LOKDOH

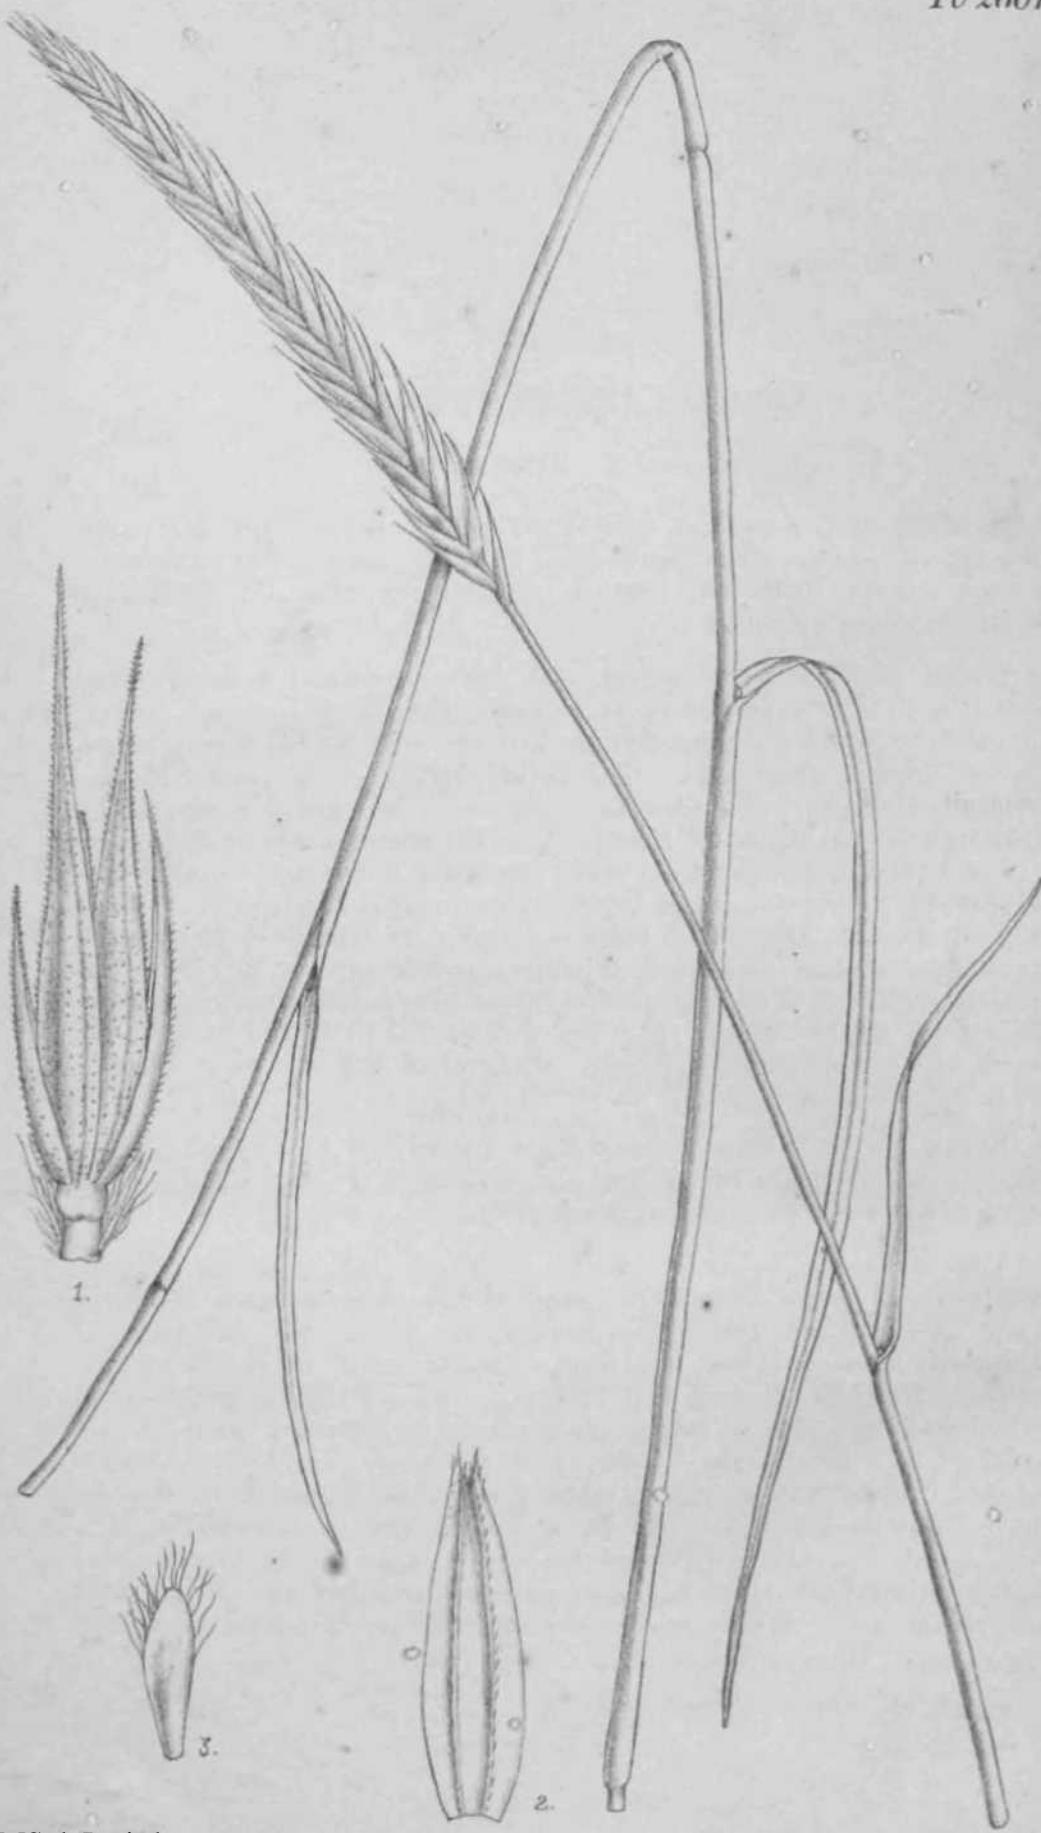

PLATE 2601.
SECALE AFRICANTTM, *Stapf.*

GRAMINE^J. Tribe HORDED.

S. africanum, *Stapf* (*sp. wot?*); affine *S. montano*, spiculis paulo minoribus, glumis plerumque plus minusye insequalibus, valvarum nervis magis distinctis, carinis omnibus tenuiter brevissimeque spinuloso scabris diversum.

Culmi graciles, ultra 1[^] ped. alti, lseves, internodiis superioribus exsertis. *Folia* (superiora tantum nota) glabra, laevia; vaginae arctae; ligulae brevissimae, obtusae; laminae lineares, angustae, ad 6 poll, longae. *Spica* linearis, densissima, 2[^]-3 poll, longa, 2[^]-3 lin. lata; rhachis articuli utrinque villosa-barbata. *Spiculor* oblongae, .5-6 lin. longaa (aristis exclusis), dense imbricatae. *Glumes*, lineares sensim in mucronem (vel aristulam) brevem et scabrum attenuatae, in carinis tenuiter brevissimeque spinuloso-scabrae, inferior plerumque paulo brevior. *Valve** linear-oblongae, in aristam tenuem scabram rectam 3-3J lin. longam product*©, glumas aequantes, 5-nerves, nervis superne viridibus distinctis, carinis ut in glumis. *Palece* valvas subsequentes, carinis scabris. *S. cereale*, Thunb. Prodr. Fl. Cap. p. 23; Fl. Cap. ed. i. p. 440; ed. Schult. p. 118: Travels ii. p. 168. Durand et Schinz, Conspl. Fl. Afr. v. p. 937 (*in nota*).

SOUTH AFRICA : Cape Colony, Calvinia Div., "Lowermost Roggeveld," near Wilhelm Stenkamps Farm (Elands Fontein of *BurchdVs* map, about twenty miles south-east of Calvinia), *Thunberg*.

Thunberg says in his Travels I.e. : "These (the lowermost **Roggp-** veld) as well as the others (Roggevelds) have been so named from a kind of rye which grows wild here in abundance near the bushes." Curiously enough it has not been collected ag-iin since Thunberg's times. Burchell (*Travels*, i. p. 256) says : "I saw none of the wild rye which has been said to be so abundant as to give the name to this district, but this might be owing to the season of the year."¹ He visited this district in Augtfst, when grasses like this would naturally have disappeared. It might be suggested that *S. africanum* is a variety of *S. cereale*, which had been introduced by the farmers and then run wild; but rye varies very little altogether, and, so far as I am aware, never in a way which would explain the differences that characterise the new species described above. ^

This and the three following plates were drawn from the original specimens in Thunberg's herbarium at Upsala, for the loan of which Kew is indebted to Professor Fries, who with great liberality placed the whole of Thunberg's South African grasses at our disposal for purposes of comparison.—O. STAPF.

Fig. 1, a spikelet; 2, a pale; 3, a lodicule. *All enlarged.*

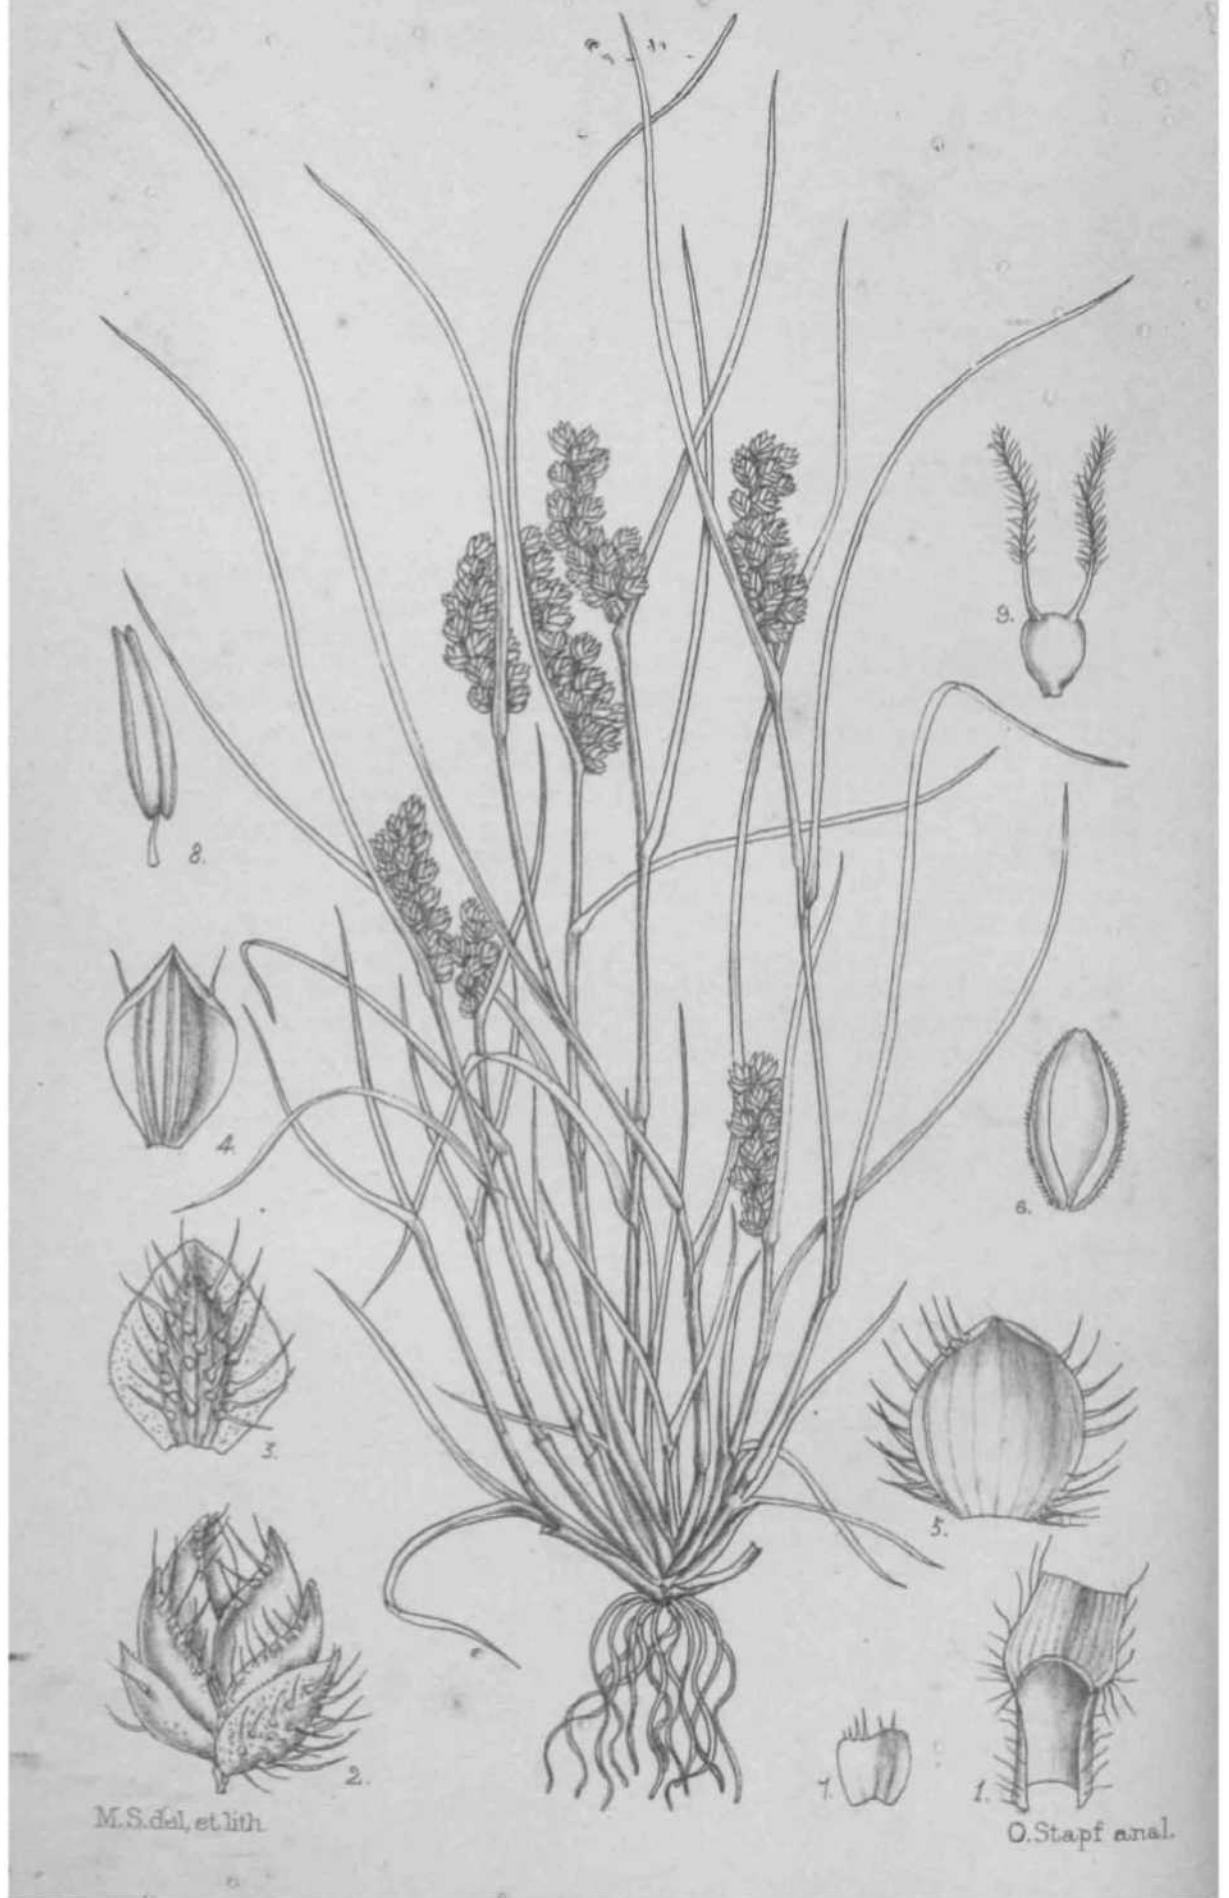

PLATE 2602

BRIZOPYEUM CILIARE, *Stajyf.*

GRAMINEJE. Tribe FESTUCE^E.

B. ciliare, *Stapf*; spiculis parvis, valvis secundum margines exiinie rigido-ciliatis, ciliistuberculis impositis uniseriatie, ab omnibus speciebus generis distincta.

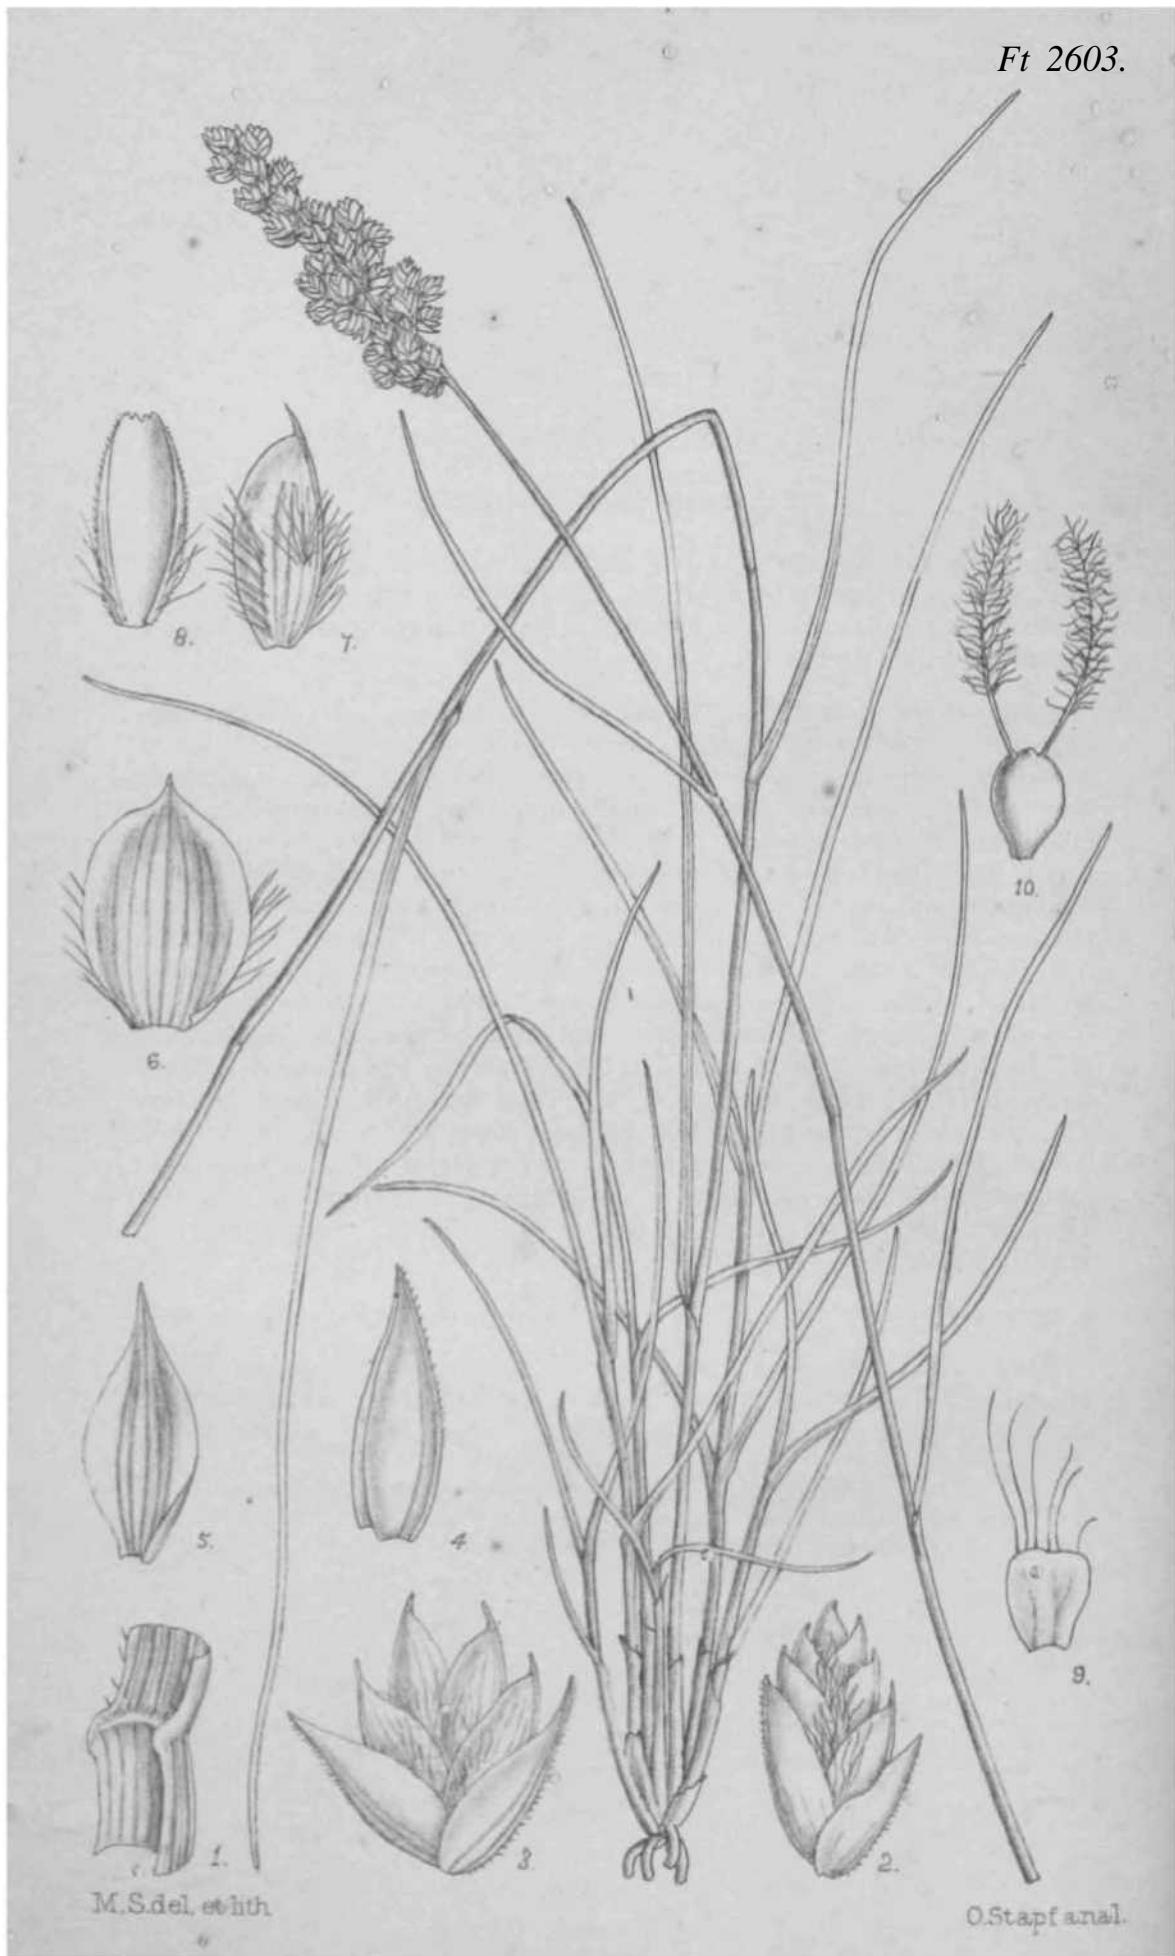

Gramen annum. *Culmi* fasciculati, geniculati, ascendentibus vel suberecti, tenues, 4-6 poll, longi, glabri, laeves, 2-3-nodi, ad paniculam vaginati vel internodiis intermediis paulo essentis. *Folia* tenuiter laxeque hirsuta; vaginas arctae, inferiores saepe purpurascentes; ligulae ad marginem redactae; laminae anguste lineares, 1-3 poll, longae, circiter 5 lin. latae, saepe convolutae, subflaccidae, summa paniculam longe excedens. *Panicula* spicifonnis, oblonga, densissima, interdum lobata, 4-9 lin. longa, 2-3 lin. lata; rhachis ramique teretes, ltuves, Lice brevissimi; pedicelli ad ^ lin. longi. *Spiculce* perlatas, ovatae, turgidae, 1^-1 ^ lin. longae, 3-6-florse. *Glumce* latae, ovatae, acutae vel subacutae, ad 1 lin. longae, 5-nerves, tenues, marginibus albis latissimis, inferior in dorso herbaceo hispida pilis e tuberculis ortis, superior subglaber. *Valvce* ovatae (a latere) subobtusae, 1 lin. longae secundum margines serie ciliorum rigidorum tuberculis impositis munitae, caeterum glabrae, firmiusculse, apice purpurese, subcompressae, nervis tenuibus. *Palece* latae, obtusae, carini3 scaberulis. *Lodiculae* minutae, sparse ciliolatae. *Antherce* 1^ lin. longae. *Dactylis ciliaris*, Thunb. Prodr. PI. Cap. p. 22; Fl. Cap. ed. i. p. 429; ed. Schult. p. 115; non Linn., nee Nees, in Linnaea, vii. (1832) p. 322.

SOUTH AFRICA : Cape Colony, without precise locality, *Thunberg*.

This is a very distinct species and quite different from *Lasiochloa ciliaris* Kunth, which this author took to be Thunberg's *Dactylis ciliaris* on the authority of a specimen so named in the herbarium at Berlin. Linneus's *Dactylis ciliaris* (Mant. ii. p. 185) is a perennial with setaceous, perfectly glabrous blades, a small obovoid, capitate panicle, and glumes equalling more or less the valves which are, apart from a whiter beard at each side of the base, glabrous.

Fi\$. 1, a lignle; 2, a spikelet; ^, lower glume; 4, upper glume; 5, a valve; 6, a pare; 7, a lodicule; 8, an anther; 9, a pistil. All enlaryi d.

Ft 2603.

PUTE 2603.

BBIZOFTBUM GLOMERATUM, *Stapf.*

GRAMINE.E. Tribe **FESTUCAE.**

B. glomsratum, *Stapf*; affine *B. oblit.ero*, *Stapf* (*Demazeria oblita*, Hem si.), sed habitu erecto, glum is valvisque acutioribus vel mucronatis teuuius nervosis, lodiculis longe ciliatis, antheris plus quam duplo majoribus diversum.

Gramen perenne, csespitosum innovationibus intravaginalibus numeros's. *Culmi* suberecti, graciles, ad 1 ped. alti, glabri, lseves, ?.-4-nodi, internodiis exsertis. *Vagina**, foliorum arctse, glaberrimae, lrev**s, inferiors breves, albide, firmiuscuse; ligulse ad marginem minute ciliolatum redastae ; laminae subsetauese, apice calloso induratse, 2 ad 6 poll, vel ultra longae, glabne, lseves. *Panicula* spiciformis, linearis oblonga, sublobata vel subinterrupta, 1-1J poll, longa ; rhachis ramique teretes, scaberuli vel hispid uli, hice perbreves; pedicelli brevissimi. *Spiculce* coarctatse, latse, ovatse vel ellipticse, circiter'2 lin. longae, vire-Bcentes, 3-6-flora. *Glumce* ovatee, acutse vel subacuminatte, || lin. longae, 3-5-nerves, nervis carinse scabrse approximatis tenuibus, marginibus albidis latissimis. *Valvce* ovatse (a late re) plerumque abrupte mucronatse, 1-1^ lin. longse, sub-firmae, secundum margines ciliatse vel fere undique a basi ad medium pilosee, pilis tenuibus acutis, nervis tenuibus. *PalecB* latse, obtusse, carinis scabris vel inferne ciliatis. *Lodiculas* longiuscule ciliatae. *Antherce* | lin. longse. *Poa glonierata*, Thunb. Prod. PI. Cap. p. 22; Fl. Cap. ed. i. p. 423; ed. Schult. p. 113. Kunth, Enum. PI. i. p. 363.

SOUTH AFRICA : Cape Colony, without precise locality, *Thunberg*.

Why this species was quoted as a synonym of *Tetrachne Dregei* Nees, by Nees and subsequent authors, is difficult to understand, as there is nothing in Thunberg's description to justify it.—O. STAPF.

Fig. 1, a ligulc; 2 and 3, spikelets; 4, lower glume; 5, upper glume (flattened out); 6, a valve (flattened out); 7, n ralvo (side view); 8, a pale; 9, a lodicule; 10, a pihtil. All enlarged.

Pi 2604.

M.S.del. et lith.

O.Stapf anal.

PLATE 2604.

ACHNERIA CAPILLARIS, *Stapf.*

GRAMINEJE. Tribe AVENEJE.

A. capillaris, *Stapf*; affinis *A. aurece*, sed annua, glumis acutioribus tenuioribus pubescentibus valvis pro ratione brevioribus glabris diversa.

Gramen annum. *Culmi* fasciculati, e basi geniculata ascendentis, ad 1 ped. alti, glabri, leaves, circiter 2-3-nodi, basi raniosi, ramis floriferis. *Folia* parce villosa; vaginae laxae vel tumidse, inferiores linea tuberculorum perforatoium munitse; ligulse ad series pilorum redacts; laminae lineares, acutse, 1-2 poll, longse, 1-1½ lin. latse, exsiccatae involutae vel convolutae, secundum margines inferiores tuberculis stipitatis perforatis munitae. *Panicula* obovata vel subpyramidalis, 3 poll, longa, 3-4 poll, lata, tandem effusa, iterum trichotome divisa, ramis 2-natis apicem versus spiouligeris filiformibus vel capillaribus glabris vel ad axillas pilosis levibus prsenter tuberculos perforates sessiles sparsos; pedicelli capillares, ad fere 2 lin. longi. *Spiculm* ovato-oblongae, 1½ lin. longse, pallide virides; rhachilla minute producta. *Glumce* ovato-lanoeolatse (a latere), acutae vel subacuminatse, hyalinse, tenuiter pubescentes, 1-nerves. *Valvce* late ovato-oblongse (a latere), obtusse vel obscure trilobse, 1 lin. longae, membranaceae, glabrse, 5-7-nerves, nervis tenuibus sub apice convergentes. *Palec* *G* valvis subsequales. *Lodiculce* glabrse, minutae. *Antherte* 1 lin. longss. *Uohus capillaris*, Thunb. Fl. Cap. ed. i. p. 412; ed. Schult. p. 110 (excl. diagn.), non Frodr. p. 20. *Sorghwm capillare* Roem. & Schult. ii. p. 840. *Andropogon (?) capillaris*, Kunth, Rev, Dram. I. p. 166; Enum. I. p. 510.

SOUTH AJFRICA : Cape of Good Hope, *Thunberg.*

This grass does not seem to have been collected since Thunberg, nor is there any evidence that subsequent writers have seen his specimen. As, moreover, Thunberg's diagnosis and description of this plant were partly contradictory, it is no wonder that Roemer and Schultes, as well as Kunthj were misled in their endeavours to find a place for it in Andropogoneae. Hackel (*Monogr. Androp.* p. 651) has already pointed out that it could not belong to this tribe. Thunberg says in *Prodr. PI. Cap.* I.e. and in the diagnosis of the species in *FL Cap.* I.e., 'flosculo hermaphrodite mutico, masculo aristato' and *glumis glabris,' whilst in the description no jncntion is made of the

heteromorphism of the florets, and the glumes are described as having a 'carina subvillosa.' As the description agrees otherwise very well with the specimen named *Helens capillaris* in his herbarium, I assume that Thunberg drew up his diagnosis from a different plant, perhaps a *Holcus* or *Aira*.—O. STAPF.

Fig. 1, a ligule; 2, a spikelet; 3, the 2 florets; 4, a valve (flattened out); 5, an upper floret; 6, pale of an upper floret (5 and 6), showing the minute continuation of the rhachis at the base; 7, a lodicule; 8, a pistil. All enlarged.

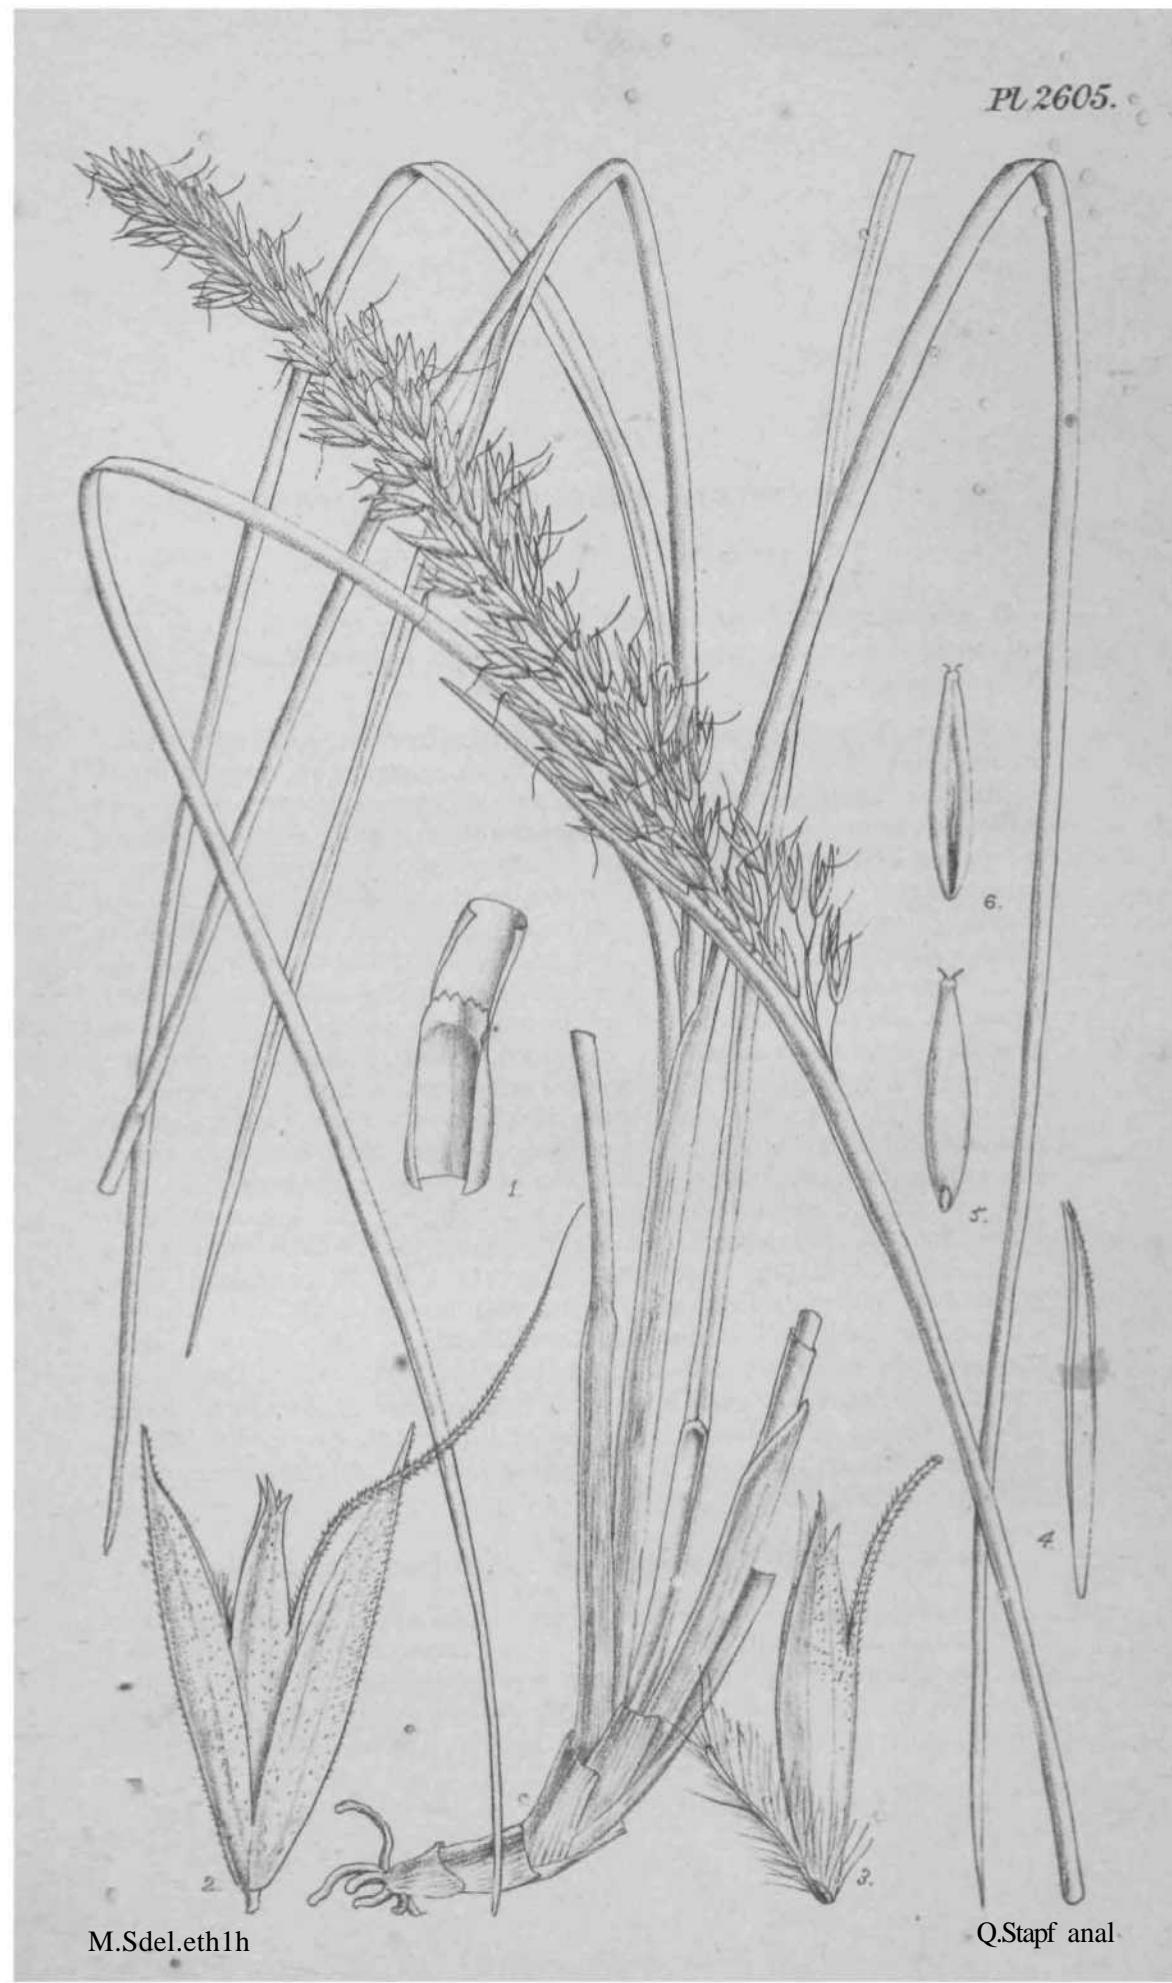

PLATE 2605.

DEYEUXIA SCLEBOPHYLLA, *Stapf*,

GRAMINEAE. Tribe AGROSTIDEA:.

D. sclerophylla, *Stapf* (*sp. nov.*); nulli speciei arete affinis, glumis valvaque rigidis, arista e sinu orta distincta, potius sectionem novam *Sclerodeyeuxiam* sistens.

Gramen dense caespitosum innovationibus intravaginalibus. *Culmi* stricte erecti, 1-2[^] ped. alti, glabri, laeves, plerumque 2-nodi, internodiis 2-1 exsertis. *Folia* glaberrima, laevia, basi arete et distiche congesta, ssepe (praecipue in innovationibus) subflabellata; *vaginas* compressae, obtuse carinatae, arctae, inferiores circiter 3 poll, longse, sulcato-striatae; *ligulae* hyalinae, ovatae, acute ad 2 lin. longse; *laminae* erectse, lineares, arete plicatae, perfurmse, rigidae, basi transverse callosse, subpungentes, 6-9 poll, longae, |-\$ lin. latse (in statu plicato), subtus laevissimae, supra scabridae et sulcato-nervosae, marginibus laevibus. *Panicula* erecta, linearis, 4-6 poll, longa, contracta; *rhachis* lsevis, gracilis; rami fasciculati vel geminati, erecti, inaequales, longiores 1-2 poll, longi, parce ramulosi vel simplices, a b/isi spiculigeri vel inferne plus minusve nudi, filiformes, laeves vel superne scaberuli; *pedicelli* laterales circiter 1 lin. longi, caeteri ssepe multo longiores, superne incrassati, lasviusculi. *Spiculce* cinereo-virescentes vel plus minusve glauco-purpurascentes, 3[^] lin. longae; *rhachillse* processus 1 lin. longus, plumtosus. *Glumce* subaequales, lanceolatse, mucronato-acuminatse, carinatae, subcoriaceae, 3-nerves, omnino scabridae. *Valva* linear-lanceolata, 2£ lin. longa, firma, omnino scaberula, sub-7-nervis, ad ^ bifida lobis bidentulis vel bimucronatis, e sinu aristata, arista scabra patulo-recurva; callus pilosus, pilis ^ - | valvae aequantibus. *Palea* angusta, 2-dentula, carinis superne scaberulis. *Lodiculce* oblongae, 2-dentatae, fere ^ lin. longae. *Antherce* 1 lin. longae. *Ovarium* glabrum. *Caryop8i8* linear oblonga, 1 lin. paulo longior, a dorso compressa; embryo parvus; hilum £ caryopsis sequans.

NEW GUINEA : Mount Scratchley, 12,200 feet, *Giulianetti*.

The glumes are as rigid as those of *Ammophila*, and the valve, though thinner, is still firmer than in any other *Deyeuxia* I have seen. The leaves are very like in structure to the leaves of *Ammophila arenaria*, but the blades are more compressed. ^ The awn springs from the sinus of the valve, whilst it is, I believe, always dorsal in the true

Deyeuxias, and reduced to a subterminal mucro or quite absent in *Ammophila*. This insertion of the awn in connection with the rigid¹ side lobes and the shortly excurrent side nerves would bring the species near to *Pentapogon*, but in that genus the rhachilla is glabrous and the ovary top conspicuously appendaged. The great similarity of the structure of the blades of *Deyeuxha sderophylla* and of the other grasses of Julianetti's collection from Mount Scratchley, with the exception of *Microlcena*, is very singular, and indicative of great (probable periodical) dryness of the air.—O. STAPF.

Fig. 1, a ligule; 2, a spikelet; 3, a floret, with the continuation of the rhachilla; 4, a pale; 5, a grain, back view; 6, the same, front view. All enlarged.

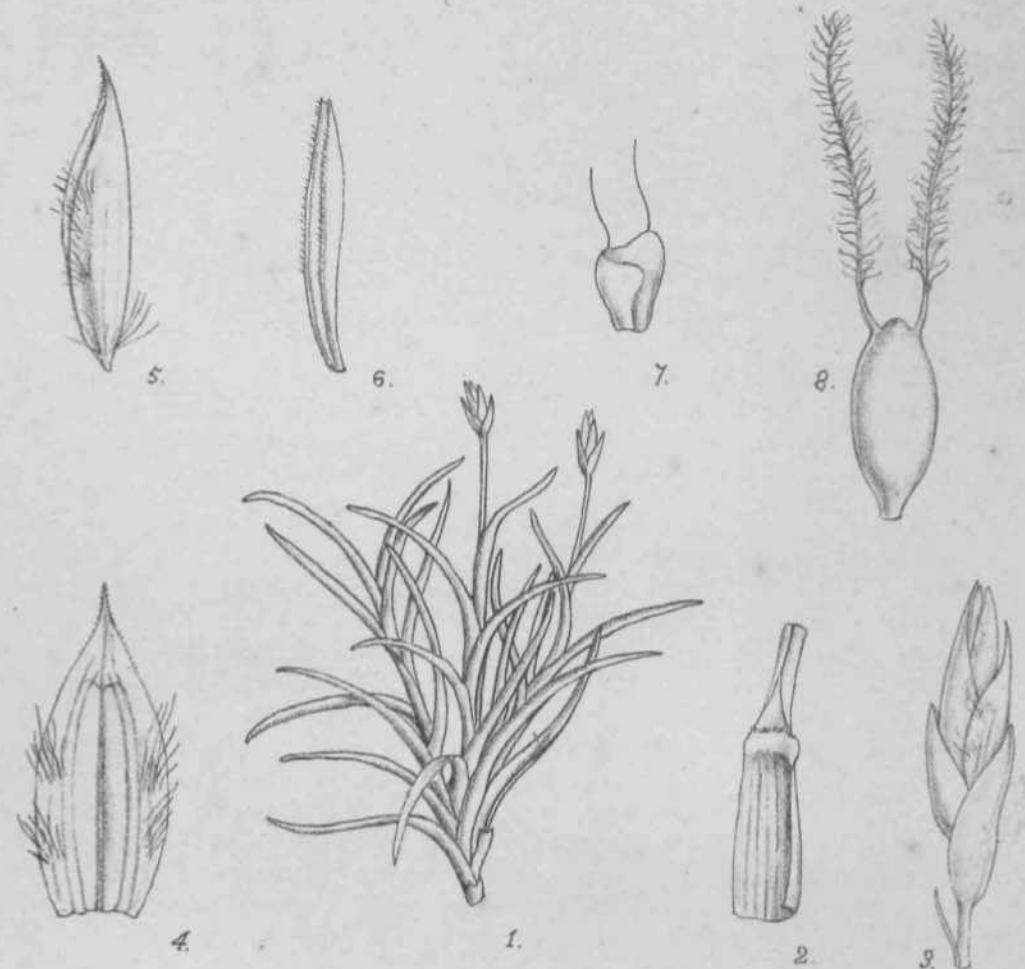

PLATE 2606.

DANTHONIA OREOBOLOIDES, *Stapf.*

GRAMINEA.: Tribe AVENAE.

D. oreoboloides, *Stapf* (*sp. nov.*) ; affinis *D. exiguae*, *Stapf* (27. *pauciflora*, *Bucb.* non *R. Brown*; *Triodia exigua*, *Kirk*), sed minor, tenuior, spiculis minoribus, valvis exsertis integris acuminatis distincta.

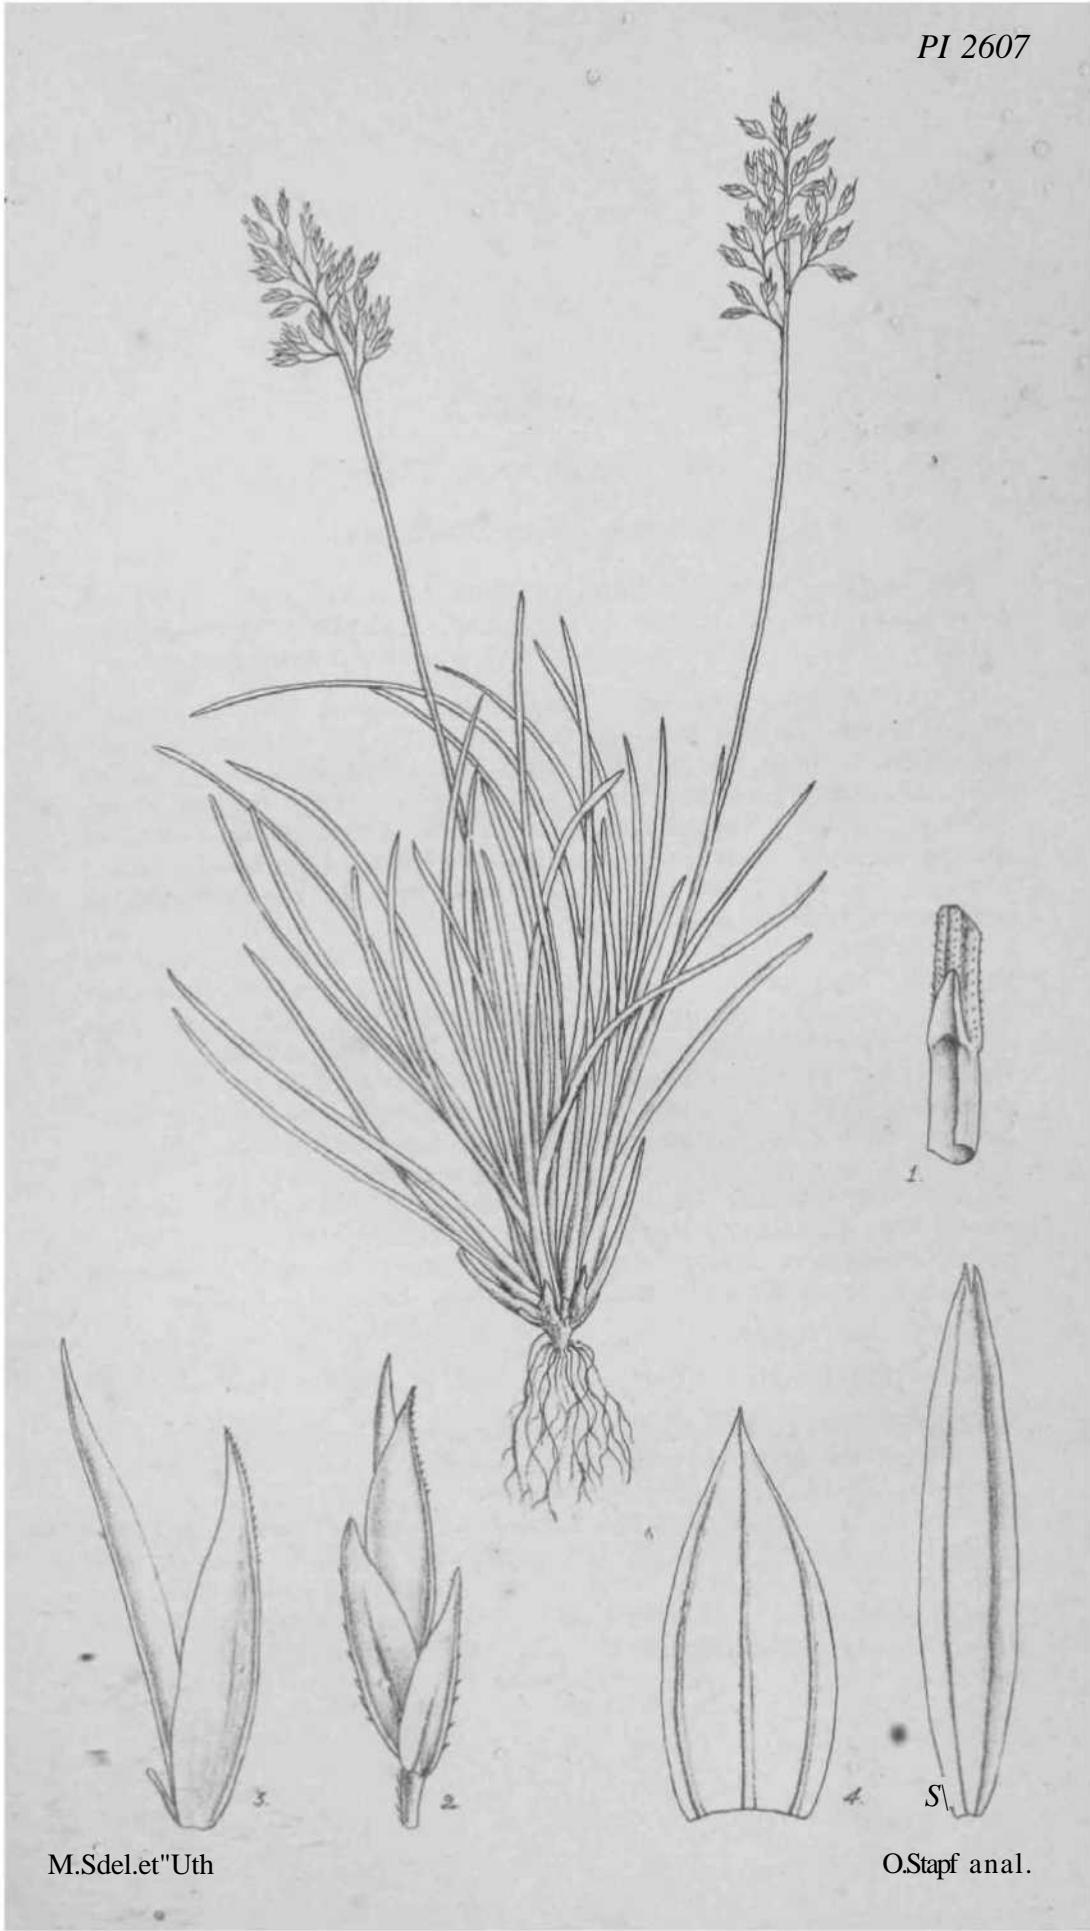

Gramen cespites densissimos 1 poll, vix altiores formans, innovationibus creberrimis cum culmis floriferis fasciculatis. *Culmi* floriferi vix 1 poll, alti, ad medium vaginati, glaberrimi, lsevissimi, tenues. *Folia* glabra, in innovationibus et ad culmorum basin disticte imbriata; vaginae arctse, laxe striatae; ligulse pilorum brevissimorum serie notatse; laminae tenuiter setaceo-subulate, acutre, J~£ poll, longse, curvse, lseves. *Spiculce* solitarise in culmorum apice, albidse, 1[^] lin. longae, circiter 3-flone; rhachilla parce pilosula. *Glumce* sequales, ovato ellipticse, subacute vel obtusse, ima basi obsolete 5-nerves, csetprum 1-nerves. *Valve* oblongae, integrae, breviter acuminatae, vix 1£ lin. longge, ad latera utrinque penicillis minutis ornatse, 7-nerves, nervo medio interdum in mucronium excurrente, callo minuto barbulato obtuso. *Palea* valvam subequans, carinis superne scabris. *Lodiculce* glabrse. *Antherce* | lin. longse. *Ovarium* glabrum.

NEW GUINEA : Mount Scratbley, 12,200 feet, *Giulianetti*.

I have no doubt that this is the grass which Sir Ferdinand von Miiller described in *Trans. Roy. Soc. Viet.* i. 2. pp. 38, 39, and named provisionally *Festuca oreoboloides*.

FOA PAPUANA, *Stapf.*

GRAMINEA: Tribe, FESTUCEJE.

Foa papuana, *Stapf* (*sp. nov.*); affinis *P. minimiflora*, *Stapf*, sed foliis minus tenuibus rigidioribus scaberulis, spiculis paulo majoribus, valvis acute acuinatatis quam palea lsevi paululo brevioribus diversa.

Gramen dense csespitosum, innovationibus crebris intravaginalibus. *Culmi* erecti, graciles, 3-4 poll, alti, laeves, vix ad medium vaginati, internodiis summo excepto brevissimis, basalibus paucis. *Folia* ad basin congesta, interdum subñabellata, glaberrima; vaginae arctae, carinatse, striatse; ligulse acutissimse, ad 1 lin. longse, hyalinae; laminae setaceae, lateraliter compressse, canaliculatae, apice oblique brevissimeque acutatse, 1^3 poll, longse, rigidse, erectse, scaberulse, imprimis ad margines et carinas, prseterea ssepe minutissime tuberculatse. *Paniculce* oblongse, 7-9 lin. longse, strictse, raini inferiores fasciculati vel geminati, simplices, 4-1-spiculati, stricti, oblique erecti, filiformes scaberuli, in axillis gland uligeri; pedicelli laterales, 1 lin. longi, ramis similes. *Spiculce* 1-florae, oblongae, acuminatae, 1 lin. paululo longiores, virides, vel purpureo-fuscescentes, interdum variegatse; rhachillse processus brevis. *Glumce* ovatse, acutse, vel acuminatse, dorso basique herbaceae, in carina scaberulse, inferior medium spiculam oequans, 1-3-nervis, superior paulo longior, latior, 3-nervis. *Valvce* oblongse, acute acuminatse, 1 lin. paululo longior, in apice et ad margines angustissime hyalinse, cseterum herbaceae, laeves, ob nervos laterales interiores suppressos 3-nerves. *Palece* valvas paulo superantes, acute 2-dentatse, laeves. *Lodiculce* oblongae, integrae. *Antherce* 1/2 lin. longae.

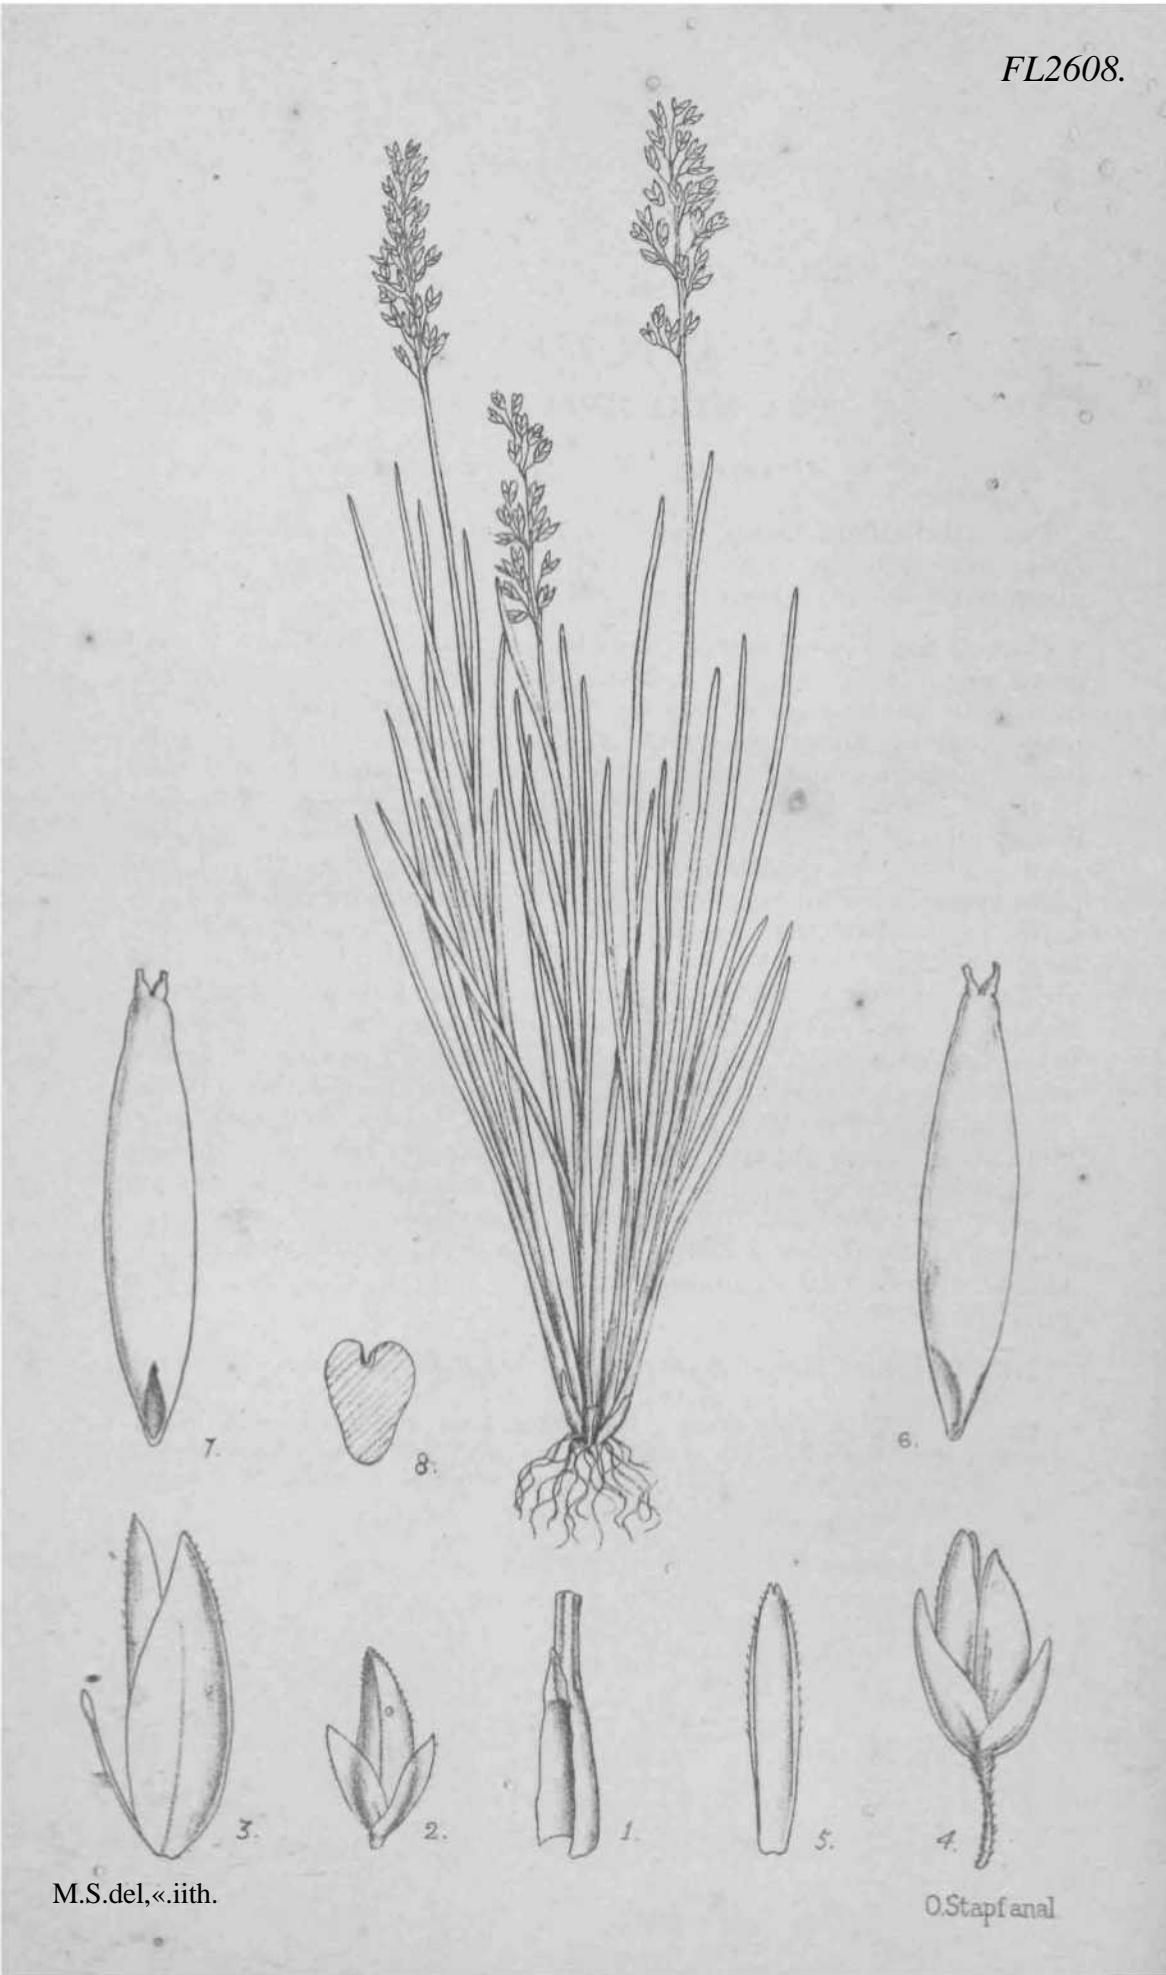

NEW GUINEA : Mount Scratchley, 12,200 ft., *Giulianetti*.

Poa papuana, *P. callosa*, *P. minimiflora* and *P. epileuca*, *Stapf*, form a small natural group, the affinity of which lies evidently with *Poa herguehnisi* Sy Hook. f. and *P. antarctica*, *Stapf* (*Triodia antarctica*, Hook. f.). In my paper on, the flora of Kinabalu (*Trans. Linn. Soc.* ser.**2, iv. p. 247), I have pointed out that the grass which I then described as *Deyeuxia epileuca* was "a very marked species, the affinity of which lies rather with some Australian species (of *Deyeuxia*) than with any others, though it is far from being closely connected" and that "the spikelets come, perhaps, nearer to those of *D. gunniana*,

Benth."; but I was then "still doubtful as to the true systematic position" of the grass (*I. c.* p. 105). The discovery of *Poa papuanr* and *P. minimiflora* has given me now the key to it in the direction indicated above. This group of *Poa* is well marked off from the rest by the minute 1-2-flowered spikelets and the firmer texture of the glumes and valves, and will probably have to stand as a section of *Poa*. *Deyeuaria gunniana*, Benth. and the closely allied *D. breviglumi8*, Benth., are, in general habit, strikingly similar to *P.papuana* and *P. minimiflora*, but the obtuse glumes and the minutely emarginate and mucronulate valves with basewards evanescent nerves point to a different genus. *P. papuana* and perhaps also *P. mi.ximi-flora* are evidently the same grasses which Sir Ferdinand von Mueller enumerated as *Festuca pustula* (*Trans. Soc. Victoria*, i. pt. 2, p. 38).—O. STAPP.

Crossotropis, Stap/in *Thiselton-Dyer, Fl. Cap.* vii. p. 317. *Spiculas* 3-9-florse, lateraliter compressae, subsessiles, subdistichae, in paniculse ramis rigidis; rhachilla tenu is, supra glumas et inter valvas articulata. *Glumce* subaequales vel sequales, angustte, membranacese, 1-nerves, firme carinatae, persistentes. *Volvos* subremota, linearis oblongse (a latere visae), breviter 2-lobae, e sinu mucronatse vel breviter aristatse, membranaceae, 3-nerves, nervis lateralibus submarginalibus subpercurrentibus rigide ciliatis; callus parvus, pilosulus. *Palece* angustae, 2-carinatae, valvis paulo breviores. *Lodiculce* 2, cuneatse, parvae. *Stamina* 3. *Ovarium* glabrum; styli distincti, gracillimi; stigmata plumosa, lateraliter exserta. *Caryopsis* oblonga, a dorso admodum compressa, concava vel plana, valva paleaque vix mutata inclusa; embryo dimidium caryopsis subsequans; hilum punctiforme, basale.—*Gramina annua vel perennia*. Foliorum lamina* plerutnque plance, ligulse hyalinm. Fanicula contracta vel patula; rami 8tricti a basi spiculigeri. Spiculse approximates vel remote[^] summa terminali8.

C. grandiglumis, Rendle in Cat. Afr. PL Welw. ii. 2, p. 226; a speciebus generis ceteris duratione perenni et habitu peculiariter differt.

Gramen paucem, cespitosum. *Cladiniere* rective vel geniculati, 4-⁸
ped. alti, glabri, lsevi, 2-3-nodi internodiis sugerioribus tandem exsertis.
Folia basin versus congesta; vaginse glabrae, rarissime pilis longis
patulis hie inde conspersae, firmulse, striatas, superiores scabrse; ligulas
truncatae, ad J lin. longae; laminae lineares, breviter acutatse, interdum
subpungentes, 1-2⁸ poll, longse, 1⁸-2⁸ lin. latse, planae vel subulatim
convolutse, glabrse, scabrse. *Panicula* 4-6 poll, longa, tandem 4-9 poll, lata,
stricta; axis angulata, scabra velfaispidula; rami solitarii vel 2-3 approxi-
mati, 2-5 poll, longi, primo treefci, tunc patuli, sappe horizontales vel sub-
deflexi, basi villosi, hispiduli. *Spiculce* remote, laterales brevissime
pe⁸icellati, appressse, 3£-5 lin. longae; rhachilla pilosula. *Glumce* lan-
ceolatae, subulato-acuminatae vel in aristas productae, 3⁸-5 lin. longae,
scaberube. *Valvce* ad 2 lin. longae, mucronatse, in nervo medio appresse
tenuiterque in lateralibus rigide et patule ciliatse. *Palece* dorso tenuisbime
pubescentes, carinis scabris. *Ant her<e* ad ⁸ Un. longae. *Caryopsis*
ultra 1 lin. longa. *Leptochloa grandiglumis*, Nees, El. Afr. Austr.

p. 252. Steud. Syn. PL Glum. i. p. 210. *Diplachne grandiglumis*, Hack, in Engl. Bot. Jahrb. xth. p. 404. Durand & Schinz, Consp. Fl. Afr. v. p. 878.

SOUTH AFRICA. Gape Colony : Albert Div., Nieuwe Hantem, stony places, 4,500-5,000 feet, *Drkge*; Aliwal North Div., between Witte Bergen and Krai River, 4,500-5,000 feet, *Drege*. Griqualand West : between Klip Fontein and Night Fontein, *Burchell*, 2167. Bechu^na-land : in stony plains near Groot Kuil, *Marloth*, 989. Orange Free State : near the Caledon River, *Zeyher*, 1844, near Winberg, *Buchanan*, 246. Transvaal : Rustenberg, *MacLean* ; near Nylenstrom, *Nelson*; 99. Natal: sandy valley of Tugela River, 1,000 feet, *Buchanan*, 279.

A minor variety of *C. grandiglumis* was described by Mr. A. Rendle, I.e., from specimens collected by Welwitsch in Pungo Andongo (2,709) and in Huilla (7,492). It has 'spikelets smaller and more delicate than in the type, 2^-3 lines long ; flowering glumes subhyaline, more prominently awned than in the type, pale hyaline.'

Crossotropis is allied to *Triraphis* and *Leptocarydion*, which has erroneously been reduced to *Triodia*, a very different and natural genus having 7-9-nerved valves. *Triraphis* differs in the usually distinctly pedicelled spikelets, which are often arranged in compound and dense panicles and the longer awns, and excurrent side nerves of the valves. *Leptocarydion*, on the other hand, has dense spiciform panicles, long and finely awned valves, and peculiar leaf blades. The true *Leptocarydion*, to which Nees referred *C. grandiglumis*, differ in the usually very minute spikelets, entire, muticous, broader valves, and mostly globose or subglobose grain. *Diplachne*, again, to which Hackel referred the plant figured here, has firmer valves of the peculiar texture of those of *Eragrostis* and relatively short glumes, the florets being usually much exserted from the latter. Two other species from tropical Africa and Arabia, viz. *C. mollis*, Stapf (*Leptochloa mollis*, Kunth ; *Triodia mollis*, Durand & Schinz), and *C. arenaria*, Stapf (*Diplachne arenaria*, Nees ; *Uralepis arenaria*, Steud.), have spikelets of a very similar structure. They are both annuals.—O. STAPF.

Fig. 1, a ligule; 2, a terminal spikelet; 3, lower glume; 4, upper glume; 5, a floret with the contiguous rhachilla joint; 6, a valve; 7, a pale; 8, a lodicule ; 9, a grain, back view; 10, the same, front view; 11, cross section of a grain. All enlarged.

PLATE 2010.

POGONABTHRIA FALCATA, *Rendle*.

GRAMINEM. Tribe ERAGROSTEJS.

Pogonarthria, *Stapfin Thiselton-Dyer, Fl. Cap.* vii. p. 316. *Sjriculce* 2-8-florae, lateraliter compressse, subsessiles, plus minusve imbricate, secundae, in ramis paniculae subspiraliter dispositae; rhachilla fragilis, supra glumas et inter valvas articulata, articulis apice ciliatis. *Glumas* rigide membranaceae, persistentes, 1-nerves. *Valvae* oblongse, rigide membranaceae, acuminatae, glaberrimse, 3-nerves, nervis lateralibus superne evanescentibus. *Paleae* 2-carinatae, valvis paulo breviores. *Lodiculce* 2, minutae, delicatulae. *Stamina* 3. *Ovarium* glabrum; styli distincti; stigmata plumosa. *Caryopsis* valva paleaque vix mutata arete inclusa, linearis-oblonga, obtuse triquetra; embryo dimidio caryopsis brevior; hilum punctiforrne, basale.—*Gramen annuum vel perennans, rigidum*. Eoliorum laminae rigidce, plerumque convoluted. Fanicula stricta ramis strictis patulis plus minus curvatis in spiras irregulares dispositis. Spiculae secundce, arctce, livide 2[^]urpurascentes vel nigrescentes.

P. falcata, *Rendle in Cat. A/r. PL Weho.* ii. 2, p. 232 (sp. *nnica*). *Gramen* cespitosum ore vaginarum excepto glaberrimum. *Culmi* stricti, erecti vel subgeniculati, 1-1[^] ped. alti, teretes, liseves, circiter 3-nodi, internodiis exsertis. *Foliorum* vaginae arctse, liseves, teretes, ore barbatse; ligule ad lineam ciliorum minutorum redactse; laminae lineares, setaceo-attenuatse, 4-8 poll, longse, 1-2 lin. latse, plans vel ssepius convolutse, rigidse, subglaucæ, laeves, *Panicula* linearis, 4-10 poll, longa, 1-2 poll. Jata; rhachis scaberula, sulcata; rami srope irregulariter approximate ad 1 poll. longi, simplices, a basi spiculigeri, scabridi, dorso plani. *Spiculæ* 1[^]-3 lin. longse; rhachillæ articuli ad 1 lin. longi. *Glumes* lanceolatse vel lanceolato-oblongae, rubescentes, subacuminatae, scaberulæ, inferior 1-1[^] lin., superior 1-1 lin. longa. *Valvae* a latere visse lanceolatse, expansæ cylindraceæ, acute acuminatae vel mucronulatae, 1 lin. longse, callo minutissimo obtuso glabro. *Palearum* carinæ scabre. *Antheræ* 1-1[^] lin. longse. *Caryopsis* 1 lin. Jonga.—*Leptochloa falcata*, Hack, in Bull. Herb. Boiss. iii. p. 386 and iv. Append, iii. p. 21. *Eragrostis* sp. Kees in Linnaea, xx. p. 255.

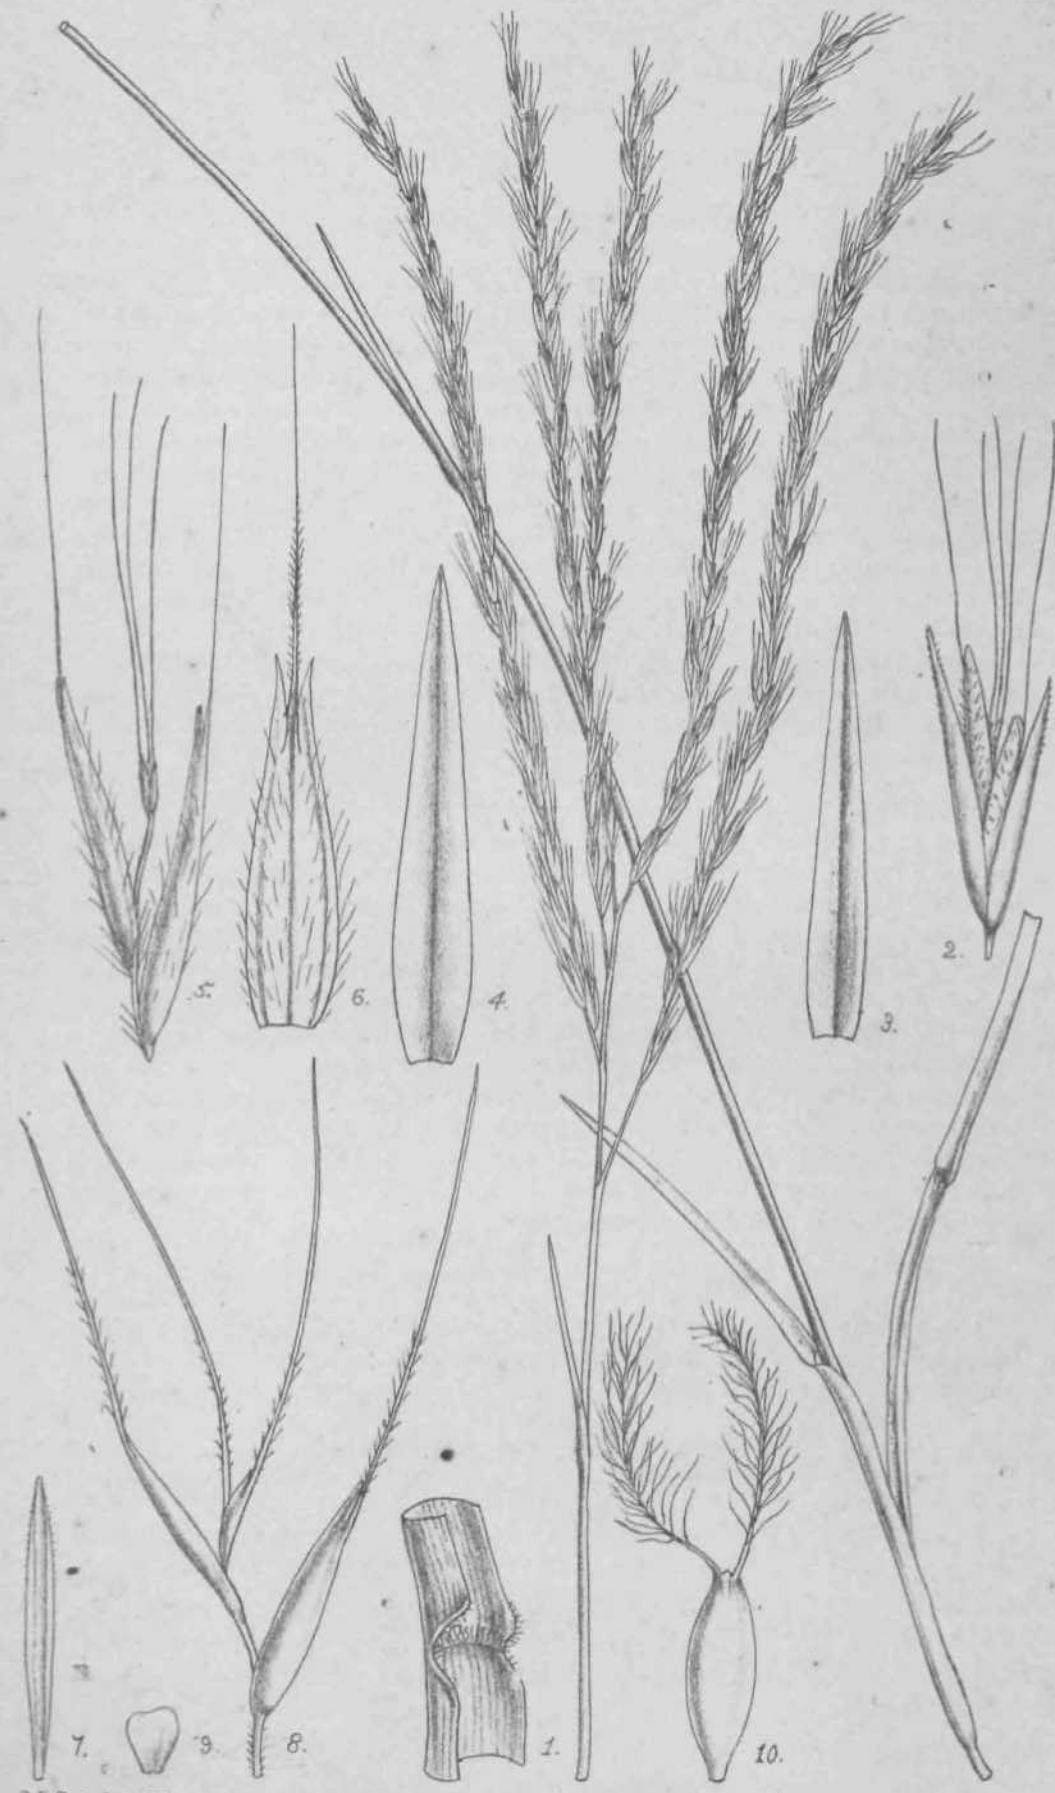

TROPICAL AFRICA. British Central Africa: Nyasaland; Nyika Mountains, 4,000-6,000 feet, Whyte. Rhodesia : I[^]shumo Valley, Holub.

Portuguese West Africa: Loanda, Museque de Luiz Gomes, *Welwitech*, 7287, 7367; Barro do Bengo, between Quicuxé and Cacuaco, *Weltitsch*, 7287 C; Pungo Andongo, between Lombe and Quibinda, *Weltitsch*, 7408; Huilla, between Lopollo and Monino, *WeLuritech*, 7487.

SOUTH AFRICA. Griqualand West: Herbert Division, St. Olair, Douglas, *Orpen*, 256; Asbestos Mountains, *Burchell*, 2101. Orange Free State: Olifants Fontein, *Rehmann*, 3514; rocky and grassy hills on the Groot and Klein Vet River, 4,000-5,000 feet, *Zeyher*, 1840; *Burke*; near Bloemfontein, *Rehmann*, 3753. Transvaal: in the Boshveld, between Eland River and Klippan, *Rehmann*, 5118; near iLydenburg, *Atherstone*, 72. Basutoland: near Leribe, *Buchanan*,* 128. Natal: by the Tugela River, 600 feet, *Buchanan*, 242; near Umlaas Drift, *Wood*, 1910.

Hackel, who described this species under *Leptochloa*, has already remarked that it differs considerably from all other species of *Leptochloa*. In fact, the affinity lies with *Jeragrostis*, to certain species of which it approaches rather closely.—O. STAPF.

Fig. 1, a lignle; 2, a spikelet; 3, an intermediate rhachilla joint; 4, terminal rhachilla joint; 6, lower glume; 6, upper glume; 7, a valve; 8, a pale with rhachilla joint; 9, a lodicule; 10, front view of a grain with hilum; 11, side view; 12, cross section of a grain. All enlarged*.

Triphlebia, *Stapf*, in *Thiselton-Dyer, Fl. Cap.* vii. p. 318. *Spiculce* 4-5-florse, lateraliter compressee, subsessiles vel breviter pedicellate}, in paniculas spiciformes dispositae; rhachilla supra glumas et inter valvas articulate,. *Glumce* subsequales, membranaceae, lanceolate, caudato-acuminatae, 1-nerves. *Valve* glumas paulo superantes, iis persimiles, 3-nerves; summa sterilis, redacta. *Palece* valvis paulo breviores, 2-carinatse. *Lodiculce* 2, minutae, hyalines, cuneatas. *Stamina* 3. *Ovarium* glabrum; styli breves; stigmata laxa plumosa, lateraliter exserta. *Caryopsis* valva paleaque vix mutata amplexa, oblonga, teres; embryo brevis; hilum punctiforme, basale.—*Gramen perenne, ccespitosum.* Foliorum *lamine angustiB*, plerumque setaceae, longae; *ligulce ad marginem ciliatum redacted.* Paniculae cylindricce, denscs, pferumque atropurpurece, griseo-pilosce.

T. alopecuroides, *Stapf* (*sp. unica*). *Culmi* erecti, ^-1 ^ ped. alti, glabri, lssves, simplices vel ima basi compressi. *Folia* dmnia basi congesta, undique pilis tenuibus patulis laxa conspersa vel rarius glabra; vaginae firmiusculae, persistentes; laminae filiformes vel setaceae, raro planae, acutissimae, 3 ad 12 poll, vel ultra longae, rigidulae. *Ianicula* |-3 poll, longa, interdum basi interrupta, ramis appressis fere a basi vel a basi ramulosis. *Spiculce* coarctatse, 2 lin. longae, glumis valvis paleis aequaliter pilis griseis saepe tuberculis minutis insidentibus conspersis. *Glumce* \ lin. longae, subulato-acuminatae. *Valve* glumis paululo breviores, saepe mucronulatae. *Palea* 1 lin. longae. *Antherce* § lin. longae. *Caryopsis* circiter £-1 lin. longa, brunnea.—*Lasiochloa alopecuroides*, Hack, in Bull. Herb. Boiss. iii. p. 393. *Kceleria Gerrardi*, Munro et Benth. in Benth. & Hook. Gen. PI. iii. p. 1184 (nomen tantum).

SOUTH AFRICA. Transvaal : Houtbosch Berg, *Nelson*, 82*; Steelpoort River, *Nelson*, 12* ; Spitzkop Goldmine, *Wilms*, 1697 ; Lymklip Spruit, *Nelson*, 52*. Orange Free State : *Cooper*, 723, 3352. Pondoland : Sirtherland. Griqualand East: grassy places on the summit of Malowe Mountain, 6,000 feet, *Tyson*, 1217, 2773 ; summit of Currie Mountain near Kokstad, 7,500 feet, *Tyson*, 1311. Natal: Kar Kloof, *Rehmann*, 7361 ; Noodsberg, *Wood*, 884 ; from Umpumulo to Reit Vlei, *Buchanan*, 167 ; without precise locality, *Gerrard*, ^74 ; *Buchanan*, 32.

Triphlebia differs considerably from *Lasiochloa* in the nervation and texture of the glumes and valves; I can, however, for the present, not suggest a better place for it than near *Lasiochloa*. It resembles superficially *Kceleria* in habit and has, like *K. cristata*, 3-nerved valves; but the shape and texture of the glumes and valves, and particularly the structure of the grain, are quite distinct.—O. STAPF.

' Fig. 1, aligule; 2, a spikelet; 3, lower glume; 4, upper glume; 5, a floret; 6, a valve; 7, a pale; 8, a lodicule; 9, an ovary; 10, a grain (side view); 11, the same (front view). *Ml enlarged**

Fruticulus circiter 3-pedalis, prsester basin parce ramosus. *Culmi* teretes, graciles, subfistulosi, infra nodos annulo glauco cereo induiti et interdum praeterea puberuli; internodia inferiora in culmis sterilibus 3-5 poll, longa, saepe breviter exserta, superiora 3-4 brevia, vaginis arete imbricatis tecta, in floriferis ut in illis sed internodiis 2-4 elongatis hornotinis additis. *Foliorum* vaginae arctae, striatae, ad nodos pilosulae, secundum margines superne tenuiter vel obscure ciliatse, ore nudas vel parce atque fugaciter fimbriatae, superiores saepe superne pubescentes, subcompressse, purpurascentes; ligulae brevisimae, truncatse; laminae breviter petiolatae, linear-lanceolatae, setaceo-acuminatse, basi rotundatae, 5-7 poll, longae, 9-12 lin. latse, virides vel plus minusve aureo-vittatae, supra parce pilosulaj imprimis secundum costam, infra molliter pubescentes, nervis secundariis utrinque 5-6 venis transversis tenuibus sed distinctis, areolis subelongatis. *SpicuJa* terminalis plerumque solitaria (raro secunda paulo infra addita) linearis, laxe 5-10-flora, 1^{^-}2[^] poll, longa; rhachilla pubescens articulis superne clavatis. *Gluma* spicularum terminalium soli tat ia suhfoliacea, lanceolata, caudato-acuminata, spiculas dimidium aequans vel longior, superne puberula, glumae spicularum lateralium 2, oblongaj, mucronato-acuminatae, superne pubescentes, inferior 5-, superior 7-nervis, ilia 5J, haec 7[^] lin. longa. *Vcdvce* ovatae, inferiores caudato-acuminatae, superiores acutre et plus minusve mucronatae, intermedvc 7-8 lin. longae, superne puberulae, marginibus ciliolatse, herbacese, in-tprdum purpurascentes. 9-nerves, plus minusve tessellatae. *Palece* linear-oblongae, 2-cuspidafce, carinis dense ciliatis, inferiores quam valvae br[^]viores, superiores eas[^] aequantes vel subsuperantes. *Lodicuhv* ciliatae. *Antherce*. 5 lin. longae. *Stylus* stigmata 3 aequans.—*Banibusa Fortwnei* var. *aurea*, *Hort.*

NATIVE COUNTRY unknown. Drawn from specimens cultivated at Kew.

This species has been in cultivation for some time. It was referred to *Arundinaria Fortunei*, Riy. Bamb. p. 314 (*Bambusa variegata*, Standish in Proc. Hort. Soc. 1861, p. 614; Sieb. et Miq. Ann. Mus. Bot. ii. p. 285; Franch. & Sav. Fl. Jap. ii. p. 183; *B. Fortunei* foliis niveo-vittatis, Van Houtte, Fl. des Serres, xv. p. 69, t. 1535; *A. picta*, Sieb. et Zucc. ex Munro in Trans. Linn. Soc. xxvi. p. III), a species only known in the barren state, and distinguished by the more graceful and dwarf habit and smaller and less hairy leaves. Some specimens of this come, however, so near to *A. auricoma* that the discrimination becomes uncertain, in any case, so far as their specific distinction is concerned; but as *A. Fortunei* is so imperfectly known, this question must remain in abeyance. The affinity of *A. auricoma* lies evidently with the North American *A. macrosperma*, Mich., and more especially with the smaller variety, described by Munro as var. *mffruticosa* and identical with *A. tecta*, Miihl. The empty bract preceding the lowest flower-bearing bract or valve is described above as glume, but it may be equivalent to the bract which, in the two instances where I have observed an additional lateral spikelet, supported the latter. The glumes of these lateral spikelets are well differentiated, which is the rule in *A. macrosperma*.—O. STAFF.

PHYLLOSTACHYS HENONIS, *Mitford.*

GRAMINEJE. Tribe BAMBUSEA.

P. Henonis, *Mitford*, *Bamb. Gard.* p. 149 ; affinis *P. Stauntonii*, Munro, sed paniculis magis decomposing et contractis, valvis brevioribus latioribus firmioribus distincta.

Frutex 8-14 ped. altus, ramosissimus, eleganter nutans. *Culmi* teretes, basi ad 1[^] poll, crassi, fistulosi, uno latere late sulcati, glabri, infra nodos parce albo-cerei, ceeterum virides, deinde lutescentes, nodis supra vaginalium delapsarum cicatrices annuliformes annulatim proinuentibus distinctis; internodia inferiora 5-6 poll, longa, superiora breviora; rami plerumque ternati, inaequales, longiores ad 20 poll, longi, vel ut superiores geminati vel summi solitarii, graciles vel gracillimi. *Folia imperfecta* innovationum ad vaginas 2-4 poll, longas latiusculas mox emarcidas et deciduas dense striatas laminas subuliformes tenues breves gerentes redacta. *Folia perfecta* 2-3 ad ramulorum apices; vaginæ arcte, tenuiter striatæ, 1-1 1/2 poll, longæ, glabræ, ore fusco fimbriatæ; ligulæ truncate, breves, ciliolatae; laminae lanceolatæ, vellineari-lanceolatæ, acuminate, basi in petiolam gracilem 1-2 lin. longum attenuatae, 2-3[^]- poll, longæ, 4-6 lin. latie, supra Jsete virides, glabræ, infra pallidiores, basi minute parcequepuberulae, ceterum glabræ, margine exteriore rigide ciliolatae, altero sublævi, rarius utroque laavi vel ciliolato, nervis secundariis utrinque 4-5, supra indistinctis, reticulatione distincta areolis minimis. *Paniculæ* in culmis subefoliatis laterales, 7-10 poll, longæ, potius densæ, a basi divisæ, interdum apice foliosæ; rami primarii geminati, insequales, plus minusve compressi vel obtuse angulati internodiis intermediis longioribus 2[^] poll, longis; rami secundarii inferiores 1 1/2-3 poll, vel ultra longi, a basi vel ex nodis superioribus plerumque fasciculatim ramulosi vel spiculigeri; ramuli basi squamis par vis sursum in bracteas lanceolatas vel linearis-oblongas saepe laminas minutæ gerentes subpersistentes abeuntibus muniti. *Spiculæ* ellipticae vel elliptico-oblongæ, circiter 8-9 lin. longæ, 2-4-floræ. *Gnma* plerumque solitaria, bractæ 89 j>necidenti conformis vel inter earn et valvas intermedia. *Valvae* lancolatæ, inferiores caudato-acuminatae, superiores sequantes vel excedentes, herbaceæ, dense pubescentes (prsesertim superne), obecure 9-nerves. *Paleæ* valvis breviores, bicuspidatæ, pubescentes. *Lodiculæ* hyalinæ, ciliolatæ. *Antheræ* 3-4 lin. longæ. (*harium* substipitatum;

stylus 2½ lin. longus: stigmata tenuiter plutnosa, paulo ultra 1-lin. longa.—*P. Henonis*, Bean in Gard. Chron. 1894, March, p. 238 (in enumer. nomen tantum); *JBambusa Henonis*, Hort. ex Bean, I.e.

NATIVE COUNTRY probably Japan. Drawn from flowering specimens grown in Lord Moreton's garden at Sarsden, Chipping Norton and a barren branch grown at Kew.

This bamboo was introduced from Japan, where it is called IJachiku, and has for some time been known to gardeners as *Bambusa Jlenonia*. It comes very near to *P. Stauntonii*, Munro, a Chinese species, and I thought for some time that it might be identical with it, but the more complete specimens in R. Brown's collection at the British Museum have since convinced me of the two plants being decidedly distinct.—O. STAPF.

POLAKIA PARADOXA, *Stapf.*

•LABIATES. Tribe, MONARDEJB.

P. paradoxa, *Stapf in Denkschr. Akad. Wiss. Wien[^] Maih.-Naturw. Cl._t i. p. 43*; uiica generis species.

[^] *Herba* perennis radice crassa. *Caulie* simplex vel ima basi parce divisus, parte subterranea |-| poll, longa, crassa, foliorum basium residuis obtecta, coma foliorum verticillariuo coronata quorum e corde caulis floriferus surgit; hie crassus, ad paniculse basin circiter semipedalis, obtuse angulatus, albidus vel purpurascens, tomentellus vel demum superne glabrescens. *Folia* ima circa caulis floriferi basin verticillatim congesta numerosa, cetera in 2-3 verticiliis 5- vel 4meris, sursum decrescentia et brevius petiolata vel summa sessilia, cinereo-tomentella et prseterea hinc inde pilis lougis patulis conspersa, ambitu oblongo-lanceolata, pinnatisecta, majora ad 3 (cum petiolo ad 5) poll, longa, segmentis linearibus, lanceolatis vel ovato-lanceolatis, forma et magnitudine valde variis, plus minusve profunde. drntatis ; folia floralia linear-lanceolata vel linearia, integra vel inferiora utrinque laciniis nonnullis aucta, acuta, mucronata. *Panicula* rigide-patula, £-1 ped. longa et lata, ramis in verticiliis 4-3-meris distantibus ; axis inferne subglabra, superne patule villosa, crassa ; rami virgati, inferiores semipedales, simplices vel interdum parce ramosi, plus minusve patule villosi, apicem versus stepe steriles, ceterum cymas oppositas plerumque ad florem solitarium redactas et bracteis linearibus vel subulato-lanceolatis mucronatis suffultas gerentes; pedicelli stricti, tenues, patule villosi, £ - | poll, longi. *Flares* heteromorphi. *Forma androdynamica*: *Calyx* obconico-campanulatus, circiter 9 lin. longus (dentibus inclusis), fere ad medium in labia sequilonga fissus, dentibus labii superi lateralibus e basi lanceolata longe subulatim attenuatis, summo multo breviore e basi lata acuminate, dentibus labii inferi ad basin fissi, lanceolate-subulatis, totus longe et patule glanduloso-pilosus, fructifer auctus, ampliatus. *Corolla* albida ; tubus subrectus, sensim in faucem ampliatus, circi&er 10 lin. longus, intus nudus ; labium superum 3-4 lin. longum, bilobum, lobis planis, inferum sequilongum, trilobum, lobis lateralibus late ovatis, porrectis, medio majore emarginato, convexulo. *Stamina* subinclusa, antica filamentis glabris, loculis ob connectivum 2-2| lin. longum remotiq, po[^]tica suppressa (?). *Stylus* labium superum subsequans. *Forma gynodynamica* ; *Calyx*

latius campannatus cum dentium aristis 6-7 lin. lonpus, dentibus latioribus aristato-mucronatis. *Corolla* tubus 6-7 lin. longus, intus supra medium annulo pilosulo munitus, labia 2[—]3 lin. longa lobis subsequalibus. *Stamina* antica loculis ob connectivum brevissimum admodum approximatis, postica filamentis perbrevis antheris rudimentariis. *NUCUICB* tantum 2 maturantes, stipite crasso brevissimo areola minima incidentes, a dorso compressse, obovoideae, 3 lin. Jongte, alutaceo-brunnese, humefacte valde rauclaginoste. *Polakia paradoxa*, Stapf ex Briq. in Engl. & Prantl, Natiirl. Pflanzenf. iv. 3. A. p. 287. *Salvia aristata*, Auch. ex Benth. in DO. Prodr. xii. p. 270 : Bunge, Labiat. Pers. (in Meⁿni Acad. Pe^{tersb.} se^{r.} 7. t. xxi. no. 1), p 41 ; 'Bois*. FL Or. iv. p. 617 ; Briq. 1. c. p. 275. *S. Owerini*, Trautv. in Act. Hort. Petrop. ii. p. 479. *S. anisodonta*, Hausskn. & Briq. in Engl. & Prantl, Natiirl. Pflauzenf. iv. 3. A. p. 286.

ORIENT : Persia, near Urmiah, *Owerin*; between Zenjan and Sultanieh, *Bunge* ; Hamadan, *Polah* & *Pichler* | Irak, at Girdu and Mowdere near Sultnnabad, Strauss j without precise locality, *Aucher*, 1563. Assyria, Mendeli, *Noe**

A very peculiar plant, the position of which has always been doubtful. Bentham, in describing it from very incomplete material, put it into *Salvia* but was uncertain whether it should go into the section *Eusphace* or in the section *jEthiopis*. Bunge referred it also to *Salvia*, but baspd on it a new section *Physosphace*. Trautvetter, who saw only the top of a panicle, described it as a new species of *Salvia*, adding " habitu peculiari a Salviis nostratibus omnibus longo receHentibus et prorul dubio generis sectionem propriam exhibentis." Boistier has it in the section *jEthiopis* ; Briquet in the section *Gongrospachae* of *Salvia* under two names, and besides as a distinct, although provisional, genus (*Polakia*), the position of which, he says, cannot be cleared up before the subgenera *Viasala*, *AUagospadonopsis* and *Covola* have been revised. When I described it as *Polakia* in 1885, I did not know *Aucher's S. aristata*, of which I saw a fruiting prinicle at Kew several years later. The material at Kew is hardly sufficient to decide the question as to the true affinity of the plant, which, in any c^{*}se, would have to occupy a separate place, even if it should be, as is very likely, reduced to *Salvia*. The specimen drawn represents the gynodynaniic state and has been figured from a plant collected by Mr. Th. Strauss near Sultanabad.— O. STAPF.

Fig. 1, calyx, cut open, and pistil; 2, corolla, cut open; 3, an anticus stamen; 4, 11 mature nutlet; 5, cross section of the same.

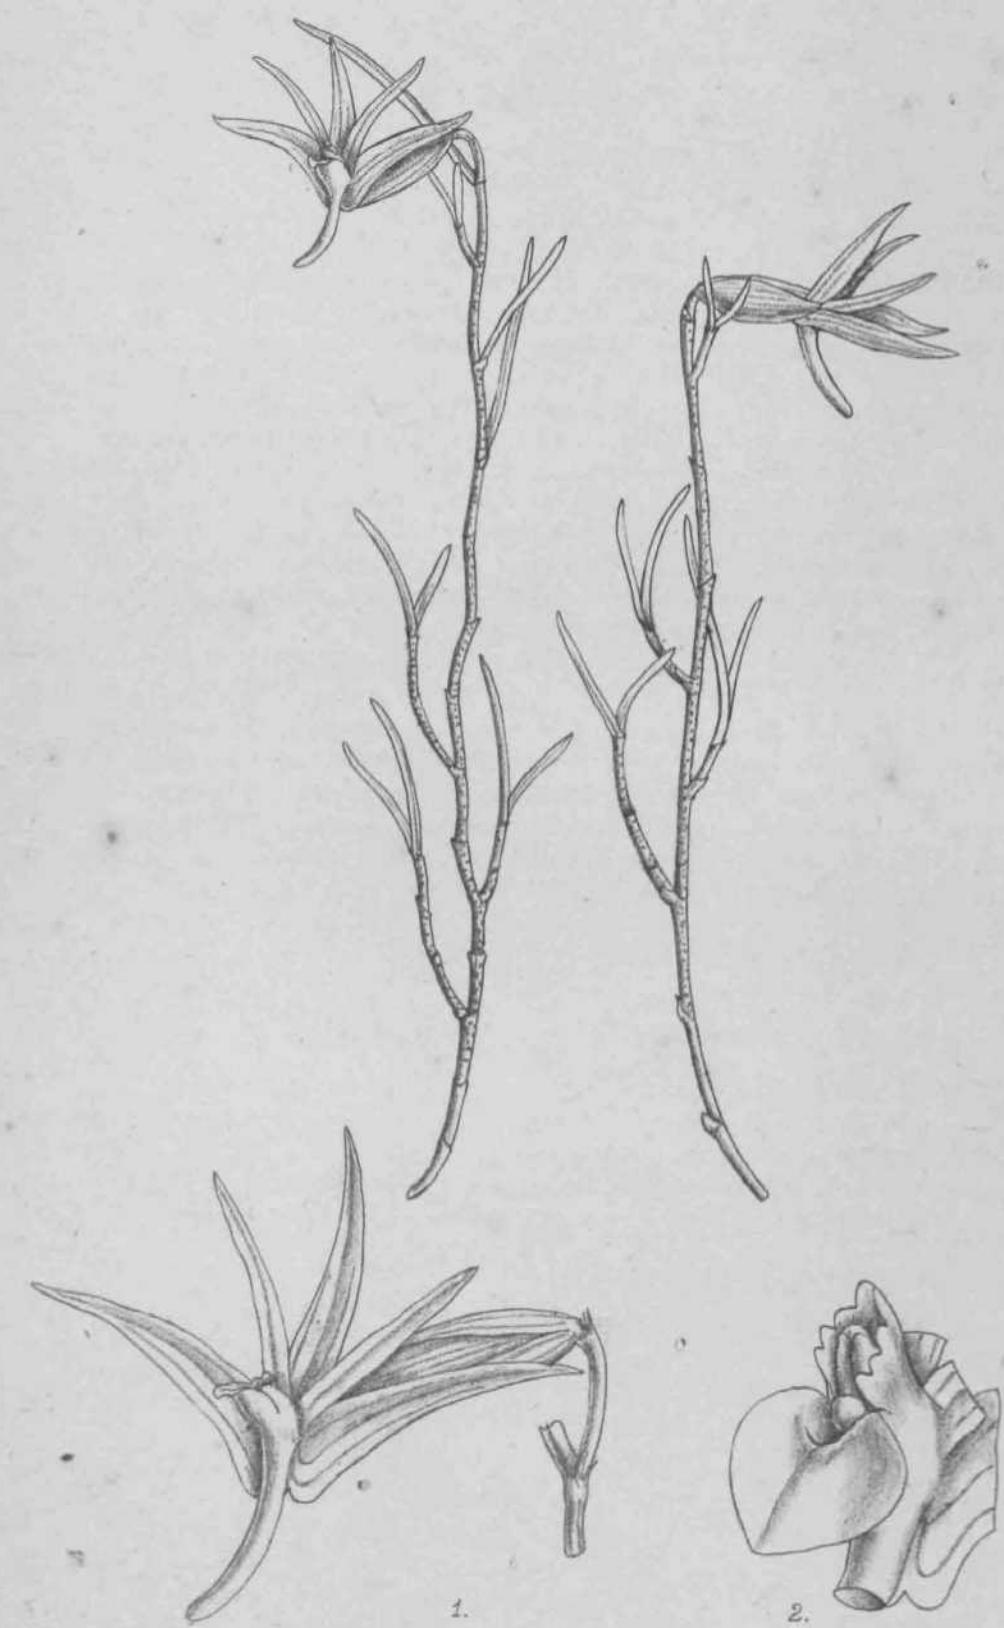

PLATE 2616.

GIULIANETTIA TEKTUIS, Rolfe.

ORCHIDEJB.

Giulianettia, Rolfe (gen. nov.), Sepala patentia, subsequalia, lateralia basi supra insertioneni oblique extensa, post labelli calcar in laminam liberam breviter bilobam connata. Petala sepalis angustiora. LabeUum basi columnse affixum et cum ea in tubum brevem connatum ; lamina erecta, integra, late cordato-ovata, concava, brevissima, medio crassiuscula, basi longe calcarata. Columna brevissima, crassa; clinandrium cavum, amplum, crenulatum. Anthera terminalis, opercularis, incumbens, convexa, 2-locularis ; pollinia (?). Herba epiphytica, humilis. Caules graciles, ramosi, vaginis scariosis striatis verrucosis obtecti, paucifoliati. Folia subteretia. Flores terminates, Solitarii, e medio bractearum irtibricatarumpaleaceo-scariosarum horizontale ad apices ramorum enascentes.

0. *tenuis*, Rolfe (sp. unica).

Caules breves, parce ramosi, foliorum vaginis striatis verrucosis obtecti, 3-4 poll, longi. Folia linearia, subobtusa, subteretia, 6-10 lin. longa; vaginis striatis verrucosis. Flores solitarii, horizontales. Bracteae spathaceo-oblongae, subacute, involutae, striatae, 6 lin. longae. Pedicelli 5 lin. longi. Sepala linearilanceolata, acuta, 6 lin. longa, lamina 1 lin. longa et lata. Petala linearia, acuta, 5 lin. longa. LabeUum late cordato-ovatum, subobtusum, 1¹/₂ lin. longum, concavum ; calcar cylindricum, obtusum, 4¹/₂-5 lin. longum. Columna crassa, 1 lin. longa.

NEW GUINEA : Mount Scratchley, 12,200 ft., *Giulianetti*.

A very interesting monotype, clearly allied to *Ceratostylis*, but differing in its large solitary flowers, in the auriculate bases of the lateral sepals united into a limb behind the spur of the lip, and in the long spur, which is about three times as long as the limb. The pollinia were missing from the flower examined.—R. ALLEN ROLFE.

Fig. 1, a flower; 2, lip and column. All enlarged.

Paeudobulbi fusiformi-oblongi, 2J-3 poll, longi, 4-5-phylli. *Folia* oblongo-lanceolata, acuta, plicata, 7-11 poll, longa, 1[^]-2 poll. lata. *Scapus* *masculus* arcuatus, 1[^] ped. altus, circa 10-florus. *Bracteae* oblongse, subobtusse, 5-8 lin. longse. *Pedicelli* || poll, longi. *Mores* subglobosi. *Sepala* et *petala* incurvo-conniventia, concava, late elliptico-oblonga, subobtusa, concava, 8-9 lin. longa. *Labellum* anticum, carnosum, cochleato-concavum, 1 poll, longum, £ poll, latum, obscure trilobum; lobi laterales in dentem parvum producti; intermedius triangulo-oblongus, subobtusus, basi subtumidus. *Columna* clavata, 7 lin longa, rostrata; antennae incurvse, subdivergentes. *Anthera* et *pollinia* perfects. *Stigma* abortivum *Scapus* *femineus* *erectus*, H ped. altus, circiter 2 florū. *Bracteae* oblongse, subobtusse, 5-6 lin. longse. *Pedicelli* 1} poll, longi. *Sepala* et *petala* patentia, elliptico-oblonga, subobtusa, 7-9 lin. longa. *Labellum* posticum, carnosum, galeatum, 9-10 lin. longum, 8-9 lin. latum, margine et apice reflexum. *Columna* crassa, brevis, ecirrhosa. *Anthera* abortiva. *Stigma* cavum.

BRAZIL : Organ Mountains, *Barbotta Rodrigues*. Figured from a plant grown in the Royal Gardens, Kew.

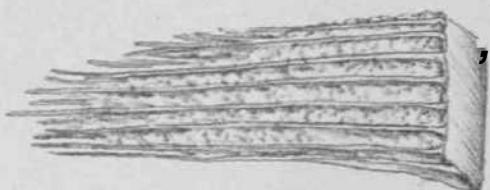

The male of this species was described by Barbosa Rodrigues in 1881, since which time nothing further seems to have been known about it until last autumn. In September a *Catasetum* which had been purchased at a sale produced a scape of female flowers, which, as often happens with this genus, could not be determined. A second scape soon followed from the opposite side of the same bulb, and when the flowers opened, in December, they proved to be males belonging to the above-named species. It is an ally of *C. luridum*, Litidl., and *C. Jlookeri*, Lindl., but differs in the details of the lip. The flowers are green, except that in the males the lip is dull yellow internally. A dried male flower and sketch of a plant which flowered in the collection in April 1861 are preserved in the Herbarium, and clearly belong to this species, for they agree in structure and colour, but there is no note as to the origin of the plant. The present species is the

twenty-third of which the female flowers have been recorded, but there is a greater number of which this sex is still unknown.—R, ALLE, JtOLFE.

Fig. 1, pi nt, showing male and female scopes (the latter after the flowers had fallen); 2, leaf; 3, male scape; 4, male flower, with the sepals and petals ? aid open ; 5, male column, with antennae (Bide view); 6, the same, with part of the antenna* removed (front view); 7, pollinia; 8, female flower. 1, *reduced*; 2, 3, 4, and 8 *natural size* ; 5, 6, and 7 *enlarged**

MOQTILEA PLATYPUS, *HemsL*

Rosaceae. Tribe CHRYSOBALANEJE.

M. platypus, *HemsL*, *Ding. PL Nov. Mex. pars 1, p. 9, et Biol. Centr. Am. Hot. i. p. 366*; ab omnibus speciebus hucusque descriptis inflorescentiae ramulis crassis compressis et magnitudine fructus recedit.

Arbor usque ad 150 ped. alta, ramulis floriferis crassiusculis primum puberulis. Folia distincte petiolata, crassa, coriacea, glaberrima, oblonga vel anguste lanceolata, 6-10-pollicaria, acuta vel subobtusa, basi rotundata vel cuneata, supra nitida, venis primariis lateralibus numerosis leviter curvatis; petiolus crassus, 6-7 lin. longus. Florea racemoso-paniculati, 3-4 IID. diametro, distincte pedicellati, solitarii vel fasciculati; paniculse terminates, 9-12 poll, longie (forsan interdum multo maiores), ramulis crassis compressis primum puberulis. Calyx dense cano-tomentosus, lobis late ovatis obtusis demum reflexis, tubo intus viloso. Petala elliptica, ciliata, quam lobi calycini longiora, caducissima. Stamina ssepius 15, subsequalia, filamentis basi villosis. Ovarium atque stylus infra medium plus minusve villosum. Fructus pro genere maximus, drupaceus, compresso ellipsoideus, leviter obliquus, 6-7 poll, longus, 4TM 5 poll, diametro, grosse irregulariterque tuberculatus vel verrucosus, ssepius unispermus, mesocarpio fibroso, endocarpio tenui. Semen ellipsoideum vel oblongo-ovoideum, circiter 3 poll, longum, cotyledonibus magnis valde fibrosis, plumula cum radicula parva.

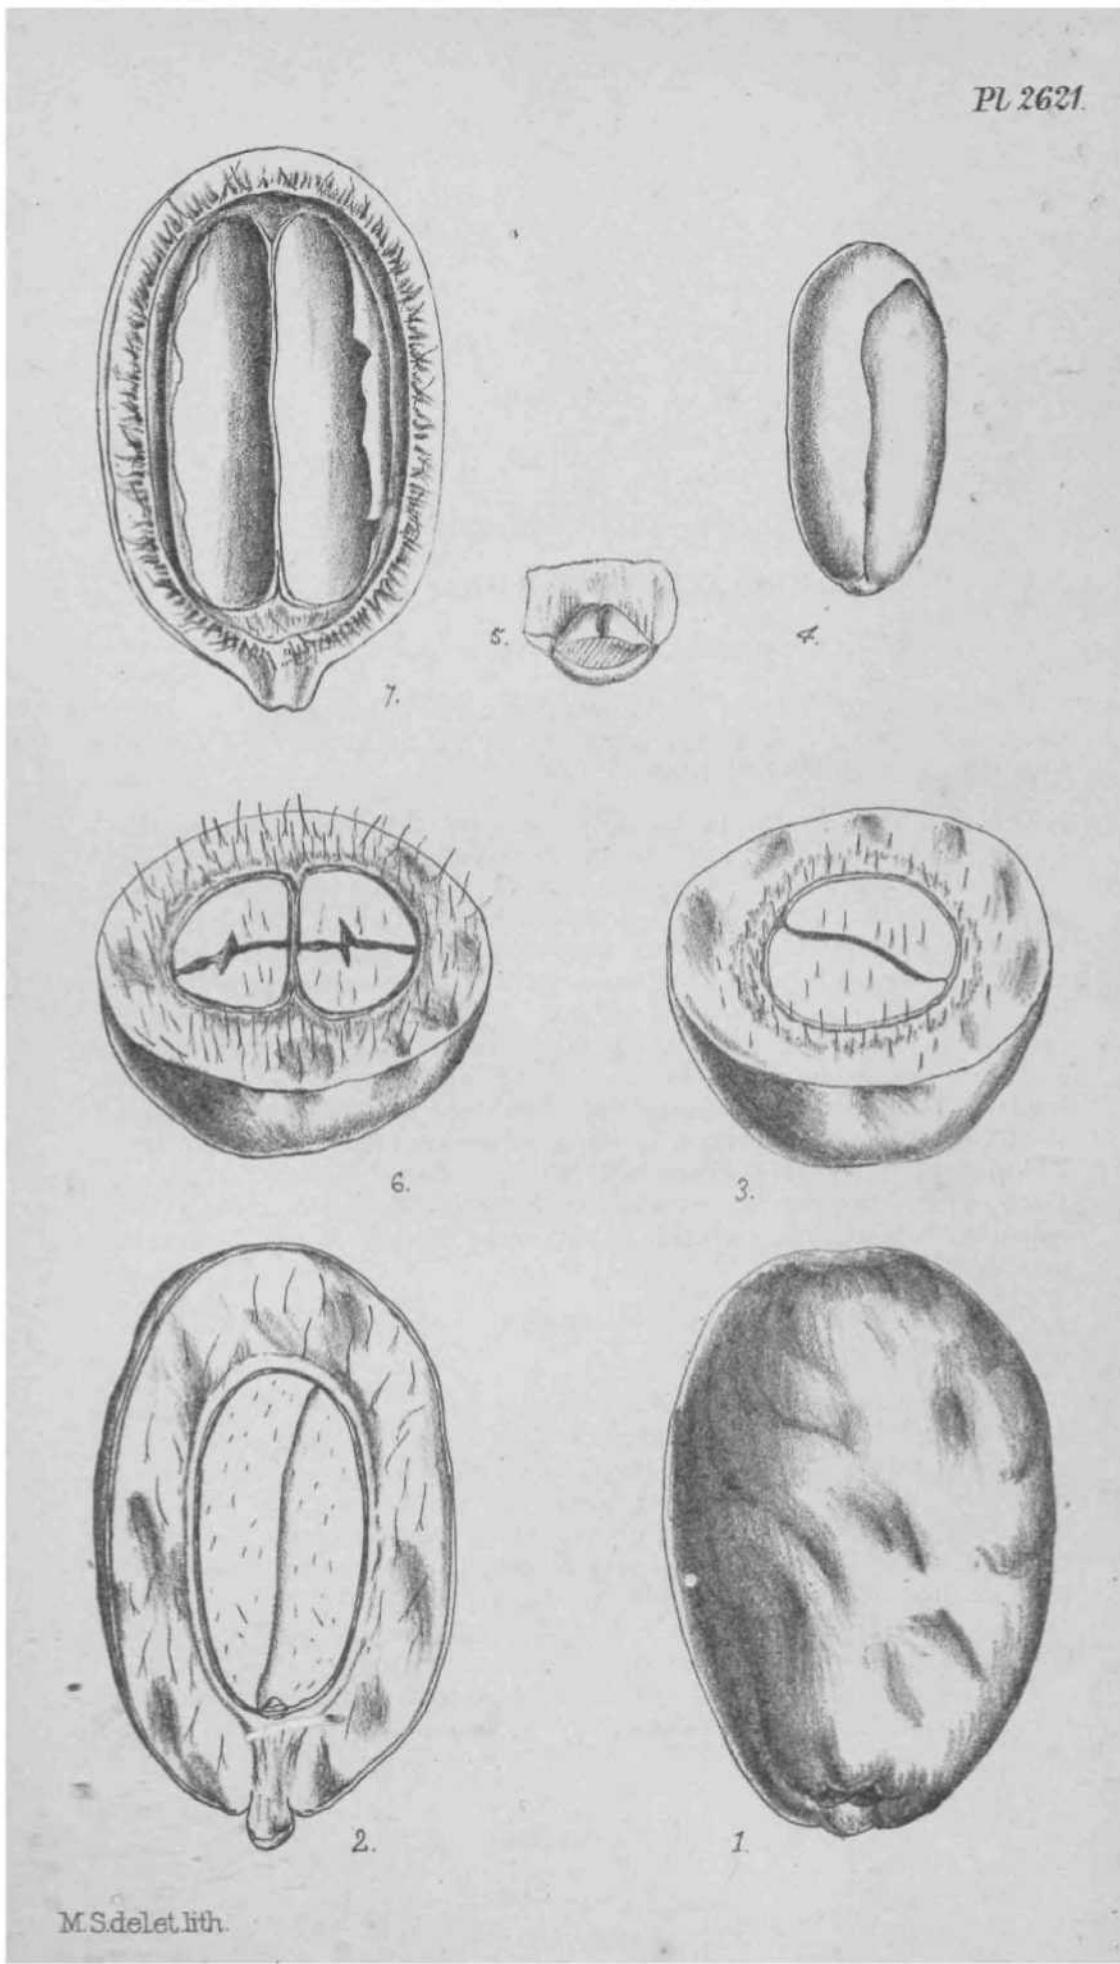

CENTRAL AMERICA: Panama (?) *Cuming*, 1272; neighbourhood of Granada, Nicaragua, cultivated, *Levy*, 222; Botanical Station, British Honduras, *Campbell*.

Kew is indebted to Mr. E. J. F. Campbell, Curator of the Botanic Garden, British Honduras, for a number of fruits of this remarkable species of *Jfoquilea*, with the information that it bears the local name of 'monkey apple,' and that it is edible. The fruit is an uncouth-looking object, and by no means suggests an apple. Mr. Campbell describes the tree as thirty to forty feet high; Mr. Levy as 50 metres. It does not appear certain that any of the specimens are from wild trees.—W. BOTTING HEMSLEY.

Plate 2618. C. dodecandra, *Hemsl.*; *Hirtella dodecandra*, DC. *Prodr.* ii. p. 529 ; *Calq. des Dess. FL Mex.* 302; species ex affinitate *C. Uit%* Benth. *brasiliensis*, sed foliis majoribus subtus argenteis.

Arbor 15-20-pedalis (Campbell), ramulis floriferis crassiusculis rigidis glabrescentibus. *Folia* breviter petiolata, crasse coriacea, rigid*, oblonga vel oblongo-lanceolata, Bsepis 2-4 poll., interdum usque ad 6 poll, longa, utrinque plus minusve rotundata, supra glabra vel cito glabrescentia, subtus brevissimie cano- vel argenteo-tomentosa, venis primariis lateralibus utrinque circiter 10-12 subtus prominentibus ; petiolus crassus, 11—3 lin. longus. *Flores* pro genere mediocres, corymboso pauiculati, brevissime pedicellati; paniculae terminales, angustse, densee, folia vix excedentes. *Calyx* cano- vel furfuraceo-tomentosus, lobis obovato-rotundatis. *Petala* oblonga, ciliolata. *Stamina* 10-15, in orbem completum disposita. *Ovarium* hirsutum, 1-loculare, 2-ovulatuni. *Fructus* drupaceus, ellipsoideus, 2-2£ poll, longus, 1-2-spermus, mesocarpio carnoso, endocarpio tenui; seminis cotyledonibus inequalibus, radicula parva, testa demum libera in fructu pcrsistenti.

BRITISH HONDURAS : Botanical Station, *Campbell*; MEXICO : Tabasco, cultivated, *Hovirosa*, 179.

It is uncertain where this tree is really wild. Under the original description, cited above, Mexico is given as the native country, without any localisation. In 1889 Kew received a set of Rovirosa's Mexican plants, including a specimen of *C. dodecandra*[^] with the note : " Cultivado en todas las quintas de S. Juan Bautista, Tabasco." In 1898 Mr. E. J. F. Campbell sent flowering and fruiting specimens to Kew from British Honduras, under the name of " baboon cap." He also describes the fruit as edible ; but he does not state whether liis specimens were taken from a wild or a cultivated tree.

The two-seeded . fruits of this species present a curious and misleading appearanimv in section, as the embryos are free nuu." the outer

testa, so that the fruit might easily be passed as two celled.—
W. BOTTING HEMSLEY.

PLATE 2620: fig. 1, a flower; 2, a petal; 3, longitudinal section of ovary and cilyx; 4, cross section. *All enlarged*,

PLATE 2621: fig. 1, a fruit; 2, longitudinal section of the same; 3, cross section of a fruit containing one seed; 4, an embryo; 5, axis of embryo with part of one cotyledon; 6, cross section of a fruit containing two seeds; 7, longitudinal section of a fruit containing the corresponding portions of the tobta of two seeds. *All except fig. 5 natural size.*

PLATE 2622.

ACTINOSTEMMA BIGLANDULOSTJM, *HemsL*

C UCUBBITACEAE.

A. biglandulosum, *HemsL* (*sp. nov.*) ; species foliorum lobis 2 basilaribus conspicue 1-glandulosis facile distinguitur.

Illerba gracillima, alte scandens, fere undique glaberrima, ramulis floriferis elongatis fere filiformibus. *Folia* longe petiolata, subcarnosa, lsevia, cordato-rotundata, absque petiolo 2-3 poll, longa lataque, apice plus minusve trilobata, cetera integra, basi ssepius auricula to- bilobata, interdum rotundato-lobata, lobis glandula parva clavata instructis; petiolus tenuis, 1- $\frac{1}{2}$ -2 poll, longus. *Cirrhi* capillares, simplices vel furcati. *Flores* masculini, 6-8 lin. diametro, in paniculas laxas, axillares, quam folia longiores dispositi. *Calycis* et *corollae* segmenta similia, linearis lanceolata, acutissima patentia. *Stamina* 5 quam corolla breviora, quorum 4 filamentis crassiusculis per paria coherentia, quintum liberum ; antherte bilocularis, loculis discretis, connectivo incrassato, supra loculos in caudam tenuem elongate *Flores* feminei ignoti, sed manifesto axillares, solitarii, breviter pedunculati, pedunculis 3-6 lin. longis. *Fructus* capsularis, prope apicem circumscisse dehiscens, demum siccus, cylindraceus, 1 $\frac{1}{2}$ -1 $\frac{1}{2}$ poll, longus et 6-9 lin. latus, aculeis numerosis 2-3 lin. longis erecto-patentibus armatus; calyptra appendice axili deorsum usque ad capsulre basin producta munita ; semina circiter 4-6, compressa, margine irregulariter lobulata, apice alata, cum ala circiter 10 lin. longa.

CHINA : in woods Mengtze plain, Yunnan, *Hancock*, 346 ; *A. Henry*, 9390, and 9390, *A.* and *B.* The flowering branch was drawn from a plant raised in the Royal Gardens, Kew, from seed sent by Dr. *A. Henry* ; the fruit and seed from his dried specimens.

A. biglandulosum presents several peculiarities that require further elucidation. The glands on the Vasal lobes of the leaves are very marked, and the terminal filiform appendage of the connective is unusual. Further, the nature of the downward (?) axile prolongation of the calyptra has not been ascertained. Only quite ripe fruits are present, so that neither the attachment of the seeds nor the connection of this central axis could be traced with certainty.—W. BOTTING HEMSLEY.

Fig. 1, male flowers; 2, andrcecum; 3, dorsal view of anther; 4, a fruit; 5, calyptra of the same; 6, a seed ; 7, an embryo. 1-3 enlarged; 4-7 natural size.

PLATE 2623.
PASSIFLORA HENRYI, *Hemsl*

PASSIFLORAOEiE.

P. (§ Decaloba-Polyanthea) Henryi, Hemsl. (sp. nov.); inter species chinenses *P. cupuliformi*, Mast, (hujus opeis t. 1768) magis quam aliis accedit, recedit foliis minoribus basi rotundatis, floribus majoribus in axillis foliorum fasciculatis, nee cymosis.

Frutex vel herba scandens, fere omnino glabra, ramis floriferis elongatis gracilibus sulcatis. *Folia* longe graciliterque petiolata, papyracea vel fere membranacea, circumscriptione valde variabilia, ssepius semiorbiculares, apice truncata vel obscure trilobata, lobis apiculatis, nunc vere orbicularia, nunc rotundata, apice acuminata, in ramis floriferis 1-2 poll., in ramis fructiferis usque ad 5 poll, lata; petiolus 1-2£ poll, longus, apicem versus biglandulosus. *Cirrhi* simplices, graciles. *Flores* albo-virescentes vel flavescientes, circiter 1 poll, diametro, in axillis foliorum 2-5, fasciculate pedicellis filiformibus 6-12 lin. longis, primum puberulis, paullo infra flores articulatis; bracteae ac bracteolae minutae, filiformes. *Sepala* et *petala* subsequalia, linearis-oblonga, obtusa. *Corona* faecialis duplex, filamentis exterioribus filiformibus quam petalis tertia parte brevioribus, interioribus brevioribus anguste clavatis; corona interior erecta, plicata. *Ovarium* globosum, pubescens vel puberulum, gynophoro brevi. *Bacca* globosa, circiter 1 poll, diametro.

CHINA : plain of Mengtze, Yunnan, at 4,500 feet, A. Henry, 10,282.

This makes the third described species of *Passiflora* known to inhabit China, and there are fruiting specimens of a fourth very distinct species in Dr. A. Henry's collection from the same region as the above.* *P. Henryi*, Hemsl., is also near *P. Leschenaultii*, DC, a native of the Pulney and NiJghirri mountains, having much larger solitary flowers. It is doubtful whether any of the Khasia specimens referred to the latter are really the same species.—W. BOTTING HEMSLEY.

**Passiflora (§ Decaloba-Polyanthea) franchetiana*, *Hemsl* (sp. nov.); ab omnibus speciebus sinensis differt foliis subcoriaceis alte bilobatis reticulato-venosis, petiolo infra medium biglanduloso.

Frutex vel herba alte scandens, ut videtur undiquo glabra vel glabrescens, ramulis fructiferis crassiusculis subteretibus. *Folia* iis

Bauhinice specierum quarundam similia, longe petiolata, demum leviter coriacea, e basi rotundata vel subcordata sursum latiora, absque petiolo 3-4 lin. longa, ab apice fere ad medium bilobata, lobis ovato-oblongis apice rotundatis divaricatis sinu aperto, vel interdum erectis sinu an gusto, a basi subquinquenervia, venis conspicue reticulatis; petiolus gracilis, 1[^]-2 poll, longus, paullo supra basin biglandulosus. *Cirrhi* m specimine kewensi desunt. *Flores* in axillis foliorum 2-6, fasciculati, pedicellis rigidiusculis puberulis circiter semipollicaribus; bractese minutse, lineares, cito deciduze. *Calyx* . . . *Fructus* globosus, siccitate 6-9 lin. diametro, gynophoro circiter 2 lin. longo) semina numerosa, nigra, compresso-ovoidea, scrobiculata, arillo aliformi cincta, absque arillo circiter 1 lin. longa.

CHINA : in woods Mengtze, Yunnan, at 5,500 feet, A. Henry, 11,192.

Fig. 1, section of flower showing corona; 2, a filament of the outer series of the corona; 3, a filament of the intermediate series; 4, a portion of the inner plicate series; 5, androecium and gynseceum. All enlarged.

PLATE 2624.
SHORTIA SINENSIS, *Hemsl.*

DIAPENSIACE^E.

S. flinensis, *Hemsl.* (*sp. nov.*); a speciebus hactenus cognitis foliis oblongo-lanceolatis deorsum gradatim attenuatis differt.

Herba perennis, subacaulis, undique glabra, caudice incrassata. *Folia* hiemalia squamiformia, superiora gradatim majora, foliis sestivalibus similia. *Folia propria* sestivalia demum coriacea, ovali-oblonga, longe petiolata, absque petiolo usque ad 5 poll, longa et 2J poll, lata, obtusa, basi cuneata, subtus pallidiora, praecipue supra medium grosse crenatodentata, crenis calloso-apiculatis; petiolus anguste alatus, laminam aequans. *Pedunculi* graciles, uniflori, prsester bracteas calyci contiguas nudi, quam folia ssepius dimidio breviores. *Flares* nutantes, circiter 1 poll, diametro. *Calyx* alte 5-partitus vel sepala sub&qualia, fere- libera, ovata, vix acuta, rigida, scariosa, longitudinaliter striata, diu persistentia, juxta basin bracteis (vel bracteolis) nonnullis similibus sed angustioribus acute acuminatis fulta. *Corolla* regularis, lobis rotundatis obtuse dentatis. *Stamina* breviter exserta, filamentis filiformibus nudis; staminodia minuta, anguscissima, squamiformia, infra stamina inserta et cum iis alternantia. *Ovarium* glabrum, triloculare, multiovulatum, stylo stamina sequante.

CHINA : south-eastern mountains at 5,000 feet, Mengtze, Yunnan, A. Henry, 11,490.

The genus *Shortia* was founded by Torrey and Gray, in 1842, for a plant inhabiting the mountains of North and South Carolina. Later, a second species was discovered in Japan, and more recently another has been found in Tibet, which, with the present very distinct one, brings the total up to four. It is doubtful whether, in view of these later discoveries which exhibit some deviations from the genus as originally described, Siebold and Zuccarini's *Schizocodon* (1843) should not be regarded as a section of *Shortia*.—W. BOTTING HEMSLBY.

Fig. 1, pistil and part of calyx; 2, a corolla laid open; 3, a cross section of an ovary. All enlarged.

PLATE 2625.

LESPEDEZA DIVERSIFOLIA, *Hemsl.*

LEGUMINOS[^]: Suborder PAPILIONACEJB.

L. diversifolia, *Hemsl.* (*sp. nov.*); inter species chinenses f oliis dimorphis insignis.

Frutex 6-pedalis, praeter flores giabrescens, ramis elongatis gracillimis primum minute strigilosis. *Folia* conferta, trifoliolata, dimorpba, papyracea, primum subtus obscure strigillosa, inferiora distincte graciliterquo patiolata, cum petiolo 1[^]-2 poll, longa, foliolis petiolulatis lanceolatis vel oblanceolatis apiculatis, apiculo cito deciduo; folia Buperiora sessilia vel subse[>]silia, foliolis brevissime petiolulatis late cordato-reniformibus latioribus quam longis abrupte acuminatis; stipulse minutissimse., *Flores* purpurei, circiter semi-pollicares, racemosi, pedicellis filiformibus vix longioribus; racemi breves, densi, 1^f-2 poll, longi, in axillis foliorum superiorum et terminales, bracteis minutis oaducis. *Calyx* ferrugineo-sericeo-hirsutus, dentibus sub-sequalibus acutis, 2 superioribus fere omnino connatis. *Petala* insequalia, alia quam caeteris brevioribus. *Stamen* vexillare liberum. *Ovarium* breviter stipitatum, hirsutum, 1-ovulatum. *Legumen* maturum ignotum.

CHINA : in the southern mountains at 6,000 feet, Mengtze, Yunnan,
A. Henry, 9243.

This very distinct species of *Lespedeza* is one of three different species (belonging, perhaps, to as many different genera) of Leguminosae in Dr. A. Henry's Mengtze collection, exhibiting the same kind of dimorphism in the leaves. One or both of the others will be figured in a future part of the *Icones*.—W. BOTTING HEMSLEY.

Fig. 1, a flower from which the petals have been removed; 2, a wing-petal; 3, a keel-petal; 4, section of pistil showing the solitary ovule. All enlarged.

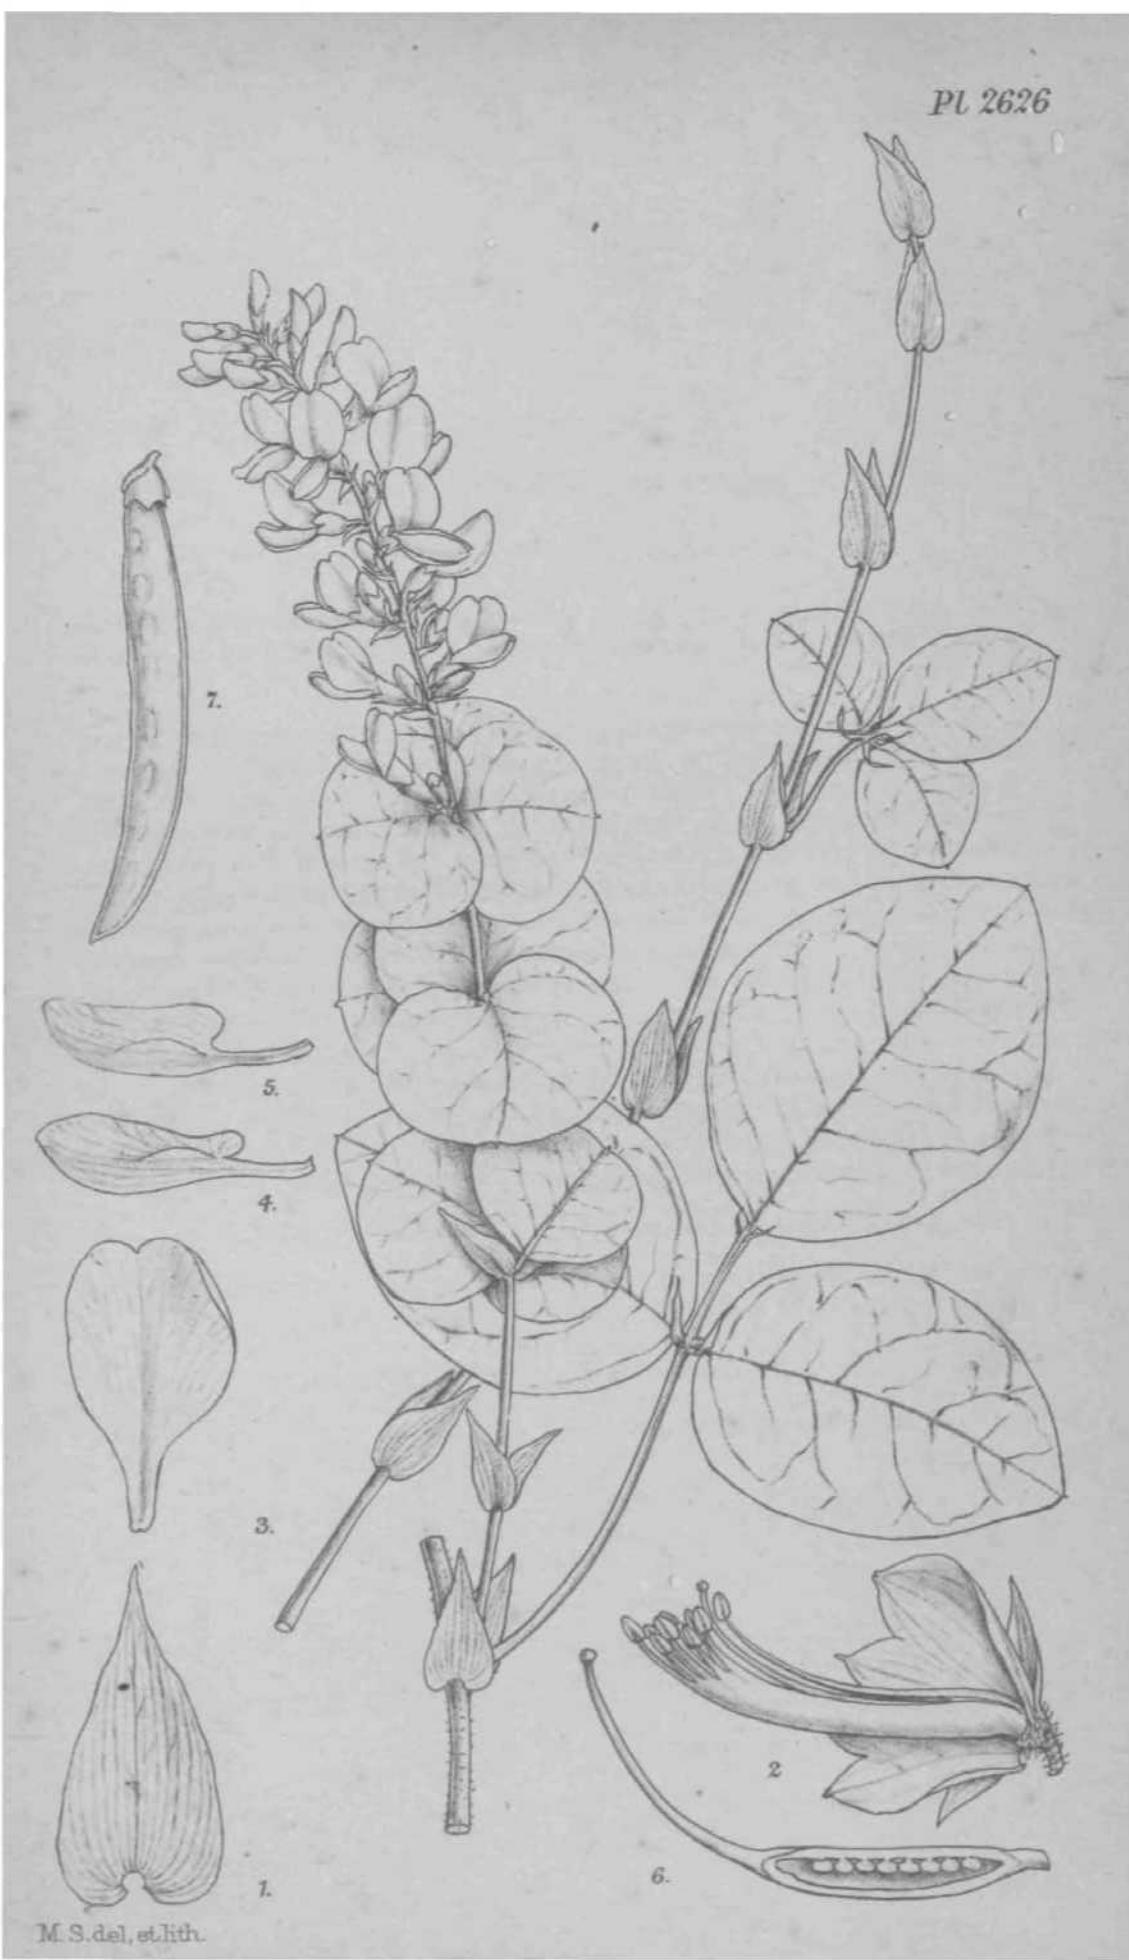

PLATE 2G26.

SHUTERIA SINENSIS, HemsL

LiEGUiMINOSiE. Suborder PAPILIOXACEJE.

S. sinensis, *HemsL.* (*sp. nov.*); species 8. *suffultm*, Benth., simillima sed robustior, omnibus partibus majoribus, calycis dentibus haud acuminatis.

Herba glabrescens, scandens, caulis ramulisque teretibus gracilis. *Folia* trifoliolata, longe graciliterque petiolata, vel in ramis floriferis subsessilia; foliola petiolulata vel subsessilia, membranacea, circumscriptione valde variabilia, elliptica, ovalia, orbicularia, vel foliorum superiorum minorum reniformia vel orbiculari-cordata, aui-plexicaulia, maxima bipollicarfa, cito glabrescentia, integerrima; petioli filiformes, longiores bipollicares; stipulse conspicuw, scariosse, cordato-ovatse, acutse* ssepius circiter semipollicares, striatse; stipellae bracteolaeque stipulis similes sed multo minores. *Flores* circiter 5 lin. longi, purpurei (*Henry*), numerosi, racemosi, brevissime pedicellati, racemis gracilibus ramulos laterales terminantibus. *Calyx* tubulosus, primo pilis paucis vestitus, dentibus deltoideis vix acutis. *Petala* subaequalia, vexillo unguiculato elliptico emarginato paullo longiore. *Ovarium* sessile, glabrum. *Legumen* lineare, fere rectum, circiter 2 poll. longum, compressum, glabrum; semina circiter 8, matura non visa.

CHINA : Mengtze, Yunnan, at 5,000 ft., A. *Henry*, 5216.

Dr. Henry describes this as shrubby, but this means only that the stems become hard and wire-like.—W. BOTTING HEMSLEY.

Fig. 1, a stipule; 2, flower from which the petals have been removed and calyx laid open; 3, standard; 4, a wing-petal; 5, a keel-petal; 6, ovary in section; 7, a pod. All except 7 enlarged.

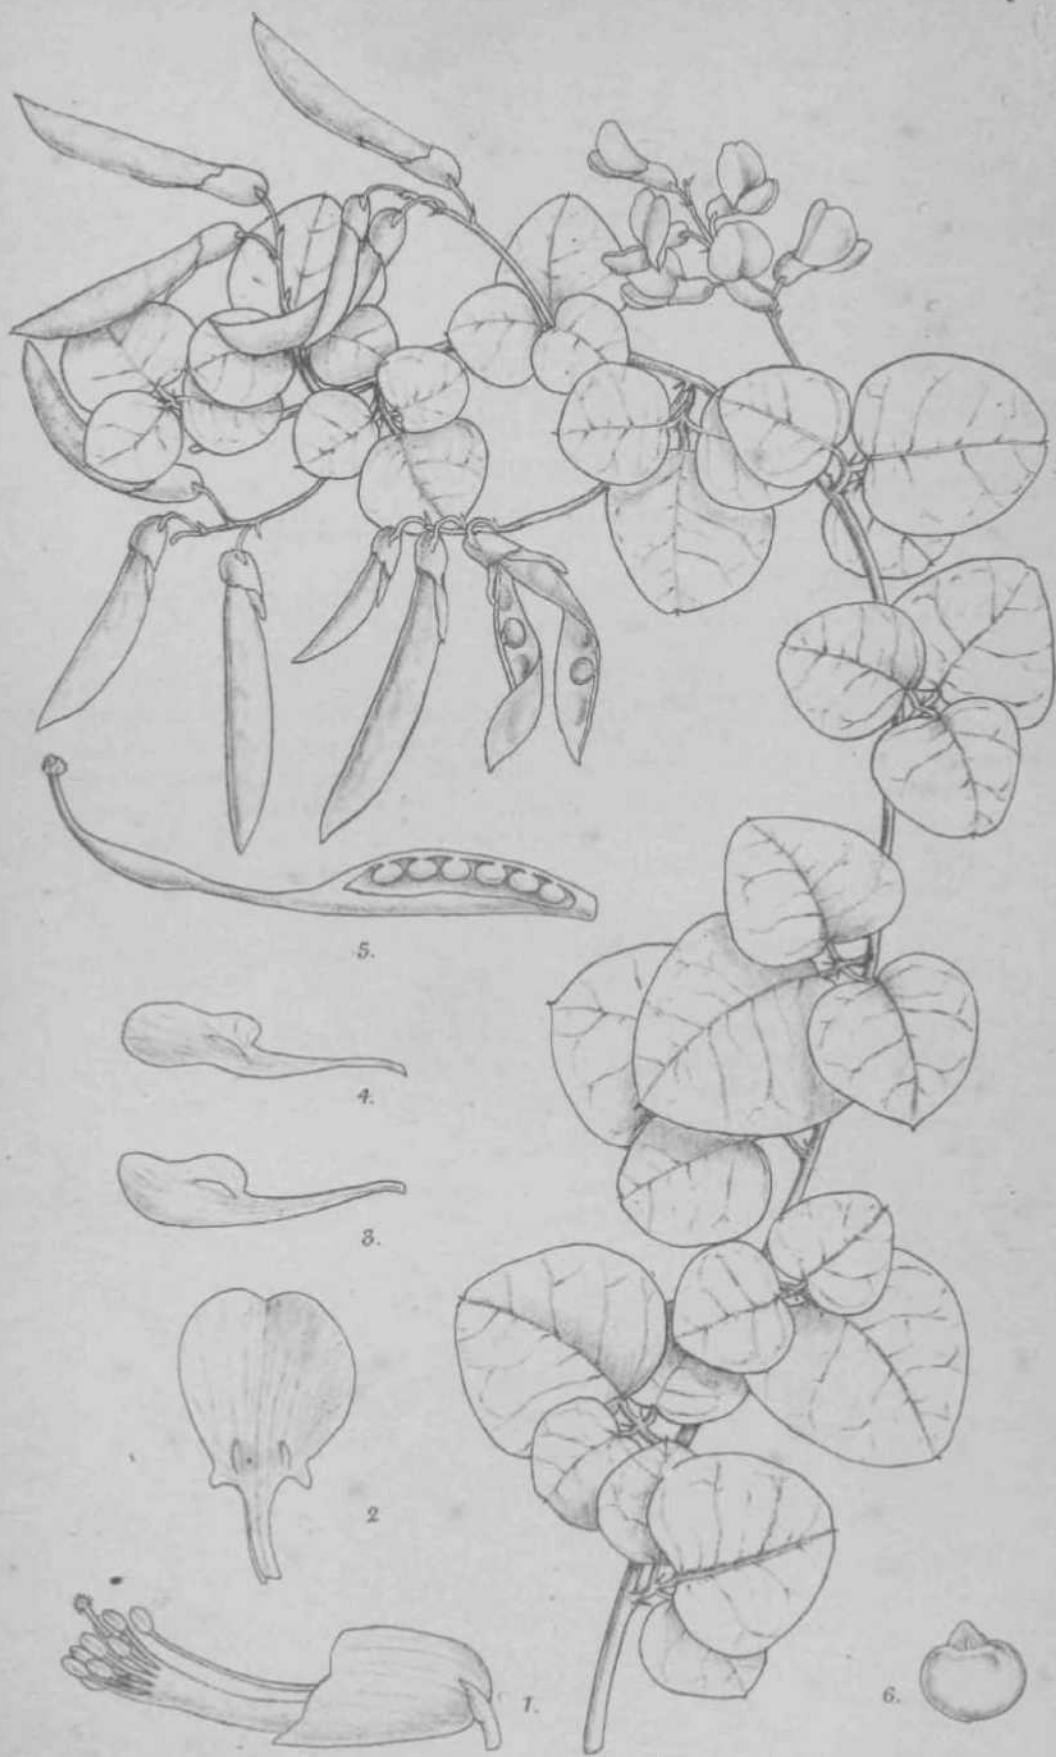

PLATE 2627.

DUMASIA COBDIFOLIA, Bentk

LEGUMINOSAE. Suborder PAPILIONACEA:

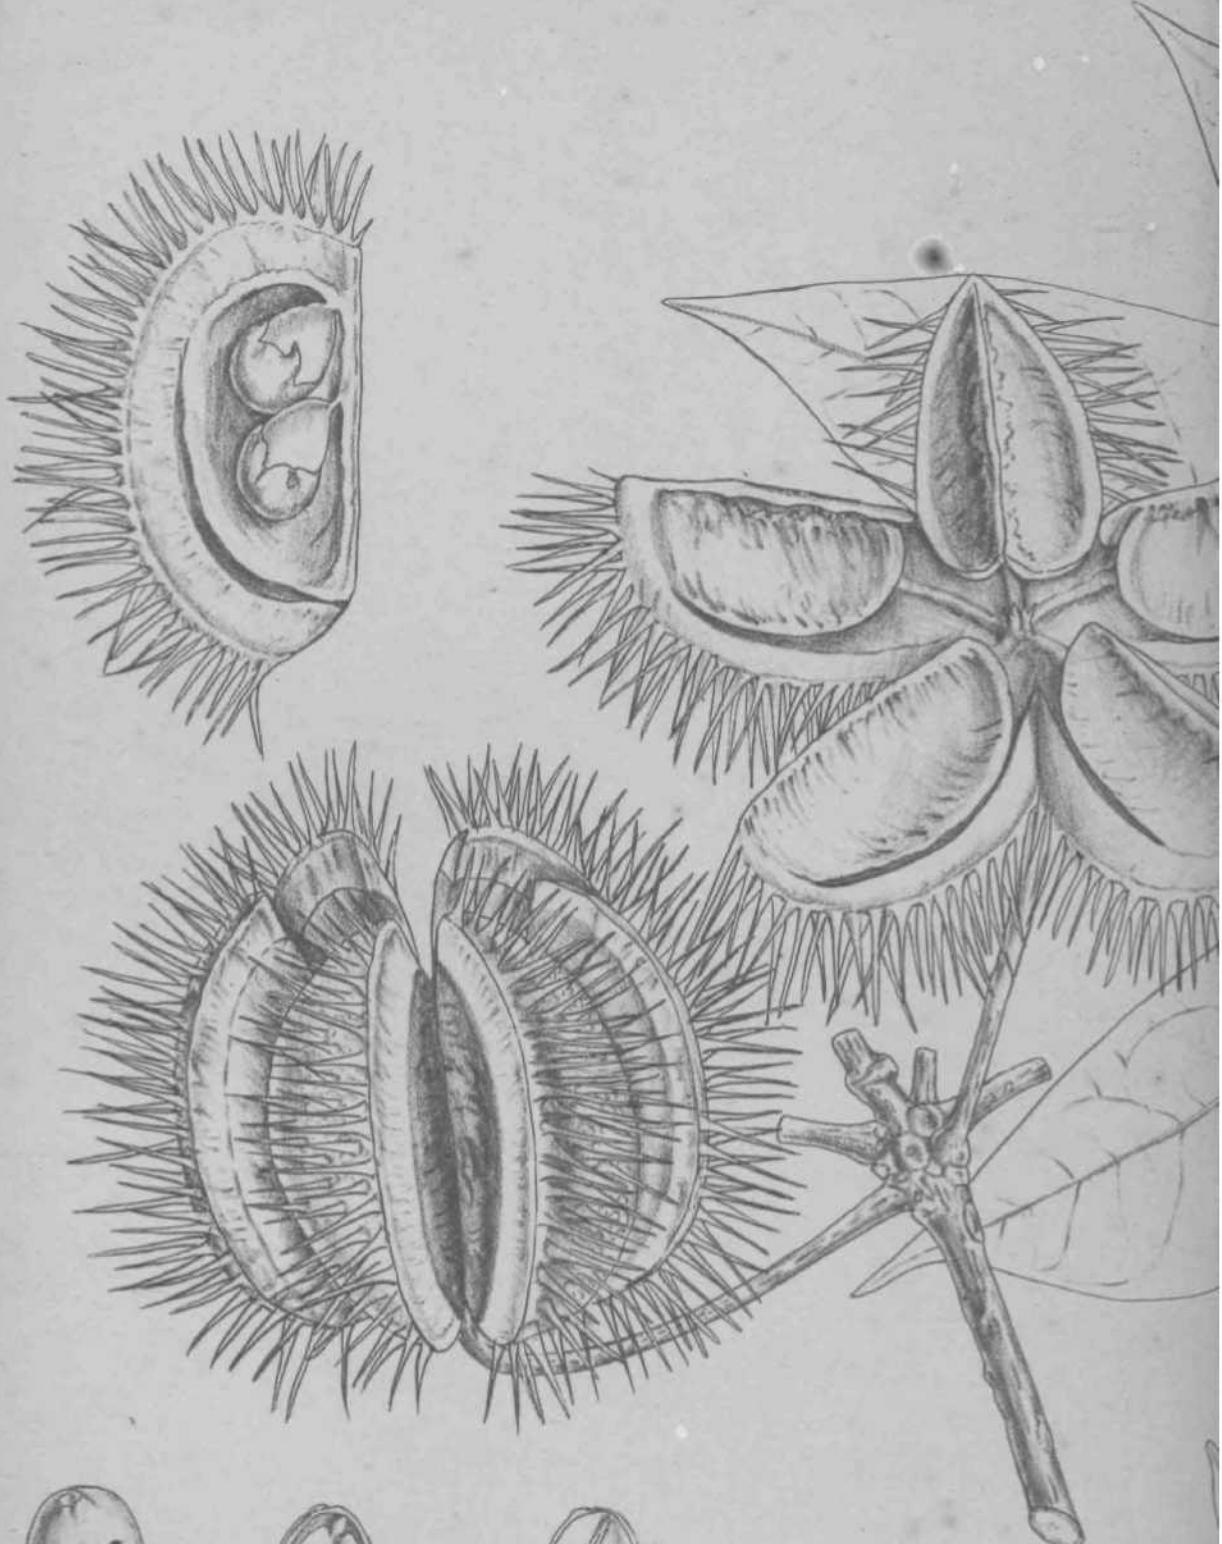

D. Cordifolia, *Benth. in Hook./. Fl. Brit. Ind.* ii. p. 183; foliolis glabris rotundato-cordatis vel reniformibus.

Herba gracillima, glabra, volubilis. *Folia* trifoliolata, brevissime petiolata; foliola brevissime petiolulata, membranacea, \wedge -1 poll, diametro, stipulis stipellisque minutis. *Flores* flavi, parvi, in racemos parvos axillares dispositi, breviter pedicellati. *Calyx* tubulosus, oblique truncatus. *Petala* longe unguiculata, vexillo basi biauriculato. *Ovarium* glabrum, circiter 6-ovulatum, stylo supra medium incrassato. *Legumen* leviter falcatum, circiter pollicare ; semina rotundata, compressa, vix 1 lin. diametro.

CUIXA : Mountains south-east of Mengtze, Yunnan, at 5,000 feet, A. Henry, 10326.

This is also a native of Ehasia and Manipur, and is figured here because there is no really good and easily accessible representation of the genus. The thickening of the style above the middle is characteristic.—W. BOTTING HEMSLEY.

Fig. 1, a flower from which the petals have been removed; 2, standard; 3, a keel-petal ; 4, a wing-petal; 5, an ovary in longitudinal section; 6, a seed. All enlarged.

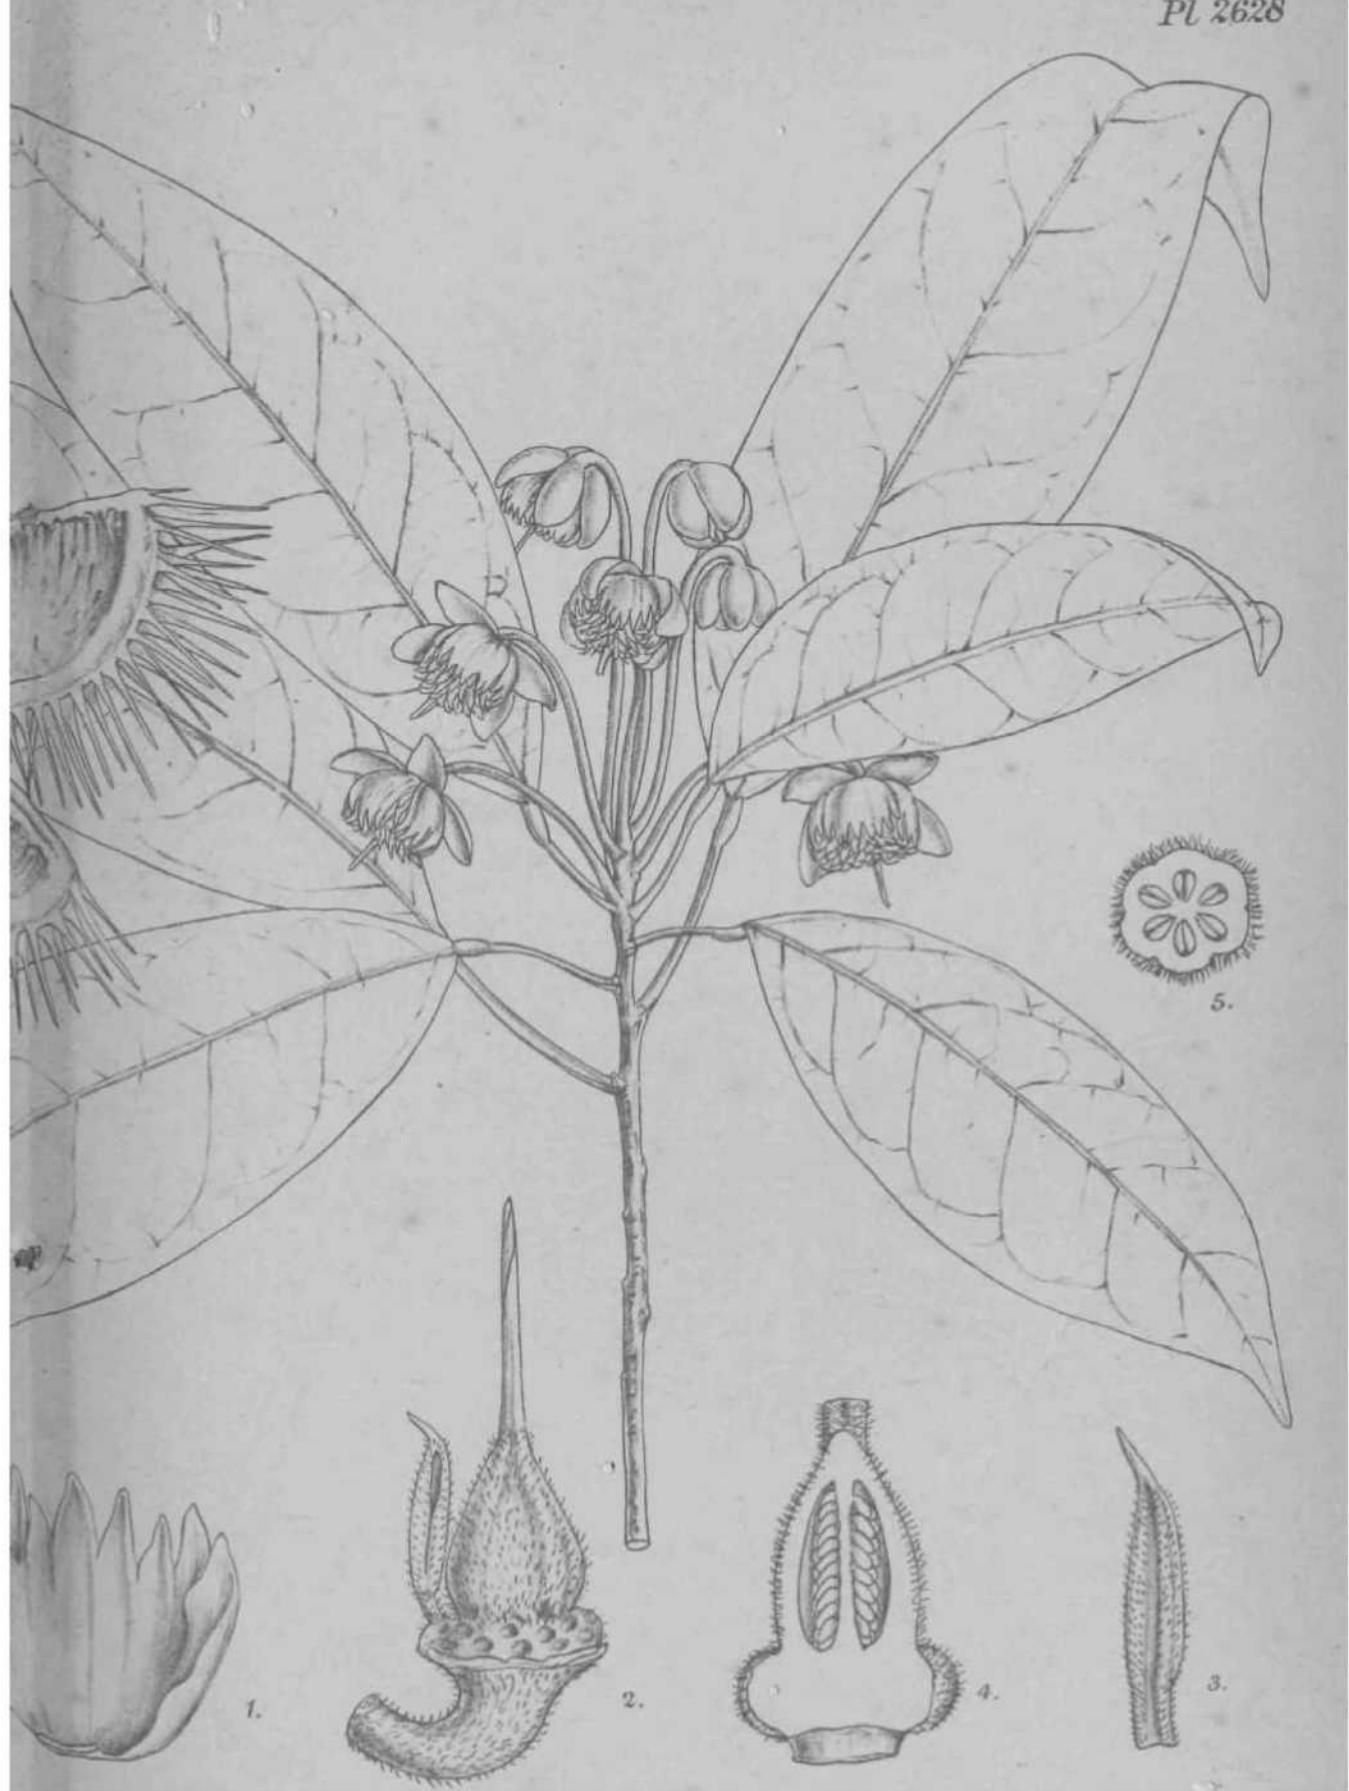

PLATE 2628.

SLOANEA HONGKONGENSIS, *Hems!*.

TILIACE.E.

S. hongkongensis, *Hernsl.* (*sp. nov.*); foliis graciliter petiolatis integris, fructu aculeis longis undique ins true to.

Arbor circiter 15-pedalis (*Ford*), prsester flores glabra, ramulis floriferis rectis rigidis. *Folia* ad apices ramulorum conferta, longe petiolata, vix coriacea, lanceolata vel oblanceolata, absque petiolo 2-4 polj. longa, integra, acuminata sed vix acuta, basi subcuneata, venis primariis utrinque 5-7 tenuibus inter se arcuatim anastomosantibus; petioli usque ad 1[^] poll, longi, apice levitt^r incrassati. *Flores* nuntantes, 6-8 lin. diaroetro, in axillis foliorum 7-9 superiorum solitarii vel in corymbos subterminales dispositi; pedunculi 9-12 lin. longi, fructiferi elongati. *Sepala* crassa, sericea, late oblonga vel ovalia, apice integra vel paucidentata. *Petala* glabra, quam sepala paullo longiora, multifida vel grosse fimbriata. *Stamina* numerosissima, petalis paullo longiora, fi la mentis brevissimis, antheris apiculatis. *Ovarium* 5-6-loculare, setulosum, stylo stamna superante. *Capsula* cum aculeis circiter 6 lin. longis saltern 2|-3 poll, diametro, 5-6-locularis, valv^Ls post dehiscentiam divaricatis diu persistentibus ; semina in quoque loculo ssepius 4 f, arillo carnosu aurantiaco usque ad medium vestita.

HONGKONG : Happy Valley and Aberdeen New Road, *W. J. Tischer*, Herb. Hongkong, 611 (1895), and *C. Ford*, 1898, without number.

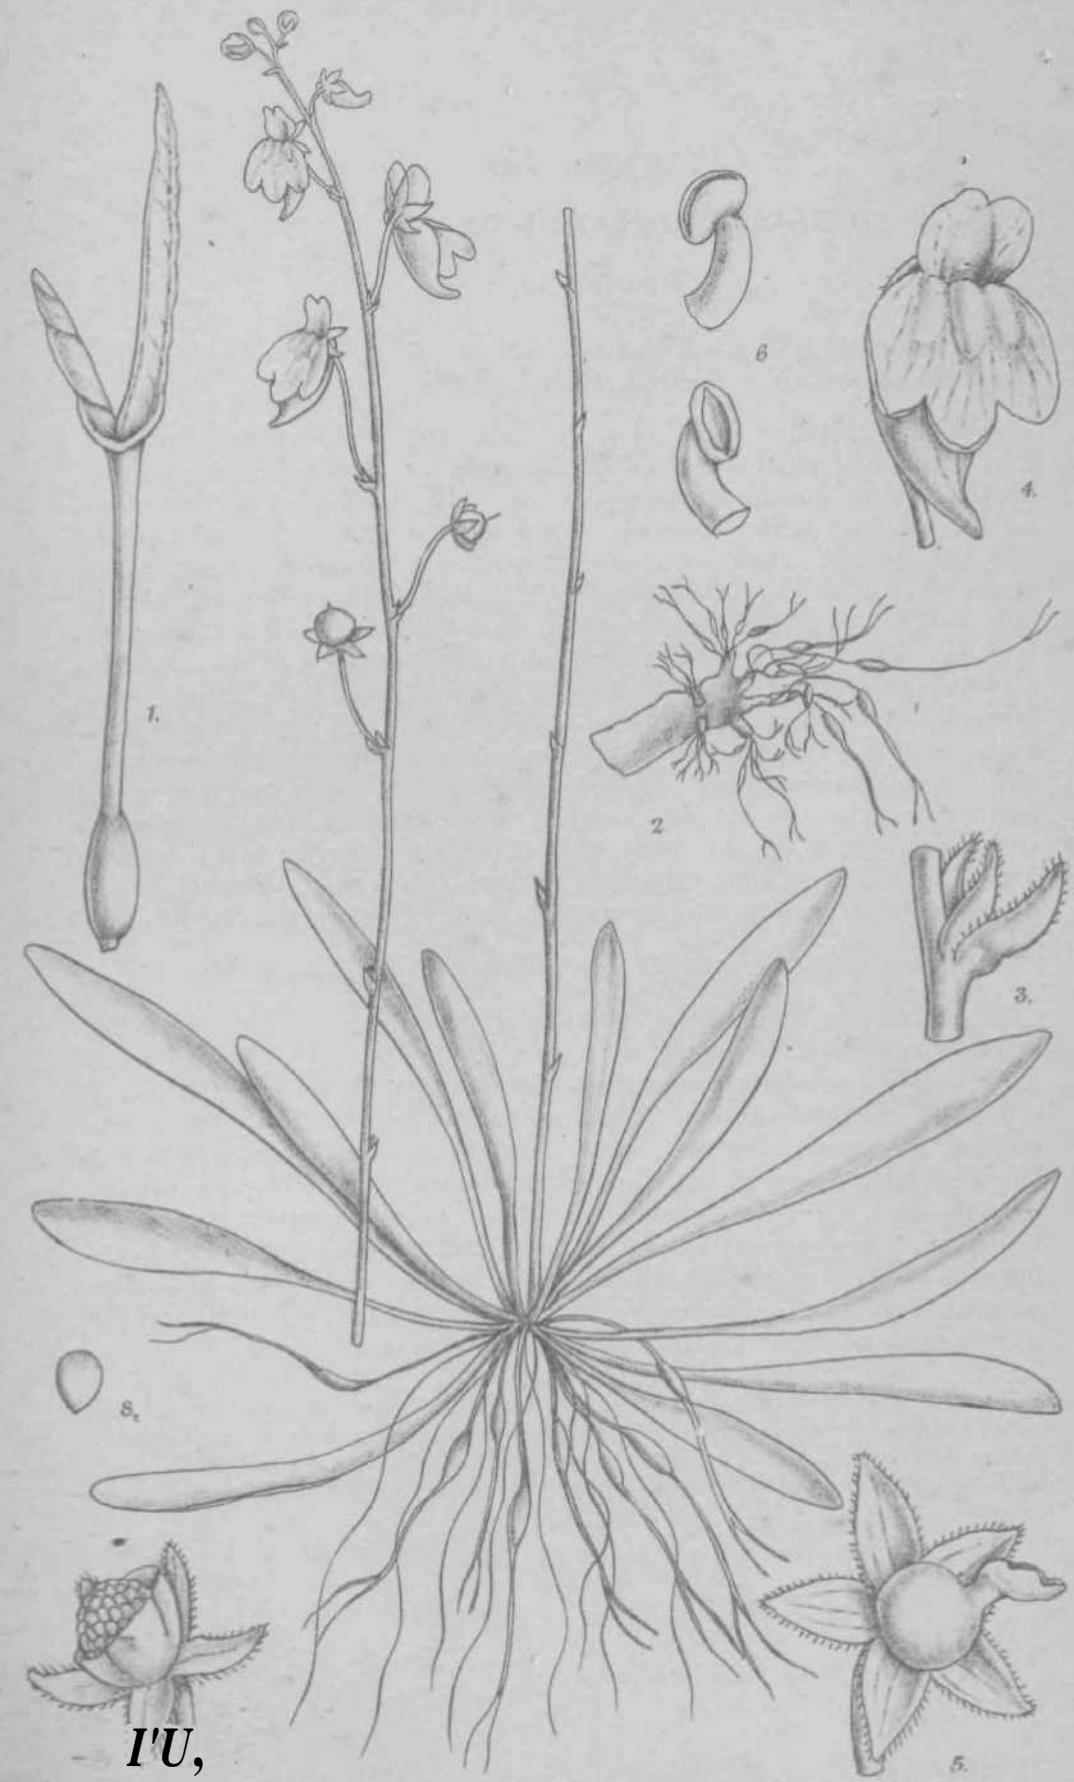

Kew is indebted to Mr. C. Ford, Superintendent of the Hongkong Botanic Garden, for the excellent and copious specimens from which the accompanying plate was prepared.

With regard to the generic name adopted, I have followed the late Sir Ferdinand von Mueller and other botanists in regarding *Echinocarpus* of the Old World as not being generically distinct from the American *Sloanea*. The distinctive characters of these genera, as well as those of Miquel's *Phcenicospermum*, are untenable. The last was supposed to differ from the others in having arillate seeds; a character common to the present plant, to some, at least, of the Indian species of *Hchinocarpus*, as well to the American *Sloanea Afassoni*, Sw., and probably to other species, the seeds of which are unknown. The genus *Sloanea* as originally limited was apetalous, but »*S. jamaicensis*«.

Hook (*Ic. PL* tt. 194-196) has distinct petals; therefore the geographical separation of *Sloanea* and *Echinocarpus* fails in two of the principal characters. K. Schumann (Engler and Prantl, *Natirl. Pflanzenf.* iii. 6, p. 5) divides *Sloanea* into three sections, namely : *Eusloanea*, apetalous; *Echinocarpus*, petaliferous; and *Phaeocarpus*, having arillate seeds. The two last should be united under the former name.

The other Chinese species of *Sloanea* are : *S. sinensis*, Hemsl. (*Echinocarpus*, Hance); & *hanceana*, Hemsl. (*E. sinensis*, Hemsl. non Hance); 8. *dasyarpa*, Hemsl. (*E. dasycarpus*, Benth.). The last is another species having arillate seeds, and it is probable that they all have.—W. BOTTING HEMSLEY.

Fig. 1, a petal; 2, gynoecium and one stamen on the receptacle; 3, back view of a stamen; 4, vertical section of ovary; 5, cross section of ovary; 6, arillate seed; 7, the same in section showing the embryo; 8, another section showing the edges of the cotyledons; 9, a cross section of the same. *All enlarged.*

I'U,

M.S. del. et lith.

PLATE 2629.

GENXISEA GUIANENSIS, JT. E. Brown.

LEXTIBULARIACE^E.

O. guianensis, N. E. Brown (*sp. nov.*) ; affinis *G. africana*, Oliv., sed foliis lanceolatis et floribus majoribus differt.

Folia IJ--2£ poll, longa, 1J-3 lin. lata, anguste lanceolata, obtusa, basi attenuata, membranacea, flaccida, glabra. *Utriculi* descendentes, breviter vel longissime stipitati ; tubus 9-10 lin. longus, basi ovoideo-inflatus ; lobi spiraliter torti 4^-7 lin. longi. *Scopu*s 4-12 poll, longus, |-| lin. crassus, plurisquamatus; flores 3-10, racemosi. *Squama* et *Bracteae* basifixae, §-f lin. longae, ovatse, acutse, minute ciliolatce. *Pedicelli* 3-8 lin. longi, basi bibracteolati, apice subtus tenuiter et minute hirtelli. *Bracteole*s £-§ lin. longe, lanceolatse, acutse, minute ciliolatse. *Calyx* 5-partitus, minute hirtellus, lobis 1 lin. longis ^ lin. latis, lanceolatis vel ovato lanceolatis acutis ciliatis. *Corolla* personata, violacea, 6-6^ lin. longa ; labium superius 2J lin. longum, erectum, ellipticum, obtusissimum, leviter emarginatum, margine reflexum ; labium inferius 3-3^ lin. longum, deflexum, calcari incumbens, trilobum, lobis oblongis obtusis, palato minute puberulo luteo ; calcar 5 lin. longum, crassum, conicum, obtusum, glabrum. *Capsula* 2 lin. diam., globosa, tenuiter minuteque pubescens, stylo brevissimo coronata.

BRITISH GUIANA : Arabapu River, Quelch ds McConnell, 150.

G. guianensis is one of the most distinct species of the genus, having larger leaves than any other at present described. In appearance it more nearly resembles *G. africana*, Oliv. (a native of Angola), than any other species known to me. The curious utricles, which are characteristic of the genus *Oenlisea*, have a very remarkable structure, which has been well described and figured in Darwin's *Insectivorous Plants*, p. 446, and Goebel's *Pflanzenbiologische Schilderungen*, ii. p. 121, tt. 15-16. *G. guianensis* demonstrates that budding sometimes takes place at the tips of the leaves, as on one leaf a young plant had commenced to develop near the apex, and on another tufts of small utricles had formed, as shown in fig. 2.—N. E. BROWN.

Fig. 1, a utricle with one of the terminal lobes flattened out; 2, apex of a leaf with tufts of utricles growing from it; 3, fragment of a scape with bract and two bracteoles; 4, a flower; 5, calyx and ovary; 6, front and side view of a stamen; 7, fruit, with the upper half of the capsule fallen away, displaying the seeds; 8, seed. All enlarged.

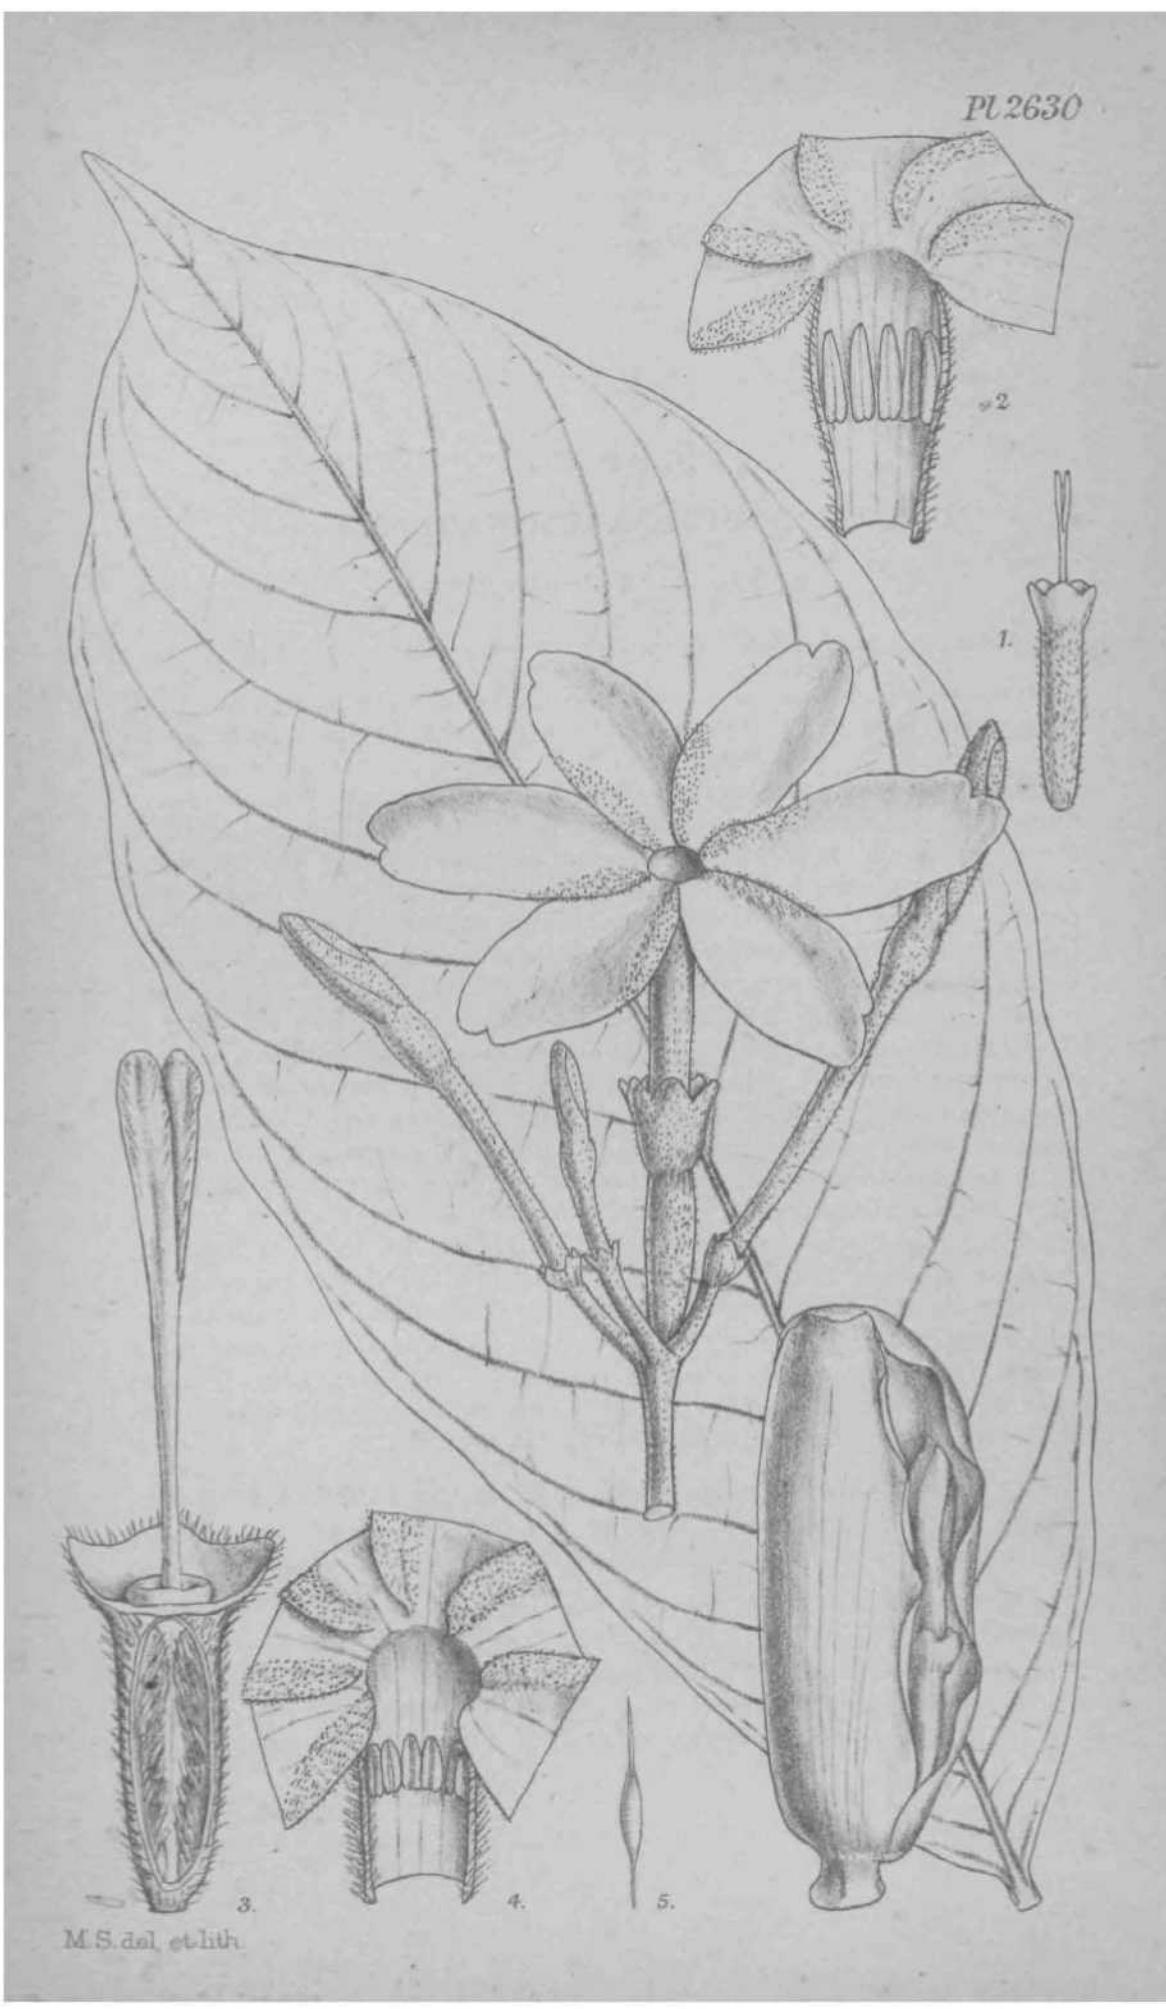

PLATE 2630.

DOLICHOLOBIUM AGUMINATUM, fURSS.

RuBiACEiE. Tribe CINCHONEJE.

D. acuminatum, *Burkill*; fuliis late obovatis acuminatis distinctum.

Arbor 50-60 ped. alta. *Folia* late obovata, apice acuminata, basi obtusa vel rotundata, supra glabra, infra pilis fulvis hirsuta, 8-10 poll, longa, 4-6| poll, lata; petioli 1 poll, longi; stipulse magnse, elliptico-ovatee, apice rotundatee, hirsutse, 2 poll, longae, 9 lin. latse, cadiucse. *Inflorescentia* 4:-d-florBk; ovarii pedicellos simulantibus umbel] i-formis; pedunculus petiolo sequilongus, hirsutus. *Flores* albi, unisexuales; flos terminalis femineus, maxim us, sessilis; alii masculi, m in ores, petalis saepissime pauperiores, sed corollse tubo longiores, pedicellati. *Calyx* infundibularis, brunneus et fere scariosus vel basi subherbacea viiidis, margine leviter sinuatus vel deutibus obtusis ornatus, hirsutus; calyx floris masculi 1 lin. longus; floris feminei 2^-3 lin. longus. *Corolle* tubus extus hirsutus, intus glaber, rectus; tubus floris masculi bene evolutus ad 2f poll, longus et 1 lin. latus, os versus ad antheras paullulo inflatus; tubus floris feminei bene evolutus 1 poll, longus, tubo floris masculi paullo latior, aequalis; lobi oblique elliptici, contorti, intus ad margines interiores extus ad margines exteriores puberuli, apice unilateraliter erosi; lobi floris masculi 5 (vel 4), 9 lin. longi, 3 lin. lati; lobi floris feminei 6 (vel 5), 11-12 lin. longi, 5 lin. Jati. *Antherce* sessiles, floris masculi iis floris feminei duplo majores, tot quot corollae lobi. *Stylus* cum stigmatibus floris feminei corollse tubum subsequans; stigmata elongato-spathulata; stylus stigmataque floris masculi multo minores. *Discus* elevatus. *Ovarium*, flore femineo maturo, 8-9 lin. longum, extus albido-hirsutum. *Fructum* maturum non vidi; semina immatura in alas typicas elongata.

SOLOMON ISLANDS : Treasury island, along the banks of a stream, *Guppy*, 187 ; Faro island, at 1,600 ft., *Guppy*, 219 ; New Georgia % in a collection chiefly from this island, *Officers of H.M.S. 'Penguin'**

It is named "Lowasi" by the natives ; and flowers in June and July.

Hitherto the genus *Dolicholobium* has been only known from Fiji. Asa Gray described two species, B. Seemann a third, and J. G. Baker two more. Imperfect material of a sixth Fijian species exists in the

Kew Herbarium. *D. acuminatum* extends the range and brings the number of known species up to seven.

I have not been able to examine specimens of *D. lati/olium*, A. Gray. The other six apparently exhibit the separation of the sexes in the manner described above, *i.e.*, the inflorescence ends in a female flower with more and larger petals than in the males, but with a shorter tube ; round it are the male flowers, sometimes as many as eight, more commonly about-three, and rarely absent. This last-named condition occurs in the two specimens of *D. longissimum*, Seem., at Kew, and it is possible that the sexes may be more widely separated here.

In the male flower the inflated tube points to the presence of perfect anthers, the style and stigma are small, and the ovary, if present, is not to be distinguished from the pedicel. In the female flower, which opens in *D. acuminatum* before the males, the straight bluntish uniform tube attracts the eye, the style and stigma are large, and the ovary is obvious.

It is no surprise that this genus should prove to be diclinous ; for Burck has admirably demonstrated the abundance of such forms in the order to which it belongs (see Ann. du Jardin Bot. Buitenzorg, iv. p. 12). *Timonius llumphii*, DC, whose floral mechanism he describes, is a comparable species. Its male flowers have a longer and narrower tube than the female and fewer corolla-lobes, and the stamens, as many as the corolla-lobes—5 in the male, 10 in the female flower. Here, however, the plant is polygamodioecious.

In some genera of Kubiacese, e.g. *Canthium*, Burck remarks that a complete series exists from full hermaphroditism of the flower to diceism ; this is hardly the case in *Dolicholobium* ; and I believe that Asa Gray's character "flores . . . 4-meri" for *D. lati/olium*, the species which I have not seen, really indicates that in his specimen the corolla of the female flower had fallen and that those remaining were 4-merous male flowers.—I. H. BURKILL.

Fig. 1, ovary, style, and stigma of male flower; 2, part of corolla of male flower laid open ; 3, ovary, style, and stigma of female flower; 4, part of corolla of female flower, laid open; 5, seed (immature). All enlarged.

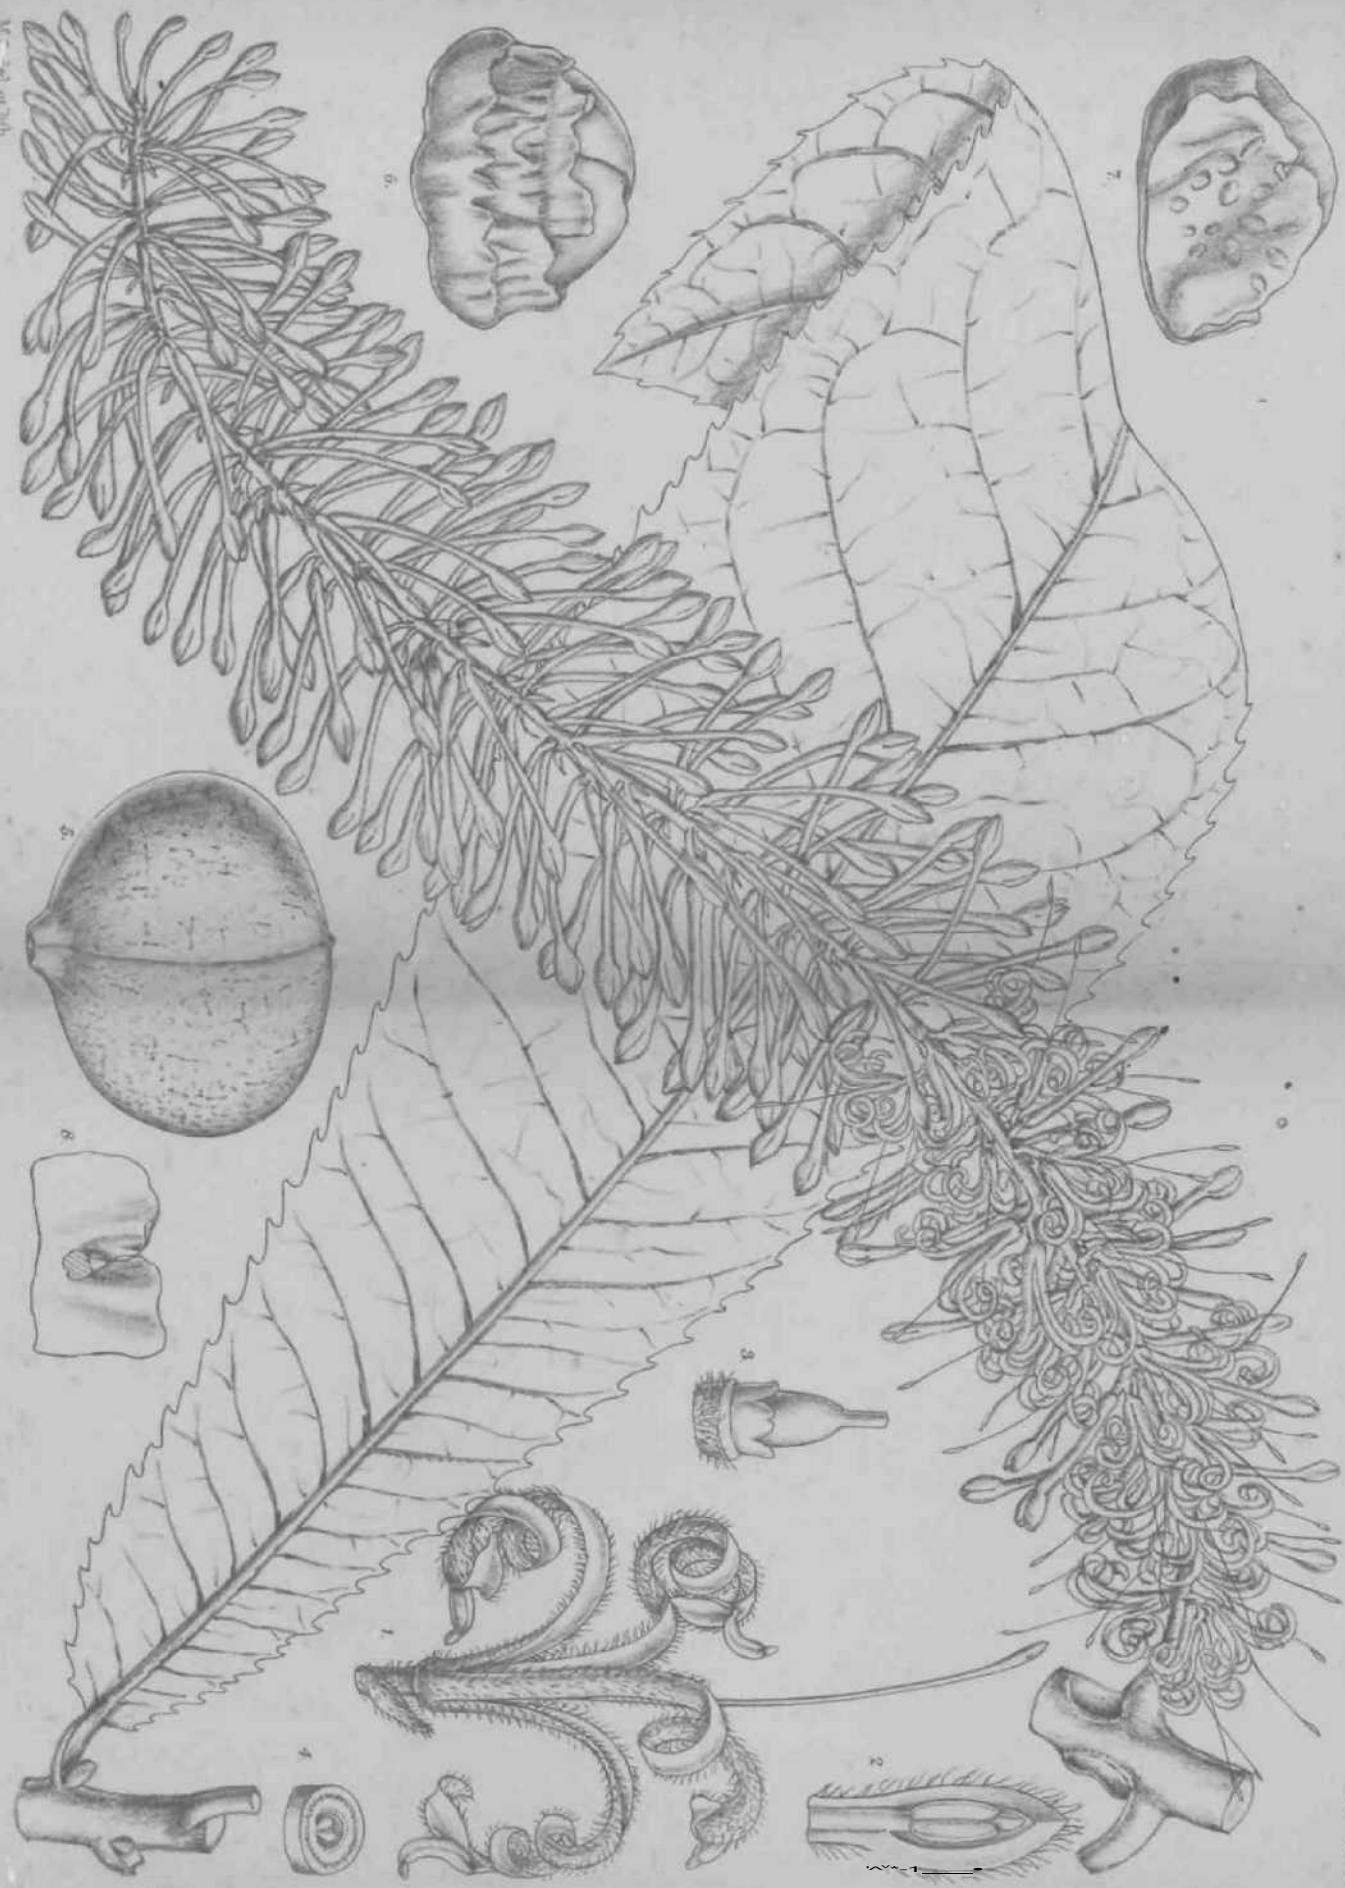

PLATE 263].

HELICIA GRANDIS, *Hemsl.*

PROTEACEA:.

H. grandis, *Hemsl* (*sp. nov*) ; ab omnibus speciebus sinensis sinensis liactenus cognitis magnitudine omnium partium differt.

Arbor 10-15-pedalis (*A. Henry*), ramulis floriferis crassis rigidis indu-
mento velutino ferrugineo vel atro-brunneo dense vestitis. *Folia* ampla,
brevissime petiolata, ad apices ramulorum conferta, subcoriacea, oblan-
ceolata, maxima sesquipedalia, et 7 poll, lata, serrulata, subacuminata,
basi rotundata vel cuneata, pricipue suhtus secus costam nervosque
ferrugineo- pubescentia, demum glabrescentia, costa crassa utrinque
elevata, venis primariis lateralibus nuraerosis, utrinque sed prrecipue
subtus conspicuis. *Flores* brunnei, staminibus cseruleis (*A. Henry*),
extus ferrugineo-tomentosi, ante anthesin graciles, circiter pollicares,
racemosi, racemis ex axillis foliorum delapsorum arete deflexis, pedicellis
brevissimis subfasciculatis. *Perianthii* stgmenta linearia, revoluta,
torta. *Ovarium* glabruin, stylo elongate capillari diu persistente, stig-
mate parvo clavato. *Oapsula* glabra, lignosa, tarde dehiscens, sub-
globosa vel lateraliter compressa, usque 2 poll, diametro, ssepius
unisperma. *Semen* erectum ; testa supra medium membranacea decidua
vel deliquescens, infra medium crassa, incrassata, dura, cotyledonibus
crassis carnosis insequalibus.

CHINA : mountains to the south-west of Mengtze, in forests at 5,000
feet, *A. Henry*, 10704.

This is a very handsome species, having ample foliage clothed with a rich brown tomentum, and brown flowers with blue stamens, according to Dr. Henry. The very long racemes are remarkably deflexed, judging from the dried specimens. A singular testa is developed by the seeds of this tree. In the upper part of the large ripe seeds it is merely a thin pellicle which early disappears, whereas in the lower part it consists of two or more irregular woody or almost bony layers.—W. BOTTING HEMSLEY.

Fig. 1, a flower; 2, upper part of a perianth-lobe and a stamen; 3, disk and pistil, upper part of the style removed; 4, cross section of an ovary; 6, fruit; 6, a seed from which the membranous testa in the upper part has disappeared; 7, inner face of one of the cotyledons showing the minute radicle at the top; 8, portion of cotyledon and radicle. *AH except 5 and 6 enlarged.*

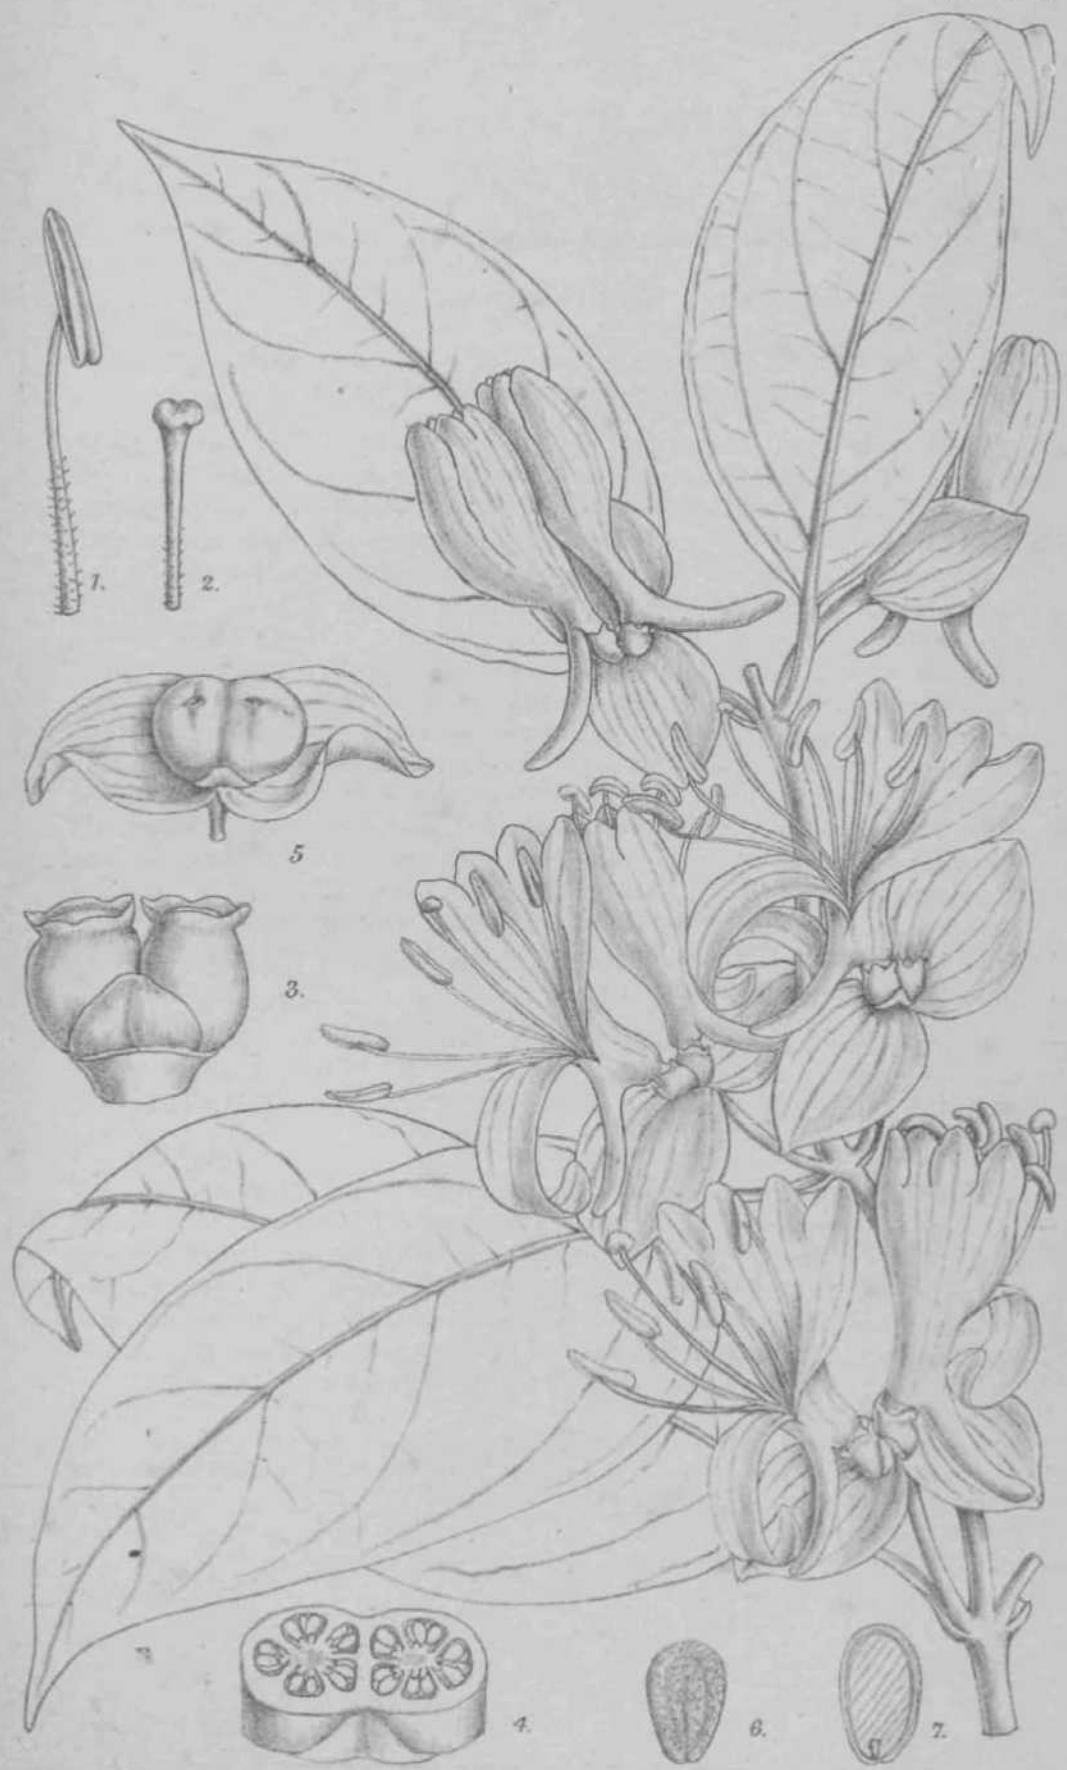

PLATE 2632.

LONICERA CALCARATA, *HemsL*

CAPRIFOLIACEJE.

L. (§ Xylosteum) calcarata, HemsL. (sp.nov.) ; ab omnibus speciebus hucusque cognitis longitudine calcaris insignite differt.

Frutex alte scandens, omnino glaberrimus, ramulis floriferis elongatis rectis teretibus fistulosis ad nodos septatis, cortice pallide brunneo. *Folia* breviter petiolata, subcoriacea, ovata, elliptica, vel lanceolata, 3-6 poll, longa et 1-3 poll, lata, acute acuminata, basi rotundata, rarius cuneata, integra, venis primariis paucis subtus sat conspicua. *Flores* geminati, rubro-lutei, bene evoluti circiter 2 poll, diametro, involucrati ; pedunculi recti, |-|| poll, longi ; involucri bracteae 2, foliacese, sessiles, ovato-lanceolatse, maximse 1J poll, longse sed ssepium minores, subacutse, diu persistentes. *Calycis limbus* brevissimus, annularis. *Corolla tubus* latus, brevis, antice in calcar semipolllicare curvatum productus ; *limbus* alte bilabi&tus, labio inferiore loriformi revoluto, superiore erecto lato breviter 4-lobulato, lobulis obtusis vel rotundatis. *Stamina* labium superius vix excedentia, filamentis filiformibus infra medium puberulis. *Ovarium* 5-loculare, loculis multiovulatis, stylo puberulo. *Baccare* geminatse, subcarnosse, omnino confluentes, involucri bracteis et bracteolis binis brevibus rotundatis bracteis alternantibus suflultai ; *semina* elliptica vel ovata, valde compressa, margine elevato.

CnNA : Szechuen, without special locality, A. Henry, 8937 ; chiefly near Tachienlu, at 9,000 to 15,000 ft., A. E. Pratt; Yunnan, rocky mountains near Mengtze, at 5,000 ft., A. Henry, 10721, 10721 A, 10721 B.

This' is an exceedingly ornamental and at the same time a most interesting species of the genus *Lonicera*, which finds its greatest concentration in Western China, where there are probably not less than fifty or sixty species. *L. calcarata* is remarkable in having the hollow stems and 5 celled ovary of *Leycesteria*, associated with a long-spurred corolla, which is represented only by a more or less pronounced gibbosity in other species.—W. BOTTING HEMSLEY.

Fig. 1, anther and part of filament; 2. stigma and part of style; 3, a twin-ovary ; 4, cross section of the same; 5, a twin-fruit; 6, a seed; 7, section of the same showing the embryo, All except 5 enlarged.

PLATE 2633.

LEYCESTERIA SINENSIS, *Hems!*.

CAPRIFOLIACE*..

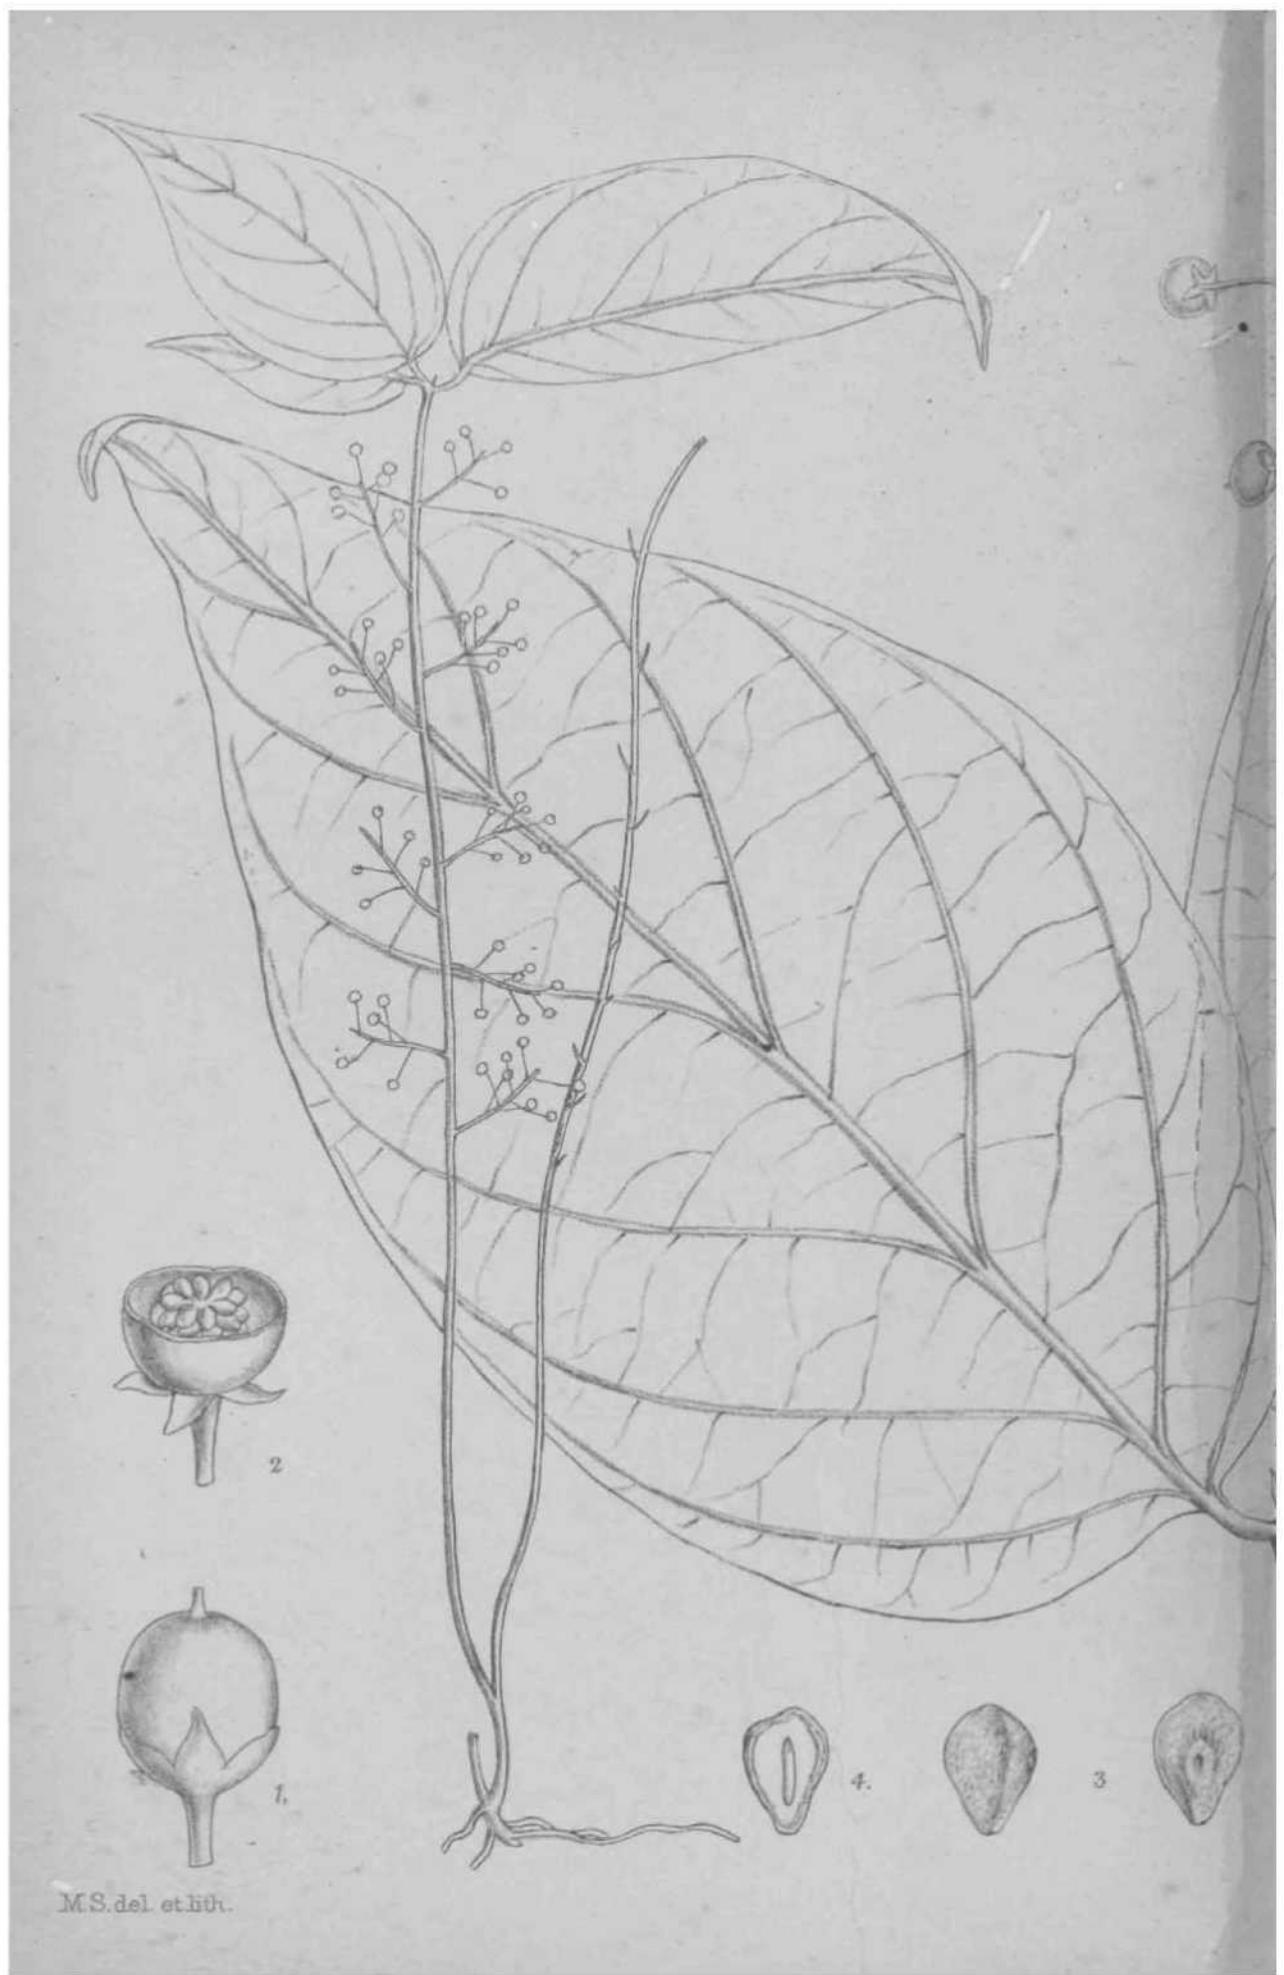

L. sinensis, *Hemsl.* (*sp. nov.*); a speciebus hactenus cognitis floribus ad apices ramorum capitatis differt.

Frutex fere glaber, paucipedalis, ramis fistulosis ad nodos septatis. *Folia* breviter petiolata, membranacea, lanceolata vel ovabo-lanceolata, cum petiolo 1[^]-3 poll, longa, longe acuteque acuminata, basi rotundata, supra parce strigillosa, subtus glauca, prcipue in venis rufis parce strigillosa, margine obscure sinuato-lobulata ac ciliolata, venis primariis utrinque circiter 5. *Flores* albi, 8-10 lin. longi, sessiles, in capitula parva ramulos breves laterales terminantia dispositi, pedunculis brevissimis; capitula 5-6-flora, bracteis 5-6 foliaceis rotundato-ovatis vel lanceolatis quam floribus brevioribus suffulta, bracteolis inter flores minoribus. *Calycis limbus* brevis, cupularis, insequaliter 5-dentatus vel 5-lobatus, lobis subacutis atque ovario fusiformi piloso-glandulosis. *Corolla* hypocrateiformis, fere recta, extus parce minuteque piloso-glandulosa, intus infra medium pilosula, lobis brevibus rotundatis. *Stamina* brevissime exserta, filamentis glabris. *Ovarium* 5-loculare, multiovulatum, stylo filiformi glabro, stamna paullo superante. *Fructus* angularis, glandulosus ; seraina (perfecta non visa) ovoidea, ltevia.

CHINA : Mountains north of Mengtze, Yunnan, at 7,000 ft., A. Henry, 9692 c.

From the above description, it is evident that *Leycesteria sinensis* is quite distinct from the familiar *L. formosa*, which has elongated racemes and large coloured bracteoles below the flowers. It is equally distinct from *L. glaucophylla*, Hook, f., which has loose racemes of flowers and very small bracteoles. Dr. A. Henry collected all three species in Yunnan, but sends comparatively little of the one here figured, which he seems to have taken for a possible variety of *L. formosa*, as he sends the latter under the same number, though lettered as from a different locality.—W. BOTTING HEMSLEY.

Fig. 1, small portion of leaf showing hairs; 2, pistil and calyx; 3, section of corolla and ovary; 4, a young fruit; 5, a cross section of ovary; 6, an imperfect seed. All enlarged.

M.S.del etlih.

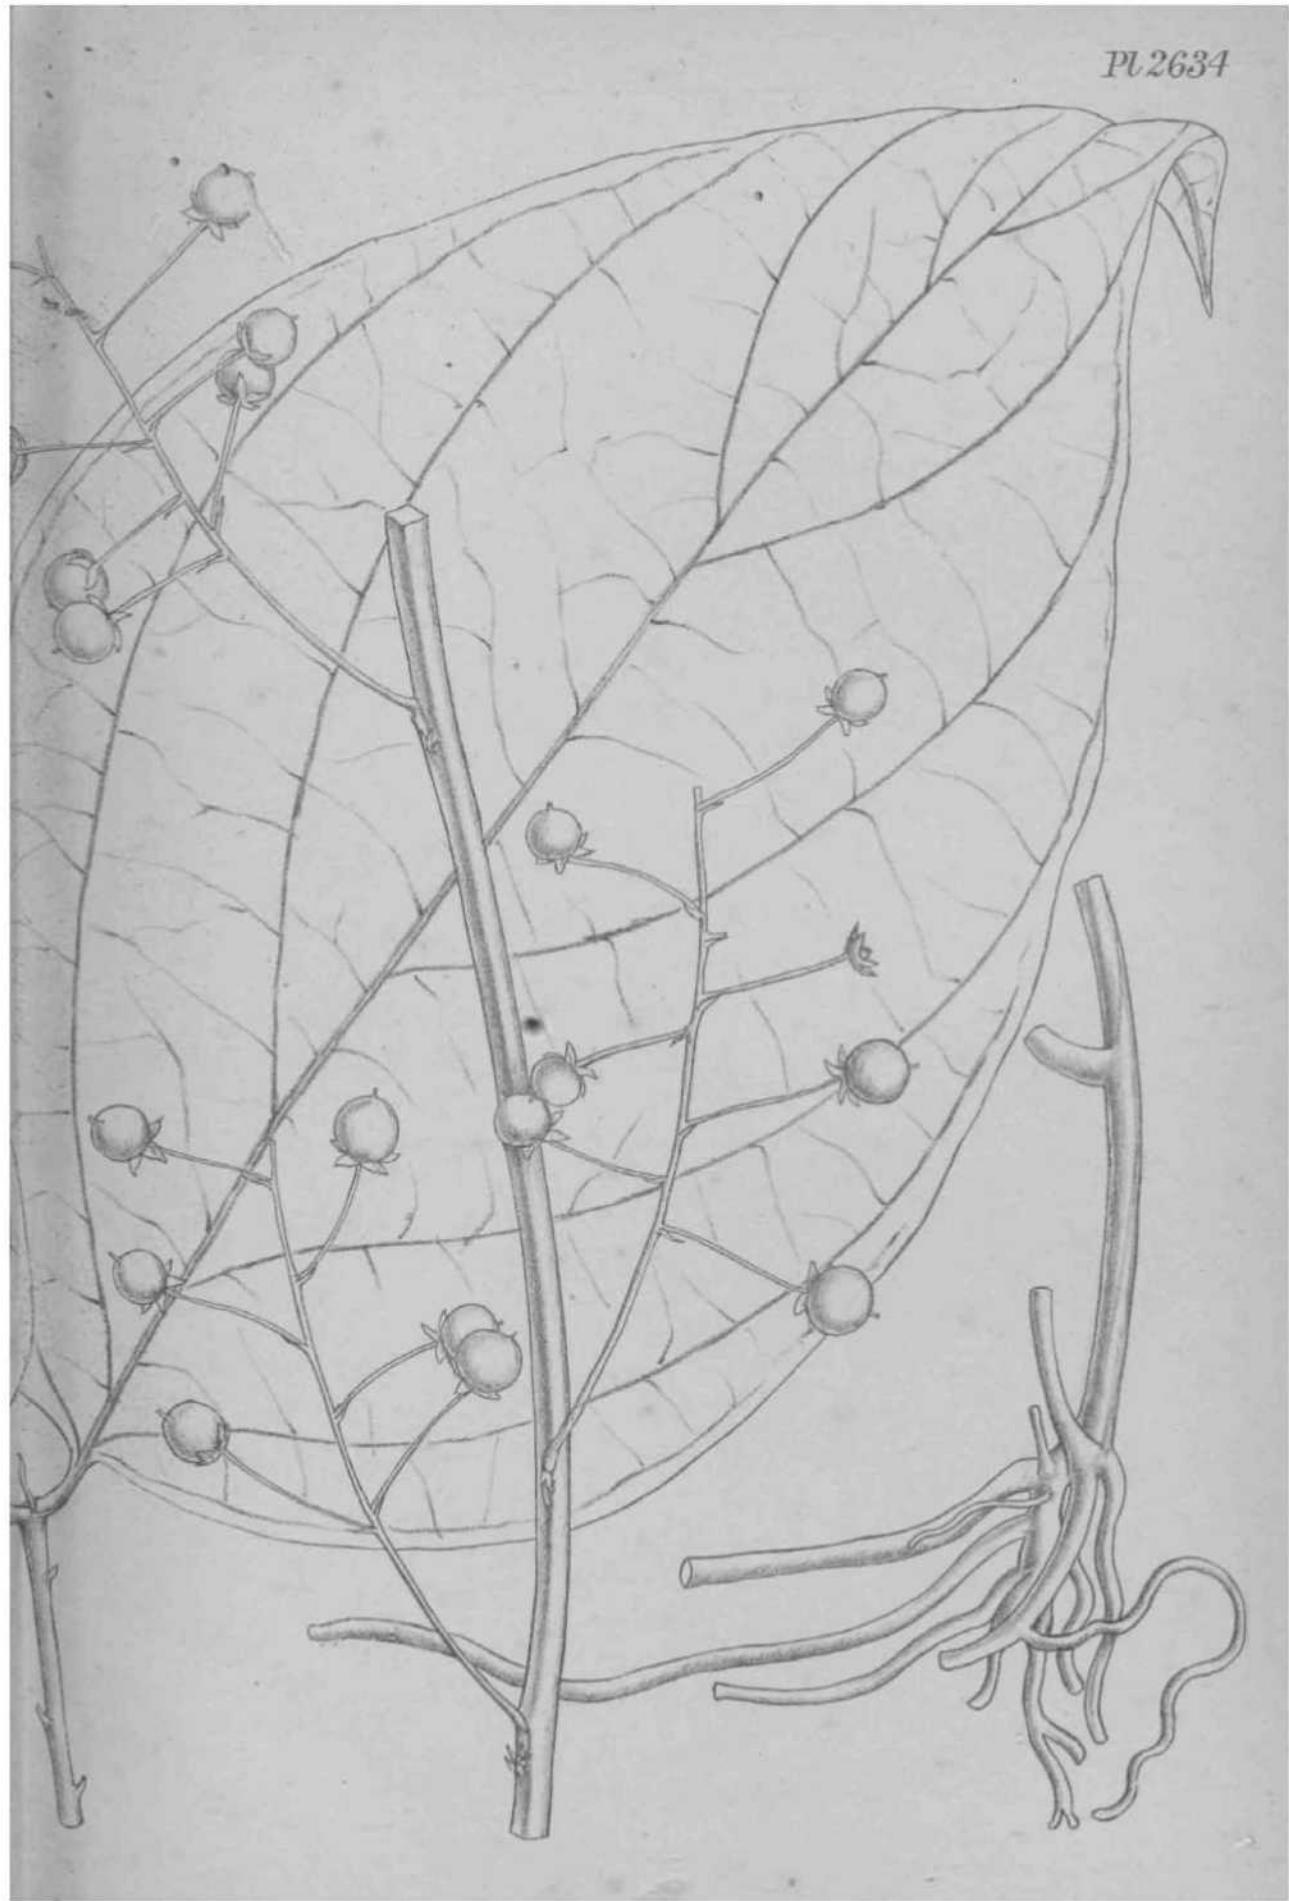

PLATE 2634.

LYSIMACHIA INSIGNIS, *Hemsl*

PKIMULACE;B.

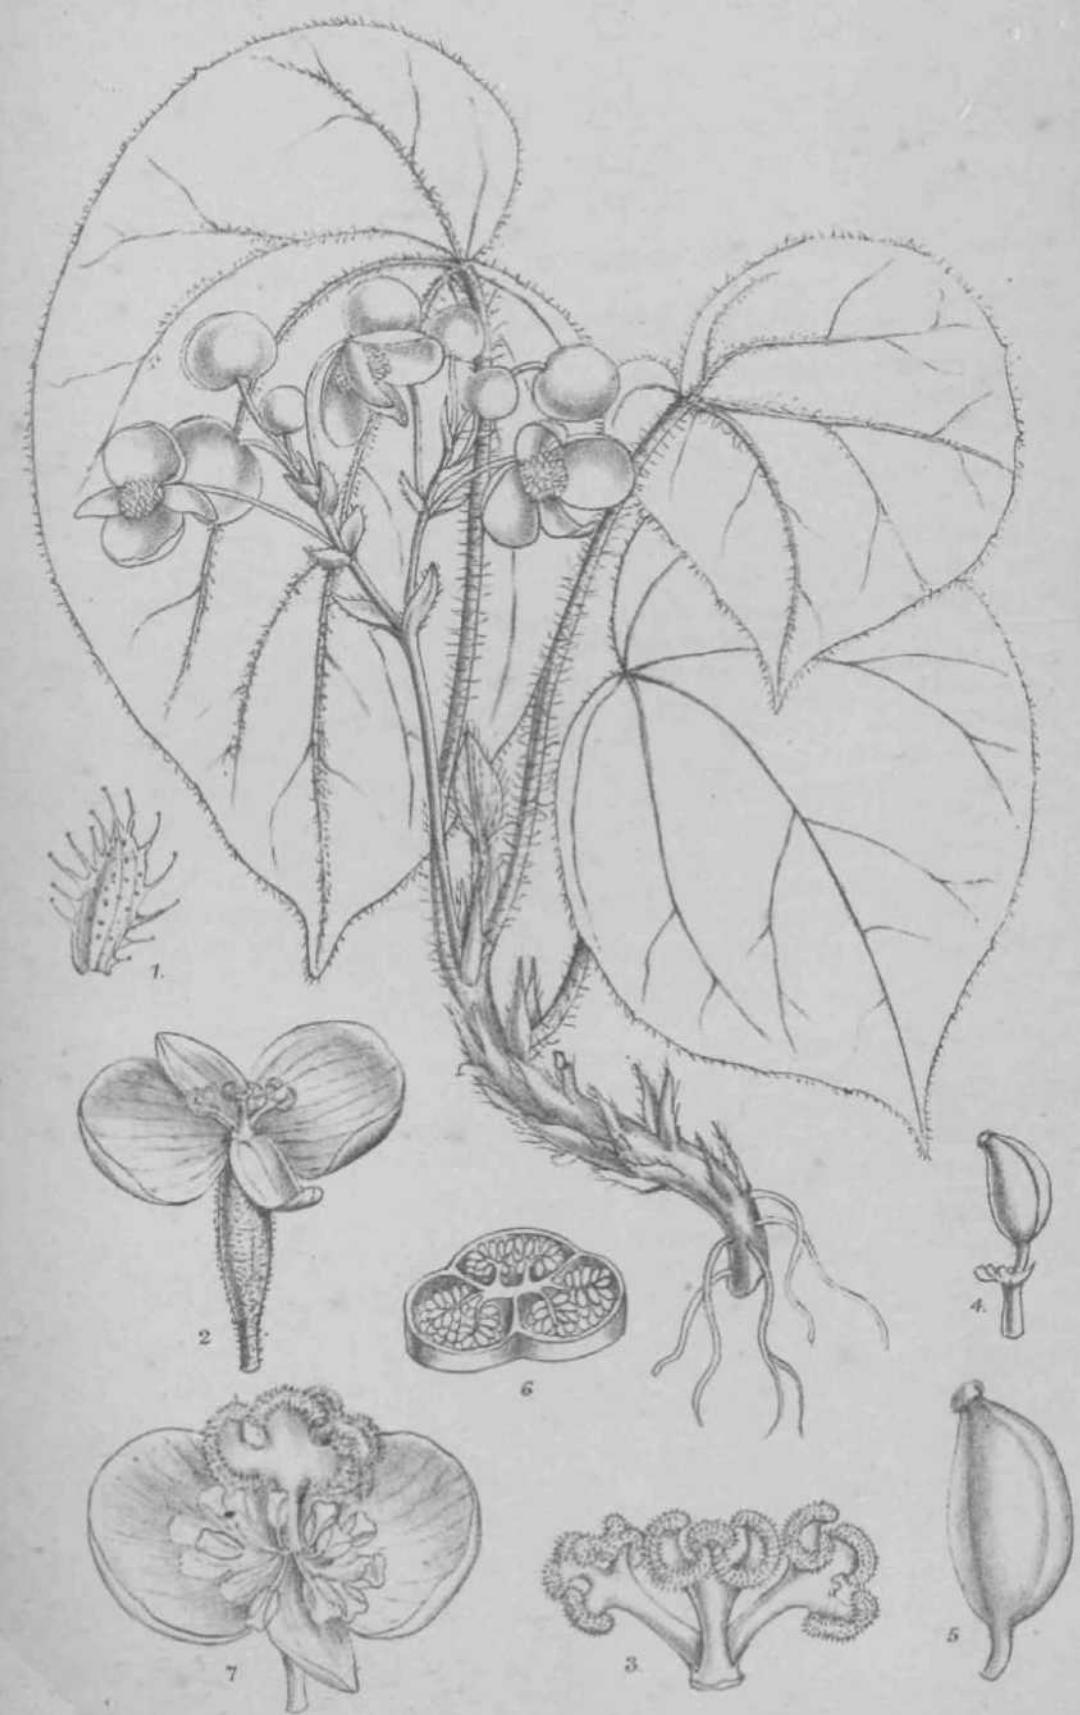

L. *insignis*, *Hemsl.* (*sp. nov.*); a speciebus omnibus hactenus descriptis habitu facile distinguitur.

Herba perennis, erecta, caulis glabris glaucis simplicibus vel rarius furcatis apice tantum foliatis, ssepius (an semper?) bifoliatis. *Folia* opposita vel subopposita, brevissime petiolata, membranacea, ovata vel cordato-ovata, 6-9 poll, longa, 3-6 poll, lata, longe acuminata, basi rotundata vel leviter cordata, supra glabra, subnitida, pallide viridia, subtus pallida, pulverulenta, venis primariis lateralibus utrinque 6-7, venis ultimis laxe reticulatis. *Mores* . . . in racemos laxos parvos secus caulem subnudum dispositi vel interdum solitarii. *Raeemi* in axillis squamarum minutarum enati, horizontaliter patentes, 2-3 poll, longi, gracillimi, 3-7-flori, bracteolis minutissimis, pedicellis capillaribus 6-9 lin. longis angulo recto divergentibus. *Capsulfe* albse (*A. Henry*) globosre, 3-4 lin. diametro, polyspermse, sepalis parvis ovatis acutis sustentse; semina angularia, subovoidea embryone minuto recto.

CHINA : Forests to the south-east of Mengtze, Yunnan, at 5,000 ft.,
A. Henry, 10406.

About sixty species of *Lydmachia* are known to inhabit China, and they exhibit a greater diversity in habit, foliage, and inflorescence, than is found in the whole of the rest of the area of the genus. *L. insignis* is quite different in habit from all the other species known.—
W. BOTTING HEMSLEY.

Fig. 1, a ripe fruit; 2, cross section of the same; 3, different views of a seed;
*i section of a seed showing the embryo. All enlarged.

VLATO 2G35.

BEGONIA BRETSCHNEIDERIANA, Hems.

BEGONIACE*E*.

B. bretschneideriana, Hems. (*sp. nov.*) ; inter species sinenses *B. Henryi* similis, differt rhizomate elongate* dense squamoso, capsula exalata.

Herba vix semipedalis, rhizomate 1-3 poll, longo squamis amplis vestito. *Folia* pauca (1-4) longe petiolata, tenuia, fere membranacea, oblique rotundato-cordata, H-4 poll, diametro, remote sinuato-denticulata, saepe breviter abrupteque acuminata, lobis basilaribus contigais vel paullum superimpositis, supra glabrescentia, subtus plus minusve prsecipue in venis ferrugineo-furfuracea; petiolus 1-3 poll, longus, gracilisculus, furfuraceo-pilosus, ferrugineus. *Scapi* (vel inflorescentise) quam folia breviores, monoici, ferruginei, solitarii vel geminati, ad medium dichotomo-ramosi, bracteis bracteolisque ovato oblongis instructi, pedicellis filiformibus. *Flares masculi* numerosi, 6-8 lin. diametro; sepala 2, orbicularia; petala 2, linearis-oblonga, sepala sequantia; stamina numerosa, filamentis filiformibus liberis. *Flores feminei* centrales, breviter pedicellati, sepalis petalisque ut in masculis. *Ovarium* 3-loculare, placentis bipartitis multiovulatis, stigmatibus 3 tortuosis. *Capsulce* oblique oblongse vel rectse, circiter 6 lin. longse, exalatse; semina perfecta non visa.

CHINA : province of Kwangtung, C. Ford, 87 of 1887 collection.

Begonia bretschneideriana is thus named to commemorate the author of the " History of European Botanical Discoveries in China :" probably the most complete account of the botanical exploration of a country extant. It is a very distinct species, especially in the fruit.—
W. BOTTING HEMSLEY.

Fig. 1, a bract; 2, a female flower; 3, stigmas; 4 and 5, fruit; 6, cross section of the same; 7, an hermaphrodite flower. All enlarged excej't 4.

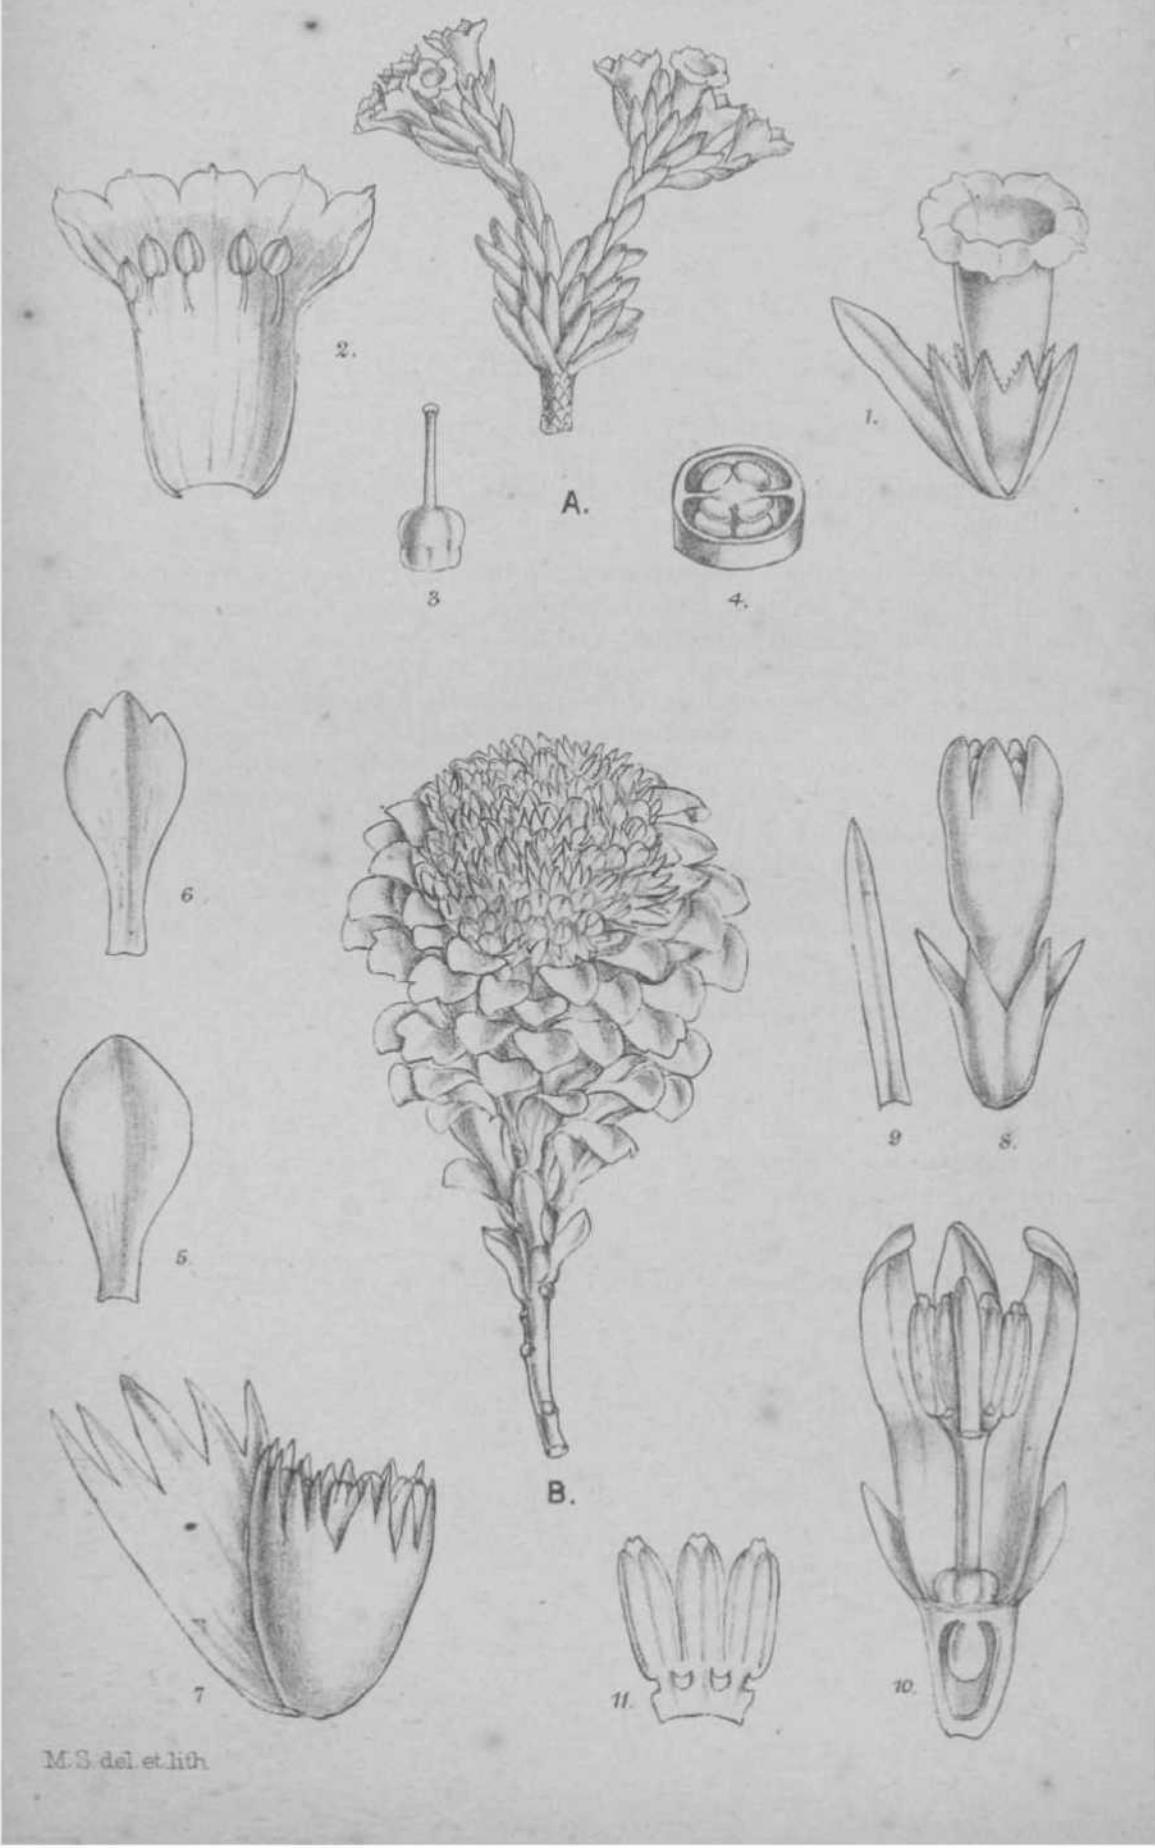

PLATE '2636 A.

BENTHAMIELLA NORDENSKIOLDII, *Dusin.*

SOLANACE^. Tribe CESTRINÆ.

B. Nordenskioldii, *Duadn*[^] ms. (*sp. nov.*) ; a *B. 2>a(agonica*, Speg., foliis angustioribus acutis et floribus minoribus diftert.

Fruticulm liumilis. *Folia* erecta, iinbricata, densissime conferta, 3 -4| lin. longa, | lin. lata, linearia, acuta, supra concava, subtus leviter carinata, crassiuscula, subrigida, glabra. *Flores* in axillis foliorum superiorum solitarii, sessiles, bi brae teat i. *Bractecu* 2-2.{ lin. longse, \ lin. latse, lineares, acuttv, glabrc, parce glanduloso-ciliatse. *Calyx* 2-2[^] Hn. longus, campanulato-tubulosus, 5-dentatus, extus glaber, intus minute glandulosus, dentibus \ lin. longis acutis minute glanduloso-ciliatis. *Corolla* 4-5 lin. longa, 1[^]-1 J lin. diam. cylindrica, apice plicato-5-loba, glabra, lobis ^ lin. longis truncatis apiculatis. *Stamina* 5* inclusa, glabra, filamentis vix \ lin. longis, antheris \ lin. longis late oblongis obtusis minute apiculatis. *Ovarium* breve, subcylindricum, apice dspresso-truncatum, g[^]abrum, 2-loculare, loculis 4- 6-ovulatis ; stylus filiforais, inclusus, glabar, stigmate pulvinato.

SOUTH PATAGONIA : *Nordenskiold.*

This is the second species at present known of the genus *BenthamieHa*, Speg., which is closely allied to *Fabiana*, Ruiz and Pav., chiefly differing in habit and the few ovules in each ovarian cell. For the opportunity of figuring it we are indebted to Mr. P. Duse*n, who presented a specimen to Kew in April 1899.—N. E. BROWX.

A. Fig. 1, a flower, accompanied by a leaf and two bracts; 2, corolla laid open; 3, pistil; 4, transverse section of the ovary. All enlarged.

PLATE 2636 B.

ACICABPHA ROSULATA, N. E. Brown.

CALYCEREJE.

A. rosulata, If. E. Brown (sp. nov.); habitu a spsciebus reliquis distinctissima.

ffera subacaulis, caule simplici. *Folia* numerosa, dense rosulata, coriacea, spathulata, 1 poll, longa, ♀ poll, laia, *integra* vel 3 dentata, obtusa, in petiolos cuneatim-angustata, glabra. *Capitula* numerosa, in axillis bractearum palmatisectarum sessilia, dense conferta. *Involucri* bractese in cyathium multidentatum connatse; dentes 1J lin. longi, linear-lanceolati, acuti. *Flores* exteriores 8-10 fertiles, centrales 4-6 steriles. *Calyx* 5-dentatus. *Corolla* 1f-1f lin. longa, tubulosa, 5-dentata, dentibus § lin. longis linear-oblongis apice incrassatis erectis. *Stamina* 5, filamentis alte connatis. *Ovarium* glabrum. *Achcenia* matura ignota.

SOUTHERN PATAGONIA : Cerro Toro, Norden?kiold, A 60.

This remarkable species differs from all the other members of the genus in its dwarf habit and densely rosulate leaves, and at first sight would seem to be better placed in *Boopis*, but the cohesion of the filaments decides us to place it in *Acicarpha*. It was collected by Dr. Nordenskiold during a Swedish expedition to Antarctic America in 1895-1897, and was sent to Kew for determination by Mr. P. Dus~~n~~^{*n} of Stockholm.—N. E. BROWN.

B. Figs. 5 & 6, leaves; 7, a separate head of flowers with its involucre and bract; 8, flower; 9, bracteole; 10, longitudinal section of flower; 11, three anthers and a fragment of the terminal tube. All enlarged.

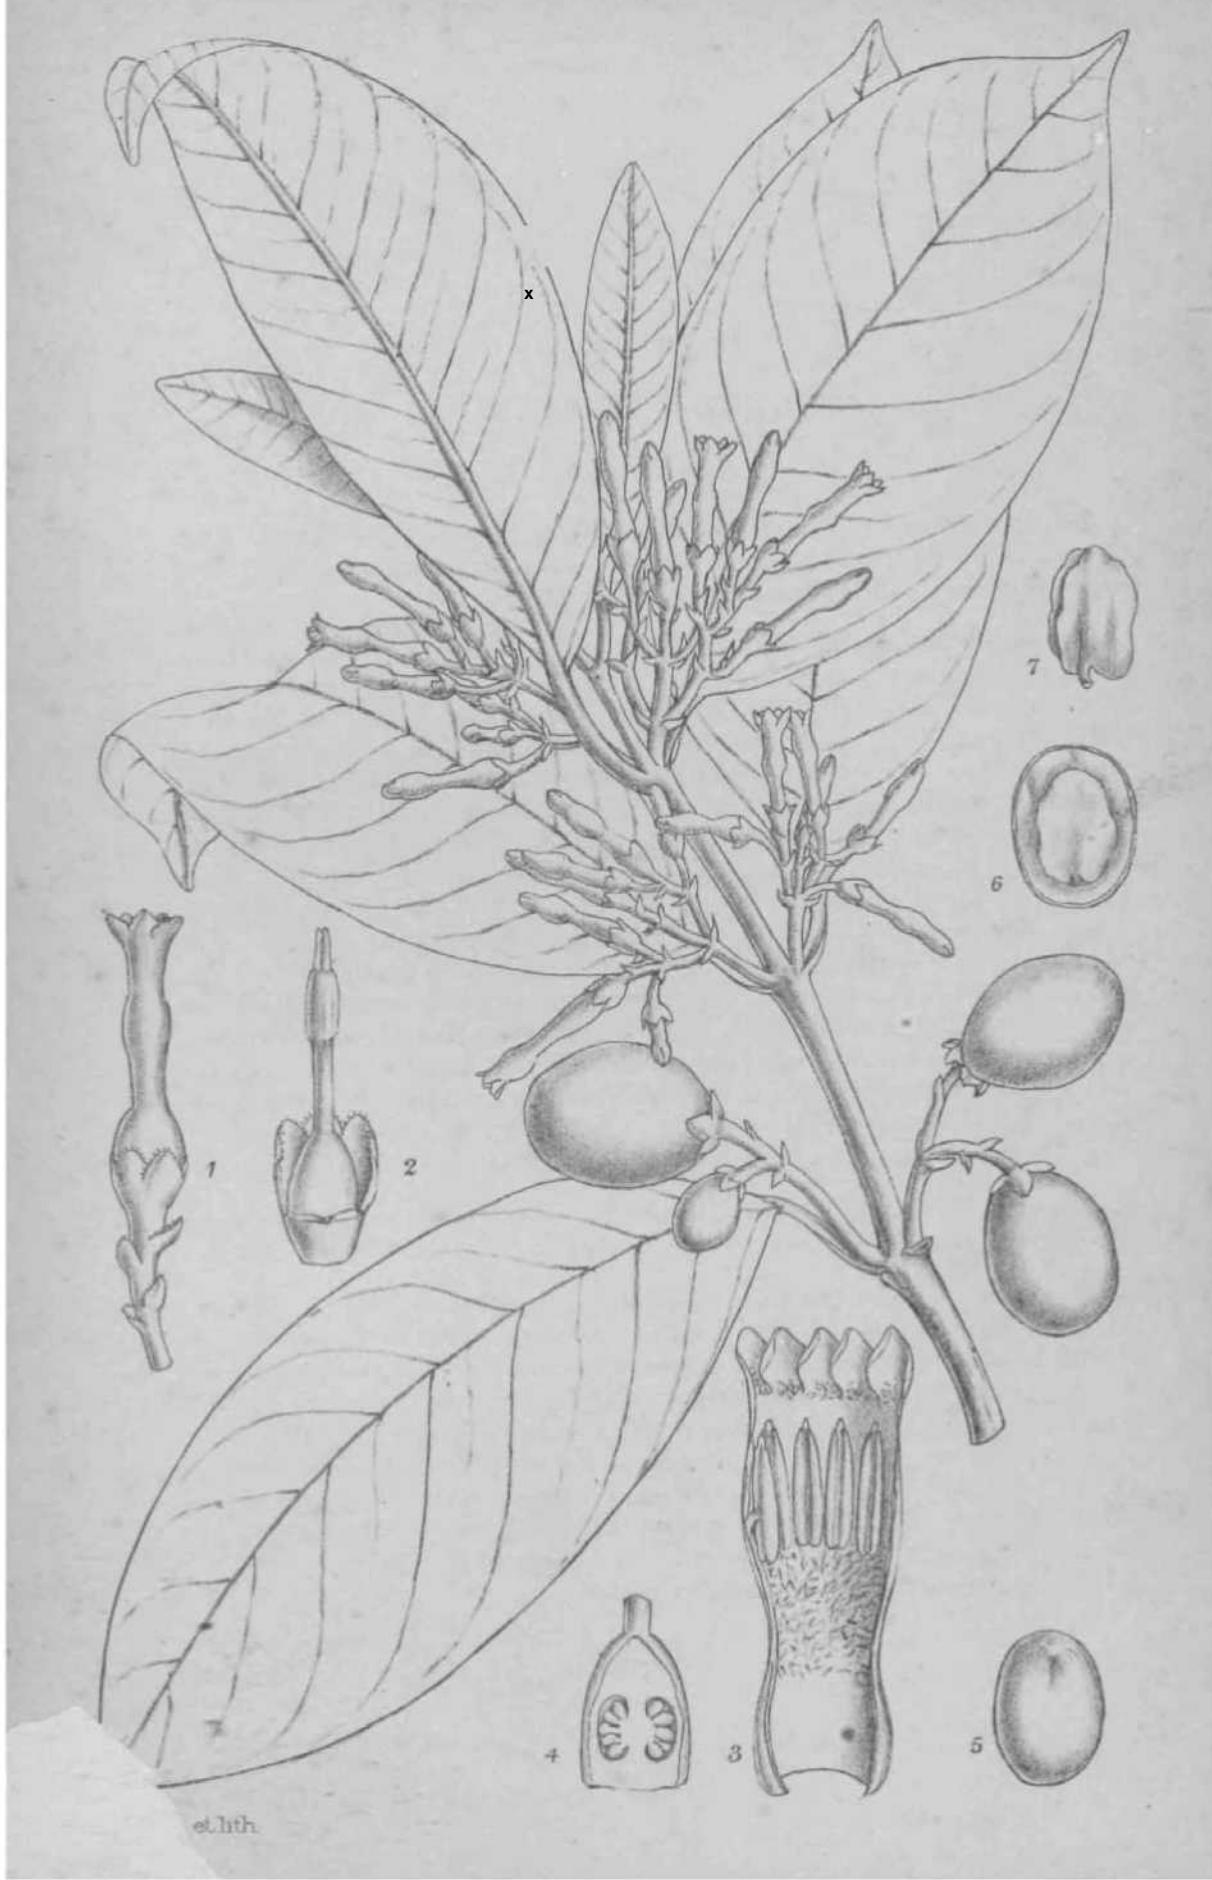

PLATE 2637.

ZSCHOKKEA. UTILIS, *He nisi.*

APOCYNACEiE.

Z. utilis, *Hemsl.* ; *Tabernaemontana utilis*, Am. in *Edinb. N. Phil. Journ.* viii. (1830) p. 318; *a.dZ. monospermam* arete accedit sed foliorum venis primariis paucioribus differt.

Arbor 30- 40-pedalis, trunco 16-18 poll, diametro, ramulis ultiniis floriferis rigidis rectia glaberrimis, internodiis brevibus. *Folia* petiolata, coriacea, glaberrima, oblonga vel oblongo-lanceolata, usque ad 6 poll, longa, 1[^]-2[^] poll, lata, obtuse acuminata, basi rotundata vel subcuneata, costa supra impressa, subtus elevata, venis primariis lateraliibus utrincue circiter 15 leviter curvatis, venis ultimis obscuris. *Floras* 7-9 lin. longi, breviter pedicel lati, in cymas axillares parvas trichotomas breviter pedunculatas dispositi. *Calycis lobi* minuti, rotundati, persistentes. *Corolla tubus* cylindricus, rectus, supra ovarium constrictus, s pra medium circum antheras paullo inflatus, extus glaber, intus infra stamina hirsutus; limbi lobi brevissimi, erecti, rotundati. *Stamina* medio tubi affixa, filamentis brevissimis, antheris omnino inclusis. *Ovarium* glabruin, 2-loculare, loculis multiovulatis, stylo stamina vix wquante. *Fructus* baccatus, ovoideus, 8-10 lin. longus, 1-spermus (an semper ?). *Semen* ovoideum vel ellipsoideum, testa brunnea, mein-branacea, albumine corneo ; embryo axilis, amplius, rectus, cotyledonibus compressis tenuibus cordatis undulatis, radiuula brevi.

BRITISH GUIANA : Upper Demerara river, *Jenman*, 4275; near Rockstone, Essequibo river, *Jewman*, 7491.

This is one of the trees called *Hya-hya* by the natives of Guiana ; and it is the cow-tree of the English colonists. Mr. G. S. Jenman, to whom Kew is indebted for the specimens described and figured here, states in a letter accompanying the specimens, that a bottle of milk was taken from the same tree and allowed to dry in the bottle, when it was found to contain a large proportion of rubber of good quality. O. A. Walker Arnott's botanical description (*Edin. N. Phil. Journ.* viii., 1830, pp. 315 318), is preceded by a detailed account of the *Hya-hya* or milk-tree of JVmerara, by James Smith, from which the following paragraphs have been extracted :

" I was then in company with a Mr Couchman, the superintendent of si wood-cutting establishment in the immediate vicinity. We luid

sent a lad to search around for the tree, and he returned in a short time to tell us he had met with it. We followed him to the spot, aiii found that he had felled the tree. It had fallen across a little rivulet the water of which, when we arrived, was completely whitened from its juice. On striking a knife into the bark, a copious stream of milk-like fluid immediately followed. Our guide drank of it, and Mr. Couchman and myself tasted it after him. It was thicker and richer than cow's milk, and destitute of all acrimony, leaving only a slight feeling of clamminess on the lips. I had already seen that it mixed freely with the water of the little stream, and as I slept that night near the spot, the next morning Mr. Couchman and myself drank it in warm coffee. With this it commingled equally well, and lost all the viscosity before perceptible in its pure state, so much so as to appear to us incapable of being distinguished from animal milk. Mr. Couchman was determined, he said, to use it as a substitute for milk at his little neighbouring woodland establishment. A variety of experiments, too, have since tended to confirm me in my opinion, that it in no way differs in quality from the vegetable milk of the cow-tree. Yet it was plain that the tree was not that described by Humboldt."

"The milk I send you has now been in bottle thirty-six days. It did not commence to curdle before the seventh day after it was taken from the tree, and even then the process appeared exceedingly slow; so much so, that on the twelfth day I used some of another portion, which had been bottled at the same time, in tea, without its being distinguished from animal milk by those who drank it."

The very closely allied *Lacistema edulis*, Karst. (*Fl. Columb.* ii. p. 101, t. 152), is described as yielding a drinkable juice or sap, called *leche y miel*, literally milk and honey, by the Spanish Americans.

An analysis of the milk of *Zschokkea utilis*, sent home by Mr. James Smith, was published by Professor R. Christison (*Edin. N. Phil. Journ.* ix. (1830) pp. 31-35).

With regard to the systematic position of the plant here figured there may be some doubt, because the limits of the allied genera are badly defined; but it certainly should not be left in *Taberncrmon-tana*.—W. BOTTING HEMSLKY.

Fig. 1, a flower; 2, pistil and portion of calyx; 3, a corolla; 4, vertical section of ovary; 5, a seed; 6, a section of the same showing the embryo in position; 7, embryo. All enlarged.

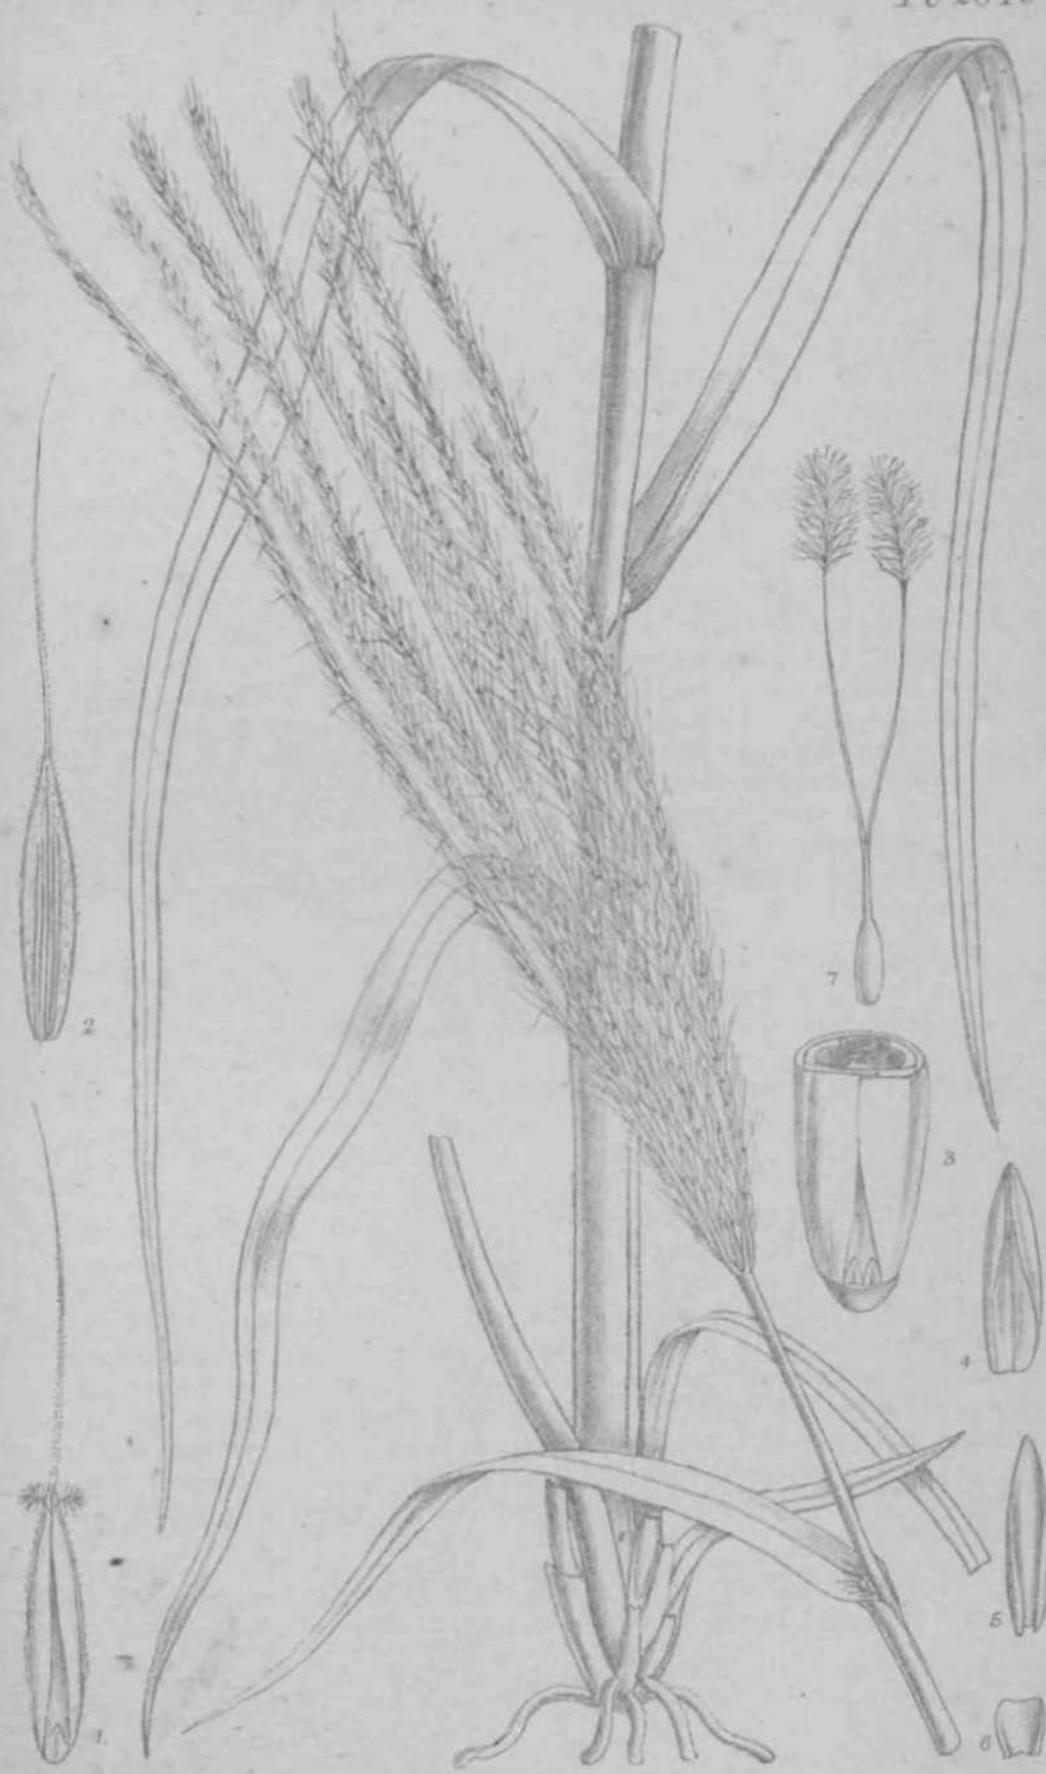

PLATE 2640.

CHLORIDION CAMERONI, *Stapf*.

GRAMINE.E. Tribe PANICEJB.

Chloridion, Stapf (gen. nov.). Spiculcn parvie, 2 valves, lanceolate, arista tee, a dorso conipressse, decidusr, geminatae, inaequaliter pedicellatae, secundas in axibus applanatis racemorum digitatorum, rhachilla subnulla. Gluma inferior suppressa, superior minuta, hyalina. Valvas admodum dissimiles ; inferior sterilis, tenuiter aristata, prominenter 7-nervis, inter nervos parallelos tenuis, marginibus inflexis, cum palea squamiformi minutissima ; superior fertilis, inferiore brevior, niutica, tenuiter 3-nervis, papyracea. Pal pa florein § subtendens 2-nervis, ca'teruni eiua valvie siroilis. Lodiculre 0. Stamina 3. Ovarium oblongo-ovoideum ; styli ima basi connati, longi, gracillimi ; stigmata sub apice spiculie ipso exserta, perbrevia. Caryopnis ignota. Grameii/jermm. Foliorum lamirut lineares, pianos ; lignla. brevissimce, membranacefp. Racemi 4-6, digitati, suberecti. Spiculcc numeroscc, congestcc, bicolores.*

C. Cameroni *Stapf (species unica).* Culmi erecti 2-3£-pedaIes, glabri, striati, 6-7-nodi, internodiis superioribus interdum breviter, sum mo longi us exsertis. *Foliorum vagina** subcompressie, striatre, inferiores dense pilosae, superiores giabratre ; ligulas ciliolatue ; laminee lineares, longe attenuate?, acutse, ad 8 poll, longa*, 2 4 lin. latse, utrinque subadpressje, pilosrc, pilis post ligulam longiusculis densis, nervis numerosis arctis, marginibus cartilagineis asperis. *Racemi* 4-8, graciles, stricti vel flexuosi ; axis dorso plana, i lin. lata, griseo-viridis vel pallescens, minute puberula, in marginibus ciliata; pedicelli scabriduli, longiores ad | lin. longi. *Spiculce* lanceolate, acuta?, 1-1[^] lin. longae (arista dempta), axi adpresso vel oblique erectw. *Gluma* (superior) ovata, acuta vel mucronulata, £-J lin. longa, pallida, pier unique 1-nervis. *Valva* sterilis dorso griseo viridis vel pallescens, scaberula, apicem versus 2-carinata, carinis superne spinuloso-ciliolatee, arista gracillima, ssepe violacea, 3-5 lin. longa ; valva fertilis oblonga, subacuta, J-l lin. longa, chartaceo-membranacea, levis, brunnea vel fusca marginibus hyalinis exceptis, tenuiter 3-nervis, nervis sub apice anastomosantibus. *AnthercB* § - | lin. longw. *Styli* } lin. longre ; stigmata £ lin. longa, purpurea.

BRITISH CRXTRAL AFRICA : Shire Highlands, *Buchanan*[^] 407 ; North Nyasa, Whyte; Namasi, *Cameron*, 15 (coll. of 1899).

Chloridion might be described as a *Digitaria* in which the lower glume is entirely suppressed and the upper reduced to a scale, whilst the lower (barren) valve runs out into a fine bristle-like awn. The pale in the axil of the lower valve is represented by a mere scale or two collateral scales $\wedge \sim r \wedge \wedge^n - l^{\circ D} g -$. A similar reduction of the glumes and the lower pale occurs in the section which I now designate *Setaridium* of *Digitaria* (§ *Setariopsis*, Stapf, in Thiselton-Dyer, *Fl. Cap.* vii. 373, 1898, not *Setariopsis* (gen.) of Scribner in Field, *Columb. Mus.* i. 288., 1896); but the species of this section have no awn, nor is there in any other species of *Digitaria*, and they have distinct lodicules. The general appearance of the inflorescence is strikingly like that of *Chloris pycnothrix*, Trin.—O. STAPF.

Fig. 1, spikelet, with the upper (only) glume at the base; 2, the same, seen from the other side; 3, fertile floret, lower part with 2 scales at the base, representing the pale of the barren floret; 4, fertile valve; 5, pale of the fertile floret; 6, usual form of the pale of the barren floret; 7, pistil. All enlarged.

DRACONTOMELUM SINENSE, *Sittpf.*

AXACARDIAOKJIS.

Dracontomelum sinense, *Skip/ (sp. nov.)* \ aftinis *D. manylfero* Blume, foliolis baud nitidulis, minoribus, tenuioribus, nervis magis curvatis, reticulatione tenuiore, panicula minore, minus pilosa, fructibus minoribus diversa.

Arbor 20-30 ped. alta; ramuli novelli angulosi tenuissime griseo-tomentelli. *Folia* 5-7-juga ; petiolus cum rhachi angulatus, tenuissime tomentellus, 5-7 poll, longus; petioluli 1-2 lin. longi; foliola ob inferiora ssepe minora latioraque plerumque inaequalia, majora oblonga, acuminata, basin versus asymmetrica 3-3½ poll, longa 10-15 lin. lata membranacea, costa excepta glabra, opaca, nervis lateralibus utrinque circiter 8-9 a medio vel infra valde curvatis, venis demum prominulis. *Panicnlce* foliis breviores, cum pedunculo 4- 6 poll, longa*, minutissime parceque puberulse; pedicelli 1|-1 lin. longi. *Sepala* late ovata, obtusa, 2 lin. longa, tenuissime tomentella. *Petala* alba, lanceolata vel linearia, apice recurva, superne coherentia, 3 lin. longa. *Filamenta* tenuia, petalis subsequilonga. *Drupa* globosa flavida acidula; putamen obtuse 3-5-gonum, depresso, | - | poll, dimetiens, 5-loculatum, saepe ob loculos 1-2 steriles 4-3-spermum. *D. mangiferum* (?), Hemsl. in *Journ. Linn. Soc.* xxiii. 149, non Blume.

TROPICAL EASTERN ASIA : Tonkin, in woods in the valley of the Lankok, *Balansa*, 3427 ; near Sontay, *Bafansa*, 3428. Hanoi, in gardens, *Balansa*, 4378, 4401, 4527, 4604. South China, commonly cultivated on the West River, *Ford*, 10.

Mr. Ford's specimens were accompanied by a label stating that " this is said to yield Chinese Olives," and this label was referred to by Mr. Hemsley I.e. 1 find, however, that there is a sheet in the herbarium, containing a flowering branch, communicated by Ford, of *Canarium Pimela*, the plant actually yielding the " Chinese Olives " (see Hance in *Journ. of Bot.* 38). This specimen was, according to a note on the sheet, received mixed with Ford's specimen of *Dracontomelum sinense*, and I suspect that the name " Chinese Olives " was originally intended for the *Canarium*, or that the fruits of either species are known by the name in South China. There is little difference in the panicles, flowers, and fruits of *I. sinense* and *D. mangifervm* apart from the length of the panicles and the size of the fruits, as all the species of this genus resemble each other very much in those points : but the much smaller and thinner leaflets distinguish *D. similar* sufficiently from *D. mangiferum*.—O. STAPF.

Fig. 1, flower; 2, fruit, copied from a coloured figure in the collection of drawings at Kew; 3. stone; 4. stone out open; S, seed; 6, embryo. All enlarged.

TYATK 2012.

KOELREUTERIA MINOR, *H*<>.*m*«*l*

SAPINDACEJE.

K, minor, *HemsL* (*sp. nov.*); a speciebus duabus descriptis foliorum et fructuum exiguate differt.

Arbor parva vel frutex 13-pedalis (C *Ford*), ramulis fructiferis crassimculis brevibus pubescentibus. *Folia* in apicibus ramulorum confertissima, simpliciter pinnata, breviter graciliterque petiolata, maxima vix 6 poll, longa, praecipue subtus et secus rhachim tenuissimam pubescentia, demum glabrescentia ; foliola 15-21, confertissima breviter vel brevissime petiolulata, tenuia, rigiduscula, oblique lanceolata, 3~H P⁰^- I^on£^a> maxima 6 lin. lata, obtusa, basi semirotundata vel subcuneata, margine crenulata. *Flores* in paniculas axillares et subterminates folia sequentes vel superantes dispositi. *Caiyx*[^] etc. . . . *Capsula* 3-alata, ante dehiscentiam circiter 9 lin. longa lataque ; semina subglobosa, strophiolata, circiter 2 lin. diametro, fere nigra, nitida, embryone spiraliter convoluto, cotyledonibus longissimis, radicula brevi.

CHINA : Province of Kwangtung, C. *Ford*, 291, August 1887.

Of this miniature *Koelreuteria* no flowers have yet been received, but it is so very distinct that we do not hesitate to describe the otherwise complete specimens. It is only known to us from the province of Kwangtung, whereas the original *K. paniclnata*, Laxm., ranges from Japan to Kansuh and Szechuen, and the more recently described *K. bipinnatn*, Franch., extends from Formosa, Ningpo, and Kiukiang, to Western Yunnan.—W. BOTTINO HEMSLKY.

Figs. 1 and 2, *a* sped in different positions; 3, a section of the same, showing the embryo; -I, the same, with the embryo removed. All enlarged.

PLATE 2643.

COCHLEARIA HOBSONI, Pearson.

CRUCIFERJE. Tribe ALYSSINEJE.

C. Hobsoni, *H. II. W. Pearson (s]). nov.*; species affinis *C. himalaicce*, Hook. f. et Thorns., a qua habitu, petalorum forma et stylo post anthesin reflexo differt.

Herba annua (?), suberecta, glanduloso-pubescentia, paulluluhi ramoaa, 6-8 poll. alta. *Foliorum lamina?* parvse, cuneatim in petiolos breves attenuate, integrse vel inferiorum interJum 3-lobatie, ovatse, obtusas, glabrse, 2-3 lin. longse. *Flores* 3-4 lin. diametro, solitarii, axillares. Pedunculi 6-10 lin. loDgi, lineis lateralibus binis oppositis glanduloso-pubescentibus instructi. *Sepala* sequalia, similia, hyaiina, ovata, obtusa, 3-nervia, basi saccata, apice paullulum crenata, utrinque glabra, 1-5 lin. longa. *Petala* late elliptica 4 lin. longa, obtusa, basi subcordata, penninervia, glabra, violaceo-rubra. *Filamenta* basi dilatata, supra violaceo-rubra; antherae concolores. *Ovarium* breviter stipitatum, 1-loculare, giabruin; stylus rectus, quam ovarium longior. *Ovula* 3-5, biseriata. *Siliculum* 2 lin. longum, stylo valde reflexo. Seminis testa punctata; cotyledones accumbentes.

TIBET : Yatung, near the Sikkim border, *Hobson*.

It is doubtful whether this species belongs to the genus *Cochlearia*. It is, however, placed here for the present on account of its close affinity to *C. himalaica*, Hook. f. and Thorns. Mr. Hobson also collected another specimen closely related to the one here described, and identical with Watt, 5795, from Jongri. The material from both collections is, however, so meagre that it is impossible to assign it to a species.—H. H. W. PEARSON.

Fig. 1, a flover from which the petals have been removed; 2, a sepal seen from -within; 3, a petal; 4, a stamen; 5, a pistil and disc; 6, a cross section of the ovary; 7, a fruit; 8, seed; 9, an embryo. All enlarged.

OSTEOMELES SUBROTUNDA, *C. Koch.*ROSACE.E. Tribe **POMEAE.**

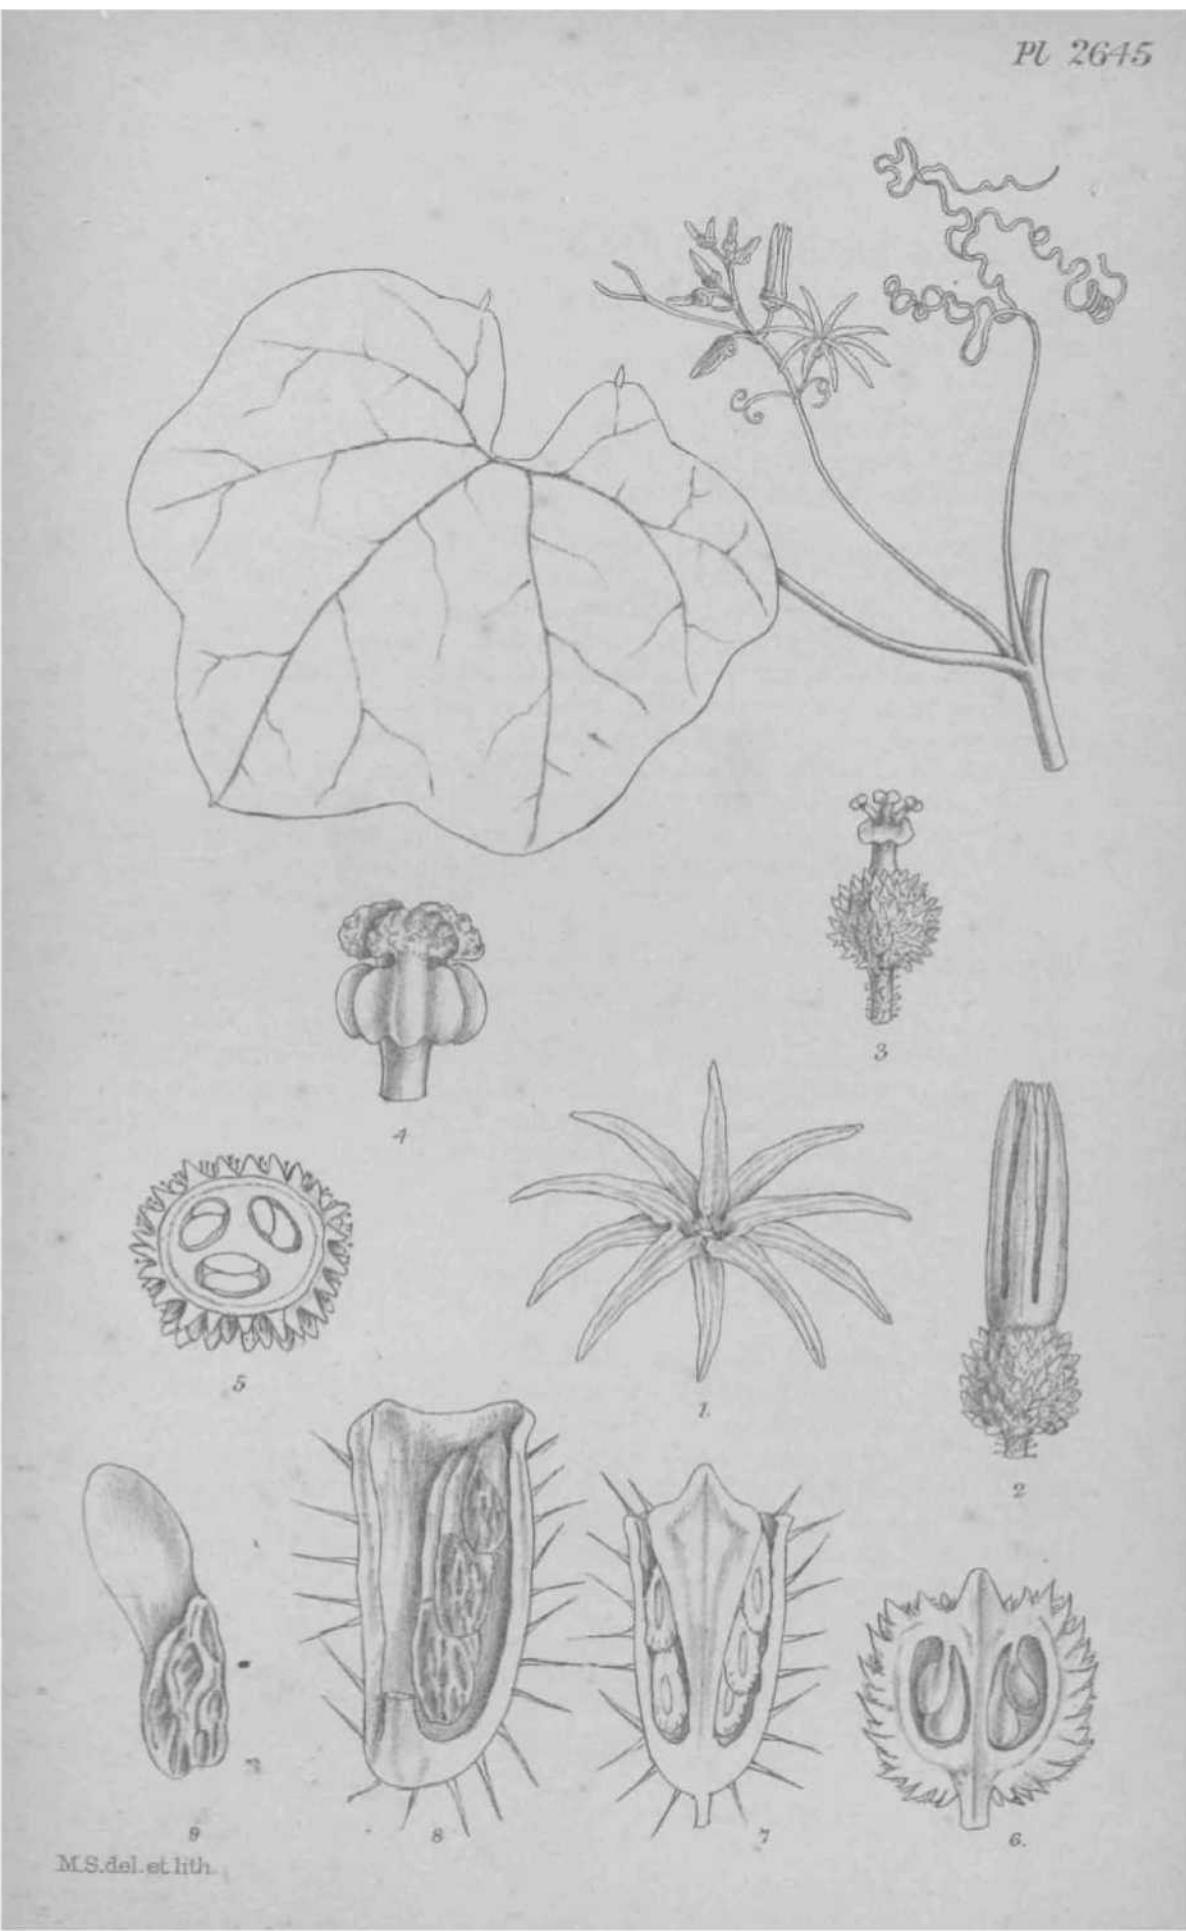

0. *subrotunda*, *C. Koch* in *Ann. Mus. Hot. Lugd. Bat.* i. p. 250; *Franch. et Savat. Enum. PI. Jap.* i. p. 143 ; a fornris omnibus hujus generis nobis cognitis foliolis crassis paucioribus apice rotundatis supra glabris atroviridibus et stylis glabris differt.

Frutex ramosus, nanus (?) novellis plus minusve sericeo-hirsutis, ramulis ultimis sterilibus gracillimis, floriferis lateralibus rigidis brevibus. *Folia conferta*, brevissime petiolata, J-lf poll, longa ; foliola 11-17, contigua, brevissime petiolulata, crassa, demum fere coriacea, obovato oblonga, 1^3 lin. longa, apice rotundata, ssepius minute apiculata, ob apiculum deciduum demum obscure emarginata, supra glabrescentia, nitida, subtus adpresso-sericea; stipulse lineares, cito deciduse. *Flares albi*, circiter 6 lin. diametro, in corymbos pnrvos ramos laterales breves terminantes dispositi. *Calyx albo-sericeus*, dentibus lanceolato-ovatis acutis quam petalis paullo brevioribus. *Petala oblongo-rotundata*. *Ovarium 5-loculare*, stylis glabris stamina sequantibus. *Fructus matus non visus*.

CHINA : North river, Kwangtung, *C. Ford*, 614, April 1896. Also recorded from Japan.

Most authors have regarded *Osteomeles subrotunda*, *C. Koch*, as a variety of *O. anthyllidifolia*, *Lindl.*, or even reduced it to this species, without giving it the status of a variety. Indeed, I, among others, formerly considered all the forms of *Osteomeles* found in the Pacific Islands and Eastern Asia as belonging to one species, *anthyllidifolia*. The plant here figured is in cultivation at Kew and elsewhere, and Mr. G. Nicholson, the Curator, called my attention to it, pointing out characters in which it differs from the forms reprobated in the *Botanical Magazine*, t. 7354. So far as we know, it has not produced flowers under cultivation in Europe, and it was originally described by Koch from flowerless specimens. But Kew possesses flowering specimens received from Mr. C. Ford, superintendent of the Hong Kong Botanic Garden, in 1896. The specimens were from a plant originally obtained from the North river, Kwangtung, and cultivated in Hong Kong. After examining the copious material of this genus at Kew from Eastern Asia, I now think that there are several distinguishable, though not very distinct, species.—W. BOTTING HEMSLEY.

Fig. 1, part of a leaf seen from below; 2. a petal; 3, stamens; 4, longitudinal section of ovary. All enlarged.

ACTINOSTEMMA BIGLANDULOSUM, *lhma* ?.

CuCURBITACEiE.

A. biglandulosum, *Hemsl.* in *Book. Ic. PL* t. 2622 (specie de-
scriptio hie einenda et aucta) ; species foliorum lobis 2. basilaribus
conspicue 2-glandulosis facile distinguitur.

1/erba monoica, gracillima, alte (saltern 20 ped.) scandens, fere
undique glabra vel glabrescens, raniulis floriferis elongatis fere fi*Ji*-
formibus. *Folia* (ramulorum floriferorum) longe graciliterque petiolata,
subcarnosa, lama, glabra, cordato-rotundata, absque petiolo 2-3 poll,
longa lataque, obscure 3-5-lobata, basi ssepius auriculato-bilobata,
interdum rotundato-lobata, lobis glandula parva clavata instructis ;
petioli gracillimi, 1[^]-3 poll, longi. *Cirrhi* capillares, simplices vel
furcati, folia sequentes vel longiores. *Flores masculi* 6-8 lin. diametro,
in paniculas laxas axillares quam folia longiores dispositi. *Calycis* et
corolla segmenta similia, membranacea, tenuissima, anguste lanceolata
vel fere linearia, acutissima, patentia. *Stamina* 5, quam petala breviora,
quorum 4 filamentis crassiusculis per paria alte cohserentia, quintum
liberum; antherse biloculares, loculis discretis, connectivo incrassato
supra loculos in caudam tenuem elongato. *Flores feminel* 7-9 lin. dia-
metro, nunc axillares, solitarii, breviter pedunculati, nunc pauci aggre-
gati, cymosi, pedunculis longioribus. *Calycis* et *corollm segmenta* simili-
lai, linear-lanceolata. *Ovarium* globosum, setosum, 3-loculare, loculis
2-3-ovulatis, ovulis ab apice loculorum pendulis. *Capmla* cylindracea,
1[^]-1 J poll, longa, demum sicca, subcrustacea, aculeato-setosa, circiter 6-
sperma, propeapicem calypratim dehiscens ; septa plus minus evanida ;
axis vel columna centralis cum calyptra decidua ; semina compressa,
tuberculato-lobulata, apice alata, cum ala circiter 10 lin. longa.

CHINA : in **woods** near Mengtze, Yunnan, *Hancock*, 346 ; *A. Henry*,
9390.

A second figure of this plant, which has been cultivated both at Kew
and Edinburgh, is given to elucidate the peculiar structure of the fruit,
imperfectly described under plate 2622. The Edinburgh plant pro-
duced female flowers (some of which were obligingly communicated by
Dr. I. B. Balfour) from which it is clear that the ovary is originally
3-celled, though usually, if not always, described as 1-celled. As the
fruit ripens the dissepiments partially disappear, and the central axis
is carried away with the operculum in dehiscence.—W. BOTTING
HEMSLEY.

4, stigma in mature state; 6, cross section of an ovary; 6, longitudinal section of the
same; 7, section of immature fruit; 8, section of mntureditto; 9, a seed. *Aft enlarged*,

DIDESMANDRA ASPERA, *Stapf.*

DILLENIACEJE. Tribe DILLENIEJB.

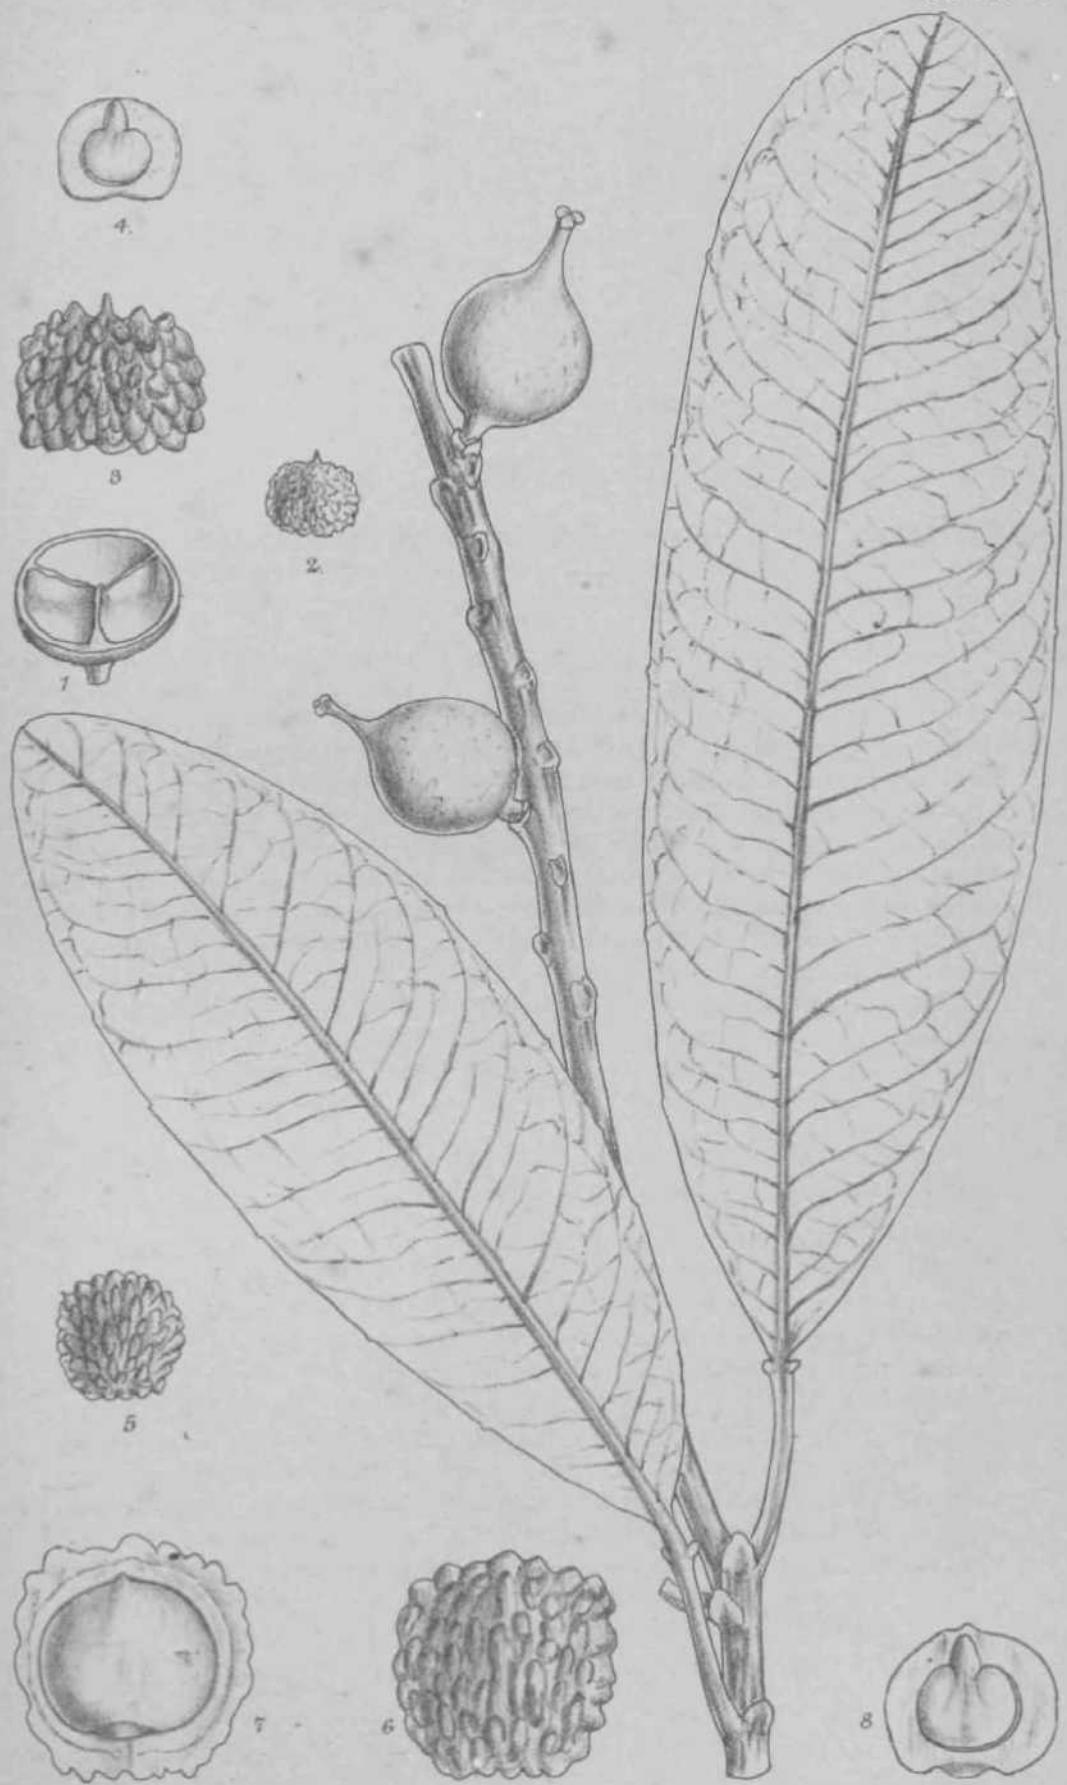

Didesmandra, *Stapf* {gen. nov.). *Sepala* 5, imbricata, exteriora duo cseteris minora. *Petala* 5, imbricata, tenera. *Stamina* 10 in phalanges 2 ante carpella positas coalita; posticum utriusque phalangis fertile, filamento crasso brevi, anthera linearis superne uncinato-curvata, connectivo apice in membranam deltoideam dilatato, loculis parallelis, longitudinaliter dehiscentibus; stamna csetera sterilia, minora, subrecta vel leviter curvata, connectivi appendice truncato vel eroso. *Carpe* *Ua* duo, libera, transverse posita; stylus perlongus, cirrosus, filiformis. Ovulum 1, e basi erectum, anatropum, rhaphe crassissima, ventrali. *Semen* (immaturum) arillo tenuissimo hyalino-membranaceo indutum. Frutex vel Arbor *ramulis et foliis serratis asperis, petiolis basi vaginantibus, amplexicaulibus*. Inilorescentia paniculata, parce ramosa floribus breviter pedicellatis, unilatraliter secus ramos dispositis.

D. aspera, *Stapf* (sp. unica). *Ramuli* asperrimi insuper parce adpresse hirsuti, deinde glabrescentes. *Folia* oblongo-ovata, acuminata, basi rotundata, serrata, 6-8 poll, longa, 2-3 poll, lata, utrinque aspera et prsecipue in nervis strigillosa, sicca supra nigro-, infra rubro-fusca; petioli ^-| poll, longi, canaliculati, basi ramulum amplectentes. *Panicula* 6 poll, longa; rami 2-4 poll, longi, asperi, parce strigilosi; bracteae parvse, subulatse, hirsutse, plerumque a iloribus plus minusve remotse, interdum suppress*. *Sepala* exteriora duo oblonga, subplana, aspera et parce minuteque strigillosa, csetera majora subnavicularia, minus aspera, omnia obtusa, ciliata, firratuscula. *Petala* ampla, f uagacia, rotundato-ovovata, crenulata, ad 1 poll, longa. *Stamina* fertilia (explanata) 8 lin. longa, sterilia 3-4 lin. longa. *Carpella* glaberrima; stylus ad 9 lin. longus, cirrosus.

BORN BO: Sarawak, Belaga on the Rejang River, Hamlan Hs collector, 2324.

Didesmandra is nearest allied to *Schumacheria*, a genus confined to Ceylon. It differs from it in the peculiar structure of the androecium, which, in both genera, is placed in front of the gynsecum. In *Schumacheria*, the number of stamens is indefinite, and they are united into one bundle, all being equal and fertile. In *Didesmandra*, however, they are arranged in two distinct bundles and heteromorphous, and only the posterior of each bundle seems to be fertile. The flowers are also considerably larger in *Didesmandra* and of a somewhat different facies.—O. STAPF.

Fig. 1, floral diagram; 2, carpels and one bundle of stamens; 3, one bundle of stamens, one fertile; 4, fertile stamen; 5, section of a carpel; 6, section of an ovule. Alt eiifttrged.

PLATK 2647.

SAFIUM VERUM, *Ntnul.*

EUPHORBIACE*E*. Tribe CROTONRJE.

S. vernm, *Hemal.* (*sp. nov.*); species ex affinitate 8. *8tylaris*, Muell. Arg., differt foliis basi haud auriculatis, petiolorum glandulis contiguis subglobosis, stylis elongatis omnino confluentibus.

Arbor 60-80-pedalis, sursum parce laxeque ramosa (*White*), novellis glabris. *RamuH* floriferi crassi, rigidi. *Folia* ad apices ramulorum conferta, longe petiolata, coriacea, oblonga vel oblongo-lanceolata, absque petiolo 5-8 poll, longa, apice rotundata et interdum glandula munita, sed non introflexa, basi subcuneata, margine integra vel plus minusve glanduloso-denticulata vel crenulata, costa supra impressa subtus elevata, venis primariis lateralibus iumerosissimis tenuibus sinuatis superne subdibrachiato-anastomosantibus; petioli ^-2 poll, longi, supra apice glandulis 2 contiguis subglobosis praditi. *Flores* in axillis foliorum superiorum racemosi; racemi folia subsequentes, rachi crassa rigida. *Perianthium* etc. . . . *Capmlce* breviter pedicellatse, subglobosse, 7-8 lin. diametro, 3-loculares, columna stylari elongata coronatae; semina compressa, rotundata vel Bubquadrata, circiter 4 lin. diametro, testa Crustacea verrucosa; embryo centralis, cotyledonibus orbicularibus.

COLOMBIA : Departments of Tolima and Cauca at 6,000 to 7,000 feet, *R. B. White* in 1890, and again in 1895, n. 9.

This is the first of a series of figures of American forms or species of *Sapium*, drawn for publication in the *Icones*, with a view to the elucidation of their affinities. Dr. J. Mueller (Muell. Arg.) placed a large number of forms—some of which had previously been described as species—under *Sapium biglandulosum*, Muell. Arg., syn. *Excascarva biglandulosa*, Muell. Arg., *Stillingia biglandulosa*, Bail]. (*DC. Prodr.* xv. 2, pp. 1204-1207); but he protected himself in the following statement : "Pro coordinatione accurata synonymorum varietates et formae variae amplius exponendse sunt, nonnullae tamen hodie nimis imperfecte notae, olim pro speciebus distinctis forte habendae sunt." This was in 1866, and little has been done in the genus since then except to add to the previously existing confusion and uncertainty. The activity recently developed in the cultivation of plants yielding rubber

has resulted in numerous inquiries being addressed to the Director of the Royal Gardens, Kew. Many of these questions it has been difficult or impossible to answer satisfactorily. Considerable time has been expended in the examination of the forms of *Sajrium* inhabiting Colombia, Venezuela, and Guiana as a beginning towards a more useful and scientific classification of the whole of the American species of this genus. It is not to be expected that we shall arrive at once at correct conclusions, because the synonymy is so involved that it is almost impossible to unravel it. Some of the earlier writers on the genus combined two or more species under one designation, while some subsequent botanists endeavoured to separate them, each in his own way, and others went still further in combining, thus creating almost inextricable confusion.

The form here figured under the name of *Sapium verum* is from material supplied by Mr. R. B. White at different dates, which was at first referred to the supposed polymorphic species *S. biglandulosum* | and the *Kew Bulletin* (1890, pp. 149-158) contains some correspondence on this so-called "Virgen Caucho" or "Colombia Virgen," one of the main features of which is the uncertainty then surrounding its identity. In a label accompanying his specimens Mr. White states that it grows all through the Andes at 6,000 to 8,000 feet elevation. If so, it is singular that botanical travellers have neglected to collect it. It is possible that it may prove to be specifically the same as *S. stylare*, Muell. Arg., but it has been thought better not to risk further confusion by combining possibly distinct species.

There is also in the Kew collection a sample of seeds sent from Colombia by Mr. R. Thomson in 1890. He was of opinion, from his own experience and observation in the country, that it was distinct from *S. bigmidulosum*; but there was not sufficient material to prove this botanically. The seed differs only in size from that furnished by Mr. White, as may be seen from the figures 5 to 8, described below, and it will probably prove to be the same species.

On this subject some notes have appeared in the *Tropenpflanzer*, No. 11, 1899; in the *Belgique Colonial*[^] January 21, 1900; and in the *Revue des Cultures Coloniales*, 1900, pp. 16 and 86. Two different names, *S. Thomsoni* and *S. Tolimensi*, are proposed; but as neither figures nor adequate descriptions are given, it is impossible to determine whether one or more species are in question, though probably only one, and that the same as ours. In conclusion, it may be added that *S. verum* Hem si., *S. stylarc*, Muell. Arg., and *S. biglandulosum* var. *moritsianum*, Muell. Arg. (*DC. Prodr.* xv. 2, p. 1206), have persistent styles; and the two last, which are probably identical, have the blade of the leaf distinctly auricled at the base, and elongated glands on the petiole.—W. BOTTING HEMSLEY.

Fig. 1, section of a fruit of the plant figured; 2, a seed of the same; 3, ditto; 4, embryo embedded in albumen; 5, a seed from the sample furnished by Mr. K. Thomson ;J>, the same; 7. the same from which half of the testa has been removed; R, embryo embedded in albumen. Figures 1, 2, and 5 natural size; the rest enlarged.

PLATE 2H48.

SAPIUM P PAUCINERVIVM, *He nisi.*

EUPHORBIACEÆ. Tribe CROTONEA:.

S. T paucinervium, *Hemsl.* (*sp. nov.*); inter species guianenses paucitatem foHorum venarum primariarum distinctum.

Arbor magna (*Jenman*), ramulis crassiusculis, cortice nigrescente, novellis glaberrimis. *Folia* in ramulis floriferis conferta, in ramulis sterilibus elongatis sparsa, distincte graciliterque petiolata, coriacea, oblongo-lanceolata vel oblanceolata, cum petiolo 2-6 poll, longa, acuminata sed vix acuta, basi subrotundata, margine crebre minuteque glanduloso-serrata, supra nitida, subtus pallidiora, opaca, venis primariis lateralibus utrinque 7-9 sat conspicuis; petioli usque ad 1 poll. loDgi, apice (vel basi laminae) biglandulosi, glandulis longe graciliterque stipitatis divergentibus. *Mores ignoti.* *Capsulce* paucse in racemos solitarios breves subterminales dispositse, distincte stipitatse, 3-loculares, ovoideae, maximse 5-6 lin. longse, glabrse, stylis deciduis, carpellis demum ab axi secedentibus. *Semina* oblongo-ovoidea vel ellipsoidea, circiter 3 lin. longa, membrana cellulari colorata arilliformi (stratum exterius testae t) inclusa, sub membrana leviter corrugata.

BRITISH GUIANA : Pomeroon river, above Maccaseema, G. S, *Jenman*, 2092.

Mr. Jenman describes this as a large forest tree, producing abundance of milk, and associated by the Indians with "toukpong." In the absence of flowers, and from the characteristics of the seeds, there is a doubt about the genus. Possibly some modifications of the generic limits may arise out of the continuation of these investigations.—W. SOTTING HEMSLEY.

- Fig. 1, base of blade of leaf and glands; 2, a fruit; 3, a seed enclosed in the shrivelled pulpy external covering; 4, the same without the pulp; 5, a section of the same showing the albumen, which occupies only a portion of the cavity; 6, a section through the same showing the embryo.—*All enlarged.*

PLATE 2649.

SAPIUM JENMANI, *Hemsl*

EUPHORBIACE.E. Tribe CUOTONE.E.

8. Jenmaoi, *Hemsl.* (*sp. nov.*); species foliis oblongo-lanceolati* abrupte obtuseque acuminatis crebre pellucido-punctatis venis primariis lateralibus numerosis tenuibus, glandulis petiolorum parvis distinctis.

Arbor magna (Jenman) novellis glaberrimis, ramulis ultimis rectis graciliusculis, siccitate cortice nigrescente. *Folia* sparsa, longe petiolata, tenuiter coriacea, oblonga vel oblongo-lanceolata, cum petiolo 2- 1) poll, longa, ssepius 3-5 poll, longa, abrupte obtuseque acuminata, basi ssepius subcuneata, haud auriculata, margine integra vel remotissime glandulosodenticulata, concoloria, crebi e minuteque pellucido-punctatu, venis primariis lateralibus numerosis arcuatis; petioli tenues, usque ad 1£ poll, longi, in ramulis floriferis ssepius 6-9 tin. longi, glandulis in apice sessilibus parvis ssepius oblique positis. *Spicce* terminates, graciles, rectse, folia superantes, bisexuales vel ssepe omnino masculi, glandulis geminatis peltatis sub floribus instruct*. *Mores masculi* 3- 7 aggregati, bracteolis minutis fimbriatis intermixti; perianthium ssepe bipartitum staminibus 2, interdum tripartitum staminibus 3. *Flares feminei* pauci, basin versus spicarum solitarii; perianthium membranaceum, gamophyllum, ovarium arete vestiens, demum rumpens; ovarium glabrum, 1-loculare, 1-ovulatum (an prim urn 3-loculare, 3-ovulatum, citissimo abortu 1-loculare?); styli ramuli stigmatosi, cito decidui. *Capsuke* tenuiter crustaceae, semper 1-loculares, 1-spermse, ovoidete vel subglobosse, 2-3 lin. diametro, 2-valves, valvis deciduis, axi (vel columna) laterali curvato seminifero cum semine persistente; semen subglobosum, compressum, circiter 2 lin. diametro, sub strato exteriore carnosum verrucosum, embryone parvo in axi albuminis.

BRITISH GUIANA : throughout the alluvial forest in the Pomeroon district, G. S. Jenman, 2091, 6645, 7505.

Mr. Jenman has sent copious specimens of this species, which he says is called *Toukpong* by the Caribs and *Hya-hya* by the Arawacks ; but there are two or three points connected with it which the material is insufficient to clear up satisfactorily. Its characteristics are : finely veined leaves thickly beset with minute transparent glands ; few marginal glands ; small, usually obliquely placed pectinate glands ; a

membranous, gamophyllous perianth closely enveloping the ovary, the enlargement of which eventually ruptures it; and a one-celled, one-seeded capsule, the equal valves of which fall away leaving the seed hanging from the curved axis, which has become (?) lateral. The youngest ovaries I have seen are one-celled, containing one ovule, and present no obvious indications of obliterated or abortive cells; yet the assumption is, from the structure of the capsule, that two out of three carpels are suppressed in an early stage of the development of the gynoecium. We are also ignorant of the shape of the style and stigma, for what looks like a sessile stigma on the ovaries represented in the plate is possibly only the scar left by a disarticulated portion.—W. BOTTING HEMSLEY.

Fig. 1, part of an inflorescence; 2, one of the pair of glands below each female flower and each cluster of male flowers; 3, bract from between the male flowers; 4, perianth of male flower laid open; 5, the two stamens of a flower; 6, calyptiform perianth of female flower; 7, longitudinal section of the one-celled ovary; 8, cross section of the same; 9, two-valved capsule and seed borne on lateral axis; 10, the same after valves have fallen away; 11, section of seed in which the albumen and embryo do not fill the cavity.—All enlarged.

8. *aucuparium*, *Jacq.* *Enum. PL Carib.* (1760) p. 31, *et Set Stirp. Am. Hist* (1763) p. 249, t. 158, *excl. synon. nonnul.*) ; foliis variabilibus, venis primariis numerosis sat conspicuis curvatis, margine serrulatis et ssepe remote glandulosis, apice glandula magna instructis cuculliformi-incrassatis introrsum flexis, glandulis petiolorum elongatis obclavatis.

Arbor 50-100-pedalis (*Jenman*) novellis glaberrimis, ramulis floriferis gracilibus, internodiis brevibus. *Folia* longe vel longiuscule petiolata, tenuiuscula, demum coriacea, haud vel obscurissime pellucido-punctata, magnitudine ac circumscriptione valde variabilia, ramulorum sterilium et surculorum majora, oblonga, oblongo-lanceolata, vel oblanceolata, cum petiolo interdum usque ad 10-12 poll, longa et 3 poll, lata, crebre calloso-serrulata, margine nunc eglandulosa nunc remote glandulosa, apice acuminata et plana vel glandula instructa, introflexa, glandulis petioli ssepius deflexis; folia ramulorum floriferorum minora, proportione latiora, interdum ovalia vel elliptica, margine ssepe fere integra, fare eglandulosa, apicis glandula cuculliformi semper bene evoluta, petioli glandulis conspicuis rectis vel sursum curvatis. *Spicce* androgynes, vel interdum omnino masculae, terminates vel pseudo-terminales, srepius solitarise, elongate, usque ad 9-10 poll, longse sed ssepius breviores, glandulis ellipticis vel oblongis peltatis conspicuis. *Flores masculi* 3-7 aggregati. *Flores feminei* solitarii. Ovarium glabrum, triloculare ; styli rami ampli, recurvi, cito decidui. *Capsules* 4-5 lin. diametro, subglobosae, coriacese vel crustaceae, triloculares, loculicide dehiscentes, valvis persistentibus. Semina subtrigona vel compresso-globosa, 2-2¹/₂ lin. diametro ; testae stratum exterius subcarnosum demum siccum, stratum interius crassum, crustaceum, corrugatum vel tuberculato-asperum ; embryo parvus. *Exccecaria biglandulosa*, var. *aucuparia*, Muell. Arg. in DC. Prodr. xv. 2, p. 1206, saltern pro parte.

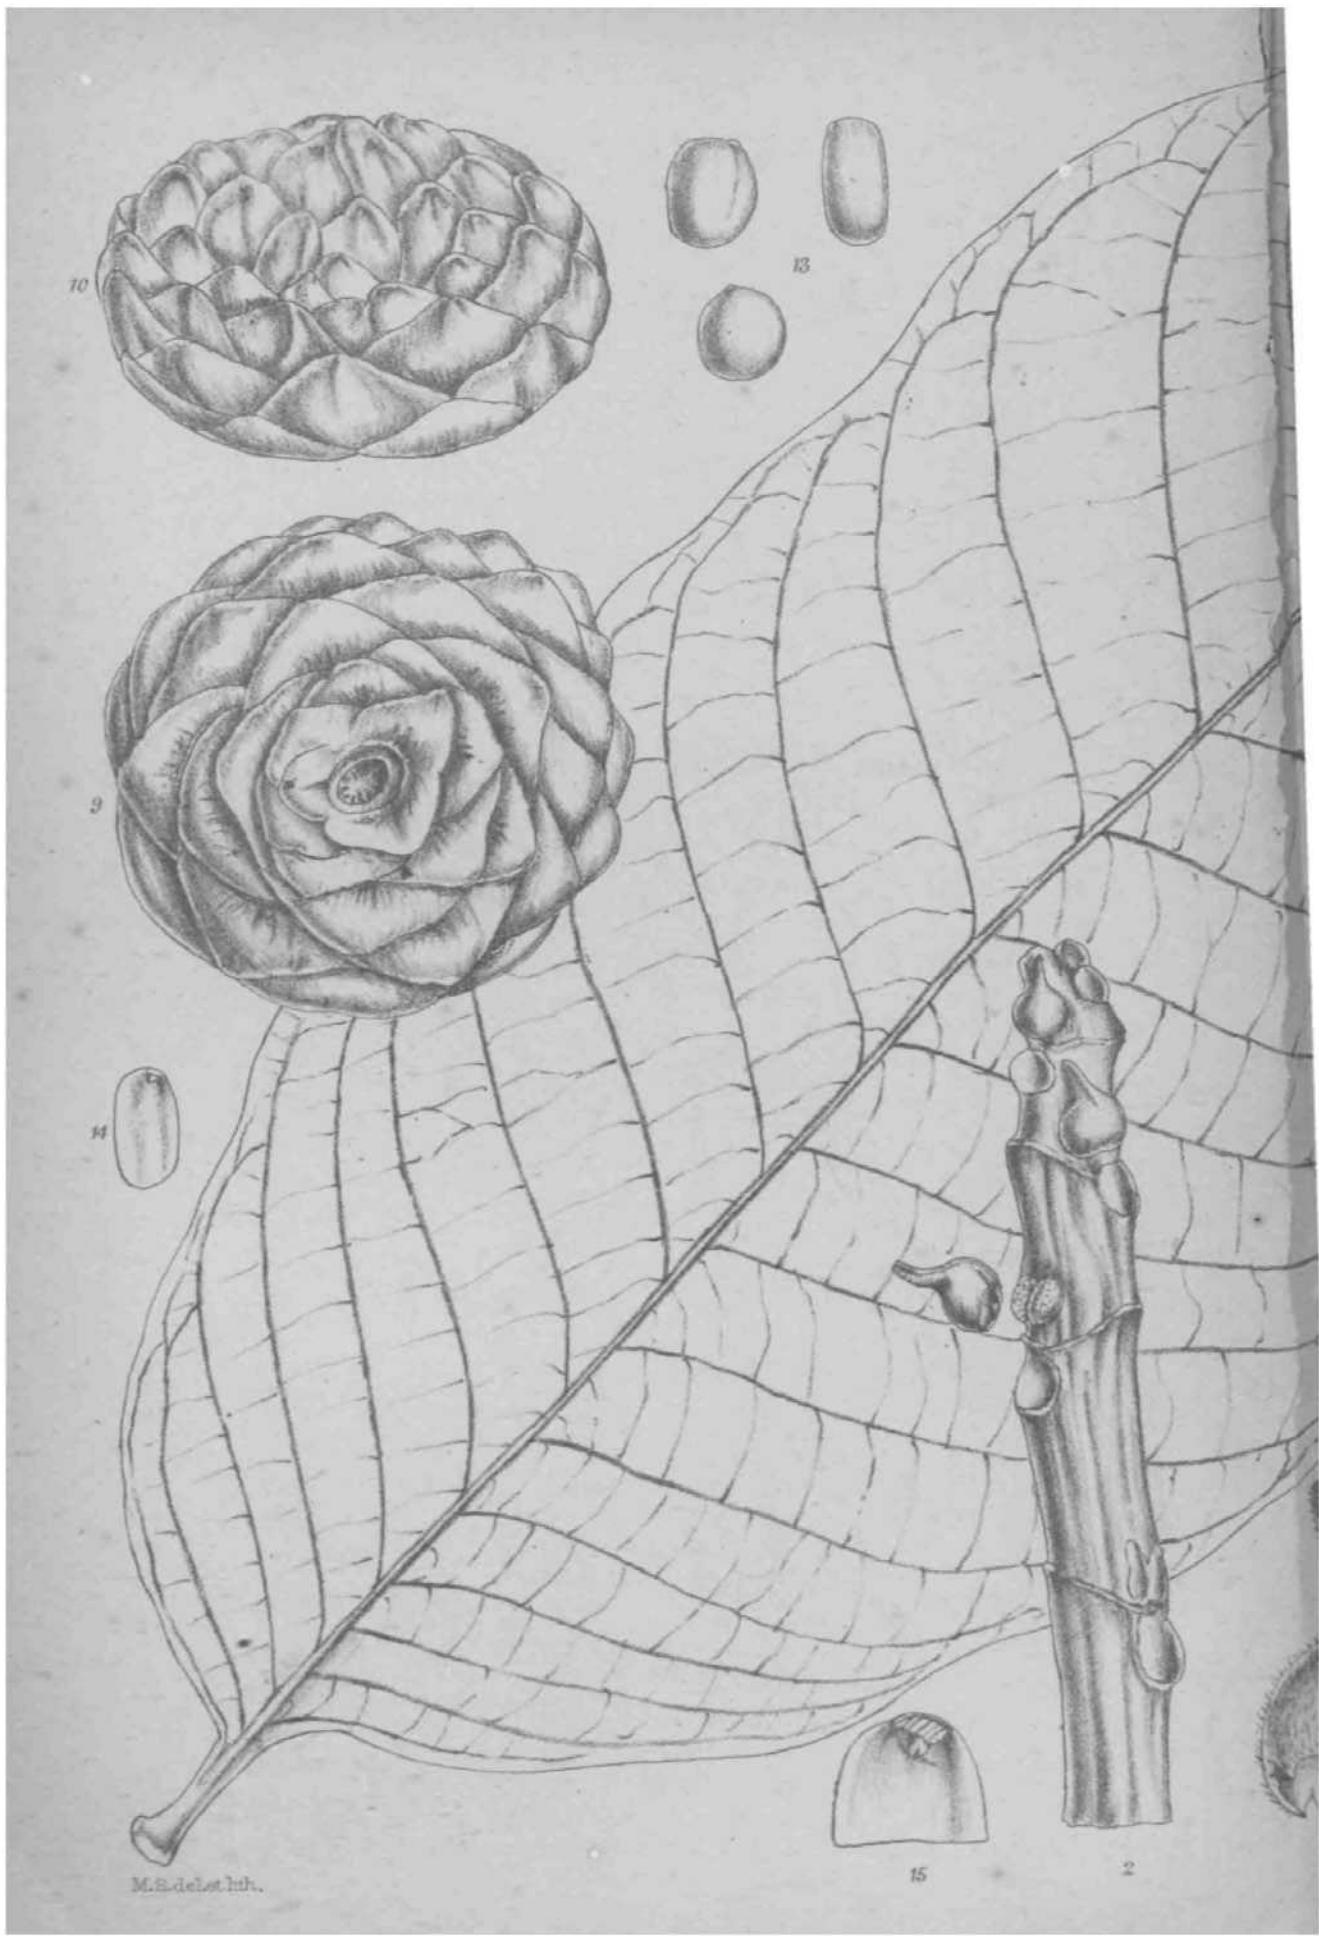

BRITISH GUIANA : common in the coast region in the neighbourhood of Georgetown, on the Canje and Lamaha rivers, and elsewhere, *Jenman*, 1957, 3653, 7506, 7508, and 7609.

In order to avoid further confusion where so much already exists, a complete synonymy of the species of the *Sapium* described above will

not be attempted here ; but references may be given and some suggestions offered. First there can be little doubt that our plant is the same as that figured and described by Jacquin, excluding from his synonymy the *Sapini arborenm foliis ellipticis*, &c., of P. Browne* (*Hist. Jam.* i. p. 338). Linnaeus (*Sp. PL* ed. 2, p. 1431), under the name of *llippomane biglandulosa*, combined at least two distinct species. S. Wartz, *Adnot. Bot.* (1829) p. 63, points this out, and says of *S. aucuparium*, Jacq., "foliis . . . apice rostro parvo subcartilagineo crasso introrsum flexo auctis a *Sapio jamaicensi* diversum." *S. jamaicense*, Sw., is probably the same as *S. Laurocerasum*, Desf. (*Cat. PL Ilort. Par.* ed. 3, p. 411), published the same year, from cultivated plants. Kew possesses a specimen bearing this name from Herb. Gay, labelled :
¹¹ *Jardin des Plantes, Ecole, le 7^e Sept. 1822.*" In 1818 G. F. W. Meyer (*Prim. Fl. Esseq.* pp. 275-6) distinguishes two species, namely : *S. llippomane*, Mey., and *S. aucuparium*, Jacq. ; but the synonymy is incorrect, and from his descriptions and localities it seems highly probable that both are forms of *S. aucuparium*. Going back to the earlier writers, Plukenet's *Tithymalus arbor americanus*, &c. (*Almagest. Hot.* p. 369, t. 229, f. 8), was described and figured from specimens cultivated at Hampton Court before 1691, and is recorded as having been received from Barbados. With the permission and assistance of the authorities of the Botanical Department of the British Museum, Kew has obtained accurate drawings of all Plukenet's specimens, some of which, at least, seem to belong to *S. aucuparium*; but further investigation is necessary before coming to a decision. It is almost certain, too, that the *Hippomane foliis ovato-oblongis, &c.*, of Plumier's *Plant. Amer.* ii. p. 164, t. 171, f. 2 (1757), is a conventionalised representation of *S. aucuparium*. But the identification of these old figures is a matter of sentiment rather than of importance.

As to the geographical area of *S. aucuparium*, neither Kew nor the British Museum possesses any West Indian specimens that could be referred to it, but it appears to be a common coast tree from Guiana to Colombia. *Sapium obtusilobum*, Muell. Arg. (*Lincea*, xxxii. p. 116), syn. *Exccecaria obtusiloba*, Muell. Arg. (*DC. Prodr.* xv. 2, p. 1023), should, perhaps, be reduced to *S. aucuparium*. It was collected by Fendler (n. 1230) near Tovar, Merida, Venezuela, and by Goudot at Turbaco, Magdalena, Colombia. An account of the petiolar glands of "*Exccecaria biglandulosa var. grandifolia*" by F. A. Poulsen will be found in the *Vidensk. Meddel. Nat. Foren. Kjffb.* 1897, pp. 356-360, tt. 1 and 2. From the foliage figured this might well be *S. aucuparium*, Jacq.—W. BOTTING HEMSLEY.

Fig. 1, baso of leaf-blade and glands; 2, apex of leaf; 3, portion of male inflorescence; 4j a male flower; 5, portion of female inflorescence; f, longitudinal section of ovary; 7, cross section of the same; 8, a seed in its fleshy integument; 9, a section of the same. All enlarged.

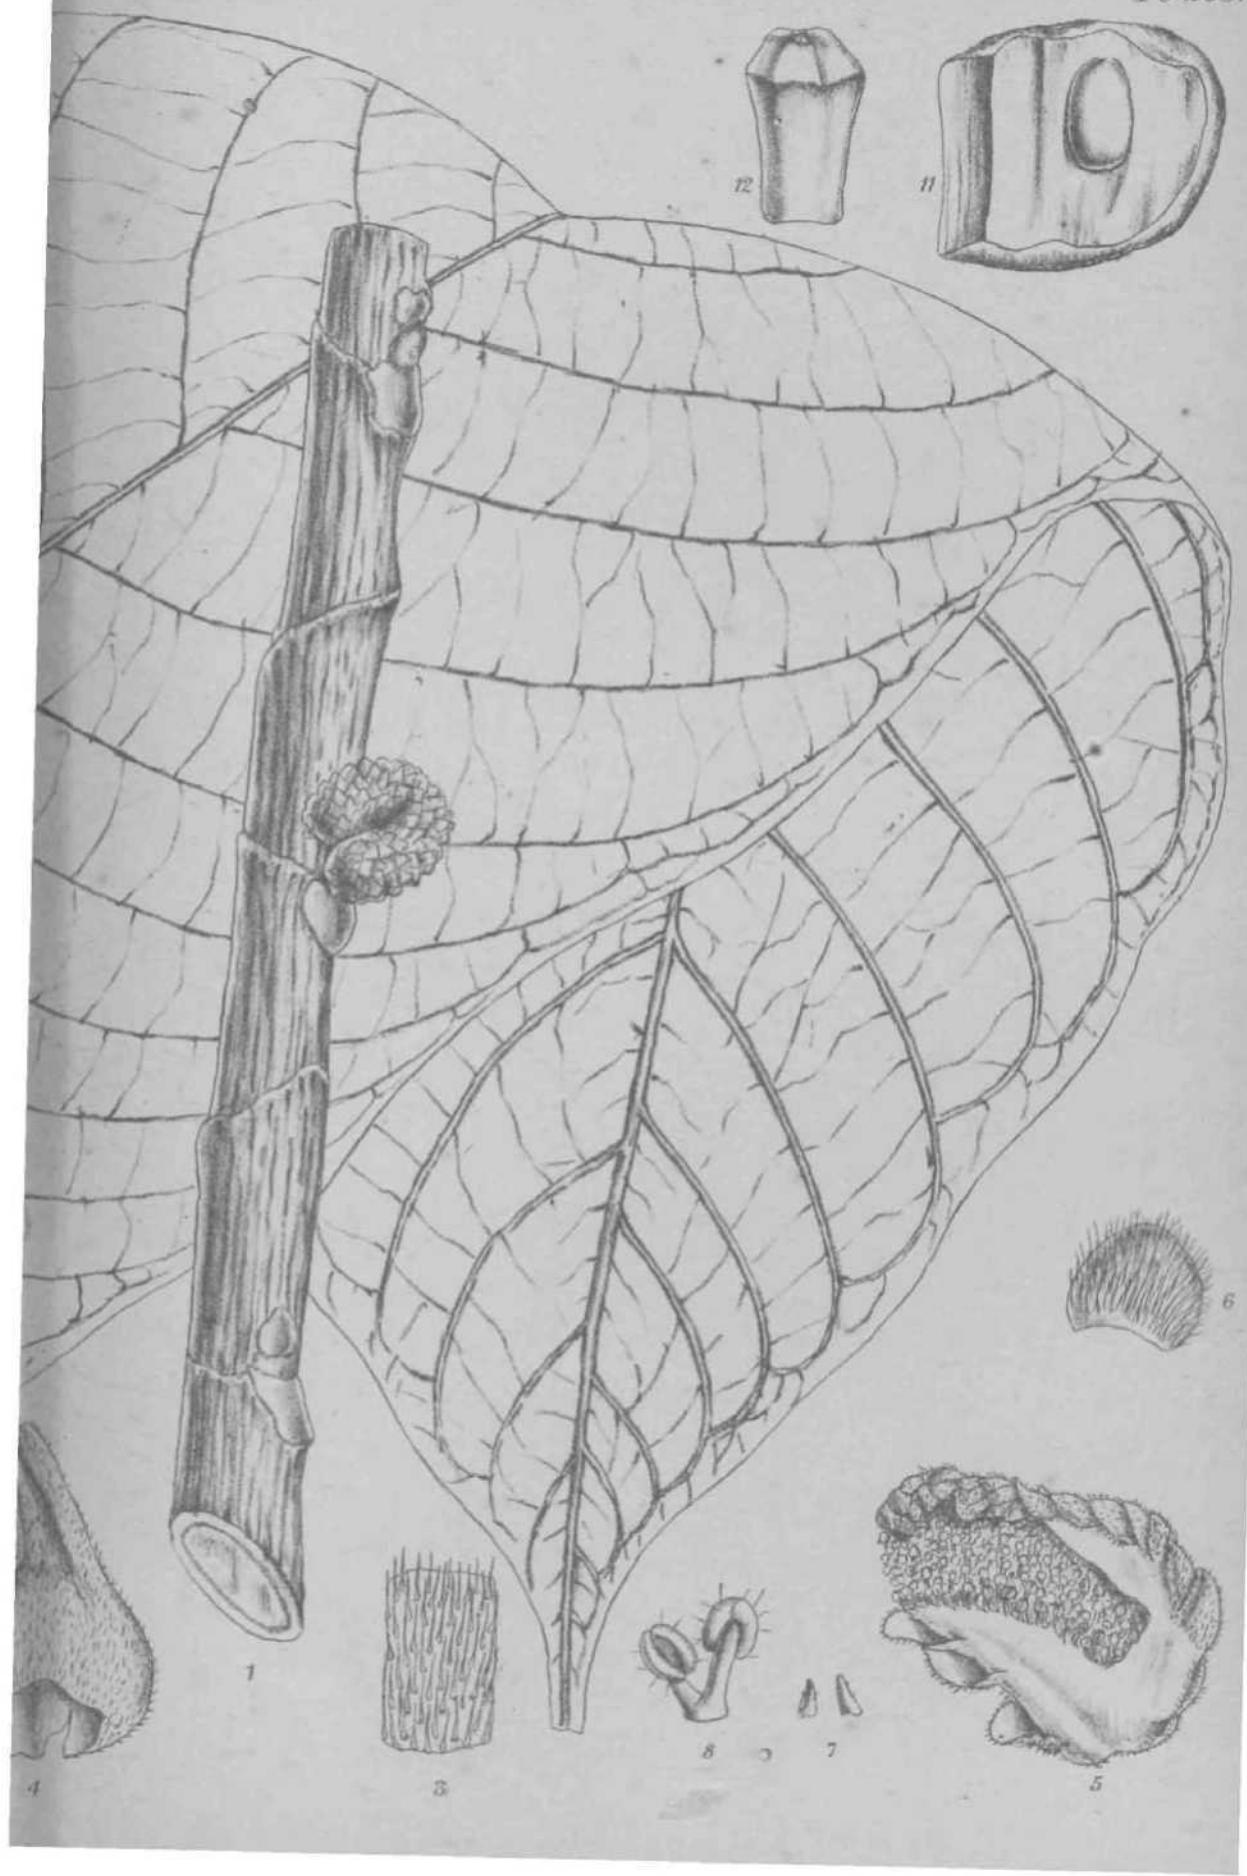

PLATE 2651.

CASTILLOA TUNU, *llemsl.*

URTICACE[^]: Tribe ARTOCAUPKJ®.

C. Tunu, *lien id. (\$p. nov.)*; aftinis *C. elazticw*, Cerv., a qua differt foliis tenuioribus basi haud cordatis utrinque multo minus hirsutis, drupeolis receptaculo fere oirmino immersis.

Arbor excelsa ramulis floriferis crassis valde medullosois prim urn strigosis demum glabrescentibus, internodiis circiter pollicaribus. Folia (pauca imperfecta tantum visa) vix coriacea, brevissime petiolata, oblonga vel lanceolato-oblonga, usque ad 18 poll, longa, basi rotundata, apice gradatim acuminata, supra parce strigillosa, aspera, subtus praecipue secus costam venasque minute strigillosa, sed vix aspera, inter venas parce puberula, venis primariis numerosis conspicuis curvatis prope marginem inter se connexis, tertiaris fere parallelis venas pidmarias connectentibus ; petioli circiter seinipollulares ; stipulse non visse sed cicatrices prominentes oblique annulatse. *Receptacula* in axillis foliorum dolapsorum sessilia, unisexualia, masculina primum bracteis calyptriformibus tecta, feminina juvenilia non visa ; masculina circiter 6-8 lin. diametro, bracteis multiseriatis parvis hirsutis; feminina matura, fructifera usque ad 2J poll, diametro, bracteis multiseriatis latis rotundatis tomentosis. *Mores masculini* nudi, diandri, filamentis basi cohserentibus. *Drupeolas* apice tantum liberte ; semina magnitudine ac forma variabilia, testa glabra laevi.—*Castilloa* no. 4, Hook. f. in Trans. Linn. Soc. Bot. series 2, ii. p. 212, t. 28, ff. 7-9 ; W.B.H. in Kew Bull. 1898, p. 141.

BRITISH HONDURAS : *Belize Estates Company*, fruits only, received May, 1886 ; R. W. Cater, imperfect leaves, received April, 1896.

COSTA RICA : Quebrada de Potrero Grande, //, Pittier.

- In consequence of the misapplication of the native name *tunu* or *toonu* in Morris's *British Honduras*, p. 74, and the absence of adequate specimens, this species was formerly confused at Kew with *Castilloa elastica*, Gerv. This mistake was rectified in the *Kew Bulletin*, 1898, p. 141 ; and now, through the courtesy of Prof. E. Bureau, and Messrs. Godefroy-Lebeuf and Jules and Eugène Poisson, we are able to figure *C. Tunu*, Hemsl. almost fully (young female flowers alone being wanted to complete the material) from specimens

collected by M. H. Pittier. As long ago as 1885 Sir Joseph D. Hooker published a good figure of the fruit of *C. Tunu*, in the place cited above, but he gave it no name. In an article on trees that yield caoutchouc (*Boletin de Agriculture* etc., año 8 (1899) num. 12, p. 6), M. Pittier alludes to this species as *el hule ?nacho*, or mule caoutchouc, 'which yields rubber in abundance and of excellent quality.' M. J. Poisson, to whom we communicated the name we proposed giving to this species, published (*Bulletin du Museum d'Histoire Naturelle* 1900, and in the *Revive des Cultures Coloniales*, vi. (1900) p. 302) some further particulars of this tree. But, as pointed out in the *Kew Bulletin*, 1898, p. 141, Mr. Rowland W. Cater was the first to furnish Kew with satisfactory evidence of (*T. Tunu* being specifically distinct from *C. elastica*).

The name *Castillooa markhamiana* having been applied to two totally different plants, it is desirable to explain its proper application. *C. ?markhamiana*, Collins (*Report on Caoutchouc* (1872) p. 12, t. 3), as suggested by Bentham and Hooker (*Gen. PL* iii. p. 372), is a species of *Perebea*. It is very closely allied to the original *P. gruijanensis*, Aubl., and should bear the name *Perebea markhamiana*. *Castillooa markhamiana*, Markham (*Peruvian Bark*, p. 453), not of Collins, is *C. elastica*, Cerv., which ranges from Mexico and Honduras to Ecuador. In this wide area, extending through about 25 degrees of latitude, or 1,750 miles, *C. elastica* exhibits a considerable amount of variation, due to local conditions and the age of the trees ; but with copious herbarium material it is not possible to define varieties. Yet the name *markhamiana* is still used (*Revue des Cultures Coloniales* (1900), pp. 277, 303) for the variety, if it may be so called, of *C. elastica* cultivated in Ceylon and perhaps elsewhere. It was obtained from Darien, Panama, and there is an excellent coloured figure of it in Sir Joseph Hooker's paper cited above. A third species of *Castillooa*—*C. australis*, Hemsl.—is figured in plate 2676, ined.

CaitiUoa costaricana, Liebm., in *K. Dansk. Selskab.* v. 2 (1851), p. 319; reprint, p. 35, judging from the description and the specimens of *Castillooa* seen from Costa Rica, is not specifically different from *C. elastica*, though it is described as having 'foliis majoribus crassioribus subsessilibus vel brevissime petiolatis profundius cordatis magis abrupte acuminatis subtus dense fulvo-hispidis.'—W. BOTTING HEMSLEY.

Figs. 1 and 2, portions of a branch bearing male inflorescences; 3, piece of bark from the same to show the strigose hairs; 4, calyprate bract (or bracts) which shields the male inflorescence ; 5, section of a young male inflorescence; 6, an involucral scale; 7, bracteoles between the male flowers; 8, a male flower; 9, infructescence seen from below; 10, the same from above; 11, a section through a portion of the same showing that the carpels (pistils) are completely immersed; 12, a single pistil (fruit) ; 13, seeds of different shapes; 14, embryo ; Id, portion of one cotyledon and axis.—All more or less enlarged, except figures 1, 2, 9, 10, 11, 12, 13, and 14.

D.P. Stapf anal.

PLATE 2052.

BANALISMA ROSTRATA, *Stapf.*

ALISMACEJE.

Ranalisma, *Stapf* (*gen. nov.*). *Flores* hermaphroditici. *Sepala* 3 herbaceo-membranacea, persistentia, post anthesin deflexa. *Petala* sepalis subsequalia, decidua. *Torus* sub anthesi convexus, deinde elongatus. *Stamina* 9, uniseriata, hypogyna. *Ovaria* numerosa, dense in toro congesta, libera*; stylus apicalis, rostriformis; ovulum unicum, basilare, erectum, anatropum, micropyle extrorsa. *CarpeUa* matura indehiscentia, inonosperma, admodum a latere compressa, alata, stylo persistente coronata, pericarpio pergamentaceo glandulis subepidermalibus notato. *Semen* erectum uncinato-curvatum; embryo hippocrepicus, radicula crassa, exterior.—*Herba perennis, paludosa, stolonifera, foliis pedunculisqws hasalibus** Folia longe graciliter petiolata, petiolo basi paulo dilatato, vaginante, lamina late elliptica vel ovato-elliptica, submembranacea. Inflorescentia cymosa, cyma pie' rumque ad florem solitarium bibracteatum reducta, rarius 2-3-flora.

R. rostrata, *Stapf* (*sp. unica*). *Stohnes* longi, graciles. *Folia* conformia; petiolus ad 8 poll, longus; lamina subapiculata, basi rotundata vel subcordata, 1-1½ poll, longa, | ad fere 1 poll, lata, 5-nervis. *Pedunculus* 2-3 poll, longus. *Bractea* oblongae, membranaceae, basi connate. *PediceUi* ^-^ poll, longi. *Sepala* late elliptica, obtusa, 2 lin. longa. *Petala* tenuia, obovato-elliptica, 2 lin. longa. *Staminum* filamenta 1 lin. longa; antherte ^-f lin. longaB. *Ovaria* stylo ensiformi longe rostrata. *CarpeUa* matura oblique ovoidea, abrupte rostrata, circuincirca alata, circiter 1^-11 lin. longa, rostro 1-1½ lin. longo non computato.

TROPICAL ASIA : Malay Peninsula, Selangor, Gua Batu woods, H. N. Ridley, 8464.

Ranalisma resembles in general habit *Elisma* and *Caldesia*; but it differs from both in the structure of the mature carpels and in the elongated torus, and from *Elisma* also in the extrorse position of the micropyle. The elongated torus might point to *Sagittaria* and *Lophiocarpus*, but the whole facies of the plant and the absence of any dimorphism in the flowers are against the assumption of a close affinity with those genera. Professor Buchenau, to whom I submitted drawings and fruits of the plant, suggested *Caldesia* as the nearest ally. The name *Ranalisma* is intended to refer to the great resemblance of the flowers and fruits of this plant with those of certain species of *Ranunculus*.—OTTO STAPF.

Fig. 1, a flower and bracts; 2, a stamen; 3, a young carpel; 4, section of a fruit; 5, a carpel; 6, an embryo.—All enlarged.

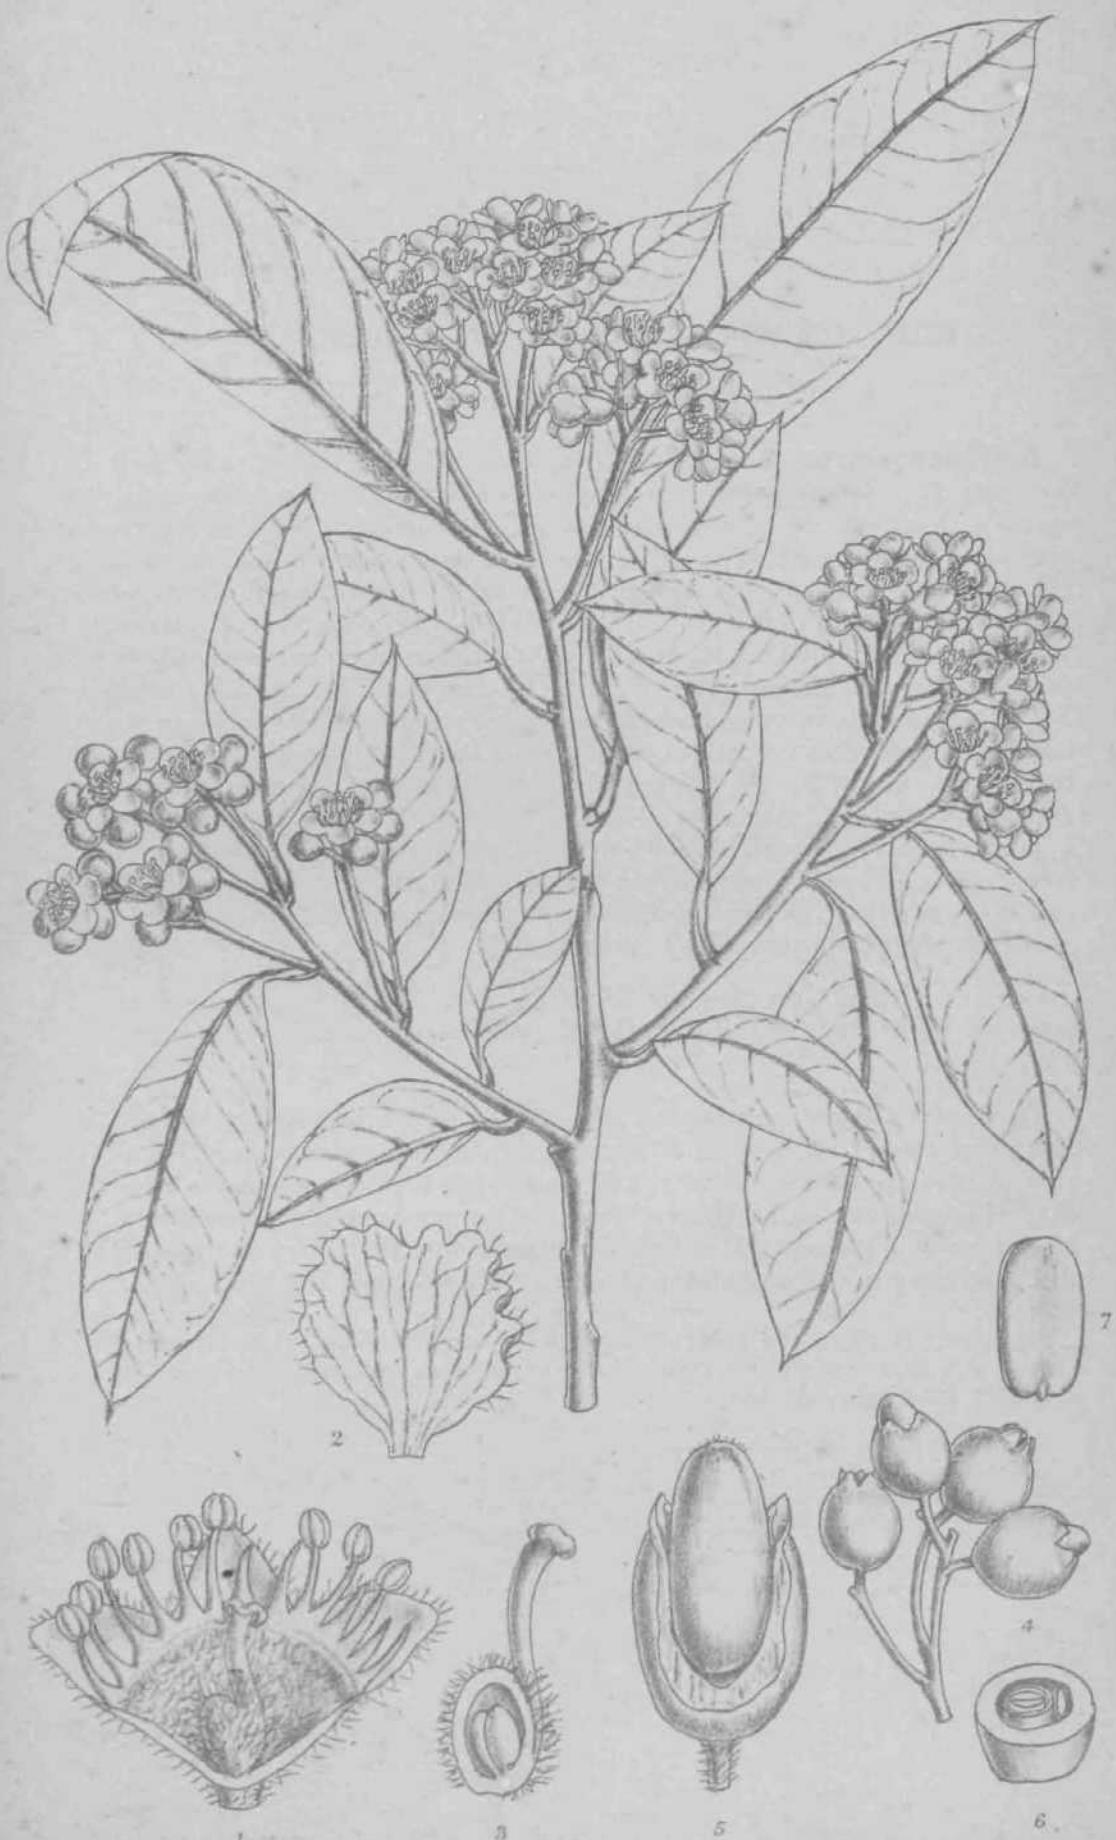

PLATE 2653.

DICHOTOMANTHES TRISTANLECARPA, Kurz.

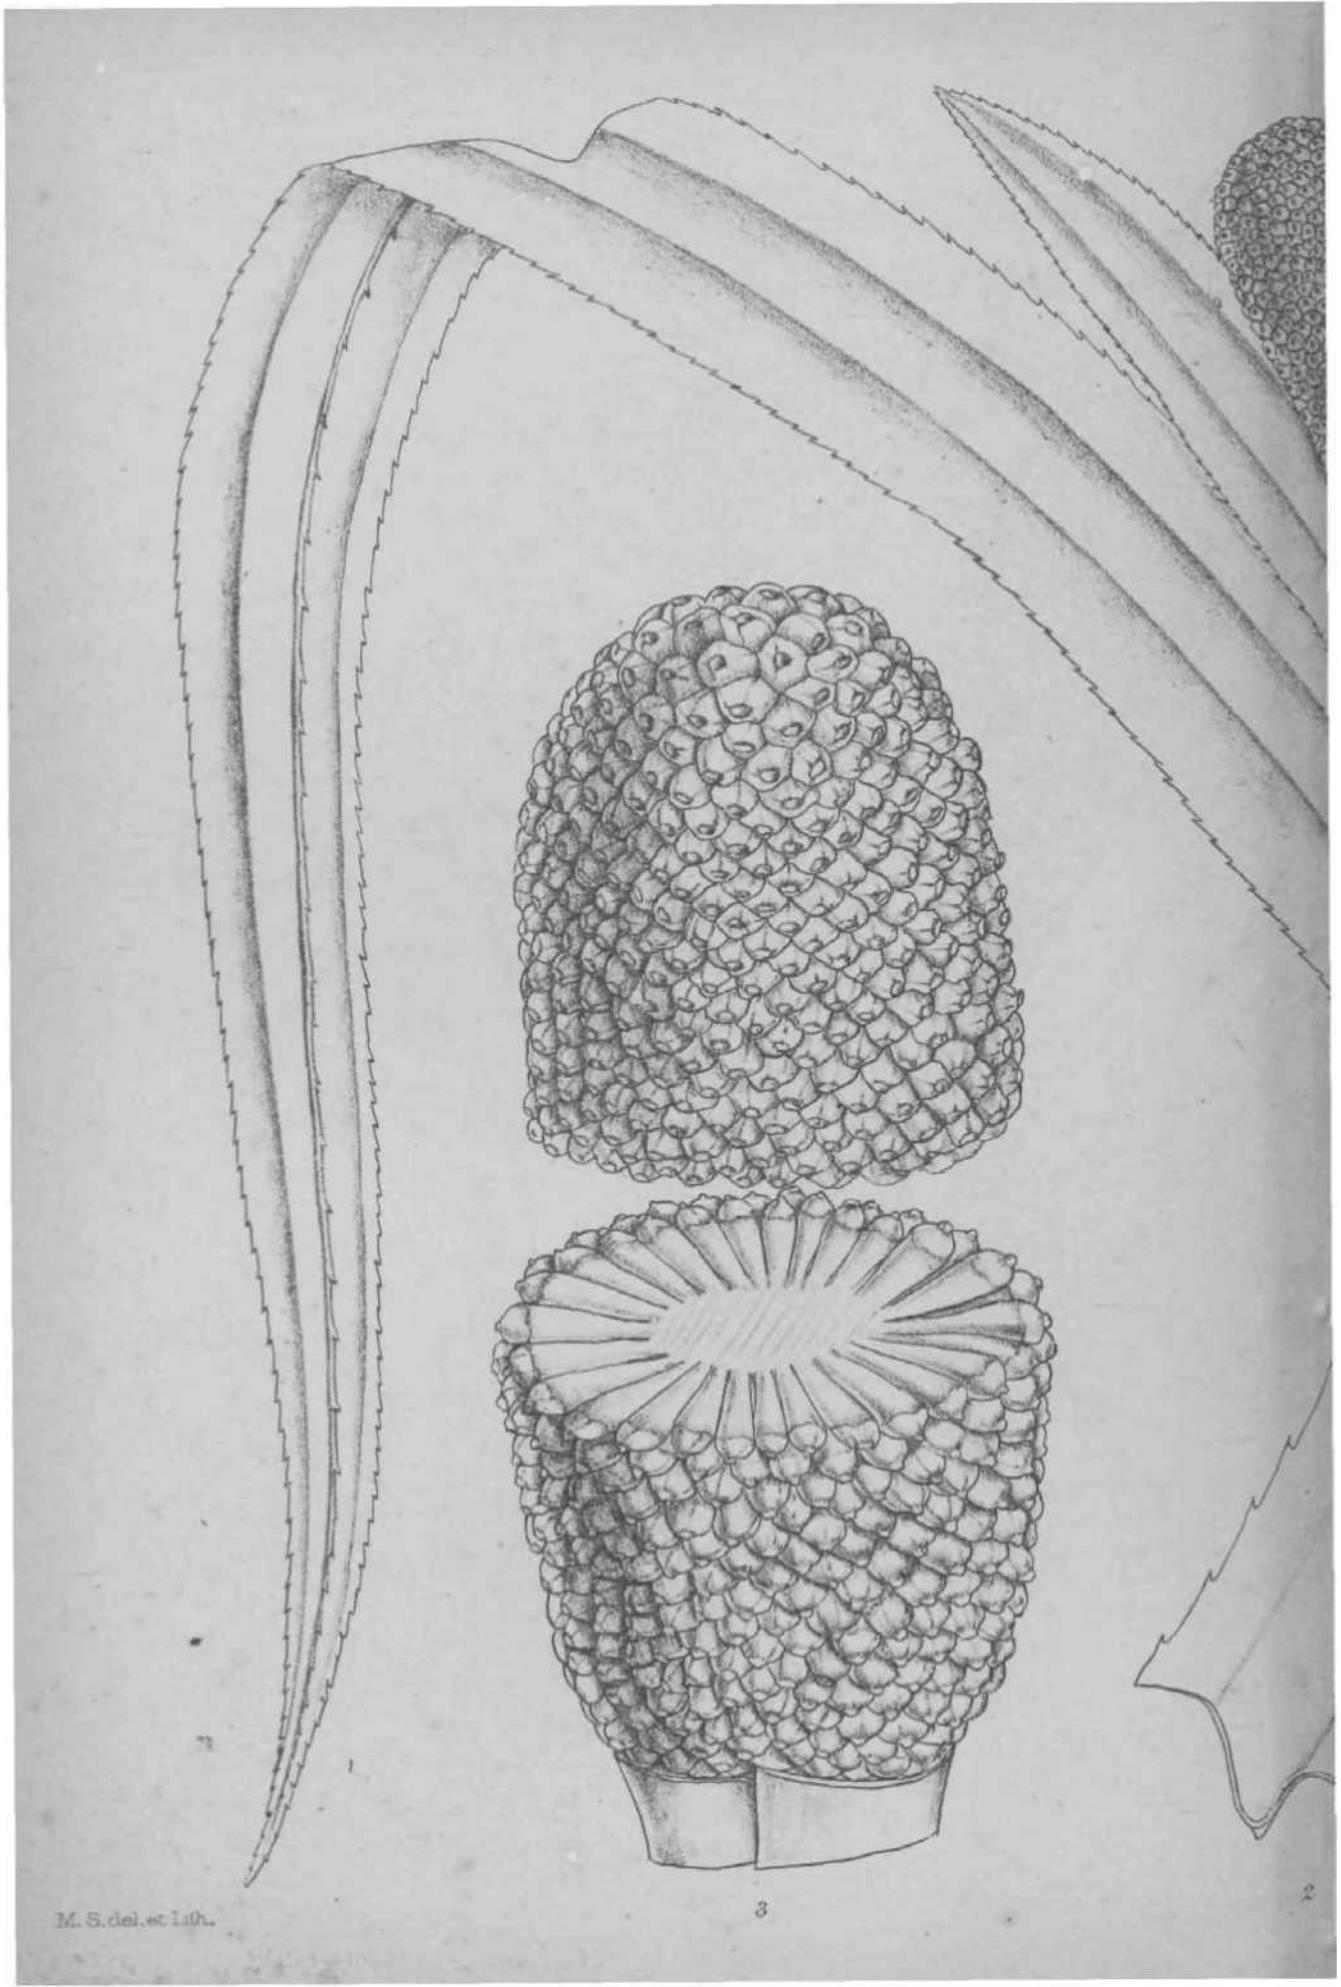

ROSACEJB. Tribe PRUNED.

D. tristanigecarpa, Kurz in *Journ. Bot.* 1873, p. 194, t. 133, f. 2 (*sp. ufiica*). *Arbor parva vel frutex 6-15-pedalis*, dense ramosus, ramulis floriffris gracilibus primum fulvo-tomentosis. *Folia brevi-petiolata*, coriacea, oblongo-lanceolata, interdum obovata, oblanceolata vel elliptica, maxima 4 poll, longa sed ssepius 2-3 poll, longa, utrinque attenuata, apiculata, integra, subtus albido-tomentosa, supra glabra vel glabrescentia nitidaque, venis primariis lateralibus curvatis subtus prominulis; stipule minutae, filiformes, cito deciduae. *Flores albi*, 3-4 lin. diametro, in cyoias corymbosas terminates brevissime pedunculatas 1-2 poll, diametro dispositi. *Calyx extus lanatus*, 5-dentatus, tubo intus hirsutus, fructifer incrassatus, carnosus, glaber, ruber. *Petala rotundata*. *Stamina 15-20*, glabra. *Ovarium hirsutum*, 1-loculare, stylo lateral! glabro; ovula 2, collateralia, ascendentia vel fere erecta. *Fructus (carpellum) siccus*, oblongus, vix 3 lin. longus, paullo exsertus, ssepius 1-spermus, pericarpio coriaceo; semen exalbuminosum vel albumine tenuissimo.

CHINA : Hotha, Yunnan, *D. J. Anderson*; Mengtze, Yunnan, at 5000 to 6000 feet, *W. Hancock*, 276; the same locality, *A. Henry*, 9367, 10255.

This very distinct genus was referred by Kurz to the Lythraceae, but when I had to deal with it (*Journ. Linn. Soc.* xxiii. p. 307) I was able to indicate its real affinity, and now, with copious specimens from Mr. Hancock and Dr. Henry, there is no doubt that it should be placed near *Pygeum*. The fleshy calyx of the fruit, the dry carpel, and ascending ovules are characteristic.—W. BOTTING HEMSLEY.

Pig. 1, part of calyx and pistil; 2, a petal; 3, section of ovary; 4, cluster of drupes; 5, a fruit from which a part of the calyx has been removed; 6, cross section of carpel; 7, embryo.—4// except 4 enlarged*

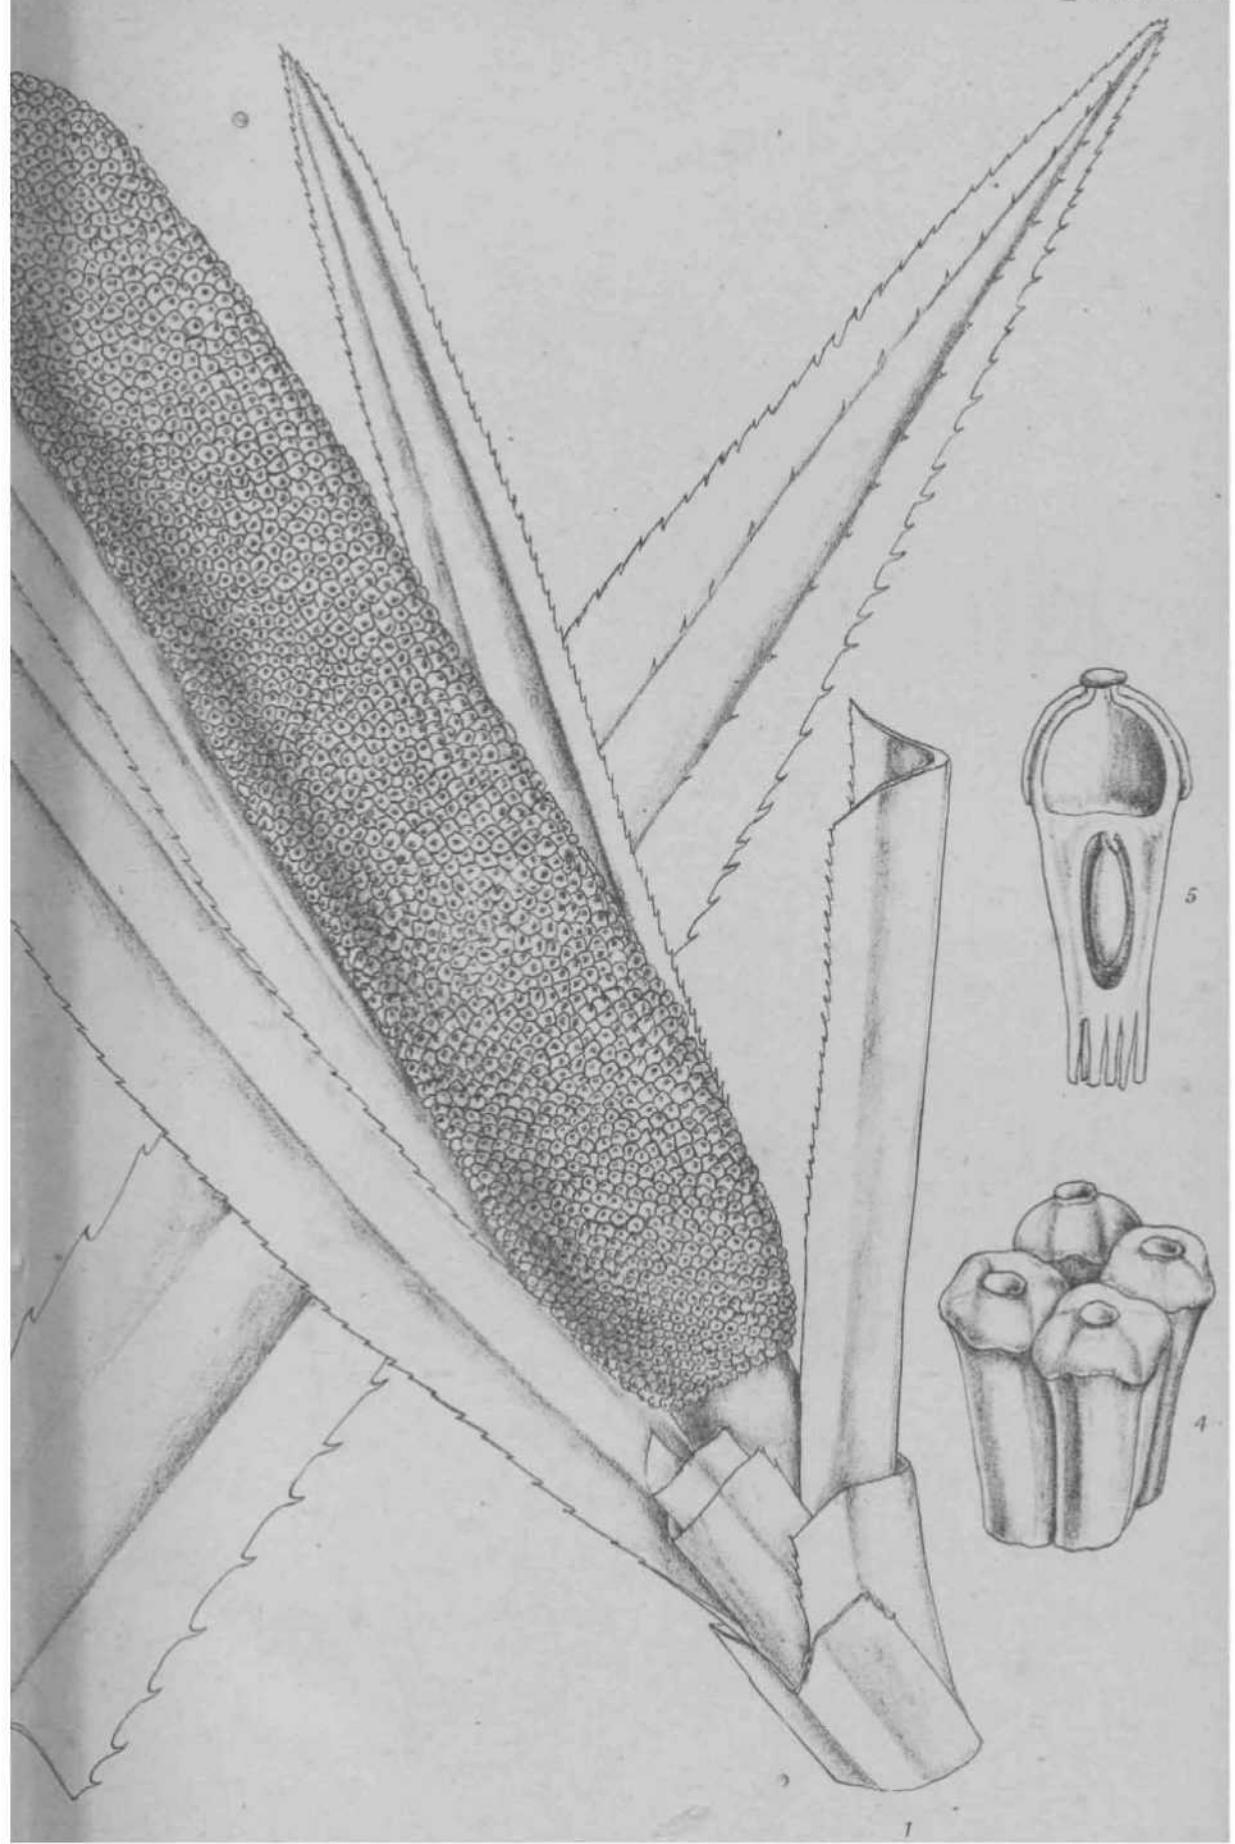

PLATE 2654.

PANDANUS COMINSII, Eemsl

PANDANACEA;:

P. **Cominsii**, Hernsl. (*sp. nov.*); inter species carpellis angustis liberis ob syncarpiura solitarium elongatum cylindricum insignis.

Folia ad basin inflorescentise femininse 2-4 ped. longa et 2-2¹ poll, lata, complicata, acuta, margine serrato-aculeolata, supra prope apicem secus costas duas laterales aculeolata, subtus secus costam centralem aculeolata. *Syncarjnum (spadix)* brevissime pedunculatum, erectum, solitarium, cylindricum, circiter 1 ped. longum et 2-2¹ poll, latum. *Carpella* permulta, libera, 6-8 lin. longa, 1£ lin. diametro.

SOLOMON ISLANDS: Mouth of creek, Siota, Florida Island, *Comins*, 363.

For this and so many other novelties from the Solomon Islands, Kew is indebted to the Venerable Archdeacon Comins. He does not give dimensions, but notes that most of the native mats are made from the leaves of this screw-pine.—W. BOTTING HEMSLEY.

Fig. 1, female inflorescence and foliage, *half natural size*; 2, tip of leaf, *natural size*; 3, basal and apical portions of female inflorescence, *natural size*; 4, carpels, *enlarged*; 6, section of a carpel, *enlarged*.

PLATE 265.

IMFATIENS GRANDIFLORA, *Tlemsl*,

GERANIACEJE. Tribe BALSAMINEJE.

I. *grandiflora*, *Hemsl.* (*up, nov.*); species magnitudine florum insignis.

Herba erecta, saltern bipedalis, glabra, caule subsimplici crasso. *Folia* alterna, petiolata, subcarnosa, oblongo-lanceolata, cum petiolo usque ad 6 poll, longa, acute acuminate, apiculato-crenata vel glanduloso-crenata, venis primariis valde curvatis in crenas excurrentibus, petiolo glandulifero. *Flores* speciosi, cum calcare 4-5 poll, longi, in axillis foliorum superiorum solitarii vel geminati, graciliter pedicellati, pedicellis quam foliis brevioribus basi bracteis parvis munitis. *Sepala* 3, lateralia late ovata, acuminata, posticum in calcar gracile curvatum productum. *Petala* lateralia obliqua, alte bifida, segmentis bilobulatis vel emarginatis anterioribus longioribus. *Capsula* matura non visa, ut videtur clavata.

MADAGASCAR : without special locality, *Warpur*.

Impatiens grandiflora, Hemsl., is one of many instances of unusually large flowers for the genus in the Madagascar Flora. *Ixwa siphonantha*, Oliver, of this work, plate 2236, having flowers eight inches long, is another.—W. BOTTING HBMSLET.

Fig. 1, anrircBcium; 2, \$ibt].—Both enlarged.

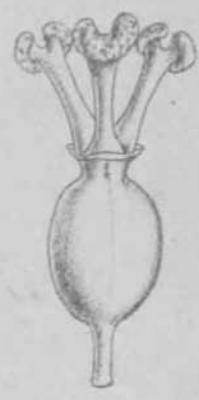

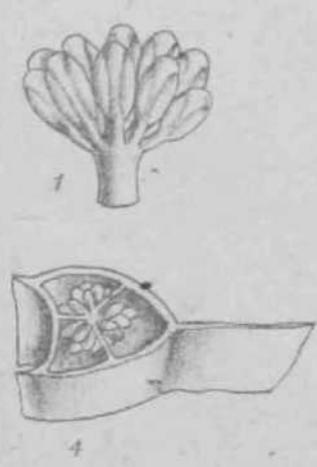

PLATE 2656.

BEGONIA WABPUBI, *Uemsl*

BEGONIACEAE.

B. **Warpnri**, *Hemsl.* (*sp. nov.*); species ex affinitate A *nance*, L'Hfr.,
a qua differt foliis paucidenticulatis nee ciliato-serratis.

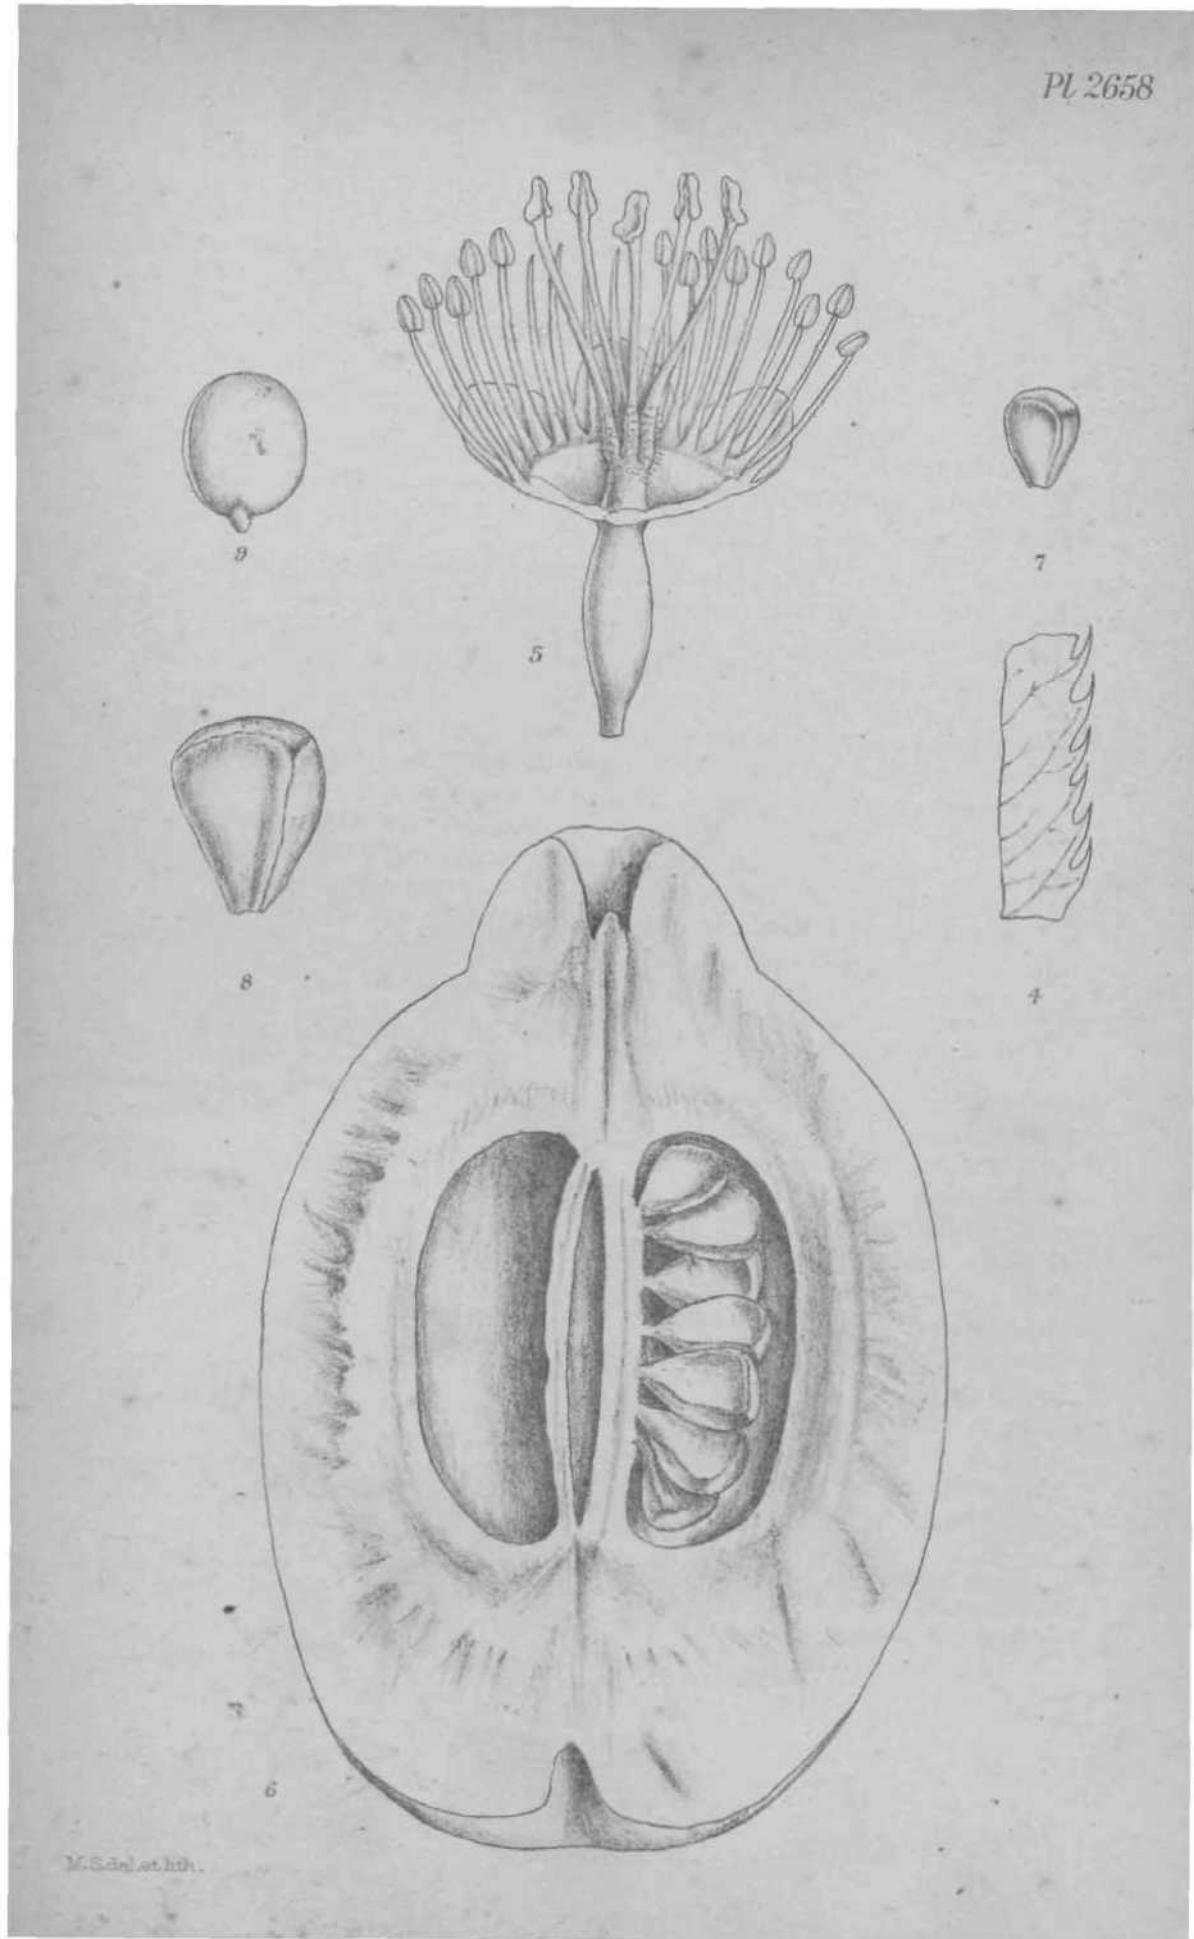

Herba perennis, tuberosa, acaulis, glabra. *Folia* pauca, longe graci-literque petiolata, subcarnosa, anguste lanceolata, cum petiolo 3-4 poll, longa, utrinque attenuata. *Scapi* graciles, folia subaequantes, androgyni, circiter triflori. *Perianthium* 4-6-phylum, segmentis ovali-oblongis 3-4 lin. longis. *Stamina* circiter 10, breviter monadelpha. *Styli* 3, liberi, stigmatibus lunatis. *Capsula* longe 1-alata, ala oblonga, 3-locularis, polysperma, placentis brevibus indivisis.

MADAGASCAR : without special locality, *Ilumblot*, 565; *Warpur.*

This belongs to an imperfectly known section named *Erminea* by De Candolle (*Prodr.* xv. 1. p. 393), comprising two other species figured by L'H^ritier (*Stirpes Novce*, tt. 47, 48), the placentaion of which is unknown. Both are natives of Madagascar.—W. BOTTING HEMSLEY.

Fig. 1, androDium; 2, pistil; 3, fruit; 4, cross section of the same.—All enlarged.

PLATES 2657 AND 2058.

CYDONTA CATHAYEN SIS, *ITemsL*

Rosaceæ. Tribe POMEA:.

C. cathayensis, Hemsl. *m*(sp. nov.); foliis lanceolatis eglandulosis, calycis lobis rotundatis erectia, fructu minore a *C. sinensi*, Thouin, differt.

Frutex dense ramosus, spinosus; rami tortuosi, rigidi, spinis rectis validis armati, vel rami steriles interdum inermes. *Folia* distincte petiolata, subcordiaceae, lanceolata vel linear-lanceolata, cum petiolo 2-5 poll, longa, acuta, basi cuneata, crebre minuteque serrata, primo precipue subtus ferrugineo-pubescentia dein glabrescentia; stipulse variabiles, nunc parvæ, nunc amplæ, foliacese, auriculiformes, serrulatæ. *Flores* brevissime pedicellati, fasciculati, pauci aggregati, circiter 1£ poll, diametro. *Calyx* glaber, lobis subcarnosis latis rotundatis erectis eglandulosis. *Petala* fere orbicularia. *Stamina* numerosa, quam petala breviora. *Styli* 5, quam stamina longiores, infra medium pilosi. *Fructus* ovoides vel fere cylindricus, basin versus abrupte constrictus, 6-7 poll, longus, 5-locularis; semina numerosa, cuneiformia, horizontalia.—*Pyrus cathayensis*, Hemsl. in Journ. Linn. Soc. xxiii. p. 256, excl. synon.

CHINA: Changyang and Ichang, Hupeh, A. Henry > 1916, 5263.

Dr. Henry's specimens of this quince are the only ones Kew possesses from China, and he notes that he had never met with it in an undoubtedly wild state. It has been cultivated at Kew for twenty years at least; but the history of its introduction is not known, and until the Director brought specimens last year of the fruit of the true *C. sinensis*, Thouin (*Ann. Mus. Hist. Nat. Par.* xix. 1812, p. 144, tt. 8 et 9; *Bot. Reg.* t. 905; *Rev. Hort.* 1889, p. 228, cum ic. color.) from the garden of the Commendatore Hanbury, at La Mortola, it bore the name of *C. sinensis*. A more detailed history of the cultivation and synonymy of the two species will appear in the *Kew Bulletin*. The Kew Herbarium contains specimens of *C. sinensis*, Thouin, cultivated in Paris in 1815; a cultivated specimen from Seringe, without any particulars; and a cultivated specimen from Kiukiang, communicated by Dr. Shearer in 1875.—W. BOTTING HEMSLEY.

Plates 2657-8, fig. 1, a barren shoot.; 2, a flowering shoot; 3, inflorescence; 4, part of margin of a leaf; 5, section of a flower; 6, section of a fruit; 7 and 8, seeds; 9, embryo.—Figures 4, 6, 6, 8, and 9 enlarged.

PLATE 269.

LIGHTFOOTIA LEPTOPHYLLA, C. //, Wright.

CAMPANULACEJE. Tribe CAMPANULEA:.

L. leptophylla, *G. II. Wright* (*sp. nov.*); ad *L. capitatam*, *Baker*, accedit, ramis minute pubescentibus, foliis majoribus tenuioribusque, capitulis bracteis foliis similibus cinctis prima facie distinguenda.

Herba gracilis, multiramosa, 15 poll. alta. *Bami* teretes, minute pubescentes, pallide straminei. *Folia* lanceolata, serrata, apice acuta vel subobtusa, basi attenuata, subsessilia, utrinque sparse albo-pilo9a vel tandem subglabra, 2 poll, longa, 4 lin. lata. *Capitula* sapius terninalia, multiflora, 9 lin. diam.; bracteae involucrantes 4-8, foliis omnino similes; bracteolae subulatse, floribus paullo breviores. *Calycia* lobi subulati, ciliati, 1[^] lin. longi. *Corolla* purpurea, fere ad basin 5-partita; lobi ligulati, 2| lin. longi. *Stamina* calycis lobis subaequalonga; filamenta ensiformia e basi rhomboidea intus papillosa; antherae oblongse. *Ovarium* 3-loculare; stylus corollam superans, apice incrassatus papilosusque; stigma minute 3-lobum.

PORtUGUESE EAST AFRICA : near water on hills between Unangu and Lake ShW, *W. P. Johnson*, 40.

In general appearance this plant approaches *Jasione*, a genus which has not yet been found south of the Tropic of Cancer. Its large thin leaves and capitate inflorescence, surrounded by leaf-like bracts, render it easily distinguishable from its congeners.—C. H. WRIGHT.

Fig. 1, a flower-bud; 2, an expanded flower; 3, a stamen, front view; 4, the same, back view; 5, transverse section of ovary.—All enlarged.

Tlate 2GG0.
MELINIS TENUISSIMA, Staph.

GRAMINEJE. Tribe PANICEJE.

M. tenuissima, Staph (*sp. nov.*); a *M. minutiflora*, Beauv., differt spiculis minoribus, gluma superiore truncata, tenuissime (nee prominenter) 7-nervi, valva inferiore (sterili) 3-nervi, superiore (fertilis) quam palea distincte minore.

Gramen 2-3 ped. altum, perenne (?). *Culmi* tenues, multinodi, e basi decumbente ascendentes, inferne ramos perlóngos erectos edentes, lseves, glabri, internodiis e vaginis exsertis. *FoUorumn* vaginae arctse, striatfe, teretes, sparse vel ima basi densius pilosse, pilis ssepe tuberculis minutis impositis; ligulse ad seriem brevium pilorum redactse; laminae linear-lanceolatse, longe et tenuiter acutatse, patulse, 2-3 poll, longse, 1[^]-2[^] lin. latse, rigidulte, glabrse, prsenter margines scaberulos lwves. *Panicula* oblonga vel ovoidea, laxa, erecta, circiter 6 poll, longa; rhachis tenuis, lsevis; rami 2-3-nati, tenuiter filiformes, ad nodos pilosi, laeves; ramuli pedicellique tenuissime capillares, hice infra apicem incrassatam pilis 1-1[^] lin. longis argenteo-nitentibus muniti, plerique 1[^]-2 lin. longi. *Spiculce* pallide virides, oblongae, 1 lin. longse. *Gluma* inferior ad squamam annuliformem redacta; superior late oblonga, truncata, superne minutissime puberula et insuper apice pilis longioribus instructa, tenuiter 5-7-nervis. *Valva* inferior vacua, anguste oblonga, breviter bifida, e sinu aristata, glumam superiorem sequans, 3-nervis, apicem versus pilosula, arista tenuissima flexuosa 7 lin. longa; superior oblonga, obtusa, 1 lin. longa, hyalina, 1-nervis. *Palea* late oblonga, truncata, obscure 2-nervis, quam valva superior major, 1 lin. longa. *Lodiculce* subquadratse, minutse. *Anthercc* 1 lin. longse.

SOUTH AFRICA : Nyasaland, Namasi, *K. J. Cameron*, 33.

A specimen collected by Schimper in Abyssinia, probably in Bege meder, No. 1410 of the '1863-8' collection, represents, as it seems, a variety of the species described above. It may be characterised thus:—

Var. abyssinica, Staph. *Panicula* angusta, 4 poll, longa; ramuli pedicellique breviores. *Valva* inferior 5-, superior obscure 3-nervis. *Antherce* 1 lin. paululo longiores.—O. STAPF.

Fig 1, a pedicel; 2, a spikelet with the anthers fallen; 3, lower glume; 4, upper glume; 5, lower valve; 6, fertile floret; 7, its valve; 8, its pale; 9, lodicule. All enlarged.

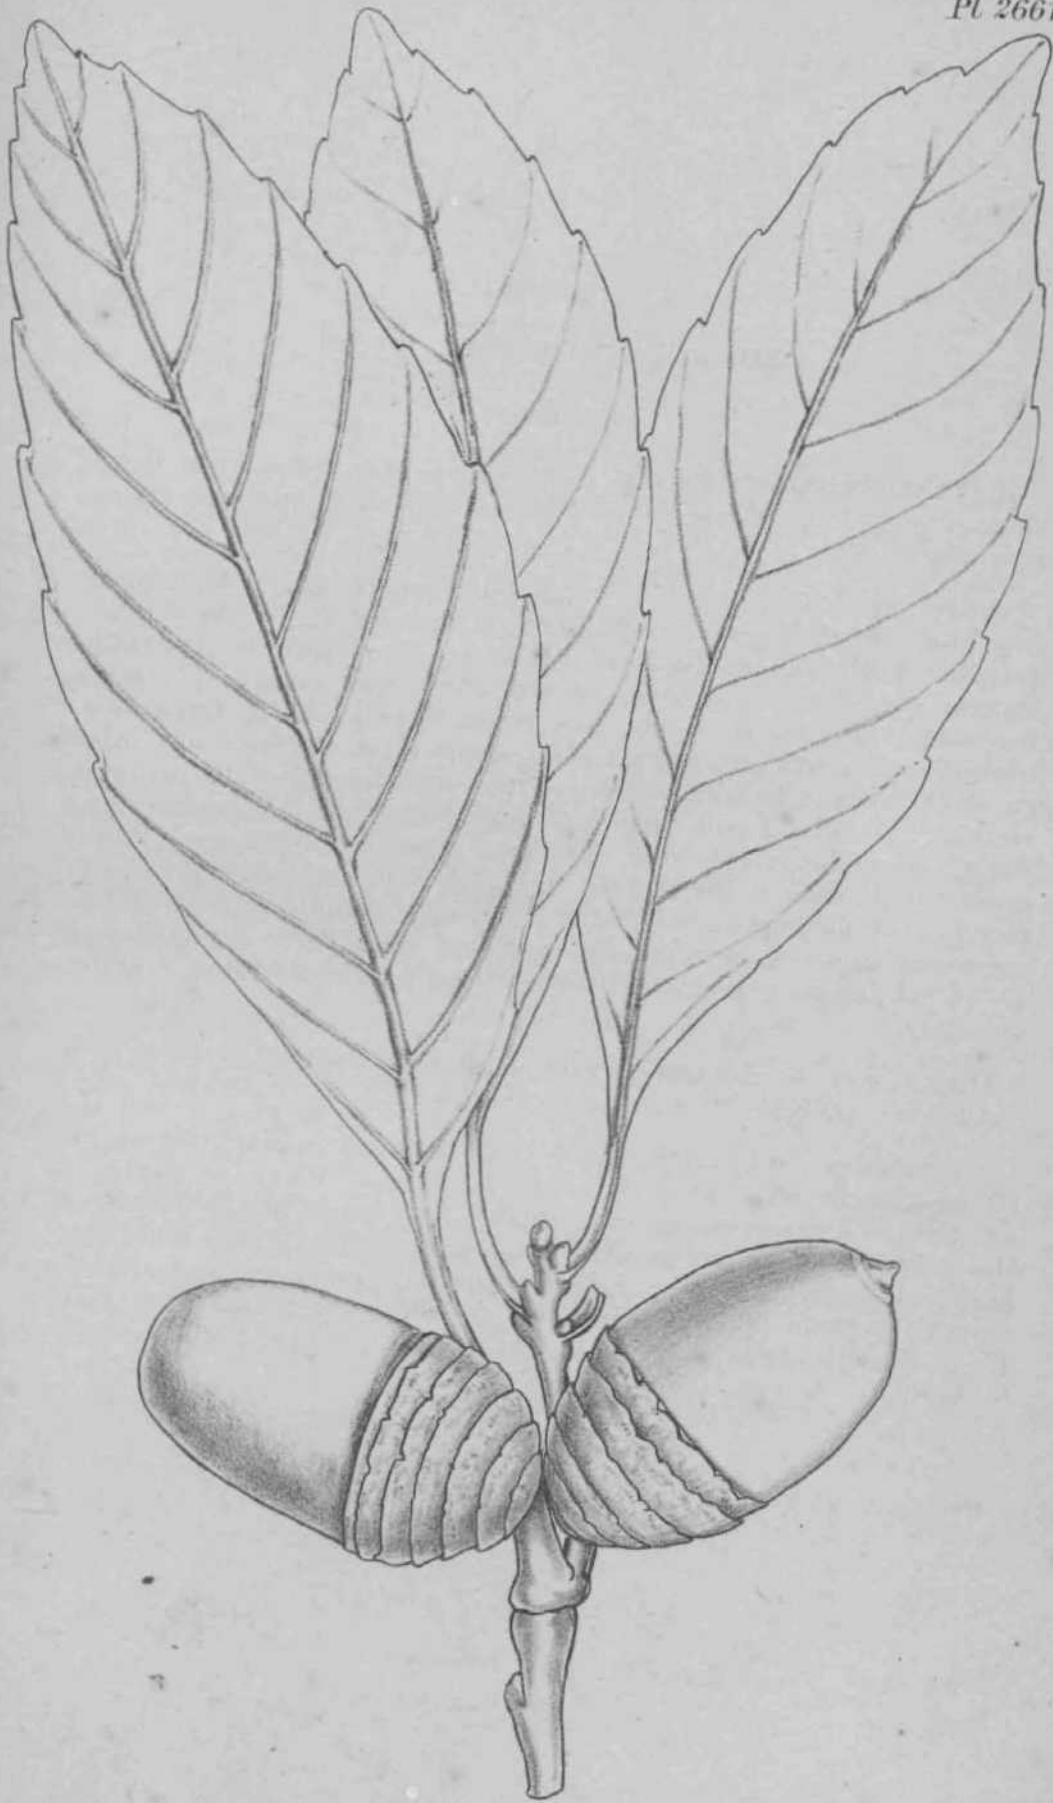

PLATE 2G61.

QUERCUS EDITHJS, *Skan.*

CUPULIFERJB.

ft' (§ Cyclobalanopsis) Edithse, *Skan* (*sp. nov.*); *Q. semiserrata* Roxb. valde affinis, differt foliis semper obtusis, nucibus longioribus angustioribusque.

Arbor 30 ped. alta (fide Ford), *Ramuli* juniores primo ferrugineo-tomentosi, citissime glabrescentes, minute lenticellosi. *Folia* elliptica vel elliptico-oblonga, adulta 3-5[^] poll, longa, 1J—2^J poll, lata, petiolata, superne crenato-serrata, basin versus integerrima vel repanda, apice brevissime acuminata, obtusa, basi cuneata, primo infra ferrugineo-tomentosa, undique cito glabrescentia, supra nitida nervis planis, infra costa et venis primariis lateralibus validis utrinque 9-10 distincte elevatis; petioli 1-1 poll, longi. *Fructus* juniores 3-4, maturi solitarii vel 2 in pedunculo valido saepissime petiolis breviore. *Involucrum* cupuliforme, 6 lin. longum, 9-11 lin. diametro, intus prsesertim ferrugineo-toinentosum, bracteis in laminas 6-8 annulares concentricas inferiores subintegras superiores crenatas connatis. *Nux* oblonga, 1[^]-11 poll, longa, presertim circum basin adpresso tomentosa, breviter apiculata,

CHINA : new British territory on mainland opposite Hongkong, near Tatitin, at 500 feet above sea-level, *Ford*, 623.

An examination of further material of this oak, remarkable among Chinese species on account of its long acorn, may determine that it is a variety of *Quercus semiserrata*, Roxb. The acorns of that species in the Kew Herbarium are never so long, and usually scarcely more than half as long, as those of *Q. Edithce*; but it appears to be extremely variable both in fruit and foliage. *Q. Edithm* is named after Lady Blake, the wife of Sir Henry Blake, G.C.M.G., Governor of Hongkong.—
S. A. SKAN.

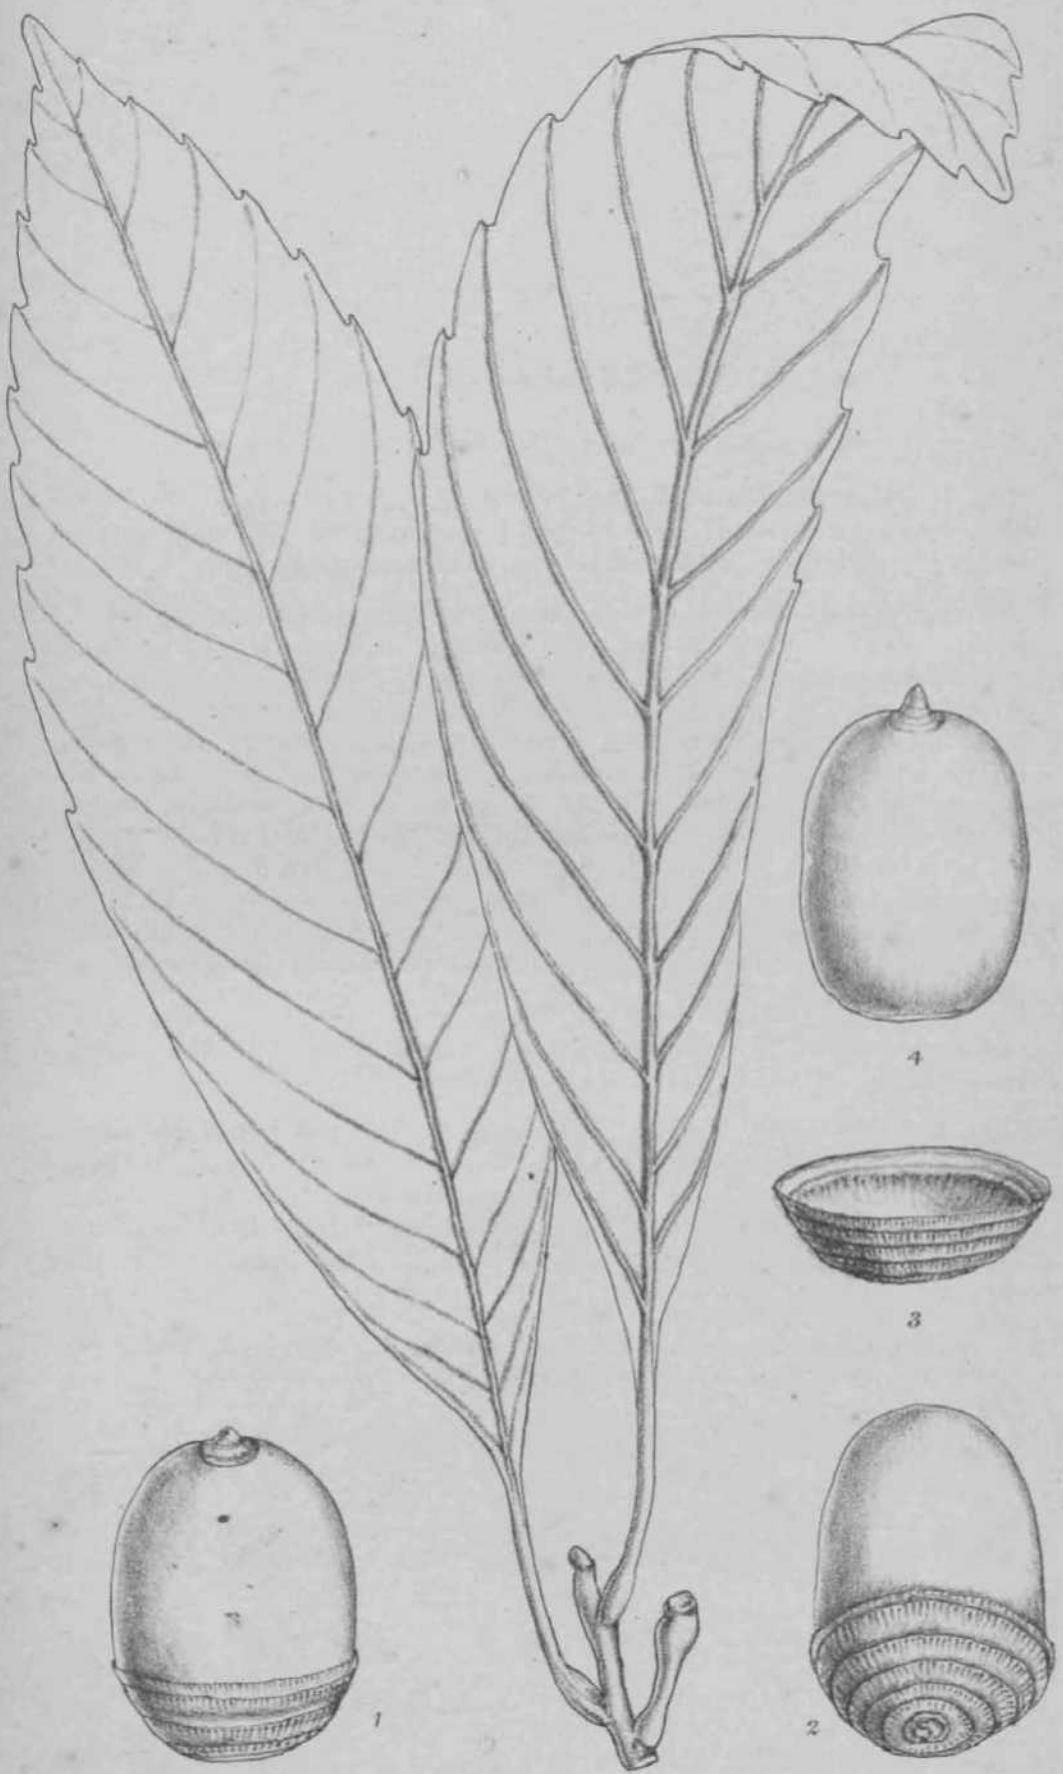

PLATE 2G62.

QUERCUS BLAKEI, Shan.

CUPULIFERJE.

ft. (§ Cyclobalanopsis) Blakei, Skan (*sp. nov.*); ad *Q. Edithm*, Skan, maxime accedit, differt foliis angustioribus tenuioribusque, involucris patelliformibus, nucibus brevioribus crassioribusque.

Arbor 30 ped. alta (fide *Ford*), ramulis foliisque tantum visis glaberrimis. *Ramuli* juniores graciles, teretes, inconspicue lenticellosi. *Folia* oblongo-lanceolata, 3^{^-}7 poll, longa, 1J--2 poll, lata, utrinque sensim angustata, apice breviter acuminata, superne undulato-serrata, infra medium integerrima vel leviter repanda, costa et venis primariis lateralibus utrinque circiter 14 supra planis, infra distincte elevatis; petioli graciles, f-1 poll, longi, semiteretes, basi incrassati. *Flores* desunt. *Fructus* in pedunculo petiolis multo breviore apice valdo incrassato. *Involucrum*, patelliforme, 1 poll, latum, intus dense ferrugineo-tomentosum, extus subtiliter pubescens, bracteis in laminas 6-7 annul ares concentricas integras connatis. *Nux* elliptico-globosa, 12-14 lin. longa, subtiliter adpresso tomentosa, passim cito glabrescens, breviter apiculata.

CHINA : New British territory on mainland opposite Hongkong, near Tatitin, at 500 ft. above sea-level, *Ford*, 622.

Q. Blakei is easily distinguished from all the previously described Chinese species of the section *Cyclobalanopsis* by the broad, shallow cupule. It is named after the distinguished Governor of Hong Kong, Sir Henry Blake, G C.M.G., from whom botanical investigations in the colony have received constant support and encouragement.—S. A. SKAN.

Pigs. 1 to 4, acorns and cupules in different positions. *Natural size*. The shallowness of the cupules is not represented so distinctly as it might have been.

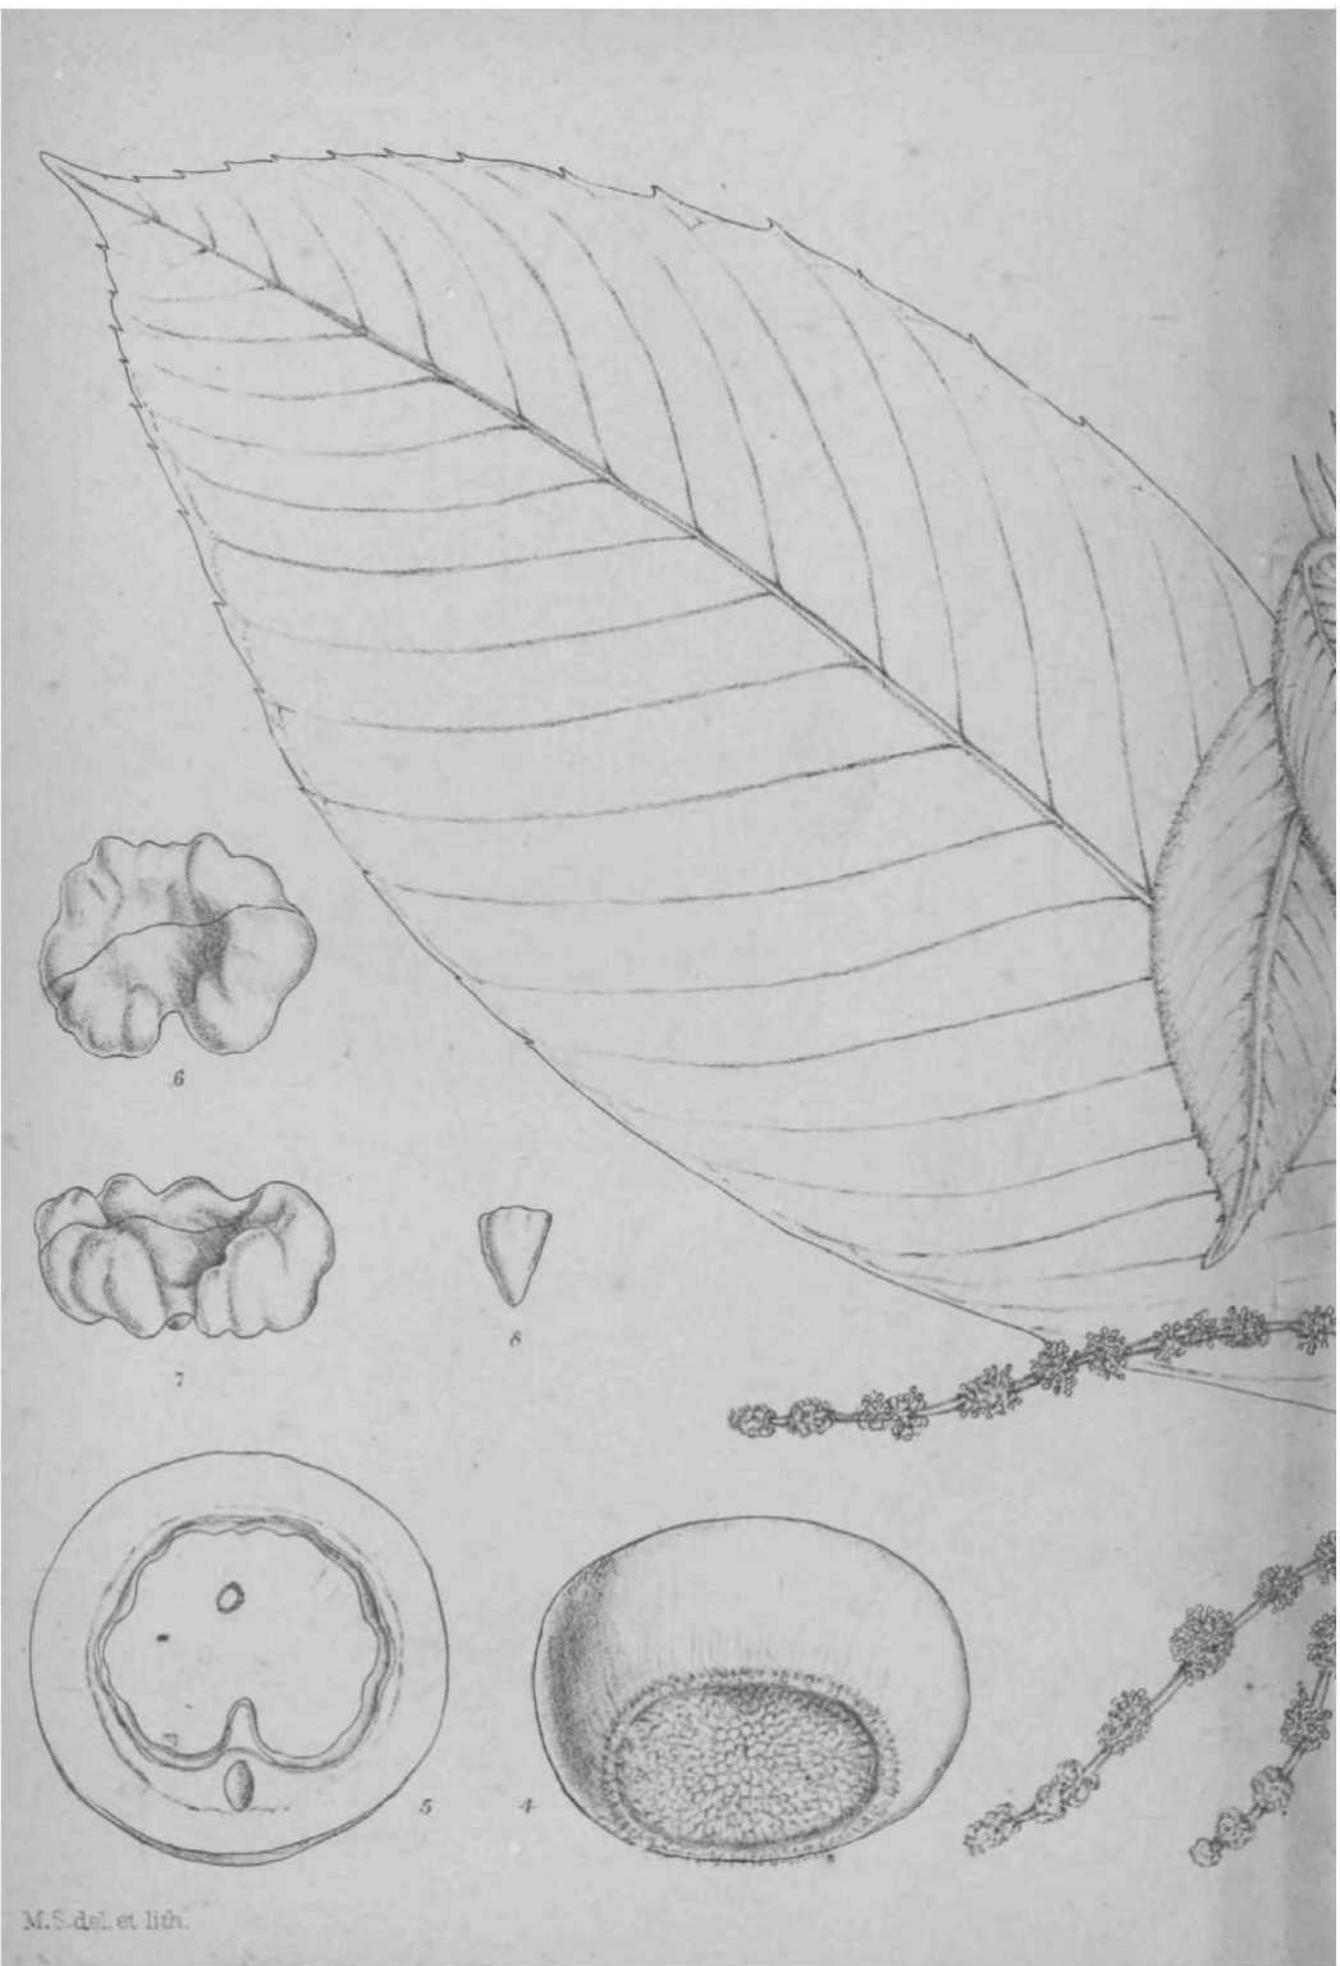

PLATE 2663.

QUERCUS BEX, *Hemsl*

CUPULIFEIME.

ft* (§ Cyclobalanopsis) **Bex**, *Hemsl* (*sp. nov.*); ad *Q. velutina*, Lindl., accedit sed omnibus partibus roinoribus, foliis anguste oblongo-lanceolatis, nuce apice haud excavata.

Arbor 60-pedalis (fide *Henry*) ramulis floriferis graciliusculis glabris cinereis egregie lenticellatis. *Folia* ad apices ramulorum conferta, juvenilia omnino densissime fulvo-tomentosa, matura supra demum glabra nitidaque, subtus etiam glabra glaucaque, di&tincte petiolata, coriacea, lanceolata, oblongo-lanceolata vel oblanceolata, maxima (in ramulis floriferis) circiter 10 poll, longa, acuminata sed vix acuta, basi cuneata, supra medium minute serrata; vense primarise laterales numerosic, angulo acuto excurrentes, per totam longitudinem fere recta?, supra impress®, subtus elevataj; petioli 9-12 lin. longi, crassi, tomentosi; stipulse lineares, fere pollicares, citissime deciduse. *Amenta* masculina circiter 3 aggregata, subterminalia, tenuia, flexilia, pendula, 3-6 poll, longa. *Perianthium* florum masculinorum alte 6-lobatum, lobis patentibus rotundatis. *Stamina* 6, filamentis glabris, antheris pilis paucis obsitis. *Flores* feminini ignoti. *Fructus* delapsus tantum visus, 2-2J poll, diametro. *Involucrum* late cupuliforme, fulvo-tomentosum, bracteis in laminas 6-7 annulares concentricas irregulariter dentatas connatis. *Nut* ossea, depresso-globosa, apice excavata, e cupula semi-exserta. *Semen* unicum, cotyledonibus sinuato-lobatis.

CHINA : Szemao, Yunnan, at 4000 ft., *A. Henry*, 12665.

This very handsome oak is similar to the Himalayan *Q. lamellosa*, Sm., but that has coarsely serrate leaves, and relatively small, ovoid acorns, more than two-thirds immersed in a very thick, lamellate cup. It is, however, more closely allied to *Q. velutina*, Lindl., but the differences are more easily seen than described. Apart from the smaller size, the leaves of *Q. velutina* are thicker and harder in texture, broadest below the middle, and have fewer primary veins. In both *Q. ReX* Hemsl., and *Q. velutina*, the young leaves are densely clothed with a woolly tomentum, and become quite glabrous with age. Flowering branchlets bear leaves in both conditions as shown in the plate. A parallel to this is exhibited by the tropical South American *Connarus erianthus*, Benth. It is difficult to say what benefit plants, under such widely different conditions, derive from this covering.—
W. BOTTING HEMSLRY.

Fig. 1, a bract from a male catkin; 2, a male flower; 3, a fruit; 4, a nut; 5, cross section of the same; 6 and 7, embryo in different positions; 8, radicle.—Figures 1, 2, and 8 enlarged; the rest natural size.

PLATE 2665.

QUEBCUS CORNEA, *Lonr.*

CUPULIFEBiE.

Q. cornea, *Lour. Ft. Cochinch.* p. 572 ; *DC. Prodr. xvi. i. p. 90* ;
Seem. Bot. Voy. § Herald, p. 413 t. 87; *Benth. FL Hongk.* p. 322;
Q. hemisphcerica, *Drake in Journ. de Bot.* 1890, p. 151, t. 3, f. 4.

CHINA : Hongkong, various collectors; **Hainan**, *B. C. Henry*;
Tonkin, *Balansa*, 2364, 2369 (*hemisphcerica*), *Balansa*, 568, 2367,
2368 (*cornea*).

The fruit, and more especially the seed, of this species had not previously been adequately figured. Lindley (*Nat. Syst. Bot.* ed. 2, p. 441) made a separate genus—*Syncedrys*—of it, on account of the 'glans ossea, intus semiquinquelocularis seminis cotyledonibus in tot lobos divisis quot loculi, more Juglandis.' As explained under Plate 2664, there are several species of this group in Eastern Asia, and it is a little uncertain whether this is really Loureiro's plant, because his description is insufficient. But, as it has been accepted by Bentham, Seemann, and A. De Candolle, and as there is not, so far as I can ascertain, any specimen in existence to settle the point, we may adopt the name. With a considerable series of specimens before me, I have no hesitation in treating *Q. hemisphcerica* Drake as the same species as *Q. cornea*, Lour., and the author agrees with me after seeing the Kew specimens. The acorns from different sources exhibit considerable variation, but not more than those of the common oak. They are edible and commonly offered for sale in the markets of South China. Mr. C. Ford, the Superintendent of the Hongkong Botanic Garden, who recently sent a fine sample of the acorns, says that their flavour is not unpleasant, and that they are certainly the most palatable of any acorn he had tasted. He further states that *Q. cornea* fruits sparingly in *Hongkong*, and that the acorns sold in the markets are said to come from the province of Kwangsi, to the west of Canton ; but he never saw the tree in sufficient abundance either in Kwantung or Kwangsi to supply the quantities seen in the markets.—

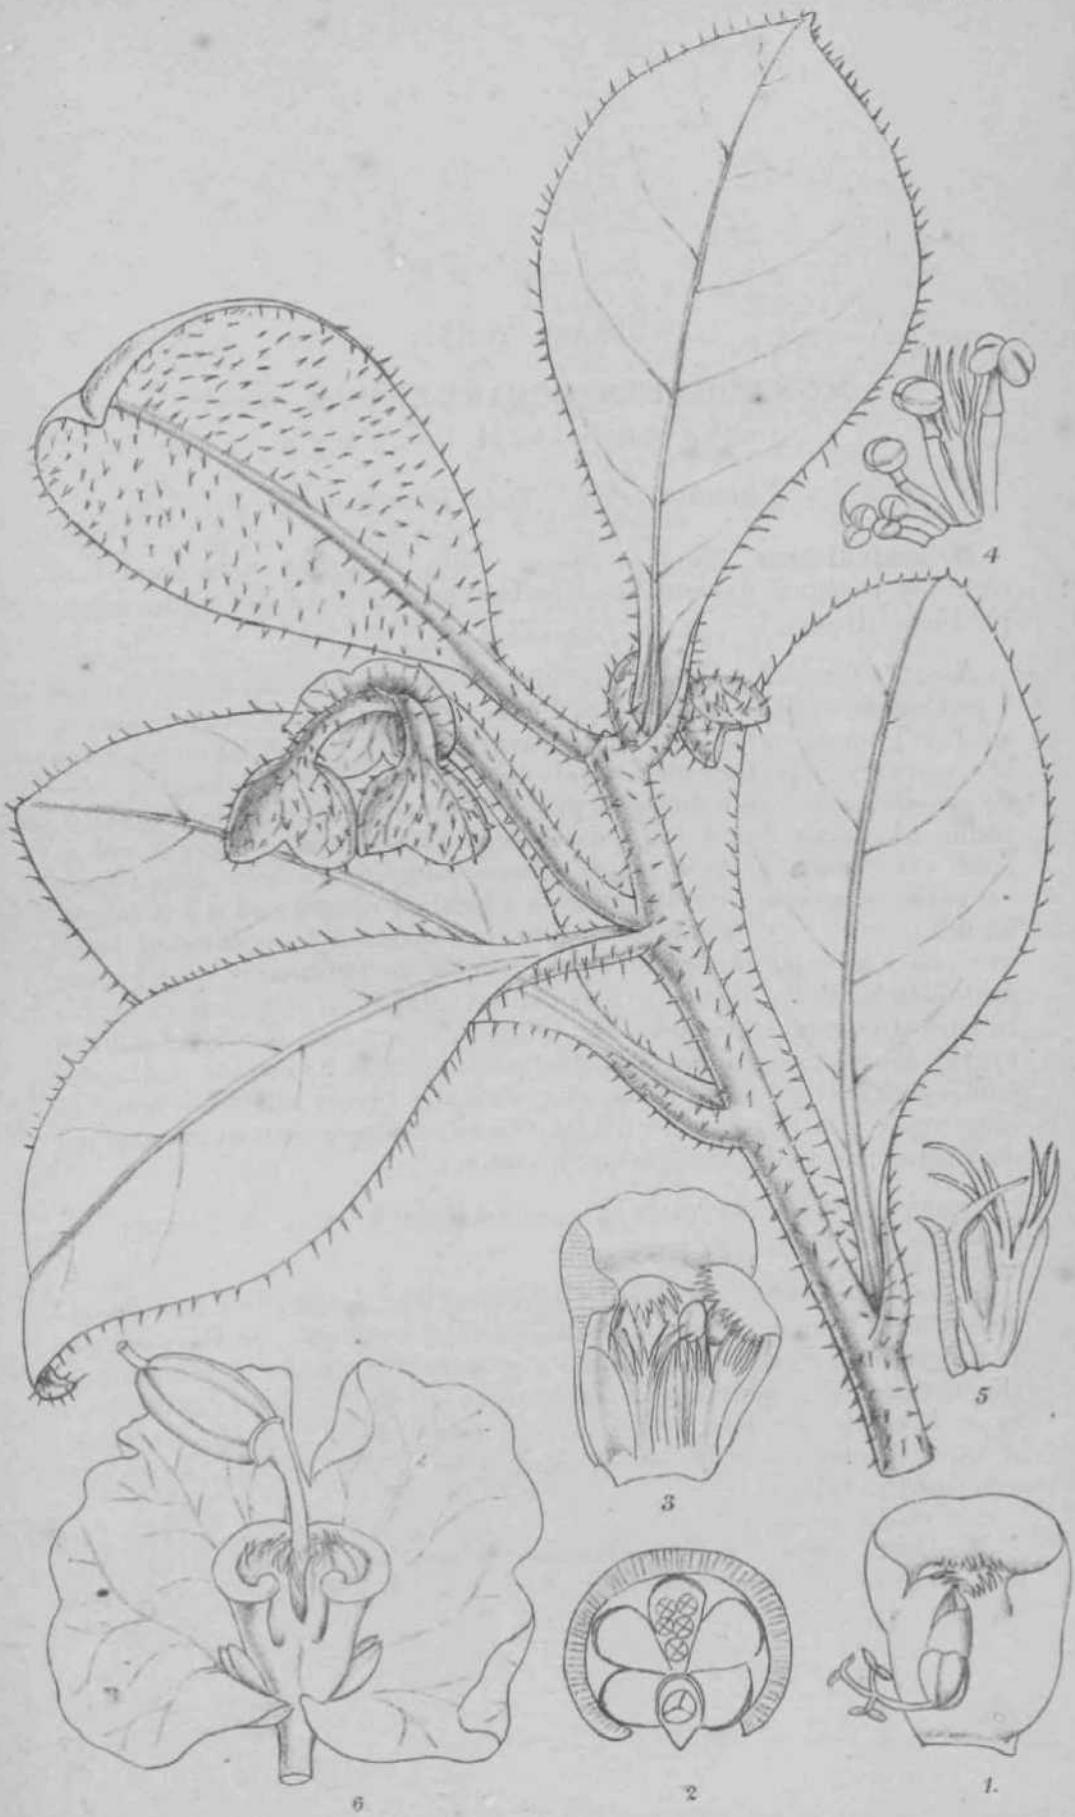

PLATE 2666.

MONADENIUM ECHINULATUM, *Stapf.* (with a cyathium qfM. levee, *Stapf*). .

EUPHORBIACE*E*. Tribe EUPHORBIEJB.

M. **echinnlatnm**, *Stapf*, a specie unica hucusque nota aculeis in omnibus partibus prsesentibus, cyathio latiore, glandula multo minus producta diversa.

Radix tuberosa. *Caulis* erectus, succulentus, aculeolatus, circiter 1 ped. alt us. *Folia* breviter petiolata, obovata, acuta, basi cuneata, ad 3 poll, longa, ad 1[^] poll, lata, carnosa, supra laevia glabraque, infra et in marginibus aculeolata; petiolus crassus, ad 6 lin. longus. *Inflorescentice* axil lares e dichasiis primo nutantibus aculeolat is composite, pedunculo crasso 1 poll, longo suffultse ; bractese late rotundatse, apiculatse vel truncatse, uno latere liberse, altero fere tota longitudine connatae, carnosulse, nervis saturate viridibus notatte, ad 4 lin. longse, ad 6 lin. latae. *Cyathium* subsessile, subglobosum, 2 lin. longum, laevr, uno latere ad medium fissum, 5-lobum, lobis membranaceis albis glabris fimbriato-laceratis incurvis insequalibus glandula subannulari crassa inte[^]ra circumdatis et superatis. *Mores* \$ in cincinnos circiter 5-fioros cyathii lobis oppositos dispositi, calyce destituti; bracteolae fimbriatse cum cyathii tubo et inter se alte connatse involucelli more flores \$ cingentes. *Flos* 2^e cyathii fissura exsertus, nutans, calyce bracteisque destitutus ; ovarium 3-sulcatum, glabrum.

TROPICAL WEST AFRICA. Described from a living plant communicated by Mr. F. Sander.

Monadenium was described by Professor Pax in Engler's *Bot. Jahrb.* xix. p. 126, from flowers and fruits, collected by Fischer in East Africa. It differs from *Synadenium* in the zygomorphism of the cyathium and the usually much more developed cyathial gland, which in this species as in *M. coccineum*. Pax, exceeds considerably the lobes of the cyathium. A third species was collected by A. Whyte in Nyasaland. It may be described as follows :

M. **I&ve**, *Stapf* \ a *M. echinulata* absentia aculeolorum, bracteis majoribus minus alte conuatis, glandula? margine recurvo cyathii lobos requante diversa.

Folia broviter petiolata, obovato- vel cliptico-lanceolata, acuta, basi longo nttenuata, ad 6 poll, longa, 2 poll, lata, glabra, lievia. *Inflows-*
*centi*w dichotome compositae, densiuscuse; pedunculus 2-4 poll. loDgus;
 bractese late rotundatse, obtusissimse, uno latere liberse, altero ad
 | connafce, nervis saturate viridibus notatse, ad 6 lin. longse. *Cyathium*
 subsessile, subglobosum, J| lin. longum, laeve, uno latere ad medium
 fissum, 5-lobum, lobis membranaceis denticulatis glabris insequalibus
 glandula subannulari margine integro recurvo circumdatis et sequatis.
Flares ut in *M. echinulato*, *Capmla* oblongo-globosa, 2-3 lin. longa,
 laevis. *Semina* dense verruculis albis obsita.

BRITISH CENTRAL AFRICA. North Nyasaland, between Kondowe and Karonga, at 2000-3000 ft., Whyte.

The general appearance of the inflorescence of *M. lame* is rather similar to that of certain species of the section *Tithymalus* of *Euphorbia*^ on account of the large involucral bracts.—OTTO STAPF.

Fig. 1, cyathium of *M. eehinvlatwn*; 2, diagram of the same; 3, part of the cyathium, seen from within; 4, a cyme of male flowera; δ, fimbriate radial bract. All enlarged* Fig. ti, cyathium of A/, l&ve.- Enlarged.

PLATE 2667.

ALLOSPONDIAS LAKONENSIS, Stapf.

ANACARDIACEJS. Tribe SpONDIEiE.

Allospondias, *Stapf* (*gen. nov.*). *Mores hermaphroditii* (vel polygami ?). *Calyx* parvus, 4-5-lobatus, lobis brevibus late triangularibus. *Petala* 4-5, linearis-oblonga, suboleta, recurva, sestivatione valvata. *Stamina* 8-10, sequalia, sub disco inserta; filamenta subulato-filiformia; antherae linearis-oblongae, versatiles, rimis longitudinalibus lateraliter dehiscentes. *Discus* annularis, obscure crenulatus. *Ovarium* subglobosum; basi disco cinctum, 4-5-loculare; ovula in loculis solitaria, pendula, micropyle supera. *Styli* 4-5, crassiusculi, in carpellorum dorso decurrentes, supreme conniventes; stigmata brevia, obliqua. *Drupa* mesocarpio carnoso; putamen lignosum, 4-5-gonum, 4-5-loculare, lateribus magis minusve depresso et linea tenui prominente longitudinali percursis, angulis apice in lobulos vel cornua brevia productis, superficie tota tenuiter fibrosa; loculi monospermi, angusti, erecti, crucis vel stellae modo dispositi, cum lacunis amplis resinifcris altemantibus, substantia loculos et lacunas includente ad parietes subtenues redacta. *Setina* oblonga; testa membranacea. *Embryo* rectus, cotyledonibus piano convexis, radicula brevissima, supera.—*Arbor mediocris*. *Folia impari-pinnata, plurijuga; foliola petiolulata, terminali excepto magis minusve in aquilatera, acuminata, nervo collectivo marginali tenuissimo vel obscuro*. Flores parvi, pediceUati, in paniculam majuscum dispositi.

A. *lakonensis*, *Stapf* (*sp. unica*). *Arbor* 10-20 ped. alta. *Ramuli* floriferi 2-3 lin. crassi, molliter tenuissime pubescentes, cinereo-fusci. *Folia* |-|| ped. longa, 8-12-juga; petiolus communis basi 1^-2 lin. crassus, molliter tenuissime pubescens; foliola petiolulo 1-1^ lin. longo suffuljo, plerumque subopposita vel superiora alternantia, lateralia oblique oblonga, acuminata, basi oblique subacuta, 3-3? poll, longa, fere 1 poll, lata, summum symmetricum ad 1} poll, latum, omnia membranacea, exsiccando fuscescentia, supra primo puberula, mox glabrata, infra ad nervos venasque puberula et insuper secundum nervum medium nee non alibi pilis tenuissimis rigidulis aspersa, nervis secundariis utrinque 9-10 obliquis prorsus curvatis, nervo marginali collectivo tenuissimo ssepe obscuro. *Paniculce* axillares, ambitu ovate, laxe ramosre, 6-8 poll, longsc, 4-6 poll, latse, tenuissime griseo-

pubescentes, pedunculo rhachique petiolo similibus, illo 3-4 poll, longo ; rami inferiores 2-4 in. longi, omnes patuli, a medio vel paulo infra ramulosi; bractese minutse, subulate; pedicelli graciles, ad $\frac{H}{2}$ lin. longi, prope basin articulati. *Flares* versus ramulorum apices congesti. *Calyx* pubescens, $\frac{1}{2}$ lin. longus, ad medium 5-lobatus. *Petala* alba, 1 lin. longa, $\frac{1}{2}$ lin. Tata. *Antherai* 1 lin. longie. *Ovarium* cum stylis $\frac{3}{4}$ lin. longum. *Putamen* 4-5 lin. longum, 3-3 $\frac{1}{2}$ lin. latum. *Spondias?* *lakonemtis*, Pierre, Fl. Cochinch. t. 375.

INDO-CHINA : Siam, Mekong valley near Lakon, *J Harmand, Herb. Pierre*, 1825. Tonkin, Hanoi, cultivated in the squares and streets, *Balansa*, 4036, 4612.

This plant was made the type of a new section *AUospondias* of the genus *Spondias* by Pierre, i.e. The author, who did not know the fruit, remarked, however, that it differed in certain characters from *Spondia* Sy and that it might have to be referred to a new genus when the fruit should be known. The Kew collections do not contain complete fruits, but several stones (putamina) deprived of their fleshy covering, which is, according to Balansa, edible. The structure of those stones with their large cavities occupying the angles and much wider than the seed-containing cells, with their considerably reduced stony substance, and the absence of the terminal pits so characteristic of *Spondias*, appear, in connection with the thin leaflets and their nervation, to justify the raising of the section *Alfospondias* to generic rank. Dr. Pierre, to whose kindness we owe a specimen of the type of his *Spondias lakonenttis*, has confirmed this view after having seen a sketch of the fruit which I had sent to him. There are large resin canals in the decurrent parts of the styles in the ovaries, and therefore outside the ovary cells and in their median line, whilst no trace of them is to be seen in the stone ; on the other hand, fine resin canals occur between the cells, and these may possibly give rise to the large cavities of the endocarp. The resinous solution in these was, of course, dried up in the stones which I have seen, and formed thin transverse films, dividing the cavities more or less perfectly into chambers.—O. STAPF.

Fig. I, a branchlet of an inflorescence; 2, a calyx; 3, a disc with 3 of the 5 stamens; 4, a disc expanded; 5, an ovary; 6, the same, cut longitudinally; 7, a stone, seen from the side; 8, the same, seen from the top; 9, a stone in cross-section ; 10, an embryo.—All enlarged.

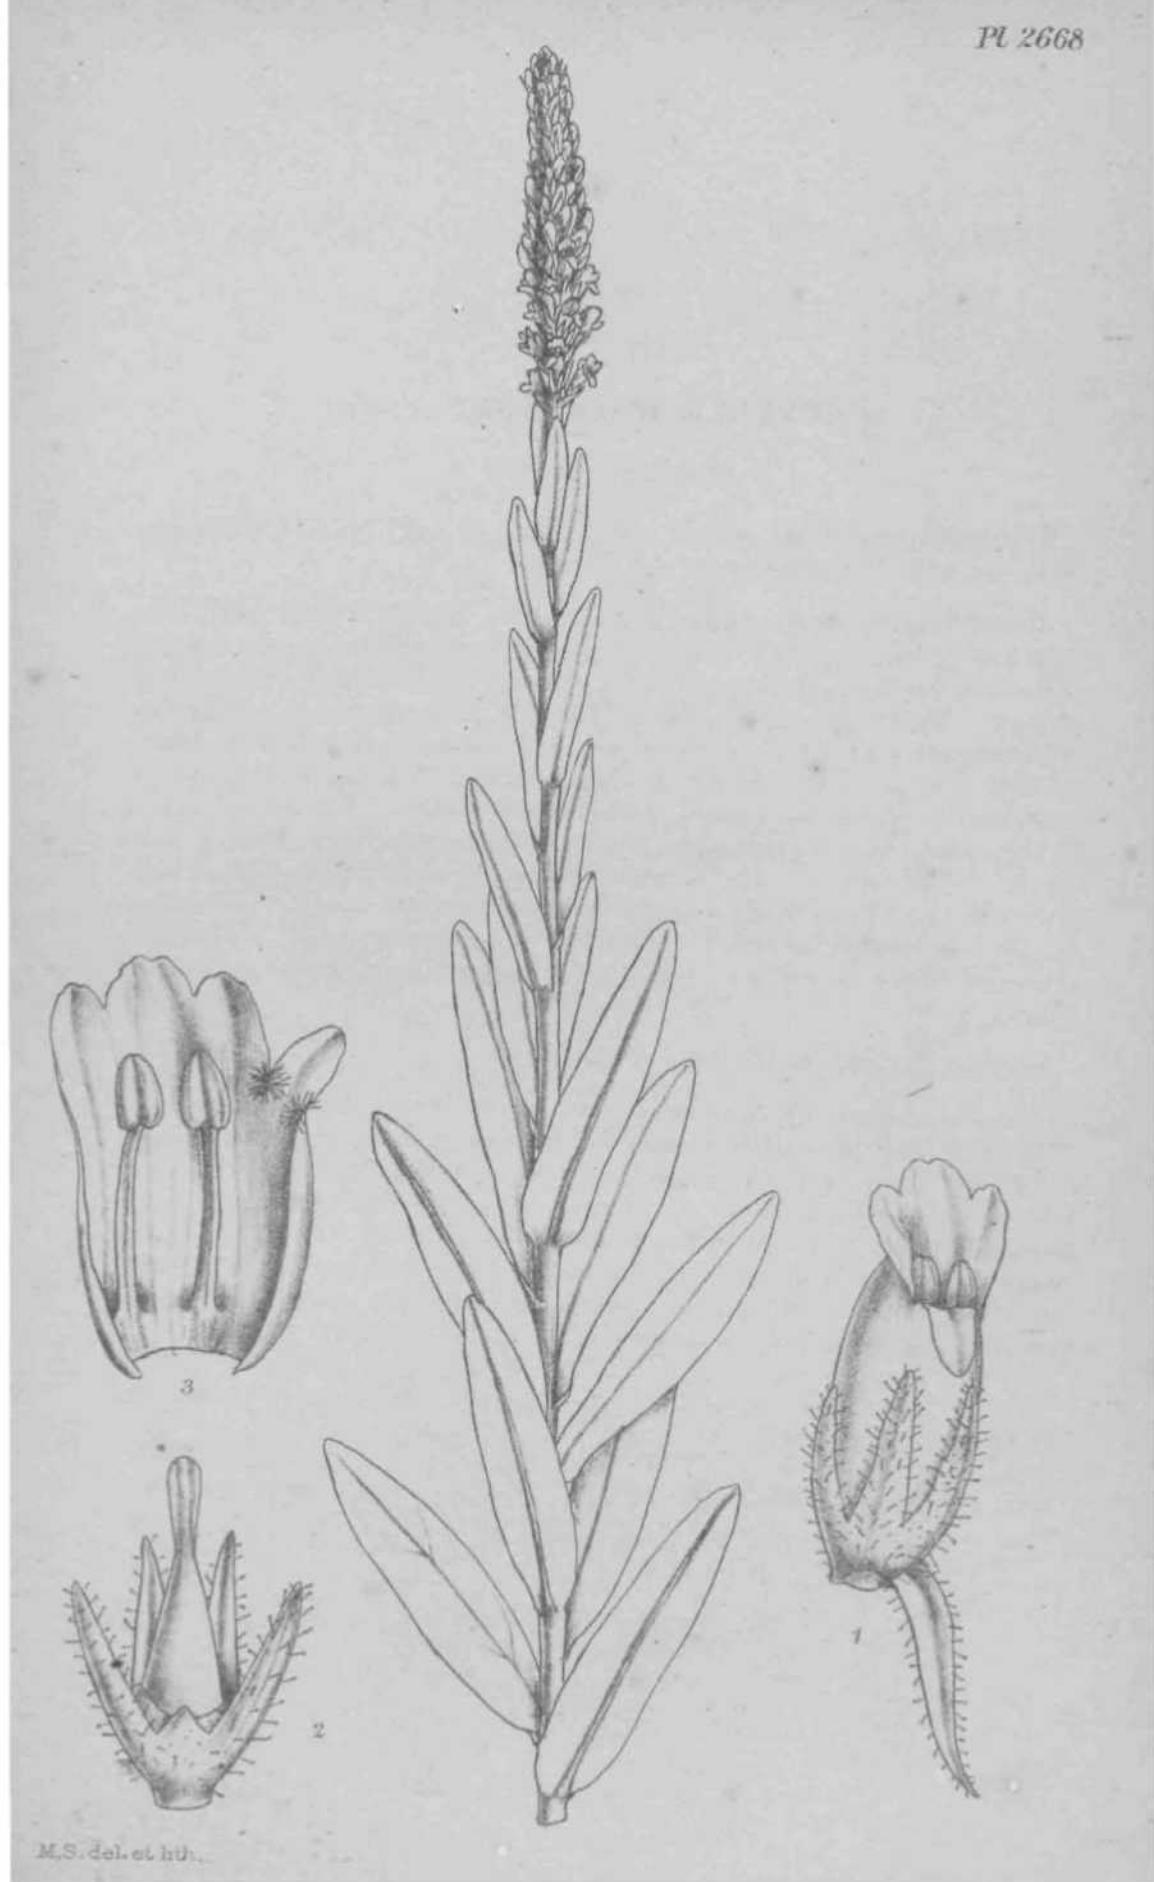

PLATE 2668.

SCROFELLA CHINENSIS, *Maxim.*

SCROPHULARIACEJS

8. **chinensis**, *Maxim*, in *Bull. Acad. Petersh* xxxii. p. 511, et in *Mil. Biol.* xii. p. 763 (*species unica*).

Herba erecta, fere omnino glabra, caule simplici 6-12 poll, alto, internodiis brevissimis. *Folia* (radicalia non visa) alterna, sessilia, suberecta, caule appressa, papyracea, oblongo-lanceolata, 9-18 lin. longa, obtusa. *Flares* minuti, brevissime pedicellati, in racemum terminalem densissimum dispositi, bracteolis parvis linearibus quam floribus brevioribus. *Calyx* parce puberulus, alte 5-lobatus, lobis, praeter posticum minutum dentiformem, linear-lanceolatis vix acutis. *Corolla* bilabiata, tubo ventricoso intus extusque glabro calycem superante, labio postico quadrinervio trilobato lobo intermedio majore emarginato, labio antico parvo integro linguiformi recurvo intus in sinibus barbato. *Stamina* 2, postica, inclusa, filamentis glabris; staminodia nulla. *Ovarium* glabrum, disco annulate crasso cinctum, ovulis plurimis. *Capsula* ignota.

CHINA : Northern Szechuen, *Potanin*.

The last communication received by the writer from the late M. Franchet, written a little more than a week before his sudden death, contained some queries respecting the affinities of *Scrofella* and *Calorhabdos*, which led to an investigation of these genera, and the results are put on record here, under plates 2668-2670. M. Franchet suggested the existence of a close relationship between these genera, but the points of difference seem to be sufficient to maintain their generic separation.—W. BOTTING HEMSLEY.

Fig. 1, a flower and bracteole; 2, calyx and pistil; 3, corolla laid open—*AU enlarged*.

PLATE 2669.

CALORHABDOS BRUNONIANA, *Be nth.*

(and dissections o/C. cauloptera, Hance.)

Scrophulariaceae.

C. brunoniana, Benth. *Scroph. Ind.* p. 44, et in *DC. Prodr.* x.
p. 456; a *C. cauloptera*, Hance, imprimis caulibus teretibus differt.

Herba perennis, glabrescens, caulibus erectis simplicibus. *Folia* alterna, quam internodia longiora, subsessilia, tenuia, fere membranacea, lanceolata, 2^{^-5} poll, longa, acuta, deorsum attenuata, minute serrata, venis primariis lateralibus paucis subtus parce setulosis. *Flores* parvi, in racemum terminalem densissimum dispositi, bracteolis lanceolatis quam calyce brevioribus. *Calyx* inaequaliter alte 5-lobatus, lobis anguste lanceolatis vix acutis margine parce minuteque ciliatis. *Corollas* tubus cylindricus, intus medio annulo pilorum instructus, leviter obliquus; limbus brevis, bilabiatus, labio postico emarginato, labio antico sequaliter trilobate, *Stamina* 2, postica, filamentis pilosulis antheris exsertis; staminodia nulla. *Ovarium* glabrum, disco annulato cinctum, stylo gracili quam staminibus breviore. *Capsula* polysperma.

INDIA : Gossain Than, Nepal, *Wcdlich*, 405.

CHINA : at the foot of Tsangshan, near Tali, *Delavay*, 3161.

In Bentham and Hooker's *Genera Plantarum*, ii. p. 963, *Pcederota axillaris*, Sieb. et Zucc, is reduced to *CalorJiabdos*, but since that was done several plants allied to *P. axillaris* have been discovered in China, as well as one very closely related to the original *Calorhabdos brunoniana*, and it seems desirable to separate them generically. The reasons for this course are given under Plate 2670.—W. BOTTING HEMSLEY.

Fig. 1, a flower and bracteole of *Calorhabdos brunoniana*, Benth.; 2, corolla of the same laid open; 3, pistil; 4, a flower of *C. cauloptera*, Hance; 5, corolla of the same laid open.—All enlarged.

BOTRYOPLEUKON VENOSUM, *Hemsl.* (and dissections of *B. stenostachyum*, *Hemsl.*)

SCROPHULARIACBiE.

Botryopleuron, *Hemsl.* (*gen. nov.*). A *Calorhabdo* differt cauiibus vagantibus vel prostratis, racemis axillaribus amentiformibus, corollas limbo subsequaliter 4-lobato, staminibus longe exaertis.

B. venosum, *Hemsl.*; *Calorhabdos venosa*, *Hemsl.* in *Journ. Linn. Soc.* xxvi. p. 197.

Herba prostrata vel vagans, fere omnino glabra, caulis gracilibus elongatis 1-3-pedalibus. *Folia* alterna, brevissime petiolata, demum subcoriacea, lanceolata, usque ad 5 poll, longa sed ssepius breviora, acute acuminata, basi cuneata vel rotundata, aculeolato-serrulata, supra nitida, subtus pallidiora, grosse reticulato-venosa, venis primaria paucis inter se arcuatim connexis supra insigniter impressis subtus elevatis. *Flores* purpurei, subsessiles, dense racemoso-spicati; racemi 1-1¹ poll, longi, brevissime pedunculati, bracteis angustis acuminatis obscure ciliolatis. *Calyx* præter margines loborum lanceolatorum glaber. *Corolice* tubus subcylindricus, intus filamentaque barbati. *Stamina* 2, postica, exserta; staminodia nuda. *Capula* oligosperma.

CHINA : Ningpo mountains, Ghekiang, *Faber*; Ichang, Nanto and mountains to the northward, *A. Henry*, 55, 2187, 4638.

BotryopLeuron as here understood, including four species, namely:

1, ***B. venosum***, *Hemsl.*, syn. ***ColorJiabdos venosa***, *Hemsl.* in *Journ. Linn. Soc.* xxvi. p. 197.

2, ***B. stenostachyum***, *Hemsl.*, syn. ***Calorhabdos stenostachya***, *Hemsl.* loc. cit. p. 196.

3, ***B. latifolium***, *Hemsl.*, syn. ***Calorhabdos latifolia***, *Hemsl.* loc. cit. p. 196, t. 4.

4, ***B. axillare***, *Hemsl.*, syn. ***Calorhabdos axUlaris***, *Benth. et Hook. f.* Gen. PI. ii. p. 963; *Pasderota axillaris*, *Sieb et Zucc. Fl. Jap. Fani. Nat.* ii. p. 20.

The propriety of giving this little group of plants generic rank will, I think, not be disputed. In the first place, their habit is so entirely

different from that of the genuine species of *Calorhahdos*[^] and as this is associated with a very peculiar inflorescence and deviations in floral structure, they constitute as distinct a genus as the majority of the genera of the order.—W. BOTTING HEMSLEY.

Fig. 1, a flower of *Botryopleuron venosuniy* Hemal.; 2, a corolla of the same laid open; 3, a pistil; 4, a flower of *B. stenostachyum*, Hemsl.; 5, corolla of the same laid open.—All enlarged.

PLATE 2671.

PLECTRANTHUS CALCARATUS, *HemsL*

LABIATS.

P. calcaratus, HemsL (sp. nov.); inter species hujus generis hucusque cognitas longitudine corollse calcaris insignis.

Herba perennis, hispidula, caulis gracillimus 1-2-pedalibus adscendentibus. *Folia* quam internodia ssepius breviora, distincte petiolata, tenuia, membranacea, ovato-lanceolata, cum petiolo 1-3 poll, longa, utrinque attenuata, crenata, paucinervia. *Flores* in racemos terminates dispositi, pauci aggregati, graciliter pedicellati. *Calycis* hispiduli labium posticum trilobatum, lobis rotundatis, lobis lateralibus multoties minoribus; labium anticum latum, emarginatum. *Corolla* extus glandulosa, intus glabra, circiter pollicaris; tubus gracilis, curvatus, longe calcaratus, calcare acuto; labium posticum sequaliter 4-lobulatum, lobulis rotundatis; labium anticum, cymbiforme. *Stamina* quam corolla breviora. *Stylus* stamna paullo excedens. *Nuculum* ovoidese, glabre, punctate.

CHINA : mountains west of Szemao, Yunnan, at 4500 to 5000 ft.,
A. Henry, 12,339.

Flowers with spurred corollas are rare in the Labiateae, and although, as the name implies, *Plectranthus* was founded on a species having that character (L'He*ritier, *Stirp. Nov.* t. 41), many of the species are not spurred, and no other species which I have seen has such a highly developed spur as the present one.—W. BOTTING HBMSLBY.

Fig. 1, a flower; 2, calyx laid open showing the disk and nutlets; 3, corolla in section showing two of the stamens; 4, fruiting calyx; 5, a nutlet.—All enlarged.

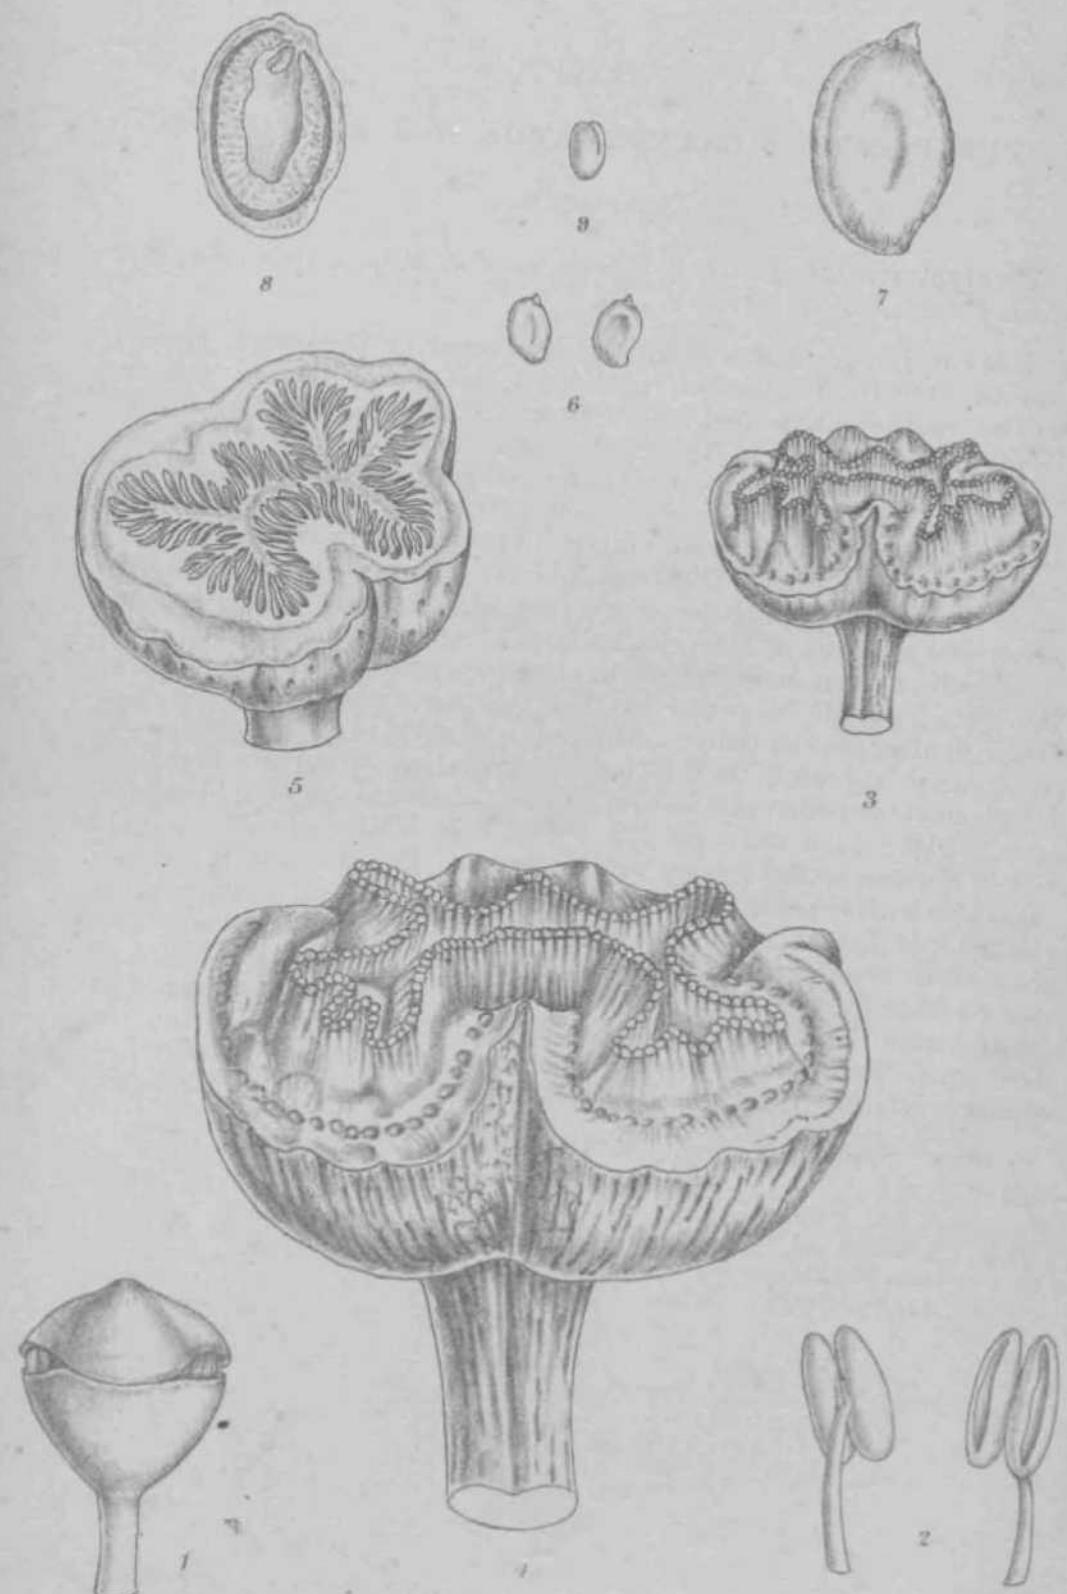

PLATE 2672.

TUPIDANTHUS CALYPTRATUS, *ffook.f. et T. Thorns.*

ARALIACEJE.

T. calyptatus, *Hook./, et T. Thorns, in Bot. Mag. t. 4908 ; Benlh. et Hook./. Gen. PL i. p. 947.*

This singular plant was originally discovered by Sir Joseph Hooker and the late Dr. T. Thomson in Khasia, but it was figured and described in the place cited above from a plant that flowered in the Royal Gardens, Kew, in 1856. As stated in the *Genera Plantarum*, the series of stigmas are incorrectly figured in the *Botanical Magazine*, and the seeds are nowhere described, so far as I am aware. Dr. A. Henry having sent ripe fruit containing perfect seeds, it was thought desirable to complete the illustration of the genus, especially as it presents characters of which scarcely a parallel is known. The ovary has sometimes upwards of 160 cells, each cell containing one ovule ; and the sessile stigmas are arranged in a sinuous manner, corresponding to the cells. It will be perceived that this arrangement permits of a larger number of cells than could appear in a circle of the same diameter. The nearest approach to this large aggregation of carpels and their arrangement is perhaps in *Sararanga sinnosa*, Hemsl. (*Journ. Linn. Soc.* xxx. p. 216, t. 11, & xxxii. pp. 479 -488 tt. 4-7; *Hooker's Ic. PL* t. 2584); but in *Sararanga* the flowers are unisexual. *Tupidanthus* is also remarkable in the order for having a very large number of stamens: a character it has in common with *Plerandra* and *Tetrapetasandra*, two Polynesian genera of Araliaceae. They have been described as 2- to many-seriate in *Tupidanthus*, but the scars in the circumference of figure 4 show that they are in one series, and upwards of 100 in number. The crustaceous pyrenes and seeds are very thin, otherwise they present no deviation from the ordinary conditions.—W. BOTTING HEMSLEY.

CHINA: Szemao, Yunnan, at 4500 ft., A. Henry, 12298, 12298 A, 12298 B.

Fig. 1, a flower-bud, the calyptae petals in course of being thrown off by the growing stamens; 2, stamens; 3 and 4, A fruit; 5, a cross section of the same; 6, pyrenes; 7, a pyrene; 8, a section of the fruit*; 9, embryo.—Alt trctpt 1, 3, .ind 6 enlarged.

PLATE 2073.

ASFIDOFTEBYS OBCOEDATA, Hemsl.

MALPIGIACEAE.

B. obcordata, Hemsl (sp. nov.); species forma foliorum facile dist ingitur,

Frutex alte scandens, ramis teretibus pubescentibus. *Folia* petiolata, coriacea, rotundato-obcordata vel apice trihbata, lobis lateralibus latis rotundatis, intermedio parvo acunrinato 3-5 poll, diametro, supra glabra, subtus pubescenii, venis primariis utrinque circiter 5 subtus elevatis. *Flores* albi, 4-5 lin. diametro, in paniculas angustas axillares quam folia bteviore dispositi, graciliter pedicellati, pedicellis pubetcentibus; bractese et brauteolese minute. *Sepala* minuta, orbiculari-oblonga, ciliolata. *Petala* tenuia, obovato-oblonga. *Stamina* 10, quam petala paullo breviora. *Ovarium* glabrum, 3-loculare, 3 ovulatutn. *Fvuctu8* ignotus.

CHINA : Szeinao, Yunnan, at £000 feet, A. Uenry, 12,894.

This is the first record of the genus from China.—W. BOTTINO
HEMSLEY.

Fig. 1, a flower; 2, calyx and pistil; 3, cross section of ovary.

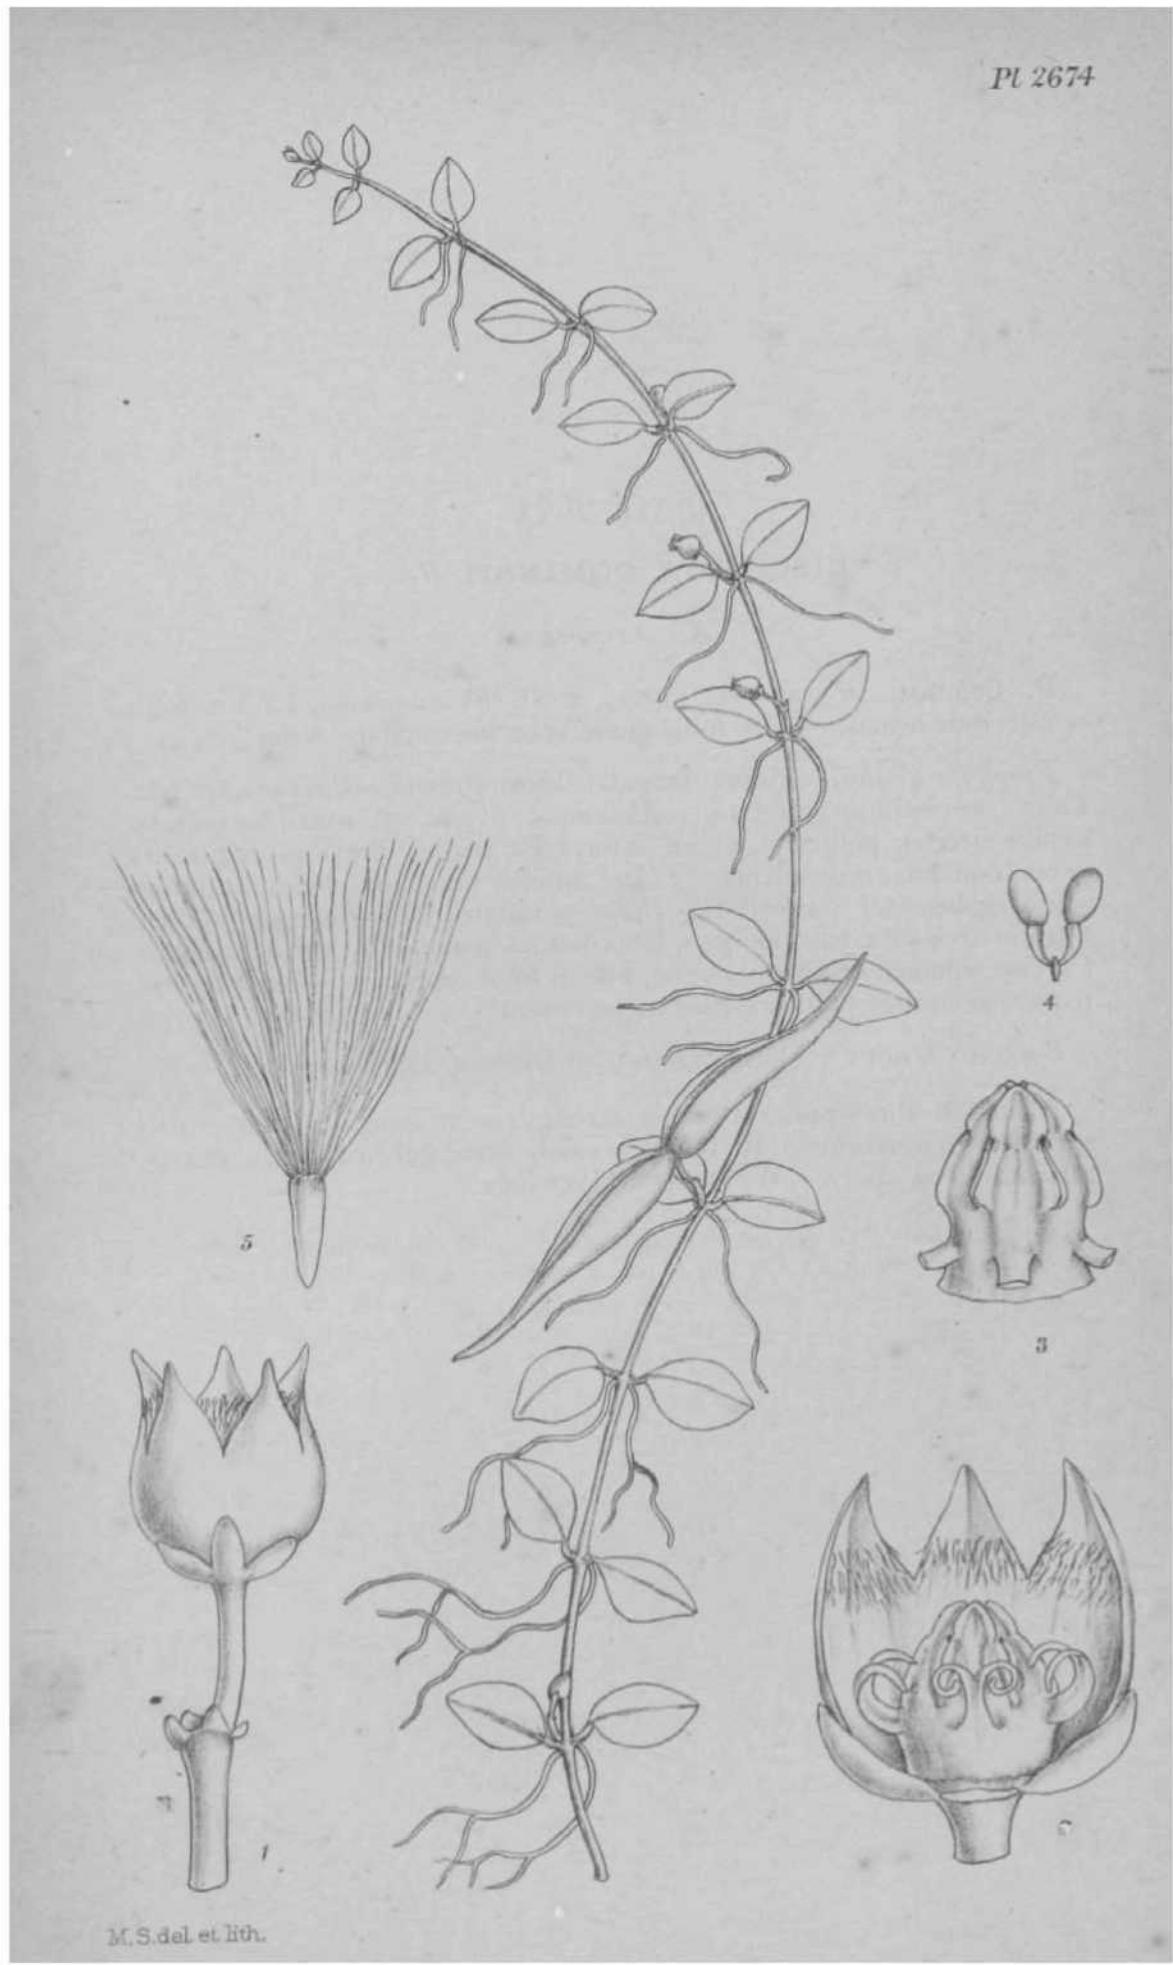

PLATE 2C74.
DISCHIDIA COMINSII, *Hemsl.*

As CLEPIADACEAE.

D. Cominsii, *Hemsl.* (*sp. nov.*); a *D. Kummularia*, R. Br. foliis tenuioribus ovatis, corollte lobis quam tubo brevioribus differt.

Epiphyta glabra, caulis longatis filiformibus ad nodos radieantibus. *Folia* brevissime petiolata, subcarnosa, ovata vel ovato-lanceolata, saepius circiter pollicaria, quam internodia ssepius breviora, vix acuta venis immersis inconspicuis. *Flores* minimi, vix 2 lin. longi, axillares, solitarii, breviter pedicellati. *Calyx* minimus, lobis oblongis obtusis. *Corolla* urceolata, tubo globoso, lobis deltoideis acutis intus barbatis. *Corona* squamae arcuato-incurvse, bifidie, lobis acutis. *Folliculi* teretes, patentes, circiter pollicares, laeves, acuminati.

SOLOMON GROUP : Florida Island, on trees on the beach, *Comins*, 316.

Although this species bears a strong resemblance to the widely spread *D. Nummularia*, R. Br., it is easily distinguished by the characters indicated above.—W. BOTTING HBMSLEY.

Fig. 1. a flower; 2, a section showing the corona; 3, nndrccium from which the corona has been removed; 4, a pair of pollen masses; 5, a seed.—All enlarged.

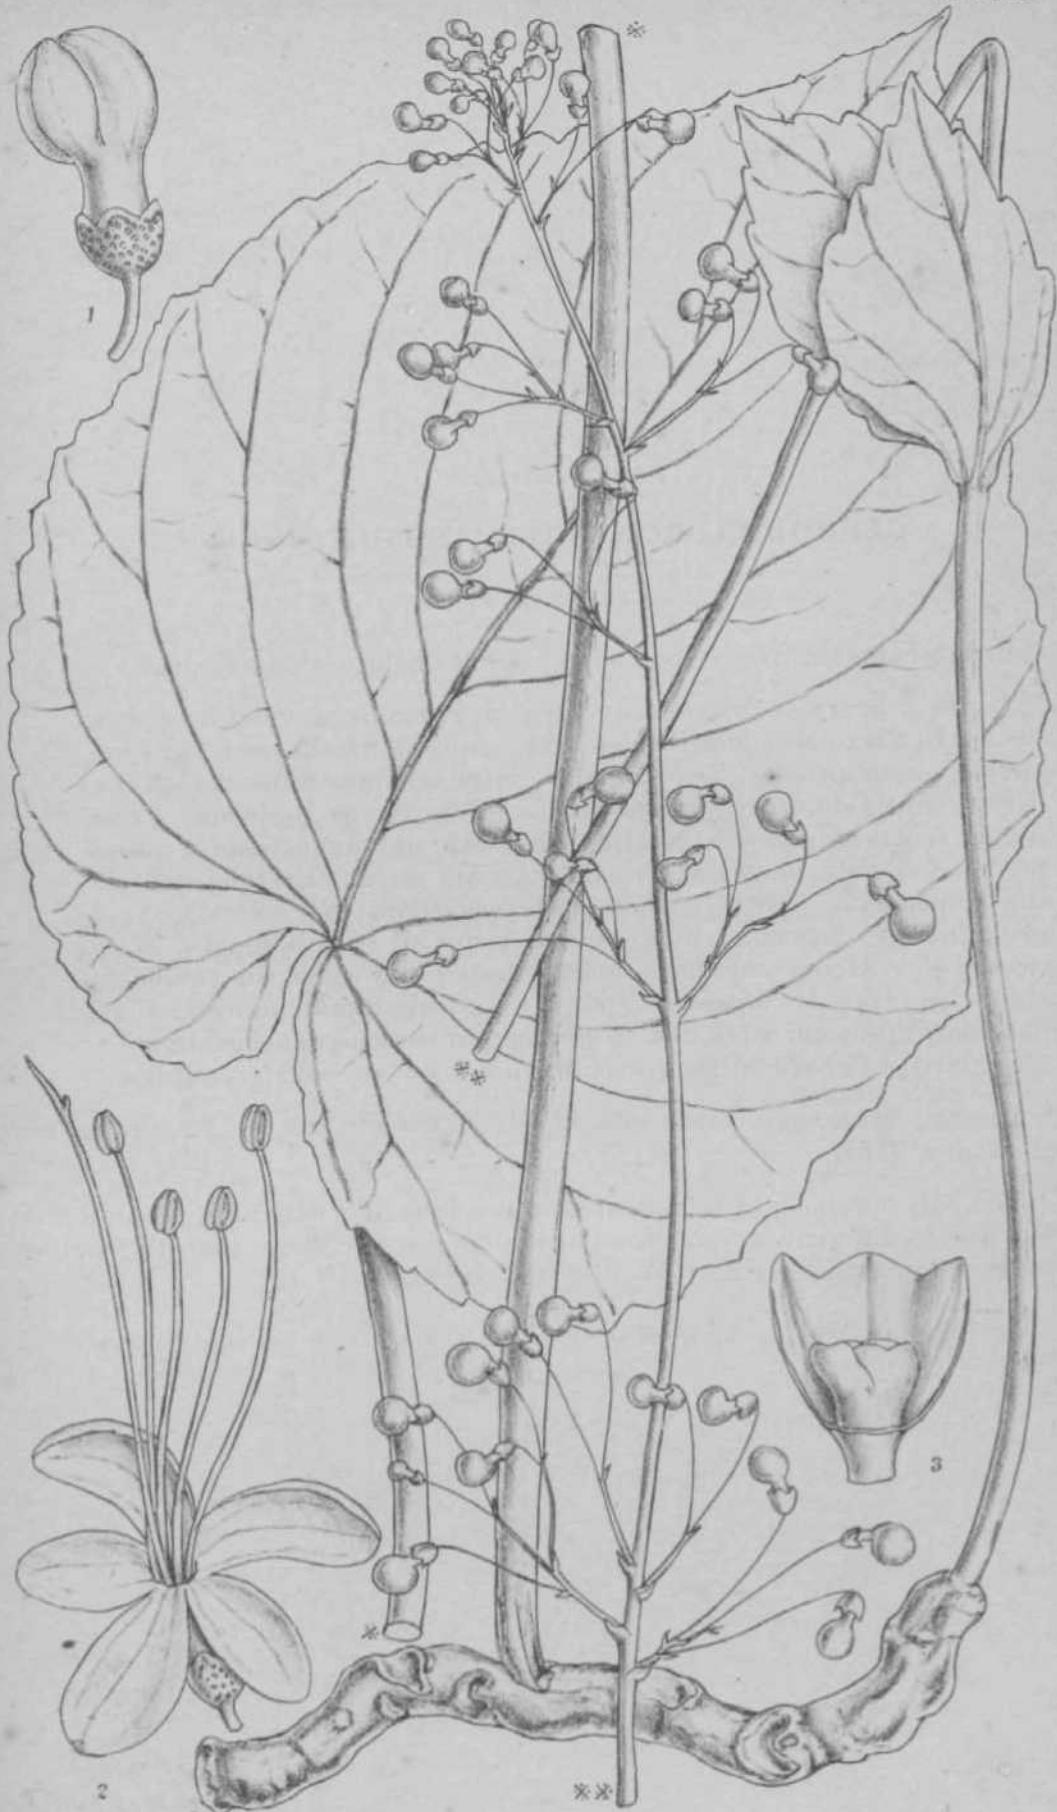

PLATE 2670.

CLERODENDRON SUBSCAPOSUM, *Ilemsl.*

VERBENACEJ2.

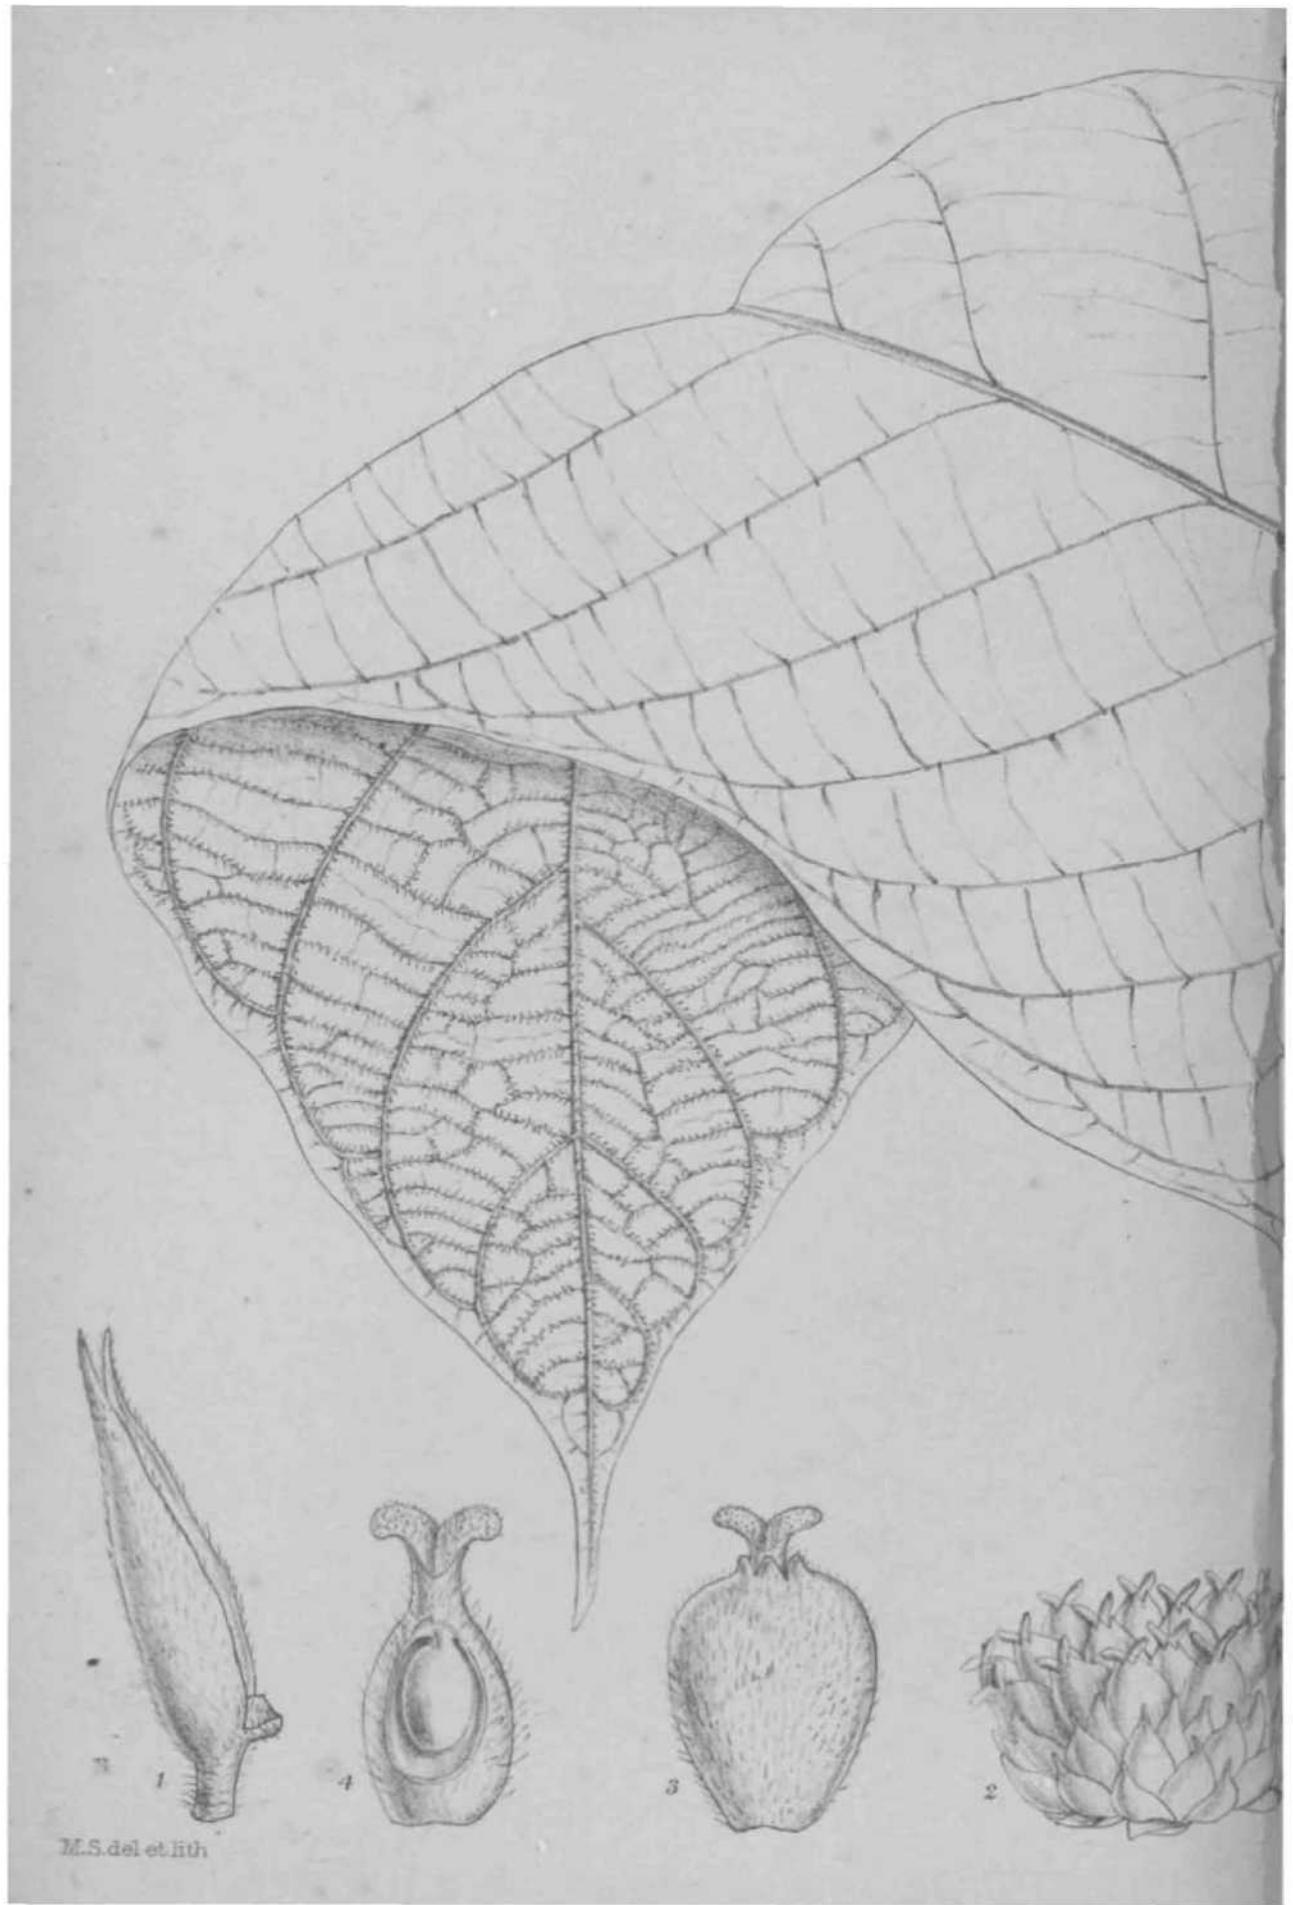

C. subscaposum, *Ilemsl.* (*ftp. nov.*); species habitu distinctissima.

Caulis primarius subcarnosus vel crassus et mollis, utvidetur prostratus, cortice laxo deciduo; cauies (vel scapi) floriferi, erecti, grailes, circiter sesquipedales, lasves, glabri, infra medium foliis 2 sessilibus parvis ovatia instructi, cetera nudi. *Folia* longe petiolata, erecta, tenuia, fere membranacea, rotundato-cordata, aine angustissimo, absque petiolo 5-6 poll, longa, acuminata, obscure irregulariterque dentata, supra hispiduln, subtus glabrescentia pallidiora vel colorata, venis primariis sat conspicuis; petioli crassi, usque ad 10 poll, longi. *Florex* cjurulei (tide Henry), absque staminibus 4-5 lin longi, in panieulam angustum laxain tenninalem dispositi; panicula¹ ramuli subverticellati. pauciflori; pedicelli capillares. *Calyx* heiiisphwricus, dentibus brevibus rotundatis. *Corolla**; tubus brevis, limbi lobis ovato-oblongis obtusis.

CHINA : Mountains south-east of Mengtze, Yunnan, at 7000 fpet,
A. Henry, 9181.

The only specimen of this plant does not bear fully expanded flowers, but it is so different in habit from anything else we know that it was considered worth figuring.—W. BOTTIXO HKMSKY.

Fig. 1, a ilowwr bud; 2, sin expand"! flowi-r; 3. part of calyx and disc—All *nlurgeil.

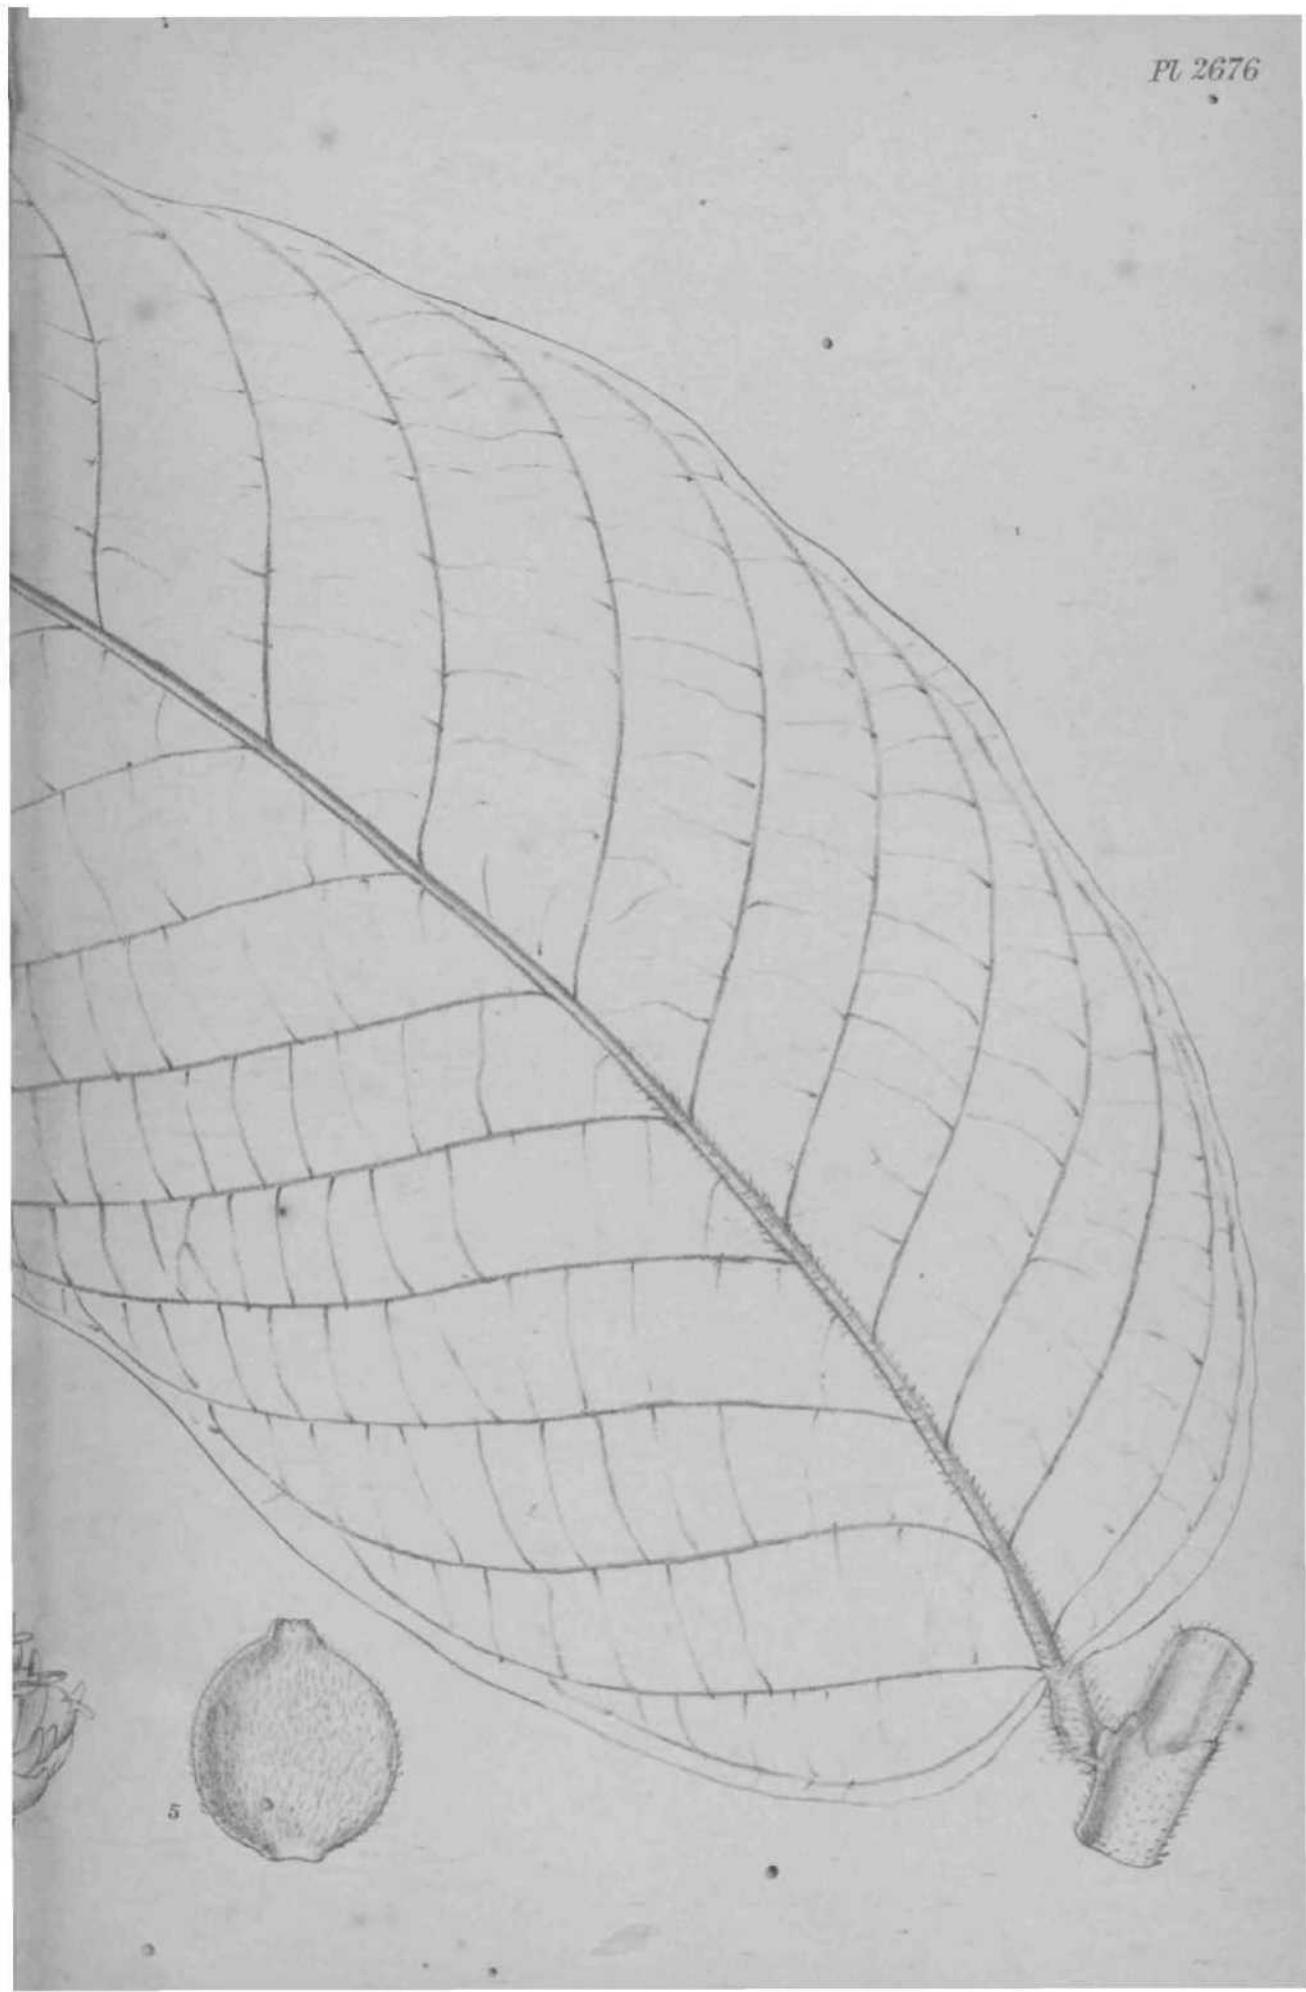

PLATE 2676.

CASTILLOA AUSTRALIS, *Hemsl.*

URTICACE^E. Tribe ARTOCARPE<£.

C. *australis*, *Hemsl.* (*sp. nov.*); species a *C. elastica* foliis minus hirsutis supra levibus, receptaculis distincte stipitatis, periatithio breviter 4-dentato, carpellis haud carnosis coriaceis differt.

Arbor sempervirens trunco erecto levi, ramis horizontalibus, sucro lacteo (*Pearce*), novellis sericeis. *Ramuli* fructifcri crassi. *Folia* brevissime petiolata, coriacea, oblonga vel oblongo-lanceolata, 12-18 poll, longa, 4-7 poll, lata, abrupte acuteque acuminata, basi cordata, margine undulata, supra glabra vel cito glabrescentia, subtns prsecipue secus costam venasque hirsuta, venis primariis utrinque 17-19 arcuatis prope marginem conjunctis supra leviter impressis subtus elevatis ; stipulse lanceolate, acutse, 1|-2 poll, longre, cito deciduse. *Flores* 7nasculini ignoti. *Receptacula* florum femininorum supra axillas foliorum soli taña, 1^-11 poll, diametro, stipitiata, stipitibus crassis 9-12 lin. longis ; bractese multiseriatse, acuminatse. *Nuculce* perfect*** desunt.

PERU : believed to be from the region of Cuzco (but the exact locality is unknown), at 4000 to 5000 feet, *Pearce*, January 1866.

Richard Fearce, who collected for Messrs. James Veitch & Sons, labelled the specimens described above as follows : 'Evg. tree with smooth erect trunk and horizontal branches with a clammy milky juice. Male Us. ? Female creamy yell. Style and stigma fleshy. Stigma bifid cushion-shaped. Nuts in a fleshy head, eatable. Com. in woods 4-5000 ft., Jan. 1866. Moro Zungo.'

Messrs Yeitch, after much research, can only say that Pearce was somewhere in the region indicated at that date.

This is all we know of *C. australis* at present.—W. BOTTING HEMSLEY.

Visr. 1, stipules; 2, a female inflorescens; 3, a female flower; 4, pistil with part of the ovary removed; 5, an immature nut.—*All except 1 enlarged.*

PLATE 2G77.

SAPIUM MORITZIANUM, *Klotzsch*!

EUPHORBIACEJB. Tribe CROTONEE.

S. moritzianum, *Klotzsch* in *Seem. Bot. Voy. 'Herald'*, p. 100 ; ab *S. aucupario*, *Jacq.*, ramulis floriferis gracilibus, foliis minoribus tenuioribus minute crebreque serratis differt.

Arbor 30-pedalis (fide *Seemann*), undique glabra, ramulis floriferis (in speciminibus visis) lateralibus brevibus gracilibus patentibus. *Folia* petiolata, tenuia, subcoriacea, linear-lanceolata vel oblonga, absque petiolo usque ad 5 poll, longa, sed rapius 2-2¹/₂ poll, longa, apice glandulosa, introflexa, basi cuneata, crebre serrulata (etiara in ramulis floriferis), epunctata, venis primariis lateralibus numerosis; petioli graciles, 3-6 lin. longi, apice glandulis binis subglobosis vel subteretibus leviter curvatis muniti; stipule parva?, reniformes, hispidulse, persistentes. *Npicce* androgynse vel interdum oranino masculit, terminates, solitarise, folia excedentes. *Flores* feminini inferiores, pauci, solitarii, juveniles non visi. *Flores* masculini circiter 7-10 aggregati. *Capsulm* 5-6 lin. diametro, leves, trivalvae; semina non visa. *Exmwria* *biglandulosa*, *I moritziana*, Muell. Arg. in DC. Prodr. xv. 2, p. 1206. *Sapium biglanduloswm*, *X moritzianwn*, Muell. Arg. in Linmea, xxxii. p. 119.

SOUTH AMERICA : Province of Panama, *Seemann*, 1243 in herb. Mus. Brit.; Columbia, without special locality, *Karsten*, 35, in herb. Berol.; 'Higuerote Gebirge/ J/brite, 236, in herb. Berol.

According to *Seemann*, loc. mp. cit., this tree bears the name *Olivo* in Panama. Neither of the collectors has any further note on it; but it is one of the most distinct of the species combined under the name *higlandulosum*. The specimens from the three collectors named above all agree in having slender branches and small closely serrulated leaves. The Higuerote mountains are probably near Higuerote Point, to the east of Caracas, in Venezuela.—W. BOTTING HEMSLEY.

Fig. 1, a stipule; 2, under side of base of leaf; 3, margin of leaf; 4, upper side of apex of leaf; 5, lower portion of a flower-spike; 6, a male flower; 7, cross section of an ovary; 8, capsule?.—^// except the last enlarged.

PLATE 2678.

SAFIUM PCEPPIGII, *Hems!*

EUPHORBIACEJE. Tribe CROTONEÆ.

Sapium Poeppigii, *Ilemsl.* (*sp. nov.*) ; similis *S. aerei*, Klotzsch, ab eo recedit foliis elliptico-oblongis levibus supra nitidis.

Ramuli floriferi crassiusculi, glabri. *Folia* omnia in specimine viso delapsa, petiolata, coriacea, oblonga vel ellippioco-oblonga, absque p9tiolo 3[^]-5 poll, longa, 1|-2 poll, lata, utrinque rotundata, apice glandula magna cuculliformi-incrassata introrsum flexa instructa, omnino glabra, supra nitida, subtus pallidiora, opaca, margine obscure crenulata et hinc inde glanduligera, venis primariis numerosis angustis utrinque vix elevatis; petiolus unicus tantum visus semipollicaris, apice glandulis binis subglobosis instructus; stipulie squamiformes, diu persistentes. *Spicce* terminales, simplices, androgynre, quam folia, ut videtur, breviores. *Flores feminini* quam in speciebus plurimis numerosiores (12-15). *Flores masculini* 5-7 aggregati. *Capsulw* desunt. *Sapium biyandulosum*, /3 *harnatum*, Muell. Arg. in DC. Prodr. xv. 2, p. 1204.

SOUTH AMERICA : ^c Peruvia subandina/ *Pcyryrig*, 67, in herb. Berol.

The whole of the material seen of this species consists of three flowering branchlets and three detached leaves, though they are shown as attached in the accompanying plate. But this is the type of Mueller's *S. biglandulosum*, *fi hamatum*, and apparently all that he had under observation.—W. BOTTING HEMSLEY.

Fig. 1, upper side of base of leaf; 2, upper side of apex of leaf; 3. intermediate part of flower-spike; 4, bud of male flower laid open.—All enlarged.

PLATE 2679.

SAPIUM CUPULIFERUM, *Hemsl*

EUPHORBIACEJE. Tribe CROTONEJE.

S. cupuliferum, *Hemsl.* (*sp. nov.*); similis *S. marginato*, Muell. Arg., a quo differt imprimis petiolis eglandulosis, bracteolarum glandulis cupuliformibus.

Frutex undique glaber, ramulis gracilibus, internodiis quam foliis brevioribus, cortice brunneo. *Folia* brevissime petiolata, petiolis eglandulosis, coriacea, rigida, erecto-patentia, anguste lanceolata, 1[^]-2 poll, longa, apice apiculata, eglandulosa, basi cuneata, margine incrassata etiamque crebre calloso-serrulata, supra subnitida, venis primariis inconspicuis; stipulss squamiformes, crassse, persistentes, ut videtur, medio 1-glandulosse. *Spicce* subterminales, solitarise, folia paullo excedentes ; in speciminibus visis flores masculini tantum adsunt. *Bracteae* circiter 8-10-floroe, latae, apiculatse, glandulis binis cupuliformibus adnatse.

SOUTH AMERICA : Gran Chaco, Argentina, *Hagenbeck* in herb. Berol.

S. cupuliferum shows better than any other species that I have examined that the glands of the inflorescence are really appendages of the bracts, though much more prominent than the bracts themselves. In general appearance it so strongly resembles *S. marginatum*, Muell. Arg., that it might easily be mistaken for that species.—W. BOTTING HEMSLEY.

Fig. 1, tinder side of base of leaf and stipules; 2, upper part of the same; 3, part of flower-spike; 4, one of the glands and a bract.—*AU enlarged.*

there are specimens in the Kew Herbarium of two other species of *Sapium* from Mexico ; or, possibly, one of them may belong to *Stillingia*, as defined in Bentham and Hooker's *Genera Plantarum*. But, it should be added, the limits of *JSapium*, *Stillingia*, *Exccecaria*, and some other allied genera have been so diversely interpreted by different botanists that their proper limits could only be defined, if even then, after a thorough study of all the numerous species of this group of the Euphorbiaceae.

The other assumed species of *Sapium* from Mexico are : *Bourgeau*, 3020, from Santa Afia, near Orizaba, and *Rovirosa*, 769, 'habitat in Famulte* sylvis primsevis, Tabasco.' The former is a sterile specimen, and is very similar to *S. mexicanum*, but differs in having oblong leaves, thicker in texture, and furnished with a prominent apical gland. The latter is the same as a sterile specimen in the Berlin Herbarium labelled : 'Schiede, 44. Vera Cruz, in sylvis.' It is the *Ficus altera* of Schlechtendal and Chamisso's enumeration of Schiede and Deppe's collection, *Linncea*, v. (1830), p. 82; and it bears the manuscript name of '*Ficus sapioides*, Kl.' in the Berlin Herbarium. The following is a description of Kovirosa's specimen, so far as it goes.

Sapium lateriflorum, *llemsl. (sp. nov.)*; a speciebus omnibus hujus atimitatis hactenus descriptis differt foliorum amplitudine et spicis axillaribus.

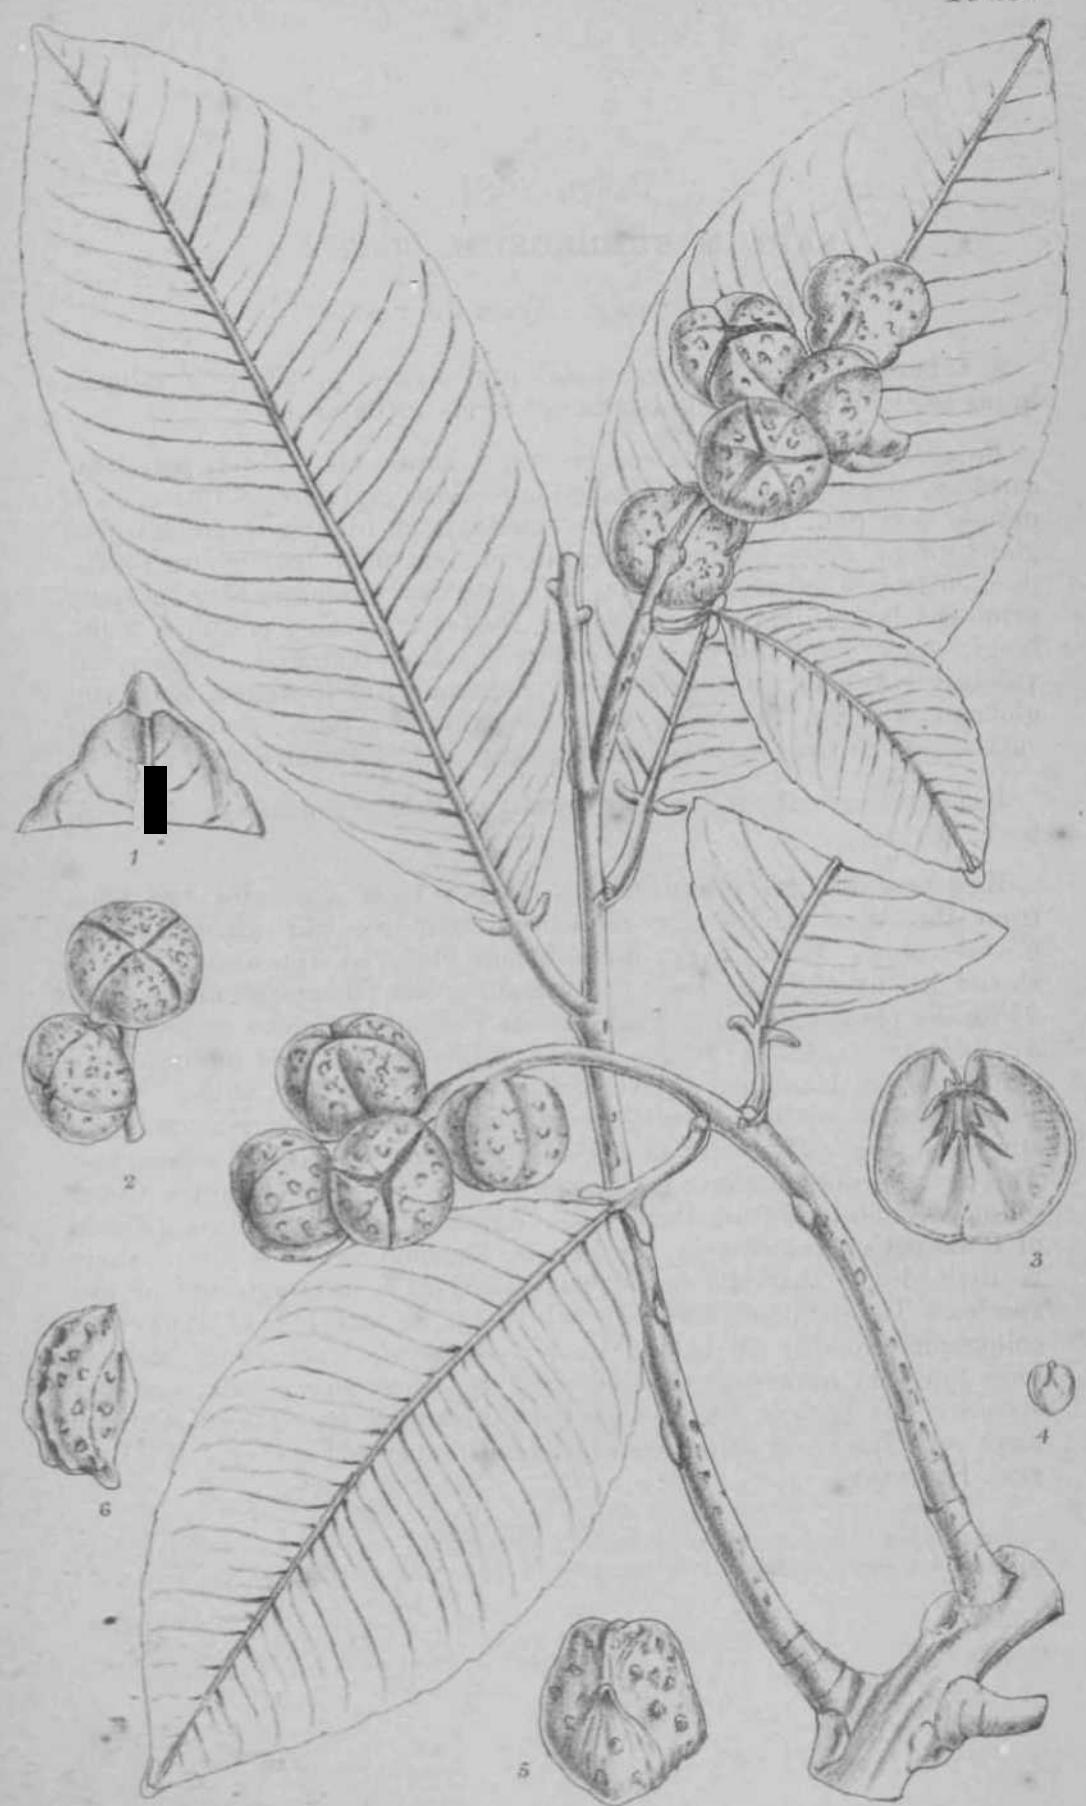

Arbor novellis omnino glabris. *Ramnli floriferi* crassi, medulla lata. *Folia* longissime petiolata, coriacea, oblanceolato-oblonga, vel in speciminibus Schiedianis interdum ovalia vel elliptica, cum petiolo usque ad 9-10 poll, longa, et 2½ poll, lata, apice rotundata, lobo parvo rotundato supra concavo (glandulifero V) terminata, basi subcuneata, margine obscurissime remoteque denticulata, venis primariis lateralibus utrinque circiter 15-17 tenuibus leviter curvatis ; petioli graciliusculi, 1½-2 poll, longi, apice biglandulosi, glandulis parvis conicis ; stipulne auriculiformes, brevissimte, persistentes. *Sjricw* secus ramulos axillares, solitarii, simplices, quam folia breviores, nudse vel 1-2 foliis parvis munitee (ob bracteas 2-3 inferiores vacuas normaliter androgyme ?), floribus masculis interrupte pseudo verticil latis. *Bractece* parvje, glandulis geminatis peltatis oblongis magnis instructs. *Flares masculi* sub unaquaque bractea 6-9. *Perianthium* bipartitum. *Stamina* 2, exserta.

MEXICO : primeval woods of Famulte', Tabasco, *Bovirosa*, 1890, n. 769.

As set forth in the differential phrase above, this species differs, among other things, from previously described species in having lateral spikes ; but this character may prove not to be of specific value. The only other specimens I have seen which exhibit the character are : *Hahn*, 882, from Martinique, and *Trail*, 765, North Brazil; both, however, specifically different from *S. lateriflorum*, Hem si., and from each other. The former has small leaves with close lateral veins, very thick flowering-branches and rigid androgynous flower-spikes, longer

than the leaves ; solitary female flowers in the lower part of the spike, and a two-celled gynoecium within a tubular perianth, and normal male flowers. The latter, collected by Dr. J. W. H. Trail, at Prainha, on the Lower Amazon, consists of long flowering-branches bearing numerous, very slender, androgynous flower-spikes, springing from the axils of fallen leaves. The spikes are from three to four inches long, distinctly pedunculate, and bear one, or rarely two, small leaves near the lowermost flowers; and the petiole of these leaves is biglandular at the apex. The pomeceum is similar to that of the Martinique plant but three-celled. Trail describes it as a slender tree, 15-25 feet high, and states that the branches when broken give a copious milky juice, which hardens into a kind of india-rubber. I have not been able to connect any other specimens with any of the three species described above as having lateral inflorescences.—W. BOTTING HEMSLEY.

Fig. 1, under surface of the apex of leaf; 2, portion of a flower-spike bearing a solitary female flower and a cluster of male flowers; 3, a male flower; 4, open capsules; 5, a seed after the removal of the outer cellular, coloured covering; 6, section of a seed showing the embryo.—*All enlarged, except 4 and 5.*

PLATH 2681.

SAPIUM SUBEROSUM, Muell Arg.

EUPHORBIACEJE. Tribe CROTONEIE.

S. suberosum, Muell, Arg. in *Linnrea*, xxxiv. p. 217; 'a reliquis hujus sectionis differt magnitudine et forma capsularum.'

Eamuli fructiferi laterales, breves, crassiusculi. *Folia* petiolata, coriacea, ovato-lanceolata, oblongo-lanceolata, vel fere elliptica, cum petiolo 3-5 poll, longa, obscure crenulata, et hinc inde in margine glandulifera, apice glandula cuculliformi instructa, basi ssepius rotundata, utrinque suberoso-buUata vel pustulata (abnormaliter ?), venis primariis lateralibus numerosissimis leviter curvatis ; petioli 4-9 lin. longi, apice glandulis binis teretibus curvatis instructi. *Spiccv*, ut videtur, solitariae. *Capsules* 3-6, congestse, 3-4-loculares, depresso-globosse, 4-6 lin. diainetro, verrucosae vel pustulatse ; semina tuberculata. *Exccecaria suberosa*, Muell. Arg, in DC. Prodr. xv. 2, p. 1202.

BARBADOS : without special locality, *Bob. Schomburgk*, 709, in herb. Berol.

Kew possesses no specimen of a *Sapium* from Barbados, and none from the West Indies, or elsewhere, that we can identify with *S. suberosum*, Muell. Arg., though the blistered appearance of the shoots, leaves, and capsules is perhaps abnormal. As stated under plate 2650, the plant figured by Plukenet as *Tithymalus arbor americanus*, &c. (*Almagest. Bot.* p. 369, t. 229, f. 8.), is recorded as having been cultivated at Hampton Court and received from Barbados. What Plukenet says is this: '*Aulce Hamptonice in plantar, rariorum ditissimumohort. Beg. collegim. & ab InsulaBarbadensi transmissu accepimus**' This is important, because it does not follow that the Hampton Court plant was obtained from Barbados. Indeed, from a careful comparison of Plukenet's specimens in the British Museum with his figure, there is little doubt that the figure was made up from fragments of two species. The detached leaves in vol. iv. pp. 82 and 111 of Plukenet's collection probably all belong to *S. suberosum*, Muell. Arg., as they have the very numerous parallel primary veins characteristic of this species ; but both *S. Lauroeerasus*, Desf., and *S. laurifolium*, Griseb., have very numerous veins, associated with clustered spikes.—W. BOTTING HEMSLET.

Fig. 1, apex of leaf seen from above; 2, four-valved capsules; 3, a carpel from within; 4, a seed ; 5 and 6, different views of the same.—*All except 2 and 4 enlarged.*

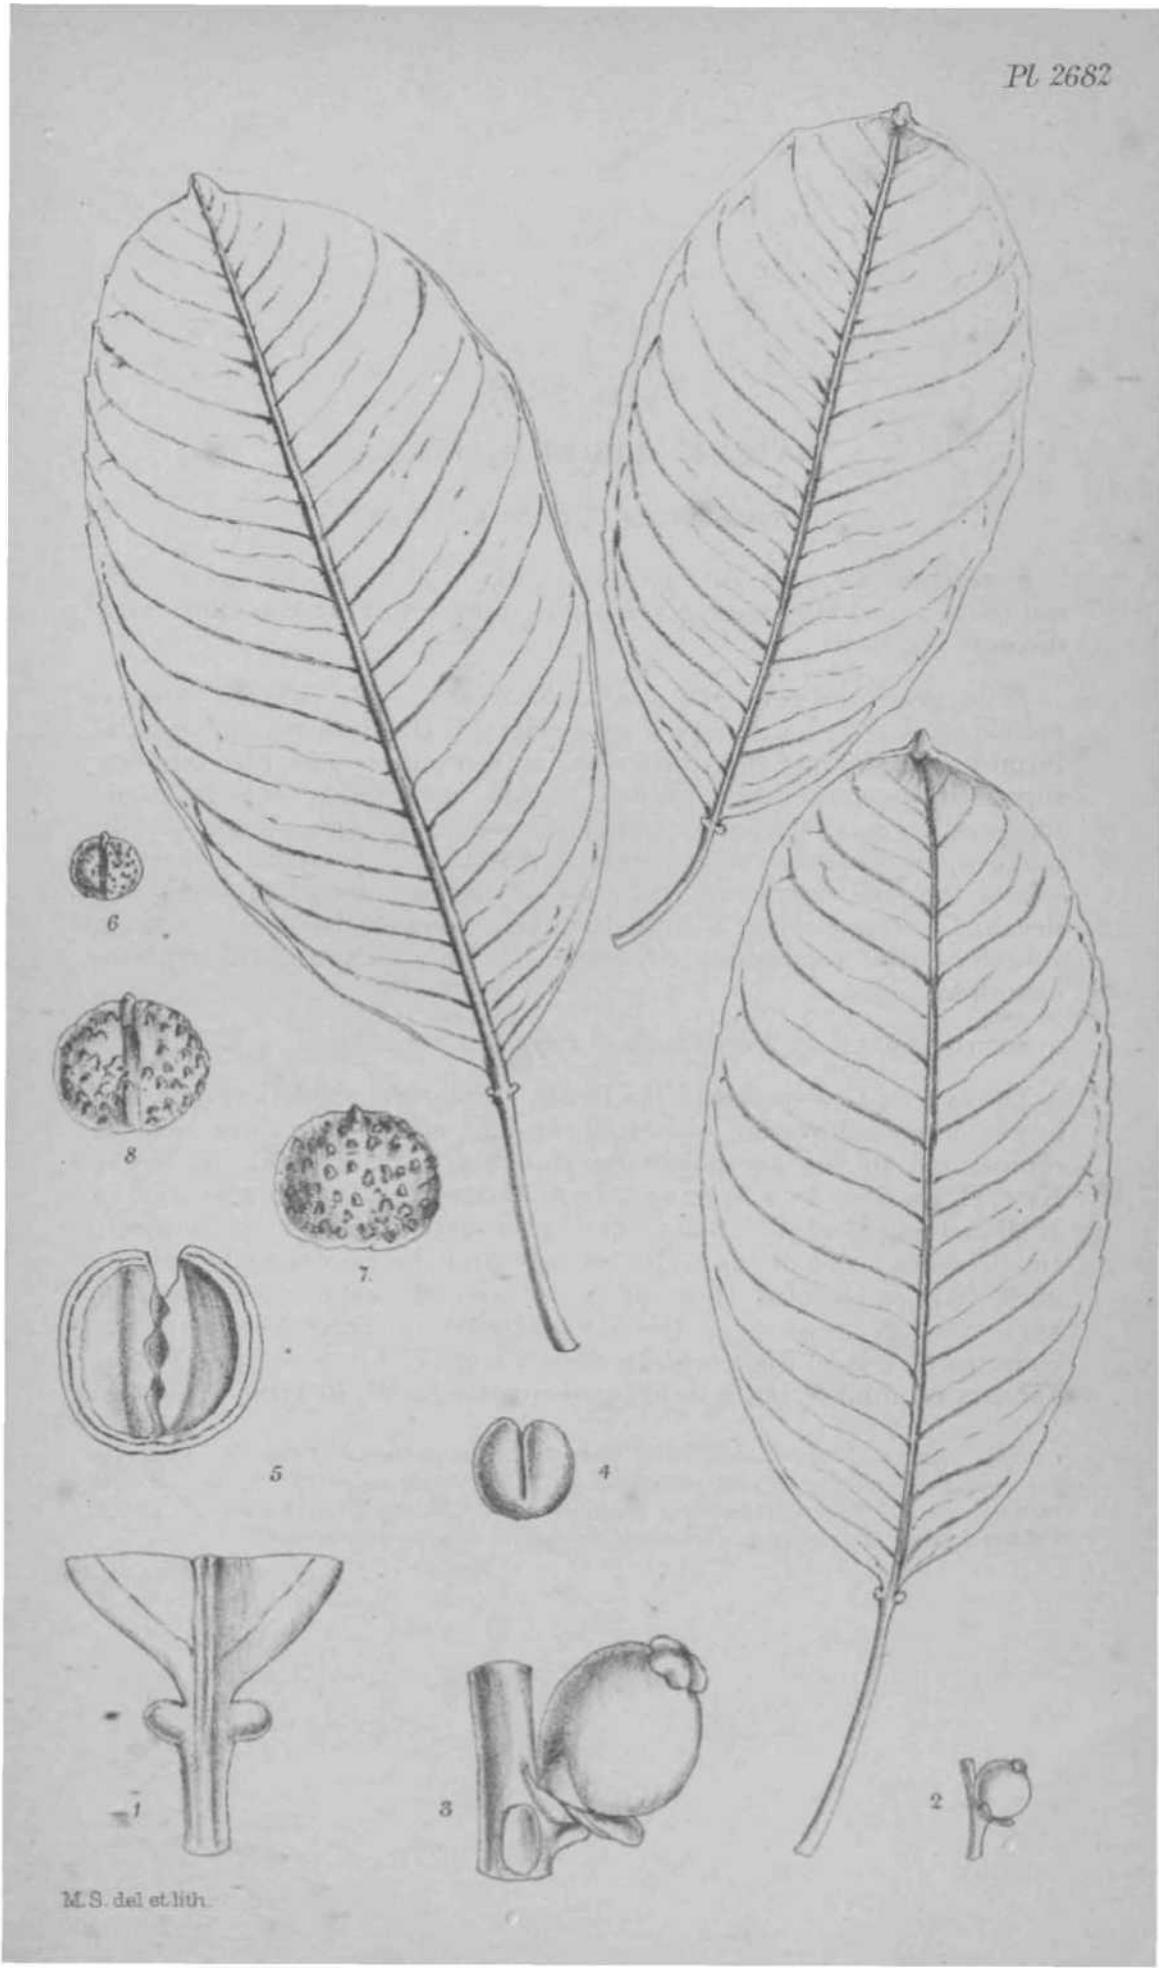

PLATE 2682.

SAPIUM AEREUM, *Klotzsch.*

EUPHORBIACEJE. Tribe ClTOTONEiE.

S. aereum, *Klotzsch* in *Linncea*, xxxii. p. 119 ; similis *S. Pceppigii* sed foliis scabridulis basi subcuneatis supra nitore submetallico viridiscente insignitis.

Folia graciliter petiolata, tenuiter coriacea, ovali-oblonga, absque petiolo 2[^]-4 poll, longa, apice rotundata et glandula magna cuculliformi-incrassata introflexa instructa, margine hinc inde glanduligera, supra viridiscentia nitida, subtus pallida, scabridula, venis primariis numerosis minus conspicuis quam in icona ; petioli graciles, 9-12 lin. longi, apice glandulis binis parvis instructi. *Flores* ignoti. *Ovarium* efformatum basi incrassata trilobata stylorum coronatum, stylis cito deciduis. *Capmle* 4-5 lin. diametro, leves, 3-loculares; semina suborbicularia, compressa, circiter 2-2[^] lin. diametro, tuberculato-exsculpta, nigra.

SOUTH AMERICA : Peru, *Ruiz & Pavon* in *herb. Berol.*

The type of this species in the Berlin Herbarium consists of detached leaves, advanced ovaries, separated capsules, and two or three seeds as represented in the accompanying plate. The nearest like it in the Kew Herbarium is a specimen from Costa Rica, at an elevation of 1550 metres (*Tonduz*, 12428), but the leaves want the metallic sheen, the persistent base of the styles is terete, and the brown seeds are only about half as large as those of *S. aereum*. There is also a specimen very near *S. aereum* in the Kew Herbarium from New Grenada, collected at Ubala, Bogota, at an elevation of 1700 metres, by J. Triana. It bears no number, but is designated 'caucho.'—W. BOTTING HEMSLET.

Fig. 1, base of uppor side of a leaf; 2, advanced female flower showing the base of the deciduous styles, natural size; *, the same enlarged; 4, one valve of capsule, natural size; 5, the same from the inside; 6, seed, natural size; 7 and 8, different views of the same.—Enlarged, where not otherwise indicated.

PLATE 2G83.

SAPIUM CILIATUM, *Hemsl*

EUPHORBIACEÆ. Tribe CROTOKEJB.

S. ciliatum, Hemsl. (sp. nov.); ab omnibus speciebus nobis cognitis margine foliorum per totaru longitudinem crebre ciliato glanduloso recedit.

Arbor 12-15-pedalis (*Trail*) novellis undique glabris. *Ramuli* foliiferi graciliusculi, recti, 1-2 ped. longi, internodiis brevissimis. *Folia* breviter petiolata, tenuia, fere membranacea, anguste oblong-lanceolata, 6-9 poll, longa, maxima circiter 1 poll, lata, apice caudata, obtusiuscula, basi subrotundata, margine eximie ciliato-glandulosa, venis primariis lateralibus distantibus inconspicuis; petioli graciles, saepius semipollicares, apice glandulis binis longe stipitatis instructi; stipulae parvae, squamiformes, lunatae, persistentes. *JHores*, etc., ignoti.

NORTH BRAZIL : Santarem, *Spruce*, without number; District of Cararaucú, between Villa Bella and Serpa, *Trail*, 770.

A figure of the leaves of this rubber-yield ing tree is given in the absence of flowers, because it is so strikingly different from all the other species of the genus *Sajrimm*, to which it almost certainly belongs. Richard Spruce, who collected it about fifty years ago, notes it as 'a small tree, occasionally met with, but never yet with flowers.' Dr. Trail collected in 1875, and designated it as 'a tree from twelve to fifteen feet high, yielding india-rubber.' I find no description in the *Flora Brasiliensis* that will include it.—W. BOTTING HEMSLEY.

Fig. 1, base of a leaf, seen from above; 2, apex of the same, seen from below; 3, a portion of the margin of the same.—All enlarged.

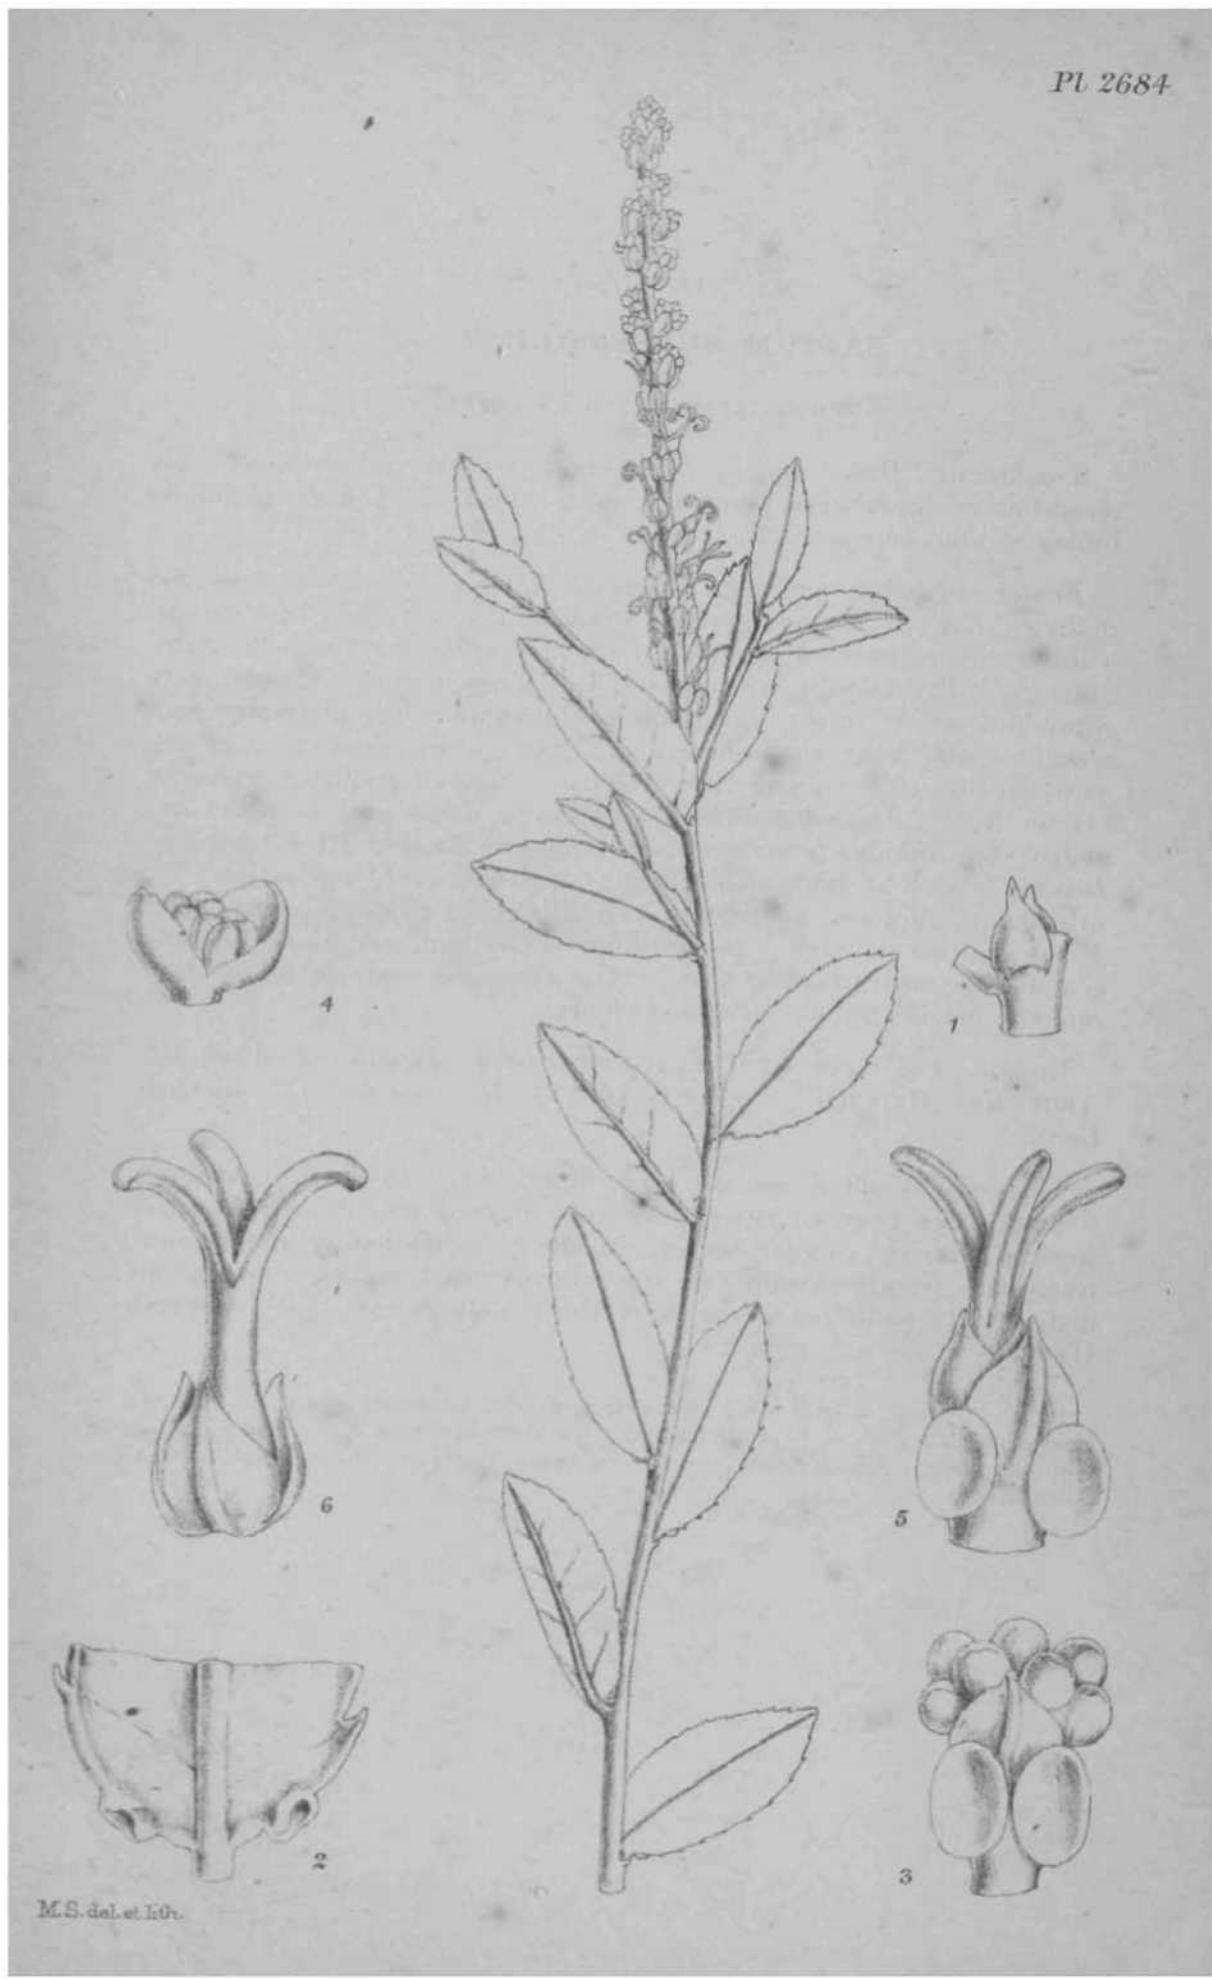

PLATE 2084.

SAPIUM SUBSESSILE, //em^.

EUPHORBIACEJE. Tribe CROTONE^E.

S. subsessile, *Hemsl.* (*sp. nov.*) ; a speciebus parvifoliis differt foliis sessilibus vel brevissime petiolatis limbo paulo supra basin glandulis binis sessilibus conspicuis instructo.

Frutex vel *arbor* *parva* ex affinitate *S. marginati*, novellis omnino glabris. *Famuli florigeri* graciles, internodiis quam foliis brevioribus. *folia* sessilia vel brevissime petiolata, coriacea, oblonga vel anguste ovato-oblonga, 3-12 lin. longa, sed scipius 6-9 lin. longa, utrinque plus minusve rotundata, apice calloso-apiculata, paulo supra basin glandulis binis sessilibus alte concavis instructa, margine crebre calloso denticulata, venis inconspicuis ; stipulae minutissimse. *Spica* terminales, solitarii, erectae, rigidae, densae, usque ad 3 poll, longae (bene evolutae non visse), androgynse, dimidio inferiore flores feniineos circiter 10-12 gerentes. *Bractem* glandulis binis orbicularibus instructi?. *Flores masculi* 7-9 sub quaque bractea aggregati; perianthium 2-phylum ; stamina 2. *Flores feminei* solitarii; perianthium 3-phylum, phyllis rotundato-acuminatis; ovarium 3-loculare, stylis elongatis recurvis ad medium connatis pereistentibus. *Fructus* ignotus.

BRAZIL: Provinces of St. Paul and Rio de Janeiro, *J. Weir*, 3 II). ARGENTINE REPUBLIC : without locality, *Ilieronymus*, 817, in herb. Berol.

This species and *S. marginatum*, Muell. Arg., to which it is closely related, differ from all those previously figured and described in this work in having smaller leaves, in the proportionately much more numerous female flowers in the androgynous spikes, and in the distinctly three-leaved perianth of the female flowers.—W. BOTTING HEMSLEY.

Fig. 1, stipules; 2, base of a leaf seen from below; 3, portion of a spike bearing a cluster of male flowers, bract and glands; 4, a detached male flower; 5, portion of a spike bearing a female flower, bract and glands; 6, a female flower detached.—All enlarged.

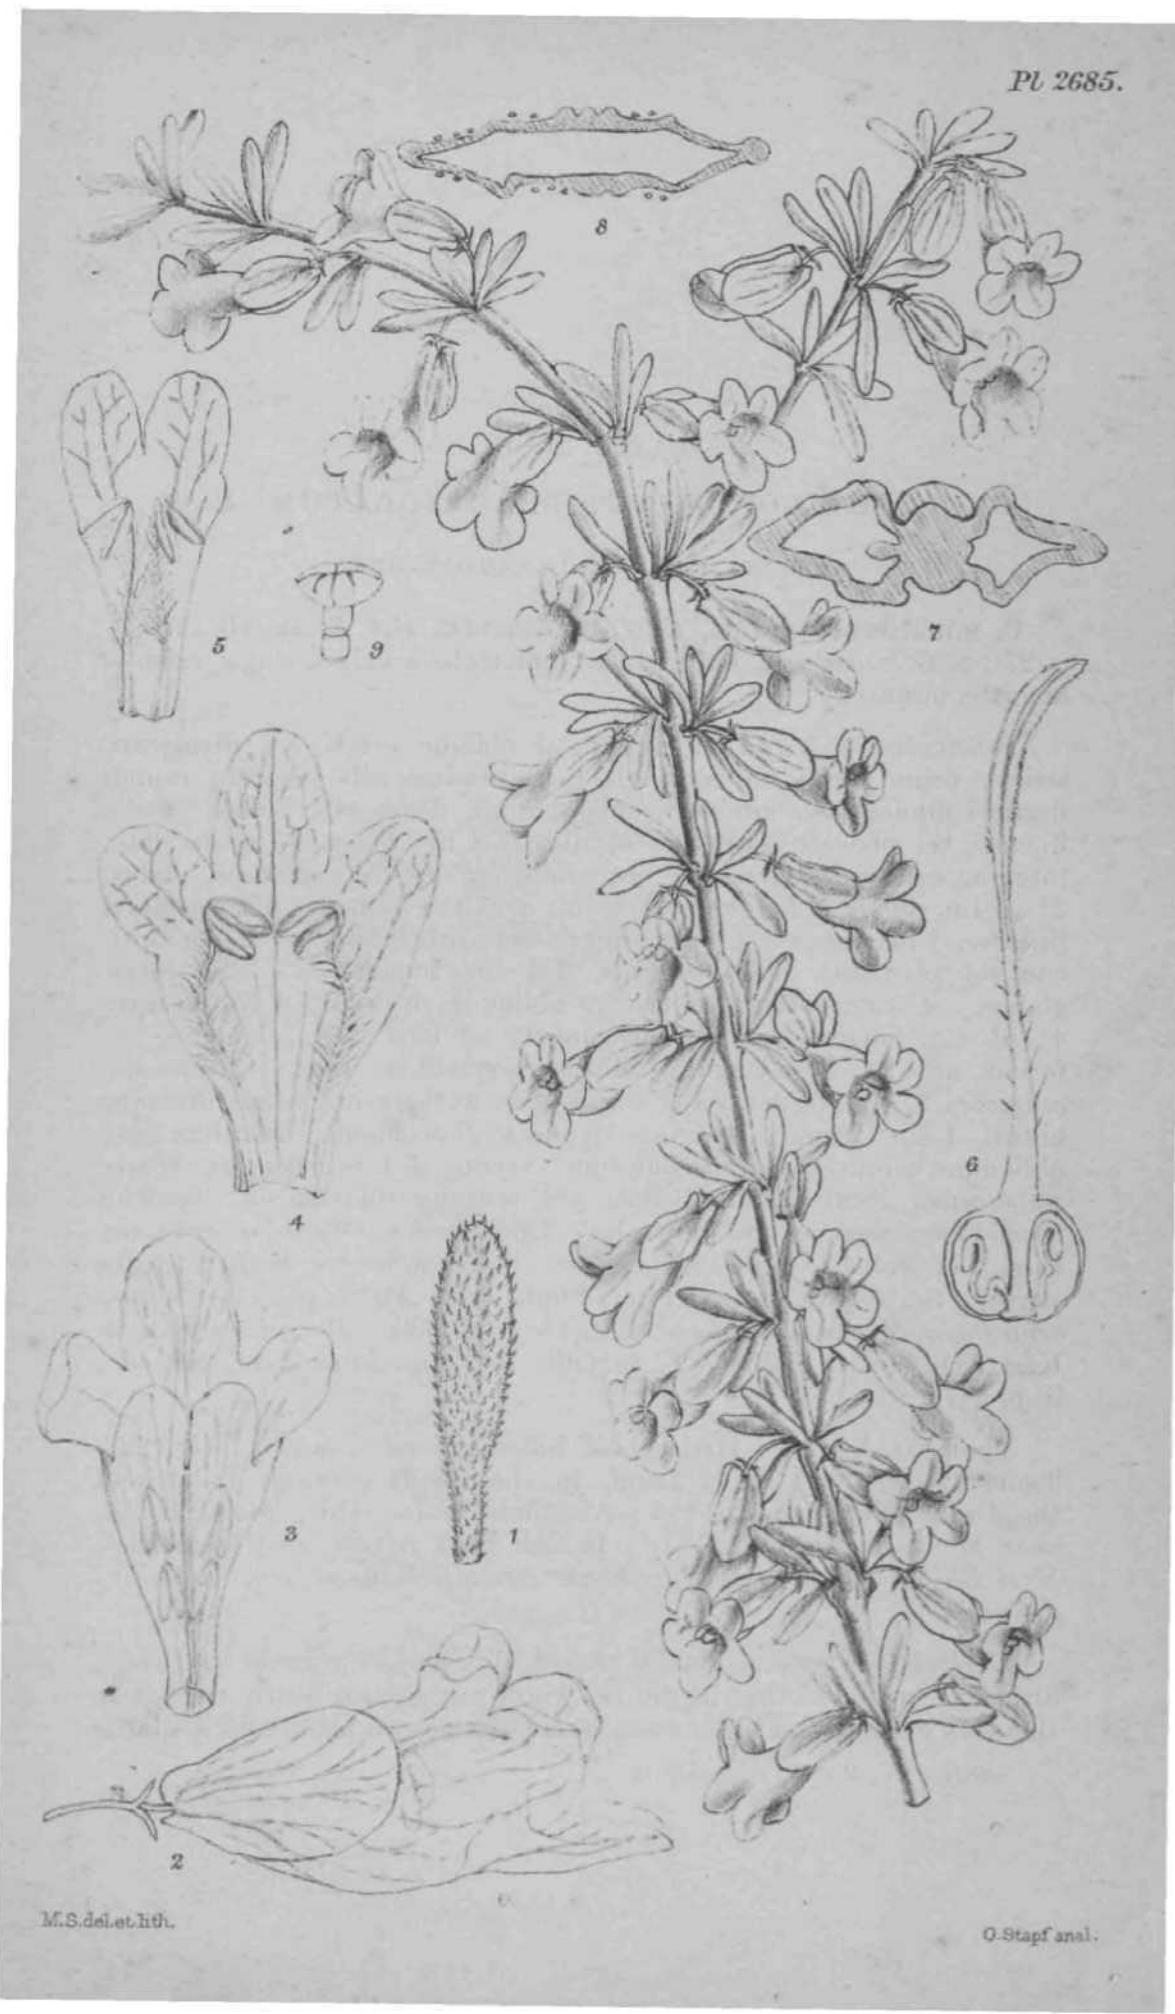

PLATE 2685.

CYCLOCHEILON MINUTIBRACTEOLATUM, Engl.

VERBENACEA: Tribe CHLOANTHE[^].

C. minutibracteolatum, *Engl. in Ann. 1st. Bot. Roma*, vii. (1897), p. 27; a *G. somalensi*, Oliv., differt bracteolis a calyce magis remotis angustis minutis.

Fruticulus 2-3 ped. altus; rami oblique erecti vel divaricati, stricti, primo hispiduli, mox glabratii, tandem albo-cinerei; ramuli floriferi admodum abbreviati, subpulvinati, dense albo lanati. *Folia* linearis- vel obovato-spatulata, obtusa, 3-6 lin. longa, 1-1[^] lin. lata, integra, camosula, utrinque scaberula. *Pedicelli* capillares, glabri, 2-3 lin. longi. *Bracteolas* |-| lin. a calyce remote, filiformes vel lineares, \ lin. longse. *Calyx* a latere visus orbicularis vel late ellipticus vel obovatus, basi cordatus, 3-4 lin. longus, 3-3¹/2 lin. latus, glaber. *Corolla* alba; tubus ore obliquus, dorso 3|-4 lin., ventre 4¹/2-5¹ lin. longus; labium superuin \| ad fere 2 lin. longum, inferum ad 2\ lin. longum lobis subsequalibus latis. *Filamenta* anteriora 2| lin, posteriora 2 lin. longa; antherarum loculi utrinque obtusi, 1 lin. longi. *Ovarium* truncato-ovoidem, interdum subobliquum minutissime glandulosum; btylus 3-4 lin. longus, sparse pubescens; loculi 2, uniovulati vel anterior biovulatus; funiculi ascendentis dorsales vel ventrales.—*Cyclocheilon minutibracteolatum*, Engl. Bot. Jahrb. xxiii. (1897) p. 508; *C. ei-iantherum* Engl. 11. cc (in parte); Stapf in Thisolfon-Dyer, Flora Trop. Afr. v. p. 274. *Tinnen erianthera*, Vatke in Linnsea xlvi. (1882), p. 539. *T. arabica*, Eak. in Kew Bull. (1894) p. 339. 2\ sp. Oliv. in Trans. linn. Soc, 2nd ser., ii. p. 347.

TROPICAL ARABIA : Hadramaut, hillsides near Gambia, *Lunt*, 222. TROPICAL AFRICA : Gal la Land, in the desert between Dolan and the Dana River, *Riva*, 1175; Abdallah, *Keller*, 187; Somali Land, near Meid, *Hildebrandt*, 1515; British East Africa, in Ulu district, *Scott-Elliott*, 6378; German East Africa, Kilimanjaro, 5000 ft., *Johnston*,

Cyclocheilon was originally placed in *Scrophulariaceas* by Oliver, although he added that he did not know any 'genus nearly related to this very curious plant,' nor * any scrophulariaceous plant with a similar

calyx.¹ Engler refers it also to *Scrophulariaceae* without discussing the question of its generic affinities. It has also been described as a Labiate, and indeed it possesses a certain superficial resemblance to *Tinnea*. Professor Oliver had only very fragmentary material at his disposal when he described *Cyclocheilon somafense*, but when *Tinnea erianthera* and *ainbica* were recognised as congeneric with *C. sonalense*, and Professor Schinz of Zurich was good enough to send to Kew the specimens of *Cyclocheilon* collected by Professor Keller in Somali Land, the material was ample enough to afford a more satisfactory result. There was no difficulty now in recognising the genus as a member of the Verbenaceae, but its position in the order was for some time a puzzle to me until I came across *Nesogenes*, a genus of two species, one of which is confined to Rodriguez Island, while the other is widely spread throughout Polynesia. Both are annuals, and the general aspect scarcely suggests an affinity with *Cyclocheilon*. They have very much smaller flowers, and the calyx is nearly always 5-toothed and very different from that of *Cyclocheilon*; but, as in this genus, it enlarges during the ripening of the fruit, and it exhibits a similar reticulation. The rest of the flower, however, is—apart from the size and the fact that the upper lip is overlapped by the lobes of the lower, instead of overlapping them, and that the division of the ovary into 2 cells is complete—so similar to that of *Nesogenes*, that the two genera must be considered as allies. The fruit of *Nesogenes* is indehiscent, with a hard crustaceous endocarp and two- or, by abortion, one-seeded. That of *Cyclocheilon* is not known in the mature state; but the young fruit possesses a pericarp, the anatomical structure of which is very similar to that of *Nesogenes* with this difference, that the sclerenchymatic layer which corresponds to the endocarp is interrupted along the sutures of the carpels, thus indicating a dehiscence along those lines. The degree to which the inflexed margins of the carpels are fused into a septum in the ovary of *Cyclocheilon* varies. The fusion is always complete at the base where the funicles rise. Higher up the epidermis of each of the two halves of the septum is quite distinct where they meet, the cells being merely interlocked and mutually agglutinated; still higher up the septum divides into two ridges or disappears altogether. There is usually one ovule in each cell in *C. minutibracteolatum*; but in Scott-Elliott's specimen I have found two in the anterior cell, which in this case was slightly larger than the posterior. In *C. somalense* two seems to be the normal number. The position of the ovules relative to the axis of the ovary is equally variable, even in the same ovary, as is also the length of the funicle, which, when elongated, is S-shaped. I now prefer the name *C. minutibracteolatum* to *C. erianthei-um*, as the latter covers, in the sense of Engler, II. cc., also *C. somalense*, Oliv.—OTTO STAPP.

Fig. 1, a leaf; 2, a flower; 3, a corolla; 4, lower lip of the corolla and antecostal stamens; 5, upper lip and postecostal stamens; 6, pistil in longitudinal section; 7, cross section of an ovary near the Ia so with a portion of the disc; 8, cross section of an ovary, at the middle; 9, a glandular hair from the ovary—All enlarged.

PLATE 2686.

HABENARIA BEPENS, Nutt.

ORCHIDACEA.: Tribe OPIIRYDEJE.

H. repens, *NntL Gen. Amer.* ii. p. 190; *LindL Gen. d Sp. Orch.* p. 310 ; *Chapm. Ft. S. U. St.* p. 461; *Cogn. in Mart. Fl. Bras.* iii. pars 4, p. 91 ; *Kriind. Orch. Gen. et Sp.* i. p. 317 (excl. Gardn. n. 3990); species distinctissima ex affinitate *H. Michauxii*, Nutt., sed caulis repentibus etuberiferis aquaticis et calcare breviore facile distinguitur.

Caules repentes, elongati, etuberiferi, radices numerosas emittentes ; florentes erecti, i-2 ped. alti, foliosi. *Folia* sessilia, oblongo-lanceolata, acuta, trinervia, 2-9 lin. longa, 5-13 lin. lata. *Racemi* 2-8 poll, longi, densiflori, multiflori. *Bractecu* linear-lanceolatre, acuminate, 5-10 lin. longse. *Pedicelli* 4-6 lin. longi. *Sejialum* posticum late ovatum, cucullatum, apiculatum; lateralia o**ata, breviter acuminata, 2^ lin. longa. *Petala* bipartita, 2 lin. longa, lacinia postica falcato-lanceolata, acuta, 2-nervia, antica linear-filiformia, acuta, postica paullo breviore. *Labellum* tripartitum, 2-2.5 lin. longum, lobis linear-filiformibus apice incurvis subequalibus; calcare linearis incurvo 3 lin. longo. *Columna* lata, brevis, anther* canalibus porrectis brevibus, processibus stigmaticis oblongis crassiusculis, staminodiis dentiformibus minutis. *Capsula* oblonga, 4-5 lin. longa.—//. *tricuspis*, A. Rich., FL Cub. iii. p. 249. //.*radicals*, Griseb. Cat. PL Cub. p. 271 (in nota).

AMERICA.—Chiefly on the coast-lands of the Caribbean Sea, and round the Gulf of Mexico to Florida and South Carolina, iii marshes and ditches, aquatic or subaquatic: S. Carolina, *Kuttall*; Georgia, near Savannah, frequent, *Elliott*; near Augusta, *Wray* ; S. Florida, Sumter Co., *Curliss*, 2772 ; Lake Co., near Eustis, *Nash*, 578, 873 ; Guatemala, round Lake Duenas, *Salvin*, 183 ; Nicaragua, Greytown, *Tate* 462 ; W. Indies, Cuba, *Wright*, 3305, 3309 \ Jamaica, St. Annes, *McNab* ; British Guiana, coast region, aquatic in trenches, *Jennian*, 4422; near Georgetown, *Jenman*, 7232; Lower Orinoco, *Rmby and Squires*, 394 ; Brazil, prov. Santa Catherina, at Blumenau, *Vk*, 873.

A very distinct and widely diffused species, readily distinguished by its submersed creeping stems, without tubers, and numerous long roots. Dr. Ilusby remarks that it is a characteristic water plant, and his

specimen has a dense mass of roots at the base of the flowering stem, and Jenman records it as 'aquatic in 40 foot trench.' The upper part of the stem is erect, and bears several leaves, which gradually decrease in size up to the inflorescence. Gardner, 3990, referred to this species by Kränzlin, belongs to *H. hexaptera*, Lindl.—B. ALLEN 'ROLFE.

Fig. 1, a flower; 2, a petal (front lobe represented proportionately too broad); 3, the column seen from the side, showing the anther, vide lobes of the robtellum, Btigmatic processes, and stauinode.—*All enlarged.*

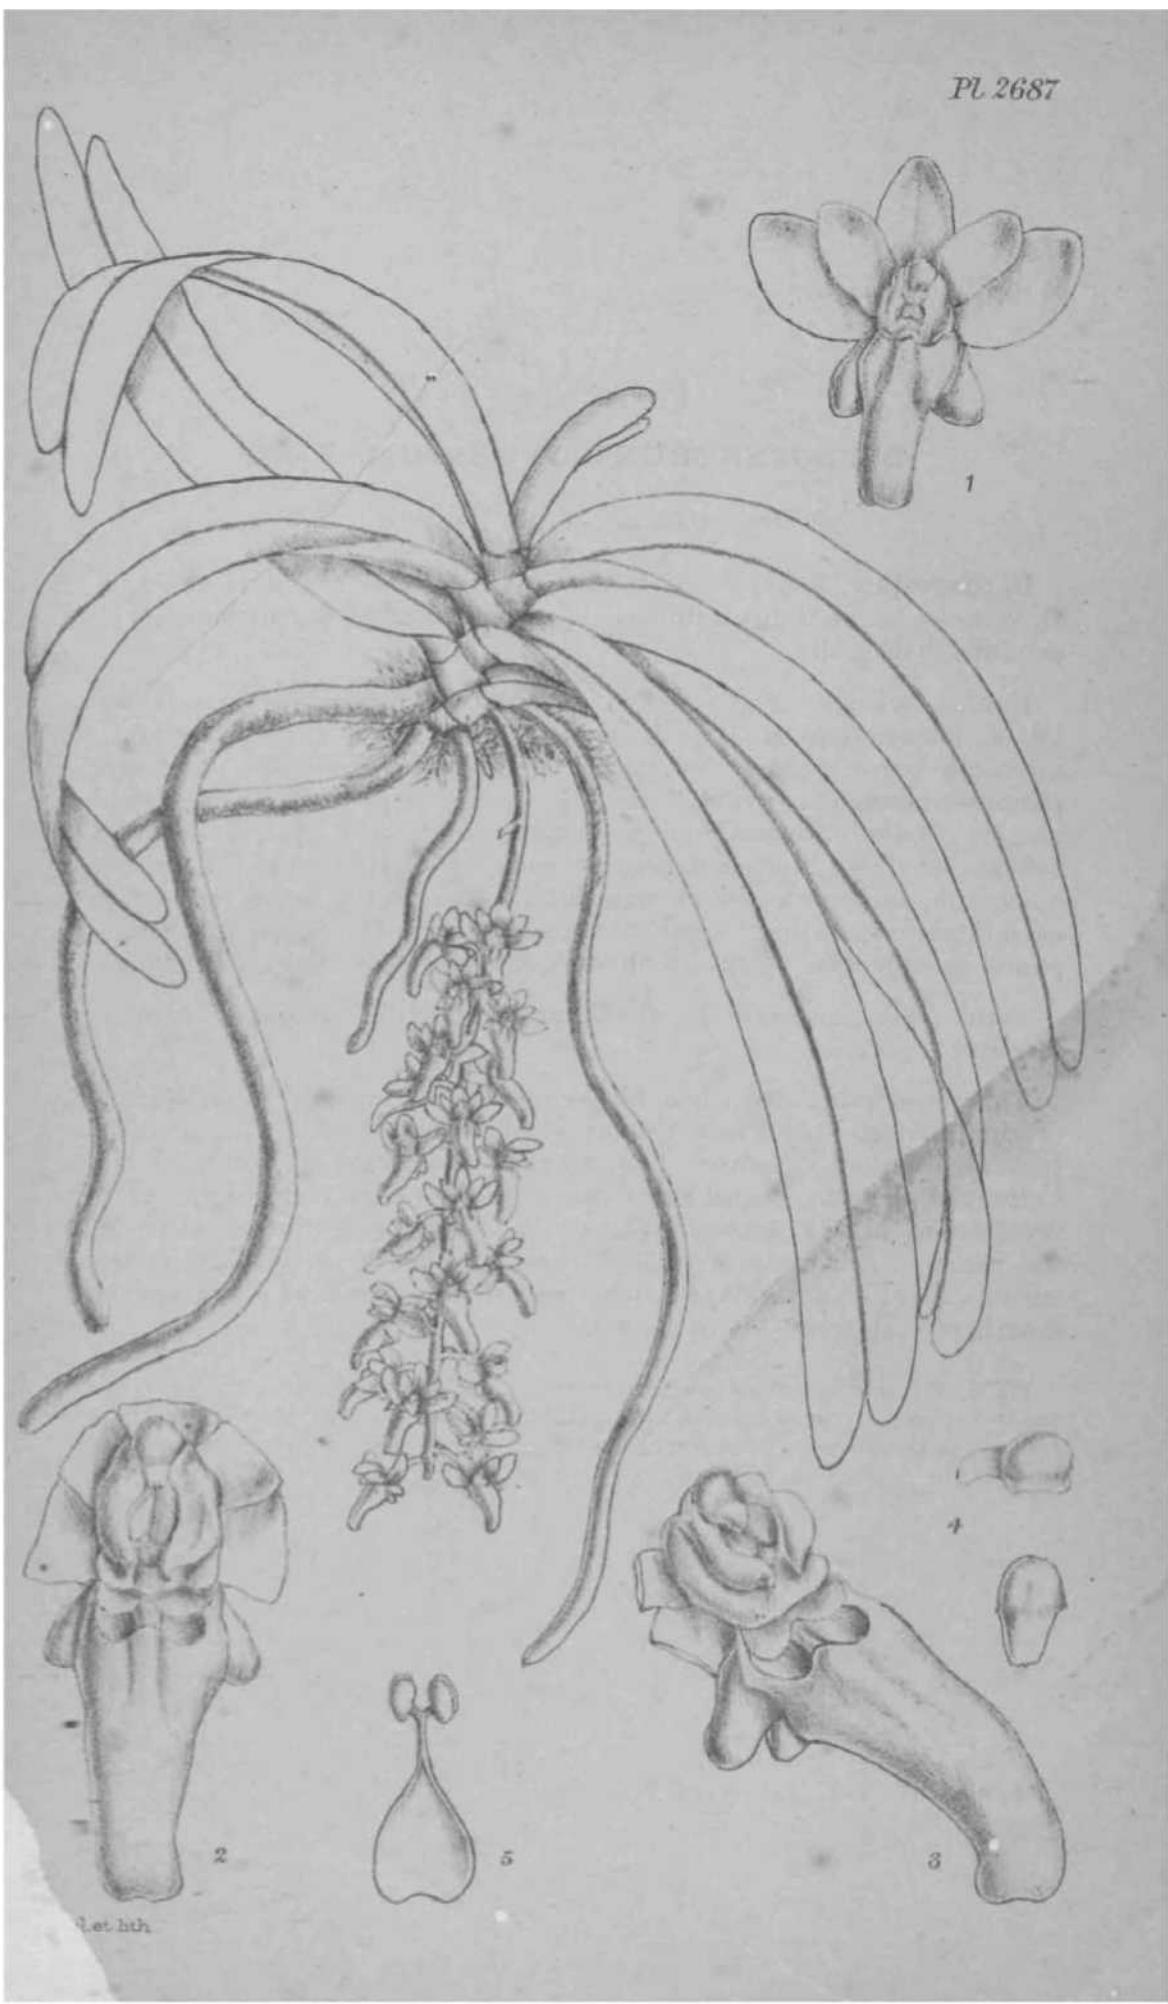

PLATE 2687.

DIPLOCBNTRUM CONGESTUM, *WigJtt.*

OBCHIDACEJE. Tribe YANDEX.

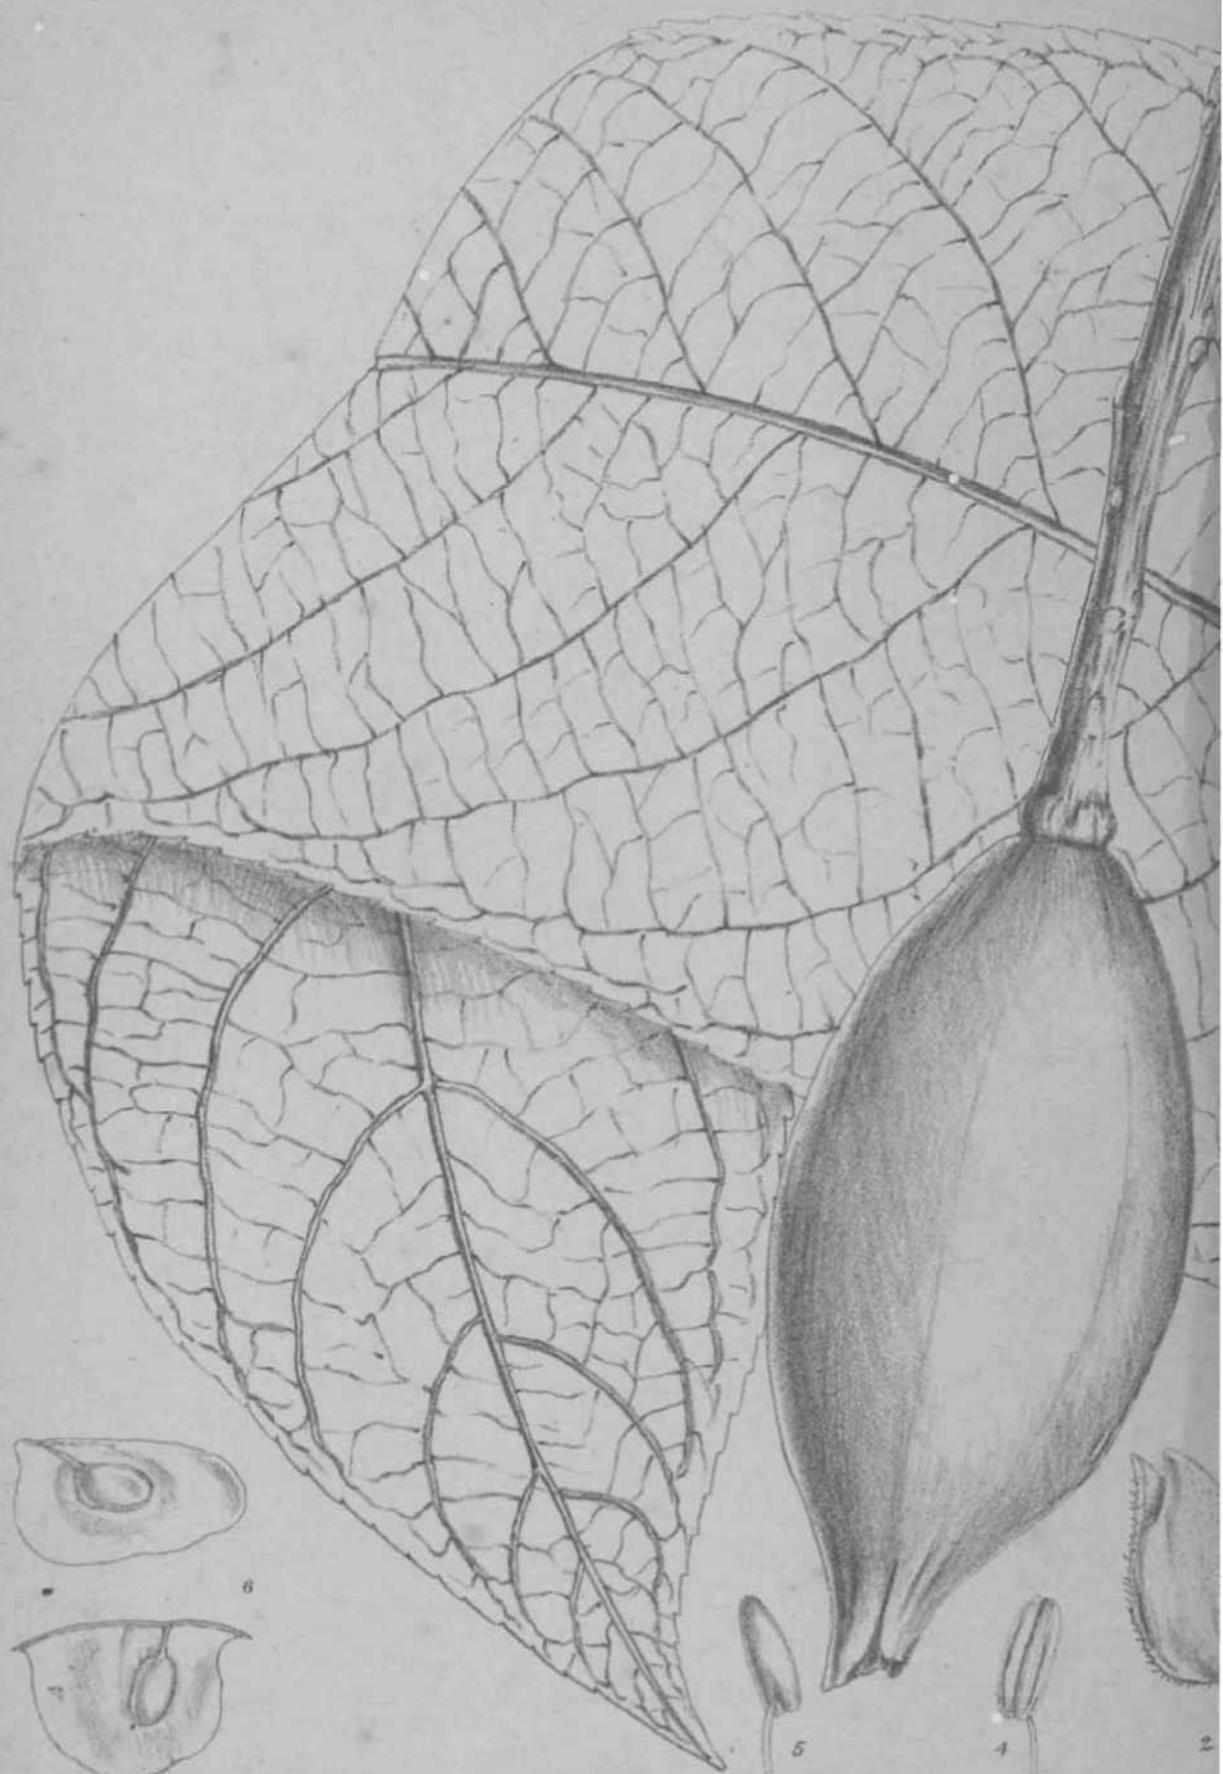

D. coagustum, *Wight Ic.* t. 1682 ; *Hook./. Ft. Brit. Ind.* vi. p. 78 ; a *D. recurvo*, Lindl., foliis latioribus et racemis non vel parum rainosis et pendulis distinguitur.

Caulis brevis. *Folia* recurva, linear-i-oblonga, apice insequaliter biloba, lobis obtusis, 3-3¹/₂ poll, longa, 4-6 lin. lata. *Racemi* penduli, interdum parce ramosi, 3-6 poll, longi, floribus numerosis. *Braeteaz* patentes, triangular!-ovatee, acutse, 1-1¹/₂ lin. longse. *Pedicelli* 1¹/₂ lin. longi. *Sepal* a elliptico-oblonga, obtusa, H-2 poll, longa, lateralia reflexa. *Petala* elliptico-oblonga, obtusa, if—1¹/₂ lin. longa. *Labellum* oblongum, apice reflexum et truncatum, basi paullo latius et obtuse carinatum, circa 2 lin. longum ; calcaria saccato-oblonga, 1 lin. longa, paullo divergentia. *Capsula* oblonga, breviter pedicellate, 5 lin. longa.

INDIA : Travancore; in the Iyamallay Hills, *Wight*; without locality, *Woodrow*.

This remarkable plant has hitherto been known only from Wight's original materials, but now a plant which was received in August 1895, from G. Marshall Woodrow, Esq., formerly Professor of Botany in the College of Science, Foona, has flowered in the Kew collection, and is represented in the annexed plate. A character in the structure of the genus which appears to have been previously overlooked is the curious flap-like appendage at the base of the column which closes the mouth of each spur.—R. ALLEN BOLFE.

Fig. 1, A flower seen from the front, showing the flaps which cover the mouths of the two spurs; 2, the same with the sepals and petals removed, showing the flaps opened; 3, the preceding seen from the side; 4, anther-case seen from the front and side ; 5, the pollinarium.—All enlarged.

M.S.del. et lith.

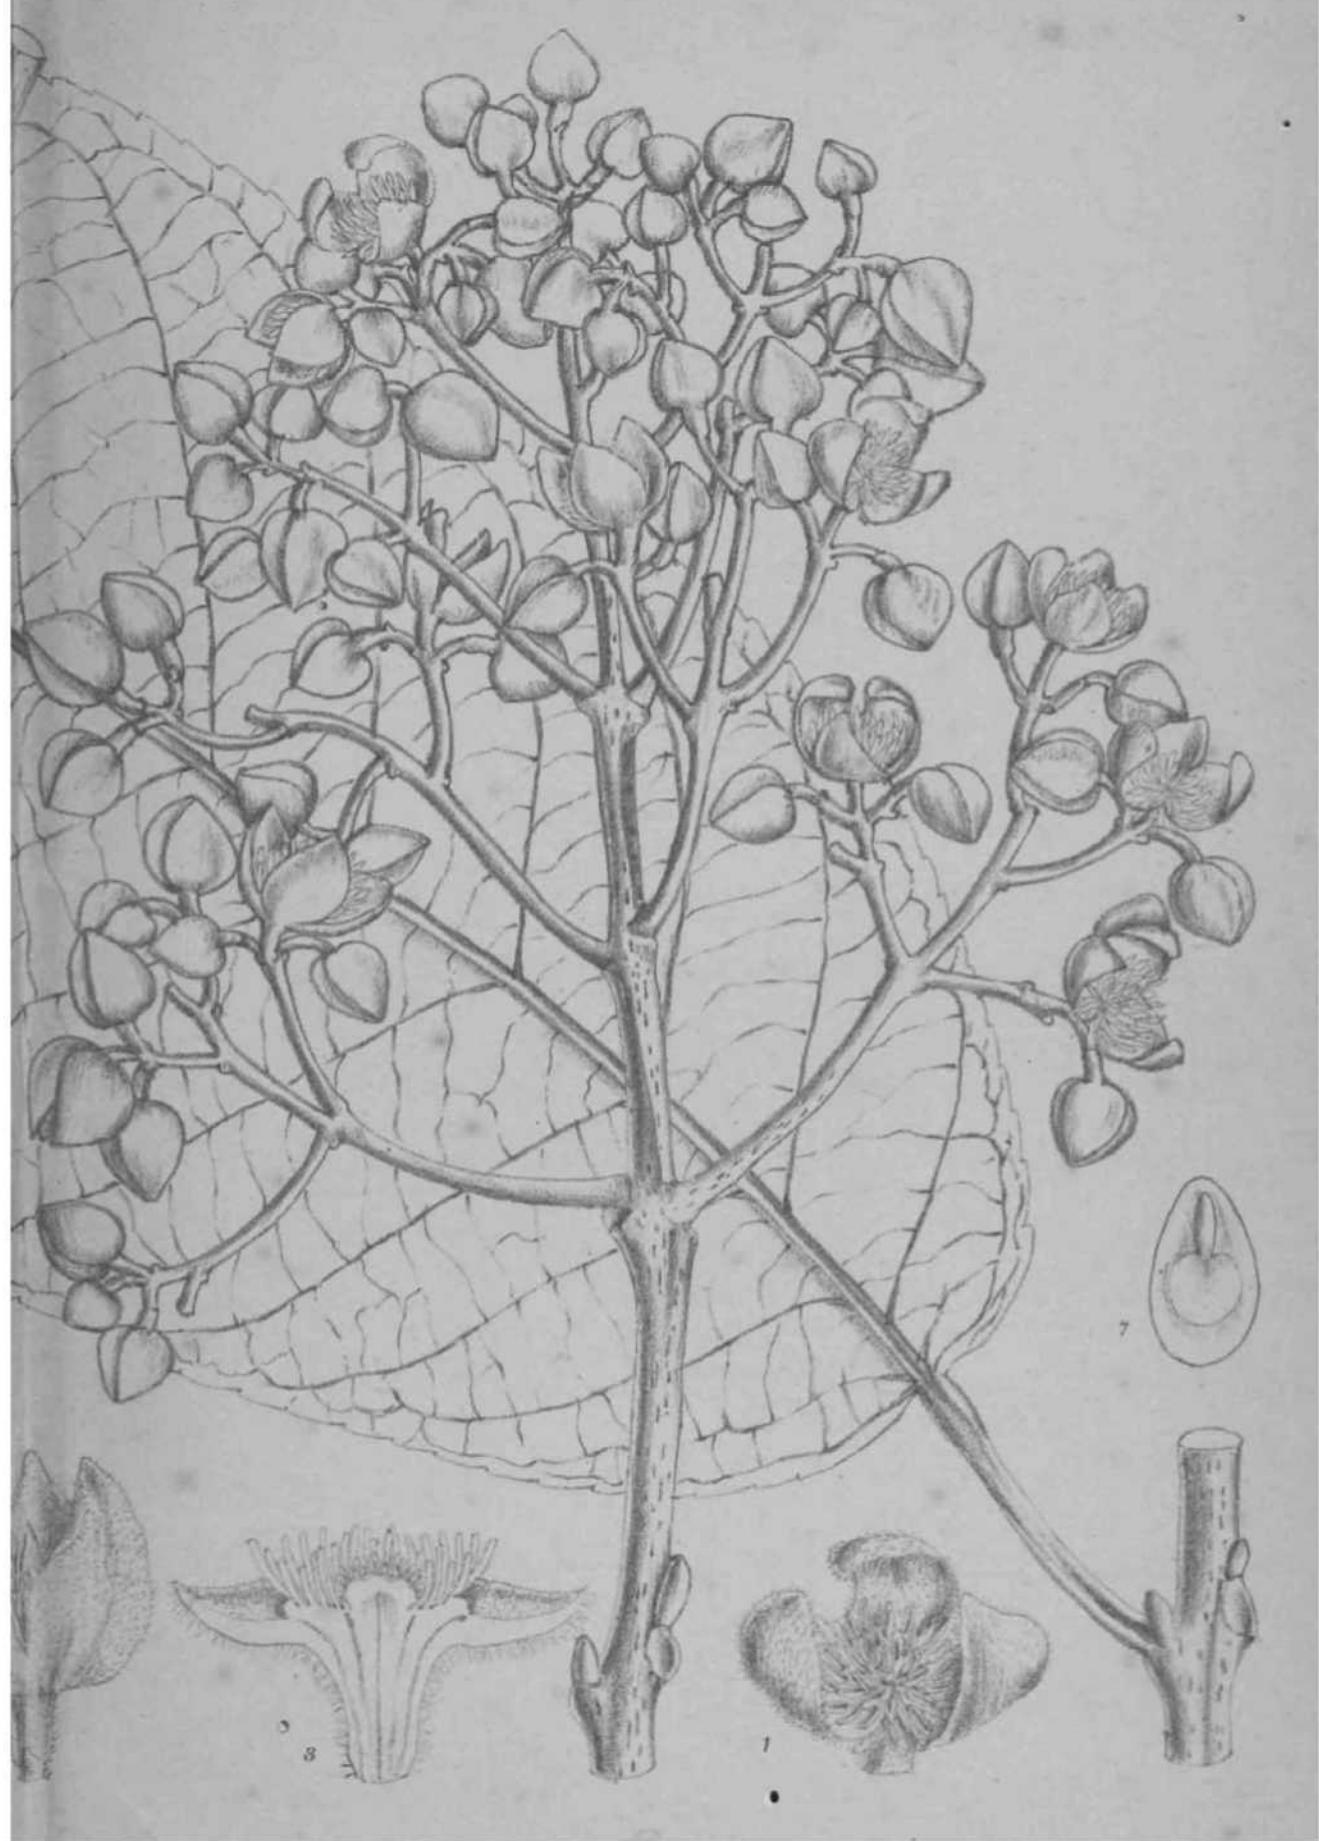

PLATE 268.

ITOA OKIENTALIS, *Hemsl*

BIXACEJE. Tribe FLAGOURTIEA.

Itoa, *Hemsl.* Genus novum ex affinitate *Poliothyrsi* (*OHv. huj. op. t. 1885*), *Carrierea* (*Franch. in Rev. llort. 1896, p. 498, fig. 170*), et *Idesm* (*Maxim.; Bot. Mag. L 6794*); a primo floribus vere unisexualibus perianthio 3-4-mero staminibus nutnerosissimis, a secundo floribus unisexualibus perianthio 3-4-mero seminibus circumalatis, a postremo perianthii lobis valvatis fructu capsulari differt, et ab omnibus foliis oppositis vel suboppositis recedit.

Flares unisexuales et probabiliter dioici; feminini non visi, masculini in paniculas pyramidales erectas terminates dispositi. *Calyx* 3-partitus vel interdum 4-partitus, sericeo-tomeniosus, crassus, coriaceus, segmentis valvatis fere liberis ovato deltoideis 5-6 lin. longis. *Petala* nulla. *Stamina* numerosissima, quain calyx dimidio breviora, filamentis filiformibus glabris antheris basifixis loculis parallelis. *Ovarium* rudimentarium parvum, hirsutum. *Fructns* lignosua, capsularis, unilocularis, placentis 6 (an semper ?) parietalibus, anguste ovoideus, 3£-4 poll, longus, utrinque attenuatus, brevissime denseque tomentosus, tarde dehiscens. *Setnina* numerosissima, valde compressa, circumalata, ala tenuissima, magnitudine atque circumscriptione valde variabilia, ssepe subdolabiformia, maxima circiter 1 poll, longa; albumen parcum ; embryo magnus, axilis, rectus, cotyledonibus orbicula/ibus, radicula tereti cotyledonibus scuali.—*Arbor 20-pedali8j ramulis floriferis glabris subcompressis crebre lenticellatis*. *Folia ampla, opposita vel subopjwftita, longe petiolata, tenuiter coriacea, oblonga vel elliptica, cum petiolo usque ad 15—18 poll, longa et 5-7 poll, lota, acuminata, basi rotundata, margine crenata, supra nitida, subtus parce pubescentia vel denmm glabrescentia, venis jmmariis lateralibus numerosis prope marginem conjunctis atque secundariis tertiarisque subtus conspicuis; petioli teretes vel supra leviter canaliculati pubcscentes 1^-2 poll, longi*. *Paniculvejlorum masculinorum breviter pedunculate circiter 6 poll, longce.*

CHINA : Mengtze, Yunnan, at 5000 feet, A. Henry, 9408, 10703.

/too, as will be understood from the comparisons made above, is one of a small group of allied genera, which are peculiar to China and Japan. This name has been given in honour of the patriarchal

Dr. Keisuké Ito, one of the pioneers of modern Botany in Japan, and of his grandson, Dr. Tokutaro Ito. A short memoir of the life and works of Dr. K. Ito, together with a portrait, appeared in the *Annals of Botany* in September, 1900, when he was already in his ninety-eighth year. He was a friend and pupil of P. F. von Siebold, whose acquaintance he made as long ago as 1826. His long life has been devoted to philanthropic and scientific work, and he has been the recipient of many honours, the last being his selection by his countrymen as one of 'The twelve Heroes of modern Japan.' An earlier portrait of K. Ito will be found in the *Journal of Botany* for 1887, with a brief History of Botany in Japan by Dr. T. Ito, who worked at Kew in 1886-87, and enriched the library by the gift of a fine copy of the *ffonzo Zufu* and several other illustrated Japanese botanical works. Among the botanical works on which he is at present engaged is a *Flora* of the Luchu Archipelago, in conjunction with Dr. J. Matsumura.

In Balansa's Tonkin collection (n. 4875) are fruits and seeds of *Itoa orientalis*, or of a closely allied species. The fruit differs, however, in being nearly globose in shape.—W. BOTTINQ HEMSLEY.

Fig. 1, a male flower with a tripartite calyx; 2, a male flower with a quadripartite calyx; 3, a longitudinal section of the same; 4 and 5, stamens; 6, seeds with part of testa removed; 7, section of seed, the wing removed, showing embryo.—All more or less enlarged.

PLATE 269.

OCHANOSTACHYS AMENTACEA, Moat.

OLACINEJE. Tribe OLACEJB.

0. amentacea, *Most*, in *Hook. f. FL Brit. Ind. i. p. 576* (*species unica*).

Arbor pulchra, 40-130 peel, alta, trunco ad 3 ped. crasso, ramis d'varicatis vel pendulis rubiginoso-brunneis deinde cinerascentibus. *Folia* elliptica vel oblonga, latitudine admodum varia, basi breviter acuta vel fere rotundata, apice breviter vel longiuscule obtuse acuminate, 2 ad fere G poll, longa, 1[^]-3f poll, lata, coriacea, in alabastris subtus fulvo- vel ferrugineo-puberula, plerumque cito omnino glabrata, supra nitida, magis minusve conspicue glanduloso punctata, nervis utrinque 5-6, rarius 7, obliquis arcuatis subtus prominentibus supra impreasis, venia transveraia inconspicuis : petioli ^-1 poll, longi. *Floret* secus rhachin 1-4 poll, longam flexuosam minute puberulam vel sub-glabram in glomerulos 2-3-floros bractea parva lanceolata suffultos dispositi vel superiores solitarii, brevissime pedicellati, apicas interruptas axillares referentes, 4- vel 5-meri. *Calyx* late breviterque dentatus, basi pilis minutis ramosis furfuraceo-puberulus, margine ciliolato. *Patala* oblonga, subacuta, crassiuscula, 1f lin. longa, intua supra medium fasciculo pilorum munita, margine papillosa, cieteruni glabra, basi primo conglutinata. *Stamina* 12-15; filamenta basi petalis agglutinata, glabra, 4 vel 5 inter petala posita ceteris paulo longiora, cetera per paria petalos opposita ; antherae didymie, connectivo punctiformi. *Discus* nullus. *Ovarium* globosum, basi sulcatum, glabrum, imperfecte 3-loculare ; stylus brevis, columnaris, stigmate minute 3-lobo. *Ovula* de axi apice ipso libera pendula, solitaria in utroque loculo, raphae dorsali. *Fructus* drupa pyriformis, 1-1[^] poll, longus, ^ poll, latus; endocarpium lignosum, subtenue. *Semen* solitarium, globosum, 6-7 lin. dimetens ; embryo minutus.—*Ochanostachya amentacea*, Valeton, Crit. Overz. d. Olac. p. 104 ; King, Mat. FL Malay. Penins. p. 588 (Journ. Asiat. Soc. Bengal, lxiv. ii. p. 100). *O. bancana*, Val. 1. c. *Petalinia bancana*, Becc. Malcsia, i. p. 257.

MALAYA : Penang, *Curtis*, 1510. Perak, tarut, *King's collector*, 4523, 6705, 6747, 7800 ; Wray, 814. Malacca, *Malacca*, 1673, 2627 ; *Griffith*, 2500. Singapore, *Edhtley*, 80. Bangka, *Teysmann*, 6718, 6719, 6723. Lingga, *Teysmann*, 6720. Borneo, *Lobb*. Sarawak, near Kuching, *Ilaviland*, 1950.

The two specimens from Borneo differ slightly from the rest in the presence of a more copious and more persistent rust-coloured tomentum. Haviland's, from which the drawing was made, has, moreover, remarkably small, narrow, and mostly G-nerved leaves ; otherwise I cannot find any divergence from the usual more broad- and large-leaved form.—OTTO STAPP.

Fig. 1. flower; 2, corolla, flattened out, and stamens; 3, young stamen; 4, anther, dehisced, seen from the top; 5, pistil; 6, ovary and calyx, in longitudinal section; 7, orary, cross section.—4// enlarged.

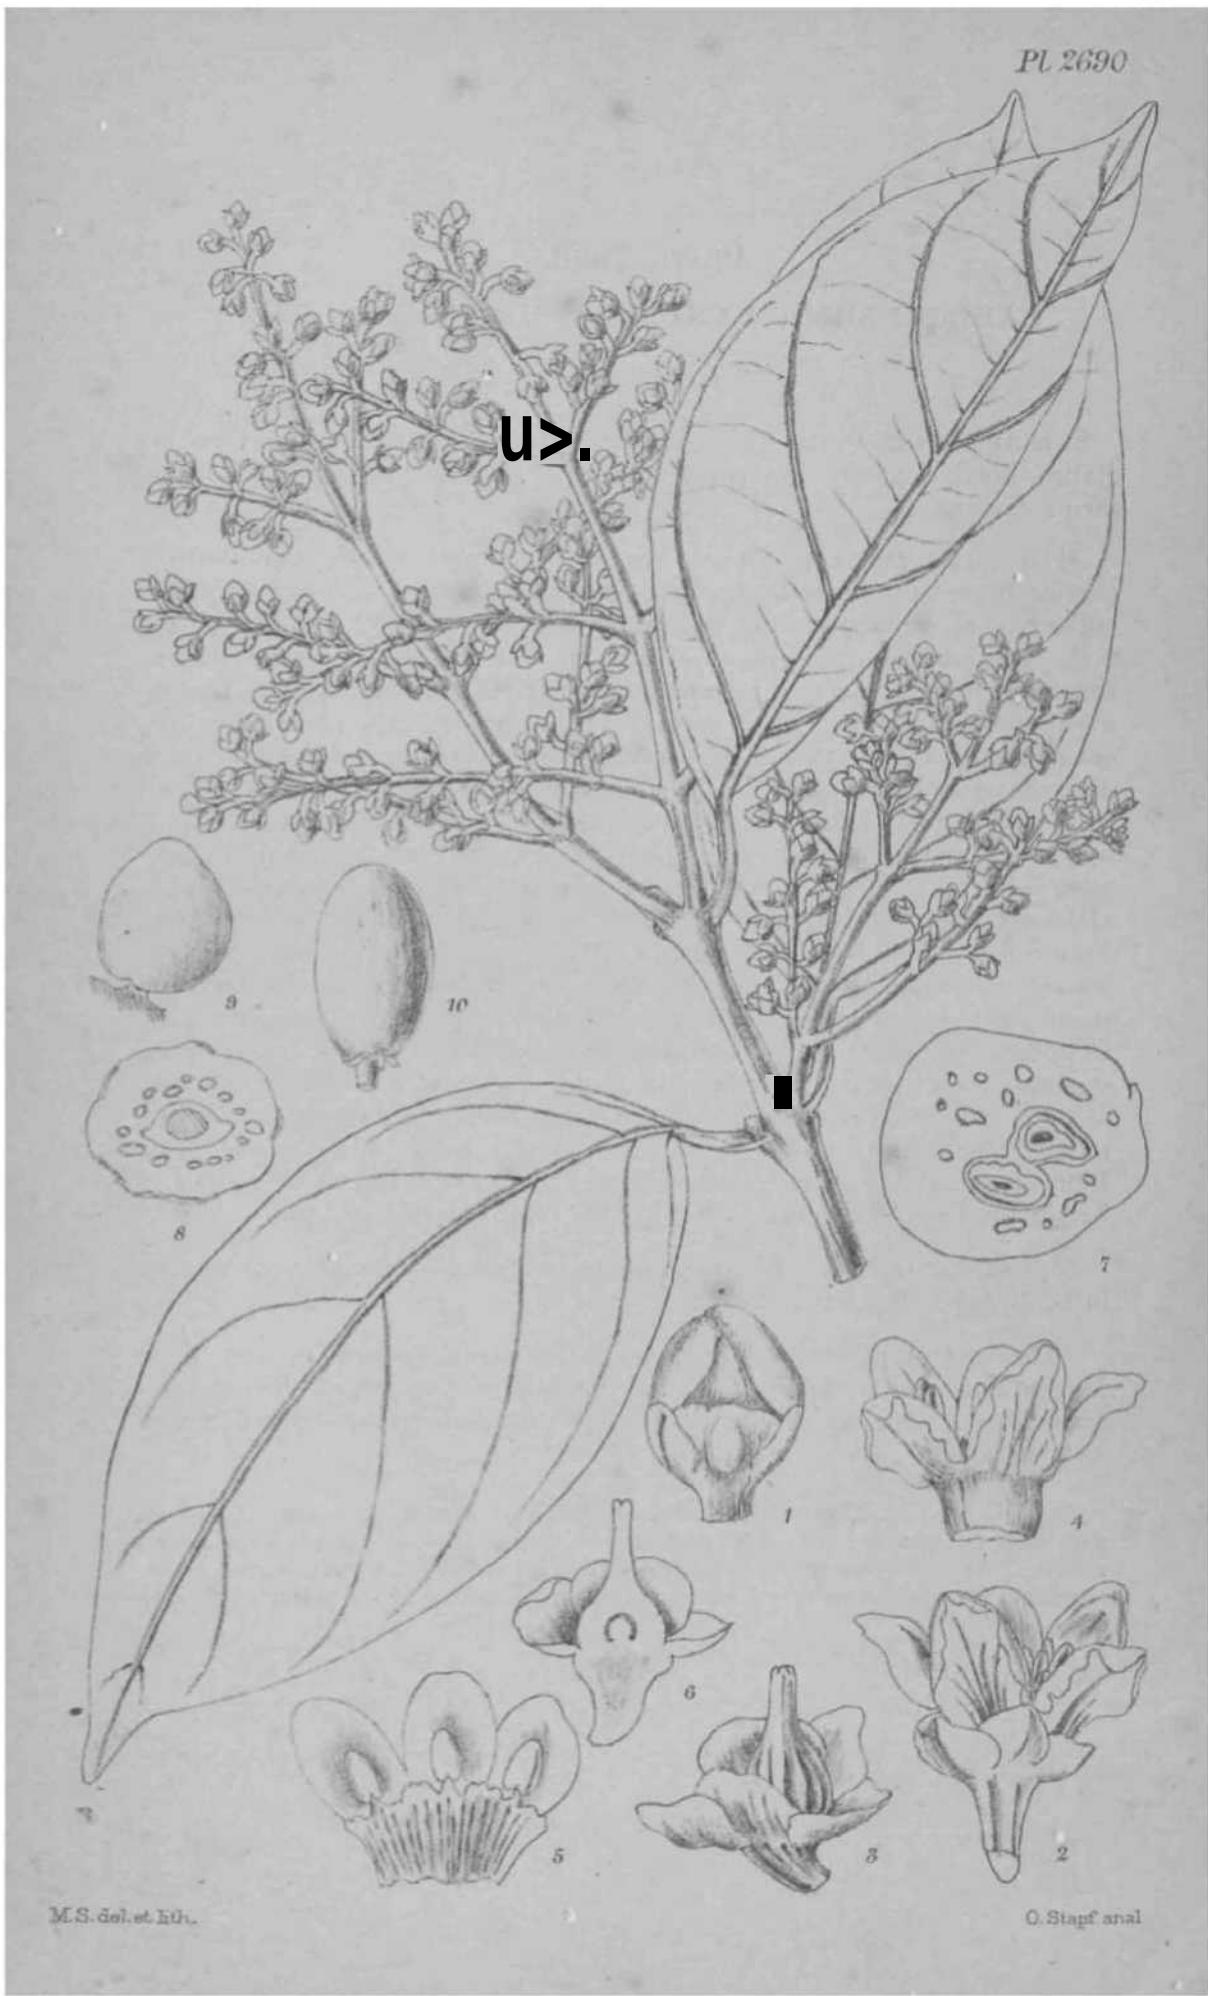

PLATE 2G90.

SARCOSPERMA PANICULATUM, *Stapfand King.*

SAPOTACEA:.

S. paniclatum, *Stapfet King*; a *S. arboreo*, Hook f., inflorescentia glabra, floribus paulo minoribus, a ceteris generis speciebus folionini forma diversa.

Arbor 50-70 ped. alta, glabra, trunco 15-20 poll, crasso, ramulorum cortice nigricante. *Folia* opposita vel subopposita, oblongo-elliptica vel subovata, subacuminata, basi rotundata, 3.[^]-8[^] poll, longa, 1[^]-2[^] poll. lata, coriacea, integra, supra nitida, viva pallide viridia, exsiccata fusco-nigricantia, secundum costam foveolis (domatiis) munita, nervis utrinque 5-8 curvatis, venis transversis obliquis laxis plerumque inconspicuis. *Flares* paniculati (rarius racemosi), in paniculæ ramis divaricatis subsessiles, 1-3 bractea minuta suffulti; panicula (vel racemi) 1-3 poll, longi. *Calyx* persistens; sepala late rotundata, ^-1 lin. longa, margine scariosa. *Corolla* breviter campanulata, viridi-alba, lobis tubo duplo longioribus late ovato-ellipticis obtusissimis, in alabastro late imbricatis, 1J-1[^] lin. longis, marginibus revolutis. *Stamina* 5, epipetala, corollæ supra faucem inserta; filaments brevisima; antheræ ovatæ, § lin. longæ, lateraliter rima dehiscentes; staminodia squamiformia, minuta, obtusa vel crenulata, carnosa. *Ovarium* sulcatum, 1- vel imperfecte 2-loculare; stylus columnaris, stigmate minute 2-4-crenulato; ovula in loculis solitaria, a basi ascendentia. *Fructus* drupaceus, ellipsoideus, (immaturus) 9 lin. longus; semina 1-2.—*Bracea paniculata*, King, Mat. Flor. Mai. Penins. p. 589 (Journ. Asiat. Soc. of Bengal, LXIV. ii. p. 101); Engler in Engl. & Prantl, Natiirl. Pflanzenf. Nachtr. p. 149.

MALAY PENINSULA : Perak, in open, old jungle on the tops of low hills, 300-500 ft., *King's collector.*

The examination of the material of this species in the Kew Herbarium has resulted in the reduction of the genus *Bracea*, described as a member of the *Olacacea**., to *Sarcospermum*.—OTTO STAPP AND G. KING.

Pig. 1, a bud; 2, a flower; 3, a calyx and pistil; 4, a corolla; 5, part of a corolla with stamens, flattened out; 6, longitudinal section of a flower, with the corolla removed; 7, cross section of an imperfectly 2-celled ovary with resin canals in the pericarp; 8, cross section of a 1-celled ovary; 9, an ovule; 10, a young fruit.—All enlarged.

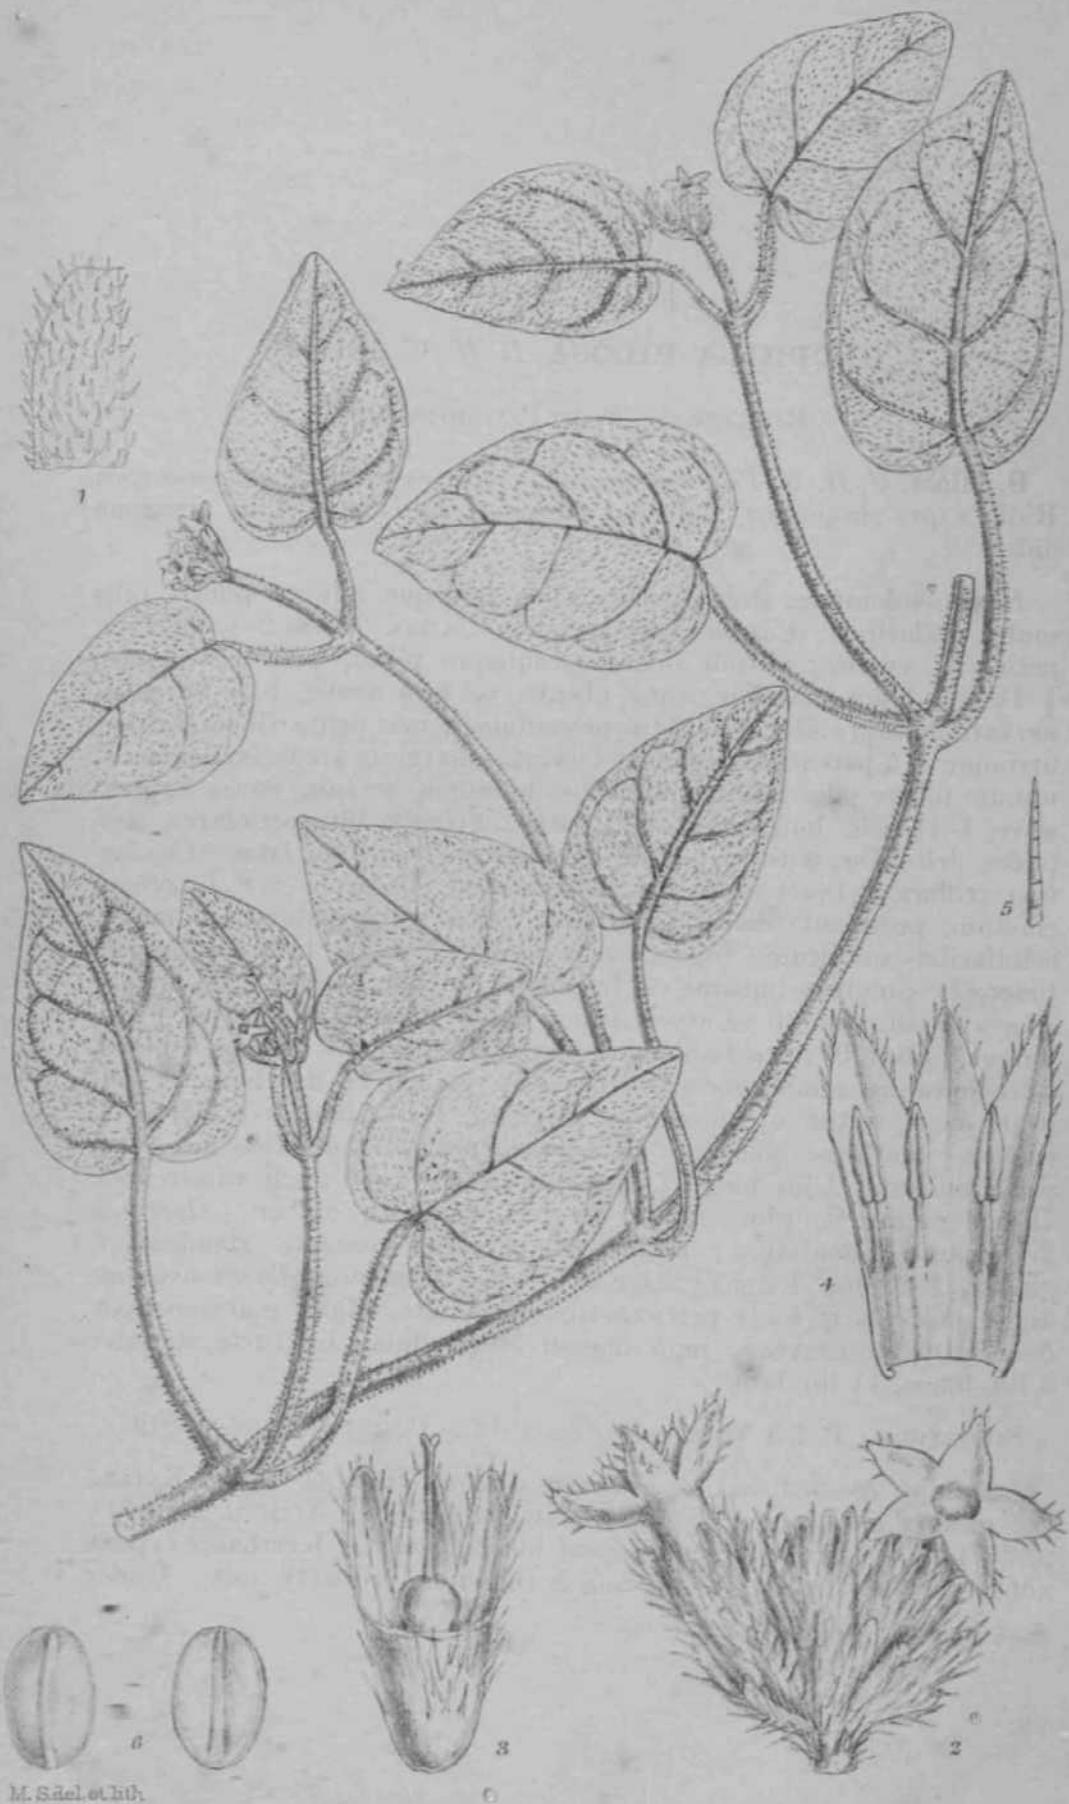

PLATE 2691.

GEOPHILA PILOSA, // H. W. Pearson.

RUBIACEÆ. Tribe PSYCHOTRIEJE.

O. pilosa, H. II. W. Pearson (*sp. nov.*); species affinia *G. melanocarpas*, Ridl., a qua stolonibus, foliisque pilosis et foliis minoribus praecipue differt.

Herba stolonifera, stolonibus caulis foliisque minute pilosis, pilis multicellularibus. *Gaulis* simplex, 2-6 poll, altus. *Folia* 2-4, opposita, petiolata, erecta; petioli dense minuteque pilosi, pilis patentibus, ^ - 1 ^ poll, longi; laminae ovatae, obtusse vel fere acutae, basi cordatse, nervatione supra obscura subitus prominula, nervis primariis lateralibus utrinque 4-5 patentim ascendentibus intra margines arcuatim connexis, minute pilosse pilis multbicellularibus, brevibus, crispis, rectis appressisve, 1-1^ poll, longae, \ -\ poll, latse. *Stipules* interpetiolares, simplices, deltoideae, obtusse, pilosse, 1 lin. longse, basi | lin. latse. *Capitulum* triflorum, bractearum bracteolarumque pilosarum 6-8 involucro cinctum, pedunculo dense minuteque piloso pilis patentibus multicellularibus suffultum; bracteae plus minus trilobatse, 1^ - 2 lin. longae; bracteolae simplices lineares vel linear-lanceolatse, circiter 1 lin. longp. *Flores* sessiles, albidi. *Calycis* tubus dense minuteque pilosus, | lin. longus, lobos 5 linear-oblongos obsolete 3-nervatos pilosos sequans. *Corolla* tubus membranaceus, urceolatus, glaber, 1^ lin. longus; lobi ovati acuti, extus ad apicem parce pilosi, 1 lin. longi. *Stamina* 5, inclusa; anthera oblongse, panduratae, obtusae vel subacute, basi paulo bilobatse, \ lin. long*; filamenta corollse tubo tenui adhaerentes. *Discus* cupularis, plus minus bivalvis, magnus, glaber. *Ovarium* 2-loculare, 2-ovulatum; stylus complanatus obsolete glandulosus, glaber, 1-1^ lin. longus; stigma breviter bilobum. *Bacca* ovoidea, angulata, calycis lobis persistentibus coronata, pilosa glabrescensve. *Semina* plano-convexa, jugo dorsali longitudinali instructa, circiter 2 lin. longa, 1^ lin. lata.

SINGAPORE : Bukit Timah, Ridley, 9516. BORNEO : Barber, 249.

I am not satisfied that *G. pilosa* is distinct from *G. hirta*, Korth., the meagre description of which (Nederl. Kruidk. Arch. ii. 2 [1851] p. 247) is insufficient for purposes of identification. Korthals's type is not in the Leyden Herbarium and is therefore probably lost. Under

these circumstances the publication of the plant as a new species seems justifiable.

G. pilosa bears a strong superficial resemblance to *G. hirsuta*, Benth., from Tropical Africa, and to *G. cordifolia*, Miq., a Guiana species, from both of which it is, however, very distinct; its affinity is clearly with *G. melanocarpa*, Ridl. The specimen sent to us under this name by Mr. Ridley differs externally from *G. pilosa* principally in the glabrous condition of all its parts, though a very different habit is suggested by the figure accompanying the original description (*Trans. Linn. Soc.* [2] iii. PL 62).

The shedding of the branches accompanied by the formation of an absciss layer is not uncommon in the genus ; this is seen in *G. pilosa*, but even more markedly in *G. melanocarpa*, Ridl., and in the African *G. obvallata*, Didr. The branch is not detached as a whole; its base slowly decays until all the tissue external to the corky plate disappears, leaving a clean scar, from which an adventitious root frequently emerges.—H. H. W. PEARSON.

Fig. 1, portion of a leaf; 2, capitulum; 8, a flower with corolla and part of calyx removed showing gynoecium and disc; 4, part of androecium; 5, hair; 6, seed.
*All enlarged**

PLATE 2092.

LOBOSTEPHANUS PALMATUS, J^T. E. Brown.

AsCLEPIADACEiB. Tribe CEROPEGIEiE.

Tobostephanus, N". E. Brown {genus novum}. Calyx 5-partitus, lobis lanceolatis acutis. Corolla campanulato-rotata, profunde 5-loba, lobis sinistrorum obtegentibus. Corolla duplex; exterior ima basi tubo stamineo et corollas affixa, membranacea, basi cupularis, superne alte 10-loba (vel lingulis inclusis 20-loba); lobi erecti; 5 minores calycislobis oppositi, inappendiculati; 5 majores corollse lobis oppositi, intus bilingulati, lingulis lobos excedentibus; coronae interioris squamae 5, tubo stamineo affixæ, oblongæ, membranaceæ. Stamina basi corolla; affixa, filamentis in tubum brevissimum connatis; anthera erecta?, oblong*, apice membrana parva terminatae. Pollinia in quoque loculo solitaria, caudiculis longis subhorizontalibus pendula. Ovarii carpella 2, basi distincta, apice in stylo conjuncta, uniovulata; ovulum pendulum; stylus apice longe rostratus. Folliculi parvi, compressi, oblique obtriangulati, angulis breviter spinosis, monospermi. Semen lunato-curvatum, utrinque attenuatum, ecomosum; glabrum.

L. palmatus, N. E. Brown (species unica). Caides 3-4 ped. longi, graciles, unifariam puberuli. Folia petiolata, palmatim 5-loba, lobis linearibus, marginibus revolutis, lobo intermedio 1-1[^] poll, longo, £ - li lin. lato, lateralibus minoribus. Umbelhe 5-6-floras, pedunculis 6-10 lin. longis, unifariam puberulis; bractese minutæ; pedicelli 1[^]-2 lin. longi, puberuli. Corollæ lobi 1 lin. longi, | lin. lati, lanceolati, obtusi, glabri. Corona exterioris lobi majores | lin. longi, oblongi, obtusi, ligulis § lin. longis linearibus obtusis; lobi minores £ lin. longi, lineares, obtusi. Coronas interioris lobi | lin. longi, oblongi, obtusi vel retusi. Folliculi 3-3[^] lin. longi et lati.

SOUTH AFRICA : Delagoa Bay, Junod, 502.

This is one of the most remarkable Asclepiads hitherto discovered, for besides being very distinct in its palmatifid leaves and many-lobed corona, it is absolutely unique in the Order in having 1-ovuled carpels and 1-seeded follicles. The triangular 3-horned follicles and curved seeds, which are quite destitute of the usual tuft of hairs at one end, are also quite unlike any other Asclepiad known to me. Its position in the system would appear to be near to *Eusteyia*.—N. E. BROWN.

Fig. 1, a flower; 2, a portion of the outer corona; 3, inner corona and beak of the style; 4 & 6, pollen masses in two positions; 6, a follicle; 7, a follicle in longitudinal section, showing the seed in its natural position.—All enlarged.

PLATE 2G93.

KICKXIA BORNEENSIS, *Stapf*.

APOCYXACEJE. Tribe ECHITIDEJE.

K. borneensis, *Stapf* (*sp. nov.*); a *K. Blancoi*, Rolfe, differt floribus brevissime pedicellatis, 1[^]-1 f poll, longis, calycis segmentis acutis.

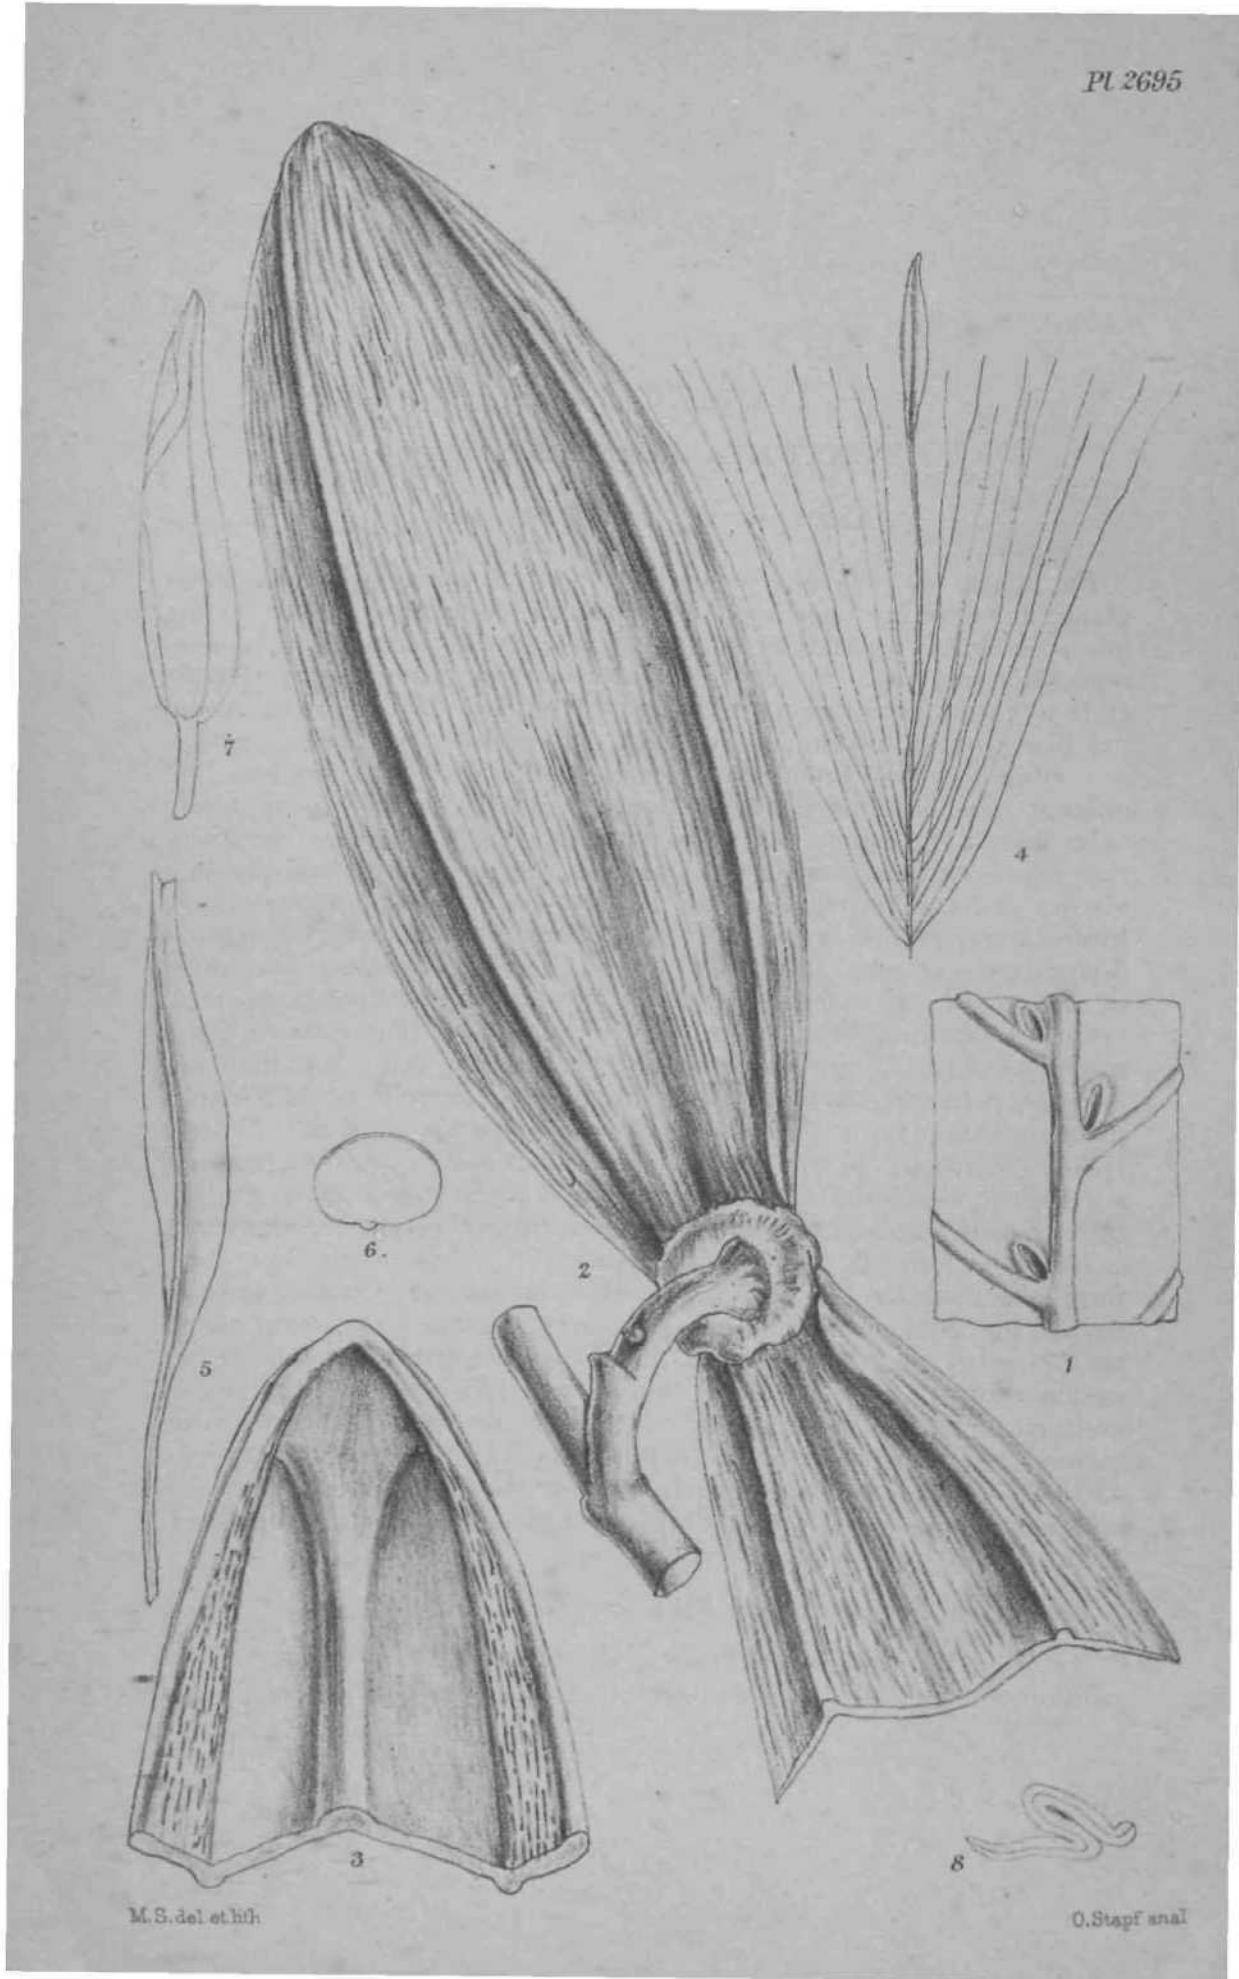

Frufbx 6 ped. altus. *Ramuli* juniores exsiccando nigro-fuscescentes, teretes, subgraciles. *Folia* brevissime petiolata; lamina lanceolato-oblonga, basi subacuta, apice acuminata, 4-4[^] poll, longa, 1[^]-2 poll, lata, integerrima, glaberrima, exsiccando supra nigro-fuscescens, subtus 'pallidior, coriacea, nervis secundariis utrinque circiter 9 sub-patulis sub margine arcuatim connectis, tertiaris venisque inconspicuis; petiolus 1[^]-2 lin. longus. *Cymce* axillares, brevissime pedunculate, pauciflorse, vel ad florem solitarium redactse; bracteolse minutse, obtusae; pedicelli brevissimi. *Flores* 1[^]-1 § poll, longi. *Calyx* 2[^]-3 lin. longus; segmenta ovata, acuta, basi extus gibba, intus glandula solitaria oblonga applanata appressa munita. *Corolla* tubus e basi subventricosa ad constrictionem cylindricus, deinde campanulatus, parte inferiore 6 lin. longa, ubi angustissima 1[^] lin. lata, glabra, parte superiore 5 lin. longa, ore 3-3[^] lin. lata, intus sparsim papilloso-pilosula; lobi oblique porrecti, obtusi vel subacuti, 6 lin. longi, 1 }-2 lin. lati, intus basin versus sparsim papillosopilosuli, ceterum glabri. *Staminum* filaments glabra; antherce 2[^] lin. longse, apicem versus in dorso sparse pilosulae. *Discus* inaequaliter 5-partitus. *Ovarium* cum stylo stigmateque 7 lin. longum. *Fructus folliculi* 6 poll, longi, coriacei, extus longitudinaliter striati. *Semina* ignota.

BORNEO : Sarawak, *Lobb*.

This is one of the four Malayan species of *Kickxia*. An account of the African species described under this name may be found in the text, accompanying the two following plates.—OTTO STAPF.

Fig. 1, a portion of the calyx and pistil; 2, a corolla, opened and flattened out; 3, an anther, front view; 4, the same, back view; 6, a portion of the follicle, cut out from the middle, showing the free inflexed placentas.—All enlarged, with the exception of fig. 5.

PLATES 2694-2695.

FUNTUMIA ELASTICA, *Stapf.*

APOCYNACEJE. Tribe ECHITIDE[^].

Funtumia, *Stapf* (*genus novum*). *Calyx* ad basin 5-partitus, intus glandulis munitus, persistens; segmenta imbricata, lata, magis minusve obtusa; glandulse numerosie vel paucse, semper applanatse, segmentis appressse. *Corolla* hypocrateriniorpha, parvula vel mediocris (tota longitudine pollicem unum haud excedens); tubus brevis, medio vel paulo supra medium ventricosus, superne crassissimus, carnosus, ore annulo crasso prominente cincto poriformi; lobi lineares vel oblongi, prsefloratione dextrorum obtegentes *Stamina* 5, in medio tubo inserta, in conum os vix attingentem arete inclusum conniven-tia; filamenta brevissirna, crassa; antherse sagittate, intus basi glandula viscosa munitse, cruribus duris solidis filamenta subexcedentibus; loculis angustissimis brevibus. *Discus* breviter tubulosus, 5-lobus vel 5-partitus, carnosus. *Carpella* libera, brevia, truncata, lateraliter in stylum abrupte constricta, e disco exserta vel ab eo paulo superata, vertice puberula; styli filiformes, supra coaliti, incrassati; stigma ovoideo-clavatum, ope antherarum glandularum cono staminali ad-hserens; placentae ad basin bipartite lamellis carpelli lateri ventrali plane adnatis, facie dorsali ovulis multiseriatim obsitis. *Fructus folliculi* distincti, breves vel elongati, divaricatim patentes, coriacei vel lignosi, secundum suturam dehiscentes; placentae maturse tantum zona angusta rugulosa utrinque secundum suturam percijrente indicate, ceterum a folliculi pariete haud distinctse. *Semina* pluriina, fusi-formia, subsemiteretia, basi coma stipitata reverse plumosa ornata; raphae filiformis, prominula; testa tenuis; albumen carnosum strato tenui embryonem circumdans. *Embryo* elongatus, subsemiteres; radicula supera, longiuscula; cotyledones foliacese, longitudinaliter contortuplicatse.—Arbores, inttridum excehce. Folia sempervirentia, *coriacea*. **Flores (in alabastris maturis) i|-| 1 lin. longi, numerosi, in axillis foliorum cymosO'Congesti, breviter vel brevissime pedicellati, albidi vel flavescentes.** (Cf. *Stapf* in Proc. Linn. Soc, Decemb. 7, 1899.)

F. elastica, *Stapf* in Proc. Linn. Soc, Dec. 7, 1899.

Arbor ad 100 ped. alta. *Truncus* erectus, cylindricus; cortex extus pallidus, maculatus; rarauli teretes, exsiccando nigricantes; latex

copiosus, coagulando massam el as tic am haud viscosam reddens. *Folia petiolata* ; lamina oblonga vel lanceolato-oblonga, basi attenuata, apice in acumen angustum plerumque acutum contracta, 5-9 poll, longa, 1[^]-2[^] poll, lata, integerrima, margine coDspicue undalataet exsiccando revoluta, glaberrima, sicca fusca, subtus pallidior, in axillis inter costam et nervos secundarios distincte foveolata (domatiis instructa), nervis secundariis utrinque 7-11 subpatulis sub margine arcuatim connexis, tertiaris venisque inconspicuis; petiolus 2-5 lin. longus. *Cymce* breviter pedunculate, multiflore, congestse, glabrse; pedunculus ad 3 lin. longus; bractese parvse, late ovatse, obtusae vel subacutse; pedicelli 1[^]-2[^] lin. longi. Flores albi vel flavescentes; alabastra conica, brevia, ad 6 lin. longa. *Calyx* 2-2J lin. longus ; segmenta latissima, ovata vel rotundata; glandular plerumque 2 cum unoquoque segmento. *Corollas* tubus supra basin constrictus, 3[^]-4 lin. longus, glaber; lobi oblongi, obtusi, 2[^]-3 lin. longi. *Stamina* infra medium tubum inserta; filamenta intus minute tomentella ; antherce acuminatse, apice minute pilosuke. *Discus* 5-partitus, segment is crenatis, ovarium paulo superans. *Fructus folliculi* clausi oblongo-clavati, apice obtusi vel rotundati, sectione transversa elliptica, plane aperti oblongo-elliptici, ad 2 poll, lati, lignosi, in lateribus vix longitudinaliter angulati, circa 6 poll, longi. Semina 6-9 lin. longa ; arista 1[^]-2[^] poll, longa, ad medium nuda, pilis ad 2£ poll, longis.—*Kickxia elastica*, Freuss in Notizbl. Bot. Gart. und Mus. Berlin, ii. pp. 353-360, t. i.; Schlechterin Tropenpfl. iv. pp. 109-120; DeWilde man in Rev. Cult. Col. vii. pp. 633, 634, and 743-747. *K africana*, Staph in Kew Bull. 1895, cum icone* ; K. Sebum, in Notizbl. Bot. Gart. und Mus. Berlin, i. pp. 217-221, cum icone*; Warb. in Zeitschr. f. trop. Landwirthsch. (Tropenpfl.), i. pp. 99-103, cum icone* ; Lecomte in Rev. Cult. Col. i. pp. 12-19, 41-47, fig. 2* ; Jumelle, Les Plantes à Caoutchouc, pp. 68-73, fig. 10 * ; non Benth.

WEST AFRICA. Gold Coast, Mampong hills, *Johnson*. Sefehi and Wan District, *Armitage*. Ashanti, Kumassi, *Cummins*, 217. Lagos, Jehu District, *Millen*, 178. Yoruba, Ibadan, *Ofoibi* ; dense forests near Shagamo and Ibadan, *Schlechter*. Lower Nigeria, Old Calabar, *Lloyd*; between Ekuké and Abaragba, *Holland*, 158, 161 (some of the fruits have remarkably small follicles). Cameroons, right bank of Mungo River, between Malende and Nyoke, and between Nyoke and Moyoka, *Preuss*, 1381 ; forests on the Upper Mungo River as far as the Bakossi Mountains, *Schlechter* ; plentiful in the basin of the Ngoko and Dseha, *Schlechter*.

At a meeting of the Linnean Society, on December 7, 1899, I pointed out that the African species described under *Kickxia* differed very essentially from the Malayan species of *Kickxia*, and I proposed then the name *Funtumia* (derived from 'Funtum,' one of the vernacular names of *F. elastica*) for the first group, reserving *Kickxia* for the other, as this genus was based on the Javanese *Kickxia arborea*. As I

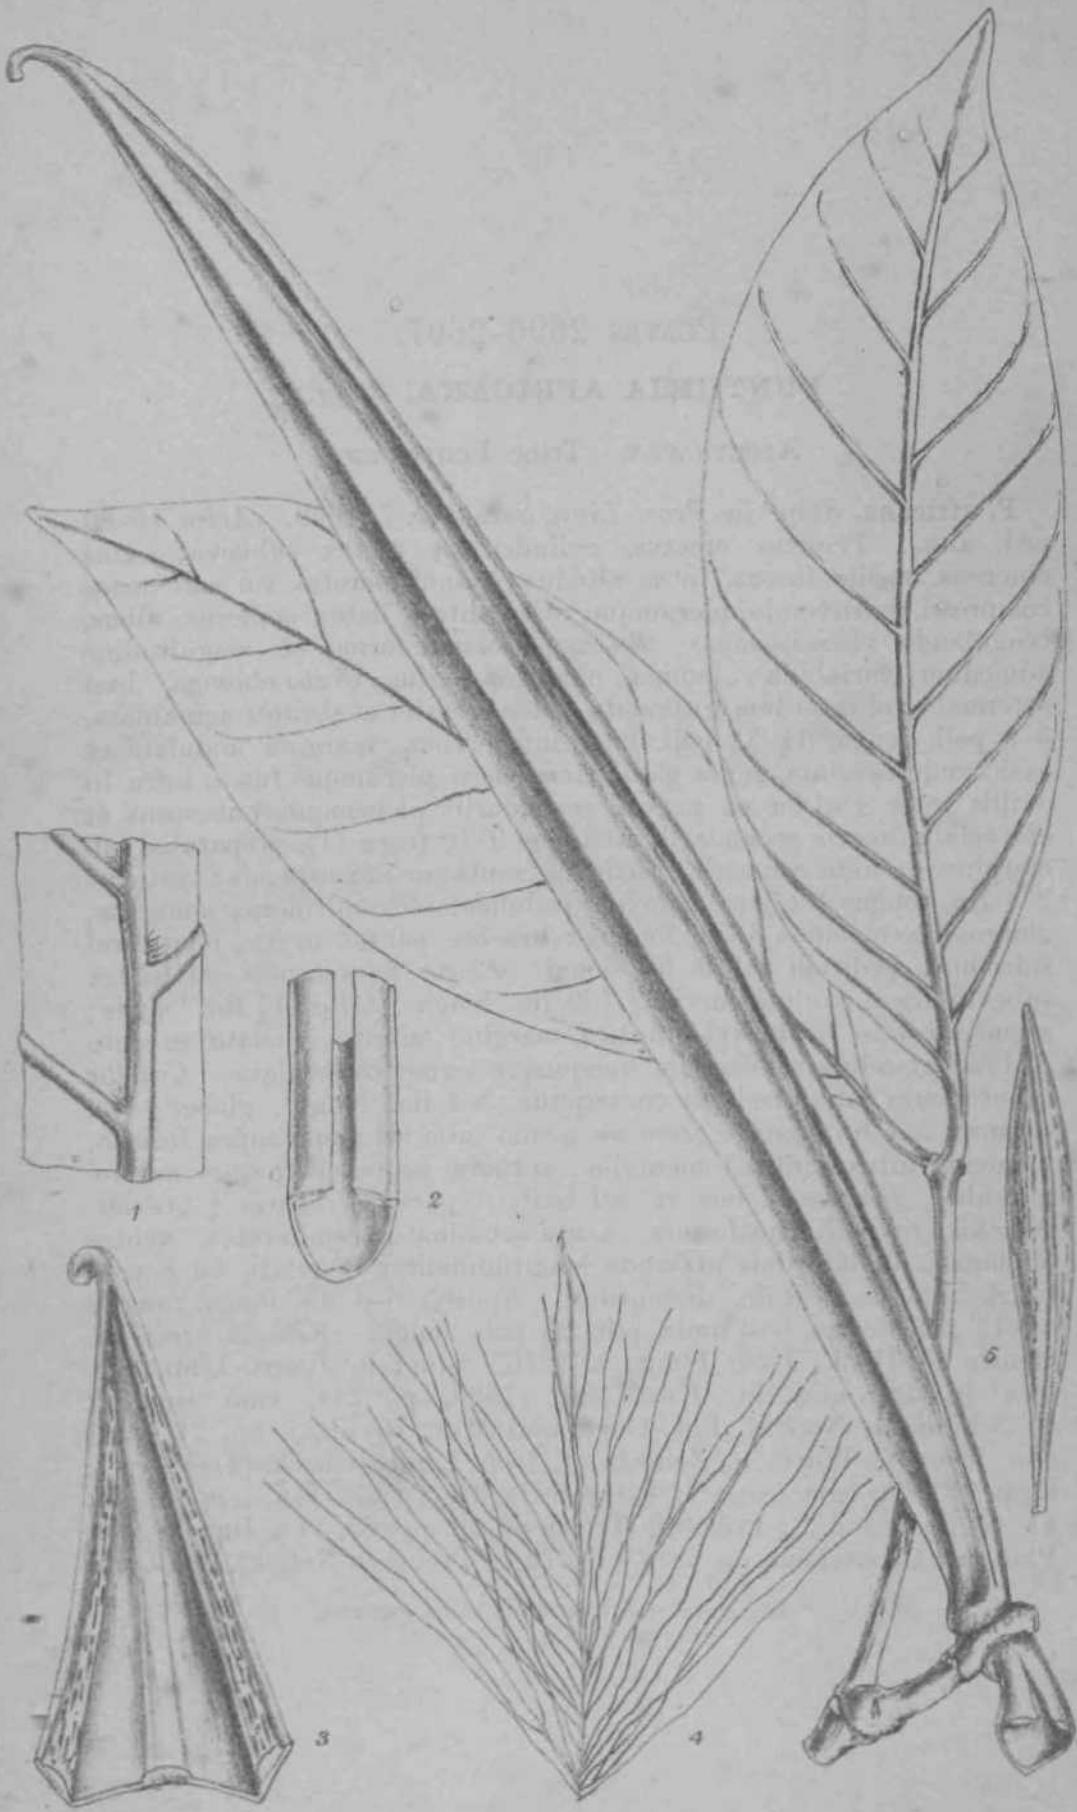

had already prepared an elaborate report, dealing with the whole question, for publication elsewhere, I confined myself to a short note in the *Proceedings* of the Linnean Society of the meeting referred to above, reserving *ti* fuller discussion of the differences of the two genera until the publication of the report. Of those differences I mention in this place only the most obvious. The cymes of *Kickxia* are few-flowered or reduced to a single flower; those of *Funtumia* are gathered in congested, many-flowered panicles. The corolla of *Kickxia* is funnel-shaped, not salver-shaped, and compared with that of *Funtumia* large (H-4 in. long); the tube is narrowest (not widest) near the middle and widened above into a cup or bell-shaped portion into which the staminal cone projects, while in *Funtumia* it is completely and tightly enclosed in the tube, which is, apart from a small orifice, closed at the mouth. The follicles are more or less parallel in *Kickxia*, but spreading at right angles to the pedicel in *Funtumia*. The placentas of *Kickxia* are bilamellate, the lamellae are free and remain free; in *Funtumia*, on the other hand, they are fused with the ventral wall of the carpels, and are, in the mature state after the seeds have fallen, only distinguishable as a narrow more or less rough zone along both sutures.

At the time I discussed the characteristics of the genera *Funtumia* and *Kickxia* before the Linnean Society, there were three species, described under *Kickxia*, referable to *Funtumia*, viz. *Kickxia africana*, Benth., now *Funtumia africana*, Stapf; *K. elastica*, Freuss, now *F. elastica*, Stapf, and *K. latifolia*, Stapf, which will have to stand as *F. latifolia*, Stapf. *F. africana* and *F. elastica* are described and figured in this place under Nos. 2694-2597, where all the literary references may be found. *F. latifolia* was described first as *K. latifolia* in *Kew Bulletin*, 1⁸⁹⁸, p. 307, and in *Ann. Mus. Congo*, Se^r. 2,1. i. p. 42, and figured in *Notizbl. Bot. Gart. und Mus. Berlin*, ii. p. 355, fig. F, G, H. Since then four more species have been described under *Kickxia* which belong evidently to *Funtumia*, viz. *K. Scheffleri*, K. Schuro., from German East Africa, *K. Zenkeri*, K. Schum., from the Cameroons, and *K. Gilletii*, De Wild., and *K. congolana*, De Wild, both from the Lower Congo. I have seen no specimens of those four, new species. *K. Zenkeri* is evidently very similar to *F. africana*, while the three other species are compared by the authors with *F. latifolia*, to which they seem to approach so closely that one or two of them may prove to be identical with it.—OTTO STAPF.

PLATE 2694.—Fig. 1, a flower; 2, a flower in longitudinal section; 3, portion of a calyx with the pistil surrounded by the disc; 4, an anther, front view; 5, cross-section through an ovary.—All enlarged.

PLATE 2695.—Fig. 1, a portion of a leaf, underside; 2, a pair of open follicles, seen from the back; 3, tip of a follicle; 4, a seed; 5, the same without the plume; 6, cross-section through the seed; 7, embryo.—All enlarged, with the exception of figure* 2 and 4.

PLATES 2696-2697.

FUNTUMIA AFBICANA, *Stapf.*

APOCYNACEAS. Tribe ECHITIDEA.

P. africana, *Stapf* in *Proc. Linn. Soc.*, Dec. 7, 1899. *Arbor* 15-80 ped. alta. *Truncus* erectus, cylindricus; cortex sublsevis, extus cinereus, medio fuscus, intus albidus; ramuli teretes vel sub nodos corapressi, exsiccando plerumque nigricantes; latex copiosus, albus, coagulando viscosissimus. *Folia* petiolata, forma et magnitudine admodum variabilia; lamina oblonga, rarius ovato-oblonga, basi attenuate vel interdum rotundata, apice breviter et abrupte acuminata, 5-9 poll, longa, 1[^]-3 $\frac{1}{2}$ poll, lata, integerrima, margine undulata et exsiccando revoluta, supra glaberrima, sicca plerumque fusca, infra in axillis inter costam et nervos secundariis plerumque pubescens et efoveolata, nervis secundariis uti*nique* 9-10 (raro 11), subpatulis, sub margine arcuato-connexis, tertiaris venisque inconspicuis; petiolus 2-4 lin. longus. *Cymes* breviter pedunculate, multiflora, congests, glabrse; pedunculus 3 lin. longus; bracteie parvae, ovate, acutse vel subacutfe, pedicelli ad 2 lin. longi. *Flares* flavescentes, alabastra subcylindrica, paululo curvata, 7-9 lin. longa. *Calyx* 1| lin. longus; segmenta late ovata vel elliptica, margine minute ciliolato excepto glabra ; glandulre plures cum unoquoque segmento tabulate. *Corolla* tubus paulo infra medium constrictus, 3-4 lin. longus, glaber; lobii lineares, 5-6 lin. longi. *Stamina* medio tubo vel paulo supra inserta, filamenta intus minute tomentella; anthera acuni*natse*>apice minute pilosulse. *Discus* 5-lobus vel ad basin 5-partitus, ovario $\frac{1}{2}$ brevier. *Fructus folliculi* fusiformes, acute-acuminati, semiteretes, ventre applanati, in lateribus utrinque longitudinaliter angulati, ad 8 poll, longi, angulis 1[^]-2 lin. distantibus. *Semina* 6-8 lin. longa.; arista 1[^]-11 poll, longa, basi nuda, pilis 2[^] poll, longis.—*Kickxia africana* % Benth. in Hook. Icon. Plant, t. 1276. *Stapf* in Journ. Linn. Soc. xxx. p. 90, and in Kew Bull. 1895, p. 244, cum icone *; K. Schum. in Notizbl. Bot. Gart. und Mus. * Descriptione et figuris fructuum exceptis.

und Mus. Berl. ii. pp. 353-360, t. 2. Schlechter in Tropenpfl. iv. pp. 326-330, De Wildeman in Rev. Cult. Col. vii. pp. 633, 634 and 747. *K. africana* var. *Klainii* and var. *iners*, Pierre, MSS.—OTTO STAPF.

WEST AFRICA : Sierra Leone, without precise locality, *Scott Elliot* and *Haydon*; near Kukunia on the Scarcies River, *Scott Elliot*, 4506 (a fruit-bearing branch with almost bright green and quite glabrous leaves); Bagroo River, *Mann*, 817. Ivory Coast, Dobou, *Jolly*, 174. Gold Coast, Sefehi and Warn District, *Armitage*; Mampongo Hills, *Johnson*, 434; E. Akim, *Johnson*, 692. Lower Nigeria, Bonny, *Kalbreyer*, 82 (detached leaves, open follicles and seeds; the follicles are rather less coriaceous than in the other specimens); Opobo, *Holland*, 157; Cross River, *Holland*, 5; Cameroons, virgin forest near Victoria, *JPreuss*, 1382; Gaboon, Libreville, *Klaine*, 662. Fernando Fo, *Mann*.

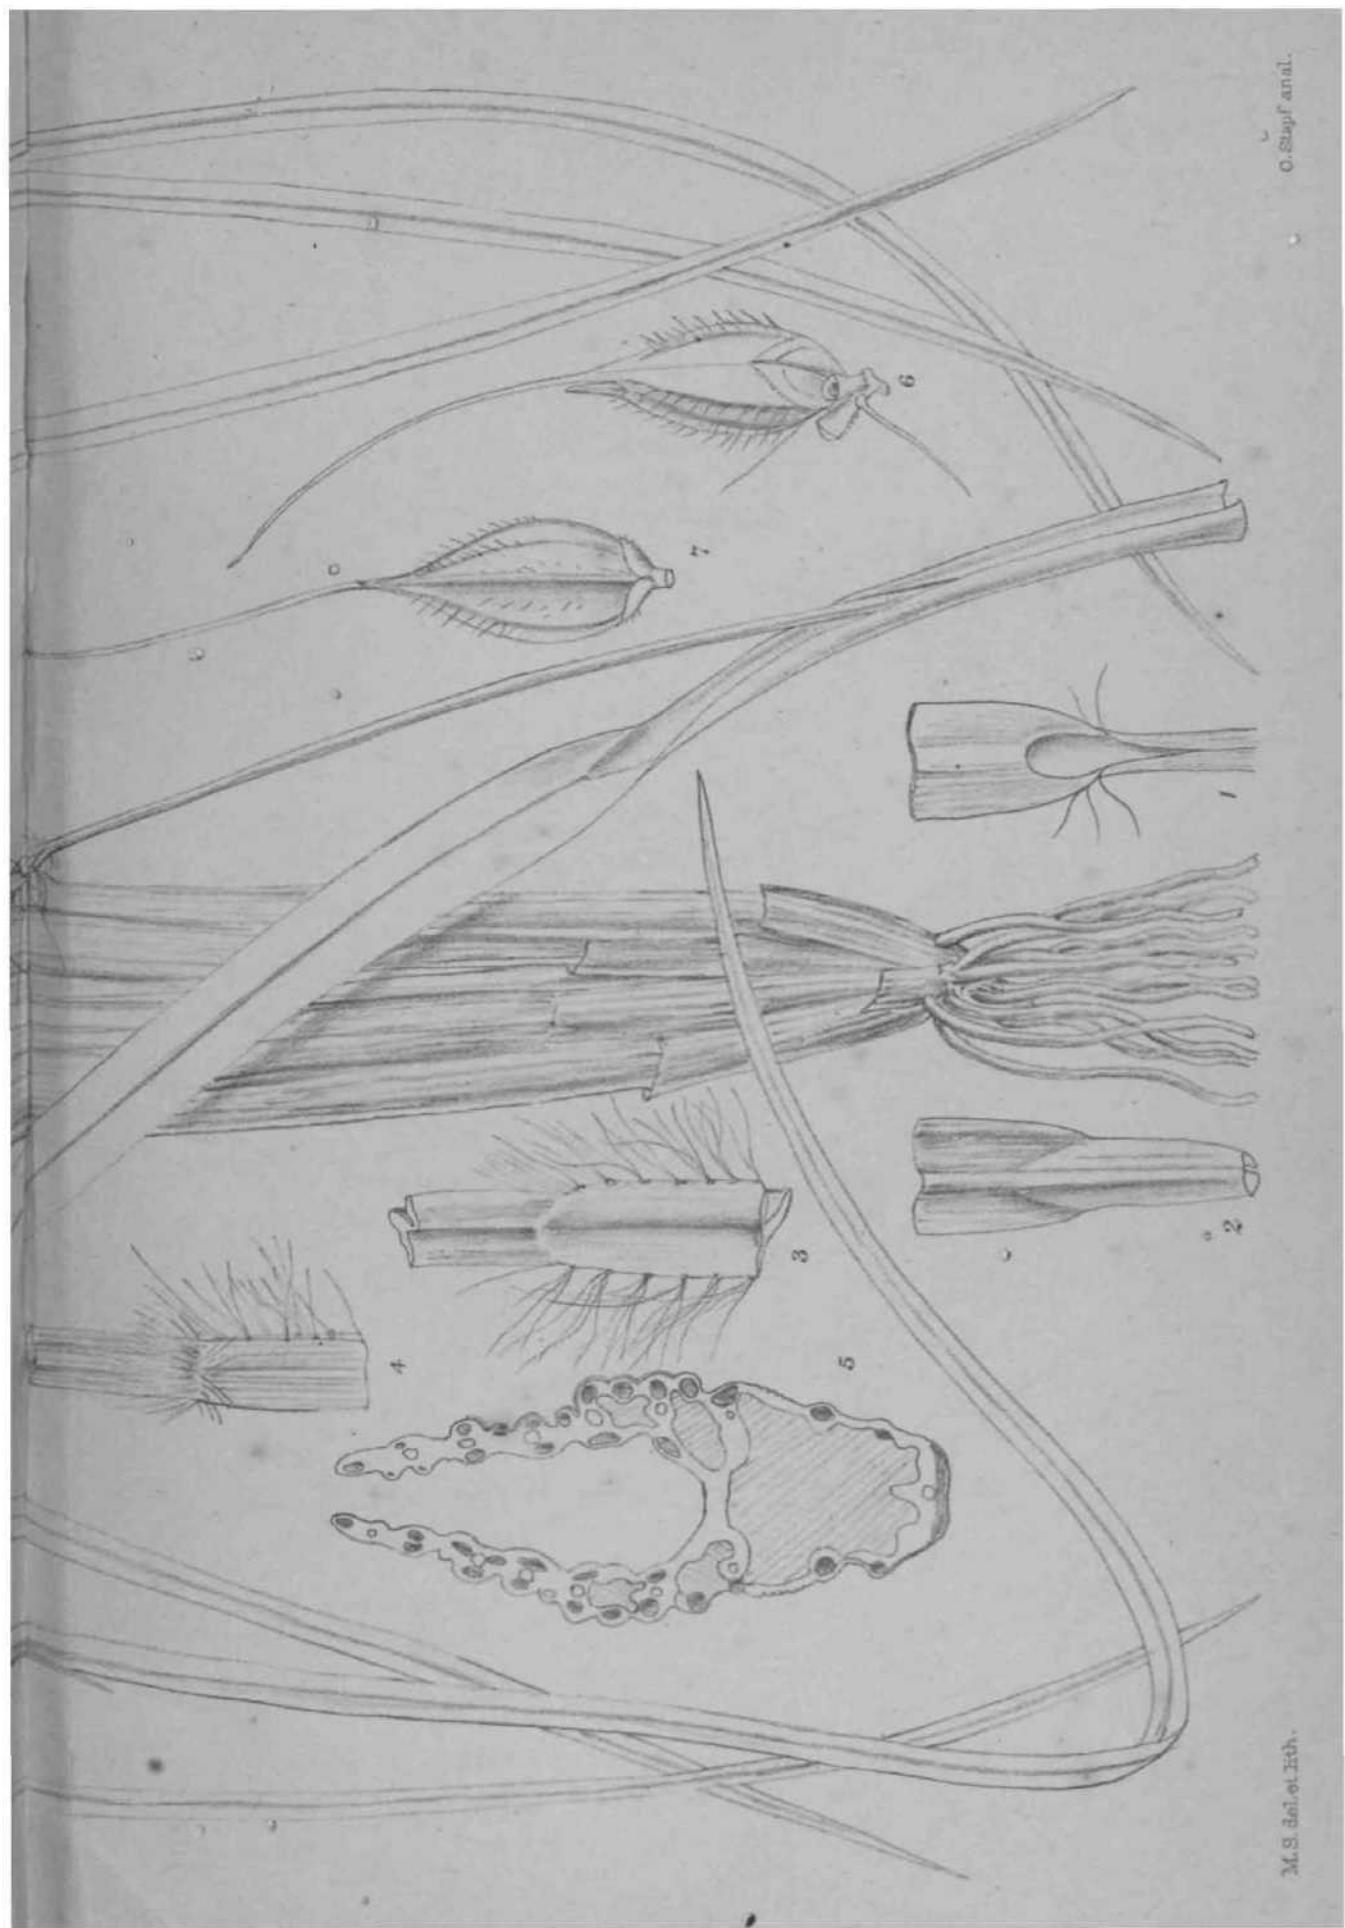

Very common in Togoland in the forests of the Agome Mts. and in the Boëm country, according to *Schlechter*, and also observed in Lower Nigeria between Ekuke and Abaraghá by *Holland* and in the Cameroons in the forests of the upper basin of the Mungo River by *Schlechter*; also common in the hill forests of the coast region, of the Cameroons according to *Dr. Freuss*.

Plate 2696. Fig. 1, a flower-bud; 2, a corolla in longitudinal section; 3, a calyx segment, seen from within; 4, a pistil, surrounded by the disc.—All enlarged.

Plate 2697. Fig. 1, a portion of a leaf, under side; 2, a portion of a follicle, cut out of the middle; 3, tip of a follicle; 4, a seed; 5, the same, without plume.—All enlarged, with the exception of fig. 4.

Pl 2698

M.S. del. et. lith.

O. Shapf anal.

The specimens from which this species is described were communicated by Professor Arcangeli, according to whom this grass first made its appearance in rice fields in Novara in 1896, when¹ certain Asiatic varieties of rice had been sown. As a weed it is "worse than the common *P. Cms galli*, and has caused considerable damage to the rice fields. Although the structure of the spikelets is practically the same as in *P. Cms galli*, the habit and particularly the leaves are so distinct from those of *P. Cms galli*, as well as of all the other species of the section *Echinochlona*, that I have not hesitated in adopting Professor Arcangeli's view that it is a distinct species.—OTTO STAPF.

Fig. 1, portion of an upper leaf showing the junction of sheath and blade, front view; 2, the same, back view; 3, portion of a basal leaf, showing the junction of sheath and blade, flattened out, front view; 4, the spike, folded, side view; 5, transverse section through the blade of a basal leaf; 6, a spikelet, with the lower glume and lower ligule in front; 7, the same, with the upper glume in front. The sheath and blades of the barren tuft of leaves are not quite correctly represented, as some of them might create the impression of being open and having bearded ligules.—*All unlarged.*

PLATE 2699.

GYMNOPODIUM FLORIBUNDUM, *Eolfe*.

POLYGONACEAE. Tribe TRIPLARIDRS.

Gymnopodium, Rolfe (*genus novum*). *Flores* hermaphroditi. *Perianthii* segmenta 6, 3 exteriora majora, carina exalata, 3 interiora minora plana, erecta. *Stamina* 9, ad basin perianthii biseriatim affixa, 6 • exteriora ad margines perianthii segmentorum interiorum prope basin adnata, 3 interiora libera; filamenta filiformia; antherae ovatse. *Ovarium* glabrum; styli breves, filiformes, apice capitato-stigmatosi; ovulum erectum, subsessile. *Nux* acute trigona, perianthio aucto clauso inclusa; semen trigonum; embryo magnus, cotyledonibus orbicularibus.

O. floribundum, Eolfe (*species unica*). *Frutex* ramosissima, ramis gracilibus subflexuosis parce pilosis. *Folia* alterna vel fasciculata, breviter petiolata, cuneato-oblonga, obtusa, glabra, reticulato-venosa, J-1£ poll, longa, 3-6 lin. lata; petiolus 1-1¹ lin. longus; ochrea brevissima. *Eacemi* graciles, interdum parce ramosi, laterales et terminales, 1¹-3 poll, longi. *Bracteae* ochreatse, parvae, apices angustse, reflexe. *Flores* parvi, graciliter pedicellati. *Perianthii* segmenta biseriata, exteriora ovata, acuta, 1 lin. longa, fructifera ad 5 lin. longa, reticulato-venosa, interiora lanceolata, acuta, minora. *Stamina* inclusa. *Nux* 3 lin. longa.

BRITISH HONDURAS : Manatee, pine ridges, *E. J. F. Campbell*, 60.

An interesting monotype, allied to *Podopterus*, Humb. et Bonpl., of which it has much the general appearance, but differs in its wingless pedicels, and in having an additional whorl of three stamens, which are situated opposite the concave faces of the ovary, and within the outer series of six.—R. ALLEN ROLFK.

Fig. 1, a flower; 2, a petal with two stamens of the outer whorl adnate to the margins at the base; 3, a pistil and the three stamens of the inner whorl; 4, the ovary in longitudinal section, and 6, in transverse section; 6, the seed in longitudinal section, showing the embryo.—All enlarged.

PLATE 2700.

LESFEDEZA VELUTINA,* Dunn.

LEGUMINOS<E. Suborder PAPILIONACEOUS.

Lespedeza velutina, Dunn (*sp. nov.*); inter species asiaticas vestitu distincta.

Frutex 2-4 pedalis (*A. Henry*), caulis petiolisque velutino-pubescentibus. *Folia* ampla, trifoliolata, omnia petiolata; petioli 1-2 poll, longi; stipulse parvae, lanceolate. *Foliola* subcoriacea, supra velutinS, viridia, infra molliter canescens, oblongo-lanceolata vel oblongo-linearia, 3-5 poll, longa; lateralia brevissime petiolulata, terminals petiolulus \wedge -1 poll, longus, venis infra prominentibus crebris; stipe!lae nullae. *Racemi* in ramorum apicibus et etiam in axillis foliorum superiorum solitarii vel fasciculati vel paniculati. *Flores* albi vel rubro tincti (*A. Henry*), 5 lin. longi, breviter graciliterque pedicellati; pedicelli calyce breviores; bractea* linear-lanceolatse, citissime deciduse; bracteolse 2, filiformes, sericee, a basi calycis ortse et tubum ejus requantes, tarde deciduse. *Calyx* brunneo-sericeus, corolla dimidio brevior, lobis 4 subequalibus linearibus tubum superantibus. *Carina* acuminata, obtusa, vexillum sequans, alas superans. *Stamen* vexillare fere liberum. *Legumen* immaturum ovatum, apice basique acutum, reticulatum, sparse hirtum.

CHINA : Yunnan, near Manpan in the Bed Eiver valley, at 3000 feet; and in the Mengtze forests at 4600 feet. *A. Henry*, 10447.

Maximowicz, in his Synopsis of this Genus (*Act. Hort. Petrop.* ii. p. 345), shows the importance for the purpose of classification of observing the relative persistence of the bracts and bracteoles. In this respect the present species stands alone in § *Campylotropis* with *L. dliata*, the only member of the section with which it is closely associated geographically.—S. T. DUNN.

Fig. 1, flower from which petals have been removed and calyx laid open; 2, standard; 3, a keel-petal; 4, a wing-petal; 5, ovary in section.—*Allenlarged.*
