Dr. Vahid Nourani
Professor, Faculty of Civil Engineering, University of Tabriz, Iran.

Dr. Saber Mohamed Abd-Allah
Associate Professor, Department of Biochemistry, Shanghai Institute of Biochemistry and Cell Biology, Shanghai, China.

Dr. Xiaoguang Yue
Associate Professor, Department of Computer and Information, Southwest Forestry University, Kunming (Yunnan), China.

Dr. Labib Francis Gergis Rofaiel
Associate Professor, Department of Digital Communications and Electronics, Misr Academy for Engineering and Technology, Mansoura, Egypt.

Dr. Hugo A.F.A. Santos
ICES, Institute for Computational Engineering and Sciences, The University of Texas, Austin, USA.

Dr. Sunandan Bhunia
Associate Professor & Head, Department of Electronics & Communication Engineering, Haldia Institute of Technology, Haldia (Bengal), India.

Dr. Awatif Mohammed Ali Elsiddieg
Assistant Professor, Department of Mathematics, Faculty of Science and Humatarian Studies, Elnielain University, Khartoum Sudan, Saudi Arabia.

Technical Program Committee Chair

Dr. Mohd. Nazri Ismail
Associate Professor, Department of System and Networking, University of Kuala (UniKL), Kuala Lumpur, Malaysia.

Members of Technical Program Committee Chair

Dr. Haw Su Cheng
Faculty of Information Technology, Multimedia University (MMU), Jalan Multimedia (Cyberjaya), Malaysia.

Dr. Hasan. A. M Al Dabbas
Chairperson, Vice Dean Faculty of Engineering, Department of Mechanical Engineering, Philadelphia University, Amman, Jordan.

Dr. Gabil Adilov
Professor, Department of Mathematics, Akdeniz University, Konyaaltı/Antalya, Turkey.

Dr.Ch.V. Raghavendran
Professor, Department of Computer Science & Engineering, Ideal College of Arts and Sciences Kakinada (Andhra Pradesh), India.

Dr. Thanhtrung Dang
Associate Professor & Vice-Dean, Department of Vehicle and Energy Engineering, HCMC University of Technology and Education, Hochiminh, Vietnam.

Dr. Wilson Udo Udofia
Associate Professor, Department of Technical Education, State College of Education, Afaha Nsit, Akwa Ibom, Nigeria.

Dr. Ch. Ravi Kumar
Dean and Professor, Department of Electronics and Communication Engineering, Prakasam Engineering College, Kandukur (Andhra Pradesh), India.

Dr. Sanjay Pande MB
FIE Dip. CSE., B.E, CSE., M.Tech.(BMI), Ph.D.,MBA (HR)
Professor, Department of Computer Science and Engineering, G M Institute of Technology, Visvesvaraya Technological University Belgaum (Karnataka), India.

Dr. Hany Elazab
Assistant Professor and Program Director, Faculty of Engineering, Department of Chemical Engineering, British University, Egypt.

Dr. M.Varatha Vijayan
Principal, Department of Mechanical Engineering, Mother Terasa College of Engineering and Technology, Pudukkottai (Tamil Nadu) India.

Dr. S. Balamurugan
Director, Research and Development, Intelligent Research Consultancy Services (IRCS), Coimbatore (Tamil Nadu), India.

Dr. Rajalakshmi Rahul
FIE Dip. CSE., B.E, CSE., M.Tech.(BMI), Ph.D.,MBA (HR)
Founder and CEO Talaash Research Consultants, Chennai (Tamil Nadu), India.

Paper Title: Design and Development of Man Portable Back Packable Multi-Purpose Drone

Abstract:This report mainly presents the concepts, design and analysis of a 'Man Portable Back Packable Multi Purpose Drone (MPBPMD)' which has many applications in different areas for different operations. The technology employed in the design of this 'MPBPMPD' is adapted from the mechanism of tilt rotor, which can be fabricated as rotor MAV, similar to helicopters and hovercrafts. The main objective of this aircraft design is to provide payload bay which can be installed with multiple payloads like a camera which can be used for surveillance or a speaker to control the animals in the reserved forest, etc. The MPBPMPD will be equipped with Auto pilot for a better operational control and navigation of the aircraft even at the places with less Launch distance using its VTOL capability. The wing attach/detach mechanism technique is also used to provide the aircraft with better portability. The complete aircraft should fit in a backpack, so that the complete model can be carried easily for better portability.

Keyword: Micro Unmanned Air Vehicle (MUAV), Tilt-rotor, VTOL, Portability, Design, Wing attach/detach.

Paper Title: Usability Audit Technology of Travel Agency Website

Abstract:In the context of growing competition in the market of tourist services, it becomes necessary to introduce digital technologies: booking tours with the help of on-line service, which saves time, speeds up the processing of the application and confirmation of the selected tour. The introduction of information technologies in the system of booking and reservation of hotels, air tickets requires the development of high-quality design and convenient search for consumers on the websites of travel companies. In the modern conditions of globalization of the tourist market, quality management of website service has become a major factor in improving the competitiveness of tourism businesses. An important aspect of the activity of a tourist enterprise is the formation of tools for evaluating its own tourist site in comparison with the websites of enterprises-leaders of the tourism market. Due to the limited financial, labor and time resources objectively arises a problem of ranking directions, methods and specific measures to improve the service quality offered by travel agencies on their web pages. To further identify ways to improve the quality and profitability of the travel agency's website, the authors proposed to use modern methods of website usability audit, that is, the evaluation of the ease of use of the site by the end user. The authors conducted an audit of the websites of travel agencies basing on the methods of taxonomic analysis. They defined the main indicators of assessing the level of quality service provided to visitors of the site, which significantly affect the e-commerce system of travel agencies and the total profit from on-line sales of travel services. The method proposed by the authors can serve as a basis for further improvement of audit technologies of websites of travel agencies and e-commerce operations.

Keyword:usability audit technologies, website, benchmarking, taxonomic analysis methods, travel agencies.

Paper Title: **Solving Multi-Objective Linear Fractional Stochastic Transportation Problems Involving Normal Distribution using Simulation-Based Genetic Algorithm**

Abstract:In real-life situations, we human beings faced with multi-objective problems that are conflicting and non-commensurable with each other. Especially, when goods are transported from source to locations with a goal to keep exact relationships between a few parameters, those parameters of such problems might also arise in the form of fractions which are linear in nature such as; actual transportation fee/total transportation cost, delivery fee/desired path, total return/total investment, etc. Due to the uncertainty of nature, such a relationship is not deterministic. Mathematically such kinds of mathematical problems are characterized as a multi-objective linear fractional stochastic transportation problem. However, it is difficult to handle such types of mathematical problems. It can't be solved directly using mathematical programming approaches. In this paper, a solution procedure is proposed for the above problem using a stochastic Genetic Algorithm based simulation. The parameters in the constraint of the above problem follow a normal distribution. The probabilistic constraints are handled by stochastic simulation-based GA for the solution procedure of the proposed problem. The feasibility of probability constraints is checked by the stochastic programming through the Genetic Algorithm approach, without finding the equivalent deterministic model. The feasibility is maintained all-over the problem. The stochastic simulation-based Genetic Algorithm is considered to generate non-dominated solutions for the given problem. Then, a numerical case study is provided to illustrate the method.

Keyword: Genetic Algorithm, multi-objective programming, stochastic fractional programming, transportation problem.

Paper Title: **Smart Home Automation usingHand Gesture Recognition System**

Abstract:Visual interpretation of hand gestures is a natural method of achieving Human-Computer Interaction (HCI). In this paper, we present an approach to setting up of a smart home where the appliances can be controlled by an implementation of a Hand Gesture Recognition System. More specifically, this recognition system uses Transfer learning, which is a technique of Machine Learning, to successfully distinguish between pre-trained gestures and identify them properly to control the appliances. The gestures are sequentially identified as commands which are used to actuate the appliances. The proof of concept is demonstrated by controlling a set of LEDs that represent the appliances, which are connected to an Arduino Uno Microcontroller, which in turn is connected to the personal computer where the actual gesture recognition is implemented.

Paper Title: **Non-Linear Performance of Strong Column Weak Beam RC Frame Building**

Abstract:Buildings are designed in different methods for resisting the lateral loads, in which strong column weak beam concept is one of the methods of designing, this method is used to avoiding the global failure of the structure In this work 3bay 5 story RC frame building is consider for the analysis, the structures are design strong column weak beam with the help of static non-linear pushover analysis of RC frame building with increasing the percentage of column sizes 20%, 40%, 60%, 80% and 100%. By varying with percentage of columns resistances of structure is increased. The parameters base shear, story displacement, and hinge formations in the structure is obtained from this analysis. The base shear and displacement are increased by increasing the column sizes, these parameters are discussed the results in detail. Comparing the all six model results the base shear in increased by 266.64% when the column size is increased by 100%. From this analysis we can reduce the failure in the structure during the earthquake. Formation of plastic hinges in column changes to beam by increasing the column size, so increase the capacity of structure. The building is analyzed by using SAP2000.

Keyword: Base shear , plastic hinges, pushover analysis, strong column, weak beam.

Paper Title: **Temperature Measurement of Coal Pipe of Coal Mills by a Modified Bridge Circuit**

Abstract:In our earlier work we proposed a method to measure the temperature of the coal pipe of Coal Mills in PF Boiler by a continuous basis, In order to achieve, accurate measurements of coal pipe temperature, using the resistive transducers like resistance temperature detector (RTD), the small resistance changes linearly with temperature, but resistance measurement by using RTD using normal Wheatstone bridge circuit would have errors for the stray capacitance presents in between bridge nodal points and the ground. Hence, by the use of a modified operational amplifier based Wheatstone bridge network, these effects can be minimized. The bridge performance has been studied experimentally with RTD. It has been observed good linearity, repeatability and variable sensitivity over the wide range of temperature.

Keyword:RTD, stray capacitance, op amp based bridge network.

Paper Title: **Elliptic Curve Digital Signature Algorithm for the Third Party Auditing**

Abstract:Cloud computing usage has been highly increased in past decades, and this has many features to effectively store, organize and process the data. The major concern in the cloud is that security is low and user requires verification process for the data integrity. Third Party Auditing (TPA) technique is applied to verify the integrity of data and various methods has been proposed in TPA for effective performance. The existing methods in TPA has the lower performance in communication overhead and execution time. In this research, Elliptic Curve Digital Signature (ECDS) is proposed to increase the efficiency of the TPA. Bilinear mapping technique is used for verification process without retrieving the data and this helps to reduce the communication overhead. The performance of ECDA is measured and compared with the existing method to analyze the performance.

Keyword: Bilinear mapping, Cloud computing, Communication overhead, Elliptic Curve Digital Signature and Third Party Auditing.

	Paper Title:	**PLC based Mall Automation System**

Abstract:This paper is formed by keeping the power consumed in the malls. As the shopping malls are the global phenomenon where every little outdoor bazaar products are sold. People not only find malls for purchasing goods, it is also known as a cultural hot spot where people of all ages meet up to interact. As everyone of us know malls consume a lot of energy and not all energy are used in an efficient manner. So, to overcome this energy loss, PLC's are used to automate the malls. To start with, the parking system is fully automated so that only a specific number of vehicles can be parked inside. The door of the parking will be opened and closed automatically until the parking is full. When the parking is full the buzzer will beep so that the further incoming vehicles will be directed to another parking area thereby avoiding confusions. Elevator will be present to take customer from basement parking. Once the customer reaches near the elevator the elevator will be directed to basement. Another small way to reduce power wastage is that if elevator is present in two different floors then the elevator will move to the floor which is nearer to the present floor. This process is done by comparing the distance between the present floor and the floor which the elevator is to be moved. The elevator will move to the floor which has less distance from the present floor and therefore a little amount of power and the customer waiting time can be saved. "Saving each penny will help you to build a house one day". Air-Conditioner of the malls are also adjustable according to the temperature. The temperature is constantly being monitored by a Resistance Temperature Detectors (RTD). If there are a lot of people then it would naturally be warm so that the temperature of the Air-conditioner is further reduced so that more cooling takes place and automatically as more people leave out the mall would be cool if the same temperature is maintained, therefore the temperature is raised accordingly. Lights and Airconditioner get turned off when there is no one in the mall. For further development PLC's can be used for theft protection in each shop in the malls. If there is no one inside the shop then all the power coming to the shop will be cut off and then if there is someone who breaks the door or the window then a buzzer is made to make noise

Keyword: Mall Automation, Man Power Reduction, PLC, Power Consumption

	Paper Title:	**Performance Enhancement of Wind Turbine**	
	Abstract:Wind turbine performance and efficiency used to face big challenges due to the highly random nature of the wind and its own small size. Wind turbine blade geometry has direct implications on the load bearing response and performance of the blade. New Wind Turbine Blade was modelled and detailed analysis was done using Ansys and Matlab. Static, Fatigue, Vibration, Computational Fluid Dynamics and Simulink Analysis was done to compare the performance of both wind turbine blades. Velocity of 83.33 m/sec have been incorporated for analysis. Various different Mathematical Equations and proper methodology was carried out to enhance the performance of Wind Turbine. Simulink Model was designed to optimize the performance of Wind Turbine. High Lift to Drag Parameter is optimized for proper Efficiency of Wind Turbine. Turbine blades are twisted so they can always present an angle that take advantages of the ideal lift-to-drag ratio. Optimization of Tower Design was carried out to enhance the performance of wind turbine. Better energy Production parameter is solved by the analysis and Simulation. Simulink Model was designed to optimize the performance of Wind Turbine. Simulink Output results shows the output of Electromagnetic Torque, Stator Current and Rotor Speed. Stress vs Strain Graph was plotted for both designed wind Turbine blades. Coefficient of drag graph was plotted to conclude the performance of Wind Turbine Blades. Turbulence behaviour is observed for both the wind turbine blades to validate the performance of Wind Turbine blades. Epoxy Material is considered for Wind Turbine blades. **Keyword:**Performance, Efficiency, Damage, Blades **References:** 1. 	Paper Title:	**CSL Net: Convoluted SE and LSTM Blocks Based Network for Automatic Image Annotation**	
	Abstract:Due to advancement of multimedia technology, availability and usage of image and video data is enormous. For indexing and retrieving those data, there is a need for an efficient technique. Now, Automatic keyword generation for images is a focussed research which has lot of attractions. In general, conventional auto annotation methods having lesser performance over deep learning methods. The annotation is transformed as captioning in deep learning models. In this paper, we propose a new model CSL Net (CSLN) as a combination of convoluted squeeze and excitation block with Bi-LSTM blocks to predict tags for images. The proposed model is evaluated using the various benchmark datasets like CIFAR10, Corel5K, ESPGame and IAPRTC12. It is observed that, the proposed work yields better results compared to that of the existing methods in term of precision, recall and accuracy. **Keyword:**Automatic image annotation, Image captioning, Deep learning, Convolution, Squeeze and Excitation Block, Long – short term memory block. **References:** 1. 	Paper Title:	**Cryptosystem using Crossover Function and Logical Operators**	
	Abstract:As technology is growing faster and exchanging of data is mostly carried through internet different mechanisms are being developed to counter unwanted access to the data. By introducing the web and pay out programs, it becomes very difficult to protect the data even with more mechanisms. It is becoming a big concern and worry in securing individuals data. These types of problems can be solved with cryptography and data can be secured in the network. In developing security systems Genetic algorithms are playing important role. In this proposed work crossover function from Genetic algorithms along with bitwise logical operations are used together to build a hybrid cryptosystem. **Keyword:**Security mechanisms, Security attack, Encryption, Decryption, Genetic algorithms, Crossover Function. **References:**1. 	Paper Title:	**Impact of Biogas Blends with Diesel on Emission of Compression Ignition Engine**	
	Abstract:Main objective of the work was to investigate the output like emission from compression ignition engine which has been run by diesel as well as the blends of biogas with diesel. Volume flow rate of biogas with petrol as a major parameter to reach the expected outcome. The engine was operated with diesel, and blends of biogas 15%, 25% and 35% with petrol. The study focused on the variation of outputs hydrocarbon, carbon monoxide(CO) Nitrous oxides(NOX) and smoke for the brake power generated by the engine. The engine exhibits better results when the proportion of biogas was increased. **Keyword:**Biogas, Carbon monoxide, Compression Ignition engine. 	Paper Title:	**The Mechanism of the Development of Social Protection of Women in the Context of Domestic Violence**	
	Abstract:True equality of rights and freedoms can be found only on the basis of recognition of the value of each person, creation of stable conditions for self-development of the human intellect, the most complete realization of his creative potential and creative abilities, the comprehensive disclosure of essential forces and talents, which will ensure everyone's full contribution to the development of society. The transition of many countries to the information society - a society of intelligence, knowledge and thinking - creates basic opportunities for self-development and self-realization for every person. The need to adopt a gender strategy is determined by social problems caused by socio-economic and political transformations in Russia. Along with the opening of new prospects for the widespread use of human abilities, people are required to have high adaptive capabilities, which differ significantly between men and women. This article was written with the aim of developing a mechanism for the social protection of women in the context of gender-based violence. The following tasks are defined in the article: how to identify and justify the significance of the physiological premises of gender inequality; show the immanent essence of gender. inequalities in the history of the peoples of the world; to	**63-69**

consider the dynamics of relations of inequality between the sexes; show the essence of violence as manifestations of gender inequality; develop a classification and analyze the types of gender-based violence; to explore the manifestation of gender-based violence in modern society. The article consists of from introduction, literature survey, methodology, recommendation, discussions, and conclusion.

Keyword:domestic violence, mechanism, risk factor, gender inequality, social protection, gender strategy, tools.

	Paper Title:	**Progressive AODV: A Routing Algorithm Intended for Mobile Ad-Hoc Networks**

Abstract:Mobile ad hoc networks are an independent wireless network that is built without permanent infrastructure and base station support. Each node in the network uses a wireless connection for connections and acts not only as an end system but also as a path to accelerating packets. Meanwhile, the network nodes are mobile and can move in each path with changing steps, creating a great dynamic of the network. Therefore, the protocols set for general ad hoc networks are inappropriate for such a situation. In addition, the performance of ad hoc routing protocols decreases with increasing network size. In this context, suggest a new way to extend the recital of routing in MANETs: the on-demand Progressive Distance Vector (PAODV). It is a modified variant of the standard AODV routing protocol, which shrinks the dynamic path when an optimal path exists and switches the traffic to it. Simulation studies with NS2 show that the proposed method improves network performance as network size, weight, or flexibility increase.

Keyword:MANETs, AODV, Routing protocols.

Paper Title: **Assessment of Thermal Performance of Non-Conventional Grooved Stepped Shoe Ribs by CFD Technique**

Abstract:In improvement of the thermal performance there is necessity of the heat transfer augmentation. Heat transfer enhancement can be achieved with enlarged or extended surface, impeded boundary level, augmentation in the turbulence etc. It is desired to keep the size of heat exchanger compact for better working conditions. In the proposed work, we made the Computational Fluid Dynamics (CFD) analysis of the non-conventional type of ribs. In this work the non-conventional Stepped grooved shoe shaped ribs were studied by changing its geometry parameters like rib height (15, 20,22mm), thickness of the rib (4, 5,10 mm), and the ratio between these entities. The numerical analysis was done to study change in rate of heat transfer and pressure drop. The effects of variation in staggered arrangements and truncation gap on thermal performance were also studied. It was observed that providing staggered arrangement with truncation gap of 20 mm gives the optimum value of thermal enhancement factor of 1.33.

Keyword: Modified shoe shape, stepped shoe shape rib, heat transfer enhancement, thermal enhancement

Paper Title: **Spectrum Allocation by Sealed Bid Game Theory**

Abstract:Wireless communication subscribers are increasing day by day specially in fifth generation (5G) wireless communication where multiple number of users (Multiple Input Multiple Output or MIMO) can be served in a specific time. The heavy data usage is also enhanced with the increasing the number of subscribers, this data transfer speed depends on the amount of spectrum allocation to the specific subscriber. Thus, spectrum allocation is a major criterion for wireless communication performance improvement. The spectrum allocation efficiency can be observed by Game Theory, which is a popular decision maker of modern era. Sealed Bid Game theory is one of the popular segment of the game theory. The spectrum allocation can be done by using Sealed Bid Game theory and spectrum equilibrium can be observed by using different sub division of Sealed Bid Game theory.

Keyword:5G, MIMO, Game Theory, Sealed Bid Game Theory, Spectrum Allocation.

Paper Title: **Enhanced Slack Time based Price Driven Demand Response for Future Effectual Smart Communities**

Abstract:Evolution of smart grid concept aims to address the imbalance between electricity demand and supply. Owing to consideration on sustainable energy, user comfort, and cost efficiency, residential Demand Response (DR) has gained a remarkable popularity over the past few years. To further enhance these benefits, herein we propose a residential appliance scheduling algorithm inspired by Least Slack Time (LST) algorithm. The conventional LST algorithm is amended with consumption thresholds and waiting factor constraints to derive proposed Minimum Slack Time (MST) algorithm, which increase cost and comfort efficiency during DR. Proposed algorithm was experimented in a simulated residential community consists of 50 houses. Further experiments were conducted by aggregating renewable energy sources using aggregated MST (AMST) algorithm. All instances were compared with an existing scheduling mechanism to assure superiority of proposed MST and AMST algorithms, in terms of grid electricity consumption, cost, Peak-to-Average Ratio (PAR), and waiting time.

Paper Title: **Manipulation of Nonsense to Bring Sense: The Pinter Technique**

Abstract:Harold Pinter, the Nobel laureate, is a literary giant of modern drama in English. His plays are categorized as belonging to the absurd theatre along with the likes of Beckett. The absurd theatre makes use of language in a peculiar way to communicate the real predicament of human existence. Harold Pinter, as a chief exponent of the Absurd Theatre made a significant stamp on the theatrical language. His style is so unique that it led to the coinage of the word 'Pinteresque'. The speeches in his plays are an interplay of both sense and nonsense. This article aims to analyze the language employed by Harold Pinter and in the process examine how absurd it actually is.

Paper Title: **Policy Design for Optimizing the Hydropower Generation Potential of Maithon Multi-purpose Reservoir System**

Abstract:It is proposed to develop an optimal operating policy for the Maithon multi-purpose reservoir system,situated at Maithon, which is approximately 48 km from the district of Dhanbad (Jharkhand), India.The present objective is to maximize hydropower generation subjected to reservoir mass balance, release, storage,reservoir-drawdown level, overflow,maximum flood zone space,maximum and minimum storage constraints under three different dependable inflow conditions namely 50%, 70% and 90%.The storage curves also been derived after analyzing the various policies and was observed to be persistent with that of demand requirements.The derived policy is capable of producing maximum annual hydropower of 133394.43 MWh,103015.14 MWh and 61782.77MWh for 50%, 70% and 90% dependable inflow conditions respectivelyagainst theexisting generated values of hydropower as 102958.3 MWh which has been averaged over last 10 years.Further the firm hydropower power values obtained under 50%, 70% and 90% dependable inflow conditions are 5.773 MW, 3.421 MW and 2.67 MW respectively.In this study the potential ofhydropower energy production of the reservoir system is explored extensively, and a trade-off between reservoir release

99-108

especially for irrigation purpose andmaximum energy production has been established for the use of various stakeholders as well as managers of reservoir operations .

	Paper Title:	**Effect of Machining Parameters in Milling Aluminum Alloy 7075-T6 under MQL Condition**

Abstract:Minimum quantity lubrication (MQL) is an eco-friendly method, where a small amount of fluid was sprayed to cutting edge in mist form with the aid of the air. The foregoing studies revealed that inappropriate machining parameters without the assistance of the cutting fluid methods became a major challenge in milling aluminum alloy 7075-T6. The paper presents the findings of the experimental work to assess the effect of machining parameters towards cutting tool life and machined surface roughness in milling aluminum alloy 7075-T6 at high cutting speed under MQL condition. An eight-run experiment was designed according to full factorial design based upon two levels of cutting speed (500 m/min, 600 m/min), feed rate (0.12 mm/tooth, 0.15 mm/tooth), and axial depth of cut (1.40 mm, 1.70 mm) and then analyzed employed ANOVA to determine the significant machining parameters. The cutting tool life and machined surface roughness were assigned by the rejection criterion of tool flank wear in the milling operation. The optical microscope and portable surface roughness tester were applied to analyze tool wear and average surface roughness value. Cutting speed and feed rate were significantly contributing to the tool life and surface roughness. The longest tool lifespan of 20.14 minutes and lowest surface roughness value of 0.569 µm were obtained at a speed of 500 and 600 m/min, respectively, with a low combination of the rest of parameter which are 0.12 mm/tooth and 1.40 mm.

Paper Title: **Design and PVT Analysis of Robust, High Swing Folded Cascode Operational Amplifier**

Abstract:The folded cascode operational amplifier (FCOA) designed in this paper is the single-pole operational amplifier (op amp). In this design, the conventional current mirror is replaced with wide swing current mirror to overcome the essential drawback of cascode configuration. In this paper, negative feedback is used to improve the small-signal gain and to ensure better stability than multistage amplifiers. This paper also aims at improving the output voltage swing, power dissipation and robustness of the op amp. The designed FCOA is proficient in achieving 67.44dB gain and 1.77V output swingat typical voltage for 180nm CMOS technology. The FCOA is highly stable with phase margin of 62.58º while dissipating 0.5mW power. This amplifier is further verified for variability analysis for Process, Voltage and Temperature (PVT) variations to check robustness. All together testing is done at 45 different PVT combinations and results are tabulated accordingly. At each corner temperature and voltage are varied for all together nine combinations to properly address the effect of PVT variations. The results shows that the op amp exhibits desired response at four corners (FF, TT, SS, and FS) of process, over -40º to 125º C temperature range. Also it is capable of operating at very low voltage up to 0.9V adequately showing reduction in power dissipation. Thus the designed op amp is low power, high swing and robust towards process, voltage and temperature variations.

Paper Title: **Deformation Exploration in Mass Spring Model using Euler and Verlet Integration Methods**

Abstract:The paper assigns the firm technique that has been designed for the mesh based simulation by using the concept of mass spring model. The general mass spring model has been utilized in a lot of applications for instance, fashion designing, merging virtual booth and in the basics of cloth simulations, consecutively in order to develop effectual surgical training through virtual environments. Though, virtual simulators necessitate meeting both requirements that are, dynamic to be real time and high realistic. While dissimilar forces have applied on the particles they generate several differential equations. In order to, solve these equations, different kinds of integration methods have been used to get the best results. Here in this paper, it shows the procedure of generating a mesh based simulation using euler and verlet integrations method. Verlet method executes vigorous compared to Euler integration method on the basis of deformation error.

Paper Title: **Modifying Exhaust After-Treatment Device for Complying with Future Emission Norms**

Abstract:Day to day increase in air pollution is one of the serious issues nowadays. One of the main contributors is automobile emissions. It contains gases like carbon dioxide, carbon monoxide, hydrocarbon, nitrogen oxides, and particular matters. In order to address such issues, this paper is focused on the reduction of emissions by modifying the design of an exhaust after-treatment device. The analysis is carried out on a 4-stroke single-cylinder 149cc FZ-S BS4 bike two-wheeler gasoline engine.CO and HC emissions absorbed by an aqueous solution having different TDS of aqua 90ppm RO water, 1000ppm Municipality water, and 10000ppm seawater. Such aqueous solution contains calcium powder and activated carbon in 10:0.5:0.5, 10:1:1 and 10:2:2 in proportion respectively. An optimum solution derived which having a mixture of 10:1:1 proportion having 10000ppm seawater is derived which shows reduction in CO by 50% and HC emission by 40% as compare conventional muffler exhaust emission. The IoT device is used with the MQ-7 sensor to measure CO emission from a modified device and data obtained are compared with PUC (Pollution under control) certified center. This research is to optimize emission from the existing gasoline engine, from April 2017 BS4 is implemented in INDIA nationwide & BS6 will be going to implement by 2020. From April 2017 manufacturer are not allowed to build new engines below BS4 standard but customer those who are having an older version of engines are not having any effect of BS4 & their engines are still emitting more pollution than the current emission norms. More than 100 million of two-wheeler engines were sold in between Feb'06- March'17. This study aims to provide a solution for such engines not from the manufacturer side but from the consumer side to upgrade their vehicle to satisfy future emission norms so that human health will be less affected by such emissions.

Paper Title: **A Wideband Subharmonic Mixer Incorporating Signal Interference Technique Based Isolation Circuit**

Abstract:A broadband (8.7 GHz – 11.5 GHz) performing passive sub-harmonic down-conversion mixer using signal interference technique (SIT) is demonstrated, designed and reported in this paper. The local oscillator (LO) frequency is half of the radio frequency (RF) for the 2xsub-harmonic mixer architecture; therefore, for the RF lying in the range 8.7 GHz to 11.5 GHz, required LO frequency range is 4.25 GHz to 5.65 GHz with 0.2 GHz fixed intermediate frequency (IF). With a broadband operation, designed prototype shows single sideband down-conversion loss in the range 9.6 dB – 12.6 dB. Moreover, large-signal testing infers an adequate linear trait of the proposed design, showing -3 dBm and 11.32 dBm for the 1 dB compression point and third order input intercept point, respectively.

Paper Title: **Data Optimization using Apache Flink**

Abstract:Map Reduce, Flink, and Spark, also become more popular in the processing of big data lately. Flink will be an open platform Big Data processing system for Apache-powered batch storage and streaming of data. Flink's query optimizer is constructed for historical information processing (batch) based on parallel storage systems approaches. Flink query query optimizer interprets the questions into jobs of different tasks that are regularly sent. Therefore, taking advantage of task similarities should prevent redundant computation. In this article, the multi-demand optimization model for Flink, Flink was planned and designed on Flink Software Stack's top priority. It's thought-about as an associate in Apache Flink's nursing add-on to maximize multi-demand information sharing. The Flink system takes advantage of option operators ' information sharing resources to reduce overlap and duplication of multi-query in-network information movement. Research findings show that the leveraging of shared option operations in vast information on multiple requests would offer promising time to perform queries. Therefore, in the stream phase, Without doubt the Flink approach can be used to boost application performance over time periods.

Paper Title:	**Tri-Concomitant Local Feature Learning for Diabetic Retinopathy Classification**	

Abstract:In this paper, we have proposed a new technique entitled as Transformed Directional Tri Concomitant Triplet Patterns with Artificial Neural Network is proposed for Diabetic Retinopathy Classification. TdtCTp consist of three stages to obtain detail directional information about pixel progression. In first stage, structural rule based approach is proposed to extract directional information in various direction. Further, in second stage, microscopic information and correlation between each sub-structural element are extracted by using concomitant conditions. Finally, minute directional intensity variation information and correlation between the sub-structural elements are extracted by integrating first two stages. After feature extraction, the extracted feature is used as input to the artificial neural network. To the best of our knowledge, this is the first learning based approach for diabetic retinopathy classification. Effectiveness of the proposed method is evaluated in terms of average precision and compared with existing state-of-the-art methods. The experimental analysis shows that the proposed method is achieved significant performance compared to other methods.

Keyword: Feature extraction, artificial neural network, Diabetic Retinopathy Classification.

Paper Title: **Enhancing the Tablet Images using Noise Reduction Algorithms by Analyzing Different Color Models**

Abstract:Unidentified tablets are challenges to both patients and healthcare professionals. Using these unknown tablets results in undesirable reaction of drug and also it is foundation to ill health that leads to death even sometimes. Thus, recognition of unidentified tablets is a significant task in medical industry. Identification of tablets is one of the major concerns for public and pharmacists, which can be carried out by means of either text-based or image-based methods. The tablet identification system is focused on removing noise from the tablet images using algorithms like Independent Component Analysis (ICA) and Discrete Wavelet Packet Transmission (DWPT). The three color space models, i.e., RGB (Red-Green-Blue), YCbCr (Y-Luma, C-Chroma of blue and red components) and HSV (Hue-Saturation-Value) are examined for their efficiency on removing noise from tablets. For each color space model, the two denoising algorithms, ICA and DWPT are analyzed and applied. The result is interpreted using metrics like PSNR, FoM, MSSI and Speed. Experimental results proved that denoising with HSV color space model gives maximum efficiency when used with ICA and DWPT-based tablet identification systems.

Keyword: Color Space Model, Tablet Retrieval, Denoising, Wavelet Packets, ICA, DWPT, Reference Image, Consumer Image.

Paper Title: **Active Power Decoupling Topology for Single Phase Bridge Inverter based on Buck-Boost Convertor**

Abstract: Increasing demand of power has led to exploration of non-conventional sources of energy. Solar energy has been the most exploited source of energy in this regard. Effectiveness of power utilization depends on the power conversion from AC to DC. Further improvement in utilization of DC power depends on the DC-DC conversion steps involved. The planned methodology offers a study of power decoupling method while no further power semiconductor are used for a DC to 1-ϕ AC device. 1-ϕ voltage source bridge inverters have primarily two drawbacks, that's reduction in DC voltage usage and disparity in power among the incoming and outgoing sides. These difficulties have been looked upon and a topology has been implemented that uses just a film capacitance beforehand buck-boost convertor that is linked to the voltage-source bridge inverter. Reenactment and preliminary outcome confirmed the credibility of the planned power decoupling technique on the 2-stage 1-ϕ bridge inverter by buck-boost convertor.

Keyword:1-ϕ AC convertor, Buck-boost convertor, voltage-source bridge inverter

Paper Title: **Brainy Diabetes Diagnosis and Doctor Recommendation System**

Abstract:Diabetes is the most common disease that is prevailing now a days from old age people to the young dynamic people which leads to death of the individuals. Eventhough many people are going to hospital in search of a treatment. These treatments may vary from hospital to hospital for the check up and diagnosis. In this scenario there is a need to make people aware of the primitive measures of diabetes and also the treatments as well as the disease intensity stages. This means there should be a treatment from home but not without the presence of a doctor. This paper resembles the diabetes diagnosis system for type1 and type2 diabetes. With the advent of artificial intelligence things are coming to the door steps. This paper illustrates an upcoming technology that makes the finger print based diabetes test system and generation of reports directly to the doctors. As this is the upcoming technology the base of Artificial Intelligence applications in attaining the application of algorithms like SVM, Linear model and Random Classifier.

Keyword: Linear regression, diagnosis, machine learning, Support Vector Machine.

	Paper Title:	**Implementation of R.A.9184 in DPWH Region III in the Bidding of Infrastructure Projects**

Abstract:Compliance to Government Procurement Act R.A.9184 by procuring entities remains the biggest challenge to realize the objectives of equality, transparency and responsibility in government procurement in the country. The study focuses on assessing the existing implementation of R.A. 9184 in the bidding of infrastructure projects of concerned District Engineering Offices in Region III by considering the constraints on its processes. There were 45 respondents answered the questionnaires gathered from the seven (7) District Engineering offices of DPWH Region III, namely, Zambales , Bataan and Pampanga. Interviews and feedbacks from the Bids and Award Committee members (BAC), BAC secretariat and Technical Working Groups (TWG) of the Procurement Division of Infrastructure projects were conducted to substantiate the answers of the respondents. The data collected were treated statistically using percentage and weighted mean. All respondents show level of awareness and understanding in the implementation of R.A 9184 of bidding process and they are able to review and re-evaluated all concerns pertaining to any ambiguity of the process. Respondents show competence on how far they understand and implement the process properly. The researchers find that there is a need in identifying minor irregularities to major irregularities to eliminate confusion in selecting the lowest responsive bidder.

	Paper Title:	**An Effective Progressive Image Transmission using Superpixel based Saliency Detection and Modified SPIHT Compression Algorithm**

Abstract:A new progressive image transmission system was proposed in this research paper for effective usage of communication bandwidth. At first, the superpixel based saliency detection method was used for segmenting the foreground region from the background region, because it gives more saliency information of an image with the benefit of color contrast. Then, Integer Wavelet Transform (IWT) was applied in the foreground image, which delivers A good quality of the image and also the compression ratio of the image was decent. Additionally, optimized neural network and modified Set Partitioned in Hierarchical Tree (SPIHT) algorithm were applied in the background image that delivers good rate distortion properties in the noise free environment and also enhances the image visual experience. In modified SPIHT, the sub-tree roots were not excluded that helps to encode and quantize the wavelet coefficients effectively. Also, it delivers more information to the image edges that effectively improves the subjective visual experience. Experiment report showed that the proposed work enhanced the Peak Signal to Noise Ratio (PSNR) upto 5dB compared to the existing work.

Keyword: Integer wavelet transform, modified set partitioned in hierarchical tree, neural network, progressive image transmission, and superpixel based saliency detection.

Paper Title: **New Technological Scheme for Dredging Process**

Abstract:The present investigation aims to propose adevelopment of new technology for marine dredging operations. The main problem of dredging process connected with profit increase and reduction of time required to produce the necessary amount of soil. It is shown in the article that these can be achieved by changing the technology of slurryprocessing and transporting only. The specific concentration of water in the slurry reductionleads to an increase of the most important working indicator - the productivity of the dredger. Under the same conditions the dredging vessel's operating time can be reduced by increasing the concentration of soil in the slurry. For this purpose, a new technological scheme was developed. It was describedhow to use the schemefor two typical operational modes of the vessel.The first one describes the process of slurry extraction and transportation through a nearshore deflate pipeline, and the second one, when the extracted soil enters the cargo hold of the dredger.

Keyword:concentration of water in a slurry, dredger, separation unit, new dredging technological scheme.

Paper Title: **Network Based Intrusion Detection System using Protocol Standardization Techniques**

Abstract:The IDS system identifies the anomaly device which connected in the network communication process through evaluating the MAC address compared with the registered list of devices. In completion, this research work ensures that all the devices which are involved in the network communications are authenticated and secured, which increases the security of the network and prevents the intruder. This research work attempts to increase the quality of service of network communication, ensuring error-free communication through monitoring the network.

Paper Title: **Determinants of Bond Rating and its Implications to Corporate Bond Yield**

Abstract:Identifying the factors that affect bond ratings is important in relation to investment decisions in long-term debt securities because they have an impact on corporate bonds. The research objective is to analyze the factors that influence bond ratings and their implications for corporate bond yields, both partially and simultaneously. This study uses a logistic regression model to estimate the determinants of corporate bond ratings and a panel data regression model to estimate the implications for corporate bond yields, by taking samples of corporate bonds listed on the Indonesia Stock Exchange (IDX) during the 2012-2016 period with a number of samples research with as many as 36 corporate bonds. Based on the results of the study, using the logistic regression method, the following research findings were obtained: company size, liquidity, leverage and profitability simultaneously affected bond ratings with a contribution of 33.62% (R2). In addition, the size and liquidity of the company have a positive and significant effect on bond ratings. While the results of the panel data regression analysis, it was found that company size, liquidity, leverage, profitability and bond rating simultaneously affected bond yields with a contribution of 70.4% (R2) while 29.6% was influenced by other variables. In addition, the size and leverage of the company has a negative and significant effect on the yield of corporate bonds. This study also shows that the larger the size of the company, the less sensitive the changes in bond yields and vice versa, the smaller the size of the company, the more sensitive it is to changes in corporate bond yields.

Keyword:bond rating, corporate bond yield, logistic regression, panel data regression

Paper Title: **Reconfigurable Antenna using Micromechanical Actuation Switches for K and Ku-Band Applications**

Abstract:In this paper, we have proposed a reconfigurable antenna using micro mechanical actuation switches for K and Ku-band applications. Overall two identical cantilever micro mechanical switches (S1 & S2) are used to design reconfigurable patch antenna. The switches are working by electrostatic actuation mechanism. With the switches, overall the antenna is offering four resonant frequencies based on the switches ON/OFF condition. The Micro mechanical switches are offering an isolation loss of -18.5dB and an insertion loss of -1dB. The switch requires a DC actuation voltages of 6V. The Proposed reconfigurable antenna is resonating at four different frequencies based on the different switching conditions of RF MEMS switches. If S1 & S2 both are ON the antenna is resonating at 16.9GHZ, if S1 -ON & S2-OFF the antenna is resonating at 47.3GHZ & 59.1GHZ, if S1 -OFF & S2-ON the antenna is resonating at 28.4GHZ, if S1 -OFF & S2-OFF the antenna is resonating at 27.9GHZ

Keyword: Patch antenna, re-configurability, RF MEMS switch, PIN diode, FET, Polarization, bandwidth, gain, directivity.

Paper Title: **A New Method to Obtain an Initial Basic Feasible Solution of Transportation Problem with the Average Opportunity Cost Method**

Abstract:In this preset article, we have explained all new method to get Initial Basic Feasible solution (IBFS) of Transportation Problem (TP) with the Average Opportunity Cost Method (AOCM). It is very simple arithmetical and logical calculation.After finding the IBFS we use Modified Distribution Method (MODI) method to optimize the IBFS. Results obtained by using this method we found that IBFS of most of the transportation problem closer to optimal solution than using the other existing methods. We illustrate the same by suitable examples.

Keyword:AOCM, IBFS, MODI, Optimal Solution, TP.

Paper Title: **Green Supply Chain Management Optimization Based On NSGA-II Method**

Abstract:Green Supply Chain Management (GSCM) is the adopted by many companies due to the government policies of various countries. The optimization technique can be applied in the GSCM to increase the profit of the company. In this research, Non-dominated Sorting Genetic Algorithm-II (NSGA-II) technique is applied for the optimization of GSCM to increase the performance. The NSGA-II method has the advantage of choosing the solution closer to the pareto-solution and uses the elitist technique to preserve the best solution in the next generation. Mathematical model of the GSCM system is established and data is provided as input to the mathematical mode. Data is generated in three types, small scale, medium scale and large scale. The proposed NSGA-II method has high performance in the optimization technique compared to existing method. The proposed NSGA-II method has the Number of Pareto Solution (NPS) metrics of 17 for large scale data, while existing method has 14.

Keyword: Green Supply Chain Management, Non-dominated Sorting Genetic Algorithm -II, Elitist technique, Mathematical model, and Number of Pareto Solution.

Paper Title:	**The Effect of Technology-Based Applications on Brand Image in the Telecommunications Industry**

Abstract:The paper investigates the effect of technology-based applications on brand image in the telecommunications industry. The study aims to identify the most influencing technology-based application on brand image and areas of improvements for each application. The study proposes a model that shows the effect of certain applications on brand image in the telecommunications industry. A quantitative survey was used for data collection to support the model. The research shows a significant overall model where technology-based applications account for 28% of variance in the consumer's perception of the brand image. Websites and social media applications have significant impact on brand image while mobile applications & services have positive but insignificant impact on brand image. The paper can help companies to adopt technology-based applications in their brand management strategies and invest more on technology-based channels to enhance the brand image, attract more customers, and gain competitive advantage. There has been little research focusing on the effect of technology-based applications on the brand image and specifically in the telecommunications industry.

Paper Title: **Determination of Cable Tension Force uUsing Accelerometer**

Abstract:Cable is the main element in a long span structure and is often used for special structures such as long span bridges, roofs and other structures that require a long span. The stiffness of the cable is determined by the amount of axial tensile force acting on the cable, and hence, the magnitude of the actual tensile force on the cable is an important factor to be determined and monitored. One simple method for determining the actual tensile force on a cable is to calculate the tensile force from the first natural frequency of the cable. However, it is important to ensure that the formulas used to calculate the tensile force are accurate. This research aims to determine the level of accuracy and the factors that influence the accuracy of the formula to determine the tension force of the cable from the natural frequency value of the cable. The methodology used in this research project was by applying free vibrations to the cable with given axial tensile load and measuring the acceleration that occurred with an accelerometer sensor. By using Fast Fourier Transform (FFT), the natural frequency value of the cable can be calculated and the actual tensile strength in the cable can be determined.From the experiment conducted, it was found that the length of the cable affects the accuracy of the measurement of the natural frequency and the magnitude of tensile force of the cable. The strain that occurs on the cable plays a very important role to the accuracy of the formulas used.

Keyword:accelerometer, cable, natural frequency, tension force.

Paper Title: **Development of the Packer and its Application for Fixing Production Casing Leaks of Oil and Gas Wells**

Abstract: A large number of oil and gas wells at the late stage of operation are characterized by high and constantly increasing water cut of the extracted product. One of the reasons for the high water cut is the presence of production casing leaks. The occurrence of production casing leaks is connected both with the quality of primary cementing and various operating conditions of wells. To solve this problem, different technologies are applied with the use of plug-back mixtures and technical means, each of which has its own advantages and disadvantages as well as its own application area. In particular, the packers of various structures are widely used. Among the many options, the retrievable packers benefit in the market even in the case of their relatively high costs due to their easy removal and reuse. The article presents the results of the work on the development of a new structure of the retrievable packer with cable termination glands and hydraulic opening system in the well. The structure of the retrievable packer was tested in the laboratory conditions with the use of a purpose-designed test rig and in the field environment. The designed stand for testing individual structural units and the packer as a whole is a casing string simulator in which the test packer is placed. The stand is equipped with a hydraulic cylinder to simulate the movement of the packer, hydrostations to simulate hydraulic loads on the packer and breakthrough fluid from the leakage of the production string, circulation pumps to simulate circulation pumping

230-235

through the packer. Field tests were carried out at one of the fields in Eastern Siberia, Russian Federation, at wells with very high water cuts. Full compliance with the claimed requirements concerning the reliability of operation of mechanisms and well plugging of the leak interval was shown. Besides that, the advantage of the packer is the possibility of communication between spaces above and below the packer. At the same time, the possibility of technological washing, acid treatment, killing and other technological operations is preserved. The use of packer during repair and insulation works in wells has made it possible to reduce the duration of works on the average by 2.5 times.

Keyword: Retrievable packer, mechanical water shut-off, test rig, field tests, experimental study.

Paper Title: **Application of PODEM Algorithm for Fault Detection and Location in FinFet based Combinational VLSI Circuits**

Abstract:FinFet transistors are used in major semiconductor organizations and a significant role is played by it in developing the silicon industries. Due to few embedded memories and other circuit issues the transistors have specific faults in manufacturing, designing of the circuit etc. This paper presents an advanced test algorithm to diagnose those faults. The circuit with different gates is designed to identify the places having faults. In addition, different algorithms such as PODEM (Path Oriented Decision Making algorithms) are used to find the fault detection and location. The Furthermore, more complicated circuits are analyzed for fault detection with different approach. In this research work Combinational Circuits are designed using 20nm/32nm technology nodes in LT Spice environment and PODEM Algorithm is implemented which is developed in MATLAB, to detect and identify fault location and sensitive test vector to detect fault in the circuit and results are presented..

Keyword: Fin Fet transistors, Fault analysis, Transfer characteristics. , PODEM Algorithm, Fault Diagnosis, Fault Detection.

	Paper Title:	**Congestion Control Through EDA with Shortest Path**

Abstract: Ad hoc mobile networks contain remote nodes linking through electronic media, without any set backend facilities. Disturbance happens in any type of intermediate nodes in these networks when data packages travel from resource to destination, leading to high package loss and also lengthy delay, triggering network efficiency destruction. This paper presents EDAODV congestion and also command directing protocol for mobile ad-hoc networks. Via determining line position and also identifying congestion degrees, EDAODV senses node-level blockage. Based on blockage rates, EDAODV makes use of the uncongested precursor and successor nodes of an overloaded node as well as starts bi-directional processes to determine alternative, uncongested courses in between them for data transmission. The algorithm discovers a lot more non-congested remedies, picking the very best solitary course for data transmission.

Paper Title: **Forced Convection upon Heat Sink of AL-Cu for Design Optimization by Experimental and CFD Analysis for Cooling of ICs in CPU**

Abstract:A heat sink device is used with specific power input at 100V and 20W by the heater attached at the base plate of copper and then obtaining the average temperature of Heat sink by the help of 10 thermocouples .Two specimens of heat sinks were designed and were tested for mass flow rate and heat transfer coefficient. With base of 1.5mm&2.5mmtip thickness and another specimen with dimensions as tip0.5mm and1.00mmbase thickness are used By experimenting and CFD simulations,optimization of heat sink design was done.Then correlation and Validation foe both the specimen was done and were found satisfactory results.

Paper Title: **Smart Volume Controller for Mobile Phones**

Abstract:In this paper, smart volume controller (SVC) using fuzzy logic is developed for mobile phones in order to improve the voice quality in the presence of background noise. The SVC uses the noise level and class information as an input to automatically raise the volume of the cell phone in the presence of background noise. Smart volume controller mainly consists of two stages: (i) Noise Classification, (ii) Fuzzy Volume Controller. Noise classification includes feature extraction and feature matching using artificial neural network classifier to differentiate between different types of noise classes. The maximum noise attenuation level of up to 55db was achieved while experimenting with the four different types of noises such as car noise, market noise, office noise, and train noise using the proposed volume controller that seems to be quite satisfactory.

Keyword: Smart volume controller, Mel frequency Cepstral coefficients, linear predictive coefficients, Real cepstral parameter coefficients.

Paper Title: **Software Design Collection and Handling of Signal Sound Body**

Abstract: We demonstrate the designed software that possibly collects the body sound data to be used for clinical diagnosis applications. Body sound signals are collected and processed through a software designed in Labview to adapt with Arduino-Uno. The analog signals transduced from a piezoelectric microphone are converted to the digital signals by an ADC component integrated in the Uno board and controlled the sampling frequency via the software. The collected signals are observed and visualized in graph panel of the software and the audio sound can play through speakers in real-time then stored the measured values as the audio file format simultaneously. The data can use to analyze by another software or study the analyzed algorithm to extract the disease signals. To evaluate the quality of the system, a series of experiments were examined in hospital environment and asserted with clinical experiences of specified medical doctors. To enhance the scope of the disease signal, the spectrum of the signal can be collected ranged on 5 Hz to 35 kHz corresponding to the full spectrum of the hardware system, with the sampling frequency reached to 100 kHz. Based on this initial system, a series of development applying to clinical diagnosis can be potentially opened in the near future.

Paper Title: **Bit Error Rate (BER) Performance of MIMO Systems in M-QAM with Nonlinear Effect**

Abstract:Out object in this paper it to study, the effect of nonlinearity on the bit error rate (BER) of MIMO systems in M-QAM modulation techniques. We consider Saleh's model (power amplifier model) for the nonlinearity, and apply the nonlinear model on MIMO system with receiver diversity and transmitter diversity. For transmitter diversity, the Space-Time Block Coding (STBC) based on Alamouti scheme is used to provide transmits diversity for two transmitting antennas. The results show that, if there is a high variation in the amplitude of the M- QAM symbols, there will behigh effect of nonlinearity that causes high BER especially for high amplitude symbols at high SNR.

Paper Title: **Development of Message Queuing Telemetry Transport (MQTT) based Vehicle Accident Notification System**

Abstract:In the recent years there has been a tremendous growth in the field of engineering and sciences, which aided in the growth and development of fast and comfortable transportation media, with this development the number of automobiles have drastically increased, which for sure is a great technological achievement but sadly with this growth, the traffic and the hustle and bustle on roads is unstoppable and with it the number of accidents and road casualties have tremendously increased. But, there is no easy and practical way to reduce the usage of the automobiles. Every day the mankind read about thousands of people dying of road casualties and most of them die because the families or the concerned ones of the indulged people are not timely informed. The death casualties can be minimized to a great extent by just timely informing the families of the concerned ones. The prototype in this paper is an accident notification systemESP8266 NodeMCU and a simple vibration sensor is the heart of this system. The vibration sensor continuously senses the vibrations and on exceeding a predefined threshold limit, sends out a notification to registered numbers.In the past similar models have been proposed, which used costlier sensors such as Accelerometerbut the design in this paper, used simpler and cheaper sensor. Moreover, in earlier designs GSM technology was used but proposed design uses a Wi-Fi based controller, which in comparison to GSM technology is more reliable and fast. Also earlier GSM module needed an additional microcontroller such as Arduino but the use of NodeMCU eliminates the requirement of any additional controller. The prototype system in this paper makes the use of message queuing telemetry transport (MQTT) protocol, which is a very reliable and fast communication protocol which further uses subscribe and publish technology. The IoT cloud platform used in this prototype is Adafruit IO which is quite simpler when compared to other cloud platforms such as Losant Platform and moreover the data is updated every two seconds in Adafruit IO. For the notification purpose protocol is used with the help of IFTTT platform and ClickSend platform, Applets and Triggers are created to fulfill the requirement.The controller is programed using basic C and C++ programming languages and Arduino IDE serves as the programming environment, various library files have also been used for the programming purposes.

Keyword: IoT; Mqtt; Accident; Adafruit-IO; ClickSend; IFTTT; Notification.

Paper Title: **A Critique on Baroreceptor and their Effective Reflex Action on Compartmental Cardiovascular Modeling in Regulating Hemodynamic Parameters**

Abstract:Baroreceptor is the feedback unit present in the living beings which acts as a sensor that is located in the walls of blood vessels. This sensor senses the deformation in the blood vessels which causes change in arterial blood pressure and regulates it via Central Nervous System (CNS) and the information are autonomic reflexes that has a great influence on circulatory system elements such as peripheral systemic resistance (Rpsym), contractility of the ventricles (Emax), unstressed volume of the ventricles (Vus_ven) and heart rate (HR). The dynamic behaviour of the baroreceptor is modeled and substantiated by applying the negative feedback mechanism. A detailed modeling and simulation study is presented considering various testing

274-283

conditions in regulating the circulatory system elements which oversees the Mean Arterial Pressure (MAP) in cardiovascular system. The Total Artificial Cardiovascular model (TAH-CVS) is also developed using pressure, volume and flow related differential equations. Based on the testing conducted under various conditions, the feedback-mechanism of the baroreceptor model is combined with the continuous TAH-CVS closed loop model to validate the effectiveness of the baroreceptor model. The simulation results of TAH-CVS model at initial conditions are compared with the TAH-CVS model with baroreceptor

	Authors:	**A.R.Visagan, M.Sumathi, G.Sujatha**
	Paper Title:	**Svs: Prediction Framework for Software Quality Enhancement through Data Mining Techniques**

50.

Abstract:Software Engineering has its origins in tackling the issue of development and maintenance of quality software. Software Quality has been defined in multiple ways but the broadest definition is that quality is the extent to which the customer is satisfied with the developed software. Data mining has the prospects of being applied to multiple domains and addressing the long standing issues faced by them. It has been successfully applied to uncover solutions to complex problems that have long confronted these domains. The proposed research is a step in the direction. It will attempt to apply existing data mining algorithms to data accumulated by software organizations in an attempt to extract useful patterns that can go a long way in addressing the issue of software quality. This work proposed Spacious Virtue Suggestion (SVS) Model for analyzing code based quality in software quality model. The first layer of this model is Extraction Layer that extracts the various attributes of software code used. After the extraction of the metrics attributes are constructed as a vector is considered as the feature vector for the second layer of the SVS Model. The second layer of the SVS model is Selection Layer which employs feature selection strategy to obtain significant metrics attributes for the software quality prediction by reducing the overlapping metrics attributes from the vector... The third layer of SVS Model is Prediction Layer which predict the good class from the training set and result shows the high accuracy in the proposed system.

	Paper Title:	**Tracking a Maneuvering Target using AUV**	

Abstract:In this paper effort is made to track a maneuvering target using Unmanned Aerial Vehicles (UAV) with range, bearing and elevation measurements. Extended Kalman filter is preferred to processmeasurements tampered with noise. Algorithm to detect the maneuver of target is developed in this paper. This information about range, bearing and elevation is communicated to weapon guidance station by means of personal communication system between UAV and weapon guidance station. Mathematical modeling in detail and simulation results is presented.

Keyword: Estimation, Extended Kalman Filter, Maneuvering Target Motion Analysis, Three-Dimensional tracking, Unmanned aerial vehicle.

	Paper Title:	**REST Architecture Optimization in Cloud Computing Ecosystem to Support E-Learning Platform**

Abstract:This study will present an application design process in the style of Representational State Transfer (REST) architecture to support the E-Learning platform in the cloud computing ecosystem. An application optimization process will be presented to provide E-Learning applications for schools, faculties or universities that in most cases need manual deployment and require more time for server provisioning.This process is optimized by providing application solutions that can provide speed of provisioning.The core system used Kubernetes containerization technology to provide scalability of growing E-Learning tenants. Evaluation of the core system architecture uses the Architecture Trade-off Analysis Method (ATAM) to evaluate aspect of performance and scalability as quality attributes. From the experimentalresults, the process of making new tenants for schools requires an average time of around 173.4 seconds. This meets the expectations of the set time limit of 5 minutes. The results of stress tests for 250 concurrent users show that the system has availability above 98%.Thus,education stakeholders such as schools and universities, no longer need to provide expensive e-learning infrastructure in the form of hardware or manpower to deploy the e-learning application on premise. In the future, this solution will provide a scalable E-Learning system that can spread at scale on the cloud computing ecosystem and support a Software as a Service solution in educational technology.

Keyword: Cloud Computing, E-Learning, Moodle, Kubernetes, REST.

Paper Title:	**Design and Analysis of DYC and Torque Vectoring using Multiple-Frequency Control Electronic Differential in an Independent Rear Wheel Driven Electric Vehicle**	

Abstract:Electric vehicle (EV) are being embraced in recent times as they run on clean fuel, zero tail emission and are environment-friendly. Recent advancements in the field of power electronics and control strategies have made it possible to the advent in the vehicle dynamics, efficiency and range. This paper presents a design for traction control system (TCS) for longitudinal stability and Direct Yaw Control (DYC) for lateral stability simultaneous. The TCS and DYC is based on multiple frequency controlled electronic differential with a simple and effective approach. Along with it, some overviews have been presented on some state of the art in traction control system (TCS) and torque vectoring. The developed technique reduces nonlinearity, multisensory interfacing complexity and response time of the system. This torque and yaw correction strategy can be implemented alongside fuzzy control, sliding mode or neural network based controller. The effectiveness of the control method has been validated using a lightweight neighbourhood electric vehicle as a test platform. The acquired results confirm the versatility of proposed design and can be implemented in any DC motor based TCS/DYC.

Keyword: Direct yaw-moment control, electric vehicle, Traction control, vehicle stability, electronic differential.

Paper Title: **Determining the Most Popular Streaming Service using Machine Learning**

Abstract:Over the past years, twitter has become a popular medium for sharing views and ideas about personalities, brands, products or services. Analyzing sentiment of people to figure out the popularity of different streaming service by the twitter profiles is helpful for determining positive or negative views. This is a comparative analysis to predict or show which of the chosen streaming services is most familiar or liked by the public. To do this, different machine learning algorithms are used to computationally identify and categorize public opinions to draw a final result. The machine learning algorithms used here are Linear SVC, Naïve Bayes and Decision Tree. These help in receiving the data and predict the output within an acceptable range. The data in this case has been extracted from Twitter using Twitter API. Twitter API takes the parameters that can access many features of Twitter and also post and find tweets containing desired words. This includes data cleaning which refers to exclude the incorrect and unnecessary forms of data. This makes the way of data processing easier, faster and more compatible. On analyzing, the frequently used words are assessed. The classifying words are trained using the above mentioned algorithms. These algorithms are the supervised classifiers which are effective and efficient when the quantity of the data is huge. Using one or more algorithms helps to decide, compare and contrast the results. Once the classifiers are trained, testing is done. Testing gives the proper assessment of the data that is required for the desired results. The performance of the test set can be checked to draw a final result. Hence, comparing the results obtained for different streaming services helps to decide the most popular streaming service.

Paper Title: **Behaviour Analysis of Alloy Wheel Plant**

Abstract:In this paper, Behaviour Analysis of an Alloy Wheel Plant utilizing RPGT under specific conditions has been discussed. An Alloy Wheel Plant is isolated into five sub- systems P, Q, R, S and T for instances of computations. An Alloy Wheel Plant consists of five frame woks for example Gravity Die Machine (P), Cutting Machine (Q), Solutiuonizing Chamber Machine (R), Azing Chamber Machine(S) and Shot Blasting Machine (T). These subsystems are associated in arrangement. On the off chance that any of the sub units comes up short, at that point the Alloy Wheel plant works in diminished state. In the event that at least two sub units fall flat, at that point systems comes up short. Parametric estimations of a system generally rely upon failure / repair rate of

319-327

individual units. Single server fixes all sub-units. Framework parameters, for example, Availability, MTSF and Number of Server's Visits utilizing RPGT are determined. Specific cases and behaviour analysis w.r.t different rates are additionally completed pursue by graphs.

	Paper Title:	**Anomaly Detection in Human Behavior using Video Surveillance**

Abstract:Conventional static surveillance has proved to be quite ineffective as the huge number of cameras to keep an eye on most often outstrips the monitor's ability to do so. Furthermore, the amount of focus needed to constantly monitor the surveillance video cameras is often overbearing. The review paper focuses on solving the problem of anomaly detection in video sequence through semi-supervised techniques. Each video is defined as sequence of frames. The model is trained with goal to minimize the reconstruction error which later on is used to detect anomaly in the test sample videos. The model was trained and tested on most commonly used benchmarking dataset- Avenue dataset. Experiment results confirm that the model detects anomaly in a video with a reasonably good accuracy in presence of some noise in dataset.

Keyword:video surveillance, anomaly detection, semi-supervised learning, unusual activity, video processing, abnormal behavior.

	Paper Title:	**MRI Image Segmentation, Prediction and Diagnostic Accuracy: Deep Learning Framework and Machine Learning Techniques Analysis for Reducing The impact of Cardiac Diseases**	
	Abstract:Background: Usage of tele - monitoring system of electronic patient record (EHR) and magnetic reasoning is expected to increase rapidly in near future, yet numerous studies have examined cardiovascular risk prediction and statistic adoptive approach could improve clinical risk prediction.Objectives: To assess the performance outcomes of various techniques for predicting the risk of cardiovascular diseases and MRI image segmentation method on the basis of systematic review.Research Design: Retrospective Cardiovascular study. We associate UCI dataset, AHA dataset, real time patient datasets, hospital dataset and sunny broken dataset from 2017 to 2019, and predicted risk using the logistic regression, stochastic gradient boosted, random forest, SVM, ROC Curve, KNN algorithm, MXNET UNET.Measures: The proposed methods have been developed in four categories to accurately diagnose cardiovascular diseases. We assessed to analyze and compared the accuracy of four different machine learning algorithms with the ROC for assessing and diagnosing cardiovascular disease from UCI cardiac datasets. The research will then focus on to predict heart diseases automatically by segmenting and classifying the patients' heart data in real- time with the help of machine learning algorithms, big data, wireless heart monitor and smart phones. We further improve the prediction accuracy by using logistic regression and ROC Curve to improve the prediction performance. Consequently, K-Nearest-Neighbor (KNN) method, R programming language and big data where applied to easily find the nearest hospitals, monitor and provide on-time visualization to the medical professionals. Finally, we propose automatic myocardial segmentation method for cardiac MRI on the basis of Deep Convolutional neural network.Results: Logistic Regression methods outperformed the standard accuracy rate even with application of ROC curve (AUC increased from 87% to 91%). Ever better performance was achieved in Models using additional Real time dataset attributes (AUC increased to 93% and KNN achieved approximately 83%). Proposed image segmentation method results tended using following techniques, Jaccard (0.6 ± 0.1 mean accuracy Dice's value) outplays the dices co efficient (0.58 ± 0.1 mean accuracy Dice's value) CCN reaches the value of the 0.9 (Table 7) and for the dice's co-efficient respectively that can be compared to manual segmentation. The accuracy tended to decline while PM (Papillary muscles) we got 0.89 for the dice's coefficient and mean squared error 0.01. Conclusions: The tele - monitoring system plays the important role for cardiovascular patients and the healthcare industry. Moreover, cardiac image classification demands a high level of expertise and significant time consumption on the part of the operator. Multicenter sufficiently powered and randomized controlled trials are needed to assess the potential benefits and cost-effectiveness of this intervention. Subsequently, our findings of image classification method will facilitate more advanced discovery.	**333-342**

	Paper Title:	**An Empirical Analysis Of Gender Role Stereotype Both At Work Place And Home**	
	Abstract:Gender and Gender stereotyping plays an influential role in one's personal and professional career too. The article tries to explore how gender effects gender stereotyping at both work place and home. The data had been collected from 100 faculty members from private universities located in Odisha, province of India through	**343-349**

a questionnaire. Stratified random sampling technique was used for selecting respondents. Descriptive statistical methods are used for demographic data of the respondents. Cross tabulation is used to test the association between home stereotype score and workplace stereotype score. Statistical package for social sciences software is used for statistical analysis of the data. Results indicate that gender stereotyping still exists in the people with higher qualification also. The effect of gender stereotyping will be seen both at personal life and professional life. The people with no gender differentiation are more supportive than people with gender stereotyping.

Keyword: About Gender, Gender stereotype, Supportive.

Paper Title:	**An Improved Mechanism for SDN Flow Space to Control Oriented Authentication NAA Network**	

59.

Abstract:The Open Daylight platform with its power by working with IEEE 802.1X port level authentication for wired and wireless networks has been very supportive because of the massive deployments at mean charge for main design considerations. Within the current marketplace, 802.1X has flourished the ground works for wireless, wire stability, LAN stability and authentication methods. EAP (Extensible Authentication Protocol) supports long time protection of the supplicant and the authentication software till the end condition of the RADIUS (Remote Authentication Dial-In User Service) server is met. This paper is focused on the RAR (RADIUS Access Request) unique identification about the users on the network with SAA (Supplicant, Authenticator and Authentication server) system which records on the attribute cost of RFC 2865 according to the forwarding server. NAA (Non-Adaptive Algorithm) using FlowVisor based virtualization packages drive inward the network timescales or statistics, dynamically controlling the flow space of switches to control the speed and results in scaling of networks. NAA is an application level protocol that contains authentication and configuration information between a Network Access Server and a shared authentication server. It avoids the attacker from listening for requests and responses from the server and calculates the improved MD5 client secret key of the response.

Keyword: Software Defined Networking, Non Adaptive Algorithm, 802.1X, FlowVisor, Flow space, Radius Access Request.

Paper Title: **Application of Image Processing In E-Commerce**

Abstract:The advancement and perpetual development in technology have made it possible to automate many processes. The proposed Algorithm in this research provides the framework to self-operate the process of quantifying the shoulder size of humans by taking the images of the user so that it can be utilized to find the shirt size of the human. The framework involves three important phases which are segmentation, edge detection, predicting shirt size. Since colour has no prominent role in measurement of size,otsu's binary thresholding for image segmentation is used in order to get binary image which separates foreground and background. Along with predictive analysis particularly regression is used as the groundwork to predict shirt size. The main application is in the apparel industry such as online shopping to automate the size detection for more expeditious results. And in the custom made apparel stitching, rather than approaching the seamster to take tape measurements our framework can be implemented therefore increasing the time efficiency.

Keyword: Image processing, application of data analysis, Otsu segmentation, measurement of a body part, Regression.

Paper Title: **Timely use of Technology to Reduce Perpetuate Stress Impacts**

Abstract:Stress has become a common thing in today's life. Because of the fast pace, it is a top health concern. Psychologists say that if they don't learn healthy ways to manage stress now, it could have serious long-term health implications, such as depression, anxiety, high blood pressure, diabetes. Currently people are suffering from stress issues everywhere. Since last few decades stress has been detected in most of the people and there has been recorded severely increasing effect of stress on human body. Stress can alter complete health which leads to reducing the tolerating power of the human. In metro cities this condition is more severe. Hence it is necessary to identify stress before it causes any serious harm and treat on it. In this project we are presenting stress detection technique and lower it with the help of Music therapy. As there are many benefits of music so by taking advantage of it we are minimizing stress level to normal state. Detection of stress using brainwaves is a

360-364

non-invasive method. We have selected 42 students who were about to go for their exam. Firstly we have recorded brainwaves before they were going to exam, then immediately after finishing their exam we have recorded brainwaves lastly they were allowed to listen to their favorite music and then recorded their brainwaves. From analysis it is clear that stressed brainwave were reduced to 29% by listening music.

Keyword: Brainwaves, stress, music impacts, stress relief.

	Paper Title:	**Power Generation using Magnetic Levitation Vertical Axis Wind Turbine**

62.

Abstract:The main aim of the paper is to design a windmill that operates without generator and ball bearings and to get maximum power output. The use of wind energy for energy generation is one of the oldest methods for harnessing renewable energy. Use of renewable energy is an essential ingredient of socio-economic development and economic growth. A vertical axis wind turbine (VAWT) is introduced by magnetic levitation technology to optimize the performance. The system utilizes the nature of permanent magnet as a replacement for ball bearings to levitate the turbine component and thus minimize energy losses while rotating, which is the major problem that furthermore, the system can be suited by conventional wind turbine. The Maglev Wind Turbine is expected to bring wind power technology to the next level. Furthermore, the system can be suited in use for more rural and urban areas of low speed regions. The selection of magnet materials in the design of wind turbine system will be discussed. Power will then be generated with an axial flux generator, which incorporates the use of permanent magnets and a set of coils.

Keyword:VAWT, Magnetic Levitation, Wind Turbine, Blade hub, Magnet.

	Paper Title:	**Vibration Characteristics of Composite Beam Having Flax, Aloevera and Sisal Fibers as Reinforcements**	
	Abstract:Composites are highly significant due to their various advantages and natural fibre reinforced composites can be vastly used in automobile and aircraft interior applications. This paper principally deals with natural fibre reinforced composite (NFC) in which flax, aloevera, sisal fibres are selected to be reinforced in epoxy matrix (as inner laminate layers) and is used in combination with glass-epoxy (as outer laminate layers). Such composite beam structures are analysed in Ansys software employing FEM. The comparison for various NFCs is presented by evaluating effect on natural frequency due to various parametric variations like laminate stacking sequence, material hybridization, and presence of cut out. **Keyword:**Cut out, Dynamic analysis, Finite element analysis, Natural fibre composites. **References:** 1. 	Paper Title:	**Strength and Durability Performance of Ferrocement Panels with the Influence of Corrosion Inhibitor**	
	Abstract:Success of Ferrocement, as with other construction material, depends largely upon its durability. ACI-549R strongly recommends that studies be undertaken to suggest durable and long-term anti-corrosion techniques to prevent penetration of water and salts that could lead to the corrosion of reinforcing wire mesh. The main objective of this study is to develop a durable Ferrocement panel by incorporating corrosion inhibitors as admixtures. The inhibitor used is sodium nitrate based inhibitor. Totally 24 Ferrocement panels are subjected to strength and durability study to ascertain the influence of inhibitor modification in cement mortar. Inhibitor admixed mortar offers marginally improved resistance against water absorption irrespective of tested dosage levels as compared to control mortar. There is a appreciable reduction in current development in the order of 18% for inhibitor admixed mortar as compared to control mortar, which is an indication of improved resistance against chloride penetration. Half-cell potential readings on galvanized Ferrocement panels should not be interpreted for corrosion probability as per ASTM C876. Ferrocement panels with crimped wire mesh and inhibitor modification offered low corrosion risk at the end of test period as per ASTM C876. There is an improvement in ultimate load carrying capacity for galvanized mesh Ferrocement panels of the order of 11-16% upon inhibitor modification in mortar. Similar ultimate load carrying capacity for crimped wire mesh Ferrocement panels for control and inhibitor modified mortar. Ductile behavior associated with multiple crack formation before failure is observed for all tested panels. It can be concluded that crimped wire mesh panel Ferrocement panels offered appreciable stiffness, load carrying capacity and ductility as compared to galvanized mesh Ferrocement panel. Inhibitor incorporation appreciably improves the durable performance of Ferrocement panels. **Keyword:**Ferrocement, Crimped wire mesh, Galvanized mesh, Half-cell potential, Stiffness. **References:** 1. Paper Title: **Optimization of Arrangement of LED on the PCB for High Power LED Module**

Abstract:LED operating under high-temperature condition badly affects reliability. To reduce junction temperature of LED is crucial. In this paper, luminous intensity and photo conversion efficient with respect to electrical power are discussed. Moreover, three arrangements for LED module are suggested, and design parameters are discussed in terms of the number of LEDs and distance between each LED. In order to evaluate thermal performance of designed the module, computer simulation was conducted. Distance between each LED is selected by 7.6, 9.6, and 13.3mm for 80, 128, and 240 LEDs, respectively and unit heat flux is calculated to be 0.47W/mm2, 0.29W/mm2, 0.16W/mm2 for 80, 128, and 240 LEDs, respectively. In this case, Maximum temperature on the PCB was 67.8□ C, 62.5□ C, and 57.1□ C for 80, 128, and 240 LEDs, respectively. The Maximum temperature and unit heat flux was reduced by 15.7% and 66%, respectively, when the number of LEDs are increased by three times. We found that the temperature between LEDs can be reduced if unit heat flux can be reduced.

Paper Title: **Field Assessment to Determine The KIBLAH Direction of Mosques in MAKKAH**

Abstract:Every Muslim must pray to ALLAH five times every day and they must direct their faces toward the KABAH (KIBLAH direction) in each prayer. Muslims Scientifics and Astronomers since the eighth century (A.D) have been concerned with the determination of the KIBLAH direction. The KIBLAH direction at any point on the earth's surface; assuming the earth to be a perfect sphere; is given by the great circle passing through that point and holy city MAKKAH. Furthermore, the KIBLAH direction from the geographic north at this point is the angle between the tangent of the meridian passing through this point and the KABAH (Azimuth). In this context, the KIBLAH direction can be determined by using the spherical triangle between this point, KABAH, and North Pole. Moreover, in MAKKAH itself the KIBLAH direction is the direction of the line connect the point to KABAH. The KIBLAH direction can be determined by many methods as mathematical (by determining the geographic coordinates by GPS, graphical, observe the sun when it's above or below the KABAH, etc. This direction refers to the true north direction which can be located by the magnetic compass when the magnetic declination is known at that point. This study investigates the accuracy of compass in determining the KIBLAH direction in MAKKAH. The methodology includes drawing the azimuth line map which is used in determining the KIBLAH direction at any point in MAKKAH. The KIBLAH direction in a few mosques in MAKKAH has been tested using the azimuth line map and compass during this study. The prismatic compass with a telescope can be used to determine the direction of the KIBLAH in MAKKAH provided that it is

388-394

not affected by local gravity and that the place of its use is far from the field of local gravity and succession. The KIBLAH direction can be obtained from the map at any location inside MAKKAH. One can be used this technique either to determine KIBLAH direction during the construction of a new mosque or to check the KIBLAH direction in an existing mosque. It should always check the value of the declination angle (δ), in the case used the compass for determining the KABLAH direction because it changes annually within 3 minutes per year. The compass should not be used if the angle of difference is not known and in this case Theodolite or any other device can be used for setting out the KIBLAH direction after knowing the true north direction.

	Paper Title:	**A Deep Analysis of Google Net and AlexNet for Lung Cancer Detection**

Abstract:Lung cancer is the major cancer that cannot be disregarded intentionally and causes deceased with late healthcare. Now, Computed Tomography(CT) scan allows the doctors to recognize the lung cancer in the beginning of the stage. Majority of cases are tends to be failed in diagnosis of determining the lung cancer eventhough the doctors are experienced, they failed to detect the cancer. Deep learning is the important technique that can be applicable in medical imaging diagnosis. In this paper, the implementation of Convolutional Neural Networks such as GoogleNet (Inception) and AlexNet are analyzed for the lung cancer detection. The cancer images from LIDC-IDRI dataset is used for this research work. The Preprocessed cancer images are trained using GoogleNet and AlexNet to determine the cancer affected part of the lungs. The identification of lung cancer by using GoogLeNet and AlexNet are used for training the network, and image classification. These networks are provided with layered architecture for classification. We have found that AlexNet and GoogLeNet provides the comparable results by including parameters like time, initial learning rate and accuracy.

	Paper Title:	**A Wireless Sensor Networks Security Protocol Architecture**

Abstract:A wireless sensor network is made up of extremely small autonomous units capable of sensing,

400-406

computing and communicating. There are numerous restrictions on wireless sensor networks as the resource available to the wireless sensor network is limited. Thus, a number of clustering protocols in a routing sensor organization of sensor networks have been proposed in the literature which increase the throughput, save energy and decrease the delay in the system. In this paper, we put forward SNP, the one of its type link layer security architecture for wireless sensor networks. In this, the design vulnerabilities which were found in the protocols such as 802.11b and GSM are addressed using SNP. Security protocols have very conservative approach while guaranteeing the security and typically add up around 16-32 bytes as overhead. Owing to the scenario that sensor networks have limited supply of energy, little memory and low power processors, a 30 byte packet is more of unaffordable luxury for the wireless sensor networks. In SNP, the different trade-offs between separate cryptographic algorithms and wireless sensor network limitations are used to find an optimum point where packet overhead, security and resource requirements are met.

Paper Title: **Design and Implementation of 256 Bit Modified Square Root Carry Select Adder for Area and Delay Reduction**

Abstract:This paper models the behaviour of modified Square Root Carry Select Adder and goes deep to investigate on its scope of reducing area and delay. This helps to overcome the drawback of conventional RCA by performing operations simultaneously for both Cin = 0 and Cin = 1, and the output is multiplexed to obtain the desired response. The work explores opportunities to reduce the area with introduction of BEC logic instead of second block RCA. The implementation of a 4 bit MCSLA and its capability of extending its word size to 8, 16, 32, 64, 128 and 256 bits are presented. The experimental result helps to verify the effectiveness of the approach. This provides understanding on how the reduction of area can bring vital improvements in Very Large Scale Integration.

70.	**Authors:** **Mohammad Yusuf, Vijaya Bhandari** **Paper Title:** **Enhancement in the Gain of EDFA in Fibre Optic Communication** **Abstract**:With the evolvement ofhigh speed and long distance data communication systems, conventional band erbium-doped fiber amplifiers (C-EDFAs) are getting more attention in recent times. Major advantage of the C-band EDFA is that it provides the user to realize a system with wide bandwidth of 40 nm. But, from the reported works, it is evident that for Gain enhancement in C-band using EDFA is reported with the use of multiple stages, multiple pumps, Gain flattening filters etc. However, these techniques suffered from high cost, complex techniques and low performance.Here enhancement process was done through the narrowband Fiber Bragg Gratings (FBG) or fiber reflectors mirrors. In this work, a conventional band erbium doped fiber amplifier is proposed with high gain and less noise figure by incorporating the two fiber bragg gratings (FBGs) for amplified spontaneous noise reinjection. Maximum ASE is emerged at 1565 nmfor the at -55 dBm carrier powers. Maximum gain is found out to be 48.16 dB with noise figure of 5.29 dBm. **Keyword:**EDFA, WDM, FBG, ASE. **References:** 1. 71.	**Authors:** **B.Krishna Kumar** **Paper Title:** **Denoising of EEG Signal using Matlab and SIMULINK Techniques and Estimation of Power Spectral Density of EEG Signal using SIMULINK AR Models** **Abstract**:The Electroencephalogram (EEG) is the standard technique for investigating the brain's electrical activity in different psychological and pathological states. Analysis of Electroencephalogram (EEG) signal is a challenging task by reason of the presence of different artifacts such as Ocular Artifacts (OA) and Electromyogram. Normally EEG signals falls in the frequency range of DC to 60 Hz and amplitude of 1-5 µv. Ocular artifacts do have the similar statistical properties of EEG signals, often interfere with EEG signal, thereby making the analysis of EEG signals more complex. In this research paper, removal of artifacts was done using wavelets (matlab coding) as well as using SIMULINK DWT and IDWT blocks and estimated the SNR. In the next stage the output of IDWT block was taken as input to Burg model and Yule walker model to estimate the power spectral density of EEG signal by setting the various parameters of the blocks. The implementation of denoising of EEG signal using SIMULINK DWT and IDWT blocks and estimation of power spectral density of denoised EEG signal using Burg model and Yule walker model was explained in detail in the paper under the methodology heading. In this research paper, the collected EEG signal is normalized and later linearly mixed with the normalized EOG signal resulting in a noisy EEG signal. This noisy EEG signal is decomposed to 4 levels by using different wavelets. This decomposition of EEG signals yields approximate and detail coefficients. Later different thresholding techniques were applied to detail coefficients and estimated the Signal to Noise Ratio of it and estimated the power spectral density of denoised EEG signal obtained from dB4 wavelet as it is providing better SNR than other wavelets mentioned in the results. **Keyword:**WT, DWT, Ocular Artifacts, power spectral density. **References:** 1. 	Paper Title:	**Heat Consumption Technique of Cloud Data Center and Produce Distilled Water**

Abstract:Cloud computing is a recent and emerging technology of computer science and engineering. In cloud data center runs more than thousands of server and host runs for process and store the data. Due to this reason, the cloud data center produces a lot of carbon and heat which exhalation into the air thus the environment pollution occurs due to the cloud data center. That is why researches in energy consumption, saving energy, cooling renewable energy, environmental pollution control are a new researches area of cloud computing. In this research, we mainly concentrate on the heating problem of the cloud data center and produce distilled water by using the heat of the cloud data center. We transfer the heat from the cloud data center to the water tank through the channel and by using this heat we produce the distilled water. For produce, the distill water huge heat and cost required. In our research proposal for producing the distilled water, the main source of the heating energy is cloud data center so we can reduce the heating cost for producing the distilled water. By using this proposed model we not only reuse the heat of the data center but also we can control the heating problem of the cloud data center which is harmful to the environment.

Keyword: Cloud Computing, Energy Consumption, Environment Pollution, Waste Heat Reuse, Water Purification.

Paper Title: **Design and Control of Space Vector Pwm Technique with the Fuzzy Control Based Multilevel Inverter for an open end Winding Induction Motor**

Abstract:In this paper the three phase open end winding IM drive is designed and controlled using a fuzzy control based multilevel inverter with SVM technique is proposed. To overcome the disadvantages of PI controller, in this project we are using the fuzzy controller. The fuzzy controller rules are analyzed very easily, because of it is a human decision making system. The traditional dual inverter having two dc sources the cost and size is might be high, so to overcome this we use the proposed method with single dc voltage source. The main objective of the proposed method is to eliminate the transformer. To achieve the multilevel output voltage waveform with three levels a dc voltage ratio 2:1 is used. The space vector PWM is used to control the switching states of dual multilevel inverter. The fuzzy controller implementation cost is less and more precise. The simulation results are used to analyze the proposed method with fuzzy controller.

Keyword: Multilevel inverter, field-orientated controller (FOC), floating bridge, SVM pulse width modulation, Fuzzy controller, OEW induction motor.

Paper Title: **Detection of Mercury in Water using Filter Paper Based Channel and Colorimetric-Android Readout**

Abstract:The heavy metals dissolved in water are exceptionally unsafe to human and marine health which causes numerious medical complications. This paper demonstrates the use of a Microfluidic paper-based channel (µPAD) and an easy-to-use colorimetric android based application for the accurate detection of heavy metal Mercury (Hg2+) in water. Gold Nanoparticles (AuNPs) functionalized with Papain and 2,6-pyridinedicarboxylic acid is used to detect Hg for further colorimetric analysis. Droplet-based Microfluidic channel in star shape with a paper-based stencil, a hydrophobic barrier and a hydrophilic channel using Polyvinyl Alcohol (PVA) was created for this. Colorimetric detection is used to create a database which is used to calibrate the color range for other unknown quantities of Mercury (Hg2+) present in water. This experimental database was used to create a user-friendly Android Application based display. The real-time android application was calibrated to quantify mercury concentrations from 0.1g / Litre to 0.001mg / Litre by observing a change in color from red to blue. This built platform can be utilized as a basic low-cost and portable system for various other fluid testings.

Paper Title:	**Recent Advances and Future Research Directions in Edge Cloud Framework**	

75.

Abstract:Recent years have shown the explosive emergence of Cloud computing in the industry and it is now the need of the hour. It is a great idea to go to utilize 5G remote advancement and man-made thinking to engage speedier response times, lower latency, improved upkeep in figuring. The cloud has at no other time been so essential to the undertaking beforehand. This is where Edge Computing came into picture — seen as an expansion to the cloud, yet interesting in a couple of crucial ways. Empowering data to be taken care of, explored and moved at the edge of the framework, edge enlisting will enable undertakings to gather and assessments data closer to where it is taken care of, consistently, without idleness. Thus it can take into consideration snappy substance conveyance and information preparing that ought to be the eventual fate of registering. In this paper we will extensively study the necessity of Edge Cloud simulation environment and simulate it through EdgeCloudSim. We find that the utilization based, fuzzy competitor based and hybrid based methodologies incline toward offloading the assignments to the edge, so they give better outcomes whereas the average service time of the Fuzzy-Based methodology is least in contrast with the others.

Paper Title: **Pairwise Sequence Alignment by Differential Evolutionary Algorithm with New Mutation Strategy**

Abstract:Sequence alignment is a significant facet in the bio-informatics research field for the molecular sequence analysis. Arrangement of two biological sequences by maximizing the similarities between the sequences by incorporating and adjusting gaps is Pairwise Sequence Alignment (PSA). Arrangement of multiple sequences is Multiple Sequence Alignment (MSA). Though Dynamic programming can produce optimal sequence alignment for PSA it suffers from a problem when multiple optimal paths are present and trace back is required. Back tracking becomes complex and it is also not suitable for MSA. So many meta-heuristic algorithms like Genetic Algorithm (GA) and Differential Evolutionary Algorithm (DE) are developed in the recent years to resolve the issue of optimization. Both GA and DE are used to produce optimal sequence alignment. But Compared to GA, DE is able to produce more optimal sequence alignment. To further enhance the performance of DE a new mutant is proposed by considering best, worst and a random candidate solution and applied on DE. It is named as New Differential Evolutionary Algorithm (NDE). By taking the test sequences from a bench mark data set “prefab4ref” tests are performed on GA, All DE mutants and NDE and it is observed that the proposed algorithm NDE outperformed all the other algorithms.

Paper Title: **Color Based Image Retrieval by Combining Various Features**

Abstract:Content based image retrieval system retrieve the images according to the strong feature related to desire as color, texture and shape of an image. Although visual features cannot be completely determined by semantic features, but still semantic features can be integrate easily into mathematical formulas. This paper is focused on retrieval of images within a large image collection, based on color projection by applying segmentation and quantification on different color models and compared for good result. This method is applied on different categories of image set and evaluated its retrieval rate in different models.

Paper Title: **Estimation of Rainfall-Runoff Relationship and Correlation of Runoff with Infiltration Capacity and Temperature Over East Singhbhum District of Jharkhand**

Abstract:In meteorology, Precipitation is any product of the condensation of atmospheric water vapor that falls under the gravity, the rainfall being the principal form of precipitation in India. Rainfall is the most important meteorological parameter for hydrology, as it controls the other processes such as infiltration, runoff, detention storage, and evapotranspiration. When precipitation falls over a catchment area, these processes have to be satisfied before precipitation water becomes runoff. Infiltration is the vertically downward flow of rainfall into ground/underground through percolation inside the soil surface and depends on soil-type, porosity, and permeability. Runoff is the flow of rainwater over the land surface that happens when there is an excess of precipitation over an area. Runoff is produced when the rainwater exceeds the infiltration capacity of the soil. The most important relationships for any watershed are the relationship between rainfall and runoff. This relationship depends on some factors such as characteristics of rainfall, runoff, and infiltration. Though the

461-466

abovementioned factors have a major impact on the volume of runoff, a consistent correlation between rainfall-runoff enables us to increase more confidence in sufficient time for the formulation of appropriate decision making for the local authority. The present research work was undertaken to analyze the correlation between annual rainfall and annual runoff for the years 1901-2018 over Jamshedpur of East Singhbhum district, Jharkhand. Further in this study, the correlation between infiltration and annual runoff was analyzed over the same area and the same data period. Correlation between temperature and annual runoff was also found. Through the graphical analysis, it was found that the value of annual rainfall and runoff are strongly correlated.As the value of the Pearson correlation coefficient (r) is almost equal to +1 which is a nearly perfect positive correlation, signifies that both variables move in the same direction. It also signifies that the two variables being compared have a perfect positive relationship; that means these two are strongly related. Through the study, it was also found that the infiltration and runoff are largely correlated. There was practically no correlation found between the values of temperature and runoff over the years.

Paper Title: **The Mechanical Behavior of Grouted Sleeve Splice Connections with and without Mechanical Interlocking Ring Under Axial Tensile Load**

Abstract:This research work thus presents rational procedure to design a grouted sleeve splice connection using a basic material such as standard pipes with little workmanship this provides the design with a good advantage in comparison to just using selection tables for costly proprietary similar connection. The mechanical behavior of such splices is a function of two important mechanisms: the bar-to-grout bond behavior and the sleeve-to-grout bond behavior. To accomplish the goal of this examination work, three arrangements with an all-out number of 66 grouted splice sleeve specimens were fabricated and tested under incremental axial tensile load. The specimens were preliminary designed according to the equations available in the literature to determine the initial sleeve dimensions. Different parameters have been examined, namely: grout compressive strength, bar embedded length, bar diameter, sleeve inner diameter, sleeve wall thickness and sleeve configuration. The examined parameters provide to have a significant impact on the mechanical behavior of the grouted splices. Considering the results, it was clear that steel bars with 18 mm, 25 mm and 32 mm diameter and 400 Mpa yield stress can be adequately spliced and the tensile strength can be reached. The steel sleeve to the grouted splice sleeve connectors significantly improve the bar-to-grout bond strength through the confinement action added by the sleeve wall. Also welding interlocking steel rings can prevent the grout-to-sleeve bond Failure. Feasibility study for tested grouted sleeves reporting their adequacy in accordance with the code provisions of ACI 318-14[1] and ECP 203-2018[5] is presented. Moreover, design equations capturing the parameters affecting the bond strength, the confining pressure, and the required embedment length are derived.

Paper Title: **Preanodized Screen Printed Carbon Electrode for Detection of Linalool using Three Terminal Network**

Abstract:Linalool is a very important flavouring compound found in plants which is used in food and beverages. Linalool has been traditionally detected by analytical instruments such as gas chromatography (GC) coupled with mass spectroscopy(MS) which are not suitable for routine tests. For fast and low cost detection of chemical compounds electrochemial sensors are most suitable. Screen printed carbon electrode (SPCE) is one of the most popular and low cost device used for detection of chemical compounds. In this article we present the detection of linalool using a low cost preannodized commercial screen printed carbon electrode (SPCE). Traditionally electrochemical sensors are used in two terminal mode, however three terminal analysis of electrochemical sensors are found to be more rationale and accurate. In this paper we have analyzed detection of linalool by an advanced three terminal analysis. First we have performed cyclic voltammetry(CV) of the SPCE which showed clear oxidation peaks at different concentration of linalool. The input-output data of the CV has been used for analysis of the impedance of the SPCE.The impedance model of the SPCE was estimated by autoregressive moving average with exogenous inputs(ARMAX) modelling technique using the CV data. The three terminal impedance fitting revealed the values of electrical parameters and the parasitic elements at different linalool concentration. The stability limits of the SPCE was also determined from the pole-zero and Nyquist plots of the estimated models. Impedance behaviour to frequency of the SPCE was further analyzed by impedance plot(Z vs -Z^') from which we are able to relate the CV scan rate to the impedance of the SPCE. Finally the sensitivity and repeatability of the SPCE was determined using a measurement circuit.

Keyword: Linalool detection, SPCE, three terminal analysis, ARMAX modeling, parasitic elements.

Paper Title: **Fault Tolerance Policy for Resilient Private Cloud Environment**

Abstract:Cloud Computing, being a delivery model is swiftly moving ahead by being adopted by small and large organization alike. This new model opens up many research challenges. As, cloud computing services are offered over the Internet on pay-per-use basis, it is very essential to provide fault tolerant services to the users. To ensure high availability, data centers are replicated. The process of replication is costly but in terms reliability it overtakes the cost factors. Vast amount of work has been undertaken in fault tolerance in other computing environments but they cannot be applied directly to the cloud. This gives an opportunity for new, effective solutions. In this paper, we propose policies for delivering fault tolerant services for private cloud computing environment related to virtual machine allocations. The experimental test results and policies derived are described with respect to virtual machine provisioning.

Keyword: Virtualization, Hypervisor, Immutable Infrastructure, private cloud, fault tolerance

Paper Title: **Formation of Creative Competence of Future Teachers in The Process of Teaching Mathematics based on Special Tasks**

Abstract: This article was written with the aim of creating the creative competence of future teachers in the process of teaching mathematics based on special tasks. The following tasks are considered in the article: how to concretize the essence and structure of the concept "creative competence of the future teacher", determine the criteria and levels of its formation; substantiate and formulate pedagogical conditions for the formation of creative competence of future teachers in teaching mathematics; to develop a methodological model for the formation of creative competence of future teachers in the process of teaching mathematics; create mathematical tasks that contribute to the formation of creative competence of future teachers in the process of their mathematical preparation; create a diagnostic complex to determine and evaluate the level of formation of creative competence of future teachers; to develop a methodology for the formation of future creative competencies in the learning process, the substantive basis of which is a complex of creatively-oriented mathematical tasks, focused on the implementation of the created model; experimentally confirm the effectiveness of the developed methodology for the formation of creative competence of future teachers in the process of teaching mathematics. The article analyzes the basic concepts - "competence", "creativity", "creative competence".

Keyword:problematic teaching, creative technologies, special tasks, mathematic teaching, interactive ways of teaching.

Paper Title: **Anodic Dissolution of Gamma Titanium Aluminide GE 48-2-2, TNM B1 and TNB V5 Materials using Electrochemical Machining Electrolytes for Aviation Application**

Abstract: Investigation of temperature resistant lightweight materials used in airplane components with higher thermal efficiency gaining importance. These materials possess challenges and replace twice dense nickel (Ni) based super alloys presently found application in aeroplane industry. In this article, anodic dissolution of commercial gamma titanium aluminide (γ-TiAl) alloys; GE 48-2-2, TNM B1 and TNB V5 were investigated. These are potential materials to be used for manufacturing low pressure turbine blades by electrochemical machining. The materials were characterized by X-ray diffraction (XRD) and scanning electron microscopy (SEM). XRD confirms the presence of two phases Ti3Al, α2 (13.8%) and TiAl, γ (86.2%). SEM shows the porous surface after the anodic dissolution. It has been found that 1 M KBr is the most effective electrolyte for the dissolution followed by NaCl and NaNO3. The effect of temperature, electrolyte concentration, passivation and rotation speed were evaluated. The dissolution potential of TNB V5 found to be high could be due to the presence carbon content which may lead to the high creep resistance in the material.

Keyword: Anodic dissolution, Gamma Titanium Aluminide, Linear sweep voltammetry, Passivation, Tafel plot

Paper Title: **Ensemble of Rule Learner and Sequential Minimum Optimization Algorithm for Intrusion Detection System**

Abstract:An intrusion detection system is a process which automates analyzing activities in network or a computer system. It is used to detect nasty code, hateful activities, intruders and uninvited communications over the Internet. The general intrusion detection system is struggling with some problems like false positive rate, false negative rate, low classification accuracy and slow speed. Now-a-days, this has turned an attention of many researchers to handle these issues. Recently, ensemble of different base classifier is widely used to implement intrusion detection system. In ensemble method of machine learning, the proper selection of base classifier is a challenging task.In this paper, machine learning ensemble have designed and implemented for the intrusion detection system. The ensemble of Partial Decision Tree and Sequential Minimum optimization algorithm to train support vector machine have used for intrusion detection system. Partial Decision Tree rule learner is simplicity and it generates rules fast. Sequential Minimum optimization algorithm is easy to use and is better scaling with training set size with less computational time. Due to these advantages of both classifiers, they jointly used with different methods of ensemble. We make use of all types of methods of ensemble. The performances of base classifiers have evaluated in term of false positive, accuracy and true positive. Performance results display that proposed majority voting method of ensemble using Partial Decision Tree rule learner and Sequential Minimum optimization algorithm based Support Vector Machine offers highest classification among different ensemble classifiers on training dataset. This method of ensemble exhibits highest true positive and lowest false positive rates. It is also observed that stacking of both PART and SMO exhibits lowest and same classification accuracy on test dataset.

Keyword: AdaBoost, Bagging, Combination rule, PART, SMO, True positive and False positive

	Paper Title:	**Model Predictive Controlled SLQZSI Fed IM Drive with Quick Response**

Abstract:This paper presents a model predictive controlled switched inductor quasi Z source inverter fed induction motor drive with quick response. MPC depends on dynamic models of the process and more frequently linear empirical models are arrived trough drive system identification. The unique nature of MPC has control logic to optimize the induction motor speed while considering the further speed. Modeling of MPC controlled SLQZSI fed IM is obtained through simulation under MATLAB platform and experimental work. The performance of closed loop controlled SLQZSI fed IM drive is analyzed in terms of rise time, settling tim, peak time and steady state error. The outcomes shows that the reaction of MP controlled SLQZSI fed IM drive are quicker than that of PI and FOPID controlled SLQZSI fed IM.

Keyword:FOPID, Model predictive controller, Peak time, Rise time, Settling time, switched inductor quasi z source inverter, Steady state error, Induction motor drives.

Paper Title: **Controlling the Chaos of Logistic Map using Switching Strategy**

Abstract:In our very recent work (2019), we extended the stability performance of logistic map up to a higher value of r using SP orbit. In this article, we further extend this range of stability by adopting switching strategy (Parrondo's Paradox) of controlling the chaos of dynamical systems. We observe that even the earlier chaotic orbits of four step feedback procedure can be converted into periodic orbits. Our approach can be used to solve a wider circle of engineering problems.

Keyword:SP orbit, switching strategy, logistic map, bifurcation plot.

Paper Title: **Implementation of Steganographic Algorithms Based on Exact Histogram Matching and Colour Visual Cryptography**

Abstract:Sensitive secret data transmission through internet has been of great security concern which can be overcome by steganographic methods achieved through secret image sharing. Two novel steganographic secret algorithms based on colour visual cryptography and exact histogram specification is proposed in the present study. The former approach combines colour visual cryptography with a secret key to produce less distorted meaningful share images. A specified histogram acts as the key for the second approach and provides better security and data obscurity compared to conventional approaches. A novel histogram specification method is also proposed which exactly matches the histogram of an image to a specified histogram.

Keyword: Steganography; Colour visual cryptography; Exact histogram specification; Meaningful Shares

Paper Title: **A Low-Cost PV Emulator using Labview and Arduino**

Abstract:A solar panel emulator is a programmable power supply which mimics the characteristics of a solar panel and can be used under laboratory conditions. This paper proposes the design of an economical solar panel emulator using LabView software and its implementation using Arduino. The proposed emulator consists of a flyback converter with a MOSFET driver which brings out the characteristics of the desired PV panel. The characteristic curves are generated using LabView software and PWM signal is generated in hardware. This PWM signal drives the MOSFET which in turn operates the flyback converter. The proposed system is simulated using MATLAB software and a prototype of the proposed system is implemented using Arduino UNO R3.

Keyword: Arduino, LabView, PV emulator, Solar simulator.

Paper Title: **Functional Connectivity and Classification of Actual and Imaginary Motor Movement**

Abstract:Imaginary Motor movement is an utmost important for the designing of brain computer interface to assist the individual with physically disability. Brain signals associated with actual motor movement include the signal for muscle activity whereas in case of imaginary motor movement actual muscle movement is not present .Authors have investigated the similarity/dissimilarity between the eeg signals generated in both the cases along with the baseline activity. To instruct the brain computer interface signals generated by electrodes of EEG must resemble with actual motor movement. Selection of electrodes placement plays an important role for this purpose. In this study major four regions of the brain has been covered frontal, temporal, parietal and occipital region of the scalp and features are extracted from the signals are standard deviations, kurtosis, skew and mean. Support Vector Machine is used for the classification between actual and imaginary motor movement along with differentiation between baseline and imaginary motor movement and actual motor movement at 14 different electrodes positions. Statistical performances of the classifier have been evaluated by computing sensitivity, specificity and accuracy. The location involved to achieve maximum accuracy for the classification of motor movements (actual and imaginary) and no motor movement is at frontal, temporal and parietal region whereas very less involvement has been seen of occipital region.

Paper Title: **The Dynamics of General Insurance Sector in India - Growth and Performance Perspective**

Abstract:Life is full of risks and uncertainties. In fact risk is everywhere. Even when you ride a bike to the nearest shop in the street, there is a risk. One must protect himself or herself from this risk. The solution is insurance. Broadly it is two types i.e. life insurance and non-life insurance (general insurance). In this paper we discuss about only general insurance. General insurance helps in securing ourselves and things we value like homes, cars, bikes or any other property from any kind of mishap whether it is big or small. General insurance protect insured property from fire accidents, floods, earthquakes, storms, thefts, travel accidents/mishaps or any other kind of calamity, even from the cost incurred against us from legal action depending upon the type of policy selected by the insurer. From the post liberalization scenario, general insurance in India is growing rapidly. The reasons behind its spectacular growth are allowing private companies to enter into Indian market, low insurance premium, TPAs (Third Party Administrators), Fast and immediate settlement of insurance claims, Innovative general insurance policies, discounts in insurance products, increasing awareness among people, more distribution channels etc. The other side of the coin is, public sector insurance companies are facing cut throat completion from private insurance companies as they offer wide variety of policies at a low premium. Due to this few general insurance companies are closed and few are forced to come out with same polices and services. Ultimately the performance of public sector general insurance companies also enhanced with the competitive moves by private players. On the other hand, customers are also exposed to new trends in the insurance market. Insurance Regulatory and Development Authority (IRDA) is the apex body in India to monitor the activities of insurance companies. It has laid down standard terms and conditions to general insurance companies and also given scope for personal accidental life insurance policies. IRDA has taken all the measures to improve the performance of general insurance companies as it is one of the fast growing areas in Indian economy. General insurance companies under public sector are facing lot of challenges from private players and to with stand in the completion, even they have improved a lot in their quality of service in multiple facets like decreasing the premium, quick settlement in claims etc. In a nut shell, general insurance business is contributing significantly to Gross Domestic Product (GDP).

Keyword:IRDA, general insurance, claims, premiums, risks, public and private sector general insurance companies.

Paper Title: **Genomic Sequence Data Compression using Lempel-Ziv-Welch Algorithm with Indexed Multiple Dictionary**

Abstract:With the advancement in technology and development of High Throughput System (HTS), the amount of genomic data generated per day per laboratory across the globe is surpassing the Moore's law. The huge amount of data generated is of concern to the biologists with respect to their storage as well as transmission across different locations for further analysis. Compression of the genomic data is the wise option to overcome the problems arising from the data deluge. This paper discusses various algorithms that exists for compression of genomic data as well as a few general purpose algorithms and proposes a LZW-based compression algorithm that uses indexed multiple dictionaries for compression. The proposed method exhibits an average compression ratio of 0.41 bits per base and an average compression time of 6.45 secs for a DNA sequence of an average size 105.9 KB.

Keyword: Compression, lossless, LZW, DNA, Multiple Dictionary, Decompression.

Paper Title: **Modelling and Simulating the Effect of Sunlight Heat on Front Bumper**

Abstract:In this speeding modern world, it became a necessity to have at least one car for every family. There often comes the time when the car has to be parked in an open area due to space or parking unavailability. During daytime, the sunlight heat causes the car's exterior parts to get heated. Especially the summer heat in India is unbearable. The temperature rises too high that the stationery car's exterior parts can reach the temperature of 90°C (Considering the car is stationery for over a period of time). The parts of the car that are exposed to sunlight heat are Hood, Front and rear bumper, Doors and Roof area. Out of all the exterior parts, Bumper is plastic and it is the most important when it comes to style and safety. In this research the effect of Sunlight heat on Front bumper is studied. The problems associated with sunlight heat on Front bumper are; the front bumper goes out of its original shape, disturbs the Clearance (Gaps) and fitting with surrounding parts, if the surrounding parts are too stiff the Front bumper itself undergoes high deformation and high internal stresses will be developed at the mating regions. In this research the FE modeling of Front bumper is done using ANSA software, the sunlight heat effect is simulated using ABAQUS solver. From the simulation results, there is 5.86mm deformation observed on Front bumper, and at the mating regions (The region where Front bumper is surrounded by other parts like Head lamp, Hood, Wheel arch) there is a displacement of 3.39mm (maximum clearance maintained at mating regions is 3mm).Several countermeasures were studied and the best way to avoid the deformation is adding Honey-comb ribs, stiffeners at the mating regions.

Paper Title: **Data Mining Techniques for Analysing Employment Data**

Abstract:This paper proposes a methodology that uses a large-scale employment dataset in order to explore which factors affect employment and how. The proposed methodology is a combination of predictive modelling, variable significance analysis, and VEC analysis. Modelling is based on logistic regression, linear discriminant analysis, neural network, classification tree, and support vector machine. Following the CRISP-DM standard process model, we train binary classifiers optimising their hyper-parameters and measure their performance by prediction accuracy, ROC analysis, and AUC. Using sensitivity analysis, we rank the variable significance in order to identify and measure factors of employment. Using VEC analysis, we further explore how values of those factors affect employment. Findings show that best performing models are neural networks and support vector machines with preference to the latter for quality of VEC. Experiments also suggest that education and age are primary contributors for correct classification with specific value distribution, discussed in the paper. All results were validated using a rigorous testing procedure that involves training, validation, and test data partitions and a combination of multiple runs along with three-fold cross-validation. This study addresses some gaps in previous research publications, which lack quantification of the conclusions made.

Paper Title: **Water Quality Monitoring and Management System for Residents**

Abstract:This paper presents a Water Quality Monitoring and Management System for the Residents. For the incoming water three water quality parameters- pH, Turbidity, and Temperature will be checked. The proposed system will check the tank level and quality of water supplied and according to the results will decide whether water to be allowed to enter into the cistern. The system notifies the user about water quality and daily water consumption via the IFTTT app, SMS or email alert as data will be uploaded on the Adafruit cloud. The objectives to design this system are to ensure the prevention of contamination of the water supply, untimed water supply and real-time automation of water supply according to the tank level, water quality, and supply.

Paper Title:	**Digital Design for Image-Adaptive Watermarking using CDF 5/3 Wavelet**

Abstract: Paper This paper presents a hardware architecture for image-adaptive watermarking in the wavelet domain. The embedding strength factor is selected by calculating the energy present between the different frequency bands. The current algorithm is constructed on a CDF 5/3 wavelet based on the model of lossless compression JPEG 2000. Wavelet filters are implemented using a parallel architecture with a lifting scheme, which makes them more efficient in terms of speed and hardware utilization. The top module of the system is built with the combination of serial-parallel architecture to balance the speed and power consumption. The presented watermarking system is tested using hardware in the loop-testing technique. The objective is to develop an image-adaptive, real time, low power consumption and robust watermarking system, which can be incorporated into existing hardware such as digital cameras, scanners, and camcorders. The watermarking system's efficiency against different assaults has been evaluated using the StirMark software. The proposed watermarking system showed robustness against most of the geometric and non-geometric attacks.

Paper Title:	**Bit Rate Transcoding for High Efficiency Video Coding**	

Abstract:High efficiency video coding (HEVC) has demonstrated a notable increase in compression performance and is taken as a successor to H.264/AVC. Efficient bit rate adaptation algorithms are required to contain the HEVC standard between real life community facilities. A present issue of bit rate transcoding is its high computational complexity which is related with the encoder of a cascaded pixel domain transcoder. This paper gives Top to Bottom (T2B) approach to reduce complexity by using different complexity schemes. Proposed approach is effective in reducing complexity in Coding Unit (CU) optimization level. Coding Unit has been analyzed in T2B Approach. While examining the coding unit information of the input video is turned to account for decreasing the number of evaluation and early terminate the process. For the Prediction Unit (PU) level the units are powerfully chosen contingent upon likelihood of Prediction Unit sizes and co-found input prediction partitioning. By utilizing this approach, complexity scalable bit rate transcoding has achieved. Machine learning approach can be used to control computational complexity. Additionally, the T2B strategy is able to gain a spread on trade-offs in transrating complexity and coding performance. Using T2B approach 15% encoding time saving is accomplished. From this scheme, for the less resolution video 27% time saving has achieved.

Keyword: Coding Unit (CU), High Efficiency Video Coding (HEVC), Transcoding, Video Coding.

Paper Title:	**Insider Detection Method in a Company**

Abstract:Managers often focus on external threats mainly due to the difficulties in evaluating the losses from the insider activities. The purpose of the study is to improve the efficient performance of an information security department and a company itself in counteracting insider threats by increasing the accuracy and rate of assessing the insider threat for each employee and ranking employees in accordance with the assessment of a summarized technical threat indicator. The authors morphologically analyze the features of insider activities in three sections and identify a promising area for combating the insiders – a prompt identification of unusual behavior signaling a breach of confidentiality. The paper describes an algorithm developed by the authors for assessing the insider threat for each employee of a company and ranking all employees by a summarized technical threat indicator. The steps to implement the algorithm are described in detail and a fuzzy derivation scheme of a summarized technical threat indicator is presented; an example is used to test the algorithm. The algorithm can be implemented as a part of a corporate information system. It is cheap to use and own, and it is rated as cost-efficient.

	Paper Title:	**Itinerary Aware Data Delivery Technique for Underwater Acoustic Sensor Networks**

Abstract:Monitoring and maintaining aquatic environment is the universal need and Underwater Acoustic Sensor Networks (UASN) is an emerging technology plays a major role in acoustic data acquistion. The data acquisition is challenging issue in UASN due to its communication characteristics. Though, there are several geo-opportunistic routing protocols were explored to improve the data acquisition it can be still improved by enhanced routing technique. The existing Geo-graphical depth adjustment routing (GEDAR) uses Global Positioning System(GPS) based notes for improving data acquisition, however it consumes more energy and increases overhead. We make an attempt to study about efficient data acquisition process and its path reliability. The proposed Itinerary aware routing protocol(IARP) acquires neighboring node's information for constructing efficient and reliable link with minimum information which improves data delivery ratio with minimum energy consumption. The proposed IARP increases 11% packet delivery ratio and reduces delay by 13%, and energy consumption by 9% comparing with existing GEDAR based algorithm. IARP also performs better than Depth based routing (DBR).

Keyword: Underwater Acoustic Sensor Networks, GEDAR, Depth based routing, Itinerary aware routing

	Paper Title:	**Influencing Variables of Drawing Process using Magnesium Tubes**

Abstract:The present work examines the deformation of magnesium tubes using drawing process. During examination, absence of wrinkling and cracking is witnessed at 303k. The effect of mandrel on the cross section of the extruded tubes, wall thickness and spring-back of the bent tube are vividly discussed. Results show that presence of mandrel decreases the cross section of distortion and the spring back angle. Further, the present investigation clarifies the thinning rate of tube wall thickness. It is found that at the bending angle of 90° largest distortion is witnessed.

Paper Title: **SURF Points Versus SIFT Points in Identification of Medicinal Plants**

Abstract:Today, digital image processing is used in diverse fields; this paper attempts to compare the outcome of two commonly used techniques namely Speeded Up Robust Feature (SURF) points and Scale Invariant Feature Transform (SIFT) points in image processing operations. This study focuses on leaf veins for identification of plants. An algorithm sequence has been utilized for the purpose of recognition of leaves. SURF and SIFT extractions are applied to define and distinguish the limited structures of the documented vein image of the leaf separately and Support Vector Machine (SVM) is integrated to classify and identify the correct plant. The results prove that the SURF algorithm is the fastest and an efficient one. The results of the study can be extrapolated to authenticate medicinal plants which is the starting step to standardize herbs and carryout research.

Keyword:digital image processing, foliage, herbal, medicinal plants, leaf vein, Scale Invariant Feature Transform (SIFT) points extraction, Speeded Up Robust Feature (SURF) points extraction, Support Vector Machine (SVM) classifier.

Paper Title: **Dynamic Resource Allocation and Memory Management using Deep Convolutional Neural Network**

Abstract:Memory management is very essential task for large-scale storage systems; in mobile platform generate storage errors due to insufficient memory as well as additional task overhead. Many existing systems

have illustrated different solution for such issues, like load balancing and load rebalancing. Different unusable applications which are already installed in mobile platform user never access frequently but it allocates some memory space on hard device storage. In the proposed research work we describe dynamic resource allocation for mobile platforms using deep learning approach. In Real world mobile systems users may install different kind of applications which required ad-hoc basis. Such applications may be affect to execution performance of system as well space complexity, sometime they also affect another runnable applications performance. To eliminate of such issues, we carried out an approach to allocate runtime resources for data storage for mobile platform. When system connected with cloud data server it store complete file system on remote Virtual Machine (VM) and whenever a single application required which immediately install beginning as remote server to local device. For developed of proposed system we implemented deep learning base Convolutional Neural Network (CNN), algorithm has used with tensorflow environment which reduces the time complexity for data storage as well as extraction respectively.

Paper Title:	**L-Index Based Weak Area Identification of IEEE 118 Bus System using Dynamic Simulation in PSS®E**	

102.

Abstract:Voltage stability is a relevant part of power system stability analysis ever since many voltage collapse incidences have occurred at different regions of the world. In this paper we take up IEEE 118 bus system as it represents a close approximation of standard Grid system. This IEEE 118-bus system has fixed number of predefined generators, synchronous condensers, transmission lines, transformers and loads. In this work IEEE 118 bus system is simulated and load flow simulation is computed using the software PSS®E. The weak buses of the IEEE standard 118 bus network are predicted with the help of L-Index Algorithm in MATLAB. Further dynamic simulation is also performed in the weak buses obtained from L-Index as it opens up scope of more detail analysis of the system. An initial transient disturbance is then introduced in the weak buses and then the resultant maximum frequency deviation and the recovery time of the voltage is computed which finally helps to detect the weak areas in the transmission network. Further Critical Clearing time of the weakest bus is also computed.

Paper Title: **Diabetic Retinopathy – Feature Extraction and Classification using Adaptive Super Pixel Algorithm**

Abstract:Diabetic Retinopathy is an ocular manifestation of diabetes . The longer a person has diabetes, higher are the chances of having diabetic retinopathy in their visual system. Hence the objective of this research work is to propose an automated, suitable and sophisticated approach using image processing so that diabetic retinopathy can be detected at early levels easily and damage to retina can be minimized. A vital point of diabetic retinopathy that it causes detectable changes in the blood vessels of the retina. The focal blurred edges are detected so as to dismiss the false alarms. A two-level approach is used here to classify data. Firstly, optimal features are extracted from the training data and secondly, the classification is done by the use of the adaptive super pixel algorithm and then the test data is analyzed. Adaptive super pixel algorithm can adjust the weights of various features based on their discriminating ability. After the application of algorithm, the diabetic eye is detected by means of various parameters like colour, texture, spatial distance, contour, mean, standard deviation, entropy and maximum pixel points. This research can aid the doctor for easy detection of the disease as it given an accuracy of about 98.33%.

Paper Title: **Hall Effects on Unsteady Magneto Hydrodynamic Convection Flow of Nanofluids Past a Rotating Porous Plate**

Abstract:The effects of Hall current are considered for the convective rotational current free of nanofluid magnetohydrodynamics (copper and alumina) in a permeable medium with a vertical porous flat plate, semi-infinite rotation with stable state of the heat source and convection limit. The slip rate is expected to oscillate over time with a constant frequency so that the boundary layer solutions are of the equivalent oscillating type. The equations to regulate the flow are analytically solved by perturbation estimation. The effects of different parameters on the flow are investigated by means of diagrams and tables.

Keyword: Porous medium; Nanofluids; Convective flow; rotating frame; Heat transfer.

	Paper Title:	**Efficient Mining of Interest Patterns on Click Stream Data**	
	Abstract:Nowadays, large amount of data is generated daily in e-commerce applications as click stream data. Because of the availability of this tremendous amount of data analyzing the user browsing behaviour and finding frequent navigation patterns of different web pages accessed by web users is an key element for retailers to optimize the website and personalized the web services of different e-commerce websites. User browsing behaviour is evaluated based on user interests on web pages or products. There are different parameters are considered while analyzing the click stream data for calculating frequent navigation patterns and context based customer behaviour in online data bases. In this paper we developed different models for optimizing and personalizing web service and sequential frequent patterns using the parameters: browsing path, frequently visited web pages, time duration of web pages and user interest. These novel models uses the parameters and applied on click stream data to optimize the web pages and improve the personalized recommendation. **Keyword:**Data stream, FP-Growth Algorithm, CURE Clustering, Frequent patterns. **References:** 1. 	Paper Title:	**Performance and Emission Analysis of CIDI Engine Fueled with Palm Biodiesel Blends and Nano Particles**	
	Abstract:The diesel fuel is most extensively used fossil fuel in automotives and a single major source of hazardous environment pollutant across the globe. As of late, the exploration thinks about distinguished that plant based biodiesel are turning into a promising option sustainable fuel and the consumable/non-eatable oils and creature fats can be utilized feed-stock in arrangement of biodiesel, in light of the fact that its chemical properties practically like fossil diesel fuel, non-poisonous, clean consuming and inexhaustible source. In this work, the performance analysis and emission characteristics of single cylinder, 4-stroke, and water cooled diesel engine was carried-out using Palm oil methyl ester as biodiesel alternative to diesel fuel. Experimental tests have been conducted with range of engine loads using palm oil methyl ester (PME) and its diesel blends with biodiesel in the ratio of 10:90 (B10), 20:80 (B20), and 30:70 (B30), 40:60 (B40), PME 100% (B100) and petro-diesel 100% by volume with and without antimony tin oxide (ATO) additive. In this research work brake power (BP), brake thermal efficiency (BTE), brake specific fuel consumption (BSFC), fuel consumption (FC) are considered as engine performance characteristics and carbon monox ide (CO), hydro carbons (HC), oxides of	**640-646**

nitrogen (NOx) are considered as emission characteristics. The experimental results revealed that B10 blend of biodiesel has comparable brake thermal efficiency as diesel. B10 has lowest and B100 has highest BSFC, FC among all the biodiesel blends and biodiesel has lower CO emission, lower HC emission and moderately higher NOx emission when compared with diesel. B10 has shown comparable performance as diesel and it can be considered as alternative to diesel fuel.

Keyword: Biodiesel, Performance, PME, Transesterification.

Paper Title: **Efficiencies of Different Techniques to Protect Rebars Against Corrosion**

Abstract:Corrosion of steel reinforcement is considered one of the major causes of reinforced concrete deterioration. In the last few decades, researchers studied many different rebar protection techniques against corrosion. Three famous techniques were considered in this research, which are rebars protective coats, sacrificial anode and impressed current. Rebars protective coats are the most used technique in small projects. They are produced with different trade names according to the manufacture. On other hand, sacrificial Anode technique is recommended for aggressive environments. Finally, impressed current technique is usually used for large and corrosion sensitive structures. The aim of this research is to compare the protection efficiency of each of these three techniques. In order to achieve that goal, two experimental programs were carried out; the first program measured the protection efficiency in terms of rebars mass loss using sixteen lollypop samples. The program tested the efficiency of two types of protective coats, three types of sacrificial anodes besides the impressed current using two concrete grades. The second program measured the protection efficiency in terms of loss in structural capacity using six (100x100x1500mm) concrete simple beams. Only one type of protective coating is used besides the impressed current technique. In both programs, all samples were tested using accelerated corrosion test and results were compared to the control samples. Programs results showed that impressed current is the most effective protection technique because it prevents the corrosion completely. On other hand, the efficiency of sacrificed anode technique depends on the activity of the anode material and finally, the efficiency of protected coats dependents on material base of the coat.

Keyword: Protection against corrosion; Protective coats; Sacrificed anode; Impressed current.

	Paper Title:	**The Interactions between Cosmopolitanization and Migration: New Trends**

Abstract:The author made a philosophical analysis of the migration phenomenon. The problems of cosmopolitanization and migration in the context of globalization have been observed and their main vectors of interaction have been pointed out here.The new methodology is cosmopolitanization. It means the world experience and cultural infinity. Global interdependence and risks of available knowledge change social and political quality of national communities. This feature is defined as cosmopolitanization. The cosmopolitan idea spreading is related to migration mainstreaming, integration and globalization. Therefore there is a need to study interference issues of cosmopolitanization and migration, the prospects of their development in the context of globalized modernity.The migration analysis can detect the general conditions of its occurrence. It helps to consider the migration structure and make a comparative analysis of immigration forms, to establish this role in the society. The philosophical understanding of the migration phenomenon is reflected in a number of concepts, including concepts of passionary changes.The migration system in the world is characterized by close economic, cultural, political and geographical bonds. The phenomenon is associated with the term «globalization» in the context of current international relations. Nowadays migration intensifies and moves into a new stage. An essential part of immigration policy is a policy of integration of migrants, which involves targeted measures in many areas of society.In this article the author reveals interaction principles of migration and cosmopolitanization. This means that a closed society disappears forever. However, most people do not perceive it as liberation. As it was noted by Ulrich Beck, the rejection of the national paradigm is not tantamount to a global «cosmopolitanism of common good».Cosmopolitanization is a response to a changing world. How will the humanity evolve? Will migration processes, integration, interaction and people interdependence develop? Will resistance to globalization be intensified? What will be the attractor of social development?

	Paper Title:	**A Single Feed Circularly Polarized Planar Antenna Array**

Abstract:A design of a circularly polarized planar antenna array of elliptical patches is presented. The designed prototype has been verified experimentally. Elliptical patches produce circular polarization by using a single feed only. A corporate feed network with quarter-wave transformers are used for uniform excitation of all the array elements. Primary advantages of the presented antenna array are structural simplicity, good circular polarization characteristics and no side lobes. Here, the design example is given for 2×2 elliptical patches at 2.8 GHz. Similar procedure can be extended for more number of array elements at the desired frequency of

109.

657-661

operation to cater the need of communication systems where circular polarization is essential.

Paper Title: **Dam Inflow Prediction by using Artificial Neural Network Reservoir Computing**

Abstract:A multipurpose dam serves multiple modalities like agriculture, hydropower, industry, daily usage. Generally dam water level and inflow are changing throughout the year. So, multipurpose dams require effective water management strategies in place for efficient utilization of water. Discrepancy in water management may lead to significant socio-economic losses and may have effect on agriculture patterns in surrounding areas. Inflow is one of the dynamic driving factors in water management. So accurate inflow forecasting is necessary for effective water management. For inflow forecasting various methods are used by researchers. Among them Auto Regressive Integrated Moving Average (ARIMA) and Artificial Neural Network (ANN) techniques are most popular. Both of these techniques have shown significant contribution in various domains in regards to forecasting. But they have a common drawback in handling non-stationary inflow patterns. To address this drawback, in this work neural Reservoir Computing technique is used.In this work, Context reverberation network, also known as reservoir computing approach, is applied for inflow forecasting. It comprises of a dynamic neural reservoir. As the nature of a neural reservoir is dynamic, it can easily model complex non-stationary patterns along with stationary ones. Proposed model is applied on daily inflow data of Srisailam Dam which is a multi-purpose dam. Here ARIMA and ANN models are compared with Reservoir Computing model. On various evaluation parameters Reservoir computing is proved better than ARIMA and ANN.

Keyword: Water Management, Reservoir Computing, ARIMA and ANN.

	Paper Title:	**Unauthorized Vehicle Parking Detection and Auto-Locking using an Arduino and a Relay**

Abstract:As the populace expands step by step, the quantity of vehicles are additionally expanding and this prompts numerous mishaps and traffic clogs. In this bustling world, individuals consistently use to leave vehicles at confined or no parking zones. At the point when a vehicle has been left at no parking territory, the street gets smaller and cause traffic clog. Enormous number of traffic police are sent to check the unlawful stopping and fine the proprietors with the goal that they would not stop again in no stopping zone, yet it is anything but a successful arrangement. In this manner, different advancements have been utilized for the identification of vehicles that are left at no leaving zone. In this proposed framework, vehicles which are parked at restricted area is being detected and locked using a relay.

Keyword: Confined-parking, Traffic Clogs, Detection Methods, and Locking System.

	Paper Title:	**Experimental Test on Glare Composite of an Aircraft Structure Under Tensile Strength Failure**

Abstract:A Glass Aluminum fiber metal laminate GLARE is a set of materials manufactured by strong bonding glass/epoxy layers within the metal layers. The combined set of materials will be providing the better mechanical properties and weight reduction for an aircraft structure. The fiber metal laminate model was fabricated as per ASTM standards 200×30×5mm and then the experimental test under tensile loading test was conducted by using universal testing machine UTM as observed the stress-strain curve as the failure strength of GLARE reaching point and finally obtained results. Also to determine the mechanical properties and material characteristics of the unidirectional loading on E-glass fibers used to assemble GLARE for an aircraft structure.

Keyword: Fiber metal laminate, mechanical properties, universal testing machine, tensile strength, failure.

Paper Title: **Home Security using Face Recognition Technology**

Abstract:Face is the easiest way to penetrate each other's personal identity. Face recognition is a method of personal identification using the personal characteristics of an individual to decide the identification of a person. The method of human face recognition consists basically of two levels, namely face detection and face recognition. There are three types of methods that are currently popular in the developed face recognition pattern, those are Eigen faces algorithm, Fisher faces algorithm and CNN neural network for face recognition

Keyword: Face recognition, Face-detection, Eigen-faces, Fisher-faces, CNN, neural network, Residual network.

Paper Title: **Application of Priority Analysis: Smart City Community Complaint**

Abstract:In this era of globalization that is happening right now, making developments in Information Technology that offers solutions to problems that occur in people's lives are important to improve available public services in the area. The development of Information Technology also gives innovation for government to improve existing public services and facilities. This report will discuss about application used by government in various regions in Indonesia in developing Smart City program that was initiated in 2014. Social Media is one of the ways and tools for community in Indonesia to give their aspiration, critic and response which aims for the improvement of government services and the development of Smart City so that they can meet the needs of the Community in their own regions. With this, responses from government is needed in accordance with the priority level of complaints given by the community through social media for the government to follow up their aspirations and complaints about the development of the Smart City.

Paper Title: **Human Face Identification based on Optimal Sparse Features**

Abstract:Security of human being is an important aspect in the context of data communication. To maintain security, technology is being developed from alpha-numeric passwords to biometric scanners. Recent advancement in security is the user authentication using face recognition. But the flaws in existing face recognition systems are yet to be addressed. This paper discusses solutions to the issues encountered by face recognition systems. Sparsity based classification is performed in this work. This method can handle errors occurs due to compress in and occlusion in a robust manner. We suggest a comprehensive classification algorithm characterized by sparse representation and 1l -minimization. In this method, the feature points and

690-693

selection of features are not critical. The effect of change in occlusion can be easily addressed by using this optimal sparse representation based classification (OSRC) algorithm.

Keyword: Face Detection, Sparsity, Optimal Sparse Representation based Classification, l1–minimization.

Paper Title: **Frictional Characteristics of Brake Pad Materials Alternate to Asbestos**

Abstract:Nevertheless, asbestos though having ample physical and tribo-mechanical properties is being banned worldwide due to its health hazardousness. Most importantly, any material replacing asbestos should have comparable friction properties. This paper aims at comparative study of frictional characteristics of asbestos base and asbestos free brake pad materials. A total of three friction materials namely AF-22 (metallic based), CL-3003 (fine brass based) and DM-6 (asbestos based) were compressed and moulded into a sample. Experiments were performed using dedicated test set-up based on Pin-on-disc principle. Coefficient of friction was compared for three materials at different conditions of sliding velocity and pressure. Experiments were performed using Taguchi's L27 orthogonal array. Ranking of the parameters have been done based on experimental results and S/N ratio analysis. The elemental composition of materials was measured by EDS technique. Scanning electron micrographs of brake pad samples were tested at different magnifications. Further investigations to evaluate wear rate, stopping distance under simulative test conditions are suggested.

Paper Title: **Cosmetology Field and It's Significance for Education and Industry Sector**

Abstract: The purpose of this paper was to identify the trends in cosmetology field. This paper also provides the definition of cosmetology, cosmetics, and other pertinent terms. Gathered articles were identified using electronic databases such as Google Scholar, Science Direct and Eric from year 2010 to 2019. These reviews found that training and earning professional licensing are crucial for cosmetologist to sustain in the beauty industry. Furthermore, these reviews bring researcher to relate that there is a lack of study in cosmetology education and teaching. Whereas, this cosmetology field is vast and growing nowadays. So that, the results of this study suggest that future study needs to be conducted to examine the educational intervention on effective learning and teaching strategies in cosmetology fields. This will provide more information required for the development of cosmetology curriculum to support students' academic interests, knowledge and skills in cosmetology.

Paper Title: **Maximum Takeoff Gross Weight of Aircraft in Search and Rescue Sorties**

Abstract: Several aircraft types are commonly used to perform many search and rescue missions throughout the world. Aircraft have been used because they are able to offer a bird's eye view of the surrounding search areas. In general, these aircraft come in various shapes, sizes and weights, and have myriad capabilities in carrying rescued and/or injured personnel and also equipment for the search and medical operations during the search and rescue sorties. For an aircraft, takeoff gross weight is important because it will affect the flying performance of the aircraft. To perform an effective search and rescue mission, the right selection of aircraft is essential such that unnecessary resources are not being wasted. In line with this notion, this study examines the distribution of the maximum takeoff gross weight of aircraft that have been typically used in search and rescue sorties. This knowledge will help in the design of future aircraft for such missions and also narrowing the selection of existing aircraft to be used on that kind of operations. It is found from the data analysis that most current operators have been using medium-haul aircraft that have a takeoff gross weight between 4,301 kg and 8,600 kg.

Keyword:search and rescue, takeoff gross weight, aircraft, performance analysis.

Paper Title: **Make Way: An Intelligent Real-Time Traffic Light Control System**

Abstract:Nowadays, automatic traffic light control is becoming an important requirement for travelers and

709-712

number of road users especially for emergency service providers such as ambulance drivers, fire fighters etc... Various alternatives have been proposed, but it has certain limitations.One such example is using an RF transmitter mounted on the ambulance which will communicate with the RF receiver mounted on the signal post in the traffic control system. A special algorithm is provided to control the traffic signals automatically by pressing the key provided in the keybord on the ambulance by the driver.But in this case, there is big trouble for car accidents or road accidents, because of automatic adjustment and a large number of vehicles, and there is a problem of delay in first aid service, with these overcrowded roads. This paper describes a solution that is "Intelligent Ambulance with Automatic Traffic Control" which includes the accident detecting, alerting and tracking mechanism with an automatic traffic light controlling system to overcome this delay of first aid service. An ambulance can thereby easily finde a freeway to reach the victim in a minimal time and thereby providing first aid as soon as possible. This is possible by using an RF transmitter on the ambulance which will communicate with the RF receiver mounted on the signal post in the traffic control system. To control the traffic signals automatically, and to move towards the location in minimal time, a specific algorithm is proposed in this paper. Thus, the traffic light gets controlled by the intelligent ambulance itself, in such a way that it could provide free path to the ambulance[1].

Paper Title: **IRNSS Orbit and Clock Bias Estimation using NavIC Ground Receiver Data: Extended Kalman Filter**

Abstract:The aim of this work is to precisely estimate the IRNSS satellite's orbit and clock errors using NavIC receiver data. Orbit determination is required to precisely calculate the user/receiver position on the Earth. In this study, Bengaluru, Surat, Kolkata, and Hyderabad's NavIC ground receivers' data is considered for orbit estimation. The pseudo-range measurements received by the ground receivers have multiple errors added due to ionospheric delay, tropospheric delay, multipath delays, satellite clock errors, and some unmodeled effects. But, the major factor accounting for errors is the satellite clock error. Hence, along with position and velocity of the satellite, even the clock correction is estimated using Extended Kalman Filter (EKF). EKF is a sequential estimation algorithm which estimates satellite position, velocity and clock error at each time instant. In this paper, results of all seven IRNSS satellite's orbit determination are discussed.

Paper Title: **Optimization of Biodiesel Transesterification using ANN and Fuzzy Logic**

Abstract:The high energy demand in domestic sector coupled with pollution brought by extensive exploitation of conventional fuels in an industrialized world makes it mandatory to boost renewable energy sources having lesser environmental impact than non-renewable ones. In this regard bio-diesel can be considered as a more reliable resource of energy that can be used readily in the existing engines. Biodiesel is formed by transesterification reaction of alcohol and triglycerides under a catalyst. In this paper, Bio-diesel is produced from karanja (pongamia pinnata) oil in sono reactor at varied methanol-oil ratios and varied catalyst ratios. Yield was found at different molar ratios of methanol:oil (6:1; 4.5:1; 3:1), different KOH concentrations (2.0 wt %; 1.5 wt %; 1.0 wt %) and different times (15 min; 30 min; 45 min; 60 min). The biodiesel thus obtained conformed to ASTM D6751 standards. The optimum conditions of maximum yield are determined at 50o C temperature, 45 min reaction time, 4.5:1 methanol:oil ratio and 1.5% of KOH. The results obtained are well in accord with the literature. Also ultrasonic vibration used for production of biodiesel proves to be promising technique. The biodiesel thus produced is analyzed using various tests to obtain its properties.Further optimization techniques namely Artificial Neural Network and Fuzzy Logic have been applied for modeling the reaction and finding the optimum yield at different conditions. The yield predicted by using ANN and Fuzzy logic was compared with the experimental yield. The ANN and Fuzzy can precisely calculate as per the experimental data with R2 = 0.998 and R2 = 0.995, respectively.

Keyword:ANN; Biodiesel; Fuzzy logic; Karanja; Transesterification.

Paper Title: **Spectral Filtering of Photovoltaic Cells using Novel Bio-Filter: Silver Coated Hibiscus Extract using Butanol Solution**

Abstract:The adaptability of the solar photovoltaic cell is huge but not without its peculiar challenges. It has been reported that the patronage of photovoltaic (PV) in Africa is drastically dropping due to the dismal performance of PV in the first year of purchase. In this research, the bio-filter was proffered as an external solution to improving the efficiency and longevity of PV module. It was observed that the bio-filter improved the efficiency of the polycrystalline panel by 60%. This means that a good percentage of the solar IR radiation can be reflected from this proposed bio-filter. This research further affirms the significance of plants as a veritable tool to protect the PV panel. Hence, this bio-filter is adjudged to be cost-effective (i.e. affordable), universal usability and eco-friendly in both the long and short term.

Keyword: Photovoltaic, bio-filter, spectral filtering. Solar energy, energy

Paper Title: **Efficient Sparse Representation based Action Recognition in video**

Abstract:Human Action Recognition (HAR) is an interesting and helpful topic in various real-life applications such as surveillance based security system, computer vision and robotics. The selected features and feature representation methods, classification algorithms decides the accuracy of the HAR systems. A new feature called, Skeletonized STIP (Spatio Temporal Interest Points) is identified and used in this work. The skeletonization on the action video’s foreground frames are performed and the new feature is generated as STIP values of the skeleton frame sequence. Then the feature set is used for initial dictionary construction in sparse coding. The data for action recognition is huge, since the feature set is represented using the sparse representation. To refine the sparse representation the max pooling method is used and the action recognition is performed using SVM classifier. The proposed approach outperforms on the benchmark datasets.

Keyword: Skeletonization Sparse representation, action recognition, sparse coding, sparse dictionaries, SVM classifier.

Paper Title: **Software Defined Networking and Network Function Virtualization for Service Providers using Network Slice AS a Service**

Abstract: The traditional network is configured based on the prescribed network requirements. Sometimes the resources of the network are underutilized and at sometimes there may resource starvation because of the static configuration of the network. As against traditional network, which is operated either as dedicated network or as an overlay network, network services can be operated over a shared network infrastructure. Thus maximum resource utilization under minimal infrastructure cost can be achieved. The on-demand network requirement can be configured dynamically using network slice. The backbone of the rapidly evolving 5G technology is network slice and service networks can be benefited from it. Different network function for multiple tenants can be enabled customized using network slice with each slice operating independently. Network slice can be offered as a service to meet various requirements from the network slice tenant with different granularities. The Software Defined Networking and Network Function Virtualization are the enabling technologies for network slice. This paper discusses various network slicing use case requirements. And also OpenFlow based software defined network environment is simulated to validate the discussions. Experimental results show that the efficiency of the service network is maximized with improved reliability of service.

	Paper Title:	**Design of Multi Modulation Scheme for SoftwareDefined Radio using FPGA**	
	Abstract: Undersized satellites are bringing a critical part in spaceship missions on account of their cheap, minute in size, less weight. All the more no of little satellites are flying together can resolve complex missions, e.g., Data trade, high exactness in route. A raising number of satellites activity on lower earth circle for complex missions abuse the SDR for correspondence in light of its consistency and flexibility . This paper shows a total programming characterized radio (SDR) model for entomb satellite interchanges (ISCs) and recreation on a Xilinx ISE programming utilizing verilog HDL. The proposed SDR baseband segment for transmitter has an a lesser measure of intensity use, separately, which is proper for low power little satellite frameworks. Programming Defined Radio (SDR) has been one of the new methods which lessens the equipment multifaceted nature and furthermore change the route for conventional remote correspondence frameworks work. Planning a multi-tweak plans framework in term of FPGA makes it adaptable and reusable. This task introduces the plan of baseband handling segment of Software Defined Radio utilizing QPSK, BPSK and encoding plan utilizing Hamming code. **Keyword:**Software defined radio (SDR), Field Programmable Gate array (FPGA), Low Density Parity Check (LDPC) code, Inter Satellite Communication (ISC) **References:**1. 	Paper Title:	**Exterior Features and Productive Qualities of Young Beef Cattle of Various Genotypes**	
	Abstract:The article describes the issues of comparative assessment of economic and biological features and productive qualities of beef cattle bred in Western Kazakhstan. The authors present norms and rations for feeding young animals of different genotypes. The results of studying the exterior features, body weight and average daily gain of Kazakh Whiteheaded breed and foreign Hereford and Aberdeen Angus breeds are presented. The authors conduct a comparative analysis of body weight and average daily gain of young animals of different breeds grown in the semi-desert zone of Western Kazakhstan. It has been found that during the growing period from 8 to 15 months, the average daily gain of body weight of the Hereford breed was 658.1 g for bull calves and 587.1 g for heifers, of the Aberdeen Angus breed – 603.8 g and 500.9 g respectively and of the Kazakh Whiteheaded breed – 758.8 g and 561.1 g respectively. **Keyword:**genotype, Hereford breed, Aberdeen Angus breed, Kazakh Whiteheaded breed, selection, acclimatization, exterior, average daily gain, body weight.	**745-750**

Paper Title: **Thermal Analisys of the Increase in Ambient Temperature Due to Motor Vehicle Activities**

Abstract: Global warming has become a problem of world wide, because it endangers living things. The consequences of global warming include the increase of the earth temperature and climate change. The increase of temperature (heating) in a city which is referred to urban heat island (UHI) is also the same problem in architecture. This research aimed to analyze the ambienttemperature of the UHI due to the motor vehicleactivities. Samples were taken from several locations: (1) Bahu Mall Parking area; (2) Manado Town Square 2 parking area; (3) along the Wolter Monginsidi street in front of Bahu Mall and (4) along the Piere Tendean street in front of Manado Town Square. This research used a quantitative method with a field survey. This research found that the ambient temperature increased when motor vehicles were stationary with engine on or moved. The temperature increased due to the heat from the engine and the reflection of the sun's heat from the body of the vehicles. The heat level obtained from the survey was 34,8 0C to 39,4 0C. For this reason, a specific material for vehicle's body is needed to prevent the increase of ambient temperature.

Keyword:urban heat island, thermal analisys, motor vehicle activities.

Paper Title: **Processing and Characterization of Natural Fiber Reinforced Polymer Composite**

Abstract:Polymer materials synthetic fibers, for example, glass and carbon gives point of interest of high stiffness and strength to weight proportion when compare with conventional construction materials, for example wood, cement and steel. The accessibility of natural fibers and comfort of manufacturing have attempted researchers to try locally accessible inexpensive fibers and do study for their feasibility of strengthening purpose. Accordingly, many researchers do broad study on the properties of polymer matrix composite. The synthetic fiber substituting with the natural fiber for example, jute, sisal, pineapple and bamboo. The natural fiber removed by retting and manual procedures were exposed to soluble base treatment. this study is concerned with the investigation of mechanical properties of Grewia Optiva and jute fiber with epoxy resin matrix-based polymer composites. study investigate the tensile, bending and abrasion behavior of composites material made by grewia optiva and jute into epoxy resin. result shows that the better tensile strength of Grewia optiva fiber composite.

Paper Title: **Locomotive Lifter for Parking in Congested Places**

Abstract:Locomotive Lifter is an independent attachment implied on the vehicle body frame in order to lift and move the vehicle at right angles from it's exact position using the retractable arm provided with the wheel dolly for parking in congested places. It works on the principle that the fluid pressure (hydraulic or pneumatic) applied in the piston cylinder respectively pulls the arm and lifts the vehicle, due to small area of the wheel dolly the effort (force applied) to push the vehicle is less irrespective of the immense structure of the vehicle. Now-a-days the most common issue probably dealt in metropolitan cities is that the mishap in parking the car in the portico or on the adjacent road side parallelly with part of the car body to be hanging outside the passage. Merely, there is enough of space to park the car but to say it is hardly occupied. The unoccupied space is due to irregular parking of the other cars crossing the parking lanes on the either sides in parallel parking or the standing pillar in indoor parking which does not allow the car to turn with it's free radius of curvature. In order to park the car perfectly one has to arrest the position of the either axial of the car and the other axial wheel has to be tilt at right angles to make an arc to park. But this case isn't possible i.e. tilting the wheels at right angle. Besides the help of this "Locomotive Lifter" we can rotate the position of the car in all 360'degree direction, either the car can be moved or the car can be rotated.

758-760

Keyword: Merely, there is enough of space to park the car but to say it is hardly occupied.

Paper Title: **Electroencephalogram with Machine Learning for Estimation of Mental Confusion Level**

Abstract:Estimating the mental state of an individual is crucial to many applications. A quantitative measure of the confusion one faces while doing a task can be useful in determining which subtask is the most difficult. This paper thus aims to develop an algorithm to estimate the confusion score using EEG signals collected using a Neurosky Mindwave Headset. Also, a full contextual audio based confusion score is generated to improve the system's resilience. In this paper, the final algorithm is used to propose an EEG based system to enable the UI/UX testing which can help in confusion estimation and thus provide a qualitative means to measure the attention and concentration level of people which can be extended to various applications. The raw EEG data collected from the device was used to calculate the confusion score using various Machine Learning algorithms. This brain computer interface (BCI) system can be extended for calculating the confusion score of a person which can be used for various applications such as teaching, child health monitoring, suicide prevention, mental health analysis etc. The brain computer interface thus calculates the confusion score and based on the threshold value of the attention and concentration level it performs certain actions such as sending messages and alerts to emergency contacts. This is further extended to solve the problem of Usability testing in Human Computer Interaction.

Paper Title: **Performance Augmentation of V- Bladed Savonius Wind Turbine**

Abstract: Fossil fuels, although an essential source of energy, have been a major cause for the degradation of the environment. The negative impacts created by these fossil fuels have forced mankind to adopt alternate measures for energy production. Renewable energy resources have been optimal in replacing the conventional energy sources as they are environmental friendly. Wind energy has been harnessed effectively all over the world for the production of electric power. Wind turbines extract the kinetic energy of the wind and convert it into mechanical energy and further convert it into electrical energy using generators. In this work, we have compared the performance of the Savonius turbine with five different blade designs. Initially, the flow around the different blade designs has been analyzed through computational fluid dynamics. Subsequently, the turbine blades were fabricated using light-weight materials like Aluminium sheet metal and tested in the low speed wind tunnel. The performance of the turbine has been characterized by measuring its rotational speed (in terms of RPM) and the amount of torque produced at different wind velocities . Based on the wind tunnel tests we were able to conclude that among the five blade designs , the V-shaped blade with an interior angle of 60˚has the highest coefficient of power of 0.09 at 12.6 m/s.

Paper Title: **Detection of Spoofed IP nodes using BAT Algorithm and Extreme Learning Machine**

Abstract:IP spoofing is known as the most important cyber-attack which is the source for DoS or DDoS attacks where the attacker is hidden inside the network and makes the computer resource services unavailable to the users. The attacker once done with spoofing the IP address will start to flood the system with keeping on sending requests and make the network bandwidth slow to the extent. This paper contains the literature study of the different types of defence mechanisms from different authors used few decades before to detect and mitigate the Spoofed IP nodes at router, host level and recently some author come up with ideas of using computational intelligence methods for detecting the different types of attacks in wireless communications which results in accurate prediction. This paper provides creating a threat model of detecting the Spoofed IP nodes among 105 network wireless communication scenario using computational intelligence algorithm, the features are selected from the simulated raw data and preprocessed by using BAT optimization algorithm and features are converted to ELM readable format and then they are trained and learned using Extreme learning machine algorithm to predict the accurate detection of the Spoofed IP nodes in the wireless communication network scenario. The proposed method provides high accuracy in detection of Spoofed IP nodes with respect to some performance metrics like end to end delay, throughput, packet delivery ratio, packet drop ratio and it is compared with the KNN-SVM exiting model proved the results.

Keyword:IP Spoofing, Feature Selection, BAT algorithm, Extreme Learning Machine.

Paper Title: **Connection of Reinforced Concrete Flat Slab and Concrete Filled Steel Tube Column: Proposed Structures, Experiment, Simulation and an Analytical Prediction Model for Shear Strength**

Abstract:Concrete filled steel tube column (CFST) combined with reinforced concrete (RC) flat slab provides potential structural solution to replace the traditional structures in high-rise buildings. The CFST column – RC slab connection is the key factor for this structure type to work effectively. This paper proposes an improved structure for connection of concrete filled steel tube column and reinforced concrete flat slabs using steel plate shear-head. The experiments of two large-sized specimens are performed to assess the capacity and reliability of the proposed connection. Numerical simulation using Abaqus is also performed to validate the test results. Based on experimental and numerical simulation results, an analytical prediction model to estimate the punching shear capacity of the flat slab is presented.

Keyword: Concrete filled steel tube, Reinforced concrete, Column, Flat slab, Connection.

Paper Title: **Rectification of Turbo lags in Turbocharger**

Abstract:A turbocharger is the most used component in an automobile. It is widely employing in marine engines and aircraft engines to provide dense air to the combustion chamber. Due to the friction between the bearings and the own impeller weight of the rotors of the turbine and compressor turbo lag is caused. To rectify the turbo lag, we proposed magnetic Levitation principle. The use of magnets can reduce friction to a great extent, further it increases the efficiency of the turbocharger. The implementation magnetic levitation concept in the conventional turbocharger reduces the friction to a greater extent and decreases the turbo lag since the shaft of the turbocharger levitates freely and so less power is required to drive the shaft. The bearings are replaced by levitation concept hence there is no requirement for lubrication of bearings thus reducing the weight, space occupied, and making the turbocharger more efficient than the present one.

Keyword: Combustion chamber, Magnetic levitation, Turbocharger, Turbo lag.

Paper Title: **Prediction and Recommendation of Precision Medicine for Cancer using Machine Learning Techniques**

Abstract: Cancer is one of the major causes of death by disease and treatment of cancer is one of the most crucial phases of oncology. Precision medicine for cancer treatment is an approach that uses the genetic profile of individual patients. Researchers have not yet discovered all the genetic changes that causes cancer to develop, grow and spread. The Neuro-Genetic model is proposed here for the prediction and recommendation of precision medicine. The proposed work attempts to recommend precision medicine to cancer patients based upon the past genomic data of patient's survival. The work will employ machine learning (ML) approaches to provide recommendations for different gene expressions. This work can be used in caner hospitals, research institutions for providing personalized treatment to the patient using precision medicine. Precision medicine can even be used to treat other complex diseases like diabetes, dentistry, cardiovascular diseases etc. Precision medicine is the kind of treatment to be offered in the near future.

Keyword:genome, oncology, neuro-genetic model, precision medicine, machine learning.

Paper Title: **The Use of Entrepreneurship Education in Community Empowerment at Lintangsongo Islamic Boarding School of Yogyakarta**

Abstract: This paper discusses entrepreneurship education at Lintang Songo Islamic Boarding School which is taught to students and the surrounding community. Islamic boarding schools are the oldest educational institutions with unique and distinctive characteristics in Indonesia. It came into existence hundreds of years ago. According to historical records, the first Islamic boarding school in Indonesia was founded by Syeh Maulana Malik Ibrahim in 1399 AD to spread Islam on Java. Therefore, it has become a part of Indonesian education for a long time. Lintang Songo is one of such Islamic Boarding Schools that aims at surviving with consistency in carrying out its social functions. Furthermore, the uniqueness of its pesantren's activities and programs is associated with entrepreneurship education for students and society. This paper, therefore, discusses entrepreneurship education to improve the economy of students and society. This field research uses qualitative methods in analyzing data. Meanwhile, data obtained by observation, documentation and interviews. The informants of this study consisted of 12 people, from the head of the LintangSongo Islamic Boarding School, the teachers, students and the community. Several questions were asked to informants, such as what economic empowerment program was developed at LintangSongo Islamic Boarding School, why LintangSongo Islamic Boarding School developed economic empowerment education. The answers to these questions are then analyzed using qualitative methods.The results showed that LintangSongo Islamic Boarding School succeeded in economic empowering of its students and local communities with entrepreneurship education, which is taught as the curriculum of LintangSongo Islamic boarding school. Economic empowerment conducted by LintangSongo Islamic Boarding School for its students and community is agricultural empowerment, plantations, animal husbandry, forestry, fisheries, home industry, food, and convection.

Keyword: LintangSongo Islamic Boarding School, entrepreneurship, economy, empowerment of the community.

	Paper Title:	**Petrographic Characterization of Hydrothermal Gold Deposits in Adi Gozomo Area, Northwestern Tigray, Ethiopia**	

Abstract: Gold mineralization in Adi Gozomo area in northwestern Ethiopia was studied through petrographic analysis from both surface and core rock samples. Mineralization is associated with Neoproterozoic basement rocks comprised of metavolcanic, metasedimentary rocks and intrusives. Four phases of deformation and development of NE-SW foliation and shear zones were some of the common geological structures. The hydrothermal gold deposit s cramped to shear zones, 2nd generation quartz veins, 4th phase of deformation, silisifed and carbonatized alteration zone. Based on decreasing order of abundance the ore assemblage of the area includes pyrite, chalcopyrite, sphalerite, pyrrhotite, arsenopyrite and gold. The petrographic data indicates that the deposit is hydrothermal vein related type and an island arc tectonic setting. The mineralization is comparable with other known orogenic sulfide deposit types of the country in particular and Arabian-Nubian Shield in general.

	Paper Title:	**Assessment of a Network Infrastructure: A Basis for New Network Topology Proposal**	
	Abstract: Colegio de Sebastian (CDS), being a young academic and business entity, is in the process of developing its operations to serve its clients' satisfaction. This means that it must adapt itself to changes and improvements to survive the tough competition of private institutions. Effective communication in any business is a vital consideration that an owner must prioritize. Most growing businesses today are inclined to the use of technology to enhance the effectivity of their communication, and this entails the structuring of their computer network. In line with this, an assessment of the current network infrastructure was done at CDS to determine the need for new network topology. Through conducted surveys, CDS' network infrastructure was found out to have problems in terms of its topology that stems out to some issues like connectivity intermittence. To be able to provide a solution to such problem, a VLAN –based topology was proposed that includes topology that aims to achieve the four characteristics of good network architecture which are fault tolerance, scalability, quality of service and security. This research effort is to emphasize that properly planning an institution's network infrastructure is essential to serve its purpose optimally. **Keyword:**computer networks, VLAN, ANOVA, network topology, network architecture. **References:** 1. 	Paper Title:	**Optimizing Process Parameters of Spark and Wire-Cut Edm through Anova using Stainless Steel Aisi 316 Material**	
	Abstract: In the present research work, Stainless Steel AISI 316 as per ASTM A 276 has been employed as the base material to perform Spark and Wire-Cut EDM. The main agenda behind performing Spark and Wire-Cut EDM on Stainless Steel AISI 316 is to find out the effect of machining parameters like surface roughness (SR) and MRR (Material Removal Rate). In-case of wire-cut EDM, brass wire) of 0.25 mm diameter is used as a tool and distilled water is used as dielectric fluid and experimental process parameters like Current (A) (2, 3 and 4 Amps), Pulse ON time (B) (25, 30 and 35 μs) and Wire feed rate (C) (40, 60 and 80 mm/sec). Similarly for spark cut EDM copper rod of 12 mm diameter and 65 mm length. Process parameters like Current (A) (6, 12 and 16 Amps), Voltage (B) (30, 35 and 40 Volts) and Pulse ON time (C) (50, 100 and 200μs) were maintained during	**817-821**

the experimentation. Statistical tools ANOVA & L-9 Orthogonal Array (OA) have been employed to optimize the machining parameters like Surface Roughness (SR) and MRR (Material Removal Rate).

Keyword:SR, MRR, Spark EDM, Wire-cut EDM, L-9 orthogonal array.

Paper Title: **Reduction of Energy Hole in WSN**

Abstract:Energy hole problem in the wireless sensor network (WSN) is a critical issue due to the energy discharge of the sensor nodes in a rapid manner which lies closer to the sink. This is because of the fact that nearer sensor nodes send their own information as well as the information received from other regions to the sink. After sometime these sensor nodes start losing their power levels and become incapable to transfer data to sink and perform other activities despite the fact the energy of nodes in other regions are still unused which further disturbs the network performance. In this article, we have proposed a Concentric Layered Hexagonal Network Division Approach (CLHND) for solving energy hole issue. Initially, the network is divided into concentric hexagons and each hexagon act as a different layer. After that, each hexagon is divided into six equal portions. In the subsequent stage, the larger layer will be selected from all other layers. Now to decrease additional energy discharging from this layer, numerous sensor nodes positioned. In the final phase to prevent the energy hole issue, a suitable directing and ordering have been done which further improves network lifetime. The simulation results showed that the proposed CLHND approach has resolved the energy hole issue as compared to the existing techniques such as HRTBR and SEHP.

Keyword:WSN, Clustering, Energy hole, Hexagon Network, Layered approach.

Paper Title: **Towards Developing Secure Data Aggregation with Integrity Verification Model (SDA-IV) in People Centric Sensing Systems**

Abstract:In present scenario of vast developments in wireless communication methods, embedded device based operations and mobile communications, sensor based techniques are widely adopted. Such systems are termed as People Centric Sensing Systems, which become very popular and acquires greater attention of researchers recently. However, security and privacy in transmitting data has been the major issue in People Centric Sensing Network (PCSN). For handling that problem efficiently, this paper presents a model called Security Data Aggregation and Integrity Verification (SDA-IV) model for providing privacy preserved data sharing between devices in PCSN. A new peer-to-peer oriented secure data sharing is achieved with the proposed model by making the user to shares their data randomly with other nodes along with the incorporating of integrity checking conceit. Moreover, the work comprises four phases: Initial Setup, Data Division and Encryption, Data Aggregation and Integrity Verification. Homomorphic Message Authentication Code is user for privacy preserving process and Hashing Functions are incorporated for integrity verification of shared data. Furthermore, the efficiency of the proposed SDA-IC model is evidenced using simulation results and comparative evaluations.

Keyword: People Centric Sensing Network, Privacy Preserving, Secure Data Aggregation, Integrity Verification, Homomorphic Encryption and MAC.

Paper Title: **Cloud Based Predictive Model for Airborne Disease Based Healthcare Data**

Abstract: Nowadays, the airborne particles have major health impact when it spreads in human, plant and animal beings. Infectious diseases spreads from these particles which are exhaled directly into the air through the exertions of coughing, breathing, talking and sneezing etc. According to the report from World Health Organization (WHO), More than 30 infectious diseases have arrived to harm the health of people in the past years. There's no medical attention for several infectious diseases to take prevention and remedy. India have lack of healthcare data to take control of the endemic infectious diseases. This paper uses predictive model which is provide a preventive guidance and suggestions for predicted Airborne diseases through machine learning algorithms. Azure machine learning studio is a cloud based environment which provides machine learning algorithmic approaches to make an intelligent model based solution to solve the particular domain based problems. This proposed model will produce an efficient outcome and helps to take better protection from the infectious diseases.

Paper Title: **Performance of Shear Reinforcement against Punching Shear Loads**

Abstract:This research targets to maximize the ductility and strength of the reinforced concrete flat slabs. However, to be efficient, the shear reinforcement must be anchored well in the tension and compression zones of the slab. The test results on the slab-column connection models which provided with shear reinforcement are introduced in this study. The benefits of using shear reinforcement are to reduce the slab thickness, and to minimize both the cost and the total weight of the structure. Twelve flat slab specimens have been tested to study the effect of different types of steel RFT on the punching shear of the flat slab. The experimental parameters include no shear reinforcement which study the advantage of using tension RFT ONLY against punching shear, no shear reinforcement which study the advantage of using compression RFT against punching shear, shear RFT (Vertical Stirrups) which study the effect of using shear RFT with constant distribution 0.5d, and a new distribution of shear stirrups which study the effect of using new different width & spacing of vertical stirrups. The twelve specimens were loaded with concentrated load at the mid span until failure. The general behavior of the deformation of the tested slab specimens was examined and recorded (cracking, deflection, and strain in both steel and concrete). A comparison established between the experimental and the numerical-theoretical results obtained from applying the punching shear strength formula given in design codes, and finite element modeling analysis; ABAQUS 2017 software package was used for this analysis. A total of six building codes were examined with regard to their provisions concerning the punching shear. A comparison had been made between the research test results and the codes equations to improve the methods of the analysis about the flat slabs. This

841-850

study aimed to improve the punching shear capacity of flat slab which leads to more accurate results compared with the codes predictions. To achieve this aim, an experimental and numerical study was carried out for this investigation.

Keyword: Flat Plates; Punching Shear; Slab-Column Connection; Shear Reinforcement; Vertical Closed Stirrups.

	Paper Title:	**Methods of Teaching University Students and Students of the Continuing Education System using Intelligent Information Systems**

Abstract:This article was written with the aim of theoretically substantiating, developing, and testing experimental methods for teaching university students and students of the advanced training system for computer specializations using intelligent information systems. The following tasks are solved in the article as: 1. To analyze the theoretical and methodological foundations of the use of ICT in teaching 2. To design and implement an intelligent information system in students' training that demonstrates the didactic potential of these systems. 3. To substantiate the criteria for the levels of understanding of university students and students of the advanced training system of educational material and formalize them, laying in the capabilities of an intelligent information system. 4. To develop methods and means of teaching university students and students of the continuing education system using intelligent information systems. 5. Experimental search to verify the effectiveness of the application of the developed methodology. Based on the problem, a training methodology was developed, didactic foundations were determined and conclusions were drawn.

Keyword:information system, ICT, continuing education system, media materials, intelligent systems.

Paper Title: **3d Image Generation from Single 2d Image using Monocular Depth Cues**

Abstract: There has been a tremendous increase in the popularity of 3D hardware such as TV's, Smartphone's, gadgets for gaming, medical equipments, 3D printing and many more. 2D to 3D conversion is applied at various levels to get 3D content. In this paper, 3D image is generated from a single 2D image. we try to convert our own Karate and Bharathanatyam (KB) Dataset which contains both indoor and outdoor poses to 3D. Here, Watershed algorithm is employed to segment the image. Depth map is generated by sharpness and contrast as depth cues. The 3D image from single 2D image is created by depth image based rendering method.

Keyword: 2D to 3D conversion image conversion, depth cues, DIBR, KB Dataset, 3D Basics, Watershed algorithm.

	Paper Title:	**Use of The Electromagnetic Field of Low Frequencies in the Production of Sausages**

Abstract:This article presents the results of the research influence of electromagnetic field on the microflora of fresh sausage. Agents, by using a field had a frequency range from 10 to 110 Hz, and the duration of exposure ranged from 15 to 60 min After exposure frequency of 10 Hz for 30 minutes, micrographic study showed a partial destruction of cellular structures, reduced ability to bind water and reduce microbiological contamination of meat. It was found that the treatment of starter cultures "ALMI-2" with a frequency of 45 Hz for 60 minutes stimulates their growth. Low-frequency starter cultures, processed by electromagnetic method, reduce the pH, moisture-binding and water-retaining ability of ground meat and increase its stickiness.

Keyword:electromagnetic treatment, fresh sausage meat, starter cultures, biomodification, test ground meat.

	Paper Title:	**Effect of Physical Parameters on Green Synthesis of Gold Nanoparticles using Zea Mays Extract**	
	Abstract:Gold nanoparticles (AuNPs) were produced by green synthesis method by utilization of Zea Mays Extract as the reducing and stabilizing solution. Selected parameters like Time, Temperature, pH, Light and Concentration effects on the preparation of gold nanoparticles was analyzed by UV- Visible Spectroscopy (UV-Vis.). The size was measured through Dynamic Light Scattering (DLS) and also confirmed by Transmission electron microscopy (TEM) techniques, it is also observed that all the reaction time, Temperature, Concentration and reaction time are very essential parameters which should be noticed with high precession during the synthesis of Gold nanoparticles. **Keyword:**Green synthesis, Gold nanoparticles, physical parameters effect. **References:** 1. 	Paper Title:	**A Marking/Traceback System for Detecting the Source of Dos/Ddos Attacks**	
	Abstract:Distributed Denial of Service (DDoS) attack is a significant threat in today's world. Attackers hide their identity by spoofing and defending. To quickly detect a spoofed Internet Protocol (IP) during a DDoS attack the number of time-to-live hops in the network can be evaluated. While using time-to-live, if the routers gets compromised it may lead to the wrong detection of spoofed IP when both the source and attacker are at same distance. To identify an attacker, this system proposes an enhanced packet marking and traceback algorithm for IP traceback that helps the traceback of the spoofed packet to its source. A number of IP traceback techniques exist, but they have limitations like the number of packets required or storage and computational overheads incurred at routers. The technique proposed reduces marking and storage overhead.. **Keyword:**IP Spoofing, DoS/DDoS, IP Traceback, Packet Marking, Storage Overhead. **References:** 1. P. Ferguson, D. 	Paper Title:	**Network Malware Detection using Soft Computing and Machine Learning Techniques**	
	Abstract:In today’s world there is rapid increase in the information which makes addressing of security issues more important. Malware detection is an important area for research in effective and secure functioning of computer networks. Research efforts are required to protect the systems from various security attacks. In this paper, we analyze usefulness of Soft Computing and Machine Learning Techniques for network malware detection. Hamamoto et al. [1] used combination of Genetic Algorithm and Fuzzy logic for implementation of network anomaly detection. The research work proposed in this paper extends the concepts discussed in [1]. The proposed work explores use of various Machine Learning algorithms such as K-Nearest Neighbor, Naïve Bayes and Decision Tree for network anomaly detection. The experimental observations are conducted on CIDDS (Coburg Intrusion Detection Data Set) dataset [14]. It is observed that Decision Tree approach gave better results as compared to KNN and Naïve Bayes techniques. Decision Tree technique gives 99% of accuracy and precision	**879-885**

of 1 and recall of 1.

Paper Title: **Emotion Recognition Expressed on the Face By Multimodal Method using Deep Learning**

Abstract:Emotional recognition plays a vital role in the behavioral and emotional interactions between humans. It is a difficult task because it relies on the prediction of abstract emotional states from multimodal input data. Emotion recognition systems operate in three phases. A first that consists of taking input data from the real world through sensors. Then extract the emotional characteristics to predict the emotion. To do this, methods are used to exaction and classification. Deep learning methods allow recognition in different ways. In this article, we are interested in facial expression. We proceed to the extraction of emotional characteristics expressed on the face in two ways by two different methods. On the one hand, we use Gabor filters to extract textures and facial appearances for different scales and orientations. On the other hand, we extract movements of the face muscles namely eyes, eyebrows, nose and mouth. Then we make an entire classification using the convolutional neural networks (CNN) and then a decision-level merge. The convolutional network model has been training and validating on datasets.

Keyword:CNN, deep learning, emotion recognition, facial expressions.

Paper Title: **Three- Dimensional Simulation of Crack Propagation using Finite Element Method**

Abstract:The 3D finite element software ANSYS Workbench software has been employed for simulation of engineering geometries which are containing a pre-cracks and holes. The new feature in this software is using the smart crack growth procedure and the mesh smoothing technique which provides an adaptive and smooth mesh around the crack path as well as the higher stresses area. Under the assumption of LEFM, the stress intensity factors was used as a crack growth criterion which provided as indicators of failure compared to the fracture toughness or threshold stress intensity factors (SIFs) in both static and dynamic loading respectively. The stress intensity factors were calculated for every crack growth step and the fatigue life time was predicted according to the number of cycles. The effect of the nominal notch position of the crack was illustrated. Simulations performed with Ansys show an identical crack path on structures that is in line with that of the experimental and numerical results performed by other researchers.

Keyword: Fatigue analysis, FEM, ANSYS Workbench, Crack growth path, Nominal notch position.

Paper Title: **Spectrum Sensing using AMC and TFT**

Abstract:Spectrum Sensing (SS) is a foremost step to implement next generation Cognitive Radio (CR) systems. The primary goal of a SS technique is to examine whether the Primary User (PU) is in active state or not by analyzing the surrounding radio environment. Traditional methods such as energy detection and Matched Filter Detection (MFD) schemes along with decision making circuits are generally used in SS. However, these techniques are developed under cooperative scenarios and they are used to sense single PU (narrowband sensing). In non-cooperative scenarios and fading channel conditions, traditional techniques produce higher false alarm. If Secondary User (SU) is occupied in the channel then SS task is more difficult. In order to overcome these limitations, a narrowband and wideband SS algorithm using Automatic Modulation Classification (AMC) and Time-Frequency Transform (TFT) is developed in this paper. The performance analysis of proposed AMC and TFT based SS technique under various channel conditions which is also described in this paper.

Paper Title: **Femur Bone Stress Analysis in CFD Modules with Parallel Processing**

Abstract:This research focuses on the aspect of femur bone modeling that will change structure in response to mechanical stresses that can be induced to bone formation. 3D femur bone models are constructed by configuring material and geometric conditions and respecting patients' specific features, providing realistic and performant structural analysis. Using CFD concept, a three-dimensional model of the femur system was established, calculated the level of stress, the distribution of the femur and the magnitude of the transmitted force. This study describes a 3D construction process as well as the generation of the mesh based on a parallel processing of eight processors. Our main contribution revolves around the use of CFD modules to simulate stress measurement in the bone and study their impact in the case of external force exerted with successive values 10N, 50N and 100N.

	Paper Title:	**Repository Construction and Reuse of Software Requirement**	
	Abstract:Software reuse is not limited to reusing code used a lot but can be used in all steps and activities related to software production. In particular, the reuse of requirements has various benefits by reusing reliable requirements, and the development of requirements is an early stage of software development and may have higher efficiency than the utilization of reuse in later stages if reuse is utilized from the initial stage. However, despite its many advantages, the study on the reuse of requirements is insufficient. Therefore, to explore the possibility of the requirements reuse, we conducted a total of four stages in this paper: selection of targets and stakeholders, construction of requirements repository, reuse of requirements repository, and result analysis, and a case study of requirements repository construction and reuse was conducted. We have confirmed the fact that the reuse of requirements possible with a high proportion in practice through the application of actual case and we have also confirmed the possibility of research on the reuse of requirements. If we deal with the reliable requirements by increasing the utilization of requirements reuse, the possibility of the project's success will also be greatly increased.	**907-909**

	Paper Title:	**Performance Analysis of Various Filters for De-Speckling of Thyroid Ultrasound Images**	
	Abstract:Thyroid ultrasonography is the most common and extremely useful, safe, and cost effective way to image the thyroid gland and its pathology. However, an inherent characteristic of Ultrasound (US) imaging is the presence of multiplicative speckle noise. Speckle noise reduces the ability of an observer to distinguish fine details, make diagnosis more difficult. It limits the effective implementation of image analysis steps such as edge detection, segmentation and classification. The main objective of this study is to compare the performance of various spatial and frequency domain filters so as to identify efficient and optimum filter for de-speckling Thyroid US images. The performance of these filters is evaluated using the image quality assessment parameters Signal to Noise Ratio (SNR), Peak Signal to Noise Ratio (PSNR), Structural Similarity Index (SSIM), Mean Square Error (MSE) and Root Mean Square Error (RMSE) for different speckle variance. Experimental work revealed that kuan filter resulted in higher PSNR, SNR, SSIM and least MSE, RMSE values compared to other filters.	**910-917**

Paper Title: **Instantaneous Drill Bit Wear Level Detection in CNC Machine using Wavelet Transform**

Abstract:The usage of machine tools is widely increased to industrial automation, manufacturing, production technology and etc. The machine tool wear condition monitoring is playing a key role to increase accuracy of the dimension in the final product. By monitoring the wearing level, the life time of the tool is accurately detected and tools can be replaced at the correct time and it can be used to minimize the process time of the task. But it is difficult to monitor and detect the machine tool weariness level from the direct methods. From the indirect methods, the weariness levels of Computer Numerical Control (CNC) machine tool for Acoustic Emission(AE) property is approached in this paper. The AE signals are recorded and pre-processed to extract the features of different wearing conditions using Wavelet Transform(WT). The WT is used to extract the discriminating features that are indirectly reflecting the wearing levels of machine tools. The CNC machines tool weariness at various stage is evaluated from statistical indexes and analyzed based on the relation between the energy distribution of machined surface and wear state of the bit. This approach effectively detects real-time wearing levels of drilling tools by AE using Wavelet technique.

Keyword:CNC machine; machine tool; acoustic emission; wavelet transform; statistical parameters.

Paper Title: **An Improvement to a Class of Intensity based Spatial Domain Corner Detection Algorithms using Image Fission and Fusion**

Abstract:Corners of an object are important as features for the representation and analysis of its shape in computer vision. Corner detection, particularly in real scenes, is still a challenge. Most of the corner detectors found in the literature generate a number of false corners, which is not acceptable in real-life applications. In this paper, an improvement to a class of corner detection algorithms is presented using image fission/fusion. In this approach, a grayscale image is first divided into several bit-planes. A corner detector is applied on all the bit-planes simultaneously and a threshold (bitplane) is obtained using the concept of information gain. Finally, all the higher bit-plane corners are recombined (up to some thresholded bit-plane) to obtain the final set of corners. Here the corner detection algorithm is considered as a binary classification problem. Experimental results show that this improved approach reduces the number of erroneous corner detection relative to existing spatial domain corner detection algorithms. The improvements are established with the help of a number of performance measures proposed by various researchers. The proposed approach works better with respect to computational time also. This approach can easily be utilized in different low-level image processing applications.

Keyword: Corner detection, bit plane decomposition, information gain, threshold, non-maximum suppression, performance measure.

Paper Title: **Improved Diagnosis of Boiler Feed Pumps in a Thermal Power Plant**

Abstract:In thermal power plants, the boiler feed pumps are classified as vital machines. Therefore, the lack of its availability leads immediately to a loss of electricity production. They can also be the source of serious incidents or accidents that directly threaten the operational safety of the machine, as well as the safety of personnel. The inspection is a very effective solution to reduce the possibility of an accident. The vibration analysis can specifically detect with opportunity the possible mechanical, hydraulic and electrical defects that probably exist in motor pump. This document presents different techniques of vibration analysis, which were applied in different pumps to make an effective diagnosis.

Keyword: Control and diagnosis of motor pumps, spectral analysis, envelope analysis, time-frequency analysis,

Paper Title:	**Serverless Stream Processing with Elastic Multi-M/M/s/K Queue System**

Abstract:The high throughput - low latency stream processing systems are required to be elastic enough to scale for varying load spike on-demand. However, in the current stream processing systems, the load shedding is observed which impacts the final accuracy. In order to get rid of this issue, the elasticity can be implemented in all kinds of resources involved in the stream processing systems. This paper focuses on providing the elastic scalability in queues and Serverless functions for the event stream processing systems. First, we explain the need of elastic multi-queue with Serverless function in detail for event stream processing, and then will propose an algorithm for elastic scalability of multi-M/M/s/K Queuing with Serverless functions for the efficient stream processing. The experiment result shows that the system scales very well in short span of time with the help of our proposed algorithm. The increased availability in turn helps improving the high processing throughput in low latency.

	Paper Title:	**Auto Metro Train to Shuttle between Stations using Arduino**

Abstract:This Paper Encapsulates About The Technology Used In Driverless Trains Which Are Furnished With A Control System. There Are Many Cases To Avoid Accidents While Driving Due To Human Faults,This Paper Is Implemented To Provide The Station Information Such As Path, Arrival And Departure Timings Of A Train. Distance Between Stations Is All Pre-Defined Relevantly To The Passengers With Announcement And Displays A Message On Screen Including The Passenger Occupancy Count In Train. This Metro Train Consists Of Controller That Operates The Train To Run From One Station To Another Station. After Train Reaches The Destination, The Process Will Be Continued For Further Stations.

	Paper Title:	**Design and Implementation of Smart Cart using Labview**

Abstract:In this present generation most of the people prefer to visit supermarkets and hypermarkets to buy the products of their needs right from the food products to the household usage items. In general these hypermarkets and supermarkets provide trolleys to their customers to have a hand free convenient shopping. Though the entire shopping goes well most of the customers get stressed out by seeing those long queues and hours of waiting near the bill counters. Even after coming up with some temporary solutions for this highly time consuming problem like increasing the man power in bill counters it didn't bring a big difference. The aim of the paper is to overcome this problem with a permanent solution. Here we introduce a new system called "SMART CART" where we can most probably eliminate the time taking process at the counters. This ultimately leads to the customer satisfaction from the starting of the shopping till the end point. And also adds benefits like reduction of man power requirement and high efficiency with low expenses. In this competitive world of technology this brings a drastic change benefiting both customers and also retail industries by the usage of automated devices. The idea is implemented using LabVIEW software and hardware MyRIO.

Keyword:SMART CART, LabVIEW, MyRIO.

	Paper Title:	**Experimentation of a Diesel Engine with Waste Heat Recovery Heat Exchanger**

Abstract:In Rural Areas The Diesel Engine Generator Set Which Uses Diesel Engine Is Used For Irrigation And Agricultural Purposes. But Today The Cost Of Diesel Is Drastically Increasing And The Fossil Fuels Are Continuously Depleting. Also The Exhaust Gases Carry Away Around 35% Of The Total Heat Supplied To The Engine. Consequently Attempts Are Taken To Elevate The Propellant Economy And To Escalate The Productivity Of The Engine By Enhancing The Pursuance And Exudation Distinctive Of The Diesel Engine. Hence A Waste Heat Recovery Exchanger Was Modeled And Synthesized To Utilize The Heat From Exhaust Gases To Preheat The Incoming Air Before Supplying It Into The Cylinder Of The Engine. Initially The Pursuance And Exudation Distinctive Of The Diesel Engine Were Carried Out Without The Heat Exchanger. Then The Same Experiments Were Carried Out With The Heat Exchanger And The Results Reveals That There Is An Improvement In The Performance And Reduction In Emissions Of The Diesel Engine.

	Paper Title:	**Effect of Working Fluid on Thermal Performance of Closed Loop Pulsating Heat Pipe**

Abstract:The pulsing heat pipe (PHP) is an technology that is increasingly capable of applying many manufacturing areas, but a thorough knowledge of its thermo-hydrodynamic There's far from enough system. This research explored the features of oscillation and the heat transfer efficiency of a closed-loop PHP using an internal and external diameter copper tube with 2.0 and 3.0 mm respectively. For all experimentation, filling ratio (FR) was 40%, five turns and different heat inputs of 20 to 80 W was supplied to PHP. The position of the PHP was vertical bottom heat type. 52 mm, 170 mm,60 mm was retained for the duration of the evaporator, adiabatic and condenser section. Water, Ethanol are chosen as working liquids. To understand, thermal resistance features and median evaporator pressures for multiple operating liquids at distinct heat inputs. An significant consideration for the results of PHPs is the research on PHP stated operating fluid. The result demonstrates that, with the rise of the heating output from 20 to 80 W, where as steadily increases above 80W, the thermal resistance reduces faster. By comparing Water , Ethanol working fluids, Ethanol provides the highest heat performance . The simulation is performed in Mat lab and the results have been contrasted.

Paper Title: **Design of a Portable Health Monitoring System Based on Node MCU**

Abstract: In the present work, we have designed a health monitoring system based on Node MCU to monitor temperature, heart rate and oxygen saturation level (SpO2) signals, sensed by respective sensors. The necessary signal conditioning circuits have been designed in our laboratory using off-the shelf electronic components. A Data acquisition system has been designed using ESP 32 Node MCU. The designed system is a low-cost alternative to the commercially available USB controller based health monitoring systems. Firmware has been developed and deployed into the Node MCU using arduino IDE. The acquired data has been displayed on OLED display. The result shows maximum errors in the measured parameters within 2%. The designed system helps to achieve portability, high functionality and low cost which makes it an easy accessible tool for public, hospital, sports healthcare and other medical purposes.

Paper Title: **Innovative Way to Check the Status of Vacancy in Outdoor Parking Lots**

Abstract:With the unprecedented increase in number of private vehicles, the availability of parking space has become a daunting task for vehicle owners. Be it a shopping mall or a government building, it is hard for drivers to find an appropriate space almost everywhere in the present times. This makes it necessary to find out novel ways to resolve the issues regarding car-parking. Though there are many systems in place for detection of space availability, but one has to shed huge amounts for their implementation. Also there are constraints in using rides-based technologies as they do not consider climatic changes and conditions. The study consists of designing a hybrid model to detect outdoor parking vacant lots and the lots getting vacant in the real-time scenario. The dataset for training, validating and testing the system is extracted from online source which consists of various images of parking lots collected from varied heights and angles. The proposed work in this paper is the

961-965

advancement of our previous work [1] in which we are going to apply more advanced machine learning techniques to classify vacant and occupied parking lots in the outdoor parking areas.

Keyword: Innovative Parking Management, Image processing, Noise removal, Feature extraction, Machine learning.

Paper Title: **A Proposed Ensemble Model with Feature Selection Technique for Classification of Chronic Kidney Disease**

Abstract:Healthcare diagnosis system is very important and critical task in medical science for doctors and medical students. Chronic kidney disease is a very serious and dangerous problem which is directly related to the human life. In this research work, we have used data mining and feature selection technique to develop the robust and computationally efficient model for classifying chronic and non chronic kidney disease. An ensemble model is constructing through combination of two more similar types of trained model which helps to improve the performance. Feature selection is frequently used in machine learning area to raise a model with a few numbers of features which increase the performance of classification accuracy. The proposed feature selection techniques principle of Genetic Search (GS) and Greedy Stepwise Search (GSW). This proposed technique called GS-NB utilizes a pursuit methodology which is embedded in the Genetic Algorithm to select the features based on natural selection, the procedure that drives biological evolution. Then proposed technique called GSW-NB utilizes a search strategy that is included in the Greedy Stepwise to search the relevant feature based on problem solving heuristic for settling the locally ideal decision at each stage. The performance of suggested technique were estimated on Chronic Kidney Disease (CKD) classification problems and compared with proposed feature selection method. The classification techniques namely the Single Rule Classification (SRC), Conditional Inference Tree (CIT) and their ensemble model (SRC, CIT) have used for classification of CKD. The proposed ensemble model have used stacking learning technique which combines multiple classifiers, hence we can improve the performance of classifiers. The classifier performance is measured with observed accuracy, sensitivity and specificity. The experimental results demonstrated that the ensemble model (SRC, CIT) with GS-NB and GSW-NB can recognized CKD better than existing model. The proposed model can be beneficial and useful in medical science for identifying and diagnosis of chronic kidney disease.

Keyword: Chronic Kidney Disease, Conditional Inference Tree, Ensemble Model, Feature Selection Technique, Genetic Algorithm, Greedy-Stepwise, Single Rule Classification.

Paper Title: **vSTAAS - an Integrated Pen-Testing Tool**

Abstract:With the increasing threat in the cyber world, securing our networks and applications are becoming costlier. An enormous quantity of cash is being spent on direct or indirect resources. Along with this, with the increasing number of tools in the market, it is leading to confusion in the IT Industry. How can we reduce the amount spent by the organization on these resources without compromising the company’s security and get deep security insight on projects? For this, vSTAAS orchestrates the process of testing applications for flaws and vulnerabilities by Integrating Solutions, Increasing Accuracy, Simplify Management, and Accelerates the testing of Third-Party Software. It offers Strong, actionable intelligence with RPA, Machine Learning, and AI Automation concerning security requirements across the SDLC. The end to end automated Application & Infrastructure security solution helps users to secure their web/mobile/infra applications. It provides cost-effective solutions with necessary remediation and posts remediation revalidation measures. The Centralized portal helps customers to review the report on vulnerability risk remediation status with high-quality end to end testing across SDLC phases.

Paper Title: **Energy-Efficient Heterogeneous Multi-Processor Environment in Cloud using Modern Artificial BEE Colony**

Abstract: Cloud Computing is an expansion in distributed, parallel as well as grid computing. The purpose behind cloud computing is the provision of dynamic hiring of server proficiencies as a virtualized and accessible service for customers and end-users. A key issue found in the cloud is the management of resources. Load balancing is a key problem in the management of resources. The job scheduling issue has charmed abundant courtesy in the field of operation research. There are various algorithms like Ant optimization, genetic algorithms, artificial bee colony which can be used to solve the problem of scheduling. No doubt, Parallelization is proved to be the best method that can be utilized for improving the concert of the above algorithms. In this article, a modified artificial bee colony is utilized in order to crack the problem of scheduling in a heterogeneous multi-processor environment. In this, ABC has various colonies located on dissimilar network hosts as well as the algorithm is accepted in several colonies in parallel fashion. The colonies communicate with each other, which is approved through exchanging immigrants. In order to determine the communication of colonies with neighbors, a dynamic strategy is followed up. The algorithm is useful in making the parallel environment more efficient by reducing energy consumption. The energy consumption is reduced for each job in the DAG. Scheduling with MABC in the heterogeneous environment becomes easy as well as effective.

	Paper Title:	**Multimodal Brain Images Fusion using Cultural Algorithm Optimized Multispectral Features**

Abstract:Medical images can be acquired through different techniques (modalities), which have their own application areas; some of them provide information on the functional activity, while others contain only anatomic information. Usually, in the first case, images have low spatial resolution while in the second case have a higher resolution. However, the analysis of medical images often requires the evaluation of more than one modality; in order provide the specialist with more information for decision making as well as for the analysis and the treatment of diseases. Image fusion aims to combine information from the same sensor or different sensors, so that the image fused retain the information content of each individual image. In remote perception, when multispectral images are analyzed, it is very important to preserve the content of spectral information of each of the bands. The challenge is to obtain good quality images that allow us to extract as much amount of information possible, for which it is sometimes necessary to enhance or modify the image to improve its appearance or combine images or portions thereof to combine the information. An ideal fusion of multispectral images and the band panchromatic will result in a new series of bands with greater spatial resolution and equal spectral content. This paper proposes a PCA, DWT and cultural optimized entropy based DWT fusion with the evaluation parameters; arithmetic mean (SM), Maximum value (V_max) and Minimum value (V_min).

Keyword:PCA, DWT, CULTURAL, SM, V_max and V_min etc.

	Paper Title:	**Down Time Analysis of Dry Toner Based Digital Printing**	
	Abstract: Digital is better than offset printing process as it imparts zero make-ready wastage. It also supports variable data printing advantages. Machine downtime of Konica Minolta C1085 and Richo pro 8100se digital press was analyzed in local market. The results indicated that white area on print matter, blank page, paper jam, paper curl, paper skew, wrinkle and creasing, print rub-off, miss feed, blur image, horizontal line, ink drop out, technical faults, custom paper, press room temperature, roller track, paper swing, paper moisture, registration, maintenance are the major issues contributed into downtime digital printing. **Keyword:**The results indicated that white area on print matter. **References:**1. 	Paper Title:	**Design and Development of a Compact Triple-Band Microstrip Patch Antenna Loaded with Shorting Pin.**	
	Abstract:A single layer coaxial probe fed compact shorted patch antenna capable of triple band operation for GSM, ISM and WiMax application has been designed, fabricated and analyzed. The designed antenna generates three separate resonances to cover 1.9 GHz DCS, Bluetooth and WLAN (2.4 GHz), 3.5 GHz WiMax bands while maintaining a small overall size of 36*28*1.6 mm3. A prototype is fabricated and experimental results show good radiation characteristics over the operating bands. **Keyword:**Compact antennas, Mobile antennas, Shorted patch antenna, Quarter-wave patch; Triple-band antenna. **References:**1. 	Paper Title:	**Mathematical Description of the Construction Principles of Electromagnetic Mechatronic Modules of Intelligent Robots**	
	Abstract:The article is devoted to the mathematical description of the principles of construction of electromagnetic mechatronic modules for the linear motion of intelligent robots. Structural schemes and mathematical descriptions of the traction characteristics of various electromagnetic mechatronic modules of linear motion, oriented for use in the manipulation systems of intelligent robots, are considered. The features of many mechatronic modules are determined. A structural diagram of the developed single-axis electromagnetic mechatronic module, the principle of its operation and distinctive features are given.	**1001-1005**

Paper Title: **Performance Improvement of MONCRYPT SSA Over Data Obfuscation in Cloud Security**

Abstract: Cloud computing means a set of Information Technology services offered to the users over the web on a rented base. Cloud computing has several benefits like pliable, planning, scalability, combination, and rebate .Security is one in every of the most challenges that hinder the expansion of cloud computing. This study introduces a brief analysis of the issues and challenges of cloud computing security. “Cloud computing services will be varied and must be defined from the perspective of the users of the service. Security of information keep within the cloud is most imperative test publically cloud setting. Due the security issues, information are uncovered by Cloud Service Providers (CSP) and others clients of cloud. To verify the information from security lapse, we are using Security Algorithm , named MONcrypt SSA to protect the data in cloud depository . The proposed technique is depend on information jumbling strategies. The MONcrypt SSA depends on Security as a Service (SEaaS). In this we can utilize the JAVA to recreation of results is utilized for measure the security of propose and existing jumbling procedures. MONcrypt contrast and present jumbling procedure that is Base64Encoding .The anticipated strategy gives better and shrewd security in examination with present obscurity strategies. Not at all like present system, MONcrypt diminishes the size of information that will be transferred in distributed storage.

Paper Title: **Efficient Technique to Detect Edge in Images with Fuzzy Rules**

Abstract: There exists an increasing demand to detect edge of an image for many real time applications. In this paper an innovative technique is proposed for detecting text using fuzy rules. The projected system primarily divides the image into fragment of 3 x 3 matrix. The proposed system uses fuzzy rules using input size of eight pixels and one output pixel. The output pixels will either be one among black, white or edge pixel. The fuzzy sytem is applied with sixteen rules for categorizing the pixel as target pixel. Fuzzification is performed which converts the input pixel into the fuzzy interval between zero and one. It is followed by calculating a degree of Hesitation, which is also called as the intuitionstic fuzzy indicator. The last step is the Defuzzification process where the pixel identified as the pixel is converted to its original image pixel with the interval between 1 and 255. The proposed system is weighed against existing edge detecting methods like Canny, Sobel, and ACO algorithm. The proposed algorithm works fine even for exigent scenarios of the image.

Paper Title: **Internet of Things based Heart Beat Monitoring System**

Abstract: Healthcare is an area that is rapidly developing in technology and services. A recent development in this area is remote monitoring of patients which has many advantages in a fast aging world population with increasing health complications. The Internet of Thongs (IOT) plays important role to monitor patient health remotely. With help of Arduino Microcontroller, Wifi module and sensors this can be possible. Sensors for monitoring essential vital signs such as electrocardiogram reading, heart rate, respiration rate, blood pressure, temperature, blood glucose levels and neural system activity are available today. Humans are facing a retardant of surprising death because of varied sickness that is because lack of medical aid to the patients at right time. Most of death happened due to right treatment at right time. With the help of technology only now it can be possible to minimize such death. The fetched data through sensors which is attached to human body can be retrieved and store on ThingSpeak cloud is used here. The Doctors can view patient's medical records remotely, recommend or prescribe drug, request for ambulance or visit patient based on data being sent from the monitoring system [13].

Paper Title: **Monod Kinetics and Modelling Equations of Quercetin Extraction from Leaves of Indian Gooseberry**

Abstract: Quercetin flavonoid are family of herbal plant compounds shows various pharmacological activities. In the present study, quercetin extraction show best results in the fermentation process than compare to extraction process due to biotransformation process. The highest concentration of quercetin was found to be 8.8µg/ml from the extraction process, and the concentration was found to be 9.6µg/ml from the fermentation process. The Extracts of the fermented process are shown with the maximum specific growth rate and the maximum yield factor (Yx/s) of Bacillus cereus are 0.3541 hr-1 and 0.234µg/ml. The extracts of non fermentation process (extraction) are shown the modelling equation for the quercetin yield extract was Es = 0.0733(1 - e-0.2767t). The model allowed fit accordance with the experimental data by producing average

1023-1028

absolute relative deviation about 9.53%.

Paper Title:	**Abundance of Ants on Chili and Corn Intercrop Planting Techniques**	

Abstract: These Ants play an important role as predators in agricultural habitats, including in controlling insect pests. The conducted research investigates the abundance of ants in several intercropping techniques on chili and corn. The intercropping techniques applied were: chili and corn intercropping using plastic mulch, corn and watermelon intercropping that did not use plastic mulch, chili and corn intercropping that did not use plastic mulch, and planting monoculture chili according to the treatment of farmers using plastic mulch and pesticides. The parameters observed in this study were the average population and fluctuations of ants in each intercropping technique. The results showed that the chili plants intercropped with corn, using plastic mulch or not, attracted more ants compared to the monoculture chili planting techniques according to farmers' habits. Observation of the ant population fluctuations captured using the pitfall trap and hand collecting method shows that the ant population is increasing with each observation

Paper Title: **Detection of Traffic Light using Machine Vision for Autonomous Vehicles Application**

Abstract: Traffic light detection is crucial to decrease the traffic light accidents at intersections and to realize autonomous driving. There are so many existing methods to detect traffic light. However, these approaches have several limitations, such as not function well in complex driving environments. Hence, to overcome such constraints, the traffic light detection for the autonomous vehicle using image processing technique is proposed. The experiments are carried out using 114 scene images that consist of 209 traffic lights with different angles, weather conditions, and distance. An image processing technique, Hough Circle Transform is used in this traffic light detection system with the help of Gaussian blurring and Sobel filter. So, the overall accuracy rate for the proposed algorithm is 75.59%. This system is possible to be used in urban areas or complex environments, whether it is at night or day, and it able to detect the traffic light regardless of the colour changes.

Keyword: Autonomous vehicle, Hough circle transform, Image processing technique, Traffic light detection.

Paper Title: **The Role of Statistical Analysis in Ensuring the Competitiveness of Tourism (Case of Uzbekistan)**

Abstract: This article discusses the importance of statistical data in planning the activities of tourism organizations. Also, the general trends in inbound and domestic tourism are identified and evaluated. The seasonality of inbound tourism turned out to be highly dependent on weather temperature. The importance of hotel classification and its influence on marketing power of tour packages is discussed.

Keyword:inbound tourism, domestic tourism, hotel classification, statistics, seasonality.

	Paper Title:	**Forecasting Past and Future Trend of Physio-Chemical Parameters in Dal Lake, Srinagar Kashmir, India using Statistical Analysis and Modelling**

Abstract: The paper presents an overview of recent physio- chemical investigations on Dal lake with emphasis on lake, long-term water quality monitoring data from Lake and Water Development Authority (LAWDA1997-2017, published and unpublished data) with present analysis of Dal Lake to compare the water trends for pH, dissolved oxygen, chemical oxygen demand(COD),NO3-N,Total Phosphorus(TP) and Transparency. The main sampling efforts include visit to 36 samplingsitesto find the past and future trend of these physio chemicalparameters(pH, DO, COD, NO3-N, TP and Transparency).Maximum decreasing trendline was found for pH in Nigeen basin in summer season and lowertrends were found inNehru park basin in winter season. Maximum decreasing trendline was found for DO in Nigeen basin in summer season and lower trends were found in Nehru park basin in winter season. COD has shown maximum increasing trends in all basins mostly in Nigeen basin in summer season and lower decreasing trends in Hazratbal basin in autumn season, concentration of NO3-N and TP have shown increasing trends in all basins of lake mostly in Nigeen basin in summer season and lower increasing trends in Nehru park basin in winter season. Trend of transparency has shown decreasing trends in all basins of lake particularly in Nigeen basin in summer season and lower trends can be seen mostly in Nehru park basin in winter season. Tourism influx,maximum use of pesticides and fertilizers in the horticultureandagriculture fields during the growing season (June–August) in the Dal Lake shows a drastic change of these parameters through these years and the influx of tourists visiting this lake has increased in the summer months which isresponsible for eutrophication of Dal Lake and needs serious managerial actions.

Keyword: Dal lake, Future trend, Water quality, Eutrophication.

Paper Title: **Automated Allocation of Resources for Examination System using Genetic Algorithm**

Abstract: The quality of education is to a major extent assessed through examination and therefore examination is an inseparable and integral part of education. Even though we have seen a lot of technological advancements, the examination process is still carried out the traditional way with most of the process performed manually. As a result of which the current system at times are prone to errors and are time consuming. Various techniques have been proposed to automate the time table generation, automatic paper setting and evaluation. One of the tasks that has not got much attention is the assignment of work on a per day basis to invigilators and their assignment to rooms for invigilation. So we propose a system that integrates task like invigilator allotment, room allotment student allotment and time table generation in an efficient way.

Keyword: Resource allocation, Invigilator allocation, Application of Genetic algorithm, automation.

Paper Title: **Urban Sprawl Assessment and Its Effect on Land Use Transformation in Varanasi City using Remote Sensing and GIS**

Abstract: This paper seeks to examine the effect of urbanization on changes in land use in the peri-urban areas of Varanasi city in India. The area of study is divided into six different classes of land use: built-up area, agriculture, vegetation, water bodies, sand and other land use. Using the maximum likelihood technique, Landsat 5 TM satellite data were used to identify land use and land cover changes from 1996 to 2017. The findings indicate a substantial increase in the built-up area, associated with reduced water and other land use cover. The urban sprawl is observed in almost all directions from the city boundaries, and along highways. Shannon's entropy analysis reveals dispersed distribution of built-up area. The approach based on GIS and remote sensing data, together with statistical analysis, has proved instrumental in the analysis of urban expansion. It also helps to identify priority areas that require adequate planning for sustainable development.

Paper Title: **Voice Controlled Car using Aurduino and Bluetooth Module**

Abstract: This project builds a voice controlled car that can be controlled by voice commands which reacts in accordance to the corresponding voice command. However noise and distance handling require future development. Simple voice commands like left, right, forward, back, stop are used to run the car. These commands are given to Bluetooth module via an android application. The Bluetooth module and control unit are combined to store and test the voice commands. When an instruction for the automobile (car) is identified, a command message is sent to Arduino UNO, the Microcontroller of the car by the Bluetooth device. This command is analyzed by the microcontroller and followed up. In the vehicle, Image processing can be utilized to become aware of the shade and the obstacles. This work has been limited to the ZigBee system in the short-range (100mts range), and is linked to the car over long distance via long-range modules.

Keyword: Arduino UNO, Bluetooth module, Image processing, zigbee system, speech recognition.

Paper Title: **Without Clay Drilling Fluids for Well Bore Wiring in Complicated Conditions**

Abstract: The causes of collapse of clay rocks of different Genesis were revealed. As a result of the experimental study, a chalk solution stabilized with non-hydrolyzed polyacrylamide was proposed. The assessment of the degree of stability of clay cores, both freshwater and marine origin in the process of washing wells with chalk solution stabilized polymer reagents. In order to ensure the stability of the wellbore wall, it is recommended to open potentially unstable clay deposits using chalk solutions stabilized with non-hydrolyzed polyacrylamide.

Paper Title: **3D Finite Element Modeling and Simulation of Friction Drilling Process**

Abstract: Friction drilling is an advanced drilling process in which that can be utilize the heat produced between the workpiece and rotating drilling tool bit to soften the work material and producing a hole on it. In this investigation our interest is to choose work material is Al 7075-T351 to analyze the stress, strain, temperature and work material deformation in friction drilling. Al 7075-T351 square-tube materials were drilled on a computer numerical control (CNC) machine centre by friction drilling has analyzed at different rotational speed and feed rate through controlled operation tests. The temperatures in work piece and tool were more in Friction drilling. Simulation has required perceiving the material flow, stresses, temperatures, and strains. Those are tough to quantify experimentally through friction drilling. In this study, CATIA is used to design the tool model and the software which is used to simulate the performance of friction drilling is DEFORM-3D and effect of tool material speed and feed rate on shape of bushing formed is observed. Taguchi's technique L9 Orthogonal Array was used to analyze the optimum values. Signal to noise ratios also administered for optimization of parameters.

Keyword: Friction drilling, DEFORM 3D, cutting temperature.

Paper Title:	**Design and Fabrication of Waste Oil Fired Furnace**

Abstract: The study carried out a design and fabrication of an waste oil-fired furnace. The study focused on ensuring a high efficiency in melting of aluminium, by effectively minimizing heat losses, and maximizing heat generation. To achieve this, a composite refractory material consisting of cement, asbestos, and clay was used, and waste oil was splashed which is used as fuel with the help of blower which is running at 3000 rpm and power rating of 1hp. The working pressure of furnace is 5.86 x105 N/m2. Changes in the furnace geometry were negligible indicating a long service life potential. With a useful heat input, the furnace is able to melt aluminium at a pouring temperature of 6600C. The design is considered safe since the working pressure does not exceed the working stress of its casing which is made of mild steel.

Paper Title:	**Implementing Query Terms Linked to Virtual Databases by Metaheuristic Techniques**

Abstract: In general case, the database trigger may be quite applicable to signified queries to validate the database requests. Specifically, these may be essential to adopt search mechanisms to identify the query terms. In such cases it may also be required to eradicate ambiguities during updates by checking consistencies,

1081-1085

durability. Many database systems support aggregate functions as it may be really linked to statistical analysis of large scale data. Again as per the requirement and schedule, multilevel aggregation may be thought of towards report generation and implementation of join predicates. In case of complexity, direct requests may be accessed to schedule the entire database operations. While optimizing the database queries, alternative query plans may be thought of implementing specific routines to eradicate the duplicity of query terms. It may be quite possible to containerize the query plans linked to several data servers exploring the inter operator parallelism. Also the assemblers linked to the query plans in the servers may steer the process accordingly. Considering the implementation mechanisms of database query plans inside a cloud storage system, the data may be automatically partitioned and replicated. The servers may change dynamically the existing load in response to the query plans. The queries as well as the transactions may be uncommon during optimization process and applications may be communicated following standard activity protocols linked to the database servers. Linking the query terms to the databases, it may also be required to incorporate metadata towards plan execution. Many times transactional database applications linked to relational cloud may have the provision of configuring and accessing the data and may face the challenges like scalability and privacy. To overcome these issues, the tasks may be relocated and rearranged linked to database servers by which better performance may be achieved dealing with complex transactions. Also the aggregation methods or techniques linked to data partitioning may enable the structured queries to yield better performance. In this paper it is intended to obtain query terms along with the threshold values linked to virtual databases.

	Paper Title:	**Determine Variables to Build Organizational Commitment**

190.

Abstract: This research aims to obtain information related with variables which can build organizational commitment of teachers at SMP (Middle School) Marsudirini in Jakarta, Bogor, and Bekasi. This research used a survey method by distributing questionnaires to teachers. This research was conducted because organizational commitment of the teachers should not be assumed to exist just like that but it must be managed its sustainability related to some variables that affect the quality of organizational commitment of the teachers so that schools have to maintain the quality and benefits for the stakeholders.The data obtained were analyzed and the result showed that the determine variables to built organizational commitment were organizational culture, leadership, work environment, and trust. From the path analysis indicated that these variables had a significant direct effect on organizational commitment. The conclusion is these variables must be built in such a way as to get the idealized organizational commitment of the teachers.

Paper Title: **Flexural, Tensile and Compressibility Behavior of Self Compacting Concrete by using Glass Fibers**

Abstract:"Fiber Reinforced Self Compacting Concrete" (FRSCC) is composed of cement, different sizes of coarse and fine aggregates, which integrate with fiber. In this current investigation, M40 grade Self Compacting Concrete reinforced with glass fibers has been developed using the Nan Su method. Fresh state and hardened state properties of Glass Fiber Reinforced Self Compaction Concrete are studied for glass fibers of different aspect ratio (875, 1285 & 1714) and percentage of volume fraction (0, 0.25, 0.5, 0.75 & 1). From the investigation carried out it is found that incorporation of glass fibers of aspect ratio 1285 and percentage of volume fraction 0.5 to SCC attains better compressive and flexural strength compared to other mixtures and also

incorporation of glass fibers of aspect ratio 1285 and percentage of volume fraction 0.75 to SCC attains better split tensile strength compared to other mixtures.

	Paper Title:	**Temporal Rainfall Variabilityand Its Correlation with Temperature over Ranchi, Jharkhand**

Abstract: The extent to which rainfall amount varies across an area (spatial) or through time (temporal) is an important characteristic to determine the climate of an area. The discipline that covers this area in Meteorology/Climatology is known as “Rainfall variability”. It is of two types: Areal (Spatial) and Temporal. The temporal variability of rainfall means variation of rainfall as time varies but the area of the location remains the same. The temporal variability of rainfall of a place helps in knowing the rainfall variability with time. Rainfall variability plays an important role in understanding climate change. In this fast growing world, urbanization and industrialization has led to the problem of global warming. As a result of this, there has been a drift rise in temperature. The present research work was taken over to analyze the temporal trend of Rainfall over Ranchi during 1975-2017 and to study its correlation with temperature over Ranchi, Jharkhand during 1975-2009. To analyze the trend in rainfall over Ranchi, rainfall data from 1975-2017 was studied. The annual rainfall ranged from a minimum of 734.6 mm to a highest of 1771.335 mm. The mean, median, coefficient of variance and standard deviation was also found on the monthly, seasonal and annual basis. Through time series graphs of rainfall, a positive trend is detected in summer season while annual, winter and southwest monsoon rainfall appeared as a negative trend. On the other hand, by utilizing non-parametric tests such as Mann-Kendall trend test and Sen Slope, it was found that there was no significant trend at 95% confidence limit in any case. Through the study, it was found that there is a significant correlation of rainfall with temperature over the years 1975-2009. Although it was found to be negative in Summer, Monsoon and Annual data, whereas there was a positive correlation between rainfall and temperature during the winter season.

Paper Title: **Encryption Algorithm using Shuffled 2-Dimension Key**

Abstract: Cryptographic algorithms are the fundamental element of security protocols and applications. They need to evolve to face the advance cyber security threats. This paper presents an encryption algorithm in which plaintext is encrypted using Shuffled 2-Dimension Key. Each time when a block is encrypted, the key is shuffled. Next time when a block is encrypted the key is different. Cipher text is more secured with shuffling 2-Dimension key as compared with same without shuffling 2-Dimension key. The results of 2-dimension array (shuffled and without shuffled) are compared with Advanced Encryption Standard (AES) algorithm. Same character is encrypted in different way as the key get changed due to shuffling.

Keyword: Cryptography, encryption, decryption, AES, shuffle.

Paper Title: **Ancillary Service Requirements Assessment Indices with the LFC in a Restructured Power Systems for RFB Unit by using Bacterial Foraging Optimization**

Abstract: This paper proposes the calculation methodology to leverage the System Support Service Request Valuation Indices (PSASRAI) facility of thetwo _Area Thermal Heat Intersected Power Network (TATRIPS) to highly restored environments. Both Indices display in the supporting demand of the Facility to improve the efficacy of the facility framework's physical activity. In the associated degree interconnected control system, the associated degree sudden strain hassle in any area triggers the frequency variance of the considerable variety of

1110-1120

territories and in addition within the tie _line forces. To ensure nice quality, this should be updated to confirm age &circulation of electrical power organizations.In addition to Integral (PI) sort controllers, there are broad uses in the dominant problems of Load Frequency Management (LFC). Consequently, the establishment of the PI management benefits for the restored control system is obtained using the calculation of microorganism hunt optimization (BFO). These regulatorsareexistent to accomplish a quicker reclamation periodwithinyield reactions of the framework. Conjointly vitality reposition is associate degree seductiveoption to embrace within the interest facet administration execution, thereforechemical reaction Flow Batteries (RFB) unit isprofitablywont to satisfy the headwould like and upgraded power gridsupportive Service demand Assessment Indices.

Paper Title:	**Improvement in Cutoff Frequency of Microstrip Butterworth Low Pass Filter using DGS Technique**	
195.	**Abstract:**This paper presents the design, analysis and fabrication of Butterworth Low pass filter with sharp rejection response using defected ground surface technique. The work is carried out to design a low pass filter with cut-off frequency 2.5 GHz to achieved the broad frequency response; the first step is to make a rectangle of 10x10mm at ground surface and the equivalent circuit for the DGS, subsequently followed to consequent L-C parameters extraction using analysis of S parameters response (EM simulation). The designed Butterworth low pass filter is realized and optimized using DGS (Defected Ground Structure) to attain a compact size, satisfactory transition sharpness along with low insertion loss in pass band and wide rejection in the stop band. The fabricated device showed the good conformity with theoretical and VNA measured result. **Keyword:**Low Pass Filter, Micro strip Filter, Butter worth, Filter, DGS **References:** 1. 	Paper Title:	**Performance Modeling of Classification Techniques on Movie Sentiments**

Abstract: The sentiment-based social media represents a gold-mine approach for analyzing the performance of the products, hotels, movies, politics, etc. Large opinions of the people are found over movie comments that are honest, informative, and casual as compared to the formal type of data-survey modeling using magazines or reports. The work proposed is based on the rating of movies. This paper analyzes the performance of classifiers for the prediction of sentiment class i.e., positive and negative by using artificial neural network, k-nearest neighbor and hybrid approach. The success of these classification techniques depends mainly on the appropriate extraction of the set of characteristics used to detect sentiments. Hybrid of two or more classifiers is mainly used to enhance the results. In the proposed experiment Hybrid of ANN and KNN shows improvement in precision and accuracy than other classifiers.

Keyword: Sentiment Analysis, Artificial Neural Network, K-Nearest Neighbor, Hybrid, Sentiments.

	Paper Title:	**Deep Learning and NLP based Side Channel Attack for Text Inference in Smartphones**

Abstract: Over the past years, smartphones have witnessed an alarming rise in embedded sensors which enhance their support for applications. However, they can be regarded as loopholes as seemingly innocuous information can be obtained without any user permissions in Android thus invading the user's privacy. Our work establishes a side channel attack by illegitimately inferring the information being typed by the user on a smartphone using the readings from 'zero-permission' sensors like accelerometer and gyroscope. This serves as a proof of concept to prevent such attacks on mobile devices in the future. While previous research has been conducted in this space, our narrative involves a predictive model using Recurrent Neural Networks that can predict the letters being typed in the keyboard solely based on the motion sensor readings, thus inferring the text. Our research was

1132-1137

able to identify 37.5% of the unseen words typed by the user using a very small volume of training data. Our tap detection method has shown 92% accuracy which plays a critical role in the text inference. This research lays the foundation to further progress in this area, thus helping to strengthen the mobile security.

Paper Title:	**11-level Multilevel Inverter for Medium Voltage High Power ID and FD Fan Drives in Power Plant**

Abstract: Multi-level inverter technology has emerged recently as a very important alternative in the area of medium-voltage high-power energy control such as ID and FD fans which runs with the help of these megawatt power drives and renewable energy integration to grid such as solar energy integration which requires pure sinusoidal voltage with less than five percent THD to synchronize to grid. For the requirement of large voltage sources(DC) in number, reduced electromagnetic interference, utilization of power electronic devices having less voltage blocking capability, less percentage of total harmonic distortion in output voltage, reduced stress on insulation they are mostly used. Various topologies are used for multilevel inverters. Among them the most commonly used is cascaded H-bridge (multi-cell). A 3-phase 11-level reduced H-bridge topology is proposed and is controlled by level shift carrier PWM in this paper. The considered topology and controlled algorithm is implemented in MATLAB/SIMULINK. The simulation results show a reduction of THD to a greater extent which will be useful in renewable areas and mega watt power drives.

Keyword:H- Bridge, Multilevel, Inverter, level shift carrier PWM, THD, ID and FD fan.

	Paper Title:	**Smart Accident Detection and Switching of Traffic Signal**

Abstract: An accident is one of the major causes of unnatural and untimely death. This is one of the serious issues throughout the world. Most of the accidents occur due to vehicle factors, improper traffic management, and lack of timely help. With the increase in the number of vehicles, it may be little hard to keep away from such accidents on road. The main objective is to implement the new advancements in saving human lives by detecting the occurrence of the accident in a vehicle and by directing the ambulance to the accident location without time delay. Also by implementing smart traffic control system, the ambulance moves to medical centre in an effective way without any stall in the traffic signals. Automation of accident detection is implemented by sensor-based ambulance management with the smart traffic management system. It consists of Crash sensor and MEMS sensor for detecting the accident in the vehicle and RF transmitter on the ambulance to communicate with the RF Receiver located on the traffic signal. This helps the ambulance to cross the junction switching the signals from Red to Green when the signal is received by the ambulance.

	Paper Title:	**Power Quality Improvement in DG System using BOA based Interlined Unified Power Quality Conditioner**

Abstract: To improve the power quality of multi-feeder distribution system, this paper proposes a concept of Interline Power Flow Controller (IUPQC). IUPQC is a structure of two filters such as, series and shunt filters. The causes for poor power quality of system is due to harmonics, power factor variations and changes in system voltage. The purpose of these converters is to mitigate the PQ issues. The reference signals required for series and shunt converters of iUPQC system is generated with the help of conventional controllers and PWM controllers. The PLL used to match the phase sequence of converters. For obtaining better improvement in Power Quality this paper is implemented with one of the optimization technique such as Bull Optimization Technique (BOA). The purpose of BOA is used to control the DC Link Voltage of iUPQC. With the help of this BOA technique, the variations in voltage and current are reduced to enhance the power quality. The effectiveness of this proposed system with BOA technique is tested and verified using Matlab/ Simulink environment.

Paper Title: **A BBO/PSO based Hybrid Technique for Distribution System Feeder Reconfiguration**

Abstract:A cooperative strategy to reconfigure the feeder network by maximizing the location and volume of the distribution generator (DG) in the power system was addressed in this report. The new feature of the proposed method is the integrated output of the Biography Based Optimization (BBO) and PSO techniques. The above methods are the optimization techniques used to configure the radial distribution system for the optimal position and capacities of the DG. For determining the optimum position and strength of the DG, the BBO algorithm includes radial distribution network voltage, actual and reactive energy. The input parameters of BBO are classified into sub settings here and are allowed as the optimization of the PSO algorithm. The PSO synthesizes the problem and uses sub-parameters to create the sub-solution. The method of BBO migration and mutation is used to determine the optimal position and ability of DG for the sub solution of PSO. The cooperative strategy introduced is then applied on the system MATLAB / Simulink, and the usefulness is evaluated using BBO and PSO techniques. The findings of the analysis demonstrate the strength of the solution suggested and affirm its capacity for resolving the problem.

Paper Title: **Encryption And Decryption of a Message Involving Byte Rotation Technique and Invertible Matrix**

Abstract: The aim of this paper is to introduce a new encryption algorithm involving byte rotation and invertible matrix. In the proposed algorithm firstly we apply byte rotation to get an intermediate cipher and then applying the invertible matrix (modulo 27), which gives the final cipher text. Using secret key matrix along with congruence modulo, the message can be encrypted and decrypted perfectly.

	Paper Title:	**The Influence of the Independent Board of Commissioners on Financial Performance**	
	Abstract: Financial performance is a view of a capable economic outcome achieved by the company at a certain time through activities company. Financial problems are one of the most vital problems for companies in business development in all companies. The company's ability to generate profits is the key to the company's success to be said to have good company performance. This study explains the phenomena of the quality of financial reporting and good corporate governance mechanisms, namely the composition of the independent board of commissioners. The total population of big cap companies is fifty companies and those who meet the criteria for the sample are thirty-two companies. This type of research is causal research. The method of analysis in this study uses path analysis to examine the causal relationships between exogenous and endogenous variables. The results showed that the composition of the independent commission's board of influence on financial statements. **Keyword:**Proportion of Independent Commissioners, Audit Committees, Financial Performance **References:** 1. 	Paper Title:	**Detection of Diabetic Patterns using Supervised Learning**	
	Abstract: World Health Organization's (WHO) report 2018, on diabetes has reported that the number of diabetic cases has increased from one hundred eight million to four hundred twenty-two million from the year 1980. The fact sheet shows that there is a major increase in diabetic cases from 4.7% to 8.5% among adults (18 years of	**1169-1173**

age). Major health hazards caused due to diabetes include kidney function failure, heart disease, blindness, stroke, and lower limb dismembering. This article applies supervised machine learning algorithms on the Pima Indian Diabetic dataset to explore various patterns of risks involved using predictive models. Predictive model construction is based upon supervised machine learning algorithms: Naïve Bayes, Decision Tree, Random Forest, Gradient Boosted Tree, and Tree Ensemble. Further, the analytical patterns about these predictive models have been presented based on various performance parameters which include accuracy, precision, recall, and F-measure.

Paper Title: **Minimization of Input Ripple Current for Soft-Switching Buck-Boost Converter**

Abstract: Among all dc-dc converters, the present trend of utilities is buck-boost converter which is capable enough to operate under on/off control so as to step-up and stepping-down the fixed input voltage by varying its duty-ratio of the switch. This converter possesses hard-switched one that means the switching device operate on non-zero voltage or non-zero current and leads to significant increase in switching loss. This issue leads to use of soft-switching of device. As far as the soft- switching of buck-boost converter is concerned, very few papers appear in literature. But in most of these cases, hardly the attention has been given to look into the aspect of ripple content at the input current level. Higher the ripple content at the input not only affect the electrical equipment (i.,e such as adding core losses to transformer in line thus reduction in efficiency), but also causes electromagnetic interference with nearby telecommunication lines and measuring equipment etc. Though there is an option to include the low-pass filter at input, but that creates a hindrance in providing the oscillation along dc link because of input filter in parallel with secondary components across the switch and load. In this research work, the parallel operation of soft-switching buck-boost converter is proposed by modifying the circuit [15] and the circuit is operated with its optimum level so as to minimize the requirement of components. The components of this converter are properly designed to enable soft-switching for the switch. The simulation of

1174-1181

the proposed circuit is carried out by MATLAB (Simulink) to validate performance.

Keyword: Buck-Boost converter, Soft-Switching (Zero-Current Switching, Zero-Voltage Switching), High frequency inductor, High frequency switched capacitors, Minimization of ripple current, MATLAB (Simulink).

Paper Title:	**Implementation of Supervised Learning towards Optimizing Queries in Database Systems**

Abstract: Machine learning is a technology which with accumulated data provides better decisions towards future applications. It is also the scientific study of algorithms implemented efficiently to perform a specific task without using explicit instructions. It may also be viewed as a subset of artificial intelligence in which it may be linked with the ability to automatically learn and improve from experience without being explicitly programmed. Its primary intention is to allow the computers learn automatically and produce more accurate results in order to identify profitable opportunities. Combining machine learning with AI and cognitive technologies can make it even more effective in processing large volumes human intervention or assistance and adjust actions accordingly. It may enable analyzing the huge data of information. It may also be linked to algorithm driven study towards improving the performance of the tasks. In such scenario, the techniques can be applied to judge and predict large data sets. The paper concerns the mechanism of supervised learning in the database systems, which would be self driven as well as secure. Also the citation of an organization dealing with student loans has been presented. The paper ends discussion, future direction and conclusion.

Paper Title: **Non-Invasive Method of Diabetes Measurement using Teg Sensor via Foot Skin Temperature**

Abstract: Diabetes is a type of metabolic dieses identified by unstable blood glucose level due to the defect in body to generate or use of insulin. Diabetes is created due to the defect in metabolism of converting the glucose to energy in blood. Hyperglycaemia is a stage were glucose value in the body is greater than 140 mg/dl which leads to type 1 diabetes for the patient. Type 1 diabetes is caused due to lack of generation of insulin in human blood and type 2 diabetes is caused due to resistance to insulin action which leads to several other diseases like foot ulcer and sever wounds in human foot or other parts of the body. Early diagnosing of diabetes disease plays an important task in improving the standard of healthy living. Traditional methods of identifying diabetes does not provides effective results and the results are not more reliable. Temperature based diabetes diagnosing model is defined using TEG sensor to analyse the heat changes in human foot. Imbalanced glucose level affects the performance of nerves system which leads to slower response for temperature change in the foot surface. TEG sensor is used to measure the heat transfer in foot by applying cold water over foot. The rate of temperature changes in foot represents the level of diabetes caused in the patient body. The signals from TEG sensor was collected and processed using signal analysis algorithm using MATLAB software.

Keyword:TEG Sensor, Diabetes foot, nerves breakdown, heat changes, dyadic wavelet transform, Autocorrelation.

Paper Title: **Calculation of Exergy Destruction of Various Components by Performing Exergy Analysis on Stage-I of Dr. Narla Tatarao Thermal Power Station (N.T.T.P.S)**

Abstract: For any nation to develop power generation plays a crucial role. The performance of a power plant is analyzed by using the Energy balance and it is done by using the first law of thermodynamics. But to know how much energy is being utilized in reality exergy analysis has to be performed which is also called as second law of thermodynamic analysis because the vital parameter quality is being considered in the exergy analysis. this paper deals with the exergy destruction calculation by performing exergy analysis for various components for a 210 mw plant of Vijayawada thermal power station(stage-1 unit-1) and from the analysis it is clear that exergy destruction is more in condenser

Keyword: Available Energy, Exergetic destruction, second law efficiency.

Paper Title: **Cloud Computing Application in Education**

Abstract: The aim of the study is doing the classification of research articles on Cloud computing adoption in education sector through meta-analysis based on number of articles in different geographical location, year of publication, types of methodology, frameworks used and research area covered in last 9 years. In total 143 research articles from 27 peer-reviewed journals from the year 2010 to 2018 were used for meta-analysis. The research findings from the meta-analysis show there is a very little study in the area of cloud computing application in education. The study contributes to the body of knowledge by identifying a classification method for research methodology types, geographical area, articles published in last nine years, types of research framework and research area through meta-analysis.

Paper Title:	**A Crazy Particle Swarm Optimization with Time Varying Acceleration Coefficients for Economic Load Dispatch**

Abstract: In power generating plants, the expenses on combustible fuel is extremely costly and the concept of ELD (Economic Load Dispatch) make possible to save the considerable portion of profits. Practically generators have economic dispatch problems in terms of non-convexity. These kinds of problem cannot be resolved by conventional optimization techniques because the complication escalates due to manifold constrained that require to be fulfilled in all operating conditions. Recently a Particle Swarm Optimization (PSO) algorithm stimulated by collective conduct of swarm can be applied effectively to translate the ELD problems. The classical PSO bears the difficulty of early convergence mainly when the space of search is asymmetrical. To overcome the trouble "Crazy PSO with TVAC (Time Varying Acceleration Coefficients)" is launched which improve the search ability of the PSO by rebooting the vector of velocity whenever diffusion or saturation locate inside and to employ a scheme of parameter automation to maintain correct equilibrium between global hunt and local hunt and also circumvent the congestion. This arrangement is developed crazy PSO with TVAC and also demonstrated on two different model experimental structures of three generation units and six generation units. The result acquired from proposed method is evaluate with classical PSO and Real coded genetic algorithm (RGA) and it is found to be superior. This method is mathematically simple, gives fast convergence and robustness to resolve the rigid optimization inconvenience.

	Paper Title:	**Safety Culture App: An innovation in Safety Performance System at the Aviation Industry**

Abstract: The purpose of this paper is to consider some of the innovation in improving employee's safety culture in the aviation industry. The aviation sectors are one of the fastest-growing sectors in the world. Establishing a sound and robust safety Culture is essential for ensuring the safety and security of the employees. There are many technological innovations to control the tangible risk but are severely limited with options to tackle intangible risk. One of the common error is a human error which creates most of the hazardous problems. In this context to reduce human error, we propose a Safety Culture App that can address most of the problems to a reasonable extent.

	Paper Title:	**Recovering Oral Motor Strength to Protect Children from Severe Cerebral Palsy through Virtual Gaming Technology**

Abstract: Recent methods and advancing world of medical electronics changed lots of traditional therapeutic intervention and approach for the management and treatment of several disorders. In the same line of approach the way of treatment of cerebral palsy is also changing more or less with recent advancement in clinical research. These clinical research and advancement gives a new pathway in the understanding of CP, early detection and prevention with primary care. This provides us a new opportunity to treat CP with the combination of both modern approach as well as the traditional therapeutic approach. Implementation of modern therapeutic electronics with enriched environment plays a vital role in treatment and management of CP. This paper provides a comparative study of mild and severely disabled children kept in different environment of treatment in the different geographical regions of the country i.e. India.

The child and therapist both are much interested and enjoy a lot when such types of therapy is given from modern devices like computer, tablet, mobile phones in the form of interactive gaming to achieve a variety of therapeutic goals. Use of electronic and software gaming specifically designed for therapeutic purposes may adjunct to manual therapy. These games in recovery of oral motor strength in rehabilitation settings are showing more enjoyable and acceptable for growing children and adults too.

Paper Title:	**Mathematical Modeling, Control Design, Simulation & Implementation of Electric Vehicle Charger**

Abstract:A proposed technique to deal with improves the power factor of single-stage rectifiers and to control the load voltage against the adjustment in grid voltage and load is exhibited. This converter topology is assessed based on execution and its remarkable highlights like simple in construction, cost efficient and high degree of performance are communicated about to examine its correctness. The proposed control technique is bridgeless, transformer-less and output current sensor-less and comprises of just two Bi-directional IGBTs and two diodes. The voltage control is accomplished by a simple voltage divider to convey to a controller to control the duty cycles of pulse width modulated signal. This paper concentrated on the numerical displaying of single stage bi-directional converter utilized in electric vehicle.

Keyword: Bridgeless-Sensor-less-Transformer-less converter, duty cycle single phase converter, PWM converter, voltage regulation.

Paper Title:	**Improved Task Scheduling using Effective Particle Swarm Optimization in Cloud Computing Environment**

Abstract:A vibrant on demand service of today's era is cloud computing where one can utilize computer resources without indirect active management by user where one can use computing resources to achieve coherence in economic scale. Since cloud computing feel like Everything as a service so there should be highly scalable and reliable mechanisms to distribute the load evenly across the VMs evenly. Innumerable cloudlet

1232-1237`

mapping policies are presented in various research articles to achieve the high performance, better QOS and minimized task execution time but maximum are conventional approaches. No unconventional realistic scheduling algorithms is available which can schedule the tasks in heterogeneous manner. Since cloudlet scheduling is crucial metrics of cloud computing that has to be heightened by combining the different parameters. This paper tried to provide effectiveness and improvement in task scheduling using nature inspired Particle Swarm optimization (PSO) strategy. A powerful nature inspired load balancing mechanism is proposed in this paper which optimized makespan and throughput in environment of varying cloudlets and virtual machines results as compared to other conventional approaches. Proposed (EPSO) algorithm is with four scheduling policies namely FCFS, Round Robin (RR) and Shortest Job First (SJF) and get near twice good throughput percentage and minimized makespan in two different environments. Author used Cloud sim toolkit and some Open Source cloud packages to simulate the results of various scheduling components. Experimental results of various components are tested and simulated on java based CloudSim toolkit framework.

Keyword: Load Balancing, Particle Swarm, Cloud computing, CloudSim, Makespan, Task Scheduling.

Paper Title: **Industrial Impurities Contamination in Musi River Ground Water Area in Hyderabad Zone**

Abstract: Water an essential requirement for the world, the need of saving water when natural resources are available. Present study focuses on the river MUSI which is started from Anathagiri hills and finally connect with river Krishna after travelling nearly 256 KM in state of Telangana state, India. Urbanization and industrialization factors in growing capital Hyderabad changes the natural flow phenomenon of river Musi when it compared with a century back word, around 1925 to 1932 most of the people depends on lakes for drinking

water like himayathsagar, usmansagar and some more. On behalf of development taken place in capital of state, water requirements are highly appreciable. But true factors showing that Musi river being polluted from past 2 to 3 decades rapidly, studies needed to rectify the heavy metal additions which are health hazardous includes sewage, chemical industrial dump. The paper focused on the level of impurities with causes and need of purification.

Keyword: Musiriver, factors for pollution, Sewage, Chemical dump

Paper Title: **Race Condition Detection Algorithms**

Abstract:A data race is similar to any other bugs in software application. Data race will result in the execution of the program unpredictable. There are 46 documented races in Linux kernel. OpenMP is an Application programming interface for shared programming model. It is a construct based model which works on fork join parallelism. OpenMP achieved node level parallelism and can manage data in single instruction multiple data and single program multiple data parallelism by executing different constructs like work sharing and parallel constructs. In any shared programming model, variables are shared by multiple threads in the program to execute different tasks by different threads. OpenMP is used to achieve parallelism by creating shared variable environment but there are chances to have data races in OpenMP programs. In this paper we discuss different algorithms to detect data races in OpenMP programs.

Keyword: OpenMP , data race detection ,OMPT, shared programming model.

	Paper Title:	**Finger Gesture Vocalizer**	
	Abstract:A Gesture Vocalizer is a small scale or a large scale system that provides a way for dumb and mute people to communicate easily. The research paper defines a technique, Finger Gesture Vocalizer which includes sensors attached to the gloves above the fingers of the person who wants to communicate. The sensors are arranged in such a way on the gloves, that they can capture the movements of the fingers and based on the change in resistance of the sensors, it can be identified what the person wants to say. The message is displayed on the LCD and is also converted to audio using the APR33A3 audio processing unit. Standard sign languages such as that of American Sign Language which is used by dumb and mute people to communicate can be employed while wearing these gloves. **Keyword:**Atmega 328p-pu, audio processing unit, communication, gesture. **References:** 1. 	Paper Title:	**Human Actions and Hand Gesture Recognition with Deep Learning**	
	Abstract: Over recent times, deep learning has been challenged extensively to automatically read and interpret characteristic features from large volumes of data. Human Action Recognition (HAR) has been experimented with variety of techniques like wearable devices, mobile devices etc., but they can cause unnecessary discomfort to people especially elderly and child. Since it is very vital to monitor the movements of elderly and children in unattended scenarios, thus, HAR is focused. A smart human action recognition method to automatically identify the human activities from skeletal joint motions and combines the competencies are focused. We can also intimate the near ones about the status of the people. Also, it is a low-cost method and has high accuracy. Thus, this provides a way to help the senior citizens and children from any kind of mishaps and health issues. Hand gesture recognition is also discussed along with human activities using deep learning. **Keyword:**Deep Learning, Human Action Recognition, Skeletal images, spatial dependencies and temporal dependencies, Hand gesture recognition, Transfer learning, machine learning, Convolutional Neural Network (CNN), Human Computer Interaction (HCI), Hierarchical spatio-temporal model (HSTM) **References:** 1. 	Paper Title:	**Minimizing Noise in Sinusiodal Function Signal using Wavelet Transform**	
	Abstract: Resistances that occur in retrieving and processing signal is caused by the interference (noise) on the data signal measurement results. The resistance will raise uncertainties in determining the value of the frequency. This is due to the signal which is mixed with the noise in the original signal. In general, the process of signal analysis uses Fast Fourier Transformation (FFT). However, by using FFT in analyzing and reconstructing there are still doubts in determining the real frequency due to the still visible noise in the signal. In this study the signal function used is a sinusiodal function, $Y = 2 \sin\pi f1t + 2 \sin \pi f2t$, with a given noise value of 2 DB. The specified frequency value of f1 and f2 equal to 0.25 Hz and 5 Hz, respectively. This research proposed wavelet transforms to analyze and in filtering original signal with noise. By using the transformation	**1254-1260**

wavelet, signal with noise filtered with the high pass and low pass filter method and also using the Haar wavelet function in analyzing. Once the signal is decomposed using wavelet transformation, the wavelet coefficients value will be obtained. The wavelet coefficient values will then threshold within a range of 5-50%. The purposed in determining the treshold value is to reduce the signal data identified as a noise signal data. If the value of wavelet coefficient below the treshold percentage value multiplied by the maximum wavelet coefficient, it is identified as a noise signal data, and the value of coefficient wavelet will be zero. The wavelet coefficient will then be reconstructed in order to obtain the data signal with the new sinusoidal function. In determining the value of the reconstructed frequency signal, the Fast Fourier Transform (FTT) method is used. The results of the study is signals with noise can be analyzed and filtered using wavelet transforms, by changing the signal into wavelet coefficients. Furthermore, the threshold of 5% is capable in reducing of noise in signal so that the graph of frequency and amplitude showed a clearer value of frequency.

Keyword: Signal, noise, wavelet transformation

Paper Title:	**Durability Properties on Marine Algae Concrete**

Abstract: Investigation of marine algae had its progress, due to chemical reaction with cement as a result nature gets affected by contamination and thus the inclusion of algae in the concrete found to control the destructive reactions. Algae are natural congenial which adds to the monetary of the concrete and, in the meantime, there is a decline of the wastes. Durability of concrete assumes an essential job in concrete structures. Durability of concrete might be characterized as the capacity of cement to withstand weathering activity and acid attack by retaining its ideal building properties. There are different materials utilized in the concrete to increase durability property. In this investigation, marine brown algae was utilized as added substance with concrete. A fixed water to cement ratio (W/C = 0.5) for M25 grade concrete was adopted with different marine brown algae percentages at 2%, 5% and 8%. The outcome demonstrates that 8% marine algae concrete performed well when contrast with traditional concrete. Deflection behaviour test established that thecrucial load limit of ideal mix concrete slab was found to be higher than the customary conventional concrete slab.

Keyword: Marine brown algae, Durability properties, sulphate attack, RCPT, acid resistance test.

Paper Title:	**Effect of Different Chemicals Compounds upon the Surface of Heavy Crude Oil**

Abstract: Heavy crude oil is one of the unconventional crude oil which is difficult to recovery by conventional methods. High viscosity of heavy crude oil is reduced by the usage of steam in thermal recovery processes. Chemical flooding practices were fewer in heavy oil field compared to thermal flooding due to the low reactivity of chemicals on high dense crude oil. In this research article, different chemical compounds were tested on the heavy crude oil in both ambient and hot water conditions. The chemical compound prepared in the ambient temperature of water has no effect on heavy crude oil. On the contrary, heavy crude oil gave response to the chemicals made up of hot water. The chemical compounds namely surfactants, solvents and some salts happened to change the surface of heavy crude oil in turn influence the recovery rate. The analysis is useful for the testing and selecting of specific chemical compound which will react with heavy crude oil and improve the production.

Paper Title: **Parameter Analysis of Interfering Applications in Multi-Core Environment for Throughput Enhancement**

Abstract: In Multi-core systems the applications co-execute in Multi-programmed mode, have interfere with each other during execution, which creates resource bottleneck affecting the performance. To reduce the interference in a given set of resources some conventional approaches don't give guarantee of performance in a conflicting application environment. In this paper, we make an in-depth analysis of benchmark applications interference for shared resources and find out application set which could be executed adopting a designated policy to mitigate the interference effects. In this work, we have performed profiling and analysis of applications on the state-of-the-art simulator gem5. Finally, we conclude the possibility of performance improvement through the designated policy. The simulation results show the scope to have a new scheduler for performance improvement in such systems.

Keyword: Interference, Multi-core, analysis, performance, policy, co-schedule.

	Paper Title:	**AI Proposition for Crypt Information Management with Maximized EM Modelling**

Abstract: There are a few circumstances where we utilize cutting edge innovations to recognize another element from the information we have. Regardless of whether it might be finished data or halfway data we attempt to recognize the new thing from the information. Mysterious information is such we have to concentrate on estimating the situations of achievement rate with this sort of enigmatic information which resembles a futile information. Enigmatic esteem resembles a pointless information which resembled an old information. We have to refine that information which isn't certified at that time. For instance consider age in an informational index as the enigmatic information since when that informational index was made that client might be with some age and after such a significant number of years still the age will be continue as before in the dataset with no update. This sort of data can be handled utilizing the grouping instrument which can be distinguished dependent on the data we accumulated from the store. The usefulness referenced in this article is to quantify the enigmatic information with the AI and approving the model dependent on the exactness we scored with the present information accessible. The total article talks about the activities we perform to accomplish the exactness of the model with various grouping systems.

Paper Title: **FIR Filter Design using Finfets at 22nm Technology**

Abstract: Finite Impulse Response (FIR) filters are the most significantdevice in digital signal processing.In many Digital Signal Processing applications like wireless communication, image and video processing FIR filters are used.Digital FIR filters primarily consists of multipliers, adders and delay elements. Area, power optimization and speed are the key design metrics of FiniteImpulse Response filter.As more electronic devices are battery operated, power consumption constraint becomes a major issue. Multipliers are the core of FIR filters. They consume a lot of energy and are generally complex circuits. With each new process technologies, the short channel effects limit the performance of FIR filters at nano regime. Various architectures have been proposed to enhance the performance of FIR filter. In this paper, FIR filter is designed using FINFETs at 22nm technology using Hspice software.

Paper Title: **Segmentation of Neonatal Brain using MR Images in an Efficient Manner**

Abstract: Image analysis using updated technology of magnetic resonance for finding, measuring and studying various tissue related structure of brain and thus discovering its medical region is an important application of segmentation process. In order to analyze the specific regions of brain, brain image segmentation plays a significant role for researchers and clinicians. In this work, we make an attempt to design an efficient segmentation model of neonatal brain MRI images of preterm infants. Initially, the dataset is collected from an eminent public repository that composes of numerous training and testing datasets. The proposed framework comprises of six phases, viz, pre-processing using FANFMF, Contrast enhancement using AAIHE, Feature extraction using PBDLFL, Affinity information using SCMMAL, Dictionary creation using DCAD and clustering using SSMLC. The main aim of this paper is to increase segmentation accuracy in the given MR images. The extraction of local features is a complex task which is simply achieved by the proposed PBDLFL via DCAD. The formation of self-similarity map from the probabilistic dictionary creation helps for better

1296-1300

segmentation process. Finally clustering based segmentation process using SSMLC algorithm is used that that helps in decreasing uncertainty and sparsity of data so that an efficient diagnosis system can be obtained. Segmentation process that is proposed in this paper can be proved as accurate and efficient by various experimental result.

Keyword: Image segmentation, Segmentation accuracy, Contrast enhancement, Dictionary creation and Self – similarity map.

	Paper Title:	**Soft Skills and Positive Attitude : Science of Bridging Gap**

Abstract: Soft skills are those essential traits and expertise that must be acquired by every person to be successful in life. These abilities, traits or skills are also most popularly called people's skills and in recent times, also known as twenty first century skills. It is proven that the hard skills or the academic or professional qualifications maybe an inevitable component of any kind of employment or job placement but the success of a person depends upon the soft skills he has. Research has shown that attitude of the pupils and development or enhancement of these skills is correlated. The attitude is different in each individual and therefore the real life application of these skills is also varied. The study undertaken endeavours to find out the correlation between the positive attitude and negative attitude of the students towards soft skills and the real life application of it.

	Paper Title:	**Design of Energy Aware Scheduling Algorithm for Executing Scientific Workflows in Cloud**

Abstract: The usage of cloud computing and its resources for the execution of scientific workflow is a rapidly increasing demand. The Scientific applications are generally large in scale; even a single scientific workflow includes more number of complex tasks. Execution of these tasks can be made successful only by deploying it in the cloud virtual machines, because only cloud environment can only provide very large number of computing assets. In cloud, every processing resource is given as Virtual Machine. Any scientific workflow deployed in the cloud needs large number of virtual machines so; huge amount of computational energy is spent by the virtual machines to execute multifaceted scientific workflows. Hence there arises the need to utilize the cloud resources in an energy efficient way. Also, if the virtual machines are planned to schedule in an energy efficient manner there is an increase of makepsan of the workflow which is going to be an important parameter for

1305-1311

completing the workflow within the deadline. So, the need for executing scientific workflows in energy efficient way with reduced makespan becomes a major issue among the researchers. It also becomes very challenging task to executing a scientific workflow in within the given deadline of a task in the given workflow. To address these issues, a new Energy Aware workflow scheduling algorithm is proposed and designed with improved makespan for the execution of different scientific applications in cloud environment.

Paper Title: **Train Delay Prediction using Machine Learning**

Abstract: Indian Railways operates both long distance and suburban passenger trains and freight services daily in the country. Trains get delayed frequently due to several reasons such as, severe weather conditions such as fog, traffic, signal failure, derailing of trains, accidents, etc, and this delay is propagated from station to station. If we can predict this in advance - it would be of great help for the commuters to plan their journey either for an earlier departure or postpone, and also lets railways to take measures to avoid delays further. In this paper, we used decision tree, a machine learning method used for predicting train delays, and Recurrent Neural Networks distinguished with various fixtures. For predicting train delays, Recurrent Neural networks with 2 layers and 22 neurons per each layer gave best results with an average error of 122 seconds.

Abstract: The primary goal of present examination is to foresee every day worldwide solar cell efficiency in view of meteorological factors, utilizing distinctive counterfeit neural system (ANN) procedures. In the present examination we report the impact of Dye Synthesized solar cell. A three-layer artificial neural network (ANN) model was developed to predict the efficiency of Dye Synthesized solar cell based on 100 experimental sets. In the present examination we report the impact of Dye Synthesized solar cell. The effect of operational parameters such as short circuit current (Jsc),Open circuit voltage(Voc),Fill factor(FF) were studied to optimize the conditions to check the efficiency of Dye Synthesized solar cell. Experimental results showed that the ANN model was able to predict adsorption efficiency with a tangent sigmoid transfer function (tansig) at hidden layer with 20 neurons and a linear transfer function (purelin) at output layer. The Levenberg–Marquardt algorithm (LMA) was used with a minimum mean squared error (MSE) of 0.00350141. The linear regression between the network outputs and the corresponding targets were proven to be satisfactory with a correlation coefficient of about 0.9993 for six model variables used in this study.

Abstract: The common practice of Municipal solid waste disposal method in developing countries is an unlined landfill dumping site. Due to this the natural resources land, water and air get polluted and also severely affected by the public living around the dumping yard. In this study, Srinivasapuram dumpsite in Thanjavur City Municipal Corporation area, India has been selected to investigate the quality of groundwater. Groundwater samples collected from 25 locations were tested as per standards for physical, chemical characteristics. The classical contour mapping method has been used to detect information from the recorded ground water quality data. Surfer 6.0 software has been used to convert the spatial data into equivalent contour map. Graphical method has been used to decide the area enclosed by each contour line. The water quality standards recommended by BIS and WHO were used to classify the critical regions based on the ground water contamination level. The water quality parameters such as pH value, Electrical conductivity, Total dissolved solids (TDS), Total Hardness (TH), Iron and Fluoride were considered for this analysis and other parameters were not included. All the collected groundwater samples the pH values are within the permissible limit of 6.5-8.5. The Electrical Conductivity vales range between 0.5mho/cm and 5.7mho/cm. The TDS values ranges between 200 and 3024 mg/l. The concentration of TDS is higher than the permissible level of the samples which are nearby the dumping yard as the contour lines are assembling around the dumpsite. The concentration of chlorides in all the samples under investigation is 12.4 to 1316 mg/l. It has been observed that concentration of total hardness (TH) of water samples varies from 118 mg/l to 2070mg/l. The presence of high concentration of iron and fluoride in the water samples adjacent to dumping yard indicate that it would have contaminated by leachate movement from MSW. The contour plots also reveal that the groundwater was contaminated as per the tests conducted for physical and chemical parameters.

Paper Title: **Unmanned Farm utilizes Virtual Fence Technology for Animal Tracking**

Abstract: In order to graze animals on farms in large areas, fences must be installed. For this reason, installation and maintenance costs are high. To solve this problem and to manage animals efficiently, we want to use virtual fences based on IoT system. A virtual fence is not about installing a physically contiguous fence but using the least IoT device to get the effect of the existing fence. As described above, since the virtual fence is not an invisible and continuous object, it can be formed in various shapes other than a rectangular shape. Virtual fences can be implemented using a variety of sensors and embedded systems currently available in the marketplace. This can reduce the cost of installing and maintaining an existing fence and provide additional benefits such as tracking the health of the animal and movement tracking. In this paper, we propose a virtual fence algorithm. The proposed algorithm can propose an animal's range of motion and take action according to specified rules. The simulation results show that the proposed algorithm can manage the animals in the virtual fence well.

Paper Title: **3D Transient CFD Modelling of Blood Flow through Coronary Artery**

Abstract: Over the past few decades, stroke has become one of the most common cause deaths. The heart muscle, like every other organ or tissue in our body, needs oxygen-rich blood to survive. Coronary artery disease means narrowing of the coronary arteries. This narrowing is due to a buildup of plaque in the walls of the arteries. Computational simulations provide invaluable information that is extremely difficult to obtain experimentally and is one of the many CFD sample applications in the biomedical area in which blood flow through an abnormal artery can be predicted. CFD analysis is increasingly performed to study fluid phenomena inside the human vascular system. In this paper, the study is to develop 3D CFD model of the Coronary artery to observe the blood flow through artery and estimate some of the hemodynamic parameters of blood during systolic and diastolic phase with plaque formation in artery. Hemodynamic parameters were quantified and flow patterns are visualized in the presence of plaques by using CFD.

Paper Title: **Determining the Significant Part in an Electrical appliance using Fuzzy Cognitive Map and to Minimize the Cost in the Creation of a Circuit**

Abstract: There are many parts in an electrical appliance, each performing various operations. In particular, if a part fails, then the appliance will not be able to carry out its operations in a better way. Thus, to determine the significant part, fuzzy cognitive map can be used. However, it is noticed that in the washing machine, the outcome of the experiment lists all the parts to play an equal role. Therefore, in order to reduce the cost, the circuit must be minimized which can be done using a Java script software. Using the above circuit in the washing machine, it is easy to identify the fault in the part even before it gets damaged.

	Paper Title:	**Design and Implementation of Robust Navigation System Platform for Autonomous Mobile Robot**	
	Abstract: An autonomous robot can navigate in a given region and reach to a specified location. The navigation system for these robots has to be reliable, versatile and rugged. In this paper, design and development aspects of such navigation system are discussed. A two level architecture is proposed for navigation of the autonomous robot. The low level controller (LLC) generates odometry data and implements closed loop feedback based PID algorithm. The high level controller (HLC) is used to generate velocity commands based on the path planned and inputs sensed from environment. The two controllers continuously exchange data with each other to reach the final destination. This navigation system platform can be used to develop autonomous mobile robots. **Keyword:**Autonomous Mobile Robot, PID, Odometry, Robotic Operating System (ROS), High Level Controller (HLC), Low Level Controller (LLC). **References:** 1. 	Paper Title:	**Artificial Intelligence Based Vector Controller for Switched Reluctance Motor (SRM)**	
	Abstract: The prevalence of the Switched Reluctance Motors (SRMs) increments step by step because of its points of interest, for example, Simple structure, low cost, less weight, high effectiveness and high beginning torque when contrasted with regular motors. SRM is an electric motor which has invaluable highlights that qualifies it to be utilized in electric vehicle, aviation and industrial applications. In this paper, the switched reluctance motor is controlled using vector control by AI controller (fuzzy) so as to limit the torque ripples by directing torque inside indicated hysteresis band. AI Control of SRM encouraged through an irregular converter. The proposed AI controllers are executed in MATLAB/SIMULINK for specified SRM parameters. As indicated by the attained outcomes the SRM behavior is better when impelled by AI controller in contrast with usual controllers. **Keyword:**Switched Reluctance Motor (SRM), Artificial Intelligence, FLC. **References:** 1. 	Paper Title:	**Humidity and Temperature Monitoring System using IoT**	
	Abstract: Indian enterprises significantly incorporate biomedical, horticultural and pharmaceutical which are the mainstays of nation economy. The checking of temperature and humidity are significant regions for every one of		**1353-**

these enterprises. Any sort of unbalancing in the ecological conditions or disconnected parameters can make budgetary misfortune in the profitability of pharmaceutical and horticulture enterprises. Checking of temperature and moistness are likewise required for biomedical industry for medications and cell culture strategies. In medicinal services segments, condition-controlled, conditions are additionally required for patients undermining. In this paper we are going to gauge temperature and humidity by utilizing Node MCU apparatus and DHT11, which will be useful for adjusting the earth to build the productivity in this in agriculture sector today's weather forecasting systems accessible based on satellite and RADAR communication. These frameworks are substantial, hard to deal with and exorbitant. They are detecting scarcely specific region and its incomplete range. In any case, in horticulture field universally not indistinguishable ecological conditions it is important to observing every single yield existing natural situation. An agriculture field premises has dissimilar humidity, temperature, moisture, light intensity because corner of plot trees and water leakage, so that kind of changes across all parameters of field are essential, and such parameters of yield continue the quality. In present paper proposed framework, enhancement of moistness and temperature. There are numerous frameworks are accessible in the market dependent on Wireless sensor organize (WSN) yet this framework is more vitality effective, little size, convenient. Sensor is coordinated bundle contains stickiness and temperature estimation ability in single bundle.

Paper Title: **Agnizing Sarcopenia and Coherent Variable Optimization of Body Fat Percentage using Genetic Algorithms and Regression**

Abstract: Obesity is a malady which poses wide threats across the world with its augmented inflation. A domineering determinant to most pandemic diseases in the human body is the agglomeration of body fat. Therefore, an apposite anatomization of body fat estimation for every individual is incumbent. The previous work aberrates and pioneered the implementation of attributes from the lipid profile and Bio-Electric Impedance Analysis (BIA) method of a person, from the conventional use of attributes such as BMI, age and gender to obtain the value of body fat percentage. But the proposed analysis meliorates the accuracy of body fat percentage and resuscitated the gamut of health gremlins it vanguards to. This paper also delineates the variable optimization using regression and genetic algorithm for the attributes incorporated to procure the body fat percentage. Thereby corroborating and revamping the veracity of the novel body fat percentage derived using lipids and the BIA method. The study has further helped in diagnosing a disease known as sarcopenia. The samples from the blood tests and Bio-Electric Impedance method have been procured from the Institute of Bio-Chemistry, after obtaining the consent from the Institutional Ethics Committee, Madras Medical College, Chennai. The simulations are carried out in MATLAB GUI and the results have been successfully obtained.

Paper Title: **Neural Network Based Prefetching Control Mechanism**

Abstract: An important issue incurred by users that limits the use of internet is the long web access delays. Most efficient way to solve this problem is to use “Prefetching”. This paper is an attempt to dynamically monitor the network bandwidth for which a neural network-based model has been worked upon. Prefetching is an effective and efficient technique for reducing users perceived latency. It is a technique that predicts & fetches the web pages in advance corresponding to the clients’ request, that will be accessed in future. Generally, this prediction is based on the historical information that the sever maintains for each web page it serves in a chronological order. This is a speculative technique where if predictions are incorrect then prefetching adds extra traffic to the network, which is seriously negating the network performance. Therefore, there is critical need of a mechanism that could analyze the network bandwidth of the system before prefetching is done. Based on network conditions, this model not only guides if the prefetching should be done or not but also tells number of pages which are to be prefetched in advance so that network bandwidth can be effectively utilized. Proposed control mechanism has been validated using NS-2 simulator and thus various adverse effects of prefetching in terms of response time and bandwidth utilization have been reduced.

Paper Title: **Intelligent Tourist Guide System using Web Development**

Abstract: There is a huge development in the Information Technology or IT sector recently. Also, there is a massive use of Geographic Information System or in short, we say as GIS nowadays. Tourism Industry is getting more and more advantage specially from GIS. GIS and Tourism Industry are bonding together in a smooth and progressive manner. In order to connect GIS and Tourism, that means in order to establish a bonding between them network is required or we can say connectivity is required. Network allows nodes to share resources in digital telecommunications. So, GIS and Tourism are interconnected with network. Network form infrastructure of modern society. When tourists visit a new place, they might not know about the place in a detailed manner or

1367-1370

it might be just a new place for them. Even services like Google which uses the Navigation system and uses the GIS system might not have all details of a place of very low tourist interests. But here we propose Intelligent Tourist Guide System using Web Development which will help tourists travelling to different parts of the world and also local people can advertise their place in order to make it a Tourist Spot and make their area famous.

	Paper Title:	**Question to Query: Converting Human Language to DBMS Query**

Abstract: In this paper a method has been proposed keeping in the mind the need for systems that could generate structured queries from normal language keeping in mind that the user has no prior knowledge of database query language. A novel method which aims at aiding analyst who aren't well versed with codes, but need quantitative outputs to analyze, predict and alert the business or market. A python model is used, which aims at converting any sentence typed in English to a query provided that such tables and database is present for query processing. Tree tagging is used here to relate words typed in to SQL query syntax. Any sentence typed in by analyst, it further annotated by parts of speech and lemmas. A list of generic words and stop words is used while parsing the input the sentence and tagging it. Query is generated by simultaneously removing the stop words, mapping the keywords with the one's used in structured query language. The generated query comes out in form of a JSON file.

Keyword: Complex SQL generation, Natural Language Processing, Query parsing, Structured query language ,Tree tagging.

	Paper Title:	**Establishing AN Association between Risk Tolerance and Behavioral Biases among Indian Investors.**

Abstract: Behavioral Finance Literature Has Shown A Mushroom Growth In The Recent Years. Literature Shed Specific Light On How The Concept Evolved And Later Developed To Various Stages Which Helped To Understand Various Market Anomalies And The Psychology Of Individuals Through Behavioral Biases. Behavioral Finance Tries To Explain The Logic Behind Applying Of Heuristics Or Shortcuts By Investors To Take Investment Decisions Which Still Need To Be Extensively Studied.

The Study Here Attempts For Identify Presence Of Different Biases In Individual Decision Making And Their Association With The Risk Tolerance Capacity. The Results Indicate That Heuristic Biases (I.E. Representativeness Bias, Overconfidence Bias And Gamblers Fallacy Bias) Are Linked To Moderate To High Risk Tolerant Investors. While Herd Bias And Prospect Biases (Loss Aversion Bias And Mental Accounting Bias) Are Found To Be Linked With Low To Moderate Risk Tolerance Levels Of Investors. Heuristics Are Positively Correlated With Risk Tolerance However; Prospect And Herd Are Found To Be Negatively Correlated With Risk Tolerance.

Paper Title: **Reliability Assessment of Photoelectric Smoke Detector, Ionization Smoke Detector and a Fire Alarm Control Panel with Both Detectors AS Notification Device**

Abstract: Notification device like smoke detectors are critical and important part of a Fire Alarm Control Panel (FACP). Popularly used smoke alarms in commercial establishments in India are photoelectric smoke alarms (PESD) and ionization smoke alarms (ISD). In this study reliability assessments of PESD with Integrated Circuit (IC) – MC145010 and ISD with IC – MC145017 have been carried out on the basis of reliabilities of their respective electronic components. The cases considered are: (I) Failure rates of all components are equal and constant over time (II) Failure rates of all components are equal and follow Weibull distribution and (III) Failure rates of all components are different. To determine failure rates of 9 volt battery of both detectors additional assumptions taken are, (a) battery life is 10 years with constant failure rate, (b) battery life follows Weibull distribution. In this paper the reliability and failure rate of two types of smoke alarms have been calculated based on failure rates of their electronic parts like resistors, capacitors, Integrated Circuits etc. These failure rates have been subsequently used for reliability assessment of a non-addressable FACP containing four PESDs and four ISDs as notification device. A comparison of failure rates was also performed on the basis of two quality factors of electronic components – military specific and lower than military specific.

Mean Time To Failure (MTTF) of PESD and ISD have been calculated in all the cases. Subsequently, MTTF values obtained in case III were used to approximate failure rates for case I case II.

Keyword: Photoelectric smoke detector, Ionization smoke detector, Reliability, MTTF

Paper Title: **Electrical Loading Assessment of Commonly-Used Transformers for Feeder 21 of Pampanga Distribution Utility**

Abstract: Transformer plays a vital part in the process of utilization of electricity. In power distribution, the most widely used equipment is the distribution transformer (DT) and function to transform the primary voltage of 13200 volts to the utilization level voltage of 230 volts. In a distribution system, transformers are installed serving commercial, industrial, irrigation, street lights and residential consumers. Distribution transformers were classified as sole-used and commonly-used distribution transformers. The study focuses on assessing the commonly-used distribution transformer of Feeder 21 of Pampanga Distribution Utility. Microsoft Excel 2013 was used to evaluate the percent loading, core and copper losses of each DT’s installed in the feeder. The DTs were classified according to their percent loading: Overloaded Above 71%, Normal Loaded 40% to 70%, and Under Loaded Below 40%. From the data from 2017-2018, 104 units commonly-used DT’s were installed in the feeder. From the results obtained, 30 units were overloaded distribution transformers while 31 units were under loaded distribution transformers. Out of 104 distribution transformers 61 of which are not in the normal loading conditions. The total Core loss in MWh of the distribution transformer in under loaded and overloaded conditions were 34.37 and 38.04, while the copper loss in under loaded and overloaded conditions was 7.46 MWh and 199.76 MWh respectively. The study also shows the implication if the percent loading was maintained to 70%, 110.21MWh will be saved by the electric utility. The researchers find that there is a need in uprating or downrating of transformer and quantifying the consumer connected in each distribution transformers for proper transformer loading may be considered by the Distribution Utility.

Keyword: Commonly–Used Distribution Transformer, Copper Loss, Core Loss, Percent Loading.

Paper Title:	**Simulation of Saltwater Intrusion in a Coastal Aquifer – Chennai, India.**

Abstract:SEAWAT-2000 is employed to reproduce groundwater movement and migration for a coastal stretch in the Chennai city, India. SEAWAT coupled interpretation of MODFLOW and MT3DMS can recreate 3-D model, variable thickness, groundwater flow and multi-layer transport. The variable thickness flow strategy uses the MODFLOW framework to decide the variable thickness flow condition. The aquifer considered for the present investigation is ~ 75 km coastal area from southern Thiruvanmiyur to northern Thiruvottiyur. The analysis considers about managing the available data most capably to create an intense and complex propagation model. The game plan parameters are quantifiable by altering the model for multi-year outputs with consistent time step. The idea is to recharge the unconfined strata using wise groundwater potential of the aquifer with progression of transmissivity and unambiguous yield for weathered, fractured aquifer alluvium and Gondwana formations starting from 2 to 143.2 m2/day along and 0.00075 to 0.2 independently. The model evaluates the extent of above mentioned study area with the targeted accuracy by segregating the data. From this, the model is perceived to be tentatively steady for any groundwater applications and associated with foreseeing the water incursion in beach front aquifers for various strategy and overall water level rising.

Paper Title:	**Gravity Modeling of Recreational Tourism (In the Example of Namangan Region of the Republic of Uzbekistan)**

Abstract: As a result of specialization and integration of tourist and recreational activities in recreational health improving zones, recreational tourism started developing rapidly in the regions. Gravity models are widely used in the study of development of therapeutic and recreational industry. The problem concentrated in this article is

1402-1408

developing the theoretical, methodological and practical recommendations for improving the “gravity rings” of recreational places by using gravity models in the example of Uzbekistan regions. For investigation the problem there were applied statistical data gained from gravity models of recreational development in the equation models. Based on theories of gravity modelling, the results of the development, study and implementation of recreation in the regions increase accuracy, the reliability of decisions and take into account the predicted results. The feasibility, accuracy and reliability of the approaches and methods used in the study are based on econometric and mathematical methods, and statistical data is based on the analysis of the data provided by the State Statistical Committee of the Republic of Uzbekistan and the survey data of recreational facilities in the selected region.

	Paper Title:	**Determination of Secant Moduli of Agbelouve Silty Sand Stabilized With Cement Used as a Roadway Layer in Togo**

Abstract: The soil stabilization use is necessary in the presence of lesser quality soils. This stabilization has the effect of modifying the soils properties, in particular the strain modulus. For road dimensioning using rational method, it is necessary to know secant modulus of the soil which is not often done in Togo. In this paper, it is determined the secant modulus at different ages of silty sand stabilized with cement at different rates. For this, specimen of silty sand stabilized with cement at rates of 2.5; 3.5 and 4.5% are subjected to the Modified Proctor test and measurement of compressive strength with strain measurement to estimate the modulus at 7, 28, 60 and 90 days of age. The results show that moduli increase with age and cement rate. From different correlations, we estimate the dimensioning modulus of Agbélouvé silty sand stabilized with cement. These estimated moduli allow saying that the cement rate studied are satisfactory from the modulus viewpoint. This study completes the information on Togolese materials needed for road dimensioning by rational methods.

Keyword: Cement stabilization, dimensioning modulus, secant modulus, silty sand, strain.

	Paper Title:	**Local Robust Gradient Patterns for Recognition of Cardiomyopathy**

Abstract: Cardiomyopathy is one of the heart diseases that cause chamber damages. The impact of heart disease ends up in unforeseen fall with light-headedness. IoT plays an important role in human healthcare systems. Through IoT, it's terribly simple to watch the health condition of the heart disease patient by detection the abnormality within the electrocardiogram signal generated by IoT sensors. The varied ECG signals represent the severity of the heart disease and every graphical record signal has distinctive patterns. This paper describes the recognition of cardiomyopathy disease based on local robust gradient patterns technique LBP operator is one of the foremost powerful techniques to recognize the patterns within the ECG graph signals. But it's highly sensitive to noise and little fluctuations. To beat these limitations LTP and its derivatives are applied. LTP operator removes the noise by dividing the signals into 3 regions. It doesn't provide fruitful results if the signal has an additional range of peaks and valleys. Merely it replaces peaks by the valley and vice-versa. RLTP technique is appropriate to beat this limitation by finding the minimum value of LTP and its complement value. However, it fails for little fluctuation in the signals. To enhance the recognition rate of little fluctuation graphical record signals the discriminant robust local ternary pattern technique is proposed by multiplying the edge gradient values with RLTP techniques. This method is applied to PTB information and therefore the Experimental results are created within the variety of tables and graphs. The proposed technique has high results on the LTP and its derivative methods and is useful for detecting cardiomyopathy with 85% accuracy.

	Paper Title:	**Performance of a Water Ionizing Device That Uses Carbon Nanotube for Treating Particulates and Other Pollutants Found in Drinking Water**

Abstract: The study was undertaken to verify performance of a commercially available water ionizing device that uses carbon nanotube to treat particulates and other pollutants found in drinking water. Two (2) deep well stations belonging to a local water concessionaire known to have quality issues were considered. Water samples were collected and analyzed for physicochemical, bacteriological and organic parameters such as Total Alkalinity, Bicarbonates, Acidity, Free CO2, Chlorine, Total Hardness, Calcium Hardness, Ca, Mg, pH, Residual Chlorine, Turbidity, TDS, color, Fe, Mn, Total coliform, HPC count and Dieldrin. The device's performance efficiency in treating the pollutants was calculated. The products' claims were verified thru actual test results. Results indicate that the device is not working as it should. It has very minimal color, Fe and Mn removal – contrary to the product claims and has zero dieldrin treatment capability. On the brighter side, the device reduced total coliform by an average of 59.67% although HPC count spiked by an average of 1,210%. The obtained results will be useful in optioneering for future treatment technologies for the water concessionaire or similar waterworks.

Paper Title: **Optimal Sizing and Positioning of Grid Integrated Distributed Generator using Particle Swarm Optimization**

Abstract: The intermittent nature of non-conventional energy sources is a major concern in Designing and Simulation of the Integration of a Distributed Generator (DG) in an existing system. Expansive sizing of any system increases the cost of the system and under sizing causes a lack of reliability and poor voltage regulation. In this paper optimal DG - Solar PV System positioning and sizing method has been proposed using particle swarm optimization algorithm (PSO). Optimal positioning and sizing of the system has been calculated for a photovoltaic system considering annualized cost of the system and reliability constraint. The DG system is simulated to determine the position and size of the system component to test the effectiveness of the proposed algorithm over the energy based system sizing method. Simulation and test results prove that the proposed optimal system configuration is able to supply the load annually with the optimum system installation cost along with its payback period.

Paper Title: **Trends in Gross Enrolment Ratio of Male Female Enrolment and Expenditure on Higher Education as Percentage of Gross Domestic Product India**

Abstract:Education plays a vital role in development of the society and the nation at large. It prepares and trained staff in any respect levels to manage capital, technology services and administration at each sector within the economy of the nation. India is presently at the stage of demographic transition wherever growth is retardation down however, the population of young people entering the labor/employment force continues to expand.

This young and huge population ought to be educated for the betterment of the state. Gross Enrolment Ratio (GER) in higher education with respect to gender is having increasing trend. The proportion of students enrolling in the higher education has increased significantly during the last two decades and as a result the higher education institutes, private universities, private and government colleges, in India are increasing significantly. Though the government of India has its own limitations towards funding the higher education should formulate the policy of funding to the universities/educational institutes so that the quality and standard in higher education is maintained. The aim of this paper is to study the trends in male, female enrolment and expenditure on higher education as % of Gross Domestic Product (GDP) of country. The secondary data is taken from the annual reports of University Grants Commission, AISHE and Ministry of Human Resource Development of India. The data is analyzed by using MINITAB19 statistical software by fitting quadratic trend and the forecasts for the period 2018-19 to 2027-28 with respect to GER of Male, Female and public expenditure on higher education in India. The accuracy of the fitted model is measured on the basis of Mean Absolute Percent Error (MAPE). It was observed that student enrolment in higher education is increased but the expenditure on higher education as % of GDP has sown decreasing trend after 2000-2001.

Keyword:GER, Higher Education, Gross Domestic Prodict, Expenditure, Quadratic Trend Analysis.

Paper Title: **Implementation of Technology Such As Enterprises Resource Planning (ERP) Through Integration of Human Capital with Quality using Analytic Hierarchical Process (AHP)**

Abstract:Information technology Such as Enterprises Resource Planning (ERP) supports the processes of electronic human resource management (e-HRM) but it lacks the other factors such human capital and quality in decision making. Human capital is related to the skill and knowledge of employee. Total Quality Management (TQM) is more emphasis on the internal customer that includes the employee within the organization. Human Capital (HC) and Quality can be integrated to improve the quality of the output. Many studies have integrated the Quality with HRM through e-HRM to improve the performances but only a few studies have done for e-HRM with the integration of HC with Quality. The purpose of this study is to implement the e-HRM through the integration of HC with Quality using Analytic Hierarchy Process (AHP). The exploration type of research design to integrate the HC with Quality is analyzed using AHP analysis based on the critical success factors (CSFs). The analysis of AHP is resulted that Employee involvement (EI = 0.234), Training, Education & Learning (TL = 0.234), Quality Measures (QM = 0.146), Performance Appraisal (PA = 0.131) and Quality Factors (QF = 0.096)

1443-1446

are selected for implementation of the e-HRM through the integration of HC with Quality. Based on the five CSFs, the conceptual model can be designed for implementation of the e-HRM through the integration of HC with Quality. The conceptual model for implementation of the e-HRM through the integration of HC with Quality needs to be empirically tested.

Keyword:AHP, CSFs, ERP, Human Capital, Quality.

Paper Title:	**Supervised Word Sense Disambiguation with Recurrent Neural Network Model**	

253.

Abstract:Disambiguating words is a branch of artificial intelligence that deals with natural language processing. The dissatisfaction of the motive of the word deals with the polysemy of the ambiguous word, processing a single word in natural language, having two or more meanings where the corresponding context discriminates the meaning. Humans are intelligent enough to derive the meaning of the word because they are a biological neural network. Computers can be trained in such a way that they should function similarly to biological neural networks. There are four different suggested approaches to clutter as the knowledge-dependent approach and the machine learning based models which are further classified as supervised, semi-supervised and unpublished learning models. The purpose of this research is to improve better communication between computers and humans. The discussed model used a supervised learning approach with recurrent neural networks.

Keyword: Supervised learning, recurrent neural network, word sense disambiguation.

Paper Title: **Heuristic Greedy Method for Spectrum Sensing in Cognitive Radio Network**

Abstract:In recent years, radio frequency spectrum in wireless communication is not effectively utilized. To utilize the spectrum effectively, an optimistic technology called “Cognitive Radio network” used. It is the best preferable next generation wireless networks. Using DSA (Dynamic Spectrum Access) approaches, it shares the spectrum effectively between the primary and secondary users. It allows the secondary users to use the spectrum by dynamic spectrum sharing algorithms. When the primary users and secondary users are using same frequency band and transmitting simultaneously, there is a spectrum underlay problem in the network. A novel heuristic greedy algorithm proposed for improving the performance parameters of cognitive radio network using co-operative spectrum sensing.

Keyword: Cognitive radio network, DSA (Dynamic Spectrum access), Heuristic greedy algorithm.

Paper Title: **Performance Analysis of Acquisition Algorithms for Navic**

Abstract:Indian Regional Navigation Satellite System (IRNSS), is an indigenous navigation system designed and developed by ISRO (Indian Space Research Organization).It is named as NavIC, Navigation with Indian Constellation by Indian Prime Minister. NavIC is designed to have seven satellite constellation that provides reliable position, navigation and timing services over India. The focal modules of NavIC receiver are acquisition, tracking and navigation unit. Among them, acquisition is the data processing unit for detecting satellite signals and their corresponding code phase and carrier frequency. In this paper, various acquisition algorithms like Serial search and Parallel Code Phase search algorithms are analyzed and compared with Cooley-Tukey FFT algorithm and sub-sampled Fast Fourier transform (ssFFT).The results obtained in MATLAB shows that the acquisition computation time for ssFFT based NavIC receiver is faster than parallel FFT acquisition and the Cooley-Tukey FFT IRNSS acquisition algorithm is faster and provides better code phase and carrier frequency values compared to serial search acquisition algorithm.

Keyword:IRNSS, NavIC, acquisition, parallel code phase search algorithm, serial search acquisition algorithm, ssFFT, Cooley-Tukey FFT.

Paper Title: **Particle Optimization of Ceo2/Water Nanofluids in Flat Plate Solar Collector**

256.

Abstract:The present research focuses on the role of CeO2/water nanofluid for estimating the performance of flat plate solar collector in respect of energetic and exergetic performance. Based on our experimental findings on varying mass flow rate, the present analysis focuses on a wide range of concentrations to find optimum volume concentration for which thermal performance is maximum. CeO2/water nanofluid exhibits high thermal conductivity improvement (~41.7%at 1.5% volume concentration) and comparatively lower dynamic viscosity. Performance evaluation of flat plate collector is based on first law analysis and qualitative nature of energy flow based on second law analysis. Experiments indicate that for~1.0% particle volume concentration at a mass flow rate of 0.03 kg/s, maximum collector efficiency is obtained up to 57.1% instead of water as the base fluid. Exergetic efficiency observed 84.6%at optimum concentration (~1.0% particle volume) of nanofluid at0.01 kg/s flow rate.

Keyword: Flat plate collector, Nanofluid, Exergy Efficiency, Energy efficiency, Optimization.

Paper Title: **A Performance Analysis on Swarm Drone Loco Positioning System for Time Difference of Arrival Protocol**

Abstract:There is an increasing application potential in swarm technology, accuracy in localization becomes a critical factor in the system in executing the desired task. As there are various localization techniques, this paper focuses on analyzing the performance of a particular radio localization technique called the Loco Positioning System operating on the Time Difference of Arrival protocol subjected to various setup configurations. The research starts with the design of various setup configurations are based on two independent parameters which are, number of anchors, and distance between anchors as they prominently affect the accuracy of the system. Position estimates are obtained by manually moving the Crazyflie equipped with a Tag within a grid system and the values are reflected through the PC client. The position estimates are then compared to the true values to obtain a relative error which is used to define the performance of the system. Data showed that operating on 4 anchors offers relatively low error and increasing the number of anchors to 8 significantly improves the accuracy of the system. Additionally, increasing the distance between anchors from 0.6 m to 2 m also improves the accuracy in the system. The obtained data offers a clear relationship between accuracy and the mentioned parameters, and a good combination of both parameters also affects the accuracy of the system. This paper offers both recommended applications and data which will aid users of the loco positioning system in determining the optimal setup based on their set of constraints.

Paper Title: **Effect of Professional Ethics, Work Experience, and Emotional Intelligence on Auditor Opinion**

Abstract:The auditor must prioritize professionalism in decision making, especially with regard to decisions related to audit results or opinions. Our study aims to understand impact by professional ethic, length of works, also emotional intelligent to ability in decision making. This study is provides primary data for hundred respondents who work at public accounting firm in South Jakarta. The data used in this research is primary data such as questionnaire. This research is conduct statistical methods to do hypothesis testing and causally research. Based on the partial results of hypothesis testing, professional ethic and emotional intelligent have a significant on auditor decision making effect however work experience has no significant effect on auditor decision making.

Paper Title: **Content Based Movie Scene Retrieval using Spatio-Temporal Features**

Abstract:Thousands of movies along with TV shows, documentaries are being produced each year around the world with different genres and languages. Making a movie scene impactful as well as original is challenging task for the director. On the other hand, users demands to retrieve similar scenes from their queries is also challenging task as there is no proper maintenance of database of movie scene videos with proper semantic tags associated with it. So to fulfill the requirement of these two (but not the least) application areas there is a need of content based retrieval system for movie scenes. Content based video retrieval is a problem of retrieving most similar videos to a given query video by analyzing the visual contents of videos. Traditional video level features based on key frame level hand engineered features which does not exploit rich dynamics present in the video. In this paper we propose a Content based Movie Scene Retrieval (CB-MSR) framework using spatio-temporal features learned by deep learning. Specifically deep CNN along with LSTM is deploy to learn spatio-temporal representations of video. On the basis of these learned features similar movie scenes can be retrieve from the collection of movies. Hollywood2 dataset is used to test the proposed system. Two types of features: spatial and spatio-temporal features are used to evaluate the proposed framework.

Paper Title: **Constructing and Conducting an Interreligious Ecotheological Leadership in Environmental Science Perspective**

Abstract:Focus of this research is to examine the interreligious ecotheological leadership in environmental science perspective and how to conduct it in the real context to solve environmental problems. It cannot be done alone, but must be conducted with all others religions to face the environmental issue which is always demanding a leader figure to overcome it. However, there has not been a defining of the interreligious ecotheological leadership, a model of leadership conducted together from various religions leader to address ecological problems.

The purpose of this research is to construct an interreligious ecotheological leadership and to reflect how such leadership is conducted in environmental science perspective. To achieve that objectives, this research used qualitative methods. Research data has been gained through seven months' involvement with the victims, that is the citizens experiencing brutal displacement in Tambakrejo, Semarang City of Indonesia. The data is combined with a documentary film "Tambakrejo #BergerakBersama" and to be analyzed using the theory-developing research method as a desk-research type to construct the interreligious ecotheological leadership model as it has been conducted in the praxis. This research has demonstrated how important the interreligious ecotheological leadership is in the environmental science perspective for the ecological problems which must be addressed together. The results can inspire anyone in facing a similar case elswhere. The result is an eco-justice implementation for the poor and the oppressed. The results also show five traits that mark interreligious ecotheological leadership as mentioned in the discussion of this paper.

Paper Title: **Detection of Truth iDiscovery in Big iData Social Media Sensing Applications**

Abstract:With the rapid growth of online social media and ubiquitous internet connectivity, social sensing has emerged as a new crowd sourcing application paradigm of collecting observations (often called clams) about the physical environment from humans or devices on there behalf. A fundamental problem n social sensing applications les n effectively ascertaining the correctness of clams and the reliably of data sources without known ether of them a prior, which s referred to as truth discovery. While significant progress has been made to solve the truth discovery problem, some important challenges have not been well addressed yet. First, existing truth discovery solutions did not fully solve the dynamic truth discovery problem where the ground truth of clams changes over time. Second, many current solutions are not scalable to large-scale social sensing events because of the centralized nature of there truth discovery algorithms. Third, the heterogeneity and unpredictably of the social sensing data traffic pose add tonal challenges to the resource allocation and system responsiveness. n this paper, we develop a Scalable and Robust Truth Discovery (SRTD) scheme to address the above three challenges. n particular, the SRTD scheme jointly quantifies both the reliably of sources and the credibly of clams sung a principled approach. The evaluation results on three real-world data traces (.e., Boston Bombing, Pars Shooting and College Football) show that the SSTD scheme s scalable and outperforms the state-of-the- art truth discovery methods n terms of both effectiveness and efficiency.

Paper Title: **PSO Optimized Nearest Neighbor Algorithm**

Abstract:Data mining can be considered to be an important aspects of information industry. Data mining has found a wide applicability in almost every field which deals with data. Out of the various techniques employed for data mining, Classification is a very commonly used tool for knowledge discovery. Various alternatives methods are available which can be used to create a classification model, out of which the most common and apprehensible one is KNN. In spite of KNN having a number of shortcomings and limitations in it, these can be overcome by with the help of alterations which can be made to the basic KNN algorithm. Due to its wide applicability, kNN has been the focus of extensive research and as a result, many alternatives have been performed with wide range of success in performance improvement. A major hardship being faced by the data mining applications is the large number of dimensions which render most of the data mining algorithms inefficient. The problem can be solved to some extent by using dimensionality reduction methods like PCA. Further improvements in the efficiency of the classification based mining algorithms can be achieved by using optimization methods. Meta-heuristic algorithms inspired by natural phenomenon like particle swarm optimization can be used very effectively for the purpose.

Keyword: Classification, Data mining, kNN, Particle Swarm Optimization, Principal Component Analysis.

Paper Title: **Perception of Fresh Graduates towards Job Portal Sites**

Abstract:Job portal sites are one of the effective technologies that deal with employment or careers in today’s world. Job portal sites offers vast number of job opportunities. This study aims to determine the factors that influence the perception of fresh graduates towards job portal sites. From this study we are able to find out why fresh graduates prefer sing job portal sites. Job portal sites helps people to find employment. Data was collected by mailing questionnaire to 233 fresh graduates in Kerala. The questionnaire was built by incorporating various variables like Productivity, User friendliness, Efficiency, Convenience, Quick response, Corporate preference, Information provision, Security, Privacy, Service quality, Extended services and Career opportunities from previous researches. The questionnaire consisted of 27 questions of which 23 were on a 5 point Likert scale. Factor analysis was used for analyzing the data. The results obtained shows factors such as efficiency, productivity, user friendliness, extended services and information provision influence the perception of fresh graduates. The study is not restricted to just one or two job portal sites, it is generalized and therefore the results are more reliable. The findings of the study also showed that most of the fresh graduates prefer Naukri.com to apply for jobs and also that most prefer using free services. We are also able to identify a problem in using job portal sites viz the job seekers often receive spam mails. The results from the paper can be used by job portal sites to improve their services. The paper provides the various factors that can be incorporated in the job portal sites to improve their services.

Paper Title: **Using Feature Extraction and Classification Methods of Movie Opinions Predication**

Abstract:Film rankings and analysis at sites like IMDb (Internet Movie Database) square measure ordinarily employed by picture show goers to make your mind up that movie to look at or obtain next. Currently, picture show goers base their choices on that movie to look at by staring at the ratings of films in addition as reading a number of the reviews at IMDB. Sentiment analysis could be a different field of different opinion where the methods of analysis are targeted on feature extraction and selection technique of emotions and opinions of the individual's audience towards selected methods from semi-structured, structured or unstructured matter information. This paper, we focus on our techniques of sentimental analysis on IMDB picture show review information. To survey the sentimental words method to classify the polarity of the picture show review on a scale of highly dislikes highly liking and performing different extraction feature and positioning of reviews. It uses these options to train our multilable classifier to classify the picture show review into its correctable.

Paper Title: **Creation of Methods for Automated Determination of Forest ParametersBased on Data from UAVS**

Abstract:The article presents a scientific study on the use of aerial photographs obtained by unmanned aerial vehicle (UAV), for the automated collection of data on forest resources in the taiga forests of the European North of Russia.

On the example of the trial plot, a technique is described for automated allocation of crown contours, calculation of the trunk diameter and timber stock in the forest area. The methodology used morphological methods for processing digital images, geographic information tools for representing and processing spatial information, as well as the results of statistical observations of leading scientists in the field of forestry.

The results have been verified in the field in several plots. The technique is applicable to automate the process of thematic interpretation of orthorectified aerial photographs with a spatial resolution of five to ten centimeters per pixel. The experiments presented in the article were carried out on images of forests in the north of the European part of Russia. The research results are used for regular automated updating of information on forest resources.

Keyword:digital image processing, aerial photographs, satellite images, UAVs, forest area, updating of information.

Paper Title: **Responses of Groundwater Lowering Systems: Empirical Equations Via Field Records**

Abstract:This study aims to evaluate the accuracy of analytical equations which are mostly used in the design of dewatering systems using deepwells. This is accomplished by analyzing the data obtained from dewatering systems executed in twenty different sites within the Egyptian Nile Valley and Delta. The studied cases included gravity flow (unconfined aquifer), artesian flow (confined aquifer) and mixed flow (semi-confined aquifer) cases. For each of the considered sites, the actual discharge from pumping drilled wells and the actual drawdown of the groundwater table were measured. Besides, a pumping test was performed at each of these sites. The field data was then analyzed by adopting the empirical analytical equations to assess the responses of groundwater to the implemented lowering systems. The obtained results showed that the actual monitored drawdown values were not in good agreement with the analytical results. Therefore, practical correlation factors, based on data from the investigated sites and a comprehensive parametric study, were derived to enhance the results of the analytical equations.

Hence, by implementing such cumulative drawdown correlation factors in the empirical equations, a more accurate assessment of the expected drawdown values can be attained. For aquifers within the Nile valley and Delta, average cumulative drawdown correlation factors of 0.7, 0.65 and 0.8 were found to be satisfactory for unconfined aquifers, confined aquifers, and semi-confined aquifers, respectively.

Keyword: Dewatering systems, groundwater flow, aquifers, analytical equations, pumping test, in-situ monitoring.

Paper Title: **Emission from Compression Ignition Engine using Biogas Blends with Diesel as a Fuel**

Abstract:A study on performance and emission of compression ignition (CI) engine has been made by utilizing biogas blends at different loads. The flow rate of biogas with air was important parameter to get the desired results. The blend of 30% with diesel was optimum which yielded optimum emission characteristics. Higher specific fuel consumption and lower brake thermal efficiency was observed when the proportion of biogas mixes with diesel in comparison with neat diesel. The out coming results from the experimental investigation exhibited reduction in NOx emission and smoke opacity. The other emissions hydrocarbon (HC) and carbon monoxide (CO) has been higher than diesel. The use of biogas as an alternative fuel in correct proportion with diesel can meet the energy demand on scarcity of conventional fuel.

Keyword:CI engine, CO, , Emission, HC, NOx.

Paper Title: **Characterisation of Shoe Soling Material Prepared by using Rubber and Leather Solid Waste**

Abstract:The ultimate aim of this research is to develop footwear soling materials from solid waste generated from leather industry. The Chrome shaving from the leather sector is used as a solid waste in this study. Styrene butadiene, Nitryl, Ethylene propylene monomer (EPDM) and Isoprene elastomers were used for this research. The rubber and chrome shavings mixes were prepared by using industrial two roll mill. Various propositions of rubbers, chrome shavings and nano fillers were characterised in this research. The developed soling materials were tested for physical testing like hardness, abrasion resistance, tensile strength, density and elongation at break and compared with compared with commercially available soling material. In this research four different experiments has been conducted among the four experiments the soling material prepared using a isoprene rubber-70 Phr and EPDM rubber -30Phr with chrome shavings -50 Phr and KLN(Silica based) nano fillers- 7 Phr meets the required parameters of commercial soling material. Hence, it is concluded that chrome shaving wastes from tannery in soling material preparation is one of the best remedy for the environmental issues.

	Paper Title:	**Micro Clustering Methodology for Document Objects using Deep Learning Techniques**

Abstract:Large data clustering and classification is a very challenging task in data mining. Various machine learning and deep learning systems have been proposed by many researchers on a different dataset. Data volume, data size and structure of data may affect the time complexity of the system. This paper described a new document object classification approach using deep learning (DL) and proposed a recurrent neural network (RNN) for classification with a micro-clustering approach.TF-IDF and a density-based approach are used to store the best features. The plane work used supervised learning method and it extracts features set called as BK of the desired classes. once the training part completed then proceeds to figure out the particular test instances with the help of the planned classification algorithm. Recurrent Neural Network categorized the particular test object according to their weights. The system can able to work on heterogeneous data set and generate the micro-clusters according to classified results. The system also carried out experimental analysis with classical machine learning algorithms. The proposed algorithm shows higher accuracy than the existing density-based approach on different data sets.

Keyword: Document Classification, NLP, Deep Learning, RNN, Micro Clustering.

Paper Title: **Artificial Intelligence Based A* Optimization Routing in Mobile Ad Hoc Networks**

Abstract:A Mobile Ad Hoc Network (MANET) is a hotchpotch of nodes with mobility feature, the established network utilization is dynamically outlined based on temporary architecture. In MANETs, the challenging and vital role is played by the routing protocols performance factors under different condition and environments. The routing protocols are liable to handle many nodes with limited resources. There exits many routing protocols in MANETs, one of the main key note that has to be considered in designing a routing protocol is to observe that the designed routing protocol is having an proportionate effect on network performance. The existence of obstacles may lead to many geographical routing problems like excess consumption of power and congestion of data. The aim of this paper is to take the assistance of A* algorithm that finds the walk-able path avoiding the concave obstacle in the path relaying on the gaming-theory model[29]. This algorithm decreases the delays in packet transmission and in turn increases the success rate of transmission. We take into consideration path length, penalty for node availability as probability of forwarding criteria and processes effective packet transmission. The simulated results analyse the performance of our protocol over other conventional algorithms based on congestion cost, path length, node availability penalty, delay, packet loss, throughput.

Keyword:MANETS, A*, Penalty of Node Availability, Path Length, Heuristic.

Paper Title: **Design of Self Controllable Voltage Level Circuit (SVL) for Low Power and High Speed 12t Sram at 15nm Technology**

Abstract:Due to trend of decreasing the device Size and increase in the chip density, the complexity in design increased and it became very complex. The main factor which is main concern in this step is Power dissipation. This can be occurring in many forms like Dynamic, subthreshold leakage and Gate leakage. For every situation the designer has to try to reduce this Power Dissipation factor. In this paper we designed a low power 12T SRAM by using the 15nm technology. SRAMs have large number of applications in high speed registers, microprocessors, small memory banks, general computing applications etc. Therefore delay, power, speed, leakage current and stability are the main concerns. These parameters are in trade off to each other. This paper focuses on the leakage current, power and stability in 12T SRAM bit -cell. We introduce a circuit "self - controllable Voltage Level (SVL)" circuit. The main task of this circuit is to reduce the stand-by leakage power of 12T SRAM. In our Work, We are using the Cadence Virtuoso simulation tool for simulating our circuit. After Comparing our results to the previous methods used for reducing the power leakage we found that there is reduction in average power compare to the previous methods used for power reduction techniques.

Keyword:SRAM, SVL 15nm,Cadence, 12TSRAM, Leakage current, Static Noise Margin(SNM).

Paper Title: **Experimental Behaviour of Tensile Properties of Aa2014-T6 Aluminium Alloy using FSW and Gtaw Process**

	Abstract:In the bringout research work carried out the comparative study of weld characteristics of Aluminium Alloy AA2014-T6 weldments, joined by employing two processes namely Friction Stir Welding (FSW) and Gas Tungsten Arc Welding (GTAW). FSW was performed with three different geometrical tool pin profiles like triangular, square, pentagon with process variables like tool rotational speed of 1400rpm, traverse speed of 86mm/min and tool tilt angle 3º. GTAW process was carried out by using constant current welding (CCW) and pulse current welding (PCW) at a frequencies of 2Hz and 4Hz respectively. This work lead to study the Ultimate Tensile Strength (UTS), 0.2%Yield Strength (YS) and % Elongation (%El) of AA2014-T6 weldments produced by FSW and GTAW. **Keyword:**Aluminium Alloy 2014-T6, FSW, GTAW, UTS, 0.2 % YS, % El. **References:** 1. 	Paper Title:	**Impact of Retention of Slump on Growth of Ready Mixed Concrete**
	Abstract:In these days the Ready Mixed Concrete (RMC) plants were giving a back bone support for construction and concrete industries. As the infrastructure increases, concrete demand also increasing proportionately due to huge benefits of concrete, consequently, number of ready mixed concrete plants were also increase proportionately to supply the concrete according to the demand. Those who are fed up with the site mixing and environmental problem associated with them, they are opting for RMC. The growth of RMC is increasing from metropolitan cities to villages. One of the key factors for the growth of RMC is retention of slump till reach the construction site by using super plasticizer. In the present study, the growth of RMC industry from 1990's in India was presented. An experimental study was done on Slump retention capacity of concrete with fly ash, GGBS and lime Stone powder with 0.4% of admixture dosage. **Keyword:**Growth of RMC, slump retention capacity, Super plasticizer, Ready mix concrete **References:** 1. 	Paper Title:	**Hybrid Regenerative System on Power Electronic Transformer for Electric Traction Applications**
	Abstract:Regenerative braking has been playing a significant role in electric locomotives to overcome dissipation of the kinetic energy as heat. For high-speed rail topologies, Power electronic transformer based locomotive has the only solution to achieve it. For the isolation purpose and to reduce the weight of the locomotive, a feasible method by substituting loco transformer with a transformer with high frequency design. With the increasing awareness of energy consumption more electrified locomotives now moving to "Green	**1575-1581**

Energy ". This paper aims to describe the importance of hybrid electric locomotive system when compared to conventional one. By integrating the regenerative braking on power electronic transformer with a storage medium will be a promising solution for the future high-speed rails. The simulation of IGBT based dc to dc converter with traction inverter with storage medium has simulated from MATLAB/ SIMULINK platform.

Paper Title: **Structure and Thermal Behaviour of BSCF-SDC-Ag Composite Cathode for Solid Oxide Fuel Cell**

Abstract:Solid oxide fuel cell (SOFC) component has always under development to enhance catalytic activity. Components such as anode, cathode and electrolyte must have better structure and behavior for good SOFC performance. Traditional $Ba_{0.5}Sr_{0.5}Co_{0.8}Fe_{0.2}O_{3-\delta}$ (BSCF) cathode in solid oxide fuel cell application has been deterred several inappropriate circumstances such as high thermal expansion coefficient (TEC) and chemical instability. $Sm_{0.2}Ce_{0.8}O_{1.9}$ (SDC) electrolyte and Silver (Ag) are added into BSCF to overcome the problem and has better material characterization and thermal stability, The composite cathode powder BSCF-SDC was prepared by high speed ball milling technique with mixture of 50wt% BSCF and 50wt% SDC commercial powder. The powders were then dried and calcined at 950^{o}C for 2 hour. Silver (Ag) with 1wt%, 3wt% and 5wt% were milled respectively with BSCF-SDC by low speed ball milling technique. The developed composite cathode was then examined by X-ray powder diffraction (XRD), Fourier transform infrared spectroscopy (FTIR), dilatometer and Thermogravimetric Analysis (TGA). The vivid distinct phase of BSCF, SDC and Ag and absence of additional secondary phase was confirmed by XRD analysis indicating good phase structure compatibility. This also assured that less chemical reaction was happened during low speed milling process for BSCF-SDC-Ag as minor secondary phases are detected. However, milling process at high speed and high calcination temperature did destruct single phase of BSCF in BSCF-SDC composite cathode. However, Ag obtains its role to retain back the BSCF crystalline phase. The higher the percent of Ag added, the higher the BSCF peak retain. The absence of addition bonding in FTIR analysis demonstrating excellent structure compatibility of BSCF, SDC and Ag during milling process. There was no significant additional bonding

1582-1585

appeared in BSCF-SDC-Ag after milling process. The thermal expansion coefficient (TEC) were determined using dilatometer, manifesting closer TEC mismatch between BSCF-SDC-Ag cathode composite and SDC electrolyte compared to BSCF-SDC. TEC is essential to be matched as it could prevent spallation during elevated operation temperature of SOFC. TGA analysis indicated cathode composite experiencing very less changes of weight when it was heated up 1000^{o}C. BSCF is revealed of decomposition occurring after 800^{o}C. Result revealed that Ag exhibited desirable thermal and structure compatibility with BSCF-SDC as promising SOFC cathode which beneficial from medium scale automobile to high scale power plant application.

Paper Title:	**Frequency Scaling Based Power Efficient Current Source Design on FPGA**	

Abstract:Power deficiency is one of the major problems that the whole world is facing now. This is happening because of the immense increase in the world's population and the global increase of industrialization. So in order to minimize the consumption of power, an energy efficient current source is designed with the help of Field Programmable Gate Array (FPGA). This work gives light on how the power variation takes place in a current source with an increase in frequency value. In this research work, the current source is implemented on 28 nanometers (nm) Airtx-7 FPGA. The work is demonstrated on Xilinx 14.1 ISE simulator. VHSIC Hardware Description Language (VHDL) is used for writing the code of current source. The frequency of current source with Airtx-7 FPGA is increased from 100MHz to 5GHz. It is analyzed that the total power consumption is less as the value of frequency is low. So it is always advisable to operate the device at a lower frequency range in order to save more energy.

	Paper Title:	**Experimental Simulation of Solar Aqua Lens Concentrator**

Abstract:The lens was built from readily available materials in the market. The liquid used in lenses were tap water, 30% sugar solution in the hyper elastic low density polyethylene foil. The experimental set up was exposed to sunlight. The focal length point and light intensities were measured at that focal point spot, concentration ratio at each focal point was calculated. The concentration ratio is inversely proportional to focal point. The experimental data was tabulated. The theoretical lens radius of curvature and deformation of lens was validated by ANSYS finite Element Modeling (FEM).The lens deformation of hyper elastic foil was also compare with AUTO CAD. Solar aqua concentrator can be used where high focusing thermal application is required.

	Paper Title:	**An Equilateral Arm Inverted U-Slot and Notch Loaded UWB-CPMA with Rendered Ground Plane**

Abstract:In this paper, a microstrip fed modified circular patch monopole antenna (CPMA) with the rendered ground surface is presented for bandwidth enhancement. In order to extend the bandwidth of a demonstrated antenna, symmetrical slots and equilateral arms inverted U-slot are loaded on the partial ground and patch individually. For additional enhancement in the secured bandwidth, symmetrical notches are truncated from the bottom of the patch. The antenna has a dimension of 30x40x1.6 mm3, which is erected on low cost, FR-4 substrate with relative permittivity ϵ_r=4.4, permeability μ=1 and loss tangent of tanδ=0.02. The proposed design is analyzed and simulated using high frequency structure simulator (HFSS). The analyzed results are validated through experimented results. The proposed antenna offers a bandwidth of 140.2 % with a maximum radiation efficiency of 94 % over the frequency scope of 2.54 GHz to 14.47 GHz. The cross-polarization levels are also found to be 20-30 dB and 12-23 dB smaller than the co-polarized level for E-plane and H-plane respectively. For better execution and assessment of proposed antenna, a parametric study has been done to analyze the performance of antenna with variations in the length of a partial ground conductor beside the other parameters. The exhibited antenna is suitable for various applications incorporating WiMAX, WLAN, UWB, C-band, X-band and UWB.

	Paper Title:	**Temperature Capstone and Humidity Monitoring using Iot with Machine Learning Algorithm**

Abstract:Controlling temperature of a controlled environment is an important aspect of any workspace whether it is a commercial space or a domestic space. If temperature or humidity is either increased or decreased of any area, it becomes very difficult to be there and thus if possible, should be kept in comfortable conditions at all times. One way to do it is to monitor and control the temperature of the closed surroundings using the concepts of Machine Learning and IoT. This research's purpose is the same to find an easy and an inexpensive way to

1601-1604

find an alternative to it which is based on microcontroller, a Wi-Fi Module, Buzzer, few Temperature sensors and a Solderless board. The system is designed in such a way that the temperature can be monitored whether it is in the given range of temperature as prescribed by the user. We are also enabling to predict the temperature which will predict the temperature according to the temperature graph being made as by the input taken by the Temperature Sensors using Polynomial Regression Algorithm. Also, if the temperature of the enclosed area is not in the threshold range as suggested by the user, the System will automatically send a notification to user(s) via SMS, E-Mail or even through a Telegram Channel .

Paper Title: **A Fuzzy AHP Methodology to Analysis the Impact of Employee Motivation in Manufacturing Industry**

Abstract:In this competitive era where employee's performance and productivity decides his or her value, motivated employees stands on the top priority of every organization. This is because a motivated employee not only adds revenue to its organization but also helps in creating brand value as only a motivated employee can generate customer satisfaction leading to customer brand loyalty. In a developing country like ours Manufacturing sectors play a very important role in the economy of the country. Through its modern implements manufacturing sectors brought great changes in the traits of agriculture which helped the agricultural sector in modernizing itself by introducing various manufacturing tools. A motivated employee through his or her performance and productivity help the manufacturing sector lowering its cost of units produced which directly benefits the society as the product will be available to them in better quality and at cheaper rate. Thus, the performance of the employees in the manufacturing sector directly or indirectly influence the pricing policy of any product. Hence a motivated employee is way more necessary not only for the benefit of organization but for our economy and the society as whole.

Paper Title: **Java Script Data Transformation Library using Fork Join Pool and Web Workers Technology**

Abstract:Transforming large amounts of data takes a lot of processing time so that the optimization technique is required. One way that can be used to perform optimization is multithreading. Nowadays, processor is proliferating. The average processor in community is multi-core processor that can do parallel processing. Prior to the emergence of Web Workers, JavaScript is a poor programming language for parallel programming. The emergence of Web Workers allows JavaScript to do a better job in parallel programming. Fork Join Pool is a method that implements the Divide and Conquers algorithm, so it is suitable for the use in multithreading. This data transformation library was created by implementing the ForkJoinPool method using Web Workers technology in JavaScript. This program is written in JavaScript and HTML language. Based on results of testing phase that has been done, it is proven that ForkJoinPool method can be implemented using Web Workers technology in JavaScript as a data transformation library. In addition, it can be concluded that the data transformation library usage affects the speed of data transformation which depends on the data transformation complexity. The higher the complexity of data transformation performed, the effectiveness in the use of data transformation libraries will increase.

Paper Title: **Email Thread Identification and Management**

Abstract:Nowadays, Email communication is use as primary communication tool in the business domain as well as in education sector. Due to massive incoming emails, overflowing inbox is one of the problems faced by email users. There are several reasons for such a situation, one of them being the unnecessary mass of thread emails. They are retained in inbox even when they are not necessary. Even if this email is deleted from inbox, the next message as thread email will hit your inbox. Wrong use of 'reply-all' tab adds to this situation called "Email storm". Thread emails are often generated because of users' careless habit to click on 'Replyall' button. It is almost like a reflex action on their part. This work intends to solve the problem of email storm on two fronts :

- Identification of thread emails
- Automatically controlling thread email

The three datasets Din, Dadm and Dexam from academic domain are used as training data. The experimental outcome shows that 'In-Reply-To', 'References' and additionally 'thread-index' are the dominant features in identifying thread emails. We have used these features to derive thread classification strategy. The developed algorithm is used to test four datasets Dcor, DCS, DF1 and DF2. Using this method accuracy upto 99.91% is achieved. Further, the paper also suggests access control rights strategy to control email storm. The model is proposed for controlling thread emails in education domain. The control mechanism will help system administrators to control email traffic.

Keyword: Email classification, thread, Reply email, access control, email storm

Paper Title: **Traffic Creation for E-Wallet through Gamification Strategy**

Abstract:Electronic Wallet vendors are the financial service providers to the customers using software known as an 'App'. Many customers feel more comfortable with cash free transaction as they always have a fear of insecurity to carry huge money, however every time the customer try to make purchases, they have to login, either by net banking or cards in order to complete the overall transaction. Many Electronic Wallet vendors expect huge traffic, frequent usage and customer loyalty towards their app. The gamification is emerging in e-commerce and the banks are looking for new ways to get more customers on their websites. In order to fulfill their expectation, Electronic Wallet vendors merge with ecommerce and design their app integrating gamification concept in such a way that the customers often transact and get satisfied with this application and it will reduce such huge process of net banking and make the customer to get engaged on their app. Therefore, it is important to study what are the most appreciated features of the website that could influence the behavior of the customer to use an electronic banking system with gaming features. Gaming techniques in Electronic Wallet app emerged as a dominant strategy in the digital payment space. E-commerce players and Electronic Wallet vendors have to make easy guidance, incentivize, and personalized experiences to the customers in order to

achieve maximum conversions.

Keyword:e-commerce, e-Wallet, Mobile banking, Gamification.

Paper Title: **Identification of a New Industrial Area Based on a Macro-Level Analysis – a Case of Bokaro District, Jharkhand, India**

Abstract:Locating a new industrial area involves a strategic decision that covers several criteria with consideration for socio-economic benefits and environmental sustainability alongwith technical, and political issues. These different criteria are described using a number of indicators in terms of quantity and quality with some possible uncertainty. Decision making thus requires appropriate tools for data collection, analysis and knowledge management to address this multidisciplinary situation. This paper tries to find out the comprehensive method for industrial site location, a sustainable approach for finding the most suitable solution. Identifying the location determinants and site suitability models used for allocating an industrial site is observed to be an essential aspect of siting of industry, as such; level of decision making is dependent on predefined constraints. Multicriteria decision making method (M.C.D.M) seems to be a consistent and efficient solution which forms the basis for locating multiple sites for industrial activity in any delineated area.

Paper Title: **Security Framework for Cloud Computing using Fragmentation and Homomorphic Encryption**

Abstract:An invention of cloud computing technology comes with numerous benefits for IT industries and others. The data store in the cloud can be easily shared among stakeholders irrespective of their location, i.e. data availability is very good. Nowadays organizations are switching to cloud platform for storing and sharing data in a decentralized manner. This is significantly reduces the economically burden to the organization. As the data are accessible through network, so major concern is to maintain the data confidentiality. Data breach in any form organization losses their trustworthy, and this affect the reputation of the organization. This is very important to maintain the privacy and security of data all the time. There are so many works has been proposed by many researchers to secure data in the cloud by using various encryption techniques. In this paper, we proposed a security mechanism to maintain confidentiality of data. This method is combination of multiplicative homomorphic encryption algorithms along with vertical fragmentation of data. We have tested our scheme based on crypto delays, communication delays, and query processing delays with an existing work. The results

1633-1638

obtained show that our method out-perform the existing work. The results obtained show improvement with the proposed method.

	Paper Title:	**Temperature Distribution on Sticky Non Compressible Fluid Flow using DHPM Technology**

Abstract: This paper deals with the analysis of temperature distribution on sticky non compressible fluid flow by utilizing DHPM (Differential Homotopy Perturbation Method) for stretched and uniform heat flux. This technique is developed for solving many distributed and temperature velocities. The exact solution for temperature distribution is compared by the final scattering medium final result to get the accurate results. This technique gives approximately 80% accuracy results compared to exact results.

Keyword: Kinematic viscosity, Similarity transforms series solution, variation iterative method, and prandtl number.

Paper Title: **Proximate and Ultimate Charaterization of Coal Samples from Southwestern Part of Ethiopia.**

Abstract:This study aimed to characterize the coal in terms of proximate and ultimate analyses. The analytical assessment of properties such as volatile matter, moisture, fixed carbon, and ash content are very important to know the quality of the coal. The proximate analysis results shows that the moisture content varies from 13.4 to 22.6 wt%, the fixed carbon varies from 26.7 and 38 wt%, the ash content varies from 11.9 to 25.7 wt%, the volatile matter varies from 23.8 to 36.5iwt%. The analytical results show that the Carbon content varies from 48.60 to 70.68 wt%, Oxygen content varies from 42.29 to 57.38 wt%, the hydrogen content ranges from 4.43 to 5.28 wt%, the sulphur varies from 1.35 toi3.04 wt%, the Nitrogen content varies from 1.86 to 2.34 wt%. Proximate analysis and calorific data show that Ethiopian coal is in the soft coal series (lignite to bituminous coal) and is genetically classified as humic, sapropelic and mixed coal. The present study helps to characterize the coal type and also highlights the importance of chemical parameters in characterizing the coal besides, tracing the depositional environment and also helps to the economical evolutions of the deposit.

Paper Title: **TSD-CPI: Traffic Sign Detection Technique Based on Centroid Position Identification in Text Mining**

Abstract:Detecting and Identifying traffic sign is a complicated issue due to the changing variability in cloud conditions. Hence, it is necessary to identify and detect of traffic signs during journey. The traffic text sign identification fails due to noise, blur, distortion and occlusion. In order to identify the text, a technique should be adapted that recognizes the text with improved accuracy. In existing algorithms such as Histogram of Oriented

1649-1653

Gradients (HOG) and Support Vector Machine (SVM) were not detecting the Centroid position. In this paper, the text Centroid of position sign is detected using text color, font and size. During journey, if the text is blurred, this Traffic Sign Detection Technique based on Centroid Position Identification (TSD-CPI) K-means algorithm for clustering is possible to use. As a result, it detects the text that with improved accuracy. Ultimately, it reduces the processing time. The experimental result reveals that using WEKA-3.8 with the proposed technique shows improvement over the existing algorithms in terms of precision and Recall which enhance the accuracy in text mining.

Keyword: Histogram, Gradients, Support Vector Machine, Centroid and K-Means.

Paper Title: **Readiness of Polytechnic Manufacturing Program in Malaysia towards Future Industry**

Abstract:Polytechnic education was introduced in Malaysia with funding from the World Bank in 1969. The purpose is to be one of Malaysia's education provider to access quality in produce holistic, enterprising and competitive human capital in line with global industrial needs. Currently, there are 37 polytechnics in they that offered quality programs with relevant curriculum. One of the programs is Diploma in Mechanical Engineering (Manufacturing) is competent skills in the field of mechanical engineering to fulfill the demand of workers in the engineering manufacturing sector. For remain competitive especially in terms of future technology advancement, this program needs to be revised so that the students who are produced can meet the requirements of the future industry specially to face the challenging in Industrial Revolution 4.0(IR4.0). To get the clear situation, the qualitative study had been conducting with the interview method to identify how far the adequate of polytechnic manufacturing program towards IR4.0 regarding the readiness of student competency, the effect of the changes and actions taken by polytechnics management. From the findings, it shown that the manufacturing programs in Polytechnic Malaysia need to arrange the strategy to make sure the student or the graduates that they develop can fulfil IR4.0 skills and competencies related.

Paper Title: **Methods and Tools for Designing a Multi-Service Platform for Agricultural Enterprises**

Abstract:The paper dwells on the problems of developing an internet platform for support of decision-making and production management for an agricultural enterprise. The described system is an open environment which is capable of integrating third-party services with the application-programming interface (API), each service being an autonomous software component (agent) with its own criteria and target. Thus, planning is done through continuous interaction of agents within the multi-service platform, using the knowledge base for storing various data on crops, such as conditions of crop growing, characteristics and peculiarities of crop production, pests, plant diseases, soil types and their specific features, technological processes (maps) for crop growing, application of fertilizers and plant protection products, crop production economy, classes of agricultural machines and equipment. Thus, the result of scheduling is the work plan for a given time horizon. On top of that, the paper describes the first prototypes of smart services and their interaction, as well as the next steps for future research.

Keyword:precision agriculture, agricultural management, decision-making support, multi-agent coordination, multi-service platform, ontology.

Paper Title: **Enhanced BGMM Based Lightweight Key Generation and Authentication Method for WBAN**

Abstract:Wireless Body Area Network (WBAN) is one of the best modern inventions that supports medical science significantly. Reliability, Latency, Security and Power consumption are the vital parameters to determine the quality of a WBAN architecture. Security Key Generation and Authentication are the important tasks which impact the vital parameters. A Body Gauss-Markov Mobility model (BGMM) based lightweight key generation and authentication method is introduced in this work to improve the quality of WBAN. Enhanced BGMM, Legacy Key Generator and Idle State Key Manager are the three functional blocks used to construct the proposed system. These new function blocks are introduced in this work to achieve higher throughput, packet delivery ratio and security. The proposed work is also indented to reduce the communication delays and power

1668-1677

consumption. Adopting new body sensor nodes and discarding unused or damaged nodes from existing network without affecting other operating nodes is the requirements of modern WBAN as well. The proposed method named as “Enhanced BGMM based Lightweight Key Generation and Authentication method for WBAN” (EBLKGAW) is deigned to manage the network stability during adaptation of new nodes and elimination of existing nodes.

Paper Title:	**Enhanced Gesture Recognition Text to Speech Browser for Visually Challenged**

Abstract:Web has understood an astonishing change in human access to learning and information. The need of plotting an upgraded program for the ostensibly tried. The present structure helps the apparently tried people to use the information in the web satisfactorily, by changing over the substance in the site page to voice for their better use. The customer can look through the substance and indispensable information from the web by simply composing the URL. The site page substances are removed by JSOUP HTML parser. The isolated substance will be scrutinized out by Text to Speech (TTS) engine. The weights in this system are the apparently tried need to type URL the required in the change box, there are no contrasting options to control TTS and there are no decisions for investigating through site pages. The proposed structure is to arrange talk affirmation engine.

	Paper Title:	**Optimal Placement of Distributed Generation Units in Radial Distribution System using Hybrid Techniques**

Abstract:Reconfiguration is a process that supports to eliminate the power loss from a distribution network and this process have the capability to reduce the losses up to a specific point. Additionally, loss minimization may be calculated through the presentation of Distributed Generation (DG) units. Conversely, the incorporation of DG into the distribution network at an improper position may cause higher in losses and fluctuations in voltage. In the meantime, the uncertainty in voltage may produce partial power failure in the system. For that reason, it is essential to deliberate the stability boundaries in DGs position and sizing in the Radial Distribution System (RDS). In this research paper, hybrid Binary Particle Swarm Optimization (BPSO) with Flower Pollination Algorithm (FPA) is proposed for the ideal reconfiguration process and placing the DG in the 69-bus RDS. BPSO is applied to identify the best DG reconfiguration and FPA is proposed to determine the optimal DG size. This technique narrowly changes the DG location in every load bus of the network that delivers the minimum value of the objective function, which is considered as the finest candidate for DG connection. The simulation outcomes indicate the proposed method is more effective in reducing the power loss from 224.9804 to 27.2183 KW with the reduction of 88.8972% when compared to existing algorithm.

Keyword: Binary Particle Swarm Optimization (BPSO), Distributed Generation (DG), Flower Pollination Algorithm (FPA), Radial Distribution System (RDS), Reconfiguration.

Paper Title: **Robust Frequency Control of an Islanded AC Micro Grid using BDA Optimized 3DOF Controller under Plug in Electric Vehicle**

Abstract:The article presents the effectiveness of a Binary Dragonfly Algorithm (BDA) based 3-DOF controller for robust frequency control in an islanded AC micro-grid system under different uncertainties. A micro-grid is incorporated with the integration of various renewable energy based distributed generations (DG). The proposed micro-grid system is structured with wind turbine generator (WTG), Photo voltaic (PV) system, Diesel engine generator (DEG), Micro-turbines (MT), Aqua electrolyzer based Fuel Cells(FC) and with few energy storage devices i.e Battery energy storage (BES) and Flywheel energy storage (FES). Moreover a chargeable plug in electric vehicle is effected as load side demand while obtaining frequency control mechanism in micro-grid system. However large dynamics, low inertia and incurred uncertainties of most DG system affects system performance especially on system frequency seriously. In view of this to obtain robust control mechanism in islanded micro-grid system the article proposes a novel Binary Dragonfly Algorithm based 3-DOF controller to ensure servicing of good quality power to remote consumers. The performances of proposed BDA optimized 3-DOF controller is compared with conventional PSO, GA technique based PID and PI controller in order to justify supremacy of proposed approaches. Finally it has been suggested that the proposed BDA optimized 3-DOF controller is more effectiveness over other optimized controllers.

Keyword: Micro-grid; Binary Dragonfly Algorithm (BDA); Diesel engine generator (DEG); Micro-turbines (MT); 3-DOF Controller; Plug in Electric Vehicle (EV)

Paper Title: **Challenges Blockchain Technology and Initial Coin Offering (ICO) in Healthcare from Legal Perspectives**

Abstract:This paper reviews the empirical literature on Initial Coin Offering (ICO), blockchain technology and impact for healthcare based on legal perspectives. The rise of blockchain technology has given impact especially

1698-1706

on financial sector and business, there are very limited research been done about the implications of this technology in healthcare sector. Based from the literature it shows that it is still scarce about blockchain and initial coin offerings in healthcare industry. The scope of this article is twofold which is i) to understand the impact of blockchain technology and initial coin offering in healthcare industry; and 2) to understand the legal challenges especially in initial coin offerings. The revolution of blockchain technology will provide more positive impact in healthcare sector and can be used as new strategic directions for future research.

Keyword: Initial Coin Offering (ICO), Blockchain technology, Healthcare management system, legal, digital tokens, digital coins.

Paper Title: **Cross Coupled Differential High Speed Comparator**

Abstract:Power efficiency and high speed comparator is presented. ,n-MOS transistors are used to design preamplifier stage and the latch stage. Both stages are controlled by a special clock circuit. By using clock circuit we can achieve enough pre-amplification gain. At the evaluation phase, the latch is activated with a delay to obtain sufficient pre-amplification gain and avoid extra power consumption. At this phase transistors are cross coupled to increase the preamplifier gain and to lower the input voltage common mode of the latch is used to strongly activate the n-MOS transistors (on the latch input) and reduce the delay. This circuit is designed with n-MOS transistors due to its inherent superiority over the p-MOS transistor. The proposed cross coupled comparator reduces the power and delay compared to conventional CMOS comparators.

Keyword: Comparator,Dynamic,Latch,Conventional, Preamplifier, Evaluation phase, Reset phase, Delay.

Paper Title: **Load-Carrying Capacity of Short Concrete Columns Reinforced with Glass Fiber Reinforced Polymer Bars Under Concentric Axial Load**

Abstract:In this paper, 1 group of plain concrete square columns 150×150×600 mm and 11 groups of concrete columns reinforced with glass fiber reinforced polymer (GFRP) were cast and tested, each group contains of 3 specimens. These experiments investigated effect of the main reinforcement ratio, stirrup spacing and contribution of longitudinal GFRP bars on the load carrying capacity of GFRP reinforced concrete (RC) columns. Based on the experiment results, the relationship between load-capacity and reinforcement ratio and the plot of contribution of longitudinal GFRP bars to load-capacity versus the reinforcement ratio were built and analyzed. By increasing the reinforcement ratio from 0.36% to 3.24%, the average ultimate strain in columns at maximum load increases from 2.64% to 75.6% and the load-carrying capacity of GFRP RC columns increases from 3.4% to 25.7% in comparison with the average values of plain concrete columns. Within the investigated range of reinforcement ratio, the longitudinal GFRP bars contributed about 0.72%-6.71% of the ultimate load-carrying capacity of the GFRP RC columns. Meanwhile, with the same configuration of reinforcement,

1712-1719

contribution of GFRP bars to load-carrying capacity of GFRP RC columns decreases when increasing the concrete strength. The influence of tie spacing on load-carrying capacity of reinforced columns was also taken into consideration. Additionally, experimental results allow us to propose some modifications on the existing formulas to determine the bearing capacity of the GFRP RC column according to the compressive strength of concrete and GFRP bars.

Keyword: Reinforced concrete, Short column, GFRP, Concentric load.

Paper Title: **ILivSpot: Secure Biometric System based on Iris Liveliness Detection**

Abstract:Liveliness detection aims to determine whether the iris presented to the sensor belongs to a live subject or it is a fake one. Liveliness detection is to classify input sample into one of the category between fake and real. This work proposes an improved biometric system which recognizes the liveliness of the iris samples in order to increase the security. In this work, the dataset of UBIRIS.v2 is used where input samples are segmented into pupil, sclera and iris and these individual segments are filtered to enhance the quality of the samples. Further, the segmentation using Fuzzy C-Mean and K-Mean clustering methods is done. Different features are extracted and fused thereafter. Fused features are then used as a training data. For testing purpose, a combined dataset of original and fake samples is used and accuracy of the system is calculated with a novel hybrid classifier AHyBrK which is a combination of ANN and KNN. Results achieve 97% accuracy in differentiating between fake and live which is 8.2% better than KNN and 5.1% better than ANN.

Keyword: Iris, Liveliness, Segmentation, Filters, Fuzzy C-Mean, K-Mean, Features, Fusion, ANN, KNN, AHyBrK Classifier, Hybrid Classification.

Paper Title: **Air Pollution Monitoring System using IoT**

Abstract:Air pollution has a very adverse impact on human beings and our ecosystem. With the rampant industrialization and exponential growth in automobile industry, the air gets highly contaminated by harmful toxins & gases released from their emissions which results into many hazardous diseases like asthma, bronchitis, mental illness, lung cancer etc. Hence the air pollution should be carefully monitored and efficiently controlled. Using internet of things (IoT) we can simultaneously gather pollutants level in highly explicit areas and transmit the data to centralized controlling and monitoring unit where suitable steps can be taken to warn people so as to reduce the level of pollutants in the air significantly.

Paper Title: **Effect of Infill Percentage on Properties of FDM Printed GPLA/PETGs**

Abstract:Additive Manufacturing termed by ASTM standard referred to in short as, the technology of fabricating a model based on creating a three-dimensional Computer-Aided Design structure. In the context of developing a product from digital data directly, widely involved various technologies. Amongst them, one being Fused Deposition Modelling (FDM) which supervises the principle of AM, is widely known for developing a polymer-constructed sturdiest range of materials or parts are having operative mechanical properties. Even though, the main problem exaggerates that, the quality of the output still denies due to which void parts are created from bubbles trapped leading to failure of parts under mechanical stresses. Since with 15% infill, stronger parts are estimated and their mechanical properties are studied. Since the work signifies the influence of 15% infill on mechanical properties in estimating stronger products by layered addition process. The experimental methodology is based on structural infill parameters determining goal in achieving and studying material mechanical properties.

Keyword: Additive Manufacturing; fused deposition modelling; tensile properties; PLA Blend; Infill percentage; 3D Printing.

Paper Title: **Water Monitoring and Automatic Feed in Aquarium Based on Microcontroller**

Abstract:technology needs to be applied to all items that are still not fully automated. But in reality still not all automation tools implement all parts working automatically. As with maintaining fish in an aquarium which is a hobby of urban residents who work manually and routinely, such as feeding fish regularly then monitoring pH, etc., therefore transferring the work of caring for fish and aquariums is important to be done automatically. Using a microcontroller and other sensors combined into an integrated system can automate activities such as raising fish in an aquarium. Automatic activities include monitoring the pH of water and feed supplemented with reports in the form of SMS as information for aquarium owners. By using an automatic water and fish feed monitoring system based on a microcontroller, aquarium owners can find out the pH value of aquarium water even though they know how to calculate it and will feel calm when traveling for a long time because the aquarium has been automated, where the bait will be given automatically according to the schedule and predetermined portion. The formation of tools using the waterfall method commonly used to design technology so that research is expected to know the impact of the formation of this waterfall. Microcontroller results are tested using a black box to measure the original size with the size of the results of the microcontroller. the results show that if this automation is done using the waterfall method and tested using a black box successfully produces automation in the aquarium. .

Keyword: Microcontroller, Aquarium Water pH Measurement, Automatic Feed..

Paper Title: **Settlement Behaviour of Soft Clay Bed Reinforced with Stone Column under Sustained Loading**

Abstract:This research paper investigates the behaviour of soft clay reinforced with stone column under sustained loading. Experiments were conducted in the laboratory on stone column reinforced prepared soft soil bed of kaolin having strength of 7.5 kPa with aggregate of size 2.5 to 10 mm as column material. The stone column with four diameters of 38.1, 50.8, 63.5 and 76.2mm were constructed which correspond to low to high area replacements ratios (i.e. 6.93% - 26.49%). The plain and reinforced soft clay beds were subjected to a sustained load of 150, 200, 250 and 300 kPa where each applied load has been maintained for 24 hours and the settlement behavior of composite ground was taken into account. The test results represent the settlement of reinforced soil bed decreases with increase of column diameters. The settlement reduction ratio is a measure of ground improvement which increases with area replacement ratio. The experimental and theoretical results values were compared as per IS15284 (Part 1): 2003 with reference of stress concentration ratio 'n'(The ratio of stress in the column to the stress of surrounding ground area). The % variation in theoretical and experimental results is in the range of 50% and therefore the theoretical procedure needs to be revised

Keyword:soft clay, stone column, compactive effort, replacement method, settlement reduction ratio

Paper Title: **A Novel Delay Based System for Type1 Diabetes using Xilinx System Generator 14.5**

Abstract:In this paper an enhanced delay based system is proposed with a parallel execution of PID and Pseudo PID controllers using a Xilinx System Generator14.5. This paper presents simulation results on Direct synthesis, IMC and lambda based designs in both PID and Pseudo PID separately and parallel. The control methodology is suited for the people under Type 1 Diabetes Mellitus and it will maintain a glucose insulin homeostasis.

Paper Title: **Two Iterative Methods to Solve Nonlinear Equations of Load Flows**

Abstract:This paper presents the results obtained when two iterative methods are applied to the solution of non-linear equations that model the load flow in electric power systems. Two iterative methods are applied; the first consists of a simplification of the rectangular form the traditional Newton-Raphson method, the second is a

1756-1763

hybrid method and relates the simplified form proposed here and a four-step Newton-type iterative method. The convergence characteristic and the mathematical preliminaries of the iterative four-step method are included in the paper. The methods were used to calculate the voltages at each node of the IEEE test system of 118 nodes and a distribution system of 40 nodes. In each method, the formation of the Jacobian matrix, widely used in traditional forms of load flows, is avoided and only elementary operations are carried out, impacting the execution times for the test systems used, being of the order of 15.6 to 279 milliseconds. The maximum error found is for the 118 node system and is of the order of 3.7%.

Keyword: Iterative methods; load flows; nonlinear equations; power systems; Newton-Raphson.

Paper Title:	**Prediction of Multi Drug Resistant Tuberculosis using Machine Learning Techniques**	

Abstract:Mycobacterium Tuberculosis bacteria is the primary cause for Tuberculosis. TB is one of the main reasons of mortality around the world. Multi Drug Resistant Tuberculosis (MDR-TB) is a type of tuberculosis bacteria which are resistant to anti-TB drugs, drugs like isoniazid (INH) and rifampin (RMP). Different Machine learning approaches has been widely applied to predict MDR TB. Here, we review different Machine Learning Approaches to predict MDR-TB. Different feature estimation methods, execution of distinct machine learning models also have been explored. Additionally, the utilization of the distinctive machine learning system models for distinguishing the dis-functionalities of MDR-TB in the recent decades has been talked about.

Paper Title: **Development of Alternative Electrical Energy Utilizing Thermo Electric Generators (TEG) for Refrigerators**

Abstract:The study aims to harness electrical energy from the wasted heat of refrigerator by using the temperature difference of the hot side surface and cold side surface. The use of Seebeck effect was applied to gather the said electrical energy. The system is composed of a charge controller to regulate the output of the thermoelectric generator as well as provide a direct current type of voltage. The energy that comes from the charge controller is stored thru a backup battery bank and will be used for the charging of the different low voltage devices like cellphones, tablets, etc. The charging time of the batteries going from zero percent charge to 100% charge depends on the output current of the TEG and also dependent on the temperature difference of the refrigerator. A current of 1.5mA coming from the TEG will provide 50mins charging time for the battery. The total mean parameters for the output system are the following: mean voltage = 5.82V, the mean current = 0.8695 mA, and the mean power output = 4.60165mW.

Keyword:alternative form of energy, thermoelectric generator, charge controller, green engineering, batteries

Paper Title: **Traffic Flow Calculation using Big Data**

Abstract: Traffic is one of the primary issues in world. It makes numerous medical issues people on foot and bikers. It is additionally one of the practical setting of a nation. U.S.A. alone squandered almost $160 billion of fuel in year 2014 alone. Mumbai remains at no.1 position in the rundown of most exceedingly awful traffic stream while Delhi taking no.4 position. In this task we use BIGDATA for guaranteeing that the explorers doesn't get struck in the rush hour gridlock. BIGDATA can enable clients to settle on better travel choices, lighten traffic blockage, diminish carbon outflows, and improve traffic activity proficiency. Our goal of traffic stream forecast is to give a superior traffic stream data. Traffic stream forecast has picked up its significance because of fast development in urban areas and increment in rush hour gridlock blockage.

Traffic stream forecast intensely relies upon authentic and ongoing traffic information gathered from different sensor sources, including inductive circles, radars, cameras, portable Global Positioning System, publicly supporting, internet based life, and so on.

In this paper, we propose a profound learning-based traffic stream forecast technique.

Keyword: Deep learning, real time information, traffic stream prediction.

	Paper Title:	**Effect of Different Operating Conditions on Performance of Commercial Low-Temperature Thermoelectric Modules**

Abstract:In the field of waste heat recovery, thermoelectric generators (TEG) are used to convert waste heat to electric power. This system attracts the attention of researchers to make it more and more efficient. The performance of thermoelectric module (TEM) plays a crucial role for thermoelectric system. Appropriate selection of thermoelectric module is one of the important criteria for enhancing the power output and conversion efficiency of thermoelectric generator. In this work, the effect of various operating conditions on performance of thermoelectric modules was experimentally investigated. Three commercial bismuth telluride (Bi2Te3) thermoelectric modules (TEM1, TEM2, and TEM3) were experimentally tested to find the best performance module for low-temperature waste heat. The open-circuit voltage, power output, and conversion efficiency were measured at various operating conditions. Different operating parameters such as water mass flow rate, heater voltage, hot and cold side temperature of thermoelectric module, and external load resistance were considered for this work. An electric heater was used as a heat source and water used as a cooling fluid at heat sink side. It was observed that the TEM1 shows maximum power output of 0.31, 0.71 and 1.25W, for temperature ranges of 80-100, 100-150, and 150-200 oC respectively. TEM3 achieved maximum power output 0.81W for temperature range of 100-150 oC. TEM1, TEM2 and TEM3 have the maximum conversion efficiency of 1.37, 0.60, and 1.64 % respectively. The TEM2 having less power output and conversion efficiency for temperature range of 80-200 oC compare to TEM1 and TEM3. However, the TEM1 is more appropriate for temperature range of 80-200 oC and the TEM3 is also suitable for the temperature range of 80-150 oC.

Keyword: Bismuth telluride; Conversion efficiency; Open circuit voltage; Power output; Thermoelectric module.

Paper Title: **An Efficient Radical Image Encryption Based on 3-D Lorenz Chaotic System**

Abstract:We propose a new encryption strategy based on the Lorenz chaotic system. Scrambling and diffusion techniques are carried out availing the chaotic sequences rendered by Lorenz system. The chaotic sequences tactically clutter the pixel positions and curtail the relationship between the original image and the encrypted image.Wittingly a high-dimensional system delivers a well robust cryptosystem bearing good efficiency and resistivity. Here we demonstrate through dilated measures and statistical analyses that the proposed system prominently improves security scales and is also potential in withstanding to various sort of attacks. Securing images in cyber space became vital in communication for instance, military affairs, national security, diplomatic affairs, medical database and so on expanding its attention broadly.

Keyword: Cryptosystem, Diffusion, Lorenz Chaotic system, Scrambling.

	Paper Title:	**Adaptive Traffic Light Control using Google Maps API at Multiple Road Intersections**	
	Abstract:In today's urbanized world one of the major and regular crisis we face is Traffic Congestion, this crisis is caused by an increase in the usage of private vehicles adjoint with the availability in the land resources present. This major crisis has increased the attention of the research and development community and has led to the development of various Intelligent Traffic Management System(ITS).In this paper we present a solution by using Google Maps API which is a crowdsourced data used for detecting trafficked areas and these values are transferred to a private cloud storage where a traffic congestion calculation algorithm is present and this algorithm is used to categorize the status of congestion for a particular intersection. **Keyword:**Traffic Light control, Google Maps API, Traffic Congestion Management. **References:**1. 	Paper Title:	**Classification of Spinal Muscle Atrophy Disease using SVM in Machine Learning**	
	Abstract:SMA is a genetic neuromuscular disease. It is a rare disease. It is caused by mutations in the survival motorneuron (SMN) gene that encodes SMN Protein. Maindifficult area of SMA is muscle weakness, causing withdifficulty with moving, swallowing or breathing. Thereare four types of SMA's. The primary objective of thispaper is to classify the SMA's by using support vectormachine classifier. Then we can easily predict the life span of the children based on the group of SMA. This disease is classified on the basis of age of onset and clinical course. **Keyword:**SMN1, SMN2, SVM, SVC, CPK, SMA Linear, RBF, Polynomial. **References:**1. 	Paper Title:	**Smart Trash Can**	
	Abstract:In the city being over populated, the excess amount of waste produced should be eliminated periodically. These wastes are being laid down, creating unhygienic conditions. Since the people available for these works are very less, the available workers need to be used efficiently. To make efficient use of employees an IOT (Internet of Things) based solution is proposed in the project where it indicates whether the trash can to be emptied in that area. When the trash can is full, an indication from sensor to micro controller is given. A cloud website is used to know the status of the trash can by the people living around. This network of systems works dynamically. Thus, this system puts an end to the overflowing of trash cans. It also reduces unwanted fuel consumption, avoids traffic and prevents diseases. This makes our city smart and clean.	**1812-1815**

Paper Title:	**Design and Development of Roadside Waste Collector**	

Abstract:Cleaning has become a basic need of all the human beings. Throughout the world many researchers are conducting experiments in order to eradicate and solve the solid waste removal process. There should be improvising with innovative ideas and techniques which may ensure good health. If an equipment is developed it should be eco-friendly with its usage. All the designer people should be aware of its affects and advantages in preparing a equipment. It's a great task in order to improve the quality and standards of a equipment for its better usage. It should be designed by keeping the ergonomic aspects. Here in this paper it describes the solid waste removal principle and its working which has been prepared by the scrap materials for the domestic purpose only with low cost expenditure. A prototype model is also prepared which uses DC drive powered rotary brush with pneumatic controlled dust shifting which helps user to remove the waste and to maintain clean and hygienic environment and thus avoids health inequalities and safety concerns with regards to workers as well as common people.

Abstract:For the humans' well-being, Mycobacterium Tuberculosis (MTB) is a fatal and adversary disease since years because of if its multidrug straining. MTB consumes nitrate as a substitute during breathing mechanism due to malingering of oxygen, therefore it increases the chances of survival. The nitrate/nitrite response (NarL) is a transcriptional governing protein. It is a two-constituent signal alteration mechanism used to stabilize nitrate enzyme that promote chemical drop and plan dehydrogenation. In this work, molecular docking using in-silico technique by benzofuran and naphthofuran byproducts has been performed. In-silico interaction of phosphodonors to NarL has been done. From the simulation results it is noticed that all compounds are binding to active site, therefore it is concluded that all benzofuran and naphthofuran byproducts partake on the dynamic site of NarL and are able to perform as leading molecule. To obtain results, SwissDock, UCSF Chimera and Protein–ligand Docking is majorly utilized.

Keyword:docking, NaRL Protein, phosphodonors, protein-ligand, SwissDOCK, UCSF Chimera.

	Paper Title:	**Customer Feedback Analyzer**

Abstract:Product reviews always act as a great source of information for a company. These reviews record the customer's feedback on the product and services that the company provides. The problem that we face is that the number of reviews in these kinds of portals are in thousands for which manual analysis is time consuming and inefficient. So, we plan to make an automated system using machine learning which can do the job of analyzing large number of comments in seconds thereby increasing efficiency. These reviews which are posted online can be both positive and negative, categorizing them into broad categories like product defected, product size invalid, good fitting, excellent working etc., will ease the process for both consumers and sellers. This will help automate the process of Customer Resolution, as it takes a lot of time for an employee to manually sort each comment into various categories and then send it to the particular team for review. Additionally, trends can also be analyzed on these comments, such as which issue is most faced by consumers around a particular date/time. This project will efficiently extract the important topics of concern which the company should focus on and also change or improve in order to keep its customers happy and loyal.

Paper Title:	**Optimization of Wear Process Parameters on 17-Cr Ferritic ODS Steel**	

Abstract:The main aim of this article deals with the wear behavior of mechanically alloyed 17-Cr oxide dispersion strengthened (ODS) Ferritic steel consolidated through Vacuum Hot Pressing (VHP) at temperature level of 1170 °C under pressure level of 60 MPa with 60 minutes as holding time and with rate of cooling of 50 ˚C /min and a vacuum level of 10-3 torr. The persuade of wear process parameters were investigated based on the load applied, sliding velocity and sliding distance at a temperature of 350°C on dry sliding track of 17-Cr Ferritic oxide dispersion strengthened steel (Fe-17Cr-0.35Y2O3-1.5ZrO2-4Al (%wt). Wear test was conducted in a dry atmosphere using a pin-on-disc wear testing machine. Wear behavior of 17-Cr Ferritic ODS steel was analyzed by using Taguchi approach. To examine the process parameter during high temperature wear rate analysis of variance and signal to noise ratios were used. During the wear analysis sliding distance was found to be influential parameters of wear rate for 17-Cr Ferritic oxide dispersion strengthened steel succeeded by functional load and sliding velocity. The regression model was found to calculate the rate of wear for 17-Cr Ferritic oxide dispersion strengthened steel.

Keyword: High temperature wear, 17-Cr ODS ferritic steel Vacuum Hot Pressing (VHP), Taguchi method, analysis of variance (ANOVA), regression model.

	Paper Title:	**Perceived Leadership Traits of Employees Based on Physical Attributes and Social Desirability: an Indian Perspective**	
	Abstract:The general perception about the importance of physical attributes and social desirability at the work place is very high. It has been considered as one of the major aspects for leadership traits. The purpose of this paper was to find the significance of physical appearance and social desirability in creating a positive impression at workplace. This study also tried to find out if these two attributes add to the perceived leadership capabilities of employees. In the present research, the author used a mix of qualitative & quantitative research methods. In the first stage, a structured interview has been conducted for 90 managers from multinational firms and they have been asked about their perception on team members' physical appearance and social skills. In the second stage, a questionnaire survey has been conducted for 270 managers from banking sector. It has been observed that in both phases of research the respondents found the confidence, relevant work knowledge, communication skills and qualification more appealing as compare to dressing style and appearance and leadership traits are not directly related to the physical attributes and social desirability. However, the research also indicates that dressing style and grooming helps in creating positive impression and the acceptability of the leadership is easier in case of people with better physical & social aspects. This research will provide a useful insight to the practitioners and HR professionals to highlight the importance of communication skills, social skills, confidence for developing leadership traits amongst the employees. It will also help in communicating the importance of physical attributes such as dressing sense, body language, etiquettes etc.

Keyword: Physical attributes, social desirability, leadership traits

	Paper Title:	**Buckling Load Predictions of Panel and Shell using Vibration Correlation Technique**	
	Abstract:Prediction of buckling loads is a very important phenomenon for aerospace and marine industry. In this paper buckling predictions of a submarine hull is considered by using a shell element and a rectangular panel is considered by using a plate element. The buckling load of a submarine hull can be predicted by using vibration correlation technique. Determination of these buckling loads can be carried out based on the boundary conditions of the submarine hull structure. The technique will be carried by considering both surface conditions and to determine the crippling load of a hull. This paper aims to use VCT for a submarine hull structure used in marine, ocean and can compare the results to aerospace industry by considering a rectangular panel for which buckling is predicted using vibration correlation technique . VCT is not very extensively used in case of thermal buckling. However in this paper, VCT is applied to verify the thermal buckling of a simple thin rectangular	

panel subjected to parabolic loading.

Paper Title: **Assessment and Analysis of a Grid-Tied Photovoltaic System with Net-Metering for State University in Pampanga**

Abstract:The utilization of renewable and eco-friendly source of energy which is also referred as “Alternative Energy” is now being recognized around the world, particularly the Solar Energy. The study proposes a grid-tied photovoltaic system with net-metering that generates electricity that is linked in the electrical grid, where in excess power is sold to the utility company. The objective is to improve the cost of energy consumption of Don Honorio Ventura State University Main Campus by designing and assessing Electrical Power System that lessens the dependency on the Distribution Utility (DU). The design of the system used with respect to the roofing area per building is (3,464) 300 Watts polycrystalline PV panels, (2) uni-directional or (1) bi-directional meter for monitoring the import and export energy, and 30kW-100kW inverter to convert DC (direct current) to AC (alternating current).The computation of the savings was based on the total kWh used per month with the system installed and includes the excess or export energy that is generated from the PV solar panels. Through the assessment of the proposed system, it will surely help Don Honorio Ventura State University (DHVSU) Main Campus to save monthly electric bill and lessen the dependency of the University to the utility grid. Since DHVSU’s building are secondary metered by the Distribution Utility, there is a need to install separate PV System set-up tp meet the individual electrical requirement. The PV system will be installed via On-Grid Connection to the DU subject to the Net Metering rules and guidelines as stated by the Renewable Energy Act of 2008.

	Paper Title:	**Automatic Medicine Vending Machine**	
	Abstract:In Pharmacies inside hospitals we can more often see lots of people waiting in queues to get the most common medicines. This wastes their time. There is also a possibility of human Error, which may become a major problem. So, in order to overcome that we decided to automate the process of Medicine Vending which is much faster and less error prone than Human pharmacist. Before meeting the doctor, the patient is issued a RFID card. After inspecting the patient, the doctor scans the RFID of the Patient in his RFID scanner which is connected with a microcontroller. Now the RFID value is pushed to web app provided to the doctor. The web app will be where the doctor inputs the medicine count in the respective text boxes. Now the prescription will be pushed to database from the web app. When the patient scans the RFID in the Automated Medicine Vending Machine placed at the pharmacy it retrieves the medicine count from the database and vends the medicines to the patient. **Keyword:**Wending machine, Tag, Scanner, Automation. **References:** 1. 	Paper Title:	**SOC Estimation of Non-Linear Lithium-Ion Battery using Modified Coulomb-Counting Method with RUL**	
	Abstract:Batteries are preferred source of energy in recent few decades, the development is vast. New development comes with new challenges, the coulomb counting method used to study battery behavior with an accurate measurement mechanism like estimating battery state of charge (SOC), battery's remaining useful life (RUL), working condition and changing tendency. To accomplish this experiment and algorithm efficiency, we used PIC18F MCU with IoT device to send data to the web server using GPRS, and can be utilized on an Electronic Vehicles (EV) and portable devices in real time to show what's really happening within the battery. The significant challenge of this method is, we might receive accumulative errors associated with initial SOC also the faults of quantities are undefined, hence to get over these restrictions, a part wise linear imprecise used with inconsistent constants to define the integrally non-linear relation amongst the SOC and open circuit voltage (VOC). In past few decades, Li-ion batteries has developed much consideration in EV applications as well as for mobile phone market due to its many advantages like, quick charging ability, more durable, light weight, good energy density, low rate of self-discharge etc. The SOC is key principle to find, control of Li-ion battery performance which is current area of interest in this publication. This paper will demonstrate how the SOC is controlled, observed with the help of Coulomb-counting algorithm. **Keyword:**Lithium-ion battery, Coulomb-counting, State of charge, Part wise linearization, RUL, Hardware implementation. **References:** 1. Paper Title:	**Optimizing the Effect of Cropping and Rotation Attacks on Watermarked Images using Back Propagation Neural Network in DWT Domain**

Abstract:Hiding an image in another image is the technique used for copy write protection. In this proposed work, the watermark is inserted into blue plane of the cover image, In this watermark extraction and embedding process, the back propagation neural network in conjunction with biorthogonal wavelets is utilized to improve the efficiency. The performance is tested by normalized correlation coefficient. The imperceptibility of the watermark is tested by cropping and rotation attacks effectively.

Keyword: Watermark, Wavelets, neural network, rotation, compression.

Paper Title:	**Usage of Porcelain Insulators Wastes in the Preparation of Cement Based Building Units**

Abstract:Porcelain electrical insulators manufactured from refractory ceramic materials have to pass stringent tests prior to final acceptance. This causes large amounts of wastes to be available at the plant premises

1867-1871

representing a waste of material besides being an environmental threat. In the present work, porcelain wastes were crushed and ground to pass 40 mesh screen and used as partial sand replacement in cement mortar cubes as first step for possible use in concrete works. The effect of particle size and percent addition on water of consistency and setting time of cement paste and flow behavior of mortars and their compressive strength was investigated. The results showed that the substitution of sand by the waste moderately altered most of the properties but helped raising the mechanical strength.

Keyword: Electrical porcelain – waste – cement – mortar.

	Paper Title:	**Experimental Exploration of Hybrid Metal Matrix Composite using Abrasive Water Jet Machining**

324.

Abstract:The abrasive mixed waterjet was with success utilized to chop several materials together with steel, metal and glass for a spread of business applications. This work focuses on surface roughness of hybrid metal matrix composite (AA6061, Al2O3, B4C). Machining was applied by AWJM (Abrasive Waterjet Cutting) at completely different parameters Water pressure, Traverse speed, Abrasive flow and stand-off distance. The reinforced composite was analyzed exploitation FE

SEM (Field Emission Scanning lepton Microscope) and distribution of reinforced was studied by AFM (Atomic Force Microscopy). For optimum results surface roughness was calculated.

Keyword: Surface roughness, Analysis of FESEM, Analysis of AFM, Al6061, B4C, Al2O3.

Paper Title: **Testing of Extract Load and Transform (ETL) in Assorted Dimensions and Perspectives**

Abstract:In day today technical field, we are working on data science. It is the field that increasing rapidly, data science is similar to data mining but if we need to perform data mining then it is necessary to have data warehouse .And if we are interested to create data warehouse then we need to perform Extract Load and Testing (ETL).ETL implies Extraction of data from various sources, Transform that extracted data into proper format and finally load the data into data house. The integration of data science with the ETL is quite prominent and required so that the higher degree of performance can be attained. In addition, the performance elevation is very important to have the testing with more accuracy.

Paper Title: **E-recruitment Technology Adoption among Generation Z Job-Seekers**

Abstract:In line with the technological changes in the industry revolutionary era of the 4.0, today's organizations have also quickly adopted new or digital technology trends. One of these new trends is E-recruitment in human resource management. Online recruitment is also known as E-recruitment which is a HR software that uses technology in a particular web-based to guide and assist the hiring process in order to reduce the financial burden, improve the effectiveness of administrative and gain access to a wider pool of talent. A total of 230 data were collected from the Z generation respondents selected purposively convenience. The data was analyzed using the PLS structure equation model to identify the adoption of E-recruitment technology by generation Z. The results of the multi-level analysis showed that the expectation of positive results affects E-recruitment retrieval. Findings and suggestions provide valuable insights on E-recruitment and its implications in the modern era of revolutionary industry 4.0.

Paper Title: **Adaptive Crop Monitoring System Based on Wireless Sensor Networks**

Abstract:Through incorporation of wireless sensor networks (WSNs) into many domains like health care, smart city and various industrial applications, it has become a broad area of research to many experts and scholars worldwide. This paper mainly concentrates on efficient development of agriculture by various modern procedures followed by farmers especially in southern part of India. This includes combination of various climatic parameters like temperature, light, rain and other environmental factors. The existing applications lack location specific data based on their system structure and other key technologies. Therefore there is a need for a systematic architecture based on various locations as environment differs from location to location. This paper presents an adaptive approach for crop management and an easy way to monitor systems which helps the farmer to get a better crop yield. The advantages and challenges of the existing systems are discussed here and various novel and innovative ideas are discussed along with future scope.

Keyword: Wireless Sensor Networks (WSN), temperature, light, crop management, environment.

Paper Title: **Uncertainty Error Analysis on Micro Hardness of Al6061-B4C Surface Composites Produced by Friction Surfacing**

Abstract:Friction surfacing is a confined surface modification process of depositing a layer of a consumable tool (Mechtrode) over the base plate (Substrate). This solid-state surfacing opts for dissimilar material and erosion resistant coatings. It is also utilized for localized repairing of worn-out components. In the present study, the hardness of the coated material is compared with the substrate. In this experiment, the Al-B4C composite consumable rod is prepared with Aluminium 6061 alloy and 3, 6, 9, 12 and 15 weight % of B4C by stir casting and coated over the Aluminium 6061 alloy plate. The 25-run experiment is conducted for the combination of the

1895-1900

rotational speed, traverse speed and axial load. The combined effect of process parameters and the increase in weight % of B4C results in the change in hardness. The hardness of the coating is enhanced by 65% than the substrate. The uncertainty analysis revealed that it has a good correlation with the hardness standard value and also it has an error of 5%. The ANOVA analysis concluded that the rotational speed and the weight percentage of the reinforcement improved the microhardness of the coating.

Paper Title: **Multiply Divisor Cordial Labeling**

Abstract:A Graph G* having multiply divisor cordial labeling with node set V* is a bijective. t on V* to {1,2,…,V*} such that an edge ab is allocate the label 1 if 2 divides (t (a) · t (b)) and 0 otherwise, then the number of edges having label 0 and the number of edges having label 1 differ by maximum 1. A graph having multiply divisor cordial labeling is said to be multiply divisor cordial graph. In this paper, we prove that cycle, cycle having 1 chord, cycle having 2 chords, cycle having triangle, path, jellyfish, coconut tree, star and bistar graph are multiply divisor cordial graphs.

Keyword: Subtract divisor cordial, jellyfish, coconut tree.

Paper Title: **On the Seidel Energy of Certain Mesh Derived Networks**

Abstract:The energy of graph G is defined as the sum of the absolute values of eigenvalues of the adjacency matrix A(G). The manual calculation of energy of graphs consumes several man hours. In this paper, we use MATLAB to generate the Seidel matrix and hence calculate the Seidel energy of some mesh derived networks.

	Paper Title:	**Route Deviation Algorithm with Location Ambiguity in Wireless Sensor Networks**

Abstract:Nowadays, the primary concern of geographic routing protocol lies in the fact of minimisation of energy dissipation during the transfer of each packet in a network. This paper proposes an energy-efficient real-time algorithm in sensor networks, i.e., Route deviation Algorithm. Route deviation algorithm combines the characteristics of both distance-based criteria and direction or angle based criteria. In this paper, we have shown a comparison amongst COMPASS algorithm, NFP, MER and Route deviation algorithm. The simulation model includes numerous parameters, namely, threshold energy, number of sensors, spread of the map, position of sensors and transmission time. The results obtained through the simulation model supports the fact that the Route deviation algorithm accomplishes the task of saving energy and adds to the life of the networks.

Keyword: Compass, NFP, MER, lifetime of network, wireless sensor network, Route deviation, transmission range.

	Paper Title:	**Implementation of MOORA Method for Determining Prospective Smart Indonesia Program Funds Recipients**

Abstract:Presidential Instruction No. 7 of 2014 mandates PIP to the Ministry of Education and Culture to summarize Indonesia Smart Card (KIP) and spread PIP funds to students that cannot afford to pay education. However, Indonesia Corruption Watch (2018) explained that the data used for the Smart Indonesia Program (PIP) was still inaccurate because almost half of the poor people with a percentage of 42.9% were not registered as participants in the Smart Indonesia Program (PIP). According to ICW, this is due to the data used for the process of determining the candidates for the Smart Indonesia Program recipients of the funds are still inaccurate and harming others who supposed to get funds. One method that usually used as a decision-making technique in

1920-1925

	the research is the Multi-Objective Optimization Ratio Analysis (MOORA) method which is a multi-criteria decision-making that has five main steps as a technique and it can be used to rank prospective PIP fund recipients based on the highest to the lowest preference values. The results of this study indicate that the first rank with the highest value was 0.0539 and the last rank with the lowest value was 0.0211 so it used to ease the stakeholders to determine the amount of KIP recipients based on the preference values. This method can be applied for stakeholders needed in compared to monotonous data processing using estimates. **Keyword:**Smart Indonesia Program, Indonesia Smart Card, Education, Multi-Objective Optimization Ratio Analysis, Criteria Weights, Preference values. **References:** 1. 	Paper Title:	**Factors Influencing Behavioural Intention to Use Mobile Banking in Champawat District of Uttrakhand**
	Abstract:India has more mobile connections compared to banking accounts, therefore GoI in Economic Survey 2014-15, proposed JAM (Jan-Dhan Yojana, Aadhar Number and Mobile Number) trinity to use ICT for more efficient and effective spread of formal banking even to the hilly areas where brick and mortar banks are challenging to build and sustain. Also, financial inclusion cannot happen without economic activity, and Mahatma Gandhi National Rural Employment Act (MGNREGA) is a policy which significantly helped to enhance the economic activity of rural India. Because of penetration of mobile technology and involvement of the same in financial inclusion, this research will contribute to understanding the constructs of mobile banking adoption in hilly rural area of Champawat District, Uttrakhand w.r.t population registered with MGNREGA. The authors found research is scarce for mobile banking adoption in hilly rural areas of India. (Mehta et, al 2019) may be the only study for Champawat district of Uttrakhand, using technology acceptance model (TAM) and total interpretive structural modelling (TISM) to develop a model. This paper takes model from Mehta et al. 2019 and examines the relationship between the constructs using structured equation modelling (SEM). **Keyword:**Financial Inclusion, Mobile Banking, Technology Acceptance Model (TAM), Intention Behavior, Hilly Rural India, Total Interpretive Structural Modeling (TISM), Structured Equation Modeling(SEM) **References:** 1. 	Paper Title:	**Optimization of Process Parameters of EDM of Inconel 617 by Taguchi Based PCA and GRA Technique and Effect of Recast Layer Formation**

Abstract:Inconel materials are manufactured in various series which have differences in their chemical composition and hence in its physical and chemical properties. These alloy materials are known for their high strength, corrosion resistance and oxidation resistance. They are not easily machine-able through conventional machining, due to rapid work hardening tendency, high toughness and hardness, tendency to form built up edges, hence for their machining, non conventional machining equipments like EDM are used. A number of experiments has been performed to optimize process parameters of EDM on different series of Inconel material like Inconel 625, Inconel 718, Inconel 601, Inconel hastelloy C-276, Inconel 690 etc. by different optimization technique Taguchi, PCA, GRA etc however there is a lack of data available for optimization of process parameters of EDM machining for Inconel 617. So in this paper optimization of process parameters like Pulse on time, peak current, gap voltage have been done by taking Material Removal Rate and Tool Wear Rate as response variables. Other process parameters have been kept constant during EDM process. It is found that for different values of process parameters pattern of variation of MRR and TWR is different. Also the effect of recast layer formation on MRR and TWR has been analyzed and it is found that at high Peak Current and high Pulse on Time, tendency of formation of recast layer is high. Formation of recast layer adversely affects MRR and TWR i.e. it reduces MRR and TWR. Also Results obtained from PCA and GRA has been compared and it is found that both methods give same optimum set of process parameters but they have differences in pattern of variation of MRR and TWR.

Keyword: Electric Discharge Machining, Inconel 617, Material Removal Rate, Tool Wear rate, Pulse on time, Peak current, Gap Voltage , GRA(Gray Relation Analysis), Taguchi design, PCA(Principle Component Analysis), Recast Layer Formation.

Paper Title: **DDEAS: Distributed Deduplication System with Efficient Access in Cloud Data Storage**

Abstract:Cloud storage service is one of the vital function of cloud computing that helps cloud users to outsource a massive volume of data without upgrading their devices. However, cloud data storage offered by Cloud Service Providers (CSPs) faces data redundancy problems. The data de-duplication technique aims to eliminate redundant data segments and keeps a single instance of the data set, even if similar data set is owned by any number of users. Since data blocks are distributed among the multiple individual servers, the user needs to download each block of the file before reconstructing the file, which reduces the system efficiency. We propose a server level data recover module in the cloud storage system to improve file access efficiency and reduce network bandwidth utilization time. In the proposed method, erasure coding is used to store blocks in distributed cloud storage and The MD5 (Message Digest 5) is used for data integrity. Executing recover algorithm helps user to directly fetch the file without downloading each block from the cloud servers. The proposed scheme improves the time efficiency of the system and quick access ability to the stored data. Thus consumes less network bandwidth and reduces user processing overhead while data file is downloading.

Keyword: Access Efficiency, Cloud Data storage, Data Deduplication, Network Bandwidth, Recovery module.

Paper Title: **Optimization of Machining Parameters for AISI 316L And 317L Austenitic Stainless Steels using Eco-Cut Wire-EDM Technique**

Abstract:Austentic stainless steel is one of the most suitable engineering material based on their superior resistance to corrosion and compatibility at high temperatures and high vacuum. However, the machinability of austenitic stainless steel is not very promising owing to lower thermal conductivity, higher degree of ductility and work hardenability. For meeting these challenges, unconventional machining procedures were evolved and can make any impenetrable design/profile on any work substance by acceptable controlling of various machining procedures. The main importance of this paper is to show the impact of machining parameters on Eco-cut Wire Electric Discharge Machining (WEDM) for disparate austenitic stainless steels (AISI 316L & 317L). Initially both the metals are machined on WEDM. Machining parameters like pulse on time(Pon), pulse off time(Poff), voltage(V) and wire tension(WT) are observed for both 316L and 317L stainless steel materials. A Box-Behnken Design (BBD) of response surface methodology (RSM) has been used for experimental work. The reaction of procedure is estimated by ANOVA analysis and response optimizer is used for optimum level checking. A series of trial runs were carried out on both the machined specimens for identifying better material removal rate(MRR), cutting speed(CS) and surface roughness(Ra).

Keyword: Cutting Speed(CS), Material Removal Rate(MRR), Surface Roughness(Ra), pulse on time(Pon), pulse off time(Poff), voltage(V), wire tension(WT), Response Surface Methodology(RSM) and ANOVA.

Paper Title: **Design of Pseudo Random Number Generator using Linear Feedback Shift Register**

Abstract:Nowadays security has become a great concern in the field of computer science and information technology. In order to protect data from unintended users and to achieve a desirable level of security, several cryptographic algorithms based on various technology have been proposed. Linear Feedback Shift Register (LFSR) may play an important role in the design of such cryptographic algorithms. LFSR based cryptographic algorithms are often lightweight in nature and are more suitable for resource constraining devices. In this paper we present a detailed analysis of LFSR and design of m-sequence LFSR to implement cryptographic algorithms.

Keyword:Q Array PRNG, FSR, Modular Arithmetic, Galois Field GF(p^m), Primitive Polynomial p(x), Primitive Polynomial p(x) over GF(p^m), LFSR, m-sequence, Run Length, Linear Recurrence, NIST.

	Paper Title:	**Earthquake Analysis, of RC Structure using Different Codes and Different Countries**

Abstract:This paper presents a seismic behavior of various structures using different codal provision as given Indian code, American code, &Newzealand code for earthquake analysis. This study is carried out on residential building of G+5, G+11, G+21 of Special RC structure . Modeling of the structure is done as per ETAB software. Time period of the structure in both the direction is taken from the software as per the three standard (9 model are made 3 model for each code). A comparative analysis is performed in terms of base shear, deflection limit, stores drift at linearly static and response spectrum.

Paper Title: **A Cross layer QoS Framework for Heterogeneous IoT environment**

Abstract:Internet of Things (IoT) is one of the fast growing technological paradigm in terms of architecture, standards, protocols, infrastructure deployment, Quality of Service (QoS), Service Level Agreements (SLAs), service provisioning, cross domain and cross platform implementations. IoT involves the techniques and technologies for sensing, actuation, communication, computation, networking and storage. In such a demanding environment the need for cross layer QoS functionalities are essential to address the issues like resources, mobility, security and energy management. The detailed review of literatures on IoT architectures and QoS implementations is made and it is observed that there is a need for cross layer QoS model in IoT environments and is one of the critical research challenges. A novel approach to address the above challenge(s) in an IoT environment requires an appropriate lathering of functional modules to different layers to meet different QoS requirements. Hence we propose a novel cross layer QoS framework supporting adaptable and distributed decision making in the IoT environment as a cross layer implementation addressing energy optimization and bandwidth efficiency. The results are verified by implementing the proposed framework in realistic IoT systems for verifying QoS parameters like delay, energy and bandwidth.

Paper Title: **Islamic Habituation in Growing Students’ Social Behavior**

Abstract:This qualitative research aimed at revealing the habituation of Islamic values in MAN Rejang Lebong. This research used observation, interview, and documentation as instruments. The results showed that the school

actualizes reciting the Qur'an before class begins, reciting prayer, reciting salawat, reading asmaul husna, praying duha and zuhur in congregation, applying the five S (senyum, salam, sapa, sopan, santun), Friday prayers, Friday safaris, Friday morning cults, Friday charities and clean Friday and the implementation of religious activities routinely carried out by school principals using strategies in familiarizing religious activities, religious routine activities continuously. So it can cultivate religious social behavior such as the honest discipline of provident living helps be flexible in association and. As for the obstacles to performing the routine of religious activity, there is still a lack of motivation in students, so a small proportion of students are still less active or frequently latent when engaging in activities.

Paper Title: **Iconic Meanings of Traditional Herbs and Shrubs: Culture-Specific Based Envirolinguistic Perspective**

Abstract:Traditional herbs and shrubs, which are ubiquitous all over the world, have been used in various cultures for many purposes, such as for medicinal and ornamental purposes. These herbs and shrubs have different names depending on the cultures where the plants grow. This envirolinguistic research which aims to conserve the names of the traditional herbs based on local culture in the perspective of linguistic and environment is a descriptive qualitative linguistic research. The tangible data of this envirolinguistic research is the list of names of the traditional herbs and plants obtained from many data resources. The location of the data sources is the places identified as the center of the agriculture of the traditional herbs in Yogyakarta Special Region and surrounding areas. Besides, in this digital era, the names of the traditional herbs can be obtained from the Internet websites. These two locational resources make the research adequately feasible to be analyzed. The linguistic data, which is the end-product of this research, are gathered or obtained by the use of observation method. The technique used to gather data also includes transcribing or recording techniques. Data can also be obtained by giving cues during the interview. This technique is sometimes accompanied by recording or transcribing, both directly and indirectly, open or secretly. The data analysis in the envirolinguistic research on the names of traditional herbs is conducted by applying the equivalent method and distributional method as commonly practiced in the linguistic research. The iconic meanings of herbs and shrubs resulted from the analysis were then presented.

Keyword:iconic meanings, traditional herbs and shrubs, ecolinguistic perspective

Paper Title: **Design E-Wallet as a Centralized E-wallet**

Abstract:Now days, billions of people are using smart phones all over the world and as the phone gets smarter, the new features gets added that reduces the human efforts in many fields. Smart phone makes the payment of different things such as ordering food, booking a cab, ordering grocery, booking a movie ticket via different mobile applications. These mobile applications work with the support of e-wallets which is recognized as digital wallets. This paper proposes the design of connecting different e-wallets present into a single smart phone. The proposed method will make digital payment much less cumbersome.

	Paper Title:	**Real-Time Mosquito Species Identification using Deep Learning Techniques**

Abstract:According to the World Health Organization, diseases such as malaria and dengue account for almost one million deaths every year. Carrier mosquitoes for a particular disease remain exclusive to it. A majority of carrier mosquitoes spread the disease throughout a region by reproducing in it. With advancements in Machine Learning and Computer Vision technologies, the species of mosquitoes in a particular region can be easily and swiftly detected using recordings of their wing movements. The wingbeats of a particular mosquito species are unique, making this a reliable method to identify them. Once these solutions are deployed on mosquito traps, a particular region can be alerted if, for example, an Aedes Aegypti mosquito is found. This mosquito species is widely known to carry the Zika virus. The identification of such carrier species can also help in detecting the spread of mosquito-borne diseases in the surveyed region. In this paper, we go through various techniques that show promising results in the identification of mosquito species. The trained models can be deployed on constrained devices to make a cost-effective and efficient mosquito species identification system.

	Paper Title:	**Nexus DNN for Speech and Speaker Recognition**

Abstract:Over the years, many efforts have been made on improving recognition accuracies on Automatic speech recognition (ASR) and speaker recognition (SRE), and many different technologies have been developed. Given the close relationship between these two tasks, researchers have proposed different ways to introduce techniques developed for these tasks to each other. In this paper an open source experimental framework is proposed for speech and speaker recognition. Then a unified model, Nexus-DNN is developed that is trained jointly for speech and speaker recognition. Experimental results show that the combined model can effectively perform ASR and SRE tasks.

Paper Title: **The Bending Strength and Hardness of Recycle Plastic Type HDPE (High Density Polyethylene) and PP (Polypropylene)**

Abstract:The purpose of this research is to know the strength, flexibility and maximum hardness of plastic waste after pressing of HDPE, PET/PETE and PP type with bending test. Furthermore, the specimen is made referring to ASTM 6272 D and the testing is carried out with the specified measurement. The results show that the strongest recycled plastic with the highest bending level is obtained from the composition of 50% HDPE, 20% PET/PETE and 30% PP, with maximum power of 52.9 N/mm2 and 137.74 Kg/mm2. In addition, the biggest flexibility strength is plastic with composition 50% HDPE, 20% PET/PETE and 30% PP with strength value of 9.53 N/mm2. As for hardness value, it reaches 12.76 Kg/mm2. Because the plastic in used is recycled Plastic, the resulting product cannot be used for food and beverage container. However, it can be used for flower pot and pencil case.

Paper Title: **Expression Invariant Features for Face Recognition**

Abstract:Personal Computer sourced Face Recognition has been a sophisticated and well-found technique which is being rationally utilized for most of the authenticated cases. In reality, there is a number of situations where the expressions of the face will be different. We are here able to instinctively detect the five universal expressions: smile, sadness, anger, surprise, neutral by studying face geometry by determining which type of facial expression has been carried out. Using some facial data with variant expressions. We hereby made some experimentations to calculate the accuracies of some machine learning methods by making some changes in the face images such as a change in expressions, which at last needed for training and recognition identifiers. Our objective is to take the features of neutral facial expressions and add them with the other expressive face images like smiling, angry, sadness to improve the accuracy.

Keyword: Face recognition, CNN, facial expressions.

Paper Title: **Mechanical and Flexural Behavior of High Performance Concrete Containing Nano Silica**

Abstract:This research work presents the role of nano silica (NS) on properties of high performance concrete. This study evaluates the influence of nano silica in three percentages (1%, 2%, 3 %,) by weight of cement. Several tests including mechanical properties and flexural test were performed to understand the influence of nano silica on behavior of concrete. It was determined that Portland cement replaced with 3% by weight with nano silica could accelerate C-S-H gel structure at early stage of hydration. In return this increases water permeability resistance of concrete specimens and acts as filler material that enhances micro structure as well as activator to promote pozzolanic activity and this will pave the way for producing good quality concrete.

Paper Title: **Erythrocyte Classification using Multi-Layer Perceptron, Naïve Bayes Classifier, RBF Network and SVM**

Abstract:Several diseases can be diagnosed based on the appearance of abnormal erythrocytes, among others anaemia and thalassemia. Process of examination peripheral blood smear manually is time-consuming and subjective. Currently, the process of examination peripheral blood smear by laboratory assistants can be assisted with digital image processing technology so that it can speed up the examination time and avoid subjectivity. This research begins with the process of microscopic image acquisition, then preprocessing, segmentation, feature extraction and classification. The microscopic image acquisition is carried out using an additional special camera on a microscope. In this study, we used peripheral blood smear of thalassemia patients and healthy individuals. We convert the RGB image to grayscale image and perform the median filtering in the preprocessing stage. In the segmentation stage, we used the watershed distance transform method. As a segmentation result, we got 7108 erythrocyte images consisting of nine types of erythrocytes. In feature extraction, we used shape, color and texture characteristics to represent erythrocytes. The combination of these three features is used as classifier’s input. One crucial stage in digital image processing technology is object classification. In this study, erythrocyte classification is done by comparing four types of the classifier to determine the best classifier performance in this case. Multi-Layer Perceptron (MLP), Naïve Bayes classifier, RBF Network, and SVM used as classifiers in this study. Experimental results showed that MLP got the highest performance with 89.6% accuracy, 89.3% precision and 89.6% recall. Furthermore SVM came in second place, followed by RBF Network and Naïve Bayes classifier.

Keyword: Classification, erythrocyte, MLP, Naïve Bayes classifier, RBF Network, SVM.

Paper Title: **Impact of Geometry Effects on Artery Stent Deployment Characteristics**

Abstract: Intravascular stenting is the leading treatment procedure for atherosclerotic coronary heart diseases. Among the various procedures, it is simpler and faster with a high initial success rate. Stent design, stent material, and clinical procedure decide the efficacy and life of stents. Strut thickness and crown radius are two essential design parameters that dictate expansion characteristics of stents. This research work discusses computational analysis of a specific stent, to explore the influence of thickness of strut on the deployment characteristics like stress/strain, foreshortening, recoil, and dog boning. The optimum stent design is one which gives maximum expansion with minimum stress distribution, dogboning, and elastic recoil. Five similar stent models with thickness ranges from 65µ to 105µ were modeled and computational method was adopted to simulate the transitory expansion nature of stent/balloon system. The FE results were substantiated with an in-vitro experiment. It was found that strut thickness has a major impact on stent recoil and low impact on foreshortening and dogboning. Foreshortening per unit expansion was almost same for entire models. Strut thickness 70µ to 80µ gives better expansion characteristics for the model under study.

Paper Title: **Problems of Social Adaptation of Bachelor's Degree Students of Pedagogical Field under the Conditions of examine in Agrarian University**

Abstract:Problem and objective. Nowadays, in the practice of training of professional educational organizations

2036-2042

there is a discrepancy between the methods of training acceptable at the basic school and the university, which complicates the process of adaptation of students to the new conditions. The social status of a "student", a large amount of information, lack of skills of independent work, reduced control over educational activities by both parents and teachers, requires the student to mobilize available resources and opportunities for successful adaptation in the university. At this stage of personal development, various forms of disadaptation behavior may appear

Training of students of pedagogical orientation in the walls of a non-core university is associated with additional problems, which, above all, consist in the emerging contradictions between the humanitarian and non-humanitarian orientation of the learning process.

The purpose of the research presented in the paper is to analyze the process of adaptation of bachelor students of pedagogical field to the conditions of training in an agrarian university and to determine the main directions of its improvement.

Proposed Methodology. Methodological grounds for the study of the problem of social adaptation of bachelor students of pedagogical field in a non-core university were: analysis; comparison; typologization of theoretical sources; diagnostic methods that allowed to carry out theoretical and methodological substantiation of the essence and specificity of adaptation of students to training in a non-core university.

The sociological toolkit of the questionnaire survey included the test methodology of K. Rogers and R. Diamond, formulas of Rylon, Spearman-Brown, Cronbach. For processing the answers of respondents (n = 210) the methods of mathematical statistics - correlation and cluster types of analysis - were used.

Results. The authors have revealed general and specific features of the adaptation process of students of pedagogical field in the conditions of training of non-core higher education institution; comparative analysis of social-psychological and social-professional adaptation of students has been carried out; the most acute problems and difficulties of social-professional adaptation have been revealed; criteria and levels of adaptation of students of pedagogical orientation have been formed; proposals on improvement of the process of adaptation of students of pedagogical orientation have been developed and applied in practice.

Conclusion. The conducted research allowed to get a comprehensive idea about the organization of the adaptation process of future teachers to the conditions of training in a non-core higher education institution. The materials of the study can be used in the management of the adaptation process in higher education, including the educational and leisure activities of curators of student groups, teachers, psychologists and educators in dormitories.

Keyword:social environment, adaptation, disadaptation, educational process, educational activity, adaptation factors, adaptation criteria, monitoring of the adaptation process.

Paper Title: **Classification of Pruning Methodologies for Model Development using Data Mining Techniques**

Abstract:Knowledge discovery process deals with two essential data mining techniques, association and classification. Classification produces a set of large number of associative classification rules for a given observation. Pruning removes unnecessary class association rules without losing classification accuracy. These processes are very significant but at the same time very challenging. The experimental results and limitations of existing class association rules mining techniques have shown that there is a requirement to consider more pruning parameters so that the size of classifier can be further optimized. Here through this paper we are presenting a survey various strategies for class association rule pruning and study their effects that enables us to extract efficient compact and high confidence class association rule set and we have also proposed a pruning methodology..

Keyword:associative classification, data mining, knowledge discovery process, pruning.

Paper Title: **Scheduling of Machines and AGVs Simultaneously in FMS through Hybrid Teaching Learning Based Optimization Algorithm**

Abstract:The most complex problem in FMS is scheduling task, due to this complexity it has created interest among many researchers. Even though FMS scheduling problem was considered earlier, material handling systems like (AGVs) scheduling was not done effectively. As transportation times cannot be neglected in an FMS, a carefully managed and designed material handling system is important in achieving the required integration in flexible manufacturing environment. Hence there is a need for scheduling both the machines and material handling system simultaneously for the successful implementation of an FMS, which makes the scheduling of FMS more complex. Metaheuristic Algorithms are mostly received by the researchers, because of their capability to tackle more complex problems. Hybridization of the metaheuristics may further improve their performance. In the present work a new hybrid metaheuristic Teaching Learning based optimization(HTLBO) is proposed to solve simultaneous scheduling problems.

Paper Title: **IGSA-FA for Optimal Placement of FACTS Devices**

Abstract:With the globalization of power market by reducing the installation and operating cost of the power plant with profitable power flow controller leads to successful implementation of optimal power flow through optimal algorithms. Finding the solution of optimal load flow problem with non-linear equation such as Newton's equation is one of the possible solution. However, applying Newton's solution to OPF for finding convergence is a little bit tedious and time consuming affecting marginal losses by involving a number of inequalities present in the system. Transmission lines capacity and bus voltage limit are vital safety factors to carry out OPF in any power system The system being operational in normal state is equipped with security measures in order to discern that it is capable of resisting contingencies devoid of any limit contravention . To ensure a consistent power system function, it is essential that the safety of the system is duly accounted for in

Paper Title: **Performance Improvement of Sensorless Vector Controlled Induction Motor Drive for Medium Power Applications**

Abstract:This paper deals with sensorless vector controlled induction motor in which torque pulsations are reduced with improved input of induction motor. In proposed technique two multi winding transformers are used for generation of 18 sinusoidal signals given to rectifier unit and the rectifier output given as input to 9 level multi level inverter. In this proposed technique gating signals to the inverter switches will be provided through space vector pulse width modulation which considers speed as reference. This configuration was simulated in MATLAB/Simulink.and the simulation results are presented here with improvement in reduction of THD.

Paper Title: **Intrusion Detection System from External Threats using Data Mining**

Abstract:Network Intrusion Detection is a significant apparatus to distinguish and examine security dangers to a correspondence arrange. It supplements other system security procedures, for example, firewalls, by giving data about the recurrence and nature of assaults. A system interruption discovery framework (NIDS) frequently comprises of a sensor that examines each bundle on the system under perception, and advances the parcels which are considered fascinating, together with an alarm message to a backend framework, that stores them for further examination and relationship with different occasions. The assessment procedure of the MAC address contrasted with the CADL is improved and streamlined with the help of the J48 choice tree calculation. The pursuit procedure is completed in the created arrangement esteem through tree based characterization.

Paper Title: **An Efficient PET-MRI Medical Image Fusion based on IHS-NSCT-PCA Integrated Method**

Abstract:Merging of multiple imaging modalities leads to a single image that acquire high information content. These find useful applications in disease diagnosis and treatment planning. IHS-PCA method is a spatial domain approach for fusion that offersfinestvisibility but demands vast memory and it lacks steering information. We propose an integrated approach that incorporates NSCT combined with PCA utilizing IHS space and histogram matching. The fusion algorithm is applied on MRI with PET image and improved functional property was obtained. The IHS transform is a sharpening technique that converts multispectral image from RGB channels to Intensity Hue and Saturation independent values. Histogram matching is performed with intensity values of the two input images. Pathological details in images can be emphasized in multi-scale and multi-directions by using PCA withNSCT. Fusion rule applied is weighted averaging andprincipal components are used for dimensionality reduction. Inverse NSCT and Inverse IHS are performed so as to obtain the fused image in new RGB space. Visual and subjective investigation is compared with existing methods which demonstrate that our proposed technique gives high structural data content with high spatial and spectral resolution compared withearlier methods.

Paper Title: **Non-Invasive Method to Diagnose Lung Energy of the Smoking Population**

Abstract:Smoking is an activity where toxic content which on fire produces smoke which can be detrimental if inhaled and mixed into the blood flow. Smoking is one of the key factors for death globally. On an average masculine and feminine smoker suffer about 13.2 and 14.5 year lifetime variation when compared to non-smoking individual. Most of the individuals who smoke regularly has higher prevalence of stroke, eye cataracts and cancer of nose, lips, tongue and mouth. The fact that 22.1% of masculine smoker and 11.9% of feminine smoker has a huge risk of dying due to lung cancer before age 80. The smoking generally has a adverse effect in its later stage and the diagnosis is generally invasive. There is a need for an early and non invasive diagnosis method for finding the adverse effects of smoking. Biowell is one such non invasive device to find psycho emotional status, Energy distribution and functional status of different organ. By using GDV based energy detection and health status analysis we can differentiate the damage caused to the brain and other major parts like Lungs, Nerve and Thoracic region. Smoking populations along with non smokers are taken and energy distribution and health status are collected, analyzed to prove the efficiency of Biowell instrument as a standard diagnostic tool.

Keyword: Smoking, Stroke, cancer, cigarettes, Energy distribution.

Paper Title: **Impact of Relationship Marketing Variables on Brand Resonance: Mediating Role of Brand Attitude**

358.

Abstract:Relationship Marketing has got its values strongly rooted in business and market place right from the year 1983. It is the core sphere of operation for all kinds of trade and no organization overlooks this concept. Holding this importance of Relationship Marketing as a core idea, the study aims at discerning the impact of Relationship Marketing Variables on Brand Resonance. Brand Resonance is yet another dominant state of psychological connect which every company would like to establish with the customers. The Relationship Marketing Variables Trust, conflict handling, empathy and Satisfaction are considered for the analysis. Brand Loyalty, Brand Community, Brand Engagement and Brand Attachment are the variables of Brand Resonance. Focusing on the relationship marketing variables that contributes towards high brand resonance would enable companies to contemplate on these profit enabling areas that eventually leads to a sustenance growth for the organization. Indian Shopping Websites has been given the prime importance in this study and data has been collected from 515 users of these websites. Multiple regression is employed as a main tool to examine the influential effect and for mediation analysis. The mediating effects of brand attitude over brand resonance is also

2084-2089

examined in this study. Drifting from the traditional view of customer satisfaction influencing Brand Loyalty, this study has found Empathy as the most influential factor on Brand Resonance followed by Conflict handling and Trust. Brand Attitude strongly mediates the relationship between relationship marketing dimensions and Brand Resonance.

	Paper Title:	**Energy Efficient Quality Assurance MAC Protocols in WSN**	
	Abstract:The key aim of the proposed research is to perform an analysis of various QoS aware MAC protocols for WSN based on simulation and literature both. The proposed work represents the designs and methodologies of different MAC protocols. And also classify the various MAC protocols based on media access and allocation of schedule for communication among the sensor nodes. The proposed work performs the analysis by designing, developing and analyzing various quality aware MAC protocols for Wireless sensor network. This paper describes the detailed analysis of different channel access methods of a network. It also depicts detail algorithms of SMAC and describes the procedure of data communication in TMAC, BMAC, and ZMAC. Also, simulate the SMAC and TMAC protocols to analyze energy efficiency as a QoS parameter. The simulation of SMAC and TMAC data transmission is done in network simulator 3 by using various network parameters. In this research the QoS parameters like Energy, Throughput, delay and, latency are analyzed by simulation and literature respectively. A new research always starts with analysis of existing one. So, Analysis of different MAC is useful for the WSN research community to propose and develop a QoS aware MAC protocol. **Keyword:**Analysis, Delay, Energy, MAC, QoS, Throughput, WSN **References:** 1. 	Paper Title:	**The Effect of Electronic Taxing System in Creating Taxpayers Insight about the Equity and Justice of Tax System**	
	Abstract:is well known, nowadays the government of any state has to collect sufficient revenue as much as possible in order finance its operation. But in reality, government of any state has facing difficulty in collecting revenue from its citizen due to various ins and outs. Among the most important reasons one is lack of tax fairness and justice. The primary objective of this study was to examine the effect of electronic taxation system in creating an insight about the fairness of tax administration system in Wolaita Sodo town. The cross sectional survey method was adopted and self administered survey and in-depth interview has been used to collect the	**2098-2104**

data. The data has been collected from 192 individual business profit tax payers from category “B” tax payers and 20 tax officers for interview through systematic random sampling techniques. The data has been analyzed by correlations and multiple regressions. The findings shows that fairness of taxation system is directly related with tax complexity, tax general knowledge, tax general fairness, exchange fairness, horizontal fairness, vertical fairness, redistributive fairness and administrative fairness and have significant effects on tax fairness in the current tax system but General fairness is insignificant at 5% level of CI.Finally, based on the findings possible recommendations were given. The tax authorities should provide sufficient tax training to improve the awareness of tax payer’s towards taxation system. More efforts would be exerted in providing tax information through various means at local and federal level about the rights and duties of tax payer’s to bring the growth in the economy of the country in general and well being of its citizens in particular. Thereby, enhancing fair tax collection and providing basis for further research in a broader scope.

	Paper Title:	**Process Optimization and Influence of Micro Structural Characterization by Friction Stir Welding of Various Materials**

Abstract:Various advanced joining techniques are available now days to suit the process challenges and to connect the specific application areas of industrial sector. Several experimental investigations on mechanical characteristics of different materials along with process parameters are successfully joined and evaluated. Friction stir welding (FSW) defines a solid state bonding operation, which uses a non-consumable tool to join the workpiece material. Friction stir welding technique can be applied to weld the similar and dissimilar materials including ferrous, nonferrous and polymers to develop sustainable byproduct. Industrial applications in the fields of automobiles, aerospace are expecting the techniques to join various combinations of materials for lightweight and improved performance from engineering designs that ensures the fulfillment of current challenging desires. As the research intensifies into wider aspects like obtaining suitable material combinations to attain the objective of reduced weight and also to satisfy applications aspects, friction stir welding gave perfect platform to exhibit newer material integration. Objective of this paper is to research and analyze the influence of critical parameters through FSW. In this direction, review based on process based methodology of different materials combinations like ferrous materials, non-ferrous materials and dissimilar material has been focused. Welding parameters influencing the FSW operations and their effect on mechanical properties in the respective categories of material pooling has been indicated. Tensile test, hardness inspection, macro and microstructural evaluations of subjected materials have been highlighted in this section. This suggest with further recommendations that FSW can also be applied effectively in case of polymeric materials in continuance of research domain.

	Paper Title:	**Soil Structure Interaction Effects on R C Structures Subjected to Dynamic Loads**

Abstract:From the past studies, every engineering structure was designed to withstand all external and internal forces applicable to the structure. For this many design methods are implemented and different techniques are found manually, experimentally and practically. One of the parameters which influence the analysis results is, support condition of the structure. Assuming fixed or pinned support in regular analysis of structure considering soil interaction with foundation may not produce accurate results as support condition differ by type of soil ie., loose, medium or hard & their characteristics. So, there is need to study about structural interaction with soil and their outcome deeply. Now a day's soil structure interaction studies are playing major role in the analysis & design of structures. Many studies are carried out on structure interaction of soil considering seismic or lateral

2114-2120

forces. This paper reviews the studies carried out on structural interaction with soil and its impacts on various reinforced concrete buildings subjected to dynamic loads.

Paper Title: **Methods of Landslide Detection using GIS and Remote Sensing Images**

Abstract:The most challenging and damaging natural disaster is the landslides around the mountainous terrain especially in the western and northern regions of India. The landslides lead to several damages in terms of socio-economic impacts, thus it gains significant researcher's attention since from the last two decades to study and early prediction of landslides. The automatic and accurate landslide detection and localization become essential to suppress the socio-economic impacts with help using sensing remote images & Geographical Information System (GIS). Nowadays remote sensing images provide useful information combined with the GIS environment related to the spatial factors that are influencing the landslide occurrence. The fundamental prerequisite for the landslide prediction using GIS is landslide inventory. In India, the satellite images collected using remote sensors such as LANDSAT ETM+, ASTER, IRS P6, etc. to form the landslide information over the parameters like aspect, slope, drainage density, relative relief, etc. Thus using the remote sensing images, the monitoring of landslide introduced. The landslide prediction using the remote sensing images however suffered from the various challenges. This paper presents the systematic review of various landslide prediction and localization methods using the remote sensing images and GIS information regardless of the study areas. The comparative analysis and the current research challenges for designing the automated landslide detection framework discussed based on the literature review.

Paper Title: **Productive and Security in Remote Sensor Network using SNR**

Abstract:Remote Sensor Networks is presently generally spread the nation over. This contraption faculties and screens the physical state of our condition and assembles every one of the information gathered at a focal area called sink. The contribution to this contraption is the physical conditions and changes over
it into electrical sign A collection of spatially distributed and dedicated sensors also known as wire less sensor network, the hubs in the system have a restricted transmission, less vitality and less space. So to improve this we use grouping methods to give an effective method to build the lifetime of a WSN hence we are utilizing Signal to Noise Ratio (SNR) based bunching instrument This plan proposes an Efficient and Secure Routing Protocol for Wireless Sensor Networks through SNR-based Unique Bunching (ESRPSDC) that can isolate the sensor hubs into a few meetings called as groups where one hub will be group head (CH) and non-cluster head (NCH) adherents. These supporters will detect and gather the information and the information will be sent to group head. The bunch head will at that point send the information to the sink. We need group heads on the grounds that the hubs can't straightforwardly send information to the sink in view of less vitality.

Keyword: Cluster Head, Wireless Sensor Networks, Noise Ratio signal

	Paper Title:	**Four Most Famous Cyber Attacks for Financial Gains**

Abstract:Cyber attacks are on the rise every day and pose a major threat to the Internet users. Cyber attackers are constantly capable of gaining hidden exposure at the moment and keeping a low profile. There is a need to carry out analyses on cyber attacks for educational purposes. In this paper we analyze four types of most famous cyber-attacks for financial gains: phishing attack, salami slice attack, ransomware attack, and cryptojacking attack. General Terms: Cyber attacks

Keyword: Phishing, salami slicing, ransomware, cryptojacking.

Paper Title: **Reliability and Energy Efficiency of DEAR Protocol with Cooperative Caching in IEEE802.15.4 based large ubiquitous Wireless Sensor Networks**

Abstract:Reliability and Energy Consumption issues in large ubiquitous Wireless Sensor Networks are a cause of concern especially because there is an inherent conflict between the two: an increase in reliability usually leads to an increase in energy consumption. Conversely, energy conservation has been a priority research concern in wireless sensor nodes. Data aggregation from various nodes and its transmission to the sink node through multiple hops which is important for network reliability increases the overall energy consumption in the network. Several schemes were proposed in the past to address the reliability needs and also to minimize the energy consumption in the network. In this context, this paper proposes a novel strategy for IEEE802.15.4/ZigBee based networks by incorporating a Distributed Energy Aware Routing (DEAR) protocol with a localized Cooperative Caching algorithm that addresses the query generated by a requester node or sink node with datum already existing in the locally available cache memory or in the memory of its one-hop neighbors or by the source node. The DEAR protocol considers battery level as a key factor to include nodes in its routing path. The proposed model is evaluated on the basis of three scenarios which were considered to illustrate the impact of energy consumption on the reliability of WSNs.

Keyword: Energy Consumption, WSNs, DEAR, Reliability, Cooperative Caching, IEEE802.15.4

Paper Title: **Mechanical Behavior of Aluminum Metal Matrix Composite for Wheel Hub Application**

Abstract:Now the days of light weight application in a industry. In light weight application the material also strength of the material also important once. The material behavior load character station and application area also important once. The most of the material not suitable for the application. In this work the aluminum MMC material has been chosen in this work. The main focus of the work is aluminum alloys wheel hub area. The main problem is wear resistance. Generally the alloy wheel hub are with stand in a 50000 KM in motor cycle. Then after they are wear out. When increase the hardness of the material hence the decreasing wear out corresponding wear resistance also improved. In this work the aluminum MMC as taken different level and observed which one material as chosen for the application. Finally we are discussed with fracture surface of the materials

Paper Title: **American Sign Language to Text - Speech using Background Subtraction using Running Averages**

Abstract:This Paper Proposes A System Which Converts American Sign Language Hand Gestures Into Text Cum Speech And Helps To Bridge The Communication Gap Between Deaf-Mute People And Rest Of The Society. Any System For This Purpose Generally Has Four Modules: Segmentation, Feature Extraction, Classification And Text-To-Speech. This Paper Focuses On An Improved Method For The Segmentation And The Feature Extraction Processes To Get More Better Resultswhile Using The Standard Techniques On The Other Two Modules. Proposed Algorithm Captures Initial 30 Frames Of The Live Video From The Web Cam Of The System To Construct The Background Model. It Then Finds The Absolute Difference Between The Current Frame And The Background Model In Order To Get The Foreground. Various Features Are Extracted

2150-2156

To Classify The Gestures Like Contour, Convexity Hull Etc.. Proposed Algorithm Has Been Tested Under Low And Normal Room Light Conditions. The Overall Performance Of The Proposed Model Will Be Very High And Will Produce Far More Better Resultsdue To Improved Proposed Algorithms For The Initial Two Modules In Comparison To Other Standard Techniques Used Like Hsv, Ycbcr The Above System Can Be Incorporated Into Simple Web Applications, Mobile Applications And Many Other Applications Translating Gestures In The Conversations In Real Time.

Keyword:ASL, Background Subtraction, Running Averages, Segmentation, Feature Extraction, HSV, YCbCr.

Paper Title: **Fuzzy Logic Based Energy Efficient Mechanism for Dymo in Mobile AD HOC Networks**

Abstract:Mobile ad hoc network (MANET) attracted various researchers in the emerging communication networks without having any centralized structure. In this network, mobile nodes moves in their own wish creating a dynamic topology. Routing is a cumbersome task with this dynamic topology from time to time change in connection pattern. DYMO is emerged as challenging protocol in MANET but works on static configuration parameters such as Hello messages. The mobile device updates the connectivity of their neighbours by sending Hello messages at frequent intervals irrespective of the network scope (terrain) and network elements(number of nodes). As the mobile nodes are battery equipped devices, lot of energy is consumed with these messages. Energy efficient mechanisms are necessary in this type of networks. In this work, DYMOHBFLWTN mechanism is proposed to set the Hello parameter dynamically in DYMO considering network terrain and number of nodes utilizing fuzzy principles. Experiments are conducted on Qualnet 7.0 simulator to evaluate mechanisms - DYMOHBFLWTN and DYMO. The proposed DYMOHBFLWTN mechanism provides better results compared to existing DYMO.

Keyword:DYMO, DYMO HBFLWTN, FuzzyLogic, Hello, MANETs.

Paper Title: **Implementation of Stepped Frequency Modulation Pulse Compression on NI Suite**

Abstract:In Radars and Sonar, the pulse compression technique is used continuously to increase the range resolution, range detection and the signal-to noise ratio (SNR). This can be achieved by modulating the transmitted pulse and then correlating it to the received pulse with the transmitted signal. This transforms short pulse into long pulse and is used to increase long pulse bandwidth by some form of modulation such as linear frequency modulation (LFM), so that Range Resolution is not compromised. The proposed Stepped Frequency Modulation (SFM) is a common Pulse Compression Method, which is useful to increase the Radar Range Resolution without losing the capability of target detection. Step Frequency Continuous Wave (SFCW) is also one of the techniques used in the Pulse Compression Technique, where the return echo step is used to determine range and is used for different purposes. This type of setup is widely used in RADAR design and testing. This Paper proposes the implementation of various Modulation techniques such as LFM, SFM and SFCW for proposed Stepped frequency Modulation using NI suite hardware PXI system which has a configurable FPGA and RF front end to generate custom waveform in wide range of frequencies with bandwidth up to 1GHz design and testing.

Paper Title: **Preparation and Characterization of Tungsten Carbide WC/Cobalt Composites by Powder Metallurgy Method**

Abstract:The Tungsten carbide (WC) based composites are good choice to replace the traditional conventional materials for obtaining high hardness and wear resistance. This work investigates the influence of cobalt content on the characterization of Tungsten carbide. The composite specimens are prepared by using powder metallurgy technique. The effect of cobalt material on the performance of Tungsten carbide hardness, fracture toughness is estimated by conducting suitable experiments. While performing experiments, a powder mixture of 89% WC, 11% of Co was manufactured with powder metallurgy, under appropriate milling conditions and Sintering temperature to ensure uniform microstructure. From the present work the optimum sintering temperature of Tungsten carbide mixed nano cobalt composite is identified. The crystalanity of the resulting materials is identified from a rapid analytical technique, X -ray Diffraction.

	Paper Title:	**Breast Cancer Detection using Gradient Boost Ensemble Decision Tree Classifier**

372.

Abstract:Detection of any abnormalities in the human is a big challenge faced by many of the field experts. One such challenge is to detect the Breast Cancer. The prime mottobehind in making this paper is to detect the breast cancer with the help of breast images in an advanced and appropriate way. In this study, an attempt is made in such a way by applying the combination of various existing technics in the extracted breast images for getting better result in detecting the Breast Cancer. Consequently,feature extracting images are appliedusing Light gradient boosting ensemble decision tree classifier for identifying benign and malign features of an image. As a result, the normal and abnormal breast cancer image is detected by combining above applications. Besides, classification accuracy and minimize classification time metrics are also achieved more appropriately than the existing detectingtechnics.

	Paper Title:	**Characterizing and Countering Communal and Anti-Communal Tweets During Disasters**

373.

Abstract:Various tweets shared during a disaster situation encompasses data related to current scenario and about emotions/opinions. By analyzing these communal tweets, abusive posts which targets various religiousandracial groups during natural calamities has been found. By reviewingits effects, a classifier has been developed to distinguish between communal and non-communalmessages, which shows better performance. People posting such communal tweets has been analyzed which says that most of them are posted by popular users from media, politicsand form strong correlated groups in the social network which makes it to reach

2174-2177

higher. An event-independent classifier has been proposed whichidentifiesanti-communal tweets automatically and propose a way to counter back. A real-time service has been developed to find tweets automatically related to an emergency segregating communal and anti-communal tweets. Government and local monitoring agencies can use this system for making decisions like filtering or to promote some news.

Keyword: Tweets, Communal, Non-Communal, Event-Independent classifier.

Paper Title: **Impact of Improved Chicken Swam Optimization Based A* algorithm In MANETs Routing**

Abstract:Wireless devices utilization had increased drastically, which has shown an impact on over-all demand and utilization Mobile Ad-Hoc Network (MANET). Routing protocol is the fundamental and vital performance factor in the Mobile Ad-hoc Network (MANET). The routing protocols in MANET are accomplished to handle a lot number of nodes with restricted resources. Multiple routing protocols exist in MANETs. Once of the main challenges in routing protocols is its generation of adverse influence on network performance. Accordingly, this paper plans to implement an obstacle-ware MANET routing model using improved meta-heuristic-based A* algorithm. The algorithm efficiently plots a path between multiple nodes avoiding obstacles, or points, on the graph that results in producing a shortest path without any obstacles. The improved meta-heuristic algorithm termed as Fitness and Position Ratio-based Chicken Swarm Optimization (FPR-CSO) is used to improvise the A* algorithm. The comparative analysis of different optimized A* over Ad hoc On-Demand Distance Vector (AODV) confirms the consistent performance of the proposed model.

Paper Title: **Performance Assessment Techniques for the 3-Phase IAG**

Abstract:This manuscript covers the analytical and optimization based techniques for the performance assessment of 3-phase IAG furnishing 3-phase and 1-phase load. It examines initially the basic phenomenon of voltage build-up and then the steady state performance of 3-phase IAG furnishing 3-phase and 1-phase load. This preliminary study forms the foundation or basis of the design of future controllers. The conventional techniques and MATLAB based optimization technique fsolve is elaborated in detail along-with advantages and disadvantages for attaining the solution of simultaneous non linear equation. The fsolve technique is recommended for the solution of non-linear equations due to its advantages over conventional method.

Paper Title: **Mapping the Spatial Accessibility of Riau's Health Facilities using QGIS**

Abstract:In this study, we try to map the health facilities' spatial accessibility in Riau Province, Indonesia. Access to proper health facilities is a determinant factor in a country's development. There are some problems in establishing and developing health facilities; one of them is the health facilities' accessibility during disaster hazards. Therefore, the health facilities' location will be related to common disaster hazards, such as forest wildfire and floods. We use QGIS software to help in building and analyzing the spatial accessibility with the final web application that can be used as a supporting tool for decision-makers.

Keyword: Health facilities, flood, forest wildfire, spatial accessibility, Riau.

Paper Title: **Reasons for the failure of B.Tech Students in Mathematics using Combined Disjoint Blocked Fuzzy Cognitive Maps (CDBFCM)**

Abstract:At the present time most of the B.Tech. students are failing in Mathematics subject. The reason is they are not having fundamentals. Lack of practice also one reason. Because most B.Tech. Students are with attitude problem. In this paper we are going to investigate the causes for the failure of B.Tech Students in Mathematics with the help of Combined Disjoint Block Fuzzy Cognitive Maps (CDBFCM). W.B. Vasantha Kandasamy, A. Victor Devadoss started the technique. This technique will be efficient if the numeral of concepts are big in figure and we have to cluster them. The troubles are going to be discussed here with the assist of Combined Disjoint Block Fuzzy Cognitive Maps (CDBFCM). Finally, we are going to identify the most important causes for the failure of B.Tech. students in Mathematics. For this we used neutrosophic device. There are five sections. Section one provides details regarding Fuzzy Cognitive Maps and the the causes for the failure of B.Tech. students in Mathematics. Section two provides basic concepts of Fuzzy Cognitive Maps, Combined Disjoint Block Fuzzy Cognitive Maps. Process of finding the unseen outline was given in section three. The difficulties are given in section four. After the completion of work decisions are given in the last section.

Paper Title: **Confidence-based Security System for Routing Protocol in Mobile Ad-hoc Networks**

Abstract:A mobile ad-hoc network (MANET) is an infrastructure-less network of wireless nodes. The network topology may change quickly with respect to time, due to node mobility. The network is a disintegrated network, activities such as delivering messages by determining the topology essential to be implemented by the nodes themselves i.e., the routing activity will be unified into mobile nodes. Due to the lack of centralized administration in multihop routing and open environment, MANET's are susceptible to attacks by compromised nodes; hence, to provide security also energy efficiency is a crucial issue. So as to decrease the hazards of malicious nodes and resolve energy consumption issues, a simple confidence-based protocol is built to evaluate neighbor's behaviour using forwarding factors. The reactive Ad-hoc on-demand multipath distance vector routing protocol (AOMDV), is extended and confidence-based Ad-hoc on-demand distance vector (CBAOMDV) protocol, is implemented for MANET. This implemented protocol is able to find multiple routes in one route discovery. These routes are calculated by confidence values and hop counts. From there, the shortest path is selected which fulfills the requirements of data packets for reliability on confidence. Several experimentations have been directed to relate AOMDV and CBAOMDV protocols and the outcomes show that CBAOMDV advances throughput, packet delivery ratio, normalized routing load, and average energy consumption.

Keyword:AOMDV, CBAOMDV, MANETs, Security.

Paper Title: **Improving the Automobile Purchasing Behavior of Customer: Classification Techniques**

Abstract:Data mining (DM) is the automate detection of relevant pattern from the database. E-Commerce is a very famous as well as frequently used new technique in the real world applications. DM is an automate detection of relevant patterns from large amount of information repositories. E-Commerce is a Killer-domain for data mining. DM is often a complex process and may require a variety of steps before some results are obtained. To predict behaviors and future trends many tools are available in DM, also allowing the businesses to make proactive pathways for the customer. In this research work, it is taken online shoppers purchasing vehicle data set and find accuracy in terms of its purchasing behavior using some of the classification algorithms. The classification algorithms namely Bayes Net and NavieBayse are utilized for the analysis and a comparative study of both the algorithms are carried out. Finally, the performance of the chosen algorithm is suggested for analyzing the vehicle data set based on the purchasing behavior of the customer and predicts some accuracy.

Keyword: Classification Algorithms, Bayes Net, Naïve Bayes Algorithms.

Paper Title: **PPDM for Medical Data using Visual Cryptography**

Abstract:Privacy preserving data mining is a growing field with advancements reported frequently. In this paper, for maintaining privacy of medical data of patients, a novel visual crypto technique of peeling with modular scheme is proposed. In this work, using the concept of group theory, PPDM for medical data is done using Verilog.

Keyword: Visual Cryptography,Concurrency, Image Slicing, privacy preservation.

	Paper Title:	**The Relationship Between Intrinsic and Extrinsic Motivation in Tooth Brushing Against Index Debris Scores on Students At Sdn Sendangmulyo 02, Semarang City**	
	Abstract:Caries are one of the serious health problems in school-age children especially elementary school. Dental caries are one of which is influenced by the behavior of people in maintaining dental and oral health. Public behavior of dental health, one of which is influenced by a person's motivation in the habit of brushing teeth. The aim of the study was to analyse intrinsic and extrinsic motivational relationships in brushing teeth against the index debris score and tooth brushing skills at the students of SDN Sendangmulyo 02, Semarang in 2019. The types of research used are analytical surveys using questionnaires with cross sectional research plans. The samples in this study amounted to 53 samples and used purposive sampling techniques. Data analysis is conducted with the analysis of univariate and bivariate, test the relationship using the test of Spearman rank. Statistical test results showed there was a link between intrinsic motivation and extrinsic students in tooth brushing against index debris scores and tooth brushing skills, where intrinsic motivational variable statistical test results show the value of ρ-value = 0.489 (ρ-value > 0.05) and extrinsic motivation indicating the value of ρ-value = 0.095 (ρ-value > 0.05). Conclusion: There is no relationship between intrinsic motivation and extrinsic motivation to the index debris score in the students of SDN Sendangmulyo 02, Semarang City Central Java. **Keyword:**motivation, index debris score, tooth brushing skills **References:** 1. 	Paper Title:	**An Improved Multi-Biometric System for Authentication**	
	Abstract:Biometrics is the new technology for calculating and measuring the body parts of a person. It is playing an important role in identifying an individual. It signifies a metrics related to person characteristics (physiological or behavioral). Biometric system may be based on single modal or multiple modals. Multimodal system also termed as multi-biometric system (hybrids two or more modals) are becoming popular. The idea behind the paper is to implement and improve the authentication processusing multiple trait for identifying a person. Here, the combination of Iris & Fingerprint based biometric model is presented. The relevant features (key-points) are extracted from these two traits in parallel and then they are passed through matching module. The key-points are extracted using Discrete Wavelet Transform (DWT) and Speeded-Up Robust Feature (SURF) descriptor and then passed to the matching (mapping) module where mapping is done using the Normalized Weighted Sum-Rule. The experimental result showed that the proposed multi-biometric model performs well showing clear variation in FAR and FRR against the existing models. **Keyword:**Biometric, multimodal, fingerprint, iris, authentication, recognition. **References:** 1. Paper Title: **Processing and Mechanical Characterization of ADC12 alloy-B4C-RHA Hybrid Composites**

Abstract:The effects of dual particulates addition on the mechanical behaviour of ADC12 alloy composites were studied. Boron carbide (B4C) and rice husk ash (RHA) particulates were used as the reinforcements in the ADC12 alloy base matrix. Hybrid composites were prepared by using liquid melt method, keeping 5 wt. % of B4C reinforcement constant and varying rice husk ash particles in steps of 3 and 6 wt. % in the ADC12 alloy. Samples were tested for microstructural characterization by using SEM and EDS. Mechanical behaviour like hardness, ultimate tensile strength; yield strength, percentage elongation and compression strength were evaluated as per ASTM standards. SEM photographs revealed the uniform distribution of B4C and RHA particulates in the ADC12 alloy and these particles were confirmed by EDS analysis. Further, hardness, tensile and compression properties of base matrix ADC12 alloy was enhanced with the addition of B4C and RHA particulates. Ductility of ADC12 alloy decreased after the incorporation of B4C and RHA particles.

Paper Title: **Respect Human Value to Control Software Development Failure**

Abstract:People learn and define their own values to interact in different situations. It is important to know the

2245-2250

human values (HV) for dealing humans in better ways. HV can also be helpful for software development managers to make right decisions for managing their teams well. Unfortunately, to a great extent, the very factor is ignored in software engineering (SE). This study aims to provide a basic motivation of the topic to SE researchers to carry out some empirical evidences to control software development failures through respecting software developers' HV. In order to operationalize the study, few disciplines, in which the HV are empirically discussed, are considered to replicate the impacts on software development. The factor HVs is well connected with satisfaction and improvement outcomes in sociology, education and management studies. Likewise, this study also literates the importance of HVs for successful software project development. This study concludes that HV can form strong correlations with software development roles and can be used to minimize the software failure.

Paper Title: **Disciplinary Control System Based on Naïve Bayes Classification Technique using Jsp Servlets**

Abstract:The idea behind the task is to create the complaint about the student, who behaves mischievously in any circumstances by not following the dress code which includes things like identity cards, shoes, tuck especially for men, students should not carry mobiles to college if any person/student violates these rules then the disciplinary committee members have the authority to take off that particular student's belongings (I.e. I'd card, mobiles). If that particular student caught more than one time for any condition then then the disciplinary committee will charge a fine and sometimes the mobile phones and I'd cards will be moved into locker (where they head of the committee members will have capacity to keep with them more than 3 days to 1 month, sometimes they will keep with them 1 year too. Students have to spend much time to take their belongings from the disciplinary committee members and also to take permissions, instead of that we are created a website and in that website students, disciplinary committee members including administrators can read, write, create and delete the comments that are created. From that data we can analyse in the way of plotting techniques and classification approach in which year students are not in discipline manner.

Keyword: Student management, Naïve Bayes classification, JSP Servlets, R Programming, plotting techniques.

Paper Title: **Design and Simulation of Spoon Shaped Antenna using DGS**

Abstract:A planer spoon shaped antenna with defected ground structure (DGS) is designed and fabricated for wireless application. The proposed antenna design exhibits 1.6GHz bandwidth, 2.20dBi Avg. Gain and maximum return loss of -24.5dB, which offers better results in wideband application. The Proposed antenna structure is simulated by software CST MWS (CST Microwave Studio) version 2018 and later comparison results are also presented

Paper Title: **Investors' Behaviour on Investment Avenues**

Abstract:Investors are confronted with a set of investment avenues, to spend their savings, based on the risk and returns availability. The behavior of investors would differ with reference to time, personality and specific

2260-2263

needs. Therefore, the study proposes to assess the influence of demographical factors and sources of information on the investors' awareness and risk attitude, towards various investment avenues. A structured questionnaire was prepared and administered to a sample of investors. It has been found that the rural and urban investors differed in their risk attitude and awareness towards various investment avenues. The Married and unmarried investors did not differ in their awareness but they differed in their risk attitude and risk levels faced by investors differ with respect to age and educational qualification of the investors. The study concludes that the recent technology development could provide knowledge to the investors about their investment options and risk level to take informed decisions on investment.

Paper Title: **Optimizing Deep Network for Image Classification with Hyper Parameter Tuning**

Abstract:The deep network model comprises of several processing layers and deep learning techniques help us in representing data with diverse levels of abstraction. Based on the practical importance and the efficiency of machine learning, optimization of deep models are carried out relating to the objective functions and its parameters for a particular problem. The present work focuses on an empirical analysis of the performance of stochastic optimization methods with regard to hyperparameters for the deep Convolution Neural Network (CNN) and to understand the rate of convergence of the optimization methods in high dimensional parameter spaces. Experimentation has been carried out in deep CNN model with different optimization methods viz. SGD, AdaGard, AdaDelta and Adam. The empirical results are evaluated using benchmark CIFAR10 and CIFAR100 datasets. The optimal values of the hyperparameters obtained demonstrates that the optimizer Adam shows the best results compared to other methods viz. SGD, AdaGard, and AdaDelta over the considered datasets. Further, it is noted that classification accuracy can be increased by choosing the best optimization techniques with hyperparameter tuning to get the optimal configuration of the deep CNN model.

Keyword: Optimization techniques, CNN, hyperparameter.

Paper Title: **An Energy Efficient Load Balancing Protocol for Multi-Hop Clustering in Wireless Sensor Network**

Abstract:Cluster based WSNs is a rising and empowering technical knowledge with the achievable to revolutionize Data Communication Technology. The purpose of WSN stretch out to diverse areas such as the security and surveillance, Medical and Health, Military related application, Agriculture, Entertainment and so on. In wireless sensor networks (WSNs), the sensor nodes are highly distributed in order to sense and transform information to base station. However, the major challenge in WSN is to avoid collision and energy dissipation due to redundant data and thereby extending the network lifetime. To address this issue, a novel energy efficient load balancing protocol (EELB) for data forwarding in multi-hop clustering based WSN is proposed. EELB is a hierarchal cluster-based protocol which schedules the sensor nodes to different modes namely sleep mode and active mode by probing the data transformed to decrease energy consumption effectively. A sensor node is set to sleep mode when it senses and transfers redundant data for an extended time. The other sensor nodes remain enabled in active mode for sensing and transmission of data packets. Also, the proposed protocol selects a reliable cluster head based on remaining residual energy level and trust value of each node. The Simulation outcomes depicts that the proposed EELB protocol performs well than conventional protocol with respect to average energy consumption, lifetime of nodes and the Packet Delivery Ratio.

Keyword: Clustering, Load balancing, Scheduling, Sensor node

Paper Title: **A Multiband Arrow Shaped Patch Antenna Based on Apollonian Gasket and Soddy's circle for Application in LTE and UWB range**

Abstract:A novel arrow shaped planar multiband antenna based on apollonian gasket and Soddy's circle with

2276-2282

Defective Ground Structure (DGS) is described in this paper. The structure is designed on an FR4_epoxy substrate (εr=4.4).The performance is evaluated using HFSS software. The antenna displays multiband behaviour in the frequency range from 3 to 10 GHz which is suitable for wireless communications applications.The antenna gives tri-frequency response in LTE range(600 MHz-6GHz):1.17 GHz, 3.44 GHz and 6 GHz;and tetra frequency response in the UWB frequency range(3 GHz to 10 GHz): 8.1 GHz, 9.5 GHz, 11.8 GHz & 13.5 GHz which could be used in wireless and radar communications.The overall performance of the antenna demonstrates an average impedance bandwidth(IBW) of 300 MHz with a good impedance matching (S11< -10 dB).The proposed antenna has the satisfactory radiation characteristics throughout its operating band. The measured highest gain differs from 1 dBi to 1.9 dBi inthe entire frequency range.

Paper Title: **Effect of Epoxy Coating on Structural Steel Section under Tension**

Abstract:Structural steel connections are one of the most critical components of any steel structure as the cross-sectional area of steel sections reduces due to bolt holes. Failure of a structural connection may lead to failure of entire steel structure. Many researchers have tried to improve the connections previously by gluing fiber

polymers at the connection. In this research glue or epoxy has been used around the bolt holes to simplify the process of using fiber polymers with steel. Epoxy is a combination of resin and hardener. It is proposed here to strengthen the structural steel connection in new structures and also in existing structures by applying a thin coat of suitable epoxy around the bolt hole. Thin steel plate with hole at the centre was tested under tensile load and results for ultimate load, breaking load, corresponding stresses and displacements obtained. Another steel plate with same geometry was then epoxy coated around the hole and same test was conducted on this specimen. Results for yield, ultimate, breaking loads and corresponding stresses and displacements recorded. The load-displacement curve is generated for both the cases and compared. The ultimate load bearing capacity of the plate increased in tension slightly after epoxy coating. Significant increase in breaking load observed as the thickness of epoxy layer was increased. Increase in the ductility of the composite plate is seen as increase in displacement is visible. There was considerable reduction of average stress around the center hole. The results indicate that structures can be safer against total failure and will give adequate warning before collapse.

Keyword: Epoxy, epoxy-coating, composite-section, stress reduction.

Abstract:Reusing the code with or without modification is common process in building all the large codebases of system software like Linux, gcc , and jdk. This process is referred to as software cloning or forking. Developers always find difficulty of bug fixes in porting large code base from one language to other native language during software porting. There exist many approaches in identifying software clones of same language that may not contribute for the developers involved in porting hence there is a need for cross language clone detector. This paper uses primary Natural Language Processing (NLP) approach using latent semantic analysis to find the cross language clones of other neighboring languages in terms of all 4 types of clones using latent semantic analysis algorithm that uses Singular value decomposition. It takes input as code(C, C++ or Java) and matches all the neighboring code clones in the static repository in terms of frequency of lines matched.

Paper Title: **Application of Zone Selective Interlocking in Electrical Power Distribution System**

Abstract:The two major concerns in today's electrical distribution system are the potential damage from fault stress and the costs associated with power outages. The optimal way to limit fault stress is to clear the fault in the shortest amount of time. Unfortunately, clearing the fault within the shortest amount of time might sacrifice coordination and lead to broader power outages. Zone Selective Interlocking Coordination assures the possible sustaining of faults for over currents and voltages with different faults. The circuit breaker operation and principle depend upon the open and close operation for the continuity of supply/service. To reduce the stress on the system, generated energy during fault conditions to be considered and its coordination to be checked.

Paper Title: **Performance of Various VoIP Vocoders using Wireshark with Asterisk PBX**

Abstract:A private branch exchange (PBX) is implemented by an Asterisk software. In conjunction with appropriate telecommunication hardware interfaces and network applications, Asterisk is employed to establish and manage the telephone calls between telecommunication endpoints, like customary telephone sets, destinations on the general public switched telephone network (PSTN), and devices or services on voice over internet Protocol (VoIP) networks. A Vocoder may be a system of coders and encoders that is employed to scaleback the bandwidth over the restricted use of bandwidth necessities and restricted capability channels in real time needs. This paper presents Performance of Various VOIP Vocoders using wireshark with Asterisk PBX.

2300-2305

Paper Title: **Optimizing the Distribution of Memristance Values of Memristive Synapses for Reducing Power Consumption in Analog Memristor Crossbar-Based Neural Networks**

Abstract:Memristor circuits have become one of the potential hardware-based platforms for implementing artificial neural networks due to a lot of advantageous features. In this paper, we compare the power consumption between an analog memristor crossbar-based a binary memristor crossbar-based neural network for realizing a two-layer neural network and propose an efficient method for reducing the power consumption of the analog memristor crossbar-based neural network. A two-layer neural network is implemented using the memristor crossbar arrays, which can be used with analog synapse or binary synapse. For recognizing the test samples of MNIST dataset, the binary memristor crossbar-based neural work consumes higher power by 19% than the analog memristor-based neural network. The power consumption of the analog memristor crossbar-based neural network strongly depends on the distribution of memristance values and it can be reduced by optimizing the distribution of the memristance values. To improve the power efficiency, the bias resistance must be selected close to high resistance state. The power consumption of the analog memristor-based neural network is reduced by 86% when increasing the bias resistance from 20KΩ to 160KΩ. For the bias resistance of 160KΩ, analog memristor crossbar-based neural network consumes less power by 89% than the binary memristor crossbar-based neural network.

Keyword:memristor, memristor crossbar, memristive synapse, handwritten digit recognition.

	Paper Title:	**SM-ARP: Stochastic Markovian Game Model for Packet Forwarding Based Arp Spoofing Attacks Detection**

Abstract:Address Resolution Protocol (ARP) spoofing attacks have become the most pivotal attacks in deteriorating the performance of computer networks. The objective of this paper is to develop SM-ARP, Stochastic Markovian game model based ARP spoofing attack detection scheme.Although many recent techniques have been developed to detect and protect against ARP spoofing attacks, the practical challenges has led to ineffective utilization. The major challenge is that the attackers employing ARP spoofing tend to alter the attack strategy at each point and increases the difficulty in detection and security implementations. The packet forwarding relaying is one suchattack strategy which is harder to detect using traditionally proven methodologies. This paper tackles the packet forwarding relay strategy based ARP spoofing attack strategy by using the proposed SM-ARPto eliminate the attack in a practically feasible manner. The proposed model utilizes a stationary Markov model for optimizing the packet forwarding behaviour of the networks. When an ARP spoofing attack is initiated, the SM-ARP model tracks the changes in the packet forwarding patterns through cache table and detects the misbehaviours. As a security measure, these misbehaved nodes are entitled to recovery and repair process to restore the network to stabilized state. Experiments are conducted to evaluate the performance of SM-ARP in an application for student marks management system. The results prove that the proposed SM-ARP model improves the detection of ARP spoofing attacks with accuracy of 88.2% and also reduces the complexity and errors.

	Paper Title:	**A Well-Organized Model in Cloud Computing Platform for Data Accessing**

Abstract:Cloud Computing is a trending technology. The main benefit is user will pay only for the resources which have been utilized in the cloud services. Data which are stored in cloud can be accessed by the people from anywhere in the world using internet connection. Because of difficulties in data access and lack of security, in the current database system people are moving to Cloud Service Provider (CSP). Network backup and recovery method are used in CSP so there is no data loss in case of hardware failure. In this paper, we planned an efficient model in cloud computing for data accessing which will reduce the search time of providing the public key of the data owner. Not only data storage and security, data access also plays an important role to consume less time. So, in this proposed system we are going to increase the time efficiency for the data accessing.

Paper Title: **Influence of Arc Flash Performance and ESDD Measurement of Bushings Tainted by Nitrates**

Abstract:Tainting devastate the feat of bushings. Conductors are insulated inside the bushing that carry a high voltage current through a grounded enclosure. An aspiration is to study the pollution performance of bushings tainted by Nitrates.Arc flash tests of 1kV,11kV,17.5kV bushings are tainted by three types of salts such as NaCl, NaNO3, KNO3. The morsels are negotiated under habitual environment as per IEC 60507. The impact of tainting salts with their solubility on Equivalent Salt Deposit Density (ESDD) and bushings arc flash voltage are scrutinized. The effect of tainted salts on arc flash fruition, the sway of volume conductivity and Equivalent Salt Deposit Density (ESDD) under different percentages are also scrutinized. The research upshot reveals that the Equivalent Salt Deposit Density (ESDD) rate escalated with escalating salt content. When salt concentration gets escalated then conductivity also get escalated. When Equivalent Salt Deposit Density (ESDD) get Escalated then the arc flash voltage and leakage current get slacken. Finally, the graphs are drawn between ESDD and Arc flash voltage, Conductivity and Salt concentration, Arc flash voltage and Leakage current are obtained using MATLAB software.

Keyword: Bushing, Tainted, Pollution arc flash, ESDD.

Paper Title: **Plant Disease Diagnosis and Classification by Computer Vision using Statistical Texture Feature Extraction Technique and K Nearest Neighbor Classification**

Abstract:Pest attack and infectious diseases has become more common in the field of agriculture in the recent times. It has become a challenging task to identify the infection or the insect that destructs the plant growth and production. Diagnosing the disease or the insect attack on the plants in the early stage will safe guard the plant growth and the production rate. Timely intervention of technology that deals with disease detection and control method can protect the plants from usage of harmful pesticides. The higher dosage of pesticides impacts the health of human as well as other creatures like birds and animals which directly or indirectly consumes the plant or get in touch with the plants in different circumstances. A Computer vision technique which combines the Digital Image processing and Machine Learning methodology has been proposed to provide pest management solution. The disease detection is based on the statistical texture feature analysis and it is classified using K nearest neighbor classifier. Statistical PCA is combined with SIFT method to extract the key points, which eliminates the non-operational key points and SFTA is used to extract the texture. The system has achieved better result in identifying and differentiating the infection and insect attack on multiple plant taxonomy. The implementation has been performed using MATLAB.

Paper Title: **E2CL, HC: Energy Efficient Cooperative Localized & Hierarchical Cluster Routing in CRN**

Abstract**:**With the advancement of Cognitive Radio Network (CRN), localization of primary users progress the

2342-

improvement of network performance with respect to power adoption and reliability. Moreover, CRN localization is essential because storage energy of CR devices is limited and causes increased network lifetime. By considering these issues, we propose an Energy Efficient Cooperative Localization approach (EE-CL) in CRN, which is used for placing Primary User (PU) position with the help of mobile a aided CR. Moreover, communication among CRs cooperation which leads to demand of more energy, amobile CR is allowed to manage the overall positional accuracy and wake up minimum number of CR to collaborate CR manager. In order to investigate influence of accurate location knowledge, a location-aware CR (LaCR) routing protocol employed and to improve the network life time a Hierarchical clustering approach is applied. Weevaluated the simulation results for the proposed Energy Efficient Cooperative Localization (EE-CL) Routing approach which achieves better performance compared to existing Cooperative Localization (CL) with respect to energy efficiency. Furthermore, remarkable performance is accomplished by LaCR protocol in terms of PUs collision risk with the help of localization knowledge obtained from EE-CL approach. Also Hierarchical Cluster Routing protocol acheives significantperformanceinenhancingthenetworklifetime.

Paper Title: **Delamination Assessment of FRP Composite Plate Using Natural Frequencies**

Abstract:The most frequent failure mode of composite plates is delamination. Deboning between the adjacent layers at a particular region of the multilayered composite plate is consider as delamination. It is due to a defect in the manufacturing practice or can be caused by service time conditions, for example, impact by foreign objects. Overall Stiffness of the composites reduces due to delamination. This paper presents the effect on natural frequency due to the delamination of the fiber-reinforced plastics (FRP) composites. In the finite element method, delamination is implemented as a VCCT or cohesive zone method, but in this article, delamination modeled as an open area in the interface layer in ANSYS ACP (pre).Numerical and experimental modal analysis is performed to delaminate as well as intact composite plates. Extract modal parameters like natural frequencies and mode shapes from the modal analysis. The results of the present paper compare among the existing simulation results and observe that good agreement between them. also, study the variation of frequencies with an increase of delamination. The new proposed modeling of delamination is simple and gives accurate results. This method i also used tostudy the delamination effect in composite plates.

Keyword: Delamination, Natural frequency, Composite plate, Modal analysis

Paper Title: **The Influence of Rice Straw on the Physical and Mechanical Properties of Banco, an Adobe Reinforced with Rice Straw**

Abstract:Making adobes with the best mechanical properties for the construction of earthen housings is the overall goal of this work. Specifically, we study the influence of rice straw on the physical and mechanical properties of these adobes. The physical and mechanical properties (compressive and flexural strength) of adobes (mixture of sandy clay and rice straw) have been studied with different proportions of straw in the mixture. It is a question of

2363-2367

determining the quantity of stalks of rice straw making it possible to optimize the mechanical performances of the composite. Various compositions have been considered with mass concentrations of rice straw ranging from 0 to 40% relative to the volume of clay sand to make 4×4×16cm prismatic specimens. The results obtained during physical and mechanical tests were presented in the form of a graph. The analysis of these data shows that the optimal addition of rice straw in the clay matrix is 25% for a better compromise between the compressive and tensile strengths. The improvement of the physical and mechanical properties of adobes is related to the good adhesion between the rice straw and the clay matrix, to the high tensile strength of the rice straw and finally to a good distribution of cracks in the composites.

Keyword: Banco, durable material, Clayey sand, Rice straw fibres, Physical and mechanical characteristics.

Paper Title: **Implementation of Knowba Filtering Method for Intereference Rejection in NBDSSS**

Abstract:Spread spectrum communication is a communication method that deliberately makes the bandwidth of the transmitted waveform larger than would be required to transmit the data over the channel.One of the most encouraging multiplexing techniques for present and forthcoming telecommunications services, such as private communications, ad-hoc wireless communications, third-generation cellular telephony and sensor networks, is the CDMA(code division multiple access) implemented with direct-sequence (DS) signaling. DS-CDMA's benefits include superior operation in multi-path settings, flexibility in channel allocation, enhanced capacity in fading settings, and the capability to share bandwidth with narrowband communication technologies without deteriorating the efficiency of either system. In our work,we are proposing a new know-ba strategy to dismissing interference where originally monitoring signal environment with high precision is called from the library and subsequently based on data that is appropriate for dismissing interference. Various interference scenarios are simulated using computer simulations to show the efficiency of the method.

Keyword:DS-CDMA, sensor networks, interference, knowledge based strategy.

Paper Title: **Sensing and Forecasting of Pollution Data in Mexico City**

Abstract:In this paper we present the characteristics of sensors used to monitor the pollution levels in Mexico City, namely sulfur dioxide (SO2), nitrogen oxides (NOx), ozone (O3), , and carbon monoxide (CO). A novel algorithm to predict contamination levels is presented: the Gamma classifier. Also, a new coding technique is introduced, allowing the conversion from a series of values taken from SIMAT databases into a set of patterns, which in turn are useful for the task of pollutant forecasting. Experimental results show a competitive performance by the Gamma classifier as a predictor, when compared to other methods.

Keyword: Associative Memory, Pattern Classifiers, Pollutant Forecasting; Pollutant Sensing.

Paper Title: **Features of Students Training: Qualifications and Technology**

Abstract:The article is based on the study of technologies and recommendations developed by the authors as a result of the experience accumulated in teaching a set of disciplines aimed at gaining knowledge and skills in the field of investigating certain types of crimes, performed at the Department of Investigation of the Lukyanov Orel Law Institute of the Ministry of the Interior of Russia from 2010 to 2019. The article examines the issues of preparation and selection of the most optimal training model, and the applied part provides the algorithm of a lesson, as well as options for assessing the work done by teams.

Paper Title: **Small Human Group Detection and Validation using Pyramidal Histogram of Oriented Gradients and Gray Level Run Length Method**

Abstract:Over the decade's human detection in security and surveillance system became dynamic research part in computer vision. This concern is focused by wide functions in several areas such as smart surveillance, multiple human interface, human pose characterization, person counting and person identification etc. Video surveillance organism mainly deals with recognition plus classification of moving objects with respect to several actions like walking, talking and hand shaking etc. The specific processing stages of small human group detection and validation includes frame generation, segmentation using hierarchical clustering, To achieve accurate classification feature descriptors namely Multi-Scale Completed Local Binary Pattern (MS-CLBP) and Pyramidal Histogram Of Oriented Gradients (PHOG) are employed to extract the features efficiently, Recurrent Neural Network (RNN) classifier helps to classify the features into human and group in a crowd, To extract statistical features Gray Level Run Length Method (GLRLM) is incorporated which helps in group validation.

Keyword: Frame Generation, Hierarchical clustering, Multi-scale completed local binary pattern, Pyramidal histogram of oriented gradients, RNN and Gray level run length method.

Paper Title: **Spectrum Opportunity Detection in Cellular Networks**

Abstract:The signal propagation over wireless channels cannot be predicted perfectly due to numerous factors such as fading, channel interference and obstacles. An interference footprint is required to be estimated accurately for evaluation of the spatial spectrum opportunity. It is difficult to determine the spatial spectrum opportunities available in uplink bands of cellular networks due to different location of primary users at different times. In this research work, spatial spectrum opportunity in uplink bands of cellular network is determined using an efficient computational geometry tool for realistic scenario. Our results shows that the performance of umbrella footprints based approach is better than that of conventional circular footprints based approach in terms of false alarm and missed detection probabilities.

Paper Title: **Impact of Combination of Natural and Synthetic Fibers on the Mechanical Properties of Concrete**

Abstract:Concrete has found its widespread application as a construction material. The use of different kinds of concrete have revolutionized the construction industry. Concrete as we know is very good in compression, however due to the development of micro cracks under tensile loading in concrete, the tensile strength of concrete is only 1/10th of its compressive strength. This drawback of concrete has been taken care of by the use of reinforcement in concrete. Rebars or reinforcement bars along with the concrete have added much to the tensile strength of concrete. Over the years steel bars, steel fibers and other materials have been used as reinforcement in concrete. Use of reinforcing bars in concrete caters the need of resisting tensile loads and thereby making Reinforced Cement Concrete an excellent construction material. However, the use of heavy steel bars as reinforcement makes concrete structures heavy and difficult to handle. In order to take care of this a new concept of reinforcement has been introduced i.e. reinforcing concrete with fibers. Different types of fibers have been used over the years as reinforcement in concrete. In this experimental study, combinations of two fibers have been used as a reinforcement. One of the fibers is a natural fiber i.e. coconut fiber and other one is a synthetic fiber i.e. polypropylene fiber. Both these fibers are used in combination with a specific percentage. In the first sample 0.5% of recron fiber was used and 0.25% of coconut fiber. In second sample 0.5% recron fiber was used and 0.75% of coconut fiber. The fiber reinforced concrete was then tested for compressive as well as tensile strength. The test results showed 29.4% and 5.3% increase in compressive strength, 32.3% and 48.9% increase in split tensile strength and 40% and 80% increase in the flexural strength of concrete for both combinations respectively. Thus, making the concrete light weight and more resistant to cracking. This could be very useful in case of concrete pavements and slabs.

Keyword: Polypropylene, Coconut Fiber, Compressive Strength, Tensile Strength, Split Tensile Strength, Flexural Strength.

Paper Title: **Applications of FP-Growth and Apriori Algorithm for Mining Fuzzified Spatial Dataset**

Abstract:Spatial data, also called geospatial data, is term needed to describe data linked to or containing knowledgeable data about a particular location on Earth's surface. Spatial data mining's primary goal is to uncover hidden complicated information from spatial & non-spatial information in spite of their enormous quantity and find the spatial relations density. Spatial Data Mining techniques, however, continue to be an expansion of individuals utilized in standard data mining. Spatial Data is an extremely challenging area since enormous quantities of spatial data have been obtained from the remote sensed to the GIS (Geographic Information Systems), ecological estimation, computer cartography, planning and many more. In a given paper, we only focus on an essential type of spatial vagueness termed as spatial fuzziness. Spatial fuzziness intakes the property of several spatial objects in certainty which don't contain boundaries of sharp type and interiors or whose boundaries as well as interiors can't be determined in precise form. This paper provides the method for finding fuzzy spatial data of association rule. Association rules provided valuable data in the assessment of important correlations observed in big databases. Compared to the previous research work, the current approach for there search highlights the superiority over the same dataset in terms of time taken and generated rules. The rules generated tell about the occurrence of attributes. The results show that the current research is more efficient than that of the previous work and also less time-consuming.

Paper Title: **Improvement in Switching Strategy for Grid Connected Pulse Width Modulated Voltage Source Inverter**

Abstract:A comparison between single band hysteresis current controller and double band hysteresis current controller for a single phase grid integrated pulse width modulated VSI is highlighted in this paper. Disadvantages of the HCC like incapability of using zero output state and bipolar nature of output voltage can be overcome by using double band hysteresis current controller. The output of double band controller (DBC) switches between +VDC and zero or -VDC and zero voltage levels resulting in unipolar nature output voltage which is better than the bipolar one in terms of the harmonic content and output current ripple. It also achieves the zero state output voltage and the switching frequency is also reduces in case of DBC. The studied system is modeled and MATLAB/Simulink environment.

Keyword: Voltage Source Inverter (VSI), Hysteresis Current Controller, Doubble Band Controller (DBC), Switching frequency, Harmonic Distortion, Pulse Width Modulation.

Paper Title: **Transient Response of Glycerin Heating Process**

Abstract:Controlling the temperature of the glycerin purification process system was not an easy task, as an increase in operating temperature would significantly reduce the quality of the purified glycerin. This is because an unlimited increase in temperature beyond the set point and an excessive prolongation of the heating process would result in the formation of an excessive secondary oxidation product in the final purified glycerin. This paper

2419-2423

discusses the transient response characteristics of the glycerin heating process using a parallel PID controller. The glycerin heating process behavior was determined experimentally using step input test and modelled as the First Order plus Delay Time. The controller parameters wereadjusted using Ziegler-Nichols, Cohen-Coon and Wang tuning methods, each of which was analyzed on the basis of the corresponding integral error criterion value. The Integral Square Error, Integral Absolute Error and Integral Time-weighted Absolute Error criteria value were used to evaluate the efficiency of the glycerin heating process. The transient response performances in terms of overshoot, rise time and settling time were also evaluated. Simulation work has shown that the process has experienced high overshoots for Ziegler-Nichols and Cohen-Coon, and has taken longer time to settle. Wang method exhibits with no overshoot but slow response. The lower gain PID controller was found to improve the process response in terms of overshoot but increase in the rise time and settling time. The results indicate that the desired process performance were more or less influenced by the interaction between the tuning parameters. The Ziegler-Nichols PID controller is not recommended for controlling glycerin heating process due to process response oscillations that are difficult to eliminate without prolonging the heating cycle.

Paper Title:	**Big Data Knowledge Discovery Platforms: A 360 Degree Perspective**	

413.

Abstract:Big Datais a buzzword affecting nearly every domain and providing different set new opportunity for the development of knowledge discovery process. Although it comes with challengeslike abundance, extensiveness and diversity, timeliness and dynamism, messiness and vagueness, and with an uncertainty as all the data generated does not relates to any specific question and can be associated with another process or activity. To address these challenges are certainly cannot be handled by the traditional infrastructure, platforms and frameworks. New analytical techniques and high performance computing architecture came into picture to handle this explosion. These platforms and architecture are giving a cutting edge to the Big Data Knowledge Discovery process by using Artificial Intelligence, Machine Learning and Expert systems. This study encompasses a comprehensive review of Big Data analytical platforms and frameworks with their comparative analysis. A Knowledge Discovery architecture for Big Data Analytics is also proposed while considering the fundamental aspect of gaining insights from Big Data sets and focus of this analysis is to provide the open challenges associated with these techniques and future research directions.

Paper Title: **Safe Path Planning of Mobile Robot in a known Dynamic Environment**

Abstract:Path planning in mobile robot navigation is an advanced method of calculating the safe and obstacle free path in static and dynamic environments are involved between source point to destination. Real time path planning method defines that how a robot can make a decision when some unknown obstacle gets encountered in the path of navigation for a dynamic situation. At the point when an obstruction comes in the way of route, the robot must

choose another and safe way to advance towards the objective by evading any impact. This study is focused on exploring the algorithm that gives the safe and shortest path when an obstacle changes the environment. By using A* algorithm in MATLAB simulation the probability of collision with obstacle and robot get increased. In this simulation work a new approach of path planning has been found by placing the virtual obstacles in the environment. A new obstacle get influence in the path of navigation, using virtual obstacle boundary around the new obstacle a short and safe path get evaluated which is collision free or low risk path . The purpose for this paper is to create a dependable and smooth direction in a real time domain with impediments and to manage the robot towards the target without hitting the obstacles also considering the size of the robot.

Keyword: Safe navigation, A* algorithm, Path planning, Virtual obstacles.

Paper Title:	**Optimization of Heat Transfer Coefficient for Al2O3 (75%) – CuO (25%) / Water Hybrid Nanofluid using Taguchi**

Abstract: To have the maximum benefits of nanofluid for high heat transfer coefficient, like hybrid composite materials in the material's revolution, the hybrid nanofluid was prepared and its performance was realized by experimentation. In this investigation, the prepared Al2O3 (75%)– CuO (25%) / Water hybrid nanofluid was used as a coolant for making pen barrel in injection molding machine. For experimentation, the three process parameters viz., Volume Fraction (VF), Volume Flow Rate (VFR) and Temperature (Temp) were controlled and optimized by using Taguchi's L9 orthogonal array to yield the maximum heat transfer coefficient. To optimize it, total nine different experiments were conducted by controlling these factors. The considered all three parameters were kept three levels. Regression equation was established to predict heat transfer coefficient by incorporating independently controllable process parameters. Based on the optimization result, it was found that the high heat transfer coefficient was achieved at 0.2 %, 6 LPM and 35 °C of VF, VFR and Temp of hybrid nanofluid respectively.

Keyword: Al2O3- CuO, hybrid nanofluid, heat transfer coefficient, optimization

Paper Title: **A Secured and Scalable Battle-Field Surveillance using WSN Multicasting**

Abstract:Real-time Battle-field surveillance using Wireless Sensor Network (WSN) is a challenging task. It demands periodic sensing, run-time decision making, and fast signal processing and high data precision. WSN for battle-field monitoring is a collection of in-expensive sensor devices capable of sensing sound and signals generated by objects. An Efficient utilization of limited resources is need of the hour in these applications. Sensor nodes must be highly dynamic in sensing and sending accurate data securely to the control centre. In this paper, The authors propose a secured and scalable mechanism to sense war field and report any intruder movement with accuracy. The Proposed approach performs better in terms of network lifetime, security and accuracy.

Keyword: Wireless Sensor Network (WSN), Battle-field Surveillance, WSN Applications, WSN Multicasting, WSN Coverage.

Paper Title: **High Performance Energy Efficient Computation Elements of Processing Unit**

Abstract:in our manuscript, various circuits for arithmetic summation are compared. Cadence 90nm technology and Quartus II EP2C20F484C7 are used for implementation of design. Logic gate-based adders, PFCA, TG and HSD technique-based adders characteristics are analyzed. Y finding is PFCA with 10T transistor performs slightly efficient compare to its counterpart. Exclusive OR-NOR design is optimum for least delay Adders for high performance energy efficient processing unit.

	Paper Title:	**Performance Analysis of Latent Heat Thermal Energy Storage using Phase Changing Material in a Circular Orientation.**

Abstract:The enormous consumption of energy has led to the fact of saving it at large. To negate the loss of energy, the present work commences research in the field of Thermal Energy Storage in its latent form incorporating Phase Changing Material (PCM) in circular oriented copper Ball Structure. Heating of PCM (by an electric heater) inferred in these copper balls continues till 85˚C(well beyond the melting point of selected PCM), and then when disconnected, PCM discharges gradually giving off the heat accumulated within. Considering 30litres of water in Latent Heat Thermal Energy Storage Tank(LHTES), for a family of four, the research intends to investigate the prolonged duration of time required to keep the water warm. The consequence presents that the time required to charge(heat) water is 4.6 hours(270minutes) and discharge(heat is given off) is 29hours(1740 minutes). Thus proving significant potential in keeping water warm for better performance in a circular orientation.

	Paper Title:	**Measurement and Denoising of Partial Discharge Signal in High Voltage Cables using Wavelet Transform**

Abstract:A huge amount of exploration propagated over the past decade investigates the characterization of Partial Discharge (PD) inception in cable ideology. Underground cables are passed down as surrogate for over hauling in congested areas. The intention of this research is to examine the feasibility of exploring insulation defects present in High Voltage (HV) Cable setup by employing PD disclosure under alternating current (AC) Voltage. Study of PD characteristics has a congregate of predictable distinguished contraption to prove the probity and the affirmation of electrical insulation of Power System. In this work, the cable is exposed into the measurement of PD signal under artificially conceived defects. PD signal parameters are mainly depends on the size of void and

2461-2468

applied voltage. In general, the measured PD signal is depraved with interferences. To identify the exact characteristics of PD distinctive and its severity, the PD signal is subjected to Wavelet Transform (WT) for denoising. Different types of WT families with various level is used for de-noising. To identify the effectiveness of the WT for de-noising guidelines like Signal to Reconstruction Error Ratio (SRER) and Reduction in Noise Level (RNL) are used.

Keyword: Partial discharge, Wavelet transform, Signal to Reconstruction Error Ratio (SRER) and Reduction in Noise Level (RNL)

Paper Title: **Behaviour of Exoskeleton Structures under Wind Loading**

Abstract:Tall buildings structural system has evolved a lot in recent times. Nowadays, a new system is being in the building as two parts namely exterior system and interior core. The exterior system will be located in the perimeter of the structure whereas the inner core located at the center which mainly accounts for the transfer of gravity load and the exterior system takes care of lateral loads rather than gravity load. The exterior shell is nothing but a diagonal grid which are effective as both gravity and lateral support to the tall buildings and this structural system is named as Exoskeleton. This exoskeleton diagrid structures imparts greater stiffness and lateral stability to the slender tall buildings. The objective of this study is to obtain a shape efficient lateral load resisting exoskeletal system using diagrid elements. Hence, the steel exoskeleton structures are analysed separately for both wind and seismic loads using ETABS 2015. 72-story structure with plan area of 2500 m2 adopted with different base plan (octagonal, rectangular and triangular shapes) with aspect ratio less than 5 has analyzed and designed. Gust factor method is adopted for wind loading since the tall structure undergoes vibration for various acceleration of the wind. The Gusts factor various from 1.19 to 2.11 in the design. Several analytical studies were conducted for different base plan with various diagrid angles and then this paper focus on obtaining a shape effective structure with optimal diagrid angles say 55.5, 65.7, 77.8 degree under adverse loading condition. Moreover, this work is done by considering following parameters say interstory drift, shear absorbing performance, the behaviour of inner core and outer shell.

Paper Title: **Agro Image De-Noising (Aid) for Enhanced Agricultural Images**

Abstract:Several Noises may be present in acquired images. This is an undesired feature for image processing techniques that analyze these images. Image de-noising helps improve efficiency of image processing. Many image de-noising methods have been proposed and exist in literature. Image de-noising methods for agricultural images have been proposed to a lesser extent when compared to the bright medical or photographic images. This paper proposes Agricultural Image De-noising (AID) which uses a discrete wavelet transform (DWT) to eliminate noise in agricultural images. This study uses specific kind of wavelet family spline wavelet transforms with appropriate decomposition level and the wavelet coefficients are analysed with hard and soft threshold methods. The denoised image using various spline wavelets is compared of hard threshold and soft threshold are assessed. The performance of AID is calculated using the peak signal to noise ratio (PSNR) and signal to noise ratio (SNR).

Paper Title: **Abdominal Aortic ANEURYSM Identification Using HLSFMM Segmentation and SVM Classifier**

Abstract:The localized inflammation of the abdominal aorta region causes Abdominal Aortic Aneurysm (AAA). The width of the lumen enlarges its size 3 cm or more than half of its diameter, which is larger than the typical diameter. There is no symptom until it becomes ruptured, which may often results in death. In this paper, a hybrid level set technique is presented to detect and segment the image taken from MRI of abdominal aortic aneurysm region. In traditional level set technique re-initialization problems are high. This problem is completely eradicated in the Hybrid Level Set Fast Marching method (HLSFMM). Median filter diminishes the noise in the image efficiently when compared to standard SVM classifier which uses Gaussian RBF kernel operator as a diameter measure by incorporating spatial data. Finally HLSFMM is utilized to extract source boundary in pre segmentation stage. The precision and the orderliness of the proposed method are extracted for different noisy MRI AAA images. Compared this result with other methods, the proposed system is much proficient for images with noises and accurate segmentations results are attained.

Keyword: Abdominal Aortic Aneurysm, Median filter, HLSFMM segmentation, SVM Classifier.

	Paper Title:	**Air Flow Control of a Smart Electric Fan using IoT Solutions**	
	Abstract:Remote control of electric fans by the application of IoT technology addresses the restrictions of "push button" controls that are usual in conventional fans. This paper explains a new control method for air flow control of a Smart Electric Fan (SEF), in this case fans mainly used in the household. In this new method the supply voltage that is applied to the motor terminals of the SEF is precisely changed with the mobile application developed by using IoT solutions. As this proposed method integrates with the conventional control methods referred to as the Firing Angle Control method or Phase Angle Control method with a new IoT-based solution, the controlling of any device becomes simpler. We developed a mobile application that enables the fan to be remotely controlled using a smartphone or tablet computer. The phase or delay angle of the voltage waveform is changed by giving as an input from the smart phone mobile application, and this results in minimizing the power loss caused due to switching in case of push button system. We demonstrated that by using this app, implementing the IoT-based solution, the air flow rate of the SEF was increased and the performance of the SEF exceeded the air flow rate of the original, conventionally controlled fan with the speed of the fan being significantly increased. Applying this control method has thus been verified to be advantageous and appropriate for the remote control of the air flow and fan speed, resulting in the efficient Smart Electric Fan. The main focus of this research was to implement the integrated control method in the residential fans.	**2487-2492**

424.	**Authors:** **B. Arun, B. V. Manikandan, K. Premkumar** **Paper Title:** **Meta-Heuristic Algorithm Optimized Fuzzy PID Controlled AGC of Three Area Power System**	**2493-2499**

Abstract:The problem of automatic generation control (AGC) is a major concern in power utilities; it plays a major role of the complicated structure and dimension of the multi-area systems. Automatic Generation Control's main intention in the multi-area system is to maintain the frequency of each control area and remain the tie-line power flows within the many defined tolerance limits by modifying the Automatic Generation Control generators' actual power outputs to accommodate the changing load requirements. Frequency control is accomplished through the primary control mechanism or the governor control mechanism. But the Area Control Error (ACE) always present in the system. The secondary controllers are surmounting this ACE to zero. The design tunes the controllers to enhance the better dynamic performance and stability of these eccentric conditions. The goal of this work is to diminish area control error, settle time, under-shoots and over-shoots of frequency divergence and net interchange tie-line error. Generally the gain values of the PID Control parameters obtain by tribulation and error technique and it need additional computation time. To reduce this obscurity of tuning of PID gains Evolutionary algorithm approach can be habituated to optimize the PID gains. Fuzzy – PID have been employed with different objective to enhance the efficient optimal solutions to the three area system. In this proposed study, GWO technique used to maximize Fuzzy-based PID controller's Proportional, Integral and Derivative gains in Three Area System.

	Paper Title:	**A Testbed System For Impact of QoS Parameter in Wireless ad Hoc Network**

Abstract:In our paper, we evaluate the impact of some QoS parameters on multimedia data in IEEE 802.11 wireless networks by deploying an experimental testbed systems. The evaluation results show that Contention Window (CW) value has a great influence on the throughput ratio between multimedia data types.

Keyword: Multimedia data, network performance, testbed, throughput, wireless ad hoc.

	Paper Title:	**Target Object Tracking with Portable Sensors in Wireless Sensor Network**

Abstract:Detection and tracking of moving target objects is one of the important problems of wireless sensor systems. In recent years, portability has become an important research area for the WSN community. Although it was never thought that the WSN arrangement was completely stable, portability was initially perceived as some of the difficulties that must be overcome, including network, inclusion and use of vitality. Target object dictates the accuracy of target objects with which the position of target objects can be estimated. This problem becomes a test, especially given the portability of the sensor and the target object, in which the directions of the sensor and the target object have to be captured. [1, 17] Through this review, we consider that we consider the question of following signals that release appropriate target object using compact sensors that depend on the social issue of the signal. Since the versatile movement of the lens is unclear, the portable sensor controller uses the approximation accumulated by a remote sensor so that the compact article indicates the time of appearance (TOA). [4] The portable sensor controller confirms the TOA estimation information of both compact target object and portable sensors to evaluate their areas before guiding the development of portable sensors to achieve the target object. We propose the calculation of approximation (min-max) to calculate the monitoring area, which can be effectively understood through quasi-different programming (SDP), and apply a cubic potential to the portable sensor path Can do. We measure the area of portable sensors and focus on each other to improve the following accuracy.[2, 5] We determine the characteristic relationship between several basic parameters of the frame and the trackingtarget object, including the thickness of the sensor, the range of detection, the portability of the sensor, and the target object. We examine the relationships and the ability to influence by multiple parameters of the framework and locate the base number of portable sensors that are required to maintain the tracking of target objects in an MSN. To further improve the execution of the framework, we propose a weighted monitoring calculation, using estimation information more efficiently.[3] Our entertainment results suggest that insufficiently insured calculations provide excellent follow-up that can be improved by requesting greatness with an equal number of sensors when contrasted and with the position of static sensors.

	Paper Title:	**A Framework for Secure Data Storage and Retrieval in Cloud Environment**

Abstract:Plenty of research work is going on for efficient storage, processing, and analysis of large volume of data generated in real time and having varying nature and quality. The most common open-source framework for efficient computation of such large volume of data is Hadoop which processes big data sets by employing clusters of networked computers. On the other hand, cloud computing refers to storage of data and applications in cloud servers and accessing of the data of applications over the Internet following an on demand scheme. So the organizations who want to reduce costs and complexities associated with big data framework, the most suitable option for them is to take help of cloud infrastructure. But one biggest concern in this regard is the security of data and applications in cloud. Though Hadoop provides in-built encryption scheme and secured HTTP protocol, once data and applications are stored in public cloud, they become vulnerable to various security breaches still remain uncontrolled by the cloud service providers giving rise of a feeling of untrust. In this scenario, encrypting sensitive business data before cloud uploading may help in preventing access of data by evil intruders. In this paper, an extension to Hadoop security with respect to shared cloud has been proposed by designing a software framework where files are encrypted before uploading to cloud. Security performance of this framework for securing data in storage as well as in transit has been implemented such that without using the framework retrieval of data is not at all possible. Extra layer of security aided by symmetric key cryptographic technique has been proposed which will enhance the security of customers' resources along with the present standard security measures of a cloud system. A software system performs symmetric encryption before transmitting a file of any format to cloud. To access this encrypted file, the same software system has to be used to download and decrypt the file. This paper also investigates the performances of most common symmetric key techniques AES, DES and triple DES cryptography with respect to the successful encryption of the customer data. This software frameworkcan be applied to provide an extra security layer at the client's end for users availing service of the cloud platform.

Paper Title: **An Unsteady Magnetohydrodynamics Flow of Bingham Fluid with Hall Effect of Heat Transfer**

Abstract:In this paper we investigated an unsteady magnetohydrodynamics flow of Bingham fluid with Hall Effect of heat transfer. Partial differential equations are simplified to higher order differential equations. MATLAB integrated bvp4c digital solver for velocity and temperature solves a set of nonlinear ordinary differential equations. The graphs show the effect of different parameters of velocity and temperature.

Keyword: Bingham fluid, Magnetohydrodynamics, Hall Effect, Heat Transfer.

Paper Title: **Content Based Image Retrieval using Feature Extraction Technique**

Abstract:Now days the image processing can be used in various areas such as in Agriculture, in Health care system also for security purpose. In case of Crime investigation the image processing can be used to identify the particular suspect from an available dataset for that purpose an image retrieval technique is presented in this paper. For image retrieval number of techniques is available. In earlier days Block Truncation Coding is used but due its some disadvantage feature extraction method is used. Using DDBTC technique two features are derived. The first feature as Color Co-occurrence Features (CCF) obtained using color quantizes features such as Bit Pattern Feature (BPF) is derived from Bitmap image. The five different distance metrics are used to measure the similarity between two images. The simulated results shows proposed Technique can shows the better result in the form of Average Precision rate (APR) and Average Recall Rate (ARR) as compared to other techniques.

Keyword: Average Recall Rate Average Precision Rate, Bit pattern feature, color co-occurrence feature, Dot diffused block truncation coding.

Paper Title: **An efficient Task Scheduling Algorithm using Modified Whale Optimization Algorithm in Cloud Computing**

Abstract:Cloud computing brings computing resources such as software and hardware, it serve service to the users through a network. Major concept of cloud computing is to share the marvellous storage section. In cloud computing, the user jobs are prepared and executed with appropriate resources to successfully deliver the services. There are large amount of task allocation techniques that are used to accomplish task planning. In order to improve the task scheduling technique, so we proposed method of efficient task scheduling algorithm. Optimization techniques are solving NP-hard problems is very famous. In this proposed technique, user tasks are stored in the order of queue methods. The priority is designed and allocated suitable resources for the task. New tasks are investigated and kept in the on-demand priority of queue. The output of the on-demand queue is given to the MWOA. It has been proved that this algorithm is capable to eliminate optimization problems and outperform the current algorithms. The method is proposed to the required more number of iterations is reduced. The proposed algorithm is compared with various scheduling algorithms such as, genetic algorithm, ant colony, standard grey wolf optimization and particle swarm optimization. The outcomes of tests indicate the better efficiency of the MWOA in expressions of makespan and energy consumption.

Keyword: In cloud computing, the user jobs are prepared and executed with appropriate resources to successfully deliver the services.

	Paper Title:	**Scene Illustration of Terrestrial Animals with Its Monitoring, Tracking and Recognizing Through Deep Learning in Relation with Granular Computing**	
	Abstract:Combining Deep Learning Technique with Granular Computing employs an inductive paradigm for the terrestrial animal's elucidation. The proposed method frames the object (terrestrial animal) in arbitrary-shaped and sized granules rather than fixed and rectangular shaped, so that object can effectively mine and recognized. The goal is to present a formal model which automatically focus only on representative pixel of each granule rather than converting pixels from entire image through scanning. Thus, this work entails the process of recognizing not only the static animal in the background, but also depicts moving animal in foreground separately. **Keyword:**Granular Computing (GrC), Deep Learning, Object Recognition, Object Tracking, CNN. 	Paper Title:	**The Effect of the Smart Navigation System Based on Augmented Reality**	
	Abstract:Currently, virtual technology is applied to everyday life. AR (Augmented Reality) has widely become a challenger technology that brings virtual 3D images into the real world through a camera. Augmented Reality is a technology that brings virtual images that is a 3D model simulated into the real world through cameras and processing that brings objects to overlap into one image and AR can help people to understand the content easily. Hence, in increasing the efficiency of services and publicizing various information, this paper presents the smart navigation system using augmented reality based on a smartphone in the case study of Benjakitti Park, Thailand. The application can navigate users to the POI destination and the system based on mobile devices is composed of two parts: the navigation application and the bone collector game. This project produced user satisfaction at a good level and the proposed application was ableto support the significant information for navigation in aspects of performance, usability, and effectiveness. **Keyword:**navigation system, augmented reality, smartphone, location-based. **References:** 1. Paper Title: **Behavior of AFRP Composite and its Practical Aspects in the Invigoration of Structural and Materialistic Properties of Corroded SHTS**

Abstract:The usage of effective composite materials currently became a regular trend in different field of industrial works and production factories. Composite materials being having a property of fulfilling more than one property simultaneously became an effective material recently in practical life. Fiber Reinforced Polymer (FRP) composite, due to its low weight, high stiffness huge load carrying capacity, corrosion less property, it became a friendly material for different engineering purposes where materials get include. In the world of Civil Engineering, Aeronautical Engineering, Mechanical Engineering and Automobile Engineering, currently the trend of FRP became very familiar for increasing the strength of materials for different properties and from different orientations. Strengthening and retrofitting of any structural elements become mandatory when the structure gets distressed due to several loading and aging effects. This research paper contains the concept of Aramid Fiber Reinforced Polymer (AFRP) composite and its application in the strengthening of corroded Steel Hollow Tubular Sections (SHTS). The improvement in the properties of SHTS after applying AFRP is discussed in this research content and its polymerization effect on strengthening. To establish a comparison on the recent research trend in this area, a special way of retrofication scheme was involved in this investigation, by following a practice of spiral or helical wrapping of AFRP to achieve a continues stiffness with a uniform unity across the height of the column. To analyze the proposed strengthening scheme, a comparative study has been done with respect to the traditional approach. A series of experimental investigation was done to come up with the result and later a brief discussion has been done regarding the usage of AFRP in different fields of Engineering. Totally 21 samples were casted both in horizontal and spiral jacketing and tested experimentally under axial compressive load by sustaining several parameters to observe the variation in the change of the properties of SHTS to verify the axial load carrying capacity along with the stiffness and Young's modulus. The experimental investigation showed that there is a remarkable improvement in the properties of AFRP strengthened specimens with respect to different parameters after the application AFRP and the effect of its polymerization with the bonding agent. Thus after the strengthening of column specimens with AFRP, the overall increment in the load ringing capacity of the SHTS was 23.27% and also the proposed scheme of spiral wrapping provided a superior result as compared to the traditional method of horizontal stripping.

Paper Title: **A Novel Clone-Based Reuse Method to Maintain Proficiency in Software Engineering Practice**

Abstract:The source code of an application paves way for a quality software product. Quality software in-turn helps in imposing software reuse. In this paper, pieces of similar codes also known as code clones or code duplications are considered as reusable software components. In general code clones are considered harmful in software engineering practice. They are considered to degrade the quality of software. Code clones are detected and removed without further processing. In this paper, a token- based CodeClone reuse method is proposed to detect type- 1 and type-4 clones. Positive effects of clones are analyzed and beneficial clones are extracted from the cluster of clones detected. The proposed method aids in the art of developing software thereby enforcing the concept of software reuse. The working principle of the proposed method is implemented using open source software as inputs. Beneficial clones are further stored in a database for future use. Clone report is generated as it assists in knowing about the clone details within a software system.

Keyword: Code clones, software engineering, beneficial clones, software reuse.

Paper Title: **Artificial Bee Colony Based MPPT Technique for Solar PV System Under Partially Shaded Condition**

Abstract:Energy recovery circuit plays significant role in PV string, during different irradiance value condition of PV modules. The BBCSC circuit is the combination of buck-boost converter and switched capacitor circuit; used to eliminate bypass diodes. The main objectives of BBCSC circuit are energy recovery from the photovoltaic modules under different irradiance value condition of PV modules and the voltage of the PV string is maintained on the level generated. In this paper, artificial bee colony (ABC) optimization technique is implemented with MPPT algorithm for solar modules string with boost converter and energy recovery circuit; to improve maximum output power and voltage values during PSC. The main limitation in the conventional method is to track exact MPP under partially shaded condition (PSC) is not satisfactory and Sometimes takes local maxima as global maxima. To overcome this, a new proposed artificial bee colony (ABC) algorithm MPPT is implemented.

Comparative analysis has been carried out and verified between the above of state of art methods through simulation results.

To valid and verify the effectiveness of the proposed BBCSC circuit, simulation results are presented in MATLAB/Simulink software.

Keyword: Buck-boost converter(BBC), artificial bee colony (ABC), partially shaded condition(PSC), switched capacitor(SC), photovoltaic (PV), maximum power point (MPP)
