Chapter 3 – Appendices

Cryptic sexual dimorphism reveals differing selection pressures on continental islands– Supplementary Information

Appendix S3.1: Second Abstract in Bahasa Indonesia

Burung terkenal karena dimorfisme seksualnya. Namun tidak semua bentuk-bentuk dimorfisme burung adalah sama, dan perbedaan-perbedaan dalam hal morfologi sangat halus sehingga mereka tidak terdeteksi oleh pengamatan biasa. Kami melaporkan hal ini pada Pelanduk Sulawesi (*Pellorneum celebense*), contoh pertama dimorfisme seksual yang telah dilaporkan untuk spesies ini atau spesies pengoceh tanah manapun di pulau-pulau Asia Tenggara. Temuan kami didasarkan pada kombinasi dari analisis morfometrik, jenis kelamin genetik, dan pengamatan pada kondisi penangkaran. Kami menjelaskan kegunaan pendekatan pengelompokan yang telah banyak digunakan dalam literatur biomedis, untuk investigasi dimorfisme seksual dalam konteks ekologis dan evolusi. Dimorfisme seksual terlihat lebih lemah di daratan Sulawesi dan lebih kuat di pulau-pulau benua dari Kabaena, Muna, dan Buton. Hal ini menunjukkan bahwa tekanan evolusi yang berbeda telah menyebabkan spesies memisah-misahkan relung berbeda di habitatnya, yang belum lama terpisahkan secara geologis. Pemisahan relung intraspesifik semacam ini adalah bagian intrinsik dari relung ekologis spesies tersebut, yang tidak boleh kita abaikan jika kita ingin memahami sepenuhnya organisme dan sistem-sistemnya yang menarik sampai kapanpun.

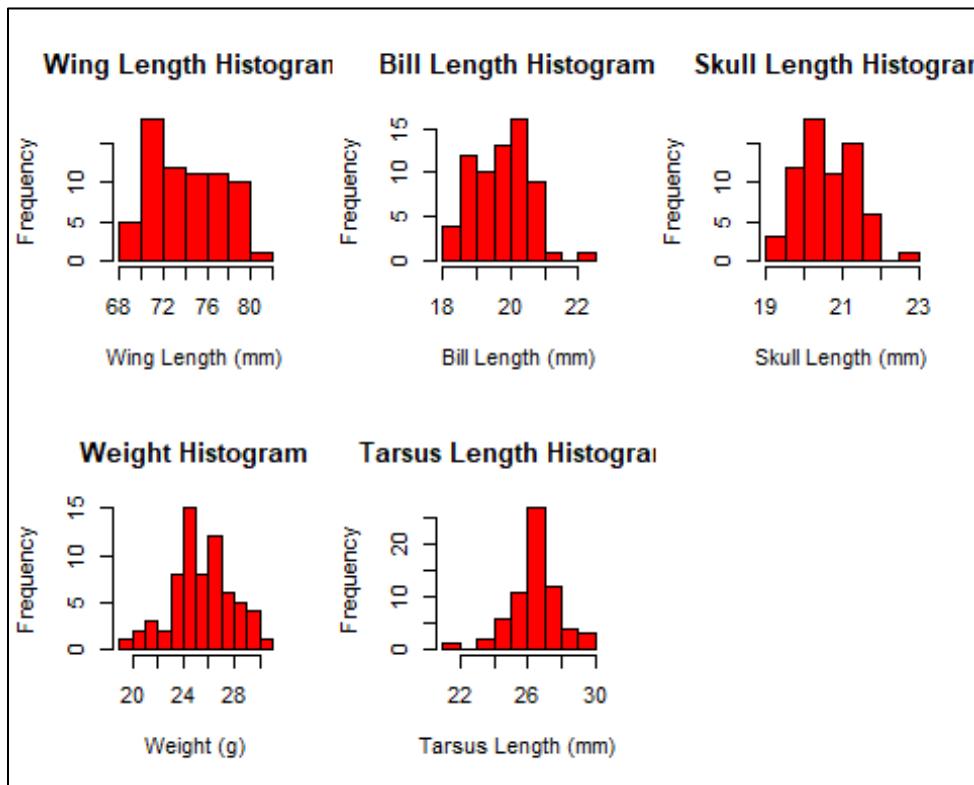

Figure S3.1. Histograms used to assess distribution of morphometric data.

Apparent bimodality in this data prompted our investigations into sexual dimorphism in this ostensibly monomorphic species.

Figure S3.2. Example PCR protocol.

Image of a protocol used in this study, showing the reagents and quantities in the master mix along with the thermal cycling program used. We opted to use a “touchdown” cycling program to improve yield (Korbie and Mattick 2008), with the annealing temperature starting at 62°C in the first cycle and dropping (or “touching down”) by 1° each cycle thereafter.

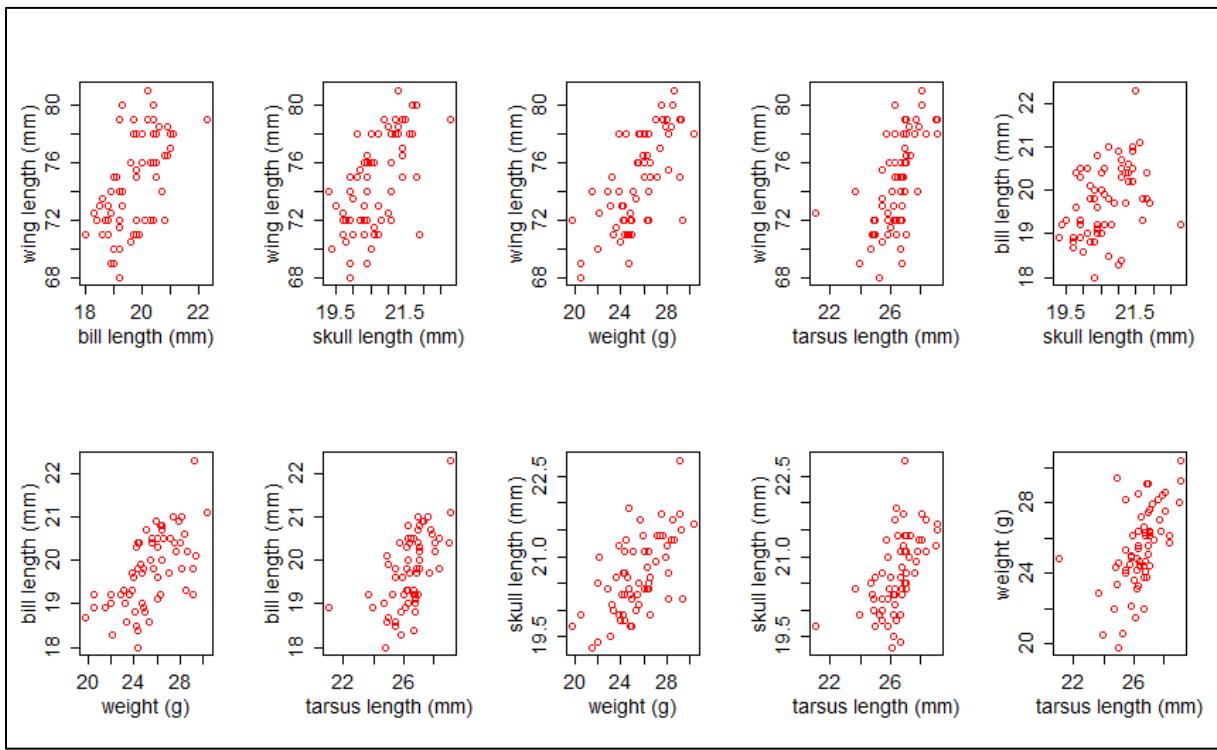

Figure S3.3. Scatterplots used to check that our morphometric variables are linearly related.

This is an assumption of MANOVA. These scatterplots show that this assumption is not violated.

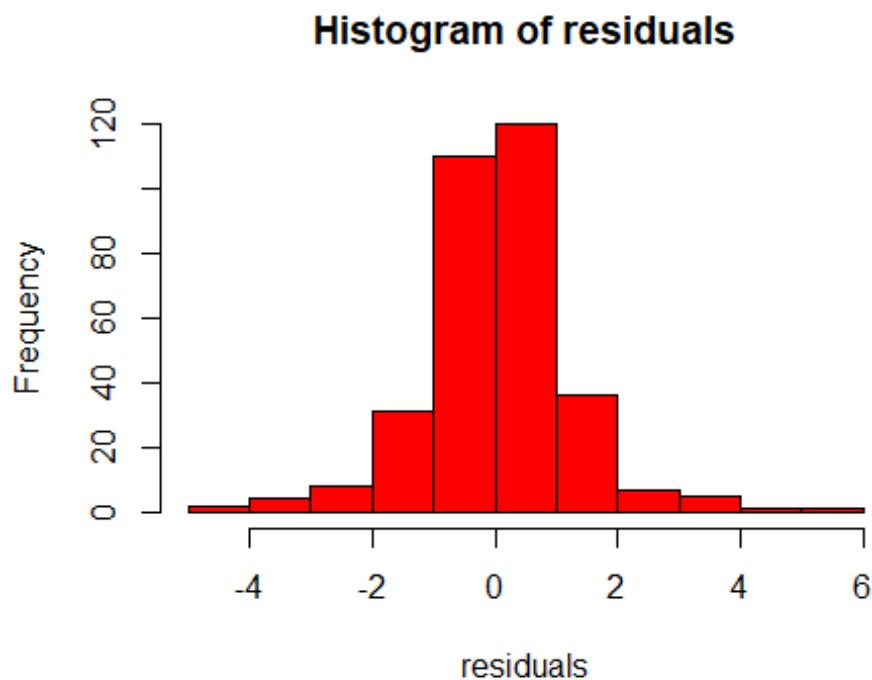

Figure S3.4. Histogram of the residuals of our Two-Way MANOVA on island and mainland dimorphism.

The residuals are normal, so this assumption of ANOVA is not violated.

Analysing the interaction between sex and population (island versus mainland) in explaining the babbler's wing length, bill length, skull length, weight, and tarsus length. "datababs" is the name of the morphometric dataframe. "Islandmainland" is a variable indicating the origin of the bird. "mclust" is the group assigned to each bird by unsupervised clustering, which our genetic sexing revealed to correspond to the sex of the bird.

Table S3.6. Full results of sexing methods

Results of our four sexing methods. Breeding sex is based on breeding condition of birds in the hand.

Morphological sex is based on our unsupervised clustering analysis, which sorted larger birds (males) into Group 2 and smaller birds (females) into Group 1. P2/P8 and CHD1F/CHD1R are two sets of PCR primers for genetic sexing, used to detect the presence of the sex chromosomes Z and W, where male birds have a ZZ karyotype and females ZW.

Figure S5.1. Example PCR protocol used in this chapter.

This shows the reagents and quantities in the master mix along with the thermal cycling program used. We used “touchdown” cycling programs to improve yield (Korbie and Mattick 2008), starting at an annealing temperature (62°C in this example) that’s 10° above the melting temperature of the primers. The annealing temperature then drops (or “touches down”) by 1° per cycle over the following 14 cycles.

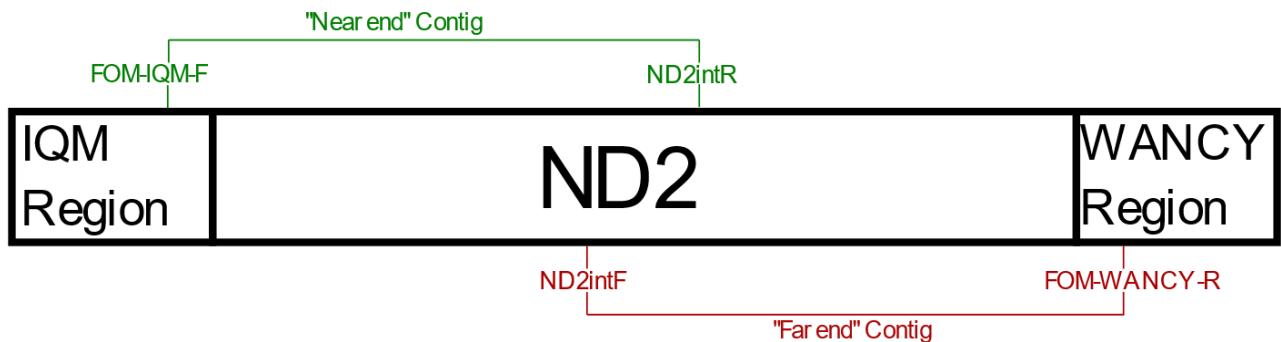

Figure S5.2. Diagram of the mitochondrial ND2 gene.

This diagram shows how we used internal primers to sequence the gene in two halves. We designed primers to bind to the IQM and WANCY regions and two sites in the ND2 gene, to give two contiguous gene reads (contigs) with an area of overlap to allow them to be aligned.

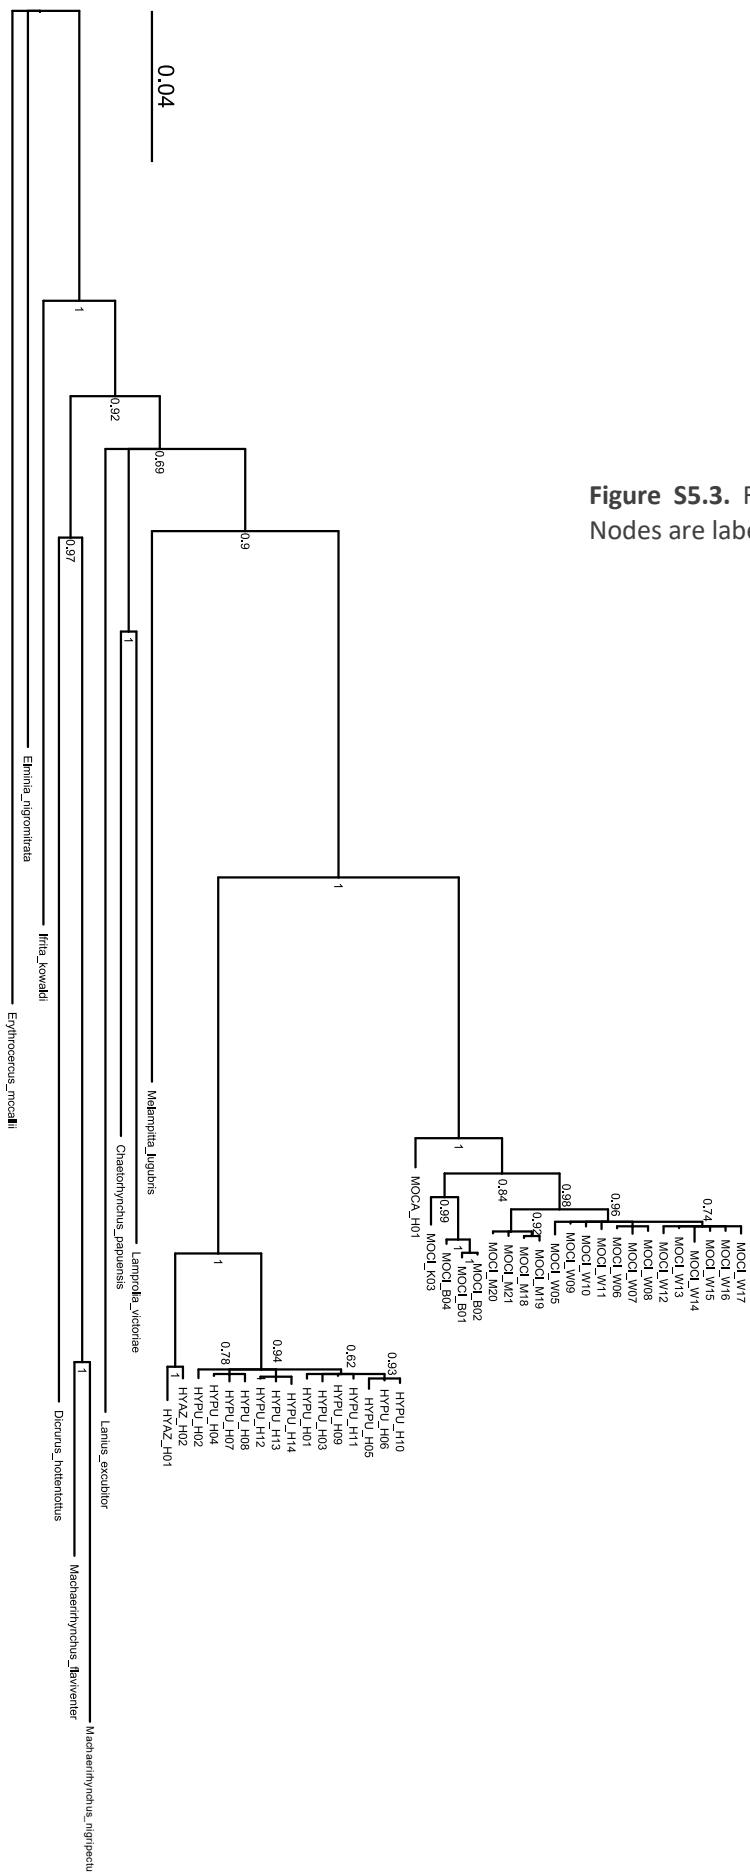

Figure S5.3. Full Bayesian tree showing all haplotypes. Nodes are labelled with Bayesian probabilities.

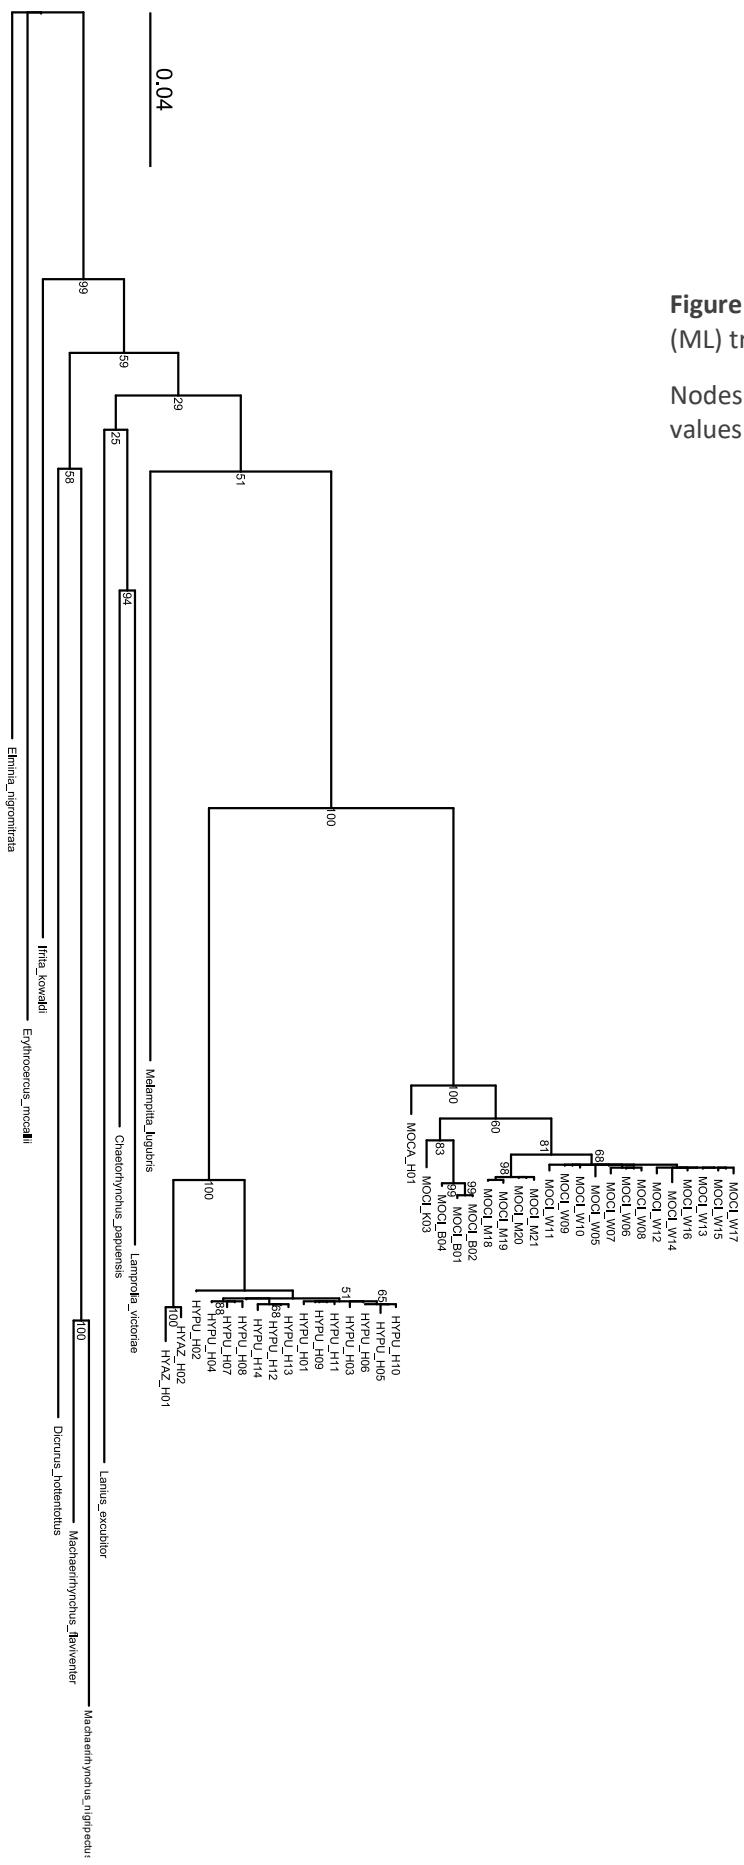

Figure S5.4. Full Maximum Likelihood (ML) tree showing all haplotypes.

Nodes are labelled with bootstrap values.

Figure S6.5. Example PCR protocol used in this chapter.

This shows showing the reagents and quantities in the master mix along with the thermal cycling program used. We used “touchdown” cycling programs to improve yield (Korbie and Mattick 2008), starting at an annealing temperature (62°C in this example) that’s 10° above the melting temperature of the primers. The annealing temperature then drops (or “touches down”) by 1° per cycle over the following 14 cycles.

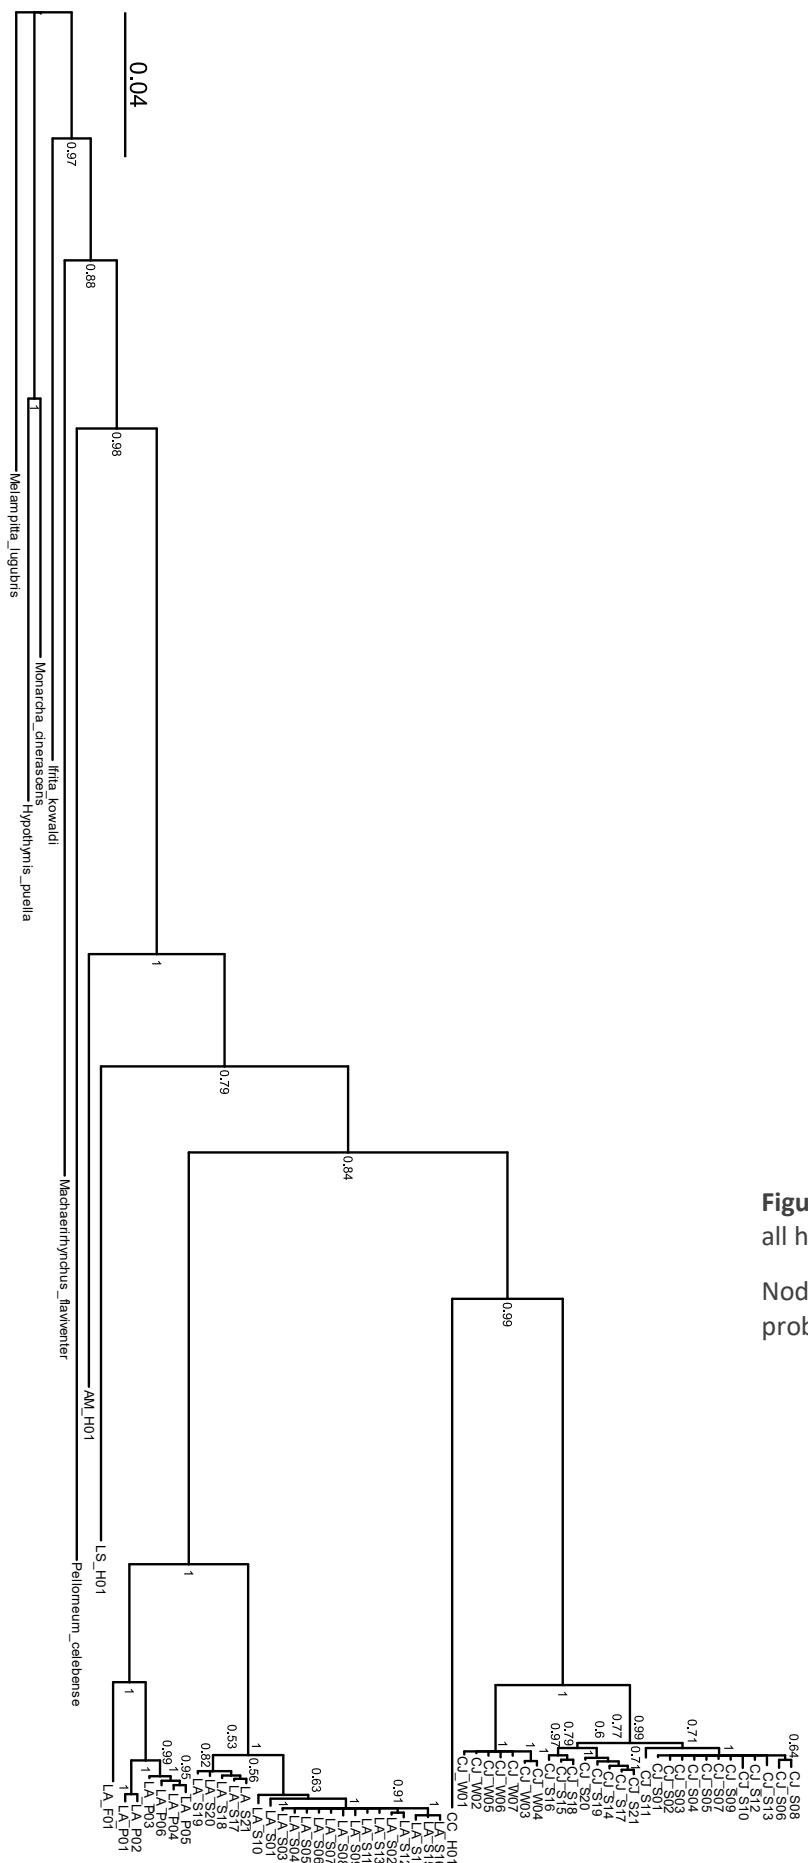

Figure S6.6. Full Bayesian tree showing all haplotypes and outgroup taxa.

Nodes are labelled with Bayesian probabilities.

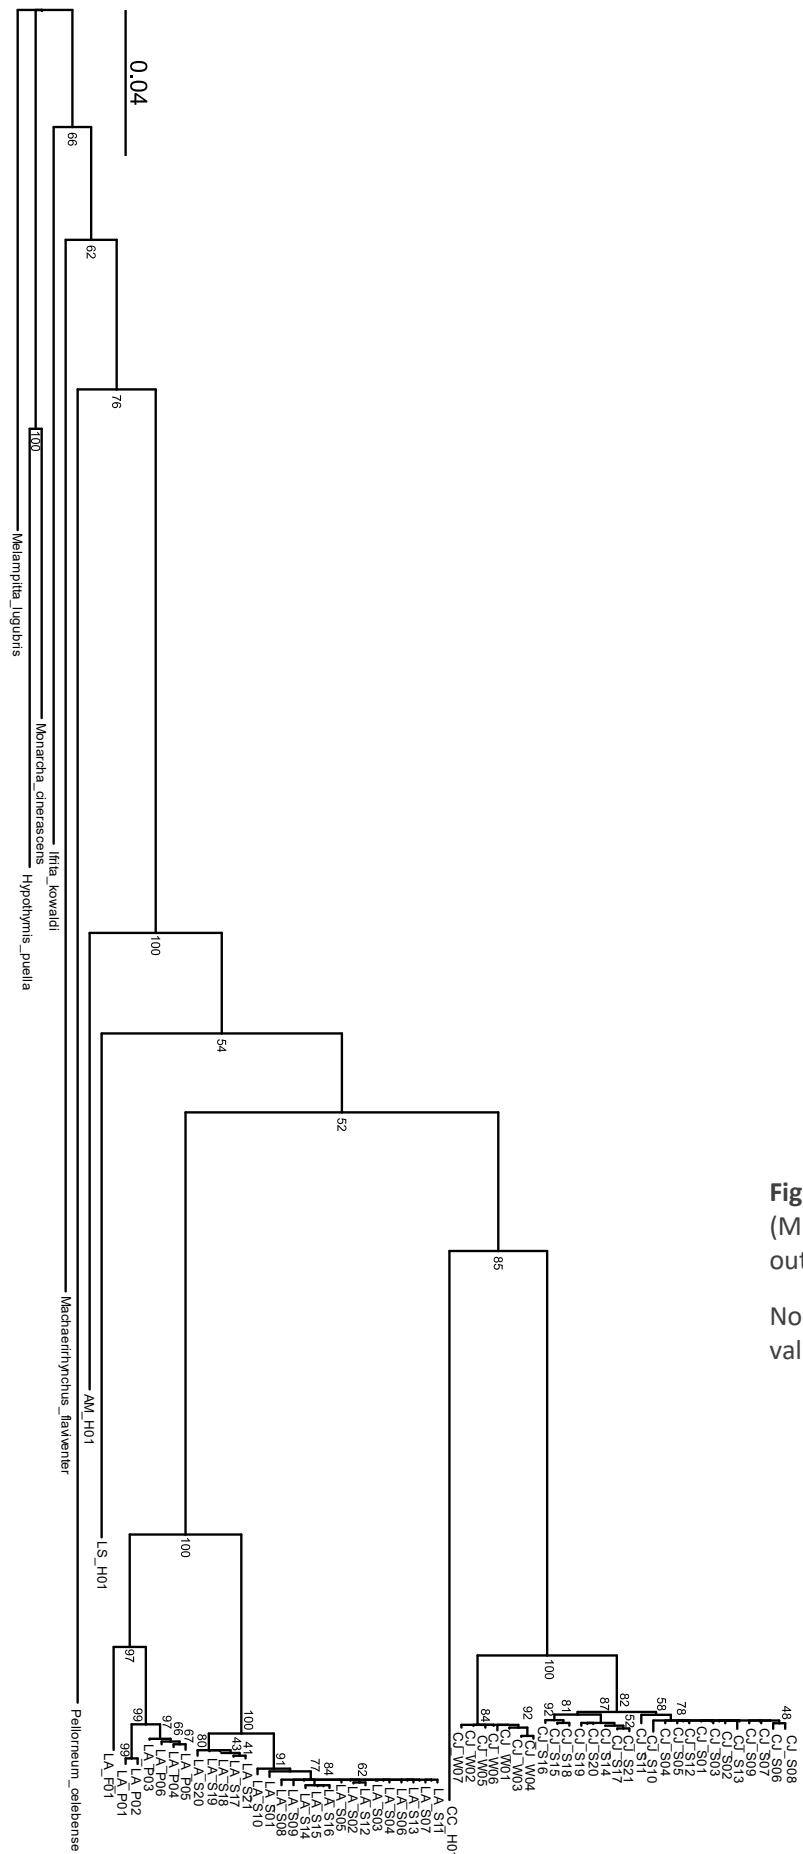

Figure S6.7. Full Maximum Likelihood (ML) tree showing all haplotypes and outgroup taxa.

Nodes are labelled with bootstrap values.

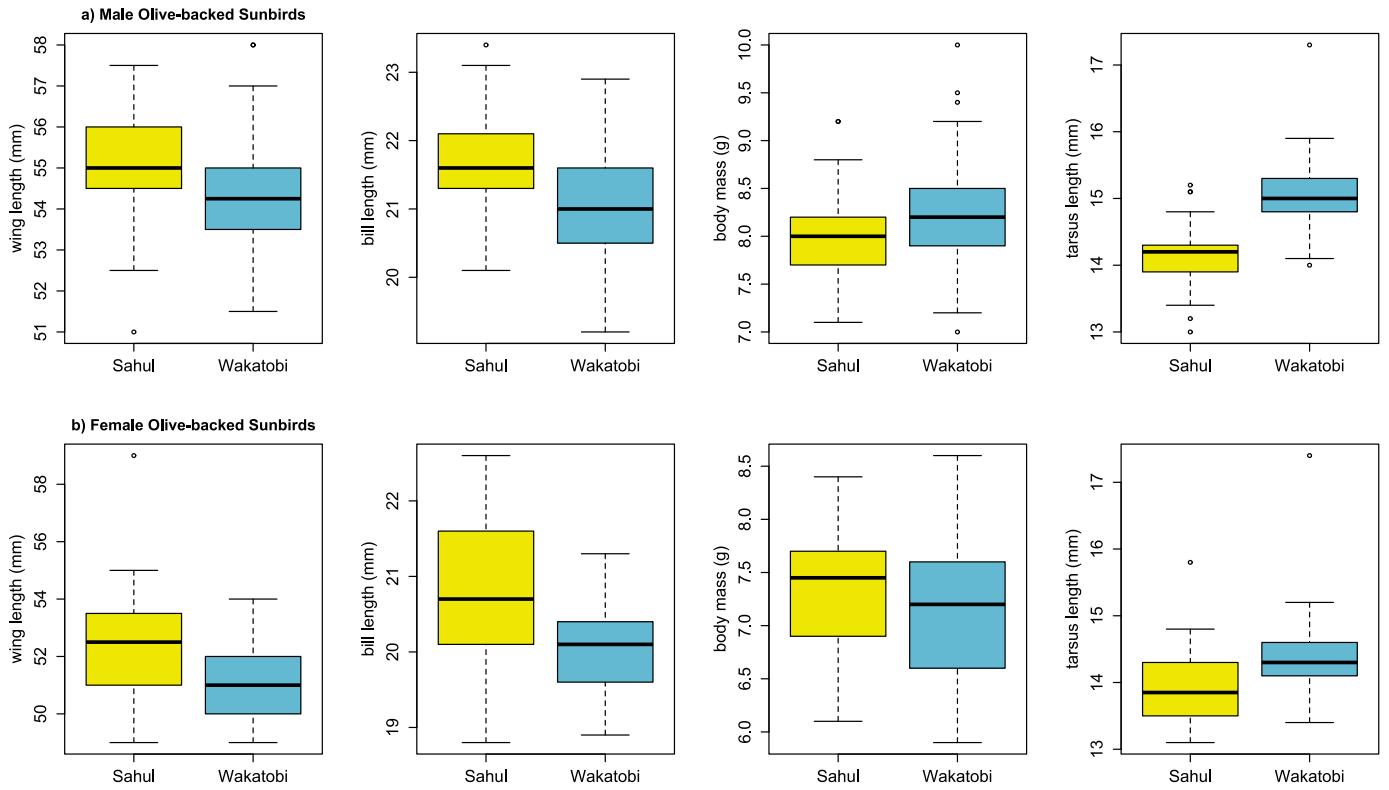

Figure S6.8. Boxplots of a) male and b) female Olive-backed Sunbird morphology.

The plots compare the “Sahul Sunbird” to the “Wakatobi Sunbird”. The “Sahul Sunbird” includes the adult birds netted on Sulawesi, its land-bridge islands, and Menui, the “Wakatobi Sunbird” the adult birds netted on the Wakatobi Islands. “Wakatobi Sunbird”. The “Sahul Sunbird” includes the adult birds netted on Sulawesi, its land-bridge islands, and Menui, the “Wakatobi Sunbird” the adult birds netted on the Wakatobi Islands.

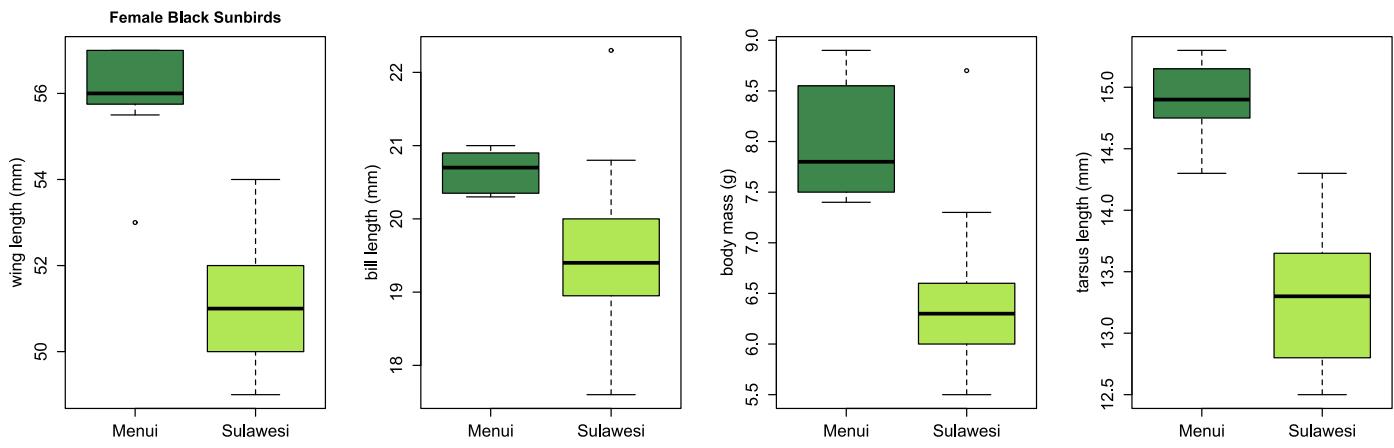

Figure S6.9. Boxplots of female Black Sunbird morphology.

These plots compare the birds netted on Menui to those netted on Sulawesi and its land-bridge islands.

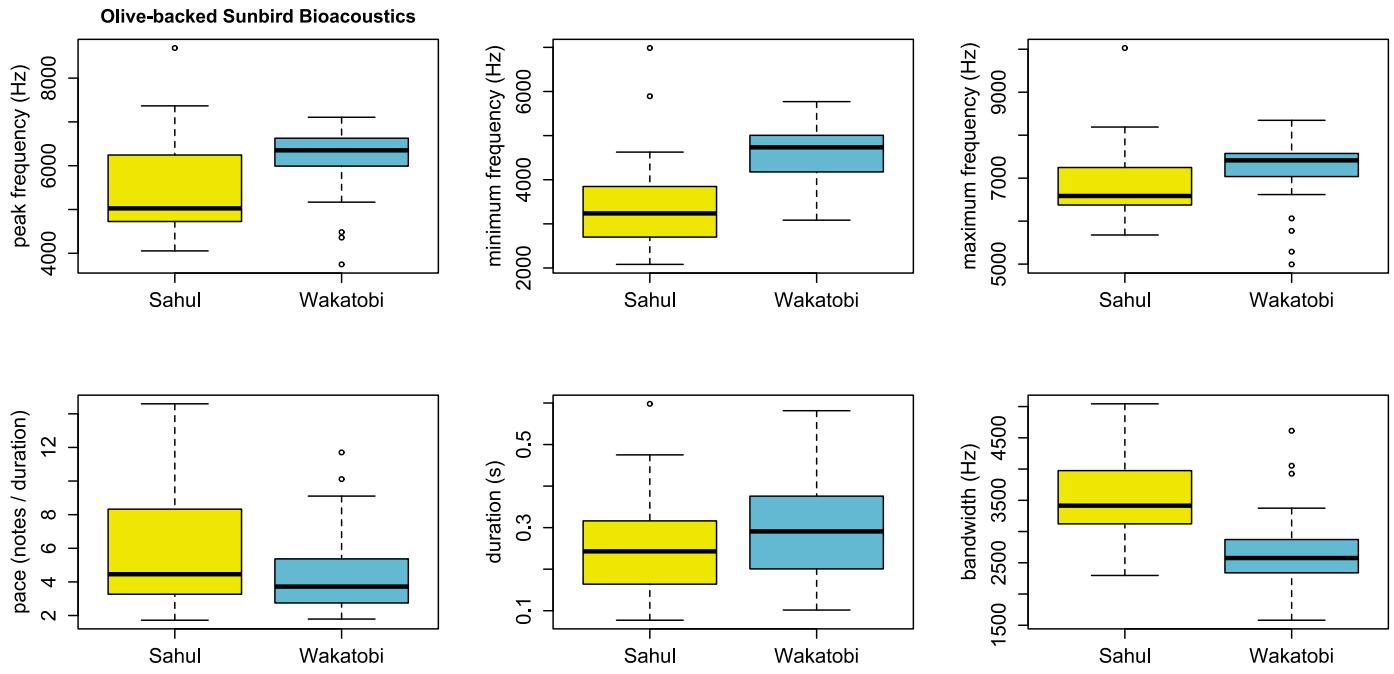

Figure S6.10. Boxplots of Olive-backed Sunbird bioacoustics

These plots compare the “Sahul Sunbird” to the “Wakatobi Sunbird”. The “Sahul Sunbird” includes the birds recorded on Sulawesi, its land-bridge islands, and Menui, the “Wakatobi Sunbird” the birds recorded on the Wakatobi Islands.

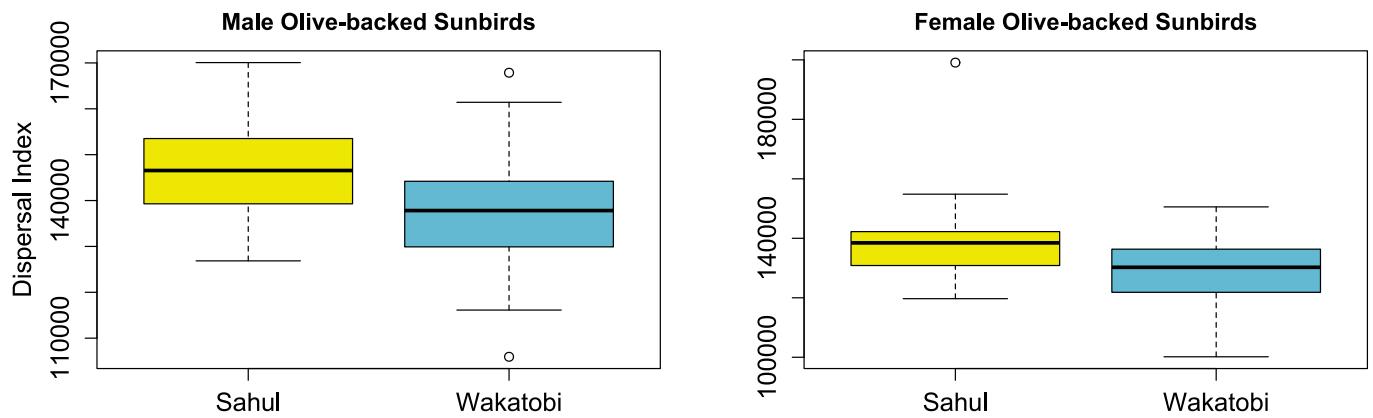

Figure S6.11. Boxplots of a) male and b) female Olive-backed Sunbird dispersal index.

These plots compare the “Sahul Sunbird” to the “Wakatobi Sunbird”. The “Sahul Sunbird” includes the adult birds netted on Sulawesi, its land-bridge islands, and Menui, the “Wakatobi Sunbird” the adult birds netted on the Wakatobi Islands.

Table S6.1. Full 1392bp sunbird DNA sequences used for phylogenetic reconstruction.

Taxonomy (including subspecies of focal species) is according to Gill et al. (2022). Table is ordered taxonomically and then geographically, with outgroup taxa presented at the end.

Table S6.10. Potential taxonomic revisions supported by our work on sunbirds.

The current species and subspecies taxonomy given here is that of Gill *et al.* (2022). Where wider inferences are drawn, the specific taxa or islands we analysed are given in square brackets.

Species (Current)	Population	Subspecies (Current)	Revised Name	Notes	Supporting Evidence
Olive-backed Sunbird <i>Cinnyris jugularis</i> (Linnaeus 1766)	Sulawesi, New Guinea, Australia, Solomon Islands	Multiple [<i>plateni</i> , <i>flavigastra</i> and <i>frenatus</i>]	Sahul Sunbird <i>Cinnyris clementiae</i> (Lesson 1827)	Split proposed by Eaton <i>et al.</i> (2021) and supported by our work	mtDNA (679bp)
ditto	Wakatobi Islands	<i>infrenatus</i>	Wakatobi Sunbird <i>Cinnyris infrenatus</i> (Hartert 1903)	"Limbo split" suggested by Eaton <i>et al.</i> (2021) and supported by our work	mtDNA (1392bp) Tobias score of 8 (based on plumage, bioacoustics, and morphology) Morphology (MANOVA) Bioacoustics (MANOVA)
ditto	Menui	Unassigned	<i>C. j. plateni</i>	Population first reported by Monkhouse <i>et al.</i> (2018). Our analysis clarifies that it belongs to the same subspecies as Sulawesi and its land-bridge islands.	mtDNA (1392bp) Morphology (MANOVA)

Olive-backed Sunbird <i>Cinnyris jugularis</i> (Linnaeus 1766)	The Philippines	Multiple [<i>obscurior</i> and <i>jugularis</i>]	Garden Sunbird <i>Cinnyris jugularis</i> (Linnaeus 1766)	Split proposed by Eaton <i>et al.</i> (2021) and supported by our work	mtDNA (679bp)
ditto	Western Philippines [Busuanga]	<i>aurora</i>	<i>Cinnyris aurora</i> (Tweeddale 1878)	Species-level split suggested by our work, more sampling needed to confirm	mtDNA (679bp)

Black Sunbird <i>Leptocoma aspasia</i> (Lesson and Garnot 1828)	Wallacea [Southeast Sulawesi and its land-bridge islands]	Multiple [<i>porphyrolaema</i>]	"Wallacean Black Sunbird"	Species-level split suggested by our work, more sampling needed to confirm	mtDNA (1392bp)
ditto	New Guinea	Multiple [<i>aspasia</i>]	"New Guinea Black Sunbird"	Species-level split suggested by our work, more sampling needed to confirm	mtDNA (1392bp)
ditto	Bismarck Archipelago	Multiple [<i>corinna</i>]	<i>Leptocoma corinna</i> (Salvadori, 1878)	Species-level split suggested by our work, more sampling needed to confirm	mtDNA (1392bp)
ditto	Southeast New Guinea [Northern Province, PNG]	<i>aspasia</i>	<i>L. a. vicina</i> (Mayr 1936)	The <i>vicina</i> subspecies of southeast New Guinea is recognised by Billerman <i>et al.</i> (2022) and Cheke <i>et al.</i> (2001) but lumped into the wider New Guinea subspecies by Gill <i>et al.</i> (2022). Our genetic analysis has shown that it is distinct.	mtDNA (1392bp)
ditto	Menui	Unassigned	<i>L. a. ssp. nov.</i>	Population first reported by Monkhouse <i>et al.</i> (2018). Our analysis clarifies that it does not belong to the same subspecies as Sulawesi and its land-bridge islands.	mtDNA (1392bp) Morphology (MANOVA)

Appendix S6.1: Dispersal index methodology and rationale

The genetic pattern exhibited by Olive-backed Sunbirds is striking, as one cryptic species (the “Sahul Sunbird”) appears to maintain a range all the way from Sulawesi to Australia, while another (the “Wakatobi Sunbird”) has diverged substantially in a small archipelago nested within this range. We hypothesised that these populations might exhibit differences in dispersal ability which would play a role in their speciation (Claramunt *et al.* 2012), and so we calculated a proxy for the dispersal ability of the “Wakatobi Sunbird” and “Sahul Sunbird”.

Wing length alone is a poor measure of dispersal ability (Dawideit *et al.* 2009), but can be used to derive other morphological traits, such as wingspan. Using studies that provided data on both wing length (L) and wingspan (S), Garrard *et al.* (2012) developed the following formula to calculate wingspan:

$$S = 1.91L + 0.06$$

Due to the physical constraints of flight, wingspan is expected to scale with body mass (m) so that, whenever body mass increases by one unit, wingspan increases by three units (Garrard *et al.* 2012). For this reason, we calculated a shape parameter known as the dispersal index (*sensu* Garrard *et al.* 2012, O’Connell *et al.* 2019b, and Ó Marcaigh *et al.* 2022), which describes “wingspan to weight ratio”:

$$\text{Dispersal index} = S^3/m$$

This allowed an investigation of variation in wingspan beyond that resulting from variation in body mass. We calculated the dispersal index of all of the Olive-backed Sunbirds that we had morphological data for. We then ran a Welch’s two-sample t-test to see if sunbirds from the Wakatobi Islands would differ in their dispersal ability, compared to the “Sahul Sunbird” populations of Southeast Sulawesi, its land-bridge islands, and Menui. This test found that the “Wakatobi Sunbird” has a considerably lower dispersal index than the “Sahul Sunbird” ($p < 0.00005$ in males, $p < 0.005$ in females).

Shifts in dispersal ability have been suggested as key drivers of diversification in island lineages (Diamond *et al.* 1976). The “Sahul Sunbird” exhibits a longer wingspan relative to its body mass, which may have enabled it to colonise the Sahul Shelf relatively recently (Schodde 1977, Mayr and Diamond 2001). Island taxa often lose their dispersal ability after colonisation, as adaptation to the local conditions favours other traits (Linck *et al.* 2016). The lower dispersal index of the “Wakatobi Sunbird” is in keeping with this hypothesis, and with the findings of studies on other birds in the Wakatobi Islands (O’Connell *et al.* 2019b) and elsewhere in the Indo-Pacific (Pedersen *et al.* 2018, Le Pepke *et al.* 2019).

Chapter 7 – Appendices

The genetic divergence between bird populations on islands is driven by both ecology and geology –
