2006-06-12 **Introduction**

M. E. Kabay, PhD, CISSP-ISSMP

WELCOME

Welcome to the June 2006 edition of the Information Security Year in Review (IYIR) project.

In 1993 and 1994, I was an adjunct professor in the Institute for Government Informatics Professionals in Ottawa, Canada under the aegis of the University of Ottawa. I taught a one-semester course introducting information security to government personnel and enjoyed the experience immensely. Many of the chapters of my 1996 textbook, _The NCSA Guide to Enterprise Security_ published by McGraw-Hill were field-tested by my students.

In 1995, I was asked if I could run a seminar for graduates of my courses to bring them up to date on developments across the entire field of information security. Our course had twenty students and I so enjoyed it that I continued to develop the material and teach the course with the NCSA (National Computer Security Association; later called ICSA and then eventually renamed TruSecure Corporation, its current name) all over the United States, Canada, Europe, Asia and the Caribbean.

After a few years of working on this project, it became obvious that saving abstracts in a WordPerfect file was not going to cut it as an orderly method for organizing the increasing mass of information that I was encountering in my research. I developed a simple database in 1997 and have continued to refine it ever since then. The database allows me to store information in an orderly way and -- most important -- to _find_ the information quickly. For that purpose, I put in as many keywords as I can think of quickly; I also classify each topic using a taxonomy that has grown in complexity and coverage over the years (more about the taxonomy in the next section).

In 2004, I was privileged to begin working with Norwich students Karthik Raman (project leader), Krenar Komoni and Irfan Sehic as my research assistants. These excellent students have provided invaluable assistance in transferring data from NewsScan, NIPC/DHS reports and other sources into the database and have also done the first cut of classification and keyword generation. They have enormously improved the coverage of the field and are continuing their work with me to expand the database to further sources in the coming year. It is difficult to estimate the hundreds of hours of time they have saved me.

I teach the IYIR course as a two-day workshop for my graduate students in the Master of Science in Information Assurance at Norwich University every June during their graduate week and then periodically during the year at different institutions as the occasion arises.

The IYIR reports are posted on my Web site now; see the introductory page at < http://www2.norwich.edu/mkabay/index.htm > and click on the IYIR button for a list of PDF files you can read on screen, search, or print out at will.

02 Taxonomy of INFOSEC Issues

Category 02 *Taxonomy of INFOSEC Issues*

2006-06-12 **Introduction**

INTRODUCTION

TAXONOMY

The taxonomy (classification scheme) of INFOSEC issues has grown over the years since I began the IYIR project. This taxonomy in now way represents a structurally sound classification with unambiguous, non-overlapping, atomic concepts; it is simply an organic development of my wish to present information in an orderly way in my courses and to be able to find examples of specific issues when I need them for teaching or writing.

The taxonomy changes almost every time I use it; the current taxonomy is listed here and is used throughout this edition of the IYIR report as well as in the INFOSEC UPDATE course based on the IYIR.

Code Description

05 Using IYIR
06 The INFOSEC UPDATE Course
07 Acknowledgements
08 About the Editor
10 Computer Crimes (cases, indictments, convictions, sentences)
11 Breaches of confidentiality
11.1 Data leakage
11.2 Unauthorized disclosure
11.3 Data theft
11.4 Covert channels
12 Wiretapping, interception (not jamming; not govt/law enforcement)
12.1 Wiretapping
12.2 Interception
12.3 Injection
13 Data diddling, data corruption, embezzlement
13.1 Data diddling
13.2 Data corruption & destruction
13.3 Embezzlement
13.4 Obsolescence
14 Viruses, virus-hoaxes, Trojans (assembly level or macro: not ActiveX or Java)
14.1 Viruses
14.2 Worms
14.3 Virus/worms
14.4 Trojans
14.5 Virus hoaxes
15 Fraud (not embezzlement), extortion, slamming
15.1 Fraud
15.2 Extortion
15.3 Slamming
16 INFOWAR, industrial espionage, hacktivism
16.1 Industrial espionage
16.2 Industrial information systems sabotage
16.3 Infrastructure protection & homeland security
16.4 Military & government perspectives on INFOWAR
16.5 Hacktivism
16.6 Disinformation, PSYOPS
17 Penetration, phreaking, cramming, uncapping (entering systems, stealing telephone or other services)
17.1 Penetration
17.2 Web vandalism
17.3 Phreaking, cramming, uncapping, theft of services
18 Theft/loss of equipment (laptops, ATMs, computers, cables, network components)
18.1 Theft of equipment
18.2 Loss of equipment

19 Counterfeits, forgery (including commercial software/music piracy)
19.1 Software piracy
19.2 Music piracy
19.3 Movies / TV piracy
19.4 Books / e-books piracy
19.5 Games piracy
19.6 Counterfeit currency, credit-cards, other negotiable tokens
19.7 Counterfeit legal or business documents
19.8 Plagiarism
19.9 Counterfeit products (hardware, clothing etc.)
1A Criminal hacker scene (conventions, meetings, testimony, biographies, publications)
1A1 Criminal hacker conventions and meetings
1A2 Criminal hacker testimony in court or committees
1A3 Biographical notes on individual criminals (including arrests, trials)
1A4 Criminal hacker publications
1A5 Criminal hacker organizations
1A6 Criminal hacker psychology
1B Pornography, Net-harm, cyberstalking, gambling, online auctions
1B1 Adult pornography
1B2 Child pornography
1B3 Pedophilia, kidnapping, Net-adoption fraud
1B4 Stalking & harassment
1B5 Gambling
1B6 Auctions
1B7 Hate groups, speech
1B8 Traffic in women, slavery
1B9 Non-virus hoaxes, urban myths
1C Identity, impersonation, spoofing
1C1 Impersonation
1C2 Identity theft
1C3 Pseudonymity
1C4 Anonymity
1C5 Phishing
1D Law Enforcement & Forensics (technology, organizations, proposals, litigation, rulings, judgements)
1D1 Organizations, cooperation for law enforcement
1D2 Technology for law enforcement
1D3 Litigation, legal rulings, judgements affecting law enforcement
1D4 Government funding for law enforcement
1E Homeland Security
20 Emerging Vulnerabilities & Defenses
21 Quality assurance failures including design flaws
21.1 General QA failures
21.2 Security product QA failures
21.3 Embedded processors
21.4 SCADA (supervisory control and data acquisition) systems, vehicle controls
21.5 Robots
22 Availability problems
22.1 DoS attacks
22.2 DDoS attacks
22.3 DoS countermeasures
22.4 Accidental availability disruptions
23 Internet tools
23.1 Java
23.2 Javascript
23.3 ActiveX
23.4 HTML, XML
23.5 E-mail & instant messaging or chat
23.6 Web-site infrastructure, general Web security issues
23.7 VoIP
23.8 SMS
24 Operating systems, network operating systems,TCP/IP problems (alerts & improvements)
24.1 Windows 9x/Me
24.2 Windows NT/2K/XP
24.3 UNIX flavors
24.4 TCP/IP, HTTP, DNS
24.5 LAN OS

24.6 WAP, WEP, Wi-Fi, Bluetooth, 802.11, WiMax
24.7 SWDR (Software-defined radio)
24.8 MAC OS
24.9 Peer-to-peer networking
24.A Secure processors
24.B Robust systems (hw / sw)
25 Computer remote control & disruption
25.1 Remote control, RATs, reprogramming, auto-updates
25.2 Jamming
25.3 RFI, HERF, EMP/T
26 Health effects of electronic equipment (phones, screens, etc.)
26.1 Radiation
26.2 Toxic materials
26.3 Heat
27 Security tools
27.1 Vulnerability assessment
27.2 Port scans
27.3 Intrusion detection systems
27.4 Firewalls & other perimeter defenses
27.5 Honeypots
27.6 Honeynets
27.7 Anti-malware technology
28 Automated surveillance
28.1 Spyware, Web bugs & cookies
28.2 Scumware
28.3 Keystroke loggers
28.4 Cell/mobile phones/GPS/cameras
28.5 Serial numbers
28.6 RFID tags
29 Sociology of cyberspace
29.1 Addiction, games & violence
29.2 Cyberdating & cybersex
29.3 Digital divide
29.4 Online & electronic voting
29.5 Online legal proceedings
29.6 Flash crowds, social e-links
29.7 Outsourcing
30 Management & Policy
31 The state of information security & technology
31.1 Surveys, studies, audits of security
31.2 Estimates, guesses, predictions, forecasts concerning security
31.3 New technology with security implications
31.4 Outsourcing
32 Censorship, indecency laws, 1st amendment (law)
32.1 Censorship in the USA
32.2 Censorship outside the USA
33 Policies, risk analysis, risk management
33.1 Acceptable use policies
33.2 Spam, spim, spit & splogs
33.3 Antispam
33.4 Authorization, access controls
33.5 Risk analysis & management
34 Net filters, monitoring (technologies)
34.1 Net filters
34.2 Usage monitoring, audit trails (employees, children)
35 DNS conflicts, trademark violations (Net, Web)
35.1 Cybersquatting
35.2 Trademarks vs DNS
35.3 Politics of the DNS
36 Responses to intrusion
37 Education in security & ethics
37.1 Elementary & middle school
37.2 High school
37.3 Undergraduate degrees
37.4 Master's degrees
37.5 Doctoral degrees

37.6 Industry courses
37.7 Conferences
37.8 Web sites
37.9 White papers
38 Consumer/employee privacy, profiling, trade in personal information
38.1 Consumer profiling
38.2 Trade in personal information
38.3 Industry efforts for privacy protection
38.4 International agreements on security, privacy, Net law
38.5 EU legislation & regulation concerning privacy
38.6 US legislation & regulation concerning privacy
38.7 Other legislation & regulation concerning privacy
38.8 Law enforcement & privacy
38.9 Surveillance
38.A Medical / HIPAA
40 Defensive Technology, Law of E-commerce, Intellectual Property
41 Cryptanalysis techniques & tools
42 Crypto algorithms (weakness, brute-force attacks, implementation flaws)
42.1 Crypto algorithm weaknesses
42.2 Brute-force attacks
42.3 Crypto product implementation flaws
43 I&A products (tokens, biometrics, passwords, Kerberos)
43.1 Tokens
43.2 Biometrics
43.3 Passwords
43.4 Kerberos
43.5 Single sign-on
43.6 E-mail authentication (e.g., SPF & SenderID)
44 Encryption algorithms, products (including steganography)
44.1 Crypto algorithms
44.2 Crypto products
44.3 Steganography
45 E-commerce security, digital signature, products, digital cash, e-payments
45.1 PKI (Digital signatures / certificates)
45.2 Digital cash
45.3 Micropayments
45.4 E-payments / e-wallets / credit-cards
45.5 Watermarks / digital-rights management / copy protection
45.6 Smart cards and other e-commerce security measures
45.7 Sales taxes on Internet commerce
45.8 E-commerce laws
45.9 E-shopping carts
46 Cryptography exports from US; Key escrow
47 US computer-crime laws
48 Foreign cyberlaws (not cases or sentences)
48.1 Non-US cryptography laws
48.2 Non-US computer-crime laws
48.3 Non-US intellectual property laws
49 Privacy, government surveillance, legislation, agreements
4A Evolution of Net law: framing, pointing, linking, jurisdiction
4A1 Framing
4A2 Pointing, linking, deep linking, metatext
4A3 Jurisdiction
4A4 Blocking
4A5 Archives
4A6 Libel
4A7 Spam
4A8 Liability
4B Intellectual property: patents, copyrights (law)
4B1 Copyrights
4B2 Patents
4B3 Reverse engineering
4B4 EULA (End-user license agreements)
4B5 Trademarks
4C Security paradigms, risk management, site-security certification, professional certification
4C1 Paradigms, security standards

4C2 Risk management methodology & tools
4C3 Certification of site security, privacy protection
4C4 Professional certification in security, auditing
4C5 Academic/Industry/Vendor/Govt efforts
4D Funny / miscellaneous

03 Sources of Information

Category 03 *Sources of Information*

2006-06-12 **Introduction**

INTRODUCTION

In the early days, I wrote all the abstracts myself. As the size of the database grew, this practice became a terrible and limiting burden. I was thrilled -- and still am -- to get permission to quote the superb abstracts written by John Gehl and Suzanne Douglas, original editors of EDUPAGE and now of the daily _NewsScan_ and weekly _Innovation_ e-publications. At this point, their work is a major component of the IYIR.

In addition, I have been quoting (with attribution) many of the contributors to Peter G. Neumann's RISKS Forum Digest. I regret that I have fallen behind in summarizing this publication since about 2004 but hope to get back on track with the help of volunteers and assistants.

Lately, the Daily Reports from NIPC (National Infrastructure Protection Center) (now the DHS daily report) have proven valuable in supplementing the material at hand.

Bruce Schneier, famed cryptographer and a valued commentator on all matters of security, has kindly allowed me to include excerpts from his monthly columns in his Crypto-Gram newsletter.

I also naturally continue to write my own abstracts of interesting articles when necessary.

For a list of news sources that cover information security news, see < http://www2.norwich.edu/mkabay/overviews/infosec_ed.pdf >.

For more information about NewsScan and Innovation, see < http://www.newsscan.com >.

For more information about RISKS Forum Digest, see the archives at <http://catless.ncl.ac.uk/Risks/ > for HTML versions or at < http://the.wiretapped.net/security/textfiles/risks-digest/ > for text versions.

Dr Neumann asks that reprints from RISKS include the following note and the following should be considered as a blanket notification for all verbatim republication of RISKS materials throughout this database:

* * *
From the
FORUM ON RISKS TO THE PUBLIC IN COMPUTERS AND RELATED SYSTEMS (comp.risks)
ACM Committee on Computers and Public Policy, Peter G. Neumann, moderator
See < http://www.csl.sri.com/users/risko/risksinfo.html > for full information.
Reused without explicit authorization under blanket permission granted for all Risks-Forum Digest materials. The author(s), the RISKS moderator, and the ACM have no connection with this reuse.

Category 04 *Copyright*

2006-06-12 **Introduction**

INTRODUCTION

As you can see at the bottom of every page of the IYIR report and the INFOSEC UPDATE, I assert copyright over this presentation (only) of the information my research team and I have collected. This is called a _compilation copyright_ and in no way derogates the copyrights of all original copyright holders. My contribution is primarily the organization and presentation of this information. I do hold the copyright on my own abstracts and on the keywords. I assert copyright purely to prevent scoundrels from SELLING what is supposed to be available FREE. The PDF version of the book you are looking at will be posted on my Web site for anyone to use.

05 Using IYIR

Category 05 *Using IYIR*

2006-06-12 **Introduction**

INTRODUCTION

Anyone who wants to refer to these IYIR and INFOSEC UPDATE documents is completely welcome to do so freely _provided_ that no one tries to make other people pay for the materials. You are welcome to reprint the documents provided that each page you choose to print is in the original format (that's why I use Acrobat PDF files to distribute the information). Just remember, if I ever find out that someone has charged somebody for what I freely give away I am going to be really, really mad!

You may, of course, use the _original_ documents as you and the copyright owners agree.

As for posting these files on your own Web sites, DON'T! I update the files constantly and absolutely do not want to have to hunt down old copies of the work and replace them with newer versions. So you're welcome to link to the files, but please do _not_ copy them to any other Web sites.

06 The INFOSEC UPDATE Course

Category 06 *The INFOSEC UPDATE Course*

2006-06-12 **Introduction**

INTRODUCTION

The INFOSEC UPDATE course is usually a two-day workshop that brings participants up to date on topics across the entire field of information security. The four half-day sessions cover the following broad areas:

Day 1:
AM: Computer Crime Update
PM: Emerging Vulnerabilities

Day 2:
AM: Management , Corporate Policy
PM: Cryptography, Law, Public Policy

For full details, see section 2 on Taxonomy.

I used to prepare slides based on the abstracts so that the students would have a workbook consisting of keywords in the slide and the details at the bottom of the page. However, this approach became unmanageable by the time I reached workbook lengths of 475 pages. It was simply too much effort for relatively minor benefits. I have therefore tried a different, much simpler approach over the last few years. I mark selected topics in my database and created the workbook from a report file. The whole thing takes me a few minutes and allows me to keep the workbook absolutely up to date. I hope that course participants will find it a useful resource and an acceptable format for the course.

Starting in 2005, I spared my MSIA graduate students the agony of sweltering through two solid days of this stuff and shrank their version of the INFOSEC UPDATE to a single day. However, if we ever get air conditioning, watch out!

INTRODUCTION

ACKNOWLEDGEMENTS

I would like to acknowledge the encouragement and support of many colleagues who have contributed to this project over the years. In particular, John Gehl and Suzanne Douglas, original editors of EDUPAGE and then later of NEWSSCAN and INNOVATION, stand out for their kindness in so generously allowing me to quote them verbatim in so many hundreds of stories. Thanks guys -- I simply could not do this without your help.

The editors of EDUPAGE kindly continued the tradition and have allowed me to include occasional abstracts from their publication.

My colleagues at NCSA / ICSA / TruSecure / CyberTrust Corporation were always supportive and encouraging during the years I continued this work until 2000; I especially thank my favorite curmudgeon, David Kennedy, Director of Resarch for CyberTrust, for many years of continuing friendship.

I also want to thank my colleagues Phil Susmann and COL Tom Aldrich at Norwich University and the National Center for the Study of Counterterrorism and Cybercrime for their encouragement and support and the opportunity to teach the two-day INFOSEC Update for several years at the annual e-ProtectIT Conference (http://www.e-protectIT.org).

My sincere thanks to my Norwich University research assistants, Karthik Raman (Chief Boss Man and Gang Leader), Krenar Komoni, Michael Martell, and Chris Aldrich. Thanks also to MSIA alumni volunteers Clark Cummings and Steve Lovaas for their contributions. Josh Durdin and Lofton Newton, although newcomers to the project, have started their contributions well and I look forward to further work with them.

The School of Graduate Studies, under the leadership of Founding Dean Fred Snow and of Dean Bill Clements, has generously funded the research assistantships that have permitted the project to progress without imposing total exhaustion on me. Many thanks.

Thanks to Dr Fred Snow, former Dean of Online Graduate Studies and to Dr Bill Clements, current Dean, for their support (moral and financial) in building the research team that has made this project easier.

And finally, as always, I thank my wife, Deborah Black, light of my life, for all her infinitely varied support over many years and in all ways.

INTRODUCTION

Here's a little information about me. For exhaustive, not to say exhausting, details, you can visit my Web site at < http://www2.norwich.edu/mkabay > and click on my CV link.

I began programming in assembler at age 15 in 1965. In 1976, I received his PhD from Dartmouth College in applied statistics and invertebrate zoology. Joined a compiler team in 1979 for a new 4GL and RDBMS in the U.S. and then joined Hewlett-Packard Canada in 1980, winning the Systems Engineer of the Year Award in 1982. Have published over 850 technical papers in operations management and security, a 1996 textbook on security, was Technical Editor of the 4th Edition of the _Computer Security Handbook_ (Wiley, 2002) and am working on the 5th edition with Senior Editor Sy Bosworth and new third editor Eric Whyne. Have lectured on security and information warfare at the US Army War College, NATO HQ, NATO Counterintelligence, and in the UK, France, Germany, Japan and China. Returned to academia full time in July 2001 and am Associate Professor of Information Assurance in the Division of Business & Management at Norwich University, Northfield, VT 05663-1035 USA as well as the Director of the Master's Program in Information Assurance (http://www.msia.norwich.edu/) and of the Bachelor's program in IA (http://www.norwich.edu/academics/business/informationassurance.html).

11 Breaches of confidentiality

Category 11 *Breaches of confidentiality*

2005-10-01 **data theft identity theft terminology dataflation privacy law court proof**

Information Security Magazine; http://tinyurl.com/9aanv

STEPHEN COBB COINS NEW TERM: DATAFLATION

Security expert Stephen Cobb writes,

>I think most people would agree that 2005 has not been, so far, a good year for information security. Indeed, when you add up the total number of personal data records reported as compromised in the first six months you get a figure that some people justly consider alarming: 66 million. But I suggest that this number, and the phenomenon it represents, goes way beyond alarming, way out into previously uncharted territory. In fact, I respectfully suggest that we don't yet have the vocabulary needed to describe what is happening to personal data today, let alone understand all of the implications.

In an effort to remedy this situation I propose a new word for that vocabulary: dataflation. But before I offer my definition of dataflation, let me provide some context for that 66 million. In the most recent U.S. census the number of Americans aged 18 or older was 210 million. If you factor in the numerous compromises of personal data records that occurred in 2004, it is entirely possible that data relating to one in three American adults is now "out there," available to be abused. <

[More in the complete article.]

11.1 Data leakage

Category 11.1 *Data leakage*

1997-02-23 **medical data confidentiality**

PA News

In Sheffield, England, a hospital handed over 50,000 confidential gynecological records to a data processing firm that hired people off the street and set them to work transcribing the unprotected data. The scandal resulted in withdrawal of the contract, but thousands of records were exposed to a wide variety of people with no background checking to ascertain their reliability.

Category 11.1 *Data leakage*

1997-07-02 **medical informatics telemedicine**

Australian

A report by Trudy Harris in _The Australian_ reviewed risks of telemedicine, a technology of great value in Australia because of great distances and sparse population. Risks included interception of unencrypted medical information, modification of critical parameters for patient care, and unauthorized access to confidential patient records.

Category 11.1 *Data leakage*

1997-07-10 **hacker password attack**

Wall Street Journal

Mark Abene, a security expert formerly known to the underground as Phiber Optik, launched a command to check a client's password files — and ended up broadcasting the instruction to thousands of computers worldwide. Many of the computers obligingly sent him their password files. Abene explained that the command was sent out because of a misconfigured system and that he had no intention of generating a flood of password files into his mailbox. Jared Sandberg, Staff Reporter for the The Wall Street Journal, wrote, "A less ethical hacker could have used the purloined passwords to tap into other people's Internet accounts, possibly reading their e-mail or even impersonating them online." Mr Abene was a member of the Masters of Deception gang and was sentenced to a year in federal prison for breaking into telephone company systems. The accident occurred while he was on parole.

Category 11.1 *Data leakage*

1997-07-19 **confidentiality error**

Telecomworldwire

A firm of accountants received passwords and other confidential codes from British Inland Revenue. Government spokesmen claimed it was an isolated incident. [How exactly did they know that it was an isolated incident?]

Category 11.1 *Data leakage*

1997-08-07 **privacy journalists Internet**

Reuters; RISKS 19 28

The ICSA's David Kennedy reported on a problem in Hong Kong, where Reuters described a slip that revealed personal details about hundreds of journalists at the end of June. Passport and identity-card details were revealed on the government Website for a couple of days. DK commented, "I suppose that's one way to get the media interested in privacy matters."

Category 11.1 *Data leakage*

1997-08-15 **privacy credit reports database**

AP, EDUPAGE

Experian Inc. (formerly TRW Information Systems & Services), a major credit information bureau, discontinued its online access to customers' credit reports after a mere two days when at least four people received reports about other people.

Category 11.1 *Data leakage*

1999-01-29 **data leakage privacy confidentiality control Web**

RISKS 20 18

The Canadian consumer-tracking service Air Miles inadvertently left 50,000 records of applicants for its loyalty program publicly accessible on their Web site for an undetermined length of time. The Web site was offline as of 21 January until the problem was fixed.

Category 11.1 *Data leakage*

1999-02-03 **data leakage Web script QA vulnerability confidentiality**

WIRED via PointCast

An error in the configuration or programming of the F. A. O. Schwarz Web site resulted paradoxically in weakening the security of transactions deliberately completed by FAX instead of through SSL. Customers who declined to send their credit-card numbers via SSL ended up having their personal details — address and so forth — stored in a Web page that could be accessed by anyone entering a URL with an appropriate (even if randomly chosen) numerical component.

Category 11.1 *Data leakage*

2000-02-06 **bank financial system leak confidentiality windfall investors market**

RISKS 20 78

An error at the Reserve Bank of Australia caused e-mail to be sent to 64 subscribers of the bank's alert service informing them of a planned 0.5% increase in the prime interest rate. However, the message was sent out six minutes early, allowing some of those traders to sell A$3B of treasury bill and bond futures — and making some people a great deal of money.

Category 11.1 *Data leakage*

2000-02-06 **confidentiality human factors workstations home computer Web browsing**

RISKS, New York Times 20 78
http://www.nytimes.com/yr/mo/day/news/washpol/cia-impeach-deutch.html

The former director of the CIA, John Deutch, kept thousands of highly classified documents on his unsecured home Macintosh computer. Critics pointed out that the system was also used for browsing the Web, opening the cache of documents up to unauthorized access of various kinds.

Category 11.1 *Data leakage*

2000-02-20 **confidentiality Web site**

RISKS, CNet 20 80
http://news.cnet.com/category/0-1005-200-1550948.html

H&R Block had to shut down its Web-based online tax-filing system after the financial records of at least 50 customers were divulged to other customers.

Category 11.1 *Data leakage*

2000-04-28 **covert channel discover discarded data trash recycle access confidentiality**

RISKS 20 88

Conrad Heiney noted in RISKS that network-accessible shared trashcans under Windows NT have no security controls. Anyone on the network can browse discarded files and retrieve confidential information. [Moral: electronically shred discarded files containing sensitive data.]

Category 11.1 *Data leakage*

2000-06-18 **privacy confidentiality anonymity**

RISKS 20 93

A RISKS correspondent reported on a new service in some hotels: showing the name of the guest on an LCD-equipped house phone when someone calls a room. Considering the justified reluctance to reveal the room number of a guest or to give out the name of a room occupant if one asks at the front desk, this service seems likely to lead to considerable abuse, including fraudulent charges in the hotel restaurant.

Category 11.1 *Data leakage*

2000-06-24 **confidentiality concealment error vulnerability**

RISKS, Wired http://www.wired.com/news/politics/0,1283,37205,00.html 20 93

New York Times Web-site staff chose an inappropriate mechanism for obscuring information in an Adobe Acrobat PDF document that contained information about the 1953 CIA-sponsored coup d'état in Iran. The technicians thought that adding a layer on top of the text in the document would allow them to hide the names of CIA agents; however, incomplete downloading allowed the supposedly hidden information to be read. Moral: change the source, not the output, when obscuring information.

2000-07-07 **e-mail domain name system DNS confusion similarity**

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB962887042191508928.htm

One of Spain's largest banks — and its most aggressive in terms of moving operations onto the Internet — is suffering from an identity crisis that has resulted in thousands of messages being routed to Bulletin Board VA, run by a rural Virginia man who publishes a weekly shopper with a circulation of 10,000. Banco Bilboa Vizcaya Argentaria, which goes by the acronym BBVA after Banco Bilbao Vizcaya merged with Argentaria SA last fall, is the owner of the "grupobbva.com" domain name, but many employees, customers and outside vendors mistakenly send their sometimes-sensitive e-mail to "bbva.com," a domain name owned by Bulletin Board VA. "When all this e-mail started coming in, I didn't know who to contact. I didn't know who to talk to," says Bulletin Board VA owner Jim Caldwell. "To me it is beyond the stage of funny." Some of the messages contain bank account numbers and balances, and at least one contained confidential information about a possible bank acquisition. BBVA says it's in the process of changing its domain name to "bbva.es," and hopes that will solve the problem. Caldwell certainly hopes so — he says he spends up to two hours a day clearing his server of the mislabeled messages. (Wall Street Journal 7 Jul 2000)

2000-07-13 **data spill confidentiality privacy e-mail address banner advertisement HTML Web page transfer**

NewsScan, Los Angeles Times
http://www.latimes.com/business/20000713/t000065732.html

Microsoft . . . acknowledged that a flaw in its Hotmail program . . . [was] inadvertently sending subscribers' e-mail addresses to online advertisers. The problem, which is described as a "data spill," occurs when people who subscribe to HTML newsletters open messages that contain banner ads. "The source of the problem is that Hotmail includes your e-mail address in the [Web address], and if you read an e-mail that has banner ads," the Web address will be sent to the third-party company delivering the banner, says Richard Smith, a security expert who alerted Microsoft to the problem in mid-June. Data spills are common on the Web, says Debra Pierce of the Electronic Frontier Foundation. "This isn't just local to Hotmail; we've seen hundreds of instances of data spills over the course of this year." Smith estimates that more than a million addresses may have been transferred to ad firms, but most of the big agencies, including Engage and DoubleClick, are discarding the information. (Los Angeles Times 13 Jul 2000)

2000-08-14 **confidentiality Web site disclosure flaw error QA quality assurance**

RISKS, SecurityFocus http://www.securityfocus.com/news/074 21 01

Kevin Poulson of SecurityFocus reported "Verizon's twenty-eight million residential and business telephone subscribers from Maine to Virginia had portions of their private telephone records exposed on a company web site. . . ." The system was designed to permit customers to file and track their repair reports, but entering any phone number generated HTML code containing the legitimate number's registered user information such as name and address.

Category 11.1 *Data leakage*

2001-02-16 **proprietary document formats hidden information concealed data confidentiality Web**

RISKS 21 25

Paul Henry noted that the well-known problem of hidden information in MS Word documents continues to be a source of breaches of confidentiality. Writing in RISKS, he explained, "I received an MS Word document from a software start-up regarding one of their clients. Throughout the document the client was referred to as 'X', so as not to disclose the name. However I do not own a copy of Word, and was reading it using Notepad of all things, and discovered at the end the name of the directory in which the document was stored -- and also the real name of the client! I checked on a number of other word documents I had for hidden info, especially ones from Agencies who are looking to fill positions -- and yes, again I was able to tell who the client was from the hidden information in the documents."

Mr Henry concluded, "Risks: What potentially damaging information is hidden in published documents in Word, PDF and other complex formats? Mitigation: Use RTF when you can -- no hidden info, no viruses."

2001-11-26 **confidentiality search engine data leakage**

NewsScan

SEARCH ENGINES DIG TOO DEEP
Search engines increasingly are unearthing private information such as passwords, credit card numbers, classified documents, and even computer vulnerabilities that can be exploited by hackers. "The overall problem is worse than it was in the early days, when you could do AltaVista searches on the word 'password' and up come hundreds of password files," says Christopher Klaus, founder and CTO of Internet Security Systems, who notes that a new tool built into Google to find a variety of file types is exacerbating the problem. "What's happening with search engines like Google adding this functionality is that there are a lot more targets to go after." Google has been revamped to sniff out a wider array of files, including Adobe PostScript, Lotus 1-2-3, MacWrite, Microsoft Excel, PowerPoint, Word, and Rich Text Format. Google disavows responsibility for the security problem, but the company is working on ways to limit the amount of sensitive information exposed. "Our specialty is discovering, crawling and indexing publicly available information," says a Google spokesman. "We define 'public' as anything placed on the public Internet and not blocked to search engines in any way. The primary burden falls to the people who are incorrectly exposing this information. But at the same time, we're certainly aware of the problem , and our development team is exploring different solutions behind the scenes." (CNET News.com 26 Nov 2001)

2002-02-20 **search engine spider web-bot exclusion cache**

RISKS 21 92

RISKS correspondent Diomidis Spinellis cogently summarized some of the problems caused by search engines on the Web: "The aggressive indexing of the Google search engine combined with the on-line caching of the pages in the form they had when they were indexed, is resulting in some perverse situations.

A number of RISKS articles have already described how sensitive data or supposedly non-accessible pages leaked from an organization's intranet or web-site to the world by getting indexed by Google or other search engines. Such problems can be avoided by not placing private information on a publicly accessible web site, or by employing metadata such as the robot exclusion standard to inform the various web-crawling spiders that specific contents are not to be indexed. Of course, adherence to the robot exclusion standard is left to the discretion of the individual spiders, so the second option should only be used for advisory purposes and not to protect sensitive data."

2002-04-22 **data leakage surveillance privacy Web cameras Webcam hijack wireless**

RISKS 22 04ff

Dave Farber noted in RISKS:

Thousands of people who have installed a popular wireless video camera, intending to increase the security of their homes and offices, have instead unknowingly opened a window on their activities to anyone equipped with a cheap receiver. The wireless video camera, which is heavily advertised on the Internet, is intended to send its video signal to a nearby base station, allowing it to be viewed on a computer or a television. But its signal can be intercepted from more than a quarter-mile away by off-the-shelf electronic equipment costing less than $250. [...] [Source: John Schwartz, *The New York Times*, 14 Apr 2002 http://www.nytimes.com/2002/04/14/technology/14SPY.html?ex=1019744700&ei=1&en=cfeb1e93a276b9ee]

Marc Roessler commented:

"This is nothing new. Such cameras are even installed in some public restaurants and shops. Note that this basically voids all claims of the shop owners concerning privacy and data protection -- ANYONE can receive that data. And, as more and more cameras are installed, the risk of malicious "camera takeovers" rises significantly. Think about webcams, cams integrated into notebooks/cellular phones, car dashboards (detect the driver falling asleep).. Those are easily tapped (or subverted, such as by installing trojan software/ firmware).. this has some enormous potential. The case of the Nanny-Cams shows the deviousness of this kind of attack: as the devices are not suspected to be used to spy on their owner ("I own that device; that makes it trusted"), they function more or less as hidden cameras. For more "camera takeover" scenarios take a look at my paper "How to find hidden cameras" [1].

JUNKED HARD DRIVES YIELD LOTS OF PERSONAL DATA
MIT graduate students Simson Garfinkel and Abhi Shelat bought 158 hard drives at second hand computer stores and eBay over a two-year period, and found that more than half of those that were functional contained recoverable files, most of which contained "significant personal information." The data included medical correspondence, love letters, pornography and 5,000 credit card numbers. The investigation calls into question PC users' assumptions when they donate or junk old computers — 51 of the 129 working drives had been reformatted, and 19 of those still contained recoverable data. The only surefire way to erase a hard drive is to "squeeze" it — writing over the old information with new data, preferably several times — but few people go to the trouble. The findings of the study will be published in the IEEE Security & Privacy journal Friday. (AP 16 Jan 2003) http://apnews.excite.com/article/20030116/D7OJBBBG0.htm

2003-05-29 **hacker vulnerability Cingular Adrian Lamo website line LLC random finding Sacremento California dumpster customer records exploit**

NIPC/DHS

May 29, Wired — Hacker exposes vulnerability in Cingular claims site.

Hacker Adrian Lamo found a security hole in a website run by lock\line LLC, which provides claim management services to Cingular customers. Lamo discovered the problem last weekend through a random finding in a Sacramento, CA dumpster, where a Cingular store had discarded records about a customer's insurance claim for a lost phone. By simply typing in a URL listed on the detritus, Lamo was taken to the customer's claim page on the lock\line website. Lamo was able to access individual claims pages containing customer's name, address and phone number, along with details on the insurance claim being made. Altering the claim ID numbers in the URL gave Lamo access to some 2.5 million Cingular customer claims dating back to 1998. Lamo said he had no intent of profiting from the exploit, just pointing out a security flaw. Cingular and lock\line closed the hole by Wednesday morning.

2004-03-16 **Microsoft leaked code Internet vulnerability exploit hacker attacker defense**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1548988,00.asp

March 14, eWEEK — Leaked code still could bear malicious fruit.

A portion of Windows source code was leaked last month, and researchers are saying that hackers have uncovered several previously unknown vulnerabilities in the code. Immediately following the code's posting on the Internet, members of the security underground began poring over the code, searching for undocumented features and flaws that might give them a new way to break into Windows machines. The real danger isn't the vulnerabilities that this crowd finds and then posts; it's the ones that they keep to themselves for personal use that have researchers worried. Experts said there has been a lot of talk about such finds on hacker bulletin boards and Internet Relay Chat channels of late, indicating that some hackers are busily adding new weapons to their armories. Another concern for Microsoft and its customers is that even though the leaked code is more than 10 years old, it forms the base of the company's current operating system offerings, Windows XP and Windows Server 2003. This means that any vulnerabilities found in Windows NT or Windows 2000 could exist in the newer versions as well.

2004-10-19 **spyware Google data leakage shared computers confidentiality**

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A43548-2004Oct18.html

GOOGLE'S PC SEARCH TOOL MIGHT PROVE THE 'PERFECT SPY'

Google Desktop Search, released last Thursday in a "beta" test phase, may prove a boon to disorganized PC users who need assistance in finding data on their computers, but it also has a downside for those who use public or workplace computers. Its indexing function may compromise the privacy of users who share computers for such tasks as processing e-mail, online shopping, medical research, banking or any activity that requires a password. "It's clearly a very powerful tool for locating information on the computer," says one privacy consultant. "On the flip side of things, it's a perfect spy program." The program, which is currently available only for Windows PCs, automatically records any e-mail read through Outlook, Outlook Express or the Internet Explorer browser, and also saves pages viewed through IE and conversations conducted via AOL Instant Messenger. In addition, it finds Word, Excel and PowerPoint files stored on the computer. And unlike the built-in cache of recent Web sites visited that's included in most browser histories, Google's index is permanent, although individuals can delete items individually. Acknowledging potential privacy concerns, a Google executive says managers of shared computers should think twice about installing the tool before advanced features like password protection and multi-user support are available.

EDUPAGE; http://news.com.com/2100-1041_3-5566145.html

USING IPODS FOR MEDICAL IMAGING AT UCLA

Physicians at the University of California, Los Angeles (UCLA), are using iPods in conjunction with an open source application developed in-house to avoid some of the steep costs of medical imaging. Physicians Osman Ratib and Antoine Rosset created Osirix, an open source tool that allows radiologists to participate in teleconferences and see high-resolution medical images on desktop Macintosh computers, rather than the $100,000 workstations that were previously required. Files for the 3D images are too large for many media, so Ratib and his team turned to the iPod, which offers a portable storage medium of 60GB. Although some cautioned that using iPods for storage presents a security risk, Ratib said the risk is no greater than with any other medium. "It's not the device, it's how you use it," he said. "When [users] are outside the institution, they can be compliant or not."

2005-11-21 **hurricane Katrina disaster lost records encryption backups critical**

DHS IAIP Daily; http://fcw.com/article91509−11−21−05−Print

LOST RECORDS CONVINCE OFFICIALS THAT ENCRYPTED DIGITAL BACKUPS ARE CRUCIAL

After Hurricane Katrina devastated the Gulf Coast region, along with many vital records, federal officials realized they needed to digitize such records to prevent future data loss. But storage analysts say federal agencies are behind the curve when it comes to safeguarding digitized records stored elsewhere. Federal agencies are not encrypting their off-site data, said Jon Oltsik, a senior analyst at research firm Enterprise Strategy Group. Katrina's destruction demonstrated the importance of electronic backup copies of documents such as health records and flood maps. But by keeping copies of critical information, agencies also create new opportunities for data theft. Oltsik is the author of a recent survey that asked 388 agencies and companies whether they encrypt backup data as they copy it to tape. "Of the five industry segments we looked at, [the local/federal] government was the worst," he said. Only three percent of government organizations said they always encrypt backup data, and 77 percent said they never do. Overall, only seven percent of the organizations surveyed said they always encrypt backup data, despite the fact that vendors have offered backup encryption tools for at least 15 years, Oltsik said.

DHS IAIP Daily; http://www.newsfactor.com/news/Gartner−Warns−About−Vista−Met adata/story.xhtml?story_id=113003ORER88

Gartner warns about Microsoft Vista metadata problem.

Windows Vista, the next version of Microsoft's Windows client operating system, will give users the ability to search for files by looking for information in the file's metadata tags. However, a report by IT research firm Gartner warned that allowing users to search for metadata tags in this manner could result in private information being inadvertently disclosed. Metadata consists of "data about data." It is supplementary information about the author of a document, its various revisions, and any changes that have been made, explained Neil MacDonald, Gartner's vice president and distinguished analyst of information security, privacy, and risk. The Gartner report, "Plan To Deal with Metadata Issues with Windows Vista," written by MacDonald and Gartner analyst Michael Silver, outlines one example in which an employee might give a document about a client the metadata tag "bad client." If that document were then sent to the client, considerable embarrassment, even loss of business, could result. The Gartner report suggested that firms must have a strategy in place for dealing with metadata before adopting Windows Vista. The referenced Gartner report is available for purchase: http://www.gartner.com/

EFF RAISES CONCERNS OVER GOOGLE DESKTOP

The Electronic Frontier Foundation (EFF) is warning users about what it says are privacy concerns with Google's new Desktop Search application. The tool indexes files from a computer, allowing users to search that content from other machines. According to the EFF, this process poses significant risks to personal privacy, particularly in light of recent government demands for access to usage logs from Google and other companies. EFF staff attorney Kevin Bankston said, "Unless you configure Google Desktop very carefully, and few people will, Google will have copies of...whatever...text-based documents the desktop software can index." If federal authorities obtain Google's records, he said, they would have access to all of those files. Officials from Google conceded that the new tool does represent a trade-off of some measure of privacy, but said such a compromise is one that many users will be willing to make. The company also said it would encrypt those files, would place strong limits on who can access the information, and would not store it for more than 30 days.

2006-04-03 **Trend Micro data leakage virus anti-virus software not installed employee computer**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/holes/story/0,10801,110142,00.html 23

TREND MICRO DATA REVEALED DUE TO VIRUS.

The failure of a Trend Micro Inc. employee to install his company's own antivirus software led to the uploading of some company reports to a popular Japanese peer-to-peer file-sharing network, the company said Monday, April 3. In disclosing the data leak, Trend Micro became the latest of a number of corporations or government agencies to report data losses as a result of viruses on the Winny network. Winny can be downloaded at no charge and is a popular way for Japanese Internet users to exchange music and video files.

JAPANESE NEWSPAPER LEAKS SUBSCRIBER INFORMATION TO INTERNET

The Mainichi Shimbun reported that information on about 66,000 subscribers (including names, addresses, phone numbers, dates of birth, and e-mail addresses) was leaked onto the Internet. This resulted from an employee copying the data onto his own computer, which was thought to have been infected with a virus that exploited a vulnerability in the *Share* file-sharing application.

2006-05-04 **Ohio University personal data disclosure Social Security numbers**

EDUPAGE; http://chronicle.com/daily/2006/05/2006050401t.htm 23

OHIO UNIVERSITY EXPOSES PERSONAL DATA

Officials at Ohio University said that a compromised server exposed personal information on about 300,000 individuals for more than a year. William Sams, CIO and associate provost for information technology at the university, said unusually high traffic tipped off IT staff that there was a problem. After investigation, it was determined that hackers had accessed a server that contained an alumni database that included more than 137,000 Social Security numbers as well as data on donations and amounts. The database did not include credit card information. Sams said the data had been exposed since March 2005. The university is working to notify individuals whose data was exposed and to offer them advice about how to minimize the risk of identity theft. Two people in the database have reported misuse of their personal information. Although one was found to be unrelated to the breach at Ohio University, officials are still trying to determine if the other incident is connected.

2001-05-04 **banking financial information social engineering industrial espionage confidentiality breach**

NIPC Daily Report

About a dozen of the nation's leading banks will discuss on 4 May how to protect themselves from using information brokers who trick other banks into turning over confidential details about individuals' finances. One recommendation on the agenda is that banks insist that brokers sign contracts promising they will not use illegal pretext calls to get data about debtors' assets. Federal regulators have urged national banks to boost efforts to protect customers against information brokers and identity thieves. The banks' apparent sense of urgency on pretext calling shows how deep an impact privacy issues have had on the financial services industry in recent years. The financial institutions want to find a way to improve security and detect fraud, while providing easy telephone and Internet access for their customers.

WEB SITES LEAK AFTER-HOLIDAY SALE PRICES
Users of several shopping Web sites, including FatWallet.com and DealofDay.com, were treated to a sneak peek of post-Thanksgiving sale prices for items ranging from Kodak digital cameras to the "8 Mile" movie soundtrack — prices retailers had no intention of revealing until after the holiday. Now, shoppers in the market for an HP printer may as well wait until the price drops to $200 after Thanksgiving — 33% off the current price on the OfficeMax Web site. And Best Buy's price on a digital camera will drop to $99.99 from its current $149.99 listing. "Someone, somewhere is getting information they shouldn't be," says an OfficeMax spokesman. Target, Best Buy, Wal-Mart, Toys R Us and others have demanded that the Web sites take the information down. Most have complied, but in many cases readers have already copied the data and posted it elsewhere on the Web. Retailers are stumped over how the information got out, but promise to take retaliatory action when they find out: "We will take appropriate legal action as soon as we discover how the information got on the site and who posted it," says a spokesman for OfficeMax. (Wall Street Journal 21 Nov 2002)

EDUPAGE; http://news.com.com/2100-7349_3-5519592.html

HACKERS HIT GEORGE MASON

George Mason University has become the latest institution of higher education to be the victim of hackers' accessing personal information of faculty and students. University officials said that hackers gained access to information including names, photos, Social Security numbers, and campus ID numbers for "all members of the Mason community who have identification cards." An e-mail sent by the university's vice president for information technology indicated that the intruders appeared to be seeking "access to other campus systems rather than specific data," but the message warned that the information the hackers obtained could be used for identity theft. George Mason had ended its practice of putting Social Security numbers on ID cards, replacing them with university-generated numbers, in response to a Virginia state law that required such a change. The university maintains a database, however, that includes Social Security numbers. University officials discovered the intrusion on January 3 and said the hackers gained access to records of more than 30,000 faculty, staff, and students.

EDUPAGE; http://online.wsj.com/article/0,,SB110566157500825906,00.html

APPLE SUES HARVARD STUDENT

Apple Computer has filed a lawsuit against the operator of a Web site that revealed information about upcoming products before the company publicly unveiled them. The ThinkSecret Web site posted rumors of a sub-$500 Macintosh computer and an iPod that uses flash memory just days before those products were announced at the Macworld show. Apple has a reputation for being one of the most secretive high-tech companies concerning new products, and it alleges that the information posted by ThinkSecret was obtained illegally. The operator of the site, however, which many industry analysts regard as one of the premier rumor sites about Apple, turned out to be 19-year-old Nick Ciarelli, a freshman at Harvard. Ciarelli, who started the site six years ago, said he has done nothing wrong in collecting material to post. "My reporting practices are the same that any journalists use," he said. "I talk to sources, I confirm details, I follow up on tips and leads that I get." Intellectual-property attorney Robert E. Camors said it will be difficult for Apple to prove harm in the case because the information revealed does not constitute trade secrets as traditionally defined and because the information was not revealed sufficiently ahead of company announcements for competitors to benefit from it.

HACKER EXPOSES ADMISSIONS RECORDS

A hacker who was able to access admissions records for dozens of business schools posted instructions online for how applicants could access those records. Among the universities whose records were exposed were Harvard University, Stanford University, Duke University, Carnegie Mellon University, and Dartmouth College. All of the affected schools use an online application and notification system called ApplyYourself. The vulnerability that allowed the unauthorized access has been fixed, but during the nine hours in which the systems were exposed, several hundred students attempted to find out if they had been accepted to schools to which they applied. Final decisions and notifications of acceptance are not expected for several more weeks. School officials have been able to identify at least some of the applicants who gained access to the records systems, and officials from some schools said such activity would factor into the admission decision. Steve Nelson of Harvard's MBA program said, "Hacking into a system in this manner is unethical and also contrary to the behavior we expect of leaders we aspire to develop." Even if a student saw a decision, said Nelson, that decision isn't final until March 30. San Jose Mercury News, 3 March 2005

EDUPAGE; http://online.wsj.com/article/0,,SB111029921614173536,00.html

HARVARD REJECTS APPLICANTS WHO PEEKED

Officials from the Harvard Business School said they will reject 119 applicants who used a hacker's instructions to try to find out whether they had been accepted by the school. Calling the action "unethical" and saying that it cannot be rationalized, a statement from Harvard said, "Any applicant found to have done so will not be admitted to this school." Administrators at Carnegie Mellon University have also said they will reject candidates who attempted to gain unauthorized access to admissions records. Applicants to several other institutions affected--including Stanford University, Duke University, and Dartmouth College--will have to wait to find out how those schools decide to treat the situation. Using the instructions posted online by a hacker, applicants were able for a short period to use a name and password to access the admissions records. Institutions have been able to identify applicants who accessed admission records based on the name and password. For many who looked, there was no decision in the system, and school officials stressed that even if an applicant located an answer, those decisions were not necessarily final. Some have criticized Harvard officials for responding too harshly to the incident. Wall Street Journal, 8 March 2005 (sub. req'd)

2005-03-09 **hacker penetration publisher database Reed Elsevier personal information disclosure FBI US Secret Service**

EDUPAGE; http://news.com.com/2100-1029_3-5605736.html

HACKERS COMPROMISE PUBLISHER'S DATABASE

Hackers compromised a database owned by publisher Reed Elsevier, gaining access to names, addresses, Social Security numbers, and driver's license numbers of about 32,000 individuals. Other information, including credit history and financial data, was reportedly not involved. The breach happened at Seisint, a data-collection company that the publisher bought last year. Seisint is a competitor to ChoicePoint, which recently reported an incident in which hackers accessed records on 145,000 individuals. According to officials at Reed Elsevier, the fraud came to light when a billing complaint from a customer showed unauthorized activity with a user name and password. Reed Elsevier is contacting the individuals affected and working with the FBI and the Secret Service to locate the hackers. CNET, 9 March 2005

SCHOOLS CRITICIZED OVER REJECTION OF NOSY APPLICANTS

A number of business-school applicants who were rejected due to their looking at university admissions records online without authorization have spoken out against the universities' decision to exclude them. Carnegie Mellon University, Harvard University, and MIT have rejected the applications of 153 individuals who used a hacker's instructions to try to find out if they had been accepted. Although some applicants involved acknowledged that accessing the records was wrong, they contended that the actions do not constitute hacking and that the institutions have overreacted. One rejected applicant wrote a letter to Harvard, admitting a "lapse in judgment" but noting that he "wasn't trying to harm anyone and wasn't trying to get an advantage over anyone." Len Metheny, CEO and president of ApplyYourself, the software that all the affected schools used for applications, said the procedure to access the records was sufficiently complicated that anyone doing so would have to have known it was unauthorized. GEORGIA UNCOVERS MISUSE OF ONLINE PORTFOLIOS

After discovering files containing personal information on its e-portfolio system, officials at the University of Georgia are reviewing the institution's policies for online portfolios. A student in the university's New Media Institute--part of the school's journalism program--had used the e-portfolio system to store a list of names and credit card numbers on a university-owned server. Officials at the school are not sure how the student obtained the list, which came from a North Carolina company that sells pharmaceutical products online, or what the student intended to do with it. The server where the file resided was immediately taken down, and officials are now combing through the rest of the files before re-posting them, looking for any other inappropriate information. According to Scott Shamp, director of the New Media Institute, the incident has raised questions about how long and under what terms the university will offer online portfolio services to its students. Shamp, who expressed support for online portfolios, pointed to the possibility of third-party options to address concerns over liability for the institution. TUFTS DISCLOSES DATA BREACH

Officials at Tufts University have begun notifying 106,000 alumni that their personal information stored on a university computer may have been compromised. The problem occurred last fall, when university officials noticed unusually large amounts of information passing through the computer, which stored names, addresses, phone numbers, Social Security numbers, and credit card numbers. The problem does not affect current students or employees. According to Betsey Jay, director of advancement communications, no evidence has surfaced about who is responsible or that any of the information was misused. At the time, officials at Tufts saw no reason to notify those affected, but a flurry of recent incidents in which personal information was compromised, including one at Tufts's neighbor, Boston College, prompted the university to inform alumni about the problem. HUNDREDS OF TEXAS DRIVER'S LICENSES MAILED TO WRONG PEOPLE

An agency that warns Texans not to share personal information with strangers because of the risks of identity theft mistakenly mailed hundreds of driver's licenses to the wrong people. The Texas Department of Public Safety (DPS) blamed the mixup on a malfunctioning machine that was recently installed to sort licenses for mailing. Statewide, at least 500 to 600 people who applied for a license renewal or replacement in late March or early April instead received somebody else's card, said DPS spokesperson Tela Mange. A driver's license contains enough personal information for thieves to open up a line of credit or a bank account in that name, make long-distance phone calls or apply for a Social Security card, according to the Texas attorney general's office. Information on the license includes a full name, signature, birth date, height, eye color, address and a photograph. The driver's license number, assigned by DPS, is also used by many agencies to verify a person's identity. In the case of the mismailed licenses, no identity theft or other crime has been reported, Mange said. [Abstract by Peter Gregory]

CISCO PASSWORDS RESET AFTER WEBSITE EXPOSURE

Cisco Systems Inc. is resetting passwords for all registered users of its Cisco.com Website after discovering a vulnerability in its search engine software that left user passwords exposed, the company said Wednesday, August 3. The passwords are used by Cisco customers, employees and partners who have registered on the Website to get access to special areas of the site or to receive e-mail alerts, said Cisco spokesperson John Noh. Cisco was made aware of the problem early Monday and corrected it immediately, Noh said. As a precaution, the company is now in the process of sending out new passwords to all registered users of Cisco.com, who will be unable to access password-protected areas until they receive their new passwords, Noh said. Noh could not say how long it will take to send out all of the new passwords. The vulnerability could not be exploited to gain access to sensitive information like Cisco's source code, he said. "We do not believe any sensitive data were compromised as a result of this."

2000-03-17 **data theft credit card fraud**

NewsScan

In January 1999, a computer vandal stole information on 485,000 credit cards from an e-commerce site and then secretly stored them in a database on a U.S. government agency's Web site. Although the theft was discovered last March (1999) when a government administrator noticed that "a lot of the memory (on the Web site) was chewed up for no reason, so he checked and found the file (containing the stolen data)," many of the credit cards remain in use today because credit card companies and card-issuing credit unions decided that it would be too much trouble to shut down the accounts and issue new numbers, according to an unnamed source. There is no evidence that the any of the cards have been used to commit fraud, and Secret Service spokesman Jim Macken says investigations point to an Eastern European perpetrator. It's unclear why the data were deposited on a government Web site, although Macken suggests that it may be the online equivalent of thumbing one's nose at U.S. authorities. Later the same day, the Secret Service announced that it had tracked down a foreign criminal reponsible for the theft of the credit card information and the misuse of government computer resources. Negotiations were in progress for extradition of the suspect. MSNBC claimed that some of the cards had in fact been used for fraud.

LYRIS LISTS TARGETED FOR SPAM
Lyris Technologies, an e-mail list management company, says it's received reports that some of its customers' mailing lists may have been compromised. The company says it's looking into spam complaints that may involved hundreds of thousands of list subscribers, and has hired an outside consulting firm to sort through the evidence. It's also investigating whether a disgruntled employee might have stolen its lists. "In the envelope world of marketing, lists are routinely stolen by employees that are moving to another company," says Jason Catlett, president of Junkbusters, who notes that spammers especially covet lists of validated e-mail addresses belonging to a targeted group. "I don't have any evidence that that happened in this case, but it's happened in the offline world, and it wouldn't be implausible if it happened online." (CNet News.com 11 Sep 2002)

RISKS; http://www.securityfocus.com/news/7697 23 8

Chats led to Acxiom hacker bust

Kevin Poulsen, SecurityFocus, 19 Dec 2003:

A Cincinnati man who plead guilty Thursday to cracking and cloning giant consumer databases was only caught because he helped out a friend in the hacker community. Daniel Baas, 25, plead guilty on 18 Dec 2003 to a single federal felony count of "exceeding authorized access" to a protected computer for using a cracked password to penetrate the systems of Arkansas-based Acxiom Corporation -- a company known among privacy advocates for its massive collection and sale of consumer data. The company also analyzes in-house consumer databases for a variety of companies. From October 2000 until June 2003, Baas worked as the system administrator at the Market Intelligence Group, a Cincinnati data mining company that was performing work for Acxiom. As part of his job, he had legitimate access to an Acxiom FTP server. At some point, while poking around on that server, he found an unprotected file containing encrypted passwords. Some of those passwords proved vulnerable to a run-of-the-mill password cracking program, and one of them, "packers," gave Baas access to all of the accounts used by Acxiom customers -- credit card companies, banks, phone companies, and other enterprises -- to access or manage consumer data stored by Acxiom. He began copying the databases in bulk, and burning them onto CDs. …

2004-02-13 **ATM automated teller machines banks card number PIN theft reader radio**

RISKS; http://www.utexas.edu/admin/utpd/atm.html 23 19

INTERESTING DEVICE TO STEAL ATM ACCOUNTS

A team of organized criminals is installing equipment on legitimate bank ATMs in at least 2 regions to steal both the ATM card number and the PIN. The team sits nearby in a car receiving the information transmitted wirelessly over weekends and evenings from equipment they install on the front of the ATM (see photos). If you see an attachment like this, do not use the ATM and report it immediately to the bank using the 800 number or phone on the front of the ATM.

The equipment used to capture your ATM card number and PIN is cleverly disguised to look like normal ATM equipment. A "skimmer" is mounted to the front of the normal ATM card slot that reads the ATM card number and transmits it to the criminals sitting in a nearby car. At the same time, a wireless camera is disguised to look like a leaflet holder and is mounted in a position to view ATM PIN entries.

The thieves copy the cards and use the PIN numbers to withdraw thousands from many accounts in a very short time directly from the bank ATM.

2004-05-06 **skimming fraud identity theft**

DHS IAIP Daily;
http://www.epaynews.com/index.cgi?survey=&ref=browse&f=view&
id=108384268562221521 2&block=

May 06, ABC News — Skimming devices implanted in Florida gas pumps.

Credit and debit cardholders in Collier County, FL, have been defrauded out of almost $500,000 since last October, by criminals who are using card skimmers inside gas pumps to make counterfeit cards for fraudulent purchases. Gas pumps are susceptible to fraud in that they can be opened with a generic key, or a screwdriver, and a skimming device can quickly be attached to the payment hardware inside the pump. By this means, the thieves obtain all the details for counterfeiting cards, namely card numbers and PINs, which can be sold over the Internet for $20 to $100 per card. Debit cards, which link directly to consumers' bank accounts, are particularly vulnerable to cloning, as the bank account can be drained while the card is still in the cardholder's possession, and banks may need convincing that the fraud actually happened. South Florida's transient population makes it a target for card thieves, and to this end, some gas stations are asking card-paying customers to provide their zip code as an additional means of verification.

2004-05-17 **Cisco networking source code leak data theft**

DHS IAIP Daily; http://news.com.com/2100−7349−5213724.html

May 17, CNET News.com — Cisco investigates source code leak.

An unspecified amount of the proprietary source code that drives Cisco Systems' networking hardware has appeared on the Internet, the technology giant acknowledged early Monday, May 17. News of the latest source code leak appeared on a Russian security site, SecurityLab.ru, on Saturday, May 15, two days after its administrators received the leaked source code. According to SecurityLab.ru, online vandals had compromised Cisco's corporate network and stolen about 800MB of source code. A person with the alias "Franz" bragged about the intrusion and posted about 2.5MB of code on the Internet relay chat (IRC) system not long after the alleged break-in. "Cisco is aware that a potential compromise of its proprietary information occurred and was reported on a public Web site just prior to the weekend," said Jim Brady, a spokesman for the company. "The Cisco information security team is looking into this matter and investigating what happened." Brady could give no further details on the matter. This is the second time this year that a major technology company's product source code has been made public without authorization. It's uncertain to what degree the leaked code will affect Cisco security.

CISCO INVESTIGATING SOURCE CODE THEFT

Cisco has launched an investigation into "a potential compromise" of its intellectual property, a company official says, following reports that some versions of its IOS had been stolen by an individual who broke into the company's corporate network. Terry Alberstein, director of corporate affairs for the Asia-Pacific, said the alleged break-in was not due to any vulnerabilities in Cisco equipment, software or services. He said the company had been made aware of the issue before the weekend, after a report appeared on the Russian security news portal, securitylab.ru. The report said an individual had broken into Cisco's corporate network and stolen the source code for IOS 12.3 and 12.3t. Version 12.3 is used across the Internet's main backbone. The individual who claimed to have accessed Cisco System's corporate network, boasted about it on an underground Internet relay chat channel, claiming that the total amount of data in the archives was around 800 megabytes. Two snippets of code were provided as proof of the claims. (The Age 18 May 2004) rec'd from John Lamp, Deakin U.

2004-09-01 **portable handheld digital assistant PDA computer security theft loss encryption confidential data**

DHS IAIP Daily; http://www.theregister.co.uk/2004/09/01/pda_sec/

September 01, The Register — PDA security still dismal.

Worker apathy about PDA security is putting corporate data in jeopardy. The storage of the names and addresses of corporate customers on PDAs is now common - but security practices are struggling to keep up with technology usage. Two thirds of users do not use any kind of encryption to protect confidential data on mobile devices, according to a survey commissioned by Pointsec Mobile Technologies and Infosecurity Europe. The Mobile Vulnerability Survey 2004 found that a third of users do not even use password protection on their devices, leaving the information vulnerable to opportunists, hackers or competitors. The survey findings show that one of the fastest and easiest ways to access corporate data is through unprotected PDAs that are lost or stolen, as they contain business names and addresses, spreadsheets and other corporate documents. One in eight (13 percent) of respondents to the survey have lost their mobile device.

2001-10-08 **covert channel confidentiality e-mail appropriate use spreadsheet ignorance novice user awareness education training Excel spreadsheet paste unformatted**

RISKS 21 69

Will Middelaer noted another risk from Excel and Outlook that creates a covert channel for inadvertent data disclosure. Writing in RISK, he recounted how he and a colleague were puzzled at the size and lengthy opening of a simple e-mail message "composed of one short sentence of plain text followed by (what I thought was) a two column by ten row grid of excel cells. I put the cells into the e-mail by highlighting them in Excel, then copying and pasting them into an e-mail. What I did not know was that the e-mail message actually contained the entire 12,000 plus cells of the spreadsheet including formatting and formulas. Though it appears to contain only the 20 cells that I intended to send him, double clicking the cells in the e-mail launched Excel, which opened with a complete version of the spreadsheet from which I had selected the cells to send him. The only piece of information missing seems to be the name of the file, as it opens with a generic name."

A later posting indicated that this is a feature, not a bug: it's in the Microsoft Knowledge Base, where the text reads, "This is by design. . . ."

[MORAL: use PASTE UNFORMATTED or PASTE PICTURE when trying to send only an excerpt from an Excel spreadsheet.]

LED LIGHTS CAN REVEAL COMPUTER DATA
Scientists in the U.S. and the U.K. have found a way to remotely eavesdrop on a computer by monitoring the flashes of LED lights on electronic devices. Optical signals from the light-emitting diode lights found in computer modems and keyboards can be captured with a telescope and processed to reveal all the data passing through the device, says Joe Loughry, a computer programmer at Lockheed Martin. "It requires little apparatus, can be done at a considerable distance, and is completely undetectable. In effect, LED indicators act as little free-space optical data transmitters, like fiber optics without the fiber." Loughry says the most vulnerable devices are equipment used in low-speed, long-distance networks, such as ATMs (automatic teller machines). Corporate LANs and home Internet connections are generally not susceptible to the spying technique. Loughry says his interest in LEDs dates back to his days in graduate school: "I was working very late one night and waiting for a long file transfer to complete and I was just staring at these lights on the front of the modem and started to wonder if there was anything there." Loughry recommends locating equipment away from windows, putting black tape over the LEDs or deactivating when not in use. (Reuters 7 Mar 2002)
http://story.news.yahoo.com/news?tmpl=story&cid=581&u=/nm/20020307/tc_nm/tech_snooping_dc_1

* * *

A vigorous discussion in RISKS poured scorn on the notion that data could be read at any but very slow transfer rates from LEDs; correspondents noted that LEDs have a long persistence phase that would grossly swamp the fluctuations of any but glacially slow transfers. Commentators relegated the claims to the FUD (fear, uncertainty and doubt) bin and recalled seeing similar discussions in the alt.folklore.computers USENET group. on the other hand, some correspondents did recount personal involvement in successful data transfer experiments using diodes and light pens that were used for debugging systems.

2003-11-14 **meta data dodgy-dosier syndrome Workshare hidden history histories information**

NewsScan

DODGING THE 'DODGY-DOSSIER SYNDROME' PROBLEM
Ninety percent of business documents are adapted from other documents, but 68% of the people doing the adapting don't know that the revised versions often contain metadata that identify the source documents, according to a study by UK software firm Workshare. The phenomenon has been dubbed "the dodgy-dossier syndrome" after the infamous UK government report on Iraq's alleged weapons of mass destruction program, a significant portion of which was found to have been copied from a 12-year-old thesis written by a PhD candidate. "There are inherent dangers due to document metadata, which identifies the historical changes within a document, author histories and document origins," says Workshare in its report. "Awareness of the term 'metadata' is low and fewer still know of its dangers." Exacerbating the problem of document adaptation is "document anarchy" — which describes the lack of standard practice in the workplace for contributing to or giving feedback on a document. "More business users are contributing to shared documents than ever before," says Workshare European VP Andrew Pearson, "and companies are losing control of what happens inside the process. Changes in the way organizations work have made this problem more acute in recent years with restructuring and flattening of the organization (bringing) these problems to the fore." (ZDNet UK 14 Nov 2003)

2005-03-01 **data leakage device recognition clock skews**

RISKS; http://www.cse.ucsd.edu/users/tkohno/papers/PDF/ 23 77

COMPUTER CLOCK CHARACTERISTICS ALLOW TCP/IP DEVICE IDENTIFICATION

Tadayoshi Kohno wrote:

Together with Andre Broido and kc claffy from CAIDA, I have been working on methods for remote physical device fingerprinting, or remotely fingerprinting a physical device without any modification to or known cooperation from the fingerprintee. At a high level, our fingerprinting techniques exploit microscopic deviations in device hardware: clock skews. At a low level, our preferred technique exploits the fact that most modern TCP stacks implement the TCP Timestamps Option (RFC 1323). When this option is enabled, outgoing TCPs packets leak information about the sender's clock. This work further supports the following well-known observation: there can be security relevant information in what one might traditionally consider to be noise.

In a follow-up posting by Markus Roth in RISKS 23.80, he clarifies the precision of this kind of identification; the following is an excerpt from a much longer text:

>The authors claim that their method will allow you to learn 6 bits of information about a device. Well, 2^6 is only 64 different devices. If there are 200 million computers on the Internet, their method would divide the world into 64 groups of 3 million computers each. Your computer would look identical to 3 million other computers!

This technique would be useful to show negative but not positive results. If a laptop in Berlin gives a skew value of 26 microseconds, you can conclude that it is a different laptop than the one in New York. But if an arbitrary laptop in Berlin shows a 45 microsecond skew, you can only say that there are 3 million other computers like it. You cannot conclude that it is the same laptop that was once in New York.<

DATA LEAKAGE VIA SPREADSHEET SENT BY E-MAIL

Westpac…, a large Australian bank, was forced to halt trading on its shares and deliver its annual profit briefing a day early after it accidentally sent its results by email to research analysts.

A template containing past results was sent to analysts. It was soon discovered that the new figures were embedded in the spreadsheet and were accessible with via "a minor manipulation". Analysts telephoned the bank to report the error and the template was recalled.

But the damage was done. The Australian Stock Exchange was notified and trading was suspended as it appeared that some people had access to information not generally available to the market. The bank then brought forward its results announcement.

[Summary contributed by David Shaw]

Patrick O'Beirne reported that it appears that the critical data were "obscured" by using black shading on the cells involved (!).

Westpac Chief Financial Officer, Philip Chronican, said there was no evidence that the figures had been circulated and there were no signs of disorderly trading in Westpac shares. He added: "It is not just one error, it is a compounding of two or three errors ... We will obviously be conducting a full inquiry to make sure it doesn't happen again."

PDF FILES MAY CARRY HIDDEN IMAGES

A colleague recently provided me with a PDF of a presentation he created using Keynote on a Macintosh. I needed to use some photographs from that document in a presentation of my own, so I used pdfimages, a public-domain tool, to extract them. Imagine my surprise when I discovered several images that were not apparent in the original, including logos for Yahoo and MSN, a snapshot of a commercial Web page, and a photograph of some former students.

I have not experimented with random files from the Web, so I don't know what tool is responsible for inserting the inadvertent images in the file, although it seems to be a classic case of using an existing document as a template for a new one. Clearly, however, PDF documents are capable of carrying images that are not visible to the casual user, and thus risk leaking information in the same way as Microsoft Word and Powerpoint.

12.1 Wiretapping

Category 12.1 Wiretapping

1997-01-16 **wiretaps law enforcement rules proposal**

EDUPAGE

EDUPAGE reports: >The Federal Bureau of Investigation has released for public comment a new proposal for facilitating tapping of digital phone calls by law enforcement officials armed with court orders. Under the new proposal, which is significantly more modest than what the Bureau had asked for in a earlier plan, law enforcement officials would operate under a formula in which (for example) 523 phone lines could be monitored simultaneously in a place such as Manhattan. Privacy advocates oppose the FBI's plan as an unacceptable expansion of electronic surveillance. (New York Times 15 Jan 97 A8)<

1997-05-29 **wiretapping eavesdropping privacy telephones government investigation**

Reuters

Government officials in Lebanon acknowledged for the first time that cellular phones and land lines were being systematically y tapped and the findings being distributed within the government. A parliamentary committee was formed to investigate the situation.

Category 12.1 Wiretapping

1997-07-17 **wiretap eavesdropping**

EDUPAGE

In July 1997, the telephone industry protested against FBI plans to allow continued wiretapping of conference calls even after the target leaves the conference call. The EDUPAGE editors wrote, "Arguing that the FBI's requests for expanded wiretap capabilities go beyond that agency's authority, telephone industry officials are asking the Federal Communications Commission to help them resist the FBI's proposed digital phone design, which would allow law enforcement officials to continue the wiretapping of a conference call even after the person targeted by a court-authorized wiretap drops out of the call. The phone industry claims the request would cost billions of dollars to implement and would expose it to lawsuits by civil liberties groups fighting against privacy invasions."

Category 12.1 Wiretapping

1997-08-08 **FBI wiretap warrant surveillance Internet phone**

Inter@ctive Week Online

Law enforcement agencies have long been able to obtain a tap-and-trace authorization from any local U.S. attorney. However, to be able to install a wiretap that would allow monitoring of conversations requires police to obtain authorization from a judge. As phone companies move towards sending speech over the Internet, tap-and-trace orders can actually provide full access to conversations being sent over the Net. Civil libertarians are concerned about a possible abuse of privacy; the Center for Democracy and Technology (CDT) and the Electronic Frontier Foundation (EFF) have both expressed concerns to the Federal Communications Commission. The ACLU is also concerned about the FBI's new wiretap policy.

DETECTING CELL PHONES USED AS BUGGING DEVICES
An Israeli company has developed a device that can detect when a room is being bugged by a modified cell phone, which an intruder could call from anywhere in the world without it emitting a ringing tone. The phone's screen remains blank and it appears to be turned off. A co-designer of the device says, "The beauty of the cell phone as a bug is that it's an innocent looking and ubiquitous object. People trust cell phones, but modified and left in idle mode the cell phone can be used as a transmitter for up to a week. If it's connected to a power supply it can provide endless intelligence. Professional bugsweepers will ignore the cell phone frequency since the phones are so common and not suspicious." (Reuters 11 Jun 2002)

2005-11-30 **wiretapping unreliable study law enforcement warrants implications Matt Blaze**

RISKS; http://www.iht.com/articles/2005/11/30/business/taps.php 24 11

STUDY: WIRETAPPING NOT RELIABLE

A _New York Times_ article discussed a study about the flaws of wiretapping done by Matt Blaze, a professor at the University of Pennsylvania. The study found that, using off-the-shelf equipment, it was possible to subvert law enforcement and other wiretapping by stopping the recorder remotely and falsifying the numbers dialed. Prof. Blaze noted, "This has implications not only for the accuracy of the intelligence that can be obtained from these taps, but also for the acceptability and weight of legal evidence derived from it".

The original article includes the following interesting detail (quoted):

* According to the Justice Department's most recent wiretap report, state and U.S. Courts authorized 1,710 "interceptions" of communications in 2004.

* To defeat wiretapping systems, the target need only send the same "idle signal" that the tapping equipment itself sends to the recorder when the telephone is not in use. The target could continue to have a conversation while sending the forged signal.

* The tone, also known as a C-tone, sounds like a low buzzing and is "slightly annoying," Blaze said, "but would not affect the voice quality" of the call."

12.2 Interception

Category 12.2 Interception

1997-02-06 **cellular eavesdropping scanners**

AP

Rep. Billy Tauzin, a Congressman from Louisiana, demonstrated to the House Commerce Telecommunications Subcommittee that an off-the-shelf police-frequency scanner can be modified to capture cellular phone calls in two minutes using a soldering iron and a two-inch wire. He then showed on the spot that the modified scanner could pick up a conversation between a cell-phone user and a regular telephone. The subcommittee is studying proposals to toughen enforcement of the law sponsored in 1992 by Rep. Edward Markey of Massachusetts that makes interception of cellular phone calls illegal and bans importation of foreign-made scanners capable of picking up these calls. The law also makes it illegal to sell scanners that can be altered easily to intercept cell- phone calls. Representatives of the Personal Communications Industry Association and the Cellular Telecommunications Industry Association argued that current laws, as written, are unenforceable and urged new approaches to protect privacy of wireless communications and that would include emerging technologies.

Category 12.2 Interception

1997-04-23 **Eavesdropping cellular phone mobile ECPA criminal prosecution interception**

RISKS; UPI, AP 18 75

Newt Gingrich's cell phone calls were overheard in December 1996 by a Florida couple using a radio scanner in their car. Gingrich was overheard "plotting strategy on how to deal with his ethics problems and possible attacks from opponents. This despite his promise, made the same day to the ethics subcommittee by his laywer, that he would not use his office or his allies to orchestrate a counter-attack to the charges." The snoopers brought their tape to the senior Democrat on the Congressional ethics committee; somehow a copy of the tape came into the possession of the New York Times, which published a report that caused much annoyance to all concerned. Republicans called foul, pointing out that such eavesdropping is explicitly illegal according to federal wiretapping statutes. In federal court in April 1997, John and Alice Martin were charged with wiretapping and faced fines of $5,000 each.

Sun Valley, ID uses a computer-based identification and authorization system using a computer-generated pass with a bar code, radio-linked scanners and computers, and so on. The system works very well. Unfortunately, after a hard disk crash in mid-December 1997, the operators found that — surprise — they had no backups for the data they lost. Thousands of users were asked to re-register with the area.

Category 12.2 Interception

1998-02-13 **RFI EMI radio-frequency interference TEMPEST eavesdropping**

RISKS 19 59

In February 1998, Martin Kuhn and Ross Anderson described a new method of using software to prevent eavesdropping via radio-frequency emissions. Ross Anderson explained in a posting to the UKCRYPTO mailing list,

>The story is as follows. Bill G gave our department $20m for a new building, and his people said that what they really wanted from our group was a better way to control software copying. So it would have been rather churlish of us not to at least look at their `problem'.

Now the `final solution' being peddled by the smartcard industry (and others) is to make software copying physically impossible, by tying program execution to a unique tamper-resistant hardware token. We wouldn't like to see this happen, and we have already done a lot to undermine confidence in the claims of tamper-proofness made by smartcard salesmen.

So Markus and I sat down and tried to figure out what we could do for the Evil Empire. We concluded that

(1) large companies generally pay for their software;
(2) if you try to coerce private individuals, the political backlash would be too much; so
(3) if the Evil Empire is to increase its revenue by cracking down on piracy, the people to go after are medium-sized companies.

So the design goal we set ourselves was a technology that would enable software vendors to catch the medium-sized offender - the dodgy freight company that runs 70 copies of Office 97 but only paid for one - while being ineffective against private individuals.

We succeeded.

In the process we have made some fundamental discoveries about Tempest. Army signals officers, defence contractors and spooks have been visibly flabberghasted to hear our ideas or see our demo.

In the old days, Tempest was about expensive hardware — custom equipment to monitor the enemy's emissions and very tricky shielding to stop him doing the same to you. It was all classified and strictly off-limits to the open research community.

We have ended that era. You can now use software to cause the eavesdropper in the van outside your house to see a completely different image from the one that you see on your screen. In its simplest form, our technique uses specially designed `Tempest fonts' to make the text on your screen invisible to the spooks. Our paper tells you how to design and code your own.

There are many opportunities for camouflage, deception and misconduct. For example, you could write a Tempest virus to snarf your enemy's PGP private key and radiate it without his knowledge by manipulating the dither patterns in his screen saver. You could even pick up the signal on a $100 short wave radio. The implications for people trying to build secure computer systems are non-trivial.

Anyway, we offered Bill G the prospect that instead of Word radiating the text you're working on to every spook on the block, it would only radiate a one-way function of its licence serial number. This would let an observer tell whether two machines were simultaneously running the same copy of Word, but nothing more. Surely a win-win situation, for Bill and for privacy.

But Microsoft turned down our offer. I won't breach confidences, but the high order bit is that their hearts are set on the kind of technology the smartcard people are promising - one that will definitively prevent all copying, even by private individuals. We don't plan to help them on that, and I expect that if they field anything that works, the net result will be to get Microsoft dismembered by the Department of Justice.

Meantime we want our Soft Tempest technology to be incorporated in as many products as possible - and not just security products!

So to Rainier Fahs, who asked: "If these rumors are true, I guess we will face a similar discussion on
free availability in the area of TEMPEST equipment. Does privacy protection also include the free choice of protection mechanism?"

I say this: our discovery, that Tempest protection can be done in software as well as hardware, puts it beyond the reach of effective export control. So yes, you now have a choice. You didn't before.<

See <http://www.cl.cam.ac.uk/~mgk25/ih98-tempest.pdf> for full details.

2004-08-24 **wiretapping prosecution trial**

NYT http://www.nytimes.com/2004/08/24/national/24tape.html?th

Back in 1996, Alice and John Martin illegally intercepted and recorded a cellular phone call involving Newt Gingrich (at that time Speaker of the House). The couple were fined $500 each for their ctrime. They gave their tape to Rep. Jim McDermott (D-WA), who cheerfully handed it over to the New York Times and the Atlanta Journal-Constitution. In August 2004, a judge finally ruled in a civil suit brought against Rep. McDermott by Rep. John Boehner (R-OH), who had been involved in the call. The judge ruled that Rep. McDermott has violated federal wiretap laws by passing on the tape.

Adam Liptak, writing in the New York Times, wrote an analysis of the legal issues involved:

"The wiretap law makes the knowing disclosure of an illegally intercepted communication both a crime and the basis for a civil lawsuit.

In 2001, however, the Supreme Court ruled that the law was unconstitutional, at least when used to punish disclosure of information about matters of public concern by people who did not themselves participate in obtaining it unlawfully.

`A stranger's illegal conduct does not suffice to remove the First Amendment shield from speech about a matter of public concern,' Justice John Paul Stevens wrote for the majority.

Judge Hogan said that decision did not protect Mr. McDermott because `he knew of the illegality of the Martins' disclosure at the time he voluntarily accepted it.'

That distinction, experts in First Amendment law said, is novel and at odds with the conventional understanding of the Supreme Court's decisions in this area."

2005-08-09 **bluetooth wireless communications insertion attack automobile car radio fraud fake message alerts**

RISKS; http://trifinite.org/trifinite_stuff_carwhisperer.html 24 01

INJECTION ATTACKS ON CAR AUDIO

Martin Herfurt of the Car Whisperer project created a proof-of-concept device called "Car Whisperer" that allows hackers to inject audio into Bluetooth-equipped vehicles. Part of the summary is as follows:

>The carwhisperer project intends to sensibilise manufacturers of carkits and other Bluetooth appliances without display and keyboard for the possible security threat evolving from the use of standard passkeys.

A Bluetooth passkey is used within the pairing process that takes place, when two Bluetooth enabled devices connect for the first time. Besides other public data, the passkey is a secret parameter used in the process that generates and exchanges the so-called link key. In Bluetooth communication scenarios the link key is used for authentication and encryption of the information that is exchanged between the counterparts of the communication.

The cw_scanner script is repeatedly performing a device inquiry for visible Bluetooth devices of which the class matches the one of Bluetooth Headsets and Hands-Free Units. Once a visible Bluetooth device with the appropriate device class is found, the cw_scanner script executes the carwhisperer binary that connects to the found device (on RFCOMM channel 1) and opens a control connection and connects the SCO links.

The carwhiperer binary connects to the device found by the cw_scanner. The passkey that is required for the initial connection to the device is provided by the cw_pin.pl script that replaces the official Bluez PIN helper (graphical application that usually prompts for the passkey). The cw_pin.pl script provides the passkey depending on the Bluetooth address that requests it. Depending on the first three bytes of the address, which references the manufacturer, different passkeys are returned by the cw_pin.sh script. In quite a few cases the preset standard passkey on headsets and handsfree units is '0000' or '1234'.

Once the connection has been successfully established, the carwhisperer binary starts sending audio to, and recording audio from the headset. This allows attackers to inject audio data into the car. This could be fake traffic announcements or nice words. Attackers are also able to eavesdrop conversations among people sitting in the car.<

Herfurt adds, "In order to avoid getting attacked by carwhisperer, manufacturers should not use standard passkeys in their Bluetooth appliances. Moreover, there should be some kind of direct interaction with the device that allows a device to connect. Another recommendation would be to switch the handsfree unit to invisible mode, when no authorized device connects to it within a certain time."

1997-06-26 **fraud identification authentication diddling sabotage**

AP

An employee of the San Mateo County District Attorney's office was accused of conspiring to have his boss, Ralph Minow, fired from his job. Paul Schmidt is accused of planting a logic bomb in his boss' computer using a fake time-stamp to make it look as if Minow had caused his own computer to crash on 97.03.26. Minow was unable to exculpate himself because the backup tapes he looked for were gone. Minow was fired and told he would be prosecuted for sabotage. However, computer security specialists noticed that one of the printouts presented as incriminating evidence of Minow's depredations had a logoff message of "Good evening" even though Schmidt claimed to have printed them in the morning. Close investigation revealed audit trails on the computer showing that someone had set the clock back to the 25th and then back. Schmidt was fired and filed a wrongful dismissal lawsuit, claiming that he was an innocent whistle-blower being persecuted for his efforts.

1997-09-11 **SSN impersonation social engineering authentication verification QA quality assurance**

RISKS; AP 19 39

It is so easy for the Social Security Administration to accept death reports that someone has died that mischief-makers can easily ruin someone life if they haven't died. In Overland Park, KS Ms Kirsten Phillips was reported dead to the SSA by a non-existent brother-in-law. One week later, she was electronically revived, but by then the damage was done: government payments stopped, direct withdrawals by the government from her bank accounts, cancelled credit cards — a real mess. [SSA regulations ought to require at least one independent verification of reported death — by calling the purportedly deceased person, for instance, or requiring official documentation from a government source.]

1997-10-24 **data diddling theft debit card bank e-commerce**

RISKS 19 42

Benoit Lavigne, writing in RISKS, reported on a curious case of data diddling. It seems that thieves broke into a picture-framing business at three in the morning on the night of Friday to Saturday. Using ten bank debit cards, the thieves instituted ten debit corrections to "refund" a total of $240,000 into their accounts from the business. The theft was bad enough, but the bank took over two weeks to reinstate the merchant's account's. One of the key vulnerabilities at the merchant's site was that the staff left a special card required to initiate transactions in the cash register. In addition, Lavigne commented, there ought to have been some mechanism on the bank side to identify the thoroughly unusual pattern of transactions and either queried them or stopped them while awaiting confirmation.

2000-01-28 **quality assurance financial systems data diddling Web**

NewsScan, ZDNet
http://205.181.112.101/zdnn/stories/bursts/0,7407,2429909,00.html

As financial institutions continue to develop online innovations, . . . electronic banking got some bad news when it was discovered that the software used by the online X.Com Bank allowed customers to transfer funds from the account of any person at any U.S. bank. All they had to know was the person's account number and bank routing information. According to the company, the dollar amounts involved in fraudulent transfer were "not significant," and the security flaw has now been corrected. But security expert Elias Levy says, "Anyone with half a clue could perform these unauthorized transfers for over a month via their Web site and create some real financial problems for other people." The company's Web site boasts that its use of technology "makes accessing and moving your money easy." (New York Times 28 Jan 2000)

2001-11-26 **embezzlement stock fraud accountants data diddling theft trial guilty plea bargaining sentencing fines imprisonment**

RISKS; US Department of Justice 21 82
http://www.cybercrime.gov/Osowski_TangSent.htm

The <www.cybercrimes.gov> Web site of the US Department of Justice announced "Former Cisco Systems, Inc. Accountants Sentenced for Unauthorized Access to Computer Systems to Illegally Issue Almost $8 Million in Cisco Stock to Themselves." Highlights of the press release:

* ". . . [F]ormer Cisco Systems, Inc., accountants Geoffrey Osowski and Wilson Tang were each sentenced . . . [on 26 Nov 2001] to 34 months in prison for exceeding their authorized access to the computer systems of Cisco Systems in order to illegally issue almost $8 million in Cisco stock to themselves."

* ". . .[In] plea agreements with the government, Mr. Osowski and Mr. Tang each pled guilty to one count of computer fraud in violation of Title 18, United States Code, Section 1030(a)(4), agreed to the forfeiture of assets that the government had seized from the defendants (including stock already liquidated for $5,049,057, jewelry and an automobile), and agreed to pay restitution in the amount of the difference between $7,868,637 and the amount that the government will recover from the sale of the seized items."

* "In pleading guilty, Mr. Osowski and Mr. Tang admitted that between October 2000 and March 27, 2001, they participated together in a scheme to defraud Cisco Systems in order to obtain Cisco stock that they were not authorized to obtain. As part of the scheme, they exceeded their authorized access to computer systems at Cisco in order to access a computer system used by the company to manage stock option disbursals, used that access to identify control numbers to track authorized stock option disbursals, created forged forms purporting to authorize disbursals of stock, faxed the forged requests to the company responsible for controlling and issuing shares of Cisco Systems stock, and directed that stock be placed in their personal brokerage accounts. The two defendants admitted that the first time that they did this, in December 2000, they caused 97,750 shares of Cisco stock to be placed in two separate Merrill Lynch accounts, with 58,250 of the shares deposited in an account set up by Mr. Osowski and 39,500 shares deposited in an account set up by Mr. Tang. In February 2001, they caused two additional transfers of stock, in amounts of 67,500 shares and 65,300 shares, to be transferred to brokerage accounts in their names. The total value of the Cisco stock that they took on these three occasions (at the time that they transferred the stock) was approximately $7,868,637."

2004-05-11 **hacker grade california high school student change grades data**

NewsScan

STUDENT HACKER 'MAKES THE GRADE'

A 17-year-old California high school student has been arrested and accused of a felony for allegedly hacking into his school's computer system and changing grades. The arrest came one week after school officials notified police of suspicious grade changes in the academic records of six juniors and one senior. Police Sgt. Steve Shulman says the investigation is continuing because "there may very well be other students involved." Administrators at Corona del Mar High School are examining the records of all 1,500 students to see if any other grades were altered. The charge against the student — "unauthorized alteration of computerized data" — carries a prison sentence of up to three years, but juvenile court officials and prosecutors have not yet decided whether to pursue charges in the case. A spokeswoman for the Newport-Mesa Unified School District says it appears that the records were accessed from a remote location — something that supposedly was not possible — and that the perpetrator was able to circumvent the password authorization feature: "We're upset that we were compromised and we're saddened that these students, who are obviously pretty smart, would use their intelligence for this. We're in a new age. We know that kids will find out what they can do, but we need to be clear that this is illegal — that it's not a game." (Los Angeles Times 11 May 2004)

1997-09-03 **data error QA quality assurance**

Knight-Ridder Newspapers

Lois Gates was surprised to discover in August 1997 that according to the Social Security Administration, she died in June 1997. The hale 65-year old was even more dismayed to find that the SSA had taken money out of her account in restitution for "erroneous" payments. Once the story hit the news media, the snafu was on its way to being fixed within days.

Category 13.2 *Data corruption & destruction*

1998-04-09 **data corruption disaster backups overwriting destroyed**

RISKS 19 66

At the Stanford University Graduate School of Business, system administrators installed additional disk capacity to their servers. They then reloaded files from a corrupt backup tape on 7 Mar. The faculty and student files were destroyed, leaving many faculty members and graduate students without their research files. [This incident again demonstrates the importance of VERIFYING THE READABILITY of backups. It also strengthens my belief in the wisdom of making TWO backups before attempting to reload a system.]

Category 13.2 *Data corruption & destruction*

2000-01-23 **backup failure operations quality control data loss**

RISKS 20 76

Someone responsible for the US National Archives' e-mail system did not understand the concept of a backup. In 1999, it seems that a system problem deleted about 43,000 messages. The contractor responsible for making backups had not, in fact, been doing any. Finally, someone turned off system logging because it slowed down the system. The Assistant Archivist had a brilliant, if pessimistic, view of backups, saying, "the safest way to save important messages is to print them out".

Category 13.2 *Data corruption & destruction*

2000-03-12 **QA quality assurance audit trail investigation grades**

RISKS 20 84 & 86

Mark Lutton reported in RISKS on a week-long gefuffle at MIT, when the grades of 22 students in a cell biology class were randomly altered. Initial suspicions focused on hacking, and the teacher, Harvey Lodish, told his class on 2 March 2000 that he had uncovered a cheating scandal. On March 10, the Boston Globe reported that in fact a teaching assistant had sorted the student-name column but not all the other ones, thus failing to carry all the data through the sort. Lutton suggested, "It seems to me that bound paper ledger books would be a much better tool for keeping grade records, at least for this teacher and his assistants." [Some other ideas: (1) Enable the audit-trail feature (can create large files but does record all changes); (2) keep daily backups with version numbers so that a good version of the data can be located and used quickly.]

In a later issue of the RISKS Forum Digest (20.86), correspondents Tony Lima and John Pearson both pointed out that the fundamental problem was that the teaching team was using a spreadsheet to do a database's job. Spreadsheets have no mechanism for ensuring record integrity, whereas even simple databases can protect against the kind of scrambling that occurred in this example.

2001-08-07 **data destruction downtime availability disaster disk format bank closure delay customer relations**

RISKS 21 58

Nicolai Langfeldt wrote from Norway to report on a massive failure of the Norwegian banking system. His report in RISKS includes the following summary:

EDB Fellesdata AS runs the computer services of about half of Norway's banks. On Thursday 2 Aug 2001, they apparently installed about 280 disks in their Hitachi storage. Then, instead of initializing the new disks, they initalized _all_ their disks -- thereby wiping out the entire warehouse. EDB Fellesdata itself declines to make any statements in the case pending further contact with their customers, the banks. They are considering lawsuits, but if one of their own employees made a "user error", they may have a hard time of it.

Talk about a lot of eggs in one basket, one can only imagine how many terrabytes of database this is, considering the number of disks, and how long it takes to restore from backup, and how many transactions were waiting to be processed from _other_ banks once the restore is done. Apparently the computers were running by Sunday, card services and ATMs were available on Monday, but Internet banking and automatic-phone-banking access is limited. They have announced that updated account balances will not be available until Wednesday, the 7th day after the mishap. The concerned banks' customers could pay their bills by visiting a local branch office the whole time, but apparently the transactions had not been processed because creditors have been warned that money may be late in arriving (but presumably retro-credited once the transaction is processed?).

Category 13.2 *Data corruption & destruction*

2002-03-11 **quality assurance QA design data integrity user interface documentation**

RISKS 21 94ff

A couple of correspondents wrote in to RISKS with yet another litany of complaints about Microsoft Office products that change input data unexpectedly. Both found that grades they were entering were being modified; one found that incorrect spellings were being forced, including into e-mail addresses. One complained about mysterious lines and bullets appearing in his text.

[MK comments: Everything the correspondents described is controlled through options available through the Tools menu item in Office products. Both correspondents illustrate the dangers resulting from the combination of bloatware (programs with enormous lists of functions and features) coupled with poor user interface design and inadequate training. Office products typically do not provide a visual indicator of the status of various "helpful" features such as the "AutoCorrect" and "Enable Autocomplete for Cell Values" functions. A user unaware of the existence of these functions has no clue where to look for the mysterious source of inexplicable data transformations, let alone any idea of how to turn them off.

MORAL: system administrators should set all autocorrection and autoformatting features OFF by default when delivering systems to novice users and should provide training to allow controlled reactivation of those features that the users feel will be helpful and controllable.]

Category 13.2 *Data corruption & destruction*

2002-03-12 **speech recognition default documentation data integrity corruption feature awareness**

RISKS 21 95

Hawkins Dale reported on another case of data corruption by default in RISKS:
>Slashdot (slashdot.org) and others are reporting that "some Windows XP users are finding random words inserted into their text as they write. The problem is caused by XP's speech recognition system, which is turned on by default by some manufacturers. It's listening to the random noise you get even when the mic is turned off."

Microsoft is blaming the problem on some computer manufacturers who enable this feature by default in their installation of the operating system.

Draw your own conclusions regarding the risks of adding powerful features that users are unaware of.<

FOR LONG-TERM DOCUMENT PRESERVATION, YOU NEED TO EMULATE
RAND Corporation researcher Jeff Rothenberg says that for long-term document preservation you need to use emulation. "If you think about anything in digital form, the article itself is a program. Not the way we usually think about it, but even a string of ASCII codes is a program, a sequence of little commands, each of which is interpreted by some simple interpreter that knows how to draw those characters on the screen and knows how to do what the command says. If you don't have the right interpreter, the one that knows what each of these commands means, then you don't have the document. You might have some aspect of it, but you've lost the original's behavior. And just looking at Web pages, fewer sites consist of static HTML. There's lots of stuff that gets generated on the fly, Javascript, server-side Java, Active Server pages. If all you save is the text of those pages, you haven't got it, and that kind of convinces me that digital documents must be executable in the future to really preserve them." (IEEE Software Mar/Apr 2002)

WRONG NUMBER COSTS GATEWAY $3.6 MILLION
A federal court has awarded a Pensacola business $3.6 million in damages from Gateway, which had accidentally distributed the wrong phone number for customer complaints to more than 275 Gateway stores. The error dated back to 1999, when someone at Gateway erred by using the 800 prefix instead of the correct 888 prefix for the company's toll-free customer complaint line. The wrong number was also posted on Gateway's Web site, listed on Internet billings and included on a form distributed to more than 100,000 Gateway customers. Mo' Money, which manufactures and distributes promotional items, said it contacted Gateway six days after the calls began, but that it took the computer company more than two years to fix the problem. "It was a nightmare," says Mo' Money president Cliff Mowe. "We had as many as 8,000 extra calls a month, and these were all angry people You couldn't get them off the line because the only number they had was ours. You'd have to explain it and go through it, and a lot of times they'd call you right back anyway." (AP 19 Jul 2002)

HOTMAIL CLEAN-UP POLICY ANGERS USERS
Microsoft's Hotmail system has instituted a new storage policy that limits the time span for saved mail to 30 days. After that, it's automatically deleted from a user's Sent file -- an action that has left many users steaming. Desperate users who've pleaded for their mail back have been told it's irretrievable, and company officials say they warned users in mid-June of the change in policy. MSN product manager Parul Shah said users could avoid the problem by creating special folders and moving important messages out of the Sent file. The company is hoping the change in policy will prompt people to sign up for a fee-based version of the service that costs $19.95 a month for an additional 8MB of storage on top of the 2MB they get for free. Microsoft says it has more than 110 million Hotmail users, but that so far fewer than 300,000 have signed up for the extra storage feature. (CNet News.com 25 Jul 2002)

NYT
http://www.nytimes.com/2004/11/10/technology/10archive.html?th=&pagewante
d=print&position=

Katie Hafner reported on a growing problem in November in a New York Times article: digital photographs and other records are much less stable than traditional paper documents. Amateurs lack the awareness and knowledge of the effects of technological obsolescence and are storing their precious data (home movies, photographs of loved ones, personal diaries) on media that are already unreadable because the technology is no longer available: 5" diskettes, old ZIP drives and the like. Worse still, even CD-ROMs are losing data integrity over a period of five years or so if their storage conditions are poor -- and often a single error in a critical area of a file will make the whole photo unreadable. Unlike fuzzy or scratched photos, a scratched CD-ROM may be completely unususable, with the loss of thousands of pictures.

DHS IAIP Daily; http://news.zdnet.co.uk/0,39020330,39189933,00.htm

SECURITY FIRM DELETED CUSTOMERS' E-MAILS

An e-mail security scanning company has accidentally deleted thousands of its customers' e-mails. GFI is now offering free upgrades to all its customers after it deleted their e-mails by sending out incorrect update information. According to GFI, the problem occurred because of a change in BitDefender's technology, one of the products that GFI uses for its e-mail scanning. When the GFI MailSecurity update mechanism tried to install BitDefender updates on customer networks, the service started to delete all e-mails by default. BitDefender and GFI then rolled back the updates. GFI has promised all customers a free upgrade to its MailSecurity 9 product, which is available in two months. The company has also released a tool that can tell customers which e-mails were deleted and when.

MEDICAL LAB DATABASE CORRUPTION AFFECTS 2,000 PATIENTS

[A] web database used by the Calgary Health Region to track and distribute results of lab tests has suffered a "glitch". According to the article that appeared today, "The Calgary Health Region announced Sunday that an Internet database - which physicians use to view lab work such as blood and urine tests - mixed up results between patients and posted records under the wrong names. Officials are now contacting the offices of nearly 400 doctors and other health providers who saw the incorrect records, to ensure patients are receiving proper treatment." Doctors are concerned that the mix-up means some patients are now receiving incorrect treatments which can complicate their conditions, or that patients are receiving treatments they don't need. Additionally, some patients may be fretting needlessly over their lab results because of the mix-up while others may be in for some unpleasant surprises when they receive the correct results.

GERMAN SOCIAL SERVICES SOFTWARE DROPS CHANGES

The online computer news service heise.de reports that an error in the software system A2LL, which computes welfare and jobless subsidies as well as administering the system, has dropped over 100,000 changes that should have been reported to health insurance providers.

New registrants, people going off welfare, address changes and the like were registered with the system and then the changes were automatically rescinded. The error cropped up after a new version of the software was installed on the central servers. [Perhaps they installed a test system by mistake that just pretends to accept changes? -dww]

The missed changes will not affect the insurance status of the people involved, but staff at the insurance companies must take care of all of the changes by hand.

2006-06-11 **quality assurance QA automatic spreadsheet format conversion correction errors percentages**

Network World Security Management Newsletter

EXCEL CAN DAMAGE PERCENTAGE DATA

Warn your users to _turn off_ automated format conversion functions in Excel (or other spreadsheets) when working with production spreadsheets where complex alphanumeric codes are to be entered. It would be better to note and correct an error than to have the software silently make assumptions and modify their input, resulting in data rejection or – worse – acceptance of faulty data.

Use the Tools | Options | Edit sequence and uncheck the "Enable automatic percent entry" because it has two different rules in effect. With that option enabled, input numbers _greater_ than 1 are _divided_ by 100; e.g., entering 10 stores the value 10% (i.e., 0.1) and entering 1 stores 1% (i.e., 0.01). However, numbers _smaller_ than 1 are _not_ converted; thus .1 is stored as 10% and .01 is stored as 1%. As you can see, there are two different numbers that can result in the same stored value (yecchhh). If the data contain numbers that cross the boundary between these (not particularly obvious) rules, the numbers stored in the spreadsheet will not be those intended by the operator.

CONVOLUTED TALE OF THE GHOST WITHDRAWALS

Charles Arthur reported in _The Register_ on a fascinating case of incompetence and criminality in the British banking system. In "How ATM fraud nearly brought down British banking" he tell of how junior barrister (lawyer) Alistair Kelman discovered in the early 1990s that

* Thousands of people were being charged for withdrawals from their bank accounts that they did not make ("ghost withdrawals").

* Banks denied the possibility of error or fraud until experts such as Prof Ross Anderson of Cambridge University convinced the courts that the claim of infallibility was nonsense.

* There were thousands of cards which delivered money without deducting it from the owner's account -- they were actually using dummy accounts created by the programmers.

* Rogue programmers at a particular bank altered the PIN-generator to create only 3 unique PINs for all bank cards -- allowing them to steal money from any account at will.

This last discovery was very serious indeed:

>This "gave me major concern," says Kelman. "The security of the entire ATM network upon which the UK banking system was based was predicated on nobody knowing your PIN." He could see that if this reached the media, people would begin comparing PINs, and on finding identical ones would tell others, and the security system used by the banks would collapse overnight. Then there would be a dramatic run on the banks … as everyone tried to take their money to a safer place, such as under the mattress.

And there wasn't time for the banks to fix the problem if anyone went public with it. Their MTBU was too short. MTBU? That' s "Maximum Time to Belly Up", as coined by the majestic Donn Parker of Stanford Research Institute. He found that businesses that relied on computers for the control of their cash flow fell into catastrophic collapse if those computers were unavailable or unusable for a period of time. How long? By the late 1980s it had fallen from a month to a few days. That's not a good thing; it meant that a collapse of the computers that any UK clearing bank relied on would destroy it in less than a week.<

Just as Kelman was about to reveal the fatal vulnerability in a secret meeting of bank security experts in June 1993, he was dismissed by his last clients, losing the legal right to intervene in the issue. He kept quiet for more than 10 years, hoping that no one else would discover this dreadful vulnerability.

>"Fortunately for the UK banking system and the British people, nobody else did discover what I found about the activities of the Rogue Bank," Kelvin notes. Two years later, though, he had corroboration of what he had learnt: "the computing staff at the [Rogue] bank were completely out of control and engaged in multiple frauds."<

RESEARCHERS FOCUS ON 'LINK ROT'
Two researchers at the University of Nebraska are focusing their attention on so-called "link rot" -- broken hyperlinks -- which are becoming an increasing concern for professors and teachers who assign reading and research activities using the Web. The two professors monitored 515 hyperlinks over a period of 20 months and found that at the end of the time, 18.8% of the links had disappeared -- over 11% of the .org links, 18.4% of the .edu links, and 42.5% of the .com links were no longer active at the end of the study. Broken links included resources from the Mayo Clinic, an encyclopedia of plant biology, links on steroid use and links to courses with relevant lecture notes. The study also found that a few of the links had redirected to porn sites, which could be a real concern for teachers of younger students. The two professors are now working on a grant proposal to the National Science Foundation to develop software that would automatically check links for faculty and alert them by e-mail if the URL or content changes. 'UNIVERSAL VIRTUAL COMPUTER' BATTLES OBSOLESCENCE
A researcher at IBM's Almaden Research Center has proposed a system he hopes will eliminate the problem of digital document obsolescence, which threatens to undermine archivists' efforts to retain digital material for future generations. Dr. Raymond Lorie has developed a prototype for a "universal virtual computer," which features architecture and language designed to be so logical and accessible that computer developers of the future will be able to write instructions to emulate it on their machines. The software written for the universal virtual computer extracts all the data stored in a file, but does not try to include all the bells and whistles associated with that file. "I don't need to recreate Acrobat Reader with all its buttons and colors," says Lorie. "That would be overkill." Instead, the program uses tags to include extra semantic information that will indicate what the file is and how to read it. These semantic tags might say, for instance, "There is text in this document and it is organized like this," he explains. John Steenbakkers, director of information technology for the Dutch national library, says the universal virtual computer concept works. "We have seen a proof of concept. If the universal virtual computer became a standard for digital archiving, it would be a major step forward," offering a controlled, one-time migration to a specific preservation format. Meanwhile, Jeff Rothenberg of the RAND Corporation says Lorie's idea of data extraction is limited. "I would prefer to store documents in their original forms and formats -- with all of the software that created them and is typically required to view them." Data extraction "will give you the contents -- or rather, what someone thought were the meaningful core contents -- in some future form. But it won't preserve the original." (New York Times 29 Aug 2002)

2001-01-05 **php Hypertext Preprocessor scripting language virus malware**

Central Command

From the Central press release:

Central Command, a leading provider of PC anti-virus software and computer security services, and its partners today announced the discovery of PHP.NewWorld, the first virus using the Hypertext Preprocessor (PHP) scripting language to infect computer systems.

PHP (www.php.net) is one of the most popular scripting languages used in the development of e-commerce and heavy content websites. It gained its popularity thanks to its user-friendly programming features, and the incorporation of cross platform compatibility between Windows, Linux, and UNIX environment features included within the language.

"Although PHP.NewWorld is currently not a major threat, it marks a new step toward new virus generation," said Steven Sundermeier, Product Manager at Central Command, Inc.

. . . .PHP.NewWorld is spread to a system when executing an infected script. . . . PHP.NewWorld looks for .php, .hm, .html or .htt files in the C:\Windows directory. All files found with these extensions will become infected. When a user executes a .php file, the virus body will be executed from an external file and will take full control. In the case that the string "NewWorld.PHP" is identified as already existing, the infection routine will not be launched again. Thus, a file will not get infected twice. PHP.NewWorld has no activation date. The virus is not able to spread out from the infected system.

Central Command

Here is the text of Central Command's announcement about a new concept virus:

Central Command. . . announced the discovery of I-Worm.LogoLogic.A, the world's first virus written using the popular Logo programming language.

"This is a proof of concept virus that utilizes a new development platform to spread, the SuperLogo programming language by Logotron. This language is popular in educational institutions and is a tool used to first expose future programming students to application development," said Steve Sundermeier, Product Manager at Central Command Inc.

Technical details

I-Worm.LogoLogic.A works only with default installations of Microsoft Windows 95 or 98 and mIRC: it assumes that the folders "C:\Windows" and "C:\Program Files" and "C:\MIRC" (default) or "D:\MIRC" or "E:\MIRC" exist. The virus requires the SuperLogo interpreter to be installed.

When executed, the virus overwrites the C:\MIRC\SCRIPT.INI with a small mIRC script that helps the propagation of the virus body (logic.lgp). The script also joins the channel #gigavirii and announces the infection, displaying the following message in the channel (a verse from "Livin' a Lie" a song written by Milk Inc., a Belgian pop band):

"Livin' a lie, tell me why I run and hide. Livin' a lie, you'll never know me deep inside."

After the mIRC infection, the virus drops a file in the Windows startup folder (C:\Windows\Start Menu\Programs\Startup\startup.vbs) that will spread the virus by e-mail. The script sends the virus to the first 80 e-mail addresses in the Microsoft Outlook and Outlook Express address book, with the following content:

Subject: Hey friends! Message: Hello! Look at my new SuperLogo program! Isn't it cool? Attachment: logic.lgp

It also overwrites C:\Windows\WINSTART.BAT and displays the following message: "You think Logo worms don't exist? Think again!"

When the infection routine is finished, the virus displays the message in the SuperLogo window: Logic, the Logo worm (c) Gigabyte

"We have no infection reports of this virus and nor do we consider it to be spreading at this time. This seems to be another demonstration by virus writers on their abilities," said Marius Gheorghescu virus researcher at Central Command's Emergency Virus Response Team.

NEW "PROOF-OF-CONCEPT" VIRUS [10 Jan 2002]
A Czech programmer has created a "proof-of-concept" virus called W32/Donut to alert security antivirus vendors and Microsoft managers of software vulnerabilities in executable files created for Microsoft's .NET Web services technology. A spokesman for Symantec, a major vendor of security software, says that the virus "does not have any significant chance to become widespread. However, it shows that virus writers are paying close attention to the new .NET architecture from Microsoft and are attempting to understand the framework that eventually will be available on most systems." NewsScan

NEW VIRUS CAN INFECT PICTURE FILES
McAfee Security is reporting that a new virus called "Perrun" is the first ever to infect picture files, which, along with other data files, have long been considered safe from such threats. Researchers at McAfee received the virus from its creator and say it's what's called a proof-of-concept virus and does not cause any damage. Up until now, viruses infected and were spread through program files; data files might be deleted or damaged, but Perrun is the first to infect them by inserting portions of the virus code into the picture file. When a .JPG picture is viewed, the virus installs a file on the victim's hard drive that can infect other pictures. Because the original picture looks fine, the victim won't know that anything's amiss. (AP 13 Jun 2002)

NewsScan

ALL QUIET ON THE VIRUS FRONT
It's been a slow year for computer virus experts, with the Klez e-mail worm the only notable annoyance now making the rounds. "Klez is the biggest case of the year and that's it," says Mikko Hypponen, manager of antivirus research at Finland's F-Secure. "That's a big surprise to us and to everybody else in the antivirus community." Other monitoring firms report similar findings: Sophos Anti-Virus in the UK says it's detecting 600 to 700 new virus types per month -- about half as many as last year. Theories on why 2002 has seen a significant drop in viruses vary, ranging from the introduction of enhanced antivirus software to stiffer anti-hacker laws to more vigilant computer users. "For the antivirus industry in general, a slow-down would not be very good," says Hypponen. "But I'd love to see it happen. It would free up the resources for us to do something other than fight a problem that shouldn't even be there in the first place." (Reuters 13 Aug 2002)

NIPC/DHS

February 18, Federal Computer Week — Pentagon thwarts spoofed e-mail.

The Pentagon said today that an attempt to send a virus through its systems last week was thwarted before damage could be caused. On the morning of February 14, someone "spoofed" the Defense Technology Information Center (DTIC) header, camouflaging the sender's real address to make recipients think the message had come from the Defense Department. The message had a virus attached and was sent through Pentagon computers to two mailing lists. "Our computers caught the virus and stripped it out," said Terry Davis, manager of the Public Web Program in the Office of the Secretary of Defense. "So what went out was the original text message that was sent in the e-mail, but the virus and the attachment were both stripped." Davis said he and a few co-workers then went into the system to put safeguards in place to prevent someone else from spoofing a DTIC header.

2003-05-06 **mobile virus PDA smartphone backdoor Rob Bamforth Bloor Research problems exploit**

NIPC/DHS

May 06, vnunet — The danger of mobile viruses.

PDAs and smartphones create backdoors into corporate infrastructures that can be exploited by viruses and malicious code to spread infections. Rob Bamforth of Bloor Research, a British IT analyst company, said that one of the principal security problems with mobile devices is that they are typically brought into organizations by individuals who have purchased them independently, rather than being issued as part of a co-ordinated IT department rollout. This makes them very difficult to control and manage when they are connected to corporate networks. Bamforth added that, while viruses currently present little danger to the actual mobile handsets themselves, the greatest problem comes from the devices being used as a transmission medium through which viruses could infect company infrastructures.

2003-08-20 **Sobig virus e-mail systems MessageLabs Inc. hacker bacdoor trojan horse**

NIPC/DHS

August 20, Dow Jones Newswire — Sobig virus spread is fastest ever.

The "Sobig.F" computer virus that began attacking e-mail systems globally Tuesday, August 19, has been declared the fastest-spreading e-mail virus of all time. E-mail filtering company MessageLabs Inc. said it intercepted more than one million copies of Sobig.F Tuesday, the most ever in a single day. The interception rate was one in every 17 e-mail messages the firm scanned. Sobig.F continued to spread aggressively Wednesday. Sobig.F, which is the sixth and latest strain of a virus that first emerged in January, spreads through Windows personal computers via e-mail and network file-share systems. Besides clogging e-mail systems full of messages with subjects like "Re: Details" and "Re: Wicked screensaver," the virus also deposits a Trojan horse, or hacker back door, that can be used to turn victims' PCs into spam machines. The worm is programmed to stop spreading on September 10.

2003-09-17 **windows flaw Blaster exploit Ken Dunham Trojan horses MSBlast worm unpatched computers root access underground source code**

NIPC/DHS

September 17, CNET News.com — Flaws set to spawn another Blaster.

Tools exploiting a new Windows flaw have started to appear, prompting warnings of imminent virus attacks. Ken Dunham, an analyst at a private security firm, said on Tuesday, September 16, that it is "highly likely" that new worms or Trojan horses will emerge in the next few days. These bugs are expected to prey on computers that have not been updated with the latest security patch for Microsoft's operating system. "A new Blaster-like worm family could be created in a matter of hours or days, now that exploit source code has been posted in the underground," Dunham wrote in an email. "The new attack tool makes it trivial for any malicious actor to gain unauthorized root access to an unpatched computer." Experts advised people last week that a new virus was reasonably likely, given the fact that the recently discovered Windows vulnerabilities are similar to those that paved the way for the MSBlast worm.

2004-03-03 **virus worm network attack epidemic Netsky**

DHS IAIP Daily; http://www.esecurityplanet.com/trends/article.php/3320501

March 02, eSecurity Planet — Virus attacks reach 'epidemic' proportions.

ust as the industry was reeling Monday, March 1, from the weekend release of a new Netsky variant and five new Bagle variants, another two Bagle variants and one more Netsky variant have hit the Internet. Netsky-D, alone, has caused $58.5 million in damages worldwide, according to mi2g, a London-based security assessment company. And as that variant continues to wreak havoc across the Internet, Netsky-E has been discovered. The latest variant spreads via email and network shares, but so far is not causing as much trouble as its predecessors. "Whoever is behind the Netsky worms is hell bent on causing as much chaos as possible," says Graham Cluley, of Sophos, Inc., an anti-virus and anti-spam company. "They have deliberately released new versions of their virus, tweaked to try and avoid detection by anti-virus software." The Bagle family ushered in Bagle-H and Bagle-I Monday. Bagle-H is an e-mail worm which contains a password-protected Zip file which avoids anti-virus detection. When the attachment is opened, the worm opens up a backdoor on Port 2745 and waits for commands from the virus author. Bagle-I follows the same pattern but has been tweaked to avoid detection by anti-virus software programmed to stop Bagle-H.

2004-03-25 **virus worm writer trial Romania Blaster variant international cybercrime free speech**

DHS IAIP Daily;

March 23, Reuters — Accused virus writer faces trial in Romania.

A decisive test for what is called the "toughest cybercrime law in the world" began Tuesday, March 23, with the opening of a case against a Romanian man charged with spreading a computer virus that affected approximately 1,000 computers. Dan Dumitru Ciobanu is accused of making "Blaster.F," a mild copy of one of last summer's harshest Internet worms. If convicted, the 24-year-old faces between three and 15 years in prison. Romania has enacted tough laws to protect its emerging reputation as a hub of skilled programmers for Western companies and erase any connection with cybercrime syndicates that law enforcement officials say are being run out of Eastern Europe. The Ciobanu case has reignited an international debate on appropriate justice for cybercrimes. With public thirst for cybercrime justice growing, experts wonder what impact a potential stiff sentence on Ciobanu will have on deterring a growing underground of virus writers.

2004-08-05 **portable digital assistant PDA malicious code virus PocketPC Kaspersky**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/26848−1.html

August 05, Government Computer News — Malicious code targeting PDAs identified.

The first backdoor code for personal digital assistants has emerged, raising concerns that handheld devices soon could be targeted by hackers. The code, called Backdoor.WinCE.Brador.a, was identified by Kaspersky Labs. It is 5,632 bytes and targets PDAs running PocketPC. The Moscow-based antivirus company called Brador a classic Trojan backdoor program, which could expose handheld devices to remote exploitation. Security experts said the threat from Brador is not imminent, but probably is inevitable. The sample seen by Kaspersky was attached to an e-mail from a Russian sender and with Russian text. It creates an executable file in the PDA's autorun folder so that it takes over whenever the device is turned on. It identifies the IP address, contacts the author and opens port 44299 for further commands. The author was offering to sell the client code. PDA users should protect their devices with anti-virus software.

2004-08-17 **e-mail viruses worms smarter MessageLabs writers spammers collaborations**

DHS IAIP Daily;
http://www.reuters.com/newsArticle.jhtml?type=topNews&storyI D=6001506

August 17, Reuters — E-mail viruses getting smarter, report says.

Computer security group MessageLabs, which scans client e-mails for viruses to block, said it picked apart some 5.6 billion e-mails from January to June this year and found 1-in-12 contained some sort of virus that penetrated firewalls meant to block them. MessageLabs said it believes the biggest e-mail security threat during the first half of 2004 was closer cooperation between virus writers and spammers, writers of unsolicited messages that often advertise products or get people to spend money. The reason the two groups are getting together is profit, MessageLabs has learned through monitoring chat rooms. With the recent proliferation of software blocking spam, the spammers are paying virus writers to create viruses that attach to their e-mails and circumvent the spam blockers.

DHS IAIP Daily; http://www.cbronline.com/article_news.asp?guid=3AF80B03−DE93
−4EBD−B37F−41BC1B124C4B

August 24, Computer Business Review Online — First 64-bit Windows virus intercepted.

Anti-virus experts have intercepted the first computer virus targeting 64-bit Windows workstations. According to an advisory issued by Symantec, W64.Shruggle.1318 is a fairly simple "proof-of-concept" virus programmed to attack 64-bit Windows executables on AMD64 systems. Alfred Huger, senior engineer at Symantec Security Response, said it looks like Shruggle has no malicious intent. The virus is not circulating in the wild; Symantec found it on a sample-sharing network used by antivirus firms. "This shows that viruses are being developed for 64-bit processors," Huger said. The worldwide move to 64-bit will not preclude the need for virus detection, he indicated. The virus does not infect 32-bit Portable Executable files and won't run natively on 32-bit Windows platforms. However, it can be run on a 32-bit computer that is using 64-bit simulation software. Original Advisory: http://securityresponse.symantec.com/avcenter/venc/data/w64. shruggle.1318.html

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0,10801,95501,00.html?SKC=security−95501

August 30, Computerworld — Organized crime invades cyberspace.

Antivirus researchers have uncovered a startling increase in organized virus- and worm-writing activity that they say is powering an underground economy specializing in identity theft and spam. "The July 2004 outbreak of MyDoom.O was yet another reminder that spammers are now using sophisticated, blended threats that mix spam, viruses and denial-of-service attacks," according to Andrew Lochart, director of product marketing at Postini Inc. According to Mikko Hypponen, antivirus research director at F-Secure Corp., MyDoom.O was the beginning of a concerted, unabashed effort to turn virus and worm infections into cash. Underground bartering and selling is conducted on Websites such as a Russian site that, among other things, sells subscription services to compromised computers. Viruses and worms carrying Trojan horse code are also powering massive identity theft rings. "Whether or not this is traditional organized crime doesn't matter -- because they are organized, and what they are doing is criminal," says Hypponen.

DHS IAIP Daily; http://news.com.com/Viruses+keep+on+growing/2100−7349_3 −5374 399.html?tag=nefd.top

September 20, CNET News.com — Viruses keep on growing.

The volume of worms and viruses is increasing, but the rate of successful attacks has dropped, according to a new report from Symantec. The antivirus company's biannual Internet Security Threat Report found that 4,496 new Windows viruses and worms were released between January and June, up more than 4.5 times from same period last year. But overall, Symantec, the daily volume of actual attacks decreased in the first six months of 2004. Alfred Huger, a senior director at Symantec's Security Response team said malicious code writers were increasingly going to spammers to sell them access to the computers that they hack, or break into. Spammers, after paying the hackers, then flood those hacked computers with unsolicited messages, or spam. Symantec also said it expects more viruses and worms in the future to be written to attack systems that run on the Linux operating system and hand-held devices as they become more widely used. The report also noted that the rate at which personal computers are being hijacked by hackers rocketed in the first half of 2004. An average of 30,000 computers per day were turned into enslaved "zombies," compared with just 2000 per day in 2003. Report: http://enterprisesecurity.symantec.com/content.cfm?articleid =1539

2004-12-07 **computer virus infection Jefferson County public schools Kentucky precautions anti-virus software**

DHS IAIP Daily; http://www.courier−journal.com/localnews/2004/12/07ky/A1−vir us1207−5418.html

December 07, The Courier-Journal (KY) — Computer virus infects Jefferson County schools.

Jefferson County public schools in Kentucky are battling a virus that has infected at least 1,000 computers and wreaked havoc on everything from attendance reports to students' ability to finish term papers. Officials blame the same "w32gaobot" virus that hit tens of thousands of school computers statewide late last month, freezing school Websites and barring student access to the Internet. After getting into the state's education computer network, that virus bogged down computers partly by generating overloading traffic on the Internet — and in some cases reading computer passwords and dispersing them and other technical information onto the Internet. Potentially debilitating viruses "show up on a regular basis now," said Cary Petersen, director of technology in Jefferson County Public Schools. One problem controlling viruses in a school system like Jefferson County's, which has about 28,000 computers, is that there are many possible entry points, including spam e-mail attachments, Internet ads or infected floppy disks. Precautions, including anti-viral software and educating workers not to open an e-mail without certain knowledge of its origins, have helped limit the spread, Petersen said.

2005-01-06 **Microsoft enter antivirus market anti-spyware technology release Windows XP Update Automatic**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,119197,00.asp

MICROSOFT TO ENTER THE ANTIVIRUS MARKET

Microsoft announced Thursday, January 6, the release of anti-spyware technology and said it would begin giving away an improved tool to remove worms and viruses from its customers' computers. While the free antivirus and virus removal tools are not an immediate threat to the products from competing companies, the releases could signal tougher times ahead for desktop security vendors, as Microsoft uses its size and influence to expand into markets now dominated by those companies, industry experts say. A spokesperson for Microsoft's Security Business & Technology Unit, says that spyware is a major concern for Microsoft customers, who are looking to the company for help. Spyware accounts for more than one-third of software program crashes on Windows XP that are reported to the company. Microsoft also says that it is releasing a free malicious-software removal tool that consolidates earlier software tools for eradicating the Blaster, MyDoom, and Sasser worms, and that will be updated each month to detect and remove other threats as they appear. Windows customers will be able to receive the malicious-code removal tool through Windows Update and the Windows Automatic Update features.

2005-01-31 **new virus anti-virus antivirus attack technique bypass filter ZIP RAR .zip .rar file compression algorithm**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1756636,00.asp

NEW VIRUS ATTACK TECHNIQUE BYPASSES FILTERS

Administrators and service providers have begun seeing virus-infected messages with a new type of attachment hitting their mail servers: an .rar archive. .Rar files are similar to .zip files in that they are containers used to hold one or more compressed files. The .rar format is not as widely known as .zip, but it is used for a number of tasks, including compressing very large files, such as music and video. Many of the messages in .rar virus e-mail are invitations to view pornographic content, which is part of the reason for the viruses' success, experts say. .Rar's compression algorithm is 30 percent more efficient than .zip technology. One recent .rar virus that appeared at the end of last week is disguised as a patch from Microsoft. Anti-virus vendors have acknowledged the presence of viruses delivered as .rar files and are working to develop tools to identify and eradicate the malware.

RISKS; http://news.bbc.co.uk/1/hi/technology/4291005.stm 23 75

UK GETS OFFICIAL VIRUS ALERT SITE

Chris Leeson relayed information from a BBC News report that "The UK government is setting up a Virus Alert site to warn users of viruses, vulnerabilities and so on. It is aimed at home and small business users. . . It is expected to issue between six and ten alerts a year, concentrating on the most major problems. It will not provide patches, but will point the user to where the patches can be downloaded. It is also made clear that the site is not a panacea or a substitute for proper AV and Firewall provision."

However, Leeson warned,

>Alas, there remains a number [of] problems:

1. This would be a great site for the Malware Brigade to spoof. I hope that it is more secure than most Web Sites.

2. They are concentrating on the most serious threats. Understandable, but even the "less serious" threats can be trouble.

3. Most PC users are simply not interested in PC Security and won't be convinced that they have to be. The new users may well not realise that they are exposed at all. (I am a little sore about this having just spent three days trying to salvage someone's XP system after the PC had spent two weeks on Broadband without Firewall or AV…)<

2005-05-18 **computer virus German election influence ring wing hacktivism Trojan Horse**

DHS IAIP Daily; http://www.iht.com/articles/2005/05/17/business/virus.php

COMPUTER VIRUS MAY BE AIMED AT GERMAN ELECTION

The creator of a computer Trojan horse that unleashed a torrent of far-right spam e-mail messages in Germany on Tuesday, May 17, may be trying to influence the outcome of the election Sunday, May 22, in North Rhine-Westphalia, a German software expert said. Computers infected with the so-called Sober.q Trojan horse unwittingly sent thousands of spam e-mails bearing links to the Website of the National Democratic Party (NPD), a party that espouses "Germany for Germans," the death penalty for some drug dealers and an end to asylum-seeker rights. "This is most likely connected to the election coming up on Sunday," said Christoph Hardy, a spokesperson for the German unit of Sophos, a British anti-virus software company. "It was probably generated by someone who is sympathetic to the far-right, trying to create anger and a protest vote in Sunday's election." Sober.q was reported to have spread widely around Europe and also to have infected computers in the United States and Asia. The originator of the Trojan horse was most likely German because the programming language used to create the Trojan horse was German, as was the language in the e-mail.

2005-06-09 **new virus vulnerability scanner hacker methods botnets**

DHS IAIP Daily; http://www.newscientist.com/article.ns?id=dn7500

NEW TYPE OF VIRUS SCANS NETWORKS FOR VULNERABILITIES

An emerging breed of computer virus that keeps hackers informed about the latest weaknesses in computer networks has been discovered by security experts. The viruses infect a computer network, scan for security vulnerabilities and then report back to hackers through an Internet chatroom. Armies of computers infected with "bot" viruses are routinely controlled via a chatroom connection and are used to knock for denial of service attacks or as a conduit for sending out spam e-mail. However, the ability of some bots to scan their hosts for unpatched security holes and report their findings back to hackers has gone largely unnoticed until now. The emerging class of malware or malicious software - known as vulnerability assessment worms - "phone home" to allow hackers to fine-tune further attacks or perhaps even target an individual PC within a network. This pernicious form of program is just one of a growing number of new viruses identified each month, says computer security expert Bruce Schneier. "The virus trend doesn't look good," Schneier writes in the June 2005 edition of the Association for Computing Machinery journal, Queue. "More than a thousand new worms and viruses were discovered in the last six months alone."

DHS IAIP Daily;
http://www.techweb.com/showArticle.jhtml?articleID=166403862

VIRUS WRITER TARGETS ANTI-VIRUS VENDORS

A virus writer apparently seeking notoriety instead of financial gain has released malicious code that ridicules anti-virus vendors and Sasser worm author Sven Jaschan, a security firm said Friday, July 29. The Lebreat-D virus, which is rated a low threat, creates in infected computers a JPEG image file of Jaschan, a German teenager recently convicted of authoring the widespread Sasser and Netsky worms, Sophos Plc said. The Lebreat worm, which is spread through email attachments and exploits a Microsoft security vulnerability, opens a backdoor to an infected Windows computer, enabling a hacker to gain control. The virus indicates that a denial of service attack could be planned against security vendors Symantec Corp. and McAfee Inc., but doesn't say when, Sophos said.

SOBER ATTACK BIGGEST VIRUS OUTBREAK EVER

Apparently, messages from the Federal Bureau of Investigation and Central Intelligence Agency are the way to spread worms, a security firm said Thursday, December 1, as it tallied up Sober's wildfire spread during November and concluded that the outbreak was the biggest ever. E-mail security provider Postini said that it had quarantined more than 218 million Sober-infected messages last week, more than four times the 50 million-message average that it blocks in a run-of-the-mill month. "This Sober generated close to a 1,500 percent increase in virus infected e-mail traffic in the past week," said Scott Petry, vice president of products and engineering at Postini, in a statement. Petry also said that Sober's attack was twice as large as the largest previous on Postini's records. Other security vendors took note of the recent Sober -- the variant is dubbed Sober.x, Sober.y, or Sober.z by most anti-virus firms -- and its impact during November. Both Sophos and Fortinet, for instance, had the new Sober at the top of their November charts as well.

DHS IAIP Daily; http://www.scmagazine.com/uk/news/article/543503/crossinfect ing−virus−discovered/ 23

CROSS-INFECTING VIRUS DISCOVERED.

The first malware to cross-infect a PC and a Windows wireless pocket device has been discovered, the Mobile Antivirus Researchers Association (MARA) said. The proof-of-concept, file-destroying Trojan automatically spreads from a Win32 desktop to a Windows Mobile Pocket PC. "With the growing use of hand-held devices, this type of virus may become very prevalent in the future. This virus closes the gap between handhelds and desktops," the association said. Jonathan Read of MARA said that previous "crossover" viruses -- "required either Bluetooth on the device and the PC, or the user had to physically transfer the virus on a memory card." But this trojan is the first to use ActiveSync -- a program that synchronizes files and other data between a Windows PC and a Windows Mobile device -- to cross-infect a desktop and hand-held PC. It also is the first crossover malware to infect the PC before attacking the mobile device. Dave Cole, director of Symantec Security Response, said today that he expects hackers to continue to experiment with new platforms, such as mobile devices. He predicts such attacks gradually will become more financially motivated as users increase their reliance on hand-held computers in their daily lives.

2006-03-15 **RFID threat viruses security vulnerability proof-of-concept**

EDUPAGE; http://www.nytimes.com/2006/03/15/technology/15tag.html 23

RFID SUSCEPTIBLE TO VIRUSES

A group of researchers affiliated with Vrije Universiteit in Amsterdam has discovered a way to spread a computer virus through RFID tags, a scenario most security experts had previously dismissed. The researchers demonstrated that a virus can spread from an infected tag to the scanners and systems that register the tags and to other tags. In an airport, for example, an infected luggage RFID tag can infect airline systems, possibly allowing some luggage to avoid being screened, and can spread to other luggage and other airports. The group called RFID malware "a Pandora's box" of potential problems. Aware of the risks of disclosing a vulnerability, the researchers also offered advice to RFID developers about how to protect their systems. Peter Neumann, computer scientist at research firm SRI International, echoed the researchers' warnings about RFID technology. "It shouldn't surprise you that a system that is designed to be manufactured as cheaply as possible," he said, "is designed with no security constraints whatsoever." Daniel Mullen, president of the Association for Automatic Identification and Mobility, which represents the industry, said companies developing the technology are engaged in an "ongoing dialogue about protecting information on the tag and in the database."

DHS IAIP Daily; http://www.computerworld.com/printthis/2006/0,4814,110330,00 .html 23

KASPERSKY WARNS OF CROSS-PLATFORM VIRUS PROOF-OF-CONCEPT.

Kaspersky Labs is reporting a new proof-of-concept virus capable of infecting both Windows and Linux systems. The cross-platform virus is relatively simple and appears to have a low impact, according to Kaspersky. Even so, it could be a sign that virus writers are beginning to research ways of writing new code capable of infecting multiple platforms, said Shane Coursen, senior technical consultant at Kaspersky. The new virus, which Kaspersky calls Virus.Linux.Bi.a/Virus.Win32.Bi.a, is written in assembler and infects only those files in the current directory. "However, it is interesting in that it is capable of infecting the different file formats used by Linux and Windows," Kaspersky said.

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1959084,00.asp 23

WORLD CUP VIRUS SEASON KICKS OFF.

The FIFA World Cup 2006 tournament won't get underway in Germany until early June, but computer virus writers are already attempting to cash in on the planet's most popular sporting event with viruses aimed at deceiving eager soccer fans. Researchers at UK-based Sophos released notification of a new attack that infects Microsoft Excel files and has been disguised as a spreadsheet charting the national teams participating in the World Cup. Identified by the security company as XF97/Yagnuul-A, the virus lives in an Excel file that offers to help people set up fantasy sports competitions related to the international soccer championship, and also attempts to market itself specifically to fans of the English Premiership, one of the world's top professional leagues. Once the World Cup virus has infected a PC, it begins forwarding itself to other people using the corrupted machine and may also send itself to people listed in any e-mail client software on the device, Sophos said. The Excel virus marks the second World Cup-oriented attack identified by the company in the last week.

1999-11-10 **virus worm e-mail attachment highlight automatic MS-Outlook prototype proof-of-concept**

AP, Dow Jones

In early November, a worrisome new worm appeared on the scene. The BubbleBoy proof-of-concept worm was sent to Network Associates, who immediately posted a free software patch and alerted the FBI of the danger. The problem with this worm was that it would infect a host if an MS-Outlook user merely highlighted the subject line of the carrier e-mail message — no double-clicking required. The worm's payload was mild — changes to the registry and a simple display screen — but experts warned that the same techniques could carry much more dangerous payloads in future variations. The worm spread by mailing itself to every e-mail address on the infected system's address list, thus posing an even greater potential danger than the Melissa worm. [This attack again demonstrates the foolishness of allowing automatic execution of code by e-mail and word-processing packages.]

1999-12-10 **virus worm e-mail denial-of-service crash attachment police**

News wires, ZDNet
http://dailynews.yahoo.com/h/zd/19991210/tc/19991210060.html

The search for the originator of the Melissa e-mail computer virus/worm began immediately after the outbreak. Initial findings traced the virus to Access Orlando, a Florida ISP, whose servers were shut down by order of the FBI for forensic examination; the systems were then confiscated. That occurrence was then traced back to Source of Kaos, a free-speech Web site where the virus may have lain dormant for months in a closed but not deleted virus-distributor's pages. In an interesting wrinkle, the MS-Word serial number on the original infected documents were circulated on the Net to help track down the perpetrator. The next steps turned to AOL, where the virus was released to the public. The giant ISP's information named a possible suspect and by the 2nd of April, the FBI arrested David L. Smith (aged 30) of Aberdeen, NJ. Smith apparently panicked when he heard the FBI were on the trail of the Melissa spawner and he threw away his computer — stupidly, into the trash at his own apartment building. Smith was charged with second degree offenses of interruption of public communication, conspiracy to commit the offense and attempt to commit the offense, third degree theft of computer service, and third degree damage or wrongful access to computer systems. If convicted, Smith faced a maximum penalty of 480,000 dollars in fines and 40 years in prison. On 10 December, Smith pleaded guilty to all federal charges and agreed to every particular of the indictment, including the ICSA.net estimates of at least $80M of consequential damages due to the Melissa infections.

2000-05-08 **worm e-mail malware**

NewsScan

The I LOVE YOU computer worm struck computers all over the world, starting in Asia, then Europe. The malicious software spread as an e-mail attachment, sending itself to all the recipients in standard e-mail address books.] Within days, there . . .[were] new variations of the destructive software program popularly known as the Love Bug because it's sent as an attachment with the words "I love you" in the subject line. In one variation, the subject line purports that the message you're receiving contains a joke, and in another you're told that the message is a confirmation notice for a Mother's Day gift order. To avoid being affected by the bug, do NOT open attachments to suspicious e-mail messages. (ZDNet 5 May 2000)

Philippine authorities . . . detained a 27-year-old man for questioning after searching the house of the suspected creator of the infamous "Love Bug" virus. The virus, called the most virulent ever created, was responsible for deleting files on computers worldwide, as it wormed its way from computer to computer using e-mail address books to target its next victims. The main suspect is said to be a 23-year-old woman living with the man who was detained, a young computer student from a middle-class family. Detectives have said it is possible that the suspect is not responsible, but her computer certainly is: "It was only [her] computer used to launch the virus that was traced but anybody could use that computer," said an official with the Philippine National Bureau of Investigation. "The user here is invisible, it could be anybody. The difference is that the person we have identified is the registered owner of that computer." (Reuters/TechWeb 8 May 2000)

[On 11 May,] Filipino computer science student Onel de Guzman of AMA Computer College in Manila . . . told authorities that he may accidentally have launched the destructive "Love Bug" virus out of "youthful exuberance." However, he would not admit that he had himself created it, saying in Tagalog: "It is one of the questions we would rather leave for the future." The name GRAMMERSoft, a computer group to which the 23-year-old man belongs, appears in the computer code of the virus, and reporters have learned that de Guzman's thesis project was rejected by AMA officials because it described a way of illegally obtaining passwords from other computer users. But investigators have not charged either de Guzman or his friend Michael Buen of any crime, nor identified them as suspects. Asked what he felt about the massive amount of damage caused around the world by the virus, de Guzman's reply was: "Nothing." (AP/San Jose Mercury News 11 May 2000)

Philippine authorities investigating the source of the "Love Bug" computer virus that originated in that country . . . [said] they have more than four principal suspects who may have been responsible for launching the virus, which destroys computer files, steals passwords, and replicates itself by sending copies of the virus to everyone in the infected computer's address book. Suspects include Onel de Guzman, a 24-year-old dropout of a computer school, and his friend Reonel Ramones, the only one of the group of suspects who will definitely be charged with criminal wrongdoing. The names of the other suspects were found on diskettes confiscated from the apartment Ramones shared with de Guzman and de Guzman's sister. (Reuters/San Jose Mercury News 12 May 2000)

2000-11-01 **virus worm payload remote control e-mail Trojan dropper**

NASA Incident Response Center http://www-nasirc.nasa.gov/nasa/whats_new.html B-00-156

The SONIC worm was found in the wild on Oct 30. This nasty remote-control worm arrived by e-mail with subject "I'm your poison" and an attachment (either GIRLS.EXE or LOVERS.EXE). If the Trojan dropper is run, it installs a core process that then searches for payload instructions on a site in the GeoCities Web-hosting service. The current payload opens a backdoor to the infected system and also monitors activity, much like BackOrifice. There were already several variants in circulation by the time the worm was discovered by Kaspersky Labs. There was some hope that the original hard-coded GeoCities site could be shut down, but it was likely that other payload-supply sites would be encoded in new variants.

2001-02-12 **encrypted Visual Basic worm infection malware**

Central Command

VBS.SST.A, aka Calamar, Kalamar.A and Anna Kournikova worm is a Visual Basic Script worm that spread rapidly worldwide starting in February 2001. Central Command described it as follows:

"The worm travels via an email message with the following text:

Subject line: Here you have, ;0)
Message body: Hi: Check This!
File attachment: AnnaKournikova.jpg.vbs

The worm attempts to trick users into executing the file attached to the e-mail message by pretending to be a jpeg graphic image of the Russian tennis player Anna Kournikova.

On January 26th the worm attempts to connect to a website www.dynabyte.nl

The worm modifies the systems registry by creating an entry named HKEY_CURRENT_USER\software\OnTheFly

When the worm is activated it emails itself to every address in the Outlook address book."

A week later, Trend Virus reported, "Several variants of the "Anna Kournikova" virus a.k.a. VBS_KALAMAR.A have emerged in the wild. These variants are similar to the previous virus and are detected by Trend antivirus, however, they differ in their subject header and message body. Like VBS_KALAMAR.A, these variants were also created using the VBSWG virus construction kit. Trend provided protection against Anna Kournikova before it began to spread, and Trend customers who had updated their pattern file and scan engine on a regular basis did not have to worry about this fast-spreading virus."

2002-05-05 **worm virus e-mail social engineering**

RISKS 22 05

In April 2002, a variant of the the KLEZ worm family known since November 2001 became a major threat to MS Outlook users worldwide. Peter G. Neumann summarized the situation:

A rogue computer program that is the online equivalent of a quick-change artist is infecting computers around the world via e-mail and clogging computer networks. The program, W32/KLEZ.H, is a "blended threat," combining elements of a virus, which infects machines, and a worm, which transports itself from machine to machine. It also tries to disable some antivirus programs. It makes itself hard for users to spot by changing its e-mail subject line, message and name of the attachment at random, drawing from a database that includes, for example, such subject lines as "Hello, honey," and "A very funny Web site." The program has grown increasingly common as users unknowingly activate it sometimes without even opening the e-mail attachment that carries the virus and allow it to send copies of itself to those in the victim's e-mail address file.

Category 14.2 Worms

2002-05-05 **worm virus e-mail social engineering**

RISKS 22 05ff

By early May 2002, the KLEZ.H worm/virus was spreading extremely fast on the Internet and was having secondary effects. For one thing, because of the habit of forging e-mail headers to make it look as if someone on a victim's address list was the originator, many non-infected people were receiving angry e-mail from victims claiming that they were spawning infected e-mail. Worse, some of the recipients complained to system administrators or ISPs, causing much confusion and wasted effort as everyone had to figure out that the supposed originator was nothing of the sort. For another, some of the anti-virus products were firing off automated warnings to the supposed originators of infected messages; when these recipients happened to have enabled autoreply messages (the dreaded "I am out of the office" script), there was a real risk of mailstorms as each additional message from the supposedly infected source prompted yet another warning. Bounce messages also contributed to the mayhem.

2003-01-10 **virus alert Internet anti-virus undetected mass mailing F-Secure**

NIPC/DHS

January 09, eSecurity Planet — Virus Alert: W32.Lirva.A and ExploreZip.

Two major viruses have struck the Internet at the same time. ExploreZip, an Internet worm first let loose in the wild back in 1999, has reemerged with just enough changes made to allow it to slip through anti-virus software undetected. And it has the added ability to override files on the infected computer, as well as on any other computer in the same network. Once ExploreZip infects a computer, it will automatically respond to any email received with a seemingly valid subject line and the user's name, along with an infected attachment. Another problematic virus is the mass-mailing worm that pays tribute to Canadian singer Avril Lavigne. The worm is going under a few different names, including Avril and Lirva (which is Avril spelled backwards). Although this virus is less destructive than ExploreZip, anti-virus software company F-Secure Corp. has rated both viruses as Level 2 Threats, the second-highest threat category. The Lirva worm got a Level 2 rating because of the speed with which it's spreading around the world. It reportedly originated, in middle Europe and has spread to Turkey, the United States and Southeast Asia in less than 48 hours. Once Lirva infects a computer, it opens the computer's Internet Explorer browser to official Avril Lavigne Web site on the 7th, 11th and 24th of the month. It then starts to display colored circles on

2003-01-14 **virus Internet alert SMTP engine self-propagating**

NIPC/DHS

January 13, ZDNet — Virus alert: W32/Sobig-A.

Anti-virus experts are warning of a new virus, code-named W32/Sobig-A, which was discovered late last week and spread rapidly over the weekend. Sobig is a mass-mailing worm incorporating its own SMTP engine, according to antivirus companies. It arrives from the e-mail address "big@boss.com" and bears a subject line such as "Re: here is that sample", "Re: Movies", "Re: Document" or "Re: Sample". The e-mail contains an attachment called "Document003.pif", "Sample.pif", "Untitled1.pif" or "Movie_0074.pif". It affects the Windows 95, 98, Me, NT, 2000 and XP platforms. When the attachment is clicked on, it runs a program that searches for files containing e-mail addresses and uses these to send infected e-mails. It also connects to a Web site and downloads a text file containing another Web address, from which it attempts to download and run another program. MessageLabs speculated that this program was a backdoor trojan horse, which could allow a hacker to take control of the user's PC. If there is a local-area network connection, Sobig attempts to copy itself onto shared network folders. CERT/CC has received over one hundred reports of this worm. Anti-virus software companies Sophos, Symantec and McAfee have published instructions on their websites for blocking and removing the worm.

2003-01-27 **worm damage Internet servers patches**

NewsScan

INTERNET WORM TOOK ONLY 10 MINUTES TO CAUSE GLOBAL HAVOC
The "SQL Slammer" worm that slowed Internet traffic significantly [in late January 2003] managed to infect computer servers worldwide in about 10 minutes, making it the fastest such virus seen, according to a University of California at San Diego team. "At its peak, achieved approximately three minutes after it was released, the worm scanned 55 million Internet hosts per second. It infect ed at least 750,000 victims, and probably considerably more," says one team member. The SQL Slammer worm was only the third of its type seen on the Net, and managed to spread nearly 100 times faster than the Code Red infection 18 months ago. (The Independent 4 Feb 2003)

THE WORM TURNED BACK: SLAMMER DAMAGE CONTAINED
[By the 27th of January, it was] unlikely that there [would] be much additional destruction from the so-called Slammer computer worm that wreaked damage on the Internet over the weekend, by infecting more than a quarter of a million computer servers and clogging networks throughout the world. The worm targeted a known [vulnerability] in Microsoft's 2000 SQL server database server; the company had issued software security patches in July but many network administrators had failed to install them. But now the worst appears to be over, says an executive at the security firm Symantec. (USA Today 27 Jan 2003)

MICROSOFT, HEAL THYSELF!
Microsoft has been embarrassed by having to acknowledge that the SQL Slammer virus, which infected computer servers all over the world, also contaminated some of Microsoft's own servers, because system administrators had failed to heed the company's own advice to install a software patch months ago to fix a known system vulnerability. A Microsoft executive had to admit: "We, like the rest of the industry, struggle to get 100% compliance with our patch management. We recognize — now more than ever — that this is something we need to work on. And, like the rest of the industry, we're working to fix it." (New York Times 28 Jan 2003)

2003-02-03 **Slammer worm avoidable vulnerability detection tool available NSA NIPC FBI SANS**

NIPC/DHS

January 31, Computerworld — Free benchmark could have found Slammer vulnerability.

Industry experts and users said the Slammer worm should have been a non-issue for companies because the patches and a free tool capable of detecting the vulnerability exploited by the worm were available six months ago. In particular, they point to the issuance in July of the Consensus Minimum Security Benchmarks, also known as the Gold Standard. Developed jointly by five federal agencies, including the National Security Agency (NSA) and the FBI's National Infrastructure Protection Center, as well as the SANS Institute and the Center for Internet Security (CIS), the Gold Standard benchmark can be used to test Windows 2000 Professional systems running as workstations for proper configuration. Alan Paller, director of research at SANS, said an NSA study of the benchmark concluded that by running it on a network a company could eliminate more than 90% of known vulnerabilities. Claude Bailey, an IT security analyst at one of the nation's largest financial management firms, said that while the Gold Standard is a good starting point, his security administrators say the problem isn't in detecting the vulnerability but in deploying the patches and fixes across an organization of 50,000 employees — and guaranteeing that the patch won't cause more problems. "We tested the original patch [for the SQL vulnerability], and it had problems," said Bailey. Now, with the financial firm in the middle of tax season, there's too much to lose to deploy patches that break other parts of the network.

2003-02-05 **study Slammer worm fastest ever SQL Server Microsoft vulnerability**

NIPC/DHS

February 03, IDG News Service — Study: Slammer was fastest-spreading worm yet.

A just-completed study into the Slammer worm, which hit the Internet a week ago, has concluded that Slammer was the fastest-spreading worm yet seen. The study was conducted by a group of experts representing the Cooperative Association for Internet Data Analysis (CAIDA); the International Computer Science Institute; security company Silicon Defense; the University of California, Berkeley's electrical engineering and computer sciences department; and the University of California, San Diego's computer science and engineering department. Slammer's spread was fast for several reasons. At just 376 bytes in size, the worm and required headers fit inside a 404-byte Universal Datagram Protocol packet. Code Red, which hit in mid-2001, was 4KB in size. The worm also worked differently from Code Red. Slammer generated random IP addresses and dispatched itself to those addresses without scanning to find out whether the target machine was running either of the two pieces of software that were vulnerable to attack: Microsoft Corp.'s SQL Server 2000 database and MSDE 2000 (Microsoft SQL Server 2000 Data Engine). Because of its random nature, given enough time, the worm would hit all vulnerable machines. Spread of the worm eventually began to slow because bandwidth from infected machines to the Internet couldn't support the exponential growth in IP packets being generated. Its signature, attacking a specific port on vulnerable systems, was also easy to detect, and network-level blocking of the ports in question was effective in slowing the worm. In the past, worms often targeted only software for which there was a large installed base of users. But given the speed with which Slammer-like worms can spread, less popular software now also presents a viable breeding ground for worms, the report said.

Category 14.2 *Worms*

2003-03-11 **worm network Windows passwords target F-Secure**

NIPC/DHS

March 10, IDG News Service — New worm targets weak Windows passwords.

A new worm, W32/Deloder-A (Deloder), appeared on Sunday and is considered a low risk for infection, according to an alert posted by anti-virus company F-Secure. The worm, which is believed to have originated in China, attempts to connect to other computers on a network through TCP (Transmission Control Protocol) port 445, randomly generating IP addresses to locate vulnerable machines. If the worm succeeds in breaking the Administrator account password, it places copies of a backdoor (trojan) program known as "inst.exe" in several locations on the infected machine. Machines running Windows 95, 98, NT, 2000, ME and XP are vulnerable to attack by Deloder, Symantec said. No infections from Deloder have been reported and most firewalls block access to port 445. Computer users are advised to contact their anti-virus company for further details.

Category 14.2 *Worms*

2003-03-12 **worm network Code Red II variant discover Internet Information System IIS infect**

NIPC/DHS

March 11, eWEEK — New variant of Code Red II discovered.

Security experts are watching a new variant of the Code Red II worm that began appearing on some monitoring networks Tuesday. The worm is nearly identical to its ancestor, save for a modified drop-dead date that is now several thousand years in the future. Known as Code Red.F, the worm uses the same infection method as the previous versions, attacking Web servers running Microsoft Corp.'s IIS software. The worm so far has infected only a few machines, and because most administrators patched their servers after the initial Code Red outbreak in 2001, it is unlikely to spread extensively, experts say. All of the Code Red worms exploit an unchecked buffer in the Index Server in the IIS software. They then spread by infecting one machine and then scanning a list of random IP addresses and attempting to connect to port 80. The original Code Red, which struck in July 2001, infected several hundred thousand IIS servers and caused massive traffic disruptions on some portions of the Internet.

Category 14.2 *Worms*

2003-03-19 **worm network vulnerability lax security policy**

NIPC/DHS

March 17, eWEEK — Deloder, Lovgate worms mark perils of slack security policy.

Many computer users persist in using their names or children's birthdays as log-on credentials, and two recent worm outbreaks have shown why that's such a risky practice. Deloder, the latest worm to hit vulnerable Windows machines, as well as a recent version of Lovgate, both use a list of common passwords in an attempt to compromise computers. Lovgate began spreading late last month, while Deloder appeared last week. Although neither worm has spread as far or as fast as threats such as SQL Slammer or Code Red, both Deloder and Lovgate clearly illustrate the danger inherent in lax security policies. In Deloder's case, the worm tries to connect to random Windows NT, Windows 2000 and Windows XP machines on TCP port 445, normally used by Microsoft Corp.'s Active Directory. It then looks for network shares on the remote machine and, if it finds any, tries to copy itself to the shares by using easily guessed passwords to gain access. The worm also installs a Trojan horse and a utility for executing commands on remote machines. Lovgate behaves in a similar fashion. It spreads from an infected machine using the Messaging API Windows functions by answering recent mail with an infected reply. It then tries to copy itself to network shares and their sub-folders. If the folders are password- protected, Lovgate tries passwords such as "admin" and "123."

2003-03-21 **Iraq war worm network social engineering spy satellite photos entice**

NIPC/DHS

March 18, Sophos — Swedish computer worm lures with Iraq spy satellite photos.

Sophos researchers report that they have discovered a new email-aware worm that feeds on public interest in the imminent war in Iraq in an apparent attempt to lure unsuspecting users. The W32/Ganda-A worm, which appears to have been written in Sweden, uses a variety of different email subject lines and message bodies in both English and Swedish to try and encourage computer users to run its viral attachment. Possible subjects are "Spy pics," "GO USA" and "Is USA always number one?" In a bizarre twist, the author of W32/Ganda-A claims to have a grievance with the Swedish educational system. Companies should consider blocking all Windows programs at their email gateway. Computer users should keep their anti-virus software updated.

Category 14.2 *Worms*

2003-05-19 **e-mail worm Palyh internet masking support@microsoft.com F-Secure registry windows address directories**

NIPC/DHS

May 19, IDG News Service — Palyh worm disguises itself as an email from Microsoft.

A mass-mailing e-mail worm known both as W32/Palyh and W32.HLLW.Mankx@mm is spreading on the Internet, masking itself as a message from support@microsoft.com. The worm arrives as an executable attachment to e-mail messages with a variety of subjects and messages. The virus can be released only when a user clicks on the attachment file, anti-virus company F-Secure Corp. said. Once released the virus code modifies the Windows registry so that the worm program is launched whenever Windows is run. It also searches an infected computer for files containing e-mail addresses that it can send itself to and looks for computers that are accessible through shared directories on a network and copies itself to those machines. Anti-virus vendors are advising customers to update their anti-virus software.

2003-06-05 **Bugbear virus internet logging keystrokes PCs confidential information**

NIPC/DHS

June 05, Reuters — Variant of Bugbear virus spreading on PCs.

A variant of the Bugbear worm, which spread around the Internet last October, opening back doors on computers and logging keystrokes, has started to infect users around the world, putting them at risk of losing confidential information. According to Mikael Albrecht of computer security company F-Secure, the worm includes a large list of domains belonging mostly to banks. "The list...includes banks from all over the world; Europe, US, Asia and Africa. Bugbear.B changes system settings if activated in one of these banks," he said. The worm variant is better at using addresses in a user's e-mail program than the original, sending itself to those addresses using the infected user's identity, said David Emm of anti-virus company Network Associates Inc. Once activated, Bugbear.B tries to disable some security programs and starts to snoop on an infected system. Bugbear.B takes advantage of a known vulnerability in Microsoft Corp.'s Internet Explorer and can be run automatically simply by reading the e-mail and not opening the attachment. Users are advised to keep their anti-virus software updated.

2003-06-26 **Sobig.E worm computer networks CERT Carnegie Mellon web browser cache hard drives**

NIPC/DHS

June 26, Computerworld — Sobig.E worm spreading around globe.

The latest version of the Sobig worm, Sobig.E, has been making its way through computer networks around the world since Wednesday. The worm spreads by scouring an infected computer's hard drive for e-mail addresses in address books or even Web browser cache files, then sends itself out to the addresses it finds. It can spoof its sender's address, so the recipients believe they are receiving a message from someone they know. Graham Cluley of anti-virus software vendor Sophos says the new version of Sobig, which is set to expire on July 14, is being sent as a .zip file, perhaps to allow it to spread in corporate environments where .exe and other file types are automatically blocked in incoming e-mails. Marty Lindner of the CERT Coordination Center at Carnegie Mellon University in Pittsburgh, said the rapid spread of the worm since yesterday means recipients are still opening files in messages even when they have been warned countless times that it's unsafe to do so. Users should update their anti-virus software and should not open unsolicited attachments.

2003-06-30 **computer virus data leakage Harvard university bugbear.b machine infection student records**

NIPC/DHS

June 30, U-Wire — Computer virus leaks files from Harvard.

The Bugbear.b virus hit the Harvard University campus June 6. When Bugbear.b infects a machine, it sends messages to recipients in an individuals' address book. In addition to a virus-laden attachment, such e-mails often contain text fragments from files on that machine, which may include documents and private correspondence. Harvard students reported receiving seemingly misaddressed messages bearing harmless communications. But at least one message received by at least three Harvard undergraduates contained a confidential memo concerning a case before the Administrative Board. Educational privacy law can penalize institutions who negligently or intentionally transmit their students' records. Director of Harvard Arts and Sciences Computer Services Frank Steen said that his department reacted quickly to the Bugbear virus and that the actual number of computers infected was minimal.

2003-08-11 **W32/Blaster worm DCOM vulnerability RPC Remote Procedure Call msblast.exe denial of service**

NIPC/DHS

August 11, CERT/CC — CERT Advisory CA-2003-20: W32/Blaster worm.

The W32/Blaster worm exploits a vulnerability in Microsoft's DCOM RPC interface as described Microsoft Security Bulletin MS03-026. Upon successful execution, the worm attempts to retrieve a copy of the file msblast.exe from the compromising host. Once this file is retrieved, the compromised system then runs it and begins scanning for other vulnerable systems to compromise in the same manner. In the course of propagation, a TCP session to port 135 is used to execute the attack. However, access to TCP ports 139 and 445 may also provide attack. The worm includes the ability to launch a TCP SYN flood denial-of-service attack against windowsupdate.com. Unusual or unexpected traffic to windowsupdate.com may indicate a network infection, so system administrators may wish to monitor network traffic. Sites that do not use windowsupdate.com to manage patches may wish to block outbound traffic to windowsupdate.com. Users are encouraged to apply the patches available on the Microsoft Website:
http://www.microsoft.com/technet/treeview/default.asp?url=/technet/security/bulletin/MS03-026.asp.

2003-08-12 **MsBlast LoveSan Blaster microsoft update worms server target DHS copy cat attacks TCp UDP**

NIPC/DHS

August 12, U.S. Department of Homeland Security — Potential for Significant Impact on Internet Operations Due to Vulnerability in Microsoft Operating Systems (2nd UPDATE: Worm Spreading on the Internet).

The Department of Homeland Security (DHS) has issued a second update to the July 24, 2003 advisory on Microsoft operating systems. Today's update warns that malicious code dubbed "MSBlast," "Lovesan," or "Blaster" began circulating on the Internet on August 11th. This worm takes advantage of the vulnerability discussed in the July 24th advisory and contains code that will target Microsoft's update servers on August 16th. This additional attack could cause significant Internet-wide disruptions. It is possible that other worms based on this vulnerability will be released over the next few days as "copy cat" attacks. In this 2nd update, DHS recommends that the Microsoft update (available at http://microsoft.com/technet/treeview/default.asp?url=/techn et/security/bulletin/MS03-026.asp) be applied as soon as possible to the systems affected. In addition to blocking the TCP and UDP ports listed in the July 24th advisory, DHS further recommends that Ports 69 (TFTP) and 4444 be blocked when possible. Both of these ports are used to spread the worm.

2003-08-13 **Blaster worm fix patch download site microsoft NT 2000 XP LoveSan Comcast Corp cable modem**

NIPC/DHS

August 13, eWEEK — Worm: long wait for fix.

Computer users were scrambling Wednesday, August 13, for alternate fixes for the havoc wreaked by the Blaster worm as many people were unable to reach Microsoft Corp.'s main patch download site. The Windows Update Web site was extremely sluggish Tuesday and Wednesday, and some users reported being unable to reach the site at all. The Blaster worm, also known as LoveSan, began infecting Windows NT, 2000 and XP machines Monday and continues to spread rapidly. The worm exploits a vulnerability in the Windows RPC (Remote Procedure Call) service and uses a lot of bandwidth scanning for other vulnerable machines once it has infected a PC. Microsoft made a patch available for the flaw in mid-July. Blaster is also causing service problems on Comcast Corp.'s cable modem network. Several Comcast customers said their service had been down for extended periods during the last couple of days and that Comcast officials said Blaster was to blame.

2003-08-18 **MS-RPC DCOM worm infeting machines DoS Denial Service nacho welchia msblast.d ICMP**

NIPC/DHS

August 18, U.S. Department of Homeland Security — New version of the MS-RPC DCOM Worm infecting machines and creating Denial of Service Conditions.

A new worm that exploits the same security weakness as the Blaster worm (also known as "lovsan" or "msblast") has been released on the Internet. This new worm, dubbed "nachi", "welchia", or "msblast.d" does not infect systems that have been updated to counter the Blaster worm but will re-infect computers that are currently infected with Blaster or one of its variants. It deletes the original worm, patches the system by downloading the update from Microsoft, and replaces the original worm with itself. The variant then begins scanning or flooding the network with high volumes of ICMP (Internet Control Message Protocol) traffic causing network congestion which can result in denial of service conditions. Users should patch the MS-RPC DCOM vulnerability immediately using the instructions available on the Microsoft Website: http://www.microsoft.com/security/incident/blast.asp.

2003-08-21 **virus network hacker Windows spread Sobig**

NewsScan

SOBIG IS FASTEST-SPREADING VIRUS EVER
The newest version of the Sobig virus is said to be the fastest-spreading network virus ever, and MessageLabs (a company that filters e-mail for corporate clients) intercepted more than a million copies of the "Sobig.F" virus in a single day — or one in every 17 e-mail messages the firm scanned. The virus spreads through Windows PCs via e-mail and corporate networks, and deposits a Trojan horse, or hacker back door, that can be used to turn victims' PCs into relayers of spam e-mail. Yesterday, a worm virus brought down the signaling systems of railroad company CSX Corp, causing delays and canceled trains through the Eastern states. (Dow Jones/AP/SJMN 21 Aug 2003)

2003-09-19 **internet explorer worm Anti-Virus companies Swen Gibe KaZaA Outlook Express shared networks e-mail Microsoft Corp. victim computer attachment patches Trojan Horse**

NIPC/DHS

September 19, Reuters — New worm targets Internet Explorer.

Anti-virus companies warned on Thursday, September 18, of a new computer worm circulating through e-mail that purports to be security software from Microsoft Corp. but actually tries to disable security programs that are already running. The worm, dubbed "Swen" or "Gibe," takes advantage of a two-year-old hole in Internet Explorer and affects systems that have not installed a patch for that security hole, according to an Internet security company. The malicious program arrives as an attachment to an e-mail pretending to contain a patch for holes in Internet Explorer, Outlook and Outlook Express and then mails itself off to addresses located on the victim's computer. The worm also can spread over Internet relay chat and the Kazaa peer-to-peer network, as well as copy itself over shared networks. Microsoft has cautioned customers in the past against e-mail software updates, saying it does not distribute patches as attachments, but rather directs them to its website.

2003-11-04 **virus worm network Web Internet SMTP engine**

NIPC/DHS

November 03, vnunet.com — Destructive MiMail variant hits Web.

Antivirus firms have warned of a destructive worm that has just emerged in the wild. The W32/Mimail.c@MM, also known as Mimail.c, is a dangerous worm that bears similarities to W32MiMail@MM. Mimail.c contains its own SMTP engine for constructing messages, and mails itself as a zip or upx attachment. After being executed, Mimail.c e-mails itself out as an attachment with the filename 'Photos.zip'. Target e-mail addresses are harvested from the victim's machine and are written to the file eml.tmp in WinDir. Users should immediately delete any email containing the following 1) Subject: Re[2]: our private photos [plus additional spaces then random characters] 2) Attachment: 'photos.zip' (12,958 bytes) which contains 'photos.jpg.exe' (12,832 bytes). Also, in a bid to make the virus e-mails less conspicuous, the 'From' address of infected outgoing messages may be spoofed with james@(target domain.com) - for example, james@abc.com.

2003-12-24 **Sober virus worm network anti-virus threat file sharing peer-to-peer mass-mailer**

NIPC/DHS

December 22, eSecurity Planet — Sober mutant starts to squirm. Anti-virus vendors on Monday, December 22, issued upgraded threat warnings for a mutant of the W32/Sober-C worm now squirming its way through e-mail in-boxes. The mass-mailer, which also spreads via file-sharing on P2P networks, has added a bilingual element and arrives with a range of attachment filenames—EXE, SCR, PIF, COM, CMD or BAT. Chris Beltoff of Sophos Inc. said the increased sightings of a mass-mailing virus at the height of the Christmas shopping season puts new PC owners at the highest risk. "The risk is high because of the new, unprotected computers that are being sold off the shelf. Depending on how long that PC has been sitting on the shelf, it's likely new PCs are unprotected against the latest viruses. Remember, the average consumer isn't going to make patching his main priority on a new computer, Beltoff said. Network Associates warned that 80 percent of the intercepted virus comes from Germany and said the characteristics of Sober-C has put Germans or users in German-speaking regions at higher risk.

2004-01-08 **new worm network warning Sophos**

NIPC/DHS; http://www.esecurityplanet.com/alerts/article.php/3295121

January 05, esecurityplanet.com — Multi-component worm searches for weak system passwords.

Sophos issued a low-level alert for W32/Randon-AB, a multi-component network worm that attempts to spread by copying components of itself to and executing them on remote ADMIN$ shares with weak passwords, on Monday, January 5. One component of the worm, B4AK.EXE, then attempts to download and execute a copy of the worm from a remote URL as a file called C:\SVCHOST.EXE. The main file is an SFX EXE which creates a folder called AL within the Windows system folder and drops and executes several files, some of which are legitimate utilities or innocuous files. The worm adds an entry to the registry Run Key to run H00D.EXE on system restart. Instructions for removing worms are at http://www.sophos.com/virusinfo/analyses/w32randonab.htm l

2004-01-08 **MSBlaster worm network patch clean-up removal tool infection Microsoft Windows XP Nachi**

NIPC/DHS; http://www.theregister.co.uk/content/56/34751.html

January 07, Register — Microsoft releases Blaster clean-up tool.

Microsoft this week released a tool to clean up systems infected by the infamous Blaster worm and its sundry variants. The software should eradicate the worm from infected Windows XP and Windows 2000 machines. However, users will still have to apply the original patch to prevent re-infection. Normally, such clean-up technology is left to antivirus firms. But this isn't a normal viral epidemic: ISPs say the worm is still generating malicious traffic, months after its first appearance. Microsoft's Windows Blaster Worm Removal Tool will disinfect machines infected with either the Blaster or Nachi worms. Nachi, released shortly after the first appearance of Blaster in August, was designed to patch vulnerable systems. Rather than help out, Nachi has instead become a serious nuisance. Its aggressive scanning behavior blighted the operation of many networks - hence the need to kill the "cure", along with the original Blaster worm. The tool is available at http://www.microsoft.com/downloads/details.aspx?FamilyID=e70a0d8b-fe98-493f-ad76-bf673a38b4cf&displaylang=en

2004-01-09 **worm variant Mimmail network e-mail Sophos**

DHS/IAIP Update; http://www.sophos.com/virusinfo/analyses/w32mimailn.html

January 08, esecurity Planet — Yet another Mimail variant surfaces.

On the heels of the Mimail.P worm surfacing on Wednesday, January 7, security vendor Sophos issued an alert for the N variant on Thursday, January 8. Like Mimail.P, W32/Mimail-N is a mass-mailing worm that disguises itself as a legitimate form from Paypal credit card information. If a network connection is detected on execution then two forms are displayed asking for credit card and personal information. Once this information is filled in, it is sent to a remote web site. If a network connection is not detected then the start page of Internet Explorer is changed to a web site with a satirical picture. The worm copies itself to ee98af.tmp and winmgr32.exe in the Windows folder and sets the following registry entry so that the latter is run on system startup: HKLM\Software\Microsoft\Windows\CurrentVersion\Run\WinMgr32. This variant also creates a zipped copy of itself as zipzip.tmp in the Windows folder and drops the fake forms as index.hta and index2.hta to the root folder. The worm scans files on the hard disk for email addresses and stores the result in outlook.cfg in the Windows folder. Instructions for removing this variant are at

2004-01-20 **worm Bagle-A speading Microsoft calculator disguise**

NewsScan

NEW COMPUTER WORM: BAGLE-A

A new computer worm called Bagle-A carries an expiration date, giving security experts concern that it might be followed by more robust versions of the now-buggy program. Daniel Zatz, security director for Computer Associates Australia, says, "One of our biggest concern is that if we look back a year ago at the Sobig variants, they all had drop-dead dates, and every time one hit that drop dead date a new variant came out; a new and improved variant of it." Bagle-A arrives in e-mail inboxes as a message containing text suggesting the e-mail may be from a system administrator, as well as an executable attachment. PC users should not open the attachment; if they suspect their computers may be infected with the virus, they should look for a file called bbeagle.exe in their Windows System directory. The file disguises itself under the Microsoft calculator icon. (CNet/New York Times 20 Jan 2004)

2004-01-20 **worm networkshare infect weak password**

NIPC/DHS; http://esecurityplanet.com/alerts/article.php/3299981

January 15, eSecurityPlanet — Worm copies itself to network shares with weak passwords.

W32/Rirc-A is a worm that spreads by copying itself to network shares protected by weak passwords at random IP addresses, according to Sophos, which issued an alert Thursday, January 15. When first run, W32/Rirc-A copies itself to the Windows System folder and appends its pathname to the shell= line in the [Boot] section of \System.ini, so that it is run automatically each time Windows is started. On versions of Windows NT, 2000 and XP the worm also appends its pathname to the following registry entry to run itself on startup:HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon\Shell. Each time the worm runs it tries to connect to random IP addresses on port 139. The worm attempts to logon to the Administrator account of remote computers using a list of 'weak' passwords and if the schedule service is active on the remote computer the worm schedules a new job to run the worm. It also attempts to connect to a remote IRC server and join a specific channel, then sends status information to this channel. More information and instructions for removing the worm can be found at:
http://www.sophos.com/virusinfo/analyses/w32rirca.html

2004-01-21 **Bagle Internet worm infect spread**

NIPC/DHS; http://www.cnn.com/2004/TECH/internet/01/19/bagle.virus.ap/index.html

January 20, Associated Press — 'Bagle' e-mail worm spreading fast.

A new Internet virus was spreading fast throughout Asia, Australia and Europe but computer security experts were divided on the seriousness of the threat from the "Bagle" worm. Experts expected some impact in the U.S. when people returned to work Tuesday, January 20, after a holiday weekend. The "Bagle" or "Beagle" worm arrives in an e-mail with the subject "hi" and the word "test" in the message body. If the accompanying attachment is executed, the worm is unleashed and tries to send itself to all e-mails listed in the user's address book. Sometimes the attachment is designed to look like a Microsoft calculator, said David Perry, spokesman for antivirus software firm Trend Micro Inc. The virus only affects machines running Microsoft Windows operating systems. The worm started spreading on Monday, January 19, and most corporations have already protected themselves against it, Perry said. Carey Nachenberg, chief architect of Symantec Research Labs, said home users, not corporations, were most at risk because companies had protected themselves quickly. "We could see this fizzle out in several days," Nachenberg said. "Or we could also see a lot of people infected" if they don't update their antivirus software.

2004-01-27 **MyDoom virus worm e-mail executable spread**

NewsScan

'MYDOOM' VIRUS MAKES THE ROUNDS

A new worm is wending its way through corporate networks, masquerading as a normal e-mail message but containing malicious code that propagates itself by mass-mailing more messages at the rate of 200 per minute. It also props open a "backdoor" that leaves the infected computer vulnerable to further misuse. Symantec said the worm — dubbed "Mydoom," "Novarg" or "WORM—MIMAIL.R" — appears to contain a program that logs keystrokes on infected machines, enabling it to collect the username and passwords of unsuspecting users. Network Associates, however, disputed that assertion, saying it had not found any keylogging program. The Mydoom worm spread rapidly yesterday, with about 3,800 infections found within 45 minutes of its initial discovery. "As far as I can tell right now, it's pretty much everywhere on the planet," says Vincent Gullotto, VP of Network Associates' virus response team. The subject lines can vary, but may include phrases like "Mail Delivery System" or "Mail Transaction Failed." The attachments are generally ".exe," ".scr," ".cmd," or ".pif" files and may be compressed as a Zip file. (AP/New York Times 27 Jan 2004)

2004-02-02 **MyDoom SCO worm SoBig denial-of-service DoS network Internet**

RISKS 23 17

MYDOOM AND SCO

Contributor Steve Wildstrom writes about the effects of worm MyDoom's denial-of-service attack on SCO's Website in February 2004. He thinks MyDoom had little impact "on the performance of the Internet as a whole." He says that sco.com was not available for the most part starting from Wednesday, January 28. Because of the worm, SCO had to move its Website to www.thescogroup.com. Wilstrom says that judging from the way they handled MyDoom, network administrator were getting better at mitigating worm attacks. In another article about MyDoom, contributor Chris Smith discusses why the worm affected his e-mail account badly. The week of January 26, 2004, Smith received over 30,000 e-mail due to MyDoom. This was about 1000MB worth of messages. He thinks he was so badly hit because he has the popular last name 'Smith', but refuses to believe that his own name is a security risk. Smith thinks MyDoom could have been stopped by the "[I]mplementation of something like Sender Permitted From (SPF)" information in e-mails.

2004-02-03 **Microsoft MyDoom DoS denial of service worm network attack**

DHS IAIP Daily;
http://story.news.yahoo.com/news?tmpl=story&cid=569&ncid=738&e=1&u=/nm/20040203/tc_nm/tech_microsoft_dc

February 03, Reuters — Microsoft site appears to weather MyDoom attack.

Microsoft Corp. appeared to have survived the worst the MyDoom worm could throw at it Tuesday. Experts say the virus, a variant of the myDoom.A virus that knocked out another company's Website Sunday, was programmed to fire continuous volleys of debilitating data at Microsoft's site Tuesday. But there was no visible impact on the software company's Web site, which barely flickered as the MyDoom.B Internet worm's trigger time of 8:09 EST passed. MyDoom.B is a low-grade variant of the original MyDoom.A virus, the fastest-spreading e-mail contagion to ever hit the Internet. MyDoom.A has infected hundreds of thousands, and possibly over one million, PCs, generating a torrent of spam e-mails and crippling corporate e-mail servers, plus slowing traffic for some Internet service providers.

2004-02-26 **Netsky worm UK email vector F-Secure propagation**

DHS IAIP Daily; http://www.vnunet.com/News/1153081

February 26, Vnunet.com — Security vendor mass-mails worm to clients.

Antivirus firm F-Secure has apologized for sending the Netsky.B virus to several thousand of its UK customers and partners via a mailing list. The e-mail apology said: "Because of a human error, you may have received an email infected with the Netsky.B virus that was relayed through our external email list server and was resent to our UK mailing list. The virus did not originate from our network -- it was sent by an unknown party to the list address. If you had up-to-date antivirus installed, the virus has been stopped automatically already and no further steps are necessary on your part." Mikko Hypponen, F-Secure's director of antivirus research, said the mailing list was outside of the firm's normal e-mail scanning. The Netsky.B worm spreads itself in e-mails inside a .zip archive or as an executable attachment. It also copies itself to shared folders of all available drives. This allows the worm to spread through peer-to-peer and local networks.

2004-03-04 **worm network attach Bagle variant Netsky e-mail**

NIPC/DHS

March 03, eWEEK — Tenth variant of Bagle worm hits the Net.

Anti-virus researchers discovered the existence of Bagle.J, the tenth variant of the worm to hit the Internet, late Tuesday, March 2. Officials at Network Associates Inc. have rated the worm as a medium risk and said they saw 50 unique samples of Bagle.J in a 90-minute period. Bagle.I also surfaced Tuesday, with Bagle.H appearing Monday. Recent speculation among anti-virus researchers that the creators of the NetSky and Bagle viruses may be engaged in some kind of competition or war has now apparently been proven true. The virus writers have been leaving profane, derogatory messages for one another in the new variants of their respective viruses during the last few days, experts say. Like its predecessors, this version relies heavily on social engineering to entice recipients into opening the e-mail and infected attachment.

Category 14.2 *Worms*

2004-03-08 **worm network Sober.D SMTP engine masquerading Microsoft update e-mail attachment executable**

NewsScan

NEW WORM MASQUERADES AS MS UPDATE

The latest variation on the Sober worm — Sober.D — tries to trick recipients into opening it by disguising itself as a Microsoft Update message. "It arrives in an e-mail that pretends to be a patch to protect against a version of MyDoom," says a senior consultant at antivirus firm Sophos. "The e-mail appears to be a Microsoft patch so people will of course double-click on that attachment." Once a user clicks on the file, the worm scans the PC to see if it's already infected — if not, it installs itself and uses its own SMTP engine to send copies of itself to e-mail addresses found on the victim's PC. Microsoft emphasizes that it does not send patches via e-mail and that users should ignore such messages. (ZDNet 8 Mar 2004)

2004-03-15 **Internet worm network password trick foil filters Bagle**

NewsScan

LATEST E-MAIL WORMS USE PASSWORD TRICK TO FOIL FILTERS

The most recent versions of the pesky Bagle worm — Bagle N and Bagle O — arrive in a compressed and password-locked .zip or .rar file with the password included in the body of the e-mail along with a message urging the recipient to open it right away. This latest technique is designed to foil corporate e-mail filters that may block ordinary zipped attachments but allow password-protected documents to pass through the network's defenses unimpeded. Once the attachment is unlocked, the worm is then forwarded to everyone in the victim's e-mail address book. "The worm's author is sneakily trying to make it more difficult for antivirus products to scan inside the password-protected files," says Graham Cluley, a researcher with U.K cybersecurity firm Sophos. (New Scientist 15 Mar 2004)

2004-03-16 **worm network attack defense failure Bagle variant ZIP**

NIPC/DHS

March 15, TechWeb News — New Bagle worm variants sneak past defenses.

Two new versions of the Bagle worm, Bagle.n and Bagle.o, were spotted over the weekend. Unlike earlier editions of Bagle, which tried to circumvent anti-virus software by placing the worm payload into an encrypted .zip archive, the new Bagles may also use a different archive format, .rar, a file type that consumers are unfamiliar with and enterprises may not block at the gateway. Additionally, Bagle.n and Bagle.o include the password to the .rar and .zip files in the message not as text, but as an embedded graphic, a tactic often used to discourage automated e-mail account creation by spammers or by Websites to prevent spam bots from harvesting e-mail addresses. When Bagle first turned to encrypted .zip files to disguise its payloads, anti-virus firms reacted by scanning the message for the in-text password. Shifting to an image of the password may make it tougher for anti-virus programs to unlock the .rar file. The new Bagles randomly attach their code to 32-bit executables on the infected machine's hard drive and then re-infect a supposedly cleaned system once the executable runs.

2004-03-19 **worm network Internet Bagle Outlook flaw exploit**

NIPC/DHS

March 18, ZDNet UK — Bagle uses Outlook flaw to speed replication.

Until the appearance of Bagle variants Q, R and S, users had to click on an e-mailed attachment to be infected by the worm. The latest Bagle incarnation has done away with the attachment altogether and spreads when a vulnerable user opens the email using an unpatched version of Microsoft Outlook. If their Outlook preview pane is open, the victim's machine will be compromised automatically. Graham Cluley of Sophos said: "This has the potential to spread very quickly because so many people, particularly home users, have not applied the patches." Mikko Hyppönen of F-Secure said that the latest variant uses a list of about 600 IP addresses, which all seem to be home computers connected to an ADSL service that have been infected by previous versions of Bagle. These "zombie" machines have been updated and are now used to send copies of the new worm to any computer on which the victim uses a vulnerable copy of Outlook to view an infected email message. Outlook uses elements of Internet Explorer to render the HTML for its preview pane, so to avoid the new Bagle worms, users should apply a patch for Internet Explorer that Microsoft released in October 2003.

2004-03-22 **worm network attack security vulnerability flaw exploit firewall BlackIce RealSecure denial-of-service hard disk**

NIPC/DHS

March 20, Washington Post — 'Witty' worm wrecks computers.

A quickly spreading Internet worm exploited a security flaw in a firewall program designed to protect PCs from online threats on Saturday, March 20, computer experts said. The "Witty" worm writes random data onto the hard drives of computers equipped with the Black Ice and Real Secure Internet firewall products, causing the drives to fail and making it impossible to restart the PCs. Unlike many recent worms that arrive as e-mail attachments, it spreads automatically to vulnerable computers without any action on the part of the user. At least 50,000 computers have been infected so far, according to computer security firm iDefense and the SANS Institute. Most infected computers will have to be rebuilt from scratch unless their owners instead decide to buy new ones, said Ken Dunham of iDefense. Joe Stewart of security services company Lurhq said he expects the worm to die out over the next few hours as vulnerable computers quickly become useless hosts. A patch is available the deveoper of the firewalls, Internet Security Systems:

2004-03-23 **worm network Internet Netsky variant security vulnerability flaw hole exploit**

NIPC/DHS

March 22, eWEEK — Netsky.P spreads through ancient security hole.

A new variant of the Netsky worm, Netsky.P, is spreading quickly. This new variant is very much like other Netsky versions with two differences, according to Vincent Gullotto of the McAfee Avert Virus and Vulnerability Emergency Response Team. The initial seating of the worm, referring to the initial group of users to whom the virus author distributed it, appears to have been in Australia. It's not clear whether or how this would facilitate spreading of the worm, but it is unusual. The other unusual characteristic of this worm is that it utilizes a very old vulnerability in Internet Explorer, the Incorrect MIME Header (MS01-020) bug. This bug, patched almost three years ago, allowed a hostile HTML e-mail to execute arbitrary code if viewed in the preview pane of a mail client. Like other Netsky variants, this one spreads mainly through a built-in SMTP engine to e-mail addresses harvested out of the user's files.

2004-03-29 **worm network Internet Bagle variant e-mail TCP**

NIPC/DHS

March 26, eWEEK — New spawn of Bagle worm unleashed.

Yet another version of the Bagle worm is on the loose and is already causing trouble in parts of Europe. Bagle.U appeared early Friday, March 26, and has begun spreading quickly, even though it contains none of the social engineering tricks that Bagle's author has used to help previous versions succeed. This variant arrives in an e-mail with a blank subject line and no body text. The sending address, as always, is spoofed, and the name of the infected executable attachment is completely random. After execution, the worm mails itself to all of the addresses in the infected machine's address book. Bagle.U does include a backdoor component that listens on TCP port 4751 and connects to a Web server in a German domain, www.werde.de, according to Network Associates Inc. Once it establishes a connection with the remote server, the worm generates a unique ID number for each specific infected machine and sends that number and the number of the port on which it is listening to the server. Bagle.U is set to expire on January 1, 2005.

2004-03-31 **worm network Internet NetSky mass-mailing e-mail**

NIPC/DHS

March 29, CNET News — NetSky variant a greater threat than thought.

Security company Symantec raised its severity rating of the latest incarnation of the NetSky worm. NetSky.Q was upgraded from a level 2 to level 3 threat on the security firm's five-point rating system. The company said it has received 379 reports of the worm since its discovery Sunday, March 28. NetSky is a mass-mailing worm that uses a bogus sender address and continually changes its subject line and content. An e-mail attachment usually carries an .exe, .pif, .scr or .zip file extension. The worm distributes itself to e-mail addresses in a victim's hard drive and copies itself into shared folders via file-sharing programs. NetSky.Q is expected to release a denial-of-service attack between April 8 and April 11 on several Websites, including those of eDonkey2000, Kazaa, eMule, Cracks.am and Cracks.st, according to Symantec.

2004-04-08 **worm virus network Netsky e-mail**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/virus/story/0,10801,91978,00.html

April 08, IDG News Service — New Netsky worms change their stripes.

New versions of the Netsky e-mail worm are spreading on the Internet. Netsky.S appeared Monday, April 5, and Netsky.T was detected Tuesday, April 6. They are the 19th and 20th editions of an e-mail virus that first appeared in February. Like its predecessors, the new Netsky variants target machines running versions of Microsoft's Windows operating system. The viruses arrive as files enclosed in e-mail messages that have faked (or "spoofed") sender addresses and vague subjects such as "Re: My details," "Request" and "Thank You!" according to anti-virus company Symantec Corp. Earlier versions of the Netsky variant abstained from opening communications ports that could be used as back doors that remote attackers could use to gain access to compromised systems. However, the latest Netsky variants open a back door on TCP Port 6789 that could be used to receive instructions or malicious code from the worm author.

2004-04-28 **Netsky worm Website Internet denial-of-service Bagle education Windows registry**

DHS IAIP Daily; http://www.techweb.com/wire/story/TWB20040428S0006

April 28, TechWeb — Netsky.x lays out Websites.

The Netsky.x worm, which hit the Internet over a week ago and targeted a trio of educational Websites for denial-of-service (DoS) attacks, has laid low two of the three in the first day of its scheduled three-day assault. Version X of the persistent Netsky worm launched a DoS attack on nibis.de, medinfo.ufl.edu, and educa.ch, educational sites from Germany, the United States, and Switzerland, respectively. The DoS attacks, which began Wednesday, April 28, by Netsky.x-infected computers, and is to run through Friday, effectively shut down the German and U.S. sites, according to Ken Godskind of AlertSite, a Web monitoring firm. Other variants released after Netsky.x--including Netsky.y and Netsky.z--also targeted the three sites for DoS attacks that could run as long as May 5. The two most recent Netskys, however, dubbed Netsky.aa and Netsky.ab -- which appeared Monday and today, respectively, don't take aim at the educational sites. Instead, Netsky.ab tries to delete the entries of several variations of its rival, Bagle, from the Windows Registry.

May 02, Computerworld — Worm unleashed that exploits latest Windows security holes, Microsoft warns.

Microsoft Corp. issued an unusual weekend security warning Saturday that a worm has been unleashed on the Internet taking advantage of a security hole announced publicly last month. Microsoft once again urged users to install its most recent critical Windows updates. "Microsoft has verified that the worm exploits the Local Security Authority Subsystem Service (LSASS) issue addressed in Microsoft Security Update MS04-011 on April 13, 2004," the company said in an announcement posted yesterday and updated 3 a.m. PDT this morning, May 2. In its security update, Microsoft included a tool that checks for system infection by the Sasser worm. Versions of Windows XP and 2000 are vulnerable, although not XP 64-Bit Edition Version 2003, Microsoft said. Both Symantec Corp. and Network Associates Inc.'s McAfee antivirus unit currently rate Sasser as medium risk, while Computer Associates rates it low risk. Trend Micro Inc. says it issued a yellow alert to its customers. For further information: http://www.microsoft.com/security/incident/sasser.asp

May 03, Reuters — Sasser worm strikes hundreds of thousands of PCs.

The fast-spreading "Sasser" computer worm has infected hundreds of thousands of PCs globally and the number could soon rise sharply, a top computer security official said on Monday, May 3. "If you take a normal Windows PC and connect to the Internet, you will be infected in 10 minutes without protection," said Mikko Hypponen, Anti-Virus Research Director at Finnish data security firm F-Secure. F-Secure says the worm, which surfaced at the weekend, automatically spreads via the Internet to computers using the Microsoft Windows operating system, especially Windows 2000 and XP. "We have already seen three versions of Sasser during the weekend, and we could see more today," Hypponen said. The current worm does not need to be activated by double-clicking on an attachment, and can strike even if no one is using the PC at the time. When a machine is infected, error messages may appear and the computer may reboot repeatedly.

May 03, Agence France Presse — Taiwan's post office hit by worm.

The new Internet worm, Sasser, that is disrupting computers across the world paralyzed a third of the offices of Taiwan's national post office. Some 1,600 work stations at 430 Chunghwa Post Co. offices, 300 of them in the greater Taipei area, were shut down by the virus Monday, May 3. "We started to receive complaints from offices at around 10:00 am saying their computers kept shutting down and rebooting automatically," a company official told Agence France Presse. "Subsequently manual processes had to be initiated while computer systems were down," the official said. The company said the computer virus had not damaged its computer systems and it expected the virus to be removed by 10:00 pm.

2004-05-03 **worm virus malicious code malware Microsoft Windows vulnerability Sasser Netsky link**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,115964,00.asp

May 03, IDG News Service — Experts probe Sasser, Netsky link.

Analysis of the Sasser and Netsky code reveals many similarities between the two worms, even as a new version of the Netsky e-mail worm appeared on Monday, May 3, that capitalized on fears caused by Sasser Internet worms by posing as an antivirus software patch, experts say. Netsky-AC is the thirtieth version of the mass-mailing e-mail worm to be released since Netsky-A appeared in February. Like earlier versions of Netsky, the AC-variant uses e-mail messages and infected file attachments to spread from computer to computer. A message buried in the worm's code and directed to antivirus vendors claims responsibility for Sasser, which first appeared on Friday, April 30. "Hey av firms, do you know that we have programmed the sasser virus?!? Yeah, thats true," the message reads, in part. The message is attributed to "the Skynet," a virus writing group that also claimed responsibility for other Netsky variants. The worm's author or authors included a sample of the Sasser worm raw "source" code as proof of the legitimacy of the claim, says Graham Cluley, senior technology consultant at Sophos.

SASSER WORM IS LATEST THREAT

A fast spreading worm known as "Sasser" surfaced over the weekend and is making its way around the globe, warn computer security experts at Finland's F-Secure. The worm shares many characteristics with the Blaster worm that infected hundreds of thousands of PCs last year, says F-Secure antivirus research director Mikko Hypponen, who notes that both worms exploit relatively new holes in the Windows operating system and frequently cause computers to repeatedly reboot. However, this time more companies appear to be ready to take preventative action, which may mitigate Sasser's damage potential. "With Sasser it seems that companies are (using software) patches better and more quickly than last year (with Blaster), but for those that are hit, they are hit hard," says Hypponen, who adds that he believes Sasser originated in Russia. The worm does not need to be activated by double-clicking on an attachment and can strike even if no one is using the PC at the time. (Reuters/Washington Post 3 May 2004)

May 04, The Australian — Red alert as web worm hits banking.

Staff at Australian banking giant Westpac were forced to revert to pen and paper yesterday as an internet-based computer virus struck Australia and threatened to cause further chaos in the U.S. overnight. Unlike many other viruses, Sasser does not travel by e-mail or attachments and can spread by itself to any unprotected computer linked to the internet. It attacks through a flaw in recent versions of Microsoft's Windows -- Windows 2000, Windows Server 2003 and Windows XP- - and causes the computer to shut down, before rebooting it and repeating the process several times. While it slows down computers, it is not believed to cause long-term damage to the hard drive. Internet security company Trend Micro on Monday, May 3, upgraded Sasser to a "red alert" -- its highest warning level. Westpac confirmed Monday it was investigating network problems caused by Sasser. Branches had switched to pen and paper manual systems to allow them to keep trading, but the bank's ATM and internet banking networks were not hit, spokesperson Julia Quinn said. The bank expected the problem to be resolved and all systems available at the start of business Tuesday, May 4, she said.

2004-05-05 **worm virus malicious code malware Microsoft Windows vulnerability Sasser Netsky**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily-updates/25838-1.html

May 05, Government Computer News — Sasser worms slowing the Internet.

The Sasser family of worms appears to be slowing down Internet traffic and making some destinations unavailable, according to observations by Keynote Systems Inc., a Web performance management company. "Reachability has crept down and we saw a spike in that at 8 p.m. Eastern Time, Tuesday, May 4, accompanied by an upward spike in packet loss," said Kirsten Husak, a consulting manager in the San Mateo, CA, company's professional services division. "It is definitely more than normal Internet variability." But the worms' impact is not as severe as some past outbreaks, such as last year's Slammer. "This doesn't seem to be affecting Web sites nearly as much." Sasser, which exploits a Microsoft vulnerability announced with the release of a patch in mid-April, first appeared May 1, and began spreading rapidly. It is believed to be the first self-executing worm and does not require any recipient action to propagate. It instructs vulnerable systems to download and execute the viral code. By May 3, four variants of the worm were in the wild, and thousands of computers had been infected. The number of infected computers has since been estimated at more than one million.

2004-05-05 **worm virus malicious code malware Microsoft Windows vulnerability Sasser Netsky**

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/internet/05/05/sasser.worm.reut /index.html

May 05, Reuters — Hunt on for Sasser worm culprit.

Security experts began the daunting task on Wednesday, May 5, of trying to track down the authors of "Sasser," a tenacious computer worm expected to infect millions of machines before it runs its course. Home users, corporations, and government agencies throughout Europe, North America and Asia have been hit. Once infected, the vulnerable PC reboots without warning as the compact program hunts for more machines to infiltrate. Microsoft (MSFT.O) said on Wednesday it had not made a decision to issue a reward for information leading to the arrest of the Sasser author. Over the past six months, the software giant has offered three separate $250,000 rewards for previous outbreaks -- so far, with no results. Microsoft said it is working with U.S. law enforcement authorities, including the Federal Bureau of Investigation, to flush out the culprits.

2004-05-05 **sasser creator authorities U.K. teaming up security experts Netsky**

NewsScan

AUTHORITIES TEAM UP ON HUNT FOR SASSER CREATOR

Security experts in the U.K. are teaming up with U.S. law enforcement officials to track down the author or authors of the Sasser worm and are investigating the theory that the creator is part of a Russian group calling itself the "Skynet antivirus group," which also was responsible for the Netsky e-mail virus outbreak. A message found in the code of a recent Netsky variant claimed responsibility for Sasser, but the reasoning behind this latest Internet assault is still murky. "With Sasser, the author seems to be showing off his coding capabilities, but otherwise I have no idea what the motive is," says Raimund Genes, European president of antivirus group Trend Micro. And while Microsoft has yet to decide whether to offer a reward for information leading to culprit, most experts agree if the originators are linked to criminal groups, a bounty offer will have little effect. "If the person doesn't disclose his identity, we will never know the author of this worm or the author of those worms that have caused global epidemics in the past," says Eugene Kaspersky, co-founder of Moscow's Kaspersky Labs. Over the past six months, Microsoft has offered three separate $250,000 rewards for previous outbreaks, but with no results. (Reuters/Washington Post 5 May 2004)

2004-05-06 **worm virus malicious code malware Microsoft Windows vulnerability Sasser**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/virus/story/0,10801,92936,00.html

May 06, Reuters — Security experts warn of nastier Sasser worm.

Computer security experts warned Wednesday, May 5, that the Sasser worm could merge with earlier viruslike programs to wreak more havoc on the Internet. Since appearing over the weekend, the fast-moving Sasser computer worm has hit PC users around the world who run the ubiquitous Microsoft Windows 2000, NT and XP operating systems. It is expected to slow down as computer users download antivirus patches. But Sasser could mutate by combining with the 2-month-old Netsky worm and become a launching pad for further Web attacks, putting it on par with Blaster, the destructive worm that appeared last year and used infected computers to attack Microsoft Corp.'s Web site. "My expectation is that Netsky and Sasser variants will merge and become what we call one 'abundant threat' that attacks through e-mail and software vulnerabilities," said Jimmy Kuo, a research fellow at Network Associates Inc.'s McAfee antivirus unit.

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/internet/05/10/computer.worm.ap/index.html

May 10, Associated Press — New Sasser worm may be circulating.

An 18-year-old German who confessed to creating the "Sasser" computer worm apparently released a new version of the program shortly before he was arrested last week, investigators said Monday, May 10. German investigators said Microsoft had reported some computer users were having problems with "Sasser e," a variation of the original worm. Frank Federau, a spokesperson for the state criminal office in Hanover, said the worm was "a slightly modified form" of the program that raced around the world over the past week, exploiting a flaw in Microsoft's Windows operating system. The suspect likely programmed it "immediately before his discovery," he said. Four versions of Sasser were already known. Police have said the German teenager was responsible for all of them in addition to the "Netsky" virus. The teenager has told officials that his original intention was to create a virus, "Netsky A," that would combat the "Mydoom" and "Bagle" viruses, removing them from infected computers. During that effort, he developed the Netsky virus further -- and after modifying it created Sasser.

2004-05-11 **worm virus malicious code malware Microsoft Windows vulnerability lsass**

DHS IAIP Daily; http://www.esecurityplanet.com/alerts/article.php/3352151

May 11, eSecurity Planet — New worm mimics Sasser, exploits LSASS vulnerability.

The arrest of the alleged creator of the Sasser worms has not been accompanied by a lull in the momentum of computer viruses. Panda Labs has detected the appearance of a new worm, Cycle.A W32/Cycle.A.worm, which, like Sasser and its variants, exploits the LSASS vulnerability affecting some Windows versions in order to infect computers through the Internet. The scenario has changed, however, as indicated by the text found inside the virus code. In this text, the virus creator -- alias Cyclone -- claims to be Iranian and refers to the social and political situation in his country. Cycle.A tries to enter computers through communications port TCP45 in order to check if the system is vulnerable. If it is, the worm causes the affected computer to download a copy of itself called CYCLONE.EXE. However, this will only take place if the application TFTP.EXE is installed on the system. Additionally, and regardless of whether the worm has managed to copy itself to the targeted computer, the attempt by the virus to enter the system causes a failure in the application LSASS.EXE which makes the computer restart every 60 seconds. Users should install the Microsoft patch available from: http://www.microsoft.com/technet/security/bulletin/MS04-011. mspx.

2004-05-12 **worm virus malicious code malware Microsoft Windows vulnerability Sasser German police raid**

DHS IAIP Daily;
http://story.news.yahoo.com/news?tmpl=story&ncid=1212&e=6&u=
/afp/20040512/tc_afp/internet_virus_germany&sid=96001018

May 12, Agence France-Presse — German police raid homes in Sasser computer worm probe.

German police have raided the homes of five people who had been in contact with a teenager arrested last week on suspicion of creating the Sasser computer worm, police spokesman Detlef Ehrike said. Investigators "suspect that other people took part in spreading the worm. The Verden prosecutors office ordered raids in the Rotenburg an der Wuemme region," Ehrike said. The 18-year-old German, whom police have not identified by name, was arrested Friday, May 7, after a raid on his parents' house turned up incriminating evidence. Acting on a tip off from computer giant Microsoft, investigators seized several items from the house, including the teen's personal computer. He faces up to five years in prison for "computer sabotage" if found guilty of creating and spreading the computer worm. The Sasser worm struck on May 1, and in less than a week affected thousands of companies and as many as 18 million computers worldwide, forcing some businesses to shut temporarily in order to debug their systems. The teenager is also suspected of creating Netsky.ac; a worm that also spread across the Internet early last week. "Two suspects have admitted receiving from the author of Sasser the source code for the Netsky worm," Ehrike said, adding that one of them had admitted to "taking part in spreading the Netsky worm."

2004-05-17 **worm virus malicious code malware Microsoft Windows vulnerability Sasser Dabber "good" worm**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/virus/s
tory/0,10801,93154,00.html

May 17, IDG News Service — New worm targets Sasser code flaw.

A new Internet worm called Dabber is believed to be the first worm that spreads by specifically targeting a flaw in another worm's code, according to LURHQ Corp., a managed security services company. Using code written to exploit the FTP flaw, the recently released worm scans the Internet for Port 5554 to identify computers running Microsoft Corp.'s Windows operating system that are infected with Sasser, LURHQ said. When it finds vulnerable hosts, it connects to the victim and uses a built-in FTP server to transfer the worm file, named package.exe, to the system. When it runs, the Dabber worm installs itself on Windows and then shuts down the Sasser worm and other worm processes, preventing them from running again. Dabber also opens TCP Port 9898 as a back door, which can be used by a remote attacker to download other code or communicate with the infected host, LURHQ said. The original advisory and insturctions for shutting down and removing Dabber are available here: http://www.lurhq.com/dabber.html

2004-05-17 **worm vulnerability IRC chat worm krisworm**

DHS IAIP Daily; http://www.esecurityplanet.com/alerts/article.php/3354731

May 17, eSecurity Planet — Worm acts with MIRC client to allow remote access.

IRC/Krisworm-C is a worm used in conjunction with a MIRC client to allow remote access to the host computer, according to Sophos, which issued an alert Monday, May 17. It has the same characteristics as W32/Krisworm-A, a worm that spreads by targeting computers with weak administrator and user passwords. The worm installs several files in the fonts subfolder of the Windows fonts folder, and also attempts to propagate via peer-to-peer (P2P) file-sharing networks. It can also propagate via IRC and via newsgroups. It terminates running antivirus and firewall software. It runs on Windows 95, 98, ME, NT, 2000, and XP. More information at: http://www.sophos.com/virusinfo/analyses/irckriswormc.html

2004-06-03 **Harry Potter game masquerading worm virus Internet Sophos**

NewsScan

POTTER-MANIA FUELS NETSKY.P WORM

The popularity of the latest Harry Potter film, which debuted in Britain Monday, is spurring the resurgence of the Netsky.P worm, which is now disguising itself as a Potter game, warn antivirus experts. Computer security firm Sophos says it has spotted thousands of copies in the last few days. "Echoing a technique used in 2000 by the Pikachu worm, Netsky.P targets young computer users by sometimes posing as content connected with the Harry Potter books and movie franchise," says Sophos senior tech consultant Graham Cluley. "Parents need to educate their children against the threats of viruses, to ensure the popularity of Potter doesn't cast a nasty spell on their computer systems." (BBC News 3 Jun 2004)

2004-08-03 **MyDoom variant Yahoo People Search Internet proliferation SANS report**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1630964,00.asp

August 03, eWEEK — New MyDoom variant uses Yahoo People Search.

Another new version of MyDoom is worming its way through the Internet. MyDoom.P arrives via e-mail, with a spoofed sending address and a subject line designed to make it look like the message is related to one that the recipient sent. The body of the e-mail contains any of a number of sentences, some of which refer to the included Zip file. Once opened, the executable file copies itself to the Windows system directory as "winlibs.exe." The executable contains a list of dozens of common first and surnames that it puts through Yahoo's People Search in an attempt to find more e-mail addresses to mail itself to, according to the Internet Storm Center at The SANS Institute. Researchers on Monday discovered a new version of the Gaobot worm, which spreads through the back doors installed by MyDoom variants, among other avenues of infection. Gaobot.BAJ connects to an IRC server on port 6667 and waits for instructions from the attacker. It then begins scanning the local network for machines sharing resources with the infected PC and tries to copy itself to those machines. Afterward, it begins scanning for PCs infected with any of the MyDoom worms and attempts to install itself through the back door these worms place on infected computers.

2004-08-09 **Bagle worm variant ZIP file Trojan creation viral download**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1633739,00.asp

August 09, eWEEK — Bagle variant exacts a 'price' with infected zip files.

Another variant of the Bagle worm began making its way across the Internet on Monday, August 9. Bagle.AQ arrives via an e-mail message with a spoofed sending address and no subject line. The only text in the message body is typically one or two words, either "price" or "new price." The name of the infected Zip file that accompanies the message is some variation on that theme as well. The files often are named Price.zip or New_price.zip, and may have a number appended to the end of the file name. Some users reported getting as many as 100 infected messages in an hour. If a user opens the Zip file with an application such as Windows Internet 13 Explorer that is not a standalone Zip file handler, the user will see an HTML file that contains exploit code. The file will then execute an included .exe file, which is a Trojan, according to McAfee Inc.'s analysis. The Trojan then connects to a number of remote sites to download the actual viral code. Because it can inject itself into the Explorer process space, the worm's outgoing traffic will appear legitimate to most firewalls.

2004-08-16 **MyDoom worm variant e-mail spread executable file photo Trojan Horse Internet download**

DHS IAIP Daily; http://www.theregister.co.uk/2004/08/16/mydoom_spam/

August 16, The Register — Infected PCs spew MyDoom variant.

The MyDoom worm saga continued Monday, August 16, with the release of yet another variant of the e-mail worm. The latest variant -- MyDoom-S (AKA MyDoom-Q or MyDoom-R) -- poses as a funny photographs in order to dupe users into opening an infectious attachment called photos_arc.exe. MyDoom-S runs when a Windows user clicks on this malicious attachment. Thereafter the worm mass-mails itself to email addresses harvested from the infected machine with the subject line "photos" and message body "LOL!;))))". Like other variants of MyDoom, MyDoom-S tries to download a backdoor Trojan (in this case Surila-G) from one of a number of Websites onto infected PCs. The Trojan allows infected machines to be controlled remotely by attackers in order to send spam, for example.

2004-08-17 **unsecure unprotected personal computer PC worm infection 20 twenty minutes Internet SANS**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/26967−1.html

August 17, Government Computer News — Unprotected PCs can expect infection in minutes.

The average survival time for an unprotected networked computer dropped from 40 minutes to 20 minutes over the last year, according to the SANS Institute of Bethesda, MD. That means that an unprotected PC can expect to become infected by a worm within 20 minutes of being connected to an unprotected network. "The actual time it will take for a specific computer to be compromised will vary widely depending on any filters applied by the Internet Service Provider and the configuration of the operating system," the institute said. But the trend reflects the narrowing window of opportunity for users to adequately protect networked computers from known vulnerabilities. Survival time is figured from daily reports submitted to SANS' Internet Storm Center by volunteers in 70 countries. ISC receives more than one billion reports of probes each month from organizations that manage more than 500,000 Internet addresses. The 20-minute figure represents the overall average time between probes on a targeted PC.

2004-08-19 **Internet worm spread instant messenger IM ICQ Outlook PivX**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,117481,00.asp

August 19, IDG News Service — New worm travels by IM.

Security researchers at PivX Solutions have intercepted new malicious code closely resembling that from widespread attacks in June credited to a worm named "Scob" or "Download.ject." The Scob in June attacks were attributed to a Russian hacking group known as the "HangUP team." The attacks begin with instant messages sent to people using America Online's AOL Instant Messenger or ICQ instant messaging program inviting recipients to click on a link to a Web page. The messages could appear to be sent from strangers or from regular IM correspondents, Larholm says. Victims are routed to Websites hosted on servers in Uruguay, Russia, and the United States. The code on the sites takes advantage of vulnerabilities in Microsoft Internet Explorer and Outlook. Though Microsoft patched those vulnerabilities in MS03-025 and MS03-040, released in 2003, the attackers are attempting to exploit unpatched systems. In addition to opening a "back door" on the victim's computer, the new attacks change the victim's Web browser home page or Outlook e-mail search page to Websites featuring adult content, Thor Larholm of PivX says. "And as with the Scob attacks, this is all about money--in this case, driving ad revenue for specific people."

2004-12-09 **worm outbreak Netsky-P worst Sophos Security report German teenager Sven Jaschan**

DHS IAIP Daily; http://www.govtech.net/?pg=news/news&id=92407

NETSKY-P TOPS LIST OF YEAR'S WORST VIRUS OUTBREAKS

Sophos, a leading security company, released a report revealing the hardest hitting viruses of 2004. In a year which saw a 51.8 percent increase in the number of new viruses, the Netsky-P worm has accounted for almost a quarter of all virus incidents reported, making it the hardest hitting virus of 2004. Sophos researchers have identified 10,724 new viruses so far in 2004 bringing the total viruses in existence to 97,535. German teenager Sven Jaschan, who wrote both the Netsky and Sasser worms, is responsible for more than 55 percent of all virus reports in 2004. Jaschan was apprehended and confessed to his involvement in May 2004, but his worms continue to spread. In November 2004, eight months since its original discovery in March, Jaschan's Netsky-P worm was still the world's most widely reported virus. Also, the United States continues to lead the world in spam, accounting for more than two of every five spam emails. Over 40 percent of spam comes from PCs that have been hijacked by viruses. Despite an increase in law enforcement, the volume of threats, such as viruses and spam, continues to rise.

2004-12-28 **Cabir smart phone worm source code released Internet Kaspersky F-Secure**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1745949,00.asp

December 28, eWeek — Source code for Cabir cell phone worm released.

Anti-virus vendors are bracing for a deluge of new and potentially dangerous mutants of the Cabir worm on smart phones running the Symbian Series 60 software. That's because the source code used to create the original Cabir worm has been posted on the Internet by a member of an international virus-writing group. According to an advisory from Kaspersky Lab senior virus analyst Aleks Gostev, the Cabir source code was previously accessible only to a limited number of people, including members of 29A, an international virus-writing group. According to information released by security research firm F-Secure, at least seven Cabir variants and one new strain of the Skulls Trojan have been detected this month alone. The first Cabir worm was discovered in June. F-Secure virus tracker Jarno Niemela said all the new variants appear to be recompiled versions based on original Cabir source code, confirming fears that the source code has been made public. Even though the worm has not been directly destructive or malicious, it is capable of blocking normal Bluetooth connectivity and completely draining the battery power from the infected phone.

2005-01-17 **virus worm masquerading Tsunami disaster donation hoax mass mailer**

DHS IAIP Daily; http://www.sophos.com/virusinfo/articles/vbsuna.html

TSUNAMI DISASTER DONATION E-MAIL PLEA IS REALLY A VIRUS

Virus experts at Sophos have discovered a mass-mailing worm that poses as a plea for donations to help with the Indian Ocean tsunami disaster. The W32/VBSun-A worm spreads via e-mail, tempting innocent users into clicking onto its malicious attachment by pretending to be information about how to donate to a tsunami relief effort. However, running the attached file will not only forward the virus to other internet users but can also initiate a Denial of Service attack against a German hacking website. E-mails sent by the worm have the subject line: "Tsunami Donation! Please help!" Although there have only been a small number of reports of the W32/VBSun-A worm, Sophos recommends computer users ensure their anti-virus software is up-to-date.

2005-01-21 **worm Crowt-A CNN headline masquerading Trojan Horse installation keystroke logger mailer anti-virus update**

DHS IAIP Daily; http://www.sophos.com/virusinfo/articles/newsheadline.html

NEW WORM POSES AS BREAKING NEWS HEADLINES FROM CNN

Virus researchers have identified a new worm which poses as information on the latest news stories. Crowt-A(W32/Crowt-A) takes its subject lines, message content and attachment names from headlines gathered in real-time from the CNN Website. It attempts to send itself by e-mail to addresses found on infected computers. Crowt-A's subject line and attachment share the same name, but continually change to mirror the front-page headline on the CNN news site. Crowt-A also installs a backdoor Trojan function that attempts to log keystrokes on infected PCs and sends gathered data to a remote user. These Trojans are often used by hackers to gain unauthorized control of PCs and to steal personal information such as bank passwords. Companies and individuals are urged to secure their desktop and servers with automatically updated anti-virus protection.

2005-01-27 **MySQL worm Microsoft Windows infection common password attack bot software**

DHS IAIP Daily;
http://news.com.com/MySQL+worm+hits+Windows+systems/2100−734 9_3−5553570.html?tag=nl

MYSQL WORM SPREADS AMONG WINDOWS SYSTEMS

A worm that takes advantage of administrators' poor password choices has started spreading among database systems. The malicious program, known as the "MySQL bot" or by the name of its executable code, SpoolCLL, infects computers running the Microsoft Windows operating system and open-source database known as MySQL. Early indications suggest that more than 8,000 computers may be infected so far. The worm gets initial access to a database machine by guessing the password of the system administrator, using common passwords. It then uses a flaw in MySQL to run another type of program, known as bot software, which then takes full control of the system.

2005-01-27 **Bagle worm variants spreading rapidly Internet Trojan Horse backdoor code execution attack peer-to-peer P2P**

DHS IAIP Daily; http://www.internetnews.com/security/article.php/3465321

NEW VERSIONS OF BAGLE WORM SPREADING RAPIDLY

Security firms are reporting on the emergence of new Bagle virus variants that are proliferating in the wild. There are likely two different variants that are new, experts said. Many security firms have raised the threat level for the variants from moderate to severe or critical, as more instances of the rapidly spreading worm are reported. The Bagle worm contains a Trojan backdoor that allows a remote user to execute arbitrary code on the infected PC. In addition to having its payload distributed via an e-mail attachment, the latest variants are also proliferating via peer-to-peer (P2P) applications as well. Instead of random subject names for e-mail, the polymorphic worm creates random file names of popular applications.

2005-03-01 **worm Bagle variant spread Internet mass mailing Trojan Horse antivirus vendor report ZIP attachment**

DHS IAIP Daily; http://news.com.com/Watchdog−attacking+Bagle+ramps+up/2100−7 349_3−5594201.html?tag=nefd.top

NEW BAGLE VARIANT RAMPS UP

A new variant of Bagle is spreading rapidly, security companies have warned. Rather than a mass-mailing worm, BagleDl-L is a Trojan horse that damages security applications and attempts to connect with a number of Websites. It has been sent via spam lists to millions of addresses in the past 12 hours, said security company McAfee, which has upgraded it to a "medium" risk. The new variant could also have boosted overall Bagle traffic, which has increased five times in the past 24 hours, e-mail security vendor Postini said Tuesday, March 1. According to antivirus companies F-Secure and Sophos, the Websites linked to by the new Bagle currently contain no malicious code. However, Trojan and worm writers have been known to add malicious code to a Website after the initial attack has calmed down. For this Trojan to work, users must manually open a ZIP-file attachment that displays the programs "doc_01.exe" or "prs_03.exe," which must be run manually to infect a computer.

2005-03-07 **first mobile messaging worm antivirus vendor report Symbian Series 60 F-Secure address book**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,119918,00.asp

ANTIVIRUS COMPANIES REPORT FIRST MOBILE MESSAGING WORM

The first mobile-phone virus that spreads using the popular Multimedia Messaging Service (MMS) is circulating among Symbian Series 60 mobile phones, antivirus companies have warned. Antivirus vendors first spotted the new virus, dubbed CommWarrior.A, on Monday, March 7. When an infected attachment is opened, the virus places copies of itself on vulnerable mobile phones and uses the phone's address book to send copies of itself to the owner's contacts using MMS. Antivirus experts believe CommWarrior, which has been spreading slowly among cell phone users since January, is not a serious threat. However, the virus could herald a new age of malicious and fast-spreading cell phone threats, according to Mikko Hyppönen of F-Secure Corporation. MMS is a popular text messaging technology that allows mobile phone users to send multimedia content, such as sound files or photos, between MMS-compliant mobile phones.

DHS IAIP Daily;
http://news.com.com/Worm+attack+forces+Reuters+IM+offline/21 00−7355_3 −5671139.html?tag=nefd.top

WORM ATTACK FORCES REUTERS INSTANT MESSAGING OFFLINE

Reuters has shut down its instant messaging (IM) system after suffering an onslaught from a new Kelvir worm, the company confirmed Thursday, April 14. The London-based international media company decided to take its Reuters Messaging system completely offline after noticing the attack on its network earlier on Thursday. The new variant attempted to spread by sending fake instant messages to people in contact lists on infected systems. The messages, crafted to look exactly like legitimate IM correspondence, attempted to lure people to a Website where their computers would be infected with Kelvir. Unlike the free IM software marketed by America Online, Microsoft and Yahoo, Reuters Messaging was created as a corporate tool, closed off from public subscribers and for internal company use only. But in recent years, the company has moved to connect its consumers with those networks. Technical workers at Reuters said they believe the new Kelvir attack could also target other IM systems. No other companies with messaging software had reported such a threat as of midday Thursday, however.

2005-06-15 **new worm AOL Instant Messaging IM AIM**

DHS IAIP Daily; http://news.com.com/New+worm+hits+AIM+network/2100− 7349_3−57 48646.html

NEW WORM HITS AOL INSTANT MESSAGING NETWORK

A new worm spread quickly on America Online's AIM instant messaging service Wednesday afternoon, June 15, but was contained within hours, experts said. The worm spread in instant messages with the text: "LOL LOOK AT HIM" and included a Web link to a file called "picture.pif." If that file was downloaded and opened, the worm would send itself to all contacts on the victim's AIM Buddy List, according to representatives from IM security companies Facetime and IMlogic. Both IMlogic and Facetime were investigating the picture.pif file to determine exactly what it does. Facetime and IMlogic received several inquiries on the worm, signaling that it was widespread. The worm hit employees at Hewlett-Packard and prompted tech support at the company to send out an alert to employees. The worm is the latest in an increasing number of cyberthreats that use instant messaging to attack Internet users. Just as with attachments and links in e-mail, instant message users should be careful when clicking on links that arrive in instant messages--even messages from people they know, experts have warned.

2005-08-04 **worm activity behavior dodge Net traps intrusion sensors**

DHS IAIP Daily; http://news.zdnet.com/2100−1009_22−5819293.html

WORMS COULD DODGE NET TRAPS

In a pair of papers presented at the Usenix Security Symposium in Baltimore, MD, Thursday, August 4, computer scientists said would-be attackers can locate such sensors, which act as trip wires that detect unusual activity. Internet sensor networks are groups of machines that monitor traffic across active networks and chunks of unused IP space. The sensor networks generate and publish statistical reports that permit an analyst to track the traffic, sniff out malicious activity and seek ways to combat it. The locations of the Internet sensors are kept secret. In a paper titled "Mapping Internet Sensors with Probe Response Attacks," a team of computer scientists from the University of Wisconsin discovered that the sensor maps furnish just enough information for someone to create an algorithm that can map the location of the sensors. All an attacker would have to do is throw packets of information at IP addresses and then check to see whether the activity showed up on the sensor reports. Researchers from Japan came to a similar conclusion in a paper titled "Vulnerabilities of Passive Internet Threat Monitors." The threat could be diminished, both studies said, if the information in the networks' public reports was less detailed.

2005-08-14 **worm attack Microsoft Plug and Play vulnerability Windows XP**

DHS IAIP Daily; http://www.securityfocus.com/news/11281

WORM SPREADING THROUGH MICROSOFT PLUG-AND-PLAY FLAW

A worm started spreading on Sunday, August 14, using a flaw in the Windows operating system's Plug-and-Play functionality, according to two security groups, who advised users to update systems using a patch released by Microsoft Tuesday, August 9. Researchers at anti-virus firm F-Secure, who dubbed the worm, dubbed Zotob, do not believe that the worm will widely infect computer systems. The worm does not infect computers running Windows XP Service Pack 2 nor Windows 2003, as those systems are somewhat protected against the Windows Plug-and-Play vulnerability. Machines that block port 445 using a firewall will also not be vulnerable, the company said. On Friday, the Internet Storm Center upgraded their threat level for the Internet to yellow, because three different groups had published code for taking advantage of the Microsoft Windows' Plug-and-Play flaw to compromise Windows machines. Microsoft's investigation into the worm indicated that it only infects Windows 2000 systems. The company verified that any system patched by its update released last Tuesday will not be infected by the worm.

MEDIA OUTLET COMPUTERS ATTACKED BY WORM

CNN, SBC Communications Inc. and other media outlet computers were shut down on Tuesday, August 16, by a computer worm that targets Microsoft Corp.'s Windows software. The destructive program is a strain of an existing worm known as Zotob affecting computers running the Windows 2000 operating system, said Stephen Toulouse, security program manager at Microsoft. “Our analysis has revealed that the reported worms are different variations of the existing attack called Zotob,” Toulouse wrote in an e-mailed statement. Customers who had updated their software or are using other operating system versions such as Windows XP, weren't affected, he said. CNN spokesperson Laurie Goldberg said there were computer failures in Atlanta and New York. ABC Inc. had computers on the U.S. East and West coasts affected, spokesperson Jeff Schneider said. Production of the London-based Financial Times newspaper was disrupted by the infection, said spokesperson Katy Hemmings. Some computers were affected at number two U.S. phone carrier SBC Communications call centers, forcing employees to manually enter orders, said spokesperson Michael Coe. Computers at the New York Times Co., the third-largest newspaper publisher, were also hit. Security hole patch: http://www.microsoft.com/technet/security/Bulletin/MS05-039. mspx

2005-08-25 **worm attack Microsoft MSN Messenger multiple languages Windows operating system OS**

DHS IAIP Daily; http://www.networkworld.com/news/2005/082505−msn−messenger−w orm.html?fsrc=rss−security

NEW MICROSOFT MESSENGER WORM WORKS IN MULTIPLE LANGUAGES

Users of Microsoft's MSN Messenger should be aware of a new "smart" worm that checks the configuration of their Windows client and sends a message in the appropriate language, according to security companies Akonix Systems and Symantec. The Kelvir.HI worm, a variant of the Kelvir IM malware that surfaced earlier this year, appears to be the first instant-message bug capable of checking systems settings and communicating in the victim's native tongue. When the worm penetrates a system, it sends a message in one of several languages, including Dutch, English, French, German and Greek as well as Portuguese, Swedish, Spanish and Turkish. The message in English is: "haha i found your picture!" If a user clicks on a link included with the message, a copy of the W32.Spyboot worm is automatically downloaded to their computer. Spyboot is a backdoor program that can, among other things, close security applications and help further spread the worm. The Kelvir.HI worm affects computers running Windows 2000, Windows 95, Windows 98, Windows Me, Windows NT, Windows Server 2003 and Windows XP, according to a Symantec advisory.

2005-10-13 **malicious code malware javascript Web page myspace friend denial of service DoS**

RISKS; http://fast.info/myspace/ 24 07

IDIOT HACKER SHUTS DOWN MYSPACE USING JAVASCRIPT WORM

A criminal hacker ("Samy") using the myspace.com service decided to falsify his popularity ratings: "Let's see here…what would make my profile rock. Well, the most popular profiles on myspace pretty much consist of people with the IQ and English delivery skills of Kanye West so I don't want to mimic those, but popularity begets popularity. I need some more friends. I need people to love me. I delved into the bug and found that I could basically control the web browsing of anyone who hit my profile. In fact, I was able to develop something that caused anyone who viewed my profile to add my name to their profile's list of heroes. It's villainous. I was ecstatic. But it wasn't enough. I needed more. So I went deeper. A Chipotle burrito bol and a few clicks later, anyone who viewed my profile who wasn't already on my friends list would inadvertently add me as a friend. Without their permission. I had conquered myspace. Veni, vidi, vici."

Unfortunately, this idiot wasn'st satisfied with linear growth of his fake popularity: "But it wasn't enough.

If I can become their friend…if I can become their hero…then why can't their friends become my friend…my hero. I can propagate the program to their profile, can't I. If someone views my profile and gets this program added to their profile, that means anyone who views THEIR profile also adds me as a friend and hero, and then anyone who hits THOSE people's profiles add me as a friend and hero… So if 5 people viewed my profile, that's 5 new friends. If 5 people viewed each of their profiles, that's 25 more new friends. And after that, well, that's when things get difficult. The math, I mean. Some people would call this a worm. I call it popularity. Regardless, I don't care about popularity, but it can't hurt, right?"

Within 20 hours, he had 1,005,831 friend requests (all fake).

[Original pointer by Paul Bissex; summary byMK]
Myspace had to shutdown temporarily to clean up the mess.

2005-10-17 **Teen worm ratings MySpace Websites Los Angeles data information networks profile XSS HTML**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,105484,00.html?SKC=security−105484

TEEN USES WORM TO BOOST RATINGS ON MYSPACE.COM

Using a self-propagating worm that exploits a scripting vulnerability common to most dynamic Websites, a Los Angeles teenager made himself the most popular member of community Website MySpace.com earlier this month. While the attack caused little damage, the technique could be used to destroy Web site data or steal private information-even from enterprise users behind protected networks, according to Jeremiah Grossman, chief technical officer at Santa Clara, Calif.-based WhiteHat Security Inc. The 19-year-old, who used the name "Samy," put a small bit of code in his user profile on MySpace, a 32-million-member site, most of whom are under age 30. Whenever Samy's profile was viewed, the code was executed in the background, adding Samy to the viewer's list of friends and writing at the bottom of their profile, "... and Samy is my hero." The worm spread by copying itself into each user's profile. Because of MySpace's popularity, the worm spread quickly. The attack depended on a long-known but little-protected vulnerability called cross-site scripting (XSS). XSS arises because many Websites-apart from static sites that use only simple HTML code-are dynamic, allowing users to manipulate Website source code.

2005-11-01 **Frankenstein AIM worm attack AOL instant messaging buddy icon adware rootkit infection remote control**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,123350,00.asp

'FRANKENSTEIN' ATTACK HITS AIM

A new worm is targeting America Online instant messenger users. The worm is installing rootkit types of backdoors on infected machines. The attack starts by the user opening a link of an AOL “buddy.” This link contains an infection sequence with drops adware files and the rootkit itself. Once on the PC, the malware shutsdown the antivirus software and installs new software that allos the PC to be remotely controlled.

2005-11-15 **instant messaging IM worm spread mutation update too slow**

DHS IAIP Daily; http://www.techweb.com/wire/security/173603062

IM WORMS MUTATING AT AN ALARMING RATE

Instant-messaging (IM) threats are mutating at an alarming rate, as virus writers attempt to bypass security-system updates that corporations use for protection. A record number of IM threat mutations have been recorded by IMlogic Inc., which has found that 88 percent of all worms tracked by its threat center also have mutations. The worst chameleon is the Kelvir worm, which has mutated 123 times during the last 11 months, the Waltham, Mass., vendor said. Art Gilliland, vice president of product for IMlogic, said, "IM threats are different than email threats. Updating virus signatures doesn't work well for IM, because the mutations are exceedingly fast and so is the speed with which these threats propagate."

2005-11-28 **worm Sober variant rise e-mail circulation social engineering**

DHS IAIP Daily; http://www.infoworld.com/article/05/11/28/HNsobervariantrise _1.html

SOBER VARIANT ON RISE, SECURITY FIRM WARNS

The latest variant of the Sober worm is proliferating, with a staggering one in 14 e-mails circulated on the Internet containing it as of Monday morning, November 28, according to the antivirus vendor Sophos. Around 85 percent of all viruses reported to Sophos are what the company calls Sober-Z, up from around 60 percent last week, said Graham Cluley, senior technology consultant. Right now, Sober-Z ranks as the third most prevalent virus for the year, behind Netsky-P in first and Zafi-D in second, he said. It first appeared around November 22 using several forms of social engineering to trick users into executing the attachment. Messages purporting to be from the U.S. Federal Bureau of Investigation warn recipients that they have been visiting illegal Websites and ask them to read a list of attached questions. Other versions pretend to be from the U.S. Central Intelligence Agency or offer video clips of Paris Hilton and Nicole Richie from the TV show "The Simple Life." While most antivirus vendors have updates that can remove the worm, the "clever" social engineering ploys are still effective, Cluley said.

5980987.html?part=rss&tag=5980987&subj=news

SOBER WORM STALLS MSN, HOTMAIL

A variant of Sober known as Win32/Sober.Z@mm is to blame for disrupting e-mail traffic between Comcast account holders and user's of Hotmail and MSN Friday, December 2. These Microsoft-based e-mail servers are getting pummeled with an "unusually high mail load," causing delays in e-mail delivery to Hotmail and MSN customers, said Brooke Richardson, MSN's lead product manager. Richardson also indicated that Internet service providers besides Comcast may be having problems directing e-mail to Hotmail and MSN servers. "We are working with Comcast and other ISPs to address [the] issues," Richardson said. Blog reports say that some Comcast subscribers, when sending e-mail to a Hotmail or MSN account, have received an error message saying their message was not received. However, Microsoft says that all e-mails, while some may be delayed, are eventually getting through.

2005-12-05 **Blaster worm active Microsoft Windows malicious software removal tool**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1896373,00.asp

TWO YEARS LATER, BLASTER WORM STILL THRIVING

More than two years after the Blaster Worm proliferated, the worm is still very much alive and there are fears within Microsoft that thousands of Windows machines will never be completely dewormed. According to statistics culled from Microsoft's Windows malicious software removal tool, between 500 and 800 copies of Blaster are removed from Windows machines per day. "The continued prevalence of [Blaster] is likely due to infected computers which, for one reason or another, will never be updated or disinfected. These computers will serve as eternal carriers for the worm," says Matthew Braverman, a program manager in Microsoft's Anti-Malware Engineering Team. In a case study on Blaster presented to the Virus Bulletin conference in October, Braverman said Blaster ranked in the top five of the most prevalent worms removed by the anti-malware utility. Braverman said the worm continues to be prevalent on a whopping 79 percent all Windows XP (Gold) machines and 21 percent of all Windows XP SP1 systems. On Windows XP SP2, infections are almost nonexistent, Braverman said, pointing out that XP SP2 systems went through a major post-Blaster security overhaul that means those systems cannot be infected through Blaster's main replication vector.

7349_3−5984845.html?tag=cd.top

NEW INSTANT MESSENGER WORM CHATS WITH INTENDED VICTIMS

A new worm that targets users of America Online's AOL Instant Messenger (AIM) is believed to be the first that actually chats with the intended victim to dupe the target into activating a malicious payload, IM security vendor IMlogic warned Tuesday, December 6. According to IMlogic, the worm, dubbed IM.Myspace04.AIM, has arrived in instant messages that state: "lol thats cool" and included a URL to a malicious file "clarissa17.pif." When unsuspecting users have responded, perhaps asking if the attachment contained a virus, the worm has replied: "lol no its not its a virus", IMlogic said. The malicious file disables security software, installs a backdoor and tweaks system files, the company said. Then it starts sending itself to contacts on the victim's buddy list. Another worm discovered Tuesday, dubbed Aimdes.E, targets AIM users and arrives with the message: "The user has sent you a Greeting Card, to open it visit:" followed by a link, according to security specialist Akonix Systems. Once the target clicks on the link, the worm installs itself on the system. It opens a backdoor on the computer and sends itself to contacts on the buddy list, Akonix said.

2005-12-07 **worm virus attack Sober January 2005 German Nazi Party formation political agenda**

DHS IAIP Daily; http://www.techweb.com/wire/security/174904530

NEXT SOBER ATTACK SLATED FOR JANUARY 5

The next big Sober worm attack is scheduled to take place Thursday, January 5, 2006, a date probably picked because it's the 87th anniversary of the founding of a precursor to the Nazi Party, a security firm said Wednesday, December 7. January 5, 2006, was the date embedded in the most recent Sober variants, said Ken Dunham, a senior engineer with Reston, VA-based VeriSign iDefense, a security intelligence firm. "We did reverse engineering on the variants, and found this date in the code," said Dunham. "The way this works is that at a pre-determined time, computers already infected with Sober will connect with specified servers and download a new payload, which will likely be spammed out in the millions, as was the last version." Sober, which boasts more than 30 variants, debuted more than two years ago, and is characterized by bilingual messages (English or German) that are mass-mailed in huge quantities. The worm's creator doesn't appear to be motivated by money. Instead, the creator -- who is assumed to be German -- has a political agenda, said Ramses Martinez, iDefense's director of malicious code operations. "There hasn't been one variant that did anything but send out right-wing German spam."

2005-12-09 **anti-virus vendors Sober code cracked FBI CIA e-mail spoofing F-secure blog**

DHS IAIP Daily; http://news.com.com/Sober+code+cracked/2100−7349_3−5989094.html?tag=nl

ANTIVIRUS COMPANIES: SOBER CODE CRACKED

The latest variant of the Sober worm caused havoc in November by duping users into executing it by masking itself as e-mails from the Federal Bureau of Investigation and the Central Intelligence Agency. Antivirus companies were aware that the worm somehow knew how to update itself via the Web. The worm's author programmed this functionality to control infected machines and, if required, change their behavior. On Thursday, December 8, Finnish antivirus firm F-Secure revealed that it had cracked the algorithm used by the worm and could now calculate the exact URLs the worm would check on a particular day. Mikko Hypponen, chief research officer at F-Secure, explained that the virus' author has not used a constant URL because authorities would easily be able to block it. "Sober has been using an algorithm to create pseudorandom URLs which will change based on dates. Ninety-nine percent of the URLs simply don't exist...However, the virus' author can pre-calculate the URL for any date, and when he wants to run something on all the infected machines, he just registers the right URL, uploads his program and BANG! It's run globally on hundreds of thousands of machines," Hypponen wrote in his blog.

2005-12-16 **worm virus Dasher outbreak Internet Microsoft Windows spyware payload**

DHS IAIP Daily; http://news.com.com/Dasher+worm+gallops+onto+the+Net/2100−10 02_3−5999114.html?part=rss&tag=5999114&subj=news

DASHER WORM GALLOPS ONTO THE INTERNET

A Windows-targeted worm that drops spying software on vulnerable PCs is spreading across the Internet, security experts have warned. The Dasher.B worm exploits a flaw in Microsoft Windows Distributed Transaction Coordinator, or MDTC, security companies said Friday, December 16. Microsoft announced and patched the hole in the component for transaction processing in October. However, initial glitches with the update may have left some users without a properly implemented fix, Sophos said. Dasher.B is a network worm that has the potential to open a back door on computers with the MSDTC flaw, security experts said. The infected systems are then prompted to connect to a remote computer for instructions. Once connected, it downloads a malicious program that tracks keystrokes. A third version of the worm emerged Friday, Dasher.C, which almost looks identical to Dasher.B, said Oliver Friedrichs, senior manager at Symantec's Security Response Center. Three versions of Dasher -- B, C and A, which emerged earlier this week -- have infected at least 3,000 systems worldwide, Friedrichs said, noting the growth rate of the infection has since leveled off.

2006-01-09 **Sober worm stops spreading**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2148257/quiet−sober−front 23

SOBER WORM INFECTION RATES ARE PLUMMETING.

The Sober worm, which was due to activate last Thursday, January 5, has stopped spreading and its author has held back from uploading malware onto any machines. Sober was the most common infection in November and December last year, and was programmed to download software from remote Websites. It was feared that host machines across the world would start sending spam or take part in denial of service attacks. Instead the virus writer has stayed undercover and the worm has ceased trying to spread itself. "When the Sober.Y download deadline passed on 6 January all infected machines started download attempts from the five different sites. At the same time, the virus stopped e-mailing itself around," said Mikko Hyppönen, chief research officer at security firm F-Secure. "As a result, the virus that had held the number one position since November 2005 just disappeared from the stats." Hyppönen added that infection rates for the worm over the past week were running at 18,000 PCs per day but are now plummeting.

2006-01-18 **new worm VB.bi threat charts January 2006**

DHS IAIP Daily; http://www.informationweek.com/news/showArticle.jhtml?articleID=177101528 23

NEW WORM HITS THE TOP OF THE THREAT CHARTS

A worm that debuted Tuesday, January 17, had quickly climbed the malware chart to the number three spot by Wednesday, January 18, a Finnish security company said. With a variety of names -- F-Secure calls it VB.bi, Symantec dubs it Blackmal.e, McAfee labels it MyWife.d -- the worm, said Helsinki-based F-Secure, is a simple Visual Basic (VB) construction that arrives as an e-mail file attachment. The worm also spreads through shared folders, and when activated tries to disable a number of security programs, including those sold by Symantec, McAfee, Trend Micro, and Kaspersky Labs. One of its distinguishing features, noted the Internet Storm Center (ISC) in its alert is that "the attachment can be either an executable file or a MIME file that contains an executable file." The latter tactic is meant to conceal the payload's danger; the MIME format is rarely used by attackers. One of the last great MIME-based attacks was the Nimda worm of 2001. Symantec, which tagged the worm with a "2" in its 1 through 5 threat scale, has posted a free-of-charge removal tool on its Website that deletes all traces of the malware.

2006-01-20 **worm malicious code Microsoft Office documents F-Secure**

DHS IAIP Daily; http://www.techweb.com/showArticle.jhtml?articleID=177102371 23

NEW WORM CORRUPTS MICROSOFT DOCUMENTS.

A new worm that already accounts for one in every 15 pieces of malicious code carries a "nuclear option" payload that corrupts data in a slew of popular file formats, a security company warned Friday, January 20. The Nyxem.e worm, said Finnish security firm F-Secure, carries code that instructs it to replace data in files with .doc, .xls, .mdb, .mde, .ppt, .pps, .zip, .rar, .pdf, .psd, or .dmp extensions with the useless string "DATA Error [47 0F 94 93 F4 K5]" on the third of the month. This list includes the native document formats for Microsoft Word, Excel, PowerPoint, and Access, as well as for Adobe PhotoShop and Acrobat. Nyxem.e is similar to the VB.bi/Blackmal/MyWife.d worm that climbed the charts earlier last week, added F-Secure. The worm arrives as an attachment to e-mail messages with a variety of subject headlines, many of which tout porn with phrases. It also tries to delete selected security software, and can spread through shared folders as well as by hijacking addresses from infected PCs.

2006-01-24 **Kama Sutra worm ActiveX Windows digital signature spoofing**

DHS IAIP Daily; http://www.securitypipeline.com/news/177103403;jsessionid=BWMKMS524JJFQQSNDBGCKHSCJUMEKJVN 23

KAMA SUTRA WORM SPOOFS DIGITAL CERTIFICATES.

The Kama Sutra worm can fool Windows into accepting a malicious ActiveX control by spoofing a digital signature, a security company said Tuesday, January 24. Sunnyvale, CA-based Fortinet said the worm -- which also goes by names such as Nyxem.e, MyWife.d, Grew.a, and Blackmal.e -- adds 18 entries to the Windows Registry to slip the ActiveX control by the operating system's defenses. "By creating the following entries, the control is considered 'safe' and digitally signed," said the Fortinet advisory. The ActiveX control, added Fortinet, is used by the worm to automatically run its code each time the PC is turned on and Windows boots. "The threat of worms like this will make them much more dangerous in the future," said Bojan Zdrnja, an analyst for the Internet Storm Center, on the group's site. As of late Monday, January 23, the Kama Sutra worm had infected more than 630,000 systems, said the Internet Storm Center. The worm is considered particularly dangerous because it contains code that triggers an overwrite of all .doc, .xls, .mdb, .mde, .ppt, .pps, .zip, .rar, .pdf, .psd, and .dmp files on the third of each month.

2006-01-30 **worm Kama Sutra Blackworm Blackmal MyWife Nyxem India Peru infection**

DHS IAIP Daily; http://www.techweb.com/wire/security/177105325;jsessionid=FICPCUF4MHL4YQSNDBOCKHSCJUMEKJVN 23

KAMA SUTRA WORM HITS INDIA, PERU HARDEST.

The worm set to overwrite important Microsoft and Adobe documents Friday, February 3, has struck India five times harder than the U.S., and Peru three times harder, a security company claimed. According to Chicago-based LURHQ, the worm -- dubbed Kama Sutra, Blackworm, Blackmal, MyWife, Nyxem, and nearly two-dozen other names -- has infected nearly 80,000 PCs in India. Peru sports almost 55,000 compromised computers. In comparison, the U.S. has about 15,000 machines contaminated with the worm. "Viruses don't always spread uniformly," LURHQ said in its report. "There are many factors at play which are hard to quantitize, such as the initial seeding, social engineering, AV deployment, and random chance. And, as with all statistics, take [these] with a grain of salt." LURHQ tagged the total number of Blackworm-infected computers at around 300,000, even though a Web-based infection counter claims a number in the millions. LURHQ, however, was able to strip out bogus "clicks" on that counter to arrive at is estimate. "An attempt was made by an unknown party to artificially inflate the counter using a set of 279 distributed (presumably compromised) computers," said LURHQ. LURHQ's report: http://www.lurhq.com/blackworm-stats.html

2006-02-03 **Kama Sutra worm hype damage mitigation mediate attention**

DHS IAIP Daily; http://wireservice.wired.com/wired/story.asp?section=Technology&storyId=1154343 23

EXPERTS: HYPE MAY HAVE MITIGATED KAMA SUTRA WORM.

Companies and individuals heeded this week's warning about a file-destroying computer worm known as "Kama Sutra," helping minimize its damage Friday, February 3, security experts said. One Italian city shut down its computers as a precaution, but otherwise the worm's trigger date arrived with relatively few reports of problems. Hundreds of thousands of computers were believed to be infected, but security vendors say many companies and individuals had time to clean up their machines following the alarm, carried by scores of media outlets. "The importance of media attention from an awareness and educational standpoint has been a very good thing," said Marc Solomon, director of product management at security vendor management McAfee Inc. "It alerts users to what may have happened and the destruction that could have occurred." David A. Milman, chief executive of the Syracuse, NY-based Rescuecom, said, "the hype was probably what prevented the disaster from happening."

2006-02-07 **Kama Sutra worm hype overblown Microsoft anti-malware team manager blog**

DHS IAIP Daily; http://www.securitypipeline.com/news/179101481 23

MICROSOFT SAYS KAMA SUTRA WORM OVERBLOWN.

As users and security firms reported little damage done by the Kama Sutra worm, a manager of Microsoft's anti-virus development team warned that overhyping threats could lead to a "cry wolf" syndrome where future alerts aren't taken seriously. "Too much hype in situations that end in false alarms ends up diluting the meaning of warnings for true worldwide threats," wrote Matt Braverman, a program manager with Microsoft's anti-malware team, on the group's blog. In particular, Braverman criticized those who called out warnings based on a Web counter that, though initially reporting the number of Kama Sutra infections accurately, was manipulated later in the process to claim millions of machines had been compromised. Braverman's comments were in sync with earlier positions taken by Microsoft in January on the worm.

2006-02-15 **Google hacking trend worm search phpBB server attack**

DHS IAIP Daily; http://www.vnunet.com/articles/print/2150292 23

GOOGLE 'HACKING' OCCURS WITH THE OBJECTIVE TO FIND SENSITIVE INFORMATION ON THE INTERNET.

Malware authors are increasingly creating digital pests that use Google to find their next victim. Using the search tool for automated vulnerability detection is the latest trend in a technique known as 'Google hacking.' George Kurtz, senior vice president for risk management at security firm McAfee, told VNUNet about the phenomenon after a presentation at the RSA Conference in San José. The Santy.a worm, for instance, targeted a known vulnerability in some versions of the phpBB open source bulletin board application to deface Websites. It found its victims through an automated Google search query. Google eventually stopped the worm from spreading by blocking all searches that would turn up servers running the application. But the search engine is able to detect the abuse only if the queries stand out from other searches. Google 'hacking' does not mean breaking into the company's servers but involves online criminals using Google and other search engines to find sensitive information on the Internet. Pictures and screenshots of 'Google hacks': http://www.siliconvalleysleuth.com/2006/02/things_you_dont.html

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 23
,10801,108868,00.html

IMPACT OF WORM TARGETING MAMBO CMS LOW, SAY RESEARCHERS.

F-Secure Corp. is warning of a network worm that targets vulnerabilities in the Mambo Content Management System (CMS) and PHP XML-RPC, a library of code for PHP programmers that allows procedures to run between computers with different operating systems. F-Secure calls the worm Mare.D, saying it installs several backdoors on a compromised system. The worm scans random hosts for those running vulnerable installations of the Mambo open source Website content management system or the PHP XML-RPC library. Two of the backdoors -- "cb" and "ping.txt" -- are connectback shell backdoors that are connected to a remote host via port 8080, F-Secure said. The third is controlled by Internet Relay Chat and written in the Perl language. The main component of the worm listens on User Datagram Protocol port 27015 for commands, F-Secure said. Mambo wrote on its Website that it has issued fixes for versions 4.5.3 and 4.5.3h. Those fixes can be downloaded from Mambo's Website. It also recommended that users upgrade their software if they have a version earlier than 4.5.3. Mambo's Website: http://www.mamboserver.com/

2006-03-29 **new Bagle worm rootkit Trojan features F-Secure report mass infection**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1944133,00.asp 23

LATEST BAGLE WORM HAS STEALTH CAPABILITIES

Malicious hackers have fitted rootkit features into the newest mutants of the Bagle worm, adding a stealthy new danger to an already virulent threat. According to virus hunters at F-Secure, of Helsinki, Finland, the latest Bagle.GE variant loads a kernel-mode driver to hide the processes and registry keys of itself and other Bagle-related malware from security scanners. The use of offensive rootkits in existing virus threats signals an aggressive push by attackers to get around existing anti-virus software and maintain a persistent and undetectable presence on infected machines. The Bagle threat started as a simple e-mail executable in 2004 but has grown and evolved over the years to become one of the most active threats against PC users. Security researchers estimate that the numerous Bagle variants have infected more computers than any other virus group.

1998-12-21 **virus network encryption executables Windows NT**

PC Week http://www.zdnet.com/zdnn/stories/news/0,4586,2178239,00.html

In December 1998, a new and dangerous network worm called the Remote Explorer attacked executables at MCI WorldCom, causing serious damage to data on several thousand of its servers and workstations. The press reported the program as a "smart virus" but it appears that it did not integrate itself into programs; instead, reports indicated that the attacking program spread through networks. The large (120 Kb) worm compressed (encrypted) executables and propagated through Windows NT networks; a clever twist increased the rate of propagation during the 15:00-06:00 window, when network management is usually at a lower level than during peak hours. In addition, the worm encrypted .DOC and .XLF files. The worm appeared to be a C program and was itself partly encrypted, making reverse engineering more difficult. Network Associates Inc. successfully cryptanalyzed the compression algorithm and issued updates to their antivirus signature strings.

Category 14.3 Virus/worms

1999-03-27 **virus e-mail Trojan Outlook address book spam**

CERT, news wires

On Friday 26 March 1999, the CERT-CC received initial reports of a fast-spreading new MS-Word macro virus. "Melissa" was written to infect such documents; once loaded, it uses the victim's MAPI-standard e-mail address book to send copies of itself to the first 50 people on the list. The virus attaches an infected document to an e-mail message with subject line "Subject: Important Message From <name>" where <name> is that of the inadvertent sender. The e-mail message reads, "Here is that document you asked for ... don't show anyone else ;-)" and includes a MS-Word file as an infected attachment. The original infected document, "list.doc" was a compilation of URLs for pornographic Web sites. However, as the virus spread it was capable of sending any other infected document created by the victim.

Because of this high replication rate, the virus spread faster than any previous virus in history. On many corporate systems, the rapid rate of internal replication saturated e-mail servers with outbound automated junk e-mail. Initial estimates were in the range of 100,000 downed systems. Anti-virus companies rallied immediately and updates for all the standard products were available within hours of the first notices from CERT-CC.

The Melissa macro virus was quickly followed by the PAPA MS-Excel macro virus with similar properties.

Category 14.3 Virus/worms

1999-03-30 **Excel macro virus e-mail ping denial of service**

CERT-CC, news wires

Hot on the heels of the Melissa macro-virus outbreak, a similar virus attacking MS-Excel spreadsheets appeared on the Net at the end of March. The PaPa macro virus was more virulent than the Melissa virus in that it sent out copies of itself to 60 names drawn from the victim's e-mail address book but did so every time an infected document was opened. In addition, the virus launched denial-of-service ping attacks on two IP addresses. The subject line of the automated junk e-mail was "Fwd: Workbook from all.net and Fred Cohen" and the text was "Urgent info inside. Disregard macro warning."

1999-04-01 **information warfare virus mail bombing denial of service**

Daily Telegraph

The onslaught of the Melissa, Papa and Mad Cow viruses caused significant operational difficulties for NATO military forces in their attacks on the Serbian state. E-mail servers were taken down for disinfection; US Navy ships were infected; and a Belgrade computer tried to swamp NATO e-mail in a simple denial-of-service attack involving 2,000 e-mail messages a day.

Category 14.3 *Virus/worms*

1999-04-02 **virus aftermath policies defenses management planning**

OTC, AP

The Melissa worm spread explosively through corporate e-mail systems and the Internet in late March. The worm spread through e-mail attachments in MS-Word ".doc" format and mailed itself to the first 50 addresses in each victim's standard e-mail address book. The worm created a false message with a deceptive subject line and content. The worm was traced to virus-writer(s) called "VicodinES."

Category 14.3 *Virus/worms*

1999-04-02 **virus worm e-mail battle information warfare malicious**

Dow Jones, Wall Street Journal

Shortly after the outbreak of the Melissa worm, the Papa worm was released with a component that caused a flood of junk e-mail to the mailbox of Dr Fred Cohen in an attempted denial-of-service attack (foiled by proper configuration management).

Category 14.3 *Virus/worms*

1999-04-15 **virus defense CERT-CC education reporting**

TechWeb

Keith Rhodes, Technical Director for Computers and Telecommunications Accounting and Information Management at the General Accounting Office, warned that Melissa was just a harbinger of trouble to come: "It is likely that the next virus will propagate faster, do more damage, and be more difficult to detect and to counter." He urged software makers to take responsibility for providing better protection in their own products against malicious code. Michael Vatis, Director of the FBI's National Infrastructure and Protection Center, warned, "Because of the ease of writing and disseminating destructive and disruptive viruses, deterring people from engaging in such conduct is the surest method of prevention." Richard Pethia, Director of Carnegie Mellon University's Computer Emergency Response Team Coordination Center at the Software Engineering Institute <http://www.cert.org> argued that only fundamental redesign would accomplish this goal. Currently, software such as MS-Word has extended its functionality at the expense of security. But Pethia added, "If we're ever faced with simultaneous infections at Internet speed, we won't be able to handle it." Only secure default configurations, strong identification and authentication and integrated virus resistance will prevent future disasters due to portable executable code.

Category 14.3 *Virus/worms*

1999-12-02 **virus worm e-mail attachment Trojan misleading subject automatic excecution double-click open spread virulent**

DOW JONES BUSINESS NEWS; Australian

At the end of November, anti-virus experts reported a flurry of infections by the Mini-Zip e-mail enabled virus/worm, a variant of the Worm.ExploreZip virus that appeared in June. This virus/worm was compressed, so it was not recognized using the known signature strings for the original virus/worm. Once resident, the Mini-Zip program reads the addresses of new e-mail in MS-Outlook and automatically sends itself as a responseusing the "RE: " convention. The fraudulent message text is, "Hi <recipient-name>! I received your e-mail and I shall send you an e-mail ASAP. Till then, take a look at the attached zipped docs. bye." However, the attachment is actually a dropper program that installs the viral code in memory on Windows 9x and Windows NT systems and continues the spread of the attachment through e-mail. In addition, the virus code resets file lengths on the C: drive to zero, causing major damage and making it hard to recover files on the damaged disk.

In December, more than 120 of Australia's largest companies were hit by the virus, causing two days of downtime. Reports that Compaq Australia may have been the first Australian site hit by the virus and therefore responsible for sending out infected e-mail caused embarrassment to that company.

1999-12-03 **virus worm BIOS checksum Y2K new year trigger date format hard drive boot error message**

Dow Jones, Computerworld
http://www.computerworld.com/home/news.nsf/all/9912035y2kworm

The upsurge in e-mail-enabled worms and viruses in late 1999 supported the predictions of anti-virus experts who said that the Y2K transition would see a flurry of new viruses and variants that would contribute to confusion about the source of software problems following New Year's Day 2000.

Nancy Weil, writing in ComputerWorld <http://www.computerworld.com/home/news.nsf/all/9912035y2kworm>, suggested that the Worm.Mypic (aka W32/Mypics.worm) identified in the first days of December demonstrated the kind of problem we were to face in the following weeks. Worm.Mypic arrives as an executable attachment (Pics4You.exe with a length of 34,304 b). If executed, the program e-mails itself to the usual first 50 names in the MS-Outlook address list (and continues to try to do so at regular intervals). As soon as the date changes to 1 Jan 2000, the resident virus overwrites checksum data for the computer's BIOS, interfering with the boot sequence. The virus also attempts to format C: and D: drives.

As usual, everyone agreed that it was critically important to update virus-signature files even more freqently than usual as we approached the new year.

2001-04-01 **Windows shares virus/worm modem autodial data destruction**

SANS

SANS issued an alert about a new type of worm on (unfortunately) 1 April 2001. The text reads as follows:

At 8:00 am on Saturday, April 1 (This is not an April Fool's joke!) the FBI announced it had discovered malicious code wiping out the data on hard drives and dialing 911. This is a vicious virus and needs to be stopped quickly. That can only be done through wide- scale individual action. Please forward this note to everyone who you know who might be affected.

The FBI Advisory is posted at
http://www.nipc.gov/nipc/advis00- 038.htm

The 911 virus is the first "Windows shares virus." Unlike recent viruses that propagate though eMail, the 911 virus silently jumps directly from machine to machine across the Internet by scanning for, and exploiting, open Windows shares. After successfully reproducing itself in other Internet-connected machines (to assure its continued survival) it uses the machine's modem to dial 911 and erases the local machine's hard drive. The virus is operational; victims are already reporting wiped-out hard drives. The virus was launched through AOL, AT&T, MCI, and NetZero in the Houston area. The investigation points to relatively limited distribution so far, but there are no walls in the Internet.

---------- Action 1: Defense ----------

Verify that your system and those of all your coworkers, friends, and associates are not vulnerable by verifying that file sharing is turned off.

* On a Windows 95/98 system, system-wide file sharing is managed by selecting My Computer, Control Panel, Networks, and clicking on the File and Print Sharing button. For folder-by-folder controls, you can use Windows Explorer (Start, Programs, Windows Explorer) and highlight a primary folder such as My Documents and then right mouse click and select properties. There you will find a tab for sharing.

* On a Windows NT, check Control Panel, Server, Shares.

For an excellent way to instantly check system vulnerability, and for detailed assistance in managing Windows file sharing, see: Shields Up! A free service from Gibson Research (
http://grc.com/)

---------- Action 2: Forensics ----------

If you find that you did have file sharing turned on, search your hard drive for hidden directories named "chode", "foreskin", or "dickhair" (we apologize for the indiscretion - but those are the real directory names). These are HIDDEN directories, so you must configure the Find command to show hidden directories. Under the Windows Explorer menu choose View/Options: "Show All Files". If you find those directories: remove them. And, if you find them, and want help from law enforcement, call the FBI National Infrastructure Protection Center (NIPC) Watch Office at 202-323- 3204/3205/3206. The FBI/NIPC has done an extraordinary job of getting data out early on this virus and deserves both kudos and cooperation. You can help the whole community by letting both the FBI and SANS (intrusion@sans.org) know if you've been hit, so we can monitor the spread of this virus.

---------- Moving Forward ----------

The virus detection companies received a copy of the code for the 911 Virus early this morning, so keep your virus signature files up- to-date. We'll post new information at www.sans.org as it becomes available.

NEW VIRUS: NIMDA [19 Sep 2001]
Saying it has no connection to the terrorist event of last week, U.S. Attorney General John Ashcroft reported the existence of a new computer virus called Nimda, which spreads in a variety of ways, including e-mail with "readme.exe" attachments, as well as infected Web sites that generate a stealth file called readme.eml. The virus can crash mail servers by creating massive loads of junk messages. (San Jose Mercury News 19 Sep 2001)
http://www.siliconvalley.com/docs/news/svfront/worm091901.htm

On the 25th of September, Peter Håkanson reported that all public hospitals in Gothenburg Sweden were crippled by NIMDA. He wrote in RISKS 21.67, "The hospitals in "Västra Götaland" sweden (west coast, population 1M) were isolated fron Internet during 23 Sep 2001. Some of internal networks had to be partitioned to prevent nimda spreading further. Reservations and computer-based medical records were unavailable."
http://www.vgregion.se

NEW VERSION OF THE NIMDA VIRUS [1 Nov 2001]
A new version of the Nimda computer virus, Nimda.E, has been detected on computer networks this week; however, the federally funded computer security organization Computer Emergency Response Team says the CERT has not seen a significant surge in the virus since it was first identified. On Tuesday, Nimda.E disrupted access to the Internet by New York Times employees, but the newspaper's computer operations are now back to normal. (New York Times 1 Nov 2001)

2002-05-04 **worm e-mail enabled virus Outlook address books flooding spam**

NIPC Daily Report

On 4 May, an outbreak of the "W32.Magister" computer virus [worm] has apparently struck businesses in Europe, the U.S., and elsewhere. Businesses reported receiving dozens of unsolicited e-mail. Replies and requests to be removed from any mailing lists involved only resulted in a flood of additional e-mail. Companies in the Netherlands, France, New Zealand, the U.K. and the U.S. were similarly affected, including such large multinationals as Unilever and Diageo. Many of the recipients were businesses in the food industry that subscribed to an e-mail newsletter service from Foodnavigator.com. The culprit appears to be the W32.Magistr.24876@mm virus. The virus infects Windows Portable Executable files. It then gathers e-mail addresses from Outlook and Outlook Express mail folders, Windows address books, and the sent items file in Netscape, and sends out multiple e-mail messages. According to the Symantec Anti-virus Research Center, the virus was first discovered on 13 March, and there have been at least 50 confirmed infections affecting more than ten sites since then. (Source: Newsbytes, 5 May)

2004-02-17 **virus worm Bagle network Internet spread momentum**

DHS IAIP Daily;
http://www.eweek.com/article2/0,4149,1528349,00.asp?kc=EWRSS03119TX1K00
00594

February 17, eWEEK — New Bagle virus gaining momentum.

A new version of the Bagle virus is making the rounds of the Internet. Known as Bagle.B, the virus is a mass-mailer like the original Bagle and also includes a component that notifies the author each time a new machine is infected. The new variant arrives in an e-mail with a spoofed sending address and a subject line that contains the term "ID" followed by a string of random characters. The text of the message simply says: "Yours ID" followed by another bunch of random characters. The attachment is an executable file with a random file. Once the user executes the file, the virus mails itself to all of the names found on the user's hard drive, with the exception of addresses in the Hotmail, MSN, Microsoft and AVP domains. Bagle.B also opens port 8866 and begins listening for remote connections, according to Network Associates Inc. The virus also sends an HTTP notification, presumably to the author, notifying him that the machine is infected.

4,00.html

Experts warn of new NetSky worm variant.

Anti-virus software companies are warning that a new version of the NetSky e-mail worm is circulating on the Internet. NetSky.B, also known as Moodown.B, first appeared Wednesday, February 18, and is spreading through infected e-mail messages and shared network folders. Once installed, NetSky tries to disable antivirus software, steal e-mail addresses and copy itself to shared network folders, anti-virus companies said. The new worm is a modified version of NetSky.A, which appeared on Monday. Like its predecessor, NetSky.B arrives in e-mail messages that have randomly generated subject lines such as "something for you," "hello" or "fake." The worm file is contained in a zipped attachment that also has a randomly generated name and file type such as "document" "stuff" or "party." Most copies of the worm appear to be coming from the Netherlands and elsewhere in Europe. Users are advised to update their anti-virus software as soon as possible.

2004-02-26 **Netsky new virus worm variation pornography hacking MP3 deception social engineering**

DHS IAIP Daily; http://www.web−user.co.uk/news/48008.html

February 26, Webuser (UK) — New version of Netsky worm appears.

A new version of the Netsky worm has been detected that snares internet users by disguising itself as pornography or documents about hacking or MP3s. Once one of these files is opened, the Netsky.C infects the user's computer and sends a copy of itself to e-mail addresses on the infected computer. It can also spread via file sharing networks such as Kazaa and the ICQ chat system. According to security experts, Netsky.C is similar to its predecessor Netsky.B as both spread by e-mail and file sharing networks. When it spreads via e-mail it selects random names for the subject line and file name. When first run, Netsky.C copies itself to the Windows folder as winlogon.exe and creates the following registry entry: HKLM\Software\Microsoft\Windows\CurrentVersion\Run\ICQNet= \winlogon.exe -stealth', so that winlogon.exe is run automatically each time Windows is started. Netsky.C also copies itself to folders on drives C to Z whose name contains the sequence of letters 'Shar', this includes shared folders and explains how it spreads through P2P file sharing where users download from each others' shared folders.

2004-05-12 **worm virus malicious code malware Microsoft Windows media player vulnerability Wallon**

DHS IAIP Daily; http://news.zdnet.co.uk/0,39020330,39154533,00.htm

May 12, ZDNet (UK) — Wallon virus wrecks Windows Media Player.

A new mass-mailing virus called Wallon was discovered in Europe on Tuesday, May 11. Maikel Albrecht of security company F-Secure said that because of recent virus outbreaks, users are less willing to open e-mail attachments, which is why Wallon's author is counting on users clicking on an e-mail link instead. "The link in the email points to the actual virus, so if you click the link you download the virus," said Albrecht. However, once the PC is infected, Wallon remains dormant until the user tries to run a media file such as an MP3 or a video. If by default the system uses Windows Media Player, the virus is activated and attempts to send HTML emails, each with a link to the virus file, to any email addresses in the computer's address book. Wallon requires intervention by the user before it can replicate, so Albrecht expects it will not spread very quickly. But unlike common viruses, Wallon is destructive because it replaces the wmplayer.exe file, which means that users infected by the worm will need to reinstall Media Player. Stuart Okin of Microsoft UK said anyone worried about Wallon should install Microsoft's MS04-13 patch, which was released in mid-April and solves the problem.

2005-09-22 **US-CERT malware virus worm Trojan horse naming plan obstacles**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1862251,00.asp

US-CERT MALWARE NAMING PLAN FACES OBSTACLES

US-CERT, the U.S. Computer Emergency Readiness Team, will begin issuing uniform names for computer viruses, worms, and other malicious code next month, as part of a program called the Common Malware Enumeration initiative. The program is intended to clear up confusion that results from the current decentralized system for naming Internet threats, which often results in the same virus or worm receiving different names from different anti-virus vendors. New malicious code samples are held for two hours and, if no other example of the new code is submitted, assigned a CME number.

Category 14.3 Virus/worms

2005-10-06 **Common Malware Enumeration CME taxonomy disagreement security experts malicious software**

EDUPAGE; http://news.com.com/2100-7348_3-5890038.html

MALWARE NAMING SCHEME PROMPTS DISAGREEMENT

Security experts are of two minds concerning the release of a scheme to provide common names for malicious software. The Common Malware Enumeration (CME) system is designed to eliminate the confusion that often arises when a new piece of malware begins circulating the Internet. As different security companies identify the code, they typically assign different names, causing confusion among computer users as to whether there are multiple threats that need to be addressed or simply one new threat with several names. Starting with the most common and damaging pieces of malware, CME will assign a unique number to each. Trend Micro's David Perry criticized the program for not covering all malware, however. He also said the scheme won't provide any benefit for consumers. His comments were echoed by IBM's Martin Overton, who said CME will make matters worse, and by Boeing's Jeanette Jarvis. Graham Cluley of Sophos, on the other hand, applauded the new system. Larry Bridwell, content security programs manager for security watchdog ICSA, also supports the naming scheme, calling it a good first step and pointing out that it was "never designed to solve the naming problem" but rather to serve "as an index." 2005-10-06 **Vnunet Security virus US CERT Internet worms threats CME malware CVE**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2143314/security−
industry− gathers

SECURITY INDUSTRY ADOPTS UNIFORM VIRUS NAMES

The US Computer Emergency Readiness Team (US-CERT) has kicked of an initiative to create common names for Internet worms and threats. Common Malware Enumeration (CME) aims to reduce confusion with the public caused by disparate naming schemes for Internet threats. Currently Internet worms are often named using information about the virus or a follow a description the author entered when crafting the malware. The new scheme will use a sequential CME number, beginning with CME-1. A similar naming system already exists for security vulnerabilities in software, which uses a Common Vulnerability and Exposure (CVE) identifier. However, CME differs from CVE in that the worm naming initiative will not include the date.

2005-10-26 **Zotob damage businesses worm Cybertrust Internet vulnerabilities Nimba MSBlast Windows**

DHS IAIP Daily;
http://news.com.com/Zotob+damage+deep+but+not+widespread/2100−7355_3−5915591.html?tag=nefd.top

ZOTOB DAMAGE DEEP BUT NOT WIDESPREAD

Fewer businesses fell victim to the Zotob worm that struck corporate networks in August than previous attacks, according to a report released on Wednesday, October 26, by computer security firm Cybertrust. Of 700 organizations surveyed, 13 percent were disrupted by the worm. Six percent of survey respondents said Zotob's impact on their company was moderate to major, which was defined as more than $10,000 in losses and at least one major business system affected, such as e-mail or Internet connectivity. According to the study, Zotob did far less damage than did other major worms designed to exploit Windows vulnerabilities. For example, the Nimda and 8 MSBlast worm made a moderate to major impact on 60 percent and 30 percent of companies, respectively. Zotob was less widespread, in part, because it targeted only PCs running Windows 2000. The worm exploited a hole in the operating system's plug-and-play feature, and let attackers take control of infected machines. Twenty-six percent of Zotob victims noted that infections occurred because they had no firewall in place. The health care industry was hit hardest, with more than a quarter of that sector's organizations reporting some impact. Cybertrust report: http://www.cybertrust.com/pr_events/2005/20051026.shtml

2006-02-03 **no expected Kama Sutra worm damage McAfee F-Secure comments**

EDUPAGE; http://news.com.com/2100-7349_3-6034706.html 23

EXPECTED DAMAGE FROM KAMA SUTRA WORM DOESN'T MATERIALIZE

The latest high-profile worm making the rounds on the Internet has so far failed to unleash the damage that some had predicted. The Kama Sutra worm, also known as Nyxem.E, MyWife, and Blackworm, was scheduled to attack infected computers on Friday and begin deleting files and causing other headaches for users. However, Paul Ducklin, head of technology at Sophos Asia-Pacific, said there have been no reports of problems so far. Ducklin attributed the lack of consequence to effective efforts by businesses to identify the worm and keep computers from becoming infected. Allan Bell, marketing director for McAfee, echoed Ducklin's remarks. "No local outbreaks reported," he said, "and very few reports of infections." F-Secure's Mikko Hypponen noted, however, that home users are typically much less aware of security threats and therefore much more widely affected by such worms. "The full scope of the problem won't come to light until during the weekend or early next week," he said, when home users turn on their computers.

2006-04-17 **Bagle virus attack computer infection worm F-Secure report**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1950098,00.asp 23

NEW ATTACK IS AIMED AT COMPUTERS INFECTED WITH BAGLE VIRUS.

A new attack aimed at computers infected with the Bagle virus threatens to generate scads of spam e-mail campaigns, and anti-malware experts concede that the threat remains a major headache. Researchers at anti-virus specialist F-Secure, based in Helsinki, Finland, described the attack, dubbed "SpamTool.Win32.Bagle.g," and said it involves a new set of URLs being sent to machines infected with Bagle. The variant is meant to use the computers to launch waves of spam messages and involves a download link that provides a new, uniquely repacked version of the attempted spam execution every 50 seconds or so, according to F-Secure. The new attack involved at least five different URLs used to distribute the new SpamTool execution, at least four of which have already been shut down, F-Secure said.

1997-04-29 **Trojan AOL**

EDUPAGE

The Department of Energy's Computer Incident Advisory Capability (CIAC) warned users not to fall prey to the AOL4FREE.COM Trojan, which tries to erase files on hard drives when it is run. A couple of months later, the NCSA worked with AOL technical staff to issue a press release listing the many names of additional Trojans; these run as TSRs (Terminate - Stay Resident programs) and capture user IDs and passwords, then send them by e-mail to Bad People. Reminder: do NOT open binary attachments at all from people you don't know; scan all attachments from people you do know with anti-virus and anti-Trojan programs before opening.

Category 14.4 *Trojans & rootkits*

1997-07-31 **AOL Trojan Horse**

Reuters, Newsbytes

AOL announced its "Download Sentry" to warn its naïve users about the dangers of executing binary file attachments that may contain Trojans. Recently AOL has been plagued by attachments that act as keystroke-capture programs and e-mail user IDs and passwords to criminals for fraudulent access to the network.

Category 14.4 *Trojans & rootkits*

1997-11-06 **phone fraud web pornography Trojan**

RISKS, EDUPAGE, news wires 18 80 ff

MOLDOVAN TROJAN
Viewers of pornographic pictures on the sexygirls.com site were in for a surprise when they got their next phone bills. Toronto victims who downloaded a "special viewer" were actually installing a Trojan program that silently disconnected their connection to their normal ISP and reconnected them (with the modem speaker turned off) to a number in Moldova in central Europe. The long-distance charges then ratcheted up until the user disconnected the session — sometimes hours later, even when the victims switched to other, perhaps less prurient, sites. The same fraud was reported in Feb in New York City, where a federal judge ordered the scam shut down. An interesting note is that AT&T staff spotted the scam because of unusually high volume of traffic to Moldova, not usually a destination for many US phone calls. In November, the FTC won $2.74M from the bandits to refund to the cheated customers.

Category 14.4 *Trojans & rootkits*

1998-01-05 **Trojans ISP criminal hackers naïve gullible trusting theft**

Wall Street Journal

Jared Sandberg, writing in the Wall Street Journal, reported on widespread fraud directed against naïve AOL users using widely-distributed Trojan Horse programs ("proggies") that allow them to steal passwords. Another favorite trick that fools gullible users is the old "We need your password" popup that claims to be from AOL administrators. AOL reminds everyone that no one from AOL will ever ask users for their passwords.

Category 14.4 *Trojans & rootkits*

1999-01-29 **Trojan horse backdoor quality assurance QA**

RISKS 20 18

Peter Neumann summarized a serious case of software contamination in RISKS 20.18: At least 52 computer systems downloaded a TCP wrapper program directly from a distribution site after the program had been contaminated with a Trojan horse early in the morning of 21 Jan 1999. The Trojan horse provided trapdoor access to each of the contaminated systems, and also sent e-mail identifying each system that had just been contaminated. The 52 primary sites were notified by the CERT at CMU after the problem had been detected and fixed. Secondary downloads may also have occurred."

Category 14.4 *Trojans & rootkits*

1999-02-12 **QA quality assurance auditing Y2K consultants fraud embezzle**

RISKS 20 21

Bruce Martin pointed out in RISKS that the frantic efforts to remediate the Y2K bugs in production software offer a perfect cover for criminals to insert Trojan code in financial software. Such Trojans could, for example, cause monetary transfers around the Y2K transition out of clients' accounts to the criminals' accounts in offshore banks. The expected confusion at the end of 1999 could cause serious difficulties for auditors as they tried to piece together the reasons for various losses experienced at the turn of the century.

Category 14.4 *Trojans & rootkits*

1999-05-11 **virus Trojan e-mail**

South China Morning Post (Hong Kong)

In May 1999, reports surfaced of a Chinese Trojan called picture.exe that had been circulating widely in China since December 1998. The program, also known as manager.exe, was circulated via an e-mail vector and would send infected-system configuration data to e-mail addresses in the PRC.

Category 14.4 *Trojans & rootkits*

1999-05-28 **Trojan back door malicious code spam attachment**

MSNBC

Network Associates Inc. anti-virus labs warned of a new Trojan called BackDoor-G being sent around the Net as spam in May. Users were tricked into installing "screen savers" that were nothing of the sort. The Trojan resembled the previous year's Back Orifice program in providing remote administration — and back doors for criminals to infiltrate a system. A variant called "Armageddon" appeared within days in France.

Category 14.4 *Trojans & rootkits*

1999-06-11 **virus e-mail attachment Windows worm executable**

Wall Street Journal

The Worm.Explore.Zip (aka "Trojan Explore.Zip) worm appeared in June as an attachment to e-mail masquerading as an innocuous compressed WinZIP file. The executable file used the icon from WinZIP to fool people into double-clicking it, at which time it began destroying files on disk. Within a week of its discovery in Israel on the 6th of June the worm had spread to more than 12 countries. Network Associates reported that ~70% of its largest 500 corporate customers were infected. [Readers should remember that the larger the number of computers in a company, the more likely that at least one will be infected even when infection rates are low. If the probability of infecting one system is "p" and there are "n" targets in a group each of which can be infected independently, the likelihood of at least one infection in the group is P = {1 - (1 - p)^n} which rises rapidly as n increases.]

Category 14.4 *Trojans & rootkits*

1999-09-20 **virus worm Trojan e-mail Y2K countdown clock fix Internet passwords**

San Francisco Chronicle

A couple of new Y2K-related virus/worms packaged as Trojan Horses were discovered in September. One e-mail Trojan called "Y2Kcount.exe" claimed that its attachment was a Y2K-countdown clock; actually it also sent user IDs and passwords out into the Net by e-mail. Microsoft reported finding eight different versions of the e-mail in circulation on the Net. The other, named "W32/Fix2001" came as an attachment ostensibly from the system administrator and urged the victims to install the "fix" to prevent Internet problems around the Y2K transition. Actually, the virus/worm would replicate through attachments to all outbound e-mail messages from the infected system. [These malicious programs are called "virus/worms" because they integrate into the operating system (i.e., they are virus-like) but also replicate through networks via e-mail (i.e., they are worm-like).]

2000-01-03 **Trojan operating system corruption damage**

SecurityPortal.com (reprinted with permission),
http://securityportal.com/topnews/finjan19991229.html

Finjan Software Blocks Win32.Crypto the First Time: Finjan Software, Inc. announced that its proactive first-strike security solution, SurfinShield Corporate, blocks the new Win32.Crypto malicious code attack. Win32.Crypto, a Trojan executable program released in the wild today, is unique in that infected computers become dependant on the Trojan as a "middle-man" in the operating system. Any attempt to disinfect it will result in the collapse of the operating system itself. It is a new kind of attack with particularly damaging consequences because attempting to remove the infection may render the computer useless and force a user to rebuild their system from scratch.

Category 14.4 Trojans & rootkits

2000-08-29 **Trojan mobile computers palmtop**

NewsScan, New York Times
http://partners.nytimes.com/library/tech/00/08/biztech/articles/30palm-virus.html

Software companies . . . reported that the first . . . [malware] to target the Palm operating system has been discovered. The bug, which uses a "Trojan horse" strategy to infect its victims, comes disguised as pirated software purported to emulate a Nintendo Gameboy on Palm PDAs and then proceeds to delete applications on the device. The . . . [malware] does not pose a significant threat to most users, says Gene Hodges, president of Network Associates' McAfee division, but signals a new era in technological vulnerability: "This is the beginning of yet another phase in the war against hackers and virus writers. In fact, the real significance of this latest Trojan discovery is the proof of concept that it represents." (Agence France Presse/New York Times 29 Aug 2000)

2000-10-27 **criminal hacker Trojan horse passwords e-mail industrial espionage source code penetration**

NewsScan, Associated Press, New York Times
http://partners.nytimes.com/2000/10/27/technology/27WIRE-MSHACK.html ,
Washington Post http://washingtonpost.com/wp-dyn/articles/A40244-2000Oct30.html

Microsoft's internal computer network was invaded by the QAZ "Trojan horse" software that caused company passwords to be sent to an e-mail address in St. Petersburg, Russia. Calling the act "a deplorable act of industrial espionage," Microsoft would not say whether or not the hackers may have gotten hold of any Microsoft source code. (AP/New York Times 27 Oct 2000)

However, within a few days, Microsoft . . . [said] that network vandals were able to invade the company's internal network for only 12 days (rather than 5 weeks, as it had originally reported), and that no major corporate secrets were stolen. Microsoft executive Rick Miller said: "We started seeing these new accounts being created, but that could be an anomaly of the system. After a day, we realized it was someone hacking into the system." At that point Microsoft began monitoring the illegal break-in, and reported it to the FBI. Miller said that, because of the immense size of the source code files, it was unlikely that the invaders would have been able to copy them. (AP/Washington Post 30 Oct 2000)

Category 14.4 Trojans & rootkits

2002-01-19 **Trojan horse back door porn fraud scumware**

RISKS 21 87

A patch for a vulnerability in the AOL Instant Messenger (AIM) program was converted into a Trojan horse that initiated unauthorized click-throughs on advertising icons, divulged system information to third parties and browsed to porn sites.

Category 14.4 Trojans & rootkits

2002-03-11 **Trojan horse executable attachment patch social engineering worm**

RISKS 21 94

The "Gibe" worm was circulated in March 2002 as a 160KB EXE file attached to a cover message pretending to be a Microsoft alert explaining that the file was a "cumulative patch" and pointing vaguely to a Microsoft security site. Going to the site showed no sign of any such patch, nor was there a digital signature for the file. However, naive recipients were susceptible to the trick.

[MORAL: keep warning recipients not to open unsolicited attachments in e-mail.]

Category 14.4 *Trojans & rootkits*

2002-04-03 **P2P peer-to-peer Trojan distributed computing storage EULA end-user license agreement**

RISKS, http://news.com.com/2100-1023-873181.html 22 02

Nicholas C. Weaver warned in RISKS that the company Brilliant Digital (BD) formally announced distribution of Trojan software via the Kazaa peer-to-peer network software. The BD software would create a P2P server network to be used for distributed storage, computation and communication -- all of which would pose serious security risks to everyone concerned. Weaver pointed out that today's naïve users appear to be ready to agree to anything at all that is included in a license agreement, whether it is in their interests or not.

2003-05-22 **Kaspersky labs trojan internet explorer startpage vulnerability automatic send function java script executes**

NIPC/DHS

May 22, ITWEB — New Trojan exploits known Internet Explorer vulnerability.

Data security software developer Kaspersky Labs reports that a new Trojan program, StartPage, is exploiting an Internet Explorer vulnerability for which there is no patch. If a patch is not released soon, other viruses could exploit the vulnerability. StartPage is sent to victim addresses directly from the author and does not have an automatic send function. The program is a Zip-archive that contains an HTML file. Upon opening the HTML file, an embedded Java-script is launched that exploits the "Exploit.SelfExecHtml" vulnerability and clandestinely executes an embedded EXE file carrying the Trojan program.

2003-07-14 **porn ads 2000 windows-based computers hijacked Migmaf Migrant Mafia trojan spam website Network Associate's**

NIPC/DHS; http://www.lurhq.com/migmaf.html

July 14, Reuters — Program hijacks PCs to send porn ads.

Close to 2,000 Windows-based PCs with high-speed Internet connections have been hijacked by a stealth program and are being used to send ads for pornography, computer security experts warned. It is unknown exactly how the trojan (dubbed "Migmaf" for "migrant Mafia") is spreading to victim computers around the world, whose owners most likely have no idea what is happening, said Richard M. Smith, a security consultant in Boston. The trojan turns the victim computer into a proxy server which serves as a middle man between people clicking on porn e-mail spam or Web site links, according to Smith. The victim computer acts as a "front" to the porn Web site, enabling the porn Web servers to hide their location, Smith said. Broadband Internet users should always use firewalls to block such stealth activity, he said. Computers with updated anti-virus software will also be protected, said Lisa Smith of network security company Network Associate's.

2004-01-08 **Trojan horse malicious agent back door HTML**

NIPC/DHS; http://www.esecurityplanet.com/alerts/article.php/3295891

January 06, esecurityplanet.com — Trojan sends spammed message with woman's picture.

BackDoor-AWQ.b is a remote access Trojan written in Borland Delphi, according to McAfee, which issued an alert Tuesday, January 6. An email message constructed to download and execute the Trojan is known to have been spammed to users. The spammed message is constructed in HTML format. It is likely to have a random subject line, and its body is likely to bear a head portrait of a lady (loaded from a remote server upon viewing the message). The body contains HTML tags to load a second file from a remote server. This file is MIME, and contains the remote access Trojan (base64 encoded). Upon execution, the Trojan installs itself into the %SysDir% directory as GRAYPIGEON.EXE. A DLL file is extracted and also copied to this directory (where %Sysdir% is the Windows System directory, for example C:\WINNT\SYSTEM32) The following Registry key is added to hook system startup: HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion \RunOnce "ScanRegedit" = "%SysDir%\GRAYPIGEON.EXE" The DLL file (which contains the backdoor functionality) is injected into the EXPLORER.EXE process on the victim machine. More information, including removal instructions, can be found at: http://us.mcafee.com/virusInfo/default.asp?id=description &virus_k=100938

2004-01-12 **Trojan horse malware spoofing masquerade Microsoft update**

NIPC/DHS; http://www.gcn.com/vol1_no1/daily−updates/24599−1.html

January 09, Government Computer News — New malware masquerades as Microsoft update.

A Trojan horse program that appears to be a Microsoft security update can download malicious code from a remote Web site and install a back door on the compromised computer, leaving it vulnerable to remote control. IDefense Inc., computer security company, said the malicious code is the latest example of so-called social engineering to fool Windows users. It is similar to the W32Swen worm, which last year passed itself off as a Microsoft patch. "The success of Swen in 2003 encouraged virus writers to put effort into creating official-looking e-mails and Web sites," said Ken Dunham, director of malicious code for iDefense. The Trojan arrives as an attachment to an e-mail that appears to be from Windowsupdate@microsoft.com. The subject line says, "Windows XP Service Pack (Express)-Critical Update." The message describes the attachment, WinxpSp1.A, as a cumulative patch that corrects security flaws in versions of Microsoft Internet Explorer, Outlook and Outlook Express. It downloads an executable file that will open a TCP port to listen for remote commands from the attacker.

2004-05-12 **bot zombie Trojan Horse malicious code phatbot**

DHS IAIP Daily;
http://www.theregister.co.uk/2004/05/12/phatbot_zombie_trade /

May 12, The Register — Phatbot arrest throws open trade in zombie PCs.

The arrest of the suspected author of the Phatbot Trojan Friday, May 7, in the southern German state of Baden-Wuerttemberg could lead to valuable clues about the illicit trade in zombie PCs. The arrest was overshadowed by the unmasking of the admitted Sasser author. But the Phatbot case may shed the most light into the dark recesses of the computer underground. Phatbot is much less common than NetSky but is linked much more closely with the trade in compromised PCs to send spam or for other nefarious purposes. Viruses such as MyDoom and Bagle (and Trojans such as Phatbot) surrender the control of infected PCs to hackers. This expanding network of infected, zombie PCs can be used either for spam distribution or as platforms for DDoS attacks, such as those that many online bookies have suffered in recent months. By using compromised machines-instead of open mail relays or unscrupulous hosts-spammers can bypass IP address blacklists. Phatbot is a variant of Agobot, a big family of IRC bots. Networks of compromised hosts (BotNets) are commonly traded between virus writers, spammers and middlemen over IRC networks. The price of these BotNets (DoSNets) was roughly $500 for 10,000 hosts last summer when the MyDoom and Blaster (the RPC exploit worm) first appeared on the scene.

2004-05-12 **Trojan Horse Mac Apple Applescript**

DHS IAIP Daily;
http://www.macworld.co.uk/news/top_news_item.cfm?NewsID=8665

May 12, Macworld — Trojan is attacking Macs.

Intego has identified a Trojan horse -- AS.MW2004.Trojan -- that affects Mac OS X. This Trojan horse, when double-clicked, permanently deletes all the files in the current user's home folder. Intego has notified Apple, Microsoft and the CERT, and has been working in close collaboration with these companies and organizations. The AS.MW2004.Trojan is a compiled AppleScript applet, a 108 KB self-contained application, with an icon resembling an installer for Microsoft Office 2004 for Mac OS X. This AppleScript runs a Unix command that removes files, using AppleScript's ability to run such commands. The AppleScript displays no messages, dialogs or alerts. Once the user double-clicks this file, their home folder and all its contents are deleted permanently. All Macintosh users should only download and run applications from trusted sources.

2004-05-18 **worms Trojans blended threats kibuv bobax**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1594860,00.asp

May 18, eWeek — Kibuv worm, Bobax Trojan try many methods.

Security experts are tracking two new threats that have emerged in the past few days, including a worm that uses seven mechanisms to spread itself. The worm is known as Kibuv, and researchers first noticed its presence Friday, May 14. Kibuv affects all versions of Windows from 98 through Windows Server 2003 and attempts to spread through a variety of methods, including exploiting five Windows vulnerabilities and connecting to the FTP server installed by the Sasser worms. The worm has not spread too widely as of yet, but with its variety of infection methods, experts say the potential exists for it to infect a large number of machines. The second piece of malware that has surfaced is a Trojan that is capable of spreading semi-automatically. Known as Bobax, the Trojan can only infect machines running Windows XP and seems to exist solely for the purpose of sending out large amounts of spam. When ordered to scan for new machines to infect, Bobax spawns 128 threads and begins scanning for PCs with TCP port 5000 open. If the port is open, it exploits the Windows LSASS vulnerability. Bobax then loads a copy of itself onto the new PC, and the process repeats. Antivirus and antispam providers say they have seen just a few machines infected with Bobax as of Tuesday, May 18.

2004-05-20 **Trojan Horse financial services identity theft online banking**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0,10801,93281,00.html

May 20, Computerworld — Canadian online banking users fall victim to Trojan.

A Trojan horse may be responsible for an online banking scam that has cost at least two Winnipeg, Canada, customers thousands of dollars. The Winnipeg Police Service is investigating two cases where money was transferred unknowingly from bank accounts. The investigation is focused around a man who recently emigrated to Canada from an unidentified locale in Eastern Europe. According to computer security experts, online banking scams and identity theft are proliferating in Canada. While Canadian e-banking customers have yet to see a surge in identity theft similar to the U.S., the banks say the onus is on consumers and enterprises to protect themselves. Keystroke loggers are the most frequently used tactic for crooks targeting banking information, said Tom Slodichak, chief security officer of WhiteHat, an IT security provider. "Although a Web session with their financial institution is usually encrypted, the keystroke logger intercepts the keystrokes before any encryption occurs, so they will get all the information--the account numbers, the names, the passwords or PINs or whatever they need to impersonate that [individual]," he said.

2004-11-23 **trojan mobile phones skulls Nokia Symbian vandalism denial-of-service attack**

NewsScan; http://www.enn.ie/news.html?code=9566568

TROJAN HORSE AIMED AT NOKIA CELL PHONES

A new attack by Trojan Horse software known as "Skulls" targets Nokia 7610 cell phones, rendering infected handsets almost useless. The program appears to be a "theme manager" for the phone. It replaces most of an infected phone's program icons with images of skulls and crossbones, and disables all of the default programs on the phone (calendar, phonebook, camera, Web browser, SMS applications, etc.) -- i.e., essentially everything except normal phone calls. Symbian, the maker of the Nokia 7610 operating system, says that users will only be affected if they knowingly and deliberately install the file and ignore the warnings that the phone displays at the conclusion of the installation process. Experts don't consider the Skulls malware to be a major threat, but note that it's the third mobile phone bug to appear this year -- and therefore probably means that this kind of problem is here for the foreseeable future. (ENN Electronic News.net 23 Nov 2004)

2005-01-24 **Trojan Horse program Symbian based phone harm useless Bluetooth reuse restore factory settings**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,119392,00.asp

NEW TROJAN HORSE PROGRAMS WILL RENDER SOME SYMBIAN-BASED MOBILE PHONES USELESS

Two new Trojan horse programs, Gavno.a and Gavno.b, masquerade as patch files designed to trick users into downloading them, says Aaron Davidson, chief executive officer of SimWorks International. Although almost identical with Gavno.a, Gavno.b contains the Cabir worm, which attempts to send a copy of the Trojan horse to other nearby Symbian-based phones via short-range wireless Bluetooth technology. The Gavno Trojans, according to Davidson, are the first to aim at disrupting a core function of mobile phones--telephony--in addition to other applications such as text messaging, e-mail, and address books. Gavno.a and Gavno.b are proof-of-concept Trojan horses that "are not yet in the wild," Davidson says. Davidson believes the Trojan programs originated in Russia. To fix infected phones, users will need to restore them to their factory settings.

2005-02-11 **Microsoft anti-spyware trojan attack information warfare disable interfere confidentiality data theft key logging e-mail attachment**

NewsScan; http://theage.com.au/articles/2005/02/11/1108061848064.html

MICROSOFT PROBES SPYWARE ATTACK

Microsoft Corp is investigating a malicious program that attempts to turn off the company's newly released anti-spyware software for Windows computers. Stephen Toulouse, a Microsoft security program manager, said yesterday that the program, known as "Bankash-A Trojan," could attempt to disable or delete the spyware removal tool and suppress warning messages. It also may try to steal online banking passwords or other personal information by tracking a user's keystrokes. To be attacked, Toulouse said a user would have to be fooled into opening an email attachment that would then start the malicious program. (The Age 11 Feb 2005)

SOPHOS anti-malware company summarizes the Trojan's functions as follows:
* Steals credit card details
* Turns off anti-virus applications
* Deletes files off the computer
* Steals information
* Drops more malware
* Downloads code from the internet

2005-04-08 **hacker bogus Microsoft update patches e-mail Trojan Horse installation**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,3919430
2,00.htm

HACKERS SEND FLOOD OF BOGUS MICROSOFT UPDATES

On Thursday, April 7, the same day that Microsoft announced details of its next round of monthly patches, hackers sent out a wave of emails disguised as messages from the software company in a bid to take control of thousands of computers. The emails contain bogus news of a Microsoft update, advising people to open a link to a Web site and download a file that will secure and 'patch' their PCs. The fake Website, which is hosted in Australia, looks almost identical to Microsoft's and the download is actually a Trojan horse — a program that can give hackers remote control of a computer. Microsoft said it is looking into the situation.

DHS IAIP Daily;
http://news.com.com/Trojan+horses+take+aim+at+Symbian+cell+p hones/2100
−7349_3−5678211.html

TROJAN HORSES TAKE AIM AT SYMBIAN CELL PHONES

The recent discovery of a large number of malicious mobile phone programs should raise concerns throughout the wireless industry, according to a virus tracker. Cell phone antivirus software company SimWorks reported Wednesday, April 20, that 52 new Trojan horses are hidden inside several different cell phones games and other readily available mobile phone software. While the software appears to be safe to share or use, the Trojans actually contain malicious software that crashes many critical cell phone system components. The Trojan horses target only cell phones that use Symbian, an advanced operating system. To date, no phones have been affected, according to Aaron Davidson, chief executive officer of SimWorks. While the damage is negligible so far, the recent warnings from SimWorks and security specialist F-Secure are raising alarm bells in the wireless industry. The latest report brings the total number of known Symbian Trojan horses to more than 100.

2005-06-04 **hacker attack Trojan horses botnet building warning Bagle virus code organized crime**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1823633,00.asp

ANTI-VIRUS COMPANIES WARN OF TROJAN ATTACK THAT BUILDS BOTNETS

Anti-virus researchers are sounding the alert for a massive, well-coordinated hacker attack using three different Trojans to hijack PCs and create botnets-for-hire. The three-pronged attack is being described as "unprecedented" because of the way the Trojans communicate with each other to infect a machine, disable anti-virus software and leave a back door open for future malicious use. Roger Thompson, director of malicious content research at Computer Associates International Inc. said that this attack "… clearly points to a very well-organized group either replenishing existing botnets or creating new ones." Once the three Trojans are installed, the infected computer becomes part of a botnet and can be used in spam runs, distributed denial-of-service attacks or to log keystrokes and steal sensitive personal information. According to CA's Thompson, the success of the three-pronged attack could signal the end of signature-based virus protection if Trojans immediately disable all means of protection. He said he thinks the attack, which used virus code from the Bagle family, is the work of a very small group of organized criminals. With the rapid proliferation of new types of virus, Trojan and worm attacks, PC users are urged to be strict about following security guidance.

2005-06-16 **United Kingdom UK cyber infrastructure Trojan horse attack Far East**

DHS IAIP Daily; http://www.vnunet.com/vnunet/news/2138105/uk−infrastructure− trojan−attack

UNITED KINGDOM'S CYBER INFRASTRUCTURE UNDER TROJAN ATTACK

Parts of the United Kingdom's (UK) key computer systems are being targeted by Trojan software apparently originating from the Far East, according to the National Infrastructure Security Coordination Centre (NISCC). Both the UK government and private companies are being targeted, and an NISCC bulletin lists 76 Trojan programs that have been detected. The organization claims that the IP addresses on the e-mails often come from the Far East. "Trojan capabilities suggest that the covert gathering and transmitting of otherwise privileged information is a principal goal," stated the bulletin. "The attacks normally focus on individuals who have jobs working with commercially or economically sensitive data." The bulletin also warned that firewalls and antivirus software do not protect against the Trojans as they can be modified by security code to avoid signature traces. 2005-06-30 **TechWeb trojan filtering Finnish firm worms Trojan horses Windows HOSTS Microsoft RAS API IP addresses Computer Associates F-Secure McAfeen Sophos Symantec Trend Micro Mitglieder**

DHS IAIP Daily; http://www.techweb.com/wire/security/164904273

NEW TROJAN FILTERING PACKETS TO ISOLATE USERS

A new Trojan is using a sophisticated technique to cut off infected computers from anti-virus and security vendors' update sites, the Finnish firm F-Secure said Thursday, June 30. It's not uncommon for worms and Trojan horses to sever links to update sites, but the until recently, said F-Secure, the method has been different: modifying the Windows HOSTS file to redirect the domains of popular security vendors to the local host so that the browser returns a blank page or error. This Trojan, dubbed Fantibag.b by F-Secure (and Fantibag.a by Computer Associates), however, blocks access by creating packet filtering policies using the Microsoft RAS packet filtering API. The result: all inbound and outbound packets between the user's machine and any of the 100+ filtered IP addresses are then dropped, essentially cutting communication and preventing updates--such as new malware signatures--from being downloaded. Among the filtered IP addresses are those belonging to Microsoft (including Windows Update), Computer Associates, F-Secure, McAfee, Sophos, Symantec, and Trend Micro. Fantibag.b sports a tenuous connection with the more prevalent Mitglieder Trojan, said Computer Associates; the former may be downloaded to systems already compromised by Mitglieder.

2005-07-04 **The Register Symbian Trojan phones Doomboot mobile smartphones Bluetooth battery Finnish**

DHS IAIP Daily;
http://www.theregister.co.uk/2005/07/04/symbian_trojan_doomb oot/

SYMBIAN TROJAN DRAINS THE LIFE FROM PHONES

Virus writers have created a new Symbian Trojan called Doomboot-A that loads an earlier mobile virus (Commwarrior-B) onto vulnerable smartphones. Doomboot-A also preventing infected phones from booting up properly. "Doomboot-A causes the phone not to boot anymore and Commwarrior causes so much Bluetooth traffic that the phone will run out of battery in less than one hour. Thus the user who gets his phone infected with Doomboot-A has less than one hour to figure out what is happening and disinfect his phone, or he will lose all data," writes Jarno Niemela, a researcher at Finnish anti-virus firm F-Secure. "The Doomboot-A installation does not give any obvious clues that something is wrong, and Commwarrior-B does not have icon and is not visible in the process list. So the installation of Doomboot-A looks very much like failed installation of pirate copied game, and [a] user has hard time noticing that something bad is happening," he added. Doomboot-A, like most Symbian Trojans, poses as a pirate copy of a Symbian game (in this case Doom 2). Users who avoid pirated games or applications should be safe from infection.

2005-07-11 **trojan horse attacks alert virus companies individuals infiltrateelements threat infrastructure operations software firewalls recipients patch vulnerabilities**

DHS IAIP Daily; http://www.esecurityplanet.com/alerts/article.php/3519236

US-CERT WARNS OF LATEST TROJAN HORSE ATTACKS

The US-CERT issued an alert last week warning of heightened trojan virus attacks against companies and individuals. Although trojan attacks that infiltrate computer systems aren't new, US-CERT said the technique used in these latest attacks have two distinct elements, which pose a threat to computing infrastructure and individual business operations. First, the trojans can elude conventional protective anti-virus software and firewalls. A number of open source and tailored trojans, altered to avoid anti-virus detection, have been used. Second, the e-mails are sent to specific or targeted recipients. Unlike "phishing" attacks, the e-mails use subject lines often referring to work or other subjects that the recipient would find relevant. US-CERT made 12 recommendations for system administrators in order to head off trojan horse attacks. They include using an anti-virus scanner on all e-mail attachments, updating operating system and application software to patch vulnerabilities exploited in the past by these Trojans; and turn off 'Preview Pane' functionality in e-mail clients and set the default options to view opened e-mails as plain text. 2005-10-31 **digital rights management DRM SONY CD-ROM rootkit Trojan copyright protection malware malicious software**

http://www.sysinternals.com/blog/2005/10/sony-rootkits-and-digital-rights.html 24 09

SONY DRM INSTALLS ROOTKIT

On Oct. 31, Mark Russinovich broke the story in his blog: Sony BMG Music Entertainment distributed a copy-protection scheme with music CDs that secretly installed a rootkit on computers. This software tool is run without your knowledge or consent -- if it's loaded on your computer with a CD, a hacker can gain and maintain access to your system and you wouldn't know it.

The Sony code modifies Windows so you can't tell it's there, a process called "cloaking" in the hacker world. It acts as spyware, surreptitiously sending information about you to Sony. And it can't be removed; trying to get rid of it damages Windows.

This story was picked up by other blogs ..., followed by the computer press. Finally, the mainstream media took it up.

The outcry was so great that on Nov. 11, Sony announced it was temporarily halting production of that copy-protection scheme. That still wasn't enough -- on Nov. 14 the company announced it was pulling copy-protected CDs from store shelves and offered to replace customers' infected CDs for free….

[The text above is the start of Bruce Schneier's analysis of the implications of the SONY DRM rootkit case -- more in the entry specifically about his analysis on 17 Nov 2005.]

2005-11-17 **digital rights management DRM SONY CD-ROM rootkit Trojan copyright protection malware malicious software collusion antivirus incompetence failure false negative**

Schneir On Security; 24 09
http://www.schneier.com/blog/archives/2005/11/sonys_drm_rootk.html

SCHNEIER BLASTS INDUSTRY COLLUSION FOR TOLERATING SONY DRM ROOTKIT

In a blistering analysis of the SONY DRM rootkit debacle, security guru Bruce Schneier attacked big antivirus makers Symantec and McAfee and industry giant Microsoft for tolerating the rootkit since mid-2004. The fundamental problem is collusion:

>The story to pay attention to here is the collusion between big media companies who try to control what we do on our computers and computer-security companies who are supposed to be protecting us.

Initial estimates are that more than half a million computers worldwide are infected with this Sony rootkit. Those are amazing infection numbers, making this one of the most serious internet epidemics of all time -- on a par with worms like Blaster, Slammer, Code Red and Nimda.

What do you think of your antivirus company, the one that didn't notice Sony's rootkit as it infected half a million computers? And this isn't one of those lightning-fast internet worms; this one has been spreading since mid-2004. Because it spread through infected CDs, not through internet connections, they didn't notice? This is exactly the kind of thing we're paying those companies to detect -- especially because the rootkit was phoning home.

But much worse than not detecting it before Russinovich's discovery was the deafening silence that followed. When a new piece of malware is found, security companies fall over themselves to clean our computers and inoculate our networks. Not in this case.

McAfee didn't add detection code until Nov. 9, and as of Nov. 15 it doesn't remove the rootkit, only the cloaking device. The company admits on its web page that this is a lousy compromise. "McAfee detects, removes and prevents reinstallation of XCP." That's the cloaking code. "Please note that removal will not impair the copyright-protection mechanisms installed from the CD. There have been reports of system crashes possibly resulting from uninstalling XCP." Thanks for the warning.

Symantec's response to the rootkit has, to put it kindly, evolved. At first the company didn't consider XCP malware at all. It wasn't until Nov. 11 that Symantec posted a tool to remove the cloaking. As of Nov. 15, it is still wishy-washy about it, explaining that "this rootkit was designed to hide a legitimate application, but it can be used to hide other objects, including malicious software."

The only thing that makes this rootkit legitimate is that a multinational corporation put it on your computer, not a criminal organization.

You might expect Microsoft to be the first company to condemn this rootkit. After all, XCP corrupts Windows' internals in a pretty nasty way. It's the sort of behavior that could easily lead to system crashes -- crashes that customers would blame on Microsoft. But it wasn't until Nov. 13, when public pressure was just too great to ignore, that Microsoft announced it would update its security tools to detect and remove the cloaking portion of the rootkit.

Perhaps the only security company that deserves praise is F-Secure, the first and the loudest critic of Sony's actions. And Sysinternals, of course, which hosts Russinovich's blog and brought this to light.

Bad security happens. It always has and it always will. And companies do stupid things; always have and always will. But the reason we buy security products from Symantec, McAfee and others is to protect us from bad security.

I truly believed that even in the biggest and most-corporate security company there are people with hackerish instincts, people who will do the right thing and blow the whistle. That all the big security companies, with over a year's lead time, would fail to notice or do anything about this Sony rootkit demonstrates incompetence at best, and lousy ethics at worst.

Microsoft I can understand. The company is a fan of invasive copy protection -- it's being built into the next version of Windows. Microsoft is trying to work with media companies like Sony, hoping Windows becomes the media-distribution channel of choice. And Microsoft is known for watching out for its business interests at the expense of those of its customers.

What happens when the creators of malware collude with the very companies we hire to protect us from that malware?

We users lose, that's what happens. A dangerous and damaging rootkit gets introduced into the wild, and half a million computers get infected before anyone does anything.

Who are the security companies really working for? It's unlikely that this Sony rootkit is the only example of a media company using this technology. Which security company has engineers looking for the others who might be doing it? And what will they do if they find one? What will they do the next time some multinational company decides that owning your computers is a good idea?

These questions are the real story, and we all deserve answers.<

2005-12-27 **Windows Live Messenger Trojan ignore message alternate link download file machine botnet hacker malicious spam security software blocks access vendors hijacking contact names**

DHS IAIP Daily;
http://www.crn.com/sections/breakingnews/breakingnews.jhtml?articleId=175700348

'Leaked' Windows Live Messenger really a Trojan.

F-Secure told users to ignore instant messages with the subject head "MSN Messenger 8 Working BETA" that go on to claim that "Messenger 8 BETA has been leaked!" The message, which refers to an alternate name for the upcoming Live Messenger, also contains a link. Users who click on the link, then download and run the executable file, are in reality installing the Virkel.f Trojan. Virkel.f adds the compromised machine to a botnet, from which the hacker can update the Trojan with additional malicious code, to make the PC into a spam zombie or along with others, launch a denial-of-service attack on Websites. Virkel.f also shuts down anti-virus and security software, and blocks access to sites that belong to security vendors. This bot worm spreads by hijacking IM contact names from an infected computer, then spimming those names with new messages about the "leaked" client.

2006-01-23 **four new Trojan horses mobile phones PCs**

DHS IAIP Daily; 23
http://www.techworld.com/security/news/index.cfm?NewsID=5219

FOUR NEW TROJANS ON THE LOOSE.

Four new Trojans are on the loose, three aimed at mobile phones and a fourth at PCs, anti-virus companies have warned. The mobile phone worms are disguised as legitimate applications and spread via Bluetooth or multimedia messages and affect phones running Symbian. The computer worm spreads via e-mail and purports to offer pornography. The phone worms -- Bootton.E, Pbstealer.D and Sendtool.A -- have a low infection rate at the moment. The first was spotted last week by F-Secure and Symantec and is perhaps the most potentially crippling of the three to those infected. It restarts the mobile but also releases corrupted components that cause a reboot to fail, leaving the device unusable. Fortunately, the phone worms are unlikely to spread very far. Unlike worms on computers, the Trojan horses hitting cell phones spread as attachments that require users to download them. The PC worm, Nyxem, however, is spreading rapidly and carries a potentially destructive set of instructions. Also nicknamed the Kama Sutra worm, it is programmed to overwrite all of the files on computers it infects on Friday, February 3, said Mikko Hypponen, chief research officer at F-Secure Corp. So far, there's no indication where Nyxem originated.

2006-01-23 **Trojan e-mail social engineering credit card warning**

DHS IAIP Daily; http://www.theregister.co.uk/2006/01/23/trojan_blitz/ 23

TROJAN BLITZ POSES AS CREDIT CARD WARNING.

Businesses in the United Kingdom faced a barrage of 115,000 e-mails containing a new Trojan on Friday, January 20, before anti-virus vendors scrambled out an update, according to e-mail filtering firm BlackSpider Technologies. The Trojan downloader malware -- called Agent-ADO -- comes in the payload to a message that poses as a warning about a user's credit card limits being exceeded. BlackSpider detected the malware at 9:10 a.m. GMT Friday, January 20. But it was three-and-a-half hours before the first anti-virus vendor used by BlackSpider issued a patch, once again illustrating the shortcomings of conventional anti-virus scanners in fighting fast-moving virus outbreaks. Infected emails commonly have the subject line "ERROR:YOUR CREDIT CARD OVERDRAFT EXCEED!" and an infected attachment, a packed executable file called FILE1185 which is 5592 bytes long. Analysis of the malware is ongoing. System administrators are encouraged to set up rules to block the malware at the gateway. Virus writers commonly use networks of compromised PCs to seed infection over a short space of time but the ferocity of the latest attack is unusual.

2006-01-23 **Trojan attack Tianjin province China**

DHS IAIP Daily; http://www.businessweek.com/technology/content/jan2006/tc20060123_003410.htm 23

TARGETED TROJANS ON THE RISE.

It was a stealth cyberattack: Last November 18, an e-mail with a nefarious purpose was dispatched from an Internet address in the Tianjin province of China. The targets: individual employees of the U.S. and European military and pharmaceutical, petrochemical, and legal companies, according to e-mail security firm MessageLabs. Attached was an apparently innocuous Microsoft Word document with a news story from CNN. And it was designed to look like it came from a trustworthy source. In this case, the Trojan was a particularly insidious variety known as a targeted Trojan because it was directed at a specific recipient -- intended to infect the computer networks of American companies. When opened, the Word document could have become a ticking time bomb. Buried inside was special code that would allow hackers to take remote control of each employee's PC. Then, working from inside the corporate networks, the hackers could steal corporate secrets or use the compromised computers to send spam and viruses. According to computer-security experts, spam, phishing e-mails, viruses, and worms will grow more slick and secretive in 2006.

2006-02-02 **Trojan horse e-mail attack fake bird flu epidemic malicious code WMF Windows vulnerability exploit**

DHS IAIP Daily; http://www.websensesecuritylabs.com/alerts/alert.php?AlertID=415 23

TROJAN HORSE/WMF EXPLOIT: FAKE BIRD FLU EPIDEMIC E-MAIL.

Websense Security Labs has received reports of a Trojan horse that attempts to trick users into visiting a malicious Website to run malicious code. Users receive an e-mail with the subject, "Attention Bird Flu in England." The body requests users to click on a link to go either of two Websites to get more information. The e-mail also claims the government is trying to hide the facts on the flu. Upon clicking on a link, users are directed to a Website which claims that you have been blocked from accessing it. This appears to be another trick by the attacker to make the user believe that the site has either been disabled or shutdown. However, within the HTML, an IFRAME is loaded that uses the recent WMF exploit to run code without user-intervention. The code is a Trojan horse downloader, which connects to another site to download new malicious code. The filename is "expl1.wmf," which downloads and runs "expl1.exe." In the past, the same sites have been used for phishing, fraud, and distributing malicious code. The sites are hosted in the .WS and .CC domains and were up and running at the time of this alert.

2006-02-17 **Sony rootkit stealth software involuntary installation DHS worry regulation laws**

DHS IAIP Daily; http://www.infoworld.com/article/06/02/17/75492_HNrootkitregulation_1.html 23

SONY ROOTKIT MAY LEAD TO REGULATION; DHS WORRIED ABOUT POTENTIAL VULNERABILITIES.

A U.S. Department of Homeland Security (DHS) official warned Thursday, February 17, that if software distributors continue to sell products with dangerous rootkit software, as Sony BMG Music Entertainment recently did, legislation or regulation could follow. "We need to think about how that situation could have been avoided in the first place," said Jonathan Frenkel, director of law enforcement policy with the DHS Border and Transportation Security Directorate, who was speaking at the RSA Conference 2006 in San Jose, CA. Last year, Sony began distributing XCP software in some of its products. This digital rights management software, which used rootkit cloaking techniques normally employed by hackers, was later found to be a security risk, and Sony was forced to recall millions of its CDs. While Sony's software was distributed without malicious intent, DHS is worried that a similar situation could occur again, this time with more serious consequences. "It's a potential vulnerability that's of strong concern to the department," Frenkel said. Though DHS has no ability to implement the kind of regulation that Frenkel mentioned, the organization is attempting to increase industry awareness of the rootkit problem.

2006-02-25 **Panda Software discovery viruses-for-sale Website**

DHS IAIP Daily; http://arstechnica.com/news.ars/post/20060225−6264.html 23

MALWARE MOVES UP, GOES COMMERCIAL.

Engineers at Panda Software uncovered evidence last week that led them to a Website touting custom-built viruses for sale. For the price of $990, a user gets his or her own pet Trojan horse, complete with tech support. If the file is discovered -- as this current model was -- the designer provides a guarantee to alter it so that it may continue to avoid detection in the face of updated antivirus software. The Trojan goes by the moniker Trj/Briz.A, and scans the user's hard drive for information that could be used for financial and identity data. It then sends that information to an attacker working behind the scenes. Additional features include the ability to gather IP addresses and in some cases, the physical location of infected computers. It can also modify the machine to prevent access to Websites devoted to antivirus products. The file that causes the Trj/Briz.A infection is called "iexplore.exe." It uses this name to pass itself off as Internet Explorer.

2006-03-01 **cross-infection virus Trojan secrecy mystery annoyance researchers MARA**

DHS IAIP Daily; http://www.securitypipeline.com/news/181401932 23

MYSTERY OVER PC-TO-MOBILE TROJAN ANNOYS RESEARCHERS.

Anti-virus researchers complained Wednesday, March 1, that a group claiming to have proof of the first PC-to-mobile Trojan hasn't shared the sample, a normal practice among security investigators. Monday, February 27, the Mobile Antivirus Researchers Association (MARA), which bills itself as a non-commercial collection of mobile malware researchers, said it had anonymously received malicious code it dubbed "Crossover." The sample, said MARA, could cross-infect a Windows Mobile Pocket PC from a desktop PC running Windows. According to MARA, the first-of-its-kind Trojan spreads to the mobile device via Microsoft's ActiveSync, then erases all files in the My Documents directory of the Windows CE- or Windows Mobile-based gizmo. But unlike the usual practice where virus researchers share samples, MARA's not willing to let others see the code, no-strings-attached, say some commercial researchers. They're left without a way to confirm Crossover's existence or MARA's claims, or update their own signatures to defend against the attacker.

2006-03-06 **Hacker Defender rootkit development halt Holy Father security firm truce**

DHS IAIP Daily; http://www.eweek.com/article2/0,1895,1934708,00.asp 23

"HACKER DEFENDER" ROOTKIT AUTHOR HALTS DEVELOPMENT.

The author of the Hacker Defender rootkit said he's taking a break from developing the popular hacking tool, but that he may soon return to developing new rootkit programs. The author, who uses the name "Holy Father," posted a message on the Hacker Defender Website calling a truce with security companies that make anti-rootkit technology. However, in an e-mail exchange with eWEEK, "Holy Father" said he isn't throwing in the towel, and that he may return to rootkit development after taking a break from Hacker Defender to work on other projects. Hacker Defender is one of the best-known rootkit programs. Rootkits have been common in computer hacking circles for years, and allow attackers to maintain access to a computer, without being detected, long after they have compromised its defenses. Hacker Defender was initially released as an open-source program in 2004. More recently, "Holy Father" has sold updated copies of the rootkit, dubbed "Golden Hacker Defender." That version of the program had an anti-detection engine designed to thwart anti-rootkit technology.

DHS IAIP Daily; http://www.theregister.co.uk/2006/03/15/slobodan_trojan/ 23

SLOBODAN TROJAN POSES AS MURDER PICTURES.

E-mails purporting to prove that the recently deceased former Yugoslav president Slobodan Milosevic was killed contain a malicious Trojan, called Dropper-FB. Online security firm BlackSpider estimates that more than 800,000 e-mails containing the new Trojan-downloader were sent to UK businesses before the first anti-virus software firm updated their software early Wednesday morning, March 15.

/03/21/76669_HNtrojanhearse_1.html

RESEARCHERS WARN OF TROJAN HEARSE.

Security researchers at Sana Security Inc. are warning of a new type of malicious software designed to steal usernames and passwords from Web surfers. The malware, dubbed "rootkit.hearse," uses rootkit cloaking techniques, making it extremely difficult to detect. In order to steal information, however, the software must first be downloaded onto a user's system. This can be done by tricking the user into downloading the malicious code, or by infecting a computer with some other form of malware. Once installed, it sends the sensitive information to a server in Russia, that appears to have been in operation since Thursday, March 16, Sana said. For more information on rootkit hearse:

14.5 Virus hoaxes

Category 14.5 *Virus hoaxes*

1997-01-19 **good times hoax joke parody**

e-mail

In late 1996, a parody of the Good Times hoax circulated through the Net. One of its most off-the-wall sections was, "Goodtimes will give you Dutch Elm disease. It will leave the toilet seat up. It will make a batch of Methamphetamine in your bathtub and then leave bacon cooking on the stove while it goes out to chase gradeschoolers with your new snowblower."

Category 14.5 Virus hoaxes

1997-05-15 **hoax urban myth rumor**

NYT

Alex Gramling, writing in the New York Times, summarized the problems caused by unverified forwarding of rumors and urban myths. Jessica Mydek, for example is not in fact a seven-year-old dying of brain cancer, and the American Cancer Society has never volunteered to donate three cents for each copy of the hoax. Tommy Hilfiger has never appeared on the Oprah Winfrey Show, let alone made racist remarks about who should wear his line of clothing. Despite attempts to counter such harmful rumors, victims have little power to overcome human stupidity and irresponsibility. [Moral: don't forward unsubstantiated stories through the net, especially if they are shocking, or make you angry. Here's some biolerplate I use to explain to gullible hoax victims how they can avoid being fooled in future:

* * * A FRIENDLY MESSAGE ABOUT THE WARNING YOU JUST SENT ME * * *

The warning you have forwarded is a hoax. The danger is imaginary and the problem is nonexistent.

Security experts request that no one circulate unverified warnings of vague, alarming dangers.

Key indicators that a message is a hoax:

* use of exclamation marks (no official warning uses them);
* use of lots of UPPERCASE text (typical of youngsters);
* misspellings and bad grammar;
* no date of origination or expiration;
* references to official-sounding sources (e.g., Microsoft, CIAC, CERT) but no URL for details;
* no valid digital signature from a known security organization;
* requests to circulate widely (no such request is made in official documents).

Some guidelines for avoiding viruses and Trojan Horse programs:
— always run a good (e.g., ICSA-certified) antivirus program in background;
— keep your virus strings up to date (e.g., at least monthly updates);
— don't execute unknown software even if you know and like the person who went it to you;
— don't forward executables unless you downloaded them from a trustworthy source (e.g., a legitimate Web site);
— if you do forward something you have personally downloaded, include the URL for the origin of the executable file.

In addition, before alerting anyone to apprehended threats, check the anti-hoax pages on the Web. See, among others,

About virus hoaxes:

2003-01-06 **virus hoaxes continue fool users anti-virus vendor information**

NIPC/DHS

January 02, ZDNet — Virus hoaxes continue to fool computer users.

Fuelled by concern over genuine threats such as Klez, Bugbear and Magistr, computer users are continuing to fall for false warnings of non-existent viruses. These hoaxes typically warn the reader not to open an e-mail with a certain subject line, or to immediately delete a particular file on their hard drive, because they contain a virus. They will also tell the reader to forward the warning to their friends and colleagues. Even though these hoaxes didn't encourage the reader to delete files from their machine, they are harmful because they waste both time and bandwidth. All the major anti-virus companies include information on such hoaxes on their Web sites.

2004-07-26 **virus hoax Bin Laden suicide al Qaeda terrorism fear uncertainty doubt FUD**

NewsScan

BIN LADEN HOAX VIRUS WARNING

E-mail purporting to contain evidence of Osama bin Laden's suicide contains a "Trojan horse" virus that could allow network vandals to take over infected computers. Naming the new scheme the Hackarmy Trojan horse, the antivirus firm Sophos says, "Thousands of messages have been posted onto Internet message boards and usenet newsgroups claiming that journalists from CNN found the terrorist leader's hanged body earlier this week." The messages point to a site where it's claimed that a file of photographs can be downloaded, but what the file really contains is a Trojan horse that can allow hackers to gain remote control of an infected computer. (The Australian 26 Jul 2004)

15 Fraud (not embezzlement), extortion, slamming

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-01-29 **E-mail**

RISKS; AP 18 81

Ms Adelyn Lee sued Oracle Corporation for wrongful dismissal and sexual harassment. Her evidence included an e-mail message from her boss, Craig Ramsey, to the CEO Larry Ellison confirming that Ramsey had fired Lee in accordance with Ellison's direct instructions. She settled out of court for a $100,000 payment. Subsequent events showed that in fact Ms Lee logged into her ex-boss' e-mail account the day after she was fired and forged the message. She was found guilty of perjury and falsification of evidence; she faces up to four years in prison.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-01-30 **cellular phone fraud**

AP

Criminals altered imported cellular phones into Finland and "cloned" them by changing the electronic serial numbers — but used the same number for all the phones. When a victim of this scam reported his phone stolen, its serial number was inactivated; hundreds of phones went dead. This was the first indication of the extent of the problem. Experts predicted that the lost revenues would amount to the equivalent of tens of millions of dollars.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-01-30 **phone fraud appropriate-use policy**

Reuters

Police in Mexico City have been placing so many calls to phone-sex lines that police stations have had their phones cut off or severely restricted.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-02-01 **phone fraud slamming**

UPI

Heartline Communications of Houston forged consumer signatures in their "slamming" operation — the unauthorized switch of long-distance carriers. A NJ judge has ruled in favor of consumers and may slap half-million dollar fines or more on the slammer.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-02-11 **fraud**

Reuters

The FTC warned that scam artists have been using the Internet to promote the usual round of frauds. In particular, beware of franchise operations; demand written documentation justifying claims of specific income from such operations. Job seekers should be skeptical of any scheme demanding advance payment for job placement; and be aware that there are _no_ "undisclosed" government positions.

In a related story, the British Securities and Investments Board announced a new Web site with information about Internet scams and risky investments promoted on the Net. See <http://www.sib.co.uk> for details.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-02-24 **fraud**

UPI, AP

The FTC won a settlement from Fortuna Alliance company in Washington state, which fraudulently deposited money contributed by victims fleeced through Internet promotions of a pie-in-the-sky pyramid (or Ponzi) scheme that promised $5,000 a month and more in return for an enrollment fee of $500 — if they suckered their friends and acquaintances into "investing" in the scheme. Most of the money received instantly went into bank accounts in Antigua. The settlement included restitution of $2.8M and assurances that the business would close down. AP reported that total reimbursements could top $5M and that (A pyramid / Ponzi scheme pays early contributors fraudulent profits out the money paid by subsequent victims; when the source of funds dries up through exhaustion of the pool of gullible people in the network, the criminals abscond with the remaining funds.)

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-03-14 **phone fraud stealing dial tone**

RISKS 18 90

From Britain, a salutary case: Unexplained long-distance calls on family phone; phone company claims could not be an error. Correspondents explain how someone could steal dial tone using wireless phones, vestigial phone lines, or wiretaps. Do not accept the "computer cannot lie" syndrome.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-04-15 **fraud e-mail**

RISKS 19 8

In April, many Microsoft Network (MSN) users received fraudulent e-mail asking for their credit card numbers to help recover from a fictitious virus attack that had supposedly wiped out billing records.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-04-16 **bank error QA law fraud**

UPI

Frank McPherson discovered a balance of $169,000 in his bank account. He told a teller about it and was informed that the money must be his. Figuring it was a credit from the government, he promptly spent it all on useful things like a new truck, a car, some mountain bikes, a new home, a camcorder and some new clothes. Unfortunately, the teller was wrong, so McPherson ended up in court, charged with fraud. Moral: do not spend money that comes from nowhere into your bank account, regardless of tellers who breezily say the computer couldn't be wrong.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-04-24 **fraud Internet**

EDUPAGE

According to Deloitte & Touche, criminals are defrauding European Union members of about $77B a year using Internet-based or Internet-mediated fraud.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-04-27 **fraud Internet**

EDUPAGE

The FTC, securities regulators and attorneys-general from 24 states found 215 cases of fraudulent marketing in a single day of surfing the Web. The FTC issued stern warnings to the fraud artists and dozens of them shut down altogether. The FTC intends to continue surfing the Web, but urges consumers to be careful and demand evidence of the wild claims they encounter. In one case, someone claimed to be able to earn $100,000 a year by grooming pets; another claimed that victims of his scam would earn $240,000 a year operating 900-number phone lines.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-05-17 **spam vandalism denial of service fraud**

RISKS 19 16

In May 1997, Jim Youll's company was subjected to repeated denial-of-service attacks, apparently because of his public anti-spam stance.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-05-22 **credit card hacker social engineering**

AAP

An unidentified 16-year-old boy with a penchant for computing tricked several banks into giving him credit cards, which he then used to order $18,000 of goods and services via computer-based purchases. He pleaded guilty to 104 countrs of fraud and was sentenced to 12 months in prison. His defense team argued that he should receive psychiatric treatment for what they described as "an anxiety disorder and elements of an obsessive, compulsive disorder." His mother excused his behavior by saying, "If we were a wealthy family he'd be at a private school, where his talents could be directed properly." Um, what about parental direction of the child's talents? (More news in October listing, where the boy was identified as Drew Henry Madden and pleaded guilty to yet more fraud.)

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-05-25 **packet sniffer credit card fraud**

EDUPAGE

A thief who ran a packet sniffer to capture 100,000 credit card numbers from a dozen on-line commerces was arrested when he tried to sell the list to the FBI for $260,000.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-05-26 **fraud Web ghost redirection penetration hack**

Guardian Weekly

Garth McLachlan of the Organised Crime Unit of the National Criminal Intelligence Service of the UK reported on new ways of defrauding victims on the Net. Simple methods include putting up Web sites that market fraudulent schemes; e.g., Ponzi / pyramid sales. Another scam is the reputable-looking site that offers venture capital — in return for a $10,000 advance fee for evaluation of the business proposals. Anyone gullible enough to send that much money to unknown people usually gets asked for more and more money but never gets anything in return. In another scam, criminals offer credit cards, collect detailed information from the victims, and then generate fraudulent cards or attack the victims' bank accounts directly. Another form of chicanery is to hack a competitor's Web page to change the prices of their products so they lose money when their automated sales programs accept credit card numbers; or sometimes to substitute a competitor's phone number so orders come to them instead of to the owner of the hacked Web page.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-06-03 **identity theft fraud credit cards checks**

American Banker

Cheryl and Roger Cullen were arrested in Delaware at dawn on 1997.03.19 in the act of trying to burn evidence of an alleged crime spree that involved hundreds of false identities and check and credit-card frauds probably amounting to more than a million dollars since 1992. The case, one of the most difficult fraud investigations of recent years, demonstrates the importance of each act of verification in the banking and commerce sector. Credit-card applications, in particular, should be scrutinized with care and all details checked for veracity before cards are issued. According to the Federal reserve, check fraud alone cost society $615M in 1995, compared with $59M for physical bank robberies.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-06-04 **fraud counterfeit electronic commerce**

Guardian Weekly, Reuter

The National Criminal Intelligence Service of the UK publicly stated that the growth in electronic commerce and specifically the coming widespread use of electronic money (e.g., the smart card systems of Mondex) will open an enormous vulnerability in the economy. Digital counterfeiting would likely be impossible to distinguish, said Gareth MacLachlan, head of the Organised Crime Unit of the NCIS; he emphasized the value of integrating full audit trails into all forms of electronic money, including electronic "cash" system that are designed at present to provide anonymous financial transactions. Dr James Backhouse of Computer Security Research Centre at the London School of Economics agreed, saying, "The biggest impact would be the loss of any audit trail. Most bank transactions leave some trail within the system and this would be lost."

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-06-08 **extortion hacking penetration banks**

Newsday

Newsday published a cover story by Matthew McAllester that started, "COMPUTER HACKERS have successfully forced financial institutions in the United States, Europe and Asia to pay millions of dollars in ransom by threatening the companies' computer networks.

"The payouts were confirmed by law enforcement officials, banking insiders and security experts interviewed over the past several weeks. When most successful, the sources said, the crimes have linked disgruntled insiders with computer experts recruited throughout the world - including the former Soviet Union, India and southeast Asia - by organized crime groups."

See <TheLibrary@newsday.com> for details.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-06-15 **Netscape bug extortion**

EDUPAGE, Newsbytes,

Christian Orellana, a Danish computer consultant, threatened to release information to the press about a serious security weakness in Netscape Navigator unless he were paid more than the $1,000 prize offered by Netscape to encourage independent quality assurance tests. His message included the words, "I think the person most suited for handling this is somebody in charge of the company checkbook. . . . I'll leave it to you to estimate what impact that would have on Netscape stocks." His actions were almost universally reviled by professional security specialists.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-07-03 **Internet fraud**

EDUPAGE

Canadian investment regulators announced they would cooperate with the U.S. Federal Trade Commission in prosecuting investment frauds involving supposed "Internet Shopping Malls." The project is called "Field of Schemes" and aims to educate senior citizens particularly targeted by criminals.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-07-07 **hackers extortion blackmail infowar Web vandalism**

Electronic Telegraph

According to an investigation by Robert Uhlig, reporter for the Electronic Telegraph in Britain, criminal hackers have been trying to blackmail hundreds of corporate and government officials by threatening to post defamatory claims on corporate Web sites. According to Nick Lockett, a barrister (attorney) with special expertise in cyberlaw, "Typically, the hackers say they will put defamatory information about a senior MP or other public figure on the target company's web site and then let the MP know about the publication of the material. If the threat is ignored, they make a small change to the company's site to prove their point and force it to take them seriously. They are testing the waters at the moment. This is almost certainly a market research exercise. A big campaign of blackmail is about to start." The journalist reports that the extortion demands are in the thousands of pounds.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-07-15 **slamming**

AP

The FTC, overwhelmed with over 16,000 complaints from enraged customers whose long-distance telephone service has been switched without their permission — a practice known as "slamming" — proposed several changes in their regulations to help victims. For example, victims would no longer pay anything at all for calls placed via the slammers' services (unlike the current rule, which pays the slammers at the rate the victims' original phone company would have charged). Other changes would force the predators to obtain explicit consent for changes and to provide easy ways to cancel unauthorized changes.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-07-29 **bank fraud counterfeit checks audit policy**

UPI

Check fraud costs American businesses nearly $10B annually. Around 55% of all criminal cases reported to the FBI involve check fraud and counterfeiting. Much of this fraud could be prevented if organizations paid attention to reasonable commercial standards. For example, every organization showed verify its bank statements quickly, conduct periodic audits, and Institute controls over accounts payable and payroll functions.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-08-21 **hackers credit card fraud encryption**

AP, USA Today http://www.usatoday.com/life/cyber/tech/ctb104.htm

Five teenagers in Bloomington, MN created about 25 credit-card numbers and stole thousands of dollars of electronic gear before they were caught. Sceptics suggested that one of the boys, who worked at a dry cleaners, more likely stole all the card numbers from his employer.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-08-26 **fraud impersonation Web theft credit card ISP**

EDUPAGE, AP

Naïve AOL members responded to credible e-mail asking them to visit a Web site where they could read a letter from AOL's chairman. The members then filled out forms with their credit card numbers and other information supposedly to update AOL records. Unfortunately, the Web site was run by thieves.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-08-29 **beeper fraud toll call**

Newsday

Scott Van Pala, a 21-year old college student in Nassau County near New York City, set up a 540-number toll line at his parents home. He was arrested in August and accused of beeping at least 4,000 beeper users at all hours of the day and night; his victims included doctors, law enforcement officers and attorneys. The victims of the scam would call the 900 number and hear a click — but be billed $0.95 per call. Others would hear only a busy signal and waste their time trying to get through. The attack lasted over 10 weeks, at which point investigators compared notes on the fraudulent billings and easily tracked the suspect down. Investigators estimated that the criminal realized $4,000 from the scam. He faced 4 years in prison.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-09-02 **fraud Internet credit cards**

Reuters

A former graduate student at Nova Southeastern University was charged with fraudulent applications for credit cards. He allegedly applied for 174 credit cards via the Internet using the names of fellow students; however, he used the same address for all of them. Banks contacted police and no cards were issued. Maybe now we understand why he had withdrawn from graduate school before he was arrested.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-09-10 **Internet fraud abuse consumers protection**

AP

The National Consumers League opened a new Web site to help consumers evaluate propositions circulating through the Internet. Complaints to the NCL tripled in 1997, with about 100 reports of fraud a month compared with about 35 per month in 1996. John D. McClain of AP wrote, "The league officials said the most common signs of fraud are extravagant promises of profits, guarantees of credit regardless of bad credit history, suspiciously low prices or prizes that require up-front payments." The site is <http://www.fraud.org/ifw.htm>.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-09-28 **spam fraud law**

RISKS, EDUPAGE 19 19

In May, Craig Nowak, a clueless college student, chose a return address at random for his slimy first attempt at junk e-mail. Unfortunately for his victim, "flowers.com" is a legitimate business whose owner received 5,000 bounced messages and plenty of abuse for supposedly spamming the world. Fortunately for the anti-spam cause, the enraged florist, Tracy LaQuey Parker, launched a lawsuit for damages and was supported by the Electronic Frontier Foundation (Austin chapter) and the Texas Internet Service Providers Association. In late September, the plaintiffs won a temporary injunction against the defendant and his ISP preventing him from further use of the appropriated domain name (not that he'd have wanted to, at that point). In November, the defendant was fined $18,910 plus court costs.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-09-30 **Internet fraud law enforcement**

AAP

The Australian Competition and Consumer Commission announced that it was joining with more than 30 other agencies worldwide to share information about consumer fraud on the Internet and to prosecute e-crooks. Consumer Affairs Minister Chris Ellison said that "Internet scams ripped off thousands of Australians each year, with promotions including fake credit card offers, tickets in phoney lotteries, useless investments, worthless phone cards and pyramid selling schemes." He added that the Commission would not release details of it targets and said, "Those involved in scams will be in for a shock."

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-10-03 **hacker credit card fraud forgery**

AAP

A 16-year-old Australian, Drew Henry Madden, of Brisbane started defrauding businesses using stolen and forged credit-card numbers just after leaving school. By 1997, he had stolen $100,000 in goods and services. In October, he pleaded guilty to 294 counts of fraud. He was given a suspended sentence. His defense attorney blamed poor security for the losses: "Defence counsel Simon Lewis said Madden started with very minor credit card fraud, but it escalated alarmingly, because the safeguards were so inadequate." Despite the youngster's unusual revenue stream, his mother appeared to have accepted his globe-trotting ways and massive purchases of lottery tickets without comment.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1997-10-21 **forgery perjury chat room**

AP

In Michigan, Circuit Judge Alice Gilbert ordered a search of an unnamed woman's computer systems by defense attorneys. The woman accused 26-year old Sean A. Crockett of assaulting her in Feb 1997 after they met via an online chat room but is in turn accused of having boasted online in a "Man Haters" chat room about fabricating the accusation.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1998-01-04 **satellite piracy scrambler decoder TV**

ICSA research

ICSA's underground research team reported a growing list of sites selling equipment and techniques for defeating satellite TV encryption (scrambling). According to other reports, criminals — many of them based in Canada — have been providing dishonest customers with the ability to benefit from high-capacity TV satellites without paying subscription fees. Signal theft is a federal felony, with prison terms and up to $100,000 per violation for selling illegal devices. Customers who steal TV signals can pay up to $50,000 and may go to jail for two years for the first conviction. The criminals who sell these devices and provide decryption algorithms usually manage to defeat changes within a couple of days. Ironically, the hackers who sell hacked access-cards complain about "thieves" when their own customers fail to pay them for the illegal products.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1998-01-06 **information warfare spam extortion**

RISKS 19 53

The National Organization of Internet Commerce was reported to have threatened the public disclosure of one million AOL subscriber names on its Web site as a pressure tactic to force the ISP to provide a mechanism to allow them to send junk e-mail to all AOL subscribers at low cost.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1998-01-22 **extortion hacker bank reward**

RISKS 19 56

A German bank, Noris Verbraucherbank, offered a DM10K reward (~U$5000) for help in getting a criminal hacker who attempted to extort DM1M by threatening to release "confidential customer information and bank access codes" according to a report in RISKS.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1998-04-23 **slamming fraud phone FCC**

EDUPAGE

The Fletcher Companies engaged in systematic "slamming" — switching customers to their expensive long-distance services without permission. The FCC, responding to over 1400 complaints, fined the group of companies $5M. FCC Chairman William Kennard vowed to crack down on these fraud artists and asked consumers to check their phone bills carefully each month.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1998-12-15 **fraud scam bilk investor sucker victims gullible confidence**

AP

Kevin Tauber formed WARPnet Holdings LLC and presented the company as an ISP to wealthy investors. Actually, said the SEC, he was allegedly a con-artist who bilked his victims of their investments. [This case reminds one that some observers, including Alan Greenspan of the Federal Reserve, have commented that the frenzy of investment in Internet businesses — many of which have never earned a profit — has all the characteristics of an investment bubble. Caveat emptor (or caveat investor).]

Category 15 *Fraud (not embezzlement), extortion, slamming*

1999-11-15 **fraud scam information warfare stock price manipulation securities**

The Times (London)

Investors in the USA and in the UK were warned off "pump-and-dump" frauds in which false information is used to generate interest in stocks. Typically the fraudsters buy cheap and then try to move the share price higher by posting exciting but wrong news about the company's prospects. Cases have involved losses in the millions of dollars. One of the techniques used by the criminals is to put up Web sites that resemble or even duplicate those of the real company and link to them from their own bogus sites.

Category 15 *Fraud (not embezzlement), extortion, slamming*

1999-11-16 **Internet Web fraud bogus prosecution**

Reuters

The New Jersey Attorney General charged nine people on several complaints of fraud from 1996 through 1998. Some of the scams included selling non-existent stock for $850,000, selling non-existent Beanie Babies through the eBay online auction service, and selling Viagra through the Net without a license.

15.1 Fraud

Category 15.1 *Fraud*

1997-01-08 **fraud Internet AOL Russia**

AP, EDUPAGE

AOL staff became suspicious about enormously expensive bills being run up by Russian users. Investigation revealed so much credit-card fraud, stolen user IDs and passwords and other forms of fraud that the company terminated services in 40 Russian cities. From mid-December 1996 on, the 2,000 Russian AOL subscribers must now access the service by logging on to local Russian Internet Service Providers.

Category 15.1 *Fraud*

1997-01-08 **fraud AOL AOL4FREE**

Reuters

Nicholas Ryan, a 20-year-old Yale University student, pleaded guilty to creating the AOL4FREE program that allowed an unknown number of larcenous AOL users to cheat the company of their $2.95 per hour access fee. On a single day, submitted AOL, the program was used 2,000 times for illegal access. Ryan, who called himself "Happy Hardcore," continuously modified his program to counter defensive measures taken by AOL programmers. As a result, the young man faced up to five years in federal prison and up to $250,000 in fines.

1997-01-08 **credit card fraud insider**

PA News

In one of the more spectacular cases of insider fraud, Elizabeth John, a manager at Harrods in London admitted having taken 1,288 receipts and confidential records from her employer's store to her flat — but insisted that she had simply forgotten to return them. The scam, involving her brother (who confessed) and others, netted 205,000 pounds of profit. One victim was so wealthy that he failed to notice that 120,000 pounds of fraudulent charges had been attributed to his Gold Mastercard. In all, 70 customers had their credit cards pillaged.

2000-06-09 **fraud misrepresentation accounting dissimulation lies investors scam**

NewsScan, Investor's Business Daily

Shaky bookkeeping practices account for some dot-coms' inflated revenue reports, and a proposal before the Securities and Exchange Commission would put an end to accounting loopholes that enable these companies to jigger their figures. At issue is a tendency on the part of some companies to report as gross revenue the total sales price of all transactions, regardless of whether any revenue from those transactions is retained by the company. For many Web businesses that sell other companies' products, this practice has enabled them to boost their reported earnings and lure unwary investors. "This is going to impact a wide range of companies," says an Internet analyst. "Companies that report revenue one way are going to be rubbing their hands in glee. Now they can say their competitors were reporting bogus figures all along." (Investor's Business Daily 9 Jun 2000)

RISKS; NewsScan;Investors.com http://www.investors.com/editorial/tech05.asp 21 02

A former employee of online press release distributor Internet Wire was arrested [on the 31st of August] and charged with securities and wire fraud in connection with the distribution of a phony press release that sent a tech company's stock price plummeting last week. Shares of Emulex, a maker of fiber-optic equipment, lost up to 60% of their value, most of it during one 15-minute freefall, after some financial news services, including Dow Jones and Bloomberg, ran stories based on the release. The bogus release claimed the company had issued a profits warning, that it was being investigated by securities regulators, and that its CEO had stepped down. The stock eventually recovered most of its value after the company denied the reports. The suspect, 23-year-old Mark Jakob, allegedly used a computer at El Camino Community College to construct and send the release, and then initiated a series of trades that netted him profits of $240,000. (AP/Investors Business Daily 1 Sep 2000)

2000-10-24 **fraud background check e-commerce dot-com firms investigation background**

NewsScan, Financial Times http://news.ft.com/news/industries/infotechnology

Internet executives are four times more likely to have "unsavory backgrounds" than execs from other industries, according to a study by corporate security firm Kroll Associates. Over the past six months, Kroll has carried out 70 due diligence background checks of dot-com executives and board members, and about 39% — 27 people — were found to have problems — much higher than the typical 10% that Kroll expected. Problems included: violations of Securities and Exchange Commission rules, insurance fraud, undisclosed bankruptcies, frauds committed overseas, and even links to organized crime. In one of the most extreme cases, two people that Kroll was investigating because they had made an unsolicited offer to invest in a U.S. dot-com company were later murdered. "In the course of the law enforcement investigation they found the two were connected to penny stocks promotional scams and organized crime," says Ernie Brod, executive managing director of Kroll's New York office. Most of the problems were not associated with the inexperienced management teams who frequently run dot-coms, but rather with "gray beards" brought in to add stature to the company. "I refer to these people as vampire investors," said Brod. "Maybe they put a couple of bucks in, then they lick their lips at the opportunity and suck exorbitant consulting fees out of them, or put their relatives on the payroll." CONGRESS TARGETS ONLINE FRAUD

The Fraudulent Online Identity Sanctions Act, sponsored by U.S. Reps. Lamar Smith (R-Texas) and Howard Berman (D-Calif.), would tack as much as seven years on to prison sentences handed down to fraudsters using the Internet to bilk unsuspecting users through a Web site registered under a false name or contact information, and would also allow copyright owners to seek larger monetary damages from fraudulently registered sites that distribute copyrighted material without permission. "The Government must play a greater role in punishing those who conceal their identities online, particularly when they do so in furtherance of a serious federal criminal offense or in violation of a federally protected intellectual property right," says Smith. The proposal could hit a snag if privacy advocates lobby against it, maintaining that private information such as home addresses and phone numbers should not be made available on the public "whois" domain name databases against the registrant's wishes. "Because of the way whois is currently structured, there are a lot of reasons why users might submit false information that have nothing to do with copyright infringement," notes Michael Steffen, a policy analyst at the Center for Democracy and Technology. MURDER IN THE INFORMATION AGE

In Korea, police have arrested a 25-year-old college senior and charged him with operating a killer-for-hire Web site and taking thousands of dollars from his customers. In one case the student allegedly received the equivalent of $8,600 from a 22-year-old woman who wanted her ex-boyfriend and his wife murdered; in another there were discussions with a boy who wanted his father and stepmother killed. None of the murder plots was carried out. (AP/USA Today 12 Feb 2004)

[MK adds: I wonder who finally complained about the poor service? Can you imagine it? "Uh, Mr Policeman, I want to complain about a murder I ordered that has not been carried out."]

2004-02-25 **Microsoft fraud cyber crime warning businesses under attack criminals**

DHS IAIP Daily;
http://www.computerweekly.com/articles/article.asp?liArticleID=128636&liArticleTypeID=1&liCategoryID=2&liChannelID=22&liFlavourID=1&sSearch=&nPage=1

February 25, Computer Weekly — Businesses are under attack from cyber criminals, says MS security head.

Businesses worldwide face increasing threats from cyber criminals attempting extortion and fraud because the software running their systems makes them vulnerable, said Microsoft's top security architect at the e-Crime Congress in London. Security architect and chief technology officer of Microsoft's security business unit David Aucsmith admitted that he is considered a "target" for complaints against his company's software, but he also stressed that many of the security issues could not have been foreseen. Microsoft is addressing these security issues by working closely with law enforcement authorities and changing its patching procedures. Much of the threat comes from criminals who are making a career from high-tech crimes such as hacking, extortion and fraud, he said. The time between the release of a patch and the creation of an exploit has dwindled dramatically. Hackers have the advantage of not having to test their exploits, which allows them to move faster than suppliers who must perform rigorous testing to ensure that their patches do not break users' systems.

2004-03-09 **fraud Internet resumes CV curriculum vitae misrepresentation lies background checks hiring**

NewsScan

RESUME FRAUD GOES HIGH-TECH

As companies ratchet up efforts to detect misrepresentations on job seekers' resumes, resume fraud is jumping to a new level, thanks to operators of Web sites that provide phony degrees and toll-free numbers for employers to call, where they're assured that a job candidate's credentials are valid. Some candidates are even paying hackers to alter class lists at universities they claim to have attended, says Charles Wardell, managing director at Korn/Ferry International. "In the past, people just lied. Now, what they are doing is they are hacking into a class of a university and putting their name on the class list." Wardell says his company has started requesting degrees and, in some cases, even grades from potential job candidates, but such documents are also easily faked, thanks to the ingenuity of Web sites such as easydiploma.com, which offers phony degrees and a verification service. "You can select the parchment paper, the insignia and the type of degree," says the head of a corporate investigation firm's background screening division. Background search firms say these increasingly sophisticated resume fraud schemes are making their jobs more difficult: "A good liar understands that you have to have some basis and facts to pull off a scam. But it's even more dangerous when employers unknowingly hire a fraud, thief or a crook," says the president of Employment Screening Resources.

2004-03-10 **4-1-9 Nigerian advance fee fraud swindler stupidity**

http://www.theregister.co.uk/2003/03/10/419_scammers_take_us_con/

The Register published the following summary of a hilarious tale of stupidity and cupidity:

>419 SCAMMERS TAKE US CON ARTIST FOR $750,000
By Lester Haines
Published Monday 10th March 2003 15:07 GMT

A businessman in Winona, Minnesota, has been taken for a cool $750,000 by Nigerian 419 scam artists, the Winona Daily News reports.

Nothing new there, you might think, but $250,000 of the cash did not actually belong to victim Carl Fratzke. Incredibly, Fratzke had pulled a scam of his own and defrauded seven friends to raise the capital. The balance came from his own savings.

Tempted, as ever, by promises of riches beyond the wildest dreams of avarice, Fratzke asked chums to invest in a scheme whereby he would buy gloves and sell them to Wal-Mart at a hefty profit. He promptly sent the cash straight to the 419 scammers.

"They sent me a facsimile of the check they were going to send me," Fratzke later testified before a presumably astounded judge. "They said: 'This is coming'."

Well, it didn't, and now Fratzke faces sentencing on 31 March on "two counts of theft by swindle and one count of theft by check". If he's lucky, the beak will hand down a stiff sentence. Jail is probably the only place he'll be safe from his friends and investors — and his own stupidity.<

2004-04-27 **UK cybercrime law review organized crime gangs hacking spam virus-writing**

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/internet/04/27/crime.britain.internet.reut/index.html

April 27, Reuters — UK to review cybercrime law.

Britain is to update its lone cybercrime law. Organized gangs around the world are honing their hacking, spamming and virus-writing skills while thinly stretched police resources are struggling to cope. The legal update will be closely watched by other countries, many of whose own laws against cybercrime are considered insufficient to fight what has become one of the fastest growing global crime waves. A group of parliamentarians will hold a public debate on Thursday, April 29, to explore ways to bring the Computer Misuse Act, or CMA, into the Internet era. Working with the UK's Home Office, the aim is to have a new cybercrime bill introduced in the next six months, MP Brian White said. Police say cybercrime costs UK industry hundreds of millions, and perhaps billions, of pounds annually. Globally, the figure is staggering, law enforcement officials say. "Serious and organized crime groups, and potentially terrorists, are moving into cyberspace simply because it's easier to hide there," said Simon Moores, a computer crime expert who works with the UK government. Thin resources, few convictions The need for an updated law is most evident to prosecutors and police. The Home Office said there were just 14 convictions under the CMA in 2002, the last year statistics were tallied.

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/25782−1.html

April 29, Government Computer News — Financial Crimes and Enforcement Network plans to modernize Bank Secrecy Act database.

The Department of Treasury's Financial Crimes and Enforcement Network (FinCEN) plans to update its computer database next year with a new data retrieval system, along with applications that will perform deeper analysis and improve data-mining capabilities. Banks report suspicious activity and other data through FinCEN's U.S.A.P.A.T.R.I.O.T. Act Communications System, including when customers make unusually large deposits or withdrawals. Law enforcement agencies can access and download the confidential information in FinCEN's database to help uncover and track terrorist financing. Bank Secrecy Act (BSA) Direct, which is basically a data warehouse, will make the information more easily accessible and understandable to law enforcement while securing the information from unauthorized users, according to FinCEN director William Fox.BSA Direct will also alert FinCEN to irregularities in Bank Secrecy Act reports submitted by financial institutions, and will audit use of the accessed data to ensure that it is not misused, Fox said. A networking function will link different law enforcement entities that are accessing the same data to avoid overlap or conflict in investigations. FinCEN expects to have BSA Direct online in the fall next year, Fox said.

2004-05-17 **fraud online job listings identity theft credit card theft**

DHS IAIP Daily; http://www.nytimes.com/2004/05/17/technology/17ecom.html

May 17, New York Times — Fraud in online job listings.

Online job sites like Monster.com, CareerBuilder and HotJobs have given employers another way to find workers, but it turns out that crime rings are making use of the sites, too. In a recent swindle, for instance, credit card thieves found unwitting money launderers through Monster.com, then left their "employees" on the hook for thousands of dollars in debts and possible criminal liability when the fraud was discovered. Federal authorities said the recent swindle was one they had not yet seen. Molly S. McMinn, an inspector for the United States Postal Inspection Service said this type of fraud was "a new twist on an old idea" of credit card thieves from foreign countries buying merchandise from online merchants with card numbers stolen from American citizens and having the merchandise shipped to associates in the United States. McMinn said fraud rings would recruit associates by putting ads on job sites for "reshippers," who, in exchange for a fee, mail the merchandise to Ukraine, Indonesia or other countries known by online merchants as hotbeds of Internet fraud. By using middlemen based in the United States, criminals can escape detection by merchants.

DHS IAIP Daily; http://www.lasvegassun.com/sunbin/stories/lv−crime/2004/may/ 27/516925888.html

May 27, Las Vegas Sun — Eleven sought in ATM, casino scam.

The FBI continues to search for 11 people named in two federal racketeering indictments alleging two Romanian crime rings are using stolen credit cards and false identification to bilk hundreds of thousands of dollars from Las Vegas, NV, casinos and ATMs. The indictments allege the credit card rings sent out runners across the country to steal credit cards that were then transported to Las Vegas, where they were used with fake driver's licenses to obtain cash advances at casinos and from automated teller machines. The groups liked to prey on people at fitness centers, where credit cards were easily taken from lockers while people worked out, or from cars parked at trail heads at recreation areas, Assistant U.S. Attorney Tim Vasquez said. On Tuesday, May 25, the FBI seized computers, printers, digital cameras, lock-picking tools, laminators, credit cards, ATM components and an ATM from the Las Vegas homes of the six people arrested in Las Vegas. "We believe they used the ATM machine to practice one of their newer techniques, which was using skimming devices," Vasquez said.

August 26, Reuters — U.S. says over 100 arrested in Internet crime sweep.

More than 100 people have been arrested in the largest global crackdown to date on identity theft, hacking and other Internet-based crimes, Attorney General John Ashcroft said on Thursday, August 26. The arrests followed a three-month investigation into a range of crimes from reselling co-workers' Social Security numbers to disabling Websites, Ashcroft said. The crackdown, dubbed "Operation Web Snare" cost some 150,000 victims more than $215 million, Ashcroft said, adding that 53 people had already been convicted. Phishing, the sending of e-mails designed to look like they are from legitimate financial institutions, and identity theft were two of the major schemes targeted. Law enforcement officials in Romania, Nigeria and Cyprus helped track down people involved in fraudulent auctions, trafficking in stolen credit card numbers and other crimes, Ashcroft said.

EDUPAGE; http://www.insidehighered.com/news/2005/05/11/nicholls

NCAA FINDS ONLINE COURSE FRAUD

An investigation of student athletes at Nicholls State University in Louisiana has revealed that students and university staff had engaged in "gross academic fraud" by fraudulently completing online courses to preserve the students' eligibility for sports. The university's registrar discovered the fraud after noticing that many student athletes were completing online courses from Brigham Young University (BYU), often with much higher grades than for classes they took at Nicholls. As it turned out, two coaches and an academic adviser were giving students answers for the courses and in some cases serving as proctors for the students' tests. The National Collegiate Athletic Association (NCAA) confirmed the fraud and imposed penalties on the school's athletic programs, but the episode has raised a red flag about the potential for similar abuse of online programs. "There appeared generally not to be sufficient monitoring either by BYU or … by Nicholls State," according to Josephine Potuto, member of the NCAA panel that conducted the investigation. A statement from the panel noted, "This case illustrates the ease with which individuals can manipulate and then breach security protocols for online correspondence courses." Inside Higher Ed, 11 May 2005

EDUPAGE; http://www.nytimes.com/2006/01/18/technology/18data.html 23

ONLINE BROKER TO COVER FRAUD LOSSES

Online stock broker E*Trade has announced a "zero liability" policy in which it will cover all losses resulting from online fraud. Although some other online brokerage firms said they have absorbed some or all of the costs of fraud in past incidents, E*Trade becomes the first to establish such a policy. Losses due to fraud in the online brokerage industry remain relatively small and are a fraction of losses to credit card fraud, but the number of data breaches is rising. Moreover, when people are victimized through brokerage fraud, they are harmed "to the tune of hundreds of thousands of dollars," according to Gerri Walsh, acting director of the Securities and Exchange Commission's Office of Investor Education. Officials at E*Trade said they expect other brokers will follow suit and implement similar policies, bringing the entire industry to a level similar to that of credit card companies. A federal law passed in the 1970s requires issuers of credit cards to limit customer liability to $50, but most issuers cover all losses.

2000-01-15 **criminal hacker investigation extortion theft proprietary information data source code**

PA, Sunday Times (London)

In September 1999, the Sunday Times reported in an article by Jon Ungoed-Thomas and Maeve Sheehan that British banks were being attacked by criminal hackers attempting to extort money from them. The extortion demands were said to start in the millions and then run down into the hundreds of thousands of pounds. Mark Rasch is a former attorney for computer crime at the United States Department of Justice and later legal counsel for Global Integrity, the computer security company that recently spun off from SAIC. He said, "There have been a number of cases in the UK where hackers have threatened to shut down the trading floors in financial institutions. . . . The three I know of (in London) happened in the space of three months last year one after the other. . . . In one case, the trading floor was shut down and a ransom paid." The International Chamber of Commerce (ICC) confirmed it had received several reports of attempted extortion. Ungoed-Thomas and Sheehan quoted Pottengal Mukundan, ICC Director of Commercial Crime Services, as saying, "We have had cases of extortion and the matter has been investigated internally and the threat removed. . . . I don't think you will find there are many companies which admit to having a problem." Finally, the authors spoke with Edward Wilding, Director of Computer Forensics at Maxima Group; he said, "Computer extortion is not rife, but we do get called to assist in incidents where extortionists have attempted to extract money by the use of encryption and where databases of sensitive information have been stolen."

According to Padraic Flanagan of the British Press Association in mid-January 2000, UK police were investigating a dozen attempts by criminal hackers to extort funds from multinational companies in Britain.

2000-01-18 **criminal hacker penetration bank extortion credit card**

AP, Dow Jones, RISKS 20 75

In January, information came to light that VISA International had been hacked by an extortionist who demanded $10M for the return of stolen information — information that VISA spokesperson Chris McLaughlin described as worthless and posing no threat to VISA or to its customers. The extortion was being investigated by police but no arrests had been made. However, other reports suggested that the criminal hackers stole source code and could have crashed the entire system. In a follow-up on RISKS, a correspondent asked, ". . . [What source code was *stolen*? It is extremely unlikely that it was *the source code for the Visa card system* as stated! There is no such thing. Like any system, it would consist of many source libraries, each relating to different modules of the overall system. So we should be asking what source was copied? (You can hardly say it was *stolen*, as that would imply that it was taken away, leaving the rightful owner without possession of the item of stolen property, and we all know that is not what happens in such cases. In a shop like Visa, the code promotion system maintains multiple copies in the migration libraries, so erasure of the sole copy is highly unlikely)."

2000-01-25 **extortion cryptanalysis smart card counterfeit theft fraud**

NewsScan, MSNBC, ZDNet
http://www.zdnet.com/zdnn/stories/news/0,4586,2428429,00.html, Crypto-Gram
http://www.counterpane.com/crypto-gram-0002.html

French programmer Serge Humpich spent four years on the cryptanalysis of the smart-card authentication process used by the Cartes Bancaires organization and patented his analysis. When he demonstrated his technique in September 1999 by stealing 10 Paris Metro tickets using a counterfeit card, he was arrested. The man had asked the credit-card consortium to pay him the equivalent of $1.5M for his work; instead, he faced a seven-year term in prison and a maximum fine of about $750,000 for fraud and counterfeiting (although prosecutors asked for a suspended sentence of two years' probation and a fine of approximately U$10,000). He was also fired from his job because of the publicity over his case. In late February 2000, he was given a 10-month suspended sentence and fined 12,000 FF (~U$1,800).

TINY COMPANY CRITICIZED FOR 'PATENTMAIL'
A little-known company called TechSearch has found a new gimmick for making money off the Net -- it's using a 1993 patent that covers a basic process for sending files between computers to demand license payments from big-name companies, including The Gap, Walgreen, Nike, Sony, Playboy Enterprises and Sunglass Hut. Other less-willing contributors include Audible, Encyclopaedia Britannica and Spiegel, which were threatened with litigation when they refused to pay up. "We chose to settle the lawsuit rather than move forward with potentially costly litigation," says a Britannica spokeswoman. Following complaints that the patent is invalid, the U.S. Patent and Trademark Office reached an initial decision late last month to void it, but TechSearch has amassed a collection of 20-some other patents that it can use to extract payments. It's filed several lawsuits against major electronics firms based on a 1986 patent on "plug and play" technology, and has initiated litigation with several distance learning providers based on a 1989 patent that broadly covers computer-based educational techniques. TechSearch founder Anthony Brown says his methods, although aggressive, are perfectly legal, and the company's law firm says it's won $350 million in settlements in a string of jury verdicts over the last six years. Critics have labeled the company's techniques "extortionate" and "patentmail." (Wall Street Journal 9 Mar 2001)

http://www.expatica.com/index.asp?pad=2,18,&item_id=33655

In June 2003, a high-tech extortionist in the Netherlands threatened to poison the products of the Campina food company in Utrecht unless he were paid €200,000. The steps for payment used an unusual degree of technical sophistication:

1. Campina had to open a bank account and get a credit card for it.
2. The victims deposited the payoff in the bank account.
3. They had to buy a credit card reader and scan the credit card to extract the data from the magnetic strip.
4. Using a steganography program and a picture of a red VW car sense by the criminal, the victims encoded the card data and its PIN into the picture using the steganographic key supplied with the software.
5. They then posted the modified picture in an advertisement on a automobile-exchange Web site.
6. The criminal used an anonymizing service called SURFOLA.COM to mask his identity and location while retrieving the steganographic picture from the Web site.

The victims worked with their local police, who in turn communicated with the FBI for help. The FBI were able to find the criminal's authentic e-mail address along with sound financial information from his PAYPAL.COM account. Dutch police began surveillance and were able to arrest the 45-year-old micro chip designer when he withdrew money from an ATM using the forged credit card.

COMPUTER PROGRAMMER ARRESTED FOR EXTORTION AND MAIL FRAUD SCHEME TARGETING GOOGLE, INC.

Extracts from the press release from the US Department of Justice, March 18, 2004

The United States Attorney for the Northern District of California announced … that Michael Anthony Bradley, 32, of Oak Park, California, was arrested … [on March 17] on a criminal complaint filed in San Jose charging him with interfering with commerce by threats or violence in violation of 18 U.S.C. § 1951, and mail fraud in violation of 18 U.S.C. 1341….

According to the criminal complaint, which was unsealed in San Jose today, Mr. Bradley attempted to defraud and extort money from Google, the Internet company best known for its free search engine, by developing a software program that automates fraudulent "clicks" on "cost-per-click" advertisements utilized by Google. These fraudulent clicks, in turn, were designed to cause Google to make payments that were supposed to be made only for "clicks" made by legitimate Web surfers.

The complaint alleges that Mr. Bradley first sent an email requesting a meeting with Google concerning his software program, which he named Google Clique, in early March. In a subsequent face-to-face meeting with Google engineers on March 10, the complaint alleges that Mr. Bradley performed a demonstration of his program, and claimed that it generated false clicks that look like real Internet traffic and were untraceable. The defendant allegedly stated that he would sell it to top spammers if Google did not pay him $100,000, and that Google would lose millions.

The maximum statutory penalty for each violation of 18 U.S.C. §§ 1341 and 1951 is 20 years imprisonment and a fine of $250,000…."

May 26, Australian Associated Press — Mobsters targeting Australians online.

Australians are being targeted by Eastern European organized crime families using the internet to extort and steal far from home. Delegates at the annual AusCERT Asia Pacific Internet Security Conference were warned Wednesday, May 26, that mobsters were hiring computer programmers to take their brand of criminal activity online. The deputy head of Britain's National Hi-Tech Crime Unit, Superintendent Mick Deats, said one Eastern European syndicate with interests in prostitution, drugs and gun smuggling was also earning money all over the world from internet credit card fraud, software piracy, child pornography and online extortion. "Australia is a focus of a lot of the phishing activity at the moment," Deats said. "The people we've arrested in London were sending money to the same people that are receiving money from attacks that are happening in Australia." Another tactic linked to several eastern European crime syndicates was using distributed denial of service attacks -- bombarding online businesses with a flood of requests aimed at overloading systems and shutting them down. The businesses were then told to pay $50,000 to make the attacks go away, he said.

CRYZIP TROJAN ENCRYPTS FILES, DEMANDS RANSOM.

Virus hunters have discovered a new Trojan that encrypts files on an infected computer and then demands $300 in ransom for a decryption password. The Trojan, identified as Cryzip, uses a commercial zip library to store the victim's documents inside a password-protected zip file and leaves step-by-step instructions on how to pay the ransom to retrieve the files. It is not yet clear how the Trojan is being distributed, but security researchers say it was part of a small e-mail spam run that successfully evaded anti-virus scanners by staying below the radar. While this type of attack, known as "ransomware," is not entirely new, it points to an increasing level of sophistication among online thieves who use social engineering tactics to trick victims into installing malware, said Shane Coursen, senior technical consultant at Moscow-based anti-virus vendor Kaspersky Lab.

Winn Schwartau, the Paul Revere of Cyberspace, speaking at a conference in Ottawa, cyberspace is increasingly a battlefield for e-spies. "Schwartau estimated the U.S. economy loses more than $100-billion annually through economic espionage, growing by 500% since 1992."

Category 16 *INFOWAR, industrial espionage, hacktivism*

1997-06-03 **information warfare**

Defense Daily 195 45

Defense Secretary William Cohen contributed to the Quadrennial Defense Review. He emphasized the U.S. DoD's commitment to defensive and offensive information warfare. "Although our current capabilities are adequate to defend against existing information operations threats, the increasing availability and decreasing costs of sophisticated technology to potential adversaries demand a robust commitment to improve our ability to operate in the face of information threats as we approach the 21st century." The report also emphasizes the importance of unprecedented cooperation between DoD, other government agencies, the business sector and the public and mentions DoD support for the President's Commission on Critical Infrastructure Protection.

1998-10-11 **industrial espionage information warfare spying lawsuit**

AP

Johnston Industries of Columbus, GA filed suit in Alabama against Milliken Industries of Spartansburg, SC claiming damages of $30M resulting from industrial espionage in 1995. The suit alleges that Justin Waldrep misrepresented himself as a graduate student at Georgia State University and that Rodney A. Taylor lied about being an investment banker. The two men were given royal treatment at JI plants and given confidential information about secret industrial processes. According to the statement of the tort, the two were actually employed on contract by Millken, which allegedly benfitted from the information to make competitive products. An AP news-wire story stated "NRB Industries of New York filed a suit against Milliken last year. The suit, which reads more like a novel of intrigue than a legal paper, accused Milliken of using the same two men to conduct corporate spying. But in this case, Waldrep was supposed to be a graduate student at Columbia University since NRB is in New York. Court records included an investigation contract signed by a Milliken division chief and an agreement stating, ``Milliken's identity will remain absolutely anonymous." Milliken settled that suit in January without disclosing the terms."

Deseret News http://deseretnews.com:80/dn/view/0,1249,30003297,00.html?

Jack Anderson and Jan Moller discovered cyberwar in December 1998 and wrote a stirring call to, um, to worry. They cited the report ("Cybercrime . . . Cyberterrorism . . . Cyberwarfare: Averting an Electronic Waterloo") from the Center for Strategic and International Studies which laid out the standard picture of infrastructure vulnerability.

Category 16 *INFOWAR, industrial espionage, hacktivism*

1999-01-04 **information warfare strategy national security**

Federal Computer Week http://www.fcw.com/pubs/fcw/1999/0104/web-rand-01-04-98.html

The RAND Corporation issued a DoD-commissioned report, "Strategic Information Warfare Rising" in mid-1998 that fueled the growing debate within the Pentagon about the wisdom of pursuing offensive information warfare capabilities. Opponents argue that widening the sphere of warfare to include cyberattacks on critical infrastructure would only increase likelihood of successful attacks on the US. The report laid out four basic scenarios for future developments in IW; as laid out by Daniel Verton, writing in Federal Computer Week, they were the following [bullets added]:
"* U.S. supremacy in offense and defensive strategic IW.
* A club of strategic IW elites, whereby a policy of no first use of strategic IW capabilities could be established.
* Global "defensive dominance" in strategic IW, whereby a regime would be established to control the spread of strategic IW similar to biological and chemical weapons.
* Market-based diversity, whereby the damage or disruption achievable through a strategic IW attack is modest and recovery is fast."

The Clinton administration proposed a 40% increase in critical infrastructure protection and computer security — a proposed budget item of $1.464B. Some $3M of this amount was earmarked for new scholarships in computer science and security programs.

Category 16 *INFOWAR, industrial espionage, hacktivism*

1999-02-12 **sabotage information warfare knowbot feedback fraud error**

RISKS 20 21

For unknown reasons, the BUY.COM online store Web site listed a $588 Hitachi monitor at only $164.50 — and staff failed to notice the error until two days later, by which time there were 1,600 orders for this incredible bargain. The potential cost was estimated by the company at $320,000. BUY.COM filled 200 orders and told all the rest that they were out of luck. They also posted new language on their Web site addressing the non-validity of erroneous prices.

Analysts speculated on the cause of the error. One intriguing possibility: the BUY.COM online store had a policy of underbidding any price on the Net and may possibly have used knowbots to scour the Web looking for prices of products it was selling. Speculation had it that if a competitor accidentally or deliberately posted a bad price, the unsupervised knowbot could very well poison the BUY.COM Web site database. The same technique could be used in an information warfare attack to ruin a competitor. Even worse, the same problem could occur if two companies inadvertently used the same policy of underbidding all competitors and then simultaneously launched automated processes to lower the price without human intervention.

A report in the Sunday Times reviewed the growing scope and cost of information warfare around the world. New e-mail-enabled viruses and new Trojans have the potential for massive damage running into the billions of dollars, according to experts such as CSI's Richard Power. James Adams, of Infrastructure Defence and author of _The Next World War: Computers are the Weapons and the Front Line is Everywhere_, said, "Hackers are a new form of terrorist. You can bring a country to its knees. It is a unique weapon. Things are getting exponentially worse."

1999-04-20 **information warfare cyberwar Netwar strategy terrorists**

Wired

An interesting paper by the Rand Corporation entitled _Countering the New Terrorism_ was put on the Web free < http://www.rand.org/publications/MR/MR989/MR989.pdf >. _Countering the New Terrorism_ by I.O. Lesser, B. Hoffman, J. Arquilla, D.F. Ronfeldt, M. Zanini, & B.M. Jenkins was abstracted as follows: "The contours of terrorism are changing, and the new terrorism has more diverse sources, motivations, and tactics than the old. It is more lethal, global in reach, and characterized by network forms of organization. Terrorist sponsorship is becoming hazier and `privatized.' The August 1998 terrorist bombings of U.S. embassies in Kenya and Tanzania fit in many ways the new mold. The chapters in this book trace the evolution of international terrorism against civilian and U.S. military targets, look ahead to where terrorism is going, and assess how it might be contained. Terrorism and counterterrorism are placed in strategic perspective, including how terrorism might be applied as an asymmetric strategy by less-capable adversaries. The report builds on a existing body of RAND research on terrorism and political violence, and makes extensive use of the RAND-St. Andrews Chronology of International Terrorism."

1999-10-01 **information warfare infowar criminal hacker attack penetration vandalism hacktivism law enforcement response**

Defense Information and Electronics Report

James Christy of the Defense-wide Information Assurance Program (DIAP) offered a strongly-worded attack on the notion that the US has ever been the target of information warfare. On the contrary, he argued in a presentation to the International Testing and Evaluation Symposium in Atlanta in late September, the attackers are cybercriminals, not cyberwarriors. The fundamental difficulties in responding effectively to such attacks, said Christy, are as follows:
* the military has expertise in computer crime but cannot help law enforcement agencies without a presidential directive;
* the civilian has not been able sufficiently to develop its familiarity with computer crime countermeasures;
* it is difficult to tell that cyberattacks are being carried out because most victims keep that information secret, not wanting to get involved with law enforcement investigators;
* precise attribution of blame is extremely difficult in cyberspace;
* the public doesn't know much about computer crime and therefore tends to favor privacy over cybercrime prevention and law enforcement;
* jurisdiction over cyberspace crimes is confused by competing geographical claims.

1999-11-17 **information warfare infrastructure vulnerability national defense**

AAP

Australian Attorney-General Daryl Williams gave a clear warning on November 17th about the necessity for infrastructure protection in the era of cyberwar. Speaking at the Security in Government Conference, he said, "Australia's security is open to compromise in ways that may be less obvious than a terrorist attack but are certainly no less significant." The Attorney-General added, "The costs of a deliberate and concerted attack on our telecommunications, energy, banking and finance or air traffic control systems would be immense in both social and financial terms. The potential sources of deliberate threats are familiar to us all: disgruntled employees or contractors, criminals, issue-motivated groups, terrorists, those engaged in commercial espionage and some foreign states. As if these are not enough, there are also new villains on the scene. The computer hacker and cyber terrorist, sometimes operating alone and equipped only with a personal computer and a modem, can inflict the kind of damage that was previously the realm of organised well-resourced groups." He urged cooperation between the government and the private sector and suggested that a vulnerability and threats database would be useful.

1999-11-17 **information warfare doctrine review survey study analysis**

Jiefangjun Bao (Beijing) translated by BBC

The Chinese military newspaper Jiefangjun Bao published an article in November emphasizing the importance of information warfare in the current military sphere. The authors, Leng Binglin, Wang Ylin and Zhao Wenxiang, made the tendentious claim that "In the Kosovo war, the Yugoslav Federation organized a `hacking' war to attack certain US, British, and NATO web sites, which forced the White House and Pentagon computer systems to cease operations, while the British Meteorological Office was paralysed and unable to provide the necessary meteorological services for NATO air attacks, and a number of NATO air attack plans even had to be cancelled." The concluded, "Experts concerned believe that net attacks have not yet been fully put to good use, because corresponding links have not been established between such attacks and combat actions, since each fights its own war. To ensure that net warfare can play the maximum role in war, it is essential to integrate it with other combat actions. Modern hi-tech warfare cannot win without the net, nor can it be won just on the net. In the future there must be coordinated land, sea, air, space, electronic, and net warfare, and the state's determination will be fully expressed in this mysterious theatre space." [The article was particularly interesting because of the ongoing cyberwar waged by Taiwan and The People's Republic in which there have been thousands of attacks on each others' Web sites.]

1999-11-18 **information warfare simulation games breakdown civil unrest rebellion**

UPI

Organizers from the Institute for Security and Intelligence's Center for Technology and Terrorism, with support from the Jane's company that publishes military magazines and books, brought together US government staff and industry executives in a war-game simulation that resulted in frighteningly believable attack scenarios. Instead of the usual dumb attacks directly eliminating their targets, these cyberwarriors concentrated on causing disruption with false information and denial of service. According to Pamela Hess writing for UPI, "The terrorists, determined to bring down the money-grubbing IRS, devised a diabolical plan with alarming speed. They would hack into the IRS audit system and send out millions of audit notices to American citizens, at the same time sending out "tax due" notices and jamming all the telephone, fax and e-mail lines into and out of the organization to give already irate citizens only busy signals. Just for fun, they tapped into immigration control and State Department systems to issue visas to known terrorists to come to the United States. They created fake documents to make it appear that the organization was investigating the personal lives of members of Congress, then leaked these to the media, along with fake compromising photographs."

2000-02-01 **industrial espionage infowar trial sentence fines**

AP, NACIC Annual Reports to Congress 1999 & 2000

In September 1997, Pin Yen Yang and his daughter Hwei Chen Yang (a.k.a. Sally Yang) were arrested with Dr Ten Hong Lee for trying to steal valuable industrial secrets from the Avery Dennison Corporation, Pasadena, California, for transfer to the Four Pillars Company in Taiwan. Dr. Lee, a Taiwan native and US citizen, had been an Avery Dennison employee since 1986 at the company's Concord, Ohio, facility. Dr. Lee allegedly received between $150,000 and $160,000 from Four Pillars/Pin Yen Yang for his involvement in the illegal transfer of Avery Dennision's proprietary manufacturing information and research data over a period of approximately eight years. Economic losses to Avery Dennison were estimated at $50-60 million. This case marked the first conviction of foreign individuals or a foreign company that went to trial under the Economic Espionage Act of 1996. The Yangs each faced a maximum penalty of 10 years in prison and $250,000 in fines. On 5 January 2000, a Youngstown, Ohio, federal judge sentenced Pen Yen Yang to two years probation along with six months of home detention for violating the 1996 Economic Espionage Act. Mr Yang's daughter was sentenced to one-year probation on the same charge. Four Pillars itself also was fined $5 million by a US District Court for accepting the pilfered secrets. In February 2000, a jury verdict in US District Court, Cleveland awarded Avery Dennison at least $40 million in damages in a civil case against Four Pillars. The judge increased the award to $80 million.

Microsoft . . . [complained] that various organizations allied to it have been victimized by industrial espionage agents who attempted to steal documents from trash bins. The organizations include the Association for Competitive Technology in Washington, D.C., the Independent Institute in Oakland, California, and Citizens for a Sound Economy, another Wash., D.C.-based entity. Microsoft . . . [said], "We have sort of always known that our competitors have been actively engaged in trying to define us, and sort of attack us. But these revelations are particularly concerning and really show the lengths to which they're willing to go to attack Microsoft." (Washington Post 20 Jun 2000)

ORACLE DEFENDS TRASHING OF MICROSOFT
Saying he was exercising a "civic duty," Oracle chairman and founder Lawrence J. Ellison defended his company of suggestions that Oracle's behavior was "Nixonian" when it hired private detectives to scrutinize organizations that supported Microsoft's side in the antitrust suit brought against it by the government. The investigators went through trash from those organizations in attempts to find information that would show that the organizations were controlled by Microsoft. Ellison, who, like his nemesis Bill Gates at Microsoft, is a billionaire, said, "All we did was to try to take information that was hidden and bring it into the light," and added: "We will ship our garbage to [Microsoft], and they can go through it. We believe in full disclosure." "The only thing more disturbing than Oracle's behavior is their ongoing attempt to justify these actions," Microsoft said in a statement. "Mr. Ellison now appears to acknowledge that he was personally aware of and personally authorized the broad overall strategy of a covert operation against a variety of trade associations." (New York Times 29 Jun 2000)

IBM'S PC BUSINESS SALE RAISES RED FLAG ON NATIONAL SECURITY

The U.S. Committee on Foreign Investments, which reviews acquisitions of U.S. businesses by foreign firms, says it's concerned that IBM's sale of its PC business to China's Lenovo Group could open the door for industrial espionage. The committee is composed of 11 U.S. government agencies, including the departments of Justice and the Treasury. The $1.75-billion deal has already passed the antitrust scrutiny of the Federal Trade Commission, which said it would not raise objections based on how the sale might affect competition in the market. The IBM-Lenovo transaction is the biggest PC industry deal since Hewlett-Packard acquired Compaq in May 2002, and would result in Lenovo becoming the third largest PC maker in the world, after Dell and HP. TROJAN HORSE SCANDAL IN ISRAEL

Israeli author Amon Jackont was upset to find parts of the manuscript on which he was working posted on the Internet. Then someone tried to steal money from his bank account. Suspicion fell on his stepdaughter's ex-husband, Michael Haephrati.

Police discovered a keystroke logger on Jackont's computer. Turned out Haephrati had also sold spy software to clients; the Trojan was concealed in what appeared to be confidential e-mail. Once installed on the victims' computers, the software sent surveillance data to a server in London, England. Haephrati was detained by UK police and investigations were underway in Germany and Israel. Twelve people were in jail in Israel; eight others were under house arrest. Suspects included private investigators and top executives from industrial firms. Victims included Hewlett-Packard, the Ace hardware stores, and a cable-communications company.

[Abstract by MK]

EXTENSIVE INDUSTRIAL ESPIONAGE CASE IN ISRAEL

A large scale industrial espionage case unfolded in Israel…. A hacker had developed a Trojan horse application and sold it to several private eye companies -- it seems the Trojan was used for keyboard sniffing as well as file transfer. The private eyes' clients chose the the targeted victims, and the Trojan was sent there by e-mail or posted CD, masquerading as legitimate business presentation.

The collected info was transferred from the victims' computers into an FTP server site (it's not clear if this site was maintained by the private eyes or the hacker) to which access was sold to the clients in the form of one-time passwords at 2000 Euro per entry.

It seems none of the targeted systems was hardened in any way to detect such an intrusion, and the scheme was discovered only because the hacker had posted some of the illegally obtained items over the net.

[Abstract by Amos Shapir]

In RISKS 23.89, Gadi Evron contributed some follow-up information that included these comments::

>… Apart from the technical side of this attack and the extreme wide-scale of it, another interesting aspect is the use of social engineering.

In one description, I heard that a woman called a certain individual at one of the companies with a business offer, and later sent him a presentation via e-mail. When that presentation did not work, she proceeded to send him a CD, which did not work either….

This is not the first time this happened, and not the first time we've seen industrial espionage in IL, or private investigator companies developing their technological and operational capabilities. I've personally been approached about such a job twice in the past 2 years.<

ISRAEL HOLDS COUPLE IN CORPORATE ESPIONAGE CASE.

An Israeli couple suspected of masterminding a computer virus that set off a major industrial espionage investigation was repatriated for trial on Tuesday, January 31, under an extradition deal with Britain, police said. Michael and Ruth Haephrati were arrested in their London home last year over allegations that a Trojan horse program they had developed was bought by private investigators who helped top Israeli corporations spy on each other's computers. Israeli police spokesperson Mickey Rosenfeld said the couple flew in overnight after Britain approved their extradition. Tel Aviv Magistrate's Court ordered them placed in custody for 10 days so that they could be interrogated by police. Computer hacking carries a maximum five year jail term in Israel, which can be increased if data theft is involved. At least 18 other Israelis have been questioned in the Trojan horse case, including corporate executives. Several private investigators have been indicted on related charges. Among companies probed by police in connection with the case were Israel's top mobile phone operator, Cellcom, and two subsidiaries of phone company Bezeq Israel Telecom -- cellular operator Pelephone and the satellite television provider YES. All of the firms denied any wrongdoing.

A Maryland attorney has filed a class-action suit against America Online, charging that version 5.0 of its software changes computer settings of users who try to upgrade from earlier versions and making it no longer possible for them to just click on the desktop icon of another Internet service provider to access the Internet. The attorney says that that AOL is in effect forcing the customer into behavior shaped to suit the company rather than the computer user, and complains: "The Internet is supposed to be like free speech, with open access." (Washington Post 2 Feb 2000)

[A few days later,] Three Washington-area Internet service providers have filed a class-action suit America Online charging that customers who install AOL's new version 5.0 software and choose it as the default browser find that their computer setting are changed in a way that makes it much harder to access providers that use other browsers, thereby allowing AOL to leverage its market position "to foreclose competition and gain unfair competitive advantage." Although not a party to the lawsuit, Prodigy is demanding compensation from AOL for the administrative and technical costs it incurred helping customers who found it difficult to access their Prodigy accounts after installing AOL version 5.0. An AOL executive says that lawsuits are without merit and insists: "We're not doing anything that other ISPs aren't doing." (Washington Post 8 Feb 2000)

YET ANOTHER "MONOPOLY"? AOL SUED BY SMALL ISP

[In April,] Galaxy Internet Services Inc., a small Internet service provider in Massachusetts, . . . [sued] America Online, charging that it "attempted to eliminate competition in the Internet service market" when it introduced new software (AOL 5.0) that blocks AOL subscribers from using other Internet service providers. About 8% of America Online subscribers also use some other ISP, and Galaxy is hoping to be joined it its suit by other competitors of AOL. (Reuters/San Jose Mercury News 4 Apr 2000)

LEGISLATION WOULD SANCTION STUDIO HACK ATTACKS
Proposed legislation crafted by California congressman Howard Berman, whose district includes Hollywood, would provide a shield against legal liability for copyright owners, such as record labels and movie studios, that used high-tech attacks against peer-to-peer Web sites to stop them from enabling illegal file-sharing. "While P2P technology is free to innovate new and more efficient methods of distribution that further exacerbate the piracy problem, copyright owners are not equally free to craft technological responses," says Berman. "This is not fair." Included in the actions a copyright holder would be allowed to take are: interdiction, in which the copyright holder swamps a P2P file server with false requests so that downloads can't get through; redirection, in which would-be file swappers are pointed to a site that doesn't contain the files they're seeking; and spoofing, in which a corrupt or otherwise undesirable file masquerades as the song or movie file being sought by a file swapper. File-swapping companies criticized the bill, saying it opens the door for copyright holders to conduct "cyber warfare" against consumers. (CNet News.com 25 Jun 2002)

RISKS; http://seclists.org/lists/isn/2004/Feb/0011.html 23 21

MALICIOUS IT DESIGN IN SUPPORT OF THE COLD WAR

Sam Garst contributed this abstract to RISKS:

On 2 Feb 2004, *The New York Times* printed an editorial by William Safire entitled "The Farewell Dossier" describing a CIA campaign in the early 1980s that supplied Russia with deliberately flawed technology; this lead directly to the massive explosion of a Siberian gas pipeline. The CIA became aware that the KGB was purchasing technology on the black market, and endeavored to supply the KGB with technology that would pass inspection, and later fail catastrophically.

Two risks leap out at me (trying hard to separate out several moral issues):

- I may test for poor design, or poor manufacturing, but these products were designed to pass testing, and then fail. Should I start testing for malicious design (perhaps, if you're building sensitive infrastructure, this is common practice)?

- These intentional flaws could 'leak' into the legitimate product lines. Hopefully, these companies had (and still have) good software build processes and code repositories. . . .

Safire indicates the story is from a soon-to-be published book: Thomas C. Reed's _At the Abyss_

DHS STUDY: REVENGE IS OFTEN THE REASON FOR COMPUTER SABOTAGE

Corporate insiders who sabotage computers so sensitive they risk endangering national security or the economy commonly are motivated by revenge against their bosses, according to a Department of Homeland Security (DHS) funded study released Monday, May 16. The study, conducted by the U.S. Secret Service and the U.S.-funded CERT Coordination Center at Carnegie Mellon University, examined dozens of computer-sabotage cases over six years to determine what motivates trusted insiders to attack and how their actions damage the country's most sensitive networks and data. The review described most attackers as disgruntled workers or former employees--typically working in technology departments--who were angry over disciplinary actions, missed promotions, or layoffs. The attacks included deleting vital software or data, posting pornography on an employer's Website, or crippling whole networks. The study said most saboteurs showed troubling signs before the attacks: truancy, tardiness, arguments with co-workers, or shoddy performance. Nearly all the employees took some steps to conceal their identities online as they plotted their attacks. All the attacks studied occurred between 1996 and 2002. The study said it did not examine insider attacks where employees sought to steal information to sell for profit or blackmail. Report: http://www.cert.org/archive/pdf/insidercross051105.pdf

The security world was rocked to its foundations when revered book reviewer Rob Slade published a favorable review of controversial writer and speaker Winn Schwartau's latest book, _Cybershock: Surviving Hackers, Phreakers, Identity Thieves, Internet Terrorists and Weapons of Mass Disruption _ [Thunder's Mouth Press, ISBN 1-56025-246-4]. Slade wrote, "s some may know, Winn Schwartau and I do not see eye-to-eye on the emphasis to be given to certain exhortations in alerting the public to matters of computer security. So when he informed me of his latest book, he noted that I might like to do the usual hatchet job on it. Unfortunately, I can't fully comply. While I may quibble with some aspects of his latest book, overall it is a good overview of the existing computer security situation, and would make a helpful introduction for new computer and Internet users. . . . While there is a heavy emphasis on the sensational, overall this book does provide the security novice with a fairly reliable picture of the current security environment. Possibilities are generally presented as such, and the analysis of relative dangers is usually good. A number of useful tips are given that can help home and small business computer users be more secure in their computer and network use. Security specialists will find little that is new here, but that is not the target audience for the book. I have frequently been asked for a recommendation for a general security introduction directed at the non-technical computer and Internet user, and, for all its flaws, I think this work may be the closest I've seen. "

2000-12-08 **government policy information warfare national security**

NewsScan, USA Today http://www.usatoday.com/life/cyber/tech/cti892.htm

In August, Richard Clarke, the National Security Council's first Infrastructure Coordinator, called on industry to strengthen their own information security as a means of strengthening national security: "By protecting the IT security of your company, you can protect the security of your country." He listed several ways the US government is trying to improve information security:

* Supporting Information Sharing and Analysis Centers (ISACs), which are industry-specific groups of companies sharing information about INFOSEC;

* Possibly amending the FOIA (Freedom of Information Act) to reduce ISAC participants' fears of being forced to reveal sensitive information if they talk to government and law-enforcement officials about cybercrimes;

* Supporting INFOSEC research by spending $600M, especially in areas not immediately attractive to the private sector;

* Sharing classified information with "trusted partners."

Speaking at a computer security conference [in December], National Security Council member Richard Clarke told the audience that the next president of the U.S. should appoint (and get Congressional confirmation of) a government-wide chief information officer with authority to oversee all of the government's security. "What this presidential election year showed is that statistically improbable events can occur. It may be improbable that cyberspace can be seriously disrupted, it may be improbable that a war in cyberspace can occur, but it could happen." Clarke said that certain other nations have created information-warfare units and are "creating technology to bring down computer networks." (AP/USA Today 8 Dec 2000)

CONDOLEEZA RICE WARNS OF TERRORIST DISRUPTIONS TO THE NET
National Security Advisor Condoleeza Rice wants to heighten awareness by both private and government organizations of the threat that cyberterrorism poses to national stability: "Today, the cyber-economy is the economy. Corrupt those networks, and you disrupt this nation. It is a paradox of our times that the very technology that makes our economy so dynamic and our military forces so dominating also makes us more vulnerable... A clear willingness to show that you are prepared to confront the problem is what keeps it from happening in the first place." (USA Today 23 Mar 2001)

2001-05-02 **infrastructure protection information warfare e-mail Web criminal hackers defacement**

NIPC Daily Report

Hackers have knocked a Transportation Department Web site offline, leaving the department unable to post railroad decisions or use e-mail. The Surface Transportation Board's Web site was hacked on 1 May, spokesman Dennis Watson said, and federal investigators have been notified. The board is responsible for oversight of the nation's railroad industry, and sends out rulings on mergers and other railroad activities daily. The site also contains news releases, economic statistics and past decisions. It is not known whether any information on the site was altered or destroyed.responsible for the attack, or from what country it originated. Watson said technicians do not know when the site will be back online. (Source: Associated Press, 2 May)

COMPUTER SECURITY: A FAST-MOVING TARGET
Lawrence K. Gershwin, the top science and technology advisor to the Central Intelligence Agency has told a Congressional committee that he doesn't "feel very good about our ability to anticipate" network attacks on U.S. computers, because hackers are developing tools and techniques faster than the CIA can keep up. But so far (and probably for the next 5 to 10 years) individual terrorists do not appear to represent a major treat against the U.S. phone system or financial networks. "Terrorists really like to make sure that what they do works. They do very nicely with explosions, so we think largely they're working on that." However, without being able to "feel very good about our ability to anticipate," that sense of security could disappear at any time. (AP/San Jose Mercury News 21 Jun 2001)

BUSH TEAM PONDERS TECH EXPORT COUNCIL [31 Jan 2001]
The Bush administration is deliberating whether to create a federal Chief Information Officer -- a technology "czar" -- or to create a technology export council instead. The Tech Czar position has been proposed as a means to coordinate e-commerce policy at home and promote the industry abroad, but a council would focus on tech-related security issues as they apply to both the online industry and the national defense. The council would also address the thorny problems associated with aerospace and computer exports, and encryption standardization. (eWEEK 31 Jan 2001)
http://www.zdnet.com/eweek/stories/general/0,11011,2680725,00.html

COORDINATING BOARD FOR INFRASTRUCTURE PROTECTION [13 Jun 2001]
Rejecting the idea of having a single security czar, the Bush Administration is planning to create a coordinating board to manage the government's initiatives focused "critical infrastructure protection" (CIP), which guards information systems that are critical to national security. The board's chairman will report directly to the national security adviser, currently Condoleezza Rice. Paul Kurtz of the National Security Council explains: "We can't have a single government agency or single government entity handling this problem. The idea is a dispersed solution that allows coordination across agencies... We can't fight for each particular agency's needs. We can help, but we need to have each agency take responsibility for their security." (USA Today 13 Jun 2001)
http://www.usatoday.com/life/cyber/tech/fcw2.htm

BUSH TO ENLARGE CYBERSECURITY GROUP [17 Jul 2001]
The Bush Administration plans to expand the office responsible for cybersecurity, replacing a single official with a group of about 21 officials from various federal agencies, including the National Security Agency, the Central Intelligence Agency, the Federal Bureau of Investigation, and the departments of State, Defense, Justice, Energy, and Treasury. The group will report to Condoleeza Rice, the National Security Advisor. The former head of the Justice Department's computer crimes division, Mark Rasch, warns sardonically: "The bad news is, nobody will do anything about critical infrastructure protection until there's a global catastrophic failure. The good news is, there will be a global catastrophic failure." (AP/USA Today 17 Jul 2001)

PHONE CARRIERS OVERWHELMED BY PANICKED CALLERS [11 Sep 2001]
Long-distance, local and wireless carriers struggled to cope with unprecedented call volumes yesterday in the wake of the U.S. attacks. Telecom companies reported between two and 10 times the number of phone calls made on an average Tuesday, and between the hours of 9 a.m. and 12 noon many customers encountered busy signals, dead air or taped recordings saying the circuits were overloaded and to try later. Cingular Wireless reported the number of attempted calls ballooned by 400% in Washington, DC and 1,000% in its New Jersey switching center. AT&T said its network handled, on average, four million calls every five minutes, while Verizon Wireless was forced to move in portable cell antennas to boost network capacity. Meanwhile, customers of VoiceStream, which is one of the few U.S. wireless companies to use the GSM mobile standard, were able to contact friends and family using text messaging, which was unaffected by call volumes and network outages. (Financial Times 11 Sep 2001)
http://news.ft.com/news/industries/telecom

INTERNET PLAYS HUGE ROLE IN DISASTER COMMUNICATIONS [11 Sep 2001]
Various Internet chat rooms were created yesterday to provide information and discussion about the terrorist events that strained traditional communications facilities, and Web sites were inundated with traffic. Major news sites (CNN, FoxNews, MSNBC, YahooNews, and ABCNews) were slowed down, as were the sites of the airlines involved in the disaster, American Airlines and United Airlines. Statistics from Keynote Systems, which monitors Web performance, give some indication of how various sites were able to cope during the day: Nytimes.com, 9 a.m. 0% availability, 10-11 a.m. 43% availability; ABCNews.com, 9 a.m. 0% availability, 11 a.m. 5% availability; USAToday.com, 9 a.m. 18% availability (took 47 seconds to connect); MSNBC.com, 9 a.m. 22% availability (38 seconds to connect); CNN.com, 9-10 a.m. 0% availability. (CNet News.com 11 Sep 2001)

FBI TARGETS E-MAIL FOR CLUES [12 Sep 2001]
The FBI has served major U.S. Internet service providers with search warrants in connection with an e-mail address believed to be connected to Tuesday's terrorist attacks. "They wanted to know what we have on our network, and our logs about this [e-mail] address, if that address has flowed through our network at any time," said an executive at Earthlink. The address does not belong to Earthlink, but the company was told to expect more warrants as the investigation continues. "They said they're going to all the ISPs," he said. Earthlink said that agents did not install the Carnivore e-mail surveillance device on its servers, relying instead on Earthlink's own computer logs. Meanwhile, AOL and Yahoo officials said their companies were cooperating fully with the FBI and an MSN spokesman would only say that the company works regularly with law enforcement officials. (AP 12 Sep 2001)
http://news.excite.com/news/ap/010912/17/tech-attacks-internet-warrants

SECURITY AND PRIVACY ISSUES: THE BALANCING ACT GROWS HARDER [12 Sep 2001]
The technologists, who generally are strong privacy advocates, are struggling to decide what to do to maintain data privacy without hampering law enforcement efforts to stop terrorists. An executive of a security services company in New Jersey says: "Yesterday changed the way we live and there's a whole new dimension in the debate over privacy versus security. More people seem to be willing to compromise but no one seems to have figured out just yet what's reasonable." And a security director at an Internet service provider admits: "As much as I don't like the intrusive nature of online surveillance technology, I really want to find the guys who did this [Tuesday's terrorist attacks in New York and Washington]." But Joseph Turow, a University of Pennsylvania professor of privacy and new media insists: "The question is whether you overreact in pursuit of a handful of terrorists and in the process change the constitutional protections of millions of American citizens." (Washington Post 13 Sep 2001)
http:/www.washingtonpost.com/wp-dyn/articles/A21207-2001Sep12.html

PROTECTING THE NATION FROM CYBER ATTACKS [12 Sep 2001]
Although computer security observers have noticed no signs of unusual network activities since Tuesday's terrorist attacks, the FBI's National Infrastructure Protection Center held an emergency meeting yesterday to consider the situation. Computer security consultant Donn Parker says, "Terrorists attacked our financial and political centers Tuesday. The logical next step is to attack our computer infrastructure. That would shake Americans' daily lives." (USA Today 13 Sep 2001)
http://www.usatoday.com/life/cyber/tech/2001/09/13/cyber-attack-next.htm

BUSINESSES TURN ATTENTION TO DATA RETRIEVAL [12 Sep 2001]
In the wake of Tuesday's terrorist attack on Manhattan, businesses are scrambling to find programmers and system administrators to assist in retrieving the financial and corporate data that form the lifeblood of the information economy. Bill Miller, CTO for Storage Networks, says he has confidence the ability of financial markets to recover their data, but that the attacks go beyond the scope of his clients' disaster mitigation planning. Meanwhile, recovery efforts are hampered by the lack of a facility in which to do business. "Most of our customers are not planning on showing up downtown for another two weeks," says Sanjay Kumar, CEO of Computer Associates. "The real question is, 'Where do these people go to work?'" Last night, for

instance, CA bussed 40 network-design specialists from Atlanta to CA headquarters in Islandia, NY to assist in data recovery efforts. (Wall Street Journal 13 Sep 2001)

THE IMPORTANCE OF REMOTE BACKUP OF CRITICAL DATA [12 Sep 2001]
Financial companies like Morgan Stanley, devastated by the attack on the World Trade Center buildings in which they were headquartered, were still able to resume operations because they used backup software and data replication software to transfer all data through instantaneous telecommunications to equivalent computing facilities located in New Jersey. (Reuters/Yahoo News 12 Sep 2001)
http://dailynews.yahoo.com/

FBI WARNS OF POSSIBLE CYBER-ATTACKS [14 Sep 2001]
Corporate systems administrators are beefing up security on their networks in response to an FBI Terrorist Threat Advisory that calls for IT professionals to "implement appropriate security measures -- both physical and cyber." Many security firms say the nation's corporate systems have a long way to go and some firms, such as RedSiren Technologies, are providing additional security measures to their clients for free. Among the recommendations RedSiren is making to clients is to review critical logs for suspicious activity in an effort to prevent corporate computers being used for distributed-denial-of-service attacks and other malicious acts. The FBI advisory will expire Oct. 11. (ZDNet 14 Sep 2001)

EXPERTS PREDICT CYBERATTACKS [18 Sep 2001]
Although cyberattacks were not launched after last week's terrorist events in New York and Washington, a number of security expects are expecting a wave of such attacks once the U.S. commences military action against the terrorists. John Gartner, director of Gartner's Internet security research group, says, "There is no doubt that we'll see big attacks coming. It's time to plan for that now." (Interactive Week/USA Today 18 Sep 2001) http://www.usatoday.com/life/cyber/zd/zd5.htm

DISASTER GIVES BOOST TO DATA STORAGE FIRMS [18 Sep 2001]
Data storage companies such as EMC; data back-up companies such as Veritas Software and Comdisco; and IT data center managers such as IBM and EDS are expected to see a rise in business in the coming months, as businesses scramble to safeguard their data assets. In addition, companies that provide services such as Web site hosting could see a boost from customers eager to locate critical parts of their IT systems outside of their own facilities. Although many corporations have slashed their information technology budgets for the year, even before last week's attacks the focus has been shifting away from new equipment purchases and toward data protection and management. "There has been a rebalancing of IT spending by large corporations towards data storage systems," says Veritas CEO Gary Bloom. (Financial Times 18 Sep 2001)
http://news.ft.com/news/industries/infotechnology

PEOPLE WANT NEWS, NOT SEX, IN CYBERSPACE [19 Sep 2001]
Sex, a long-time Top 10 search engine term, has dropped down to No. 17 in popularity following last week's attacks. "Popular search terms last week turned almost exclusively to disaster-related information," says a spokesman for AltaVista. In addition to sex, almost all the perennial favorites like Pamela Anderson Lee, Britney Spears and Backstreet Boys were knocked off the list. Replacing them were news-related search terms, including CNN, news, World Trade Center, BBC and Pentagon. Google and Yahoo confirmed the same pattern on their search engine sites, with Yahoo saying its traffic had surged to at least 10 times normal levels since last week, and the overwhelming number of users seeking information about the attacks. (Reuters 19 Sep 2001)
http://news.excite.com/news/r/010919/20/net-attack-internet-dc

FEDS TRACK TERRORISTS' PAPERLESS TRAIL [20 Sep 2001]
Federal agents are retracing the steps of the 19 hijackers involved in last week's attacks, who apparently used a pay-per-use public Internet terminal at a Kinko's store in Hollywood, Fla. to access online ticket sites. According to an FBI document obtained by Der Spiegel magazine, some of the hijackers even entered their frequent flier numbers as they purchased their electronic tickets. A spokesperson for Travelocity confirmed that at least two of them had used the service to book flights, but declined to say whether they had booked their seat assignments on their desired planes, as some in the media have speculated. A research librarian in Delray Beach, Fla., also confirmed that one of the 19 men named by the FBI had used a computer at her library in late August. (Wired.com 20 Sep 2001)
http://www.wired.com/news/politics/0,1283,46991,00.html

TECHNOLOGY REPLACEMENT COSTS ENORMOUS [20 Sep 2001]
Billions of dollars will be spent to replace technology destroyed in the terrorist attacks last week, and some computer manufacturers have ramped up production of PCs to a night-and-day basis to meet the need. Industry analyst Astok Kumar says: "Basically, Dell and Compaq will pick up most of the business and it will give the industry a much-needed shot in the arm." One individual involved with the reconstruction process said: "It's just staggering to me. We spent thousands of dollars just to get these bankers up and running over this weekend, and this is just temporary. It is not replacing their equipment." (New York Times 20 Sep 2001)

BUSH ADMINISTRATION WANTS ITS OWN INTERNET [11 Oct 2001]
The Bush Administration, citing security concerns, has proposed a new Internet-like network be created to handle sensitive government information. The new network, dubbed GOVNET, is the brainchild of Richard Clarke, the newly appointed presidential adviser for Cyberspace Security. "Planning for this network has been going on for several months," says Clarke. The General Services Administration, which will play a key role in deploying the self-contained network, has posted a Request for Information on its Web site, calling on the high-tech industry to create potential blueprints for GOVNET. "There will be no interconnections or gateways to the Internet or other public or private networks," says the RFI, which also calls for immunity to cyber-attacks and full encryption using the standard recommended by the National Security Agency. (ZDNet News 11 Oct 2001)
http://news.excite.com/news/zd/011011/07/should-the-government

'GOVNET' WOULD BE A MISTAKE, EXPERTS SAY [15 Oct 2001]
The Bush administration's proposed "Govnet" -- an independent government computer network that is separate from the Internet -- would be costly and would fail to create a safe haven from hack attacks and viruses, according to security experts. While the concept is theoretically feasible, it would be very difficult to execute. For instance, inside government offices, employees could easily pass viruses from the public Internet to Govnet via floppy disks, unless the floppy disk drive were locked shut. And if the Govnet fiber optic cable is run through the same conduits used by the Internet, it would be susceptible to the same sorts of physical attacks. "The thought is if we can have complete control over it, it will be bulletproof," says one security expert. "But this is farfetched unless they assume there's not going to be any kind of human intervention or place where someone is going to connect in through a PC." Experts recommend that instead of creating a new network from scratch, the government should improve its security practices and use existing security technologies. One possibility would involve virtual private network technology, which enables businesses to use the Internet securely by encrypting data communications before they are sent over the public network and decrypting them at the receiving end. 2002-03-24 **information warfare infowar cyberterrorism book review**

RISKS 21 98

Noted infowar gadfly Winn Schwartau -- the cyberterrorism prophet everyone either loves or hates -- published another novel in 2002, _Pearl Harbor Dot Com_. Peter G. Neumann's review in RISKS read in part, "[T]his book seems to make a rather compelling novel out of a surprisingly large number of security and reliability risk threats that we have discussed here over the years. The story echoes one of the fundamental problems confronting Cassandra-like risks-avoidance protagonists and agonists alike, namely, that, because we have not yet had the electronic Pearl Harbor, people in power perceive that there is little need to fix the infrastructural problems, so why bother to listen to the doom-sayers who hype up the risks? Well, in this novel, one man's massive craving for vengeance reaches major proportions, and significant effects result on critical infrastructures. In the end, the good hackers contribute notably to the outcome.

The book is somewhere within the genre of technothrillers, with a typical mix of murder, mayhem, intrigue, computer-communication surveillance, and non-explicit s*x. I enjoyed it. It is entertaining, and the convoluted plot is quite consistent, fairly tight, and to RISKS readers, each incident is technologically quite plausible -- because many of the attacks seem almost reminiscent of past RISKS cases, sometimes just scaled up a little."

Brien Webb wrote an interesting analysis of Microsoft testimony:

>From a 2002/05/13 article by Caron Carlson in eweek.com:

http://www.eweek.com/article/0,3658,s%253D701%2526a%253D26875,00.asp

"A senior Microsoft Corp. executive [Jim Allchin] told a federal court last week that sharing information with competitors could damage national security and even threaten the U.S. war effort in Afghanistan. He later acknowledged that some Microsoft code was so flawed it could not be safely disclosed."

and later, directly quoting Allchin...

"Computers, including many running Windows operating systems, are used throughout the United States Department of Defense and by the armed forces of the United States in Afghanistan and elsewhere."

Microsoft proposes to withhold details of the MSMQ protocol (TCP port 1801 and UDP port 3527), the Windows File Protection API, as well as APIs for anti-piracy protection and digital rights management under the security carve-out.

I recall that the Windows NT family of operating systems was designed to meet DOD's C2 security criteria, including the Orange Book (standalone, which they passed), as well as Red Book (networking) and Blue Book (subsystems) criteria which they started working on at least 4 years ago; I don't know if they've yet passed, but I suspect not if it's so flawed that they don't want to disclose the protocol or API! See
http://msdn.microsoft.com/library/default.asp? url=/library/en- us/dnproasp2/html/windowsntsecuritysystems.asp

So, one risk of flawed software might be that you have to publicly invoke national security (read patriotism) as a last refuge from legal process.<

OFFICIALS FEAR TERRORIST ATTACKS ON DCS AND SCADA SYSTEMS
For some months now the FBI has been evaluating evidence that al-Quaida terrorists located throughout the world have been trying to develop ways to use the Internet to interfere with the control of major physical systems in the U.S., such as dams, utility systems, nuclear power plants, and so forth. Those kinds of facilities are managed through digitally systems called "distributed-control systems" (DCS) and "supervisory control and data acquisition" (SCADA) systems. Systems like that were typically not designed with public access in mind, so they usually lack even rudimentary security protection. The director of the FBI's National Infrastructure Protection Center said last month: "The event I fear most is a physical attack in conjunction with a successful cyber-attack in conjunction with a successful cyber-attack on the responders' 911 system or on the power grid." THE RISKS FROM CYBERTERRORISM
Cybersecurity experts are busy lobbying Congress for protections from liability lawsuits but some analysts say the media may be over-stating the risks from terrorist cyber attacks. Marc Maiffret of eEye Digital Security says, "Terrorists are only recently starting to realize the benefits of having people within their organizations that have real hacking skills," and University of South California professor of communications Douglas Thomas adds: "Cyber-terrorism is a lot more difficult than many people assume." Even so, security expert Stanley Jarocki warns that terrorists could do a lot of damage by cracking U.S. corporate systems: "Today, some say it would be easier for a terrorist to attack a dam by hacking into its command-and-control computer network than it would be to obtain and deliver the tons of explosives needed to blow it up. Even more frightening, such destruction can be launched remotely, either from the safety of the terrorist's living room, or their hideout cave." (AP/USA Today 24 Jul 2002)

IBM TEAMS WITH U.S. GOV'T ON WIRELESS EMERGENCY NETWORK
IBM is working with a consortium of government agencies to build a wireless emergency network that will enable police, fire and safety groups in the Washington, DC area to communicate with each other in real time via instant messaging. The Capital Wireless Integrated Network (CapWIN) -- the first such network in the nation -- will run on top of existing communications and computer systems and will be accessible via standard PCs, handhelds and cell phones. "The purpose of CapWIN is to enable these functions by leveraging existing networks and systems... The hard part is going to be to make sure that we get the user requirements defined correctly the first time," says Kent Blossom, director of safety and security systems for IBM, which will supply clustered eServers to link to installed servers and databases. The CapWIN network will enable law enforcement and emergency response groups to communicate with one another over a secure IM system, search multiple databases, and facilitate better coordination between different agencies or officers responding to an emergency. WORTH THINKING ABOUT: WHY WE REALLY, REALLY NEED COMPUTERS
Resist all those temptations to smash your computer and walk away. Think of where you'd be without it. Michael White, former science editor of British GQ, writes: "Even though most of us can recall a time when digital, modem, and hard drive were not words we thought about or used often, it is difficult to imagine a world without computers. If all the computers in the world shut down tomorrow, we would not simply regress to a time before they were commonplace — there would be no return to a 1950s lifestyle — such an event would mark the end of civilization itself. For today we are totally dependent upon computers. The way electricity is delivered to our homes and our factories, the way essential commodities such as gasoline and food reach us is controlled entirely by automated computerized networks. If the world's computers were to shut down, our gas, electricity, and water supplies would soon stop; sewage systems would fail; the financial markets would collapse in disarray; communications would break down; there would be no TV, no radio; military and law-enforcement establishments thrown into confusion; hospitals could function only on a basic level. And from all this, anarchy would soon follow."

BUSH ADMINISTRATION PONDERS CYBERSECURITY PLAN
The Bush Administration is considering creating a technology fund, possibly "jointly financed by government and industry," that would "address those "areas that fall outside the purview of both industry and government and yet are critical to the future secure functioning of the Internet." Working papers for the national cybersecurity plan cite the development of highly secure versions of computer operating system software as something that could be paid for by the proposed fund. In addition, the draft documents discuss sweeping new obligations on companies, universities, federal agencies and home users to secure their own "portions of cyberspace." Other ideas under consideration include: improving security of wireless technologies and prohibiting their use in some cases by federal workers; beefing up protection of computer systems that help operate major utilities like water and power; coming up with a game plan for responding to cyberattacks when it's not immediately evident whether the source is a hostile government or a teenage hacker; creating an industry testing center that would ensure software updates don't undermine security measures; and contemplating the creation of a new government network that would handle communications and computing tasks during Internet outages. The White House cautioned that the ideas in the working papers are subject to change until approved by the president, and that any recommendations would still need go through traditional policy and budget processes. (AP 7 Sep 2002)
http://apnews.excite.com/article/20020907/D7LT1J980.htm

CYBERSECURITY PLAN AUTHORS SEEK FEEDBACK
The White House panel drafting recommendations on beefing up U.S. cybersecurity has decided to open it up for more comment before it is presented to President Bush in two months. "If we just come up with a government strategy and announce it without participation from the people who have to implement it, we're not going to get the level of cooperation? that we need for this," says Bush administration senior cybersecurity advisor Richard Clarke. The National Strategy to Secure Cyberspace offers nearly 60 suggestions on ways that home users, small businesses, universities, large corporations and government agencies can improve cybersecurity, including installing and using security products such as firewalls and antivirus software. However, the draft report backs away from legal action. "We're not creating regulation, not creating mandates," says Clarke. "We want to do this through market forces." (AP 18 Sep 2002)

HOME ISN'T WHERE THE SECURITY IS

Columnist Robert Lemos says the Bush administration's plan to ask home computer users to secure their systems as part of its "National Strategy to Secure Cyberspace" is a misguided effort. Citing the prevalence of users who still call tech support wondering why their computer won't turn on (because they've neglected to plug it in), Lemos says: "The experts are guilty of wrongheaded thinking in relying upon home users to shore up the nation's security. Frankly, that's somebody else's job. Home users are responsible for protecting their own important data. But it's a dangerous illusion to believe they will take better precautions after authorities ask them to upgrade their cyberdefenses." Lemos says the government instead should be focusing on persuading the ISPs "to protect cyberspace from home users. There are simple technologies for doing this. Source egress filtering — a technique for preventing users from sending data with a false source address, useful in denial-of-service attacks — should be the norm. Companies filter e-mail messages for any viruses and disallow several types of executable attachments; ISPs should do the same." Security expert Dorothy Denning says the only question left is, who will pay? "Once you start formalizing where we are going to put liability, the questions start coming up about who's going to pay for it. And, almost anywhere you put it, the costs are going to end up coming back to the users." (CNet News.com 29 Oct 2002)

HOUSE SUBCOMITTE FLUNKS U.S. ON INTERNET SECURITY
A U.S. House of Representatives Government Reform subcommittee has concluded that U.S. Internet security suffers serious problems, especially in the departments of State, Justice and Transportation. The exception to the rule is the Social Security Administration, which the head of the committee called a "shining example of sound leadership and focused attention" on computer security. The most glaring weakness at other agencies is vulnerability against insiders attempting sabotage or trying to profit personally by destroying or stealing sensitive information. And Richard Pethia of the federally funded CERT Coordination Center warned the committee: "Until customers demand products that are more secure or there are changes in the way legal and liability issues are handled, the situation is unlikely to change." BY-PRODUCT OF HOMELAND SECURITY IS BUSINESS FOR IT COMPANIES

The creation of the new 170,000-person Department of Security, which among other things will integrate the activities of 22 existing government agencies, will have enormous consequences for information technology contractors, and Harris Miller of the Information Technology Association of America predicts: "The impact is going to be quick and dramatic, and it will provide a lot of opportunities for IT companies." Just a few of those opportunities are: a $10 billion project by the Immigration and Natural Service to keep track of people entering the U.S.; the creation of an advanced research projects agency, along the lines of the Pentagon's DARPA; and a host of activities required to bring all 22 agencies up to a baseline level of security. SAFE & SOUND IN THE CYBER AGE

Stephen and Chey Cobb, security consultants, remind you that computer security is your patriotic duty:
... "Fellow citizens, now is the time to firewall your broadband connections and filter your email, lest your computer be abused by those who would attack our nation's critical infrastructure. Now is the time to do your patriotic duty and install security patches for your applications, change your passwords, and tighten up those directory permissions. If not, that computer in your den, the one on the high speed Internet connection, could become an attack platform."

Sound a little hokey? Maybe, but we'd be surprised if anyone can find a flaw in the logic or fault any of the stated facts. As far as we are concerned, and we're the ones who've been giving this speech, the large and growing number of unprotected, high-powered, always-on, broadband-connected personal computers does indeed represent a threat to the national infrastructure (note that we are both U.S. citizens, but this is by no means a uniquely American perspective — we would be holding the same truths to be self-evident if we were citizens of the United Kingdom, or Germany, or Brazil, or anywhere else that is experiencing a rapid increase in broadband connectivity).

We have had these thoughts, and said these things, for some time, but we feel compelled to reiterate them now, because our President has just signed the Homeland Security Bill, causing the biggest overhaul of the U.S. government since the National Security Act of 1947 unified the Armed Forces under a single department and created the National Security Council and Central Intelligence Agency. The Homeland Security Department is expected to have a combined workforce of more than 175,000 employees and pull together more than 20 agencies. As if that wasn't enough for one bill, the Homeland Security Act also amends a bunch of other laws and encompasses things like the creation of a new form of charitable trust to "provide for the spouses and dependents of military, CIA, FBI and other federal employees killed in the line of duty in the war on terrorism." A noble goal, but arguably extraneous to the creation a new department of government. We will have more to say about the Homeland Security Act in future columns, after we have more completely digested all 470 pages (okay, that's the double-spaced version, but still, this is not light reading).

What we want to highlight here is the starring role that computer security plays in this legislation. For a start, the bill includes a definition of information security and spells out that other C-I-A, the one that infosec people have been working at for years: Confidentiality, Integrity, and Availability. In a dramatic turn, the bill makes significant amendments to the Computer Fraud and Abuse Act of 1986. Indeed, these amendments are to be known as the "Cyber Security Enhancement Act of 2002." The "enhancements" include increased penalties for criminal hacking, up to life imprisonment "if the offender knowingly or recklessly causes or attempts to cause death" through conduct such as intentionally accessing a computer without authorization or exceeding authorized access.

What we don't see in the Homeland Security Bill, or in the $900 million appropriation for computer security research that was also passed last week, is funding for the education of network computer users and operators. These are the people, like you, and us, and generations just getting started, who are connecting their computers to the Internet. The connections are often high bandwidth (24 million Americans have broadband Internet connections at home according to Pew report this summer).

Whose job is it to tell the people who have these connections that their computer could unwittingly host a distributed denial of service attack? Who is responsible for telling computer owners to make sure they are not harboring programs that could bring down emergency service communications during a terrorist attack? When you get a Dell does it say on the box: "Dude, this thing could kill someone"? No, and we don't expect to see such a warning sticker any time soon. That is the point. With powerful technology comes a ton of responsibility. But it tends to arrive somewhat later than the technology itself.

In the meantime, securing all those computers on the network will take some serious motivation. Patriotism seems like a good place to start.

... Chey Cobb, the author of "Network Security for Dummies," is an independent consultant and former senior technical security advisor to the NRO and can be reached at chey@patriot.net. Stephen Cobb, the author of "Privacy for Business: Web Sites and Email," is Senior VP of Research and Education for ePrivacy Group and can be reached at scobb@cobb.com.

PROPOSED NATIONAL STRATEGY TO SECURE CYBERSPACE

The President's Critical Infrastructure Protection Board is planning to propose that Internet service providers be required to help build a centralized monitoring system that could be used to protect network users from both computer viruses and terrorist attacks. The plan would be part of an Internet strategy for the new Department of Homeland Security. Some technology company executives say they fear that the system could be used to invade individual privacy but Tiffany Olson, chief of staff for the Board, says that the plan will not require gathering data that would allow monitoring at an individual user level. She says a centralized monitoring system is needed because, currently, "we don't have anybody that is able to look at the entire picture. When something is happening, we don't know it's happening until it's too late." (New York Times 20 Dec 2002)

GOVERNMENT VOWS TO RESPECT CITIZEN PRIVACY
Responding to concerns that the Internet monitoring center proposed by the government's forthcoming report "National Strategy to Secure Cyberspace," President Bush's top cyberspace adviser, Richard Clark, says that the plan contains nothing which "in any way suggests or proposes a government system that could extend to monitoring individuals' e-mails"; to the contrary, it "articulates a strong policy of protecting citizens' privacy in cyberspace." The Bush administration contemplates that any Internet monitoring operation would be run by the private sector and not the government. There is no proposal for monitoring e-mail or other data traffic of Internet users. (20 Dec 2002)

2003-01-06 **Department Homeland Security IT key success federal agencies US government anti-terrorism**

NIPC/DHS

January 02, National Journal's Technology Daily — IT systems key to success of Department of Homeland Security.

Strong information technology systems will be crucial to the success of the new Department of Homeland Security, according to the General Accounting Office (GAO). The GAO report (03-260), released December 24, found that federal agencies have made progress in addressing their homeland security missions since the September 11, 2001, terrorist attacks, and that information sharing between federal agencies has increased. But GAO said federal agencies still face many challenges, such as improving their collaboration with state and local officials and with the private sector. Twenty-two existing federal agencies and offices will move into the new DHS, which also will include an Office of State and Local Coordination and a liaison official for the private sector. GAO estimated that the full transition to the new department could take five to 10 years, and recommended that the Office of Management and Budget (OMB) work with the department to implement the appropriate management systems. "Strong financial and information technology systems will also be critical to the success of [the DHS] and other organizations with homeland security missions."

2003-01-07 **Department Homeland Security IT implementation worries security**

NIPC/DHS

January 06, Washington Post — Setting up IT infrastructure will help the Department of Homeland Security.

One of the challenges in creating a department from a hodgepodge of 22 federal agencies and 170,000 employees is the information technology headache. "It is not enough to shuffle redundant or overlapping programs under the new bureaucracy," Michael Scardaville, a policy analyst at the Heritage Foundation, wrote in a recent report. The department "should develop and deploy an information technology infrastructure that links and fuses intelligence and law enforcement terrorism databases." Representative of the agency's challenge will be monitoring the thousands of freighters that enter U.S. ports daily. The department wants a "smart border" program in which cargo ships heading for U.S. ports would electronically file information detailing the contents of cargo containers, crew members' names and nationalities, and what stops the ships are scheduled to make before reaching the United States. Steven I. Cooper, special assistant to the president on information technology's place in homeland security, admitted, it may be a lengthy process. "I think parts of it could probably be done fairly quickly, meaning within months instead of years," he said. "To fully put together something like that across the world is obviously going to take a longer period of time." In the meantime, short term priorities for the new department will include border and transportation security technology, such as equipment that identifies radioactivity and software that identifies non-obvious trends in databases or protects computer infrastructure from hackers.

2003-01-08 **Department Homeland Security cyber terrorism combat secure cyberspace**

NIPC/DHS

January 07, Associated Press — Revised White House security initiative focuses on agencies.

An internal draft of the Bush administration's revised plan to improve cybersecurity, the National Strategy to Secure Cyberspace, is circulating among government offices and industry executives this week. In the new plan, the number of initiatives to tighten security for vital computer networks was reduced from 86 to 49. The plan no longer includes a number of voluntary proposals for America's corporations to improve security, focusing instead on suggestions for U.S. government agencies, such as a broad new study assessing risks. Among the draft's changes was the removal of an explicit recommendation for the White House to consult regularly with privacy advocates and other experts about how civil liberties might be affected by proposals to improve Internet security. The draft notes that the new Department of Homeland Security (DHS) will include a privacy officer to ensure that monitoring the Internet for attacks would balance privacy and civil liberties concerns. The draft proposes to use the DHS to launch some test attacks against civilian U.S. agencies and to improve the safety of automated systems that operate the nation's water, chemical and electrical networks. The new version also says the Defense Department can wage "cyber warfare" if the nation is attacked. It warns that although it can be difficult or even impossible to trace an attack's source, the government's response "need not be limited to criminal prosecution." The new version also puts new responsibilities on the CIA and FBI to disrupt other countries' use of computer tactics to collect intelligence on government agencies, companies and universities.

2003-02-03 **US infrastructure protection cyber terrorism threat security**

NIPC/DHS

February 02, New York Times — Departing security official highlights cyber threat.

Richard A. Clarke, the blunt, sometimes abrasive White House adviser who raised the alarm about unconventional national security threats ranging from failed states to biological and computer terrorism for more than a decade, quietly resigned as President Bush's special adviser for cyberspace security on Friday. In an interview after his last day in office, Clarke warned that although the government had made considerable progress in defending its electronic infrastructure from computer attacks, the United States faced ever greater peril, given its growing dependence on the Internet. "A sophisticated cyberattack may not result in massive deaths," he said. "But it could really hurt our economy and diminish our ability to respond to a crisis, especially if it is combined with a war, or a terrorist attack." Clarke said the attack last weekend by a computer bug known as the Sapphire worm showed the vulnerability of the United States' increasingly Internet-based economy. Though it was a relatively simple bug, he said, Sapphire, which has also been called Slammer, ravaged systems throughout the United States and overseas in just a few hours, shutting down some of the Bank of America's automated teller machines and Continental Airlines' online ticketing system, and denying access to the Internet to millions of personal computer owners. "Don't assume that the damage done by hackers in the past is predictive of the future," Clarke said. "As Sept. 11 showed, as long as our vulnerabilities are large, some enemy will exploit them in a new and hugely damaging way." Clarke said the nation is safer today than before Sept. 11 because al Qaeda's sanctuary in Afghanistan is gone and because Americans had rounded up hundreds of al Qaeda operatives abroad and tightened aviation security overseas and domestically. Clarke said he was leaving his post now because "11 years in the White House and a total of 30 in government is more than enough," and because President Bush would soon unveil a new national strategy to protect the nation's information infrastructure, which Clarke and his team had drafted.

2003-02-18 **industry government plan secure cyber space anti-terrorism infrastructure**

NIPC/DHS

February 14, Government Computer News — Industry will work with government on cyberspace plan .

The White House unveiled its National Strategy to Secure Cyberspace on Friday. The plan's five priorities are: 1) A national cyberspace security response system; 2) A threat and vulnerability reduction program; 3) A security awareness and training program; 4) A plan to secure governments' cyberspace; 5) An approach to intelligence agency and international cybersecurity. The plan called for exercises to evaluate the impact of cyberattacks and pinpoint weaknesses for correction. The plan put the Justice Department and other agencies in charge of improving information sharing, investigative tools and cybercrime research. It said the General Services Administration and Department of Homeland Security will continue to cooperate on a federal software patch clearinghouse and work with the private sector on a similar clearinghouse. Federal agencies were told to tighten security measures, expand their use of security assessment tools and install applications to check continuously for unauthorized network connections. The plan said the government will also review the National Information Assurance Partnership to assess whether it is properly dealing with security flaws in commercial software. It further said the government will consider licensing or certifying private security service providers for minimum capabilities, "including the extent to which they are adequately independent." In the international arena, the plan noted that the U.S. government will not necessarily limit its response to cyberattacks to criminal prosecution and it "reserves the right to respond in an appropriate manner." That mirrors the government's pursuit of al-Quaida, which has been carried out partly by legal prosecution and partly by warfare. It called for building North America into a "cyber safe zone" with the cooperation of Canadian and Mexican public and private sectors.

WHITE HOUSE OUTLINES NEW INTERNET SECURITY STRATEGY
The White House has released a new Internet security strategy focused largely on voluntary efforts by institutions in the private sector and by individual Americans. The plan suggests, without mandating, numerous steps that government agencies should take to set the example for good security procedures, and specifies that the five major priorities for action are: setting up a security response system; identifying threats and vulnerabilities; increasing awareness and training; securing critical government sites; and fostering cooperation nationwide and abroad. Acting chief White House security czar Howard Schmidt says, "This is a good start. It's a very practical and pragmatic plan and it gives us the capability to move forward in the confines of the current budget situation. There's never enough money in security, but this gives us the ability to have a dialogue with industry and set goals." (San Jose Mercury News 15 Feb 2003)

2003-02-20 **cyber terrorism threat steps action States critical infrastructure protection**

NIPC/DHS

February 19, Government Computer News — States take first step toward cyberthreat sharing.

Last weekend thirteen states conducted a communications exercise that could lead to a new, multistate information sharing and analysis center (ISAC). The ISAC, which would pool cyberthreat data gathered by states, is led by William Pelgrin, director of the New York City Office of Cyber Security and Critical Infrastructure. No formal center exists yet, however. During the dry run, participating states reported to a central location any suspicious activities they monitored on the Internet over the Presidents Day weekend. "There was no malicious activity," said Mike Russo, chief information security officer in Florida's state technology office. "The exercise was about the communications and working relationships with the other states." Because sharing information about security threats and vulnerabilities is seen as essential to protect the nation's critical infrastructures, the federal government has encouraged the creation of ISACs to share information in commercial sectors such as banking, public utilities and IT. It also encourages information sharing with federal agencies. The ISACs serve as central collection points where data can be gathered and evaluated. Most such information is sanitized before distribution because of participating organizations' liability concerns.

2003-02-25 **National Infrastructure Protection Center NIPC Indiana University cooperate cyber infrastructure protection security**

NIPC/DHS

February 25, National Infrastructure Protection Center — NIPC and Indiana University agree on cooperative cyber infrastructure security efforts.

In an effort to support and enhance the security and readiness of the cyber infrastructure, the National Infrastructure Protection Center (NIPC) has signed an agreement with Indiana University, operator of the Research and Education Network Information Sharing and Analysis Center (REN-ISAC). Indiana University, via the REN-ISAC, will ensure that research and education network operators receive the most current counter-terrorist threat alerts, warnings and analysis. In turn, the network operators and participating universities and research centers will be encouraged to work through the NIPC to voluntarily pass incident information. Incident information will include not only specific incidents immediately threatening participating networks, but trend information that may indicate an organized attack is in preparation or underway. "The Nation's research and education networks carry not only information critical to research but critical commercial and financial information as well. That is why information sharing between the federal government and network operators is vital in the war against terrorism," said Admiral James Plehal, Acting Director of the NIPC. "Advance knowledge of the type and nature of attacks can make a vital difference in their readiness to prevent, and mitigate the consequences of an attack," he said. Indiana University is home to a Global Network Operations Center (Global NOC) which manages several national and international high-speed networks and network links. The NIPC will transition into the Department of Homeland Security on March 1st.

2003-02-28 **Department Homeland Security DHS technology barrier divide education**

NIPC/DHS

February 26, Federal Computer Week — Info sharing hobbled by lack of technology.

Agencies merging into the Homeland Security Department as well as others sharing information in the government's antiterrorism efforts are working to overcome technological barriers, but the work is going to take time, according to a panel of agency officials who spoke February 26 at an AFCEA International Inc. conference in Washington, D.C. One challenge is ensuring that information stays out of the hands of those not authorized to see it. To that end, the National Security Agency (NSA) is developing "trusted control interfaces," which the CIA is implementing, said William Dawson, chief information officer of the CIA's Department of Intelligence Communications. The interfaces' intent is to strip classified information from messages before passing them to someone of a lower security class. An early stage of the system is running at the CIA, but most of the capabilities won't be ready until September, Dawson said.

2003-03-06 **Congress cyber security threat terrorism panel infrastructure civilian protection**

NIPC/DHS

March 04, News.com — Congress sets up cybersecurity panel.

The U.S. Congress on Tuesday established its first panel devoted to cybersecurity. In its first meeting, the new House Homeland Security Committee voted to create a subcommittee that will oversee the federal government's "cybersecurity, science, and research and development" efforts relating to homeland security. The office of chairman Chris Cox (R-CA) said the cybersecurity subcommittee will be in charge of the "protection of government and private networks and computer systems from domestic and foreign attack (and) prevention of injury to civilian populations and physical infrastructure caused by cyberattack." The Senate does not have a parallel effort, though its subcommittee on technology, terrorism and government information shares similar duties.

2003-03-11 **Internet violence Islamic fundamentalism connection**

NIPC/DHS

March 02, Time Magazine — Investigators examine the links between Islamic fundamentalists and the Internet.

On February 26, Sami Omar al-Hussayen, a Ph.D. Candidate in computer security at the University of Idaho, was charged with violating conditions of his student visa by registering and maintaining a dozen militant websites promoting violence against U.S. interests. U.S. officials want to know more about al-Hussayen's work for the sponsor of most of these sites, the radical Islamic Assembly of North America (IANA), a Michigan-based group known as one of the most strident voices of Islam on the Web. IANA hosted the websites of two radical Saudi sheiks - Salman al-Awdah and Safar al-Hawali - both of whom are closely associated with Osama bin Laden and who provided religious justification for the September 11 attacks, according to the SITE Institute, a Washington-based terrorist-research group that monitors the Internet. Al-Hussayen's case also may provide fresh evidence that at least some of these anti-American websites are being supported by funds coming from Saudi Arabia. Al-Hussayen is accused of covertly receiving $300,000 from abroad and disbursing much of it to IANA. A Saudi-embassy spokesman in Washington said no government money has gone to IANA.

2003-03-12 **US federal government secure Internet net DHS**

NIPC/DHS

March 10, eWEEK — Federal government moves to secure net.

The White House and the new Department of Homeland Security have begun in earnest the process of implementing the plan to secure the nation's critical networks. The most significant move is the development of a private, compartmentalized network that will be used by federal agencies and private-sector experts to share information during large-scale security events, government officials said at the National Information Assurance Leadership conference in Washington D.C. last week. The system is part of the newly created Cyber Warning Information Network (CWIN), a group of organizations including the National Infrastructure Protection Center, the Critical Infrastructure Assurance Office and others that have some responsibility for the security of federal systems. The private-sector Information Sharing and Analysis Centers will also be included. The CWIN, a key part of the Bush administration's National Strategy to Secure Cyberspace, will use a secure, private IP network separate from the public Internet, according to officials. As part of the plan to improve security, the CIO of each federal agency is, by statute, now accountable for the security of that agency's network.

2003-03-17 **DHS infrastructure protection evaluation anti-terrorism**

NIPC/DHS

March 13, Federal Computer Week — Homeland CIO outlines priorities.

Steve Cooper, the CIO of the new Department of Homeland Security (DHS), told an industry gathering that it is essential to move quickly to build DHS' infrastructure because "state-sponsored terrorists and al Qaeda are not going to wait until we have our act together." He said he and his information technology team will complete an inventory of IT assets brought together by the merger of 22 federal agencies. It will be evaluated for "reuse, renewal, retirement or enhancement," and he expects to decide what systems to keep and what to retire by August. In the next six weeks, DHS will issue a series of requests for information about wireless and geospatial technology to help officials decide how to create the best systems.

NIPC/DHS

Ridge: Cybersecurity at 'heart' of department's work.

Department of Homeland Security (DHS) Secretary Tom Ridge said on Thursday that his department will work as hard to address threats to the Internet as it does to address physical threats. "We will not distinguish between physical and cyber in this new unit," Ridge told the House Homeland Security Appropriations Subcommittee in a hearing on the fiscal 2004 budget. Ridge said that he understands a cyber attack could affect every aspect of the U.S. economy and government and that preventing such an attack is "at the very heart" of his department's duties. He also said that since last month, the department has been "actively engaged" in talks about the nation's cyber infrastructure with the private sector and other groups "because they have their own list of what the vulnerabilities are." Much rests on the vulnerability assessments being done on critical infrastructures, he said. Ridge said the department's chief information officer is developing plans for a technology framework that would enable Homeland Security to share information both within and outside the department. A strategic plan to let the department's various agencies access terrorist watch lists also is being prepared, he said.

2003-03-24 **security built up telecom companies East coast US anti-terrorism FCC**

NIPC/DHS

March 24, Washington Post — Telecom firms rebuild, beef up security.

Since the terrorist attacks in New York and at the Pentagon crippled communications networks along the East Coast, telecommunications companies have invested heavily to fortify their facilities. All over the country, telecommunications companies have added fiber-optic lines, increased their ability to reroute traffic and beefed up their security in response to lessons learned in the September 2001 attacks. Jeffrey M. Goldthorp, chief of network technology at the Federal Communications Commission, has been working with the nation's leading telecommunications companies for the past year. He was reluctant to discuss specifics but did point to one unnamed company that he said recently moved a huge database to a hardened underground shelter. The database will be a key resource in case the network, or any section of it, needs to be rebuilt. The FCC also recently orchestrated a series of "mutual aid" contracts between companies that allow them to work together immediately after a disaster without having to negotiate costs or other legal issues.

2003-04-04 **Department Homeland Security DHS Internet infrastructure design critical system**

NIPC/DHS

April 01, National Journal — DHS may oversee Internet infrastructure.

The Bush administration's acting cybersecurity adviser Howard Schmidt said Tuesday that homeland security and government agencies officials are working to formalize a security apparatus for the global Internet root servers, a series of computer systems that underpin the Internet's address system. After an attack on those servers and the Internet domain-name system last October, Schmidt, several agencies officials, computer-security experts and root-server operators discussed in January how they could better respond to such incidents. Their talks identified the need to develop a framework for determining when individuals and companies that operate the Internet's mission-critical domain system should report an attack or disturbance to government officials.

2003-04-17 **cyber attack terrorism cyberspace action war Iraq**

NIPC/DHS

April 15, Reuters — More talk, little action in war on cyber terrorism.

At a time when war in Iraq has heightened fears of terrorism, the technology industry is not moving quickly enough to guard against intrusions from hackers, identity thieves and more concerted attacks by rogue governments, computer experts said Tuesday at the RSA conference in San Francisco. Howard Schmidt, the White House cyber security adviser who is working with the technology industry to improve security, said that work to date had been strong on new ideas to improve security, but slow to execute. Despite repeated warnings of rogue nations preparing for cyber-attacks that could cripple vital computer-run U.S. infrastructure, no such attacks are known to have occurred to date. If computer systems have so far been spared a massive terrorist attack, smaller security breaches from hackers and pranksters with no political agenda occur on a daily basis. The Computer Emergency Response Team (CERT) tracked some 52,658 online security "incidents" in 2001, more than double the 21,756 reported in 2000, and way up from 9,859 in 1999. Members of the high-tech advocacy group TechNet said that while the threat of a political-based cyber terrorist attack may have been overstated, random pranksters had the ability to do much damage.

2003-04-21 **US President IT security adviser resign critical infrastructure protection**

NIPC/DHS

April 18, Washington Post — President's top IT security adviser to resign.

White House cybersecurity adviser Howard Schmidt will resign from his post at the end of the month. The former chief of security at Microsoft Corp., Schmidt became chair of the President's Critical Infrastructure Protection Board in February following the departure of his predecessor, Richard Clarke. Schmidt played a key role in drafting the administration's recently released cybersecurity strategy, and has spent the last two years building ties with the private sector in a joint effort to protect the nation's most important information systems from cyber-attack. Schmidt's imminent departure would leave the administration without a high-ranking official solely in charge of cybersecurity. In January, the administration consolidated the work of five federal cybersecurity offices into the Department of Homeland Security (DHS). Full responsibility for cybersecurity matters currently rests with Robert Liscouski, a former Coca-Cola executive who was recently named assistant secretary of infrastructure protection at the DHS.

2003-04-24 **Department Homeland Security cyberwar game simulation anti-terrorism**

NIPC/DHS

April 23, Government Computer News — DHS gets into the cyberwar game.

The Department of Homeland Security (DHS) is simulating cyberattacks and biological assaults to help prepare for the possibility of the real thing, deputy secretary Gordon England said. "A week ago, I participated in a war game with the Business Roundtable," England told attendees at the U.S. Chamber of Commerce's Conference on Critical Infrastructure and Homeland Security today. The Business Roundtable is an association of corporate chief executive officers that makes policy recommendations for economic growth. Part of the war game involved a cyberattack on financial institutions "that sucked money out of the financial system," England said. England endorsed the Business Roundtable's approach of periodically reviewing its members' plans for recovery from attacks and urged the Chamber of Commerce to adopt similar plans. In response to a question about the department's approach to regulation, England said, "I would like the DHS to have as few regulations as possible-our job is to coordinate the work of other federal agencies."

2003-04-25 **cyber space cyberterrorism anti-terrorism threat networkks**

NIPC/DHS

April 24, New York Times — Defending the cyber realm.

Security experts have warned that cyberterrorism presents a great potential threat to the U.S., with its increasing dependence on computer networks for everything from weapons systems to hydroelectric dams to commerce. However, security technology developer Symantec says it has yet to record a single cyberterrorist attack — by its definition, one originating in a country on the State Department's terror watch list. That could be because those inclined to commit terrorist acts do not yet have the know-how to do significant damage, or perhaps because hackers and adept virus writers are not motivated to disrupt networks for a cause. But should the two groups find common ground, the result could be devastating, said Michael A. Vatis, head of the Institute for Security Technology Studies at Dartmouth College.

2003-04-29 **threat cyber terrorism Internet infrastructure protection**

NIPC/DHS

April 25, London Free Press — Cyber attacks a concern?

The FBI calls cyber-terrorism a "premeditated, politically motivated attack against information, computer systems, computer programs and data which results in violence against non-combatant targets by subnational groups or clandestine agents." Some fear cyber-terrorists could shut down the Internet or substantially interfere with the use of oil, gas, power grids, telecommunications and emergency services. Others, however, say these fears are overstated as many critical systems are based on secured networks not accessible through the Internet. Terrorists and computer hackers can be a dangerous combination. There are reports that after investigations regarding several hijackings, authorities were led to believe terrorists had gained access to the architectural schematics of the planes through cyber-crime.

2003-04-30 **Korea Information Communication Ministry Internet attack SQL slammer**

NIPC/DHS

April 28, The Korea Herald — Korea's MIC takes measures to prevent online attacks.

The massive Internet shutdown caused by the SQL Slammer computer virus on January 25 caused chaos for Korea's 10 million high-speed Internet users. Now, Korea's Ministry of Information and Communication (MIC) has announced that it will take an active role in promoting security countermeasures aimed at creating fast and accurate communication routes where fixing and preventing network attacks will take only a matter of minutes. The MIC plans to create an information security base, develop information security related technology and standardization, and train manpower in the sector. It will build a support center dealing with attacks and security breaches on the Internet that will run 24 hours per day. MIC is also working on introducing rights to request information and investigate the scene of the crime. Other preventative measures involve working and communicating with multiple online businesses and service providers to make sure that each complies with standards in prevention.

2003-05-05 **DHS Topoff2 warfare computer terrorist Ted Macklin emergency operations Dartmouth College Institute Security**

NIPC/DHS

May 05, Government Computer News — Terror attack mock-up has a cyber angle.

The Department of Homeland Security (DHS) and dozens of federal, state and local agencies will launch a simulated five-day terrorist attack on May 12 designed to include a small role for cyberwarfare, officials said Monday. The attack game, called Topoff 2, will include a small element of computer warfare, said Ted Macklin, assistant director of the Office of Domestic Preparedness (ODP). It will not focus on an emergency operations center takedown but on the ability of state and local authorities to recognize a cyberattack, he said. Seattle Mayor Greg Nickles said that participants will begin with the assumption that their computers will work, but "that could be an area they surprise us with." An ODP official who is working on Topoff 2 said DHS has contracted with Dartmouth College's Institute of Security and Technology studies to prepare a "sand table" analysis of a cyberattack, in coordination with Seattle.

2003-05-16 **Netanyahu Woolsey terror technology CIA IDPartners conference U.S.**

NIPC/DHS

May 16, Computerworld — Netanyahu and Woolsey speak out on terror and technology.

This week former Israeli Prime Minister Benjamin Netanyahu and former CIA director R. James Woolsey warned of the dangers of inaction and lack of preparedness when it comes to cyberterrorism and homeland security. "The power of the few to terrorize the many has grown by leaps and bounds...because of technology," Netanyahu said during an interview broadcast Tuesday as part of the Terror and Technology Online conference, sponsored by IDPartners LLC. He was referring to the ability of international terrorist organizations to physically destroy key cyber-based infrastructures or attack those infrastructures using the Internet. When asked what can be done to meet the threat, Netanyahu said, "through security systems and security norms that are enforced by governments." Woolsey said the networks and systems that power the U.S. economy "were put together by businesspeople...with an eye toward openness and ease of access, and were not put together with a single thought in most cases...to terrorism."

2003-05-26 **critical infrastructure lawmakers cyber terror vulnerability government agencies Richard Clarke regulations police**

NIPC/DHS

May 26, The Hill — Lawmakers see cyberterror vulnerability.

Lawmakers are charging that government agencies and industry are not doing enough to protect the country's power plants, industries and financial institutions from the threat of cyberterrorism attacks. Science committee staffers have noted that 80 to 90 percent of the country's infrastructure is under private control. Staffers for the House Government Reform Technology Subcommittee are making site visits to private sector companies to assess its state of preparedness. At a subcommittee hearing in April, former White House advisor on cyber security Richard Clarke said, "I think we want to avoid regulation" and a "cyber security police." But a few weeks later, members of the National Infrastructure Advisory Committee, a White House advisory group. concluded that regulation might be the best way to get some industries to implement better cyber security, as well as physical infrastructure security. An alternative to government regulation is self-regulation through regional Information Sharing and Analysis Centers. But the threat of having competitors aware of a company's vulnerabilities has made this problematic for many organizations.

2003-05-27 **homeland security webcam ordinary american monitoring from home 10$ hour**

NewsScan

HOMELAND SECURITY VIA WEBCAM

Jay Walker, who made his fortune by inventing Priceline.com, is working on a new brainstorm that addresses the timely issue of homeland security. The premise behind USHomeGuard is simple: use webcams at the 47,000 "critical infrastructure facilities" that are at risk, enabling ordinary, online Americans to help monitor the sites from their homes. If a person spots a potential terrorist — a hooded man trying to scale a power plant fence, for instance, or a panel truck parked next to a reservoir — on-site security could be alerted with the click of a mouse. Walker suggests that work-at-home monitors could be reimbursed at up to $10 an hour, paid by the government agencies and companies that need the service. "We like to think of USHomeGuard as a digital victory garden," says Walker. "It lets people be part of the solution." A spokesman for the Department of Homeland Security says federal officials have not done any "serious evaluation" of the proposal, adding that the agency isn't currently contemplating any strategies that rely on Internet surveillance. Meanwhile, law enforcement officials worry that such a system would generate too many false alarms. "People get suspicious easily, and this could quadruple our call volume," says Capt. Joe Carrillo of the San Jose Fire Department. "The idea is really good. But the timing is really bad," he added, alluding to California's current budget crisis. (AP/CNN.com 27 May 2003)

WORTH THINKING ABOUT: HOW TO FORM A DEMOCRACY

Historian Bernard Bailyn comments on the creativity of America's Founding Fathers as shapers of the new democracy:
"The Founders of the American nation were one of the most creative groups in modern history. Some among them, especially in recent years, have been condemned for their failures and weaknesses — for their racism, sexism, compromises, and violations of principle. And indeed moral judgments are as necessary in assessing the lives of these people as of any others. But we are privileged to know and to benefit from the outcome of their efforts, which they could only hopefully imagine, and ignore their main concern: which was the possibility, indeed the probability, that their creative enterprise — not to recast the social order but to transform the political system — would fail: would collapse into chaos or autocracy. Again and again they were warned of the folly of defying the received traditions, the sheer unlikelihood that they, obscure people on the outer borderlands of European civilization, knew better than the established authorities that ruled them; that they could successfully create something freer, ultimately more enduring than what was then known in the centers of metropolitan life.
"Since we inherit and build on their achievements, we now know what the established world of the eighteenth century flatly denied but which they broke through convention to propose — that absolute power need not be indivisible but can be shared among states within a state and among branches of government, and that the sharing of power and the balancing of forces can create not anarchy but freedom.
"We know for certain what they could only experimentally and prayerfully propose — that formal, written constitutions, upheld by judicial bodies, can effectively constrain the tyrannies of both executive force and populist majorities.
"We know, because they had the imagination to perceive it, that there is a sense, mysterious as it may be, in which human rights can be seen to exist independent of privileges, gifts, and donations of the powerful, and that these rights can somehow be defined and protected by the force of law.
"We casually assume, because they were somehow able to imagine, that the exercise of power is no natural birthright but must be a gift of those who are subject to it."

SKY-HIGH SURVEILLANCE HITS AIRLINE INDUSTRY

Southeast Airlines is pioneering an in-flight surveillance program that will use digital videocameras installed through the cabins of its planes to record passengers' activities throughout the flight as a precaution against terrorism and other threats. The charter airline, based in Largo, Fla., says it may use face recognition software to match faces to names and personal records, and plans to store the digital data for up to 10 years. "From a security standpoint, this provides a great advantage to assure that there is a safe environment at all times," says Southeast's VP of planning. The airline says that while such security measures are not required by the FAA, it expects other airlines will adopt similar systems soon. That prediction alarms privacy advocates who especially question the need for retaining the video after the flight is over. "What's the point of keeping track of everyone when nothing happens on the flight?" asks Lee Tien, senior staff attorney for the Electronic Frontier Foundation, who points out that the video system could record conversations between passengers as well as capture the titles of passengers' reading material. (Wired.com 18 Jul 2003)

2003-07-23 **digital control systems traditional computer networls physical infrastructure LAN WAN remote administration vulnerability risk assesment**

NIPC/DHS

July 23, Government Computer News — NDU prof: digital control systems can weaken security.

The growing integration of digital control systems with traditional computer networks is opening a new avenue of attack against the nation's physical infrastructure, John H. Saunders, a professor at the National Defense University, said Wednesday, July 23, at the GOVSEC security conference in Washington. Controls for operating utilities, buildings and campuses are being turned over to cost-effective digital systems with remote access capabilities. Proprietary protocols and single-purpose firmware have offered a degree of security for these systems. But standardizing on a few protocols is increasing the risk. Digital control systems also are being connected to LANs, WANs and the Internet for remote administration. Government administrators can do little about the level of security at utilities, but they can increase security within their own buildings, Saunders said. Building engineers need to focus on security the way systems administrators do, by performing systems inventories and vulnerability and risk assessments, and by implementing policy, he said.

2003-07-31 **Homeland Security Windows PC buffer overflow exploit vulnerability tool**

NewsScan

GOVERNMENT SOUNDS THE ALARM ON HACK ATTACKS
The U.S. Department of Homeland Security warns that in recent days computer hackers have successfully tested new tools that exploit a vulnerability known as "buffer overflows" in order to gain control of Windows PCs via the Internet. The vulnerability was discovered by Polish researchers who call themselves the "Last State of Delirium Research Group" and Microsoft has posted a patch on its Web site that individual PC owners can install to safeguard their machines. Experts warn that the attack tools, once perfected, could be used to disrupt Internet traffic by clogging data networks, or could allow crackers to delete or steal sensitive files. However, a senior security manager at Symantec says hackers haven't yet worked out all the glitches in these tools. "It is a little early. The exploit needs to be perfected. The effort applied to the exploit is certainly increased, but we're not sure if that's indicative of when we might see a widespread threat. People certainly need to be aware of this." Meanwhile, Internet Security Systems, which operates an early warning network for the technology industry, has raised its alert level to the second notch, indicating "increased vigilance" is warranted. "Everybody is predicting a widespread event, going from zero to 60 very quickly," says Internet Security Systems engineering director Dan Ingevaldson, who rates the probability of a major attack as "closer to imminent than probable." 2003-08-25 **virus network Sobig organized crime fraud**

NewsScan

ORGANIZED CRIME BEHIND SOBIG MESS?
Antivirus specialist Peter Simpson warns that the Sobig.F virus is the latest in a series of attempts on the part of organized crime to shift some of their illicit activities online. "Sobig smashed all the records in terms of pure numbers, but that's not nearly the whole story. This is the sixth in a series of controlled experiments. This isn't about some kiddy writing viruses in his bedroom — this is really a very sophisticated example of organized crime," says Simpson, a manager at Clearswift's ThreatLab. Simpson explained that the purpose of a virus such as Sobig isn't to cause damage, but to gain control of the machine in order to access information such as financial details for the purpose of fraud. It also comes in handy for disguising the source of spam by hijacking the victim's machine and identity. "The real question here has to be about the motives of the virus writer. This isn't just about writing a virus that will spread rapidly and break records; the motives here are very different and are clearly criminal. It's all about the hidden agenda." 2003-09-15 **homeland security cybersecurity incident response awareness federal agency strategy**

http://www.fcw.com/fcw/articles/2003/0915/web-cyber-09-15-03.asp

YORAN TO LEAD U.S. CYBER SECURITY
The Department of Homeland Security has announced that Amit Yoran will head the recently created National Cyber Security Division. Yoran currently serves as vice president of managed security services at Symantec Corp. The National Cyber Security Division comprises the Federal Computer Incident Response Center, the National Infrastructure Protection Center, and the Critical Infrastructure Assurance Office. It is responsible for awareness of and preparation for cybersecurity, including coordinating warnings and responses to cyber threats. The division, which was created in June, has been working on such issues since its inception. A spokesperson from the division said that having someone in charge will allow the division to pursue projects included in the National Strategy to Secure Cyberspace. NIPC/DHS

September 23, Associated Press — MTA upgrading its security system against computer hackers.

The New York Metropolitan Transportation Authority said it would strengthen its defenses against computer viruses and theft now that officials have said its computer system could be attacked. The agency has already installed "Critical Tier I" computer firewalls at its headquarters. Documents say the firewalls will protect access to the MTA's network and its website. An "Intrusion Detection System" has also been placed in MTA computers and employees have been offered encryption software. An additional firewall and other virus protectors will be installed later. The agency is also expected to approve $5.25 million in upgrades for the security of regional bridges and tunnel facilities.

HOMELAND SECURITY SEEKS BETTER TRACKING SYSTEM FOR H1-B WORKERS

A report by the General Accounting Office (GAO), the investigative arm of Congress, says that the Homeland Security Department needs to keep track of when foreign high-tech workers with H-1B visas enter and leave the country, and to develop rules limiting the length of time workers who lose their jobs are allowed to remain in the country. According to the GAO, "much of the information needed to effectively oversee the H-1B visa program is not available." The Homeland Security Department agreed with the recommendations and is in the process of changing the systems used to track the foreign workers. (AP/San Jose Mercury News 2 Oct 2003)

2003-11-03 **infrastructure protection recommendation US FCC**

NIPC/DHS

October 30, FCC — Media Security and Reliability Council to review infrastructure security recommendations.

Recommendations to ensure the continued operation and security of media infrastructure will be presented to leaders from the broadcast, cable and satellite industries at the biannual Media Security and Reliability Council (MSRC) meeting Thursday, November 6. MSRC is a Federal Advisory Committee that reports to FCC Chairman Michael K. Powell. Chairman Powell formed MSRC following the events of September 11, 2001, in order to study, develop and report on best practices designed to assure the optimal reliability, robustness and security of the broadcast and multichannel video programming distribution industries. The Communications Infrastructure Security, Access and Restoration Working Group will present detailed best practices recommendations relating to physical security, including prevention and restoration matters. The council members have until November 26 to vote on the recommendations.

2003-11-06 **cyber security cyberspace plan halt Congress FBI report incident**

NIPC/DHS

November 04, Washington Post — Congressman puts cybersecurity plan on hold.

A congressional plan to require publicly traded companies to get computer security audits will be put on hold while technology businesses try to come up with a proposal of their own. Rep. Adam Putnam, R-FL, chairman of a House technology subcommittee, said he will postpone plans to introduce his bill and wait about 90 days to see what kind of alternative the business community proposes. There are no similar bills in the Senate. Businesses often keep cybercrime incidents under wraps and are generally unwilling to publicize any computer security measures, even with law enforcement. According to an April study by the Computer Security Institute and the FBI, just 30 percent of companies that experienced cyberattacks last year reported such incidents to authorities. The business community is also generally opposed to government-sponsored requirements on cybersecurity, whether from Congress or the White House.

2003-11-26 **terrorism evaluation US government simulation ISTS Dartmouth DHS**

NIPC/DHS

November 24, Associated Press — Government evaluates simulated terrorist attacks.

Experts inside government and the Institute for Security Technology Studies at Dartmouth College are still formally evaluating results of a simulated terrorist attack carried out by the Department of Homeland Security (DHS) over five days in October. The "Livewire" exercise simulated physical and computer attacks on banks, power companies and the oil and gas industry, among others. "There were some gaps," said Amit Yoran, the chief of the agency's National Cyber-Security Division. "The information flow between various sectors was not as smooth as we would perhaps have liked." Yoran said the mock attacks during the exercise tried to broadly disrupt services and communications across major industrial sectors, enough to make consumers to lose economic confidence. It modeled bombings at communications facilities outside Washington and cyberattacks aimed at companies and other networks. Yoran said the exercise affirmed that troublesome interdependencies exist throughout the nation's most important systems. A broad power outage could also bring down key telephone or computer networks, disrupting repair efforts.

SOLICITOR GENERAL DISCUSSES CANADA'S NATIONAL SECURITY POLICY

The Solicitor General of Canada, Wayne Easter, stated that it was time for a substantive review of Canada's national security policy. Easter noted that such a review would need to examine how the Canadian national security system interacts with the U.S. Department of Homeland Security. Additionally, Easter said that it was time to consider the creation of a centralized Canadian national security agency which could also assist in co-coordinating the work of the provinces and territories in times of crisis. He emphasized that keeping the border open for commerce and closed to criminals and terrorists was a priority.

2003-12-05 **technology companies secure cyberspace Department Homeland Security DHS urge infrastructure protection**

NIPC/DHS

December 05, Mercury News (CA) — Tech firms urged: secure cyberspace.

Department of Homeland Security (DHS) Secretary Tom Ridge warned Wednesday, December 4, that terrorists who "know a few lines of code can wreak as much havoc as a handful of bombs." It is important that "we share information, work together and close any gaps and weaknesses that terrorists would otherwise seek to exploit," Ridge told an audience of about 350 business leaders and technology experts attending the National Cyber Security Summit in Santa Clara, CA. "It only takes one vulnerable system to start a chain reaction that can lead to a devastating result," Ridge added. Robert Liscouski, the DHS's assistant secretary for infrastructure protection, made clear there would be consequences if the corporations that control 85 percent of the nation's critical infrastructure chose not to cooperate. The DHS wants businesses to provide information about cyber attacks so it can identify major threats to computer networks that control everything from water supplies and power lines to banking and emergency medical services. DHS officials say they need such data to create an early warning system. The full text of Secretary Ridge's remarks are available on the DHS Website: http://www.dhs.gov/dhspublic/interapp/speech/speech_0151.xml

2003-12-05 **information security cyber chief security officer council**

NIPC/DHS

December 04, Federal Computer Week — Fed cybersecurity chiefs get a council.

Information security has become important enough to warrant a federal Chief Security Officers Council to work with similar groups of government executives, the man in charge of national cybersecurity said this week. There is already a CIO Council, a CFO Council and a Chief Human Capital Officers Council, but security is so complicated now that Amit Yoran, director of the Department of Homeland Security's National Cyber Security Division, decided to initiate a council focused specifically on that one issue. "The CIOs have a lot on their plate and under [the Federal Information Security Act] every agency must have a security official...and this allows them to collaborate and discuss issues," Yoran said. The new CSO Council will work closely with the CIO Council, but having a separate forum where chief security officers can get together and discuss problems, tactics and best practices should make improvement easier, Yoran said.

2003-12-11 **US government agencies cybersecurity secure critical information systems fail test**

NIPC/DHS

December 09, Government Executive — Agencies get failing grades on cybersecurity.

Federal efforts to secure critical computer systems and sensitive information are improving, but more than half of all agencies are still doing very poorly at the task, lawmakers said Tuesday, December 9. Overall, the federal government received a grade of D for cybersecurity, up from a grade of F a year earlier, according to the 2003 Federal Computer Security Scorecard released Tuesday. The scorecard, which is compiled by the House Government Reform subcommittee, is based on information reported by each agency and federal inspectors general to Congress and the Office of Management and Budget. Senator Susan Collins (R-ME), who chairs the Senate Governmental Affairs Committee, urged agencies to take immediate action to improve cybersecurity. "The administration has reason to believe that cyberattacks could be part of terrorists' game plans," she said. "We cannot afford to be caught off guard."

2004-01-08 **US government IT security efforts department**

NIPC/DHS; http://www.eweek.com/article2/0,4149,1426312,00.asp

January 05, eweek.com — Agencies beef up IT security.

The Department of Justice (DOJ), one of a handful of agencies that received a failing grade on last month's report card on IT security delivered by a congressional subcommittee, is at the forefront of the movement. The DOJ has made a number of changes, including the establishment of a department-wide IT security staff that answers directly to the CIO, according to DOJ officials. That group, in turn, has set about organizing a security council within the department, they said. The council comprises the top security officials from each of Justice's dozens of component organizations, and is now responsible for implementing and overseeing all the security programs in the department. So far, the results have been encouraging, department officials said. Another agency, the Environmental Protection Agency has created an automated security evaluation and remediation application capable of testing the security posture of each machine and monitoring the remediation process for any problems found. The Department of Transportation recently implemented a comprehensive vulnerability assessment and remediation package that performs continuous scans, instead of the traditional monthly or quarterly assessments.

RISKS 23 13

BRUCE SCHNEIER ON ORANGE ALERT IN SALON (FROM DAVE FARBER'S IP)

Contributor Cory Doctorow supplies a Bruce Schneier article on flight cancellations and US anti-terrorism efforts. In this article entitled "Homeland Insecurity," Schneier analyzes the event of 15 flight cancellations in the US in January 2004. Schneier points out that all 15 of these flight cancellations had turned out to be false alarms. He says that security is a tradeoff between its costs and benefits, and stresses that cancelling flights because of not-so-credible threats will be too expensive in the long run. But Schneier appreciates that intellegence is difficult, and involves painstaking data analysis. "The crucial bits of data," he observes, "are just random clues among thousands of other random clues, almost all of which turn out to be false or misleading or irrelevant." He says that, in fact, working with too much data can be problematic. Schneier adds that throwing more computers into data analysis will not help because "[F]inding the real plot among all the false leads requires human intelligence." He concludes that the 15 airline cancellations reflected old problems with US intelligence--"too much bureaucracy and not enough coordination."

2004-01-20 **eyeglass lie detector law enforcement airport security anti-terrorism Homeland Security**

RISKS; http://www.eetimes.com/story/OEG20040116S0050 23 14

LIE-DETECTOR GLASSES, 90% ACCURATE?

Steve Holzworth refers us to a story in eetimes.com on a new lie-detector technology that may come to be used for airport security soon. This lie detector measures the frequency range of voice patterns to report with 89% accuracy if someone is lying. The lie detector is so small that it can fit in the eyeglasses of law enforcement officers. When an airport security screener asks a passenger, "Do you plan on hijacking this plane?", the lie detector will flash green, yellow, or red to the security screener to indicate true, uncertain, or false passenger responses. Given the success rate of this lie-detector, Steve Holzworth remarks, "Oh, excellent! I only have a 1 in 10 chance of being falsely accused." In a follow-up article, contributor Ron Bean says that this lie-detector technology "sounds like it's detecting people's emotional "hot buttons", rather than lies per se." He thinks a good actor could defeat this lie-detector. He concludes by asking, "What's the rate for false positives vs false negatives?" for this lie-detector. Contributor Peter B. Ladkin attempts to answer that in his follow-up article. Ladkin says the 89% accuracy of the lie detector says nothing about the technology's usefulness. Ladkin calls false positives and false negatives Type 1 and Type 2 errors respectively. He writes that in order to understand the problem, one needed "reliable information about the background rate of lying" of the population. Ladkin considers three cases with the given 1 in 10 success rate. In the first case, the background rate of lying is 1 in 10; therefore the passenger is never falsely accused of lying. In the second case, all errors are of Type 1; so the passenger "has a 1 in 10 chance of being falsely accused." In the third case, "[E]rrors are evenly split between Type 1 and Type 2, and the background rate of lying is 1 in 2." Now, an innocent passenger and an actual hijacker have a 1 in a 20 chance of failing and passing the test respectively. Ladkin thinks this technology is "impossible in serious use." He concludes, "…the company spokesman is Bsing,
as are most people who claim to have measured the accuracy of lie-"detector" apparatus."

NIPC/DHS; http://www.gcn.com/vol1_no1/daily−updates/24775−1.html

January 28, Government Computer News — Davis, Putnam ratcheting up IT security oversight.

Two key lawmakers are pressing agencies to correct longstanding IT security problems. Tom Davis, chairman of the House Government Reform Committee, on Tuesday, January 27, said his committee will hold a hearing this spring on at least two contracts that failed to take the Federal Information Security Management Act into account. Adam Putnam, chairman of the Government Reform Subcommittee on Technology, Information Policy, Intergovernmental Relations and the Census, said he sent a letter to agency secretaries requesting a meeting with their CIOs to discuss their IT security action plans. Putnam said the letters are part of an effort to increase awareness of agency IT security problems. Putnam said his staff already has met with six CIOs and will meet with the CIO Council in March to discuss agency IT security plans, milestones and his subcommittee's expectations. He added his staff also will meet with the appropriations committee staff members to discuss the importance of funding IT security. "We've had some very positive discussions with the CIOs so far," Putnam said.

2004-03-22 **security crisis co-ordination center National Cyber Partnership Homeland Security**

NIPC/DHS

March 18, Federal Computer Week — Security groups call for crisis coordination center.

Two national task forces organized by the National Cyber Security Partnership on Thursday, March 18, called for a public awareness campaign, an early warning contact network and a national crisis coordination center to improve the nation's responses to cyber vulnerabilities, threats and incidents. Establishing a national crisis coordination center by 2006 most likely would require legislation or an executive order. Guy Copeland, who led the Early Warning Task Force, said the center would coordinate threat analyses, warnings, research and responses for critical infrastructure-sector experts and federal, state and local officials. The early warning contact network, to be set up as early as December, would be a multichannel network housed and administered by the Department of Homeland Security's U.S. Computer Emergency Readiness Team. Communication would occur primarily via the Internet, although task force leaders recommended having a backup means of communicating if the Internet goes down. Reaching home users will be accomplished largely through the cooperation of Internet service providers who would keep their customers informed of cybersecurity threats and attacks, task force leaders said. 2004-03-30 16.3 March 30, SearchSecurity.com — SCADA security hearing begins today. Last summer's massive blackout in the Northeast demonstrated the vulnerability of our nation's most critical networks. It also set in motion an inquiry that today, March 30, brings together legislators and IT experts to discuss how to better secure these networks from further disaster. Supervisory Control and Data Acquisition (SCADA) systems, associated with power plants and other mission-critical networks, especially need stronger protection. "Historically, there is a false sense of security related to SCADA systems. Some administrators have been comforted by the thought that these systems are specialized and often deployed in a 'closed' network utilizing proprietary protocols," explains Andre Yee, president and CEO of a network security vendor. One problem with securing SCADA is the unique nature of the systems. Most operate in real time and can't afford to be offline for lengthy upgrades or security installations, for fear of a degradation of performance. Another problem, Yee notes, is with newer SCADA systems incorporating more Web accessibility, which poses myriad problems when using the Internet, a public conduit susceptible to attack. They also leverage Unix and Windows systems, which puts networks at risk, particularly given the number of vulnerabilities that can be exploited.

2004-03-26 **security education coding programming Department Homeland Security**

DHS IAIP Daily;

March 25, Federal Computer Week — Security needs better education for programmers.

Dealing with Internet computer worms and viruses requires a long-term education effort aimed at programmers while they are still in college, a Department of Homeland Security (DHS) executive said Thursday, March 25. Lawrence Hale, deputy director of the DHS' U.S. Computer Emergency Readiness Team, said, "the things that are costing us the most pain are preventable." Programmers can be taught to avoid creating buffer overflows and other well-known vulnerabilities found in commercial software, said Hale, speaking at the FOSE conference on government technology in Washington, DC. It could be years before the results of education show up in software that is being sold, but the effort is needed more than ever because the problem is getting worse, officials said. Hale said an increasing number of cyberattacks are done for profit. "Worms are turning machines into mail servers," he said. "Your machines are being used to spam." In addition to working with universities to promote secure programming practices, DHS is working with researchers at Lucent Technologies' Bell Labs and other organizations on new tools that could detect the precursors of network attacks, Hale said.

2004-03-31 **critical infrastructure protection challenges efforts report**

NIPC/DHS; http://www.gao.gov/highlights/d04354high.pdf

March 15, General Accounting Office — GAO-04-354: Critical Infrastructure Protection: Challenges and Efforts to Secure Control Systems (Report).

Computerized control systems perform vital functions across many of our nation's critical infrastructures. For example, in natural gas distribution, they can monitor and control the pressure and flow of gas through pipelines. In October 1997, the President's Commission on Critical Infrastructure Protection emphasized the increasing vulnerability of control systems to cyber attacks. The House Committee on Government Reform and its Subcommittee on Technology, Information Policy, Intergovernmental Relations and the Census asked GAO to report on potential cyber vulnerabilities, focusing on (1) significant cybersecurity risks associated with control systems (2) potential and reported cyber attacks against these systems (3) key challenges to securing control systems and (4) efforts to strengthen the cybersecurity of control systems. GAO recommends that the Secretary of the Department of Homeland Security (DHS) develop and implement a strategy for coordinating with the private sector and other government agencies to improve control system security, including an approach for coordinating the various ongoing efforts to secure control systems. DHS concurred with GAO's recommendation. Highlights: http://www.gao.gov/highlights/d04354high.pdf

TSA EYES RFID BOARDING PASSES

The Transportation Security Administration is looking into the possibility of using RFID-tagged airline boarding passes that would enable passenger tracking in airports -- a proposal that has raised the hackles of some privacy advocates. TSA says it would use the special boarding passes in conjunction with its "registered traveler" program, which would permit frequent fliers to provide detailed personal information, corroborated by a background check. The RFID passes would allow these registered travelers to speed through "special lanes" during the boarding process. The TSA has already started work to deploy RFID boarding passes in some countries in Africa under the Federal Aviation Administration's Safe Skies for Africa Initiative. But Katherine Albrecht, who worked against the use of RFID tags on retail goods, says this new proposal is a "nightmare scenario," which uses technology to invade people's privacy. "Are they going to track how long I spend in the ladies room?" she asks. (Computerworld 1 Apr 2004)

2004-04-21 **Department Homeland Security coordination infrastructure protection**

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?articleID=18902167

April 19, InformationWeek — DHS needs public-private cooperation.

Speaking at the Information Security Decisions conference in New York on Monday, April 19, Amit Yoran, director of the Department of Homeland Security's National Cyber Security Division, noted the challenges associated with this need for public-sector agencies and private-sector companies to coordinate their knowledge of cyberthreats and physical threats, as well as infrastructure vulnerabilities. DHS estimates that private-sector companies run 85% of the services required to ensure national security, public health and safety, and economic stability. Yet private-sector executives are reluctant to provide critical infrastructure information about their companies' operations for fear of their vulnerabilities becoming a matter of public record. Software quality is also a key issue for cybersecurity--particularly because most software users aren't security experts. Developers must address the most obvious problems. "Ninety-five percent of software bugs are caused by the same 19 programming flaws," Yoran said. And software quality will only become more difficult to police as more and more is developed by foreign nationals both offshore and within the United States, Yoran said. Companies will have to be on guard against backdoors potentially written into software that could allow access to their systems.

2004-04-25 **security clearinghouse Federal government ISACS secure network operations center SOC DHS**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1572951,00.asp

April 25, eWEEK — Feds making plans for security clearinghouse.

The federal government is developing plans for a secure network operations center (SOC) for all security information flowing to and from the government. The SOC would be a clearinghouse that gathers and analyzes data from the private sector, mainly the Information Sharing and Analysis Centers (ISACS) in several major vertical industries. The SOC would be run jointly by personnel from the DHS and a civilian contractor that would help build the facility. DHS officials said that even though there are less formal information-sharing efforts between government and private industry, there still is a need for a more structured program. "We're trying to operationalize the public/private partnership," said Amit Yoran, director of the National Cyber Security Division at DHS, last week. "The private sector genuinely wants to make progress on this. I think, as we get more considerate of the private sector in terms of the FOIA [Freedom of Information Act] exemption, things will come along." Officials said they hope to have plans for the SOC finalized soon and intend to fund the initiative out of the current fiscal year's budget, which runs out September 30.

http://www.nytimes.com/2004/04/27/national/27BOIS.html?ex=1084089284&ei=1&en=bd65293d3d6b1e62

The U.S.A.P.A.T.R.I.O.T. (Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism) Act makes it a crime to provide "expert guidance or assistance" to groups deemed terrorist. As a result, 34-year-old Sami Omar al-Hussayen of Saudi Arabia, a PhD candidate in computer science at the University of Idaho, was charged with three counts of conspiracy to support terrorism and 11 counts of visa and immigration fraud for being the Webmaster for several Islamic organizations, some of which had Web links to other sites where people praised suicide bombers in Chechnya and in Israel. He was charged with providing "computer advice and assistance, communications facilities, and financial instruments and services that assisted in the creation and maintenance of Internet Web sites and other Internet medium intended to recruit and raise funds for violent jihad, particularly in Palestine and Chechnya."

Defense lawyers denied that Mr. Hussayen sympathizes with extremist views; prosecutors claim that he is a secret terrorist. Civil liberties advocates argue that the law is so broad that "Somebody who fixes a fax machine that is owned by a group that may advocate terrorism could be liable," according to Prof. David Cole of the Georgetown University school of law. Judge Audrey B. Collins of the Federal District Court in Los Angeles wrote in another case dealing with the U.S.A.P.A.T.R.I.O.T. Act that "a woman who buys cookies at a bake sale outside her grocery store to support displaced Kurdish refugees to find new homes could be held liable" if the sale were sponsored by a group that were designated terrorist by the government.

Civil liberties activists also point out that the defendants activities as Webmaster and dealing entirely with ideas and statements are supposed to be protected by the First Amendment of the US Constitution.

2004-04-27 **Homeland Security NSA team up cybersecurity COAEIAE**

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0426/web−nsa−04−27−04.asp

April 27, Federal Computer Week — DHS, NSA team on cybersecurity.

On April 22, officials from National Security Agency (NSA) and the Department of Homeland Security (DHS) announced the formation of the National Centers of Academic Excellence in Information Assurance Education. It stems from NSA's Centers of Academic Excellence in Information Assurance Education Program, which started in 1998 and recognizes 50 universities in 26 states. The National Strategy to Secure Cyberspace, issued in 2002 by the Bush administration, directs the government to foster training and education programs that support computer security needs and responsibilities, and improve existing information assurance programs. Earlier this month, NSA officials announced they would hire 1,500 people by September and 1,500 employees each year for the next five years. Agency jobs include information technology and acquisition positions in addition to traditional code-making and code-breaking roles, according to an April 7 statement.

[U.S.A.P.A.T.R.I.O.T.]… ACT RULES MUFFLE DISSENT

The secrecy provisions of the ...[U.S.A.P.A.T.R.I.O.T.] Act have prevented the American Civil Liberties Union from publicizing a lawsuit it filed three weeks ago challenging the FBI's methods of obtaining many business records. The ACLU was recently allowed to release a redacted version of the lawsuit following extended negotiations with the Justice Department. "It is remarkable that a gag provision in the U.S.A.P.A.T.R.I.O.T. Act kept the public in the dark about the mere fact that a constitutional challenge had been filed in court," says ACLU associate legal director Ann Beeson. "President Bush can talk about extending the life of the U.S.A.P.A.T.R.I.O.T. Act, but the ACLU is gagged from discussing details of our challenge to it." The crux of the ACLU's case concerns a section of the Act that allows the FBI to request financial records, telephone and e-mail logs, and other documents from businesses without a warrant or judicial approval. Such requests are known as "national security letters," and the FBI has issued scores of such letters since late 2001. The ACLU complaint says that using national security letters to force Internet service providers to turn over names, screen names, e-mail addresses and other customer information without proper notice to customers raises questions about the constitutionality of the ...[U.S.A.P.A.T.R.I.O.T.] Act's legal underpinnings. (Washington Post 29 Apr 2004)

2004-05-03 **wireless federal government Homeland Security**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/0503/pol−wireless−05−03 −04.asp

May 03, Federal Computer Week — Agencies team to develop integrated wireless network.

The Integrated Wireless Network (IWN) will provide a common wireless infrastructure to support the departments of Homeland Security, Justice, and Treasury, and officials expect to release their requirements this summer. Bringing three diverse departments together can be challenging, said Mike Duffy, Justice's deputy chief information officer for e-government, citing as an example the number of people needed to approve a memorandum of understanding. But the three agencies' leaders see the benefits and are committed to the project, he said. "The architecture analysis we conducted show there are substantial savings to be had both in cost and spectrum use by consolidating the three departments' resources," Duffy said. The new network will replace the aging wireless systems in many of the departments' components and will be designed to serve more than 80,000 law enforcement and homeland security users at 2,500 radio sites. The statement of objectives for IWN will be released in June or July and will outline the expectations and constraints of the project, officials said. Although the project will initially focus on voice capabilities, it will soon require wireless data capabilities, officials said. Also, the standards-based system must work with state and 10 local law enforcement systems.

DHS IAIP Daily; http://home.businesswire.com/portal/site/google/index.jsp?ndmViewId=news_view&newsId=20040503005637&newsLang=en

May 03, Business Wire — Responder network to be installed in Kansas agencies.

A $993,500 grant from the U.S. Department of Justice was awarded to the University of Kansas to install a Homeland One First Responder Network across the state of Kansas. The Kansas Law Enforcement Training Center and the Kansas Fire and Rescue Training Institute, both units of University of Kansas Continuing Education, will administer the grant. The grant calls for Homeland One First Responder Training and Communications Network to be installed at 319 Kansas law enforcement and fire services agencies across the state. "The University of Kansas has been a recognized leader in providing law enforcement and fire service training for more than 60 years," said JoAnn Smith, vice provost for university outreach and dean of Continuing Education at the University of Kansas. Homeland One's training modules are modeled on National Interagency Incident Management Systems and based on the Department of Homeland Security's Office for Domestic Preparedness (ODP) First Responder Training Guidelines and Standardized Emergency Management System (SEMS) standards.

DHS IAIP Daily; http://www.gcn.com/23_10/homeland−security/25813−1.html

May 04, Government Computer News — Virginia uses software template to standardize its agencies' COOPs.

The Virginia Information Technologies Agency (VITA) is providing state and local government agencies with training and a template for establishing standard continuity of operations plans (COOPs). Paul Lubic, VITA's associate director for policy, practice and architecture, said his agency recently bought software to promote the adoption of best practices. "We see a value in using the template so the continuity of operations plans will be in a standard format, which will enhance the management of those plans at the governor's office level," Lubic said. "Having them all look the same will let us quickly navigate to get the information we need in case of an emergency." The software includes an online template that lets agencies create their plans and store them in a central repository. "To answer the questions, the agencies must have an understanding of their business and the processes that are critical to their mission," Lubic said. The system also can notify government workers in the event of a disaster via wireless e-mail devices.

2004-05-04 **business continuity planning disaster recovery federal government**

DHS IAIP Daily; http://www.gcn.com/23_10/homeland−security/25793−1.html

May 04, Government Computer News — Agencies take notice of continuity planning.

Next week, more than 2,500 federal employees from 45 agencies will test how prepared the government is to stay open if disaster strikes. The Homeland Security Department's Emergency Preparedness and Response Directorate, which still uses the acronym FEMA, will run Exercise Forward Challenge to see how far along agencies are in developing and implementing continuity of operations plans, or COOPs. During the exercise, employees will go to alternate work sites outside Washington and then try to hook up to their networks, access e-mail and data files, communicate with other federal officials and perform their usual tasks. "This is a full-scale operation designed to test interdependencies and essential functions," FEMA undersecretary Michael Brown said. "Agencies will find out if their plans 9 work, and it will give them a wake-up call to fix any problems." Brown last month told lawmakers he is confident that agencies are prepared. Linda Koontz, director for information management issues for the General Accounting Office, expressed less optimism. She told the committee that she would not guarantee that agencies would continue to operate at full capacity if a catastrophe hit the Washington area.

2004-05-13 **business continuity of operations planning coop federal government Homeland Security DHS**

DHS IAIP Daily; http://www.dhs.gov/dhspublic/display?content=3554

May 13, Department of Homeland Security — Federal Government tests continuity of 8 operations plans.

The Department of Homeland Security (DHS) and more than 40 other agencies are testing their continuity of operations (COOP) plans during Forward Challenge 04 (FC 04), a two day exercise May 12-13. The exercise is a full-scale, scenario-based event in which Federal departments and agencies are implementing COOP plans, deploying pre-designated personnel and leadership at alternate sites away from the National Capital Region and performing essential functions at those locations. In order to ensure Federal departments and agencies are prepared to continue essential operations during any type of threat or emergency, DHS maintains an active program of planning, testing, training and evaluation of the Federal Executive Branch COOP program. Forward Challenge 04 tests the federal government's readiness to respond and ability to resume critical operations during an emergency situation. "This is the first-time that the Federal government has conducted a government-wide test of its continuity of operations plans," said DHS Secretary Tom Ridge.

DHS IAIP Daily; http://fcw.com/fcw/articles/2004/0510/web−dhsvis−05−13−04.as p

May 14, Federal Computer Week — DHS funds data center.

The Department of Homeland Security (DHS) has created a center to develop new methods and tools that would manage, analyze and graphically represent vast and diverse amounts of data to discover and predict potential terrorist activities. The Department of Energy's Pacific Northwest National Laboratory (PNNL), located in Richland, WA, will receive $2.5 million this year for the new National Visual Analytics Center (NVAC) that will work on projects related to analyzing data that includes text, measurements, images and video. It's expected that NVAC will establish four or five regional visual analytics centers next year as funding becomes available. NVAC's core responsibilities include research and development, education, technology evaluation and implementation and integration and coordination of research programs across government agencies. It will not collect data but develop tools for new ways to evaluate information currently being used by counter-terrorism analysts. It will also work with university researchers to develop future visual analytics technology.

2004-05-14 **Homeland Security states Websites communication training events calendar**

DHS IAIP Daily; http://www.govtech.net/news/news.php?id=90248

May 14, Government Technology — Oklahoma's redesigned Homeland Security Website.

Oklahoma's Office of Homeland Security recently launched an enhanced Website with several new interactive services that facilitate communication between the eight Oklahoma regional councils, its members and training officers. The Web site allows the public to see who is working on homeland security initiatives in their area while providing a secure electronic avenue for authorized users to communicate with officials and other select representatives. After successful login, authorized users can post messages and documents to regional bulletin boards. The training events calendar is accessible to the public and published on the Office of Homeland Security Web site. "The new Website is an excellent way for our office to communicate with the public and with responders, each of whom is essential to homeland security efforts," said Kerry Pettingill, director of the Oklahoma Office of Homeland Security.

DHS IAIP Daily; http://www.gcn.com/vol1_no1/homeland−security/25913−1.html

May 18, Government Computer News — Auditors warn of delays, overruns in Customs system.

The Department of Homeland Security's (DHS) massive new system for processing import-export data faces continuing cost and scheduling problems, the General Accounting Office (GAO) said on Tuesday, May 18. Customs and Border Protection, a DHS agency, last year inherited the Automated Commercial Environment project from the Customs Service. Since then, cost and scheduling problems have multiplied, GAO reported. ACE releases 1 and 2 cost $109.4 million instead of the planned $86.1 million, while releases 3 and 4 ballooned from $146.4 million to $192.4 million, GAO said. GAO said the customs agency coped by borrowing resources from forthcoming releases and overlapping activities to catch up with its schedule. Department officials said they agree with the auditors' conclusions and are working to correct the problems. The report is available at http://www.gao.gov/new.items/d04719.pdf

TRIAL OF MAN ACCUSED OF USING INTERNET FOR TERRORISM

In the terrorism trial of a University of Idaho computer science graduate student Sami Omar Al-Hussayen, a 34-year-old Saudi national, prosecutors say that they've proven a conspiracy between the defendant and the Michigan-based Islamic Assembly of North America to use the Internet to foster terrorism, and that they should therefore be allowed to show jurors Web postings about the Assembly that are not specifically related to Al-Hussayen. In rebuttal, Defense attorney David Nevin argues that his client is charged with promoting terrorism just because some Internet sites he helped maintain carried objectionable material: "We're circling around and around and making our way toward the issue of the First Amendment that has been floating around here from the start." Besides being accused of terrorist activities, Al-Hussayen is also accused of visa fraud and making false statements to cover up his association with the Assembly. (AP/USA Today 18 May 2004)

DHS IAIP Daily; http://www.wnbc.com/traffic/3328661/detail.html

May 20, Associated Press — Possible ban on subway photos, videos to deter terrorists.

New York Transit officials on Thursday, May 20, proposed banning photography on subways and buses for their more than seven million daily riders to deter terrorists from conducting surveillance of the nation's largest mass transit system. NYC Transit, the division of the Metropolitan Transportation Authority that runs the subways, the buses and the Staten Island Railway, said the ban on photography and videotaping would not apply to journalists with valid ID cards or to people with written permission. Officials have paid increasing attention to transit security as the Republican National Convention approaches and following the March 11 Madrid commuter train bombings, which killed 191 people. NYC Transit President Lawrence Reuter said the rule changes were "intended to enhance security and safety" for customers and employees. NYC Transit also proposed banning passengers from using end doors to move from one subway car to another, putting feet up on seats and standing on skateboards on subways or buses, among other changes. Violators of the rules would be subject to fines. The changes need MTA board approval after a 45-day period of public comment.

SYSTEM FOR TRACKING VISITORS TO U.S.

The Department of Homeland Security is getting ready to award a very large contract (perhaps worth as much as $15 billion) for a network of databases to track visitors to the country before and after they arrive. The system will attempt to show where the visitors are going and whether they pose a terrorist threat. The three companies vying for the contract, which is called US-Visit, are Accenture, Computer Sciences, and Lockheed Martin. Visitors arriving at checkpoints will face real-time identification to confirm they are who they say they are and to make it possible to track them while they remain inside the U.S. Asa Hutchinson of Homeland Security says, "This is hugely important for the security of our country and for the wise use of our limited resources. We're talking here about a comprehensive approach to border security." Civil libertarians are alarmed that the databases could, despite assurances from the Homeland Security department, be used to monitor American citizens. (New York Times 24 May 2004)

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/0816/news−dhs−08−16
−04. asp

August 16, Federal Computer Week — DHS recommends agencies test Windows SP2.

The Department of Homeland Security's U.S.-Computer Emergency Readiness Team (US-CERT) is recommending that all Microsoft Windows XP users, including agencies, carefully test the company's newest security patch, Service Pack 2, and then deploy it throughout their organizations. US-CERT officials view the patch as a step in the right direction because it "makes Internet Explorer highly resistant to the types of attacks we've seen recently, such as download.ject, and enables Windows firewalls." Download.ject is a Trojan horse program 10 that attempts to download and install a file by exploiting vulnerabilities in Microsoft's Internet Explorer Web browser. Testing is important. Security features embedded in the upgraded operating system will be turned on by default, for example, and because users are being urged to install SP2 through automatic download, people unfamiliar with security policies could suddenly be faced with having to make vital decisions about their systems' protection. Those default features also could break certain custom applications that agencies have developed.

DHS IAIP Daily; http://www.usatoday.com/tech/news/2004−08−16−cyberterror −gra nts−ark_x.htm

August 16, Associated Press — Arkansas center to train officers in cyberterrorism.

Department of Homeland Security Undersecretary Asa Hutchinson announced on Sunday, August 15, a $34 million grant program that will be shared among 14 groups nationwide to counter terrorism. The National Center for Rural Law Enforcement in Little Rock was among the 14 groups that will share in the training grant program. The center is part of the University of Arkansas' Criminal Justice Institute, and was awarded $2.8 million of the total grant to train rural law enforcement officers to recognize cyberterrorism, preserve the physical evidence as they would any crime scene, and notify the appropriate federal agency. Hutchinson said said cyberterrorism presents a threat to the country's security and the operation of utilities, government infrastructure, and commerce. A majority of the nation's power companies report some kind of "cyber attack" at least once a year, he said. The program out of the Little Rock center will address such cybercrime as computer hacking into sensitive files, computer viruses, and the breakdown in water and sewer systems because of a computer adjustment to the controls, he said.

2004-08-16 **Internet terrorism information Web scanner detection 95% text based pattern recognition terror content hits surfers**

DHS IAIP Daily; http://www.haaretz.com/hasen/spages/465047.html

August 16, Haaretz (Israel) — Web scanner can detect terror content.

Engineering faculty researchers at Ben-Gurion University (BGU) in Israel reported Sunday, August 15, that they have developed a system that can identify 95 percent of Internet pages with terrorism-related content. The experimental system, which is being developed to detect information regarding terror activity automatically, was designed by Dr. Mark Last of the Department of Systems Information Engineering at BGU, and Prof. Abraham Kandel of the National Institute for Systems Test and Productivity, in the United States. The system is based on the recognition of patterns in texts with terror content, based on examples from existing Internet sites. It uses these patterns to identify "hits" by surfers on other sites with similar characteristics, in order to locate users affiliated with terror organizations and new sites set up by terrorist elements, among other things. According to Last, the development has great importance in view of the considerable use of the Internet in coordinating and orchestrating terror acts. "The lack of ability to enforce limitations on Internet users allows terror organizations to set up Internet sites that spread incitement, raise money in support of terror and find new supporters for their causes," Last said.

DHS IAIP Daily;
http://www.cnsnews.com/ViewForeignBureaus.asp?Page=%5CForeignBureaus%5Carchive%5C200408%5CFOR20040827d.html

August 27, Cybercast News Service — U.S. companies providing indirect service to terrorist websites, report says.

American Internet Service Providers are being used indirectly by the Palestinian Islamic Jihad and other terrorist groups to market their terrorist messages, Israel's Intelligence and Terrorism Information Center at the Center for Special Studies said in a recent report. "Palestinian and international terrorist organizations make massive use of the Internet to spread propaganda supporting terrorism and as a means of maintaining contact between organizations and headquarters, their infrastructures and their target populations," the report said. Two of the companies listed in the report said they were now in the process of correcting the situation. Preference for U.S. and Western companies provides terror groups with "advanced technological support," the ability to "disappear" among the multitudes of Western companies on the Internet -- and to a certain extent, allows protection under U.S. freedom of speech guarantees, the report adds. Brian Marcus, director of Internet monitoring for the Anti-Defamation League in New York, said that laws governing the posting of terrorism-related material on websites fall into a "gray area," but service agreements may enable companies to close down websites. Report: http://www.intelligence.org.il/eng/sib/8_04/internet.htm

2004-08-30 **New York City information technology IT disaster recovery plan**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1640674,00.asp

August 30, eWEEK — NY IT prepares for disaster recovery.

As New York City braces for the Republican National Convention (RNC) this week, IT managers at the city's financial services companies may be nervous about the potential for terrorism, but they're prepared. Having learned from the terrorist attacks of September 11, 2001, and the massive power blackout of 2003, many Manhattan-based companies are now hardened with beefed-up disaster recovery initiatives, such as encrypted data backup processes, remote backup facilities and redundant telecommunications systems. While the threat of terrorism has remained somewhat of a constant in New York, the RNC has pushed companies located in the area around Madison Square Garden to aggressively plug any holes in their disaster recovery strategies. The RNC's IT staff said they are ensuring that their own systems remain open at all times. "Our first line of defense is redundancy. Most everyone has a cell and a land line," said Max Everett, director of IT for the RNC. "We're working directly with the Secret Service and US-CERT to ensure our data integrity and network security."

2004-08-30 **US states cyberattack alert plan risk assessment color code network security threats Homeland Security**

DHS IAIP Daily; http://www.nwfusion.com/news/2004/083004nastd.html

August 30, Network World — States prepping cyberalert plan.

Looking to gauge the risk of attacks against their networks, state officials this week will vote on new measures that would assess threats and dictate specific actions to take to protect key resources. If adopted, the common alert-level procedures would color-code the threat to state networks and recommend action to take in response to specific threats. The proposed cybersecurity alert system would establish a secure Website state officials could tap to determine why each state has the security ranking it does and whether they should take action based on what other states experience. Homeland security ranked among the key topics considered last week at the National Association of State Telecommunications Directors (NASTD).

2004-09-01 **terrorism antiterrorism Homeland Security Al Qaeda technology computers critical infrastructure protection arrests**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,117658,00.asp

September 01, PC World — Al Qaeda's tech traps.

Al Qaeda and other terrorist groups are becoming more technically adept at using the Web and computers. The arrest of alleged Pakistani terrorist Mohammad Naeem Noor Khan, captured this summer with 51 optical discs and three computers full of terror intelligence, is the most recent indicator. For the past ten years, dissidents from the Middle East, Chechnya, and Latin America have used the Internet to further their cause, says Josh Devon, a senior analyst at the SITE Institute, a terrorism research group that monitors the Web. But the proliferation of the Web and the availability of more powerful and affordable graphics and multimedia processing tools have dramatically increased al Qaeda's and other terrorist groups ability to communicate, to broadcast their message, to create public lists of who and what to target, and to train others much more than was possible even five years ago. While technology can make it easier to conceal information and communicate covertly using digital tools such as encryption, it also leaves digital trails of evidence. Computer intelligence found on Khan's computers was instrumental in the arrests of Pakistani and UK terror suspects.

2004-09-01 **information security technology human factors terrorism Homeland Security linguistics computation Arabic language**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27131−1.html

September 01, Government Computer News — The human factor trumps IT in the war on terror.

Computer scientists at the University of Maryland are pushing the technology envelope to assist in intelligence gathering and analysis, but the people using the data may be the limiting factor in its effectiveness. “While there is a lot of good information out there, it isn’t getting to the right people at the right time,” said William J. Lahneman, coordinator of the Center for International and Security Studies in the School of Public Policy. Implementing recent presidential directives on moving data across agency lines will require not only changing IT architectures, but will “challenge the very culture” of those agencies, said James Hendler of the university’s Institute for Advanced Computer Studies. Hendler is focusing on the intelligence needed to use the Web effectively in gathering information and answering questions. The university’s Computational Linguistics and Information Processing Lab is developing more-fluent automated translation systems for languages such as Arabic. Co-director Amy Weinberg said the lab also is working on how to rapidly ramp up systems to handle new languages as new threats develop. Some terrorist groups already are ahead of the government in their use of existing Web technology to win the hearts and minds of people, said Lee Strickland, director of the university’s Center for Information Policy.

2004-09-02 **US government agencies software security quality assurance Homeland Security DHS IA Directorate**

DHS IAIP Daily; http://www.infoworld.com/article/04/09/02/HNusgovt_1.html

September 02, IDG News Service — U.S. government agencies aim for software assurance.

U.S. government agencies need to better understand the vulnerabilities of the software they're buying, said IT workers from several government agencies during a software assurance forum in Washington, D.C., last week. The forum, sponsored by the Department of Defense (DoD) and the Department of Homeland Security (DHS), was the first step in a long-term discussion between government agencies and vendors on how to create more secure software, said Joe Jarzombek, deputy director for software assurance in the DoD Information Assurance Directorate. Prompting the forum was "a growing awareness of the fact that we've got a lot of vulnerabilties in the software we're acquiring," said Jarzombek. A major concern among government IT workers is a need to understand how and where software is developed. In many cases, software used by government agencies is developed by outsourced workers, Jarzombek said, and government purchasers need to know that information. Software developers should expect more security demands from customers in the near future, added Mike Rasmussen, principal analyst Forrester Research Inc. Government agencies are under pressure from Congress to improve their cybersecurity, and agencies are moving toward making more security demands of software vendors.

2004-09-17 **Department Homeland Security DHS cyber security industry**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1647410,00.asp

September 17, eWeek — DHS follows industry lead on cyber-terror.

Lawrence Hale, deputy director of the Department of Homeland Security's (DHS) cyber security division, said Friday, September 17, that the DHS depends on the private sector to take the lead in fighting cyber-terrorist threats. "The normal things you do to protect your network will help protect you against cyber-terrorism," he said. Speaking at a conference on cyber-security organized by NBC News and the Northern Virginia Technology Council, Hale said the department is already aware of some cyber-terror threats, as well as the activities of terrorist organizations on the Internet. "They're using cyberspace for recruiting, fund-raising and communication," he said. Private-sector businesses in the United States are already taking the lead in making sure that they are protected against attacks and intrusion, according to Hale -- and the government is following their lead. While he wouldn't divulge details, Hale said the government is working to lessen the severity of any attack on it. He said the fact that most federal departments and agencies design and build their own networks and computer systems makes it less likely that any one type of attack would succeed across the government. He also explained that the department wants to expand its role with private businesses in its fight against cyber terrorism.

2004-09-19 **cyberterrorism information Internet Website identification algorithm Ben-Gurion University BGU**

DHS IAIP Daily; http://www.jpost.com/servlet/Satellite?pagename=JPost/JPArti
cle/ShowFull&cid=1095565998846

September 19, Jerusalum Post (Israel) — Algorithms can identify cyber-terrorism.

Professor Mark Last of the Ben-Gurion University (BGU) department of information systems engineering is working on ways to make terrorist's communication on the Internet more difficult by conducting pioneering research on fighting terror in cyberspace. "The Internet helps terrorists a great deal, and makes their life easier in many senses -- because it is really a very difficult problem to find something suspicious in the sea of traffic. Access to the Internet is relatively easy and affordable worldwide, and it is easy to use while concealing your identity," Professor Last says. His team has developed an experimental system that succeeded in identifying about 95% of Web pages with a terrorist content. Last's cooperation with colleagues at the University of South Florida led to the U.S. National Institute of Systems Test and Productivity in Florida getting involved in the subject. His lab is now working as a subcontractor for the National Institute to design methods that will enable government agencies and commercial companies to improve security, quality and cost effectiveness of large-scale information systems, with a focus on cyber-terror. Their ability to distinguish cyber-terror activity from normal activity is becoming increasingly more reliable thanks to changes in the algorithms.

2004-10-01 **US Department Homeland Security cybersecurity chief Amit Yoran resignation**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A64915−
2004Oct 1.html

October 01, Associated Press — U.S. cybersecurity chief resigns.

The government's cybersecurity chief has abruptly resigned after one year with the Department of Homeland Security. Amit Yoran informed the White House about his plans to quit as director of the National Cyber Security Division and made his resignation effective at the end of Thursday, September 30. Yoran said he "felt the timing was right to pursue other opportunities." It was unclear immediately who might succeed him even temporarily. Yoran's deputy is Donald "Andy" Purdy, a former senior adviser to the White House on cybersecurity issues.

2004-10-05 **critical infrastructure protection control systems vulnerable report hackers viruses**

DHS IAIP Daily;
http://www.forbes.com/business/feeds/ap/2004/10/05/ap1577435 .html

October 05, Associated Press — Experts say control systems vulnerable. Businesses and government agencies must re-examine the growing threat of cyberterrorism to automated computer systems running power grids, dams and other industrial facilities, security experts said at a conference Tuesday, October 5. From 1982 until about 2000, problems with such systems usually were associated with internal accidents or inappropriate employee behavior, said Eric Byres, manager of Critical Infrastructure Security Research at the British Columbia Institute of Technology. But a review by Byres of the last three years showed that 90 percent of these problems come from break-ins by hackers and computer viruses.

2004-10-07 **schools terrorism data loss information warfare surveillance threat Iraq**

NewsScan; http://www.usatoday.com/tech/news/2004-10-07-school-disk_x.htm

TERROR IN THE INFORMATION AGE

Law enforcement authorities have notified school districts in six states that a computer disc found by the U.S. military in Iraq contained photos, floor plans and other information about their schools. The officials say there is no evidence of any specific plans to stage Beslan-like terrorist attacks on the schools, which are in Georgia, Florida, Michigan, New Jersey, Oregon and California. Schools have been urged to watch for various activities which, though legitimate on their own, which may suggest a threat if many of them occur together: interest in obtaining site plans for schools, bus routes and attendance lists; prolonged "static surveillance" by people disguised as panhandlers, shoe shiners, newspaper or flower vendors or street sweepers not previously seen in the area; observation of security drills; and so forth. Clevelandbased school safety consultant Kenneth Trump says: "It's a positive sign that they're finally discussing this after years of downplaying or denying even the possibility of a terrorist strike on schools. Public officials are in fear of creating fear, but we have to put the cards on the table, educate people in the school community and make sure they are well prepared."

2004-10-08 **Municipal Websites information terrorism clues weakness disclosure**

DHS IAIP Daily; http://washingtontimes.com/metro/20041007−113112−4486r.htm

October 08, Washington Times — Municipal Websites may help terrorists plot attacks.

Too many details on municipal Websites can tip off terrorists to security weaknesses and vulnerable targets, a military researcher told a conference of U.S. mayors in Washington, D.C. on Thursday, October 7. Gerald G. Brown, distinguished professor of operations research at the Naval Postgraduate School in Monterey, CA, said municipal leaders must not confuse "sunshine" laws, which require public access to some government data, and the allure of "really cool Websites." Brown said that seemingly innocuous information, such as budget data, can become fodder for terrorist plots. "Frequently these sites are used to ask for things: 'We need a firetruck. We need a Hazmat crew,' " Brown said. "If I'm attacking you, that's pretty good information."

2004-10-10 **Terrorism Knowledge Base terrorist information collection FBI CIA Rand Corporation Department Homeland Security funding**

DHS IAIP Daily; http://www.chicagotribune.com/technology/chi−0410100381oct10 ,1,6912082.story?coll=chi−techtopheds−hed

October 10, Chicago Tribune (IL) — Site tracks and charts terrorism information.

The Terrorism Knowledge Base, an online database available at http://www.tkb.org includes detailed reports on more than 18,000 terrorist incidents and nearly 1,000 terrorist groups and their leaders dating back to 1968. The database is still in its final shakedown stage, but it is already available for public use. Created by the National Memorial Institute for the Prevention of Terrorism in Oklahoma City, the database represents the largest repository of international terrorism information ever made publicly available on the Internet. Information sources include the FBI, the CIA and the Rand Corporation, a non-profit research think tank that for the first time is making its proprietary terrorism incident database--long regarded by government experts and scholars as the world's most extensive--available to the public. The Department of Homeland Security is providing some of the funding to support the project. The intended audience ranges from citizens curious about terrorism to journalists, researchers, intelligence and law-enforcement agencies, and even spies in the field working clandestine assignments.

2004-10-11 **chat-room instant messaging IM surveillance anti-terrorism RPI professor Bulent Yener chatter pattern recognition algorithm National Science Foundation NSF grant**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A25272−2004Oct 11.html

October 11, Associated Press — U.S. funds chat-room surveillance study.

The U.S. government is funding a yearlong study on chat room surveillance under an anti-terrorism program. A Rensselaer Polytechnic Institute computer science professor hopes to develop mathematical models that can uncover structure within the scattershot traffic of online public forums. Professor Bulent Yener will use mathematical models in search of patterns in the chatter. Downloading data from selected chat rooms, Yener will track the times that messages were sent, creating a statistical profile of the traffic. "For us, the challenge is to be able to determine, without reading the messages, who is talking to whom," Yener said. The $157,673 grant comes from the National Science Foundation's Approaches to Combat Terrorism program. It was selected in coordination with the nation's intelligence agencies.

2004-10-14 **state local homeland security IT program need federal guidance**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27632−1.html

October 14, Government Computer News — CIOs: State and local homeland security IT needs more federal guidance.

State and local homeland security IT programs would be more effective if the federal government provided firmer standards and practices, senior federal officials said Thursday, October 14. Department of Homeland Security (DHS) CIO Steve Cooper, Justice Department CIO Vance Hitch and other high-level officials who spoke at an Industry Advisory Council meeting in Washington, D.C. agreed on the point. Cooper said he and Hitch should provide additional leadership to state and local governments on technology issues. Cooper noted that he was not necessarily talking about specific industry standards, but "the technology directions and the policies." DHS' state and local office has a weekly videoconference with state and local advisors, but that information may not reach all 89,000 municipalities, Cooper said.

2004-10-15 **Canadian anti-terrorism cyberterrorism force NSA Communications Security Establishment CSE**

DHS IAIP Daily; http://www.ctv.ca/servlet/ArticleNews/story/CTVNews/1097878208404_93287408/?hub=SciTech

October 15, Canadian Press (Ottawa) — Canada creates new force to fight cyber-terrorism.

A high-level national task force is being assembled to help Canada steel its defenses against potential cyber-attacks by terrorists. The head of Canada's electronic spy agency said the panel of private- and public-sector officials will help the country catch up to the United States in securing cyberspace. Communications Security Establishment (CSE) chief Keith Coulter noted Washington has already begun moving to protect their own key grids and networks. CSE, perhaps Canada's most secretive agency, has the dual role of helping protect crucial information-technology systems and eavesdropping on foreign communications. CSE and agencies in the United States, Britain, Australia and New Zealand share intercepted communications of interest with one another. Of particular importance is CSE's relationship with its American counterpart, the National Security Agency (NSA), Coulter said. "CSE and NSA share intelligence, tackle common problems posed by changing technology and track threats to our collective security."

2004-10-19 **information security federal networks meeting DHS standards report**

DHS IAIP Daily; http://www.gao.gov/cgi−bin/getrpt?GAO−04−375

October 19, Government Accountability Office — GAO-04-375: Information Technology: Major Federal Networks That Support Homeland Security Functions (Report).

A key information systems challenge in homeland security is ensuring that essential information is shared in a timely and secure manner among disparate parties in federal, state, and local governments, and in the private sectors. This requires communications networks that provide information-sharing capabilities between the various levels of government—federal, state, and local. The Government Accountability Office's (GAO) objective was to identify and describe, through agency reporting, major networks and examples of applications that the agencies considered important in supporting their homeland security functions. Nine agencies identified 34 major networks that support homeland security functions -- 32 that are operational and two that are being developed. Of these 34, 21 are single-agency networks designed for internal agency communications. Six of the 34 are used to share information with state and local governments; four share information with the private sector. Highlights: http://www.gao.gov/highlights/d04375high.pdf

2004-10-27 **Department Homeland Security DHS German Interior Ministry multilateral conference cyber security watch warning incident response**

DHS IAIP Daily; http://www.dhs.gov/dhspublic/display?content=4077

October 27, Department of Homeland Security — Homeland Security and German Interior Ministry co-host multilateral conference on cyber security.

The U.S. Department of Homeland Security's Information Analysis and Infrastructure Protection (IAIP) Directorate and the German Ministry of the Interior co-hosted a multilateral conference in Berlin October 20-22, 2004, on International Cyber Security Cooperation: Watch, Warning, and Incident Response. The conference consisted of delegations from fifteen countries including those from Europe, Asia Pacific and the Americas and represented a significant collaborative effort on the need for an international framework for cyber information sharing and incident response. The goal of the conference was to bring together government cyber security policy makers, managers of Computer Security Incident Response Teams (CSIRTs) with national responsibility, and members of the cyber law enforcement community. During the conference the participating countries discussed critical areas essential for building an international framework for cyber security, including: an arrangement among sovereign states to exchange cyber information, the incorporation of existing and emerging regional information sharing arrangements, and ways to improve information sharing in the near term and in the future.

2004-10-27 **database forged identities art cross border Rules of Crime Homeland Security DHS concern**

DHS IAIP Daily;
http://www.nytimes.com/2004/10/27/arts/design/27iden.html?or ef=login

October 27, New York Times — How to cross borders, social or otherwise.

Heath Bunting and Kayle Brandon, two British artists, are compiling a database exploring elements of legal status in Britain, with the ultimate goal of allowing people to create a new identity from information collected on the Internet. The first stage of their project is the focus of "Rules of Crime," a show that runs through November 13 at the New Museum of Contemporary Art's temporary home in Chelsea, NY. In its final form, their project may be viewed as the Homeland Security Department's worst nightmare: a road map enabling all sorts of undesirables to penetrate a nation's borders, banking systems, supermarket loyalty clubs. Bunting and Brandon are among a growing number of artists who are harnessing technologies associated with governments and corporations to challenge the status quo. The Website for their project, known as the Status Project (http://status.irational.org) says it will eventually provide a how-to guide to getting a passport. The Status Project grew out of BorderXing, in which the artists documented illegal treks they made across European borders. The BorderXing Website, available for individual use by request (http://irational.org/cgi-bin/border/clients/deny.pl) offers pictures, suggested routes and tips for evading the authorities.

2004-10-28 **do not fly list airport TSA Transportation Safety Authority Kabay DNFL false positives authentication correction failure homeland security terrorism**

NewsScan; Ubiquity

DO-NOT-FLY LISTS: DO-NOT-TAKE-SERIOUSLY!

The current issue of Ubiquity, an online publication of the ACM (edited by the editors of NewsScan), contains an article by Norwich University professor M.E. Kabay arguing that "the current implementation of do-not-fly lists and the use of documents to authenticate passenger identity won't necessarily improve airport security." A sample: "Deirdre McNamer (how appropriate) wrote a story in The New Yorker magazine in October 2002 about a 28-year-old pinko-gray-skinned, blue-eyed, red-blond-haired criminal called Christian Michael Longo who used the alias 'John Thomas Christopher.' His alias was placed on the DNFL used by the Transportation Security Administration. He was arrested in January 2002 but his alias was not removed from the DNFL. On March 23, 2002, 70-year-old brown-skinned, dark-eyed, gray-haired grandmother Johnnie Thomas was informed that she was on the master terrorist list and would have special security measures applied every time she flew. Indeed, the poor lady found that she was repeatedly delayed by a scurry of activity when she presented her tickets at an airline counter, extra X-rays of her checked baggage, supplementary examination of her hand-baggage and extra wanding at the entrance gates. On one occasion she was told that she had graduated to the exalted status labeled, 'Not allowed to fly.' She discovered that there was no method available for having 'her' name removed from the DNFL; indeed, one person from her local FBI office dismissively told her to hire a lawyer (although ironically, he refused to identify himself). An employee of the TSA informed her that 'four other law-abiding John Thomases had called to complain.'" (Ubiquity 28 Oct 2004)

2004-11-02 **computer data terrorism information extensible markup language XML metadata standard Homeland Security DHS FBI DoJ**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/1101/web−terrorxml−11−0 2−04.asp

November 02, Federal Computer Week — Standardizing terror data.

Government officials crafting proposals for cross-agency counterterrorism information sharing plan to assign stewardship over a core set of Extensible Markup Language (XML) standards. Members of the Information Systems Council will identify XML standards and people responsible for them, said Bill Dawson, intelligence community deputy chief information officer at the CIA. Final plans are due to the president by December 24. Metadata standards enabling the widest possible dissemination of intelligence information are required under Section 3 of Executive Order 13356. On September 20, officials connected four previously incompatible systems -- the FBI's Law Enforcement Online network, the Justice Department's Regional Information Sharing System, the Homeland Security Network and a criminal intelligence network in California.

2004-11-04 **cybercrime hacker hiring FBI crime list 10 Best Wanted**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A25579−2004Nov 4.html

November 04, Washington Post — More cyber-crime cases added to FBI list.

A former technology company executive charged with hiring hackers to attack a competitor's Website has joined the FBI's most-wanted list, the latest sign of the federal law enforcement agency's growing interest in cyber-crime. The most-wanted list is a group of more than a dozen people that includes some of America's most elusive criminals. It includes alleged embezzlers, an accused child pornographer and individuals indicted on drug and murder charges. The most-wanted list is not the same list as the notorious "10 Most Wanted," rather it is a list that the bureau started almost five years ago on its Website to nab suspects who are less of a threat or less prone toward physical violence, said spokesperson Paul Bresson. "This is the first time we've had such a significant number of people being investigated and prosecuted for computer crime," said Mark Rasch, a former prosecutor in the Justice Department's computer crimes and intellectual property section. "And we're only going to see this trend continue because investigators are getting better at identifying these individuals," said Rasch. The list, which currently includes 16 suspects, is located at http://www.fbi.gov/mostwant/alert/alert.htm

2004-11-08 **counter terrorism data sharing extensible markup language XML Department Homeland Security DHS**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/27854−1.html

November 08, Government Computer News — Counterterror data sharing will rely on XML.

The Department of Homeland Security (DHS) will tweak the new Data Reference Model (DRM) to create a data model for the exchange of counterterrorism data. Under Executive Order 13356, DHS data architect Michael Daconta is leading a revision of the Federal Enterprise Architecture's 30-page DRM to share counterterrorism data while preserving individual privacy. At a meeting of the Association for Information and Image Management's National Capital Chapter in Arlington, VA, last week, Daconta said he is looking seriously at the way the Global Justice XML data model would handle metadata about agencies' watch lists. "XML is neutral" on concepts such as watch lists' heterogeneous collections, Daconta said, but it can bridge documents and data because its primary job is information exchange. Use of federated queries will require a standard governmentwide identifier for persons of interest, as well as a central registry for the metadata, Daconta said.

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml;jsess ionid=XC2WBO3X2RJCIQSNDBCCKH0CJUMEKJVN?articleID=54201030

November 30, InformationWeek — Homeland Security Network advances.

The Homeland Security Department is moving forward with its plans to create a data network accessible to intelligence analysts and law enforcement across federal, state, and local boundaries. Homeland Security is moving into the testing and accreditation phase of its Homeland Secure Data Network, first introduced in April. The secure network, which could cost up to $350 million to create, will initially connect Homeland Security intelligence personnel with the Defense Department's Secret Internet Protocol Router Network (SIPRNET) to send and receive information with classified security levels. Initiatives also are under way to next year connect Homeland Security, the Defense Department, and areas within the FBI and the greater intelligence community, including the CIA.

2004-12-06 **committee cybersecurity post Department of Homeland Security DHS recommendation**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/1206/web−dhs−12−06−04.a sp

December 06, Federal Computer Week — Committee pushes for cybersecurity post.

Members of the House Select Homeland Security Committee have recommended establishing a new assistant secretary position within the Homeland Security Department (DHS) to better integrate and coordinate cybersecurity issues. The recommendation is one of six suggestions listed in a new 41-page, bipartisan report that was released today by the committee's cybersecurity subcommittee. The report stated that although DHS officials have created the National Cyber Security Division and several other coordination entities, "now is the time to build toward more robust capabilities." It also stated DHS officials need to exert more effort to work with the private sector and across critical infrastructure sectors in addition to state and local governments. Report: http://hsc.house.gov/files/cybersecurityreport12.06.04.pdf

GROUP URGES GOVERNMENT TO FOCUS ON CYBERSECURITY

The Cyber Security Industry Alliance is calling on the Bush administration to beef up its cybersecurity operations, starting with elevating the position of national cybersecurity director to assistant secretary level. "There is not enough attention on cybersecurity within the administration. The executive branch must exert more leadership," says Alliance director Paul B. Kurtz, who's a former senior cybersecurity official in the Bush administration. Kurtz was joined by Amit Yoran, the former director of Homeland Security's National Cyber Security Division who resigned in September. Meanwhile, a provision in the recently passed intelligence overhaul bill that would have raised cybersecurity's profile in the Homeland Security Department was stripped out before passage. The Alliance's recommendations mirror those outlined in a report issued Monday by the House subcommittee on cybersecurity, which also calls for the administration to consider tax breaks and other incentives for businesses that make computer security a top priority. In addition, both groups are urging the Homeland Security Department to take the lead in creating a disaster recovery and response plan, should the U.S. suffer debilitating digital sabotage. 2004-12-10 **cybersecurity office Department of Homeland Security DHS IAIP CSIA proposal recommendation**

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1739061,00.asp

December 10, eWeek — Cyber-security office moving ahead.

The office in charge of cyber-security in the Department of Homeland Security (DHS) is planning to continue moving ahead on the agenda the agency has already set. According to Lawrence Hale, deputy director of the National Cyber-Security Division at DHS, the agency considers physical and cyber-security so deeply intertwined that it would be impossible to separate them. Hale said the current organization of the IAIP (Directorate of Information Analysis and Infrastructure Protection) has cyber-security and physical security working together. Earlier this week, the CSIA (Cyber-Security Industry Alliance) released a series of recommendations, including a reorganization that would make the director of the cyber-security division an assistant secretary. Supporters say such a change would raise the profile of cyber-security, thus bringing the area more clout and more funding. While Hale said he thinks CSIA's proposals are an important means to raise the visibility of cyber-security, he doesn't agree that cyber-security should be treated differently from physical security. But he said he thought the CSIA meeting in Washington, DC where the recommendations were presented was helpful.

EDUPAGE; http://www.fcw.com/fcw/articles/2005/0103/web-response-01-06-05.asp

FEDS LAUNCH NATIONAL RESPONSE PLAN

The Department of Homeland Security has released a plan that directs how the federal government is to work with state, local, and tribal governments, as well as with the private sector, in the event of a national emergency. The National Response Plan is rooted in the National Incident Management System, which is currently under development by the Federal Emergency Management Agency and is expected to be complete by the end of fiscal 2007. The National Response Plan establishes standards for training and organization. In addition, it outlines protocols for handling incidents that span various jurisdictions, with the goal of helping officials at all levels of government better coordinate their responses despite widely varying technologies used in prevention, response, and recovery efforts.

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2005/0131/web-dhs-02-02-05.asp

DEPARTMENT OF HOMELAND SECURITY PRIVACY OFFICE ISSUES FIRST ANNUAL REPORT

Department of Homeland Security (DHS) officials on Wednesday, February 2, released DHS' first annual privacy report to Congress, outlining work done in numerous areas, including technology. A primary goal of the department's privacy office, which is the first Congressionally mandated one for a federal agency, is ensuring that technologies sustain "privacy protections relating to the use, collection, and disclosure of personal information," according to the 112-page report. The office is examining use of biometric technology, radio frequency identification devices, data mining, and distributed data environments -- where data is shared with users, but remains with the owner. The privacy office is also considering the effect of emerging technologies, including geospatial information systems and services, unmanned aerial vehicles, and ubiquitous sensor networks, which may potentially raise separate privacy protection concerns, according to the report. DHS IAIP Daily; http://www.dhs.gov/dhspublic/display?content=4362

HOMELAND SECURITY LAUNCHES REGIONAL TECHNOLOGY INTEGRATION INITIATIVE IN SEATTLE

The Department of Homeland Security on Friday, February 18, announced the addition of a new urban area to its Regional Technology Integration (RTI) initiative, which focuses on speeding the effective integration of innovative technologies and organizational concepts to the homeland security efforts of regional, state, and local jurisdictions. Through the program, managed by Homeland Security's Science & Technology directorate, four urban areas across the country have now been announced as the initial pilot locations for this program. The Seattle, Washington urban area joins Memphis, Tennessee; Anaheim, California; and Cincinnati, Ohio, as the pilot locations. These initial locations will provide the science and technology community with a realistic environment to test maturing hardware and concepts. The program will also provide information on how best to choose, deploy, and manage these technologies to strengthen the security posture of these and other communities. The goal of Homeland Security's Regional Technology Integration initiative is to facilitate the successful transfer and integration of existing and advanced homeland security technology systems to local governments in order to improve their preparedness and response.

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2005/0221/web−cyber−02−22−05 .asp

FEDERAL GOVERNMENT TO HOLD CYBER PREPAREDNESS EXERCISE

The federal government and several international partners will hold a cyber preparedness exercise in November, Department of Homeland Security (DHS) officials said at the RSA Conference in San Francisco last week. Its purpose is to give federal agencies an opportunity to test their plans for responding to a direct or indirect attack on the computer networks that control the nation's critical infrastructure such as power plants and oil pipelines. The exercise will be unclassified, and the public will be informed, said Hun Kim, deputy director of the National Cyber Security Division at DHS. The RSA Conference brings together IT professionals from industry, academia, and government to share information and exchange ideas on technology trends and best practices in IT security.

2005-03-01 **Department Homeland Security DHS Justice DoJ Extensible Markup Language XML information exchange sharing Collaboration on Objects for Reuse and Exchange**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2005/0228/web−dhsdoj−03−01−0 5.asp

DEPARTMENTS OF HOMELAND SECURITY AND JUSTICE WORK ON XML MODEL TO HELP SHARE INFORMATION

Department of Homeland Security (DHS) and Department of Justice officials have a new partnership to enhance development of an Extensible Markup Language (XML) model that could save federal, state, local and tribal agencies billions of dollars as they improve their computer systems to share information with one another. Officials said this represents a significant step in broadening the use of the Global Justice XML Data Model, which was started about three years ago, across the federal government. It could mean future partnerships with other departments, such as Transportation and Health and Human Services, and the intelligence community, which used the model as the basis for a schema to share the terrorism watch list. XML is essentially an open standard or translator that systems can use to communicate with one another. Development of the core model would ensure long-term stability of the model and ensure that early efforts in its use are not wasted. The information-sharing initiative is called the Collaboration on Objects for Reuse and Exchange.

2005-03-18 **cybersecurity report prioritization government advisory committee vulnerabilities recommendations**

RISKS; http://www.nitrd.gov/pubs/ 23 81

PRESIDENT'S INFORMATION TECHNOLOGY ADVISORY COMMITTEE RELEASES NEW REPORT -- CYBER SECURITY: A CRISIS OF PRIORITIZATION

Vital to the Nation's security and everyday life, the information technology (IT) infrastructure of the United States is highly vulnerable to disruptive domestic and international attacks, the President's Information Technology Advisory Committee (PITAC) argues in a new report. While existing technologies can address some IT security vulnerabilities, fundamentally new approaches are needed to address the more serious structural weaknesses of the IT infrastructure.

In Cyber Security: A Crisis of Prioritization, PITAC presents four key findings and recommendations on how the Federal government can foster new architectures and technologies to secure the Nation's IT infrastructure. PITAC urges the Government to significantly increase support for fundamental research in civilian cyber security in 10 priority areas; intensify Federal efforts to promote the recruitment and retention of cyber security researchers and students at research universities; increase support for the rapid transfer of Federally developed cyber security technologies to the private sector; and strengthen the coordination of Federal cyber security R&D activities.

To request a copy of this report, please complete the form at http://www.nitrd.gov/pubs/, send an e-mail to nco@nitrd.gov, or call the National Coordination Office for Information Technology Research and Development at (703) 292-4873. Cyber Security: A Crisis of Prioritization can also be downloaded as a PDF file by accessing the link at http://www.nitrd.gov/pubs/.

About PITAC

The President's Information Technology Advisory Committee (PITAC) is appointed by the President to provide independent expert advice on maintaining America's preeminence in advanced information technology. PITAC members are IT leaders in industry and academia representing the research, education, and library communities, network providers, and critical industries, with expertise relevant to critical elements of the national IT infrastructure such as high-performance computing, large-scale networking, and high-assurance software and systems design. The Committee's studies help guide the Administration's efforts to accelerate the development and adoption of information technologies vital for American prosperity in the 21st century.

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?artic leID=159903541&t

PRESIDENTIAL COMMITTEE CRITICIZES IT INFRASTRUCTURE SECURITY

The President's IT Advisory Committee (PITAC) on Friday, March 18, released the results of a report, "Cyber Security: A Crisis Of Prioritization," criticizing the country's IT infrastructure as highly vulnerable to attack by terrorists and cybercriminals. "The IT infrastructure is highly vulnerable to premeditated attacks with potentially catastrophic effects," committee chair Marc Benioff and co-chair Edward Lazowska wrote in a February 28 letter to President Bush. This infrastructure includes the public Internet as well as power grids, air-traffic-control systems, financial systems, and military and intelligence systems, they add. The committee comprised of IT leaders and academia, makes four key recommendations to help curb security exposures and provide long-term IT infrastructure stability: increase federal support for fundamental research in civilian cybersecurity; intensify federal efforts to promote recruitment and retention of cybersecurity researchers and students at research universities; provide increased support for the rapid transfer of federally developed, cutting-edge cybersecurity technologies to the private sector; and, better federal coordination of cybersecurity R&D. DHS IAIP Daily; http://thescotsman.scotsman.com/index.cfm?id=305582005

BRITISH INTELLIGENCE WARNS OF POSSIBLE CYBER ATTACK IN UK

International terrorists are training to launch cyber-terror attacks on Britain which could cripple vital economic, medical and transport networks, the government's counter-terrorism coordinator said Monday, March 21. Sir David Omand, one of the most senior members of the British intelligence community, said surveillance of suspected al Qaeda affiliates suggests they are working to use the Internet and other electronic communications systems to cause harm. Intelligence officials say that no matter how much the state does to prepare for cyber-terrorism, a great deal will rest on the willingness of the private sector to "harden" their systems against attack. Britain has not yet experienced genuine acts of cyber-terrorism, but Sir David said intelligence chiefs are in little doubt that the country must be ready for such an attack. The authorities' greatest fears about electronic attacks relate to the more exposed networks that make up what is known as "critical national infrastructure", many of which are in civilian hands. The global nature of the Internet means the threat from cyber-attacks is equally international, forcing British agents to work closely with nations they say they would often regard with suspicion or even hostility.

DHS FAILED TO PROTECT PASSENGER DATA IN TSA'S CAPPS 2 TESTS

Richard M. Smith reported on questionable data safeguards in the DHS:

A new government report says officials in the Department of Homeland Security didn't do enough to keep airline-passenger data secure when using it to test a traveler-screening program. DHS's Inspector General says the Transportation Security Administration gathered 12 million passenger records from February 2002 to June 2003 and used most of them to test the Computer Assisted Passenger Prescreening System, or CAPPS 2, which was designed to check passenger names against government watch lists. Passengers weren't told their information was being used for testing. TSA officials shelved CAPPS 2 last year amid complaints it was an invasion of passenger privacy. The agency has replaced it with a similar system, called Secure Flight, which is being tested and is expected to debut in August.

The report raises concerns because Secure Flight ultimately will gather private information, such as names, addresses, travel itineraries and credit-card information, on anyone who takes a domestic flight. That effort could be slowed by a Government Accountability Office study due Monday which is expected to be critical of TSA's efforts to develop passenger-privacy protections.

The report said TSA "did not ensure that privacy protections were in place for all of the passenger data transfers" and noted that "early TSA and [CAPPS 2] efforts were pursued in an environment of controlled chaos and crisis mode after the Sept. 11 attacks."

Investigators also found TSA provided inaccurate information to the media about the agency's use of real passenger records for CAPPS 2 testing and wasn't "fully forthcoming" to the agency's own internal privacy officer during an investigation into the matter. "Although we found no evidence of deliberate deception, the evidence of faulty processes is substantial," investigators said.

DHS IAIP Daily; http://www.eweek.com/article2/0,1759,1782286,00.asp

CYBER-TERRORISM ANALYST WARNS AGAINST COMPLACENCY

Cyber-security and counterterrorism analyst Roger Cressey on Monday, April 4, pleaded with IT executives not to underestimate the threat of "national cyber-event" targeting critical infrastructure in the United States. During a keynote address at the InfoSec World 2005 conference, Cressey warned against discounting the danger of the Internet being used in a terrorist-related attack. "It may not be a terrorist attack, but a cyber-event is a very, very serious possibility. When it happens, it will have serious economic impact on our critical infrastructure." Cressey, who served as chief of staff to the president's Critical Infrastructure Protection Board at the White House, said there was enough evidence that U.S. enemies were actively using the Web to recruit, organize and communicate terrorism activities. Cressey, the on-air counterterrorism analyst for NBC News, said the rapid rate in which Internet security vulnerabilities was being detected only adds to the worry. Cressey used part of his keynote to call on VoIP (Voice over Internet Protocol) developers to put security on the front burner. Describing VoIP security as the great challenge of this decade, he said it would be a "big mistake" for another nascent industry to emerge without built-in protections.

DHS IAIP Daily; http://www.informationweek.com/story/showArticle.jhtml?articleID=160501384

COMMITTEE TO INFORM DHS ON PRIVACY ISSUES

A new group of public- and private-sector leaders in academia, business, and technology met Wednesday, April 6, in Washington, DC, to help the Department of Homeland Security (DHS) gain a greater understanding of how IT can be used to fight terrorism without exposing personal data to theft or abuse. The department's Data Privacy and Integrity Advisory Committee launched with a statement of mission and the selection of its inaugural chairman and vice chairwoman. Paul Rosenzweig, the committee's new chairman and a senior legal research fellow at the Heritage Foundation, said that the committee's greatest challenge will be helping the department as a whole focus on preserving individual freedoms while tightening security, and doing this in a public way. The committee will serve to inform DHS about privacy concerns related to all of the department's various agencies and directorates, which protect the nation's borders, waterways, and critical infrastructure. EU TASK FORCE TO STUDY IT CRITICAL INFRASTRUCTURE

The European Union has set up a task force to explore what its 25 member states are doing to combat cyberthreats against the region's critical infrastructure. As part of the EU's Critical Information Infrastructure Research Coordination (CI2RCO) project, announced Friday, April 15, the task force aims to identify research groups and programs focused on IT security in critical infrastructures, such as telecommunications networks and power grids. "We want to bring together experts across the European Union, learn more about their programs and how we can cooperate in curbing what we view as a global problem," said Paul Friessem, a director at the Fraunhofer Institute for Secure Information Technology (SIT), one of the organizations in the European task force. "We also intend to collaborate with experts outside the EU, in particular in the U.S., Canada, Australia and even possibly Russia." One of the problems facing the task force is convincing parties to divulge information that some governments view as critical to their national security. The task force will also ask the critical infrastructure players about their requirements. The plan is to submit an overview of the situation to the European Commission over the next few months.

DHS IAIP Daily;
http://www.infoworld.com/article/05/04/20/HNcyberpilot_1.htm l

CYBER ATTACK EARLY WARNING CENTER BEGINS PILOT PROJECT

A fledgling nonprofit group working to develop an automated cyber-attack early warning system, the Cyber Incident Detection Data Analysis Center (CIDDAC), is about to begin a pilot project to collect data on network intrusions from a group of companies in national-infrastructure industries. Backed by a grant from the Department of Homeland Security, CIDDAC has set up an operations center at the University of Pennsylvania's Institute of Strategic Threat Analysis and Response laboratory. Around 30 organizations will eventually participate in the project, although some are still being selected, according to CIDDAC Executive Director Charles Fleming. He expects to have useful data from the pilot test in about five months. CIDDAC's focus is on linking together organizations in industries such as banking, electrical power, gas and oil, telecommunications and transportation. The center will use a network of sensors, dubbed RCADSs (Real-Time Cyber Attack Detection Sensors), to gather information on intrusions and attempts. CIDDAC will also pass collected information on to law enforcement agencies, but Fleming emphasized that serving private-sector alert needs is the group's priority. CIDDAC Website: http://www.ciddac.org/

EDUPAGE; http://chronicle.com/prm/daily/2005/04/2005042101t.htm

PENN TO HEAD STUDY OF CYBERATTACKS

A new program sponsored by the Department of Homeland Security will attempt to collect real-time data on cyberattacks in the private sector, with the goal of using such data to prevent future attacks. Led by the University of Pennsylvania, the Cyber Incident Detection Analysis Center will install monitors on corporate networks. In the event of an attack on the network, the monitors, which will cost companies $10,000 annually, will transmit data to the Institute for Strategic Threat Analysis and Response at the university, where it will be analyzed and made available to researchers at other institutions. Those with access to the data will not be able to see which company it came from, and researchers will not be directly involved in prosecuting individuals responsible for cyberattacks. Charles Fleming, executive director of the center, said a pilot program will be carried out before the monitors become widely available. Chronicle of Higher Education, 21 April 2005 (sub. req'd)

DHS IAIP Daily;
http://www.infoworld.com/article/05/04/28/HNmicrochip_1.html

U.S. SEEKS GREATER MICROCHIP INDUSTRY PROTECTION

The migration of microchip production outside the U.S. poses a major threat to the nation's security and economy and the Department of Defense should take the lead in efforts to rebuild the industry at home, warns a recent report from a federal advisory committee. It points to China as a beneficiary of current trends. "From a U.S. national security view, the potential effects of this restructuring are so perverse and far reaching and have such opportunities for mischief that, had the United States not significantly contributed to this migration, it would have been considered a major triumph of an adversary nation's strategy to undermine U.S. military capabilities," says the report, from the U.S. Defense Science Board Task Force on High Performance Microchip Supply, dated February 2005. The report puts renewed emphasis on a call for revitalizing U.S. chip production in the face of its continued migration overseas, and warns that losing the manufacturing end of the chip industry ultimately puts research and development at risk since, historically, "R&D tends to follow production. 2005-05-04 **NSF cyber infrastructure plan Internet2 improving security colleges universities**

EDUPAGE; http://chronicle.com/prm/daily/2005/05/2005050401t.htm

NSF WORKING ON CYBERINFRASTRUCTURE PLAN

Arden L. Bement Jr., director of the National Science Foundation (NSF), this week told attendees of an Internet2 meeting in Virginia that the NSF is developing a plan to support development of the nation's cyberinfrastructure, including that of colleges and universities. Bement said that funding for cyberinfrastructure is "one of the most important investments of the 21st century," though the announcement was short on specifics. The NSF's Cyberinfrastructure Interim Working Group submitted a report to Bement that reportedly outlines the details of the plan, but the agency said it will not release the report until some issues are cleared up. In his comments, Bement noted that higher education in particular is in need of improvements. What he described as six-lane superhighways for data "are reduced to two-lane roads at most college and university campuses." Such "information overload," as he called it, impedes research from being conducted efficiently. Still, Bement noted that money for the NSF "is not plentiful" and that it will likely be even scarcer in the future. Chronicle of Higher Education, 4 May 2005 (sub. req'd)

2005-05-05 **US Computer Emergency Readiness Team US-CERT service expansion Department of Homeland Security**

DHS IAIP Daily; http://fcw.com/article88781−05−05−05−Web

US-CERT EXPANDS SERVICES

The Department of Homeland Security's U.S. Computer Emergency Readiness Team (US-CERT) will offer federal agencies expanded cybersecurity alerts and threat management services. Federal employees who are designated as first responders in their agencies will have greater access to advanced warnings about cyberattacks. With such early warnings, network and computer security managers often can block incoming worm or virus attacks before they cause damage or disrupt computer network services. "We're been working for some time with public- and private-sector partners to build a better understanding of what we need by way of cyber situational awareness," said Andy Purdy, acting director of the National Cyber Security Division in DHS' Information Analysis and Infrastructure Protection Directorate. Cybersecurity officials who are members of the federal Government Forum of Incident Response and Security Teams will use the new alert and threat management services, along with existing government and commercial services, to protect federal agency networks and computer systems.

2005-05-09 **Department Homeland Security secure network installation issue**

DHS IAIP Daily;
http://www.washingtontechnology.com/news/1_1/daily_news/2616 1−1.html

DHS SECURE NETWORK WAS RUSHED.

The Department of Homeland Security's (DHS) $337 million network for sharing top-secret data was developed in a rush, and as a result is inadequate and does not meet the needs of its users, according to a new report by the department's Acting Inspector General Richard L. Skinner. Department officials developing the Homeland Security Secure Data Network (HSDN) hurried to finish the job in nine months because they believed they would be cut off from the Pentagon's secure data network by a December 31, 2004 deadline, the inspector general (IG) said. The IG report stated, "…the methods for collecting and documenting the functional and security needs of users during the requirements definition phase for the new network did not provide adequate assurance that user needs at the 600 sites will be met." The 600 sites referred to are DHS intelligence gathering units and federal, state and local agencies involved in homeland security. The inspector general is recommending that all system users be involved in defining its requirements in the future, and that completion of all testing be verified before deployment. Inspector General's Report: http://www.dhs.gov/dhspublic/interweb/assetlibrary/OIG_05-19 _Apr05.pdf

2005-05-18 **survey Homeland Security information technology IT initiative complete**

DHS IAIP Daily;
http://www.washingtontechnology.com/news/1_1/daily_news/2619 9−1.html

SURVEY: HOMELAND SECURITY IT INITIATIVES NEARLY COMPLETED

Most homeland security IT initiatives may be near completion for federal agencies governmentwide, according to the new 2005 Federal IT Marketing Report published by Market Connections Inc. The findings are based on a survey of 600 federal IT professionals, including 181 from Defense agencies, 44 from the Department of Homeland Security and 375 from other civilian agencies. Anti-terrorism IT projects appear to be in the final stages. Forty-six percent of the respondents said they had completed at least 75 percent of their homeland security IT initiatives. The five most important homeland security IT initiatives reported were IT security, physical security, disaster recovery, threat assessments and threat response. The least important IT initiatives were information-sharing with the public, support of state and local agencies, information-sharing between agencies and adapting existing technology, the report said. 2005-05-26 **GAO report DHS unprepared computer cybersecurity**

EDUPAGE; http://news.com.com/2100-7348_3-5722227.html

GAO SAYS DHS UNPREPARED FOR CYBERSECURITY

The Government Accountability Office (GAO) has issued a report strongly critical of the readiness of the Department of Homeland Security (DHS) to deal with threats to the nation's cybersecurity. According to the report, DHS "has not fully addressed any" of 13 areas of cybersecurity, including bot networks, criminal gangs, foreign intelligence services, spammers, and spyware. "DHS cannot effectively function as the cybersecurity focal point intended by law and national policy," said the authors of the report. During the past year, DHS has seen the departure of a number of high-level officials, including the director and deputy director of Homeland Security's National Cyber Security Division, the undersecretary for infrastructure protection, and the assistant secretary responsible for information protection. A representative of DHS refuted the GAO's findings, saying that DHS has made improvements to the "nation's cybersecurity posture." He noted that DHS, as a new federal agency, measures progress in nonquantitative, less formal ways. CNET, 26 May 2005

2005-05-26 **Government Accountability Office GAO critical infrastructure protection DHS report**

DHS IAIP Daily; http://www.gao.gov/new.items/d05434.pdf

CRITICAL INFRASTRUCTURE PROTECTION: DEPARTMENT OF HOMELAND SECURITY FACES CHALLENGES IN FULFILLING CYBERSECURITY RESPONSIBILITIES (REPORT)

GAO was asked to determine (1) DHS's roles and responsibilities for cyber critical infrastructure protection, (2) the status and adequacy of DHS's efforts to fulfill these responsibilities, and (3) the challenges DHS faces in fulfilling its cybersecurity responsibilities. DHS established the National Cyber Security Division to take the lead in addressing the cybersecurity of critical infrastructures. While DHS has initiated multiple efforts to fulfill its responsibilities, it has not fully addressed any of the 13 responsibilities, and much work remains ahead. DHS established the US-CERT as a public/private partnership to make cybersecurity a coordinated national efforts. However, DHS has not yet developed national cyber threat and vulnerability assessments or government/industry contingency recovery plans for cybersecurity, including a plan for recovering key Internet functions. DHS faces a number of challenges which include achieving organizational stability, gaining organizational authority, overcoming hiring and contracting issues, increasing awareness about cybersecurity roles and capabilities, establishing effective partnerships with stakeholders, achieving two-way information sharing with these stakeholders, and demonstrating the value DHS can provide. Until it confronts and resolves these underlying challenges and implements its plans, DHS will have difficulty achieving significant results in strengthening the cybersecurity of our critical infrastructures. 2005-05-31 **FBI DHS Homeland Security cell phones airplane objection anti-terrorism FCC**

DHS IAIP Daily; http://news.zdnet.com/2100−1035_22−5726850.html

FBI AND DHS OBJECT TO CELL PHONES ON AIRPLANES

The FBI and Department of Homeland Security (DHS) are objecting to a proposal to permit the use of cellular telephones and other wireless devices on airplanes. Unless telecommunications providers follow a lengthy list of eavesdropping requirements for calls made aloft, the FBI and DHS don't want cellular or wireless connections to be permitted. In a letter to the Federal Communications Commission (FCC) sent last Thursday, May 26, the police agencies said any rule permitting "in-flight personal wireless telephone use must consider public safety and national security" concerns. At the moment, technical and social reasons keep cell phones muted during flight. The FCC is considering proposals to relax those restrictions The FBI and DHS say that the 1994 Communications Assistance for Law Enforcement Act, or CALEA, requires that airlines follow strict wiretapping guidelines. The police agencies, for instance, want to be able to eavesdrop on conversations no "more than 10 minutes" after the call is made. "There is a short window of opportunity in which action can be taken to thwart … crisis situations onboard an aircraft, and law enforcement needs to maximize its ability to respond to these potentially lethal situations," the agencies say in their letter. Letter to FCC: http://www.askcalea.com/docs/20050526_doj_fcc-wt-04-435.pdf

DHS IAIP Daily; http://www.dhs.gov/dhspublic/display?content=4532

IDAHO NATIONAL LABORATORY RECEIVES SECOND ROUND OF HOMELAND SECURITY FUNDING FOR CYBER THREAT REDUCTION PROGRAM

The U.S. Department of Energy's Idaho National Laboratory (INL) received a second round of funding this week from U.S. Department of Homeland Security to continue a multi-year cyber security program. The Control System Security Center will receive $11.7 million in 2005 to continue its efforts to secure the computer-aided control systems that operate the nation's critical infrastructures. Control systems are the digital automation systems that operate infrastructures such as the electric power grid, oil and gas refineries, and telecommunication systems. "This year we plan to focus our efforts on establishing baseline security assurance levels and cyber recommendations to increase industry security," said Julio Rodriguez, INL department manager for Critical Infrastructure Assurance. "We're at the point where industry is beginning to recognize the potential threats of unsecured control systems and they are more willing to work with government agencies to improve the security of the nation' s critical infrastructures." The Department of Homeland Security selected INL for this project because of its expertise in design, assessments and operational management of control systems across several industrial sectors.

2005-06-09 **DHS lacking disaster backups TSA Coast Guard insufficient money management**

DHS IAIP Daily; http://www.nytimes.com/2005/06/09/politics/09home.html

INTERNAL AUDIT FINDS DHS IS LACKING DISASTER BACKUPS

An internal inspector general audit released on Wednesday, June 8, concluded the computer systems at 19 Department of Homeland Security (DHS) sites that served agencies like the Transportation Security Administration, Customs and Border Protection and the Coast Guard had no functioning backups or relied on obviously deficient or incomplete backups. Even the Federal Emergency Management Agency, which is in charge of disaster recovery, was unprepared, the report said. The department "must be able to provide mission-essential services with minimal disruption following a disaster," the report said. Adequate backups were lacking for networks that screen airline passengers, that inspect goods moving across borders and that communicate with department employees and outside officials. Those same agencies, the auditors found, have in most cases failed to prepare sufficiently written disaster recovery plans that would guide operations if a main office or computer system was knocked out. The problems, the audit said, are insufficient money and insufficient management attention. "We recognize that information-technology continuity is important to lead an effective recovery, which is why we are developing a plan to ensure critical systems continuity," a spokesperson, Brian Roehrkasse, said. EDUPAGE; http://www.theregister.com/2005/06/13/us_bio_passports/

U.S. EXPECTED TO DITCH BIOMETRIC PASSPORT REQUIREMENT

Government officials in the United Kingdom are optimistic that the United States will withdraw an upcoming requirement that individuals traveling under the Visa Waiver program have biometric passports. The program allows people from 27 countries to make short visits to the United States without a visa. The U.S. Department of Homeland Security had issued a ruling that participants in the Visa Waiver program would be required to have biometric identifying information added to their passports by October 2004, which was extended to October 2005. Officials in Ireland have put on hold their efforts to comply with the regulation, believing that U.S. officials have come to see the technology as sufficiently unreliable to compel its use by this fall. Critics of biometric technology also point to the possibility that such information could be used to violate individuals' civil liberties. The Register, 13 June 2005

RETAILERS JOIN HOMELAND SECURITY INFORMATION NETWORK

Retailers are among the industry groups being invited to join a recent incarnation of the federal Homeland Security Information Network (HSIN) specifically intended for critical infrastructure owners and operators and designed to help share unclassified information to guard against terrorist attacks. The National Retail Federation (NRF) has recruited executives from nearly 100 retail companies to participate in the network, called HSIN-CL, the trade group said in a press release. The information network is a composite of several regional networks that share information among law enforcement, fire departments, local government agencies and businesses. Technologies used within the network include wired and wireless telephones, e-mail, facsimiles, and text pagers to share alerts and notifications. The network sends real-time information to its members, may be used "to discuss day-to-day security issues" and "to share information on suspicious activities with federal authorities" according to the NRF release. Other industry sectors, including the chemical industry, ports and financial services, are expected to participate in the HSIN-CL as well. LEOs MONITOR READING MATERIALS

Law enforcement officials have made at least 200 formal and informal inquiries to libraries for information on reading material and other internal matters since October 2001, according to a new study that adds grist to the growing debate in Congress over the government's counterterrorism powers. In some cases, agents used subpoenas or other formal demands to obtain information like lists of users checking out a book on Osama bin Laden. Other requests were informal -- and were sometimes turned down by librarians who chafed at the notion of turning over such material, said the American Library Association, which commissioned the study. 2005-07-19 **GAO Infrastructure Protection DHS summarize work status challenges cybersecurity recommendations**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/36434−1.html

CRITICAL INFRASTRUCTURE PROTECTION: CHALLENGES IN ADDRESSING CYBERSECURITY (TESTIMONY)

The Homeland Security Act of 2002 and federal policy established the Department of Homeland Security (DHS) as the focal point for coordinating activities to protect the computer systems that support our nation's critical infrastructures. GAO was asked to summarize previous work, focusing on (1) DHS's responsibilities for cybersecurity-related critical infrastructure protection (CIP), (2) the status of the department's efforts to fulfill these responsibilities, (3) the challenges it faces in fulfilling its cybersecurity responsibilities, and (4) recommendations GAO has made to improve 13 cybersecurity of our nation's critical infrastructure. While DHS has initiated multiple efforts to fulfill its responsibilities, it has not fully addressed any of the 13 responsibilities, and much work remains ahead. The department established the US-CERT as a public/private partnership to make cybersecurity a coordinated national effort, and it established forums to build greater trust and information sharing among federal officials with information security responsibilities and law enforcement entities. However, DHS has not yet developed national cyber threat and vulnerability assessments or government/industry contingency recovery plans for cybersecurity, including a plan for recovering key Internet functions.

DHS TO MOUNT MAJOR IT SECURITY EXERCISE

The Department of Homeland Security plans to conduct a major cybersecurity preparedness and response exercise to be called Cyber Storm in November, a department official said in congressional testimony Tuesday, July 19. Andy Purdy, acting director of DHS' National Cyber Security Division (NCSD), described Cyber Storm as "a national exercise" during a hearing of the Senate Homeland Security and Governmental Affairs Subcommittee on Federal Financial Management, Government Information and International Security. According to written testimony Purdy presented, the division has worked with the Justice and Defense departments to help form the National Cyber Response Coordination Group (NCRCG). "The NCRCG has developed a concept of operations for national cyber incident response that will be examined in the National Cyber Exercise, Cyber Storm, to be conducted by NCSD in November 2005 with public and private-sector stakeholders."

EDUPAGE; http://news.zdnet.com/2100-1009_22-5814289.html

DHS URGES INDUSTRY TO USE LAW TO IMPROVE SECURITY

Following the terrorist attacks of September 2001, Congress passed a law designed to encourage private-sector research into security technology, but so far, relatively few companies have taken advantage of the law, according to the Department of Homeland Security (DHS). Michael Chertoff, secretary of DHS, said that despite the provisions of the Support Anti-Terrorism by Fostering Effective Technologies (SAFETY) Act of 2002, which shields approved companies from civil litigation if their technologies fail to perform, only 17 products and services have earned the law's highest level of protection. None of the 17 specifically focuses on information technology security. To increase the nation's security infrastructure, said Chertoff, "we have to look beyond the walls of DHS itself, to the private sector and to the world of high tech." Chertoff pointed to technologies currently used to screen airline passengers as one area that needs attention, saying that current screening is at a "basic, primitive" stage. ZDNet, 1 August 2005

DHS IAIP Daily; http://www.techweb.com/wire/security/167100173#_

TERRORISTS COPYING HACKER TACTICS.

Cyber-terrorists are trying to break into government networks around the world using the same tactics as run-of-the-mill hackers, a U.S. State Department official said Tuesday, August 2. "The same technique that a hacker would use, the same technology, will be utilized by somebody with a different political motivation," Michael Alcorn, branch chief of the State Department's Office of Anti-Terrorism Assistance, in a statement made to the AFP wire service in Kuala Lumpur on Tuesday. The Office of Anti-Terrorism Assistance trains foreign law enforcement personnel on a variety of terrorism-related topics, including cyber-security. "The problem we're all facing is a global borderless problem, where attacks can occur anywhere in the world and originate from anywhere else in the world," Alcorn told the AFP. He went on to say that cyber-security problems and resulting terrorist activity was widespread, and claimed that some of the evidence of attacks has come from overseas law enforcement agencies which have confiscated militants' computers. "They're finding evidence on these computers that indicates militants have looked into or are researching this type of technology," Alcorn said.

2005-08-03 **DHS SAFETY Act anti-terrorism civil lawsuit immunity**

DHS IAIP Daily; http://news.zdnet.com/2100−1009_22−5814289.html

DHS CALLS FOR TECH INDUSTRY INVOLVEMENT

Support Anti-Terrorism by Fostering Effective Technologies (SAFETY) Act of 2002 provides government-authorized companies with immunity from civil lawsuits if their anti-terrorism products fail to perform. In order to get on the approved list, companies must first go through a two-step application process. But only 17 offerings -- none related to information technology -- have received such approval. In a speech at the Commonwealth Club in Santa Clara, CA, Thursday, July 29, Department of Homeland Security (DHS) Secretary Michael Chertoff said the newly created position of assistant secretary for Cyber and Telecommunications Security would be in charge of stepping up the government's collaboration with tech companies. So far, none of the approved services pertain specifically to information technology security. The latest technology to make the list was a cargo container inspection system for use at ports. DHS is eyeing technological advances to beef up border enforcement, emergency preparedness, transportation and cybersecurity, Chertoff said. "But there is a way forward," Chertoff said, pointing to high-tech biometric identifiers and radio frequency identification tags as potential new avenues for screening. A transcript of Secretary Chertoff's remarks is available on the DHS Website: http://www.dhs.gov/dhspublic/display?content=4700 More about the SAFETY Act of 2002: https://www.safetyact.gov/DHS/SActHome.nsf/Main?OpenFrameset &6EWVEC

2005-08-11 **DHS report private vendor domestic security improvement businesses**

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 ,10801,103827,00.html

BUSINESSES NEED TO FOCUS ON CYBERSECURITY

The Department of Homeland Security (DHS) will focus significant efforts on cybersecurity and on working with private vendors to develop technologies designed to provide domestic security in the coming months, DHS Secretary Michael Chertoff said Wednesday, August 10. Chertoff, speaking at the InfraGard National Conference in Washington, DC, also called on private companies to make more of an effort to protect their cyberinfrastructures. He also said more incentives are needed for IT vendors to focus on cybersecurity. InfraGard is an organization started by the FBI to improve information sharing about critical infrastructure between the U.S. government and private industry. One incentive for private companies to develop cybersecurity products would be to institute legal reforms that limit damages from product lawsuits, Chertoff said. As an example, he cited the Support Anti-terrorism by Fostering Effective Technologies Act of 2002, which limits liability for products designed to combat terrorism. But he said Congress should go further in protecting companies from product lawsuits. However, private companies should already have good reasons to protect their infrastructures, he said. "In today's threat environment, active security measures are critical to businesses themselves, because the cost of an attack will very, very greatly outweigh the cost of protection." CIOs WARN CONGRESSIONAL COMMITTEE OF CRITICAL INFRASTRUCTURE VULNERABILITIES

On Sep 15, 2005, CIOs of several major US corporations warned the House Science Committee "the nation's critical infrastructure remains vulnerable to cyber attack. The witnesses said the economy is increasingly dependent on the Internet and that a major attack could result in significant economic disruption and loss of life."

….

"Urging action to address this vulnerability, the witnesses advocated increased funding for cybersecurity research and development (R&D) and greater information sharing between industry and government and among various sectors of industry. Witnesses also urged greater federal attention to cybersecurity and praised the creation of an Assistant Secretary for Cybersecurity at the Department of Homeland Security (DHS)."

….

>[Mr. John Leggate, Chief Information Officer, British Petroleum Inc.] testified that an informal survey earlier this year found that executives in the telecommunications, energy, chemical, and transportation sectors estimated that about 30 percent of their revenue depends directly on the Internet. He also said that, because of interdependency among various industry sectors, a single attack could reverberate throughout the global economy: "These cascading dependencies all too quickly create 'domino effects' that are not obvious to the corporate customer or the policymaker."<

DHS IAIP Daily; http://www.securityfocus.com/news/11351

U.S. MAKES SECURING SCADA SYSTEMS A PRIORITY

Wary of the increasing number of online attacks against industrial control systems, the U.S. government has stepped up efforts to secure the systems used to control and monitor critical infrastructure, such as power, utility, and transportation networks. Andy Purdy, acting director of the National Cyber Security Division at the Department of Homeland Security (DHS), stated, "The exposure of these systems to malicious actors in cyberspace is greater than in the past, because these systems are more often connected to the Internet. With the profit margins of many of the owners and operators, it is a challenge to convince them to spend to reduce the risk." DHS has become increasingly concerned over the lack of security of such control networks -- among which the best known is the supervisory control and data acquisition (SCADA) system -- because the majority of such control systems are owned by private companies and are increasingly being interconnected to improve efficiency.

DHS'S INSPECTOR GENERAL AUDITS IT SYSTEMS

An audit by the Department of Homeland Security's inspector general, Richard L. Skinner, found that many of the department's IT systems remain uncertified and unaccredited, while plans to correct weaknesses are undeveloped. The report also said contingency plans have not been developed and tested for all systems, and added that tools used to measure progress are neither complete nor current. "We recommend that DHS continue to consider its information security program a significant deficiency for [fiscal] 2005," the report concluded. DHS officials agreed with the recommendations and, according to the report, have developed remediation plans for fiscal 2006. Skinner evaluated DHS' compliance with the Federal Information Security Management Act of 2002, which focuses on program management, implementation and evaluation of the security of unclassified and national security IT systems. The department has made progress on several fronts, including developing so-called Plans of Action and Milestones, as well as a Trusted Agent FISMA tool to collect and track data related to FISMA compliance. DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/37654−1.html

AGENCIES MUST MONITOR INSIDER NETWORK THREATS, EXPERT SAYS

Agency networks are more vulnerable than ever, according to a former Central Intelligence Agency (CIA) official and cybersecurity expert, and the greatest threat to an organization's network security may come from within. Eric Cole, who worked for the CIA for more than five years, told an audience of government and corporate security professionals Monday, November 28, at the inaugural Techno Forensics Conference at the National Institute of Standards and Technology that despite their best efforts, networks are only getting more porous. Cole said an emerging threat for organizations is that the emphasis on thwarting outside attacks and tracing their origins has led them to overlook the insider threat. In several recent cases, organizations conducted preliminary forensic examinations after network incidents and identified employees as being responsible. Aside from network insecurity, Cole said agencies need to have standardized procedures for computer forensics. A lack of standardized procedures for computer forensics, he warned, will jeopardize organizations' abilities to use forensic examinations at trial.

2005-12-02 **DHS software vulnerability flaw database grading system**

DHS IAIP Daily; http://www.securityfocus.com/news/11360

FEDERAL FLAW DATABASE COMMITS TO GRADING SYSTEM

A federal database of software vulnerabilities funded by the U.S. Department of Homeland Security has decided on a common method of ranking flaw severity and has assigned scores to the more than 13,000 vulnerabilities currently contained in its database, the group announced last week. The National Vulnerability Database (NVD), unveiled in August, completed its conversion over to the Common Vulnerability Scoring System (CVSS), an industry initiative aimed at standardizing the severity rankings of flaws. The CVSS gives vulnerabilities a base score based on their severity, a temporal score that measures the current danger -- which could be lessened by a widely available patch, for example -- and an environmental score that measures an organization's reliance on the vulnerable systems. The move to the CVSS gives the flaw-ranking initiative a major boost. Created by security researchers at networking giant Cisco, vulnerability management software provider Qualys and security company Symantec, the CVSS has not been used widely, though many companies are considering scoring flaws with the system. To date, no software vendor has yet graded vulnerabilities in its product using the CVSS.

DHS IAIP Daily; http://news.com.com/Homeland+Security+helps+secure+open 23
−sour ce+code/2100−1002_3−6025579.html?tag=nefd.lede

DEPARTMENT OF HOMELAND SECURITY HELPS SECURE OPEN-SOURCE CODE

The U.S. Department of Homeland Security (DHS) is extending the scope of its protection to open-source software. Through its Science and Technology Directorate, DHS has given $1.24 million in funding to Stanford University, Coverity and Symantec to hunt for security bugs in open-source software and to improve Coverity's commercial tool for source code analysis. The DHS grant will be paid over a three-year period, with $841,276 going to Stanford, $297,000 to Coverity and $100,000 to Symantec. In the effort, which the government agency calls the "Vulnerability Discovery and Remediation, Open Source Hardening Project," Stanford and Coverity will build and maintain a system that does daily scans of code contributed to popular open-source projects. The automated system should be running by March, and the resulting database of bugs will be accessible to developers, they said. Symantec will provide security intelligence and test the source code analysis tool in its proprietary software environment, said Brian Witten, the director of government research at the Cupertino, CA, security software vendor. The list of open-source projects that Stanford and Coverity plan to check for security bugs includes Apache, BIND, Ethereal, KDE, Linux, Firefox, FreeBSD, OpenBSD, OpenSSL. and MySQL, Coverity said.

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/38026−1.html 23

DEPARTMENT OF HOMELAND SECURITY GRANT KIT OFFERS CYBERSECURITY GUIDANCE

The Department of Homeland Security's (DHS) new preparedness unit is urging state governors to prepare cybersecurity plans, adopt a new national XML-based model for information-sharing and implement newly developed common rules for geospatial content. The recommendations are some of the most detailed that the federal government has made to state and local governments on using IT in the fight against terrorism. The IT-related guidance is included in the fiscal 2006 grant application kit for the distribution of $3.9 billion in federal homeland security grants to states and localities this year, published by the preparedness directorate. Cybersecurity guidance was attached as an appendix for the first time. Guidelines for topics to be included in the cyberplans are somewhat open-ended. Recommendations cover about two-dozen questions related to policy, training, IT deployment and vulnerability. In addition, DHS is recommending that states, local and tribal government adopt geospatial data guidelines developed by the Information Content Subgroup of the Federal Geographic Data Committee Homeland Security Working Group in October 2005.

2006-01-24 **DHS privacy national database critical infrastructure information**

DHS IAIP Daily; 23
http://www.washingtontechnology.com/news/1_1/homeland/27812−1.html

DHS VOWS TO PROTECT INFO ON NATIONAL DATABASE.

The Department of Homeland Security (DHS) has stepped up assurances that it will maintain the confidentiality of critical infrastructure information submitted to the National Asset Database, according to the newly revised draft National Infrastructure Protection Plan (NIPP) Base Plan version 2.0. DHS will evaluate all requests to view the database and will grant access only to select DHS employees and others on a "tightly controlled, need-to-know" basis, the revised plan states. The new language is set forth in the 234-page NIPP distributed by DHS this week. The plan was delivered by e-mail via NIPP@dhs.gov. The plan establishes a work and time frame for assessing vulnerabilities and risks and coordinating protections for 17 critical infrastructure sectors, including IT and telecommunications. Cybersecurity is treated as a cross-sector responsibility. DHS' assurances about database access appear to address concerns raised by IT executives and others over protecting confidentiality of the information they might submit on specific vulnerabilities within their sectors. One fear raised by IT industry members is that disclosing weak spots in their own networks may result in leaks that can be exploited by competitors.

2006-01-27 **AT&T disaster recovery exercise Dallas**

DHS IAIP Daily; http://www.physorg.com/news10220.html 23

AT&T TO CONDUCT DISASTER EXERCISE.

AT&T will conduct its largest-ever network disaster recovery exercise in Dallas, TX, on Wednesday, February 8, the company said Wednesday, January 25. The telecommunications group said that self-contained equipment trucks will test and evaluate how well the company can support services in the event of a disaster. A total of 43 trailers will be used for the latest exercise in the Dallas-Fort Worth area. AT&T said it has invested over $300 million in its network disaster recovery program, which includes engineers and technicians across the country. The team has been activated 21 times since 1990, including responding to Hurricanes Katrina and Rita last year, the San Diego wildfires in 2003 and the September 11, 2001, attacks in New York City.

DHS IAIP Daily; 23
http://www.washingtontechnology.com/news/1_1/daily_news/2787 7−1.html

DHS, AGENCIES PLAN JOINT CYBER STORM EXERCISE.

The Department of Homeland Security (DHS) will test how well it works with other federal agencies and private IT companies to protect cybersecurity in a national exercise from February 6-10. The Information Technology Information-Sharing and Analysis Center will take part in the exercise, known as "Cyber Storm," with DHS to test its draft concept of operations for responding to cybersecurity incidents. Participating in Cyber Storm are Cisco Systems Inc., Citadel Security Software Inc., Computer Associates International Inc., Computer Sciences Corp., Intel Corp., Microsoft Corp., Symantec Corp., and VeriSign Inc., the center announced on its Website. Cyber Storm also will involve government agencies. According to Donald Purdy, acting director of DHS' National Cyber Security Division, the division established the Government Forum of Incident Response and Security Teams (GFIRST) to facilitate interagency information sharing and cooperation for readiness and response. The teams, comprising government computer experts, are responsible for IT security at government agencies. In addition to the GFIRST teams, the agency has worked with the Defense and Justice departments to form the National Cyber Response Coordination Group to provide an organized federal response to cybersecurity breaches.

EDUPAGE; http://www.wired.com/news/technology/0,70198-0.html 23

TSA CALLS FOR AUDIT OF SECURE FLIGHT PROGRAM

The federal government's Secure Flight program has suffered another setback, this time from Kip Hawley, head of the Transportation Security Administration (TSA). Hawley told Congress that he has ordered a "comprehensive audit" of the program, though he did not say what prompted his decision. The program is intended to increase airline security by checking the names of all passengers against watch lists, a task currently carried out by airlines. Under the Secure Flight program, the federal government would assume that responsibility. Critics of the program point to its cost--$200 million over four years--noting that even last month Hawley said the TSA still was not entirely sure how it would work. They also have complained about privacy concerns of the program and routine mistakes that airlines reportedly make in checking passenger names against watch lists.

DHS IAIP Daily; http://www.ebcvg.com/press.php?id=2071 23

DOJ ANNOUNCES NATIONAL COMPUTER SECURITY SURVEY.

The Department of Justice (DoJ) announced plans Friday, February 10, to conduct the first-ever national survey to measure the prevalence and impact of cybercrime on businesses within the United States. The survey, conducted by DoJ's Bureau of Justice Statistics and the Department of Homeland Security's National Cyber Security Division, will estimate the number of cyber attacks, frauds and thefts of information and the resulting losses during 2005. The survey, which will start this month and will be completed by the end of the year, will provide critical information for businesses, industry, government and other users to make more informed decisions about how to target resources to fight cybercrime. The comprehensive survey will collect information from a wide range of industry sectors. Currently no national baseline measure exists on the extent of cybercrime. The survey data will enable the federal government to assess what needs to be done to reduce computer security vulnerabilities and will provide the first official national statistics on the extent and consequences of cybercrime among the country's 5.3 million firms with salaried employees.. Additional details about this survey:

DHS IAIP Daily; http://www.techweb.com/wire/security/180202527 23

CHERTOFF SAYS IT WEAKNESSES HURT KATRINA RESPONSE.

Department of Homeland Security Secretary Michael Chertoff took responsibility for the poor response to Hurricane Katrina Wednesday, February 15, but he also blamed the department's inability to conduct surveillance, communicate efficiently, track shipments, and handle Web traffic. Testifying before the U.S. Senate Committee on Homeland Security and Governmental Affairs, Chertoff said the Department of Homeland Security and the Federal Emergency Management Agency need interoperability, hardened communications, a tracking system for shipments, improved surveillance resources, upgraded software and better hardware. Without hardened communications equipment, leaders could not obtain the information they need to make proper decisions during disasters, Chertoff said. Improvements are underway, but the department has to come up with agreements for supply chain management and real-time monitoring, Chertoff said. Chertoff's remarks:

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,124741,00.asp# 23

FBI DIRECTOR: CYBER THREATS FLUID AND FAR REACHING.

Hacker hunters need to develop new techniques to take on the latest generation of sophisticated and well-organized cyber criminals, FBI Director Robert Mueller told attendees of the RSA Conference 2006 on Wednesday, February 15. In particular, Mueller said in a keynote address, the FBI must work with corporations and international law enforcement to help combat online criminal acts that are seldom reported. "Increasingly our cyber threats originate outside of the United States," he said. "The once-clear divisions of jurisdiction and responsibility between agencies [and nations]...have been rendered obsolete by the fluid and far-reaching nature of today's threats." The FBI now has more flexibility to work with international law enforcement and is helping build relationships with those foreign agencies by putting operatives "on the ground" in countries that may be hotbeds for cybercrime, according to Steven Martinez, the deputy assistant director for the FBI's Cyber Division, who spoke after Mueller.

2006-02-16 **FBI Director Mueller call partnerships fighting cyber crime**

EDUPAGE; http://www.fcw.com/article92354-02-16-06-Web 23

FBI DIRECTOR CALLS FOR MORE PARTNERSHIPS

Speaking at the RSA Conference this week, FBI Director Robert Mueller called for more partnerships among law enforcement agencies, the private sector, and colleges and universities. Mueller characterized cyberspace as a "largely unprotected frontier with seemingly limitless opportunity," noting that much of that opportunity is exploited by criminals. He said the changing landscape of technology infrastructure makes traditional jurisdictional boundaries obsolete. The FBI now includes a division created in 2002 that focuses exclusively on cybersecurity, and each of the bureau's 56 field offices includes a squad that deals with computer crimes. The FBI has a number of existing programs coordinated with private-sector organizations, but those partnerships need to expand, Mueller said.

2002-04-22 **information warfare infowar asymmetrical communications consolidation cooperation hardening networks**

Security Wire Digest 4 31

*ARMY UNITS JOIN FORCES IN IT NETWORK DEFENSE
By Cheryl Balian

The U.S. Army's institutional and tactical divisions, as well as other defense agency partners, are stepping up plans to develop a fully consolidated and more secure computer network.

Military units such as the Space and Missile Defense Command, the Defense Information Systems Agency, and the U.S. Army Signal Command are making the changeover, entitled "The Mannheim Project," a priority as part of a larger information technology merger. The centralized network is designed to provide increased security against asymmetrical warfare that may target the Department of Defense's (DoD) information systems.

"Much greater collaboration is needed," says Lt. Gen. Robert W. Noonan, Jr., the Army's deputy chief of staff for intelligence. The technological framework of government and military agencies like the DoD is considered a ripe target for attacks that could target anything from tactical and personnel information to the network's structure, he adds.

One of the first stages of this informational movement is occurring at the Army Signal Command, which is transforming its operations and will become known as the Network Enterprise Technology Command (Netcom). Netcom will be charged with overseeing and managing day-to-day operations for all of the Army's IT systems and networks. Netcom will also provide regular situation reports to the Army's CIO beginning May 1, but formally launches in October.

One expert cites private industry as a useful role model for securing military and government IT systems, because large companies tend to operate under a framework of free-flowing information and interoperability.

"(The military) should tap into that," said Gilman Louie of In-Q-Tel, a venture capital vehicle established by the Central Intelligence Agency. "They are going to have to deal with industry anyway if they're going to face asymmetrical warfare." Louie stressed that the Army needs to take advantage of the IT processes--including the information sharing model--and infrastructure established by the corporate world to maximize security.

WHAT IS NRO?
NRO, or National Reconnaissance Office, was mentioned in Stephen and Chey Cobb's "Safe & Sound in the Cyber Age" column in NewsScan the other day, and some of readers asked for more information about it. Here is Stephen's elaboration on the topic: Although many Americans have never heard of it, the NRO is probably the biggest of all the U.S. intelligence agencies in terms of dollars spent. Until the '90s the government repeatedly denied the existence of the NRO, which was established by Eisenhower. Some people think the agency would still be secret today if it had not decided to build a very visible $300-million headquarters on the edge of Dulles airport. Serving as the collector of intelligence data, via satellites, spy planes, and other means, the NRO does not have as many direct employees as the slightly better known National Security Agency (with 20,000 workers, the NSA is the largest employer in Maryland). And the NRO budget, publicly listed at $6 billion per year, appears to be less than that of the NSA. But a lot of NSA/CIA/USAF personnel actually work at the NRO, together with a huge band of contractors. And the director of the NRO just happens to control the Pentagon's $68-billion space budget. Remember when a Titan 4 rocket exploded shortly after launch from Cape Canaveral in 1998? The NRO satellite it was carrying was reported to be worth $1 billion. That was only one of many such, not to mention planes, drones, etc. They all generate huge amounts of traffic requiring highly complex networks and massive computing power to handle and digest. Chey Cobb worked on securing those networks and computers. Note that all of the above is unclassified. Here are links to 2 views of the agency: Official: http://www.nro.gov/index1.html Unofficial:
http://www.fas.org/irp/eprint/thompson.html Also note that the unofficial view, while generally critical of the agency, points out recent advances in security as one area of improvement.

PENTAGON TO SUPPLY COMBAT VIDEOPHONES
In an effort to counter hostile propaganda, the Pentagon plans to equip public-affairs officers with two-way videophones, enabling them to set up on-the-spot video interviews with frontline military commanders. The $27,000 Austrian-made Scotty Tele-Transport videophones come in a rugged briefcase that cradles a laptop computer with video-editing and recording capability and includes a built-in camera, a keyboard and a pair of collapsible satellite dish antennas. Television networks have begun using such equipment extensively in the past year, and the Department of Defense and U.S. intelligence agencies already own similar devices. "They have these systems, but they hadn't thought about using it in this kind of way," says Lt. Col. David Lamp, a spokesman for the U.S. Joint Forces Command. "We're finally getting a realization in the world that information is power." Instead of sitting quietly while enemy forces broadcast claims that U.S. forces have bombed a hospital or distributed poisoned emergency food rations to refugees, as happened in Afghanistan, "the best thing to do is to try to manage it, to use it. Commanders who don't do that, or leaders who don't do that, they usually end up learning the hard way." (AP 22 Jan 2003)

2003-02-10 **Department of Defense DOD US computer network attack CNS task force**

NIPC/DHS

February 07, Federal Computer Week — DOD plans network attack task force.

The Defense Department is planning to form a joint task force focused solely on computer network attack (CNA) as part of the ongoing reorganization of U.S. Strategic Command (Stratcom). Stratcom recently acquired oversight of DOD's information operations and global command, control, communications, computer, intelligence, surveillance and reconnaissance (C4ISR) capabilities. Currently, Stratcom's Joint Task Force-Computer Network Operations is charged with defending all DOD networks from attack, as well as initiating cyberattacks when instructed by the president or Defense secretary. However, Stratcom's reorganization also will result in splitting the JTF-CNO into two separate task forces - one focused on computer network defense, and the other on CNA, according to DOD officials. A DOD spokesman said that CNA is "bound by largely the same rules that apply to any war strategy or tactic - very clear rules of engagement (ROE) will prove necessary. "All pieces of the enemy's system of systems that are valid military targets have been - and will be - on the table as we go about war planning," the spokesman said. "It is unimportant whether we take out a computer center with a bomb or a denial-of-service program. If it's critical to the enemy and we go to war, it will be in our sights."

E-MAIL GOES TO WAR
E-mail is a great morale-booster for military personnel, but military historian Keith Eiler worries that "the volume of message traffic can be very dangerous. It's a potentially serious problem and not one that is easily solved." There are fears that enemy forces could obtain a soldier's message home and find ways of misusing it. But though some military advisors have discussed ways of clamping down on personal e-mail from the front lines, Army chief information officer Lt. Gen. Peter M. Cuviello says: "We have not had a problem in Bosnia, Kosovo, Sinai, East Timor, or Korea in recent times, so I don't expect there is going to be a problem," and an Army spokesman in Qatar says, "There are no restrictions on e-mails, it's kind of up to the judgment of the individual person." The father of Army soldier, Gary K. Richardson probably speaks for most families of service men and women, saying that the Internet is "more wonderful than you can imagine. When you get a message, you know that her hands were just on the keyboard and that she was alive and well just a few minutes ago." (New York Times 12 Mar 2003)

2003-03-14 **Iraq war satellite communication jam subvert GPS US**

NIPC/DHS

March 12, Associated Press — Iraqis could try to jam satellite signals.

Iraq could try to jam U.S. military satellite signals during a possible invasion, but the United States has defenses against such attempts, Pentagon officials said Wednesday. Iraq also reportedly is seeking ways to jam the Global Positioning Satellite (GPS) signals that help guide U.S. bombs. At the Pentagon, Brig. General Franklin Blaisdell and Army Col. Steven Fox promoted what they said was America's dominance of space as a key strength in any future military operations. Satellites allow U.S. commanders to see what is going on in hostile countries, communicate with soldiers and pilots, and guide precision weapons. The Army has more than 1,000 transmitters that help it keep track of soldiers and units while a battle is going on, Fox said. As it did during the 1991 Persian Gulf War, the Defense Department is buying access to commercial communications satellites to help serve the massive bandwidth needed to connect all the high-tech gear, Blaisdell said. The military also successfully launched a broadband communications satellite on Monday, he said.

2003-03-28 **US Army Defense Message System DMS faster secure e-mail**

NIPC/DHS

March 27, Federal Computer Week — Army taps DMS for wartime comm.

The Army recently implemented the Defense Message System (DMS) to provide users with better-protected and faster communications than e-mail over the Defense Department's Secret Internet Protocol Router Network (SIPRNET). DMS messages travel over the Defense Information Systems Network, which distributes voice, video and data messages. The system - a $1.6 billion effort to secure DOD communications worldwide - is designed to provide writer-to-reader service for classified and top-secret information, delivering messages to DOD users at their desktops and to other agencies and contractors, if necessary. Retired Air Force Master Sgt. Arthur Edgeson, senior systems engineer at the Fort Detrick, MD, office of Data Systems Analysts Inc., said DMS became active at Camp Doha (Kuwait) at the end of last month and has experienced a noticeable increase in traffic since Operation Iraqi Freedom began March 20. "Yes, SIPR e-mail is classified, but it could be hacked into. Or if we're overrun by the enemy, they would have access to the computers and could send messages...to mislead or misdirect [coalition] forces," said Edgeson. Edgeson acknowledged that DMS still has bugs to work out and that many DOD users remain faithful to Autodin, another system. But Autodin does not allow users to include attachments. It requires users to pick up messages at a central message center twice daily and is run on antiquated equipment. DMS may not be perfect, but it can send and receive all messages for both systems and deliver them to the user's desktop quickly and securely, Edgeson said. The other military services also are using DMS, but each has its own time lines, personnel and priorities, he said.

2003-04-02 **Iraq war communication network Internet computer hardware software intelligence support**

NIPC/DHS

March 29, Washington Post — Computer support staff at home is crucial to war effort.

To a greater extent than any war before it, Operation Iraqi Freedom depends on an elite group of technicians, engineers and other specialists in the United States who are standing by 24 hours a day, seven days a week to assist the troops. Pentagon officials have called this conflict a "network centric" one, with computers and wireless technology linking intelligence from the 250,000 U.S. troops and the drones, tanks, planes and other vehicles in a way that has compressed decision-making from what in the past might have been days into minutes. A single mix-up, glitch or crash in the technology could cost lives. So far, the technology has held up well, and there have been few major problems, according to about a dozen of the contractors who provide technical support services to the military. Working in classified "safe rooms" or reachable via pagers and cell phones around the country, they have been working behind the scenes to make sure the multitude of software and hardware systems is working properly.

Category 16.4 *Military & government perspectives on INFOWAR*

2003-04-11 **physical infrastructure attack Iraq war bomb communication Corporate America disaster recovery**

NIPC/DHS

April 08, Security Net — Physical attack still the biggest threat.

Baghdad's telecommunications infrastructure fell silent during the first week of April under a rain of precision-guided bombs. U.S. and British planes targeted phone facilities and other critical pieces of the Iraqi communications infrastructure to isolate the leadership from the levers of power. The U.S. military chose to use bombs — not hackers — to drop Iraqi networks for a reason. Nothing brings a network to a halt more easily and quickly than physical damage. Yet as data transmission becomes the lifeblood of Corporate America, most big companies haven't performed due diligence to determine how damage-proof their data lifelines really are. Only 20% of midsize and large companies have seriously sussed out what happens to their data connections after they go beyond the company firewall, says Peter Salus of MatrixNetSystems, a network-optimization company based in Austin, TX. The collapse of the World Trade Center left most of Lower Manhattan, the epicenter of the global financial system, without data connections for a week or more. Many of the affected companies thought they were covered for any eventuality, having contracted for not one but two high-capacity data connections from their offices. Redundancy doesn't help much, however, if your connections pass through the same geographical location. Unfortunately, massing huge chunks of connectivity in so-called "telecom hotels" is the norm.

WHITE HOUSE SECURITY ADVISER RESIGNS
Howard Schmidt, the former Microsoft security chief who became White House cybersecurity adviser in February following Richard Clarke's departure from that office, has tendered his resignation, saying: "While significant progress has been made, there still is much to do. The nation as a whole is much better at responding to cyberattacks then at any time in the past, but cybersecurity cannot now be reduced to a `second tier' issue. It is not sufficient to just respond to attacks, but rather proactive measures must also be implemented to reduce vulnerabilities and prevent future attacks." (AP/San Jose Mercury News 22 Apr 2003)

2003-05-14 **cyber R&D DHS center Charles McQueary cybersecurity cyberterrorism**

NIPC/DHS

May 14, Federal Computer Week — DHS creating cyber R & D center.

Charles McQueary, the under secretary for Department of Homeland Security 's (DHS) Science and Technology Directorate, told the House Science Committee Wednesday that the DHS is creating a research and development center to coordinate cybersecurity efforts across civilian and defense agencies, universities, and the private sector. In an effort to help develop state-of-the-art and low-cost technology to prevent cyberterrorism, the DHS center will partner with the National Science Foundation and the National Institute of Standards and Technology, two federal agencies that deal with R & D, as well as with academic institutions and private corporations. "The center will foster national and international cooperation in creating a robust and defensible cyber infrastructure," McQueary said. DHS spokesman David Wray said there is no date yet for the start-up of the cybersecurity center.

2003-07-03 **Illinois supercomputer cybersecurity thwart hackers NCSA battlefield communications**

NIPC/DHS

July 03, Associated Press — Illinois supercomputer center to head military cybersecurity effort.

Hoping to thwart hackers, the military is launching a new research effort at the University of Illinois to improve the security of battlefield computers and communications systems. Officials at the school's National Center for Supercomputing Applications (NCSA) on Thursday announced an initial $5.7 million grant from the Office of Naval Research to establish a new research center to develop technology against enemy hackers, NCSA director Dan Reed said. Other research projects will include developing remotely programmed radios and refining ways for monitoring battlefield environments. The NCSA is a high-performance computing center that develops and deploys computing, networking and information technology for government and industry. Software developers will try to determine the best way to share information among military forces without fear of interception. The government also is seeking a framework for determining quickly when and how a computer network is under attack, Reed said.

2003-07-29 **new jersey army intrusion detection systems IDS cyberterrorism**

NIPC/DHS

July 29, InformationWeek — New Jersey teams with the Army on intrusion detection.

The Army will help New Jersey analyze the state's network as a step in developing an intrusion-detection system. The agreement with the U.S. Army Communications-Electronics Command Research, Development, and Engineering Center based at Fort Monmouth, NJ, is the first such collaboration between the center and a state. Charles Dawson, New Jersey's chief technology officer, says a comprehensive intrusion-detection program is a key component in the state's homeland security plans to protect its IT infrastructure from cyberterrorism. The technical components of the program include host-based intrusion-detection systems, network-based intrusion-detection systems, and security information-management systems. The state also will receive guidance in developing policies and procedures to effectively manage the program.

2004-02-27 **virtual war games military exercises Navy battle**

NewsScan

VIRTUAL WAR GAMES

Three aircraft carriers at Navy bases on both U.S. coasts are engaged this week in a virtual war game that uses computers to simulate battle conditions at sea. Vice Adm. Albert H. Konetzni Jr. says: "This will bring war-gaming to a new level. It will put the operators, the players, under great stress. They will be making decisions that are truly, truly critical to the carrying out of the operations, and it allows the operators, even down to the unit level, to really understand how they play in these scenarios." One of the participants in the exercise says: "We're trying to simulate all conditions of warfare that we could encounter: mine, surface, air, asymmetric threats like a small boat attack. All that stuff that could be damaging to the Navy is put forward into this war game." (San Jose Mercury News 27 Feb 2004)

2004-04-23 **cyber war game Army information warfare West Point NSA**

DHS IAIP Daily;
http://www.reuters.com/newsArticle.jhtml?type=technologyNews
&storyID=4897789&section=news

April 21, Reuters — Army confronts enemies within in cyber war game.

The mission: to secure an entire computer network for the United States and its allies against a vague enemy force. Hostile agents aim to wreak havoc on military plans, sabotaging databases, computer terminals and communications. But the cyber warriors planning a best defense aren't analysts hunkered down at the Pentagon. They are cadets at West Point competing against military academies and other schools in a four-day Cyber Defense Exercise this week. And the "enemy" isn't al Qaeda or Iraqi insurgents. It's a team led by none other than the National Security Agency (NSA). The NSA team, known as the "Red Cell," launches attacks on selected networks at the Air Force, Army, Coast Guard, Merchant Marine and Naval academies from an operations center somewhere in Maryland. The computer scenario plays out virtually inside the cadets' computers. Going on the offensive, or using so-called hackback techniques, is against competition rules. Also out-of-bounds are forms of sabotage in which computers can be turned into zombies and used to attack opponent machines with millions of data messages, shutting down communication.

2004-05-12 **war games military academy NSA cyber defense**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/25867−1.html

May 12, Government Computer News — Merchant Marine Academy wins cybersecurity exercise.

The United States Merchant Marine Academy (USMMA) won out over four other service academies recently in a cybertraining exercise organized by the National Security Agency (NSA) and the United States Military Academy at West Point. During the Cyber Defense Exercise, a team of cadets from each academy had to design, build and configure a computer network that simulated a deployed joint services command. NSA and Department of Defense security experts tested the networks over a four-day period, attempting intrusions and identifying vulnerabilities. Teams were evaluated on maintaining services and their ability to recover from and prevent future security breaches, according to an NSA release. NSA found that the USMMA's network was stronger and more flexible then the 2003 champion, the U.S. Air Force Academy. Other teams participating were West Point, a former two-time winner; the U.S. Coast Guard Academy; and the U.S. Naval Academy.

2004-05-13 **broadband access bandwidth federal government DISA**

DHS IAIP Daily; http://www.gcn.com/vol1_no1/daily−updates/25882−1.html

May 13, Government Computer News — DISA seeks bandwidth tech ideas.

The Defense Information Systems Agency (DISA) is seeking industry feedback on technologies that will add bandwidth to the Defense Information Systems Network (DISN). Under the DISN Access Transport Services request for information, released last week, the Defense agency is looking to industry for ideas to upgrade the older network at roughly 600 sites so it can be integrated with the $900 million Global Information Grid-Bandwidth Expansion program. As part of the DISN upgrade, many legacy voice, data and video systems, as well as emerging capabilities—such as the department's premier network-centric warfare initiatives—will move to operate over IP. DISN currently operates via a switched-circuit transport system. According to the RFI, which closes on May 24, DATS will provide leased access transmission services between the government-owned backbone network and customer locations. The transmission services will be required to support bandwidths up through OC-192. The DATS contract will provide similar services to two current DISA contracts that are expiring over the next two years, including the DISN Transmission Services CONUS (Continental United States) contract and the DISN Switched/Bandwidth Manager Services CONUS contract.

2004-05-17 **computer security US army military network defense**

DHS IAIP Daily; http://www.fcw.com/fcw/articles/2004/0517/news−army−05−17−04 .asp

May 17, Federal Computer Week — Army-wide security plan takes shape.

The Army will devise a servicewide computer security plan to boost protection of its information technology assets, according to Army and industry officials. Army officials say they want to develop a strategy that treats all systems as part of a cohesive enterprise, rather than securing each system individually. They realized the need for such a plan when they began taking an enterprise approach to managing their hardware and software, officials said. Their participation in military network defense groups also raised their awareness about the importance of cybersecurity, they said. Top Army IT officials, citing Army policies, would not confirm that their networks have seen more cyberattacks during the past five months. "The military typically experiences increases in computer network attacks when the geopolitical climate is the way it is," said Lt. General Steve Boutelle, the Army's chief information officer.

2004-08-04 **cyber terrorism information asymmetrical warfare China Russia US Homeland Security concern**

DHS IAIP Daily; http://www.usatoday.com/tech/news/2004−08−02−cyber−terror_x. htm

August 04, USA TODAY — Cyberterror impact, defense under scrutiny.

A coordinated cyberattack against the U.S. could topple parts of the Internet, silence communications and commerce, and paralyze federal agencies and businesses, government officials and security experts warn. Such an attack could disrupt millions of dollars in financial transactions, hang up air traffic control systems, deny access to emergency 911 services, shut down water supplies and interrupt power supplies to millions of homes, security experts say. But from whom the attacks would come is unclear. Intelligence shows al Qaeda is more fixated on physical threats than electronic ones, government officials and cybersecurity experts say. That hasn't dissuaded other groups and nations from eyeing cyberterrorism as a means to damage the U.S., whose infrastructures are increasingly tied to the Internet. "There are a large number of threats: hackers, cybercriminals, other countries," says Amit Yoran, director of the Department of Homeland Security's National Cyber Security Division. "It goes beyond al Qaeda." More than two dozen countries, including China and Russia, have developed "asymmetrical warfare" strategies targeting holes in U.S. computer systems. Because of U.S. military firepower, those countries see electronic warfare as their best way to pierce U.S. defenses, military experts say.

DHS IAIP Daily; http://www.miami.com/mld/miamiherald/11332057.htm

U.S. OFFICIALS WARN OF CHINESE INTELLIGENCE AND CYBERWARFARE ROLES IN LATIN AMERICA

U.S. officials said Wednesday, April 6, there is no evidence that China is seeking to boost its military presence in Latin America, but for the first time warned about Chinese intentions to establish an intelligence and cyberwarfare beachhead in the region. Roger Noriega, assistant secretary of state for Latin America, and Rogelio Pardo-Maurer, the top Defense Department official for the Western Hemisphere, testified before a House panel as several legislators argued that China is trying to fill the void left by the lack of U.S. involvement in the region. Noriega and Pardo-Maurer said China's interests in Latin America were mostly on the economic side, but warned that Beijing could also have an intelligence agenda as it increased trade with Latin America. Pardo-Maurer said that "we need to be alert to rapidly advancing Chinese capabilities, particularly in the fields of intelligence, communications and cyberwarfare, and their possible application in the region." This is the first time that a senior Pentagon official warned so directly about Chinese cyberwarfare capabilities in the region.

2005-12-13 **research report hacker attack US network Chinese military information warfare INFOWAR**

DHS IAIP Daily; http://www.physorg.com/news8992.html

RESEARCHERS: HACKER ATTACKS IN U.S. LINKED TO CHINESE MILITARY

A systematic effort by hackers to penetrate U.S. government and industry computer networks stems most likely from the Chinese military, the head of a leading security institute said. The attacks have been traced to the Chinese province of Guangdong, and the techniques used make it appear unlikely to come from any other source than the military, said Alan Paller, the director of the SANS Institute, an education and research organization focusing on cybersecurity. In the attacks, Paller said, the perpetrators "were in and out with no keystroke errors and left no fingerprints, and created a backdoor in less than 30 minutes. How can this be done by anyone other than a military organization?" Paller said that despite what appears to be a systematic effort to target government agencies and defense contractors, defenses have remained weak in many areas. Security among private-sector Pentagon contractors may not be as robust, said Paller, because "they are less willing to make it hard for mobile people to get their work done." The U.S. military has code-named the recent hacker effort "Titan Rain" and has made some strides in counter-hacking to identify the attackers, Paller said.

DHS IAIP Daily; http://www.networkworld.com/news/2006/011606−military−security.html 23

MILITARY CLAMPING DOWN ON SECURITY

Lt. General Charles Croom, commander of the Joint Task Force (JTF) on Global Network Operations (GNO) and director of the Defense Information Systems Agency (DISA), last week said a sweep is underway of all Department of Defense (DoD) networks to uncover security holes amid a get-tough policy. “The attacks are coming from everywhere and they’re getting better, ” said Croom in his keynote address at the DoD Cyber Crime Conference last week. The discovery of a botnet last November 5th inside DoD networks contributed to the decision to clamp down security. So far, the results are troubling. “Almost 20 percent of our accounts are unauthorized or had expired,” Croom said, noting that military personnel tend to move every two or three years and accounts are sometimes left open. The exact tally of improper accounts won’t be known until March, he said. The biggest changes to come may be in the next six months as the JTF-GNO, the organization set up to centralize decisions about security and operations in the Army, Navy, Air Force and Marines, evaluates a possible redesign of its two primary global IP-based military networks.

DHS IAIP Daily; http://www.fcw.com/article92121−01−27−06−Web 23

EXPERTS: COUNTRIES MAKE DANGEROUS CYBER ADVERSARIES.

When other countries launch cyber attacks, the United States should expect to see more robust ways to crack systems and more dangerous methods to manipulate them, two cybersecurity experts said Thursday, January 26. Countries have many resources and can attack at least as effectively as independent cybercriminals can, said Matthew Devost, president and chief executive officer of the Terrorism Research Center. China, North Korea and Russia already use cyber attacks to advance their interests, Devost said, speaking on a panel at the Black Hat Federal conference in Arlington, VA. Cyber attacks from countries can be difficult to investigate because analysts may not be able to tell if a given country is launching the attack or if other organizations are attacking through the country’s resources, he said. Countries and terrorist organizations can have a different perception of time than other cyber attackers do, Devost said. They can wait years, performing reconnaissance and placing agents inside target organizations to find vulnerabilities, he said. Preparation is important to stopping attacks from other countries, said Tom Parker, security research group manager at MCI. Organizations must anticipate their adversaries’ actions and look at all data, attack profiles and threat types, he said.

DHS IAIP Daily; http://news.zdnet.com/2100−1009_22−6034895.html 23

HACKERS TAP GREEK GOVERNMENT CELL PHONES.

Unknown eavesdroppers tapped the cell phones of Greek Prime Minister Costas Karamanlis, five cabinet members and dozens of top officials for about a year, the Greek government said on Thursday, February 2. Illegal software installed at Greece's second biggest mobile phone operator, Vodafone Greece, allowed calls to and from about 100 phones to be recorded. Most belonged to the government but one was owned by the U.S. embassy in Athens, officials said. "The phones tapped included the prime minister's, the whole leadership of the defense ministry and the whole leadership of the public order ministry, some foreign ministry phones, one former minister, now in opposition, and others," government spokesperson Theodore Roussopoulos told a news conference. The wiretaps lasted from just months before the 2004 Athens Olympics until March 2005, when Vodafone Greece discovered the incident. "As soon as we discovered the phone-tapping software, we removed it and informed the state, as was our obligation," George Koronias, head of Vodafone Greece, said in a statement. But the shutdown of the illegal software in the Vodafone system wiped out all traces of how and from where it had been installed, Public Order Minister George Voulgarakis told the news conference.

5710900773FD8

CHINA ATTACKS UK PARLIAMENT USING WINDOWS SECURITY HOLE.

Chinese hackers attacked the UK Parliament in January, the government's e-mail filtering company, MessageLabs, has confirmed. The attack, which occurred on January 2, attempted to exploit the Windows Meta File (WMF) vulnerability to hijack the PCs of more than 70 named individuals. E-mails were sent to staff with an attachment that contained the WMF-exploiting Setabortproc Trojan. Anyone opening this attachment would have enabled attackers to browse files and possibly install a key-logging program to attempt the theft of passwords. None of the e-mails got through to the intended targets, MessageLabs says, but the UK authorities were alerted. MessageLabs said the e-mails had been traced to servers in China's Guangdong Province, hence the suspicion that the latest attack was part of a more general campaign of electronic subversion. This is not the first time the UK Government has come under Trojan attack from China. Last summer, the National Infrastructure Security Coordination Center (NISCC) reported that UK government departments had been hit by a wave of Trojans originating in China.

VM0LSQLDIUSQSNDBCSKHSCJUMEKJVN

DHS WEATHERS CYBER STORM.

The U.S. Department of Homeland Security (DHS) still has to evaluate how well it fared through a series of simulated cyber attacks this week, but government and private companies avoided real-world damage and complications during their preparedness exercise. More than 100 public, private and international groups participated in mock attacks replicating the invasion of a utility company's computer system and the disruption of power grids. The exercise, called Cyber Storm, was designed to test the abilities of private companies and government agencies to deal with a major cyber security incident. DHS announced the completion of the exercise on Friday, February 10, but has yet to fully evaluate how effectively the groups communicated, cooperated and responded. Participants will evaluate the exercise, gauge interagency coordination and try to identify how current policies would affect response and recovery in the event of a real attack. The lessons learned this week are expected to be incorporated into a National Response Plan, which could be used if real attacks occur.

2006-03-08 **Internet cloaking Web security threats bogus terrorist criminal Websites**

DHS IAIP Daily; http://www.gcn.com/online/vol1_no1/40075−1.html 23

INTERNET "CLOAKING" EMERGES AS NEW WEB SECURITY THREAT.

Terrorist organizations and other national enemies have launched bogus Websites that mask their covert information or provide misleading information to users they identify as federal employees or agents, according to Lance Cottrell, founder and chief scientist at Anonymizer of San Diego, CA. The criminal and terrorist organizations also increasingly are blocking all traffic from North America or from Internet Protocol addresses that point back to users who rely on the English language, Cottrell told an educational seminar in Washington at the FOSE 2006 trade show's Homeland Security Center Tuesday, March 7. Among the risks of the terrorist cloaking practice are that the organizations can provide bogus passwords to covert meetings. By doing so they can pinpoint federal intelligence agents who attend the meetings, making them vulnerable to being kidnapped or becoming the unwitting carriers of false information, Cottrell said.

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/story/0 23
,10801,110417,00.html

WEB ROLE EXAMINED IN LONDON, MADRID BOMBINGS.

Investigations into the Madrid and London bombings highlight two worrying trends for European security services -- the emergence of autonomous, homegrown radical cells and their skilled exploitation of the Internet. "It is quite clear that the Internet is playing an ever greater role in radicalization and recruitment, and indeed also in facilitating the practical planning [of attacks]," European Union counterterrorism chief Gijs de Vries told a conference in Berlin last week. The Islamic militants involved in the Madrid attacks, for example, derived inspiration from an Islamist Website. In addition, the suicide bombers involved in last July's London attacks developed their plan using information they obtained from the Internet; they were not part of an international terror network.

DHS IAIP Daily; http://www.msnbc.msn.com/id/12305580/ 23

PORTABLE COMPUTER DRIVES PEDDLED AT BAZAAR OUTSIDE BAGRAM AIR BASE, AFGHANISTAN.

This week in Bagram, Afghanistan, an NBC News producer, using a hidden camera, visited a bazaar and bought a half dozen of the memory drives the size of a thumb known as flash drives. Some of the discovered data would be valuable to the enemy, including: Names and personal information for dozens of Department of Defense interrogators; documents on an " interrogation support cell" and interrogation methods; IDs and photos of U.S. troops. The tiny computer memories are believed to have been smuggled off base by Afghan employees and sold to shopkeepers. Whoever buys one can simply plug it into another computer, and in a couple of minutes, see thousands of files.

2006-04-13 **terrorist Web chatter Internet privacy concern proxy server**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/content/article/2006/04/12/AR2006041201968.html?nav=rss_technology/special/08 23

TERRORISTS' WEB CHATTER SHOWS CONCERN ABOUT INTERNET PRIVACY.

Terrorist groups, which for years have used the Internet and its various tools to organize and communicate, are paying more attention to addressing security and privacy concerns similar to those of other Web users, counterterrorism experts say. Recently, postings on jihadist Websites have expressed increasing concern about spyware, password protection, and surveillance on chat rooms and instant-messaging systems. One forum recently posted a guide for Internet safety and anonymity on the Internet, advising readers of ways to circumvent hackers or government officials. "The Shortened Way of How to be Cautious; To the User of the Jihadi Forums, In the Name of Allah, the most Gracious and Merciful" was posted last month by an al-Qaeda-affiliated group calling itself the Global Islamic Media Front. The posting advised Internet cafe users to set up a proxy -- a software program that erases digital footsteps such as Web addresses or other identifiable information -- before Web surfing. "There's a lot of things like that," said Evan Kohlmann, a consultant on international terrorism. Last month, Kohlmann said, he found a jihadist Website posting pirated McAfee anti-spyware software, which the site encouraged users to download to avoid monitoring.

2006-05-02 **US businesses WTO Russia talks intellectual property rights enforcement weak**

EDUPAGE; http://www.abcnews.go.com/Politics/wireStory?id=1914448 23

BUSINESS GROUPS URGE CAUTION IN WTO TALKS WITH RUSSIA

U.S. businesses urged the Office of the United States Trade Representative to demand more efforts from Russia in addressing intellectual property crimes before granting approval for the country to join the World Trade Organization (WTO). Russia, with one of the largest global economies not represented in the WTO, is in bilateral talks with the United States over admission to the group. Industry organizations point to Russia as one of the worst offenders for piracy of copyrighted music, movies, and software and called on U.S. officials to take a tough stance. Eric Schwartz, vice president of the International Intellectual Property Alliance, said, "Enforcement at present is very, very weak." Businesses calling for renewed pressure on Russia pointed to proposed legislation in the country that would actually weaken protections for copyright owners. Christin Baker, a spokeswoman for the U.S. Trade Representative's office, said, "We made it very clear to Russia that improvements...are necessary for them to enter the WTO."

2006-05-03 **information warfare cyberwar insidious attacks data corruption mole insider employee damage scenarios**

TechTarget http://tinyurl.com/nnf72

DIGITAL DOOMSDAY CAN BE AVOIDED WITH PREPARATION

Bill Brenner began his report in TechTarget's SearchSecurity with the following paragraphs which reflect a scenario long described by Winn Schwartau since the early 1990s:

"A common nightmare scenario in the business world is that a hacker will crack a company's digital defenses, steal sensitive data or disable the network. Scott Borg, director and chief economist at the U.S. Cyber Consequences Unit (US-CCU), an independent organization that churns out information security data on behalf of the government, says enterprises face a darker possibility.

Online outlaws could quietly penetrate the network and, over six to eight months, alter critical data so that it's no longer accurate. For instance, an attacker could access a health insurance company's patient records and modify information on a person's prescriptions or surgical history. Or an attacker could access an automotive company's database and tamper with specifications on various car parts."

2006-05-30 **information warfare cyberconflict computer network attack PRC China**

RISKS; DoD 24 30
http://www.defenselink.mil/pubs/pdfs/China%20Report%202006.pdf

CHINA CONTINUES PUSH FOR CYBERWAR CAPABILITIES

The annual "Military Power of the People's Republic of China" for 2006 was presented to Congress by the US DoD in May. Two sections in particular speak to concerns about information warfare capabilities (pp. 35-36):

Exploiting Information Warfare The PLA considers active offense to be the most important requirement for information warfare to destroy or disrupt an adversary's capability to receive and process data. Launched mainly by remote combat and covert methods, the PLA could employ information warfare preemptively to gain the initiative in a crisis.

Specifi ed information warfare objectives include the targeting and destruction of an enemy's command system, shortening the duration of war, minimizing casualties on both sides, enhancing operational effi ciency, reducing effects on domestic populations and gaining support from the international community.

The PLA's information warfare practices also refl ect investment in electronic countermeasures and defenses against electronic attack (e.g., electronic and infrared decoys, angle refl ectors, and false target generators.

Computer Network Operations. China's computer network operations (CNO) include computer network attack, computer network defense, and computer network exploitation. The PLA sees CNO as critical to seize the initiative and achieve " electromagnetic dominance" early in a confl ict, and as a force multiplier. Although there is no evidence of a formal Chinese CNO doctrine, PLA theorists have coined the term "Integrated Network Electronic Warfare" to outline the integrated use of electronic warfare, CNO, and limited kinetic strikes against key C4 nodes to disrupt the enemy's battlefi eld network information systems. The PLA has established information warfare units to develop viruses to attack enemy computer systems and networks, and tactics and measures to protect friendly computer systems and networks. The PLA has increased the role of CNO in its military exercises. For example, exercises in 2005 began to incorporate offensive operations, primarily in fi rst strikes against enemy networks.

Formation of Information Warfare Reserve and Militia Units

The Chinese press has discussed the formation of information warfare units in the militia and reserve since at least the year 2000. Personnel for such units would have expertise in computer technology and would be drawn from academies, institutes, and information technology industries. In 2003, an article in a PLA professional journal stated "coastal militia should fully exploit its local information technology advantage and actively perform the information support mission of seizing information superiority." Militia/reserve personnel would make civilian computer expertise and equipment available to support PLA military training and operations, including "sea crossing," or amphibious assault operations. During a military contingency, information warfare units could support active PLA forces by conducting "hacker attacks" and network intrusions, or other forms of "cyber" warfare, on an adversary's military and commercial computer systems, while helping to defend Chinese networks.

The PLA is experimenting with strategy, doctrine, and tactics for information warfare, as well as integrating militia and reserve units into regular military operations. These units reportedly participate with regular forces in training and exercises.

In the last days of January 2000, political activists (hacktivists) defaced and damaged Japanese government and business Web sites in protest for the failure of Japan to admit responsibility for the Rape of Nanking (also called the Nanjing Massacre) of 1937. Some sites (e.g., that of the National Personnel Authority) suffered major data destruction ; others (e.g.,Posts and Telecommunications Ministry, Government Data Research Center) saw propaganda messages added to their content. The Bank of Japan reported that its Web site was attacked 1,600 times in a single day. The attacks stimulated concern that Japanese enterprises as a whole were failing to implement effective network and Web security.

2002-05-20 **hacktivisists investigation Web vandalism defacement arrests confidentiality penetration probation juvenile**

Security Wire Digest, SecurityFocus; http://online.securityfocus.com/news/414 4 39

Hacktivists calling themselves the Deceptive Duo were arrested in May after an FBI investigation. Using handles "Pimpshiz" and "The Rev," the pair vandalized dozens of Web sites supposedly to stress the importance of improving security in the face of international threats to the USA's infrastructure. In one case, the pair posted a page apparently stolen from a bank system that showed customer names and account numbers.

Robert Lyttle, 18, was ordered into house arrest for having violated the terms of his probation for a previous hacking conviction only four months prior to the latest alleged crimes. In the previous conviction, Lyttle had defaced more than 200 Web sites, replacing them with pro-Napster e-graffiti and had been ordered to serve 90 hours of community service and was barred from hacking and from using pseudonyms online. As an 18-year-old, Lyttle faced federal charges instead of juvenile court this time. Little information was made available by the FBI about the second hacker suspected in the case.

May 20, — Athens Olympics braced for wave of cyberattacks.

The Athens Olympics organizers are bracing themselves for a wave of cyberattacks once the games are under way, but insist that a physical breach of security still represents the biggest threat. Although questions remain about whether some of the venues will be ready for August 13, the IT planning is on course with a second technical rehearsal using some of the venues and simulating the four busiest days of the games taking place on June 14. By the start of the games some 200,000 people-hours of testing will have been completed and 10,000 defects are expected to be found and corrected. The infrastructure itself is fairly tried and tested with a policy of keeping complexity and risk down by only introducing new technology where it is essential. As such the platforms of choice are Unix and Windows, with Linux not getting a look-in.

DHS IAIP Daily;
http://www.eweek.com/article2/0,1759,1639243,00.asp?kc=EWRSS03119TX1K0000594

August 25, eWeek — Some concerns over electronic jihad.

Russian security researcher Yevgeny Kaspersky of Kaspersky Labs International said Wednesday, August 25, that a number of Arabic and Hebrew language Websites contained an announcement of an 'electronic jihad' against Israel to start on Thursday. However, Kaspersky stressed that such information was not necessarily trustworthy. "The e-jihad has been discussed for years, but an undisputed attack has yet to surface," said Ken Durham, director of malicious code at iDefense Inc. But Durham said security pros are increasingly worrying about when political activists might join with like-minded security and Internet programmers. While Kaspersky's warning appears to suggest wide-scale DDoS (distributed denial of service) attacks, experts suggested that important Internet services, as well as its root servers, are also at risk. For example, a DDoS attack in June against Akamai Technologies Inc. slowed traffic across the Internet for several hours. And in July, DoubleClick Inc.'s DNS (domain name system) was attacked and unable to serve ads for a similar time frame.

JAPAN SUSPECTS CYBER ATTACK ON OFFICIAL WEBSITES

Japan's police and defense agencies said they had come under cyber attack, amid reports a Chinese website was calling for the jamming of Japanese servers amid a heated bilateral disagreement. "Access to the homepage of the National Police Agency was hampered from around 9:00 pm (1200 GMT Wednesday, April 13) to 3:00 am (1700 GMT)," the national police said in a statement. "We are investigating the cause but it is highly possible that it was a cyber attack in which a large volume of information was sent to the address of the homepage," it said. Japanese media reports said a Chinese website had urged Internet users to flood Japanese servers with irrelevant data. A police spokesperson said the agency was "aware of the call" from China but had not identified what hampered the access. The Defense Agency also said its Website had been experiencing access problems from late Wednesday, April 13. Tensions have been rising between Japan and China. Japan announced Wednesday that its companies would have the right to drill for oil and gas in an area of the East China Sea bitterly disputed between the Asian economic powers.

2005-04-25 **Web server attacks growing quickly survey hacktivism Iraq war teenager involvement**

DHS IAIP Daily; http://news.bbc.co.uk/1/hi/technology/4480689.stm

SURVEY: WEB SERVER ATTACKS 'GROWING FAST'

A survey by Zone-H revealed that web server attacks and Website defacements grew by 36% during 2004 when almost 400,000 incidents were recorded. The attacks include 49 separate sorties against U.S. military servers and huge numbers of Website defacements. The figures were collated by Zone-H , a web-based organization that uses a world-wide network of volunteers to spot and investigate web server attacks and site defacements. "Defacement is just one option for an attacker," said Roberto Preatoni, Zone-H coordinator. "In most circumstances the techniques used by defacers are the same techniques used by serious criminals to cause more serious damage." The report found that more than half of all attacks and defacements, 55%, succeeded by exploiting a known bug or vulnerability or an administration mistake. The figures show that the many incidents occur on the anniversaries (mid-March) of the start of the most recent war in Iraq when both pro-Muslim and pro-American groups defaced sites. The survey also found that the long holidays around Christmas provoke a spike in attacks and incidents. The frequency of attacks also dips around the time that schools re-open suggesting that many teenagers are behind the defacements. Survey: http://www.zone-h.com/news/read/id=4457/

2003-01-14 **information warfare Iraq war e-mail campaign convince leaders defect United Nations UN**

NIPC/DHS

January 12, CNN — U.S. E-mail attack targets key Iraqis.

U.S. military and other U.S. government agencies have begun a surreptitious e-mail campaign inside Iraq in an effort to get some Iraqis to defy President Saddam Hussein. Thousands of e-mail messages have been sent out since Thursday. The disguised e-mails, being sent to key Iraqi leaders, include instructions to the e-mail recipients to contact the United Nations in Iraq if they want to defect. If they do not, the messages warn, the United States will go to war against them. Senior military sources told CNN this was the first time the military had engaged in this type of "information warfare campaign." The U.S. military and intelligence officials were apparently hoping that the Iraqis do not realize where the e-mails are coming from. One official tells CNN the Pentagon wanted "to preserve this capability as long as possible," but once the e-mail campaign was discovered it would be acknowledged publicly. The official also says the United States acknowledges that Iraq may have already shut off some Internet gateways to prevent the e-mails from getting through. He said these same types of messages will now be sent by radio broadcast in the days ahead from U.S. airborne and ground platforms.

2003-03-26 **disinformation malicious imposters news corporate Web sites Iraq war**

NIPC/DHS

March 25, The Register — Malicious impostors sow seeds of disinformation.

Security testing outfit NTA Monitor has warned of the increased likelihood of attacks against news sites and corporate Web sites during the current war in Iraq. News sites are especially at risk, because attackers could use weaknesses in sites or domain registration tricks to 'rewrite' breaking news to try to create confusion and panic, according to NTA. The most obvious risk is denial of service attacks, in which sites are deliberately brought down by extreme traffic volumes. However the subtler attacks are of much greater concern. By registering similar domain names or 'typo squatting' - booking domains with common typo errors (e.g., wwwcompany.com) - traffic intended for official news sites could be re-directed. Attackers can impersonate Internet news sites and make major changes to the news, with potentially disastrous impact.

2003-04-03 **biological virus hoax Website misinformation disintermedation Hong Kong**

NIPC/DHS

April 01, Reuters — Website hoax fans virus panic.

A teenager's website hoax about a killer virus that is sweeping Hong Kong sparked panicked food buying and hit financial markets on Tuesday, forcing the government to deny it would isolate the entire territory. "We have no plan to declare Hong Kong an infected area," Director of Health Margaret Chan told reporters. "We have adequate supplies to provide (for) the needs of Hong Kong citizens, and there is no need for any panic run on food." In Hong Kong, 685 people are infected by severe acute respiratory syndrome, also known as SARS, and 16 have died from the virus. The fake website scare fueled dismay in the territory adjoining China's Guangdong province, where the virus is believed to have originated four months ago. The hoaxer copied the format of the public Internet portal of the Mingpao, one of Hong Kong's leading newspapers, and posted a message saying the government would declare the city of seven million "an infected place."

2003-04-03 **Iraq Information Ministry war disinformation propaganda US attack**

NIPC/DHS

March 31, salon.com — Iraq goes offline.

U.S. Tomahawk cruise missiles aimed at destroying Saddam Hussein's propaganda machine reportedly destroyed several satellite dishes and an Internet server housed at Iraq's Ministry of Information building Saturday. Local phone service in the city was also reportedly disrupted by separate missile strikes on two telecommunications switching centers. Yet Babil Online, the home page of an Iraqi newspaper run by Saddam Hussein's son Uday, was still reachable following the bombing. Babil Online may have escaped the attacks because of its physical location — the site appears to be hosted on a server not in Baghdad but in Beirut, Lebanon. Some observers have speculated that the United States left Iraq's Internet infrastructure untouched for the first week of the war in order to maintain communications with potential defectors in the high ranks of Iraq's government and military personnel. But Peter W. Singer, a fellow at the Brookings Institute, said he doubted that preserving Iraq's Internet capabilities was high on the priority lists of U.S. military planners. "Internet access is still limited mostly to elites in the country. The U.S. is mostly concerned about protecting things like water and electricity and bridges," said Singer. He said the mission of Iraq's Information Ministry has been not only to fire up nationalism but also to manipulate world opinion and to raise international protests against the war.

2003-04-04 **biological virus hoax SARS Website misinformation disintermedation Hong Kong SMS text message**

NIPC/DHS

April 03, Associated Press — Six million mass text messages avert SARS panic.

When a false Internet story about Asia's mystery illness sent fears through Hong Hong, authorities used a fast and simple way to shoot down the rumor: they sent a blanket text message to about 6 million mobile phones that denied the territory had been declared an "infected city." Severe Acute Respiratory Syndrome, or SARS, has killed at least 78 people and sickened more than 2,200 worldwide. The government used the text message on Tuesday after the "infected city" hoax report appeared online, prompting panic among some residents who thought the territory would be shut down. The government's text response said: "Director of Health announced at 3pm today there is no plan to declare Hong Kong as an infected area." The hoax story was allegedly posted by a 14-year-old boy who was quoted as saying he did it for fun, and didn't think anybody would believe the story. A telecommunications professor said mass text messaging - or SMS messaging - was justified in emergencies, but could potentially be abused. "It's very important for phone operators to identify where the information comes from," said KL Ho, who teaches at the Department of Electrical and Electronic Engineering at the University of Hong Kong. "It's also very important to remind users not to believe just one single source," Ho said.

CNN DEFENDS ITSELF AGAINST NEWS-FILTERING CHARGES
In a memo to his staff, CNN top news executive Eason Jordan has denied that his motive for failing over a 12-year period to report horrors of the Saddam Hussein regime was to keep the CNN Baghdad bureau open. "A number of people have told me CNN should have closed its Baghdad bureau, helped everyone who told me the horror stories flee Iraq, with me thereafter telling those stories publicly long before now. While that is a noble thought, doing so was not a viable option." He says that such victims would not have left their country simply to be able to share their stories with the world. "So we reported on Iraq's human rights record from outside Iraq and featured many interviews with Iraqi defectors who described the regime's brutality in graphic detail. When an Iraqi official, Abbas al-Janabi, defected after his teeth were yanked out with pliers by Uday Hussein's henchmen, I worked to ensure the defector gave his first TV interview to CNN. He did." DHS IAIP Daily; http://news.zdnet.com/2100−1040_22−6068963.html 23

ISLAMIC MILITANTS RECRUIT USING U.S. VIDEO GAMES.

The creators of combat video games have unwittingly become part of a global propaganda campaign by Islamic militants to exhort Muslim youths to take up arms against the U.S., defense officials said on Thursday, May 4. Tech-savvy militants from al-Qaeda and other groups have modified video war games so that U.S. troops play the role of bad guys in running gunfights against heavily armed Islamic radical heroes, Department of Defense officials and contractors told Congress. The sites use a variety of emotionally charged content, from images of real U.S. soldiers being hit by snipers in Iraq to video-recordings of American televangelists making disparaging remarks about Islam. The underlying propaganda message, officials say, is that the U.S. is waging a crusade against Islam in order to control Middle Eastern oil, and that Muslims should fight to protect Islam from humiliation.

The Dominion (Auckland, NZ)

The New Zealand Telecom fraud unit saved the company several $M in its first four month in 1997. Using an HP computer to spot unusual calling patterns, the system helps staff notify subscribers if calls seem to be outside their usual usage of the telephone system. Some of the frauds were costing $K per day. The proactive approach to spotting fraud has paid off in reduced complaints from customers and avoidance of disputes over expensive calls.

RISKS 19 74

Peter G. Neumann, editor of RISKS, provided the following summary of a trans-border hacking case: "21-year-old Jason Mewhiney was arrested by the Canadian RCMP on 27 charges related to using a computer in his home to access computer systems of the U.S. government (including NASA and NOAA, the National Oceanic and Atmospheric Administration), as well as Canadian and U.S. universities. In one case he allegedly caused `extensive damages'."

Category 17 *Penetration, phreaking, cramming, uncapping (entering systems, stealing teleph*

1998-05-31 **social engineering penetration misrepresentation Web vandal**

EDUPAGE

The ACLU site on AOL was vandalized by an intruder who simply asked an AOL help-desk staffer — now an ex-employee — for a new password for the ACLU account. The success of this ancient trick may be in part a function of the sheer size of the help-desk organizations for large ISPs; with thousands of people staffing the help desks, many of them relatively new and poorly trained, even a very low probability that any one employee will hand out passwords like party favors leads to a very high probability that at least one gullible person will give away the store. For probability freaks, this "birthday formula" is P{at least one failure} = 1 - (1-p)^n where p=probability of one failure and n=number of independent units subject to failure.

1999-08-11 **criminal hacker probes Trojans back door**

Bangkok Post (Thailand)

A question-and-answer column in the Bangkok Post, Thailand in August 1999 showed how widespread criminal hacking has become in this Internet-assisted age. Howie Mirkin wrote, "In the past two weeks I have experienced about three to four "back orifice" hacking attempts per day. I have a small program called anti-BO, which detects such attempts. I have been notifying the appropriate ISPs after doing a WhoIs ISP Lookup and a trace route to help them determine the user.
The anti-BO program gives the time and host id. I have had a couple of ISPs come back and tell me that they throw hackers off their connection, but we know that nothing will stop them if they want to hack. . . . It is a real pain to keep getting these hits and have to stop working and gather data to report them. Are there any laws about this? What I really wonder is how many people are getting hacked without knowing it because they have no detection program."

Craig Emmott, Director of Support Services of Internet Thailand, responded, "Unfortunately, scanning for backdoor programs such as Back Orifice is very common these days. If ISPs are informed of the time and origin-IP of the scanning they can contact the owner of the account being used at the time. However, this will often turn out to be a hacked account or the owner will deny all knowledge of the incident. Until the TOT and TA provide caller-ID on modem access lines, there is little ISPs can do other than advise these account owners to change their password." He added, "Generally, these would-be hackers don't target any specific individual. Instead, they scan whole blocks of dialup lines belonging to target networks. The main objective is to steal passwords and use them to get some free Internet access at other users' expense." Finally, he commented, "There are now over 100 backdoor/Trojan programs available on the Internet, but Back Orifice and NetBus are still the big favourites in Thailand. The most practical defence against them is to only run software from trusted sources and to use one of the major anti-virus products, all of which can detect the most widely used Trojans."

1999-08-31 **back door e-mail script Web confidentiality bug**

PA, Wired http://www.wired.com/news/news/business/story/21490.html

In August, two serious security holes were demonstrated on the HotMail servers run by Microsoft and claimed to be the biggest free Web-mail system in the world, with millions of subscribers affected. The problems were as follows:
(1) An error in the code for entering data into a form allowed a user login without any password at all;
(2) An undocumented back door allowed anyone to log in to any HotMail account using the canonical password "eh."
These problems meant that all unencrypted HotMail e-mail was readable to anyone who used the exploits and that such people could also impersonate their victims through e-mail. The holes caused Microsoft to shut down access to HotMail for a day while the vulnerabilities were removed.

The perpetrators, calling themselves "Darkwing" and "Hackers Unite," took responsibility for the hack. The criminal hacker spokesperson was Swedish computer expert Lasse Ljung, who said, "Hackers Unite hacked Hotmail because they wanted to show the world how bad the security is on Microsoft. . . . It is a big company on the net, so it wasn't to destroy it for others, it was to show the people how bad the security is."

1999-09-29 **criminal hacker bank financial transactions penetration credit card confidentiality**

Scotsman

Frans De Vaere admitted breaking into the Web site of a Belgian bank in mid-August. He stole logon IDs and passwords and successfully accessed the account balances of many customers; luckily he was unable to effect any transactions. The bank, identified as "Generale de Banque" in a report by Alex Blair in _The Scotsman_ newspaper, refused to take legal action against the criminal hacker. However, the Skynet ISP run by the state telecom company, Belgacom, was not so accommodating. The criminal hacker broke into more than 1,000 Web sites on Skynet and stole the credit-card numbers of about 20 clients. Police began an investigation, but unfortunately Belgium has no specific law addressing computer crime and so the intruder is still unpunished.

1999-10-14 **criminal hacker ISP theft of service vulnerability**

SMH

In an odd twist, the Australian ISP FreeOnline treated a criminal hacker respectfully after he claimed in the Oz version of _2600_ magazine that it was possible to use the ISP without registering for a userID and password. Members of the criminal hacker magazine's club affirmed that the exploit was in fact being used successfully despite the denials of the ISP's technical staff that there was a vulnerability. The company's CEO, Sydney Low, said, "If Pho can show us that there is a flaw we'll pay him $100 an hour, because we're happy to support behaviour that increases the smarts of the industry. While we don't want to stifle this kind of activity, we don't think he should have posted the hack to a Web site without confirming its legitimacy with us first." [This kind of statement gives succour to the enemy and feeds the propaganda engine of the criminal underground. There is no place for acceptance of people who break into systems, steal services, and then boast about their exploits in detail so that other criminals — and children — can imitate their behavior.]

1999-10-21 **criminal hackers Israel politics police law enforcement prosecution court phreaking theft of services telephone long-distance calls**

Wall Street Journal

In October 1999, the Israeli government finally began the trial of two blind Israeli Arab brothers, Munther and Muzhir Badir. The two were suspected of a series of major attacks on telephone systems for call-sell operations, fraudulently selling other people's land, and credit-card fraud. The indictment included 47 different counts of criminal activity. The flamboyant brothers became celebrities in Israel, with regular interviews in the media. The bitter intercommunal relations of Jews and Arabs in Israel complicated the case, with many opponents of the Israeli government claiming that the brothers were abused in the notoriously rough Israeli jails. In one interesting wrinkle, Munther Badir claimed that he worked for the Labor Party in 1998; he said he had sabotaged the party's system and then repaired it, blaming the crash on the Prime Minister's political opponents. However, Labor Party officials denied any record of Badir's working for them.

Security Wire Digest 4 31

FLORIDA BANK BREACH NETS ONLINE BANKING DATA
A cracker managed to breach a Florida bank's firewall and steal the personal data of 3,600 online-banking customers. Officials at Republic Bank--among the first in the state to offer Internet banking in 1996--discovered the incident a few weeks ago but kept it from customers until April 17. The theft came to light after the attackers contacted the bank, whose main Web site runs Microsoft's IIS 4.0 and is hosted by Advances.com of Fort Lauderdale. No accounts were accessed during the attack, the bank reports. The FBI is investigating and Republic Bank has contracted a team of security consultants to review its systems.

2002-04-25 **crimina hacking bank penetration data theft automated teller machine ATM trial conviction prison sentences**

Security Wire Digest 4 32

RUSSIAN ATM CRACKERS SENT TO PRISON
Two leaders of a Russian hacker group received five-year prison sentences for their roles in stealing almost a million dollars from foreign bank accounts after manipulating automatic teller machines (ATM) in Moscow. More than 6,000 people were victims of the thefts, according to a news report. Zviadi Beria and Vladimir Medvedov, who adamantly denied their guilt, were each sentenced to five years in prison. The group's main organizer, Yuri Levashov, cooperated with authorities and received a three-year sentence, with immediate release due to a special arrangement. Four others were given three-year suspended sentences.

2002-05-05 **penetration confidentiality data leakage Web defacement management response**

RISKS 22 05

Midwest Express Airlines distributed the following announcement about a hack:

On the morning of Monday April 22, Midwest Express Airlines was informed that customer profile data had been published on the Internet, specifically on the U.S. Space and Naval Warfare Systems Command Web site. The data published contained a handful of user profiles including names and e-mail addresses. This screenshot of data was captured from the Midwest Express test server, not the actual Web site. This test server is used for testing new enhancements to www.midwestexpress.com.

Midwest Express has always taken steps to ensure security. As a result of this situation, a number of additional precautionary measures were taken to ensure that customer data was protected:

* The U.S. Space and Naval Warfare Web site immediately removed the defaced Web page from the Internet.

* A security company was contracted to eliminate any vulnerability to our test server.

* All customer passwords to Web profiles were changed to protect and restrict access to the customer data.

Since all passwords have been changed, the next time you visit midwestexpress.com and login to your profile, you will be prompted to change your own password upon successfully answering a challenge/response question that you created.

While Midwest Express is confident in the security of its Web site, we are always assessing our Web site for potential vulnerabilities and taking appropriate steps when needed. We assure you that your customer information, purchases and other transactions are secure.

NewsScan; http://www.nytimes.com/2002/05/17/technology/17IDEN.html

CREDIT REPORTS STOLEN FROM EXPERIAN DATABASE
Network vandals have stolen 13,000 credit reports in recent months from Experian, a national reporting agency. An Experian executive said, "I've never seen anything of this size. Privacy is the hallmark of our business. We're extraordinarily concerned about the privacy issue here, and the trust factor." The intruders used an authorization code from Ford Credit to obtain the reports, which gave the intruders access to each victim's personal and financial information, including address, Social Security number, bank and credit card accounts and ratings of creditworthiness. Ford has sent letters via certified mail to all 13,000 people, urging them to contact Experian and the two other major credit reporting companies, Equifax and TransUnion, and to report any evidence of abuse to the FBI. RISKS, FINDLAW 22 10

Computer hackers have cracked into the California state personnel database and gained access to financial information for all 265,000 state workers, including Governor Gray Davis, officials said Friday [May 2002]. The database, housed at state's Teale Data Center in Rancho Cordova, holds names, Social Security numbers, and payroll information for everyone from office workers to judges. Authorities said that so far they have found no evidence that the information has been used illegally. <http://www.sfgate.com/cgi-in/article.cgi?file=/chronicle/archive/2002/05/25/MN179392.DTL>

NewsScan

YALE ACCUSES PRINCETON OF HACKING INTO ADMISSIONS RECORDS
Princeton University has admitted that its admissions personnel hacked into rival Yale's computer system to check on the applications status of 11 students who also had applied to Princeton. The university has suspended with pay its associate dean and director of admissions, and a spokeswoman expressed deep regret "that information provided by students in good faith to the university was used inappropriately by at least one official in our admissions office." The perpetrator(s) apparently were easily able to access the students' records via the publicly available Yale.edu Web site because they already had the students' passwords -- the names, Social Security numbers and dates of birth they had provided on their Princeton applications. The site had been set up with a feature that enabled students to check on the status of their applications themselves. The founder of one electronic-rights group noted that while Princeton's actions clearly were wrong, it was foolish of Yale to rely on Social Security numbers and birth dates to secure student data. "It's not enough to have a weak Web site and depend on the good ethical behavior of others not to penetrate it," he said. "Similarly, it is not adequate to say that just because you found the weak Web site you should go ahead and penetrate it." (Wall Street Journal 26 July 2002)

PRINCETON'S PUNISHMENT FOR COMPUTER VANDALS
Princeton University has decided on the punishment for two Admissions Office officials responsible for the invasion of Yale University's computer system to obtain applicant files: the one who actually did the breaking in will be transferred to another job, and the dean to whom he reported will be allowed to retain his position until his scheduled retirement next June. Princeton president Shirley M. Tilghman says the university has learned from this episode of computer vandalism: "One of the lessons of this experience is that even individuals with a high degree of sensitivity to ethical principles in traditional settings can fail to be equally sensitive when technology is involved," she said, "as when someone who would never open a sealed envelope addressed to another person enters a secured Web site." (New York Times 14 Aug 2002)

2003-02-24 **criminal hackers hacking America Online AOL customer database private personal sensitive information disclosed**

NIPC/DHS

February 21, Wired — Hackers compromise security at AOL.

Hackers have compromised security at America Online, potentially exposing the personal information of AOL's 35 million users. The most recent exploit, launched last week, gave a hacker full access to Merlin, AOL's latest customer database application. Merlin, which runs only on AOL's internal network, requires a user ID, two passwords and a SecurID code; hackers obtained all of these by spamming the AOL employee database with phony security updates, through online password trades, or by "social engineering" attacks over AOL's Instant Messenger (AIM) or the telephone. Another hole has allowed hackers to steal AIM screen names, even those of AOL staff members and executives. Most at risk are screen names that hackers covet, like Graffiti, or single-word names like Steve. While many of these hacks utilize programming bugs, most hackers are finding it far easier and quicker to get access or information simply by calling the company on the phone. These social engineering tactics involve calling AOL customer support centers and simply asking to have a given user's password reset. Logging in with the new password gives the intruder full access to the account.

2003-03-07 **criminal hacker hacking penetration theft sensitive private data university students Austin**

NIPC/DHS

March 06, American Statesman — Hackers steal vital data about university students and staff.

Computer hackers have obtained the names, Social Security numbers, and e-mail addresses of about 59,000 current and former students, faculty members and staff at the University of Texas at Austin in one of the largest cases of potential identity theft ever reported. Authorities do not know whether the information has been put to illegal uses such as obtaining credit cards or withdrawing money from financial accounts. Law enforcement officials were expected to obtain and execute search warrants late Wednesday in Austin and Houston at homes where computers are thought to have been used in the cyberspace break-in. UT officials said the computer breach could easily have been prevented with basic precautions, adding that the incident will prompt them to redouble security measures and to accelerate a plan to phase out most uses of Social Security numbers on campus. The university has set up a Web site - www.utexas.edu/datatheft - where it plans to post information. A telephone hot line will also be established, possibly staffed round the clock seven days a week, said Don Hale, vice president for public affairs. The university has reported the theft to the FBI, the Austin Police Department, the Travis County district attorney's office and other authorities.

2003-03-18 **hacking penetration theft conviction University Texas Austin sensitive private information**

NIPC/DHS

March 15, Washington Post — Student charged with hacking at U-Texas.

Federal prosecutors charged a University of Texas student Friday with breaking into a school database and stealing more than 55,000 student, faculty and staff names and Social Security numbers in one of the nation's biggest cases of data theft involving a university. Christopher Andrew Phillips, 20, a junior who studies natural sciences, turned himself in at the U.S. Secret Service office in Austin. He was charged with unauthorized access to a protected computer and using false identification with intent to commit a federal offense. Authorities had announced the cyber-theft last week. There is no evidence that Phillips disseminated or used the information, officials said. Phillips was released without bail and will have "limited access to computers," Johnny Sutton, U.S. attorney for western Texas, said at a news conference. If convicted, Phillips faces as many as five years in prison and a $500,000 fine, Sutton said.

2003-03-19 **hacking compromise Army Web server Windows 2000 vulnerability exploit Microsoft CERT CC**

NIPC/DHS

March 18, Federal Computer Week — Army Web server hacked.

A hacker last week exploited a previously unknown vulnerability in Microsoft Corp.'s Windows 2000 operating system to gain control of an Army Web server. Russ Cooper of security services company TruSecure Corp. said that on March 10 the hacker used an attack code to operate the Army system as if he or she had the highest security clearance and therefore was able to gain complete control of the system. The Army identified the problem after performing a network scan and finding data output from a port on one of its internal servers to an "unspecified region," he said. Both Microsoft and Carnegie Mellon University's CERT Coordination Center issued security warnings about the "buffer overflow" vulnerability and Microsoft has developed a patch, available on the Microsoft Web site, to fix it. The vulnerability affects systems running Microsoft Windows 2000 with Internet Information Server (IIS) 5.0 enabled and the code exploits an unchecked buffer in the WebDAV protocol. Exactly which Army computer was attacked, the sensitivity of the data contained on the system, and the attacker's intentions are still unknown. Compounding the surprising nature of an attack on a Defense Department system is the fact that this was a previously unknown vulnerability, or "zero-day exploit," which are extremely rare in the computer security arena. Vendors often issue patches before hackers have infiltrated a system.

2003-03-24 **criminal hackers hacking penetration National Security Agency NSA US**

NIPC/DHS

March 20, SecurityFocus — Hackers claim NSA breach.

Hackers claim to have compromised a computer at the National Security Agency (NSA). However, instead of obtaining a cache of highly-classified documents about the NSA's global surveillance work, the purported hackers mostly found biographies of agency personnel, and a handful of routine, correspondences between NSA spokespersons and media outlets. Journalist and NSA expert James Bamford says the apparent breach probably isn't a threat to national security. "I certainly don't think that it's acceptable that even unclassified computers can be hacked into there, but it doesn't sound like they've gotten beyond the non-classified computers in public affairs," said Bamford. An e-mail message sent to the hackers' address in Switzerland was not immediately answered Thursday. The group signed their message "Nescafé Open Up", the slogan of an ad campaign for flavored instant-coffee. The hackers' motives are unknown at this time.

2003-04-09 **criminal hacking Russia hacker hospital systems Al-Jazeera Trojan access**

NIPC/DHS

April 07, Associated Press — Ely hospital hacker traced to former Soviet Union.

A hacker who invaded the computer system at William Bee Ririe Hospital in Ely, Nevada, has been traced to the former Soviet Union, authorities said. The FBI said the hacker used the Web site of Al-Jazeera, the Arab news network, as a conduit to the hospital. Officials at the hospital said patient records are safe, but added that the cyber intruder may have accessed employee Social Security and bank information. Jim Crosley, information technology manager for the Ely hospital, detected the Ely break-in on March 20. He said the system seemed to be protected from attacks, but the FBI lab's analysis of the hospital's hard drives showed a game program, "Blaster Ball," contained a Trojan horse, a hidden code that acted as a beacon and let hackers into the hospital's system. "Two employees admitted downloading the game from the Internet and installing it at a work station," Crosley said. "The Trojan horse reported back to the hackers, and the system was compromised."

2003-07-30 **Kentucky government computers french hackers user password files computer security Ed Hatchett**

NIPC/DHS

July 30, Associated Press — French hackers break into Kentucky government computers.

State investigators in Kentucky believe French hackers have been using the Transportation Cabinet's computers to store pirated computer files including newly released movies and video games. State auditor Ed Hatchett said he believed the hackers entered the system on April 2, and have been using it since. Because they also gained access to the system's administrator and user password files, they could be able to manipulate any state file on the infected network, Hatchett said. Based on the Internet addresses investigators were able to trace, they suspect the hackers were from France, said B.J. Bellamy, chief information for the auditor's office. Other Internet addresses they found were based in Canada and Croatia, he said. Transportation Cabinet inspector General Bobby Russell said the department had already been working to tighten its computer security system before the auditor's findings.

2003-11-12 **criminal hacker hacking penetration Australian Defense top-secret data information file**

NIPC/DHS

November 10, Australian Associated Press — Hackers reach Australian Defense files.

Hackers have reportedly accessed top-secret files inside the Australian Department of Defense. "There have been three incidents in which an external security breach has led to unauthorized access to computer systems," Senator Hill had told an inquiry into computer security in the public service. According to the minister, the Defense Department also reported 13 cases since 2000 of its own staff trying to hack into computer systems without authorization. A review of electronic security inside commonwealth agencies has reportedly uncovered a culture of theft and lax security inside the public service. The inquiry comes amid a series of thefts of computers containing classified information from a customs office at Sydney Airport and the Transport Department in Canberra. Submissions by the major departments to the Joint Committee of Public Accounts and Audit has found that more than 1600 computers have vanished since 1998. Senator Hill said three computers stolen in the past two years contained information classified as "secret", but they had been recovered and the risk to national security had been assessed as low, he told the inquiry in a memo.

2004-03-17 **hacking attack penetration announcement California disclosure law**

NIPC/DHS

March 12, Security Focus — Hosting company reveals hacks, citing disclosure law.

Citing California's security breach disclosure law, Texas-based Allegiance Telecom notified 4,000 Web hosting customers this week of a March 3 computer intrusion that exposed their usernames and passwords. The law, called SB 1386, took effect July 1, 2003. It obligates companies doing business in California to warn their customers in "the most expedient time possible" about any security breach that exposes certain types of information: specifically, customers' names in association with their social security number, drivers license number, or a credit card or bank account number. Attorneys have warned that SB 1386 applies to e-commerce companies nationwide if they house information on residents of California. The intrusion did not directly expose information covered by the law, according to the company. Instead, the intruder pilfered thousands of passwords protecting customers' Web hosting accounts. Because many of those accounts are held by e-commerce companies, Allegiance issued the notice anyway, informing clients that SB 1386 may now oblige them to pass on the warning to their California customers if they accept personally identifiable information.

2005-01-11 **hacker penetration T-Mobile wireless product manufacturer customer private information disclosure**

DHS IAIP Daily; http://www.securityfocus.com/news/10271

HACKER PENETRATES T-MOBILE SYSTEMS.

A sophisticated computer hacker had access to servers at wireless giant T-Mobile for at least a year. Twenty-one year-old Nicolas Jacobsen was charged with the intrusions last October, after a Secret Service informant helped investigators link him to sensitive agency documents that were circulating in underground IRC chat rooms. The informant also produced evidence that Jacobsen was behind an offer to provide T-Mobile customers' personal information to identity thieves through an Internet bulletin board, according to court records. Jacobsen could access information on any of the Bellevue, Washington-based company's 16.3 million customers, including many customers' Social Security numbers and dates of birth, according to government filings in the case. He could also obtain voicemail PINs, and the passwords providing customers with Web access to their T-Mobile e-mail accounts. Jacobsen faces two felony counts of computer intrusion and unauthorized impairment of a protected computer in a federal case in Los Angeles, currently set for a February 14th status conference.

FBI SHUTS DOWN UNCLASSIFIED E-MAIL SYSTEM.

The FBI said Friday, February 4, it has shut down an e-mail system that it uses to communicate with the public because of a possible security breach. The bureau is investigating whether someone hacked into the www.fbi.gov e-mail system, which is run by a private company, officials said. "We use these accounts to communicate with you folks, view Internet sites, and conduct other non-sensitive bureau business such as sending out press releases," Special Agent Steve Lazarus, the FBI's media coordinator in Atlanta, said in an e-mail describing the problem. The FBI computer system that is used for case files, classified and sensitive information, and internal communications is unaffected, Lazarus said.

SCAMMERS ACCESS CHOICEPOINT DATA ON 35,000

ChoicePoint confirmed on 15 Feb that criminals recently accessed its database of consumer records, potentially viewing the personal data of about 35,000 Californians and resulting in at least one case of identity fraud. The unidentified individuals posed as legitimate businesspeople in order to [breach]* its defenses. Chuck Jones, a company spokesman, said that roughly 50 fraudulent accounts were set up by the schemers, through which they could view the data of California residents.

News of the crime first surfaced when ChoicePoint sent an e-mail to individuals potentially affected by the attack last week. Among the data available through the company's services, and possibly accessed by the criminals, are consumers' names, addresses, Social Security numbers and credit reports.

(Matt Himes in news.com , relayed via RISKS by Monty Solomon)

UNIVERSITIES REJECT STUDENTS WHO CHECKED THEIR ADMISSION STATUS ONLINE

[In early March 2005, some students tried to check the status of their applications to various graduate schools by using information published in an online forum on how to find their records. Several schools responded by rejecting those candidates, provoking some controversy about whether the students had done anything wrong in the first place and whether the response was draconian. Mony Solomon summarized the university response and Peter Neumann summarized some of the controvery in the following RISKS posting.]

Sloan School of Management has joined Carnegie-Mellon and Harvard in rejecting applications from prospective students who hacked into a website to learn whether they had been admitted before they were formally notified. 32 MIT applicants reportedly took a peek, along with 1 at CMU, 119 at Harvard, and 41 at Stanford. The Web site is run by ApplyYourself, and also used by other business schools. Its access was compromised by a posting on a BusinessWeek Online forum. [PGN-ed from Robert Weisman, *The Boston Globe*, 8 and 9 Mar 2005]

[Dave Farber's IP list had several responses. Rejected applicants considered their treatment excessive. One candidate saw only a blank page at ApplyYourself, but was rejected for having accessed the site. Dave Lesher wrote

> What's the B-schools' culpability in contracting out a process to a company with inadequate security? [Presumably] the schools demanded SSN's and other financial data from the applicants. Was there informed consent by the applicants to have their data shared with, in effect, a data broker? Could they apply WITHOUT so agreeing?

Joe Hall wrote

> What strikes me is how constructing a URL that is available to students without any further authentication or protection is considered "hacking". That's inevitably diluting any geek cred. held by any of us who are even crappy hackers!

Joe also noted Ed Felten's post on this subject at http://www.freedom-to-tinker.com/archives/000780.html

PGN wonders what if a competing candidate had masqueraded as other candidates to see if others had been accepted, and thereby wound up getting them all rejected! Could that be a suitable defense for the rejected students? PGN]

2005-03-17 **Boston College alumni database Social Security Numbers information disclosure virus data leakage**

EDUPAGE; http://news.zdnet.com/2100-1009_22-5623084.html

VIRUS INFECTS BOSTON COLLEGE ALUMNI DATABASE

A computer at Boston College with access to an alumni database has been found to be infected with a virus that may have exposed personal information on more than 100,000 individuals. According to officials at the college, the computer was operated not by the college but by a third-party IT service, which officials declined to name. Although no evidence has so far surfaced that any of the information in the database was in fact accessed by hackers, officials decided to notify anyone who might have been affected. Jack Dunn, spokesperson for Boston College, said, "We thought it was necessary to send out the precautionary advisory to alert the alumni and to offer them steps that they could take to ensure their privacy." Dunn also noted that Boston College will hereafter delete Social Security numbers from its records, despite their usefulness in maintaining accurate records. Social Security numbers have lately been highlighted as one of the pieces of personal information that pose the greatest risk for identity theft. Members of Congress have recently proposed strict restrictions for how and when Social Security numbers can be gathered and sold. ZDNet, 17 March 2005

EDUPAGE; http://www.post-gazette.com/pg/05077/473361.stm

DARTMOUTH DECIDES TO PENALIZE, BUT NOT ELIMINATE, HACKERS

Applicants to the Tuck School of Business at Dartmouth College who used a hacker's tips to try to access admissions records were not automatically disqualified, though their actions were considered by school officials in their admissions decisions. The decision to consider applications of those involved in the hacking was made after consultations with faculty and staff and with the appliants themselves. Unlike officials at Harvard University, Duke University, MIT, and Carnegie Mellon University, administrators at Dartmouth decided that the hacking, while serious, "did not reach the level that would necessarily bar a person from being a valued member of the Tuck community," according to Paul Danos, dean of the school. Attempting to access restricted records was viewed by the school as "a very important negative factor" in considering the applications, but ultimately the school's decision did not rest on that single factor. Of the 17 applicants involved, some were admitted, and those who enroll will be monitored and counseled. The incident will also become a part of their files. Pittsburgh Post-Gazette, 18 March 2005

2005-03-18 **criminal hackers Web site vulnerability exploit consequences university admissions ethics**

http://www.post-gazette.com/pg/05077/473361.stm

APPLY YOURSELF TO BREAKING INTO … APPLYYOURSELF, INC.

Criminal hackers posted instructions on March 2, 2005 on how to break into the ApplyYourself Inc. database online, a repository of applications used by many universities to track applicants.

About 150 candidates did break into the database and were identified because they looked at their own applications. Most of the six top business schools involved in the breakin rejected the applicants outright. However, Dartmouth College's Tuck School of Business decided to count the breakins as a factor detracting from an applicant's suitability but not absolutely barring their admission. Stanford University's business school had not yet decided on a firm policy by mid-March. Ethicists pointed out serious problems with the laissez-faire attitude of these schools.

BOSTON COLLEGE LOSES THOUSANDS OF SSNs

[Same case as one in VIRUS INFECTS BOSTON COLLEGE ALUMNI DATABASE entry]

Geoff Kuenning summarized yet another after-the-fact response to a breach of confidentiality:

Hackers have invaded a Boston College database of alumni, compromising data on up to 100,000 people. The data includes Social Security Numbers. In a choice quote, Jack Dunn of BC ``noted that Boston College will hereafter delete Social Security numbers from its records, despite their usefulness in maintaining accurate records."

Question: If every organization that currently stores SSNs waits until *after* they are hacked before they decide that maybe it's not smart to expose sensitive data, how many Americans will be left with uncompromised SSNs?

Liability laws are desperately needed.

HACKER(S) BROKE INTO CMU COMPUTERS

Monty Solomon summarized another attack on university data:

A hacker [or hackers] who tapped into business school computers at Carnegie Mellon University may have compromised sensitive personal data belonging to 5,000 to 6,000 graduate students, staff, alumni and others. The breach confirmed by officials in the Tepper School of Business is the latest in a recent string of campus computer break-ins nationally and the second since early March affecting Tepper. There is no evidence that any data, including Social Security and credit card numbers, have been misused, officials said. But they have begun sending e-mails and letters alerting those affected. They include graduate students and graduate degree alumni from 1997 to 2004, master's of business administration applicants from September 2002 through May 2004, doctoral applicants from 2003 to this year, and participants in a conference that was being arranged by the school's staff.…

Bob Heuman commented:

Another case of not knowing how long the exposure existed and therefore how much exposure the personal information really had. Once again we have Social Security Numbers, credit card data, etc. exposed for an indeterminate amount of time. I have gone to the university's own web site and the Tepper School web site and neither has any mention of this report as of the time I checked, which is Apr 21 at 4:45PM EDT.

EDUPAGE; http://online.wsj.com/article/0,,SB111569768679229042,00.html

FBI THWARTED COMPUTER ATTACKS

An investigation into the theft of part of the operating system software for Cisco routers has prevented network attacks on government and university computers, according to the FBI. In May 2004, a hacker was able to access Cisco's software and reportedly used that information to compromise networks at several military installations and at the National Aeronautics and Space Administration. Computers at the Argonne National Laboratory, the National Center for Supercomputing Applications, and the San Diego Supercomputer Center were also compromised. The FBI said that law enforcement action has apparently ended the break-ins. As part of the investigation, authorities in Sweden detained a teenager thought to be involved in the malicious activity, though it remains unclear whether U.S. authorities will be able to prosecute that person.

CVS FIXES PRIVACY HOLE

The CVS Corp.has cut off Web access to ExtraCare card holders' detailed purchase information after a consumer group showed reporters how easily an intruder could log into the system and find out, say, how many condoms or enema kits someone's bought. CVS has issued about 50 million of the loyalty cards, which allow the drugstore chain to track each customer's purchases and, in exchange, provide a 2-percent rebate on those purchases, along with customized coupons. To log into your account on CVS.com, all you need is the card number, your ZIP code, and the first three letters of your surname. Even now, anyone with that information can easily find out the card holder's home address, phone number, and total purchases each quarter. But until last week, the Web site also allowed customers to request a detailed purchase report to be e-mailed to them -- to any address they put in….

2005-07-15 **data theft confidentiality credit card hack**

Crypto-Gram

CARDSYSTEMS SOLUTIONS HACKED -- 40M PEOPLE AFFECTED

Bruce Schneier wrote, "The personal information of over 40 million people has been hacked. The hack occurred at CardSystems Solutions, a company that processes credit card transactions. The details are still unclear. The New York Times reports that "data from roughly 200,000 accounts from MasterCard, Visa and other card issuers are known to have been stolen in the breach," although 40 million were vulnerable. The theft was an intentional malicious computer hacking activity: the first in all these recent personal-information breaches, I think. The rest were accidental -- backup tapes gone walkabout, for example -- or social engineering hacks. Someone was after this data, which implies that's more likely to result in fraud than those peripatetic backup tapes.

CardSystems says that they found the problem, while MasterCard maintains that they did; the New York Times agrees with MasterCard. Microsoft software may be to blame. And in a weird twist, CardSystems admitted they weren't supposed to keep the data in the first place."

2005-07-22 **hacker hacking penetration perimeter breach University of Colorado information disclosure Social Security Numbers**

EDUPAGE; http://www.thedenverchannel.com/technology/4757407/detail.html

CU COMPUTERS HACKED

Officials at the University of Colorado said hackers gained access to two servers at the university, possibly exposing personal information on nearly 43,000 students and employees of the institution. One server, at the College of Architecture, contained data on 900 individuals; the other, at the university's health center, included information for another 42,000 people. The servers included names, Social Security numbers, addresses, and dates of birth, according to the university, but neither included credit card information. Still, university officials are advising those affected to monitor their credit reports for suspicious activity, and the university has set up a Web site and a hot line to answer questions. Investigators looking into the situation said that one hacker came through a server in France, while the other came through a server in Eastern Europe. University officials have no information so far that any of the personal data on the servers has been misused. The Denver Channel, 22 July 2005

DHS IAIP Daily; http://www.techweb.com/wire/security/166402258

HACKERS SPREADING SPYWARE FROM FREE PERSONAL WEBSITES

Attackers are using free personal Web hosting sites provided by nationally- and internationally-known ISPs to store their malicious code, and to infect users with worms, viruses, and spyware, a security firm said Monday, July 25. Websense, a San Diego, California-based Web security and content filtering vendor, has detected a big jump in the use of personal hosting sites, said Dan Hubbard, the company's senior director of security and technology research. "Attackers don't have to go to the trouble to find a compromised machine, search for one with a vulnerability they can exploit to turn into a zombie," said Hubbard. "Plus, they're reliable. Since they're offered up by national and international Internet service providers, they're built on a lot of infrastructure. Third, they often offer quite a bit of storage space, in some cases up to 500MB." The problem is that too few free hosting services offer even the most basic security tools, Hubbard said. None of the services found hosting malicious sites use a graphics-based question to make sure that a human, not a bot, registers for the service, he said.

CU SUFFERS ANOTHER HACK

Hackers broke into a server at the University of Colorado (CU), marking the third security breach in the past six weeks. The latest attack targeted servers that held information for the school's ID card, known as the Buff OneCard. Those servers included names, Social Security numbers, and photographs but not financial information. Potentially exposed in the attack is personal information for 29,000 students, some former students, and 7,000 staff members. Students who will be entering the university in the fall were not affected. Dan Jones, IT security coordinator, said it was not clear whether this attack was perpetrated by the same people who compromised two other servers recently. In April, CU had decided to move away from using Social Security numbers as identifiers for students, based on security problems at other institutions and the risk of identity theft. Some systems on campus, however, still use Social Security numbers to track students, according to Jones. Officials at the university said they will hire an independent auditing firm to assess the institution's security measures and will also evaluate some 26,000 computers to determine which could be placed behind a firewall. The Denver Post, 3 August 2005

HACKERS HIT ANOTHER UNIVERSITY

Sonoma State University, an hour north of San Francisco, has become the latest in a growing list of universities to suffer a hacker attack that put personal information of students and staff at risk. At Sonoma State, hackers in July gained access to several computer workstations, which allowed them to access a number of other computers before university staff detected and put an end to the intrusion. In all, the hackers had access to names and Social Security numbers of nearly 62,000 students, applicants, or employees of the university between 1995 and 2002. A spokesperson for the university said the hackers did not have access to financial information and noted that there is currently no evidence that any of the information has been misused. Nevertheless, the university is required by state law to contact individuals whose personal information has been compromised, and the university is working to do just that. The university has set up a Web site with information and is advising affected individuals to contact credit-reporting agencies to be on the lookout for possible identity fraud. SPAIN ARRESTS HACKER AFTER BREACH AT U.S. NAVY BASE

Spain's Civil Guard said on Monday, January 16, they had arrested a man who hacked into a U.S. Department of Defense computer, breaching security at a U.S. naval base in California. The man was part of a group of hackers which attacked more than 100 computer systems, including one at the U.S. Navy's Point Loma base in San Diego where nuclear submarines are maintained in dry docks. U.S. security services found someone had illegally accessed the computer and subsequently traced the link to Spain. Spanish authorities pinpointed the group in the southern city of Malaga and arrested one man. Many of the group were students though all were over 18. "They did it for the challenge, there's no implication of terrorism," a Civil Guard spokesperson said, adding that the man would face unspecified charges. The Guard did not say when the arrests or the hacking took place.

BRITISH PARLIAMENT ATTACKED USING WMF EXPLOIT.

The British Parliament was attacked late last year by hackers who tried to exploit a recent serious Microsoft Windows flaw, security experts confirmed on Friday, January 20. MessageLabs, the e-mail-filtering provider for the UK government, said that targeted e-mails were sent to various individuals within government departments in an attempt to take control of their computers. The e-mails harbored an exploit for the Windows Meta File (WMF) vulnerability. The attack occurred over the Christmas period and came from China, said Mark Toshack, manager of antivirus operations at MessageLabs, who added that the e-mails were intercepted before they reached the government's systems. The vulnerability with the way that WMF images are handled by Windows was discovered in November 2005. In a WMF attack, exploit code is hidden within a seemingly normal image that can be spread via e-mail or instant messages. The attack was individually tailored and sent to 70 people in the government, MessageLabs said. It played on people's natural curiosity by purporting to come from a government security organization. The Trojan was hidden as an attachment called "map.wmf".

DHS IAIP Daily; http://www.computerworld.com/securitytopics/security/hacking /story/0,10801,108195,00.html 23

HACKERS LURK IN AMD WEBSITE.

Advanced Micro Devices (AMD) Inc.'s customer support discussion forums on the forums.amd.com site have been compromised and are being used in an attempt to infect visitors with malicious software, an AMD spokesperson confirmed Monday, January 30. The problem was first reported Monday in a blog posting by Mikko Hypponen, manager of antivirus research at F-Secure Corp. in Helsinki. According to F-Secure's Hypponen, attackers are exploiting a widely reported flaw in the way the Windows operating system renders images that use the WMF (Windows Metafile) graphics format. This flaw was patched on January 5, so users who are running versions of Windows that have the latest patches installed are not at risk, he said. Attackers have figured out a way to use AMD's forums to deliver maliciously encoded WMF images to visitors, which are then used to install unauthorized software on the unpatched systems, he said. "Most of the tool bars show pop-ups, follow your search and other keyword activity, and use that to target ads to you," Hypponen said. "It's for-profit hacking. Somebody is making money from each machine that is hit by these tool bars."

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/content/article/2006/02 /13/AR2006021300387.html 23

MAN THREATENS TO ATTACK OLYMPIC COMPUTERS.

A would-be hacker was being investigated by police Monday, February 13, after threatening to attack the internal computer network of the Turin, Italy, Olympics organizing committee. The man -- a technical consultant for the Turin Organizing Committee -- illicitly gained access to off-limits sections of the network, police officer Fabiola Silvestri said. "This consultant -- who is now a former consultant -- said in a very strong way that he could do certain things to the network," Turin Organizing Committee spokesperson Giuseppe Gattino said. "Nothing has happened and all the passwords have been disabled."

In a separate case, police found that a Turin antiques dealer had acquired five Internet domains that had similar names to Olympic Websites. If accessed, the domains redirected users to the dealer's Website, which also carried Olympic logos and other copyrighted material, Silvestri said. Once he had been told that what he was doing was illegal, the dealer deleted the material and redirected users from his domains to Olympic Websites, she said.

2006-02-14 **hacker break in penetration University of Arizona journalism computers**

DHS IAIP Daily; http://www.azstarnet.com/metro/115789 23

ROMANIAN HACKER BREAKS IN TO UNIVERSITY OF ARIZONA JOURNALISM COMPUTERS.

Hackers broke into the computer system of the University of Arizona journalism department, and students were unable to use the computers Monday, February 13. All of the department's Apple Macintosh computers were affected and have been logged off the server and the Internet until the problem is solved, said Jacqueline Sharkey, head of the department. No information has been lost so far, she said. It was unclear Monday how long it would take to fix the security leak, she said. Department officials uncovered the problem during the weekend when they ran a security check on the computers. The computers are protected by a password, and Sharkey said she suspects that the hackers got through by trying "again and again and again." The security check showed that in other unrelated cases, hackers from Korea and Indonesia had tried to gain access to the system but were unsuccessful, she said.

HIGH-PROFILE COMPUTER BREACHES DRAW ATTENTION TO SECURITY.

In December, an intruder breached the security of two Iowa State University computers containing encrypted credit card numbers of athletics department donors and Social Security numbers of more than 3,000 university employees. An investigation determined that the intruder hacked into the computers to store and distribute pirated movies or music. The incident prompted efforts over the past four months to tighten security around sensitive information and a greater awareness among students, faculty and non-information technology staff that the threat of an attack exists and it is up to the entire university community to prevent another incident. Incidents such as the one at Iowa State have created greater awareness nationwide of the widespread threat of computer security breaches. According to a recent FBI survey of more than 2,000 businesses in Iowa, Nebraska, New York and Texas, nearly nine out of 10 suffered from a computer virus, spyware or other online attack in 2004 or 2005. Though most companies use security software, computer hacking techniques are also far ahead of what they were 18 months ago, according to Loras Even, managing director of RSM McGladrey Inc.'s Integrated Technology Solutions.

EDUPAGE; 23
http://news.yahoo.com/s/ap/20060424/ap_on_hi_te/ut_computer_breach

UT SUFFERS ANOTHER COMPUTER BREACH

Officials at the University of Texas at Austin (UT) said a hacker broke into a computer system at the university's McCombs School of Business and may have accessed sensitive data on nearly 200,000 students, faculty, and alumni. The breach is the second major incident for the university after a former UT student was found to have hacked into a university computer system in 2003. In that incident, the hacker accessed about 40,000 Social Security numbers. William Powers Jr., president of UT, said that the current incident, which may have begun as early as April 11, appears to have been limited to the business school. The university has set up a hotline for those whose information may have been compromised.

RISKS 24 26

ANOTHER SECURITY/PRIVACY BREACH AT THE UNIVERSITY OF TEXAS

Nearly 200,000 electronic records at the University of Texas at Austin's business school have been illegally accessed, including SSNs and possibly bio info on faculty, students, staff, and alums. The previous breach occurred in 2003, resulting in a former UT student receiving five years of probation and having to pay $170,000 in restitution for accessing almost 40,000 SSNs. Last year, a former UT student received five years probation and was ordered to pay $170,000 in restitution for hacking into the school's computer system in 2003 and accessing almost 40,000 Social Security numbers.

2000-04-05 **Web attack law enforcement deterrence arrest search warrant seizure evidence ISP**

RISKS 20 87

Ulf Lindqvist reported in RISKS that the operators of the Web site for the Swedish National Board of Health and Welfare (Socialstyrelsen) reported an attack to the National Police Computer Crime Squad so promptly that the police were able to find the perpetrator's home phone number from the ISP involved. Armed with a search warrant, they arrested a 16 year-old boy and seized his and his parents' computers. Lindqvist wrote, "What I personally find noteworthy in this story is how quickly the police reacted and that it could be a sign of the trend to treat computer crimes no differently than "low-tech" crime. When organizations see that it actually helps to call the police in cases like this, maybe they will be less reluctant to do so. The deterrent effect on would-be criminals by likely detection and immediate response should not be underestimated."

2003-05-02 **internet radio station site hacker damage Denver Colorado Larry Nelson w3w3 FBI e-mail**

NIPC/DHS

May 02, Rocky Mountain News — Hackers damage Internet radio site.

Hackers broke into the Web site of an Internet radio station in Denver, CO that's sponsoring a Denver conference next week aimed at thwarting computer break-ins. The attack is believed to have caused more than $50,000 in damage. Larry Nelson of the w3w3 network, the target of the attack and sponsor of the conference dubbed "Cyber Security Super Bowl," said the hackers got away with up to 1,000 names and e-mail addresses for people attending the conference. The conference will bring together industry and government experts from around the nation to discuss homeland defense and cybersecurity - a growing field that aims to protect computer systems from hackers. Nelson said the FBI and two cybersecurity firms probing the attack plan to use the case as a model to underscore the threat of Internet-based break-ins.

2003-07-02 **warning message 6000 websites hackers challenge.com Critical Infrastructure necessary measures security server**

NIPC/DHS

July 02, Associated Press — Warning of massive hacker attacks.

Hackers plan to attack thousands of Web sites Sunday in a loosely coordinated "contest" that could disrupt Internet traffic. Organizers established a Web site, defacers-challenge.com, listing in broken English the rules for hackers who might participate. The Chief Information Officers Council cautioned U.S. agencies and instructed experts to tighten security at federal Web sites. The New York Office of Cyber-Security and Critical Infrastructure Coordination warned Internet providers and other organizations that the goal of the hackers was to vandalize 6,000 Web sites in six hours, and urged companies to change default computer passwords, begin monitoring Web site activities more aggressively, remove unnecessary functions from server computers and apply the latest software repairs. The purported "prize" for participating hackers was 500-megabytes of online storage space, which made little sense to computer experts who said hackers capable of breaking into thousands of computers could easily steal that amount of storage on corporate networks.

2003-07-07 **hackers web vigilante-style attacks break-ins online vandalism small internet sites disrupted**

NIPC/DHS

July 07, Associated Press — Hackers limit disruption to small Internet sites.

A battle among hackers erupted on the Internet yesterday as some factions disrupted a loosely coordinated effort among other groups trying to vandalize Web sites around the world. Unknown attackers for hours knocked offline an independent security Web site that was verifying reports of online vandalism and being used by hackers to tally points for the competition. U.S. government and private technology experts warned last week that such vandalism was likely. After three such vigilante-style attacks, the hacker organizer extend the contest until 6 p.m. yesterday. With continued attacks disrupting the ability of vandals to claim credit for their break-ins, some experts said it could be later this week before damage from the weekend's hacking would be known. There were no reports of vandalism involving larger, more well-known Internet sites, which may be a testament to improved online security at large companies, government agencies and organizations.

2003-12-19 **NASA Websites hacked Brazilian defacement vandalism Netcraft PHP**

NIPC/DHS

December 18, ComputerWorld — NASA sites hacked. Thirteen NASA Websites were defaced Wednesday by a Brazilian crew dubbed drwxr, according to a statement from Zone-H, an organization that monitors hacking. Zone-H said the defacer apparently modified the index pages on the sites to express his opinion about the Iraq war. The main NASA Web site did not appear to be among those hit by the attack. Zone-H, citing Netcraft Ltd., a British Internet consultancy, said the sites were running the Apache 1.3.27 Web server with PHP (an open-source scripting language often used to create dynamic Web pages) and several Apache modules on a Linux system. "We can suppose that the server was remotely compromised using a vulnerability in a PHP script, then the defacer probably gained root privileges using the local root exploit for the Linux kernel 2.4.22 published by iSEC Security Research last week." NASA spokesman Brian Dunbar confirmed that the sites had been hacked and defaced and said the agency had taken them offline. The hacked NASA Web sites include its Computing, Information and Communications Technology Program site; the NASA Advanced Supercomputing Division; the NASA Information Power Grid; and the NASA Research & Education Network.

DHS IAIP Daily; http://www.washingtonpost.com/wp−
dyn/content/article/2005/06 /02/AR2005060201604.html?nav=hcmodule

MICROSOFT SAYS MSN WEBSITE HACKED IN SOUTH KOREA

Microsoft acknowledged Thursday, June 2, that hackers booby-trapped its popular MSN Website in South Korea to try to steal passwords from visitors. The company said it was unclear how many Internet users might have been victimized. Microsoft said it cleaned the Website, http://www.msn.co.kr and removed the dangerous software code that unknown hackers had added earlier this week. A spokesperson, Adam Sohn, said Microsoft was confident its English-language Websites were not vulnerable to the same type of attack. The Korean site, unlike U.S. versions, was operated by another company Microsoft did not identify. Microsoft's own experts and Korean police authorities were investigating, but Microsoft believes the computers were vulnerable because operators failed to apply necessary software patches, said Sohn, an MSN director. MSN Korea said the only site affected by the hacking was the MSN Korea news site: http://news.msn.co.kr

DHS IAIP Daily; http://www.internetnews.com/security/article.php/3512081

HACKERS DEFACE KOREAN MOZILLA WEBSITE

The Korean language Mozilla Website was hacked and defaced last week, prompting calls from some corners of the open source community to gain control of the independent site. The job was likely the work of the notorious Simiens Crew, a Brazil-based outfit, and while the main page was not affected, other pages were replaced by the message "Simiens Crew ownz u viva os macacos." The phrase "os macacos" means "the monkeys" in Portuguese. It could be that the hackers simply have misspelled their own name, according to MozillaZine, a Web-based forum for the browser's enthusiast. The proper spelling is "Simians" and means apes. The crew has attacked several high-profile sites, often exploiting a vulnerability in the AWStats log file analyzer, according to MozillaZine. While Mozilla Europe, Mozilla Japan and Mozilla China have an official affiliation with the foundation, the Korean language Website has no official connection. Channy Yun, leader of Mozilla Korean Community, said the hack happened because there was not a patch for a PHP vulnerability for the company hosting mozilla.or.kr. He assured users he would backup and fix the problem with the ISP.

2002-05-14 **cell phone wireless clone fraud differential cryptanalysis**

NewsScan

ATTACK OF THE PHONE CLONERS
A team of engineers from IBM and the Swiss Federal Institute of Technology have found a way to capture the data necessary to "clone" a cell phone in 60 seconds. Previous methods used to copy the identifying data that enables calls to be charged to another person's phone took about eight hours. The researchers found that they could gain valuable information about the numerical "key" a phone uses to uniquely identify its owner by timing how long the phone's chip took to complete certain tasks and by measuring changing current flows across the chip. Taken together, the information revealed what was being done to the numerical key. The researchers say that chips can be protected against this type of espionage by making sure all computational tasks take the same amount of time, or by changing the way a chip carries out certain computations. 2003-02-18 **telephone PBX phone fraud hacking Taiwan credit card information stolen scam**

NIPC/DHS

February 14, SC Infosecurity News — Taiwanese telco virtual operator system hacked.

Chungwa Telecom of Taiwan has issued warnings about its virtual telephone operator service, which allows the company's staff to act as PBX operators for those Taiwanese companies without their own operator staff. Hackers have been taking advantage of companies that had not changed their control PIN from the default settings of 0000, 9999 or 1234. The result has been that hackers have been able to intercept calls originally destined to be handled by Chungwa's operators, routing to their prepaid (and anonymous) mobile phones. The hackers are said to have taken card details from callers and used the information to swindle them. Taiwan's Morning Post newspaper says that Chungwa Telecom has not revealed the scale of the problem, or the names of the companies affected, although the paper says the firms are known to be in the courier and allied business markets. The paper adds that affected customers' claims have been settled, while police are investigating the scam. The firms affected by the scam are said to have suspended their use of the virtual operator facility, switching back to using their own staff to answer calls.

2003-06-10 **compromising PBX Private Brach Exchange systems voice mail internet service providers overseas Bill Murray FBI 911 center**

NIPC/DHS

June 10, Washington Post — Phone networks open doors for hackers.

Federal law-enforcement officials said last week that they are tracking numerous reports of hackers who gain access to corporate voice mail and telephone systems to launch Internet attacks. The hackers, according to the Department of Homeland Security (DHS), tap into corporate phone systems, or private branch exchange (PBX) systems, using them to make long-distance calls to Internet service providers in other cities or overseas. Hackers compromising PBX systems can use them as entryways into computer systems, said Lisa Pierce, a research fellow for the Giga Information Group. From there they can steal corporate information, eavesdrop on conversations and create havoc on the system because no one knows where the attacks are coming from, she said. FBI cyber division spokesman Bill Murray said poorly secured PBX systems also present a serious national security threat. A hacker could use a compromised PBX system to route dozens of calls simultaneously to an emergency 9-1-1 center, overloading the emergency call center and preventing real emergency calls from getting through. A tutorial on locking down PBX and voicemail systems is available from the National Institute of Standards & Technology at: http://www.csrc.nist.gov/publications/nistpubs/800-24/sp800- 24pbx.pdf

2003-06-25 **phone phreaking victims pay AT&T**

NIPC/DHS

April 21, New York Times — AT&T trying to collect bills from the victims of hackers.

The city of East Palo Alto, CA, is battling with AT&T over who is responsible for a $30,000 long-distance phone bill that resulted from voice mail hacking. Last summer, hackers in the Philippines and Belgium penetrated the agency's voice mail system, operated by SBC Communications, the local phone service provider, by figuring out system pass codes. AT&T wants the city to pay the bill for the fraud, which it says was the customer's responsibility to prevent. It offered a settlement in which it would pay 30 percent of the charges, but the city says the company should pay the whole thing. Voice mail hackers have discovered that if voice mail customers do not change their default pass code when the system is set up, they can sometimes break in by figuring out assigned pass codes. Hackers breaking into the system then change the outgoing message to one that automatically accepts collect calls. Once connected, the hackers can leave the line open for hours, charging up enormous bills. AT&T now requires that individuals accepting collect calls, besides having to respond "yes" when prompted, also enter a three-digit number.

June 25, SecurityFocus — AT&T lets phone fraud victims off the hook. AT&T said Wednesday that it would forgive all of the outstanding long distance charges that the company had been trying to collect from victims of the so-called "Yes-Yes" voicemail subversion fraud. Last year fraudsters began cracking weak and default PINs on individual and small business voice mail boxes provided by local phone companies, then changing the outgoing messages to say "yes, yes, yes" over and over again. The newly-agreeable voice mail could then be used for third-party billings. The scam left scores of victims holding liable for thousands of dollars of long distance calls they never made-typically between $8,000 and $12,000. AT&T insisted that the victims pay up, arguing that it was the consumer's poor voice mail security that was at fault. When pressed, the company sometimes offered to absorb 35% of a fraudulent billing. The company announced Wednesday that it's will abandon those collection, but the amnesty offer only applies to past victims of this particular type of fraud.

2003-09-11 **Voice mail hijacked passwords small businesses outgoing messages protection accept collect calls Yes positive**

NIPC/DHS

September 11, KIRO TV (Seattle, WA) — Voice mail hijacked to accept collect calls from crooks.

The words "Yes, Yes, Yes" usually mean something positive, but not in this case. A new con uses these three words to rip off voice mail users. Maureen Claridge says she got stuck with a large phone bill because someone hijacked her voice mail. Maureen's voice mail usually sounded like this: "This is Maureen; I'm in the office, but on the other line, leave a number and I'll get back to you as soon as I can." But a crook hacked into it and recorded the words "yes, yes, yes." The crooks target people who have simple voice mail passwords. They use the password to hack into the system and change the message to accept collect calls. Then they ask you a series of questions, usually three, and the answer is "yes, yes, yes." The voice mail telephone company says small business people are often targeted, because they don't answer their phones on the weekend. To protect yourself, check your outgoing message from time to time and change your password to something only you would know.

CABLE MODEM HACKERS CONQUER THE CO-AX
(Kevin Poulsen, SecurityFocus)

A small and diverse band of hobbyists steeped in the obscure languages of embedded systems has released its own custom firmware for a popular brand of cable modem, along with a technique for loading it -- a development that's already made life easier for uncappers and service squatters, and threatens to topple long-held assumptions about the privacy of cable modem communications. The program, called Sigma, was released in its final version last month, and has reportedly been downloaded 350 to 400 times a day ever since. It's designed to be flashed into the nonvolatile memory of certain models of Motorola's Surfboard line, where it runs in parallel with the device's normal functionality. It gives users almost complete control of their cable modem -- a privilege previously reserved for the service provider. The project is the work of a gang of coders called TCNiSO. With about ten active members worldwide, the group is supported by contributions from the uncapping community -- speed-hungry Internet users who rely on TCNiSO's research and free hackware to surmount the bandwidth caps imposed by service providers, usually in violation of their service agreement, if not the law. To them, Sigma is a delight, because it makes it simple to change the modem's configuration file -- the key to uncapping, and, on some systems, to getting free anonymous service using "unregistered" modems. "I've known TCNiSO for two years now and I've done a lot of things with their techniques," wrote a Canadian uncapper in an e-mail interview. "Sigma is the greatest one I've seen." …

2005-04-05 **New York state law target modem hijacking consumer international phone calls phreaking service theft**

DHS IAIP Daily; http://www.nytimes.com/aponline/technology/AP−Modem−Hijackin g.html

NEW YORK LAWMAKERS TARGET MODEM HIJACKING

New York state lawmakers unveiled a bill Monday, April 4, that is believed to be the first in the nation to target modem hijacking, a practice in which thieves tap into people's computer modems to make international phone calls. If passed, the law would allow telephone companies and the state attorney general to bring lawsuits against modem hijackers and their accomplices. The hijackers tap into people's modems by luring computer users to specific Websites – sometimes through e-mails – where pop-up windows emerge inviting the user to click on them. The windows authorize the downloading of modem software that is then remotely accessed to make international calls that are charged back to the user. Consumers can fight hijacking by using a dedicated phone line for the computer dial-up connection, then blocking international calls to that line. New York Legislature: http://www.state.ny.us

RISKS; http://www.wired.com/news/privacy/1,68370-0.html 23 95

HOTEL TV SYSTEM HACKED USING LAPTOP & TUNER

Adam Laurie, tech director of the London security and networking firm "The Bunker", apparently got bored on a recent trip and found the time to hack the hotel's TV system which lets customers not just watch 'normal' TV programming, but also, for a fee, provides access to not-safe-for-work flicks and access to the Internet including e-mail.

The article reports that a laptop running linux, its IrDA port and a USB TV tuner can be used to trick the TV into doing more than it was supposed to do, including gaining access to the NSFW content without being charged for it, snooping on other people's TV watching habits, their Internet browsing habits and their e-mails. Also, the "coding" system used for infrared-based access control to the hotel minibars doesn't seem to be insurmountable either.

[Abstract by Florian Liekweg]

The bill so far: Lost profit for the hotel, lost privacy for the customers, the possibility for corporate espionage. Return value: Easy network access. Good deal, eh?

2005-12-22 **British face fines Parliament companies software hijacks connection United Kingdom fraudulent text messages voice mails applications Trojan spam**

DHS IAIP Daily; http://news.com.com/British+rogue+dialers+face+heftier+fines /2100−1037_3−6005760.html?tag=cd.lede

British "rogue dialers" face heftier fines.

British Parliament members have agreed to raise the maximum fine that can be imposed against companies that operate "rogue dialer" software that hijacks a dial-up Internet user's Web Connection. Parliament on Wednesday, December 21, agreed that, as of Friday, December 30, companies caught abusing United Kingdom premium-rate services should be liable to fines of up to $434,281, up from the existing limit of $173,998. The higher fines will also apply to fraudulent text messages and voice mails that tell people they have won a prize. Many thousands of dial-up Internet users have fallen victim to rogue dialers throughout 2005. Once installed on a dial-up user's PC, the applications can secretly dial a premium-rate number. This has led some people to run up call charges of hundreds of pounds. It's thought that many rogue dialers are spread using Trojan horses contained within spam e-mails. Last month, Ofcom warned that there was "growing evidence of consumer harm" arising from rogue dialers.

FIND THAT LAPTOP! NEW TRACKING SOFTWARE FOR NOTEBOOKS
In response to an epidemic of laptop thefts, leading notebook makers IBM, Hewlett-Packard and Dell are offering software with their new machines that enable tracking as soon as their connected to the Internet. IBM, which offers ComputracePlus software from Absolute, says it's seeing growing demand from laptop customers in the education and enterprise markets. Service costs start at $49 for a 12-month license for a single computer. The tracking-agent software imperceptibly connects to Absolute's monitoring center whenever its user connects to the Internet. If the notebook is reported stolen or lost, its location is tracked and local law officials are called in to retrieve it. Although popular, this approach to laptop security does have some weaknesses. "A lot of people steal laptops for commercial espionage -- to get the data that resides on them," says an IDC analyst. "Those people will steal them without ever intending to go online." In other cases, a thief could reformat and configure the hard drive in a way that bypasses the tracking agent. "We'll survive a reformat of the hard drive, but where it gets tricky is when people reinstall operating systems on top of each other," says Absolute CEO John Livingston. Experts say this type of tracking system works best if it is part of a larger theft-prevention strategy that includes cable locks or motion-sensitive alarms. (CNet News.com 22 Aug 2002)

UNINTENDED CONSEQUENCES OF CALIFORNIA DATA-THEFT REPORTING LAW

A laptop computer containing names, SSNs, and some addresses and birthdates for 98,369 alumni, grad students and applicants was stolen from an office at UC Berkeley. In compliance with California's new data-theft reporting law, the breach was reported and has now been widely publicized -- although ironically, as a writeup on slashdot points out, this publicity may have alerted the thief, who was probably only interested in the hardware, to the true value of his find.

STOLEN COMPUTERS CONTAIN 185,000 PEOPLE'S MEDICAL RECORDS

Two computers containing the financial and medical records of nearly 185,000 current and former patients were stolen from the offices of the San Jose Medical group late last month. The group's vice president for information technology says he believes the thieves were interested in the computers and not the information they contained. Nonetheless, the affected patients are being notified pursuant to California's Security Breach Information Act. The company had been transferring patient data from secured servers to the PCs; some of the data were encrypted.

LATEST LOSS OF PERSONAL INFORMATION: MCI

Officials from long-distance carrier MCI are investigating the loss of employee data after a laptop was stolen from the car of an MCI financial analyst. The laptop contained names and Social Security numbers for about 16,500 employees, whom the company has notified. A spokesperson for MCI said the machine was password-protected but did not say whether the employee data were encrypted. MCI is reviewing the incident to see whether the analyst violated any company policies, such as those concerning what types of information may be put on laptops and what information must be encrypted. MCI is also taking this opportunity to make sure employees who have access to sensitive information are clear on company policies. The company said that so far there have been no reports that any of the information on the laptop has been sold or misused. Wall Street Journal, 23 May 2005 (sub. req'd)

MOTOROLA EMPLOYEE DATA STOLEN

Over the Memorial Day weekend, thieves broke into the offices of Affiliated Computer Services (ACS), a provider of human resources services, and stole two computers with personal information on Motorola employees. The computers, which reportedly employed security measures to make accessing their files difficult, contained names and Social Security numbers of an unspecified number of employees but did not include any financial information, according to a Motorola spokesperson. Lesley Pool, chief marketing officer at ACS, described the theft as an "amateur burglary" and said no evidence has surfaced that any of the information has been used for illicit purposes. Most of those affected are U.S. employees of Motorola, which employs about 34,000 people in the United States. Motorola has notified all of the affected employees and offered them fraud insurance at no charge. Reuters, 10 June 2005

AMERIPRISE LAPTOP WITH PERSONAL DATA STOLEN

A laptop containing information on 230,000 individuals was stolen from the car of an employee of Ameriprise Financial in December, according to the company. The computer included names and Social Security numbers for more than 70,000 financial advisors, and names and Ameriprise account numbers for 158,000 customers of the firm, which was spun off of American Express last year. Andy MacMillan, a spokesperson from the company, said that although access to the data is protected by a password, the data were not encrypted, which is a violation of written company policies. MacMillan said the company does not believe that the thief knew about the information contained on the laptop and thinks that it is unlikely any of the information will be accessed or used fraudulently.

RISKS; NYT; http://tinyurl.com/rgh5t 24 15

AMERIPRISE LAPTOP COMPUTER STOLEN WITH DATA ABOUT 230,000 CUSTOMERS & EMPLOYEES

A report mirrored on emergentchaos.com summarized another data loss through unencrypted disks on a stolen laptop:

>On Wednesday, Ameriprise Financial, an investment advisor firm, said that a company laptop stolen from an employee's parked car in December contained the personal information of some 230,000 customers and company advisors, The New York Times reports.

The sensitive information contained in the laptop included the names and Social Security numbers of roughly 70,000 current and former financial advisors, as well as the names and internal account numbers of about 158,000 customers.

Andrew MacMillan, Ameriprise spokesperson, said the culprits likely had no idea that the laptop contained sensitive information, and in turn, the potential risk of "any data being used or discovered is very low." MacMillan noted that the laptop was protected by a password, but the data was not encrypted, a blatant breach of the company's privacy regulations. Ameriprise has fired the employee involved.<

[MK comments:
1) Firing the employee seems like an empty response to the problem, which is that corporate computers were being issued without mandatory disk encryption;
2) Having a company spokesperson announce to the world that the crooks "likely had no idea that the laptop contained sensitive information" is an inherently self-defeating form of reassurance.]

VAST DATA CACHE ABOUT VETERANS HAS BEEN STOLEN

Personal electronic information on up to 26.5 million military veterans, including their names, Social Security numbers, and birth dates, was stolen from the residence of a Department of Veterans Affairs employee who had taken the data home without authorization. …Comments about no evidence of data misuse (yet) and no health/financial records, but deeply embarrassing to VA. No mention of a statement that this incident was not reported for several weeks….

[Abstract by Peter G. Neumann]

Martin Bosworth, writing for ConsumerAffairs.Com, wrote "In every public case, company representatives insist the laptops are stolen simply for their resale value, as opposed to the data they contain. The more skeptical might say that as consumers get smarter about not sharing their information on the Web, enterprising hackers and data thieves are taking advantage of other holes in the security fence -- namely slipshod government and business policies. Whether it's a criminal conspiracy or good old-fashioned incompetence, public and private agencies are not adequately protecting the personal information that's entrusted to them and, in many cases, are less than forthcoming about the circumstances surrounding laptop losses."

The FirstGov.gov Web portal included an extensive Web page entitled "Latest Information on Veterans Affairs Data Security" at < http://www.firstgov.gov/veteransinfo.shtml >.

In early June, the VA revealed that the stolen data included information about 2.2 million active-duty military personnel and National Guard troops. According to an Associated Press report, a class-action lawsuit filed by a coaltion of veterans' groups demanded "that the VA fully disclose which military personnel are affected by the data theft and [sought] $1,000 in damages for each person — up to $26.5 billion total. The veterans are also seeking a court order barring VA employees from using sensitive data until independent experts determine proper safeguards." The complaint added, "VA arrogantly compounded its disregard for veterans' privacy rights by recklessly failing to make even the most rudimentary effort to safeguard this trove of the personally identifiable information from unauthorized disclosure."

2006-06-02 **laptop computer stolen unencrypted disk drive confidentiality data leakage control credit-card numbers**

RISKS 24 31

HOTELS.COM LOSES CONTROL OF 243,00 CREDIT-CARD NUMBERS

CNNMoney reports that about 243,000 Hotels.com credit-card numbers were stolen back in February via the theft of a laptop computer. They believe that the theft was of the computer, with no idea of the information on the hard drive, and, likely as well, no intention of using the information on the hard drive. That it takes from February to June to determine what was on the hard drive is difficult to accept, however, and leaves unanswered what MIGHT have happened in the intervening three months respecting identity theft or misuse of the credit cards. Lots of unanswered questions, but typical of the problem when a laptop gets stolen.

NewsScan

TOP 10 DATA DISASTERS
Although machine failure is at fault for the majority of lost data disasters, humans are increasingly culpable as well, according to recovery experts at Kroll Ontrack. "Despite being the easiest problem to prevent, we are seeing more cases where human error is to blame. Interestingly, we see a 15 to 20% increase in calls to recover lost data on Mondays. This could be a result of the rush to complete work and leave early for the weekend on Friday afternoons, as well as a lack of staff concentration on Monday mornings," says a Kroll spokesman. The Top 10 list of unusual data loss stories includes laptops being shot or thrown against the wall in a fit of e-rage; laptops suffering spills of red wine or latte because users were "drinking on the job," laptops falling off mopeds or car roofs, then being crushed by oncoming traffic; and PCs being thrown out a window or into a river to destroy evidence of theft or fraud. Our favorite? The laptop that slipped into the bathtub with its owner while he was working on accounts. Amazingly, Kroll Ontrack says in all these cases, it was able to rescue and restore computer files. (BBC News 16 Oct 2003)

DHS IAIP Daily;
http://www.chinapost.com.tw/taiwan/detail.asp?ID=48429&GRP=B

May 04, The China Post — Hackers cause almost one million dollar loss for banks, CIB reveals.

Hackers have invaded the computer systems of over 700 Taiwan companies and caused losses of more than USD$900,000 for banks with electronic financial services, according to an initial estimate by the Criminal Investigation Bureau (CIB). In the field of computer hacking, CIB officials said mainland China is the major source of hackers targeting Taiwan with the aim of stealing commercial secrets, technical know-how, and computer systems of government agencies in charge of military, transport, public security, and finance affairs. Other sources include the United States, Japan, and South Korea. Officials said the hackers normally implant malicious programs in the form of "Trojan Horse" viruses onto the less guarded Internet operating systems of educational institutions like schools. The virus and software programs then wait for opportunities to enter the systems of other organizations with more stringent security. Companies suffering from the attacks include information service companies, high-tech firms, enterprises in the traditional manufacturing industries, and banks with Internet services. The dozens of banks reported that over USD$600,000 million was lost in the electronic fund transfer process.

2005-07-12 **data leakage computer loss theft government agencies UK survey report**

RISKS; http://www.egovmonitor.com/node/1843 23 94

UK GOVERNMENT LOSES AT LEAST 150 COMPUTERS IN 1ST 6 MONTHS OF 2005

Central government departments have reported to have suffered at least 150 cases of computer theft in the last six months, according to official figures. The Home Office alone recorded 95 incidents of computer items being stolen between January and June 2005 - equivalent to a theft taking place in the Department every other day.

By comparison, the Ministry of Defence reported 23 computer thefts to date in 2005, down from a total of 153 in the previous year….

In a written answer, Doug Touhig, a junior minister at the MoD, said the Ministry had also experienced 30 attempted computer hacking incidents so far in 2005, having only reported 36 for the whole of 2004. However the Minister gave an assurance that "none of the reported incidents of hacking had any operational impact". Most of these incidents were due to internal security breaches, rather than external threats. Half of the cases were classed as "internal - misuse of resources".

Instances of reported computer thefts in other departments were in single figures so far this year, and most recorded no cases of IT systems being accessed illegally.

The Department for Transport said it had experienced 71 cases of computer hacking in 2003-4, 31 in the following year and one incident since April. The Treasury, the Department for International Development and the Department for Education and Skills said their IT systems had been breached on one occasion in 2004-5. Figures from the DfES show that in the two years since 2003/4, it experienced 37 incidents of computer theft, all but one of which were "perpetrated by insiders". The Department of Health said it did not distinguish between losses and theft of IT equipment, but said there were 44 such incidents in 2004-5, costing it almost 40,000 pounds. Figures provided by Health Minister Jane Kennedy put the total sum lost by the Department over the last four years at 233,000 pounds.

AUDITOR LOSES CD-ROM WITH McAFEE EMPLOYEE DATA

Jeremy Epstein wrote the following summary of YADL (Yet Another Data Loss):

It was widely reported that the names, SSNs, and other personal information for 6000 current & former McAfee employees were potentially compromised. An auditor from Deloitte had the information on an unlabeled (but unencrypted) CD that was left in an airplane seatback pocket. It's unknown whether the CD simply went in the trash as part of airplane cleaning, or whether someone picked it up. McAfee is offering employees and ex-employees two years worth of credit monitoring through Experian.

The really interesting part (which I saw in the *San Jose Mercury* article, but not elsewhere) is that the auditor "had made the CD for backup purposes, and it was their decision not to encrypt the data." McAfee's spokesperson aid they have policies to prevent such actions, but they can't control what the auditor does with the data.

So if McAfee didn't have policies in place to prevent storing sensitive data in an unencrypted form (and/or to safeguard the media), Deloitte would have flunked them on their Sarbanes-Oxley audit. But because it was Deloitte who did the dirty deed, it looks like no one will be held accountable. One hopes that the Deloitte employee who made the CD is now a former employee.

The Register < http://www.theregister.co.uk/2006/03/30/ey_nokia_lapop/ >

ERNST & YOUNG LOSES LAPTOP COMPUTER WITH CUSTOMER DATA

The international consulting firm Ernst & Young lost a series of laptop computers in 2006. In February, the firm admitted that a laptop with confidential customer data -- including the SSN of Scott McNealy, CEO of Sun Microsystems -- had been lost or stolen in January. McNealy reported that his identity had in fact been compromised.

Then a March report in the Miami Herald stated that some Ernst & Young auditors went to lunch on Feb 9 -- leaving their laptop computers in a conference room in the office building where they were working. Two men stole four laptops. E&Y declined to issue a public statement about these breaches of security, although they did assure the public that "password protection" sufficed to compensate for loss of control over the data.

On March 15, The Register's Ashlee Vance, indomitable reporter that she is, wrote that E&Y lost yet another laptop computer -- this one stolen in January from an employee's car. It contained financial and tax records compromising the security of "thousands" of IBM employees and ex-employees. Once again, the company refused to issue a public statement about the theft and informed the potential victims of identity theft two months after the incident. On March 23, Vance found out that E&Y had admitted to BP that 38,000 employees were included in the January laptop theft.

The Register <
http://www.theregister.co.uk/2006/05/12/wellsfargo_computer_loss/ >

WELLS FARGO LOSES COMPUTER WITH SENSITIVE CUSTOMER DATA

Ashlee Vance, writing in The Register, reported that
>At least one poor Hewlett Packard employee compromised by Fidelity's March laptop loss has now been told Wells Fargo lost his personal data, too.

The staffer received a note this week from Wells Fargo, saying the financial institution had lost a computer packed full of sensitive data such as customers' names, addresses, Social Security numbers and Wells Fargo mortgage loan account numbers, according to a document sent to The Register. Wells Fargo has admitted the loss, telling us that it affected a "relatively small percentage of Wells Fargo customers." The company, however, has millions of customers, so it's pretty tough to tell what a "small percentage" means.

The company said that, "a computer - being transported for Wells Fargo Home Mortgage, a division of Wells Fargo Bank, N.A., by a global express shipping company between Wells Fargo facilities - has been reported as missing and may have been stolen. Wells Fargo said there is no indication that the information on the computer equipment has been accessed or misused. The computer has two layers of security, making it difficult to access the information."<

COPYRIGHT SITUATION IN CHINA

Pirated videodisks of the movie "Titanic" were available throughout China last November, a month before its release in U.S. theaters, and about half a million pirated disks are smuggled into China every day from Macao. Chinese officials say there is little they can do about this blatant violation of the intellectual property rights agreement that China reached with the United States in 1995. One official explains: "The profits are so great, they will take any risk. They're like drug dealers. It is very difficult to arrange a crackdown. You have to coordinate all these different departments, the copyright publication department, the police, the Industrial and Commercial Administration. We take copyright violations very seriously. But when it comes to copying a disk, most Chinese people don't see what's wrong." And one merchant who sells pirated material insists: "There's nothing wrong with selling pirated VCDs. My son loves watching them." (New York Times 28 Mar 98)

Reuters

Jim Loney wrote a summary for Reuters news wire of the losses due to piracy of intellectual property and counterfeiting. Some key points:
* US Customs Commissioner Bonni Tischler predicted that copyright violations and counterfeiting was "going to dwarf every type of crime in the next millennium."
* U.S. companies have estimated they lose $200B a year to product piracy involving designer clothes, shoes, handbags, software, CDs and videos.
* World-wide, software piracy costs industry $11B a year.
* 38% of the 615M new software product installations were illegal copies.
* 97% of all the software in Vietnam was stolen.
* 90%+ of all software was stolen in Bulgaria, China, Indonesia, Lebanon, Oman, and Russia.
* 60% of the software being sold by auction on the Net is illegitimate.
* Criminals are setting up shop in jurisdictions with no cyberspace laws or lax law enforcement (such as Russia) and selling stolen property all over the world.
Loney concludes, "Customs officials say judicial systems lag behind exploding crime on the Internet. Cybercrime is difficult for juries to visualize, penalties are small and the risk of jail is minimal in comparison to crimes like armed robbery."

1999-12-01 **ATM automated teller machines counterfeit cards fraud international**

MOSCOW TIMES

In October 1998, reports surfaced of organized data theft from banks in Moscow, where unsuspecting users of automated teller machines (ATMs) were the victims of a crime ring that used their stolen card information and PINs to create counterfeit cards that were then used for unauthorized withdrawals in several European cities. Both VISA and Europay accounts were charged; the companies have stated or implied that their Russian agency, Union Card of Moscow, was heavily involved in the fraud. The first arrests occurred in March 1999, when four Kazakh nationals were arrested in Munich with counterfeit cards at an ATM; they were convicted of organized credit card forgery and sentenced to up to 4 1/2 years in jail. Other arrests in the case were made throughout 1999 in Stockholm, Paris and London. The London arrest of Krister Elgsgem, a 32 year old Swedish man, occurred by chance in late November; an off-duty policeman was in line immediately behind the criminal as he fed about 50 obviously counterfeit (white, without logo) bank cards into an ATM. Russian police authorities have issued no statements about their investigation.

EDUPAGE; http://www.itworld.com/Man/2683/060213iipa/ 23

INTELLECTUAL PROPERTY GROUP CALLS FOR FOCUS ON RUSSIA

In comments submitted to the U.S. Trade Representative (USTR), the International Intellectual Property Alliance (IIPA) urges the agency to identify Russia as a Priority Foreign Country, a designation for countries considered most threatening to intellectual property. The IIPA estimates that piracy rates in Russia are as high as 85 percent for business software, 67 percent for music, 81 percent for movies, and 82 percent for entertainment software. In addition, the Priority Foreign Country list indicates countries whose antipiracy efforts are minimal. The IIPA has previously requested that Russia be put on the list, but only Ukraine is on the highest-priority list. According to the IIPA, Ukraine should be moved down a step, to the Priority Watch List, with 15 other countries, including China, Egypt, Thailand, and Venezuela. The IIPA said countries including Pakistan, Brazil, and Taiwan had improved efforts during 2005 to address intellectual property concerns.

NewsScan, Wall Street Journal
http://interactive.wsj.com/articles/SB957492236169474418.htm

The FBI has arrested 17 people, five of them former or current employees of Intel, on charges of involvement with Internet sites devoted to pirated software. The five were described as having held low-level engineering jobs, and an Intel spokesman said four out of the five were no longer with the company. All 17 suspects were members of a loosely organized group called Pirates with Attitudes, which operated one of the Internet's oldest "warez" sites — a term describing a hacker variation of software sold in stores by merchants. Most warez sites are run as hobbies and their users are often teenage boys who view downloading a pirated software program to be a rite of passage. The indictments do not allege that the perpetrators were attempting to make money through their activities, but the potential penalties include a US$250,000 fine and five years in prison. "This is the most significant investigation of copyright infringement involving the use of the Internet conducted to date by the FBI," says a spokeswoman for the Bureau's Chicago office. "It demonstrates the FBI's ability to successfully investigate very sophisticated online criminal activity." (Wall Street Journal 5 May 2000)

CUSTOMS SERVICE EXPANDS SOFTWARE PIRACY INVESTIGATION [19 Dec 2001]
The U.S. Customs Service, which is conducting what is described as the largest criminal investigation into software piracy ever pursued by the federal government, is expanding "exponentially" its questioning of employees and students at some of the nation's top universities. Included in the Operation Buccaneer sweep are Duke University, the Massachusetts Institute of Technology, the University of California at Los Angeles, and the Rochester Institute of Technology. Executives at several software companies have also been questioned as law enforcement officials work to shut down a multibillion-dollar international piracy ring that has produced counterfeit versions of everything from the newly launched Windows XP operating system to such recent Hollywood fare as "Harry Potter and the Sorcerer's Stone." Customs officials say some of the software appears to have been stolen by executives and other insiders at the affected companies. No arrests have been made so far, and officials are trying to persuade more suspects to cooperate in exchange for leniency. "We have people here who have never contemplated spending any time in prison who all of a sudden are coming to the realization that, wait a minute, I'm in trouble here," says Special Agent Alan Doody, who's heading up the operation. MICROSOFT TO LIMIT DOWNLOADS TO LEGAL SOFTWARE OWNERS

Microsoft will soon begin requiring users to employ a program called Windows Genuine Advantage before downloading software patches or updates. The program verifies that the computer requesting the download is running a legitimate copy of Windows software rather than a pirated or counterfeit version. Initially, the requirement will apply to users in China, Norway, and the Czech Republic, but it will include all users by the middle of the year. Users will still be able to receive software updates and patches using the Automatic Updates feature. The program is part of Microsoft's three-pronged approach to limiting software piracy: educating users, designing products that discourage illegal copying, and legal enforcement. In addition to allowing downloads, the program will also offer users discounts on Microsoft products and services. Analysts noted that although the obvious benefit of the program is to Microsoft by way of decreasing the incidence of software piracy, users stand to benefit as well. Ensuring that a computer is running a legitimate version of an operating system shields that computer from bugs and glitches associated with pirated software, while guaranteeing that patches and upgrades will work properly.

2005-08-01 **Microsoft anti-piracy system hacked Windows Genuine Advantage WGA copy**

DHS IAIP Daily;
http://www.techworld.com/security/news/index.cfm?NewsID=4134

HACKERS BREAK INTO MICROSOFT'S ANTI-PIRACY SYSTEM

Hackers found a way around Microsoft's Windows Genuine Advantage (WGA) anti-piracy system last week, only a day after the system went into effect. WGA requires Windows users to verify they are using a genuine copy of Windows before they are allowed to download certain software updates. Security patches aren't covered by the system, and remain available to any Windows user, legitimate or not. Using a simple JavaScript hack, all users had to do was paste a JavaScript URL into the Internet Explorer browser window at the beginning of the process; this turned off the key check, according to users. Microsoft said it was investigating the hack but didn't consider it a security flaw. The company said that it may not take immediate action to fix the problem. "As the validation system is updated from time to time, we will address this and other issues that may arise," a Microsoft spokesperson said. Microsoft put WGA into place to cut down on Windows piracy, and to persuade users who are running pirated copies of Windows to buy legitimate licences.

MICROSOFT AND EBAY HOOK UP TO CATCH PIRATED SOFTWARE

Microsoft and eBay are working together to stop the sale of pirated software on the online auction site. The companies said in a statement that over 21,000 suspect software sales were removed from the eBay United Kingdom site between August and October this year. Around half were sales of counterfeit copies of Windows, and 36 percent were fake copies of Microsoft Office. Microsoft claimed that the crackdown is working because eBay removed 11,535 suspected counterfeit sales from the site in August. This fell to 4,460 in September and 5,423 in October.

2005-12-08 **software piracy intellectual property rights violation copyright infringement study BSA**

EDUPAGE; http://news.com.com/2100-1014_3-5987127.html

PUTTING THE NUMBERS TO SOFTWARE PIRACY

A study conducted by research firm IDC on behalf of the Business Software Alliance (BSA) indicates that as much as 35 percent of software is pirated, down only about 1 percent from last year. The study covered 70 countries, representing 99 percent of the global market for IT spending. Software piracy is significantly lower than it was in the early 1990s, when, for example, the piracy rate in Europe was nearly 80 percent. That number has fallen to 35 percent, but, according to Beth Scott, European vice president of the BSA, the current rate is still 20 times higher than losses to shoplifting. The IDC study estimates that a reduction in the piracy rate to 25 percent would lead to the generation of 2.4 million jobs and $400 billion of economic growth. Piracy remains rampant in some countries, including China (90 percent) and Russia (87 percent). The problem is so bad that China, which is one of the world's largest markets for PCs, is not on the list of top 20 global markets for software because so much software is obtained illegally. EDUPAGE; http://news.bbc.co.uk/2/hi/technology/4663388.stm 23

ISPS IN BRITAIN ORDERED TO DISCLOSE IDENTITIES

In the United Kingdom, the High Court has ordered 10 ISPs to disclose the identities of 150 individuals suspected of trading copyrighted software. The Business Software Alliance estimates that one-quarter of all software used in the United Kingdom is illicit. The court ruling came after a group called the Federation Against Software Theft (FAST) petitioned the court to order the disclosures, noting that software pirates hide behind fake names and bogus e-mail addresses and are notoriously difficult to track down. FAST said that after it has obtained the identities of those suspected of illegally trading software, it will consult with law enforcement authorities. John Lovelock, an official at FAST, said the group intends to make an example of software pirates, and the group's legal counsel said the current court action is "only the first wave of an ongoing strategy."

News http://www.sjmercury.com/svtech/news/breaking/merc/docs/010346.htm

U.S. District Judge Jed Rakoff . . . [said] MP3.com is using "indefensible" and "frivolous" arguments in its defense against charges of copyright violations brought by the Recording Industry Association of America. The judge, in ruling against MP3.com, determined that the company "is replaying for the subscribers converted versions of the recordings it copied, without authorization, from plaintiffs' copyrighted CDs. On its face, this makes out a presumptive case of infringement." Rakoff called MP3.com's fair-use defense "indefensible" and its claim that it was protecting record companies from music pirates "frivolous." (Bloomberg/Los Angeles Times 5 May 2000)

[In a related case,] Settling a copyright infringement lawsuit brought against it by Warner Music and BMG Entertainment, the Internet music distribution company MP3.com . . . signed licensing agreements with both those companies. Customers are able to access music in the MP3 database at any time and from any device with Internet access. Warner executive Paul Vidich . . . [said] that the settlement agreement "clearly affirms the right of copyright owners to be compensated for the use of their works on the Internet." (AP/San Jose Mercury News 9 Jun 2000)

[In September,] . . . federal judge [Jed Rakoff] . . . ruled that MP3.com willfully violated music copyrights and . . . ordered it to pay at least $117 million in damages to Seagram's Universal Music Group — believed to be the largest copyright infringement penalty in history. "This should send a message that there are consequences when a business recklessly disregards the copyright law," says a senior VP of the Recording Industry Association of America, which represents Universal and the four other major music companies. "We trust this will encourage those who want to build a business using other people's copyrighted works to seek permission to do so in advance." The industry's lawsuit claimed that MP3.com had violated copyright laws by creating a database of 80,000 unauthorized CDs, and the judge's ruling assessed a $25,000 penalty for every Universal CD illegally posted on its My.MP3.com service — somewhere between 4,700 and 10,000 recordings. MP3.com . . . [said] it will appeal the ruling, which it called "draconian." (Los Angeles Times 7 Sep 2000)

Downloading music off the Internet is not stealing in the eyes of 53% [±7% for 95% confidence limits] of all U.S. Internet users, according to a new study by the Pew Internet & American Life Project [which interviewed 237 people who download music and 12,751 candidates of which 6,413 were Internet users; the interviews were carried out by phone from March through August, 2000]. And those who are active downloaders are even more adamant about their position — 78% do not believe that downloading and sharing files for free is wrong, and 61% don't care if the music they're downloading is copyrighted. Even among the general population, 40% of those surveyed said they didn't see anything wrong with downloading music off the Internet, while 35% said the downloaders are stealing, and 25% chose not to take a position. In a finding guaranteed to raise the ire of the Recording Industry Association of America, only 21% of music downloaders end up actually buying the music they get off the Internet. RECORD INDUSTRY TAKES AIM AT 'OPEN NAPSTER' CLONES
With legal victory over Napster on the horizon, the record industry has begun to take action against hundreds of Napster clones that also offer free music downloading via the Internet. Since [the 19th of February 2001], the Recording Industry Association of America has sent about 60 legal notices to the ISPs that provide Web connections for "Open Napster" servers -- computers that run Napster-like software, but aren't affiliated with Napster. One expert estimates that there are 350 such servers operating globally, although the number varies daily. Legal observers say the issues against Open Napster operators are clear-cut, but battling these guerilla operations is difficult. It's likely that smaller versions of Napster will continue to pop up on the Internet, because all it takes to run an Open Napster site is a PC and a fast Internet connection. PAID MUSIC SERVICES READY TO PICK UP WHERE NAPSTER LEFT OFF
A handful of file-sharing startups -- including U.K.-based Wippit, and U.S. firms CenterSpan Communications and Ipingpong -- are hoping to establish their paid music download services before Napster can follow through with plans to retool itself into a fee-based system by summer. An early version of Wippet is already in public trials, and later this month CenterSpan plans to start its own public tests of a new, secure file-sharing system based on technology it acquired from the now-defunct Scour. Meanwhile, Ipingpong plans to sweeten the pot by offering financial rewards to users based on the amount of music they ship to friends. "Napster has certainly opened up the [music] industry's minds," says Wippit's CEO, who says he approached an industry executive six months ago who "actually laughed in my face, saying, 'This can't happen.'" OOPS -- MP3.COM JURY DROPS A ZERO
Jurors who ordered MP3.com to pay Tee Vee Toons $300,000 for violating its copyrights have told the trial judge they goofed -- they meant to award something closer to $3 million. "The total was supposed to be between $2 and $3 million," said U.S. District Judge Jed Rakoff. "This matter is far from obvious in how it should be adjudicated." News that the jurors had essentially dropped a zero in arriving at the announced award of $296,873 stunned both sides. Tee Vee Toons, the largest U.S. independent music label, had sought damages of $8.5 million, but MP3.com said at this point there was no basis for upsetting the award, noting that one of the jurors was a math teacher. Rakoff said he would issue a ruling in several weeks. (Bloomberg/Los Angeles Times 10 Apr 2001)

MORE PEOPLE TRADING BOOTLEGGED MUSIC THAN EVER
An estimated 15 million people downloaded illicit music online this summer, surpassing the song-swapping binge that followed the federal appeals court ruling against Napster in February. In the wake of that ruling, a new generation of file-swapping sites has arisen to fill the void. "It's like playing whack-a-mole: You kill one of these guys and another one pops up to take its place," says a Gartner Dataquest researcher. The fastest growing of these new services -- MusicCity's Morpheus and KaAaA, have logged 3 million users since Napster installed song-filtering technology in June, according to Jupiter Media Metrix. And a host of other sites -- Aimster, AudioGalaxy, iMesh and BearShare -- are expanding at a slower pace. "Not only are these services less centralized -- and more difficult to police, but whereas Napster was only an MP3 application, consumers now have been introduced to the wonderful world of porn and movie pirating," says a Jupiter analyst. The sustained popularity of these underground services is eroding CD revenues, with sales of albums and singles down 5.4% for the second quarter this year. Gartner predicts CD sales will continue to decline dramatically, with revenue off 20% by 2005. "No amount of wishful thinking on the part of the music industry will stop this." MUSIC PUBLISHERS, RECORDING INDUSTRY INK LICENSING DEAL
The National Music Publishers' Association, Harry Fox Agency and the Recording Industry Association of America (RIAA) have signed a licensing agreement that will pave the way for a new generation of online music subscription services backed by the Big Five record labels. Under the terms of the agreement, all RIAA member labels and their licensees -- including the new online services -- will have access to every musical work authorized to be licensed by the Harry Fox Agency. Harry Fox will issue licenses for subscription services offering on-demand streaming and limited downloads, or downloads that can be played only for a designated period of time or number of times. To get the ball rolling, the RIAA will pay Harry Fox $1 million toward royalties to be determined. Once rates are determined, royalties will be payable on a retroactive basis, but if the two sides don't settle on a rate within the next two years, the recording industry will pay $750,000 a year until a rate is set. NAPSTER RULING [11 Feb 2001]
A California federal appeals court [ruled on February 12, 2001] on whether to shut down Napster or allow it to keep operating while its legal case continues. Napster lost the first round in its battle with the recording industry last July when a lower court ruled that the file-swapping service was guilty of "wholesale" copyright violation and ordered it to cease trading copyrighted material pending a full trial. The appeals court prevented that order from taking effect until it had a chance to review the injunction. If Napster wins its case, the ruling could unleash any number of other ventures that have been awaiting a decision on whether a "personal use" exception to copyright law extends to downloadable music. But even if it loses, the peer-to-peer file-sharing technology on which it's based is here to stay. Meanwhile, Napster has teamed up with recording giant Bertelsmann, which has offered it much-needed capital if it switches to a subscription-based service that pays artists' royalties. (AP 11 Feb 2001) http://news.excite.com/news/ap/010211/22/napster-lawsuit

NAPSTER RIVALS SEE OPPORTUNITY IN RULING [13 Feb 2001]
[The] appeals court decision [on February 12, 2001] prohibiting Napster from facilitating the sharing of copyrighted music files was welcomed by Napster rivals, who believe that record labels will now become more receptive to licensing agreements with them. Analysts say the recording industry's legal battle with Napster has stymied the online music distribution industry, and with the conclusion of the protracted court case in sight, may be more willing to negotiate deals with sites that present an alternative to Napster, which has been labeled a haven for "electronic shoplifting." Shares in RealNetworks, MP3.com, Liquid Audio and EMusic.com all rose on yesterday's news. "Now it's the time for the industry to move forward to build great businesses that respect the legitimate interests of consumers, artists and rights holders," says RealNetworks chairman and CEO Rob Glaser. (Reuters/InfoWorld 13 Feb 2001) http://www.infoworld.com/articles/hn/xml/01/02/13/010213hnnapriv.xml?p=br&s=6

NAPSTER OFFERS $1 BILLION TO RECORD COMPANIES; "NOT ENOUGH" [21 Feb 2001]
Online music-swapping service Napster, which is still embroiled in lawsuits for infringing on copyrights, is proposing to pay record companies $1 billion over five years to end the dispute. The five major companies would divide up $150 million annually (according to what percentage of their works are exchanged by Napster users) and an additional $50 million would be directed to independent music companies and artists. Music industry executives and analysts dismissed the offer as insufficient. Napster also announced details of its plan to convert its operation into a subscription-based activity. Users probably will be charged a fee of $5.95 to $9.95 for computer downloads of an unlimited number of music files, plus an additional fee for downloads to their own compact disks. (New York Times 21 Feb 2001) http://partners.nytimes.com/2001/02/21/technology/21NAPS.html

NAPSTER RULING MAY COME [2 March 2001]
With a federal judge about to rule (maybe today) on whether online music-swapping service Napster must shut down for ignoring copyright laws, some analysts are worried that the downfall of Napster would have a serious negative impact on the Internet itself. Ford Cavallari of the research firm Adventis says: "We believe that if you take Napster out of the mix, you basically stunt the growth of DSL and cable modems." And computer manufacturing companies have been busy selling computers configured specifically for people who want to download free music and create custom CDs. Cavallari estimates that Napster's 64 million users account for 3% of all Internet traffic. Some of those users are now convinced that "it doesn't make sense to pay" the piper anymore: they can call the tune without paying. (Washington Post 2 Mar 2001)
http://washingtonpost.com/wp-dyn/articles/A10875-2001Mar1.html

NAPSTER HOPES TO SURVIVE ORDER TO CURB COPYRIGHT ABUSE [6 March 2001]
Online music-swapping service Napster is now under a court order from U.S. District Judge Marilyn Hall Patel in San Francisco to delete from its database any song protected by copyright. It will have three business days to accomplish the task of removing a huge inventory of songs identified by the five major record companies suing it for copyright infringement. Copyright law professor Peter Jaszi of American University predicted: "What is likely to happen is that the recording companies will blanket Napster with a very, very large number of file names." To stay alive, Napster is making efforts to evolve its free service into one that charges a subscription fee and pays royalties for copyrighted material. (Washington Post 7 Mar 2001)
http://washingtonpost.com/wp-dyn/articles/A32654-2001Mar6.html

NAPSTER ACCUSED OF EVADING JUDGE'S ORDER [28 March 2001]
The Recording Industry Association of America (RIAA) is complaining that online music-swapping service Napster has failed to remove from its database 675,000 copyrighted songs it is required by court order to shield from its users. RIAA president Hilary Rosen said: "Amazingly, every single one of the copyrighted works that was originally contained in our law suit is still readily available on Napster. Napster's filter fails to do even that which Napster claims it should do - let alone all of the things we believe Napster should do." The parties to the dispute will appear in court again in mid-April. (San Jose Mercury News 28 Mar 2001) http://www.siliconvalley.com/docs/news/svfront/nap032801.htm

MEDIATOR NAMED IN LAWSUIT AGAINST NAPSTER[10 Apr 2001]
U.S. District Court Judge Marilyn Hall Patel has picked A.J. "Nick" Nichols to serve as a mediator to evaluate the technical issues in the recording industry's lawsuit against online music-swapping service Napster. The industry says that Napster has

failed to observe a court order requiring it to keep copyrighted music off its site, whereas Napster claims it is doing everything that is technically possible. Nichols has a Ph.D. in engineering from Stanford University and has previously served as mediator in a lawsuit between Sun and Microsoft. (WSJ/AP/San Jose Mercury News 10 Apr 2001)
http://www.siliconvalley.com/docs/news/svfront/078061.htm

NAPSTER LICENSES RELATABLE SOFTWARE [20 Apr 2001]
Napster has harnessed a new tool in its efforts to remove copyrighted music from its service. Relatable's TRM software identifies songs by mapping their sound patterns -- a process that the company says will work regardless of the file format or quality. "TRM will help ensure that the millions of music files transferred through the new Napster system will be accurately monitored, and it will enable the appropriate allocation of royalties," says Relatable CEO Pat Breslin. (AP 20 Apr 2001)
http://news.excite.com/news/ap/010420/16/napster

SONGBIRD TARGETS NAPSTER LISTINGS [10 May 2001]
New software written by a 20-year-old Internet entrepreneur enables artists and record labels to quickly identify songs available on Napster even if the song's title or artist's name is garbled. Songbird, as the software's called, improves on Napster's own efforts to identify copyrighted material because it can simultaneously tap into some 90 different Napster servers rather than checking one server at a time, says creator Travis Hill. Songbird was recently demonstrated at the International Federation of Phonographic Industries headquarters in London, and was able to ferret out 40 Janet Jackson files listed under such names as anetJ acksonJ. The software is available on www.iapu.org. (Wall Street Journal 10 May 2001)
http://interactive.wsj.com/articles/SB989427592571440686.htm (sub req'd)

NAPSTER STRIKES DEAL WITH MAJOR RECORD LABELS [6 Jun 2001]
Napster has inked a deal to license music from three major record companies once it starts operating as a legal service later this summer. The agreement between Napster and MusicNet, the online music collaboration backed by AOL Time Warner, Berteslmann and EMI Group, marks Napster's latest step toward legitimacy. Under the deal, Napster users would pay one fee to access Napster's database of songs from independent record labels, and an additional fee to access MusicNet's content. The exclusive arrangement could give MusicNet a significant edge over rival service Duet, which is backed by Sony and Vivendi Universal. (Los Angeles Times 6 Jun 2001)
http://www.latimes.com/business/20010606/t000047089.html

NAPSTER, THE MOVIE [6 Jun 2001]
The film production arm of Liberty Media Group, cable TV organization, is working on a movie called "Napster" to tell the story of the music-swapping software that turned the recording industry upside down. Napster, which was created in 1999 by Shawn Fanning, a Northeastern University dropout with "nappy" hair, allows a community of users to share music files over the Internet, including songs protected by copyright. Outraged, the music industry lodged numerous lawsuits against Napster, though it now appears there will be an accommodation between Napster and the industry. The big record labels are planning use Napster to offer consumers a paid subscription service. (Reuters/USA Today 6 Jun 2001)
http://www.usatoday.com/life/cyber/tech/review/2001-06-06-napster-movie-reut.htm

NAPSTER STRIKES ROYALTIES DEAL WITH EUROPEAN RECORD LABELS [27 Jun 2001]
In another step toward legitimacy, Napster announced it has signed a commercial deal with groups representing 150 European independent record labels. The non-exclusive deal with the UK's Association of Independent Music (AIM) and Europe's Independent Music Companies Association marks a minor victory for Bertelsmann, which has backed Napster's efforts to move from renegade status to a legitimate fee-based service. Meanwhile, the independent labels hailed Tuesday's deal as a victory for collective licensing. "The majors are busy creating an (online) duopoly of their own. We don't know to what extent we will be closed out of their plans. It makes sense for us to have an alternative," said AIM vice-chairman Martin Mills. The European Commission has launched an antitrust investigation into PressPlay and MusicNet, the two online music services run by the big five record labels. (Financial Times 27 Jun 2001)
http://news.ft.com/news/industries/media

NAPSTER SUSPENDS ITS SERVICE [3 Jul 2001]
Napster, struggling to comply with a federal court order to stop its users from illegally swapping copyrighted music, suspended operations over the weekend because its technological solution needs more work. The company has been using filtering software that identifies a song by its unique acoustic properties, but some number of pirated songs have been slipping through the filter. Analyst P.J. McNealy says: "We knew they had technical challenges. this is the first time that they've outwardly said, 'They're huge,' and they shut it down." (San Jose Mercury New 3 Jul 2001)
http://www.siliconvalley.com/docs/news/svfront/nap070301.htm

NAPSTER ORDERED TO STAY CLOSED [12 Jul 2001]
Unconvinced by Napster's claim that its new filtering technology works "with 99% accuracy" to prevent customers from illegally swapping copyrighted music, Federal District Judge Marilyn Hall Patel has ordered Napster to shut down. An attorney representing the music publishers who'd filed the suit says: "Instead of being able to distribute infringing works while they figure out some way to stop doing it, Napster just has to stop distributing until they can do it legally. Which is sort of what we've been after for a year and a half." (San Jose Mercury News 12 Jul 2001)
http://www.siliconvalley.com/docs/news/svfront/nap071201.htm

NAPSTER GETS REPRIEVE [19 Jul 2001]
Napster got a breather on Wednesday when a U.S. federal appeals court temporarily suspended a lower court decision ordering it to shut down while it implemented filters to block the trading of copyrighted material. The court decision offers Napster the chance to demonstrate the effectiveness of its new fingerprinting filters, which it says are capable of blocking over 99% of copyrighted songs from its service. U.S. District Court Judge Marilyn Hall Patel had said that anything less than 100% effectiveness failed to comply with her ruling ordering Napster to remove all copyrighted material from its site. Meanwhile, the Recording Industry Association of America says it's confident that Napster will be blocked once again after the Court of Appeals reviews the case. (Financial Times 19 Jul 2001)

NAPSTER TO OFFER SUBSCRIPTION SERVICES BEFORE YEAR'S END [22 Aug 2001]
Napster's new chief executive, Konrad Hilbers, is promising that, as soon as his company fully complies with a court order to remove all copyrighted material from its site, he will start offering music-subscription services, to begin by the end of this year. "I'm very much a believer in what Napster stands for, which is the sharing of music among friends and private consumers when it comes to making available things like my children's Christmas carol singing or a garage band... It is quite obvious that we are challenging some of the music industry's business. (AP/USA Today 22 Aug 2001)
http://www.usatoday.com/life/cyber/tech/2001-08-22-new-napster-services.htm

NAPSTER INKS PRELIMINARY DEAL WITH MUSIC PUBLISHERS [24 Sep 2001]
Napster has reached a preliminary settlement with U.S. songwriters and music publishers in a further step toward legitimizing its online music service. Napster has agreed to pay songwriters and publishers $26 million in damages for past infringement, plus $10 million in advance for future royalty payments. The company, though, is still facing court action by the record labels, and talks in those lawsuits are continuing. The agreement marks the first of what is likely to be several announcements from companies hoping to launch online music services before the end of the year. Such agreements are a prerequisite for two industry-backed services -- Pressplay and MusicNet -- to launch their member-supported sites this fall. Napster CEO Konrad Hilbers says his revamped service will be up and running before the end of the year, also. (Financial Times 24 Sep 2001)
http://news.ft.com/news/industries/media

NAPSTER RELAUNCH HIT WITH DELAYS [30 Oct 2001]
Napster says it will postpone the launch of its new secure subscription-based service until next year, citing difficulties in obtaining record label licenses. The delay is a setback for Napster, which had hoped to beat the upcoming competition by several months. Industry-backed Pressplay and MusicNet both hope to launch their services before the end of the year, although they'll face several hurdles -- most notably, antitrust investigations in the U.S. and Europe. EMI TO OFFER NEW SUBSCRIPTION SERVICE EMI
Recorded Music has cut a deal with Liquid Audio that will provide EMI a way to launch a subscription service for consumers who want to permanently download song tracks off the Internet, burning copies to CDs, and transferring music compilations to portable players. Gerry Kearby of Liquid Audio says: "People can go out, for a pre-prescribed amount of money a month and download a bunch of songs, own those songs and burn them to CD -- not just rent them like the other services. For the first time, it brings the consumer much closer to the experience that they learned to love with Napster -- in a legitimate way." The new service will begin by focusing on EMI's Christian music catalog, offering subscribers access to an online jukebox of thousands of Christian songs for $14 a month; jazz, classical and other genres are expected to be added to the service at a later date. BERTELSMANN THINKS THE DAY OF FREE MUSIC IS OVER [13 Feb 2001]
"I don't think in the long term there will be any free services left out there," says the e-commerce chief executive of Bertelsmann, the German media conglomerate that forged a deal last year with Napster and laid out plans to develop a fee-based music swapping service on the Internet. "When we closed the alliance with Napster, we never focused on the lawsuit. We focused on the new membership-based service. Whatever is happening on the legal front has no impact on our position." (Reuters/San Jose Mercury News 13 Feb 2001)
http://www.mercurycenter.com/svtech/news/breaking/internet/docs/843771l.htm

[The company certainly put its money where its mouth is, as shown in the next item:]

BERTELSMANN BUYS MYPLAY.COM [30 May 2001]
German media giant Bertelsmann is acquiring Myplay.com for $30 million in an strategy aimed at building up its Web-based music business. Myplay operates an online music storage locker, which enables users to manage and store their song collections online. It also owns technology used to create digital subscription services. The purchase continues the trend of large media companies acquiring Internet music startups. Bertelsmann also backs Napster, the file-swapping service, and is part of MusicNet, a venture formed by RealNetworks, AOL Time Warner and EMI. (Financial Times 30 May 2001)
http://news.ft.com/news/industries/media

BMG TO TEST PROTECTIVE CDs [31 Jul 2001]
Bertelsmann's BMG Entertainment is testing a new type of compact disc that enables consumers to make a limited number of digital copies, but prevents unlimited "ripping" of songs. Listeners can e-mail songs to others, but the recipients will have to pay a fee to listen to them. The CDs use technology from SunnComm, based in Phoenix, Ariz. BMG's test is the latest sign that the era of free music is drawing to a close. (Wall Street Journal 31 Jul 2001)

BERTELSMANN LICENSES NAPSTER TECHNOLOGY [23 Oct 2001]
Bertelsmann, which has backed Napster with funding, says it will use Napster's new secure technology for the German group's BeMusic operations as part of a licensing arrangement between the two companies. BeMusic's holdings consist of Web retailer CDNow, record club BMG Direct, and myplay Inc, a digital music locker business. The technology's underlying architecture, which does not include Napster's peer-to-peer functionality, will serve as the platform for BeMusic's offerings. (Reuters 23 Oct 2001) http://dailynews.yahoo.com/h/nm/20011023/tc/tech_bertelsmann_napster_dc_1.html

LISTEN UP: NEW ONLINE MUSIC SERVICES READY FOR LAUNCH [3 Dec 2001]
Several online music sites are ready for launch, offering musical selections for a monthly subscription fee. Rhapsody, created by the independent music firm Listen.com, will be presented as a streaming service available for $5.95 to $7.95 a month (visit www.listen.com if you want to see how it works). Tomorrow, MusicNet (backed by EMI, RealNetworks, AOL Time Warner, and Bertelsmann's BMG) will begin a similar service priced at about $9.95 a month. Later this month, Pressplay (jointly owned by Vivendi Universal's Universal Music and Sony Music) will join the competition for your mind and heart and ears. REALNETWORKS IN TALKS WITH 3 MAJOR RECORD LABELS
RealNetworks is negotiating license rights with three major record companies -- Warner Music Group, BMG Entertainment and EMI Group -- to use their music in its planned subscription service, tentatively called MusicNet. As part of the deal, RealNetworks is offering the companies the option of an ownership interest in MusicNet. Other possibilities include making MusicNet available to other online services, and giving Napster an opportunity to license the service. If RealNetworks can sign a deal with Warner, BMG and EMI, the resulting service would present a strong challenge to the Duet subscription music service now being developed by Sony and Universal Music Group. (Wall Street Journal 30 Mar 2001)

MICROSOFT LAUNCHES MUSIC SERVICE [4 Apr 2001]
Microsoft is jumping on the music bandwagon with the first public test of MSN Music, its free Web-based service designed to help listeners discover new songs and artists. Users can specify styles and characteristics of music that they'd like to listen to, and a string of songs is then streamed to their PCs. The result is comparable to a custom-tailored radio channel -- users do not have the capability to listen to a particular song on demand. The distinction is important -- by not allowing users to download songs, Microsoft is relieved of the burden of negotiating individually with record labels for copyright licenses. Microsoft's announcement comes on the heels of the launch of MusicNet, a joint venture of AOL Time Warner, EMI Group, Bertelsmann and RealNetworks. (Wall Street Journal 4 Apr 2001)
http://interactive.wsj.com/articles/SB986337880412283670.htm (sub req'd)

AOL TIME WARNER UNVEILS ONLINE MUSIC SERVICE [12 Dec 2001]
AOL Time Warner has launched its long-awaited MusicNet online music subscription service, which it will offer for $9.95 a month. AOL's move into the online music space is being closely watched by experts who see it as a natural leader in the nascent market. "AOL beginning to sell digital music subscriptions is critically important and potentially cataclysmic for a lot of retailers out there in the long run," says a Jupiter Media Metrix analyst. Meanwhile, RealNetworks just launched its service, dubbed RealOne, last week and AOL rival Microsoft's MSN service is poised to launch its competing Pressplay service in the next few weeks. MusicNet is jointly owned by AOL's Warner Music, RealNetworks, EMI and Bertelsmann. Pressplay is owned by Vivendi Universal and Sony. (Wall Street Journal 12 Dec 2001)

VIVENDI, SONY PLAN A DUET [23 Feb 2001]
Vivendi Universal and Sony are teaming up to launch an online "virtual jukebox" music service this summer. Duet, as it's called, will challenge the recently announced deal worked out between Napster and Bertelsmann to offer a subscription-based Napster service. "It is an alternative to Napster which will allow us to monitor exactly which titles have been listened to and downloaded," says the head of Vivendi's Universal Music France. "It is over a secure network that prevents the item from getting distributed all over the Internet and provides better sound quality." Sony and Vivendi will have equal ownership of Duet and will offer a subscription service and a pay-per-listen option. (Reuters/Los Angeles Times 23 Feb 2001)
http://www.latimes.com/business/20010223/t000016279.html

YAHOO JOINS DUET WITH VIVENDI AND SONY [6 Apr 2001]
Yahoo has inked a deal with Vivendi Universal and Sony to deliver music over the Net. The new alliance, which calls for Yahoo to provide worldwide distribution for Duet, the online music platform being developed by Universal and Sony Music, will add a much-needed channel to Vivendi's U.S. distribution network. The alliance comes only days after the three other big music companies -- AOL Time Warner, Bertelsmann and EMI -- launched their MusicNet initiative with RealNetworks. "We're really jazzed about this," says Jeff Mallett, Yahoo's president and COO. "It provides our 100 million registered users with access to the premier entertainment destination." (Financial Times 6 Apr 2001)
http://news.ft.com/news/industries/internet&e-commerce

VIVENDI MAKES A PLAY FOR MP3.COM [21 May 2001]
Vivendi Universal, the world's second largest media group, is buying online music distributor MP3.com for $372 million in cash and shares. The amount is considerably less than MP3's peak valuation, but values the company at 3.1 times its estimated 2001 earnings. The purchase is Vivendi's third and most substantial move this year in terms of opening up new U.S. distribution channels. In March, Vivendi and Sony announced their Duet collaboration, an online music distribution service, and last month Vivendi announced a separate music deal with Yahoo. (Financial Times 21 May 2001)
http://news.ft.com/news/industries/internet&e-commerce

VIVENDI AND AOL CHARGED WITH CD PRICE-FIXING [1 Aug 2001]
The Federal Trade Commission has accused Warner Music (a unit of AOL Time Warner) and PolyGram (now a part of Vivendi) of colluding in 1998 to fix prices on CDs, cassettes and videos of opera singers Placido Domingo, Luciano Pavarotti, and Jose Carreras, knowns as "The Three Tenors." Neither company has admitted wrong-doing, but AOL has settled the case and Warner "has made the business decision to resolve this matter amicably rather than engage in protracted adversarial proceedings." (Washington Post 1 Aug 2001)
http://www.washingtonpost.com/wp-dyn/articles/A12775-2001Jul31.html

VIVENDI PUTS A LOCK ON ITS MUSIC CDs [26 Sep 2001]
Vivendi Universal's Universal Music Group, the world's biggest music company, says it is preparing to roll out "a number of releases" on CDs that contain technology preventing consumers from making digital copies. The move is the most aggressive to date among U.S. record labels to block copying onto computers and other devices. A company spokesman declined to say exactly what technology would be used, but said it "will not impede the consumer experience." Meanwhile, Sony Music Entertainment reported it has used copy protection on some promotional releases of its new Michael Jackson single that were sent to radio stations last month, but doesn't plan to use on commercial releases of the singer's new album. However, the company affirmed that its "goal is to implement copy protection on a broader basis to deter digital piracy." BMG Entertainment said it's conducting trials of copy-protection on promotional CDs in the U.S. and Warner Music is "looking closely at the technology" and doing market research on the concept. No comment was available from EMI. (Wall Street Journal 26 Sep 2001)

SONY LICENSES MUSIC TO SONG-SWAPPING SERVICE [28 Feb 2002]
Peer-to-peer music-swapping service CenterSpan Communications says it's clinched a deal to distribute Sony Music Entertainment songs, marking the first time a major record label has licensed its content to a file-sharing outfit. CenterSpan bought the file-swapping Web site Scour.com after it declared bankruptcy in 2000. The pact calls for CenterSpan to pay Sony about $2 million in cash plus 283,556 shares and a warrant to buy 189,037 additional shares at $8.11 per share. A CenterSpan spokesman said the company is also talking to other record labels and movie studios, as well as online music subscription services such as Pressplay. "The deal continues the experimental phase the music industry is going through as it tries to figure which digital distribution model is going to work," says a GartnerG2 analyst. DOES FREE ONLINE MUSIC MAKE FANS WANT TO BUY?
The market and consumer research firm Jupiter Research has issued a report reports that, contrary to what the music industry thinks, music file-sharing networks such as Kazaa and Music City are actually good for business: "File-sharing is a net positive technology", says the report, because "it gets people enthusiastic about new and catalog music." But not so fast there. Hart Research Associates, in a study prepared in November for the Recording Industry Association of America, came to just the opposite conclusion: "People who love music and buy it and who also use file-sharing services would be buying more of it were it not for the availability of free music online." The correct answer? Pay your money and take your choice. (New York Times 6 May 2002)

NAPSTER PONDERS BANKRUPTCY
Napster is considering filing for Chapter 7 bankruptcy protection following the breakdown of talks with Bertelsmann, which wanted to take a majority stake in the online music swapping business. Bertelsmann was offering between $15-20 million for the stake, but the board was split between John Fanning, uncle of Napster founder Shawn Fanning, and former Napster CEO Hank Barry and John Hummer of Hummer Winblad Venture Partners. At the same time, Napster CEO Konrad Hilbers, Shawn Fanning, who serves as chief technology officer, and four other vice presidents announced their resignations. Bertelsmann may still be able to lay claim to Napster's technology, which was used as collateral for the $85 million in loans it has already made to the company. The failure of Napster would signal a major victory for the entertainment industry in the battle for control over digital music and film, but some Silicon Valley groups warn such a view may be short-sighted: "Hollywood needs to offer a legal and suitable legitimate opportunity for downloading movies," said Intel chairman Andy Grove. "It is self-protection. But technology always wins in the end." (Financial Times 15 May 2002)
http://news.ft.com/news/industries/internet&e-commerce

BERTELSMANN BUYS NAPSTER'S ASSETS FOR A SONG
Bertelsmann is acquiring Napster's brand and products for $8 million and will forgive $85 million in loans it has already made to the online music swapping service, which is in the process of filing for Chapter 11 bankruptcy protection. The announcement came as a surprise, because negotiations over a possible sale had broken down last week -- at that point, Bertelsmann was offering $15-20 million for the company. Under the new deal, Konrad Hilbers and Shawn Fanning, who had resigned last week, will rejoin, with Hilbers assuming the position of chairman in addition to his earlier role as CEO, and Fanning re-assuming his title of chief technology officer. Bertelsmann hopes to relaunch Napster as a paid service. It is already a backer of MusicNet, which it operates in combination with AOL Time Warner and EMI Group, and sources close to the company say it has not yet decided how it will position the two separate online music ventures. MUSIC INDUSTRY WAGES GUERRILLA WARFARE AGAINST P2P SERVICES
In a practice called "spoofing," the music industry has been swamping online music-swapping services like Morpheus, Kazaa, and Grokster with thousands of phony or mangled music files rather than the sought-after songs. One music executive, speaking anonymously, says: "We're not using any of this with any kind of promotion or marketing in mind. We're doing this simply because we believe people are stealing our stuff and we want to stymie the stealing." And Cary Sherman, president of the Recording Industry Association of America, says: " From the outset, it's been very clear that one of the only ways -- as a practical matter -- to deal with the peer-to-peer problem is by means of technological measures. There are certainly mechanisms that are available -- that are completely lawful, such as spoofing." (San Jose Mercury-News 27 Jun 2002)

MUSIC LABELS PLAN ACTION AGAINST INDIVIDUAL SONG-SWAPPERS
The major music labels, working through the Recording Industry Association of America, are preparing to file copyright lawsuits targeting high-volume song providers on peer-to-peer music services. The suits will be part of a broader effort, including a PR campaign that may feature prominent artists urging fans to respect copyright laws. The industry's new legal tack is a marked shift from earlier efforts, which had focused on putting peer-to-peer music services such as Napster, Morpheus and Kazaa out of business. People close to the situation say the RIAA is still in the early stages of planning its efforts and hasn't decided yet exactly what actions should trigger such a lawsuit, although it's agreed that legal retaliation would focus on individuals who supply the largest amounts of music, as well as so-called "supernodes," or people who provide the centralized directories that enable online music-sharing. Suits against individual Internet users could cause a backlash from some fans, but record companies say they have no choice as they face diminishing music sales while home CD-burning has soared. COLLEGES TOLD STUDENT PIRACY "OUT OF CONTROL"
A letter sent to more than 2,000 university presidents by the Recording Industry Association of America (RIAA) and the Motion Picture Association of America (MPAA) says: "We are concerned that an increasing and significant number of students are using university networks to engage in online piracy of copyrighted creative works. We believe there must be a substantial effort, both disciplined and continuous, to bring this piracy under control... Students must know that if they pirate copyrighted works they are subject to legal liability. It is no different from walking into the campus bookstore and in a clandestine manner walking out with a textbook without paying for it." (Cnet 11 Oct 2002)

STUDENTS EVADE UNIVERSITY TACTICS TO PROTECT MEDIA FILES
As colleges and universities across the country take steps to rein in rampant unauthorized file downloading, students are ignoring policy changes that discourage such activities and are becoming more adept at circumventing technology blockades. "If you don't know how to do it, other people will just tell you," says one student. "There's not much they can do to stop you." And while university administrators are moving to placate entertainment companies complaining of student abuses, there's a pragmatic motivation at work as well — a large portion of most universities' bandwidth is being devoured by students' insatiable demand for online entertainment. Schools have closed off file-trading portals such as Kazaa, but the newest version of the Kazaa software includes a "port-hopping" feature that automatically seeks out open ports for its downloading activities. "It's an ongoing battle," says one network administrator. "It's an administrative nightmare trying to keep up." Meanwhile, schools appear conflicted in their quest for more ethical behavior among their students. "The biggest problems that universities are having is they have not openly decided whether their primary responsibility in this regard is law enforcement or education," says Virginia Rezmierski, who teaches in the University of Michigan's School of Information and recently surveyed universities on their monitoring practices. "Right now they're doing more monitoring than education." (New York Times 27 Nov 2002)

PRESSPLAY DEBUTS, AIMSTER RESURFACES AS MADSTER [23 Jan 2002]
Pressplay, the online music distribution service backed by Sony and Vivendi Universal, announced its launch this week following about a month of public testing. U.S.-based subscribers will be able to receive up to 300 streamed tunes on demand, as well as up to 30 downloads each month for $9.95. Heavy users can opt for a $24.95 deal that provides 1,000 songs and 100 downloads. Unlike rival MusicNet, pressplay subscribers will be able to burn a limited number of songs onto their own CDs. Meanwhile, renegade music-downloading Web site Aimster has resurfaced under a new moniker — Madster, named after company founder John Deep's daughter Madeleine. Aimster had been under siege by AOL Time Warner, which that the "Aimster" name and Internet domain infringed on its trademarked AIM instant messaging software. (Newsbytes 23 Jan 2002)
http://www.newsbytes.com/news/02/173858.html

INJUNCTION AGAINST MADSTER
A U.S. district court in Chicago has ruled in favor of the record companies and the Recording Industry Association of America, which had sued the file-sharing company Madster over the use of its file-swapping services by individuals who misappropriated copyrighted music. The said Madster?s very reason for being seemed to be "the facilitation of and contribution to copyright infringement on a massive scale." Madster founder Johnny Deep says his company has no way of knowing how people are using the service, since the files are all encrypted. More to come. (AP/San Jose MercuryNews4 Sep 2002)
http://www.siliconvalley.com/mld/siliconvalley/4003605

JUDGE ORDERS MADSTER TO SHUT DOWN
A federal judge in Chicago has issued a temporary restraining order against Madster, telling it to immediately disable its file-servers. U.S. District Judge Marvin Aspen said that record labels "will continue to suffer irreparable harm" otherwise. The Madster Web site continued to advertise $4.95 a month memberships last night, although downloads of the company's file-sharing software were not available. Lawsuits against Madster (formerly Aimster) had been on hold following its March bankruptcy filing, but a bankruptcy judge recently lifted the stay for the purpose of allowing plaintiffs to seek a preliminary injunction motion. That motion was issued October 30, but the service disregarded the order, which set the stage for yesterday's restraining order. The order is in effect through December 22, barring further notice from the court. (AP 4 Dec 2002)

DANISH ANTI-PIRACY GROUPS SENDS BILLS TO VIOLATORS
The Copenhagen-based AntiPiratGruppen, an organization whose efforts to stop theft of digital media are supported by the Danish entertainment industry, has found a new strategy. Instead of attacking Internet service providers for allowing copyright violations to happen, the organization goes directly against the violators themselves, sending them bills ranging from $130 to $13,300. (The $13,300 bill went to a disc jockey). If the recipients of bills do not pay up they will be sued. Various Danish newspapers and consumer groups are upset that Internet service providers have cooperated with AntiPiratGruppen by helping it identify copyright violators. (AP/USA Today 4 Dec2002)

MUSIC INDUSTRY PRESSURES VERIZON ON FILE-SWAPPER'S IDENTITY
The Recording Industry Association of America is pressuring a federal judge to force Verizon to reveal the identity of an Internet service subscriber accused of illegally trading copyrighted songs. Verizon general counsel Sarah Deutsch says if the judge capitulates, it would set a precedent that would harm the privacy rights of Verizon's ISP customers and could force other ISPs to give up the names of subscribers without judicial review. Verizon has already agreed to hand over the information if the RIAA files a separate "John Doe" suit against the alleged file-swapper, but the RIAA refused, saying that anti-piracy laws don't require a separate lawsuit. The Verizon subscriber who's the focus of the controversy is accused of sharing thousands of songs on the Kazaa network, and is located in the Pittsburgh area. Deutsch pointed out that the person in question may be totally unaware of the dispute. "Our general policy is to inform a user when we receive a subpoena. Since in our view this isn't valid, we haven't gotten the customer involved in the debate." (AP 4 Oct 2002)
http://apnews.excite.com/article/20021004/D7MENVS00.htm

COURT ORDERS INTERNET PROVIDER TO IDENTIFY A SUBSCRIBER
To facilitate the enforcement of the 1998 Digital Millennium Copyright Act, a federal district court judge in Washington has ordered Verizon Communications to identify a subscriber whom the Recording Industry Association of America (RIAA) suspects of using to Internet to make available unauthorized copies of several hundred copyrighted songs. The ruling is significant for at least two reasons. First, it shows that the recording industry is now targeting not only big companies accused of large-scale copyright violations but also individual violators. Second, it indicates that a willingness by the court to compel Internet service providers to yield subscriber information without requiring a copyright holder to file a lawsuit. (New York Times 22 Jan 2003)

VERIZON GOES TO COURT TO DEFEND CUSTOMER PRIVACY
Verizon Communications is asking a federal appeals court to declare unconstitutional a lower-court decision that ordered it to reveal the identity of a customer suspected of downloading copyrighted music files over the Internet. Verizon deputy general counsel John Thorne says, "I see a great jeopardy of privacy for people who are not doing anything wrong," and notes the lower court's ruling would make it possible for "strangers, stalkers, telemarketers, pollsters, creditor and anybody else" to obtain the identity of almost any Internet user. "No matter where you go, your identity can be compelled to be revealed under this process." (Reuters/USA Today 30 Jan 2003)

RECORDING INDUSTRY, WEBCASTERS REACH ROYALTY PACT
In a move to head off a potentially difficult arbitration process, the recording industry and Internet radio operators have agreed on terms for paying royalties to labels and artists for songs played on the Web. The rate set for 2003-2004 is nearly identical to that set by the Librarian of Congress for 2002 — webcasters can either pay a rate of 0.0762 cents per song per listener, or 0.0117 cents per listener hour. Webcasters that sell subscriptions to listeners can also choose to pay 10.9% of their subscription revenue. Both groups appeared to be satisfied with the agreement, which will save them millions of dollars in legal fees by avoiding arbitration. (Wall Street Journal 3 Apr 2003)

MUSIC PIRACY VIOLATIONS: $150K A SONG
The Recording Industry Association of America (RIAA) has filed lawsuits against four students it says it misappropriated academic computing resources to "illegally distribute millions of copyrighted works over the Internet." Two of the accused students are enrolled at Rensselaer Polytechnic Institute, one student is enrolled at Princeton, and the fourth is at Michigan Technological University. If they are convicted, they could be fined as much as $150,000 for each song they illegally traded. Digital media analyst Phil Leigh says of the RIAA's action: "This is just another step in the direction of demonstrating to the public that there will be penalties for what they consider to be copyright violations. I think they're attempting to take a carrot-and-stick approach here. They're whacking a few people with a stick now. And the carrot is the more liberal rules relating to label-backed subscription online services." (San Jose Mercury News 4 Apr 2003)

JUSTICE DEPT. SUPPORTS MUSIC INDUSTRY IN VERIZON CASE
The U.S. Justice Department filed a brief Friday supporting the effort by the Recording Industry Association of America to force Verizon Internet Services to identify a subscriber suspected of violating copyrights by offering more than 600 songs online. Verizon had asked a federal judge to block the subpoena, arguing that it violated the First Amendment's "protection of the expressive and associational interests of Internet users." However, the Justice Dept. filing said the subpoena, which was sought under the Digital Millennium Copyright Act, was legal. The judge will now have to decide the constitutional issue, which is viewed as an important test of the DMCA's applicability in Internet copyright cases. The filing comes as the recording industry is becoming increasingly aggressive in its quest to identify and punish music "pirates." (AP 19 Apr 2003)

JUDGE SAYS IT AGAIN: VERIZON MUST REVEAL CUSTOMERS' IDENTITIES
U.S. District Court Judge John Bates has reaffirmed his previous ruling requiring Verizon to reveal to the Recording Industry Association of America (RIAA) the names of two Verizon customers accused by RIAA of illegally downloading hundreds of copyrighted songs from the Internet. The ruling will probably be appealed to the U.S. Supreme Court, with Verizon asserting that the subpoena is invalid, since it relies on the Digital Millennium Copyright Act (DMCA), yet falls outside the scope of DMCA, which does not cover material that is merely transmitted over a network, and not stored on it. Verizon is asserting that the protection of its customers' privacy takes precedence over the subpoena that was issued. (Internet.com 25 Apr 2003)

GROKSTER AND STREAMCAST: WE DIDN'T DO IT
A federal judge has ruled that two Internet music services that offer peer-to-peer software used by millions of people to share copyrighted music illegally are not themselves guilty of copyright infringement. The judge's reasoning was that, since the technology is also used for many perfectly legal purposes, the two services should not be held responsible in those cases when it happens to be used for illegal purposes. The ruling will be appealed. The music industry insists that the two services, Grokster and StreamCast, are overwhelmingly used by people to exchange copyrighted material, and that legal uses are insignificant. Many industry analysts predict that the industry will soon have to change fundamentally and begin providing inexpensive, easy-to-access music over the Internet. (New York Times 26 Apr 2003)

RULING FORCES ENTERTAINMENT INDUSTRY TO RETHINK STRATEGY
Friday's ruling exonerating Grokster and StreamCast of charges of violating copyright laws will force the entertainment industry to broaden its battle against Internet piracy on three fronts: the courts, in Congress and in the marketplace. In addition to appealing the most recent ruling, the movie studios and record labels may start suing individuals who trade copyrighted files. One music label president, who spoke on condition of anonymity, says the ruling leaves industry no choice: "It makes them [consumers] angrier, but we have no other path right now. It's ridiculous what we're doing, but we have so few options." The industry is also lobbying Congress for stricter anti-piracy laws, and at the same time must find a way to give consumers a compelling alternative to piracy: "The most effective way to combat unlicensed sites is to offer licensed services with reasonable consumer rules at attractive prices," says a digital media analyst at Raymond James. "This attempt to enforce prohibition is a failure." The fact that many of the illegitimate sites are polluted with viruses, pop-up ads and low-quality files creates an opportunity for industry to offer a high-quality, hassle-free online service, he adds. (Los Angeles Times 26 Apr 2003)

CYCLES OF VIOLENCE IN THE MUSIC WARS
The record industry's options for fighting illegal music downloads from the Internet include some that may be illegal, such as attacking personal Internet connections to slow or halt the downloads, or the use of software called "freeze" that locks up a computer system for a certain minutes or hours and risks the loss of data, as well as software called "silence" that would scan a computer's hard drive for pirated music files and attempt to delete them, at the risk of deleting legitimate music files as well. Stanford Law School professor Lawrence Lessig, who specializes in Internet copyright issues, says: "Some of this stuff is going to be illegal. It depends on if they are doing a sufficient amount of damage. The law has ways to deal with copyright infringement. Freezing people's computers is not within the scope of the copyright laws." VERIZON AGREES TO REVEAL IDENTITIES OF SUBPOENAED CUSTOMERS
Following a federal appellate court's rejection of its efforts to resist a subpoena, Verizon has relented and is releasing the names of four individuals alleged to have illegally downloaded copyrighted music. The music-downloading lawsuit was filed by the Recording Industry Association of America (RIAA), whose president, Cary Sherman, says: "The Court of Appeals decision confirms our long-held position that music pirates must be held accountable for their actions and not be allowed to hide behind the company that provides their Internet service." Privacy advocates and Internet service providers are unhappy with the decision, and some are urging new legislation to prevent the release of the identities of previously anonymous Internet subscribers; however, entrepreneur Jorge A. Gonzales of Zeropaid.com thinks that new laws will be unnecessary: "The technology will move faster than the court systems. The new programs being developed are going to mask users. By the time Verizon has to start turning over a lot of names, the identities of users will be unknown." (New York Times 5 Jun 2003)

P2P PERVADES THE CORPORATE SUITE
Peer-to-peer file-swapping software is deeply entrenched in corporate networks, according to a study of 560 companies by Canadian firm AssetMetrix, which found that 77% of the companies reported P2P applications such as Kazaa and Morpheus installed. Among companies with more than 500 employees, 100% had at least one P2P program installed. "Corporations are frantic about how to rein in some control over this," says AssetMetrix president Paul Bodnoff. "Like with software licenses, most companies want to be on the right side of the law. The challenge is how they do that." In addition to worries over legal liability for employee's file-swapping activities, corporate IT managers say they're also concerned about the drain of resources caused by such activities. Transfers of large media files can bog down legitimate data traffic, and P2P software can also allow viruses to worm their way onto the systems, compromising network security. P2P CACHING PUTS ISPs AT RISK FOR COPYRIGHT VIOLATION
Swedish firm Joltid is marketing its PeerCache technology, which is designed to ease network traffic gridlock by caching frequently traded digital files within file-swapping systems. The software, which has been licensed by three major European ISPs, is built to work with FastTrack, one of the most popular P2P protocols which forms the basis for applications such as Kazaa and iMesh. PeerCache plugs into the ISP network and temporarily caches FastTrack P2P traffic, easing the bandwidth crunch. However, the technology is raising the hackles of the recording industry, which warns that even temporarily storing copyright files could make ISPs accomplices in illegal file trading. "Just using the word 'caching' doesn't mean that the service is automatically exempt from copyright liability," says the IFPI, the international counterpart to the U.S.'s RIAA. Meanwhile, Joltid founder Niklas Zennstrom, who co-founded Kazaa, maintains that European Union laws allow ISPs to temporarily cache traffic on their servers regardless of the file's legal status. "One should bear in mind that [whether] an ISP is caching a file or not does not make the file more or less available for end users. It only impacts the load on the ISP's network. Thus, by caching P2P traffic, ISPs are not encouraging or [discouraging] users to download files. It is just a way for the ISP to organize their network." Zennstrom says PeerCache is being tested by a number of European ISPs. (CNet News.com 18 Jul 2003)

EXPERTS SHARE TIPS ON AVOIDING FILE-SHARING LAWSUITS
In the wake of the recording industry's unprecedented moves against individual consumers to enforce copyright laws, legal experts are warning people who engage in music file-swapping to immediately stop sharing potentially infringing files or to disable file-sharing software. "…(I)he first thing you should do if you want to be off (the RIAA's) radar is to stop uploading," says Electronic Frontier Foundation senior intellectual property attorney Fre von Lohmann. But whether that strategy will prove successful is uncertain, because the RIAA has been collecting snapshots of individuals' shared file folders since June 26 to use as evidence lawsuits. Even if a file-swapper has since deleted those files, "that snapshot establishes enough evidence to establish infringement," says copyright expert Evan Cox. An RIAA spokeswoman says her group might be "willing to talk settlement" if a file-sharer has erased the evidence, but that will be considered on a case-by-case basis. The RIAA is using a provision included in the 1998 Digital Millennium Copyright Act to issue subpoenas requiring ISPs to disclose the names of suspected infringers, raising the stakes in its battle against unauthorized use of its copyrighted music. "What I think they're going to do is start suing moms and dads and families across America," says California attorney Ira Rothken. "They could lose their house or lose their ability to send their kids to college. That is not the intent of copyright statutes, to bankrupt a middle-class family." EFF SETS UP DATABASE OF RIAA SUBPOENA TARGETS
The Electronic Frontier Foundation has stepped right into the middle of the file-swapping fray, offering potential targets of the subpoenas recently issued by the Recording Industry Association of America (RIAA) a way to check and see if they're on the list.
We hope that the EFF's subpoena database will give people some peace of mind and the information they need to challenge these subpoenas and protect their privacy," says EFF senior counsel Fred Von Lohmann. The database allows people to check their file-sharing "handle" (e.g., hottdude123) against a list of subpoenas issued. If they see their name, they can access an electronic copy of the subpoena, which includes the name of their ISP, a list of songs pirated and the Internet address of the user. By the end of last week, nearly 900 subpoenas had been issued, with 75 additional being added every day. The subpoenas are intended to force the ISPs to divulge the identity of the alleged file-swappers and the RIAA is threatening lawsuits, claiming damages ranging from $750 to $150,000. "The recording industry continues its futile crusade to sue thousands of the more than 60 million people who use file-sharing software in the U.S.," says Von Lohmann. The EFF has teamed with the U.S. Internet Industry Association to set up a Web site called subpoenadefense.org, which provides information on lawyers and other resources for those facing legal action. 2003-08-27 **music RIAA lawsuit file-sharing MP3 copyright infringement**

NewsScan

THE RIAA HASHES IT OUT
How is the RIAA tracking down music file-swappers? (RIAA is the Recording Industry Association of America, a music-industry trade association.) It uses a library of digital fingerprints (or "hashes") that uniquely identify MP3 music files traded as far back as May 2000, and compares the hashes of music files on a person's computer against those in the library. Finding MP3 music files that precisely match copies that have been traded online provides evidence that a person may have participated in file-sharing services. One lawyer for a person already charged with illegal file-swapping protests: "You cannot bypass people's constitutional rights to privacy, due process and anonymous association to identify an alleged infringer." SBC RESISTS SUBPOENAS TO IDENTIFY MUSIC DOWNLOADERS
In another challenge to the recording industry, No. 2 regional phone company and Internet service provider SBC is refusing to comply with subpoenas requiring it and other ISPs to turn over to the Recording Industry Association of America (RIAA) the identities of subscribers suspected of music copyright infringers. SBC's general counsel James D. Ellis sees it as a privacy issue: "Clearly, there are serious legal issues here, but there are also these public policy privacy issues. We have unlisted numbers in this industry, and we've got a long heritage in which we have always taken a harsh and hard rule on protecting the privacy of our customers' information." Matthew J. Oppenheim, a top RIAA executive, says: "SBC believes that free music drives its business. That's the only explanation for why they would relitigate issues that have been resolved." RIAA WITHDRAWS IN A CASE OF MISTAKEN IDENTITY
The Recording Industry Association of America (RIAA) has withdrawn a lawsuit that accused a 66-year-old woman of illegally downloading and sharing more than 2,000 songs online. An attorney for the Electronic Frontier Foundation says the woman and her husband simply use the Internet to send e-mail to their children and grandchildren. Also, they use a Macintosh, which cannot run the software needed for the Kazaa file-sharing service they are accused of using illegally. The RIAA accusation seems to have been a case of mistaken identity, and the EFF attorney says more mistaken-identity cases are expected because many Internet service providers do not assign IP addresses to any one user but shuffle them around. RIAA CALLS ON P2P TO POLICE NETWORKS
Recording Industry Association of America (RIAA) chairman and CEO Mitch Bainwol suggested at a Senate hearing on Tuesday that Kazaa and other peer-to-peer file-sharing software vendors could institute three reforms that would discourage users from illegal activities: change the default settings so users aren't unwittingly sharing private documents; incorporate "meaningful" warnings about trading copyrighted content; and filter unauthorized copyrighted works off the P2P networks. "The file-sharing business must become responsible corporate citizens… moving beyond excuses. If the Kazaas of the world can institute three common-sense reforms, lawsuits can be avoided, the record industry will be healthier, there will be more jobs, consumers will get the music they want." Kazaa responded that it's already instituted the first two recommendations but that the third would be technically impossible. "If you're going to block the titles of every song, every word in every copyright song, every copyright movie, and every copyright book, you might as well input the whole dictionary," said Philip Corwin, attorney for Kazaa parent Sharman Networks. Meanwhile, rapper LL Cool J said though royalties generated through legitimate online music downloads were small, they were better than nothing. "Some of the artists may only get a nickel out of the 99 cents [charged per song]. Can we at least get that? Is it alright for us to make a living as Americans?" MUSIC INDUSTRY CRACKDOWN SPAWNS 'CYBER-SPEAKEASIES'
Music download enthusiasts are flocking to 21st century versions of "speakeasies" —high-tech clubs that offer encrypted software designed to shield users from identification and prosecution by a zealous recording industry. Coincidentally, the software now being served up may have broader appeal in the business world as well. "The software that users are moving toward, it has characteristics that businesses need — which is a high degree of privacy, a high degree of security and the ability to handle large files," says New York University telecommunications professor Clay Shirky. "Thanks to the RIAA, ease of use surrounding encryption technologies, which was never a big deal before, is a big deal now." In addition to old favorites such as Kazaa and Morpheus, file-swappers are now turning to newer iterations, such as Blubster, which features both stronger privacy protection as well as easy-to-use encryption and decryption. Another program, called Waste, can be used to set up an encrypted instant-messaging and content-sharing network of 50 users, without the potential liability of a central server. And an offshoot of Freenet, dubbed Locutus, is targeting corporate users with its ability to search corporate networks for information distributed across a wide range of computers. "It's kind of like Google for people's hard disks, but with added security. You can define who has permission to find what kind of files," says Ian Clarke, who heads up Freenet and Locutus parent Cematics. (AP/CNN.com 6 Oct 2003)

NewsScan

APPLE iTUNES DOES WINDOWS
Apple is expanding its popular iTunes music download service into Windows territory, promising a wider selection of songs and some new features to maintain its lead in an increasingly competitive market. The launch was accompanied by the usual Apple glitz — CEO Steve Jobs chatted via remote link-up with U2 lead man Bono and the Rolling Stones' Mick Jagger in a prelude to a live performance by singer-songwriter Sarah McLachlan. "It's like the pope of software meeting up with the Dali Lama of integration," gushed Bono — referring to the iTunes software and Apple's integrated online music store. Analysts say that iTunes faces stiff competition in the Windows space, but that its flexibility to download tunes onto multiple devices gives it an edge. "There's going to be a lot of jockeying for position in the next 12 months," says a Forrester Research analyst. "But I think iTunes is a real winner because it has the portable player, the jukebox and the store all together." (Reuters 16 Oct 2003)

SUING DOWNLOADERS JUST GOT MORE EXPENSIVE
Friday's court ruling absolving Internet service providers of the duty to reveal subscribers' names when music companies serve them with a subpoena means that the costs for going after people who download music illegally just got a lot higher. Legal experts say the music industry can still bring civil lawsuits against individuals without knowing their names — so-called "John Doe" suits — and then ask a judge for permission to issue subpoenas, but "That's a time-consuming and fairly expensive process," says one intellectual property attorney. Previously, recording industry lawyers had been issuing subpoenas before filing any lawsuits. The new procedure will also allow targeted individuals to contest the subpoenas in court. "It's not going to stop (the recording industry) from filing legitimate claims. It's going to give the targets of those claims procedural protection if they're incorrectly named," says a lawyer for the Electronic Frontier Foundation. "This is certainly a setback for the industry if they're looking to threaten without suing. It raises the stakes all around," says Jonathan Zittrain, co-director of the Berkman Center for Internet and Society at Harvard Law School. (AP/Washington Post 23 Dec 2003)

NewsBits; http://www.nytimes.com/2004/01/05/business/media/05song.html

Songwriters Say Piracy Eats Into Their Pay

David Bernstein wrote about the effects of music piracy on songwriters in a January 5, 2004 article in the New York Times. Songwriters' income depends largely on royalties from album sales; with the drop in such sales as a result of widespread theft of music tracks, writers have seen their income decline. For example, veteran songwriter Charles Strouse, 75, saw his income drop by 50% between 2002 and 2003 due to piracy. Typically, writers receive a few pennies for every copy of their music sold; with 2B illegal downloads per month displacing sales, their revenues are seriously affected. Many writers have lost steady jobs at music-publishing companies and are looking for other work.

ANONYMOUS SERVICE MASKS FILE-SWAPPERS

Wyatt Wasicek, a programmer whose day job is working for an Internet service provider, is offering music downloaders who use file-sharing programs such as Kazaa a way to do so anonymously. His service, AnonX, is available for $5.95 a month and provides protection by setting up a virtual private network between the user's computer and the company's servers. The AnonX computers act as proxies, so that the actual users' identities are masked. Wasicek has promised not to divulge the e-mail addresses of his 7,000 subscribers and says he doesn't think he can be forced to do so because AnonX's official owner lives in Vanuatu, the Pacific island nation that also hosts Kazaa's parent company, Sharman Networks. AnonX's servers are located overseas as well. Wasicek says he decided to create AnonX to shield the occasional file-sharer who's unaware of copyright infringement ramifications. "I'm doing this to protect the family with the 13-year-old, not the 25-year-old with 25 movies he's sharing with his buddies. I wanted to go back to the good old days when people could surf anonymously," says Wasicek. (AP 11 Feb 2004)

RIAA FILES 531 MORE LAWSUITS AGAINST FILE-SHARERS

The Recording Industry Association of America has filed five separate lawsuits against 531 Internet users that it accuses of illegal file-sharing. The action comes on the heels of four similar suits filed by the RIAA against 532 users last month. All the suits are using the "John Doe" method, which identifies the alleged song-swappers through their numerical Internet addresses. The RIAA is seeking to discover the swappers' names and addresses through court-issued subpoenas. An appeals court in December ruled in favor of Verizon that the RIAA could not force ISPs to divulge the identities of subpoena targets before the lawsuits were filed. Sarah Deutsch, VP and associate general counsel for Verizon, says it has not yet received any subpoenas during this go-round, but is interested to see whether briefs filed by the Electronic Frontier Foundation and American Civil Liberties Union protesting RIAA's tactics will affect the case. "We're waiting for the resolution of the due process issues that have been raised by the public interest groups," says Deutsch. Meanwhile, Nielsen SoundScan, which tracks U.S. music sales, says U.S. album sales are up 10.4% this year compared to the same period in 2003. (Reuters/New York Times 17 Feb 2004)

TABLES TURNED ON RIAA — ACCUSED FILE-SWAPPER FIGHTS BACK

A New Jersey woman has countersued the Recording Industry Association of America, accusing it of extortion and racketeering tactics in its strategy to sue individual file-sharers. Michele Scimeca's lawsuit is one of "a handful" of countersuits, according to the RIAA. "If someone prefers not to settle, they of course have the opportunity to raise their objections in court," says an RIAA spokesperson. "We stand by our claims." Scimeca contends that by suing file-swappers and then settling the cases before they're brought to trial while threatening potential liabilities that could reach into the hundreds of thousands of dollars, the RIAA is engaging in activities more often associated with gangsters and organized crime. "This scare tactic has caused a vast amount of settlements from individuals who feared fighting such a large institution and feel victim to these actions and felt forced to provide funds to settle these actions instead of fighting," says Scimeca's attorney. "These types of scare tactics are not permissible and amount to extortion." The RIAA has sued a total of about 1,500 people and has settled with 381 of those. (CNet News.com 18 Feb 2004)

NAPSTER-BACKING VENTURE FIRMS HIT WITH LAWSUIT

Universal Music and EMI Group have filed a copyright infringement lawsuit against Hummer Winblad Venture Partners and two partners — John Hummer and Hank Barry — alleging that the venture capital group contributed to unauthorized copying of music through its $13 million investment in Napster and through Barry's role as Napster's CEO for more than a year. Both men also served on Napster's board. The suit seeks $150,000 per copyright violation plus punitive damages. "Businesses, as well as those individuals or entities who control them, premised on massive copyright infringement of works created by artists should face the legal consequences for their actions," said the two record labels in a joint statement. Hummer Winblad's investment was made in May 2000 — after the recording industry sued Napster for enabling copyright infringement, but the case never made it to trial. Napster filed for bankruptcy protection in June 2003. The National Venture Capital Association is watching the case closely and cautioned that the outcome could have a chilling effect on investment in unproven technologies, thus hampering economic growth. "The concern is that investors are being sued for investing in high-risk companies," says NVCA VP Jeanne Metzger. (Reuters 23 Apr 2003)

DJs ORDERED TO PAY IN MUSIC PIRACY CASE

The Federal Court of Australia has ordered five disc jockeys, a record store and its director to pay a total of $140,000 to the owners of copyright, whose music they had copied and sold. The award was in favor of Universal Music, Sony Music Entertainment (Australia) and Warner Music Australia. The DJs who were asked to pay go by the names Moto, Chocolate Boy Wonder, Peter Gunz, Demo, and Tikelz. Record store Anthem Records and its director Joe Sitoa were also asked to pay. The respondents had produced and distributed compilation CDs containing music from some of the biggest names in rhythm and blues, including Ja Rule, Jennifer Lopez and Missy Elliot. STATES TO FILE-SHARING COMPANIES: WATCH OUT

Most of the country's state attorneys general have sent a warning letter to seven companies that promote online file-sharing software such as Kazaa and Morpheus, warning them that there could be legal consequences if they don't adequately inform computer users about the potential risks of using their software. The letter also urged the companies not to add encryption features to their software to hide users' identity: "Encryption only reinforces the perception that P2P technology is being used primarily for illegal ends. Accordingly, we would ask you to refrain from making design changes to your software that prevent law enforcement in our states from investigating and enforcing the law." Adam Eisgrau of P2P United, a trade group that represents several of the firms, says: "Asking us not to use encryption is incredibly shortsighted when there are clear legitimate corporate and public uses for a private network." Fred von Lohmann of the Electronic Frontier Foundation in San Francisco says of the letter: "I'm not aware of any state law that file-sharing violates. This letter is clearly an exercise of political clout on the part of the entertainment industry." (AP/San Jose Mercury News 5 Aug 2004)

COURT ON FILE-SWAPPING: GET USED TO IT

A three-judge panel of the 9th Circuit Court of Appeals has ruled that the movie and recording industries can't stretch copyright law to block online piracy of songs and movies. If the decision is appealed, the U.S. Supreme Court could revisit its landmark Sony Betamax ruling that protected
from copyright lawsuits products that have substantial legitimate uses. Whereas the same appeals court ruled against file-sharing service Napster in 2001 because it stored illegally copied files on its central computers, today's peer-to-peer file-sharing networks have no central computers -- and
cannot even monitor users, let alone control them. The court urged the entertainment industry to adapt to file sharing the way movie studios did after losing the Betamax case: "The introduction of new technology is always disruptive to old markets, and particularly to those copyright owners whose
works are sold through well-established distribution mechanisms. History has shown that time and market forces often provide equilibrium in balancing interests, whether the new technology be a player piano, a copier, a tape recorder, a video recorder, a personal computer, a karaoke machine or an MP3 player."(Los Angeles Times 20 Aug 2004)

UNIVERSITIES BEEF UP ANTI-DOWNLOADING TACTICS

Many U.S. universities are greeting returning students with tighter restrictions on using campus networks for illegal music downloading and file-swapping. Until recently, universities had relied on a soft approach -- lecturing students on copyright issues and making them sign pledges to abstain from illegal downloading -- but many are now taking a more hardline stance. Virginia State University recently installed network firewalls that block download sites such as Kazaa and eDonkey -- a move that officials say instantly reduced bandwidth usage from 95% to 51%. The University of Nevada at Las Vegas has installed technology that automatically deletes files saved to communal computers whenever the machines are turned off. "We're not content police. We're bandwidth police," says UNLV associate provost Lori Temple. "We make it so downloading music is a horrible idea." And the University of Florida has developed its own software, Icarus, to detect
illegal downloading by scanning network traffic for peer-to-peer files. A first violation cuts off the student's for 15 minutes -- the second time, the penalty goes up to five days. Meanwhile, other schools are taking the carrot approach, striking deals with legitimate music services, such as the
reincarnated Napster, to offer free or very inexpensive access to streamed music. All these measures are necessary, say college administrators, in order keep their schools off the RIAA's growing lawsuit list. (Wall Street Journal 23 Aug 2004)

MUSIC INDUSTRY SHOULD CHARGE LESS, SELL MORE

The music industry is fighting a losing battle, says Newsweek columnist Steven Levy, who says the RIAA's legal tactics make about as much sense as trying to sue a hurricane: "Technology generates its own form of nature, a set of conditions that enforce an artificial, yet equally unstoppable, reality… For the longest time, the labels viewed digital music as something that could hurt them with hurricane force but made no efforts to adjust to this new reality, let alone exploit it." Levy notes that Real Networks' experiment with sharply cutting prices for digital music -- to 49
cents per song -- was a losing proposition because they still owed 70 cents in royalties for each song sold. But what's impressive is that Real sold six times as much music and took in three times as much money as when they had prices pegged at the industry's 99-cent standard. Levy says that if
labels and artists would agree to smaller royalties, everyone could get richer quicker: "Behind Door One is the money you can make by selling a million copies of a tune. Behind the other door is the money to be reaped by selling 6 million copies at half the price. Do the math, guys!" Not only
that, but lowering prices significantly might just stamp out the scourge of pirated music -- and that's what the labels say they want, right? (Newsweek 27 Sep 2004)

SUPREME COURT TURNS DOWN INTERNET PIRACY CASE

The Recording Industry Association of America has lost a round in its ongoing efforts to use the courts in its battle against online music piracy. The U.S. Supreme Court on Tuesday turned down a request to settle a dispute over whether Internet service providers can be forced to identify subscribers accused of illegally swapping music and video files. Lawyers for Verizon, which had sought to keep subscribers' information private, argued that the recording industry has been quite successful in going after people who trade copyrighted works, having sued more than 3,000 alleged infringers in the past 10 months. The issue turns on the provisions of the 1998 Digital Millennium Copyright Act, which was written before the problem of file-swapping was common. An appeals court earlier ruled that it's up to Congress, not the courts, to expand the law to cover popular file-sharing networks. This latest decision is separate from a petition filed last week by the recording industry asking the Supreme Court to hold Grokster and Streamcast Networks responsible for their customers' file-swapping activities.

NewsScan; http://www.nytimes.com/2004/12/06/arts/06down.html

ARTISTS LOVE THE WEB, HATE MUSIC PIRACY

In the first large-scale survey of artists (i.e., filmmakers, writers and digital artists), musicians and the general public, the Pew Internet and American Life Project has found that only about half of the artists polled thought that sharing unauthorized copies of music and movies online should be illegal. Nearly two-thirds of those said filesharing services such as Kazaa and Grokster should be held responsible for illegal fileswapping, while only 15% thought it was a good idea to go after individual users. Among musicians, 37% said the file-sharing services and users should share the blame for illegal file-swapping, while 17% singled out the services as the guilty parties. The survey results indicate that while file-swapping is an ongoing irritant to artists and musicians who see their work distributed for free on the Net, they also value the widescale exposure that the Internet makes possible. "The overall picture is that the musician-artistic community has a much wider range of views and experiences than folks who watch the Washington debate about copyright might imagine," says Lee Rainie, director of the Pew Internet Project. RUSSIAN MUSIC SITES SPECIALIZE IN CHEAP DOWNLOADS

Russian music sites with names like MP3search.ru and 3MP3.ru provide music fans with a way to bypass the copyright restrictions on most U.S. and European online music services and pay less while they're at it. The sites offer a large selection of highquality downloads with no restrictions for about 10 cents or less per song, but U.S. lawyers warn that downloading music from these sites is just as illegal as downloading from free P2P sites like Kazaa: "It doesn't matter if somebody downloads in the U.S. and believes that it's legal because the site tells them so," says one intellectual property attorney. However, several of the Russian sites say they pay licensing fees to a group called the Russian Organization for Multimedia & Digital Systems (ROMS), which purports to represent Russian copyright holders and acts "in conformity with the requirements of the Russian laws," according to ROMS legal expert Konstantin Leontiev. Meanwhile, the International Federation of the Phonographic Industry says that Russia is second only to China in CD piracy and is threatening legal action against some Russian music sites. EDUPAGE; http://chronicle.com/prm/daily/2005/04/2005042201t.htm

JUDGE REJECTS RIAA'S EXPEDITED SUBPOENAS

A federal judge in North Carolina handed the Recording Industry Association of America (RIAA) a legal defeat in its effort to learn the identities of two students accused of illegal file sharing. The RIAA had sought the identities from the students' universities, the University of North Carolina at Chapel Hill and North Carolina State University, under an expedited subpoena process the group has since abandoned. In a December 2003 decision, another federal judge had rejected the expedited subpoenas, which did not require a judge's signature, ruling that Verizon could not be forced to disclose identities of its customers. In their capacity as Internet service providers (ISPs) for students, universities were given similar protection from the expedited subpoenas. In this case, Judge Russell A. Eliason ruled that an ISP that does not store information but merely transmits it cannot be compelled under the Digital Millennium Copyright Act to reveal identities of its users. After the 2003 decision, the RIAA began filing individual "John Doe" lawsuits for illegal file sharing. Under that process, which costs the RIAA more time and money than the other, ISPs can be forced to turn over identities of users. Chronicle of Higher Education, 22 April 2005 (sub. req'd)

2005-06-07 **peer-to-peer P2P legal music downloading services report**

EDUPAGE; http://www.reuters.com/newsArticle.jhtml?storyID=8721861

MORE CONSUMERS TURNING TO LEGAL MUSIC SERVICES

Growing numbers of U.S. consumers are using legal online music services, making them viable competitors to peer-to-peer (P2P) services, which are typically rampant with illegal file sharing, according to research firm NPD Group. NPD data indicate that Apple's iTunes music store ties for second on a list of the most-used online music services, even with LimeWire and just behind WinMX. Other legal services Napster and RealNetworks's Rhapsody placed seventh and ninth on the list, which also includes such P2P services as Kazaa and BearShare. Isaac Josephson of NPD pointed out that, aside from avoiding the risk of prosecution, legal online music services offer several advantages over P2P networks, including convenience of finding what you're looking for and knowing that files you download do not contain spyware. These factors, coupled with the threat of legal action for copyright violations on P2P networks, make paying for music online an attractive proposition, according to Josephson. Reuters, 7 June 2005

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/12426744.htm

CAMPUSES STILL WORKING TO CHANGE STUDENT DOWNLOAD HABITS

Despite the availability of legal online music services on a growing number of college and university campuses, many students continue to get their music from illegal P2P downloads. At American University in Washington, D.C., only about half of the 3,800 students use the Ruckus music service. A similar percentage was reported for the 10,000 students of the University of Rochester, who have access to Napster. Pennsylvania State University estimates that about 40 percent of its 70,000 students use the Napster service provided to them. For students willing to risk being sued by the entertainment industry and downloading computer viruses, incentives for illegally downloading songs include the ability to copy the songs to CDs and to portable devices and to keep the music after they have left college. Officials from legal online music services acknowledged the hurdles in persuading all college students to abandon illegal file sharing, but they said that offering the services to college students will prove to be beneficial in the long term. EDUPAGE; http://www.insidehighered.com/news/2005/09/22/filesharing

REPORT ADDRESSES CAMPUS EFFORTS TO CONTROL FILE SHARING

A report submitted to Congress this week provides a snapshot of campus programs to provide legal alternatives to illegal file trading. Prepared by the Joint Committee of the Higher Education and Entertainment Communities, the report noted that the number of institutions offering legal download services has tripled during the past year, to 70, covering more than 670,000 students nationwide. Campuses offering such services include a number of large and high-profile institutions, and many other colleges and universities are expected to introduce such programs. The report acknowledged that measuring the effect of legal options on student behavior can be difficult, and it noted that large numbers of students at some schools continue to engage in illegal file trading despite the option of a legal service. The most successful approach, according to the report, is for a campus to enforce copyright policies and work to limit illegal file trading while offering students a legal alternative.

EDUPAGE; http://chronicle.com/daily/2005/09/2005092301t.htm

CONGRESSMEN TO ASK FOR REVIEW OF HIGHER ED ANTIPIRACY EFFORTS

At a U.S. House of Representatives subcommittee meeting this week, lawmakers, campus officials, and representatives of the movie industry and of a provider of legal download services discussed efforts by U.S. Colleges and universities to curtail copyright violations on their networks. Reps. Lamar Smith (R-Tex.) and Howard Berman (D-Calif.) said they will ask the Government Accountability Office to issue a formal report on what effects those efforts have had on student file-trading habits. According to Smith, "We will ask for the report so we can increase the scrutiny and increase the public attention to piracy." Also at the hearing, Norbert Dunkel, director of housing at the University of Florida, described his institution's use of an application called Icarus, which automatically restricts usage of the network for students who connect to P2P services. Dunkel said the tool, which the university developed, has led to a 95 percent reduction in outgoing traffic from the university's network and virtually eliminated notices of copyright infringement. Smith applauded the application, but Daniel Updegrove, vice president for information technology at the University of Texas at Austin, expressed concerns that such a blanket approach to the problem could limit the academic freedom and privacy of students. EDUPAGE; http://news.com.com/2100-1027_3-5952060.html

I2HUB SHUTS DOWN

I2Hub, the P2P service that ran on Internet2's very high-speed network, has ceased operation amid growing concerns over the liability of such services for copyright infringements by their users. I2Hub was launched in early 2004 on the academic and research network that connects more than 200 locations. Although the service made forays into legal activities, it was largely used by students at connected campuses to trade music and movies at speeds substantially higher than possible with commercial Internet services. A number of i2Hub users had been targeted by the entertainment industry for copyright infringement, however, and the service itself was cited by the Recording Industry Association of America in September as a possible target of legal action. The closure of i2Hub follows that of Grokster last week and an announcement by eDonkey, the most popular P2P service, that it would change its business model to a paid download service. EDUPAGE; http://news.zdnet.com/2100-9595_22-5989758.html

P2P CLOGGER TO CLOSE

A company that tried to limit illegal file trading by flooding P2P networks with junk files is being shut down and put up for sale. Overpeer, which is owned by Loudeye, contracted with record companies and movie studios to place thousands of bogus versions of songs and movies on P2P services. When users searched for and downloaded those files, they would get garbage or advertisements rather than the desired files. Since late 2002, when Overpeer was at its height, a number of strategies have been developed to allow file traders and the services they use to make reasonably good guesses about files and to filter out the bogus ones. Officials from Loudeye said revenues had fallen significantly and that the division would cease operations immediately. Loudeye will attempt to sell Overpeer's assets. ZDNet, 9 December 2005

2006-01-08 **legal music download increase after Christmas 2005 piracy anti-piracy intellectual property right theft**

EDUPAGE; http://news.com.com/2100-1027_3-6023769.html 23

LEGAL DOWNLOADS SURGE AFTER CHRISTMAS

Sales of music tracks online surged over the holidays, indicating what might be new baseline levels for the market. During the Christmas week, 9.5 million tracks were downloaded from legal online music services, a new record for single-week sales. The following week, that number jumped to nearly 20 million tracks, triple the number sold during the same week a year earlier. Analysts attribute much of the gain to the ballooning number of portable MP3 players in the hands of consumers and to strong sales of gift cards. For the year, legal downloads rose 147 percent to 142.6 million. Although a drop always follows the holiday spike, analysts said the holiday numbers could indicate a market that will grow to perhaps 750 million or 1 billion tracks in 2006. Such numbers still pale compared to downloads on P2P services, which are estimated at 250 million per week, but experts say the upswing in legal downloads signals a changing tide for online music.

2006-01-19 **students blame software tool peer-to-peer I2HUB RIAA lawsuit settlement EFF**

EDUPAGE; http://chronicle.com/daily/2006/01/2006011901t.htm 23

STUDENTS BLAME I2HUB FOR THEIR DOWNLOADING HABITS

A group of students at the University of Massachusetts at Amherst are demanding that the operators of the now-shuttered i2hub pay for their settlements with the Recording Industry Association of America (RIAA). According to Lisa Kent, an attorney at the university's Student Legal Services Office, which is representing the 42 students, i2hub deceived students into believing the service was endorsed by the university. This deception led to their believing that downloading materials over the network was legal. Unless i2hub pays the $157,500 that the RIAA is seeking from the students, the student legal office will file a lawsuit, said Kent. Charles S. Baker, the attorney for Wayne Chang, who created i2hub when he was a sophomore at UMass Amherst, rejected Kent's argument, saying that the software that Chang wrote was technically legal. "i2hub," he said, "is not responsible if your clients used the software for an improper purpose." Fred von Lohmann, a lawyer for the Electronic Frontier Foundation, compared the students' legal argument to "a shooter deciding to sue a gun company, saying, 'The gun made me do it.'"

DIGITAL FOUNTAIN GUSHES CONTENT
Digital Fountain has developed new technology that packages streaming video and audio in a different way for Internet transmission, making its server hardware as much as 30 times more efficient than existing hardware in broadcasting movie and music files. When coupled with multicasting software, a single machine can deliver files on demand to an almost unlimited audience. The technology uses "meta-content" packets that provide mathematical snapshots that represent random chunks of files. Unlike the conventional process, which requires that all of a file's packets be received in the correct order, Digital Fountain's technology enables a server to receive the packets in any order -- missing packets don't slow the process. One Digital Fountain server can pump DVD-quality video simultaneously to 4,000 users, a load that could require up to 30 conventional servers. (Wall Street Journal 16 Apr 2001)

NETWORKS SUE PERSONAL DIGITAL RECORDER MAKER [1 Nov 2001]
Three major television networks -- NBC, ABC and CBS -- are suing SONICblue Inc., maker of ReplayTV personal digital video recorders, saying that new ReplayTV 4000 would violate their copyrights by allowing users to distribute programs over the Internet. In a joint statement, the broadcasters said the device "violates the rights of copyright owners in unprecedented ways" and "deprives the copyright owners of the means by which they are paid for their creative content and thus reduces the incentive to create programming and make it available to the public." The company, which has not yet released the ReplayTV 4000, said the device limits to 15 the number of times a user can send any particular show to another ReplayTV 4000 owner, or so-called "TV buddy." The product also supports a digital rights copy protection technology that broadcasters could use to restrict consumers from sending shows over the Internet. Analysts say the lawsuit marks the networks' preemptive strike against a technology that is expected to flourish over the next few years and that could spark the same controversial issues as Napster's music-sharing technology. VIVENDI PLANS ONLINE VIDEO SERVICE
Vivendi Universal is launching MP4.com -- a Web site that features a collection of short videos, including animated flicks, feature film-related content, movie trailers and games -- in a few weeks. MP4.com piggybacks on the concept of MP3.com, a music-aggregation site that Vivendi acquired last May. The move into online video follows Sony's debut last September of Screenblast, a site that offers would-be film and animation makers the publishing tools to create video, animation and music. The target user group is 18- to 24-year-olds, an age cohort most likely to have access to broadband connections in dorms or on college campuses. "The concept of MP4 is good if Vivendi can afford the bandwidth and the streaming costs that could attract a big audience," says a digital media researcher at Raymond James Financial. In recent years, a number of similar endeavors have failed to find a viable business model, with Pop.com, AOL Time Warner's Entertaindom, Digital Entertainment Network, Pseudo Programs, CMGI's iCast, and Icebox all falling victim to the dot-com debacle. MGM AND CINEMANOW PLAN VIDEO-ON-DEMAND OVER THE NET
MGM is teaming up with CinemaNow of Marina del Rey, Calif., to become the first major Hollywood studio to offer video-on-demand via the Internet. The companies will offer both downloadable and "streamed" versions of "What's the Worst That Could Happen?" and "The Man in the Iron Mask" to any consumer with a high-speed Internet connection and a Windows-based computer. "Our intention in the next two years is to find out as much as we can about how consumers want VOD delivered, what they think about it, [and] how much they want to pay," says MGM Home Entertainment marketing VP Blake Thomas. MGM had previously joined with four other Hollywood studios in the "Movielink" joint venture, but that effort and its rival, Movies.com, have become bogged down in an antitrust probe by the Justice Department. The MGM movies will be available at two streaming speeds: 300 kbps, which is described as a near-VHS-quality picture, and 700 kbps, which is between VHS and DVD quality. Prices will range from $2.99 to $5.99, depending on location and Internet connection. (Los Angeles Times 20 Feb 2002)

'WE FEEL IT'S LEGAL': NEW DVD BACKUP SYSTEM
The software developer 321 Studios, based in St. Louis, Mo., plans to start using its Web site to sell downloadable copies of its software for making backup copies of DVD movies. The Motion Picture Association of America (whose chairman Jack Valenti has called DVD recorders "the newest incarnation of movie piracy") will probably file a lawsuit against 321, but the company's president says: "Our position is that our product is for the purpose of making backup copies of the movies you already own. We feel it's legal." (USA Today 29 Oct 2002)

DVD-COPYING SOFTWARE MAY BE JUDGED TO BE ILLEGAL
Federal District Judge Susan Ilston has hinted that she may ban certain software products made by 321 Studios that allow consumers to copy movies onto DVDs. The 321 software makes it possible to evade the electronic locks designed to deter consumers from copying a movie onto another DVD or a CD, thereby violating the anti-piracy protections included in the Digital Millennium Copyright Act (the constitutionality of which has been under attack). In her ruling, the judge referred to two recent rulings against the distribution of other programs that circumvent electronic locks: the DeCSS software for copying DVDs and ElcomSoft Co.'s program to decrypt certain electronic books. However, 321 Studios is arguing that those products are different from its own because its has the legitimate purpose of helping consumers make backups of the discs they own. However, an attorney for the movie studios says manufacturers of DVD players are authorized to unlock discs, but 321 Studios is not. (Holland Sentinel 18 May 2003)

VALENTI ON DIGITAL PIRACY
Dick Valenti, president of the Motion Picture Association of America, sees the fight against digital piracy as vital to America's economic future: "Piracy is a fact plain and real, with the unwanted prospect of its rapid spread in the future. Antipiracy must take precedence over everything. Current conservative estimates indicate that the film industry loses $3.5 billion each year to hard-goods piracy (counterfeit DVDs, VHS tapes and optical discs). That figure does not take into account the damage done by online piracy. The digital world with its zeroes and ones and perfect copies of originals has changed the movie landscape forever, which is why the movie world's priorities have been permanently altered. The industry wants to use the Internet to dispatch films to consumers. But as we do, we must also challenge piracy and defeat it with every weapon we can summon — and we will succeed, I am convinced — or one day we will sit upon the ground and tell sad stories of the decline and fall of America's greatest artistic triumph and an awesome engine of job and economic growth." HOLLYWOOD THREATENS LAWSUITS AGAINST ONLINE PIRATES

The Motion Picture Association of America says its members are poised to file copyright-infringement lawsuits against digital movie downloaders, following the lead of the music industry, which has filed thousands of such lawsuits over the past year. But while the music industry has demonstrated decidedly mixed results, the movie industry may be more successful, in part because the campaign is getting underway while movie downloading is still relatively rare, representing only 2% of all online file sharing. "The studios have a little bit of a head start. By taking action now, [they] have a better chance in making a real dent in the problem," says one copyright attorney. One reason for the small number of film downloads is the size of the files -- users could download hundreds of songs in the same time it takes to download one movie. In addition, movie fans are not as disaffected with that industry, unlike music enthusiasts who resent paying $15 for a CD with only one or two songs that they really want. "The deal between you and Hollywood is pretty good. The deal between you and the music industry has been pretty lousy for a long time," notes Eric Garland, CEO of BigChampagne. (Wall Street Journal 5 Nov 2004)

FIRST CHARGES FILED UNDER CAMCORDER LAW

A 19-year-old man from Missouri has become the first person charged under a recently enacted federal law banning the use of camcorders to tape movies in theaters and then make them available online. According to the Motion Picture Association of America, such camcorder piracy accounts for more than 90 percent of movies that are available online prior to their release outside theaters. Curtis Salisbury is charged with taping two movies in theaters and placing them on so-called warez networks, where many pirated movies and songs find their way onto the Internet. From there, pirated content typically ends up on P2P networks. Unlike the majority of people who upload copyrighted content to such networks, Salisbury tried to profit financially from the movies he posted. He is charged with conspiracy, copyright infringement, and two violations of the law banning camcorders in theaters. He faces up to 17 years in prison. Reuters, 5 August 2005

2000-07-20 **intellectual property IP copyright infringement piracy lawsuits auctions Web sales**

NewsScan

Sega . . . shut down more than 60 illegal Web sites and 125 auction sites selling pirated versions of its Dreamcast games, which until recently had been viewed as a "Fort Knox of online intellectual properties" — protected by far more sophisticated technology than the relatively simple music, film and video files targeted by services like Napster and Scour. Despite the security precautions, several dozen Dreamcast titles were released this month on the Internet and have been traded via networks like Internet Relay Chat (IRC). Charles Bellfield, Sega's director of communications, says his company's actions mark one of the first times that the Digital Millennium Copyright Act of 1998 has been invoked to go after the Web-hosting companies and ISPs used by pirate traders. "It is the first time that this act has been used not just to stop piracy, but also physical sales over the Internet. It is the first time that Web-hosting companies and Web auction sites are being held accountable for the contents of what is being sold." (Reuters 20 July 2000)

LIBRARY PACT SIGNALS NEW CHAPTER IN E-BOOK LENDING
California State University system is working with NetLibrary to provide simultaneous access to electronic books for multiple borrowers -- a significant change in how subscription models generally work. Previously, a single copy of an e-book could be borrowed by only one reader at a time -- just like a print version. Under the new rules, half of the 1,500 e-books owned by Cal State will be available to multiple readers at the same time, at no extra cost. Libraries need to exert more influence in the ongoing debate over the fledgling e-book industry, says Evan Reader, of the CSU Chancellor's office. "They accept what's put on the plate. We don't want to do that." The Cal State system has 23 campuses and 370,000 students. "I suspect (NetLibrary) went along with it because of our size," says Reader. (Wired.com 21 Aug 2001)

DIGITAL PIRACY SPREADS FROM MUSIC TO BOOKS
Book publishers are beginning to see the same kind of piracy tactics recently experienced by the recording industry, and Internet monitoring firm Envisional predicts that the illegal downloading of books could become as big a problem as Napster. Envisional found nearly 7,300 copyrighted titles available for free through file-sharing networks such as Gnutella, including more than 700 individual copies of J.K. Rowling's Harry Potter books. In most cases, the book has been scanned and converted into downloadable text, but in a few instances hackers had cracked the copyright protection codes to e-books and made them available. Envisional says the files it found are simply the tip of the iceberg. "It's a relatively conservative estimate of the number of illegal books out there," says an Envisional executive. EDUPAGE; http://chronicle.com/daily/2006/04/2006042001t.htm 23

PUBLISHERS SETTLE COPYRIGHT LAWSUITS, MORE PENDING

Two academic publishers have settled six of 20 lawsuits filed against individuals for selling copies of instructors' manuals online. The manuals accompany specific textbooks but are intended for faculty only because they include answers to homework and quiz questions in the texts. The individuals involved in the settlements were accused of making copies of instructors' manuals and selling them online, according to William Dunnegan, an attorney representing Pearson Education and John Wiley & Sons. Terms of the settlement were not released, nor were the names of the defendants. Other cases are still pending, and the publishers involved said the lawsuits are just one part of a larger campaign to address the problem of illegal online sales of copyrighted academic texts. Dunnegan said he hopes other academic publishers will join Pearson and Wiley, saying, "It will be easier to enforce as part of a group effort."

ARREST MADE IN VIDEOGAME CODE THEFT

The FBI-led Northwest Cyber Crime Task Force has made arrests in "several countries" as part of its investigation into the theft of Valve Corp.'s Half-Life 2 videogame code last year. The task force declined to give details on the arrests, but Valve chief executive Gabe Newell credited a "core group" of the company's customers for sending and analyzing information that helped lead to the arrests. "Gamers were able to unravel what are traditionally unsolvable problems for law enforcement related to this kind of cyber-crime," says Newell. Following the theft, Valve was forced to rewrite parts of its programming, delaying the game's launch by almost a year from its original release date. Some industry insiders say the delay has caused something of a backlash against hackers. "Gamers really want to play Half Life 2, and they really, really resented the delay," says the founder of a videogame news site called GameSpot. Fan Darrin Schrader agrees: "It hurts the community when people do this. I just hate cheaters, and hackers are cheaters." (Washington Post 11 Jun 2004)

2005-06-15 **game system digital rights copy protection vulnerability exploit**

RISKS; http://www.eepi.org/archives/eepi-discuss/msg00100.html 23 90

EXPLOIT OF SONY PSP RAPIDLY DEVELOPED

Lauren Weinstein wrote two excellent postings in the Electronic Entertainment Policy Initiatiave discussion list and pointed to them in a summary for RISKS.

>As we know, often even the most elaborate attempts at controlling access to hardware and software, even using the very latest technologies, may be less than entirely successful.

An example is the just-announced "exploit" of Sony's powerful and popular new "PSP" portable gaming system (which includes WiFi and other advanced capabilities). The unit employs digital signing and hardware AES encryption to try prevent the running of "unofficial" applications.

However, … the PSP exploitation door has apparently been opened quite wide both for piracy and a vast array of homebrew applications….

The powerful new PSP -- based on the MIPS R4000 CPU -- complete with a gorgeous color display and WiFi capability, became an obvious target for homebrew applications, ranging from game emulators to Linux projects. However, the device was designed to refuse the execution of programs that had not been "signed" by Sony, primarily as a control against game piracy, we assume.

However, it was soon discovered that the earliest PSP units, released only in Japan, contained a firmware flaw allowing the running of properly manipulated unsigned code. Immediately, homebrew applications began to appear. By the time the PSP was released in the U.S. Just a few months ago, the early Japanese version 1.0 firmware had been replaced with version 1.5, and the execution hole appeared to be closed. A high premium on the early Japanese units resulted.

The U.S. PSP fans stayed busy by discovering a Web browser included in a popular PSP game for update purposes ("Wipeout Pure"), that could be manipulated to reach arbitrary sites via various DNS tricks. Meanwhile, various hacking groups worked at finding a way to open an unsigned execution path on the 1.5 firmware.<

In his follow-up article, Weinstein reported

>…[T]he exploit for Sony's PSP … was released as "advertised" this morning and has already been tested by many users around the world. Reports indicate that it provides the functionality previously discussed, and it has been confirmed that it will not run on PSP firmware later than the 1.5 version. All but the earliest (firmware 1.0) PSP units in Japan, and all U.S. Units, have so far been shipped at firmware level 1.5. Sony has recently released firmware versions 1.51 and 1.52, which block the exploit, that some users have already flashed to their units via Web downloads.

While the exploit apparently works, it is not by itself a terribly practical long-term procedure, since it involves the rapid swapping of memory sticks during the startup of each unsigned application.

However, the camel's nose is now in the tent, and the exploit, by allowing the execution of arbitrary unsigned code (including the ability to reflash the unit's firmware), will likely lead *very* rapidly to more "user-friendly" and far-reaching exploitations and homebrew applications."<

In a posting in RISKS 23.92, Weinstein continued, >It only took around a week for the exploit to evolve from unwieldy but powerful hack, to user-friendly production program, but the "signed-code" security system of the Sony PSP Portable running 1.5 firmware, designed to prevent the execution of pirated or other "unofficial" (e.g. Homebrew) code, appears to have been obliterated.<

Edupage, New York Times
http://www.nytimes.com/library/tech/00/01/circuits/articles/20chea.html

EDUPAGE pointed to a report in the New York Times in January 2000 that provided good information on the problem of academic forgery. A variety of anti-plagiarism sites have popped up on the Web to help academics pounce on students who plagiarize material for their essays, term-papers and theses. Some of the useful services are < http://www.plagiarism.org/ >, < http://www.canexus.com/ >, < http://www.cs.berkeley.edu/~aiken/moss.html >, and < http://www.integriguard.com/ >. The engines variously compare student texts (submitted online, of course) with databases of papers, including other student papers and those available on plagiarism sites. Identical or similar passages are highlighted in a written report for the teacher. The technology should not be used as the sole basis for an accusation of plagiarism. [As a university professor back in 1978, I spotted obvious plagiarism when a dull-witted male student submitted his essay with a cover page that used a different font from that of the rest of the paper. Confronted with my skepticism, he blustered that he had written every word — even though he could not remember the exact title or any of the content of the paper. But the clincher was language: the French-language paper used the _feminine_ form for all reflexive terms. At that point he broke down.]

SCHOOLS ADOPT HIGH-TECH ANTI-CHEATING TOOLS [11 Jun 2001]
Secondary and post-secondary schools are increasingly trying to defeat high-tech cheaters by using high-tech tools to search out plagiarism, exam manipulation, and other forms of dishonesty. Some examples: software from turnitin.com will be used at 1,800 schools to compare term papers with text on the Internet and in publications; more than 100 schools will use software that prevents students from using e-mail or the Web to cheat on computer-based tests; national testing centers will use thumbprint scanners and digital cameras to monitor students and prevent imposters from taking tests under other names. The tools seem to work: an anti-plagiarism service tested at UCLA this year detected "significant instances of plagiarism" in student papers and lab reports submitted. (USA Today 11 Jun 2001)
http://www.usatoday.com/life/cyber/tech/2001-06-11-tech-tools-nab-cheaters.h tm

THEIR CHEATIN' TECHNO HEARTS: HS STUDENT PLAGIARISM [28 Jun 2001]
According to a survey of 4,500 high school students by Rutgers management professor Donald McCabe, who has studied cheating on college campuses, plagiarism from Web sites is even worse a problem at the secondary level than at the university level. More than half of the high school students surveyed admitted either downloading and reusing an entire paper from the Web or at least copying parts of a paper without citation. Of college students surveyed, only 10-12% have admitted doing such things. But plagiarists often get caught, and the Internet sometimes taketh away what the Internet hath given... as can happen when a teacher enters the five or so words from a student paper and plugs them into a search engine. Then the game is over. (New York Times 28 Jun 2001)

PLAGIARISM TOO EASY

Jim Griffith complained about the distortion of a 1997 article he wrote that was recently modified without his permission, stripped of attribution, and widely circulated and even printed in otherwise reputable astronomy publications. He wrote, "As moderator of RHF, I understand the difficulties of identifying the original source of a piece, and the ease with which people remove attributions. I'm disturbed by the casual way so many publications blindly printed the piece without doing a serious attempt to identify the source or the original version. Granted, that source isn't immediately obvious, but a reasonable Google search or a date-sorted Google Groups search would have definitively identified both the author and the original wording. In effect, Google Groups is now my primary hope for preserving my original copyright (although I did have the foresight to encode in the piece an in-joke that only I know -- and the plagiarized versions preserve that in-joke). Had I originally distributed the piece via e-mail, I'd now have no hope of ever claiming credit or preserving the original version." He added, "I'm mainly disturbed by the ease with which the original piece was corrupted, and that that corruption was blindly accepted and propagated. It is now the case that corrupted version is more prevalent than the original. This is disappointing, given that an advantage of electronic communications is supposed to be the way it preserves information. I wonder if we'll find that in a hundred years, the most popular Internet version of "Romeo and Juliet" is one with a new, happier ending?"

EDUPAGE; http://chronicle.com/prm/daily/2005/03/2005031402n.htm

STUDY SHOWS ONLINE CITATIONS DON'T AGE WELL

A study conducted by two academics at Iowa State University has shown a remarkably high rate of "decay" for online citations. Michael Bugeja, professor of journalism and communication, and Daniela Dimitrova, assistant professor of communication, looked at five prestigious communication-studies journals from 2000 to 2003 and found 1,126 footnotes that cite online resources. Of those, 373 did not work at all, a decay rate of 33 percent; of those that worked, only 424 took users to information relevant to the citation. In one of the journals in the study, 167 of 265 citations did not work. Bugeja compared the current situation to that of Shakespearean plays in the early days of printing, when many copies of plays were fraught with errors due to the instability of the printing medium. Anthony T. Grafton, a professor of history at Princeton University and author of a book on footnotes, agreed that citation decay is a real and growing problem, describing the situation as "a world in which documentation and verification melt into air." EDUPAGE; http://chronicle.com/prm/daily/2005/05/2005051901t.htm

JOURNALS USING SOFTWARE TO UNCOVER PLAGIARISM

Software designed to uncover plagiarism is increasingly being used not only for student papers, where it got its start, but also for academic journals, where it is turning up instances of self-plagiarism as well. Although some dismiss self-plagiarism as unimportant relative to plagiarizing another's work, the practice of republishing one's own work in various venues strikes others as similarly objectionable. Christian Collberg, assistant professor of computer science at the University of Arizona, characterized self-plagiarism as vita padding and said that self-plagiarists who are funded from public sources are misusing taxpayer money. Collberg is working on a software application specifically designed to uncover instances of self-plagiarism. Though not as concerned about self-plagiarism, Cornell University is testing a plagiarism-detection application on an archive it maintains of articles in physics, math, and computer science. Among the 300,000 articles in the archive, the tool has found a few thousand instances that warrant further investigation. Chronicle of Higher Education, 19 May 2005 (sub. req'd)

EDUPAGE; http://news.bbc.co.uk/2/hi/uk_news/education/4848224.stm 23

PHONE CHEATING INCREASING

According to the Qualifications and Curriculum Authority (QCA), cheating on examinations in the United Kingdom is increasing, due in part to the number of cell phones being taken into exams. Although the incidence of cheating remains relatively low, officials from the country's testing agencies have begun to separate the kinds of cheating they discover. New data indicate that in 60 percent of the cases reported, the infraction involved bringing a cell phone into a test. Despite acknowledging that many times the phones were brought accidentally, the QCA said in its report that "it is essential that [the cheating] is actively addressed to ensure that learners, parents, and employers can continue to have confidence in the examination system." A spokesperson from the Department for Education and Skills echoed those sentiments, saying, "We expect schools to maintain high standards of discipline." The spokesperson continued, "There is no place for mobile phones in the classroom, let alone in the examining hall."

An article by Connie Guglielmo in Inter@ctive Week for December 23, 1998 summarized the non-technical risks of online shopping. Some criminals are selling counterfeit goods through their Web sites. Brand-holders are using the services of professional firms to sweep the Net looking for unauthorized use of their trademarks.

VIRTUAL NEWS SETS
More than 40 U.S. television stations and many production studios are now using virtual newsrooms that give the impression that newscasters are broadcasting from gigantic, futuristic sets when the truth is that they are actually in cramped, narrow rooms. How is it done? Just about everything in the room is painted a certain shade of blue, and when the TV camera records that particular color it substitutes digital imagery to make people and any objects not in that color appear superimposed on the digital set. So when you see a news anchor standing in front of a huge wall of video monitors, you're just seeing "smoke and mirrors" (or maybe just mirrors -- unless the anchor's excitement set his pants on fire). 2005-01-04 **AMD microprocessor chip manufacturer warning counterfeit PC server chips Athlon XP**

DHS IAIP Daily; http://www.internetnews.com/ent−news/article.php/3454481

AMD WARNS ABOUT COUNTERFEIT PC AND SERVER CHIPS

AMD is warning customers of potentially mislabeled PC and server chips after helping foil a counterfeit ring in Taiwan. The company alerted authorities to a problem in Taipei late last month. Raids at four sites led to multiple arrests for "re-marking" or reselling re-marked AMD Athlon, Athlon XP and Opteron processors. Re-marked processors have been tampered with and may have been illegally re-labeled with inaccurate frequencies, model numbers, or both. "We strongly recommend consumers and businesses buy AMD processors only from authorized distributors and certified resellers," AMD spokesperson Catherine Abbinanti said. AMD said customers can identify genuine AMD products by a so-called "Processor-in-a-Box" sticker. The label, which has been in place since 2003, includes a unique serial number and a 3-D hologram used for tracking, distribution, authenticity and warranty service.

2003-04-14 **student hacking demonstration intellectual property systems disallowed Georgia**

NewsScan

COURT BLOCKS PRESENTATION ON HACKING UNIVERSITY SYSTEMS
A Georgia state court has issued a restraining order prohibiting two students from making a conference presentation on how to break into and modify a university electronic transactions system. Blackboard, an education software company, argued that the information in the presentation was gained illegally and would have harmed the company's commercial interests and those of its clients, but Interz0ne conference organizers argued that the students' free speech rights were abridged. "The temporary restraining order pointed out that the irreparable injury to Blackboard, our intellectual property rights and clients far outweighed the commercial speech rights of the individuals in question," said a Blackboard spokesman. The information was gleaned after one of the students had physically broken into a network and switching device on his campus and subsequently figured out how to emulate Blackboard's technology. Because that alleged act was illegal, publication of the resulting information should be blocked, said the court. The court's decision was grounded largely in federal and Georgia state antihacking laws and a state trade secrets act, rather than the Digital Millennium Copyright Law, which has been invoked in several similar cases. 2003-07-31 **manifesto superworm Cide Red Brandon Wiley Curious Yellow bandwidth sapphire worm cybersecurity**

NIPC/DHS

July 31, Government Computer News — Superworm Manifesto unveiled at cybersecurity briefings.

Typical worms, such as Code Red, use random scanning to propagate, wasting bandwidth and competing with themselves once released. The Sapphire worm, an example of a theoretical worm concept called Warhol, succeeded in infecting 90 percent of vulnerable machines within about 10 minutes, but continued trying to spread randomly, drawing attention to itself and quickly running out of bandwidth. Brandon Wiley of the Foundation for Decentralised Research unveiled a guide for creating a new generation of worms this week at the Black Hat Briefings security conference in Las Vegas, NV. He also offered a way for systems to be inoculated. Wiley's superworm concept, called Curious Yellow, would combine the fast-spreading characteristics of a Warhol worm with an algorithm that would let the worms coordinate their activities to avoid overlap, multiple infections and competition. The result is a large, robust network of exploited machines that can be continually updated to carry out tasks, benign or malicious.

2004-08-03 **computer hacking contest Singapore HackAttack 2004**

DHS IAIP Daily; http://www.usatoday.com/tech/news/2004−08−03−singapore−hacke rs_x.htm

August 03, Associated Press — Singapore to hold computer hacking contest.

Singapore said Tuesday, August 3, it would organize a contest to find the tech-savvy city-state's best computer hacker. Six pairs will compete in the August 20 "BlackOPS: HackAttack Challenge 2004," organized by the government-funded National Infocomm Competency Center, said its marketing manager Yvonne Choo. They will "penetrate, exploit, gain access and obtain privileged information from the other teams' servers, for the purpose of corporate espionage," the center said on its Website. Teams will also have to defend their organization's networks against hacking from other teams in the daylong event, it added. Choo said he hoped the contest would help shed light on ways to prevent actual computer attacks. The prize for the best hacker will be a DVD burner and free computer classes. Asia has been the root of some of the worst attacks by hackers in recent years. Close to 80% of Singapore's four million citizens own personal computers and the island is largely considered to be the most technologically advanced in Southeast Asia.

2004-08-03 **Defcon 12 Meet the Feds presentation talk recruitment NSA US government criminal hacker**

DHS IAIP Daily; http://www.pcworld.com/news/article/0,aid,117226,00.asp

August 03, PC World — Government seeks a few good hackers.

A well-attended session at the recent Defcon 12 hackers' conference in Las Vegas, NV, was "Meet the Feds," a recruitment presentation by a group of federal cybercrime law enforcement agents, who fielded questions from would-be cybercops. September 11, 2001, marked a turning point for government recruitment, says former NSA Director of Information Assurance Mike Jacobs, who now works in the private sector. Before the terrorist attacks, the NSA typically received about 200 applications monthly, he adds. In the three months following the attacks, more than 20,000 people applied for employment at the NSA. In the presentation, he urged computer-savvy patriots to put their skills to use defending the country from spies, terrorists, and other criminals. One hitch, of course, is a security clearance--elusive for some hackers. Jim Christy, director of the Department of Defense's Cyber Crime Center, and Tim Huff, a special agent with the FBI's Computer Analysis Response Team, fielded questions about so-called gray-hat hackers, who sometimes break the law but aren't charged. Christy and Huff made it clear that cybercriminals--even those who haven't been caught--are not likely to be invited to join the ranks of cybercops.

2004-08-20 **computer hacking contest Singapore HackAttack 2004 techniques**

DHS IAIP Daily;
http://story.news.yahoo.com/news?tmpl=story&cid=562&ncid=738&e=7&u=/ap/20040820/ap_on_hi_te/singapore_hacking_contest

August 20, Associated Press — Computer experts vie in hacking contest.

Twelve computer experts hunkered down Friday, August 20 for a seven-hour contest to find the best hacker in tech-savvy Singapore. Divided into six two-person teams, the contestants participating in "BlackOPS: HackAttack challenge 2004" have to defend their networks and servers from hacking while attacking other teams' systems. The contestants hailed from Brunei, China, Myanmar and Singapore, but their identities couldn't be revealed because they all work in the computer security business, organizers said. Teams were not allowed to use the Internet as a hacking tool, only computers and modems. Asia has been the root of some of the worst attacks by hackers in recent years. Singapore has said it is increasingly concerned about cyber security in the highly wired city-state where eight in 10 households own personal computers. Hackers can be jailed for up to three years or fined up to $5,852 under Singapore's Computer Misuse Act. Organizers had said they hoped the contest would help shed light on ways to prevent actual computer attacks.

LAWYERS SAY HACKERS ARE GETTING BUM RAP
The National Association of Criminal Defense Lawyers has joined with the Electronic Frontier Foundation and the Sentencing Project in publishing a position paper that argues people convicted of computer-related crimes tend to receive harsher sentences than perpetrators of comparable non-computer-related offenses. "The serious nature of the offenses is overplayed," says Jennifer Granick, author of the paper and clinical director at Stanford University's Center for Internet and Society. "The (majority) of the offenses are generally disgruntled employees getting back at the employer or trying to make money." In a review of 55 cases prosecuted under the most-often used computer crime statute, only 15 involved harm to the public and only one resulted in a threat to safety. Those convicted "are receiving sentences based on the fear of the worst-case scenario rather than what the case may really be about," says Granick. The paper was submitted in response a request for public comment by the U.S. Sentencing Commission as required by the Homeland Security Act of 2002. Cybercrime legal expert Scott Frewing says he agrees with many points raised in the paper, but recommends a two-tiered sentencing threshold: "I would be comfortable in a situation where the code addresses the discrepancy between those who cause bodily injury and those that don't. If that results in the law being unfair to a virus writer, maybe that's enough to put them on notice." (CNet News.com 20 Feb 2003)

2003-09-18 **FBI bust hackers David Smith Melissa Virus creator helps AP Associated Press 1999 arrest track viruses senders DeWit Netherlands**

NIPC/DHS

September 18, Associated Press — Virus sender helped FBI bust hackers.

Federal prosecutors credited the man responsible for transmitting the Melissa virus — a computer bug that did more than $80 million in damage in 1999 — with helping the FBI bring down several major international hackers. Court documents unsealed Wednesday, September 17, at the request of The Associated Press show that David Smith began working with the FBI within weeks of his 1999 arrest, primarily using a fake identity to communicate with and track hackers from around the world. According to the court document, Smith helped the FBI bust virus senders abroad and stop viruses in the U.S. The letter says that two months after his arrest, Smith gave the FBI the name, home address, e-mail accounts and other Internet data for Jan DeWit, the author of the so-called Anna Kournikova virus in the Netherlands. The FBI passed the information on to authorities in the Netherlands. DeWit was arrested and later sentenced to probation. The federal prosecutor also said that Smith was working with the FBI to develop an investigative tool that theoretically could help identify an e-mail sender who was trying to mask his or her identity.

2005-07-05 **Sasser worm author confession Germany prosecution Sven Jaschen**

EDUPAGE; http://www.nytimes.com/reuters/technology/tech-crime-germany-sasser.html

AUTHOR OF SASSER WORM CONFESSES

Prosecutors in Germany have announced that Sven Jaschan, on trial for writing the Sasser computer worm, this week confessed to all charges against him. Regarded as possibly the most damaging computer worm ever released, Sasser and its several versions are blamed for crashing as many as one million computers around the world, affecting home users and companies including the European Commission and Goldman Sachs. Jaschan, who is 19 now and was a minor when he committed some of his crimes, had previously admitted to writing the worm; this week, he also confessed to data manipulation, computer sabotage, and interfering with public corporations. He faces up to five years in prison and paying restitution to those affected by Sasser. Monetary damages from the worm have only reached about $150,000, but that number could easily rise into the millions if all those affected reported the damage. GIRLS JUST WANT TO HAVE HACKER FUN [4 Mar 2002]
An unidentified hacker who claims to be a 17-year-old girl says she was motivated to write the "Sharpei" worm to dispel the notion that there aren't any female virus writers and to annoy Microsoft, rather than to have it spread to actual computer users. Going by the name "Gigabyte," she says on her Web site that she's a high-school senior who takes kick-boxing classes and likes techno and trance music. A consultant for Sophos, the U.K. based security company that reported the worm says, "I just don't know what she's accomplishing by this. She's neither hurting nor helping people." The worm was written to spread via Outlook Express e-mail, with a subject line reading, "Important: Windows Update." (Reuters/New York Times 4 Mar 2002)

MELISSA VIRUS WRITER NETS JAIL TIME
David L. Smith, creator of the "Melissa" virus, was sentenced Wednesday to 20 months in prison and a $5,000 fine for his role in unleashing the destructive program that caused more than $80 million worth of damage worldwide in 1999. Smith, who is among the first people ever prosecuted for creating a computer virus, called the act a "colossal mistake." "My curiosity got the better of me, as I soon began to write the 'Melissa Virus,'" he wrote in a letter to U.S. District Judge Joseph A Greenaway Jr. "It didn't take me too long as I borrowed a lot of the code from other viruses that I found on the Internet." Smith could have received up to five years in prison, but prosecutors suggested the shorter sentence, saying he had given authorities extensive assistance in thwarting other virus creators. RUSSIAN CAUGHT BY FBI STING GOES TO JAIL FOR COMPUTER CRIMES
Twenty-seven-year-old Russian computer hacker Vasily Gorshkov came to the U.S. for a job interview, but the interview was part of a sting operation to apprehend Gorshkov and another programmer for computer crimes, fraud and conspiracy. The two Russians complied with a request by the bogus interviewers to demonstrate their hacking skills, and when they used their passwords to hack into a computer network in Russia the FBI secretly logged those passwords to gather evidence against the pair. Gorshkov has just been sentenced to three years in a U.S. federal prison. (VNUnet 7 Oct 2002)

2003-01-06 **Xbox hacking mastermind Microsoft Linux Lindows rivalry**

NIPC/DHS

January 03, CNN — Mystery man named in Xbox hack contest.

A longtime Microsoft opponent has emerged as the mystery backer and mastermind behind a contest that offers $200,000 to anyone who successfully hacks into the software giant's Xbox video game console, a top technology news site reported. Michael Robertson, a former dot-com entrepreneur and now chief executive of U.S. software company Lindows.com, revealed himself as the anonymous donor and contest's creator in an interview on Thursday with CNET News.com. Last July, Robertson anonymously dangled the prize money to any programmers who could successfully hack into the Xbox and adapt it so that it would run on the Linux operating system, an emerging competitor to Microsoft's Windows operating system. Robertson recently extended the deadline as no group has fully mastered the challenge. The hack contest goes beyond a sporty challenge. Linux proponents have long charged that its freely distributed operating system, designed and modified by mainly unaffiliated groups of programming enthusiasts, is an important step for the future development of computing devices. They argue that the market dominance of Windows, which is the operating system on more than 90 percent of all PCs, gives Microsoft and a small number of its business partners unfair and anti-competitive control in the design of the growing number of devices that come equipped with computing capabilities. Robertson's firm Lindows.com is a start-up that aims to promote the use of the Linux open-source operating language in computer systems, a move that would challenge Microsoft's dominant Windows operating system.

NIPC/DHS

January 03, Government Computer News — Hacker of federal Websites could spend a decade in jail.

NASA's inspector general has announced that William Douglas Word of Pelham, Alabama faces up to ten years in prison after pleading guilty to defacing sites of NASA, Defense Department agencies, Interior Department and the International Trade Commission, among others, according to a grand jury indictment handed down in the U.S. District Court for the Northern District of Alabama. Much of the criminal activity occurred in late 1999, the inspector general said. The NASA Office of Inspector General (OIG) investigated the crime together with the Defense Criminal Investigative Service, the Naval Criminal Investigative Service and the FBI. James E. Phillips, U.S. attorney for the Northern District of Alabama, prosecuted the case. Word "was rolled up in a group of hackers that decided to turn themselves in after we got close to confronting them," a NASA official said. "This was the typical hacker case where they were demonstrating their skills." Word is to be sentenced April 24.

BANNED FOR LIFE ON THE NET?
Kevin Mitnick, once tagged by the government as "the most-wanted computer criminal in U.S. history," is now ending his probation and will once again be free to start using the Internet. (He intends to set up shop as a computer security consultant.) Legal experts disagree about whether computer criminals can be banned from Internet activity even after they have served sentences and finished their probationary periods. Jennifer S. Granick of the Stanford Center for Internet and Society says no: "Computers are everywhere. The A.T.M. is a computer; the car has a computer; the Palm Pilot is a computer. Without a computer in this day and age, you can't work, you can't communicate, you can't function as people normally do in modern society." Ross Nadel of the U.S. Attorney's office in Northern California says yes, arguing that banning someone from the Internet may be necessary if in a particular case Internet use was integrated and inseparable from the crime that was committed. The courts are similarly divided on the issue, and legal observers don't expect the question to be fully resolved for many years. (New York Times 21 Jan 2003)

NIPC/DHS

February 07, silicon — Two held in computer virus raid.

Two men from northeast England are being interviewed today by the National Hi-Tech Crime Unit (NHTCU). The move follows the execution of search warrants this morning in County Durham, United Kingdom (UK). Two addresses were searched and evidence retrieved relating to computer and drugs offences. The operation was jointly conducted with officers from Durham Constabulary and the United States multi-agency CATCH team (Computer and Technology Crime Hi-Tech Response Team), which is based in Southern California. A simultaneous search warrant was executed at an address in the state of Illinois where additional evidence in the case was seized. The two UK-based men have been identified as members of an international hacking group known as "THr34t-Krew". The NHTCU claims this group is behind a worm called the TK which has infected approximately 18,000 computers worldwide.

TEENAGER "DVD-JON" CHARGED AS CRIMINAL FOR BREAKING DVD CODE [11 Jan 2002]
Norwegian prosecutors have lodged a criminal indictment against Jon Lech Johansen, who three years ago when he was 15 years old, wrote and distributed on the Internet software that could break the code protecting DVDs from being copied by individuals who did not pay for them. Johansen says he wrote the software to be able to use his computer to play movies he had purchased. A lawyer for the Electronic Frontier Foundation, which is defending the young man, says the law under which he's being prosecuted was intended to protection financial institutions, rather than to prevent an individual from accessing his own property. The prosecution is charging that in the three months after the young man (now widely known as "DVD-Jon" posted the software on the Internet, it was downloaded by more than 5,000 individuals. (AP/San Jose Mercury News 11 Jan 2002)
http://www.siliconvalley.com/docs/news/svfront/034227.htm

'DVD JON' ACQUITTED BY NORWEGIAN COURT
Jon Lech Johansen (also known as DVD Jon), who was accused of illegally developing and distributing the DeCSS program for breaking the digital copy-protection mechanism on DVDs, has been acquitted in a Norwegian court. The rationale for the judge's decision was that the software could be used for legal purposes as well as illegal ones. "If a person's motive is to solely encourage or solicit illegal actions, then it would be illegal to distribute it" — but the court made the judgment that Johansen was not motivated in that way. (PC World 7 Jan 2003)

2003-03-17 **computer criminal hacking Web defacement prosecution conviction Pakistani**

NIPC/DHS

March 14, Associated Press — Pakistani pleads guilty to hacking U.S. Web sites.

A hacker who breached the computer network at Sandia National Laboratories and posted an anti-Israeli message on the Eglin Air Force Base Web site pleaded guilty to computer and credit card fraud charges, the U.S. attorney's office said Thursday. There were no known political or terrorist overtones to the breaches of four computer networks by 18-year-old Adil Yahya Zakaria Shakour of Los Angeles, said Patty Pontello, a spokeswoman for federal prosecutors. Shakour penetrated the Florida air base's computer server repeatedly in April and May 2002, altering the Web page to denounce the Israeli advancement into Palestine and crediting the defacement to the "Anti India Crew." Shakour is a Pakistani who could face deportation after he completes a prison term of up to 15 years, to be set at his June 12 sentencing. He agreed to make restitution of approximately $100,000 for damage to the computer networks. More than $2,700 in damage was done to the Sandia Labs unclassified Web site in Livermore.

'KINGPIN' CRACKER ARRESTED IN THAILAND
Thai officials arrested a Ukrainian man described by a U.S. embassy spokesman as a "kingpin" of international computer crime. Maksym Vysochansky, 25, is accused of selling counterfeit versions of flagship software products by major companies such as Microsoft and Adobe. Vysochansky, who used a number of aliases, is thought to have been involved in fraudulent schemes worth up to $1 billion. "This guy was on the U.S. Secret Service's 10 most wanted list. He's definitely a big shot," said the embassy official. Authorities allege that Vysochansky also built a "back door" into the software he sold that allowed him to hack into buyers' financial and credit card information. "It was a very complicated and sophisticated fraudulent scheme," said the embassy official. Vysochansky likely will be extradited to the U.S. where he'll face charges of copyright violations, trafficking in counterfeit goods and money-laundering. (News24.com 22 May 2003)

2003-08-29 **MsBlaster creator copycat teenager hacker worm house detention monitored electronically Blaster.B FBI Symantec**

NIPC/DHS

August 29, TechWeb — Accused MSBlaster creator placed under house detention.

A teenager has admitted creating a copycat of the MSBlaster worm, Seattle-based U.S. Attorney John McKay said Friday, August 29. Jeffrey Lee Parson, 18, of Hopkins, MN, was arrested early Friday morning on one count of intentionally causing or attempting to cause damage to a computer. Parson was placed under house detention and is being monitored electronically, said McKay. All computers in his home were seized by the FBI, and he has been denied access to the Internet. Parson is accused of modifying the original MSBlaster worm, and a variant, Blaster.B. The variant shared the same destructive characteristics as its parent, attacking PCs which had not been patched against a vulnerability in the Windows operating system. The worm, which according to security firm Symantec infected more than 500,000 systems worldwide, caused some computers to constantly reboot, snarled enterprise network and Internet traffic, and forced Microsoft to take the unusual step of disabling one of the addresses used to connect with its WindowsUpdate service. Estimates by analysts as to the damage done by MSBlaster and its follow-ups range as high as $1.3 billion.

2003-09-15 **Adrian Lamo hacker NY Times Sacramento employee records phone numbers SSN Social Security Excite Home Corp Yahoo Inc WorldCom**

NIPC/DHS

September 09, Reuters — New York Times hacker surrendered, booked.

Hacker Adrian Lamo, 22, turned himself in to federal authorities in Sacramento, CA, on Tuesday, September 9, to face charges related to breaking into the internal network of The New York Times newspaper. Lamo could face fines and prison time under the Computer Fraud and Abuse Act of 1986, which outlaws unauthorized access to computer networks. Lamo hacked into the New York Times network in February 2002 and accessed employee records, phone numbers, and Social Security numbers of editorial page contributors. In the past Lamo has also discovered holes in corporate networks of Excite@Home Corp., Yahoo Inc., and WorldCom, among others, often through laser printers and other unlikely entry points. Lamo's defense is likely to be the "white-hat hacker" defense, said Mark Rasch, former head of the computer crime unit at the U.S. Department of Justice. White-hat hacker is a term used for people who work to protect computers from attack while "black-hat hackers" are those who attempt to break into them. However, the law focuses on the intent to break into the computer, not the motive, said Rasch.

September 15, CNET News.com — Restrictions lifted on NY Times hacker. A federal judge on Friday, September 12, said Adrian Lamo, the so-called "homeless hacker," could go free on bail with only limited restrictions on his computer use until his next court date in October. U.S. Magistrate Judge Debra Freeman kept Lamo's bail at the earlier amount of $250,000 but lifted the restrictions that barred him from using a computer at all. Instead, Freeman said, the 22-year-old California resident can use a computer for email and to apply for a job or a college program. Lamo is facing two criminal charges. One claims he illegally entered the network of The New York Times, viewed confidential employee records and created a false administrator account; the other says he ran up about $300,000 on the paper's Lexis-Nexis account.

2003-10-17 **evidence trial exculpation defense criminal hacker compromise Trojan horse**

NewsScan; http://news.bbc.co.uk/go/pr/fr/-/2/hi/technology/3202116.stm

In England, 19-year-old Aaron Caffrey was charged with crashing computers and networks at the port of Houston, TX after breaking into its systems in September 2001. In October 2003, a jury acquitted the young man because they accepted his defense that criminal hackers had taken control of his computer and used it to attack the port even though he admitted being a member of the criminal hacker organization, admitted breaking into other computer systems, and was unable to provide a shred of evidence that his computer contained any remote-control software or other indications that his computer had been taken over by others.

NEW DEFENSE: THE COMPUTER DID IT
Prosecutors in computer hacking cases are facing a new defense strategy that likely will become more prevalent in the age of hijacked PCs: the computer did it. Defense lawyers in three cases recently tried in the U.K. successfully argued that the crimes committed by their clients were, in fact, the results of "Trojan" programs placed on their computers without their knowledge. While it is relatively easy to trace a hack back to a particular computer, it's much more difficult to prove that the owner of that computer committed the crime. "On the one hand, this is 100% correct that you can not make that jump from computer to keyboard to person," says Bruce Schneier, chief technology officer for Counterpane Internet Security. "On the other hand, this defense could be used to acquit everybody. It makes prosecuting the guilty harder, but that's a good thing." But computer security consultant Dave Morrell says the defense also gives the green light to hackers. "It sets a precedent now in the judicial system where a hacker can just claim somebody took over his computer, the program vanished and he's free and clear." The Trojan defense has not yet been put to the test in the U.S. (Reuters/CNN.com 28 Oct 2003)

DHS IAIP Daily; http://securityfocus.com/news/8048

February 14, Associated Press — Belgium police arrest female virus-writer.

Belgian police arrested a 19-year-old female technology student who gained international notoriety for creating computer viruses, it was reported Saturday, February 14. The woman, identified only by her nickname "Gigabyte," was charged with computer data sabotage under legislation introduced in 2000 to deal with cyber-crime, the daily La Libre Belgique reported. If convicted, she faces up to three years in prison and fines of up to $127,000. Police reportedly released the woman after 24 hours, confiscated her five computers and shut down her Website. She was arrested Monday in her hometown of Mechelen, 20 miles north of Brussels. "She was preparing to publish new viruses on this site," Inspector Olivier Bogaert of the Belgium police was quoted as telling La Libre Belgique. Her youth and gender helped gain Gigabyte notoriety in the male-dominated world of computer hackers. In a 2002 interview Gigabyte defended her work, saying she herself never spread the viruses she created and published on her Website. "When people make guns, can you blame them when somebody else kills with them?" she was quoted asking. "I only write them. I don't release them."

2004-03-12 **music movie piracy case Australia extradition intellectual property rights issues**

NewsScan

PIRACY EXTRADITION CASE ADJOURNED

A Sydney, Australia court is to decide if Hew Raymond Griffiths, 41, who is alleged to have headed an international software piracy ring known as "Drink or Die," should be extradited to face charges in the U.S. Griffiths had been indicted by a grand jury in the state of Virginia with one count of criminal copyright infringement and one count of conspiracy to commit criminal copyright infringement. If convicted he faces up to 10 years imprisonment and a $500,000 (US) fine. Griffith's barrister argued the U.S. had not made out a case for extradition, having failed to prove dual criminality — that what his client allegedly did in the U.S. would also have been a crime in Australia. However, the Commonwealth DPP refuted that argument, saying it had made a valid case for extradition in relation to both criminal copyright and conspiracy. (The Australian 12 March 2004, rec'd from John Lamp, Deakin University)

2004-03-25 **federal wiretapping keylogger California arrest**

NIPC/DHS

March 23, Reuters — Feds charge California man for using keystroke logger.

A California man who prosecutors say planted an electronic bugging device on a computer at an insurance company was indicted on Tuesday, March 23, on federal wiretapping charges. Larry Lee Ropp, a 46-year-old former insurance claims manager, is the first defendant charged with a federal crime for using a "keystroke logger," which tracks the activities on a computer and feeds the information back to its owner, a spokesman for the U.S. Attorney's Office in Los Angeles said. Prosecutors did not say what they believe Ropp hoped to gain by bugging the computer, which was being used by a secretary to executives at the company where he worked, Bristol West Insurance Group. But an affidavit filed with the indictment suggests he intended to supply information to attorneys representing a class of people who were suing the company. Investigators were tipped to Ropp after he was fired from the company and asked another employee to remove the keystroke logger, which records every keystroke made on a computer, from the secretary's machine.

2004-03-26 **Internet blacmailer arrest Holland Netherlands Net-harm credit card fraud**

NIPC/DHS

March 24, The Register — Dutch Internet blackmailer gets ten years.

A 46-year-old Dutch chip programmer who tried to blackmail dairy company Campina has been jailed for 10 years by a Dutch court on blackmail charges and five counts of attempted murder. The blackmailer put agricultural poison in Campina Stracciatella desserts in a bid to extort money. The man forced Campina to open a bank account and asked them to deposit $242,750. Campina was issued with a credit card for the account which the blackmailer intended to use to withdraw the cash. But to avoid breaking cover, he asked Campina to buy a credit card reader and extract the information from the card's magnetic stripe. The output, together with the card's pin code, was sent to him electronically via steganography. Campina received an envelope containing a floppy with a stego program and some instructions. The company then had to encode the credit card data into a picture. The blackmailer downloaded the picture, decoded the information it contained, created his own copy of the card, and finally went to withdraw the cash. To download the online picture, he used the Anonymizer.com service, believing the company's privacy policy would protect him. However, he was caught red-handed last year when he withdrew the money from a cash machine using his copy of the credit card.

2004-05-08 **worm virus malicious code malware Microsoft Windows vulnerability Sasser**

DHS IAIP Daily; http://www.chron.com/cs/CDA/ssistory.mpl/world/2558235

May 08, Reuters — Police: Microsoft helped catch suspect.

German police were led to the home of an 18-year-old man suspected of creating the "Sasser" computer worm after a tip-off from Microsoft, police said Saturday, May 8. Spokesman Frank Federau for Lower Saxony police said that German police were certain they had the man behind one of the Internet's most costly outbreaks of sabotage. "We are absolutely certain that this really is the creator of the Internet worm because Microsoft experts were involved in the inquiry and confirmed our suspicions and because the suspect admitted to it," he said. Microsoft had received anonymous tip-offs about the worm's creator and then contacted the FBI and German police, Federau said. All three worked together to find the suspect. The teenager's computers were confiscated by police but the suspect himself was not in custody, Federau said. Since appearing a week ago, Sasser has wreaked havoc on personal computers running on Microsoft Windows 2000, NT and XP operating systems, but is expected to slow down as computer users download anti-virus patches. The computing underground responsible for hatching worms and viruses has proved a difficult ring to crack for law enforcement and security experts were surprised at the rapid arrest.

2004-05-18 **phishing email scam fraud**

DHS IAIP Daily; http://www.washingtonpost.com/wp−dyn/articles/A37406−2004May 18.html

May 18, Washington Post — E-mail scammer gets four years.

An Internet scammer who used e-mail and a fraudulent Website to steal hundreds of credit card numbers was sentenced to almost four years in jail Tuesday, May 18, one of the stiffest-ever penalties handed down for online fraud. Houston, TX federal court Judge Vanessa Gilmore sentenced Houston resident Zachary Hill to 46 months in jail for his role in duping consumers into turning over 473 credit card numbers. Hill used a "phishing" scheme to make his e-mail look like it came from America Online, the nation's largest Internet service provider, or PayPal, the online 4 payment subsidiary of auction giant eBay. The message told victims that their accounts had lapsed and that the companies required their credit card numbers and passwords to restart them. Hill prompted recipients to enter their information into Web forms designed to look like pages run by the companies, the Justice Department said. Hill then used the credit card numbers to buy $47,000 in goods and services.

2004-05-27 **Trojan Horse hacker sharing peep data theft Taiwan engineer**

DHS IAIP Daily; http://www.nytimes.com/aponline/international/AP−Taiwan−Chin a−Cyber−Attack.html

May 27, Associated Press — Taiwan engineer accused in cyber attack.

A Taiwanese computer engineer was arrested on charges he had designed a virus-like Trojan horse that Chinese hackers found and used to attack the island's business and government systems, police said Thursday, May 27. Wang Ping-an, 30, designed "Peep," which earlier this year allowed the attackers to steal information and retain control of infected computer systems, police said. "He placed his program on popular hackers' Web sites and encouraged people to download it," said Lin Chieh-lung, an official from an Internet crime investigation task force. "He might have wanted only to show off his skills, but he should be aware what harm this could cause." If convicted on charges of vandalizing public and corporate property, he could face up to five years in prison, police said. Police said they began a probe months ago after noticing hackers had stolen confidential government data. They then discovered "Peep" was responsible for the theft of data from hundreds of Taiwanese schools, companies and government agencies. The attacks were traced back to mainland China, police said. In recent years, fears have grown that China might enforce its claim of sovereignty over self-ruled Taiwan by shutting down the island's heavily computerized society with a cyber-attack instead of a conventional invasion.

DHS IAIP Daily;
http://www.cnn.com/2004/TECH/internet/08/12/internet.attack. ap/index.html

August 12, Associated Press — Teen pleads guilty in Internet attack.

A Minnesota high school senior pleaded guilty Wednesday, August 11, in federal court to unleashing a variant of the "Blaster" Internet worm, which crippled more than a million computers last summer. Jeffrey Lee Parson, 19 is likely to face 18 months to three years behind bars after pleading guilty to one count of intentionally causing or attempting to cause damage to a protected computer. He also could be ordered to pay millions of dollars in restitution, Assistant U.S. Attorney Annette Hayes said. Parson had pleaded not guilty after his arrest last August, but told U.S. District Judge Marsha Pechman on Wednesday: "I downloaded the original Blaster worm, modified it and sent it back out on the Internet." Different versions of the Blaster worm, also known as the LovSan virus, crippled computer networks worldwide last summer. Parson's variant launched a distributed denial-of-service attack against a Microsoft Corp. Windows update Website as well as personal computers. The government estimates Parson's version alone inundated more than 48,000 computers. Parson was charged in Seattle, WA, last August because Microsoft is based in suburban Redmond, WA.

JUDGE REJECTS GUILTY PLEA IN AOL SPAM CASE

A federal judge in New York has refused to accept a guilty plea from a former AOL software engineer accused of stealing 92 million subscriber e-mail addresses and selling them to spammers. Judge Alvin Hellerstein said he was not convinced that Jason Smathers had actually committed a crime under the new "CAN-SPAM" legislation passed by Congress this fall. The technicality hinges on whether Smathers deceived anyone -- a requirement of the CAN-SPAM law. "Everybody hates spammers, there's no question about that," said Hellerstein, who told federal prosecutor David Siegal: "I'm not prepared to go ahead, Mr. Siegal. I need to be independently satisfied that a crime has been created." Prosecutors allege that Smathers sold the list to Las Vegas resident Sean Dunaway, who then resold it to spammers, netting Smathers more than $100,000 from the deal. (Wall Street Journal 21 Dec 2004)

EDUPAGE; http://news.zdnet.co.uk/software/0,39020381,39197662,00.htm

DRINK-OR-DIE CONSPIRATORS HEADED TO PRISON

A British court has sentenced three men to prison for their involvement in the so-called Drink-or-Die group, which cracked the copy protections on software and then distributed it over the Internet. The three men received sentences ranging from 18 to 30 months, while a fourth man received a suspended sentence; all were charged with conspiracy to defraud. Prosecutors alleged that the piracy ring cost software companies millions of dollars in lost sales, and the verdicts were seen by some as a strong, clear message to software pirates. Others were critical of the government's case, however, saying that the men should have been charged with copyright violations rather than conspiracy. Security expert Peter Sommer, who served as a witness for the defense, said the government has no way of proving how much the ring cost software makers. He said the conspiracy case cost the government significantly more money and took much longer to try than a copyright case. A spokesperson from the British Crown Prosecution Service said the charges were appropriate, commenting that the authorities do "not determine cases on the basis of how much they will cost to prosecute." 2005-08-27 **worm malicious code two arrests investigation Microsoft operating system OS FBI cybercrime**

EDUPAGE; http://www.siliconvalley.com/mld/siliconvalley/12488476.htm

TWO MEN NABBED IN WORM INVESTIGATION

Two men have been arrested in connection with an investigation into the Zotob worm, which surfaced in August and took advantage of a flaw in the Microsoft operating system. The worm affected computers at organizations including The New York Times, ABC, CNN, the Associated Press, and the Immigration and Customs Enforcement bureau. According to Louis M. Riegel, assistant director for cyber crimes at the FBI, Farid Essebar was arrested in Morocco, and Atilla Ekici was arrested in Turkey. Riegel said that Ekici had paid Essebar to write the worm, and the pair are also suspected of writing the Mytob worm, which was released in February. Zotob is able to infect computers even if users do not open any applications. As a result, some users are struck by the worm without knowing about it. Still, experts believe the damage from the worm has been relatively minor, given that the operating system most affected, Windows 2000, is more than five years old and that most organizations quickly patched the flaw that Zotob exploits. TWO ARRESTED IN U.S. COMPUTER WORM PROBE

Authorities in Morocco and Turkey have arrested two people believed responsible for a computer worm that infected networks at U.S. companies and government agencies earlier this month. Farid Essebar, 18, was arrested in Morocco, while Atilla Ekici, 21, was arrested in Turkey on Thursday, August 25, Louis M. Riegel, the FBI's assistant director for cyber crimes, said Friday. They will be prosecuted in those countries, Riegel said. Essebar wrote the code that attacked computers that run Miscrosoft operating systems and Ekici paid him for it, Riegel said. It's unclear they ever met, "but they certainly knew each other via the Internet," he said. Riegel said he does not know how much money changed hands. Miscrosoft and FBI officials also declined to estimate the monetary damage done by the Zotob worm and its variations. The worm disrupted computer operations in mid-August at several large news organizations, including The Associated Press, ABC, CNN, and The New York Times; such companies as heavy-equipment maker Caterpillar Inc.; and the federal Immigration and Customs Enforcement bureau. EDUPAGE; http://news.bbc.co.uk/1/hi/technology/4376470.stm

FILE SHARER CONVICTED IN SWEDEN

For the first time, a file sharer has been convicted in Sweden, a country long seen as soft on digital piracy. Indeed, the country only this past July passed a law against downloading copyrighted material. The conviction stems from a case prior to passage of the downloading law, when Andreas Bawer uploaded a movie to the Internet. Although the court found Bawer not guilty of downloading the film because the new law had not been put into place, it found him guilty of violating copyright law for distributing the film online. In its ruling, the court said, "Illegal material can in this way be spread quickly and reach many people, which can lead to heavy economic losses for the copyright owners." Because Bawer did not try to profit from his actions, the court decided to fine him rather than sentence him to prison. Bawer's attorney said his client had not yet decided whether he would appeal the verdict. Henrik Ponten of the Swedish Anti-piracy Agency praised the ruling, saying that Sweden has "taken the first step toward a functioning copyright law." BBC, 25 October 2005

DHS IAIP Daily; http://news.yahoo.com/s/ap/20060128/ap_on_hi_te/microsoft_source_code;_ylt=Am2Q37WFib1DhYnAQZ9D.JEjtBAF;_ylu=X3oDMTA5aHJvMDdwBHNlYwN5bmNhdA−− 23

"ILLWILL" SENTENCED FOR STEALING MICROSOFT CODE.

A Connecticut man known on the Internet as "illwill" was sentenced to two years in prison Friday, January 27, for stealing the source code to Microsoft Corp.'s Windows operating software, among the company's most prized products. William Genovese Jr., 29 of Meriden, CT, was sentenced by U.S. District Judge William H. Pauley, who called Genovese "a predator who has morphed through various phases of criminal activity in the last few years." Genovese pleaded guilty in August to charges related to the sale and attempted sale of the source code for Microsoft's Windows 2000 and Windows NT 4.0. The code had previously been obtained by other people and unlawfully distributed over the Internet, prosecutors said. Source code is the blueprint in which software developers write computer programs. With a software program's source code, someone can replicate the program. Industry experts expressed concern that hackers reviewing the Microsoft software code could discover new ways to attack computers running some versions of Windows. Prosecutors said in an indictment in February 2004 that Genovese posted a message on his Website offering the code for sale on the same day that Microsoft learned significant portions of its source code were stolen.

SPANISH HACKER SENTENCED TO TWO YEARS IN JAIL AND FINE OF $1.6 MILLION.

Experts at Sophos have welcomed the news that a hacker who stopped over a third of Spanish computer users from using the Internet has been sentenced to two years in jail. Santiago Garrido, 26, used a computer worm to launch Distributed Denial-of-Service (DDoS) attacks after he was expelled from the popular "Hispano" IRC chat room for not following rules. The attacks disrupted an estimated three million users of the Wanadoo, ONO, Lleida Net and other Internet service providers, amounting to a third of all of Spain's Internet users at the time of the offence in 2003. Garrido, who went by the aliases "Ronnie" and "Mike25", was sentenced at a court in La Coruña and also faces a $1.6 million fine.

BRITISH COMPUTER HACKER FIGHTS EXTRADITION TO THE U.S.

A British computer enthusiast accused by the U.S. government of the world's "biggest military hack of all time" began his court fight against extradition to the United States on Tuesday, February 14. Gary Mckinnon was arrested in June last year on charges of computer fraud issued by U.S. prosecutors claiming he illegally accessed 97 U.S. government computers -- including Pentagon, U.S. Army, U.S. Navy and NASA systems. Prosecutors say he hacked into sensitive equipment over a one-year period from February 2002 and caused $700,000 worth of damage, after crippling U.S. defense systems in the wake of the September 11 attacks. If found guilty, Mckinnon could face up to $1.75 million in fines and 60 years in jail.

EDUPAGE; http://news.zdnet.com/2100-1009_22-6042290.html 23

SPAMMER SENTENCED FOR STEALING PERSONAL DATA

A federal judge in Arkansas has sentenced a well-known spammer to eight years in prison for illegally accessing and downloading more than one billion records from data broker Acxiom. Prosecutors alleged that in 2003, Scott Levine stole a password file from Acxiom, which claims to have the world's largest database of consumer information. Levine then used those passwords to download other sensitive information. Levine operated Snipermail.com, an e-mail operation that was repeatedly accused of sending spam and claiming that it was doing so with "opt in" authorization from recipients. Although there was no evidence that Levine used the information he stole from Acxiom for identity theft, a federal jury found Levine guilty in August of 2005 of unauthorized access to a computer connected to the Internet. Levine was also fined $12,300 and may be forced to pay restitution.

CHARGES FILED IN USC HACK

Charges have been filed against a network administrator in San Diego related to a June 2005 incident in which a server at the University of Southern California (USC) was compromised. Federal authorities have charged Eric McCarty with gaining unauthorized entry to a USC computer system for applications that contained information on more than 275,000 applicants dating back to 1997. Michael Zweiback, an assistant U.S. attorney in the cybercrimes and intellectual property unit, said, "Universities are becoming bigger and bigger targets to the hacker community," adding that "hackers always want to see if they can beat the technical people on the other side." If found guilty of the alleged hacking, McCarty could be sentenced to 10 years in federal prison.

VIETNAMESE DISTRIBUTED DENIAL-OF-SERVICE HACKING SUSPECT ARRESTED.

Sophos has announced news that a man has been arrested in Vietnam for launching a distributed denial-of-service attack against a commercial Website. The attack on Vietco's Website caused huge losses to the company. Nguyen Thanh Cong is suspected of beginning an attack on the Vietnamese e-commerce site, www.vietco.com, in March 2006. The Website, which has 67,000 regular members, auctions cell phones and other consumer electronics products. Cong faces charges for creating a Trojan horse that exploited a flaw in Microsoft's Internet Explorer. The Trojan horse, which is said to have been planted on a pornographic Website, turned unpatched computers into zombie PCs which were then ordered to repeatedly hit the Vietco site -- overwhelming its servers.

CALIFORNIA MAN PLEADS GUILTY TO BOT ATTACK.

Christopher Maxwell, a Vacaville, CA, resident, was accused of intentionally damaging a computer he was not authorized to access and using it to commit fraud. He made the guilty plea on Thursday, May 4, in federal district court in Seattle. Back in mid-2004, Maxwell and a group of co-conspirators created a network of bots using more than 13,000 zombies. Maxwell used the bot network to install adware on compromised computers, reaping commissions of approximately $100,000 for himself and his co-conspirators, according to the initial complaint.

GUILTY PLEA IN COMPUTER ATTACK

Christopher Maxwell has pleaded guilty to charges that he and a group of conspirators used a network of zombie computers to install adware on unsuspecting users' computer. Maxwell is said to have earned about $100,000 in commissions from the adware. The scheme involved using a bot network of 13,000 zombie computers, which Maxwell controlled using powerful computers at California State University at Northridge, the University of Michigan, and the University of California at Los Angeles. Maxwell's bot network swamped the computers at Northwest Hospital in Seattle, causing disruptions to communications among hospital staff. Costs for the hospital to address the issue were estimated to be $150,000. Maxwell will be sentenced August 4.

2000-01-06 **criminal hacker phone phreak physical security social engineering lying cheating misrepresentation forgery trickery deceit**

HackCanada http://www.hackcanada.com/ice3/misc/telaccess.txt

A criminal hacker calling itself "~Wizbone '99" published a new edition in January 2000 of an unfortunately excellent guide to social engineering that, I regret to say, bears reading by security specialists. "Gaining physical access to Server and Telecom rooms (v2.1)" < http://www.hackcanada.com/ice3/misc/telaccess.txt > summarizes the ways criminals can fool security and other personnel and gain access to restricted areas in the workplace. The writer recommends forging documents, having work shirts embroidered with the name of a fictitious firm, and other ways of lying convincingly. One of the obviously missing elements in the document is any sign that the author realizes that what (s)he is doing is wrong. The well-known principles of physical security are reinforced by the experience of this criminal: choose and train your security guards well, keep employees aware of their responsibility to report suspicious activity, communicate among different sectors of the organization, and accompany visitors and contractors at all times in secure areas.

2005-07-11 **Phrack magazine publication ending computer security mischief information exchange**

EDUPAGE; http://software.silicon.com/security/0,39024655,39150241,00.htm

SECURITY COMMUNITY BEMOANS LOSS OF HACKER MAGAZINE

Long-time hacker magazine "Phrack" will stop being published this year after nearly 20 years as an information exchange for computer mischief, and at least some computer security experts believe computer users will be less safe after it is gone. Hackers have routinely undermined their own efforts by revealing their successes at compromising systems or causing other damage. Pete Simpson of computer security firm Clearswift noted that although the magazine makes computer exploits available to those who would use them to cause harm, by definition it also makes them available to the community of users working to protect computers from hackers. Simon Perry, vice president of security strategy at Computer Associates, said that security experts will still be able to find information about new exploits but that "Phrack was great as a one-stop shop" for such information. Simpson commented that after Phrack shuts down, younger hackers are likely to develop new vehicles to tell the world about their triumphs, once again leveling the playing field. 2003-09-02 **spammers internet e-mailers Bilk Club message board Damon Decrescenzo junk**

NewsScan

CALLING ALL SPAMMERS
Who would ever have thought? It turns out that spammers need online community, too, and they can find it at The Bulk Club — a support group for junk e-mailers. The overnight success of The Bulk Club (159 members signed up since its launch six months ago) belies the stereotype of the spammer as lone sociopath, lurking in the Internet's shadows. In fact, the club's rapidly swelling membership signals a move on the part of spammers to circle the wagons in an effort to protect and legitimize the embattled bulk e-mail industry. And what do members get for their $20 per month fee? Access to a variety of how-to articles (such as "How to Spoof"), spamming software, a members' message board and "300,000 FRESH e-mails/week." Also, thanks to a Web site security flaw uncovered last week, they received a bit of unwanted publicity — the entire Bulk Club membership roster was revealed, including some of the biggest names in bulk e-mailing: Damon Decrescenzo, a Florida junk e-mail who's been sued by both Microsoft and Amazon; Internet porn king Seth Warshavsky; and John Milton — an alias used by former neo-Nazi Davis Wolfgang Hawke — and Jon Thau, both of whom are responsible for many of those penis enlargement ads you might have received. 2004-10-07 **cybersecurity conference globalization privacy organized crime federal research investment lacking Eugene Spafford CERIAS**

DHS IAIP Daily; http://searchsecurity.techtarget.com/originalContent/0,28914 2,sid14_gci1012829,00.html

October 07, SearchSecurity — Globalization, privacy and organized crime to drive security.

Organized crime is pouring massive amounts of resources into phishing, online extortion and other malicious activities by exploiting a U.S. weakness -- the lack of federal research and law enforcement investment in cybercrime, warned one of the nation's most influential infosecurity leaders Wednesday, October 6. "We are beginning to face well-financed, well-organized groups of professional criminals, and as far as I can tell, there's been little federal funding invested in this at all," Eugene Spafford said at the Information Security Decisions conference in Chicago. Spafford, the executive director of the Center for Education and Research in Information Assurance and Security (CERIAS), said less than $50 million in federal funding currently is being invested in basic cybersecurity research. Attacks will come in the form of extortion, protection rackets and threats to business availability via denial-of-service attacks. Spafford said nations around the world are subsidizing hacker training programs in an effort to obtain confidential information that can benefit their businesses and citizens. Some examples include China, India, Brazil, North Korea, South Korea and Cuba.

DHS IAIP Daily; http://www.theregister.co.uk/2006/02/01/tycoon_hacking_charge/ 23

UK TYCOON CHARGED WITH COMPUTER HACKING.

Matthew Mellon, the heir to a $11.7 billion oil and banking fortune, has been charged with a computer hacking offense over his alleged involvement in a snooping, bugging and blackmail ring in the United Kingdom. Mellon will appear alongside 17 other defendants in court later this month. Members of the group were arrested after a year long investigation by the Met Police into a detective agency run by a former policeman. Scotland Yard's probe unearthed evidence that suspects also broke into the National Health Service computers and stole medical files in order to facilitate blackmail. Investigators said members of the group donned false uniforms in order to gain access to premises where they left bugs. Mellon, chief designer at upmarket shoe firm Harry's, a company he created five years ago, is charged with conspiracy to cause unauthorized modification of computers. Another wealthy entrepreneur, Adrian Kirby, who made an estimated fortune of $115 million chiefly by running a waste disposal unit business, faces phone tapping, computer hacking and conspiracy to pervert the course of justice charges. Scott Gelsthorpe of Kettering, Northamptonshire, a former policeman in Essex, faces 15 charges. All 18 suspects face an appearance in court on Thursday, February 23.

DHS IAIP Daily; http://www.newsfactor.com/news/WMF−Exploits−Sold−by−Russian− Hackers/story.xhtml?story_id=01200162XEHO 23

WMF EXPLOITS SOLD BY RUSSIAN HACKERS.

According to Moscow-based antivirus firm Kaspersky Labs, Russian hackers propagated the Windows Meta File (WMF) exploit that wreaked so much havoc on computers in December 2005 by selling it to Internet criminals for $4,000. The exploit took advantage of a bug in Windows' rendering of WMF images, putting PC users at risk when they visited Websites that had been infected by the exploit. In a posting on its Website, Kaspersky said that over a thousand instances of malicious code based on the exploit were detected in a week. But because of the Christmas holiday season, less damage occurred than might have happened otherwise, Kaspersky said. According to Kaspersky researchers, the person who discovered the exploit in early December began selling it by the middle of that month to anyone prepared to pay $4,000. But the antivirus community only identified the exploit on December 27.

2003-03-18 **virus writer psychological profile study**

NewsScan

PROFILE OF A VIRUS WRITER
According to the UK's Sophos, one of the world's largest antivirus companies, about 1,000 viruses are created every month, and in almost all cases the perpetrators are computer-obsessed males between the ages of 14 and 34. "They have a chronic lack of girlfriends, are usually socially inadequate and are drawn compulsively to write self-replicating codes. It's a form of original graffiti to them," says Sophos CEO Jan Hruska. Virus writers tend to explore known bugs in existing software or look for vulnerabilities in new versions in order to create and spread their infections, and Hruska notes that the next target for the virus writing community could be Microsoft's .Net platform for Web services. To boost the impact of their creations, virus writers also tend to share information to create variants of the same infection, such as the infamous Klez worm, which has been among the world's most prolific viruses in the last year. 2003-08-26 **virus Sobig network vandal motivation attacker**

NewsScan

MORE THEORIES ABOUT SOBIG VANDAL'S MOTIVATION
Is money the real motivation for the spread of the Sobig virus? Sobig is transmitted as an e-mail attachment and is the sixth variant of the malicious code by an unknown attacker. Mikko H. Hypponen, director of antivirus research at F-Secure corporation in Finland says: "I think the motivation is clear: it's money. Behind Sobig we have a group of hackers who have a budget and money." Computer security expert Russ Cooper suggests that the vandal is acting out comic book fantasies: "You can liken this guy to Lex Luthor and we're all Supermen. Luckily, we've been able to get the kryptonite from around our necks each time so far." One popular theory is that Sobig is the work of an e-mail spammer who is aggressively trying to build a clandestine infrastructure for blitzing the Internet with junk e-mail. Antivirus software researcher Joe Hartman of TrendMicro says, "If machines remain infected they could be used in any kind of attack. The question we ask ourselves is, What is he trying to achieve? We don't think it's planned for a specific threat, rather its more likely a money-making spam scheme." And Bruce Hughes of Trusecure points out: "There is some evidence that he's been tied in with spammers." Sobig spreads further only when a computer user selects the attached program that then secretly mails itself to e-mail addresses stored in the user's computer. The Computer Emergency Response Team at Carnegie Mellon University says, "Our current advice is: Don't open an attachment unless you are expecting one." (New York Times 26 Aug 2003)

TORVALDS: GEEKY KIDS NEED DATES
Asked how to end virus and worm attacks, Linux creator Linus Torvalds told an interviewer: "When you have people who hook up these machines that weren't designed for the Internet, and they don't even want to know about all the intricacies of network security, what can you expect? We get what we have now: a system that can be brought down by a teenager with too much time on his hands. Should we blame the teenager? Sure, we can point the finger at him and say, 'Bad boy!' and slap him for it. Will that actually fix anything? No. The next geeky kid frustrated about not getting a date on Saturday night will come along and do the same thing without really understanding the consequences. So either we should make it a law that all geeks have dates — I'd have supported such a law when I was a teenager — or the blame is really on the companies who sell and install the systems that are quite that fragile." (New York Times Magazine 28 Sep 2003)

NEW STUDY REFUTES NET 'GEEK' STEREOTYPE

The typical Internet user has plenty of friends, an active social life and would rather read a good book or log on than watch TV, according to a report by UCLA's World Internet Project, which surveyed Net users and non-users in 14 countries to come up with its results. The image of Net users as socializers contradicts the stereotype of propeller-head "geeks" who spend their days (and nights) hunched over their keyboards, shunning human contact. The study did, however, reinforce some other demographic trends, including the fact that wealthier people tend to be more avid users, and that men outnumber women on the Net, although those figures vary by country, with Italy exhibiting the largest gender gap and Taiwan the smallest. Meanwhile, the digital divide — the phrase widely used to describe the disparity in Internet usage between rich and poor — appears to be narrowing around the world. Sweden, Korea and the U.S. had the largest number of low-income users. (Reuters/CNet News.com 14 Jan 2004)

2004-03-04 **network virus worm writers fight online MyDoom Bagle Netsky**

NewsScan

VIRUS WRITERS SQUABBLE ONLINE

The writers of Internet plagues MyDoom, Bagle and Netsky have ratcheted up their competition, embedding insults and threats against each other in the coding of the latest versions of their computer bugs. For example, "MyDoom.f is a thief of our idea!" and "Bagle — you are a looser!" both appear in the code of the latest Netsky worm [no one ever said worm writers were literate!]. Ken Dunham, director of malicious code at iDefense, says the spat appears to exemplify the rivalry between the authors of MyDoom and Bagle, both of which attempt to take control of infected computers, while the Netsky worm attempts to deactivate the other two. "There's a huge pool of computers that are always infected," says Dunham, who estimates that number at somewhere in the low hundreds of thousands. Virus writers "want to make sure they have complete control of those computers." Meanwhile, the new versions just keep on coming — there've been 11 versions of Bagle, seven of MyDoom and six of Netsky, which appeared only last month. "We are just seeing variation after variation," says a VP of one antivirus company. (Washington Post 4 Mar 2004)

CRIMINAL HACKER "SOLO" ACCUSED OF BREAKING INTO US GOVT COMPUTERS TO FIND EVIDENCE OF UFO COVERUP

Rob Singh reported on the case in the London _Evening Standard_ newspaper:

Gary McKinnon, 39, was seized by the Met's extradition unit at his Wood Green home.

The unemployed former computer engineer is accused of causing the US government $1billion of damage by breaking into its most secure computers at the Pentagon and Nasa. He is likely to be extradited to America to face eight counts of computer crime in 14 states and could be jailed for 70 years….

Most of the alleged hacking took place in 2001 and 2002…. Friends said that he broke into the networks from his home computer to try to prove his theory that the US was covering up the existence of UFOs. He is accused of a series of hacking offences including deleting "critical" files from military computers. The US authorities said the cost of tracking him down and correcting the alleged problems was more than £570,000. The offences could also see him fined up to £950,000 if found guilty on all charges…. [T]he US first issued an indictment against him in November 2002.

Prosecutor Paul McNulty alleged that McKinnon, known online as "Solo," had perpetrated "the biggest hack of military computers ever". He was named as the chief suspect after a series of electronic break-ins occurred over 12 months at 92 separate US military and Nasa networks.

McKinnon was also accused of hacking into the networks of six private companies and organisations. It is alleged that he used software available on the internet to scan tens of thousands of computers on US military networks from his home PC, looking for machines that might be exposed due to flaws in the Windows operating system.

Many of the computers he broke into were protected by easy-to-guess passwords, investigators said. In some cases, McKinnon allegedly shut down the computer systems he invaded.

The charge sheet alleges that he hacked into an army computer at Fort Myer, Virginia, where he obtained codes, information and commands before deleting about 1,300 user accounts….

2006-04-13 **NASA hacker Gary McKinnon speaker Infosecurity Europe Guantanamo Bay stay unauthorized access penetration**

DHS IAIP Daily; http://news.zdnet.co.uk/internet/security/0,39020375,39263341,00.htm 23

NASA HACKER TO SPEAK AT SECURITY SHOW.

NASA hacker Gary McKinnon will be joined by other hackers and security experts on a panel discussion at the Infosecurity Europe conference Thursday, April 27, in London. McKinnon faces the prospect of an indefinite stay in Guantanamo Bay, but this won't prevent him from appearing on the Infosecurity panel and discussing hacking at a UK security conference. The NASA hacker is currently fighting extradition to the U.S. in what has been a protracted trial. He is charged with gaining unauthorized access to 97 U.S. government computers, including machines belonging to NASA and the Department of Defense. He claims he was searching for evidence of UFOs.

1997-02-26 **hacker**

AP, Reuter

Chris Zboralski, a 21 year-old French criminal hacker, was fined $8,500 and given an 18-month suspended sentence in Paris for using the FBI's phone system to place $250K of AT&T international phone calls at US government expense in 1994. According to AP, Judge Francis Bruty called Zboralski "a computer genius with a lamentable morality." However, his expertise consisted largely of impersonating an FBI agent and convincing a bureaucratic dupe to give him the access numbers for the FBI's conference-call account. Zboralski showed no remorse; on the contrary, he signed a book deal with a French publisher and announced that he was going into business as a security consultant. Better watch your phones if you hire him.

C!Net http://www.usnews.com:80/usnews/issue/970602/2crac.htm

David Freedman and Charles Mann published _At Large_ (Simon & Schuster), an analysis of the curious case of Matt Singer, known in the computer underground as "phantomd." This maladjusted and unfortunate youngster broke into accounts at MIT, Los Alamos and Livermore National Laboratories, Intel, and many other sites. He tried to use the supercomputers at NASA sites to run Crack, a password-guessing program for determining passwords encrypted in UNIX password files. The FBI's National Computer Crime Squad, founded ion 1992 by Agent Jim Settle, obtained warrants for wiretaps on their key suspect, Matt Singer. By this time, the youngster was attempting to break into the main Internet backbones to run a high-speed sniffer program. With an accomplice, he snagged 60 Mb of data in break-ins of a few minutes at a time, accumulating untold numbers of logins and unencrypted passwords. In December 1992, the FBI burst into the Singers' home and found a poverty-stricken, brain-damaged, schizophrenic 19-year old barely aware of the world around himself but addicted to the joys of criminal hacking. The Department of Justice declined to prosecute and the case sank into obscurity, as did Matt Singer, who was living on Social Security disability payments when the authors completed their book about him.

1997-06-19 **hacker culture information warfare**

TechWire

The UK's Defence Evaluation and Research Agency warned that "The hacker community is splitting into a series of distinct cultural groups — some of which are becoming dangerous to businesses and a potential threat to national security." Alan Hood, a research scientist in the information warfare section of DERA, said that information brokers coordinate attacks by ordinary hackers and then sell the information to governments or competing organizations. Meta-hackers observe ordinary hackers and then silently take advantage of the vulnerabilities discovered by the blabbermouth hackers. "Elite" hackers stick to their own class of hacker and sneer at those who use widely-available tools and scripts. "Dark-side" hackers attack systems for financial gain or to do harm, violating the much-vaunted standards of the hacker world. Most importantly, Hood urged network managers to stop trying to prevent all attacks; instead, focus on deterrence, protection, detection and reaction. Make it difficult enough for hackers that they will move on to another target; encrypt sensitive data and prevent social engineering; install intrusion-detection software; and respond to all attacks or oddities on your systems.

1997-07-16 **hackers convention Hack-Tic HIP**

Scotsman, Wired, Agence Presse France

The Hacking in Progress hacker convention took place in August in a field near Amsterdam. Some of the topics of discussion suggest that the hacker underground may be moving towards a more mainstream approach to technology. For example there were talks about Internet censorship, spam, and cryptography. Many of the hackers now work for corporations, including the Dutch ISP XS4All, which was itself founded by reformed hackers. However, the criminal side of hacking was also well represented. Many of the discussions focused on how to abuse systems rather than on how to repair them. There was also an embarrassing incident when telephone engineers for the Netherlands PTT discovered a break-in by a cellular phone user at the camp who fraudulently tried to place free international calls.

1999-01-08 **criminal hackers statements hacktivism ethic propaganda**

National Post (Canada)

After the Legion of Underground (LoU) announced on the 1st of January 1999 that they would attack and disable the computer systems of the People's Republic of China and of Iraq, a coalition of criminal hacker organizations announced opposition to the move. Eric Corley (using his pseudonum "Emmanuel Goldstein"), editor of _2600: The Hacker Quarterly_, signed the statement from Cult of the Dead Cow, Chaos Computer Club, !Hispahack, LOpht, Phrack, Pulhas, and Toxyn. "This kind of threat, even if made idly, can only serve to further alienate hackers from mainstream society and help to spread the misperceptions we're constantly battling. And what happens when someone in another country decides that the United States needs to be punished for its human rights record? This is one door that will be very hard to close if we allow it to be opened," said Corley in the statement. "We strongly oppose any attempt to use the power of hacking to threaten or destroy the information infrastructure of a country, for any reason," the coalition said. "Declaring war against a country is the most irresponsible thing a hacker group could do. This has nothing to do with hacktivism or hacker ethics and is nothing a hacker could be proud of," the coalition said in the statement. "Space Rogue" (of The L0pht), wrote, "Though we may agree with LoU that the atrocities in China and Iraq have got to stop, we do not agree with the methods they are advocating."

1999-02-17 **meta-hacking criminal script kiddies thieves Internet Web**

OTC

Script kiddies are increasingly being manipulated by meta-hackers — more experienced criminals who use the naïve kids to infiltrate systems and then collect information through their minions' activities. According to David Butler of Axent Technologies, "Cracking attempts rise by a factor or three or four during school holidays." New tools for meta-hacking include Java-based Trojans that can corrupt innocent users' browsers so that they inadvertently attack other Web sites and transmit information to the malefactors. In another meta-hacking attack, someone inserted code into the free Tcpwrapper software for authenticating logins; the Trojan version sent login records to an e-mail address. According to one of Nokia Telecommunications' marketing directors, Bob Brace, the company detected 24,000 cracking attempts between October 1998 and the end of January 1999. Many of the probes were spaced out over time in a stealth technique to avoid detection, said Brace.

1999-04-01 **criminal hacker punishment imprisonment protests pity**

Daily Telegraph

Wendy Grossman, writing in the _Daily Telegraph_ (1999-04-01), discussed the Kevin Mitnick case. She described how a relatively minor criminal hacker become the poster boy for a generation of criminal hackers and wannabes. Her closing remarks were particularly interesting: "The hacker community tends to follow the prison careers of all hackers and crackers as though they were political prisoners, and has rallied to support Mitnick, particularly as his time in jail without a bail hearing lengthened. The Free Kevin Web site (www.kevinmitnick.com) recounts every incident of his jail career, from his lack of access to legal books to the bizarre report that in early 1997 he was put in solitary confinement for unauthorized possession of 74 cans of tuna. No one is saying it was all right for Mitnick to break into computer systems. But nothing he did was as destructive as Robert Morris's 1988 Internet worm, a badly written bit of code that paralysed large portions the network; Morris got probation. Equally, Mitnick is not known to have profited from information he copied, unlike some hackers who served lighter sentences. Finally, the general word about Mitnick is that he is not particularly a technical genius; his skill is in "social engineering" – persuading people to give him information they're not supposed to, such as passwords. Ultimately, what Mitnick's case and the publicity surrounding it have done is widen the gap of distrust between hackers and the law."

1999-06-14 **criminal hacker psychology biography history story adolescent teen-ager penetration gang tools subculture motivation amorality**

Wall Street Journal

John Simons of the Wall Street Journal wrote an extensive biographical sketch of Patrick Gregory, the 18-year-old who confessed to the FBI that he was "Mosthated," one of the founders of gH (Global Hell). The gH criminal hacker gang, with up to 30 members at various times, was one of the groups responsible for a wave of Web vandalism against US government and university sites in the Spring of 1999. The adolescent's story details how he became increasingly disruptive in school and finally quit school without graduating. He was arrested for possessing marijuana, lost his driver's license, and turned to full-time criminal hacking with a criminal hacker from Green Bay, WI who called himself Mindphasr. The two of the formed Global Hell and became involved in stealing credit-card numbers and abusing corporate conference-call lines. Gregory repeatedly broke into corporate systems, read internal e-mail, and vandalized systems. He then stupidly decided that a good way to get a job was to leave messages on the systems he penetrated telling administrators how to patch their security holes — so-called "gray-hat" hacking. He actually did get a job from one of his victims, Parachute Computing Systems of Austin, TX but blew it by continued criminal hacking in his spare time. He was busted by the FBI, which seized his computer. His mother immediately bought him another one and he was back online within a few days.

1999-07-06 **criminal hacker convention conference meeting**

South China Morning Post (Hong Kong), Birmingham Post (UK), Wall Street Journal

The annual DEFCON convention started in Las Vegas in early July 1999, complete with two camera crews filming the proceedings and interviewing criminal hackers after their presentations. Highlights (so to speak) included the release of BO2K, the new version of the BackOrifice program produced by the Cult of the Dead Cow in 1998. Along with the usual discussions of techniques used for criminal hacking, the convention featured various games such as Spot the Fed, Hacker Jeopardy (hosted by Winn Schwartau), various online games, a hacking contest, and wrestling in inflatable Sumo wrestler costumes. Some Federal officials actually spoke to the hackers (receiving some jeers at their suggestion that criminal hackers should join the good guys) and at least one security firm installed software on the hacker-target machines as a form of quality assurance: Ron Gula of Network Security Wizards, Inc. installed his intrusion-detection system on the target machines and was able to detect all attacks launched by the hackers, some of whom even suggested improvements to his program.

1999-07-06 **criminal hacker psychology biography interview**

Straits Times (Sinapore)

The Straits Times (Singapore) published an interesting interview with some non-hacker observers of the criminal hacker scene in that country. Samuel Kwan, 16, and Nathanael Ng, 19, distinguished between honorable hackers and crackers, repeating the usual propaganda about intruders who leave polite messages indicating security vulnerabilities so they can be fixed. The young people sneered at "lamers" (aka "script kiddies") who use automated attack tools to cause harm but have no understanding of security or computer science.

www.thesynthesis.com

Someone calling him(or her)self "Bronc Buster" circulated a long description dated 1999-10-13 about a visit to the hacker collective New Hack City. The criminal-hacker supporter provides an interesting glimpse into the hacker underground, with hints of intrigue, elitism, and a time perspective that might startle adults: "New Hack, as the people who hang out there like to call it, was an idea that started way back in 1995 on the opposite side of the country, in Boston. It started with several friends wanting to find a place to gather, where they could share their experience with each other, learn, experiment, and most importantly pool their limited resources. In the early days of the Internet, as we know it, computer equipment was expensive, and dial-up access to it was hard to come by and was also expensive." The early days of the Internet? 1995? "So five people, FreqOut, GarbageHeap, ChukE, Rosie, and Deth Veggie, start the original New Hack City in Boston in 1995." The article continues with details of the links of this "hacker think-tank" with other criminal hacking organizations: "Many members of New Hack are also in the cDc, have been associated with the L0pht or worked with 2600. Regular people that hang out include a few people from the DOC, some people with 2600, and other notable groups. When I was there, several cDc members were there that are also part of the New Hack crew; like Tweety Fish, Deth Veggie and Sir Dystic (who wrote the original Back Orifice tool)."

Although the sites offer only tiny grainy images of naked Japanese models, sociologists say that the key to predicting whether a new technology will take off is to determine whether it's used for pornography: "It's inevitable, I suppose, that with any new technology people will use it for porn," . . . [said] David Birch, CEO of Consult Hyperion. "That's been the story with photography and video cameras." The news should be welcomed by wireless companies, which have reported slower growth rates than they had hoped. (The Independent 8 Jul 2000)

2000-08-25 **pornography scam fraud credit-card international jurisdiction criminals theft**

NewsScan, RISKS, E-Commerce Times 21 03
http://www.ecommercetimes.com/news/articles2000/000824-4.shtml

The Federal Trade Commission has filed a lawsuit against Crescent Publishing Group and 64 affiliated companies that operate adult Web sites, accusing them of charging customers for services advertised as "Free Tour Web Sites." Like many adult sites, the Crescent sites requested that users supply credit card information to verify they were of legal age to view pornographic material. Customers who'd been promised a free online peep show say they were then billed for recurring monthly membership fees ranging from $20 to $90. Included among the complainants were some people who said they'd never visited the sites at all — in fact, one woman who'd been charged a recurring fee for several months didn't even own a computer. To add to the confusion, the charges were made under different company names. Instead of finding a charge from Highsociety.com on their statements, consumers would find charges from "Online Forum," or "Hoot Owl," or "Knock Knee." The FTC has classified the scam as one of the largest it's ever seen on the Internet, generating $141 [million] in the first 10 months of 1999 alone.

RISKS correspondent Lenny Foner noted the folly of using credit cards as a form of age authentication.

PORN INDUSTRY A FORCE IN DRIVING INNOVATION
The world's oldest profession has been instrumental for years in driving technological innovation. The porn industry was an early force in popularizing Polaroid cameras, VCRs, and CD-ROMs, and became the first industry to make money on the Web. Now it's turning its eye toward DVD technology and has begun making DVD movies that resemble video games, allowing viewers to watch and play along. "The technology fits our product," says one cutting edge DVD producer. Meanwhile, the interactive technology now pioneered by porn purveyors likely will find its way into mainstream Hollywood studios before too long: "It has a great children's application, says David Crawford, DVD production manager for Wicked Pictures. "You can tell a nice little fairy tale and have this be the frame of it. The idea is great, whether the content is for adults or children." (Los Angeles Times 9 Jan 2001)

KIDS AND PORN ON THE WEB
The constitutionality of the Child Online Protection Act of 1998 has yet to be decided by the U.S. Supreme Court, but its effectiveness may be in as much doubt as its wisdom, because Napster-like free swapping services may develop that will make the law largely irrelevant, since it makes Web site operators responsible for ensuring that their patrons are adults. But Herb Lin, a senior scientist at the National Research Council, says: "Right now, the so-called adult online industry is in it for the money. But what happens when a different community starts exchanging pornography on the Net and no money changes hands at all, just like Napster?" The technology already exists for doing just that. EUROPEAN ISPs TURN TO PORN FOR PROFITS
Cash-strapped European ISPs are branding their own adult content, aiming for the tried-and-true profits found in pornography and sex-related products. "What's triggering the move towards (adult content) is the steady revenue streams it generates. Sex sells," says Yankee Group European Internet strategies director Scott Smith. Freenet.de, Germany's No. 2 ISP, is preparing a mid-August launch of Fundorado.de, a site hawking hardcore videos, photos and sex chat rooms for about $8 a month. And on Monday, Freenet.de's biggest domestic rival T-Online announced it was teaming up with Barcelona-based Private Media Group to break into the adult content business, while last month, GMX.de -- a German free e-mail service -- said it would develop a similar venture. Meanwhile in the UK, struggling e-tailer Lastminute.com quietly introduced an auction specializing in sex toys last week. "The old revenue stream was click-throughs and e-commerce. Companies are being urged to develop new business models to convince investors there is value in an ISP or portal business," says Kai Kaufman, an analyst with Dresdner Kleinwort Wasserstein in London. A recent study by Netvalue indicated that 33% of German Internet users regularly access adult sites, and a 1998 Datamonitor report predicted that Internet pornography would represent a $2.8-billion business by 2003. INTERNET FINDS NEW WAY TO LOSE MONEY: ONLINE PORNOGRAPHY
Oh, the trials of the pornographer. How do you stand out against all the competition? With so much porn available for free, how do you get people to pay? With broadband connections widely available, how do you prevent customers from downloading everything quickly and then canceling their subscriptions? The days of easy profit on the Web are over, even for pornographers. The marketing and publicity for one well-known sex site says, "I think things are shaking out. The same rules have always applied to this business as any other." Another problem for online pornographers is that credit card companies tend to view them as "slow-pays" or deadbeats, and consider them to be a major source of fraud complaints and illegal activities such as underage sex and bestiality. So what's a poor pornographer to do? Many of them are now turning to online gambling. They're not really interested in sex, they're interested (surprise) in money. (San Jose Mercury News 4 May 2002)

RealNetworks has made no secret of its desire to emulate the cable industry, with its core business strategy focused on delivering name-brand content and software services to paying customers. The company is currently in discussions with several audio and video producers to expand the lineup on its RealOne SuperPass service, and VP Dave Richards says that although there are no immediate plans to offer adult-only fare, the possibility of a future venture cannot be ruled out. "We expect we will have different tiers" of service. "Maybe even an adult tier." And while some analysts say getting into porn distribution is the kiss of death for mainstream publishers, others point out that the cable industry has dabbled in adult content for years without sparking a major backlash. Still, several Internet companies have tested the waters in the booming online pornography industry and decided to pull back. In April 2001, Yahoo yanked all pornographic ads, auction items and merchandise from its site in response to consumer complaints, and in January 2000, Ask Jeeves shelved plans to launch a separate search engine for pornography in order to preserve its family-friendly image. Private Media Group, a Spanish adult-entertainment company, has made an all-stock offer worth $2.4 million in a bid to acquire the trademark and Web address of the now-defunct Napster. Last week, a bankruptcy judge rejected a $9 million bid by Bertelsmann, saying the deal wasn't negotiated at arm's length, as required by law. Private Media said it plans to use the Napster trademark to promote its collection of "top quality" adult-oriented fare at a reasonable price, and to offer adults the ability to swap adult content for free. Private Media owns the global copyrights to what it claims is the largest library of adult-oriented content in the world. "Acquiring Napster is our way of entering the peer-to-peer marketplace for adult content in a closed environment," says Private Media CEO Charles Prast. "Along with Hollywood and the recording industry, we have become increasingly concerned about the level of copyright infringement inherent in the peer-to-peer file swapping services." HOLIDAY VIDEO GAMES ARE RISQUÉ BUSINESS
This holiday season will serve up some of the raciest footage yet on the upcoming releases of new computer and video console games. The offerings range from "Dead or Alive Xtreme Beach Volleyball," which offers buxom, scantily-clad volleyball players who "jiggle" realistically, to "BMX XXX," in which players rack up cash on the circuit and then get to spend it at a local strip joint, watching live-action footage of topless dancers. The BMX game also allows players to design their own topless biker characters, starting with chest measurements. "Consumers seem to be getting a little bored of a guy on a bike on a ramp," says Ben Fischbach, brand manager for Acclaim. "This product is a true comedic entertainment property. We really look at this game as 'American Pie' meets 'Airplane' meets 'Howard Stern.'" And while BMX XXX is rated "M" for players 17 and up, there are a number of other BMX games on the market now aimed at younger players, and the Parents Television Council worries that parents might grab it off the shelf without noticing the rating. In an effort to alert parents to the mature content, PTC has issued a warning about the game: "This may look like an ordinary biking game but it is the first sports game to carry an M rating and feature strippers, public urination, and yes? dog humping," reads the notice. (CNN/Money 17 Sep 2002)

VIDEO SEXXX GAMES

2003-04-30 **P2P peer-to-peer file swapping music piracy**

NewsScan

FILE-SWAPPERS' DIRTY LITTLE SECRET
Despite the best efforts of the music industry, file-swapping services like Kazaa and Morpheus just keep getting bigger. But that doesn't mean music piracy is burgeoning out of control; instead, file-swappers increasingly are trading in smut. A February survey showed that 42% of all Gnutella users were seeking blue images and movies, a phenomenon that Greg Bildson, COO of LimeWire, a leading maker of Gnutella software, refers to delicately: "We're about all different kinds of content sharing." Wayne Rosso, president of Grokster, is a little more blunt: "P*rn — there's a ton of it being traded around." The surge in p*rn-trading has some smut-peddlers considering RIAA-type retaliations against the Gnutellas and Kazaas of the world. Like the movie executives, they blame the free services for their falling revenues. "The explosion of free p*rnography, fueled by file sharing, has diminished interest in pay sites," warns one veteran p*rn industry observer. Meanwhile, some businesses have taken a more collaborative approach. "We love file trading. Why? It's called greed. We've found a way to monetize that sharing," says the sales director for Triple X Cash. His company embeds hidden links in video clips and sends them out on file-sharing networks. When a file-swapper downloads a clip and clicks somewhere in the video's frame, he's taken to one of Triple X's sites. The company gets 25 to 40 "joins" — $30 monthly subscriptions — per day from this technique. "The record industry should have taken a cue from the p*ornographers," says Grokster's Rosso. Microsoft MSN is closing down Internet chat services in most of its 34 markets in Europe, Latin America and Asia, and is limiting service in the U.S., citing concerns over use of the online forums for pornography scams and pedophile and sexual predator activities. "We recognize that it's a common industry-wide problem," says an MSN spokeswoman. "We've taken a look at our service and how can we make efforts to step up our efforts to provide a safe environment." In the U.S., MSN will now require chat room users to subscribe to at least one other paid MSN service, so that it will have credit card numbers that it can use to track down those who violate MSN's terms of use. In Canada, Brazil, New Zealand and Japan, MSN will offer some moderated chat rooms and discussions. The move to restrict chat use will probably turn out to be a good thing for the company, says one Microsoft watcher, by allowing it to shed a number of freeloaders. "I think this change will have welcome side effects, like keeping spammers out of the chat rooms. But fundamentally I believe this is a move to make MSN more profitable. It will allow the company to get rid of some infrastructure that was supporting chat, and to make money on what it leaves in place." (AP 24 Sep 2003)

NewsScan; http://www.washingtonpost.com/wp-dyn/articles/A62546-2005Jan10.html?nav=headlines

PORN DRIVES DVD TECHNOLOGY

Just as it has with other home entertainment technologies, pornography is proving a driving force in the future of high-definition DVDs. The multi-billion-dollar industry releases about 11,000 DVD titles a year, giving it a strong position in the debate over which technical standard -- Blu-ray or HD-DVD -- will dominate in next-generation DVDs. Analysts say currently, the smaller outfits are leaning toward HD-DVD because of its lower cost, while larger operations like Blu-ray's bigger storage capacity, which could be used for "creative expression" -- like giving viewers a choice of camera angles. Hollywood is also lining up on both sides of the battle, with Fox and Disney declaring their preference for Blu-ray and Warner Home Video siding with HD-DVD. But for now, everyone's kind of waiting around to see which format takes the lead. "We're kind of riding it out a little further to see where the trend goes," says an executive with leading porn producer Wicked Pictures. (Reuters/Washington Post 10 Jan 2004)

2004-02-08 **pornography porn digital piracy unworried intellectual property rights copyright**

NewsScan

PORN INDUSTRY VIEWS PIRACY AS 'DIRECT MARKETING'

The pornography industry takes a very different view of digital piracy than their counterparts in Hollywood and the music business — they're all in favor of it. "It's direct marketing at its finest," says Randy Nicolau, president of Playboy.com, who doesn't mind one bit that his magazine's pictures appear on thousands of other Web sites. When asked whether he thinks the entertainment industry is on the wrong track with their prosecution of online freeloaders, Nicolau says, "I haven't spent much time thinking about it. It's like asking Henry Ford, 'What were the buggy-whip guys doing wrong?'" And while the folks peddling porn may have a live-and-let-live attitude when their content gets ripped off, they show a different face when someone else is making money off of it. "We haven't gone after Joe Citizen who's sharing something he printed off something from the Hustler Web site with another guy," says a lawyer who represents Hustler on copyright issues — but he does send out about 20 letters a week to fee-based Web sites who are charging for his client's content. Meanwhile, another group, Titan Media, tracks down copyright violators and then offers them amnesty if they will become subscribers, an approach that may work for other content owners, says Wendy Seltzer, a staff attorney for the Electronic Frontier Foundation who calls it "a much more sensible approach" than the music industry's litigation strategy. "People always want this stuff. Seeing some of it just whets their appetite for more. Once they get through what's available for free, they'll move into the paid services." SUPREME COURT WARY OF ONLINE PORNOGRAPHY LAW

The Supreme Court has ruled in a 5-4 decision that a law meant to protect children from exposure to online pornography is probably an unconstitutional restriction on free speech guaranties of the Constitution's First Amendment. The law, which passed in 1998 and was signed by then-President Clinton, is now backed by the Bush administration. Known as the Child Online Protection Act, the law would have authorized fines up to $50,000 for the crime of placing material that is "harmful to minors" within the easy reach of children on the Internet. The majority opinion, written by Justice Anthony M. Kennedy, said that "there is a potential for extraordinary harm and a serious chill upon protected speech" if the law were to take effect. The case has been sent back to a lower
court for a trial that would allow a discussion of what technology, if any, might allow children to be shielded from online pornography but at the same time would allow adults to see and buy any material that is not illegal. (AP/Washington Post 29 Jun 2004)

NET-PORN IS GOOD FOR YOU, SAY ACADEMICS

Pornography is good for people, says the academic leading an Australian taxpayer-funded study of the subject. Alan McKee and his colleagues Catharine Lumby and Kath Albury are conducting the Understanding Pornography in Australia study. The Labor party is considering forcing Internet service providers to filter hardcore porn in order to protect children using home computers. McKee says: "The surprising finding was that pornography is actually good for you in many ways. When you look at people who are using it in everyday life, over 90% report it has had a very positive effect" because it had taught them to be "more relaxed about their sexuality," made them think about another person's pleasure, and made them less judgmental about body shapes. ADULT CONTENT TO BOOST WIRELESS WEB SERVICES

Analysts say porn purveyors will do the same thing for the wireless sector that they did for the fixed-line Internet, fueling major growth while raking in the bucks. In the U.S., consumers will shell out some $90 million for adult entertainment in four years' time, according to a report by Yankee Group, which estimates that excluding portals of U.S.- based wireless operators, half of all wireless data traffic consists of pornography. Meanwhile, the only thing holding back the U.S. carriers is the worry over a backlash if adult content falls into the hands of children: "Fear is trumping greed for the moment, but the two can work together if carriers can develop a solid mechanism for protecting minors and safely profit from the opportunity," says Yankee. CONVICTION SECOND-EVER FOR TRANSMISSION OF OBSCENE E-MAIL MESSAGES.

A California man accused of managing the computer system to send hundreds of thousands of pornography-related e-mail messages has pleaded guilty to violating a U.S. antispam law. Kirk F. Rogers of Manhattan Beach, CA, pleaded guilty in U.S. federal court in Arizona Tuesday, January 31, to violating the U.S. CAN-SPAM Act, according to the U.S. Department of Justice (DOJ). Rogers' plea is the second-ever U.S. conviction related to the transmission of obscene e-mail messages, the DOJ said. Rogers agreed to forfeit money obtained in his spamming operation and faces a maximum sentence of five years in prison for a one-count violation of CAN-SPAM (Controlling the Assault of Non-Solicited Pornography and Marketing Act). Sentencing is scheduled for June 5.

SPAMMERS TARGET USERS' PCs
Security experts at UK firm MessageLabs say that a "trojan virus" mailed to up to 1 million computer users last week was designed to exploit a vulnerability on Windows PCs that would enable the perpetrator to use the recipients' PCs to distribute ads for Web sites carrying incest pornography. Internet security experts have suspected for some time that spammers would use viruses to access third-party computers, but MessageLabs says their investigation offers the first conclusive proof. "This is a massive discovery. It completely undermines the spammers' claim that they are legitimate marketers and shows that they are nasty insidious hijackers who drive me and the vast majority of computer users nuts," says MessageLabs senior technologist Matt Sergeant. The virus targeted a feature known as open proxy, which is often installed by software companies as the default setting on home PCs. Proxy servers are designed to allow the machine to link to the Internet through a local network, but if left open, they provide a back door for computer crackers to hijack the machine. The incident last week targeted customers of Outblaze, a Hong Kong-based webmail company that has about 30 million customers worldwide and owns domain names such as usa.com. "Open proxies are becoming the spammers' lifeline so they are always looking for more. Now we know how they are going about it," says Sergeant. (The Guardian 13 Jun 2003)

Supreme Court upholds convictions for child pornography

John B. Martin, 64, of Belle Fourche, South Dakota, was convicted in 2002 of having child pornography on his office and home computers; he claimed that his three-year project of collecting pornography was an attempt to provide evidence for new anti-porn laws. Records showed no attempts to contact government or law enforcement on this subject. He was sentenced to 90 days in local prisons in lieu of several years in federal prison. In his appeal against this sentence, his attorneys argued that the child pornography laws were unconstitutional because their overly-broad language could forbid ownership of digitally-created or modified images that did not in fact involve real children. In a decision on his appeal, the Supreme Court of the United States (SCOTUS) ruled unanimously that "the laws did not violate the U.S. Constitution, did not improperly restrict free speech and gave Martin adequate notice of what activities were illegal."

Man held on sex charge

A North College Hill man has been arrested and charged with unlawful sexual contact after authorities said he tried to solicit sex from a 14-year-old female on the Internet. The minor was in fact a detective with the Regional Electronic and Computer Investigations, which is made up of deputies, officers and detectives from the Cincinnati police department and Hamilton County Sheriff's Department. David Gipson Jr., 32, was arrested in Sycamore Township on Monday and charged with one count of attempted unlawful sexual contact with a minor and one count of importuning. Authorities arrested Gipson at the location he designated to meet the girl.

Green Bay, Wisconsin Area man charged in child-sex sting

A 22-year-old De Pere man was arrested Saturday after he allegedly arranged to have sex with 10- and 12-year- old girls while their father watched. However, hat father turned out to be special agent Eric Szatkowski of the state Department of Justice Division of Criminal Investigation. Nicholas Arendt now faces two counts of attempted sexual assault of a child under 13. Szatkowski zeroed in on Arendt after a complaint was filed with the cyber-tip line of the National Center for Missing and Exploited Children. According to the criminal complaint filed Monday in Brown County Circuit Court, Szatkowski first posed as the father of two young girls, ages 10 and 12, in an Internet chat room and agreed to bring his children to Arendt's Morning Glory Road apartment for sex.

University student first to be sentenced over internet porn

An Australian university graduate is facing jail under tough new Queensland laws aimed at catching pedophiles preying on children in internet chat rooms. Matthew William Ross Kennings will be the first person sentenced under the laws next month after pleading guilty in the District Court in Brisbane yesterday. The 26-year-old refugee centre volunteer was charged in July last year with intending to procure a person he believed to be under 16 years old to engage in a sexual act. The new laws were introduced two months beforehand, with police and the state's Crime and Misconduct Commission setting up a joint operation to target offenders. Kennings was caught after making contact with one of the officers who was posing as a 13-year-old girl using the name BeckyBoo13 in internet chatroom MSN Whisper.

SC Attorney General pushes to outlaw Internet child stalking

A bill that would make enticing children using the Internet illegal in South Carolina was unanimously approved Wednesday by a SC House subcommittee. If passed by legislators, it would be the first law in the state barring adults from luring children to have sex or commit crimes. The bill makes it easier to prosecute these crimes by expanding the state grand jury's authority to investigate them, state Attorney General Henry McMaster said. Sexual cybercrimes often cross state lines because the Internet enables predators to contact children in practically any part of the world.

2004-01-30 **sexual abusers sentencing Salazar pedophilia criminal record seduction Internet**

NewsBits; http://www.tecrime.com/llartL06.htm

Sexual abusers of children often get deals, no convictions

Manny Garcia and Jason Grotto wrote a report for the Miami Herald about the variable prosecutions of men caught seducing minors into sexual relations. In one case, 20-year-old Alan Salazar was arrested in Houston after arranging for a 14-year-old Dania Beach, FL teenager to fly to Texas. The perpetrator "pleaded no contest to interfering with the custody of a minor, [but] a Broward County judge withheld adjudication, meaning Salazar can say he has never been convicted of a crime." According to research by the newspaper staff, most of the Internet seduction cases end up without convictions even though the criminals plead guilty or no contest; about 80% of the child pornographers arrested in the state have their convictions erased from their criminal records. "Investigators blame the Florida Criminal Punishment Code, which scores some Internet sex crimes no worse than writing a bad check at the grocery store." Defense attorneys claim that their clients did not know that their victims were minor; some accuse police of entrapment when the officers impersonate children online.

1997-04-01 **anonymity stalking harassment threats free speech law**

AP

John Hendren,writing for AP, reported in April on several cases of cyber-harassment. An Annapolis, MD woman was mail bombed after she warned other writers about extortionate fees from an author's agency; her name, phone number and address were posted on alt.sex groups on the USENET and resulted in floods of offensive phone calls. A woman in Atlanta was appalled when someone posted a photograph of an unknown anonymous woman with the victim's name and contact information; she received calls from men who told her the announcement claimed she was offering free sex. A victim of such anonymous harassment founded WHOA — Women Halting Online Abuse — to help victims fight this oppression. The CyberAngels, an offshoot of the Guardian Angels vigilante group, claim to be willing and able to help victims; another vigilante is Peter Hampton, who can marshall thousands of people to saturate Web servers and who claims to take unspecified measures to damage harassers.

1997-04-15 **eavesdropping harassment cyberstalking**

RISKS, Reuters 19 8 ff

Around April 1997, police resolved a case of what had appeared at first to be spectacularly successful and mysterious technical attack on a suburban family in Emeryville, Ontario. Starting at the beginning of 1997 and dubbed "The Emeryville Horror" by a credulous press, the case involved heavy breathing on the phone, vague threats, boasts and inexplicable control of household electrical appliances. Counter-surveillance experts swept the house and found it "clean." Police suggested that the couple's adolescent boy might be responsible. After much denial by the family, they brought their son into the local police station for a polygraph exam to prove his innocence; he promptly confessed to the whole thing, which turned out to be a prank gone 'way too far. The 15-year old was recommended for psychiatric evaluation. As Ron Pfeifle implied in a subsequent issue of RISKS, the moral for all of us techno-nerds who speculated about wiring, HERF guns, and the whole bit: use Occam's Razor liberally when something seems too weird to be true.

NewsScan

CYBERSTALKING ON THE RISE
Cyberstalking — stalking people over the Net — is increasing across the U.S., according to a new study by Wired Safety. And while women remain the most likely targets, they're getting into the act as perpetrators, too. In addition, growing numbers of children are cyberstalking children. "We didn't find much good news," said Wired Safety executive director Parry Aftab. "Identity theft is increasing. And because more people are cyber dating they become victims of cyberstalking when things don't work out." Aftab expressed concern over a recent court ruling that compelled Verizon to turn over the name of an ISP subscriber under the subpoena power of the Digital Millennium Copyright Act. "This is an outrageous and dangerous ruling. It was supposedly about music piracy, but the result of the case is that anyone can obtain personal information about any Internet user by simply filling out a one-page form and submitting it to a court clerk. There is absolutely nothing you can do to protect yourself, even if you are a police officer doing undercover work against s*xual predators. The future safety and privacy of all Americans engaged in online communications now rests with Verizon winning this case on appeal." 2000-02-14 **gambling stupidity gullibility consumer cheating fraud law**

NewsScan, New York Times
http://partners.nytimes.com/library/tech/00/08/biztech/articles/11gambling.html

The future of online gambling could be decided in a trial . . . [that started in February and pitted] the U.S. Justice Department against the World Sports Exchange (www.wsex.com), an online betting operation based in Antigua. The importance of the case goes beyond gambling, however, says one Internet attorney: "This is an interesting case of asserting jurisdiction over overseas Web sites in a criminal context. It will be closely followed by companies doing business on the Internet, both in the U.S. and abroad." The attorney prosecuting the case maintains that where the bet is placed physically doesn't matter; the crime occurs when an "interstate wire communication facility" like the Internet is used to transmit the wager. But Internet legal experts disagree, pointing out that legislation aimed at banning Internet gambling has not yet been passed in the House of Representatives. "This pushes the concept of jurisdiction to its limits," warns Henry Judy, a member of the American Bar Association's committee on cyberspace law. (Financial Times 14 Feb 2000)

[In August,] A co-owner of an online offshore gambling business based on the Caribbean island of Antigua . . . [was] sentenced to 21 months in a U.S. prison for violating . . . [that] country's federal Wire Wager Act, which makes it illegal to use telephone lines in interstate or foreign commerce to place sports bets. The prosecutor noted: "An Internet communication is no different than a telephone call for purpose of liability under the Wire Wager Act." (Reuters/New York Times 11 Aug 2000)
