## **2. Expected deliverables from the consultancy**

From the Terms of Reference (ToR) for the consultancy, the following deliverables were distilled:

1. In collaboration with the Breeding Plans Consultancy Team (BPCT), review of species prioritization in Ethiopia
2. Define a process action plan for a consolidated list of 150 species
3. In collaboration with the BPCT, define criteria to identify up to 25 species to be included in the breeding programmes
4. Prepare guidelines for species distribution modelling for indigenous tree species (including candidate species for breeding)
5. Prepare guidelines for species distribution modelling for exotic tree species (including candidate species for breeding)
6. Review species with respect to available information

Each of these deliverables is addressed in a separate section (3-8).

### 3. Review of species prioritization in Ethiopia

The main list of priority tree species that was consulted during the formulation of the PATSPO project was the list of priority tree species of the Ethiopian country report for the *State of the World's Forest Genetic Resources* (SoW-FGR, Institute of Biodiversity Conservation [2012](#)). Given that this report was relatively recent and a key reference for PATSPO, the same report was used as the main source to select a wider set of candidate tree species for breeding and for suitability modelling.

This main list of priority tree species is shown in Annex 5 of the PATSPO project and lists 24 priority species. However, when cross-checking with the original SoW-FGR priority list (Table 4 in that report), it transpired that three species were omitted in the PATSPO priority list: *Cordeauxia edulis*, *Moringa stenopetala* and *Prunus africana*. Moreover, two species were included in the SoW-FGR priority list (and maintained in the PATSPO priority list) as invasive species to be removed: *Acacia drepanolobium* and *Prosopis juliflora*. The 25 priority species are given in the next section of this report and its various appendices.

The manual of the *Useful Trees and Shrubs of Ethiopia* (UTSE, Bekele-Tesemma *et al.* [2007](#)) can be considered as a priority listing of *useful tree species*, which could serve as a ‘long list’ of species that could be used by PATSPO. With the main objective of PATSPO of [mosaic restoration](#), it makes sense to focus on species with utilitarian values that restore livelihoods in tandem with landscapes. As PATSPO proposes to support tree portfolios consisting of indigenous and exotic species, UTSE seems to provide a list of species that provides a good balance between exotic and indigenous species. A similar information source is an interactive tool for species selection (Kuria *et al.* [2017](#)), but this tool is expected to list subset of the UTSE species list as the second tool is an output of a project that focused on two sites in Ethiopia. Yet other tools are the *Agroforestry Tree* database (Orwa *et al.* [2009](#)), [PROTA](#) or other web-databases listed by the *Agroforestry Species Switchboard* (Kindt *et al.* [2018](#)), but with specific focus on Ethiopia, UTSE seems a good starting point for a long list of priority species.

The World Agroforestry Centre (ICRAF) developed priority setting guidelines for selecting species to be domesticated (Franzel *et al.* [1996](#); Franzel and Kindt [2012](#)), but these have never been applied to priority setting in Ethiopia. As application of these guidelines in other ICRAF regions resulted in selecting tree species for a particular product of high market value (the ‘product prioritization’ step that selected fruit in West and Central Africa and timber in Peru), it could have been possible that a previous priority setting exercise would have resulted in species for a particular product and therefore of lesser relevance for the portfolio of species required for PATSPO. A priority list of fruit species for Eastern African drylands is available from Teklehaimanot [2008](#), but obviously these only are fruit species.

Reubens *et al.* ([2011](#)) developed a multi-criteria decision support system to select priority tree species for rehabilitation of northern Ethiopian highlands, focusing on areas between 2100 and 2800 m above sea level in the Central Zone of Tigray. This tool provides a sophisticated approach to species selection. However, it is focused on one particular region within Ethiopia. The multi-criteria system will give higher ranking to species with higher diversity in products and services that they provide, which may not necessarily result in optimal species mixtures (*i.e.* if species exist that are more specialized than perform better for some of the planting objectives than ‘all-round’ species; a similar argument can be made for working teams or for the portfolio effect [of biodiversity]).

When searching online for ‘priority tree species’ + Ethiopia, the list of priority tree species prepared for an earlier report on the state of forest genetic resources in Ethiopia (Million and Leykun [2001](#)) is among the first results. The earlier report provides a list of species that are mainly planted for construction and industrial products. Given that smallholders also select and plant trees for a variety of non-timber tree products (or agroforestry tree products; Simons and Leakey [2004](#); Leakey *et al.* [2005](#); Dawson *et al.* [2014](#)), the more recent

SoW-FGR provides a more balanced list in respect to the variety of planting objectives, including different environmental services (see Appendix IV in this report).

Lists of commercial timber and bamboo species for Ethiopia, *i.e.* species with similar planting objectives as those of the earlier SoW-FGR report have been compiled by Desalegn *et al.* (2015<sup>1</sup>). Derero *et al.* ([2012](#)) identified fodder and fruit tree species of high importance in the Afar and Somali Regions of Ethiopia.

Searching for priority species for Ethiopia also results in lists of priority tree species for conservation, for example the *Red List of Endemic Trees and Shrubs of Ethiopia and Eritrea* developed for the *Global Trees Campaign* (Vivero *et al.* [2005](#)). With a focus of PATSPO on restoration of landscapes and livelihoods, threats to conservation or endemicity was not considered a valid criterion to prioritize species for this project. This does not imply that none of the selected species are currently threatened. For example, *Hagenia abyssinica* features in the SoW-FGR top-25 priority tree species and was also highlighted in the *Red List* in Box 3 of that report (Vivero *et al.* [2005](#)). Another example that also illustrates the importance of food trees is the top-25 *Cordeauxia edulis*, highlighted in Box 1 of the *Red List* (Vivero *et al.* [2005](#)). As the two species that were mentioned directly above are not endemic to Ethiopia, it also transpires that the listing by Vivero *et al.* ([2005](#)) is not comprehensive as it excludes non-endemics.

## 4. Definition of a process action plan for a consolidated list of 150 species

The PATSPO project document lists as one of the outputs the development of high resolution habitat suitability maps that delineate species- and provenance-specific recommendation domains for up to 150 priority tree species in Ethiopia.

In a first step of compiling the priority species list (primarily to handle species spelling and synonyms), a master list of botanical names was compiled for all species listed in following resources:

- (i) The Useful Trees and Shrubs of Ethiopia (Bekele-Tesemma [2007](#))
- (ii) The Ethiopian country report for the SoW-FGR (Institute of Biodiversity Conservation [2012](#))
- (iii) The [vegetationmap4africa](#) species known to occur in Ethiopia
- (iv) The seed price list from EEFRI's Central Ethiopia Environment and Forest Research Center obtained on 20<sup>th</sup> November 2017
- (v) The seed price list from the Amhara tree seed centre obtained on 21<sup>st</sup> November 2017

Information of the [vegetationmap4africa](#) was obtained from information that was compiled to produce the map and its documentation. Information was extracted from the database that was also used for the [Africa Tree Finder](#), selecting tree and shrub species that were known to occur in Ethiopia. In addition to species that were included in the [Atlas of the Potential Vegetation of Ethiopia](#) (Friis *et al.* [2010](#)), some species were added that were known to occur in Ethiopia and that were documented for other countries of the vegetationmap4africa.

Species names from the master list were checked for spelling errors and current names with the *Taxonstand* package (version 2.1 of 2<sup>nd</sup> November 2017 run in R version 3.4.0). This package automates standardization of taxonomic names and removal of orthographic errors by checking [The Plant List](#). Species names were checked on 21<sup>st</sup> November 2017 against the newest version of [The Plant List](#) (version 1.1 of September 2013). Five species names were excluded from the master list as their names could not be confirmed – all these species were from the SOW-FGR report (*Bothuodna schimperi*, *Tricompetala biachycesas* [? *Triumfetta brachyceras*]; these were species listed for *ex situ* collection) or from the seed price list (*Casuarina matao*, *Leucaena cunninghamiana*).

The final master list of species consisted of 655 entries (Appendix I). Of the 655 species, 438 were listed in the [vegetationmap4africa](#) (these are mainly indigenous tree species), 353 in the SoW-FGR (expanded with the seed lists) and 230 in the Useful Trees for Ethiopia.

The next step was to identify species that had been categorized as priorities or as important species for Ethiopia based on a report that was recently prepared for the SoW-FGR (Institute of Biodiversity Conservation [2012](#)). As this first step resulted in a list of 96 species (documented below), the list was further expanded to a long list of 240 species (*i.e.*, 36.6% or roughly one third of the 655 species).

The primary source of selecting candidate species for species suitability modelling (SDM) was the SoW-FGR report prepared by Ethiopia. This report provides **25 priority tree species** when excluding two invasive species (Table 4 in that report; see Section 3).

The SoW-FGR report for Ethiopia further lists the 52 main species currently used in Ethiopia for solid wood products, energy, non-wood forest products, agroforestry species and stimulants (Table 5 in that report), 34 forest species used for environmental services or social values (Table 6 in that report), 58 species distributed by

the FRC between July 2006 and November 2010 (Table 8 in that report), 10 species for which genetic variability was assessed (Table 9 in that report), 7 target species for *in situ* conservation (Table 10 in that report), 9 species with tree improvement programs (Tables 13 and 14 in that report), 7 species with seed production areas (Table 15 in that report) and 56 species with seed available from the FSC (Table 16 in the report). To this list were added 70 species listed in the seed price list obtain from the Addis Ababa tree seed centre (obtained from CE-EFRC on 20<sup>th</sup> November 2017) and 36 species from the Amhara tree seed centre (obtained on 21<sup>st</sup> November 2017). Also added were tree species imported by the High Value Tree Crops project into the country (Table 12 in the SoW-FGR report). The complete list of species consisted of **96 species** (Table 4.1). Criteria that were not used to compile the top-96 included the number of *ex situ* conservation stands (Table 11 in the SoW-FGR report; including 32 of the top-96 species) and the number of species with identified natural stands (also 32 from the top-96, but a different species assemblage).

The top-96 species were classified as exotic or indigenous species based on information available from the SoW-FGR report and the Useful Trees and Shrubs of Ethiopia (Bekele-Tesemma *et al.* 2007). For species that were not included or species with conflicts in species origins between the two sources, information was obtained from Kew's [Plants of the World](#) portal (accessed 22<sup>nd</sup> November 2017). (The same method of checking species origins was used for the long list of species described below).

An alternative list of 10 most demanded exotic species and 10 most demanded indigenous species was obtained from an EEFRI presentation on 20<sup>th</sup> September 2017 attended by the BPCT (Hendre Prasad, pers. comm.). All these 20 species are included in the list of 96 species, with nine species (6 exotics and 3 indigenous species, see Section 5) occurring both in the top-25 and top-20 lists.

**Table 4.1.** 96 candidate species for breeding. T-25: top 25 species identified in the SoW-FGR; T-20: top 20 species identified by the BPC; Origin: native (N) or exotic (E); SoW-FGR: table number or Appendix 5 (A5) (see main text for details on these tables); Seed: seed listed in the seed price list of the Addis Ababa (AA) or Amhara (AM) seed centre. Species included both in top-25 and top-20 are shown in **bold** typeface.

Species	T-25	T-20	Origin	SOW-FGR	Seed

96	<b>Ziziphus spina-christi</b>			N	11	AM

The top-96 could all be considered as candidate species for plant breeding (see Section 5). With the objective of expanding the list of 96 selected species towards 150 species to be mapped, following species were added from the master list:

- (i) Any species that are priorities for the African Orphan Crops Consortium ([AOCC](#), 16 species were added)
- (ii) Any species listed among the 215 most frequently used species for plantations in the tropics ([Pancel 2015](#); 15 species were added, not including *Psidium guajava* already added by the AOCC)

This process resulted in a list of 126 species that could be considered as the priorities for high resolution HSM defined by PATSPO. However, as paucity of presence point location data may complicate SDM (see sections 6 and 7), the priority list for SDM was expanded further with 114 native species that were listed both in the [vegetationmap4africa](#) and the UTSE manual. This resulted in the list of 240 candidate species of Appendix II (the ‘long list’).

A list of priority tree species prepared for an earlier report on the state of forest genetic resources in Ethiopia (Million and Leykun [2001](#)) focused more on species with construction and industrial purposes. Out of the 23 species identified in that report, 11 occurred in the top-96. Species that were outside the top-96 were in the long list (*Apodytes dimidiata*, *Blighia unijudata*, *Diospyros abyssinica*, *Manilkara butugi*, *Milicia excelsa*, *Ocotea kenyensis*, *Olea capensis* [listed as *Olea hochstetteri*, a synonym of *Olea capensis* subsp. *macrocarpa*], *Polyscias fulva*, *Trilepisium madagascariense* and *Syzygium guineense*), but two species were not: *Afrocarpus gracilior* and *Olea welwitschii*. In the UTSE, *Afrocarpus (Podocarpus) gracilior* is treated as synonym of *Afrocarpus falcatus*, one of the six indigenous species that occurred both on the top-25 and top-20. In the *Atlas of Potential Natural Vegetation of Ethiopia* by Friis *et al.* [2010](#), *Afrocarpus (Podocarpus) gracilior* is not listed. However, both [ThePlantList](#) and the [AfricanFloweringPlant](#) database treat *Afrocarpus gracilior* as a unique species. *Olea welwitschii* is a unique species according to ThePlantList and the AfricanFloweringPlant database. It is listed under this name in the UTSE and in the Ethiopian atlas by Friis *et al.* [2010](#), but was listed in the VECEA project by its synonym of *Olea capensis* subsp. *welwitschii* as this was the name by which it was listed in the *Useful Trees and Shrubs* manuals for Uganda and Tanzania. *Olea capensis* was listed in the long list. (Both *Olea welwitschii* and *Olea capensis* are listed as unique species native to Ethiopia by the *Plants Of the World* portal [accessed January [2018](#)]).

Desalegn *et al.* ([2012](#)) list eight species that have been selected as suitable veneer species for Ethiopia, five of which are included in the top-96. The three species that were not listed (*Ocotea kenyensis*, *Olea capensis* and *Olea welwitschii*) are mentioned in the previous paragraph as they were included in those species listed by Million and Leykun ([2001](#)).

Desalegn *et al.* (2015) provide a longer list of 68 commercial timber and bamboo species that could be further expanded to 70 species. Leaving aside the 16 *Eucalyptus* and 4 *Pinus* species listed and also species listed by Million and Leykun [2001](#), species outside the top-96 included *Acacia caffra*, *Acacia drepanolobium* (prioritized as invasive species by the latest SoW-FGR report), *Acacia mellifera*, *Acrocarpus fraxinifolius*, *Alliophylus abyssinicus*, *Alstonia boonei*, *Antiaris toxicaria*, *Bridelia micrantha*, *Cordia alliodora*, *Fagaropsis angolensis*, *Gmelina arborea* (among the two species for expansion of the list of 68), *Mimusops kummel*, *Prosopis juliflora* (another invasive species prioritized for removal in the latest SoW-FGR report) and *Trichilia dregeana*. Leaving out the two invasive species, species occurred in the long list except for *Acacia caffra* (not in the master list and a species [native to southern Africa](#)), *Acacia mellifera* (master list, V4A), *Acrocarpus fraxinifolius* (not in the master list and a [species native to Asia-Tropical and Asia-Temperate](#)), *Alstonia boonei* (master list, V4A) and *Cordia alliodora* (not in the master list and a [neotropical species](#)).

Of the 20 highest scoring species for planting on private land identified by the multi-criteria decision support system by Reubens *et al.* (2011), 17 were included in the top-96. Not included were *Euphorbia candelabrum* (rank 11), *Acacia etbaica* (rank 13) and *Euphorbia abyssinica* (rank 16); these species were included in the long list, however.

The top five indigenous fruit tree species for Ethiopian drylands identified by Teklehaimanot 2008 (sorted from highest to lowest ranking as: *Cordeauxia edulis*, *Vitellaria paradoxa*, *Balanites aegyptiaca*, *Borassus aethiopum*, *Sclerocarya birrea*) were either in the top-96 (the first three species) or the long list (the last two species).

Highly preferred fodder and fruit tree species to improve livelihoods in the Afar and Somali Regions as identified by Derero *et al.* (2012) were among the top-96, with exception of *Berchemia discolor*, *Cordia sinensis* and *Dobera glabra* (all among the long list, except *Cordia sinensis*; this species was only listed in the master list [it is listed in the [vegetationmap4africa](#), but not the UTSA]).

Although conservation priority was not a criterion to select candidate tree species, the top-96 included two species from those listed in the red list of endemic tree species for Ethiopia and Eritrea (Vivero *et al.* 2005): the critically endangered *Boswellia ogadensis* and the vulnerable *Boswellia picrotae*. Various threatened frankincense-producing species such as *Boswellia neglecta* (also top-96) have recently been identified as crucial to dryland restoration in Ethiopia (Mokria *et al.* 2016; see also BBC Earth 2017 and ICRAF 2016).

From the above comparisons with other priority setting exercises, the importance of several of the top-96 species can be confirmed. Species not captured in the top-96 typically occurred in the long list. As the availability of presence location data is expected to be one of the main constraints to species distribution modelling and mapping (Boakes *et al.* 2010; Feeley and Silman 2011; Duputié *et al.* 2014; Kindt 2018), it probably was good practice to have selected an extra 90 species above the target of 150 species (see also Sections 6-8). Therefore, the main exercise that would remain is to check with Ethiopian researchers whether some important species have been omitted from the list of 240 candidate species. As the only seed lists that were considered in the compilation of the master list were those of the Addis Ababa and Amhara seed centres, it may also prove useful to cross-check seed lists from other tree seed centres against the top-96 and long lists.

## 5. Definition of criteria to identify up to 25 species to be included in the breeding programmes

When excluding two priority species identified as priorities for removal, the Ethiopian country report for the *State of the World's Forest Genetic Resources* (SoW-FGR, Institute of Biodiversity Conservation [2012](#)) lists 25 priority tree species for Ethiopia, *i.e.* the same number of species to be identified through the consultancy. In response to the updated top-25 (from the top-24 of the PATSPO project document), Lars Graudal (email of 21<sup>st</sup> November 2017) agreed with the list but also mentioned that demand and supply data should be considered. Probably for similar reasons of selecting highly-demanded species (and ideally also species with high future demands), the BPCT seems to have departed from the top-24 of the PATSPO project document to a top-20 consisting of the 10 most demanded indigenous and 10 most demanded exotic species (these are listed in Table 4.1).

The BPCT has created a set of scores to prioritize species (Box 1). These criteria include criteria listed in Chapter 7 of the PATSPO project document:

- (i) Survey of planting areas and value production in planting programmes,
- (ii) Market survey of forest products consumption, and
- (iii) User preference measurements.

**Box 1.** Criteria identified by the BPCT for selection of species for the PATSPO breeding programme.

1. Overall demand for seed
2. Farmers preference and economic benefits
3. Existence of seed value chain
4. Multipurpose species with weight on its suitability for agroforestry systems
5. High biomass production to provide values for local farmers through fodder, fruit production, fast and valuable timber production
6. Flowering and seed production at young ages to achieve a fast seed production and short breeding generations
7. Species with high value in restoration of degraded land
  - a. High tolerance/resistance to drought and competition from weed and grass
  - b. Create the right microclimate and soil conditions for regeneration of other species
  - c. Soil improvement capacity
8. Tolerance/resistance to pests and diseases
9. Existence of enough genetic diversity and especially genetic variation at provenance- or individual-tree level

My recommendation would be to apply the criteria to the top-96 rather than the top-25 or top-20. Another recommendation could be to use a weighted scoring approach where national restoration targets (expected area to be restored) and economic benefits (long-term returns on investment; this was the main objective in ICRAF's priority setting for accelerated domestication) are given higher weights – one reason for higher weights is that an ideal species mixture does not necessarily require highly multipurpose species. Ideally the final selection of species would be done in close collaboration with national partners.

The first BPCT criterion (and the additional criterion given by Lars Graudal) reflects the current farmer demand for exotic and indigenous tree species. Six indigenous species occurred both on the top-25 and top-20: *Acacia senegal*, *Afrocarpus falcatus*, *Cordia africana*, *Faidherbia albida*, *Hagenia abyssinica* and *Juniperus procera*. If the main criterion was to select a subset of top-25 species based on the expected current demand for indigenous tree species, then these would be six candidate species for the breeding programme.

Only three exotic species occurred both on the top-25 and top-20: *Eucalyptus camaldulensis*, *Eucalyptus globulus* and *Grevillea robusta*. The small overlap can principally be explained by the fact that only four exotic species were included in the top-25, including the three Australian species mentioned in the previous sentence and *Cupressus lusitanica*. With an estimated number of seedlings planted of close to 44 million (Appendix IV), *Cupressus lusitanica* was the fourth most demanded exotic species and could join the three other exotic species to result in 10 priority species for breeding (equalling the original objective for the BPCT). Another choice, however, could be *Casuarina equisetifolia* (not top-25, but top-20) that is the second most demanded exotic species with close to an estimated 121 million seedlings planted (*Eucalyptus camaldulensis* tops the list with over 450 million seedlings and *Eucalyptus globulus* is third with over 50 million seedlings; *Grevillea robusta* only comes 21<sup>st</sup> with close to 330,000 seedlings).

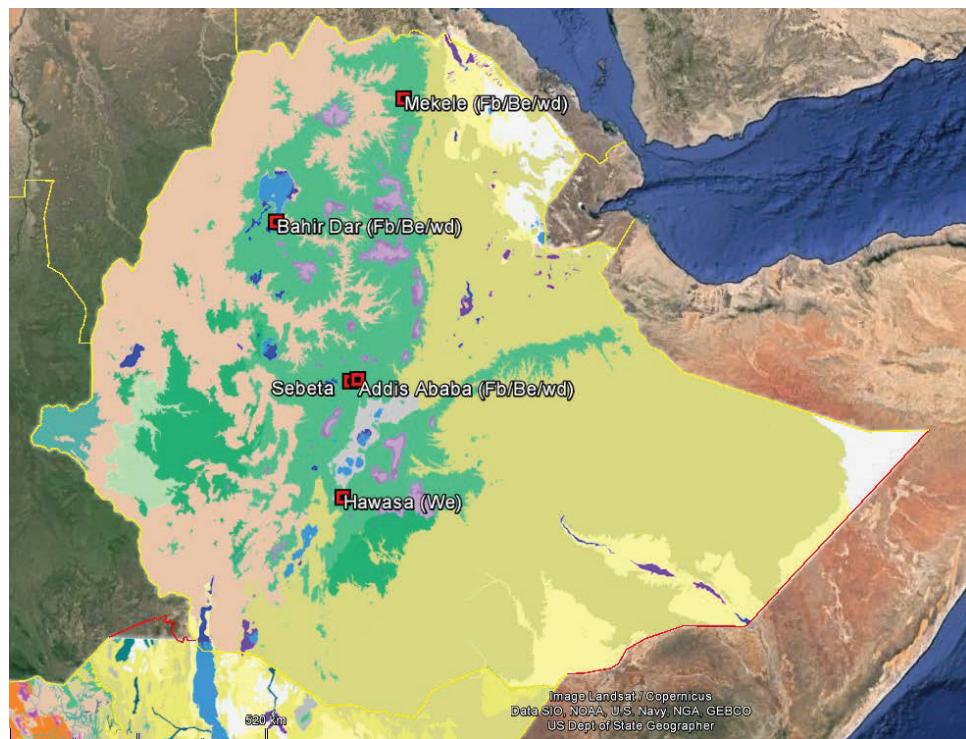

Although using the consensus of top-25 and top-20 lists would probably not correspond to the scores that would be obtained with a carefully selected set of criteria, the consensus list of nine species did include the two species that were finally selected by the BPCT, *Cordia africana* and *Grevillea robusta*.

For the establishment of breeding seed orchards, the BPCT implicitly identified an additional criterion for the prioritization of species for the breeding programme: the species needs to be suitable to the planting sites available to PATSPO. The BPCT decided to focus on highland species or species from the Rift Valley. The principle reason to select these species was that breeding seed orchards need to be established close to research stations (figures 5.1 and 5.2).

All seed centres except Hawasa are in the potential natural vegetation (PNV) mosaic of “Complex of Afromontane undifferentiated forest (Fb) with wooded grasslands (wd) and evergreen or semi-evergreen bushland and thicket (Be) at lower margins”. Hawasa is in the PNV of Upland *Acacia* wooded grassland (We).

What is interesting is that the locations of several seed centres are within ecological transects from *Combretum-Terminalia* wooded grassland to Dry Evergreen Forest. When the basic scientific objective is to test differences between vegetation types (proxies for planting zones), it is good to include species that have natural populations in adjacent vegetation types such as the *Combretum-Terminalia* wooded grassland.

**Figure 5.1.** Location of PATSPO seed centres on the [vegetationmap4africa](#). Image created from Google Earth (23<sup>rd</sup> November 2017). Codes for vegetation types are given in the main text.

**Figure 5.2.** Locations of two PATSPO seed centres on the [vegetationmap4africa](#). Image created from Google Earth (23<sup>rd</sup> November 2017). Codes for vegetation types are given in the main text. The salmon-coloured vegetation type directly east of Bahir Dar is Dry *Combretum* woodland.

**Table 5.1.** Characteristics of the five seed centres targeted by PATSPO. Latitude, longitude and altitude obtained from the BPCT. PNV: Potential Natural Vegetation inferred from the [vegetationmap4africa](#) (Figure 5.1; full names in main text). Other variables are bioclimatic variables obtained from AFRICLIM (Platts *et al.* [2014](#); 150 arc-seconds resolution; downloaded September 2015): abbreviations in table footnote, temperatures in degrees C, rainfall in mm.

Variable	Addis Ababa	Bahir Dar	Hawasa	Mekele	Sebeta

**Bio1:** mean annual temperature; **Bio2:** mean diurnal range; **Bio3:** isothermality; **Bio4:** temperature seasonality (standard deviation of monthly values); **Bio5:** maximum temperature of the warmest month; **Bio6:** minimum temperature of the coldest month; **Bio7:** annual temperature range; **Bio10:** mean temperature of the warmest quarter; **Bio11:** mean temperature of the coolest quarter; **Bio12:** mean annual rainfall; **Bio13:** rainfall of the wettest month; **Bio14:** rainfall of the driest month; **Bio15:** rainfall seasonality (standard deviation of monthly values); **Bio16:** rainfall of the wettest quarter; **Bio17:** rainfall of the driest quarter; **PET:** potential evapotranspiration; **MI:** moisture index; **Mlaq:** moisture index of the most arid quarter; **MImq:** moisture index of the most moist quarter; **DM:** number of dry months; **LLDS:** length (months) of the longest dry season

Other descriptors (mainly for bioclimatic variables) of seed centres are given in Table 5.1. Mekele stands out as much drier (such as the number of dry months) than other locations in the Fb-Be-wd mosaic. As such, it provides an ideal location to check for accuracies of the [vegetationmap4africa](#) and AFRICLIM (Platts *et al.* [2014](#)).

**Table 5.2.** Association of indigenous candidate species for breeding with vegetation types. T-25: top 25 species identified in the SoW-FGR; T-20: top 20 species identified by the BPC. Suitable vegetation types: Fb: Afromontane undifferentiated forest; Be: Evergreen and semi-evergreen bushland and thicket; We: Upland *Acacia* wooded grassland. Marginally suitable vegetation types: Wcd: Dry *Combretum* wooded grassland; Fa: Afromontane rain forest; Fe: Afromontane moist transitional forest. Not suitable vegetation types: Bd: Somalia-Masai *Acacia-Commiphora* deciduous bushland and thicket; S: Somalia-Masai semi-desert grassland and shrubland. Species are sorted first by suitable then marginally suitable vegetation types.

In addition to the criteria for selecting breeding plant species for Ethiopia, tables 5.2 and 5.3 can be used to filter species suitable to PATSPO planting sites. For indigenous tree species, suitability is inferred by matching vegetation types of the [vegetationmap4africa](#). For exotic tree species, suitability is inferred from [Ecocrop](#) with data on annual temperatures and precipitation as in Table 5.1. However, see section 8 on a note on the reliability of the Ecocrop approach.

**Table 5.3.** Planting sites suitability (inferred from [Ecocrop](#)) of exotic candidate species for breeding. T-25: top 25 species identified in the SoW-FGR; T-20: top 20 species identified by the BPC team. Temperature suitability:  $t_- < \text{absolute minimum} < t_i < \text{optimal minimum} < T < \text{optimal maximum} < t_a < \text{absolute maximum} < t_+$ . Precipitation suitability:  $p_- < \text{absolute minimum} < p_i < \text{optimal minimum} < P < \text{optimal maximum} < p_a < \text{absolute maximum} < p_+$ . Species within the optimal ranges for all seed centres are in **bold** typeface. Note that SDM is expected to provide more robust estimates of site suitability (see section 8).

## 6. Prepare guidelines for species distribution modelling for indigenous tree species (including candidate species for breeding)

Species distribution modelling (SDM) and subsequent habitat distribution mapping (HDM) in baseline and future climates can be achieved with the [BiodiversityR](#) software, using similar scripts for ensemble suitability modelling as described recently (Kindt [2018](#); see also De Sousa *et al.* [2017](#) or Gaisberger *et al.* [2017](#) for recent applications). Among the options available from [BiodiversityR](#), it is recommended to use the Variance Inflation Factor method to select a subset of less-correlated environmental data layers, to calculate the ensemble suitability from *probit*-transformed algorithm-specific suitability values, to repeat the calibration procedure at least five times, to use a absence-presence threshold that maximizes the sum of sensitivity and specificity and also to provide *count suitability maps* (maps that show how many algorithms predict species presence; for this reason, it is further recommended to infer suitability from at least 10 algorithms).

Openly-available presence location data sets can be obtained from the [Global Biodiversity Information Facility](#) and from the RAINBIO mega-database (Dauby *et al.* [2016](#); the geographic focus of RAINBIO is the region south of the Sahel and north of Southern Africa, with the majority of data from tropical forest regions but also Ethiopia well represented [see Section 8]). It is recommended to calibrate SDM with presence location data that represent the range of each species, especially for HDM of future climates. However, to avoid that the environmental niche is not fully represented especially for Ethiopia, it is also recommended to supplement openly-available presence location data sets with data gathered in Ethiopia. One possibility are the location records available from passport data of accessions held by the Ethiopian Biodiversity Institute (ideally expanded with information from [field genebanks](#)) – a request for point locations has been forwarded by the Ethiopian PATSPO team. Other possibilities are location records from botanical expeditions (see Section 8) or from (previous) collections from Ethiopian tree seed centres (*e.g.* as records available from the Oromia regional tree seed centre).

Although the accuracy of location data has been checked in the RAINBIO mega-database, it is recommended to check for possible errors (such as locations that are not in the expected country, locations in the ocean or locations that correspond to the institute where herbarium specimens are kept rather than the collection site location) and exclude these records with software such as the *Biogeo* (Robertson *et al.* [2016](#)) or *CoordinateCleaner* (Zizka and Silvestro [2017](#)) packages.

Even after cleaning location data, it is likely that unknown biases will remain in the data (Fithian *et al.* [2015](#)). Methods of environmental filtering (using the [dismo::gridSample](#) R function) that reduce bias and improve accuracy of SDM are described in Varela *et al.* [2014](#). Prior to SDM and possible environmental filtering with an added objective of reducing spatial autocorrelation of the data, it is further recommended to subject presence location data to spatial thinning as available from the *spThin* (Aiello-Lammens *et al.* [2015](#)) or *red* (Cardoso [2017](#)) packages (the randomized spatial thinning process needs to be repeated several times in attempts of maximizing the number of retained records).

With the objective to project HDM to future climates, the recommended source of bioclimatic layers is AFRICLIM (Platts *et al.* [2014](#)) as future geospatial data are also inferred from regional climate models, whereas other data sets such as [WorldClim](#) or [Climond](#) do not use regional models. AFRICLIM further provide a wider set of bioclimatic variables than available from WorldClim, although the *envirem* package (Title and Bemmels [2017](#)) can also generate a wider set of bioclimatic variables from WorldClim. A decision will need to be made whether the objective of SDM is to infer the bioclimatic niche of species, or whether a wider set of environmental variables should be considered. If soil gridded data would be used, the SoilGrids250m data set (Hengl *et al.* [2015](#)) could be considered, but precision of presence location data in respect to soil properties will need to be evaluated

(bioclimatic data seem less problematic with respect to local variation). Probably interesting are the topographic wetness and terrain roughness indices available from [ENVIREM](#) (Title and Bemmels [2017](#)) (it is a safe assumption that these elevation-derived topographic indices will not be significantly different in the mid-21<sup>st</sup> century that is the target of climate change modelling). When interpreting future HDM, it will be good practice to discuss transferability of SDM in space and time (*e.g.*, Werkowska *et al.* [2016](#)).

Once HDM have been produced, clustering or related methods could be used to identify seed zones within areas mapped as suitable for a particular species, but such methods will need to be explored more fully once HDM exercises have been completed (one method is based on the Mahalanobis distance and available via the *R* functions of *BiodiversityR::ensemble.centroids* and *BiodiversityR::ensemble.zones*; among genecological references to be consulted in a literature review are Hamann *et al.* [2011](#); Breed *et al.* [2013](#); Butterfield *et al.* [2016](#); Espeland *et al.* [2016](#); Nevill *et al.* [2016](#); Bucharova *et al.* [2017](#); Derero *et al.* [2017](#); O'Neill *et al.* [2017](#) and Ramalho *et al.* [2017](#)).

SDM would ideally be done as a multiple-stage process whereby distribution maps prepared in a previous stage are validated in a next stage. Validation can be done with different plausible HDM through a consensus algorithm based on expert opinions (*e.g.*, van Zonneveld *et al.* [2013](#) or Gaisberger *et al.* [2017](#)). In the most ideal case, methods of expert validation or field checking could be incorporated in online HDM that are part of the decision-support tools to be developed within PATSPO. Where repeat HDM exercises would be conducted with updated presence data sets (or even updated bioclimatic layers), the same *R* scripts could be used at regular intervals to generate suitability layers that are used in a data portal.

If not used as calibration data, information from ecological surveys could also be used to verify the accuracy of HDM. One recent study that collated information on species assemblages from different montane forest surveys across Ethiopia is available from Young *et al.* [2017](#) (see also Figure 6.1 and section 16). Information from a comprehensive review of species composition of ‘church forests’ located in central and northern Ethiopia is available from Aerts *et al.* [2016](#). Of similar utility would be data from previous on-farm (*e.g.*, Endale *et al.* [2017](#)) and nursery (*e.g.*, Dedefo *et al.* [2016](#)) surveys conducted within Ethiopia. New data from surveys conducted within PATSPO could also prove valuable, especially if these were conducted in areas previously not explored or documented.

**Figure 6.1.** Distribution of montane forest reserves with studies on species assemblages. The list of references is available in Appendix VI. Source: Young *et al.* 2017

## 7. Prepare guidelines for species distribution modelling for exotic tree species (including candidate species for breeding)

For exotic species, similar SDM calibration approaches can be used as those for indigenous species that were documented in the previous section. However, it can be expected that presence locations from within Africa will not fully represent the environmental niche of an exotic species. Hence presence locations may need to be sourced globally or from an area that represents tropical and subtropical regions. The most likely source for these data is the [Global Biodiversity Information Facility](#).

For 12 important (top-96) Australian species that had Australasia as the only native continent in GRIN-GLOBAL (*Acacia decurrens*, *Acacia melanoxylon*, *Acacia saligna*, *Callistemon citrinus*, *Casuarina cunninghamiana*, *Corymbia* (synonym: *Eucalyptus*) *citriodora*, *Eucalyptus camaldulensis*, *Eucalyptus globulus*, *Eucalyptus grandis*, *Eucalyptus saligna*, *Eucalyptus viminalis* and *Grevillea robusta*), an additional source for presence locations to combine with GBIF data would be the [Atlas of Living Australia](#) (possibly obtained via the Biodiversity and Climate Change Virtual Lab; <http://www.bccvl.org.au/data-portal/>).

With bioclimatic data required for location data outside of Africa, AFRICLIM (Platts *et al.* [2014](#)) cannot be used. Hence bioclimatic data could be sourced from the second version of WorldClim (Fick *et al.* [2017](#)) and possibly expanded with the *envrem* package (Title and Bemmels [2017](#)). Generation of future suitability maps may require release of future data sets for WorldClim. It is possible that a comprehensive bioclimatic data set will not be needed for calibration of SDM (this is a hypothesis that could be tested). Using three *Eucalyptus* species as examples, Booth ([2016](#)) recommended using the three bioclimatic variables of the moisture index (the ratio of mean annual actual evapotranspiration to the mean annual potential evapotranspiration), the mean minimum temperature of the coldest period (week or month) and the growing degree days (the number of days more than 5 degrees C) to maps their future climatic ranges. To estimate suitability outside the native range of Australian species, Booth ([2015](#)) considered information from introductions and botanic gardens, albeit that management interventions such as irrigation may need to be considered to only include point locations where the species is suitable under ambient bioclimatic conditions.

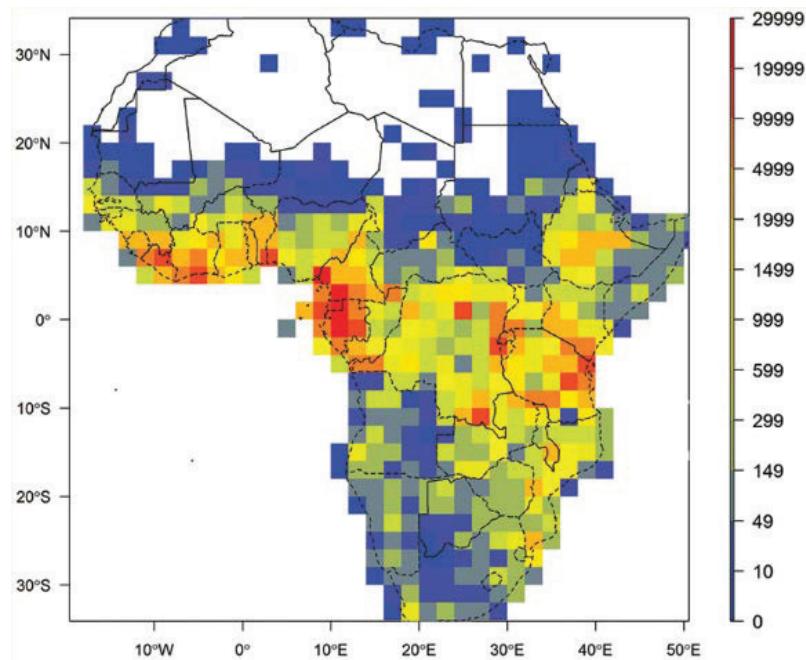

Possibly mainly as an exercise to investigate data quality, the modelling framework of FAO's [Ecocrop](#) based on temperature and rainfall limits could also be applied for exotics. The Ecocrop approach is not expected to be as reliable as more sophisticated approaches of SDM such as machine-learning or ensemble approaches (*e.g.*, Elith *et al.* [2006](#); Wissz *et al.* [2008](#)) and a wider set of bioclimatic variables (*e.g.*, Booth *et al.* [2014](#)) may be essential to calibrate reliable SDM. As indication of [Ecocrop](#)'s limitations, for example, is the observation that Addis Ababa is more suitable for *Eucalyptus globulus* than the other tree seed centre locations listed in Table 5.3. (Søren Moestrup, pers. comm.). In the case of this species, the mean annual temperature of Addis Ababa of 17.5 degrees C was below the lower optimal limit of 18.

## 8. Review species with respect to available information

With environmental data such as AFRICLIM (Platts *et al.* 2014) being available as open-source data sets, the major hurdle for reliable SDM is the availability of reliable presence point locations. Although record density is high in Ethiopia for the RAINBIO mega-database (Dauby *et al.* 2016; Figure 8.1), a considerable number of priority species do not have sufficient point locations for reliable SDM (30 records as defined by Wisz *et al.* 2008 or 100 geographically and climatically filtered data as defined by Varela *et al.* 2014; Table 8.1). Even for the lower limits of 14 for narrow-ranged and 25 for widespread species identified by van Proosdij *et al.* (2015), insufficient presence locations are available for many species. Several species do not have presence locations available in RAINBIO.

It is recommended, therefore, to supplement the openly available species data with data available from surveys in Ethiopia, such as the surveys conducted by Ib Friis and collaborators (Figure 8.2).

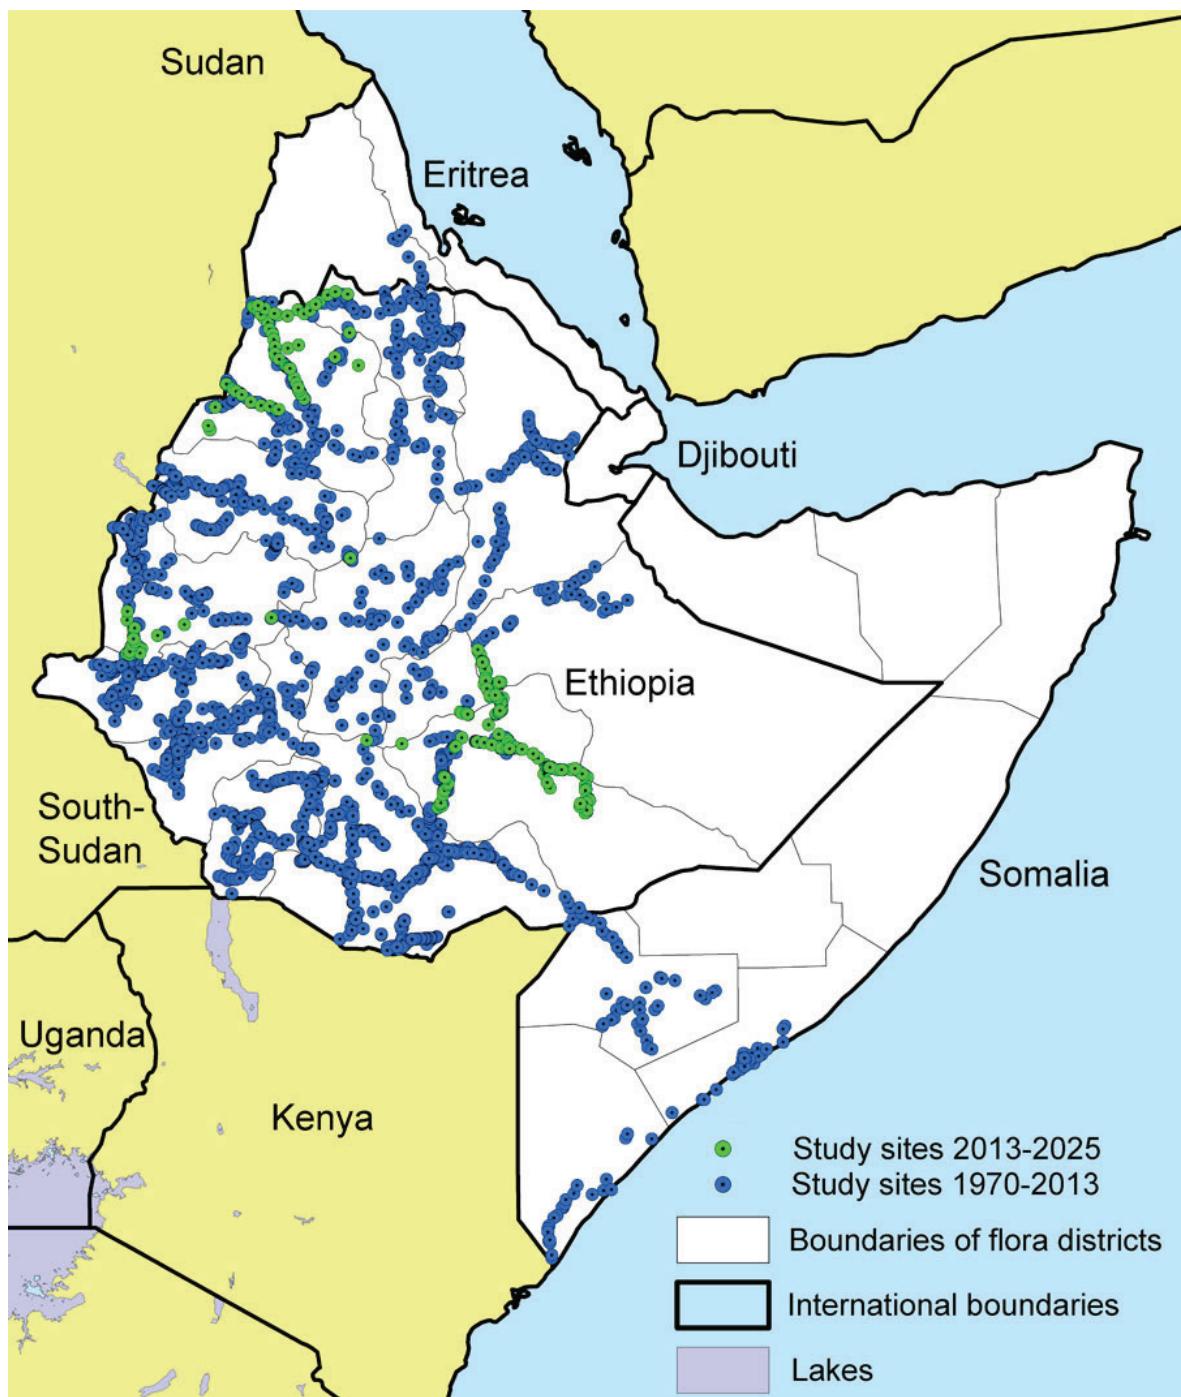

**Figure 8.1.** Record density (2 arc-degree grid) of records in the RAINBIO mega-database (Dauby *et al.* 2016).

**Table 8.2.** Number of RAINBIO records for the long list of species.

Number of records	all	top 25	top 20	top 96
< 1	60	5	10	38
1-29	37	5	1	14
> 29	143	15	9	43
30-99	62	10	5	19
> 99	81	5	4	24

**Figure 8.2.** Location of botanical fieldwork involving Ib Friis (Carlsberg Foundation 2017). Image copied from web page.

## 9. Visits

Most of the visit to Ethiopia (18 – 26 November 2017) was spent on the ILRI campus. As an office was shared with the consultancy teams for the breeding plans and for the base line survey of seed demand and supply and the tree seed sector analysis, this offered ample time for discussions and information exchange.

In the morning of 20<sup>th</sup> November and together with the BPCT, the CE-EFRC (EEFRI) tree seed centre next to campus was visited and discussions held with Kedra Mohammed (CE-EFRC tree seed centre manager, [kedramohammed@gmail.com](mailto:kedramohammed@gmail.com)).

Professor of Plant Systematics & Biodiversity Sebsebe Demissew ([sebsebe.demissew@aau.edu.et](mailto:sebsebe.demissew@aau.edu.et); [sebseb.demissew@gmail.com](mailto:sebseb.demissew@gmail.com)) was visited on the campus of the College of Natural Sciences on Friday 24<sup>th</sup> November to discuss collaboration and data exchange for SDM (he is a collaborator in the [vegetationmap4africa](http://vegetationmap4africa)).

## **10. Acknowledgments**

This report benefited much from interactions with the Ethiopia-based PATSPO team (especially Søren Moestrup, Niguse Hagazi and Kiros Hadgu), the consultancy teams for the breeding plans (Jon Kehlet Hansen, Abayneh Derero and Hendre Prasad) and for the base line survey of seed demand and supply and the tree seed sector analysis (Jens-Peter B. Lillesø, Sammy Carsan, Abayneh Derero). Roeland is grateful for the interactions and information received from Kedra Mohammed of Ethiopian National Tree Seed Centre (EEFRI). The quick response from Nicholas Young, Bruno Verbist and Raf Aerts on species assemblage data sets from Ethiopia was great to receive. Administrative support from Mekdes Sime, Sallyannie Muhoro and Nellie Mutio was also greatly appreciated.

## 11. Appendix I. Master species list

Top 25: species identified as priority tree species by the Ethiopian report for the SoW-FGR; Top 96: species identified as candidate species for breeding; Long list: species identified as candidate species for species distribution modelling; Ethiopia useful trees: species listed in the Useful Trees and Shrubs for Ethiopia; SOWFGR and price list: species listed in the SOW-FGR report or seed lists; Ethiopia V4A: species listed in the [vegetationmap4africa](#) to be part of Ethiopian species assemblages. Species synonyms are provided in Appendix III.

## 12. Appendix II. Long list of candidate species for species distribution modelling

T-25: species identified as priority tree species by the Ethiopian report for the SoW-FGR; T-96: species identified as candidate species for breeding; Long list: species identified as candidate species for species distribution modelling; Origin: native (N) or exotic (E); E: Ecocrop; F: Selection of Forages for the Tropics; G: Global Species Matrix; H: Tropical Forestry Handbook; L: Seed Leaflets; T: AgroforesTree database; U: Food Composition Database; W: The Wood Database; A: AOCC; C: Invasive Species Compendium; I: Global Invasive Species Database; S: SoW-FGR with minimum two countries; w: wood density database. Species synonyms are provided in Appendix III.

Species	T-25	T-96	Origin	E	F	G	H	L	T	U	W	Y	A	C	I	S	w
1 Acacia abyssinica		x	N	x	-	-	-	-	-	-	-	-	-	-	-	-	-

46 <i>Breonadia salicina</i>			N	-	-	-	-	-	-	-	-	-	-	-	x	x	
47 <i>Bridelia micrantha</i>			N	x	-	-	x	x	-	-	-	-	-	-	-	x	
48 <i>Buddleja polystachya</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
49 <i>Cajanus cajan</i>	x		E	x	x	x	-	-	x	x	-	x	-	-	-	-	
50 <i>Calliandra calothyrsus</i>	x		E	x	x	x	x	x	x	-	-	-	-	-	x	x	
51 <i>Callistemon citrinus</i>	x		E	-	-	-	-	-	-	-	-	-	-	-	-	-	
52 <i>Calotropis procera</i>			N	x	-	x	-	-	x	-	-	-	x	-	-	-	
53 <i>Capparis tomentosa</i>			N	x	-	-	-	-	x	-	-	-	-	-	-	-	
54 <i>Carica papaya</i>	x		E	x	-	-	-	x	x	-	x	x	-	-	x	-	
55 <i>Carissa spinarum</i>			N	-	-	-	-	-	-	-	-	x	-	-	-	-	
56 <i>Casimiroa edulis</i>			E	x	-	-	-	-	x	-	-	x	-	-	-	-	
57 <i>Casuarina cunninghamiana</i>	x		E	x	-	-	-	-	x	-	-	-	x	-	x	x	
58 <i>Casuarina equisetifolia</i>	x		E	x	-	x	x	x	x	-	-	-	x	x	x	x	
59 <i>Catha edulis</i>	x	x	N	x	-	-	-	-	-	-	-	-	-	-	-	x	
60 <i>Ceiba pentandra</i>			NE	x	-	x	x	x	x	-	-	x	-	-	x	x	
61 <i>Celtis africana</i>	x		N	-	-	-	-	x	-	-	-	-	-	-	-	x	
62 <i>Celtis toka</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
63 <i>Citrus sinensis</i>	x		E	x	-	-	-	-	x	x	-	x	-	-	x	x	
64 <i>Coffea arabica</i>	x	x	N	x	-	-	-	-	x	-	-	x	-	-	x	x	
65 <i>Combretum aculeatum</i>			N	x	-	-	x	x	-	-	-	-	-	-	-	-	
66 <i>Combretum collinum</i>			N	-	-	-	-	x	-	-	-	-	-	-	-	-	
67 <i>Combretum molle</i>	x		N	x	-	-	-	x	-	-	-	-	-	-	-	x	
68 <i>Commiphora africana</i>	x		N	x	-	-	-	x	x	-	-	-	-	-	x	x	
69 <i>Commiphora erythraea</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
70 <i>Commiphora guidottii</i>	x		N	-	-	-	-	-	-	-	-	-	-	-	-	-	
71 <i>Commiphora habessinica</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
72 <i>Commiphora myrrha</i>	x	x	N	-	-	-	-	x	-	-	-	-	-	-	-	-	
73 <i>Cordeauxia edulis</i>	x	x	N	x	-	x	-	-	x	-	-	-	-	-	-	-	
74 <i>Cordia africana</i>	x	x	N	x	-	-	-	x	x	-	-	-	-	-	x	x	
75 <i>Corymbia citriodora</i>	x		E	-	-	x	-	-	x	-	-	-	-	-	x	x	
76 <i>Corymbia maculata</i>			E	-	-	x	-	x	-	x	-	-	-	-	-	x	
77 <i>Croton macrostachyus</i>	x		N	-	-	-	-	x	-	-	-	-	-	-	-	x	
78 <i>Cupressus lusitanica</i>	x	x	E	x	-	-	x	-	x	-	x	-	-	-	x	x	
79 <i>Cupressus sempervirens</i>	x		E	x	-	-	-	-	-	x	-	-	x	-	x	x	
80 <i>Cupressus torulosa</i>			E	x	-	-	x	-	x	-	-	-	-	-	x	x	
81 <i>Cyathea manniana</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
82 <i>Cytisus proliferus</i>	x		E	x	-	x	-	-	x	-	-	-	-	-	-	-	
83 <i>Dalbergia melanoxylon</i>			N	x	-	-	-	x	x	-	x	-	-	x	-	x	x
84 <i>Dalbergia sissoo</i>			E	x	-	-	x	x	x	-	x	-	-	x	x	x	
85 <i>Delonix regia</i>	x		E	x	-	-	x	-	x	-	-	-	-	x	-	x	x
86 <i>Dichrostachys cinerea</i>			N	x	-	-	-	x	-	-	-	-	-	x	x	-	x
87 <i>Diospyros abyssinica</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	x	
88 <i>Diospyros mespiliformis</i>			N	x	-	-	-	-	x	-	-	-	x	-	-	x	x
89 <i>Discopodium penninervium</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
90 <i>Dobera glabra</i>			N	x	-	-	-	-	x	-	-	-	-	-	-	-	
91 <i>Dodonaea viscosa</i>	x		N	x	-	-	-	-	x	-	-	-	-	-	-	x	
92 <i>Dombeya torrida</i>			N	-	-	-	-	-	x	-	-	-	-	-	-	x	
93 <i>Dovyalis abyssinica</i>	x		N	-	-	-	-	x	-	-	-	-	-	-	-	-	
94 <i>Dovyalis caffra</i>	x		E	x	-	-	-	x	x	-	-	x	-	-	-	x	
95 <i>Dracaena steudneri</i>			N	-	-	-	-	-	-	-	-	-	x	-	-	-	
96 <i>Ehretia cymosa</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	x	
97 <i>Ekebergia capensis</i>	x		N	x	-	-	-	-	x	-	-	-	-	-	-	x	
98 <i>Embelia schimperi</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-	
99 <i>Ensete ventricosum</i>			N	x	-	-	-	-	-	-	-	-	x	-	-	-	
100 <i>Entada abyssinica</i>	x		N	x	-	-	-	-	x	-	-	-	-	-	-	-	
101 <i>Erica arborea</i>			N	-	-	-	-	-	-	x	-	-	x	-	-	-	
102 <i>Erythrina abyssinica</i>	x		N	x	-	-	-	-	x	-	-	-	-	-	-	x	
103 <i>Erythrina brucei</i>	x		N	-	-	-	-	-	-	-	-	-	-	-	-	-	
104 <i>Erythroxylum fischeri</i>			N	-	-	-	-	-	-	-	-	-	-	-	-	-

### 13. Appendix III. Synonyms of species names used in the report

Synonyms based on *The Plant List* (November 2017). The list also contains spelling variants and mistakes from documents referred to during the consultancy.

Species	Synonym or alternative spelling
<i>Afrocanthium lactescens</i>	<i>Canthium lactescens</i>
<i>Afrocarpus falcatus</i>	<i>Podocarpus falcatus</i>
<i>Afrocarpus gracilior</i>	<i>Afrocarpus falcatus</i> subsp. <i>gracilior</i>
<i>Agarista salicifolia</i>	<i>Agauria salicifolia</i>
<i>Allophylus ferrugineus</i>	<i>Allophylus macrobotrys</i>
<i>Anogeissus leiocarpa</i>	<i>Anogeissus leocarpus</i>
<i>Baccharoides filigera</i>	<i>Vernonia filigera</i>
<i>Baccharoides filigera</i>	<i>Vernonia hymenolopis</i>
<i>Bauhinia thonningii</i>	<i>Piliostigma thonningii</i>
<i>Brucea antidyserterica</i>	<i>Brucea antidisentrica</i>
<i>Bytneria catalpifolia</i>	<i>Bytneria catalpifolia</i>
<i>Cadaba divaricata</i>	<i>Cadaba divericata</i>
<i>Cadaba linearifolia</i>	<i>Cadaba heterotricha</i>
<i>Canarium schweinfurtii</i>	<i>Canarium schweinfurthii</i>
<i>Carissa spinarum</i>	<i>Carissa edulis</i>
<i>Cassine buchananii</i>	<i>Elaeodendron buchananii</i>
<i>Cassipourea ruwensorensis</i>	<i>Cassipourea ruwensoriensis</i>
<i>Citrus aurantiifolia</i>	<i>Citrus aurantifolia</i>
<i>Combretum hartmannianum</i>	<i>Combretum hartmannianum</i>
<i>Combretum molle</i>	<i>Combretum rochetanum</i>
<i>Coptosperma graveolens</i>	<i>Tarenna graveolens</i>
<i>Corymbia citriodora</i>	<i>Eucalyptus citriodora</i>
<i>Corymbia maculata</i>	<i>Eucalyptus maculata</i>
<i>Crossopteryx febrifuga</i>	<i>Croaaophy pebrripuga</i>
<i>Cupressus sempervirens</i>	<i>Cupressus pyramidalis</i>
<i>Cynanchum hastifolium</i>	<i>Cynanchum clavidens</i>
<i>Cynanchum viminale</i>	<i>Sarcostemma viminale</i>
<i>Cytisus proliferus</i>	<i>Chamaecytisus palmensis</i>
<i>Cytisus proliferus</i>	<i>Chamaecytisus proliferus</i>
<i>Dirichletia glaucescens</i>	<i>Carphelea glaucescens</i>
<i>Discopodium penninervium</i>	<i>Discopodium eremanthum</i>
<i>Dodonaea viscosa</i>	<i>Dodonaea angustifolia</i>
<i>Dombeya longibracteolata</i>	<i>Dombeya longibracteolata</i>
<i>Dombeya torrida</i>	<i>Dombeya schimperiana</i>
<i>Dombeya torrida</i>	<i>Dombya torrida</i>
<i>Ehretia cymosa</i>	<i>Ehretia abyssinica</i>
<i>Euphorbia burgeri</i>	<i>Euphorbia burger</i>
<i>Euphorbia nigrispinoides</i>	<i>Euphorbia nigrispinoides</i>
<i>Euphorbia shebeliensis</i>	<i>Monadenium shebeliensis</i>
<i>Faidherbia albida</i>	<i>Acacia albida</i>
<i>Ficus cordata</i>	<i>Ficus salicifolia</i>
<i>Ficus laurifolia</i>	<i>Ficus ovata</i>
<i>Ficus thonningii</i>	<i>Ficus ruspolii</i>
<i>Fleroya rubrostipulata</i>	<i>Hallea rubrospiculata</i>
<i>Fleroya rubrostipulata</i>	<i>Hallea rubrostipulata</i>
<i>Galiniera saxifraga</i>	<i>Galiniera saxifrage</i>
<i>Gardenia ternifolia</i>	<i>Gardenia turnifolia</i>
<i>Grewia damine</i>	<i>Grewia bicolor</i>
<i>Gymnanthemum myrianthum</i>	<i>Vernonia myriantha</i>
<i>Gymnosporia heterophylla</i>	<i>Maytenus heterophylla</i>
<i>Gymnosporia senegalensis</i>	<i>Maytenus senegalensis</i>

<b>Species</b>	<b>Synonym or alternative spelling</b>
<i>Helichrysum elephantinum</i>	<i>Helichrysum elephantium</i>
<i>Hypericum roeperianum</i>	<i>Hypericum roeperanum</i>
<i>Kirkia burgeri</i>	<i>Kirkia burger</i>
<i>Lannea schweinfurthii</i>	<i>Lanna schaleintunthii</i>
<i>Lantana viburnoides</i>	<i>Lantana kisi</i>
<i>Lecaniodiscus fraxinifolia</i>	<i>Lecaniodiscus fraxinifolius</i>
<i>Lepisanthes senegalensis</i>	<i>Aphania senegalensis</i>
<i>Leptadenia lancifolia</i>	<i>Leptadenia hastata</i>
<i>Leucaena diversifolia</i>	<i>Leucaena diversifolica</i>
<i>Lonchocarpus laxiflorus</i>	<i>Philenoptera laxiflora</i>
<i>Ludwigia adscendens</i>	<i>Ludwigia stolonifera</i>
<i>Luffa cylindrica</i>	<i>Luffa cylindrica</i>
<i>Maerua denhardtiorum</i>	<i>Maerua deinhardtiorum</i>
<i>Manilkara butugi</i>	<i>Manilkara butugii</i>
<i>Maytenus arbutifolia</i>	<i>Gymnosporia arbutifolia</i>
<i>Melia azedarach</i>	<i>Melia azadarach</i>
<i>Micromeria unguentaria</i>	<i>Satureja unguentaria</i>
<i>Millettia ferruginea</i>	<i>Millettia feruginea</i>
<i>Moringa rivae</i>	<i>Moringa rivae subsp. longisiliqua</i>
<i>Mucuna pruriens</i>	<i>Mucuna pruriens</i>
<i>Ocimum formosum</i>	<i>Becium formosum</i>
<i>Ocimum spectabile</i>	<i>Erythrochlamys spectabilis</i>
<i>Olea capensis</i> subsp. <i>welwitschii</i>	<i>Olea welwitschii</i>
<i>Olea europaea</i>	<i>Olea europaea</i> subsp. <i>cuspidata</i>
<i>Olea europaea</i>	<i>Olea europaea</i> var. <i>africana</i>
<i>Orbivestus cinerascens</i>	<i>Vernonia cinerascens</i>
<i>Otostegia tomentosa</i>	<i>Otostegia tomentosa</i> subsp. <i>steudneri</i>
<i>Paraserianthes lophantha</i>	<i>Paraserianthes lophanta</i>
<i>Phoenix dactylifera</i>	<i>Phoenix dactiflora</i>
<i>Phyllanthus dewildeorum</i>	<i>Phyllanthus dewildiorum</i>
<i>Phyllanthus emblica</i>	<i>Emblica officinalis</i>
<i>Phytolacca dodeandra</i>	<i>Phytolaca dodeandra</i>
<i>Polyscias farinosa</i>	<i>Polyscias farinose</i>
<i>Pouteria alnifolia</i>	<i>Malacantha alnifolia</i>
<i>Premna schimperi</i>	<i>Premna shimperi</i>
<i>Pterocarpus lucens</i>	<i>Terocarpus lucease</i>
<i>Pterolobium stellatum</i>	<i>Pterolobium stellatum</i>
<i>Rothea myricoides</i>	<i>Clerodendron myricoides</i>
<i>Rothea myricoides</i>	<i>Clerodendrum myricoides</i>
<i>Rydingia integrifolia</i>	<i>Otostegia integrifolia</i>
<i>Sarcocephalus latifolius</i>	<i>Sarcocephatur latitolive</i>
<i>Sclerocarya birrea</i>	<i>Sclerocarya birrea</i> subsp. <i>caffra</i>
<i>Searsia glutinosa</i>	<i>Rhus glutinosa</i>
<i>Searsia longipes</i>	<i>Rhus longipes</i>
<i>Searsia natalensis</i>	<i>Rhus natalensis</i>
<i>Searsia pyroides</i>	<i>Rhus pyroides</i>
<i>Searsia retinorrhoea</i>	<i>Rhus retinorrhoea</i>
<i>Searsia ruspolii</i>	<i>Rhus ruspolii</i>
<i>Searsia ruspolii</i>	<i>Rhus susplii</i>
<i>Searsia tenuinervis</i>	<i>Rhus tenuinervis</i>
<i>Sesbania bispinosa</i>	<i>Sesbania aculeata</i>
<i>Shirakiopsis elliptica</i>	<i>Sapium ellipticum</i>
<i>Spathodea campanulata</i>	<i>Spathodea nilotica</i>
<i>Tamarix senegalensis</i>	<i>Tamarix nilotica</i>
<i>Tragia abortiva</i>	<i>Tragia abortive</i>
<i>Vepris boreensis</i>	<i>Teclea boreensis</i>
<i>Vepris nobilis</i>	<i>Teclea nobilis</i>
<i>Vernonia cylindrica</i>	<i>Vernonia cylindrical</i>
<i>Wendlandia arabica</i>	<i>Wendlandia arabica</i> subsp. <i>aethipica</i>

<b>Species</b>	<b>Synonym or alternative spelling</b>
<i>Yushania alpina</i>	<i>Arundinaria alpina</i>
<i>Yushania alpina</i>	<i>Sinarundinaria alpina</i>
<i>Ziziphus jujuba</i>	<i>Ziziphus mauritiana</i>

## 14. Appendix IV. Species descriptions from the SoW-FGR for 96 candidate species for plant breeding

Species	Priority	Uses	Services	Seedlings	Ex situ
1 <i>Acacia abyssinica</i>		energy, non wood forest products, agroforestry	soil and water conservation, aesthetic values	3,186,834	13
2 <i>Acacia decurrens</i>		energy, agroforestry	soil and water conservation	15,736,872	
3 <i>Acacia melanoxylon</i>				6,724,278	
4 <i>Acacia nilotica</i>		energy, non wood forest products		99,707	
5 <i>Acacia polyacantha</i>				146,710	8
6 <i>Acacia saligna</i>		energy, non wood forest products, agroforestry	soil and water conservation, shade	21,986,737	
7 <i>Acacia senegal</i>	economic, gum and resin	energy, non wood forest products	soil and water conservation , biodiversity conservation	1,266,270	4
8 <i>Acacia seyal</i>			soil and water conservation, shade	1,442,806	10
9 <i>Acacia tortilis</i>		energy, non wood forest products, agroforestry	soil and water conservation, shade	437,011	6
10 <i>Adansonia digitata</i>	economic, high value fruit in lowlands	non wood forest products			
11 <i>Afrocarpus falcatus</i>	economic, timber, threatened	solid wood products	biodiversity conservation, cultural values, aesthetic values, shade	174,257	3
12 <i>Albizia grandibracteata</i>				73,043	1
13 <i>Albizia gummifera</i>		solid wood products, energy, non wood forest products, agroforestry		159,330	6
14 <i>Albizia lebbeck</i>				303,659	
15 <i>Albizia schimperiana</i>		solid wood products, energy, non wood forest products, agroforestry		384,714	
16 <i>Azadirachta indica</i>		solid wood products, energy, non wood forest products, agroforestry		28,512	
17 <i>Balanites aegyptiaca</i>					
18 <i>Bauhinia thonningii</i>			soil and water conservation		6

Species	Priority	Uses	Services	Seedlings	Ex situ
19 <i>Boswellia microphylla</i>		non wood forest products			
20 <i>Boswellia neglecta</i>		non wood forest products			
21 <i>Boswellia ogadensis</i>		non wood forest products			
22 <i>Boswellia papyrifera</i>	economic, gum and resin	non wood forest products			
23 <i>Boswellia pirottiae</i>					
24 <i>Boswellia rivae</i>		non wood forest products			
25 <i>Cajanus cajan</i>			soil and water conservation		
26 <i>Calliandra calothyrsus</i>				112	
27 <i>Callistemon citrinus</i>				3,516,191	
28 <i>Carica papaya</i>		non wood forest products, agroforestry			
29 <i>Casuarina cunninghamiana</i>				372,947	
30 <i>Casuarina equisetifolia</i>				120,976,035	
31 <i>Catha edulis</i>	economic and social, , stimulant, medicinal, agroforestry, export commodity	stimulant			
32 <i>Celtis africana</i>			shade		1
33 <i>Citrus sinensis</i>		non wood forest products, agroforestry			
34 <i>Coffea arabica</i>	economic and social, , stimulant, medicinal	stimulant	soil and water conservation, cultural values		
35 <i>Combretum molle</i>					
36 <i>Commiphora africana</i>		non wood forest products			
37 <i>Commiphora guidottii</i>		solid wood products, non wood forest products			
38 <i>Commiphora myrrha</i>	economic, gum and resin	non wood forest products			
39 <i>Cordeauxia edulis</i>	economic, high value fruit in lowlands	non wood forest products	soil and water conservation		
40 <i>Cordia africana</i>	economic, timber, agroforestry, threatened	solid wood products, non wood forest products, agroforestry	soil and water conservation, soil fertility, biodiversity conservation, cultural values, aesthetic values, shade	2,760,830	27
41 <i>Corymbia citriodora</i>				20,790,393	

	<b>Species</b>	<b>Priority</b>	<b>Uses</b>	<b>Services</b>	<b>Seedlings</b>	<b>Ex situ</b>
42	<i>Croton macrostachyus</i>		solid wood products, non wood forest products, agroforestry	soil and water conservation	3,320	2
43	<i>Cupressus lusitanica</i>	economic, timber	solid wood products		43,988,449	
44	<i>Cupressus sempervirens</i>				68,548	
45	<i>Cytisus proliferus</i>				2,178,995	
46	<i>Delonix regia</i>				91,066	
47	<i>Dodonaea viscosa</i>				27,980	3
48	<i>Dovyalis abyssinica</i>				306,828	
49	<i>Dovyalis caffra</i>				3,143,528	
50	<i>Ekebergia capensis</i>			soil and water conservation, shade	22,014	
51	<i>Entada abyssinica</i>				90,984	6
52	<i>Erythrina abyssinica</i>			soil and water conservation		1
53	<i>Erythrina brucei</i>		non wood forest products, agroforestry	soil and water conservation	940	
54	<i>Eucalyptus camaldulensis</i>	economic, construction, fuelwood	solid wood products, energy		450,270,952	
55	<i>Eucalyptus globulus</i>	economic, construction, fuelwood	solid wood products, energy,		50,607,540	1
56	<i>Eucalyptus grandis</i>				15,148,622	
57	<i>Eucalyptus saligna</i>				43,572,735	
58	<i>Eucalyptus viminalis</i>				8,161,041	
59	<i>Faidherbia albida</i>	agroforestry	energy, non wood forest products, agroforestry	soil and water conservation, soil fertility, biodiversity conservation	2,148,579	3
60	<i>Ficus carica</i>			biodiversity conservation		
61	<i>Ficus sur</i>			biodiversity conservation		2
62	<i>Ficus sycomorus</i>			soil and water conservation		1
63	<i>Grevillea robusta</i>	economic, multipurpose	solid wood products, energy, agroforestry	soil and water conservation	329,598	
64	<i>Hagenia abyssinica</i>	economic, timber, medicinal, agroforestry, threatened	solid wood products, non wood forest products, agroforestry	soil and water conservation, aesthetic values	9,004,788	4
65	<i>Jacaranda mimosifolia</i>				3,472,549	
66	<i>Jatropha curcas</i>				169	
67	<i>Juniperus procera</i>	economic, timber, threatened	solid wood products	biodiversity conservation, aesthetic values	1,789,985	4
68	<i>Leucaena leucocephala</i>		non wood forest products, agroforestry	soil and water conservation	8,909,564	
69	<i>Maerua aethiopica</i>				9,767	

	<b>Species</b>	<b>Priority</b>	<b>Uses</b>	<b>Services</b>	<b>Seedlings</b>	<b>Ex situ</b>
70	<i>Malus domestica</i>		non wood forest products, agroforestry			
71	<i>Mangifera indica</i>		NA			
72	<i>Melia azedarach</i>				713,305	
73	<i>Millettia ferruginea</i>		NA		427,072	6
74	<i>Moringa stenopetala</i>	economic, multipurpose	non wood forest products, agroforestry	soil and water conservation	227,361	9
75	<i>Olea europaea</i>		solid wood products, energy, non wood forest products		355,434	3
76	<i>Oxytenanthera abyssinica</i>	economic, multipurpose	solid wood products, energy, non wood forest products			5
77	<i>Parkinsonia aculeata</i>				258,773	
78	<i>Persea americana</i>		non wood forest products, agroforestry			
79	<i>Phoenix reclinata</i>				22,459	2
80	<i>Pinus patula</i>		solid wood products		286,184	
81	<i>Pouteria adolfi-friedericii</i>	economic, timber	solid wood products	soil and water conservation		
82	<i>Prunus africana</i>	economic, timber, medicinal, threatened	solid wood products, energy, non wood forest products	soil and water conservation, shade	69,533	2
83	<i>Pterolobium stellatum</i>				1,695	2
84	<i>Rhamnus prinoides</i>	economic, beverage	non wood forest products			1
85	<i>Schefflera abyssinica</i>		non wood forest products, agroforestry			
86	<i>Schinus molle</i>				5,054,218	
87	<i>Sesbania bispinosa</i>		non wood forest products, agroforestry		22,731,571	
88	<i>Sesbania sesban</i>			soil and water conservation, shade		1
89	<i>Spathodea campanulata</i>				4,621,920	
90	<i>Tamarindus indica</i>	economic, high value fruit in lowlands	non wood forest products, agroforestry	soil and water conservation, soil fertility, biodiversity conservation, shade	53,523	6
91	<i>Terminalia brownii</i>			shade		
92	<i>Vitellaria paradoxa</i>	economic, high value fruit in lowlands	non wood forest products	soil and water conservation, shade		
93	<i>Warburgia ugandensis</i>			shade		
94	<i>Yushania alpina</i>	economic, multipurpose	solid wood products, energy, non wood forest products			

<b>Species</b>	<b>Priority</b>	<b>Uses</b>	<b>Services</b>	<b>Seedlings</b>	<b>Ex situ</b>
95 <i>Ziziphus jujuba</i>	economic, high value fruit in lowlands	non wood forest products	soil and water conservation		
96 <i>Ziziphus spina-christi</i>					3

## 15. Appendix V. Number of locations records from the RAINBIO database

Top 25: species identified as priority tree species by the Ethiopian report for the SoW-FGR. Top 20: top 20 species identified by the BPC. Top 96: species identified as candidate species for breeding; Records: number of location data points in the RAINBIO mega-database (Dauby *et al.* 2016).

	Species	Top 25	Top 20	Top 96	Records
1	<i>Acacia abyssinica</i>		x	x	72
2	<i>Acacia asak</i>				6
3	<i>Acacia brevisspica</i>				153
4	<i>Acacia bussei</i>				62
5	<i>Acacia lahai</i>				63
6	<i>Acacia nilotica</i>		x	x	374
7	<i>Acacia oerfota</i>				53
8	<i>Acacia polyacantha</i>			x	275
9	<i>Acacia senegal</i>	x	x	x	197
10	<i>Acacia seyal</i>			x	139
11	<i>Acacia sieberiana</i>				235
12	<i>Acacia tortilis</i>		x	x	115
13	<i>Acokanthera schimperi</i>				35
14	<i>Adansonia digitata</i>	x		x	91
15	<i>Afrocarpus falcatus</i>	x	x	x	12
