Cancer Cell

Distinct Immune Cell Populations Define Response to Anti-PD-1 Monotherapy and Anti-PD-1/Anti-CTLA-4 Combined Therapy

[Cancer immunotherapy recognized with the 2018 Nobel Prize in Physiology or Medicine](#)

HOW ?

HOW ?

Cancer Immunotherapy

- In metastatic melanoma, anti-PD-1 antibodies have become **standard care** providing high efficacy and minimal toxicity
- the combination of the anti-CTLA-4 antibody with anti-PD-1 has been shown to have higher response rates than anti-PD-1 monotherapy, but at the cost of **significant toxicity**
- Several unmet needs in the field of immunotherapy
- Why some patients respond to Tx, while some others not ? (different signaling pathways ? what cells are enabling the response ? What mechanisms prevent an effective immune response in non-responders ?)
- Need for baseline biomarkers in order to identify responders and non-responders...Is this important ?

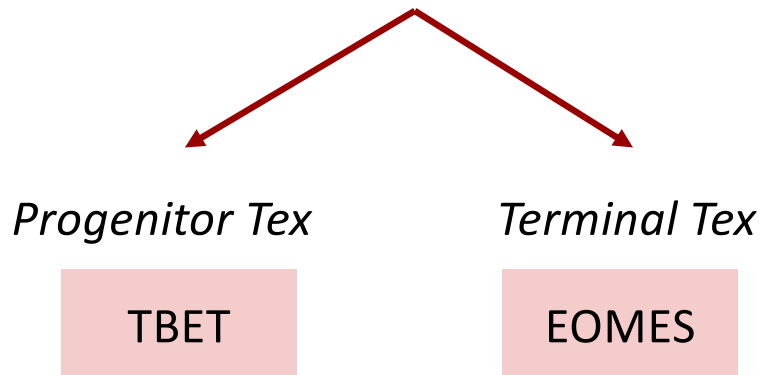

Clinical characteristics

- PD1 inhibitors: nivolumab, pembrolizumab
- CTLA4 inhibitor: ipilimumab
- Response evaluated by RECIST classification

Key immune targets

→ T cell exhaustion = dysregulation due to persistent stimulation

→ TIGIT, LAG-3: immunosuppression, future checkpoints

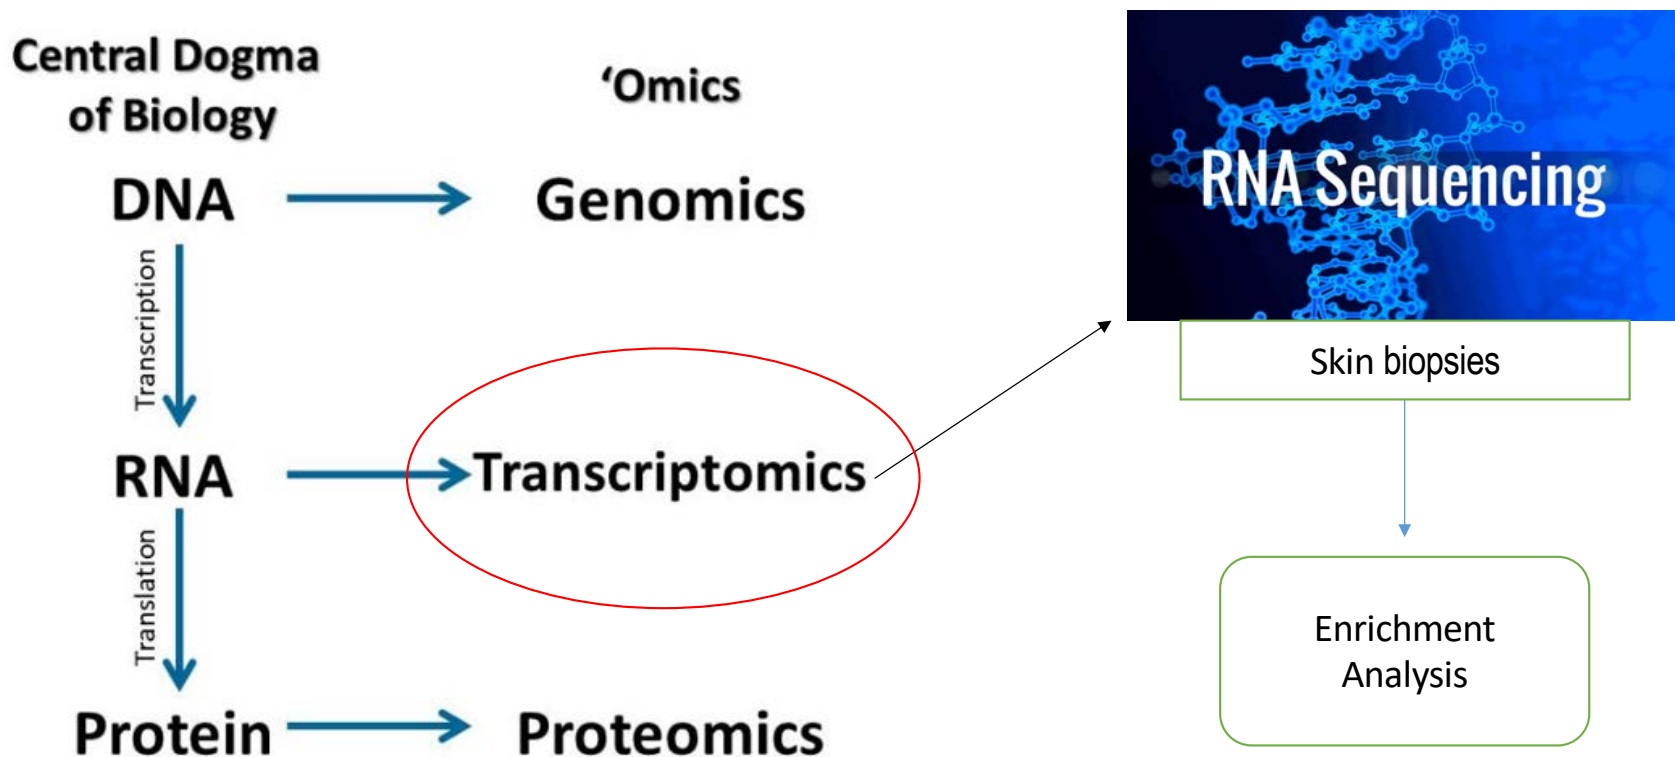

Figure . Pauken K., Wherry J. Snapshot: T cell exhaustion. Cell. November 2015

How can we detect non-responders ?

Differential Gene Signatures of patients to Anti-PD-1 demonstrate two distinct gene clusters

- Responders vs. non-responders at Tx (Monotherapy)
- This analysis identified 310 DEGs ($p < 0.05$)
- Two distinct gene clusters associated with **immune signaling** and **cellular signal transduction**
- IFN-related and tumor-infiltrating T cell genes were associated with better outcomes
- Responding patients also expressed higher levels of other immunosuppressive checkpoints and proteins in their tumors

The transcriptomic profiles of non-responders to monotherapy reveal decreased expression of immune checkpoint receptors

- ~ 50% of patients had low CD8+ and PDL1+ counts
- Fewer immune checkpoint receptors
- Decreased immune response
- The group of high CD8+ and PDL1+ displayed increased expression of immune targets

Differential Gene Signatures of non-responders to Combined Immunotherapy show T-cell & NK-cell mediated cytotoxicity

- A similar analysis on the combined anti-CTLA-4 and anti-PD-1
- This analysis identified 328 DEGs ($p < 0.05$)

Associations

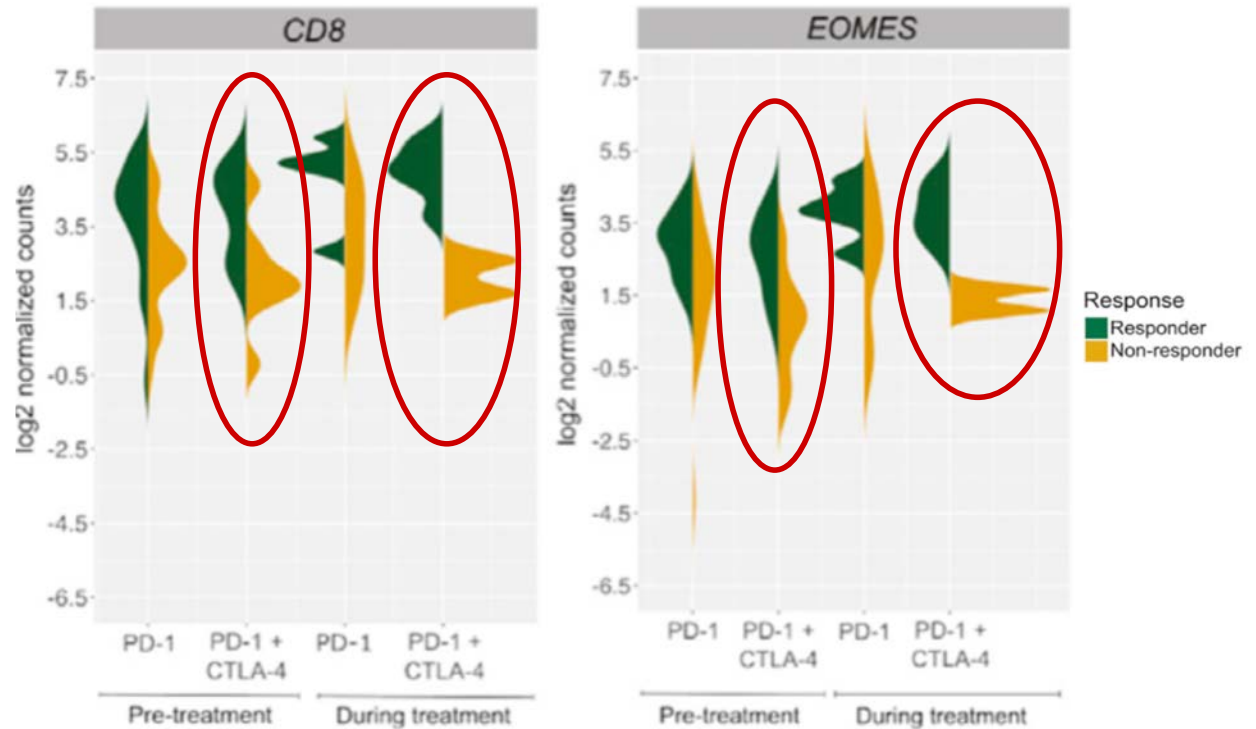

- T cell-related genes
- NK cell-mediated cytotoxicity
- T cell cytotoxicity
- Cytokine signaling

Distinct CD8 and EOMES expression profiles

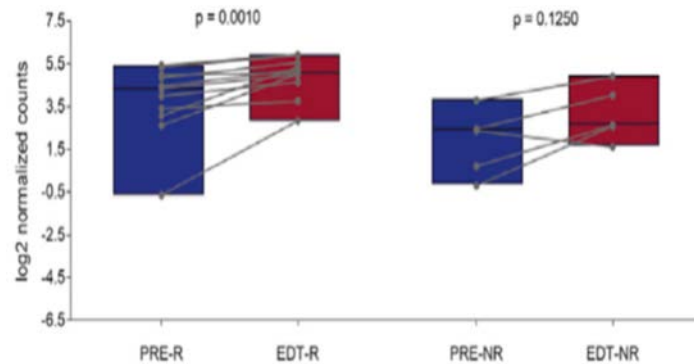

→ *CD8 and EOMES*

Distinct separation in expression profiles of both between responders and non-responders early during treatment in combined immunotherapy

Increase in expression of immune markers from PRE to EDT

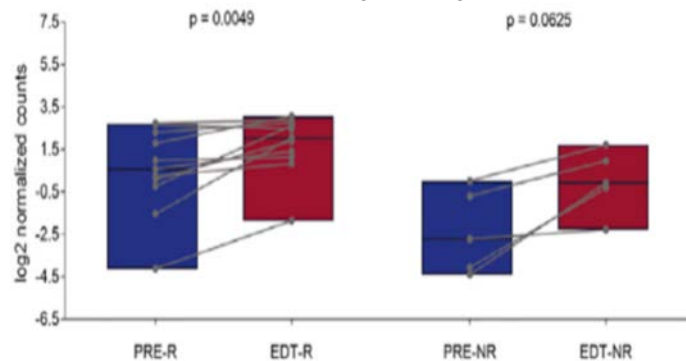

CD8

EOMES

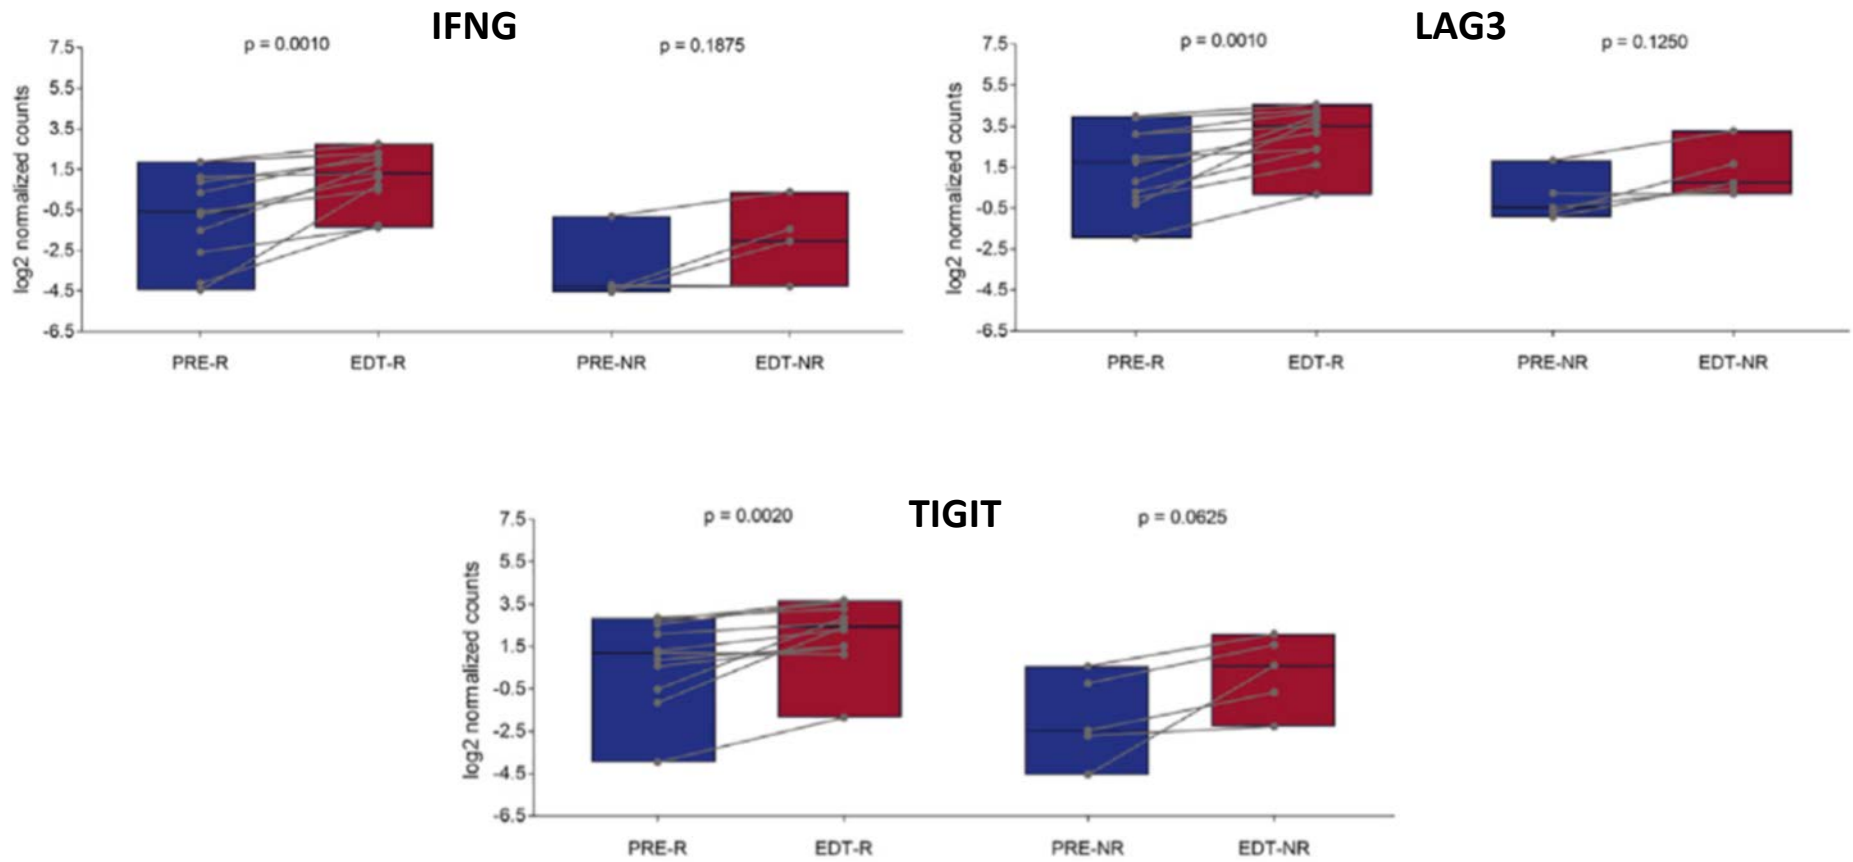

TBX21 (TBET)

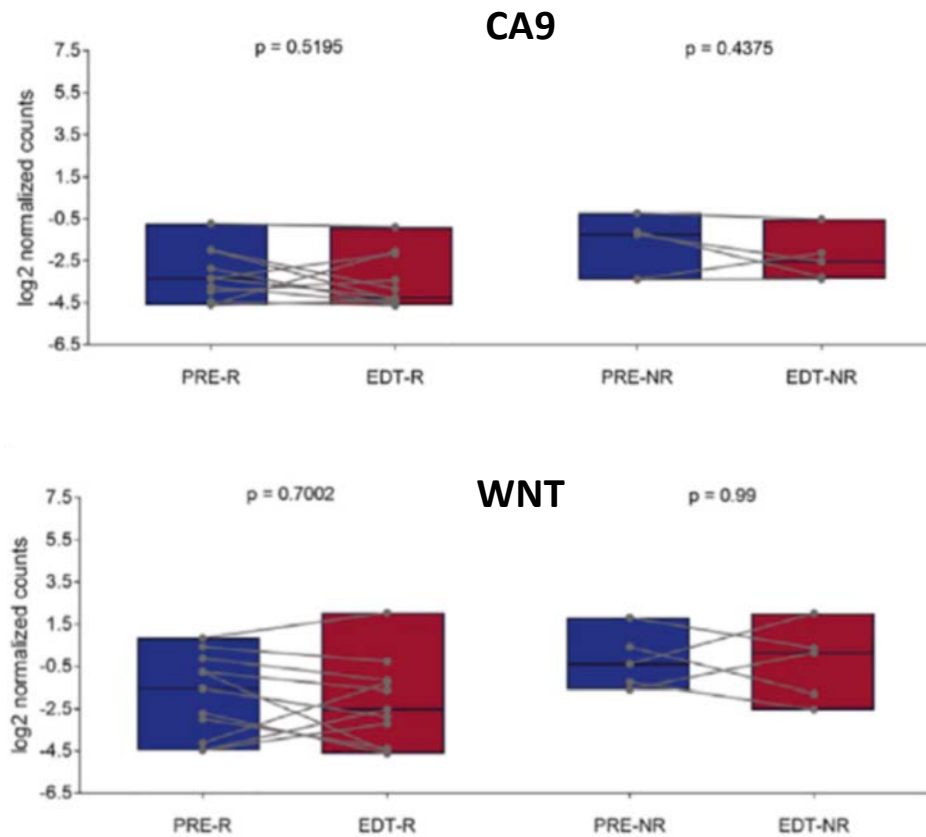

- Paired PRE and EDT biopsies
 - Single- and combination- treated patient data were combined
- *Responders: significant **increase** in expression from PRE to EDT for immune genes*

Increase in expression of immune markers from PRE to EDT

No change in CA9 and WNT expression profile

CA9 and WNT

- Both downregulated in responders to immunotherapy at baseline
- ***No significant difference*** in the change of expression level from PRE to EDT of either CA9 or WNT both for responders and non-responders

Transcriptomic profiles at PRE: similarities and differences

→ *Responders at PRE*

Transcriptomic profiles EDT: similarities and differences

→ *Responders EDT*

ALL Pre- treated responders showed increased CD8, PDL1.

CD8
PDL1

PRE, EDT responders showed **increased** CD8, PD1, PDL1.

mono

combo

Intratumoral CD8 Density

EDT combo responders showed **increased FOXP3** suggesting overall increase in TILs.

PRE: Responders showed **increased** CD45RO, EOMES, TBET (anti-PD-1 monotherapy)

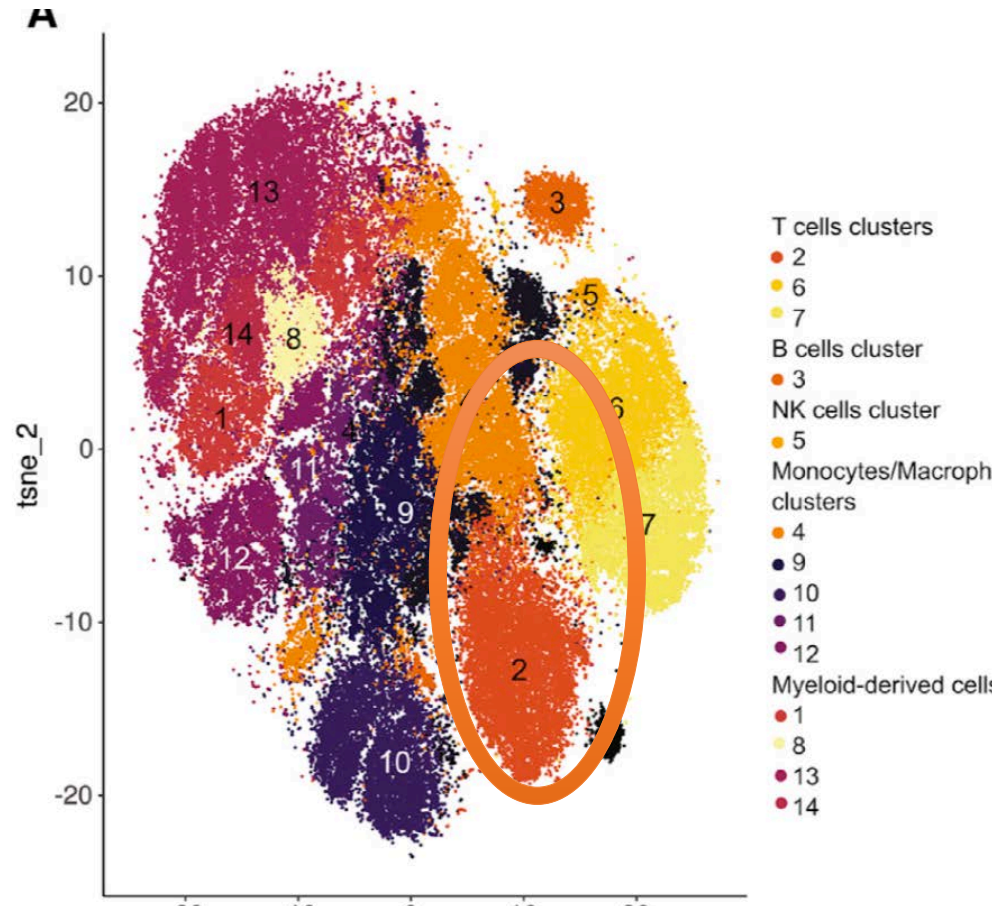

All in all

✓ agreement with transcriptome: **increased T cell markers** → **responders** (PRE+ EDT)

Responders have distinct subsets of T cells

- Tissue: all pre-treatment of mono- and combo-
- Method: mass cytometry
- Results: t-SNE of leukocytes
→ 3 T cell clusters (2,6,7)

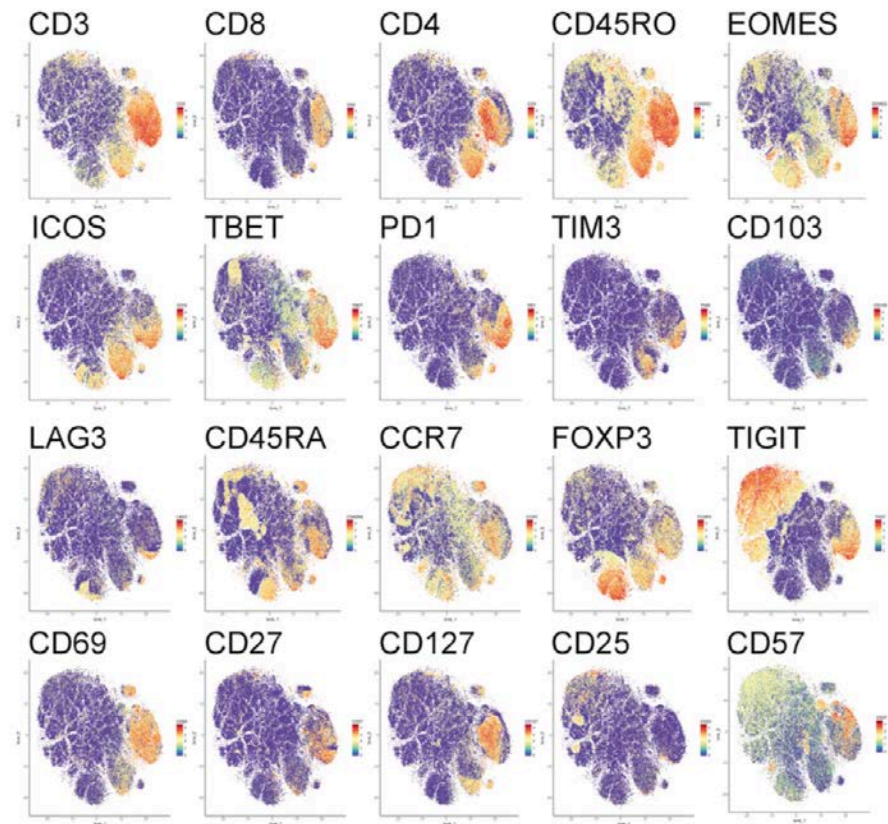

Responders have distinct biomarkers of T cells

t-SNE plots of markers of T cells

- **CD4⁺ or CD8⁺** of responders to both treatment:

↑ **CD69, EOMES, CD45RO**, CD103, TBET, HLA-DR, PD-1, TIGIT

↓ CCR7, CD57

Expression of CD8⁺/ CD4⁺ EOMES⁺ CD69⁺ CD45RO⁺ T cells

- High expression to responders vs. non- responders to **combo**
- High expression but NOT statistically significant difference responders vs. non- responders to **mono-**
- ! not large sample

Q: what is the **association** of high expression of CD8⁺/ CD4⁺ EOMES⁺ CD69⁺ CD45RO⁺ T cells with PFS and tumor shrinkage?

CD8⁺/ CD4⁺ EOMES⁺
 CD69⁺ CD45RO⁺
 T cells

PFS of responders and non-responders:

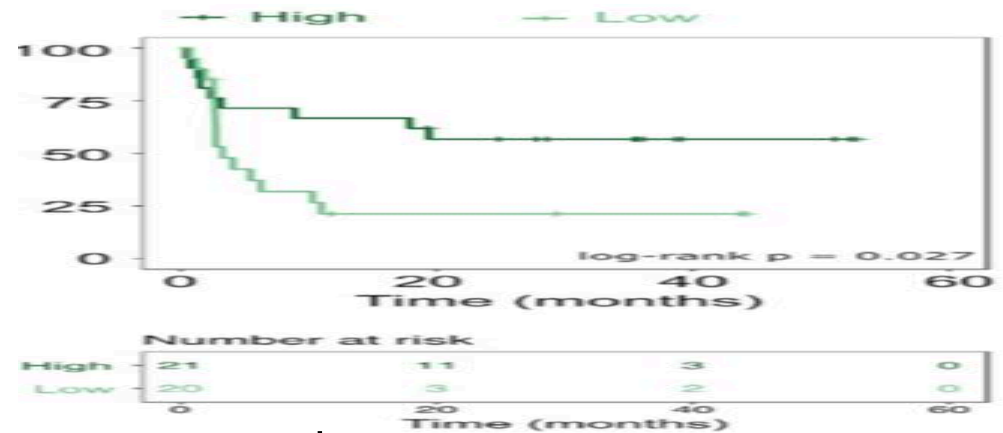

- ↑ to monotherapy

high vs. low expression: 24 vs. 3 months

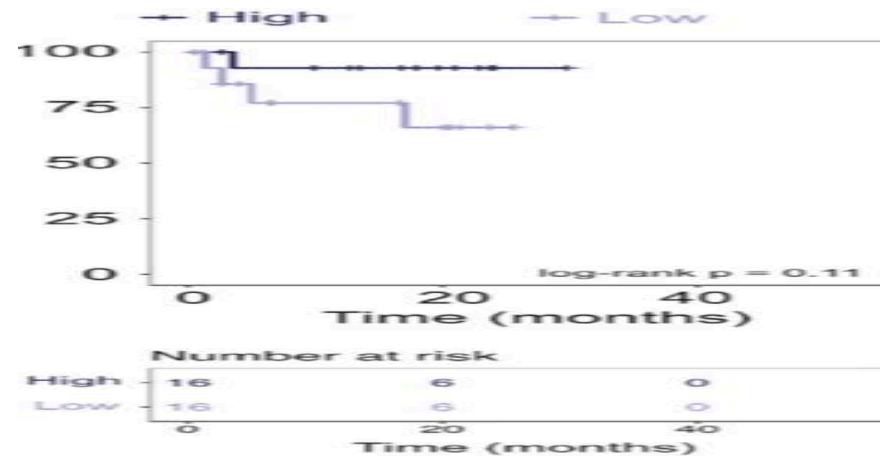

- Increase but not significant to combo (not enough sample)

high vs. low expression: 19 vs. 6 months

monotherapy:

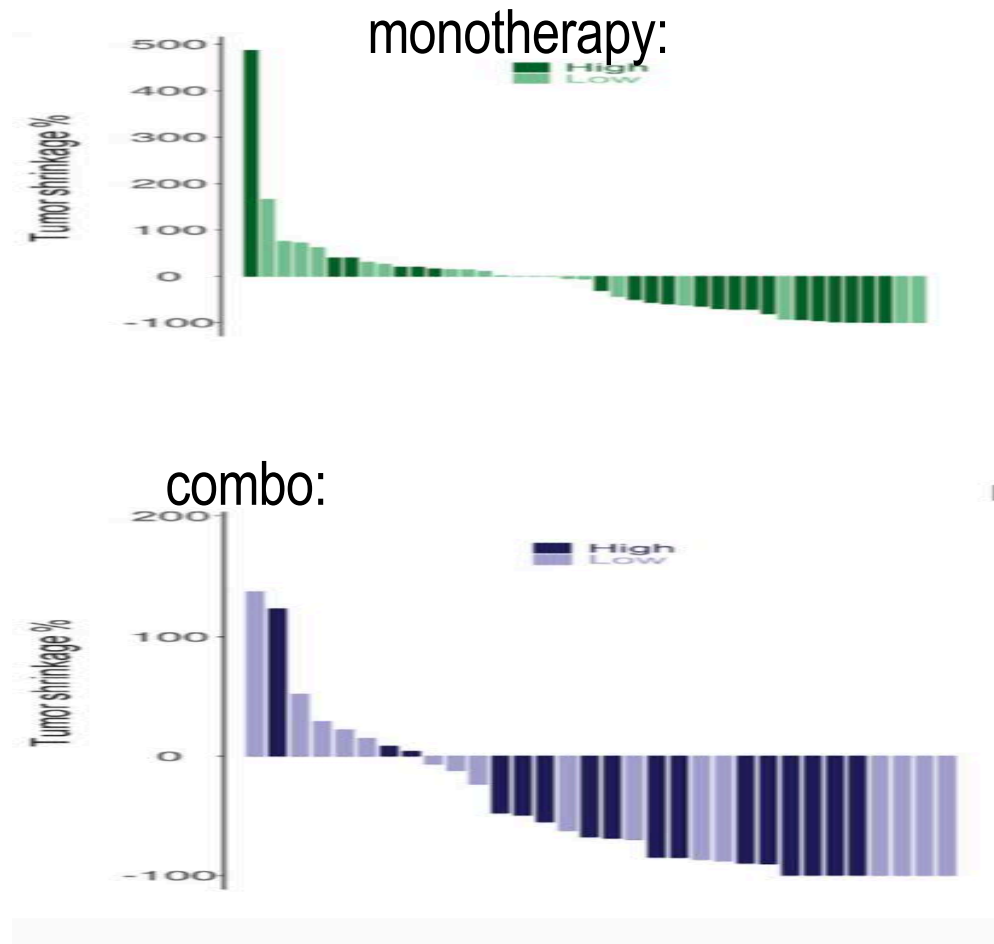

combo:

High expression of CD8⁺/CD4⁺ EOMES⁺ CD69⁺ CD45RO⁺ T Cells is associated with tumor shrinkage

Tumor shrinkage of patients:

- 71% of monotherapy treated with high expression
- 81% of combo- treated with high expression

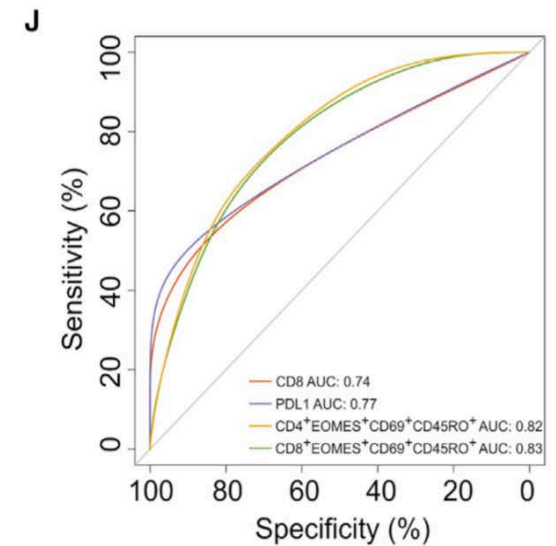

ROC curve for biomarkers: how much they predict response!!!

- CD8⁺/ CD4⁺ EOMES⁺
CD69⁺ CD45RO⁺ > CD8⁺
or PDL-1
- for CD8⁺/ CD4⁺ EOMES⁺
CD69⁺ CD45RO⁺:
AUC = 0.7 for mono
AUC = 0.8 for combo

monotherapy

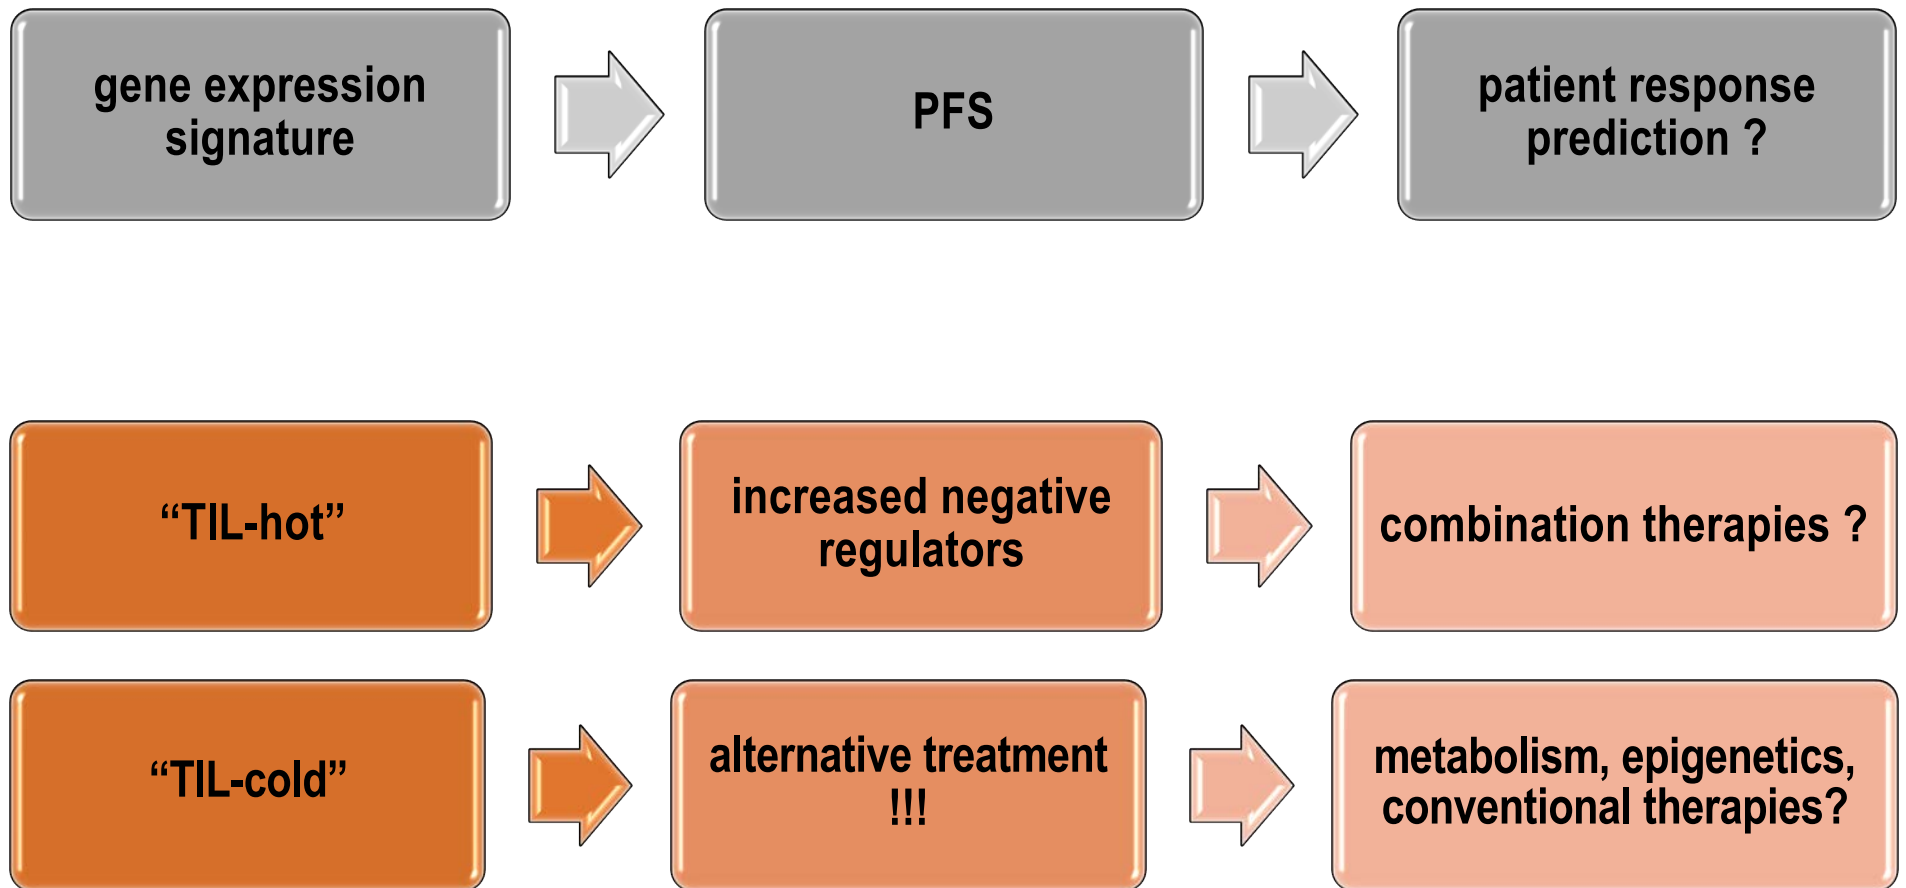

combo

Summarizing and philosophizing

Phenotypes	Response to therapy	Additional comments
EOMES+CD69+CD45RO+ (effector memory)	both therapies	tumor shrinkage
TBET Hi EOMES Lo CD8+	a-PD1	reinvigoration
TBET Hi EOMES Hi CD8+	anti-CTLA-4	
EOMES+CD69+CD45RO+ CD57 Lo (responding tumors)	combo	not terminal + TBET Hi

We keep on summarizing and philosophizing

And we keep on summarizing and philosophizing

Non-responders

Hypoxia ?

Q remains !! → Which non-responders to anti-PD-1 monotherapy would respond to combined therapy and vice versa ?
