ABSTRACT

Wen, Jun. Systematics and Biogeography of *Aralia* L. (Araliaceae): Revision of *Aralia* Sects. *Aralia*, *Humiles*, *Nanae*, and *Sciadodendron*. *Contributions from the United States National Herbarium*, volume 57, 172 pages. This treatment provides a revision of four sections of *Aralia* L. (Araliaceae). It is the third and last of the *Aralia* monographic series by the author. The first was on *Aralia* sect. *Pentapanax* (Seem.) Wen (19 species, Wen 2002); and the second was on *Aralia* sect. *Dimorphanthus* (Miq.) Miq. (29 spp., Wen 2004). This revision treats *Aralia* sects. *Aralia* (14 spp.), *Humiles* (3 spp.), *Nanae* (1 sp.), and *Sciadodendron* (5 spp.). A taxonomic key to all sections of *Aralia* is provided. Species keys are provided for each of the three sections with multiple species. As typified by *Aralia fargesii* Franch., *Aralia* sect. *Anomalae* Harms is now placed in synonymy of *Aralia* sect. *Aralia*. *Aralia* sect. *Nanae* is the only monotypic section of the genus, consisting of *Aralia nudicaulis* L. Marchal's genus *Coudenbergia* is merged with *Aralia* sect. *Sciadodendron* in this study. Detailed descriptions on the morphology and ecology, illustrations, and distribution maps are provided for each taxon of the four sections (23 species). The phylogeny of *Aralia* based on sequences of the internal transcribed spacer (ITS) regions of nuclear ribosomal DNA and three chloroplast markers, including the *ndhF* gene, the *trnL-F* region, and the *atpB-rbcL* spacer, is presented. An early biogeographic radiation of *Aralia* is hypothesized. Taxa of *Aralia* sect. *Humiles* do not form a clade with those of the Asian *Aralia* sect. *Pentapanax*. These two sections were once treated as constituting the genus "Pentapanax," and they are shown here to be non-monophyletic and best treated as belonging to two different sections. *Aralia bahiana* J. Wen is herein described as a new species from Bahia, Brazil. *Aralia* sect. *Sciadodendron* is a new nomenclatural combination with the genus *Sciadodendron* as its basionym. The newly lectotypified names include (accepted names in boldface): *Aralia cachemirica* Decne., *A. californica* S. Watson, *A. californica* var. *acuminata* S. Watson ex Howell, *A. chilapensis* Sessé & Moc., *A. continentalis* Kitagawa, *A. cordata* Thunb., *A. edulis* Sieb. & Zucc., *A. fluminensis* Glaz., *A. henryi* Harms, *A. humilis* Cav., *A. pilosa* Franch., *A. pubescens* DC., *A. racemosa* L. var. *sachalinensis* Regel, *Megalopanax rex* Ekman ex Harms, *Pentapanax ulei* Harms, and *Sciadodendron excelsum* Griseb.

Key words: *Aralia*, *Aralia* sect. *Aralia*, *Aralia* sect. *Dimorphanthus*, *Aralia* sect. *Humiles*, *Aralia* sect. *Nanae*, *Aralia* sect. *Pentapanax*, *Aralia* sect. *Sciadodendron*, Araliaceae, biogeography, systematics.

Systematics and Biogeography of *Aralia* L. (Araliaceae): Revision of *Aralia* Sects. *Aralia*, *Humiles*, *Nanae*, and *Sciadodendron*

by

J. Wen¹

INTRODUCTION

Aralia L. is one of the approximately 50 genera of the predominantly tropical Araliaceae (or the ginseng plant family). The genus consists of 71 species and is the fifth largest in the Araliaceae (following *Schefflera* J. R. Forst. & G. Forst., *Polyscias* J. R. Forst. & G. Forst., *Oreopanax* Decne. & Planch., and *Dendropanax* Decne. & Planch.). *Aralia* plays an important role in understanding the diversification of Araliaceae because it represents most north temperate species of the family. Harms (1898) considered *Aralia* as one of the centers of diversity within Araliaceae and suggested that it played a critical role in leading to other lineages in Araliaceae and Apiaceae. Recent phylogenetic analyses of the core Araliaceae suggest that *Aralia* is closely related to *Panax* L. The *Aralia* – *Panax* clade constitutes one of the three major clades in the core Araliaceae (Wen et al. 2001; Plunkett et al. 2004). Within Araliaceae, *Aralia* and *Panax* are perhaps most closely related to *Polyscias*, *Pseudopanax* K. Koch, and their close relatives (Wen et al. 2001; Plunkett et al. 2004).

The phylogenetic position of *Aralia* in the Araliaceae and its relationship to *Panax* were variously hypothesized prior to modern phylogenetic analyses. Seemann (1868) treated *Aralia* and *Panax* in different tribes. Harms (1898) suggested a close relationship between *Aralia* and *Panax*. Emphasizing a single-character taxonomy, Hutchinson (1967) placed *Aralia* and *Panax* once again in different tribes. But this treatment has been criticized as “unnatural” (Hoo and Tseng

1978, p.178). On the other hand, some workers (e.g., Decaisne and Planchon 1854; Clarke 1879; Burkhill 1902) treated *Panax* as a synonym of *Aralia*. Based on the 5-merous flowers and articulated pedicels, Harms (1898) and Eyde and Tseng (1971) suggested that *Stilbocarpa* (Hook. f.) Decne. & Planch. from New Zealand and adjacent islands may be closely related to *Aralia* and *Panax*. Vegetatively *Stilbocarpa* shares many similarities with some early-diverging lineages of Apiaceae. Mitchell et al. (1999) have shown that *Stilbocarpa* is nested in a clade of Apiaceae with *Azorella* and *Schizeilema* from the Southern Hemisphere, very distinct from any araliaceous genera.

As slightly modified from Wen (1993), *Aralia* is here defined by the following characters: 1-4-pinnately compound leaves, articulated pedicels, 5-12-merous flowers, imbricate aestivation, smooth seed surface, and smooth endosperm. Recent phylogenetic analyses have tested the *Aralia* generic concept, and major lineages or clades within *Aralia* have been delimited (Wen 2001a, also see Wen 2002, 2004). Species of *Aralia* are now classified into six sections (see Wen 2002, 2004) primarily based on characters including habit, presence/absence of prickles, leaf architecture, trichome types, and presence/absence of bracts at the base of the inflorescence. These sections are: *Aralia* sect. *Aralia* (14 spp.), sect. *Dimorphanthus* (29 spp.), sect. *Humiles* Harms (3 spp.), sect. *Nanae* Harms (1 sp.), sect. *Pentapanax* (Seem.) J. Wen (19 spp.), and sect. *Sciadodendron*

¹ Department of Botany, National Museum of Natural History, MRC-166, Smithsonian Institution, P.O. Box 37012, Washington, D.C. 20013-7012, U.S.A., wenj@si.edu

(Griseb.) J. Wen (5 spp.). Because of the large number of species involved, revisions of these sections have been published in three treatments. The present monograph of *Aralia* is the third and the last of the series (see Wen 2002 for the revision of *Aralia* sect. *Pentapanax*; and Wen 2004 for the treatment of *Aralia* sect. *Dimorphanthus*).

Aralia is widely distributed in different areas of Asia and the New World. Asia has relatively high species diversity for *Aralia* (57 of the 71 species), whereas only 14 species occur in the New World. The 57 Asian species belong to three sections (sect. *Aralia*, sect. *Dimorphanthus*, and sect. *Pentapanax*) with only sect. *Pentapanax* endemic to Asia; the other two sections are disjunct between Asia and North America. Despite the relatively low species diversity, the New World species of *Aralia* belong to five sections with three endemic to the New World (sect. *Humiles*, sect. *Nanae*, and sect. *Sciadodendron*) and two sections disjunct with Asia (sect. *Aralia* and sect. *Dimorphanthus*). The high species richness of *Aralia* in Asia is largely due to the greater number of species in two sections: sects. *Aralia* (11 out of 14 in Asia) and *Dimorphanthus* (27 out of 29 in Asia).

Aralia has a long taxonomic history (Wen and Reveal 1992). It was first reported from the New World by Cornut in 1635. Several species were introduced into cultivation in Europe in the 1600's and 1700's. Tournefort (1700) coined the name for the genus from the old French-Canadian name "aralie" (Fernald 1950). Several species of *Aralia* have been cultivated in various countries in Europe and Asia. Commonly cultivated *Aralia* species include: *A. cordata* Thunb., *A. elata* (Miq.) Seem., *A. cachersimica* Decne., *A. stipulata* Franch., and sometimes *A. spinosa* L., *A. racemosa* L., and *A. californica* S. Watson (also see Harms 1897; Rehder 1900; Wen 2002, 2004).

Systematic studies of *Aralia* provide a much-needed framework for further biogeographic studies, especially on the origin and development of the eastern Asian and eastern North American disjunct distribution, and the diversification of taxa within each of the two continents. Two sections of *Aralia* (sects. *Aralia* and *Dimorphanthus*) and their close relative *Panax* (Wen et al. 2001) are disjunctly distributed in eastern Asia and eastern

North America (Wen 1991; Wen and Zimmer 1996; Wen et al. 1998; Wen 1999, 2000a, 2001a). The disjunct distributions of congeneric plants between eastern Asia and eastern North America have fascinated botanists since the Linnaean period (e.g., Halenius 1750; Gray 1840, 1846, 1859, 1878; Hu 1935, 1936; Hara 1952, 1956, 1972; Li 1952, 1972; Graham 1972; Boufford and Spongberg 1983; Wu 1983; Tiffney 1985a, 1985b; Parks and Wendel 1990; Wen 1998, 1999, 2001b). Many studies have documented the disjunct distributional patterns in various taxa. Phylogenetic analyses have now been conducted for many plant genera or sections (see review in Wen 1999, 2001b; Manos and Donoghue 2001). Both molecular and fossil data suggest multiple origins of the disjunct pattern in the Tertiary (Tiffney 1985a, 1985b; Wen et al. 1996; Wen 1999; Xiang et al. 2000). Few studies, however, provide taxonomic treatments or monographs of genera that show this disjunct pattern.

With the completion of the revision of *Aralia* sect. *Pentapanax* (Wen 2002) and sect. *Dimorphanthus* (Wen 2004), the largest and most challenging yet-to-be monographed section is *Aralia* sect. *Aralia*. It consists of 14 species with three species in North America and eleven species in Asia, primarily in the Sino-Himalayan floristic region extending from eastern Russia southward to Taiwan, and from Japan westward to Kashmir, India and western Pakistan. Mainland China has relatively high species diversity, harboring six of the eleven Asian species (with *A. cachersimica*, *A. taiwaniana*, *A. cordata*, *A. glabra* and *A. schmidtii* excepted). *Aralia cordata* occurs throughout Japan, and *A. taiwaniana* is restricted to the mountains of central Taiwan. Species of the section form a monophyletic group with synapomorphies including ternately compound leaves.

This treatment includes a comprehensive revision of four sections of *Aralia* (sects. *Aralia*, *Humiles*, *Nanae* and *Sciadodendron*), with detailed documentation of the morphology, ecology, distribution, and uses of the 23 species belonging to these sections, presentation of a multigene phylogeny of *Aralia*, a synopsis of the classification of the genus, and discussions of the group's biogeographic diversification.

TAXONOMIC HISTORY

Generic concept and historical infrageneric classifications

Aralia (Araliaceae) consists of 71 species distributed in eastern and southeastern Asia and the Americas. *Aralia* is defined as those species of Araliaceae with pinnately to quadri-pinnately compound leaves, articulated petioles, 5-12-merous flowers, imbricate petals, and articulated pedicels (as modified from Wen 1991, 1993). Previous workers provided various infrageneric classifications of *Aralia* (e.g., Persoon 1805; Sprengel 1825; Blume 1826; de Candolle 1830; Decaisne and Planchon 1854; Miquel 1863; Harms 1896; Nakai 1927; Hoo and Tseng 1965). However, their systems are of limited value because of the problematic generic limits of *Aralia*, and the utilization of only one or two characters for infrageneric classification (see Wen 1993 for more detailed discussions). This current definition of *Aralia* recognizes the following synapomorphies: pinnately compound leaf architecture, presence of stipules, 5-12-locular ovaries, smooth seed surface, and flattened seeds. Its closest relative, the genus *Panax* possesses palmately compound leaves, absence of stipules, 2-4-locular ovary, rough seed surfaces, and non-flattened seeds.

Most early workers (e.g., Persoon 1805; Sprengel 1825; Blume 1826; de Candolle 1830) followed the broad Linnaean concept of *Aralia*, which stressed reproductive characters in defining the genus. It is now realized that floral characters are relatively conserved in Araliaceae (Philipson 1979; Wen et al. 2001) and the sole use of these characters is not effective in delimiting genera in the family. The Linnaean concept of *Aralia* had thus been abandoned by later workers (e.g., Miquel 1863; Seemann 1868; Li 1942; Hoo and Tseng 1978; Philipson 1979; Shang 1985b; Wen 1993).

Most previous systems of *Aralia* emphasized only one or two characters (e.g., Persoon 1805; Sprengel 1825; Blume 1826; de Candolle 1830; Decaisne and Planchon 1854; Nakai 1927; Hoo and Tseng 1965). Because different workers stressed different characters, their systems are very different. These systems resulting from the overemphasis on one or two characters are

apparently artificial and of limited predictive value.

Harms (1896) constructed his classification of *Aralia* based on several characters, but with an emphasis on inflorescence structure. The sections in Harms' system appear more natural than those in previous systems. Harms followed Miquel's (1863) generic concept of *Aralia*. Furthermore, Harms' sect. *Capituligerae* was established based only on its capitate inflorescences. This character appears to have evolved at least twice in *Aralia*: once in the *A. dasypylla* and *A. urticifolia* complex, and a second time in *A. dasypylloides*. *Aralia* sect. *Capituligerae* is thus not monophyletic, and Harms' system of the genus stands in need of revision.

Li and Xiang (1992) proposed a new classification of *Aralia*, in which two subgenera and eight sections were recognized. These workers circumscribed all herbaceous taxa in *Aralia* as constituting their new subgenus *Paralia* Shang & X. P. Li, and placed all woody, prickly members in subgenus *Aralia*. However, the treatment of the herbaceous members in a new subgenus is illegitimate because the type species of *Aralia*, *A. racemosa*, belongs to this group (cf. Wen et al. 1998). Subgenus "Aralia" sensu Li and Xiang (1992) is equivalent to Miquel's sect. *Dimorphanthus*. Li and Xiang (1992) proposed four new sections for *Aralia*: sects. *Undulatae* C. B. Shang & X. P. Li, *Glaucae* C. B. Shang & X. P. Li, *Echinatae* C. B. Shang & X. P. Li, and *Tomentosae* C. B. Shang & X. P. Li. These new sections were largely based on presence or absence of leaflet pubescence, leaflet margin, presence or absence of prickles on petioles and inflorescence, and presence or absence of tomentose or strigose pubescence. Our phylogenetic analysis suggests that none of the sections recognized by Li and Xiang is monophyletic (Wen 2004).

Wang and Hu (2001) proposed another classification of *Aralia*, in which two subgenera and six sections were recognized. Four of the sections are herein treated as synonyms of sect. *Dimorphanthus*. Two new sections described in Wang and Hu (2001) are illegitimate because they were based on type species of previously described sections. The type of sect. *Laxipaniculae* Z. Z. Wang was designated to be *A. spinifolia*, which is

also the type of sect. *Echinatae* C. B. Shang & X. P. Li (Li and Xiang 1992). *Aralia undulata* is the type for sect. *Undulatae* C. B. Shang & X. P. Li as well as for sect. *Glabrae* Z. Z. Wang.

Harms' (1896) classification of *Aralia* has been most influential. Hoo and Tseng (1965, 1978) basically followed Harms (1896), but split Harms' sect. *Arborescetes* into two sections based on slight differences in inflorescence structure.

Species of Harms' sects. *Anomalae* and *Genuinae* are similar: herbaceous, unarmed, branched, leaves tripinnate (on lower portion of stem) to pinnate (on upper portion of stem), flowers small, and inflorescence terminal and axillary. Harms established these two sections based on slight differences in inflorescence pattern, i.e., sect. *Anomalae* with umbellate overall inflorescence structure and sect. *Genuinae* with paniculate overall structure. It is now realized that intermediates exist between Harms' two "sections". *Aralia cordata* (sect. *Genuinae*) sometimes has an umbellate structure, and *A. fargesii* (sect. *Anomalae*) sometimes demonstrates a paniculate pattern of inflorescence. Our phylogenetic analysis suggests that species of *Anomalae* and *Genuinae* constitute a monophyletic group. Harms' sects. *Anomalae* and *Genuinae* are, therefore, combined here into one section, *Aralia*.

Marchal (1879a) regarded his *Coudenbergia* (monotypic then) as a close relative of *Aralia*, but differing from the latter by the former's 8-merous flowers (vs. 5-merous), the recurved oblong to linear anthers (vs. straight anthers), and concave floral disc with adnated edges (vs. conical to flat floral disc with free edges). These differences indeed hold true if *Coudenbergia warmingiana* is the sole member of the genus. However, there is little doubt that *Coudenbergia angelicifolium* and *C. ulei* (now as the synonym of *Aralia warmingiana*, which is the accepted name for *Coudenbergia warmingiana*) are very closely related and they should be treated as congeners. With the expanded concept of the *Coudenbergia* group, *Coudenbergia* and *Aralia* become hardly distinguishable. In terms of the number of floral parts, *Coudenbergia angelicifolium*, *C. ulei* and *C. warmingiana* are 5, 6, and 8-merous, respectively. Flowers of *Aralia* s. str. are 5-(6)-merous. Thus, based on floral parts, *Aralia* and *Coudenbergia* can not be well separated. The discovery of *Aralia weberbaueri* Harms made the limits between

Aralia and *Coudenbergia* even more indistinct. The floral structure of Harms' *Aralia weberbaueri* is very similar to that of the other *Aralia* species, with more or less distinct styles and 5merous floral parts. But it has a conical to flat floral disc and is vegetatively very similar to the South American *Coudenbergia* species. Even Harms himself (1917) was not certain about his placement of this species in *Aralia* or in *Pentapanax* (Harms merged *Coudenbergia* with *Pentapanax* in his worldwide monograph of Araliaceae in 1898). He, thus, described it as *Aralia?* *weberbaueri*. In his original description, he presented the hypothesis that *Aralia weberbaueri* was an intermediate between *Aralia* and *Pentapanax* sensu Harms (as he treated *Coudenbergia* under the synonymy with *Pentapanax*). Because the difference between *Coudenbergia* and *Aralia* is minor and the intermediate forms are distinguishable, I treated *Coudenbergia* under synonymy with the Linnaean *Aralia* (Wen 1993). This treatment is now supported by phylogenetic data (Wen 2001a, 2002, 2004, this study).

Sciadodendron, a monotypic genus consisting of *S. excelsum* from Central America, the Caribbean to northern South America, was described as closely related to *Aralia*, but differing in its more numerous floral parts, more enlarged anthers, straight (vs. recurved) filaments, and non-arcuated pedicels (Grisebach 1858; Gentry 1993; Wen 1993). Recent phylogenetic analysis using the ITS sequences of the nuclear ribosomal DNA (Wen 2001a) suggested that *Sciadodendron* is nested within *Aralia*. Wen (2002) formally merged it with *Aralia*.

Aralia from the New World

Linnaeus (1753) accounted for three *Aralia* species from eastern North America: *A. nudicaulis*, *A. racemosa* and *A. spinosa*. The early history of these species was discussed in detail by Wen and Reveal (1992). Subsequently it was shown that they belong to three different sections. *Aralia nudicaulis* and *A. racemosa* are treated in this monograph, and *A. spinosa* was treated in Wen (2004). *Aralia californica* and *A. bicrenata* were later reported from the western part of North America and both species are members of sect. *Aralia* commonly compared with the eastern North American *A. racemosa* (Smith 1944).

The Sessé and Mociño expedition in 1787-1803 to Mexico and nearby regions resulted in the publication of eight species of *Aralia*: *A. chilapensis* and *A. pinnata* published in Sessé and Mociño (1888), and *A. fruticosa*, *A. lobata*, *A. longifolia*, *A. ovata*, *A. tuxtlensis* and *A. sp.* in their *Flora Mexicana* (Sessé and Mociño 1894). Only their *A. chilapensis* and *A. pinnata* truly belong to the genus *Aralia* with both herein treated as the synonyms of *A. humilis*. The other six species belong to *Oreopanax* and *Dendropanax* (see McVaugh 2000).

Cavanilles (1797) described his *Aralia humilis* based on cultivated material from the Madrid Botanical Garden. In the original description, it was noted that it flowered every year in October and had fruits in 1792. McVaugh (2000) found no type material in the Sessé and Mociño Herbarium nor in the general Madrid herbarium. Most likely, the plant was grown from seeds collected in Mexico during the Sessé and Mociño Expedition. The other major expedition to Mexico at the time was the Malaspina Expedition, during which botanists Née and Haenke collected in western and central Mexico in 1791. Apparently Cavanilles' *Aralia humilis* was planted in the Madrid Botanical Garden earlier than 1791.

De Candolle's *Aralia pubescens* was described based on material growing in the Botanical Garden in Montpellier, France (De Candolle 1813). Later in his *Prodromus*, De Candolle (1830) also included *Aralia scabra* Presl ex DC. as a synonym of *A. pubescens*. Standley (1924) expressed uncertainty whether *A. pubescens* should be treated as a synonym of *A. humilis*. Smith (1944) defined *A. humilis* broadly and treated *A. chilapensis*, *A. pinnata*, *A. brevifolia*, *A. pubescens* and *A. scabra* as its synonyms.

Grisebach (1858) described *Sciadodendron* as a new monotypic genus from Panama, consisting of *S. excelsum*. It was regarded as a close relative of *Aralia*, but was differentiated from the latter by *Sciadodendron*'s 10-12-locular ovaries. Donnell Smith (1910) reported *Reynoldsia americana* from Peninsula Nicoya of Costa Rica. *Sciadodendron excelsum* and *Reynoldsia americana* were shown to be identical along with Rusby's (1920) *Pentapanax granatensis* (Harms 1928; Smith 1936). Wen (2002) merged *Sciadodendron* with *Aralia* and made the nomenclatural combination.

Marchal (1879a) described three species of

Aralia: *A. regeliana* and *A. brevifolia* from Mexico and *A. soratensis* from Bolivia. He also reported *Coemansia warmingiana* (= *Aralia warmingiana*) as a new species from Minas Gerais of Brazil.

Harms (1908) described *Pentapanax ulei* from Bahia, Brazil. This name was placed as a synonym of *Aralia warmingiana* by Wen (1993). Harms (1918) described *Aralia? weberbaueri* from Peru as a species very similar to *Aralia soratensis*. He also compared his new species with *Pentapanax angelicifolius* Griseb. from Argentina. He suggested that *A. soratensis* and *A. weberbaueri* were intermediates between *Aralia* and *Pentapanax*. Wen (1993) placed *A. weberbaueri* and *Pentapanax angelicifolius* as synonyms of *A. soratensis*, which has nomenclatural priority. Harms (1924) also reported Ekman's *Megalopanax rex* Ekman ex Harms, which was recently merged with *Aralia* (Wen 1993).

Standley (1924) recognized five species of *Aralia* from Mexico: *A. scopulorum*, *A. regeliana*, *A. humilis*, *A. pubescens*, and *A. racemosa*. His *A. racemosa* clearly represented *A. bicrenata*. He differentiated *A. pubescens* from *A. humilis* by the pubescence on the pedicels. He defined *A. humilis* as possessing glabrous pedicels.

Smith (1944) enumerated the North American species of Araliaceae and recognized the following eight species of *Aralia* from North America: *A. racemosa*, *A. californica*, *A. nudicaulis*, *A. spinosa*, *A. hispida*, *A. humilis*, *A. regeliana* and *A. scopulorum*. He also treated *Sciadodendron* and *Megalopanax* as distinct genera from *Aralia* because they have more numerous floral parts (7-12 vs 4-6). He distinguished *Sciadodendron* from *Megalopanax* by the former's nonarticulated pedicels and slightly divided styles (vs. articulated pedicels and firmly connate styles). *Aralia bicrenata* was placed as a synonym of *A. racemosa*.

Aralia from the Old World

Species of *Aralia* from the Old World belong to three sections: *Aralia*, *Dimorphanthus* and *Pentapanax*. The latter two sections have been recently monographed and the taxonomic history of the species has been reviewed by Wen (2002, 2004). For regional interests, the readers are referred to Miquel (1840, 1856a, 1856b, 1857, 1863), Ridley (1922), Blume (1826), Blanco (1877), van Steenis (1948), Backer and Bakhuizen

van den Brink (1965), and Philipson (1951, 1977, 1979) for southeast Asia; Li (1942), Ho (1952), Hoo and Tseng (1965, 1978), Ling (1977, 1987), Shang (1985a, 1985b), Li and Xiang (1992), Huang (1993), Wen (1994), and Wang and Hu (2001) for China; Nakai (1927) and Lee (1993) for Korea; Ohwi (1984) for Japan; Wallich (1831-32), Don (1834), Clarke (1879), Mizushima (1966), and Wen et al. (2002) for the Himalayan region; and Bui (1964) and Ha (1974) for Indochina. The first Asian *Aralia* species was described by Linnaeus (1753) based on collections made by P. Osbeck near Canton, China (Bretschneider 1898; Hansen and Moule 1973), which was *Aralia chinensis* of sect. *Dimorphanthus*. Below I provide only a brief history of the taxonomic work of *Aralia* sect. *Aralia* in the Old World.

Thunberg (1784) described *Aralia cordata* of Japan, the first Asian species of sect. *Aralia*. The same species was later described as *A. edulis* and *A. nutans* by Siebold and Zuccarini (1837) and Franchet and Savatier (1878), respectively. Although *Aralia cordata* was mostly regarded as an endemic species to Japan earlier in its history (Thunberg 1784; Persoon 1805; De Candolle 1830; Don 1834; Miquel 1863; Franchet and Savatier 1875), a few workers thought that it also occurred in continental eastern Asia (e.g., Harms 1896; Nakai 1909; Li 1942). Kitagawa (1935) published *Aralia continentalis* based on specimens from Manchuria of northeastern China as well as Korea.

He noted differences between *A. cordata* and *A. continentalis* in overall inflorescence architecture, pedicel length, thickness and pubescence, and the connation of styles. The separation of the two taxa was first proposed in Russian literature according to Pojarkova (1973) and was accepted by a few later workers (e.g., Pojarkova 1950, 1973; Kitagawa 1979; Lee 1993). Hoo and Tseng (1978) somehow recognized both *A. continentalis* and *A. cordata* from China.

Matsumura (1899) reported *Aralia glabra*, the second recognized species of sect. *Aralia* from Japan based on collections made near Nikko. Harms (1896) described *A. henryi* from Central China with the specimen A. Henry 6655 as the type. Franchet (1896) reported his *A. pilosa* from Central China, also citing A. Henry 6655 as one of the two syntypes. Franchet's name appeared one day later than Harms' (September 16 vs. 15, 1896) and the species is thus recognized as *A. henryi*. In the same paper, Franchet (1896) described two additional species of sect. *Aralia*: *A. atropurpurea* and *A. fargesii* from China.

Hoo and Tseng (1965) described *A. tibetana* from Tibet, China. The species was later recorded to occur also in India and Nepal (Wen et al. 2002). Liu and Lu (1976) described *A. taiwaniana* from Central Taiwan. Other Asian taxa of the section include *A. schmidtii* (Pojarkova 1950) and *A. cachemirica* from the Himalaya (Decaisne 1844).

PHYLOGENETIC RELATIONSHIPS

A phylogenetic analysis is herein presented to help identify and test main evolutionary lineages within *Aralia*. The sampling includes 48 species of Araliaceae, representing all previously recognized sections of *Aralia*, its close relative *Panax*, and representatives of the *Polyscias* clade. The *Polyscias* clade was hypothesized to be closely related to the *Aralia-Panax* clade. Five species of the Asian core Araliaceae clade (see Wen et al. 2001) were included as outgroups. A detailed phylogenetic analysis of the *Aralia-Panax* clade will be published in a separate paper (J. Wen, in prep.). Herein I outline only the main findings.

Phylogenetic analyses were based on four molecular markers: the internal transcribed spacer (ITS) regions of nuclear ribosomal DNA and three chloroplast markers including the *ndhF* gene, the *trnL-F* region, and the *atpB-rbcL* spacer. The analyses were performed with PAUP* (version 4.0, Swofford 2003) using heuristic searches with MULPARS and furthest addition sequence options. Clade support for monophyletic groups revealed in the maximally parsimonious tree(s) (MPTs) was examined with 500 bootstrap replicates (Felsenstein 1985) with the random addition and the heuristic search options using parsimony.

The parsimony analysis generated 816 MPTs with a total length of 1389 steps, a consistency index of 0.69 (0.54 excluding uninformative characters), and a retention index of 0.73. The strict consensus tree with bootstrap support and the 50% majority-rule consensus tree are presented in Figs. 1 and 2, respectively.

The phylogenetic analysis supports a close relationship between *Aralia* and *Panax* with 100% bootstrap support. Within *Aralia*, six major

lineages are recognizable, and these six groups corresponding to the currently recognized sections of the genus (Figs. 1 and 2). The monotypic sect. *Nanae* (*A. nudicaulis* of North America) is herein suggested to be most closely related to the New World endemic sect. *Humiles*. Xiang and Li (1990) merged *Aralia scopulorum* of New World sect. *Humiles* with the Asian sect. *Pentapanax*, and this analysis does not support the monophyly of the sect. *Pentapanax* – sect. *Humiles* group (Figs. 1–

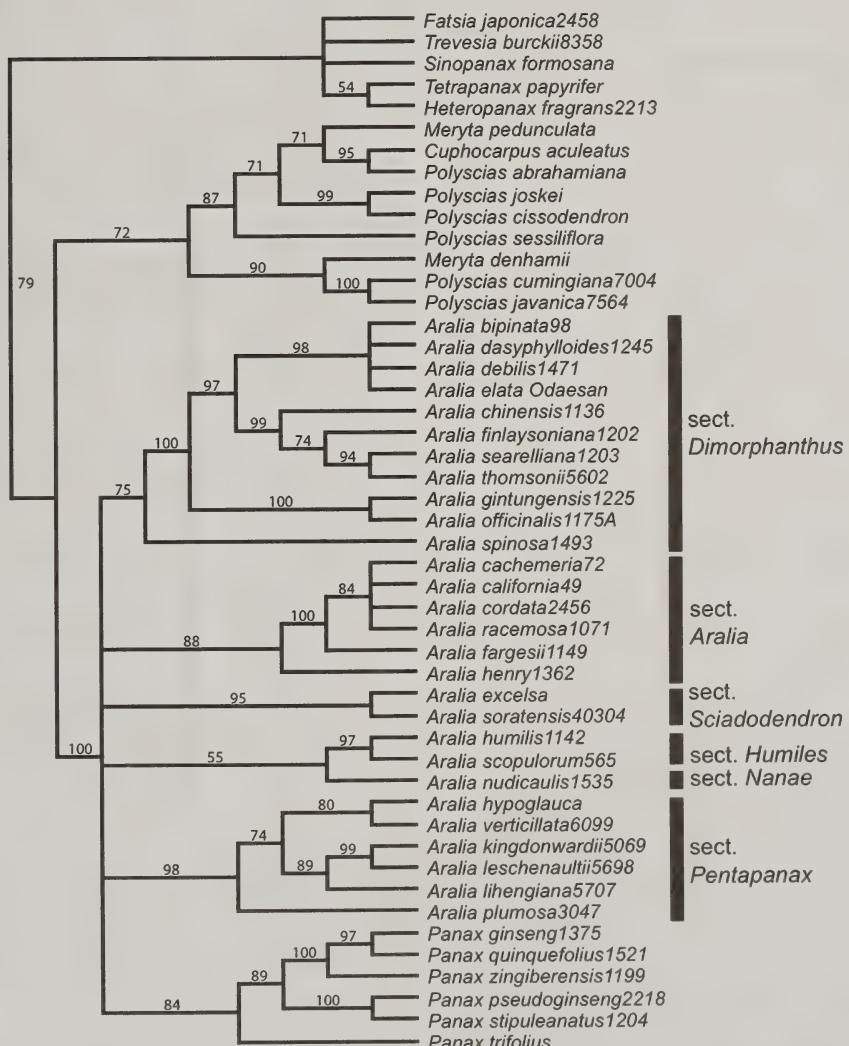

Fig. 1. Strict consensus tree of maximum parsimony analysis of *Aralia* and its close relatives based on sequences of the internal transcribed spacer (ITS) regions of nuclear ribosomal DNA and three chloroplast markers including the *ndhF* gene, the *trnLF* region, and the *atpB-rbcL* spacer (816 maximally parsimonious trees, a total length of 1389 steps, a consistency index of 0.69, and a retention index of 0.73). The bootstrap support of 500 replicates is indicated above the clades.

2). Nevertheless the relationships among the six sections of the genus are still poorly resolved. Additional molecular markers will be employed

to resolve the relationships among the major lineages.

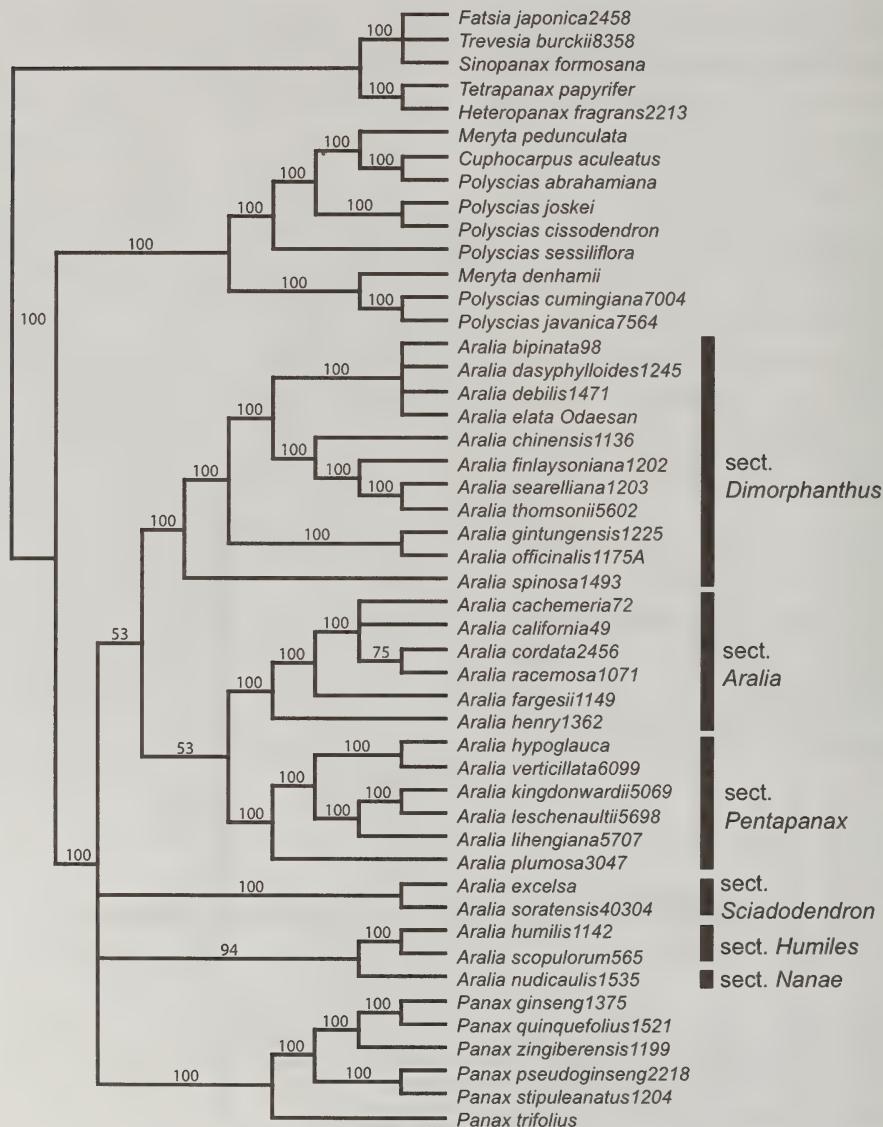

Fig. 2. The 50% majority-rule consensus tree of the parsimony analysis of *Aralia* and its close relatives based on sequences of the internal transcribed spacer (ITS) regions of nuclear ribosomal DNA and three chloroplast markers including the *ndhF* gene, the *trnL-F* region, and the *atpB-rbcL* spacer (816 maximally parsimonious trees, a total length of 1389 steps, a consistency index of 0.69, and a retention index of 0.73).

MORPHOLOGICAL CHARACTERS

This section is intended to discuss the variation of the characters used to delimit taxa; and to define the characters used in the descriptions and keys.

Habit

Aralia species are perennial herbs, shrubs or trees. Species of *Aralia* sect. *Aralia* are perennial herbs. *Aralia nudicaulis* of sect. *Nanae* has been described as being herbaceous, yet it has an extensive underground rhizome system and is thus essentially woody. Members of *Aralia* sect. *Dimorphanthus* consist of shrubs, treelets or trees, occasionally woody climbers, or semishrubs (i.e., herbaceous with a woody base). *Aralia* sect. *Pentapanax* often has epiphytic members. Species of sect. *Sciadodendron* are often trees or sometimes large shrubs, whereas members of sect. *Humiles* are often shrubs to sometimes small trees.

Underground systems

Aralia nudicaulis (sect. *Nanae*) is highly clonal with branched horizontal rhizomes. Most species of sect. *Aralia* have rhizomes and well-developed roots. Some species of *Aralia* sect. *Dimorphanthus* have been observed to form large clones (e.g., *Aralia elata*, *A. hispida*, *A. spinosa*, and *A. stipulata*), and it is presumed that they possess rhizomes. This character has not been used taxonomically, because most species have not been well documented for their underground features.

Prickles

All members of *Aralia* sect. *Dimorphanthus* bear prickles on their stems. The presence of prickles is herein regarded as a synapomorphy of the section (Wen 2004). Taxa of other sections are unarmed.

Leaf architecture and morphology

Leaf architecture is considered to be taxonomically useful in *Aralia*. *Aralia* sect. *Aralia* and sect. *Nanae* have ternately compound leaves. Leaves of sect. *Dimorphanthus* have mostly

bipinnate, but sometimes 3- or rarely 4-pinnate leaves. *Aralia* sect. *Sciadodendron* usually has 3- or 4-pinnate leaves. *Aralia* sect. *Humiles* and sect. *Pentapanax* usually have pinnate to bipinnate (rarely 3-pinnate) leaves. Taxa with 2-4-pinnate leaves usually have a pair of accessory leaflets or pinnae at each division of the rachis (see Fig. 1 in Wen 2004).

Trichomes and vesture

Vesture is taxonomically useful in *Aralia*. The terminology used in this revision follows Lawrence (1951), Harrington and Durrell (1957), and Stearn (1983), and is defined as below (examples refer to the abaxial leaflet surface if not specified otherwise): *ciliate*, margins with soft hairs; *pilose*, with sparse slender soft hairs; *pubescent*, with short soft straight hairs (e.g., in *A. thomsonii*); *scabrous*, with short, coarse, stiff white hairs, usually with a slightly swollen base, rough to touch (e.g., on the adaxial leaflet surface of *A. atropurpurea*); *tomentose*, with dense, more or less interwoven, short soft hairs (e.g., *A. dasypylloides*). Vesture is usually regarded as useful in differentiating species, but less so phylogenetically because of uncertainty in establishing transformation series.

The trichome types in *Aralia* may be roughly grouped into four types: (1) branched (Fig. 3A, e.g., on lower leaf surface of *A. humilis*); (2) long and soft (Fig. 3B, e.g., in *A. nudicaulis*); (3) biserrate (Fig. 3C, e.g., in *A. racemosa*, and *A. cordata*); and (4) multiseriate (Fig. 3D, e.g., in *A. elata*). Also see Figs. 4-8 for detailed illustrations of trichome morphology of *Aralia apiooides*, *A. atropurpurea*, *A. cordata*, *A. racemosa*, and *A. humilis*.

Cuticles

Two main cuticular patterns were reported on the abaxial leaflet surface in members of sect. *Dimorphanthus*: (1) striate, and (2) coronulate (see Wen 2004). This terminology follows Hardin and Beckmann (1982). The coronulate pattern is found only in *Aralia* sect. *Dimorphanthus*, including in the following species: *A. bipinnata*, *A. dasypylloides*, *A. debilis*, *A. decaisneana*, *A. elata*,

A. gintungensis, *A. officinalis*, *A. spinosa*, *A. stipulata*, and *A. undulata*. The abaxial surface of all other *Aralia* species is striate, suggesting the coronulate pattern as the derived character state in the genus. The adaxial leaflet surface has the striate cuticle pattern throughout the genus *Aralia* (Figs. 9-10).

Pedicel articulation

Pedicel articulation has been regarded as an important taxonomic character in Araliaceae. In *Aralia*, there is a secondary loss of pedicel articulation in *A. excelsa* and its close relative, *A. bahiana*, a new taxon reported in this study.

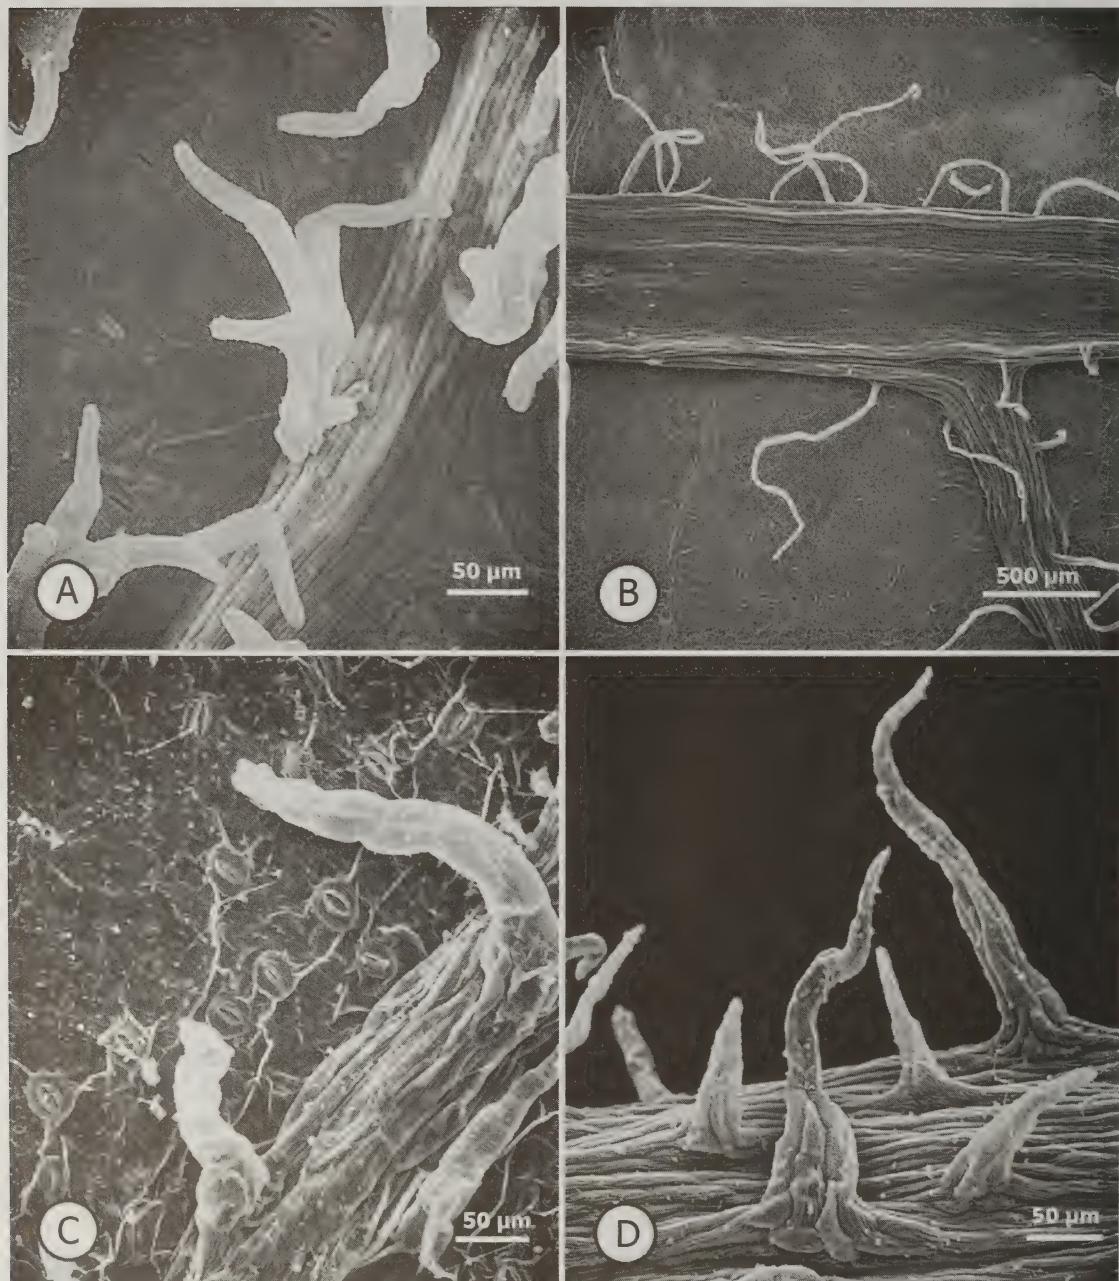

Fig. 3. Trichome types on lower leaflet surface in *Aralia*: A. Branched (*A. humilis*). B. Long and soft (*A. nudicaulis*). C. Biseriate (*A. racemosa*). D. Multiseriate (*A. elata*).

Inflorescence

The presence or absence of a main inflorescence axis was in the past considered to be important taxonomically in *Aralia* (Harms 1896; Hoo and Tseng 1965). Harms (1896) used this character to distinguish two sections: sect. *Genuinae* (= sect. *Aralia*) with a well-developed main axis, and sect. *Anomalae* without a main axis. Hoo and Tseng (1965) employed this character to

differentiate sect. *Arborescentes* Harms (synonymous with sect. *Dimorphanthus*, characterized by having a main axis) from sect. *Digitatipanicula* Hoo (without a main axis). In contrast to Harms (1896) and Hoo and Tseng (1965), I regard the presence or absence of a main inflorescence axis as significant only at the species level, and so it is not used here to delimit sections (also see Wen 2004). Several species (e.g., *Aralia fargesii*) show an intermediate inflorescence

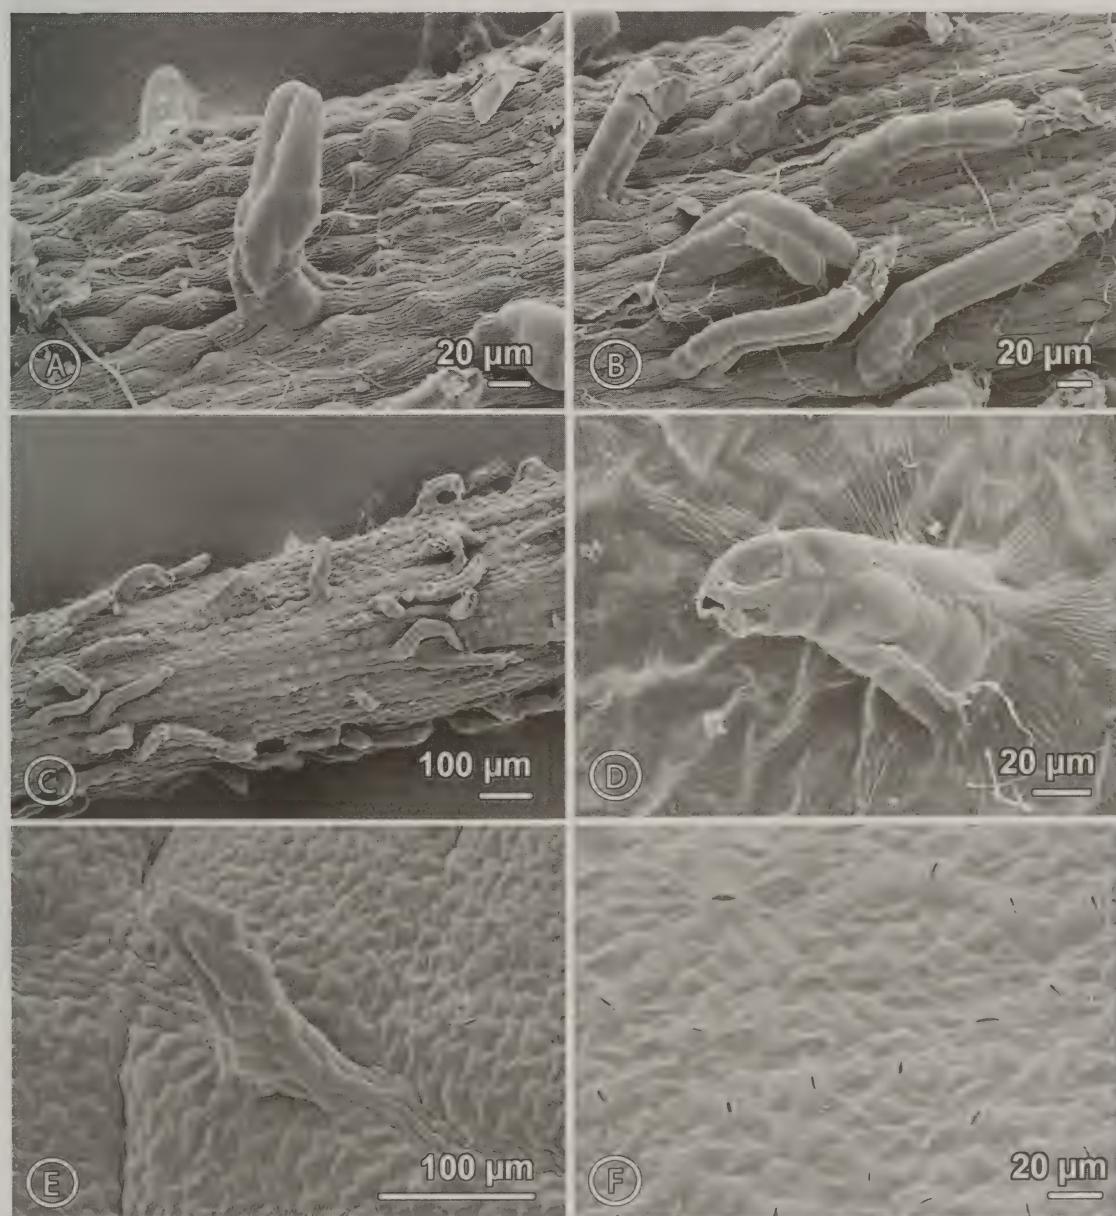

Fig. 4. Epidermal characters of *Aralia apiooides*: A-C. Trichomes on pedicels. D. Trichome on lower leaflet surface. E. Trichome on upper leaflet surface. F. Stomates on lower leaflet surface (Wen et al. 1241, US).

architecture between the two extreme conditions.

Bracts and bracteoles

The size, shape, pubescence and persistence of bracts and bracteoles in the inflorescence are useful for delimiting taxa in *Aralia*.

Flowers

Floral morphology is relatively constant in *Aralia* as well as it is throughout Araliaceae (Eyde and Tseng 1971; Wen 2004). Most species of *Aralia* possess 5 minute triangular to rounded sepals, 5 petals that are ovate or nearly so, 5 stamens, 5-locular ovaries, and styles that are distinct or connate at the base. *Aralia* sect. *Sciadodendron* shows more variation in floral parts, ranging from having 5-merous to 10- or even 12-merous flowers. *Aralia nudicaulis* and *A. scopolorum* occasionally have 6-merous flowers with the predominant condition of being 5-merous. The condition with more than five petals appears to represent secondary increase. In *Aralia excelsa* of sect. *Sciadodendron*, the author observed the later developmental split of 4-5 petals into 8-10 separate petal units.

Filament length shows interspecific variation in most cases. In the dioecious *Aralia nudicaulis*, the male flowers have significantly longer filaments than the female flowers.

The division of styles is useful to differentiate taxa. Species in *Aralia* have completely free or distinct styles (e.g., in *A. nudicaulis*) to nearly completely united styles (e.g., in *A. excelsa*).

Shape of the floral disc may prove to be taxonomically and/or phylogenetically significant. In sect. *Aralia*, *A. atropurpurea* has a projected floral disk, whereas *A. californica* has a flat floral disk. In sect. *Dimorphanthus*, some species such as *A. armata*, *A. bipinnata*, *A. chinensis*, *A. dasypylloides*, *A. malabarica*, *A. searelliana* and *A. spinifolia* have projected floral discs, whereas in other species (such as *A. foliolosa*), they are flat. This character may be important for differentiating closely related species, but it clearly varies within sections.

Fruits

Fruit size and shape may be used to differentiate species. Most *Aralia* species have dark purple to blackish fruits. *Aralia henryi* is the only taxon of the genus possessing bright red fruits.

POLLEN MORPHOLOGY

Aralia L. — Pollen mostly subprolate in equatorial view, triangular to rounded triangular in polar view; 3-colporate, the colpal margins incurved, sometimes with a colpal ridge, costa ectocolpi variable, from poorly developed (*A. californica*, *A. humilis*) to more prominent (*A. leschenaultii*, *A. nudicaulis*); the endoaperture mostly lalongate, frequently with diffuse lateral margins (*A. hispida* excepted), costa endocolpi variable, small but sharply delimited (*A. californica*) to more prominent (*A. leschenaultii*); the tectum variable, complete, and punctate, incomplete, and finely reticulate with perforations larger at the poles (*A. spinosa* and other taxa in sect. *Dimorphanthus*), incomplete and perforate to irregularly perforate, or weakly striato-reticulate (most species in sects. *Aralia*, *Humiles* and *Pentapanax*). In TEM, the nonapertural endexine thin; the apertural endexine thickened at the colpi, sometimes (partially) filling the arch of the ectexine, sometimes with a gap or marked thinning

at the boundary of nonapertural and apertural endexines (*A. californica*; *A. hispida*, *A. leschenaultii*); the foot layer thin to thick; the columellae very short, sometimes elongated at the poles (conspicuously so in sect. *Dimorphanthus*); the tectum variable, continuous, or nearly so to more discontinuous. Many *Aralia* species examined have a weakly striato-reticulate tectum (sects. *Aralia*, *Humiles*, and *Pentapanax*). *Aralia nudicaulis* is a morphologically very distinct species within *Aralia* and is the sole member of sect. *Nanae* (Harms 1896; this study). Its very thin exine may represent an extreme reduction. On the other hand, pollen of *Aralia* sect. *Dimorphanthus* is thicker-walled and has elongated columellae at the poles (cf. Wen and Nowicke 1999). Taxa of sect. *Dimorphanthus* also have larger tectal perforations at the poles (see Wen and Nowicke 1999; Wen 2004). See Figs. 11-15 for pollen characteristics of *Aralia*.

CHROMOSOME NUMBERS

I herein provide an update on the chromosomal evolution in *Aralia* sect. *Aralia*, and sect. *Nanae*. The base chromosome number of *Aralia* has been suggested to be $x = 12$ (Wen 2002). The readers are also referred to Yi et al. (2004) for more information on chromosomal evolution in

Araliaceae, and to Wen (2004) for an overview of chromosome numbers in *Aralia*. Both diploids and tetraploids have been reported from sect. *Aralia* and sect. *Nanae* (see Table 1). To date all counts for members of sect. *Dimorphanthus* (*Aralia elata* var. *elata*, *A. elata* var. *mandshurica*, *A. hispida*,

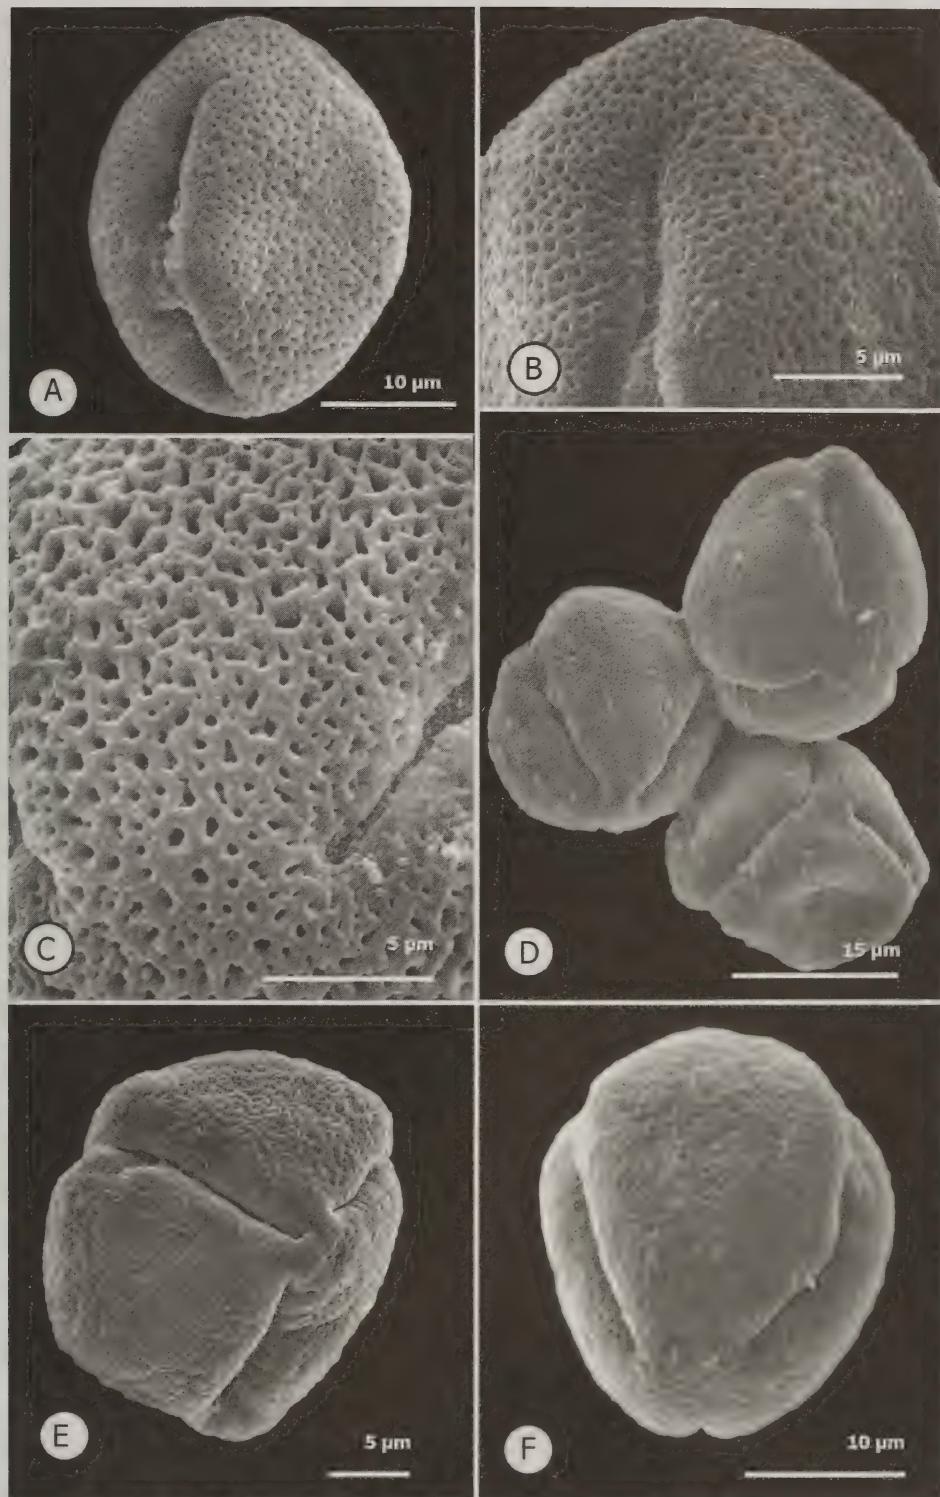

Fig. 15. Pollen morphology of *Aralia*. A-F. *A. scopulorum* (Purpus s.n., Jan-Mar 1898, US).

and *A. spinosa*) and sect. *Pentapanax* (*A. franchetii*, *A. leschenaultii*, and *A. parasitica*) have been $2n = 24$. Chromosomal numbers of sect. *Humiles* and

sect. *Sciadodendron* have not been reported at present.

INFRAGENERIC CLASSIFICATION

Based primarily on the results from the phylogenetic analyses and our current understanding of the morphological variation in *Aralia*, a new classification of the genus is herein formally described with six sections recognized.

I. *Aralia* sect. *Aralia*

- Aralia* sect. *Anomalae* Harms, Bot. Jahrb. 23: 12, 1896.
Aralia sect. *Genuinae* Harms, Bot. Jahrb. 23: 15, 1896.

Branched herbs with rhizomes. Leaves stipulate, bi or tripinnate on lower portion of stem, pinnate to bipinnate on upper portion of stem, trichomes simple. Umbels aggregated into umbellate or paniculate structure, and inflorescence usually robust, terminal and axillary. Flowers small (1-2 mm in diameter), 5-merous. Fruits dark purple or occasionally red.

Number of species: 14.

Type species: *A. racemosa* L.

Distribution: eastern Asia, the Himalayas, eastern North America, and western North America.

List and distribution of species in *Aralia* sect. *Aralia*

1. *Aralia californica* S. Watson
California & Oregon
2. *Aralia bicrenata* Wooton & Standl.
SW US & N Mexico
3. *Aralia racemosa* L.
E N America
4. *Aralia cordata* Thunb.
Japan & Korea
5. *Aralia schmidtii* Pojark.
E Russia
6. *Aralia taiwaniana* Y. C. Liu & F. Y. Lu
Taiwan
7. *Aralia continentalis* Kitag.
China, Korea & E Russia
8. *Aralia cachemirica* Decne.
Himalaya
9. *Aralia tibetana* G. Hoo
E Himalaya

10. *Aralia fargesii* Franch.
China
11. *Aralia atropurpurea* Franch.
China
12. *Aralia apoides* Hand.-Mazz.
China
13. *Aralia glabra* Matsum.
Japan
14. *Aralia henryi* Harms
China.

II. *Aralia* sect. *Humiles* Harms

- Aralia* sect. *Humiles* Harms, Bot. Jahrb. 23: 13. 1896.

Unarmed branched shrubs. Leaves pinnate or bipinnate (*A. regeliana*), stipulate; trichomes on lower leaf surface branched, stomates on both abaxial and adaxial leaf surfaces. Umbels 5-15, loosely clustered into panicles, inflorescence terminal. Flowers 5 (-6)-merous. Fruits dark purple.

Number of species: 3.

Type species: *A. humilis* Cav.

Distribution: Central to North America.

List and distribution of species in *Aralia* sect. *Humiles*

1. *Aralia humilis* Cav.
C & N America
2. *Aralia regeliana* Marchal
Mexico
3. *Aralia scopulorum* Brandegee
Baja California

III. *Aralia* sect. *Nanae* Harms

- Aralia* sect. *Nanae* Harms, Bot. Jahrb. 23: 12, 1896.

Herbs with long horizontal rhizomes, acaulescent, dioecious. Leaves ternately compound, solitary, arising from the tip of the short rhizome, trichomes simple and slender, occasionally branching at the tip. Inflorescence solitary, arising from the base, umbels (2) 3 (7) in a cluster with a long scape. Flowers 5 or occasionally 6-merous, styles 5 (-6), free. Fruits

blackish purple.

Number of species: 1.

Type species: *Aralia nudicaulis* L.

Distribution: North America.

IV. *Aralia* sect. *Pentapanax* (Seem.) J. Wen

Aralia sect. *Pentapanax* (Seem.) J. Wen, Cathaya 11-12: 31. 2002.

Pentapanax Seem., J. Bot. 2: 294. 1864. Type species: *Pentapanax leschenaultii* (DC.) Seem.

Parapentapanax Hutch., Gen. Fl. Pl. 2: 56. 1967.

Type species: *Parapentapanax racemosus* (Seem.) Hutch.

Unarmed shrubs or trees, branched, glabrous or with simple trichomes. Leaves pinnate, rarely bipinnate or tripinnate (*A. wilsonii* and *A. plumosa*), stipulate to exstipulate. Umbels or occasionally racemes (*A. gigantean*, *A. lihengiana*, and *A. subcordata*), then aggregated into panicles or umbellate panicles, inflorescence terminal, subtended by persistent bracts at the base. Flowers 5-merous, styles connate, or connate at the base, rarely free. Fruits dark purple.

Number of species: 19.

Type species: *Aralia leschenaultii* (Seem.) J. Wen

Distribution: widely distributed in Asia, especially in the Sino-Himalayan region such as northern India, Nepal, and western China, also extending to Java in Indonesia, northern Thailand, and northern Vietnam.

Aralia sect. *Sciadodendron* (Griseb.) J. Wen, comb. et stat. nov.

Sciadodendron Griseb., Bonplandia 6: 7. 1858.

Type species: *Sciadodendron excelsum* Griseb.

Coudenbergia Marchal, Bull. Acad. Roy. Sci. Belgique 47: 514, 1879. Type species: *Coudenbergia warmingiana* (Marchal) Marchal.

Megalopanax Ekman ex Harms, Notizbl. Bot. Gart.

Berlin 9: 122, 1924. Type species:

Megalopanax rex Ekman ex Harms.

Unarmed glabrous trees or large shrubs, branched. Leaves 3- to 4- or 2-pinnate. Umbels clustered into panicles, several inflorescences usually aggregated at tip of stem, with persistent bracts at the base. Flowers 5-, 6-10-(12)-merous, styles connate or at least at the base. Fruits dark purple.

Number of species: 5.

Type species: *Aralia excelsa* (Griseb.) J. Wen

Distribution: Central and South America.

5. Leaves 1-2-pinnately or occasionally 3-pinnately compound, ovaries 5-locular, from eastern to southeastern Asia Sect. *Pentapanax*

REPRODUCTIVE BIOLOGY

The reproductive biology of a few *Aralia* species has been documented. Possible evolutionary pathways leading to various reproductive systems have been proposed for the New Caledonian Araliaceae (Schlessman et al. 1990, 2001). A range of reproductive systems are present in *Aralia*, e.g., dioecious, andromonoecious, and hermaphroditic (Wen 2004).

Lovell (1898) noted that protandrous dichogamy is strongly developed in *Aralia racemosa*, a member of the herbaceous *Aralia* sect. *Aralia*. At the beginning of anthesis, the styles are initially united and only about 1 mm long and the stamens are about 3 mm long with the anthers horizontal or inclining outward. Small dipterans visit the flowers, thrusting their heads between the stamens or the bodies of the larger ones passing through them. With the stamens and petals falling away, the styles elongate to about 3 mm long and become reflexed finally. Abundant nectar is

produced and can be seen as minute drops on the floral disk. The honey-bee was observed to make 40 or so visits in one minute, and *Lucilia cornicina* was seen to visit 26 flowers in the same time. Lovell (1898) reported that a large number of less specialized hymenopterans, such as ichneumonflies and wasps visited the flowers.

The reproductive biology of *Aralia nudicaulis* (sect. *Nanae*) has been well studied (e.g., Barrett and Hellenur 1981; Barrett and Thomson 1982; Bawa et al. 1982; Edwards 1984; Flanagan and Moser 1985; Thomson and Brunet 1990). *Aralia nudicaulis* is dioecious in the boreal and temperate forests of North America. The species is pollinated mostly by bumble bees. The female ramets have fewer flowers per umbel than the male ramets and reach peak flowering before the male ramets. The sex-related differences in the frequency of flowering have been examined in detail in the species by Bawa et al. (1982). Bawa et al. (1982) also noted that a large proportion of sexually

mature ramets may not flower in a given year.

Aralia hispida (sect. *Dimorphanthus*) is andromonoecious and maintains outcrossing through synchronous dichogamy (Thomson and Barrett 1981; Thomson et al. 1982; Thomson 1988; Thomson et al. 1990). This species blooms in three ranks (primary, secondary, and tertiary) of umbel orders. All flowers of one order complete opening before flowers of the next order start. The flowers

are protandrous, with the flowers open first as males. After 5-7 days, the styles elongate and diverge, signaling the functioning female-phase of the flower. The female-phase flowers are cross-pollinated before the opening of flowers of the next order. Pollinators of *A. hispida* are primarily *Bombus* spp. (Thomson et al. 1982; Thomson 1988).

SPECIES CONCEPTS

In this treatment, species have been delimited using a phylogenetic concept sensu Nixon and Wheeler (1990). All species of *Aralia* are recognized by a unique combination of character states in comparable individuals. Once again, I view species as hypotheses based on available characters (also see Wen 2002, 2004). The circumscription may be revised as needed when additional data become available.

Species-delimiting characters must show fixation throughout the distributional range. Some “species” were based on extreme conditions of certain characters. For example, *Aralia pubescens* was described by de Candolle (1813) based on the highly pubescent specimens from Chiapas. When collections of *Aralia humilis* were examined throughout its distributional range, I realized that pubescence on leaves, inflorescence and pedicels is highly variable in this species. It is difficult to discern any discontinuity in this character nor any geographic integrity of the pubescent “form.” Therefore I have treated *Aralia humilis* broadly and placed *A. pubescens* as a synonym of *A. humilis*.

Aralia bicrenata was previously recognized as a variety or a subspecies of *A. racemosa* or simply

treated as a synonym of *A. racemosa*. Our field studies in Colorado, New Mexico, Arizona, and Texas suggest that *A. bicrenata* differs from *A. racemosa* in its inflorescence structure, leaflet margin, stipule morphology, and stem color. Our herbarium work also shows that these morphological differences are consistent throughout the distributional range of both taxa. Geographically there is no overlap between the two taxa. Varieties are considered by this author to have one or a few morphological distinctions that have geographic integrity (Lewis 1955; Stuessy 1990). Unlike species, some geographic overlap may occur among other conspecific varieties, but such overlap is common at this level in the hierarchy (Lawrence 1951; Stuessy 1990). In my previous revisions of *Aralia* such as in sect. *Dimorphanthus*, morphological differences among conspecific varieties are mostly related to pubescence, shape, texture, number of lateral veins of leaflets, and pedicel length. Considering the differences in several morphological characters and the lack of geographic overlap, I recognize *Aralia bicrenata* as a species distinct from *A. racemosa*.

DISTRIBUTION AND BIOGEOGRAPHY

Early evolutionary radiation in *Aralia*

Our phylogenetic analyses using multiple markers have not generated a well resolved phylogeny of *Aralia* at “deep” level (see Figs. 1 & 2). The sections I presently recognize are all supported as monophyletic groups, yet the

relationships among them remain poorly resolved. I propose that the major lineages of the genus diversified as an evolutionary radiation in a very short period of time.

It is significant that the New World harbors a relatively high diversity of major lineages even though it has only 14 of the 71 species of *Aralia*.

The New World species of the genus belong to five sections, of which three are endemic to the New World (sect. *Humiles*, sect. *Nanae*, and sect. *Sciadodendron*) and two sections disjunct with Asia (sect. *Aralia* and sect. *Dimorphanthus*). The 57 Asian species belong to three sections (sect. *Aralia*, sect. *Dimorphanthus*, and sect. *Pentapanax*) with only sect. *Pentapanax* endemic to Asia, and the other two sections disjunct between Asia and North America. Most species in Asia are from two sections: sects. *Aralia* (eleven out of 14 in Asia) and *Dimorphanthus* (27 out of 29 in Asia).

Aralia sect. *Aralia*

This section has a wide intercontinental disjunct distribution in the northern hemisphere, with eleven species in eastern Asia and three species allopatrically distributed in North America. Within eastern Asia, species are primarily allopatric in distribution. Only distantly related taxa, such as *A. continentalis*, *A. fargesii* and *A. henryi* in Central China may occur in the same mountain. In North America, *A. racemosa* is in eastern North America, *A. bicrenata* is in southwestern North America and northern Mexico, and *A. californica* is in California and southern Oregon. Wen et al. (1998) suggested the origin of the section in eastern Asia and that the ancestor of the North American taxa migrated across the Bering land bridge in the late Tertiary and diversified in North America. Within North America, an eastern and western North American biogeographic track is supported by the distribution of *A. racemosa* – *A. bicrenata* – *A. californica*. The eastern species *A. racemosa* occupies an extensive distributional area, whereas the western *A. californica* is more restricted to California and southern Oregon. This may be due to the fact that *A. californica* has co-existed and co-adapted with the redwood and the Douglas fir forests, which are ecologically restricted in western North America.

Within Asia, the *Aralia cordata* – *A. taiwaniana* – *A. continentalis* – *A. schmidii* – *A. tibetana* – *A. cachersimica* group shows an eastern Asian biogeographic track spanning from Japan, across China and to the western Himalaya in the East – West direction. The *Aralia cordata* – *A. continentalis* group shows a close biogeographic relationship of the Sino-Japanese region as a biogeographic track. This track is also supported in *Aralia* by the distribution of *A. glabra* in Japan

and *A. fargesii* in central China.

The phylogeographic relationship of the *Aralia cordata* complex (*A. cordata*, *A. taiwaniana*, *A. continentalis*, *A. schmidii*, *A. cachersimica* and *A. tibetana*) needs to be carefully examined. The six species occur allopatrically and are morphologically similar. *Aralia taiwaniana* may have been derived from *A. cordata* in Japan and been preserved in the central mountains in Taiwan. *Aralia schmidii* from the Sakhalin and Kuril islands in eastern Russia, north of the Japanese archipelago in the North Pacific may have its origin from *A. cordata* in Japan. The split between *A. continentalis* and *A. cordata* may be more ancient. Because of the presumably central role of *A. cordata* in giving rise to other species in the complex, it may be difficult to discern the evolutionary relationships among these species.

Aralia sect. *Humiles*

This section is distributed in relatively dry habitats from southern Arizona across Mexico to Guatemala, Honduras, and Nicaragua. Phylogenetic analysis has not been conducted for the section. Based on morphological comparisons, *Aralia scopulorum* from Baja California may be a derivative species of the more widespread *Aralia humilis*, especially from populations of northern Mexico. Furthermore *A. regeliana* may also be a derivative of *A. humilis*, likely from a bipinnate form in central or southern Mexico. The two species in each presumed progenitor-derivative pair do not overlap in geographic distribution, and allopatric speciation via geographic and habitat isolation may explain such a pattern.

Aralia sect. *Sciadodendron*

The five species of *Aralia* in this section are primarily allopatric in distribution in the neotropics. *Aralia rex* occurs in the Caribbean island of Cuba; *A. excelsa* is distributed in Central America, extending south to Colombia and Venezuela; *A. soratensis* is found in the Andes of Peru, Bolivia, and Argentina; *Aralia bahiana* is a new species recorded only from Bahia, Brazil; and *A. warmingiana* is primarily in the lowland areas in Brazil and Paraguay. These five species are morphologically highly distinct and may have radiated early in the evolutionary history of the

section, and developed in separate trajectories in Central and South America. *Aralia bahiana* and *A. excelsa* both have non-articulated pedicels. This character state may be apomorphic in *Aralia* and may be the synapomorphy for the two species. The geographically highly restricted *A. bahiana* may be a derivative of the more widespread *A. excelsa*. Nevertheless, it is also possible that *A. bahiana* was derived from *A. warmingiana* of Brazil.

Aralia soratensis from South America is

morphologically similar to the North American *A. spinosa*, which belongs to *Aralia* sect. *Dimorphanthus* (see Wen 2004). They differ primarily in the presence of prickles in *A. spinosa*, and in the more congested and more compact inflorescence of *A. soratensis*. The morphological similarities of the two species suggest the close relationship between sect. *Sciadodendron* of the neotropics and sect. *Dimorphanthus* primarily of the northern hemisphere.

Trees, shrubs, lianas or herbs with rhizomes, armed or unarmed; leaves alternate, 14pinnate, rachis articulated, mostly stipulate; inflorescence terminal, paniculate or corymbose or umbellate, usually consisting of umbels, capitula or racemes, occasionally umbels solitary; flowers 512merous, with pedicels articulated below, only occasionally non-articulated; sepals 512; petals 5-12, imbricate; stamens 5-12, recurved in buds; ovary inferior, 512locular, occasionally aborted into 3, with a

floral disk, styles distinct or connate at the base or completely connate; fruit a berry, 512-locular, more or less globose.

Aralia consists of 71 species disjunctly distributed from eastern Asia to southeastern Asia and the Americas from Canada to Argentina, Bolivia, Peru and Brazil. Eastern and southeastern Asia is especially rich in *Aralia* species (57 spp), whereas South America, North America and Central America together have 14 species.

ARALIA L. SECT. ARALIA

Aralia sect. *Genuinae* Harms, Bot. Jahrb. 23: 15. 1896.

Aralia sect. *Anomalae* Harms, Bot. Jahrb. 23: 12. 1896, synonym nov.

Branched unarmed herbs with rhizomes. Leaves alternate, stipulate, ternately bi- or tripinnate on lower portion of stem, pinnate to bipinnate on upper portion of stem, petiole articulated. Trichomes simple, biseriate. Inflorescence terminal and axillary, paniculately or umbellately arranged, with many umbels, pedicels articulated below the flowers. Sepals 5, minute, triangular or rounded. Petals 5, imbricate. Stamens 5. Ovary inferior, 5-locular, styles 5, connate at the base, floral disc small and flat. Fruit a berry, 5-seeded, dark purple when mature.

Endosperm smooth.

The section consists of 14 species disjunctly distributed between eastern Asia (11 spp.) including the Himalayas and North America (3 spp.). Species of this section are perennial herbs primarily in mesic temperate forests.

Species in the section are largely differentiated based on stipule morphology, leaf architecture, pubescence, leaflet size, shape and margin, inflorescence architecture, number of flowers per umbel, division of styles, and fruit size, shape and color.

Key to species of *Aralia* sect. *Aralia*

1. Fruits red; inflorescence with fewer than 10 umbels, each terminal umbel with fewer than 10 flowers *A. henryi*
1. Fruits dark purple; inflorescence with more than 20 umbels, each terminal umbel with more than 10 flowers 2
2. Inflorescence a dense panicle with more than 25 primary branches 3
2. Inflorescence a loose panicle or an umbellate structure with fewer than 15 primary branches 11
3. Fruits 5.5-7 mm in diameter *A. californica*
3. Fruits 3-5 mm in diameter 4
4. Inflorescence corymbose in architecture 5
4. Inflorescence paniculate to racemose in architecture, primary bracts usually not leafy 7
5. Inflorescence with leaves and leafy bracts subtending the primary inflorescence branches; terminal umbels with 12-20 (25) flowers; in southwestern US and in northern Mexico *A. bicrenata*
5. Inflorescence with leaves subtending the primary inflorescence branches, with the leaves decreasing in size drastically from lower part of the inflorescence to the upper part; terminal umbels with (25-) 35-60 flowers 6
6. Leaflet margin finely serrulate, base of leaflets cordate, stipules lanceolate; endemic to the Sakhalin & Kuril islands of far eastern Russia *A. schmidtii*
6. Leaflet margin doubly serrate, base of leaflets obliquely truncate to subcordate, rarely cordate, stipules narrowly triangular; endemic to Taiwan *A. taiwaniana*
7. Terminal umbels usually with fewer than 35 flowers 8
7. Terminal umbels usually with 35 or more flowers 9
8. Stem dark purple to greenish purple, without stiff hairs at the base of stem; stipules narrowly triangular, not leafy; flowers smaller with petals 1.4-1.6 mm long, 0.9-1.1 mm wide; eastern U.S. and Canada *A. racemosa*
8. Stem green to greenish purple, with stiff hairs at the base of stem; stipules leafy; flowers longer with petals 1.8-2 mm long, 0.9-1.1 mm wide; mainland China, Korea & eastern Russia *A. continentalis*

9. The pair of leaflets below the terminal leaflet narrowly ovate, base rounded to subcordate *A. cachemirica*
9. The pair of leaflets below the terminal leaflet ovate to broadly so, base cordate 10
10. Leaves primarily tripinnately ternate; leaflets membranaceous; stipules not leafy *A. tibetana*
10. Leaves primarily bipinnately ternate; leaflets papery or chartaceous; stipules usually leafy on the lower part of the stem *A. cordata*
11. Leaflets glabrous throughout; pedicels 12-45 mm long *A. glabra*
11. Leaflets pilose to pubescent; pedicels less than 15 mm long in general 12
12. Leaflet margin irregularly doubly serrate with deep teeth, sometimes lobed *A. apioides*
12. Leaflet margin serrate to doubly so without deep teeth, never lobed 13
13. Pedicels 8-12 mm long in terminal umbels; styles completely distinct to the base *A. atropurpurea*
13. Pedicels 5-6 mm long in terminal umbels; styles connate to the middle or more *A. fargesii*

1. *Aralia californica* S. Watson — Fig. 16; color plate 1: A-F.

Aralia californica S. Watson, Proc. Amer. Acad. Arts 11: 144. 1876. TYPE: U.S.A. CALIFORNIA: northern California, 1860-62, W. H. Brewer 747 (lectotype: US!, here designated; isolectotype: GH!, UC!).

Aralia californica S. Watson var. *acuminata* S. Watson ex Howell, Fl. N. W. Amer. 1: 271. 1898. TYPE: U.S.A. OREGON: southern Oregon, Siskiyou Mountains, Jul 1888, T. Howell 786 (lectotype: GH!, here designated).

Robust spreading perennial herb, shrub-like, 1.5-3.5 m tall, 1-3 m in spread, andromonoecious. Stem pilose, green to light purplish green, with 3-5 leaves; rhizomes thick and horizontal, bearing purple buds. Leaves 40-150 cm long, 35-160 cm wide, ternately compound, spreading, lower leaves tripinnate, uppermost ones pinnate; stipules 1.2-7.0 cm long, 1-7.0 cm wide, leafy on lower leaves, triangular to irregularly ovate on upper leaves; petioles (8) 15-35 cm long, sparsely pilose, green to purplish green; leaflets 8-45 cm long, 4.5-22 cm wide, papery, ovate, narrowly ovate to broadly so, acuminate to acute at apex, subcordate, cordate to rounded at base, commonly oblique on lateral leaflets, serrate to doubly serrate at margin; lateral veins 9-12 on each side, conspicuous on both surfaces, green above and light green below, slightly pilose along the veins on both surfaces, petiolules 0.2-4, mostly 0.5-1.5 cm long, slightly

pilose and thick. Inflorescence terminal and axillary, pilose, green, sometimes purple, axillary inflorescences 20-30 cm long, terminal inflorescence 30-75 cm long, 10-25 cm wide, consisting of numerous umbels, twice or thrice branched, primary branches many, racemosely arranged on a main axis, often 3-8 forming a circle on the main axis, each primary branch 5-10 cm long, consisting of 3-10 umbels, with a few lateral umbels bearing no fruits (functionally male umbels); terminal umbels 30-75-flowered, pedicels 12-20 mm long, pubescent; lateral umbels 20-30-flowered, pedicels 6-12 mm long; bracts of primary branches linear to lanceolate or often leaf-like, pilose, the upper ones 10-20 (30) mm long, 1-2 mm wide, the lower ones transitioning into a bipinnately ternate leaf or a pinnate leaf subtending the inflorescence branch; bracteoles linear, nearly glabrous and ciliate at margin, 2-2.5 mm long. Flowers cream white; calyx of 5 teeth, sepals 0.5-0.6 mm long and wide, triangular, persistent on fruits, with a conspicuous vascular bundle in the middle; petals 2-2.3 mm long, 1.1-1.3 mm wide, narrowly triangular to narrowly ovate, greenish white to white, with a conspicuous vascular bundle in the middle; stamens 5, recurved in buds, filaments 2.3-2.6 mm long; ovaries 5-locular, hypanthium with 10 conspicuous vascular bundles. Fruits 6-7 mm long, 5-6 mm wide, globose, dark purple to blackish, persistent styles 2.2-2.6 mm long, divided to the middle or only connate at the base.

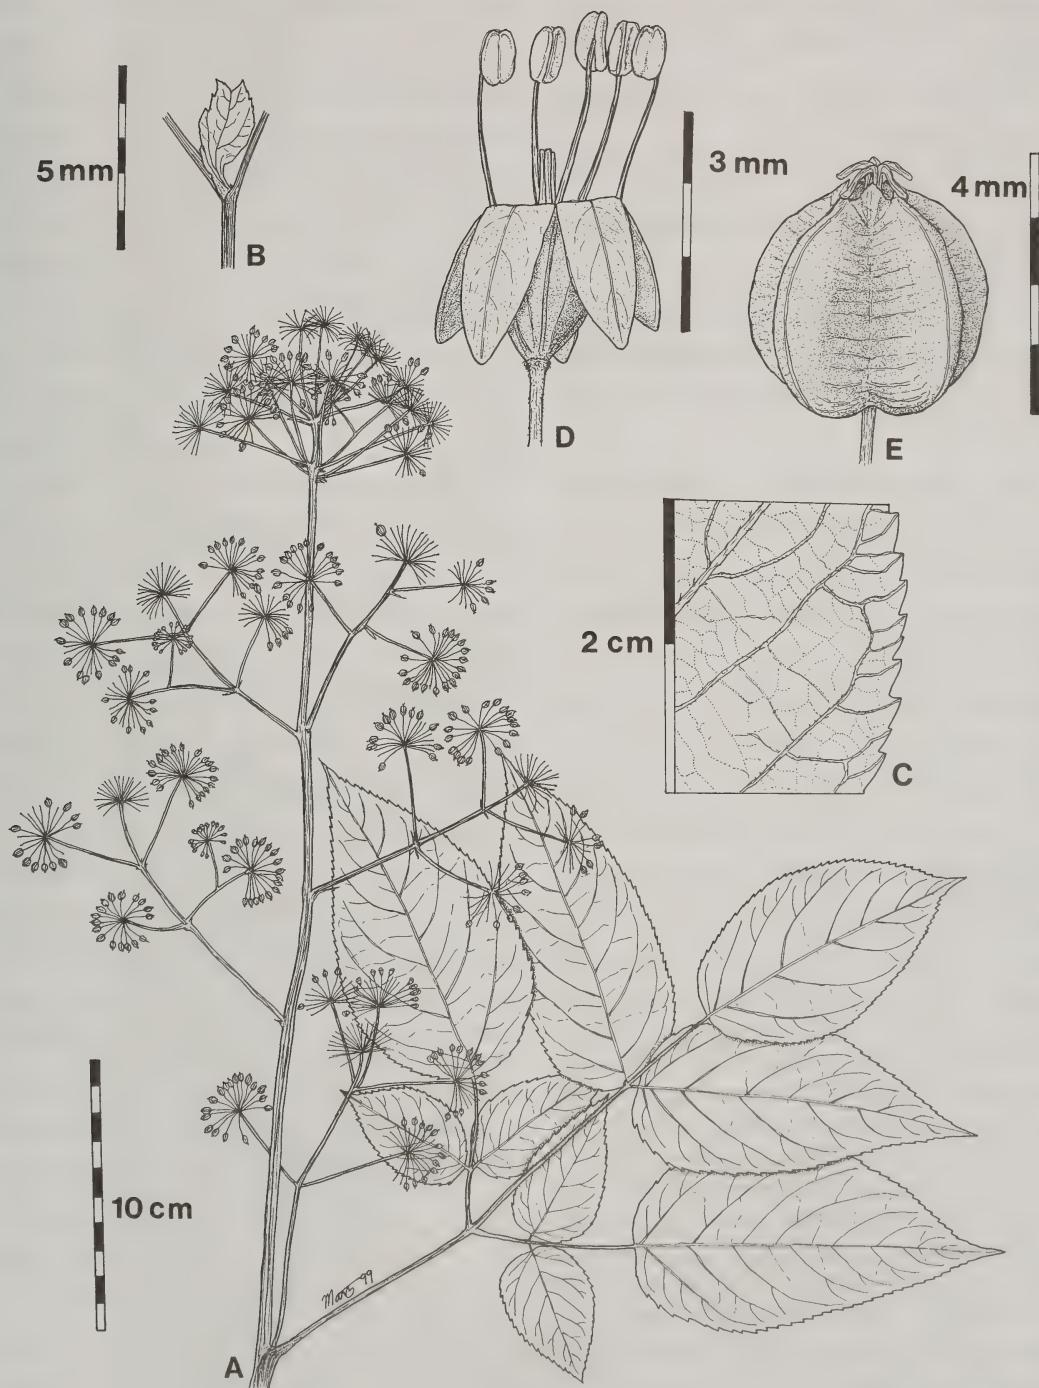

Fig. 16. *Aralia californica* S. Watson. A. Habit with a leaf and an inflorescence. B. Leafy stipule. C. Close-up of leaflet margin and veinlets. D. Flower. E. Young fruit.

Common names: spikenard, California spikenard, Californian spikenard, California ginseng, elk clover, western aralia, and western spikenard.

Uses: roots used as a tonic or for curing menstrual disorders.

Phenology: flowering in June to July; fruiting in August to September.

Distribution: California and southern Oregon of U.S.A. (Fig. 17).

Ecology: in shady and moist habitats, e.g., in moist redwood, Douglas fir, and/or pine forests, mountain slopes and valleys, at the edge of forests, along river banks, shaded streams, creeks, and ravines; 0-1830 m.

Representative specimens examined: U.S.A.
CALIFORNIA: Alameda Co., Strawberry Canyon, near creek, 4 Sep 1932, *J. E. Adams* 21 (UNCC); Oakland Hills, ravines, *Dr. Bolander s.n.* (NY); Berkeley, Strawberry Canyon, University of California campus, 22 Aug 1939, *H. P. QUÉBEC: Lac-Saint-Jean Co., Pointe-Bleue, à découvert sur les berges calcaires du lac Saint-Jean, élément du taillis de *Sambucus*, *Viburnum*, etc, 25 Jul 1935, *Marie-Victorin, Rolland-Germain & Meilleur* 44562 (MT!).

Perennial herb, 0.6-2.5 m tall with large aromatic roots. Stem pilose, dark purple to greenish purple, with 4-5 leaves; rhizomes thick and horizontal. Leaves 50-83 cm long, 54-87 cm wide, ternately compound, spreading, purple at nodes; stipules 1.2-1.5 cm long, 0.4-0.9 cm wide, narrowly triangular to lanceolate, not leafy, glabrous, ciliate at margin, thick papery; petioles 15-30 cm long, purple; leaflets 7-20.5 cm long, 4.5-14 cm wide, thin papery, the pair of leaflets below the terminal leaflet ovate, other leaflets ovate to broadly so, acute at apex, subcordate to cordate at base, commonly oblique on lateral leaflets, doubly serrate at margin; lateral veins 8-9 on each side, conspicuous on both surfaces, leaflets green, nearly glabrescent on upper surface, pilose on lower surface, petiolules 0-3 cm long, pilose. Inflorescence terminal and axillary, pubescent; axillary inflorescences 6-21 cm long; terminal inflorescence 15-40 cm long, 3-10 cm wide, consisting of numerous umbels, primary inflorescence branches 15-25, racemously arranged on a main axis, often 3-5 forming a circle on the upper part of the main inflorescence axis, each primary branch 3-14.5 cm long, consisting of 1-10 umbels, with a few lateral umbels bearing no fruits (functionally male umbels); terminal umbels 20-25-flowered, pedicels 6-8 mm long, pubescent, tip enlarged conspicuously at anthesis, somewhat slightly enclosing the base of the hypanthium; lateral umbels 10-20-flowered, pedicels 3-5 mm long; bracts of primary branches 3-5 mm long, 0.5-1 mm wide, linear, more or less pilose, ciliate at margin; bracteoles 1.0-1.5 mm long, 0.2-0.3 mm wide, linear, ciliate at margin. Sepals 0.2-0.3 mm long and wide, triangular, glabrous, persistent on

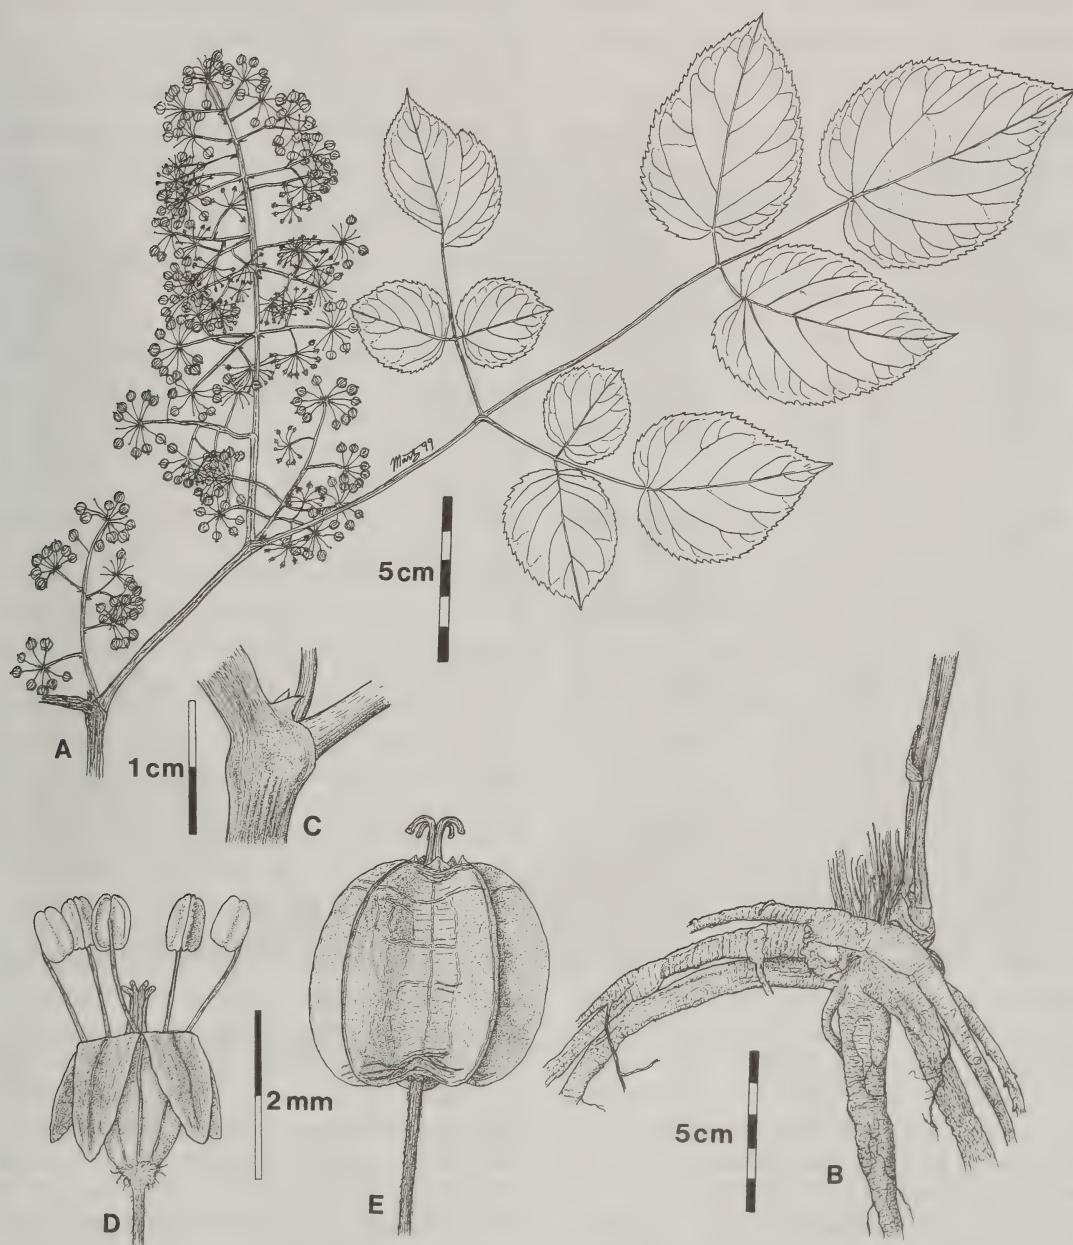

Fig. 18. *Aralia racemosa* L. A. Habit with a leaf and a terminal and an axillary inflorescence. B. Root and rhizome. C. Leaf base showing triangular stipules. D. Flower. E. Fruit.

fruits; petals 1.4-1.6 mm long, 0.9-1.1 mm wide, ovate, greenish white to white, with a conspicuous vascular bundle in the middle, spreading to recurved at anthesis; stamens 5, erect at anthesis, filaments 1.3-1.5 mm long, anthers 0.4-0.5 mm long, 0.2-0.3 mm wide, oblong, whitish yellow; ovaries 5-locular, styles 0.6-0.7 mm long at anthesis, base of styles more or less enlarged,

appearing like a stylopodium. Fruits 4-4.5 mm long, 3.5-4.5 mm wide, globose, dark purple to purple, turning dark maroon-red when mature, persistent styles divided to the middle, 1.3-1.5 mm long. Seeds 2-2.2 mm long, 1-1.2 mm wide, 0.2-0.25 mm thick, kidney-shaped, whitish gray, smooth.

Common names: spikenard, American spikenard, Indian root, spignet, spiceberry, petty-morrel, life-of-man, and old man's root.

Uses: aromatic roots used in syrup of spikenard, a tonic, or for cough and irritation of the bronchopulmonary tract.

Phenology: flowering in June to August; fruiting in August to October.

Distribution: widely distributed in eastern U.S.A. and Canada, westward to South Dakota and North Dakota, south to Georgia and Alabama (Fig. 19).

Ecology: rich deciduous forests, wooded slopes, ravines, moist bluffs, riverside forests, creeksides, and streamsides; 100-1500 m.

Lancaster Co., Rawlinsville, 1883, *J. Galen* 1047 (US).

Marie-Victorin and Rousseau (1940) described *Aralia racemosa* var. *foliosa* Vict. & J. Rousseau based on the presence of leafy bracts or leaf-like structures on the inflorescence in some collections from Québec, Canada. This character is occasionally observed in specimens from other areas (e.g., *Raud* s.n. collected from Hancock Co. of Maine on 29 Aug 1889; and *Clemens* s.n. collected from Ironwood, Michigan on 28 Jul 1909). Scoggan (1978) proposed to recognize it as a form: *Aralia racemosa* L. f. *foliosa* (Vict. & J. Rousseau) Scoggan. I have found that the species is quite variable and I prefer not to recognize forms in this treatment.

Aralia racemosa is easily distinguished from *A. californica* by the former's non-leafy stipules, much narrower inflorescence (3-10 cm vs. 10-25

cm wide), fewer flowers (20-25 vs. 30-75) per terminal umbel, shorter pedicels (6-8 mm vs. 12-20 mm long) on terminal umbels, and smaller fruits (4-4.5 vs. 6-7 mm long). The distinction between *A. racemosa* and *A. bicrenata* is discussed under *A. bicrenata*.

TYPE: U.S.A. NEW MEXICO: Socorro Co., near Holts Ranch in the Mogollon Mountains, 20 Jul 1900, fl., E. O. Wooton s.n. (holotype: US!, US Herb. # 563963; isotype: US!, US Herb. # 736551).

Aralia arizonica Eastw., Proc. Calif. Acad. Sci., IV, 20: 148. 1931. TYPE: U.S.A. ARIZONA: Cochise Co., Chiricahua Mountains, Cave Creek Canyon, 6-8000 ft., 26-29 Jun 1927, J. A. Kusche s.n. (holotype: CAS!, photo at US!).

Robust perennial herb, 1-2.2 m tall, andromonoecious. Stem sparsely pubescent on the older parts, pubescent on the younger parts, green to greenish purple, with 4-6 leaves; rhizomes thick and horizontal. Leaves 73-120 cm long, 60-118 cm wide, ternate, spreading; stipule 3.2-8.9 cm long, 1.1-5.8 cm wide, leafy; petioles 25-45 cm long, light green to purplish green; leaflets 6-14 cm long, 3-8 cm wide, thin papery to papery, the pair of leaflets below the terminal leaflet narrowly ovate, other leaflets ovate to broadly so, acuminate to acute at apex, truncate, broadly acute to subcordate at base, commonly oblique on lateral leaflets, doubly serrate at margin; lateral veins 8-9 on each side, conspicuous on both surfaces, green and sparsely pilose on veins and veinlets on the adaxial surface, light green and pilose on veins and veinlets on the abaxial surface, petiolules 0.2-4 cm long, pilose. Inflorescence 35-50 cm long, 30-50 cm wide, terminal and axillary, the transition between the axillary inflorescence below and the upper terminal inflorescence gradual, essentially the inflorescence terminal with the lower primary branches subtended by bipinnately ternate leaves and the upper primary branches subtended by leafy bracts, the overall architecture corymbose,

consisting of 10-20 primary branches, primary branches often 3-5 forming one or two circles on the upper part of the main inflorescence axis, each primary branch 8-30 cm long, consisting of 3-30 umbels, with some lateral umbels functionally male; terminal umbels 12-20 (-25)-flowered, pedicels 7-12 mm long, pubescent, tip enlarged; lateral umbels 8-15-flowered, pedicels 3-6 mm long; bracts of the upper primary branches leafy to lanceolate or linear, the leafy ones varied in size, 1-5 cm long, 0.4-3 cm wide, the lanceolate to linear true bracts 5-12 mm long, 1-3 mm wide, pilose, ciliate at margin; bracteoles 1.1-2.0 mm long, 0.4-0.7 mm wide, lanceolate, pilose, ciliate at margin. Sepals 0.4-0.6 mm long and wide, triangular, persistent on fruits; petals 1.9-2.0 mm long, 1.1-1.3 mm wide, ovate, greenish white to white, with a conspicuous vascular bundle in the middle; stamens 5, filaments 2-2.4 mm long, anthers oblong, 0.9-1 mm long, 0.6-0.7 mm wide; ovaries 5-locular, styles 0.6-0.8 mm long at anthesis, base of styles slightly enlarged. Fruits 3.5-4.5 mm in diameter, globose, occasionally ovoid globose, dark purple, persistent styles divided to 1/3 to the base, 1.5-1.7 mm long. Seeds 2.5-2.9 mm long, 1.5-2.0 mm wide, 0.4-0.5 mm thick, kidney-shaped, whitish gray, smooth.

Common name: spikenard.

Phenology: flowering in July to August; fruiting in August to October.

Distribution: in Arizona and New Mexico, rare in Colorado (La Plata Co. and Mineral Co.), Utah, and Texas (a single population on Mt. Livermore, Jeff Davis Co.) of U.S.A. as well as in northern Mexico (Chihuahua, Coahuila, and Sonora) (Fig. 21).

Ecology: deciduous or mixed broadleaf and coniferous forests, edges of forests, along streams, on rocky cliffs in moist habitats, and roadsides near forests; 1500-3000 m.

Representative specimens examined. **Mexico.** CHIHUAHUA: Mpio. Madera, arroyo de las Garrochas, ejido "El Largo-Madera", 18 Oct 1990, fl, 2600 m, A. Benítez P. 2930 (MEXU); Mpio. This species has often been treated as part of *Aralia racemosa*, either as a synonym (Smith 1944), or as a subspecies (Welsh and Atwood 1975). Kearney and Peebles (1951) also listed *A. bicrenata* as a synonym of *A. racemosa*; yet they also noted morphological differences between the two. In particular, their inflorescence architecture is highly distinct with *A. bicrenata* having the corymbose architecture and *A. racemosa* with the racemose overall structure. The stipule of *A. bicrenata* is often leafy, whereas that of *A. racemosa* is small, nonleafy and triangular. The stem of *A. bicrenata* is green to purplish green whereas that of *A. racemosa* is dark purple. Furthermore the leaflets of *A. bicrenata* are often truncate to subcordate at base, and those of *A. racemosa* are cordate to deeply so.

Kearney and Peebles (1951) documented that the fruits of *A. bicrenata* are eaten by various birds.

4. *Aralia cordata* Thunb. — Fig. 22; color plate 4: A-C.

Aralia nutans Franch. & Sav., Enum. Pl. Jap. 2: 376. 1878. TYPE: Japan. Hokkaido, Savatier 3835 (holotype: P!; isotype: P!).

Perennial herb 1.5-2 m tall, andromonoecious. Lower part of stem with stiff hairs. Rhizomes stout and horizontal. Leaves 60-100 cm long and wide, tripinnately to bipinnately pinnate; upper leaves pinnate to bipinnate or trifoliolate; stipules 2-2.3 cm long, 0.7-1 cm wide, narrowly triangular, often becoming leaf-like and enlarged, especially for those on the lower part of the stem; petioles 12-22 cm long, pubescent with soft and scabrous hairs; leaflets 5.5-22 cm long, 4-10.5 cm wide, papery, basal leaflets ovate, other leaflets ovate to narrowly so, acuminate to acute at apex, cordate, subcordate to rounded at base, often oblique on lateral leaflets, serrate to serrulate at margin; lateral veins 8-10 on each side, conspicuous on both surfaces, sparsely scabrous on adaxial surface, pilose along veins and veinlets on abaxial surface, petiolules 0-2 cm long, pilose. Inflorescence 30-65 cm long, a terminal panicle with the lower 2-5 primary branches subtended by leaves rather than bracts, pilose, consisting of 20-50 primary branches, mostly racemously or sometimes paniculately arranged on a main axis, often 2-8 forming a circle on the upper half of the main inflorescence axis, each primary branch 3-22 cm long, consisting of 1-10 umbels; terminal umbels mostly 35-95-flowered, pedicels 9-14 mm long, pubescent, tip of pedicels enlarged and with a cluster of scabrous hairs; lateral umbels 18-35-flowered, pedicels 7-9 mm long; bracts of primary branches 4-9 mm long, 0.6-0.8 mm wide, linear, pilose; bracteoles 1.6-2 mm long, 0.1-0.2 mm wide, linear, pilose. Sepals 0.3-0.4 mm long, 0.2-0.3 mm wide, narrowly triangular; petals 1.5-1.8 mm long, 0.9-1 mm wide, ovate, with a conspicuous vascular bundle in the middle; stamens 5, 2.2-2.3 mm long, filaments 1.7-2 mm long, anthers 0.7-0.8 mm long, 0.4-0.5 mm wide, ovate; ovaries 5-locular, styles 0.6-0.8 mm long at anthesis, base of ovary slightly pilose with a few

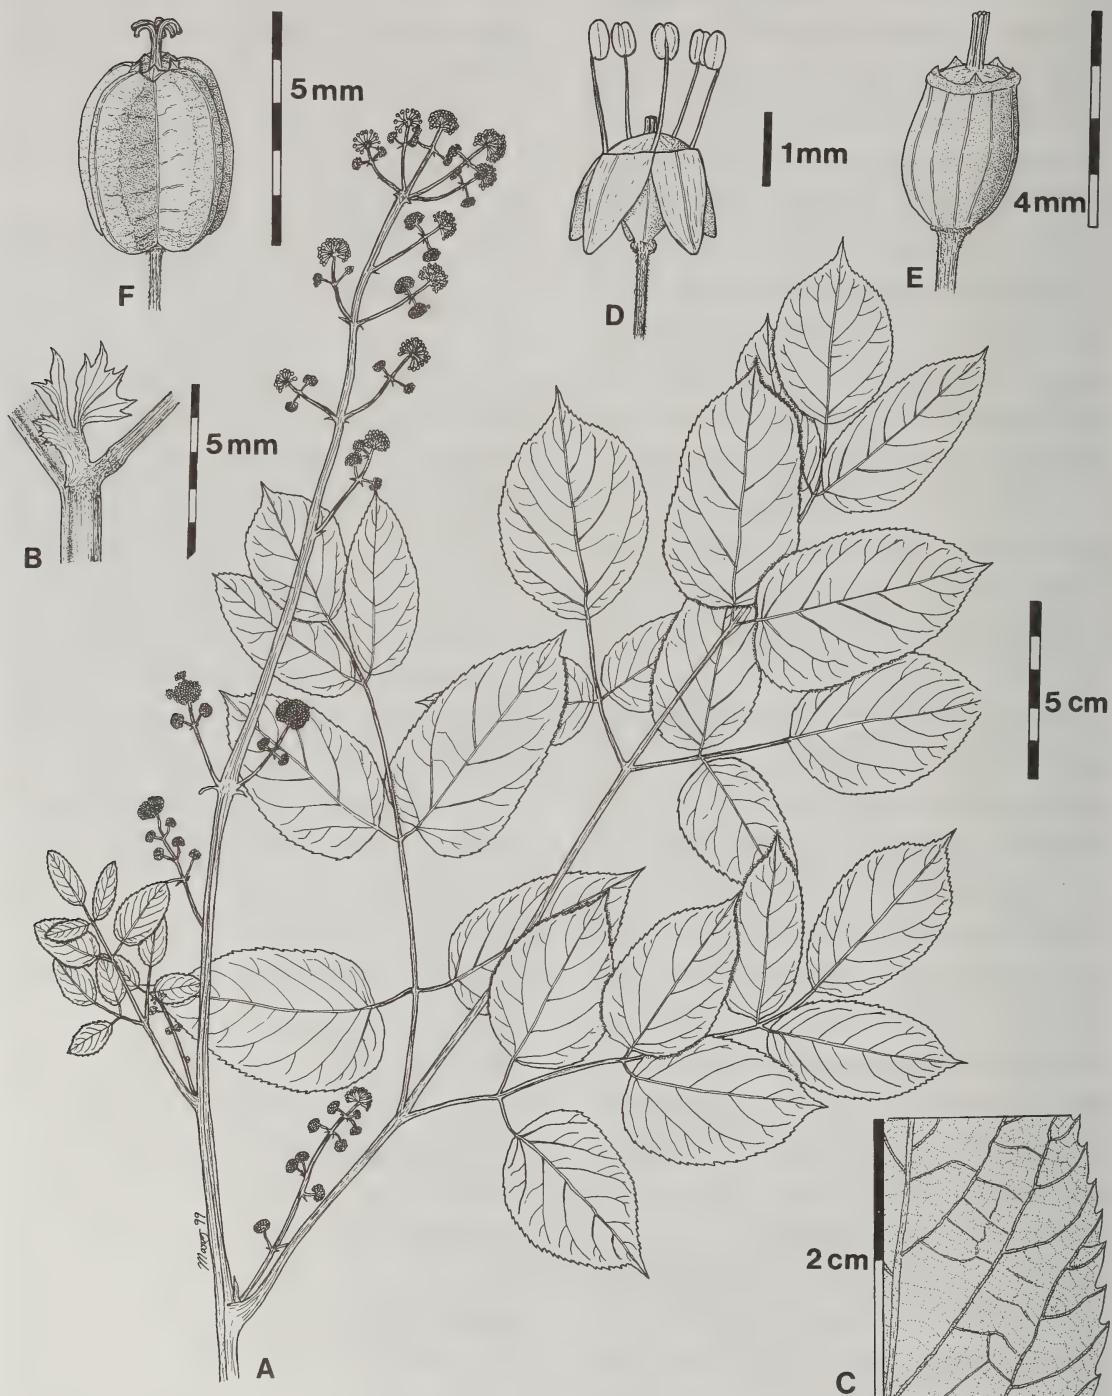

Fig. 22. *Aralia cordata* Thunb. A. Habit with leaf and inflorescences. B. Leafy stipule. C. Close-up of leaflet margin and veinlets on lower surface. D. Flower. E. Young fruit. F. Fruit.

scattered hairs, the top part of the ovary conspicuously exposed and appearing like a stylopodium. Fruits 3.2-3.5 mm long and wide, globose, persistent styles 5-divided, connate at the base.

Common names: udo.

Uses: young shoots as vegetables.

Phenology: flowering in July to September; fruiting in August to November.

Distribution: widely distributed in Japan (Fig. 23), also in Ullung-do of Korea.

Ecology: deciduous forests, or mixed broadleaf and coniferous forests, edges of forests, roadsides near forests; 50-1500 (-2000) m.

Additional specimens examined: Additional specimens examined: **Japan. Hokkaido:** Insula Jesso, circa Hakodate, 1861, *Albrecht s.n.* (K, NY, part 2 of the specimen only, part 1 is *Aralia elata* var. *elata*); west side of Shibetsu city, ca 6 km E of Soeushinai, Hokkaido Temporary Game Preserve, 280 m, mixed forests of *Quercus*, *Acer* and *Betula* and some gymnosperms, 1 Sep 1977, fl, *D. 5. *Aralia schmidtii* Pojark. — Fig. 24; color plate 4: D-E.

Aralia schmidtii Pojark., Fl. URSS 16: 588. 1950.

TYPE: **Russia.** Sakhalin, near Due, 2 Aug 1860, P. Glehn s.n. (holotype: LE!; isotypes: G!, K!, NY!).

Aralia racemosa L. var. *sachalinensis* Regel, Index Seminum Hort. Bot. Petr. 1864: 22. 1864.

Aralia cordata Thunb. var. *sachalinensis* (Regel) Nakai, J. Arnold Arbor. 1924. TYPE:

Russia. Sachalin, 1860, F. Schmidt s.n. (lectotype: LE!, here designated; isolectotypes: G!, GH!, LE!, NY!).

Aralia sachalinensis hort. ex Sieb. et Voss in Vilm. Blumengärten, 3 Aufl. I, 403. 1896, nom. nud.

Perennial herb 1-3 m tall. Leaves ternately compound, upper leaves pinnate to bipinnate or trifoliolate; stipules 5-13 mm long, 1.6-4.3 mm wide, lanceolate, sparsely covered with a few hairs, ciliate at margin; leaflets 6-21 cm long, 3-12.5 cm wide, papery, basal leaflets of the pinnae ovate, other leaflets ovate to narrowly so, acuminate at apex, cordate to subcordate at base, often oblique on lateral leaflets, serrulate at margin; lateral veins 9-11 on each side, conspicuous on both surfaces, sparsely scabrous on adaxial surface, often with scattered hairs on veins and veinlets, pubescent with scabrous hairs on abaxial surface, petiolules 0.1-2.4 cm long, pilose. Inflorescence 30-50 cm long, a terminal panicle with the lower 3-4 primary branches subtended by leaves rather than bracts, pilose, consisting of 20-30 primary inflorescence branches, mostly racemosely or sometimes paniculately arranged on a main axis, often 3-5 forming a circle on the upper part of the main inflorescence axis, each primary branch 6-12 cm long, consisting of 1-3 umbels, usually only the terminal umbel of each branch bearing fruits, others becoming aborted or functionally male; terminal umbels mostly (25-) 35-60-flowered, pedicels 15-22 mm long, pubescent, tip of pedicels enlarged and with a cluster of hairs; lateral umbels 18-25-flowered, pedicels 9-15 mm long; bracts of primary branches 5-10 mm long, 0.7-0.9 mm wide, linear, somewhat pilose; bracteoles 1.7-2.2 mm long, 0.2-0.3 mm wide, linear, pilose. Sepals 0.3-0.4 mm long, 0.2-0.3 mm wide, narrowly triangular; petals 1.6-2 mm long, 1-1.1 mm wide, ovate, with a conspicuous vascular bundle in the middle; stamens 5, 2-2.3 mm long, filaments 1.8-2 mm long, anthers 0.6-0.8 mm long, ca. 0.5 mm wide, ovate; ovaries 5-locular, styles 0.6-0.8 mm long at anthesis, connate at base, base of ovary slightly pilose with a few scattered hairs, the top part of the ovary conspicuously exposed and appearing like a stylopodium. Fruits 3-3.2 mm long and wide,

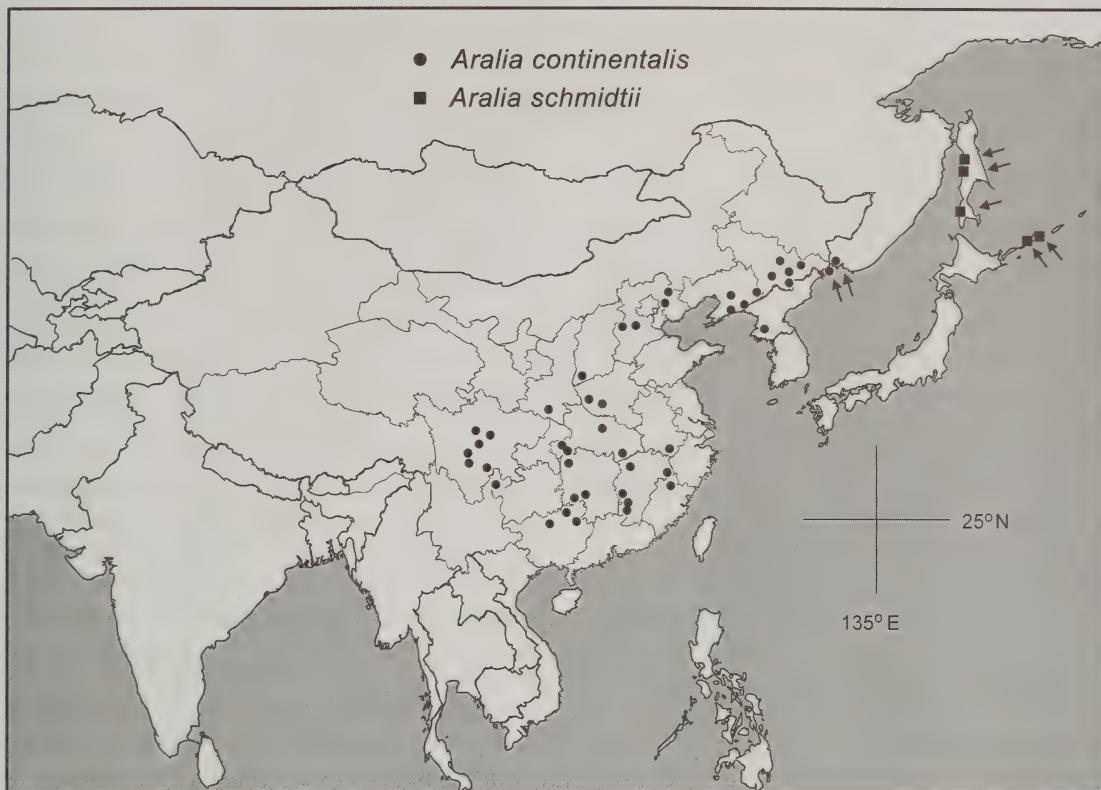

Fig. 25. Map of eastern Asia showing the distribution of *Aralia continentalis* Kitag. in China, far eastern Russia, and Korea, and *A. schmidtii* Pojark. in Sakhalin and Kuril islands.

globose, persistent styles connate at the base (divided roughly to the middle).

Phenology: flowering in July-August; fruiting in August to September.

Distribution: Sakhalin and Kuril islands, Russia (Fig. 25).

Ecology: Deciduous forests near sea shore.

Additional specimens examined: Russia. Kuril Islands, Kurilsk Island, 20 Jul 1982, floral buds, V. Barkalov s.n. (MW); Kuril Archipelago, Iturup, 5 Aug 1988, fl, V. Barkalov s.n. Sachalin, Augustinowiz 71 (K); Sagalien, Aug 1908, Faurie 398 (BM).

Nakai (1924) cited *Aralia racemosa* var. *sachalinensis* Regel as originally published by Regel (1864b; in Gartenfl. 13: 100. t. 432. 1864). Regel (1864a) also provided a brief description of *Aralia racemosa* var. *sachalinensis* (in Index Seminum Hort. Bot. Petr. 1864: 22). Regel (1864a) actually has nomenclatural priority, as it was published on March 8, whereas Regel (1864b) appeared in April. Regel (1864b) is a detailed description with an excellent illustration.

When Pojarkova (1950) originally published *Aralia schmidtii*, she clearly indicated her *Aralia schmidtii* as a new species (not a new name), and treated *Aralia racemosa* var. *sachalinensis* Regel as a synonym. She used a different type, as *A. racemosa* var. *sachalinensis* was described based on a plant raised from seeds collected by Schmidt.

Aralia schmidtii differs from the closely related *A. cordata* by the former's longer pedicels and more numerous flowers per terminal umbel.

6. *Aralia taiwaniana* Y. C. Liu & F. Y. Lu — Color plate 5: A-H.

Aralia taiwaniana Y. C. Liu & F. Y. Lu in Y. C. Liu, Quart. J. Chinese Forest. 9: 136, t. 8. 1976.
TYPE: **China.** TAIWAN: Nantou Hsien, F. Y. Lu & C. H. Ou 1507 (holotype: NCUF!).

Perennial spreading herb 1-2 m tall, andromonoecious. Stem pubescent. Rhizomes thick. Leaves ternately compound, lower leaves 75-90 cm long and wide, tripinnately ternate, upper leaves pinnate to bipinnate; stipules 4-10 mm long, 2-4 mm wide, narrowly triangular to lanceolate, pilose, sparsely ciliate at margin; leaflets 5.5-15 cm long, 3-9.5 cm wide, papery, the basal leaflets of the pinnae ovate, other leaflets ovate to narrowly so, acuminate to abruptly so at apex, truncate, rounded to subcordate or sometimes cordate at base, often oblique on lateral leaflets, finely serrate to doubly so at margin; lateral veins 8-10 on each side, conspicuous on both surfaces, scabrous on adaxial surface, often with scattered hairs on veins and veinlets, pilose on abaxial surface, petiolules of lateral leaflets 0.3-2.5 cm long, pilose. Inflorescence a terminal or axillary panicle, pilose, terminal inflorescence 20-55 cm long, consisting

of 10-30 primary inflorescence branches, more or less racemosely arranged on a main axis, sometimes 6-12 forming a circle on the upper part of the main inflorescence axis, or forming 2-3 circles on the inflorescence axis, each primary branch 6-18 cm long, consisting of 2-7 umbels, terminal umbels mostly (25-) 35-65-flowered, pedicels 15-20 mm long, slender and pilose, tip of pedicels enlarged and with a cluster of hairs; lateral umbels not well developed, usually of male flowers, 15-25-flowered, pedicels 3-12 mm long; bracts of primary branches 5-20 mm long, 0.7-2 mm wide, linear, pilose, sometimes becoming leafy; bracteoles 1.8-2 mm long, 0.3-0.4 mm wide, linear, pilose. Sepals 0.3-0.5 mm long, 0.4-0.5 mm wide, triangular; petals 1.8-2 mm long, 0.9-1.1 mm wide, ovate, with a conspicuous vascular bundle in the middle, tip slightly enlarged; stamens 5, 1.7-2.2 mm long, filaments 1.5-2.1 mm long, anthers 0.6-0.7 mm long, 0.4-0.5 mm wide, ovate, light, yellow; ovaries 5-locular, styles 0.5-0.6 mm long at anthesis, base of ovary nearly glabrous, top part of ovary projected, disk pale yellow turning magenta. Fruits 3.2-4 mm long and wide, globose, dark purple at maturity, persistent styles divided from the middle or nearly to the base. Seeds 1.5-1.8 mm long, 0.9-1 mm wide, 0.4-0.6 mm thick, kidney-shaped, greenish white.

Common names: Taiwan tu-dang-gui; and tu-dang-gui.

Phenology: flowering from July to September; fruiting from August to November.

Distribution: endemic to Taiwan (Chiayi, Hsinchu, Hualien, Ilan, Miaoli, Nantou and Taichung) (Fig. 26).

Ecology: in mixed coniferous and broadleaf forests, or in broadleaf forests; (1250) 1700-2900 m.

Additional specimens examined: China. TAIWAN: Chiayi Co., Alishan, 24 Aug 1990, fl, C. H. Ou et al. s.n. (TNM). Hsinchu Co., Kuanwu, 20 Jun 1990, fl, C. H. Ou et al. s.n. (TNM). Hualien Co., Mt. Kwarenko-Tyo, between Be Derikku and Be Padahu, 2900 m, monte Tyuosenzan, 30 Jul 1936, fl, N. Fukuyama & Suzuki-Tokio ST 15202 (PE, TAI).

Aralia taiwaniana usually occurs from 1250-2900 m in altitudes in Taiwan. It is interesting to note that a few specimens from Pingtung of southern Taiwan at very low altitudes are morphologically abnormal with smaller leaflets, and shorter and fewer pedicels. The Pingtung

collections (from Gangkou) were most likely from cultivated material. The Government of Formosa Nursery formerly stood on this site and the Japanese like udo as vegetables. Gangkou is near the seashore and appears to low in altitude for natural populations of *A. taiwaniana*.

Aralia taiwaniana differs from *A. cordata* in that *A. taiwaniana* has pubescent (vs. hirsute lower stem surface) and does not have leafy stipules (cf. color plates 4C and 5D). Compared to *A. cordata*, *A. taiwaniana* tends to have leafy and smaller inflorescence.

In comparison with *Aralia continentalis*, *A. taiwaniana* has finer leaflet margin and its pedicels are statistically longer. It is interesting to note that the few specimens from Pingtung of southern Taiwan at very low altitudes are morphological abnormal with smaller leaflets, and shorter and fewer pedicels. The Pingtung collections (from Gangkou) were most likely from cultivated material. The Government of Formosa Nursery was there and the Japanese folks like udo as vegetable. Gangkou appears to be too low in altitude for *Aralia taiwaniana*, as it is near the seashore.

Aralia taiwaniana resembles *A. schmidtii* that both taxa have more than 35 flowers in each terminal umbel. Yet they can be differentiated as follows:

1. Leaflet margin finely serrulate, base of leaflets cordate, stipules lanceolate; endemic to the Sakhalin & Kuril islands of far eastern Russia
..... *A. schmidtii*
1. Leaflet margin doubly serrate, base of leaflets obliquely truncate to subcordate, rarely cordate, stipules narrowly triangular; endemic to Taiwan
..... *A. taiwaniana*
7. *Aralia continentalis* Kitag. — Fig. 27; color plate 6: A-E.

Aralia continentalis Kitag., Bot. Mag. (Tokyo) 49: 228, t. 3. 1935. *Aralia cordata* Thunb. var. *continentalis* (Kitag.) Y. C. Zhu in Z. Y. Chang (ed.), Pl. Medic. Chinae Bor.-Orient.: 787. 1989. TYPE: **China**. LIAONING: southern Manchuria, Fengtien Prov. [Liaoning Prov.], Jalu [Yalu] River valley, near Schildagou, 13 Aug 1897, fl. V. Komarov 1152 (lectotype: TI!, here designated; isolectotype: BM!, LE!).

Perennial spreading herb 1-3.3 m tall. Stem pubescent, lower part sometimes with stiff hairs. Rhizomes thick. Leaves 50-100 cm long and wide, ternately compound, lower leaves tripinnately ternate, upper leaves pinnate to trifoliolate or tripinnately ternate; stipules 5-20 mm long, 3.5-15 mm wide, pilose; leaflets 5-16.5 cm long, 3-9.5 cm wide, papery, the basal leaflets of the pinnae ovate, other leaflets ovate to narrowly so, acuminate to acute at apex, cordate to subcordate or sometimes rounded at base, often oblique on lateral leaflets, serrate to doubly so at margin; lateral veins 7-9 on each side, conspicuous on both surfaces, scabrous on adaxial surface, often with scattered hairs on veins and veinlets, pubescent with scabrous hairs on abaxial surface, petiolules of lateral leaflets 0.1-2.2 cm long, more or less pilose. Inflorescence a terminal or axillary panicle, pilose, terminal inflorescence 30-65 cm long, consisting of 20-35 primary branches, paniculately or racemously arranged on a main axis, occasionally 3-5 forming a circle on the upper part of the main inflorescence axis, each primary branch 5-15 cm long, consisting of 2-18 umbels, often the primary branches further divided into a panicle; terminal umbels mostly 16-35 (-50)-flowered, pedicels 6-10 mm long, pubescent, tip of pedicels enlarged and with a cluster of hairs; lateral umbels 8-13-flowered, pedicels 4-7 mm long; bracts of primary branches 5-9 mm long, 0.6-0.8 mm wide, linear to lanceolate, somewhat pilose; bracteoles 1.2-2 mm long, 0.2-0.3 mm wide, lanceolate, pilose. Sepals 0.4-0.5 mm long, 0.6-0.7 mm wide, triangular to broadly so; petals 1.8-2 mm long, 0.9-1.1 mm wide, ovate, with a conspicuous vascular bundle in the middle, tip slightly enlarged; stamens 5, 2.5-2.7 mm long, filaments 2-2.4 mm long, anthers 0.6-0.8 mm long, 0.4-0.5 mm wide, ovate; ovaries 5-locular, styles 0.6-0.7 mm long at anthesis, base of ovary nearly glabrous, the top part of ovary slightly projected. Fruits 3.5-4 mm long and wide, globose, persistent styles divided to the middle. Seeds 2-3 mm long, 1.2-1.4 mm wide, 0.8-1 mm thick, kidney-shaped.

Common names: tu dang gui and duhe (China), and Dok-whal (Korea).

Uses: leaves as vegetables; roots as blood-regulating medicine.

Phenology: flowering in July and August; fruiting in September to October.

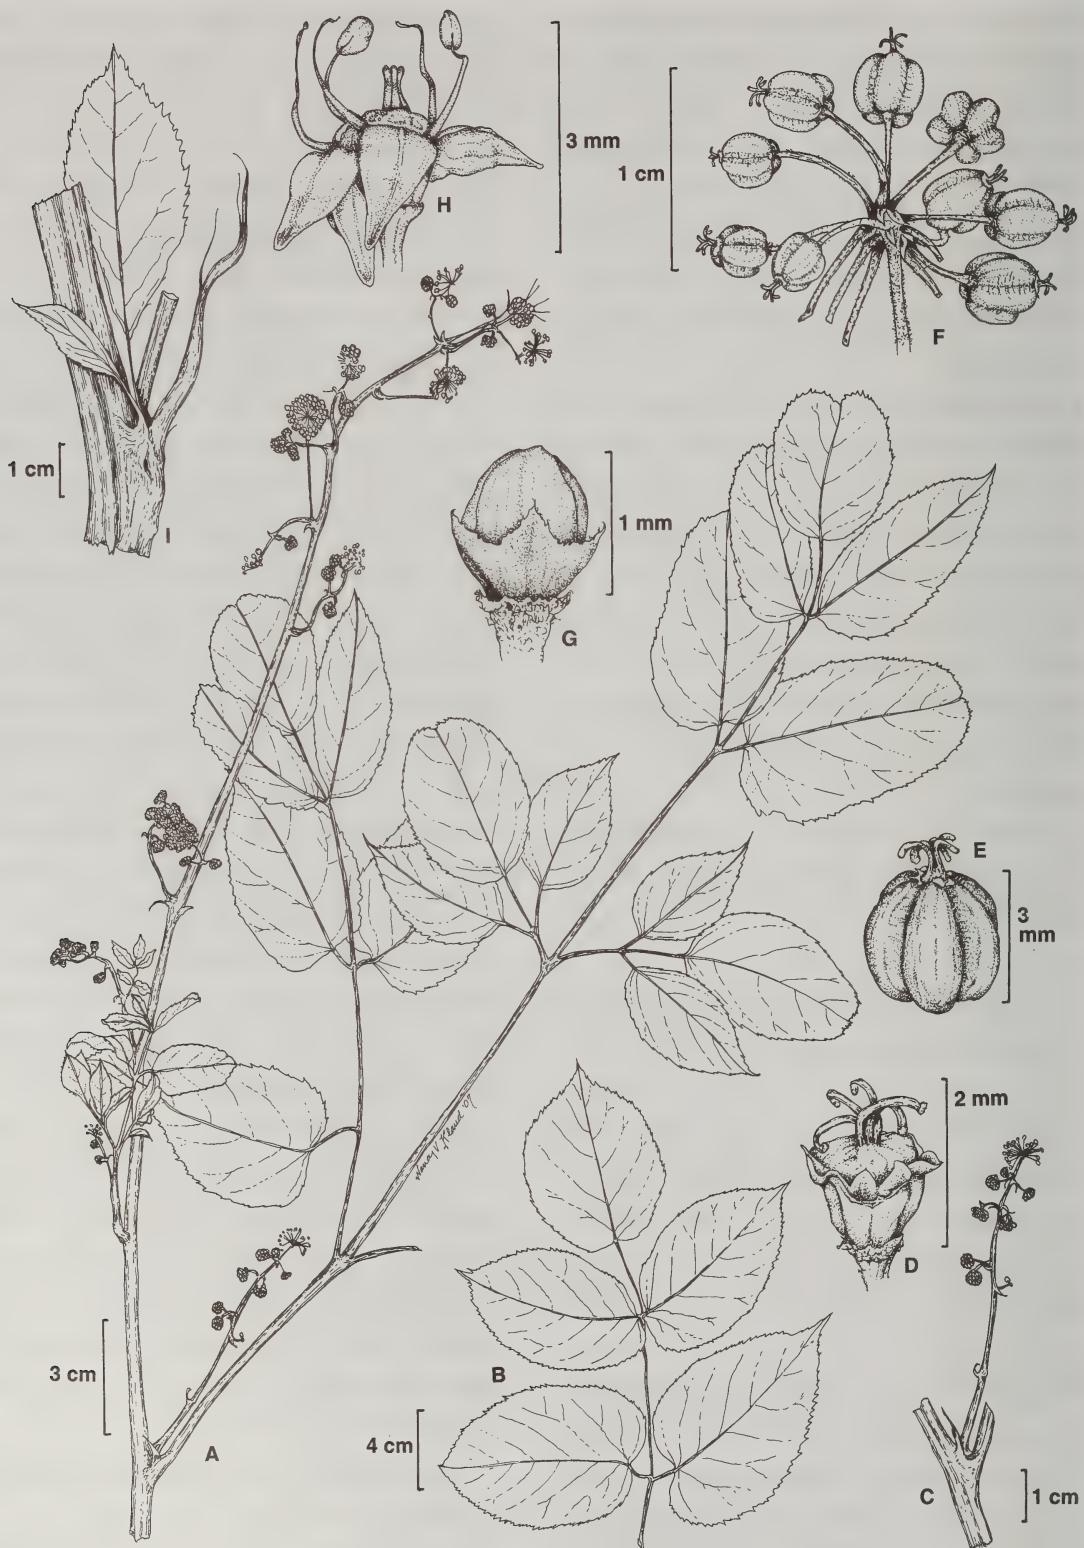

Fig. 27. *Aralia continentalis* Kitag. A. Habit showing leaves and inflorescences. B. Part of a lower leaf showing the terminal pinna. C. Axillary inflorescence. D. Flower after anthesis. E. Young fruit. F. Umbel with fruits. G. Floral buds. H. Flower. I. Leaf-like stipule (A, C & G – Ye 2002, MO; B, D & H – Biao 1104, MO; E & F – Wang 60812, A; I – Ching 2957, A).

Distribution: eastern Russia, eastern, central, south-central, and northern part of China (to northern Guangxi province in the southern part of China), and Korea (Fig. 25).

Specimens from cultivated source: **China.** JIANGXI: Lushan Botanical Garden, 4 Sep 1988, fr, *J. Wen* 610 (OS).

Kitagawa (1935) cited five specimens (syntypes) in the original description of *Aralia continentalis*. *V. Komarov* 1152 is representative of the morphology of the Manchurian "*A. continentalis*" and was distributed to different herbaria (BM, LE, and TI). It is thus selected as the lectotype for *Aralia continentalis*. It is noted that *Komarov* 1152 consists of mixed collections which were made in the summer of 1897. The lectotype was collected on August 13, 1897. Two other specimens of *Komarov* 1152 were seen, but were not considered as isolectotypes: (Korea, 6 July 1897, *V. Komarov* 1152, K; and China, Jilin, Mu-dan-dsian, 10 Jul 1897, *V. Komarov* 1152, A, W).

8. *Aralia cachemirica* Decne. — Fig. 28.

Aralia cachemirica Decne. in Jacquem. Voy. Inde 4: 72. 1844. TYPE: **India.** Kashmir, Mt. Vestervonne, 3087 m, 12 Jun 1831, *V. Jacquemont* 718 (lectotype, P!, here designated).

Aralia macrophylla Lindl., Edward's Bot. Reg. 30: 73. 1844. TYPE: **India.** North part (type not seen).

Robust, spreading, and unarmed perennial herb 1.5-2.3 m tall; stem green to greenish purple. Leaves 1.7-2.3 cm long, 0.8-1.2 cm wide, lower leaves ternately compound, upper leaves pinnate to bipinnate; stipules narrowly triangular, membranaceous, ciliate at margin, pilose; uppermost petioles 4-19 cm long, greenish, puberulent; leaflets (4)-8-21 cm long, (1.5) 3-8.5 (11) cm wide, thick papery, the pair of leaflets below the terminal leaflet narrowly ovate, other leaflets ovate to narrowly so, rarely elliptic, acute to acuminate at apex, rounded to subcordate, rarely cordate at base, commonly oblique on lateral leaflets, serrulate to serrate, sometimes doubly so at margin; lateral veins (8)-10-12-(19) on each side, conspicuous on both surfaces, nearly glabrescent to slightly scabrous on adaxial surface, often with scattered hairs on veins and veinlets, glabrescent to slightly puberulent on abaxial surface, petiolules 0.2-2.2 cm long, glabrescent to

slightly pilose. Inflorescence 15-45 cm long, terminal and axillary, paniculate in overall structure, puberulent, consisting of numerous umbels, primary inflorescence branches 15-30, mostly racemosely or sometimes paniculately arranged, often 3-8 forming a circle on the main inflorescence axis, each primary branch 3-10 cm long, consisting of 1-4 umbels, usually only the terminal umbel of each branch bearing fruits, others becoming aborted; terminal umbels mostly 35-70-(95)-flowered, pedicels 7-11 (-16) mm long, pubescent; lateral umbels 15-25-flowered, pedicels 5-8 mm long; bracts of primary branches 3.5-8 mm long, 0.5-1 mm wide, linear, somewhat pilose, sometimes leafy at the lower part of the inflorescence; bracteoles 1.2-2.2 mm long, linear, more or less ciliate at margin. Sepals 0.3-0.4 mm long, broadly to narrowly triangular, persistent on fruits; petals 1.7-2.2 mm long, ca. 1 mm wide, ovate, greenish white to white, with a conspicuous vascular bundle in the middle; stamens 5, 1.8-2 mm long; ovaries 5-locular, styles ca. 0.5 mm long at anthesis, base of styles conspicuously enlarged, appearing like a stylopodium. Fruits 3-4 mm long, 3.8-4 mm wide, globose, persistent styles ca. 1 mm long, divided to the middle. Seeds 2-2.2 mm long, 1 mm wide, 0.2-0.25 mm thick, kidney-shaped, whitish gray, smooth.

Phenology: flowering in late June to September; fruiting in September and October.

Distribution: Northwestern India, northern Pakistan, and western Nepal, most often collected from the Kashmir region (Fig. 29).

Ecology: river valleys, streamsides, and mixed forests; 2100-3650 m.

Additional specimens examined. **India.** Humid woods above Sendjigam, 2600 m, *V. Jacquemont* 913 (P, 2 sheets); *V. Jacquemont* s.n. (P). 8-9000 ft, 1884, *J. F. Duthie* 595 (LE); NW India, *J. F. Four specimens of *Aralia cachemirica* are preserved at P, which were collected during Victor Jacquemont's voyage to India [*V. Jacquemont* 717, 718, 913 (2 sheets), and a specimen without number]. *V. Jacquemont* 718 bears both leaves and flowers and is representative for the species. It is thus selected as the lectotype.

Two specimens (*J. D. Hooker s.n.*, LE, from Sikkim, 10-12000 ft; and *O. Polunin et al.* 5045, BM, E, from Nepal, below Garjigoth, 9500 ft, 9 Aug 1952) appear to be morphologically intermediate between *A. cachemirica* and *A. tibetana*. They are herein cited as *A. cachemirica* on a tentative basis. Field studies are required in

these areas to ascertain the taxonomic status of the populations represented by these specimens.

The type of *Aralia macrophylla* has not been located at present. Its author, Lindley (1844, p. 73), noted the species as follows: "This is an herbaceous plant from the North of India, looking like *A. racemosa*, but much larger in all its parts. The flowers, which are greenish-yellow, have been produced in the garden of the Horticultural Society, where the plant has been raised from seeds presented by the East India Company."

9. *Aralia tibetana* G. Hoo — Fig. 30; color plate 7: A-F.

Aralia tibetana G. Hoo, Acta Phytotax. Sin., Add. 1: 175. 1965. TYPE: CHINA. XIZANG: Tibet [Xizang Prov.], Rung-sa, Mt. Jolmo Lungma, under forests of *Tsuga*, 3100 m, 2 Aug 1959, *Mt. Jolmo Lungma Exped. Team* 758 (holotype: PE!).

Panax tripinnatum Wall. ex Don, Gen. Hist. 3: 384. 1834 (non *Aralia tripinnata* Blanco, Fl. Filip. ed. 1: 223). TYPE: Emodi [Himalaya], at Gosain Than [now in Nepal], Aug 1821, fl, *N. Wallich* 4934 (holotype: BM!; isotypes: G!, K!, K-W!).

Perennial herb, up to ca. 2 m tall, stem purple to dark purple, nearly glabrous, bearing 4-5 leaves; rhizomes thick. Leaves 50-90 cm long, 40-80 cm wide, tripinnately or bipinnately ternate; uppermost leaves 12-20 cm long, 10-15 cm wide, bipinnate to pinnate, or occasionally tripinnate; stipules of lower leaves 1.5-2.5 cm long, 1-1.2 cm wide, membranaceous, narrowly triangular to ovate, pilose, somewhat divided or toothed at the tip, enclosing the emerging young shoot, stipules of upper leaves 2-3 mm long, triangular in shape; petioles of uppermost leaves 3-7 cm long, pilose; leaflets 3.5-11.5 cm long, 2.3-5.5 cm wide, membranaceous, ovate, or occasionally narrowly so to elliptic, sharply long acuminate or sometimes acuminate at apex, rounded to subcordate at base, doubly serrulate to sometimes doubly serrate at margin, lateral veins 7-9 on each side, sunken on adaxial surface, conspicuous on both surfaces, adaxial surface green, scabrous when young, pilose along veins to glabrescent when mature, abaxial surface whitish green, pilose, or at least along the veins and veinlets, with conspicuously visible fine

Fig. 30. *Aralia tibetana* G. Hoo. A. Leaf with axillary inflorescence. B. Stipule. C. Umbel also showing bracts. D. Inflorescence. E. Floral bud. F. Flower. G. Flower showing anthers and gynoecium after breaking off two petals. H. Fruit. I. veinlets; petiolules 0.1-2 cm long, slightly pilose. Inflorescence 20-40 cm long, terminal and axillary, consisting of numerous umbels, primary inflorescence branches 12-30, mostly racemosely arranged, often 3-7 forming a circle on the main inflorescence axis, each primary branch 4-8.5 cm long, consisting of 1-4 umbels, usually only the terminal umbel of each branch bearing fruits, others becoming aborted; terminal umbels mostly 30-70-flowered, pedicels 6.5-11 mm long, pubescent, enlarged and with tufts of hairs at the tip, the hairs and the enlarged tip forming a somewhat disk-like structure at the base of the flower; lateral umbels 15-25-flowered, pedicels 4.5-9.5 mm long; bracts of primary branches 5-7 mm long, 1-2 mm wide, lanceolate to narrowly triangular, ciliate at margin, sometimes bracts becoming leafy and enlarged; bracteoles 1.6-2.2 mm long, 0.4-0.6 mm wide, lanceolate, glabrous or nearly so. Sepals 0.4-0.6 mm long, 0.4-0.5 mm wide, narrowly triangular, persistent on fruits; petals 1.5-2.0 mm long, 1-1.2 mm wide, ovate, pale purplish, with a conspicuous vascular bundle in the middle; stamens 5, 2.2-2.8 mm long, filaments 2-2.5 mm long, anthers 0.7-0.8 mm long, 0.4-0.5 mm wide, ovate; ovaries 5-locular, styles 0.7-0.8 mm long at anthesis, tip of ovary enlarged and projected. Fruits 2.7-3.5 mm long, 3-3.4 mm wide, globose, purplish black, persistent styles divided to the middle, 1.1-1.3 mm long. Seeds 2-2.5 mm long, 1-1.2 mm wide, 0.6-0.7 mm thick, kidney-shaped, whitish gray, smooth.

Common name: Xizang tu dang gui.

Phenology: flowering in July and August; fruiting in September to October.

Distribution: in the eastern Himalaya, including eastern and central Nepal, Sikkim of India, western Bhutan, and southern Tibet and western Sichuan of China (Fig. 31).

Ecology: in shady forests, edge of woods, grassy slopes, among rocks and shrubs, especially in mixed *Rhododendron* forests; 2400-4250 m (8,000-14,000 ft).

Additional specimens examined: **Bhutan.** Bhutan. Mindook La, 31 Jul 1884, in fl., *Dungboo* 2 (P). Tilaging Timpu, 8000 ft, 17 Aug 1914, *R. E. Cooper & A. K. Bulley* 2567 (BM); Dotura + Timpu, 1 Oct 1914, fr, 10,000 ft, *R. E. Cooper* 2983 (BM); west Bhutan, Damthaug, 30 Sep 1933, *F.*

Panax decompositum Wall. ex DC. (de Candolle 1830) was previously treated as a synonym of *Aralia cachemirica* by Clarke (1879). Wen et al. (2002) placed it as the synonym of *Aralia tibetana*. My recent examination of *N. Wallich* 4935 at K-W has shown that this specimen belongs to *Aralia armata* (Wall. ex G. Don) Seem.

I noted a few specimens from Sichuan, China which are similar to *Aralia tibetana*. But they differ from the latter that the lateral leaflets immediately

below the terminal leaflets have relatively long petiolules (14-18 mm long); and that the teeth at the leaflet margin are short and triangular with a slightly glandular tip. These specimens are cited as below: **China.** SICHUAN: Baoxin: Bao-Hsin (Moupin), in shadow or damp places, creeping thick roots used as asprine, Jul-Aug 1939, young fr, *S. Y. Hu* 1242 (A, 2 sheets). Dujiangyan Shi, west of Kuan Hsien, woodlands, Pan-lan-shan, 8000 ft, Oct 1910, fr, *E. H. Wilson* 4285 (A, 2 sheets). Heishui, Wabo, 2750 m, 8 Jun 1959, floral buds, *Chuan-Jing-A (Sichuan Economic Plants Aba)* 1333 (KUN). Hongqi, Lema, herb 1 m tall, 31 Jul 1959, fl, *Sichuan Economic Plants Liangshan Team* 1510 (KUN). Leibo Xian, Shanlinggang, Dagudui Xiang, Huangmaolang, 2700 m, herb 20-30 cm, 19 Jun 1959, *Sichuan Economic Plants Liangshan Team* 0801 (KUN). Lieng Ho Kou, Aug 1938, *Wang & Wen* 694 (A). Western China, locality unknown, 8500 ft., 2-3 ft, Jul 1903, in fl., *E. H. Wilson* 3710 (A, BM, K, P).

Further collections and field studies are required to determine whether these collections represent a new species or just *Aralia tibetana*.

10. *Aralia fargesii* Franch. — Color plate 8: A-F.

Aralia fargesii Franch., J. Bot. (Morot) 10: 302. 1896. TYPE: **China.** CHONGQING: Sut-chuen oriental [now Chongqing Shi], District of Tchen-keou-tin [Chengkou], *R. P. Farges* s.n. (holotype: P!, photo [A]!; isotypes: P(4)! photo [A]!, leaves only).

Aralia kansuensis G. Hoo, Acta Phytotax. Sin., Addit. 1: 174. 1965. TYPE: **China.** GANSU: Xigu (now Zhouqu Xian), Heiyugou, Shanshengyeliang, on a *Quercus* tree, 3100 m, 19 Jul 1951, young fr, *Z. B. Wang* 14444 (holotype: WUK!; isotype: PE!).

Perennial spreading herb 0.7-1.5 m tall. Stem purple to purplish green; rhizomes thick and horizontal in older plants, younger ones well developed tap roots. Leaves 27-45 cm long, 20-35 cm wide, 3-4 on each plant, tripinnately or bipinnately ternate; stipules 8-10 mm long, 2-3 mm wide, narrowly triangular, membranaceous; petioles of uppermost leaves 7-12.5 cm long, pilose; leaflets (3-) 5.5-11 cm long, (1.5-) 3-8.5 cm wide, membranaceous to chartaceous, ovate to broadly or narrowly so, acuminate to sharply so at

apex, cordate, subcordate, to rarely truncate at base, doubly serrate at margin, lateral veins 7-9 on each side, conspicuous on both surfaces, adaxial surface green, sparsely scabrous, abaxial surface light green, pilose along the veins and veinlets, petiolules 4-20 mm long, pilose. Inflorescence 15-43 cm long, terminal and axillary, a loose panicle consisting of an umbellate structure at the top and 2-3 branches below, pilose, the top umbellate structure with 4-6 primary branches, each primary inflorescence branch 7-14 cm long, mostly with 1-6 umbels; terminal umbels 15-25-flowered, pedicels 5-6 mm long, pubescent; lateral umbels 7-15-flowered, pedicels 4-5 mm long; bracts of primary branches leafy to lanceolate, variously sized; bracteoles 1.3-1.5 mm long, 0.1-0.2 mm wide, linear to lanceolate. Sepals 0.5-0.6 mm long, 0.6-0.7 mm wide, triangular, persistent on fruits; petals 1.6-1.8 mm long, 1-1.1 mm wide, ovate, with a conspicuous vascular bundle in the middle; stamens 5, filaments 1.9-2.1 mm long, anthers ca. 1 mm long, ovate; ovaries 5-3-locular, styles 5-3 lobed to the middle. Fruits 4-5 mm in diameter, globose, persistent styles divided to the middle. Seeds 3-3.2 mm long, 1.3-1.4 mm wide, ca. 0.2 mm thick, kidney-shaped, whitish, smooth.

Common name: long yan du he.

Uses: roots as blood-regulating medicine, also for arthritis.

Phenology: flowering in July; fruiting in August to September.

Distribution: Hubei, Chongqing, Gansu, Sichuan, Shaanxi and Qinghai provinces of China (Fig. 32).

Ecology: in forests or thickets, relatively rich habitats; 1750-3400 m.

Additional specimens examined: China. CHONGQING: Western China, Wu Shan (Mt. Wu), 9000 ft., 5 Jul 1903, in fl., *E. H. Wilson* 3698 (BM, K, 2 sheets, P, 2 sheets, PE). Aralia fargesii differs from *A. atropurpurea* in its styles connate to the middle (vs. completely distinct in *A. atropurpurea*), well developed thick rhizomes (vs. well developed tap roots) in older plants, inflorescence a loose panicle with an umbellate structure on top and 2-3 additional primary branches below (vs. an umbellate inflorescence in *A. atropurpurea*), and shorter pedicels (5-6 mm vs. 8-12 mm in terminal umbels). In general, *Aralia fargesii* is a bigger and a more robust plant ca. 1-1.5 m tall,

Aralia kansuensis G. Hoo is now treated as the synonym of *A. fargesii*. The type of *Aralia kansuensis* bears smaller leaflets which are 3-5 cm long and 1-2.5 cm wide. There are two inflorescences on the type specimen; one is an umbellate structure with 7 primary branches, and the other bears two whorls of primary branches (6-7 branches each). The type resembles closely *A. fargesii* except that the leaflets are smaller. I interpret the morphotype in "*A. kansuensis*" as the extreme condition at the higher altitudes and its westernmost distribution. Another specimen (Z. B. Wang 14625) was also collected in Xigu of Gansu, but at a lower altitude (2500 m). This specimen shows the typical morphology of *A. fargesii*. Huang Tu Team 5939 was collected from Xunhua of Qinghai province at the altitude of 2800 m. One of the two sheets has smaller leaflets (3-5 cm long, 1.5-2 cm wide), closely resembling the type specimen of *A. kansuensis*, and the other sheet has much larger leaflets (7-8.5 cm long, 3-4.7 cm wide).

Perennial herb 0.5-1 m tall, andromonoecious. Main roots 15-40 cm long, deep, forked often unequally. Stem purplish green, with 2-4 leaves. Lower leaves 60-75 cm long, 50-70 cm wide, tripinnately ternately compound; upper leaves 17-25 cm long, 13-22 cm wide, bipinnately ternate to pinnate or sometimes trifoliate; stipules 3-4 mm long, 2-3 mm wide, narrowly triangular, more or less ciliate at margin; petioles 2.3-14.5 cm long, slightly pilose to glabrescent, occasionally more densely pilose, especially in Muli area of Sichuan province; leaflets 2.5-7.8 cm long, 1.5-5 cm wide, 1-5 per pinnule, chartaceous to sometimes membranaceous, ovate to narrowly ovate, or sometimes broadly so, acuminate to sharply so at apex, cordate, obliquely cordate, subcordate, truncate to rounded at base, finely doubly serrate at margin, lateral veins 7-9, conspicuous on both sides, adaxial surface green, scabrid, abaxial surface grayish green, pilose along the veins and veinlets, petiolules more or less pilose, those of lateral leaflets (0) 0.3-2 cm long, gradually becoming shorter toward the tip of the pinnae, those of terminal leaflets 1.2-3.5 cm long. Inflorescence 10-25 cm long, loose, terminal and axillary, more or less umbellate in outline, sometimes with one or two umbels below the primary umbellate structure, glabrous, primary branches 2-4, each with 1-5 umbels, each primary branch 8-20 cm long, subtended by a leafy bract or a lanceolate bract, sizes of bracts varied greatly, terminal umbels 15-25-flowered, pedicels 8-12 mm long, pilose to nearly glabrous, lateral umbels 8-14-flowered, pedicels 5-11 mm long, pilose to nearly glabrous, bracteoles 1.5-1.8 mm long, 0.2-0.35 mm wide, lanceolate. Flowers dark purple,

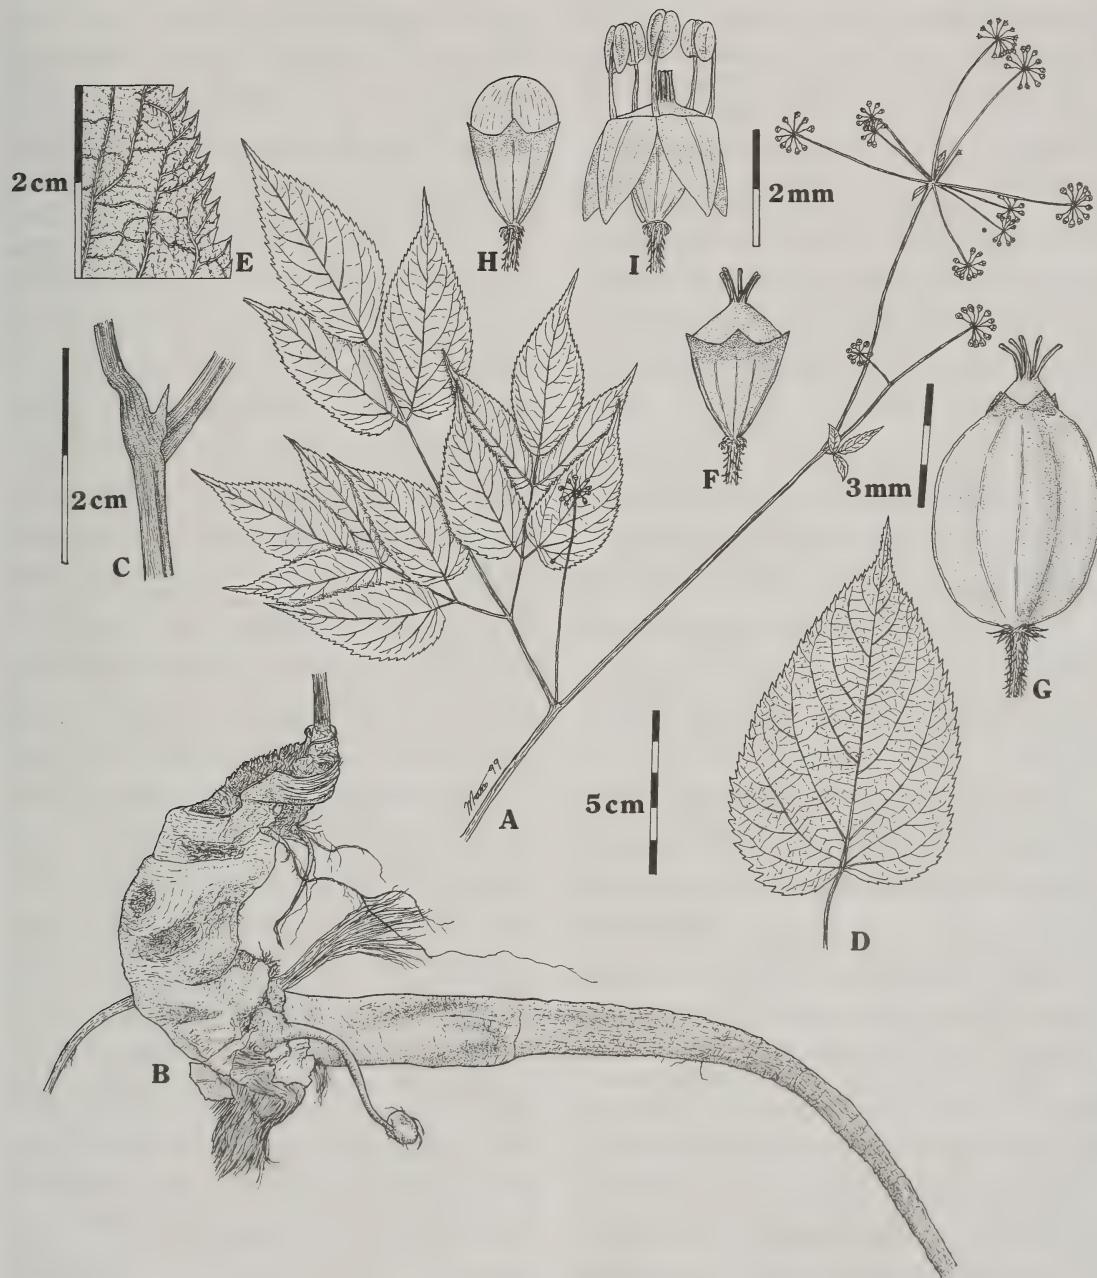

Fig. 33. *Aralia atropurpurea* Franch. A. Habit showing a leaf and inflorescences. B. Rhizome and root. C. Base of petiole showing stipule morphology. D. Leaf on a leaf on the lower part of the stem. E. Close-up showing leaflet margin and pubescence on lower surface. F. Flower after anthesis. G. Young fruit. H. Floral bud. I. Flower (A-I - Wen 3057, US).

floral buds globose, with several flowers aborted, perhaps functionally male, on each terminal umbel, more so on lateral umbels at fruiting stage; sepals minute, 0.5-0.6 mm long, 0.4-0.6 mm wide, triangular or narrowly so, spreading at anthesis, recurved afterwards, persistent into fruiting stage; petals 1.5-2.0 mm long, 1.2-1.3 mm wide, ovate; stamens 1.5-1.7 mm long, filaments 1.2-1.5 mm long, anthers 0.4-0.5 mm long, 0.3-0.4 mm wide, oblong; gynoecium conical at base, styles 5, 0.7-0.9 mm long, completely divided after anthesis, the apical portion of the ovary somewhat projected. Fruits 5-6 mm in diameter, globose, 5-ridged when dry, with 5 persistent recurved styles. Seeds 3.5-3.7 mm long, 2.1-2.2 mm wide, ca. 0.2 mm thick, kidney-shaped, whitish.

Common name: nong zhi long yan du he.

Uses: roots used as blood-regulating medicine and for correcting irregular menstrual period.

Phenology: flowering in June to September; fruiting from July to October.

Distribution: Sichuan and Yunnan of China (Fig. 32).

Ecology: in broadleaf or mixed conifer and evergreen broadleaf forests; 1800-3300 m.

Additional specimens examined: China. SICHUAN: Huidong, Baisha Xiang, 3100 m, 19 Jun 1959, fl, S. G. Wu 771 (KUN). When describing *Aralia yunnanensis*, Franchet (1896) cited two specimens (*Delavay* 4027 and *Delavay* 4581). The two specimens are different in habits (*Delavay* 4027 herbaceous, and *Delavay* 4581 woody) and they apparently represent two distinct species. Li (1942) typified *Aralia yunnanensis* with the herbaceous *Delavay* 4027,

then treated it as a variety of *A. fargesii*. Li's definition of *Aralia fargesii* was broad. The type of *Aralia fargesii* was collected near Chengkou of the now Chongqing Shi. *Aralia fargesii* has connate styles to the middle and much larger leaves, and more robust inflorescences with more flowers in each umbel.

Aralia yunnanensis is herein treated as a synonym of *Aralia atropurpurea*. At the type locality of *A. yunnanensis* in Jishan or also known as Jizhushan, typical *A. atropurpurea* also occurs. Many intermediates were found between the two "species." In general, plants of "*A. yunnanensis*" grow at somewhat higher altitudes. Both "species" can co-occur and there is a lack of consistent differences between the two. I thus recognize them as one species. Both names were published in the same paper by Franchet in 1896, with *A. atropurpurea* on p. 301, and *A. yunnanensis* on p. 303. Also *A. yunnanensis* was associated with a species in *Aralia* sect. *Pentapanax*. I thus prefer the use of *Aralia atropurpurea*, which describes the often purple stem of the species.

The holotype of *Aralia dumetorum* Hand.-Mazz. from W bears the handwriting of Handel-Mazzetti "*Aralia dumetorum* Hand.-Mazz., sp. n." This specimen was collected by E. E. Maire in July 1913. Interestingly, the herbarium label said "fl. grises - fruits noirs" (flowers greyish and fruits black). The specimen had flowers, which appears to be collected in July, but no fruits were seen on the specimen.

Examination of the types of *Aralia dumetorum* and *A. melanocarpa* suggests that these two "taxa" are identical. The type localities of both *Eleutherococcus melanocarpa* H. Lév. [= *Aralia melanocarpa* (H. Lév.) Lauener] and *A. dumetorum* were Ma-li-ouan of Yunnan. But the type of *Eleutherococcus melanocarpa* was collected in October in the same year by E. E. Maire when the plants were bearing fruits, whereas that of *Aralia dumetorum* was collected in July. Furthermore, some E. E. Maire (Edward Ernest Maire) specimens from Yunnan at P were labeled with the collector R.-P. Maire. "R.-P. Maire" represented Révérend Pére Maire because Edward Ernest Maire was a missionary priest in Yunnan then.

I herein treat both *Aralia melanocarpa* and *A. dumetorum* as synonyms of *A. atropurpurea*. Li (1942) cited Wilson 4185 (A) as *A. dumetorum*, and noted that *A. dumetorum* possessed terminal

paniculate inflorescence. Apparently Li did not have access to the holotype of *A. dumetorum* during WWII, when his treatment of Araliaceae of China was completed. Handel-Mazzetti (1933) described the inflorescence of *A. dumetorum* as a terminal panicle, and this taxon was described based on one specimen (the type). The holotype of *A. dumetorum* actually bears an inflorescence with three main branches originating from one point, two of them having two umbels and one with a single umbel. This is here interpreted as an umbellate structure, just like that in *A. atropurpurea*, which usually has 2-4 primary branches originating from one point.

E. E. Maire noted on the label of the type specimens of *Aralia melanocarpa* that the flowers were greenish white and fruits black. The holotype has fruits with purple tints. All *Aralia atropurpurea* has dark purple fruits.

12. *Aralia apioides* Hand.-Mazz. — Fig. 34; color plate 10: A-G.

Aralia apioides Hand.-Mazz., Symb. Sin. 7: 701. 1933. TYPE: **China**. YUNNAN: in region of Landsang-djiang (Mekong) and Lu-djiang (Salween) divide, Saa-lumba, 28°, 3500-3600 m, 18 Jun 1916, H. Handel-Mazzetti 8979 (holotype: W!; isotypes: WU!, 3 sheets).

Perennial herb ca. 1 m tall. Rhizomes thick and horizontally oriented. Tap roots forked. Leaves 40-55 cm long, 30-40 cm wide, ternately compound; stipules 0.5-1.5 cm long, 0.4-1.2 cm wide, triangular to narrowly so; petioles 15-18 cm long, glabrescent; leaflets 2-4.5 cm long, 1.2-2.2 cm wide, 3-5 per pinnule, membranaceous, ovate, acuminate at apex, obliquely truncate to sometimes acute or slightly subcordate at base, irregularly doubly serrate at margin with relatively deep teeth, sometimes lobed, lateral veins 6-8, conspicuous on both sides, adaxial surface green, scabrid, abaxial surface grayish green, pilose along the veins and veinlets, petiolules 2-11 mm long, gradually becoming shorter toward the tip of the pinnae, more or less pilose. Inflorescence 28-40 cm long, with a long stalk 19-30 cm long, with 6-14 primary branches umbellately arranged at the upper part, sometimes with one or two branches below the top umbellate structure, slightly pilose, each primary branch subtended by a lanceolate to

linear bract or a reduced simple leaf or a trifoliate structure, variously sized, each branch with 1-5 umbels, 7-9 cm long, terminal umbels 9-15-flowered, pedicels 7.5-13 mm long, pilose, lateral umbels 7-10-flowered, pedicels 5-7 mm long, pilose, bracteoles 1.3-1.5 mm long, 0.4-0.7 mm wide, lanceolate to narrowly triangular. Floral buds somewhat globose. Sepals minute, 0.6-0.7 mm long, 0.4-0.5 mm wide, narrowly triangular to triangular; petals 1.3-1.5 mm long, 0.7-1 mm wide, ovate; stamens 1.3-1.6 mm long, filaments 1.1-1.3 mm long, anthers 0.5-0.6 mm long and wide, broadly ovate; gynoecium conical at base, styles 5, 0.8-1 mm long, completely divided after anthesis, the apical portion of the ovary slightly projected. Fruits 4.5-5.5 mm long, 4-5 mm wide, globose, styles 1.2-1.5 mm long, distinct and persistent, purple.

Common name: qing ye long yan du he.

Phenology: flowering in June-July; fruiting in July-August.

Distribution: in northwestern Yunnan, southeastern Tibet, and western Sichuan, China (Fig. 35).

Ecology: common in *Picea* forests, or mixed conifer and broadleaf forests, shady and moist habitats; 3000-3600 m.

Additional specimens examined: China. SICHUAN: Baoxin Xian, formerly Mupin, 1954, T.-P. Soong s.n. (KUN, no. 0563335). Miyaluo, Xiamuozhigou, 2900 m, 8 Aug 1956, fr, D. P. He 45641 (WUK). The type specimens of *Aralia apiooides* have young leaves with unopened floral buds. One of the isotypes has somewhat more mature leaves, with leaflets up to 3.5 cm long and 2.3 cm wide, and margin irregularly doubly serrate.

This species differs from *Aralia atropurpurea* by its irregularly doubly serrate leaflet margin with relatively deep teeth or sometimes lobed (vs. finely doubly serrate at margin in *A. atropurpurea*).

13. *Aralia glabra* Matsum. — Fig. 36.

Aralia glabra Matsum., Bot. Mag. (Tokyo) 12: 17.

1899. TYPE: Japan. Nikko, 4 Oct 1895, fl & immature fr, *Matsumura s.n.* (holotype: TI!).

Aralia glabra Matsum., Bot. Mag. (Tokyo) 11: 441.

1897. nom. nud.

Glabrous perennial herb 0.6-0.9 m tall. Stem

purplish green. Rhizome thick. Lower leaves 45-75 cm long, 30-65 cm wide, tripinnately ternate; upper leaves 17-31 cm long, 13-22 cm wide, bi- or tripinnately ternate; stipules 7-10 mm long, 4-5 mm wide, narrowly triangular, membranaceous, ciliate at the upper margin; petioles 3-9 cm long; leaflets 3.5-11 cm long, 2-6.5 cm wide, (2) 3-5 (6) per pinnule, membranaceous, ovate to narrowly ovate, occasionally broadly so, acuminate to long acuminate at apex, cordate, obliquely so or rounded at base, doubly serrate at margin, lateral veins 7-9 on each side, conspicuous on both sides, adaxial surface green, sparsely scabrid, abaxial surface grayish green, slightly pilose along the veins and veinlets, petiolules 0-2.5 (-4) cm long, gradually becoming shorter toward the tip of the pinnae, glabrous. Inflorescence 30-48 cm long, loose, more or less umbellate in outline, glabrous, primary branches 4-8, with 3-5 primary branches umbellately arranged at the top, 1-3 scattered along the main axis, each primary branch 8-25 cm long, with 1-5 umbels; terminal umbels 15-42-flowered, pedicels 12-33 mm long, glabrous or nearly so; lateral umbels 8-14-flowered, pedicels 6-11 mm long, glabrous or nearly so; bracts subtending the primary branches 7-9 mm long, 0.9-1.3 mm wide, lanceolate to linear; bracteoles 1.2-1.7 mm long, 0.8-1.2 mm wide, lanceolate to narrowly triangular. Flowers dark purple, floral buds somewhat globose, with several flowers aborted on each terminal umbel, more so on lateral umbels at fruiting stage; sepals minute, 0.4-0.6 mm long, 0.5-0.7 mm wide, triangular to broadly so, spreading at anthesis, recurved afterwards, persistent into fruiting stage; petals 1.8-2.0 mm long, 1.2-1.3 mm wide, ovate, sometimes forming a calyptra and falling off at anthesis as a unit; stamens ca. 1.8 mm long, filaments ca. 1.5 mm long; gynoecium conical at base, styles 5, completely divided after anthesis, ca. 0.8 mm long, the apical portion of the ovary somewhat projected. Fruits 4.1-4.5 mm long, 4.2-4.5 mm wide, globose, 5-ridged when dry. Seeds 3.2-3.5 mm long, 1.5-1.6 mm wide, 0.4-0.5 mm thick, kidney-shaped.

Common name: Miyama-udo.

Phenology: flowering in July to October; fruiting in August to October.

Distribution: in central Honshu, Japan (Fig. 37).

Ecology: in *Abies* or *Tsuga* forests, shady

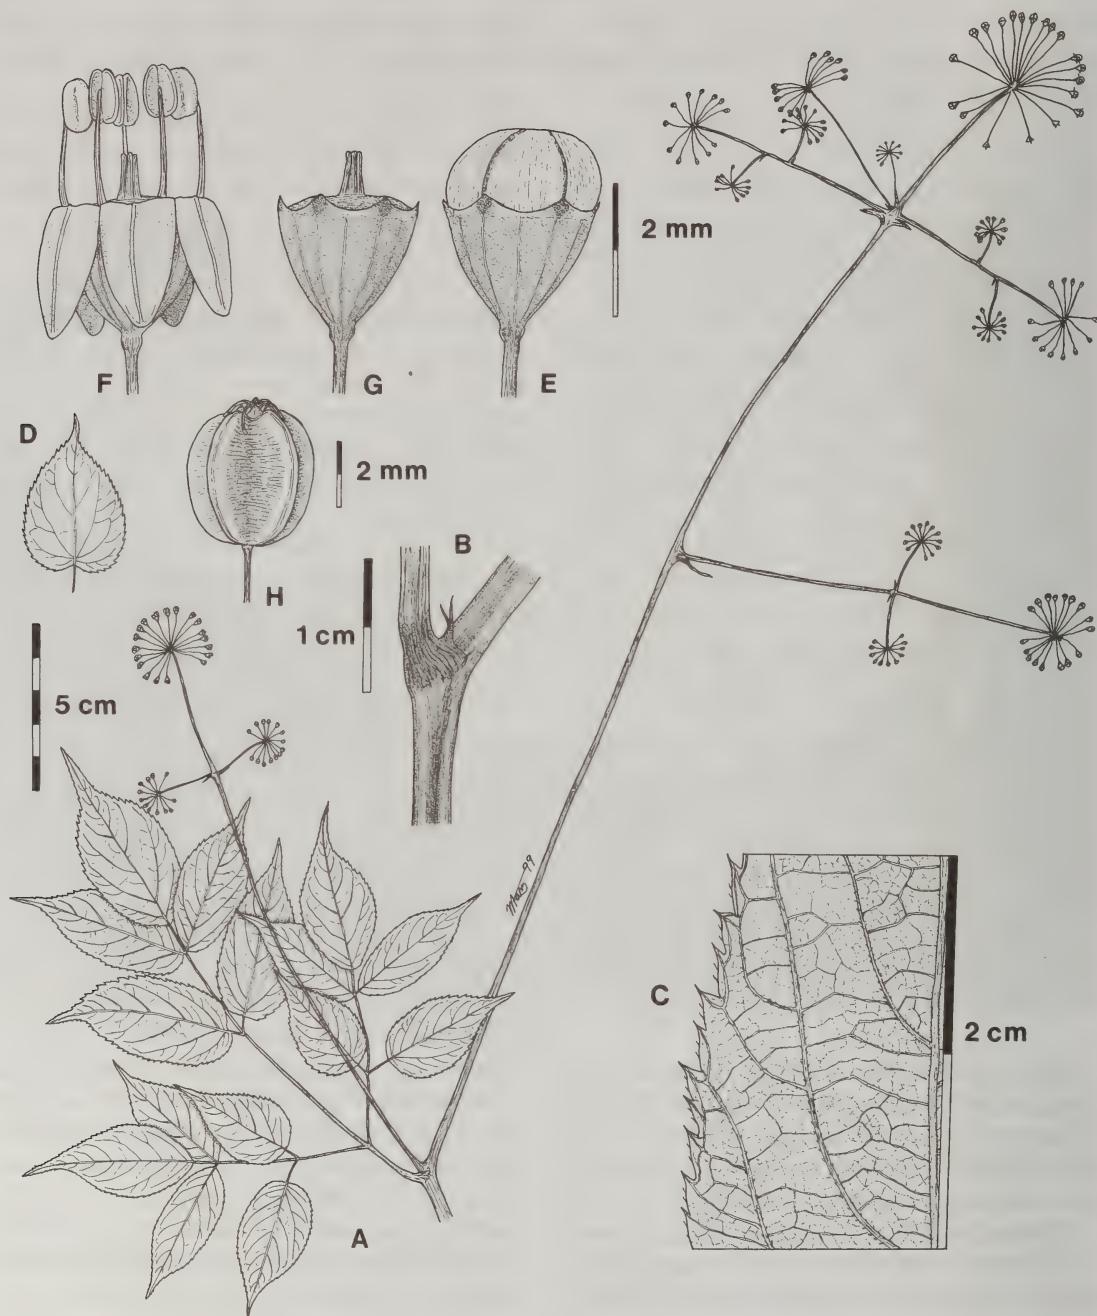

Fig. 36. *Aralia glabra* Matsum. A. Habit showing a leaf and inflorescences. B. Base of petiole showing stipule morphology. C. Close-up of leaflet margin. D. Leaflet of a lower leaf. E. Floral bud. F. Flower. G. Flower after anthesis. H. Fruit (A-G – Murata 16727, US; H – Asano 5060, TI).

habitats; 1430-1810 m.

Aralia glabra is a close relative of *A. fargesii*

in central China. It differs from the latter by its longer pedicels and its glabrous stems and inflorescences. The two species have similar inflorescence architecture, with most primary branches umbellately arranged on the upper part of the main axis, and 1-3 additional primary branches at the lower part.

Aralia pilosa Franch., J. Bot. (Morot) 10: 302. 1896 (16 Sep). TYPE: **China**. CHONGQING: Su-tchuen oriental [now Chongqing Shi], Tchen-keou-tin [Chengkou], R. P. Farges s.n. (lectotype: P!, here designated; isolectotypes: P!, 5 sheets).

Perennial herb 0.25-1 m tall. Rhizomes horizontal, elongated, with or without internodes. Stem purplish green, glabrous to pubescent with long hairs. Leaves ternately compound, decreasing in size upwards, lower leaves 20-45 cm long, 18-32 cm wide, upper leaves 6-12 cm long, 6-8 cm wide, ternately palmately compound; stipules 7-23 mm long, 1.5-4 mm wide, membranaceous, glabrous, lanceolate, adnate to the base of petiole; petioles 2-13 cm long, gradually becoming shorter toward the tip of the stem, sparsely pubescent with long hairs; leaflets 3.5-10 cm long, 2-6 cm wide, 1-3 per pinnule, membranaceous, elliptic or broadly so, sometimes ovate, acuminate at apex, cordate, acute or occasionally rounded at base, doubly serrate at the upper 2/3 of the margin, the lower 1/3 of margin mostly serrate, lateral veins 8-10 on each side, conspicuous on both surfaces, adaxial surface green, sparsely pubescent with long soft hairs along the veins or glabrescent, abaxial surface light green, pubescent along the veins and veinlets, hairs 0.5-2 mm long, petiolules 0-20 mm long, pilose. Inflorescence 5-20 cm long, terminal and axillary, relatively small, loose paniculate in outline, glabrous or nearly so, primary branches 1-3, scattered along the main axis, each primary branch subtended by a triangular bract, with 1 umbel, 1-3-flowered, pedicels 3-5.5 mm long, glabrous; bracts subtending primary branches 1.5-2 mm long, 0.9-1.3 mm wide, narrowly triangular to lanceolate, glabrous; bracteoles 1.5-1.8 mm long, 0.5-0.8 mm wide, narrowly triangular, glabrous. Sepals 0.4-0.5 mm long, 0.35-0.45 mm

wide, rounded, spreading at anthesis; petals 1.2-1.4 mm long, 0.8-1.0 mm wide, ovate; stamens ca. 1.3 mm long; gynoecium 3-5-locular, styles 3-5, ca. 0.5 mm long, almost divided to the base. Fruits 4.5-5 mm long, 4-4.5 mm wide, red, globose, 5-seeded. Seeds 3.6-4.3 mm long, 2-2.2 mm wide, 0.3-0.4 mm thick, kidney-shaped.

Common name: rou mao long yan du he.

Phenology: flowering in June to July; fruiting in July to late August.

Distribution: in Anhui, Chongqing, Gansu, Guizhou, Hubei, Hunan, Shaanxi, Sichuan, and Yunnan provinces of China (Fig. 39).

Ecology: in mesic forests, shady and moist habitats; 1000-2300 m.

Additional specimens examined: **China**.

Wen 10640 (US).

The type specimens of *A. henryi* bear flowers, young fruits, and mature fruits on the same plant. The reproductive biology of the species is poorly known. The flowers appear to be bisexual.

Fig. 39. Map of China showing the distribution of *Aralia henryi* Harms.

Aralia henryi is highly distinctive in *Aralia* in that it bears red fruits. Other *Aralia* species have dark purple fruits. Furthermore, its ovaries are 3-5 locular, rather than 5-locular in the section. I

considered the option of recognizing it as a distinct section. Nevertheless, it seems most closely allied with members of *Aralia* sect. *Aralia*, and I herein place it in this section.

ARALIA SECT. NANAЕ HARMS

Aralia sect. *Nanae* Harms, Bot. Jahrb. 23: 12, 1896.

Dioecious herb with long horizontal rhizomes, acaulescent, with one ternately compound leaf and one inflorescence arising from the base, trichome simple and slender, occasionally branching at the tip. Umbels (2) 3 (7) in a cluster with a long scape (1018 cm). Flowers 5merous, styles 5, free. Fruits blackish purple.

One species widely distributed in North America, especially common in eastern North America.

V. Nash s.n. (holotype, NY!).

Aralia nudicaulis f. *depauperata* Marie-Vict., Nat. Canad. 71: 206. 1944. TYPE: Canada. QUÉBEC: Longueuil, comté de Chambly, bois, 11 Jun 1941, F. F. Marie-Victorin & Rolland-Germain 56602 (holotype: MT!; isotypes: GH!, NY!, US!, all three isotypes are vegetative].

Acaulescent perennial herb, 0.35-0.7 m tall,

highly clonal, dioecious. Rhizome long, branched and horizontal; upright stem 3-10 cm long, depending upon the age of the individual. Leaves 30-60 cm long and wide, ternately compound, usually single or occasionally two arising from the tip of the upright stem (rhizome in essence), purplish at nodes; stipules absent; petiole 10-45 cm long; leaves usually with 3 (-4) primary segments, each segment with 4-7 leaflets when leaves are bipinnately ternate, sometimes leaves tripinnately ternate; leaflets 6-13 cm long, 4-7.5 cm wide, papery, ovate to oblong, acute to acuminate at apex, acute to broadly so at base, commonly oblique on lateral leaflets, doubly serrate at margin; lateral veins 8-9 on each side, conspicuous on both surfaces, leaflets green, glabrous to nearly glabrescent on upper surface, glabrous to slightly pilose on lower surface, petiolule 0-1.8 cm long, pilose with long hairs when young, becoming glabrescent to nearly so. Inflorescence acaulescent, glabrous, appearing at the same time as the young leaves, purplish initially, then becoming green, usually with 3 or variously 2-7 umbels at the apex of a long stalk, occasionally the peduncle of 1-2 umbels shortened drastically with the flowers clustering at the base of the peduncle of the well-developed umbel; inflorescence stalk 15-30 cm long, glabrous, peduncle of the umbels 2.5-9 cm long, glabrous; each umbel 25-100-flowered, male umbels usually having more flowers per umbel; pedicels 9-18 mm long, slightly pilose with long hairs to glabrous, tip slightly enlarged at anthesis; bracts at the base of the inflorescence stalk 7-25 mm long, 7-11 mm wide, usually 3-5 embracing the tip of the stem to protect the buds, ovate to oblong, glabrous; bracts at the base of the peduncle 3-5 mm long, 0.8-1 mm wide, lanceolate, glabrous; bracteoles 0.4-0.8 mm long, 0.25-0.4 mm wide, narrowly triangular, glabrous and caducous. Sepals 0.5-0.6 mm long

and wide, triangular, glabrous, persistent on fruits; petals 2.2-2.8 mm long, 1.1-1.2 mm wide, ovate, white to purplish white, with a conspicuous vascular bundle in the middle, spreading to recurved at anthesis; stamens 5, erect at anthesis, filaments 2.5-3.5 mm long; anthers 1-1.2 mm long, 0.7-0.8 mm wide, oblong, whitish yellow; ovaries 5- or occasionally 6-locular; styles 1.2-1.3 mm long at anthesis, completely distinct to the base, base not projected. Fruits 6-8 mm long, 5-7 mm wide, globose, purplish black, persistent styles 3-3.5 mm long, completely distinct to the base. Seeds 4.5-5.5 mm long, 2.5-3 mm wide, 0.9-1.1 mm thick, kidney-shaped, whitish gray, smooth.

Common names: wild sarsaparilla, aralia, false sarsaparilla, American sarsaparilla, shotbush, small spikenard, wild licorice, rabbitroot, and salsepareille (Quebec).

Uses: roots and rhizomes used as an alterative, tonic, or antisyphilitic, often used by the American Indians in decoction.

Phenology: flowering from May to July; fruiting in June to August.

Distribution: widely distributed in North America from Newfoundland to northern Alberta and north-central British Columbia, southward to northern Georgia in the eastern range and Colorado and eastern Washington in the western range (Fig. 41).

Ecology: moist or dry woods, thickets, riparian areas, margins of prairies, or bog edges; 50-2700 m.

This is the most widely distributed species of *Aralia* in North America. Although it has been treated as herbaceous (e.g., Smith 1944), it is woody in essence, because it has a woody horizontal rhizome and a short upright woody stem. Flanagan and Bain (1988) remarked that the plant behaves like an "underground or buried shrub." Most woody species of *Aralia* are distributed in warmer areas. *Aralia nudicaulis* is the northernmost species of the entire genus. Scoggan and Cody (1979) also recorded the species in the southern Yukon Territory, although the author has not examined collections there yet. The herbaceous habit is apparently secondary or derived in the genus.

The generic name "*Aralia*" initially coined by Tournefort (1700) is thought to have derived from

the Indian common name “aralie” for *Aralia nudicaulis* (Marie-Victorin 1964; Wen and Reveal 1992).

Aralia nudicaulis is the only species so far well documented to be dioecious in *Aralia*. Other species are primarily andromonoecious. Barrett and Hellenurum (1981) and Bawa et al. (1982) also noted that in rare cases inflorescences of the species

may contain perfect flowers or both male and female flowers. The male and female flowers are dimorphic. The female flowers have five long styles and five short stamens with non-functional and smaller anthers. The male flowers bear five long stamens and five short styles (also see Flanagan and Bain 1988).

ARALIA SECT. HUMILES HARMS

Aralia sect. *Humiles* Harms, Bot. Jahrb. 23: 13. 1896.

Unarmed branched shrub. Leaves pinnate to bipinnate, stipulate; trichomes usually branched when present into dendroids, stomates on both abaxial and adaxial leaf surfaces. Umbels 5-15, loosely clustered into panicles, inflorescence

terminal. Flowers 5 (-6)-merous. Fruits dark purple.

This section consists of three species distributed in Central and southwestern North America.

Key to species of *Aralia* sect. *Humiles*

tree, 15-20 ft, 13 May 1893, in fr., C. G. Pringle
4366 (holotype: P!; isotypes: BM!, F!, G!, LE!,
MEXU!, MSC!, P[2]!, US!, WU!).

Shrub to small tree 0.5-10 m tall. Stem grayish

to dark brown, branchlet terete. Stipule 1.5-2.5
mm long, 0.9-1.5 mm wide, adnate to petiole base,
the free portion triangular to narrowly so, pilose;
Leaves 9-27 cm long, 6-16 cm wide, usually
pinnate in architecture, sometimes bipinnate,
pinnate leaves with (3-) 5-9 leaflets, accessory
leaflets often present, especially on bipinnate
leaves; petioles 5-9 cm long, pubescent with many

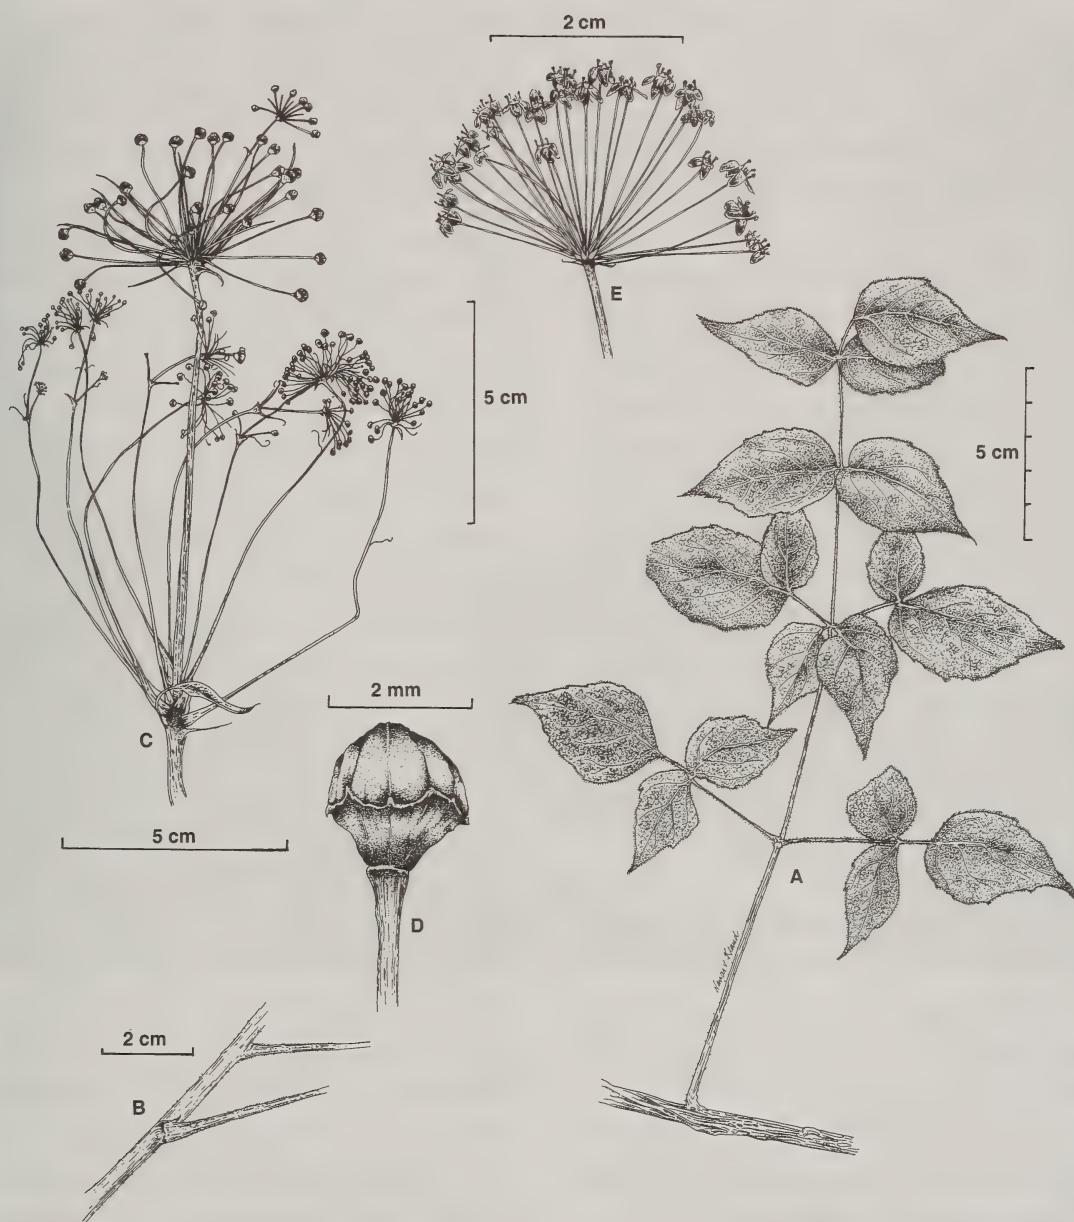

Fig. 44. *Aralia humilis* Cav. A. Stem with a bipinnate leaf. B. Stem and lower part of petiole showing stipules. C. Inflorescence. D. Floral buds. E. Umbel with flowers at anthesis.

curved white hairs; leaflets 2.8-7.5 cm long, 1.6-6.5 cm wide, papery, ovate to broadly or narrowly ovate, acute to acuminate at apex, rounded, broadly acute to slightly subcordate at base, symmetrical or sometimes oblique, serrulate to serrate at margin, tip of teeth glandular, lateral veins 5-6, conspicuous above and below, adaxial surface pilose with white

soft dendroid or branched hairs, green to dark green, abaxial surface usually densely pilose with branched hairs, light green, petiolule 1.5-16 mm long, pilose with often branched hairs. Inflorescence 12-30 cm long, 8-20 cm wide, terminal at the branch apex, more or less pubescent with branched soft hairs, green to purplish green,

consisting of 5-10 primary branches paniculately arranged on a main axis; inflorescence bracts 5-7 arranged in several whorls at the base of inflorescence, 3-4 mm long, 4-5 mm wide, semi-persistent, triangular to broadly so in shape, dark brown in color, glabrous or glabrescent; each primary branch consisting of 1-3 umbels, terminal umbels with 25-45 flowers, lateral umbels 15-20 flowered, with peduncles 3-10 cm long; pedicels glabrous to pubescent, slightly enlarged at the tip, pedicels of terminal umbels 12-23 mm long, those of lateral umbels 5-8 mm long; bracts of primary branches 2-3.5 mm long, 1-2 mm wide, narrowly triangular to lanceolate, pilose, often caducous; bracteoles 1.8-3.5 mm long, 0.7-1.2 mm wide, lanceolate, more or less pilose. Sepals 0.4-0.5 mm long and wide, triangular; petals 2-2.2 mm long, 1.3-1.5 mm wide, ovate, greenish white; stamens 5, filaments 2.2-2.5 mm long, anthers 0.8-1 mm long, 0.6-0.7 mm wide, oblong; styles 0.9-1.1 mm long at anthesis, divided; floral disk slightly projected. Fruits 5-6.5 in diameter, globose, dark purplish black, bloomy, persistent styles 1.5-2 mm long, divided up to the base and recurved, with the base of the style projected and exposed between the persistent sepals and the divided part of the styles. Seeds 4-5 mm long, 2-2.2 mm wide, 1.5-1.8 mm thick, kidney-shaped.

Common names: candelilla (Durango, Mexico); cuajilotillo (Sinaloa, Mexico); tacamajaca (Jalapa, Guatemala).

Uses: in Chihuahua, flowers, leaves and bark used as tea for fever, wood for making rattles and violin (see *R. A. Bye* 5996, MEXU).

Phenology: flowering in August to September, December, January, and February; fruiting in August, late September, October, December, February, March, May and June.

Distribution: widely distributed in Mexico, Guatemala, Honduras, south to Nicaragua, and north to Arizona of U.S.A. (Fig. 45).

Ecology: thickets, pine forests, mixed forests, rocky outcrops, lava beds, scrub woodland, rocky hill, and selva baja caducifolia; (100) 750-2655 m.

fl, L. McGill & E. Lehto L20373 (ASU, NY, US).

Smith (1944) indicated that *Aralia humilis* occurs in southern New Mexico and Arizona to Guatemala. Frodin and Govaerts (2003) indicates the distribution from southern New Mexico, southern Arizona, Mexico to C. America. So far I have not seen any collections from New Mexico and the species was not recorded in floras of New Mexico by Wooten and Standley (1915) and Martin and Hutchins (1980). Within the U.S., the species appears to occur only in Arizona.

There seems to be no specimens in the Sessé & Mociño herbarium corresponding to the original material of *Aralia chilapensis*. The watercolor plate of “*Aralia chilapensis* Sp. N.”, accession number 6331.0246 in the Torner Collection of Hunt Institute for Botanical Documentation, Pittsburgh is herein selected as the lectotype. The Torner plate bears the number “346” near the top (also see Field Museum negative 30658, designated as “S. + M. Pl. 346”). A print of 30658 is now at the US National Herbarium with the courtesy from the Field Museum Herbarium.

Pentapanax mexicanus C. B. Shang & X. P. Li was described based on Pringle 4366 collected from Zapotlan, Jalisco, Mexico (Xiang and Li 1990). The holotype was indicated to be at PE, and no isotypes were cited in the original description. I examined a specimen of Pringle 4366 at P, indicated by the senior author C. B. Shang as the holotype; and I also failed to locate any specimen of Pringle 4366 at PE. In an earlier draft of the paper by Xiang and Li (1990) distributed by the junior author, the holotype of the species was indicated to be at P. It seems that “PE” was a misprint of “P” in the protologue when the holotype was indicated. This raises an intriguing issue on whether the name *Pentapanax mexicanus* is valid, as the holotype was not in the herbarium as indicated in the original description. Nevertheless, Pringle 4366 clearly is a specimen of *Aralia humilis*.

My delimitation of *Aralia humilis* is the same as that of Smith (1944). Standley (1924) recognized *Aralia pubescens* as from Sonora to Oaxaca of Mexico based on pedicel pubescence. Nevertheless, he suggested that *A. pubescens* may be a synonym of *A. humilis* (Standley 1924, p. 1081). I examined the collections across Mexico and also made field observations in Mexico and

Arizona. Initially I attempted to recognize three entities within the current concept of *Aralia humilis*. These three entities include *Aralia humilis* s. s. from southern Arizona and northern Mexico (Chihuahua, Durango, Sinaloa, and Sonora), *Aralia pubescens* from Jalisco, Michoacan, Oaxaca, Puebla and Colima of Mexico with pubescent and more or less shorter pedicels, and *Aralia chilapensis* widespread in central to southern Mexico, Guatemala, Honduras, and south to Nicaragua with glabrous and somewhat longer pedicels. Clearly these distinctions have lots of intermediates and the narrower species concept will make it difficult practically to identify taxa in Oaxaca, Jalisco and Puebla where both “*Aralia chilapensis*” and “*A. pubescens*” and their intermediate forms occur. I herein treat *Aralia humilis* as a variable species especially concerning its pubescence and length of pedicels and leaflet shape. Most likely *Aralia humilis* may be the progenitor of both *Aralia regeliana* and *A. scopulorum*. Based on the leaf architecture and leaflet morphology as well as geographic distribution, *Aralia regeliana* may have derived from the bipinnate forms of *Aralia humilis* from central to southern Mexico; and *A. scopulorum* of Baja California may be a derivative of *A. humilis* from northern Mexico. Detailed phylogeographic analyses are needed to construct the speciation history of *Aralia* sect. *Humiles*.

17. *Aralia regeliana* Marchal — Fig. 46; color plate 13: C-F.

Aralia regeliana Marchal, Bull. Acad. Roy. Sci. Belgique, ser. 2, 47: 73. 1879. TYPE: Mexico. TAMAULIPAS: Tanque Colonada ad Victoria, Aug 1842, Karwinsky 777 (holotype: LE!).

Deciduous shrub 1-4 m tall. Stem grayish brown, branchlets terete. Leaves 10-20 cm long, 7-13 cm wide, bipinnate or mixed with pinnate ones, with 3-7 leaflets, accessory leaflets absent; stipule 2.5-3.5 mm long, 1.2-1.5 mm wide, adnate to petiole base, lanceolate in outline, ciliate at margin; petioles 3-8.5 cm long, glabrous; leaflets (2) 3-6 cm long, 2-3.8 cm wide, chartaceous, broadly ovate to ovate, acuminate at apex, subcordate to truncate at base, symmetrical, sparsely serrate at margin, teeth often callose-tipped, lateral veins 6-7, conspicuous above and below, abaxial

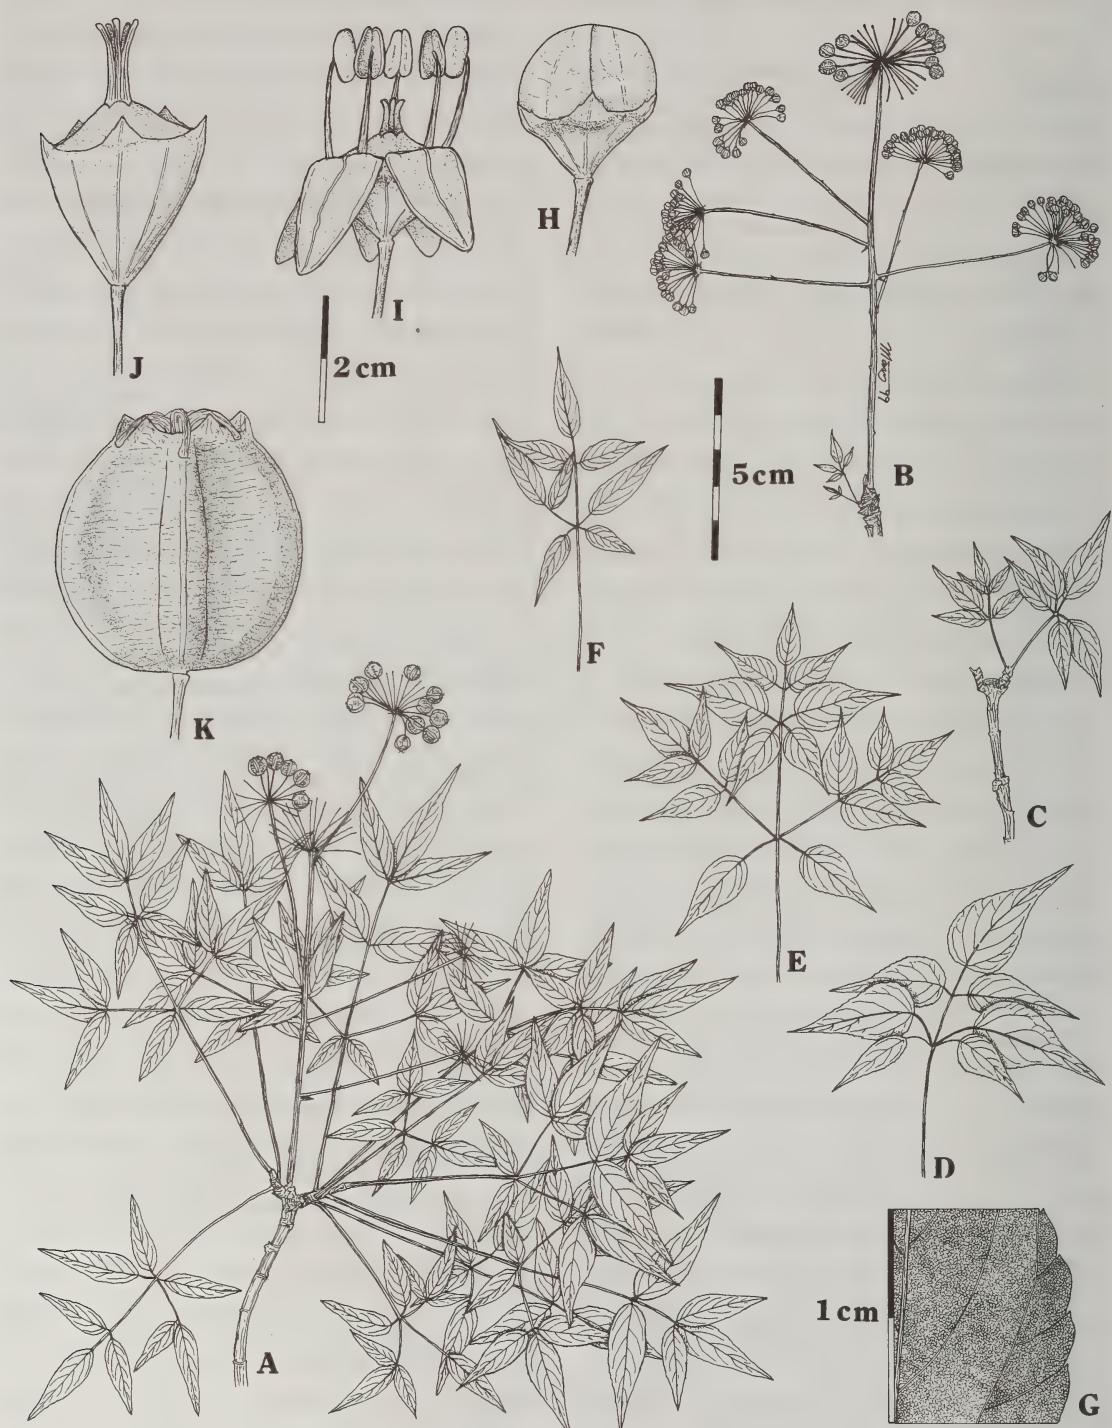

Fig. 46. *Aralia regeliana* Marchal. A. Habit with leaves, stem and inflorescence. B. Inflorescence. C. Leaves on upper portion of stem, showing leaf variation in architecture. D. Leaf with accessory leaflets. E. Bipinnate leaf with accessory leaflets. F. Leaf. G. Lower leaf surface and teeth at margin. H. Floral buds. I. Flower. J. Flower after anthesis. K. Fruit.

and adaxial surface glabrous, or occasionally with a few scattered hairs on the veins on the upper surface, petiolules 1.5-8.5 mm long, glabrous. Inflorescence 6-15 cm long, 5-11 cm wide, terminal at the branch apex, pilose, consisting of 3-10 primary branches arranged on a main axis; inflorescence bracts 5-8, arranged spirally at the base, 5-7 mm long, 3-4 mm wide, not persistent, narrowly triangular in shape, brown in color; each primary branch with 1-3 umbels with the terminal umbel well developed and the lateral ones poorly developed or aborted, terminal umbels with 25-35 flowers, lateral umbels 15-25 flowered, peduncles 1.5-3 cm long; pedicels pilose, slightly enlarged at the tip, pedicels of the main terminal umbel at the tip of each inflorescence 12-16 mm long, those of the terminal umbel of primary branches 7-12 mm long, those of lateral umbels of 5-7 mm long; bracts of primary branches 5-7 mm long, 2-3.5 mm wide, narrowly triangular to lanceolate, ciliate at margin; bracteoles 2-3 mm long, 0.8-1 mm wide, lanceolate, ciliate at margin. Sepals 0.3-0.4 mm long and wide, rounded to triangular; petals 2.1-2.3 mm long, 1.3-1.5 mm wide, ovate; stamens 5-6, filaments 2.3-2.5 mm long, anthers 0.6-0.7 mm long, ovate; styles 5-6, ca. 1.0 mm long after falling off of petals, divided; floral disk projected. Fruits 6-6.5 long, 5.2-5.5 mm wide, ovoid globose, black with purple juice, persistent styles 1.2-1.5 mm long, divided up to the base. Seeds 4.7-5 mm long, 2-2.2 mm wide, 1.5-1.6 mm thick, kidney-shaped.

Common name: jamoncillo (Tamaulipas, Mexico).

Phenology: flowering from February to March; fruiting in April to June, also in October.

Distribution: endemic to Mexico (Coahuila, Durango, Guanajuato, Hidalgo, Queretaro, San Luis Potosi, and Tamaulipas) (Fig. 47).

Ecology: in canyons, limestone hill slopes, open limestone ridges, steep rocky slopes; 1250-3138 m.

Additional specimens examined: Mexico. COAHUILA: Sierra de Jimulco and up to 3 km N of Mina San Jose which is 8 km NE of Estacion OTTO, 25°6'30"-8°30"N, 103°13'30"W, 1800-3138 m, mat. Mexico, La Miquiguana, 1841-42, Karwinsky 1248 (LE).

Aralia regeliana is characterized by its glabrous and bipinnate leaves with ovate leaflets having a long acuminate apex. It is noted that E. Ventura & E. Lopez 9217 (el Pinalito Redondo, por Carricillo, Mpio. De Atarjea, Guanajuato, MEXU) appears to be *A. regeliana*, yet they have pubescent leaflets. Because this collection was from transitional zones

of *Aralia regeliana* and *A. humilis*, it may represent a hybrid of the two species.

18. *Aralia scopulorum* Brandegee — Fig. 48; color plate 13: A-B.

Aralia scopulorum Brandegee Proc. Calif. Acad. Sci. 2:165, f. 8. 1889. *Pentapanax scopulorum* (Brandegee) C. B. Shang in Y. W. Yuan & al. (eds.), Proc. Intern. Symp. Bot. Gard. 1990: 630, 1990. TYPE: Mexico. BAJA CALIFORNIA SUR: Comondu Canon, common on rocks, 12 Mar 1889, fl & young fr, T. S. Brandegee s.n. (holotype, UCI!; isotypes, A!, GH!, GH photo!, PH!, US!).

Deciduous shrub to small tree 1.5-8 m tall. Stem grayish brown, branchlet terete. Leaves 10-20 cm long, 7-13 cm wide, pinnate, with 3-7 leaflets, accessory leaflets absent; stipule 3-4 mm long, 1-1.5 mm wide, adnate to petiole base, lanceolate in outline, ciliate at margin; petioles 3-8.5 cm long, glabrous; leaflets (2) 3-6 cm long, 2-3.8 cm wide, chartaceous, broadly ovate to ovate, acuminate at apex, subcordate to truncate at base, symmetrical, sparsely serrate at margin, teeth often callose-tipped, lateral veins 6-7 on each side, conspicuous above and below, abaxial and adaxial surface glabrous, or occasionally with a few scattered hairs on the veins on the upper surface; petiolules 1.5-8.5 mm long, glabrous. Inflorescence 6-15 cm long, 5-11 cm wide, terminal at the branch apex, pilose, consisting of 3-10 primary branches arranged on a main axis; inflorescence bracts 5-8, 5-7 mm long, 3-4 mm wide, not persistent, arranged spirally at the base, narrowly triangular in shape, brown in color; each primary branch with 1-3 umbels with the terminal umbel well developed and the lateral ones poorly developed or aborted, terminal umbels with 25-35 flowers, lateral umbels 15-25-flowered; peduncles 1.5-3 cm long; pedicels of the main terminal umbel at the tip of each inflorescence 12-16 mm long, those of the terminal umbel of primary branches 7-12 mm long, those of lateral umbels of 5-7 mm long, pilose, slightly enlarged at the tip; bracts of primary branches 5-7 mm long, 2-3.5 mm wide, narrowly triangular to lanceolate, ciliate at margin; bracteoles 2-3 mm long, 0.8-1 mm wide, lanceolate, ciliate at margin. Sepals 0.3-0.4 mm long and wide, rounded to triangular; petals 2.1-

2.3 mm long, 1.3-1.5 mm wide, ovate; stamens 5-6, filaments 2.3-2.5 mm long, anthers 0.6-0.7 mm long, ovate; styles 5-6, divided, ca. 1.0 mm long after falling off of petals, floral disk projected. Fruits 6-6.5 long, 5.2-5.5 mm wide, ovoid globose, black with purple juice; persistent styles 1.2-1.5 mm long, divided up to the base. Seeds 4.7-5 mm long, 2-2.2 mm wide, 1.5-1.6 mm thick, kidney-shaped.

Common names: sauco cimarrón, and sauchio.

Phenology: flowering from February to May; fruiting in April to June, also in October.

Distribution: Baja California (primarily in Baja California Sur), Mexico (Fig. 47).

Ecology: in canyons, deep canyon bottom, hillsides, among rocks, hill ridge, rocky slopes, volcanic rock outcrops, and also around high arid rims (in lesser stature); 200-1600 m.

Additional specimens examined: Mexico. BAJA CALIFORNIA NORTE: ca. 3 on southeast ridge, Cerro la Sandía, 28°24'N, 113°27.5'W, 1300 m, 24 Jan 1964, sterile, shrub ca. 2 m tall, R. ARALIA SECT. SCIADODENDRON (GRISEB.) J. WEN

Aralia sect. *Sciadodendron* (Griesb.) J. Wen, comb. et stat. nov.

Sciadodendron Griseb., Bonplandia 6: 7. 1858. Type species: *Sciadodendron excelsum* Griseb.

Coemansia Marchal, Bull. Acad. Roy. Sci. Belgique 47: 94. 1879. nom. illeg., non Tiegh. & Monnier in Ann. Sci. Nat. Bot., Ser. 5, 17: 392. 1873.

Coudenbergia Marchal, Bull. Acad. Roy. Sci. Belgique 47: 514, 1879. Type species: *Coudenbergia warmingiana* (Marchal) Marchal.

Megalopanax Ekman ex Harms, Notizbl. Bot. Gart. Berlin 9: 122, 1924. Type species: *Megalopanax rex* Ekman ex Harms.

Unarmed glabrous shrub or tree, highly branched. Leaves tri- to bipinnate or quadripinnate. Umbels clustered into panicles, several inflorescences usually aggregated at tip of stem or a somewhat short branch, with persistant bracts at the base, pedicels articulated or non-articulated at

the base of the flower. Flowers 5-, 6- or 8-12-merous, styles connate or at least at the base, occasionally completely distinct. Fruits dark purple.

Five species from Central and South America.

Key to species of *Aralia* sect. *Sciadodendron*

1. Pedicels not articulated 2
1. Pedicels articulated 3

2. Fruits subglobose, 6-7 mm long, peduncles relatively slender, 1-1.5 mm in thickness *A. excelsa*
2. Fruits ovoid globose to globose, 7-8 mm long, peduncle stout, 2-3 mm in thickness *A. bahiana*

3. Ovary 5-locular *A. soratensis*
3. Ovary 6-10-locular 4

4. Leaflets entire at margin, subcordate to less often rounded at base; peduncle of umbel thick, 3-5 mm in diameter; umbels 90-120-flowered; endemic to Cuba *A. rex*
4. Leaflets sparsely serrate at margin, rounded at base; peduncle of umbel 1.5-2 mm in diameter; umbels 25-40-flowered; distributed in South America (Brazil and Paraguay, extending to Argentina) *A. warmingiana*

19. *Aralia soratensis* Marchal — Fig. 49; color plate 14: A-F.

MO!, NY!, US!, 2 sheets, photo at K).

Tree 4-15 m tall, about 7-15 cm in dbh, polygamo-monoecious. Bark furrowed, gray. Leaves 80-125 cm long, 70-120 cm wide, bipinnate to tripinnate, sometimes pinnate near the inflorescence; stipule 3-5 mm long, 2-3 mm wide, adnate to the base of petiole, the free portion triangular to narrowly so, subcoriaceous, glabrous; petioles purplish green to light green, 20-50 cm long; rachises green, turning purplish, subtended by a pair of accessory 3-5-foliate pinnae at the base of the first two lower pinnae and a pair of accessory leaflets at the upper pinnae; leaflets 5.5-10.5 cm long, 2.5-6.0 cm wide, glabrous, acuminate at apex, rounded, obtuse to subcordate, sometimes truncate at base, sparsely finely serrate to sometimes crenately serrate at margin, adaxial surface green, abaxial surface light green, petiolule 6-17 mm long, glabrous. Inflorescence terminal, consisting of an aggregation of 2-5 panicles on a short axis, each panicle 17-30 cm long, 10-20 cm wide, with 25-40 primary branches arranged racemously on a main axis, primary branches 4-9 cm long, glabrous, each with 2-5 umbels, lateral

Pentapanax angelicifolius Griseb., Abh. Konigl. Ges. Wiss. Göttingen 24: 144. 1879. *Coudenbergia angelicifolium* (Griseb.) C. B. Shang in Y. W. Yuan & al. (eds.), Proc. Intern. Symp. Bot. Fruit (A & C – Schnell 189, W; B - Vervoort & Cueze 7632, W; D-F – Meyer s.n., 15 Sep 1967, W; G - Lorentz & Hieronymus 214, GOET).

umbels often aborted or functionally male, bracts and bracteoles persistent, glabrous, primary bracts (subtending the individual panicles) 3-5 mm long, 6-8 mm wide, triangular, subcoriaceous, secondary bracts 3.5-5 mm long, 2.5-4 mm wide, narrowly triangular, bracteoles 0.6-0.9 mm long, 0.4-0.6 mm wide, narrowly triangular; umbels 12-25-flowered, pedicels 5-9 mm long, glabrous, articulated near the base of the flower. Flowers yellow-green, nearly odorless, appearing at the same time as leaves; sepals minute, triangular; petals 2.1-2.3 mm long, 1.2-1.3 mm wide, greenish white, ovate; filaments 2.1-2.5 mm long, anthers 0.8-1 mm long, oblong; ovaries 5-locular. Fruits 4-5 mm in diameter, globose, blackish purple when mature, persistent styles slightly divided at the tip, connate 4/5 at the lower part, floral disc 2-3 mm in diameter at the fruiting stage, conspicuous.

Local names: sacha paraiso (Jujuy, Salta and Tucumán, Argentina), paraiso (Jujuy, Argentina), yapicay (by Guarani tribe, Chuquisaca, Bolivia), and mara blanca (Santa Cruz, Bolivia).

Uses: firewood or making utensils (Potosí of Bolivia), medicinal (Chuquisaca, Bolivia).

Phenology: flowering in September to October; fruiting in December.

Distribution: northern Argentina, Bolivia, and Peru (Fig. 50).

Ecology: scattered in valley bottom and dry deciduous scrub on hillsides, open dry forests, premontane moist forest, slopes with semi-deciduous forests, and dry legume-dominated vegetation; 380-2900 m.

Additional specimens examined: **Argentina.** JUJUY: Jujuy, Dr. Grisebach & Dr. Lorentz 11/77 (K); Dec 1878, fl, Grisebach s.n. (K); S. Lorenzo, Nov 1873, in fl., P. G. Lorentz & G. Aralia fluminensis Glaziou, Bull. Soc. Bot. France 56 (3): 332. 1909. TYPE: **BRAZIL**: RIO JANEIRO: Rio Janeiro, Feb 1874, *A. Glaziou* 6559 (lectotype, P!, here designated; isolectotype, K!).

Tree 5-30 m tall, dbh to 40 cm, hermaphrodite. Leaves 45-100 cm long, 40-90 cm wide, tripinnate, with 4-6 pairs of pinnae; stipules 5-10 mm long, 4-6 mm wide, adnate to the base of petiole, the free portion triangular, subcoriaceous, glabrous; petioles 15-45 cm long, purplish green; rachises green, turning purplish, subtended by a pair of accessory 3-5-foliate pinnae at the base of the first two lower pinnae and a pair of accessory leaflets at the upper pinnae; leaflets 3-6.5 cm long, 1.5-3.5 cm wide, glabrous, acuminate at apex, rounded at base, sparsely serrate at margin, adaxial surface green, abaxial surface light green, petiolule articulated below the blade, that of lateral leaflets 4-8 mm long, that of terminal leaflets 13-20 mm long, glabrous. Inflorescence terminal, consisting of an aggregation of 2-5 panicles on a short axis, each panicle 13-23 cm long, 10-15 cm wide, with 8-20 umbels racemously arranged on a main axis, main axis with light brownish scales, appearing rough, each umbel with a thick peduncle, peduncle 4-7 cm long, 1.5-2 mm thick, with light brownish scales, thus appearing rough, bracts and bracteoles persistent, glabrous, primary bracts subtending the individual umbels 4-8 mm long, 5-8 mm wide, triangular, coriaceous, bracteoles 1.7-3 mm long, 1.2-1.5 mm wide, narrowly triangular, glabrous. Flowers appearing at the same time as young leaves open; umbels 25-40-flowered, pedicels 4-7 mm long at anthesis, 10-13 mm long when fruiting, glabrous, stout, articulated near the base of the flower; sepals 6-8, minute, triangular; corolla cream, petals 7-8, 2.4-2.6 mm long, 1.1-1.2 mm wide, narrowly ovate; filaments 2.1-2.5 mm long, anthers 0.8-1 mm long, oblong; ovaries 6-8-locular. Fruits 5-6 mm long, 4-5 mm wide, ovoid globose, blackish purple when mature, persistent styles 1.8-2.1 mm long at the fruiting stage, stout, slightly divided at the tip, connate 4/5 at the lower part.

Common names: salbugueiro falso and salbugueirão (Minas Gerais, Brazil), and caroba (Paraguay).

Phenology: flowering from March to December; fruiting from October to January.

Distribution: Brazil, Paraguay, and Argentina (Fig. 52).

Ecology: in dry deciduous caatinga forest on calcareous hills; 150-300 m.

Additional specimens examined: Argentina. FORMOSA: Territuro de Formosa, Guayenlec, arbol giganteo, fr, P. Jörgensen 3254 (MO, US). **BRAZIL.** MINAS GERAIS: Vicosa, 11 Jan 1935, sterile, J. G. Fig. 52. Map of South America showing the distribution of *Aralia warmingiana* (Marchal) J. Wen.

Three syntypes were cited by Glaziou when he described *Aralia fluminensis* (Glaziou 1909, p. 332) and they are *Glaziou 6559*, 1895, and *109416a*. I have seen the following Glaziou collections: *Glaziou 6559* (K, P), *Glaziou 10895* (K, LE, P, 2 sheets), *Glaziou 19416a* (P), and *Glaziou s.n.* (P) collected from Engenho Noro of Rio Janeiro, 8 Aug 1873 (see specimens cited for detailed information of the four collections). All of these specimens bear the handwriting of Glaziou “*Aralia fluminensis* Glaz.” The specimens clearly represent *Aralia warmingiana* and they are all vegetative bearing no flowers nor fruits, as the original description says. I suspect *Glaziou 1895* and *109416a* in the original description (Glaziou 1909) were misprinted and they actually represent *Glaziou 10895* and *19416a*. Because of the confusion concerning two of the three syntypes, I herein select *Glaziou 6559* as the lectotype for *Aralia fluminensis*.

21. *Aralia rex* (Ekman ex Harms) J. Wen — Fig. 53.

Aralia rex (Ekman ex Harms) J. Wen, Brittonia 45: 53. 1993

Megalopanax rex Ekman ex Harms, Notizbl. Bot. Gart. Berlin 9: 122. 1924. TYPE: **Cuba**. HABANA: Lomas de Camoa, 25 km from Habana, 29 Sep 1923, fl, E. L. Ekman 17551 (lectotype, K!, here designated; isolecotypes, BM!, MO!, NY!, 2 sheets, US!).

Tree 5-13 m tall, hermaphrodite. Leaves ca. 100 cm long, tripinnate, to pinnate near the inflorescence, with 3-4 pairs of pinnae; stipules adnate to the base of petiole, lanceolate, subcoriaceous, glabrous; petioles 10-20 cm long; the primary pinnae subtended by a pair of accessory 3-5-foliolate pinnae or a small bipinnate structure on the at the base of the lowermost pinnae; leaflets 4.8-8 cm long, 2.4-4.3 cm wide, glabrous, membranaceous to chartaceous, acuminate at apex, subcordate to rounded at base, entire at margin, adaxial surface green, abaxial surface light green, petiolule articulated below the blade, that of lateral leaflets 2-8 mm long, that of terminal leaflets 10-30 mm long, glabrous. Inflorescence paniculate with a thick main axis, main axis 13-20 cm long, glabrous, brown, conspicuously lenticellate, with ca. 2 whorls of umbels, each whorl with 10-20

umbels; each umbel with a thick peduncle, peduncle 7-14 cm long, 2.5-5 mm thick, articulated near the middle, rough and lenticellate; bracts and bracteoles persistent, glabrous, primary bracts subtending the individual umbels 4-6 mm long, 3-5 mm wide, triangular, coriaceous, bracteoles 1-1.5 mm long, 0.7-1 mm wide, narrowly triangular, glabrous. Flowers appearing after the opening of young leaves; umbels 90-120-flowered, pedicels 9-13 mm long at flowering stage, glabrous, slender, articulated at the base of the flower. Sepals minute, triangular, 4-7-toothed on the calyx ring; petals 7-10, 3.5-5 mm long, 1.5-2 mm wide, narrowly oblong to lanceolate; filaments 4-5 mm long, anthers 2-3 mm long, oblong; ovaries 7-10-locular. Fruits 6-7 mm in diameter, subglobose, with 6-8 ribs when dry, styles stout, persistent stigmas divergent.

Phenology: flowering in September; fruiting in November.

Distribution: endemic to Cuba (Havana and Cienfuegos) (Fig. 54).

Ecology: on limestone rocks, mountain forests, thickets or low forests; ca. 450 m.

Conservation: a rare species in need of conservation.

Additional specimens examined: **Cuba**. CIENFUEGOS: Topaz de Colantes, W80°15', N21°55', 16 Nov 1988, sterile, 450 m, mountain forest, trees 5-13 m tall, R. Dechamps & R. Carrera 12190 (MO). HABANA: Lomas de Camoa, on naked limestone rocks, in thickets or low forests, 6 Nov 1921, E. L. Ekman 13451 (NY); 22 Nov 1921, E. L. Ekman 13523 (BM, MO).

Harms (1924) cited three specimens when describing Ekman's *Megalopanax rex* (Ekman 17551, 13451 and 13523). The original specimens were most likely at B and were destroyed during WWII. *Ekman 17551* bears many flowers and is most widely distributed. The Kew specimen of *Ekman 17551* bears Harms' handwriting and is thus selected as the lectotype here.

22. *Aralia excelsa* (Griseb.) J. Wen — Fig. 55; color plate 15: A-F.

1856, nom. nud. *Sciadodendron excelsum* Griseb., Bonplandia 6: 7. 1858. TYPE: **Panama**. *Duchassaing s.n.* (lectotype: GOET!, here designated).

Reynoldsdia americana Donn.Sm., Bot. Gaz. 49: 455. 1910. TYPE: **Costa Rica**. Peninsula Nicoya, tree of medium height, nomen vernacularum "Chile", Jan 1900, A. Tonduz 13823 (holotype: US!, photo at NY; isotype: US!).

Pentapanax granatensis Rusby, Desc. S. Amer. Pl. 72. 1920. TYPE: **Colombia**. MAGDALENA: Santa Marta, near Masinga, 250 ft, a tree to 40 ft or more, occasional in forest below 1500 ft, flowers March-April, white, flowers terminal 10-20 short branchlets crowded together forming a large cluster, leaves deciduous about the time flowering, leaves 3-pinnate, 22 Mar 1898-99, H. H. Smith 1595 (holotype: NY!; isotypes: E!, K!, P!, 2 sheets, PH!, U!, US!, 2 sheets).

Highly branched and unarmed tree (4) 8-30 m tall, dbh 20-50 cm, hermaphrodite, bark furrowed. Leaves 60-125 cm long, 50-100 cm wide, quadripinnately to tripinnately compound, or bipinnately compound when young, with 5-6 pairs of primary pinnae; stipules 10-13 mm long, 1.5-2.5 mm wide, adnate to the base of petiole, lanceolate, subcoriaceous, glabrous and more or

less ciliate at margin; petioles 20-50 cm long, purplish green; rachises green, turning purplish, subtended by a pair of accessory 3-5-foliolate pinnae at the base of each primary pinna; leaflets 4-7 cm long, 1.5-4 cm wide, glabrous, apex acuminate, base rounded, margin sparsely serrate, adaxial surface green, abaxial surface light green, petiolule more or less articulated below the blade, that of lateral leaflets 0-5 mm long, that of terminal leaflets 10-20 mm long, glabrous. Inflorescence consisting of 1-6 panicles on a short branch, each panicle 7-15 cm long, 5-12 cm wide, with 10-20 umbels racemously arranged on a main axis, main axis glabrous, lower portion appearing rough and with scales, each umbel with a peduncle 3.5-10 cm long, 1-1.5 mm thick, glabrous, each subtended by a few coriaceous broadly triangular bracts, bracts and bracteoles persistent, glabrous, primary bracts subtending the individual umbels 3-6 mm long, 3.5-7 mm wide, triangular, coriaceous, bracteoles 1-1.4 mm long, 0.8-1.1 mm wide, narrowly triangular, glabrous. Flowers appearing before or at the same time as young leaves open; umbels 15-35-flowered, pedicels 4.5-8 mm long at flowering stage, 5-9 mm long when fruiting, non-articulated below the flower, glabrous, stout. Sepals 9-10, minute, semicircular or inconspicuous; petals 9-10, 2.6-2.8 mm long, 1-1.5 mm wide, narrowly ovate, often calyptate and falling together, yellowish white; filaments 3-4 mm

Fig. 55. *Aralia excelsa* (Griseb.) J. Wen. A. Leaf with accessory pinna. B. Stem with inflorescences. C. Inflorescence. D. Floral bud. E. Flower after anthesis. F. Fruit. (A - Steyermark et al. 109907, NY; B - Moreno 25344, BM; C-E - Smith 1595, NY; F - Folsom 3436, BM).

long, anthers 1.5-1.8 mm long, ca. 1 mm wide, narrowly oblong; ovaries 9-10-locular. Fruits 6-7 mm long, 7-8 mm wide, subglobose, dark purple when mature, persistent styles slightly divided at the tip, largely connate, stylar column 1.2-1.5 mm long at the fruiting stage, stout.

Vernacular names: calenturo (Colombia), cebratano, lagarto, and corroncho de lagarto (El Salvador), lagarto and palo de lagarto (Nicaragua), cedro macho (Chamela, Jalisco, Mexico), jobo de lagarto (Alligator Jobo), and mangabé (Panama), and "Chile" (Costa Rica).

Uses: in Panama, the species was cultivated as a street tree; and the petioles were employed for making bird cages (Standley 1928). The natives of Panama apply the macerated leaves with beneficial effect to ulcers. In Nicaragua, it was used as fence post; and the ashes of the wood are used for making soap.

Phenology: flowering in January to July; fruiting in May to August.

Distribution: Colombia, El Salvador, Haiti, Mexico (Jalisco, Colima, and Islas Marías), Costa Rica, Honduras, Nicaragua, Panama, and Venezuela (Fig. 56).

Ecology: Tropical lowland dry forests, or dry forest – moist forest transitional areas, densely forested floodplains to more open hillsides (selva mediana); 0-860 m.

Additional specimens examined: **Colombia.** Municipio Fonseca: Corregimiento Distraccion, sitio Las Casitas-El Socorro, bosque a 2 km, sitio modera damente pendiente con abundantes rocas, bien drenado, algo perturbado, parcela, 500 m, 72°59.4'W, 10°9.1'N, 31 Aug 1990, sterile, *O. Smith, S. Nehlin & M. Lobo* 109907 (NY, U, 2 sheets). YARACUY: a 5 km este de Yaritagua, 1 Apr 1980, fl, *N. Romírez* 367 (K).

N. Romírez 367 (K) from Venezuela shows transitional pedicel articulation. The tip of pedicel has a slight constriction, but is not articulated.

Grisebach (1858) cited that Duchassaing's name "*Arbor excelsa*," which apparently represents a misprint. The lectotype from GOET bears the name "*Aralia excelsa*" below Grisebach's writing "*Sciadodendron excelsum*." The type is a collection made after the flowering with petals already falling off. The ovaries on the type are clearly 10-12-locular, as also indicated on the type specimen by Grisebach.

I am aware that Linden (1856) used *Aralia excelsa* as a *nomen nudum*. Hooker (1862) mentioned that the name *Aralia excelsa* was used for the plant *Leea coccinea* Planch. (Leeaceae) in the horticulture trade with no authority. As the *nomen nudum* by Linden has no nomenclatural standing, the new combination of *Aralia excelsa* (Griseb.) J. Wen is the correct name for this widely distributed taxon of Araliaceae in Central America extending to South America.

The specimen *Bernardi* 7382 (K, NY) collected from Bolívar, Venezuela clearly has an articulation below the flower. It was collected in floral bud condition and appeared to be 5-merous in floral

parts, but each petal seemed to split into two. Like *A. warmingiana*, the specimen has an articulation at the pedicel tip, yet the flowers seem to be smaller than those of *Aralia warmingiana*. Geographically it is out of the normal distributional range of *A. warmingiana*. The inflorescence and floral morphology are similar to those of *A. excelsa*, except that they differ in the pedicel articulation. This collection may represent a new species, but more collections are needed to confirm its identity. Its collection data are as below: Venezuela, bosque de San Mateo, El Cristo-La Paragua, Estado Bolívar, 300 m, 7 Mar 1959, floral buds, no leaves yet, A. L. Bernardi 7382 (K, NY).

23. *Aralia bahiana* J. Wen, sp. nov. — Fig. 57.

Aralia bahiana J. Wen. TYPE: **Brazil.** BAHIA: Mun. de Itiuba, Fazenda Experimental da Epaba, arvore de approximadamente 6 m de altura, fuste retilineo com casca lembrando o pau-d'arco-roxo, madeira mole, estepe arborea densa e floresta estacional decidual, afroamentos rochosos, 10°43'S, 39°50'W, 26 May 1983, young fr, G. C. P. Pinto & H. Bautista 91/83 (holotype: US!; isotype: NY!).

Arbor. Folia ampla tripinnata, usque 50-70 cm longa, foliola glabra, ovata, apice acuminata, basi rotundata, margine parce serrulata. Umbellae 15-35-florae, pedicellis inarticulatis. Fructus oblongo-globosus, stylis 8-9.

Branched and unarmed tree 6-7 m tall. Leaves 50-70 cm long, 50 cm wide, tripinnately compound; stipules 6-7 mm long, 1.2-1.5 mm wide, adnate to the base of petiole, lanceolate, subcoriaceous, glabrous; petioles 15-20 cm long; each pinna subtended by a pair of accessory 3-5-foliate pinnae; leaflets 3-5 cm long, 1.5-2.5 cm wide, glabrous, ovate, acuminate at apex, rounded at base, sparsely and inconspicuously serrulate at margin with a few teeth, adaxial surface green, abaxial surface light green, petiolule more or less

articulated below the blade, that of lateral leaflets 0-2 mm long, that of terminal leaflets 10-15 mm long, glabrous. Inflorescence consisting of 4-5 umbellate units on a short branch, each unit with 5-10 umbels racemously arranged on a main axis, main axis 4-6 cm long, glabrous, appearing rough and with scales, each umbel with a peduncle 4-6 cm long, 2.5-3 mm thick, glabrous and more or less rough, each subtended by a few bracts at the base and ca. 0.5-1 cm from the base, bracts and bracteoles persistent, glabrous, primary bracts subtending the individual umbels 4-6 mm long, 5-7 mm wide, triangular, coriaceous, bracteoles 1.8-2.2 mm long, 1.2-1.5 mm wide, narrowly triangular, glabrous. Umbels 15-35-flowered, pedicels 6-13 mm long, glabrous, stout, non-articulated below the flower. Sepals 8-9, minute, inconspicuous; petals 8-9, 4-4.5 mm long, 1.2-1.3 mm wide, narrowly ovate, seemingly non-calyptate, white; filaments 3.5-4 mm long, anthers 1.6-1.9 mm long, 0.9-1 mm wide, narrowly oblong; ovaries 8-9-locular, persistent sepals 8-9, minute, inconspicuous. Fruits 7-8 mm long, 6-8 mm wide, ovoid globose to globose, persistent styles slightly divided at the tip, largely connate, stylar column 1-1.5 mm long.

Vernacular name: tingui-bravo.

Phenology: with a few flowers in late April, and in young fruits from late April to late May.

Distribution: Bahia, Brazil (Fig. 50).

Ecology: Estepe Arborea Densa e Floresta Estacional Decidual.

Additional specimens examined: **Brazil.** Bahia: Município de Santa Terezinha, ca. 5 km W da Estrada Santa Terezinha-Itatim, em uma Estrada vicinal distando ca. 14 km E de Itatim, 26 Apr 1994, in fruit & with a few flowers, L. P. de Quiróz & N. S. Nascimento 3853 (K, 3 sheets).

Aralia bahiana is closely related to *A. excelsa*, sharing the character of the non-articulated pedicel. It is distinguished from the latter by the very stout peduncle and the ovoid globose fruits of the new species.

Fig. 57. *Aralia bahiana* J. Wen. A. Branch with leaves showing leaf architecture. B. Branch showing young inflorescence on old branch. C. Young infructescence. D. Young fruit. E. Older fruit (A-E - Pinto & Bautista 91/83, US).

EXCLUDED NAMES

Aralia sololensis Donnell-Smith, Bot. Gaz. 56: 58. 1913. TYPE: **Guatemala.** Prope Patulul, Dept. Sololá, Feb 1906, fl, W. A. Kellerman 5828 (holotype: US!; isotype: OS!).
= *Sambucus simpsonii* Rehder (Adoxaceae) This

species is clearly not a member of Araliaceae and was excluded from the New World *Aralia* (see Smith 1936; Standley and Williams 1966; Frodin and Govaerts 2003).

ACKNOWLEDGEMENTS

This study was supported by the National Science Foundation (DEB-0196051, and DEB-0108536), the Institute of Botany of the Chinese Academy of Sciences, the Field Museum, the Smithsonian Institution (the Small Grants Program of the National Museum of Natural History, the Botany Collections Fund, the Walcott Fund, and the Laboratory of Analytical Biology), and the John D. and Catherine T. MacArthur Foundation. Field and/or herbarium assistance was kindly provided by many colleagues and friends: Susan Agnew, Reinaldo Aguilar, Qing Ban, Manzhu Bao, John Beaman, Stephan Beck, John Boggan, Zhiyu Cao, A. S. Chauhan, Martin Cheek, Hongfeng Chen, Longqin Chen, Yansheng Chen, Zhiyuan Chen, Fernando Chiang, Nancy Coile, A. P. Das, J. I. Davis, Yunfei Deng, Michael Dillon, Hanmin Dong, James Dong, Michael Dong, Larry Dorr, Barbara Ertter, Kuomei Feng, David Frodin, De-zhi Fu, Song Ge, Gang Hao, James W. Hardin, M. Hasebe, De-yuan Hong, Chiming Hu, Pu-hua Huang, Sovanmoly Hul, Stefanie Ickert-Bond, Hugh H. Iltis, M. Ito, Yunsheng Jiang, Samuel B. Jones, Jr., Shusheng Lai, Thomas G. Lammers, De-zhu Li, Heng Li, Liangqian Li, Na Li, Rong Li, Xiangping Li, Xuedong Li, Qi Lin, Yourun Ling, Ho-Yih Liu, Yan Liu, Zhengyu Liu, Pete Lowry, Zhengwei Lu, Xiaozhong Luo, Yibo Luo, A. A. Mao, Esteban Martinez, Lucinda McDade, Ying Meng, Michael Nee, Bing Ni, Zelong Nie, Christine Niezgoda, Simon Owens, Ze-hui Pan, Arun K. Pandey, Jose Panero, M. K. Pathak, Ching-I Peng, Mike Powell, Alan Prather, John Pruski, Haining Qin, Jim Reveal, Rusty Russell, M. Sanjappa, Ed Schilling, Suhua Shi, N. P. Singh, Larry Skog, Jim Soloman, David M. Spooner, Tod Stuessy, Hang Sun, Hui Tang, Guangfu Tao, Roy Vickery, Jose L. Villasenor R., Huilin Wan,

Chao-liang Wang, Jinghua Wang, Meila Wang, Xiao Wei, Tom Wendt, Carol Wilson, Emily Wood, C.-Y. Wu, Fuwu Xin, Kexue Xu, Aleck Yang, Gan Yao, Tingshuang Yi, Nelson Zamora, Mingli Zhang, Qifa Zhang, Zhiyun Zhang, Jim Zech, and Shiliang Zhou. The curators of A, ASU, B, BKF, BM, BSHC, CAS, DES, DS, E, F, G, GH, GOET, HAST, K, K-W, KUN, L, LE, LL, LPB, MEXU, MO, MSC, MT, MU, NCSC, NCUF, NY, OS, P, PE, PH, RSA, SRSC, TAI, TAIF, TEX, TI, TNM, U, UC, UNM, US, W, WU, WUK, and YU are gratefully acknowledged for permitting the examination of their specimens. I thank Jeff Martz, Nancy Klaud, Zorica Dabich and Alice Tangerini for providing the botanical illustrations, Larry Dorr, Dan Nicolson, Fred Barrie, Pedro Acevedo and Warren Wagner for helpful discussions and advice on nomenclature, historical references, localities and/or collectors, Jimmy Triplett and Akiko Soejima for checking locality names of *Aralia cordata* from Japan, Christian Feuillet for interpreting references in French, and Paul Peterson for valuable advice during the preparation of the manuscript. Zelong Nie, Hanmin Dong and Michael Dong helped plot the distributional maps, Stefanie Ickert-Bond and Sue Lutz put together the plates on pollen and trichome morphology, Tracy Belaski made the 14 color plates with InDesign, and Sue Lutz and Stanley Yankowski helped with SEM work on trichomes and pollen morphology. John Boggan helped draft distributional maps, provided valuable comments on the earlier version of the manuscript, and helped with obtaining interlibrary loans. Finally, without the love and support from my family, Hanmin, Michael, James, and Grandma and Grandpa Dong, this monograph series of *Aralia* would never have been completed!

INDEX TO SCIENTIFIC NAMES

(Accepted names are in **bold**; synonyms are in *italics*; main entry for each is in **bold**; and figures and plates are in parentheses)

- Abies** 70, 71, 72, 75, 79, 92, 94, 102, 103, 113
- Acacia berlandieri** 129
- Acacia crassifolia** 129
- Acanthophora** Merr. 34
- Acer** 38, 40, 42, 44, 47, 48, 66, 70, 71, 72, 75, 85, 86, 113, 114, 115, 116, 117
- Acer rubrum** 48, 117
- Acer saccharum** 44, 66, 115
- Agave lechuguilla** 129
- Agave macroura** 129
- Agave parryi** 126
- Anadenanthera macrocarpa** 136, 138
- Andropogon** 126
- Apiaceae** 5
- Aralia L.** 5, 22, 34
- Aralia apioides** Hand.-Mazz. 13, 28, 36, **100**, 102, 103, (15, 58, 101, 102)
- Aralia arizonica* Eastw. 68
- Aralia armata** (Wall. ex Don) Seem. 22, 30, 93
- Aralia atropurpurea** Franch. 10, 13, 22, 28, 36, **96**, 99, 100, 103, (16, 57, 95, 97)
- Aralia bahiana** J. Wen 14, 30, 33, 34, 134, **149**, (137, 150)
- Aralia birenata** Wooton & Standl. 8, 9, 28, 32, 33, 35, **68**, 73, (24, 51, 69, 71)
- Aralia bipinnata** Blanco var. *bipinnata* 30
- Aralia bipinnata** Blanco var. *apoensis* (Elmer) J. Wen 30
- Aralia brevifolia* Marchal 9, 118
- Aralia cachersimica** Decne. 6, 10, 28, 33, 36, **87**, 90, 93, (88, 89)
- Aralia caesia** Hand.-Mazz. 29
- Aralia californica** S. Watson 6, 8, 9, 22, 28, 33, 35, **36**, (23, 37, 39, 49)
- Aralia californica* S. Watson var. *acuminata* S. Watson ex Howell 36
- Aralia castanopsisicola** (Hayata) J. Wen 29
- Aralia chilensis* Sessé & Moç. 9, 118, 127
- Aralia chinensis** L. 10, 22, 30
- Aralia continentalis** Kitag. 10, 28, 33, 35, **83**, 87, (54, 79, 84)
- Aralia cordata** Thunb. 6, 8, 10, 13, 28, 33, 36, **73**, 80, 83, 151, (52, 74, 76)
- Aralia cordata* Thunb. var. *continentalis* (Kitag.) Y. C. Zhu 83
- Aralia cordata* Thunb. var. *sachalinensis* (Regel) Nakai 77
- Aralia dasypylla** Miq. 7, 31
- Aralia dasypylloides** (Hand.-Mazz.) J. Wen 7, 13, 22, 30
- Aralia debilis** J. Wen 13, 30
- Aralia decaisneana** Hance 13, 30
- Aralia delavayi** J. Wen 29
- Aralia dumetorum** Hand.-Mazz. 96, 99, 100
- Aralia echinocaulis** Hand.-Mazz. 30
- Aralia edulis** Siebold & Zucc. 10, 73, 77
- Aralia elata** (Miq.) Seem. var. *elata* 26, 30, 75, (14)
- Aralia elata** (Miq.) Seem. var. *mandshurica* (Rupr. & Maxim.) J. Wen 26, 30

- Aralia elata** (Miq.) Seem. var. *ryukyuensis* J. Wen 30
- Aralia elata** (Miq.) Seem. var. *inermis* (Yanagita) J. Wen 30
- Aralia excelsa** (Griseb.) J. Wen 14, 22, 29, 30, 33, 34, 134, 142, 148, 149, (63, 145, 147)
- Aralia fargesii** Franch. 4, 8, 10, 15, 28, 33, 36, **94**, 96, 99, 105, (56, 95)
- Aralia ferox** Miq. 30
- Aralia finlaysoniana** (Wall. ex Don) Seem. 30
- Aralia fluminensis** Glaziou 140, 142
- Aralia foliolosa** Seem. ex C. B. Clarke 22, 30
- Aralia franchetii** J. Wen 27, 29
- Aralia frodiniana** J. Wen 30
- Aralia gigantea** J. Wen 17
- Aralia gintungensis** C. Y. Wu 14, 30
- Aralia glabra** Matsum. 4, 6, 10, 28, 33, 36, **103**, 105, (104, 105)
- Aralia glabrifoliolata** (C. B. Shang) J. Wen 29
- Aralia henryi** Harms 10, 22, 28, 33, 35, **106**, 108, 109, (64, 107, 108)
- Aralia hiepiana** J. Wen & Lowry 30
- Aralia hispida** Vent. 9, 13, 22, 26, 30, 32
- Aralia humilis** Cav. 9, 13, 22, 28, 32, 33, **118**, 127, 131, (14, 19, 21, 25, 60, 119, 120, 121, 123)
- Aralia hypoglauca** (C. J. Qi & T. R. Cao) J. Wen & Y.-F. Deng 29
- Aralia kansuensis** G. Hoo 94, 96
- Aralia kingdon-wardii** J. Wen, Lowry & Esser 29
- Aralia laevis** J. Wen 29
- Aralia leschenaultii** (DC.) J. Wen 22, 27, 29
- Aralia lihengiana** J. Wen, L. Deng & X. Shi 29
- Aralia macrophylla** Lindl. 87, 90
- Aralia malabarica** Bedd. 22, 30
- Aralia melanocarpa** (H. Lév.) Lauener 96, 99, 100
- Aralia merrillii** C. B. Shang 30
- Aralia montana** Blume 30
- Aralia nudicaulis** L. 8, 9, 11, 13, 22, 29, 31, 47, 73, **109**, 117, 118, (14, 21, 23, 59, 110, 112)
- Aralia nudicaulis** f. *prolifera* (Apgar) 109
- Aralia nudicaulis** var. *prolifera* Apgar 109
- Aralia nudicaulis** var. *elongata* Nash 109
- Aralia nudicaulis** f. *depauperata* Marie-Vict. 109
- Aralia nutans** Franch. & Sav. 10, 73
- Aralia officinalis** Z. Z. Wang 14, 30
- Aralia parasitica** (D. Don) J. Wen 27, 29
- Aralia pilosa** Franch. 10, 106
- Aralia pinnata** Sessé & Moç. 9, 118
- Aralia plumosa** H. L. Li 29
- Aralia pubescens** DC. 9, 32, 118, 127
- Aralia racemosa** L. 6, 7, 8, 9, 28, 31, 32, 33, 34, 35, **42**, 67, 68, 73, 90, 114, (14, 18, 20, 43, 45, 50)
- Aralia racemosa** var. *foliosa* Vict. & J. Rousseau 42, 67
- Aralia racemosa** L. f. *foliosa* (Vict. & J. Rousseau) Scoggan 42, 67
- Aralia racemosa** subsp. *birenata* (Wooton & Standl.) S. L. Welsh & J. T. Atwood 68

- Aralia racemosa* L. var. *sachalinensis* Regel 77, 80
Aralia regeliana Marchal 9, 28, 33, 118, 127, 131, (26, 61, 128, 130)
Aralia rex (Ekman ex Harms) J. Wen 30, 33, 134, 142, (143, 144)
Aralia sachalinensis Hort. ex Sieb. et Voss 77
Aralia scabra C. Presl ex DC. 9, 118
Aralia scaberula G. Hoo 30
Aralia schmidtii Pojark. 6, 10, 28, 33, 35, 77, 80, 83, (52, 78, 79)
Aralia scopulorum Brandegee 9, 11, 22, 28, 33, 118, 127, 131, (27, 61, 130, 132)
Aralia searelliana Dunn 22, 31
Aralia shangiana J. Wen 29
Aralia sololensis Donnell-Smith 15
Aralia soratensis Marchal 19, 30, 33, 34, 134, (20, 24, 62, 135, 137)
Aralia spinifolia Merr. 7, 22, 30
Aralia spinosa L. 6, 8, 9, 13, 14, 22, 27, 30, 34
Aralia stellata (King) J. Wen 29
Aralia stipulata Franch. 6, 13, 14, 30
Aralia subcordata (Don) J. Wen 29
Aralia taiwaniana Y. C. Liu & F. Y. Lu 6, 10, 28, 33, 35, 80, 82, 83, (17, 53, 81)
Aralia thomsonii Seem. ex C. B. Clarke 13, 30
Aralia tibetana G. Hoo 10, 28, 33, 36, 90, 93, 94, (55, 91, 93)
Aralia tomentella Franch. 29
Aralia tripinnata Blanco 90
Aralia undulata Hand.-Mazz. 8, 14, 30
Aralia urticifolia Miq. 7, 31
Aralia verticillata (Dunn) J. Wen 29
Aralia vietnamensis T.-D. Ha 31
Aralia warmingiana (Marchal) J. Wen 8, 9, 30, 33, 34, 134, 138, 142, 149, (25, 139, 141)
Aralia? weberbaueri Harms 8, 19
Aralia wilsonii Harms 29
Aralia yunnanensis Franch. 96, 99
Aralia sect. *Anomalae* Harms 8, 15, 28, 34
Aralia sect. *Aralia* 5, 6, 10, 13, 26, 28, 31, 33, 34, 35, 109
Aralia sect. *Arborescentes* Harms 30
Aralia sect. *Capituligerae* Harms 30
Aralia sect. *Digitatipanicula* Hoo 30
Aralia sect. *Dimorphanthus* (Miq.) Miq. 6, 13, 22, 30, 33, 34
Aralia sect. *Echinatae* C. B. Shang & X. P. Li 7
Aralia sect. *Genuinae* Harms 28, 34
Aralia sect. *Glabrae* Z. Z. Wang 7
Aralia sect. *Humiles* Harms 13, 28, 33, 118, 127
Aralia sect. *Nanae* Harms 28, 119
Aralia sect. *Pentapanax* (Seem.) J. Wen 6, 13, 29, 99
Aralia sect. *Sciadodendron* (Griseb.) J. Wen 13, 22, 29, 33, 133, 134
Aralia sect. *Undulatae* C. B. Shang & X. P. Li 7
Araliaceae 5, 7, 8, 9, 10, 14, 22, 26, 31, 100, 148, 151
