FOREWORD

This research was performed by the U.S. Army Construction Engineering Research Laboratory (CERL) for the Directorate of Military Programs, Office of the Chief of Engineers (OCE). The work was done under Project No. 4A762720A896, "Environmental Quality Technology"; Technical Area B, "Source Reduction Control and Treatment"; Work Unit 036, "Training Area Maintenance." The OCE Technical Monitor was Mr. Donald Bandel, DAEN-MPO-B.

The work was performed by CERL's Environmental Division (EN). The help of the following individuals is acknowledged: S. E. Thomas helped identify and obtain the original tape, R. L. Chilausky made the tapes readable and converted the Federal Information Processing Standard codes, and L. A. Engelman edited the files to fit CERL's purpose. Also, W. J. Garrison, R. S. Baran, and S. E. Thomas have further developed the basic file for use on other environmental research projects. Dr. R. K. Jain is Chief of CERL-EN.

COL Louis J. Circeo is Commander and Director of CERL, and Dr. L. R. Shaffer is Technical Director.

ENDANGERED SPECIES ON U.S. ARMY INSTALLATIONS

1 INTRODUCTION

Background

A major environmental issue facing U.S. Army installation land managers and planners is the presence, or potential presence, of one or more endangered species. If an installation encounters such a species, there is often concern about the possible effect on troop training. Because of the severity of the consequences if these species are harmed, most installations have completed a preliminary survey to see whether the post might be inhabited by an endangered species. Another factor, often examined somewhat less carefully, is the presence of critical habitats for these species. Definitive surveys to identify and locate each endangered species or critical habitat generally have not been completed, but are in various stages, depending on the installation and, in some cases, the notoriety of the endangered species itself.

The potential for altering the training mission is real. The managerial disturbance caused by the red-cockaded woodpecker over the past few years is an example every installation in the southeastern coniferous forest ecosystem can understand. Another isolated example is the golden-cheeked warbler which inhabits parts of Fort Hood, TX. To make this bird's survival more likely, the installation has set aside a large tract of land in which training is suspended during the warbler's breeding season.

When it is found that the training mission might disturb an endangered species or a critical habitat, the installation's Facilities Engineer may be asked to solve the problem in a way that serves both the endangered species, or its critical habitat, and the training mission. The solution is generally complex and may not be easily effected. For example, the red-cockaded woodpecker was a significant problem; several posts worked on their own solutions, with mixed success. After some time, the individual installations, through coordination with their major commands (MACOMS), established a line of communication to help each other develop a broadly applicable solution.

The ability to immediately identify other installations which may have the same problem could reduce the time needed to find a solution, and could reduce duplication of effort.

Another difficulty in the orderly examination of Army lands for the presence of endangered species is that it is often very hard to determine which species must be the subjects of such a search. By definition, endangered species are uncommon, and are often shy. Even fairly careful surveys of an entire installation may miss such a species if it is not specifically the subject of the search.

The information in this report will help the Facilities Engineer organize and direct such a survey, and will allow him/her to locate other installations that may have dealt with the same species.

Purpose

The purpose of this report is: (1) to list the species presently considered endangered by the Federal government, as well as those that are candidates for listing, or that are of undetermined status; and (2) to list the installations where these species might be found.

Mode of Technology Transfer

It is recommended that the information in this report be incorporated into an Engineer Technical Note.

Use of Report

Chapter 1 describes the methods used to generate information about the endangered species listed in Appendices A and B. Chapter 2 explains how the Facilities Engineer can use this information most efficiently.

Appendix A, which lists endangered species on various installations, will give some preliminary information to installations that have not completed an initial survey, and will reinforce the data acquired by posts with completed studies.

Appendix B is organized by species; for each, a list of installations is given. When a MACOM or installation recognizes that a species may conflict with the Army's mission, this list can be screened to determine the extent of the problem on an Army-wide basis, and to identify installations that already may be working to resolve the difficulty, or may be willing to engage in a joint venture.

2 INFORMATION ACQUISITION

The information in Appendices A and B is from a Department of Energy (DOE) computer file that contains distribution data on endangered species of Federal concern under the Endangered Species Act of 1973.¹ Included for each species are: (1) the common name, (2) the scientific name, (3) the family, (4) the group (mammal, bird, etc.), (5) Fish and Wildlife Service (FWS) listing and recovery priorities, (6) the Federal legal status, (7) the geographic distribution by counties or islands, (8) Federal Register citations, and (9) the sources of the information on distribution of the species. Status types are endangered, threatened, proposed, formally under review, candidate, deleted, and rejected. Distribution is by Federal Information Processing Standard (FIPS) county code and is of four types: designated critical habitat, present range, potential range, and historic range.

The condition of the file required that the U.S. Army Construction Engineering Research Laboratory (CERL) identify the FIPS code for each county included within installation boundaries. All adjacent counties were also designated, but those listings are not given in this report. CERL's work produced a list of endangered species for 49 installations (Table 1), including common name, scientific name, group, status, and range characteristics. The DOE file has been modified and appears in the appendices considerably shortened to display the most pertinent information.

The lists in Appendices A and B are incomplete in one way which may, occasionally, be of interest. Many species breed in one known area and overwinter in another. Both areas are included in this report's listings; however, the much larger area over which a migratory bird, for example, must fly between the two extremes is not listed. The peregrine falcon, for instance, might fly over any county in the eastern half of the country at some time; therefore, the bird is listed in the DOE file under

¹John Nagy and Charles E. Calef, *ESUSA: U.S. Endangered Species Distribution File*, BNL 51129 (Brookhaven National Laboratory, October 1979), 64 pp.

"Statewide-Unspecified." This category has not been used in Appendices A and B because it does not provide specific information about the presence of a species. For some states, such as Alaska, specific ranges and distribution of many species are not well known; these species are on DOE's Statewide list, but are not included in Appendices A and B.

3 ARMY APPLICATION OF INFORMATION

The information in the appendices has been listed in two different forms for distinct purposes. Appendix A lists each installation (see Table 1) and gives the species by common name or, if no common name is available, scientific name. The installations are listed alphabetically by state. This appendix is most useful to the individual who is concerned with a specific installation and the endangered species there. Information about the species is provided in the following format:

FIPS Code	Installation Name			
	County	C	P	H
Common Name	(listed in		X	
Mammals	hierarchical			X
Birds	sequence)	X		
Reptiles				X
Amphibians			X	
Fish		X		
Plants			X	

For each species listed, the three columns headed C, P, and H may be marked with an X. The "C" means "critical habitat"; this is an area with the physical and biological elements necessary for the species' survival. The "P" means "potential," which indicates that a species has strong potential to be present based on current knowledge. The "H" represents "historical range," the widest known distribution of the species in the past.

Appendix B is designed for those who wish to identify installations which may have a similar problem species or habitat. This appendix is critical to developing communication between installations, especially when rather uncommon species are involved. If it is discovered that an installation is inhabited by an endangered species or has a critical habitat within its boundaries, this list can be quickly checked for other installations that may have the same situation. These installations then may be able to work together to solve the problem.

When applying the material in this report, the user must be careful for two reasons. First, the DOE data collection effort was concerned with every

county in the United States, but did not consider areas smaller than counties. Thus, the designation that a species is, or may be, found in a county which is part of an Army installation does *not* mean that the species is in fact on the installation. The designation merely suggests that there is potential for a problem concerning that species.

Second, many of the entries in Appendix A are for historical range (H) only. It is unlikely that a species is present if only historical range is listed. Rather than spending time looking for such species, the user of this report should concentrate on species with current potential (P) to be present.

Although there are very few entries for critical habitat (C), this is the most important level of all. When counties are designated critical habitat for any species, this means that the species is known to be present, and that the land areas critical to its survival have been defined. Legal conflicts and public controversy are most likely with such cases, which must be approached very carefully to avoid even the appearance of indifference.

4 CONCLUSION AND RECOMMENDATION

This report has listed: (1) endangered species by installation, and (2) installations by endangered species. It is recommended that these lists be used to help coordinate the U.S. Army endangered species program between installations and between MACOMs.
