## **RONDEAU PROVINCIAL PARK INSECT SPECIES LIST**

The following list was generated from the University of Guelph Insect Collection computer database on 5 October 2009 and compiles the 1728 taxa found in Rondeau Provincial Park that have identified material deposited in the Guelph collection. The majority of this material was collected and identified during a survey in 2003 but historical material and material collected after 2003 were included to compile this list. The Odonata (dragonflies and damselflies) and Lepidoptera (butterflies and moths) were not a focus of the study and more complete lists of species that occur in Rondeau Provincial Park may be available from the Rondeau Provincial Park naturalists. For further information please contact Dr. Stephen Marshall (information available from the University of Guelph Insect Collection website). The development of this list was supported by Ontario Parks (with special thanks to Sandy Dobbyn).

Orders are arranged taxonomically. All families, genera and species are arranged alphabetically.

Note: The term "c.f." is used here to indicate some level of uncertainty in the species identification. Any taxon that does not list the species represents either a specimen(s) that are not identifiable beyond the generic level or represent groups for which expertise was not available to identify the material.
