ABSTRACT

The Depot Maintenance Planning and Programming System (DMPPS) is a large computer system developed over a period of two and a half years by the David W. Taylor Naval Ship Research and Development Center (DTNSRDC), Code 186 for the Naval Sea Systems Command (NAVSFA), Code 070T. The System was developed to project shipyard resource requirements (i.e., labor mandays and costs as well as material costs) by shipyard production shop and by ship work breakdown structure (SWBS). It enables management to assess the impact on the shipyards and ship systems of

- Changes in depot-level maintenance/alterations policy
- Major changes in force levels and/or composition
- Budgetary constraints

DMPPS consists of a network of interdependent computer programs written in FORTRAN IV. It was developed at DTNSRDC using the CDC 6000 series computers and was subsequently converted for the IBM 360/370 series computers. It is now installed and operational at the NAVSFA 070 computer terminal (which accesses an IBM 370/168 computer). This document presents the IBM 360/370 version of the DMPPS program modules. The modules have been grouped into six subsystems. Each of Volumes 2-7 of this document describes, in detail, one of these subsystems. An executive summary of the entire DMPPS is presented in Volume 1. The content of the seven volumes is indicated as follows:

- Volume 1 - Executive Summary
- Volume 2 - Preprocessor Subsystem
- Volume 3 - Alterations Subsystem
- Volume 4 - Repair Subsystem
- Volume 5 - Synthesizer Subsystem
- Volume 6 - Report Generator Subsystem
- Volume 7 - Feedback Subsystem

6. REPORT GENERATOR SUBSYSTEM

DOD Instruction 4151.15 imposed certain reporting requirements on depot level maintenance facilities. In particular it required cost and workload projections by Ship Work Breakdown Structure (SWBS) for the current and five succeeding fiscal years. SWBS is used to classify work with respect to its cause or purpose. The Report Generator Subsystem is the final module in the Depot Maintenance Programming and Planning System (DMPPS) and was designed to meet those requirements. The subsystem consists of four programs: REPSHOP, PREWBS, REPWBS, and REPMAT whose functions are to produce summary reports. Forecasting of work breakdown may be specified by SWBS, by Shop, or by SWBS-Shop Matrix reports. The program Xplode (Volume 5 - Synthesizer Subsystem) generates files showing the distribution of projected workloads among the nine single-digit SWBS categories and the 20 shipyard production shop categories (19 shops and "other direct" work). The program PREWBS (Section 6.2) is a preprocessor that reads the SWBS File and a Group Definition Card Deck defining various ship groupings. Groups are identified by ship type and hull number range combinations and may encompass broad categories such as surface ships, amphibious ships, or carriers; or may specify a single ship type and hull number. The program PREWBS creates a file which has as a header record the ship group definition and contains all availabilities pertaining to those ships. The program REPWBS uses this file as input and, with a data deck containing material factors and manday rates, produces reports on projected direct labor mandays, direct labor dollars, and material dollars. Reports may be generated for all work in a given shipyard for designated ship groupings and fiscal years. Additional report options include ownership (Navy or private), coast (east or west), type of work (work on active ships, MAP (Military Assistance Program) work, NRT (Naval Reserve Training) work and conversion work) as well as a separation of repair and alteration work.

Reports produced by the program REPSHOP reflect projected workloads in the various production shops pertaining to repair work, alteration work, or their total. Reporting is done by shipyard, then within a

yard by ship groups, and within groups by year. Input cards are used to define ship groupings. Workload projections may be formulated at both the shipyard and individual ship and ship group level.

The program REPMAT forecasts the distribution of work to be performed in both shops and SWBS categories by producing a matrix for a given shipyard, ship group, and year. The mandays are spread over the production shops and "other direct" categories and the nine single-digit SWBS categories and their totals, formulating a 10-by-20 matrix. Reports specify repair mandays, alteration mandays, or total mandays, according to input options.

6.1 PROGRAM REPSHOP

6.1.1 DESCRIPTION

REPSHOP is a report generator that produces summary reports of projected workloads to be performed in the various production shop categories. The 19 production shop categories referred to in these reports are as follows:

<u>Shop Number</u>	<u>Shop Name</u>
06	Central Tool Shop
11	Shipfitter Shop
17	Sheetmetal Shop
23	Forge Shop
26	Welding Shop
31	Inside Machine Shop
36	Weapons System Shop
38	Outside Machine Shop
41	Boiler Shop
51	Electric Shop
56	Pipe and Copper Shop
64	Woodworking Shop
65	Module Repair and Maintenance Facilities
67	Electronics Shop
71	Paint Shop
72	Rigging Shop
81	Foundry Shop
94	Patternmaker Shop
99	Temporary Service Shop

Those areas, in which productive work is performed, that are not covered by these categories are referred to as "other direct." The projections are for a period of five years and reflect total direct labor mandays for repairs and for alterations. The program uses as input the Shop File created by the program Xplode (Volume 5 - Synthesizer Subsystem), a Group Definition Card Deck, and input cards defining report options.

Each record on the Shop File corresponds to a record on the Depot Maintenance Assignment File (DMAF). It contains the ship type and hull number, type of work, shipyard, sector, and fiscal year, as well as the 20 repair manday values and the 20 alteration manday values projected for the shipyard production shop categories. (The 19 shop categories and "other direct" will be referred to as the 20 shops.)

Shop 65 has been deleted from the matrix for reporting purposes, since Charleston Shipyard is the only yard that uses it. Historical data collected to date from Charleston showed no work in that shop. In the future, if work is projected for shop 65, it will be combined with shop 68.

Reports can be generated for repair mandays, for alteration mandays, or for the total of both. Any five fiscal years may be chosen. Selection of shipyard is made first and ship groupings are determined within a given yard. The desired years remain constant for all reports.

A Group Definition Card Deck defines the ship groupings which may be reported on. Since the user may define the ship groupings, there is great flexibility in levels of reporting. A group may consist of a single ship, a ship class, functional ship groupings, or any combination of these. Also since the Group Definitions are input values, it is quite simple to redefine groups, but this should not be necessary as provision has been made for 100 ship groupings. For each grouping there may be as many as six sets of lower and upper ship-type/hull-number range combinations. For example, surface combatants might be described by the following grouping: CG 4 through CGN 39, CV 19 through CVN 70, DD 714 through DDG 41, FF 1037 through FFG 7, and CVT 16 through CVT 16.

A group number is assigned to this grouping. This group number is compared to the one requested on the Yard Option card. If there is agreement, the ship type and hull number are examined. Those that fall within the grouping are reported on. The capability to select various groupings means that reports can be made on broad categories, such as all surface ships, or to the detail of a single ship type and hull number. In the sample run, work projected for all CGN's was desired. Therefore,

Group 1 was defined as CGN 1 through CGN 9999. Thus every hull number between 1 and 9999 was included. Group 2 consisted of one ship and was defined as CGN 35 through CGN 35.

A type A Yard Option card, the first of two to describe the various options, contains the shipyard name and the word "ALL" if the entire yard is to be reported on. To designate the type of work desired, the word "REP" for repairs, "ALT" for alterations, and "TOT" for total of repairs and alterations must be requested. Any combination of these options may be selected. In addition, the required years to be reported on are input on this card. The years do not have to be sequential.

The second Yard Option card, a type B card, contains the yard name and group numbers required for that yard. There may be 15 sets of Yard Option cards with as many as 25 groups per yard. A Yard Option Terminator card follows the final type B Yard Option card and contains the word "LAST." A sample input set-up is shown in Figure 6.1-1.

All yard information is read at the beginning of the program and is stored in arrays. The first record of each yard on the Shop File is examined. If that yard is not required, the entire yard is skipped. The subroutine SUM is called to process the data for each record in which the year and ship type are among those requested. As a yard is completed, subroutine REPORT is called and data are extracted for reports by year and group number. Figure 6.1-2 presents a hierarchical diagram of REPSHOP.

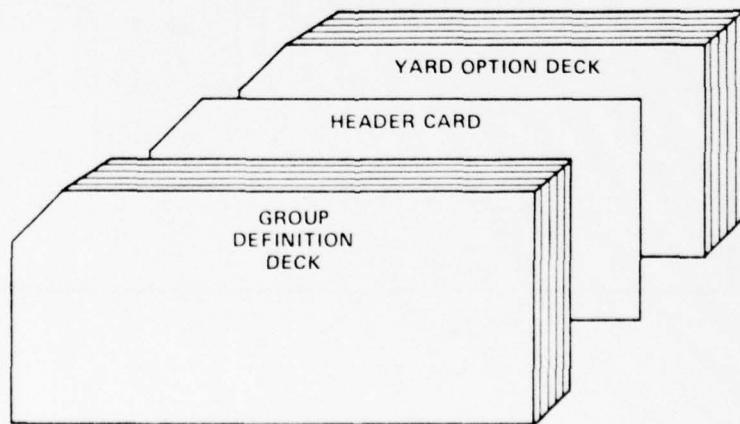

Figure 6.1-1 - Input Deck for REPSHOP

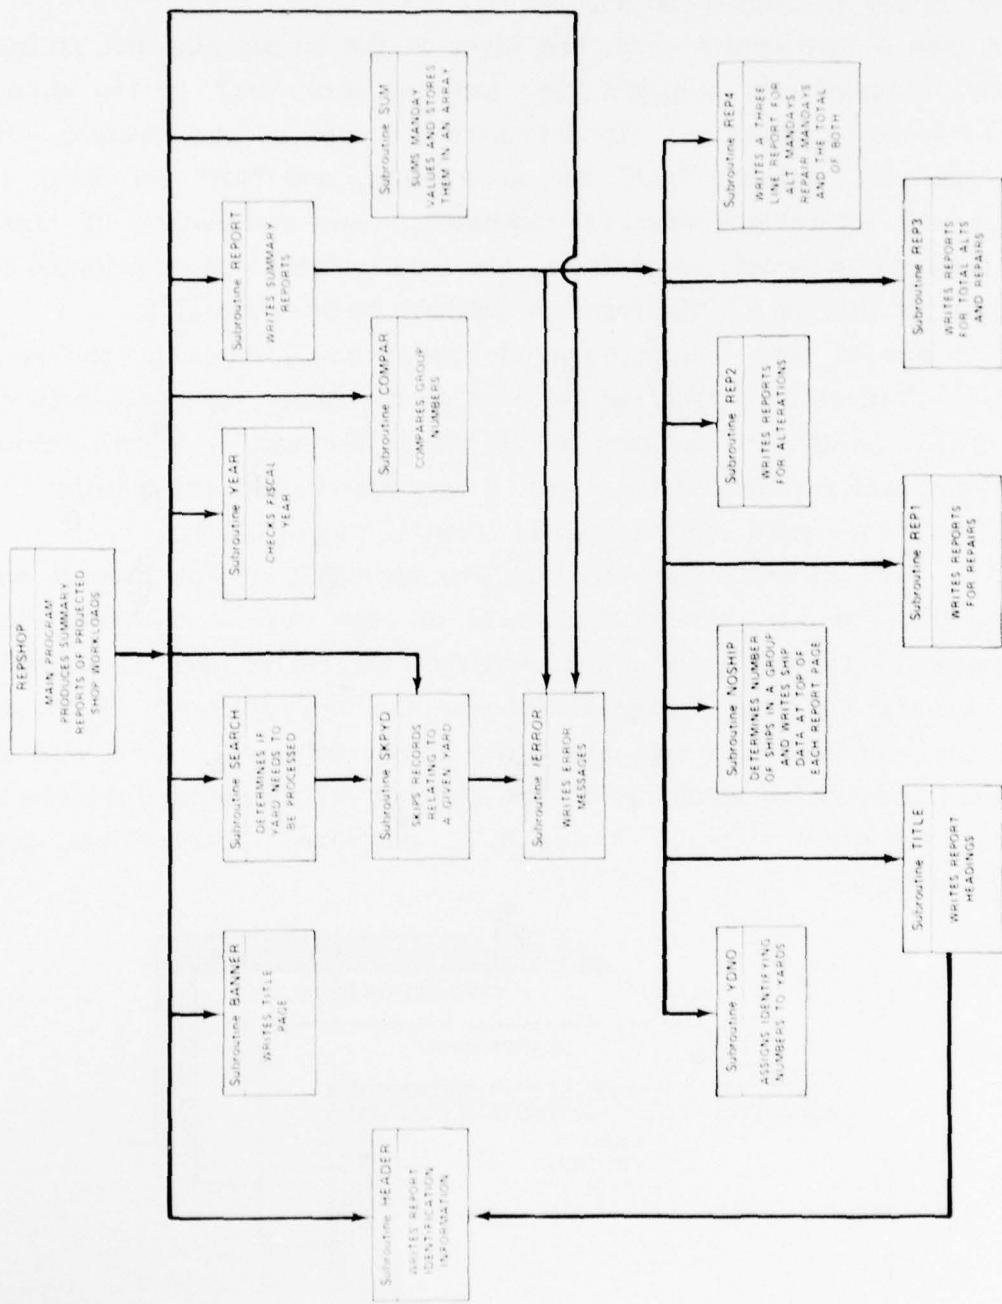

Figure 6.1-2 – PFPSHOP Hierarchical Diagram

Main Program

The function of the main program is to collect data for summary reports of projected shop workloads for repairs, alterations, or the total of both. It uses as input the Shop File created by program Xplode and input cards defining the report options. In addition, it creates a Group Definition Data Base from the Group Definition Card Deck.

Subroutine BANNER

This subroutine writes a title page with the words "SHOP REPORTS." The date and identifying information appear in the upper left corner.

Subroutine COMPAR

Subroutine COMPAR is called for each shop record whose fiscal year is among those requested. This subroutine compares the group numbers to be processed for a given shipyard with the array of group numbers in the Group Definition Data Base. If there is agreement, the ship type and hull number are examined to see that they fall within the lower and upper limits of any of the selected groupings. Matching group numbers are stored in the JGROUP array for use in subroutine REPORT. A flag is set if a match has been found and the data processing proceeds; otherwise an alternate return is made.

Subroutine HEADER

This subroutine writes report identification information in the upper left corner of each page and the page number on the right. Shop reports are identified by the number "61" followed by the yard number and type of report. Yard numbers are assigned in Subroutine YDNO and carried in the argument list as "ID."

The identifications for type of work are as follows:

- 01 for repairs
- 02 for alterations
- 03 for total of repairs and alterations
- 04 for all three options

Therefore 61-02-02 would represent a report of total alterations shop mandays for Long Beach.

Subroutine IERROR

Subroutine IERROR is called to indicate lack of data in any requested ship grouping. An error message is written on unit 7 and is not interspersed with the summary reports. When an end-of-file mark is encountered on the Shop File, a message is written and the program is terminated.

Subroutine NOSHIP

NOSHIP determines the number of ships in a given group and writes the ship type and hull numbers at the top of each report page.

Subroutine REPORT

Using the yard name, the options, and the arrays of data collected by other subroutines, subroutine REPORT extracts the data elements for the individual reports. Tests are made to ensure that there is data for each of the requested groups. If all work done in an entire yard has been calculated, it is stored as the first "group number" in the data array and must be extracted as such. The flag JOPT is used to determine the type of manday package required. When JOPT = 3, the manday values for repairs must be added to the manday values for alterations to give total mandays. The values for a given yard, group number, and year are transferred to the subroutines REP1, REP2, REP3, and REP4 for final output.

Subroutine REP1

Subroutine REP1 uses the repair mandays for a given yard, group number, and year as extracted by subroutine REPORT and writes them in a report format for repairs.

Subroutine REP2

Subroutine REP2 uses the alteration mandays for a given yard, group number, and year as extracted by subroutine REPORT and writes them in a report format for alterations.

Subroutine REP3

Subroutine REP3 uses the total of repairs and alteration mandays calculated in subroutine REPORT and presents them in a report format for total of alterations and repairs.

Subroutine REP4

Subroutine REP4 uses the alteration mandays, the repair mandays, and the total of repair and alteration mandays for a given yard, group number, and year and presents them as a three-line report.

Subroutine SEARCH

Subroutine SEARCH is used in determining whether a yard needs to be processed. The yard name read from the Shop File is compared with the array of yard names requested by input data. If there is no match, subroutine SKPYD is called to skip to the next yard and an alternate return is made.

Subroutine SKPYD

This subroutine is used to skip all records on the Shop File relating to a given yard. As each record is read, its yard name is compared to the name of the yard to be skipped. When a new yard name appears, the file is backspaced and the program continues.

Subroutine SUM

This subroutine sums the manday values and stores them according to group number and year in an array for repairs and an array for alterations. Subroutine SUM is called with one of three options: (1) to sum the values for given groups but not for an entire yard, (2) to sum the values for an entire yard but not for groups, (3) to sum the values for an entire yard as well as for given groups. Values are stored in two arrays, one for repairs and one for alterations. The first subscript refers to the group number, the second subscript refers to the year, and the third subscript refers to the 20 shops. If an entire yard is processed, the data for it are stored as the first "group number" in the array and later treated accordingly.

Subroutine TITLE

This subroutine is called by the subroutine REPORT with an argument designating identifying notation to be written with the data. The options are: (1) TOTAL DIRECT REPAIR MANDAYS BY SHOPS, (2) TOTAL DIRECT ALTERATION MANDAYS BY SHOPS, (3) TOTAL DIRECT REPAIR AND ALTERATION MANDAYS BY SHOPS.

Subroutine YEAR

This subroutine checks the fiscal year for a given data record against the array of years requested by input. If there is no agreement, transfer is made to that portion of the program that reads the next data record from the Shop File.

Subroutine YDNO

Subroutine YDNO assigns a number to each yard for report identification. For example: Charleston is 01, Long Beach is 02. The subroutine argument "ID" is transferred to subroutine HEADER with this identifying number to be used for report identification.

6.1.2 RUN SET-UP

The following set-up is used to run the REPSHOP program on the IBM 360/370 computer:

```
//NVSRFPS JOB (XXXXXXXXXX,XXXXX),USER,CLASS=C,TIME=(1,15),MSGLEVEL=1
//JOBLIB DD DSN=NVS01.DEPOT.LIB,DISP=SHR
// EXEC PGM=REPSHOP
//GO.FT05F001 DD *

    REPSHOP card inputs (unit 5)

//GO.FT06F001 DD SYSPUT=A          (SHOP REPORTS)
//GO.FT07F001 DD SYSPUT=A          (ERROR MESSAGES)
//GO.FT11F001 DD DSN=NVSJ1.SHOP.EXplode.DATA,DISP=SHR   (INPUT FILE)
```

6.1.3 INPUTS

Card inputs are made using unit 5. The format for these cards is shown in Section 6.1.3.1.

Unit 5 - Card inputs which (1) define ship groups by setting lower and upper limits on ship type and hull number, (2) give identifying report information, (3) set the desired options and years required, (4) determine which yards and groups are to be reported on.

The following additional unit is used to input information from a disk file created by the program Xplode:

Unit 11 - Shop File

The format for this file is given in Section 6.1.3.2.

6.1.3.1 Unit 5 - Card Inputs

Group Definition Cards. The Group Definition Deck describes the various ship groupings. Two cards, a type A and a type B, are required to define each group. There may be as many as 100 groups. A group definition terminator card follows the last type B group definition card.

Type A Group Definition Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IGRPNO(I)	Group Number	1-3	I3
GRPDEF(I,1,1)	Ship Set 1 Ship-Type/Hull-Number (Lower Bound)	9-16	A8
GRPDEF(I,1,2)	Ship Set 1 Ship-Type/Hull-Number (Upper Bound)	20-27	A8
GRPDEF(I,2,1)	Ship Set 2 Ship-Type/Hull-Number (Lower Bound)	33-40	A8
GRPDEF(I,2,2)	Ship Set 2 (Upper Bound)	44-51	A8
GRPDEF(I,3,1)	Ship Set 3 (Lower Bound)	57-64	A8
GRPDEF(I,3,2)	Ship Set 3 (Upper Bound)	68-75	A8

Type B Group Definition Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
GRPDEF(I,4,1)	Ship Set 4 Ship-Type/Hull-Number (Lower Bound)	9-16	A8
GRPDEF(I,4,2)	Ship Set 4 Ship-Type/Hull-Number (Upper Bound)	20-27	A8
GRPDEF(I,5,1)	Ship Set 5 (Lower Bound)	33-40	A8
GRPDEF(I,5,2)	Ship Set 5 (Upper Bound)	44-51	A8
GRPDEF(I,6,1)	Ship Set 6 (Lower Bound)	57-64	A8
GRPDEF(I,6,2)	Ship Set 6 (Upper Bound)	68-75	A8

Group Definition Deck Terminator Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
Terminator	Terminator of Ship Group Definition Deck (any negative number)	1-3	I3

Identification Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
DATE	Date (mo/dy/yr)	1-12	3A4
COMENT	Comment	15-34	5A4

Yard Option Cards. There are two cards for each required yard: a type A card which describes the options and years and a type B card for requesting the group numbers. A Yard Option terminator card follows the final type B Option card.

Type A Yard Option Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IYDSFL	Yard name	1-5	A5
ALL	The punch characters "ALL" will sum entire yard	8-10	A3
REP	The punch characters "REP" will compute repairs only	13-15	A3
ALT	The punch characters "ALT" will compute alterations only	18-20	A3
TOTAL	The punch characters "TOT" will compute total of repairs and alterations	23-25	A3
IYEAR(1)	2-digit year	30-31	I2
IYEAR(2)	2-digit year	33-34	I2
IYEAR(3)	2-digit year	36-37	I2
IYEAR(4)	2-digit year	39-40	I2
IYEAR(5)	2-digit year	42-43	I2

Type B Yard Option Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IYDSEL	Yard name	1-5	A5
IYDGRP(1-25)	Group numbers to be processed	7-80	15(1X,12)

Yard Option Terminator Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
LAST	End card of input data	1-5	A5

Figure 6.1-1 gives an example of an input deck for REPSHOP.

6.1.3.2 Unit 11 - Shop File

The Shop File is a binary file, so the format presented is to be used as a guide to indicate the size of the variables. No Shop File is created for private yards. The following format is used for each record on the Shop File:

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
ISFULL	Ship type and hull number	1	(A8)
ITYPWK	Type work	2	(A3)
IYD	Yard	3	(A5)
IGROUP	Group number (set = 0)	4	(I3)
IFYR	Fiscal year (this record)	5	(I2)
OWN	Yard ownership indicator	6	(A1)
COAST	Coast	7	(A1)
IPERD	Period (this record)	8	(A1)
ICONT	Continuation indicator	9	(A1)
ISTRT	Availability start date (mo/dy/yr)	10	(I6)
IFND	Availability end date (mo/dy/yr)	11	(I6)
ISPEC	Specialization category	12	(A3)
SVALP(1-20)	Total direct repair mandays for shops	13-32	(20F10.2)
SVALA(1-20)	Total direct alteration mandays for shops	33-52	(20F10.2)
IDAYS	Production shop productive (PSP) mandays this period	53	(I7)
IPERCT	Percent of PSP mandays for alterations	54	(I3)

6.1.4 OUTPUTS

The following units are used by REPSHOP for generating hard-copy output:

Unit 6 - Summary shop reports

Unit 7 - Error messages

Section 6.1.7 shows a sample of these outputs.

6.1.5 PROGRAM LISTING

6.1.6 GLOSSARY

COMMON VARIABLES

Common Block/IDATA/

- GRPDFF(100,6,2) Array of ship group definitions where the first subscript refers to the group number, the second to the ship type and hull number, and the third to (1) lower bound of a set and (2) upper bound of that set.
- IYDSEL(15) Array of yards to be processed.

Common Block/IDENT/

- COMENT(5) Array of report identification information.
- DATE(3) Array containing the date of the run.

Common Block/MISC/

- IYDGRP(15,25) Array of group numbers where the first subscript refers to the yard name and the second to the group number to be processed.
- JGROUP(25) Array of matching group numbers for a specific yard.
- KGROUP(25) Array of group numbers required for a specific yard.
- MGROUP(25) Array of matching group numbers for a specific record.

Common Block/REP/

- IHULL(100,6,2) Array of hull numbers where the first subscript refers to the group number, the second to the hull number, and the third to (1) a lower bound for a set and (2) an upper bound for that set.
- ISHIP(100,6,2) Array of ship types where the first subscript refers to the group number, the second to the ship type, and the third to (1) a lower bound for a set and (2) an upper bound for that set.

Common Block/VAL/

VALA(20)	Array of total direct alteration mandays for shops for a given yard.
VALR(20)	Array of total direct repair mandays for shops for a given yard.
VALT(20)	Array of the total of the repair and alteration mandays for a given yard.

Common Block/WORK/

ARRAYA(25,5,20)	Array of alteration data where the first subscript refers to the ship group number, the second to the year, and the third to the 20 alteration mandays for shops.
ARRAYR(25,5,20)	Array of repair data where the first subscript refers to the ship group number, the second to the year, and the third to the 20 repair mandays for shops.
SVALA(20)	Array of total direct alteration mandays for shops for a given record.
SVALR(20)	Array of total direct repair mandays for shops for a given record.

LOCAL VARIABLES

Main Program

ALL	Variable used to request the summary of data for an entire yard.
ALT	Variable used to request computation of alteration data.
COAST	Coast (east or west).
I	DO-loop index.
IALL(15)	Array used to determine whether the entire yard is to be summed.
ICONT	Continuation indicator.
IDAYS	Production shop productive (PSP) mandays for this period.
IDONE	Variable set equal to the number of yards required and decremented as each one is completed.
IDUMMY	Dummy variable used in reading the second of a pair of group definition cards.
IDUM1	Dummy variable used in re-reading group definition cards for print-out.
IDUM2	Dummy argument in subroutine HEADER.
IEND	Availability end date (mo/ay/yr).
IFIRST	Flag set to "1" after reading first record of a yard; otherwise set to "0".
IFYR	Fiscal year for this record.
IGROUP	Group number read from Shop File.
IGRPNO(100)	Array of group numbers identifying groups in Group Definition Deck.
II	Subscript designating specific yard.
III	Counter used to determine number of yards.
IOPT(15)	Array of options for a given yard.
IPERCT	Percent of PSP mandays for alterations.
IPERD	Period (this record).

Main Program (Continued)

ISHULL	Ship type and hull number, read as a single variable from the Shop File.
ISPEC	Specialization category.
ISTRT	Availability start date (mo/dy/yr).
ITPWK	Type work.
IYD	Yard name read from Shop File.
IYDP	Name of yard (of previous record).
IYDYR(5)	Array of years for a specific yard.
IYEAR(15,5)	Array of years where the first subscript refers to the yard and the second to the year.
J	DO-loop index.
JJ	Counter used to determine the number of groups and years to be processed for a given yard.
JOPT	Option for a specific yard, which when set to "1", repairs are reported on; when set to "2", alterations are reported on; when set to "3", a total of repairs and alterations are reported on; when set to "4", repairs, alterations and the total are all reported on.
K	DO-loop index.
KK	Flag which when set to "0", groups are summed but not entire yard; when set to "1", entire yard is summed but not groups; when set to "2", entire yard and groups are summed.
KOPT	Flag set to "1" if entire yard is to be processed, otherwise set to "0".
L	DO-loop index.
LAST	Variable containing the letters "LAST" and used in testing termination of input data.
MYEAR	Number of years to be processed for a specific yard.

Main Program (Continued)

NGROUP	Number of groups to be processed for a specific yard.
NGRPS(25)	Array of number of groups for a specific yard.
NYDS	Total number of yards to be processed.
NYEARS(15)	Array containing number of years to be processed.
OWN	Yard ownership indicator.
REP	Variable used to test for computing repair values.
TOTAL	Variable used to test for computing the total of repairs and alterations.
ZALL	Variable used to test for the characters "ALL".
ZALT	Variable used to test for the characters "ALT".
ZREP	Variable used to test for the characters "REP".
ZTOT	Variable used to test for the characters "TOT".

Subroutine COMPAR

I	DO-loop index.
IFLAG	Flag set to "1" after finding an agreement between the group numbers to be processed and the group numbers identifying group definition data base.
IGRPNO(100)	Array of group numbers identifying groups in Group Definition Deck.
ISHULL	Ship type and hull number.
J	DO-loop index.
K	DO-loop index.
NGROUP	Number of groups to be processed for a specific yard.

Subroutine HEADER

ID	Identification number assigned to each yard.
IDP	Yard identification number (of previous record).
IPAGE	Variable used to increment page numbers.

Subroutine HEADER (Continued)

JOPT	Option for a specific yard, which when set to "1", repairs, only are reported on; when set to "2", alterations, only are reported on; when set to "3", a total of repairs and alterations are reported on; when set to "4", repairs, alterations and the total are all reported on.
NOPG	Flag set to "2" when pages are to be numbered, otherwise, set to "1".

Subroutine IERROR

IDBL	Double precision variable used to transfer yard names for error messages.
IDUMMY	Single precision variable used to transfer group numbers for error messages.
N	Error number.

Subroutine NOSHIP

IBLANK	4-character blank space.
JJ	Subscript designating a specific group number in the ISHIP and IHULL arrays.
KK	DO-loop index.
KKK	Subscript designating a specific ship type and hull number in the ISHIP and IHULL arrays.
L	Implied DO-loop index.
MM	Index used in I/O statements.

Subroutine REPORT

I	Index for fiscal year.
ID	Identification number assigned to a specific yard.
IYD	Yard name being processed.
IYDYR(5)	Array of years for a specific yard.
J	DO-loop index.
JJ	Flag for group number.

Subroutine REPORT (Continued)

JOPT	An option for a specific yard when set to "1", repairs only are reported on; when set to "2", alterations, only are reported on; when set to "3", a total of repairs and alterations are reported on; when set to "4", repairs, alterations and the total are reported on.
KK	Group number requested for which there was no data.
KOPT	Flag set to "1" if entire yard is to be processed, otherwise set to "0".
L	DO-loop index.
LL	Index for group number of interest.
MYEAR	Number of years to be processed for a specific yard.
NGROUP	Number of groups to be processed for a specific yard.

Subroutine REP1

ISHP(20)	Array of shop numbers.
K	Index used for I/O statements.
M	Index used for I/O statements.

Subroutine REP2

ISHP(20)	Array of shop numbers.
K	Index used for I/O statements.
M	Index used for I/O statements.

Subroutine REP3

ISHP(20)	Array of shop numbers.
K	Index used for I/O statements.
M	Index used for I/O statements.

Subroutine REP4

ISHP(20)	Array of shop numbers.
K	Index used for I/O statements.
M	Index used for I/O statements.

Subroutine SEARCH

III	Argument used in transferring subscript of required yard.
IYD	Yard name being processed.
NYDS	Total number of yards to be processed.

Subroutine SKPYD

IDUM	Dummy argument in IERROR subroutine.
ISHULL	Ship type and hull number.
ITYPWK	Type work.
IYD	Yard name.
IYDP	Yard name (of previous record).

Subroutine SUM

I	DO-loop index.
IFYR	Fiscal year for this record.
IYDYR(5)	Array of years for this yard.
J	DO-loop index.
JJ	Subscript used in matching group numbers.
JJJ	Initial parameter of DO-loop.
KK	Flag when set to "0", groups are summed but not entire yard; when set to "1", entire yard is summed but no groups; when set to "2", entire yard and groups are summed.
KKK	Control variable in "computed go to".
KOPT	Flag set to "1" if entire yard is to be processed, otherwise set to "0".
L	DO-loop index.
LLL	Terminal parameter of DO-loop.
NGROUP	Number of groups to be processed for a specific yard.

Subroutine TITLE

ID	Identification number assigned to a yard.
JOPT	Option for a specific yard. When set to "1", repairs, only are reported on; when set to "2", alterations, only are reported on; when set to "3", a total of repairs and alterations are reported on; when set to "4", repairs, alterations and the total are reported on.

Subroutine YDNO

ICHASN	Variable containing the characters "CHASN".
ID	Identification number assigned to a yard.
IPEARL	Variable containing the characters "PEARL".
IPHILA	Variable containing the characters "PHILA".
IPTSMH	Variable containing the characters "PTSMH".
IPUGET	Variable containing the characters "PUGET".
IYD	Yard name being processed.
LBECH	Variable containing the characters "LBECH".
MARE	Variable containing the characters "MARE".
NORVA	Variable containing the characters "NORVA".

Subroutine YEAR

I	DO-loop index.
IFYR	Fiscal year for a given record.
IYDYR(5)	Array of years for a given yard.

6.1.7 SAMPLE RUN

The card inputs (unit 5) for the sample run of REPSHOP consisted of Group Definition cards and yard option cards. Three groups were defined. Group 1 was a group of all CGN's and was defined as CGN 1 through CGN 9999. Group 2 consisted of a single ship, the CGN 35. Group 3 defined the CV 59 Class of carriers, so the lower bound of the ship type-hull number was CV 59 and the upper bound was CV 62. Two shipyards were scheduled to be reported on. They were Norfolk and Puget Sound. In both cases, summaries were required for repairs, for alterations, and for their total. All three ship groupings were requested for Norfolk but reports for Puget Sound were to be generated for Group 2 only. Three non-consecutive fiscal years were to be reported on.

The Shop File (unit 11) produced by program XPLODE is a binary file. Ten data records from this file are given in a readable format. Each record was printed on five lines. The first line contains identifying information from the Depot Maintenance Assignment File (DMAF). The second and third lines give the total direct repair mandays for each of the 20 shops and the fourth and fifth lines give the total alteration mandays for each of the 20 shops, plus two other values from DMAF. These are the Production Shop Productive (PSP) mandays for that record and the percent of PSP mandays for alterations.

Shop reports (unit 6) show the mandays projected by shops for five fiscal years at Norfolk Shipyard for Group 1, a group of all CGN's. When projections were requested for Group 2, the CGN 35, an error message was written stating there was no work for that ship at Norfolk for any of the required years. There were, however, projected workloads at Puget Sound for the CGN 35. Summary reports were produced for the CV 59 class at Norfolk and all sample outputs show repair mandays, alteration mandays, and total mandays.

6.2 PROGRAM PREWBS

6.2.1 DESCRIPTION

The program PREWBS (Prepare SWBS File) facilitates the generation of SWBS reports by preprocessing the SWBS File for use by the program REPWBS. The SWBS File is a binary file prepared by the program Xplode (see Section 5.1). It breaks down the work for each scheduled availability (on DMAF) by single-digit SWBS category.

OSD guidelines for reporting by SWBS categories established the primary reporting level as groups of ships. These groups may be quite broad--such as surface combatants, submarines, etc.--or they may be more restrictive--to ship types, ship classes, or even individual hulls. In order to permit such wide variations in ship groupings, DMPPS uses the following scheme to define the groups. A DMPPS ship group consists of sets of ship-type/hull-number ranges (such as CV 19-CVN 70). Up to six sets of ranges are permitted in defining each ship group. Note that a ship may fall within more than one group or, conversely, may not belong to any group. Both these cases are permissible within the SWBS reporting structure.

Cards specifying the desired ship groups form one of the key inputs to PREWBS. The first phase of the PREWBS processing includes reading in these cards, storing the group definitions in an array, and checking them for error. The error check involves examining each ship-type/hull-number range for alphabetical order. A list of all ship groups is produced and any erroneous ranges are indicated by an asterisk. In addition, all ship groups (including those with errors) are written into the PREWBS output file, the SWBS (by Groups) File.

The second (and final) phase of the PREWBS processing involves reading in each record of the SWBS File, examining the ship type and hull number of the record, and determining which, if any, group or groups the ship falls within. All information from the SWBS File record is

duplicated on the SWBS (by Groups) File for each group within which the ship falls. In addition, each new record contains a group number. Thus, if a ship falls within no group, the record is not written at all on the SWBS (by Groups) File. On the other hand, if a ship falls within three groups, three copies of the record are made (each with a different group number).

To expedite its processing, PREWBS compares the ship type and hull number of the current SWBS File record with that of the preceding record. If they are the same, the list of groups to which the ship belongs has already been prepared and need not be regenerated.

A sort must follow the PREWBS program. It is an integral part of the run set-up for PREWBS (see Section 6.2.2) and sorts the output SWBS (by Groups) File first by group, then by fiscal year.

PREWBS consists of a main program and two subroutines. The hierarchical diagram of PREWBS is given in Figure 6.2-1.

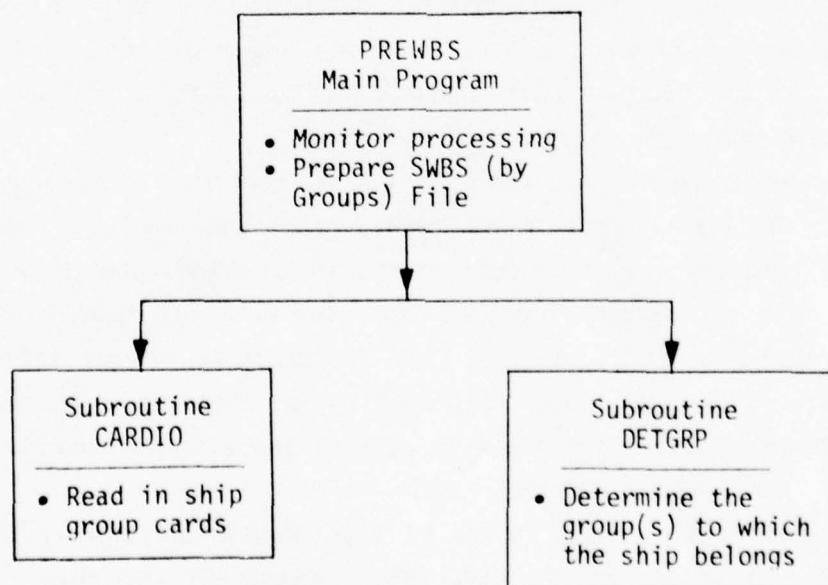

Figure 6.2-1 - PREWBS Hierarchical Diagram

Main Program

The main program of PREWBS calls subroutine CARDIO to read in and process the ship group cards. It then reads in (one at a time) the records of the SWBS File, calls subroutine DETGRP to prepare a list of the groups within which the ship falls, and prepares the SWBS (by Groups) File.

Subroutine CARDIO

Subroutine CARDIO reads in all ship group cards, examines them for error, prints them out, and writes them on the SWBS (by Groups) File.

Subroutine DETGRP

Subroutine DETGRP prepares a list of the groups within which a particular ship falls.

6.2.2 RUN SET-UP

The following set-up is used to run the PREWBS program on the IBM 360/370 computer:

```
//NVSPREWB JOB (XXXXXXXXXX,XXXXX),USER,CLASS=C,TIME=(,15),MSGLEVEL=1
//J0AL19 DD DSN=NVS01.DEPOT.LIB,DISP=SHR
// EXEC PGM=PREWBS                               (EXECUTE PROGRAM PREWBS)
//GO.FT05F001 DD *
[REDACTED]
      PREWBS card inputs (unit 5)

//GO.FT06F001 DD SYSOUT=A                      (LIST OF GROUP DEFINITIONS)
//GO.FT10F001 DD DSN=NVS01.SWBS.EXPLODE.DATA,DISP=SHR   (INPUT FILE)
//GO.FT11F001 DD DSN=&SWBS,DISP=(,PASS),UNIT=SYSDA,SPACE=(1444,30),
//               DCB=(LRECL=144,RECFM=VBS,BLKSIZE=1444)        (OUTPUT FILE)

// EXEC SDA                                     (SORT SWBS.GROUPS FILE)
//SORTIN DD DSN=&SWBS,DISP=(OLD,DELETE)
//SORTOUT DD DSN=NVS01.SWBS.GROUPS.DATA,DISP=SHR
//SYSIN DD *          SORT FIRST BY GROUP NUMBER, THEN BY FISCAL YEAR
//               SORT FIELDS=(25.0,4.0,A,29.0,4.0,A1,FORMAT=BI
```

6.2.3 INPUTS

Card inputs are made using unit 5. The format for these cards is given in Section 6.2.3.1.

Unit 5 - Card inputs which define the ship groups.

The following additional unit is used to input information from a disk file created by a previously run program (Xplode):

Unit 10 - SWBS File.

The format for this file is given in Section 6.2.3.3.

6.2.3.1 Unit 5 - Card Input

Group Definition Cards. Two cards are required to define each ship group. As many as 100 such pairs of cards may be input.

Type A Card. The format for the first group definition card is:

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IGRPNO	Group number	1-3	I3
SHIP(1,1)	Ship type of the lower bound of the first ship range	9-12	A4
IHULL(1,1)	Hull number of the lower bound of the first ship range	13-16	I4
SHIP(1,2)	Ship type of the upper bound of the first ship range	20-23	A4
IHULL(1,2)	Hull number of the upper bound of the first ship range	24-27	I4
.	.	.	.
.	.	.	.
.	.	.	.
SHIP(3,2)	Ship type of the upper bound of the third ship range	68-71	A4
IHULL(3,2)	Hull number of the upper bound of the third ship range	72-75	I4

Type B Card. The format for the second group definition card is:

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IGRPNO	Group number	1-3	I3
SHIP(4,1)	Ship type of the lower bound of the fourth ship range	9-12	A4

Type B Card (Continued)

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IHULL(4,1)	Hull number of the lower bound of the fourth ship range	13-16	I4
.	.	.	.
.	.	.	.
.	.	.	.
SHIP(6,2)	Ship type of the upper bound of the sixth ship range	68-71	A4
IHULL(6,2)	Hull number of the upper bound of the sixth ship range	72-75	I4

Termination Card. The final input card must be of the following format:

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
	Must contain a negative number	1-3	I3

6.2.3.2 Unit 10 - SWBS File

The SWBS File is a binary file. Each record on the file corresponds to a record on the Depot Maintenance Assignment File. The organization of each record is as follows:

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format*</u>
SHULL	Ship-type/hull-number	1	(A8)
TW	Type work	2	(A3)
YARD	Shipyard	3	(A5)
INFO(1)	Group number (=0)	4	(I3)
INFO(2)	Fiscal year (this record)	5	(I2)
INFO(3)	Yard ownership indicator	6	(A1)
INFO(4)	Coast	7	(A1)
INFO(5)	Period (this record)	8	(I1)
INFO(6)	Continuation indicator	9	(A1)
INFO(7)	Availability start date (mo/day/yr)	10	(I6)
INFO(8)	Availability end date (mo/day/yr)	11	(I6)
INFO(9)	Specialization category	12	(A3)
RINFO(1-9)	Total direct repair mandays for each SWBS category	13-20	(9F10.2)
RINFO(10-18)	Total direct alterations mandays for each SWBS category	21-29	(9F10.2)
RINFO(19)	Fraction of total direct repair mandays for "other direct"	30	(F10.6)
RINFO(20)	Fraction of total direct alterations mandays for "other direct"	31	(F10.6)

*The format is given for reference only. Since the file is a binary file, formats are not used in reading the file.

6.2.4 OUTPUTS

The following unit is used by PREWBS to generate hard-copy output:

Unit 6 - List of ship group definitions.

Section 6.2.7 shows a sample of this output.

PREWBS uses the following additional unit to store information on disk for use by a subsequent program (REPWBS):

Unit 11 - SWBS (by Groups) File (Unsorted).

The format of this file is given in Section 6.2.4.1.

6.2.4.1 Unit 11 - SWBS (by Groups) File (Unsorted)

The SWBS (by Groups) File is a binary file. The formats given for the variables are thus for reference only.

Group Definition Records. The group definition records precede all other records in the unsorted version of the SWBS (by Groups) File. There may be up to 100 such records on the file. The "format" for each record is:

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
BLANK	Contains Hollerith blanks	1	(A5)
IDUM	Contains a zero	2	(I1)
BLANK	Contains Hollerith blanks	3	(A5)
IGRPNO	Group number	4	(I3)
IDUM	Contains a zero	5	(I1)
SHIP(1,1)	Ship type of lower bound of first ship range (in the group)	6	(A4)
IHULL(1,1)	Hull number of lower bound of first ship range	7	(I4)
SHIP(1,2)	Ship type of upper bound of first ship range	8	(A4)
IHULL(1,2)	Hull number of upper bound of first ship range	9	(I4)
SHIP(2,1)	Ship type of lower bound of second ship range	10	(A4)
IHULL(2,1)	Hull number of lower bound of second ship range	11	(I4)
-	-	-	-
-	-	-	-
-	-	-	-
SHIP(6,2)	Ship type of upper bound of sixth ship range	28	(A4)
IHULL(6,2)	Hull Number of upper bound of sixth ship range	29	(I4)
FILLER(1-3)	Dummy array	30-32	(3A4)

SWBS Records. Each SWBS record corresponds to a record on the SWBS File (and hence to a record on DMAF). However, there may be more than one SWBS record for any given record on the SWBS File, if the ship (to which the record applies) falls within more than one group. Conversely, if the ship falls within no group, the SWBS File records for the ship do not appear on the SWBS (by Groups) File. The "format" for each SWBS record is as follows:

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
SHULL	Ship type-hull number	1	(A8)
TW	Type work	2	(A3)
YARD	Shipyard	3	(A5)
INFO(1)	Group number	4	(I3)
INFO(2)	Fiscal year (this record)	5	(I2)
INFO(3)	Yard ownership indicator	6	(A1)
INFO(4)	Coast	7	(A1)
INFO(5)	Period (this record)	8	(I1)
INFO(6)	Continuation indicator	9	(A1)
INFO(7)	Availability start date (mo/day/yr)	10	(I6)
INFO(8)	Availability end date (mo/day/yr)	11	(I6)
INFO(9)	Specialization category	12	(A3)
RINFO(1-9)	Total direct repair man-days for each SWBS category	13-20	(9F10.2)
RINFO(10-18)	Total direct alteration mandays for each SWBS category	21-29	(9F10.2)
RINFO(19)	Fraction of total direct repair mandays for "other direct"	30	(F10.6)
RINFO(20)	Fraction of total direct alteration mandays for "other direct"	31	(F10.6)

6.2.6 GLOSSARY

COMMON VARIABLES

Common Block /GROUPS/

GRPDEF(100,6,2) Lower (third subscript=1) and upper (third subscript =2) bounds of the six ship-type/hull-number ranges for up to 100 ship groups.
IGRPNO(100) Group number of the ship groups.
NGRPS Number of ship groups.
IGRPS(10) List of groups (by group number) to which the current ship belongs.
NG Number of groups to which the current ship belongs.

LOCAL VARIABLES

Main Program

I DO-loop index.
INFO(9) Array used to transfer some of the information from the SWBS File to the SWBS (by Groups) File.
RINFO(20) Array used to transfer some of the information from the SWBS File to the SWBS (by Groups) File.
SHULL Ship type and hull number of the current SWBS File record.
SHULLP Ship type and hull number of the previous SWBS File record.
TW Type of work of the current SWBS File record.
YARD Shipyard of the current SWBS File record.

Subroutine CARDIO

BLANK	Contains Hollerith blanks.
FILLER(3)	Array whose elements are all zero.
I	DO-loop index.
IAST	Contains a Hollerith asterisk.
IBLANK	Contains Hollerith blanks.
IDUM	Contains zero.
IERROR	Error indicator. Indicates whether or not any errors were encountered in any of the group definitions.
IHULL(6,2)	Array containing the hull numbers of the six ship ranges of the current group. The second subscript indicates lower versus upper bounds.
J	DO-loop index.
LINE	Line counter for unit 6 hard-copy output.
N	Number of groups processed.
NOTE(6)	Array used in printing out the group definitions to flag erroneous ship ranges with an asterisk.
NSPTS	Number of sets of ship ranges for the current group.
SHIP(6,2)	Array containing the ship types of the six ship ranges of the current group. The second subscript indicates lower versus upper bounds.

Subroutine DEIGRP

I	DO-loop index.
J	DO-loop index.
SHULL	Ship type and hull number of the current ship.

6.2.7 SAMPLE RUN

The sample run of PREWBS used the SWBS File created by the program Xplode (Volume 5) as its basic input file. Since this is a binary file, it cannot be merely printed out. However, a formatted version was prepared by Xplode for the sample run and is reproduced in this section to enable the user to trace the processing done by PREWBS. Similarly, the PREWBS output file, the SWBS (by Groups) File (unit 11), is a binary file and, as such, cannot be meaningfully printed out. In this case, the file was sorted and a formatted version of the sorted SWBS (by Groups) File is displayed.

Card inputs to PREWBS defined the following three groups:

1. All CGN's
2. CGN 35
3. CV 59 Class ships

Unit 5 - Card Inputs

1	CGN	1	CGN	9999
1				
2	CGN	35	CGN	35
2				
3	CV	59	CV	62
3

6.3 PROGRAM REPWBS

6.3.1 DESCRIPTION

The REPWBS program produces summary reports of total direct labor mandays, direct labor dollars, and material dollars for various Ship Work Breakdown Structure (SWBS) categories projected for five fiscal years. These reports are generated for various ship groupings. The following nine SWBS categories are referred to in these reports:

1. Hull Structure
2. Propulsion Plant
3. Electrical Plant
4. Command and Surveillance (Shipboard Installations)
5. Auxiliary Systems
6. Outfit and Furnishings
7. Armament (Shipboard Installations)
8. Integration/Engineering (Shipboard Response)
9. Ship Assembly and Support Services

REPWBS uses as input a file, SWBS (by Groups), created by the program PREWBS. This program is a preprocessor that reads the SWBS File produced by the program Xplode (Volume 5 - Synthesizer Subsystem) and a Group Definition Card Deck which defines various ship groupings. For each grouping there may be as many as six sets of lower and upper ship-type/hull-number range combinations. A group may consist of a single ship, a ship class, functional ship groupings, or any combination of these. In the sample run, work projected for all CGN's was desired. Therefore, group 1 was defined as CGN 1 through CGN 9999. Thus any hull number between 1 and 9999 was included. Group 2 consisted of one ship and was defined as CGN 35 through CGN 35. For each ship on the SWBS File, the program determines to which group, or groups, the ship belongs. The program PREWBS then creates and sorts a new file which has as a header

record the ship group definition, and which contains all records pertaining to those ships. These records are sorted by fiscal year within a group. The format for this file, SWBS (by Groups), is shown in Section 6.3.3.2.

REPWBS input data consist of a header card containing run identification information, the years to be reported on, and a material factor. In addition, a set of cards specifying manday rates must be input for each yard and year. Group Option Cards specify the reporting options and the shipyards for each of the groups to be reported on.

A "group total" report is always printed. Twelve other reports may optionally be generated for each ship group. Table 6.3-1 gives the 12 options. In addition, there may be 13 "yard" reports. That is, the work in as many as 13 shipyards may be reported on for each ship group. These reports show the direct labor mandays, direct labor dollars, and material dollars for all ships in a given shipyard for that ship grouping and the requested fiscal year.

Since data for one ship group are always printed before the next group is processed, any combination of reports may be selected. Therefore the sets of reports requested for one ship group may be entirely different from those selected for another. A ship group identification page, which lists the lower and upper limits of the ship type and hull number of all ships in the group, precedes all reports for that group.

As each record of the SWBS File is read, subroutine DOLLAR is called to determine the manday rate for the yard and year. Data are stored in an array according to the option and year, or in an array for yard and year. There are also arrays for "other" shipwork (UNOW). Such work is tabulated as a separate column since no breakdown of UNOW work by SWBS is currently available to the DMPPS. The subroutine REPORT calculates the material costs and extracts the data for reports by options and year for each requested ship group.

Figure 6.3-1 is a hierarchical diagram of REPWBS.

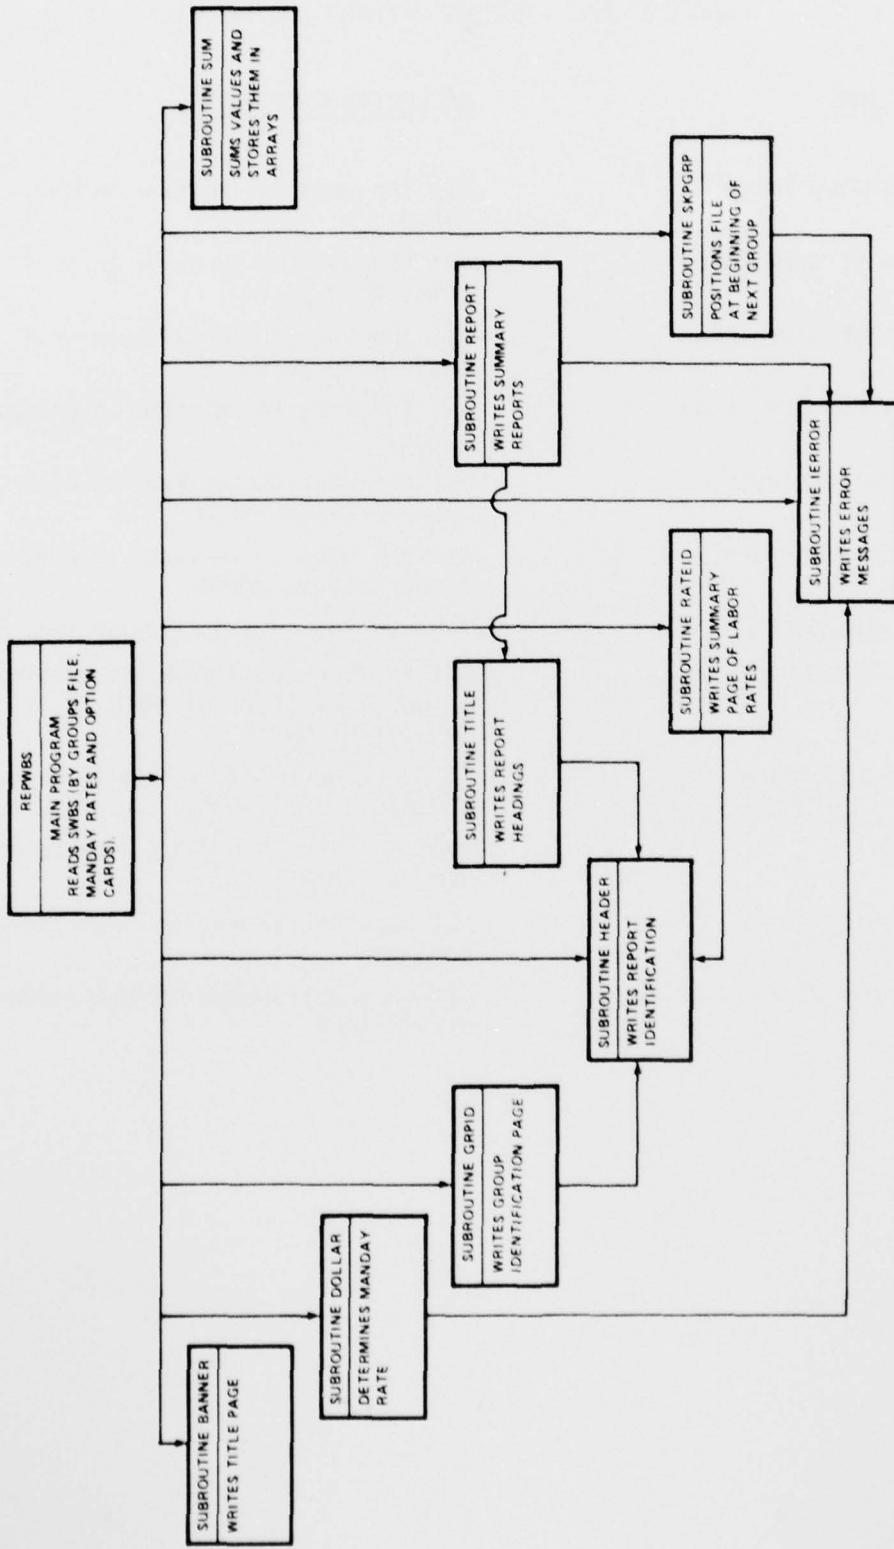

Figure 6.3-1 – PEPMES Hierarchical Diagram

TABLE 6.3-1 - REPORT OPTIONS FOR REPWBS

<u>REPORT NAME</u>	<u>INCLUSIVE CRITERIA</u>
work in Navy Yards	All the work to be done in Navy yards
East Coast Navy Yards	All the work to be done in east coast Navy yards
West Coast Navy Yards	All the work to be done in west coast Navy yards
work in Private Yards	All the work to be done in private yards
East Coast Private	All the work to be done in east coast private yards
West Coast Private	All the work to be done in west coast private yards
Conversion Work	The type of work is Conversion
Active Ship Work	All the work performed on active ships (i.e., type of work is not NRT or MAP)
Reserve Ship Work	All work performed on Naval Reserve Training (NRT) ships
MAP Work	Type of work is Military Assistance Program (MAP)
Repair Work	All work attributed to ship/ordnance repairs
Alteration Work	All work attributed to ship/ordnance alterations

Main Program

The function of the main program is to produce data for summary reports of projected workload by Ship Work Breakdown Structure (SWBS) for direct labor mandays, direct labor costs, and material costs. Reports may be generated by ownership, coast, active shipwork, Conversion, Reserve shipwork, Military Assistance Program (MAP) work, and repair and alteration work. All work in any given shipyard may be reported on by ship group and by year. The program uses as input the SWBS (by Groups) File, Manday Rate cards, and Group Option cards.

Subroutine BANNER

This subroutine writes a report title page with the words "SWBS REPORTS". The date and identifying information appear in the upper left corner.

Subroutine DOLLAR

Subroutine DOLLAR uses the year and yard from each record on the SWBS File and determines the appropriate manday rate. Since no rates have been stored for the private yards, the value of \$150 per manday is used. If no manday rates are stored for a particular year and yard, an error message is written and that record is omitted.

Subroutine GRPID

This subroutine writes the group identification page which precedes all reports (for the group). It gives the lower and upper limits of all the ship-type/hull-number range combinations in the group.

Subroutine HEADER

Subroutine HEADER writes report identification information in the upper left corner of each page and the page number in the upper right corner. SWBS reports are identified by the number "63" followed by the date and the identifying information input from the header card.

Subroutine IERROR

The function of subroutine IERROR is to generate error messages indicating lack of data for specific conditions. Table 6.3-2 lists the conditions which cause error messages to be printed and the message that is written on unit 8. A group number of zero will cause the program to stop.

Subroutine RATEID

The purpose of subroutine RATEID is to write a summary page of labor rates which are expressed in dollars per manday. The rates are tabulated for the required years for each shipyard. This subroutine also gives the material factor as a percent of total labor cost.

Subroutine REPORT

Subroutine RFPORT uses the group number, the options, and the arrays of data collected by other subroutines and extracts the data elements by SWBS for individual reports. Any "other" shipwork (UNOW) data are tabulated as individual items under a heading of "OTHER". Material costs are calculated as a percent of total direct labor cost. If a report has been requested but no data are found, subroutine IERROR is called and an error message is written.

Subroutine SKPGRP

Subroutine SKPGRP is used to skip all records on the SWBS (by Groups) File relating to a given ship group. A negative value for the fiscal year signals the header record for a new group. When a negative value is encountered, the file is backspaced and is positioned at the beginning of the next group.

Subroutine SUM

This subroutine sums the manday values and labor costs and stores them in arrays for scheduled shipwork and for "other" shipwork (UNOW). Unless repair and alteration data are to be reported on separately, their values are combined. In the arrays for scheduled work, the first subscript refers to the option or to the yard, the second subscript refers to the year, and the third subscript refers to the manday values or to the labor costs. In the UNOW arrays, the first subscript refers to the option or yard, the second subscript refers to the year, and the third subscript refers to (1) total other manday work and (2) total other labor costs.

Subroutine TITLE

This subroutine is called by subroutine REPORT with a flag designating the type of report headings to be written. If there is UNOW work, an extra column for "other" work must be included.

TABLE 6.3-2 - ERROR MESSAGES GENERATED BY REPWBS

<u>Flag</u>	<u>Option</u>	<u>Condition</u>	<u>Printed Message</u>
1	-	Group number is zero or blank	GROUP NUMBER = 0, USE OTHER VERSION OF PROGRAM
2	-	End of file mark encountered in reading SWBS (By Groups) File	END OF FILE ENCOUNTERED
3	-	No manday rates found for the required year	NO MANDAY RATES FOR 19xx
4	-	No manday rates found for the required yard	NO MANDAY RATE FOR xxxx
5	1	No data for Navy shipyard work for the required year and group	NO NAVY YARD WORK FOR 19xx FOR GROUP xx
	2	No data for east coast Navy shipyard work for the required year and group	NO EAST COAST NAVY YARD WORK FOR 19xx FOR GROUP xx
	3	No data for west coast Navy shipyard work for the required year and group number	NO WFST COAST NAVY YARD WORK FOR 19xx FOR GROUP xx
	4	No data for private yard work for the required year and group number	NO PRIVATE YARD WORK FOR 19xx FOR GROUP xx
	5	No data for east coast private yard work for the required year and group number	NO EAST COAST PRIVATE YARD WORK FOR 19xx FOR GROUP xx
	6	No data for west coast private yard work for the required year and group number	NO WEST COAST PRIVATE YARD WORK FOR 19xx FOR CROUP xx
	7	No data for Conversion work done for the required year and group number	NO CONVERSION WORK FOR 19xx FOR GROUP xx
	8	No data for Active ship work (all work except NFT and MAP) for the required year and group number	NO ACTIVE SHIP WORK FOR 19xx FOR GROUP xx
	9	No data for Naval Reserve Training work for the required year and group number	NO RESERVE WORK FOR 19xx FOR GROUP xx

ERROR MESSAGES (Continued)

<u>Flag</u>	<u>Option</u>	<u>Condition</u>	<u>Printed Message</u>
5	10	No data for Military Assistance Program work for the required year and group number	NO MAP WORK FOR 19xx FOR GROUP xx
	11	No data for any of the ships in the required group	NO DATA FOR GROUP xx
6	-	No data for a specified yard for the required group	NO DATA FOR xxxxx FOR GROUP xx

6.3.2 RUN SET-UP

The following set-up is used to run the REPWBS program on the IBM 360/370 computer:

```
//NVSWBS JOB (XXXXXXXXXX,XXXXX),USER,CLASS=C,TIME=(,15),MSGLEVEL=1  
//JOBLIB DD DSN=NVS01.DEPOT.LIB,DISP=SHR  
// EXEC PGM=REPWBS  
//GO.FT05F001 DD *
```

REPWBS card inputs (unit 5)

```
//GO.FT06F001 DD SYSOUT=A          (SWBS REPORTS)  
//GO.FT08F001 DD SYSOUT=A          (ERROR MESSAGES)  
//GO.FT12F001 DD DSN=NVS01.SWBS.GROUPS.DATA,DISP=SHR (INPUT FILE)
```

6 3.3 INPUTS

Card inputs are made using unit 5. Section 6.3.3.1 shows the format for the input cards.

Unit 5 - Card inputs which: (1) give identifying report information and desired years, (2) give manday rates, (3) select group numbers and report options, (4) request yards to be reported on.

The following additional unit is used to input information from a disk file previously created by the program PREWBS:

Unit 12 - SWBS (by Groups) Data File.

The format for this file is given in Section 6.3.3.2.

6.3.3.1 Unit 5 - Card Inputs

Header Card. This card must appear as the first input card. Its format is:

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
DATE(1-3)	Date (mo/dy/yr)	1-12	3A4
COMENT(1-5)	Report identification information	15-34	5A4
IYEAR(1-5)	Array of years to be reported on	40-53	5I2
IMAT	Percent of direct labor costs for material	72-74	13

Manday Rate Cards. The Manday Rate Deck consists of one card for each shipyard giving manday rates for the fiscal years to be reported on. A Manday Rate Terminator Card follows the final Manday Rate Card.

Manday Rate Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IYARD	Yard name	1-5	A5
RATE(1-5)	Array of manday rates for five fiscal years	6-40	5(1X,F6.2)

Manday Rate Terminator Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
LAST	Terminator; contains the characters "LAST"	1-4	A4

Group Option Cards. The Group Option Deck describes the various report options. There are two cards for each required group: a type A card which describes the report options, and a type B card which designates the yards to be reported on. The Group Option Deck is terminated with a negative group number.

Type A Group Option Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IGRP	Group number	1-3	I3

<u>To Request Reports on: Punch Characters:*</u>				
ZNAVWK	Work in Navy Yards	"NAV"	5-7	A3
ZNAVE	East Coast Navy Yards	"NE"	9-10	A2
ZNAWV	West Coast Navy Yards	"NW"	12-13	A2
ZPRI	Work in Private Yards	"PRI"	15-17	A3
ZPRIE	East Coast Private	"PE"	19-20	A2
ZPRIW	West Coast Private	"PW"	22-23	A2
ZCON	Conversion Work	"C"	25	A1
ZACT	Active Ship Work	"ACT"	29-31	A3
ZRES	Reserve Ship Work	"RES"	33-35	A3
ZZMAP	Map Work	"MAP"	37-39	A3
ZREP	Repair Work	"REP"	41-43	A3
ZALT	Alteration Work	"ALT"	45-47	A3

*Variable contains the noted characters if that report is requested; otherwise those fields are left blank.

Type B Group Option Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IYDSEL(1-13)	Array of yards to be reported on	1-78	13(A5,1X)

6.3.3.2 Unit 12 - SWBS (by Groups) Data File

The program PREWBS sorts the SWBS File, created by program Xplode, by ship groupings. A Group Definition Record precedes the ship availability data for those ships in the group. Each record contains direct labor repair mandays and direct labor alteration mandays by SWBS.

The SWBS (by Groups) File is sorted in ascending order by the following parameters:

Group number

Fiscal year

Since this is a binary file, the format presented is given only as a guide to indicate the size of the variables.

Group Definition Records. The format of each Group Definition Record on the SWBS (by Groups) File is as follows:

Variable Name	Description	Position	Format
DUM	Double precision dummy variable	1	(A8)
IDUM1	Dummy variable	2	(A3)
DUM1	Double precision dummy variable	3	(A5)
IGROUP	Group number	4	(I3)
IDUM2	Variable contains zero	5	(I2)
SHIP(1,1)	Lower bound of first ship type in a group	6	(A4)
IHULL(1,1)	Lower bound of first hull number in a group	7	(A4)
SHIP(1,2)	Upper bound of first ship type in a group	8	(A4)
IHULL(1,2)	Upper bound of first hull number in a group	9	(A4)
SHIP(2,1)	Lower bound of second ship type in a group	10	(A4)

Group Definition Records. (Continued)

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
IHULL(2,1)	Lower bound of second hull number in a group	11	(A4)
.	.	.	.
.	.	.	.
SHIP(6,2)	Upper bound of sixth ship type in a group	28	(A4)
IHULL(6,2)	Upper bound of sixth hull number in a group	29	(A4)
FILLER(1-3)	Dummy array	30-33	(3A4)

SWBS Record. Each SWBS Record corresponds to a DMAF Record. Any DMAF record describing ships specified by the Group Definition Record are included. The format of each SWBS Record is as follows:

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
ISHULL	Ship-type/hull-number	1	(A8)
ITYPWK	Type work	2	(A3)
IYD	Yard	3	(A5)
IGROUP	Group number	4	(I3)
IFYR	Fiscal year (this record)	5	(I2)
OWN	Yard ownership indicator	6	(A1)
COAST	Coast	7	(A1)
IPERD	Period (this record)	8	(I1)
ICONT	Continuation indicator	9	(A1)
ISTRRT	Availability start date (mo/dy/yr)	10	(I6)

SWBS RECORD. (Continued)

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
WVALA(1-9)	Total direct alteration mandays for SWBS	22-30	(9F10.2)
MATREP(10,20)	Fraction of total direct repair mandays required for "other direct"	31	(F10.6)
MATALT(10,20)	Fraction of total direct alteration mandays required for "other direct"	32	(F10.6)

6.3.4 OUTPUT

The following units are used by REPWBS for generating hard-copy output:

Unit 6 - Summary SWBS reports.

Unit 8 - Error messages.

Section 6.3.7 shows a sample of these outputs.

6.3.5 PROGRAM LISTING

```

*****PROGRAM REPBWS(INPUT,OUTPUT,TAPE5=INPUT,TAPE6=OUTPUT,TAPE8,TAPE12)**** 10
C
C      PROGRAMMER JEAN ST LAURENT - DTNSROC - CODE 1863          REPW 20
C      WRITTEN MAY 1976          REPW 30
C
C      REPWBWS IS A REPORT GENERATOR FOR TOTAL DIRECT LABOR HANDEYS
C      AND MATERIAL DOLLARS BY SWBS FOR SHIP GROUPINGS.          REPW 40
C      BROKEN DOWN BY FISCAL YEAR          REPW 50
C      SHIP GROUPINGS (IGRPI AND YEAR (IYEAR) ARE INPUT VALUES          REPW 60
C      THE PROGRAM PREWBWS IS A PREPROCESSOR FOR REPWBWS WHICH SORTS          REPW 70
C      THE SWBS DATA FILE BY SHIP GROUPINGS          REPW 80
C
C      IN ADDITION TO A GROUP TOTAL REPORT, THE FOLLOWING OPTIONS          REPW 90
C      ARE AVAILABLE          REPW 100
C      NAVY WORK -      INPUT AS NAV - USED AS IOPT = 1          REPW 110
C      NAVY EAST -     INPUT AS NE - USED AS IOPT = 2          REPW 120
C      NAVY WEST -     INPUT AS NW - USED AS IOPT = 3          REPW 130
C      PRIVATE WORK -   INPUT AS PRI - USED AS IOPT = 4          REPW 140
C      PRIVATE EAST -   INPUT AS PE - USED AS IOPT = 5          REPW 150
C      PRIVATE WEST -   INPUT AS PW - USED AS IOPT = 6          REPW 160
C      CONVERSION WORK - INPUT AS CON - USED AS IOPT = 7          REPW 170
C      ACTIVE SHIPS -   INPUT AS ACT - USED AS IOPT = 8          REPW 180
C      (ACTIVE WORK IS ALL WORK EXCEPT NRT AND MAP)          REPW 190
C      RESERVE SHIPS -  INPUT AS RES - USED AS IOPT = 9          REPW 200
C      MAP WORK -      INPUT AS MAP - USED AS IOPT = 10          REPW 210
C      REPAIR WORK -   INPUT AS REP - USED AS IOPT = 11          REPW 220
C      ALT WORK -      INPUT AS ALT - USED AS IOPT = 12          REPW 225
C
C      ALSO, SUMMARIES MAY BE MADE BY YARD          REPW 230
C      UP TO 13 DIFFERENT YARDS MAY BE SELECTED          REPW 240
C      THEY ARE INPUT IN THE IYDSEL ARRAY          REPW 250
C
C      TAPE ASSIGNMENTS
C      -----
C      TAPE5 - INPUT - CARDS          REPW 260
C      TAPE6 - OUTPUT          REPW 270
C      TAPE8 - OUTPUT - ERRORS, ONLY          REPW 280
C      TAPE12 - INPUT OF SWBS DATA FILE SORTED BY PREWBWS          REPW 290

6.3.6 GLOSSARY

COMMON VARIABLES

Common Block /IDATA/

IHULL(6,2) Array of hull numbers; the first subscript refers to the hull number and the second to (1) lower bound of a ship group and (2) upper bound of that group.

SHIP(6,2) Array of ship names; the first subscript refers to the ship type and the second to (1) lower bound of a ship group and (2) upper bound of that group.

Common Block /IDENT/

COMENT(5) Array of report identification information.

DATE(3) Array containing the date of the run.

Common Block /MISC/

IYEAR(5) Array of years to be reported on, determined by input.

RATE(15,5) Array of manday rates; the first subscript refers to the yard and the second to the year.

Common Block /INPUT/

IYARD(15) Array of yards corresponding to the manday rates specified by the array RATE.

IYDSEL(13) Array of yards to be processed, determined by input.

Common Block /OTHER/

IFLAG(15,5) Array of flags; the first subscript refers to the option and the second to the year.

IFLAGG(15,5) Array of flags; the first subscript refers to the yard and the second to the year.

IUNOS(15,5) Array of flags; the first subscript refers to the option with respect to "other" shipwork (UNOW) and the second to the year.

Common Block /OTHER/ (Continued)

IUNOSS(15,5) Array of flags; the first subscript refers to the yard with respect to UNOW work and the second to the year.

Common Block /WORK/

ARRAY1(13,5,18) Array of direct labor mandays; the first subscript refers to the option, the second to the year, and the third to the nine single-digit SWBS categories for repairs and for alterations.

ARRAY2(13,5,18) Array of material dollar values; the first subscript refers to the option, the second to the year, and the third to the nine single-digit SWBS categories for repairs and for alterations.

ARRAYD(13,5,18) Array of direct labor mandays; the first subscript refers to the yard, the second to the year, and the third to the nine single-digit SWBS categories for repairs and for alterations.

ARRAYM(13,5,18) Array of material dollar values; the first subscript refers to the yard, the second to the year, and the third to the nine single-digit SWBS categories for repairs and for alterations.

UARRAY(13,5,2) Array containing (1) direct labor mandays for UNOW (if the third subscript is "1"), and (2) UNOW material dollars (if the third subscript is "2"). The first subscript refers to the option and the second to the year.

UYARD(13,5,2) Array containing (1) direct labor mandays for UNOW (if the third subscript is "1"), and (2) UNOW material dollars (if the third subscript is "2"). The first subscript refers to the yard and the second to the year.

LOCAL VARIABLES

Main Program

ACT	Variable containing the characters "ACT".
ALT	Variable containing the characters "ALT".
COAST	Coast (east or west).
CON	Variable containing the characters "CON".
CONV	Variable containing the character "C".
DUMI	Dummy variable in header record of SWBS File.
EAST	Variable containing the character "F".
FILLER(3)	Dummy array used in reading the header records of the SWBS File.
I	DO-loop index.
IBLANK	8-character blank space.
ICONT	Continuation indicator.
IDBL	Double precision dummy argument in subroutine IERROR.
IDUMMY	Dummy argument in subroutine IERROR.
IDUM1	Dummy variable in header record of SWBS File.
IDUM2	Additional dummy variable in header record of SWBS File.
IDUM3	Dummy argument in subroutine IERROR.
IDUM4	Additional dummy argument in subroutine IERROR.
IEND	Availability end date (mo/dy/yr).
IEXTRA	Argument in subroutine REPORT.
IFYR	Fiscal year for this availability.
IGROUP	Group number read from SWBS File.
IGRP	Group number to be reported on.
II	Variable used as the option number in a "computed go to". Also a counter used to determine numbers of yards and number of years to be processed.
III	A flag set to "1" when there is UNOW work, otherwise set to "0".
IMAT	Percent of direct labor costs for material.
IONCE	Argument in subroutine SKIPFP.
IOPT(14)	Array of options for a given ship group.
IPEDD	Period (this record).

Main Program (Continued)

ISHULL	Ship type and hull number - read as a single variable from the SWBS File.
ISPEC	Specialization category.
ISTRPT	Availability start date (mo/dy/yr).
ITYPWK	Type of work.
IUNOW	Variable containing the characters "OW".
IYD	Yard name read from SWBS File.
J	DO-loop index.
JJ	Subscript designating a given year in the IFLAG, IFLAGG, IUNOS, and IUNOSS arrays.
K	DO-loop index.
L	DO-loop index.
LAST	Variable containing the letters "LAST" to test for termination of Manday Rate Deck.
MATALT	Fraction of total other direct repair work, read from SWBS (by Group) File.
MATREP	Fraction of total other direct alteration work, read from SWBS (by Groups) File.
NOYARD	Number of yards for which there are manday rates.
NYDS	Number of yards to be processed for a given group.
NYEAR	Number of years to be reported on.
OWN	Yard ownership indicator (Navy or private).
PRI	Variable containing the character "P".
PRIV	Variable containing the characters "PRI".
REP	Variable containing the characters "REP".
RES	Variable containing the characters "RES".
VALUES(18)	Array of nine repair and nine alteration mandays read from the SWBS File.
WEST	Variable containing the character "W".
YDRATE	Manday rate for a given yard and year, returned as an argument in subroutine DOLLAR.
ZACT	Variable used to test for "ACT", active work.
ZALT	Variable used to test for "ALT", alterations.
ZCON	Variable used to test for "CON" - type work is conversion.
ZMAP	Variable containing the characters "MAP".

Main Program (Continued)

ZN	Variable containing the character "N".
ZNAVE	Variable used to test for "NE" - sector is Navy-east.
ZNAW	Variable used to test for "NW" - sector is Navy-west.
ZNAWK	Variable used to test for "NAV" - ownership is Navy.
ZNAVY	Variable containing the characters "NAV".
ZNE	Variable containing the characters "NE".
ZNRT	Variable containing the characters "NFT".
ZNW	Variable containing the characters "NW".
ZPE	Variable containing the characters "PE".
ZPRI	Variable used to test for "PFI" - ownership is private.
ZPRIE	Variable used to test for "PF" - sector is private-east.
ZPRIW	Variable used to test for "PW" - sector is private-west.
ZPW	Variable containing the characters "PW".
ZRFP	Variable used to test for "REP" - repair work.
ZRES	Variable used to test for "RES" - type of work is NRT.
ZZMAP	Variable used to test for "MAP" - type of work is MAP.

Subroutine DOLLAR

I	DO-loop index.
IDBL	Double precision dummy argument in subroutine IERROR.
IDUMMY	Dummy argument in subroutine IERROR.
IDUM1	Dummy argument in subroutine IERROR.
IFYR	Fiscal year for this availability.
IYD	Yard name being processed.
J	DO-loop index.
OWN	Yard ownership indicator (Navy or private).
PRT	Variable containing the character "P".
YDRATE	Manday rate for a given yard and year.

Subroutine GRPID

BLANK	4-character blank space.
IGROUP	Group number being processed.
J	DO-loop index.
K	Index for I/O statement.

Subroutine HEADER

IPAGE	Variable used to increment page numbers in reports.
NOPG	A flag set to "2" when pages are to be numbered, otherwise set to "1".

Subroutine IERROR

IDBL	Double precision argument used to transfer yard names.
IDUMMY	Argument used to transfer the year or to designate which error message to write.
IDUM1	Argument used to transfer the year.
IDUM2	Argument used to transfer the group number.
N	Error number.

Subroutine RATEID

I	Index used for I/O statements.
IMAT	Percent of direct labor costs for material.
J	Index used for I/O statements.
NOYARD	Number of yards for which there are manday rates.
NYEAR	Number of years to be reported on.

Subroutine REPORT

DAY(9)	Array of manday values for a given yard and year.
DOL(9)	Array of material costs for a given yard and year.
I	DO-loop index.
IDAY(9)	Integer form of the array DAY.
IDBL	Double precision dummy argument in subroutine IERROR.

Subroutine REPORT (Continued)

IDOL(9)	Integer form of the array DOL.
IDUMMY	Dummy argument in subroutine IERROR.
IDUM1	Dummy argument in subroutine IERROR.
IEXTRA	Flag set to "1" for printing UNOW data, otherwise set to "0".
IGROUP	Variable used to transfer group number to subroutine IEREOF.
II	Subscript used to designate a given option.
IICPT	Variable used to transfer the option to subroutine IERPOP.
IIYARD	Variable used to transfer a yard name to subroutine IERPOP.
IMAT	Percent of direct labor costs for material.
IOPT(14)	Array of options for a given ship grouping.
ISUMPL	Direct labor costs in thousands of dollars.
IPDOL	Direct labor costs for UNOW in thousands of dollars.
IUSUM	Integer form of labor mandays for UNOW.
J	DO-loop index.
JSUMDL	Total labor cost for all SWBS.
JSUMDY	Total direct costs for material.
JYEAR	Year being reported on.
K	Index used for I/O statements.
KK	DO-loop index.
MAT	Direct labor costs for material in thousands of dollars.
NUMBER	Counter for number of reports per page.
NYDS	Number of yards being reported on.
NYEAR	Number of years being reported on.
UPOL	Direct labor costs for UNOW.
USUM	Labor mandays for UNOW.

Subroutine SKPGRP

IDBL	Double precision dummy argument in subroutine IEREOF.
IDUMMY	Dummy argument in subroutine IEREOF.

Subroutine SKPGRP (Continued)

IDUM1	Dummy argument in subroutine IERROR.
IDUM2	Dummy argument in subroutine IEPROR.
IFYR	Fiscal year for this availability.
IGROUP	Group number read from SWBS File.
IONCE	Flag set to "1" when file has been rewound, otherwise set to "0".
ISHULL	Ship type and hull number - read as a single variable from the SWBS File.
ITYPWK	Type of work.
IYD	Yard name.

Subroutine SUM

I	Subscript used to designate a given yard in the UYARD, ARRAYD, and ARRAYM arrays.
IFYR	Fiscal year for this availability.
II	Subscript used to designate a given option in the UARRAY, ARRAY1, and ARRAY2 arrays.
III	Flag set to "1" when there is UNOW work, otherwise set to "0".
ISAVE	Flag set to "1" when UNOW work is summed, otherwise set to "0".
IYD	Yard name being processed.
J	Subscript used to designate a given year in the ARRAY1, ARRAY2, ARRAYD, ARRAYM, UARRAY, and UYARD arrays.
JJ	DO-loop index.
JOPT	Option number.
K	DO-loop index.
L	DO-loop index.
UDOL	Material dollar value for UNOW for a given option and a given year.
USUM	Labor manday value for UNOW for a given option and a given year.
VALUES(18)	Array of repair and alteration labor manday values for a given option and a given year.
YDRATE	Manday rate for a given yard and year.

Subroutine TITLE

I	Index used for I/O statements.
IEXTFA	Flag set to "1" for printing headings for UNOW data, otherwise set to "0".
IFYR	Fiscal year for this availability.
IGROUP	Group number.
ISWBS(9)	Array of SWBS numbers.

6.3.7 SAMPLE RUN

The card inputs (unit 5) for the sample run requested that reporting be projected for one year, 1982. The percent of direct labor costs for material was defined as 25. Manday rates were given for eight Navy shipyards and one rate was used for the private yards. All options (shipyard ownership, coastal location, and type of work) as well as yard summaries were requested for Group 1. Various combinations of options and yards were requested for the other groups. The SWBS (by Groups) Data File (unit 12) was used as input to REPWBS. A sample of this file may be found in Section 6.3.3.2.

The sample output (unit 6) shows Direct Labor Mandays, Labor Costs, and Material Costs, projected for SWBS. Reports produced show breakdowns by sector and work categories. All options were requested for Group 1, a group of all CGN's. The following categories were reported on:

- Work in Navy Yards
- East Coast Navy Work
- West Coast Navy Work
- Conversion Work
- Active Ship Work

There was no private work for this group, so the following three reports were omitted:

- Work in Private Yards
- East Coast Private
- West Coast Private

Of the work categories requested, the following categories contained no data for the required group and year:

- Reserve Ship Work
- MAP Work

Any request for which there was no data produced an error message (unit 8) which gave the option, year, and group number. Three yard summaries were requested, but there was no data for Long Beach.

Group 2 was defined as an individual ship and a yard summary was the only request. Output included the projection of all work for the CGN 35 in Puget Sound Naval Shipyard for 1982. A group total is always produced and includes all work projected for that group of ships for the given year. In this case the group total and the Puget Sound summary were identical as any work projected for the CGN 35 is performed at Puget Sound Naval Shipyard.

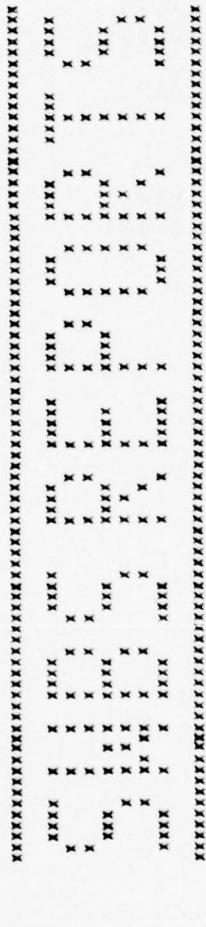

The reports for Group 3, a group of carriers (CV 59 through CV 62), were presented to show a spread of work in both Navy and private shipyards and the totals for the individual yards.

6.4 PROGRAM REPMAT

6.4.1 DESCRIPTION

REPMAT is a report generator that produces summary reports of projected workloads for the various production shop and Ship Work Breakdown Structure (SWBS) categories. Each report contains a 10-by-20 matrix whose rows reflect the mandays projected for the SWBS categories and whose columns show the mandays in shops. The shops consist of the 19 production shop categories and the SWBS represents the nine single-digit SWBS categories. Shop 65 (Module Repair and Maintenance Facilities) has been deleted from the matrix for reporting purposes, since Charleston is the only shipyard that uses it. Historical data collected to date from Charleston Shipyard showed no work performed in that shop. In the future, if work is projected for shop 65, it will be combined with shop 68.

The 19 shop categories referred to in these reports are as follows:

<u>Shop Number</u>	<u>Shop Name</u>
06	Central Tool Shop
11	Shipfitter Shop
17	Sheetmetal Shop
23	Forge Shop
26	Welding Shop
31	Inside Machine Shop
36	Weapon System Shop
38	Outside Machine Shop
41	Boiler Shop
51	Electric Shop
56	Pipe and Copper Shop
64	Woodworking Shop
65	Module Repair and Maintenance Facilities
67	Electronics Shop
71	Paint Shop
72	Rigging Shop

PRECEDING PAGE BLANK

81	Foundry Shop
94	Patternmaker Shop
99	Temporary Service Shop

Those areas, in which productive work is performed, that are not covered by these categories are referred to as "other direct."

The following nine SWBS categories are referred to in these reports:

1. Hull Structure
2. Propulsion Plant
3. Electrical Plant
4. Command and Surveillance (Shipboard Installations)
5. Auxiliary Systems
6. Outfit and Furnishings
7. Armament (Shipboard Installations)
8. Integration/Engineering (Shipboard Response)
9. Ship Assembly and Support Services

The program uses as input the SWBS-Shop Matrix File created by the program Xplode (Volume 5 - Synthesizer Subsystem), a Group Definition Card Deck, and input cards defining report options. Reports can be generated for one of three options: (1) repair mandays, (2) alteration mandays, or (3) total mandays. Data are reported first by yard, then within a yard by ship groups, and within groups by year.

A Group Definition Card Deck defines the ship groupings which may be reported on. Ship groupings are defined by the user. A group may consist of a single ship, a ship class, functional ship groupings, or any combination of these. For each grouping there may be as many as six sets of lower and upper ship-type/hull-number range combinations. For example, surface combatants might be described by the following groupings: CG 4 through CGN 39, CV 19 through CVN 70, DD 714 through DDC 41, FF 1037 through FFG 7, and CVT 16 through CVT 16.

A group number is assigned to this grouping. This group number is compared to the one requested on the Yard Option card. If there is agreement, the ship type and hull number are examined. Those that fall within the grouping are reported on. The capability to select various

groupings means that reports can be made on broad categories, such as all surface ships, or to the detail of a single ship type and hull number. Provision has been made for 100 ship groupings.

A type A Yard Option card, the first of two to describe the various options, contains the shipyard name and the word "ALL" if the entire yard is to be reported on. For the type of work desired, the word "REP" for repairs, "ALT" for alterations, or "TOT" for total of repairs and alterations must be requested. This option must agree with the option used in creating that specific yard on the SWBS-Shop Matrix File. In addition, the years to be reported on are input on this card.

The second Yard Option card, a type B card, contains the shipyard name and the group numbers. A Yard Option Terminator card follows the final type B Yard Option card. A sample input set-up is shown in Figure 6.4-1.

Due to the tremendous amount of data involved, it is feasible to execute the program Xplode creating a SWBS-Shop Matrix File for only two or three yards prior to generating reports. It is unlikely that one would store SWBS-Shop Matrix data for all shipyards, as each Depot Maintenance Assignment File (DMAF) availability produces 21 data records and requires a tremendous amount of machine storage space. When processing a yard, the program Xplode reads a ship availability from the DMAF and produces one record for each of the 20 shops within the shipyard. This record shows the mandays that the shop will expend in the nine SWBS categories.

All yard information is read at the begining of the program and is stored in arrays. The first record of the SWBS-Shop Matrix File is examined. If that yard is not required, the entire yard is skipped. The subroutine SUM is called to process the data for each record containing the year and the ship type requested. As a yard is completed, subroutine REPORT is called and data are extracted for reports by year and group number. Figure 6.4-2 shows a hierarchical diagram of REPMAT.

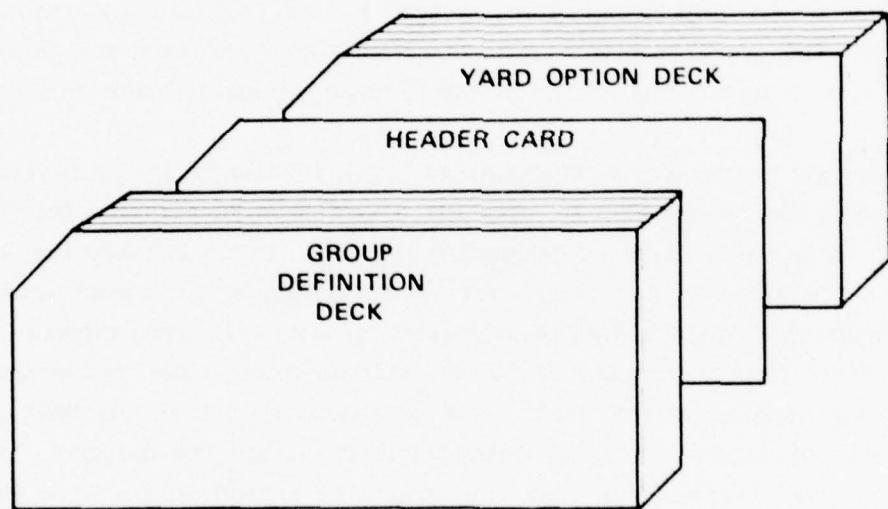

Figure 6.4-1 - Input Deck for REPMAT

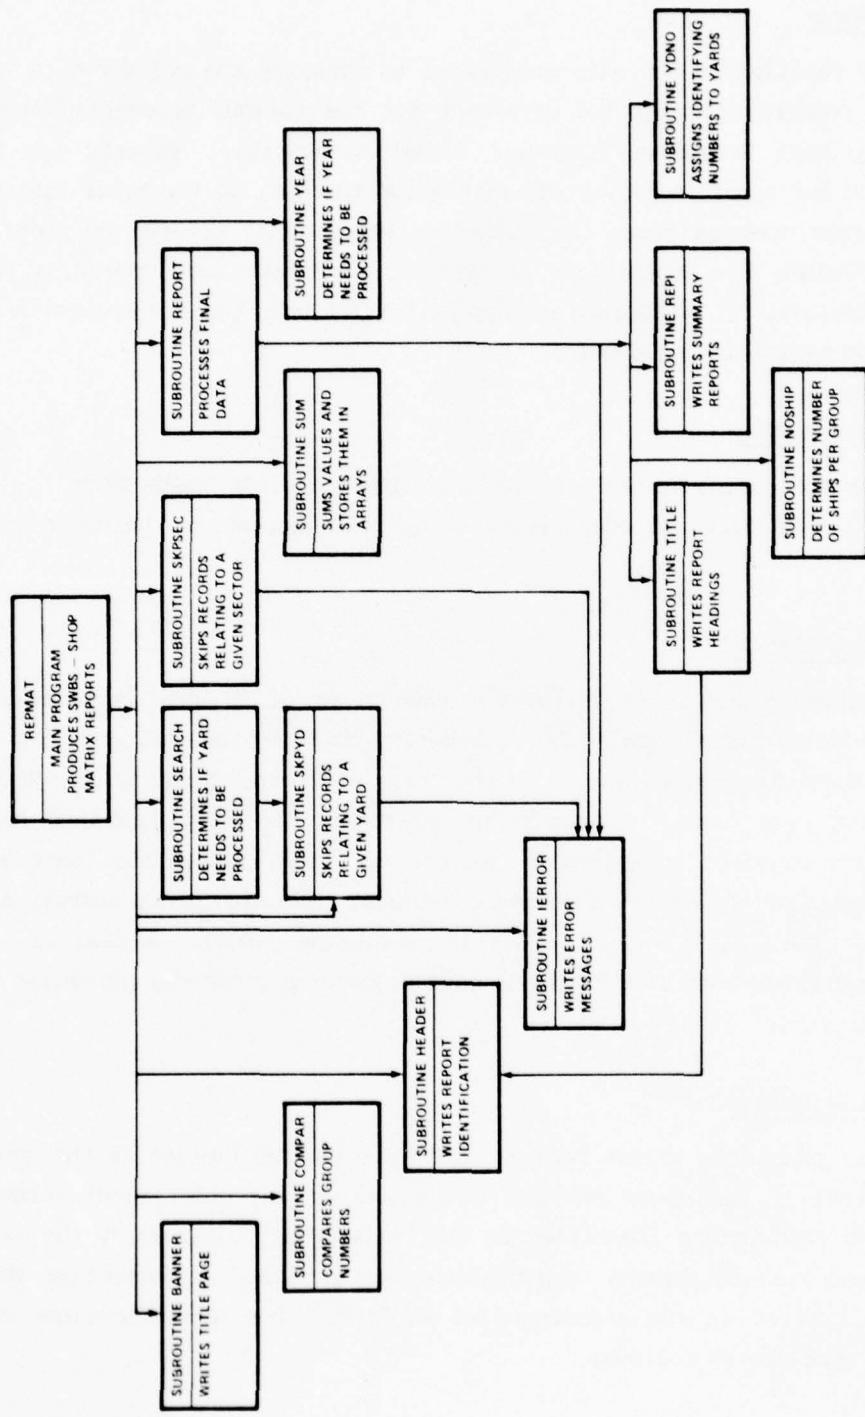

Figure 6.4-2 - REPMAT Hierarchical Diagram

Main Program

The function of the main program is to identify and collect data for summary reports of projected workloads for the various production shops and Ship Work Breakdown Structure (SWBS) categories. Reports may be generated for repair mandays, for alteration mandays, or for total mandays. The program uses as input the SWBS-Shop Matrix File created by program Xplode (Volume 5 - Synthesizer Subsystem), and input cards defining the report options. In addition, a Group Definition Data Base is created from the Group Definition Card Deck.

Subroutine BANNER

This subroutine writes a title page with the words "SWBS-SHOP REPORTS". The date and identifying information appear in the upper left corner.

Subroutine COMPAR

Subroutine COMPAR is called for each group of 20 shop records with the designated fiscal year. This subroutine compares the group numbers to be processed for a given yard with the array of group numbers in the Group Definition Data Base. If there is agreement, the ship type and hull number are examined to determine whether they fall within the lower and upper limits of any of the selected groupings. Matching group numbers are stored in the JGROUP array for use in subroutine REPORT. A flag is set when a match has been found and the data processing proceeds; otherwise an alternate return is made.

Subroutine HEADER

This subroutine writes report identification information in the upper left corner of each page and the page number in the upper right corner. SWBS-Shop reports are identified by the number "62" followed by the yard number and type of report. Yard numbers are assigned in subroutine YDNO and are carried in the argument list as "ID". The identifications for type of work are as follows:

- 01 for repairs
- 02 for alterations
- 03 for the total of repairs and alterations

Therefore, 62-01-02 would represent a report of total alteration mandays for Charleston.

Subroutine IERROR

The subroutine IERROR is called to indicate lack of data in any requested ship grouping. If the SWBS-Shop Matrix File was not created for an option that was requested (repairs, alterations, or total), an error message is written on unit 7.

Subroutine NOSHIP

The NOSHIP subroutine determines the number of ships in a given group and writes the ship type and hull numbers at the top of each report page.

Subroutine REPORT

Using the yard name, the option, and the arrays of data collected by other subroutines, subroutine REPORT extracts the data elements for the individual ~~re~~ rts. Data are stored in separate arrays for each of the required years. Tests are made to ensure that there are data for each of the desired groups. If all work in an entire yard has been calculated, the total is stored as the first "group number" in the data array and must be extracted as such. The values for a given yard, group number, and year are transferred to the subroutine REPI for final output.

Subroutine REPI

Subroutine REPI uses the manday values for a given yard, group number, and year as extracted by subroutine REPORT and writes them in a report format.

Subroutine SFARCH

Subroutine SEARCH is used to determine whether a yard is to be processed. The yard name, read from the SWBS-Shop Matrix File, is compared with the array of yard names requested by input data. If there is no match, subroutine SKPYD is called to position the file at the beginning of the next yard and an alternate return is made.

Subroutine SKPSEC

This subroutine is used to skip all records on the SWBS-Shop Matrix File for a given sector. As each record is read, it is checked for a separator record which is a record of all "9's". After the separator record is encountered, the program proceeds to the next sector.

Subroutine SKPYD

Subroutine SKPYD is used to skip all records on the SWBS-Shop Matrix File relating to a given yard. As each record is read, the yard name is compared with the name of the yard to be skipped. When a new yard name appears, the file is backspaced and the program continues.

Subroutine SUM

This subroutine sums the manday values for the nine SWBS categories and the 20 shops and stores them in arrays according to group number. There is an array for each of the five years. Subroutine SUM is called with one of three options: (1) to sum the values for given groups but not for an entire yard; (2) to sum the values for an entire yard but not for groups; (3) to sum the values for an entire yard as well as for given groups. In these data arrays the first subscript refers to the group number, the second subscript refers to the nine single-digit SWBS categories, and the third subscript refers to the 20 shops. If an entire yard is processed, the data are stored as the first "group number" in the array and later treated accordingly.

Subroutine TITLE

This subroutine is called by subroutine REPORT with an argument designating identifying notation to be written with the data. The options are: (1) TOTAL DIRECT REPAIR MANDAYS BY SWBS AND SHOPS, (2) TOTAL DIRECT ALTERATION MANDAYS BY SWBS AND SHOPS, (3) TOTAL DIRECT REPAIR AND ALTERATION MANDAYS BY SWBS AND SHOPS.

Subroutine YEAR

This subroutine checks the fiscal year for a given data record with the array of years requested by input. If there is no agreement, transfer is made to that portion of the program that reads the next group of data records.

Subroutine YDNO

This subroutine assigns a number to each yard for report identification. For example: Charleston is 01, Long Beach is 02. The subroutine argument "ID" is transferred to subroutine HEADER with this identifying number to be used for report identification.

6.4.2 RUN SET-UP

The following set-up is used to run the REPMAT program on the IBM 360/370 computer:

```
//NVSREPM JOR (XXXXXXXXXX,XXXXX),USER,CLASS=C,TIME=1,15),MSGLEVEL=1
//JOBLTR DD DSN=NVS01.DEPOT.LIB,DISP=SHR
// EXEC PGM=REPMAT
//GO.FT05F001 DD *

    REPMAT card inputs (unit 5)

//GO.FT06F001 DD SYSOUT=A          (SWRS-SHOP REPORTS)
//GO.FT07F001 DD SYSOUT=A          (ERROR MESSAGES)
//GO.FT11F001 DD DSN=NVS01.MATRIX.EXPLODE.DATA,DISP=SHR (INPUT FILE)
```

6.4.3 INPUTS

Card inputs are made using unit 5. The format for these cards is shown in Section 6.4.3.1.

Unit 5 - Card inputs which (1) define ship groups by setting lower and upper limits on ship type and hull number, (2) give identifying report information, (3) set the desired options and years required, (4) determine which yards and groups are to be reported on.

The following additional unit is used to input information from a disk file created by the program Xplode:

Unit 8 - SWBS-Shop Matrix File.

The format for this file is given in Section 6.4.3.2.

6.4.3.1 Unit 5 - Card Inputs

Group Definition Cards. The Group Definition Deck describes the various ship groupings. Two cards, a type A and a type B, are required to define each group. There may be as many as 100 groups. A group definition terminator card follows the last type B group definition card.

Type A Group Definition Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IGRPNO(I)	Group Number	1-3	I3
GRPDEF(I,1,1)	Ship Set 1 Ship-Type/Hull-Number (Lower Bound)	9-16	A8
GRPDEF(I,1,2)	Ship Set 1 Ship-Type/Hull-Number (Upper Bound)	20-27	A8
GRPDEF(I,2,1)	Ship Set 2 Ship-Type/Hull-Number (Lower Bound)	33-40	A8
GRPDEF(I,2,2)	Ship Set 2 (Upper Bound)	44-51	A8
GRPDEF(I,3,1)	Ship Set 3 (Lower Bound)	57-64	A8
GRPDEF(I,3,2)	Ship Set 3 (Upper Bound)	68-75	A8

Type B Group Definition Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
GRPDEF(1,4,1)	Ship Set 4 Ship-Type/Hull-Number (Lower Bound)	9-16	A8
GPPDEF(1,4,2)	Ship Set 4 Ship-Type/Hull-Number (Upper Bound)	20-27	A8
GRPDEF(1,5,1)	Ship Set 5 (Lower Bound)	33-40	A8
GRPDEF(1,5,2)	Ship Set 5 (Upper Bound)	44-51	A8
GRPDEF(1,6,1)	Ship Set 6 (Lower Bound)	57-64	A8
GRPDEF(1,6,2)	Ship Set 6 (Upper Bound)	68-75	A8

Group Definition Deck Terminator Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
Terminator	Terminator of Ship Group Definition Deck (any negative number)	1-3	I3

Identification Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
DATE	Date (mo/dy/yr)	1-12	3A4
COMMENT	Comment	15-34	5A4

Yard Option Cards. There are two cards for each required yard: a type A card which describes the options and years and a type B card for requesting the group numbers. A Yard Option terminator card follows the final type B Option card.

Type A Yard Option Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IYDSEL	Yard name	1-5	A5
ALL	The punch characters "ALL" will sum entire yard	8-10	A3
REP	The punch characters "REP" will compute repairs only	13-15	A3
ALT	The punch characters "ALT" will compute alterations only	18-20	A3
TOTAL	The punch characters "TOT" will compute total of repairs and alterations	23-25	A3
IYEAR(1)	2-digit year	30-31	I2
IYEAR(2)	2-digit year	33-34	I2
IYEAR(3)	2-digit year	36-37	I2
IYEAR(4)	2-digit year	39-40	I2
IYEAR(5)	2-digit year	42-43	I2

Type B Yard Option Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
IYDSEL	Yard name	1-5	A5
IYDGRP(1-25)	Group numbers to be processed	7-80	25(1X,12)

Yard Option Terminator Card

<u>Variable Name</u>	<u>Description</u>	<u>Field</u>	<u>Format</u>
LAST	End card of input data	1-5	A5

An example of an input deck for REPMAT is shown in Figure 6.4-1.

6.4.3.2 Unit 8 - SWBS-Shop Matrix File

The SWBS-Shop Matrix File is a binary file so the format is given only as a guide to the size of the variables.

Header Record. The format for the Header Record is described below. The arrays of yards and their options are dimensioned for 13.

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
OWN	Yard ownership indicator	1	(A1)
COAST	Coast	2	(A1)
IYEAR	First fiscal year of LRPS projection	3	(I2)
IYDSFC(1)	Yard name	4	(A5)
IOPTS(1)	Option flag	5	(A1)
IYDSEC(2)	Yard name	6	(A5)
IOPTS(2)	Option Flag	7	(A1)
.	.	.	.
.	.	.	.
.	.	.	.
IYDSEC(13)	Yard name	28	(A5)
IOPTS(13)	Option flag	29	(A1)

Manday Record. There is one Manday Record for each of the 20 shops for each six-month period of an availability.

<u>Variable Name</u>	<u>Description</u>	<u>Position</u>	<u>Format</u>
ISHULL	Ship-type/hull-number	1	(A8)
ITYPWK	Type work	2	(A3)
IYD	Yard	3	(A5)
IGROUP	Group number	4	(I3)
IFYR	Fiscal year (this record)	5	(I2)
OWN	Yard ownership indicator	6	(A1)
COAST	Coast	7	(A1)
IPERD	Period (this record)	8	(I1)
ICONT	Continuation indicator	9	(A1)
ISTRRT	Availability start date (mo/dy/yr)	10	(I6)
IEND	Availability end date (mo/dy/yr)	11	(I6)
ISPEC	Specialization category	12	(A3)
VALUES(1-9)	Mandays for SWBS for this Shop	13-21	(9F10.2)
ISHOP	Index used to identify the shop number	22	(I2)

Figure 6.4-3 shows an example of a SWBS-Shop Matrix File.

6.4.4 OUTPUTS

The following units are used by REPMAT for generating hard-copy output:

Unit 6 - Summary SWBS-Shop Matrix reports.

Unit 7 - Error messages.

Section 6.4.7 gives a sample of the SWBS-Shop Matrix reports.

6.4.5 PROGRAM LISTING

```

PROGRAM REPMAT(INPUT,OUTPUT,TAPE5=INPUT,TAPE6=OUTPUT,TAPE8,
1 TAPE7)
C
C      REPMAT IS A REPORT GENERATOR WHICH GIVES TOTAL DIRECT LABOR
C      MANDAYS IN THE FORM OF A SWBS-SHOP MATRIX
C      PROGRAMMER JEAN ST LAURENT CODE 1863
C      WRITTEN APRIL 1976
C
C      PRIOR TO RUNNING REPMAT, PROGRAM Xplode MUST CREATE A
C      SWBS-SHOP FILE FOR GIVEN YARDS AND OPTIONS
C      THE OPTIONS ARE:
C          REPAIRS, ONLY           - JOPT = 1
C          ALTERATIONS, ONLY      - JOPT = 2
C          TOTAL OF ALTS AND REPAIRS - JOPT = 3
C
C      REPORTS MAY BE PRODUCED FOR SELECTED GROUPS OF SHIP CLASSES
C      FOR A GIVEN YARD AND YEAR
C      THERE IS ALSO A PROVISION TO SUM ALL DATA FOR A YARD
C      SET TALL = 1
C
C      DATA MAY BE REPORTED ON FOR AS MANY AS 5 YEARS
C      THE REQUIRED YEARS ARE INPUT AS - IYEAR
C
C      TAPE ASSIGNMENTS
C          TAPE5 - INPUT - CARDS
C          TAPE6 - OUTPUT

6.4.6 GLOSSARY

COMMON VARIABLESCommon Block /IDATA/

- GRPDEF(100,6,2) Array of ship group definitions in which the first subscript refers to the group number, the second to the ship type and hull number, and the third to (1) lower bound of a set and (2) upper bound of that set.
- IYARD(13) Array of yard names for a given sector.
- IYDSEL(15) Array of yards to be processed.

Common Block /IDENT/

- COMENT(5) Array of report identification information.
- DATF(3) Array containing the date of the run.

Common Block /MISC/

- IYCPP(15,25) Array of group numbers in which the first subscript refers to the yard name and the second to the group number to be processed.
- JGROUP(25) Array of matching group numbers for a specific yard.
- KGROUP(25) Array of group numbers required for a specific yard.
- MGROUP(25) Array of matching group numbers for a specific record.

Common Block /RFP/

- IHULL(100,6,2) Array of hull numbers in which the first subscript refers to the group number, the second to the hull number, and the third to (1) the lower bound for a set and (2) an upper bound for that set.
- ISHIP(100,6,2) Array of ship types in which the first subscript refers to the group number, the second to the ship type, and the third to (1) a lower bound for a set and (2) an upper bound for that set.

Common Block /WORK/

- ARRAY1(25,9,20) Array of direct labor mandays for the first year requested; the first subscript refers to the group number, the second to the nine single-digit SWBS categories, and the third to the 20 shops.
- ARRAY2(25,9,20) Array of direct labor mandays for the second year requested; the first subscript refers to the group number, the second to the nine single-digit SWBS categories, and the third to the 20 shops.
- ARRAY3(25,9,20) Array of direct labor mandays for the third year requested; the first subscript refers to the group number, the second to the nine single-digit SWBS categories, and the third to the 20 shops.
- ARRAY4(25,9,20) Array of direct labor mandays for the fourth year requested; the first subscript refers to the group number, the second to the nine single-digit SWBS categories, and the third to the 20 shops.
- ARRAY5(25,9,20) Array of direct labor mandays for the fifth year requested; the first subscript refers to the group number, the second to the nine single-digit SWBS categories, and the third to the 20 shops.
- VALUES(9,20) Array of direct labor mandays; the first subscript refers to the nine single-digit SWBS categories and the second to the 20 shops.

Common Block /VAL/

- SUMSHIP(9) Array of total direct labor mandays for the nine SWBS categories.
- SUMWBS(20) Array of total direct labor mandays for the 20 shops.
- TOT Total direct labor mandays for a given yard and year.
- VALYR(9,20) Array of direct labor mandays for a given year; the first subscript refers to the nine single-digit SWBS categories and the second to the 20 shops.

LOCAL VARIABLES

Main Program

ALL	Variable used to request the summary of data for an entire yard.
ALT	Variable used to request computation of alteration data.
COAST	Coast (east or west).
I	DO-loop index.
IALL(15)	Array used to determine whether the entire yard is to be summed.
IALT	Variable containing the character "A".
ICONT	Continuation indicator.
IDONE	Variable set equal to the number of yards required and decremented as each one is completed.
IDUMMY	Dummy variable used in reading the second of a pair of group definition cards.
IDUMM1	Dummy variable used in re-reading group definition cards for print-out.
IEND	Availability end date (mo/dy/yr).
IFIRST	Flag set to "1" after reading first record of a yard; otherwise set to "0".
IFYR	Fiscal year for this record.
IGROUP	Group number read from SWBS-Shop Matrix File.
IGRPNO(100)	Array of group numbers identifying groups in Group Definition Deck.
II	Subscript designating a specific yard.
III	Counter used to determine number of yards.
IIOPT(15)	Array of options used when the SWPS-Shop Matrix File was created.
IOPT(15)	Array of options requested for a given yard.
IPERD	Period (this record).
IREP	Variable containing the character "R".
ISEP	Variable containing the characters "99999".
ISHP	Shop number.
ISHL	Ship type and hull number read as a single variable from the SWBS-Shop Matrix File.

Main Program (Continued)

ISPEC	Specialization category.
ISTRRT	Availability start date (mo/ay/yr).
ITOT	Variable containing the character "T".
ITYPWK	Type of work.
IYD	Yard name read from SWBS-Shop Matrix File.
IYDP	Yard name (of previous yard).
IYDYR(5)	Array of years for a specific yard.
IYEAR(15,5)	Array of years; the first subscript refers to the yard and the second to the year.
IYEAR1	First fiscal year of the LRPS projection.
J	DO-loop index.
JJ	Counter used to determine the number of groups to be processed.
JJJOPT	Option for a specific yard.
JJOPT	Option used in creating the SWBS-Shop Matrix File.
JOPT	Type of report requested for a specific yard.
K	DO-loop index.
KK	Flag when set to "0", groups are summed, but not entire yard; when set to "1", entire yard is summed but not groups; when set to "2", entire yard and groups are summed.
KKK	Subscript designating a specific yard.
KOPT	Flag set to "1" if entire yard is to be processed, otherwise set to "0".
L	DO-loop index.
LAST	Variable containing the characters "LAST" and used in testing termination of input data.
M	DO-loop index.
MYEAR	Number of years to be processed for a specific yard.
NGROUP	Number of groups to be processed for a specific yard.
NGRPS(25)	Array of number of groups for a specific yard.
NYDS	Total number of yards to be processed.
NYEARS(15)	Array containing the number of years to be processed for a specific yard.
OWN	Yard ownership indicator (Navy or private).

Main Program (Continued)

REP	Variable used to test for computing repairs.
TOTAL	Variable used to test for computing the total of repairs and alterations.
ZALL	Variable used to test for the characters "ALL".
ZALT	Variable used to test for the characters "ALT".
ZREP	Variable used to test for the characters "REP".
ZTOT	Variable used to test for the characters "TOT".

Subroutine COMPAR

I	DO-loop index.
IFLAG	Flag set to "1" after finding an agreement between the group numbers to be processed and the group numbers identifying the group definition data base.
IGRPNO(100)	Array of group numbers identifying groups in Group Definition Deck.
ISHULL	Ship type and hull number, read as a single variable.
J	DO-loop index.
K	DO-loop index.
NGROUP	Number of groups to be processed for a specific yard.

Subroutine HEADER

ID	Identification number assigned to each yard.
IDP	Yard identification number (of previous record).
IPAGE	Variable used to increment page numbers.
JOPT	Variable used to identify type of report. When set to "1", repairs are reported on; when set to "2", alterations are reported on; when set to "3", a total of repairs and alterations are reported on.
NOPG	Page counter.

Subroutine IERROR

IDBL	Double precision variable used to transfer yard names for error messages.
------	---

Subroutine TERROR (Continued)

IDUMMY	Single precision variable used to transfer group number for error messages.
N	Error number.

Subroutine NOSHIP

IBLANK	Four-character blank space.
JJ	Subscript designating a specific group number in the ISHIP and IHULL arrays.
KK	DO-loop index.
KKK	Subscript designating a specific ship type and hull number in the ISHIP and IHULL arrays.
L	Implied DO-loop index.
MM	Index used for I/O statements.

Subroutine REPORT

I	Index for fiscal year.
ID	Identification number assigned to a specific yard.
II	Control variable designating the year in a "computed go to".
IYD	Yard name being processed.
IYDYR(5)	Array of years for a specific yard.
J	DO-loop index.
JJ	Flag for group number.
JOPT	An option for a specific yard. when set to "1", repairs only are reported on; when set to "2", alterations only are reported on; when set to "3", a total of repairs and alterations are reported on.
KK	Group number requested for which there were no data.
KOPT	Flag set to "1" if entire yard is to be processed; otherwise set to "0".
L	DO-loop index.
LL	Index for group numbers.
M	DO-loop index.

Subroutine REPORT (Continued)

MYEAR Number of years to be processed for a specific yard.
NGROUP Number of groups to be processed for a specific yard.

Subroutine REP1

ISHP(20) Array of shop numbers.
ISWBS(9) Array of SWBS numbers.
L Index for I/O statements.
M DO-loop index.
N Index for I/O statements.

Subroutine SEARCH

II DO-loop index.
III Argument used in transferring subscript of required yard.
IYD Yard name being procesed.
KK DO-loop index.
KKK Argument used in transferring subscript of yard read from the header record.
NYDS Total number of yards to be processed.

Subroutine SKPSEC

IDUM Dummy argument in IERROR subroutine.
ISEP Variable containing the characters "99999".
ISHULL Ship type and hull number.
ITYPWK Type of work.
IYD Yard name being processed.
IYDP Yard name (of previous record).

Subroutine SKPYD

IDUM Dummy argument in IERROR subroutine.
ISHULL Ship type and hull number.

Subroutine SKPYD (Continued)

ITYPWK	Type of work.
IYD	Yard name.
IYDP	Yard name (of previous record).

Subroutine SUM

I	DO-loop index.
IFYR	Fiscal year for this record.
II	Control variable used in designating the required year in a "computed go to".
IYDYR(5)	Array of years for this yard.
J	DO-loop index.
JJ	Subscript used in matching group numbers.
JJJ	Initial parameter of DO-loop.
K	DO-loop index.
KK	Flag when set to "0", groups are summed but not entire yard; when set to "1", entire yard is summed but not groups; when set to "2", entire yard and groups are summed.
KKK	Control variable in "computed go to".
KOPT	Flag set to "1" if entire yard is to be processed, otherwise set to "0".
L	DO-loop index.
LLL	Terminal parameter of DO-loop.
NGROUP	Number of groups to be processed for a specific yard.

Subroutine TITLE

ID	Identification number assigned to a yard.
JOPT	Option for a specific yard. When set to "1", repairs are reported on; when set to "2", alterations are reported on; when set to "3", a total of repairs and alterations are reported on.

Subroutine YDNO

ICHASN	Variable containing the characters "CHASN".
ID	Identification number assigned to a yard.
IPEARL	Variable containing the characters "PEARL".
IPHILA	Variable containing the characters "PHILA".
IPTSMH	Variable containing the characters "PTSMH".
IPUGET	Variable containing the characters "PUGET".
IYD	Yard name being processed.
LBECH	Variable containing the characters "LBECH".
MARE	Variable containing the characters "MARE".
NORVA	Variable containing the characters "NORVA".

Subroutine YEAR

I	DO-loop index.
IFYR	Fiscal year for a given record.
IYDYR(5)	Array of years for a given yard.

6.4.7 SAMPLE RUN

A Group Definition Deck, a Header Card and a Yard Option Deck formed the card input (unit 5) to the program REPMAT. The SWBS-Shop Matrix File (unit 8) was created by program Xplode for specific yards and options. For the sample run, Norfolk Shipyard was selected to be "exploded" and a file was created for the total of repair and alteration mandays. For each record on the Depot Maintenance Assignment File (DMAF), the SWBS-Shop Matrix File contained a record reserved for material costs and one record of SWBS data for each of the 20 shops. The sample input shows a header record for Norfolk and data for two DMAF records. The yard option card requested that a SWBS-Shop Matrix be projected for Norfolk for total mandays. In addition, the summation of total work to be performed in the yard was requested. This option disregards any ship groupings and produces a SWBS-Shop Matrix report for the given yard and year.

SWBS-Shop Matrix reports are 10-by-20 matrices in which the rows reflect the work projected for SWBS categories and the columns show shop mandays. For example, in the summation matrix for Norfolk, the portion of work projected for SWBS 3 and Shop 38 is 2514 mandays. Group 1 was a group of all CGN's and was defined as CGN 1 through CGN 9999. The nine SWBS values for each shop are totaled and these values correspond to the report produced by REPSHOP for the same group number and year (Section 6.1.7).

Group 3 was a group of carriers in the CV 59 class and had a hull number lower bound of 59 and an upper bound of 62. This same grouping was used in reports produced by program REPWBS.

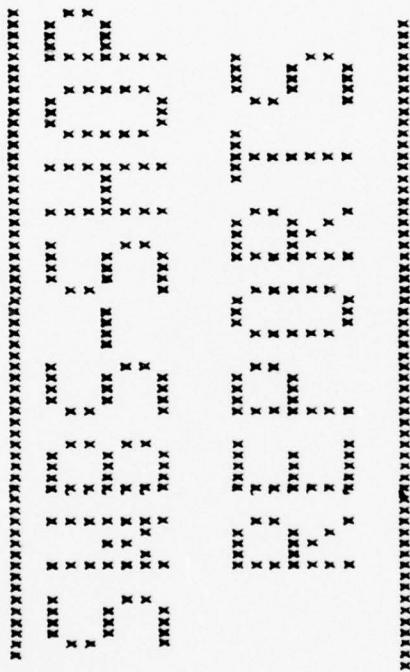

In the SWBS-Shop Matrix reports, 19 shops are summed and totals are tabulated for each SWBS category. Comparisons may be made with the projections in reports produced by REPWBS for Norfolk (Section 6.3.7).

DTNSRDC ISSUES THREE TYPES OF REPORTS

1. DTNSRDC REPORTS, A FORMAL SERIES, CONTAIN INFORMATION OF PERMANENT TECHNICAL VALUE. THEY CARRY A CONSECUTIVE NUMERICAL IDENTIFICATION REGARDLESS OF THEIR CLASSIFICATION OR THE ORIGINATING DEPARTMENT.
2. DEPARTMENTAL REPORTS, A SEMIFORMAL SERIES, CONTAIN INFORMATION OF A PRELIMINARY, TEMPORARY, OR PROPRIETARY NATURE OR OF LIMITED INTEREST OR SIGNIFICANCE. THEY CARRY A DEPARTMENTAL ALPHANUMERICAL IDENTIFICATION.
3. TECHNICAL MEMORANDA, AN INFORMAL SERIES, CONTAIN TECHNICAL DOCUMENTATION OF LIMITED USE AND INTEREST. THEY ARE PRIMARILY WORKING PAPERS INTENDED FOR INTERNAL USE. THEY CARRY AN IDENTIFYING NUMBER WHICH INDICATES THEIR TYPE AND THE NUMERICAL CODE OF THE ORIGINATING DEPARTMENT. ANY DISTRIBUTION OUTSIDE DTNSRDC MUST BE APPROVED BY THE HEAD OF THE ORIGINATING DEPARTMENT ON A CASE-BY-CASE BASIS.
