HISTORY OF THE BOTANICAL GARDEN

Kaunas Botanical Garden was established in 1923 at Lithuanian University (later it was renamed after Vytautas Magnus) as the centre of botanical sciences. Former manor of famous nobleman Juozapas Godlevskis in Aukštoji Freda near Kaunas was chosen as a place for the Garden. Creation of the manor was begun at the end of the 17th century. The surrounding park was landscaped to adjust the ponds to the form J and G letters. With only slight changes they have still remained.

Presently, Kaunas Botanical Garden of VMU occupies the area of 62,5 hectares. Approximately 7300 different plants comprise the collections and expositions.

SECTORS OF SCIENCE

Sector of Medicinal plants. For the moment the collections-expositions of medicinal plants contain 419 species, which belong to 290 genera and 90 families. Their classification is based on bioactive plant compounds. 26 species belongs to the category of protected and rare plants. The collections-expositions of spices-melliferous plants contain 150 species belonging to 99 genera and 40 families. The collection of hops contain 30 varieties, one hybrid and 19 wild individuals.

Sector of Plant Pathology. Sientists of the sector investigate pathological condition of introduced plants in Lithuania.

Sector of Dendrology. Over 800 species, subspecies, varieties, forms and cultivars of introduced woody plants including 270 gymnospermous and 600 angiospermous are grown in the dendrology collections and expositions.

Sector of Pomology specialised collection contains 385 species and clones of berry plants (actinidia, cranberry, blueberry, snowballtree).

Sector of Floriculture. Collections of woody and herbaceous ornamental plants occupy central part of the Botanical Garden. There, 4801 taxa of ornamental perennial plants are

grown. The genera that contain many cultivated species are exhibited separately: roses (350), dahlias (276), peonies (185), irises (196), astilbes (53) and the plants of grasses family. Flora Systematics group exhibits plants of 85 families and over 650 taxa of local flora and introduced plants, and 50 rare and medium-rare plants of the Lithuanian flora in systematic order. There is a considerable collection of bulbs and monocotyledon plant species in the isle of the pond. These are tulips, lilies, autumn crocus, grape hyacinths, scillas. 110 cultivars are grown in the abundant collection of day lilies.

The **Greenhouse** was built in 1923–1938 and now occupies the area of 665 m². Approximately 1567 different plants are grown in there. The plants are located according to the geographical and climatic principle. The most interesting of them are cycads, banana, pineapple, coffee-tree, bamboo, date-palm, monkey-puzzle, olive-tree, bo-tree, gum-tree, etc.

Park of the Botanical Garden consists of two parts – the old manor park and the arboretum. In the old landscape style park plants grow with no clear system. In the arboretum, founded in 1923, the plants are planted and grown in a systematic order according to genera and families.

A new exhibition – rock garden with alpine plants was established in 2011. It represents 140 species of woody, herbaceous and bulbous plants.

In 2011, very special B. Galdikas oak grove was planted. It is comprised of 50 genetic clones of 31 famous Lithuanian oaks - nature monuments.

GEOGRAPHICAL SITUATION:
