THALIACEA — I

Family: Salpidae

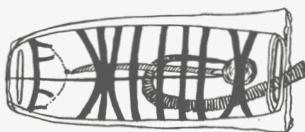

(By J. H. Fraser)

1947.

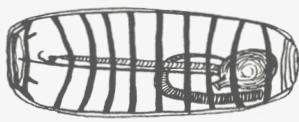

SOLITARY FORMS

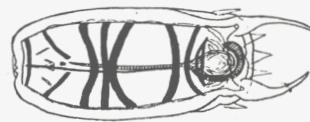

*Cyclosalpa bakeri*

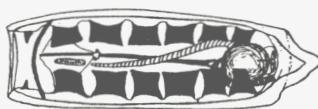

*Salpa fusiformis*

*Salpa maxima*

*Thalia democratica*

*Iasis zonaria*

*Ihlea asymmetrica*

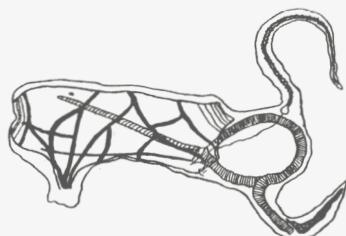

*Pegea confoederata*

*Thetys vagina*  
(side view)

AGGREGATE FORMS

*Cyclosalpa bakeri*  
(side view)

*Salpa fusiformis*

*Salpa maxima*

*Thalia democratica*

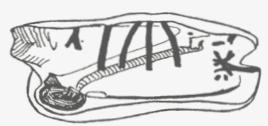

*Iasis zonaria*

*Ihlea asymmetrica*

*Pegea confoederata*

*Thetys vagina*  
(side view)

Salps have an alternation of generations in their life history. Solitary forms (=oozoids) are asexual and produce chains of aggregate sexual forms (=blastozooids=gonozoids) by means of budding from a stolon. Asymmetrical aggregate forms are either dextral or sinistral according to the side of the stolon on which they developed.

- A. Intestinal tract not forming a ball-shaped "nucleus"..... Genus CYCLOSALPA  
 B. Intestinal tract forming a more or less compact "nucleus"..... Genus SALPA  
 (including the following sub-genera = *Brooksiella*, *Iasis*, *Ihlea*, *Metcalfina*, *Pegea*, *Ritteriella*, *Thalia*, *Thetys*, *Traustedtia*).

The most satisfactory characters for specific identification are the number and arrangements of the muscle bands, which are characteristic from the early stages (>3 mm.); and the shape of the test:— see figures.

| Species   | Solitary Forms                   |              |                    |   | Aggregate Forms                  |                           |                                   |   |
|---|----------------------------------|--------------|--------------------|---|----------------------------------|---------------------------|-----------------------------------|---|
|   | Length in mm.<br>Normal/<br>Max. | Test         | Ventral<br>Muscles | Other points (for dorsal<br>muscles and shape of test<br>see figures)               | Length in mm.<br>Normal/<br>Max. | Test                      | Ventral<br>Muscles                | Other points (for dorsal<br>muscles and shape of test<br>see figures)   |
| 1. <i>Cyclosalpa bakeri</i><br>Ritter .....     | 25/50                            | flaccid      | present            | Intestine parallel to gill.<br>Ring of granular luminous material in lateral edges. | 30/50                            | very flaccid              | see figure                        | Large intestinal loop in "post abdomen". Anterior muscles continue into vestigial peduncle. Testis and caecum form trailing appendages. |
| 2. <i>Salpa fusiformis</i><br>Cuvier .....      | 40/80                            | rigid        | inter-<br>rupted   | Nucleus with reddish streaks  | 30/80                            | rigid                     | inter-<br>rupted                  | Fusiform character (as figure) usual, but protuberance may occasionally be short.   |
| 2a. — var. <i>aspera</i><br>Chamisso .....      |                                  |              |                    | Test rigid and spinose  |                                  |                           |                                   | Test rigid and spinose. Protuberances may be long or short.   |
| 3. <i>Salpa maxima</i><br>Forskål .....         | 50/160                           | rigid        | absent             | All muscles independent   | 50/150                           | rigid                     | inter-<br>rupted                  | —   |
| 4. <i>Thalia democratica</i><br>(Forskål) ..... | 25/                              | rigid        | continu-<br>ous    | Test protrudes posteriorly in two large and several smaller appendages              | 15/                              | rigid                     | widely inter-<br>rupted           | —   |
| 5. <i>Iasis zonaria</i><br>(Pallas) .....       | 30/65                            | very rigid   | inter-<br>rupted   | —   | 35/50                            | very rigid                | widely inter-<br>rupted           | Larger specimens often carry embryos up to 20 mm. long.   |
| 6. <i>Ihlea asymmetrica</i><br>(Fowler) .....   | 15/30                            | very flaccid | present            | Usually found in a disintegrating condition.  | 15/25                            | very flaccid              | asym-<br>metrical<br>(see figure) | Some variability in precise details of muscle arrangements. Usually found in a disintegrating condition.                                |
| 7. <i>Pegea confoederata</i><br>(Forskål) ..... | 40/120                           | rigid        | absent             | Muscles do not reach to lateral edges of body                                       | ?                                | rigid near<br>the nucleus | absent                            | Muscles barely reach the lateral edges of body.   |
| 8. <i>Thetys vagina</i><br>(Tilesius) .....     | < 190<br>(220 with appendages)   | rigid        | absent             | Number of body muscles varies. Body produced posteriorly into two long appendages.  | < 190                            | rigid                     | absent                            | —   |

Further Information on Identification.

1. *Cyclosalpa bakeri*: Metcalf, 1918, p. 37, Plates 7—10.
2. *Salpa fusiformis*: Metcalf, 1918, p. 88, Figs. 73, 77, 78; Ihle, 1927, p. 26, Figs. 4, 5; Apstein, 1901, p. 7, Fig. 6.
- 2a.— form *aspera*: Metcalf, 1918, p. 92, Fig. 81; Ihle, 1927, p. 28.
3. *Salpa maxima*: Metcalf, 1918, p. 83, Figs. 64, 67, 68; Ihle, 1927, p. 26; Apstein, 1901, p. 10, Fig. 9.
4. *Thalia democratica*: Metcalf, 1918, p. 109, Figs. 104, 107; Ihle, 1927, p. 29, Figs. 6, 7; Apstein, 1901, p. 6, Fig. 5 (as *S. mucronata*).
5. *Iasis zonaria*: Metcalf, 1918, p. 100, Figs. 90, 97, 98; Ihle, 1927, p. 28; Apstein, 1901, p. 10, Fig. 9.
6. *Ihlea asymmetrica*: Metcalf, 1918, p. 183, Figs. 140, 145 (as *Apsteinia*); Ihle, 1927, p. 25, Figs. 2, 3; Apstein, 1901, p. 8, Fig. 7.
7. *Pegea cofoederata*: Metcalf, 1918, p. 127, Figs. 119, 123; Ihle, 1927, p. 30.
8. *Thetys vagina*: Metcalf, 1918, 121, Figs. 114, 117; Ihle, 1927, p. 30; Apstein, 1901, p. 10, Fig. 11 (as *Salpa Tilesii*).

(The following species are found in the North Atlantic and the Mediterranean but have not yet been recorded from the area under consideration:

*Cyclosalpa affinis* (Chamisso), *Cyclosalpa pinnata* (Forskål), *C. pinnata* var. *polae* (Sigl), *Cyclosalpa virgula* (Vogt), *Brookssia rostrata* (Traustedt), *Ihlea punctata* (Forskål), *Salpa cylindrica* (Cuvier), *Metcalfina hexagona* (Q. and G.), *Ritteriella amboinensis* (Apstein).)

Salps normally occur at or near the surface of the warmer oceans but tend to become mesoplanktonic as they are carried towards the north European coasts with a concomitant drop in temperature. They are found only in areas directly affected by oceanic water and are reliable "indicators" of such. The occurrence of any particular species tends to be spasmodic and the distribution in the north European area varies with the changes of the Atlantic influx. In favourable conditions they may occur in large swarms.

Distribution

Species  
Figures in brackets  
refer to species that  
only occur  
exceptionally.
