EXECUTIVE SUMMARY

This report describes results of sediment monitoring conducted in the Santa Margarita River Estuary (SMRE) located on Marine Corps Base Camp Pendleton (MCBCP) in 2022, performed on behalf of the MCBCP Environmental Security (ES) Staff, as part of their Municipal Watershed Monitoring Program. MCBCP voluntarily complies with certain additional monitoring requirements of the San Diego Regional Water Quality Control Board (SDRWQCB) National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) permit, Number CAS0109266 / Order Number R9-2013-0001, as amended by Order Number R9-2015-0001 and Order Number R9-2015-0100 (collectively referred to as the Phase I MS4 permit). The work described here is intended to assist evaluation of the California Sediment Quality Objectives (CASQO) for the SMRE. This effort also leverages data collected under the SMRE monitoring program as mandated under the SDRWQCB Investigative Order (IO) No. R9-2019-0007 (referred to here as the Order). The monitoring work was conducted by the Energy and Environmental Science Branch at the Naval Information Warfare Center (NIWC) Pacific.

Sediment monitoring was conducted at three (3) locations on 12 July 2022, during the summer index period and following the analytical techniques and quality controls/assurances as required under the Sediment Quality Assessment Technical Support Manual and as specified under the SMRE IO Workplan and Quality Assurance Project Plan (QAPP; SCCWRP, 2014; Weston, 2019a,b). Samples were analyzed for standard sediment quality characteristics and benthic community composition, and were tested for toxicity with marine amphipods (Eohaustorius estuarius) and Mediterranean mussel (Mytilus galloprovincialis) embryos using standardized protocols (SCCWRP, 2014; Weston, 2019a,b).

The sediment evaluation showed that all three stations were categorized as "Likely Unimpacted" using standard CASQO guidance. In addition, as part of the SMRE IO Monitoring Program, benthic community data were also analyzed using the multivariate-AZTI's Marine Biotic Index (M-AMBI) approach, which categorized all three stations as "Unimpacted".

Historical sediment monitoring of stations in the SMRE has been conducted since 2009. With the exception of station SMRE-1 in 2015, from 2009 through 2019 all stations were categorized as either "Likely Unimpacted" or "Unimpacted" using standard SQO guidance. Station SMRE-1 was found to be "Possibly Impacted" in 2015 primarily due to both the chemical and benthic indicator lines of evidence exhibiting "moderate" levels of disturbance.

1. Introduction

This report describes results of sediment monitoring conducted in the Santa Margarita River Estuary (SMRE) located on Marine Corps Base Camp Pendleton (MCBCP) in 2022, performed on behalf of MCBCP Environmental Security (ES) Staff, in support of their Municipal Watershed Monitoring Program (MCBCP, 2020). MCBCP is included in the National Pollutant Discharge Elimination System (NPDES) requirements of the State Water Resources Control Board Small Municipal Separate Storm Sewer System (MS4) permit, NPDES Number CAS0000004 / Water Quality Order Number 2013-0001-DWQ, and subsequent amendments (collectively referred to as the Phase II MS4 permit). However, MCBCP voluntarily complies with certain additional monitoring requirements of the San Diego Regional Water Quality Control Board (SDRWQCB) MS4 permit, NPDES Number CAS0109266 / Order Number R9-2013-0001, as amended by Order Number R9-2015-0001 and Order Number R9-2015-0100 (collectively referred to as the Phase I MS4 permit). The work described herein is intended to evaluate the current California Sediment Quality Objectives (CASQO) for the SMRE. While a complete CASQO analysis of estuary sediments was not included in some of the previous municipal watershed monitoring reports, results from this effort were compared to prior year data (CH2M, 2016; CH2M, 2018; CH2M, 2019). This effort also leverages data collected under Investigative Order (IO) Number R9-2019-0007 issued by the SDRWQCB (Sorensen et al., 2023). The monitoring was conducted by the Energy and Environmental Science branch at the Naval Information Warfare Center (NIWC) Pacific.

Sediment monitoring was conducted at three (3) locations on 12 July 2022, during the summer index period, following the analytical techniques and quality controls/assurances as required under the Sediment Quality Assessment Technical Support Manual and as specified under the SMRE IO Workplan and Quality Assurance Project Plan (QAPP; SCCWRP, 2014; Weston, 2019a,b). Samples were analyzed for standard sediment quality characteristics and benthic community composition, and were tested for toxicity with marine amphipods (Eohaustorius estuarius) and Mediterranean mussel (Mytilus galloprovincialis) embryos using standardized protocols (SCCWRP, 2014; Weston, 2019a,b). This report describes the methods, results and data evaluation used to meet the monitoring goals following the CASQO line of evidence (LOE) framework to assess sediment quality using various metrics.

1.1. Study Area

MCBCP is the largest expeditionary training facility on the West Coast. The facility covers approximately 150,000 acres, with an average daytime population of approximately 70,000. It spans from southern Orange County to northeastern San Diego County and is home to multiple expeditionary forces, special operations battalions, tactical support activities, assault, medical and air units, and recruitment and field training forces.

The SMRE (herein referred to as the Estuary) is part of the Santa Margarita Watershed (Figure 1) and sits entirely within the boundaries of MCBCP (Figure 2). It is a fairly linear water body that extends approximately 2.4 miles along its longitudinal axis to the northeast from the ocean. The perennial wetted portion of the Estuary is roughly 98 acres. It is ~ 0.6 miles across at its widest point along its

western edge, but rapidly narrows to about 1/10th that distance at the Interstate Highway 5 (I-5) bridges. The Estuary continues to narrow to the northeast and can be as narrow as 20 feet (ft) across in the upper reaches. The Estuary is very shallow, with water depths commonly less than one meter, and ranging up to ~5 m under the bridges, presumably as a result of scouring. A large portion of the western Estuary is not wetted or has water depths of only a few inches at low tide.

The Estuary receives freshwater inflow from the Santa Margarita River, with a median daily discharge 1 of about 6.5 cubic ft per second (cfs) based on data from the United States Geological Survey (USGS) gage 11046000, located about five miles upstream of the Estuary mouth. Maximum inflows, as high as 44,000 cfs, occur during winter storms. Surface water inflows can diminish to zero during the summer dry period as confirmed by visual observations (Sorensen et al., 2021, 2022 and 2023). Surface water runoff is affected by upstream runoff, evapotranspiration demands by phreatophytes, upstream diversions, and pumping of the groundwater basin. Hydrodynamic modeling results have identified and confirmed that there is a groundwater flow into the Estuary from the watershed even during the dry season.

When open to the ocean, the Estuary is influenced by semi-diurnal tides that typically result in two high and two low water periods a day. During this time, the ocean can have a strong influence on Estuary hydrodynamics and basic water quality parameters. Previous monitoring of water quality in the Estuary (Katz and Rivera-Duarte, 2012) showed that this ocean influence results in a steep longitudinal gradient in water quality parameters in the vicinity of the I-5 bridges that can be thought of as a transition from a western ocean-dominated lower Estuary segment to an eastern river-dominated upper Estuary segment.

The Estuary does not always have a connection to the ocean, however, and can be isolated through buildup of a large beach berm. Historical gage data collected near the I-5 bridges between 1981 and 2010 (USGS gage 11046050) show that the mouth was essentially closed to the ocean (with < 0.1 ft change in water elevations each day, showing no tidal influence) 22% of the time. The size, depth, and location of the opening through the beach berm is in constant flux as a result of competing forces of freshwater flow through the Estuary, wave action and long-shore sediment drift along the beach. The beach berm tends to increase in height through the summer dry period, reducing the overall amount of tidal exchange with the Estuary, even if it remains open. This berm height effectively controls the lowest level of water in the Estuary, which is only augmented (or increased) when the tides are able to bring ocean water above the berm. Data collected from 2014 to 2016 shows that when the mouth is effectively closed from exchange, the highest spring tides can overtop the berm, adding ocean water

¹ Median daily discharge from USGS Gage 11046000 for the period from January 1981 through September 2020. Prior to January 1980, the gage was located at different locations downstream and statistics are not comparable.

to the Estuary and raising its level (Katz et al., 2018). The Estuary mouth can be opened or enlarged very quickly during large winter storms.

In January of 2017, a historic rain event occurred (total monthly precipitation of >6 inches) which resulted in an episodic river flow event of greater than 25,000 cfs. This resulted in significant flushing and scouring of the Estuary (herein referred to as a "reset event"). Incidentally, similar reset events occurred at the end of 2019 and early 2020.

1.2. Site Background

MCBCP voluntarily complies with several watershed monitoring components for the SDRWQCB MS4 NPDES permits, and has elected to perform watershed monitoring in accordance to protocols specified in permit A of the Phase I MS4 Permit, outlined in their Municipal Watershed Monitoring Guide (dated June 2, 2016). This Municipal Watershed Monitoring Guide summarizes annual monitoring requirements which include, among other requirements, ambient bay (Estuary) monitoring. The ambient bay monitoring portion of the requirement is designed to provide an overview of the Estuary's health, and consists of water and sediment chemistry, sediment toxicity, and benthic infauna analyses. Previous Estuary monitoring seasons completed under MCBCP's Municipal Watershed Monitoring Program occurred in 2002-2004, 2005-2006, and 2008-2019 (CDM, 2009; CH2M, 2016; CH2M, 2018; CH2M, 2019). This report will only focus on sediment quality, sediment toxicity, and benthic community analysis (BCA), and will then calculate an integrated score for each monitoring site using these LOEs. The results from the 2022 monitoring event will then be compared to historic results for the same analyses.

1.3. Monitoring History

Between 2009 to 2019, the ambient bay (Estuary) monitoring component of the MCBCP Municipal Watershed Monitoring Program focused on collecting and analyzing sediment from three locations within the Estuary. While the exact location of sampling slightly changed from year to year, sampling sites were generally labeled as outlet (SME-3; located close to the Estuary mouth), middle (SME-2; located close to the southbound I-5 bridge), and inlet (SME-1; located on the east side of the Stuart Mesa bridge) monitoring points (Figure 2). For these efforts, sediments were characterized using several parameters including chemistry (and texture), toxicity, and BCA, all used to inform CASQO analysis (CDM, 2009; CH2M, 2016; CH2M, 2018; CH2M, 2019).

Sediment chemistry and texture analyses typically included: total organic carbon (TOC), grain size and some combination of polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs) (Aroclors), synthetic pyrethroid insecticides, organophosphate pesticides, organochlorine pesticides, and heavy metals. Inclusion of analyses for all these chemistry classes and parameters varied from year to year.

Sediment toxicity analysis typically included an acute and chronic measurement and followed United States Environmental Protection Agency (USEPA) approved methods and CASQO guidelines. Species analyzed varied, but generally consisted of an amphipod (e.g. *Eohaustorius estuarius*) and mussel (e.g. *Mytilus galloprovincialis*). The BCA methods followed CASQO protocols for identification of benthic macroinvertebrates (SCCWRP, 2014).

Finally, an overall station score was generally calculated in each monitoring year following the California multiple LOE (MLOE; Chemistry, toxicity, benthic community) methods and procedures (SCCWRP, 2014).

Collection of samples generally involved use of some form of a grab sampler from each site and consisted of either a composited sample from multiple small grabs or one larger grab sample that was separated into sub samples for each of the various analyses performed for each site. Sampling generally occurred in the recommend sampling period of early summer (June or July) to align with the summer index growth period. For a complete description of methods used and parameters measured per each of the monitoring years, refer to the annual municipal monitoring reports (CDM, 2009; CH2M, 2016; CH2M, 2018; CH2M, 2019).

2. METHODS

To assess sediment quality under the CASQO framework in 2022, three main analyses were completed: BCA, sediment chemistry and sediment toxicity. Field collection of sediment samples and BCA were leveraged with other monitoring efforts under a current five-year monitoring program for the SMRE in response to IO R9-2019-0007.

2.1. Sediment Collection and Processing

As with historical sampling described above, the 2022 effort collected sediment samples from three stations in the SMRE (Table 1, Figure 3), placed in the same general vicinity as historic municipal

watershed monitoring locations but aligned with current monitoring stations under the SMRE IO (R9-2019-0007). These three sampling locations are located in approximately the "inlet", "midpoint" and "outlet" points of the Estuary. Historic monitoring locations are also provided in Table 1 (and shown in Figure 3) for comparative purposes.

Table 1 Sample station locations.

Station ID	General Location	Latitude (Degree N)	Longitude (Degree W)			
	202	22 Sites				
MA1 / W1	Outlet	33.23402	-117.4133			
MA2 / W8	Midpoint	33.23547	-117.40857			
Е3	Inlet	33.23783	-117.39352			
I	Historic Sites (approximate locations)					
SME-3	Outlet	33.23385	-117.41335			
SME-2	Midpoint	33.23437	-117.41130			
SME-1	Inlet	33.23513	-117.40929			

Figure 3 Sediment stations, MA1, MA2 and E3 at Santa Margarita Estuary (SME). Historic monitoring stations noted with pink markers.

Sediment samples were collected by NIWC staff using a Multi-Substrate Subtidal Sampler (SUBS-Sampler; Patent No. 11,054,345 B2; Figure 4) with a 4-inch diameter (0.008 m²) core barrel, as per Bight Regional Monitoring suggestions for brackish estuarine sampling (McLaughlin et al., 2019). This sampler design was chosen due to the shallow water depths of the Estuary stations (averaging approximately 1.5 ft), requiring manual operation which prevented the use of a large grab sampling device.

Figure 4 Subsampler/ BCA sample collection. The SUBS sampler in water just prior to collecting sample (left). Suction tube method of draining water, in this case into tray for benthic sample collection (right).

For BCA, all sediment samples were collected in subtidal conditions and the entire contents of the grab sample (including water) were placed in plastic containers and transported back to the shoreline for further processing. Samples were sieved through a 0.5-mm mesh screen to remove sediment fines. All residual sediment, debris, shells, and benthic organisms remaining on the screen were carefully collected into labelled wide-mouth bottles. Samples were "fixed" on-site in formalin buffered with borax and diluted by seawater to create a 5% formalin preservative. The benthic samples were stored at ambient temperature throughout transit and shipped to the EcoAnalysts benthic laboratory in Moscow, Idaho for further processing and identification. A copy of the chain of custody form is provided in Appendix A.

For the chemistry and toxicity sediment samples, additional grab samples were collected and placed in high density polyethylene (HDPE) bag liners by NIWC Pacific personnel. Between sites, all equipment was thoroughly washed and rinsed with ambient water and then deionized water to avoid cross-contamination. Chemistry and toxicity samples were then transferred to the NIWC Pacific Bioassay Laboratory in insulated ice chests containing blue ice. Upon receipt at the NIWC Pacific Bioassay Laboratory, arrival temperature of the samples was documented, and samples were stored at 4°C until processing.

At the NIWC Pacific Bioassay Laboratory, sediment samples were thoroughly homogenized and subsamples from each station were collected into the following containers for chemistry analysis: 1×8 oz. amber glass jar (for total organic carbon and trace metals) and 3×4 oz. amber glass jars (for

organic contaminants). These samples were shipped priority overnight in insulated ice chests containing blue ice to Weck Laboratories, Inc. in Industry City, CA on 13 July 2022. Copies of the chain of custody forms for chemistry are provided in Appendix B.

The remaining homogenized sediment material was press-sieved through a 1-mm sieve to remove native organisms and potential predators before being placed into toxicity exposure chambers at NIWC Pacific. Copies of the chain of custody forms for toxicity are provided in Appendix C.

2.2. Analytical Methods

Samples were analyzed for BCA metrics by EcoAnalysts Inc., for bulk chemistry by Weck Laboratories, and for toxicity by NIWC Pacific's Bioassay Lab. Complete reports for the BCA and bulk chemistry analyses are provided in Appendix A and B, respectively; toxicity test data and statistical summaries are provided in Appendix C. The following sections summarize the analytical methods for each set of parameters.

2.2.1. Benthic Community Analysis

All BCA samples were processed by EcoAnalysts Inc. using CASQO protocols for identification of benthic macroinvertebrates (SCCWRP, 2014) and in accordance to SMRE IO approved Workplan and QAPP (Weston, 2019a,b). Briefly, at the laboratory, samples were transferred to 70% ethanol for long-term preservation and storage. Organisms were then separated into vials according to major taxon categories (e.g., mollusks, crustaceans, annelids, etc.) under a dissecting microscope until 100% of the sample was sorted. A quality assurance (QA) check consisting of a 10% re-sort of each sample was performed by staff who did not initially sort the sample to assure \geq 95% accuracy in the removal of all macrofauna from each sample.

All sorted organisms were identified by qualified taxonomists down to the lowest practical taxonomic level (generally considered to be genus/species) and enumerated. A quality control (QC) check was performed by conducting a full taxonomic re-analysis of two samples by taxonomists who did not originally identify the organisms.

Following guidance outlined by the CASQO framework and in accordance with the IO workplan (Weston, 2019a), determination of benthic community condition was investigated using four indices (Index of Biotic Integrity [IBI], Relative Benthic Index [RBI], Benthic Response Index [BRI], and River Invertebrate Prediction and Classification System [RIVPACS]). These indices characterize the sample into one of four categories of disturbance (Reference, Low, Moderate, and High), and are based on the level of abundance, the variety of taxa, and signs of stress. The results of these four indices were then summarized into one integrated benthic indicator value for each sample, which forms the benthic community LOE that goes into the CASQO MLOE calculation for that site.

As part of the SMRE IO monitoring program and in an effort to determine whether community effects as deemed by the CASQO methods are due potentially to anthropogenic disturbance or are environmentally driven, the M-AMBI was also computed. The M-AMBI is more suitable for dynamic estuaries such as the SMRE as it is more inclusive of benthic assemblages unique to lower saline environments and those in which a natural salinity gradient is present (Gillett et al., 2019). For a

complete description of M-AMBI analysis methods and raw data associated with this analysis, refer to Sorensen et al. (2023).

2.2.2. <u>Sediment Chemistry</u>

Weck Laboratories analyzed bulk sediment samples for grain size, percent solids, total organic carbon (TOC), cadmium, copper, lead, mercury, zinc, a suite of low and high molecular weight PAHs, a suite of chlorinated pesticides, and a suite of 51 PCB congeners. This included all 18 PCB congeners used in the calculation of the CASQO chemistry LOE. The analyses and published protocols that were followed are shown in Table 2. A full list of analytes measured is presented in Table 3. A full suite of QC samples was prepared for every analysis batch including a procedural blank, matrix spike, matrix spike duplicate, duplicates, a laboratory control sample and standard reference material.

*Shaded cells are used for PCB CASQO calculations.

2.2.3. <u>Sediment Toxicity</u>

NIWC Pacific's Bioassay Laboratory conducted two toxicity tests on all samples in accordance with CASQO guidelines using standard methods (US EPA, 1994; ASTM E1367-03; SCCWRP, 2014).

Bulk sediment acute toxicity was evaluated using a 10-day amphipod (*Eohaustorius estuarius*) survival toxicity test (Figure 5). Sediment water interface (SWI) chronic toxicity was evaluated using a 2-day Mediterranean mussel (*Mytilus galloprovincialis*) embryo-larval development test (Figure 5). Negative controls consisting of sediment from the amphipod collection site were included in the 10-day whole sediment test. For the 2-day SWI test, a chamber control (screen tube) and a seawater negative control were also tested concurrently. In addition, a 4-day reference toxicant test and a 2-day reference toxicant test using cadmium and copper were conducted concurrently for the amphipods and Mediterranean mussels, respectively. Summaries of the test conditions are provided in Table 4 and Table 5.

Figure 5 Toxicity test organisms used for the sediment toxicity line of evidence: *Eohaustorius* estuarius (left) and *Mytilus galloprovincialis* (right).

All test chambers were set up with sediment, water and aeration on the day prior to test initiation. Screen tubes for the SWI test were gently introduced to each test chamber on the day of test initiation. Water quality parameters including pH, dissolved oxygen (DO), salinity, temperature and ammonia were measured in the overlying water prior to organism addition. Mussel embryos were introduced to the screen tubes and amphipods were introduced directly into each chamber. Daily observations of water quality, aeration and sediment condition (e.g., anoxia, microbial growth, etc.) were made.

At the end of the exposure period for the SWI toxicity test, screen tubes were carefully removed from the sediment and the embryos were washed into glass scintillation vials and preserved in 10% buffered formalin for later microscopic examination. At the end of the 10-day survival test with marine amphipods, surviving organisms were recovered by sieving sediment through a 500-µm mesh sieve

and were immediately enumerated. Ammonia in the overlying water was measured on the day of termination for both tests. The results from the two tests for each station were integrated into a single toxicity LOE metric following the CASQO framework.

Table 4 Specifications for 10-day whole sediment acute exposure test using the marine amphipod *Eohaustorius estuarius*.

Test period	7/15/2022 – 7/25/2022			
Test organism	Marine amphipod – Eohaustorius estuarius			
Test organism source	Northwestern Aquatic Sciences (Newport, OR)			
Test duration; endpoint	10-day; survival			
Test solution renewal	None			
Feeding	None			
Test Chamber size/type	1L glass mason jar			
Test sediment depth	2 cm			
Test sediment manipulation	Homogenized and sieved to <1.0 mm			
Overlying water volume	800 ml			
Control sediment source	Sediment from amphipod collection site, Yaquina Bay, OR			
Test temperature	15 ± 1 °C			
Test salinity	$32 \pm 2 \text{ PSU}$			
Light quality	10-20 μE/m²/s (Ambient laboratory levels)			
Photoperiod	Continuous light (24 hr), ambient laboratory lighting			
Aeration	Laboratory filtered air, continuous (1-2 bubbles per second delivered through capillary tubing)			
No. of organisms per chamber	20			
No. of replicates	5			
Overlying water source	Filtered (0.45 µm) natural seawater collected from near the mouth of San Diego Bay at NIWC Pacific Laboratory			
Test acceptability criteria	≥ 90% mean survival in control sediment			
Reference toxicant	Cadmium chloride (CdCl); 96-h water only exposure; six concentrations (4 replicates each)			
Test protocol	US EPA, 1994; ASTM E1367-03; SCCWRP, 2014			

Table 5 Specifications for 2-day sublethal exposure test using the Mediterranean mussel *Mytilus galloprovincialis* embryo-larvae at the sediment-water interface.

Test Period	7/15/2022 – 7/17/2022			
Test organism	Mediterranean mussel – Mytilus galloprovincialis			
Test organism source	Field collected in Mission Bay, San Diego, CA			
Test duration; endpoints	48 hr; embryo-larval percent normal alive			
Test solution renewal	None			
Feeding	None			
Test Chamber size/type	1L glass mason jar w/ polycarbonate screen tubes with 25 μm mesh			
Test sediment depth	5 cm			
Test sediment manipulation	Homogenized and sieved to <1.0 mm			
Overlying water volume	300 ml			
Test temperature	15 ± 1 °C			
Test salinity	$32 \pm 2 \text{ PSU}$			
Light quality	10-20 μE/m ² /s (Ambient laboratory levels)			
Photoperiod	16 hr light/ 8 hr dark			
Aeration	Laboratory filtered air, continuous (1-2 bubbles per second delivered through capillary tubing)			
No. of organisms per chamber	~250 eggs, appropriate sperm density to provide > 90% fertilization success (determined in a pre-test trial)			
No. of replicates	5			
Overlying water source	Filtered (0.45 µm) natural seawater collected from near the mouth of San Diego Bay at SSC Pacific Laboratory			
Test acceptability criteria	≥ 80% survival in control			
Reference toxicant	Ammonia chloride (NH ₄ Cl); 48-h water only exposure; seven concentrations (5 replicates each)			
Test protocol	Anderson, 1996 (modified); USEPA, 1995			

For purposes of interpretation, data from the 10-day survival test were categorized by following the flow chart in Figure 6 (SCCWRP, 2014):

1) First, if mean percent survival was greater than 90%, the sample was deemed Non-toxic. If mean percent survival for each treatment was less than 90%, the data were adjusted to the control response (i.e. [mean survival of test sample/mean survival of control]*100]).

2) Second, after control normalization, if the mean percent survival was greater than 82%, the non-normalized data were statistically compared to the control response using a student's t-test assuming unequal variance. If the sample was found to be not significantly different from the control, the sample was deemed Non-toxic. If the sample was found to be significantly different from the control, the sample was deemed to be of Low Toxicity. This procedure would continue following the flow chart for samples with lower survival rates.

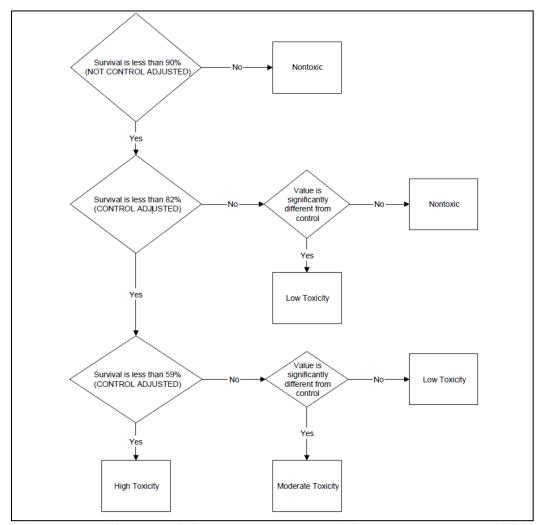

Figure 6 Flow chart for determining the *E. estuarius* toxicity response category (SCCWRP, 2014).

For purposes of interpretation, data for the 2-day sublethal exposure test were categorized by following the flow chart in SCCWRP (2014):

- 1) First, if mean percent normal alive (PNA) was greater than 80%, the sample was deemed Nontoxic. If mean PNA for each treatment was less than 80%, the data were adjusted to the control response (i.e. [mean PNA of test sample/mean PNA of control]*100]).
- 2) Second, after control normalization, if the mean control-adjusted PNA was greater than 77%, the non-normalized data were statistically compared to the control response using a student's t-test assuming unequal variance. If the sample was found to be not significantly different from

the control, the sample was deemed Non-toxic. If the sample was found to be significantly different from the control, the sample was deemed to be of Low Toxicity. This procedure would continue following the flow chart for samples with lower control-adjusted PNA values.

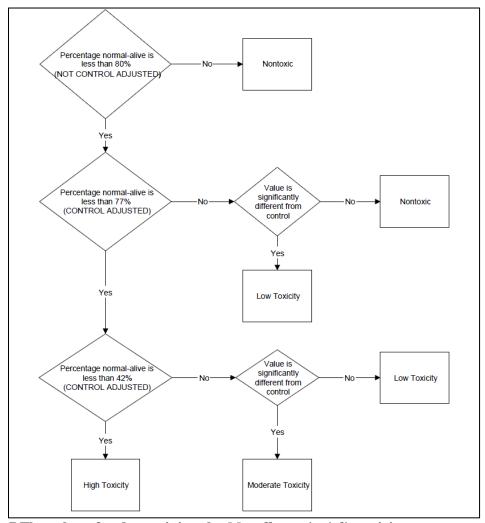

Figure 7 Flow chart for determining the *M. galloprovincialis* toxicity response category (SCCWRP, 2014).

3. 2022 MONITORING RESULTS AND ASSESSMENT

Sampling details and a general description of sediments at time of collection are provided in Table 6 (where PSU indicates practical salinity units).

Table 6 Sampling station conditions.

Station ID	Sample Date	Collection Time	Marine (>27 PSU) OR Brackish (<27 PSU)	Sampling Depth (ft)	General Characteristics
MA1 / W1	12 Jul 2022	09:25	Marine	1.6	brown, sandy
MA2 / W8	12 Jul 2022	10:35	Marine	1.9	brown, silty clay, sulfide odor
Е3	12 Jul 2022	14:14	Brackish	1.0	brown, sandy

3.1 Benthic Community Analysis

Benthic community analysis results for each station are summarized in Table 7. The complete results can be found in Appendix A. The table contains the measured abundance and taxa values along with several standard indices used to assess community metrics such as richness, diversity, dominance and evenness.

The taxonomy QC samples passed, achieving an average 95.8-97.7% similarity between the original and QC identifications. The individual and integrated index scores for each station are shown in Table 8. When averaged together into one score, known as the Integrated Benthic Indicator, stations MA1 and E3 were categorized as High Disturbance and station MA2 was categorized as Moderate Disturbance. Using the M-AMBI method to assess benthic community condition, all three stations were categorized as Low Disturbance.

Table 7 Summary of benthic community abundance, richness, diversity, evenness, and dominance data.

	Station ID		
Benthic Community Index	MA1	MA2	E3
Total Abundance (Individuals/0.1 m²)	33	1240	678
Richness (Taxa/0.1 m²)	12	20	15
Shannon-Wiener Diversity	1.75	1.54	1.77
Pielou's Evenness	0.70	0.51	0.65
Schwartz Dominance	4	3	4

Table 8 Summary of individual benthic community indices scores and categories and integrated benthic community indicator. Categories are Reference, Low Disturbance (Low), Moderate Disturbance (Moderate), and High Disturbance (High).

Benthic Community Index		Station ID				
		MA1	MA2	Е3		
IBI	Score	2	1	3		
1D1	Category	Moderate	Low	High		
DDI	Score	0.05	0.58	0.25		
RBI	Category	High	Reference	Low		
BRI	Score	47.44	66.52	77.80		
DKI	Category	Low	Moderate	High		
DIVDACC	Score	0.19	0.52	0.38		
RIVPACS	Category	High	Moderate	Moderate		
Integrated Ber	nthic Indicator	High	Moderate	High		

Table 9 Summary of M-AMBI benthic community indices scores and condition. Conditions are Reference, Low Disturbance, Moderate Disturbance, and High Disturbance.

Station ID	M-AMBI Score	M-AMBI Condition
MA1	0.53	Low Disturbance
MA2	0.53	Low Disturbance
E3	0.52	Low Disturbance

3.2 Bulk Sediment Chemistry

Bulk sediment chemistry results are summarized in Table 10 through Table 14. The dataset includes five metal concentrations, 18 PAHs, 10 chlorinated pesticides and 18 PCBs that are required to perform the CASQO calculations as well as total organic carbon, percent fines, and the additional PCB congeners specifically requested by the SDRWQCB. Data are presented as reported by the analytical Lab. All QC parameters were within the established control limits. The complete results including QA are in Appendix B.

3.2.1 Physical chemistry

A summary of the physical sediment metric results is presented in Table 10. Sediment percent fines (<0.63µm) were 0.56, 0.54 and 4.97% in site samples MA1, MA2 and E3, respectively. TOC measurements were 0.116, 0.679 and 0.138% for sites MA1, MA2 and E3, respectively. Total solids measured 72.5, 68.7 and 64.6% for MA1, MA2 and E3, respectively. Site sediments were composed primarily of medium sized (MA1 and MA2) and fine (E3) sand.

Table 10 Bulk sediment total organic carbon and sediment grain size concentrations in units of percent for sediment monitoring stations.

	Measurement	\$	Station ID				
	(%)	MA1	MA2	Е3			
Tot	al Organic Carbon (TOC)	0.116	0.679	0.138			
	Total Solids	72.5	68.7	64.6			
Gravel (>2mm)		0.00	0.00	0.00			
	Coarse (0.5-2mm)	10.18	14.88	3.68			
Sand	Medium (0.25-0.5mm)	61.91	56.42	28.76			
	Fine (0.0625-0.25mm)	27.35	28.15	62.58			
Silt (0.00391 - 0.0625mm)		0.22	0.33	4.35			
Clay (<0.00391mm)		0.34	0.21	0.62			
	Percent Fines (Silt + Clay)	0.56	0.54	4.97			

3.2.2 Metals

The bulk sediment metals data are presented in Table 11. Cadmium and Mercury were not detected (ND) in all three samples. Copper measured 3.1, 3.5 and 15 mg/kg in MA1, MA2 and E3, respectively. Lead measured 1.2, 0.87 and 4.0 mg/kg for sites MA1, MA2 and E3, respectively, and Zinc measured 9.7, 12 and 49 mg/kg MA1, MA2 and E3, respectively. CASQO maximum reporting limits (RL) and laboratory achieved RL are also reported for metals in Table 11.

The National Oceanic and Atmospheric Administration (NOAA) Screening Quick Reference Tables (Buchman, 2008) Effects Range Low (ERL) and Effects Range Medium (ERM) concentrations for inorganic contaminants in marine sediments are also included in Table 11. The ERL represents a value at the low end of the range at which toxicity may begin to be observed in sensitive species and the ERM is the median concentration at which toxicity may be observed. ERL and ERM concentrations are used as benchmarks that, if exceeded, could result in occasional toxicity to marine organisms.

Table 11 Bulk sediment metals concentrations (mg/kg) for sediment monitoring stations, as well as general guidelines.

	CASQ		Method	S	tation ID			
Analyte	O Max RL	Achieved RL Range	DL	MA1	MA2	Е3	ERL ¹	ERM ¹
Cadmium	0.09	0.28 - 0.31	0.083	ND	ND	ND	1,200	9,600
Copper	52.8	0.69 - 0.77	0.40	3.1	3.5	15	34,000	270,000
Lead	25.0	0.69 - 0.77	0.29	1.2	0.87	4	46,700	218,000
Mercury	0.09	0.014 - 0.015	0.0079	ND	ND	ND	150	710
Zinc	60.0	6.9 - 7.7	3.3	9.7	12	49	150,000	410,000

¹Screening values are from Buchman (2008). ND indicates measured value was below method detection limit.

3.2.3 PAHs, Pesticides and PCBs

Bulk sediment PAH, Pesticide and PCB data as well as CASQO maximum RL and laboratory achieved RL are presented in Table 12, Table 13, and Table 14, respectively. All measurements for these analytes were ND. For all of these analyses, the sample and/or sample extract was diluted prior to preparation due to matrix interferences. The method detection limit (MDL) and method reporting limit (MRL) were raised due to this required dilution. A few of the PCBs listed in Table 3 were not include in the PCB analytes provided by the analytic laboratory. However, none of the missing PCBs were part of the required PCBs needed for calculating the CASQO and it is unlikely that the analytes would have resulted in any detectable concentrations.

Table 12 Bulk sediment PAH concentrations in $\mu g/kg$ for sediment monitoring stations.

	CASQO	Achieved	Method		Station ID					
Analyte	Max RL (μg/kg)	RL Range (µg/kg)*	DL (ug/kg)	MA1	MA2	Е3				
	Low Molecular Weight PAHs (LMWPAH) in units of μg/kg									
Naphthalene	20	97 - 120	7.3	ND	ND	ND				
1- Methylnaphthale ne	20	97 - 120	6.1	ND	ND	ND				
2- Methylnaphthale ne	20	97 - 120	6.1	ND	ND	ND				
2,6- Dimethylnaphth alene	20	97 - 120	9.3	ND	ND	ND				
Acenaphthene	20	97 - 120	5.3	ND	ND	ND				
Biphenyl	20	97 - 120	7.8	ND	ND	ND				
Fluorene	20	97 - 120	6.1	ND	ND	ND

PCB 206	3.0	32 - 81	32	ND	ND	ND

		Achieved	Method DL		Station ID	
Analyte	Max RL (mg/kg)	RL Range (mg/kg)	(mg/kg)	MA1	MA2	E3
PCB 209	3.0	32 - 81	32	ND	ND	ND
Sum PCBs				ND	ND	ND
Sum NO	Sum NOAA 18 PCBs**			ND	ND	ND

Due to the nature of matrix interferences, sample and/or sample extract was diluted prior to preparation. The MDL and MRL were raised due to the dilution; * - MISSING ANALYTES. ** - Sum NOAA 18 includes the sum of PCB congeners 8, 18, 28, 44, 52, 66, 101, 105, 118, 128, 138, 153, 170, 180, 187, 195, 206, and 209. ND indicates measured value was below method detection limit.

3.2.4 Chemistry Line of Evidence

The chemistry results were analyzed using two indices: the California Logistic Regression Model (CA LRM) and the Chemical Score Index (CSI), shown in

Table 15. Integration of these two indices yields the Chemistry LOE (SCCWRP, 2014) under CASQO. The integrated results showed that all three stations had Minimal Exposure.

Table 15 Chemistry indices and Overall Integrated Chemistry LOE for sediment monitoring stations. Categories are Minimal Exposure (Min. Exp.), Low Exposure, Moderate Exposure, and High Exposure.

Chamis	stry Index	Station ID					
Chemis	on y muex	MA1	MA2	E3			
CA	Score	0.06	0.07	0.26			
LRM	Category	Min. Exp.	Min. Exp.	Min. Exp.			
CCI	Score	1.00	1.00	1.00			
CSI	Category	Min. Exp.	Min. Exp.	Min. Exp.			
Integrated Chemistry Indicator		Min. Exp.	Min. Exp.	Min. Exp.			

3.2.5 Quality Control Results

All QC parameters were within the established control limits.

The RL for all metal analyses were below the established CASQO max RL except for cadmium. The analytical laboratory confirmed that the increased cadmium RL was a result of the dry weight correction factor and not a result of an interference.

The RLs for all organic analyses were above the established CASQO max RL due to the nature of matrix interferences. The samples and/or sample extracts were diluted prior to preparation and the MDL and MRL were raised due to the dilution.

3.3 Toxicity Tests

3.3.1 10-day Amphipod Survival Test

The amphipod 10-day whole sediment toxicity test resulted in controls that met test acceptability criteria of 90% survival. All water quality parameters measured were within the recommended range for the duration of the test. Mean survival was 100, 98 and 100% for stations MA1, MA2 and E3, respectively (

Table 16, Figure 8). Mean percent survival was greater than 90% for all samples, and thus all were deemed Non-toxic. Bench water quality and count sheets associated with the toxicity tests are provided in Appendix C.

Table 16 Mean percent survival for the 10-day whole sediment acute exposure test with *E. estuarius*.

Station ID	Mean % Survival	% Difference from Control	Toxic Response
Control Sediment	100	-	-
MA1	100	0.0%	Non-toxic
MA2	98	-2.0%	Non-toxic
E3	100	0.0%	Non-toxic

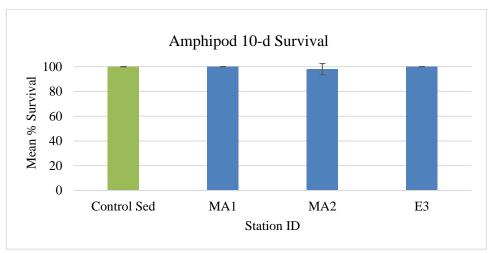

Figure 8 Mean percent survival for the 10-day whole sediment acute exposure test with *E. estuarius*. Control Sed – control sediment.

3.3.2 2-day Sediment-Water Interface Test with Bivalve Embryos

The Mediterranean mussel 2-day SWI toxicity test resulted in controls that met or exceeded test acceptability criteria of 80% normal (

Table 17). Mean PNA was 84.9, 88.9 and 83.0% for stations M1, M2 and E3, respectively (

Table 17). All water quality parameters were within the recommended range for the duration of the test. For this monitoring event, all samples resulted in non-normalized PNA of greater than 80%, therefore all samples were deemed Non-toxic, and further assessment from the flow chart was not needed. Category score results are shown in Table 17. Bench water quality and count sheets associated with the toxicity tests are provided in Appendix C.

Table 17 Summary of Statistical Results for 2-day Sediment-Water Interface Test with *M. galloprovincialis*.

Station ID	Mean PNA (%)	% Difference from Control	Toxic Response
Screen Tube Control	91.9	-	-
MA1	84.9	-7.6%	Non-toxic
MA2	88.9	-3.3%	Non-toxic
E3	83.0	-9.7%	Non-toxic

PNA - Percent Normal Alive

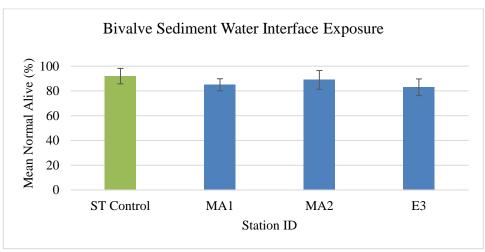

Figure 9 Mean PNA for the 2-day SWI exposure with *M. galloprovincialis*. ST – screen tube control.

3.3.3 <u>Integration of Toxicity Test Results</u>

To determine the overall Toxicity LOE for each station, numeric category scores were applied to each sample based on the response (Non-toxic = 1, Low Toxicity = 2, Moderate Toxicity = 3, High Toxicity = 4; SCCWRP 2014). Then the numeric category scores from each individual toxicity test were averaged. For the three stations tested, all were deemed Non-toxic with LOE category scores of 1 (Table 18).

	Numeric Ca			
Station ID	10-day Whole Sediment Test	2-day Sediment- Water Interface Test	Overall Toxicity LOE Category	
MA1	1	1	1 – Non-toxic	
MA2	1	1	1 – Non-toxic	
E3	1	1	1 – Non-toxic	

Table 18 Toxicity Line of Evidence.

3.3.4 Toxicity QA/QC

A few QA/QC deviations from USEPA and internal protocols that occurred during testing were noted on raw data sheets. A thorough review of the data and test procedures did not identify any likely impacts on test results as a result of these deviations; therefore, all presented data were deemed acceptable.

All tests were conducted within the recommended 1-month holding time. Temperatures of the samples were within the USEPA recommend range of 0-6°C. Control test acceptability criteria were met for both the amphipod whole-sediment test and the bivalve SWI toxicity test. Total ammonia concentrations were below those that would be anticipated to be toxic to the test endpoints, with overlying water concentrations less than 1.2 mg/L in both tests (Appendix C). A glossary of the qualifier codes used on the test datasheets is provided at the end of Appendix C.

3.3.5 Reference Toxicant Testing

A 4-day and a 2-day reference toxicant test using cadmium chloride (CdCl₂) and copper sulfate (CuSO₄) were conducted concurrently for the amphipods and Mediterranean mussels, respectively. The laboratory controls associated with these tests met test acceptability criteria. Statistical analyses were conducted using Comprehensive Environmental Toxicity Information System (CETIS) Software, Version 1.9.7.9 (Tidepool Scientific Software). For the amphipod reference toxicant test, the median lethal concentration (LC₅₀) was 11.3 μ g/L which fell within two standard deviations of the laboratory's historical means (8.91 \pm 5.8 μ g/L), indicating sensitivity to cadmium was consistent with that historically observed for amphipods. In addition, for the Mediterranean mussel reference toxicant test, the median effective concentration (EC₅₀) for the PNA was 6.12 μ g/L which fell within two standard deviations of the laboratory's historical means (8.2 \pm 3.9 μ g/L), indicating sensitivity to copper was consistent with that historically observed for Mediterranean mussels.

3.4 Sediment CASQO Assessment and Receiving Sediment Monitoring Evaluation

The analytical chemistry, toxicity, and benthic community LOE results for each sediment sampling location were used to determine an overall station evaluation of sediment quality. The CASQO MLOE category was assigned to each sample using the lookup tables in the CASQO CalcTool V5.5.xls with guidance from the CASQO Technical Support Manual (SCCWRP, 2014). The individual LOE and overall MLOE for each station are shown in Table 19. The three stations at SMRE exhibited minimal chemistry indicators, were all non-toxic, and showed moderate to high disturbance categories for the benthic community using CASQO indices (but low disturbance using the M-AMBI). Overall, these stations were all categorized as "Likely Unimpacted".

Table 19 Individual chemistry, toxicity, and benthic community LOE and overall station CASQO assessment based on integrated MLOE.

	Station ID					
Line of Evidence	MA1	MA2	E3			
Integrated Chemistry Indicator	Minimal Exposure	Minimal Exposure	Minimal Exposure			
Integrated Toxicity	Non-toxic	Non-toxic	Non-toxic			
Integrated Benthic Indicator	High Disturbance	Moderate Disturbance	High Disturbance			
CASQO Weight of Evidence	Likely Unimpacted	Likely Unimpacted	Likely Unimpacted			

Table 20 shows the overall CASQO assessment using the M-AMBI BCA analyses. All three stations were categorized as Unimpacted with this approach.

Table 20 CASQO assessment incorporating the M-AMBI benthic community line of evidence.

	Station ID					
Line of Evidence	MA1	MA2	E3			
CASQO Weight of Evidence with M-AMBI BCA	Unimpacted	Unimpacted	Unimpacted			

4. COMPARISON OF 2022 RESULTS TO HISTORICAL MONITORING RESULTS

4.1 Comparison of 2022 Benthic Community Analysis to Historical Monitoring Results

Historic BCA individual indices and integrated scores ranged from low to high among sites and within a given year. Between 2010 and 2016, the mean integrated score across all three stations was ranked as moderate to high disturbance levels (Table 21). Note, a BCA analysis was not performed in monitoring year 2009 (CDM, 2009). In addition, it should be noted, that between 2014-2016, the overall CASQO benthic LOE was not calculated (CH2M, 2016). Values presented in those years were interpreted values by the study team in 2019 (CH2M, 2019). However, these interpreted values do align with a similar pattern of improvement over time that was reported for other parameters within the Estuary for those monitoring years (CH2M, 2019). This is further supported by a similar decrease in disturbance levels following the 2017 Estuary reset event. Finally, decreased disturbance levels were reported throughout the Estuary between 2017-2019. It should be noted, that this same trend (i.e. improvement in Estuary conditions following Estuary reset events) has been reported in other separate studies of the Estuary between 2015-2020 (Katz et al., 2016; Sorensen et al., 2020). Overall the 2022 BCA scores are consistent with what has reported historically for these locations (CH2M, 2019; Sorensen et al., 2022).

Table 21 Mean Integrated Benthic Community Score by year (2010-2022).

Year	Mean Integrated Score ¹
2010	Moderate
2011	Moderate
2012	Moderate
2013	High
2014*	Moderate
2015*	Moderate
2016*	High
2017	Moderate
2018	Low
2019	Low
2022	Moderate

Notes:

- (1) Mean disturbance level of three monitoring stations reported for that year
- (2) * SQO not calculated in this year, indicates these were interpreted values by author (CH2M, 2019)
- (3) Table generated from data previously reported in CH2M, 2019

4.2 Comparison of 2022 Sediment Chemistry to Historical Monitoring Results

Overall, the 2022 sediment chemistry concentrations are consistent with what has been reported historically for these sites within the Estuary (CH2M, 2019).

4.2.1 PAHs, Pesticides and PCBs

Over the 10-year monitoring period, the ambient bay monitoring results, with a few exceptions, showed that all PAHs and synthetic pyrethroids were either not-detected or at a concentration which fell below the RL but above the MDL (i.e. an estimated but relatively low value). A qualitative summary of parameters which were measured above the RL and MRL is provided in

Table 22 below. Note, a summary of PCBs is not included in this table as the presence of PCBs in estuary sediment samples historically has not been detected. All measured values were for the most part below the NOAA marine sediment screening ERL and ERM values for inorganic and organic contaminants (Buchman, 2008).

Table 22 Estuary Sediment Contaminant Parameters reported above Method Reporting Limits (2009-2022).

Parameter	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2022

Notes:

4.2.2 Metals

Between 2009 and 2016, several measured sediment metal concentrations remained relatively constant (e.g. copper, zinc, and nickel) while others appeared to gradually increase (e.g. arsenic and lead). As a result of the January 2017 Estuary reset event, substantial reductions in sediment metal concentrations were observed in 2017. Overall, measured concentrations were half that of concentrations reported in 2009. Between 2017-2019, overall metal concentrations stayed below previously reported concentrations and were fairly consistent throughout this period. Table 23 provides a summary of measured metals in the Estuary. Concentrations provided represent the highest concentrations measured amongst the three

⁽¹⁾ x indicates parameter detected in at least 1 of the 3 sites at concentration above reporting limit (RL)

⁽²⁾ Blank cells indicate parameter report at all sites as either non detect or below RL but above method detection limit (estimated value)

⁽³⁾ Table adapted from data reported in CH2M, 2019

^{(4) 2022} data added for comparative purposes

monitoring stations for that monitoring year. Overall, the 2022 metal concentrations are consistent with what has been reported historically for these sites within the Estuary (CH2M, 2019).

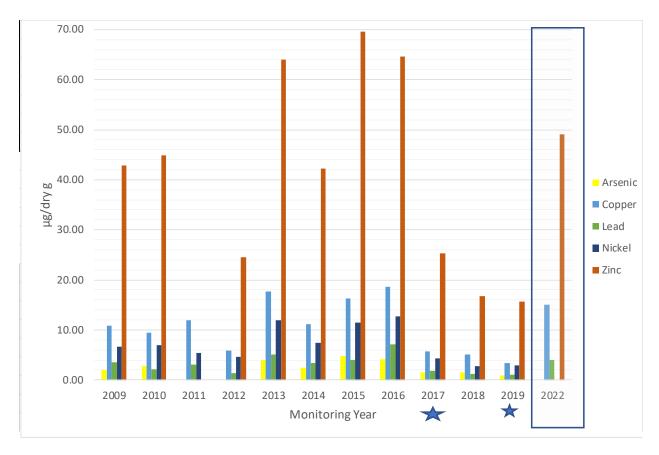

Table 23 Summary of historic Estuary Sediment Metal Concentrations (2009-2022).

Parameter	Units	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2022
Antimony	μg/dry g	0.09	<0.042	<4.9-5.1	<6.2-6.5	0.19	0.10	0.21	0.16	0.12	0.12	0.08	*
Arsenic	μg/dry g	2.01	2.72	<2.5	<1.2-1.3	4.02	2.49	4.70	4.16	1.54	1.50	0.84	*
Cadmium	μg/dry g	0.10	<0.042	<2.5	<0.6-0.7	0.16	0.85	0.12	0.13	0.05	0.04	0.03	*
Chromium	μg/dry g	18.18	17.20	14.00	14.90	51.38	21.98	34.60	31.23	27.24	11.30	13.90	*
Copper	μg/dry g	10.89	9.45	12.00	5.90	17.65	11.22	16.28	18.64	5.75	5.11	3.36	15.00
Lead	μg/dry g	3.55	2.17	3.10	1.40	5.11	3.44	3.96	7.13	1.77	1.22	1.07	4.00
Nickel	μg/dry g	6.71	6.91	5.40	4.60	11.99	7.37	11.49	12.68	4.35	2.77	2.85	*
Selenium	μg/dry g	0.11	0.03	<4.9-5.1	<6.2-6.5	0.22	0.13	0.31	0.24	0.09	0.17	0.07	*
Zinc	μg/dry g	42.93	44.90	<4.9-5.1	24.50	63.96	42.27	69.55	64.61	25.24	16.80	15.70	49.00

Notes:

- (1) Highest concentration recorded in any of the three stations sampled that year presented in table
- (2) < indicates vaue was below RL but above MDL (estimated value)
- (3) Table adapted from CH2M, 2019 and includes data collected in 2022
- (4) * indicates metal not measured for this year

An example of metal concentrations trends is provided in Figure 10. For a more detailed description of observed individual metal concentrations by monitoring station and year, refer to prior annual municipal monitoring reports (CDM, 2009; CH2M, 2016; CH2M, 2018; CH2M, 2019).

Notes:

- (1) Star indicates signifianct rain event occured resulting in high volume river flow (> 25,000 cubic feet per second (CFS)
- (2) Presented values are highest concentration recorded in any of the three stations sampled that year
- (3) Figure generated from data previously reported in CH2M, 2019
- (4) Data collected in this 2022 has been included and is highlighted with shaded box.

Figure 10 Estuary Sediment Concentration Trends for Arsenic, Copper, Lead, Nickel and Zinc (2009-2022).

When comparing all of the sediment chemistry results, overall, the 2022 sediment chemistry LOE scores are consistent with what has been reported historically for these sites within the Estuary (CH2M, 2019).

4.3 Comparison of 2022 Sediment Toxicity to Historical Monitoring Results

Historic sediment toxicity in the Estuary from 2010 through 2022, based on average percent survival per year, are summarized in

Table 24. Note, no sediment toxicity data were reported for 2009 (CDM, 2009). Excluding 2011, mean survival rates have general increased with the average between the three stations ranging between 90-99%. In some years, individual station mean survival was below the laboratory negative control survival, but were generally not below the CASQO set mean for normally developed larvae of 82.1 to

92% with control of 91%. For 2022, the average was 99%. Thus, based on CASQO standards, Estuary sediments for all monitoring years except 2011 have been classified as non-toxic (CH2M, 2019).

Table 24 Historic Estuary Sediment Toxicity (Average Mean % Survival) between 2010-2022.

Year	Average ¹ Mean (%) Survival
2010	90
2011	74*
2012	90*
2013	93
2014	94
2015	96
2016	98
2017	99
2018	96
2019	93
2022	99

Notes:

- (1) Average acrossed 3 monitoring stations
- (2) *Indicates at leat one or more of the three stations had a value that was statistically significant reduction from the laboratory control.
- (3) Table generated from data previously reported in CH2M, 2019
- (4) Average of 2022 data added for comparison

4.4 Comparison of 2022 CASQO Assessment to Historic Monitoring Results

Finally, a CASQO MLOE analysis was performed for each of the three monitoring sites from 2009 to 2019. In general, when looking across all 10 monitoring years, sediment toxicity was categorized as "non-toxic" or "low toxicity". The benthic community integrated scores between sites has shown a little more variability, ranging from low to high disturbance. With few exceptions (2015, one site), all monitoring sites within the Estuary over the years have been reported as "minimal exposure" to chemical contaminants. This minimal exposure classification means that the level of contamination is unlikely to result in adverse effects to marine organisms (Bay et al., 2013). The overall CASQO calculation per location assessment has remained relatively consistent over the years, with a classification of as either "Unimpacted" or "Likely Unimpacted". Table 25 shows historical CASQO assessments for sites SME-1, SME-2 and SME-3. For comparison purposes, 2022 station MA1 is in close proximity with historical station SME-3 and MA2 is in close proximity to historical station SME-1. Thus, results of the 2022 study are consistent with previous assessments of the SMRE in that the Estuary is considered Likely Unimpacted when using the CASQO MLOE or Unimpacted when applying the M-AMBI with other sediment lines of evidence.

Table 25 Historical CASQO assessment at sites within the SMRE (Table adapted from CH2M, 2019).

Sampling Year	Station ID ^A	CASQO Assessment
	SME-1	Likely Unimpacted
2009	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
	SME-1	Likely Unimpacted
2010	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
	SME-1	Likely Unimpacted
2011	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
	SME-1	Likely Unimpacted
2012	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
	SME-1	Likely Unimpacted
2013	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
2014*	SME-1	Likely Unimpacted
	SME-2	Unimpacted
	SME-3	Likely Unimpacted*
	SME-1	Possibly Impacted
2015*	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted*
	SME-1	Likely Unimpacted*
2016*	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
	SME-1	Likely Unimpacted
2017	SME-2	Likely Unimpacted
	SME-3	Likely Unimpacted
	SME-1	Unimpacted
2018	SME-2	Unimpacted
2018	SME-3	Likely Unimpacted
	SME-1	Unimpacted
2019	SME-2	Unimpacted
	SME-3	Unimpacted
	MA1 / W1	Likely Unimpacted
2022	MA2 / W8	Likely Unimpacted
	E3	Likely Unimpacted

^A – Historical station SME-1 is comparable to station MA2; Historical station SME-3 is comparable to station MA1 * Some BMI index scores were not calculated by the CASQO calculator because there were too few taxa or organisms; however, a manual calculation or interpretation of these indices, consistent with the CASQO guidance, is presented.

5. CONCLUSIONS

This report described results of a 2022 sediment monitoring effort conducted in the SMRE located on MCBCP. This work was performed on behalf of the MCBCP ES staff as part of their Municipal Watershed Monitoring Program. The MCBCP Municipal Watershed Monitoring program has been in effect since 2009 and specific components, including ambient lagoon (Estuary) monitoring requirements, were outlined in their 2016, Municipal Watershed Monitoring Program Guidebook (MCBCP, 2016). The overall ambient bay monitoring requirement was designed to provide an overview of the Estuary's health and consists of water chemistry, sediment toxicity, sediment chemistry, and benthic infauna sampling. Previous monitoring seasons completed under MCBCP's Municipal Watershed Monitoring Program occurred in 2002-2004, 2005-2006, and 2008-2019 (CDM, 2009; CH2M, 2016; CH2M, 2018; CH2M, 2019).

For 2022, similar to prior years, sediment monitoring efforts were conducted at three (3) locations in the Estuary during the summer index growth period. In keeping with the CASQO MLOE approach and current monitoring requirements under Investigative Order No. R9-2019-0007 (SDRWB, 2019; Weston, 2019a), sediment samples from each location were analyzed for standard sediment quality characteristics, BCA and toxicity testing (SCCWRP 2014; Weston, 2019a & b). An LOE score for each of the three components was calculated for each site and combined to calculate an overall site-specific sediment quality assessment.

The 2022 results are summarized in the following. For the sediment quality/chemistry LOE, all three sites were characterized as "minimal exposure," indicating that exposure to these sediments is unlikely to result in adverse effects to marine organisms. For the BCA LOE, under the CASQO calculations, the three sites were ranked from moderate to high disturbance levels. However, applying the M-AMBI calculation to the BCA LOE evaluation, all three sites were ranked at low level disturbance. For the sediment toxicity LOE, all three sites were classified as non-toxic. Finally, the overall site-specific sediment quality evaluation categorized all three sites as "Likely Unimpacted" using the CASQO guidance or "Unimpacted" applying the M-AMBI approach.

Finally, results of this year's sediment analysis yield similar results to what has been reported previously under the MCBCP Municipal Watershed Monitoring Program. Sediment toxicity has generally been categorized as non-toxic, BCA has been variable, and chemical contamination has been generally categorized as minimal exposure, with the resultant overall sediment quality remaining relatively consistent over the years, with a classification of as either "Unimpacted" or "Likely Unimpacted".

EXECUTIVE SUMMARY

Marine Corps Base Camp Pendleton (MCBCP) is monitoring water quality and biological condition of sediments within the Santa Margarita River Estuary (SMRE) to determine the overall health of the ecosystem as part of a 4-year investigative order (No. R9-2019-0007). As part of the program, a benthic community assessment is to be conducted each year. The results that follow document the third year of the monitoring program.

For Year 3, the benthic community sample collection occurred on July 12, 2022. All samples were collected by personnel from the Energy and Environmental Sciences Group of the Naval Information Warfare Center Pacific (NIWC PAC). A total of nine stations were sampled, with three stations in each of the main estuary locations: below the I-5 bridge (and closest to the mouth), above the Stuart Mesa bridge (and furthest upstream), and between these two bridges. The stations were selected to equally represent each of the three estuary hydrographic regimes. Each infaunal sample was collected using a 4-inch diameter (0.008 m²) Multi-Substrate Subtidal Sampler (SUBS-Sampler; NC 110686 Patent Pending) and sieved onsite by a representative from EcoAnalysts.

Once processed, specimens from benthic infauna samples were identified to the lowest practicable level by qualified taxonomists and enumerated. Under California Sediment Quality Objectives (CASQO) guidance, benthic community data were analyzed using standard diversity and evenness measures as well as the following indices: the Index of Biotic Integrity (IBI), the Relative Benthic Index (RBI), the Benthic Response Index (BRI), and the River Invertebrate Prediction and Classification System (RIVPACS). The integration of these indices is accomplished by calculating the median value for the four scores, which was then categorized into an overall level of disturbance known as the Integrated Benthic Indicator. Additionally, the data was analyzed using the Multivariate AZTI Marine Biotic Index (M-AMBI) which has been recently calibrated and updated for California estuarine habitats.

Overall, the benthic communities of the 2022 survey had high abundance and moderate taxa richness. Most were dominated by a handful of brackish amphipods. Survey-wide, stations averaged 696 individuals per 0.008 m², and ranged from 33 to 1240 individuals per 0.008 m². The highest abundance was at station MA2 (above the Stuart Mesa bridge), while the lowest abundance was at station MA1 (nearest the estuary mouth). Station MA2 and MA3 had the highest taxa richness (20 taxa) while station M8 and MA5.5 had the lowest (9 taxa). Similar to prior surveys, the communities that were present were notably different below the I-5 bridge and above the Stuart Mesa bridge. The samples collected closer to the mouth of the estuary contained more mollusks and marine-tolerant taxa while those further upstream above the Stuart Mesa bridge contained stress-tolerant taxa that thrive in brackish conditions.

Of the nine stations, none were categorized at a reference or low level of disturbance based on the CASQO integrated score. Five stations were categorized at a moderate level of disturbance (MA2, MA3, MA4, M8, and MA5) while four stations were of high level of disturbance (MA1, E3, E5, and MA5.5). Similar to prior years, the individual CASQO indices ranged widely in categorization of the stations.

For the Year 3 (2022) dataset, the M-AMBI ranked two stations (E5 and MA5.5) at a reference level, four stations at a low level of disturbance (MA1, MA2, M8, and E3), and three stations at a moderate level of disturbance (MA3, MA4, and MA5). None of the stations were classified as being highly disturbed by the M-AMBI. While both the CASQOs and M-AMBI agreed that stations MA3, MA4, and MA5 were moderately impacted, they disagreed on the level of impact at all other stations, especially at those located above the Stuart Mesa Bridge.

1. INTRODUCTION

As part of a continuing commitment to monitoring and maintaining healthy water quality conditions within the Santa Margarita River Estuary (SMRE), Marine Corps Base Camp Pendleton (MCBCP) evaluates present and future conditions within the estuary to assess if water quality goals are being met. An investigative order (No. R9-2019-0007) was issued by the San Diego Regional Water Quality Control Board in 2019 to monitor water quality and nutrient loading reductions over a 4-year period. Samples were collected by the Energy and Environmental Sciences Group of the Naval Information Warfare Center Pacific (NIWC PAC) at SMRE stations throughout the summer and fall months of 2021 and analyzed for an assortment of nutrient-specific chemistry analytes as well as benthic community condition in accordance with the California Sediment Quality Objectives (CASQO). The biological results for Year 3 of the investigative order monitoring are included in this report.

2. METHODS

2.1 Sample Collection

All sediment samples were collected by representatives from NIWC Pacific and processed onsite by a senior scientist from EcoAnalysts. Nine stations were sampled for benthic community analysis (BCA) on July 12, 2022 (Table 2-1). One sample was collected at each station using a Multi-Substrate Subtidal Sampler (SUBS-Sampler; NC 110686 Patent Pending) with a 4-inch diameter (0.008 m²) core barrel, as per Bight Regional Monitoring suggestions for brackish estuarine sampling. This sampler design was chosen due to the shallow water depth of the SMRE stations (averaging approximately 1 ft), requiring manual operation which prevented the use of a large grab sampler.

An overview map of all benthic community stations is presented in Figure 2-1 (plotted from station coordinates at time of collection: due to the dynamic nature of the estuary, some stations may appear to be on land). Three stations were sampled from each location within the estuary. Station MA1, MA2, and MA3 were below the I-5 bridge and closest to the mouth of the estuary. Stations E3, E5, and MA5.5 (E7) were furthest upstream and located above the Stuart Mesa Bridge. Stations MA4, M8, and MA5 were located in the middle of the estuary between the two bridges.

Location	Station	Latitude (°N)	Longitude (°W)	Depth (ft)	Collection Date	Collection Time
	MA1	33.23401	-117.41337	1.6	7/12/22	0940
Below I-5 Bridge	MA2	33.23546	-117.40857	1.9	7/12/22	1042
21.480	MA3	33.23453	-117.40858	0.8	7/12/22	0910
	MA4	33.23622	-117.4024	1.3	7/12/22	1213
Between Bridges	M8	33.23744	-117.39791	0.5	7/12/22	1303
2	MA5	33.23781	-117.39543	2.2	7/12/22	1320
	E3	33.23787	-117.39352	1.0	7/12/22	1530
Above Stuart Mesa Bridge	E5	33.23714	-117.38986	0.7	7/12/22	1500
	MA5.5 (E7)	33.23747	-117.38808	0.8	7/12/22	1442

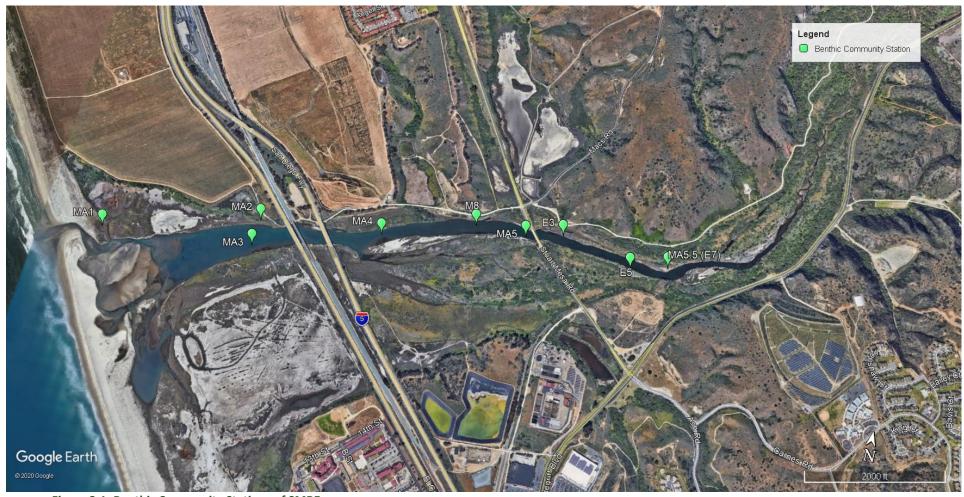

Figure 2-1: Benthic Community Stations of SMRE

2.2 Sample Processing

After collection, benthic infauna samples were brought to shore and sieved through a 0.5-mm mesh screen to remove sediment fines. All residual sediment, debris, shells, and benthic organisms remaining on the screen were carefully collected into labelled wide-mouth bottles. Samples were "fixed" on-site in 10% buffered formalin and diluted by seawater to create a 5% formalin preservative. The benthic samples were stored at ambient temperature throughout transit and shipped to the EcoAnalysts benthic laboratory in Moscow, ID.

2.3 Benthic Sample Sorting and Taxonomy

Benthic samples arrived at the Moscow EcoAnalysts facility in good condition. All benthic samples were processed by EcoAnalysts using the CASQO and Bight 2018 protocols for identification of benthic macroinvertebrates (SCCWRP 2014 and 2018). At the laboratory, samples were transferred to 70% ethanol for long-term preservation and storage. The sorting process entailed placing small quantities of sample in a petri dish, removing all organisms under a dissecting microscope, and placing them into vials according to major taxon categories (e.g. mollusks, crustaceans, annelids, etc.). This process was continued until 100% of the sample was sorted. Sorted material was then transferred back to the original sample container and underwent a quality assurance (QA) check to control for thoroughness and consistency in sample sorting. During the sorting QA, 10% of each sample was re-sorted to ensure a 95% organism removal efficacy. This sorting review was performed by staff who did not initially sort the sample.

All specimens were identified by qualified taxonomists to the lowest practicable taxonomic level (LPTL) and enumerated (SCAMIT 2021). In most cases this was genus or species level; those organisms identified to a higher taxonomic level were due to a qualifier, such as damage or immaturity of the specimen. As a quality control (QC) check, a full taxonomic re-analysis of two samples was performed by taxonomists who did not originally identify the organisms. Any significant identification discrepancies and their resolutions were noted in the QC report. If taxonomy results between the original and QC IDs were >10% different, a reconciliation between the taxonomists occurred. All benthic data and results of the taxonomy QC are presented in Appendix A.

2.4 Statistical Analysis

All benthic data were reviewed for adherence to the CASQO Line of Evidence (LOE) framework. CASQO statistical analyses and calculations were performed using the Data Integration Tool v. 5.7 and the RIVPACS Benthic Index Calculator Tool, both of which are available through the Southern California Coastal Water Research Project (SCCWRP) website (www.sccwrp.org). These calculators categorize and compare the data with a SCCWRP reference database based on sample location (latitude and longitude) as well as collection depth. Diversity and evenness indices were calculated using PRIMER v. 7 software (Clarke and Gorley 2015) whereas dominance scores were calculated in Excel. An additional Multivariate AZTI Marine Biotic Index (M-AMBI) analysis was conducted using the newly developed R software script calibrated to CASQO conditions (Gillett et al. 2019) and using R v. 4.0.3 (R Core Team 2020). This script is available for download through the SCCRP website.

Prior to any statistical analysis, all benthic identifications with qualifiers (such as from damaged or juvenile specimens lacking key identifying features) and which were marked as "non-distinct" taxa by the taxonomists were aggregated with similar or higher-level taxa to avoid artificial inflation of community richness and diversity indices. All epifauna, such as corals or sponges, were noted if present (annotated as "large/rare" in the dataset) but not included in any statistical analyses.

2.4.1 SQO Benthic Community Condition

The LOE for determination of benthic community condition closely followed CASQO guidance and was investigated using four indices: the Index of Biotic Integrity (IBI), the Relative Benthic Index (RBI), the Benthic Response Index (BRI), and the River Invertebrate Prediction and Classification System (RIVPACS). The outcome of these independent indices characterizes the sample into one of four categories of disturbance: Reference, Low, Moderate, and High. An integrated result from these four indices is created by calculating the median value of the four category scores. This creates one categorical value known as the Integrated Benthic Indicator. If this score falls between two categories, the value is rounded up to the next highest integer, as per SQO guidance (SCCWRP 2014).

2.4.1.1 Index of Biotic Integrity

The IBI compares four metrics for a sample against the ranges as expected under reference conditions (Table 2-2). A sample metric that falls outside of its reference range is given a score of 1, while those that are within range are given a score of 0. The sum value of these four metrics indicates the level of disturbance for a sample (Table 2-3).

Table 2-2: IBI Metrics and Reference Ranges

Metric	Reference Range		
Total Number of Taxa	13 to 99		
Number of Mollusk Taxa	2 to 25		
Abundance of Notomastus sp.	0 to 59		
Percentage of Sensitive Taxa	19 to 47.1		

Table 2-3: IBI Score Thresholds

IBI Score	Category	Category Score
0	Reference	1
1	Low Disturbance	2
2	Moderate Disturbance	3
3 or 4	High Disturbance	4

2.4.1.2 Relative Benthic Index

The RBI compares a weighted sum of multiple community metrics with the sample abundance of positive indicator taxa (PIT; *Monocorophium insidiosum*, *Asthenothaerus diegensis*, and *Goniada littorea*) which are typically found in healthier habitats and the presence/absence of negative indicator taxa (NIT; *Capitella capitata* complex and Oligochaeta) which are more tolerant of stressful conditions within impacted areas. The results are compared against predictive disturbance level categories. Prior to calculations, the taxa richness and abundance data per sample is normalized in relation to the habitat and the values are scaled accordingly. These scaled metrics are combined to create a Taxa Weighted Value (TWV). Samples that contain the NIT in any abundance receive a -0.1 NIT value for each NIT taxa present (if both NIT are present, the NIT value = -0.2). The PIT value is obtained through the following equation (where *N* is abundance):

$$PIT = \frac{\sqrt[4]{N_{M.insidiosum}}}{\sqrt[4]{473}} + \frac{\sqrt[4]{N_{A.diegensis}}}{\sqrt[4]{27}} + \frac{\sqrt[4]{N_{G.littorea}}}{\sqrt[4]{15}}$$

Using these values, the Raw RBI score is then calculated and converted to a final RBI Score, which is compared against the RBI disturbance level categories (Table 2-4):

$$Raw RBI = TWV + NIT + (2 \times PIT)$$

$$RBI Score = \frac{Raw RBI - 0.03}{4.69}$$

Table 2-4: RBI Score Thresholds

RBI Score	Category	Category Score
> 0.27	Reference	1
> 0.16 - ≤ 0.27	Low Disturbance	2
> 0.08 - ≤ 0.16	Moderate Disturbance	3
≥ 0.08	High Disturbance	4

2.4.1.3 Benthic Response Index

The BRI weighs the abundance of pollution-tolerant taxa within a sample against the predictive disturbance level categories. The pollution tolerance score (*P*) is obtained for each species using the most current literature (SCCWRP Species List 2022). The BRI score is then calculated with the following equation:

$$BRI Score = \frac{\sum (\sqrt[4]{N_i} \times P_i)}{\sum \sqrt[4]{N_i}}$$

Where *N* is abundance of a species (*i*). This score is compared against the BRI disturbance level categories to determine level of community impact (Table 2-5).

Table 2-5: BRI Score Thresholds

BRI Score	Category	Category Score
< 39.96	Reference	1
≥ 39.96 - < 49.15	Low Disturbance	2
≥ 49.15 - < 73.27	Moderate Disturbance	3
≥ 73.27	High Disturbance	4

2.4.1.4 River Invertebrate Prediction and Classification System

The RIVPACS is a predictive model that compares the number of observed taxa present (O) in a sample to that expected (E) under minimal disturbance conditions (i.e. reference locations). This is done in a three-step calculation. First, the model determines the probability of the test sample belonging to a reference sample group from one of twelve Southern California marine bays due to physical features (such as depth, latitude, and longitude). Second, the taxa and abundance lists are determined for the expected (E) sample community based on the distribution of reference taxa as well as the probabilities calculated in the first step. Lastly, the observed number of reference taxa (O) in the test sample is counted and the O/E (Observed/Expected) RIVPACS score is calculated. This value is then compared to disturbance level categories (Table 2-6).

Report # PG101822.01 6 EcoAnalysts, Inc.

Table 2-6: RIVPACS Score Thresholds

RIVPACS Score	Category	Category Score	
> 0.90 - < 1.10	Reference	1	
> 0.74 - ≤ 0.90			
or	Low Disturbance	2	
≥ 1.10 - < 1.26			
> 0.32 - ≤ 0.74			
or	Moderate Disturbance	3	
≥ 1.26			
≤ 0.32	High Disturbance	4	

2.4.2 Diversity and Evenness Indices

In addition to taxa richness (the number of unique taxa in a sample) and total abundance (the sum of organisms in a sample), three standard biodiversity measures were used to calculate benthic community diversity and evenness: the Shannon-Wiener Diversity Index, Pielou's Evenness Index, and Swartz Dominance Index.

2.4.2.1 Shannon-Wiener Diversity Index

This index is a quantitative measure of the biodiversity within a sample based on the number of different types of species (taxa) that occur. The result of this diversity index increases both when abundance and evenness increases. The measure is depicted as H' and is calculated based on the following formula:

$$H' = -\sum_{i=1}^{R} p_i \ln p_i$$

Where R is the richness of the dataset in terms of total number of different taxa, p_i is the proportion of individuals belonging to the ith species in the dataset.

2.4.2.2 Pielou's Evenness Index

Evenness is a measure of biodiversity that quantifies how equivalent the community is numerically. The evenness index (J') describes how close in abundance each species is within a given taxonomic group for a given sample. The evenness of a population can be represented by Pielou's evenness index:

$$J' = \frac{H'}{\log_{e} S}$$

Where S is abundance of organisms and H' is Shannon-Wiener diversity. J' is constrained between 0 and 1, with more evenly distributed communities having higher J' values.

2.4.2.3 Swartz Dominance Index

Swartz Dominance Index (SDI) is a community evenness index that ranks taxa accounting for 75% of a sample's total abundance (taxa ranked from most to least abundant, with the first taxon for which the cumulative percentage is greater than 75% is the last organism included). The higher the SDI value, the less likely a community is experiencing stress.

Report # PG101822.01 7 EcoAnalysts, Inc.

2.4.3 M-AMBI Analyses

In an effort to determine whether community effects as deemed by the CASQOs are due to potentially anthropogenic disturbance or are environmentally driven, an additional analysis was conducted on Year 3 data. This Multivariate AZTI Marine Biotic Index (M-AMBI) is a benthic community index more suitable for dynamic estuaries such as SMRE. Commonly used in European surveys and recently calibrated for West Coast waters (Gillet et al. 2015, Pelletier et al. 2018, and Gillett et al. 2019), the M-AMBI is more inclusive of benthic assemblages unique to lower saline environments and those in which a natural salinity gradient is present. It is also designed for continental-scale applicability.

Each taxon in a sample is assigned an Ecological Group (EG) from I to V that corresponds to its tolerance level. The EG reference database was recalibrated for US and West Coast taxa (Gillett et al. 2015) and employed for AZTI Marine Biotic Index (AMBI) scoring. The AMBI score is a calculation based on the abundance of taxa within each EG (Borja et al. 2000). The M-AMBI is then a weighted tolerance index that combines a site's diversity, richness, and AMBI score via a factor analysis and compared to salinity-driven thresholds to create a M-AMBI score ranging from 0 (bad) to 1.0 (good). This score is then categorized to determine a site's condition and level of disturbance (Table 2-7). For the SMRE monitoring program, the updated M-AMBI condition categories that are "CASQO compatible" were used (Gillett et al. 2019).

Salinity inputs for each station were 24-hr averages taken over the BCA collection period during a full tidal cycle from the nearest water quality monitoring station to capture extremes in salinity exposure within the estuary (Table 2-8). Taxa that did not have EG values assigned at the species level were bumped back to genus level if an EG value was available.

Table 2-7: M-AMBI Score Thresholds

M-AMBI Score	Category	
≥ 0.58	Reference	
< 0.58 - ≥ 0.48	Low Disturbance	
< 0.48 - ≥ 0.39	Moderate Disturbance	
< 0.39	High Disturbance	

Table 2-8: M-AMBI Salinity Inputs

Station	Avg 24-hr Salinity (ppt)	Water Quality Monitoring Station Location		
MA1	32.1	Estuary Mouth (MA1)		
MA2				
MA3	34.2	I-5 Bridge		
MA4				
M8				
MA5	31.0	Stuart Mesa Bridge		
E3				
E5	17.4	Farthest Unstream (MAF E)		
MA5.5 (E7)	17.4	Farthest Upstream (MA5.5)		

3. BENTHIC COMMUNITY RESULTS

The CASQO analysis of community condition, univariate results from the benthic community metrics, and M-AMBI results are presented in the following sections. The taxonomy QC samples passed, achieving an average 95.8-97.7% similarity between the original and QC identifications. All benthic community data, metrics, and taxonomy QC results are presented in Appendix A while the sample Chain of Custody (CoC) is provided in Appendix B.

3.1 Diversity and Evenness Indices

The total abundance of organisms, taxa richness, and community composition indices were calculated for each station (Table 3-1). Abundance ranged from 33 to 1240 individuals per 0.008 m², with station MA2 being the most abundant and station MA1 being the least. The average abundance across all stations was 696 individuals per 0.008 m².

Station MA2 and MA3 had 20 taxa per 0.008 m², which was the highest taxa richness in the survey. Station M8 and MA5.5 had the lowest taxa richness (9 taxa per 0.008 m²). The average richness across all stations was 14 taxa. Diversity ranged from a score of 1.16 (station MA4) to 1.80 (station E5 and MA5.5). Dominance scores were similar at most stations, generally measuring 3 to 4. Stations MA3 and MA4 had the lowest dominance with a score of 2.

Table 3-1: Diversity, Taxa	Richness, and Evenness	Results for SMRE Stations
----------------------------	------------------------	---------------------------

		Stations							
	Ве	low I-5 Brid	lge	Between Bridges			Above Stuart Mesa Bridge		
Benthic Community Index	MA1	MA2	МАЗ	MA4	M8	MA5	E3	E5	MA5.5 (E7)
Total Abundance (no of indiv. per 0.008 m²)	33	1240	369	466	729	1176	678	1071	500
Richness (no of taxa per 0.008 m²)	12	20	20	16	9	12	15	12	9
Shannon- Wiener Diversity	1.75	1.54	1.19	1.16	1.42	1.45	1.77	1.80	1.80
Pielou's Evenness	0.70	0.51	0.40	0.42	0.65	0.58	0.65	0.73	0.82
Swartz Dominance	4	3	2	2	3	3	4	4	4

3.2 Community Condition Indices and CASQO Line of Evidence

All four indices in the CASQO LOE scored all stations with a broad range of disturbance levels from reference to high disturbance (Table 3-2 through Table 3-4). The Integrated Benthic Indicator summarizes the four index results into one category by calculating the median of the four category scores. None of the SMRE survey stations were categorized at a reference or low level of disturbance.

Five stations were categorized at a moderate level of disturbance (MA2, MA3, MA4, M8, and MA5) while four stations were of a high level of disturbance (MA1, E3, E5, and MA5.5).

Table 3-2: CASQO Metrics for Stations Below I-5 Bridge

		Station					
Benthic Community Index		MA1	MA2	MA3

3.3 M-AMBI Results

For the Year 3 dataset, M-AMBI consistently scored with a range of conditions (Table 3-5). Those furthest upstream (E5 and MA5.5) were classified as reference. The stations closest to the mouth of the estuary (MA1 and MA2) as well as one station in the middle of the estuary (M8) and one upstream station (E3) were categorized at a low level of disturbance. Stations MA3, MA4, and MA5 were classified as having moderate disturbance. None of the stations were scored at a high disturbance level.

Table 3-5: M-AMBI Results for Year 3 Dataset

		Year 3 (2022)		
		M-AMBI Score	M-AMBI Condition	
Station	MA1	0.53	Low Disturbance	
	MA2	0.53	Low Disturbance	
	MA3	0.44	Moderate Disturbance	
	MA4	0.42	Moderate Disturbance

	E3	0.52	Low Disturbance	
	E5	0.78	Reference	
	MA5.5 (E7)	0.67	Reference	

4. DISCUSSION

Similar to the Year 2 2021 survey, the Year 3 survey resulted in a high abundance at all but one station (MA1) with a moderate level of taxa richness at all stations. Most communities were somewhat evenly composed with the exception of MA3 and MA4. These stations were dominated by only two taxa. There was little agreement between the CASQO indices for SMRE stations located throughout the estuary; most stations were assigned a mixture of disturbance categories for the same sample (such as Reference, Low Disturbance, and High Disturbance). In Year 3, the CASQO Integrated Benthic Indicator for all stations is above the "bad" threshold of moderate to high disturbance (Figure 4-1). None of the stations were classified under the "good" threshold of reference to low disturbance. Overall, CASQO results were similar to those seen in the Year 1 survey.

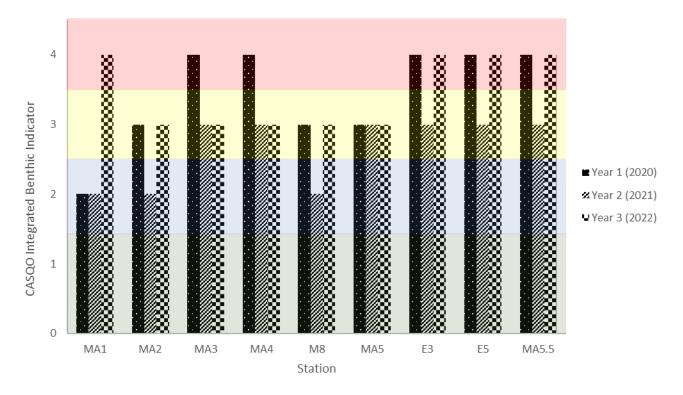

Figure 4-1: CASQO Integrated Benthic Indicator Rankings and Condition Categories for SMRE Stations in Years 1 through 3

(Red: High Disturbance, Yellow: Moderate Disturbance, Blue: Low Disturbance, Green: Reference)

It's important to note that the CASQO benthic indices are currently calibrated for only two California habitat types: San Francisco polyhaline and southern California marine bays (SCCWRP 2014). The Santa Margarita Estuary is neither of these and is a dynamic watershed that experiences a range of temperatures and salinities within a small area. As such, the SMRE survey benthic dataset was compared against reference communities of which it has little similarity. Additional multivariate analyses (M-AMBI) were thus conducted to provide another line of evidence alongside the CASQOs that may be more applicable to the dynamic estuarine environment these communities are a component of. Similar to Years 1 and 2, this approach was conducted on this year's dataset (Year 3) to provide consistency across the multiyear program (Figure 4-2).

The M-AMBI ranked all but three of the 2022 Year 3 stations into higher disturbance categories than the Year 2 2021 survey (Figure 4-2). However, few stations were categorized within the "bad" threshold of moderate to high disturbance, with the exception of MA3, MA, and MA5 (none of which were classified as highly disturbed). All three of the stations above the Stuart Mesa Bridge (E3, E5 and MA5.5) improved over the Year 1 2020 survey, two of which (E5 and MA5.5) are classified at a reference level. In addition, the M-AMBI consistently categorized stations at a lower level of disturbance than the CASQOs (Table 4-1). In the Year 3 survey, stations MA3, MA4, and MA5 were the only stations to be similarly categorized by M-AMBI and the CASQOs at a moderate disturbance level.

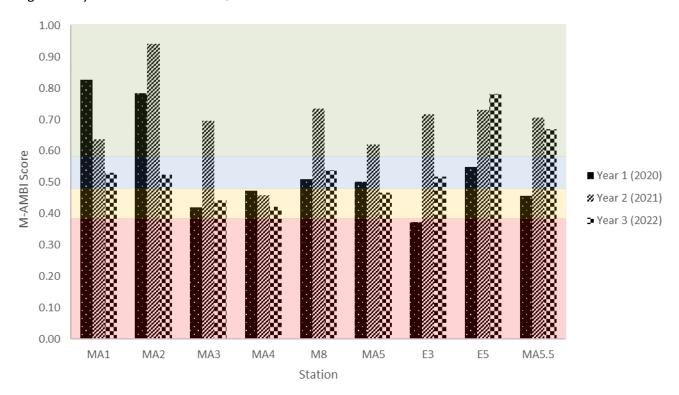

Figure 4-2: M-AMBI Scores and Condition Categories for SMRE Stations in Years 1 through 3 (Red: High Disturbance, Yellow: Moderate Disturbance, Blue: Low Disturbance, Green: Reference)

Table 4-1: M-AMBI vs CASQO Condition Categories for Year 3 (2022)

		Year 3 (2022)		
		M-AMBI Condition Category	CASQO Condition Category	
Station	MA1	Low Disturbance	High Disturbance	
	MA2	Low Disturbance	Moderate Disturbance	
	MA3	Moderate Disturbance	Moderate Disturbance	
	MA4	Moderate Disturbance	Moderate Disturbance	
	M8	Low Disturbance	Moderate Disturbance	
	MA5	Moderate Disturbance	Moderate Disturbance	
	E3	Low Disturbance	Moderate Disturbance	
	E5	Reference	High Disturbance	
	MA5.5 (E7)	Reference	High Disturbance	

Similar to prior surveys, the community compositions of the three sampling areas in the estuary in Year 3 were noticeably different from one another. Below the I-5 bridge, stations contained more marinetolerant taxa and mollusks than stations furthest upstream, with the additional appearance of the brackish amphipods Grandidierella japonica, Monocorphium acherusicum, and Monocorphium insidiosum. Stations MA2 and MA3 contained the highest number of taxa in this year's survey with communities composed of different polychaete taxa, mollusks, crustaceans, and other taxa groups. Stations that were furthest upstream above the Stuart Mesa bridge contained organisms more tolerant of brackish conditions, including Trionia imitator (a small brackish snail), Capitella capitata (an opportunistic, sedentary polychaete that is tolerant of stressful conditions), M. insidiosum, and Cerithidea californica (a common marine snail found in salt marshes and tidal flats in California). Stations located between both bridges contained a mix of marine and brackish taxa that were more common to upstream locations and were dominated by G. japonica, C. capitata, M. insidiosum, and C. californica. Clusters of small sea anemones were collected at stations in both the middle of the estuary as well as those above the Stuart Mesa Bridge. Overall, these results mirror those obtained from previous surveys in which the communities were symptomatic of a strong salinity gradient, with higher numbers of taxa that are more tolerant of large swings in conductivity thriving upstream.

The high numbers of oligochaetes present at most stations between both bridges as well as those above the Stuart Mesa Bridge may contribute to the moderate to high disturbance rankings expressed by the CASQOs, as all oligochaetes are numerically considered to be tolerant taxa via SCCWRP protocol and are thus left at the subclass level of Oligochaeta (SCCWRP 2014). The calibrated M-AMBI drops this higher-level taxon due to the abundance of both tolerant and intolerant oligochaete species within transitional ecosystems.

5. CONCLUSION

Most of the stations sampled in the Year 3 SMRE survey had high abundance and a moderate taxa richness. Benthic assemblages were dominated at most stations by brackish amphipods. The CASQOs categorized most stations in the Year 3 survey at a moderate level of disturbance and four stations (MA1, E3, E5, and MA5.5) at a high level of disturbance. The M-AMBI ranked the stations furthest upstream (E5 and MA5.5) at a reference level. Stations located closest to the mouth of the estuary (MA1 and MA2) were of low disturbance while those located in the middle of the estuary were a mix of low to moderate disturbance.

For the Year 3 dataset, the M-AMBI results agreed with the CASQO ranking at three stations (MA3, MA4, and MA5) with a moderate level of disturbance. All other stations were consistently categorized lower in disturbance than the CASQOs, however.

Similar to previous years, the westernmost sampling area below the I-5 bridge and those upstream above the Mesa Stuart bridge contained different benthic communities in the Year 3 survey, with westernmost stations being composed primarily of marine polychaetes, crustaceans and mollusks while stations in eastern part of the estuary contained high numbers of opportunistic brackish water crustaceans and stress-tolerant taxa (such as oligochaetes, the polychaete *Capitella capitata* and the amphipod *Monocorphium insidiosum*).

This is a complete final report. The information in this report applies to the samples analyzed in accordance with the chain-of-custody document. Weck Laboratories certifies that the test results meet all requirements of TNI unless noted by qualifiers or written in the Case Narrative. This analytical report must be reproduced in its entirety.

Dear Cassandra Sosa,

Enclosed are the results of analyses for samples received 7/14/22 with the Chain-of-Custody document. The samples were received in good condition, at 5.6 °C and on ice. All analyses met the method criteria except as noted in the case narrative or in the report with data qualifiers.

Item

Notes and Definitions

AN-IP	Sample results for structural isomers may have contribution from their isomeric pair.
M-02	Due to the nature of matrix interferences, sample was diluted prior to preparation. The MDL and MRL were raised due to the dilution.
M-04	Due to the nature of matrix interferences, sample extract was diluted prior to analysis. The MDL and MRL were raised due to the dilution.
MS-01	The spike recovery for this QC sample is outside of established control limits possibly due to sample matrix interference.
R-02	The RPD was outside of QC acceptance limits due to possible matrix interference.
R-03	The RPD is not applicable for result below the reporting limit (either ND or J value).
%REC	Percent Recovery
Dil	Dilution
dry	Sample results reported on a dry weight basis
MRL	The minimum levels, concentrations, or quantities of a target variable (e.g., target analyte) that can be reported with a specified degree of confidence. The MRL is also known as Limit of Quantitation (LOQ)
ND	NOT DETECTED at or above the Method Reporting Limit (MRL). If Method Detection Limit (MDL) is reported, then ND means not detected at or above the MDL.
RPD	Relative Percent Difference
Source	Sample that was matrix spiked or duplicated.

Any remaining sample(s) will be disposed of one month from the final report date unless other arrangements are made in advance.

All results are expressed on wet weight basis unless otherwise specified.

All samples collected by Weck Laboratories have been sampled in accordance to laboratory SOP Number MIS002.

Payment terms are NET 30 days from invoice date. New accounts require payment prior to the release of test results until a credit application has been approved. Weck Laboratories accepts credit card payments (VISA/Master Card, American Express). Credit application/credit card approval form and Weck Laboratories' terms & conditions can be found at www.wecklabs.com under Resources. Paperless reports (PDF) are included while mailed paper reports are available at additional cost.

Method Reporting Limits (MRL) and Method Detection Limits (MDL) are based upon specified sample volume or weight. When matrix interferences are apparent, sample amounts may be reduced during the preparation step and/or may be diluted prior to analysis. This is done to reduce analytical interference and instrumental contamination and will result in elevated MRL/MDL on the test report.

Afterhours fees apply to analytical processing that includes but is not limited to test set-up, extractions, digestions, transfers, analyses or readings. Special Courier Services afterhours, weekends, holidays, rush or large item transport are available on a per project quote basis. Field Services (courier or sampling) that are not cancelled 48 hours in advance are subject to charges covering travel and restocking expenses. Changes in analytical project requirements after work is underway in the lab or has been reported that necessitates re-analysis or re-processing of deliverables may incure additional fees.

Comments

No additional comments.

Receipt

The samples were received on 8/31/2022 9:50 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 1.0° C.

Organic Prep

Method D4464: The sample duplicate precision associated with analytical batch 570-264193 was flagged as being outside control limits due to a LIMS. limitation. The mean grain size for the sample and sample duplicate were within RPD acceptance criteria.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Client: Weck Laboratories, Inc.

Job Number: 570-108193-1

Login Number: 108193 List Source: Eurofins Calscience

List Number: 1

Creator: Patel, Jayesh

oreator. Fater, Jayesii		
Question	Answer	Comment
Radioactivity wasn't checked or is = background as measured by a survey meter.</td <td>N/A</td> <td></td>	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Embryo-Larval Development Test – SPAWNING CHECKLIST & CALCULATIONS

Batch ID: OSIC7211G

Analyst: GR

Animal Source: field collected

Spawn/Test Date: 7/15/2022

Date Received: 5/16/22

Task	Time
Spawning Inducement Initiated	0930 1 Temp from 15°C to 24°C
Spawning Begins	1030 307 19
Females/Males Isolated in Incubator	1100
Fertilization Initiated	1110
Fertilzation Terminated/eggs rinsed	1120
Embryo Counts	1220
Embryo addition to vials	1245

Embryo addition to vials
Embryo Counts:
Embryo Stock #1: 17 , 17 Mean = 17 / 20 uL * 1000 uL/mL = 850 cells/mL
Embryo Stock #2: 13, 17, 19 Mean = 19.7 / 20 uL * 1000 uL/mL = 983 cells/mL
Embryo Stock #3: 25, 52, 24 Mean = 27 / 10 uL * 1000 uL/mL = 1350 cells/mL
Adjust selected embryo stock to 2000 embryos/ml. Confirm density:
Selected Stock: Moon - / ** 1000 1/ 1
Selected Stock :, Mean =/ uL * 1000 uL/mL = cells/mL
Add 100 μl of 2000 embryo/ml stock to obtain 20 embryos/ml in test vials.
7 - 7 - 7 - 7 - 7 - 7 - 7 - 7 - 7 - 7 -
Time Zero Counts (if applicable):
Rep A 14 , Rep B 120 , Rep C 13 , Rep D(04 , Rep E 101 ; Mean = 111.6
Noton
Notes:
* back down to 1500 @ 1030.
Made 3 hatches of the 14 eggs combined w/ solution of
all 3 29
1240 - All batches @ 2-cell stage
Add 200 yel of #1 for 170 oull/me

Glossary of Qualifier Codes:

- Q1 pH out of recommended range; refer to CAR
- Q2 Temperatures out of recommended range; corrective action taken and recorded in Test Temperature Correction Log
- Q3 Temperatures out of recommended range; no action taken, test terminated same day
- Q4 Sample aerated prior to initiation or renewal
- Q5 Salinity out of recommended range; refer to QA section of report
- Q6 Spilled test chamber/ Lost test animal
- Q7— Instrumentation Error/Failure; refer to CAR
- Q8 Inadequate sample volume, 50% renewal performed
- Q9 Inadequate sample volume, no renewal performed
- Q10 Sample out of holding time; refer to QA section of report
- Q11 Refer to QA section of report for explanation
- Q12 Supplemental information is footnoted
- Q13 Test initiated with an incorrect number of test organisms
- Q14 Replicate(s) not initiated
- Q15 Survival counts not recorded due to poor visibility or heavy debris
- Q16 Test aerated due to dissolved oxygen levels dropping below 4.0 mg/L
- Q17 Test initiated with aeration due to an anticipated drop in dissolved oxygen
- Q18 Airline obstructed or fell out of replicate and replaced, drop in dissolved oxygen occurred
- Q19 Animals out of appropriate age range at test initiation
- Q20 Readings not taken, tech error
- Q21 Organisms in replicate not counted, tech error
- Q22 Dissolved oxygen above recommended range, but remained within the 100% ±10% saturation requirement

13. SUPPLEMENTARY NOTES

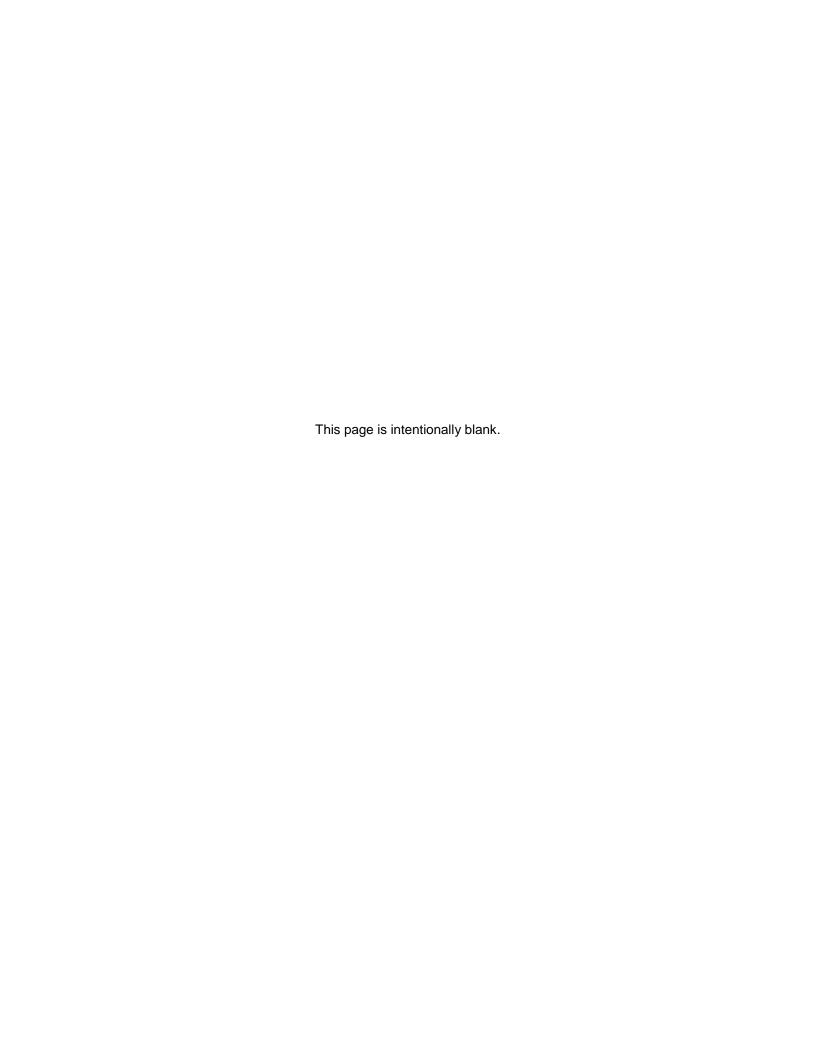

14. ABSTRACT

This report describes results of sediment monitoring conducted in the Santa Margarita River Estuary (SMRE) located on Marine Corps Base Camp Pendleton (MCBCP) in 2022, performed on behalf of MCBCP Environmental Security (ES) Staff, in support of their Municipal Watershed Monitoring Program (MCBCP, 2020). Sediment monitoring was conducted at three (3) locations on 12 July 2022, during the summer index period, following the analytical techniques and quality controls/assurances as required under the Sediment Quality Assessment Technical Support Manual and as specified under the SMRE IO Workplan and Quality Assurance Project Plan. Samples were analyzed for standard sediment quality characteristics and benthic community composition, and were tested for toxicity with marine amphipods (*Eohaustorius estuarius*) and Mediterranean mussel (*Mytilus galloprovincialis*) embryos using standardized protocols. This report describes the methods, results and data evaluation used to meet the monitoring goals following the California Sediment Quality Objectives line of evidence framework to assess sediment quality using these various metrics.

15. SUBJECT TERMS

California Sediment Quality Objectives (CASQO), Sediment Monitoring, Marine Corps Base Camp Pendleton (MCBCP)
