attempt to infringe copyright." Groups such as the Business Software Alliance and the Recording Industry Association of America welcomed the proposed changes to copyright law, while those concerned about fair use rights expressed reservations. An organization called Public Knowledge said in a statement that it is "concerned that the Justice Department's proposal attempts to enforce copyright law in ways it has never before been enforced." 2005-11-22 **Internet Web plagiarism copyright infringement intellectual property rights violations UK British government parents teachers children**

EDUPAGE; http://news.bbc.co.uk/2/hi/uk_news/education/4460702.stm

THE INTERSECTION OF TECHNOLOGY AND CHEATING

An expert in the impact of technology on teaching and learning has told the British government that parents and teachers--not technology tools--can effectively address the problem of Internet cheating. Following a report from the Qualifications and Curriculum Authority that identified widespread cheating, government officials sought advice from Jean Underwood, professor at Nottingham Trent University, about solutions to students' using technology to cheat. Underwood acknowledged that the line between providing appropriate assistance to a student and facilitating cheating is not always clearly defined, and she noted that some technologies can help examiners easily identify instances of plagiarism. But students, she said, will forever be able to find ways to circumvent technology that screens for cheating. The real solution will be to change student attitudes toward their work, making them understand the value of doing it themselves and genuinely learning the material. BBC, 22 November 2005

2005-11-30 **Free Software Foundation FSF General Public License GPL open-source Richard Stallman license revision intellectual property rights copyright**

EDUPAGE; http://www.nytimes.com/2005/11/30/technology/30license.html

OPEN SOURCE LICENSE UP FOR REVISION

The Free Software Foundation has announced plans to revise the General Public License (GPL), which covers many open source applications including the Linux operating system. The license has not been revised since 1991, long before Linux and other open source applications had been implemented widely. Now, according to Eben Moglen, the foundation's general counsel, "The big boys, corporations and governments, have far more reason to be interested and concerned." The GPL and the Free Software Foundation are the creations of Richard Stallman, an unwavering critic of proprietary software and the author of much of the source code that led to the Linux operating system. Stallman has used the license and the foundation to foster what he says are the four principles of software: the ability to use, study, copy, and modify it. Stallman acknowledged that with the success of open source applications in recent years, the task of revising the GPL is complicated by patent issues, which must allow open source and proprietary software to run on the same systems. A first draft of the new GPL will be presented at MIT in mid-January. The revision process is expected to be completed by the end of 2006, with the Free Software Foundation making final decisions about changes. New York Times, 30 November 2005 (registration req'd)

2005-12-12 **intellectual property rights copyright violation infringement Music Publishers' Association MPA scores lyrics downloading illegal**

EDUPAGE; http://news.bbc.co.uk/2/hi/entertainment/4508158.stm

SONG SITES UNDER THE GUN FOR COPYRIGHT VIOLATIONS

An organization representing U.S. sheet music publishers has said that in 2006 it will begin an effort to rein in the illegal online distribution of music scores and lyrics. The Music Publishers'
Association (MPA) said that such material is widely available on the Internet and suggested that, in addition to forcing sites to shut down and fining site operators, sentencing those responsible to jail time would be an effective deterrent. Lauren Keiser, president of the MPA, said the effort would initially focus on "very big sites that people would think are legitimate and very, very popular." David Israelite, president of the National Music Publishers' Association, echoed Keiser's comments, saying sites that publish guitar "tabs" and lyrics are stealing from songwriters and that "all tools under the law" will be used to curb the practice. Recently, music publishing company Warner Chappell forced PearLyrics to shut down its Internet site for unauthorized presentation of song lyrics. Walter Ritter, developer at PearLyrics, complained about the action from Warner Chappell, saying that his company provided a service that users want but that is otherwise unavailable. BBC, 12 December 2005

EDUPAGE; http://online.wsj.com/article/SB113435527609919890.html

HARPERCOLLINS TO DIGITIZE BOOKS

HarperCollins has announced plans to digitize its own books and make those files available through search services, marking the latest development in the rapidly changing landscape of electronic access to books. Google is working on its hotly contested service to scan vast numbers of texts and make them available online, while other companies have begun their own programs to digitize books. The move by HarperCollins is that company's attempt to be a part of new technologies while retaining control over its content. The company will pay to have an estimated 20,000 backlisted books digitized, as well as about 3,500 new titles each year. Those electronic files will be open to search engines to make indexes but not to download images of the pages. According to Brian Murray, group president of HarperCollins, "We'll own the file, and we'll control the terms of any sale." Jane Friedman, chief executive of the publisher, said, "We want to be the best collaborator, but we also want to take charge of our future." The company said the effort would also allow it to keep certain titles available long after they are out of print. Wall Street Journal, 12 December 2005 (sub. req'd)

2005-12-12 **music piracy illegal downloading intellectual property rights copyright violation RIAA lawsuit Cecilia Gonzalez ruling**

EDUPAGE; http://news.com.com/2100-1028_3-5991531.html

APPEALS COURT REJECTS SAMPLING DEFENSE

An appeals court has upheld a federal court ruling against a woman who had been sued by the Recording Industry Association of America (RIAA) for illegally trading music files. The RIAA initially offered Cecilia Gonzalez a settlement of about $3,500, which she rejected, and at her trial, a federal judge ruled in favor of the RIAA. In her appeal, Gonzalez argued that she had only downloaded songs with the intention of "sampling" them to decide if she wanted to purchase them and that this activity was protected under fair use. Gonzalez's computer contained at least 1,370 songs that she had downloaded. The three-judge appeals court rejected her argument and ordered Gonzalez to pay a fine of $22,500. In its opinion, the court compared her defense to a "thief's contention that he shoplifted 'only 30' compact discs, planning to listen to them at home and pay later for any he liked." The ruling gives the recording industry an appellate-court victory that--while only a formal precedent in Illinois, Indiana, and Wisconsin--is likely to bolster its legal efforts to curb illegal file trading. GOOGLE PONDERS STARTING AN ONLINE BOOKSTORE

At this year's Consumer Electronics Show (CES), officials from Google said they are considering launching an online bookstore, though they were quick to say such a venture would depend on permission from copyright holders. Google has been embroiled in ongoing legal disputes with publishers and other copyright holders over its effort to scan millions of texts, creating what CEO Eric Schmidt called "the world's largest card catalogue." Despite Google's contention that the scanning project does not violate copyright, many copyright holders disagree and have challenged the project in court. An online bookstore would be a fundamentally different proposition, according to Google officials, and such a plan would only go forward with the express permission of copyright holders. During the CES, Google unveiled an online video store, the company's first offering that allows consumers to pay for premium content.

EDUPAGE; http://news.com.com/2100-1025_3-6035858.html 23

MICHIGAN PRESIDENT DEFENDS GOOGLE'S BOOK SCANNING

Speaking at the annual conference of the Professional/Scholarly Publishing division of the Association of American Publishers, the president of the University of Michigan defended her institution's participation in Google's Book Search program. The program has upset many publishers and other copyright owners, who contend that the project violates their intellectual property rights. Mary Sue Coleman told conference attendees that the program "is about the social good of promoting and sharing knowledge" and argued that Thomas Jefferson would have loved it. Insisting that vast numbers of cultural artifacts are at risk of being lost due to insufficient efforts at conservation, particularly among libraries, Coleman characterized Google's project as one of preservation and her institution's participation as central to the university's mission. She noted that the University of Michigan had been "digitizing books long before Google knocked on our door, and we will continue our preservation efforts long after our contract with Google ends." Coleman's comment also included a clear defense of the rights of copyright holders. Her institution would not "ignore the law and distribute [protected material] to people to use in ways not authorized by copyright."

2006-03-03 **European Commission EC European Digital Library intellectual property rights copyright issues**

EDUPAGE; http://www.theregister.com/2006/03/03/european_digital_library_goes_live/ 23

EC PUSHES FOR DIGITAL LIBRARY

The European Commission (EC) is supporting a plan to create a European Digital Library that may one day include as many as six million volumes from libraries around Europe. The commission acknowledged that opinions differ about intellectual property concerns for digitized works, noting that a study it conducted showed wide disagreement between rights holders and institutions such as libraries. Still, the EC said it will work to settle those differences and begin working on the project, which would involve collaboration among all of the national libraries in the European Union and potentially other organizations such as museums. The EC said that by 2008, two million books, photographs, and other materials will be available through the European Digital Library and that this total could rise to six million by 2010.

2006-03-13 **online library e-publishing problems Questia Media copyright intellectual property rights issues**

EDUPAGE; http://news.com.com/2100-1025_3-6048801.html 23

ONLINE LIBRARY TRIES TO AVOID PROBLEMS OF E-PUBLISHING

Houston-based Questia Media is a digital-library company whose executives believe they have seen past the errors of e-publishing. CEO Troy Williams and Chairman Rod Canion, who founded Compaq, survived the fallout from failed electronic publishing efforts and now count about 150,000 subscribers to their company's academic offerings, which target high schools and their students. Questia continues, in part, because although users did not warm to the idea of reading a novel on a screen, they are much more willing to conduct academic research online, said Williams. Much of Questia's current library of 65,000 books consists of hard-to-find materials. Much of the library content is copyrighted, so Questia has worked out agreements with publishers and other copyright holders, most of whom are happy to have high school students exposed to their materials.

2006-03-13 **Google service online book sales copyright intellectual property rights Book Search Library Project litigation**

EDUPAGE; http://news.zdnet.com/2100-9588_22-6049002.html 23

NEW GOOGLE SERVICE SELLS BOOKS ONLINE

Google has announced a new service by which it hopes to sell online access to copyrighted books on behalf of publishers, similar to a program announced last fall between Amazon.com and Random House. With Google's new service, users would be able to buy electronic access to the full text of a book, based on terms determined by the publisher, but not allowed to make or save copies of the book. Currently, users of Google's Book Search service can see small bits of books but cannot access the full texts. According to Google, the new program is intended to help publishers increase revenues. The announcement comes as Google's legal troubles continue over its Library Project, a program to scan millions of books, including copyrighted books and those in the public domain. Public domain materials would be available online in their entirety, while only selected portions of copyrighted books would be online. Publishers and other copyright holders have challenged Google in court, saying the company has no right to make digital copies of their books, regardless of how it limits access to those copies.

2006-04-23 **copyright law intellectual property rights US Congress revision Digital Millennium Copyright Act DMCA stricter EFF Software and Information Industry Association**

EDUPAGE; http://news.com.com/2100-1028_3-6064016.html 23

COPYRIGHT LAW UPDATE FAVORS COPYRIGHT HOLDERS

Despite pressure from a number of quarters to introduce restrictions on the Digital Millennium Copyright Act, Congress appears to be headed the other direction. Drafts of the Intellectual Property Protection Act of 2006 are circulating among lawmakers, and a spokesperson for the House Judiciary Committee said the bill will likely be introduced soon. The bill adds a number of new layers to copyright law, including increasing fines for certain copyright crimes; criminalizing attempted copyright violations, even if they fail; and allowing copyright owners to impound "records documenting the manufacture, sale, or receipt of items involved in" violations. Jason Schultz, staff attorney at the Electronic Frontier Foundation, said of this last provision that the recording industry has long wanted the ability to obtain server logs that would indicate "every single person who's ever downloaded" certain files. Keith Kupferschmid, vice president for intellectual property and enforcement at the Software and Information Industry Association, welcomed the bill, saying that it gives government officials needed authority to prosecute intellectual property criminals.

2006-04-27 **copyright infringement intellectual property rights issues RIAA MPAA LANs**

EDUPAGE; http://news.com.com/2100-1025_3-6066118.html 23

COPYRIGHT INFRINGEMENT LETTERS TARGET LANS

The Recording Industry Association of America (RIAA) and the Motion Picture Association of America (MPAA) have sent letters to presidents of 40 universities in 25 states asking that they investigate possible illegal file trading on campus local area networks (LANs). The letters suggest that many students might think that trading copyrighted files across LANs is either not illegal or sufficiently shielded from copyright owners that it's okay to do. The letters encourage recipients to see whether students are using applications such as Direct Connect (DC++), MyTunes, or OurTunes to swap files on LANs and, if so, to take actions to stop them. Fred von Lohmann, a senior staff attorney at the Electronic Frontier Foundation, faulted the RIAA and the MPAA for being out of step with the times. Music labels sent similar letters regarding Napster, he said. "Here we are, seven years later, and the problem from their perspective is bigger than ever." The entertainment industry should make licensing arrangements with colleges and universities, he said, and "let the students do what they're going to do anyway."

1997-05-14 **intellectual property patent antivirus**

COMTEX Newswire

Trend Micro Inc. sued McAfee Associates and Symantec Corp. for patent infringement because the competitors offer antivirus products that scan inbound files from the Internet for viruses. Trend Micro's General Counsel, Robert Lowe, said, "The broadest set of claims basically addresses when you have a server intercepting data being sent from one computer to a second computer, when you perform certain types of virus scanning processes such as separating high risk data from low risk data, and having certain types of predetermined actions that occur when a virus is detected, such as deleting it or storing it in a quarantine area." Other antivirus manufacturers might face lawsuits from Trend Micro as well, said the lawyer.

NewsScan, Salon.com
http://www.salon.com/tech/feature/2000/02/28/geographic/index.html

iCraveTV founder Bill Craig says he's developing technology that will indicate a Web surfer's geographic location when he or she logs on to a site, enabling the site operator to send pages targeted to people in that region. "It would be a huge breakthrough for the Internet and for copyright holders," says Craig, who would also stand to benefit, because it would enable him to sidestep the current controversy over his business of streaming video of sports events and movies to which he doesn't own the rights. The service is legal in Canada, but has unleashed protests from broadcasters in the U.S., and in January a U.S. judge ordered iCraveTV to stop the streaming. Craig is hoping that his "geographic intelligence" technology will alleviate concerns over iCraveTV, and maybe grow into an even more lucrative business than streaming TV broadcasts. "We want to build a business where we can go to rights holders and say, 'You want it released only in Canada, you've got it; in the U.S., you've got it,'" says Craig. (Salon.com 28 Feb 2000)

2000-03-10 **software patents**

NewsScan, USA Today http://www.usatoday.com/life/cyber/tech/cth529.htm

Amazon CEO Jeff Bezos says that even though his company has received two potentially profitable e-commerce technology patents, he believes the length of time that patents protect a piece of software code is too long. "Especially in the age of the Internet, a good software innovation can catch a lot of wind in three or five years," Bezos wrote in an open letter to customers and Internet users (http://www.amazon.com/exec/obidos/subst/misc/patents.html/102-6583935-10424 35). He proposes drastically shortening the current 17-year term, and instituting a one-month public comment period prior to issuing patents so that other companies with similar or superior technology could ensure their rights are protected. Bezos says his company will retain its 1-Click and Amazon Affiliate patents, but will enforce them only "when there are important business reasons for doing so." (AP/USA Today 10 Mar 2000)

The U.S. Patent and Trademark Office is overhauling the way it reviews applications for many online practices, and will now require a broader search of past practices and inventions before awarding patents. The change comes in response to critics who charge the Office with granting overly broad patents for basic Web techniques, such as Amazon's "1-Click" ordering process. Examiners reviewing applications in the business-method area will now have to follow new procedures, including searching online databases for similar technology ideas. "If you make these decisions without adequate data, you run the very real risk of issuing patents on things that were already invented, or patents that are far broader than they should be," says Roland Cole, executive director of the Software Patent Institute. http://interactive.wsj.com/articles/SB968792884357682385.htm

An administrative board for the European Patents Office has voted 10-9 to allow patents for software in Europe, with a final decision coming in November at a conference of the all the countries represented by the Office. Software patents are available in the U.S. and Japan, and multinational companies have been arguing for unlimited patenting as part of a uniform global legal framework. Critics, however, fear that large companies will use the patenting process as a tool to squelch innovative technologies that threaten their standard products. Among the dissenting countries were Germany, the U.K. and France. The head of the German delegation expressed his reservations over the change: "We would have problems with the U.S. tendency to patent everything that can be patented. That would stifle innovation and cause a glut of litigation." (Wall Street Journal 13 Sep 2000)

2000-09-30 **intellectual property patent hyperlink litigation royalties court lawsuit**

NewsScan, New Scientist
http://www.newscientist.com/news/news.jsp?id=ns225851

It turns out that British Telecom has owned a U.S. patent covering hyperlinks for the last 14 years, but up until . . . [June had] made no attempt to exploit the patent commercially. The patent, which expires in 2006, was buried among 15,000 other global patents owned by the telecom giant until it was rediscovered "a few years ago" during a routine review of the company's intellectual property. BT has now decided to commercialize the technology, which allows Web surfers to move between pages by clicking on pictures or text — a move that could earn BT hundreds of millions of pounds. "We are not trying to stop anybody using the Internet. We simply want some reasonable royalties based on the revenues that other organizations are enjoying from making use of this intellectual property," BT said in a statement Monday. "We are not trying to take anything away from Tim Berners-Lee, but [BT] did invent a way of structuring information to make it easily accessible." The company added that it has spent the last two years researching its claim to the technology to make sure it holds up in court. "It is not something you want to shoot from the hip on," it said. (Financial Times 20 Jun 2000)

[However,] British Telecom's claim that it patented Internet hyperlinking technology back in 1976 . . . hit a snag [in September]. The U.S.-based Internet Patent News Service . . . [pointed] patent lawyers to a Web site (http://sloan.stanford.edu/MouseSite/1968Demo.html) that hosts a 90-minute film shot by Stanford University in 1968 featuring Douglas Englebart demonstrating the first computer mouse — and using it to click on hyperlinks. 2000-10-04 **patent business method legislation**

NewsScan, Computer
Userhttp://www.computeruser.com/news/00/10/04/news5.html

A new bill introduced by Reps. Rick Boucher (D-Va.) and Howard Berman (D-Calif.) seeks to strengthen the review process for companies wishing to patent a "business method." The U.S. Patent and Trademark Office has recently come under fire for issuing patents to Amazon.com for its "1-click" check-out model, and to Priceline.com for its "name your own price" e-commerce service. These overly broad patents have led to unnecessary lawsuits over common business practices, say critics. "Something is fundamentally wrong with a system that allows individuals to get patents for doing the seemingly obvious," said Boucher. The Business Method Patent Improvement Act would require the Patent Office to publish all business method patent applications after 18 months, and would offer an administrative "opposition" process to settle disputes without litigation. It would also discourage patents on processes whose only distinguishing factor is that they use a computer to accomplish the task. (Computer User 4 Oct 2000)

ALTAVISTA SAYS IT OWNS WEB INDEXING TECHNOLOGY
AltaVista has claimed a patent on a method of indexing Web sites used by most search engines and company intranets, and is threatening to sue companies using these search techniques for patent infringement. "We believe that virtually everyone out there who indexes the Web is in violation of at least several of [AltaVista's] key patents," says David Wetherell, CEO of CMGI, AltaVista's parent company. AltaVista owns 38 patents, "many of which we think are fundamental to the search area," and has applications pending for another 30, says Wetherell. "If you index a distributed set of databases -- that's what the Internet is. And even within intranets, that's one of the patents." AltaVista's move will intensify the debate over to what extent companies should be allowed to claim monopolies over methods that have become building blocks of the Internet. "If nothing is done, the Web will become fenced in by competing patents, turning an open, free and transparent playing field into a proprietary wasteland littered with nonsensical and stifling legislation," says one critic, CEO of a Web design and development company. TECHNOLOGY IS EASY, POLICY IS HARD: CERF WANTS RULE CHANGES
Internet pioneer and WorldCom senior VP Vint Cerf thinks government policies are impeding the advancement of the Internet, but acknowledges: "Policy problems are harder to solve, and probably more important than the technology ones. Policy doesn't have a simple answer. Sometimes it has to do with attitude, sometimes it has to do with culture, sometimes it has to do with the legal framework." He would like to see the government require phone and cable network companies to share those networks with Internet service providers at a fair price, and he would like to see strong support for the extension of "fair use" principles of copyright law extended to the digital world: "Even though there will be some people in the publishing industry who think fair use isn't fair, I believe it has served reasonably well. We don't have a good definition of fair use for online, digital material." If policy issues were worked out properly, technologists would be able to create a new communications environment that would have enormous impact. For example, people "could download a one-hour HDTV movie in 16 seconds. This changes your whole view of video on demand." And with new views like that will come a renaissance of communication, entertainment, and learning, because "most of the creative uses don't come from the people who design the network, they come from the people who use it. That's what happened with the World Wide Web and Java." (KRT/San Jose Mercury-News 3 Jun 2002)

PICTURE THIS: COMPANY CLAIMS JPEG PATENT
Forgent Networks, based in Austin, Texas, is claiming that a patent it holds covering a "coding system for reducing redundancy" directly applies to the compression technique used in the creation of JPEG images. The patent originally was granted to Compression Labs in 1986 and later acquired by Forgent, which says it will now seek licensing revenue from companies that use JPEG "in all fields of use," with the sole exception of the satellite broadcast business. Last month, Forgent sealed a licensing deal with Sony, and a company spokeswoman says it's in discussions with several other companies, but did not disclose names. In a statement published last week, Forgent said the patent could apply to companies that make "devices used to compress, store, manipulate, print or transmit digital images." The licensing plan has sparked concern among many users of digital imaging technology. "It's sort of an ambushing kind of thing," says one digital photography hobbyist. (Wired.com 19 Jul 2002)

CLICK-AND-PAY: BT ASSERTS PATENT CLAIM FOR HYPERLINKS [7 Feb 2002]
The BT Group in the U.K. is targeting Prodigy in the first of a series of planned lawsuits aimed at enforcing its claim to have a copyright covering hypertext links. The claim, which is supported by a U.S. patent obtained in 1984 (before the creation of the World Wide Web), would allow BT to demand royalty payments from Internet service providers who offered their users the ability to surf the Web by using hyperlinks. A company spokesman argues: "We believe we have a duty to protect our intellectual property and we would expect companies to pay a reasonable royalty based on the revenues that they have enjoyed through the use of that intellectual property." Various critics of the BT lawsuit maintain that hyperlinking was conceived all the way back in the 1960s, and promoted by such well-known Internet luminaries as Ted Nelson and Doug Engelbart. (Retuers/USA Today 7 Feb 2002)
http://www.usatoday.com/life/cyber/tech/2002/02/07/patent-suit.htm

DOUBTS ARISE OVER BT'S CASE FOR HYPERLINK PATENT [13 Feb 2002]
Judge Colleen McMahon, the judge assigned to British Telecom's case defending its right to collect royalties from a 26-year-old patent covering hyperlinking, has raised doubts over the validity of the case. She noted that it would be difficult to prove that a patent first filed in 1976 -- long before the Web was created -- would apply to today's technology, and that comparing a 1976 computer to a 2002 computer was like comparing a mastodon with a jet. If BT prevails, its first likely target for royalty collection is Prodigy Communications, and if that attempt is successful, BT will notify other ISPs in the U.S. that they must pay up. (The U.S. is the only country where the patent has not yet expired.) Some analysts say the royalties could total tens of millions of dollars if the patent is upheld. (Financial Times 13 Feb 2002)
http://news.ft.com/news/industries/internet&e-commerce

BT LOSES BATTLE TO CLAIM HYPERLINK ROYALTIES
In a test case for British Telecom's claim that it owns a patent on hyperlinking technology, U.S. Judge Colleen McMahon has dismissed BT's claims, saying that Prodigy's use of the technology did not infringe on BT's 25-year-old patent. McMahon found several flaws in BT's argument, most notably that the Internet has no "central computer" as described in the original patent filing. As part of its defense, Prodigy offered a 1968 video by Stanford University computer scientist Douglas Engelbart apparently demonstrating hypertext technology, eight years before BT filed its patent application in the U.S. (BBC News 23 Aug 2002)

SONICBLUE AND TIVO CALL A TRUCE
Sonicblue and TiVo are dismissing their patent infringement claims against each other and plan to devote their energies to building the market for digital video recorders (DVRs) instead. "We believe our energies are better spent expanding the market for digital video recorders rather than fighting each other. Both sides believe in the merits of their respective positions, but the overall success of the DVR category is what is most important to the companies at this time," said the two companies in a joint statement. Sonicblue still faces a lawsuit, however, filed by major entertainment companies, including AOL Time Warner, MGM, Disney and the big three TV networks. The plaintiffs allege that the company's service, which allows viewers to strip out commercials and to send copies of recorded programs to other ReplayTV recorders via the Internet, amounts to copyright infringement. AOL PATENTS INSTANT MESSAGING TECHNOLOGY AOL
Time Warner has quietly won a U.S. patent for its ICQ instant messaging technology, representing a potential goldmine for the media giant. The broadly worded patent defines AOL's IM application as one that enables users to chat with and identify one another across a specific "communications network," opening up the possibility for AOL to collect royalties from rivals. ICQ, which was developed in the mid-1990s by a group of Israeli scientists at a company called Mirabilis, was the first breakthrough chat application. It filed a patent for its technology in 1997 and was acquired by AOL in 1998 for $287 million. (Reuters 19 Dec 2002)

SBC CLAIMS PATENT ON WEB INTERFACE
SBC Communications is enforcing its patents on what it claims is any use of frame-like user interfaces in Web sites. According to SBC's interpretation of its "Structured Document Browser" patents, hundreds of thousands of Web sites, including that of the U.S. Patent and Trademark Office, could be infringing on the telecom's intellectual property. "SBC Intellectual Property currently is working with several commercial Web site owners regarding patent licensing agreements related to specific techniques for enabling consistent navigation features from different pages of a Web site," SBC announced in a statement yesterday. At issue are Web sites that use an interface that remains on-screen while a user navigates the site. SBC so far has contacted only a few sites with requests for licensing fees, with suggested amounts ranging between $527 and $16.6 million per year, depending on the annual revenue of the company and what kind of license they sign up for. STREAMING PATENT HAS NET RADIO SITES STEAMED
A company that says it owns patents on the process of transmitting compressed audio or video online is flexing its muscle, demanding fees from a host of Internet multimedia companies. Acacia Media Technologies says its patents may even cover pay-per-view movies on cable TV and in hotel rooms. And while Acacia's move has outraged Internet entrepreneurs, many of them are reluctantly forking over the fees. "We did research on the claims and found that they were pretty clear — somewhat broad, but specific enough to cover us," says Zack Zalon, general manager of the Radio Free Virgin Web site. "We realized that they were tight enough that a license would be substantially less expensive in the long run than litigation." Meanwhile, the trend toward companies exercising ownership over what generally are viewed as overly broad patents has drawn the ire of many experts, but analysts admit it's a strategy that's likely to increase in popularity. "With the economy the way it is, you see a lot more people trying to leverage their intellectual property. It's one of the few ways left that people can actually make money," says Rich Belgard, an independent patent consultant. (CNet News.com 6 Feb 2003)

U.S. PATENT SYSTEM IS BROKEN, SAYS LESSIG
Stanford law professor Lawrence Lessig has warned Europeans not to follow the same path toward software patent protection as the U.S., saying "The system in America is broken — to the great detriment of software developers generally — and there is no reason to believe the Europeans could do any better." Critiquing the last 10 years' tendency toward granting overly broad patents, he notes that software developers — those whom patents ostensibly would protect — are actually some of the most vocal critics of the current system. "Developing software is [now] like crossing a minefield," says Richard Stallman, the originator of the free software movement that has developed the GNU/Linux operating system. "With each design decision, you might step on a patent that will blow up your project." Lessig says that Europeans should take pains to avoid a similar quagmire: "American software developers will continue to choke on software patents, especially as more and more get enforced in massively expensive litigation? Until software patents prove themselves safe and effective, Europe could gain a great deal by sparing its developers the same drug. Rather than copying a failed American policy, the Europeans could be exploring alternatives to patents that might provide protection without sinking the intended beneficiaries. No doctor would approve an untested drug for his or her patient. Nor should Europe inflict such a remedy on its already weakened software industry." (Financial Times 20 Feb 2003)

MOVIELINK SLAPPED WITH PATENT INFRINGEMENT LAWSUIT
Movielink, a joint venture involving five Hollywood studios, has been sued for patent infringement by USA Video Technology in a case that could have an impact on other future video-on-demand endeavors. The USA Video lawsuit alleges that Movielink, which sells digital copies of films for downloading from the Internet, violates a patent called "Store and Forward System" that was awarded in July 1992. The patent broadly covers a method for Internet users to request and receive "a digitized video program for storage and viewing," according to the complaint. The plaintiff's attorney says the resolution of the case could affect many other VOD offerings. "This case is ripe now because the content is available and the legal landscape permits (an online movie rental service)," says Erik B. Cherdak, plaintiff attorney for the case. "The reality is this case has far-reaching effects on whether the corner video store will remain as a going concern in the future." Movielink, which launched last November, is a partnership of MGM, Paramount Pictures, Warner Brothers, Sony Pictures Entertainment and Universal Pictures. (CNet News.com 10 Apr 2003)

LINUX USERS WARNED OF INTELLECTUAL PROPERTY INFRINGEMENT
The SCO Group, which acquired control of Unix intellectual property from Novell after it bought the rights from AT&T back in 1992, has sent letters to Linux customers warning that commercial users may face legal liability for using Linux with a license from SCO. If SCO's tactic is successful, it could undermine one of the basic tenets of the open software movement, of which Linux has been the most successful example. Linux is a Unix derivative first developed in the 1990s, and has won a loyal following because of its low cost, reliability and ability to run on inexpensive computer hardware. Linux developer Linus Torvalds says he has not heard what parts of Linux might be infringing: "I'd dearly love to hear exactly *what* they think is infringing, but they haven't told anybody. Oh well. They seem to be more interested in FUD [fear, uncertainty and doubt] than anything else." The latest move follows a $1-billion lawsuit filed by SCO in March against IBM, alleging IBM took parts of the Unix code and transferred them to Linux. IBM dismissed the lawsuit as unfounded. MICROSOFT SCOOPS UP UNIX LICENSE FROM SCO
Microsoft is buying the rights to SCO Group's Unix technology for an undisclosed amount, in a move that will bolster SCO's controversial campaign to demand royalties from users of the Linux operating software, which SCO claims infringes on its Unix patents. Linux supporters have demanded that SCO identify which parts of the code are duplicative, but SCO says that doing that would allow programmers to cover up their transgressions by rewriting the software. "That's like saying, 'show us the fingerprints on the gun so you can rub them off,'" says SCO CEO Darl McBride. Microsoft, which competes fiercely with both Linux and Unix, at the same time has been a long-time backer of SCO and some in the Linux community have speculated the software giant is secretly bankrolling SCO's litigation to reduce the Linux threat. A Microsoft spokeswoman denied that rumor. (Wall Street Journal 19 May 2003)

W3C ADOPTS POLICY ON PATENTS
The World Wide Web Consortium (W3C) has approved a policy on patents that requires all those who participate in the development of a W3C recommendation must license essential claims on a royalty-free basis. It also requires W3C members to make disclosures on patents they own and requests that anyone else who sees technical drafts share their knowledge of patents which may be essential. At the same time, the policy suggests a process for handling unexpected patent claims that are inconsistent with the terms of the W3C Patent Policy. In that instance, the W3C will convene a Patent Advisory Group, which may then recommend: a legal analysis of the patent, the removal of the patented feature, or cessation of work in that area altogether. The W3C's efforts to create a patent policy have been contentious since it first released its Patent Policy Framework Draft in 2001, says Daniel Weitzner, chair of the Patent Policy Working Group, who cautioned technology companies against trying to exploit the patent exception process. "Anyone who thinks that's going to be an easy way to squeeze fees out of Web standards I think is mistaken," says Weitzner. (Internet News 21 May 2003)

PATENT OFFICE RECONSIDERS CONTROVERSIAL NET PATENT
The U.S. Patent and Trademark Office is taking the unusual step of reconsidering a patent awarded to three University of California researchers in 1998. Patent No. 5,838,906 covers technology used to build small interactive programs into Web pages, potentially affecting everything from banner ads to interactive customer service. The patent's validity was invoked by Eolas Technologies (which was founded by one of the inventors and has licensed the patent exclusively) in its lawsuit against Microsoft. That legal action resulted in a $520 million jury award in favor of Eolas and prompted Microsoft to pledge a redesign of its Internet Explorer browser to avoid further infringement, a move that Web creator Tim Berners-Lee says could "render millions of Web pages and many products of independent software developers incompatible." Deputy patent commissioner Stephen G. Kunin cited "a substantial outcry from a widespread segment of the affected industry" in his decision to reexamine the patent and noted that patent examiners may not have adequately considered "prior art" in their investigations. RISKS; http://www.law.com/jsp/article.jsp?id=1039054478800 23 12

SUING THE CUSTOMERS

Joyce Scrivner writes about a patent infringement countersuit by Rockwell Automation Inc. Rockwell was suing "a law firm currently suing Rockwell's customers." Rockwell customers were being sued because they could potentially cough up more money than Rockwell itself. Rockwell feels that the law firm, Niro Scavone, sought to "'shakedown' manufacturers through threats of potential business interruption or catastrophic damages." In a follow-up article, contributor Paul Robinson comments that Rockwell automation "doesn't have a leg to stand on" in this case. According to patent law, he says, everyone in the chain of producer, distributor, and consumer is liable if they've been in contact with a product that infringes on someone else's patent. It doesn't matter who is actually sued. Robinson adds that Rockwell is wrong to call Niro Scavone's actions a 'shakedown' because the law firm was "using the courts." He explains: "If I threaten you if you don't pay me for something, that's extortion and a crime. If I threaten to sue you if you don't settle, that's legal. If I just sue you anyway, whether I have a case or not, that's also legal."

NewsScan

PATENTLY ABSURD?

A number of industry and government officials have come to the conclusion that the U.S. patent system has become absurd — especially in fields such as computers, software and biotechnology. Intellectual property attorney Mark Banner says: "Very bad patents are getting through. It's draining millions of dollars that could be spent on finding a better mousetrap." Yet the current system has its defenders. Jon Dudas of the Patent Office insists that most patents are valid, and Jay Walker (whose company patented the "reverse auction") argues: "We as a nation are ahead of the rest of the world because we have strong property rights. Everybody said you couldn't have patents on electricity. Guess what? They were wrong." Others in the debate take the position that the problem with the patent system is not that it's unfair but that it's irrelevant: software executive Jordan Greenhall says: "If you didn't have any patents at all, people would still be doing the same stuff because of the speed of the marketplace." ACACIA PRESSURES ACADEMIA FOR PATENT PAYMENTS

Acacia Media Technologies, which last month suffered a setback in its efforts to force adult entertainment sites to make licensing payments for using its patented streaming video technology, has now turned its attention to higher education, whipping off dozens of letters to colleges claiming
the schools' use of streaming video for purposes such as distance learning violates its patents. Acacia's digital media patents were acquired from Greenwich Information Technologies in 2001 and since then Acacia has secured dozens of licensing deals with companies, including Walt Disney.
And while a handful of colleges and universities have agreed to pay up, most have resisted. The American Council on Education and the Electronic Frontier Foundation both are advising colleges not to pay, citing last month's legal ruling that several terms in Acacia's patents were indefinite
-- a verdict that could knock a hole in Acacia's case for demanding payments from other sectors. "Honestly, I think it's a sign of desperation," says EFF staff attorney Jason Schultz. "Acacia knows the hammer is coming down on its patents, and it's going to extract as much as it can before the apocalypse," adding that the company's tactics were "a threat to the future of education… I think that's despicable. Universities are under enough pressure in their budgets right now to try to pay for
everything. The last thing they need to do is give a pound of flesh to some tech company that doesn't even make a product." (AP 9 Aug 2004)

2005-01-11 **IBM patents source projects licensing fees property patents Matsushita Electric Industrial**

EDUPAGE; http://www.nytimes.com/2005/01/11/technology/11soft.html

IBM OFFERS PATENTS TO OPEN SOURCE PROJECTS

IBM will begin allowing the use of 500 technologies covered by patents it holds by developers working on open source projects. While IBM will not forfeit the patents, it will seek no licensing fees from groups that use them on projects that meet a definition by the Open Source Initiative. Despite past donations of intellectual property to open source groups, the new program is seen as a fundamental shift in the company's approach because unlike those donations, this one does not hold the potential to harm IBM's competitors. The 500 patents that will be available involve 14 categories of technology and do not target any specific open source project. IBM said it hopes to create a "patent commons," including the initial 500 as well as other patents, that other companies could join. IBM's new approach to managing its intellectual property, however, has not diminished its pursuit of new patents. IBM, which is the world's largest patent holder, collected 3,248 new patents in 2004, 1,300 more than Matsushita Electric Industrial, which had the second-highest tally for the year.

EDUPAGE; http://news.com.com/2100-1032_3-5596500.html

EOLAS CASE SET TO GO AROUND AGAIN

Both sides claimed partial victory from an appeals court ruling in the patent infringement case between Microsoft and the University of California (UC). The case focuses on technology patented by Mike Doyle, a researcher at the university, which has been incorporated into most Web browsers, including Microsoft's Internet Explorer (IE). Eolas Technologies, a company that was spun off of the university and which holds a patent on the technology, has claimed patent infringement by Microsoft. A lower court found for Eolas and awarded it $565 million in damages, but an appeals court this week sent the case back to a lower court to be tried again. The appeals court ruled that Viola, a browser written before UC applied for its patent, should have been considered by the jury. If Viola is determined to be "prior art," UC's patent could be invalidated. Microsoft has also argued that Doyle misled the U.S. Patent and Trademark Office, a charge that the appeals court decision brings back to the table. In UC's favor, the appeals court said the patent, if valid, covers a wider range of applications than attorneys for Microsoft had argued. The court also upheld the finding that copies of IE shipped abroad would be covered by a U.S. patent and would be considered in determining damages if the patent is upheld. CNET, 2 March 2005

2005-09-30 **intellectual property rights patent infringement lawsuit litigation Eolas University of California Web browser launch technology Microsoft WWC**

EDUPAGE; http://chronicle.com/daily/2005/09/2005093001t.htm

EOLAS RULING SWINGS BACK TO UNIVERSITY OF CALIFORNIA

The U.S. Patent and Trademark Office has issued its final ruling in favor of the University of California in its patent dispute with Microsoft. At issue is a technology used for launching certain applications in Web browsers. The technology was developed at the University of California at San Francisco and licensed to a company called Eolas Technologies. Eolas and the university had earlier won a $521 million judgment against Microsoft for violating the patent in its software, but that ruling was appealed on the grounds that the patent was not valid. Despite a preliminary ruling in which the Patent and Trademark Office indicated its leaning toward Microsoft's position on the Eolas patent, the final ruling upholds all of the university's claims. The ruling rejects the assertions of both Microsoft and the World Wide Web Consortium that the patent relies on "prior art." The case now returns to district court for trial. 2005-11-08 **intellectual property rights patent infringement ACE Acacia Research litigation lawsuit**

EDUPAGE; http://chronicle.com/daily/2005/11/2005110801t.htm

LEGAL DANCE WITH ACACIA CONTINUES

Not long after Acacia Research updated the terms of a licensing agreement it is offering to colleges and universities, officials at the American Council on Education (ACE) said they are continuing with efforts to challenge Acadia's patent claim. Acacia contends that it owns patents that cover streaming of audio and video files over the Web and that most higher education institutions use technology that violates those patents. After a backlash from the terms it initially offered, Acacia revised its offer, freeing small schools from any licensing fee but insisting that large schools owe as much as $5,000 per year. Although ACE was involved in the negotiations that led to the revised offer, David Ward, the organization's president, informed member campuses that ACE has not endorsed any agreement with Acacia and said institutions might benefit from waiting "until the broader legal negotiations are completed." Karlton Butts, vice president of licensing for Acacia, said he is not aware of any broader negotiations and contended that Acacia is "not trying to pull a fast one." Sheldon E. Steinbach, general counsel for ACE, said the communication from Ward was "a clarification that we felt was necessary." Many institutions remain cautious about signing a licensing agreement, pointing to ongoing debate over the legitimacy of Acacia's patent claims. 2005-11-10 **intellectual property rights patent infringement issue share source code**

EDUPAGE; http://news.zdnet.com/2100-3513_22-5943781.html

NEW GROUP ADDRESSES OPEN SOURCE PATENT ISSUE

A new organization hopes to eliminate one of the major obstacles to adoption of open source technology: concern over patent and royalty disputes over shared code. The Open Invention Network (OIN), which includes IBM, Sony, Royal Philips Electronics, and Linux distributors Red Hat and Novell, will acquire and freely share patents that organizers hope will encourage broader adoption of open source tools, particularly Linux. Any organization that agrees not to assert its patents over those who have licenses with OIN will be permitted to use OIN patents for free. The business model for OIN represents a new arrangement in which patents are shared to promote the underlying Linux technology. Industry analyst Richard Doherty said, "A lot of lawyers are going to throw their hands up and ask, 'How do we make money from this?'" The answer, he said, is that they might not. ZDNet, 10 November 2005

2005-11-15 **intellectual property rights patents Open Source Development Labs OSDL library database**

EDUPAGE; http://www.internetnews.com/dev-news/article.php/3564201

OSDL OPENS PATENT LIBRARY

The Open Source Development Labs (OSDL) has unveiled its public patent library (PatentCommons.org), which offers a free searchable database of patents donated to the open source community. The library is a catalogue of patents whose owners have agreed not to exert any control over the technologies as long as they are used to improve the open source community. The OSDL does not hold any of the patents but simply offers the site as a clearinghouse for information about patents, where they came from, what they do, and under what conditions they can be used. Officials from the OSDL said they expect more patents to be added to the database soon but that they wanted to launch the service now, ahead of patent pledges they expect later. The site should free open source developers from much of the uncertainty they have when using patented technologies in their development efforts. Internet News, 15 November 2005

2005-11-28 **intellectual property rights violation patent infringement US Supreme Court Hearing eBay case MercExchange**

EDUPAGE; http://online.wsj.com/article/SB113319064690608067.html

U.S. SUPREME COURT TO HEAR E-BAY PATENT CASE

The U.S. Supreme Court will hear a patent-infringement lawsuit involving eBay and a patent holding company that eBay lost in 2003. MercExchange holds a patent over sales and purchasing methods used in online auctions. The appeal deals with whether the U.S. District Court that handled the case should have issued a permanent injunction against eBay. The Federal U.S. Circuit Court of Appeals, which handles patent lawsuits on appeal, ruled that the federal trial judge should have issued a permanent injunction against eBay, which said they believe the legal reasoning used will force district courts to issue more injunctions in patent lawsuits. Meanwhile, Congress is considering legislation that would change how patent injunctions are issued by federal courts. The U.S. Patent and Trademark Office is also exploring the issue. BLACKBERRY WORKAROUNDS READIED TO SIDESTEP PATENT PROBLEMS

Research In Motion Ltd. said Wednesday, November 30, it is preparing workarounds to keep Blackberry services in the U.S. up and running, in the event a court issues an injunction against the company as a result of ongoing patent litigation. A new chapter emerged in its dispute with NTP Inc., earlier Wednesday when a federal judge invalidated a $450 million settlement between RIM, maker of the Blackberry email device, and the Arlington, VA, patent holding company. The ruling was a victory for NTP, which had argued that the settlement was never finalized. As a result, U.S. District Judge James R. Spencer could next consider whether to re-issue an injunction preventing RIM, based in Canada, from offering Blackberry service in the U.S. In a statement, RIM said it was prepared to argue against the injunction, but also said it was ready to make changes to its technology to avoid the alleged patent infringement. "As a contingency, RIM has also been preparing software workaround designs, which it intends to implement if necessary to maintain the operation of Blackberry services in the United States," the company said.

2005-12-02 **intellectual property rights violation patent infringement Microsoft Internet Explorer IE tweak Eolas Technologies applets ActiveX**

EDUPAGE; http://www.internetnews.com/xSP/article.php/3568286

MICROSOFT TWEAKS IE TO SIDESTEP EOLAS PATENT

Microsoft has made a change to its Internet Explorer browser to avoid infringing on a patent held by Eolas Technologies, though Microsoft continues to dispute the validity of that patent. Eolas was granted a patent in 1998 for a technology that allows certain programs, such as applets or ActiveX controls, to be launched automatically from Web pages. Eolas sued Microsoft in 1999 and in 2003 was awarded $521 million for infringement of its intellectual property. That case has been working its way through appeals courts and is set for a retrial. In the meantime, Microsoft has opted to modify its browser so that users must manually accept the launching of ActiveX controls on Web pages. Unlike an earlier proposal, the one implemented will not require users to accept each such control on a Web page but simply to accept them all at once. Microsoft's Michael Wallent said this solution is less intrusive and that for most users, it will be "an almost invisible change." Microsoft is working with developers to rewrite Web pages in a way to minimize the effects of the change. Internet News, 2 December 2005

RISKS; http://tinyurl.com/dtkra 24 11

BLACKBERRY PATENT INFRINGEMENT LAWSUIT

A "long-running patent infringement battle between the maker of BlackBerry, Research In Motion, and NTP, a tiny patent holding company, might cause a service shutdown, perhaps within a month. … R.I.M., which is based in Waterloo, Ontario, promises it has a solution that will keep its beloved BlackBerries humming even in the face of an injunction. While most analysts view the prospects of a shutdown as unlikely, they have little faith in the proposed solution, which has potential legal pitfalls of its own. What's more, the history of the struggle between the companies means that no outcome is certain."

MOBILE MAIL PATENT SUIT FILED AGAINST MICROSOFT

Visto Corporation of Redwood Shores, California, a start-up company dedicated to mobile e-mail, has sued Microsoft Corporation for infringement of three patents. The suit targets methods for handling information between servers and handheld devices. Microsoft bundles its Windows Mobile operating system with its Exchange e-mail server. According to a Visto release, "This method of bundling software … potentially increases the rate and manner in which their infringement on Visto's patents occurs." Microsoft representatives declined to comment until the company had seen and evaluated the suit. San Jose Mercury News, 15 December 2005

2005-12-19 **NTP RIM Blackberry patent review infringement lawsuit court case e-mail rejection**

EDUPAGE; http://www.nytimes.com/2005/12/20/technology/20rim.html

PATENT OFFICE EXPECTED TO REJECT NTP PATENTS

The U.S. Patent and Trademark Office notified NTP, a patent holding company, and Research in Motion (RIM), maker of the BlackBerry wireless e-mail device, that it expects to reject the five patents held by NTP. The two companies are involved in a patent infringement lawsuit brought by NTP. The patent office had issued preliminary rejections of the e-mail patents in the past, but speeded its review process in response to a request by RIM. The patent review is separate from the patent infringement lawsuit, which could potentially stop most BlackBerry service in the United States. NTP expects to appeal the final patent rulings, a process that could take several years.

2006-01-30 **Microsoft Office forced upgrade corporate business users legal setback**

DHS IAIP Daily; http://news.zdnet.com/2100−3513_22−6032870.html 23

MICROSOFT PATENT SPAT FORCES BUSINESSES TO UPGRADE OFFICE.

Microsoft has begun e-mailing its corporate customers worldwide, letting them know that they may need to start using a different version of Office as a result of a recent legal setback. The software maker said Monday, January 30, that it has been forced to issue new versions of Office 2003 and Office XP, which change the way Microsoft's Access database interacts with its Excel spreadsheet. The move follows a verdict last year by a jury in Orange County, CA, which found in favor of a patent claim by Guatemalan inventor Carlos Armando Amado. Microsoft was ordered to pay $8.9 million in damages for infringing Amado's 1994 patent. That award covered sales of Office between March 1997 and July 2003. Although existing customers can keep using older versions on current machines, any new installations of Office 2003 will require Service Pack 2, released by Microsoft in September. Office XP will need to be put into use with a special patch applied. The software maker started notifying customers this month, in an e-mail sent via its sales channel. All those affected will have been informed by next month, Microsoft said. The company said the necessary downloads are available from its Website.

2006-03-03 **Blackberry patent litigation completed RIM NTP**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1933824,00.asp 23

RIM, NTP SETTLE CASE: BLACKBERRY SERVICE IS SAFE.

BlackBerry maker Research In Motion (RIM) and patent-holding company NTP on Friday, March 3, announced that both parties have entered into a settlement agreement and a license that will end the patent litigation that had been threatening to shut down BlackBerry service in the United States. Under the terms of the settlement, RIM will make a one-time payment to NTP of $612.5 million. In return, NTP has granted RIM a license that will let RIM continue its BlackBerry-related wireless business, according to officials at both companies. The license covers all the current wireless e-mail patents involved in the litigation as well as any future NTP patents, officials said. The resolution also protects all the wireless carriers and channel partners who sell BlackBerry products, as well as any other hardware makers who have licensed BlackBerry software for use in their own devices.

EDUPAGE; http://chronicle.com/daily/2006/03/2006032802n.htm 23

ANOTHER PATENT THREATENS CAMPUS TECHNOLOGY

Another company has contacted a number of colleges and universities about a technology patent they might be infringing, this time for systems that transfer money across the Internet to campus cards. in 1998, JSA Technologies applied for a patent, which was granted in 2005, that covers such transfers. Many institutions use campus cards for student expenses such as books, food in snack bars, or campus fees. Jon Gear, vice president of JSA, said the company has no intention of forcing institutions to discontinue their funds-transfer systems. The company, he said, is simply enforcing a patent that protects its intellectual property. Gear said JSA contacted a number of schools, though he declined to say how many or to name them, and will negotiate licensing fees, which he said would be "negligible." Lowell Adkins, executive director of the National Association of Campus Card Users, said his organization is working to clarify the issue. "It's still really unclear what the scope of the patent is," he said. "We need to understand how they're going to exercise their rights."

2006-04-06 **Electronic Frontier Foundation EFF US Patent and Trademark Office online test-taking patent intellectual property rights**

EDUPAGE; http://chronicle.com/daily/2006/04/2006040601t.htm 23

EFF CALLS FOR PATENT TO BE INVALIDATED

The Electronic Frontier Foundation (EFF) has called on the U.S. Patent and Trademark Office (USPTO) to invalidate a patent that broadly covers technologies that allow tests to be posted and taken online. In 2003, the USPTO granted the patent to Test.com, which has since contacted a number of colleges and universities, as well as businesses, that conduct online testing, saying those services violate the patent. Many of those approached by Test.com believe that the idea of putting tests on the Web is too obvious to warrant a patent. Now, the EFF says it has evidence that, even if the idea justifies a patent, Test.com was not the first to develop the technology to make it happen. According to the EFF, the IntraLearn Software Corporation began selling products with online testing capabilities in 1997, two years before Test.com applied for its patent. Jason Schultz, staff lawyer for the EFF, said that the USPTO would address the validity of the patent, which could take as long as a year or more. If the office determines that a patent is appropriate, said Schultz, it will "a tiny insignificant patent" rather than the very broad patent granted to Test.com.

2000-03-16 **Internet content filtering censorware reverse engineering hacking civil lawsuit restraining order**

AP, NewsScan, USA Today 20 85
http://www.usatoday.com/life/cyber/tech/cth570.htm; RISKS

Microsystems Software Inc. (Framingham, MA) filed a civil lawsuit in mid March 2000 against two software experts who reverse engineered their Cyber Patrol software. Eddy L. O. Jansson (thought to live in Sweden) and Matthew Skala (a graduate student in computer science at University of Victoria in British Columbia, Canada) posted a utility called "cphack" on the Web to allow kids to determine their parents' password for the program's administration functions and thus bypass Cyber Patrol filters. The software was instantly posted around the world, making it impossible to stop the spread of the anti-censorware regardless of what the authors do.

Bear Giles, a frequent and always lucid commentator in RISKS, wrote that the entire question of encrypting the blacklists should be examined. Are these lists of forbidden sites concealed to protect children? Against what? "[H]ow would knowing that a site is on the blacklist permit a kid to access the blocked site? How many kids have the technical knowledge to edit the blacklist?" Giles asked whether such lists are encrypted as an anticompetitive measure and to prevent users and analysts from determining the rate of false positives (exclusion of sites on spurious grounds).

A federal judge in Boston . . . [ordered] a halt to distribution of the "cphack" software created by two computer hackers by reverse-engineering the commercially distributed "Cyber Patrol" program that allows parents to shield their children from pornography on the Internet. The judge's order also applies to any mirror Web sites where the program has been made available. Peter Junger, a law professor and free speech advocate, calls the ruling "a rather horrifying challenge to people's right to write software" and to figure out how it works by taking it apart and examining it. (USA Today 17 Mar 2000)

2000-03-24 **Internet content filtering censorware reverse engineering hacking civil lawsuit restraining order subpoena court documents e-mail forgery delivery reliability**

NewsScan

In the MicroSystems case against two hackers who reverse-engineered that company's "Cyber Patrol" filtering software in order to create a "cphack" program to thwart its effectiveness, MicroSystems attorney Irvin B. Schwartz prevailed on U.S. District Judge Edward Harrington to allow him to send e-mail copies of the restraining order to anyone who is distributing a copy of cphack. Schwartz says, "It makes sense. You want to put people who might conceivably be in violation of a court order that they're on notice... It provides a medium to serve the court's order at Internet speed as opposed to snail mail or even worse, by courier." But Wired magazine columnist Declan McCullagh charges that the e-mails are "subpoena spam" and says: "E-mail is easy to forge. I can't even be certain it really did come from a real lawyer." 2000-03-28 **Internet content filtering censorware reverse engineering hacking civil lawsuit restraining order copyright**

POLITECH, Wired

The Mattel suit trying to stop distribution of cphack moved to the next stage on March 28, 200 when Judge Edward Harrington of the US District Court in Boston ruled that all mirror sites must remove copies of cphack or face legal consequences. In an interesting twist, Mattel declared in court that it now owned the copyright for cphack and therefore could control its distribution. However, Declan McCullagh pointed out that the original software was released under the GNU General Public License, apparently permitting anyone to distribute the code for free regardless of later copyright claims.

In early April, the ACLU filed suit for a stay of Judge Harrington's order while they appealed his ruling.

Crypto-gram http://www.counterpane.com/crypto-gram-0004.html 00 04

Bruce Schneier of Counterpane Internet Security < http://www.counterpane.com/index.html> analyzed the disastrous Uniform Computer Information Transactions Act (UCITA) which was signed into law in Virginia and Maryland. Specifically, he pointed out that the Act allows software makers to include a back door so they can remotely disable software if users fail to abide by the terms of their license. As Schneier wrote, "The naive conceit here is that only the manufacturer will ever know this disable code, and that hackers will never figure the codes out and post them on the Internet. This is, of course, ridiculous. Such tools will be written and will be disseminated. Once these tools are, it will be easy for malicious hackers to disable peoples' computers, just for fun. This kind of hacking will make Back Orifice look mild." As for using public-key cryptography to ensure that only authorized instructions could be effective, Schneier commented that such assurances would depend upon perfect implementation of cryptography; however, "Given the industry's track record at implementing cryptography, I don't have high hopes."

SUN CLAIMS VICTORY OVER MICROSOFT IN JAVA DISPUTE
Microsoft yesterday agreed to settle a long-running legal dispute with Sun Microsystems over Sun's Java programming language and related software development tools. Under the terms of the settlement, Microsoft will pay Sun $20 million and accept Sun's termination of its prior Java licensing agreement. In addition, Microsoft will relinquish use of the Java trademark. The lawsuit, originally filed in 1997, alleged that Microsoft had modified Java in order to optimize its performance with the Windows operating system. Microsoft said it decided to settle in order to avoid "costly litigation" and left open the possibility that it might now proceed to develop its own, independent version of Java. Meanwhile, Sun CEO Scott McNealy called the settlement "a victory for our licensees and consumers. The [software development] community wants one Java technology. This agreement further protects the authenticity and value of Sun's Java technology." (Financial Times 24 Jan 2001)

RECORDING INDUSTRY THREATENS RESEARCHER WITH LAWSUIT [24 Apr 2001]
The litigation department of the Recording Industry Association of America (RIAA) has threatened legal action against a Princeton University computer scientist if he and his colleagues give a conference presentation this week explaining how to get around a system developed by the industry to protect copyrighted music. The researcher, Dr. Edward W. Felton, works in the field of steganography, which develops techniques such as digital watermarking. The head of RIAA's litigation department insists: "There is a line that can get crossed, and if you go further than academic pursuit needs to go, you've crossed the line and it's bad for our entire community, not just for artists and content holders, it's everyone who loves art, and it's also bad for the scientific community." (New York Times 24 Apr 2001)
http://www.nytimes.com/2001/04/24/technology/24MUSI.html

COMPUTER RESEARCHERS YIELD TO THREAT OF LITIGATION [27 Apr 2001]
A group of computer scientists at Princeton and Rice universities has decided to withdraw an academic paper that was to be presented at a conference this week, because the Recording Industry Association of America said that public presentation of the work would violate the Digital Millennium Copyright Act of 1998, because it would describe how to evade the systems used to protect copyrighted music. Princeton computer scientist Edward W. Felton explained the group's decision by saying: "Litigation is costly, time-consuming, and uncertain, regardless of the merits of the other side's case. We remain committed to free speech and to the value of scientific debate to our country and the world." John McHugh of Software Engineering Institute at Carnegie Mellon University commented: "This was an excellent technical paper. This was pure and simple intimidation. This paper didn't do anything that a bright technical person couldn't easily reproduce." (New York Times 27 Apr 2001)
http://www.nytimes.com/2001/04/27/technology/27MUSI.html

COURT CASE TESTS ACADEMIC FREEDOM AND COPYRIGHT LAW [7 Jun 2001]
Princeton University computer scientist Edward W. Felton and colleagues at Princeton, Rice and Xerox, have asked a federal court for a declaratory judgment that would overturn a part of the 1998 Digital Millennium Copyright Act. The scientists say that the DMCA has constrained them from presenting their research results because the recording industry said the research, if made public, would undermine the industry's antipiracy technology, used to protect content on compact disks. Dr. Felton says that what is needed is "a broad principle that scientific investigation and publication is okay, that discussion of these technologies is okay. Publication is how scientists communicate with each other." (New York Times 7 Jun 2001)

AIMSTER VS. RECORDING INDUSTRY [21 May 2001]
The recording industry may be hoist on its own petard if the Napster-like music swapping service called Aimster is successful in its legal strategy against the Recording Industry Association of America (RIAA). Unlike Napster, Aimster (which has no central servers to maintain and leaves users individually responsible for their actions) encrypts transmissions, and so there is no way for the RIAA or any other outside party to distinguish between files which are in compliance with copyright law and those that infringe on it. Of course, RIAA could simply decrypt the files -- but then it would be in violation of the Digital Millennium Copyright Act (DMCA), a law that it strongly supports, and that makes it a criminal offense to circumvent encryption protection of copyrighted material. (The New Republic 21 May 2001)
http://www.tnr.com/cyberlaw/babbitt051101.html

NOW IT'S AIMSTER'S TURN [25 May 2001]
"This is Napster all over again": Five major record companies, of which four are represented by the Recording Industry Association of America (RIAA), have filed a lawsuit against the Internet service Aimster, charging it with allowing users to illegally exchange copyrighted music. But Aimster insists that, unlike Napster, it's "not a music sharing service" but a service that delivers private messages and files (music or any other kinds of files) and is not authorized to examine the content of those communications. (New York Times 25 May 2001)
http://www.nytimes.com/2001/05/25/technology/25MUSI.html

AIMSTER TARGETED BY NEW LAWSUIT [5 Jul 2001]
Aimster, already being sued for copyright infringement by a long list of recording companies, is now being sued by the National Music Publishers Association (NMPA), whose chief executive says: "We are extremely disappointed that before the ink was even dry on Ninth Circuit Court of Appeals' opinion concluding that Napster was engaging in massive copyright infringement, another Internet music service would seek with impunity to supplant Napster and expect to get away with it." But the Aimster's chief executive charges that the publishers are in collision with the recording industry, and says that Aimster is quite different from Aimster. He insists that Aimster is not a music-swapping service like Napster, but rather an instant messaging system that, coincidentally, allows files of all kinds to be swapped confidentially through member "buddy lists." (Reuters/USA Today 5 Jul 2001)
http://www.usatoday.com/life/cyber/tech/2001-07-05-aimster.htm

NAPSTER ALTERNATIVE USE UP 20% [5 Nov 2001]
The use of Napster-like peer-to-peer music file-sharing sites like Kazaa, MusicCity and Grokster rose 20% during the month of October, signaling U.S. Internet users' insatiable demand for digital music and video downloads. All three sites use software licensed from FastTrack, an Amsterdam-based technology company, and share the same network. "The growth of the FastTrack network continues to be astounding," says a Webnoize analyst. "During the last four months the number of users typically logged on has risen by 480%, and in November will likely surpass the 1.57 million simultaneous users that Napster... enjoyed at its peak... As higher awareness translates into higher usage, the FastTrack network may ultimately become many times larger than Napster ever was." Meanwhile, a recent Jupiter Media Metrix survey shows that song-swapping has declined in Europe over the same period. According to the report, music downloads are down by 50% in Europe since February, the point at which Napster usage hit its zenith. (Reuters 5 Nov 2001)

ADOBE CHIMES IN, ASKS GOVERNMENT TO FREE DMITRY [24 Jul 2001]
Adobe Systems is asking the government to release Russian programmer Dmitry Skylarov, who was arrested last week in Las Vegas for violating the Digital Millennium Copyright Act (DMCA) by trafficking in code used to break the encryption used to protect Adobe's eBook Reader software. An international "Free Dmitry" movement has protested the government's action, which was taken at Adobe's urging. Adobe now says that although it strongly supports the DMCA and the enforcement of copyright protection of digital content, it believes that " the prosecution of this individual in this particular case is not conducive to the best interests of any of the parties involved or the industry." A lawyer for the Electronic Frontier Foundation, a civil liberties advocacy group, said: "We explained to Adobe, imagine how you would feel if one of your programmers was visiting in Russia and was arrested for making software that was considered illegal there? It sort of hit home with them that what they are doing here isn't right." However, a government attorney prosecuting the case says: "This is a criminal case brought by the United States against the defendant, and to that extent no one else is a party." (San Jose Mercury News 24 Jul 2001)

"FREE DMITRY" PROTESTS CONTINUE [31 Jul 2001]
About a hundred protesters showed up yesterday in San Francisco to denounce the arrest of Russian programmer Dmitry Sklyarov, who the government has accused of violating the U.S. Digital Millennium Copyright Act (DMCA). The charge was based on Sklyarov's role in the development of software used to evade copyright protections used on Adobe eBook software. An attorney for the Electronic Freedom Foundation told the gathering of Sklyarov supporters that the long-standing "Fair Use" principle of copyright law "allows people to make use of things freely without the permission of the copyright holder." One protester said: "I'm interested in freedom of speech and trying to redress the balance between copyright holders to control information and the lack of the individual's right to challenge that." (Reuters/San Jose Mercury News 31 Jul 2001)

BAIL FOR DMITRI [7 Aug 2001]
A federal district court in San Jose has released the 26-year-old Russian programmer and graduate student Dmitri Sklyarov on $50,000 bail. Arrested at a software conference in Las Vegas, he is charged with criminal violation of the Digital Millennium Copyright Act (DMCA) of 1998, and faces up to five years in prison and a half-million dollar fine for promoting a software product that evades the encryption algorithms used by Adobe Systems to protect e-books. Sklyarov is viewed by many as a martyr for the cause of freedom of information, and his lawyer says: "If there are constitutional questions out there, we're certainly going to be raising them. I see this as being an intellectual fight to the death. Either the criminal provisions of the DMCA are going to be killed, or we're in a position where some civil liberties are going to be killed." (New York Times 7 Aug 2001)
http://partners.nytimes.com/2001/08/07/technology/07HACK.html

DID DMITRI VIOLATE RUSSIAN LAW? NYET! [9 Aug 2001]
The Russian official responsible for fighting high-tech crimes in that country says that programmer Dmitri Sklyarov, arrested in Las Vegas for violating U.S. digital copyright laws, broke no Russian laws. "If this case was being reviewed in Russia, we would have nothing against Dmitri Sklyarov. No crime falling under current Russian law has been committed." Sklyarov, now out on $50,000 bail, is charged with having violated the 1998 Digital Millennium Copyright Act (DMCA) by promoting software capable of evading the encryption used by Adobe's eBook Reader. Adobe has dropped its support of the case. (AP/San Jose Mercury News 9 Aug 2001)
http://www.siliconvalley.com/docs/news/svfront/075617.htm

WHAT IS DMITRI THINKING? [3 Aug 2001]
Here's what Dmitri Skyarov -- the 26-year-old Russian cryptographer arrested in Las Vegas for violating the Digital Millennium Copyright Act -- has this to say about what has happened to him: "If someone will allow me to choose not to be famous in this case, I would prefer not to be famous. I'm not company chief. I'm just a programmer." The programs he developed are written in Russia and violate no Russian laws. He's anxious to return to his wife and two children in Moscow, where his hope is "to be as independent as possible. It's very hard to have real dreams in Russia. All things change very fast, and you never know what will happen tomorrow." (San Jose Mercury News 13 Aug 2001)
http://www.siliconvalley.com/docs/news/svfront/sklyar081101.htm

RELEASE OF RUSSIAN PROGRAMMER [14 Dec 2001]
Dmitry Sklyarov, the 27-year-old Russian programmer arrested in the U.S. for violating the Digital Millennium Copyright Act (DMCA) by writing and promoting code that could be used to evade the copy-protection features of the Adobe Acrobat eBook Reader, is being released, but the U.S. government will continue its prosecution of his employer, ElcomSoft of Moscow. Skylarov's cause was embraced by a worldwide collection of programmers, scientists, free-speech advocates and civil libertarians who organized "Free Dmitry" rallies. COPYRIGHT TRIAL SET FOR RUSSIAN
Associated Press

The first criminal trial under the Digital Millennium Copyright Act will begin Aug. 26, a federal judge decided Monday. ElcomSoft Co. Ltd. of Moscow could be fined $500,000 if convicted of selling a program that let users circumvent copyright protections on electronic-book software made by Adobe Systems Inc. Such programs are legal in Russia but banned under the 1998 Digital Millennium Copyright Act. Attorneys for the company failed this month to convince a judge that the law is too broad, vague and unconstitutional.

*STUDENT CRACKS XBOX, OPENS GAME CONSOLE TO OTHER OSES
With three weeks of work and $50 in hardware, a graduate student at the Massachusetts Institute of Technology cracked the security protections of Microsoft's Xbox, making it possible to run competing software and operating systems on the popular video game console. In a paper posted on MIT's Web site last weekend, Andrew Huang described how he build hardware that read the Xbox's internal security system and crack the encrypted data exchanged between two chips that prevented the console from being exploited. Huang says he technique gives users the ability to turn the Xbox into a standalone computer that can run non-Microsoft software and OSes, including rival Linux. Huang says he also discovered a series of other vulnerabilities that could allow users to run the code of their choice on the box and identify users when the Xbox is connected to the Internet.

2002-12-17 **jurisdiction prosecution intellectual property reverse engineering e-commerce electronic books DMCA fair use free speech**

Security Wire Digest 4 26

JUDGE UPHOLDS U.S.'S RIGHT TO PROSECUTE ELCOMSOFT
A federal judge in California has ruled the United States has jurisdiction to prosecute a Russian software company that last year marketed a program on the Internet that allowed pirating of electronic books. Lawyers this week asked the same judge to dismiss copyright infringement charges leveled against ElcomSoft last year under the Digital Millennium Copyright Act (DMCA) on grounds the DMCA is too far-reaching and unconstitutional. ElcomSoft created a product that breaks the copyright protections in Adobe Systems' eBook Reader. One of its programmers, Dmitry Sklyarov, was arrested in July after speaking about the tool at the DefCon hacker conference in Las Vegas. In February, Sklyarov entered a plea-bargain deal, admitting to five DMCA violations. ElcomSoft argues the DMCA doesn't clearly define tools considered illegal, making all technologies suspect. This, they argued, violates fair-use and free speech rights. Prosecutors maintain the 1998 copyright law is broad, but clear on prohibiting tools that circumvent copyright protection controls.

RUSSIAN FIRM CLEARED IN U.S. COPYRIGHT CASE
ElcomSoft Co. Ltd., based in Moscow, has been found not guilty of criminal charges that it violated the 1998 U.S. Digital Millennium Copyright Act by selling a software program designed to circumvent the digital locks used to enforce copyright protections on Adobe Systems e-book software. The two-week trial was the first criminal prosecution under the controversial DCMA, which prohibits the sale of technology that can be used to break the code that "locks" digitally formatted movies, music and other software. The case hinged on whether ElcomSoft had "willfully" violated U.S. law, an intent the defendants denied. "They never intended to violate the law," said defense attorney Joseph Burton. ElcomSoft president Alexander Katalov pointed out that the program was legal in Russia and was not meant to be used for electronic books that had not been legally purchased. He said he didn't know that the software was illegal under U.S. law. (Reuters 17 Dec 2002)

SUPREME COURT BACKS OFF ON DVD DESCRAMBLING CODE
The U.S. Supreme Court has rescinded an emergency stay barring defendant Matthew Pavlovich from distributing DeCSS, a software utility that descrambles the digital lock on most DVDs to prevent copying them. Pavlovich is now free to distribute the code, but could be sued again if he decides to do so. "The entertainment companies need to stop pretending that DeCSS is a secret," says Cindy Cohn, legal director for the Electronic Frontier Foundation, which is assisting Pavlovich. "Justice O'Connor correctly saw that there was no need for emergency relief to keep DeCSS a secret. It doesn't pass the giggle test." The rescission is just the latest twist in a case that has been winding its way through the courts since 1999, when the DVD Copy Control Association — a coalition of movie studios and consumer electronics makers — filed a lawsuit against scores of people, alleging violations of California's trade secret laws. JUDGE DISMISSES CHALLENGE TO DIGITAL COPYRIGHT ACT
U.S. District Judge Richard Stearns has dismissed a lawsuit by the American Civil Liberties Union on behalf of a Harvard student who sought proprietary information from software company N2H2 so that he could reverse-engineer its software filtering product. The student and the ACLU had argued that software filters violate constitutional free speech protections because such filters unintentionally block far more than just pornography, and thereby deny people access to information to which they have a right. But Judge Stearns ruled that "there is no plausible protected constitutional interest that Edelman can assert that outweighs N2H2's right to protect its copyrighted material from an invasive and destructive trespass." 2003-04-16 **Digital Millenium Copyright Act Super DMCA privacy anonymizing restrictions bill law legislation offshore**

NIPC/DHS

April 14, SecurityFocus — 'Super-DMCA' fears suppress security research.

University of Michigan graduate student Niels Provos who is noted for his research into steganography and honeypots — techniques for concealing messages and detecting hackers, respectively — says he's been forced to move his research papers and software offshore and prohibit U.S. residents from accessing it, in response to a controversial new state law. At issue are the so-called "Super-DMCA" (Digital Millennium Copyright Act) bills under consideration in seven states, which have already become law in six others. The state measures appear to target those who would steal pay-per-view cable television shows or defraud broadband providers. The Michigan law, which took effect on March 31st, typifies the legislation: Among other things, residents of the Great Lakes State can no longer knowingly "assemble, develop, manufacture, possess, deliver, offer to deliver, or advertise" any device or software that conceals "the existence or place of origin or destination of any telecommunications service." It's also a crime to provide written instructions on creating such a device or program. Violators face up to four years in prison. Taken literally, the law would target businesses like Anonymizer.com and Hushmail — both services cater to privacy-conscious Internet users determined to conceal their place of origin from marketers, or to communicate anonymously. Critics say it would also ban firewalls and NAT boxes, dealing a blow to Internet security.

2003-05-13 **DMCA copy protection Digital Millennim Copyright Act ACM Association Computing Machinery hackers ckrack security systems patents copyright**

NIPC/DHS

May 13, SecurityFocus — Security research exemption to DMCA considered.

Computer security researchers would be allowed to hack through copy protection schemes under a proposed exception to the Digital Millennium Copyright Act (DMCA) being debated in official hearings this week. The DMCA's anti-circumvention provision generally makes it unlawful for anyone to "circumvent a technological measure that effectively controls access" to DVD movies, digital music, electronic books, computer programs, or any other copyrighted work. However, the Association for Computing Machinery (ACM) would like an exemption permitting white hat hackers to crack copy protection schemes "that fail to permit access to recognize shortcomings in security systems, to defend patents and copyrights, to discover and fix dangerous bugs in code, or to conduct forms of desired educational activities."

CHALLENGE TO DMCA; 'TOO SOON TO CHANGE THE LAW' SAYS HATCH
Verizon is challenging the constitutionality of the subpoenas forcing Verizon to turn over names and addresses for at least four Internet subscribers. The Digital Millennium Copyright Act of 1998 permits music companies and others to force Internet providers to turn over the names of suspected pirates upon subpoena from any U.S. District Court clerk's office (and a judge's signature is not required). Sen. Orrin Hatch (R-Utah), chairman of the Senate Judiciary Committee, has said that it's too early to consider changing the 1998 law. "These issues have not ripened enough. I don't think we can yet determine if these subpoenas are being used responsibly to identify alleged infringers... As we start to hear more voices protesting the impact of these subpoenas, there may be more of a chance to reconsider their impact." (AP/San Jose Mercury News 16 Sep 2003)

NewsScan; http://www.wired.com/news/infostructure/0

REVERSE ENGINEERING TAKES A LESSON FROM THE GENOME PROJECT

There's a lot more in common between reverse-engineering software and the algorithms used in bioinformatics research than you would expect, says security analyst Marshall Beddoe. In both cases, scientists must fill in a lot of blanks -- much of bioinformatics is devoted to finding DNA sequences separated by long gaps of unknown data, and the same is true in protocol reverse-engineering. Scientists attempting to reverse engineer software protocols find that network conversations are full of "junk" -- usually the actual data being sent -- which interferes with the analysis of the of the command sequences. Beddoe solved the problem by using bioinformatics algorithms to eliminate the junk data sandwiched between commands. Meanwhile, Avaya senior security consultant Dan Kaminsky says he's investigating using genomic pattern analysis for identifying and clustering "mutant" machines on a corporate network. "Generating an ordered, hierarchical breakdown of interrelationships from huge piles of information is a problem that crops up everywhere. I'm not surprised to see bioinformatics solutions finally being applied to the rest of our poorly understood, oversized networks," says Kaminsky.

EFF SEEKS PROTECTION FOR COMPUTER RESEARCHERS

The Electronic Frontier Foundation (EFF) has called on Sony EMI to pledge not to pursue prosecution of computer researchers who investigate the security of the company's products. Last fall, the company was caught in a public outcry over technology included in music CDs. The technology installed itself on users' computers and scanned them for potentially illegal activities. The company has removed those tools from CDs, but security researchers believe they have reason to reverse engineer copy protections on EMI CDs, a practice which would violate not only the Digital Millennium Copyright Act but also EMI's end user license agreement. Fred von Lohmann, senior staff attorney with EFF, said, "When it comes to computer security, it pays to have as many independent experts kick the tires as possible, and that can only happen if EMI assures those experts that they won't be sued for their trouble."

EDUPAGE; http://www.internetnews.com/bus-news/article.php/3599026 23

EFF LISTS CONSEQUENCES OF DMCA

The Electronic Frontier Foundation (EFF) has issued a report detailing what it said are the unintended effects of the Digital Millennium Copyright Act (DMCA). The law was enacted seven years ago to address intellectual property issues that arose with the development of the Internet and other technologies. Among other provisions, the law includes a prohibition on circumventing antipiracy measures, even if such circumvention was done for reasons that reasonable people would see as legitimate, according to the EFF. In a number of cases, the DMCA has been invoked to suppress information obtained by researchers about security weaknesses. The EFF's report said that the law has been used not so much to limit piracy as to "threaten and sue legitimate consumers, scientists, publishers, and competitors." The Cato Institute recently released a report on the DMCA with similar findings.

RISKS; CNET news.com http://tinyurl.com/k5ebw 24 26

CONGRESS PROPOSING TO STRENGTHEN DMCA

For the last few years, a coalition of technology companies, academics and computer programmers has been trying to persuade Congress to scale back the Digital Millennium Copyright Act.

Now Congress is preparing to do precisely the opposite. A proposed copyright law seen by CNET News.com would expand the DMCA's restrictions on software that can bypass copy protections and grant federal police more wiretapping and enforcement powers.

The draft legislation, created by the Bush administration and backed by Rep. Lamar Smith, already enjoys the support of large copyright holders such as the Recording Industry Association of America. Smith, a Texas Republican, is the chairman of the U.S. House of Representatives subcommittee that oversees intellectual property law.

SOFTWARE REVIEW PROHIBITION CHALLENGED BY LAWSUIT [8 Feb 2002]
The State of New York is suing Network Associates, a company that makes McAfee Virus Scan and other software products, over a Network Associates prohibition which specifies: "The customer will not publish reviews of this product without prior consent from Network Associates Inc." New York says that the company is guilty of censoring consumers in order to shield itself "from criticism and commentary that is the essence of the free market." Network Associates argues that its use of the restriction is nothing more than an attempt by the firm to exercise its right "to set the terms of its license," which is a matter between the consumer and the company. In its response to the lawsuit, the company has also explained that its only motivation for the restriction was to make sure that customers did not publish reviews of outdated versions of products. 1999-04-26 **theft law enforcement deterrence detection forensics**

JOURNAL OF COMMERCE

Computer crime and theft of high-tech components cost a lot not only to the victims but also to law enforcement agencies forced into expensive and lengthy investigations and court cases. The San Jose Police Department decided to use a bit of outreach in a bid to reduce vulnerability to high-tech crime. A four-person squad operates a computer forensics laboratory that helps in investigations of all sorts where computer data are part of the evidence; the members also visit local industries to point out vulnerabilities and encourage tighter physical and computer security. The officers encourage insurers to push prevention as an important tool: "We don't have all the answers," Lieut. Stephen Ronco, commander of the unit, said. "But if underwriters can go back to their respective clients and simply ask them, how are you preventing such crimes, are your inventory audits tight, do you have security measures and other anti-theft policies in place to give guidance to supervisors and employees, it would help enormously."

2006-04-27 **law legislation Georgia USA private investigator forensic specialist licensing**

RISKS; The Register 24 27
http://www.theregister.co.uk/2006/04/26/law_change_for_pis

GEORGIA LAW REQUIRES LICENSING FOR DIGITAL FORENSICS SPECIALISTS?

Some computer professionals will need to get a Private Investigator license just to continue doing their computer work. I imagine this will also apply to accountants and auditors, in fact anyone who analyses data that is on computer systems, on behalf of some other company, and perhaps people who work at software houses, computer retailers, whoever does repairs to computers, installations of new stuff. We will have to be asking suppliers of firewall, anti-virus, anti-spam, anti-spyware etc. if they have a PI license, otherwise it might be illegal to buy their products, and if there are no such suppliers, then it may be illegal to be protected against the cyber-criminals.

Companies will need to get an opinion from their lawyers, with respect to filing annual reports with the state and with government regulators. We are supposed to swear this data is correct under penalty of perjury, but it was derived by accounting and computer experts, not Private Investigators, but now it is illegal to get such data from people who are not Private Investigators? Does this also mean that Police Department personnel need to get a PI license before they may testify in court?

2000-05-11 **software quality assurance QA liability pressure**

NewsScan

In testimony provided to the Congressional subcommittee holding hearings on the love bug virus, noted computer security expert Peter G. Neumann of SRI International warned that the software industry is not doing what it should to keep the Internet safe: "Vastly many more people are now relying on the Internet, and most of them are oblivious to the risks... Overall, the situation is grave. The commercial marketplace is not leading. The government is not exerting enough driving forces. This is a really ridiculous predicament, and would be a very bad joke if it were not so serious... Until software developers and system purveyors are liable for the failures of their products, there will be no real motivation to develop robust systems... The mass-marketplace is overly concerned with features; it tends to be long on fancy features and to ignore critical requirements such as rudimentary robustness. However, robust features can be achieved with good design and good programming practice, rather than the business-as-usual practices of sloppy development and a rush-to-market mentality. If automobiles were recalled as often as computer system flaws are detected, we would still have horses and buggies." (New York Times 11 May 2000)

2000-07-17 **web of trust confidence paradigm system ratings vulnerabilities**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB963786024674216913.htm

With cyberfraud proliferating at Internet speed, the question of trust on the Internet is prompting some netizens to develop new systems known as "reputation managers" that attempt to "computerize" a trust function for wary Web surfers. One of the most sophisticated examples is Epinions.com, which solicits and compiles people's reviews of a variety of products and services. As you read the writeups, you tell Epinions which were most "trustworthy" and helpful, and the next time you return, Epinions prioritizes them based on who has earned your trust. The Google search engine works on a similar system, with each Web page in its database ranked by how many other sites link to it. Each link is counted as a "vote" for the trustworthiness of that site. In contrast, eBay's feedback system, in which every buyer who successfully completes a transaction gets to rate the seller, is fraught with potential for fraud. Jakob Nielsen, a Web design specialist who studies reputation systems, says "The eBay system actually works perfectly if everyone is completely honest. But if you can put in your own rating, it falls apart." (Wall Street Journal 17 2000)

2000-12-12 **security alerts publication details Web link URL controversy discussion debate completeness**

RISKS 21 16

Chris Adams summarized a debate over new, more limited forms of bug alerts. Some companies, including Microsoft, are publishing their alerts with much less technical information and referring interested readers to their Web site for full details. Adams criticized this practice, arguing that (quoting him verbatim):
* Access for people with marginal Internet connections or browsers other than IE/Netscape is less convenient.
* Information is unavailable if the Web server is down or overloaded, as might happen with an important advisory. It seems counterproductive to put important, time-sensitive material behind a single point of failure, particularly when the decision is to deliberately avoid using a free distributed, fault-tolerant distribution channel.
* It makes it much easier for a vendor to change an advisory without notifying anyone, especially since changed or removed advisories won't be archived in anywhere near as many places as a mailing list such as BUGTRAQ. In addition to covering up bad work, this would also make it easier to remove or tone-down past advisories about companies the author is now aligned with.
* It opens the prospect of tailoring content to the reader. This could be as simple (and annoying) as charging for access to some content or as complex as determining what to show based on where the request came from (e.g. competitors, vendors or journalists). While this would probably be caught for something major, particularly at first, it would not surprise me to find at least subtle tampering happening regularly if this becomes commonplace.

In a follow-up posting, a report by Richard M. Smith on BUGTRAQ stated that the new Microsoft security bulletins include Web bugs, presumably to track how many people read the bulletins.

2001-07-22 **privacy risk management false positives power of a test suspicion reporting law enforcement police notification postal service**

RISKS 21 54

Alan Wexelblat noted in RISKS a report by "Insight Magazine . . . [1] that since 1997, the US Postal Service has been reporting innocent activity it deems 'suspicious' to federal law enforcement officials. Evidence includes a training video with this chilling instruction: 'It's better to report 10 legal transactions than to let one illegal transaction get by.'

The risks of a system that presumes guilt until innocence is proven are too numerous to list here. Not least of them is the impossibility of proving a negative (I did not intend this cash to be used for illegal purposes). A similar reporting system in the banking arena is known to generate ratio of 99,999 false positives for every true positive. Yes, I do mean a ratio of 10^5:1 errors to correct results. I can't imagine any other system in which that error rate would be acceptable.

The information on suspicious activities is, of course, kept in a database controlled in secret and used for purposes no one is willing to discuss. The Post Office will not discuss the parameters used to flag 'suspicious' activity, though the video states that unwillingness to give out personal information such as date of birth and/or produce identification papers is automatically suspicious.

Someone help me verify that I'm still living in America, please?

2002-06-06 **security by obscurity open-source software homeland critical infrastructure protection**

Security Wire Digest 4 44

Edited version of an excerpt from Cheryl Balian's report in Security Wire Digest:

>A white paper released in June 2002 by the Alexis de Toqueville Institution (ADTI) in Washington, D.C., says that open-source software is inherently less secure and more likely to exploited by terrorists and other wrongdoers than closed-source, proprietary software.

The report, "Opening the Open Source Debate," suggests that the federal government's adoption of open-source software could compromise the safety of U.S. air traffic, e-commerce and surveillance systems. In a statement, ADTI says, "Terrorists trying to hack or disrupt U.S. computer networks might find it easier if the federal government attempts to switch to 'open source' as some groups propose."<

The ADTI's contention was met with incredulity by the security community, which cited Kerkhoff's principle that the security of a system should not reside in its obscurity.

SAFE & SOUND IN THE CYBER AGE: INTERNET GRAND SLAM
Could your company survive without the Internet? This is not a rhetorical question. In the wake of last weekend's "Slammer" attack, corporations may have to contemplate getting by without the Internet. That sounds like hyperbole until realize how much trouble was caused by just 376 bytes of worm code. The basic facts have been widely reported. Late last Friday, or early Saturday in Asia, a worm was released onto the Internet targeting a vulnerability in Microsoft Corp's SQL Server 2000. Activity generated by the worm's probing for systems to infect brought Internet traffic to its knees, at least in parts of Asia. Weekend Web surfers in North America experienced everything from momentary delays to complete lack of access. American Express customers couldn't check their accounts online. Web operations were paralyzed for two days at Countrywide, the country's biggest residential mortgage provider. The Atlanta Journal-Constitution couldn't print Sunday's first edition on time. Some 911 emergency services were forced to revert to manual dispatching. On top of that, some weekend shoppers found their Bank of America cash cards couldn't produce "cash back" at supermarkets. For some, even plain old cash at ATM machines was unavailable.

A lot of technical staff at companies that rely on SQL Server and related code spent the weekend at work, removing the worm from infected systems and patching them to prevent reinfection. Even so, some employees couldn't get to their data on Monday morning, including some employees at Microsoft itself. An internal memo, issued over the weekend and leaked to the press on Tuesday, made it clear that Microsoft had failed to apply to many of its own systems the very patches it had urged customers to install to avoid this problem in the first place.

Unfortunately, all the talk about Microsoft and SQL Server has tended to obscure two of the scariest parts of the story:
1. Our society is a lot more dependent on the Internet and "immature" systems than anyone has so far been prepared to admit.
2. The Internet exists at the whim of those who know how to destroy it.
In this column and the next we will address these points in the above order, starting with the issue of dependency.

Over the last few months, Bank of America has spent millions of dollars on a television advertising campaign touting the ubiquity of its ATM machines. Imagine that you just switched your account to Bank of America because of those ads, only to find that access to your money is denied, by 376 bytes of rogue computer code released onto the Internet. In our admittedly unscientific sampling of consumer opinion at the coffee shop we found universal disbelief that such a thing could happen. Sadly, it comes as no surprise to us. As security experts, we have made it our business to know a lot about network infrastructure (after all, that's where a lot of data is most vulnerable). People who know more than we do about that infrastructure have been warning us for years about excessive inter-dependencies, lack of redundancy, single points of failure, and so on (they have also pointed out that 90% of all military communications are handled by commercial carriers, but that's another column). There have also been plenty of warnings about excessive reliance on immature code, i.e. software which is not deployed through a production process that includes thorough pre-production testing and a proper maintenance cycle (companies that had installed the patches for SQL Server before the weekend were not infected, although they may still have been affected by the traffic overload which the worm created). Now the public has very concrete proof that the experts were right.

Now we know we cannot rely on our bank to provide 24/7 access to our money. Hopefully, companies will now set about beefing up their networks, providing redundant channels and managing their code (funded by some of the huge costs savings they reaped by shifting data and voice from private lines to the Internet). Fortunately, the advice of network experts can also help the consumer. Redundancy is the best strategy to avoid being denied access to your cash by an ATM system failure. Just make sure you have debit card accounts at more than one bank!

In the next column we will explain why we think the Internet exists at the whim of those who know how to destroy it.

NIPC/DHS

February 27, Government Computer News — DoD releases second half of security policy.

Directive 8500.2, an information assurance policy that sets specific controls and standards for how users should secure Department of Defense (DoD) networks, was released by the Pentagon on Thursday. While 8500.1, which was released last October, supplied a framework for DoD to follow to protect its information systems, 8500.2 tells users how to secure their networks, said Robert F. Lentz, director of information assurance for the Office of the Assistant Secretary of Defense for Command, Control, Communications and Intelligence. The 8500.2 policy instructs Defense agency leaders to provide security training to all military and civilian personnel, including contractors, that meets an employee's job level of responsibility for working with DoD information systems. The policy establishes information assurance (IA) managers and officers to ensure that DoD systems meet IA specifications. According to 8500.2, information transmitted on Defense networks is shared across the Global Information Grid and is becoming more vulnerable to attacks and denial of service. The vulnerabilities stem from "increased reliance on commercial information technology and services; increased complexity and risk propagation through interconnection; the extremely rapid pace of technological change; a distributed and nonstandard management structure; and the relatively low cost of entry for adversaries."

2003-03-26 **security specifications standards base requirements**

NIPC/DHS

March 24, eWEEK — Security specs in the works.

The CEO Cybersecurity Task Force by the end of this year will release a set of network security best practices for enterprises to adopt as a minimum standard. The task force plans to challenge executives to have their companies meet these base-line requirements by a certain date, which has yet to be determined. The hope is that peer pressure and a walk-before-you-run approach will entice laggard enterprises into shoring up their security. The task force, formed last week, is a subset of TechNet- a national organization of technology industry CEOs, somewhat akin to a lobbying group, that works with legislators to help shape policy. In addition to developing the base-line security guidelines, the task force plans to work with government security officials to develop an efficient, workable plan for public and private information sharing of attack and threat data. This is a hot topic both in Washington and in Silicon Valley, where corporate IT staffs see little to gain by divulging such sensitive data.

2003-04-09 **corporate security single entity holistic**

NIPC/DHS

April 07, Computerworld — Handle corporate security as single entity, users say.

Companies can improve their ability to detect and respond to both cyber and physical threats by tying their IT security to other aspects of corporate security. But the cultural and business-process changes involved in implementing such a holistic view of security can be daunting for most corporations, users said here last week at a conference organized by ASIS International, an organization of security professionals. Lew Wagner of the MD Anderson Cancer Center at the University of Texas in Houston, said coordinating IT security functions with areas such as physical protection, facilities management, human resources and legal and audit functions has helped enhance overall threat-detection and incident-response capabilities at the hospital. A holistic view of enterprise security can help plug gaps that might otherwise be missed, said James Litchko, of Litchko & Associates Inc., a security consultancy in Kensington, MD. For instance, the majority of IT-related security threats still stem from procedural and process flaws-such as failure to secure access to crucial systems, inadequate backups and lack of auditing-rather than from technology glitches, Litchko said.

2003-04-09 **cyber terrorism cyberspace attack Australia risk threat open door**

NIPC/DHS

April 08, Next — Australia leaves the hack door open to cyber sabotage.

Australia's critical information infrastructure is at risk because of the Federal Government's focus on physical infrastructure and terrorism, the head of Australia's Computer Emergency Response Team (AusCERT) says. AusCERT general manager Graham Ingram says that Malaysia, South Korea and Japan are spending enormous amounts of money on protecting information infrastructure - things such as government, banking, public utility, telecommunications and emergency networks. In Australia, many of these assets are in private hands. AusCERT has been contracted by the Federal Government to provide a free service to the general public and business about new threats to networked computer systems as part of the Trusted Information Sharing Network (TISN). TISN is a voluntary forum for owners of critical infrastructure to exchange information on security issues announced last November. But Kate Lundy, IT spokeswoman for Australia's Labor Party, says laws are needed to force the private sector to comply with minimum standards of protection for critical information infrastructure.

2003-04-18 **Federal Information Processing Standard FIPS crypto cryptography international Canada Britain UK**

NIPC/DHS

April 15, Government Computer News — FIPS-140 gains international acceptance.

The Federal Information Processing Standard for cryptographic modules, FIPS-140, has become the de facto international standard for cryptography, with 300 products validated by independent laboratories. It is moving toward becoming an official international standard as well. In October, the International Standards Organization began considering a proposal to make FIPS-140-2 an international standard, and Britain in November accepted it as the standard for protecting personal information submitted to the government. The National Institute of Standards and Technology (NIST) and its Canadian equivalent, the Communications Security Establishment, jointly run the validation program, which certifies product compliance with FIPS-140-2. "I have heard that many states are recognizing FIPS-140," said Ray Snouffer, manager of NIST's Security Management and Testing Group. The standard is also required by many private-sector organizations, including banks in Europe and U.S. companies such as Visa International Service Association and Boeing Co. But the United Kingdom is the first country other than the United States to adopt the standard.

2003-04-28 **Peter Neuman software testing quality assurance manufacturer reponsibility**

NewsScan

SOFTWARE MAKERS DON'T DO ENOUGH TESTING, SAYS NEUMANN
Peter Neumann, principal scientist at SRI International's Computer Science Laboratory in Menlo Park, California, says that most software is released without undergoing a sufficient amount of testing, and adds: "The idea that we depend on something that's inherently untrustworthy is very frightening." Last year a study commissioned by the National Institute of Standards and Technology found that software errors cost the U.S. economy about $59.5 billion a year, or 0.6% of the country's entire GDP. Should software makers be held responsible for shoddy code? Barbara Simmons, former president of the Association for Computing Machinery, thinks they certainly should: "Software is being treated in a way that no other consumer products are. We all know that you can't produce 100% bug-free software. But to go to the other extreme and say that software makers should have no liability whatsoever strikes me as absurd." (AP/USA Today 28 Apr 2003)

2003-05-16 **NIST National Institute Standards Technology FISMA FIPS security risk categorize national confidentiality integrity availability information**

NIPC/DHS

May 16, Federal Computer Week — NIST releases draft security standard.

The National Institute of Standards and Technology's (NIST) Computer Security Division Friday released the draft of a new Federal Information Processing Standard, FIPS 199, which dictates how agencies should categorize their systems based on the security risk faced by each. The standard is the first step in several requirements generated by NIST under the Federal Information Security Management Act (FISMA) of 2002, all aimed at setting minimum security requirements for all government systems not related to national security. The draft outlines three categories of risk, which are based on the potential impact of a breach in three areas: the confidentiality, integrity and availability of the information in the system. Comments on the draft are due within 90 days. The draft is available on the NIST Website:
http://csrc.nist.gov/publications/drafts.html

2003-07-25 **cybersecurity DoD COTs monoculture vulnerability**

NewsScan

CYBERSECURITY AT THE DEFENSE DEPARTMENT
Purdue University computer science professor Eugene Spafford says there is too much reliance in the Defense Department on off-the-shelf commercial software: "Most of those products are not written to be used in an environment where there is a significant threat. We have attacks being committed by hackers, by anarchists, by criminals, probably by foreign intelligence services. The products have not been designed to be reliable or robust under those kinds of circumstances." There's also a "near mono-culture" resulting from the use of common products across many different DOD systems: "When a new attack is found that has affected any one of these products, it seeps through the entire network. Operators of systems may be in the position of applying three to five security critical patches per week for every system under their control. That really is unacceptable for us to be in a state of high readiness." Microsoft chief security strategist Scott Charney offers an perspective on the issue: "Reasonable minds are debating whether a homogeneous environment or a heterogeneous environment is better for decreasing risk. The advantage of a homogeneous environment, or more of a mono-culture, is it's much easier to manage. You train your people in a particular system, and they manage that system, they know all the security settings, you run tools to make sure they lock it down." (IDG News/Infoworld 25 Jul 2003)

2003-11-04 **NIST security control proposal standards federal information systems FIPS**

NIPC/DHS

November 03, Federal Computer Week — NIST releases security controls proposal.

The National Institute for Standards and Technology (NIST) released the first draft of a publication describing mandated security controls for federal information systems on Monday, November 3. NIST officials want agencies to experiment with the initial public draft, "Special Publication 800-53: Recommended Security Controls for Federal Information Systems." It outlines electronic and physical controls for systems categorized under three levels of potential impacts, such as what would happen if someone steals information from a federal system and modifies the data or disrupts a government service. NIST's Computer Security Division plans to use agencies' comments from the initial draft and an open workshop in March to develop final security controls that would become the new "FIPS 200: Minimum Security Controls for Federal Information Systems." FIPS 200 is required under the Federal Information Security Management Act of 2002. NIST expects to publish FIPS 200 in the fall of 2005, when its controls will become mandatory for all federal agencies.

2003-11-18 **NIST security guidelines posted draft federal information systems protection**

NIPC/DHS

November 14, Government Computer News — NIST posts security control guidelines for comment.

The National Institute of Standards and Technology (NIST) released an initial public draft of recommended security controls for federal information systems Thursday, November 13. The guidelines for mandatory controls are expected to go into effect in two years. The Special Publication 800-53 was drafted under the Federal Information Security Management Act. SP 800-53 is one of seven NIST publications to be completed over the next two years as a security framework. Federal Information Processing Standard Publication 200, "Minimum Security Controls for Federal Information Systems," will replace SP800-53 in late 2005 and will be mandatory for government systems not involved in national security. Controls include management, operational and technical safeguards and countermeasures that ensure the confidentiality, integrity and availability of government systems. The current 238-page report is preliminary and covers only guidelines for low and moderate security baselines. NIST's Computer Security Division will accept comments on the initial draft of SP 800-53 until January 31, 2004. The draft is available online:
http://csrc.nist.gov/publications/drafts.html

2003-11-25 **worms msblast slammer code red carnegie mellon software information systems security**

NewsScan

NEW STUDY TARGETS IT MONOCULTURE
The National Science Foundation is funding two universities — Carnegie Mellon and the University of New Mexico — to investigate ways to diversify software and information systems in an effort to fend off cyberattacks. "We are looking at computers the way a physician would look at genetically related patients, each susceptible to the same disorder," says Carnegie Mellon engineering professor Mike Reiter. "In a more diverse population, one member may fall victim to a pathogen or disorder while another might not have the same vulnerability." The $750,000 grant comes in response to massive digital epidemics caused by the Code Red, Slammer and MSBlast worms, which disabled hundreds of thousands of computers over the past year. The researchers hope to create an application that could generate diversity in key aspects of software programs without hampering their utility. The result could prove a boon for Microsoft by helping it to break up its monoculture without losing market share. (CNet News.com 25 Nov 2003)

2003-12-24 **NIST security guidance standards FISMA FIPS**

NIPC/DHS

December 22, Federal Computer Week — NIST releases security level guidance. The National Institute of Standards and Technology (NIST) released a draft of the last piece of guidance for agencies to determine the proper level of security on information systems last week. The "Special Publication 800-60: Guide for Mapping Types of Information and Information Systems to Security Categories" provides the middle step for guidance and standards required under the Federal Information Security Management Act (FISMA) of 2002. NIST's categories of security impact are based on draft Federal Information Processing Standard (FIPS) 199, which the division released in September. The goal of the guidance is to have agencies assign impact levels without considering potential security controls and countermeasures, but in October, NIST released another draft guide outlining minimum-security controls for each category. NIST also released a draft interagency report on smart card technology development and adoption within agencies. The draft report is in response to a January General Accounting Office report that recommended that NIST play a greater role in smart card implementation governmentwide. Additional information is available on the NIST Website:
http://csrc.nist.gov/publications/drafts.html

2004-01-15 **monoculture SNMP virus worm network Internet parallel agriculture pest epidemic**

CNET News http://news.com.com/Seeds+of+destruction/2009-7349_3-5140971.html

AGRICULTURE EPIDEMICS MAY HOLD CLUES TO NET VIRUSES

Computer scientists and biologists have been thinking about the parallels between computer viruses and biological viruses for years. Robert Lemos, a distinguished writer for CNET News, wrote a report on the growing collaboration in January 2004. One of the main ideas is that monoculture makes both agricultural fields and computer networks more susceptible to pathogens such as the Potato Blight that devastated Ireland in 1845 and the MSBlast worm that attacked Windows computers in August 2003. Many experts have pointed out that almost all of the major attacks on the Internet have been rooted in the Microsoft monoculture, including the Outlook e-mail client and the IIS (Internet Information Server) products. Another widespread technology at risk is SNMP, which could also be exploited by worms.

January 23, Federal Computer Week — NIST releases telnet, IT security drafts.

Federal agencies desiring to minimize work disruptions from outside intrusions can begin with simple safeguards, such as preventing unauthorized users from using the telnet protocol to gain access to a server, according to officials at the National Institute of Standards and Technology (NIST). Draft documents on computer security released Thursday, January 22, by the NIST give an example of how unauthorized telnet users simply identify themselves as a guest to gain access to sensitive government files. The Risk Management Guide for Information Technology Systems suggests that disabling telnet is about a 10-hour procedure. Practical advice in the 58-page document includes other ways that agencies can develop standards for safeguarding sensitive but unclassified information in federal computer systems. As applied to information systems, the guide says, risk management is a responsibility of executive managers to be shared with technical managers, and not a technical manager's sole responsibility. Engineering Principles for Information Technology Security, a 33-page document also released this week, offers an overview of accepted principles and practices for security information technology systems. Additional information can be found on the NIST Website:

2004-02-23 **AVDL Application Vulnerability Description Language XML base standard security**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?articleID=18100080

February 23, Information Week — Application security standard edges forward.

An application security standard known as Application Vulnerability Description Language (AVDL), which was proposed last year, is moving closer to reality. AVDL is based on XML and is designed to provide a standard way for application vulnerabilities to be defined and classified so all security applications from different vendors that companies use to secure their apps will understand the same language when it comes to security threats. For example, when a new software vulnerability surfaces, a company's vulnerability scanner could scan systems to spot the new flaw. The scanner then could send information to firewalls and patch-management systems, which those applications could then use to automatically adjust to better protect against any potential attacks, such as a worm or a hacker attack. AVDL 1.0 standard is complete and is expected to receive final standards approval next month. Gartner VP and analyst John Pescatore says that because of the number of application vulnerabilities that surface each week -- sometimes more than 80 are announced -- standards such as AVDL can help companies reduce the threat they face from the moment a vulnerability is discovered to the time it takes them to respond and patch.

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0405/web−nist−04−06−04.asp

April 06, Federal Computer week — Last draft released for security guide.

The National Institute of Standards and Technology (NIST) on April 6 released a final draft of security guidelines for federal agencies that need to certify and accredit their information systems. With May as their target date for publication, NIST officials cited an urgent need to receive comments on the final draft document by April 21. The proposed guidelines are relevant to security requirements that all federal agencies must meet under the Federal Information Security Management Act of 2002. NIST officials incorporated several significant changes in the final draft based on earlier comments they received. Among them are newly defined roles for the chief information officer and senior agency information security officer in the certification and accreditation process. Also new are additional guidelines for low-impact information systems, a revised timetable for interim approval to operate information systems, and a summary table of tasks and subtasks for security certification and accreditation. Special Publication 800-37, Guide for the Security Certification and Accreditation of Federal Information Systems, is available online.

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0419/web−ncsp−04−19−04.asp

April 19, Federal Computer Week — Last part of security strategy released.

A cybersecurity task force organized by the National Cyber Security Partnership issued a 104-page report with recommendations for the federal government and industry on Monday, April 19. The report is the last of five documents prepared by industry and academic experts on the President's National Strategy to Secure Cyberspace, a general blueprint for improving the nation's cybersecurity readiness. The task force members called for what they said were needed improvements to the consumer- and vendor-oriented software security testing program operated by the National Institute of Standards and Technology and the National Security Agency. The report recommends that NIST receive an initial $12 million in new appropriations and $6 million in following years for developing security requirements for specific classes of products such as intrusion-detection systems and virtual private networks. Other steps outlined in the report include making vendors responsible for shipping software products with more of their security features enabled and having the federal government mandate software-vulnerability analysis as a condition of procurement. The group also recommended that industry groups work together to develop a well-defined set of technical standards for designing secure IP networks. The report is available online: http://www.cyberpartnership.org/TF4TechReport.pdf

2004-05-13 **NIST Standards Documentation FISMA**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/25881−1.html

May 13, Government Computer News — NIST releases computer security documents.

The National Institute of Standards and Technology (NIST) has published final versions of three computer security documents and released one draft document for public comment. Special Publication 800-38C, Recommendation for Block Cipher Modes of Operation: the CCM Mode for Authentication and Confidentiality, specifies an authenticated encryption mode of the Advanced Encryption Standard. The Guide for the Security Certification and Accreditation of Federal Information Systems (Special Publication 800-37), is one of a series of guidelines to help agencies comply with the Federal Information Security Management Act (FISMA). FISMA requires that all IT systems be certified and accredited for operation. The new guidelines provide a standardized approach for assessing the effectiveness of security controls determining the risks posed by threats to the system. A draft of An Introductory Resource Guide for Implementation of the Health Insurance Portability and Accountability Act Security Rule (Special Publication 800-66), provides help for agencies subject to both HIPPA and FISMA. The document identifies NIST resources for addressing HIPPA requirements, and provides cross-mapping between HIPPA and FISMA requirements to help agencies avoid redundant work. Additional information is available on the NIST Website: http://www.nist.gov/

2004-05-25 **vulnerability reporting OIS guidelines**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/26045−1.html

May 25, Government Computer News — Group wants input on vulnerability reporting guidelines.

The Organization for Internet Safety (OIS) is soliciting comments on its guidelines for reporting and responding to software security vulnerabilities. OIS, a consortium of software vendors, researchers and security consultants, released the guidelines in July 2003, hoping to bring some order to the continual struggle between code makers and code breakers. The second version is expected to be available in mid-July. OIS hopes to address some issues in the second release that were sidestepped in the first edition, such as what role—if any—the government should play in vulnerability reporting. The voluntary guidelines are an effort to balance the public's right to know about possible software problems against the need for vendors to correct those problems before they are made public. Comments are being accepted through June 24 at feedback@oisafety.org. Details for the comment process are available at www.oisafety.org/review-1.5.html

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/1025/web−niap−10−27 −04. asp

October 27, Federal Computer Week — NIAP chief touts Common Criteria.

Officials at the National Information Assurance Partnership (NAIP) have effectively raised the level of security in many information technology products used by the government, the security group's director said Wednesday, October 27. NIAP, an initiative of the National Institute of Standards and Technology and the National Security Agency, is responsible for implementing the Common Criteria Evaluation and Validation Scheme, a rigorous set of security tests that adhere to international standards. The testing directly improved 30 percent of the products tested by eliminating security flaws that could have been exploited by attackers, said Jean Schaffer, director of NIAP. Critics say Common Criteria testing costs too much and takes too long, but Schaffer argued that these claims are made by those who do not have firsthand knowledge about the testing.

RISKS 23 73

BUY VS BUILD -- OR ELSE

Paul Robinson wrote an essay for RISKS that pointed out how unusual it is in our society for us to build tools or other products from scratch in our normal lives. We buy bread, cutlery, peanut butter, kitchen sinks, stoves, tiles … almost everything we need is created by specialists and used by others.

So why do we think it is still normal to build software from scratch? Why aren't we insisting on building software from well-tried-and-tested modules that we can use to put together the desired functionality?

And how come other products, such as wrenches, refrigerators and washing machines, have warranties -- some of them lifetime warranties -- but software generally does not? Why are we tolerating this degree of shoddy engineering and production in such critical tools in our current lives?

The question that should be asked is, "why this is allowed to continue?"

Robinson writes:

Software as it is currently being developed provides so much value relative to its costs that we as practitioners of this medieval-class craft (in terms of our level of automation and sophistication of production methods) can get away with practices that would not be tolerated by a Taiwanese manufacturer of toasters.

And this is the reason we are seeing programming jobs being outsourced to low wage countries. If you're going to get crappy software there's no reason to pay premium prices for it. It is exactly the sort of situation that befell the American automobile manufacturers back in the 1970s and 1980s. And unless we start to make changes we will see exactly the same thing happening.

Actually some of the software development places that are used for outshoring have formal practices in place for reducing defects. So it is entirely possible what we are getting is the exact equivalent of what I stated above. The overseas "manufacturers" produce better quality at a lower cost than we do.

I think that a basis of component architecture is the direction that we need to go in the development of software. That we need to make more software to be designed as a series of reusable components that can be used in other contexts. It also means we need to develop at least an engineering discipline in a way of making software of higher quality and eventually to reduce the risks of development.

And this is why I now understand more clearly why I knew that there was something right about this concept even though I didn't know exactly why at the time. In a book I once wrote, the main character explains about realizing the validity of a concept even if you're not sure why:

>I know how that is; more than once I've had gut feelings about things where I couldn't put my finger on it, but I knew something wasn't right. Later I would discover why I had that feeling, and, more importantly, why I was right, but at the time I did not have the evidence or knowledge to know why I felt that way.<

- George Green, "In the Matter of: The Gatekeeper: The Gate Contracts"

We can continue on the same path of disaster-ridden bugware or we can choose to change. We can change because the current methods do not work very well, they spell disaster in terms of cost, reliability, future employment potential, and the possibility of seeing our craft ruined by heavy-handed government mandates for licensing. We can choose to change because if we do not, the choice on how to make the changes may be made for us, and in a manner we will not appreciate.

The process will not be easy, but the benefits to us will more than outweigh the short-term losses by having to re-learn a new way of working, and thinking. If we want to continue to have fun in this craft without being placed into a bad position because of our own arrogance in failing to acknowledge the incompetence, sloth and waste our current practices contain, we need to change. And we need to do it before we are forced to do so because the customers decide they can't stand it any more, before we do.

* * *

This essay provoked a flurry of interesting contributions in RISKS 23.74 < http://catless.ncl.ac.uk/Risks/23.74.html#subj2 >. Highlights include these points [with authors in square brackets so you can find their full comments easily]:

* The same issues were raised in 1968 by Doug McIlroy in a NATO conference on software engineering; see < http://homepages.cs.ncl.ac.uk/brian.randell/NATO/>. [Jim Horning]

* Problems in components spread throughout the industry; e.g., "the buffer overflow in the commonly-used JPEG decoding algorithm." [Rick Russell]

* Software is much more complicated than manufactured goods. [Rick Russell]

* Describing software is much more difficult than describing physical objects or tools and therefore reusability is difficult to engineer or attain. [Kurt Fredriksson]

* Even when reusable components are part of a software project, there is still lots of work because of dependencies that may break the code when components are poorly upgraded. [Jay R. Ashworth]

* Object-oriented programming has resulted in aborted development of more advanced programming languages. [Kurt Fredriksson]

* It may not be possible to write perfect code using the specifications of existing code because new situations may impose unexpected constraints that lead to unexpected behavior of the systems. [Ray Blaak]

* Work by Jef Raskin, the architect of the Macintosh project at Apple, may lead to error-free user interfaces. See his text "The Humane Interface: New Directions for Designing Interactive Systems." [Richard Karpinski] [MK looked up the ISBN: 0-201-37937-6 & the AMAZON URL: http://tinyurl.com/abt7a]

* "…[T]he problem isn't a lack of components, it's that we're building much larger systems in relation to the power of those components." [Geoff Kuenning]

* "… [O]ther people's components will only work for you if those people's domain model is sufficiently close to yours -- otherwise they are be too generic to be of any use to anybody, all they are is overhead." [Dimitri Maziuk]

* "Software is not constrained by the laws of nature (until or unless it comes to controlling a real system)…. Thus while traditional manufacture is bounded by well-established physical parameters which lend themselves to repeatable solutions, requirements for software systems are not so bounded. This tends to mean that the requirements for each system are unique. And because of the perception that software can do anything, the requirements tend to be complex too: arguably excessively so. Working this down into the details of implementation, this means that the components needed tend to be unique for each system - thus limiting the possibilities of reuse." [Stephen Bull]

2005-02-28 **National Institute of Standards and Technology NIST security guidelines release Federal Information Security Management Act FISA**

DHS IAIP Daily;
http://news.com.com/NIST+releases+final+security+guidelines/ 2100−7348_3−5593256.html?tag=nefd.top

NIST RELEASES FINAL SECURITY GUIDELINES.

A final version of security guidelines designed to protect federal computer systems and the information they hold was released Monday, February 28, by the National Institute of Standards and Technology (NIST). The guidelines will serve as a road map for federal agencies in meeting mandates set by the Federal Information Security Management Act (FISA). Government agencies will be required to have certain security controls, policies and procedures in place. At the heart of the initiative is an effort to protect the confidentiality, integrity and availability of all federal information systems that are not part of the national security system. The security controls in the new NIST guidelines span 17 key areas, ranging from user identification to authentication to risk assessment. Guidelines: http://csrc.nist.gov/publications/nistpubs/800-53/SP800-53.p df

2005-06-09 **NIST feds control security computer systems FISMA**

EDUPAGE; http://www.fcw.com/article89154-06-09-05-Web

FEDS LOOK TO ADD CONTROLS TO COMPUTER SYSTEMS

The National Institute of Standards and Technology (NIST) is developing a set of controls that federal agencies will be compelled to adopt to increase the security of their computer systems. The controls are part of an effort to bring agencies into compliance with the Federal Information Security Management Act (FISMA). FISMA Implementation Project Leader Ron Ross said that agencies will be required to add 17 safety controls to their systems, noting that stronger controls will be required for more important systems. When finalized, the controls will become mandatory in January 2006. Agencies will have one year to implement the controls on existing systems; for new systems, the controls will be required immediately. Ross stressed that although it will not be "easy to put in all these controls and get them working," the government must make every effort "to establish a federal level of due diligence" for its computer systems. 2005-12-15 **IT costs laws compliance budgets corporate governance study Sarbanes-Oxley SOX**

EDUPAGE; http://news.zdnet.com/2100-9595_22-5996670.html

MEETING COMPLIANCE LAWS RAISES IT COSTS

According to a recent Gartner study, laws on corporate governance and compliance, such as the U.S. Sarbanes-Oxley Act, force businesses to spend more on information technology. The report predicts increases in IT budgets from 10 to 15 percent in 2006, up from roughly 5 percent in 2004. The survey included 326 audit, finance, and IT professionals in North America and Western Europe. Gartner recommended solutions that can support multiple regulations across a business to maximize effectiveness on spending for compliance.

2006-02-15 **vulnerability exploit code Microsoft product challenge Security Bulletin critical rating iDefense auction sale**

DHS IAIP Daily; 23
http://www.windowsitpro.com/windowspaulthurrott/Article/ArticleID/49416/windowspaulthurrott_49416.html

IDEFENSE OFFERS $10,000 BOUNTY FOR CRITICAL BUG BY 31 MARCH 2006

iDefense announced that it will pay $10,000 to anyone who discovers a bug in a Microsoft product that results in a new Microsoft Security Bulletin with a severity rating of critical. But there's one slight catch: The bug must be reported by midnight March 31, 2006, EST. The company has paid for vulnerability reports for some time now. However iDefense is changing its tactics to some extent. A spokesperson for iDefense said, "Going forward, on a quarterly basis, we will select a new focus for the challenge and outline the rules for vulnerability discoveries that will qualify for the monetary rewards." iDefense competes against a growing underground market for vulnerability reports and exploit code, where reports and code are sometimes sold the highest bidder and other times sold to everyone who can pay the asking price.

2006-03-06 **open source bug hunt results posted DHS funding Coverity Stanford Symantec team**

DHS IAIP Daily; http://www.gcn.com/online/vol1_no1/40053−1.html 23

OPEN-SOURCE BUG HUNT RESULTS POSTED.

Coverity Inc. of San Francisco, CA, has released the results of a Department of Homeland Security (DHS)-funded bug hunt that ranged across 40 popular open-source programs. The company found less than one-half of one bug per thousand lines of code on average, and found even fewer defects in the most widely used code, such as the Linux kernel and the Apache Web server. To test the programs, Coverity deployed analysis software first developed by Stanford's computer science department. Ben Chelf, chief technology officer of Coverity, warned that this automated bug scan is not definitive, but it can point to bugs traditional in-house code review techniques can miss. The results are the first deliverable of a $1.2 million, three-year grant DHS awarded to a team consisting of Coverity, Stanford University and Symantec Corp. of Cupertino, CA. DHS wants to reinforce the quality of open-source programs supporting the U.S. infrastructure.

National Underwriter Property and Casualty

Several insurance companies began providing insurance to pay for damages resulting from illegal penetration of computer systems and networks and even against extortion. For example, in May 1999, the F&D/Zurich company in Baltimore announced policies with up to $25M in compensation for damages to e-businesses. Some policies cover insider damage such as logic bombs or destruction of critical data by enraged employees; Brad Gow of ACE USA in Philadelphia reported on one case where an employee at a Massachusetts defense contractor "destroyed all their critical databases and project data. The company identified direct costs of rebuilding data at about $2.4 million." Daniel Hays, writing for the _National Underwriter Property and Casualty_ publication, said that estimated total loss from missed sales and other opportunities and other setbacks to that business were projected to be $10 million.

NewsScan, TechWeb http://www.techweb.com/wire/story/TWB20000613S0012

Prompted by results from its 15-month Project Groundbreaker feasibility study, the National Security Agency plans to use private sector sources to develop and maintain the bulk of its unclassified information technology infrastructure. This dramatic change in NSA's long-standing IT operations is intended to ensure the agency's agility and adaptability in the Information Age. The move to abandon the traditional policy of developing spy technology in-house in favor of procurement from the rapidly expanding encryption and fiber-optic technology available off-the-shelf was inspired in part by last January's massive computer failure that crippled NSA's global spy network for several days. The IT modernization will cover NSA's distributed computing, its enterprise/security management, networks and telephony. It is expected to save the government as much as $1 billion over 10 years. 2001-11-12 **national identity card terrorists reliance incorrect assumption risk management**

RISKS 21 75

Frequent RISKS contributor Adam Shostack pointed out a significant risk of national ID cards: mistaken reliance on identification as a substitute for trustworthiness. His cogent analysis follows:

"I believe that there is an important risk, that of reliance, that will accompany a high-tech national ID card. Every terrorist commits their first act of terrorism at some time in their life, and before that time, they cannot be any database of known terrorists.

Once you start issuing cards, people will start relying on 'identity verification' rather than threat management. We'll see people relying on background checks [1] rather than xrays. We'll see special lines for frequent fliers, who are 'known trustworthy.' They differ from pilots and flight crew in that they don't run into co-workers who can notice and react to strange behavior before the flight. If you want to keep knives and guns off of planes, the answer lies in xrays, magnetometers, and other searching technology, not in believing that you know who's who. Many of the national id card risks come from a layer of indirection from the real problem, which is not "Is Alice trusted," but, "Is the person in front of me trusted?" National ID cards not only do nothing to solve this problem, they distract us from attempting to solve it."

2002-06-28 **insurance risk statistics mandatory reporting**

NewsScan

WHITE HOUSE WORKING TO PROMOTE CYBERSECURITY INSURANCE
The White House has been meeting with insurance industry leaders to discuss ways in which the industry could develop viable cybersecurity insurance policies for businesses. Insurance executive Robert Hartwig says, "Businesses will soon purchase this in the same way they buy property insurance. They wouldn't think of not insuring the buildings they're in, and soon they won't go without insuring the value of their computer systems." A general problem in creating such policies is that there is no real way of estimating an insurance provider's financial risk: "If you're insuring automobiles," says White House cybersecurity advisor Richard Clarke, "you can anticipate that there will be a certain number of accidents out of a given number of drivers, so you know what your loss exposure is. With cyberinsurance, there's not a lot of data that allows anyone to make that kind of prediction." (Washington Post 27 Jun 2002)

2003-01-15 **Microsoft expands security rating system vulnerabilities listing**

NIPC/DHS

January 13, Info World — Microsoft adds category to security rating system.

After customers complained that they couldn't identify the most serious security vulnerabilities, Microsoft has added a fourth category to its vulnerability rating system. But critics feel that the extra tier adds even more complexity to an administrator's job. Under the new system, fewer bulletins get the "critical" stamp. Only vulnerabilities that could be exploited to allow malicious Internet worms to spread without user action are now rated critical. Many issues that were previously rated critical are now "important," a new category in the rating system. These "important" vulnerabilities could still expose user data or threaten system resources, but they might not receive the urgent attention from administrators that they deserve. A two-tiered system would let administrators quickly decide whether they need to drop all tasks at hand and apply a patch, or whether the risk is small enough that they can wait and include it in a weekly patch cycle.

Category 4C2 *Risk management methodology & tools*

2003-01-16 **network sharing attack data countermeasure hacking**

NIPC/DHS

January 13, eWeek — Sharing attack data could thwart hackers.

Two Harvard University security researchers have developed a model showing that enterprises that share their sensitive data about network attacks and security breaches are less attractive targets and, hence, less likely to be attacked. The reason is that attackers who spend time, and in some cases money, finding and exploiting vulnerabilities in common applications will not want information about their attacks shared, as it would reduce their chances of compromising other potential targets. The paper, to be presented later this month at the Financial Cryptography conference in Gosier, Guadeloupe, supports the U.S. government's contentions about the importance of sharing attack data. The next draft of the National Strategy to Secure Cyberspace, due early this year, is expected to include language encouraging CIOs to forward more information to the government. Security specialists and CIOs worry that sharing sensitive data with anyone will expose them to embarrassment and potential lawsuits from customers. The government's interest in attack data is partially due to the creation of the Department of Homeland Security which will be responsible for early warning and analysis.

2003-01-29 **hacking insurance risk mitigation**

NewsScan

HACKER INSURANCE
The latest cyber attack (last weekend's SQL Slammer virus, which infected thousands of computer servers throughout the world) has given a new boost to "network risk insurance" (AKA "hacker insurance"), which is expected to grow from the $100 million industry it is now to a $2.5 billion industry by 2005. Bruce Schneier, the chief technology officer for Internet security at Counterpane, thinks that insurance is every bit as important as prevention: "I believe that within a few years hacking insurance will be ubiquitous. The notion that you must rely on prevention is just as stupid as building a brick wall around your house. That notion is just wrong." But getting "hacker insurance" is not as easy as one might think, because insurers typically require a third-party assessment of the insurance applicant's security system, which might cost as much as $50,000. (Reuters/USA Today 28 Jan 2003)

2003-02-07 **probabalistic risk management software mathematics statistics**

NIPC/DHS

February 06, New York Times — Assessing the odds of catastrophe.

A rapidly evolving set of conceptual and computing tools allow mathematicians, engineers and insurance executives to assess the risk of low-probability, high-consequence events. The field, known as probabilistic risk assessment, helps companies and government agencies decide whether they are prepared to take the chances involved. And now some of the techniques are being used to analyze the chances of terrorist attack. Developed four decades ago, the idea behind probabilistic risk assessment is that mathematics can help determine the chances of a particular outcome (a power system failure, or a hurricane that destroys thousands of homes) based on what is known or estimated about the smaller variables that lead to those outcomes. Jim Goodnight of SAS, a maker of statistical software, said that with faster processors, more advanced software and a huge availability of memory - whether on big mainframe computers or on lashed-together PC systems - "the ability to do the incredibly difficult modeling is becoming more reachable every day." Probabilistic models, of course, are only as useful as the assumptions fed into them. Moreover, they are best used when a system or piece of equipment is being designed. The most daunting challenge, however, may be modeling minds. In describing the challenge of modeling terrorism, Hemant H. Shah of RMS, a risk-modeling firm, said, "Hurricanes do not make an effort to strike your weak points. In the case of terrorism you're dealing with a question of intent. You're modeling an adversary in the context of conflict."

2003-04-17 **coporate IT security disclosure secure cyberspace**

NIPC/DHS

April 14, eWEEK — Feds mull IT disclosure.

Momentum is building in Washington to require all public companies to annually report the performance of their IT security initiatives, not just the financial services and health care industries that face scrutiny now. The Bush administration considered requiring companies to report on network security during the crafting of the National Strategy to Secure Cyberspace. But the idea was unpopular in many enterprises and did not make the final plan, released in February. Last week, former presidential adviser for cyberspace Richard Clarke, who spearheaded the strategy, urged Congress to act quickly to legislate such obligations. Enterprises object to the suggestion of broad reporting requirements, but some see a certified audit process reflected in annual Securities and Exchange Commission filings as beneficial. Possible requirements include disclosing measures taken to secure systems, identifying IT security auditors and detailing breaches.

2003-11-05 **data sharing disaster recovery business continuity planning Homeland Security**

NIPC/DHS

November 04, GCN.com — Data sharing needs to begin before first response, officials say.

For the National Guard Bureau, the ability to share data for disaster planning and first response has been hampered by a constant stream of hacker intrusions on its unclassified networks over the past two years. "We're getting hacked all over the place. I actually see it getting worse, and it's making it harder and harder for us to share information," said Maureen Lischke, CIO for the National Guard Bureau. She and other government officials spoke about data sharing to support homeland security at an Industry Advisory Council event in Washington. Although cultural barriers represent the biggest hurdle, federal groups also need to think about sharing information before a major atrocity occurs, not after, said David Boyd, the Homeland Security Department's deputy director of R&D and director of the Safecom program to provide wireless communications to federal, state and local first responders. There's very little of such pre-disaster data sharing occurring now, beyond of the tactical warfighting level, said John Paczkowski, director of operations and emergency management for the Port Authority of New York and New Jersey. An open architecture is necessary to maintain some fundamental level of interoperability, Paczkowski said.

STARTUP OFFERS INSURANCE AGAINST LINUX COPYRIGHT CLAIMS

Open Source Risk Management is launching insurance-like protection aimed at indemnifying Linux users against copyright infringement claims like those made by SCO Group. The company says it has completed a six-month study comparing Linux with several version of Unix and found no copyright problems. "We have come out of the examination process with the strong belief that there are no meritorious copyright infringement claims in the kernel. With all we have seen to date, I don't believe they have a strong case," says OSRM executive director John St. Clair. OSRM's legal protection covers only copyright infringement, but it plans to offer patent protection as well for an additional charge. It also has launched an Open Source Legal Defense Center, which offers companies expert legal advice for $100,000 per year, while charging $250 per year for individual programmers. The copyright-infringement protection is priced at 3% per year of the total coverage -- so for protection against $1 million of legal costs, a company would pay $30,000. Meanwhile, an SCO spokesman disputed OSRM's claims: "Everything we have looked at and found would run contrary to what they're finding." (CNet News.com 18 Apr 2004)

2004-05-25 **software suppliers risk management defense acquisitions**

DHS IAIP Daily; http://www.gao.gov/new.items/d04678.pdf

May 25, General Accounting Office — GAO-04-678: Defense Acquisitions: Knowledge of Software Suppliers Needed to Manage Risks (Report).

The Department of Defense (DoD) is increasingly reliant on software and information systems for its weapon capabilities, and DoD prime contractors are subcontracting more of their software development. The increased reliance on software and a greater number of suppliers results in more opportunities to exploit vulnerabilities in defense software. In addition, DoD has reported that countries hostile to the United States are focusing resources on information warfare strategies. Therefore, software security, including the need for protection of software code from malicious activity, is an area of concern for many DoD programs. GAO was asked to examine DoD's efforts to (1) identify software development suppliers and (2) manage risks related to foreign involvement in software development on weapon systems. To address software vulnerabilities and threats, GAO recommends that DoD better define software security requirements and require program managers to mitigate associated risks accordingly. DoD agreed with the findings but only partially concurred with the recommendations over concerns that they place too much responsibility for risk mitigation with program managers. GAO has broadened the recommendations to address DoD's concerns. Highlights: http://www.gao.gov/highlights/d04678high.pdf

2005-01-19 **risk analysis terrorism politics propaganda rationality fear hysteria**

RISKS 23 68

SCHNEIER ON THE ILLUSION OF SECURITY

Curt Sampson published a review of an interesting article in ATLANTIC MONTHLY in January/February 2005. [That article extensively quoted noted security expert Bruce Schneier.] Mr Sampson's review follows:

In the January/February 2005 issue of _The Atlantic Monthly_ there is an article by James Fallows entitled "Success Without Victory," discussing risk management as it applies to the war on terror.

One key point is that there are people out there who, in the tradition of RISKS readers themselves, take a sensible and scientific approach to the war on terror, seeing it as an exercise in risk management rather than something that can be "won," causing all of the risks to go away:

> There will always be a threat that someone will blow up an airplane or a building or a container ship…. But while we have to live in danger, we don't have to live in fear. Attacks are designed to frighten us even more than to kill us. So let's refuse to magnify the damage they do. We'll talk about the risk only when that leads to specific ways we can make ourselves safer. Otherwise we'll just stop talking about it, as we do about the many other risks and tragedies inevitable in life.
>
> We cannot waste any more time on make-believe….measures that seem impressive but do not make us safer, such as national threat-level warnings and pro forma ID checks. The most damaging form of make-believe is the failure to distinguish between destructive but not annihilating kinds of attack we can never eliminate but can withstand and the two or three ways terrorist groups could actually put our national survival in jeopardy. We should talk less about terrorism in general and more about the few real dangers.
>
> Screening lines at airports are perhaps the most familiar reminder of post-9/11 security. They also exemplify what's wrong with the current approach. Many of the routines and demands are silly, eroding rather than building confidence in the security regime of which they are part.
>
> [Daniel] Prieto argues that the roughly $4 billion now going strictly toward airline passengers could make Americans safer if it were applied more broadly in transportation -- reinforcing bridges, establishing escape routes from tunnels, installing call boxes, mounting environmental sensors, screening more cargo. All these efforts combined now get less than $300 million a year, which will drop to $50 million next year.

Where the article gets really interesting, however, is in pointing out the political barriers to doing the rational thing from a risk-analysis point of view. For example, spending less on airline security in order to spend more on land and water transportation:

> Rationally, this is an easy tradeoff: less routine screening of passengers who don't call out for special attention (watch lists, travel and spending patterns, and other warning mechanisms can be improved), in exchange for more and faster work to reduce the vulnerabilities of bridges, tunnels, and ports. In wartime a commander would easily make such a decision to protect his troops. But politically this decision is almost impossible. Such a tradeoff would make it likelier that some airplane, somewhere, would be blown up. If that happened, whoever had recommended the change would be excoriated -- even if more people had been spared equally gruesome fates in subways or near ports.

And even examples of where this is already happening:

> [Terror and counter-insurgency experts] understand that this struggle will be with us for a very long time, that success will mean reducing rather than absolutely eliminating the threat of attacks, and that because there is no enemy government or army to surrender, there can be no clear-cut

> moment of victory. "Ironically, when President Bush said this in the campaign, he was immediately jumped upon," Jenkins said. "It was a moment of truth for which he was promptly punished. Senator Kerry had a similar moment, when he said that the objective was to reduce terrorism to no more than a nuisance. Conceptually that was quite accurate, even if it was not the most felicitous choice of words. And he was punished too. In a campaign with a great deal of nonsense about the threat of terrorism, these two moments of truth were mightily punished, and the candidates had to back away and revert to the more superficial and less supportable assertions."

The article goes on with some general and specific recommendations for improving the security of America against terror attacks.

The approach will be nothing new to RISKS readers, though the details may be. But I find it very hopeful that articles like this are appearing in general interest magazines rather than just specialized forums like this.

2005-02-10 **proposed legislation security measures identification authentication I&A law enforcement risk management propaganda hysteria terrorism privacy**

RISKS; http://www.house.gov/paul/congrec/congrec2005/cr020905.htm 23 71

RISK MANAGEMENT AND TERRORISM

Larry Sudduth commented in RISKS that few congresscritters (MK's word) seem to understand risk management. He was pleased to report on one who apparently does.

H.R. 418, the "Immigrants ID bill" or "REAL ID Act of 2005," is advertised in part as establishing and rapidly implementing "regulations for State driver's license and identification document security standards, to prevent terrorists from abusing the asylum laws of the United States, to unify terrorism-related grounds for inadmissibility and removal." (See http://thomas.loc.gov/cgi-bin/bdquery/z?d109:h.r.00418:)

The Honorable Dr. Paul characterizes HR 418 as a National ID Card bill masquerading as immigration reform. The clarity and brevity of his comments merit reading, both from an infosec perspective as well as a countermeasures perspective (… excerpted and LMS-ed below):

" ...this bill will do very little to make us more secure. It will not address our real vulnerabilities. It will, however, make us much less free. In reality, this bill is a Trojan horse. It pretends to offer desperately needed border control in order to stampede Americans into sacrificing what is uniquely American: our constitutionally protected liberty."

"This bill establishes a massive, centrally-coordinated database of highly personal information about American citizens: at a minimum their name, date of birth, place of residence, Social Security number, and physical and possibly other characteristics ... that will be shared with Canada and Mexico!"

"This legislation gives authority to the Secretary of Homeland Security to expand required information on drivers' licenses, potentially including such biometric information as retina scans, finger prints, DNA information, and even Radio Frequency Identification (RFID) radio tracking technology."

"There are no limits on what happens to the database of sensitive information on Americans once it leaves the United States for Canada and Mexico - or perhaps other countries. Who is to stop a corrupt foreign government official from selling or giving this information to human traffickers or even terrorists? Will this uncertainty make us feel safer?"

Security practitioners know better than most the aptness of the saying, "err in haste, repent at leisure." I hope Representative Paul's common-sense proves to be contagious before HR 418 comes to a floor-vote.

SECURITY? NUCLEAR PLANTS DON'T NEED NO STINKIN' SECURITY!

Jim Horning relayed a discussion of nuclear power industry opposition to proposals for improved cyber security in nuclear generator plants.

"Two companies that make digital systems for nuclear power plants have come out against a government proposal that would attach cyber security standards to plant safety systems. The 15-page proposal, introduced last December by the U.S. Nuclear Regulatory Commission (NRC), would rewrite the commission's 'Criteria for Use of Computers in Safety Systems of Nuclear Power Plants.' The current version, written in 1996, is three pages long and makes no mention of security. The plan expands existing reliability requirements for digital safety systems, and infuses security standards into every stage of a system's lifecycle, from drawing board to retirement. Last month the NRC extended a public comment period on the proposal until March 14th to give plant operators and vendors more time to respond. So far, industry reaction has been less than glowing."

"The NRC tries to promote the use of digital technology in the nuclear power industry on the one hand, but then over-prescribes what is needed when a digital safety system is proposed," wrote one company president.

"The entire cyber security section should be deleted and only a passing reference to the subject retained," another company wrote.

AIRPORT SECURITY CHECK OF LICENSES A FARCE

John F. McMullen provided this abstract of an article by Richard A. Clarke, former counter-terrorism adviser on the U.S. National Security Council that was published in the New York Times:

Have you ever wondered what good it does when they look at your driver's license at the airport? Let me assure you, as a former bureaucrat partly responsible for the 1996 decision to create a photo-ID requirement, it no longer does any good whatsoever. The ID check is not done by federal officers but by the same kind of minimum-wage rent-a-cops who were doing the inspection of carry-on luggage before 9/11. They do nothing to verify that your license is real. For $48 you can buy a phony license on the Internet (ask any 18-year-old) and fool most airport ID checkers. Airport personnel could be equipped with scanners to look for the hidden security features incorporated into most states' driver's licenses, but although some bars use this technology to spot under-age drinkers, airports do not. The photo-ID requirement provides only a false sense of security.

RISKS 23 79

NEED PROFESSIONAL RISK ASSESSMENT TO IMPROVE SYSTEMS

Jack Goldberg published a thoughtful essay about risk management in RISKS:

Risks associated with developing and using computer systems have been documented widely (e.g., by PGN) and have become part of popular awareness. Economic costs resulting from these risks are huge, though presently unquantified. They include the costs of system failures, abandoned system developments, and lost opportunities to build valuable systems whose complexity is deemed beyond present art.

Despite the widespread awareness of this situation, nothing fundamental has been done to change it. New system technologies attempt to improve matters by giving system builders better tools. Large corporate and government initiatives to improve system trustworthiness have been announced. Despite many advances, system development risks have not abated. New systems keep getting developed whose defects are discovered too late to be repaired economically. Repairs become patches and basic defects remain embedded in the system. These problems are pervasive, both in safety and infrastructure-critical applications and in the mundane data-processing applications that support the national economy.

With all the awareness of the hazards of system building, why does this bad situation continue? We suggest that the reason is the weakness of current risk assessment for new systems. Warnings about computer system risks that are given in an early stage do not have the force of warnings in other disciplines such as medicine and civil engineering and so they are ignored or discounted.

What can be done to improve the believability of warnings about development hazards? We do not envision a super-powerful tool that can generate a high-confidence hazard assessment for all situations. Rather we see the need for a profession of hazard auditors who have earned acceptance based on their scientific skills and experience. The need for their skills should be assumed and demanded in all system development efforts. Their observations (and if necessary, testimonies) should be communicated to purchasers, builders and users. Tools should be developed to support their analyses.

Building such a profession would be a substantial effort but the effort would surely be justified by the enormous cost of current development deficiencies. Government agencies, corporations, universities and professional associations all have clear roles to perform.

RISKS; http://tinyurl.com/chvdq 24 11

HASSLES OF TERRORIST WATCH LISTS

Contributor Richard M. Smith documents a CNET news article bemoaning the hassles of being placed on a terrorist watch list. Nearly 30,000 airline passengers found out in 2004 that they were on such lists. The article continued:

>Jim Kennedy, director of the Transportation Security Administration's redress office, revealed the errors at a quarterly meeting convened here by the U.S. Department of Homeland Security's Data Privacy and Integrity Advisory Committee.

Marcia Hofmann, staff counsel at the Electronic Privacy Information Center, said this appeared to be the first time such a large error has been admitted. "It was a novel figure to me," Hofmann said. "The figure shows that many more passengers than we've anticipated have encountered difficulty at airports. The watch list still has a long way to go before it does what it's supposed to do."

Kennedy said that travelers have had to ask the TSA to remove their names from watch lists by submitting a "Passenger Identity Verification Form" and three notarized identification documents. On average, he said, it takes officials 45 to 60 days to evaluate the request and make any necessary changes.

Travelers have been instructed to file the forms only after experiencing "repeated" travel delays, he said, because additional screening can occur for multiple reasons, including fitting a certain profile, flying on a one-way ticket, or being selected randomly by a computer.<

HEALTH SITES GET ACCREDITATION FROM STANDARDS GROUP
The American Accreditation Health Care Commission has put the stamp of its approval on 13 online health-care sites, the first such sites to earn AAHCC accreditation. AAHCC sets quality standards for managed-care and other health-care programs. The move is aimed at helping people sort out good information from bad in the health care field, which has become a popular area of online research among consumers. "There is so much bad information on the Internet, especially about health-care content," said Kevin Noland, COO of A.D.A.M., one of the sites to earn accreditation this week. "Someone needs to set a standard so people feel they are getting information from a trusted source." Standards for approval include full disclosure about funding and advertising, quality of editorial content, linking to other sites, and privacy and security. Other accredited sites include WellMed, WebMD and Health Insurance Association of America. (Wall Street Journal 14 Dec 2001)

NIPC/DHS

August 13, Government Computer News — NIST releases guidelines for IT security metrics.

The National Institute of Standards and Technology (NIST) has released its final version of guidelines for developing metrics to help ensure agencies meet IT security requirements. Metrics-measurable standards-monitor the effectiveness of goals and objectives established for IT security. They measure the implementation of security policy, the results of security services and the impact of security events on an agency's mission. The publication uses the critical elements, and security controls and techniques laid out in an earlier NIST publication, 800-26, Security Self-Assessment Guide for IT Systems. NIST Special Publication 800-55, Security Metrics Guide for IT Systems is available online

NIPC/DHS

November 19, Government Computer News — Congress plans report cards on cybersecurity.

On the heels of Office of Management and Budget efforts over the past year to boost cybersecurity, lawmakers are set to weigh in on agency progress. The House Government Reform Subcommittee on Technology, Information Policy, Intergovernmental Relations and the Census next month will issue a cybersecurity report card detailing agency progress in meeting the requirements of the Federal Information Security Management Act (FISMA). The subcommittee has been working to focus the legislative and executive branches on the importance of cybersecurity with a variety of hearings over the past year. Subcommittee staff director Bob Dix, speaking Wednesday, November 19, at the Enterprise Architecture 2003 Conference in Washington D.C. said the subcommittee also plans to explore whether the federal procurement process can be used to improve software security. "If we use the purchasing power of the federal government to insist that developers provide more secure products, that will benefit all users in both the public and private sectors," he said.

DHS IAIP Daily; http://www.computing.co.uk/news/1157762

September 01, Computing (UK) — IT users seek to certify security.

IT security experts from some of the UK's most influential businesses are meeting this week to try to establish a professional body for certifying information security staff. The group, which includes the Royal Bank of Scotland, Royal Mail and BP, will meet with The Information Security Forum, in an attempt to create an industry body which links financial and IT security needs. David Lacey, Royal Mail director of information security, told Computing that the group hopes to establish codes of conduct and professional certification for IT security staff, to ensure compliance with growing corporate financial auditing regulations. Following the meeting, the group will expand its plans for security standards, benchmarking, business processes and vendor management. Lacey expects to produce a report before the end of October to share with IT suppliers.

MICROSOFT SAYS SECURITY IS JOB #1
In January Microsoft chairman and cofounder Bill Gates instructed the company to shift its priority from adding new software features to ensuring that its software is secure, and in the months since then the company's software designers have been reexamining the millions of lines of Windows operating system software, looking for security vulnerabilities. Rebecca Bace, a security consultant who has been critical of Microsoft, comments: "I think that the reason that people are upset with them is the perception that Microsoft will always choose the extra feature, begging the issue of whether that feature is actually of high value to the user and damning the security impact it might represent to all users." But Microsoft security expert Michael Howard insists that, if that was ever true, it's definitely not true since Gates called for a new company-wide emphasis on security as the number one priority: "Microsoft has always had a crisis-driven mentality. You have my word: we will lead the industry in delivering secure software." (New York Times 8 Apr 2002)

2003-01-10 **report INFOSEC standards US federal government infrastructure protection**

NIPC/DHS

January 09, Federal Computer News — Council offers vision for infosec standards.

President Bush's private-sector infrastructure protection advisory council agreed January 8 that the federal government should encourage the development and use of open standards in the market instead of dictating specific standards. But federal officials should also use the government's significant buying power to push for interoperability in those market standards and solutions that will raise the baseline of security across all sectors. The National Infrastructure Advisory Council's report will go to the president later this month along with a revised National Strategy to Secure Cyberspace, said Richard Clarke, chairman of the President's Critical Infrastructure Protection Board. The recommendations fall in line with the approach taken by the Bush administration in its draft cybersecurity strategy, which the White House released in September 2002 for comment. Revisions proposed by Clarke's office include setting specific priorities, such as taking a closer look at the Common Criteria security product certification program. Later this month, the council plans to meet again to look at other infrastructure protection issues, including the international migration to Version 6 of the Internet Protocol and developing a systematic vulnerability assessment program for private-sector infrastructure.

2003-01-16 **Microsoft international governments access secret code security testing Russia NATO**

NIPC/DHS

January 15, New York Times — Microsoft to give governments access to code.

Microsoft announced today that it will allow most governments to study the programming code of its Windows systems. Under the program, 97 percent of the code to Windows desktop, Windows server and Windows CE hand-held software will be available to governments online for inspection and testing. To view the other 3 percent - the most sensitive technology - government representatives must come to Microsoft headquarters in Redmond, WA. Governments will also be allowed to plug their security features instead of Microsoft's technology into Windows. More than two dozen countries are encouraging agencies to use "open source" software - developed by programmers who distribute the code without charge and donate their labor to debug and modify the software cooperatively. The best-known of the open source projects is GNU Linux, an operating system that Microsoft regards as the leading competitive threat to Windows. One appeal of Linux is that developers have complete access to the underlying source code, whereas Microsoft has kept some Windows technology secret. Microsoft expects that perhaps 60 foreign governments and international agencies will eventually join its government security program. The first to join were Russia and the North Atlantic Treaty Organization, and the company is negotiating with 20 other groups.

2003-03-18 **best security practice report Telecom NRIC FCC infrastructure**

NIPC/DHS

March 14, Government Computer News — Telecom advisory group finishes work on best security practices.

The Network Reliability and Interoperability Council (NRIC) completed work Friday on a set of best practices to ensure the security and availability of the nation's communications infrastructure. During its quarterly meeting, industry working groups chartered by the Federal Communications Commission (FCC) presented 162 recommendations for steps to be taken by network operators, manufacturers and service providers to help with service restoration in the event of man-made or natural disruptions. The recommendations will be voted on by the entire council by March 28. NRIC was created as an industry advisory committee in 1992, and received its most recent charter from FCC chairman Michael Powell in January 2002. NRIC VI focuses on homeland security and was charged with coming up with a set of voluntary best practices for network security and survivability. Approval of recommendations made Friday would complete the first phase of the council's current work. The second phase is education and outreach to encourage use of the best practices. Practices recommended for adoption Friday focus on restoring service after attacks on or damage to physical or cyber links.

2003-04-11 **Microsoft source code partner access shared debug test secure**

NIPC/DHS

April 10, New York Times — Microsoft to allow partners to alter some source code.

Microsoft announced Wednesday that it would allow its industry partners to modify and then redistribute the underlying programming code used in cellphones, hand-held computers, television set-top boxes and other small devices. The new policy does not apply to Microsoft's mainstay products in personal computer desktop software and data-serving software that runs computer networks. According to analysts, the move shows that even Microsoft must respond, at least in markets it does not dominate, to the changed attitudes and practices in the software industry prompted by the rise of "open source" software - software developed by programmers who distribute the code without charge and then cooperatively debug, modify and add improvements to the software. Microsoft does not embrace the open source formula as a way of doing business. But the company is selectively borrowing some of the open source practices for the way it develops software. It is doing so mainly in response to the growing popularity of the best-known open source project, the GNU Linux operating system, a competitor to Microsoft's Windows. Microsoft rivals like IBM and Oracle are promoting Linux. Microsoft calls its approach the Shared Source Initiative, which it began nearly two years ago.

2003-04-16 **Open Security Exhange group Computer Associates security standards specifications implementation**

NIPC/DHS

April 14, eWEEK — Companies form Open Security Exchange.

Computer Associates International Inc. (CA) and several other companies announced Monday the formation of a group that is working to define and implement open specifications and best practices for integrating information security and physical security. The group plans to submit the specifications to an industry standards body, but has yet to decide which one it will approach with the idea. The Open Security Exchange grew out of CA's own efforts to integrate the management of network and physical security within large enterprises. The announcement of the group's formation came at the RSA Conference in San Francisco. Among the specific problems that the new group plans to address initially are audit and forensics, authentication, and centralized provisioning. Whether competitors and large companies from disparate industries can work together to make the idea work remains to be seen. The group's specification is available on its Web site, which is http://opensecurityexchange.com.

2003-04-17 **industry vendor TechNet alliance security standards specifications**

NIPC/DHS

April 15, CNET News.com — Alliance takes security call to boardroom.

TechNet, a lobbying group of more than 150 information technology companies, said Tuesday that it would work with the Internet Security Alliance and the four large accounting firms to create guidelines and best practices that they say executives need in order to secure their companies. The accounting firms are KPMG, PricewaterhouseCoopers, Deloitte & Touche and Earnst & Young. The starting point will be a top-10 list of security steps for executives that the Internet Security Alliance has already created. "We wanted to aim at the top because we believe that at the top, with boardroom involvement and (policy) trickling down, we can get the best results," said John Shaughnessy of the Internet Security Alliance. President George W. Bush in February 2003 said the United States government would not regulate technology companies, but rather would promote cooperation between the industry and the government to secure infrastructure. The groups plan to release the guidelines and then to set a date by which its membership should comply with the security steps.

2003-04-22 **Indiana Purdue University cybersecurity center information assurance security research studies**

NIPC/DHS

April 18, Associated Press — Law professor will head university's cybersecurity center.

Indiana University (IU) law professor Fred Cate will be the inaugural director of the Center for Applied Cybersecurity Research which will research computer and Internet security issues. Cate, an expert on privacy and information law, said the center will encourage university partnerships with businesses and with federal and state government agencies. IU created the center with $125,000 from a private donor and a matching amount from its own funds, said Michael McRobbie, IU's vice president for information technology and chief information officer. He said the center will be based both in Bloomington and at Indiana University-Purdue University at Indianapolis. It will bring together university staff with computer-security duties - from information technology, legal, audit and police departments - with faculty performing research related to cybersecurity, he said.

2003-04-23 **cyber risk e-crime cyber sabotage Australia companies share information protect infrastructure**

NIPC/DHS

April 22, The Australian — Austrialian business called on to fight cyber risks.

Australian companies are being asked to share information freely in order to defeat threats ranging from cyber-sabotage to e-crime. "If just one part of the economy is attacked, the repercussions are likely to be felt by all sectors and all businesses," Attorney-General Daryl Williams told business representatives at the launch of the Trusted Information Sharing Network (TISN) in Melbourne this month. Businesses often view infrastructure protection as a government problem, according to Tom Patterson of Deloitte & Touche Security. "If you look at what runs the economy, it's not your government, it's your companies. Every company has an obligation to protect its business not only for its stakeholders and its shareholders but also for the economy as a whole," he says. The government hopes TISN will become a forum for open exchange of information about system attacks and vulnerabilities, as well as protection of key sites from cyber-sabotage. A Critical Infrastructure Advisory Council will be set up to oversee efforts in various industry sectors as well as developing strategies for business continuity and consequence management.

2003-07-25 **Microsoft integrated security Windows Office R&D**

NewsScan

MICROSOFT PROMISES 'INTEGRATED INNOVATION'
Microsoft plans to increase its R&D spending this year by perhaps 8%, to a total of $6.9 billion, and to expand its work force by 4,000 to 5,000 positions during the current fiscal year. Disputing recent pronouncements by others, Microsoft co-founder and chairman Bill Gates says that that the computer industry is far from being in decline or in a state of rapid consolidation: "The debate about what came out of the boom and what these information technology investments mean has really gotten fairly extreme. Obviously we put our money where our beliefs are in saying we disagree with all of this." And Microsoft's business strategy at this point in time? "Integrated innovation" that will give the company's Windows and Office software customers a continuous stream of features and service. Gates says, "It shouldn't be necessary for people to buy additional products for their secure infrastructures." (New York Times 25 Jul 2003)

2003-10-22 **Carnegie Mellon lab cyber-security engineering technologies new CERT Internet Explorer CyLab education research**

NIPC/DHS

October 22, eWEEK — Carnegie Mellon lab tackles cyber-security.

Security, engineering and public policy experts at Carnegie Mellon University are joining together to form a new lab at the school dedicated to researching and developing new security technologies. The new organization, known as the Carnegie Mellon CyLab, will include representatives from the school's engineering, computer science and public policy departments, as well as personnel from the CERT Coordination Center. The group will seek to promote collaboration between the government and the private sector. CyLab's charter will differ significantly from that of CERT, which is charged with analyzing and responding to security threats and attacks. A quasi-public organization, CERT is partially funded by the federal government. CyLab will also receive public money, but will concentrate on finding long-term solutions to pervasive security problems instead of looking at how to mitigate the latest attack on Internet Explorer, as CERT does. The group's mission is essentially threefold: education; research and development; and response and prediction. In addition to offering bachelor's, master's and doctorate degrees in security-related disciplines, CyLab will also work to educate home users on the inherent dangers of the Internet and the steps they can take to combat those issues.

2003-11-14 **technology security alliance chief security officer importance Internet**

NIPC/DHS

November 12, Washington Post — Tech security chiefs form alliance.

Nearly a dozen top technology luminaries are lending their star power to a new think-tank that will look for ways to elevate the status of chief security officers in the private sector, a move that they say will go a long way toward improving Internet security. The Global Council of Chief Security Officers was formed by former White House cybersecurity adviser Howard Schmidt. The council will consult with technology vendors and industry groups to help design more secure products for the next generation of the Internet, Schmidt said. MCI's Vint Cerf said that the council should also encourage more compatibility between different and competing technologies. Failure to do so, especially as the Internet grows into even more of a commercial medium, could prove damaging to online networks. The council will hold its first meeting in San Jose in January and a CSO summit in San Francisco the following month. U.S. CERT, a new partnership between the Department of Homeland Security and the CERT Coordination Center—a government funded security watchdog group at Carnegie Mellon University in Pittsburgh—will oversee the council's day-to-day activities. The council is on the Web at:

2003-12-04 **government official security summit Department Homeland Security DHS cooperation public private sector**

NIPC/DHS

December 02, CNET News.com — Government officials join security summit.

Silicon Valley executives are slated to meet on Wednesday , December 4, with top bureaucrats from the Department of Homeland Security (DHS) to hammer out ways that the private sector can work with government to enhance national security and avoid creating regulations. The National Cyber Security Summit will bring together top executives at security and technology companies with policy-makers. Corporate leaders are expected to announce several new task forces and initiatives aimed at making information security a boardroom issue. The gathering comes nine months after the Bush administration unveiled its plan to secure the Internet through cooperation instead of regulation. It also comes just in time to stiffen opposition to a bill that would require companies to reveal the results of a security audit in their financial reports. The meeting, which will be held at the Santa Clara Marriott, will try to convince government officials that security-savvy organizations can teach industry executives to consider information security at the boardroom level. The meeting will establish at least three task forces, including the Corporate Governance Task Force, the CEO Cyber Security Task Force, and the Technical Standards and Common Criteria Task Force.

2003-12-05 **industry security tools software release cyber summit GISRA FISMA**

NIPC/DHS

December 04, — Industry groups release security tools.

A pair of information technology industry groups unveiled security assessment tools at this week's National Cyber Security Summit in Santa Clara, CA. TechNet, an association of chief executive officers (CEO) and other senior executives, unveiled its Corporate Information Security Evaluation tool, which takes CEOs, chief information officers, and chief security officers through 88 points on risk management, people, processes, and technology. The Information Technology Association of America, in partnership with the Marshall School of Business at the University of Southern California, announced its Cyber Security Assessment, which will build on information provided by the TechNet evaluation. The key is performing both assessments regularly and measuring progress at every step, said Harris Miller, president of ITAA. Both tools drew from the government's recent experience with self-assessments under the Government Information Security Reform Act (GISRA) of 2000 and the Federal Information Security Management Act (FISMA) of 2002, said Art Coviello, co-chairman of TechNet's Cyber Security CEO Task Force. There, the focus also was on repeated measurements to identify shortcomings and demonstrate improvement or regression, he said.

2003-12-16 **National Science Foundation NSF program secure computer network**

NIPC/DHS

December 15, Government Technology — NSF announces $30 million program. To promote research into more dependable, accountable and secure computer and network systems, the National Science Foundation (NSF) has issued a solicitation for the Cyber Trust program, which expects to fund up to $30 million in awards. The Cyber Trust program will support up to three research center-level efforts as well as single-investigator and team awards, subject to NSF's merit-review process and the availability of funds. The Cyber Trust program is seeking innovative proposals in three broad areas: fundamental research, multi-disciplinary research, and education and workforce development. Fundamental research is needed to advance the state of the art in knowledge and technology about trustworthy computing. This covers such areas as security and privacy models and metrics, evaluation and certification methods, denial-of-service prevention, long-lived data archiving methods, privacy protection, and network and application forensics. Multi-disciplinary research is needed to improve understanding of the social, legal, ethical and economic trade-offs that affect the design and operation of trusted information systems. Additional information is available online:

2004-02-25 **computer security firms alliance secure US communication networks**

NewsScan

COMPUTER SECURITY FIRMS FORM NEW ALLIANCE

Eleven top U.S. computer security firms have banded together to form the Cyber Security Industry Alliance, a lobbying group that hopes to work cooperatively with Congress to come up with a plan for securing the nation's electronic communications networks. "Rather than saying to Congress, 'This is not an issue, stay out,' we as an industry need to figure out how to solve thee problems in a proactive way before someone gets fed up and says it's time to legislate," says Sanjay Kumar, CEO of Computer Associates. One of the Alliance's first tasks will be to develop common standards for reporting and sharing information on Internet security threats. Former White House technology adviser Richard Clarke says the proliferation of malicious worms and viruses in 2003 has fueled demand for action: "Last year was the worst in history in terms of the damage from cyber-attacks. I think we're getting to the point where Congress wants something to happen, the people and American corporations that buy information technology want something to happen, and so having the technology security industry organized to be part of that debate makes a lot of sense." Other companies involved in the Alliance include: Bindview Corp., Check Point Software Technologies, Netscreen Technologies (a subsidiary of Juniper Networks), PGP Corp., RSA Security and Secure Computing Corp. 2004-04-01 **softeware industry acknowledges network security Bush administration**

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/internet/04/01/cybersecurity.ap /index.html

April 01, Associated Press — Software industry makes room for government.

In a surprise shift, leading software companies acknowledge in a report to the Bush administration that the government might need to force the U.S. technology industry to improve the security of America's computer networks. The companies, including Microsoft Corp. and Computer Associates International Inc., said the Homeland Security Department "should examine whether tailored government action is necessary" to compel improvements in the design of computer software. The 250-page report containing that recommendation and dozens more was being released Thursday, April 1. It cautioned that government should require security improvements only when market forces fail. It also said businesses already are demanding software that is safer and more resilient to attacks. But the report said the most sensitive computer networks -- such as those operating banks, telephone networks or water pipelines -- "may require a greater level of security than the market will provide." In those cases, the software companies recommend "appropriate and tailored government action that interferes with market innovation on security as little as possible." It urged the government to work with companies to produce a formal study during the 2005 fiscal year, which begins in October.

2004-05-18 **data sharing government portal**

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0517/web−irish−05−18− 04.asp

May 18, Federal Computer Week — When Irish eyes are sharing.

Using a central portal for citizen services, Irish officials are allowing agencies to share information while ensuring that agencies retain their autonomy. "The idea is agencies don't talk directly to each other," said Sean McGrath, chief technology officer of business integration company Propylon, 11 speaking Monday, May 17 on a panel at the CIO Summit. "They talk to a single hub." That hub is at the heart of the Public Services Broker, which provides citizens with a single point of access to government services and allows for data sharing governmentwide. Rather than share information directly, agencies provide data to a central location, which packages and disseminates the requested information. This approach is faster and cheaper than distributed architectures and allows for flexibility and ownership among agencies. The Public Services Broker portal will go live next month, said Oliver Ryan, director of Ireland's Reach agency.

2004-05-18 **data sharing security bridge federal government PKI federated identity**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/0517/web−pki−05−18−04.a sp

May 18, Federal Computer Week — Three agencies, supplier certified for security bridge.

Three federal agencies and a federal supplier have achieved cross-certification status with the Federal Bridge Certification Authority, a secure systems infrastructure for exchanging data. The admission of four new members doubles the number of organizations that have passed rigorous tests required for cross-certification with the bridge, federal officials announced at a recent Federal Public Key Infrastructure (PKI) Deployment Workshop in Washington, DC. Cross-certification means the eight federal agencies and supplier with that status can exchange sensitive information online knowing that the other cross-certified agencies' digital signatures and certificates be trusted. The conceptual architecture that includes the bridge has been expanded to include newer security policy concepts such as those defined by the Office of Management and Budget's E-Authentication program. But officials said the federal bridge continues to play an important role in secure data exchanges among agencies and among the federal government and the states, other countries and businesses.

2004-05-24 **outsource government network services treasury**

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0524/tec−treasury−05−24−04. Asp

May 24, Federal Computer Week — Treasury to outsource network services.

By the end of the year, U.S. Department of Treasury officials expect to award what could be the federal government's largest telecommunications contract for managed services. The new contract will be based on service-level agreements, which private-sector officials increasingly view as the most efficient way of buying telecom services. "We want obviously the best service for the cheapest price, as any organization would," said Mike Parker, acting chief information officer at Treasury. Department officials said they expect to use the managed services contract to acquire such advanced network capabilities as IP multicast, IP Version 6, IP telephony and optical-wavelength service. IP multicast is a way to broadcast video signals via networks that use relatively low bandwidth. The contract will cost Treasury as much as $1.5 billion, but it will get the agency out of the telecom business. It will no longer own the network assets on which it will depend.

2004-06-24 **Brazil lawsuit Microsoft attacked Australia OSIA Bill Gates**

NewsScan

MICROSOFT'S BRAZIL LAWSUIT 'REPREHENSIBLE'

OSIA, Australia's Open Source industry body, has issued a scathing criticism of Microsoft's lawsuit against Sergio Amadeu, President of the Brazilian National Institute for Information Technology, calling it a "reprehensible action" that attempts to "curb freedom of speech and of criticism." The defamation lawsuit was filed after Amadeu defended the Brazilian government's decision to shift 300,000 PCs from Windows to Linux. He had said this decision "makes sense for a developing country where a mere 10% of the 170 million people have computers at home and where the debt-laden government is the nation's biggest computer buyer." OSIA also referred to Microsoft's "abuse" of its monopoly position, and Bill Gates's address to university students in 1998, where he made a statement saying, "Although about 3 million computers get sold every year in China, people don't pay for the software. Someday they will, though. As long as they are going to steal it, we want them to steal ours. They'll get sort of addicted, and then we'll somehow figure out how to collect sometime in the next decade." (The Age, 24 Jun 2004)

2004-07-30 **Georgia Fulton County network security upgrade bandwidth usage**

DHS IAIP Daily;
http://www.informationweek.securitypipeline.com/news/2610099 8

July 30, InformationWeek — Georgia County looks at network traffic.

The Department of Information Technology in Fulton County, GA, has just completed a network-security upgrade that gives it the ability to detect the amount of network resources being consumed by applications across the county's 5,500 PCs. Use of instant messaging, radio broadcasts over the Web, and peer-to-peer file sharing apps such as Kazaa are not new to the county. But their proliferation had recently begun "eating up bandwidth that I'm purchasing with taxpayer dollars," says county CIO and IT director Robert Taylor. Not a good thing, particularly as Fulton County expands its E-government initiatives to provide its 886,000 residents with greater access to county records via the Web. Rather than buying additional DS3 lines, which run at around 45 Mbps and cost about $8,000 per month, Taylor and his staff decided to make better use of the network's existing bandwidth. The upgrade will also improve security. The network was hit last October by a denial-of-service attack caused by the Welchia virus, an aggressive infection designed to exploit a software flaw in recent versions of Windows. Although the virus was contained, Smith says, the server is being used to identify malicious behavior before it becomes a problem.

2004-08-04 **Federal Communications Commission FCC network outage reporting rules**

DHS IAIP Daily; http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC−
250543 A1.pdf

August 04, FCC — FCC adopts rules to enhance network outage reporting.

The Federal Communications Commission (FCC) on Wednesday, August 4, adopted new rules requiring wireless, wireline, cable, and satellite telecommunications providers to report information electronically to the FCC about significant disruptions or outages to their communications systems. The Commission also ruled that all sensitive information collected as a result of these new rules will be protected from public disclosure. These actions will facilitate more reliable telecommunications throughout the United States and promote homeland security, building on the telecommunications industry's efforts to date to improve outage reporting. Under the new rules, both wireless and satellite providers will be subject to the FCC's reporting requirements. The increasing use of cell phones and pagers, as well as the Nation's growing dependence on satellite communications as critical infrastructure, necessitated these changes to the Commission's rules. Action by Report and Order and Further Notice of Proposed Rulemaking (FCC 04-188).

2004-08-27 **cybersecurity memo required Office of Management and Budget OMB**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27089−1.html

August 27, Government Computer News — OMB asks agencies for cybersecurity check-up.

Agencies have until October 6, 2004 to report to the Office of Management and Budget (OMB) on how they have improved their cybersecurity over the past year. In a memo to agency executives, OMB director Joshua B. Bolten said agencies should summarize the results of their annual IT security reviews of systems, agency progress in correcting weaknesses defined in their plans of actions and their inspector general evaluations. Last year, agencies said about 62 percent of all systems were secured, and OMB earlier this month, said that number had increased to 70 percent. Agencies still are well behind the administration's goal of 90 percent of all systems secured by December 2003.

2004-09-21 **America Online AOL second level security subscription**

NewsScan

AOL OFFERS SECOND LEVEL OF SECURITY

AOL has become the first major U.S. online business to offer customers a second layer of security, which it will make available to subscribers for $1.95 a month in addition to a one-time $9.95 fee. The system uses a matchbook-size device displaying a six-digit log-on code that changes every minute; it requires that the second password be entered in order to check e-mail or access such services as calendars, stock portfolios and AOL's Bill Pay. Gartner analyst Avivah Litan estimates that no more than 5-15% of AOL subscribers will sign up initially but says that "you have to start somewhere." (AP/Washington Post 21 Sep 2004)

2004-10-11 **National Institute of Standards and Technology NIST minimum security concerns document publication**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/1011/web−nist−10−11 −04. asp

October 11, Federal Computer Week — NIST details minimum security controls for federal information systems.

A new document by the National Institute of Standards and Technology (NIST) spells out the minimum security controls that federal agency officials must use to comply with the statutory requirements of the Federal Information Security Management Act of 2002. The document, Special Publication 800-53, will be available at www.nist.org until November 30 for public review and comment. NIST officials said they are especially interested in receiving comments about the cost and potential impact that the recommended computer security controls could have on federal agencies.

2004-10-18 **security Microsoft Cisco alliances Dell AOL Yahoo spyware customers**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A41629-2004Oct18.html

SECURITY PROBLEMS PROMPT STRANGE BEDFELLOWS

With security looming as major issue for users, top technology firms are coming to terms with the need to form alliances in order to combat the plague of viruses, computer worms and spyware programs that threatens computing productivity. One case in point is today's announcement that Microsoft and Cisco are teaming up to tackle the problem, in an acknowledgement that many corporate customers have made major investments in both companies' technology and do not want to be forced to choose between them when it comes to security solutions. Meanwhile, Dell is partnering with the nonprofit Internet Education Foundation -- a coalition that includes tech giants like AOL and Yahoo -- to educate consumers about the risks of spyware. Dell VP Mike George says his company normally does not become involved in software issues, but in recent months has stepped up efforts to help consumers rid their computers of spyware and other problems because they are turning off potential users.

2004-11-04 **Microsoft patch issue help preparation security bulletin publication Website**

DHS IAIP Daily; http://www.infoworld.com/article/04/11/04/HNmicrosoftpatchin g_1.html

November 04, IDG News Service — Microsoft to help users prepare for patching.

Microsoft Corporporation will give customers advance notice of its monthly security updates in an effort to help them prepare to install related software patches, the company announced Thursday, November 4. Starting this month, Microsoft will publish on its Website a summary of planned security bulletins three days before they are released in their entirety. The summary will include information on which products are affected by updates, and severity ratings for security problems. The company normally releases security bulletins on the second Tuesday of each month. It previously offered customers who signed up through support personnel advanced notifications, but the information was not published for all customers. The information will be available at http://www.microsoft.com/technet/security/default.mspx

2004-11-17 **Carnegie Mellon University CMU Korean Information Security Agency collaboration CyLab**

DHS IAIP Daily; http://www.cmu.edu/cmnews/extra/041116_cylab.html

November 17, Carnegie Mellon University — Carnegie Mellon to create collaborative research lab with Korea Information Security Agency.

Carnegie Mellon University and Korean officials have agreed to create a new collaborative research lab for the study and development of leading-edge security technologies. Officials from the Korea Information Security Agency (KISA) have pledged $6 million over the next three years to establish CyLab Korea at Carnegie Mellon. KISA will also establish CyLab Korea in Seoul, Korea, with more than 10 research staff members. Both sites will work together on research projects and develop new technologies and paradigms that will usher in an era of more secure computers, networks and communications systems. KISA is a center of excellence responsible for the computer network security of commercial information technology infrastructure that covers nearly 90 percent of the entire infrastructure of information technology in the Republic of Korea (South Korea).

2004-11-27 **UK IT computer network sprawl chaos failure prevention project healthcare banking**

DHS IAIP Daily; http://www.newscientist.com/news/news.jsp?id=ns99996706

November 27, New Scientist — Sprawling systems teeter on IT chaos.

The UK government is spearheading a $19 million program aimed at finding ways to avert catastrophic failures in large IT networks. Some systems are now so large they are untestable, making it impossible to predict how they will behave under all circumstances. The hidden flaws could lead to crashes in critical networks like healthcare or banking systems. The scheme has been given added urgency by the failures of power grids in the U.S. and Italy last year. There is a real danger that such massive interconnected systems will exhibit potentially disastrous "emergent behaviors," says David Cliff of Hewlett-Packard's laboratory in Bristol, UK. The $19 million the UK is to spend will be used to set up a national center to study IT complexity, managed by the Engineering and Physical Sciences Research Council.

DHS IAIP Daily; http://austin.bizjournals.com/austin/stories/2004/11/29/dail y13.html?jst=b_ln_hl

November 30, Austin Business Journal (TX) — UT's info security center to address cybersecurity concerns.

The University of Texas has established a new security center to address the growing cybersecurity problems across the country. The Center for Information Assurance and Security's (CIAS) goal is to conduct research that will lead to innovative cybersecurity solutions and address the national need to produce more trained professionals in the field. "Despite considerable industry spending to develop solutions, the cybersecurity problem continues to grow at an alarming rate," says Frederick Chang, director of the CIAS and a research professor. The new center will involve business, government and academia in its effort to be a multi-disciplinary initiative.

2004-12-02 **United States US Japan cooperation cybersecurity information networks security global culture**

DHS IAIP Daily; http://tokyo.usembassy.gov/e/p/tp−20041202−05.html

December 02, U.S. Department of State — United States, Japan should cooperate on cybersecurity.

The United States and Japan should intensify cooperative efforts to secure their information networks and work toward the creation of "a global culture of cyber security," according to Lincoln P. Bloomfield Jr., assistant secretary of state for political-military affairs. Bloomfield addressed the U.S.-Japan Critical Information Systems (CIP) Forum hosted by the Vanderbilt Institute for Public Policy Studies in Washington, DC on Tuesday, November 30. "Weaponizing" information technology (IT) is relatively cheap and attacks can be carried out with "a reasonable expectation of impunity," according to Bloomfield. For this reason, the United States and Japan must join forces to protect their own and global information systems, he said. The two countries' governments have made steps in this direction, Bloomfield pointed out. The first formal discussion of cybersecurity began in June 2002, and efforts continued with meetings in February 2004. Each nation must take systematic, coordinated actions to protect its own networked information systems, Bloomfield said. Global efforts to secure information systems, he said, include not just governments but information technology developers, vendors, data managers, and telecom providers.

2004-12-14 **General Services Administration GSA security working group revival standards evaluation**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/30948−1.html

December 14, Government Computer News — GSA will revive security working group.

The General Services Administration (GSA) will re-establish a government-wide working group to evaluate telecommunications security and draft standards. The effort will be part of GSA's Multitier Security Profile Program, an effort to package security services for agencies, said John Johnson, assistant commissioner for service development at GSA's Federal Technology Service. He said the working group would be in place within two months. Because of the importance of security, the new group will remain in place indefinitely, Johnson said. It will build on the early work to look at changes in telecomm security needs and recommend standards, he said.

2005-01-07 **IT technology schools Internet schoolwork curriculum**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/10588049.htm

PAIGE CALLS FOR STRONGER IT EMPHASIS

Education Secretary Rod Paige this week called for improved use of technology in U.S. schools. According to a report issued by the Department of Education, virtually all of the nation's schools are connected to the Internet, and schools on average have one computer for roughly every five students. Despite this level of technology available, and despite the fact that many students are using computers regularly for schoolwork, educators do not have the skills or the understanding to effectively integrate technology into the curriculum, according to the report. "Schools remain unchanged for the most part," said Paige, "despite numerous reforms and increased investments in computers." Although insufficient funding is frequently cited as a reason for the lag in teacher training, the report rejected that argument, pointing out that funding can come from a number of sources.

2005-01-13 **FBI computer system attacks intelligence agencies software**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7324403

FBI'S NEW COMPUTER SYSTEM ALREADY OLD

A complete overhaul of the FBI's computer system following the September 11 attacks may prove to have been wasted effort, according to the agency. Criticism was leveled at intelligence agencies following the attacks of September 11, with some arguing that, had information been freely shared among the agencies, the attacks might have been prevented. The FBI undertook to replace all of its systems at one time, which agency officials said was the wrong approach. One official compared the initiative to "changing wheels on a car that is going at 70 miles per hour." Such an overhaul, he said, should be done in stages. Critics faulted the old system for being largely paper-based, preventing agents in the field from accessing needed information or from filing reports electronically. An application called Virtual Case File was supposed to fix many of those problems, but after numerous delays, the software that was finally delivered last month is largely unusable. 2005-01-18 **Media Lab Europe funding MIT corporate funding research**

EDUPAGE; http://www.nytimes.com/2005/01/18/technology/18lab.html

MEDIA LAB EUROPE TO CLOSE

Five years after it was opened, Media Lab Europe will close its doors, unable to attract sufficient funding to remain viable. Modeled after the successful Media Lab at MIT, Media Lab Europe opened in Dublin, Ireland, hoping to secure 165 million euros as a 10-year budget. Despite 35.5 million euros from the Irish government--as well as another 22.5 million the government spent on Media Lab's facilities, which were rented to the lab for virtually nothing--organizers of the lab were only able to sign up eight corporate and private-sector partners. Some critics of the lab said the funding model that worked in the United States was unlikely to work in Europe and should have been adjusted accordingly. Others noted that in an environment where public funding of academic research was difficult to come by, the Irish government's generous support of Media Lab may have annoyed other researchers in the country, thereby isolating the lab from them. Nicholas Negroponte, founder of Media Lab, said he had hoped the lab would seed other such research projects in Europe, but he attributed its demise to the bursting of the dot-com bubble and to what he called "top-down, highly bureaucratic and geopolitical funding offered by the E.U."

2005-01-18 **report spending cybersecurity Presidents Information Technology Advisory Committee research academic Cyber Trust NSF**

EDUPAGE; http://chronicle.com/prm/daily/2005/01/2005011802n.htm

REPORT CALLS FOR INCREASED SPENDING ON CYBERSECURITY

A new report from the President's Information Technology Advisory Committee calls for increased federal spending on cybersecurity research and stronger efforts to support academic research into cybersecurity. The report outlines a number of structural issues that contribute to the current problem, including a bureaucracy that causes confusion among federal agencies about the sources of funding for cybersecurity projects. According to the report, the Cyber Trust, which was established by the National Science Foundation (NSF), funded only 8 percent of the proposals it reviewed, while 25 percent warranted support. The report recommends increasing the NSF's cybersecurity budget by $90 million a year. Because cybersecurity projects often involve classified material, many colleges and universities cannot participate. The report argues that the government should take steps to increase the number of faculty involved in cybersecurity research--currently fewer than 250--and to attract more students to the field, with the goal of doubling the number of cybersecurity researchers in 10 years.

2005-01-26 **Sun Solaris open source Microsystems Dell HP Linux products systems products operating system**

EDUPAGE; http://www.nytimes.com/2005/01/26/technology/26sun.html

SUN MOVES SOLARIS TO OPEN SOURCE

Sun Microsystems has announced it will make its Solaris 10 operating system available as an open source product. Sun has lost ground to companies including Dell and HP that increasingly offer Linux-based products. Changing consumer sentiment regarding proprietary systems has left Sun defending its products, and the company's latest move is designed to persuade developers to once again consider Sun's technology. The open source Solaris will be available free of charge, and developers will be able to make changes to the operating system to improve it as they see fit. According to John Loiacono, executive vice president for software at Sun, the goal is to get more developers using Solaris, thereby increasing opportunities for Sun to sell its other products and hardware. The company also announced it would modify its stance on intellectual property and allow free use of 1,600 of the patents it holds on the Solaris operating system.

EDUPAGE;
http://www.nytimes.com/2005/02/10/technology/circuits/10info.html

FIGHTING COMPUTER DISTRACTIONS

A number of academic and commercial researchers are working to limit the distractions that computer users continually face. Activities such as reading e-mail, checking the weather online or surfing other Web sites, or simply fiddling with electronic music files can prove to be significant impediments to productivity for many people. Researchers often speak of "cognitive flow," a state of strong focus on a particular task. Some projects, including one involving researchers at Microsoft and the University of Maryland, study flow with the goal of designing applications that attempt to discern such a state in computer users. Software can then assign priority levels to potential interruptions, such as a new e-mail message, and determine whether to alert the user or to wait until the flow has ended. Alon Halevy, a professor of computer science at the University of Washington, is also working on e-mail systems that can decide when best to interrupt the user. Other efforts focus on understanding the types of functional structures that cause or promote distractions.

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?artic leID=60402267

FEDERAL GROUP FORMED TO BOOST SECURITY

The consistent failure of many federal agencies to secure their IT systems has prompted government officials to create a new organization, which will be funded by the private sector, to help chief information security officers improve cybersecurity. The formation of the CISO (Chief Information Security Officer) Exchange was disclosed last week by the federal CIO Council and the chairman of the House Government Reform Committee, Tom Davis, R-VA, who also released a computer-security scorecard for two dozen federal departments and agencies. Unlike the CIO Council, the CISO Exchange will be an informal organization aimed at providing more than 100 departmental and agency chief information security officers with a way to collaborate. The exchange will be co-chaired by Justice Department CIO Van Hitch, who heads the CIO Council's cybersecurity and privacy committee, and Government Reform Committee staff director Melissa Wojciak. All money to support the CISO Exchange will come from business, mostly IT security companies. As of last week's announcement, no company had been asked to contribute money.

SINGAPORE UNVEILS PLAN TO BATTLE CYBER TERROR.

Singapore is to spend $23 million over three years to battle online hackers and other forms of "cyber-terrorism" in one of the world's most connected countries, government officials said Tuesday, February 22. Describing the infrastructure behind the Internet as a "nerve system" in Singapore, Deputy Prime Minister Tony Tan said a new National Cyber-Threat Monitoring Center would maintain round-the-clock detection and analysis of computer virus threats. Singapore has one of the world's highest Internet penetration rates, with 50-60 percent of its 4.2 million people living in homes wired to the Internet. The Cyber-Threat Monitoring Center will link up with companies that provide anti-virus systems and governments running similar centers, including the United States and Australia. It is expected to be fully operational by the second half of 2006.

2005-02-24 **Britain UK Home Office Internet security hacking groups National Infrastructure Security Coordination Centre NISCC Website**

DHS IAIP Daily; http://www.computerweekly.com/articles/article.asp?liArticle ID=136955&liArticleTypeID=1&liCategoryID=2&liChannelID=22&li FlavourID=1&sSearch=&nPage=1

BRITAIN LAUNCHES INTERNET VIRUS ALERT SERVICE

Britain's Home Office has launched a high-profile campaign to secure the Internet against hacking groups using networks of infected computers to launch worm, spam and denial of service attacks against critical businesses and services. The campaign, which features a Website and an alert service to help non-IT specialists protect their computer systems, is designed to plug one of the weakest links in security on the Internet: home and small business PCs. The campaign will encourage home users and small businesses to sign up to an alert service, run by the National Infrastructure Security Coordination Centre (NISCC), part of the Home Office, which will give advice on urgent threats that affect home PCs, PDAs and mobile phones. Although the service is not designed to replace alert services run by firewall and anti-virus companies, NISSC believes that its links with international IT security organizations will help it to identify new computer threats as quickly as or before commercial alerting services. For more on the new service, visit http://www.itsafe.gov.uk

2005-03-07 **technology companies coordinate efforts compliance Sarbanes-Oxley**

EDUPAGE; http://www.internetnews.com/bus-news/article.php/3487896

TECH COMPANIES COORDINATE COMPLIANCE EFFORTS

A group of eight leading technology companies has formed a working group to help organizations understand and meet a growing number of technology regulations, including such legislation as the Sarbanes-Oxley Act. Founding members of the Compliance and Management Electronic Information (CMEI) working group include Oracle, HP, Sun Microsystems, and Veritas; the group will begin posting resources on the Internet Law and Policy Forum Web site in the next six months. As technology increasingly underpins business processes, the range of regulations with which a company must comply can be daunting. For example, U.S. regulations require companies to maintain records on former customers for seven years; laws in the United Kingdom, in contrast, require companies to immediately delete information on former customers. The CMEI working group will publish best practices, work to foster communication between businesses and regulatory agencies, and offer resources for companies to help them understand various compliance requirements. 2005-03-08 **US government Office of Management and Budget OMB six month study information technology IT security function vendor management**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/35249−1.html

OMB TO STUDY CONSOLIDATION OF IT SECURITY FUNCTIONS.

The Office of Management and Budget (OMB) expects this month to launch a six-month study of whether some federal IT security functions could be provided centrally by agencies or commercial vendors. Karen Evans, OMB administrator for e-government and IT, said Tuesday, March 8, at the Government Computer News Cybersecurity Conference in Washington, D.C. that a task force would complete its work by September so that guidance would be available to agencies for the fiscal 2007 budget cycle. The study will apply the Business Reference Model, a function-focused method for describing business operations, to cybersecurity. Each agency has its own security needs and acceptable risk profiles, and the study might not support the use of common providers for IT security, according to Evans. But she said there is enough common need that she doubts there is a good business case for 26 executive branch departments and agencies each going its own way for security. The study is part of a broader move by OMB toward focusing on the outcome of IT security management.

2005-03-16 **Florida Sarasota County wireless Wi-Fi network security intrusion prevention devices**

DHS IAIP Daily; http://www.fcw.com/article88313−03−16−05−Web

SARASOTA COUNTY, FLORIDA GOVERNMENT SECURES WIRELESS NETWORK.

Cautious about the security of its wireless network, the Sarasota County, FL government has installed devices in its buildings to detect and prevent wireless intrusion. By using such devices to secure about three million square feet of airspace across 15 of the county's 200 buildings, it is easier for information technology personnel to spot any unauthorized vulnerabilities or attacks on the wireless infrastructure. "We minimize the risk that occurs through these devices," said Bob Hanson, Sarasota County's chief information officer. Hanson said his government has security policies in place, but with considerable employee turnover each year, it's difficult to keep up their education. He said there are almost 5,000 employees in the area covered, and rogue wireless access points are perplexing. Sarasota IT officials can monitor their airspace using a centralized Web-based interface. Rich Swier, CEO of monitoring system company, said that although the benefits of wireless are obvious, it has also created a problem. Before, security personnel only had to worry about security within their facilities. "Now you're having your good guys, your employees and so forth bringing in devices and exposing your network outside your four walls."

DHS IAIP Daily; http://news.bbc.co.uk/1/hi/technology/4360727.stm

EUROPEAN GOVERNMENTS TO FORM INTERNET 'TERROR WATCH' TEAM

Five European governments are setting up a hi-tech team to monitor how terrorists and criminals use the Internet. The group will make recommendations on shutting down Websites that break terrorism laws. The plans for the initiative came out of a meeting of the G5 interior ministers in Spain that discussed ways to tackle these threats. The five countries also agreed to make it easier to swap data about terror suspects and thefts of explosives. The interior ministers of Spain, Britain, France, Germany and Italy -- the G5 -- met in Granada, Spain last week for an anti-terrorism summit. To combat terrorism the ministers agreed to make it easier for police forces in their respective states to share data about suspects connected to international terror groups. Part of this anti-terror work will involve the creation of the technical team that will keep an eye on how organized crime groups and terrorists make of the web.

2005-03-24 **Federal Bureau of Investigation companies report intrusions management concern security breaches stock prices**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,100598,00.html

FBI ASKS COMPANIES TO REPORT CYBER INTRUSIONS.

Corporate executives are often reluctant to report network intrusions for fear of having those security breaches made public and drag down stock prices. But state and federal law enforcement officials who spoke at an information security panel in New York on Wednesday, March 23, said such reports can sometimes provide an important missing link in larger cybersecurity investigations. "It may be a critical piece of information you're submitting to us – you never know where that fits into the pie," said Ron Layton, section chief of the cyber coordination branch for the Department of Homeland Security (DHS). Layton was one of several law enforcement officials who spoke at an information security conference sponsored by AIT Global Inc. and InfoWorld Media Group. Network intrusion reports don't necessarily have to fall within the statutory $5,000 minimum loss for federal authorities to investigate them, said Kent McCarthy, a special agent for the Secret Service in New York. McCarthy said the Secret Service does its best to protect the anonymity of corporations that report network intrusions. "We're not looking for a press release," he said. http://www.computerworld.com/managementtopics/outsourcing/is ptelecom/story/0,10801,100695,00.html

ISPS AND TELECOMM COMPANIES FORM ALLIANCE TO SHARE DETAILED INFORMATION ON ATTACKERS.

Leading global telecommunications companies, Internet service providers (ISPs) and network operators will begin sharing information on Internet attacks as members of a new group called the Fingerprint Sharing Alliance, according to a published statement from the new group. The companies, including EarthLink, Asia Netcom, British Telecommunications and MCI, will share detailed profile information on attacks launched against their networks. Information to be shared will include the sources of attacks. The alliance will make it easier for service providers and network operators to crack down on global Internet attacks more quickly, according to Tom Schuster, president of Arbor Networks, which launched the new alliance. The alliance replaces an ad hoc system of e-mail messages and phone calls that operators of large networks have used to coordinate their response to attacks and threats, Arbor said. The alliance will make it easier for them to cooperate and will lower the threshold that attacks must surpass to get the attention of ISPs. Even attacks on small ISP customers will prompt a response from large infrastructure providers.

2005-04-05 **federal information security improvement CISO Exchange Government Accountability Office GAO**

DHS IAIP Daily; http://www.federaltimes.com/index2.php?S=766429

GROUP AIMS TO BOOST FEDERAL INFORMATION SECURITY

A group of government and industry executives will meet for the first time this month to map out a strategy for improving the government's information security. The CISO Exchange is comprised of five chief information security officers from various federal agencies, one federal chief security officer, and two executives from information technology companies. It is a privately funded working group that will hold quarterly educational meetings and produce an annual report on the government's information technology security policies and operational issues. The exchange was announced in February by the federal Chief Information Officers Council and Representative Tom Davis from Virginia, chairman of the House Government Reform Committee. They announced the exchange as a way to boost security through educational meetings between chief information security officers and others in government and private industry. The group also will work with the Government Accountability Office and inspector general offices. At least 50 companies have inquired about joining the exchange, said Stephen O'Keeffe, of O'Keeffe & Company, the company managing the meetings. The two fellows on the exchange so far paid $75,000 apiece, he said.

A&from=news

NATIONAL SCIENCE FOUNDATION ANNOUNCES INTENT TO ESTABLISH CYBERSECURITY CENTER

The National Science Foundation (NSF) has announced it intends to establish two new Science and Technology Centers (STCs) in fiscal 2005. One is a major collaborative cybersecurity project led by the University of California, Berkeley, and a second, centered at the University of Kansas, will study polar ice sheets. The cybersecurity center will investigate key issues of computer trustworthiness in an era of increasing attacks at all levels on computer systems and information-based technologies. The Team for Research in Ubiquitous Secure Technology (TRUST) will address a parallel and accelerating trend of the past decade–the integration of computing and communication across critical infrastructures in areas such as finance, energy distribution, telecommunications and transportation. The center will lead development of new technologies based on findings from studies of software and network security, trusted platforms and applied cryptographic protocols. Formal approval of the new centers, with funding estimated at nearly $19 million over five years for each center, is still subject to final negotiations between NSF and the lead institutions. UC Berkeley Press Release: http://www.berkeley.edu/news/media/releases/2005/04/11_trust .shtml

Additional information from an article by Daniel S. Levine in the SF Business Times:
* The project leader will be S. Shankar Sastry, UC Berkeley professor of electrical engineering;
* "Other members of the TRUST effort are Carnegie Mellon University, Cornell University, Mills College, San Jose State University, Smith College, Stanford University and Vanderbilt University. The initiative also brings together industrial and other affiliates, including Bellsouth, Cisco Systems, ESCHER (a research consortium that includes Boeing, General Motors and Raytheon), Hewlett-Packard, IBM, Intel, Microsoft, Oak Ridge National Laboratory, Qualcomm, Sun Microsystems and Symantec."

EDUPAGE; http://www.nytimes.com/cnet/CNET_2100-7349_3-5666782.html

NSF TO FUND COMPUTER SECURITY RESEARCH CENTER

The National Science Foundation (NSF) has awarded a $19 million grant to create a technology center to study cybersecurity. The project, called the Team for Research in Ubiquitous Secure Technology (TRUST), will be led by the University of California, Berkeley, and will receive the funds over five years. Other higher education institutions participating in the project include Carnegie Mellon University, Cornell University, Mills College, San Jose State University, Smith College, Stanford University, and Vanderbilt University. S. Shankar Sastry, professor of computer sciences at Berkeley and director of TRUST, said, "The cybersecurity community has long feared that it would take an electronic Pearl Harbor for people to realize the scale of disruptions possible from a concerted attack by terrorists." The TRUST project will conduct research into computer security in a variety of industries, specifically addressing the integration of technologies among "critical infrastructures." 2005-04-14 **Chief Information Security Officers CISO Exchange CIO council withdrawal vendor fundraising practices**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml;jsessionid=D4M3LDAZ5RJUCQSNDBGCKH0CJUMEKJVN?articleID=160900663

FEDERAL GOVERNMENT ABANDONS VENDOR-BACKED CYBERSECURITY FORUM

The federal CIO Council is the latest government institution to retreat from the Chief Information Security Officers (CISO) Exchange because of fund-raising practices. Karen Evans, the administration's top IT official, said in a White House statement issued Thursday, April 14, that she accepts the CIO Council's recommendation to withdraw from the CISO Exchange, a privately financed group headed by government IT experts to help develop practices to improve cybersecurity. Evans said she's asking the CIO Council's best-practices committee to develop ways to improve weak cybersecurity scores among federal departments and agencies. Evans' comments came nearly a week after House Reform Committee chairman Tom Davis, R-VA, announced his withdrawal of support for the CISO Exchange because of the way the group solicited money from vendors to support its operations. The CISO Exchange was to hold quarterly education meetings as well as produce a report on federal IT security priorities and operations. CISO Exchange Website: http://www.cisoexchange.org/

2005-04-15 **vendor government cybersecurity focus call Congress legislation information technology CSIA Department of Homeland Security DHS**

DHS IAIP Daily; http://www.nwfusion.com/news/2005/0415vendocall.html

VENDORS CALL FOR MORE GOVERNMENT CYBERSECURITY FOCUS

The U.S. government needs to get more serious about cybersecurity, but Congress should look at broader ways to combat security problems than focusing on bills that address specific issues such as spam or spyware, a group of executives from IT security product vendors said last week. Members of the Cyber Security Industry Alliance (CSIA), meeting in Washington, DC, Thursday, April 14, repeated their call for Congress to create an assistant secretary for cybersecurity position at the Department of Homeland Security. Members of the year-old CSIA, meeting as a rash of data breaches have been announced in recent months, said they committed this week to helping Congress and administration officials understand cybersecurity issues. While most CSIA executives said they would welcome the right kind of cybersecurity legislation, not all technology companies favor new laws. Private companies should have time to find their own solutions to data breaches and explain their efforts to Congress, said Howard Schmidt, chief security strategist at eBay, during a forum on ID theft at the Washington think tank the Center for Strategic and International Studies Friday, April 15. 2005-05-09 **Iowa State University ISU computer network Internet attack simulation ISEAGE Department of Justice critical infrastructure protection**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1813648,00.asp

UNIVERSITY LABORATORY STUDIES EFFECTS OF INTERNET ATTACKS

A new test laboratory at Iowa State University (ISU) will allow researchers to study how computer networks respond to massive Internet attacks and could lead to breakthroughs in computer defenses and forensics, said a researcher behind the project. The new test network, ISEAGE (Internet Simulation Event and Attack Generation Environment), was funded by a $500,000 grant from the Department of Justice. ISEAGE is the first research lab to be able to re-create any cyber-attack on any part of the Internet infrastructure, said Doug Jacobson, director of information assurance at ISU. The guts of the new test lab are software tools, developed by Jacobson, that let researchers change traffic patterns, replay attacks in endless configurations and collect attack data, Jacobson said. "We can make an attack that looks like it came from 1,000 computers, but we don't need 1,000 computers to do it," he said. The testbed can just as easily simulate attacks from 100,000 Internet-connected machines—or from every Internet address in existence, Jacobson said. Researchers will use ISEAGE to model attacks on critical cyber-infrastructure, such as state and federal computer networks.

EDUPAGE; http://chronicle.com/prm/daily/2005/05/2005051301t.htm

HOUSE HEARS DEBATE OVER DARPA FUNDING

The debate over what some describe as a troubling shift in the stance of the Defense Advanced Research Projects Agency (DARPA) for research it chooses to fund moved to the House Science Committee this week. DARPA came under fire from a number of sectors recently when it acknowledged that it would give preference in funding decisions to projects with more immediate results, rather than basic, long-term research with less obvious--but some say more vital--implications for developing new technologies. Critics of the change also said funding for cybersecurity projects was inadequate and should be increased. Joining the academics at the hearing who were critical of DARPA's changed focus was Rep. Sherwood L. Boehlert (R-N.Y.), who expressed his support for basic research and for cybersecurity projects specifically. Anthony J. Tether, director of DARPA, defended his agency, saying that projects of the type described are in fact being funded. In addition, he suggested that funding for certain types of research, such as computer science, is often included in grants supporting other types of research, such as microelectronics. 2005-06-20 **Office Management Budget OMB security reporting guidelines FISMA**

DHS IAIP Daily; http://www.fcw.com/article89321−06−20−05−Web

OFFICE OF MANAGEMENT AND BUDGET MODIFIES SECURITY REPORTING

The Office of Management and Budget (OMB) has issued new security reporting guidelines that emphasize contractor oversight and data privacy protections. Under the 2005 Federal Information Security Management Act (FISMA) reporting guidelines issued Monday, June 13, agencies will have to answer new questions about data privacy and contractor oversight in reports they must submit to OMB by October 7. When OMB officials added the new questions, they also dropped some old ones. Agencies, for example, will no longer have to report how many times they were victims of a malicious code attack because someone in the agency had not installed a necessary security patch. The new guidelines emphasize that agencies are responsible for ensuring that federal contractors maintain appropriate security controls on equipment used to deliver network or other managed services. The security controls also apply to contractor support staff, government-owned and contractor-operated equipment and contractor-owned equipment in which any federal data is processed or stored. "Agencies must ensure identical, not equivalent security procedures," according to the guidelines. That means agencies must make certain that federal contractors conduct risk assessments, develop contingency plans, certify and accredit their systems and everything else that federal agencies must do to comply with FISMA.

2005-07-19 **Federal NIST draft standard documents information security seretary FIPS Publication cost effective program assessment**

DHS IAIP Daily; http://www.fcw.com/article89611−07−18−05−Web

NIST OFFICIALS INVITE COMMENT ON DRAFT STANDARD

Computer scientists at the National Institute of Standards and Technology (NIST) have released draft versions of two documents that they consider to be among the most important in a recent series of NIST documents on information security. One is a small publication describing minimum security requirements that will become mandatory after the Commerce Department secretary signs the document, as he is expected to do at the end of this year. That document is "Draft Federal Information Processing Standard (FIPS) Publication 200: Minimum Security Requirements for Federal Information and Information Systems." A second document, "Draft Special Publication 800-53A: Guide for Assessing the Security Controls in Federal Information Systems," is a 152-page guide to developing a cost-effective information security program based an agency' s assessment of its risks. Both documents are meant to help federal agencies secure their information systems and comply with the Federal Information Security Management Act (FISMA) of 2002, NIST officials said.

2005-08-01 **annivsary issue RISKS FORUM DIGEST congratulations great work splendid achievement mazal tov**

RISKS 23 96

20TH ANNIVERSARY OF RISKS!

Congratulations and THANKS to Peter G. Neumann for his stellar work on the RISKS FORUM DIGEST, which reached its 20th anniversary on 1 August 2005. Here's Peter's comment:

>Somehow it escaped my attention when I put out RISKS-23.95 a few minutes ago, that it was exactly the 20th anniversary of the day on which I had put out RISKS-1.01, on 1 Aug 1985 -- using a primitive line-by-line editor on a huge (not-so-)Silent 700 with an acoustic coupler over a very slow cross-country phone line. Since then, the various technologies have of course increased dramatically. Unfortunately, the risks have also -- in that the same kinds of problems still recur with respect to safety, reliability, security, survivability, interoperability, human culpability, and so on, seemingly ad infinitum, combined with the reality that so many more people are now dependent upon computers and their interconnectivity.

I imagine that I won't keep it up for *another* 20 years (for example, I observe that my ratio of puns seems to have declined), but hopefully one (or some) of you will want to continue the tradition when the time comes. It would be a real shame to let the Risks Forum disappear. Even though the same or similar problems keep recurring, there is an important message herein -- and just another reminder of the needs for constant vigilance, increased awareness, better education, and -- above all -- BETTER SYSTEMS.

Cheers to all! PGN<

GERMAN GOVERNMENT LAUNCHES NATIONAL IT SECURITY PLAN

The German government aims to counter the alarming rise in computer viruses with a national IT security plan that includes the establishment of a computer emergency response center. The new plan was unveiled Thursday, August 18, in Berlin by Interior Minister Otto Schily. The German government's "National Plan to Protect IT Infrastructures" has three major focuses: early prevention, swift response and security standards. The Federal Office for Security in Information Technology (BSI) will play a key role. It will be responsible for developing and implementing new security standards in the public sector, and publishing guidelines for the private sector. BSI will also house the computer emergency response center, which will collaborate with providers of IT security services in the private sector. Among the planned tasks of the center: sending e-mail alerts about potential threats and responding to attacks with hotline technical support. The German IT security plan is available in German on the ministry's Website at: http://www.bmi.bund.de/cln_028/nn_122688/Internet/Content/Co
mmon/Anlagen/Nachrichten/Pressemitteilungen/2005/08/National

2005-08-24 **FBI DoJ information sharing IT project criminal investigations**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/security/36759−1.html

DEPARTMENT OF JUSTICE, FBI TO SPUR INFORMATION SHARING

The FBI and Justice Department plan to accelerate their efforts to consolidate systems and improve sharing of information needed for criminal investigations and prosecutions by launching two major IT projects. The FBI project, known as Next Generation IAFIS, is aimed at upgrading the Integrated Automated Fingerprint Identification System run by the bureau's National Crime Information Center in Clarksburg, WV. Next Generation IAFIS is intended to improve the efficiency of IAFIS' function of matching fingerprint evidence to the bureau's trove of millions of sets of 10-finger images, according to FBI officials and procurement documents. Next Generation IAFIS will also interact with the IDENT fingerprint database run by the Department of Homeland Security's U.S. Visitor and Immigrant Status Indicator Technology system. Justice's Litigation Case Management System (LCMS) project is intended to promote information sharing among the 94 U.S. attorneys' offices and six major divisions at headquarters that bring cases to court. As it stands now, the U.S. attorneys' offices have litigation case management systems that link poorly or not at all with one another and with headquarters systems. 2005-09-19 **Iowa State information protection center CIP fund NSF**

EDUPAGE; http://www.fcw.com/article90846-09-19-05-Web

IOWA STATE TO HOST INFORMATION PROTECTION CENTER

The National Science Foundation (NSF) is providing the initial funding for a new Center for Information Protection (CIP) at Iowa State University. Corporations, security vendors, and academic researchers will work together through the center to develop solutions to short-term security concerns. The center has already attracted 13 charter members, including Boeing, Cargill, Principal Financial Group, Palisade Systems, Iowa State University, and the New Jersey Institute of Technology. The center's goal is to draw 30 corporate members and to develop security solutions in one year or less. Kurt Shedenhelm, chief executive officer and president of Palisade Systems, said the new center differs from similar efforts in its quest for short-term fixes, compared to the five- and ten-year cycles of other initiatives. The NSF will continue to provide funding for three years, at which time the center can apply for further funds; organizers hope the center can be self-sustaining in five years. Federal Computer Week, 19 September 2005

EDUPAGE; http://chronicle.com/daily/2005/09/2005092001t.htm

PENN STATE DEBUTS P2P FOR ACADEMIC PURPOSES

A new application developed at Pennsylvania State University at University Park puts P2P technology to use in academic pursuits. Funded in part by a $1.1 million grant from the Andrew W. Mellon Foundation, LionShare allows users to search for and access files on other users' computers, similar to P2P applications that have opened the door to a wide range of copyright violations. LionShare, in contrast, is designed for academic purposes, including sharing very large files and other educational materials among approved users. For example, faculty can restrict usage to students registered in their classes. In addition, users can attach keywords and other metadata to files, making them easier to locate and organize. Pilot tests of LionShare have been successful. Michael J. Halm, senior strategist for Penn State's Teaching and Working With Technology office, said that in courses where LionShare was used, although faculty are driving the usage of the tool, students have said they would "definitely use it too" in classes where it was available. The application will be available free from Penn State. Chronicle of Higher Education, 20 September 2005 (sub. req'd)

DHS IAIP Daily; http://news.com.com/Schools+get+tailored+cyberattack+data/2100−7347_3−5900684.html?tag=cd.top

SCHOOLS GET TAILORED CYBERATTACK DATA

U.S. colleges and universities are getting a service that analyzes security data to help fend off cyberattacks. According to Steffani Burd, the executive director of Information Security in Academic Institutions, "The goal is to have an accurate assessment of information security in academic institutions." The project is sponsored by the research arm of the U.S. Department of Justice and run by Columbia University's Teachers College in New York. Academic organizations will be expected to submit logs from their firewall and intrusion detection systems so the service can parse the data and generate reports on attacks. Those reports can then be used to protect networks. Johannes Ullrich, the chief research officer at the SANS Institute and founder of DShield.org states, "Academic institutions face the challenge of maintaining an open network while also providing security for their users. This data will help them decide what protection to deploy while minimizing restrictions."

2005-10-25 **OMB IT cybersecurity security training reporting situational awareness incidence response lifecycle security solutions**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/37418−1.html

OFFICE OF MANAGEMENT AND BUDGET TO IMPROVE IT SECURITY NEXT FISCAL YEAR

The Office of Management and Budget (OMB) plans to set up several lines of business for IT security in the next fiscal year. A " line of business" is a necessary business function that typically is outside of agencies' primary missions, such as cybersecurity. Rather than have each agency duplicate non-essential functions, OMB designates agencies with expertise in these areas to provide them to other agencies on a fee-for-service basis. Four problem areas will be addressed: (1)security training: to standardize security processes, develop common criteria, and help provide a career path for information security professionals; (2) Federal Information Security Management Act reporting: to standardize reporting processes and help ensure consistent and effective IT program management; (3) situational awareness and incident response: to improve the sharing of information about IT vulnerabilities and threats and provide resources for responding to security incidents; and (4) lifecycle security solutions: to provide a methodology for evaluating security tools. The program will not replace existing IT security programs and resources, such as the U.S.-Computer Emergency Readiness Team. According to OMB estimates, federal spending on security has been static, at about $4.2 billion a year for the last three years, while total IT spending has been slowly growing.

2005-10-27 **US administration information technology IT system agency consolidation**

DHS IAIP Daily; http://fcw.com/article91215−10−27−05−Web

ADMINISTRATION TO CONSOLIDATE INFORMATION TECHNOLOGY SYSTEMS ACROSS AGENCIES

According to Karen Evans, the Office of Management and Budget's administrator for e-government and information technology, the government is looking to consolidate information technology systems and turn them into a "utility" instead of keeping them agency-specific. Rather than restricting IT to individual agencies, IT should be seen as an enterprise, she told members attending the Government Electronics and Information Technology Association (GEIA IT). A recent example is that during the recent hurricane disasters along the Gulf Coast, a number of e-government initiatives were tapped to keep government agencies operational: the Coast Guard and the Transportation Security Administration used the National Finance Center and epayroll.gov to make sure 67,000 customers were paid, and USAServices.gov helped the Federal Emergency Management Agency add call centers and handle over one million calls.

DHS IAIP Daily; http://www.gao.gov/new.items/d06165.pdf

INTERNET MANAGEMENT: PREVALENCE OF FALSE CONTACT INFORMATION FOR REGISTERED DOMAIN NAMES (REPORT)

Individuals or organizations seeking to register the names of their Websites may provide inaccurate contact information to registrars in order to hide their identities or to prevent members of the public from contacting them. Contact information is made publicly available on the Internet through a service known as Whois. Data accuracy in the Whois service can help law enforcement officials to investigate intellectual property misuse and online fraud, or identify the source of spam e-mail, and can help Internet operators to resolve technical network issues. The Government Accountability Office was asked, among other things, to (1) determine the prevalence of patently false or incomplete contact data in the Whois service for the .com, .org, and .net domains; (2) determine the extent to which patently false data are corrected within one month of being reported to the Internet Corporation for Assigned Names and Numbers (ICANN); and (3) describe steps the Department of Commerce and ICANN have taken to ensure the accuracy of contact data in the Whois database. DHS IAIP Daily; 23
http://www.washingtontechnology.com/news/1_1/homeland/28284− 1.html

COUNCIL TO DRAW UP CYBER ATTACK RESPONSE.

Setting up a national IT disaster response apparatus is one possible topic to be addressed by the IT Sector Coordinating Council as it drafts a sector-specific plan for protecting the nation's computer networks against a terrorist attack or other disaster, according to the group's chairman. The goal is for private sector IT companies and government to work together to prevent and to respond to cyber attacks. The council wants ideas from the IT industry and from the Department of Homeland Security as it begins work on the sector-specific critical infrastructure protection plan at its Tuesday, April 4, meeting. The council expects to complete the plan by September.

EDUPAGE

In its defense of the Communications Decency Act, lawyers for the government argued that censoring the Net is designed to protect First Amendment rights by allowing parents to use the Net without fear for their children's moral development. The ACLU responded that this argument was outrageous and oxymoronic. For some survivors of the sixties, it reminded one of the satirical slogan, "Kill for Peace!" and other more risqué versions.

FOOT-AND-MOUTH BELIEVED TO BE FIRST VIRUS
UNABLE TO SPREAD THROUGH MICROSOFT OUTLOOK
Researchers Shocked to Finally Find Virus That Email App Doesn't Like

Atlanta, Ga. (SatireWire.com) — Scientists at the Centers for Disease Control and Symantec's AntiVirus Research Center today confirmed that foot-and-mouth disease cannot be spread by Microsoft's Outlook email application, believed to be the first time the program has ever failed to propagate a major virus.

"Frankly, we've never heard of a virus that couldn't spread through Microsoft Outlook, so our findings were, to say the least, unexpected," said Clive Sarnow, director of the CDC's infectious disease unit.

The study was immediately hailed by British officials, who said it will save millions of pounds and thousands of man hours. "Up until now we have, quite naturally, assumed that both foot-and-mouth and mad cow were spread by Microsoft Outlook," said Nick Brown, Britain's Agriculture Minister. "By eliminating it, we can focus our resources elsewhere."

However, researchers in the Netherlands, where foot-and-mouth has recently appeared, said they are not yet prepared to disqualify Outlook, which has been the progenitor of viruses such as "I Love You," "Bubbleboy," "Anna Kournikova," and "Naked Wife," to name but a few.

Said Nils Overmars, director of the Molecular Virology Lab at Leiden University: "It's not that we don't trust the research, it's just that as scientists, we are trained to be skeptical of any finding that flies in the face of established truth. And this one flies in the face like a blind drunk sparrow."

Executives at Microsoft, meanwhile, were equally skeptical, insisting that Outlook's patented Virus Transfer Protocol (VTP) has proven virtually pervious to any virus. The company, however, will issue a free VTP patch if it turns out the application is not vulnerable to foot-and-mouth.

Such an admission would be embarrassing for the software giant, but Symantec virologist Ariel Kologne insisted that no one is more humiliated by the study than she is. "Only last week, I had a reporter ask if the foot-and-mouth virus spreads through Microsoft Outlook, and I told him, 'Doesn't everything?'" she recalled. "Who would've thought?"

2001-03-13 **bugs history folklore**

NewsScan

WORTH THINKING ABOUT: THE HISTORY OF BUGS
Princeton University's Edward Tenner wants us to know that bugs, those notorious enemies of technology, have been around long before computers: "The bug, that perverse and elusive malfunctioning of hardware and later of software, was born in the nineteenth century. It was already accepted shop slang as early as 1878, when Thomas Edison described his style of invention in a letter to a European representative: 'The first step is an intuition and it comes with a burst, then difficulties arise -- this thing gives out and then that -- "Bugs" -- as such little faults and difficulties are called -- show themselves, and months of intense watching, study and labor are requisite before commercial success -- or failure -- is certainly reached.' "Edison implies that this use of 'bug' had not begun in his laboratory but was already standard jargon. The expression seems to have originated as telegrapher's slang. Western Union and other telegraph companies, with their associated branch offices, formed America's first high-technology system. About the time of Edison's letter, Western Union had over twelve thousand stations, and it was their condition that probably helped inspire the metaphor. City offices were filthy, and clerks exchanged verse about the gymnastics of insects cavorting in the cloakrooms. When, in 1945, a moth in a relay crashed the Mark II electromechanical calculator that the Navy was running at Harvard -- it can still be seen taped in the original logbook -- the bug metaphor had already been around for at least seventy-five years."

See http://www.amazon.com/exec/obidos/ASIN/0679747567/newsscancom/ for Edward Tenner's "Why Things Bite Back." (We donate all revenue from our book recommendations to Literacy Action's adult literacy programs.)

RISKS 21 42

Date: [not included]
From: "Keith F. Lynch" <kfl@KeithLynch.net>
Subject: Converting Pi to binary: DON'T DO IT! (via Russ Perry Jr.)

Newsgroup: alt.math.recreational

WARNING: Do NOT calculate Pi in binary. It is conjectured that this number is normal, meaning that it contains ALL finite bit strings.

If you compute it, you will be guilty of:

* Copyright infringement (of all books, all short stories, all newspapers, all magazines, all web sites, all music, all movies, and all software, including the complete Windows source code)
* Trademark infringement
* Possession of child pornography
* Espionage (unauthorized possession of top secret information)
* Possession of DVD-cracking software
* Possession of threats to the President
* Possession of everyone's SSN, everyone's credit card numbers, everyone's PIN numbers, everyone's unlisted phone numbers, and everyone's passwords
* Defaming Islam. Not technically illegal, but you'll have to go into hiding along with Salman Rushdie.
* Defaming Scientology. Which IS illegal -- just ask Keith Henson.

Also, your computer will contain all of the nastiest known computer viruses. In fact, all of the nastiest POSSIBLE computer viruses.

Some of the files on my PC are intensely personal, and I for one don't want you snooping through a copy of them.

You might get away with computing just a few digits, but why risk it? There's no telling how far into Pi you can go without finding the secret documents about the JFK assassination, a photograph of your neighbor's six year old daughter doing the nasty with the family dog, or a complete copy of the not-yet-released Pearl Harbor movie. So just don't do it.

The same warning applies to e, the square root of 2, Euler's constant, Phi, the cosine of any non-zero algebraic number, and the vast majority of all other real numbers.

There's a reason why these numbers are always computed and shown in decimal, after all.

NewsScan

COMPUTERS AND ROCK 'N' ROLL: THAT'S WHAT IT'S ALL ABOUT
In the current issue of Computer magazine, former Intel computer architect Bob Colwell has an amusing piece on the relation between computers and rock 'n' roll, and here's a sample: "I particularly like spotting the correspondences between the arts and sciences. For example, you might not think a rock musician would understand what an inverter logic gate does, but apparently Eric Clapton does in his song 'Opposites': "Night after day, day after night./White after black, black after white./Fight after peace, peace after fight./Life after death, death after life." Colwell comments that "Clapton clearly understands that there is a time delay involved in propagating through the gate -- hence the word 'after.' When he figures out AND and OR gates, Clapton will be able to devise entire computers in his lyrics. Wait -- maybe that's what 'I Shot the Sheriff' is all about. Never could figure out why it was okay to shoot the sheriff but not the deputy. But that construction is very clearly a conjunctive logical expression (S AND NOT D -- hey, maybe that's why he needed the inverter)." To explain functional languages, Colwell analyzes the lyrics of "The Locomotion": "Ev'rybody's doin' a brand new dance now./ C'mon baby, do the locomotion./ I know you'll get to like it if you give it a chance now./ C'mon baby, do the locomotion." And vector processing? Well, what better example than "The Hokey Pokey": "You put your right foot in,/ You put your right foot out,/You put your right foot in,/And you shake it all about./You do the Hokey-Pokey,/ And you turn yourself around./That's what it's all about!" RISKS 22 01

Yet another entry in the RISKS April-Fool's Day celebration:

Date: Mon, 21 Jan 2002 23:07:30 -0500
From: Gene Spafford <spaf@cerias.purdue.edu>
Subject: Surprise Settlement Evenly Splits Microsoft (unknown source)

[From SatireWire, via various intermediaries. Reprised for the occasion. PGN]

Decision Keeps Redmond from Monopolizing Massive Microsoft Patch Industry

Surprise Settlement Evenly Splits Microsoft; One Firm To Make Software, Other To Make Patches

Redmond, Wash. In a surprise settlement today with nine U.S. states, Microsoft agreed to be split into two independent companies -- one that will continue to make Microsoft operating systems, browsers, and server software, and another, potentially larger company that will make patches for Microsoft operating systems, browsers, and server software.

Critics immediately charged that the settlement -- which overrides a previous agreement with the U.S. Department of Justice -- does nothing to diminish Microsoft's standing as the world's most powerful software company. But industry analysts argued that providing patches for security holes in Microsoft programs is a major, untapped growth industry, and applauded the states for not allowing Redmond to control it.

"Just consider, Microsoft can make an operating system, such as Windows XP, and sell 200 million copies, but each one of those copies is going to need at least five patches to fix security holes, so that's 1 billion patches," said Gartner Group analyst Mitch Fershing. "That is an enormous, undeveloped market."

Microsoft employees seem to agree, as sources in Redmond described a "mad scramble" among staffers to position themselves for spots at the new company, called Patchsoft. Asked why people would want to leave Microsoft for a startup, the source said the answer was "really quite simple."

"Everyone here is asking themselves, 'Do I want to be part of the problem, or part of the solution?'" he said.

But J.P. Morgan analyst Sherill Walk suspects another motive. "Considering the sheer number of patches we're talking about, I think the new company will become another monopoly, and I believe the people who've jumped ship very well know that."

"Nonsense. It's really all about consumer choice," responded Patchsoft's new co-CEOs, Bill Gates and Steve Ballmer.

But how will Patchsoft make money? Currently, Microsoft issues free patches for problems in Windows XP, SQL Server, Internet Explorer, Outlook, Windows 2000, Flight Simulator, Front Page, Windows Me, Media Player, Passport, NT Server, Windows 98, LAN Manager (for a complete list of MS software needing patches, see www.support.microsoft.com). Under the agreement, Microsoft will no longer issue patches, which Gates said explains the recent five-day outage at Microsoft's upgrade site. "That was planned," he said. "It was a test of the Microsoft No Patch Access system. Went perfectly. No one was able to download anything."

At a press conference to outline the settlement, Connecticut Attorney General Richard Blumenthal pledged to keep a close eye on Patchsoft to ensure it would not overcharge for its services. He also expressed hope that other firms would soon become Certified Microsoft Patch Developers (CMPDs) and challenge the spin-off. Asked if Patchsoft, with so many former Microsoft employees, will have an advantage over potential competitors in the Microsoft patch market, Blumenthal said the settlement prohibits collaboration.

"Patchsoft developers will not have any foreknowledge of bugs or security holes before software is released. They'll just have to be surprised," he said.

"So it will be just like it was when they were at Microsoft," he added.

One Reuters reporter, meanwhile, questioned the long-term viability of Patchsoft. "This seems like a logical split right now, but what if Microsoft's products improve to the extent that patches are needed less frequently, or perhaps not at all?" she asked.

"I'm sorry, I can only respond to serious questions," Blumenthal answered.

RISKS 22 02

Date: Mon, 01 Apr 2002 08:54:41 -0800
From: Crispin Cowan <crispin@wirex.com>
Subject: Announcing Immunix SnackGuard

New Product Release: SnackGuard WireX Communications, Inc., 1 Apr 2002

[This arrived too late for the April Fool's Issue, but better late than never? (Or better never than later?) PGN]

WireX is pleased to announce the latest addition to the Immunix family of security tools: SnackGuard. SnackGuard effectively guards your favorite snacks in the break room from "snack smashing" attacks: the predations of other hungry engineers. This protection is especially vital in these trying times of unemployment, when nomadic tribes of hunter/gatherer geeks roam the halls of once mighty dot.com's in search of food and caffeine.

Following on StackGuard's "canary" defense, SnackGuard employs WireX's patent-pending "turkey" defense: when SnackGuard detects the "gobbling" noise of some turkey scarfing down your favorite pop tarts and heavily caffeinated beverages, it issues a pink slip, halting the gobbler.

While SnackGuard is effective in defending your snacks, it is not without costs. SnackGuard increases run time when you are running to catch the bus or the elevator, in that successful defense of your snacks tends to increase "programmer's butt". Excessive consumption of caffeinated beverages without intervening bathroom breaks may also induce personal "buffer overflows".

While SnackGuard is "free speech", it is not "free beer": you may modify and distribute this gag as you wish, but go buy your own brewskis.

%D 1902
%G 076455302X
%I International Data Group (IDG Books)
%O U$21.99/C$411.95 415-312-0650 fax: 415-286-2740
%P 166 p.
%S for Dummies
%T "Hacking for Dummies"

As regular RISKS readers will note, I always enjoy a new addition to the "for Dummies" series. This time the imprint has outdone itself with a lighthearted romp through network naughtiness, by two of the least known, but most accomplished, practitioners of the field.

Some may question the need for such a work, but the authors maintain that they are performing a valuable service to corporations and society at large. "A vital system security penetration community is important," they state in the introduction. "It thins the herd of security practitioners. We have a moral responsibility to ensure that those who, not having the authority to fire people who insist on using Outlook, get blamed when major events happen and are forced to look for work in other fields."

In a switch from the standard format, the "Part of Tens" comes first, pointing out how to knock holes in each of the ten domains of the security common body of knowledge. This sets up a series of helpful icons used to point out specific attacks that can be mounted against each domain. (Security management attacks tend to get a bit repetitive after a while: there are only so many ways of rewording the advice to pretend to be the CEO's secretary.)

Some common and handy attacks (such as the ubiquitous brute force denial-of-service attack, featuring a sledgehammer) are listed, but there are a number of little-known tricks, like the means of attacking a computer that has been sealed in a lead-lined vault, surrounded by armed guards, and cast in concrete. Dorothy Denning's sidebar on starting wars by manipulating e-mail systems is particularly interesting. Security professionals are not ignored: in an interesting display of fair-mindedness, the authors suggest that incident-response team members prepare by ensuring they always have plenty of sugar in their gas tanks for extra energy on late-night calls.

Critical reaction to the tome has been spirited but mixed. Winn Schwartau, in the foreword, asks "is it moral, is it ethical" to provide such information to the general public, before concluding, "Who cares? Nobody has time for this." Phil Zimmermann has roundly condemned the section on anonymous communications, stating that the government has a legitimate need for access to private communications, while Fred Cohen is upset that the authors suggest viruses could be used for beneficial purposes. Richard Stallman is reported to be disturbed by the position that software

development can take place in the kind of anarchic environment promoted by the book, and has launched a campaign to ensure that everyone has valid licenses for Microsoft products. Bruce Schneier, on the other hand, points out that the information in the book presents no danger to the public. "As long as you've got a strong crypto algorithm and good technical solutions, it doesn't matter about implementation and people."

RISKS 22.02

Date: Thu, 4 Apr 2002 12:21:17 PST
From: "Peter G. Neumann" <neumann@csl.sri.com>
Subject: April Foolishness

Quite a few people have apparently gone to Amazon.com to order "Hacking For Dummies" -- a bogus (i.e., nonexistent) book reviewed by Rob Slade in RISKS-22.01. Perhaps, not surprisingly, the ISBN bears a strange resemblance to the ISBN for "S*x for Dummies". We have to call a Slade a Slade. Perhaps his review was too subtle? Perhaps your fearless moderator needs to be more obvious in highlighting April Fools' items, besides putting it up front in the issue rather than buried in its usual end-of-the-issue position? Aw, come on! April Fool's Day is seemingly a worldwide tradition, and that's part of the fun.<

Category 4D *Funny / miscellaneous*

2002-04-01 **joke**

RISKS 22 01

On April Fools, Peter Neumann's traditional joke issue of the RISKS FORUM DIGEST published a tongue-in-cheek report on the addition of software piracy law enforcement to the duties of the Bureau of Alcohol, Tobacco and Firearms:
>WASHINGTON (Reuters) - The Department of the Treasury announced today that responsibility for enforcement of new federal regulations of the software industry will fall under the jurisdiction of the Bureau of Alcohol, Tobacco and Firearms (ATF). As the regulations come into effect, the bureau will be renamed to be the Bureau of Alcohol, Tobacco, Firearms, and Software (ATFS).

The new regulations have been taken by most observers as a key indication of the Federal Government's serious concern over the software production scandal gripping the nation. The final verdict of the grand jury investigation into the dangers of unregulated software production was praised as a major victory by software leaders in Redmond last month.

The grand jury investigation centered on the disturbing trend that key portions of the nation's critical infrastructure are being entrusted to a software product for which the secret inner workings (known as `source code') are becoming as prevalent as pornography on the Internet.

The Director of the ATF's 5,000-strong team of agents has pledged his full support to enforce the new regulations, under which all software development must take place only in licensed facilities by trained induhviduals. He was joined at a press conference this morning by the Director of the National Infrastructure Protection Center, who said, "It's about time the ATF took the entire software industry into its jurisdiction." He continued, "We would never consider laying the blueprints for our critical assets out for all to see. I applaud the new regulations for bringing sanity to a long unchecked industry."

The public will have until 1 Jun 2002 to dispose of all unregulated software products they may own. Possession of unlicensed software products can result in penalties up to 20 years in jail and multi-million dollar fines. Currently, only Smallsoft of Redmond, Washington, has achieved the necessary regulatory status to produce software in compliance with the new regulations.

An underground group of activists using the moniker ``the Electronic Frontier Foundation" (EFF) has been strongly critical of the Federal Government's position throughout. Police have indicated the violent clashes are expected between supporters of the EFF and US Presidential nominee Billy Doors, the major proponent of the regulations, as he addresses business leaders in Winnemucca, Nevada, this afternoon.

[I suppose we can understand why they chose the acronym ATFS, given alternatives such as FATS, AFTS, FAST, etc. PGN]<

RISKS 22 01

Date: Mon, 1 Apr 2002
From: Peter Neumann <risks@sri.com>
Subject: Computers to Cars (unknown source)

[I have had several requests for including this item in RISKS from those who have not yet seen it, even though it has been circulating for a while. I have no idea who originally created it, but I am grateful to the author for his or her incisive observations. PGN]

For all of us who feel only the deepest love and affection for the way computers have enhanced our lives:

At a recent computer exposition (COMDEX), Bill Gates reportedly compared the computer industry with the auto industry and stated: "If General Motors had kept up with the technology like the computer industry has, we would all be driving $25.00 cars that got 1,000 miles to the gallon."

In response to Bill's comments, GM issued a press release stating: "If General Motors had developed technology like Microsoft, we would all be driving cars with the following characteristics:

1. For no reason whatsoever, your car would crash twice a day.

2. Every time they repainted the lines in the road, you would have to buy a new car.

3. Occasionally your car would die on the freeway for no reason. You would have to pull over to the side of the road, close all of the windows, shut off the car, restart it, and reopen the windows before you could continue. For some reason, you would simply accept this.

4. Occasionally, executing a maneuver such as a left turn would cause your car to shut down and refuse to restart, in which case you would have to reinstall the engine.

5. Macintosh would make a car that was powered by the sun, was reliable, five times as fast and twice as easy to drive -- but would run on only five percent of the roads.

6. The oil, water temperature, and alternator warning lights would all be replaced by a single "General Protection Fault" warning light.

7. The airbag system would ask "Are you sure?" before deploying.

8. Occasionally, for no reason whatsoever, your car would lock you out and refuse to let you in until you simultaneously lifted the door handle, turned the key and grabbed hold of the radio antenna.

9. Every time GM introduced a new car, car buyers would have to learn to drive all over again because none of the controls would operate in the same manner as the old car.

10. You'd have to press the "Start" button to turn the engine off.

2002-04-22 **social engineering joke unexpected consequences**

RISKS 22 04

At the University of New South Wales, Geoffrey Brent runs a discussion list on which he posted an amusing April Fool's joke to illustrate many of the features of hoaxes. One of the list participants was taken in, however, and vented embarrassingly in front of the whole list. Realizing he'd been fooled, he became nasty and even physically threatening; he eventually had to be thrown off the list. Brent commented in RISKS, "The (April Fool-specific) risks: Forgetting that there will ALWAYS be somebody who doesn't get the joke, no matter how obvious you make it - and that human failure modes are just as bizarre and dangerous as technological ones."

[MK comments: This incident illustrates one of the dangers of any security testing that includes social engineering: embarrassing the victims. I have long held that one should be extremely careful in running social engineering simulations during penetration tests; one way to avoid trouble is to ensure that everyone is prepared for the tests so they can treat the whole thing as a contest.]

2003-07-29 **Pentagon DARPA INFOWAR betting assassinations contracts Middle East**

NewsScan

PENTAGON'S ONLINE TRADING MARKET PLAN DRAWS FIRE
The U.S. Defense Department's Defense Advanced Research Projects Agency (DARPA) has plans to set up an online Policy Analysis Market that will allow traders to bet on the likelihood of future terrorist attacks and political assassinations in the Middle East. The bizarre scheme has drawn fire from Senators Ron Wyden (D-Ore.) and Byron Dorgan (D-N.D.). "The idea of a federal betting parlor on atrocities and terrorism is ridiculous and it's grotesque," said Wyden, while Dorgan described the plan as "useless, offensive and unbelievably stupid. How would you feel if you were the King of Jordan and you learned that the U.S. Defense Department was taking bets on your being overthrown within a year?" However, the Pentagon defended the initiative, comparing it to commodity futures markets. "Research indicates that markets are extremely efficient, effective and timely aggregators of dispersed and even hidden information. Futures markets have proven themselves to be good at predicting such things as election results; they are often better than expert opinions." The market would allow traders to deposit money in an account and then use it to buy and sell contracts. If a particular event comes to pass, the bettors who wagered correctly would win the money of those who guessed wrong. (BBC News 29 Jul 2003)

2003-09-04 **virus names sophos anna kournikova VBSWGJ**

NewsScan

WHAT'S IN A VIRUS NAME?
Did you ever wonder who's responsible for all those quirky virus names making the news headlines from time to time? There are macho names, like Blaster, Chernobyl and Slammer; cute ones like Birthday, Smile and Teddy Bear; steamy ones like DeepThroat, Hooker and NakedWife; and nonsense names like Klez, Nimda and Yaha. Then, of course there are those names that seem to refer to the virus creator, like Brat, Faker and Slacker. "Sometimes it's obvious what to call a new virus because it's similar to a previous virus, or contains a message inside its code," says Chris Beltoff, security analyst with Sophos. "Other times analysts have to seek inspiration — I remember there was one which was named after the meal a virus analyst had just had." There *are* some rules: researchers are not supposed to name viruses after businesses, brand-name products or celebrities. That's why the Anna Kournikova virus is officially know as VBSWG.J. But sometimes analysts just have to scan those memory banks to come up with something appropriate. Researcher George Smith recalls naming one particularly shoddy virus "Heevahava" after a childhood memory: "I grew up in Pennsylvania Dutch country and a heevahava was the farmhand given the job of holding the bull's pizzle during the collection of semen. Locally, heevahava was used as an insult meaning 'dolt' or 'idiot.'" (Wired.com 4 Sep 2003)

2004-03-21 **psychology cyberspace honesty open up online permanent records**

NewsScan

THE ONLINE HONESTY PARADOX

Cornell University professor Jeffrey Hancock conducted an experiment recently that concluded people are less likely to fib online than when talking in person or on the phone. While this proposition flies in the face of warnings over psycho-weirdos lurking in chat rooms and on cyber-dating sites, New York Times columnist Clive Thompson says actually it makes sense, considering the relative durability of the e-mail message. While a lie spoken in person or over the phone can later be denied, on the Internet, your words may come back to haunt you. "Today's titans of industry are laid low not by ruthless competitors but by prosecutors gleefully waving transcripts of old e-mail, filled with suggestions of subterfuge… We all read the headlines; we know that in cyberspace our words don't die, because machines don't forget." A second contributing factor, says Thompson, is that there's "something about the Internet that encourages us to spill our guts, often in rather outrageous ways. Psychologists have noticed for years that going online seems to have catalytic effect on people's personalities." Indeed, an experiment conducted by Open University psychologist Adam Johnson found that strangers chatting online were much more likely to offer up personal details about themselves than when conversing face-to-face. "Our impulse to confess via cyberspace inverts much of what we think about honesty," says Thompson, citing the current corporate convention of flying cross-country for that all-important five-minute face-to-face meeting before signing off on a deal. Instead, Thompson suggests that "as more and more of our daily life moves online, we could find ourselves living in an increasingly honest world, or at least one in which lies have ever more serious consequences." (New York Times 21 Mar 2004)

2004-03-30 **super computer laptop flash mob gathering processing power**

DHS/IAIP Update

March 29, New Scientist — Flash mob to attempt supercomputing feat.

An attempt to transform a motley collection of laptops into the first ad-hoc supercomputer is scheduled for April 3 at the University of San Francisco. Over 1000 laptop owners will gather in the university gym in an attempt to build a "flash mob" supercomputer. The project's organizers hope that FlashMob will run fast enough to beat supercomputers in the list of the world's top 500 supercomputers. One of the challenges facing John Witchel, the USF graduate student running the project, and his colleagues, is that "You essentially don't know anything about the computers until they show they up that day." The team therefore had to write code that not only allows the computers to share lots of data quickly, but also determines each processor's speed and memory as it goes. This allows the computational tasks to be allocated in the most efficient way possible. To beat the slowest computer in the top 500, FlashMob will have to perform a rigorous mathematical calculation called Linpack at a rate of at least 403 billion flops (floating point operations per second).

2004-05-04 **computers health research disease fighting MIDAS initiative NIH**

DHS IAIP Daily; http://www.nih.gov/news/pr/may2004/nigms−04.htm

May 04, National Institutes of Health — Computers combat disease.

A new initiative, called MIDAS, will develop powerful computer modeling techniques to analyze and respond to infectious disease outbreaks, whether they occur naturally or are released intentionally in a bioterrorist attack. MIDAS is sponsored by the National Institute of General Medical Sciences (NIGMS), a part of the National Institutes of Health (NIH). NIGMS recently awarded the first four grants in this new initiative, totaling more than $28 million over five years. Three of these grants will support the creation of mathematical models to study various aspects of infectious disease epidemics and community responses. These research grants together total $9.5 million over five years. A fourth award, totaling $18.8 million over five years, funds researchers to develop a central database to organize information from the other three groups. It also supports the development of user-friendly computer modeling tools for the broader scientific community, policy makers and public health officials to use to simulate epidemics, and response strategies.

MATSUSHITA DEBUTS HIGH-TECH 'SLEEP ROOM'

Matsushita Electric Works is taking the wraps off its "Sleep Room" next week in Tokyo, giving the sleep-deprived a chance to analyze their sleep patterns and catch 40 winks while they're at it. The company says its new product is geared toward the growing market of insomniacs in a country
where students start burning the midnight oil in elementary school -- a pattern that's then replicated in the typical workday. A Health Ministry survey indicated in 2000 that 31% of Japanese don't get enough sleep because of work, school or long commuting times. Another 29% cited stress
as a prime source of wakefulness. At Matsushita's "Vitality Diagnostic Corner," visitors are greeted by a "sleep counselor" who leads them through a 30-minute software program designed to pinpoint sleep problems and develop a "sleep profile." Customers can then try out a 30-minute session
in the sleep room, where they're greeted by a wall-sized TV displaying a soothing river scene surrounded by forest and augmented by gentle guitar and piano music blended with gurgling water and bird sounds. After a few minutes, the lights dim, the TV screen goes blank, and the bed's mattress kicks into gear, vibrating and kneading strategically to administer a massage and ease the customer into sleep. After 30 minutes, the lights slowly come on and the TV displays a crystal lake, while the bed gradually cranks up to a sitting position. The company plans to market the device to
homeowners for $30,000, and says even though the price is high, there will be takers. "Nobody who's come in here for 30 minutes hasn't fallen asleep," says a Matsushita official. (AP/USA Today 14 Jun 2004)

DHS IAIP Daily;
http://www.eweek.com/article2/0%2C1759%2C1636023%2C00.asp

August 15, Associated Press — Computer could link workers, stay secure.

A new supercomputer could join workers at the Idaho National Engineering and Environmental Laboratory in Idaho Falls, ID, with colleagues in France, Chile and across the U.S. while keeping sensitive information secure. The system could reach speeds of up to 1,500 gigaflops, making it one of the 150 fastest supercomputers in the world, officials said. Calculations and models that formerly took researchers a year will only take days to complete using the new system, officials said. Researchers will use the supercomputer to design the next generation of nuclear power plants, research the cause of mad cow disease and develop microbes that can eat heavy metals to use cleaning up contaminated sites. Those outside the laboratory must be approved by the U.S. Department of Energy to use the system. The computer can isolate information, essentially giving each user its own part of the system to control, Greenwade said.

2004-08-26 **Friday no e-mail Veritas employee communication face-to-face**

NewsScan

COULD 'E-MAIL-FREE' FRIDAYS REPLACE KHAKIS AND KNIT SHIRTS?

We all know that e-mail is turning into a huge time and productivity sink, but one lone crusader in Silicon Valley is trying to do something about it. Two months ago Jeremy Burton at Veritas Software decreed that Fridays in his marketing department were to be "e-mail free" -- employees
who needed to communicate with each other were instructed to stop by and chat or use the phone. "E-mail is supposed to be this big productivity tool, but it's getting to the point where it is out of control," says Burton, who complains that he was regularly spending two hours a day just dealing with e-mail. The ban applies only to interdepartmental communications and violators are fined $1 per transgression, with the proceeds going toward charity (so far, almost $70 has been collected). Many workers have endorsed the ban, noting the advantages of face-to-face conversations, and Burton says he plans to continue the policy indefinitely. (Wall Street Journal 26 Aug 2004)

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4189411.stm

USING VIDEO GAMES TO TEACH LIFE SKILLS

According to researchers at Futurelab, a British nonprofit investigating how technology can be used for innovative learning, video games have the potential to be highly effective tools for holding students' attention and teaching them about a variety of topics. This sentiment echoes recent findings of the London Institute of Education, which said video games have educational potential. "Games teach life skills such as decision making [and] problem solving," according to Futurelab's Martin Owen. One company, Lateral Visions, saw an opportunity in the educational potential of video games and developed an auto-racing game called Racing Academy. In it, players build and maintain the cars they race, using data to try to improve their performance. The game allows players to use chat rooms to exchange information and ideas, and Owen finds this aspect of the game particularly promising for developing student learning. Futurelab researchers who have been testing the game in two secondary schools have had a positive response from most students, and the researchers have generally been supportive of using the game to enhance learning.

2005-01-21 **California parks wireless SBC Wi-Fi campgrounds Hiking**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=7397115

CALIFORNIA PARKS TO GO WIRELESS

Officials from California State Parks this week announced a partnership with SBC Communications to bring Wi-Fi access to 85 of the state's parks over the next six months. Wi-Fi access is already available in the baseball stadium of the San Francisco Giants and in downtown San Jose. The fist state park to have Wi-Fi access will be San Elijo State Beach, near San Diego. Current customers of SBC will be able to access the Wi-Fi service in the state parks for free; others will have to pay $7.95 per day. According to a spokesperson from SBC, the revenue from the service will be split between the company and the state. California State Parks spokesman Roy Stearns said that access will largely be limited to areas in and around visitors' centers and campgrounds. Hiking trails, said Stearns, will not be part of the coverage area.

2005-01-24 **tech companies grid computing consortium Globus Consortium IBM Intel HP Sun Microsystems Nortel Networks corporations academic research organizations Linux**

EDUPAGE; http://www.nytimes.com/2005/01/24/technology/24grid.html

TECH COMPANIES FORM GRID COMPUTING GROUP

A group of leading high-tech companies has announced the formation of a consortium that will work to bring grid computing to corporate enterprises. The Globus Consortium, which includes IBM, Intel, HP, Sun Microsystems, and Nortel Networks, will work to develop grid computing tools geared specifically for corporations, as opposed to existing tools, which typically focus on the needs of academic and research organizations. The consortium's work will be based on software from the Globus Project, which was founded in 1996 by a group of researchers at labs and universities. All of the Globus Project's applications are freely shared and open source. The formation of the new consortium echoes the move of Linux, the open source operating system, from its beginnings in research laboratories into the corporate world. As Ken King, vice president of grid computing at IBM, said, "It starts in government labs and universities and then moves into broader commercial use."

2005-01-25 **word hyperlink Web Liquid Information project connections links CNN menu choices definition**

EDUPAGE; http://www.wired.com/news/culture/0,1284,66382,00.html

MAKING EVERY WORD A LINK

A researcher at University College London wants to change the basic functioning of the Web, allowing readers of Web pages to change those pages--similar to wikis--and making every word a "hyperword." The Liquid Information project is the brainchild of Frode Hegland, who is collaborating with Doug Engelbart, inventor of the computer mouse. Hegland's vision of the Web is one in which consumers of content can also be producers of content. Users would be able to make connections, add links, and change the way information is presented. On an example page, Hegland has modified a CNN Web page such that users can hover over any word to display a menu of choices, including getting a definition of the word, performing a Google search for the word, and highlighting instances of the word in various colors. Hegland said that we need to replace the current Web, which consists of "handmade, one-way links" with what he calls "deep legibility" so that users can "make connections, explicit or otherwise." Hegland conceded that a Web like the one he envisions would require smart users. But, he added, "people are pretty smart. The days of baby steps when everything is shown to users are over."

2005-01-27 **software scan Arabic texts scanners texts language word vowels benefits writings**

EDUPAGE; http://www.nytimes.com/aponline/technology/AP-Arabic-Software.html

DEVELOPING SOFTWARE TO SCAN ARABIC TEXTS

Computer researchers at the University at Buffalo are working on software that will allow computer scanners to read Arabic writing, including handwritten texts. Arabic is a visually complicated language, with some words, for example, having multiple representations. In addition, Arabic characters can be represented differently depending on where they appear in a word, and vowels are often not written at all. Intelligence-gathering efforts after September 11 were hampered by the lack of Arabic-language scanning software, but organizers of the project note other potential benefits, including expanded access to Arabic writings and the ability to digitize vast amounts of Arabic literature and put it on the Web. Venu Govindaraju, director of the Center for Unified Biometrics and Sensors at the University at Buffalo, noted that "The whole Internet is skewed toward people who speak English." Govindaraju said the software will help prevent classic texts in Arabic from "disappear[ing] into oblivion."

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4243733.stm

MEDIA LAB FOUNDER PROPOSES INEXPENSIVE LAPTOP FOR EDUCATION

Nicholas Negroponte is developing a sub-$100 laptop computer that he said could be a vital educational tool for children in developing countries. Negroponte, the chairman and founder of MIT's Media Lab, said the idea comes from pilot programs in Maine, in which schoolchildren were given laptops, and in Cambodia, where he and his wife have set up two schools and given the students laptops. Children can use the devices as text books, according to Negroponte, who said such computers could become "very important to the development of not just that child but now the whole family, village, and neighborhood." Negroponte noted that in Cambodia, the students use them not just as text books but also as "a TV, a telephone, and a games machine." Building a laptop for less than $100, he said, will require deleting extraneous applications and running a Linux-based operating system. "[I]f you can skinny it down," he said, "you can gain speed and the ability to use smaller processors and slower memory." Negroponte hopes to start distributing the machines by the end of 2006. BBC, 7 February 2005

2005-02-14 **trading color sound visually impaired graphics blind graduate Cornell University colored maps**

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4257961.stm

TRADING COLOR FOR SOUND FOR VISUALLY IMPAIRED

Working with a graphics specialist and another student, a blind graduate student at Cornell University has developed a computer application that translates colors into sounds, allowing him to read and understand colored maps of the atmosphere. Victor Wong, who has been blind since age seven, said he recognized the need for such a tool for his own studies, as well as for blind scientists generally. The application translates the colors of digitally created images into one of 88 notes, with blue at the low end and red at the high end. Users manipulate a stylus on a tablet to "read" the images through sound. Wong believes that because he formerly could see, his "color memory" may afford him the ability to visualize the colors and use the application in a way that someone who has never been able to see could not. The software remains primitive, but Wong said he hopes it can one day be developed to give blind people access to photographs and other images.

EDUPAGE;
http://www.registerguard.com/news/2005/02/14/b3.wa.research.0214.html

UW PROJECT WORKS TO MAKE GRAPHICS MORE ACCESSIBLE

Researchers at the University of Washington are looking for ways to make graphics accessible to blind or visually impaired students. Funded in part by a grant from the National Science Foundation, the Tactile Graphics Project aims to open up science and engineering to students with visual disabilities, who have traditionally been largely left out of such fields due in part to the difficulty of "seeing" graphics with their hands. Researchers in the project are working with blind students from the university and local high schools to develop new and effective means of representing graphics and figures in a way that the blind can understand clearly. Such representations must be sufficiently detailed to be useful but not so complex as to be confusing. Tactile printers, or embossers, is one technology that already exists, but because the software is outdated and difficult to learn, the printers are not extensively used, according to Melody Ivory-Ndiaye, an assistant professor at the university's Information School.

EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4304375.stm

PILOT PROGRAM DISTRIBUTES HANDHELDS IN KENYAN SCHOOL

A pilot project run by an organization called EduVision is distributing handheld computers to schoolchildren in western Kenya to replace aging, outdated textbooks. In the program, students receive devices called E-slates, which receive transmissions from a base station in the school. The base stations receive and process information delivered by satellite and transmit text, images, and study questions to the E-slates. EduVision's Matthew Herren explained that the system is very simple to set up but that "getting feedback or specific requests from end users is difficult" because the system uses one-way connections. Herren said organizers of the program are working with Google, which has begun an initiative to digitize millions of public-domain texts and make them available online. Putting those resources into the handheld program, said Herren, would give "every rural school in Africa ... access to the same libraries as the students in Oxford and Harvard."

2005-04-02 **Pentagon US government DARPA computer science research funding diverted universities**

EDUPAGE; http://www.nytimes.com/2005/04/02/technology/02darpa.html

DARPA FUNDS DIVERTED FROM UNIVERSITIES

Confirming rumors among academics at a number of colleges and universities, the Pentagon's Defense Advanced Research Projects Agency (DARPA) has acknowledged a shift away from university projects. DARPA has long been a supporter of broad-ranging, long-term research initiatives at institutions of higher education, and many credit such programs with many of the innovations that underpin today's household technologies. In seeking shorter-term projects with more concrete deliverables, however, DARPA has significantly cut back funds for university projects. Since 2001, the portion of DARPA's relatively stable budget allocated to university projects has dropped by nearly 50 percent. Many in the research community fear that the shift away from basic, open-ended research will result in slower technological progress. Ed Lazowska, a computer scientist at the University of Washington and co-chairman of the President's Information Technology Advisory Committee, said, "Virtually every aspect of information technology upon which we rely today bears the stamp of federally sponsored university research." He characterized DARPA's change in focus as "killing the goose that laid the golden egg." New York Times, 2 April 2005 (registration req'd)

2005-04-07 **ACM ICPC international programming contest US falling behind computer science industry**

EDUPAGE; http://news.zdnet.com/2100-9595_22-5659116.html

CODING CONTEST SHOWS U.S. STUDENTS FALLING BEHIND

At this year's Association for Computing Machinery International Collegiate Programming Contest, the University of Illinois's tie for 17th place was the best result for any U.S. team, representing the worst performance for U.S. institutions in the 29 years of the competition. Many observers believe the result is indicative of a variety of factors that have resulted in a striking shift in technological preeminence away from U.S. schools and companies. As recently as 1997, the United States came out on top, when a team from Harvey Mudd College won the competition. David Patterson, president of the Association for Computing Machinery and a computer science professor at the University of California, Berkeley, noted, "The U.S. used to dominate these kinds of programming Olympics." Others pointed out that applications from outside the United States to computer science and other technology programs at U.S. graduate schools have dropped lately. ZDNet, 7 April 2005

EDUPAGE; http://news.com.com//2100-1022_3-5681438.html

FEWER COLLEGE STUDENTS PURSUING COMPUTER SCIENCE DEGREES

A new report from the Computing Research Association (CRA) shows a significant drop in the number of college freshmen in the United States who say they plan to major in computer science. The CRA looked at data from the Higher Education Research Institute at the University of California at Los Angeles and found that between fall of 2000 and fall of 2004, interest in computer science fell by more than 60 percent and is now 70 percent below its all-time high. Interest among women has fallen even further, said the CRA, dropping 80 percent since 1998 and 93 percent since 1982. The CRA also conducted surveys of higher education institutions and came up with similar results. The report goes on to suggest that the United States will have difficulty meeting the demand for IT workers in coming years, increasing the gap with countries including India and China that are producing larger numbers of computer science graduates. "Freshmen interest levels at any given point have been an accurate predictor of trends in the number of degrees granted four to five years later," according to the report. CNET, 22 April 2005

2005-07-01 **quantum computing information processing progress HP DARPA**

EDUPAGE; http://www.nytimes.com/2005/07/01/technology/01hewlett.html

HP CLAIMS PROGRESS ON QUANTUM COMPUTING

Researchers at HP said they have taken a significant step in the development of a functioning quantum computer, and the Pentagon's Defense Advanced Research Projects Agency (DARPA) is contributing as much as $10 million to support the project. As opposed to the transistors--which can register either 1 or 0--that underlie today's computer processors, quantum computing is based on the physics of subatomic particles, allowing so-called "qubits" to represent both 1 and 0 simultaneously. The result could be vastly expanded processing power of quantum computers compared to those based on transistors. The DARPA funding will be used by the researchers to construct a functioning prototype. One researcher commented that to perform a single demonstration will not be difficult; the challenge lies in doing it reliably and "in a way that will allow us to do quantum information processing." Other quantum physics researchers question the basis of the HP team's approach, saying that fundamentally different approaches to quantum computing hold more promise. 2005-07-15 **science engineering higher education graduates US losing group internationally**

EDUPAGE; http://www.insidehighered.com/news/2005/07/15/science

U.S. LOSING GROUND IN SCIENCE AND ENGINEERING

Confirming the suspicions of many, a new report from the National Bureau of Economic Research indicates that the United States is steadily losing ground to a number of other countries, particularly China, in the number of PhDs it awards in science and engineering fields. In 1970, nearly one-third of the world's college students attended a college or university in the United States, and more than half of the science and engineering PhDs were awarded by U.S. schools. A number of global factors contributed to those numbers, making them artificially high. Since that time, however, higher education around the world, and especially programs in science and engineering, has greatly expanded, leaving the United States with just 14 percent of the world's college students by 2001. According to the report, China could surpass the United States as early as 2010 in the number of science and engineering PhDs it awards. Inside Higher Ed, 15 July 2005

2005-08-15 **research University of California Berkeley Internet search technology improvement**

EDUPAGE; http://news.com.com/2100-1038_3-5831050.html

BERKELEY PROJECT AIMS TO CREATE BETTER SEARCH TECHNOLOGIES

Researchers at a new center being developed at the University of California at Berkeley will study search technologies in an effort "to solve the problems that have been engendered by the success of search," according to Robert Wilensky, the director of the center. Among the topics of study will be privacy, fraud, multimedia search, and personalization. Plans for the new center have not been finalized, but organizers said it will be an interdisciplinary effort, including 20 or so faculty from various departments. Wilensky said that having an environment with so many researchers from differing fields of study results in "something bigger than its parts." The new research center will encourage commercial search companies to participate. Higher education has played a prominent role in the development of search technologies. Both Google and Yahoo were started at Stanford University, while Lycos was born at Carnegie Mellon University. Other institutions around the country are also working on projects to further develop search technologies. CNET, 15 August 2005

DHS IAIP Daily; http://msnbc.msn.com/id/9131498/

SCIENTISTS BRING TECHNOLOGY TO POST-KATRINA DISASTER SCENE

In Hurricane Katrina's wake, researchers are bringing cutting-edge technologies to the disaster area. The search-and-rescue tools include devices and software that can turn walkie-talkies into Internet grids when the phones are out, robots and aerial mini-planes that can look for signs of life amid the wreckage, and sensor systems that can sniff out public health threats in the storm's aftermath. Cisco Systems is setting up mobile communication kits and wiki-based networks to deal with Katrina's information overload. "It's not us saving people. It's us getting the technology to the people who will use it to save people," explained Robin Murphy, a professor at the University of South Florida who directs the Institute for Safety Security Rescue Technology. Murphy and her USF team are heading to New Orleans to link up with Louisiana State University's Fire Emergency Training Institute and put their tools to the test.

2005-10-05 **Google Sun partnership Microsoft competition**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/12823481.htm

GOOGLE AND SUN ANNOUNCE PARTNERSHIP

Google and Sun Microsystems have announced a partnership that many see as a joining of forces against Microsoft. Sun has long been a direct competitor with Microsoft, and most analysts believe Google has aspirations to compete with the software giant. Few specifics were released about the new arrangement. Google, which already buys Sun hardware, will expand those purchases, and Sun customers who download Java will have the option of also downloading Google's toolbar. Beyond those changes, most speculation about the deal concerns Sun's OpenOffice, an open source application that competes with Microsoft's Office suite of software. The companies said they will jointly develop OpenOffice, though some analysts expect Google to take primary responsibility for the work. John Rymer, an analyst with Forrester Research, said he believes Google will not simply redistribute OpenOffice. "When [Google does] something," he said, "it has to be cool. It has to go further than Microsoft Office." The deal is also a reunion of sorts for Sun CEO Scott McNealy and Google CEO Eric Schmidt, who worked together at Sun for 14 years. 2005-10-13 **science technology research development R&D US leading position loss**

EDUPAGE; http://news.com.com/2100-11395_3-5894854.html

PANEL WARNS U.S. NOT KEEPING PACE IN SCIENCE

A new report says that the United States stands to lose its leading position in science and research unless efforts are made to strengthen support for educational and other scientific programs. The panel that wrote the report was convened by the National Academies and included representatives from corporations and higher education, as well as Nobel laureates and former presidential appointees. The panel pointed to the narrowing scientific gap between the United States and countries such as China and India; recent results showing declining performance among U.S. students in science and math compared with students around the world; and economic factors that work against U.S. scientific interests. Among the report's recommendations are funding scholarships to support 10,000 students annually to pursue careers in teaching math and science; allocating money for 30,000 students per year to study science, math, and engineering; and relaxing visa regulations to allow international students to find employment in the United States after they graduate. 2005-10-27 **GPS data error human judgement override accident consequences legal liability**

RISKS 24 10

WHICH DO YOU BELIEVE: COMPUTERS OR REALITY?

Mike Scott contributed this chilling tale of excessive dependence on computerized information:

>My son was being driven by a friend in London. The friend's car was equipped with some sort of GPS navigation. They were driving eastbound along the north side of the River Thames, intending to cross at Tower bridge to a destination on the south side of the river. The GPS said "turn right" when they reached the bridge. The only snag is that this is a one-way system. To cross the bridge you turn left, *away* from the bridge, and drive right round the block. Unfortunately, said friend [paid] more attention to the GPS than the road signing, and very nearly collided with a car coming the other way.<

Mr Scott wondered about legal liability of the GPS navigator makers if there had been an accident.

2005-12-06 **Internet Web browser Firefox plug-in George Mason University research bibliography sources citing bookmarking**

EDUPAGE; http://chronicle.com/daily/2005/12/2005120602t.htm

GEORGE MASON DEVELOPS ACADEMIC BROWSER ADD-ON

Researchers at George Mason University are developing a plug-in for the Firefox browser that will help academics organize sources and properly cite them. The tool is designed to harvest bibliographic information from online sources and organize it for someone doing research on the Web. Assuming the bibliographic elements are formatted in a way the software can recognize, the application will parse title, author, and other information and correlate it with the source. Daniel J. Cohen, assistant professor of history and one of the developers, said it can be thought of as "incredibly smart bookmarking…. You're not just bookmarking the page, but you're automatically [capturing]…all that info that scholars want to save." Unlike commercial products that organize sources, the new application will tie directly into the browser, eliminating the step of manually collecting citation details. The open source application is expected to be completed next year and will be available for no charge from George Mason's Web site. Cohen said he believes the application will make unintentional plagiarism less likely than if a researcher were keeping sources organized manually.

CHINA OVERTAKES U.S. AS SUPPLIER OF INFORMATION TECHNOLOGY GOODS

After almost a decade of explosive growth in its electronics sector, China has overtaken the U.S. as the world's biggest supplier of information technology goods, according to a report by the Organization for Economic Cooperation and Development. Data in the report, published on Monday, December 12, show that China's exports of information and communication technology increased by more than 46 percent to $180 billion in 2004 from a year earlier, easily outstripping for the first time U.S. exports of $149 billion, which grew 12 percent from 2003. The figures compiled by the Organization for Economic Cooperation and Development, based in Paris, also reveal that China has come close to matching the U.S. in the overall value of its trade in information and communications technology products. The value of China's combined exports and imports of such goods soared to $329 billion in 2004 from $35 billion in 1996. Over the same period, the value of American information technology trade expanded at a slower rate, to $375 billion from $230 billion. Organization for Economic Cooperation and Development's data: http://www.oecd.org/document/8/0,2340,en_2649_201185_3583309 6_1_1_1_1,00.html

EDUPAGE; http://networks.silicon.com/webwatch/0,39024667,39155109,00.htm

STUDY EVALUATES WIKIPEDIA CONTENT

According to a research study published in the journal Nature, Wikipedia compares favorably with the Encyclopedia Britannica in the accuracy of its information despite recent criticisms of its content and methods. The Nature study compared articles from both Web sites on a wide range of topics, asking field experts to review the accuracy of the entries. Serious errors (such as misunderstandings of vital concepts) were evenly distributed between the two encyclopedias, with four serious errors each. As for errors of fact, omissions, or misleading text, Wikipedia had 162 such errors and Britannica had 123. The study is the first to use peer review to compare the accuracy of the two sources' coverage of science. Silicon.com, 16 December 2005

2006-03-16 **hackers competition Windows XP run Intel Mac**

DHS IAIP Daily; 23
http://www.macworld.com/news/2006/03/16/xponmac/index.php

HACKERS GET INTEL MAC TO RUN WINDOWS XP.

A contest to see who could get Windows XP working first on an Intel Mac has been won, according to the contest's coordinator, Colin Nederkoorn. Getting Windows XP to work on the Mac is not a plug and play process. According to the documentation included with the file download provided on Nederkoorn's Website, users must create an install CD themselves using a PC equipped with a CD-R drive, Microsoft's Windows XP SP 2 CD-ROM and Nero CD burning software. Step-by-step instructions for creating the disc are included. Users must also reformat and repartition their Intel Mac's hard disk drive to include a separate partition where Windows XP can be installed, then go through a multi-step process to make sure the software is installed properly and the Mac can recognize it. Once that's done, users will be able to switch between Mac OS X and Windows after rebooting the Mac. To load Windows XP on an Intel Mac: http://onmac.net/

2006-05-03 **Iraq online library US Department of Defense DoD weapons systems research**

EDUPAGE; http://chronicle.com/daily/2006/05/2006050301t.htm 23

ONLINE LIBRARY PART OF INTERNATIONAL SECURITY

A group of academics has partnered with the U.S. Department of Defense to develop an online library in Iraq that organizers hope will help the country hold on to its senior scientific researchers, many of whom have considerable experience developing weapons systems. Following the U.S. invasion of Iraq, 85 percent of the country's university libraries were destroyed or looted. Organizers of the online library said that although many in the country lack reliable Internet access, an online library was nonetheless the fastest, least expensive way to provide access to scientific material. The Iraqi Virtual Science Library is initially funded by the Defense Department's Defense Threat Reduction Agency and runs on U.S. government servers, though officials said they hope to turn control of the library over to Iraqis within the next few years. Fourteen publishers are participating in the program, offering discounts of as much as 97 percent over regular subscription prices. The Iraqi Virtual Science Library provides access to articles from about 17,000 academic journals. A representative of Springer, one of the publishers involved, said that because of the discounts, the Iraqi library has more content than most U.S. libraries, which must "cherry-pick" what they will purchase.
