

Vegetation Management and the AWS in EBRPD

R. Stoelting, B. Halstead, K. Swaim, C. Swaim, D. Bell

Implementation of Study:

*Measuring the response of the Alameda striped racer
(=whipsnake) Masticophis lateralis euryxanthus
to fuels management
in the East Bay Regional Park District, California
(Richmond et al. 2015)*

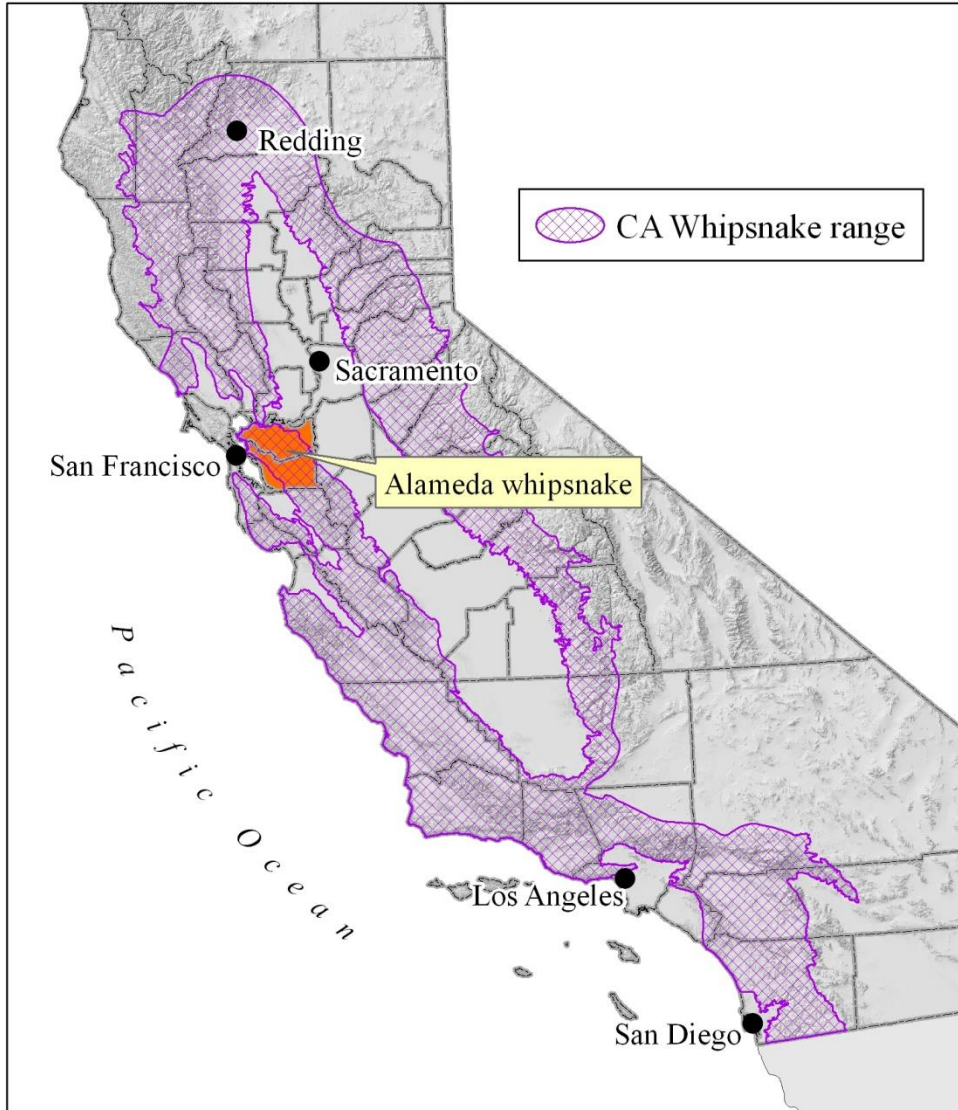

J. Q. Richmond¹, C. S. Brehme¹, T. Lim² and R. N. Fisher¹

¹USGS-WERC, San Diego Field Station

²AECOM, Oakland, CA

Chaparral whipsnake

Research Objectives

- 1. Estimate the occupancy and behavioral responses of AWS to fuel-load reducing treatments, in particular to the creation of scrub islands.**
- 2. Identify significant correlates of occupancy and habitat use across the sampled area regardless of treatment.**

A priori hypotheses – structural habitat components

- % cover
- vegetation type
- distance to scrub
- scrub patch size
- fragmentation
- canopy height
- distance to urban edge
- distance to road
- presence of dominant invasive
- soil type
- aspect
- slope

A priori hypotheses –
Primary Constituent Elements (2 & 3) of Critical Habitat

Study Design *Richmond et al. 2015*

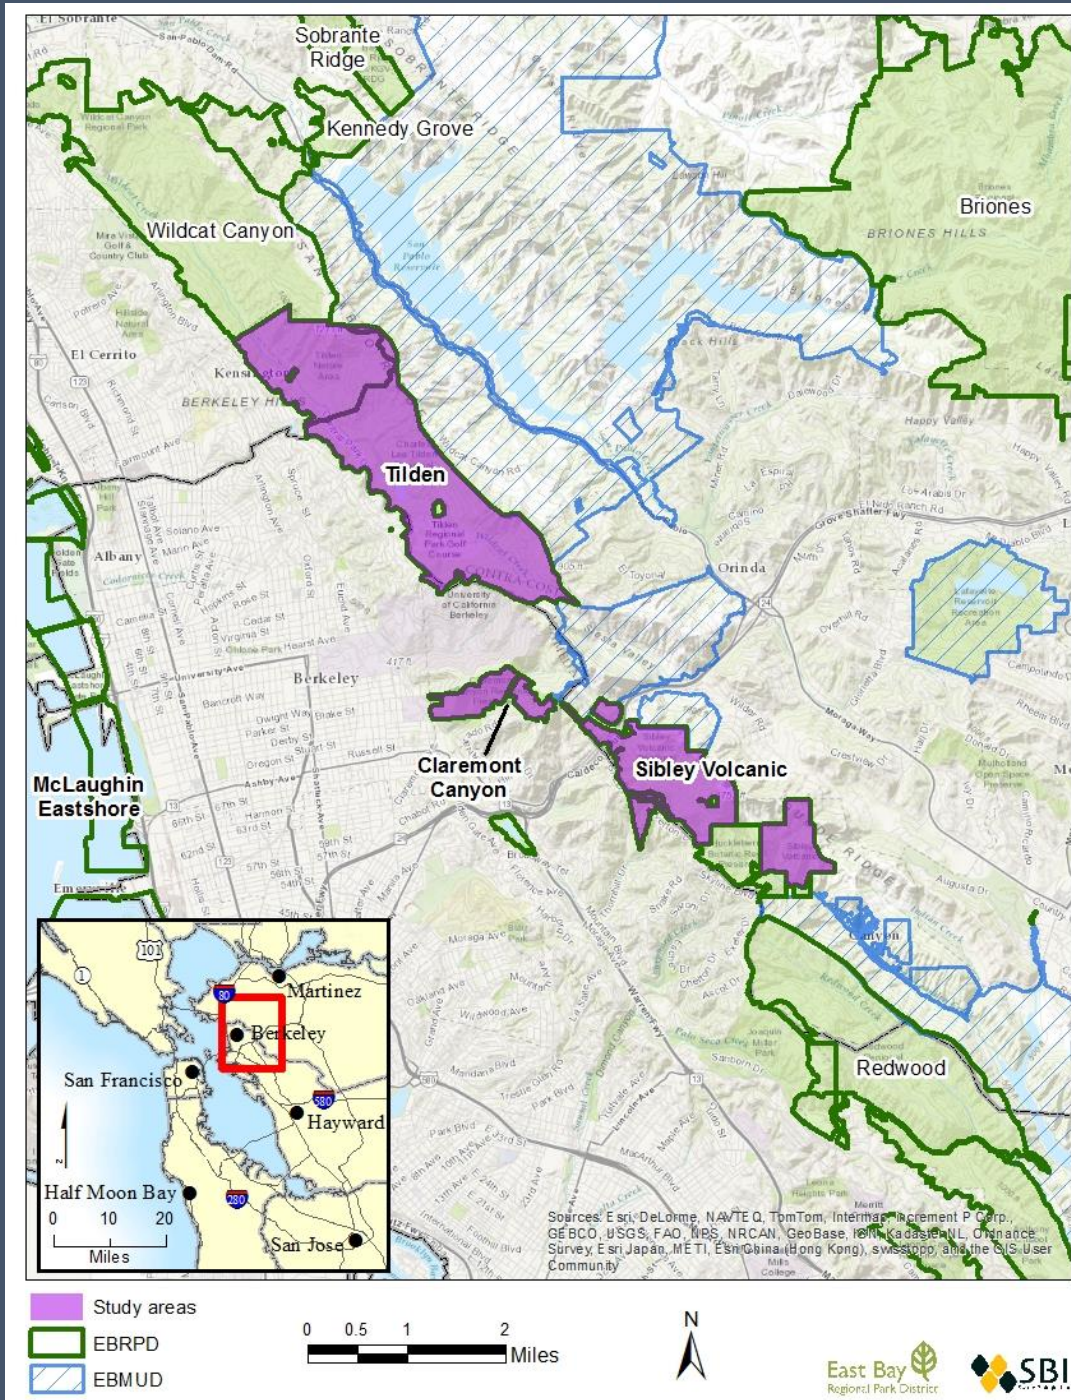

Before-After Control Impact
Sampling in 2016, 2019, 2021

30 days April-May

40 Control vs
40 Maintenance Treatment vs
40 Initial Treatment Plots

Plot Selection Constraints

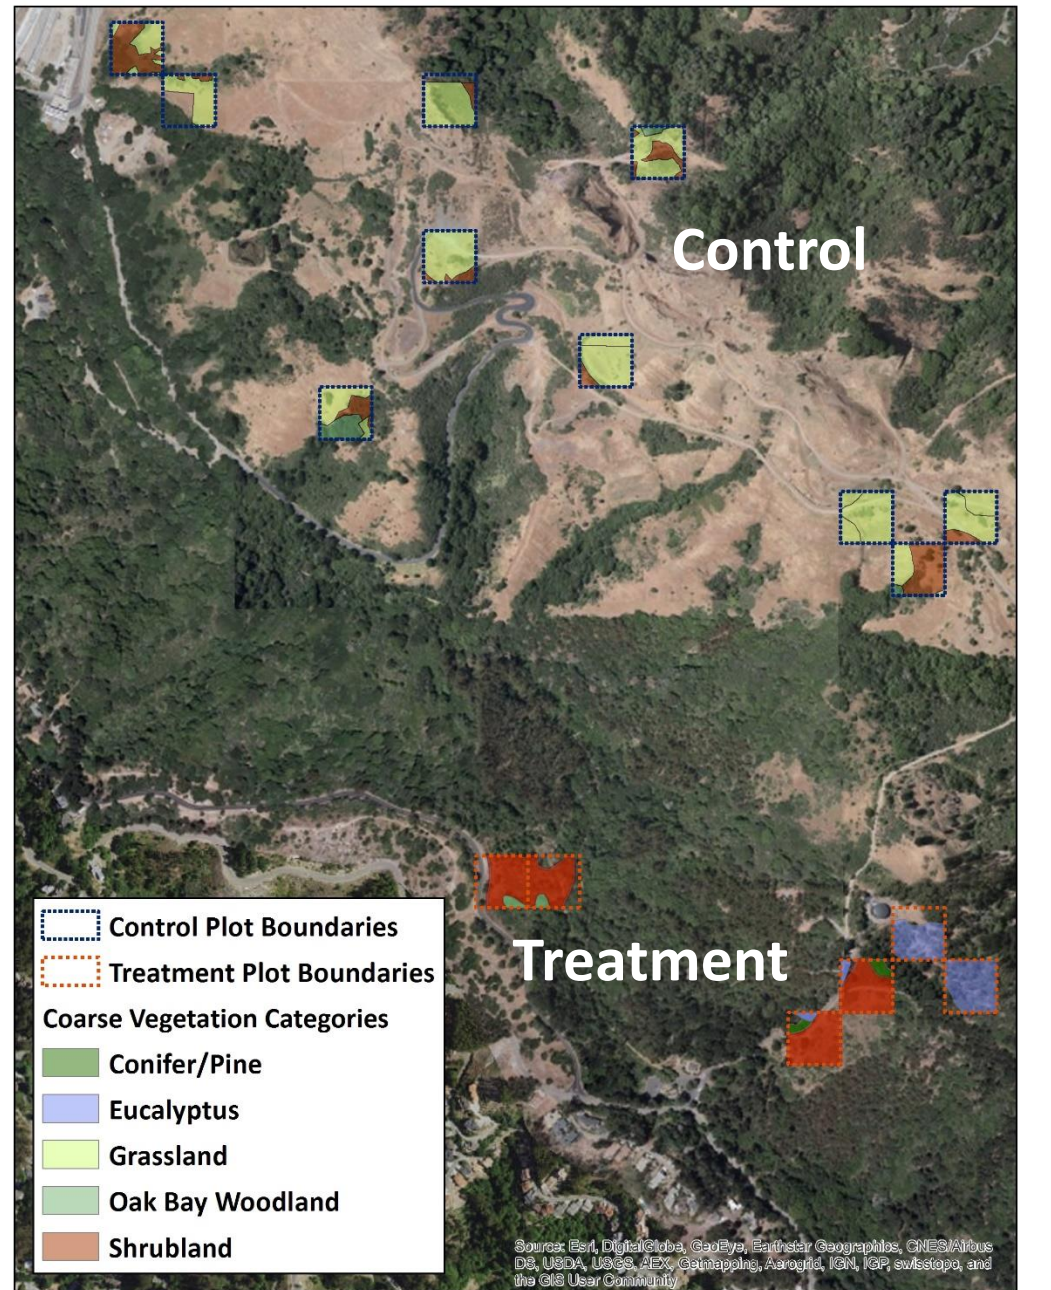

- Control and Treatment: Shrub
- Treatment: FEMA-funded

Methods – Trapline Placement

Plot Selection Constraints

- Control and Treatment: Shrub
- Control: exclude RTA
- Treatment: FEMA-funded

Methods – Drift-Fence Funnel-Trap Design

Trapline Schematic (plane view)

Trapline Schematic (oblique view)
Snake Trap Design and Dimensions

Example of actual trapline set up.

Methods – Drift-fence Funnel Trapping

Methods – Trapping Data

Methods – Vegetation Data

- Species ID
- % Cover
- Height
- Substrate
- Aspect

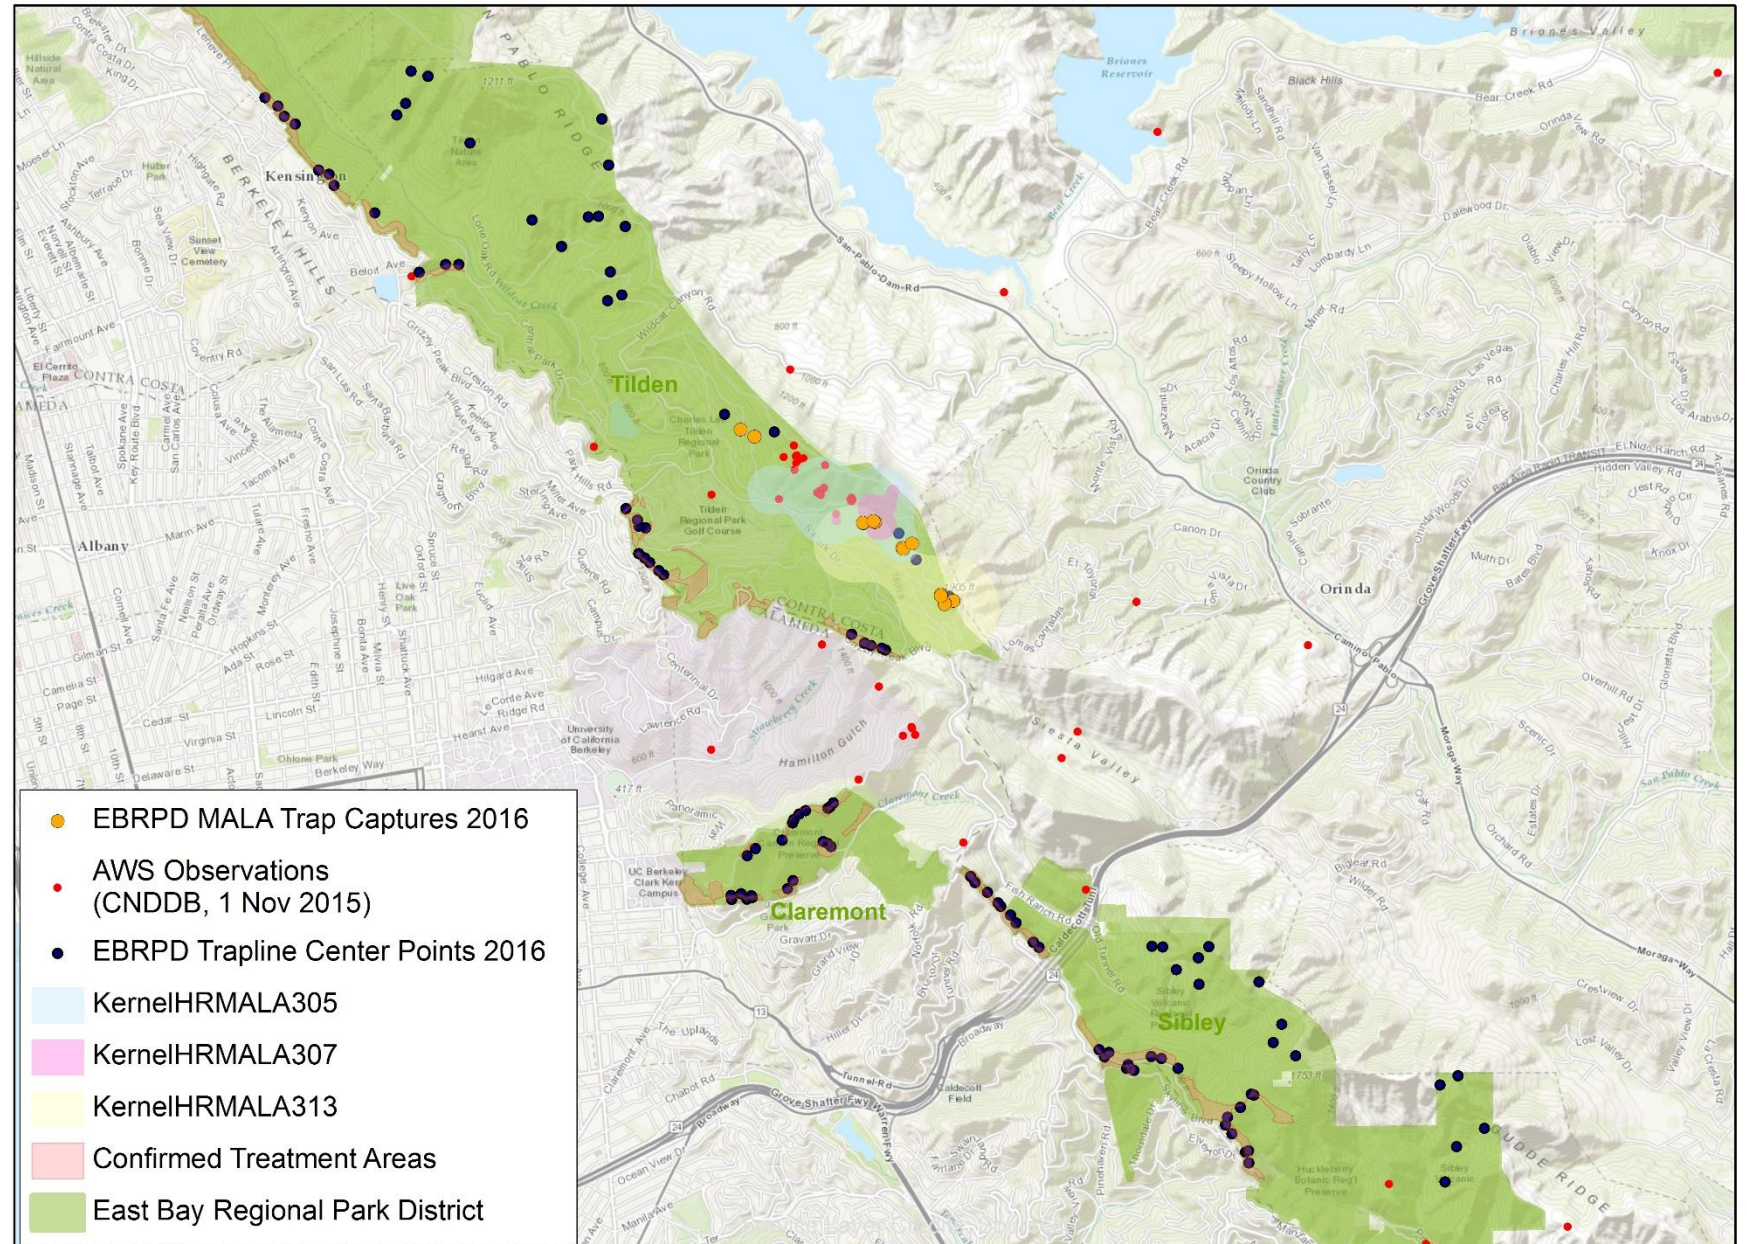

Methods - Telemetry

- Locate every 48 hrs
- Substrate
- Vegetation
- Temperature
- Activity

Results

- 22 AWS (28 x)
- 9 traplines
- South Tilden
- $\hat{N} = 32$ (22-61)
- $\hat{p} = 0.068$
(0.038-0.103)
- $p^* = 0.93$
- $\hat{\psi} = 0.080$
(0.002-0.369)
- # Occupied 'Sites'
= 11 (9-15)

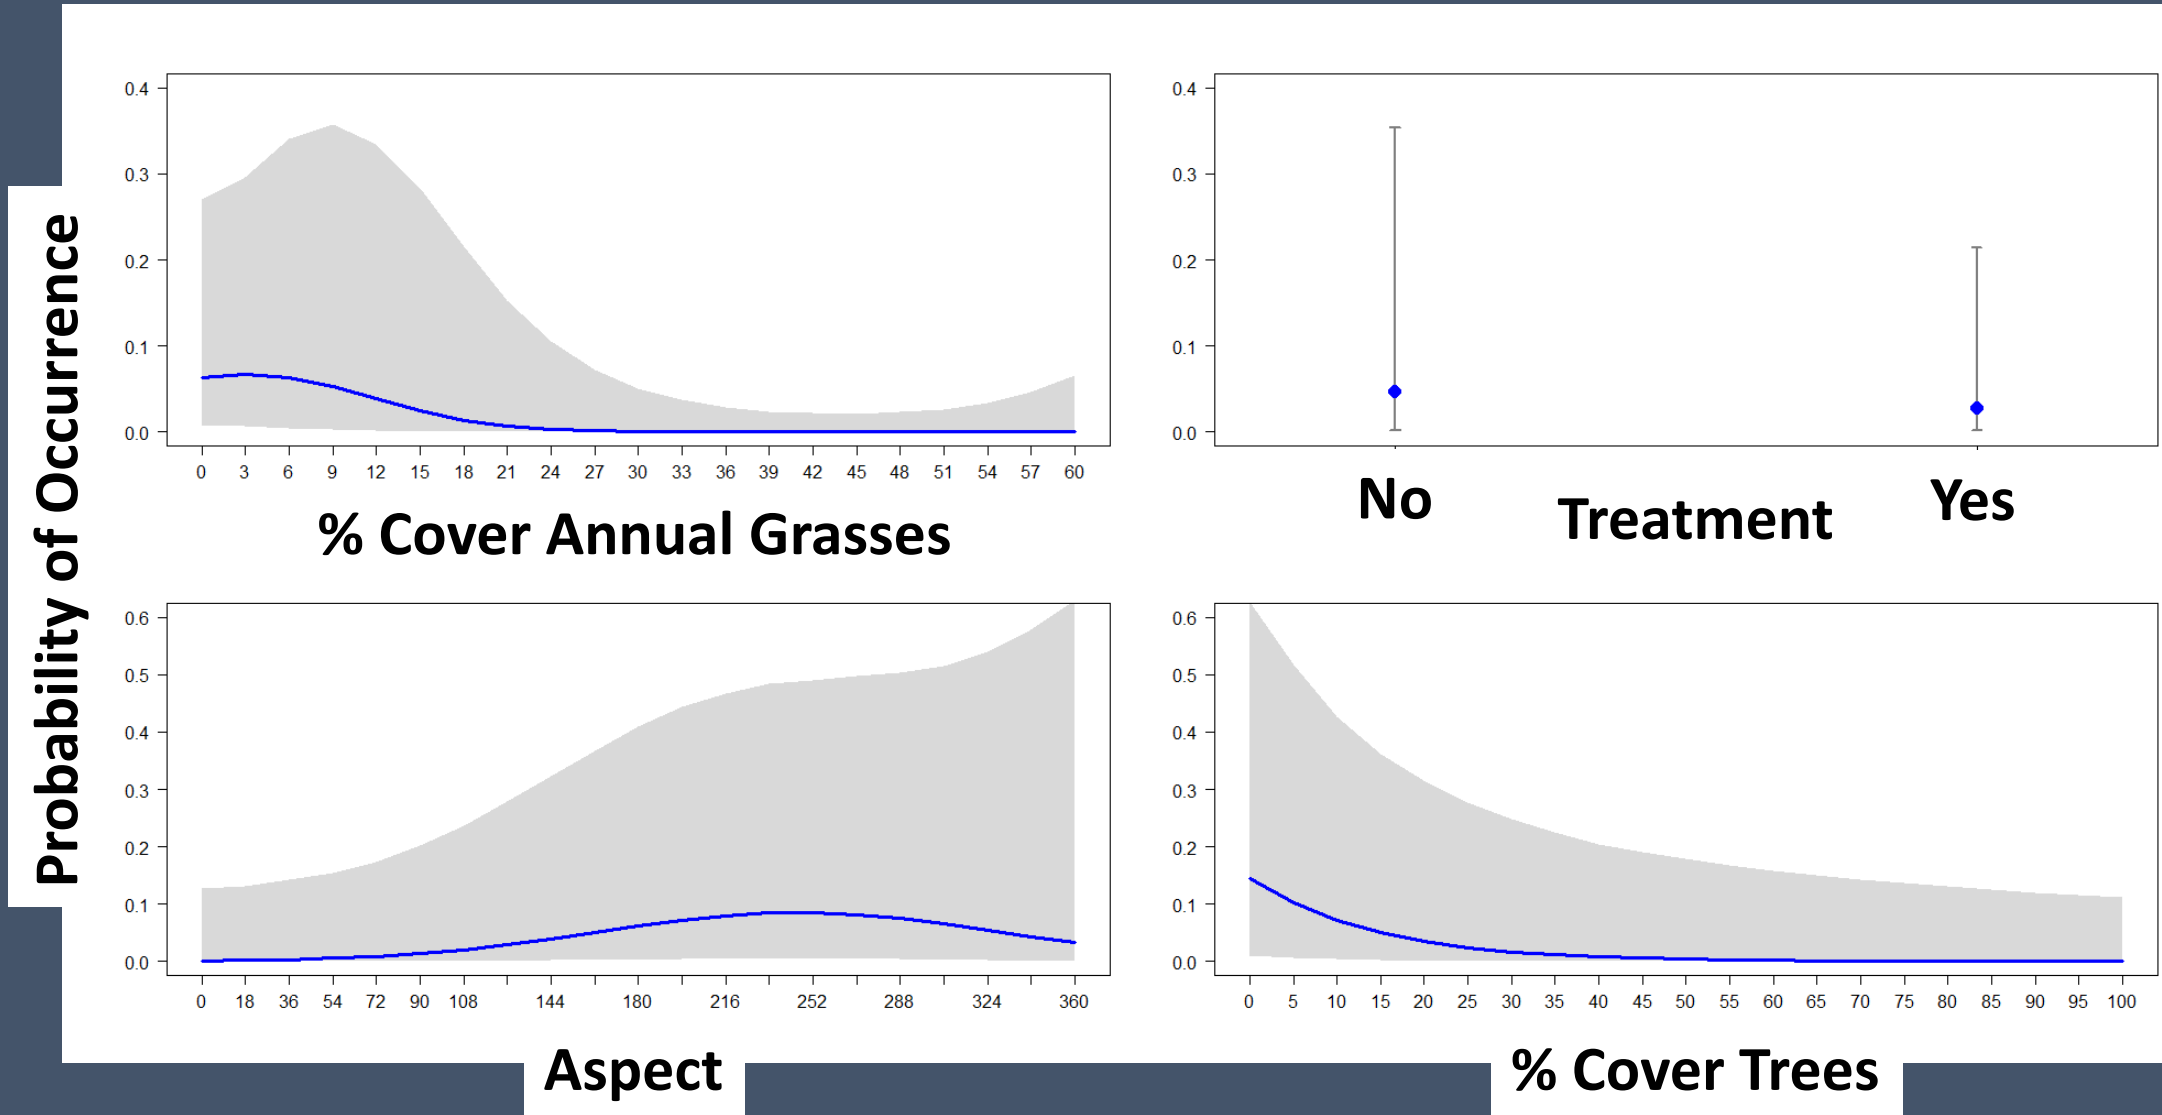

Results – Occupancy: *Detection Probability*

$$p^* = 0.93$$

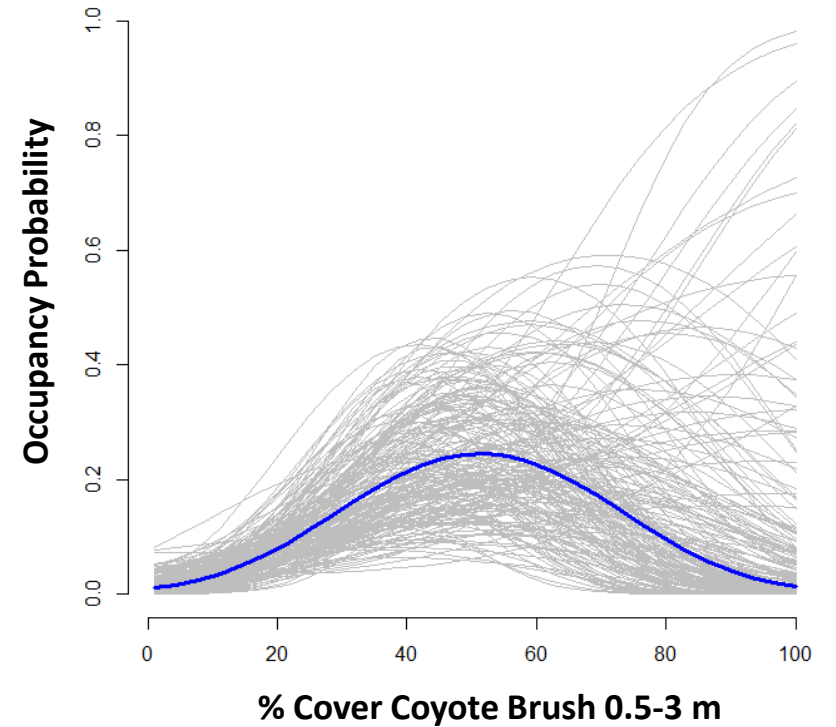

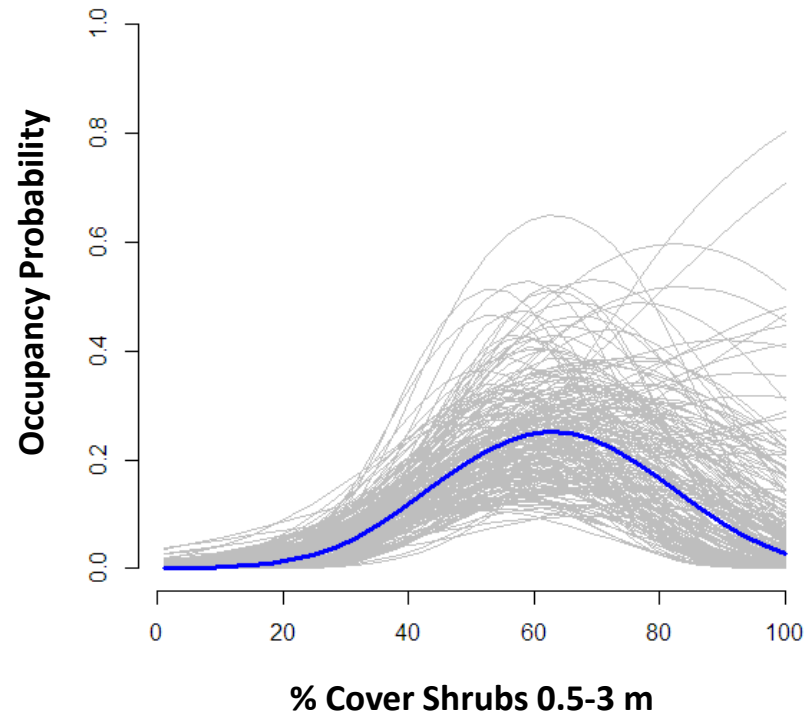

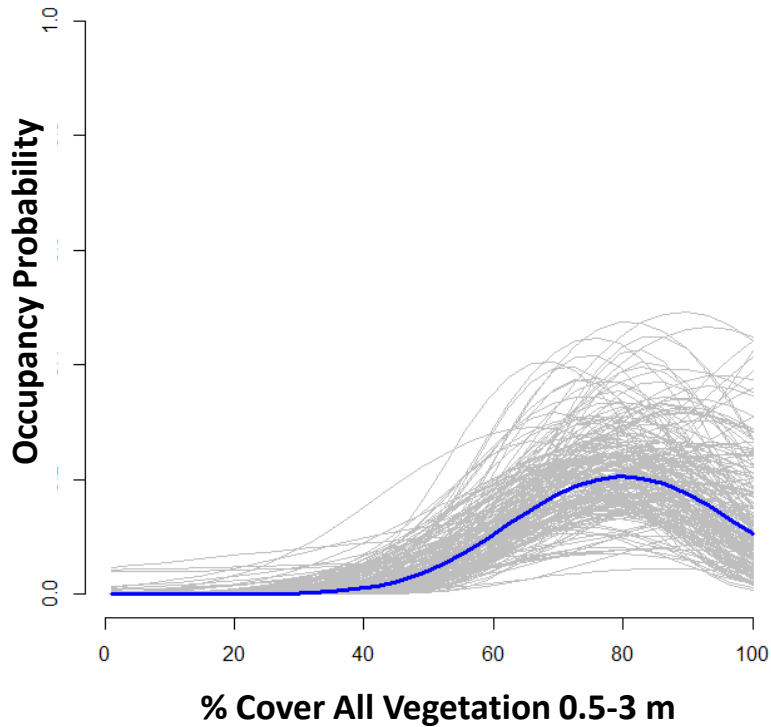

Results

Best model covariates based on marginal posterior probabilities.

Results - Occupancy

Relationship of Shrub Cover to Occupancy Probability

Results - Telemetry

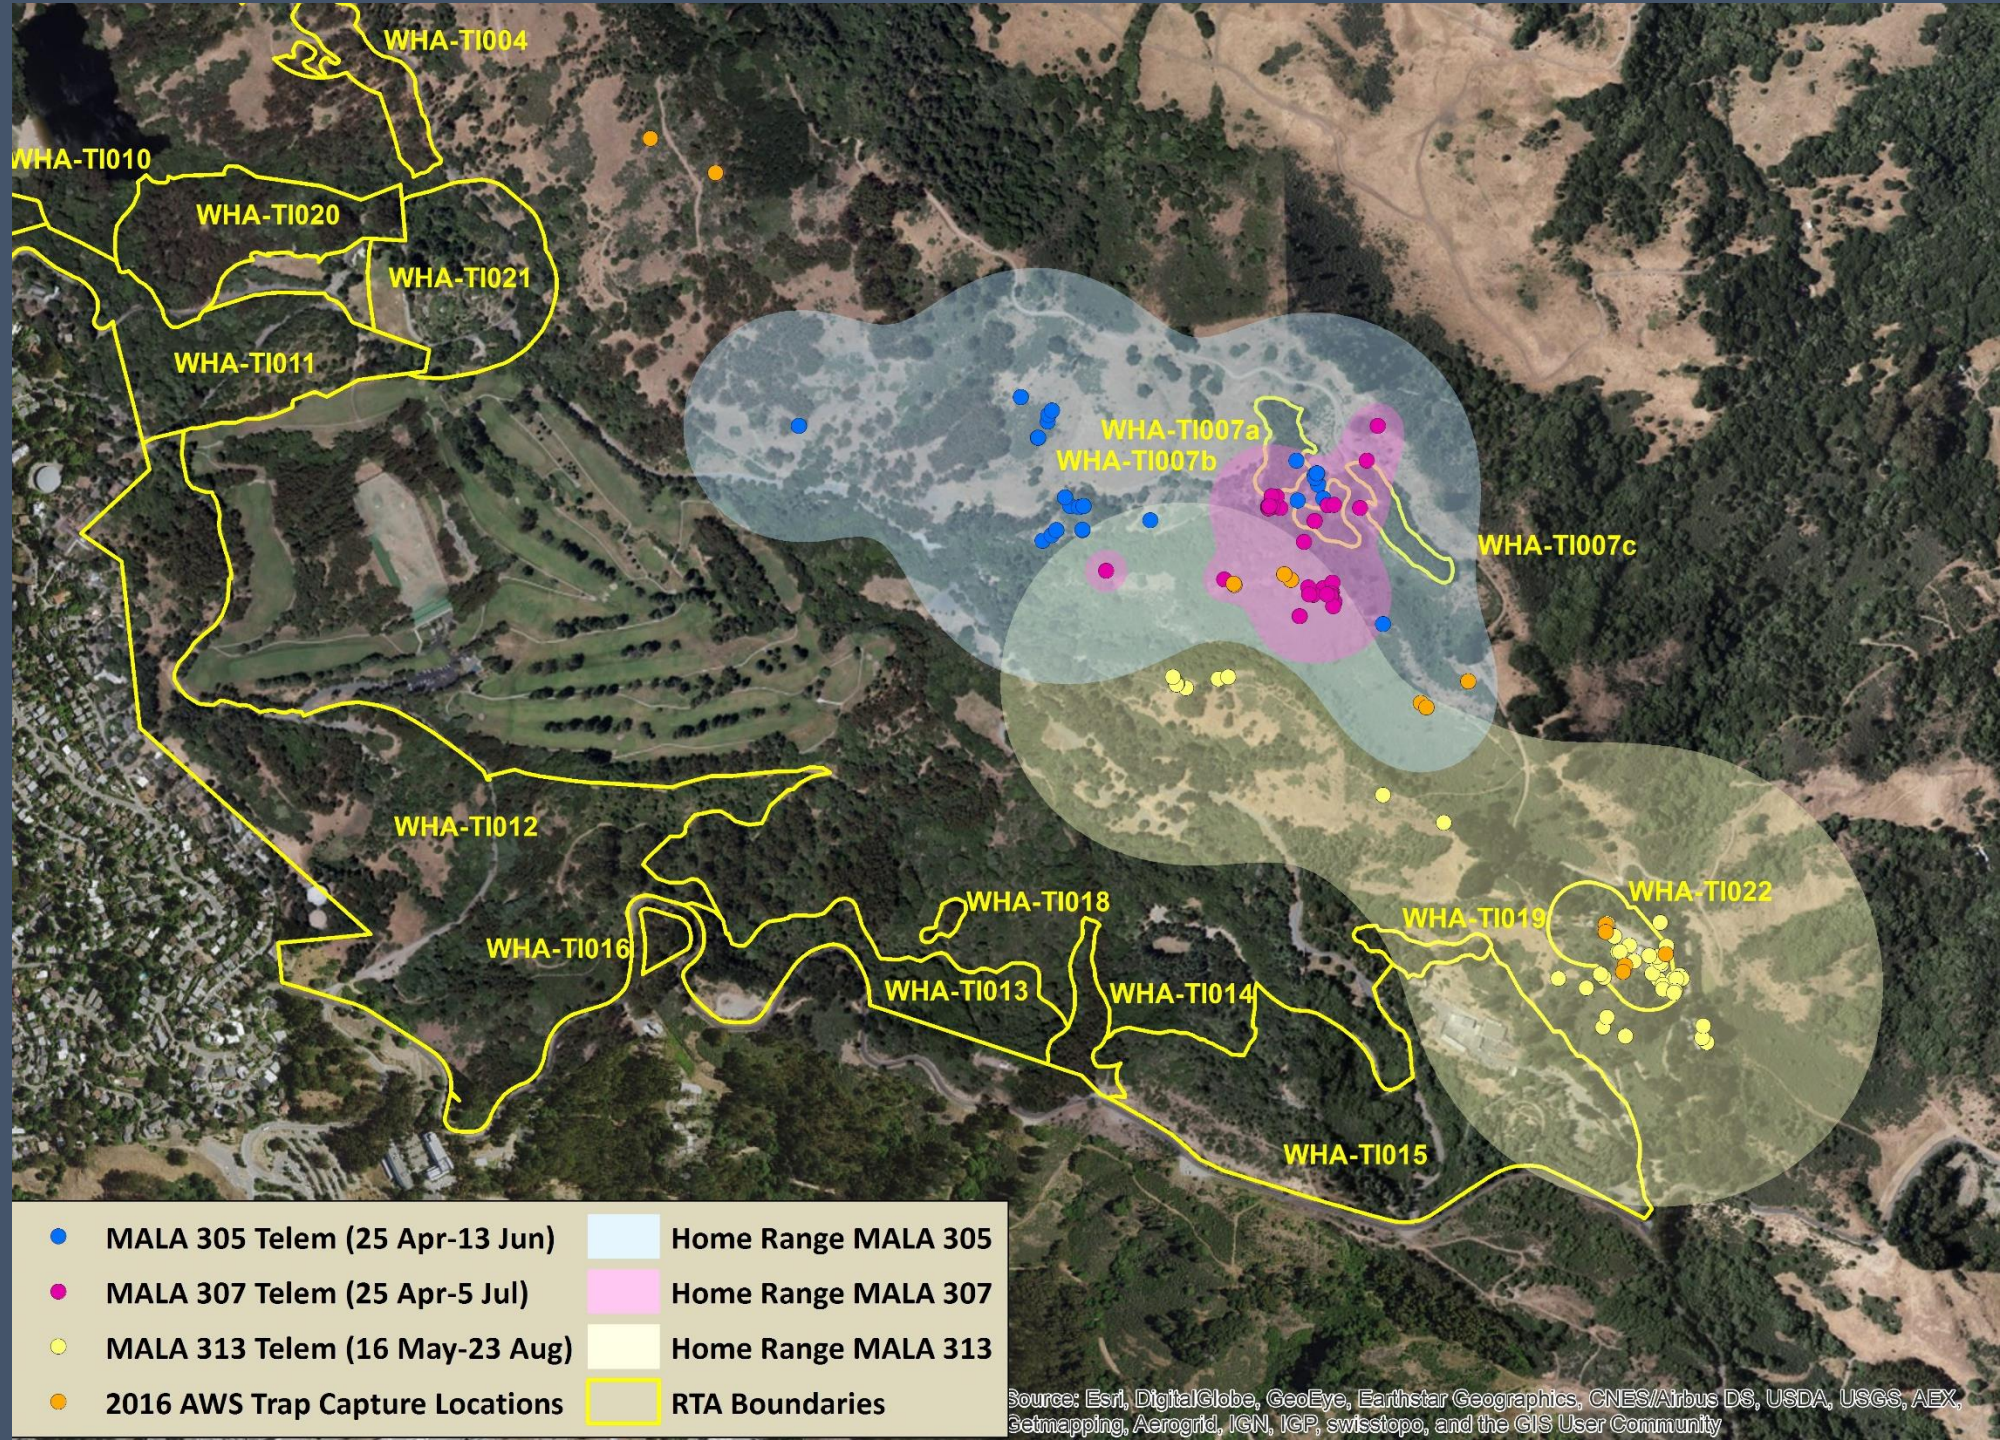

Home Range = 95% Kernel Utilization Distribution

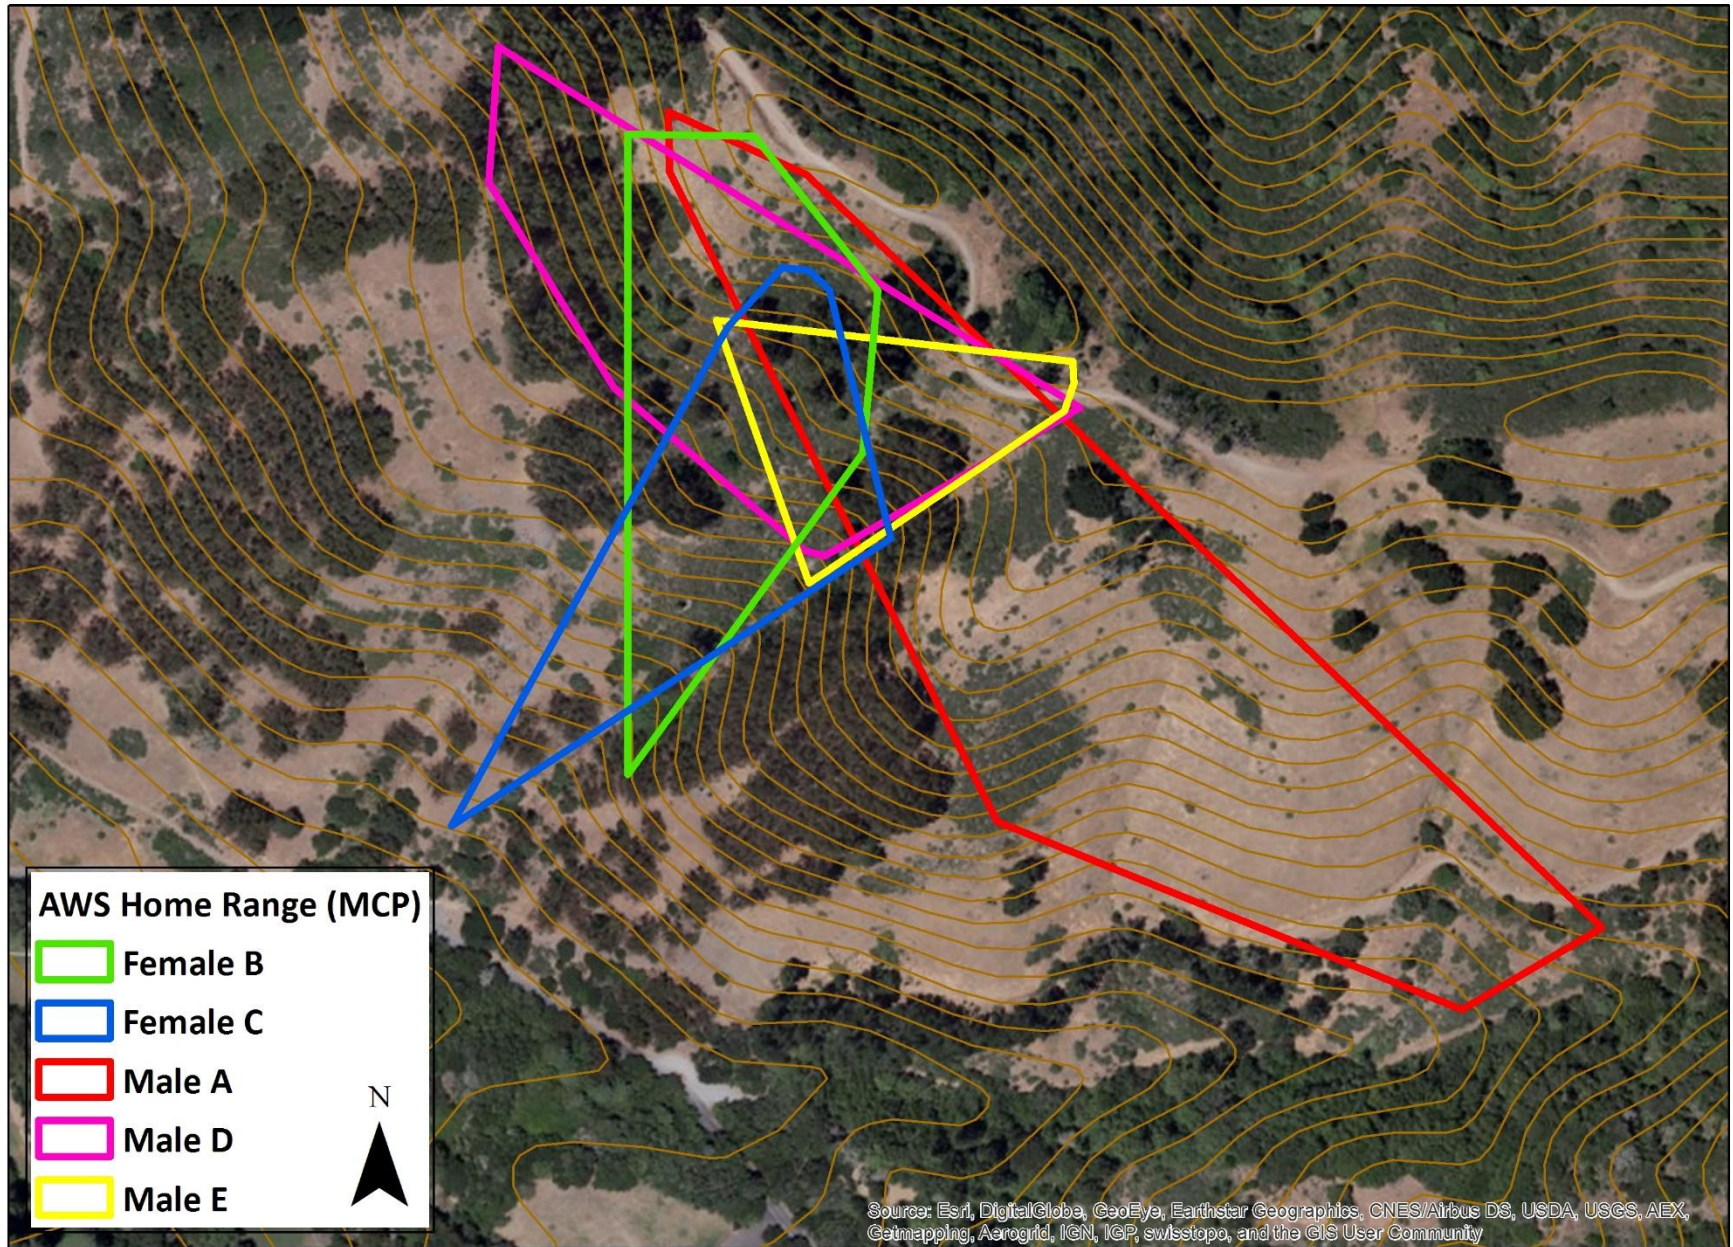

66.7 ha M

9.5 ha F

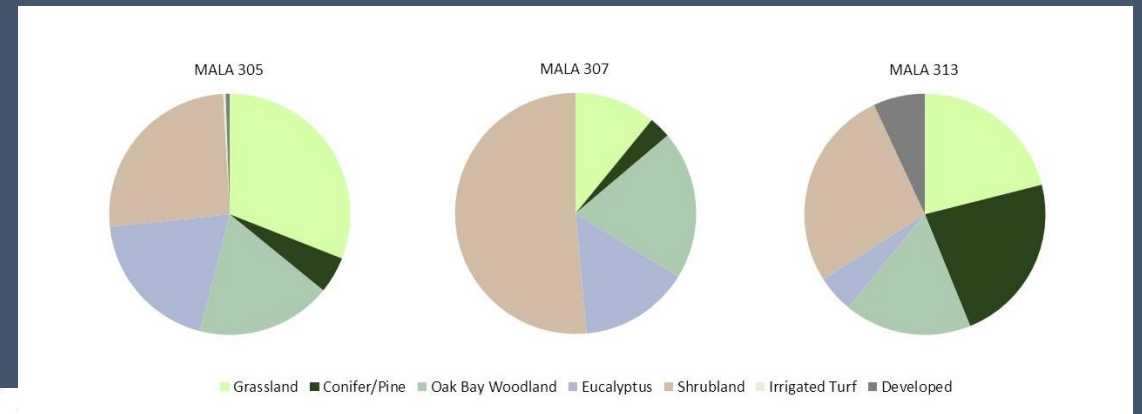

81.0 ha F

April – August

Results - Telemetry

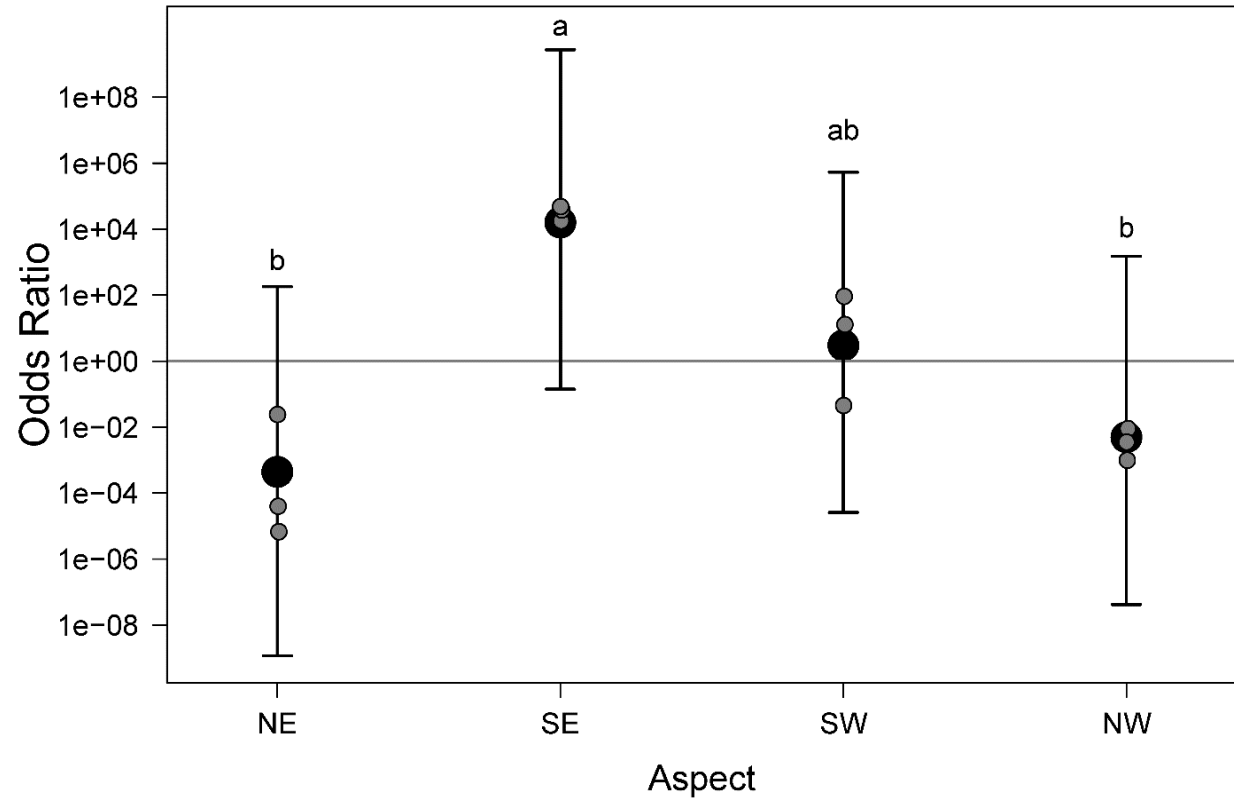

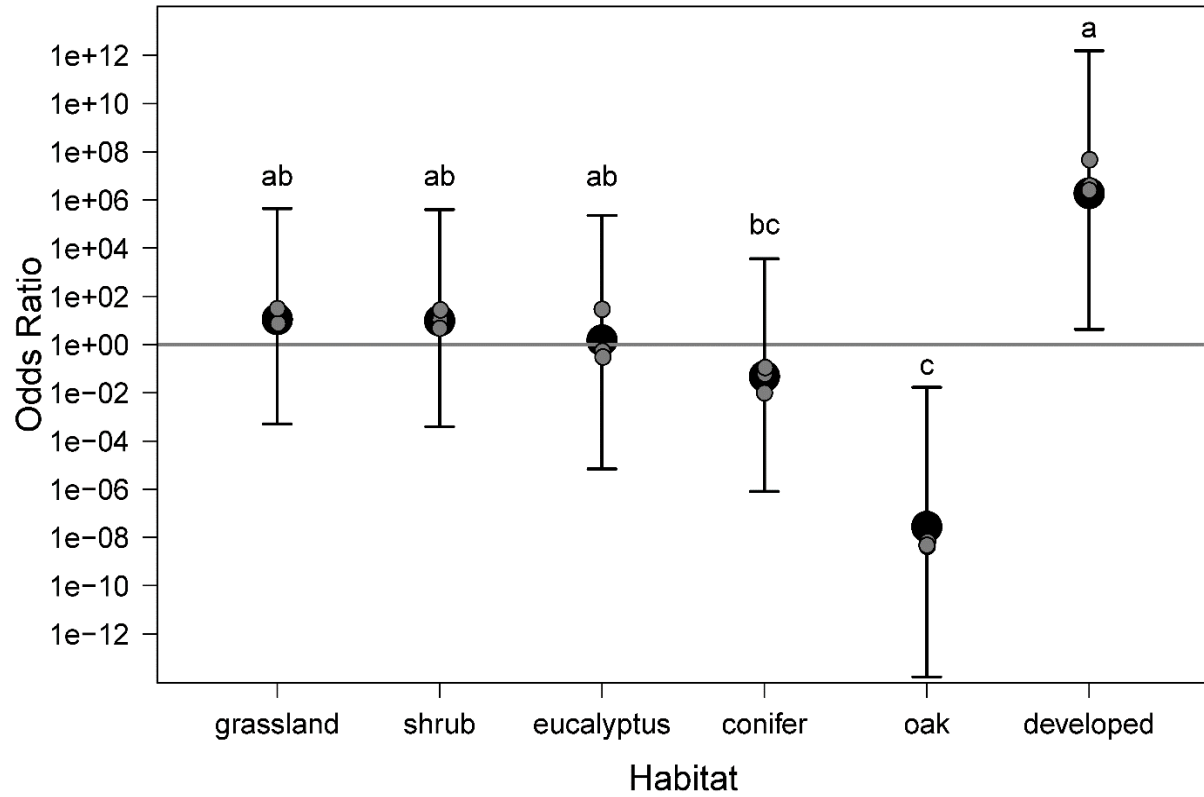

03.30.2008

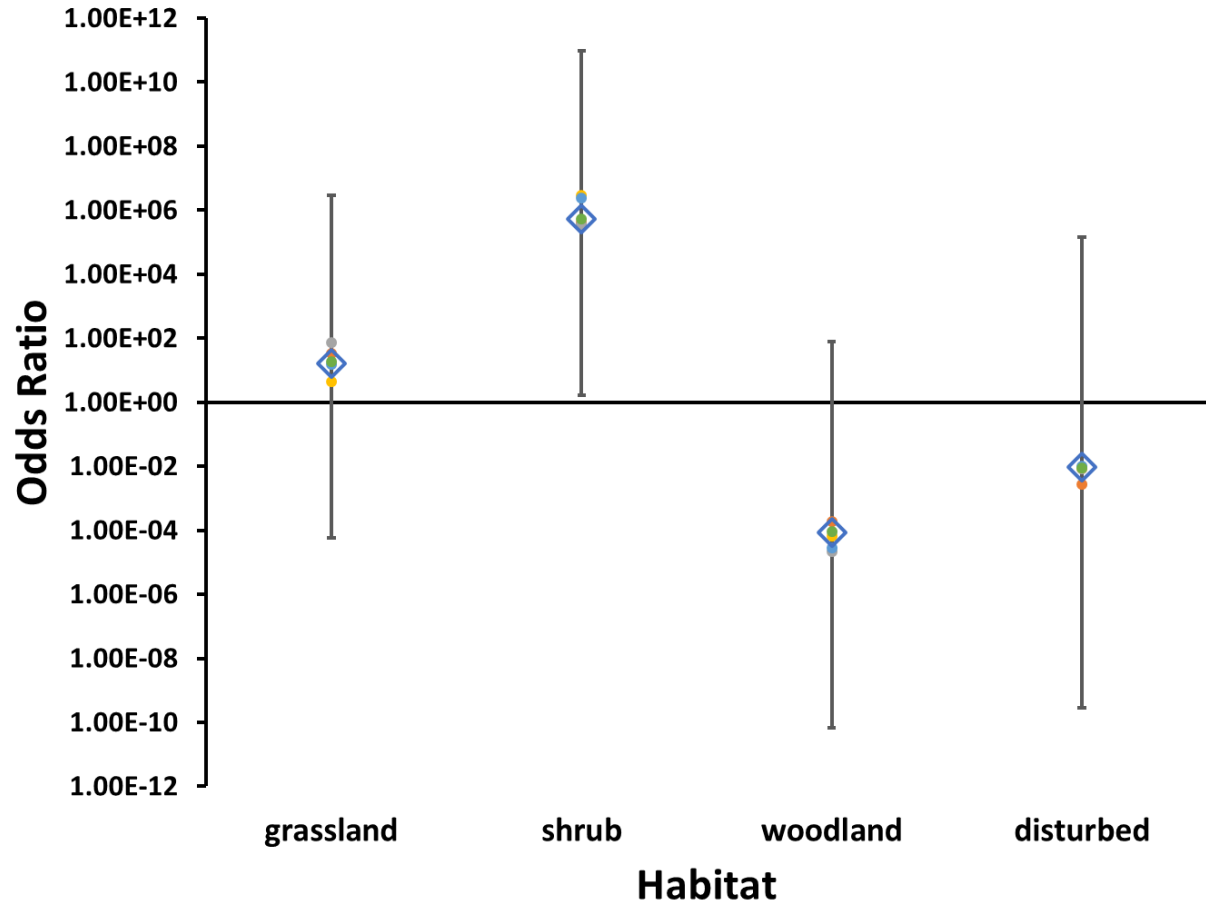

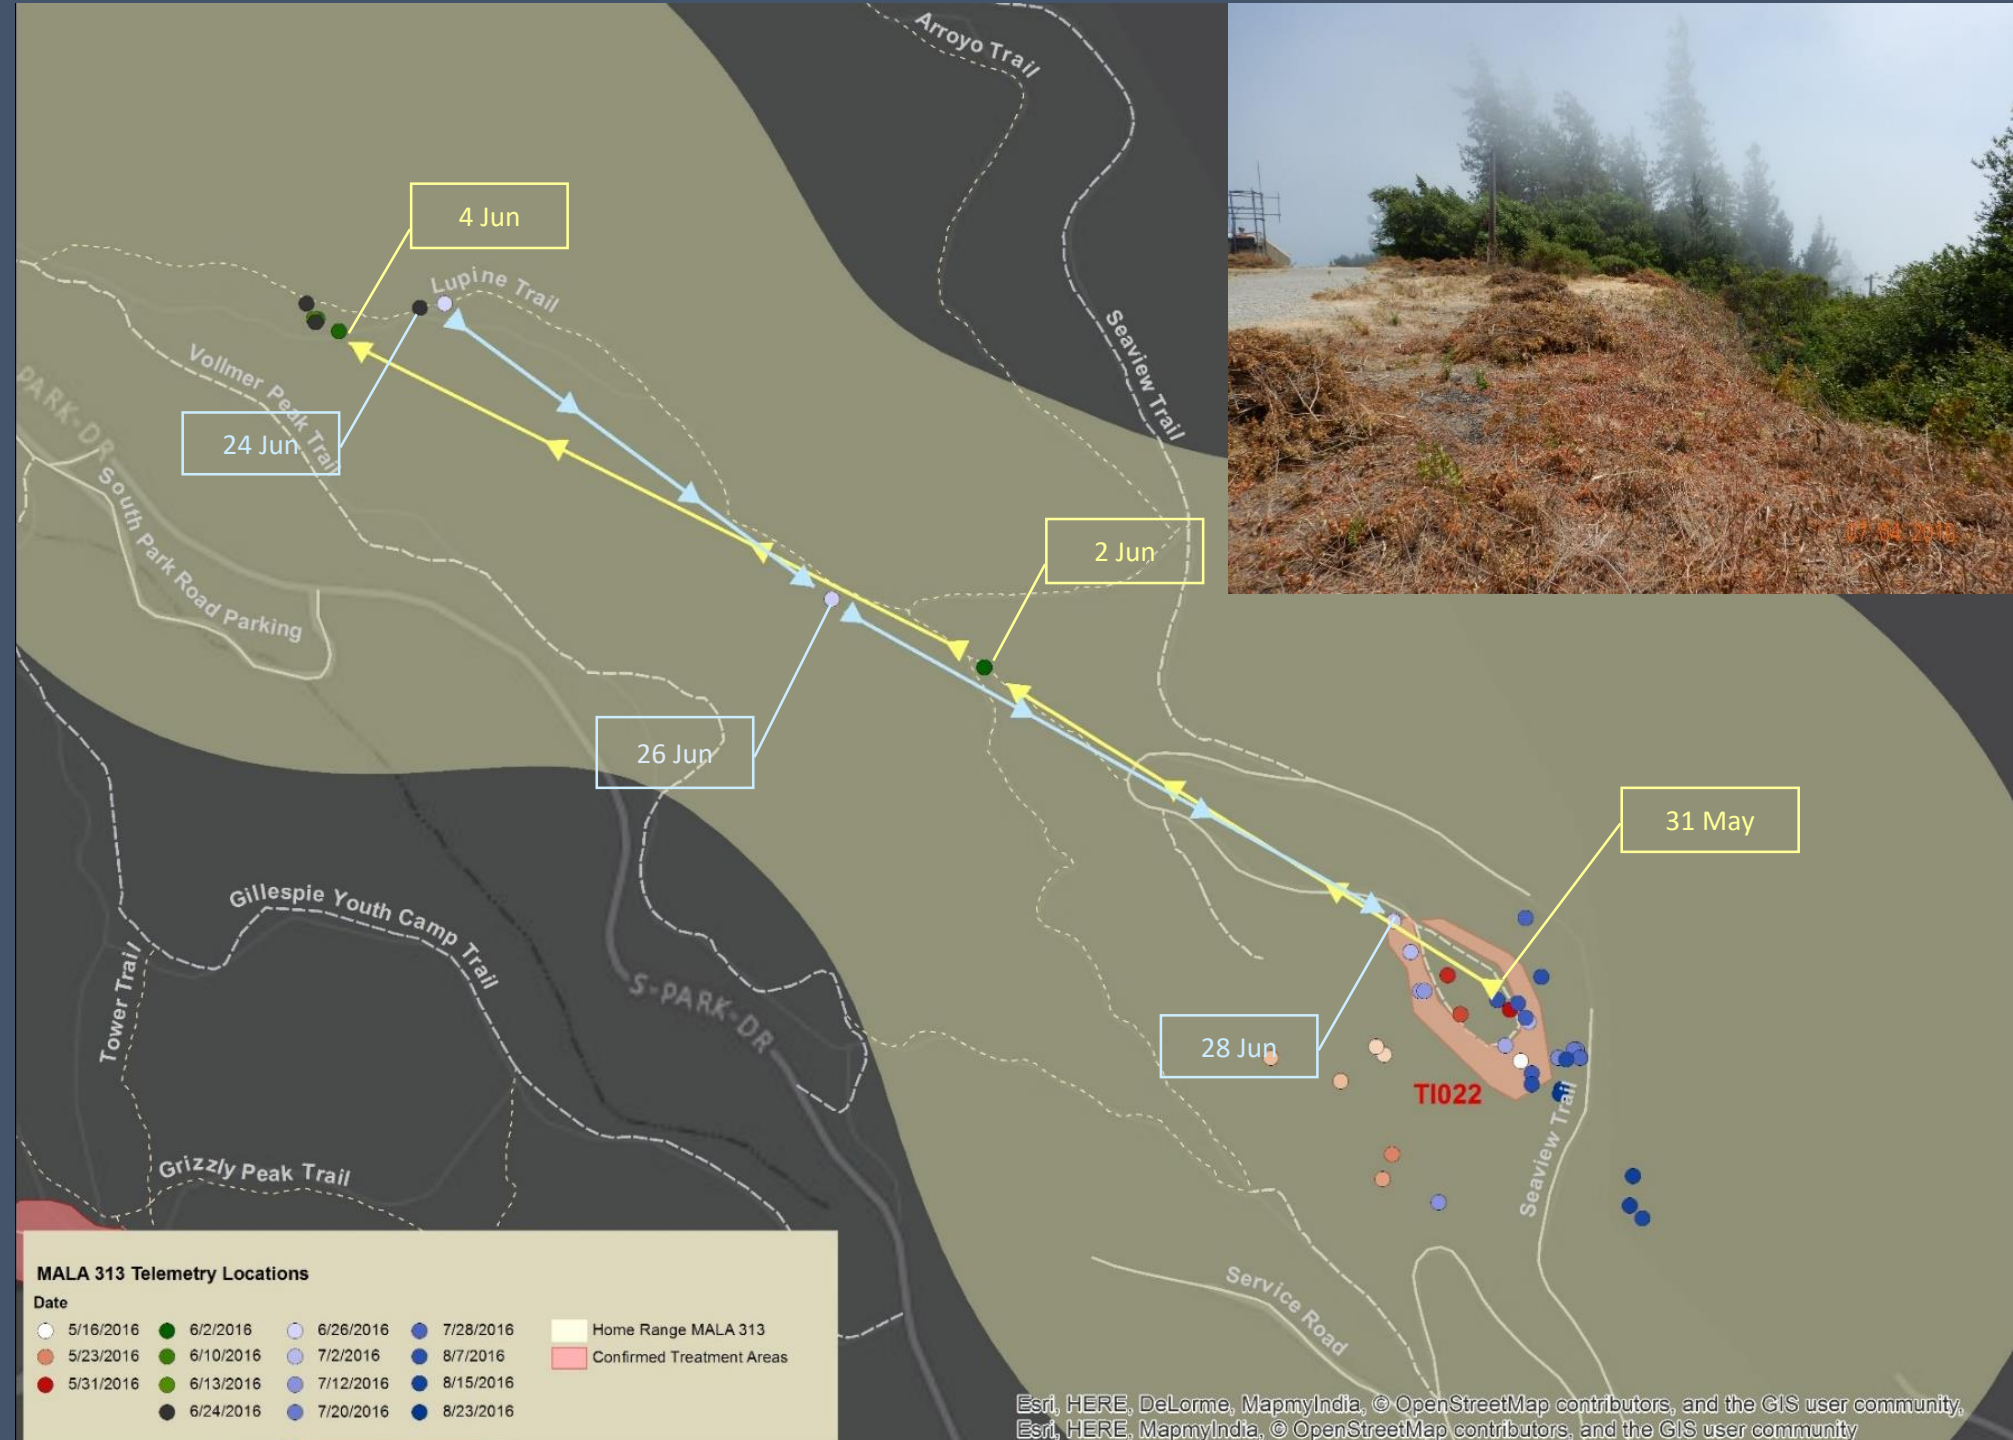

Stonebrae/ Garin

Results - Telemetry

Vs. . . . Results – Telemetry (1990-1992)

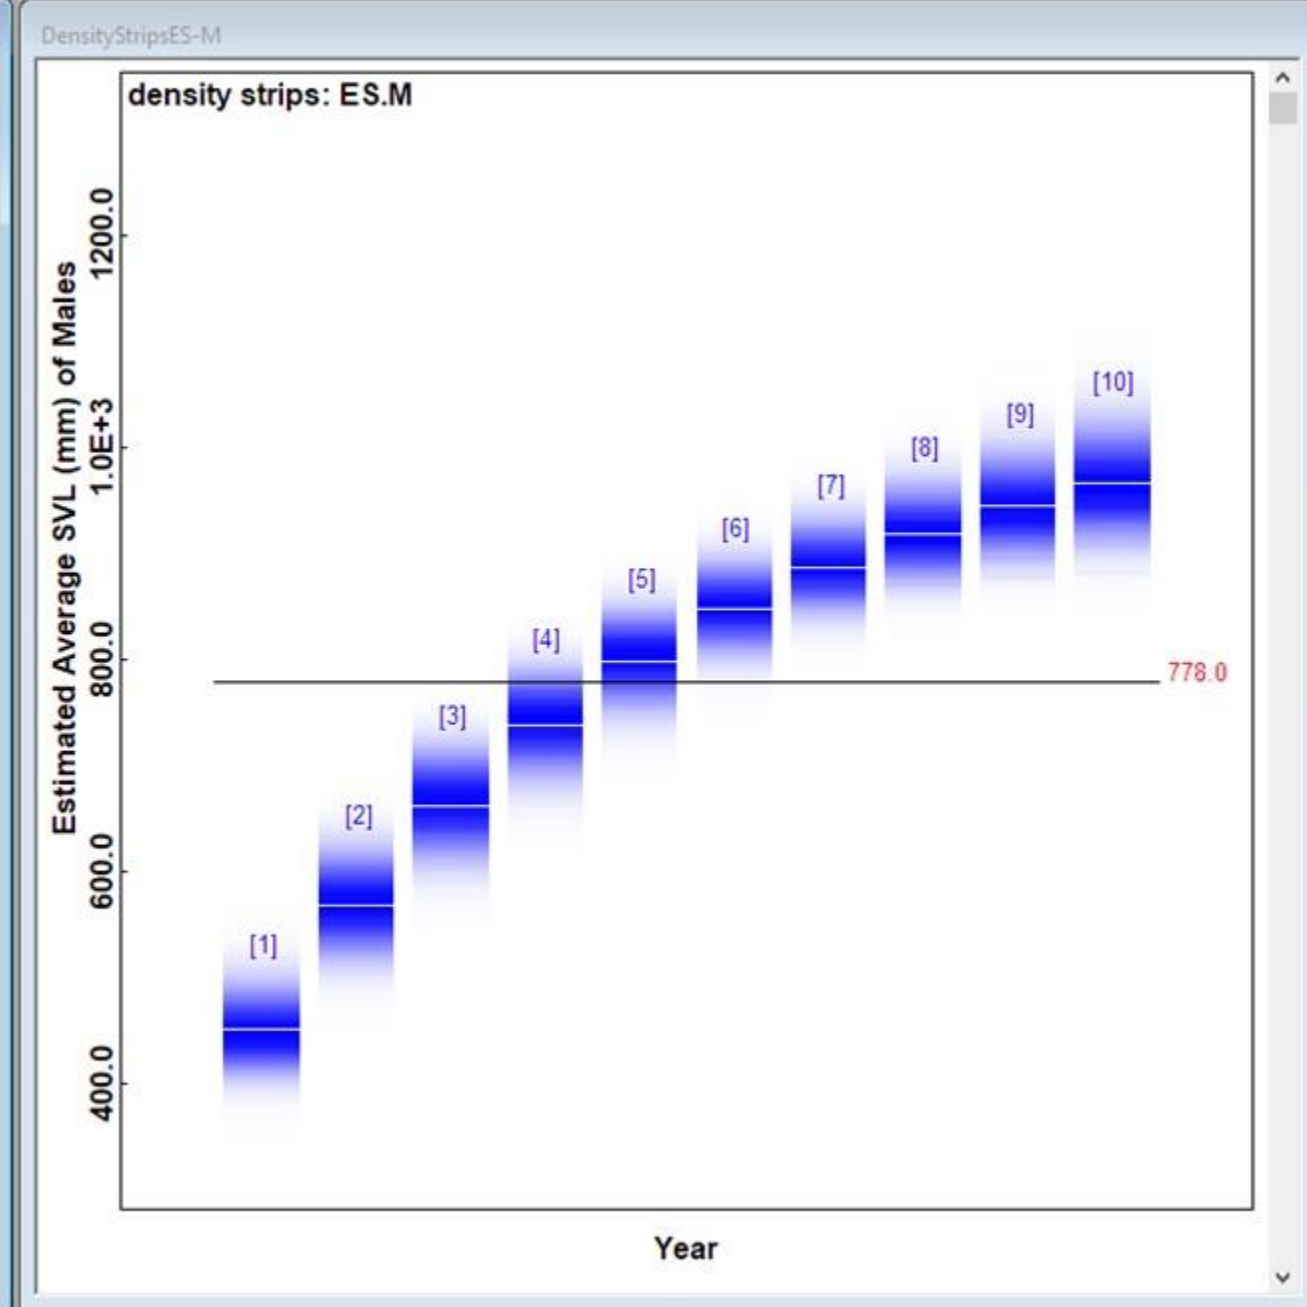

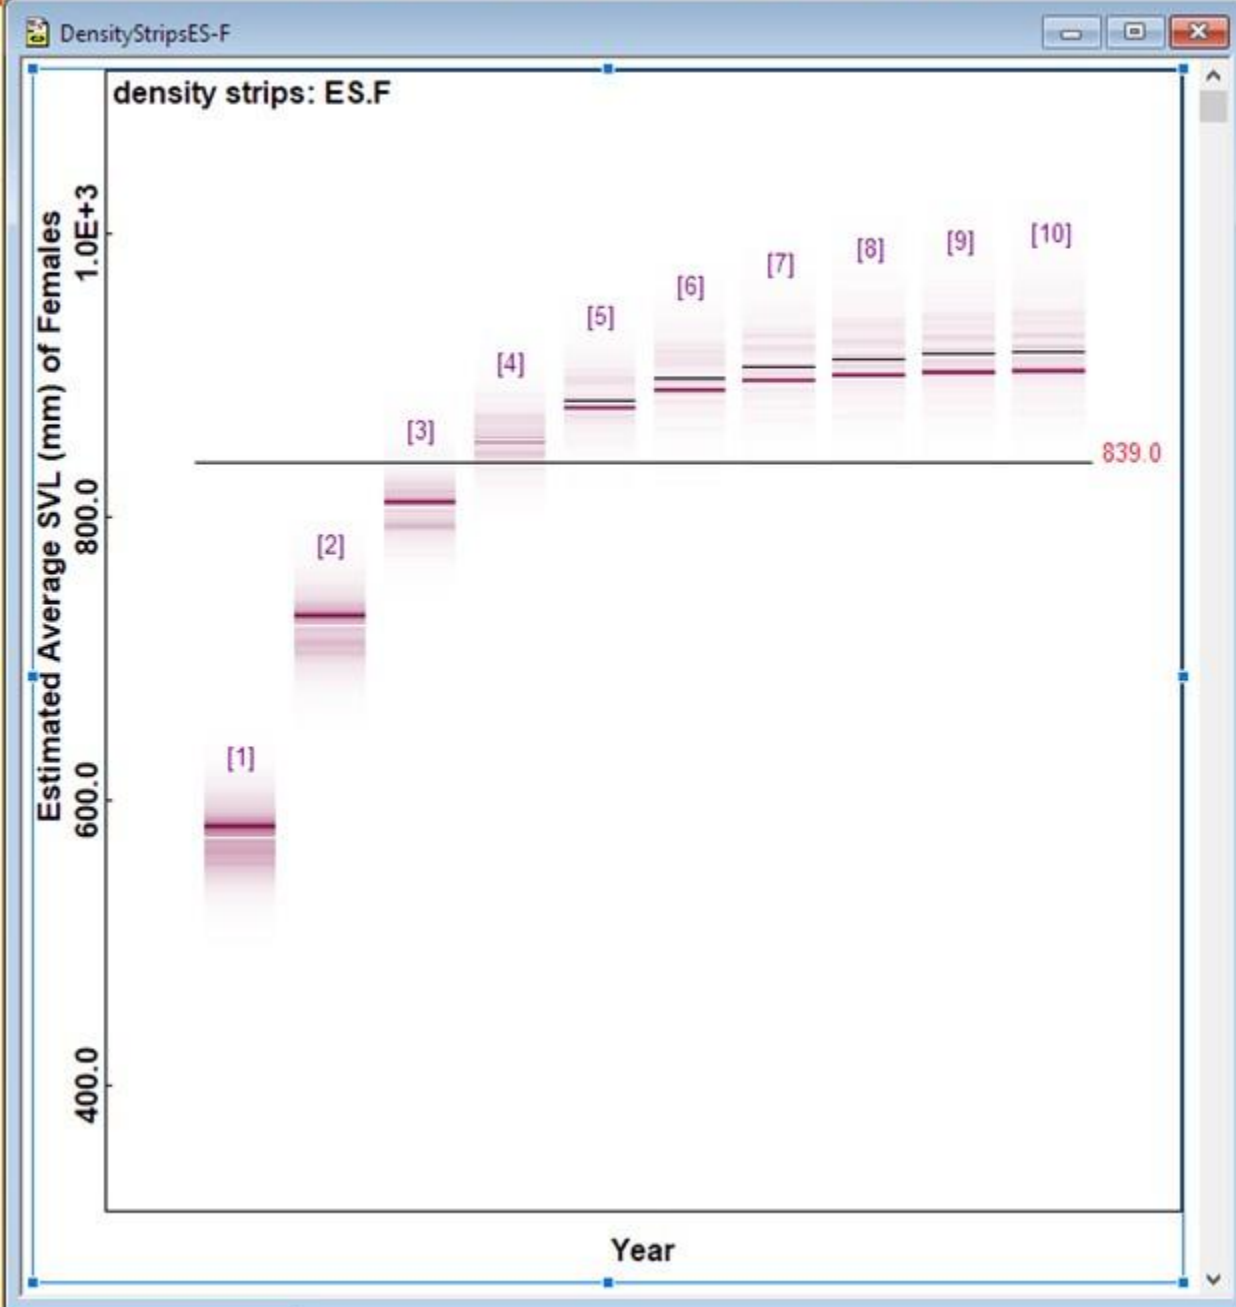

Summary (Year 1)

- Low daily detection probability ($\hat{p} = 0.068$)
- High cumulative detection probability ($p^* = 0.93$, $n_{\text{surveys}} = 37$)
- Low occupancy ($\hat{\psi} = 0.080$)
- Clumped distribution within Tilden
- Number of individuals in breeding population ($\hat{N} = 34$)
- Able to relate occupancy probability to variation in habitat
- Snakes already utilizing maintenance treatment area
- Conflicting habitat results, but similar aspect pattern from telemetry
- *Preliminary results* – more to follow after treatment . . .
