CNIDÁRIOS

Sabia que...

... a picada de água-viva e outros cnidários serve para defesa e caça, apesar de viverem fixos ou nadarem lentamente. Os cnidários têm parte de seu corpo coberto de células que contêm um arpão que, em contato, dispara automaticamente e injeta um veneno.

Did you know...

... why do jellyfish sting? Cnidarians have part of their bodies covered in cells armed with a harpoon which, on contact, is automatically shot out and which injects a stinging poison. This allows them to defend themselves and to hunt despite living fixed to the substrate or swimming very slowly.

Saviez-vous...

... pourquoi méduses piquent? Cnidaires ont une partie de son corps couvert de cellules pourvues d'un harpon que, par contact, se déclenche automatiquement et injecte un poison cuisante. Cela leur permet de se défendre et de chasser en dépit d'être fixé ou nager très lentement.

Sabías...

... ¿por qué pican las medusas? Los cnidarios tienen parte de su cuerpo cubierto de unas células provistas de un arpón, que por contacto, se dispara automáticamente e inyecta un veneno urticante. Esto les permite defenderse y cazar a pesar de vivir fijos al sustrato o nadar muy lentamente.

Wusstest Du...

... Warum stechen die Quallen? Ein Teil des Körpers der Nesseltiere ist mit Zellen bedeckt, die mit Harpunen versehen sind. Diese werden automatisch bei Kontakt abgeschossen und injizieren ein brennendes Gift. Dies erlaubt die Nesseltiere sich zu verteidigen und zu jagen, auch wenn sie fix am Substrat leben oder nur sehr langsam schwimmen.

Sappiate...

... perché meduse pungono? Cnidari hanno parte del suo corpo coperto di celle fornite con un arpione a condizione che, al contatto, si attiva automaticamente e inietta un veleno urticante. Questo permette loro di difendersi e di cacciare, nonostante viva fissato al sustrato o nuotare molto lentamente.
