Male of *Evarcha nepos* (O. Pickard-Cambridge, 1872)

Summary

The arachnofauna of Cyprus currently includes 449 species, of which all known and all new localities are presented. Nineteen species are considered endemic, but several new species will be described in the future. The unknown male of *Dipoena galilaea* Levy & Amitai and the unknown females of *Improphantes cypriot* Tanasevitch, *I. turok* Tanasevitch, *Palliduphantes minimus* Deeleman-Reinhold and *Steatoda trianguloides* Levy are described for the first time. Male and female of *Phaeocedus hebraeus* Levy, 1999 have been incorrectly matched and the female is described for the first time. *Lepthyphantes lagunculus* Denis from Algeria is redescribed and transferred to the genus *Theonina* **n. comb.** The species is also cited for the first time in Spain, Morocco and Cyprus. *Lathys arabs* Simon, 1911 is not a synonym of *L. stigmatisata* (Menge, 1869) but a distinct species, *contra* Lethinen, 1967. *Ctenidae* and *Anahita syriaca* is a new family, genus and species for Europe. The following species are new to Europe: *Improphantes turok* Tanasevitch, *Mermessus fradeorum* (Berland), *Mogrus logunovi* Prószyński, *Neoscona sodom* Levy, *Phaeocedus hebraeus* Levy, *Pterotricha schaefferi* (Audouin), *Silhouettella tomer* Saaristo, *Talanites dunini* Platnick & Ovtsharenko, *Tetragnatha demissa* (C. L. Koch), *Zygiometella perlongipes* (O. Pickard-Cambridge, 1872), *Oxyopes sobrinus* O. Pickard-Cambridge and *Theridion ochreolum* Levy & Amitai. Not less than 325 species are cited here for the first time in Cyprus. A number of species records were critically evaluated and were apparently misidentifications.

I. Introduction

Cyprus is an island in the Eastern Basin of the Mediterranean with a total land area of 9251 km². For a detailed description of the geography, the climate, the geology and the habitats, we refer to Sparrow & John (2016) 'An introduction to the wildlife of Cyprus'.

Cyprus has two distinct mountain ranges, the large, central, gradually sloping Troodos Massif, up to 1951m, and the narrow, steep, Pentadaktylos Range (Keryneia mountains), reaching 1024m and fringing the northern coast for 160 km.

Cyprus has an extreme Mediterranean climate, with hot and dry summers, and mild and rainy winters.

Natural and semi-natural habitats in Cyprus include woodlands (coniferous, oak and riparian), scrubland (phrygana) and some grasslands, dunes and small wetlands.

Woodlands are preferred habitats for spiders and several endemic species can be found here. Coniferous forests occur at all altitudes in Cyprus. At lower levels, they are dominated by Calabrian pine *Pinus brutia*. Black pine (*Pinus nigra pallasiana*) forests occur on the higher peaks of the Troodos Mountain, at somewhat lower altitudes mixed with *Pinus brutia*. Cypress forests can mainly be found on the slopes of the Pentadaktylos range, and *Juniperus* forests on the slopes of the Akamas Peninsula and Karpasia. Finally, cedar forest with the endemic *Cedrus brevifolia* are mainly found in the 'Cedar Valley' in the Paphos forest. Oak forests (*Quercus infectoria veneris*, *Q. alnifolia*) occur as small stands, mainly on the Troodos mountain range. Riparian forests with *Platanus orientalis*, *Salix alba* and *Alnus orientalis* occur along the upper parts of the major rivers of the island, while in the lower parts of the rivers which are often dry they are replaced by riparian galleries with *Nereum oleander* and *Tamarix* spp.

Scrublands of phrygana are very common in Cyprus, but difficult to explore for spiders. The main type is a short, pillow-forming, thorny vegetation, grading into more arborescent vegetation with Olive (*Olea europaea*), Pistachio (*Pistacia lentisca*) and Kermes oak (*Quercus coccifera*).

Wetland habitats are important for spiders including the marshy areas surrounding them. Some natural or brackish lakes include the Akrotiri, Famagusta, Larnaka, and Paralimni lakes. Many reservoirs and dams have been created by man, some of them with interesting marshy areas, such as the Achna Lake.

Agricultural environments such as olive, carob and almond groves, vineyards, patches of low intensity cereals and grazing land may also offer suitable habitats for spider species.

II. History of the study of the spiders of Cyprus

Very little arachnological research has been carried out on Cyprus and the spider fauna is very poorly known.

The first spider mentioned in the literature was also one of largest and most striking species found on the island. In an important paper on Mediterranean Mygalomorpha, the German arachnologist, Ausserer (1871) described *Ischnocolus gracilis*, now considered a junior synonym of *Chaetopelma olivaceum* (C. L. Koch, 1841). In the same paper, he described another mygalomorph spider, *Brachythele incerta* which has never again been reported in the literature.

In the early years, Simon (1874) described *Nurscia flavipes* from Cyprus, but this appears to have been a synonym of *N. albosignata* Simon 1874. Similarly, he described *Micaria todilla* from Cyprus (Simon, 1878), but this appears to have been a junior synonym of *M. ignea* O. Pickard-Cambridge, 1872. Strand (1907) added 3 species to the fauna of Cyprus in a small contribution.

The Polish arachnologist, Kulczyński (1908) was the first to publish a paper dealing entirely with spiders of Cyprus. Nineteen species were listed for the first time in Cyprus, of which seven were new to science.

In general, researchers contributing to the arachnofauna of Cyprus concerned themselves with revisions of families or genera. Deeleman-Reinhold (1988) contributed with the genus *Dysdera* (four species), Bosmans & Van Keer (1999) with the theridiid genus *Enoplognatha* (two species), Knoflach (1999) with the theridiid genus *Neottiura* (one species), Bosmans (2009) with the zodariid genus *Zodarion* (one new and three revised species), Jäger *et al.* (2011) with the sparassid genus *Olios* (one species) and finally Zonstein & Marusik (2016, 2019) contributed to the *Filistatidae* of Cyprus.

Wunderlich (1980, 1995a-c, 2011) published many contributions to the Mediterranean arachnofauna, including the fauna of Cyprus: *Walckenaeria cyprusensis* in 1995, *Theridion cyprusense* in 2011 and *Ariadna cyprusensis* in 2011.

A few authors described single species from Cyprus. Deeleman-Reinhold (1985) discovered a new linyphiid spider, *Palliduphantes minimus*. Bosselaers (2002) described a new genus, *Akamasia* (named after

the Akamas Peninsula in Cyprus) which includes only one known species at present; the Cyprus endemic *Akamasia cyprogenia*. Vollmer (1997) described a second *Chaetopelma* species from Cyprus: *C. karlamani*. Azarkina (2006) described the salticid species *Aelurillus cypriotus*, Panayiotou *et al.* (2010) described *Berinda cypria*.

In a paper on European Linyphiidae, Tanasevitch (2011) described several new species from the Mediterranean, among them two new species (*Araeoncus cypriacus* and *Improphantes cypriot*) and nine species cited for the first time in Cyprus.

Logunov (2013, 2015) is an important researcher of the spider fauna of Cyprus. In 2013, he added 15 species to the fauna of the island and a further 13 species of Salticidae in 2015, as a result of which, salticids are among the best known of Cypriot spiders.

Further recent contributions are those of Chatzaki & Russell-Smith (2017) adding 7 species of Gnaphosidae, Aharon *et al.* (2017) clarifying the identity of the *Artema* species occurring in Cyprus, Azarkina *et al.* (2018), describing the unknown female of *Aelurillus cypriotus*, Bosmans *et al.* (2018) revising the genus *Haplodrassus*, Gücel *et al.* (2018, 2019) describing new *Dysderocrates* and *Harpactea* species from Cypriot caves, Özkütük *et al.* (2019), citing a *Cheiracanthium* species for the first time and finally Chatzaki & Van Keer (2019) citing *Echemus levyi* for the first time.

Finally, we should mention two recent books dealing with the spider fauna of Cyprus. McCowan's book (2014), "60 Cypriot Spiders" is a popular introduction to the spiders of Cyprus. Bosmans, in Sparrow & John (2016, Wildlife of Cyprus), wrote a contribution on spiders which adds no new species for the island.

Summarizing, Nentwig *et al.* (2019) mention 107 species reported from Cyprus in the literature. Compared with other Mediterranean islands this number is relatively low, as can be seen in Table 1:

	Surface area (km ²)	Distance from mainland (km)	Number of known species	Author
Sardinia	24.090	200	459	Pantini <i>et al.</i> , 2013
Crete	8.336	96	430	Bosmans <i>et al.</i> , 2013
Lesbos	1632	12	296	Bosmans <i>et al.</i> , 2009
Chios	904	8	315	Russell-Smith <i>et al.</i> , 2011
Korfu	607	7	243	Russell-Smith 2014
Lefkada	334	2	117	Russell-Smith 2014
Cyprus	9.251	70	107	Nentwig <i>et al.</i> , 2019

Table 1: Number of spider species on, and surface area of, the Mediterranean islands Sardinia, Crete, Lesbos, Chios, Korfu, Lefkada and Cyprus.

Many more spider species are thus to be expected in Cyprus. Along with a team of European arachnologists, several collecting trips have been organised, and some local arachnologists started to cooperate with the project.

III. Methods and Material

The material studied was collected by different arachnologists. RB, A.R-S, MK, JVK and KHK identified their material themselves. They are not listed as collectors in the text, only the deposition in their collection is referred to. Material of Michael Hadjiconstantis and Christos Zoumidis was identified by RB and material of John Murphy was identified by AR-S.

AR-S had some Salticidae and Thomisidae identified by Dmitri Logunov, the Agelenidae by Angelo Bolzern, some Pholcidae by Bernhard Huber and some Gnaphosidae by Maria Chatzaki.

Material of the Natural History Museum was identified by Marjan Komnenov.

An overview of all examined collections is given in table 2.

Collector	Year	Location	Seen by
-----------	------	----------	---------

IV. Taxonomic part

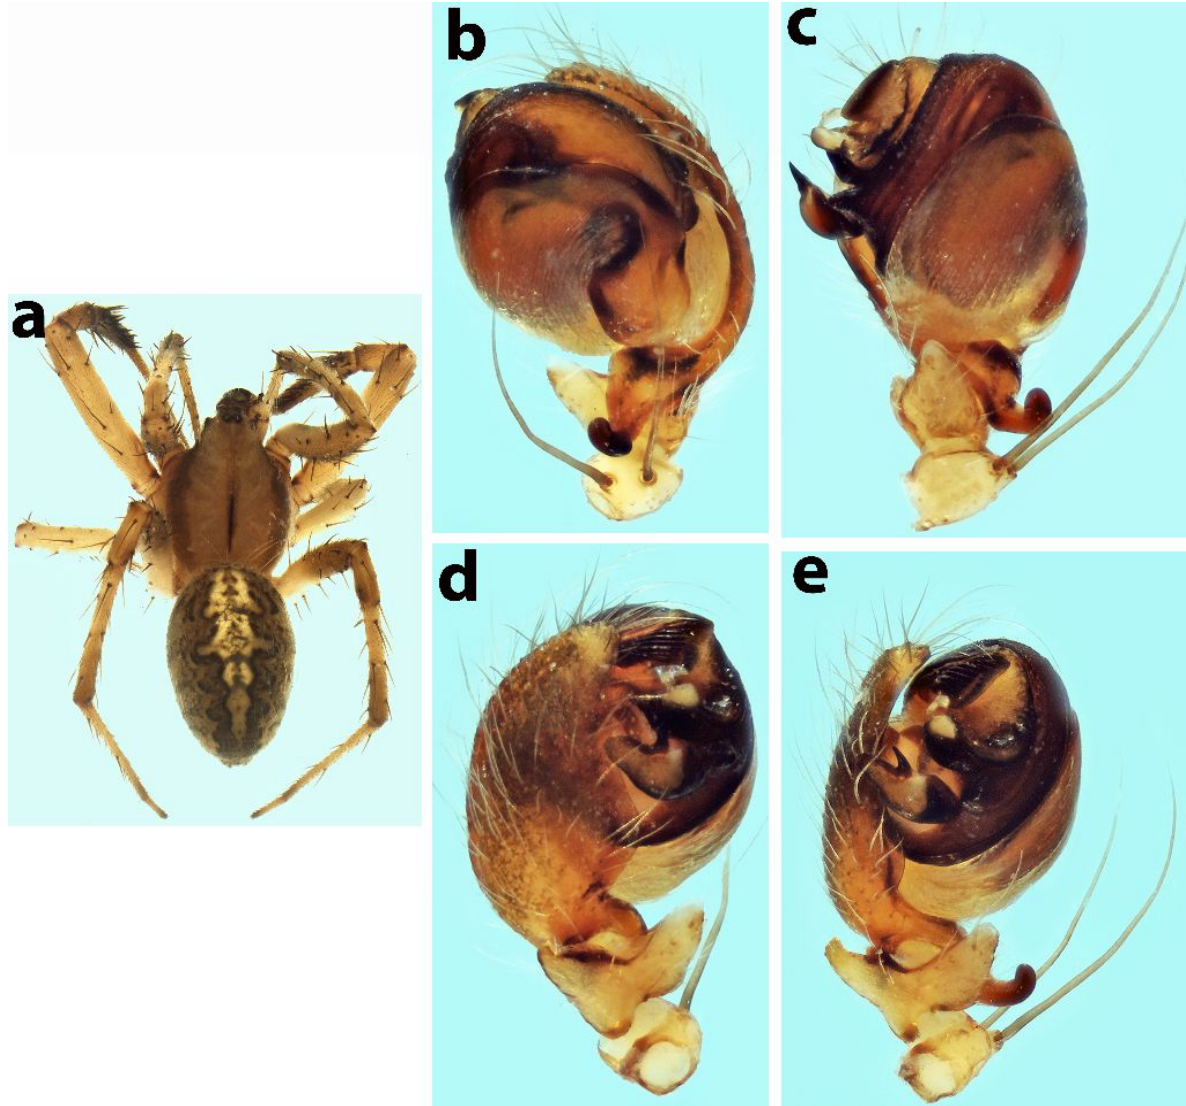

In this part, some poorly known or rarely illustrated species are discussed.

Family Araneidae

Neoscona sodom Levy, 1998

(Figs 1 a-e)

Neoscona sodom Levy, 1998a: 340, figs 117-126.

Figs 1a-e. *Neoscona sodom* Levy. a. Male, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, prolateral view; e. Idem, ventro-prolateral view.

Diagnosis

Neoscona sodom Levy differs clearly from *Neoscona adianta* (Walckenaer, 1802) and *N. subfusca* (C. L. Koch), the other *Neoscona* species occurring in Cyprus, by its general colour, abdominal pattern and further by the shape of the median apophysis with a black spike, and the fan-shaped terminal apophysis.

Records

See part V, page 41.

Comments

This species is only known from two localities in Israel, the male from the Dead Sea region, the female from the Yizre'el Valley. It is new to Cyprus.

Family Ctenidae

Anahita syriaca (O. Pickard-Cambridge, 1872)

(Figs 2 a-f)

Anahita syriaca; Levy, 2003: 11, figs 16-22 (descr. ♂, ♀).

Diagnosis

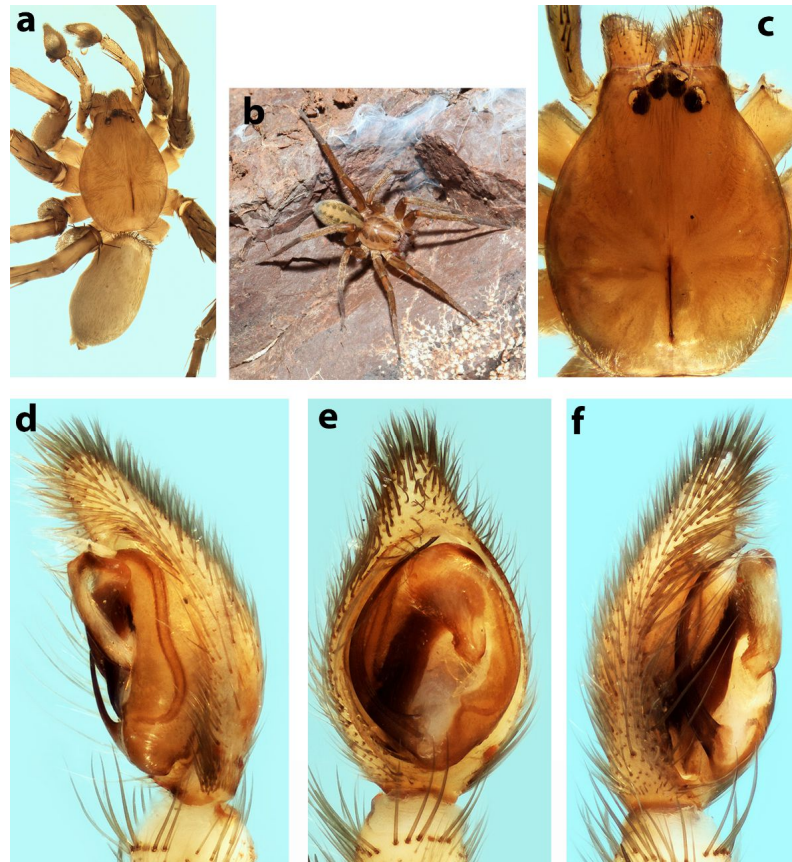

Ctenidae are recognised by the peculiar eye disposition in rows of 2-4-2 (Fig. 1c). Since *Anahita syriaca* is the only European species of the family, it cannot be confused with any other. The male is further characterised by the absence of a tibial apophysis and the semi-circular embolus (Figs 1d-f), the female by the shape of the square, epigynal plate.

Comments

This is the first record of both the family and this genus for Europe. The female was first described by O. Pickard-Cambridge (1872) from the plains of the Jordan, the male was described much later by Levy (2003), from Israel.

Records

See part V, page 45.

Figs 2 a-f. *Anahita syriaca* (O. Pickard-Cambridge). a. Male, dorsal view; b. Male, dorsal view, living specimen; c. Male prosoma, dorsal view; d. Male palp, retrolateral view; e. Idem, ventral view; f. Idem, proventral view.

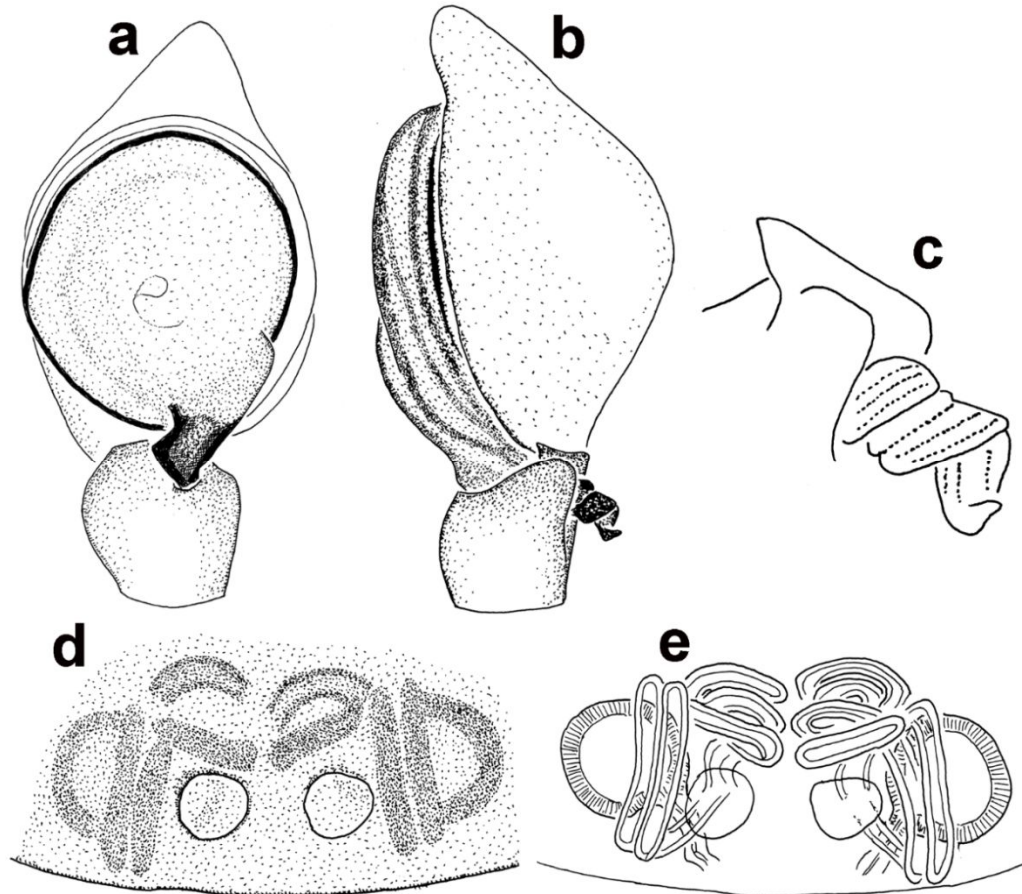

Family Dictynidae

Lathys arabs Simon, 1911

(Figs 3 a-e)

Lathys arabs Simon, 1911: 278.

Lathys puta; Lehtinen 1967: 243, figs. 257, 266 (synonymy, here rejected).

Figs 3a-e. *Lathys arabs* Simon. a. Male palp, ventral view; b. Idem, retrolateral view; c. Part of male palpal cymbium and tibia, detail, dorso-prolateral view; d. Epigyne, ventral view; e. Vulva, ventral view.

Type material

Lectotype ♂, 1 ♀ 2 ♀♀ paralectotypes of *Lathys arabs* Simon from Algeria, S. Bou Saada, Aïn Oghrab, MNHN AR 403; 3 paratypes from Algeria, Biskra, MNHN AR 396; ♀♀ paralectotypes from Tunisia, Nefzaoua, Vibert leg., MNHN AR 420; examined; all by present designation, and all mentioned in the original description by Simon 1910.

Comparative material examined

Lectotype ♂, 4 ♀♀ paralectotypes of *Lathys maura* Simon from Algeria, Annaba, Forêt de l'Edough, on bushes together with *Lathys humilis*, VI.1884, MNHN AR 413.

Diagnosis

Lathys arabs was described from Algeria by Simon (1910). This species was synonymized with *Lathys stigmatisata* by Lehtinen (1967), although he did not mention examining type material. The first author examined the type material of *Lathys arabs* and figures of the species were published in Bosmans *et al.* (2009). Males differ from the related *Lathys stigmatisata* (Menge) by the absence of a patellar apophysis and the shorter distal part of the conductor, directed in posteo-dorsal direction. In females of *L. arabs*, the

epigynal openings are widely separated and there are two pairs of vertical loops in the fertilisation duct (fig. 3e), but only one pair in *Lathys stigmatisata*. *Lathys arabs* has to be considered a distinct species. The paper of Marusik *et al.* (2006) was of great help to describe the different parts of male palps and epigynes.

Description

Measurements: Male (n = 7): Total length 2.2-3.2; prosoma 0.81-1.05 long. Female (n = 15): Total length 2.2-3.4; prosoma 0.88-1.38 long.

Colour: Prosoma yellowish brown, with foveal region grey, often some pale grey radiating stripes; legs pale yellowish; abdomen dorsally with large pale grey spot, filled with 5-6 grey chevrons, laterally with a pattern of oblique, alternate pale grey and darker grey stripes, the paler stripes sometimes interrupted by darker spots or completely dark grey with whitish spots.

Male palp (Figs 3 a-c): Patella without apophysis; tibia with short, pointed retrodorsal and larger prodorsal apophyses; base of conductor trapezoid in ventral view, distal part cork-shrew-like, with 3.5 loops, terminally bluntly pointed; bulbus circular, flattened, embolar base not visible, arising at ventral side of bulbus, embolus whip-like, imbedded in lateral grooves of bulbus, describing 3.5 circles.

Epigyne (Figs 3 d-e): Median septum as wide as the diameter of each atrium; copulation ducts with 3 horizontal and two vertical loops

Records

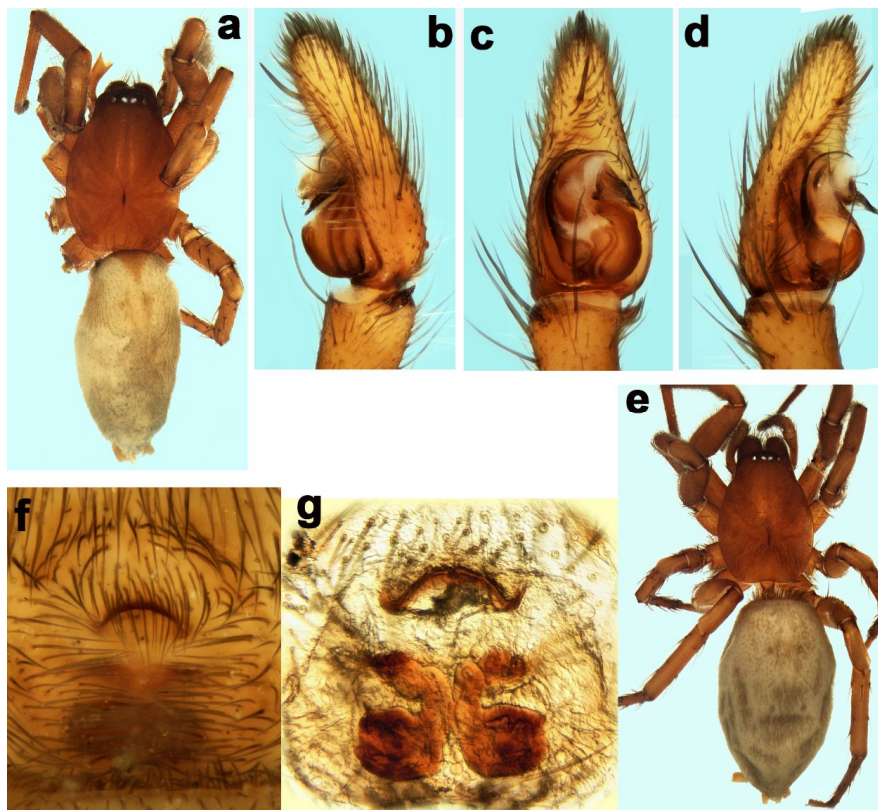

See part V, page 47.

Family Gnaphosidae

Berinda idae Lissner, 2016

(Figs 4 a-e)

Berinda idae Lissner, in Lissner & Chatzaki, 2016a: 9, figs 1a-c, 2a-b, 3a-b, 4a-b, 5a-b, 6-7 (descr. ♂♀).

Figs 4 a-e. *Berinda idae* Lissner. a. Male, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, prolateral view; e. Female, dorsal view; f. Epigyne, ventral view; g. Vulva, dorsal view.

Comments

According to the World Spider Catalog (2018), the genus *Berinda* includes seven species, all from the eastern Mediterranean region or Central Asia. Three of them occur in Cyprus. Males of *Berinda idae* differ from all other *Berinda* species by the short, triangular retrolateral tibial apophysis (Figs 4b-c), females by the short, rectangular hood (Figs 4 f).

This is the first record of *Berinda idae* outside of Greece. Previously, it was known from the Dodekanese (Kalymnos, Nisyros) and the Cyclades (Santorini, Christiani Islet) (Lissner & Chatzaki, 2012). In the specimens from Cyprus, the tibial apophysis of the male looks shorter (probably due to a different angle of view) and the epigynal hood is more incised posteriorly, but these are considered minor variations.

Records

See part V, page 53.

Drassyllus cyprius Chatzaki & Russell-Smith, 2017 (Figs 5 a-k)

Drassyllus cyprius Chatzaki & Russell-Smith 2017: 24 (descr. ♂♀).

Figs 5 a-k. *Drassyllus cyprius* Chatzaki & Russell-Smith. a. Male prosoma, dorsal view; b. Female, dorsal view; c. Idem, ventral view; d., Male palp, retrolateral view; e. Idem, ventral view; f. Idem, prolateral view; g. Male palpal tibia, lateral view; h. Tip of bulbus, ventral view; i. Epiyne, ventral view; j. Vulva, ventral view; k. Vulva, dorsal view.

Comments

This recently described species is apparently common and widespread in Cyprus.

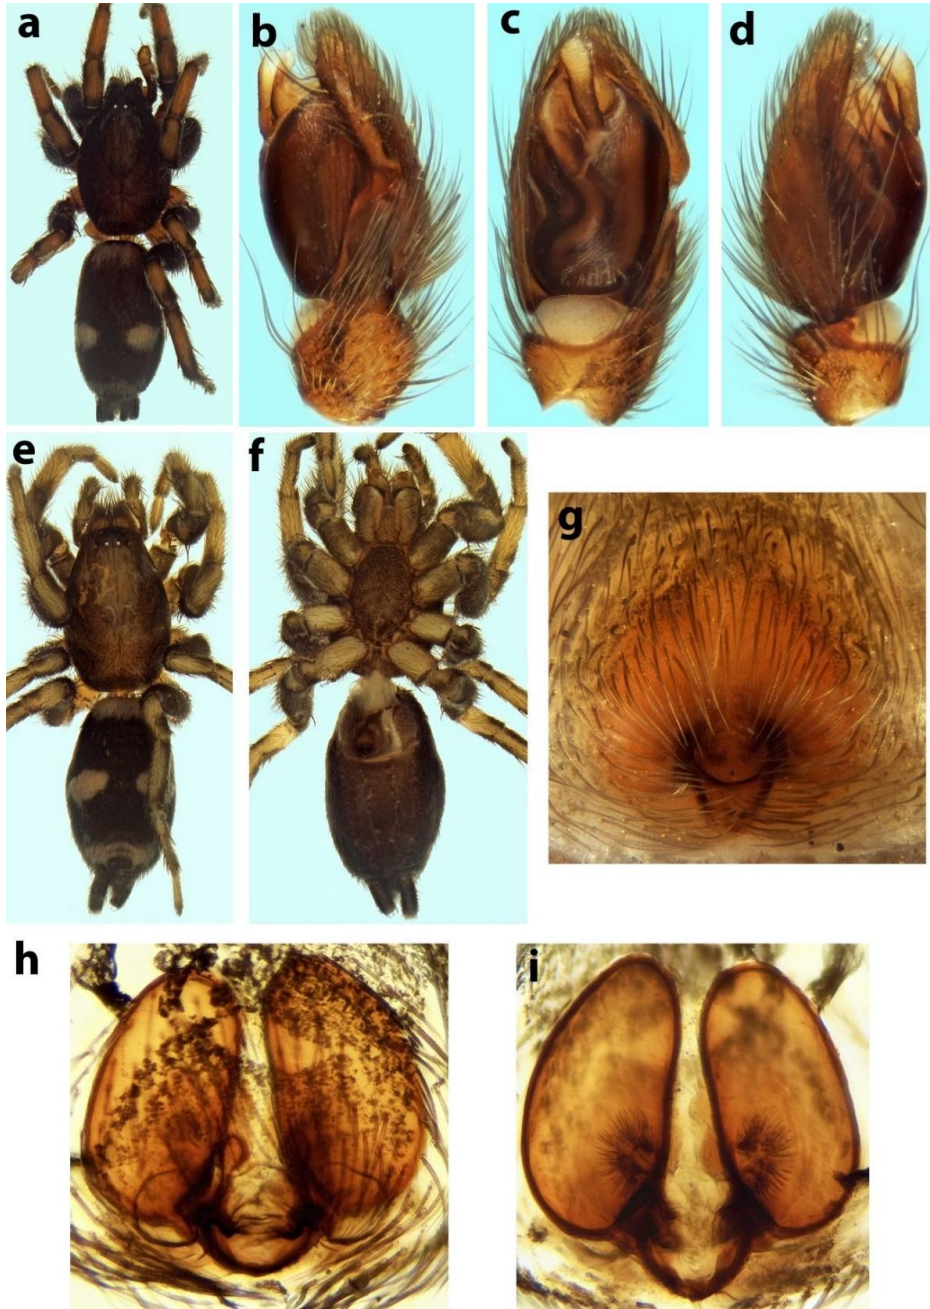

Records

See part V, page 56.

Phaeocedus hebraeus Levy, 1999

(Figs 6 a-i)

Phaeocedus hebraeus Levy, 1999: 429, figs 1-5 (descr. ♂, non ♀).

Figs 6 a-i. *Phaeocedus hebraeus* Levy a. Male, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, proventral view; e. Female, dorsal view; f. Idem, ventral view; g. Epigyne, ventral view; h. Vulva, ventral view; i. Vulva, dorsal view.

Type material

Holotype male from Israel, Mount Scopus, 14.VI.1944, paratype female (misidentified, see below) from Israel, Poriya, 20.IV.1940, A. Shulov leg; examined by Chatzaki & Van Keer (2019).

Diagnosis

Males of this species are easily recognised by the large, elongate rectangular conductor (fig. 6 c), females by the small, rounded postero-median depression in the epigyne (fig. 6 g).

Comments

Phaeoecedes hebraeus was described from Israel by Levy (1999), the male from Mount Scopus in Jerusalem, the female from Poriya in Galilea, about 100 km to the North. Levy (1999) considered them to belong to the same species. However, in Cyprus we collected males of the species together with females that are different from Levy's female specimen. It is clear that Levy (1999) mismatched both sexes, the female belonging to another genus. Chatzaki & Van Keer (2019) came to the same conclusion and attributed the female to a juvenile *Drassodes*.

Records

See part V, page 65.

Other material examined

GREECE: Attiki: Alepohori camping site, 1 ♂, 22.V.1998, R. Bosmans leg. (CRB).

Disribution

Until now only known from Israel, cited here for the first time in Greece and Cyprus.

Synaphosus shirin Ovtsharenko, Levy & Platnick, 1994

(Figs 7 a-e)

Synaphosus shirin Ovtsharenko, Levy & Platnick, 1994: 23, figs 82-83 (descr. ♂); Chatzaki & Russell-Smith, 2017: 248, figs 29-34 (descr. ♂♀).

Figs 7 a-e. *Synaphosus shirin* Ovtsharenko, Levy & Platnick. a. Male, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, prolateral view; e. Idem, dorsal view.

Comments

Synaphosus shirin was originally described from Iran by Ovtsharenko *et al.* (1994). Only the female was known. Recently, Chatzaki & Russell-Smith (2017) found females together with males which they described for the first time. More *Synaphosus* species are cited further down in this paper.

Records

See part V, page 65.

***Talanites dunini* Platnick & Ovtsharenko, 1991**

(Figs 8 a-e)

Talanites dunini Platnick & Ovtsharenko, 1991: 117, figs 5-8 (descr. ♂♀).

Talanites dunini Levy, 2009: 23, figs 51-52.

Comments

According to the World Spider Catalog (2018), the genus *Talanites* comprises 15 species: one from Tunisia, 1 from Egypt, 8 from the Near and Middle East, and 5 from the United States and Mexico.

Talanites dunini was described from Azerbaijan and Turkmenistan (Platnick & Ovtsharenko, 1991), and Levy (2009) cited it also in Israel. Here it is mentioned for the first time from Europe in Cyprus.

Records: See part V, page 66.

Figs 8 a-e. *Talanites dunini* Platnick & Ovtsharenko. a. Male, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, prolateral view; e. Idem, dorsal view.

Family Linyphiidae

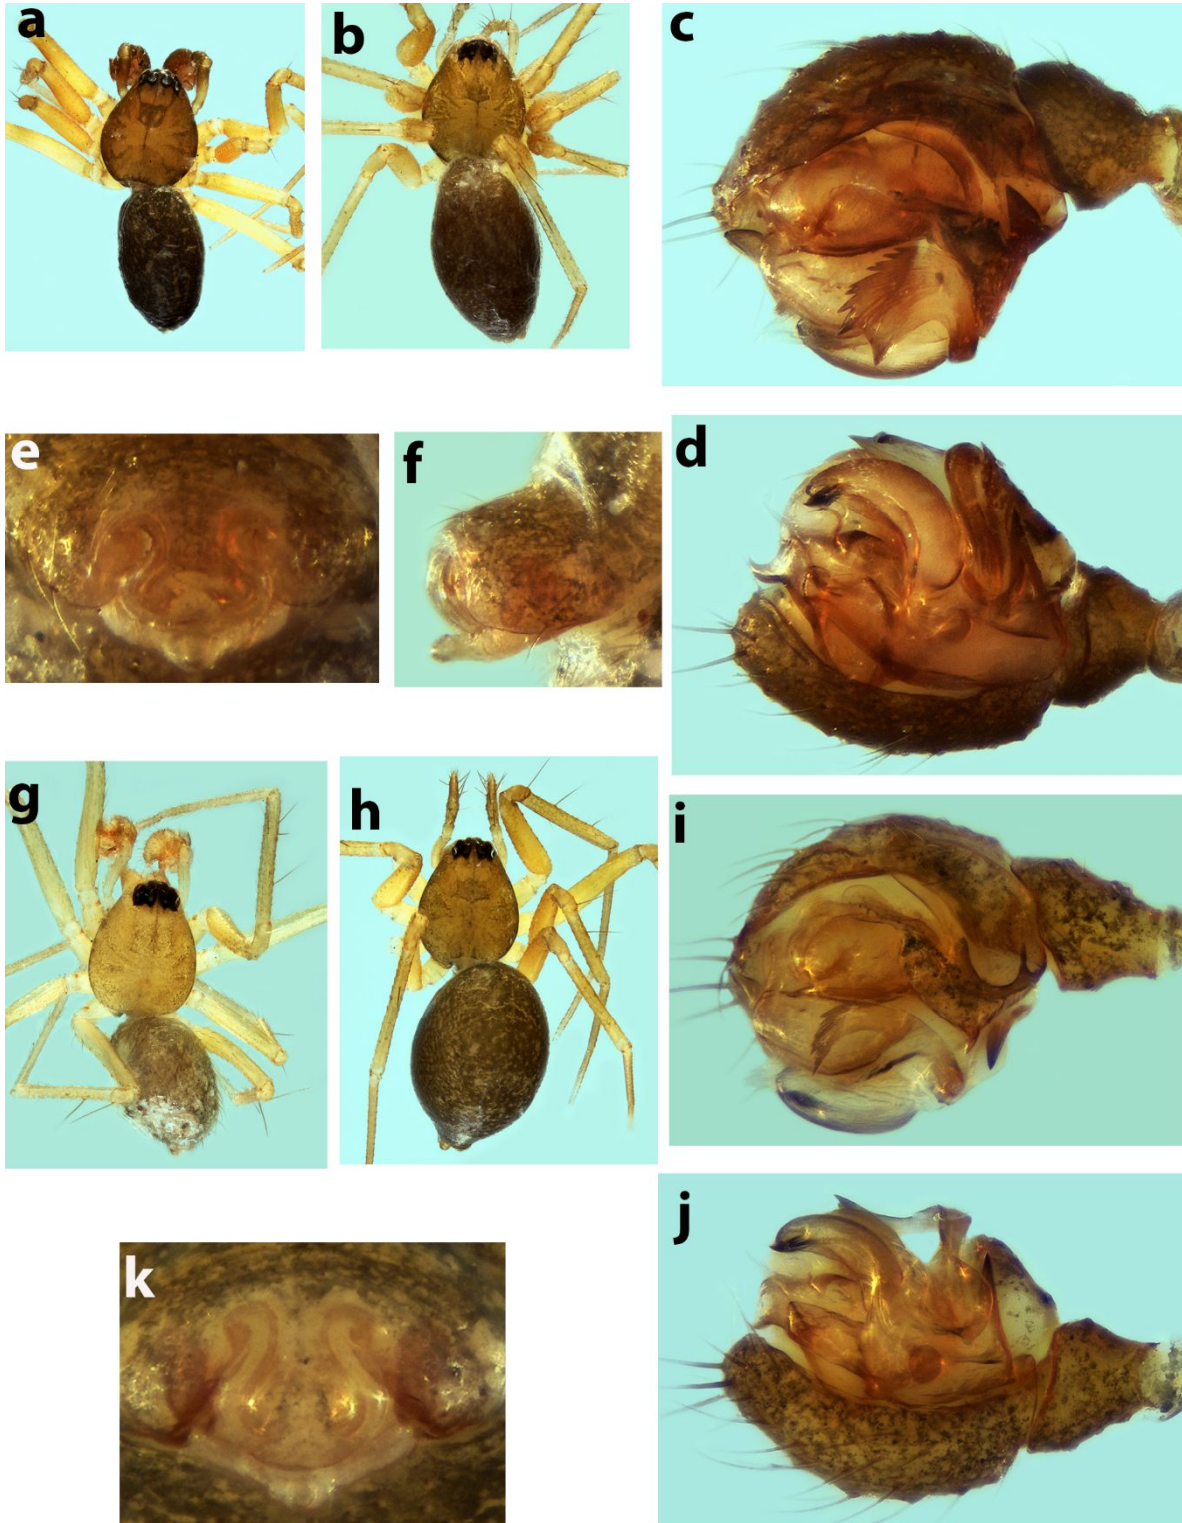

***Canariphantes tenerrimus* (Simon, 1929)**

Lepthyphantes tenerrimus Simon, 1929: 611, 737 (descr. ♀).

Lepthyphantes homonymus Denis, 1934: 76, figs 3 (descr. ♂).

The specimens cited below correspond best with the drawings of Tanasevitch (2011) of *Canariphantes homonymus* Denis (now a junior synonym of *C. tenerrimus* (Simon), based on material from Greece. Typical for *C. tenerrimus* is the L-shaped, terminally pointed lamella, clearly differing from the terminally bifurcate lamella of *C. nanus*. Except for the citation of Tanasevitch from Greece, *C. tenerrimus* is only known from the western part of the Mediterranean (Spain, Portugal, France, Morocco and Algeria). Further studies are necessary to confirm the present identification.

Records: See part V, page 71.

Figs 9 a-k. a-f. *Improphantes cypriot* Tanasevitch. a. Male, dorsal view; b. Female, dorsal view; c. Male palp, retrolateral view; d. Idem, prolateral view; e. Epigyne, ventral view; f. Idem, lateral view. g-k. *Improphantes turok* Tanasevitch. g. Male, dorsal view; h. Female, dorsal view; i. Male palp, retrolateral view; j. Idem, prolateral view; k. Epigyne, ventral view.

***Improphantes cypriot* Tanasevitch, 2011**
(Figs 9 a-f, 10a-b)

Improphantes cypriot Tanasevitch, 2011: 67 (descr. ♂).

Diagnosis

Closely related to *I. turok*, males differing by the numerous teeth on the dorsal margin of the lamella in *I. cypriot* (Fig 10a), compared to only small, terminal teeth in *I. turok* (Fig. 10c). However, some of the teeth of the lamella can be broken off. Females differ in the scape being wider than long in *I. cypriot*, as long as wide in *I. turok* (Fig. 10b versus fig. 10e).

Description

Measurements: Male: Total length 0.61-0.67; prosoma 0.55-0.59 long, 0.43-0.49 wide. Female: Total length 0.73-0.90; prosoma 0.53-0.62 long, 0.39-0.49 wide.

Spination: Fe I with 1 prolateral spine, Fe II-IV spineless; Ti with 2 dorsal spines, Ti I with additional pro- and retrolateral spine, Ti II with additional retrolateral spine.

Records

See part V, page 74.

***Improphantes turok* Tanasevitch, 2011**
(Figs 9 g-k, 10 c-g)

Improphantes turok Tanasevitch, 2011: 69, figs 65-69 (descr. ♂, ♀).

Description

Male: Total length 0.59-0.70; prosoma 0.41-0.66 long, 0.31-0.38 wide.

Female: Total length 0.63-0.77; prosoma 0.41-0.55 long, 0.31-0.52 wide.

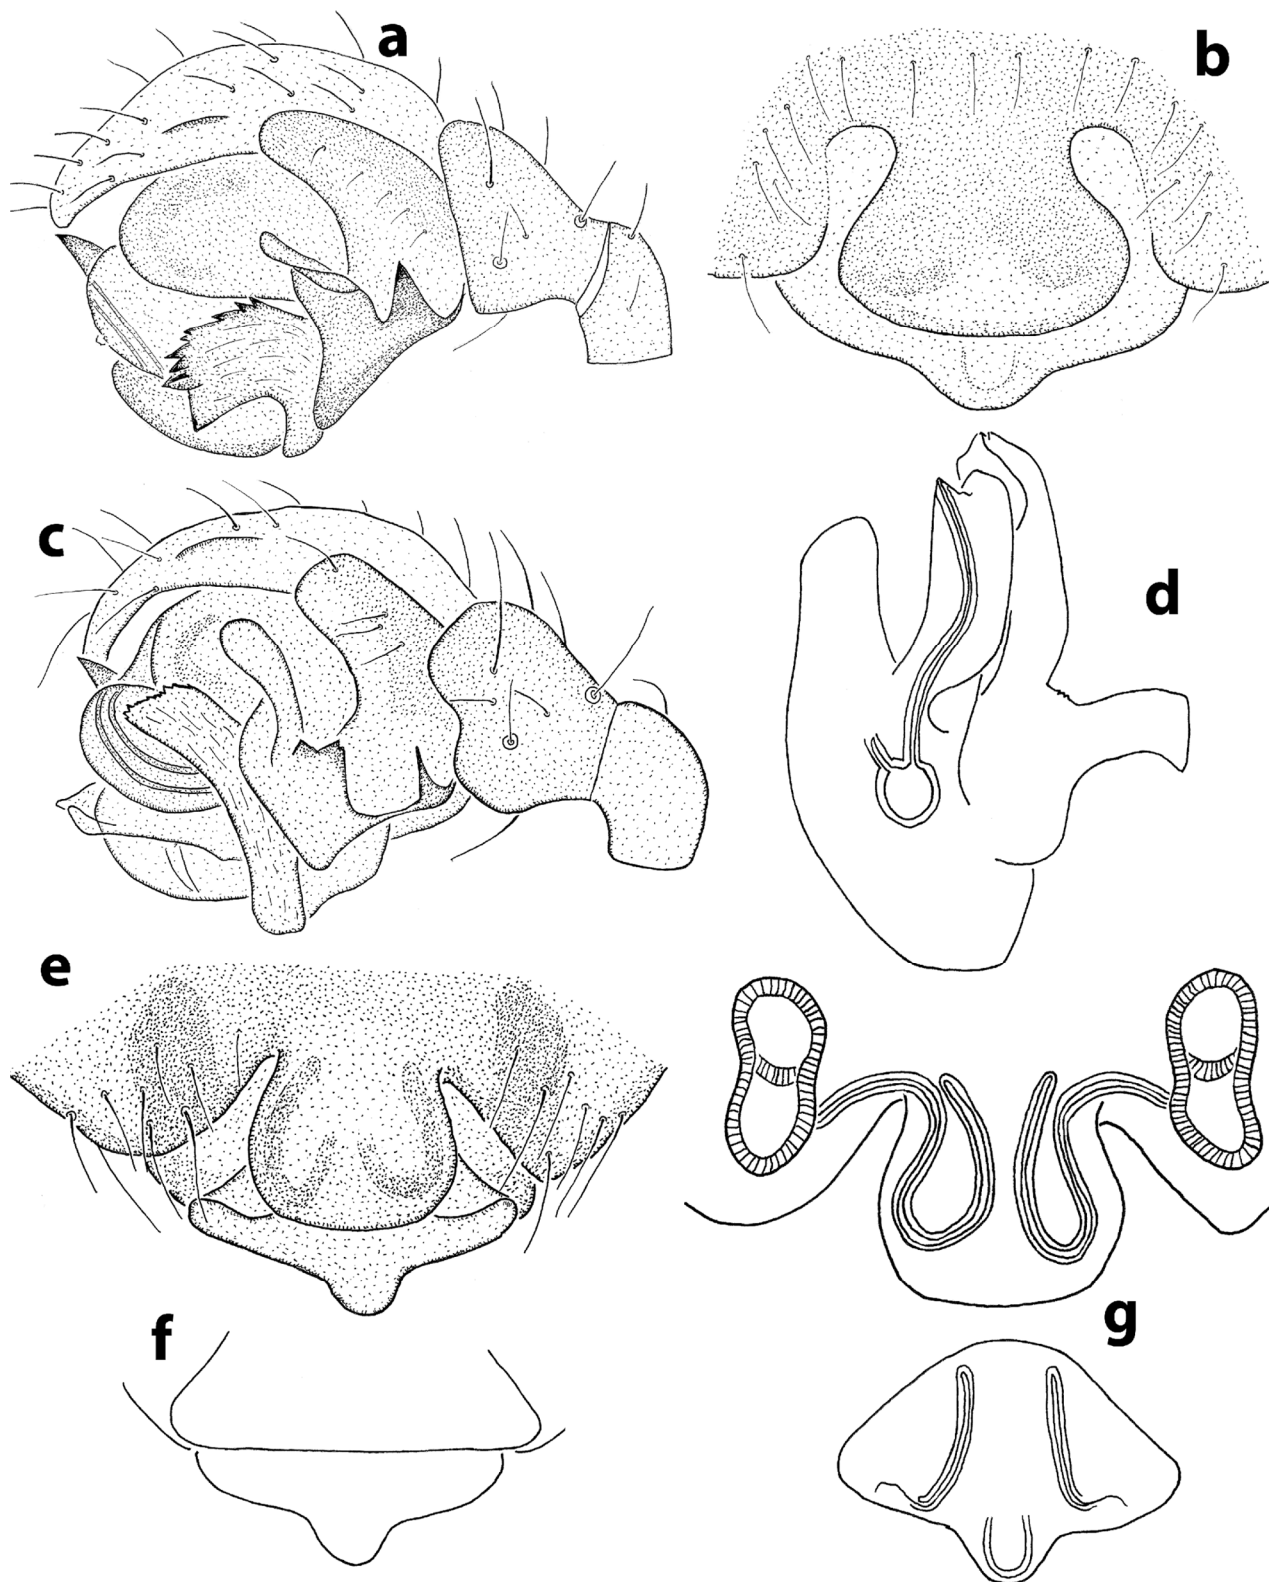

Colour and spination as in *Improphantes cypriot*.

Diagnosis

See *Improphantes cypriot*.

Records

See part V, page 75.

Figs 10a-g. a-b. *Improphantes cyprion* Tanasevitch. a. Male palp, retrolateral view; b. Epigyne. c-g. *Improphantes turok* Tanasevitch c. Male palp, retrolateral view; d. Embolic division, prolateral view; e. Epigyne, ventral view; f. Epigyne, dorsal view. g. Vulva, ventral view, distal part dissected.

***Megalephyphantes turkeyensis* Tanasevitch, Kunt & Seyyar, 2004**

(Figs 11 a-f)

Lepthyphantes congener Kulczyński, 1908: 68, pl. 2, fig. 17 (descr. ♂, misidentified).

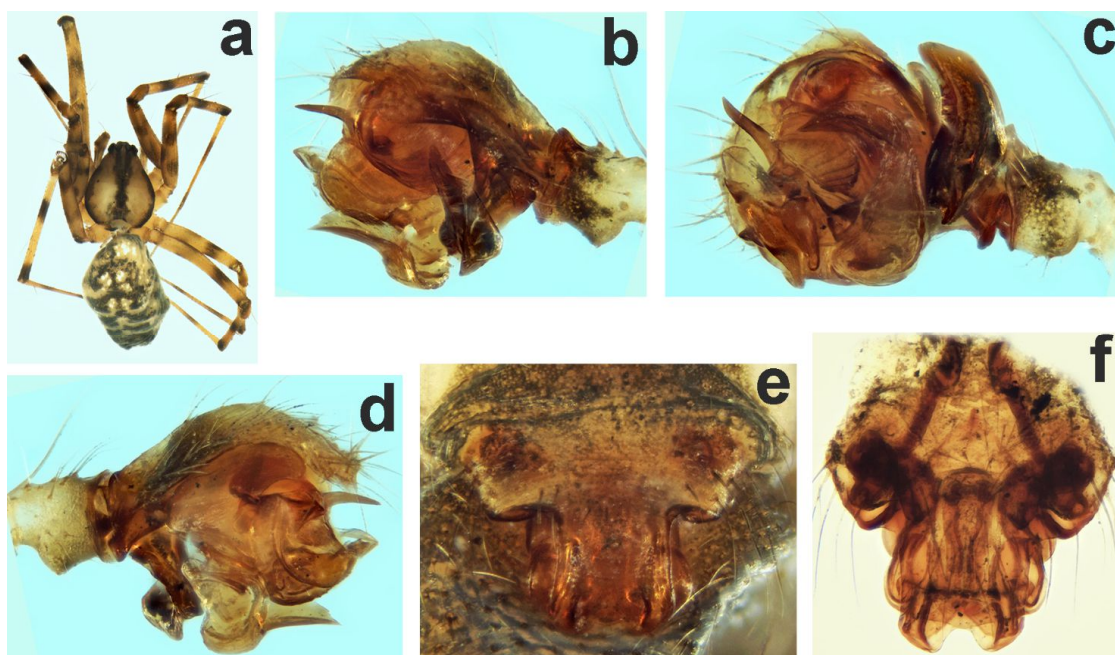

Megalephyphantes turkeyensis Tanasevitch, Kunt & Seyyar, 2005: 279, figs 1-9 (descr. ♂).

Megalephyphantes turkeyensis Tanasevitch, 2011: 74, figs 82-83 (misidentification as *L. congener* confirmed).

Palliduphantes montanus; Topçu *et al.* 2013: 91 (misidentification).

Comments

Kulczyński (1908) described a male collected in Cyprus as the unknown male of *Lepthyphantes congener* (O. Pickard-Cambridge, 1872), now considered a synonym of *Frontinellina frutetorum* (C. L. Koch, 1834). Tanasevitch (2011) pointed out that this is not correct and that the specimen described by Kulczyński is in reality *Megalephyphantes turkeyensis* Tanasevitch, Kunt & Seyyar, described in 2005 from Turkey. Tanasevitch (*op. cit.*) cites the species also from Ikaria, an island of the Cyclades, and this record has been overlooked by Nentwig *et al.* (2019) and Chatzaki *et al.* (2015). Tanasevitch, Kunt & Seyyar (*op. cit.*) mention examining females of *Megalephyphantes turkeyensis* but these were never figured or described. The first author was able to examine specimens cited as *Palliduphantes montanus* (Kulczyński, 1898) from Turkey and these appeared to belong to *Megalephyphantes turkeyensis* as well. *Palliduphantes montanus* must be deleted from the Turkish list of spiders.

Figs 11 a-f. *Megalephyphantes turkeyensis* Tanasevitch, Kunt & Seyyar. a. Female, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, prolateral view; e. Epigyne, ventral view; f. Vulva, ventral view.

Diagnosis

The species is closely related to *Megalephyphantes lydiae* Wunderlich, 1994 from Greece. Males differ in the terminally pointed lamella (fig. 10b), rounded in *M. lydiae*, and the absence of a dorsal tooth in the embolus of *M. turkeyensis*. Females differ in the scape being more rectangular and longer than wide (fig. 10e), while it is more rounded and somewhat wider than long in *M. lydiae*.

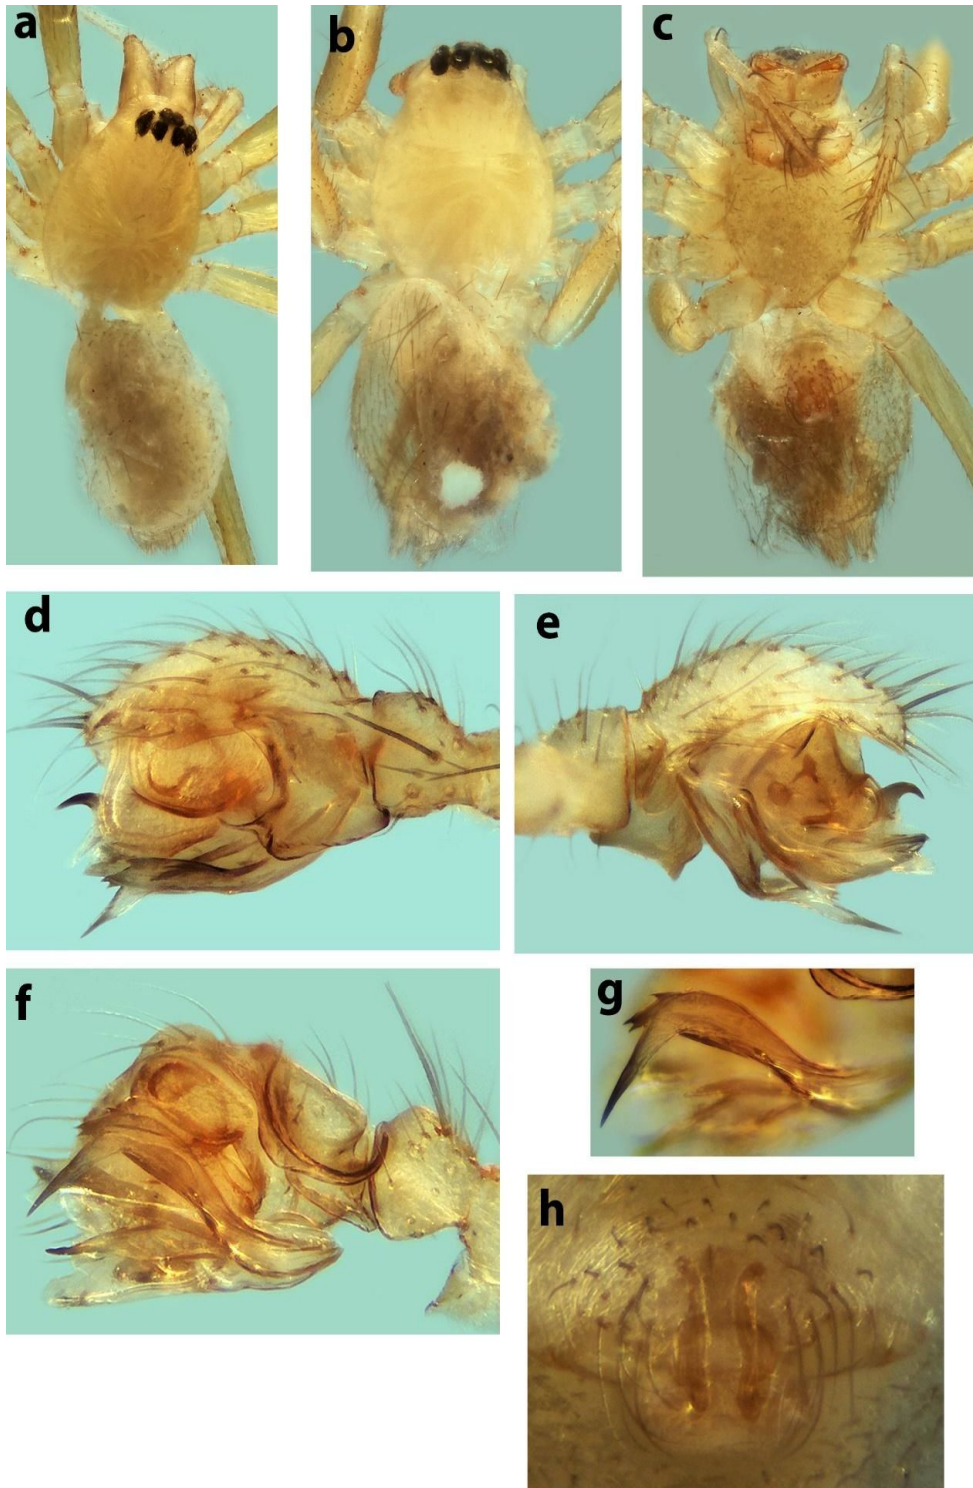

Comparative material examined

Greece, Lesbos, Mandamanos, 2 ♂♂ 2 ♀♀ of *Megalephyphantes lydiae* (CRB).

Records: See part V, page 76.

Palliduphantes minimus (Deeleman-Reinhold, 1986)
(Figs 12a-h)

Lepthyphantes minimus Deeleman-Reinhold, 1986: 46, figs 35a-b (descr. ♂).

Figs 12 a-h. *Palliduphantes minimus* (Deeleman-Reinhold). a. Male, dorsal view; b. Female, dorsal view; c. Idem, ventral view; d. Male palp, retrolateral view; e. Idem, prolateral view; f. Idem, ventral view; g. Lamella, ventral view; h. Epigyne, ventral view.

Diagnosis

Palliduphantes minimus is the only *Palliduphantes* species in Cyprus. It is a small, pale species of which males are recognised by the strongly pointed distal tooth of the lamella and the presence of three teeth along its dorsal margin (fig. 11g), females by the short, strongly curved scape (fig. 11h).

Description

Measurements: Male: Total length 1.5; prosoma 0.65 long, 0.51 wide. Female: Total length 1.6; prosoma 0.71 long, 0.56 wide.

Colour: Pale yellowish, only eyes with narrow black rings.

Prosoma: Anterior median eyes separated by half their diameter, from the anterior laterals by their diameter; posterior eyes separated by their diameter. Chelicerae with 3 large promarginal teeth and 4 smaller, closely set retromarginal teeth, laterally with 18 stridulating ridges in the male.

Spination: Legs with long spines, proximal dorsal spine on tibia I 2.7 as long as the tibia's diameter; femur I with 1 prolateral spine; tibia I with 2 dorsal, 1 prolateral and 1 retrolateral spine, Tibia II with 2 dorsal and 1 retrolateral spine, Ti III-IV with 2 dorsal spines; metatarsi I-IV with 1 dorsal spine.

Male palp (Figs d-g): Dorsal spine on patella slightly longer than its diameter, that on tibia 1.5 times as long as its diameter; proximal part of paracymbium with 4 hairs and small basal tooth, distal part small and rounded; lamella elongated, with 2 basal teeth, terminally split into 3 sharp teeth.

Epigyne (Fig. 12 h): Scape sigmoid, short and strongly curved.

Records

See part V, page 78.

***Theonina laguncula* (Denis, 1937) n. comb.
(Figs 13 a-k)**

Lepthyphantes laguncula Denis, 1937: 1045 (descr. ♂, ♀); Bosmans, 1985: 172 (citation); Bosmans 2006: 178 (citation).

Type material

Type series of one ♂ and ♀ from Algeria, Forêt de Zouagha, Djebel Daya, 13.V.1936; depositon unknown, not in MNHNP.

Etymology

The etymological meaning of the name *laguncula* was not given by Denis (1937). In Latin, *laguncula* means 'a small flask' and this obviously refers to the shape of the apophysis on the palpal patella.

Diagnosis

Both sexes are at once recognised by their contrasting colour pattern. Males are further easily recognised by the shape of the chelicerae and the bottle-shaped apophysis on the palpal patella, females by the rectangular scape.

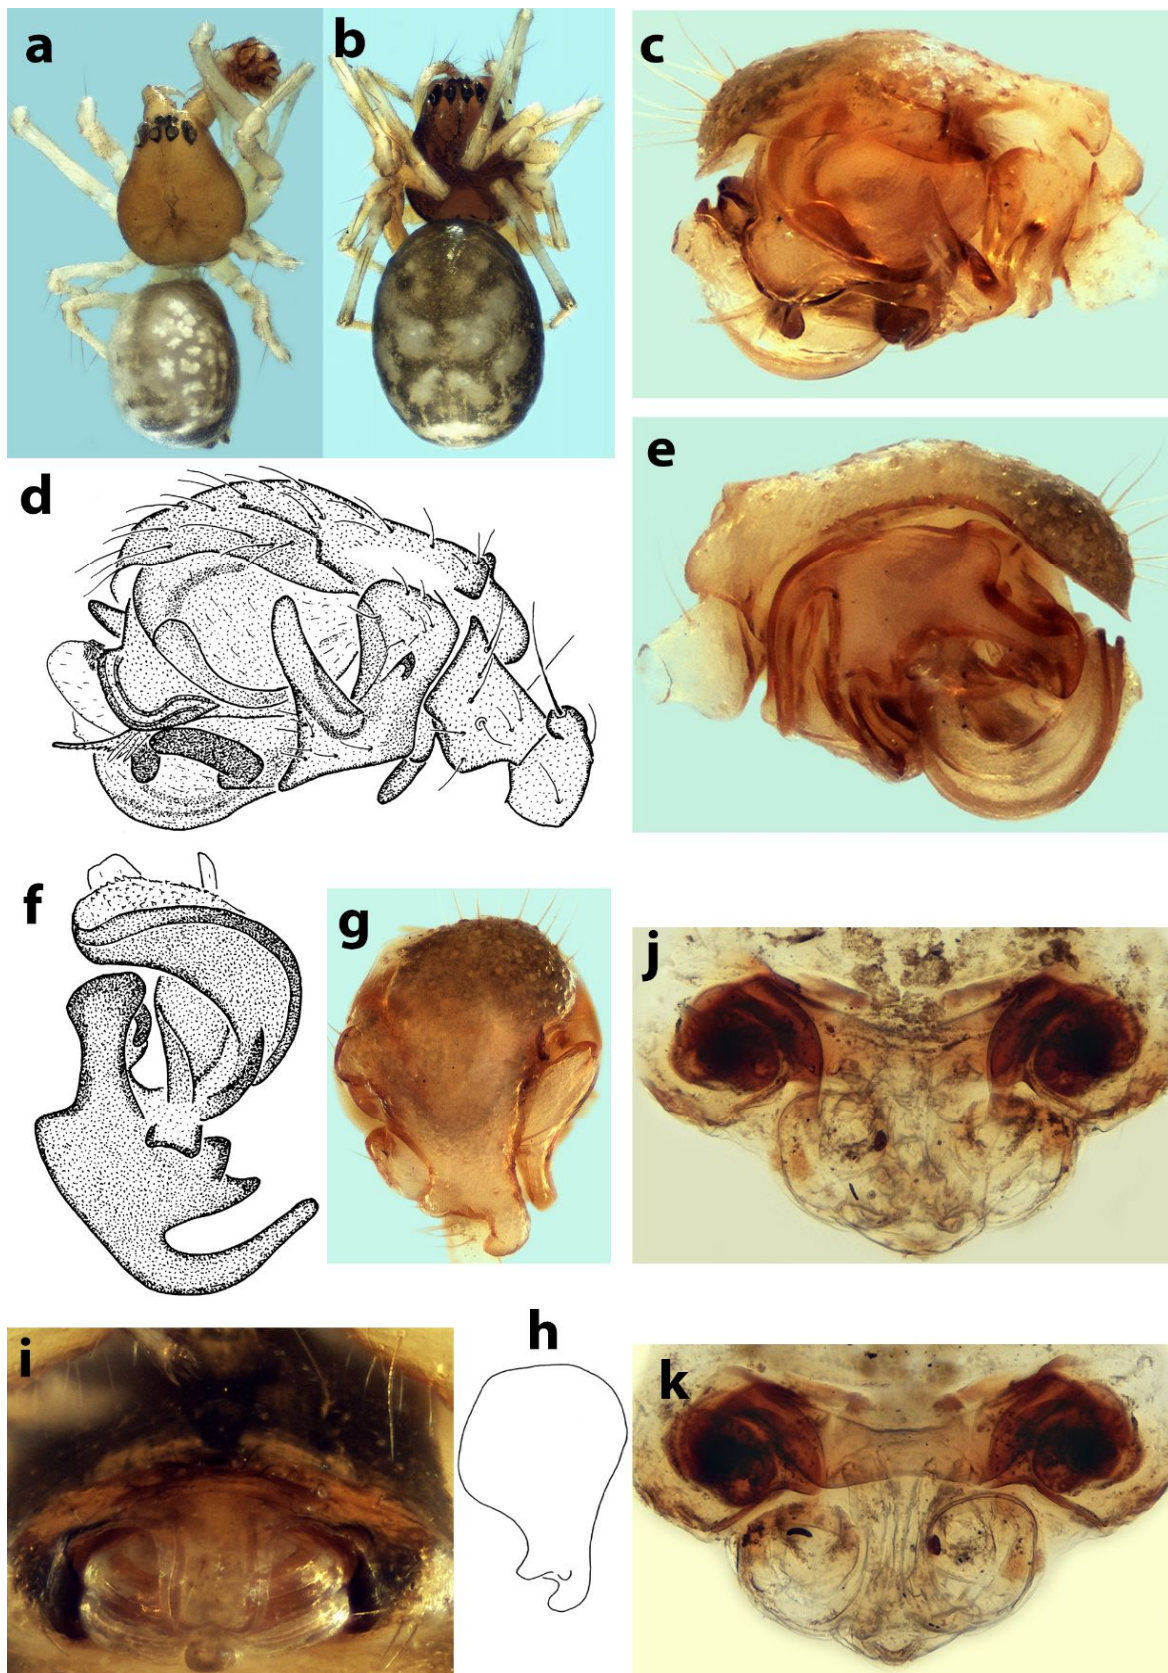

Comments

The shape of the male palp (large basal tubercles on cymbium, C-shaped embolus), and of the female epigyne (flattened S-shaped scape with broad distal part) resemble closely those of *Theonina cornix* and *T. linyphioides* (see Bosmans, 2006) and *Lepthyphantes laguncula* is therefore best placed in this genus.

Description

Measurements: Male (n=1): Total length 2.1; carapace 0.83 long, 0.68 wide. Female (n=6): Total length 1.8-2.3; carapace 0.65-0.86 long, 0.58-0.71 wide.

Colour: Carapace speckled olive brown, region behind the eyes and thoracic region yellowish orange; chelicerae and sternum yellowish orange; legs yellowish white, tibiae, metatarsi and tarsi with median and distal grey annulations, often poorly marked; abdomen grey, with two oblique white chevrons and 5 transverse white stripes, venter pale yellow with small scattered white spots.

Figs 13 a-k. *Theonina laguncula* (Denis) **n. comb.** a. Male, dorsal view; b. Female, dorsal view; c, d. Male palp, retrolateral view; e. Idem, prolateral view; f. Embolic division, ventral view; g, h. Cymbium, dorsal view; i. Epigyne, ventral view; j. Vulva, ventral view; k. Idem, dorsal view.

Chelicerae: In male tapering at the edge, diverging, laterally with 10-11 stridulating ridges, fang groove with one anterior and one posterior tooth, chelicerae of female normal, fang groove with 3 large anterior and 4 smaller posterior teeth.

Legs relatively short, Femur I only slightly longer than length of prosoma. Spinulation: Femora spineless; Tibiae I-II with 2 dorsal, 1 prolateral and 1 retrolateral spine, tibiae III-IV with 2 dorsal spines, metarsi spineless.

Male palp (Figs 13 c-h): Patella with strong cylindrical apophysis bearing a long hair; cymbium with curved, posterior horn, at retrolateral side accompanied by a smaller tubercle; paracymbium U-shaped, basal part with median tooth, distal part gradually narrowing, terminally rounded; radix with a strong distal concavity at prolateral side and two median tubercles on retrolateral side; lamella elongated, gently curved, with parallel margins, terminally rounded; embolus large, sickle-shaped, with transverse carina (fig. 13f).

Epigyne (Figs 13 i-k): With flattened and S-shaped scape, anterior part rectangular, distal part much wider with strong lateral lobes protruding from the epigynal cavity and with small stretcher.

Material examined

MOROCCO: Tanger-Tétouan: 10 km E. Chefchaouen, 500m, 1 ♀, stones in *Quercus suber* forest, 15.V.1985, R. Bosmans leg. (CRB).

SPAIN: Alicante: Sierra de Aitana, 1 ♂, pitfalls in *Pinus* forest, 19.IV.1997, M. Perez leg. (CRB).

Baleares: Ibiza: Sa Talaia, 200m, 1 ♀, pitfall in *Pinus* forest, 8-18.IV.2018, R. Bosmans leg. (CRB).

Malaga: Sierra de Mijas, 1 ♀, low and open dry woods, IV.1095, P. Hillyard leg. (BM).

CYPRUS: Paphos: Akamas Peninsula Agios Minas, 4 ♀♀, in dense *Pinus* litter, 2.V.2007 (CAR-S, CRB, CRS); Smigies, W. Neo Chorio, 300m, 1 ♀, litter and stones in *Pinus* forest, 30.IV.2010 (CRB).

Distribution

Theonina laguncula was until now only known from its type locality in Algeria but appears to have a large distribution area in the Mediterranean, from Morocco and Spain in the West to Cyprus in the East.

Family Lycosidae

Pardosa roscai (Roewer, 1951) (Figs 14 a-i)

Lycosa maculata Rosca, 1939: 95, figs 7-9 (descr. ♂♀; preoccupied by Hahn, 1822).

Lycosa roscai Roewer, 1951: 438 (replacement name).

Pardosa bulgarica Buchar, 1968: 124, figs 4D-G (synonymy).

Pardosa cribrata roscai; Fuhn & Niculescu-Burlacu, 1971: 90, figs 37a-e (transfer from *Lycosa*, reduced to subspecies).

Pardosa roscai; Bayram, Efil & Deltshiev, 2009: 465, figs 1-5 (elevated to species).

Comments

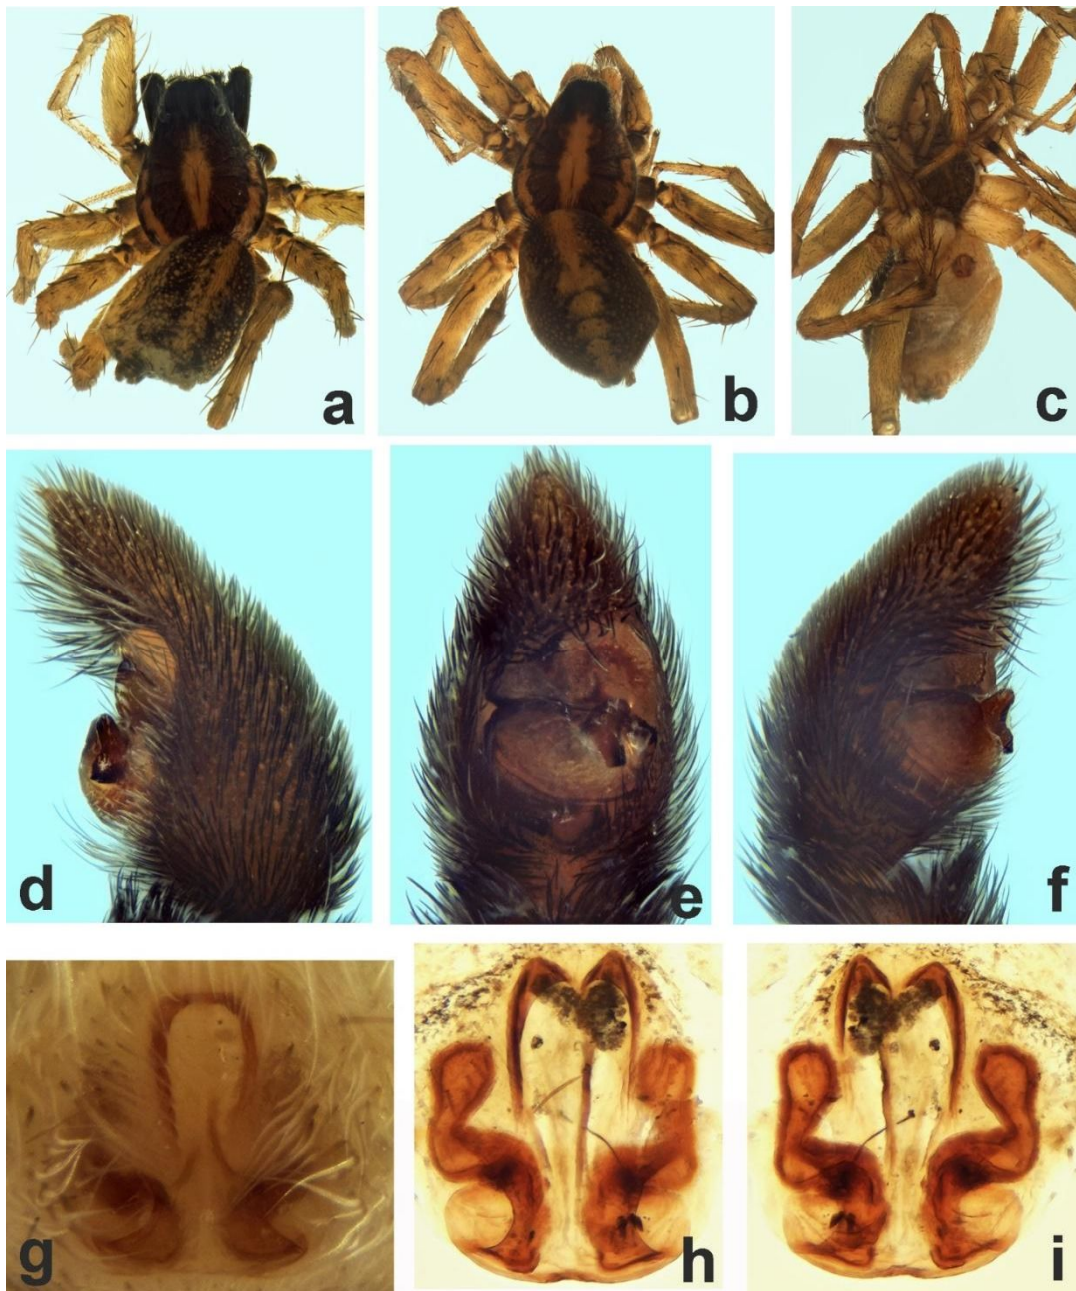

Pardosa roscai belongs to the *proxima* group of *Pardosa*, a group of species that are not easy to identify. It is closely related to *Pardosa cribrata* Simon and *P. hortensis* (Thorell). Males can be recognised by the relatively short cymbium, apically densely covered with black setae. Females are recognised by the relatively wide anterior cavity of the epigyne. See also Bayram *et al.* (2009).

Distribution

The species is common in Bulgaria (Buchar 1968), Romania (Fedoriak *et al.* 2016), Turkey (Bayram *et al.* 2009) and Iran (Zamani & Mozaffarian (2017). Fedoriak *et al.* (*op. cit.*) mention also material examined from Italy, but this is not retained in the WSC (2019).

Records

See part V, page 88.

Figs 14 a-i. *Pardosa roscai* (Roewer). a. Male, dorsal view; b. Female, dorsal view; c. Idem, ventral view; d. Male palp, retrolateral view; e. Idem, ventral view; f. Idem, prolateral view; g. Epigyne, ventral view; h. Vulva, ventral view; i. Idem, dorsal view.

Family Nemesiidae

Brachythele incerta Ausserer, 1871

(Figs 15 a-d)

Brachythele incerta Ausserer, 1871: 175, descr. ♀.

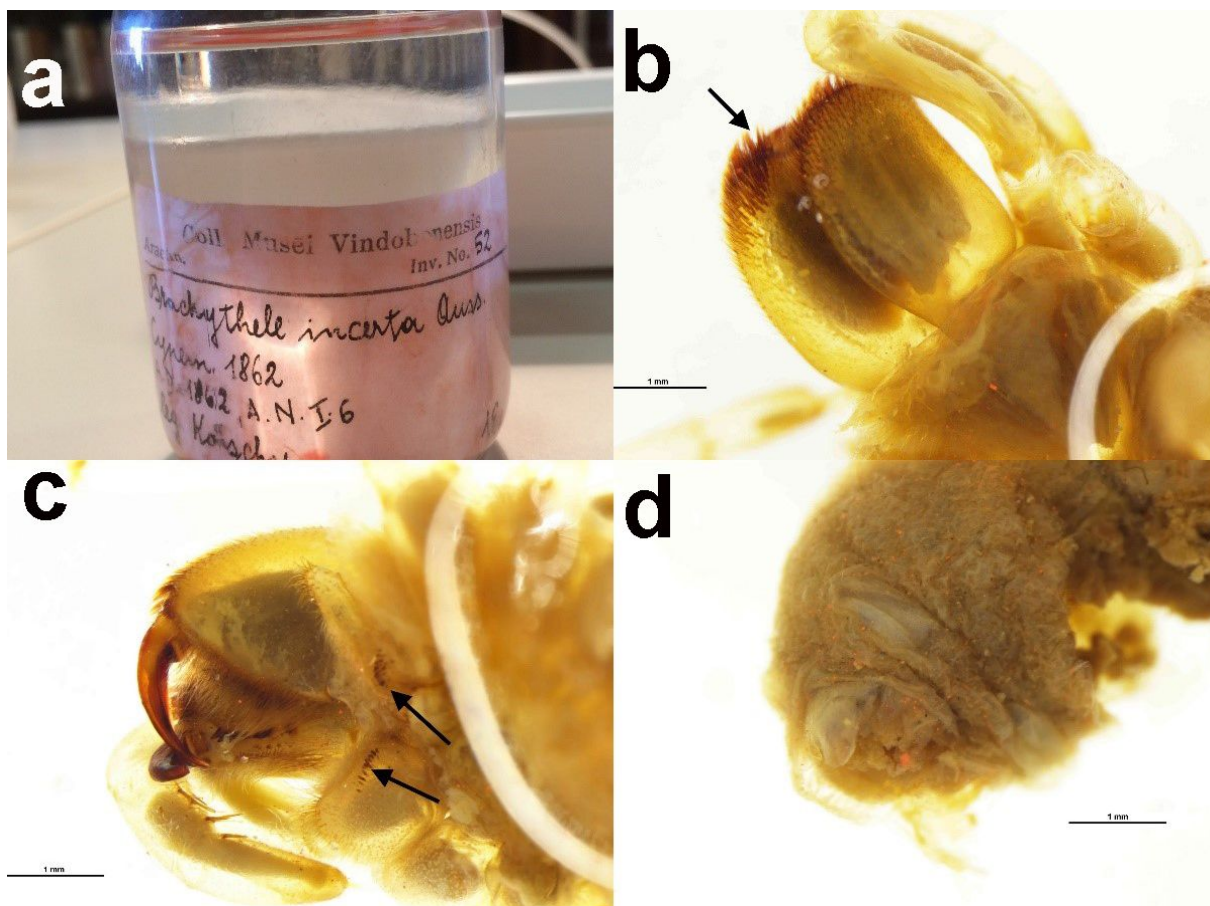

Fig 15 a-d. *Brachythele incerta* Ausserer a. Labelled vial containing the type specimen; b. Chelicerae showing presence of strong distal bristles and absence of rastellar teeth; c. maxillae with spicules in groups; d. Strongly damaged abdomen missing all diagnostic characters.

Type material

Holotype ♀ from Cyprus, without further locality, labelled “Arach. 62, Könshing leg. 1862”; NHMW, examined by Arthur Decae. The specimen was found to be in very poor condition. Absence of strong rastellar teeth (15b, arrow) and presence of spicules grouped on maxillae (15c, arrow) indicate the genus level identity is correct.

Comments

Although badly damaged, the morphology of the preserved specimen clearly indicate that both the family level (Nemesiidae) and the genus level (*Brachythele*) are correct. As such, it remains the only record of *Brachythele* from Cyprus.

Records

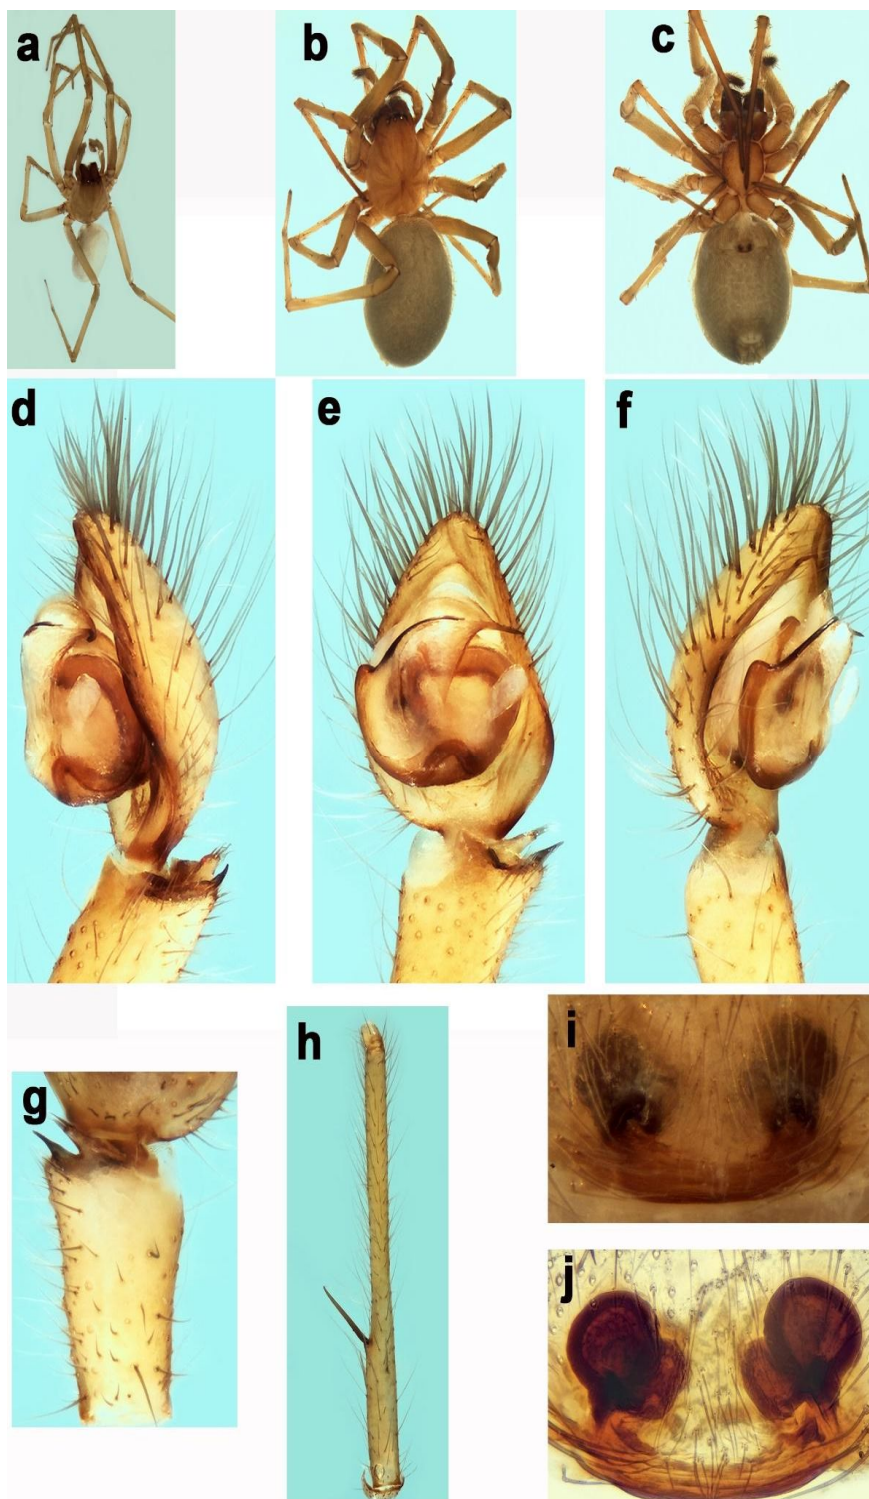

See part V, pag 91.

Family Phyxelididae

Phyxelida anatolica Griswold, 1990 (Figs 16 a-j)

Diagnosis

See Griswold, 1990.

Figs 16 a-i. *Phyxelida anatolica* Griswold. a. Male, dorsal view; b. Female, dorsal view; c. Idem, ventral view; d. Male palp, retrolateral view; e. Idem, ventral view; f. Idem, prolateral view; g. Male palpal tibia, dorsal view; h. Male metatarsus with clasp spine; i. Epigyne, ventral view; j. Vulva, ventral view.

Diagnosis

See Griswold, 1990.

Comments

This family with only one genus and one species in Europe occurs also in Cyprus. Identification of this species for European arachnologists not familiar with the family is not easy, and therefore photos of the species are provided. The disposition of the eyes is very typical (fig. 16b), the metatarsi have a typical spine (fig. 16h) and male palps have very peculiar tibial apophyses (fig. 16d-e), females on the contrary have no special characters in the epigyne.

Records

See part V, page 101.

Family Tetragnathidae

***Tetragnatha demissa* L. Koch, 1872**
(Figs 17 a-v)

Diagnosis

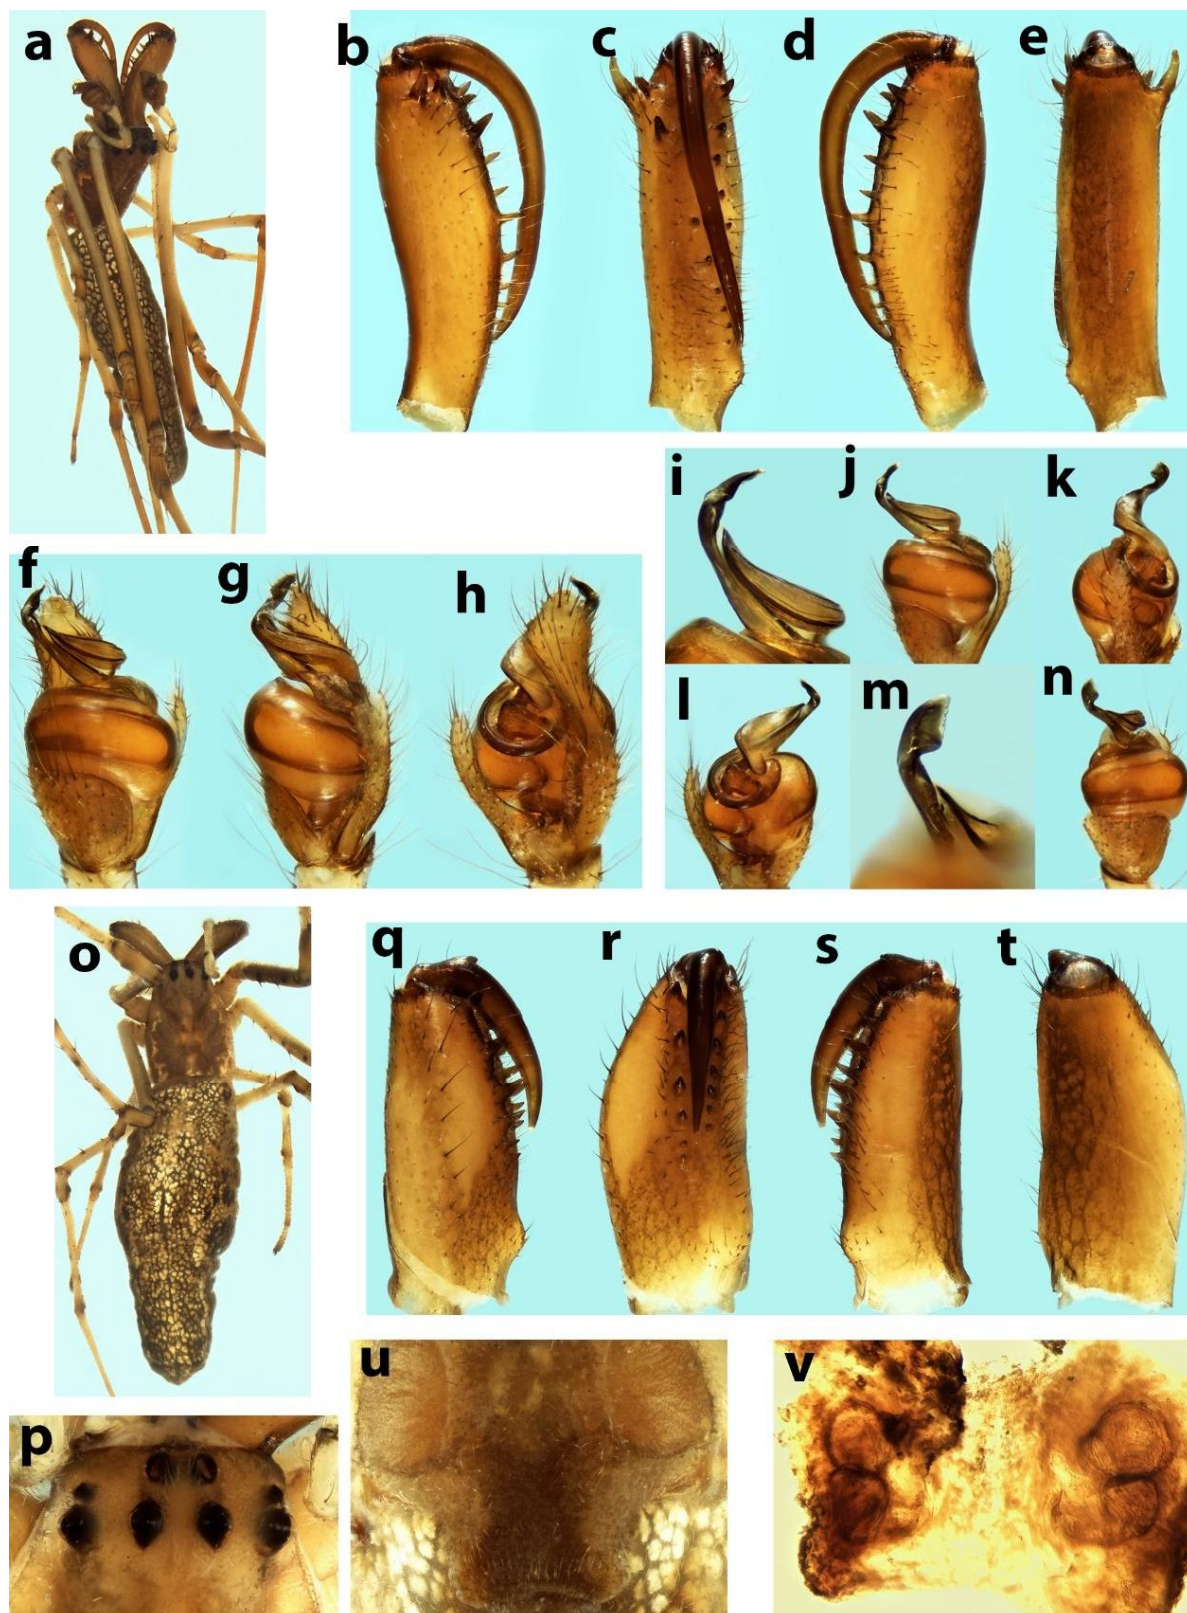

Males of this species are recognised by the slight S-shape of the conductor when viewed ventrally, females by the epigyne which is wider than long, and by the bilobed spermathecae.

Comments

In April 2010, males and females of an unknown *Tetragnatha* species were collected in the marshy vegetation at the border of Asprokremmos Dam. They were collected again in April 2011 at the same site and in Meneou in a salt marsh and neighbouring fields. None of the European species appeared to correspond with the species. Earlier descriptions of *Tetragnatha demissa* (e. g. Saaristo, 2010) correspond well with the species and it is cited here as such.

Records

See part V, page 121.

Figs 17 a-v. *Tetragnatha demissa* L. Koch. a. Male, dorsal view; b. Left chelicera of male, anterior view; c. Idem, interior view; d. Idem, posterior view; e. Idem, exterior view; f. Male palp, retrolateral view; g. Idem, ventral view; h. Idem, prolateral view; i-n. Embolus and conductor, different views; o. Female, dorsal view; p. Eye region of female, dorsal view; q. Left chelicera of female, anterior view; r. Idem, interior view; s. Idem, posterior view; t. Idem, exterior view; u. Epigyne, ventral view; v. Vulva, ventral view.

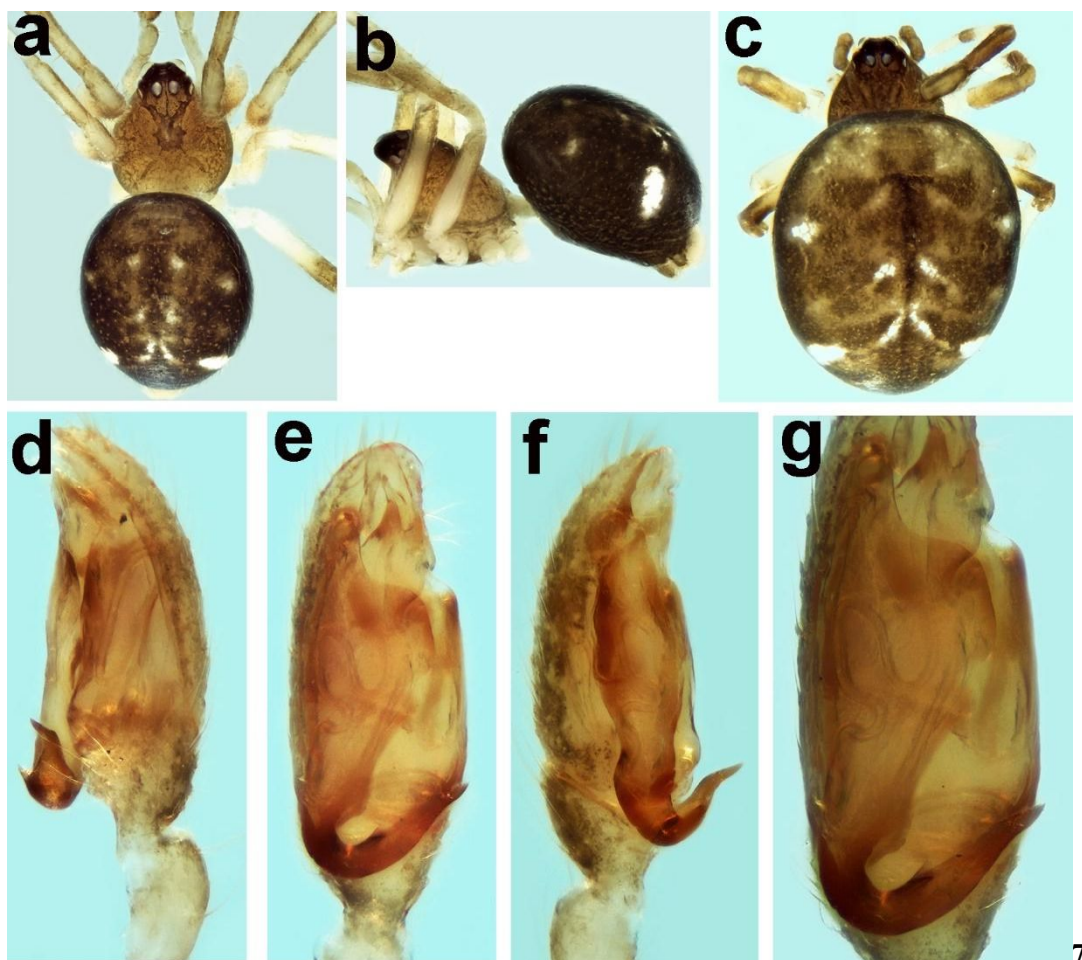

Family Theridiidae

Dipoena galilaea Levy & Amitai, 1981 (Figs 18 a-g)

Dipoena galilaea Levy & Amitai 1981: 186, figs 37-42 (descr. ♀).

Diagnosis

The male of *Dipoena galilaea* can be easily recognised by the abdominal pattern (figs 18 a-c) and the large, elongated palp (figs 18d-g).

Figs 18 a-g. *Dipoena galilaea* Levy & Amitai, 1981. a. Male, dorsal view; b. Idem, lateral view; c. Female, dorsal view; d. Male palp, retrolateral view; e. Idem, ventral view; f. Idem, prolateral view; g. Detail, ventral view.

Comments

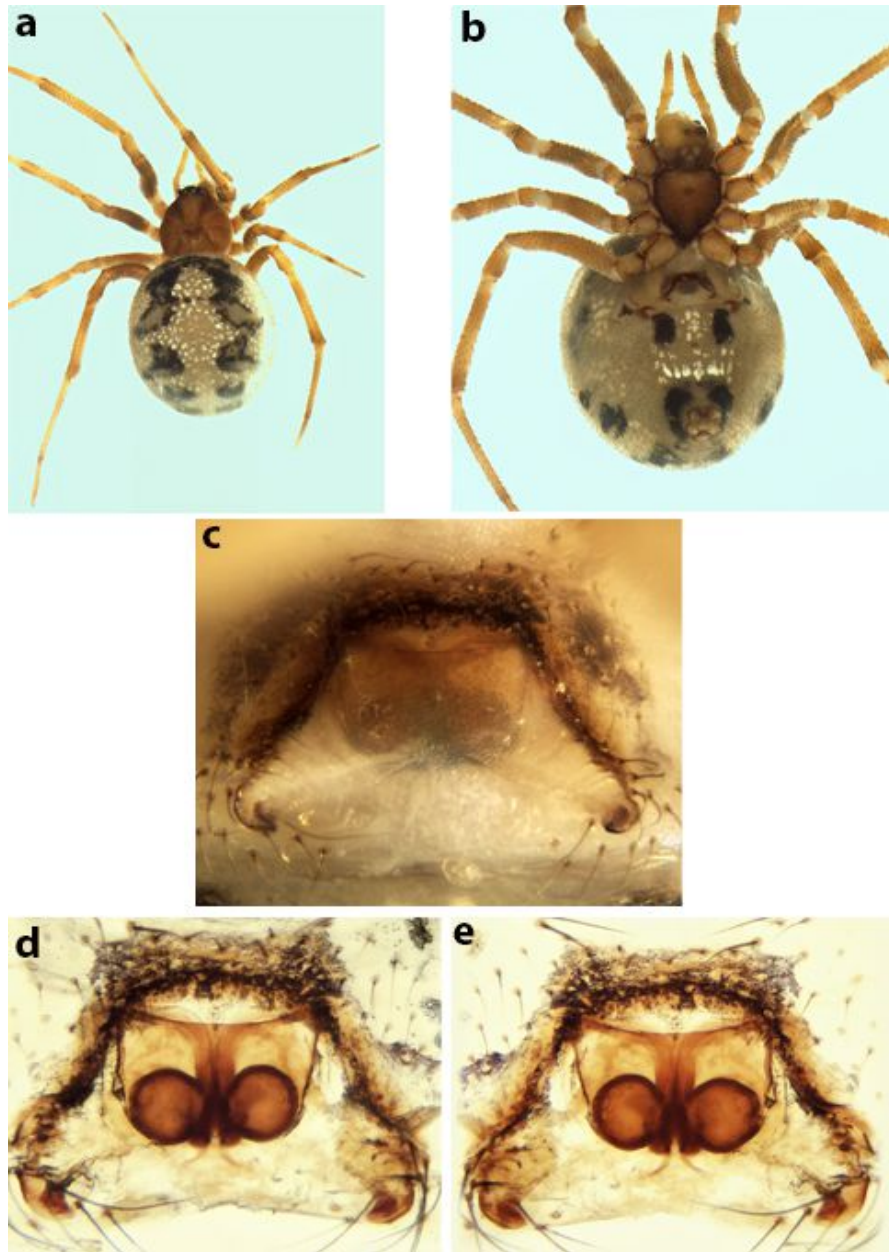

The female of *Dipoena galilaea* was described from Israel by Levy & Amitai (1981). Females were further recorded in Greece on three occasions: Russell-Smith *et al.* (2011) in Chios, Bosmans *et al.* in Lesbos (2009) and Van Keer *et al.* (2010) in Macedonia. The male has not been described previously and resembles most to the one of *Dipoena punctisparsa* Yaginuma, 1967 from Korea and Japan.

Records

See part V, page 125.

Steatoda trianguloides Levy, 1991
(Figs 19 a-e)

Steatoda trianguloides Levy, 1991: 228, figs 3-6.

Figs 19 a-e. *Steatoda trianguloides* Levy, 1991. a. Female, dorsal view; b. Idem, ventral view; c. Epigyne, ventral view; d. Vulva, ventral view; e. Idem, dorsal view.

ell

Comments

Levy (1991) described a new male theridiid species from Israel, naming it *Steatoda trianguloides*, because of its close relations to *Steatoda triangularis*. The colour and the densely punctated prosoma were very alike. It was collected at 1700m on the rocky slopes of Mt Hermon in Israel. Later, the same species was found in Corsica by Lissner (2016), but no details of the habitat were given. A female collected on the top of Mount Olympos is here tentatively described as its mate.

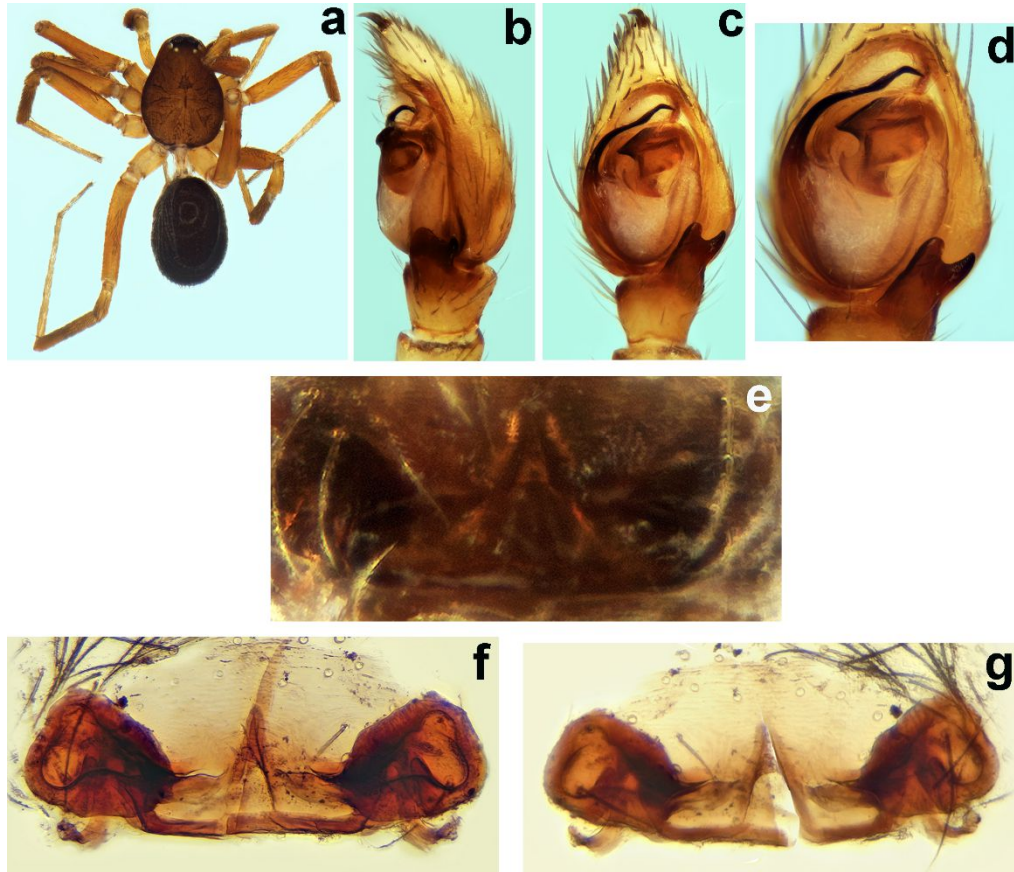

Records: See part V, page 138.

Family Zodariidae

Zodarion barbarae Bosmans, 2009

(Figs 20 a-g)

Zodarion barbarae Bosmans, 2009: 248, figs 80-83, 138-139.

Figs 20 a-g. *Zodarion barbarae* Bosmans a. Male, dorsal view; b. Male palp, retrolateral view; c. Idem, ventral view; d. Idem, detail; e. Epigyne, ventral view; f. Vulva, ventral view; g. Vulva, dorsal view.

This species was so far only known from the Taigetos and Parnonas Mountains in the Greek Peloponnisos (Bosmans, 2009). The specimens from Cyprus are slightly larger than the Greek specimens, but the palp and epigyne are identical.

Description

Measurements: Male (n=9): Total length 2.2-2.8; prosoma 1.08-1.37 long, 0.82-0.99 wide. Female (n = 3): Total length 3.1-4.2; prosoma 1.51-1.61 long, 1.11-1.20 wide.

Male palp and epigyne: See Bosmans (2009) and figs 20 a-g.

Records

See part V, page 147.

V. List of species and records

The following is a checklist of all spider species currently known from Cyprus. Earlier published records and new observations are grouped separately. For each species, data are given by the 6 districts of Cyprus: Famagusta (Ammochoostos), Keryneia, Larnaca, Nicosia (Lefkosia), Limassol and Paphos (Fig. 21).

Fig. 21. Districts of Cyprus.

Habitats and microhabitats of the localities are briefly described, and dates, collectors, sexes and number of individuals are given. We also provide references to where illustrations can be found. If species are figured in *European Spiders* (Nentwig *et al.* 2019, <http://www.araneae.unibe.ch>), these references are given first as they are available on the internet. Finally, the known distribution and general comments are provided.

Family Agelenidae

Agelena orientalis C. L. Koch, 1837

Identification: <https://araneae.nmbe.ch/>.

Citations

None.

New records

FAMAGUSTA: Cape Greco, Ayia Napa, 3 ♂♂ 1 ♀, 35m, under stones in phrygana, 27.IV.2010 (CRB); Prastio S., Agios Andronikos, 30m, 1 ♂, on herbs in *Eucalyptus* forest, 27.V.2011 (CRB); Vokolida S., Cape Elaia, 10m, 1 ♀, on shrubs near the beach, 26.V.2011 (CRB).

LARNACA: Achna Reservoir, 50m, 1 ♀, on herbs bordering lake, 27.V.2011 (CRB); Kornos Picnic site, 350m, 1 ♀, on shrubs in *Pinus* forest, 28.V.2011 (CRB).

NICOSIA: Agridi, near Dali, 1 ♂, in grass in house yard, VII.2009 (CDM).

Distribution: Italy to Central Asia. New to Cyprus.

Benoitia lepida (O. P-Cambridge, 1876)

Agelena lepida; De Blauwe, 1980b: 19.

Tegenaria dentifera Kulczyński, 1908: 78

Identification

Kulczyński, 1908: 78, pl. 2, fig. 18.

Citation

Without precise locality (Kulczyński, 1908).

New records

Distribution: Cyprus.

***Tegenaria domestica* (Clerck, 1757)**

Identification: <https://araneae.nmbe.ch/>.

Citation

Without precise locality (Kulczyński, 1908).

New records

NICOSIA: Kakopetria SE., Platania Camping site, 1 ♀, pitfalls in *Pinus brutia* forest, 6.IV.-8.VI.2014, M. Hadjiconstantis leg. (CMH).

Distribution: Cosmopolitan.

***Tegenaria maronita* Simon, 1873**

Identification

Levy, 1996: 101, figs 59-64.

Citations

None.

New records

NICOSIA: Cedar Valley Forest, 1 ♂, under stones, 29.IV.2007, det. A. Bolzern. (CAR-S).

Distribution: Lebanon, Israel, Turkey, and new to Cyprus.

***Tegenaria pagana* C. L. Koch, 1840**

Identification: <https://araneae.nmbe.ch/>.

Citations

None.

New records

NICOSIA: Dali, 13, Agios Andronikos, 1 ♀, in garden, IV.2007, det. A. Bolzern (CDM).

Distribution: Europe to Central Asia, USA to Chile, New Zealand.

***Tegenaria parietina* (Fourcroy, 1785)**

Identification

Bolzern *et al.* 2013: 806, figs 1E, F, 21N–R.

Citations

None.

New records

NICOSIA: Pedoulas, 1750m, 1 ♀, in web against wall, 19.V.2010 (CRB).

Distribution: Mediterranean to Central Asia. New to Cyprus.

***Tegenaria* sp.**

A number of *Tegenaria* specimens could not yet be identified to species level and will be treated in a further paper.

***Textrix caudata* L. Koch, 1872**

Textrix caudata; De Blauwe, 1980a: 12.

Identification: <https://araneae.nmbe.ch/>.

Citations

Without precise locality (De Blauwe, 1980a).

New records

None.

Distribution: Mediterranean, expanding to Central Europe.

Family Anyphaenidae

***Anyphaena sabina* L. Koch, 1866**

Identification

Simon 1932: 895, 960, figs 1345-1346; Urones, Barrientos & Espuny, 1995: 123, figs 18-22.

Citations

None.

LARNACA: Kornos picnic site, 350m, 2 ♀♀, beaten in *Pinus* forest, 28.V.2011 (CRB); Larnaca SW, Hala Sultan Tekke Mosque, 5m, 1 ♀, under stones and litter bordering salt lake, 16.V.2011 (CRB); Mosfiloti, 1 ♀, under stones in dry eroded grassland on hillside, 12.IV.2017 (CAR-S); Stavrovouni Monastery, 350m, 1 ♀, on bark of *Pinus* trees, 28.IV. 2010 (CRB).

LIMASSOL: Akrotiri Peninsula, 2 ♂♂ 8 ♀♀, margin of central salt lake, 7.V.1972, coll. A. Stubbs (MMUE); Akrotiri Peninsula, near British Airbase, 2 ♂♂ 3 ♀♀, swept in pine wood,

4.V.2007 (CAR-S), 1 ♂, (CRS); Akrotiri Peninsula, Fasouri, 1 ♂, swept from flowering herbs and grass, 27.IV.2007 (CAR-S); same site, 1 ♂ 3 ♀♀, in reed litter, 27.IV.2007, 2 ♀♀ (CAR-S), 1 ♂ 3 ♀♀, 4.V.2007 (CRS); Fasouri reedbeds, Akrotiri Peninsula, 4 ♂♂ 5 ♀♀, on muddy ground, edge of reedbed, 17.IV.2017 (CAR-S); Caledonia Waterfall, Pano Platres, 2 ♂♂ 5 ♀♀, under stones and in litter, edge of *P. nigra* forest, 26.IV.2007 (CAR-S); Pano Platres, 1 ♀, in small web on shrubs, 6.V.2007 (CAR-S); Troodos S., road to Pano Platres, 2 ♂♂ 3 ♀♀, under stones in *Pinus nigra* forest, 28.IV.2007 (CRS), 2 ♂♂ 5 ♀♀ (CAR-S), 2 ♂♂ 3 ♀♀, 26.IV.2007 (CAS). NICOSIA: Agridi, near Dali, 1 ♂, in yard, 14.III.2010 (CDM), 3 ♀♀, on and under stones, river bank, 29.IV.2013 (CDM), 1 ♂, in eucalyptus litter, 29.IV.2013 (CAR-S); Athalassa National Forest Park, Nicosia, 3 ♂♂ 10 ♀♀, in Eucalyptus plantation, 2.V.2013 (CRS), 1 ♂ 3 ♀♀, under stones in pine plantation, 8.V.2013, 1 ♂ 1 ♀, in deep eucalyptus litter (CAR-S), 10 ♀♀ (CRS); Marathassa Dam, 3 ♀♀, beaten from shrubs around lake, 20.V.2011 (CRB); Lympia Reservoir, Lympia, 1 ♀, under stones below dam wall, 9.V.2013 (CAR-S), 3 ♀♀ (CDM), 1 ♀ (CRS).

PAPHOS: Akamas Peninsula, ca. 2 km. S. of Cape Geronnisos, 1 ♂ 3 ♀♀, under stones in dry phrygana, 3.V.2007 (CRS); Avakas gorge and surroundings, 1 ♀, 22.III.2018 (CKHK); Evretou Reservoir, 1 ♀, under stones and in grass tussocks, 13.IV.2017 (CAR-S); Kelefos bridge, Diarizos River Dam, 550m, 1 ♀, beaten from shrubs, 21.V.2011 (CRB); Lefka NW, 120m, 1 ♀, beaten from bushes in fruit plantation, 18.V.2011 (CRB); Oikos N., Xerargaka picnic site, 350m, 2 ♀♀, beating shrubs and stones in *Pinus* forest, 20.V.2011 (CRB);

Distribution: Italy, Eastern Mediterranean, Kazakhstan. New to Cyprus.

***Devade tenella* (Tyschchenko, 1965)**

Identification

Esyunin & Efimik, 2000: 680, figs 1.7-8, 2.10, 3.5.

Comments

There has been much confusion in the past about *Devade* species. The first *Devade* species was described in the genus *Amaurobius* by O. Pickard-Cambridge (1872) as *A. indistinctus* and later

described again under different names and in different genera: *Diotima hirsutissima* Simon, 1880, *Altella lybica* Denis, 1947 and *Strinatella spinosa* Denis, 1957. This bears out the doubts arachnologists had in placing the species in a correct genus. *Devade tenella* (Tyschchenko, 1965) from Kazakhstan, with its synonyms *Momius hispidus* Andreeva & Tyschchenko, 1969 and *Devade uiensis* Esyunin 1994 is a second, closely related *Devade* species. Esyunin (1994) considered it a synonym of *D. indistincta* whereas Esyunin & Marusik (2000) and Esyunin & Efimik (2000) considered it an independent species. The holotype female of *Devade indistincta* (O. Pickard-Cambridge, 1872) and the type material of *D. tenella* should be re-examined to clarify the status of the two species. Our specimens resemble most the careful drawings of Esyunin & Efimik (2000) of *Devade tenella* and are therefore identified as such.

Pinus forest, 20.V.2011 (CRB); Pegeia, Pikni Forest, 345m, 13 ♂♂, pitfalls in former carob plantation, 11.III. - 23.III.2018 (CKHK); same site, 365m, 4 ♂♂, pitfalls in pine forest, 11.III. - 23.III.2018 (CKHK); same site, 375m, 5 ♂♂, pitfalls in open ruderal site, 14.III. - 23.III.2018 (CKHK); Souskiou, 1 ♀, 16.III.2013 (CDM); Stavros-Lysos road, 900m, 1 ♂, leaf litter, 21.IV.2017, S. Huber leg. (CSH).

Distribution: Mediterranean to Central Asia.

Alopecosa sp.

? *Tarentula simoni*; Kulczyński, 1908: 83 (misidentification).

Citations

Without precise locality (Kulczyński, 1908, sub *Tarentula simoni*).

Comments

Two species of *Alopecosa* occur on Cyprus, the very common *A. albofasciata* and another common species, currently under study. Most probably this is the species that Kulczyński (1908) mentioned as *Tarentula simon*. It is closely related to that species but it is perhaps a new species.

Records

FAMAGUSTA: Cape Greco, Ayia Napa, 35m, 1 ♀, under stones in phrygana, 20.XI.2010 (CRB). LARNACA: Mosfiloti, 1 ♀, under stone in dry eroded grassland on hillside, 12.IV.2017 (CAR-S). LIMASSOL: road Chionistra-Prodomos, 2 ♀♀, pitfalls in *Pinus nigra* forest, 6.IV. - 8.VI.2014 (CMH); road Kakopetria-Pedoulas, Marathos picnic site, 2 ♂♂ 1 ♀, 25.XI.2010 (CRB); Livadi Tou Passia, E. Troodos, 1750m, 1 ♂ 1 ♀, pitfalls in peat marsh, XI.2010-III.2011(CRB); Mount Olympos (Chionistra), 1900m, 3 ♂♂ 3 ♀♀, pitfalls in *Pinus* forest, XI.2010 - III.2011 (CRB), 3 ♀♀, pitfalls in open *Juniperus foetidissima* forest, 6.IV. - 8.VI.2014 (CMH), 2 ♂♂ 1 ♀, 1820m, under stones in *Pinus* forest, 25.XI.2010 (CRB), 1 ♂, pitfalls in *Pinus* forest, XI.2010 - III.2011 (CRB); Pano Platres E., Mesa Potamos Waterfalls, 1 ♂, 950m, in litter in *Pinus* forest, 4.V.2010 (CRB); Troodos Square, 2 ♀♀, pitfalls in open, mixed *Pinus nigra* and *Juniperus foetidissima* forest, 6.IV. - 8.VI.2014 (CMH); Troodos Square, 1 ♀, *Pinus nigra* forest, 11.V.2016 (CMH); Troodos, near summit of Mount Olympos (Chionistra), 2 ♀♀, under stones in *Pinus brutia* forest, 19.IV.2017 (CAR-S);

Troodos, Persephone Trail, 1732m, 1 ♀, in *Pinus nigra* forest, 19.III.2018 (CKHK).

NICOSIA: Lakatamia, 1 ♀, in olive grove, 1.I. - 1.X. 2016 (CMH); Pano Amiantos, 1 ♀, pitfalls in *Pinus brutia* forest, 6.IV. - 8.VI.2014 (CMH); near Platania Scout camping site, 1 ♂ 2 ♀♀, pitfalls in *Pinus brutia* forest, 6.IV. - 8.VI.2014 (CMH); near Prodomos reservoir, 2 ♀♀, pitfalls in *Pinus nigra* forest, 6.IV. - 8.VI.2014 (CMH). PAPHOS: Akamas Peninsula, Avgas Estuary, 2 ♂♂, stones in rock strewn slope near beach, 31.III.1997 (CJB); Paphos, Bay at hotel "Paphian Bay", 6 ♂♂ 1 ♀, pitfall traps on rocky beach, 1-6.IV.1997 (CJB), 4 ♂♂ 4 ♀♀, stones in rock strewn terrain near beach, 5.IV.1997 (CJB); Paphos, Tombs of the Kings, 1 ♂ 1 ♀, stones in rock strewn terrain, 1.IV.1997 (CJB).

Distribution: Holarctic. New to Cyprus.

Family Thomisidae

Bassaniodes Pocock, 1903

Recently, the large crab spider genus *Xysticus* was split up (Breitling, 2019), and the Cypriot species *Xysticus caperatus*, *X. pseudorectolineus*, *X. tenebrosus*, and *X. tristrami* are no longer known under their familiar name *Xysticus*, but as *Bassinioides*. The other species occurring in Cyprus (*Xysticus cor*, *X. edax*, *X. laetus*, *X. pseudoluctuosus* and *X. xerodermus*) remain into *Xysticus*.

***Bassaniodes tristrami* (O. Pickard-Cambridge, 1872)**

Identification

Wunderlich, 1995d: 762, figs 43-44.

Citations

Without precise locality (Kulczyński, 1908, sub *X. tristrami*).

Comments

The identification of the female specimens mentioned below is a bit doubtful, as no adult males were collected. Identification based on females, are difficult to distinguish them from *Bassanioides pseudorectolineus*. The capture of males should confirm the presence of the species in the island.

Levy (1976), without examining the material, considered the record of *Bassanioides tristrami* of Kulczyński (1908, sub *Xysticus*) as a misidentification and attributed it to *Bassanioides ferus*. Kulczyński's excellent drawing (fig. 14, epigyne longer than wide) does not look like Levy's figures at all (figs 13, epigyne wider than long). They look on the contrary very well like those of *Bassanioides pseudorectolineus* (see Demir *et al.*, 2008: 65, figs 1-7, sub *Xysticus p.*), the commonest *Bassanioides* species in Cyprus according to our collections. So, Kulczyński's citation (1908) remains doubtful.

J. Murphy (MMUE); Neo Chorio, 1 ♀, under stone, 30.III.1998, coll. J. Murphy (MMUE); Paphos NW, 1 ♀, under stones at the edge of a large sand pit, 24.IV.1986 (NHMW); Polis W., Latsi, path to Blue Lagoon, 50m, 1 ♂, 22.IV.2017, S. Huber leg. (CSH); Smigies, 1 ♀, under stone in hillside scrub, 26.III.1998, coll. J. Murphy (MMUE).

Distribution: Eastern Mediterranean, Ukraine.

VI. Discussion

Prior to this publication, only 103 spider species had been recorded from Cyprus (Nentwig *et al.*, 2019). The 449 species recorded here more than quadruples that number, a testimony to the efficacy of focused surveys by teams of arachnologists in documenting biodiversity. Figure 1 shows the increase in the number of species per year. Interest in the spider of Cyprus appears to have been very low and grew very gradually until 2012, rising quickly from then on.

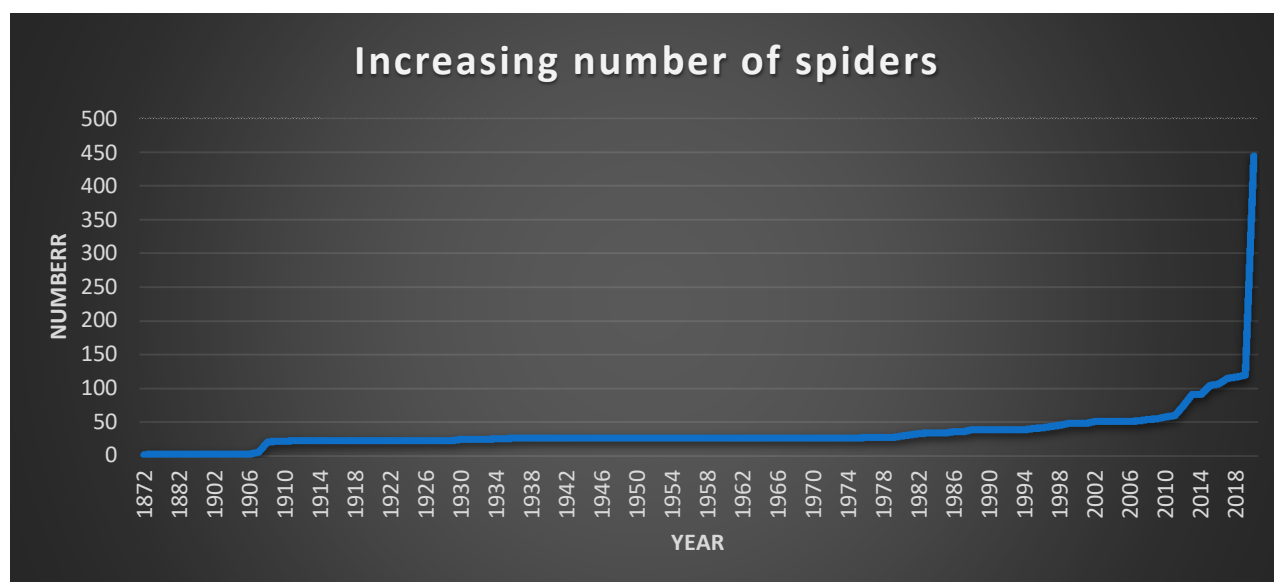

Figure 1: The number of species recorded per year in Cyprus between 1872 and 2019.

A consideration of Table 1 above shows that the total number of spider species in Cyprus (449) is close to that for the island of Crete (430 species), a similarly sized eastern Mediterranean island (Bosmans *et al.*, 2013). Furthermore, a comparison of the family composition of the spider faunas of these two islands indicates that they are closely similar in this respect as well. For the seven most species-rich families (Araneidae, Gnaphosidae, Linyphiidae, Lycosidae, Salticidae, Theridiidae, Thomisidae) the proportion of each family represented in the total lies within 1.5% of each other in the two islands. This is not to suggest that there are no significant differences at all. The fauna of Cyprus includes two families, Ctenidae and Phyxelididae (each represented by a single species) not represented in Crete or elsewhere in Europe and a number of genera that also are not known to occur in Crete (e.g. *Hersiliola* (Hersiliidae), *Cithaeron* (Cithaeronidae), *Zaituna* (Filistatidae) and *Akamasia* (Zoropsidae)).

Another clear difference between the spider faunas of Cyprus and Crete lies in the number of endemic species represented in each island. In Crete there are 58 species recorded as endemic to the island, representing 13.5% of all spiders (Bosmans *et al.*, op. cit.). By contrast, in Cyprus only 17 species endemic to the island are currently known, representing 4.3% of all spiders. The reasons for this difference are not entirely clear but a significant factor could be the close proximity of Cyprus to Turkey on the one hand (only 70 km at the nearest point) and to Syria on the other (only 105 km at the nearest point). It seems likely that there has been frequent movement of spider species from Turkey and the Middle East to Cyprus. This suggestion is strongly borne out by the distribution data provided in this catalogue which includes a relatively high proportion of species which are also represented in Turkey and/or the Middle East.

How complete is our knowledge of the Cyprus spider fauna? Although the present work provides a useful starting point, it is almost certain that the species list will expand significantly over the coming decades. A paper in preparation includes 23 species new to science from the island (Bosmans *et al.*, in prep.) and further collecting will very likely reveal many more, both new to Cyprus and to science. Given the island's position at a crossroads between Asia, Africa and Europe and our limited knowledge of the fauna of the eastern Mediterranean as a whole, we can confidently expect to see a rapid growth in the number of species from Cyprus.

Table 3 lists the 17 currently known endemic species of Cyprus. The species that will be described as new in a future paper are not taken into account here. Dysderidae and Linyphiidae are the most abundant species.

Six of the species listed show no special habitat preferences and have large distribution areas, occurring in all or almost all island districts. These species perhaps also occur in nearby Turkey. Four species prefer litter in forest or phrygana, two species are restricted to caves and one species seems to prefer wetland habitats. Several species have insufficiently known habitats and more research is necessary to establish the preferences of these species.

Family	Species	Districts	Habitat
Dysderidae	<i>Dysderocrates kibrisensi</i>	Ni	Caves
Dysderidae	<i>Harpactea ceconii</i>	La Li Ni Pa	Various
Dysderidae	<i>Harpactea gunsolorum</i>	Ke Ni	Forests
Dysderidae	<i>Harpactea kalavachiana</i>	Ni	Caves
Gnaphosidae	<i>Berinda cypria</i>	Fa Li Pa	Various
Gnaphosidae	<i>Drassyllus cyprius</i>	Ke La Li Ni Pa	Forest, phrygana
Linyphiidae	<i>Araeoncus cypriacus</i>	Li Pa	Litter
Linyphiidae	<i>Improphantes cypriot</i>	Fa La Ni Pa	Various
Linyphiidae	<i>Palliduphantes minimus</i>	Ke La Li Ni	Forests, grass tussocks
Linyphiidae	<i>Walckenaera cypresensis</i>	Li Ni Pa	Forests, mostly at high altitudes
Liocranidae	<i>Mesiotelus cyprius</i>	Fa Ke La Li Ni Pa	Various
Nemesiidae	<i>Brachythele incerta</i>	Unknown	Unknown
Oonopidae	<i>Opopaea saaristoi</i>	'North Cyprus'	'Plants on sandy ground'
Salticidae	<i>Aelurillus cypriotus</i>	Fa Li Ni Pa	Various
Theridiidae	<i>Theridion cyprusense</i>	Pa	Bushes along rivers, springs and near beach
Theraphosidae	<i>Chaetopelma karlamani</i>	Fa Ke La Ni	Forests at higher altitude
Zoropsidae	<i>Akamasia cyprogenia</i>	Ni Pa	Forest litter

Table 3: Currently known endemic species of Cyprus, their distribution in districts and recorded habitat preferences (Fa: Famagusta; Ke: Keryneia; La: Larnaca; Li: Limassol; Ni: Nicosia; Pa: Paphos).

Acknowledgements

B. Huber is thanked for the identification of Pholcidae, D. Logunov and G. Azarkina for the identification of Salticidae and Thomisidae, M. Chatzaki for the identification of Gnaphosidae and A. Bolzern for the identification of Agelenidae. Without their willing help this catalogue would have been impossible to complete. Many thanks also to Martin Askins, Maria Chatzaki, George Constantinou, Herman Dekoninck, Marios Giannapas, Evan Jones, Christodoulos Makris, Eleni Panayiotou, Matthew Smith, Robin D. Symeou and Lut Vannieuwenhuysse for their valuable help during sampling. Theo Blick and Aydin Topçu are thanked for examining material of *Megalepthyphantes turkeyensis*. We thank Christof Hörweg (NHMV) for making available for study the holotype of *Brachythele incerta*. Finally, we would like to thank Theo Blick, Wolfgang Nentwig and some ARABEL members for interesting discussions.
