Paper Title: **Design and Optimization of Genetic Algorithm (GA) based High Gain and Directive CPW-Fed Slot Dipole Antenna for Wideband Applications**

Abstract:Genetic Algorithm (GA) is proposed in this paper for the design of a wide bandwidth, high gain and directive CPW-fed slot-dipole antenna. The proposed antenna is built on a FR4 substrate that is cheap and easy to produce. Genetic Algorithm is used to select parameters that reflect antenna geometry to achieve wider bandwidth and reduced return loss (parameter S11) and high gain values at resonant frequency. The antenna design shows a wide operating bandwidth of 1.4 GHz (simulated) and 1.3 GHz (measured) over the X-band, a return loss (S11) of -25.83 dB (simulated) and -23.08 (measured) and a gain and directivity of 5.61 dB (simulated) and 11.87 dB (simulated) at 10.5 GHz resonating frequencies. In this work, all simulations were performed using the ANSYS HFSS v14.0 software. A prototype antenna was produced and then characterized using VNA to validate the design. Measurement results were in good agreement with the results simulated using ANSYS HFSS.

Keyword: Antenna Optimization, CPW-fed Slot Dipole Antenna, Genetic Algorithm, High Gain, High Directivity Antenna.

Paper Title: **Algorithm for Multi- objective Traveling Salesman Problems based on Modified Transitive closure**

Abstract:One of the challenging facts of the Multi Objective Traveling Salesman Problem (MOTSP) is to find the best compromised solution. In this paper, we have proposed a modified transitive closure algorithm to solve MOTSP using Genetic Algorithm (GA). Modified Transitive Closure method generates all the initial solutions of each objective. By applying Genetic Algorithm (GA), compromised solutions are obtained. Numerical examples are provided to show the efficiency of the proposed algorithm for MOTSP

Keyword: Traveling salesman problem, Route Conditions, modified transitive closure method, Genetic Algorithm.

Paper Title: **Ensemble Learning Technique for Cloud Classification**

Abstract:Automatic cloud classification is one of the important areas of remote sensing for metrological applications. Machine learning and deep learning techniques have been used for automatic classification of the cloud type. Several pretrained models are developed using convolutional neural network (CNN), which is part of deep learning. The classification performance of pretrained networks can be further improved using ensemble methods. Ensemble learning can perform better than single learner. In this paper, we proposed two different ensemble learning techniques: ensemble of CNN and ensemble of classifier. In first approach, CNN ensemble is performed, where the features extracted by two or more CNN are combined together using single classifier. The second method is to ensemble the predictions of different classifiers produced by a single or multiple CNN. The accuracy of cloud classification of the proposed methods has improved compared to without ensemble of pretrained networks.

Keyword: Pretrained network, Cloud classification, Ensemble learning

Paper Title: **The System of Modern University Missions Realization in the Measurement of Three Key Components**

Abstract:Analysis of the choice of potential entrants' choice of Kyiv National Economic University named after Vadym Hetman (KNEU). We represent key influential factors of choosing KNEU named after Vadym Hetman by entrants: Motivational and Prestigious, Demographic, Geographical, Psychographic, Social. The article presents the key factors, hypotheses confirmation and segment identification of the applicants who choose university.

We build up the system of potential factors quantity of choosing KNEU by entrants on the basis of the above-mentioned hypotheses. This structured hierarchical scheme has 5 levels. Construction of the potential factors' magnitude of choosing KNEU by entrants.For building up the abovementioned potential factors quantity system of choosing KNEU by entrants it was realized the survey by questionnaire for each of the presented factors within KNEU annual survey of first-year students entitled "Motivational factors of university entrants before entering the university".

The results of the survey, which was conducted in 2007, 2011 and 2017 for each item in all levels of the hierarchical scheme, were processed. In the three-dimensional Cartesian coordinate system, it was selected the axes are, which correspond respectively to the values of specific, relevant and potential factors for choosing KNEU by entrants. We presented in geometric interpretation the potential of choosing KNEU by respondents in the form of rectangular parallelepipeds.

The modern knowledge economy requires a modern system of proficiency competencies. That's why the most successful universities focus on instruments of higher education quality, realize educational programs' modernization on the base of student-centred education philosophy and build up a new system of thesocial network in the direction of social responsibility projects and business partnership with the academic community

Keyword:innovative, forward-looking education, stakeholder, social responsibility, segment identification, Motivational and Prestigious factors, Relevant factors, potential factor, student-centred philosophy.

	Paper Title:	**Man in the Middle of Face Recognition System: using Skin Color and Template**
	Abstract:During last 10 years people are very much attracted to face recognition systems and they are very much eager to solve the issues related to face recognition system. It helped them very much in the field of electronics and uses over pattern unlocking and password entering system. There are numerous applications as for security, affectability and mystery. Detection of a face is the most significant and initial step of recognition framework. This article demonstrates a new method to face recognition system using color and template of an image. Whatever the background it may go to be, our system will detect the face, which is an important stage for face detection. The pictures utilized in this framework for Face detection are the color images, while the images used for the Face Recognition are the Gray images which are converted from color pictures. The illumination compensation technique is applied on all the images for removing the effect of light. The Red, Green, and Blue values of each pixel will be converted to YCbCr space. Based on the probability of each pixel in terms of Cb, Cr values, we extract the skin pixels from the query image,. The positive probability shows a “skin pixel”, while the negative probability shows “not a skin pixel”. Finally the face is projected. In face recognition, we used 4 templates of different sizes for Gabor image content extraction. Finally we employed the relevance feedback mechanism to retrieve the most similar images. If the user did not satisfy with the given results he can give the correct images to the system from the displayed images. Exploratory outcomes demonstrate that the demonstrated system is adequate to recognize face of a human face in a picture with an exactness of 94%. **Keyword:**Probability function, Face detection, Gabor based templates, templates extraction, Face Recognition **References:** 1. 	Paper Title:	**A Novel Framework for Video Delivery to Handheld Devices using Cloud Environment**

Abstract:Handheld devices are responsible for most of the internet traffic nowadays. Video streaming services plays a vital role in internet traffic because of its increasing size and high definition. Even though the mobile devices are capable to store and process huge data, the limitations of resources (Power, Memory, Processing, etc.), are creating bottleneck during video delivery process. Mobile devices are heterogeneous in nature in terms of service provider, geo location, hardware and software configuration and many other aspects. It is very difficult to provide the expected service to those devices without any compensation. To maintain the trade-off among the user expectation, device configuration and service provision a novel framework is proposed here. The framework covers various aspects of streaming services like user experience, delivery and storage of the contents, consumption of power resources, network conditions etc.,. The novel framework was tested with the cloud environment, within our parametric boundary it provide smooth streaming services to the handheld devices.

Keyword: Cloud Computing, Device Heterogeneity, Quality of Experience, Streaming Services, Subjective Analysis, User Experience, Video Transcoding.

	Paper Title:	**An Effective Classification of Citrus Fruits Diseases using Adaptive Gamma Correction with Deep Learning Model**	
	Abstract:In farming sector, diseases affected in plants are mainly accountable for the minimized profit that leads to financial loss. In case of plants, citrus is utilized as a main resource of nutrients namely vitamin C globally. But citrus diseases greatly affect the productivity as well as quality. In recent days, computer vision and image processing approaches are commonly applied for detecting and classifying the plant diseases. This paper presents a novel deep learning (DL) based citrus disease detection and classification model. A new DL based AlexNet architecture is employed for effective identification of diseases. The presented model involves four main processes namely pre-processing, segmentation, feature extraction, and classification. Initially, pre-processing takes place to improve the quality of the image. Then, the Otsu method is applied to segment the images. Next, Alex-Net model is applied as a feature extractor. Finally, random forest (RF) classifier is used to classify the different kinds of citrus diseases. Besides, adaptive gamma correction (AGC) model is applied to improve the contrast of the applied citrus images. A comprehensive experimentation takes place on Citrus Disease Image Gallery Dataset. The results are examined under several cases and the outcome ensured the effective characteristics of the presented AGC-A model. **Keyword:**Alex Net, Citrus disease, Deep learning, Gamma correction. **References:** 1. 	Paper Title:	**Spam, a Digital Pollution and Ways to Eradicate It**	
	Abstract:Due to the growing popularity of the microblogging and networking sites like twitter, Gmail, Facebook etc., there has been an increase in the number of spammers. Spammers on Twitter seem to be more dangerous than the mail spammers as they exploit the limitation on the characters of Twitter for their own purposes. Spammers have also become creative in framing their content to cleverly escape the classifiers. This survey is thus mainly used to discuss and analyze the recent research that had been put forth regarding the spam detection in social media sites such as Twitter. This survey analyses the papers that tackled various problems faced on Twitter and the problems faced by the methods that have already been presented before. We then compared all the methods present in the papers to see which method or combination of methods could give the best result in detecting spam. **Keyword:**Bayes methods, Classification algorithms, Clustering algorithms, Feature extraction and Machine learning algorithms. **References:** 1. Paper Title: **Additive Manufacturing of a Gorlov Helical Type Vertical Axis Wind Turbine**

Abstract:In this work, a Gorlov helical type Vertical Axis Wind turbine (VAWT) model is designed and manufactured by using one of the additive manufacturing techniques called Fused Deposition Modelling (FDM) through a 3D Printer. The VAWT was made by interpretation of the wind conditions and by selecting of the suitable Airfoil profile for the blades of the turbine based on the DMS analysis (Q-Blade is an open source software which is particularly used in designing of wind turbine blades). The CAD modelling is done on SOLIDWORKS 2017 and later converted in to a Stereolithography (STL) format file which is compatible with the 3D Printing software called CURA by Ultimaker. All the parts were manufactured on the 3D Printer and assembled together and coupled with the suitable generator for the generation of Power. This VAWT is more suitable for urban areas and can generate more power even at the lower wind speeds unlike the Horizontal Axis Wind Turbines (HAWT) which require open lands for their efficient working.

Keyword:3D Printing, Additive Manufacturing, Fused Deposition Modelling, Vertical Axis Wind Turbine.

Paper Title: **Effect of Wrapping Reinforced Concrete Surface with FRP Sheets on Corrosion Resistance**

Abstract:Fiber Reinforced Plastics (FRP) sheets are widely used now in the field of repair and strengthening of reinforced concrete structures. The presence of FRP sheets on reinforced concrete surface for repair and strengthening provides some level of protection for reinforced concrete against corrosion. This kind of protection can be considered as an indirect protection because the main purpose is not for protection but for repair and strengthening. Two fibers/resin systems were considered in the experimental program; the first is glass/polyester system with one, two, and three layers of glass fibers and the second is carbon/polyester system with one layer of carbon fibers. Effectiveness of the indirect method was evaluated through comparing them with the well-known direct protection methods (coating of steel surface, coating of concrete surface, and by using concrete admixtures). A total of 16 accelerated corrosion cells were tested in order to measure the total mass loss of the reinforcing steel bars which expresses the effectiveness of all direct and indirect protection methods.

Keyword: Corrosion resistance; (FRP) wrapping sheets; indirect corrosion protection; CFRP; GFRP.

Paper Title: **A Proposed Cascaded Multilevel Inverter with R-Load at Different Carrier Frequencies**

Abstract:Cascaded multilevel inverter has the major problem as voltage imbalance across the capacitors connected in circuits which are acting like dc sources. The number of level generation depends on the number of DC sources and switches placed in cascaded multilevel inverter topology. In this proposed topology the positive levels and zero levels of the inverter have been explained. This topology also work in symmetrical condition. The topology is simulated in MATLAB and its THDs are calculated at different modulation index. The voltage stress and loss calculations are carried out at different carrier frequencies.

Paper Title: **Performance Analysis of Spectrum Sensing in Cognitive Radio under Low SNR and Noise Floor**

	Abstract:Cognitive radio (CR) is a new technology that is proposed to improve spectrum efficiency by allowing unlicensed secondary users to access the licensed frequency bands without interfering with the licensed primary users. As there are several methods available for spectrum sensing, the energy detection (ED) is more popular due to its simple implementation. However, ED is more vulnerable to the noise uncertainty so for that reason, we present a robust detector using signal to noise ratio (SNR) with dynamic threshold energy detection technique is combined with the kernel principal component analysis (KPCA) in Cognitive Radio Networks (CRN). The primary purpose of kernel function is to ensure that its dependency relies on inner-product of data without the feature space data requirement. In this paper, with the aid of kernel function the spectrum sensing with the leading eigenvector approach is modified to a feature space of higher dimensionality.By introducing of efficient detection system with dynamic threshold facility helps the better detection levels even low SNR values with quite a lot of noise uncertainty levels. The simulation results of the proposed system reveal that KPCA outperforms with that of traditional PCA in terms of false alarm rate, detector performance when tested under various uncertainties for orthogonal frequency division multiplexing signal. **Keyword:**Cognitive Radio; Energy Detection; kernel Principal Component Analysis; Spectrum sensing; Principal Component Analysis **References:** 1. 	Paper Title:	**Automatic Tuberculosis Screening using Chest Radiographs**
	Abstract:Tuberculosis is considered to be dreadful disease also became greater peril in many regions of the world. Demonising tuberculosis still remains a challenging process where Opportunistic infections in immune compromised HIV/AIDS patients. If it is left untreated, rate of patients with tuberculosis are huge. We have standard diagnostics methods which are not considered to be accurate.They are sluggish and un faithful. An effort towards detection of tuberculosis is made in this paper by automated approach using chest radio graphs. In this method primary step is to segment an image suing texture method and lung region is extracted using graph cut extraction method. For the above said method a set of texture and shape features are formed on the lung region to	**2665-2668**

enable the CXR,then binary classifier is used to detect normal or abnormal images. In proposed method we use Artificial Neural Networks (ANN) for screening and to identify the presence of tuberculosis

Paper Title: **Bio-medical Image Retrieval using Various Statistical Methods**

Abstract:In recent, the healthcare sectors rely more on imaging technologies for early detection and diagnosis of the disease. But, the abundant images obtained from these imaging technologies have complex disease patterns associated with them and thus an expert requires more time to analyze and arrive at the decision. Hence, the image retrieval techniques have a significant role to assist the experts by retrieving the most similar images existing in the database and also help them to compare a new scan of the patient with the top matched images and arrive at the quick decision during the diagnosis of a patient. So, we have performed our studies on the two-dimensional structural Magnetic Resonance Imaging of the Open Access Series of Imaging Studies dataset. The collected images are preprocessed and categorized into different groups based on the ventricular region of the brain. After the categorization, we employ second and higher-order statistical approaches to extract the textural features. Then the computed textural features of the images existing in the dataset are compared with the textural features of a query image to retrieve the top matched images using similarity distance as the metric. Then the image retrieval performances of the proposed hybrid based statistical methods are measured. The obtained results shows that the combined features of Gray Level Co-occurrence Matrix and Law's Texture Energy Measure attains the highest precision across the categorized groups of a dataset and it achieves 80% precision for Group1, Group2 images and 60% precision for Group3 images.

Paper Title: **Performance Enhancement of Double Pipe Heat Exchanger with Helical Fin and Vortex Generator using CFD**

Abstract:Transferring heat from one fluid to another fluid without losing of major energy is a challenging task in the food processing and other industries. Double Pipe Heat Exchanger (DPHE) are light capacity Heat Exchangers (HE) used for air and other gas applications. In the present work an attempt is made to enhance the heat transfer of DPHE with helical fins and vortex generator. The working fluids are air and steam (water vapour) along outer and inner pipes. The parameters considered are helix angles, i.e. 350, 400, & 450 and pitch size i.e. 80 mm, 75 mm and 70 mm, and a vertex generator. CATIA V5 and Autodesk CFD are used for modelling and analysis. It is found that 400 angle helix fin 70 mm pitch along Delta Wing type (Triangular) vortex generator (VG) gives best performance.

Keyword:DPHE, Vortex generator, Autodesk CFD, Catia.

Paper Title: **Paddy Seed Classification and Identifying Varieties using Random Assessment Classification**

Abstract:The current research work focuses in developing an accurate and efficient classification and feature extraction algorithm for paddy seed image analysis. The paddy images that are preprocessed by applying hybrid mediangaustransform algorithms were segmented using Paddysegmatch algorithm. The resultant image's features are extracted by applying the proposed enhanced rapid SURF feature extraction including various features of image. Later, the paddy seeds are classified to form different categories by applying the proposed Random Assessment Classification algorithm. Experimental results on Paddy seed real-time image analysis database show that the proposed method performs better classification accuracy compared with SVM and KNN classification algorithms.

Paper Title: **Data Analyzing Immigration to Canada using Predictive Analysis (Multiple Linear and Non-Linear Regression)**

Abstract:The immigration to Canada impacts the government in different manner like increase in population, waste, fossil fuel and it also benefits like increase economic growth, trade which will increase the GDP value of Canada, increase in workforce of country, open market, globalization, technologies and adapt to different cultures, food, and people[1]. These would result in a decrease in discrimination and aware about their rights and duties. The immigrants are more interested in entrepreneurship than others [2]. Which would impact increase in development in the country. The work explores the impact of immigration to Canada from all around the world. The top 5 countries that immigrate to Canada is analyzed by using Jupyter notebook. The prediction is done only for the top 5 countries that immigrate to Canada by analyzing the previous immigrants from 1980 - 2013. The multiple linear regression is used to analyze the data.

Paper Title: **Factors Affecting the Adoption of Moodle in Gulf Universities**

Abstract:The study examined the Moodle system adoption by the students in three Gulf universities “Saudi Arabia, United Arab Emirates and the Kingdom of Bahrain” and examines the students' perceptions towards this system from the framework of two theories: The Theory of Reasoned Action (TRA) and the Theory of Planned Behavior (TPB). This study is descriptive survey research. The convenience sampling technique was adopted in the selection of 231 respondents from the sampled universities. The results revealed that the students used the Moodle system for many purposes such as doing assignments, to check upcoming events, downloading the course materials and to participate in discussions with my instructors. The results also revealed that the most impactful perceived ease of use factors: easy usage, flexibility and interaction. Finally, the study is suggested to investigate academic concerns and needs to develop the usage of Moodle in Arabian and Gulf universities.

	Paper Title:	**Implementation of the Contante Justitie Principle of Justice in Local Leaders Election and General Election in Indonesia**

Abstract:The Settlement of Disputes over local leaders election and general election disputes in Indonesia is currently conducted in several legal institutions . The settlement, among others, was approved by the election supervisory agency (Bawaslu) and the Civil service arbitration tribunal (PTUN). To resolve disputes over the results of the local leaders and the general election conducted by the Constitutional Court. When there is a violation on code of conduct by the election organizer is resolved by The Honorary Council of The General Election Organizer . The settlement of disputes over general election and local leader election leaves an inconsistence if related to Law number 48 of 2009 concerning Judicial Power, which leads to legal uncertaity. This paper uses the normative research method by using an agreement (statute approach) and using a case (case approach). This paper analyzes the implemantation of the Contante Justitie Principle to realize legal objectives for justice, certainty and expediency. From these considerations emerged a new statement needed in court to resolve disputes over local leaders election and general election, so that the objective of law that had been aspired to were obtained.

Keyword: Contante Justitie Principle, Regional Heads Election, and General Election, Electoral Justice.

Paper Title: **Planning of People Management System in One of the Telecommunication Companies in Indonesia using the System Usability Scale Method**

Abstract:At this time the application for mobile applications on an industrial scale and companies are still considered very lacking for it's application, it is because the industry that is currently running is still likely to use a desktop. Which with the mobile application opportunity and understanding of technology from everyone in the company, business process automation can be done more efficiently through mobile applications. Planning of this people management system aims to resolve the problem experienced by one of the telecommunications companies in Indonesia, which at present employees find it very difficult to make requests for overtime, leave and claims, because the current system is still in desktop or manual form filling which still depends on the office network environment. Therefore, a mobile application-based People Management System (PMS) will be made in which the process will run in real time and can be done anywhere. For the initial stages of development planning Mobile applications for People Management System (PMS) will greatly help the company problems mentioned earlier. By using Heuristic Task Analysis (HTA) as a method for reviewing the effectiveness of work and activities that are not properly carried out, so it can be obtained desirable productivity (Stanton, 2006)., and the System Usability Scale (SUS) method for interface testing which is carried out directly by end users (Martoyo & Falahah,2015). Based on the provisions of the System Usability Scale score, the assessment results of 10 respondents for the People management system application of 79.0 where the score is the Acceptability Ranges in the Acceptable category and are in grade B. From these results it is felt that there is still need for further development because current planning is for the initial planning phase, there needs to be further development to improve the performance of the company and comfort for employees.

Paper Title: **An Adaptive Authentication Schemes based on the user Mobility in Medical-IoT**

Abstract:The utilization of wireless communication in the medical The utilization of wireless communication in the medical filed led to the quality life of patients. The patients who are residing in the remote areas can consult and communicate with the doctors through the health care authority. However, providing the security at the time of communication is a difficult task in medical-IoT. The researchers developed many schemes for data authentication, but every scheme has their own drawback and they are majorly concentrated on the static communication. This paper developed the different authentication mechanisms between the patient and doctor who are available in different regions. The proposed mechanism provides the authentication, anonymity, data integrity and mutual authentication. It also uses the symmetric encryption techniques to preserve the security in Medical–IoT. The performance of the authentication mechanism is tested with real time environment. The results proved that the proposed algorithm is efficient in resisting the replay attacks and preserves the anonymity, data integrity and authentication.

Paper Title: **Multipath Routing of Elephant Flows in Data Centers Based on Software Defined Networking**

Abstract:The data center networks encompass various cloud services. Network congestion and network load imbalance may occur in data center networks due to elephant flows. In order to improve the throughput and overall utilization of the network, a dynamic load balancing mechanism has to be in place. Software Defined Networking (SDN) is used to perform the balancing of the network load. SDN can obtain the global view of the network and hence contain the status and topology of the entire data center network. The elephant flows can be split and send to multiple paths based on the current state of the network. The described idea is implemented in the OpenFlow environment and tested for improvement. The result shows the enhancement in throughput and network utilization.

Paper Title:	**Tool of Automated System Armoured Scaffold to Rank Requirements through AHP**

Abstract:Requirement Engineering is really significant phase in software development life cycle. Construction of software and its functionalities is entirelygrounded on the requirements elicited for the project[6]. In this paper, we propose a tool to prioritize the requirements only with AHP bearing in mind effortless implementation for large Scale Application, Precision of result and Stakeholder's Contribution. The tool is developed in Java and SQL. This work principallyfocused on applying AHP for larger projects. The proposed framework has been assessed through an exploratory case study that has fixed number of requirements and the status after the arrival of new requirements to the priority list. This is to know about the certainty of the projected framework, which has been conducted in a software firm. Then the tool was developed for the framework and used by the company to check for the certainty of result. The deployment of the tool and the result obtained from the effort are presented.

Keyword:AHP, Tool, Requirement prioritization, Users, comparisons, priority.

Paper Title:	**Multiple Fault Detection of Rolling Bearing through Ensemble Empirical Mode Decomposition of Vibration Signal**

Abstract:Generally, two or more faults occur simultaneously in the bearings. These Compound Faults (CF) in bearing, are most difficult type of faults to detect, by any data-driven method including machine learning. Hence, it is a primary requirement to decompose the fault vibration signals logically, so that frequencies can be grouped in parts. Empirical Mode Decomposition (EMD) is one of the simplest techniques of decomposition of signals. In

2724-2726

this paper we have used Ensemble Empirical Mode Decomposition (EEMD) technique for compound fault detection/identification. Ensembled Empirical Mode Decomposition is found useful, where a white noise helps to detect the bearing frequencies. The graphs show clearly the capability of EEMD to detect the multiple faults in rolling bearings.

Authors:	**G Manjunath Swamy, G. R. Bharath Sai Kumar, K Veeresh**
Paper Title:	**Development and Testing of Hydraulic 'Bharath Valve' to Control Multiple Actuators**

Abstract: The Research is entitled "Design, Fabrication and Performance Testing of Directional Control Valve for Control of Multiple Actuators". An indexing unit is a direction control valve used in Hydraulic system. This device shall be named 'Bharath Valve' (US10180190), as is the name of its Inventor. This valve can control more than one number of actuators. This valve consists of a hollow outer cylinder and inner cylinder. The inner cylinder fits in the hollow portion of outer cylinder; this inner cylinder is operated manually. The rotation of the inner cylinder inside the outer cylinder changes the direction of flow of liquid through the valve this control the movements of actuator. This Indexing valve can become a highly advantageous replacement of the conventional Spool valves that are used for controlling the actuator. In the present scenario one spool valve can control only one actuator thus the number spool valves used in a hydraulic system is equal to the number of actuators. However 'Bharath' valve can control more than one number of actuators, this in turn makes the number of system components less and also reduces the overall cost of hydraulic system. Even the controlling of movement of actuators can be easy. A computer interface if given can make this valve versatile and a very cheap alternative to the existing valves, taking number of components, construction, friction and efficiency into account. This research proves that 'Bharath' valve has more advantages than that of existing ones and some of the advantages are listed below,

- One valve can control more than one actuators thus reduces the number of valves.
- Construction of this indexing valve is simpler and parts involved in friction is less.
- Reduction in the cost of manufacturing is highly significant.
- This valve makes it possible to actuate the desired cylinder keeping the other at rest.
- The modification in operating actuators of system can be easily changed by operating ON/OFF flow valve connected to the inlets of Indexing valve.

Keyword: Bharath Valve, Hydraulic Indexing valve, spool valve, rotary valve, pump, motor, hydraulic actuators, efficiency etc.

Paper Title: **Chronic Kidney Disease Diagnosis Model Based on Case Based Reasoning**

Abstract:Provision of health care services is still a major challenge for developing countries. To mention some of the challenges: Lack of highly qualified medical human resources, financial as well as the ability of manage and transform scare resources to meet healthcare needs. In particular, In Ethiopia health care management related to the kidney disorder suffers from the following challenges: lack of highly qualified medical human resources, financial as well as the ability to manage and transform scarce resources to meet healthcare needs.On the one hand, Artificial Intelligence (AI) helps the medical sciences. Hence, in this paper we proposed a framework for CBR system to facilitate and support the diagnosis of chronic kidney diseases with domain expert's advice. Interview and techniques have been employed on this study to acquire the necessary information required to develop intended CBR system. Finally, we evaluate the performance of the developed framework using recall and precision.

Paper Title: **ROI Selection Criteria for Finding the Abnormal Tissues from Breast Magnetic Resonance Imaging**

Abstract: The imaging methods in breast diagnostics play a preeminent role in the early detection and finding out the exact location & area of the suspicious breast tissues for malignancy. The further treatment significantly depends on the tumour-to-breast size relationship. The tumor size considered as the most influential factors for pathological/clinical assessment of breast cancer. In general, localization of the tumor's location and also the selection of a region of interest (ROI) were performed manually by an experienced radiologist. The objective of this paper is to propose an effective criterion for selection of ROI for abnormal tissues detection from breast MRI. This paper implements an efficacious ROI selection criterion for finding the exact location & area of the breast abnormal tissues from magnetic resonance imaging automatically. The proposed algorithm integrates the simple techniques like filtering, edge detection and morphological operations for inner segmentation. Outer breast region segmentation is performed by selecting the peak and valley points and then connects the selected points by

2744-2749

applying fit to circle function which makes the MR image rotation invariant. The method is implemented on the 80 images contained in S1 dataset i.e. multi-parametric breast MRI dataset and the evaluation is done through comparative analysis of predicted image with manually segmented images. The experimental results in terms of evaluation matrices i.e. Precision, Recall and Score depict the efficacy of the proposed work.

	Paper Title:	**Energy Efficient Data Aggregation in Wireless Sensor Networks using Mobile Sink Node**

Abstract:The wireless sensor networks consist of numerous small nodes which are also called as energy resource-constrained sensor nodes. The communication of these nodes can be done in a various way. There is also the processing of signal tasks which is done through the various computational resources provided by the networks. The energy of the sensor nodes gets consumed when transmit the data or receive data from the network. To reduce energy consumption of the network various techniques has been proposed which are known as clustering techniques. In the proposed work the mobile sink is deployed in the network which reduces overhead in the network. Experimental results shows that the proposed work outperforms the existing one in terms of reduced energy consumption of the network, increased throughput of the network, reduced delay in the network.

Paper Title: **Coaxial Probe Fed Modified Sierpinski Fractal Antenna for Wireless Applications**

Abstract:A modified Sierpinski fractal antenna has been designed for wireless applications. The designed antenna exhibits multiple resonance behavior due to the basic attributes of the fractal shapes. The proposed antenna has planar, compact in size and is suitable for various wireless applications. It is designed on the Flame Retardant epoxy board substrate (FR4), which is very easily available, light in weight and has less cost. IFS (Iterated Function System) methodology is accustomed to generate the complex fractal layout using the scripting methodology (.vbs) in the HFSS simulator. Scripting method provides a straight forward solution to generate complicated fractal structures by generating code in MATLAB. The proposed antenna resonates at five different frequencies 1.859 GHz, 3.623 GHz, 5.929 GHz, 9.095 GHz and 9.547 GHz with smart values of return loss up to -26 dB. It additionally demonstrates good radiation properties and has VSWR values less than two for all resonating frequencies. Radiation characteristics are displayed by 2D and 3D radiation patterns. It also has an low profile value of Gain of 3 dB.

Paper Title: **Mathematical Modelling and Tray Drying Kinetics of Loquat (Eriobotrya japonica)**

Abstract:The present study was aimed to investigate drying of loquat slices in tray dryer at different temperatures Drying was conducted at 45°C, 55 °C, and 65°C at constant air velocity of 0.5 m/s in tray dryer;time taken for drying of slices was 12 h, 10 h and 9h respectively. The analysed moisture data was fitted in four different drying mathematical models, i.e. Henderson and Pabis, Page, Logarithmic and Newton (Lewis).Statistical analysis predicted that Page model was best-fitted model for describing drying characteristics of loquat slices. Best-fitted model was selected by obtaining maximum value of regression coefficient (R2) and minimum value of chi square ($\chi 2$) and root mean square error (RSME). It was observed that shrinkage percentage was less at higher temperature as compared to the lower temperature, i.e., 45°C.

	Paper Title:	**Application Framework Development for Algorithm Design of PAPR Reduction in OFDM**

Abstract:Orthogonal Frequency Division Multiplexing (OFDM) is a well-built candidate for Physical Layer of 5G Communications as like it was there in 3G and 4G. With many advantages OFDM has some limitations like synchronization, Peak to Average Power Ratio (PAPR) etc. PAPR in OFDM remained the hot topic in PHY design of modern wireless communication systems since decades. Researchers are working to solve this problem with various approaches. Being one of the problem solvers team we realized that for a new researcher major effort goes into development of framework rather than actual PAPR algorithm. With this paper we tried to solve this issue by designing a simplified framework for developing, testing and measurement of PAPR of OFDM in Laboratory Virtual Instrumentation Engineering Workbench (LabVIEW) Platform. LabVIEW is a cutting edge, state of the art graphical programming environment which makes programming more simplified by adapting icons and connectors instead of text instructions, which makes computer programming language least complex, so that one can focus more on algorithm design rather than solving syntactical issues of the programming language. There are numerous applications of LabVIEW platform such as Instrumentation, image processing, digital signal processing, digital communication and many more. We have used core programming, signal processing and digital communication modules of LabVIEW for this research work. This paper has three sections, in section one, we explained need of framework, in second section we have explained detailed explanation of framework and its deployment and in the third section result and conclusion has been described..

Paper Title:	**Effects of Fault Current Limiters in Transient Stability Performance of Hybrid Wind Farm**	

Abstract:Low voltage ride through capability is an ability of the wind farm to stay connected with grid at the time of disturbance in the power system. The penetration of wind based renewable energy resources is increasing and the low voltage ride through consideration is vital for systems studies. The literature available demonstrates the improvement in low voltage ride through either by using fault current limiters or by implementing a control strategy for induction generator based wind farms. In this paper the low voltage ride through capability enhancement of the fixed speed induction generator is presented with various fault current limiters. The authors have presented the effects of fault current limiters in the aggregated hybrid wind farm consisting the combination of fixed speed induction generators and doubly fed induction generators which is not available in literature so far. A transient fault is simulated using PSCAD/EMTDC software in both the cases and the results are presented and discussed.

Paper Title: **Microcontroller Based Bi-Directional DC-DC Converter for Automobile Application**

Abstract:This paper presents different topology for non isolating bi-directional dc–dc converter for automotive application. To increase and decrease the voltage level Buck-boost bidirectional converter type is used. This type of converter reduces the switching losses by using less number of switches. Also regenerative concept was introduced. During braking operation the energy stored in the motor was reduced by buck operation of the bidirectional converter and stored into the battery. This Battery will also act as the supply voltage when required. An auxiliary energy storage battery stores the regenerated energy which is obtained during the process of braking and it fed back to the electric machine in the electric vehicle applications. Auxiliary battery provides the power to the bidirectional dc-dc converter to boost the high-voltage bus during vehicle starting. To achieve power transfer between two dc power sources in either direction, the bidirectional dc-dc converters are used since it has the ability to reverse the direction of the current flow and power. This can also be used in multi port systems. In Multi-Port HEVs, two or more voltage source purposes of better performances of the vehicle are used.

Keyword:dc–dc converter, Buck-boost bidirectional converter, Auxiliary battery, Multi-Port HEVs.

Paper Title: **Awareness on Calcium Carbide Ripened Fruits and Recommendations for Toxic Free Artificial Ripening of Fruits**

Abstract:Fruit ripening using calcium carbide became a bad practice by the fruits sellers. Unfortunately calcium carbide being a low priced alternative available to the fruit traders/cold store operators/farmers, other safe methods are not practiced by the fruit producers/sellers. In spite of ban on usage of calcium carbide for the purposes of fruit ripening, several farmers and traders use calcium carbide due to its easy availability and non-awareness of its toxicity on human health. Study is conducted on awareness of these factors among the fruit consumers. About 190 literates gave the feedback, based on which recommendations made for making safe and healthy fruits available in the market for consumers. Initiatives of government of India on these aspects are also discussed. Technical details on ethylene ripening chambers and its maintenance are also presented.

Keyword: Fruit ripening, Calcium carbide, safe ripening practices, mango and banana ripening chambers, Ethylene.

Paper Title: **Forward-Lane Integrity Watchdog System**

Abstract:Today there exist a lot of smart vehicles which can change lane on their own, using their sensors to detect the vehicles around them and using various neural or non-neural algorithms to detect the lane on the road. But these are inherently limited to well-structured road environment and struggle with un-structured road or damaged road. This paper aims to propose a new system, based on cloud and deep-learning neutral networks to process images from each region to train a neural network to be highly efficient in that particular region. We use "Collective wisdom" of people along with data analysis to improve the accuracy of the model.

Keyword:convolutional neural network, cloud-computing, data analysis, un-structured roads, collective wisdom

Paper Title: **Proactive Fault Tolerance Policy for Virtual Machine Management in Private Cloud Environment**

Abstract:Cloud computing being a new delivery model has many research challenges. It opens the door to great amount of innovative methods and practices. Many researchers have come-up with novel and efficient fault tolerant solutions for the cloud. With the rapid advancement in internet technology, usage of smart devices and social networking are giving rise to tremendous amount of data and demands resources like never before. Cloud

2793-2796

computing delivery model provides solution to the need of the day. The recent advancement in IoT, Edge computing etc, has expanded the scope of visualizing cloud computing with a different perspective. There is a need for re-provisioning the existing components of the cloud model. Most of the research on fault tolerant algorithms, mechanisms and techniques are focused on datacenters. In this paper we propose fault detection and prevention policies for VM creation lifecycle derived from cloud computing patterns.

Keyword: Fault Tolerance, Proactive policies, patterns, Virtual Machine.

Paper Title: **Image Encryption and Decryption using RSA Algorithm with Share Creation Techniques**

Abstract:visual cryptography system proposed a image encryption and decryption method. In the proposed method Red, Green, Blue color images using visual cryptography. In existing system is working for share created, it is encrypted separately by using visual secret share creation (VSS) algorithms. The proposed work is original images share1 and ahare2 created XOR-Based visual cryptography. This proposed schemes share1 encryption and share2 encryption included in RSA algorithm. The share1 and ahare2 decryption process is enable secret image sharing and then stacking. The proposed system is value calculate the PSNR and MSE formula and then image security using NPCR and UACI formula. The visual cryptography existing work to compare the proposed work and better results quality of RGB color images. The color image encryption and decryption using RSA algorithm and matlab coding.

Keyword: Image security, Share creation Method, RSA algorithm, NPCR, UACI.

Paper Title: **Development of A Multiparameter Algorithm for Establishing the Economic Efficiency of Research**

Abstract:This article presents the results of the development of a universal multi-parameter algorithm, which consists in applying the research of the level of resistance to financial and economic risks, taking into account the stage of the life cycle of the production process and the level of production stability and technological risks. The relationship between the levels of risk tolerance of subjects from the stage of the life cycle of the production process is revealed and studied. An algorithm for taking preventive measures is proposed.

Keyword:algorithm, technological parameters, systematization of data, optimization.

Paper Title: **An Enhancement of Underwater Images using DCP and CLAHE Algorithm**

Abstract:The lack of resource requirement in this population world, we are in a position to require another resources. In this regard, ocean is one of our sustenance. It is the exact platform for various applications like, transport, food, energy etc., but still we are surveyed partly at all aspects. One of the main focus of challenge is scattering of light as it penetrate from air to water which presents us with a bluish background while studying the scenery. In this, added to this there is a hazy appearance in the visuals and calls for Image Enhancement techniques. Here, Dark Channel Prior(DCP) is used to remove the haze and noise induced by the bluish environment. However, this proposal of method is also used to increase darkness of the image, Contrast Limited Adaptive Histogram Equalization (CLAHE) is used on the RGB image to enhance the contrast and intensity of the image. Finally, we get visually pleasing result, colour correlation method is carried out. The experimental result shows that a enhanced underwater image from the base image, and mostly useful to analyze and monitoring the underwater images.

Keyword:CLAHE, Dark channel prior, Haze, Image Enhancement, RGB

Paper Title: **A DQ Synchronous Reference Frame Current Control for Grid Connected Photovoltaic Systems using Single Phase Cascaded H Bridge Multilevel Inverter**

Abstract:This paper projects a high performance decoupled current control using a dq synchronous reference frame for single-phase inverter. For the three-phase inverter the conversion from AC to DC with Proportional Integral controller grants to obtain steady state error for AC Voltages and currents but has a few challenges with the single-phase systems. Hence, an orthogonal pair (β) is created by shifting the phase by one quarter cycle with respect to the real component (α) which is needed for the transformation from stationary to rotating frame. The synchronous reference frame control theory helps in controlling the AC voltage by using DC signal as the reference with the proportional integrator controllers. The implementation of the control is done with two-stage converter with LCL filter for a single-phase photovoltaic system. A modified MPPT Incremental conductance algorithm along with decoupled current control helps in regulating the active and reactive power infused into the grid where the power factor is improved, the efficiency of the system is increased above 95% and total harmonic distortion for current is also reduced to3%. The results have been validated using MATLAB.

	Paper Title:	**An Advanced Strategy of Multi User Storage System for Cloud Computing**	
	Abstract:Cloud computing is an emerging model of business computing. In cloud computing, client can use and retrieve the services anytime by using any smart devices to manage complex computing processes and to access very large data storage. The developers have recognized the required of a multi USER storage system that can help in utilizing the cloud power by enhancing its functionality and improve its performance. In this paper, proposing the architecture of advanced Multi-user storage System which primarily focuses on the price negotiation		**2823-2826**

mechanism between cloud users and providers. This system presents a perfect way for scalable and open systems that are changed dynamically. The model is based on cooperative and collaborative USERs and is managed. Also this architecture is designed to monitor the user's jobs while they are being processed.

Paper Title: **Safety Measures and Auto Detection against SQL Injection Attacks**

Abstract:The SQL injection attack (SQLIA) occurred when the attacker integrating a code of a malicious SQL query into a valid query statement via a non-valid input. As a result the relational database management system will trigger these malicious query that cause to SQL injection attack. After successful execution, it may interrupts the CIA (confidentiality, integrity and availability) of web API. The vulnerability of Web Application Programming Interface (API) is the prior concern for any programming. The Web API is mainly based of Simple Object Access Protocol (SOAP) protocol which provide its own security and Representational State Transfer (REST) is provide the architectural style to security measures form transport layer. Most of the time developers or newly programmers does not follow the standards of safe programming and forget to validate their input fields in the form. This vulnerability in the web API opens the door for the threats and it's become a cake walk for the attacker to exploit the database associated with the web API. The objective of paper is to automate the detection of SQL injection attack and secure the poorly coded web API access through large network traffic. The Snort and Moloch approaches are used to develop the hybrid model for auto detection as well as analyze the SQL injection attack for the prototype system.

Paper Title: **Exergy Analysis of VCR System with Air-Cooled Condenser Working With Refrigerants R-134a & Hydrocarbon**

Abstract:This paper gives a detailed exergy analysis of a Vapour Compression Refrigeration System with the refrigerants R-134a and HC (mixture of R-290/R-600a). The aim of this paper is to find out the Exergy Analysis, Exergetic efficiency, Exergy Product, Exergy Destruction Ratio (EDR), Co-efficient of performance and 2nd law efficiency for the main components of the system such as compressor, condenser, evaporator and expansion device (throttle valve). The objective of this work is to find out an exergy analysis of the Hydrocarbon refrigerant as an alternative for R-134a. The VCRS performance using R134a will be evaluated for the effect of evaporating temperature on COP, exergetic efficiency and EDR and then compared with Hydrocarbon refrigerant. Due to prevention of GWP (Global Warming Potential), Hydrocarbon and R-134a are used as refrigerants to give better result for domestic refrigerator operation[8].

Keyword:COP, EDR, EP, Exergetic loss,Exergic efficiency, Exergy Product, Hydrocarbon and R-134a.

Paper Title: **Performance Testing in A Multi Tenant Cloud Architecture using Genetic Algorithm**

Abstract:Recent researches in cloud discusses about the application response testing, performance testing, security testing and many more, but still there is a lack of researches addressing issues like resource utilization and user interactions in cloud SaaS testing. The load on the cloud, SaaS instance keeps varying dynamically with respect to time, it is difficult to find the exact load at a particular interval of time. One does not know where to look for the solution and where to start, this made SaaS instances non deterministic in nature. In order to find a solution for such non deterministic problems, we make use of Genetic Algorithm which is considered as a good solution for non-deterministic problems.We determine the optimized resources that a cloud instance, would need to manage the dynamic load at all times. Toaddress the resource utilization of a group of users in Multi-Tenant Architecture (MTA), we adopt Genetic Algorithm which uses a popular technique, called neighborhood search and instance ranking policy. The basic concept of this paper is to explore the neighbors of an existing solution, that is considered as the solutions which can be obtained with a specific operation on the base population. In addition to that,this paper discusses about the ranking of all the available population and select the most highly ranked one. Instance ranking policies are aimed at minimizing the number of nodes in use or maximize the resources available to each node in an instance.

Keyword: Software-as-a-Service (SaaS), Virtual Machines, Cloud Multi Tenant Architecture (MTA), Genetic Algorithm (GA), Non-determinism.

Paper Title: **In Silico Molecular Modeling & Docking of Phytochemical Compounds with Odorant Binding Proteins (OBP1) of Culex Quinquefasciatus.**

Abstract: Malaria, Dengue Fever, West Nile Encephalities, Sleeping Sickness, Leishmaniasis, Japanese encephalitis (JE) are the widest large range of diseases causing highest mortality to human beings at Global level and they belong to the group Vector borne diseases (VBD). It is estimated that more than one million deaths were happening every year mostly in tropical regions of South America, Africa & Asia due to these vectors i.e., mosquitoes and mites, which are main disease transporting vectors from one host to another. A remarkable effort has been made to develop various types of insecticides and insect repellents. To control VBD, a bio-defense strategy methods have been employed which were found to be more costly and labour intensive, recurring and time consuming. A new class of repellents were made based on structure based rational approaches of ligand molecules based binding efficiencies with Odorant binding proteins (OBPs) or other olfaction inhibitory compounds with attractive characteristics.

But, with very limited knowledge available to screen photo-chemical compounds to design novel mosquito repellents employing a very high-throughput Insilco computational biology methods. Therefore, in this context, we attempted to screen out 3 phytochemicals from different plants exhibiting mosquito repellent activities reported from published literature and various public domains & molecular docking studies, aiming at the Odorant Binding Proteins of Culex quinquefasciatus. The N, N-Diethyl-m-toluamide (DEET) was widely used mosquito repellent chemical chosen as standard reference to validate the binding affinities and specificities of selected compounds aligned with Odoront Binding Proteins. A total of such 50 compounds including DEET were docked against the active site of OBT models or Crystal Structures using AutoDock. Among 5 phytochemical compounds, sum of 3 compounds have resulted in high affinity binding energies & high no of hydrogen-bonds as compared to standard reference of DEET. Among the selected Citronellol, Saponin, and Azadirachtin, are showing the highest docking scores which secure to develop more effective and safer mosquito repellents in future prospect.

Keyword: Odorant-binding protein, Phyto-chemicals, DEET, Azadirachtin.

	Paper Title:	**Performance Exploration on Various Document Clustering Techniques with K-Means Family**	
	Abstract:Clustering performs a important position in numerous fields which include Computer science & packages, facts, pattern reputation, system studying technique and find out dating among the files. Clustering focuses on document clustering, and other related area. Increase within the extent of statistics saved in virtual form (text, photograph, audio) has improved the need for requirement of an automated tool, that allows people to find and manage the records in an efficient way. Usually clustering refer to document clustering technique investigates the documents and find its relation. This paper center of attention on the a range of clustering methods and evaluation its overall performance. This paper also categories the document clustering techniques as three major groups, namely Group K-means, Expectation Maximization and Semantic-based techniques (Hybrid method). Several experiments were conducted to analyse the performance accuracy and Speed. **Keyword**: K means, K*, Hybrid, data set, bisection. **References:** 1. 	Paper Title:	**Forecasting Foreign Currency Exchange Price using Long Short-Term Memory with K-Nearest Neighbor Method**	
	Abstract:With the growing population in the world, economic stability varies day by day. In case of India all banking transaction rules and regulations are taken by Reserve bank of India (RBI) whereas for other countries it is different. Therefore numerous academicians have projected their research on forecasting the currency exchange rate for diverse countryside. Foreign currency exchange rate prediction is a very pivotal task for international market. Hence researchers have explored different methods for predicting foreign currency exchange rate. In this work, we have taken Indian rupees (INR) with two different country's data set such as Japanese yen (JPY) andChinese Yuan (CNY)for daily, weekly and monthlyprediction beforehand. We implemented a hybrid model oflong short-term memory (LSTM) with K-nearest neighbour (KNN) which gives better opening price prediction accuracy on our dataset. The accuracy of the prediction results are measured by the help of performance standards such as mean absolute percentage error (MAPE) and root mean square error (RMSE). **Keyword:**Currency exchange rate, LSTM, KNN, RBI. **References:** 1. Paper Title:	**An Adaptive Slide Window Security Method for Transaction Updation in Data Stream Mining**	

Abstract:Data steam mining has gained large interest in current research domain. Where various information's are retrieved based on the content of the context, the accuracy of the input stream with respect to its privacy is a major challenge. Windowing technique is used an effective approach in providing security measure in data stream mining. The recent develop windowing approach operates using sliding window, where anonymity is focused by different processing rules. The linear search sliding window has a constraint of search overhead and loss of generality under distributed information. In this paper, a new adaptive window approach for privacy coding in data stream mining is proposed. This presented approach is developed with the concern of minimize the search overhead and accuracy in search mining performance using adaptive window monitoring.

Keyword: Slide window approach, adaptive window coding, data stream mining.

Paper Title: **An Intrusion Detection Model Based on Deep Long Short Term Recurrent Neural Network**

Abstract:With the rapid increase of network based services and internet users on various platforms are becoming the major targets of attacks. Intrusion detection is the process of monitoring the attacks and analyzing their signs and violation of security policies which are occurring in the systems or networks. Intrusion Detection System is a prominent research area in security analysis and evaluation. In order to identify the attack type, we proposed Deep Long Short Term Memory-Recurrent Neural Network (DLSTM-RNN) method with seven optimizers and 500 epochs to train and test a dataset. Initially the data transformation, normalization are used to preprocess the data. The preprocessed train and test data is given input to the model. The bench mark NSL-KDD dataset used to train and test the model. The results are obtained for five-class classification (attack types).The model outperformed with adamax optimizer on NSL-KDD dataset. The metrics accuracy, detection rate, and false alarm rate areevaluated to ascertain the detection efficacy of the model. We compare the model to existing convolutional learning methods.

Paper Title: **Towards Developing Sustainable Smart Cities in India**

Abstract:The present paper provides a comprehensive review of frameworks for Sustainable and Smart Cities. The key findings highlight the large gap between the concept of Smart Cities and Environmental Sustainability. We recommend to improve the sustainability quotient by incorporating the use of Information and Communication Technology, thus developing Sustainable Smart Cities. In India, the stipulated guidelines regarding Smart Cities have been proposed by Ministry of Urban Development (MOUD) and 14 environmental indicators have been proposed. The extensive review of literature and the present guidelines demands an urgent need of framework for Sustainable Smart Cities in India. Moreover, the indicators selected must fulfill the criteria for smartness and sustainability. The paper concludes by suggesting a framework comprising of four steps: Indicator selection, Benchmarking, Assigning weights and development of Sustainable Smart Cities Environmental Index by the use of selected indicators. The framework developed in this order ensures the Sustainable Smart Cities appear attainable in India.

Paper Title: **Improving Security for Internet of Things Devices using Software Defined Networking**

Abstract:This theory has recently been expanded to IEEE 802.15.4 wireless networks, which constitute a key element of the Internet of Things (IoT). Nonetheless, the various patterns of traffic needed for SDN management make it difficult to adapt this method to these extremely demanding situations. Software-Defined Networking (SDN) key contribution of this work is the solution to network with IoT devices that enables network because of better functionalities in case of providing interfacesfor the layers. SDN enables significant advantages of

2881-2884

applications to be created on the basis of interaction with traffic networks, trustable authentication, or service eminence. This report suggests the use of a SDN gateway as a decentralized platform to track traffic from IoT gadgets. The configured SDN gateway capable of detection the possible abnormal behaviors and provide it particularly valuable applicability for (obstructive, transmission or application of providing best services to the system).

	Paper Title:	**Hybrid Scheduler (S_LST) for Soft Real-Time System based on Static and Dynamic Algorithm**

Abstract:In the Soft Real-Time System scheduling process with the processor is a critical task. The system schedules the processes on a processor in a time interval, and hence the processes get chance to executes on the processor. Priority-driven scheduling algorithms are sub-categorized into mainly two categories called Static Priority and Dynamic Priority Scheduler. Critical Analysis of more static and dynamic priority scheduling algorithms have been discussed in this paper. This paper has covered the static priority algorithms like Rate Monotonic (RM) and Shortest Job First (SJF) and the dynamic priority algorithms like Earliest Deadline First (EDF) and Least Slack Time First (LST). These all algorithms have been analyzed with preemptive process set and this paper has considered all the process set are periodic. This paper has also proposed a hybrid approach for efficient scheduling. In a critical analysis, it has been observed that while scheduling in underload situation dynamic priority algorithms perform well and even EDF also make sure that all process will meet their deadline. However, in an overload situation, the performance of dynamic priority algorithms reduce quickly, and most of the task will miss its deadline, whereas static priority scheduling algorithms miss a few deadlines, even it is possible to schedule all processes in underload situation, whereas in an overload situation, the static algorithms perform well compared to the dynamic scheduler. This paper is proposing one Hybrid algorithm call S_LST which uses the concept of LST and SJF scheduling algorithm. This algorithm has been applied to the periodic task set, and observations are registered. We have observed the Success Ratio (SR) & Effective CPU Utilization (ECU) and compared all algorithms in the same conditions. It is noted that instead of using LST and SJF as an independent algorithm, Hybrid algorithm S_LST performs well in underload and overload scenario. Practical investigations have been led on a huge dataset. Data Set consists of the 7000+ process set, and each process set has one to nine processes and load varies between 0.5 to 5. It has been tried on 500-time unit to approve the rightness everything being equal.

Paper Title: **A Self-Configurable Edge Computing for Industrial IoT**

Abstract:The proliferation of Industrial Internet of Things (IIoT) introduces the concept of a smarter production environment. The emerging technologies like software defined network (SDN), IIoT and cloud computing will bring great advancements in the modern industrial revolution called Industry 4.0. Therefore, with the rapid development of IIoT technology, the proposed work incorporates with Edge Computing (EC). The current manufacturing process and automation, computing and wireless network reaches out to headways in innovation from easy to the point where all things (devices) and machines can interface through an Internet of Everything (IoE). This paper extends the work carried out in traditional methods, by integrating the cloud layer, Automatic Guided Vehicles (AGV), Industrial Wireless networks (IWN) and Industrial robots through EC is conferred to make autonomous decision-making capabilities. EC is emerging as a significant element in the smart industry to bring legacy in the context of Industrial IoT (IIoT). Finally, our proposed framework demonstrates that the active RFID-enabled AGV and industrial robots are brought in to exploit for effective resource management under the EC-based IIoT architecture, subsequently, it improves the conveyor efficiency and overall energy consumption in the warehouse for material handling.

Paper Title: **Free Code Sharing Web Platform with Intelligent Developer Suggestion Tool**

Abstract:Due to increase in demands for websites, faster deployment requirements and complex functionality requirements, developers face the need for a centralized code repository system to store repetitive codes and a suggestion tool to help them in solving the errors and warnings they face during development. The proposed system provides a centralized database for storing repetitive code segments, errors, warnings and solutions and also a code suggestion mechanism to provide suggestions to the developer during development. The system includes a code collection system to help the user to add the codes, errors and solutions to the centralized database and an analyzer system to fetch the web-page data, errors and warnings to analyze and provide appropriate suggestions to the developer. The proposed system focuses to reduce work and development time of developers by providing code suggestions during development and also facilitate effective code reusability.

Paper Title: **Tele-Healthcare Unit for Remote Patient Monitoring**

Abstract:Tele-health is characterized as the usage of electronic data and broadcast using telecommunication advancements to help and advance long-distance clinical medicinal services, patient and expert long-distance clinical health care, patient and professional health education, public healthmonitoring and health administration. In this research, the proposed system that uses Sensors to monitor patient's health and uses internet to alert the practitioner and family members in case of emergency. It is capable of monitoring health status of the patient at home, which is at remote location also. If system identifies any parameter is beyond the normal range temperature, the health care unit gives continuous alertation about the patients' status over Internet and also shows details of heartbeat & temperature of patient continuously using the IoT.

Paper Title: **Vibration Characteristics of Carbon Fiber Reinforced Polymer Composites under Varying Fiber Orientation Composition**

Abstract:Many engineering applications today are increasingly made of laminated composite plates. The properties of laminated composite plates can change as the laminate and fiber composition change, enabling the engineering structure and components to be customized according to the desired static or dynamic properties. Therefore, it is of interest to investigate variation in dynamic properties of composites under different fiber orientation composition to forecast their vibration response. In this study, the natural frequency and mode shape of carbon fiber-reinforced polymer composite plates were obtained numerically under varying composition of the 0°, ±45° and 90° fiber orientations. Sixteen different cases were simulated using finite element method, showing changes in the natural frequency and mode shape of carbon fiber-reinforced polymer composite plates with changes in the composition of the fiber orientation. The first five values of natural frequency and mode shape of the composite laminate were reported and analyzed using a surface regression method. In addition, the effect of the stacking sequence on the natural frequency of the composite plate having the same orientation composition was also analyzed. Comparison with previous studies showed good agreement of the present numerical modeling. Numerical results indicate potential to develop relationships to estimate modal properties based on composition of fiber orientation.

Keyword: Carbon fiber-reinforced polymer (CFRP), Natural frequency, Mode shapes, Fiber orientation, Stacking composition.

Paper Title: **Effect of Seismic P-Waves Propagation on Circular Tunnels in Layered Ground**

Abstract:During propagation of the compression seismic P-waves, the tunnels are subjected to ovaling deformations. In cases where the soil stiffness is varying along the tunnel cross-section, tunnel lining may take sharper deformed shapes and subjected to magnified bending moments and thrust forces. This paper investigates the effect of the soil stratification on the seismic behavior of circular tunnels under P-waves loading. A 2D finite element models with time history earthquake (EQ) analysis were performed accounting for different tunnel/soil interface slippage conditions. The finite element analysis results were compared with recent analytical solution for calculating the seismic forces of the tunnel lining. The study proved that soil stratification has a great effect on the tunnel seismic forces and it should be considered in the analysis and design. Illustrative curves were presented in this paper to give approximate magnification factors for the anticipated forces. It should be used as a guide in the preliminary design stage.

Keyword: Soil Stratification, Seismic P-Waves, Circular Tunnel, Earthquake Loads.

Paper Title: **Design & Analysis of Multiband Sierpenski Gasket Fractal Antenna using Iteration Method**

Abstract:Wireless communication systems require antennas of multiband support,small design dimensions and higher gain. To provide size reduction and better impedance matching, geometrical interpreted fractal antenna is suitable. This allows the antenna to operate at different frequencies. To rise performances with respect to bandwidth, gain and multiband resonance, an array can fulfil the requirements. This paper shows the design and simulation of the Sierpinski Gasket array for multiband applications (4GHz to 8GHz, 8GHz to 12GHz) up to 4th iteration. The fractal geometry for patch antenna is selected due to low cross polarization radiation and ease of fabrication. Sierpinski gasket is known by the name, Sierpinski triangle having triangular slots using mid-point geometry of the triangle. This array makes use of micro strip feed where FR4 epoxy is used as the dielectric substrate. A low profile dielectric is used to get the radiation in maximum amount. This antenna finds its uses in satellite communications and transmissions,Wi-Fi. The simulation is carried out by using High Frequency Structure Simulator HFSS V13 software for the proposed antenna.

	Paper Title:	**Energy Holes Minimization with Enhanced AEIAWSNHP Algorithm**	
	Abstract:The developments of wireless sensor network are motivated by many applications. It needs the Sensor nodes location. Sensor nodes are based primarily for identification procedure to resolve their significant position. In general, Sensor nodes are capable of some restricted power supply. As a result for detecting the power of sensor nodes an Identification algorithm is used by wireless sensor network. An Efficient Identify Algorithm for Wireless Sensor Networks with High Precession (AEIAWSNHP) is one efficient energy identification algorithm that has been proposed recently. In this work we examine the blow of using three techniques through the improvement of AEIAWSNHP in civilizing the energy efficient of enhanced AEIAWSNHP.At first, a Distinct-assessment Method, where a node estimate its location simply at one time. Secondly, active power manages; in this place the mention nodes decrease their communication power according to the gap to the node that transmits the position requirements. Third, an addition and expanding request speed method, that regulate the frequentness of dispatching the locate inquiry. The simulation result present that the new technique decreases the power utilization of the updated AEIAWSNH, Accuracy of the location assessment remains unchanged. **Keyword:**Identify procedure; power competence; enhanced AEIAWSNHP; consecutive-enhancement identify algorithm; Wireless sensor network. **References:** **1.** M. 	Paper Title:	**Smart Garbage Collection and Dumping System using NI myRIO and Arduino**	
	Abstract:The key issue in waste management system to ensure healthy environment is Garbage Collection and Dumping In traditional method, at public places garbage bins are placed to collect the garbage, which is usually		**2934-**

collected by the garbage collection truck with the help of employed personnel and will be sent to the dumping yard to dump the collected garbage. These bins overflowed frequently before the routine maintenance takes place, which leads to bad order and unhygienic environment causing various life-costing diseases. As this problem is increasing day-by-day, an automated system for effective waste management system is desired which can collect garbage timely without human involvement is proposed and is implemented using NI myRIO, Arduino UNO and NI LabVIEW software. The proposed system consists of two main sub systems- Big Bin and small bin. Big bin moves in a regular predefined path marked as black line in regular time intervals to collect garbage from Small Bins placed in different locations. The proposed system is capable to automate the entire garbage collection and dumping process to ensure healthy environment.

Paper Title: **N-gram based Machine Translation for English-Assamese: Two Languages with High Syntactical Dissimilarity**

Abstract:To bridge the language constraint of the people residing in northeastern region of India, machine translation system is a necessity. Large number of people in this region cannot access many services due to the language incomprehensibility. Among several languages spoken, Assamese is one of the major languages used in northeast India. Machine translation for Assamese language is limited compared to other languages. As a result, large number of people using Assamese language cannot avail lots of benefits associated with it. This paper has focused on the development of the English to Assamese translation system using n-gram model. The n-gram model works very well with the language pair having high dissimilarity in syntax compared to other models. The value of n has a very big role in the quality and efficiency of the system. Bilingual Evaluation Understudy (BLEU) score differs significantly with the change of the n-gram. This model uses tuples to reduce the consumption of excess memory and to accelerate the translation process. Parallel corpus has been used for training the n-gram based decoder called MARIE. The number of translation units extracted using n-gram model is much less than the translation units extracted using phrase based model. This has a high impact on system efficiency.

Keyword: Statistical Machine Translation, N-gram, MARIE, English-Assamese Translation, Tuple Extraction

	Paper Title:	**Text Classification of Cornell Movie Data using Data Mining with Feature Selection**

Abstract:Text Classification is branch of text mining through which we can analyze the sentiment of the movie data. In this research paper we have applied different preprocessing techniques to reduce the features from cornell movie data set. We have also applied the Correlation-based feature subset selection and chi-square feature selection technique for gathering most valuable words of each category in text mining processes. The new cornell movie data set formed after applying the preprocessing steps and feature selection techniques. We have classified the cornell movie data as positive or negative using various classifiers like Support Vector Machine (SVM), Multilayer Perceptron (MLP), Naive Bayes (NB), Bays Net (BN) and Random Forest (RF) classifier. We have also compared the classification accuracy among classifiers and achieved better accuracy i. e. 87% in case of SVM classifier with reduced number of features. The suggested classifier can be useful in opinion of movie review, analysis of any blog and documents etc.

Paper Title: **Inquisition on Cost & Time Overrun in Road Construction Projects in Kashmir.**

Abstract:The success of the project is generally acknowledged by the fact whether the project is completed within the time and budget. There are many challenges in this for completion of project within time and budget, this result in poor performance of project often. The construction cost and time overrun is most substantial problem in Jammu and Kashmir. This problem is faced by all parties like contractors, clients, subcontractors and suppliers. The aim of this research study is to find out factors that leads to cost and time overrun in road construction projects in Jammu and Kashmir. The results of this research shows the key factors that cause cost and time overrun in road construction projects in Jammu and Kashmir are Land acquisition problems, payment delay for completed work, delay in shifting of utilities inclement weather conditions, Security situation, design changes during construction, Lack of modern technology and market inflations

Keyword:project acknowledged construction, Kashmir.

Paper Title: **Design and Development of Integrated Stationary Cycling Charger for Promoting Healthy Lifestyle**

Abstract: A powerful smartphone with all the high-end features has becomes one of the basic necessitie in today's modern life. People use the smartphone not only for communication purpose, but for other things such as entertainment, education, and work. As our life has becomes very much dependent on this kind of technological gadget which makes everything easier and faster to access, it becomes a main reason for our lack of daily physical activities which poses potential health issues such as obesity, high cholesterol level and high blood pressure. Despite various brands and models of a smartphone, one thing in common is the use of battery to power the device, where it needs to be recharged over time. The movement of wheel with a motor installed able to generate electricity thus powering the battery. In this research, the enjoyable and healthy activity of cycling is further upgraded to become what is known as a "cycling charger" as a way of promoting a healthy lifestyle within the community. It focuses on the conceptual design and prototype development of a stationary cycling charger which can be located everywhere within the public area for easy access and usability. The specification and parameters of the cycling charger are determined based on the average potential users, including the electrical capacity and device protection. It is then followed by the modelling and simulation works using a software to determine the feasibility before proceeding to the prototyping stage where all the designed circuitries are fabricated and integrated with sensors and microcontrollers for processing information and providing user interface. Lastly, several measurement and operation verification are conducted to ensure a satisfactory operation of the developed

2966-2971

cycling charger. It is verified the developed prototype can be operated at a minimum cycling speed a low as 8 km/h which is good for wide range of user with different cycling ability. Its size which is basically based on the available stationary cycling exercise platform and together with an independent battery supply for all its operation make it easier and flexible to be installed within the public area.

Paper Title: **Characterization of Al-SiO2 Composite Material**

Abstract:The present investigation centers at assessing the mechanical properties of Aluminum within the sight of Silicon di-oxide, and their blends. The creations were signified the necessary level and mix throwing technique was utilized for the improvement of Aluminum Metal Matrix Composites. Basic portrayals were done on Metal Matrix Composites by X-beam diffraction techniques and Field Emission Scanning Electron Microscopy (FE-SEM) was utilized for the miniaturized scale basic examinations. The tests for mechanical properties of metal lattice composites like tensile quality and Hardness were done. Within the sight of Silicon di-oxide (0-10%) with Aluminum grid, it was clear that the densities of the composites were diminished and the hardness was expanded. Correspondingly, a decline in rigidity additionally had been seen with decline in support in the Metal Matrix. The SEM examination completed for contemplating the Material Morphology has likewise been emerged in this investigation.

Paper Title: **Improvement on Mechanical Properties of Fresh and Hardened Concrete by Marble Waste and Pumicite**

Abstract:Development, world-over is fuelled by growth of the economy and the growth of economy is fuelled by growth in infrastructure. Estimates record a consumption of 6.6 Gigatonnes of concrete in China in earlier part of this decade, for infrastructure development. But today the world is poised on a tipping point environmentally, and sustainable growth is the need of the hour. This requirement is leading to research in replacement of energy intensive materials, along with capture and utilization of available waste. Marble powder waste which has deleterious impact on environment is one such material. Existing literature majorly focus on utilization of marble powder as fine aggregates in concrete. This study aims to study the suitability of marble powder as a filler material and as a replacement of cement. Pumice breccias are used as coarse aggregates. Experimental investigations were conducted to ascertain the compressive and split tensile strength in concrete with marble powder replacing cement by various percentages. The results indicate a general improvement in both compressive and split tensile strength.

Paper Title: **A Dwt and Scrambling Based Blind Watermarking Algorithm for Digital Images Authentication**

Abstract:Like the other multimedia that is spread on the Internet, images are also vulnerable to theft and attacks. Protecting the image is therefore an urgent necessity because it represents a large proportion of the digital content. Authentication and ownership protection are the basic demands of image security and these are achieved by applying watermarking techniques. For the Muslim world, the Holy Quran has its sanctity, which does not accept any controversy or doubt. As part of keeping pace with modern technology, digital copies of the Holy Qur'an are available, which are widely distributed all over the world. Therefore, it is necessary to ensure that these copies maintain their integrity and ensure that there are no malicious manipulations. In this paper, we propose an image watermarking scheme to authenticate the images of digital version of Holy Quran using discrete wavelet transform DWT. Here a fragile watermark is used to clarify whether there is any modification occurred to the intended images. Initially the cover image is decomposed by DWT where 2nd and 4th level coefficients are exploited for watermark embedding. The intended watermark is obtained by scrambling the original cover image. Then the scrambled image is inserted into the DWT coefficients by several trials using different embedding gains. To evaluate our system and see how effective it is to detect any error or manipulation, PSNR, SSIM and MSE are employed beside that they are acting as an imperceptibility measure. Results proved that our method has achieved a good level of imperceptibility and can detect any slight tamper. It is necessary to bear in mind that this method is valid for application to normal color images as well and gives an excellent level of efficiency.

Paper Title:	**Design and Analysis of Three Phase Soft Switching Inverter Incorporating Fuzzy Logic Controller**

Abstract:A soft switching three phase inverter with the fuzzy logic system is proposed . The controller design is explained in this paper. The soft switching is achieved through zero voltage switching methods.The soft switching is attain through auxiliary circuits.Therefore, the auxiliary circuit will be enhanced the conversion efficiency, and the conduction loss will be scaled down. The performance of proposed controller is illustrated using MATLAB Simulink.The mode of the prototype is fabricated and tested. The Simulation and hardware results validate each other, which show that the presented method is both satisfactory and consistent with expectation.

Keyword: Zero voltage switching, soft switching, Fuzzy logic controller, switching losses , Three phase inverter.

	Paper Title:	**Feedback Based Adaptive Recurrent Neural Network for Cancer Detection using Gene Data Pattern**	
	Abstract:Cancer detecting technology plays a vital role in the medical community. Researches have shown that patients that are affected by cancer carry same type of genetic patterns in their DNA. With this in mind, this research work concentrates on analysing gene pattern for detecting cancer using deep learning algorithms. The Feedback based Adaptive Recurrent Neural Network (FA-RNN) approach is designed to classify and analyse the gene pattern recognition. The data augmentation is done to improve the quality of the input data from COSMIC dataset which includes the detection of missing values, removing the noise present in input using multiple imputations and reducing higher base value can be done using dimensionality reduction process. After obtaining the improved dataset, the training phase begins by estimating the exact weight value of feedback layer using feedback weight loop calculation technique to lessen number of repetition during training. Moreover, the error calculation is done to evaluate the exact weight values of feedback layer used for classification. Finally the classification is done by selecting the next appropriate hidden neuron using the neuron selection activation function. The performance of the Feedback based Adaptive Recurrent Neural Network technique can be analysed using the evaluation metrics accuracy, computation time and Root Mean Square Error (RMSE) and the attained results are compared with the Recursive Neural Network(RNN) and Convolutional Neural Network(CNN) algorithms. The obtained results such as higher accuracy, reduced RMSE and less computation time in Feedback based Adaptive Recurrent Neural Network indicates that it performs the enhanced operation than CNN and RNN.

Keyword: Convolutional Neural Network(CNN), Recursive Neural Network (RNN), Feedback based Adaptive Recurrent Neural Network (FA-RNN).

	Paper Title:	**Settlement Analysis of Recycled Concrete Fine Aggregate Blended Soils using Geostudio**	
	Abstract:Crushed concrete (CC) is one of the most abundant waste materials generated from construction industry. This material is widely recycled and used in various applications like pavement, concrete aggregates and backfilling. Crushed concrete is mixed with any of virgin soil to increase the engineering properties of soil. In the present study, a sample of crushed concrete is collected from demolished buildings at Secunderabad and the material is segregated according to gradation for the present study. The index properties of crushed concrete like pH, specific gravity, water absorption, particle size distribution are obtained. Locally available soil is partially replaced i.e., 30%, 50%, and 70% with crushed concrete fine aggregates and its compaction characteristics and shear strength parameters are determined. In the continuation of the study, a numerical model is developed using a finite element software i.e GeoStudio Sigma/w. Mesh and boundary extent convergence studies are done for the model. The top 1m virgin soil is replaced with the mixture of CC and soils. Settlements for various percentages of	

CC and for different width of footing are obtained for a uniform stress of 200kPa. The stress is applied in 5 stages in order to simulate real field conditions. It was observed that 30% replacement of CC have given the least settlement for all widths of footing considered in the study

Paper Title: **Improving Duty Cycle-based MAC Protocol in Wireless Networks using AI and Machine Learning**

Abstract:Duty cycle of a Medium Access Control (MAC) protocol is made up of sleep phase, wake-up phase and listen phase. MAC protocols usually proposes to optimize the duration of the wake-up and listen phases, in order to increase the duration of the sleep phase, thereby reducing the unwanted energy consumption of the wireless node. In this paper, we propose an Artificial Intelligence (AI) and machine learning (ML) based approach, which uses a hybrid combination of Time Division Multiple Access (TDMA), Bitmap Assisted MAC (BMA) and Sensor MAC (SMAC). The machine learning layer utilizes the duty cycle in the MAC layer, and generates multiple solutions for a given wireless communication. The AI layer then selects the best solution from the generated solutions by incorporating a duty cycle factor in the selection function, thereby optimizing the duty cycle of the protocol. The proposed system shows a 15% improvement in communication speed, and a 10% reduction in energy consumption across multiple communications. We plan to further extend this work for rural India, and apply it to real time agricultural applications.

Paper Title: **Effect of Surface Applied Organic and Inorganic Corrosion Inhibitors on Reinforced Steel in Concrete**

Abstract:This paper presents the results of an experimental investigation carried out to study the effect of surface applied organic and inorganic corrosion inhibitors on reinforced steel in concrete. The reinforcement bars were coated with Neem powder (organic inhibitor) and Zinc powder (inorganic inhibitor) as corrosion inhibitors. The samples of beams of size 100X100X640mm having 4 steel bars as reinforcement were prepared and cured in normal water for 15 days and in saline environment for 42 days. The inhibitors were applied in the form of 2 coats, 4 coats and blend of both. The grade of concrete used was M30. Half-cell Potential and Weight loss measurements were carried out to determine the efficiency of corrosion inhibitors [11]. The corrosion inhibition efficiency of controlled specimen and coated specimens were compared. From the results it was seen that samples with 4 coats of Neem showed 44% inhibition efficiency as compared to control specimens. Similarly specimens with two coats of Neem, four coats of Neem and Zinc also showed better corrosion inhibition efficiency. Highest weight loss was observed in case of control specimen. The study concludes that use of surface applied corrosion inhibitors prove efficient in enhancing the corrosion inhibition efficiency of concrete. Surface applied corrosion inhibitors provide

3023-3031

protective layer to the reinforcement thereby protecting it from corrosion and increasing the durability of the structure. This type of technique of using corrosion inhibitors in concrete can be used in various structures such as buildings, bridges, sewage pipes, marine structures, abutments & piers, RCC roads which are subjected to harsh environmental conditions.

Paper Title: **Efficacy of Channel Estimation and Efficient use of Spectrum using Optimised Cyclic Prefix (CP) in MIMO-OFDM**

Abstract:The performance of MIMO-OFDM network gets affected due to problems in the channel estimation which is essential for designing receivers. The issues in MIMO are due to sizable inadequate Cyclic Prefix (CP) in admired Orthogonal frequency division multiplexing (OFDM), a massive amount of detection error and channel estimation problem occurs due to which performance delay turn out. This paper proposes a solution, its implementation and analysis of results. The article uses the BAT and Modified Flower Pollination (MFP) algorithm for optimizing the CP length. Minimum CP length gets considered to achieve better throughput for the same MFP algorithm. This algorithm has been proposed to optimize CP length to achieve minimum error rate of bit (BER) and PAPR-Peak to average power ratio, thereby maximizing the spectrum efficiency. For comparing the efficacy of optimized CP and unoptimized CP, the paper examines the results obtained on studying the performance in the spectrum. The performance of BAT and MFP algorithm are compared with each other to determine the better optimization methodology for the problem.

Paper Title: **An Advanced Optimization Protocol for Cross Layer Routing in MANET**

Abstract:Through advancements in communication techniques, there have been significant advances in information technology. Information exchange is captive from infrastructure-based to infrastructure-free techniques. Development in wireless technology and portable computing systems has brought interest in the mobile communication field. The increasing flexibility of people around the network has generated demand for mobile networks such as MANET that can be deployed rapidly and without infrastructure. When users of MANET expect effective communication, seamless reliability is currently crucial across heterogeneous mobile wireless systems. The main challenges in adhoc networks are regular topology changes due to flexibility and limited battery capacity for mobile devices. Depletion of the power source may cause early links in the network to be unavailable. Often, due to frequent breaks in path and affects the performance adversely needed for applications as well as node flexibility. This research paper aims to test and suggest a cross-layer interaction model between transport layer, routing layer, data link layer, and physical layer with power-efficient routing intentions. Using the proposed link prediction model, the article modified the incorporated AODV routing protocol by the link prediction algorithm to predict the accessibility time and even before the connection breaks. The proposed algorithm increases the service quality of the network and NS2 simulator checked the model. The simulation results indicate that the performance of the AODV routing algorithm is much more effective than the current algorithm.

Paper Title: **Stationary Wavelet Transform based Image Fusion using fusion rules**

Abstract:Multifocus image fusion is a current research topic in the area of image processing for visual sensor

3045-

networks. Discrete wavelet transform based fusion algorithms suffer from unintended effects like smoothing of edges, loss of contrast and artifacts. To overcome these problems, Stationary Wavelet Transform based algorithm using fusion-rules is proposed and applied to multifocus images. Stationary Wavelet Transform well preserves the edges and avoid artifacts with its shift-invariance property. Entropy and spatial frequency based fusion rules in this work can effectively characterize the intensity variations in an image there by loss of contrast is minimized. Simulation results show that the proposed method can amply preserve the edges and also avoid artifacts with no loss of contrast.

Keyword: Stationary Wavelet Transform, Entropy, Image Fusion, Spatial Frequency, Fusion rules.

Paper Title:	**Hybridization of Monarch Butterfly and Grey Wolf Optimization for Optimal Routing in VANET**

515.

Abstract:The routing process in Vehicular Ad hoc Networks (VANET) remains a more demanding task in city backgrounds. Identifying an optimal end-to-end path that satisfies reduced overhead and delay control is still facing a lot of difficulties and limitations in recent days. These limitations are owing to the increased movement of vehicles, the repeated failures of a path, and the varied obstacles that might have an effect on the consistency of the data routing and transmission. Hence, this paper intends to present an enhanced VANET routing model by considering the network quality metrics including congestion, travel, collision and QoS awareness cost. Accordingly, in the proposed work, a cost model is modeled as the solution for the vehicle routing problem by taking into account the above-mentioned constraints. For determining the optimal route, this research work establishes a new hybrid algorithm known as Grey Updated Butterfly Operator (GU-BO) that links both the concepts of Monarch Butterfly Optimization (MBO) Algorithm and Grey Wolf Optimization (GWO). Finally, the performance of the implemented approach is compared over other conventional approaches with respect to congestion and cost analysis, and proves its superiority of proposed work over others.

Keyword: Collision cost; Cost analysis; MBO optimization; Optimal routing; VANET.

Paper Title: **Development of the Edible and Poisonous Mushrooms Classification Model by using the Feature Selection and the Decision Tree Techniques**

Abstract:This research aims to develop a classification model for edible and poisonous mushrooms by applying the feature selection approach together with the decision tree technique. Two feature selection methods were applied, including 1) Chi-square and 2) Information Gain, while the effectiveness of the model was compared by three decision tree methods such as Iterative Dichotomiser3, C4.5 and Random Forest. The data used for classifying the edible and poisonous mushrooms derived from the Encyclopedia of Thai mushrooms and the book entitled "Diversity of Mushrooms and Macrofungi in Thailand". The results of the model's effectiveness evaluation revealed that the model using the Information Gain technique alongside with the Random Forest technique provided the most accurate classification outcomes at 94.19%; therefore, this model could be further applied in the future studies.

	Paper Title:	**A Novel Integrated Type 2 Diabetes Prediction Model for Indian Population using Data Mining Techniques**

Abstract:Late diagnosis and undiagnosed type 2 diabetes are the two major concerns for India, which is going to be a diabetes capital shortly. Several diabetes risk score (DRS) tools have been proposed and deployed for detecting the persons with high risk. These DRS tools have been developed using the multiple logistic regression model. But this model is both imperfect and subject to misuse. Another major issue with the DRS tools developed for Indian population is that they are based on the very limited urban population that does not represent the population of India. The objective of current research work is to develop a classification model for type 2 diabetes prediction. Along with this, the building of a novel integrated model for type 2 diabetes risk prediction is discussed consisting of the aggregate classification model and Indian weighted diabetes risk score model. The dataset used to develop and validate the model is obtained from the Annual Health Survey comprising of nearly 0.7 million and nearly 75 thousand adult participants respectively from around 400 districts of India. The proposed integrated diabetes risk prediction model predicts diabetes with 69.89% sensitivity, 56.58% specificity. The positive predictive value of the proposed integrated model is 15.88%, which is a significant improvement as the prevalence of diabetes is only 3.68% for the study population. Developing countries such as India, where undiagnosed diabetes and limited financial resources are a significant concern, the proposed integrated model for diabetes risk prediction can be useful as a cheaper tool useful for mass-screening, which can save up to 30% of the total screening cost.

	Paper Title:	**Implementation of Parallel and Pipeline Scheme in the Standard Floating Point Adder to Improve the Speed**

Abstract:In real time Signal Processing applications, the analogue signal is over sampled as per the Nyquist criterion in order to avoid the aliasing effect. Floating Point (FP) adder is used in the floating point Multiplier Accumulator Content (MAC) for real time Digital Signal Processing(DSP) applications. The heart of any real time DSP processor is floating point MAC. Floating Point MAC is constructed by Finite Impulse Response (FIR) or Infinite Impulse Response (IIR) filters. FIR filters are stable than IIR filters because the impulse response is finite

3073-3076

	in FIR. Hence, for stable applications FIR filters are preferred. These FIR filters are intern constituted by FP adder, FP multiplier and shifter. In conventional floating point adder the two floating point numbers are added in series. Series means one after the other so the computation speed is less. In series fashion adding the floating point numbers means definitely it furnishes more delay[1] because in the addition of floating point numbers, along with the addition of mantissas; computation is required for both signs and exponents also. Hence, the processing speed is slow for computing the floating point numbers compared with fixed point numbers. Therefore, in order to increase the speed of operation for floating point addition in real time application i.e., to add 16- samples at a time which are in floating notation; a parallel and pipe line technique is going to be incorporated to the two bit floating point architecture. Before developing such novel architecture, a novel algorithm is developed and after, the novel architecture is developed. The total work is simulated by Modelsim 10.3c tool and synthesized by Xilinx 13.6 tool. **Keyword:**Over sample, Nyquist criterion, Floating point adder, floating point MAC, parallel and pipe line technique, novel floating point architecture. **References:** 1. 520.	**Authors:** **Emetere Moses E., Adesina Tijesuni** **Paper Title:** **Energy Planning and Sustainable Biogas Production Prospect Within Residential Quarters in Developing Countries** **Abstract**:The prospects of biogas as a major energy option to alleviate the energy needs in Africa is huge based on its teeming population. However, the main source of biogas i.e. human excretal is being neglected, thereby loosing resource worth 500 MW of electricity. This research is geared towards estimating the accruable biogas that can be harnessed in a typical student hostel in a developing country. The data was collected at the main chamber of the hostel. The estimation of the optimized state of methane, hydrogen sulphide and carbon dioxide is given as 12%, 0.94% and 4.42% respectively. It was also affirmed that the algae growth on the walls of the sewage line is responsible for the low carbon dioxide values. Also, it was reported that the production of hydrogen sulphide gas is predictable, as it is not directly related to the concentration of microorganism in the sewage chamber. This research gives an eye-opener on biogas wastage in developing countries. **Keyword:**biogas, renewable energy, energy planning, energy. **References:**	**3084-3089**

Paper Title: **Modern with Advanced Direction in Green Cloud**

Abstract:As the Multiple Clouds or Cloud are very flexible and very vast field of data with the correspondence advantages. But as the traffic loads are increasing day by day, which directly hits on the speed of cloud computing. Hence, Green Cloud is added with cloud computing to maintain the traffic load balancing, Cloud computing is introduced with (ICTs) to face advance challenges for the cloud platform and general securities. Cloud computing advancements have an assortment of use spaces, since we are getting solid versatility, reliability and superiority at general minimal efforts. The Cloud computing upheaval is upgrading current systems administration like Cloud computing implement it's on tool and merge to take the advantages of Green cloud, and also offering promising natural security prospects just as monetary and innovative favorable circumstances. These advances can possibly improve vitality productivity and to decrease carbon impressions and e-squander. Cloud computing can be changed by this type of highlights into green Cloud computing. After deep study of Green Cloud, It has been founded that Green Cloud should be audit by the primary accomplishments. I have worked in the paper to turn in the modern direction to improve the old research, so that cloud computing take more or latest advantagesby the use ofgreen cloud, and the clients can work smoothly without facing said issue.

Paper Title: **Experimental Research of Wire Cut EDM for SR & MRR using Taguchi Method**

Abstract:The present research work is to examine & advance the latent procedure factors affecting the MRR, SR and Electrode Attire despite the fact machining of Nickel composites utilizing WEDM progression. This exertion includes investigation of the connection amid the different information route considerations like Pulse-on time(Ton), Pulse off time(Toff), Pulse Peak Current(IP), Wire substantial, Work piece material & procedure factors. In light of the picked information parameters and execution estimates L-16 symmetrical exhibit is chosen to streamline the most appropriate qualities for machining for nickel amalgams by WEDM…

Paper Title: **A Smart Eye for the Lost Aeroplane**

Abstract:Now a days even with the aeronautical modern technology along with weather forecasting, aviation accidents still cannot be avoided and hearing news about loss of control, airplane crashes and disappearance due to humans errors, bad climate, mechanical failure or any obstruct. Some missing flights in middle of the seas still could not found where they were collapsing. In this paper the design of a module consists of two layers inner and outer with some sensors. The module is made with hard metal, whenever the flight crashes and interact with water the pH sensor will measure the water. If the water salinity is equal to the sea water, the outer layer of the module become open up and using GPS can find current location and transmitted through RF transmitter. In case of some regions like Bermuda triangle no signals work.The inner module that designed the body like, does not allow the water to pass through it easily inside and it can float on the water. The module consists of high intensity flickering lights can easily identify the location where the module present and through memory in the module can find the place where the planes were collapsed..

Paper Title: **Impact of Heat Shield Thickness on Performance of Roll through Simulation**

Abstract: Rolls of the packing machine undertakes an imperative job in packing industries. So as to decrease the power input and reducingthe heat dissipation rate, there are numerous methodologies, for example, surface coatings, surface boronizing and with heat shields and so forth. This work is expected to reducethe power contribution to heaters by diminishing the heat dissemination rate utilizing heat shields with simulation of different thicknesses. There is a decrease of dissipation of heat by using Stainless steel 316 Ti (0.7 mm thickness) heat shields and there is a reduction of 13.9% in power input, 28% time saving and14% in heat dissipation rate is noticedwhencompared to standard rolls up to steady surface temperature where there is saving of 198W per hour in power after steady temperature. Hence an attempt is being made for improving results that are obtained from experiments by using simulation through ANSYS steady state thermal analysis. From the results it is inferred that as thickness of heat shield increases the input electrical energy for the heater goes on reducing and results shows that 0.7 mm thickness shield is 4.28% efficient than 0.8 mm heat shield. Further through simulation optimum thickness is was observed. But thickness is restricted to 1mm only because of machine specification complexity. Further the results of simulation for varying thickness are presented with contours of temperature distribution and heat flux.

Paper Title: **Transformation of Public Administration Mechanisms: Experience of Uzbekistan**

Abstract:Experts in the field of political research believe that computerization and the emergence of branched information systems require further improvement of the communication foundations of interaction between the subjects of the political process. This seems to be one of the strategic directions in the development of modern democracy. The growing interest in the field of political communications in social research is due to the fact that the development of political communications has significant potential for further democratization of socio-political institutions and processes in modern society. This article discusses the issues of transformation of the public

3110-3118

administration system in Uzbekistan, the formation of effective mechanisms of "Electronic Government", the existing problems and prospects for the development of this sphere in Uzbekistan

Paper Title: **Synote Usage on E-learning Search**

Abstract:E-Learning plays a necessary role in the way of searching a secured educational video resources for the students. In this paper, e-learning domain introduces a concept of searching a video resources in annotated way with linked data cloud. The purpose for the student to choose e-learning is that the learner can continue learning anywhere and at any time .This paper goes with unique approach of synote tool where synote tool allows the e-learners to search the syntactic web information accurately and with different online video resources. Linked data cloud concept is applied in this concept to search a secured search. The result is proved for secured search of educational video resources and shows the reusability of resources for e-learners.

Keyword:E-learning ,educational video resources, linked data cloud ,synote ,syntactic web information.

Paper Title: **Predicting & Visulaizing the Clusters Assignments in Health Care Dataset for Disease Prediction**

Abstract:DM is the process which is used for the analyzing hidden patterns of data. This analyzing completed according to the several perspectives for categorization into usable information. Here, DM is referred as the Data Mining It is composed and assembled in same regions, like data warehouses, for effective analysis, DM algorithms. In paper we will use these records and will find the major attribute which plays an important role in disease prediction. To do so, first we implemented Naive bayes' algorithm where every pair of features being classified is independent of each other. Once we get the Naive Bayes' Result then we apply the Clustering technique on the same dataset. Simple K-Means Clustering is used to get the clusters of the data results. We can visualize the Cluster assignments for each attribute against the Resultant or prediction attribute. We can have the better understanding through these visualizations about the dependencies of attributes on the prediction variable. K-means algorithm is an iterative algorithm that tries to partition the dataset into K predefined distinct non-overlapping subgroups (clusters) where each data point belongs to only one group. And after final analysis of the result of both techniques we found two attributes which are having maximum weight as compare to others. These two attributes Glucose and Insulin must consider in the diabetes prediction.

Paper Title: **Anaerobic Degradation of Raw Coconut Waste for Biogas Production**

Abstract:Disposal of coconut coir waste has been a difficult task for the coir industry. Coir pith is being piled up in the outskirts of the coir industry. A solution to the coir pith disposal is the biogas production from it. Raw coir pith without any treatment was tested for its potential to produce biogas. There was very little biogas generated

3130-3131

from raw coir pith. Due to the constraints of high electrical conductivity and high lignin content, direct anaerobic treatment of raw coir pith cannot be an efficient solution. Treatment of coir pith is required for increasing the quantity of biogas produced.

Keyword: Raw coir pith, Kinetics, methane, biogas, coir industry commas.

Paper Title: **Cold-Formed Steel Beam-Column Joints with Latex Layer Wrapping**

Abstract:Columns are the primary element of a structure and are the first element to face the effect of lateral load during an earthquake. To resist such lateral seismic loading high strength and ductile steel frames with higher energy absorption capacity are generally preferred. The nominal ductile capacity of the steel can be boosted up with additional wrapping that could optimize the seismic performance significantly. The present work deals on the behaviour of cold-formed steel beam and cold formed steel column wrapped with latex layers for strengthening. The specimens were subjected to reversed quasi-static cyclic loading to partially simulate the seismic forces. Experimental results shows significant increase in strength capacity of beam-column with latex layer wrapping.

Keyword: Seismic, reversal load, Latex wrapping, beam-column joint, composite.

Paper Title: **Adaptive Ability and Stability of the Genotypes of Collection Samples of Green Beans in Siberia**

Abstract:The interaction of the genotype with individual groups of factors has long been the research subject of plant breeders and geneticists. The phenomenon of the "genotype-environment" interaction accompanies the entire history of plant breeding. Due to the necessity of expanding the area of green beans cultivation and the climatic variability, assessing the gene pool of this crop by its adaptive ability and stability for isolating highly plastic and stable genotypes with high productivity is quite relevant. This task is also important for searching for genotypes resistant to biotic and abiotic stress. The article provides an assessment of the adaptive ability and stability of the following green beans varieties: overall adaptive ability, variance of the specific adaptive ability, relative stability, and breeding value of the genotype. The studies were performed at the experimental field of the Garden of Michurinists Educational and Production Farm of the Novosibirsk State Agricultural University. In 2015 – 2018, the authors studied the adaptive ability and stability of 16 varieties of bushy green beans by the main components of the crop productivity. The adaptive ability, the relative stability, and the selective value of the genotypes were determined by the method of A. V. Krichevsky, according to which the adaptive ability is the ability of a genotype to maintain its inherent phenotypic manifestation of the trait in particular environmental conditions. The overall adaptive ability (OAA) of the genotype characterizes the average value of a trait in various environmental conditions, and the specific adaptive ability (SAA) — a deviation from the OAA in a particular environment. The analyzed parameters were calculated by the yield of green beans based on the results of four years of hybrids cultivation. The comparative analysis of common green bean varieties showed a wide polymorphism in terms of the OAA, the SAA, and the breeding values of the genotypes (BVG). This allows identifyingpromising genotypes

3136-3139

to be included in the selection process by certain characteristics.

Keyword:common beans, variety, coefficient of variation, overall adaptive ability, specific adaptive ability, screening, relative stability, plasticity, Western Siberia.

Paper Title: **Enhanced Genetic Algorithm Optimization Models for Vehicular Routing Problems**

Abstract:The Vehicle Routing Problem (VRP) is one of the most studied combinatorial optimization problems because of its practical relevance and complexity. Though there are several techniques have been proposed to solve the VRPs and its variants effectively, each technique has its own tradeoff values in terms of the performance factors. From this perspective, the work presented in this paper proposed an intelligent routing strategy for VRP based on distance values between the cities. The proposed strategy uses an enhanced model of Genetic Algorithm to find the optimal tour paths among the cities under distance based optimized tour path estimation scenarios. For distance-based optimization approach, experiments were performed on the standard benchmark TSP instances obtained from TSPLIB. A set of fine-grained result analyses demonstrated that the proposed model of routing strategies performed comparatively better w.r.t. the existing relevant approaches. By considering this problem as the base, a distinct model was developed as a set of assistive modules for Genetic Algorithms (GA), which are aimed at improving the overall efficiency of the typical GA, particularly for optimization problems. The capability of the proposed optimization models for VRP is demonstrated at various levels, particularly at the population initialization stage, using a set of well-defined experiments.

	Paper Title:	**Topology Optimization of Disc Brake Rotor**

532.

Abstract:The main purpose of this study is to analyze the thermo-mechanical behavior of the brake disc during the braking phase. Brakes must undergo through continuous use, so many issues surround their heating characteristics when it comes to their development, including contact region properties, material choice, and development of hot spots, associated physical geometry, and deformations. The coupled thermal-structural analysis is used to determine the deformation and the Von Misses stress established in the disc to enhance performance and life of the rotor disc. A comparison between analytical calculations and results obtained from Finite Element Analysis (ANSYS) is done and the values obtained from the analysis are in the range of allowable values. The experiment has been performed with different disc-geometries. Based on the experiment results we have performed ANSYS simulation for the disc-brake. Hence best suitable optimum design is suggested based on the performance, strength and rigidity criteria.

	Paper Title:	**Fuzzy Controlled Multiple Output Dc to Dc Flyback Converter with Output Voltage Regulation**

533.

Abstract:The aim of this paper is to design and closed loop control implementation of a DC to DC Flyback converter with multiple output features.DC-DC Conversion technology is the major subject area in the field of powerelectronics
engineering and drives and has been under development form six decades. Most of the advance systems like telecommunication and computer systems use the single output DC-DC Converter for different levels of voltage in the same system, which limits the efficiency, power density and increases the cost of the whole system. To achieve the features like high efficiency and high density for advance systems Multiple Output DC-DC Converter (MODC) are gathering much attention, and most of the research work is going to get the regulated multiple outputs, for different application like computer, electric vehicles, aircrafts etc. A MATLAB/Simulink model of a Multiple Output Flyback Converter (MOFC) is developed to get the regulated multiple output voltage.Two different control techniques have been employed such as Proportional Integral Derivative Control (PIDC) and Fuzzy Logic Control (FLC), to achieve the same for normal and disturbances cases and its performance is then estimated in terms of various parameters like Rise Time (Tr), Settling Time (Ts) and Overshoot (OS). The comparative results clearly reveal the better response of the proposed approach.

Keyword: Flyback converter, Multiple Output, FLC, PIDC.

Paper Title: **Performance of Sustainable Nano Concrete**

Abstract:Sustainable Nano concrete is a concrete having less energy consumption during the production and releases less carbon dioxide as compared to conventional concrete. About one ton of CO2 is discharged in the manufacture of one ton of Portland cement, thus having a large influence on global warming. The concrete industry is adopting sustainable technologies to diminish this impact. This paper presents the investigation on a sustainable concrete having Ground Granulated Blast Furnace Slag (GGBS), which is a byproduct of the steel industry, blended with Nano materials. Mechanical characteristics of concrete mixes having varying GGBS content (60%, 70%, and 80%) by weight of cement were investigated and compared with conventional concrete. To enhance the workability, compression strength, durability and early strength of GGBS based concrete, Nano silica, micro silica and calcium carbonate (CaCO3) were added to the concrete mix. It was found that concrete having 60% GGBS as replacement for cement exhibit improved mechanical properties. Also investigations were carried out on reinforced concrete beam with 60 % GGBS. Results indicate that concrete with 60 % GGBS could be used as a sustainable building material.

Paper Title: **Homomorphic Cryptosystems for Data Security in Cloud Storage**

Abstract:Cloud Computing enables users to use remote resources thus reduces the burden on local storage. However, the use of such services gives rise to new set of problems. The users have no control over the data which they have stored on those storages so to achieve data authentication with confidentiality is utmost important. As every user may not have that expertise so they can request for data verification task to Trusted Verifier (TV) which will be an authorized party to check the intactness of outsourced data. Since the data owner stores the data on the cloud in an encrypted format, it becomes difficult to check the integrity of the data without decrypting. But by using homomorphic encryption schemes the integrity checking can be made possible without original copy. In this paper, we have given implementation and performance details of two homomorphic encryption schemes, Rivest Shamir Adleman (RSA) and Paillier. The RSA is multiplicative homomorphic scheme where the Paillier is additive homomorphic scheme. Both the algorithms are partially homomorphic thus limited in their functions. Due to homomorphic property of these algorithms, original contents will not get revealed in the verification process. This framework will achieve authentication of data by maintaining confidentiality.

	Paper Title:	**A Forecasting Method Based on ARIMA Model for Best-Fitted Nutrition Water Supplement on Fruits**	
	Abstract:The main focus of this research is to promote a forecasting method in the greenhouse of cultivation for the nutrition water level of strawberry fruits. In the greenhouse of cultivation, this study selects strawberry fruits as the focus on research. With adequate nutrition water supply conditions, the autoregressive integrated moving average and seasonal autoregressive integrated moving average (ARIMA-SARIMA) were utilized to create forecasting for the nutrition water level of strawberry leaves in the fruit greenhouse of cultivation, thus forecasting strawberry's nutrition water rate through greenhouse environmental parameters. Next, the multi-scale feature vectors of greenhouse temperature and nutrition water parameters in the greenhouse have been extracted by using the data pre-processing method to eliminate the testing and training value of variables, thus improving the forecasting and generalization ability of the model. The extracted feature vectors have been used to train and optimize the SARIMA model, finally obtaining the forecasting model of nutrition water rate of strawberry fruits leaves in the greenhouse of cultivation, which has been compared in experiments with the autoregressive integrated moving average and seasonal autoregressive integrated moving average (ARIMA - SARIMA) model. The results indicate that when training samples become a certain amount, the forecasting accuracy and regression fitting degree of ARIMA - SARIMA can be higher than that of the two traditional models. We forecasted that the strawberry greenhouse included 233 samples collected from a strawberry greenhouse in South Korea, and the 6 variables involved are greenhouse maximum temperature, greenhouse minimum temperature, greenhouse average temperature, quality of nutrient water, humanity, and CO2, which would influence the strawberry growth in production concentration directly or indirectly with the variation of nutrition water every day.

Keyword: Nutrition Water, Greenhouse Average Temperature, Humanity, Co2, ARIMA and SARIMA Model.

	Paper Title:	**Measurement of the Thermal Conductivity and Rainwater Resistance of the Stabilized Mound Soil with Cement**	
	Abstract:This study is the result of experimental work in the field thermal of buildings. The study focuses on mounds termite’s clays. In this study a thermal analysis by the measurement of the thermal conductivity and the thermal resistance is carried out. This approach to determining the characteristics of materials has led to a better understanding of the possible choice of local building materials available in Chad. The estimation of thermal parameters of building materials plays a key role in a large number of scientific and industrial fields. Our choice	**3174-3179**

has been focused on the termite mound soil which is currently of interest as a result of availability, energy crisis and that of housing.Unlike cement concrete, thé soil has long been used as a building material with practically many environmental benefits and considerable energy savings.

The results obtained showed that the materials we used have a appreciable thermal properties. Brick from naturally occurring mound termite soil has better thermal resistance than brick made from mound termite soil, which means it is worked in advance. The influence of density on thermal resistance has been demonstrated. The stabilization of the cement reinforced the structure of the material and its resistance to erosion of the rain water.

Keyword:mound termites soil, thermal resistance, building materials, thermal comfor.

Paper Title: **Pattern Recognition in Digital Images using Fractals**

Abstract:Pattern recognition in digital images is a conjoint problem with application in remote sensing, electron microscopy, medical imaging and astrophysics, still no general solution which can be rivalled with the human cognitive system in which a pattern can be conceded subject to random positioning and scale. This research has stemmed in the design and implementation of a new algorithm for general pattern recognition based on the use of fractal image compression. This approach has for the first time allowed the pattern recognition problem to be solved in a way that is invariant of rotation and scale. It allows both ANNs and correlation to be used subject to appropriate pre-and post-processing techniques for digital image processing.

Paper Title: **Choosing the best Bin Packing Algorithm for Replica Placement in Multi-Tenant Cloud System**

Abstract:Of late, Cloud Computing is visibly seen to reduce infrastructure costs with high data availability and performance conforming to service level agreement for both the service providers and the users. With the rapid and explosive growth of the number of cloud users, Cloud Data Management System must serve an array of different analytical and transactional workloads. Hence, to ensure the scalability in a multi-tenant system, replica placement algorithms always come into the picture appropriately. In our work, we have vividly analyzed various replica placement algorithms in terms of their performance and tried to find the beneficial aspects to be the fittest one to tackle the situation when the actual observed workloads are immensely deviated from the estimated workloads.

Paper Title: **Design the Optimum Sizes and Analysis Shapes of Gantry Machines**

Abstract:In the present day's need of the special purpose machine is more to the industries. Earlier heavy load carrying machines are there that to in open place only. By taking them in consideration in this paper made such that must lift 1 ton capacity weight with very effective in operation and maintenance in small area of industry. The initial period many type of gantry are used to lift the heavy load and problem with that is they were heavy in structure and completely manually one. So designing the new structure with new technology which can easily pick the material and place to another place using gantry in small scale industry. Redesigning the structure reducing the material to save the cost of structure. In this project gantry design is developed by considering present development in machinery, it helps to pick and place the heavy parts in rail transportation, aerospace and other automobile industries. In this paper going to discuss how the beam will deform when it having self-weight, gravity loading, structural analysis and modal analysis is done on the machine which shows the results like stresses and displacement, to reduce the cost of the machine, thickness of machine columns is reduced and this is the type of optimization carried out here. The amount of strength and stiffness is maintained same as the original model and all results compared to the original model, the structural analysis and modal which is of main result viewing in the whole work.

Paper Title: **Effect of Vertical Drains on Strength and Deformation Characteristics of Lithomargic Clay**

Abstract:During olden days, construction used to be carried out only on the sites having good strength. But now-a-days availability of sites with favourable properties are limited. So, there is a need to modify the properties of

3199-3204

subsoil using different types of Ground Improvement Techniques. Depending upon the nature of soil, a suitable economical technique needs to be adopted. Soft soils have weaker strength and they are highly compressible and take a lot of time for settlement. So, these are typically problematic for construction. There is a need to improve the condition by accelerating the rate of consolidation.

To achieve higher rate of consolidation, it is important to develop shorter paths for movement of the water. A vertical drainage system can be provided to accelerate the rate of consolidation and help to minimise excess pore pressure in the sub-soil. As a result of this, a stable situation is reached more quickly. Thus to enhance the strength of the soil and to accelerate the consolidation rate, vertical drains of different diameters and with varied spacing are employed.

The improvement in properties of soft consolidating lithomargic clay is experimentally tested with vertical sand drains in developed prototype. The vertical sand drains installed with 1.905 (0.75 inch) diameter and 6 cm spacing is more effective in increasing Ultimate Bearing Capacity (UBC) of soil and also the rate of settlement of 35.26 % is significant up to 60 kg of preloads. Thus problematic lithomargic clay can be improved in its strength and settlement characteristics.

Keyword: Lithomargic clay, Ultimate Bearing Capacity, Rate of consolidation, Vertical drains.

Paper Title: **Heat Transfer using Nanofluid**

Abstract:Latest trend of miniaturization of thermal systems, calls for the improvement in their efficiency. Nanofluid contains the nanoparticles having large surface area and improves the thermal efficiency. This enhancement is the function of different mechanisms and parameter. This paper explores the heat transfer nature of nanofluids by addressing the experimental studies available in literature and conducting an experimental study using water based Copper oxide nanofluids. Nanoparticles were characterized by X-ray diffraction analysis and Field Emission Scanning Electron Microscopy to confirm the material, size and morphology of the nanoparticles. Thermal conductivity analysis has been performed at 30˚C, 40˚Cand 50˚C with 0.1%,0.5% and 1% concentration by weight. Mechanism of agglomeration, concentration and size of particles are found to be more significant in affecting the heat transfer. The maximum enhancement of 22.9 % in thermal conductivity is found in case of 1% weight concentration nanofluids consisting of small size (20nm) nanoparticles at temperature of 50˚C.

Keyword:heat transfer, temperature, volume concentration, nanofluids, clusters.

Paper Title: **Ion-Conductance and Solvation Behavior of Benzyl Trimethyl Ammonium Chloride in Aqueous-Methanol Mixtures**

Abstract: Ion-conductance and solvation conduct associated with diverse electrolytes in solvents is recited to be shaped by numerous aspects like density, viscosity, dielectric constant of medium, ion-solvent relations and solvent-solvent actions. Ion-solvent interactions soothe the ion by solvating it. Conductance statistics and viscosity numbers of distant electrolytes is of use in analyzing the ion solvent relations and solvation behavior of the ions. Conductance and ion-solvation behavior of benzyl trimethyl ammonium chloride has been measured in aqueous methanol and aqueous dimethyl formamide of different composition in the temperature range of 283K to 318K. Limiting molar conductance dissociation constant of the ion pair, KC are figured using Fuoss-Kraus Limiting Law. $\lambda 0$ rise with percentage of water in the solvent fusion. KC value is highest in pure aqueous solvent. Walden product is highest in 20% aqueous-methanol mixture signifying that ion-solvent interactions are highest at this composition of solvent combination and Walden .product as a function of the specific ion-solvent interactions including structural effects.

Keyword: Benzyl trimethyl ammonium chloride, Free energy change, Aqueous-MEOH, Ion-solvation.

Paper Title: **Research on Mechanical & Tribological Properties of Natural Fiber Composites**

Abstract:The composite materials play an vital role and all the researchers are attracted towards this research areas and the composite material give an outcome of very enriched material properties which will change our future and avoid so many disadvantages that are facing now here we are discussing about a composite material that is made of resign and hardener by mixing in the proportion of 90:10 percentages that is we add 90% of the resign to the 10% of hardener along with the filler material and horn powder.

Here we are interested in checking the material properties that are obtained during our experiment and see how they are differ from the previous ones like they are avoiding toxicity of the material or not and the strength both tensile and compressive and see how much the hardness is increased along with these we also do wear resistance test on the pin on disc experiment setup and obtain their results.

Keyword: Nanotubes, Nano-materials, Composite materials, Epoxy resins.

Paper Title: **Characterization of Hybrid Composite Made of False Banana Fiber and Sisal Fiber**

Abstract:The importance of natural fiber reinforced composites is rapidly developing both in terms of engineering application and research field. The aim of this investigation is conducting an experiment to obtain the water absorption, physical and Mechanical properties of hybrid composite was fabricated from (False Banana Fiber) FBF and (Sisal Fiber) SF through general purpose (GP) resin-hardener mixture. The samples fabrication procedure was carried out by varying FBF and SF weight ratio to see its effect of mechanical and physical properties. Three samples (FBF: SF) i.e., 1:1 ratio, 3:1 ratio and 1:3 ratio with ply orientation as the reinforcement material. Then, tensile strength, compression strength, flexural strength water absorption percentage and density was conducted

3220-3226

according to ISO and ASTM standards. The results show that the overall tensile strength shows a 1:3 ratio have shown 69 MPa which are higher than 1:1 ratio and 3:1 ratio. 3:1 ratio. In a compression strength test also 12.30 MPa which was higher result is obtained from 3:1 ratio. For both flexural(bending) strength and water absorption (for ordinary tap water and rainwater) test 380 MPa and (2.64 % and 3.07 %) respectively resulted, which are relatively less than from 1:1 ratio and 3:1ratio.

Keyword: Experiment, flexural strength, GP resin, Hybrid composite, Volume fraction

Paper Title: **Design and Analysis of Higher Efficiency Non isolated DC-DC Converter for Electric Vehicles**

Abstract**:**The design and analysis of higher efficiency non isolated DC-DC converter for Electric Vehicles is presented. A Battery Charging System (BCS) plays a key role in achieving fast charging and higher efficiency. The BCS integrates acascaded DC-DC converter and a bidirectional PWM converter. In order to achieve more reliability and stiff voltage, aCascaded buck-boost converter which is partitioned with the help of a capacitor is integratedand to achieve higher efficiency with less number of switches, a bidirectional PWM converter used There are various PWM techniques, among them hysteresis and sinusoidal pwm technique are used. The output voltage obtained after both the operations (boost and buck) is given to the battery or load. Simulation is done in MATLAB and the results are analyzed with PI controller and without PI controller in this paper.

Keyword: Electric Vehicle,BCS,DC-DC converter, cascaded Buck-Boost converter, Bi-directional PWM converter, PI controller, MATLAB/ SIMULINK.

	Paper Title:	**An Improved Technique for Image Deblurring**	
	Abstract:The predicament in image deblurring, that is, the resurgence of an image against the noise along with the blur is an important issue in task dealing with image processing applications. .Owing to the deblurrng issue, many techniques related to regularization has found a concern in the recent years. In this paper, an efficient regularization method is put forward which utilizes the Lagrangian multiplier for the deblurring process. The major contribution of the proposed scheme is to determine the values of regularization approach towards attaining an better enhanced tradeoff among image resurgence and noise restraint using projection based image deblurring. **Keyword:**image deblurring,regularization, Lagrangian multiplier **References:** 1. 	Paper Title:	**Improving the Efficiency of Solar Photovoltaic Cell by Decreasing Surface Temperature**	
	Abstract:Supply of energy is able to meet the increasing demand of today's people, which is major causes faced by world. The shortage of power can be reduced by using renewable energy resources. There are many renewable energy resources like wind, tidal and biomass energy, solar energy. The most significant form of renewable source is solar energy. It has undergone a research and development in the recent years and still it is developing. Solar photovoltaic cell is device used in solar energy conversion. It converts forthrightly electrical energy from the sunlight. The efficiency of PV cell is disturbed when rise in working temperature. Temperature on the panel is inversely proportional to the power generation. The main problem met by solar cell is temperature rise. Due to this temperature the energy conversion is low. By decreasing the temperature on the surface of PV panel to enhance the electric efficiency. So, in present-day different cooling methods have been projected and verified experimentally. Several techniques have been tried, mostly based on active water and air cooling, as these are simple techniques. The main objective of this system is to increase the solar panel efficiency using water cooling method of the panel gets cooled by exchange temperature. **Keyword:**Solar PV, Cell Temperature, efficiency improvement **References:** 1. Paper Title: **E-Blood Bank Application using GPS and Cloud Computing**

Abstract: In numerous elective cases, similar to mishaps, there might be Associate in Nursing basic might want for explicit blood gathering. When contrasted with the extent connection of interest of the blood awfully less amount of people blessing the blood, hence the need of the blood will increment. Blood Donation and intromission Services (BTS) are essential for sparing individuals' lives. Blood donation centers endure visit lack of blood; in this manner, commercials are frequently observed on informal communities encouraging sound individuals to blessing blood for patients UN organization frantically need intromission. The E-Blood Bank is Associate in Nursing robot application that allows the client to go looking contributors of explicit individuals bolstered their area, in a short measure of your time. This application won't exclusively demonstrate the rundown of contributors anyway also facilitated with trailing the circumstance of the close to benefactors and giving SMS cautions to them, all together that the patient will be presented with blood a little while later. in order to blessing blood through the application, one must enroll himself by giving all the ideal subtleties. These subtleties ought to be substantial and valid all together that they'll be caterpillar-followed at the hour of crisis. when all the learning is acknowledged by the Admin, the benefactor will be extra to the rundown of enrolled contributors. GPS module is encased to discover the givers. Accordingly, exclusively enrolled individuals, UN office need to blessing blood, ready to get to the administration. Cloud-basically based administrations are prove horribly significant in basic blood conveyance as they care ready to focal and quick access to giver's information and site from wherever and whenever.

Paper Title: **Real-Time Waste Controlling with ISB**

Abstract:Nowadays, dustbins placed at the road are stuffed quickly due to the massive quantity of wastages in cities. Earlier waste controlling frameworks fundamentally dependent on the assortment of blended/arranged waste and moving it far to transfer zones has a critical negative effect on the earth and people. Wastages are generated from three varieties of sources like domestic, commercial and industrial. There is no quick replacement for the filled dustbin. This creates an unhealthful condition for all living things and spreads the bad smell around the streets. By doing so, there may be a probability to spread diseases. In order to avoid such situations, ISB (IOT based smart Bin) is to be implemented in cities of India. Smart Bin is to be placed at each street by tracking the level of garbage through the internet.

Paper Title: **CDMA design for on-Chip Communication Network**

Abstract:Network on chip is used to implement the communication features on a Silicon chip. To increase the performance of Code Division Multiple Access (CDMA) Network On Chip (NOC) ,a Standard-basis (SB) Method is Proposed.In this Method, a source code from various transmitters are encoded separately using an orthogonal code . These coded data are Combined together by an Exclusive-OR operation and it is then sent to their destinations through the communication interface.By Performing AND operartion between original coded data and their Orthogonal code, chip sequence can be obtained. The Standard basis (SB) encoding and decoding technique is compared with the Walsh Based (WB) code in terms of power, area and throughput and the Proposed Standard basis encoding and decoding technique is proven to be more efficient.

Paper Title: **Market Basket Analysis with Enhanced Support Vector Machine (ESVM) Classifier for Key Security in Organization**

Abstract:Market Basket Analysis is considered to be one among the highly popular and efficient sort of data analysis exploited in the marketing and retailing field. The objective of market basket analysis lies in deciding the products purchased together by the customers. Its name has originated from the concept of customers filling into a shopping cart everything of all they had purchased (a "market basket") while doing shopping in the grocery. Having a knowledge of the products that customers buy in group can be quiteusefulfor a retailer or to any other organization. A store could make the best use of this information to keep the products that are often sold together in the same place, whereas a catalog or World Wide Web (WWW) merchant could utilize it for deciding the structure of their catalog and order form. Since several applications such as market basket analysis, fraud detection in web, medical diagnosis, census data, Customer Relationship Management of business that makes use of association rules exists, the process involving Decision making can be improved. Security is also regarded to bean important facet for transactions done individually and frequent itemsets for database that are horizontally

3261-3267

partitioned. In order to render security for lastly bough often used itemsets for transaction purposes, this research work introduces a novel key security algorithm that uses RSA cryptographic technique which is classifier based. The classifier makes use of information about several often utilized itemsets and it provides a key value to the actual company. For instance, in case if there are any reliance users, only the valid users can obtain that market info. The rest of the users belonging to the reliance organization are not allowed to select the data's key value. First, the frequent itemsets are mined with the help of association rule mining employing Probabilistic Graphical Model techniques. Then the Enhanced Support Vector Machine (ESVM) classifier checks the key values of the mined frequent itemsets.

Keyword: Association rules, Customer relationship management, ESVM, Frequent item set mining ,key values, Market basket analysis.

Paper Title: **Sliding Mode Control for 2 Degrees of Freedom Upper Limb Rehabilitation Robotic System under Uncertainties**

Abstract: Rehabilitation of patients suffering from post-stroke injuries via robots is now adapted word widely. The aim of this therapy is to restore and improve the dysfunction and the performance of the affected limbs doing repetitive tasks with the help of rehabilitation robots, as robots are best way to perform repetitive task without any monotony failure. Control of these rehabilitation robots is an important part to consider because of nonlinearity and uncertainty of the system. This paper presents nonlinear sliding mode controller (SMC) for controlling a 2 degrees of freedom (DOF) upper limb robotic manipulator. Sliding mode control is able to handle system uncertainties and parametric changes. One drawback of using SMC is high frequency oscillations called as chattering. This chattering can be reduced by using boundary layer technique. Experiments have been carried out under perturbed conditions and results have shown that SMC performs well and remain stable and thus proves to robust controller for upper limb robotic manipulator.

Paper Title: **Impact of Stem Education on Academic Achievement of Elementary School Students' of Delhi**

Abstract:STEM education does not follow traditional teaching methods but is based on interesting and critical thinking activities. It is important to increase students' interest and awareness of STEM educational activities to encourage them to learn STEM. STEM-based education can help students or children learn and participate in activities based on real-life experiences. We need to let them know that what they learned in STEM today is not only building their own future, but also the cornerstone of the country.

Since no study has been done to know the difference in the academic achievement and basic attitude of the students towards this approach based on gender school types (government and private); before and after the conduction of STEM programme this study will give STEM practitioners strategies to design and integrate STEM

content purposefully for the students ; so that students can develop a positive attitude towards STEM programme which will in turn help them to acquire higher academic achievement and make study more effective. This study will also through light on the teachers to make STEM programme more effective. This study will also be of immense help to the school authorities while opting for better STEM programme.

Keyword: Blended learning, effective teaching, motivational skills, engaging classroom, better learning environment, STEM approach.

Paper Title: **Smart ECG Monitoring Wireless System**

Abstract:Under advanced patient diagnostic approach, expensive wearable Holter Electrocardiography unit is used to record cardiac parameters for 24 or 48 hours. This may cause inconvenience to patient due to weight, dangling wires and taxing additional time to transfer data to the hospital from patient's location. IOT plays a crucial role to read and transfer ECG data from remote places effectively for individuals and more. In this paper low cost, low power, portable ECG monitoring system is designed and experimented. Hardware-software co-design realizes real-time, wireless, acquisition of cardiac parameters. AD8232 is used to capture cardiac signals and processing is realized using MSP432P401R microcontroller and IOT. Under the event driven approach, in case of specific abnormality, Electrocardiogram (ECG) signal is transmitted, otherwise no transmission is allowed in order to reduce power consumption.This approach increases battery life time and reduces complexity.

Paper Title: **Effect of Temperature on 60nm and 100nm Nanosphere Size Standard using Dynamic Light Scattering**

Abstract:It is difficult to use kinetic motion as a measurement tool without temperature affecting the results. In this study, the size of a known nanosphere was used to monitor the effect of temperature towards particle size determination using dynamic light scattering principles. Temperature deviations are always picked up by size measurement using the principle of Brownian motion. The particle size of 60nm and 100nm polystyrene latex nanoparticles in 10mM NaCl solution was measured at four different temperatures set points of 20, 25, 30, 35 and 40°C using dynamic light scattering mechanism. As a result, the size of polystyrene latex nanoparticles was increased with the increases of the temperature. Therefore, for particle size analysis using dynamic light scattering mechanism the temperature of the test must be maintained at 25°C in order to obtain accurate measurement.

Paper Title: **EEG Based Headband for Emotion Detection**

Abstract:EEG is the term used for recording the brain electrical activity. In Electroencephalography, the encephalon means brain. EEG measures electrical activity generated by thousands of neurons that exists in human brain. The brain electrical activity is measured in voltages. This paper is focused on recognizing emotion from human activity, measured by EEG signals. Making the computer more empathic to the user is one of the aspects of affective computing. With EEG-based emotion detection, the computer can actually take a look inside user's head to observe their mental state. A low power, low noise and high sensitive analog signal from brain decoded into filtered digital output. The decoder picks a low amplitude and a microvolt signal from brain and decodes it into a filtered and amplified output. As of thelatestattentiongiving fromexaminationteam in creatingsensitivecommunicationamong human beings and peripheral device, the proof of identity of emotive state of the previousdeveloped a necessity. Electro-encephalography establishedimportantconsideration from scientists, becausethey establish modest, inexpensive, transportable, and easily solving theidentification of mind states in this paper.[2] In this paper, it provide a comprehensive overviewfrompresent works in emotion detection using EEG signals.

Paper Title: **Rumour Detection Models & Tools for Social Networking Sites**

Abstract:Efficient utilization of social networking sites (SNS) had reduced communication delays, at the same time increased rumour messages. Subsequently, mischievous people started sharing of rumours via social networking sites for gaining personal benefits. This falsified information (i.e., rumour) creates misconception among the people of society influencing socio-economic losses by disrupting the routine businesses of private and government sectors. Communication of rumour information requires rigorous surveillance, before they become viral through social media platforms. Detecting these rumour words in an early stage from messaging applications needs to be predicted using robust Rumour Detection Models (RDM) and succinct tools. RDM are effectively used in detecting the rumours from social media platforms (Twitter, Linkedln, Instagram, WhatsApp, Weibo sena and others) with the help of bag of words and machine learning approaches to a limited extent. RDM fails in detecting the emerging rumours that contains linguistic words of a specific language during the chatting session. This survey compares the various RDM strategies and Tools that were proposed earlier for identifying the rumour words in social media platforms. It is found that many of earlier RDM make use of Deep learning approaches, Machine learning, Artificial Intelligence, Fuzzy logic technique, Graph theory and Data mining techniques. Finally, an improved RDM model is proposed in Figure 2, efficiency of this proposed RDM models is improved by embedding of Pre-defined rumour rules, WordNet Ontology and NLP/machine learning approach giving the

3291-3296

precision rate of 83.33% when compared with other state-of-art systems.

Keyword: Social Networking Sites (SNS), Rumour Detection models (RDM), Pre-defined rules, WordNet Ontology.

Paper Title: **Blockchain Based E-Voting System**

Abstract:Building an electronic casting a ballot framework that fulfills the lawful necessities of administrators has been a test. An appropriated record innovation is an energizing mechanical headway in the Information Technology world. This paper intends to assess the utilization of block chain as administration to actualize dispersed electronic casting a ballot framework. The paper elicit ate the prerequisites of structure electronic casting a ballot framework and distinguishes the lawful and mechanical constraints of utilizing block chain as an administration for acknowledging such frameworks. The paper assesses a portion of the prominent block chain systems that offer block chain as aadministration. This paper proposes a novel electronic casting a ballot framework dependent on block chain that tends to all constraints. All the more for the most part this paper assesses the capability of dispersed record advancements through the portrayal of a contextual analysis, to be specificthe procedure of a race and actualizing a block chain-based application which improves the security and diminishes the expense of facilitating an across the nation decision.

Paper Title:	**The Effect of the Hydrolyzates of Keratin- and Collagen-Containing Wastes of Poultry Processing in the Diets for Broilers on the Cecal Microbial Community**

Abstract:The use of new protein-rich animal-derived ingredients in the diets for modern commercial poultry is an urgent problem for the researchers. The wastes of poultry slaughter and processing can be used for the production of concentrated feed-grade protein ingredients after the short-term and intense thermal treatment in the thin layer and subsequent enzymatic hydrolysis. These wastes contain primarily keratin and collagen. The aim of the study presented was the investigation of the effects of these hydrolyzates of keratin- and collagen-containing wastes in diets for broiler chicks on the cecal microbial community. The study was performed in the vivarium of All-Russian Research and Technological Institute of Poultry on four treatments (50 birds per treatment) of Ross-308 broilers reared on the floor to 38 or 49 days of age. Control treatment 1 was fed a diet with fishmeal (67% of crude protein) as a source of animal protein. Treatment 2 was fed the same diet with keratin-derived additive (85.7% of crude protein) as a substitution for the fishmeal; treatment 3 was fed the same diet as treatment 2 additionally supplemented with a probiotic containing live cultures of Bacillus subtilis, Lactobacillus paracasei and Enterococcus faecium; treatment 4 was fed the same diet as treatment 1 with a mixture of keratin- and collagen-derived additives (67.1% of crude protein) as a substitution for the fishmeal and the same probiotic as treatment 3. The qualitative and quantitative composition of cecal microbiota was determined via molecular genetic terminal restriction fragment length polymorphism (T-RFLP) technique. It was found that keratin- and collagen-derived feed additives rendered no negative impact on the intestinal microbiota. Cecal concentrations of beneficial (normal) species in the treatments fed experimental diets were higher in compare to the control treatment.

Paper Title: **The Curiosity of Education Faculty Students in Learning**

Abstract:In this study we described the curiosity of education faculty students in learning based on aspects of interest, novelty-seeking, the openness of experience and exploration. We used cross-sectional survey with a quantitative approach to collect data and to measure curiosity in learning we used questionnaire. The participants were 286 spread across 9 study programs in the faculty of education. The results showed that students sometimes have a curiosity in learning. This condition explained the curiosity of students in learning tends to be in the medium category and tends to be low because the number of students who are rare and never curiosity in learning more than students who often and always curiosity in learning.

	Paper Title:	**The Cultural Value and Character Education of Full Day School Implementation in Indonesia**

Abstract:This qualitative paper investigated how full-day school is viewed from the aspect of character education and the formation of cultural values for students. The results were obtained that the learning process by extending learning time is an activity in instilling character education through interaction between teacher, student, and the school environment. Character education is carried out through extracurricular activities, carrying out intense and ongoing communication between teachers and students and organizing routine diversity activities. The implementation of the full-day school policy is also an effort to encourage awareness of students through cultural activities as a step to instill concern and love for the values of local traditions in the city of Bengkulu by conducting music, dance and other creative activities.

Paper Title: **Aerodynamic Performance of Biomimicry Snake-Shaped Airfoil**

Abstract:The cross-section shape and proportionality between geometrical dimensions are the most important design parameters of any lifting surfaces. These parameters affect the amount of the aerodynamic forces that will be generated. In this study, the focus is placed on the snake-cross-section airfoil known as the S-airfoil. It is found that there is a lack of available researches on S-airfoil despite its important characteristics. A parametric study on empty model of the S-airfoil with a cross-section shape that is inspired by the Chrysopelea paradise snake is conducted through numerical simulation. Simulation using 2D-ANSYS FLUENT17 software is used to generate the lift and drag forces to determine the performance of airfoil aerodynamic. Based on the results, the S-airfoil can be improved in performance of aerodynamic by reducing the thickness at certain range, whereby changing the thickness-to-chord ratio from 0.037 to 0.011 results in the increment of lift-to-drag ratio from 2.629 to 3.257. On other hand, increasing the height-to-chord ratio of the S-airfoil will increase maximum lift coefficient but drawback is a wide range of angles of attack regarding maximum lift-to-drag ratio. Encouraging results obtained in this study draws attention to the importance of expanding the research on S-airfoil and its usage, especially in wind energy.

Keyword:snake-cross-section airfoil, parametric study, CFD simulation, lift force coefficient, aerodynamic performance.

Paper Title: **Application of Solar Absorption Refrigeration in Milk Pasteurization**

Abstract:Pasteurization coupled with refrigeration makes milk safe for human consumption and also extends the shelf-life of the milk. In a milk processing plant, hot water is used as heating medium and chilled water as cooling medium .In milk pasteurization heating and cooling process of milk was integrated by using plate heat exchangers known as regeneration section which saves 82.36% energy. Refrigeration plant for milk processing contributes approx. 30 % of total electricity load. This electricity load can be reduced by using vapor absorption refrigeration system (VARS) which requires heat input in the form of hot water. In the present study the VARS uses 1, 1, 1 tetrafluroethane (R134a) as refrigerant and n,n-dimethyl formamide (DMF) as absorbent. The COP of the system was obtained between 0.48 to 0.71 and refrigeration capacity varied from 0.69 kW to 2 kW. The absorption refrigeration system requires 1.4kW of hot water per kW of refrigeration capacity. Thus the integration of solar energy with absorption refrigeration plays important role in energy optimization and sustainable development in milk processing industry.

Keyword: Pasteurization, Vapor absorption refrigeration system, Coefficient of performance, Dimethyl formamide, tetrafluroethane.

Paper Title: **Cognitive Radio Techniques over Conventional Radio Systems**

Abstract:Cognitive Radio (CR) has advanced like a brilliant innovation for crossing over the divergence between the accessibility and assignment of the radio recurrence range among various clients. It can change its transmission parameters dependent on the apparent accessibility of the range groups in its working condition. Cognitive radio (CR) innovation vows to be one potential answer for take care of the issue of absence of recurrence range, by permitting access of unlicensed clients in authorized groups, in view of a shrewd methodology and without meddling with the authorized user(PU). Subjective Radio has developed as a savvy innovation in crossing over the divergence between the accessibility and distribution of the radio recurrence range among numerous clients. This paper shows an outline of the spectrum holes in the licensed bands, the concepts of CR, types, spectrum holes, its features and sensing methods the transceiver details and it compares with conventional radio in terms of performance parameters such as interference, operating frequency, security, spectrum utilization, reliability, efficiency and power consumption

Paper Title: **Assessment of the Various Techniques and Models Used To Secure the Applications of Internet of Things**

Abstract:In The Today's Environment Digitization Plays A Vital Role In Daily Aspects Of Life And Mostly All The Appliances Are Digitally Connected And Smart In Operation That Grows Rapidly In All Over The World. For This, Iot Frameworks Is Mainly Applied And Utilized To Build Different Types Iot Applications. During The Formation Of Applications In Iot, Different Types Of Rules, Standards And Procedures Are Used Which Is Embedded In The Iot Framework. While Implementing The Privacy And Security In The Applications Needs A Variety Of Procedures And Mechanisms For Confirmations That All The Things Are Properly Working And Threat Avoidance. This Paper Focuses On Assessment Of Various Security Mechanisms Which Can Be Applied To Build An Iot Application. Also, The Pros And Cons Of Each Technique In The Domain Of Iot Application.

Paper Title: **A New Metadata Scheme for Multimedia and Intelligent Learning Objects**

568.

Abstract:The purpose of this contribution is to improve the interoperability of educational and multimedia metadata in the context of a new application profile based on the LOM standard, without affecting their educational purpose. our metadata analysis led to the creation of new elements and new categories by strengthening the semantic representation of pedagogical objects and the different structures of multimedia documents, namely: spatial, temporal and hypermedia structures, this proposal also includes the characteristics of description visual.

This contribution was essential given the absence of a metadata schema capturing multimedia and educational characteristics at the same time. the choice to gather descriptive elements based on the LOM standard, has proven to be wise since this standard is the most recognized and known in the field of eLearning.

Throughout this article, we cite the advantages of pedagogical use of Multimedia, more specifically in eLearning. We then present intelligent learning environments on the one hand and educational objects on the other. Finally, we fix the new elements of our application profile, the latter is crowned with a semantic description in the form of an ontology.

Keyword: Multimedia content, Smart learning objects, Metadata interoperability, Application profile, Ontology, Multi-agent Systems, Ontology matching, E-learning standards.

	Paper Title:	**Design and Implementation of Smart Helmet and Intelligent Bike System**

Abstract:A smart helmet that covers and protects the head from any damage in driving a two-wheeler vehicle. The main aim of our project is to provide safety for a rider and to make life of citizens more secure while driving a vehicle. The alcohol sensor is used to detect the alcohol content in riders breath. If rider is in drunk state, without wearing the helmet the bike will not start. In this situation, the rider should have to wear the helmet then only the rider can start the bike. Zigbee module acts as transceiver to communicate between the sensors and control devices. The respective person of registered number can know the details whether the rider was drunk or not. The main advantage is to avoid the two-wheeler accidents and drunk drive cases. This project mainly focus on wearing of helmet or not.

Keyword: Smart helmet, Intelligent bike system, Arduino.

	Paper Title:	**Film Coefficient Optimization for Al2O3 (50%) – CuO (50%)/ Water Hybrid Nanofluid using Taguchi Technique**

Abstract:To have the maximum benefits of nanofluid for high film coefficient, like hybrid composite materials in the material's revolution, the hybrid nanofluid was prepared and its performance was realized by experimentation. In this investigation, the prepared Al2O3 (50%) – CuO (50 %)/water hybrid nanofluid was used as a coolant for making pen barrel in injection moulding machine. For experimentation, the three process parameters viz., Volume Fraction (VF), Volume Flow Rate (VFR) and Temperature (Temp) were controlled and optimized by using Taguchi's L9 orthogonal array to yield the maximum film coefficient. To optimize it, total nine different experiments were conducted by controlling these factors. All these three parameters were considered in three levels. Regression equation was established to predict film coefficient by incorporating independently controllable process parameters. Based on the optimization result, it was found that the high film coefficient was achieved at 0.2 %, 6 LPM and 35 °C of VF, VFR and Temp of hybrid nanofluid respectively.

Keyword: Al2O3- CuO, hybrid nanofluid, film coefficient, optimization

Paper Title: **An Image Based Encryption Algorithm for Multimedia Applications**

Abstract:Multimedia is the most popular domain in recent era, where it handles distinct information such as text, image, music, video and etc. The security and channel capacity are the challenging parameters in real time multimedia applications. In this research work, an image based double encryption scheme has proposed along with DCT compression technique. The input image is encrypted by Chaotic Baker map and Advanced Encryption Standard (AES) algorithms. The encrypted image is compressed by DCT compression technique. The PSNR and MSE of proposed double encryption method attains 77.1617 and 0.0013 respectively. The experimental results are compared with the individual encryption methods shows that the performance of Double encryption is superior to the other existing methods.

Keyword:DCT compression, Advanced Encryption Standard, Chaotic-Baker Map, PSNR and MSE.

Paper Title: **A Novel Planar Monopole Antenna with Truncated Ground Plane for Wireless Communication**

Abstract:In this paper, triple-band planar monopole Microstrip Antenna intended for different applications like Bluetooth, Wi-Fi, Wireless LAN (2.4 GHz), LTE 2500 band, WiMax (3.5 GHz), and a piece of C-band applications. The reception apparatus has been intended to work at different recurrence groups, for example, 2.25 – 2.5 GHz, 3.32 – 3.97 GHz, and 5.90 – 8.67 GHz individually. The proposed receiving antenna comprises of a planar monopole reception apparatus imprinted on RT/duroid 5880 substrate (through a general permittivity of 2.2 and loss tangent of 0.0009) and the base side printed with a truncated ground. The planar monopole reception apparatus has been viably structured and reproduced by utilizing Ansys-HFSS design tool. The component of the proposed receiving antenna is 40 × 28.4 × 1.575 mm3. The reenacted outcome shows return loss, voltage standing wave ratio (VSWR), radiation pattern, and gain of the Antenna. Also, the truncated ground plane structure is straightforward, vigorous and possesses little space, building it appropriate for different applications.

Keyword: Microstrip monopole antenna, impedance transfer speed, return misfortune, VSWR and radiation design.

Paper Title: **Linear Static Examination of a Composite Base Structure**

Abstract:The base structure of the spacecraft connects the satellite with the launch vehicle and it is the main load bearing member. To satisfy the structural requirements, advanced materials are used commonly to manufacture the mechanical load bearing members. The paper deals with the analysis of the base structure of the spacecraft using a combination of metal with the composite materials like CFRP (Carbon Fiber Reinforced Plastic). Analysis is done for base structure of the spacecraft by varying materials in ANSYS 14.5 for each ring. The variation of the materials is done on the insert ring of the base structure along the height in five different ways. The analysis done suggest that the combination of Ti and CFRP ensures lower deformation and weighed 7.34 kg achieving a mass saving of 35% on the existing structure.

Paper Title: **Face Spoofing Detection using Enhanced Local Binary Pattern**

Abstract:Among various biometric systems, over the past few years identifying the face patterns has become the centre of attraction, owing to this, a substantial improvement has been made in this area. However, the security of such systems may be a crucial issue since it is proved in many studies that face identification systems are susceptible to various attacks, out of which spoofing attacks are one of them. Spoofing is defined as the capability of making fool of a system that is biometric for finding out the unauthorised customers as an actual one by the various ways of representing version of synthetic forged of the original biometric trait to the sensing objects. In order to guard face spoofing, several anti-spoofing methods are developed to do liveliness detection. Various techniquesfordetection of spoofing make the use of LBP i.e. local binary patterns that make the difference to symbolise handcrafted texture features from images, whereas, recent researches have shown that deep features are more robust in comparison to the former one. In this paper, a proper countermeasure in opposite to attacks that are on face spoofing are relied on CNN i.e. Convolutional Neural Network. In this novel approach, deep texture features from images are extracted by integrating the modified version of LBP descriptor (Gene LBP net) to a CNN. Experimental results are obtained on NUAA spoofing database which defines that these deep neural network surpass most of the state-of-the-art techniques, showing good outcomes in context to finding out the criminal attacks.

Paper Title: **Spectral Analysis of MST Radar Signal using Maximum Likelihood Estimation Algorithm**

Abstract:In this work, we propose Maximum likelihood estimation of low- rank Toeplitz covariance matrix (MELT) with reduced complexity algorithm for computing the power spectral density of mesosphere-stratosphere-troposphere (MST) radar data. MELT is designed based on the method of majorization-minimization and it is an iterative algorithm to update the powers in each successive step. We tested MELT algorithm for complex signal, which contain multiple frequency components in existence of different noise conditions. For simulated complex data, it can be seen that MELT works much better for low Signal to Noise Ratio (SNR) conditions and also effectively detects the frequency components with a fine resolution in the existence with high noise impact. At last, MELT algorithm is applied to the radar data received from MST radar established at National Atmospheric Research laboratory (NARL), Gadhanki. MELT algorithm estimates the accurate Doppler spectra and thus in turn, estimate the wind parameters using Doppler profiles. For the purpose of validation, the obtained radar results through MELT are compared with the Global Positioning System (GPS) radiosonde.

Keyword: Majorization-Minimization (MM) technique, Maximum-likelihood estimation (MLE), Toeplitz matrix, Spectrum estimation, MST Radar and GPS radiosonde.

Paper Title: **Effect of Combination of Alumina-Silica Rich Minerals with Fly Ash on Structural Behaviour of the Basalt Fibre Reinforced Geopolymer Concrete**

Abstract:Cement production is one of the major C02 emitter which contributes around 8% of the world’s carbon dioxide emissions. So the Engineers are in the need of developing alternate material for cement to reduce the effect of vulnerable climatic changes in the world. This paper aims at presenting the experimental study on effect of combination of silica rich minerals with fly ash based geopolymer concrete. Fly ash was found to be successful in enhancing the performance of geopolymer concrete. The Utilization of more industrial wastes will promisingly

3380-3386

contribute for reducing the environmental pollution. To determine the effective admixture combination with fly ash in geopolymer concrete, industrial wastes such as silica fume, GGBS, Metakaolin, palm oil fly ash were used. The concrete mixes were designed with 60 percentile of fly ash and 40 percentile of other industrial wastes to replace the cement in Geopolymer concrete. The Concrete specimens were casted and cured at different conditions namely Oven curing, Steam curing and sunlight. The Compressive, tensile and flexural strength behaviors were determined for the designed concrete mixes and the results were presented.

Keyword: Basalt fibre, curing, fly ash, Geo-polymer, GGBS, Metakaolin, POFA, Silica fume.

	Paper Title:	**Choke Point in Mini Expansion Device for the Development of Portable Vaccine Kit**

Abstract:Vapor compression refrigeration system is substantial to human comfort and needs that contributes to the progress mainly in agriculture, food preservation and in medical application. One of the applications that this study focused on is the study of the choke points in mini expansion device for the development of portable vaccine carrier kit. This study utilized a vapor compression refrigeration system, and aims to improve the system operation of a small-scale vapor compression refrigeration system by using spirally-arranged capillary tubes with five(5) different hydraulic diameters, namely; 0.20mm, 0.25mm, 0.30mm, 0.35mm and 0.40mm. A 1/8 horsepower vapor compression refrigeration system of a water dispenser is used as an experimental rig that supply the required refrigerant flow on the spirally- arranged expansion device. Guitar strings are used to reduce the hydraulic diameter of the commercially available capillary tubes. With the inserted guitar strings, the five(5) different hydraulic diameters in this study would be connected to the experimental rig. The data gathering method is developed by using a data logger and the fabricated spirally-arranged capillary tubes connected to the experimental rig. The determination of its lengths of choke point and the behavior of the pressure drop is measured during the different trials used for every hydraulic diameter of the spirally-arranged capillary tube. The mathematical equation that correlates the hydraulic diameters of the capillary tubes and their corresponding choke points is represented by the equation y = -1,836.0x2 + 2,319.0x-1 - 1.7860, where y is the distance of the capillary tube choke point and x is the hydraulic diameter of the fabricated spirally-arranged capillary tubes. This equation correlates the hydraulic diameter of a capillary tube to its corresponding choke point length with a value of R2 = 0.9947.

Keyword:hydraulic diameter, capillary tube, distance of choke point, pressure drops.

Paper Title: **Measurement of Process Parameters in Magneto-Rheological Fluid Assisted Cylindrical Surface Nano Finishing Process using Grey Relational Methods**

Abstract:Techniques for the analysis of machining parameters on cylindrical surface finish of 304L stainless steel with multiple response. It depends on quadratic pattern - (GRG) Grey Relational Grade is proposed in this paper. In this work, optimized the machining parameters such as working gap, Work-Piece Speed (WPS), and wheel speed rate and flew value are concluded the various responses such as Material Removal Rate (MRR), Normal Force (F-N), and surface roughness (Ra). Optimal process parameter is determined by Taguchi concept utilizing the GRG the performance index. And value of GRG used to recognize parameters optimum level. A antecedent of Variance (ANOVA) is used to resolve the augmentation of aspect r.

Keyword: Cylindrical surface finish, magneto rheological fluid, AISI 304L austenitic stainless steel, genetic algorithm, ANOVA, microstructure study.

Paper Title: **Performance Examination of OFDM Modulation Techniques in LTE 4G**

Abstract:The digital modulation methods are being chosen in high data rate systems as Long Term Evolution (LTE) and LTE-A. Quadrature Phase Shift Keying (QPSK) and Binary Phase Shift Keying (BPSK) is the simplest form of the PSK with double carrying capacity when compare to the other traditional techniques in modulation. In conventional method the performance was analyzed in MIMO .In this paper proposed the performance analysis of BPSK and QPSK modulator and demodulator in LTE 4G system models under the Additive white Gaussian Noise (AWGN) and Rayleigh fading by comparing the Bit Error Rate (BER). From the analysis, compare to BPSK QPSK has good BER. Using the MATLAB Simulink tool Implementation is performed.

Paper Title: **Freehand Sketch-Based Authenticated Security System using Convolutional Neural Network**

Abstract:An Authenticated Security System is a highly desired feature. In this paper, a FreeHand Sketch-based Authentication Security strategy is proposed for authentication purposes by allowing a user to choose one label from a collection of different labels and asking him to sketch the corresponding image for the selected label for registration to avoid mischievous registration and the sketched image gets preprocessed using adaptive threshold with Gaussian mixture and then predicted with a trained Convolutional Neural Network(CNN) data model to generate the necessary image label. The produced image label will compare with selected image label. If both are same then the details will store in the system database. The user gets login with his/her authorized details with sketch based image password. The image password gets preprocessed using adaptive threshold with Gaussian mixture and then predicted with a trained CNN model to produce the image name. The produced image name will compare with the system database for authentication. The methodology is tested with some sample input image passwords and the performance calculation is carried out using metrics like Recall and Precision. The proposed work exhibits the accuracy of approximately 85% by ensuring the authentication for the user security.

Paper Title: **Automated Regression Testing for Web Services**

Abstract:Web services represent class of applications developed through open internet standards. They help to develop dynamic applications and thus are used to deliver business components or functionalities on the web. Business functionalities as per changing market scenarios are frequently changing and so are these web services. It is therefore the need to properly ensure quality of these web services as they are essential to deliver functions which are required for organizations in their strategic business. To maintain desired level of quality, software maintainability of such applications is important. Regression Testing is required for proper maintaining any software and it becomes very costly in terms of cost and labor for constantly changing applications. Thus to reduce maintenance cost we need to reduce effort required in such testing. This paper presents an efficient regression testing strategy which is also automated to reduce the regression costs of web services. The strategy is implemented through an extensive framework supported by automation and also integrates data testing with regression. The proposed work is particularly useful for those applications which are delivered over web.

Paper Title: **A Hybrid Transition for IPv4-IPv6 Co-existence in Small Size Organization**

Abstract:Internet Protocol version 6 (IPv6) is the current generation Internet protocol developed by the Internet Engineering Task Force (IETF) to handle the shortage of IP addresses in IPV4. The transition from IPv4 to IPv6 is gradually being done not happening as anticipated. It is unavoidable to have both IPv4 and IPv6 networks during the transition period, but unfortunately they are not compatible in nature. It is essential to maintain the IPv4 and IPv6 coexistence. The inter-communication ability of IPv4 and IPv6 is the dire need of network community. Many transition techniques are proposed in the recent years. This paper discussed the key difficulties in IPv4-IPv6 transition, and introduced the hybrid approach for coexistence of IPv4 and IPv6. It hybrid the advantages of

weightage and tunneling translation techniques for providing inter-communication ability of IPv4 and IPv6. The proposed algorithm has been simulated and the performance metrics; transmission latency, throughput, jitter and delay have been analyzed from end to end host, through various scenarios includes IPv4 only, IPv6 Only, Dual stack, GRE tunneling. The performance of the proposed algorithm is analyzed and the future scope is discussed.

Keyword:IPv4, IPv6, ISP, Transition techniques.

	Paper Title:	**Diagnosis for Early Stage of Breast Cancer using Outlier Detection Algorithm Combined with Classification Technique**

Abstract:Breast cancer is the most dangerous cancers that lead to women in death. Particularly in the developed countries it takes second leading place that increase the chance of death in women. It can be not easily diagnosed by the lab. It has difficult to identifying at the beginning stage. This cancer begins from breast and disseminate to other body parts. It has cured easily if it is identified at beginning stage. The correct classification of benign cancer can prevent from superfluous treatment for patients. This paper focused on diagnosis early stage of the breast cancer based on data mining algorithms. The automatic diagnosis process plays on important role in data mining. The proposed method has a process of three stages. First, data objects are grouped into clusters using k-means clustering algorithm. Size of the dataset has to shrink gently the computation time also reduced. The second stage, the outlier detection (OD) algorithm has used to detect the outliers from the cancer dataset. Finally, diagnose the cancer is either benign or malignant using decision tree classification algorithm. The breast cancer dataset has been used to test the efficiency of the proposed method. The experiments were conducted in breast cancer dataset before and after removal of outliers. Comparison results prove that the proposed method as serves as the better one with high accuracy. This breast cancer research will help with a medical practitioner to diagnose the breast cancer and so that it helps to recover the patients.

	Paper Title:	**One Phase Moving Boundary Problem**	

Abstract:In this paper we introduced a variable time step method to obtain interface to moving boundary problem for Slab and Sphere. We present the basic difficulty, apart from the need to find the moving boundary, that there is no domain for the space variable. This difficulty is handled by the age old principles of basic mathematics. Naturally, giving symbolic names to the unknowns develop equations involving them and solve it using the conditions of the problem. High order accurate initial time step sizes for given space step size are obtained with the help of Green’s theorem. The Subsequent time steps are obtained by an iterative scheme. This variable time step method handles Dirichlet’s problem of freezing or melting of a Slab and spherical droplet.

Keyword:interface, Finite difference method, Crank-Nicolson scheme, stefan problem, variable time step.

	Paper Title:	**Different Injection Pressure on VCR Engine using Hibiscus Oil**	

Abstract:This present examination researches the presentation and outflow qualities distinctive infusion pressure on factor pressure proportion of a diesel motor utilizing Hibiscus oil. With different mixes of hibiscus seed oil, biodiesel and diesel mixes are set up to use as fuel on factor pressure proportion diesel motor. The outcomes indicated that decrease in brake warm effectiveness, nitric oxide and increment in brake explicit fuel utilization, carbon monoxide, hydrocarbon with Blends of hibiscus seed biodiesel mixes than flawless diesel. The minor departure from execution parameters like Brake explicit fuel utilization, Brake warm effectiveness and NO emanations Hydro carbon, Carbon Monoxide are surveyed and broke down.

Paper Title: **Design and Fabrication of Safety Buckle using Additive Manufacturing**

Abstract:Main objective is to optimize the arm component design. We have studied the existing design of the arm component and captured the initial design data. Later, we have optimized this design using honeycomb structure and found through analysis that the optimized design data is way beyond beneficial in terms of material, mass and the volume. The challenge now is to manufacture. We have recommended additive manufacturing to produce this honeycomb structured arm component, for various reasons as stated in the journal.

Paper Title: **CNSL as Alternate Fuel with Different Additives for CI Engines**

Abstract:The depletion of fossil fuel and the environmental deterioration are the 2 main problems which is faced by the world in recent days. Only limited amount of stocks can provide the fossil fuel based fuels. The various derivatives of the vegetable oils have been identified as the straight vegetative oils which are used in diesel engines. These have the characteristics of high viscosity, lesser volatility level and very low cold flow properties. The CNSL oil was chosen and mixed with several additives and the quality and emission characteristics were described and charted in this paper. Based on the experimental work done the results were compared. The experiments show that the lower blends can be used directly in the engine by which the overall consumption of diesel is reduced. Amongst all the different blends used such as B20,B15 and B10 the blend B20 was preferred showing improved performance in the engine compared to the different blends available. The experiment was done with the different additives such as DiEthylEther (DEE), Ethanol (EA), and Iso Butane(ISO)

Paper Title: **Design of a Hexagonal Solar Fish Dryer**

Abstract:Solar drying is a general methodology adopted to protect agricultural goods, fishes as well as meat in tropical as well as subtropical areas. Drying helps to maintain the quality of product and improve its shelf-life by bringing down the wastage to minimum levels. Conventional driers have lot of limitations like infestation by insect, rodents, other animals, exposure to wind-borne dirt and dust, lack of proper monitoring as well as escalated cost of the automatic dryers. Solar dryers are being used all around the world in different countries in varied models. These dryers are of two different methods one that work with natural convection with air-flow established by buoyancy and the other with air flow by a fan in forced convection mode. This is a paper on the outcome of a solar dryer designed especially for fisherman to dry fishes effectively. A different configuration with an objective to capture major amount of incident solar energy and dry fishes at a faster rate is being suggested as an alternative.

Paper Title: **Manfacture of Al-B4c Metal Matrix Composites Via Stir Casting Methode**

Abstract:Aluminum alloys are widely used in the aerospace and car industries due to their low density and suitable mechanical housing, excellent corrosion resistance and wear, and the low thermal coefficient of expansion compared to conventional metals and alloys. Exceptional mechanical residency of those alloys and the relatively low production value lead to a candidate that is very attractive for the diffusion of applications, from scientific and technical point of view. Manufacturing of aluminum alloy based totally casting composite with the aid of stir casting is one of the most within your budget techniques of processing MMC. The primary goal of this paper is to make aluminum metallic Matrix composite with different sythesis of fortification garbage of Boron Carbide Via utilizing mix throwing approach and Hardness of the Al-B4C MMCs measured via Vickers hardness method.

Keyword: Composite, steel Matrix Composite, Stir casting and Aluminium metallic Matrix Composite.

Paper Title: **Effect of Titanium Oxide Nanoparticle Additives on R22 Refrigeration System**

Abstract:To explore the conservation technique for energy resources and making more efficient new energy systems has initiated the demand for usage
of Nanoparticle in heat transfer fluids. The study explored the impact of Nanolubricants based on Mineral refrigeration oil and Tio2 Nanoparticle at three various mass concentrations 0.6g/l,024g/l and 046g/l in a vapour confining refrigeration system. Experiments are finalized out to read the important functions of cooling models, like as coefficient of performance (C.O.P), Compressor work and refrigeration effect when titanium oxide (Tio2) Nanoparticle are added to the lubricant. The experiment conduced using R22 refrigerant. The process of Tio2 Nanoparticle by the cooling model was raising the cooling level of accuracy and Collaborative of task and reduction of compressor work.

Keyword: Nanolubricants, Tio2 Nanoparticle, R22, Coefficient of performance.

	Paper Title:	**Performance Characteristics of VCR Engine using Lemon Grass Oil and Methanol Mixed with Diesel**

Abstract:In the Experimental study, experiments has been done on an immediate infusion, single cylinder, constant speed, water cooling system VCR engine at injection pressures 200, and compression ratio of 17.5 using various blends. The effect of dual biodiesel blends and injection pressure were examined with various engine loads.

Lemongrass oil and methanol were blended with diesel at a variety of blend ratios for the purpose of investigation. Presentation and release characteristics obtained from the systematic study reveals that Brake Thermal Efficiency (BTE) and brake specific fuel consumption (BSFC) of blend B20 (i.e. Lemongrass 20 % methanol 30% and Diesel 50%) was higher than diesel.

The emission of carbon monoxide (CO), hydro carbons (HC), and carbon dioxides (CO2) of dual biodiesel blends with better than that of diesel. It was identified that with increase in injection pressure from 200bar can be improving the performance analysis while reducing exhaust gas emissions. But increases the nitrogen oxides emissions.

	Paper Title:	**Multipath Routing for Balancing the Load in Manet**

Abstract:Mobile Ad hoc Networks (MANETs) have attracted quite a concentration owing to their extensive potential applications. Load balancing is vital for enhancing performance in MANETs. Routing overload is the major causes of breaking routing performance in the network. To resolve these challenges, this paper intends a novel routing scheme is called Multipath Routing for Balancing the Load (MRBL) in MANET. In this scheme, the relay node is selected based on the received signal strength. During data transmission, the route node is overload due to heavy data transmission. When utilizing the multipath routing strategy. As a result, decreased network overhead and increased the packet delivery ratio. This work is simulated in NS-2 simulator, and the results show that MRBL scheme performs better than the baseline protocol.

	Paper Title:	**RF Energy Harvesting using Wireless Sensor Network for Low Power Applications**

Abstract:The evolution of telecommunications systems emphasizes the importance of RF energy in the surroundings. This energy can be utilized for less power device namely wireless sensor network. The performance of small DC/RF converter is calculated in this paper in sequence to enslave the WSN performance for energy recovered. Specially to attain the performance in GSM band the efficient rectifier is achieved. Based on the selection of rectifying diode the design methodology works and causes the losses in rectifying antenna. By employing the slope method the advantageous performance is obtained in Advanced Design System (ADS) software. Implementing Schottky diodes in rectifier and voltage doubler HSMS 2850 is used. RF/DC conversion the maximum efficiency is 38% is achieved with 10dBm input power level. A uniform distribution of sensor node with network loads is utilized to control the WSN performance of Base station location as well as distance. For such reason Low Energy Adaptive Clustering Hierarchy (LEACH) protocol is utilized.

Paper Title: **Systolic Fir Filter using Bypass Multiplier**

Abstract:In DSP the most common function is Finite Impulse Response (FIR) filter which is realized in field Programmable gate Arrays (FPGAs). For efficient Very Large Scale Integration (VLSI) computation systolic FIR filter architecture has attractive models. High speed is the major concern for fast computation in real time Digital Signal Processing (DSP) applications. In conventional systolic FIR filter method uses general array multiplier structure which takes more time to compute the process with high design complexity with less power. To overcome this problem the systolic FIR filter utilizing Bypass Feed Direct Multiplier(BFDM) is proposed. The proposed method 16 tap systolic FIR parallel processing offers less delay with less design complexity which is used in image and signal processing applications. The proposed method is simulated using Xilinx ISE 12.4 ISE tool and the functions are evaluated by MODELSIM 6.3C.

Paper Title: **Spectrum Sensing in Cognitive Radio using Frequency Domain**

Abstract:An efficient bandwidth allocation and dynamic bandwidth access away from its previous limits is referred as cognitive radio (CR).The limited spectrum with inefficient usage requires the advances of dynamic spectrum access approach, where the secondary users are authorized to utilize the unused temporary licensed spectrum. For this reason it is essential to analyze the absence/presence of primary users for spectrum usage. So spectrum sensing is the main requirement and developed to sense the absence/ presence of a licensed user. This paper shows the design model of energy detection based spectrum sensing in frequency domain utilizing Binary Symmetric Channel (BSC) ,Additive white real Gaussian channel (AWGN), Rayleigh fading channel users for 16-Quadrature Amplitude Modulation(QAM) which is utilized for the wide band sensing applications at low Signal to noise Ratio(SNR) level to reduce the false error identification. The spectrum sensing techniques has least computational complexity. Simulink model for the energy detection based spectrum sensing using frequency domain in MATLAB 2014a.

Keyword:CR, Simulink, Energy detection, spectrum sensing.

Paper Title: **Skin Cancer Diagnostic using Machine Learning Techniques - Shearlet Transform and Naïve Bayes Classifier**

Abstract:Development of abnormal cells in the skin is known as skin cancer or melanoma, which can spread other parts of the body. Melanoma rarely occurs in eye, mouth and intestines. In this study, the classification of melanoma using shearlet transform coefficients and naïve Bayes classifier is discussed. The melanoma images are decomposed by the shearlet transform. Then, from the shearlet coefficients, predefined number of (50, 75 and 100) coefficients are selected from the decomposed subbands. The selected subband coefficients are directly applied to the naïve Bayes classifier. Performance of skin cancer classification system is measured in terms of accuracy. Results show that a better classification accuracy of 90.5 % is achieved at 3rd level with 100 coefficients of shearlet transform and naïve Bayes classifier for skin image classification system.

Keyword: Melanoma, Shearlet transform, Subband coefficients, Naïve Bayes classifier.

	Paper Title:	**Voltage Regulation in BDC Based on Fuzzy Logic Controller using Solar Power Generation**

Abstract:The PhotoVoltaic (PV) based grid system coupled with Bidirectional DC-DC Converter (BDC) utilize Fuzzy Logic Controller (FLC) for increasing voltage gain and reduce the settling time of DC link voltage than conventional is presented. BDC satisfied the load requirements, and control the power flow from different sources such as PV, grid, and battery. However, problems in conventional system are high Total Harmonic Distortion (THD), DC link voltage gain and settling time of capacitor voltage. The generated power is used for improving the power quality at the output of the inverter using Sliding Mode Controller (SMC). The converter and inverter operate has bidirectional performance and utilize the hybrid power generation as mentioned. The battery can act as a load based on operating modes of BDC and power generation. It provides a comparative analysis of Proportional Integral (PI) and FLC method that is effectively performs harmonic reduction in BDC.

Keyword: Bidirectional Converter, Fuzzy Logic Control, Sliding Mode Control.

	Paper Title:	**Design and Fabrication of Flexible Management Robot Vehicle (AGV)**

Abstract:This project is focusing on developing a multifunctional automated guided vehicle. This AGV system has to be obtained by the major part of all workstations into shop floor. This type of vehicle is assigned to all over the shop floor. This article has presented as an analytical concept of design a AGV system. The concept model has obtained a performing of design procedure which consists of two steps, 'selection of feasible zones' and 'selection of final guide path.'This AGV for all manufacturing industry which contains the features like it can carry the finished component pallets, collision detection and computer control. A command based or teach pendent interface based wireless control is provided to control the robot. A collision detection sensor ensures robot may not hit any obstacles in its path. The robot has compact size which can easily move on rough area. In this project we describe

Anandapriya** **Paper Title:** **The Physical Design Implementation of a 32-Bit 5-Stage Pipelined MIPS Processor using SCL 180nm Technology** **Abstract**:The proposed work describes the physical design implementation of a 32-bit 5-stage pipelined MIPS processor. The various blocks of this processor include the data-path, control logic, data and program memories. Hazard detection and data forwarding units have been included for efficient implementation of the pipeline. Modified architecture is proposed that leads to significant area reduction by exploiting most of the functional units in a single clock cycle. Also, by increasing the instruction throughput, the overall performance is increased. The simulation of Verilog design for this project is done in Cadence NCLaunch followed by synthesis using Cadence Genus. The RTL to GDSII implementation is carried out in Cadence Innovus using SCL 180nm Technology. Physical verification is performed in Cadence Virtuoso using Calibre tool. **Keyword:**MIPS Processor, Pipeline, RTL to GDSII, SCL 180nm. **References:** 1. Pluzhnova** **Paper Title:** **Assessment of the Level of Technological Development in the Field of Research and Development: The Regional Dimension** **Abstract**:The purpose of this study is to examine the existing approaches to assessing the level of technological development of the countries of the world. Methods: Using the experience of previous studies , the article supports and develops ideas for constructing a composite index, allowing to assess the level of technological development of the research and development area at the subnational level. Results: According to the level of technological development of the sphere of research and development with the use of the proposed index, we compiled the rating of Russian regions . The factors, determining the gap in the level of technological development in the sphere of research and development , are identified, and the size of the existing gap between the Russian regions is estimated. In the course of the study , it was possible : to assess the level of technological development of research and development at the subnational level; to identify the strengths and weaknesses that affect the level of technological development of research and development ; to identify Russian regions -leaders and regions-outsiders as a whole in terms of the level of technological development of the sphere of research and development, as well as for individual "referent elements"; to conduct a comparative analysis of the level of technological development in the sphere of research and development of Russian regions; to determine the impact of each subindex on the composite index. Practical relevance: The necessity of developing a given approach is substantiated simultaneously at the sectorial and regional levels. There is a composite index describing the level of technological development of research and development at the subnational level.	**3495-3502**

Paper Title: **Experimental Research on the Tribological -Mechanical Properties of Al-SiC composites and EN31 Steel**

Abstract:In this research, metal matrix composites was fabricated using stir cast technique. Al 6061 alloy (Matrix) and silicon carbide (Reinforcement) were selected as particles. Tata Ace (mini truck) frame made of EN31 steel considered as a comparative material. Optimal weight % of SiC particles was selected as 30 %. Tensile, impact, hardness tests and tribological behaviour of the fabricated composites and EN31 steel was carried out. The mechanical tests such as tensile, impact and hardness are conducted according to the ASTM standards. The results shows that the fabricated composites had improved properties when compared to EN31 steel.

Keyword: SiC particles, Metal matrix composite, Stir casting, carbon steel EN31.

Paper Title: **Experimental Research on AA 6061/SICP Composites**

Abstract:Aluminium alloys are widely used in aerospace and automobile industries due to high strength to low weight ratio and their good mechanical properties such as better corrosion resistance and wear resistance, low thermal expansion as compared with other metals. The main objective of our work is to improve the mechanical properties such as impact strength, hardness of Aluminium based Metal Matrix Composite (MMC), and its relation with processing of the silicon carbide particulate (SiCp) as reinforced in Aluminum matrix. AA6061 alloy is chosen as matrix alloy, in which Aluminum is the base element. The work has been proposed for four different weight proportions of SiCp to aluminium matrix and the processing of the metal matrix composite is to be processed with stir casting setup and heat treated.

Paper Title:	**Current Apprises of Opinion Mining Methods**

Abstract:increasingly, the data is increasing day by day and storage capacity is expanding more and more, this allowing the field of SA to growing and developing faster in research and prospecting for different opinions and emotions to be combed and technically treated to be more accurate. In our present, data can be a wealth where major global companies and development, research and crime detection centers benefit from it. In this paper we focused on the current apprises of research in this field which contributed to various improvements in the field of sentiment analysis. We have tackles comprehensive overviews for different fields which related to the Sentiment Analysis (Transfer Learning (TL), Building Resource (BR), Emotion Detection (ED)) which have the popularity of researchers has gained in recent times and attracted them. We have the aim of this survey which is to give a clear and accurate picture about the techniques of analyzing emotions and related fields.

Paper Title: **The Assessment of Effectiveness of R&D within the Framework of Federal Target Programs**

Abstract:The purpose of this study is to develop approaches to assessing the effectiveness of R&D of civilian use carried out within the framework of federal target programs based on integrated accounting of performance indicators and the cost of projects. Methods of comparative analysis as well as the methods of expert estimations were used. The developed methodology is tested on the example of the most knowledge-intensive program — the Federal Targeted Program "Research and development on priority directions of scientific and technological complex of Russia for 2014-2020" showing its practical applicability. It confirmed the hypothesis about the existence of significant differentiation of projects containing R&D according to the quantitative structure as well as scientific and technical potential of the established objects of intellectual property in comparison with the costs of R&D. The existing system for assessing the effectiveness of R&D conducted within the framework of targeted programs is carried out with aggregate output parameters and does not pay attention to the specific contribution of each project in improving the indicators of the entire program. The authors proposed to use the concepts of "weighted effectiveness" and "innovative efficiency" of projects. The quantitative evaluation of projects based on these parameters made it possible for us to perform the ranking of projects, to identify groups of projects with varying degrees of innovative efficiency, and to distribute the most effective, low efficiency and expensive projects according to thematic areas of research.

Keyword:effectiveness, efficiency, federal target programs, financing of contracts, objects of intellectual property, research and development.

Paper Title: **Automatic Boundary Delineation of Agricultural Fields in Multi temporal Satellite Imagery with Segmentation**

Abstract:A right difference in agricultural areas is the primary necessity for any sector-primarily based implementation together with estimating agricultural subsidies. Improved decision remote sensing image currently offer higher useful geographic records to delineate regions; however, their automatic managing is tedious. Its miles therefore critical to increase strategies that permit this activity to be completed right away. In any such process, a novel approach named improving the Enhanced Gustafson-Kessel-Like clustering (EGKL) version explores the use of a pc-mastering device to define agrarian areas. The current method seems for limits as either segment corners or linear traits are adjoining regions of small variation all the time series. Nearby everyday deviations from all images a while are coupled, ensuing in a sequence of extended directional edge filters. Even though, in order beautify the excellent of boundary delineation, this advised paintings is merged with sequential features of small variability across the time collection, which includes the standard deviation (STD), Near-Infra Red (NIR) band, or an index along with the Normalized Difference Vegetation Index (NDVI), or band ratios (particularly for hill us of a), or important component images. A photograph evaluation of the effects obtained with the aid of a methodology relevant to two fields of an excessive-resolution satellite image of the fractured agricultural landscape shows that it is helpful to apply the guide vector machines technique for such a task. Finally, the experimental results reveal that the proposed segmentation method is more efficient than the existing segmentation techniques in factors of each quantitative overall performance metrics and appropriateness for land-use classification.

Abstract:When the foundation soil is not strong enough to hold on with the loads transmitted to it .At such places the structure could be damaged, in order to eliminate this threat the soil properties such as stability, shear strength, durability etc are enhanced by mixing it with different admixtures such as lime, cement etc .At some occasions fibers (obtained from waste materials)are used to enhance the soil properties. In past a large number of studies have shown the effectiveness of such mixing materials at considerable percentages. It has been studied that the outcome of such materials when used in soil improvement techniques is handsome. In this examination the polypropylene fiber ,obtained from waste materials has been used. The different percentages of fiber reinforcement are used and the corresponding changes in the shear strength parameters are examined. The effects of polypropylene fiber reinforcement on the soil samples are examined by carrying out Direct Shear Test and Unconfined Compression Test.

Abstract:The daylight conditions that are fit for an interior can be easily achieved by applying the simple and comprehensive principles, the daylighting rules of thumb in the process design. In architecture, these rules can be expressed in a different kinds of modes and are divided into categories that based on the parameters which constitute them. Since daylighting is the control admission of natural light, one of the categories can be the light well topology. Thus, an opening plays an important role in influencing the effectiveness of daylight distribution in building. One of the categories is light well typology. This study was conducted using an existing sample of single side opening and two side opening light wells with the comparison of additives to light-well typology under under overcast and intermediate skies without sun also to proposes daylighting rules of thumb for light wells. There are several types of light wells simulated for daylighting performances in this study. Light well models were simulated by conducted using IES_VE application software. Regression analysis was then carried out to find correlation between the measurements obtained in the daylighting simulation and the calculations derived from an established daylighting formula. Thus, existing daylighting formula is modified to create new daylighting rules of thumb for light wells with reflectance mirror in single storey terrace houses. These simple equations can serve as rules of thumb to helparchitects and engineers in calculating daylight levels for different light well designs.

	Paper Title:	**Hybridization of Artificial Bee Colony Algorithm and its variants with Hyperbolic Spiral based Local Search**

Abstract:Artificial bee colony (ABC) algorithm is grounded on intelligent swarming behavior of honey bees. It is one of the efficient algorithm for optimization. The ABC algorithm is good in exploration and sometimes fails to exploit properly. Local search strategies in addition to existing steps play important role to improve exploitation. In order to improve exploitation here a local search inspired by the nature of hyperbolic spiral introduced in ABC. The purposed variant used with ABC, Best-so-far ABC and Gbest ABC. Outcomes proved that hybrid of these algorithms with hyperbolic search gives good results with higher accuracy and reliability.

	Paper Title:	**Decomposition of Regional Development Shifts**

Abstract:Subject. No breakthrough in the economic development of the Russian Federation could be achieved without the maximum utilisation of the inner regional potential. This implies high relevance of studies concerning the aspects of influence produced by internal and external factors on regional development, as well as analyses of the existing conditions at the macroeconomic level that support or hinder the engagement of inner regional reserves and opportunities in the regions' socioeconomic development. This would make the basis for a more comprehensive view of the regional system and its inherent properties, helping to identify ways to manage regional development.

Objectives. Analysis and decomposition of developmental shifts in the Russian regions and their classification based on internal and external influences.

Methods. The primary research method is the shift-share analysis method. The methods of logical and statistical analysis, particularly, correlation analysis, are also used.

Results. The driver effects of shifts are calculated at the national, industry, and regional levels for 80 regions of the Russian Federation and the period comprising two time points, 2012 and 2017. The regional and industry

3552-3557

effects are analysed by the types of economic activities. It is established that, firstly, the regional effect is negative for most regions and, secondly, the industry effect (in combination with the national effect) acts to smooth out the negative regional effect.

Conclusions. A conclusion is made that positive shifts can be achieved both in strong and weak regional economies. Generally, the shifts in Russian regions are mostly influenced specifically by the internal regional conditions, which are mostly adverse, suggesting high importance of regional effects. The research highlights the significance of industry policies at the federal level, primarily in economic activities such as agriculture and manufacturing, and the need for improvement of regional policies implemented at the federal level to raise the number of self-developing regions.

Keyword:region, regional development, shift-share analysis method, national effect, industry effect, regional effect.

Paper Title: **Digital Revolution of Education 4.0**

Abstract:The purpose of this article is to show the evolution and requirement of the educational system such as the Industrial Revolution 4.0 (IR 4.0). The fourth industrial revolution (RI 4.0) brought about a state of change in education. IR 4.0 is disciplined by artificial intelligence and digital physical frames, making the human-machine interaction even extra versatile. By preparing students for the next life and working with IR 4.0, you can replace people working in specific fields with smarter robots. Education requires the use of relevant information and skills that cannot be replaced by robots. Creative Education 4.0 ends innovation by focusing on improving education and skills to make future learning more personal, super, smart, portable, global and virtual. The explosion of IR 4.0 has changed future learning into fairy tale miles. Science fiction goes to science-creative energy is omnibus; virtual classrooms and augmented reality grow in smart classrooms. Self-sufficient smart robots, guided tours, vehicles and classrooms are today's pleasures. State-of-the-art instructors need to look for new ways to improve their future learning using educational innovations. In this sense, this introduction assumes that teachers need to review the old

origins of orientation and learning and update their learning experience to complete the necessities of Education 4.0.

Paper Title: **A Novel Scheduled Power Management using Iot Controlled Energy Meter**

Abstract:In this proposed system, scheduled power management is to reduce the excess use of energy and to reduce the energy tariff of the domestic consumers. The price differs, if one unit exceeds the value fixed by tariff 1a plan. For domestic customers, scheduling of energy is done by using energy meter which is controlled by IOT and Arduinos. If the consumer uses excess of scheduled energy the user gets an SMS and the circuit will be tripped automatically, in case if there is necessity for more energy, we switch to normal function from the scheduled function which can be maintained by IoT. The consumer can check the energy consumption in webpage. The internet of things paradigm has been proposed in order to check the energy consumption and also for automation purposes like tripping the circuits when energy usage is increased. A very low cost, advanced embedded hardware has been used to make the prototype model.

Keyword:IOT (internet of things), tariff, scheduled energy, Arduino.

Paper Title: **Modeling Discrete Channels Based on Gilbert Model using MATLAB Software**

Abstract:Examining the state of discrete channels requires the study of the physical and mathematical characteristics of these channels. The Gilbert model allows for the determination of the channel state for detecting and correcting errors mainly in discrete channels. In the Gilbert model, the channel can be in two cases. It is a good case that there are no errors, and in the worst case, an error with px is likely to occur. The need for error-free channels for discrete channels, as well as the use of discrete channels for data transmission, as well as the use of Virtual programs for error detection and correction. The article deals with the use of Gilbert's model to detect and correct errors in discrete channels, and to combat noise in providing reliability and resilience of information. In addition, Gilbert's model is based on the modeling of the discrete channels using the MATLAB software and the removal of detected errors by a virtual model.

Keyword:information, message, channel, signal, system, model, model memory.

Paper Title: **Impact of Scrum Adoption on Enterprise in Transition for Software Development**

Abstract:In every product development companies should be aware about the quality and customer’s satisfaction of the product that they are developing. To get high quality product based on the customer and circumstances of development, suitable process model has to be used in development. Scrum framework is the one which focus on maximize flexibility and minimize transparency in project development. Most of the companies are going with Scrum as it is simple to use and it is a tool rather than process model. When new process models are chosen, they need to be adopted into the enterprise and has to go for a change. As adoption is a continuous process, at least for some period the behavior and new culture of the new framework has to be managed in its early days. When new concept is introduced there should be smooth transition from exiting to new ones. In this work impact of Scrum adoption in developing value-added card products and in financial services is discussed

	Paper Title:	**Smart Agriculture IOT with Cloud Computing, Fog Computing and Edge Computing**	
	Abstract:Smart Farming could be a explained as a farming method which works on the thought process of a fashionable technology to increase the yield of the amount and quality of agricultural merchandise. IoT-based smart farming, a system solely made for the observation of crops in the field with the assistance of sensors and automating the irrigation system in accordance to our needs. Antique cloud-based system which uses mostly IoT models are inadequate to handle the traffic and the database of knowledge. So as to an extent it turns out to be lower latency, longer battery life for IoT devices, a lot of efficient money-based knowledge management, access to knowledge management and AI, ML IoT-EDGE based system is proposed or may be adopted. Edge for the IoT brings potential edges for several IoT deployments, as well as removal of interval in conjunction with geometric communications potency, compared to exploitation of the cloud to process and store knowledge. For example, several IoT processes will have a high level of automation at the sting leading to low latency for fast processing. The machine ifogsim is employed for modelling and simulating the sting based mostly on the IoT system which also includes the edge and the fog. The results of this method are to indicate that Edge computing based mostly IoT models are a lot of economical and extremely fast and may turn out and provide higher results when put next to different systems. **Keyword:**IOT (Internet of Things) Cloud Computing Fog Computing Edge computing Smart Farming **References:** 1. 	Paper Title:	**Local Aggregation Scheme for Data Collection in Periodic Sensor Network**	
	Abstract:Data aggregation is an important technique for data collection & aggregation in WSN where sensor nodes sense the raw data and sends the aggregated data to the sink node. In a cluster based periodic network, sensor node senses the data on a specific time interval, performs local aggregation and send aggregated data to Cluster Head (CH). Various Local aggregation algorithms are used to remove redundant data at sensor nodes but local outlier detection problem is still unsolved. Therefore, a local aggregation algorithm has been proposed which uses the temporal correlation property of WSN to eliminate redundant and local outlier data which improves the data sent ratio and data quality. Sensor measurement is collected at different time interval of a sensor, exhibits temporal correlation because measurements varies with small or same difference (δ) and measurements are treated as similar measurements. In proposed local aggregation approach, each sensor node finds similar measurements of sensors with their frequency (number of occurrence) in a specific time interval (Temporal correlation). Set having higher frequency is selected and transmitted the average values of measurements that lie in the selected set to the cluster head. If sensors don't detect any reading between intervals it simple send a message 'data not found' instead of sending empty set. In this way we delete redundant and local outliers. The experimental result shows that algorithm improves the data quality and data sent ratio by eliminating redundant data and local outliers. **Keyword:**Data aggregation, Data fusion, WSN, Temporal correlation. **References:** 1. Paper Title: **Business Process Reengineering: A Scope of Automation in Software Project Management using Artificial Intelligence**

Abstract:This research paper aims an analytical study on the software development organization insight into trending automation technologies and their implementation Software Engineering Management (SEM) processes. Software Project Management (SPM) is a scientific art for planning, controlling execution and monitoring. SPM approaches are more focusing towards the essential requirement for the success of software project development. It has been very challenging to manage software development using existing project management procedures driven by software development organizations and this is one of the areas of problem statement for this research. This paper discusses an analytical study for the requirements and consideration of BPR in SPM, explores to spot and emphasizes the important success factors for the execution of a BPR using benefits of Artificial Intelligence (AI) in software development organization. BPR is organizational mechanism that improves ability to respond to challenges of qualitative result by change and improvement in software engineering processes, productivity, product quality and competitive advantages. AI will be the best approach and scope of automation SEM processes for software development organizations. This paper also represents a conceptual view of software engineering model shift for improvements in capability of project managers to handle agile thinking and problem solving for betterment of SPM using Artificial Intelligence.

Keyword:AI – Artificial Intelligence, BPR - Business Process Reengineering, BPM – Business Process Management, SE - Software Engineering, SEM – Software Engineering Management, SPM – Software Process Management, SPI – Software Process Improvement

Paper Title: **Interference Mitigation of Heterogeneous Cognitive Radio Network using Spatial Diversity**

Abstract:The heterogeneous cognitive radio networks are playing the most important role in the future generation wireless networks in order to address the problem of spectrum scarcity and to satisfy the demand of multiple coexistence networks. . In a country like India the deployment of CRN is possible on television network with the help of TV White Spaces (TVWS) as its capacity is quite high due to digital transmission of TV channel. The use of multiple wireless standards such as IEEE 802.11a, IEEE 802.22, IEEE 802.19.1 and many more wireless networks operating in the same frequency band of TVWS creates the coexistence scenario which involves the heterogeneous networks. The interference mitigation is the most important issue in such heterogeneous networks. In literature, the issue of interference mitigation is addressed mainly at the medium access layer; however, very limited work is presented at physical layer. In this paper, an interference mitigation problem of heterogeneous cognitive radio network at physical layer is addressed. The spatial diversity based techniques are proposed to mitigate the interference in heterogeneous CRN. The coexistence of different wireless networks in secondary CRN is considered for analysis. The characterization of aggregate interference is carried out for different interference scenarios. The proposed system outperform for heterogeneous CRN network over TVWS network.

Paper Title: **Effective Positioning of Shear Wall in G+5 Storey Building on Sloping Ground**

Abstract:Earthquake is a natural calamity. It has been observed that the earthquake has proved to be more fatal in today's time. The prime reason for this catastrophe is the extermination of the man-made structures during the earthquake, Lack of lateral strength and stability in the man-made structure is the prime reason for their demolition during the earthquake. Mostly man-made structure is multistory buildings for this reason that is necessary for the multistory building to withstand against seismic activities. For the past few decades, some new methods have been adopted to make multistory building laterally strong and stable, a shear wall is one of them which are a structural member which provides lateral stiffness and strength to the structure. The earthquake can be even more lethal on sloping land. This paper studies the influence of shear wall in the multistory building built on sloping ground. For this purpose, four different models have been taken. Modal one is the conventional rigid frame building and the remaining three models are kept with the shear wall. All conditions (ground slope, material, seismic zone, soil condition, etc.) Except for the size of the shear wall are identical. The linear static analysis has been carried out to evaluate the story shear and its reduction as a result in all three cases. The entire analysis is done on software called sap: 2000.

Keyword:seismic load, shear wall, sloppy ground, rigid frame structure, and sap: 2000.

	Paper Title:	**Multimodal Transpose Rotation Mobius Transformation Based Cancellable Template Generation Technique**	
	Abstract:Cancelable biometric is such a template security conspire, that replaces a biometric template when the stored template is taken or lost. It is a feature level area transformation where a misshaped variant of a biometric template is produced and coordinated in the transformed space. The issue persevere with the utilization of unique template can be abstained from utilizing cancellable biometrics. In this work, a nonexclusive structure has been intended for producing irreversible portrayal of templates of multimodal which depends on Mobius transformation on unique picture. So the template security is additionally improved. The simulation output of the proposed framework give better execution in Identification of clients. Another strategy called "MTRMT" is proposed to address the issue of stored Templates. The Proposed epic strategy has been assessed with the ongoing fingerprint got from 50 volunteers of veerapandi village in Coimbatore locale. The exploratory outcome shows the better execution of the proposed framework. **Keyword:**Multimodal, Feature level and Cancelable Biometrics. **References:** 1. A. A. Ross, K. Nandakumar, and A. K. 	Paper Title:	**Implementing Convolutional Neural Networks for Simple Image Classification**	
	Abstract:In recent years, huge amounts of data in form of images has been efficiently created and accumulated at extraordinary rates. This huge amount of data that has high volume and velocity has presented us with the problem of coming up with practical and effective ways to classify it for analysis. Existing classification systems can never fulfil the demand and the difficulties of accurately classifying such data. In this paper, we built a Convolutional Neural Network (CNN) which is one of the most powerful and popular machine learning tools used in image recognition systems for classifying images from one of the widely used image datasets CIFAR-10. This paper also gives a thorough overview of the working of our CNN architecture with its parameters and difficulties. **Keyword:**Convolutional Neural Network, image recognition, CIFAR-10, machine learning. **References:** 1. 	Paper Title:	**Optimisation of Smart Water to Enhance Oil Recovery Efficiency in a Part of Oil Field of Upper Assam Basin, India**	
	Abstract:Researchers have proved the significance of water injection by tuning its composition and salinity into the reservoir during smart water flooding. Once the smart water invades through the pore spaces, it destabilises crude oil-brine-rock (COBR) that leads to change in wettability of the reservoir rocks. During hydrocarbon accumulation and migration, polar organic compounds were being adsorbed on the rock surface making the reservoir oil/mixed wet in nature. Upon invasion of smart water, due to detachment of polar compounds from the rock surfaces, the wettability changes from oil/mixed wet to water wet thus enhances the oil recovery efficiency. The objective of this paper is to find optimum salinity and ionic composition of the synthetic brines at which maximum oil recovery would be observed. Three core flood studies have been conducted in the laboratory to investigate the effect of pH, composition and salinity of the injected brine over oil recovery. Every time, flooding has been conducted at reservoir formation brine salinity i.e at 1400 ppm followed by different salinities. Here, tertiary mode of flooding has been carried out for two core samples while secondary flooding for one. Results showed maximum oil recovery by 40.12% of original oil in place (OOIP) at 1050ppm brine salinity at secondary mode of flooding. So, optimized smart water has been proposed with 03 major salts, KCl, MgCl2 and CaCl2 in secondary mode of flooding that showed maximum oil recovery in terms of original oil in place. **Keyword:**COBR Interactions, Oil Recovery Efficiency, Polar Compounds, Smart Water, Wettability Alteration **References:** 1. 	Paper Title:	**Framework towards the Process of Estimating or Predicting Perceived QoE Based on the Datasets Obtained From the Mobile Network**	
	Abstract:Nowadays, the research study community visualizes a standard shift that is going to put the focus on Quality of Experience metrics, which relate directly to complete consumer satisfaction. Yet, determining QoE coming from QoS sizes is a daunting job that powerful Software Defined Network operators are currently able to tackle through artificial intelligence strategies. In this paper, our experts pay attention to a few essential QoE factors, and we to begin with proposing a Bayesian Network design to anticipate re-buffering proportion. This paper suggested a structure for modeling mobile network QoE, making use of the vast records analytics approach. The planned platform explains the method of estimating or forecasting perceived QoE based upon the datasets obtained or collected from the mobile network to enable the mobile network operators efficiently to deal with the network functionality as well as supply the individuals an adequate mobile Internet QoE. **Keyword:**mobile, network, datasets, prediction **References:** 1. Paper Title: **Early Dementia Diagnosis Based on DNN Based Correlational Analysis and Fisher Criterion Based LDA using Morphological Brain Multiplexes**

Abstract:The expanding recurrence of dementia happening is a disturbing patterning that has incited dire research intending to avert the improvement of the sickness. Diagnosing dementia in its beginning periods is an urgent advance in averting the improvement of the ailment into exacerbated side effects. Early mild cognitive impairment (EMCI) is the early symptom of dementia. This can be analyzed using mapping mind associations utilizing Magnetic Resonance Imaging (MRI). In the approach, for improving the correlational block, we presented an enhanced classifier also, for improving the performance of discriminative block, an optimized LDA is to be proposed. For correlational analysis, Deep Neural Network (DNN) is presented in this work. Besides, for discriminative analysis, a novel and efficient feature selection method is presented. Fisher criterion is used to select the most discriminatory and appropriate features to ensure consistent feature selection and classifier learning goals and to improve the classifier's performance. In the Mat lab framework this proposed method is implemented. The performance of this proposed approach is evaluated concerning Accuracy, Sensitivity, and Specificity.

Keyword: Brain multiplex, Correlative analysis, Dementia, discriminant analysis DNN, Fisher criterion

	Paper Title:	**Computational Analysis of Kinematics of 3 – Links Articulated Robotic Manipulator**	
	Abstract:The Computational Analysis of Kinematics of 3 – Links Articulated Robotic Manipulator has been presented in this. The design of robot manipulators requires accurate computational analysis, involving the geometric position of the linking arms. The method of Forward Kinematics and Inverse Kinematics were employed in estimating the robotic arm's position with respect to link lengths and angle, in which the angle required to move the end effector to a desired position is estimated and determined. A three link robotic arm with a rigid rotational base was also illustrated using free body diagrams, and computational estimation of the required parameters. The outcomes of the forward kinematics reveals that the robot end effector position can be estimated using the values of x, y, and z coordinates thereby providing a better means of controlling or adapting robot's arm/motion to its environment. **Keyword:**Articulated Robot; End effector; Forward Kinematics; Free Body Diagram; Inverse Kinematics; Planar Robot; Robotic; Rigid Body; Robot Arm. **References:** 1. 	Paper Title:	**Performance Examination of SEPIC Based Hybrid Cascaded Single-Phase Multilevel Inverter**	
	Abstract:In the present scenario, reduced part count(RPC) multilevel inverters are become popular compared to traditional multilevel inverters(MLIs). This is mainly due to reduced size and cost and alleviates the issues of more passive components, flying capacitor voltage balancing issues and the requirement of complex switching schemes. Also, the RPC is getting attraction for various industrial and transportation applications. Therefore, in this paper, a novel 17 level inverter is proposed by cascading MLIs with the reduced part count. The complete operation, switching schemes and output are presented to evolve the performance under steady-state conditions using MATLAB software. **Keyword:**Multilevel inverter, DC-DC boost converter, sinusoidal pulse width modulation (SPWM); **References:** 1. Paper Title:	**Exploring the Extreme Learning Machine for Classification of Brain MRIs**	

628.

Abstract:Magnetic Resonance Imaging (MRI) technique of brain is the most important aspect of diagnosis of brain diseases. The manual analysis of MR images and identifying the brain diseases is tedious and error prone task for the radiologists and physicians. In this paper 2-Dimensional Discrete Wavelet Transformation (2D DWT) is used for feature extraction and Principal Component Analysis (PCA) is used for feature reduction. The three types of brain diseases i.e. Alzheimer, Glioma and Multiple Sclerosis are considered for this work. The Two Hidden layer Extreme learning Machine (TELM) is used for classification of samples into normal or pathological. The performance of the TELM is compared with basic ELM and the simulation results indicate that TELM outperformed the basic ELM method. Accuracy, Recall, Sensitivity and F-score are considered as the classification performance measures in this paper.

Paper Title: **Transition Metal Oxide-Based Perovskite Structures as a Bifunctional Oxygen Electrocatalysts: Fe Doped LaCoO3 Nanoparticles**

Abstract:In this report, we have investigated lanthanum cobalt iron (LaCo1-xFexO3) perovskite nanoparticles synthesized by combining metallic nitrates, deionized water, and citric acid by using sol-gel method and subsequently calcinated at 400 °C for 1h and 900 °C for 7h, respectively. The formation of single-phase perovskite structure is a series of LaCo1-xFexO3 (x = 0, 0.2, 0.4, 0.6, 0.8, 1). The crystal structure, mean particle, and morphology properties of the prepared LaCo1-xFexO3 perovskite oxide nanoparticles were examined by X-ray diffraction (XRD), field emission scanning electron microscopy (FESEM). The perovskite structure has shown special performance for oxygen reduction reaction (ORR) and oxygen evolution reaction (OER) catalytic activity in alkaline medium. As the combined valence transition metal oxides are rising capable candidates for bifunctional electrocatalysts, the electrochemical performance of the LaCo1-xFexO3 catalyst was thoroughly investigated. Koutecky-Levich results on the ORR polarization curves of all compounds shows that the four-electron pathway is favorable on these perovskite oxides. In this paper, we report B-site Fe doping in perovskite structure is a sufficient strategy to improve ORR and OER catalytic activity for application in metal-air batteries.

Keyword: Metal-air batteries, Bifunctional catalyst, Perovskite oxides, Electrochemical behavior.

Paper Title: **Factors Affecting the Sales of Airlines in India with Special Reference to Air India**

Abstract:India's aviation industry is largely untapped with enormous growth opportunities, provided that air transport is still expensive to most of the country's population, almost 40 per cent of whom are the upwardly mobile middle class. The industry will engage and work with policy makers to adopt effective and rational decisions to improve India's civil aviation industry. The primary aim is to identify the factors responsible for low sales of Air India. Secondly, the aim is to evaluate the causal relationship between factors identified and the dependent variable airline choice. It was found that Air India should reduce the cost of ticket on both domestic and international flights. Customer doesn’t find services delivered up to the mark. The quality of food, service of cabin-crew, lateness of flight and safety should be improved by Air India to remain competitive in the market. It has become and more imperative for the Air India to prove its mettle and not just settle on the taxpayers money bailed out by the exchequer but also on price, service and safety ground.

	Paper Title:	**Optimization of Productivity Measures to Improve Performance of Selected Banks – Indian Perspective**

Abstract:Efficiency or productivity is one of the significant estimates which help in measuring the development and advancement of economy of the nation. The efficiency has a pivotal influence in authoritative accomplishment of greatness which is basic for dynamic culture. Ideal efficiency of an organization relies upon coordination between all data sources that yield most extreme gainfulness with least exertion. Thus the present research is centre around a goal of recognize and look at the components impacting the efficiency just as benefit execution of selected banks in India both in public and private sector. For which a sample of twenty banks were selected. The time frame considered for the research is ten years from 2008 to 2018. The procedure which is utilized in the present research is correlation analysis which explains the connection between the selected factors. Regression analysis is also utilized to dissect the effect of selected independent factors, for example, magnitude of sales, value addition, cost of sales, profit before tax (PBT) of each worker. Dependent factors encompass of return on assets and return on value addition by fixed assets. Furthermore, free example test is utilized to survey the connection among profitability and execution proportions of selected banks in India both in public and private sector. In this manner, the outcomes from correlation analysis demonstrate that practically all the independent factors aside except from sales volume and cost of sales in selected banks in India both in public and private sector. Results from regression analysis shows that business per worker is having noteworthy negative effect on ROA.

	Paper Title:	**Design of Multi-loop Current Control Strategies for LCL Filtered Grid-connected PV System**

Abstract:This paper presents numerous feedback current controller methods for the grid-connected PV systems incorporating with third order LCL filter. The various potential dual-loop feedback current controller schemes for a

grid-tied electrical converter and a comparison among these controllers are made based on their performance. The effectiveness of these current controllers are based on various views like performance under polluted grid condition and also the dynamic performance of two control schemes under different transient conditions. A commonly used PI controller are employed in all cases of multi-loop controllers and also the electrical converter used here is operated in voltage control mode. In this work, a third-order low-pass LCL filter is employed to minimize the high order harmonics which are created due to the switching of the converter. The LCL filter is incorporated among the dc-ac converter and the utility grid. Two current regulation techniques are focused here. The design, analysis and the performance of these controllers are briefly discussed in this paper. By comparing their performance, anyone can suggest their applications in the grid-tied PV systems. All the current control schemes are incorporated with a grid-connected system of 2-KVA voltage source inverter. Simulation results are produced to validate the performances of two current control schemes. The output ohmic resistance of VSI is taken into account here for their performance analysis.

Keyword: Voltage source Inverter (VSI), Low-pass LCL filter, Grid-connected PV system, Dual-loop current control schemes, power quality.

Paper Title:	**Home Automation and Security using Raspberry Pi and Whatsapp**

Abstract:This paper presents an ingenious remotely sensible system that controls the home appliances by using WhatsApp. This is an IOT based model designed and developed by using Raspberry Pi-3. In this proposed system of home automation, the feasibility of executing certain important tasks with higher controllability and remote access have been incorporated. Home appliances such as lights, fans, air conditioners, power driven electrical and electronic commodities etc., are made to control from any part of this world, using a mobile phone with WhatsApp installed in it. For ensuring this functionality, a web interface has been developed using the Raspberry Pi, as a web server for operating and controlling the home appliances through any Wi-Fi accessible mobile device with WhatsApp feature.

Paper Title: **CATIA V5 ANSYS Based Performance Enhancement on Disc Brake**

Abstract:In the modern automobile vehicles the system of braking is the main primary essential parts. It takes up the wheel kinetic energy then dissipates it as heat energy and decelerate or else vehicle stop. While apply the disc brake high stress is generated, therefore problem of frictional wear occur. In order to enhance the functional performance, take thermal analysis for selecting minimum heat flexes material. In this research work, software of Catia v5 as well as ANSYS is used for creating modal and analyzing. The Suggest result materials are fabricated using stir casting method and conducting wear test.

Paper Title: **Sol-Gel Synthesized N and Mn Co-Doped TiO2 Nanomaterial for Photocatalytic Degradation of Malathion under Visible Light Irradiation**

Abstract:Different weight percentages (0.25-1.00 wt%) of Nitrogen (Non-Metal) and Manganese (Metal) co-doped nano titania were synthesized by sol-gel method and characterized by XRD, UV-vis.DRS, FT-IR, XPS, SEM and TEM. The XRD results has shown that all the prepared catalysts are in anatase phase indicating that co-doping of N and Mn did not affect the crystal structure of TiO2. From the UV-vis.DRS spectra a significant absorption shift towards visible region was noticed in N and Mn co-doped TiO2 and their presence was confirmed by XPS and FT-IR results. SEM and TEM results showed spherical nanoparticles with average particle size of 9 nm. Photocatalytic efficiency of synthesized nano materials was tested on non-biodegradable organophosphorous pesticide, Malathion under visible light irradiation. The effect of dopant concentration, pH, catalyst dosage, and initial pesticide concentration on photocatalytic degradation of malathion was studied and optimum conditions were established. Among the synthesized samples 0.50 wt% N & 1.00 wt% Mn-TiO2 exhibited best photocatalytic performance. Photoluminiscent spectroscopy (PL) was used to examine the rate of production of oxidative species, hydroxyl radicals which play key role in photocatalytic degradation.

Keyword: Malathion, Manganese, Nitrogen, Sol-gel method, Titanium dioxide, Visible light.

Paper Title: **Computer Based Bone Breakage Detection using Machine Learning Techniques**

Abstract:X-Ray is one of the most commonly used medium to extract the images of any bone in the body.Fracture of a bone is most common in recent days due to accidents or any means.In order to detect whether there is a fracture or not the orthopaedics suggest for x-ray.In many places due to more patients there might be a delay of doctor consult which may leads to the increase in the severity of problem.In order to avoid this we have proposed an automatic bone fracture detection system where a system is trained about the fractures and further used to detect the fractures in a bone in the x-ray images.ANN,PNN.BPNN are the classifiers used for bone fracture detection where BPNN has given more prominent results compared to ANN and PNN with an accuracy of 82%.

Paper Title: **Characterization of Roselle & Kevlar hybrid Composites**

Abstract:This paper center essentially around the ongoing patterns and advancements in Bio compounds as connected to the therapeutic and building industry, refering to certain models. Present research is Alkali treated along with Silane treated and untreated fibres hybrid composite was prepared and all the types of physical and chemical properties studied. All the Silane treated composite shown enhanced concert than untreated composite. Performance possessions of composite devising various tenders in textile& non textile. Silane has an added advantage both physical and chemical properties enhancement.

Paper Title: **Dynamic Bit Coin Value Prediction**

Abstract:Bitcoin is online money that is utilized worldwide to make online installments. It has thusly become a venture vehicle in itself and is exchanged a route like other open monetary forms. The capacity to foresee the value change of Bitcoin would in this way encourage future venture and installment choices. The objective of this paper is to learn with what exactness the bearing of Bitcoin cost in USD can be anticipated. The value information is sourced from the Bitcoin Price Index. The errand is accomplished with changing degrees of achievement through the usage of a Bayesian streamlined intermittent neural system (RNN) furthermore, a Long Short Term Memory (LSTM) arranges. The LSTM accomplishes the most noteworthy order precision of 59%.

Paper Title: **Design and Implementation of Agrobot with Automatic Sun Tracking**

Abstract:Advancement in recent technology introduces the agriculture robotics. These robots can be harvesting stage, pesticide spraying, weed control, automatic milking and many other applications. These robots can replace the human labor and improve the production rate. To meet up the future demands and to overcome the disadvantages of the traditional methods, a agrobot that can do seed sowing along with soil testing process with automatic sun tracking solar panel manner is proposed in this paper. The agrobot will move around various ground contours, digs the ground, sows the desired number of seeds and cover it with the soil. Then adequate content of water is poured in to the ground according the texture of ground. This agrobot also do the soil testing process and

3708-3710

	the results of solid testing process can be viewed in the mobile phones through GSM module. This paper gives the complete installation details of the agricultural robot. This proposed agrobot is able to sow the seed, monitors the soil fertility, moisture content along with the automatic sun tracking solar panel. **Keyword:**Agrobot, Moisture Sensor, pH Sensor, Ultrasonic Sensor, Solar Panel. **References:** 1. 	Paper Title:	**Twin Band-Notched Ultrawideband MIMO Antenna**
640.	**Abstract**:In this article, we have presented various techniques that are used for improving different parameters related to UWB antenna. In this Paper, we planned for MIMO antennas in contemporary wireless communication which enhances the bandwidth and gives compact antennas. The antenna band we notched is of planned MIMO which offers an bandwidth with the operational band-notched. The bandwidth capacity of the antenna is from 2.93-20 gigahertz with sharp rejection at WLAN-band with isolation of not exactly - 22 dB is accomplished for the whole band, by utilizing a simple modified shaped structure in the bottom plane, port isolation and transmission capacity are improved. The diversity execution performance is likewise contemplated and whole outcomes shows it's a potential point of using MIMO based diversity antenna for ultra wide band applications which is demonstrate in this paper. The parameters to assess the performance of the MIMO are explained, the whole examination completed in different sections has been outlined. **Keyword:**DGS, UWB, SRR and MIMO **References:** 1. 	Paper Title:	**Utilization of Storm Water Management Model for Urban Flood Scenario**
641.	**Abstract**:Majors cities in India have witnessed huge floods from past few decades. Due to rapid population growth and improper urban planning the chances of creek, localised or flash urban floods have drastically increased. Climatic changes are also a key reason for heavy rainfall that increases the flood volume and depth in a catchment. Modelling of Storm water plays a key role in estimating flood runoff quantity and quality. To check these issues SWMM is used to simulate floods scenario in Urban areas. This hydrological study is carried out to simulate and understand the rainfall runoff characteristics of the study area by using SWMM. It is an effective tool used for simulating flash floods and runoff in urban areas. In this study catchments have been subdivided into 14 parts and modelled for year 2017 rainfall events of 1-hr interval. The present study area is evaluated by importing AutoCAD map of the area in SWMM. Further Rainfall Data is imported as time series in the model. The results depict that	**3716-3721**

the Runoff for the Sub catchments of S1, S2, S3, S9, S13 blocks are maximum. The study states that no nodes are flooded and also no overflow sections. Thus, the selected study area storm network system has been well planned and has enough carrying capacity to carry the simulated rainfall for a prolonged duration.

Keyword: AutoCAD, Flash Floods, Scenario, Sub catchments, SWMM.

Paper Title: **Existence of Nano Level Force in Protein Plays Applications of Maximum Untold Understanding of Life Form**

Abstract:There are many interactive forces between atoms applied to solve the problem of nature of molecules. One would go on applying this to several diseases and sufferings. On doing so, we have discovered that a new dimension of atomic arrangements playing a role in existence of force of interaction at nano level say at 1.6 nm. Arrangements are in such way that it maintains a carbon fraction of 0.3144 in the structure of biologically important molecule called protein. Arrangements are important from maintaining structure and another way of interaction due to the deficiency of this domain formation. All our analysis conclude that there is new kind of force of attraction available for advancing the science here in biology and other field as well as other elements possess this nano level forces of attraction. Our results are validated with crystal availability because of force existence. Otherwise other may have to be studied accordingly. Bond of all atoms involved in domain formation are altered from original value of bond formation but increased or decreased according to the type of bonds. Alteration can be a measure of this newly identified nano level force of interaction. Our analysis can be extended to other problems in our science of untold answer.

Paper Title: **Development of Low-Cost Auto Robot for Plastic Floating Garbage Collection using IoT**

Abstract:Nowadays, there is still much plastic waste floating in the sea and rivers, causing a limited number of officials to take care of this waste is not thoroughly. In this paper propose to develop the low-cost auto robot from waste materials based on Internet of Things for grabbing and collecting the floating garbage in the closed of water pool. The sensors and motors were mixed to control the robot on water surface and collect the plastic floating waste which is detected by sensors. To classified the floating garbage, the Fast Approximation Nearest Neighbor algorithm was applied to system in the web platform. The activities for garbage collection were submitted to social media such as LINE notify application. As a result, the auto robot system has the accuracy value at 94.4% and 98.8% for stationary mode and cover mode respectively.

Keyword:auto robot, floating garbage, Internet of Things, image processing, social media.

Paper Title: **Improving Responsiveness Conversation of Thai Chatbot through Sentiment Analysis Classification Techniques**

Abstract:Nowadays, internet and social media are play and important role for the business and marketing. Especially, the social media marketing drives the businesses with fierce competition. if there is communication between a large number of customers, it is necessary to have the staff to coordinate thoroughly Resulting in higher expenses as well. Chatbot can be solve this problem by action like a human to deliver a suitable message for their customers. This paper proposes the techniques for analyzing the sentiments that coexist with chat messages or the conversations. Naïve Bayes, K-Nearest Neighbor, and Support Vector Machine techniques were used to classify the sentiments based on Cross-Industry Standard Process for Data Mining. As a result, the highest accuracy is produced by Support Vector Machine with value at 94.60% for improving the chatbot able to communicate effectively with sticker messages.

Keyword:chatbot, classification, conversation, sentiment analysis, social media marketing.

	Paper Title:	**Realization of Optimized CORDIC Core for Implementing Sine and Cosine Operations**

Abstract:Cordic, which is an iterative vector rotation calculation for different coordination systems, has been proposed in this paper that has low latency and low area utilization. The main limitation is that in comparison to standard CORDIC, the number of micro-rotations necessary increases with the input angle bit-width which leads to additional stages of micro-rotation. In order to overcome this, the most area utilizing stages are recoded using the two bits of the input angle simultaneously such that our suggested technique can achieve a smaller micro-rotation for bigger bit width applications. In this article, using parallel and pipelined CORDIC architecture a Digital sine and cosine generator is intended and applied which utilises optimized Micro-rotation Angle Recoding algorithms to achieve low latency and reduces area of the design. The proposed work reduces the delay by 34%.

Keyword: Cordic; Iterative Approach; Pipelined Analysis; Bbr; Mar;

	Paper Title:	**Approximate Adder Implementation using Quantum- Dot Cellular Automata for Digital Signal Processing**

Abstract:We explore quantum-dot cellular automata (QCA) design for approximate computing units in digital signal processors. For this cause, a common approach for design is introduced, and approximation-oriented mirror adders (AMA) are developed. In this work, we compromise power/area efficiency of circuit-level design with accuracy supervision. We compare Approximate Mirror Adder cells designed using conventional CMOS technique and using QCA. Our technique picks fairly accurate adder designs that minimalize the over-all area, hitherto maintaining the ultimate performance by studying their error resilience.

	Paper Title:	**High Performance Network Intrusion Detection System**

Abstract:In this paper, we present intrusion detection system for finding the variant types of attacks in the network. It is the way to enhance the functionality in the network by reducing the chances of risks. ICMP protocol and AES encryption algorithm are used to report the error messages and manage the information being sent from source to destination. If there is any malicious activity occurred in the network, the user will be alerted of it by specifying them the type of malicious activity. As a result it reduces the chances of intrusions and contacting multiple resources for resolving single issue.

	Paper Title:	**Fake News Detection Models and Performances**

Abstract:Fake News detection is a hard problem for decades after the advent of social media. As misinformation, so called fake news continues to be rapidly distributing on internet, the reality has becoming increasingly shaped by false information. Time after time we have consumed or being exposed to inaccurate information. The last few years have been talking about guarding against misinformation and not progressed much in this direction.
The social media is one of the medium where the fake news spreads so rapidly and impact many in a lesser span of time. Machine Learning and Natural Language processing are the core techniques to detect the fake news and stopping from spreading on social media. Many researchers putting their effort in this new challenge to curb down. This paper provides an insight on feature extraction techniques used for fake news detection on soft media. Text feature extraction works with extracting the document information which represent the whole document without loss of the sole information but words which are considered irrelevant were ignored for the purpose of improving the accuracy. Term Frequency Inverse Document Frequency (TF-IDF), BoW(Bag of Words) are some of the important techniques used in text feature extraction. These techniques are discussed with their significance in this paper. One of the important approach, Automated Readability Index is used to test the readability of the text to build the model also discussed in this paper. This paper will play a significant role for the researchers who are interested in the area of fake news Identification.

Paper Title: **GIS Based Land Assessment Identification using GLR and PMR Value**

Abstract:Paper The objective of valuation of a land is to ascertain a market value or benefit value, which is basically determined by the locality of the any land in Madurai City area in 2007 and 2019. The spatial factors are important in deciding the valuation of the land. In order to arrive at frequent value estimation for a land, there are many factors which are tangible and intangible for valuation of a land that accounts for during the process of land valuation. There are many methods used previously for deriving a value of the land, we have the GLR and PMR values based on which the land valuation are being put forth. The already researched method can provide a date for valuing the land our project takes in hand and derives a map structure using GIS technology, for deriving GLR and PMR for an area. Spatial distribution map was formulated with the help of inverse distance weighted technique. Using GLR and PMR, we would be able to identify easily the value of the land, identify the location of the land (latitude and longitudinal location) using Garmin GPS. We declared a comparative statement for the values of the land between 2007and 2019.

Keyword: Land valuation, GIS, spatial distribution, GLR and PMR values

Paper Title: **Respect Human Value to Control Software Development Failure**

Abstract:People learn and define their own values to interact in different situations. It is important to know the human values (HV) for dealing humans in better ways. HV can also be helpful for software development managers to make right decisions for managing their teams well. Unfortunately, to a great extent, the very factor is ignored in software engineering (SE). This study aims to provide a basic motivation of the topic to SE researchers to carry out some empirical evidences to control software development failures through respecting software developers' HV. In order to operationalize the study, few disciplines, in which the HV are empirically discussed, are considered to replicate the impacts on software development. The factor HVs is well connected with satisfaction and improvement outcomes in sociology, education and management studies. Likewise, this study also literates the importance of HVs for successful software project development. This study concludes that HV can form strong correlations with software development roles and can be used to minimize the software failure.

Paper Title: **Landmark Points Detection in Case of Human Facial Tracking and Detection**

Abstract:This paper describes the human facial landmark points detection is very important in the field of image processing as face detect, face identifies, face re-construct, face corners alignment, different head pose and facial expression analysis. Facial landmark is an essential point for applying face processing operation ranging from biometric recognition to mental states. In this paper, Haar cascading face detection technique is used to face detection and tracking. Histogram of Oriented Gradients (hog) has been used for 68 landmark points detection in case of human tracking and detection and support vector machine (svm) classifier are used for 68 landmark points detection for right-left eyebrow, left-right eye, nose, lips, chin, and jaw. The existing methods work effectively but many issues occur in detection as of different head poses, facial expressions, facial occlusion, illumination, colour, shadowing and self-shadowing etc. The performance of experimental results shows the advantages of our purposed method is highly accurate in terms of facial 68 landmark points tracking and detection and less error detection rate with the Multi-PIE database.

Keyword: Face detects, Face tracking, Human Facial 68 landmark points detections.

Paper Title: **Bilingual (English to Bengali) Technical E- Dictionary for Aviation OOV Words**

Abstract:E-dictionaries, quite common today are available for multiple languages in monolingual, bilingual and multilingual forms. In NLP they form the core of a series of tools that are used to understand words, sentences and in turn the language itself. These E-Dictionaries work well for any language domain as a whole. For almost all languages E-dictionaries are available, but once specialized technical domains are encountered these E-Dictionaries are quite useless. Aviation is one such specialized domain for which no E-Dictionary, translation or transliteration tool exist. On the other hand the need for such tools for specialized domains are increasing. The tool discussed in this paper is an attempt to bridge the gap that currently exists between English and Bengali languages.

Paper Title: **Performance of Biodiesel Fuel and Neem Oil Blends in Single Cylinder Diesel Engine**

Abstract:Biodiesel, a promising elective fuel has increased huge consideration because of the anticipated brevity of regular powers. One of the most encouraging options for utilizing customary non-renewable energy sources is the utilization of fluid energizes, for example, biodiesel got from neem oil by means of transesterification forms speaks to one of the most suitable alternatives for the utilization of regular petroleum derivatives. In this venture, within the sight of a homogeneous corrosive impetus, the oil is changed over into butyl ester known as biodiesel. The physical properties of neem oil, neem butyl ester, such as density, flash point, Kinematic viscosity, fire point and Pour point, have been found. To request to acquire the information for investigation, similar attributes test will likewise be led for the diesel fuel Diesel and mixes of neem oils are to be tried in a CI Engine to look at execution and discharge qualities.

Paper Title: **Development of Learning Tools Based on Problem Based Learning for Electrical Motorcycle Maintenance Course: Cognitive Ability**

Abstract:This study was designed to evaluate the effectiveness of learning tools based on Problem-Based Learning for the ElectricalMotorcycle Maintenance course in SMKs. This research applieda quantitative research approach and a quasi-experimental research design. The method consists of four stages namely: define, development, design and disseminate. The results of this research wereas follow: (1) An Instructional Design had been developed for motorcycle electrical System at Vocational High School. (2) The effectiveness was 86.26%. Based on the finding, it can be concluded that the tested program is effective to be used. On the other hand, results obtained from this research also proved that PBL-based Learning Devices is giving positive effectson improving student learning outcomes.

Paper Title: Altered Structural Connectivity in Autism Spectrum Disorder

Abstract: Research in Neurological field has been in great trend in recent days, since the need of detection and treatment of various neuropsychological disorders are in increasing order. Automated approaches for the detection are possible by various technological methods. Autism Spectrum Disorder (ASD) is a one such serious disorder which can be diagnosed in early ages of children. The Emerging technology had contributed the neuro imaging techniques to understand the various basic features and characteristics that cause the disorder. This neuro imaging had lead to a better perspective called connectome analysis which deals network structures (connectome) derived from the neuro images and are used in detection and treatment of the disorder. For these analysis functional and structural connectomes / network of brain are utilized. In this work structural connectomes derived from the Diffusion Tensor Imaging of Typically Developing and Autism Spectrum Disordered had been considered . This connectome / network consists of 264 regions (based on PowerNeuron_264 atlas) and thus 69696 connectivity features (connection between regions). Using the structural connectomes, average connectome analysis had been done and 91 connections had been identified as altered in ASD. There are 112 distinct regions involved in these altered connections and are having varied number of altered connections from one to six. 15 regions among them found to have much alteration since more number of (More than 2) altered connectivity are involved with these regions. To prove the finding , Data mining technique, Support Vector Machine was applied over 42 connectivity features (0.06% of original) out of 91 and are involved with the 15 regions filtered and the classification is done (with 82% accuracy) . Classifier rules are utilized in the diagnosis of ASD . The 15 regions extracted through thisprocess are found to be altered in ASD. These altered regions are related to sensory(touch and taste), memory, movements control, Lexical processing, Consciousness and sleep. This proposed system surely have effective use in the process of high dimensional and complex brain data and the identification of typically developed and autism spectrum disordered brain .This methodology can also be used in detection of other diseases, Role of various Regions, influential regions, etc.,

Paper Title: **Mechanical Characterization of FRBC prepared from Coir Fibres**

Abstract:This experimental study demonstrates the consequences of orientation of fibers in fibre reinforced biocomposite materials (FRBC) and its impact on their mechanical behaviour. Various samples of FRBC were synthesized from coir rope using hand layup method and epoxy resin in which orientation of coir rope was varied at 0°, 45° and 90° respectively. Test results reveal enhancements in tensile strength while reduction in flexural rigidity for all the samples of prepared composite in comparison to samples of pure epoxy material. The mechanical behavior of FRBCs is sensitive to the orientation angle of coir fiber in the matrix. The results show improved tensile strength for FE-90 samples by about 28%, but the flexural rigidity declined by about 59% as compared to E-samples. The minimum decline in flexural rigidity is about 16% for FE-00 samples while tensile strength enhanced by about 11% approx. It is concluded that, FRBCs prepared from coir fibres with hand layup method, are light weight and possess improved strength therefore, they are suitable for structural and reinforcement purpose.

Paper Title: **Effect of Various Activation Function on Steering Angle Prediction in CNN based Autonomous Vehicle System**

Abstract:Autonomous or Self-driving vehicles are set to become the main mode of transportation for future generations. They are highly reliable, very safe and always improving as they never stop learning. There are numerous systems being developed currently based on various techniques like behavioural cloning and reinforcement learning. Almost all these systems work in a similar way, that is, the agent (vehicle) is completely aware of its immediate surroundings and takes future decisions based on its own historical experiences. The proposed work involves the design and implementation of Convolutional Neural Network (CNN) enhanced with new activation function. The proposed CNN is trained to take a picture of the road in front of it as input and give the required angle of tilt of the steering wheel . The model is trained using the behavioural cloning method and thus learns to navigate from the experiences of a human agent. This method is very accurate and efficient. In this paper, for the detection of object and vehicle in autonomous vehicle, the existing Tensorflow object Detection API is collaborated with pretrained SSD MobileNet model. This paper presents in detail literature survey on various techniques that have been used in predicting steering angle and object detection in self driving car. Apart from that, the effect of activation functions like ReLU, Sigmoid and ELU over the CNN model is analysed.

Paper Title: **An Exigent Device that aids to Educate the Attention Deficit Hyperactivity Disorder (ADHD) Children**

Abstract:ADHD called the Attention Deficit Hyperactivity Disorder is predominant among the children and the teens. Children having ADHD has differences in the way they persevere things and also has slight variation in their brain development that affects attention, the ability to focus and self control. Thus children with ADHD face obstacles in their path towards success than the normal student. These children get bored with the tasks and get distracted easily. Completing their routine would be a difficult task for them. They are unable to sit still in the class and they roam around. In order to overcome this difficulty in learning among ADHD children Virtual Reality can be implemented. These ADHD children could use VR glasses for simulating their vision and creating a immersive 3D environment. VR headset will put forth a screen in front of the eyes which eliminates the contact with the real world .By doing so, they can learn things without any boredom and they will have a feeling of being in motion. This helps to increase their ability to concentrate.

Keyword: Virtual Reality, ADHD, VR glass

Paper Title: **Development and Research of a Current Source for Electrical Impedance Tomography**

Abstract:The probe current source is an essential component of equipment in electrical impedance tomography (EIT). This article discusses the development of a current source for an EIT - from a block diagram to a hardware implementation. A methodology for determining the output resistance of a current source is described, an experimental bench and the results of an experimental evaluation of the source output resistance - the most important parameter of current sources determining its characteristics - are presented.

Keyword:electrical impedance tomography; current source; output resistance; experiment.

Paper Title: **Phishing Detection using Machine Learning Techniques**

Abstract:Phishing is a type of cyber-crime where spammed messages and false sites allure exploited people to give delicate data to the phishers. The obtained touchy data is along these lines used to take characters or access cash. To battle against spamming, a cloud-based framework Microsoft azure and uses prescient investigation with machine making sense of how to manufacture confidence in personalities. The goal of this paper is to construct a spam channel utilizing various machine learning techniques. Classification is a machine learning strategy uses that can be viably used to recognize spam, builds and tests models, utilizing diverse blends of settings, and compares various machine learning technique, and measure the exactness of a prepared model and figures a lot of assessment measurements. The present study compares the predictive accuracy, f1 score, precession and recall of several machine learning methods including Logistic Regression (LR), Support Vector Machines (SVM), Decision Tree (DT), and Neural Networks (NNet) for predicting phishing emails and improves logistic regression technique by using feature selection methods and improves the accuracy to detect phishing.

Paper Title: **An Improved Model to Increase Retrieval Time and Security by Data Fragmentation and Replication Process in Cloud**

Abstract:Cloud computing provides several features to users as well as to the organizations. Even though, there are some issues faced by the user while usingthe cloud. Security is a major concern that is always considered. Likewise Data replication is a significant technique to be consideredfor retrieval time. Replication helps to fetch the data from remote which is a high-time consuming process.To overcome the security issue along with data replication a novel approach is proposed in this paper.Dynamic fragmentation is utilized for the division of a file into fragments. Each cloud nodes has a different fragment to enhance the data security of the system. Blowfish technique is used for encrypt the files before storing in cloudthatdivides messages into 64 bits blocks then encrypts them separately. The result of experimental evaluation shows that this schemes increase the overall performance.

Paper Title: **Effect of Drilling Process Parameters on Surface Roughness of LM6/B4C Composites**

Abstract:Metal matrix composites are a new course of materials with superior properties to those of the components. Such materials ' machining is distinct from that of traditional materials. So the optimization of machining process parameters becomes inevitable. By applying Taguchi's Signal-to-Noise ratio method, this paper examines the effects of drilling process parameter such as feed, spindle speed, drill material and percentage reinforcement on the drilled hole's surface roughness. Variance analysis was used to evaluate each system parameter's contribution to surface roughness. The composites were manufactured by stir casting technique using aluminium alloy (LM6) as matrix material and boron carbide particulates at 3%, 6% and 9% by weight as material for the reinforcement. There are four factors investigated each at three levels, so 34 which implies 81 experiments has to be conducted, but by using Design of Experiments approach 27 experiments were conducted using L27 orthogonal array The minimum surface roughness measured for the hole was 1.08 µm at combination of 3000 rpm spindle speed, 50 mm/min feed rate, 3% reinforcement and Carbide drill.

Paper Title: **Stability of Physically-Loaded Helical Springs used In Smart Fork Lift**

Abstract:In the following section, the behavior of helical compression springs is considered in smart fork lift (established in previous work). We have used commonly used cylindrical and conical shape helical spring as storage devices in which stability defined in term of load-gains, deflections and evaluation of spring-rates. Springs' rates of both springs were compared on a common platform. Initially both springs (helical-conical) was prepared from the coiled wires. These prepared springs also known as coil springs which regain its original form and position when distorted by the loaded in smart fork-lift apparatus. These coils springs here developed by the applying the heat treatment and quenching processes on the galvanized spring steel material by using the threaded shape fixtures. This prescribed work focused on effect of physically-loaded gains by cylindrical and conical shaped helical spring in smart fork lift. Here, springs worked as mechanical devices to bear the lifting load which differed here greatly in strength and in size depending on changing its parameters. Both the cylindrical and conical shape was made of helically coiled wires with constant clearance between the active coils and able to absorbed external counter-acting loads applied against each other in their axis. One direction deformation in axially format was considered.

Keyword: Heat treatment, helical-conical springs, Quenching process, spring –rate, smart fork lift.

	Paper Title:	**Improvement of Geotechnical Properties of Lateritic Soil using Quarry Dust and Lime**

Abstract:Most of the rural roads are not covered by a wearing layer and sub-base is the topmost layer, hence it should be strong enough to take the load of the vehicles and not wear off due to bad weather conditions. Soil is the basic foundation of all civil engineering systems. Soil must withstand all loads without failure. In some areas, soil may be soft that cannot withstand all types of loads. Soil stabilization is required in such situations. There are different soil stabilization methods are available in the literatures. But the chemical composition of the soil is adversely affected by some approaches such as chemical stabilization. The quarry dust and lime were mixed with locally available lateritic soil to examine the improvement in the geotechnical properties in developing better subgrades for rural roads. This study presents the influence of lime, in the range of 0-5% with crusher dust blended lateritic soil. However, 4% lime addition can be observed as lime fixation point which can provide substantial increase in the workability of the soils and improved strength. Thus the properties of lateritic soil can be improved and hence locally available soil can be used as subgrade in rural road construction.

	Paper Title:	**Age Group Estimation Model using K-Nearest Neighborhood**

Abstract:Age estimation labels exact real age or age group for a given face image. How to recognise the face of a human depends upon the age invariant features and patterns. After finding out the aging patterns, the researchers are in investigation to find out in what way we can characterise the aging of a face to get accurate performance. We can estimate the age through multi class classification or regression or a combination of both classification and regression. In our paper we are classifying, predicting and evaluating our proposed aging pattern algorithm to estimate the age. The brief process is first we split the data in to two subsets i.e. training data and test data by using stratified cross validation method. By using training data and test data we are classifying or predicting the age group using K-neighbourhood method and evaluation measures are considered by using confusion matrix. The Classification and Evaluation of Age estimation models results us to find out the best estimation model for different types of datasets which are used in different applications like biometric, law enforcement, and security control and human-computer interaction.

Paper Title: **Enhanced Particle Swarm Optimization assisted Cooperative Spectrum Sensing in Cognitive Radio under Rayleigh Fading Scenario**

Abstract:When performing cooperative spectrum sensing by using Soft Decision Fusion (SDF), the weighting coefficients play a major role in the detection performance. In this work, by utilizing the Enhanced Particle Swarm Optimization (EPSO) is optimization of the weighting coefficient vector is carried out. The EPSO selects the best weighting coefficients from the weighting coefficient vector. The detection accuracy of the EPSO technique is evaluated and contrasted with traditional PSO, GA (Genetic Algorithm) and also with traditional Soft-Decision Fusion (SDF) methods by using MATLAB simulations. From simulation results, it is inferred that the proposed technique outperforms all other Soft-Decision methods over Rayleigh channel. An increased detection performance is obtained as inferred from the results.

Keyword: Cooperative spectrum sensing, Rayleigh fading channel, Soft decision fusion, Particle Swarm Optimization, Enhanced particle swarm optimization, weighting coefficient vector.

Paper Title: **Feature Level Solution to Noise Robust Speech Recognition in the context of Tonal Languages**

Abstract:Performance of a speech recognition system is highly dependent on the operational environments. The mismatched ambient conditions have adverse impact on the performance of an Automatic Speech Recognition (ASR) system. The speech parameterization techniques for tonal speech recognition are different from those used for non-tonal speech recognition. It is due to the fact that tonal speech has two components – basic linguistic unit and tone. The basic linguistic unit with different tones convey different meanings. Therefore, the feature set used for tonal speech recognition must have the capability to representing both of them. Tone is determined by the fundamental frequency of the speech signal which is highly sensitive to noise. Since at the time of parameterization of the non-tonal speech recognition systems, these highly noise-sensitive tone related information are discarded, the traditional noise elimination methods used for non-tonal speech recognition fail to deliver robust performance in tonal speech recognition. In the present study, we have analyze the performance of different commonly used feature sets for noisy tonal speech recognition. Hidden Markov Model (HMM) based speech recognizer has been used for performance evaluation. Noise elimination techniques sub-band spectral subtraction and Wiener filter have been used for noise reduction and their relative performance have been evaluated.

Paper Title: **Power Quality Improvement using Modified Cuk-Converter with Artificial Neural Network Controller Fed Brushless Dc Motor Drive**

Abstract:Power factor rectification converter (PFRC) hinged bridgeless modified CUK (MCUK) converter supplied to brushless DC engine drive utilizing an Artificial Neural Network controller. Presently, alteration for

3871-

traditional CUK converter can be obtained through adding a voltage multiplier circuit, to decrease converter losses for wide variation of speed to accomplish most extreme Power Factor and to limit the Total Harmonic Distortion (THD). The designed bridgeless PFRC based converter was investigated hypothetically to obtain the circumstances, for example, Power factor (PF) and Total Harmonic Distortion (THD) are assessed and contrasted with traditional Diode Bridge Rectifier hinged CUK converter supplying to brushless DC motor drive and bridgeless altered CUK using PI controller driven brushless DC motor. Here, simulation results uncover that the ANN controllers are viable and productive contrasted with PI controller, as the steady state error when ANN control used is less and the stabilization of the system is better while using it. Additionally in ANN system, the time to perform calculation is less as there are no numerical models. The performance of the designed framework is simulated in MATLAB/Simulink environment.

Paper Title: **Isolation Enhancement of 3GHz Probe Fed Rectangle Microstrip Patch Antenna by Second Resonance Suppression Technique for Wireless Applications**

Abstract:Microstrip patch antenna is very popular and extensively used in GHz wireless communications. The demand of increased wireless communication applications, needs increase in bandwidth, gain, efficiency and isolation of microostrip patch antenna. Microstrip patch antenna is a low profile antenna but has narrow bandwidth, low gain, low efficiency and isolation. In this paper a microstrip patch antenna is designed with 1.6mm RT Duroid substrate material. The bandwidth, gain and isolation were found to be 60MHz, 7.5dB and -40dB with dual resonance. The bandwidth and isolation enhancement is achieved withsecond resonance suppression technique. The second resonance suppressed by using two slots. Simulations were conducted with different lengths of slots and at different positions and compared. A bandwidth of 270MHz, gain of 7.9dB and an isolation of -46dB are obtained. Bandwidth increase of 450% and 115% isolation increase are achieved.

	Paper Title:	**Impact of RCS- Cross Root Process and die design in commercial Brass Alloy Sheets**

670.

Abstract:Commercial Brass Alloy Sheet are subjected to intense plastic deformation using RCS method to improvise its metallurgical / Mechanical properties. The impact of Repeated Corrugation and Straightening Process for a number of cycles using two different type of dies on hardness, homogeneity and grain structure in commercial Brass Alloy Sheet at room temperature is evaluated experimentally. Two types of V-grove corrugation dies (flat groove corrugated, and semi-circular grooved corrugated) and flattening dies were used in this work with a pressing velocity of 1mm/min. The modus operandi involves repeated and controlled corrugation followed by straightening for a number of cycles. In the process the brass sheets are made to undergo intense plastic deformation by repeated shearing using first flat groove corrugated dies followed by flattening of sheets using flat dies and in the second setup, semi-circular groove corrugated dies are used, followed by flattening of sheets using flat dies. In the samples processed using flat groove corrugated dies, the BHN increases from 95.47 to 234.34 upto 4th cycles and then decreased to 218.63 in the 5th cycle experimentally. In the samples processed using semi-circular groove corrugated dies, the BHN increases from 95.47 to 202.02 upto 4th cycle and then decreases to 194 for 5th cycle experimentally. The results of simulation studies done using the simulation software (AFDEX) are in consonance with the experimental results. Simulation analysis done to study the behavior of commercial Brass Alloy Sheet subjected to plastic deformation using Semi-circular groove corrugated dies shows that the effective strain has increased from 0.6442 for the 1st cycle to 2.94 at the end of 5th cycle, and for the flat grooved corrugated dies the effective strain increases from 1.17 for the 1st cycle to 6.21 at the end of 5th cycle. This RCS process can be used for bulk production of sheets with high hardness, fine grain structure and smoother surface.

Paper Title: **Hybrid Solution (ECDHE + NewHope) for PQ Transition**

Abstract:It is assumed that certain mathematical or computational problems which are used in traditional cryptographic schemes are hard to solve for an attacker using today's computers. But, lots of companies are trying to build quantum computer and in coming few years commercial quantum computer will be in reality. Security of traditional asymmetric cryptographic algorithms can be broken using quantum computers. So, researchers all over the world are planning for transition to post-quantum cryptography. One solution is to build hybrid solution combining both traditional and post-quantum primitives which will provide traditional cryptographic guarantees as well as quantum resistance [1].The best and feasible hybrid solution can be used in the protocols like SSL/TLS, SSH and PGP.

Paper Title: **Gradual Weight Updating for Sentiment Mining**

Abstract:Nowadays, many people prefer the use of social media for communicating and exchanging opinions with each other over face to face communication. This has lead to a generation of a tremendous amount of textual opinioned data. Understanding this opinioned data is useful from all perspectives. But the major challenge exists here is how to extract the exact sentiment hidden behind this huge data. To solve this problem, keyword spotting or dictionary-based approaches are followed. In this paper, we present a Gradual Weight Updating for sentiment mining. It not only considers the polarity of each word similar to the unigram methodology but, it also focuses on the entire cluster of words that contains the unigram. The different steps it follows for sentiment extraction of the word are polarity fetching, cluster marking, weight tagging, valence shifter, adversative conjunction handling, and final score generation. The paper contributions in the area of domain independent opinioned word extraction and accurate polarity mining with the help of context marking approach. We used the various opinionated datasets to compare and illustrate the performance of our proposed system.

Paper Title: **SecHDFS: Efficient and Secure Data Storage Model over HDFS using RC6**

Abstract:In today's world the data used by various institutions and organizations is increasing and process petabytes of data per hour. Hence big data storage platform called Apache Hadoop is designed to process large amount of data, but it does not guarantee the security of user stored files in Hadoop. In this paper, a secure HDFS

is designed for an efficient and secure data storage model. We encrypt and decrypt client data using RC6 symmetric block cipher. In this research work, Hadoop distributed file system (HDFS) is customized using RC6 which provides transparent end-to-end encryption on user's data for read as well as write. Our proposed SecHDFS will mitigate several security attacks such as replay attacks, data node impersonating attacks, and brute-force attacks. The proposed model imparts better results than the inbuilt AES symmetric algorithm.

Paper Title:	**Renewable Energy based Green Power Generation for Rural Electrification**

Abstract:A major challenge for developing countries is access to electricity in rural area for accelerating its growth. There are significant impediment from the utilities to extend either improved service to the rural user or provide extended hours of supply through conventional grid supply. In developing countries, the most significant challenges are technologies used to upgrade and methods for electrification, which results in poor reliability of supply and high distribution losses, leading to hindering both economic and social development, so energy planners have suggested a hybrid energy system for the electrification of rural areas. This study investigates green energy based integrated generation for rural loads. This proposed system can orchestrate with the grid as well as with the renewable energy-based generator. The wind energy has a natural variance, to satisfy the energy demand during the nocturnal and overcast period a complementary renewable energy generator is critical, or an energy storage mechanism is needed to meet the energy demand. This type of pooled exploitation and interconnection is used to improve the reliability and resilience of the grids. The integration of distributed and clean energy resource like wind generation will reduce fossil fuel emissions and provides electricity in areas which are limitedly served by unified electrical infrastructure. Hence, it is expected to develop/modify technologies available for harnessing renewable energy sources. A MATLAB/Simulink is used to build a model for a grid-wind based integrated generation. Results obtained from MATLAB/Simulink are a close match with a practical system.

Paper Title:	**Speculation of Software Reusability Estimation using CK (Chidamber and Kemerer) Metrics**

Abstract:In today's software community the most interesting topic is software reusability because of its immense benefits that comprise of decreased product schedule, cost and increase in product quality. Most of the time, software is not built from scratch since it is costly and time-consuming process. Therefore, existing software documents (source code, documents, design, etc.) are used to develop the new application according to user requirements. But still the software reusability is not being followed as a standard approach in the process of software development. Till now initiating the software reuse process there is a need to analyze and properly understand the user requirements in spite of considerable upfront investments for software reusability. We have studied various aspects of software reusability along with software metrics and are being presented in this article. Efficient software designs can be enabled by assessing the software reusability extent. The aging resilient software design could be of paramount significance to enable faultiness software system. The estimation of software reusability plays an important part in software's cost reduction and quality improvement, in an object-oriented programming. In this paper the idea about the designing the CK metrics suite along with metrics' evaluation is presented that can help for object-oriented based systems in reflecting the accurate results.

	Paper Title:	**Gate Pass System**	
	Abstract:The objective of this work is to make the hectic process of getting a gate pass easier and less stressful. This also saves time and is paperless unlike the traditional method. It uses the modern technology and is handled online. The process involves registration, verification and granting permission to the students on the same platform. Thus saves the legwork. It's a faster process. And various measures are taken to make it foolproof. This project helps the hostellers in SRMIST to apply for gate-pass. The goal is to create an easier platform to manage the out pass request rather a traditional method of writing in papers. The goal of this project is to create a user friendly application which will be time saving for both student as well as the authorization. **Keyword:**Gate-pass, paperless, permission , online **References:** 1. 	Paper Title:	**Medical Applications using Blockchain and Machine Learning**	
	Abstract:Blockchain was particularly used in Cryptocurrency technologies. Prior to 20th century there was no other technologies for determining the health of a person naturally. At the dawn of the 21st Century machine learning played a vital role in determining the health of a person using various algorithms and natural language processing techniques. Now for every machine learning technique to work for it needs data. Data is very important as far as providing information is concerned. Data sharing plays a vital role in improving accuracy of techniques involved. Along the blockchain technology plays a vital role in this aspect. Thus, the merging of these two techniques involve provides highly accurate results in terms of machine learning with privacy and reliability of Blockchain technology. This technique uses natural language processing techniques which focuses basically mainly on healthcare techniques such as cancer detection, prediction of machines used in healthcare etc. Prior to healthcare which is used in blockchain it was used in cryptographic techniques only. Also, this technology can be used to provide medical suggestions to the doctors based on the condition of the patient. The accuracy of this method can be increased more using providing as much data as we can. This combination of Blockchain and machine learning algorithms can be used widely in healthcare, where the data is highly secured and there is no fear of data loss. This paper involves how combining these two technologies can be helpful in healthcare. **Keyword:**blockchain, natural language processing, algorithms, cryptocurrency, data, accuracy, prediction **References:** 1. 	Paper Title:	**Image Enhancement using Recursive Standard Intensity Deviation Based Clipped Sub Image Histogram Equalization**	
	Abstract:The low exposure image enhancement has become indispensable inimage processing for better visibility. The most challenging in image enhancement is especially to curtail over-enhancement problems. This paper presents a method, performs the separation of the histogram based on respective standard intensity deviation value and then recursively equalizes all sub histograms independently. The over-enhancement problem is minimized by this method. It applies more in an underwater image, because of its low light conditions. The experiment results are analyzed in terms of entropy and output image inspection. The proposed method results show significant improvement over earlier recursive based histogram equalization algorithms. **Keyword:**Recursive standard intensity deviation basedhistogram equalization, clipped histogram, entropy. **References:**	**3933-3937**

Paper Title: **Hoax News Classification using Machine Learning Algorithms**

Abstract:Hoax news on social media has had a dramatic effect on our society in recent years. The impact of hoax news felt by many people, anxiety, financial loss, and loss of the right name. Therefore we need a detection system that can help reduce hoax news on social media. Hoax news classification is one of the stages in the construction of a hoax news detection system, and this unsupervised learning algorithm becomes a method for creating hoax news datasets, machine learning tools for data processing, and text processing for detecting data. The next will produce a classification of a hoax or not a Hoax based on the text inputted. Hoax news classification in this study uses five algorithms, namely Support Vector Machine, Naïve Bayes, Decision Tree, Logistic Regression, Stochastic Gradient Descent, and Neural Network (MLP). These five algorithms to produce the best algorithm that can use to detect hoax news, with the highest parameters, accuracy, F-measure, Precision, and recall. From the results of testing conducted on five classification algorithms produced shows that the NN-MPL algorithm has an average of 93% for the value of accuracy, F-Measure, and Precision, the highest compared to five other algorithms, but for the highest Recall value generated from the algorithm SVM which is 94%. the results of this experiment show that different effects for different classifiers, and that means that the more hoax data used as training data, the more accurate the system calculates accuracy in more detail.

Keyword: Hoax News, Text classification, Machine Learning, Support Vector Machine, Naïve Bayes. Decision Tree, Logistic Regression, Stochastic Gradient Descent, Neural Network –MLP.

Paper Title: **SSR Based Slotted Patch Antenna with Integrated Wave Guiding structure for 5G Application**

Abstract:An electrical small microstrip patch antenna with guided SIW slotted configuration is investigated in this paper. In the proposed design the primary antenna patch includes a slotted SRR configuration which later converted into concentric SRR slotted configuration. Here the antenna patch with concentric slot contributes dual-band resonance. The impedance matching at both the resonance is improved with guided SIW slotted structure. The proposed antenna patch incorporates a slot inside the concentric slot to correct the pattern asymmetric. The proposed antenna shows resonance at 28 GHz and 37.5GHz for mmWave 5G applications. The proposed antenna is implemented with a physical dimensions of 4.7mm ×2.7mm × 0.8mm.

Keyword: Microstrip antenna, 5G application, Slotted Patch, Frequency, Impedance.

Paper Title: **Design of a Stand-Alone Rooftop PV System for Electrification of an Academic Building**

Abstract:Solar energy is one of the most promising options of renewable energy in the context of energy sustainability. Nowadays, as the utilization of solar energy has been continuously expanded in wide scale, researches related to the topic have been carried out all over the world. The prime focus of this study is to provide sustainable energy generation for an academic building located in a rural place, where power outage is a frequent issue. In this study, individual power system components have been suitably designed which could electrify the building for yearlong use. A rooftop photovoltaic (PV) system with three days battery backup has been considered for the present case. Designing of the PV system is based on the selection of individual electrical appliances and its operating time in a day. For this purpose, a survey has been carried out over a year in order to identify the day in which maximum power was utilized. The study revealed that the total estimated capacity of the stand-alone PV system should be 138.6 KWp in which 446 PV modules bearing 300 Wp each are connected together in series parallel combination. Total 656 numbers of batteries (12V- 200Ah each) are required for power backup which

3955-3964

store the excess PV generation. Suitable size also been considered for inverters and charger controller which are connected in parallel and series respectively. The area required to install PV modules on the rooftop without shadow effect has been properly assessed. Besides being PV system design, brief cost analysis has been carried out in terms of simple payback period, unit cost of power generation and cash flow in terms of present value.

Paper Title:	**Digital Forensics Tools**	

Abstract:In this paper we will we reviewing the basic fundamentals of digital forensics and all go through the various types of forensics investigation teams available to us. We will also discuss about the different types of digital crimes that take place and the various tools present in order to counteract the crimes that are being committed. There will also be a comparative review among all the tools present based on various factors present giving the reader an abstract view about which tool to use for the best type of results.

	Paper Title:	**Prediction and Analysis of Water Resources using Machine Learning Algorithm**	

Abstract:Water demand prediction plays an important role in urban and environmental planning, ecological development, decision-making processes and optimum utilization of water resources. A precise water demand prediction has a key job in the forecasting, design, process, and organisation of water resources frameworks. The under stress natural resources and the ever increasing population size makes it dominant to accurately and efficiently forecast water demand in the urban area which is possible by applying data mining techniques on the huge volumes of available water data. This paper focuses on building precise predictive models for water demand prediction using support vector machine which takes care of the nonlinear changeability of water demand at diverse levels for optimal operations.

	Paper Title:	**Effect of Different Propagation Models in Routing Protocols**	

Abstract:Mobile Ad hoc Networks (MANET) are wireless networks where communication of nodes takes placevia radio waves. Due to dynamic topology and mobility of nodes frequent path failure takes place which in return affects the Quality of Service (QoS) in MANET. This paper mainly focuses on the experimental analysis on different propagation models namely Two-ray ground reflection, Free Space and Shadowing models on AODV and DSDV. We have done rigorous experiments to verify the effects of various propagation models and try to find its environment suitability. The QoS parameters we have used for the observation of the performance are throughput, delay and Packet-Delivery-Ratio (PDR). Simulation is done using NS-2.Free Space model gives better performance in both the protocols in contrast to other models. This paper will be helpful for researchers, students who are newly involved in research for better understanding and utilization of propagation models in corresponding environment.

Keyword:MANET, AODV, DSDV, Propagation model.

Paper Title: **Variable Frequency Signal Carrying Nonlinear Transmission Line - Modeling using Machine Learning**

Abstract:in modeling of complex systems, manual creation and maintenance of the appropriate behavior is found to be the key problem. Behavior modeling using machine learning has found successful in modeling and simulation. This paper presents artificial neural network (ANN) modeling of transmission line carrying frequency varying signal using machine learning. This work uses proper orthogonal decomposition (POD) based reduced order modeling. In this proposed work, snapshot sets of complex mathematical model of nonlinear transmission line and also linear model are obtained at different time interval. These snapshot sets are arranged in matrix form separately for nonlinear and linear models. POD method is applied on both the matrices separately. This reduces the order of the matrix which is used as input and output data set for neural network training through machine learning technique. Trained neural network model has been verified using different untrained data set. The proposed algorithm determines the dimension of the interpolation space prompting a considerable decrease in the computational expense. The proposed algorithm doesn't force any imperatives on the topology of the appropriate circuit or kind of the nonlinear segments and hence relevant to general nonlinear systems.

Keyword: Transmission line, proper orthogonal decomposition, model order reduction, artificial neural network, machine learning.

Paper Title: **Fresh, Strength and Durability Characteristics of Binary and Ternary Blended Self Compacting Concrete**

Abstract:Paper Mineral admixtures being the economical alternatives to Ordinary Portland Cement (OPC) for various normal and special concretes induce desirable properties to concrete such as higher flow, low heat of hydration, higher strength gain and enhanced durability. Ground granulated blast furnace slag(GGBFS) being one of the largely used mineral admixture alongside Fly Ash as supplementary cementitious material in concrete contributes to enhanced durability properties and low heat of hydration. Various replacement percentages of GGBS at 30%, 40%, 50% and 60% are used in binary blended Self compacting concrete(SCC) in the present study. At 40% replacement level, SCC exhibited improved workability, strength and durability properties. Alccofine(Ultrafine GGBS) used in ternary blended SCC enhanced early strength gain without affecting workability of SCC to a significant extent.

Keyword: Ground granulated blast furnace slag(GGBFS), Alccofine, Ordinary Portland cement(OPC).

Paper Title: **Feature-Based Opinion Mining and Managed Machine Learning with Sentiment Classification Models**

Abstract:Sentiment Analysis is individuals' opinions and feedbacks study towards a substance, which can be

	items, services, movies, people or events. The opinions are mostly expressed as remarks or reviews. With the social network, gatherings and websites, these reviews rose as a significant factor for the client's decision to buy anything or not. These days, a vast scalable computing environment provides us with very sophisticated way of carrying out various data-intensive natural language processing (NLP) and machine-learning tasks to examine these reviews. One such example is text classification, a compelling method for predicting the clients' sentiment. In this paper, we attempt to center our work of sentiment analysis on movie review database. We look at the sentiment expression to order the extremity of the movie reviews on a size of 0(highly disliked) to 4(highly preferred) and perform feature extraction and ranking and utilize these features to prepare our multilabel classifier to group the movie review into its right rating. This paper incorporates sentiment analysis utilizing feature-based opinion mining and managed machine learning. The principle center is to decide the extremity of reviews utilizing nouns, verbs, and adjectives as opinion words. In addition, a comparative study on different classification approaches has been performed to determine the most appropriate classifier to suit our concern problem space. In our study, we utilized six distinctive machine learning algorithms – Naïve Bayes, Logistic Regression, SVM (Support Vector Machine), RF (Random Forest) KNN (K nearest neighbors) and SoftMax Regression. **Keyword:**Sentiment Analysis, Opinion Mining, Movie Review, Machine learning, Classification Algorithms **References:** 1. 	Paper Title:	**Indian Premier League Dataset Analytics using Hadoop-Hive**
	Abstract:Big Data is a term used to represent huge volume of both unstructured and structured data which cannot be processed by the traditional data processing techniques. This data is too huge, grows exponentially and doesn't fit into the structure of the traditional database systems. Analyzing Big Data is a very challenging task since it involves the processing of huge amount of data. As the industry or its business grows, the data related to the industries also tend to grow on a larger scale. Prominent data analysis tools are required to analyze the data in order to gain value out of it. Hadoop is a sought-after open source framework that uses MapReduce techniques to store and process huge datasets. However, the programs written using MapReduce techniques are not flexible and also require maintenance. This problem is overcome by making use of HiveQL. In order to execute queries in HiveQL, the platform required is Hive. It is an open-source data warehousing set-up built on Hadoop. HiveQL queries are compiled into MapReduce jobs that are executed utilizing Hadoop. In this paper we have analyzed the Indian Premier League dataset using HiveQL and compared its execution time with that of traditional SQL queries. It was found that the HiveQL provided better performance with larger dataset while SQL performed better with smaller datasets.	**3999-4004**

Paper Title: **Pioneering Methods for Enhancing PPI and Phenotype Networks for Candidate Disease Prioritization**

Abstract: The physical contacts of high-specificity between two or more protein molecules constitute Protein-Protein Interactions (PPIs). PPI networks are modeled through graphs where node denotes proteins and edges denote interaction between proteins. The PPI network plays an important role to identify the interesting disease gene candidates. But, the PPI network usually contains false interactions. Many techniques have been proposed to reconstruct PPI network to remove false interactions and improve ranking of candidate disease. Random Walk with Restart on Diffusion profile (RWRDP) and Random Walk on a Reliable Heterogeneous Network (RWRHN) was two among them. In these methods, Gene topological similarity was incorporated with original PPI network to reconstruct new PPI network. Phenotype network was constructed by calculating similarity between gene phenotypes. The reconstructed network and phenotype networks were combined to rank candidate disease genes. However, the PPI reconstruction was fully related with the quality of protein interaction data. In order to enhance the reconstruction of PPI, a Piecewise Linear Regression (PLR) based protein sequence similarity measure and Bat Algorithm based gene expression similarity were proposed with RHN. In this paper, additional measure called Interaction Level Sub cellular Localization Score (ILSLS) is proposed to further reduce the false interaction in the reconstruction of PPI network. ILSLS is the combination of Normalized Sub cellular Localization score (NSL) and Protein Multiple Location Prediction score (PMLP). The proposed work is named as Random Walker on Optimized Trustworthy Heterogeneous Sub Cellular localization aware Network (RW-OTHSN). In order to enhance the ranking of RW-OTHSN, phenotype structure is considered while construction phenotype network to rank the candidate disease genes. The phenotype structure is characterized based on h*-sequence model which identify highly discriminative signatures with only a small number of genes. This proposed work is named as Random Walker on Optimized Trustworthy Heterogeneous Sub Cellular localization and Phenotype structure aware Network (RW-OTHSPN). The efficiency of the proposed methods are evaluated on PPI network database in terms of Average degree, Relative Frequency for PPI reconstruction, Number of successful predictions, precision and recall for candidate disease gene ranking.

Paper Title:	**A New Hybrid Strategy for Malware Detection Classification with Multiple Feature Selection Methods and Ensemble Learning Methods**

Abstract:A dramatic increase in malware in our day-to-day life causes a noteworthy problem in cyber security. The traditional approaches and signature-based models are not sufficient to defense with the new malware. To achieve zero-day attacks of malware, these approaches are not much competent to face new malware. To enhance the compete for the mechanism of classifying new malware the machine learning approaches are highly effective. To classify new malware with the high dimensionality of data leads to reduce the quality of output and low-performance results. In this paper, we propose a new hybrid strategy that combines the power of feature selection methods along with ensemble learning methods to improve accuracy for high dimensionality of data. This hybrid approach having three stages, preprocessing, feature selection and classification. Three different types of feature selection methods: ExtraTreesClassifier, Percentile and KBest feature selection methods are used to select the best features (dimensionality reduction) and four ensemble classifiers: AdaBoost, Gradient Boosting, Random Forest and Bagging are used for classification. The accuracy of ensemble classifiers are increased with this hybrid model and produces better results of classification with 91.50% accuracy. For dealing with the high dimensionality of data this hybrid approach is very effective and gives better results.

Paper Title:	**Quality Assurance of Data Transmission in Queuing Networks**

Abstract:With the development of high-speed communication networks, the so-called property of self-similarity of flows has an increasing impact on the quality of service. From a practical point of view, this can be explained by the high variability of traffic intensity and, as a consequence, the high receipt of packets to the network node at a high data rate, which leads, due to the limitation of the buffer, to packet losses. For a long time, it was believed that the traffic of the local network is described by the classical Poisson distribution. Telephone networks were originally built on the principle of channel switching, and computer networks are usually based on the principle of packet switching, but the calculation methods have remained virtually the same. Packets at high speed of their movement on a network arrive on a node not separately, and the whole pack. Traffic in such networks has ripples, which increases the likelihood of congestion in the network nodes, which lead to buffer overflows and cause losses and / or delays. Pulsations lead to differences in the speed of information flows, in which the ratio of the maximum value to the minimum speed is tens of times. At the same time, it turned out that in multiservice networks, the number of events in a given time interval depends on previous, very distant events. This means that at large scales of a multiservice network, traffic has the property of self-similarity, i.e. it looks qualitatively the same at any sufficiently large scales of the time axis.

Paper Title:	**Life Cycle Cost Estimation of Distribution Transformer Failure from Life Data Exploration**

694.

Abstract:Transformers are major equipment in a power system. Their reliability does not only affect the electric energy availability within a supplied area, but also the economical operation of a utility. Many power utilities in the world including Malaysia have distribution transformers that have been in operations for over 30 years. Aged distribution transformer will have higher risk of unexpected failure which will increase the operational cost. Nevertheless, the occurrence of transformer failure can be predicted based on historical events. In this research work, 2-Parameter Weibull distribution is used to model distribution transformer life data. Life data analysis is conducted based on the statistical model and failure prediction for distribution transformers is analysed. Since frequency of failures as a function of time from life data model varies with different manufacturers and affects the life cycle cost, both life data analysis and net present value concept could be combined to establish an enhanced methodology for life cycle cost estimation of distribution transformer failure. A case study was conducted on sample populations where distribution transformer with similar manufacturer and capacity were grouped together. Results for each transformer group were compared and examined. It was pointed by the results that appropriate modelling and analysis had allowed life cycle cost due to transformer failure to be estimated. Outcomes from the assessment would contribute to transformer life cycle management as one of the factors to consider in the decision making for asset replacement, maintenance and planning.

Paper Title: **Simulation of Hydrate Phase Boundary for Natural Gas Mixture with High CO2Content through Simulation**

Abstract:Gas hydrates are solid crystalline structures in which water molecules trap small guest gas molecules and encage them through hydrogen bonding. Gas hydrates are known to be problematic in flow assurance applications as they can form plug inside the pipelines during oil and gas production, transportation and processing. In order to inhibit hydrate formation thermodynamically, various chemicals including some alcohols e.g. methanol (MeOH), mono- ethylene glycol (MEG) are used as thermodynamic hydrate inhibitors (THIs). In this paper, a simulation study is performed using PVTsim software wherein it predicts the hydrate formation for pure CO2 solution mixture and CO2-MEG solution mixture systems using different equation of states. These equations of states include Soave-Redlich-Kwong (SRK), SRK-Peneloux, Peng- Robinson (PR) and Peng-Robinson Peneloux. The simulation results obtained using these equation of states were validated with the experimental data and PR-PenelouxEoS was found to be in better agreement. The hydrate formation regions are determined in between the pressure range of 10 to 110 bara for natural gas mixture containing high percentage of CO2 in it. The inhibitors are used in 5, 10 and 20 wt% concentrations. The hydrate inhibition efficiency increased with the increase in concentration. Simulation results showed that methanol performed better in comparison to the other inhibitors at all concentrations.

Keyword:gas hydrates, phase boundary, PVTsim, equation of states.

Paper Title: **Smart Tyres: An Environmental-Friendly Solution to Road Accidents**

Abstract:The absence of the tyres monitoring system on vehicle has caused difficulty for driver to check the pressure and temperature of the tyres in real time. Besides that, due to the large geographical area of rural area where the distribution of petrol station with air pump might not be equally distributed, certain area is hard to access air pump. The abnormal pressure and increases in temperature on tyre lead to longer braking distance, tyre blowouts and related issues. The paper describes the deployment of IoT sensors for monitoring application in tyres and data is accessible on mobile app. This monitoring system consists of two sensors to measure the temperature and pressure of the tyre using ESP32 microcontroller board and uploaded into the cloud platform using Wi-Fi technology. While Blynk the mobile app is designed to collect the informative data from the cloud platform and the data is represented in graphical representation using open source Cloud platform. It is made available for real-time monitoring data. Apart from that, this system also incorporates alert system to provide a scalable monitoring system as well as alerting the user for any abnormal reading of the tyre.

Paper Title: **Design Development of a Coffee Maker using Design for Assembly Method**

Abstract:The purpose of this research is to evaluate the design of a coffee maker by using Boothroyd Dewhurst Method which this method is one of the Design for Assembly (DFA) methods. DFA method will help to simplify the assembly designs of the product that will leads to significant cost savings and less tine to produce a product. Main objective of DFA is to estimate the difficulty of assembly, eliminate unnecessary parts and assembly tooling and design products that are less costly to manufacture. The study will focus on analyzing the current design of coffee maker, reducing the number of parts, comparing the design efficiency and the cost between the current and improved design. The product is evaluated by using Manual Handling Table and Manual Insertion Table. The results of current design are used to make improvement to the coffee maker. Then, new design is made by eliminating or combining the old design so that total cost and time for assemble the coffe maker is reduced. Lastly, comparison is made between new and old design.

Paper Title: **The Effect of Air Gap and Moisture for the Skin Burn Injury of the Firefighter’s Personal Protective Clothing (PPC)**

Abstract:Fire fighters are commonly exposed to intense heat and fire. They suppressed fire by spraying water to avoid flame from spreading. They are enforced to use the Personal Protective Clothing (PPC) made of the flame-retardant material to protect themselves from the skin burn injury. Skin burn injury is the most common injury occurs among them. Yet, the exposure to extreme heat and moisture absorption into the clothing layers caused severe burn injury formation. The purpose of this study is to investigate the effect of air gap combined with the moisture absorption in the fabrics using Finite Element Method (FEM) and the Bio heat Equation. From the simulation experiment it is discovered the air gap is a good insulator capable of preventing skin burn with a skin temperature of 48°C. However, the presence of moisture strongly affects skin temperature. It had elevated to 59.64°C forming a second-degree type burn injury. The presence of moisture had weakened thermal protection of the flame-retardant material and the air gap against the heat flux. It is found the moist material properties had enhanced heat transfer from the heat flux to the skin surface resulting severe skin burn despite they were encapsulated with the Personal Protective Clothing (PPC).

Paper Title: **Performance of V2oIP Application via VANET**

Abstract:In Vehicular ad hoc network (VANET), vehicles are connected and communicated among themselves with different purpose, which move at their relative high speed. Much of the focus surrounding VANET has targeted the framework, model, environment or protocols. Few performance analysis studies have been carry out on V2OIP application at rural and urban area. The present paper set out to study the performance analysis of V2oIP applications between users in different distance and range. The performance are measures on jitter, delay and MOS of the applications; video call, video streaming and video conferencing. Several recommendations are

highlighted related to pursue in testing on other rural and urban areas, ISPs, number of users, network monitoring tools or video and voice activities.

Keyword: Performance Analysis; Voice Over IP; Video Streaming; Video Conferencing; Video Call.

Paper Title: **Reliability Performance of Conductive Ink Subjected to Hygrothermal Aging**

Abstract:In the era of rapid technological development, the popularity in printed technologies and electronic packaging have resulted in a tremendous increase in the use of carbon-based conductive ink due to their advantageous features such as being environmental-friendly, low cost and lower assembly temperature. From the literature, it has been highlighted that the interconnect material are exposed to some degree of humidity and elevated temperature during the service life in an actual application. To-date, there is not yet a great length of literature reporting on the reliability performance of such materials when exposed to hygrothermal aging. Therefore, the objective of this research work is to investigate the reliability performance of the conductive ink

when subjected to hygrothermal aging. In this study, the samples were exposed to either the room temperature condition with temperature of 20°C and humidity of 60% RH and secondly when subjected to hygrothermal aging in an environmental chamber with humidity of 85% RH and a temperature of 85°C up to 24 hours. Following these, the samples were tested in terms of electrical conductivity using a four-point-probe (ASTM F390) and lap shear test (ASTM D1002) via tensile loading to evaluate the bonding strength at the interface between the adhesive and the substrate. Next, morphological study was done using Scanning Electron Microscopy (SEM). With the presence of water molecule in the conductive ink, the molecule of carbon black and epoxy become unstructured and traces of riverlines are evident. In addition, there is a dramatic decrease in the sheet resistance following hygrothermal aging relative to the samples conditioned at room temperature, possibly due to enhancement in the conductivity of the ink. In contrast, as for the mechanical shear stress, the lap shear stress following hygrothermal aging process becomes weaken compared to those conditioned at room temperature, which could be associated with weak surface energy, brittle and weak bonding between carbon black molecules and the aluminium substrate interface.

Paper Title: **Compressive Strength Development of Geopolymer Mortar by Utilization Slag and Fly Ash Mixtures**

Abstract:The paper displays the use of two base solid wastes materials to produce the alkaline-activated binder mortar to reduce the CO2 emission on climate change. The solid materials used in this research were slag and fly-ash to improve the compressive strength (CS) of alkaline activated mortar (AAM). The output AAM of 7 trial mixes were designed with different combinations of slag and fly ash. The mixes combinations were made in ratios of (100:0), (90:10), (80:20), (70:30), (50:50), (25:75), and (0:100), respectively. The combination of 10 M NaOH and Na2SiO3 was used as alkaline activator (AA). The wt. ratio of Na2SiO3 to NaOH = 2.5, and wt. ratio of AA to solid material = 0.52. The samples of AAM were cured at 75°C for 24 h. Among all the 7 trial mixtures, it was found that mixture with a combined ratio of slag:fly ash of 25:75 produce the maximum CS at 28 days of 88.87 MPa. Therefore, the alteration percentage of SiO2 and Al2O3 derived from fly ash in combination with CaO derived from slag contributed to significant CS improvement due to the formation of (N-A-S-H), (C-S-H) and (C-(A)-S-H) gels. The result observed of gel binder formation was confirmed by XRD and FESEM analyses.

Paper Title: **Crypto Ransomware Detection on Windows Operating System**

Abstract:Crypto-ransomware is a kind of malware threat, and it is one of approach frequently used by cybercriminals. It is due to the capability to hijack the victim's files and data by totally encrypting it using sophisticated cryptographic libraries such as OpenSSL and Microsoft Cryptography API. From the ransom note left by the attacker on the infected machine, the victim is told to fulfil the requested payment to get back the files. New variants of ransomware were released from time to time, thus making the task of detecting and analyzing it becomes challenging and resource consuming. Obfuscation and polymorphism employed in most modern malware made the task of identifying it even harder. This research investigates the domain of detecting ransomware on a Windows-based platform. We reviewed some of the related works done within this domain. In this research work, we proposed a framework for crypto-ransomware detection on the Windows-based platform by using information such as API calls and registry.

Paper Title: **Takt Time Analysis in Lean Six Sigma: From Conventional to Integration**

Abstract:Lean Six Sigma offers a comprehensive roadmap, tools and technique for continuous business process improvement. Principally, Lean Six Sigma integrates Lean’s principle of “value” and “speed” with Six Sigma’s “consistency” (i.e. variation reduction) concept into the DMAIC (Design, Measure, Analyze, Improve, Control) framework. The integration of Lean and Six Sigma advances the pace of business process improvement. Conceptually, Lean and Six Sigma must be applied side by side from both management (i.e. soft practices) and technical (i.e. hard practices) perspectives. However, empirical research found that prior studies on Lean Six Sigma tends to focus on the study of integration from the soft perspective, such as exploring and confirming the determinants for Lean Six Sigma success as well as the application of Lean Six Sigma processes within varies business environments. There is lack of study on the integration of Lean Six Sigma from hard perspective. Hence, the concept of how Lean and Six Sigma tools could be integrated remains ambiguous because there are no standard guideline that available. As such, based on a Lean Six Sigma project(of minimizing new students registration cycle time)that conducted in one of local private university as single case study, this paper explores how Lean and Six Sigma tools could be integrated based on Lean Six Sigma principle, with the focus on a Lean’s tool, namely “Takt Time Analysis”. Finding from the study suggested that Takt Time Analysis could be expanded from “Lean-based” tools to as “Lean Six Sigma tool” by including process variation and process capability as parameters for analysis. The finding as well as the LSS based Takt Time Analysis methodology developed in this study has descriptive value in terms of studying the integration of Lean and Six Sigma tools that govern continuous business process improvement via Lean Six Sigma.

Paper Title: **Digital Image Falsification Detection System for Effective Data Communication**

Abstract:In this proposed system a digital imagefalsification can be identified using the combination of both adaptive over block based segmentation, feature keypointbased feature extraction algorithms(Scale Invariant Feature Transform (SIFT) and Speeded Up Robust Features (SURF)) and forgery region extraction algorithm. The proposed falsification detection algorithm comprises both block based falsification detection algorithm (adaptive over block based segmentation and block feature matching algorithm) and the keypoint based falsification detection algorithm(forgery region extraction algorithm). Adaptive over block based Segmentation algorithm adaptively segments the input digital image into separate(non overlapped) blocks in irregular manner. Scale Invariant Feature Transform (SIFT) algorithm and Speeded Up Robust Features (SURF) algorithms are used to draw out features from the segmentedblocks as a block features. Then the extracted features are matched with the feature points of other segmented block. If the feature key points are matched with any other feature point presents in the segmented blocks, then the matched feature points are marked as Labeled key Points (LKP), which can be doubted as a forged regions. Finally, the Forgery Region Extraction algorithm can be used to detect the forged region from the input digital image based on the extracted labeled feature points. The experimental outcomesdisplay that the novelfalsification detection system can accomplished the requirements compared with the existing digital imagefalsification detection methods.

Keyword: Falsification, Forgery, SIFT, SURF, Feature key points, Segmentation, Morphological

Paper Title: **Non Contact Heart Rate Monitoring using Facial Video**

Abstract:Heart rate (HR) is a direct measure of heart's function. Conventional measurement based on contact-based measurement may cause discomfort to patients, especially in the case of long-term monitoring. This paper proposes a non-contact method of measuring heart rate using facial video of the patient. The variation of light intensity from the skin from each heart beat is used to estimate HR. A standard RGB camera is used to record the video. The Region of Interest (ROI) is obtained using face detection and tracking algorithms. A mean is taken across the frame yielding three values per frame. The Photo Plethysmo Graphy(PPG) signal is isolated using Independent Component Analysis (ICA). The signals are further filtered to reduce out of band noise and improve accuracy. The Fast Fourier Transform (FFT) is used to convert the signal to frequency domain and the peak is identified, whose frequency will correspond to the HR. This method of measuring HR has several advantages over conventional methods. HR measurement during exercise, prisons where contact-based methods cannot be employed, and long-term HR measurement in hospitals are some applications where the proposed method will be highly advantageous. The method also reduces the amount of hardware needed for HR measurement; HR can be measured even using smartphones.

Keyword: Independent Component Analysis (ICA), Photo Plethysmo Graphy (PPG), Fast Fourier Transform (FFT).

Paper Title: **Common Mode Voltage Reduction in Three Phase Inverter using Pre-Calculated Harmonic Eliminated PWM Method**

Abstract:Common Mode Voltage (CMV) produced in Pulse Width Modulated (PWM) inverters causes premature failure of the motor bearings. Therefore CMV has to be reduced. Pre-calculated Harmonic Eliminated PWM (PHEPWM) scheme is proposed to reduce the CMV in three phase inverter. The accurate switching angles have to be calculated by solving nonlinear equations. The switching angles for the pre-calculated harmonic elimination technique are calculated by using Newton-Raphson algorithm. The proposed modulation scheme is evaluated and tested at various switching frequencies for different modulation index. With this PHEPWM it is possible to eliminate the lower order harmonics, 5th, 7th , 11th, 13th, 17th, 19th, and 23rd from the inverter output voltage for any desired value of the fundamental component in for any desired modulation

4090-4097

index. The CMV in inverter using PHEPWM method is compared with CMV produced using classical Sinusoidal PWM (SPWM) method.

Keyword: Common Mode Voltage (CMV), Pulse Width Modulated (PWM), Pre-calculated Harmonic Eliminated PWM (PHEPWM)

Paper Title:	**A Unique Single Source Nine Level Inverter with Reduced Switching Devices for Single Phase AC Applications**

Abstract:In recent times there is a huge demand in reduced switched multilevel inverter. The multilevel inverter is one of the attractive features in harmonics elimination. This paper proposes single source nine level inverter with reduced switching devices for single phase AC applications. The conventional cascaded and other multilevel inverter comprises of more number of switches, passive components as well as sources. This makes the system larger in size, weight as well as less cost effective. The proposed multilevel inverter has the ability of producing nine levels with reduced number of switches and source. In addition to that the single source nine level inverter utilizes the simplified control algorithm which reduces the complexity. The Sinusoidal Pulse Width Modulation (SPWM) scheme is one of the most common control techniques which have the simple structure. The operation of the circuit and control algorithm is discussed in detail. The results are verified by the Matlab/Simulink which shows the value and righteousness of the system.

Paper Title:	**PV Fed Seven-Level Inverter using Fuzzy Control Technique**

Abstract:In recent decades, multi level inverter has been playing important role to lessen the total harmonic distortion in the power electronic converters. The number of switches and and its losses have been the critical factor in multi-level inverters. In this Proposed technique, photo-voltaic based seven level inverter has been proposed to adjust the harmonics in the multi-level inverter. This proposed circuit consists of DC to DC converter and capacitor selection circuit. The number of switches utilized is very less and switching loss also less. A part from simulation study, the hardware proves the advantages of proposed system.

Keyword: Multi-Level Inverter(MLI); Photo-Voltaic(PV); Optimization; Direct Current(DC).

Paper Title: **Modified PMSG System using Trans Z Source Network for Grid Connected UPFC System**

Abstract:This paper presents a grid connected UPFC system for PMSG wind power network using a Trans Z-source converter. The Trans Z-source converter has a common stage buck boost converter to produce DC voltage from AC input voltage by stabilizing the shoot through state. In the proposed system, the changing in shoot-through state is used to keep trans Z-source voltage regulation with respect to d-q current is capable to take out the more power from the turbine (wind) and fed to grid. The proposed system with UPFC has higherefficiency performanceand cost effectivecompare with conventional Z source PMSG based UPFC system. Matlab simulations are carried out and results prove that proposed system is better.

Paper Title: **Road Tyre Friction Used to Generation of Electrification**

Abstract:The current scenario of energy demands in India have waded new research areas for hunting the alternative energy resources to compensate the polluting non renewable resources. It brings larger importance to the idea of harvesting the frictional energy between the Roads and the vehicular tyres. This is exerted as a stress on the road surface accompanied by Heat dissipation. This wasted form for energy can be made productive by using Piezoelectric Generator and Thermoelectric Generator. Piezoelectric Generator generates electricity in response to stress acting on its mechanical axis while Thermoelectric Generator generates power when an ambient temperature difference is provided. These are embedded below the road surface with suitable insulations and proper structure to improve its performance. This system would have very low capital cost when compared to the total cost of power generation, transmission and distribution in conventional power generation methods with the life time of this system in concern . The pollution free electricity thus generated from the road by using these generators can be stored in a battery and later used for the domestic electrification. This method will be best suited for the electrification of all time loads like Traffic signals, street lights, lighting especially in highways.

Paper Title:	**Credit Card Fraud Detection using Machine Learning**

Abstract:Fraudulent transactions using credit card has been a growing concern with far reaching among various such as including government, corporate organizations, finance industry. Internet business is the most helpful answer for grow the client base and accomplish the biggest stage with a little venture. The fast development in the E-Commerce has significantly expanded Visas use for online buys and it actuated blow-up in the Credit card misrepresentation. For both online just as ordinary buy Credit card turned into the most well-known method of instalment, extortion cases associated with it are additionally emerging. The false exchanges are mistaken for certified exchanges and the basic example coordinating methods are not frequently enough to identify those cheats precisely. Effective location misrepresentation framework execution wound up basic to limit their misfortunes for all credit card issuing banks. Present day strategies dependent on Artificial Intelligence, Data mining, Fuzzy rationale, Machine learning, Sequence Alignment, Genetic Programming and so forth., are developed in distinguishing different Visa deceitful exchanges. When credit card transactions become a common mode of payment, machine learning has been based on handling the credit card fraud problem. This paper investigates naïve bayesian, k-nearest neighbor's performance on highly skewed credit card fraud based on genetic and optimization algorithm to determine the fraudulent transaction using credit card. Logistic Regression is a supervised classification technique which returns the probability of binary dependent variable predicted from the independent dataset variable that is logistic regression predicts the probability of different outcomes that have two values either yes or no and false or true. The Proposed System have been applied with genetic and optimization algorithm to find out the fraudualent transaction using credit card.

Paper Title: **Generating Rainfall Data using GANs**

Abstract:Rainfall prediction is one of the major discussions in the meteorology because it is a major factor on which many things in the environment rely on. Neural Nets or any other machine learning algorithms need very large amount of data in order to achieve better accuracy but sometimes data can be scarce, this type of problems can be resolved by using Generative Adversarial Networks. Generative Adversarial Networks which are known for generating data by using the existing features from the old data, like generating images etc. There are many types of datasets which are scarce, rainfall data in one among them. So, the proposed system generates the rainfall data using GAN. The generated data is used for training the classifier, which predicts the rainfall.

Paper Title: **Implementation of Digital Signature Algorithm using Big Data Sensing Environment**

Abstract:WBAN is a self-governing and perceptive used to informant the activities of a person and to improve the individuality of people, which satisfies the requirements of the user's needs. In this paper, we propose a Big data retrieval unit in WBAN using Elliptical Curve Cryptography. Big data transmit the data through Map reduce and retrieve the data safely using ECCDS algorithm. Map-reduce is a programming method for accessing multiple data sets on multi-node hardware efficiently using a distributed storage process and it incorporate the entire in-between requirements connected via the identical in-among key in . Cloud Sim extensible toolkit is used to enable the modeling and to enhance the application provision.

	Paper Title:	**Building Energy Utilization with LED Lighting and Occupant Sensing System**	
	Abstract:Building Energy management systems (BEMSs) are needed to monitor and regulate energy consumption in buildings, thus, contribute in reducing the environmental challenges facing our planet. A new energy saving method based on BEMS is proposed in this paper. The proposed method is a smart LED lighting system based on an Arduino microcontroller, a simple motion sensor, and a camera. A complete design and implementation of the smart lighting system is presented in the paper. In addition, the proposed smart system is validated in the paper under various experimental conditions. The results show that simple installation of commercially available motion sensors and cameras can contribute significantly to reduce the electricity bill and CO2 emission. **Keyword:**Energy; Buildings; Energy Management System; Smart Lighting System. **References:** 1. 	Paper Title:	**Design and Development of Smart Solar Grass Cutter**	
	Abstract:From the time immemorial, the sun is the major source of energy for life on earth used for heat and lighting. Nowadays, solar energyhas been known as a renewable energy source. It is an alternative energy to that of fossil fuel and it can be collected from the renewable resources such as sun, wind and hydro. This paper introduces a new development of grass cutter, named as Smart Solar Grass Cutter, by usingsolar irradiance as a primary energy source with the presence of a solar panel. This grass cutter prototype is developed to reduce air pollutant and improve the current design specifically the blade position based on the previous studies. With current technology, this new prototype is designed as remotely controlled grass cutter using Arduino UNO. Smartphone is used as the remote controller. After developing an established prototype, the design analysis is	**4137-4141**

carried out to bevalidate with the theoretical values to ensure that the prototype can be safely used. The Smart Solar Grass Cutter can operate more than two hours when the used battery is fully charged. Based upon the results, the Smart Solar Grass Cutteris reliable with high efficiency of the system compared to the previous studies. Therefore, it can be concluded that the prototype is reliable and environmentally friendly.

Keyword: Smart Grass Cutter,Solar Grass Cutter, Smart Solar System.

Paper Title: **Intelligent Home Automation System for Disabled People**

Abstract:This paper presents the intelligent Home Automation System (HAS) for disabled people, since still now facilities for disabled people are insufficient around the world. Numerous researchers developed different technologies considering Bluetooth technology, ZigBee system, and Wifi technology. However, these topologies lack efficient support for disabled people. Therefore, to engage the disabled people with the modern technology and make their life safe, secure and comfortable, authors have introduced the Rasberry Pi 3 Model B with Blynk application which is able to control the home appliances from their smart android phone. In this research, the motion of the intruder has been considered as the key parameters and HOG method is used to detect the motion. Experimental validation of the proposed model implies that this process is more secure and user-friendly for disabled people compare to other existing technology. Therefore, the main contribution of this research is to develop a secured automated system, which will enable the disabled people to control the home appliances and thus overcome the limitation of the existing technology.

Paper Title: **Extreme Learning Machine with Multi-Agent System for Regression**

Abstract:From the point of learning speed as well as generalization, Extreme Learning Machine(ELM) is widely known as an effective learning algorithm than the conventional learning methods. Basically, hidden neurons are not required in neuron alike, instead, weight is the parameter that would need to learn about the link in between output and hidden layers. The creation of an output is to integrate each independent of several ELMs. The precise approach is included in a Multi-Agent System. The novelty of ELM-MAS (extreme learning machine based multi-agent system) is put forward in the paper for solving data regression problems. The ELMs consist of two layers which are the parent agent layer and individual agent layer. The effectiveness of the ELM-MAS model is proved with some activation functions employing benchmark datasets (abalone, strike and space-ga) and real world application (Nox emission). The outcomes indicate that the proposed model is capable to attain improved results than other approaches.

	Paper Title:	**Genetic Rules Induction Fuzzy Inference System for Classification and Regression Application in Energy Industry**

Abstract:Genetic fuzzy system encompasses genetic algorithm and fuzzy logic. It divulges the advantage of optimization with ease of understanding for classification and regression of energy performance of buildings, transformer, and harmonic current in energy industry. This paper presents development of a new rules induction algorithm namely genetic rules induction fuzzy inference system for classification and regression (GRIFISCnR) that combines genetic algorithm with fuzzy logic to facilitate efficient design of building, transformer and harmonic current filter in energy industry using Pittsburgh approach. GRIFISCnR possesses the rules induction capability over other algorithms for multi-class classification and regression problems without compromising on interpretability and accuracy. It manages to strike a balance between interpretability and accuracy, and yield better accuracy with lesser number of rules. It is easier to interpret and understand fuzzy rules as compared to numerical numbers.

Paper Title: **An Ensemble Classifier based Power Quality Disturbances Classification**

Abstract:Evolution of the current modern era demands a huge and good power quality supply day by day. Power utility suppliers and power exchange specialist organizations face a noteworthy test in recognizing the kind of Power Quality Disturbances (PQD). Our research illustrates the technique of PQD classification by utilizing wavelet signal decomposition and Ensemble classification. A normal wave without disturbance and waves with PQD events of single-type and hybrid-type were generated using MATLAB using the mathematical model as per the definition and parameters outlined by IEEE 1159 and IEC61000 customary. Discrete Wavelet Transform (DWT) is pertained to decompose the signal form the generated PQD to get the illustration in time and frequency domain. In this research work, our database consists of 14000 generated signals of a normal wave and the PQDs, which were divided into 80% for the train set and 20% for the test set for each PQDs. An ensemble methodology for multiclass order was chosen as the classifier of the component vector for the PQD. Examinations were conjointly made with elective sorts of classifiers and different kinds of mother wavelet channel capacities to observe and investigate the exhibition qualification. The outcomes demonstrated that the blend of DWT and Ensemble Classifier delivers an optimal solution to recognize the class of PQD with a precision of 100% for each train and test set.

Paper Title: **Fault Detection of a Medium Voltage Cable Joint using Support Vector Machine Algorithm**

Abstract:Fault detection of the cable joints is one of significant problems in the electrical utilities and industrial companies to increase the network stability as the system interruption can make side effects for both power generation units, renewable energy generation units and other power sources beside of the costumers. In this paper, fault detection of a 20kV XLPE cable joint had been studied using the measured partial discharge (PD) signals and also support vector machine algorithm. In this study, the measured data had been classified based on proposed features as the indices of data classification and they had been used in the classifier algorithm to determine fault based on measured signals and the corresponding obtained features. The results show that the proposed features and applied algorithm could determine the faults in the cable joints with an appropriate range of accuracy. This study could develop the previous studies on a widely used cable joint. This research can be helpful for the electrical utilities to increase network stability.

Paper Title: **The Performance of waste Heat Recovery Systems using Steam Rankine Cycle and Organic Rankine Cycle For Power Generation**

Abstract:This paper presents extensive modelling of an Organic Rankine Cycle (ORC) system for a combined cycle power plant and to compare and evaluate the performance of ORC and Steam Rankine Cycle (SRC). In addition, ORC as a second stage waste heat recovery system after SRC too was modelled. Conceptual design of an ORC was made to replace the SRC system used in the power plant and its performance was compared with that of the SRC above. Upon replacing the steam cycle with ORC, the system efficiency is 7.63 %. The total energy destruction is 5140.41 kW. The result shows that ORC delivers very low system efficiency. The steam cycle produces 202.5MW whereas the presented ORC produces just 1.016MW of power. On the other hand, if ORC is implemented on the chimney the system will produce 0.2% of extra power on top the current power production of 675MW. The efficiency of this system is 7.81%. It is recommended to add the ORC at the chimney to tap more useful energy from the otherwise waste energy rejected into the environment.

Paper Title: **Developing a Hydropower Vortex Induced Vibration System in Slow Stream Water**

Abstract:Energy resources are beginning to replenish and the reliability on renewable energy has increased to 30% as we approach year 2020. However the current sources of renewable energy used for mass generation also have its own drawbacks mainly in terms of costing, maintenance and geographical changes which incur environmental disturbances. Energy harvested from Vortex Induced Vibrations (VIV) in water with a continuous flow of more than 0.3m/s has the ability to replace conventional hydropower methods with a more cost efficient and environmental friendly way. This research managed to produce a prototype focused on using a spring system to maximize oscillations induced by the vortex in flowing water onto a cylinder shaped PVC pipe of a specific diameter. The energy harvesting method adapted in this system is a piezoelectric tape. Upon every oscillation, the designed system is able to flick the piezoelectric tape inducing a certain amount of voltage. Initial design of prototype was to discover the most adequate cylinder PVC pipe for vortex in water to produce oscillations. The best way to design the system was tested to maximize flow induced oscillations. The final prototype of this stage also found the best harvesting method for the transformation process of induced oscillation into electrical energy. At this stage the prototyping is detailed at combining the existing prototype and piezoelectric transducers. The end product successfully produced up to 0.2watts/second of power. However, the unstable flow conditions and small scale testing prototype incurred an inconsistent power generation. From this research, it was brought to conclusion that the prototype has to be of a larger scale for real life applications of vortex induced vibration hydropower system.

Paper Title: **Performance of Memristor Based Ring Oscillators True Random Number Generator for Energy Technology**

Abstract:We are living in an era where everything is trying to be more connected in terms of the different physical entities and its surrounding environment. This new concept that is developing called the Internet of Things (IoT) has garnered a lot of attention [Bodei, 2019 #45]. There are various of applications and smart objects associates with the IoT and this leads to an increase in security challenges. IoT security is very important

4183-4189

but getting harder to achieve. One example of utilization of IoT is in the smart grid infrastructure and this in turn increases the need for network security. An integrated internet-based smart grid and energy resources also called Energy Internet (EI) has a lot of security challenges that comes with the current smart grid. Smart grid infrastructure and any means of energy that implements the internet system also known as Energy Internet (EI) has many security challenges that come with the current smart grid. A memristor based ring oscillator True Random Number Generator design has been proposed in this research as a solution that can combat security challenges that existed in the hardware implementation of devices. Inputs based on non-deterministic methods are being used in TRNGs to generate outputs that possessed randomness characteristics in applications of IoT that makes it secure. Complementary metal oxide semiconductor (CMOS) technology of 0.18 µm are being used in the TRNG design and a software of LT SPICE IV helps to realized it.The proposed TRNG design produced output that passed 10 out of the 15 NIST tests, therefore showed that the TRNG produce a fairly random output.

Paper Title:	**A Light Weight Solar Powered Mini Quadcopter for Environmental Monitoring**

Abstract:A flying quadcopter equipped with green and environment friendly solar energy is designed and implemented in this study for monitoring purposes. It is capable to operate with light weight small solar panel

generated power with designated light weight boost converter integrated in the body of the flying model. A preliminary design of the solar powered quadcopter has been performed by calculating and estimating the maximum lifting weight of flying model, voltage rating of the solar panel, battery voltage rating and its capacity. A charging during operation has been supplemented to the quadcopter to facilitate the operation as well as charging at the same time. In addition, crash protection structure has also been equipped to the design to reduce the impact to the structure during improper landing. With the enhanced ability of providing self-sustaining energy source, the quadcopter is capable to carry out environmental sensing with proper sensor mounted on it.

Paper Title: **Solar Tower Power: The Impact of External Receiver on Optimal Performance and Energy Storage**

Abstract:An external receiver was seen as a major component of the Solar Tower Power (STP) plant. This generated stable power from concentrated sunlight. However, the flux distribution on its surface was an issue related to the external receiver that could affect the performance and energy storage in STP. The heat flux increased during long-term use, failure reduction, receiver efficiency and performance. The main advantage of the STP structure was its substantial heat storage capacity which allowed the system to generate stable and continuous electric power. In this study, the researchers reviewed existing literature to investigate the effect of the STP external receiver on the optimum energy storage and performance of the STP; especially regarding the solar flux distribution and efficiency. The researchers aim to improve the external receiver's optimal performance without affecting the incident heat fluxes. The literature review indicates that ideal receiver conditions lead to solar energy flux distribution optimal performance. Therefore, system optimisation was necessary to satisfy all limitations; like loss occurring due to heliostat field, solar flux flow patterns, external tubular receiver designs, and Heat Transfer Fluid (HTF) selection. These limitations, along with factors affecting these limitations, are reviewed in this study.

Paper Title: **Performance of Clustering Techniques of Multiple Partial Discharge Sources in High Voltage Transformer Windings**

Abstract:There are numerous of clustering techniques that have been exploited by researchers in many applications such in medical application, image processing application as well as in high voltage application. Clustering technique is an unsupervised learning algorithm used to identify group structure in a set of data that contain different characteristics. Nowadays, within the latest HV insulation system, there are more than one dielectric media, which contribute to multiple source of partial discharge (PD). Therefore, data identification for PD is significantly vital to discover the kinds of faults that inducing discharges in a HV insulation system. Nevertheless, it is critical that the methodology used for further investigation such as phase-resolved partial discharge (PRPD) analysis is capable of producing a sufficient separation between the clustered data. An experiment was performed to generate a pair of PD sources simultaneously within a winding of the HV transformer. The PD pulses were collected from two measuring points measured by two wideband radio frequency current transformers (RFCTs) at the bushing tap-point to earth (BT) and the neutral to earth-point (NE).The performance oft-Distributed Stochastic Neighbour Embedding (t-SNE), Principle Component Analysis (PCA) and time-frequency mapping based on sparsity roughness at distinguishing multiple PD sources is determined and presented.

Paper Title: **Water Absorption Properties of Kenaf/Glass Reinforced Unsaturated Polyester Composites used in Insulator Rods**

Abstract:Kenaf fibres have acquired enormous attention in recent years, owing to their economic viability and environmental acceptability. Kenaf (natural) fibres have been started to replace the glass fibre (synthetic) in mechanical, electrical applications and have been utilized in several applications of industrial engineering. The current study deals with water absorption of kenaf/glass fibre reinforced unsaturated polyester composite materials used in high voltage polymeric insulator rods. The kenaf/glass hybrid composites were based on 20%, 30% and 40%(by volume) of kenaf fibers replacement glass fibres with modified 60 vol.% unsaturated polyester resins. The composites were immersedin distilled water at room temperature, and composites resistance to water absorption in terms of the rate of water absorption was determined.A considerable difference in the properties of water absorption of the hybrid composite was found demonstrating that the water absorption effect on the characteristics of insulator rods depends on the arrangement and volume fraction of kenaf fibre of the composite used. Based on the results obtained, a slight effect of water absorption on pure glass fibre composite (control) was observed. The addition of kenaf fibre on glass fibre composite rod increased the water absorption of the composite. It was shown that glass fibres surrounding kena ffibre reduced water absorption. Despite the fact that 40 vol.% of kenaf fibre composite had the highest natural fibre content, it showed the lowest water absorption because of its arrangement on all composite diameters, and also because of being surrounded by glass fibres. All of the materials reached equilibrium and ceased to absorb water after 300 hours.

Keyword: Kenaf Fibre; Glass Fibre; Insulator Rod; Hybrid Composite; Water Absorption.

Paper Title: **A Multi Platform for Utility using openFMBTM Reference Architecture: Chalenges and Lessons Learned**

Abstract:The exponential growth of smart micro grids is making centralized control unmanageable. Data generated by grid-edge devices are also inaccessible due to the installation of private micro grids with proprietary communication protocols. The OpenFMBTM reference architecture solves this interoperability issue and eases the manageability of huge data by creating a virtual node that would allow exchange information between field devices with the use of publish/subscribe paradigm. However, the OpenFMBTM framework is yet to be adopted by industries but researches related to the implementation of this framework is being conducted with the aim to find out the cost and reliability on performance issues such as accuracy, scalability and security. Smart Grid Interoperability Panel (SGIP) provided a live demonstration of OpenFMBTM framework at DistribuTECH conference. DistribuTECH demo provides a guideline to setup simulators deployed in a single Linux machine. This paper discusses about the simulation demo and lessons learned to further developing the project. The implemented demo focuses on the use of MQTT communication protocol for transport layer data transfer. The experiment uses the guidelines of the DistribuTECH demo and addresses the challenge of deploying the framework in real devices at industry level.

Paper Title: **Decoupled Control of Three Phase Grid Connected Solar PV System**

Abstract:A reliable grid connected Photovoltaic (PV) system require effective control schemes for efficient use of solar energy. This paper presents a three-phase grid tied PV system with decoupled real and reactive power control to achieve desired power factor with Maximum Power Point Tracking (MPPT) controller to get maximum solar energy. The synchronous reference frame (dq) control along with decoupling concept is used to control the DC-AC inverter output, while the Phase Locked Loop (PLL) synchronization technique is used to monitor and synchronize the voltage and current at the grid side. The DC-DC converter with Incremental Conductance (InC) based MPPT model is also designed in this paper due to better accuracy compared to Perturb & Observe (P&O) algorithm. The simulation is performed in MATLAB/SIMULINK and a 31.5 kW PV system is modelled to get 30 kW power with the help of MPPT at Standard Test Conditions (STC). Any power factor value between 0.85 lagging to 0.9 leading can be obtained by changingreference q current in this inverter control strategy. The simulation results show that the change of reactive powerdoes not affecttheactive power values of the system, which verifies the effectiveness of the decoupled control strategy of the inverter.

Paper Title: **Application of Sustainable Transport Policies in Areas of High Frequent Density Campus of Jadiriya**

Abstract:This research investigates and discusses theimplementation ofthe master plan for transport and parking at the campus of University of Baghdad in 2017. Although the master plan emphasizes on economic benefits and revenue, it is benefit of environmental sustainability. Thus, there is a need to effectively implement the master plan and provide new proposals on sustainable transportation to reduce the number of private car parking spaces. The work began by analyzing the earlier designed general parking outline in university's master plan to determineif it meetsthe requirements of buildings after successive implementation. The success or failure of the master plan in relation to reduction in the demand for parking was also assessed. A statistical model was developed to represent the relationship between the area of roads required and the number of cars in parking, and the group of independent factors that are believed to have an impact on these numbers as well as to forecast

4223-4230

future needs as regards parking spaces. The distribution of parking cars was found not be neither environmentally sustainable nor socially justifiable, given the clear variation in access time on foot from the nearest parking lot to the workplace. Nonetheless, the over 23% of non-users of vehicles on campus can contribute to the actualization of the concept of sustainable transport (walking). Therefore, this study recommends the preparation and implementation of detailed designs of sustainable transport and parking programs to reduce the planning, environmental, social and economic problems that exist in the master plan of the university campus.

Paper Title: **The Performance of V-Trough Solar Concentrator Photovoltaic Systems at Varying Panel Surface Temperatures**

Abstract:The photovoltaic (PV) panel performances are dependent upon many factors. A study was executed to ascertain the effect of a V-Trough Concentrator (VTC) to be engaged on a PV Panel in this research where the performance of PV panels are compared at different surface temperatures both back and front. The experiment was conducted using two similar rated monocrystalline PV panels. One of the PV panels was installed with a VTC while the other is without the VTC that served as Control for benchmark purposes. The optimum VTC selected is a 60° VTC. Both PV systems were built with a lower supporting mechanism and were placed to operate under similar operating and weather situations, while the PV panel surface temperature both front surface and back surface, Open Circuit Voltage (Voc), as well as Short-Circuit Current (Isc) readings are being recorded down at specific time. The theoretical output is determined and compared. This paper ends with a presentation of the results obtained in a study on the PV panel surfaces temperature in relation to its performance by PV system using a 60o VTC.

Paper Title: **Design an Ultra- Wideband Modified Wilkinson Power Divider Fed-by Balanced Antipodal Vivaldi Antenna Array for Imaging Applications**

Abstract:In this paper, design of compactand modified geometrical structure of 1-to-4 way ultra-wideband Wilkinson power divider used as a feeding network for 4-element of balanced antipodal Vivaldi antenna (BAVA) array has introduced. The proposed Wilkinson power divider has been designed and printed on low-cost Epoxy laminate substrate FR4 along with the thickness of 1.6mm and relative permittivity of εr =4.3 respectively. The transformation of power divider network which are based on bent corners as a replacement of

4236-4241

sharp corners or edges used for the decrement in unintended radiation and employing a single radial stub on each branch to encounter the antenna-specifications. Further some adjustments in the dimension of stubs matching in order to increase the reflection of the power divider network. The design presents the model of a power divider and maintains an equal power splitting at different ports with practical insertion loss and conventional return loss below -10dB. The reasonable impedance matching has achieved at every single port with acceptable isolation performance values over the (3-to-10 GHz) frequency range. The divider as well as antenna elements design and its optimization are practicable via computer simulation technology (CST) simulation software. The experimental results are revealed to encounter the array-specifications under ultra-wideband frequency range..

Paper Title: **Design of an Elliptical Patch Antenna for RF Energy Harvesting Application in 2.4 GHz Frequency band**

Abstract:In this paper, the design and prototype of an elliptical patch antenna is presented, which operates at the frequency of 2.4 GHz frequency band. It harvests energy from 'Radio Frequency' waves. The elliptical antenna has an antenna substrate made with FR4 board with dielectric constant of 3.95. The paper presents the simulation results of the basic parameters of the antenna such as: return loss, input impedance, bandwidth, gain, directivity and efficiency. The experimental results for return loss, band width and input impedance was also presented in the paper. The antenna has a gain of 5.84 dB, directivity of 6.25 dBi, return loss of -43.35 dB, bandwidth of 373 MHz, input impedance of 50.35 Ω and efficiency of 90%. The high gain, properly matched impedance for minimum return loss and high efficiency of the antenna make it eligible for energy harvesting application.

Paper Title: **Time of use Period Determination for Residential Customers in Peninsular Malaysia**

Abstract:Time of Use (TOU) is basically one of the demand response programs which enable the end-user consumers to adjust their energy use in response to changes in electricity prices over a period of time with an incentives. Generally, Time-of-Use implementation helpto reduce system's maximum demand by transferring some of the demand into different hours. Time-of-Use also is a cost reflective electricity pricing scheme in which days are commonly split into multiple periods such as peak, mid-peak and off-peak. The residential sector is expected to have the highest growth as compared to commercial and industrial sectors. This is due to an increase in population and increasing living standards which increase the number of households and the electrical electricity consumptionper householdas more households and individuals choose to buy more electrical appliances. This paper presented a new clustering method called Jenks Natural Breaks in order to segmentize the Time of Use period for the residential customers in Peninsular Malaysia. A comparison of K-Means clustering method and the proposed Jenks Natural Breaks method is presented in this paper. The time of use determination are performed using these two methods based on the average of six actual residential customer's load profiles. In this paper, two-part periods (zones) segmentation of TOU areconsidered for analysis and discussions. The results

4246-4249

shows the TOU Peak period using the K-Means clustering method is between 10.00am and 8.00pm while for a new proposed Jenks Natural Breaks method the TOU Peak period is between 9.00am and 8.00pm.

Paper Title: **Tongue Image Analysis for Medical Diabetes Diagnosis using Canny Edge Algorithm**

Abstract:Tongue diagnosing is one amongst the vital areas in diagnosing most of the diseases, so tongue designationhas received more significance among the experts. Tongue diagnosing is usually carried out by processing the tongue images, but the processing of tongue image is not easy task to carry out. The difficulty strikes because of the irregular shape of the tongue, interference of lip with the tongue, the different shape of the tong etc. In this paper, we proposed support vector machine (SVM) based tongue classification method for processing the tongue image. Shape detection Hough transformation is used, an edge detectoruses canny edge algorithmfor extracting the shape of the tongue, Gabor features are used to extract the texture features of the image. Color feature extraction is done by extracting 12 color features, color image segmentation strategy and region of interest is used for segmentation. Finally, classification is done by using SVM classifier.

Keyword: Tongue diagnosis, SVM, Canny Edge Algorithm, Gabor features.

Paper Title: **Estimation of Mode-III Interlaminar Fracture Toughness in GFRP Laminates**

Abstract:The composite material is heterogenous in nature has several applications ranging from sports to defence industries replacing the conventional materials. Assessing the strength composite material for out of plane delamination characterization is a challenging task. One of the test specimens which can simulate the out of the plane loading is the Edge crack torsion (ECT) specimen, to study thedelamination growth in composite laminates in a controlled environment. For the present work a fixture was developed to simulate out of plane loading and hence to estimate mode-III fracture toughness. The testcoupons werecast using from bi-directional satin glass fibre woven mat, subsequently a starter crack was introduced in the mid plane. A 100 KNInstron Universal test loadingframe was used in static condition. It was observed that the crack growth did initiate from specimen centre.The fracture parameter experimentally measured was found to bedependent on the crack growth.

Paper Title: **Determination of Parameters of Grates on Rubber Brackets of Fiber Material Cleaners**

Abstract:The article shows the installation scheme of the grate and the principle of operation of the cleaner of fibrous material from large litter. The oscillation of the grates installed in the upper and lower cleaning zones with different thickness of the rubber support was studied. On the basis of theoretical studies of the grate in the form of a single-mass system, regularities of the change in vertical mixing and speeds of grates are obtained. Graphical dependences of the change in the amplitude of oscillations of the mixes and the speeds of the grate are constructed on the variation of the mass of the grate, the disturbing force on the cotton being revealed, and also on the stiffness coefficient of the elastic support. Full-factorial experiments obtained regression equations. By solving the problem, graphical dependencies of the change in the cleansing effect on incoming factors are constructed. The analyzes substantiate the parameters of the fibrous material cleaner.

Keyword: Fibrous material, cleaner, large litter, rubber support, thickness, vibration, stiffness, dissipation, full-factor, optimization.

Paper Title: **Characterization of bio-Oil produced by Microwave Pyrolysis of Karanja Seed.**

Abstract:Pyrolysis is one technique that produces three products in a short span of time in which both conventional and non-conventional method of heating (microwave irradiation) can be done. Karanja seed powder is taken as the feedstock in this microwave pyrolysis experiment. Proximate and Elemental analysis of karanja seed powder resulting volatile content of about 84.89% and moisture content of 10.11% whereas the Carbon of 52.08%, Hydrogen of 8.26%, Sulphur of 0.21%, Nitrogen of 4.02% and oxygen of 35.04%. Microwave pyrolysis for karanja seed was conducted for two power inputs of 700W and 800W in which bio-oil yield is high of 47% at 700W and non-condensable gases of 39% at 800W. The FT-IR results resembles the presence of aliphatic compounds. The TGA analysis was also taken for the produced bio-oil. The rheological study was made to determine the dynamic viscosity of the produced bio-oil at 50 rpm in room temperature which is averaged to 52 cP. The flash point of 90°C and fire point of 94°C was also determined for the produced bio-oil.

Keyword: Dynamic viscosity, FT-IR, Karanja seed, Microwave pyrolysis.

Paper Title:	**Extracting and Transforming Heterogeneous Data from XML files for Big Data**

Abstract:Digital technology is fast changing in the recent years and with this change, the number of data systems, sources, and formats has also increased exponentially. So the process of extracting data from these multiple source systems and transforming it to suit for various analytics processes is gaining importance at an alarming rate. In order to handle Big Data, the process of transformation is quite challenging, as data generation is a continuous process. In this paper, we extract data from various heterogeneous sources from the web and try to transform it into a form which is vastly used in data warehousing so that it caters to the analytical needs of the machine learning community.

Keyword: Big data, data transformation, data warehousing, ETL.

Paper Title: **Polytechnic Student's Readiness Towards Project Based Employment**

Abstract:Project Based Employment (PBE) is the current trend in employment that is gaining momentum. The growing need for PBE has led to the need for employees with high knowledge and skills as well as good attitude. The aim of this study is to identify the readiness of polytechnic students towards PBE in two Conventional Polytechnic from the southern zone states. This study employed a survey method. A total of 361 students comprised of first, second and third year from Civil Engineering, Electrical Engineering and Mechanical Engineering courses from Politeknik Melaka and Politeknik Port Dickson were selected as study samples. The instrument of this study is a questionnaire with the alpha value .919. Data obtained were analysed using SPSS software version 21.0. Descriptive analysis in the form of mean score was used to identify the readiness of polytechnic students towards PBE. The findings show that polytechnic student`s readiness is in high level in terms of knowledge, skills and attitude towards PBE. From the knowledge aspect, polytechnic students know that PBE can provide employers with skilled and knowledgeable employees. Meanwhile, from the employability skills aspect, it shows that polytechnic students have the ability to interact well when working in groups. From the technical skills aspect, polytechnic students can complete their practical work by using the right equipment corresponding with the current PBE demands. From the attitude aspect, polytechnic students are always trying to develop themselves in the field they are involved in. In conclusion, polytechnic students are ready to face PBE in the future and they have initiative to improve their knowledge, skills and attitudes to the higher level to align with current industry demand. Overall, the results of this research have been able to help graduates and other educational institutions to improve and enhance the quality of students in line with the country's demand.

Paper Title: **Opinion Mining using Machine Learning Techniques**

Abstract:Sentiment analysis or opinion mining has gained much attention in recent years.With the constantly evolving social networks and internet marketing sites, reviews and blogs have been obtained among them, they act as an significant source for future analysis and better decision making. These reviews are naturally unstructured and thus require pre processing and further classification to gain the significant information for future use. These reviews and blogs can be of different types such as positive, negative and neutral . Supervised machine learning techniquess help to classify these reviews. In this paper five machine learning algorithms (K-Nearest Neighbors (KNN), Decision Tree, Artificial neural networks (ANNs), Naïve bayes and Support Vector Machine (SVM))are used for classification of sentiments. These algorithms are analyzed usingTwitter dataset. Performance analysis of these algorithms are done by using various performance measures such as Accuracy, precision, recall and F-measure. The evaluation of these techniques on Twitter datasetshowed predictive ability of Machine Learning in opinion mining.

Paper Title: **Methods of Forming the Control Voltage in the Current Generation Problem for Electrical Impedance Tomography**

Abstract:The paper considers questions of control signal for injection current generation in electric impedance tomography devices. The most common injection current generation scheme is voltage controlled current sources. In these circuits, the shape, frequency and amplitude of the current are set by the control voltage. The most common control voltage generation schemes are considered; their advantages and disadvantages are indicated. A circuit using direct digital synthesis and an amplitude-tuning digital-to-analog converter was selected, its block diagram was developed, and an operation algorithm was described. The developed scheme will improve the efficiency of the research by the method of electrical impedance tomography due to the complete automation of the process of controlling its parameters.

Paper Title: **Design of Low Cost Wireless Surveillance System for Aircraft**

Abstract:The aim of the project is to estimate the position and orientation of a moving platform in a 3D environment which is of significant importance in many areas such as robotics, sensing, surveillance and Unmanned Aero Vehicles. In order to perform this, one can employ single or multiple sensor fusions to improve the accuracy of estimation and to compensate for individual sensors deficiencies. We are using camera surveillance controller system in which we control the movement of the camera and it is live video streaming to a remote location. The camera is made to view +180 to -180° by using servomotor. The GPS and IMU sensor modules are implanted onto the model for controlling and monitoring the flight. Wireless technology allows viewing remotely and controlling the flight as required. This paper focuses on LOW-COST WIRELESS SURVEILLANCE for improved security, more flexible and efficient systems.

Paper Title: **Meeting Scheduling Application using Availability and Priority Attendance Heuristics**

Abstract:Meeting scheduling is a repetitive and time consuming task for many organizations. Emails and electronic calendars has been used to help a meeting host in this process. However, it does not automate the process of searching the optimal time slot. Manual scheduling may result in suboptimal schedule. Therefore, automation is needed for meeting scheduling problem. The purpose of this research is to propose an applied model consisting of both acquiring participants' existing schedule, and searching for an optimal time slot. Previous studies groups the solution of meeting scheduling into either constraint satisfaction or heuristics approach. Heuristics is more appropriate for a dynamic environment. The heuristics-based model is designed to consider participant availability and participant prioritization. The more participants are available, the better the time is as a candidate for optimum schedule. In the proposed model, the availability of certain key person, experts, or host may carry more weight than normal participant. An Android based application is developed as a prove of concept of the proposed model. Google Calendar API is used in this model to acquire the existing schedule, then each time slot is assigned a score based on availability weighting. The time slot with the highest score is considered the optimal solution. Evaluation is done by simulating the scheduling part for various numbers of meetings and time slots. The result shows that the model is capable of searching the optimal meeting schedule in less than one second for each of the experiment.

Keyword: Meeting scheduling problem, agent-based, heuristics, mobile application.

Paper Title: **Visual Cryptography Based Authentication Technique for Cloud Environment using SVD Factorization**

Abstract:World is going toward digitalization and cloud computing plays an important role to connect digital devices for communication with each other. Communication with authentic device and secure its illegal access is the main feature of cloud providers. With the growth of cloud technologies attackers are also finding different attack vectors to break down the cloud authentication system. Previous research illustrates that there is need to develop strong authentication technique to strengthen the trust on cloud systems. This paper demonstrated a visual cryptographic authentication technique for cloud environment. The technique is based on the SVD factorization method. SVD works effectively to create multiple shares of an image and make strong authentication algorithm on the basis of random image feature selection. Result analysis shows that SVD factorization works effectively rather than LU factorization in cloud environment.

Keyword: Cloud Authentication Technique, SVD Factorization, Visual Cryptography, Image factorization, Cloud Security, Tenant Privacy Preservation.

Paper Title: **Artificial Music Generation using LSTM Networks**

Abstract:Advancements in machine learning have minimized the gap of variation between human and algorithm composed music. This paper realizes a music generation system using evolutionary algorithms. The music generation is fully automated with no requirement of human intervention. Multiple music sample from a single dataset were used to the neural network. Software has been constructed to exhibit the results over various datasets. The proposed model is based on recurrent neural network with the input layer represents a measure at time T, and the output layer represents the measure at time T+1. The approach results in generation of new music composition by the system. Composition rules are used as constraints to evaluate the melodies generated by the novel neural network. Thus, the results are expected to evolve to satisfy the defined constraints. The proposed system of work would be capable of music generation without human intervention.

Paper Title: **Implementation of 2D-DCT as an Efficient Accelerator for HEVC Video CODEC**

Abstract:Programmable architectures like GPU based embedded system for video and imaging applications are widely used due to their high performance, as they allow flexibility for running customized functions. However these architectures do not allow reconfiguration of the architecture at run time and optimization of the hardware resources. This paper explores the FPGA based architecture suitable for all video CODEC standards used in multimedia applications which is both programmable and reconfigurable. The proposed architecture demonstrates an accelerator to perform two dimensional 8*8 discrete Cosine Transform (DCT) and Inverse Discrete Cosine Transform (IDCT). The accelerator can be reconfigured to compute higher order two-dimensional DCT/IDCT according to different system requirements and is implemented on Xilinx Zynq evaluation board 7vx485tffg1157-1. The architecture is found to have a high scalability in terms of power and area. The synthesis results reads, 48% improvement in both dynamic and static power consumption, with optimal hardware utilization suitable for high performance video CODECs.

Paper Title: **Design of Ultrasonic Conical Horn using Aluminium Alloy and Steel**

Abstract:Horn plays an important role in ultrasonic machining process. The design of horn is critical to its efficiency and quality of machining process. Ultrasonic horns are tuned. Components designed to vibrate in a longitudinal mode at ultrasonic. Frequencies. Reliable performance of such horns is normally decided by the uniformity of vibration amplitude at the working surface and the stress developed during loading condition. The design parameters of horn are calculated from the theoretical derivation of horn. By these parameters, the horn is designed and analyzed using CREO PRO and ANSYS software. In this paper the main object of the project is to Improve the performance of the Horn from the analysis test results, The horn is compared with other available horn results by comparing its natural frequency, amplitude vibration and temperature of the horn.

Paper Title: **Khasi to English Neural Machine Translation: an Implementation Perspective**

Abstract:Being able to translate and communicate consistently from one language to another would have been the ultimate goal of an intelligent system. With recent advancement of Neural Machine Translation (NMT), it has shown a promising solution to the problem of machine translation. NMT generally requires large size parallel corpora to obtained a good translation accuracy. In this paper, we would like to explore a Translation system from Khasi to English language using both supervised and unsupervised technique. Unsupervised was inspired to help attaining a better translation accuracy for low resource language. It was influenced by the recent advancement of unsupervised neural machine translation which primarily relies on monolingual corpora. In this work, Supervised NMT technique was also implemented and compared with the standard OpenNMT toolkit. Here, we also use Statistical Machine Translation (SMT) tools like Moses as a standard benchmark to compare the translation accuracy. When considering monolingual corpus, we obtain an accuracy of 0.23%. Given the small size monolingual corpus the result was lacking but showed promising rooms for improvement. We obtain much better accuracy of 35.35% and 41.87% when we use parallel corpus in supervised NMT and OpenNMT respectively. On comparison with SMT system with Blue score of 43.76%, the supervised NMT system was on par in its performance. Lastly, with improvement in corpus size and better adaptation of preprocessing steps on the source language (Khasi) the result can be tune to a better outcome.

Keyword: Khasi to English NMT, machine translation, supervised NMT, unsupervised NMT .

Paper Title: **An Efficient K-Means Method Based on Centroid Handling for the Similarity Estimation**

Abstract:The main aim of this paper is to handle centroid calculation in k-means efficiently. So that the distance estimation will be more accurate and prominent results will be fetched in terms of clustering. For this PIMA database has been considered. Data preprocessing has been performed for the unwanted data removal in terms of missing values. Then centroid initialization has been performed based on centroid tuning and randomization. For distance estimation Euclidean, Pearson Coefficient, Chebyshev and Canberra algorithms has been used. In this paper the evaluation has been performed based on the computational time analysis. The time calculation has been performed on different random sets. It is found to be prominent in all the cases considering the variations in all aspects of distance and population.

Paper Title: **Smart Storage with the Internet of Things and Voice Recognition**

Abstract:In the era of automation ruling the world by coming into each and every field, now it has entered into the field of Storage. Automation has reduced the time complexity and the manual power in the entire field it has intruded. And likewise it will reduce the time complexity and tracking of the stored items and retrieving the same from the storage. This model of storage can be done with the help of Internet of Things, Cloud computing and machine learning. Cloud computing plays a major role due to its robustness and its portability which does give an extra edge in the business. To survive in business today you need to make smart choices. Storage can be a small business savior. This model can be used in many fields like medicine, business etc. Tracking and retrieving in these large amounts of storage can be made easier with the help of database.

Paper Title:	**Phishing Diagnosis: A Multi-Feature Decision Tree-based Method**

Abstract:Phishing is an electronically connected criminal activity in which the attacker steals the user's personal information like username, countersign, internet banking account, credit/debit card number with the expiration date, password, pin, legitimacy, confidential patient record, CVV number, etc. to boon financially. Email-based phishing is the most common and traditional way of phishing scams, in which the phisher will send a suspicious email with an embedded URL and ask the user to click the URL. When the user clicks on the link, the link will be redirected to a spoofed site that looks the same to the original site to steal their credentials and displays some error message. Later the phishing uses those credentials for malicious purposes. To overcome these scams, many anti-phishing tools have developed. Among that the machine learning-based approaches can give a better result. This paper is an extensive study of the various machine learning-based anti-phishing approaches and their results that detect the phishing URL's from the URLs with URLs features. Six most important models of machine learning have been examined for the phishing detection problem. The Decision Tree-based method outperforms other methods.

Paper Title: **Growing Trends in Indian Farming using Internet of Things (IoT)**

Abstract:India is a land of different weather conditions and versatile soils. Every year Indian farmers are facing problem of sudden rain in their areas without any correct weather forecast which leads to damage of the already grown crops. The second major problem pertaining to Indian farmers is the lack of sufficient knowledge about their soil. The soil forecasting of how the soil structure is changing day by day due to different weather condition and other external factors, and which crop will be optimally suited to be grown in such soil are some of the problems common to the farmers.

This paper makes an attempt to assess and propose model solution along with developing a prototype of device using IoT for use by farmers in Indian agriculture practice. The solution proposed will have a centralized data server to analyze the data and report to the farmer the precautionary steps to be taken in advance for safety of the crops. The solution proposed have eco-friendly energy management through solar plant and wind energy which makes IoT device more portable and low cost, along with making it implementable in Indian rural sectors..

Keyword: IoT, Indian Farming, Weather Forecast, soil checkup, GPRS.

Paper Title: **Integrated Dwt-Differentiation Algorithm for Fault Detection and Relay Coordination in Micro Grid**

Abstract:The Bidirectional flow of current makes it difficult to detect fault in the microgrid. The level of fault current changes continuously with change in load, it leads to selectivity and sensitivity issue of relay. In this paper integrated DWT-differentiation algorithm is proposed for fault detection and relay coordination, the input waveform of fault current is proceed with discrete wavelet transform. Time scale function of DWT used to extract exact feature from signal which helps in further effective analysis. The Optimization function of relay is mainly depends on PSM (plug setting multiplier) and TDS (Time dial span). The Fault current used to calculate this parameter are already analyzed from DWT. Standard 9 bus IEEE system is used as reference. Fault is detected at 21 different locations; initially primary protection is activated and secondary protection operates only if first selected pair of relay fails to operate .The differential algorithm select best pair of backup relay and relay coordination is carried out resulting in reduction of operating Time.

Keyword: Microgrid protection; Relay coordination; fault detection; differential algorithm.

Paper Title: **A Computation Model for Plannedand Functional Systems using Enterprise Information Technologies**

Abstract:All the large scale and medium scale companies have the anticipation of obtaining long term benefits perhaps of short term financial losses, probable breakdown as well. For that Enterprise Information Technologies (EIT) put into service by many large scale and medium scale companies in an increasing number in the expectation of achieving long term benefits. EIT is a very costly and risky asset of Information Technology and the assessment is done based on the increase in the production and the reinforcement of corporate restructure through the business integration process. To work out this, we propose Analytical Network Process (ANP) to handle distinguished assessment of associated set of evident, critical and operational attributes. To illustrate the stability and the consequential administrative significance, we perform analyzes and carry out experiments with real-world data.

Keyword: Analytical Network Process (ANP), Enterprise Information Technologies (EIT), Enterprise Resource Planning (ERP)

Paper Title: **Diabetes Impacted Cardiovascular Disease Prediction using Machine Learning**

Abstract:Utilizing big data growth in biological and health communities, an accurate analogy of medical data can benefit the detection of diabetes impacting cardiovascular diseases. Using k-Means clustering (kMC) algorithm for structured data of heart disease patients, we narrow down to cardiovascular diseases impacted by diabetes. To our knowledge, none of the previous work focused on predicting heart diseases specifically for diabetes patients. Contrasted to multiple other prediction algorithms, the accuracy of predicting in our proposed algorithm is faster than that of other prediction systems for cardiovascular diseases.

Paper Title: **Effect of Steel Fibre in Non-Conventional Self Compacting Concrete**

Abstract:In this study self-Compacting-Concrete containing steel fiber offer improvements on strength parameters of self-compacting concrete for M-30 grade of concrete using steel fiber. The main objective of this project has to find the effect of steel fiber on fresh and harden properties of Non-conventional self-compacting concrete. The use of fibers extends its potentialities since fibers arrest cracks and retard their propagation. In this investigation Mix proportion of concrete was 1:1.67:1.31 and maintaining water-cement ratio of 0.6 in order to find harden properties of steel fiber reinforced concrete (SFRC) containing fibers of 1%, by volume of cement. The flexural and split tensile strength of becomes higher compared with the conventional concrete. The non-conventional SCC with demolished aggregate is less costly than the conventional concrete.

Keyword:conventional concrete, demolished aggregate, segregation, self compacting concrete, steel fiber.

Paper Title: **Temperature Dependence of the Density of States and the Change in the Band Gap in Semiconductors**

Abstract:The temperature dependence of the density of energy states in semiconductors has been studied. Strong doping with impurities with deep levels broadens the conduction band and the valence band. This enhances the absorption of light below the red border. Consequently, a possible change in the width of the forbidden zone. In this paper, using the mathematical model, temperature dependence of the density spectrum of states, changes in the band gap are shown by analyzing the density spectrum of energy states, an explanation of the anomalous temperature dependence in acceleration semiconductors is proposed, the effects of doping with a high concentration on the band gap of the semiconductor are investigated. Explained absorption in the range of 0.6-0.9 eV for silicon.

Keyword:density of states, energy gaps, doping, impurity, forbidden semiconductor zone, control of energy bands, accelerated semiconductor.

Paper Title: **Smart Ration Card System using Lab View**

Abstract:This paper proposes the innovative distribution system called "smart ration card program using LabVIEW." Money is wasted in the PDS (public distribution system) due to corruption. Instead of a traditional ration card, this paper utilizes the basic RFID Tag system used as an e-Ration card. This machine is identical to the one used by ATM Machine. Compared to our debit / credit card, the e-ration card. Instead of a conventional ration card, the user must use this card to get the ration from the proposed system. Research on reducing bribery and better management of PDS (public distribution system) is being brought together from our side.

	Paper Title:	**Energy Harnessing System using Thermoelectric Generator with Radiation Concentrator and Solar Tracker**	
	Abstract:Harnessing systems gather the attention of many researchers today as the energy demand increase with an escalating price of fuel. Studies about renewable resources are kept being pursued by different countries to aid the deficiency of main power producers in their respective locality. Thermoelectric generators, which utilize the Seebeck effect to convert heat into usable electric energy, is the main focus of this study. It has been added with a radiation concentrator and solar tracker to maximize the heat accumulation for larger temperature difference which results to a great amount of stored energy. The energy coming from the sun is focused and concentrated using a Fresnel lens to optimize the heat and increase the output of the thermoelectric generator. The energy is then inserted in a charge controller to have a constant dc voltage output. The output voltage now will be utilized by low powered and devices and has a backup battery storage for the energy. **Keyword:**energy harnessing, solar tracker, charge controller, green engineering, thermoelectric energy, seebeck effect. **References:** 1. 	Paper Title:	**Classification of Semantic Similarity Technique between Word Pairs using Word Net**	

Abstract:The concept of relevancy is a most blazing topic in information regaining process. In the last few years there is a drastically increase the digital data so there is a need to increase the accuracy of information regaining process .Semantic Similarity measure the similarity between word-pair by using WordNet as ontology.We have analyzed the different category of semantic similarity algorithm to compute semantic closeness between word-pair and evaluate its value by using WordNet.We have compared various algorithms on Miller- Charles data set of 30 word-pair is used to rank them category wise.

Keyword: Semantic similarity,Semantic closeness,WordNet,Least common subsumer

Paper Title: **Navigation Environment In A Medical Institution: An Eye-Tracking Examine**

Abstract:Navigation and wayfinding are well-known issues that people face in their life every day. In many situations, and especially in the case of medical facilities, it is vital that users find the desired destination quickly and successfully. This is not only about comfort, but also about life and health safety. In this regard, the development of an effective navigation system becomes an extremely important mission for health care institutions. Therefore, the eye-tracking technology, which makes it feasible to look at the problem through visitor's eyes, appears to be a pertinent tool for an objective assessment of the existing navigation, as well as finding ways to optimize it. This article considers present approaches to the analysis of navigation systems dealing with a large number of clients and describes our visual navigation study conducted in a health center. The first part of our study included the current navigation environment evaluation and the decision-making points detection, serving as a starting point for the implementation of a new, user-oriented navigation in the medical center. In the second part of the study the effectiveness of the applied system was confirmed. The results obtained show that navigation environment improvement can significantly reduce users' time to reach the goal, as well as length of their route. Thus, we managed to apply the eye-tracking method to the improve user experience in a medical establishment.

Keyword:eye-tracking, navigation, user experience, wayfinding.

	Paper Title:	**Image Water-Marking/De-Watermarking using Spatial Domain Technique**

Abstract:There are various existing techniques for cryptography and watermarking. The multimedia data security can be achieved by means of encryption and decryption i.e. cryptography. While watermarking is employed for hiding multimedia data using images. The proposed work focuses on the new method combining these strategies for producing effective solution to improve security of secrete multimedia data. In the proposed dissertation work the images will be used as multimedia data. The proposed method involves the encryption of data to be hid. The cover image is then used as the media for hiding encrypted data. The encrypted data combined with cover image is treated as embedded image. The embedded image then compressed using wavelet transforms compression.

	Paper Title:	**Fog Computing-Security Platform for IoT and Cloud in-Healthcare System**

Abstract:The introduction of cloud computing has revolutionized business and technology. Cloud computing has merged technology and business creating an almost indistinguishable framework. Cloud computing has utilized various techniques that have been vital in reshaping the way computers are used in business, IT, and education. Cloud computing has replaced the distributed system of using computing resources to a centralized system where resources are easily shared between user and organizations located in different geographical locations. Traditionally the resources are usually stored and managed by a third-party, but the process is usually transparent to the user. The new technology led to the introduction of various user needs such as to search the cloud and associated databases. The development of a selection system used to search the cloud such as in the case of ELECTRE IS and Skyline; this research will develop a system that will be used to manage and determine the quality of service constraints of these new systems with regards to networked cloud computing. The method applied will mimic the various selection system in JAVA and evaluate the Quality of service for multiple cloud services. The FogTorch search tool will be used for quality service management of three cloud services.

Paper Title: **Application of Foam Stopping for Mitigation of Spontaneous Heating In Underground Coal Mines**

Abstract:The problem of spontaneous heating is a major threat to safety and productivity in mines all over the world. In India, more than 80% of fires are caused due to Spontaneous Combustion. The applicability of inert gases is expensive, time-consuming and is a very tedious process. Hence the application of advanced technologies becomes essential to be introduced in mines. In this context, Central Mine Planning and Design Institute (CMPDI), Ranchi, India carried out an R&D project entitled "Construction of quick setting stopping in case of fire in an underground mine using expansion foam agent" under the funding from the Ministry of Coal, Government of India.

Under this project, two Indian mines were selected in consultation with MCL for carrying out the proposed work in Orient Mine No.3 and Bundia Mine of MCL (Ib Valley AREA). Coals from both the mines have been collected and analysed in the laboratory. The proximate analysis and CPT/IPT results show that both the coals are moderately prone to spontaneous heating. Considering both intrinsic and extrinsic properties, two stoppings were constructed in the Hirakhand Bundia mines and four in orient mines. Periodic supervision along with the altering ingress of air from intake was been checked. After careful supervision of nearly 4 years, the stoppings proved to be strong enough to be leakage proof. This paper describes the application of foam technology as stopping to avoid air entry, thus preventing the occurrences of spontaneous heating/fire in a panel of Indian coal mines.

Paper Title: **Identification of Traffic Accident Hotspots using Geographical Information System (GIS)**

Abstract:Limiting the number andseverity of traffic accidents is one of the major goals of road traffic safety management.The alarming rate of road accidents globally emphasizes the importance of an effective traffic safety management system. Identification of accident hotspots is the first step towards implementation of efficient traffic safety management.Until the arrival of Geographical Information System (GIS),traffic accident analyses have been performed based ontraditional statistical methods alone. The advent of GIS-based techniques has led toimproved traffic accident analysis by employing spatial statistics,enabling engineers and researchers to account for variation in the spatial characteristics of hotspot locations in the analysis. This paper discusses the different spatial and statistical methods that are employedintraffic accident hotspots identification. An example application of Planar Kernel Density Estimation (PKDE)for hotspot identification is presented based on crash data for Des Moines city of Iowa state. The effect of varying bandwidths in creating density mapsis investigated and the optimum bandwidth to obtain distinct hotspots is identified as 500 m for the chosen study area.The paper also discusses the scope for future research in traffic accident hotspot analysis.

Paper Title: **RF Propagation Model for Wireless Sensor Network of MARs**

Abstract:NASA exploration mission on Mars includes the use of rovers and sensors communicating via wireless sensor networks. The network components have a limited range of transmission, low power consumption, low price and a small lifespan. A wireless network's performance is mainly dependent on the RF environment. A Wireless Sensor Network (WSN) on the Mars ground is planned to deploy wireless sensors capable of operating under harsh environmental conditions to detect few properties of regolith on the Martian surface. The main interest property is dielectric permittivity and permeability. Since communicating on the Mars is a difficult and challenging task, the behavior of communications surfaces can be predicted by a channel model. So, efforts have been put to Develop a channel propagation Model to know the behavior of communication channel on the atmosphere of Mars. In order to study the model for radio propagation on Mars, two sites were selected from Gale crater and Meridian Planum at different sites for the Mars with near-flat surfaces, a certain area with peaks and a region with few craters.

Paper Title: **Defending Against Sybil Attacks by Enhanced Event Based Reputation System in Vanet**

Abstract:In earlier times, vehicles were the realm of mechanical & automobile people, but with proliferation of computer technology & electronic components, vehicles are becoming "Computer on Wheels". These technology lies in VANET (Vehicular Ad-Hoc Network) environment.

VANET has various road safety applications, with the aim of communication interoperability between cars. In VANET, Sybil attack have been reckon as a major threat, by creating illusion or traffic congestion, it may lead mass destruction. Previously Event Based Reputation System (EBRS) named technique has been used to defend this Sybil attacks, but there was one major drawback that they were not considering RSU and TA modules security. For these both modules assumption has been made that it cannot be compromised thus it is trustable. But in this way VANET environment cannot be established thoroughly .In this paper we proposed enhance Event Based Reputation System to defend Sybil attacks in VANET environment, which is going to eliminate that major assumption by considering RSU and TAs security mechanisms.

Paper Title: **Correction of Load Cell Output using Particle Swarm Optimization**

Abstract: A load cell is a type of force transducers that transform force and mechanical stress into electrical signal. But the output becomes distorted due to the presence of transient response. Particle Swarm Optimization (PSO) based correction of load cell output is presented this paper. PSO is a robust stochastic optimization technique that considers a swarm of particle (data) as its search space and looks for the best solution. The current approach optimizes a load cell output based on the median value of the signal. The optimization algorithm tries to bring the output response near to the median value.

Paper Title: **Hardware Implementation of 15-Level Cascaded Multilevel Inverter using Pic16f877a**

Abstract:Multilevel inverters can manufacture a high- power, high- voltage inverter with a multilevel structure

4454-

to control the voltage of the device. A symmetrical multilevel cascaded standard inverter requires 'n' DC sources for' 2n+1' levels that require isolated DC sources for power conversions. The objective of this paper is to increase the number of levels by reducing the number of dc sources. The proposed scheme is to use a multilevel asymmetrical inverter with a separate DC power supply. The analysis is extended to the use of the single DC power source with the remaining ' n-1 ' DC source being a capacitor and simultaneously maintains the capacitor 's DC voltage level and selects a fundamental frequency switching pattern to produce an almost sinusoidal output. Matlab simulink simulation is performed to verify the performance of the Asymmetrical Multilevel Inverter using isolated Dc source. The results of simulation and hardware are presented and discussed in this paper.

Paper Title: **Dynamic Trust Management for Community Based Mobile Grid Application**

Abstract:Mobile Grid is the inter-networking of heterogeneous physical as well as virtualdevices. Each device transfer and share the information with each other. Trust management plays a significant role in network based applications for information collection, data mining, qualified services with context-awareness, upgraded client protection and data security. It assists individuals with beating impression of vulnerability, threat and participates in client acknowledgment to utilization on grid services and applications. In this paper a unique trust management protocol is proposed for network based mobile grid application to manage misbehaving nodes whose status or performance may change dynamically. Trust plays an important role for handling the security in the community based system. Trust management provides facilitate to identify malfunctions and also make legitimate collaboration and enhance the user privacy and information security.

Paper Title: **Detection and Prevention of Manet using Hybrid SVM with Ann**

Abstract:Mobile Ad hoc Networks (MANET) have been exceptionally vulnerable against attacks because of the dynamic and self-configurable nature of its system foundation. This kind of wireless network is appropriate for temporary communication linked due to its nature of less-foundation and there is no any control of centralized manner. Design a routing mechanism that are security aware with higher QoS parameter is very competetive and the major tasks involved in ad hoc types of network as per the limited power resources and their dynamic routing topology. This paper mainly focused on the design of a secure and trusts based on-demand routing mechanism using Ad-hoc on demand distance vector (AODV) protocol to compute trust-based produces path initialed from source up to destination that will fulfill minimum two end-to-end QoS parameters of network. So here, the generalized AODV routing protocol has been extended from traditional routing mechanism to analyze the performance of this model with combination of artificial intelligence concept. The proposed ad hoc based routing mechanism is used to found possible routes that are prevented through trust adjacent position of security validation protocols and enhanced link optimized route computes on the basis of Artificial Neural Network (ANN) as an artificial intelligence algorithm for well-organized communication in MANET. In addition, this research demonstrates the effectiveness of bio inspired Firefly Algorithm (FFA) as an optimization approach with the consideration of several performance QoS metrics of network. The results have been measured in terms of throughput and PDR with SVM and ANN approach. It has been observed that the throughput and PDR measured using ANN approach is better compared to SVM approach an average of 0.755 PDR value has been obtained using ANN approach.

Keyword: Mobile Ad hoc Networks, d-hoc on demand distance vector, Artificial Neural Network, Firefly Algorithm, SVM, and PDR.

Paper Title: **Enhanced Detection of Diabetic Retinopathy using Advanced Filters**

Abstract:Nowadays in India, diabetic patients are more increasing. The major issue with diabetic patients is Diabetic retinopathy which causes the loss of vision. For the ophthalmologist, it is very difficult to identify the diabetic retinopathy because of the low resolution of the eyes. For the specialists, it is easy to find the blood vessels in the retina to diagnose the many populations in a very short time. Various existing methods are used to find the abnormal retinal images of diabetic patients based on their image features. But the results are not that much accurate. In this paper, an enhanced image filter with local entropy thresholding for blood vessel extraction under different normal or abnormal conditions is proposed to improve the performance of the patient information.

Paper Title:	**DSTATCOM for Harmonic Mitigation in Distribution Lines using Two-Level Inverter**

Abstract:Distribution systems have been facing serious problems of harmonics load current mainly due to advancement in power electronic based and other non-linear loads. The DSTATCOM has been widely used to mitigate the load current harmonics problems in distribution system. The power quality improvement is one of the major problems when the distribution side load increases with non-linear loads like electric vehicles, laptops, PCs etc., There are some power quality mitigation technique available at the load side where the electronic chargers works with unity power factor (UPC) control. But many DC loads are connected without the UPC. So, it is a need for a device which corrects the real and reactive power at the distribution level. The DSTATCOM is connected to the Indian distribution system with 415V, 50Hz. In this paper the linear loads and nonlinear loads are coupled to the system and analysis with DSTATCOM and without DSTATCOM cases are presented.

Keyword:DSTATCOM, Distribution systems, Unity power factor control, non-linear loads.

Paper Title:	**Esa Based Upqc Controller to Improve Power Quality in Microgrid System**

Abstract:Generally, Power Quality is the main concern parameter in present power system scenario, the main causes for effecting the power quality is due to either harmonic distortion, voltage imbalances, reactive power variations. There are many techniques applied to maintain this power quality in literature. In Facts family, the UPQC controller plays a key role, because it uniquely controls all the transmission parameters. The UPQC controller is combination of series-shunt converters with common dc link. The signals required for these converters are generated by reference and actual signals of bus and dc link capacitor. Phase locked loop helps to provide the phase angle sequence required to improve power factor. In addition with, this paper is implemented

4479-4486

with extended search algorithm to better control the dc link voltage for improving power quality. Mat lab/Simulink is used to test the system conditions and performance.

Paper Title:	**Optimization of CFRP Micro Drilling Parameter using 2-Level Factorial Method Towards Thrust Force**

Abstract:Carbon Fiber Reinforced Polymer (CFRP) is extensively used in aircraft and automotive industries due to it exceptional material properties such as high strength to weight ratio and corrosion resistance. Nevertheless, micro drilling process of CFRP material poses various challenge as it has irregular material properties along the structure. High cutting force which lead to poor hole quality is one of the issues that always occur when drilling this material. Hence, the understanding on the relationship between process parameter and material behavior is vital to achieve optimum performance of machining process. The experiment was carried out using 2-level factorial design with variable spindle speed range of 8,000 – 12,000 rpm and feed rate range of 0.01-0.015 mm/rev. Micro drill bit with diameter of 0.9 mm was used and new fresh drill were used for every run to avoid tool wear effect. As a result, lower thrust force of 6.3742 N is obtained from the combination of spindle speed 10k rpm and feed rate 0.0125 N. Therefore, it can be concluded that, optimum parameter falls between the range of 8,000 – 12,000 rpm of spindle speed and 0.01-0.015 mm/rev of feed rate. Validation of the optimum parameter suggested from 2-level factorial which are 8,000 rpm and 0.01 mm/rev is executed. The final result obtained shows 4.5% of error from targeted value and this result is absolutely acceptable and portray the reliability of the experiment.

Paper Title:	**Machine Learning: A Software Process Reengineering in Software Development Organization**

Abstract:BPR (Business Process Re-engineering) is an organizational mechanism that improves the organizational ability in responding to the challenges of qualitative result by change management and improvement in software engineering processes, productivity, product quality and competitive advantage. BPR inherits, explores and implements the building of process change, to incorporate enhancements to the essential considerations and protocols of (SEM) Software Engineering Management. Machine Learning (ML) can be the

key aspect for BPR in software development organization. The goal of this research study is raising the conceptual vision about integration of automation technology like ML and its life cycle development within Software Development Life Cycle (SDLC) of the software product and highlights benefits and drawbacks ML techniques in SPM (Software Project Management), and how to implement ML in standard SEM practices. We have attempted the introduction of machine learning in SEM to determine specific performance and tasks reuse using empirical analysis and discussion on implementation of ML algorithms. The empirical study of software technologies includes control structure of an autonomous software application. In current era, ML imparts consistently promising accuracy in some SEM fields. The goal of this paper is an empirical and analytical study and literature review to propose desired level of quality software, through the comparative evaluation of existing processes and their respective support for Software Quality Engineering (SQE).

Paper Title: **Environmental Quality for EIA**

Abstract:Now a day, Environmental degradation is a global level issue and very serious threat to eco-system. Hence analyzing the environmental quality becomes mandatory to overcome the various types of environmental pollution. Hence, EIA becomes compulsory in almost more than 29 countries to execute any of the proposed activities like the construction of dam structures, mining works, construction and execution of industries etc. Analyzing the existing environmental condition of the proposed study area is very important as a part of EIA. The current study have been conducted for analyzing the air quality at a Industrial City in South India due to the Huge human settlements, the subsequent development of Urbanization through Deforestation, Colonization, Industrialization and Transportation, and in turn, to ascertain the increase in pollution level. The emissions through Area sources were identified and the environmental quality has been determined through a specific technology transfer – Environmental Evaluation System (EES) with the assigned parameter importance units.

Paper Title: **Implementation of Tumor Prediction System using Classification Algorithms**

Abstract:As the huge volume of healthcare data was being unused, recent researchers were focused on predicting the many diseases by analyzing the past patient records. In continuation with that, there are lot of researches focused on predicting the tumor on the human body. In this research, two widely used classification algorithms called Naïve Bayes and Random tree were considered for implementation and analysis with the UCI Machine learning Tumor data set. The data cleaning technique called "Replace Missing Values" in the WEKA tool has been considered for cleaning the data. The implementation has been done with the original dataset and the cleaned dataset. Finally, it is found that the Random tree algorithm is performed well with improved accuracy and reduced error rate. The accuracy obtained before data cleaning is 90.8333% and after data cleaning is 93.3333 %. Similarly, the error rates were reduced reasonably and they are 9.1667 % before data cleaning and 93.3333 % after data cleaning. In future, the data cleaning techniques has to be tuned well to improve the accuracy further.

Paper Title: **Closed Loop Control of Multilevel Dc-Dc Boost Converter**

Abstract:This paper presents a multilevel DC-DC boost converter (MBC). It is derived from a conventional boost converter just by adding (2N-1) number of capacitors and same number of diodes in order to obtain N levels of output voltage. Its key feature is to convert low input DC to a high output DC at various levels. This feature makes it a suitable candidate for renewable applications like photovoltaic (PV) system, fuel cell system etc. This paper presents a mathematical model of a N level boost converter. Effect of series resistance (ESR) in inductor is analyzed. A closed loop system for a three level MBC is developed and corresponding simulation results are presented.

Keyword: Multilevel DC-DC boost converter (MBC), PV system, fuel cell system, ESR.

	Paper Title:	**Early Model of Vision-Based Obstacle Mapping Utilizing Grid-Edge-Depth Map**	
	Abstract:This paper described a new method of obstacle mapping in an indoor environment utilizing a Grid-edge-depth map. The Grid-edge-depth map contained the information of distance and relative position of the object in the front of the robot. This mapping method utilized this information to mark off the visible obstacle/s in a particular virtual map. The 2D map created as a representative of the environment using a 300 by 500 pixels image. Every pixel represents a one by one cm of the environment and the obstacle's size. The obstacle's size was 30 by 30 pixels when it mapped by the system. It was a fixed size in the mapping process since the system cannot calculate the dimension of the detected obstacle. If the obstacle detected, the system checked its distance in GED-map. Then the system calculated the obstacle's position against the goal, and finally map it in the 2D map. In this case, the proposed method in building a 2D map of the obstacle in the indoor environment combined with the rules to decide the direction of the mobile robot. The rules used to avoid the collision to the obstacle. The evaluation of the method showed that the system could map the detected obstacles, the initial position, and the goal's relatif distance and position. The robot also reaches the goal position while avoiding the collision to the obstacle. **Keyword:**GED-map, Map building, Mobile robot, Stereovision, distance **References:** 1. B. Rahmani, A. 	Paper Title:	**Model Health, Safety and Work Environment Factors as Prediction of Work Motivation on Construction Projects**	
	Abstract: Construction project work is one of the high-risk jobs. Based on statistical data on construction accidents in the last ten years, it continues to increase, which has an impact on decreasing work productivity and at the same time a threat to the health, safety and environment of the workforce. Efforts to increase awareness of Health, Safety and the Work Environment (HSE)for workers are important to provide encouraging attitudes and safe actions in preventing the risk of accidents and diseases caused by work, thereby increasing worker productivity.Motivation is a form of encouragement from within the employee to behave and act. The	**4524-4528**

productivity of a construction project is closely related to the motivation of the workforce.The purpose of this study is to determine an effective model of health, safety and work environment (HSE) and to know the relationship between HSE factors as a prediction of work motivation to prevent the risk of work accidents.The research method used was a questionnaire survey distributed to 35 construction workers / contractors such as project managers, experts, project implementers, foremen and construction workers in buildings with more than five floors.Data were analyzed using Partial Least Squares. Work accidents affect HSE workers, which then makes work activities delayed, work costs increase, even the quality of work decreases. Therefore, efforts are needed to prevent work accidents through work motivation as psychological interventions in understanding HSE factors for increasing worker productivity on construction projects.The results of this study confirm that the worker's health factors are able to predict work motivation and work motivation in stages of work productivity, meaning that the better the health of workers will increase work motivation and the higher the work motivation, the higher work productivity. Work environment factors indirectly have a positive effect on work productivity, meaning that the better the work environment, the higher the work productivity through work motivation.

Keyword: Health, Safety and Work Environment, Work Motivation, Partial Least Squares, Productivity.

Paper Title: **Perusing on Cloud Computing and its Security Issues**

Abstract:This paper examines the figuring of cloud and imposing security over information in the available cloud data by investigating information over cloud and its viewpoints that are identified with every possible security. It provides subtleties of information to impose security policies and approaches that are utilized through the world to provide assurance of extreme information by reducing dangers. Accessibility of information in the

4529-4533

cloud is productive for a number of applications that exists and presents information over various applications that required security provisions by utilizing virtualization over distributed computing that may become hazard information when a visitor OS is implemented over a hypervisor without possessing the firm quality of visitor OS which may comprises of security provision in the cloud.

Keyword:the available cloud data by investigating information over cloud and its viewpoints that are identified with every possible security

Paper Title: **Reactive Extraction of levulinic acid using tri-n-Octylamine in 1-hexanol**

Abstract:Reactive extraction of levulinic acid using tri-n-octylamine (TOA) in 1-hexanol was investigated by physical and chemical extractions from aqueous solution at room temperature. Using the equilibrium data, the distribution coefficient (KD), extraction efficiency (E %), loading ratio (Z), stoichiometric loading factor (ZS) and modified separation factor (Sf) are evaluated. It was observed that chemical extraction provided a better yield than physical extraction. A maximum KD was obtained as 10.715 using 40% TOA (0.9059 mol/L) while 91.46 % of the levulinic acid was extracted. By increasing the initial concentration of levulinic acid resulted in a decrease of KD and E%. The KD and E% increased by increasing the TOA concentration from 10 to 40 % (0.2264 mol/L to 0.9059 mol/L).

	Paper Title:	**Experimental Analysis in Cloud Computing for Wireless Sensor Networks**	
	Abstract:Wireless sensor network (WSN) Is an obvious improvement for pretty some time. In most actual applications, the giant percentage of information collected the use of sensors are required to be taken care of and be made available for at some thing detail, anyplace get to. Despite the fact that, WSNs are produced from gain obliged devices which nonattendance of capacities to keep large piece of records and carry out resulting getting prepared of the information. WSNs can be advanced with the resource of cloud scenario which gives such agencies. In this way, a Sensor-Cloud shape is expected in this advice planning far flung sensor interface with cloud circumstance. The organized framework is appropriate for adaptable and unavoidable figuring packages attractive net of things (IoT) and intended for use in certifiable programs. Making worldwide places want proportionate social protection motion solutions for serve massive hundreds. This advice includes the problems related to restorative administrations movement that can be tended to using the consolidated framework. It can be used for appealing humans, systems, recuperation administrations courting to build up and transmit prosperity statistics as and at the same time as required if you want to enhance social protection organizations for the not unusual and concrete masses. Within the IoT engaged shape, barely any stressful conditions are perceived for assessment. This speculation weights on issues together with a ways flung sensors and gives unique responses for the ones worrying conditions. WSNs generally chip away at IEEE 802.15.4 elegant the use of selective suggests which incorporates shape and the board capriciousness even as joined with internet. This proposition clothes answer for prepare sensor thoughts-set with cloud situation which is predicated upon internet. Execution of 6LoWPAN based totally totally completely center factors allows ordinary correspondence over the frameworks collectively with internet.	**4540-4546**
	Keyword:WSNs can be advanced with the resource of cloud scenario which gives such agencies. In this way, a Sensor-Cloud shape is expected in this advice planning far flung sensor interface with cloud circumstance.

	Paper Title:	**Controlling Analysis of Breast Cancer Under the Application of Data Mining**	
787.	**Abstract**:In the present period, tremendous measure of information is being delivered by numerous sources, for example science, business, prescription, sports, geology, condition and so forth. This produced information is in unstructured, huge estimated and crude arrangement, subsequently very little helpful. Thus, the need emerges for certain systems with which, the valuable information can be separated. Information mining separates the helpful information from huge databases. It manages extraction of understood, already not known and conceivably helpful data from information. It additionally requires programs that recognize regularities and examples in the information. In past years, AI systems have been effectively utilized for a wide scope of genuine application situations. Breast malignant growth is probably the deadliest ailment, is the most well-known everything being equal and is the main source of disease passings in ladies around the world. The arrangement of Breast Cancer information can be helpful to foresee the result of certain illnesses or find the hereditary conduct of tumors. Beginning period treatment serves to curebreast malignant growth as well as help in avoiding its repeat. Information mining calculation can give incredible help with the forecast of beginning time breast malignant growth that consistently has been testing research issue. The proposed research will recognize the best calculation that is utilized to anticipate the repeat of the breast malignant growth and improve the exactness the algorithms.	**4547-4551**

Paper Title: **Work-Life Balance Analysis Score Model**

Abstract:Most of the companies are finding innovative ways to provide work-life balance to employees. Some of the measures creches for their children, flexible work timings, paternity leaves among others. Some of the companies are looking at technology to provide a better work-life balance. With the increasing need for a more integrated model of analyzing the work-life balance, in this manuscript, a contemporary model of machine learning-based work-life balance score analysis system is proposed, which indicates potential performance over the training and test pattern used for analysis. Though the scope for improving the accuracy of the system exists, still in terms of the pragmatic application of the model, it can be stated that the model is effective and has a scope of implementation over the real-time conditions.

Paper Title: **Adaptive Random Testing for Composite Webservices**

Abstract:Utilization of the Internet management in Service Oriented Architecture (SOA) is creating in the remaining lanes are no longer many years.The nature clean administration and procedures is essential to the success of SOA applications and try is both broad affirmation. Today tried the strategy in the SOA web administration will not last inspection technique computerized check results. In this exploration, Adaptive Random Testing for Object Oriented (Artoo) proposed in SOA to improve survival through mechanization we see the results of affirmation. Separation metric imaginable between items in the Adaptive Random Testing (ART) for mechanization try articles set programming. The proposed strategy is classified in the framework of state financial institutions to break up the flow of survival. The proposed approach was investigated as far as locating and deficiencies in handling time. shows the proposed method shows the adequacy deficiency findings and the reaction time is estimated as 3ms.

Keyword: Adaptive Random Testing for Object Oriented, distance metrics, Service Oriented Architecture, testing methods and test result verification.

Paper Title: **Design of Res Based Pv-Wind Generation System for Microgrid System**

Abstract:Power expansions of network to disconnected areas are related with specialized and affordable issues. To examine the power Renewable Power Sources (RES) are used. In this paper, the design of RES based PV based wind generator is proposed. Here voltage source converter is used in the autonomous small scale applications. The both battery energy storage system and the diesel generator will produce the operation as fast as possible compared to other blocks. The main advantage of this system is control the system without any interpretations. AC source is obtained because of the proposed Distributed Generation set acts as an AC source. By utilizing fluffy rationale controller in this framework, to decrease the deviations in the waveforms. A wide assortment of matlab/simulink reproduction results is introduced to exhibit every one of the highlights of the proposed framework.

Keyword:voltage source converter (VSC), battery energy storage system (BESS), diesel generator (DG), renewable energy sources (RES).

	Paper Title:	**A Most Efficient Health Care (HC) Based Algorithm for Prevention of Brain Disease Facets in Data Mining Applications**	

Abstract:Nowadays the use of data mining has been increasing rapidly in many areas like research applications, medical applications, healthcare applications, etc. The data mining applications really providing great applications for all areas due to its huge amount of data related to different types of data which was related to different types of areas in the storage servers, one of the problem with this mining applications is how to get the relevant data from the huge amount of data, many research and development applications are providing different types of solutions to retrieve the data from the mining. Once data was retrieved from the servers the users easily can solve their problems from their homes, for example, online doctor’s information systems. In the olden days when the information technology is not vastly distributed the patient doesn’t know the doctor's availability the success percentage of doctor treatment, how many doctors are available in their city, etc. This manuscript was proposing the algorithm for the healthcare system which is called query facets algorithm, which can fetches data from the server based on the query.

	Paper Title:	**Deep Image Based Iterative Rendering Scheme for Security**	

Abstract:In this paper proposing an implementation of image compression technique for the purpose of security. The proposed system is an algorithm which can provide security as well as compression operations simultaneously. This method is mainly applied on the binary images and gray scale images. The image compression gives a good scan path using least bits. It divides the images into corresponding bit planes. Here a key is obtained using encryption and this provides security for our system in effective way. Hence the proposed system produces effective results compared to other encryption techniques.

Keyword: Image compression, encryption, decryption, security.

Paper Title: **Research of Dumbbell Shaped DGS to Enhance The Bandwidth and Multiple Band Applications**

Abstract:A monopole microstrip rectangular patch with dumbbell shape slotted on ground for multiple band, enhance the bandwidth. The proposed antenna is fabricated on FR 4 epoxy material with electrical permittivity of 4.4 and magnetic permeability 1.The dimensions of proposed antenna are 70 x 50 x 1.6 mm3 and the dumbbell shape is slotted on ground of substrate which resonates at four different frequencies 5.9 GHz, 7 GHz, 8.7 GHz and 9.7 GHz. The proposed antenna has bandwidths of 200 MHz 300 MHz, 300 MHz, 300 MHz at four resonant frequencies The proposed antenna covers 4/8 GHz C band, 8/12 GHz X band and used in radar, satellite communications. The reflection coefficient (S11), radiation characteristics, peak gain and VSWR of designed antenna are described

Paper Title: **Strategic Research on Automated Network for HRM using Knowledge Management**

Abstract:In this paper the strategic research on automated network for human resource management using knowledge management. The main intent of HRM is to manage the people in the organizations. The proposed system gives effective and efficient outputs by ensuring the human talent based on the goals of organization. Here the main intent of KM is to compensate, trained and recruited by using human resources. RMA is used in the proposed system to improve the performance assessments in effective way. The HRM based KM provides the contribution between the people to share the knowledge. Hence the proposed system ensures the knowledge focus and reinforces the management goals in effective way.

Keyword: Human Resource Management (HRM), Knowledge Management (KM), RMA (Resource Management Agencies), Data Acquisition, Adaptation and Perfection.

Paper Title: **Next Gen Farmer: An Efficient Trust Based Recommender System for Agriculture**

Abstract:Collaborative Filtering (CF) technique is a major method among the proposal strategies. Regardless of its prosperity, despite everything it experiences a few shortcomings proportional to information meagre condition and operator cold-begin issues prompting poor suggestion precision and decreased inclusion. Trust-based suggestion ways of consolidating the additional information as of the user community conviction organize keen on co-operative separating and may be advanced in explaining such disputes. This paper will provide the best way to utilize trust with community separating to determine the disputes and develop the outcomes.

Paper Title: **Macro-Economic Determinants of Life Insurance Business – Empirical Evidence during 2000-01 to 2015-16**

Abstract:There is a strong link between an institutional framework of insurance sector and sustainable economic growth. Insurance business has a positive impact on economic development and vice versa. As a developed insurance market stimulates economic growth of a country, the level of its economic growth affects insurance business development in return. In India, regulatory changes commenced since mid-nineties for opening up of insurance markets to private and foreign insurers. After more than one and half decade execution of insurance sector reforms, Indian life insurance business have been witnessed the better growth. In this juncture, the present study focuses on an examination of the role of a macroeconomic environment in the development of life insurance industry in India by using time series data with regression analysis. The study finds that the savings to GDP ratio, banking sector development, expenditure on social security to GDP, gross enrolment ratio and life

4599-4606

expectancy are most significant and positive factors in driving the life insurance business during the study period..

Keyword: Indian life insurance business have been witnessed the better growth. In this juncture, the present study focuses on an examination of the role of a macroeconomic environment

Paper Title: **Research of Professional of the Classification and Segmentation of Computed Tomography Brain Images**

Abstract:Subsequent to the process of classification, the more prevalently used part in most of the applications of image processingand computer vision is the image segmentation. The entire study concerning the Computed Tomography(CT) holds image segmentation as a very essential or even an inevitable part in classifying the different kinds of tumor in the different levels. Once classification of the parts or portions in the images as tumorous and non-tumorous is over, what follows next is the process of segmentation of the tumor regions in the CT images and it is the proposed methodology that takes the entire care of these both, classification and segmentation as well. For the purpose of classifying, the Support Vector Machine (SVM) with various parts and advancement systems is placed into utilization. At the point when it adds up to arrangement and improvement, the SVM with SMO appreciates an unmistakable power over different approachs in the investigation of grouping process. Following the characterization procedure, the MRG with limit advancement satisfies the division procedure. Concerning the edge advancement, certain calculations like HS,EP, Gray WolfOptimization (GWO) and Lion Algorithm (LA) are brought into utilization. The outcomes are shown with the assistance of a wide arrangement of execution measures. The near examination as far as affectability, explicitness and precision is directed in the enhancement procedures mentioned earlier. The implementation of the proposed methodology takes place on the working platform of MATLAB.

Paper Title: **Research of Clustering Algorithms using Enhanced Feature Selection**

Abstract:In Present situation, a huge quantity of data is recorded in variety of forms like text, image, video, and audio and is estimated to enhance in future. The major tasks related to text are entity extraction, information extraction, entity relation modeling, document summarization are performed by using text mining. This paper main focus is on document clustering, a sub task of text mining and to measure the performance of different clustering techniques. In this paper we are using an enhanced features selection for clustering of text documents to prove that it produces better results compared to traditional feature selection.

Keyword:enhanced feature selection, text mining, clustering.

Paper Title: **A Direct Discrimination Packet Flow Based Improving Security against Reactive Traffic Attacks in Wireless Communication**

Abstract:The wireless networks is most difficult of selective filling attacks. If jammer localizations and resistance routing are left alone, both are very promising, and the service overhead is still below the real-time requirements. To propose a new Direct Discriminant Packet Flow Exploration [DDPFE] algorithm based on network utility maximization (NUM) to resolve the centralized reaction disturbance optimization problem in multi-source network without any lose to send the data. The impact of the networks is estimated through interference and combine these estimates with the ability to assign problems in this type of attacks. To overcome this type of physical-layer characterization of cryptographic primitives attacks using a Cooperative Crypto Riddle Hiding Algorithm (CCRHA) for the control channel jamming problem in-network, which takes advantage of the transfer the data using the Ad-hoc network. The resolution to detect the schema attacks and isolate the nodes for the threshold. CCRHA Presenting to find selectively invasive attackers in wireless networks. Multiple metrics are measured to detect areas of interference of the wireless network. Multi-measurement method considered Packet Delivery Ratio (PDR) and signals strength variation as parameters to detect the selective jamming attacks.

Keyword: Ad-hoc network, Cooperative Crypto Riddle Hiding Algorithm, Direct Discriminant Packet Flow Exploration, Network Utility Maximization, Reactive Jamming Attack.

Paper Title: **An Ontology Based Expert System for Lung Cancer : OBESLC**

Abstract:Lung Cancer is the second most recurrent cancer in both men and women and which is the leading cause of cancer death worldwide. The American cancer Society (ACS) in US estimates nearly 228,150 new cases of lung cancer and 142,670 deaths from lung cancer for the year 2019. This paper proposes to build an ontology based expert system to diagnose Lung Cancer Disease and to identify the stage of Lung Cancer. Ontology is defined as a specification of conceptualization and describes knowledge about any domain in the form of concepts and relationships among them. It is a framework for representing shareable and reusable knowledge across a domain. The advantage of using ontology for knowledge representation of a particular domain is they are machine readable. We designed a System named OBESLC (Ontology Based Expert System for Lung Cancer) for lung cancer diagnosis, in that to construct an ontology we make use of Ontology Web Language (OWL) and Resource Description Framework (RDF) .The design of this system depends on knowledge about patient's symptoms and the state of lung nodules to build knowledge base of Lung Cancer Disease. We verified our ontology OBESLC by querying it using SPARQL query language, a popular query language for extracting required information from Semantic web. We validate our ontology by developing reasoning rules using semantic Web Rule Language (SWRL).To provide the user interface, we implemented our approach in java using Jena API and Eclipse Editor.

Keyword: Semantic Web, Ontology, Lung Cancer, RDF, OWL, SWRL, SPARQL.

Paper Title: **Behavioral Analysis of Various Techniques of Model Order Reduction Used in the Reduction of Large Scale Control System**

Abstract:It is very important task to study the behavior of the processes occurring in the industry. To attain this task, the knowledge of the transfer function of the system should be there. When working in robust environment, these transfer functions becomes so tedious that it becomes very difficult to obtain these transfer functions and hence affects the study of the behavior of these system. Due to this, the requirement for reduction of these transfer function becomes a necessity to analyze the behavior of foresaid systems and it becomes easy to do the desired modifications in the system i.e addition of any feature, desired changes in the behavior etc., furthermore the thing to be kept in consideration while doing the reduction in transfer function that the behavior viz. peak overshoot, settling time, steady state error of the two systems (reduced and the original system) should be approximately same, so it is prime importance that the applied model order reduction technique should provide a more accurate approximation of original higher order system. The paper presents here the different categories of model order reduction techniques that can be applied to achieve the motto of model order reduction of higher order systems. The techniques presented are categorized into the four different categories to understand them and their merits and demerits and these will help in proper selection of the model order reduction technique to obtain the most accurate reduced order approximation of large scale system.

Keyword:model order reduction techniques, state space models, transfer function models, soft computing, mixed approaches

Paper Title: **Filtering and Detection of Intima-media Thickness (IMT) for the risk of Carotid Artery Atherosclerosis**

Abstract:Ultrasound images of carotid artery in brightness mode (B-mode) are used to detect the probabilities of atherosclerosis and cardiovascular diseases. They are used to measure the intima-media thickness (IMT). Ultrasound images suffer from peculiar phenomena which creates speckle (a type of noise) on the image. The speckles present in the medical images detoriates the quality of the image. This paper presents a work which is used to remove the speckles by utilizing the local characteristics of the image in the filter named as local statistics mean variance (lsmv) filter. It is a preprocessing step of medical image processing. Conventional IMT was done by locating the far walls of the carotid artery. This can be changed by applying segmentation algorithm which could automatically detect the far walls and could measure the IMT. This paper approaches towards automatic edge detection method using Prewitt operator. The objective behind automatically calculating IMT of carotid artery is to reduce the human effort and at the same time would benefit the patient by diagnosing the patient condition. The work that is proposed is analyzed by calculating various parameters in case of despeckling (filtering) as well as segmentation method. The performance parameters show that the proposed method performs better and at the same time reduces the manual effort.

Keyword:carotid artery, intima-media thickness, lsmv filter, medical image, segmentation

Paper Title: **Facial Gender Analysis using Gabor-DWT Feature Extraction Method**

Abstract:Facial Gender Analysis has application of specific gender entry detection, human machine interface for digital marketing, real time targeted advertisement and gender demographic analysis. The facial gender can be predicted by classification of the texture and unique edges pattern. Gabor filter can extract the edge- texture patterns on the face but has problem of high dimensionality with redundancy. For accuracy enhancement, the dimension and redundancy is needed to reduce by proposed technique as maxDWT feature optimization method. The proposed model is evaluated on real life challenging dataset of face as illumination variation, POSE, face profile, age variation and obstruction on face as hat, birthmark, moles, speckles, beard, etc. Results shows that proposed technique far better than existing state of art methods of gender prediction.

Keyword: Gabor filter, DWT, Gender prediction.

Paper Title: **Identifying and Grouping Abnormalities in Medical Images using Shortest Path Algorithms**

Abstract:The majority of the patient conclusion rotates around in distinguishing variations from the norm in their particular restorative pictures. These pictures are of different kinds, likely Ultrasound, CT Scan, MRI and infinitesimal pictures like bio-synthetic slides, smaller scale organic slides and neurotic slides. Barely any irregularities are cracks, awful cells in blood, tumors, contagious recognizable proof and so on. Finding the unusual segments, abnormalities in these pictures needs aptitude by the doctor; this adept recognizable proof advances and ensures sound drug by the doctor or specialist to persistent. In medicinal infinitesimal pictures ordinary bits and strange segments are combined. None of the irregular segments are identified with strange and typical parts of picture for example deviations are dissipated among ordinary bits of picture. These deviations are absent in certain bits for explicit region in the pictures. None of these deviations are covered nor can be gathered into a solitary segment physically in the picture. Deviations can be segregated alongside typical segments of pictures. Recognizing such deviations incompletely goes under bunching. This venture recognizes deviations in Medical Microscopic pictures. These deviations can be distinguished outwardly which uncovers about the nearness of deviation however to know the level of deviation in an example picture is basic. So as to accomplish this all deviations must be associated. This task interfaces all deviations utilizing Shortest Path calculation and bunches utilizing Hierarchical Clustering calculations.

Keyword: Abnormalities, Medical Images, Shortest Path.

Paper Title: **Electrode System Analysis for Bioimpedance Cardiac Diagnosis**

Abstract:Electrodes and their placement play a vital role in medical diagnosis. Electrical signal in human body such as ECG, EEG and EMG etc., are the critical diagnosis parameter. Measurements of such signals are obtained by proper selection of electrode and their placement on human body surface. Electrical bioimpedance diagnoses used to detect various disorders are critically depends on type of the electrodes used and their position. In impedance measurements two electrodes are used to send electrical signal and minimum two electrodes to pick the electrical signal response on tissues in terms of voltage across two terminals. In this paper different electrode systems used for bioimpedance cardiac monitoring are analyzed based on the type of electrodes used, location of electrodes in human body and positioning of electrodes in specific location.

Keyword: Bio-impedance cardiograph, electrode system, Ag-AgCl electrode, Signal generator and Low frequency.

Paper Title: **BLDC Motor Speed Control using Fuzzy Logic PID Controller and Comparing It With PI Controller**

Abstract:In this project, mathematical model of the Brushless DC motor (BLDC) is developed and the closed-loop Fuzzy PID controller has been simulated in MATLAB-Simulink environment. The three-phase (BLDC) is developed and the DC power is supplied to this machine though six step inverter whose switching state is controlled by the hall signal. The hall effect sensor senses the rotor posit ion of the motor and it generates binary digit number which is decoded and given to the six-step inverter. The mathematical model is developed using the back emf equations and torque equation of the BLDC motor. The PI controller doesn't operate properly during dynamic state and hence the fuzzy-PID-controller is better option to control and regulate the speed of the BLDC motor which has high performance in comparison to the PI controller. And, we can get the smooth speed-torque characteristics using Fuzzy PID controller.

Keyword:PID controller, fuzzy logic, BLDC motor, Hall effect sensor, Electromagnetic torque.

	Paper Title:	**A Fully Automated Solar Tracking System**	
	Abstract:This is dual axis tracking system, the path of the sun is been tracked by the system is been determined in this procedure. The optimization goal is to increase the amount of generation energy with the help photovoltaic system considering the tracking system consumption. Determination of the tilt angle and azimuth angle trajectories is described as a nonlinear and bounded optimization problem, in future there will be drastic amount of shortage of non-renewable energy resources, we have to replace these resources ,For collection of solar energy we need to improve of efficiency we used sensors (LDR) for tracking of suns path to make sure that the panel should be placed in MPPT-(maximum power point tracking) to observe more efficiency to make sure that the panel should be placed in MPPT point. **Keyword:**High altitude wind control (HAWC), Power electronic converter (PEC), and cost of power (COE). **References:** 1. 	Paper Title:	**The Role of Woodball Sports Organization Universitas Negeri Semarang (Unnes) in Producing Talented Athletes**	
	Abstract:Survey method through evaluative descriptive approach is used in this study, which aims to determine the existence of woodball athletes coaching at student activity units (UKM) UNNES so that it can be used as reference for other regions to build up and produce potential athletes for the region, and further for Indonesia. The results of this study indicate that coaching woodball athletes at UKM UNNES going very well, because it is supported by the research results of students and lecturers in the field of woodball sports, supported by the human resources, and facilities and complete woodball sports equipment. The constraints faced include: (1) program/training schedules often conflict with the lecture schedule of students; (2) lack of coaching funds to follow the event and funds to organize events; (3) athletes/students sometimes took too long dispensation (permit college) while following the championship (so that athletes got mind burden for not following the lecture); (4) lack of attention and participation of universities in Semarang, Central Java, particularly those with sports studies program to jointly develop the woodball sport; and (5) starting early 2018 woodball permanent field area cannot be used in full (athletes began to fret about finding a place to practice).	**4928-4932**

Paper Title: **Numerical Analysis of Intake Valve of CI Engine**

Abstract:Internal combustion engines are considered as complex system. The important aspect of any engine is power output which, largely depends upon the proper combustion of air fuel mixture. The aim of this research work is to outline the improve performance of Four stroke Compression Ignition engine by modifications in Inlet manifold geometryThe study is performed on Kirlosakr CI engine. At beginning design of existing inlet valve was studied and CAD drawing is prepared in CATIA V5 Software. Based on existing design and work done by various researchers new modified inlet valve with addition of small plate, is designed in CATIA V5 Software. The numerical investigation is performed using Ansys CFX solver in 14.5 In numerical simulations Engine with two ports is considered to be designed to study the movement of air flow

Paper Title: **Effect of Austenization Temperature on the Microstructure in Cr-Mn-Si Steel**

Abstract:This work is a part of research on the microstructure and mechanical properties of Cr-Mn-Si steels after various thermal treatments. In order to increase the resistance of the materials against failure it is necessary to possess simultaneously high strength and plasticity at the same time. Normally, in conventional metals, this is impossible. The purpose of the present study is to trace the polymorphic transformation of the microstructure and the redistribution of the trace elements in the corresponding microstructural transformations of the steel at each stage of applied heat treatment - austenization, quenching, austempering, tempering. The chosen sequence of applied heat treatments is to obtain a bainite structure of up to 50% in order to achieve high strength and toughness of the material.

Paper Title: **Enhanced Thermal Conductivity and Superior Antimicrobial Activity by Cu/Ni Nanofiber Dispersed Fluids with Prolonged Stability**

Abstract:The present study reports the synthesis, characterization and antibacterial properties of Cu/Ni nanofluids. The influence of various synthesis parameters on the stability of nano suspensions were studied and optimized. The samples were characterized using UV-Visible spectroscopy and TEM imaging techniques. The TEM images revealed the formation of nanofibers. The optimized composition of the Cu/Ni nanofluid was found to be stable for more than four months with zeta potential value of 40.4mV. The thermal conductivity studies showed 19% enhancement in comparison to the base fluid (water). The antibacterial properties of the nanosuspensions were studied by performing minimum inhibitory concentration tests (MIC) and zone of inhibition analysis.

Keyword: Bimetallic Nanofluids, Cu/Ni nanofibers, Thermal conductivity, Antimicrobial activity.

Paper Title: **Implementation of AES for Encryption in Vertex- 3 of FPGA Environment for Security**

Abstract:Data transmission with protection is main concept which is getting demand now a days for which number of encryption of data techniques are developed and now in this paper Advanced Encryption Standard (AES) Algorithm is used and is implemented on FPGA kit using vertex-3 family. We use 128 bits consists of input, key data, output data for this design. It is called an iterative looping with replacement box, key, loop in

4954-4958

this design for both encryption and decryption of data. We use Xilinx software platform for simulation of our design that is AES by which area utilization and throughput is increased for achieving low power consumption, high data security, reduced latency and easy architectural design. This data operation is applicable in many areas.

Keyword:AES, encryption, decryption, Latency, FPGA, Throughput.

Paper Title: **Adaptive Technique for Salt and Pepper Noise Removal through Functional Link Artificial Neural Network**

Abstract:In this paper, an adaptive method for removing salt and pepper noise from images is proposed. A second order difference operator is used to locate the corrupted pixels in images by comparing with a threshold, which is selected adaptively using the image properties. A functional link artificial neural network (FLANN) based method is proposed to set a threshold for each corrupted image for identification of noisy pixels using recursive zero attracting least mean square (RZALMS) as the updating algorithm. Median filter is used to eliminate noise from the detected pixel locations.

Keyword: Adaptive threshold, Median Filter, Reweighted zero Attracting LMS, Salt and Pepper noise.

Paper Title: **DE Optimized LFC of Three Area Interconnected Power System with DFIG Wind System under Deregulated Environment**

Abstract:Load frequency control (LFC) of an interconnected three-area power system with HVDC link under deregulated environment in presence of wind system is investigated. Integration of renewable sources in to exiting plants will affect the system frequency and hence design of a suitable controller is needed to maintain frequency within limits. Study of impact of wind penetration in to deregulated environment is a key factor. The secondary PID controller improves the overall system performance during sudden load disturbances and random variations of wind input. The optimal values of PID controllers in all three areas and pitch control in wind system are tuned by using Differential Evaluation (DE) algorithm.

Paper Title: **Hand-Held Object with Action Recognition Based On Convolutional Neural Network in Spatio Temporal Domain**

Abstract:Several applications such as object recognition and face recognition are established with the progress of smart devices and computer technology, to assist human-computer interaction (HCI). In HCI, Hand-held object recognition hasamain role. This approach helps the computer to realise the user's intentions and also meetsthe user requirements. Hand as an organ which is considered as a direct and natural way of communication for humans. The Hand-held Object Recognition (HHOR) assigns a label for the object which is heldin hand this could help machines in understanding the environment and the intention of the people. However, it has not been well studied in the community.So, in this paper, we proposed system for recognizing such activities happening between hands and faces in real time. The interaction events (e.g. eating, phoning and smoking) between hands and faces are analysed using the event analysis approach. Ratio histogram is used for obtaining the essential colour bins for detecting the desired objects via re-projection method. For object tracking and feature extraction, a code book method is used. To recognize various human-object interaction events, the dynamic and multiplicity contexts of event are modelled together. Finally, atwo stage cascaded CNN classifiers for the recognition is implemented as this technology improves the performance of object recognition.To make fair comparisons, six methods were compared in this paper based on the HMDB dataset. This system is effective and can be performed in real time because an exhaustive search process to find possible interaction pairs in the huge space of all possible event parameters is not involved. Experimental results have proved the superiority of our proposed system to analyse different human behaviours and events between hands and a face.

Paper Title: **Mockup Strategy and Analysis of Data Accretion in NS2 for Wireless Sensor Networks**

Abstract:Wireless Sensor Networks (WSNs) stay built after partial towards plentiful figures of dispersed interrelated sensor nodes. Standing and running a detailed and systematic test bed for enormous networks turn out to be affluent and time consuming. Predominantly in networking domain, it is classy to set up complete network deprived of simulation process since positioning with certain products may possibly be overpriced and more time consuming. In such Network Simulators save much of time and money. Recreation is used for data networking and it in that way aids investigators in resolving interrogations on time and likewise in insignificant cost. Energy effectiveness is a significant metric in source controlled Wireless Sensor Network (WSN). Data accretion is attained through repeatedly smearing the recommended structure at gathering domes. Multi-Interface Multi-Channel Routing Protocol is instigated here which makes use of metric demarcated by end to end delay, data and vitality ingestion. Further, the projected firmness and accretion are completed to additionally advance energy reserves and network epoch.

Paper Title:	**Constructability Risk Assessment in Construction Projects**

868.

Abstract:Construction projects are started in a very critical and dynamic environment which results in more number of uncertainties and risks, which have the demand of time constraints. Now a days construction industries are changing their scenario by day to day basis based on their needs and uncertainties that prevails all over the world. By taking into consideration of all the uncertainties or risks, the important role played by few risks aspects which includes Constructability risks, financial risks, technical risks and administrative risks etc. In the above risks, the constructability risk plays major role which affect the entire process and progress of the work. From the past literatures it is to be observed that Technology risk, design risk, construction risk, procurement risk , management risk are considered to be more important. To overcome the above hurdles certain risk identification approach i.e. Formal approach, informal approach, and static approach. A special team can also be appointed by the clients to identify, analysis and to take preventive measure of the before the start of the work itself.

Keyword: Risk Identification, Construction risk management, Constructability risk, Descriptive Statistics.

Paper Title:	**Big Data Tools and Techniques: A Roadmap for Predictive Analytics**	

Abstract:Nowadays, large volume of data is generated in the form of text, voice, video, images and sound. It is very challenging job to handle and to get process these different types of data. It is very laborious process to analysis big data by using the traditional data processing applications. Due to huge scattered file systems, a big data analysis is a difficult task. So, to analyses the big data, a number of tools and techniques are required. Some of the techniques of data mining are used to analyze the big data such as clustering, prediction, and classification and decision tree etc. Apache Hadoop, Apache spark, Apache Storm, MongoDB, NOSQL, HPCC are the tools used to handle big data. This paper presents a review and comparative study of these tools and techniques which are basically used for Big Data analytics. A brief summary of tools and techniques is represented here.

	Paper Title:	**Fusion of Image Feature Descriptors for Person Re-identification**

Abstract:Person re-identification has gained a lot of research interest in recent years. Extracting and matching features play an important role in this scenario. Past studies of image feature detectors and descriptors are more generic in nature. Different types of detectors and descriptors are used for person re-identification over the last few years. Most of these descriptors are a combination of two or more variants of descriptors. This research paper will focus on the comparative analysis and evaluation of various features detectors and descriptors used for image matching with relevance to person re-identification. We also explore how the combination of local and global descriptors can improve the re-identification rate. VIPeR dataset is used for the evaluation of descriptors.

	Paper Title:	**Environmental Framework for Soil Sampling Using Iot**

Abstract:The population of India has reached over 1.2 billion, and the population level is growing. Therefore, after 25–30 years we can expect a difficult issue for food supplies, it is important to advance agribusiness. The main goal of this exploration is to test the measurement in the soil of the three noteworthy macronutrients (nitrogen (N), phosphorus (P), and potassium (K)) according to the farmer's. The soil sample sums N, P, and K are managed by comparing the solution with a shading map. This will represent N, P, and K as strong, moderate, and weak in self-restraint. The traditional procedures for agricultural land require human involvement. Nevertheless, human mediation can be restricted with this approach.

Paper Title: **Concrete Filled Steel Tube Column And Wide Beam Connection: Proposed Structures and Experiment**

Abstract:Structural solutions utilizing concrete filled steel tube (CFST) column and reinforced concrete (RC) wide beams are used effectively in high-rise buildings, especially for large span. Currently, there have not been many theoretical and experimental researches on CFST column - RC wide beam connection to ensure the effectiveness of this structure type. Moreover, there have not been any experimental researches on the connection of CFST column – Prestressed concrete (PC) wide beam, as well as on assessing the effect of prestressed cables and shear head shape on the shear strength of the connection. This paper proposes connection structures; conducts experimental program, analyzes and compares different types of connections between CFST column and RC, PC wide beam using large size specimens to evaluate the actual behavior of proposed connections. Experimental results give a better view of the effect of shear-head shape as well as the prestressed force on the shear strength of the wide beam at the connections.

Paper Title: **Drivable Road Corridor Detection using Flood Fill Road Detection Algorithm**

Abstract:Current image processing techniques for drivable road detection make use of lane markings. However, most roads lack lane markings which make such techniques obsolete. For such conditions, an image processing technique is required which identifies the boundaries of the road based on the color differences between the road and the surroundings. This paper proposes a flood fill road detection approach in which we first analyze a sample of the road and compute its RGB pixel distribution. The pixel range is used to detect the other road pixels in the image. Edge detection algorithms are then applied on the detected road to give road edge. It classifies the road on the basis of the visible differences between the road and its neighborhood. It allows for subtle color differences on the road surface, and unlike a color mask, due to the inherent growing nature of a flood fill algorithm, it does not detect neighborhood elements beyond the boundary having features similar to the road. This technique also manages to detect any obstructions on the road as opposed to other edge detection algorithms. We also propose methods to enable quick computation of otherwise expensive flood-fill algorithm. The method was tested on both marked and unmarked lanes and produced satisfying results for both images and videos.

Keyword:road detection, image processing, flood-fill algorithm

Paper Title: **Diabetes Diagnostic Model Based on Truth-value Restrictions Method Using Inference of Intuitionistic Conditional and Qualified Fuzzy Propositions**

Abstract:Diabetes is a challenging problem nowadays. Not only in India, but it also spreads over worldwide, In the present research paper a novel scheme based on intuitionistic fuzzy propositions to explore the knowledge base rule system with uncertainty has been developed and for the extension of fuzzy propositions to the domain of factors causing diabetes. In this paper, we have constructed the conditional and qualified intuitionistic fuzzy proposition mathematically for the diabetes diagnostic model. We have also developed an algorithm for Truth-value restriction method using the conditional and qualified intuitionistic fuzzy proposition;with the help of developed algorithm for truth-value restriction method we will give a scheme to check this severity of the diabetes. Numerical computations have also been carried out to demonstrate our approach.

Keyword: Diabetes, Intuitionistic fuzzy set, Intuitionistic fuzzy relation, Intuitionistic fuzzy propositions, PIDD, Truth-value restrictions method.

Paper Title: **Sliding Mode Control of dc-dc Buck Converter using Typhoon Hardware in Loop Software**

Abstract:In this paper, a small standalone solar powered DC microgrid is designed and analysed. The control technique used here is sliding mode control. The common control technique of controlling dc-dc converter is

5022-

	proportional Integral (PI) controller, which is not able to execute well under variations of load. DC-DC converter is nonlinear and time variant system therefore sliding mode controller can be used for dc-dc converter. DC microgrid model is designed and analysed by simulation using Typhoon HIL to observe the system's dynamic response in view of load impact and battery charging. The buck converter is designed with PWM (pulse width modulation) based sliding mode controller. The tool chain have processor with ultra low latency and unprecedented execution rate for the converter. Dynamic equations associated with the control logic is derived for buck converter. The control technique is tested for step load changes. Sliding mode controller performance is compared with proportional integral (PI) controller. Fast and robust dynamic response of output voltage is obtained. **Keyword:**Buck converter, sliding mode control (SMC), PWM (pulse width modulation), HIL (hardware in loop), DC microgrid. **References:** 1. 	Paper Title:	**An Implementation of New Qr Based Encryption Algorithm For Secure Medical Data In Cloud Storage**
	Abstract:Healthcare Information technology encryption is more and more popular alternative in terms of retaining sensational records inclusive of patient PHI. With more carriers implementing IOT, EHR-Connectivity and usage of linked gadgets, the problem over whether encryption is important is important is an extra widely wide-spread. Encryption of health data is while companies change information into encoded textual content, which makes the facts unreadable unless a person has a key or code to decrypt it. This could be a terrific choice for covered entities or commercial enterprise buddies that regularly manage electronic PHI (ePHI) and want to make sure unauthorized customer can't admit to get the information. In this paper discussed about the new QR based encryption Algorithm for secure medical data which is stored inside of the cloud. **Keyword:**QR, Encryption, Medical data, **References:** 1. A. E. Paper Title: **An effective smart agriculture system using Internet of Things**

Abstract:Agriculture is the most important sector of economy, contributing major employment in the country and helping to develop the industry development with 16 percent of the national GDP growth and improving the life of people. Agriculture provides food, fiber, fuel, furniture, raw materials, a free fare and fresh environment, and plenteous nourishment for driving out starvation. But in the present scenario, the manual practices being followed by the farmers in our country are posing a huge threat to the sustenance of this sector. There is a need to incorporate automated system for various agricultural activities like irrigation, soil monitoring, harvesting and weather monitoring. Herein, we have created a Smart IoT based agriculture field monitoring and automatic field controlling agricultural storage system. The objective of any IOT system is to develop a smart automation system (smart home, smart IoT agriculture, smart monitor health, smart easy transport, etc.) using IoT technologies such as wireless sensors, embedded control devices and wireless communication protocols. We hereby present an IoT system interconnected with wireless devices which can sense the field and send the data to assigned system and finally the results can be noted with proper arrangements. Wireless sensors are used to sense the field and monitor the field with various aspects controlled manually and could be automated based on the requirement. In this paper we shall see that this IoT system shall not directly connect every device with the Internet but will connect through VPS integrated IoT Gateway. We propose a system that shall monitor and control the moisture level in the field soil and this real time data will be transmitted to the client to provide security for the farmland and avoid animal threats. The proposed smart IoT system will also monitor the growth of the trees.

Paper Title: **Functions in Column-Based Intelligent Systems**

Abstract:The possibility of implementing functions in column-based intelligent systems have been considered in the article. The basic concepts and definitions have been provided. The representation of functions in such systems have been proposed and the problem of implementing functions has been formulated. The solution to the problem of the implementation of functions using the element-by-element comparison method and the intersection method has been provided, as well as an assessment of the complexity of the solution.

Paper Title: **Information on Tachinid Fauna (Diptera, Tachinidae) Of the Phasiinae Subfamily in the Far East of Russia**

Abstract:For the first time, a comparative analysis of the tachinid fauna of the Phasiinae subfamily of the Russian Far East with the fauna of neighboring regions has been presented. The Phasiinae fauna of the Primorsky Krai (Far East of Russia) is characterized as peculiar but closest to the fauna of the southern part of Khabarovsk Krai, Amur Oblast and Eastern Siberia. The following groups of regions have been identified: Southern, Western and Eastern Siberia; Amur Oblast and Primorsky Krai, which share many common Holarctic and Transpalaearctic species.Special mention should be made of the fauna of the Khabarovsk Krai, Sakhalin Oblast, which are characterized by poor species composition and Japan (having a subtropical appearance).

Paper Title: **Phenolic Compounds and Antioxidant Potential of Wild-Growing Plant Materials of the North Caucasus Region**

Abstract:The article presents the results of studying the qualitative composition and quantitative content of some groups of phenolic compounds in 11 types of medicinal plants growing in the foothills of the North Caucasus, and provides the estimates of the antioxidant activity of extracts from these plants. The qualitative and quantitative content of phenolic compounds was determined using a Kapel-105M capillary electrophoresis system, and the total antioxidant activity of the extracts was measured on a Tsvet Yauza-01-AA device with an amperometric detector.

In the studied plant samples, the total content of tannins was determined, eight phenolcarbonic acids were identified and quantified, as well as quercetin and rutin — two of the most important flavonols.

The highest total content of phenolcarbonic acids (11,776.2 mg/kg), as well as the highest antioxidant activity were noted in the aqueous extract obtained from Echinacea purpurea (lat. Echinacea angustifolia).

The direct relationship between the antioxidant activity of the studied medicinal raw material and the content of phenolic compounds has been experimentally established as follows: the higher is the concentration of phenolic substances, the higher is the antioxidant activity.

5062-5071

The results of this study provide new information on the composition and content of phenolic compounds in some types of wild-growing plant raw materials of the North Caucasus and the antioxidant activity of extracts based thereon that will facilitate the use of the studied plants as a potential source of natural antioxidants in the production of functional materials.

Keyword:medicinal raw material, phenolcarbonic acids, rutin, quercetin, tannins, extract, antioxidant activity.

Paper Title: **Enhancement of Face Recognition using Deep Learning**

Abstract:Our aim in this paper is to increase the accuracy of existing facial recognition system on a comparative smaller dataset as per the requirements of present day. Namely in sensitive regions. The methodology that has been adopted is by combining more than one algorithms. The feature detection capability of harr cascade along with Ada boost to fetch to Bilinear CNN so that on a comparative smaller dataset can produce comparative result as on bigger dataset.

Keyword: Deep Learning, CNN, Bilinear CNN, RNN, PCA.

Paper Title: **A Method for Text Data Fragmentation to Provide Security in Cloud Computing**

Abstract:Security is one of the most crucial aspects in cloud computing, in order to provide security in cloud computing there are many cryptographic and non-cryptographic techniques [2][3] are used. Most of the non cryptographic approaches suffer from security breaches and the main drawback of cryptographic algorithms is computation time incurred in encryption and decryption of data. A methodology is proposed to implement unique approach to provide a security in cloud computing. Where text file will be fragmented based on random number generation.From the random number generation algorithm lower range and higher range values will be calculated so that the new random number which needs to compute should be within the lower and higher range of random number.Fragments can be obtained based on the new random number. With reference to the random number, block size or fragment size will be calculated. Hence text file will be divided into fragments.

Keyword: Cryptography, Fragments, Random Number

Paper Title: **The Role of Aquatic Training Program Among Special Need Children on Vestibular Processing of Sensory Stimulation**

Abstract:This study is pursued to find the role of Aquatic Training Program for children with special needs. Sensory profile questionnaire was used to assess the before and after performance of each students of each

5080-

groups for Vestibular Processing, of 25Children average of age nine years, randomly selected from Asha AWWA school at Delhi, India. Participants were divided into two groups Experimental (13) and Control groups (12). Result of Two Way ANOVA reflects positive accelerated change only in experimental group, showing moderate to considerable benefits with 27 session aquatic training program. In addition, individualized improvement was also studied, which resulted into minor to major enhancement of vestibular processing among all the experimental group participants. Hence a prolonged Structured Aquatic Training Program (intervention) is off paramount to get the best results. These findings also enhance the preceding research work based on aquatic intervention as vestibular senses develop first and controls other senses since the baby is in womb, so it is important to develop this sense so other sense can process better to acquire a better life.

Keyword:special need, aquatic training program, vestibular processing, standard of living, quality of life.

Paper Title: **Design of Approximate Polar Maximum-Likelihood Decoder**

Abstract:Polar codes, presented by Arikan, accomplish the ability to acquire nearly error-less communication for any given noisy channel of symmetry with "low encoding and decoding complexities" on a huge set of fundamental channels. As of late, polar code turned into the best ideal error-correcting code from the perspective of information theory because of its quality of channel achieving capacity. Though the successive cancellation decoder with approximate computing is efficient, the proposed ML-based decoder is more efficient than the former. As it is equipped with the Modified Processing Element which shows the better performance with the properties of Median Filter. The proposed ML-based decoder diminishes the area and power consumed and logic utilization. In the present paper, effective polar decoder architecture is structured and executed on FPGA utilizing Vertex 5. Here we examine the proposed unique construction that is appropriate for decoding lengthy polar codes with less equipment multifaceted nature.

Paper Title: **Water Quality Assessment in a Watershed in Cusco, Peru using the Grey Clustering Method**

Abstract:Water quality assessment is a current issue of increasing concern in many countries around the world for reasons such as population health, national economic development and the environmental quality of ecosystems. At this juncture, the Grey Clustering method is used to assess water quality at discharge points, from the beginning to the end of the environmental monitoring process in the area of influence of the Anabi mining unit in the Chonta and Milos micro-watershed. The parameters evaluated were pH, dissolved oxygen, total suspended solids (TSS), iron and manganese. The results obtained through the Grey Clustering methodology showed a monitoring point with contamination from a treated water discharge. On the other hand, in order to obtain greater efficiency in the evaluation of water quality, national standard DS 004-2017-Minam (Water Quality Standards) and international standards were used through the PRATI index. Through the results obtained it was observed that (by means of the Prati index) there is a better classification of the water quality in each point, therefore this research becomes an important tool for future studies to consider the Prati index for greater reliability of results.

Paper Title: **Recent Advancement in Mobile Payment Security Systems**

Abstract:The recent advancements in Information Technology have brought considerable changes in the way tasks are accomplished across the globe. The world has become a more connected place and a major impact as well as reason of this can be attributed to the steep rise in the usage of mobile devices. Mobile devices are being used for online payments in the form of shopping, money transfers, bill payments and what not. The majority of monetary transactions on the Internet now take place through mobile devices and therefore, mobile payment systems being wireless systems calls for an even more secure protocols and payment environment. Although the various security protocols available today boast of implementing the security requirements i.e. data confidentiality, integrity, non-repudiation, authentication and authorization, still the security of m-commerce transactions remain a major concern for mobile payment users. A number of m-commerce security techniques, models and protocols have been proposed by authors in recent past. This paper presents the recent advancements of the models and techniques authors proposed and the technologies and protocols used in these models. The paper also highlights the open areas of research in the field.

Paper Title: **Small-Scale Power Generation by Horizontal Axis Magnus Wind Turbine**

Abstract:The present work describes a method of small-scale generation of electric power using a horizontal axis Magnus Wind Turbine (MWT). Present levels of environmental pollution from fossil fuels and the high cost of generating electricity can be solved by using Green energy extracting wind turbines. Many researchers are trying to use renewable sources of energy to solve this problem. The present work investigates the generation of electricity by using Horizontal axis Magnus wind turbine. It is observed with a small investment and proper selection of the location of the site for deployment, the wind power is a better economical solution than other methods.

Paper Title: **Combating PUE Attack in Cognitive Radio Networks using RSSI Based EKF and UKF**

Abstract:The problem of spectrum scarcity in wireless communication can be reduced by Cognitive Radio (CR) technology in which the spectrum holes or unused spectrum can be allocated to the secondary or unlicensed users. But the major problem in CR is providing security. Various security issues are present at different layer. One of the major wide spread security issue in the cognitive radio is the Primary user emulsion attack in which the malicious secondary user emulated as primary user to get spectrum resources for a long time. One of way to avoided PUEA is, by obtaining the location of malicious user. The conventional location detection techniques such as time of arrival, time difference of arrival and direction of arrival, will give better performance when the user is stationary. Even though Received Signal Strength Indicator along RF fingerprint technique gives the better location of mobile user but it requires the more hardware. Hence the cost is high.

In this paper, the author proposed an algorithm to locate the attacker using EKF and UKF with RSSI. In this algorithm, the initial position of user can be obtained by Received Signal Strength Indicator. This initial position integrated to EKF and UKF to track the location of primary user, which is a mobile user so that PUE Attack can be identified and avoided. The author also compares the performance of Extended Kalman Filter with Unscented Kalman Filter by Matlab software.

Keyword: Cognitive Radio, Extended Kalman Filter, Primary User Emulsion Attack, Received Signal Strength Indicator, Unscented Kalman Filter .

Paper Title: **Implementation of Leakage Power Reduction Techniques in Field Programmable Device**

Abstract:This paper provide a summary of low-power technique for field-programmable gate arrays (FPDs). It cover system level propose technique as well as device level propose methods that have besieged present trade devices. In addition to describe present investigate happening circuit level as well as architecture-level create technique. Current studies on power model as well as on low-power computer-aided design (CAD) are also information. At last, it proposes that would allow the use of Field Programmable Device (FPD) equipment in applications where power and energy consumption is critical, such as mobile devices.

Paper Title: **Cancer Clumps Detection using Image Processing Based on Cell Counting and Artificial Neural Network Techniques**

Abstract:Cancer is one of the main reasons for death among humans. So much research has been done for detecting and diagnosing cancer using image processing and classification and techniques. But the disease remains as one of the deadeist disease. Thus early detection of the disease is only one of the reasons to cure the cancer. In this proposed technique identifying cancer cell by using Image Processing, Artificial Neural Network techniques using cell counting, area measurement and detection of clumps. With the help of proposed technique we detect the cancer traits of any CT image, mammography image of biopsy samples automatically. So many algorithms was proposed but there was a lack of flexibility and the level of accuracy is not consists. Before applying proposed algorithm, the system preprocesses the input images with various techniques like gray scaling, binarization, inversion and flood fill operation. The proposed method can be work on various images and fine tuned with a feedback system and if can effectively used for automatically detection of cancer cells in a unique way and lead to open up new dimension in detecting cancer cell in the field of medical sciences.

Paper Title: **Quality of Services Improvement for Secure Iot Networks**

Abstract:Evolution of technologies like IoT has enabled connection of devices around the world through internet. The devices are mostly termed as smart devices because of their capability to transmit, receive and process data. It is considered to be one of the fastest growing technologies and its users are increasing rapidly day by day. Successful implementation of IoT depends on the amount of data that is being either transmitted or received over the networks, ensuring quality of services (QoS) and the methods adopted to fight the energy constraints of the battery powered devices. The QoS parameters at the network level are end to end delay, throughput, jitter and packet delivery ratio. With the increase in number of IoT device on the network it has become essential to concentrate on security of devices and at the same time security of data that is being

5127-5135

transferred over the networks. In this paper we have tried to study the algorithms that have been used to preserve location of source and sink nodes to protect it from breaching and also tried to analyze the effect of these security algorithms on the QoS of IoT networks.

	Paper Title:	**Implementation of Improved Association Rule Mining Algorithms for Fast Mining with Efficient Tree Structures on Large Datasets**	
	Abstract:ARM is a significant area of knowledge mining which enables association rules which are essential for decision making. Frequent itemset mining has a challenge against large datasets. As going on the dataset size increases the burden and time to discover rules will increase. In this paper the ARM algorithms with tree structures like FP-tree, FIN with POC tree and PPC tree are discussed for reducing overheads and time consuming. These algorithms use highly competent data structures for mining frequent itemsets from the database. FIN uses nodeset a unique and novel data structure to extract frequent itemsets and POC tree to store frequent itemset information. These techniques are extremely helpful in the marketing fields. The proposed and implemented techniques reveal that they have improved about performance by means of time and efficiency. **Keyword:**Association Rule Mining, FP-tree, POC tree, PPC tree **References:**1. 	Paper Title:	**Using Lens at Aperture of Antenna for NFF and FFS**	
	Abstract:Antenna technology is developing in today’s world where data transmission is main. In such environment number of different antennas is developed for near field and far field focusing. In this paper a linear feed antenna array is presented which is a sectoral horn H-plane antenna having dielectric lens of biconvex shape are placed in the aperture. Only in h-plane our antenna focuses its beam for providing high aperture and small width of linear array illumination. For the array length illumination in the other plane the field distribution	**5142-5145**

is found on the array having nice agreement of 10 GHz frequency prototype. In this paper we use CST tool for simulation.

Keyword:CST, prototype, H-plane, far field, biconvex, aperture.

Paper Title: **Optimizing the Directionality and Minimizing the Reflections using Lenses**

Abstract:In antenna propagation waves should be guided from leakages and directionality which has became more essential now a days due to number of hurdles which scatters the signal. In this paper we design a leaky lens antenna of UWB frequency and simulate that using CST tool in parallel plate waveguide that works efficiently in high frequency range of 6-30GHz. This approach is totally based on propagation of leaky waves by focusing on the lenses properties. Eventually we increase the gap between the lens and slot for optimal directivity in antenna and then for optimizing the transmission coefficient and minimizing the reflection we use the Matching layer in it. As a result directional radiation will be obtained which is much more achieved than any other antenna of Ultra Wide Band Range and the minimum bandwidth is required which is less than -10dB for radiation.

Keyword:UWB, leaky waves, hurdles, directivity, radiation.

	Paper Title:	**Bending Analysis of Sandwich Panel with Soft Core**

Abstract:A sandwich panel is a lightweight structure, economical and having low thermal conductivity. It is made up of three layers in which the middle layer is called core which is bounded with thin layers at top and bottom called faces. Generally, the core has relatively low-density which makes it lightweight. The bending behavior of the sandwich panel with soft core is studied using the finite element (FE) based software ABAQUS. Shell elements in the three-layer arrangement has been considered to model the sandwich panel. The present model is validated with suitable published results. Then it is extended to analyze bending of sandwich panel with soft core. An FE model has been developed to generate many new results for different thickness, boundary conditions, aspect ratio, etc.

Keyword:sandwich panel, flexural behavior, ABAQUS

	Paper Title:	**VOTE: Verifiable Auditing for Outsourced Database with Token Enforced Cloud Storage**

Abstract:Database deploying is one of the remarkable utilities in cloud computing where the Information Proprietor (IP) assigns the database administration to the Cloud Service Provider (CSP) in order to lower the administration overhead and preservation expenditures of the database. Regardless of its overwhelming advantages, it experiences few security problems such as confidentiality of deployed database and auditability of search outcome. In recent past, survey has been carried out on the auditability of search outcome of deployed database that gives preciseness and intactness of search outcome. But in the prevailing schemes, since there is flow of data between IP and the clients repeatedly, huge communication cost is incurred at the Information Proprietor side. To address this challenge, we introduce Verifiable Auditing of Outsourced Database with Token Enforced Cloud Storage (VOTE) mechanism based on Merkle Hash Tree (MHT), Invertible Bloom Filter(IBF) and Counting Bloom Filter(CBF). The proposed scheme reduces the huge communication cost at the Information Proprietor side and achieves preciseness and intactness of the search outcome. Experimental analysis show that the proposed scheme has totally reduced the huge communication cost at the Information Proprietor side, and simultaneously achieves the preciseness and intactness of search outcome though the semi-trusted CSP deliberately sends a null set.

Keyword: Cloud Computing, Database Encryption, Integrity Auditing, Invertible Bloom Filter, Outsourcing Computation, Query Auditing.

Paper Title: **Identification of Park Effect Probability in Wave Energy Conversion System using Multi Criteria Decision Making Method (AHP) and Neural Network Model (GMDH Shell)**

Abstract:The present research work demonstrates the trend of Park Effect to the Wave Energy Conversion system or in wave energy converter. The Park Effect occurred due to various reasons in a real field application of Wave Energy Conversion. Park Effect occurred in wind energy as well as wave energy. All possible factors are considered to find out the Park Effect. To analyze the Park Effect probability, Analytical Hierarchy Process (AHP) is used, from the result a model is generated through Neural Network software named GMDH Shell. There are significant uncertainties arising in particular from the lack of field tested result to calculate the Park Effect proximity on the devices. However, applying various hypotheses for design and physical parameters, it was found that the benefits of Park Effect influenced factors are all non-beneficiary to Park Effect trend. After all the calculations it can predict the proximity of the Park Effect in a Wave Energy Conversion system.

Paper Title: **Classification of Imbalanced Big Data using SMOTE with Rough Random Forest**

Abstract:Learning from datasets is an important research topic today. Amongst the various data mining tools available for the purpose, none works satisfactorily in the case of imbalanced data mainly because this type of data gives rise to various minority classes, which may affect the learning process. In addition to the large volume, characteristics of Big Data also include velocity and variety. The Synthetic Minority Oversampling Technique (SMOTE) is a widely used technique to balance imbalanced data. Here, we have focussed on extending this concept to conform to the Big Data environment by combining it with the concepts of rough random forest (RRF). This hybrid approach comprising SMOTE and RRF algorithms for learning from imbalanced datasets has been applied on various benchmark datasets from the KEEL Dataset Repository. The results obtained are satisfactory. The velocity aspect of Big Data has been handled by this method on the dynamic dataset of the stock market. The results obtained have been verified using popular online websites related to stock markets.

Keyword:big data, rough set theory, random forest, rough random forest, SMOTE, stock market data.

Paper Title: **Ionospheric Modeling and Forecasting Services of GNSS**

Abstract: The study of ionospheric variability is vital for refining and predicts services of GNSS (Global Navigation Satellite System) applications. The GNSS service provides an explicitly obtainable resource GNSS information, goods and services in support of the earthly reference structure. GNSS is provides an Earth observation, navigation, positioning, timing and other applications, that an assistance Society and Science. To investigate the variations in the daily averaged TEC (Total Electron Content) by taking several model components such as solar activity component, geomagnetic activity and periodic components at different latitudes ranging from 10 N to 26 N for the year 2018. The presented results would be useful to download, processing and analysis the IGS (International GNSS Service) data. MSSA model can reproduce quite well the observed values of GPS-TEC by utilizing only the first 4 singular modes and constitutes 99% of the total variance. The data is transformed into the singular values which are used for forecasting a noiseless time series. The proposed system results show that higher accuracy is achieved by MSSA (Multivariate Singular Spectrum Analysis) based model. It can also be noted that the training of MSSA is much faster and achieves higher learning accuracy, lowest training time. MSSA is effective even the space weather conditions are active during different solar phase periods.

Paper Title:	**Student Dropout Prediction & Educational Data Mining**

Abstract:Educational data like students performance is very important to study and analyze and to improve the quality of education. The study concerned to data mining techniques with educational data is known as Educational Data Mining (EDM). This study finds knowledge and interesting patterns in educational organization. Students performance are the subject mainly concerned to find the qualitative model based on student's personal and social factors then classify and predict the student performance. Proper counseling to underperforming students can reduce dropout ratio and help them to continue their studies.

Paper Title:	**Securing the IOT Devices with Artificial Immune System**

Abstract:Security is the main concern for IOT devices as are expected to share a lot of crucial information about the user and his surroundings. The traditional security mechanisms are ineffective against sophisticated and advanced security attacks such as Man in the Middle Attack, Denial of Service attack, Identity cloning. Different solutions have been proposed for user authentication. Device authentication is crucial in IOT environment and cannot be neglected. Despite this device authentication has not gained equal attention from the research community.

The aim of this research is to develop a lightweight and robust device authentication algorithm by Artificial Immune System to ensure data integrity in IoT networks. The concepts of Artificial Immune system are utilized for generating a non-redundant device signature which is used to differentiate between authentic and malicious nodes. The device signature is generated dynamically and is non reusable. This property makes the proposed

5193-5196

algorithm secure against numerous high-level attacks such as frequency analysis attacks, Man in the Middle attack, side channel attacks, Denial of Service attack.

The developed algorithm is tested in real time and prevents malicious nodes from entering the network. In addition to being immune against the high level attacks the proposed algorithm functions with low communication cost. The proposed algorithm can be used for providing security in IOT devices with limited battery life and processing power such as IOT enabled and remotely deployed Wireless Sensor Networks for forest fire detection, power plant monitoring , remote military applications and many others.

	Paper Title:	**Real Time Cyberbullying Detection**

Abstract:Automated approaches for detecting cyberbullying on online platforms has remained a primary research concern over past years. Cyber bullying is defined as the use of electronic communication to bully a person, typically by sending messages of intimidating or threatening nature. The victims especially teenagers suffer from loss of confidence, depression, sleep disorder. The research on automated cyberbullying approach is mainly focused on data driven methods. Such methods work on a database of static texts, usually collected from online platforms and are not feasible for dynamic nature of a real-life social networking scenarios.

The aim of our research is to develop a cyberbullying detection system using Fuzzy Logic. Three types of bullying emotions are considered in this research work namely aggression, abuse and threat. In the proposed approach chat between two users is continuously monitored and emotion present in each message is determined. Based on the emotion each user's behavior is categorized as decent or bullying. If the detected bullying nature is higher than a defined threshold value the account of user is ceased and reported automatically.

The proposed approach is tested with a chat application developed in Microsoft .Net Framework and approach can detect cyber bullying in good time. The proposed approach, if implemented with social networking platforms can serve as a useful aid for preventing online harassment. The developed algorithm can also be applied in surveillance and human behavioral analysis.

Paper Title: **A Machine Learning way to Build Trust on Social Network.**

Abstract:A social network is a type of service provided by the online platform where an individual can communicate easily with each other, it also provides personal relationships and social interactions. Apart from this it also provides the website where users can build a public figure(profile) and can interact with other users. The social networking sites mainly have the trust issues to overcome, this we tried to build trust in online networks by using the Naive Bayes algorithm algorithm which is deployed through by communication direct and indirect trust and for calculating the trust values Bayesian conditional and Dempster-Shafer theory is implemented. Reenactment results with various arrange parameters are introduced to show the adequacy of the proposed plan.

Paper Title: **Improvement of Power Quality in an Adaptive Boost PFC Converter with Generation of PWM Control Signal by Cascading Power Factor and Chaos Controller Circuits**

Abstract:This work discusses about a digital controller system for reduced effect of chaos and improved power factor of a 1-phase AC-DC converter system. It is shown that, the proposed controller technique is able to suppress the chaos at variable load condition of a boost power factor correction (BPFC) converter. Furthermore, a systematic methodology based on bifurcation diagram from tuning the controller is proposed. To achieve improved power quality in BPFC converter, combination of average and peak inductor current mode control methods are performed. In the MATLAB/SIMULINK environment, simulation circuit for the BPFC converter with average current control method is developed to improve power factor. Further, to reduce the effect of chaos produced in converter, peak inductor current mode with delayed feedback control method is adopted. At an output power of 650 W operating at 130K Hz switching frequency, this converter provides Total Harmonic Distortion (THDi) reduction of 20% and improved Power Factor (PF) of input current compared to other conventional converter. For real time operation of the system, rapid prototyping test is carried out using DAQ (Data acquisition) board NI 6351. The delayed feedback control has a better performance than any other methods proposed earlier.

Paper Title:	**A Suggestive Low Power TIQ Comparator Architecture using Adiabatic Logic for Implementation of 3-bit Flash type ADC.**

Abstract:Power consumption is prime concern for the designers in modern day scenario. For the devices that are power-driven by tiny rechargeable or non-rechargeable batteries over the entire life period, such as medical transplant devices or portable medical instruments, necessitates lowest possible power consumption. In these devices Analog-to-Digital Converter (ADC) isdynamic component to provide connectionamongstAnalog and Digital system. The paper is aimed to report the design contests and tactics for low power ADCs which are used in biomedical graft devices and instruments. A comparator module of ADCs used in designing of such devices requires more power than other blocks in the device, a low power comparator is suggested for Threshold-Inverter-Quantizer (TIQ)usingDiode-Free-Adiabatic-Logic (DFAL) to implement Flash type ADCs. The projected 3-bit Flash ADC is simulated using Cadence ® Virtuoso IC616 with TSMC 65nm technology. The ADC was simulated atpeak to peak voltage of 1.2V andcapacitive load of 1fF,results in consumption of5.53 µW of average power, which is 66.03 % lesser relative toconservative CMOS-TIQ based comparator. Observed static parameters are: DNL is equal to-0.62 / + 0.57 LSB and INL is equal to- 0.44/ +0.41 LSB.Dynamic parameters observed results are as: THD = -25.25dB, SNR=19.45 dB, SNDR=18.39 dB, ENOB=2.76 bits, SFDR = 23.4 dB.

Keyword:CMOS, PMOS, NMOS, ADC, TIQ,DFAL, VTC, MUX, LSB, DNL, INL, SFDR,SNR, ENOB.

Paper Title: **Outage and Throughput Analysis of Spectrum Sharing Cognitive Radio Network Incorporating Energy Harvesting Hybrid Relay**

Abstract:In this paper, cooperative spectrum sharing in cognitive radio (CR) network is incorporated with multi-antenna based RF energy harvesting relays (EH). The performance has been analyzed in the presence of multiple primary users. The relays can harvest energy from source signal and interference from primary transmitter. The relays follow adaptive hybrid protocol (AHR) for forwarding the received signal from source to destination. Outage probability and achievable throughput have been analyzed using a time-splitting relaying (TSR) scheme at the destination where best relay selection (BRS) strategy is used. The outage performances of energy harvesting and non-energy harvesting model have been compared. Throughput and outage performance comparison for AF, DF and AHR have been analyzed. The effect of the number of primary users is also investigated. A trade-off is shown between the number of relays and the number of antennas to achieve the desired throughput. The results depict that the use of energy harvesting strategy in cognitive radio network can result in an energy-efficient solution for future wireless communication.

Keyword: Amplify-and-Forward (AF); Decode-and-Forward (DF); Adaptive Hybrid Relay (AHR); Energy Harvesting (EH).

Paper Title: **Graphical Robust PID Tuning of TITO Processes**

Abstract:In this paper, PID controller for Decentralized TITO process is tuned using graphical approach. Ideal decoupler is used to decouple TITO system and then each decoupled system is approximated to FOPDT model. The Graphical method uses boundaries determined by the loci of stability and frequency domain characteristics such as Gain, and Phase margin etc. common region of these loci gives the values of the PID controller coefficients. The results are validated using MATLAB and the simulated results are presented for Coupled tank system.

Paper Title: **Antibacterial, Antioxidant and Anti-Inflammatory Potential of the Different Extracts of Holoptelia Integrifolia**

Abstract:Medicinal plants are play significant impact in the personal medicine for most of the people all over the world as an alternative live saving medicines and most of their medicinal properties are well known for anticancer activity. The different extracts of Holoptelea integrifolia (H.integrifolia) leaves, stem bark and fruits were studied as a potent natural source of antimicrobial, antioxidant and wound healing potential. This work was carried out to evaluate antimicrobial, antioxidant and anti-inflammatory activity of different extracts of H.integrifolia. The antimicrobial activity of the H.integrifolia ethanolic extract was studied against five fungal and bacterial strains by utilizing the agar well diffusion method and MIC. Among several strain, the ethanolic extract of fruit has shown higher antimicrobial inhibition zone as 9.25-16 mm compare to other two extracts of stem and leaves as 10- 13.25 mm and 6-10.2 mm respectively. The antioxidant activities for different extract were also determined by DPPH free radical assay, Hydroxyl Radical Scavenging and Nitric Oxide Radical Scavenging Activity method. The anti-inflammatory activity also estimated basedon formalin induced paw edema method on Wistar albino rats. The different extracts of leaves, stem bark and fruit parts of Holoptelea integrifolia were estimated for in vivo anti-inflammatory activity against the animal model of female Wistar albino rats. The results of anti-inflammatory activity revealed that the Ethanol extracts showed vital and dose-dependent anti-inflammatory effects. Our findings revealed that aerial parts of H.integrifolia contais potential antimicrobial, antioxidant and anti-inflammatory compounds, which expose the medicinal potential of the selected plant could be a significant drug candidates against microbial, oxidative and inflammation-related pathological processes as a future alternative medicine.

Paper Title: **Assessment of Groundwater Quality in Al'am District using the Canadian Water Quality Index**

Abstract:The study assesses groundwater quality characteristics in Al'am District which is a part of Salah al-Din Governorate, by use of the Canadian Council of Ministers of the Environment Water Quality Index (CCMEWQI). The samples were taken from six groundwater wells for the assessment and sampling was done at six months per year. Based on CCMEWQI calculated values, the six wells from which the samples collected were in poor rank for drinking purpose. The prime causes of deterioration groundwater quality are total dissolved solids (TDS), and total hardness (TH). This study suggested further improvement and continuous monitoring for the groundwater in the study area to provide safe drinking water.

Keyword: Groundwater, The Canadian Council of Ministers of the Environment Water Quality Index (CCMEWQI).

	Paper Title:	**Hardness and Fracture Toughness of Ceramic Composite Using Experimental and Analytical Methods**	
	Abstract:The present work investigated and discussed the impact of addition of graphene to Al2O3 ceramic matrix (alumina) and its effect on different mechanical properties of resulting alumina-graphene (Al-G) composite tool material. Alumina – Graphene (Al-G) ceramic composite tools were prepared through powder metallurgy technique by maintaining different weight proportions of graphene. The wt% is varied from 0.15 to 0.65 with an interval of 0.1%. Hardness and Fracture toughness properties were tested and these properties were observed to be increased at lower content of graphene up to 0.45wt% and later on a decrement trend was observed with increased content of graphene. The composite with 0.45wt% of graphene yielded the highest hardness (HV) and fracture toughness (KIC) parameter values at an indentation load of 294N. The composite specimens were prepared through Microwave sintering of powder metallurgy technique to ensure uniform grain structure to the resulting composite. **Keyword:**Alumina –Graphene, Ceramic Composite, Fracture toughness, Hardness, microwave sintering **References:**1. 	Paper Title:	**Performance of Exclusive Bus Lanes in Chennai**	
	Abstract:A bus lane is a lane which is provide only for operating buses and used to avoid traffic congestion. The current bus transit system in Chennai, known as MTC (METROPOLITAN TRANSPORT CORPORATION), is accommodating about 4 million transport units sufficient to accompany increasing number of passengers. Buses have to share the lane with other vehicles, which affects their capacity, speed, reliability, and quality of service. Due to traffic congestions, travel during peak hours in Metropolitan cities has become unattractive. An attempt has been made in this paper to provide lanes only for operation of buses. Three arterial roads connecting Kelambakkam to Sholinganallur, Chennai central to TambaramVandaloor zoo to Tambaram were selected for the study. Traffic volume survey was conducted in these areas. Based upon the survey conducted and analysis made, suggestions are proposed for the exclusive bus lanes for theselected area where traffic congestion is more during peak hours.	**5255-5258**

Keyword: Bus lane, peak hour, traffic congestion, traffic volume.

Paper Title: **A Decision-making Problem as an Applications of Intuitionistic Fuzzy Set**

Abstract:The fuzzy sets and Intuitionistic fuzzy sets are very useful concepts to elaborate the vagueness in real world problems. The objective of our study is to apply fuzzy set theory and Intuitionistic fuzzy set theory in decision making process. In this paper, we identify in which society a person has to purchase a house in order to fulfil his requirement to maximum extent. In our study we use intuitionistic fuzzy sets to find a relation between the societies and the parameters. And then we find a relation between a person and the parameters. We calculate Normalized Euclidean distance between two Intuitionistic fuzzy sets to make a decision of purchasing house in a society.

Keyword: Fuzzy sets, Intuitionistic fuzzy sets, distance between two intuitionistic fuzzy sets.

Paper Title: **Power Quality Issues in Grid Tied Solar System and its Prevention**

Abstract:The present day demand due to the reduction of fossil fuel resources on a worldwide basis has enforced an urgent seek for alternative energy sources a well-acknowledged as renewable energy sources. In India the integration of solar PV generation in the utility grid is attainment high popularity. Consequently, the solar panel interfaced with the grid cause the power quality issues such as voltage regulation, flickers, harmonics etc. In this paper solar grid integration technology, challenges of integration & their mitigations techniques such as FACTS devise and power electronics are discussed. The key objective of this paper is to identify the problems associated with grid connected solar power system and the study of implementation of new projects of solar PV grid integration without repeating apparent challenges faced in prevailing plans and prepare data for scientists and researchers on feasibility of SPV grid integration.

Keyword: Power Quality, Harmonics, Solar PV Energy, fossil fuel, voltage regulation, UPQC.

Paper Title: **Vehicle Security System using Motion Sensors**

Abstract:A lot of advancements in science and technology have been observed in last decade. Children used to play in cars and by mistake they lock themselves in the car. As the parents were unaware of this, children face the problem of suffocation which may lead to their death. This concept is developed to avoid this kind of disasters by using the advanced technology such as motion sensors. when the sensor detects any abnormal motion in the vehicle the oxygen is supplied inside the vehicle through oxygen cylinders.

Keyword:PIR Motion sensor, abnormal motion detection, suffocation, wireless connected device.

Paper Title: **A Compound Reconfigurable Solid State Planar Plasma Antenna**

Abstract:In today's modern wireless era, reconfigurable antennas play a vital role for functioning under selective frequency bands, different polarizations and radiation patterns according to the users' application. This article, gives an insight on solid state plasma planar compound reconfigurable antenna for military radar applications at X-band by using array of Lateral PIN (LPIN) diodes. Silicon-dioxide (SiO2) is used as substrate and proximity coupled feeding technique is chosen to avoid biasing problem in LPIN diodes and also to have compatibility with processing on a standard silicon process. The proposed antenna comprises of a square metallic patch placed above the substrate with linear array of LPIN diodes at adjacent sides of patch to provide fine and coarse tuning in frequency over the range of 8-12 GHz and LPIN diodes placed in the ground plane to provide pattern reconfiguration. Hence, the antenna with compound reconfigurability converges to a solution, where a single antenna satisfies the needs for multiple applications.

Paper Title: **Teacher Competence in Developing Creativity Elementary School Students**

Abstract:Creativity is an important aspect of human life. Creativity can help someone in solving problems and facing the development of science and technology. Student creativity will develop optimally if the teacher has sufficient competence. The more creative a teacher, the more creative the students. This study aims to obtain a data picture of the creativity ability of fifth grade elementary school students in Gorontalo Province. The study was conducted in elementary schools in Gorontalo Province for grade 5 elementary school students. The research method was descriptive-quantitative, with a sample population of fifth grade elementary school students coming from 6 regions in Gorontalo Province. The fifth grade elementary school sample was taken using the stratified random sampling technique for each district and city, so that a total sample of 120 students was obtained. The measuring instrument used was the Verbal Creativity Test developed by Munandar and the data were analyzed using descriptive statistics. The results showed that some 75 % grade elementary school students throughout the province of Gorontalo has a low level of creativity ability. This shows that the low creativity of students is due to the lack of variation in providing learning methods and strategies by the teacher.

Paper Title: **Third-Party Interest in Arbitration Dispute Settlement Process**

Abstract:The existence of a Third Party in the Civil Code, in general, is a party to be taken into account not to suffer harm to a civil dispute. However, things are different in Arbitration Law which is a special branch of the Civil Code. Moving from the principle of secrecy, there is a disclosure of information on disputes in the world of commerce, which is characterized by variants of Contract Law in the world of commerce so as to make the potential losses that arise for other parties against the same trade object . Arbitration Law in Indonesia has ignored the interests of interested third parties by relying on the entry of such parties on the basis of voluntary parties and the approval of the Arbitral Tribunal.

Paper Title:	**Design of Clean Water Pipes in Bangga Village, South Dolo District, Sigi Regency**

Abstract:This study is to provide an overview of the design of clean water pipelines in Bangga Village, South Dolo District, Sigi Regency. The limitation in this design is to analyze the availability of water/discharge mainstay of the Bangga River using the F.J Mock method and calculate the need for clean water in Bangga Village according to the estimated population for the next 27 years. The design method is carried out using meteorological data collection methods, data on population density, topographic data, and rainfall data, then calculates the need for clean water and is compared with the reliable discharge. The result is obtained a minimum mainstay of the Bangga River discharge (Qand 0.282 m3 / sec) to meet the needs of clean water in the service area until 2040 required a water debit of (6,295 ltr / sec). From the water requirements, 2 (two) design methods were designed which included 1 (one) clean water pipeline design and 2 (two) clean water pipeline design. From the design results obtained a maximum pressure of 4.2662 kg / cm2 which occurs at the node / pipe connection P.15 this does not exceed the maximum allowable limit of 10 kg / cm2, while the maximum speed obtained at 1.1688 m / sec which occur at vertices P, 6 and P. 12 this does not exceed the maximum limit of 3 m / sec. For the number of pipe requirements needed in this design are 1747 sticks, where for Ø 8 "17 sticks, Ø 6" 259 sticks, Ø 4 "108 sticks, Ø 3" 760 sticks, Ø 1 "565 sticks, Ø ½ "38 sticks.

Keyword: Pipe design, maximum pressure.

Paper Title:	**Metal Additive Manufacturing by Powder Blown Beam Deposition Process**

Abstract:Additive Manufacturing (AM) is a tool less manufacturing process for building complex components layer by layer. Powder based AM techniques are used for producing porous and dense parts or products by Powder Bed Fusion (PBF) and powder blown Beam Deposition (BD) processes respectively suitable for different applications.

The present review is mainly focused on the commercially available technology of powder blown Beam Deposition (BD) process for producing fully dense parts, and functionally graded materials used in automotive,

5291-5304

aerospace, defense, and nuclear reactors. The properties of BD parts and comparison of the properties of BD parts with Selective Laser Melting (SLM), casting, and Acram's Electron Beam Melting (EBM) parts are presented. This paper provides an insight into the microstructural characteristics and mechanical properties of parts produced by BD process. A brief discussion is presented on challenging issues and applications of BD process. An attempt is made to present available and under development AM testing standards used to evaluate the properties of AM parts. This review also focused on porous parts produced by BD process for medical applications, and metal foil based BD process. Here, new developments in AM process like hybrid manufacturing and 4D printing are also discussed.

Keyword: Additive Manufacturing, Beam Deposition, Direct Metal Deposition (DMD), Microstructure, Mechanical Properties, 4D Printing.

Paper Title: **Design and Fabrication of Shoe Cleaning Cum Polishing Machine**

Abstract:In this work, an endeavour had been made to structure and manufacture a programmed shoe cleaning cum polishing machine which makes the shoe cleaning process simple and efficient. This venture centres on computerization of the shoe polishing and sparkling procedure with no human contribution all the while. The fundamental reason to plan the programmed shoe cleaning machine is to diminish human exertion to zero. The machine comprises of four principle units transportation, cleaning activity area, polishing activity area and control unit which controls the entire activity as indicated by given guidelines.

Keyword: Computerization, no human exertion, polishing area, control unit.

Paper Title: **An Information Secure Attribution Model for Observing Spurious Drugs in Health Care Organization**

Abstract:The goal of the paper is to propose an appropriated secure provenance framework to check the dependability of the medications in the midst of misleading and fake medications. There are various Drug and Cosmetic Acts in the nation for the control of illegal medications however over 58% of the medications are not certified which requires a circulated provenance framework with high level of information security. Aside from the client mindfulness and extreme discipline for such unlawful exercises, an on request administration which will help the end client to know the starting point of the medications, the different changes during preparing and the last vendors. The safe provenance model tends to least loss of security of the pharmaceutical assembling organizations to improve the dependability of the item and furthermore the individuals. The model is actualized as a portable sending model with verified provenance against potential assaults in various health care industry particularly initiating spurious drugs with respect to various scenario.

Paper Title: **Automated Tilt Conveyor for Cylinder Head**

Abstract:Cylinder head is one of the main components of an Automobile Engine. In machine shop there are three bays having a machines in which the cylinder head is machined. Makino machine is one of them where the operations like roughing, semi finish; drilling and tapping are carried out. The component has to be loaded by use of a manipulator in a vertical position into the machine such that its rocker face should be facing the operator. So, the component coming from the previous operation through a conveyor with combustion face on top should be tilted to 90 degree such that its rocker face will be facing the operator in a horizontal position. This tilting process has been carried out manually which results in damage of valve guide and valve seat of a cylinder head. This leads to reduction in quality and productivity and also it results in increased operator fatigue since the cylinder head weighs heavy. There is also a chance that when tilting the component manually the component may fall down and hurts operator which results in increased value of effort and ergonomic index. To overcome this problem our research work a modification is made in the conveyor of the makino machine with a low cost automatic arrangement provided for cylinder head tilting purpose.

Keyword: Automobile, automatic tilting, cylinder head Makino machine.

Paper Title: **A Software Defined Network Based Energy-Efficient Model for Internet of Things**

Abstract:Internet of Things (IoT) is a new platform that provides the communication among heterogeneous objects. The aim of theIoT is to allow anything can communicate with anywhere at any time to share the information. Generally, devices in IoT are equipped with limited power. The power failure of single node changes the entire network architecture in the IoT framework. To attain an efficient routing, there is a need to design energy-efficient routing algorithm for IoT heterogeneous objects. The proposed Software Defined Network based Energy-Efficient Routing Protocol (SD-EERP) takes care to reduce energy consumption and transmission overhead of monitoring every device in the IoT paradigm. The aim of the proposed SD-EERP algorithm is to enhance the lifetime of the devices by choosing the energy-efficient path to reach the target device. The proposed model implements the Software Defined Network (SDN) based cluster architecture. The

5318-5320

cluster head selection is based on residual energy and speed.All the cluster heads connect to the SDN controller to manage the entire network architecture.The simulation results show the proposed algorithm can minimize the energy consumption and increase the packet delivery ratio when compared with SCBRP.

Keyword: Internet of Things, routing, heterogeneous, Software Defined Network, cluster head.

Paper Title: **Constructive Neural Network: A Framework**

Abstract:In this paper, two techniques for construction of feedforward neural network are being reviewed: pruning neural network algorithms and constructive neural network algorithms. In pruning method, training starts with a larger than required network and subsequently delete the redundant hidden nodes and redundant weights till there is a satisfactory solution. In the constructive method, training of the network starts with minimum structure and then according to some predefined rule some more layers of neurons are added. A number of major issues are discussed that can be considered while constructing a constructive neural network i.e. how to select network architecture, network growing strategy, weight freezing, optimization technique, activation function and stoppage criteria

Keyword: Neural networks; Pruning algorithm; Constructive algorithm; Optimization technique and Activation function.

Paper Title: **Modifiers of Modern Indian Drama**

Abstract:Drama in India has been the mainstream source of entertainment for ages. It is in fact the oldest form of entertainment. It has for centuries survived as a way of life rather than an organised event. Stories from religious scripts were being performed on various events. However the Modern Indian Drama came into existence only in the early eighteenth century. The major factors that created a great impact on the growth of Modern Drama may be considered to be: Colonial Cities, Indigenous Theatres, Playwrights, Ticket. With the development of these concepts Modern Indian Theatre grew substantially.

Paper Title: **Accident Prevention and Traffic Control by Otsu Method and Haar-Cascade Hand Detector**

Abstract:The rapid development of economy and continuous improvement of people's purchase ability in every country, purchasing the motor vehicles is increasing rapidly, so as the traffic accidents and accident death rate, which says the road traffic situation in everywhere, is worse day by day. Traffic and Accident control is a complex activity in developing countries shows in increasing number of riders and automobiles every day. The prediction and prevention of traffic accidents is an important part of the traffic safety, the purpose of prediction is to achieve the objective of reducing traffic accidents. The work proposes by using the existing video through the cameras positioned on highways, traffic signal and busy roads that can detect the incidents/events. The system can also be proposed with the ability to read and track the vehicle number helps in searching of vehicles violating the rules by finding the License plate number using Optical Recognition method which finds the alpha numeric character from the segmented image. Counting the vehicles passed through the mentioned place using Haar-cascade hand detector which helps to count the number of vehicles passed through can perform Traffic control system.

Keyword: Image Processing, Pattern Recognition, HAAR- Cascade, OTSU method, Traffic Control.

Paper Title: **Cost & Coal Management of a CFBC Boiler in a Power Station**

Abstract:India, being the world's third most observable customer and third most essential power producer with relentless presented generally sensational of 364.17 GW, contributing 68% of warm Capacity as of 31st October 2019. The dependable report of the International Energy Agency (IEA) shows that general coal use is on the trip again +1.79% showed up contrastingly in relationship with 2018. Consequently, Thermal power passing on stations is essential. For the Simhapuri Thermal Power Station (the one considered in the present assessment), it is seen that, for a progress in Magnetic substance by 2%, the particular coal use expands by about 8%. Suffering, regardless, the trash content is associated by 2%, the particular coal use expands by about 5%. It is in like way observed that, for a 4% improvement in fixed carbon; the particular coal use diminishes by about 25%. Starting now and into the not all that far off it is proposed to present an interfacing with separator at the bed material stacking point. With this foundation of pulling in separator gear saw a yearly electrical vitality sparing farthest point of 116.14Lakh kWh and coal experience resources of 12730 MT. Seen electricalenergy speculation accounts works out to be 5.3 % of the yearly electrical centrality ate up (2158.9 Lakh kWh) during the year Sep 2018 – Aug 2019. Assessed yearly centrality cost sparing point of confinement of Rs. 769.54 Lakhs (counting coal hold saves) works out to be 8.9 % of the yearly significance cost (Rs. 8635.8 Lakhs) for the year Sep 2018 – Aug 2019. The Proposed issue is attempted with MATLAB condition and cost appraisal of warm power plant is disengaged and existing making data. The test results exhibited that the proposed structure gives a feasible system beast experience additional items and essential for suffering assignments.

Paper Title: **Research onWeighted Least Square and Linear State Estimation Methods under Ill Condition of Power System**

Abstract:A Jacobian matrix is said to be ill-conditioned if it is very sensitive to small changes. In this paper, the performance of Weighted Least Square (WLS) and Linear State Estimation (LSE) methods under stressed condition and ill condition of power system are compared. In weighted least square method, real/ reactive power injections/flows with very few bus voltage magnitudes are used to obtain the state vector (bus voltages) for given network model. This method inclined to convergence errors when the system is in stressed state or ill condition state. In Linear State Estimation method, bus voltage and current measurements are used to obtain the state vector. Because of its linear nature, LSE method is suitable under stressed condition/ ill condition of power systems. IEEE 14 bus, 13 bus ill conditioned system and EHV 24 bus systems are used in matlab environment to examine the proposed (LSE) method and simulation results are summarized.

Paper Title: **Optimal Location of multi-type FACTS for Power System Security Enhancement**

Abstract:Transmission congestion results from the contingencies in the power system and increasing load demand that has to be supplied through predetermined corridors in case of restructured environment. The Flexible AC Transmission Systems (FACTS) devices when deployed in a power system can result in improving the system performance in terms increased loading capability of transmission lines, reduction in losses, improved stability and security of the system by relieving stress on congested lines. This work deals with congestion management of the power transmission network by employing FACTS devices, with the help of Genetic Algorithm (GA) based optimization algorithm. Optimal location of FACTS placement and optimal parameter settings of these devices are the objectives for the optimization problem. The optimization process aims at maximizing the loading capability by the network by transferring power from overloaded lines to adjacent lightly loaded lines. FACTS devices considered are TCSC, SVC and UPFC for the alleviation of the overload on transmission lines and to reduce overall transmission loss of the system. An IEEE 30-bus system is used to illustrate the effectiveness of the proposed method.

Keyword:congestion management; FACTS; Optimal Location; Genetic Algorithm.

Paper Title: **Hybrid Bacteria Foraging Particle Swarm Optimization based Optimal Reactive Power Dispatch for the Alleviation of Voltage Deviations**

Abstract:This paper presents a hybrid algorithm for optimal reactive power dispatch by combining two popular evolutionary computation algorithms; Bacterial Foraging algorithm and Particle Swarm Optimization. The Hybrid algorithm combines velocity and position updating strategy of Particle swarm optimization algorithm and reproduction and elimination dispersal of Bacterial foraging algorithm. The proposed algorithm is applied to solve optimal power flow with the objective of minimization of Sum of squares of voltage deviations of all load buses. The proposed approach has been evaluated on a standard IEEE 30 bus test system and 24 bus EHV southern region equivalent Indian power system. The results obtained by the proposed Hybrid algorithm are compared with their basic counter parts and superiority of the proposed hybrid algorithm is demonstrated.

Keyword: Optimal Reactive Power Dispatch, Voltage deviations, Bacterial Foraging Algorithm, Particle Swarm Optimization, Hybrid algorithms.

Paper Title: **Classification of Skin Diseases by Image Processing using Machine Learning Techniques**

Abstract:Dermatological ailments are the most predominant illnesses around the world. Despite being normal, its finding is very troublesome and requires broad involvement with the space. One of the serious issues coming in the therapeutic field is that specialists are not ready to recognize that tainted part which isn't obvious by unaided eyes and along these lines they just work the unmistakable contaminated piece of the skin and this may cause a significant issue like malignancy or any hazardous malady later on. Skin malignancy arrangement framework is created and the relationship of the skin disease picture crosswise over various kinds of neural system is set up. The gathered restorative pictures are feed into the framework, and utilizing diverse picture preparing plans picture properties are upgraded. Valuable data can be separated from these therapeutic pictures and go to the order framework for preparing and testing utilizing MATLAB picture handling tool stash for discovery of dead skin. In any case, a programmed restorative pictures examination framework dependent on proposed AI procedure as Artificial neural systems of PCA with following highlights of the pictures: I. Appropriate Enhancement ii.Feature extraction and choice iii.Grouping.In this manner, the aftereffects of the proposed method utilizing MATLAB programming are completed for investigation which are helpful to the specialist.

Paper Title: Performance Analysis of Copper Absorber Tube Parabolic Collector

Abstract:The solar parabolic trough collector technology is one of the most reliable technologies in the field of solar thermal. This is due to the fact that temperatures as high as 400o C can be achieved using this technology. The energy development from these systems used for hot water production, process steam requirement, power generation and many more. Majorly they have wide applications in cooking. They are also used to generate steam at higher temperatures which is used to run a subsequent engine.

In the present Paper, performance analysis of copper absorber tube parabolic collector is done for different parameters of the system such as Reflector sheet material, heat transfer fluid, Period of Sun Incidence at different levels the output responses such as Out Temperature of heat transfer fluid, Discharge, and Thermal Efficiency are recorded for each run. The optimization method S/N ratio analysis is applied for determining the optimal parameters level for better responses and the optimum results are confirmed experimentally

Keyword:parabolic trough collector, copper absorber tube, Taguchi Design of Experiment, S/N ratio analysis

Paper Title: Design of a Sampler circuit for Flash ADC using 45nm Technology

Abstract:This paper presents design of a sampler circuit for folding flash ADC. There is a desire for Low power high performance ADC for communication. For low power the size of the ADC should be minimized and for the fast performance flash can be used. Hence to reduce the number of transistors in flash ADC folding network is proposed here. Sampling is the important technique used in the ADC part. In this discussion the sampler circuit includes a differential track and hold switch followed by a variable gain amplifier with a gain of 1 db, a buffer and a folding network. An input voltage of1 V and the sampling frequency of 1GS/s is applied to the sampler circuit. Effective number of bits of more than 5.7 bits is achieved also THD is below -35db in VGA. Buffer achieves a ENOB of 10bits with THD less than -65db. This sampler circuit is designed with the technology of 45nm for coherent sampling. Worst case SNDR is calculated.

Keyword: Variable gain amplifier (VGA), buffer, Effective number of bits (ENOB), Total harmonic distortion (THD).

Paper Title: **Performance and Implementation of Grid Connected Single Phase Photovoltaic System and FPGA-Design Based MPPT**

Abstract:Solar Photo Voltaic system are used for power generation by the process of photovoltaic effect. The solar power is varying continuously on a particular day due the variations in the temperature and irradiances. To overcome the power loss of PV system maximum power point tracking techniques are used to generate maximum solar power . Generally digital signal processors are used for implementing maximum power point tracking algorithms, but the performance is limited. The high degree of flexibility is achieved by the use of field-programmable gate arrays (FPGA) chips. The PV systems are used to provide stable and reliable power. The paper presents the single-phase implementation of the grid connected PV system and FPGS based P&O MPPT algorithm. The proposed system consists of P&O MPPT algorithm for maximum solar power extraction, bi-directional DC-DC converter for is used for controlling the battery. The solar power is used to serve the connected load and the excess power is used for serving grid utility. The single-phase inverter is used for DC-AC conversion. The Xilinx ISE is used for simulation of MPPT algorithm. The grid connected PV system is simulated using MATLAB/SIMULINK.

Keyword: Solar PV system, DC Converter, Inverter, MPPT technique, FPGA.

Paper Title: **Tamil text detection in videos using Gradient Vector Flow and Fuzzy C-Means**

Abstract:In videos, detecting text with multifaceted scenarios is perplexing. Texts in those videos have content full data facts that will be applied for various applications. Here, a system is proposed to enrich the text detection process from video. Here, a new method is implemented that detects Tamil text based on Gradient Vector Flow (GVF) and fuzzy c-means. First the video is split into number of frames. To circumvent temporal redundancy in each frame, a key frame is chosen and the frame where the text be located is identified to be the key frame. The dominant edge pixel is identified in that frame by the sobel edge map. Edge components are detected conforming towards the dominant pixel in sobel detector for constructing Text Candidates (TC).Clustering of a pixel is performed to detect text by using fuzzy c means clustering algorithm. Finally text is detected.

Keyword: Gradient vector flow, Dominant pixel, Text candidate, Fuzzy C-means.

Paper Title: **Medical Image Compression by Optimal Filter Coefficients Aided Transforms using Modified Rider Optimization Algorithm**

Abstract:Owing to a large amount of images, image compression is requisite for minimizing the redundancies in image, and it offers efficient transmission and archiving of images. This paper presents a novel medical image compression model using intelligent techniques. The adopted medical image compression comprises of three major steps such as, Segmentation, Image compression, and Image decompression. Initially, the Region of Interest (ROI) and Non-ROI regions of the image are split by means of a Segmentation procedure using Modified Region Growing (MRG) algorithm. Moreover, the image compression process begins which is varied for both ROI and Non-ROI regions. On considering the ROI regions, the compression is carried out by Discrete Cosine Transform (DCT) model and SPIHT encoding method, whereas the compression of Non-ROI region is carried out by Discrete Wavelet Transform (DWT) and Merge-based Huffman encoding (MHE) methods. As a main contribution, this paper intends to deploy the optimized filter coefficients in both DCT and DWT techniques. Here, the optimization of both filter coefficients is performed using Modified Rider Optimization Algorithm (ROA) called Improvised Steering angle and Gear-based ROA (ISG-ROA). In the final step, decompression is done by implementing the reverse concept of compression process with similar optimized coefficients. The filter coefficients are tuned in such a way that the Compression Ratio (CR) should be minimum. In addition, the comparative analysis over the state-of-the-art models proves the superior performance of the proposed model.

Keyword: Image compression; Region of Interest; Discrete Cosine Transform, Discrete Wavelet Transform, Filter Coefficients; Modified Rider Optimization Algorithm

	Paper Title:	**Renewable Energy-based Induction Motor Water flow control**	
	Abstract:Water flow measurement is very important in some specific applications like water craft, house hold applications, submarine and etc, in some applications renewable energy is used as source because it is pollution free and easily available, Solar panel yield is not sufficient to drive induction motor due to irregular temperature and irradiance, solar panel production improved by boost converter to control by using MPPT Controller, MPPT Controller controlled by different algorithms in that P&O Algorithm is design to maintain constant voltage,		**5394-5399**

induction motor require AC supply but boost converter gives DC supply, to convert DC to AC by using IGBT inverter, water pump is connected to the induction motor through flow sensor, inverter firing angle control PWM technique, that PWM controller design by DSPIC30F4011,flow measurement by yf-s201 flow sensor is used, result compare by Software and hardware.

Keyword: Induction motor, MPPT Controller, Water Pump, Flow Sensor

Paper Title: **Method of Patternmaking in Fashion Institution and Fashion Industry**

Abstract:There are many approaches and procedures that can be used to create patternmaking in higher education institutions and the fashion industry. Literature demonstrates that there are several methods that essentially generate patterns such as draping, flat patterns and Computer Aided Design (CAD) that include 2D and 3D applications. Many Malaysian institutions are studying patternmaking using flat pattern and draping [4], which is different from the fashion industry using CAD software. In order to produce skilled workers in the field of patternmaking, they must learn and apply the pattern-making techniques and methods well so that they do not have any problems when it comes to working in the industry or the education sector. This study describes the basic method, process and CAD software that can be used in the field of patternmaking.

Paper Title: **Automatic Detection of Tomato Leaf Deficiency using Soft Computing Technique**

Abstract:Indian Economy mostly depends on Agriculture. Agriculture and its value-added products will occupy considerable amount of gross domestic product (GDP) and provides employment to more than half of the country's workforce. Among all the countries India is one of the world's largest producer of agriculture and horticulture crops. Among all the vegetables Tomato is one of the most important vegetable used to consume all over the world. Disease easily affect the tomato plant due to insects and nutrient deficiency. To detect nutrient deficiency using image segmentation and classification is the main focus of this paper. If detect nutrient deficiency in early stage then he yields increased and the disease caused due to lack of nutrient deficiency also reduced. In this paper k-means and Expectation maximization segmentation algorithms are used for segmentation and SVM classifier used for classification. Based on the results Expectation Maximation provide better result than K-means segmentation.

Keyword:deficiency detection, k-means, Expectation-Maximization, SVM.

Paper Title: **Non Destructive Behavior of Corroded Reinforced Geopolymer Concrete Beams**

Abstract:Corrosion of steel reinforcement bar embedded in geo-polymer material has been an object of study to confirm its technical viability. The available alkalinity of geo-polymer material initially was suspected to be harmful for alkali-silica reaction, but then it was found to be beneficial to maintain passivity of the steel bar in concrete. Many researchers carried out studies on the influence of corrosion on bond, generally developed on the basis of experimental tests in specimens subjected to artificial corrosion. The current density applied to accelerate the corrosion influences the bond strength. Since, natural corrosion develops in a very long time, an artificial corrosion has been provided.

Keyword: Artificial corrosion, Geo polymer, Corrosion, Current density.

Paper Title: **Parasite Analyser using Artificial Neural Network**

Abstract:Crop destruction causes so much damage to the crops or agricultural products which causes reduction in the productivity. There are numerous important crops are at risk. Parasites are controlled environmentally by unfriendly pesticides. Once a pest has reached either an economic threshold, or intolerable level action should be taken. Pesticides are used as a control measure while other strategies will not bring the parasite population under the threshold. So, here we use early parasite analyser to detect the parasite in a plant and its location. We use artificial network method to analyse the parasite. ANN technique is used to detect the pest in the field. This method is used to resolve the problem of classification identification, authentication, diagnostics, optimization and approximation.

Paper Title: **2D Hypersonic Scramjet Inlet Geometry of Mach 7 using CFD**

Abstract:In the era of space transportations there is a huge demand on space technology to improve on cost reduction and take the heavy loads into space. Thus the load carrying capacities will be increase with this air breathing engines. This work gives a report on the design, analysis of optimal 2D scramjet engine inlet operating at Mach 7 without use of movable geometry. A computational study for scramjet inlet with different ramp angles is carried out. Several cases are considered to compress the air by rounding leading edge without moving the whole cowl up and down, by fixing the cowl lip and assuming axisymmetric inlet with rounded edge. The numerical tests are conducted to obtain maximum total pressure recovery, drag force and outlet Mach number for given flight condition. Two dimensional effects are studied with Navier-strokes approach to compute the pressure and Mach number at a different location. Oblique shock waves, expansion waves and shock wave interactions are primarily focused. Computational Fluid Dynamics (CFD) solver is used; steady flow simulations are carried out for inlet geometries with one, two, three and four ramps. Geometrical shape is redesigned based on oblique shock wave analysis. The corrected model is tested on Fluent with boundary layer considerations that the theoretical analysis is not able to cover. Lastly, a conclusion summarizing the design process is drawn and the optimal model is recommended for the Mach 7 inlet with different ramps with contraction ratio 10. It had been observed that two ramp scramjet inlet model has been preferred to use which has optimum pressure recovery and lower drag.

Paper Title: **Digital Classroom Enquiry System**

Abstract:Digital world is the one wherein the ideas and the services are being exchanged through Online medium. In this digital world everyone can get connected with every other person for the process of communication. In the process of digitalization, we have emerged into a new concept of digital class room. This digitalization can be extended outside the classroom which shall make the digital classrooms even smarter. In this paper we propose a system which uses a digital touch screen placed outside a classroom. This touch screen is the communication medium between the students and the teachers. The display screen is designed in such a way that every detail regarding the classroom can be viewed on the display. Just a glance at this digital touchscreen enables the students to understand what is going on in the classroom. This screen is accessible to anyone. The home screen of the display is designed in such a way that it gives the glimpse of the events happening in the classroom.

Keyword: Digitalization, Smart boards, CCTV camera, Smart classroom.

Paper Title:	**An Advanced Relevance Feedback Method to Improve Performance of CBIR using Convolutional Neural Network and Comprehensive Values**

Abstract:Content-Based Image Retrieval (CBIR) is extensively used technique for image retrieval from large image databases. However, users are not satisfied with the conventional image retrieval techniques. In addition, the advent of web development and transmission networks, the number of images available to users continues to increase. Therefore, a permanent and considerable digital image production in many areas takes place. Quick access to the similar images of a given query image from this extensive collection of images pose great challenges and require proficient techniques. From query by image to retrieval of relevant images, CBIR has key phases such as feature extraction, similarity measurement, and retrieval of relevant images. However, extracting the features of the images is one of the important steps. Recently Convolutional Neural Network (CNN) shows good results in the field of computer vision due to the ability of feature extraction from the images. Alex Net is a classical Deep CNN for image feature extraction. We have modified the Alex Net Architecture with a few changes and proposed a novel framework to improve its ability for feature extraction and for similarity measurement. The proposal approach optimizes Alex Net in the aspect of pooling layer. In particular, average pooling is replaced by max-avg pooling and the non-linear activation function Maxout is used after every Convolution layer for better feature extraction. This paper introduces CNN for features extraction from images in CBIR system and also presents Euclidean distance along with the Comprehensive Values for better results. The proposed framework goes beyond image retrieval, including the large-scale database. The performance of the proposed work is evaluated using precision. The proposed work show better results than existing works.

Keyword:CBIR, CNN, Alex Net, Feature Extraction, Similarity Distance, Comprehensive Values and Image Retrieval.

Paper Title:	**Performance Optimization Through Data Pipeline in Heterogenious Hadoop Cluster**

Abstract:Big data has received a momentum from both The scholarly group and organisation. The MapReduce version has risen into a noteworthy figuring mannequin on the aspect of large information research. Hadoop, that is an open supply utilization of the MapReduce mannequin, has been generally taken up by the network. Cloud expert businesses, for example, Amazon EC2 cloud have now upheld Hadoop client applications. no matter the whole lot, a key take a seem at is that the cloud educated co-ops do not a have asset provisioning tool to satisfy client occupations with due date prerequisites. As of now, it's miles completely the consumer duty to assess the require degree of property for his or her pastime running in an open cloud. This postulation correct-knownshows a Hadoop execution mannequin that exactly gauges the execution duration of exertions and in a similar manner arrangements the desired degree of property for a vocation to be finished indoors a due date. The proposed mannequin utilizes in the neighborhood Weighted Linear Regression (LWLR) mannequin to assess execution time of a vocation and Lagrange Multiplier device for asset provisioning to fulfill client art work with a given due date. .

	Paper Title:	**ACTSMLT: Automatic Classification of Text Summarization using Machine Learning Technique**

Abstract:In today's world, due to the steep rise in internet users, Community Question Answering (CQA) has attracted many research communities. In order to provide the correct and perfect answer to the user asked question from a given large collection of text data, understanding the question properly to suggest a precise answer is a challenging task. Therefore, Question Answering (QA) system is a challenging task than a common information retrieval task done by many search engines. In this paper, an automatic prediction of the quality of CQA answers is proposed. This is accomplished by using five well known machine learning algorithms. Usually, questions asked by the user are based on a topic or theme. We try to exploit this feature in our work by identifying the category of the question posted and further map with the corresponding question. Similarly, for the answers posted by the multiple user's are processed as answer for category mapping. Here, the results show that for Question Classification (QA), Linear Support Vector Classification (LSVC) is found to be the best classifier and Multinomial Logistic Regression (MLR) is the most suitable for Answer Classification (AC). The MS Macro dataset is used as the underlying dataset for retrieving and testing the question and answer classifiers. The Yahoo Answers are used as a golden reference during the testing throughout our experiments. Experiments results show that the proposed technique is efficient and outperforms Metzler and Kanungo's (MK++) [1] while providing the best answer summary satisfying the user's queries.

	Paper Title:	**Innovations in Public Sector Services to Reduce the Traffic Volume**

Abstract:Coimbatore is the Second largest city of Tamilnadu with all its wealth of IT hubs, Educational

Institutions, and varied business start-ups increasing the population growth of the city by which the city stands as Manchester of South India. The transport structure is in such a way that the city is confined within six arterial roads bordering the city. The city holds 265 bus transports totally with passenger capacity around 0.2 million. Other than bus transports there are many other sources for transport in the city including, auto-rickshaws, share autos, call taxies, Omni buses, self-vehicles like car, bike, and 'n' number of vehicles used by institutions and industries. Since Coimbatore is a well- planned and cleaned city among other metro cities like Bangalore, Kochi, Chennai etc., in South India, the same is destroyed due to annoying vehicular growth in last decades. The city with exaggerated students and IT hands arises a question regarding punctual travel to schools, colleges, offices and rate of accidents in peak hours besides vast transport facilities. Coimbatore ranks 23rd of the country in the fatal accidents faced by motorists and city walkers. The accidents are caused due to increase in vehicle population at the rate of 0.15 million per annum inculcating all buses, 2-wheelers and 4-wheelers. This uncertainty shift from place to place gives a gap for implementation of MRTS in the city of Coimbatore.

Keyword: Traffic demand, Environmental pollution, traffic study, vehicle population and accidents.

Paper Title: **Communication Concept Between Bluetooth As a Master and Slave To Exchange Digital Information**

Abstract:In this digital era and the increasingly developing human resources, it is possible to create new research in this era of development. One example of its development is the discussion of the concept of serial communication. In technology, we know the name of the serial communication. In today's world serial communication is the forerunner of communication between platforms in general. In this journal we will know what serial communication is, it is a communication method that is carried out one way and the concept of sending data is bit by bit or, in other words serial communication is one method of data communication that is sent over a cable which gets one bit of data in a a certain time simultaneously and alternately. In this study using the main tool namely the HC-05 Bluetooth module which is used as a master and slave.

Keyword:HC-05 Bluetooth Module, Serial Communication, Bit of Data.

Paper Title: **Secure and Selective Cloud Data Auditing using Deep Machine Learning**

Abstract:The tradition of moving applications, data to be consumed by the applications and the data generated by the applications is increasing and the increase is due to the advantages of cloud computing. The advantages of cloud computing are catered to the application owners, application consumers and at the same time to the cloud datacentre owners or the cloud service providers also. Since IT tasks are vital for business progression, it for the most part incorporates repetitive or reinforcement segments and framework for power supply, data correspondences associations, natural controls and different security gadgets. An extensive data centre is a mechanical scale task utilizing as much power as a community. The primary advantage of pushing the applications on the cloud-based data centres are low infrastructure maintenance with significant cost reduction

for the application owners and the high profitability for the data centre cloud service providers. During the application migration to the cloud data centres, the data and few components of the application become exposed to certain users. Also, the applications, which are hosted on the cloud data centres must comply with the certain standards for being accepted by various application consumers. In order to achieve the standard certifications, the applications and the data must be audited by various auditing companies. Few of the cases, the auditors are hired by the data centre owners and few of times, the auditors are engaged by application consumers. Nonetheless, in both situations, the auditors are third party and the risk of exposing business logics in the applications and the data always persists. Nevertheless, the auditor being a third-party user, the data exposure is a high risk. Also, in a data centre environment, it is highly difficult to ensure isolation of the data from different auditors, who may not be have the right to audit the data. Significant number of researches have attempted to provide a generic solution to this problem. However, the solutions are highly criticized by the research community for making generic assumptions during the permission verification process. Henceforth, this work produces a novel machine learning based algorithm to assign or grant audit access permissions to specific auditors in a random situation without other approvals based on the characteristics of the virtual machine, in which the application and the data is deployed, and the auditing user entity. The results of the proposed algorithm are highly satisfactory and demonstrates nearly 99% accuracy on data characteristics analysis, nearly 98% accuracy on user characteristics analysis and 100% accuracy on secure auditor selection process.

Paper Title: **Energy Consummation in cognitive radio network using Different Methods**

Abstract:The cognitive radio and resource allocation techniques have been proposed for efficiently utilizing the radio resources. Cognitive radio is an emerging technology intended to enhance the utilization of the radio frequency spectrum and allocate the available resources correctly. The cooperative communication system, with the same total power and bandwidth of legacy wireless communication systems, can increase the data rate of the future wireless communication system. A combination of cognitive radio with resource allocation can further improve the future wireless network performance and reduces the energy consummation. Efficient resource allocation in cognitive radio network (CRN) is essential in order to meet the challenges of future wireless networks. In this Paper, we are going to discuss the different Localization Techniques, objectives and protocols used in the literature for resource allocation in CRN. This paper also highlights the use of power control, cooperation types, network configurations, and Energy consummation used in CRN. Finally, directions for future research are outlined of proposed algorithms for energy minimization.

Keyword:CRN, Cooperative communication, Resource allocation algorithms, Energy Consumption.

Paper Title:	**Secure Data Transmission by Detecting Different Attacks in CRN to improve the throughput**

Abstract:Cognitive Radio (CR) is a technology that promises to solve the data transmission problem by allowing secondary users to coexist with primary user without causing any interference to the communication. It means to improve the usage of the radio assets to improve the throughput. Despite the fact that the operational parts of CR are being investigated broadly, its security viewpoints have increased little consideration. In this work, present a CRN architecture , Different Protocol, with complete rundown of major known security dangers and assaults inside a Cognitive Radio Network (CRN). Our goal in this paper is to dissect the distinctive security issues of the primary ongoing advancements of Cognitive Radio Networks with proper resource allocation to improve the throughput.

Paper Title: **Consumer Strategies for Adoption of Performance Analysis of 4g Mobile Services**

Abstract:We use a preference test to determine the ability of consumers to pay for mobile services enhancements with an emphasis on changes to four-gyms and roaming networks. Increasing mobile Internet speed (eventually, with 4 G), unlimited mobile Internet, improved quality (possible with 4 G) and unrestricted use in two neighboring countries are the characteristics of improved mobile services we are investigating. (unrestricted roaming). The results show that uncontrolled roaming services are most important to people. The next move to do is to increase the speed and infinite attributes at 1 per cent. . The statistically insignificant effect of improved quality at the rate of 5percent indicates that users are satisfied with the current quality level which they achieve with 3G. To research 4 G network recognition of mobile and web consumers. To analyze how the use of 4 G technologies viewed smartphone and internet consumers. Research the factors affecting smartphone and web users ' behavioural expectations (BI) through 4G. Mobile User necessities are rising faster than constantly and the limitations of the existing mobile communication systems have required the researchers to

emanate up with additional advanced and proficient technologies. 4G and 4G-LTE mobile technology is the next step in this trend. This is next generation of wireless networks 4G-LTE that will completely replace 3G networks. it is responsible for its customers with enhanced speed and entirely IP based multimedia services. 4G-LTE is completely approximately an integrated, global network that will be intelligent to afford a complete IP solution where voice, data and streamed multimedia can be specified to users on a basis. But there is a pronounced essential of deploying such technologies that can incorporate entirely these systems into a single combined system. The aim of this paper is to focus the benefits, challenges in deployment and opportunity of technologies. Comparative analysis of 4G-LTE based on performance in new communication trend and generations in India.

Paper Title: **Reinventing the workplace –Strategic to Employee Career Development in Indian Telecom Industry-A Research**

Abstract:Indian telecom industry is the world's fastest growing industry with the constant changing technology. The intensive competition of this industry has led community to signify the importance of HR. Today, organizations are searching for most proficient HR in order to recruit and retain them for the growth and development of their organization. In the present study, an effort has been made to examine the Human Resource practices in both the public and private sectors of Indian telecom Industry and also aimed to analyze the impact of HR practices and satisfaction level on employee career development. An interview schedule has been administered on a sample of 89 employees of BSNL and Airtel in Hyderabad. The study was analyzed by

using statistical techniques namely chi-square, multiple regression analysis and Garrette ranking method. The findings of the study revealed that, BSNL employees are older; less qualified have more work experience and technical skills while compared to Airtel. The personnel of Airtel were younger, highly qualified with less work experience and focused both on HR and technical skills. The employees of both the organizations were highly satisfied on career development.

Keyword:employee career development, HR practices, Indian telecom industry and technical skills.

Paper Title: **Classification among Microaneurysms, Exudates, and Lesion free Retinal Regions in the Eye Images using Transfer Learned CNNs**

Abstract:When pancreas fails to secrete sufficient insulin in the human body, the glucose level in blood either becomes too high or too low. This fluctuation in glucose level affects different body organs such as kidney, brain, and eye. When the complications start appearing in the eyes due to Diabetic Mellitus (DM), it is called Diabetic Retinopathy (DR). DR can be categorized in several classes based on the severity, it can be Microaneurysms (ME), Haemorrhages (HE), Hard and Soft Exudates (EX and SE). DR is a slow start process that starts with very mild symptoms, becomes moderate with the time and results in complete vision loss, if not detected on time. Early-stage detection may greatly bolster in vision loss. However, it is impassable to detect the symptoms of DR with naked eyes. Ophthalmologist harbor to the several approaches and algorithm which makes use of different Machine Learning (ML) methods and classifiers to overcome this disease. The burgeoning insistence of Convolutional Neural Network (CNN) and their advancement in extracting features from different fundus images captivate several researchers to strive on it. Transfer Learning (TL) techniques help to use pre-trained CNN on a dataset that has finite training data, especially that in under developing countries. In this work, we propose several CNN architecture along with distinct classifiers which segregate the different lesions (ME and EX) in DR images with very eye-catching accuracies.

Paper Title:	**Weather Predictions using Support Vector Machine and Rough Set**

Abstract:Climate modelling and weather prediction, the application of science and technology to predict the state of the atmosphere for a given location is a challenging task for the researchers in this modern age.Now-a-days the soft computing techniques have been evolved which can be used for the prediction of weather with more accuracy and less errors. But, Soft computing technique is a new approach to construct computationally intelligent systems that are supposed to possess humanlike expertise within a specific domain, adapt themselves and learn to do better in changing environments. Hence, this paper tries to analyze soft computing techniques i.e Rough Set and SVM for weather prediction of Delhi and reveals that Rough set exhibits promising result that SVM.

Paper Title:	**Delay Analysis of Wireless Cellular Networks for Better Qos**

Abstract:The message for call requests is created by mobile devices during a call which is then sent to a base station (BS). A BS processes the response of a call request and chooses to accept or deny the call. Signals such as location notifications, paging and switching due to user mobility take a significant share of the total traffic

5517-5524

load within mobile cellular networks. Therefore, between signaling packets, the maximum allowable delays may differ. This time will be delayed because if the time is longer than the allowable pause. The quality of service is therefore reduced, which for service providers is not acceptable. In this paper, we propose an empirical model to determine an overall delay in the processing of wireless cell network signaling packets, which involves the delay in the radio channel and the wired component delay in processing. We are demonstrating the effectiveness of priority processing in reducing handoff delays. We also assess the delay between cells according to their positions in the area and their influence on processing delays by the number of nodes. In addition, we evaluate the difference in delay between cells depending on their position within the network area and how many stations influence time delayed processing.

Keyword: Quality of Service, Handoff delay, mobility, mobile cellular network, signaling.

Paper Title: **An Intruder Detection System based on Feature Selection using Random Forest Algorithm**

Abstract:In every part of the world, there is tremendous growth in digital literacy in the present era. People are trying to access internet-based applications with the use of digital machines. As a result, the internet has become a primary requirement for everyone, and most business transactions often take place conveniently across the network. On the other hand, intruders involved in making intrusions and doing activities such as capturing passwords, compromise on the route, collecting details of credit cards, etc. Many malicious activities are taking place over the network due to this intruding activity on the internet. Applications such as host-based Intrusion Detection System (IDS) and network-based IDS have previously been used to control network intruders. Mostly when they come with Encrypted packets, spoofed network ids, these techniques were not able to control intruders promisingly. It is essential to examine these types of attacks periodically to identify patterns of recent attacks. In this paper, the authors have proposed a model based on deep learning by using the NSL – KDD dataset to solve these problems. For later train, the model with data with a random forest classifier algorithm, the principal component analysis applied for feature selection. The model is designed to detect patterns of intruders effectively using the knowledge gained from training data. To detect malicious patterns over the network, the model shows a sufficient accuracy of around 90 percent.

Keyword: Feature selection, Intrusion detection, Random forest, Principle component analysis, NSL-KDD dataset

Paper Title:	**Geological, Geomorphological and Ground Water Quality in the area of Amaravathi, Guntur District, Andhra Pradesh, India.**

Abstract:The area of Amaravati, a new capital of ithe State of Andhra Pradesh, is located in the Guntur district, where the groundwater has been a potentialiresource to meet several needs due to frequentifailuresi of monsoon, and its quality has been deteriorated under the different environmental conditions. The Amaravati covers an area of about 217 km2 and is distributed in 28 villages in three mandals viz., Mangalagiri, Thullur iand Tadepalle. Agriculture is the main occupation of the people. The climate of the area is dry-humid, with average annual temperatures of 18o to 48oC. The average annual rainfall is about 1,357 mm. Field investigations were conducted in the month of December 2015. The data on rainfall, topographic conditions, soil cover, geomorphological features, geological, structural and hydrogeological conditions, drainage and land use practices was collected. Groundwater samples collected from the field were analyzed for major on chemistry, viz. pH, total dissolved solids (TDS), total alkalinity (TA), total hardness (TH), calcium (Ca), magnesium (Mg), sodium (Na), potassium (K), bicarbonate (HCO3), chloride (Cl), sulphate (SO4), nitrate (NO3) and fluoride (F). Keeping ithe increase of water consumption with respect to the rapid growth population in the near future of the capital area, it is essential to assess the contaminates caused by poor quality of groundwater with respect to drinking purpose and industrial developments. In order to provide this base-line information for the purpose of the decision-making by policy-makers and water-managers.

Paper Title: **Lane Detection and Lane Change Warning as Advanced Driver Assistance Systems using Computer Vision**

Abstract:Road ways are the life line of any economy, for a country like India where economy isgrowing rapidly it is putting its toll on every sector for meeting the needs of the growing economy. Good's and personal transport are becoming vital with time and money aspects and the roads and vehicles on the roads are expected to perform optimally drastically increasing the speed on the road network and constantly increasing and modifying the infrastructure needed to meet the demands. As the speed of the vehicle increases the accident rate and the damage caused by the collision will also increase. Safety of the road network is not to be compromised and proper systems to ensure the safe passage of the vehicle and proper warning systems are to be implemented. This system should be viable in all the condition and should be cost-effective. In this paper we are implementing a vision based system to identify the lane and other vehicles from the video it captures from a properly calibrated camera mounted on the front side of the vehicle. The system is designed to automatically and continuously detect the lines exploiting the new processing techniques and warning the driver if any other is in the breaking distance of the vehicle or if the vehicle is moving out of the lane. Cost effectiveness of the system is a major aspect as many of the available systems use equipment which very good at performing their task but are not affordable. Effort is put in making the system cost effective and not compromising with the reaction time and accuracy..

Paper Title: **Predictive Analytics based Financial Assistance Model for Chronic Care Patients in India**

Abstract: Indian pharmaceutical industry (IPI) has traversed through many phases and it is in emerging

5544-

phase now (2019). IPI is looking for innovation, creativity, newness in patient connect to perform different activities to achieve their stated goals. According to a recent World Health Organization report, approximately 50% of the people with chronic illness do not take their medication as prescribed [1]. Medication Non-Adherence is a huge problem across the world. Pharmaceutical companies across the world manufacture medicines with set of standard operating procedures, guidelines, quality execution systems, inspection and verification from quality control and quality assurance activities. The very intention of producing medicines is to sell them to the patients who are in need. The last thing Pharmaceutical companies expects from Health Care Professional (HCP) is to write the prescription and patient carrying it to Pharmacy to buy the medicine. The medicines for chronic illness are expensive in general. Despite having the prescriptions for medicines, there are plethora of reasons for Patient not to buy them. One of the most remarkable reason is – 'the medicine costs are exorbitant'. If the medicines are not taken in case of the chronic illness, the patient's quality of life degrades over a period of time, eventually resulting to fatality. This is a known concern to Pharmaceutical companies and new methods are invented to address the need for supporting the Patient at difficult times. This paper made an attempt to introduce predictive analytics based financial assistance model for chronic care patients in India.

Paper Title: **Research on Single-Phase Grid Connected PV Systems**

Abstract: The demand for renewable vitality based power production has been increased because of many reasons such as to reduce the level of carbon emission, to minimize the consumption of non-renewable energy source and to maintain the environment pollution free. Among the available renewable resources such as hydroelectric, wind, solar, biomass and ocean, solar energy has gained much attention by researchers in the recent decades all over the world. The abundant availability and increasing global warming threat urge the researchers to develop an efficient solar energy conversion system. This survey purposefully intended to elaborate the significance of solar power system. This system consists of set of a PV array to transform sunlight into electrical power (dc). Then the converter and inverter circuits are utilized to produce stable ac power. To overcome the challenges like non-uniform insolation, temperature and partial shading effects, various artificial intelligence and optimization techniques have evolved to maximize the power output from the panel. Even with recent technological breakthrough the efficiency is still less than 20%.

This survey presents the several existing solar energy conversion systems with its challenges and mitigation methods under different environmental conditions for improving the power output.

Paper Title: **A Hybrid Technique for the Performance Optimization in the Combustion Process of a Power Plant Boiler**

Abstract:Coal-based warm power stations are the pioneers in control age in India and are significantly awesome nonlinear structures. The warm introduction data procured from thermal control plant shows that glow rate and evaporator capability is changing consistently and the plant is doubtlessly losing a couple of Megawatts of electric power, and more fuel use as such achieving significantly higher carbon impressions. It is incredibly difficult to examine the rough data recorded step by step during the full power action of the plant in light of the fact that a warm power plant is a staggering structure with an enormous number of parameters. Subsequently there is a prerequisite for nonlinear showing for the power plant execution assessment in order to satisfy the growing needs of money related and operational necessities. The point of this paper is to give a blueprint of a coal-ended power plant, in perspective on real plant data and this fills in as the internal model for estimate of the Heat Rate and Boiler Efficiency. This model of the thermodynamics of a power plant is used to choose the effect of changes in different elements upon the glow rate and evaporator capability utilizing affectability coefficients, which show the heading of progress in the variable that will improve warmth rate and pot adequacy, and thus exhibits the general criticalness of these different components. This information can be used to provide guidance to the plant managers and pros concerning where they should devour their undertakings to improve the glow rate and evaporator viability. Further assortment in these key parameters foreseen by affectability examination helps in extemporization of Heat Rate and Boiler Efficiency.

	Paper Title:	**Dynamic Performance of PV Array fed Vector Drive Unit**

Abstract:In emerging applications of solar powered units the significance of its operation and control plays vital role. Industries to home, in all applications need induction motors due to its robust, simple and reliable.so this type of machines used widely in variable speed applications. In the scenario this paper presents the operation and dynamic performance of vector drive fed by PV array. Any drive unit equipped with power management unit, signal conditioning, drivers and controllers and control unit. This system powered by the excitation from PV array with MPPT controller and the load here is a vector drive. Vector control is advantageous over scalar control due to its low speed regulation, low maintenance and minimum speed at Rated torque and wide base speed range. The proposed system consists of PV array, MPPT Controller, vector controlled drive. Solar panel output boosted using Dc-Dc converter with Maximum power point tracking controller Using Incremental Conductance method and the performance curves(P-V, I-V,V-I) presented. Dynamic modelling and analysis of Individual units and the respective performance curves presented here and the simulations done in MATLAB/SIMULINK Platform.

	Paper Title:	**Preventing Accidents and Detecting Traffic Loads on Highways with V2v Communication in VANET**

967.

Abstract:Road safety became as fundamental problems to the governmental manufacturing of vehicles over the past quarter century. The aggregation of word's vehicles have undergone with amazing improvement, enhancing the activity of density and causing a lot of glitches. In this article, we highlighted the problems of detecting the load of traffic on motorways and suggested a system for detecting and preventing incidents on motorways utlizing ad-hoc networks for vehicles. To do this, we implement a vehicle 2 vehicle connecting scenario using a Weighted Cluster Algorithm (WCA) and calculate the power based on various network parameters. The daily population increase in India is increasing, leading to a massive increase in road traffic. Improving new vehicle development has led organizations, specialists and foundations to concentrate their best to develop the safety of road, which is considered as a crucial thing today.(Panse, 2016).

Paper Title:	**Production of Candle from Oil Extract of a Legume - Soybean**

Abstract:This research confirmed that candles produced from oil extract of soybeans are eco-friendly and healthier alternatives to commercial candles made from paraffin wax. The soybeans were sorted, washed, crushed, dehulled and grinded prior to extraction to increase the surface area. Soybean oil is about 30% of the total soybean composition. Soxhlet extraction method was used with hexane as solvent. The extracted oil was then solidified with stearic acid to form wax inside a mold. Physical tests were carried out to prove its claims as a safer alternative to paraffin wax. The results supported the claims that soy candles are more economical and produced lesser soot than the paraffin candles.

	Paper Title:	**Effect of Industrial Waste and Geopolymers on Stabilisation of Expansive Clay**

Abstract:Expansive clay soils are geotechnically problematic in nature as they possess less shear strength, high compressibility and low permeability. This research work was carried out with a view to improve index and engineering properties of expansive soil by stabilizing it with industrial wastes and geopolymers. The industrial wastes such as fly ash, silica fume and sodium-hydroxide were used for the stabilization of expansive soil. the virgin clay soil was tested for its index properties, compaction characteristics and shear strength determination. the stabilization of clay is made by adding and mixing those materials by varying its percentage. In the stabilization of soil with sodium hydroxide, an attempt has been made to study the effect of its molarity on the various properties of the soil. The clay soil stabilized with various materials was also tested for the same properties and that results were compared with that of virgin soil to find the effect of stabilization.

Keyword: Clay, Stabilization, Flyash, Silicafume, Sodium hydroxide.

	Paper Title:	**CFD Analysis of Dynamics of Interaction of ShockWave -Vortex Core over Flapped Wing of Supersonic Aircraft at different angle of attack & Mach number**

Abstract:The objective of this paper was to analysis the condition for the appearance of the many types of interaction of a vortex core with shock wave over a flapped wing of a supersonic aircraft. A five digit NACA 23012 aerofoil was selected for this work. Structured Mesh was generated by Quadrilaterals Method. Steady-state density based implicit solver and K-ω SST turbulent model was selected. Q criterion method with vorticity

5578-5589

magnitude was used to calculate the vortex core. NACA aerofoil Scaled model was manufactured by using NACA profile for experimental work and CFD results were validated by pressure coefficient calculated by wind tunnel setup. Finally, concluded that weak interaction with no vortex breakdown was observed at M= 1.4 and a strong interaction with a bubble-like vortex breakdown formed at M= 1.8 and It found that when a shock wave interact with vortex core, disturbance is generated, which expands along the shock wave and deformed into many small vortices. The flow field is compressed behind the curved shock wave which is reason of acoustic waves. This principle are related to the shock–turbulence interaction which is one of major source of noise. Also concluded that initially at low angle of attack,it observed a strong organized flow field in the downstream region which is due to less strength of the shock. The development of a transmitted shock wave across the vortex core was observed because of shock scattering phenomenon. The moderate breakdown of the vorticity field that occurs after a very strong shock at M =1.4 also observed and the breakdown was more intense when increased Mach No. up to 1.8. Weak and strong interaction region were observed and three stages of interaction found by the flow field over aerofoil at high Mach No. =1.8.

Paper Title: **Efficient Management of Egg Shell and Conch Shell Wastes by Utilization as Bio- Fillers in Eco-Friendly Gypsum Mortar**

Abstract:The efficient waste management and recovery of waste materials are the most important goals of sustainable environmental development. The egg shells and conch shells are solid wastes being deposited in enormous amount which creates large disposal problem. In order to examine the possibility of utilizing these wastes for use in building materials the egg shell and conch shell powders were used as partial replacement for the manufacture of eco-friendly bio mortars. The mechanical characterization of the bio mortar produced by substituting finely ground egg shell and conch shell powder at various percentages were quantitatively investigated. The present research work was executed in two groups – the first group of bio mortar consists of raw egg shell and conch shell powder and the second group consists of thermally treated egg shell and conch shell powder as a partial substitute for binder. The results showed that the untreated egg shell and conch shell powder did not cause much improvement in the strength parameters of bio mortar whereas the thermally treated egg shell and conch shell substituted mortar exhibited a significant improvement in the mortar strength. The scanning electron microscopy images also reveal the denser and compact structure of mortar which supports the filling effect caused by these wastes. This improvement in strength was due to the calcite present in the egg shell and conch shell powder. The calcite traces were further confirmed by the FTIR and XRD studies. Thus the usage of these waste materials as binder reduces the manufacture of cement which minimizes the environmental pollution by mitigating the CO2 emissions.

Keyword:egg shell powder; conch shell powder; thermal treatment; calcite; bio –mortar; pollution abatement.

Paper Title:	**Optimization of Biodiesel Synthesis using Heterogeneous Catalyst (SiO2) from Karanja Oil by Taguchi Method**	

Abstract:Biodiesel is renewable and environmental friendly fuel which has the capable to gain comparable engine performance. In this experimental study, Karanja oil synthesized by using Transesterification process. Transesterification of Karanja oil to biodiesel using SiO2 as a heterogeneous catalyst is studied using five different parameters and levels each. Minitab is used to fix the orthogonal arrays and Taguchi method is used to analyze the interaction effect for the transesterification reaction. The five different parameters responsible for biodiesel yield are molar ratio of methanol to oil, catalyst concentration, reaction temperature, reaction time and stirring speed. Effect of these parameters has studied on small scale. The biodiesel yield obtained experimentally at optimum conditions are 20% methanol to oil molar ratio, 3% SiO2 catalyst addition, 65ºC reaction temperature, 180 min reaction time and 500 rpm stirring speed is 77%.

Paper Title: **Assessment of Possessed Generic Green Skills for Green Jobs of Electrical Installation and Maintenance Work Graduates of Technical Colleges in Nigeria**

Abstract:The purpose of this study is to uncover employers' assessment of possessed generic green skills for green jobs of electrical installation and maintenance work graduates of technical college in Nigeria. The study used 120 out of 140 employers of technical College Graduates in Adamawa State. The instrument used for the data collection was a questionnaire. Mean and standard deviation were used to analyze research data. The hypothesis was tested at 0.05 level of significance. The findings reveal that, in the rewinding of electrical machines modules of electrical installation and maintenance work, technical college graduates have adequate skills to work in the industry except in few areas like: conduct of preventive maintenance and testing faults in electrical filing machines' winding, the ability to locate faults in electrical filing machines' winding, carrying out insulation resistance test, interpreting drawings of electrical equipment where they showed averagely adequate and slightly adequate skills. Similarly, from the data obtained and analyzed, the result indicates that the graduates have adequate skills in industrial installation except in few areas like: Ability to handle power transmission equipment and components, maintain simple power tools, to test simple power tools, to interpret drawings of electrical equipment, to read symbols. Therefore, the researchers concluded that technical college graduates have adequate technical skills for green jobs and to work in the industries.

Paper Title: **Effect of Diethyl Ether on Combustion and Emission Characteristics of Biodiesel Blend B20 Algae Oil**

Abstract:Emission of carbon dioxide gases and damages occurring to the protective layers of the atmosphere due to the presence of pollutants like methane, chlorofluoro carbons etc. are the reasons for the Governments to adopt stricter emission norms. In the present situation where global warming is at an alarming level, there is a need to have alternate fuel which can reduce harmful emissions to a considerably low and acceptable level. Blends of B20, B40 and B100 algae oil are tested in variable compression ratio diesel engine and compared with diesel for its combustion, mechanical properties and emission performance. The performances of B20 blend are found closer to the performance of fossil fuel diesel and the blend is found suitable as one of the choice for the alternate fuel. Blend of B20 is further tested by adding 10% diethyl ether and an improvement in mechanical and emission characteristic is observed.

Paper Title:	**Detection of Breast Cancer by Thermal Based Sensors using Multilayered Neural Network Classifier**

Abstract:Consideration of public health problem issues, one of the most common diseases in public is cancer. Most of the women population is suffering from breast cancer which is the most well known appearance of cancer in metropolitan cities of India and abroad. There many number of imaging modalities to diagnose cancerous cells. Among those, mammography is alone an imaging modality which diagnoses the breast cancer at an early stage. Furthermore, this modality involves X-rays which are more harmful to human health and make the patient inconvenience. Through the mammogram, doctors can analyze, estimate and evaluate the cancer stage so that doctors can give better and correct treatment to the patients. With this mortality and death rates can also be diminished up to some extent. In this paper, the author proposed an intelligent system to identify and find out the severity of breast cancer. By using a thermal based sensor which is of negative Temperature Coefficient (NTC) available with C-MET Thrissur which replaces Mammography. The stage at which the cancer is progressing is classified with the help of Intelligent System Algorithms which works on the temperature data obtained from the thermal device. The data is pre-processed and applied to multilayered backpropogation neural network model. The neural network classifies the preprocessed images into normal, benign and cancer. The output of the network is presented to the doctors through graphs and displays.

	Paper Title:	**Robust Parallel Operated Inverters in Microgrid with SRF(Synchronous Reference Frame) – PLL(Phase Locked Loop) and SRF - Virtual Impedance Compensation Loop for Proportional Load Sharing**

Abstract:: Power flow control is most important in inverter interfaced Microgrids with highly penetrated DERs in islanded mode for their functionality to feed the connected loads. The different types of interfacing inverters connected to DERs, have been discussed for their principle of operation. The conventional inverters with droop control method of, P-f, Q-v alone failed to control with unequal line impedances. New inverters with SRF-virtual impedance compensation and SRF-phase locked loop along with droop characterstics have been implemented for defined functionalities in this paper. The design guidelines have been provided and the results are evaluated in Matlab/ Simulink platform to prove the effectiveness of the methodology.
