HEMICYCLIA PORTERI, *Gamble.*

EuPHORBIACBiE. Tribe PHYLLANTHEiE.

H. Porteri, *Gamble (sp. nov); II. venustce,* Thwaites, quoad folia similis, sed staminibus numerosioribus differt; a *II. Gardner*^ Thwaites, foliis integerrimis acuininatis, fioribus majoribus distincta.

Arbor par,ya vel frutex 20-30-pedalis, dioica, ramulis pallide fulvis lenticellis multisalbisornatis. ^ofo'abreviterpetiolata^vatajacuminata, coriacea, integerrima, apice retusa, 2-3 poll, longa, \-\\ poll, lata, basi inaequalia, supra nitida, glabra, subtus reticulata, glabra vel secus costam glandulis aureo-tomentosis ornata, venis primariis lateralibus curvatis prominulis utrinque 5-6. *Flores masculi* 5-7 lin. diametro, in ramis infra folia vel in axillis foliorum fasciculati, pedicellis 3-4 lin. longis, ad basin bracteis minutis munitis; fl. feminei ignoti. *Sepala* floris masculi 4, rotundata, imbricata, 2 interiora majora, extus aureo-pubescentia, intus etiam prsecipue secus nervos pubescentia. *Petala* 0. *Stamina* 24-25, glabra, circa discum centralem latum margine undulatum affixa, filamentis \ lin. longis, antheraruin loculis parallelis longitudinaliter dehiscentibus.

INDIA : Warsanad Valley, Madura District, Madras, at about 2,000 feet, *H. J. Porter,* April 1897.

This small tree is found growing gregariously in moist soil near streams. Its wood is very hard and close-grained, resembling boxwood, and weighs about 61 lbs. per cubic foot. It is locally called * Agilwood,' which is usually the name of *Aquilaria Agallocha,* with which it seems to have been confused. It is used for posts and rafters, and much esteemed.—J. S. GAMBLE.

PLA*E 2703.

LEPINIA SOLOMONENSIS, *Ilenisl.*

APOCYNACEiE.

I. flolomonensis, *ffemsl. (sp. nov.);* species quam *L. taitensis,* Decne. fere omnibus partibus major, foliis abrupte acuminatis, corollae tubo breviore.

Arbor usque ad 15 ped. alta *(Comins),* ramulis floriferis crassia, novellis glabris. *Folia* alterna, petiolata, coriacea, oblonga vel oblongo-lanceolata, cum petiolo 4-8 poll, longa, 1^-2 poll, lata, abrupte longeque acuminata, obtusa, basi cuneata vel subrotundata, venfe primariis numerosissimis rectis tenuissimis. *Pedunculi* oppositifolii, quam flores toeviores, apice furcati, paucitiori, pedicellis brevissimis crassis rigidis. *Flares* vix pollicares. *Calycis scgmenta* parva, ovalia, ciliolata. *Corolla lobi* oblique quadrati. *Stamina* medio tubi affixa, infra faucem inclusa, filamentis brevibus puberulis. *Ovarium* glabrum, 4-loculare, loculis uniovulatis, stjlo incluso. *tructU8* carpella 4 (abortu interdum 3), uno s»pe casso, longissime gracillimeque arcuatim stipitata, apice tantum connata et cruciatim disposita, cum stipitibus usque 8- 9 poll, longa, monosperma, parte spminifera circiter sesquipollicari, indehiscentia, demum fibrosa. *Semina* in quoque carpello solitaria, fusiformia vel oblonga, in longitudinem suKata, transversim rimulosa, testa tenui; albumen corneum ; ventre fere ad medium impressum ; embryo rectus, tenuis, fere cylindricus, cotyledonibus radice brevioribus.

SOLOMOX ISLANDS : San Cristoval, *R. B. Coniins,* 132; chiefly New Georgia, *Officers* of H.M.S. Penguin, 1894-5 (fruit associated with leaves of *Cerbera)* ; without locality, *W. Micholitz.*

Specimens of this singular plant were fir*t sent to Kew in 1890 by Archdeacon Comins, and it was thought it might be the original and only described species, *L. taitensis,* Dene., which is not represented by an authenticated specimen at either Kew or the British M useum. The species inhabiting thn Society and Solomon Islands are certainly very closely allied, but there are differences which seem to justify separating them rather than risk combining two under one name. The distribution of the genus is remarkable, for, so far as I am aware, it lias not been found between Tahiti and the Solomon Islands, which nro separated by 50° of loDgitude, equal to about 3,300 miles in the latitudes of these islands.—W. BOTTING HEMSLEY.

FiR 1, a flower-bud; 2, calyx and |fl»til; 3, part of corolla luid open, showing attachment of stamens; 4, a ripe fruit; 5, a seed; 6, a section of the sumo; 7, embryo. ***All except 4 ami 5 enlarged.***

CUSCUTA HYGROPHIL.2E, //. //. *W. Pearson.*

CONVOLVULACKiE.

C. (§ Eugrammica) HygrophilflB, *H. II. W. Pearson (sp. nov.)*; C. *chinenst,* Lamk., affinis, sed calyce haud carinato, calycis lobis obtusissimis vel rotundatis, squamis multo minoribus differt.

Caules n'lifprmes. *Spica* compacta, umbellate, umbellulis 5-6 breve peduncuiatis paucifloris instructs. *Flores* globosi, 1-1 \ lin. diametro. *Calyx* late campanulatus, irregulariter 4-5-lobatus, £-£ lin. longus, persistent ; lobi subrotundi vel breviter oblongi, apice obtusissimi rotundative. *Corolla** tubus breviter campanulatus, extus inter lacinias o-sulcatus, | lin. longus, persistens; laciniee breviter oblongse, obtuste, sub anthesin erectce vel reflex*, J lin. longre. *Antherce* ovatue ; filamenta ^-^ ii$_{n\#}$ l$_{on}$ga, ad basin subdilatata. *Squama* 10, parvae vel bubnullse, oblongse, 2-6-laciniatse, jugo staminali utrinque adhaerentes, inclussB, j - Hn. longse. *Ovarium* globosum, apice fovea alta lataque mstructum, slyli 2 (rarius 3) subulati, subsequales, ovario breviores ; stigmata capitata, leviter lobata. *Capmla* obconica, apice alte depressa, 1-2- (rarius 3-) sperma, circ. 1 lin. longa. *Semina* subangu-Jaria, complanata, minutissime tuberculata, \ lin. diametro.

MALAY PENINSULA : State of Johor ; Johor Babru, *Ridley,* 9161.

T'le ^10sfc P^nt is *Hygrophila quadrivalvis,* Nees (Acanthaceae). The fruits of this species are dry and capsular, and open irregularly tiff, tne kftse, These characters place the species in the section *Eugrammica.* Within this section its affinities must be sought for in Bngelmann's group *Obtusilobas,* which, like the other divisions of the subgenus *Grammica,* is most numerously represented in the New World. *C. chinenstHy* Lamk., is the only other species of this group found in India, where it is not known to occur east of Silhet. It ranges from Turkey to Siberia and Japan, and southward to Tropical Africa, Madagascar, and Australia. It is also found in China as far south-west as Pakhoi, and it is not improbable that it may yet be recorded from the Malay Peninsula. *C. Hygrophilce* also bears an external resemblance to the Australian *C. australis,* R. Brf, from which it is easily distinguished by its *dty* fruit, fewer and more flattened seeds, smaller scales, and finer steins.

This is interesting as being the first species recorded from the Malay Peninsula, no specimens having hitherto been received at Kew from the country to the east and south of the Khasia Hills and Silhet.—H. H. W. PEARSON.

CHINA : **Mengtze, Yunnan, in mountain forests,** ***A. Henry,*** **10540 ; Szemao, Yunnan, at 5,000 ft.,** ***A. Henry,*** **11651.**

This highly ornamental tree at first suggests Leguminosae and the tribe Cassie* rather than Sapindace* ; but the number of stamens, associated with bhe structure of the ovary, seems sufficient to « J » t o its affinities. The insertion of the petals high up in the calyx^ube and the absence of a disk are characters which distinguish it from its nearest allies. Unfortunately the fruit is unknown, and the ovaiy is only known in quite a young state. This genus was *^ " ™ " of Dr. BnS Brltschneider, and specimens of it were exhibited at a meeting of the Linnean Society, April 18, 1901. Some particulars of

its characteristics and affinities appeared in the *Gardener^ Chronicle,* May 4, 1901, p. 291. Dr. Hretschneider, whose scholarly attainments and writings in connection with the Flora of China are well known, having been previously asked whether it would be agreeable to him, replied under date of February 26 :—* Let me state that I highly appreciate the honour done to me, and that I feel very proud of finding my name commemorated in the Flora of China and in connection with Dr. Henry's vast botanical explorations.' Early in May news reached this country of the death of this eminent sinologist.—W. BOTTING HEMSLEY.

PLATE 2710.

BABIANA SPATHACEA, *Gawler.*

IRIDACEJE. Tribe IXIEJE.

B. spathacea, *Gawler ex Sims in Bot. Mag. sub* t. 539 *{nee Bot. Mag.* t. 638); *Baker in Dyer, FL Cap.* vi. p. 108. Gladiolus spathaceus, *Linn, f. Suppl.* p. 96 ; *Thunb. Dies.* no. 55 ; *Thunb. Prod.* p. 9 ; *Thumb. FL Cap.* i. p. 208, et *ed. Schtdtes,* p. 52.

Folia linearia vel lineari-lanceolata, acuta, subplicata, molliter piloso-pubescentia vel interduin subglabra, 4-9 poll, longa, 2-6 lin. lata. *Spica* erecta, jtricta, simplex vel basi pauciramosa, 2-3 poll, longa, dense multiflora. *iBractece* 9-15 lin. longae, 3 lin. latae, lanceolate, longe aristato-acuminatae, complicate, membranaceae, hyalinae, uninerves, nee striatae, glabrae, albae, nervo in aristam rufo-brunneam excurrente. *Bracteolce* 7-8 lin. longae, l£-2 lin. latae, bracteis similes. *Perianthium* erectum, glabrum ; tubus 1| poll, longus, gracilis, apice ampliatus et procurvus, purpureus; lobi subsequales, 6 lin. longi, 1^ lin. lati, oblongi, obtusi, albi, inferiores basi purpureo notati. *Stamina* exserta; antherae 2-3 lin. longaa. *Ovarium* lf-1i lin. longum, trigono-turbinatum, glabrum; stylus exsertus, filiformis, apice breviter trifidus; stigmata leviter dilatata.

SOUTH AFRICA : Calvinia Division; in Bokkeland (Onder Bokkeveld) and the dry regions of Hantain, *Thunberg;* Brand Vley, *Johanssen,* 14.

This is one of many interesting South African plants found by the older collectors which have long escaped the notice of subsequent travellers. It was discovered in November, 1774, by Thunberg, and apparently has not been collected since that date until now. Its rediscovery by Mr. Johansson about a hundred miles to the north of the locality where Thunberg found it is, therefore, of considerable interest, the more so as Mr. Johansseu also collected *MriosphiBra Oculus-Cati,* Less., which, like the *Babiana,* has hitherto only been known from the specimens collected by Thunberg.

Babiana spathacea, Gawl., is one of the most distinct species of the genus, the long dense spike, long-tubed flowers, and membranous hyaline bracts serving to distinguish it at once from all others. Unfortunately the name *B. spathacea* was given by Gawler to two distinct plants. When the genus *Babiana* was originally established at the place quoted above (which reference has been overlooked by all subsequent authors, even by Gawler (Ker) himself, since he does not quote it in his *Ind.*

Gen. p. 151), Thunberg's plant was indicated as belonging to it. 'But two years later, Gawler figured *(Bot. Mag.* t. 638) as *B. spathacea* another species, which he supposed to be the same as *Gladiolus 8pathaceu8,* Thunb.; but it is utterly different from that plant. This figure exactly agrees with unlocalised specimens in the Kew Herbarium named *B. spathacea,* and with one collected in Little Namaqualand, between Koper Berg, Silver Fontein and Kaus Mountain, 2,000-3,000 feet, by Dr&ge, 8386. These specimens are referred by Mr. Baker to *B. disticha,* Ker, and the plate to *B. mucronata*> var. *longicollis,* Baker; but as the plant figured in *Bot. Mag. t.* 638 is perfectly distinct from both *B. disticha* and *B. mucronata,* I propose that it should bear the name *B. Gawleri.*—N. E. BROWN.

(*With dissections of* U. flavescens, *Stapf)*

APOCYNACEÆ. Tribe LANDOLPHIEÆ.

TTrnularia, *Stapf {gen. nov.).* *Calyx* parvus, 5-partitus, cglardulosus, segmentis rotundatis. *Corolla* urceolari-hypocrateriformis, tubo subgloboso fauce constricta esquamata; lobi contorti, sinistrorsum obtegentes, tubo sequilongi vel breviores, rotundati vel late ovati, ba*i subcordati. *SHmina* raedio tubo inserta, inclusa, antkene lanceolatoovatae vel oblongae, connectivo saepe apiculato, in filamentis fequilongis nutantes, loculis basi inappendiculatis. *Discus* nullus. *Ovarinm* integrum, 1-loculare, placentis 2 parietalibus, apice basique interdum confluentibus ; stylus brevis ; stigma ovoideum, basi annulo membranaceo circumdatum, apice breviter biiidum; ovula numerosa, 4-8-seriata. *Fructus* baccatus, globosus, pericarpio crasso, edulis. *Semina* in pulpa carnosa nidulantia, sparsa, ovoidea vel oblongo-ovoidea, ventre profunde sulcata, dorso longitudinaliter angustissirae multisulcata ; albumen corneum, copiosum, forma et sculptura semini conforme: cotyledones planes, foiiacese, radicula longiuscula.— Frutices *scandentes, scepe drriferi.* Folia *opposita, petiolata, pennineruia, nervis tenuibus crebrioribus parallelis approximatė vel magxs distantibus.* Floras *in panicvlis axUlaribus brevibus laxis muUifloris^ ramis pedicellisque tenuibus.*

U. beccariana, *Stapf Fnitex* ope cirrorum apice ramosorum scandens, glaber; rami juniores subcompressi vel subquadranguli, tandem teretes, ad nodos nodosi, cortice fusco griseo vel grjseo. ^°«a elliptica, breviter obtuseque acuminata, basi rotundata, *o%-o%* poll, longa, l|-2l poll, lata, tenuiter coriacea, supra exsiccando nigrofuscescentia, sublucida, subtus pallide fusca, costa nemsque supra impressis, subtus prominula, nervis lateralibus tenuibus utnnque circiter 12 oblique patulis sub margine prorsus curvatis, vems obliquis tenuissimis, areolas angustas cingentibus; petiolus \ poll, longus, supra canaliculatus. *PaniculcB* lax«f ad H poll, long* Jataeque, ramis ramulisque demum magis minusve divaricatis gracihbus bracteis ovatis minutis; pedicelli ad 1 lin. longi. *Calyx* ad \ hn. altus, seg'ner,tw rotundatis vel ovato-rotundati* albo-ciliolatis. *Corolla* in alabastro maturo magis minusve conica, 3 lin. longa; tubus subglobosus ; lob^ tubo «quilongi vel paululo breviores, late ovati obtuse W " ^ ™ stigmate \ lin. longus. *Wilhyhbeia sp.* Benth. m Benth. & Hook.

Gen. Plant, ii. p. 691. *Ancylocladus beecarianns* O. K. Rev. Gen. i. p. 412 *(nomen)*; Pierre in Bull. Soc. Linn. Paris, ii. p. 98.

BORNEO : Sarawak, forests of Bin tula, *Beccari,* 3764 ; Baram, *Hosa,* 24.

Urnularia is allied to *WUlugltbeia* and *Chilocarpus.* It differs from the first in the shape of the corolla, the lax, though short, and graceful panicles, and, to judge from the only fruit known so far (see below under *U. ooatifolia),* in the very different structure of the seed, *Willughbeia* possessing exaibuminous seeds with large and very thick cotyledons. So far as the seeds, are concerned the new genus approaches *Chilocarpus* very closely, with this exception, that the testa and the albumen are finely but deeply grooved on the back, the grooves running parallel and lengthwise. The baccate edible fruit, however, and the shape of the corolla remove *Urnnlaria* distinctly from *Chilocarpus. Urnulaina* comprises at present five species, viz. *U. jlavescens,* Stapf *(Willughbeia jlavescens.* Dyer ex Hook, f., Fl. Brit. Ind. iii. p. 625), *U.javanica,* Stapf *(Willughbeia javanica,* Bl.), *U. beccariana,* Stapf, described above, and two more new species from Borneo, the descriptions of which are given below. A flower of *U. jlavescens* has been added on pi. 2711, to show the corolla completely open. It will also be seen from this figure that the mouth of the corolla of this species is not furnished with ' small lobulate tubercles' as stated in Fl. Brit. Ind. 1. c, nor have I been able to find such tubercles in *Willughbeia oblonga,* Dyer. This is placed in Fl. Brit. Ind. 1. c. next to *W jlavescens*; but it seems to me to be a typical *Willughbeia.*

In explanation of fig. 6 on pi. 2711, I might remark that I found the ovules of the two placentas of *U. beccariana* completely interlocked and sometimes so cemented together, that, except in very thin sections, the placentas would rather give way at their base when I tried to separate them. The outer integument was always very conspicuous by its dark brown or almost black colouring.

XT. oblongifolia, *Stapf (sp. now), Frutex* scandens, glabcr ; rami juniores subcompressi vel quadranguli, tandem teretes, ad nodos paululo nodosi, cortice fusco. *Folia* oblonga, subabrupte obtuseque acuminata, acumine ad £ poll, longo, basi rotundata, 3-4 poll, longa, 1 J-l^ poll, lata, tenuiter coriacea, supra exsiccando nigricantia, lucida, snbtus fusca, costa supra impressa, nervis lateralibus pertenuibus utrinque ultra 30 patulis rectis, venis partim nervis subparallelis partim admodum obliquis areolas angustas cingentibus; petiolus 6-8 lin. longus, supra canaliculatus. *Panicula* fioresque iis *U. beccarianm* simillima. *WUlughbeia javanica,* Hallier f. Kautschuklianen in Jahrb. Hamburg. Wissensch. Anst. xvii. (1899) p. 145 (quoad spec. Beccar.) non Blume.

BORNEO : Sarawak, Mount Matang, *"Beccari,* 2272.

U. ob?on$_t$'/ifo7iti. differs from *U. jaoanira* in the leaves being larger

(3-4 in. by 1J-1J in; instead of 2-3 in. by J-lj in.), more distinctly oblong, more rounded at the base, and long acuminate with more numerous, straighter and more prominent nerves, in the more delicate panicles and in the almost obtuse anthers. It yields, according to Professor Beccari, a good sort of rubber.

IT. ovatifolia, *Stapf (sp. nov.).* *Frutex* scandens, glaber; rami juniores subcompressi, mox teretes, ad nodos vix nodosi, cortice badio, nonnunquam in cirros apieem versus ramosos hamatos abeuntes. *Folia* ovata vel ovato-elliptica, subabrupte breviterque vel obscure acuminata, acumine obtuso, basi rotunddta, 2^-4 poll, longa, H-2} poll, lata, coriacea, supra exsiccando nigro-virescentia, opaca, subtus pallida vel subglauca, costa supra impressa, nervis lateralibus patulis prorsus curvatis supra tenuibus, infra prominulis utrinque 12-15, venis admotlum obliquis plerumque inconspicuis; petiolus supra canali-culatus, circiter i poll, longus. *Panimla* \\-\\ poll, longa lataque, divaricata, ramulis pedicellis subgracilibus. *Flores* utin *U. beccariana.* *Fructus* globosus, 2 poll, dimetiens. *Semina* 4-6 lin. longa.

BORNEO : Sarawak, near Kuching, *Haviland,* 2302.

The flowers are described by Dr. Haviland as having a pink turgid tube and a yellow limb.—OTTO STAPF.

Fig. 1, a flower-bud; 2, longitudinal section of a fliwer; 3, a corolla-lobe; 4, side view of an anther; 5, front view of the same; 6, cross-section of an ovary of *Urnitiaria beccarlana*; fig. 7, flower and bud of *U. flavewcns.* All enlarged.

HAZARDIA DETONSA, *Greene.*

COMPOSITE. Tribe ASTEROIDEJE.

H. detonsa, *Greene, Pittonia,* i. p. 29 ; species //. *camp.,* Greene, simillima, a qua differt (fide Greene) foliis firmioribus argute serratis.

CALIFORNIA : **Island of Santa Cruz, *E. L. Greene.***

Some years ago Dr. Ed. Palmer collected specimens of a shrubby composite in Guadalupe Island, off the coast of Lower California, which the late Dr. Asa Gray at first regarded as the type of a new genus, but subsequently described *(Proc. Amer. Acad.* xi. p. 75) under the name of *Dip!o8tephium canum.* Since then Prof. E L. Greene, Dr. F. Franceschi, and others, have collected some closely allied plants in the smaller islands of Santa Cruz and San Clemente, some four or five degrees further north. Prof. Greene has dealt with them in the place cited above, where he founds the genus *Ilazardia* and describes three species, namely, //. *cana, H. detonsa,* and //. *serrata.* Since then several other quite distinct species have been added to the genus. But I have some doubts about the specific distinctness of the three insular forms described as such by Prof. Greene. From fuller material, including cultivated specimens, I suspect that //. *cana* and //. *detonsa* should be united ; but that point can only be settled by examining a large number of specimens. On the other hand, a plant collected by A. W. Anthony in San Clemente and distributed under the name *cana,* seems to be quite distinct.—\V. BOTTING HEMSLEY.

SYMPETALANDBA BOBNEENSIS, *StapJ.*

LEGUMINOSÆ. Tribe DIMORPHANDREA:.

Sympetalandra, *Stapf (gen. nov.).* *Calyx* campanulatus, latus, breviter 5-lobus, lobis in alabastro primo imbricatis. *Petala* 5, sequalia, oblonga, imbricata (summo sestivatione intimo), basi in tubum breveni coalita. *Stamira* 10, libera, alterna breviora, in corollae ore inserta ; antherae uniformes, basifixse, apice glandula decidua instruct®, loculis longitudinaliter dehiscentibus. *Ovarium* stipitatum, stipite libero, 2-ovulatum ; stylus filamenta vix excedens, stigmate terminali puncti-formi. *Legumen* ignotum.—Arbor *parva, glabra.* Folia *paripinnata, %'juga, foliolis coriaceis pellueido punctatis opposite.* Flores *parvi, breviter pedicellatè racemosi, racemis densis axillaribus et extra-axillaribus versus apices ramorum et terminalibus in paniculani collectis.* Bractete *minutes ; bracteolce nulled,*

S. borneensis, *Stapf (species unica).* *Bamuli* cortice brunnei vel nigricantes. *Folia* bijuga; foliola oblonga vel oblongo-lanceolata, utrinque subacuta vel subacuminata, 3 £-5 in. Jonga, 1-2 in. lata, coriacea, subnitida, nervatione utrinque prominula, nervis secundariis utrinque circiter 5, venarum reticulatione laxa, distincta; petiolus communis 2-3£ in. longus, basi modice tumidus, apioe in subulam productus; petioluli crassiusculi, 4-6 lin. longi. *Eacemi* pedunculati, 2-5 poll, longi, ad £-2 poll, nudi, rhachi tandem incrassato, stricta; bracte» ovatae, persistentes, vix \ lin. long* ; pedicelli ad | lin. longi, plerumque breviores. *Calyx* f lin.longus, lobis rotundatis vel subacutis, pellucido-punctatus. *Petala* \\ lin. longa, basi ad £ lin. coalita, oblonga, pbtusa vel subacuta, concava, pellucido-punctata. *Filamenta* rosea, episepala JjhH lin. longa, epipetala 1}-1 J lin. longa ; antherae vix £ lin. longae. *Ovarium* stipite discum cupularem vix excedente glabro oblongum, «uperne rufo.villosum.

BORNEO : **Sarawak, near Kuching, by the river, *Haviland,* 1628.**

The distinctly imbricate «stivation of the lobes of the gamosepalous calyx and the corolla distinguish ihis genus from the *Mimosea* as defined il*j present, and point to the affinity with the small tribe of *Dimor-Vhandreae* in *Catsalpinea:*. It can, however, not be said to be closely

allied to one of the four genera composing that tribe. It differs from *Burkea* in the simply pinnate leaves, the long filaments and style, from *Dimorphandra,* two species of which have also simply pinnate leaves, in all the ten stamens being fertile, and the small number of ovules, and from the two remaining genera in the structure of the leaves and the few ovules.—OTTO STAPF.

PLATE 2722.

JULIAWIA MOLLIS, *Hemsl.*

ORDO NATURALIS %

J. mollis, *Hemsl. (sp. nov.) ;* a specie unica Mexicana hactenus descripta foliis undique molliter villosis et foliolis ovato-oblongis per totam longitudinem crenatis differt.

Ramuli floriferi crassi. *Folia* decidua, in apicibus ramorum conferta, imparipinnata, distincte petiolata, cum petiolo 3-4 poll, longa, juvenilia saltern omnino albido-villosa ; foliola opposita, sessilia vel subsessilia, crassa, oblonga vel ovato-oblonga, leviter insequalia, \-\\ poll, longa, vix acuta, basi rotundata vel subcordata, ab apice usque ad basin alte crenata, venis primariis rectis per crenas excurrentibus. *Flores mascvli* minuti, in amenta composita in axillis foliorum superiorum solitaria dispositi; amenta gracilia, pendula, 2-3 poll, longa, foliis coetanea -*el prsecociora, infra medium prater bracteolas minutas nuda. *Perianthium* 6-8-partitum ; segmenta lineari-lanceolata, acuta, extus pilosula. *Stamina* 6-8, quam perianthium paullo breviora, antheris longitudinaliter dehiscentibus, supra medium pilis paucis munitis. *Flores* feminei ac fructus hujus speciei ignoti.

MEXICO : Barranca of Guadalajara, Jalisco, at 4,000 ft., *C. G. Pringle,* 6871.

This and the following plate are published with the view of elucidating a very obscure genus. It is highly probable that female flowers, if not perfect fruit, of one or the other of the species already exist in herbaria, and these figures may lead to their identification with the foliage. As long ago as 1843 Schlechtendal published *(Linnwa,* xvii p. 635) a very elaborate description of a Mexican tree, which he named *Hypopterygium adttringens.* This name he afterwards changed *(op. cit.* p. 746) to *Juliania adstringens,* because the former generic name had been previously given to a genus of Hepaticse. Although Schlechtendal's description is very full so far as it goes, it is insufficient, because he had neither female flowers nor perfect fruit. Our material is not much better, but it comprises three distinct species. A second species, *J. Hvaucui,* was published *(Hot. U.S. ExpL Exjnd.* i. p. 371) by the late Dr. A. Gray ; also from very imperfect material. There are specimens in the Kew Herbarium of *J. Huaucui* from Lima, Matthews, and Canta, in the same district of Peru, McLean. There can be no doubt about the two published species being congeneiic, and they are very distinct. Nor is there any doubt about *J. mollis,* Hemsl., being different from the original *J. adstringens,* Schlecht.—

W. BOTTING HEMSLEY.

PLATE 2723.

JULIANIA ADSTRINGENS, *Schlecht.*

ORDO NATURALIS I

J. adstringens, *Schlecht. in Linncea,* xvii. (1813) p. 746 ; a *J. molli^* Hemsl., foliolis supra medium multo latiorib is infra medium edentatis facile distinguitur. *llypopterygium adstringem,* Schlecht. in op. cit; p. 635.

MEXICO : Valle Grande, States of Michoacwi and Guerrero, at 450 metres, *E. Langlassd,* 319 bis.

There can be little doubt about this being the species described so fully and exactly by Sohlechtendal, although he describes the leaves of the sterile branches as *abrupte subcaudato acute acuminata.* With regard to the nature of the fruit, whether inferior or superior, whether two of the seed-vessels spring from a common involucre, or from a perianth, we are in no better position to decide than was Schlechtendal some sixty years ago. It will be seen that the seed-vessels are in pairs, and there are indications of some rudimentary enveloping organs at their base. At their apex are remains of styles, and possibly also of perianth-lobes ; but we cannot be sure of their nature. The seed-vessels examined have three collateral or parallel cells, and one imperfect seed was found.

One can only suggest that this singular genus will prove the type of a new natural order, having affinities with the Burseracese, Anacardiaoeae, and Juglandacese. Mr. Langlass£ describes the species here figured as a tree from twelve to twenty feet high having a milky juice and a bark like that of the cork.oak.—W. BOTTING HUMBLEY.

PLATE 2724.

EMBELIA. SAXATILIS, *Hernal*

MYRSINACEA:.

E. saxatilis, *Hemsl. (sp. nov.);* inter species sinenses repentes foliis longe calloso-dentatis insignis.

Frutex ferrugineo-hirsutus caulibus gracilibus elongatis, supra terrain et rupes late vagans. *Folia* pnecipue in ramulis lateralibus brevibus conferta, distincte graciliterque petiolata, tenuia, lanceolata vel oblongo-lanceolata, cum petiolo 6-15 lin. longa, utrinque attenuata, apiculata, longe calloso-denticulata, nigro-punctata, venis paucis in vagina inferiore satis distinctis. *Inflorescentice* pseudo-umbellate?, in axillis foliorum inferior um ramulorum lateralium brevissime pedunculate, 5-6-florae, quam folia dimidio breviores, glanduloso-pubescentes, ferruginesB ; pedicelli filiformes, circiter 3 lin. longi ; bracteolse lineares, circiter 1 lin. longse. *Flores* albi (tide *Henry),* dimorphi, i.e. nunc staminibus longe exsertis stylo brevi, nunc stylo exserto staminibus brevibus inclusis. *Sepala* ovata, acuta, *i* lin. longa. *PetaJa* sublibera, obovato-oblonga, vix acuta, circiter l£ lin. longa, pulverulenta vel papillosa, glandulis prsecipue linearibus predita. *Genitalia* glabra. *Bacca* globosa, 2£-3 lin. diametro.

CHINA : Mengtze, Yunnan, creeping on wooded cliffs at 8,000 feet. ***A. Henry,* 9793.**

This is one of several elegant new species of *Embelia* of climbing or trailing habit from Yunnan. The flowers, or rather the genitalia, are dimorphic in the present species. Whether they are functionally unisexual as designated by Dr. G. Mez in his description of *E. polypodioide8>* Hemsl. & Mez, I have not been able to ascertain. A description of a very closely allied species may follow here.

E. procumbens, *Hemsl. (sp. nov.);* species *E. saxatili,* Hemsl., arete accedit, a qua differt inter cetera foliis tenuioribus oblongo-ellipticis apice rotundatis, floribus minoribus subracemosis, pedunculis longioribus, pseudoracemis folia interdum sequantibus, sepalis denticulatis, petalis nigro-punctatis simul apicem versus rubro-punctatis.

CHINA : Mengtze, Yunnan, growing in mountain forests at 8,000 feet, creeping on the ground, *A. Ihnry$_y$* 11160.

This also has long- and short-styled flowers with short and long stamens respectively. I should have regarded them as both fertile, in different degrees perhaps, as in Primula; but it is a point that cannot be settled from the material under examination.—W. BOTTING HEMSLEY.

Calyx anguste campanulatus, breviter sequaliterque 5-lobatus, lobis erectis acutis. *Corolla* bene evoluta non visa; tubus cylindricus, rectus, supra medium inflatus ; limbus . . . *Stamina* 5, sequalia, inclusa, tubo medio affixa, h'lamentis brevissimis; anthene lineari-oblongse. *Ocarium* oblongo-ovoideum ; stylus filiformis, inclusus, basi indurata porsistente. *Capsula* ovoidea, polysperma, corolla marcescente coronata. *Semina* insequalia, srepius irregulariter cuneata, angulata, Ire via, peltatim aifixa, longe funiculata.—Herba *perennis scapigera*, ***nndique glabra, rhizomate subhorizontali.*** **Folia** ***omnia radicalia, coriacea, longe vel longissime petiolata, lanceolata, maxima circiter*** **15** ***poll, longa, erecta, swpius utrinque attenuata, interdum basi rotundata, ajnce acuta, margine acvleolato-dentata, interdum obscure lobulata^ venis primariis lateralibus utrinque*** **5-6/** ***petiolus semiteres, quam lamina scbpissime longior.*** **Scapi** ***erecti, gracilinsculi, per Mam. longitudinem nudi, quam folia swpissime longiores.*** **Flores** ***parvi,*** **10-20** ***wl opicem scapi fasciculatim conferti; pedicelli gradles,*** **2-5** ***lin. longi; bracteoloB lineares, quam pedicelli circiter dimidio breviores.***

C. Henryi, ***Hemsl. (species unica).***

CHINA : forests south-east of Mengtze, Yunnan, at 5,000 feet, ***A. Ilenry,*** **10735.**

This genus is dedicated to the memory of Caroline, the late wife of Dr. A. Henry, who accompanied him to China in 1891, and was with him successively at Shanghai and in Formosa. Mrs. Henry assisted to some extent in collecting, but delicate health necessitated change, and she first went to Japan, where she made a small collection of plants around Arima, near Kobe. Subsequently Mrs. Henry went to Denver, Colorado, accompanied by Miss M. Henry, now Mrs. A. S. Crum, of Mailoor, in the Nilghiris. These two ladies made a considerable collection of Colorado plants, a set of which is at Kew ; but Mrs. Henry grew gradually worse, and died in 1894. Perfect flowers of *Carolinella* are still wanting, but I fear we may have long to wait, because the seed from the Kew specimens has not germinated.—**W. BOTTING HEMSLEY.**

PLATE 2727.

HARTIA SINENSIS, *Dunn.*

TERNSTROEMIACEJB. **Tribe GORDONIEJJ.**

Hartia, *Dunn.* Genus novura ex affinitate *Schimce,* Reinw., a qua staminibus altius monadelphis, fructu acuminato, embryone recto diifert.

Sepala* 5, basi connata. *Petala* 5, in tubum brevem coalita, superne imbricata. *Stamina* numerosa, corollas basi adnata, alte monadelpha; antherae versatiles. *Ovariwn* 5-loculare ; styli 5, connati; ovula ex basi cujusque loculi 4-5, adscendentia, anatropa. *Capsula* acuminata, 5-sulcata, lignosa, loculicide dehiscens. *Semina* lenticularia, margine alata; albumen copiosum ; embryo rectus, cotyledonibus orbicularibus planis quam radicula infera brevioribus.— Arbor *20-$0-pedalis* (A. Henry). Folia *alterna, coriacea, supra glabra, infra reticulata, sparse sericea, glabrescentia, ovato-lanceolata,* 2^-4 *poll longa, acutavel rarxus breviter acuminata, basi rotundata, crenatoserrata; petiolis semipollicarihus cymbi/armibus infra sericeis.* Flores *solitarii, pollicares, pedunculis'brevibus axillaribus; bracteofa* 2, *ut sepala petalaque externe sericece.* Calycis *lobi incvquales, imbricati, rotundati vel acuti, minonbus dentatis, sinibus in fructu apertis.* Petala *alba* (A. Henry), *ovata, margine crenulata, staminibus longiora.* Staminum *tubus partes eorum liberas et corolla tubum cequans.* Styli *ad apicm colmrentes.* Capsula 7-9 *lin. longa,* 6 *lin. diam.* Semina 1-3 *lin. diam.

CHINA : **Yunnan, south of Manmer in the Red River valley, at 6,000 feet, and in the Szemao forests, at 7,000 feet, *A. Henry,* 10465,** 10465A.

The genus is related to *Stuartia,* Linn., and to *Schima,* Reinw. It is distinguished from both by the more extensive cohesion of its stamens ; from the former in addition by its more numerous seeds, and from the latter by its acuminate fruit, more copious albumen, and straight embryo.

The leaves of this species have peculiar boat-shaped petioles, which enclose successively the growing point of the stem.

It is at Dr. Henry's suggestion that the genus is dedicated to Sir Robert Hart, Bart, G.C.M.G., Inspector General of the Chinese Maritime Customs, without whose help and encouragement these and so many other scientific collections by members of his staff could never have been made,—S. T, DUNNs

PLATE 2732.

LACHNOSTACHYS **VERB ASCI FOLIA,** *F. MuelL*

• VERBENACEJE.

L. **verbascifolia,** *F. MuelL Fragm. PhyU Austral,* vi.p. 158; Benth. *FL Austral,* v. p. 38, floribus pentameris.

WEST AUSTRALIA: Cue, *Victor.* Herbarium of the Bureau of Agriculture, W. A.

This, one of the most singular plants in the Australian Flora, was also received through Mr. Alex. Morrison.

The genus *Lachnostachys,* Hook., was founded in the *Icones Plant' .arum* in 1842, and two species are figured: *L. albicnna.* Hook., t. 414, and *L. ferruginea.* Hook., t. 415 ; but the floral structure was misunderstood and the ovary was not accounted for. It was first referred to Amarantaceae. Afterwards, F. Mueller, describing *(Fragm. Phyt. Austral,* i. p. 241) another species, under the name of *Walcottia eriobotrya,* placed it in the Buettneriacese with the remark : 'plantam Verbenaceam quam Buettneriaceam mentiens.' The same plant was subsequently described by Turczaninow *(Bull. Soc. Nat. Mosc.* 1863, ii. p. 215), as *Pycnolachne ledifolia,* and correctly referred to the Verbenacese. *Lachnostachys verbasçifolia,* so far as my investigations go, is invariably pentandrous, with a pentamerous calyx and corolla; but both Mueller and Bentham describe it as sex-novemmerous. The corolla lobes are not developed between the stamens. Briquet (Engler & Prantl, *Natiirl. PJlanzenf.* iv. 3. A. p. 164) has, by a slip, substituted the name *Lachnocephalus* for *Lachnostachys,* so that the latter name does not appear in the index to the work cited.—W. BOTTING HEMSLET.

LEUCONOTIS ELASTICA, *Becc.*

APOCTNACEiE.

I. **elastica,** *Becc. Nelle Foreate di Borneo,* pp. 368, 562, 563, fig. 59 ; ab omnibus speciebus hucusque descriptis foliis amplis ellipticis vel late elliptico-oblongis abrupte cuspidato-acuminatis, nervis utrinque 2-3 patulis subtus eximie conspicuis et sub margine arcuato-connexis distincta.

Rami juniores crass^ giaberrimi, exsiccando nigrescentes, magis minusve vernicosi, internodiis 2-3 poll, longis. *Folia* elliptica vel late elliptico oWlonga, utrinque rotundata, apice abrupte cuspidato-acuminata, 5-6 poll, longa, 2|—3} poll, lata, crasse coriacea, glaberrima, in alabastra vernice induta, supra exsiccando fuscescentia vel nigrescentia, lucida, subtus magis minusve glauca, costa et nervis lateralibus utrinque 2-3 sub margine arcuato connexis supra immersis subtus prominulis eximie conspicuis; petioli robusti, 1 poll, longi, paris cujusque linea transversa elevata connexi. *Inflorescentice* paniculatte, congeat.jp, foliis multo breviores, minute puberuhe, demum glabrescentes ; pedunculus crassus, vix i poll, longus; bractese ovata-, acutse, inferiores ad 2 lin. longse ; pedicelli crassi, brevissimi. *Calyx* 2 lin. longus, segmentis oblongis obtusis apicem versus puberulis intus eglandulosis. *Corolla* flava; tubus ad 5 lin. longus, e basi latiore cylindricus, glaber ; lobi rotundato-ovati, 2 lin. longi. *Anthers* supra tubum medium insertse, os attingentes, 1^ lin. longse. *Ovarium* glabrum, 2-loculare, loculis pauciovulatis. *Fructus* ovoideo-giobosus, baccatus, dense verrucosus, H-2 poll, longus. *Semina* (haud plane matura) circiter 4, oblonga, ad 6 lin. longa; cotyledones foliaceie basi cordata; radicula brevis.

BORNEO : Sarawak, Bintulu, *Beccari,* 899, 2291; near Kuching, ***Haviland,* 3063.**

Beccari, 3708 *(I.e.* p. 562), also from Sarawak, comes very near to *L. elastica* ; but its leaves taper more gradually towards the acumen, and have 4 or 5 nerves on each side. The internodes of the leaf-bearing branches are also shorter, being only 1-2 in. long. There are, however, neither flowers nor fruits, and it is therefore impossible to say whether it is only a slightly aberrant form of *L. elastica* or not. *L. elastica* is, according to Beccari, an excellent rubber plant.—OTTO STAPF.

DIURANTHERA MAJOR, *ffemsl*

LILIACEA. Tribe ASPHODELEJE.

Diuranthera, *Hemsl.* Genus novum a generibus hujus affinitatis differt staminibus divergentibus, antheris basi bicaudatis.

D. **major,** *Hemsl. (sp. nov.);* a *D. minore*, H. C. Wright (infra), statura, foliis multo latioribus undulatis flaocidis recurvis, floribus majoribus, ant'nerarum caudis acutis recedit.

Herba scaposa, glabra, circiter bipedalis. *Folia* pauca, subcarnosa, late linearia vel lingulata, maxima visa pedalia, crispato-undulata, margine minute papillosa, flaccida, recurva, acuta, nervis utrinque 6-8. *Scopus* erectus, pauciramosus, bracteis quam floribus brevioribus angustis acutissimis. *Flores* albi, glabri, circiter 2 poll, diametro, geminati vel terni, singillatim evoluti, breviter pedicellati, pedicellis medio articulatis. *Perianthii segmenta* similia, Bed interiora angustiora, linearia, acutissima, recurva, marcescentia. *Stamina* 6, divaricata, quam perianthium breviora, filamentis ñ'liformibus ; antheras elongatap, curvatae, basi bicaudatse. *Ovarkim* sessile, 3-loculare, loculis circiter 12-ovulatis; stylus valde declinatus, apice recurvus, stigmate parvo. *Capsula* trialata, loculis sajpius dispermis. *Semina* orbicularia, conipressa, circiter 1J lin. diametro, basi biauriculata, funiculo inter auriculas posito; testą Crustacea, nigra, punctulata \ embryo clavatus, in albumine carnoso centralis et oblique positus, radicula hilum spectans.

WESTERN CHINA : raised from seed collected by Mr. E. H. Wilson for Messrs. James Veitch *k* Sons, who presented Kew with a living plant, from which our drawing and description were made.

D. **minor,** *H. C. Wright,* hie; *Paradisea minor,* H. C. Wright, in Kew Bulletin, 1895, p. 118.

WESTERN CHINA : Mengtze, Yunnan, at 6,000 feet, *W. Hancock*, 94.

The characters upon which this genus is founded may seem rather slight, but Mr. J. *ii.* Baker, whose knowledge of the Liliacese is probably unsurpassed, agrees that it is as distinct as many others, and that it would be difficult, us an alternative, to decide what existing

genus to place it in. The stamens recall those of some of the Melastoniacese, and especially those of some of the species of *Dichcetanthera* figured in Baillon's *Histoire NaturelU des Plantes de Madagascar,* tt 378-382. The seeds are very peculiar, but unfortunately they were not obtained until after the plate was printed off.—W. BOTTINO HEMSLBY.

Arbor **20-pedalis, trunciflora.** ***Folia*** **petiolata, ampla, glabra, paribjpinnata, petiolo communi tereti, perfecto non viso; pinnae bijugse, distantes, stipitatse, inaequales, par superius majus, circiter pedale, 10-foliolatuin, par inferius minus, circiter semipedale, 6-foliolatum.** ***Foliola*** **breviter petiolulata, tenuia, fere membranacea, ovata, .3-6 poll, longa, interdum leviter obliqua, obtuse acuminata, basi rotundata vel interdum subcuneata, integra, venis primariis lateralibus utrinque circiter 7, venis ultimis conspicue reticulatis.** ***Pedunculi*** **ex trunco vel ligno vetere** ***(Comins)*** **3-4 poll, longi, circiter 5-6-flori.** ***Flores*** **prope apicem pedunculi conferti, breviter pedicellati, cum staminibus circiter bipollicares.** ***Calyx*** **coriaceus, per anthesin tubulosus, intequaliter breviterque dentatus vel fere truncatus, fructifer auctus, campanulatus, n'ssus.** ***Corolla*** **circiter pollicaris, subcarnosa, lobis apice incrassatis intus carinatis.** ***Stamina*** **numerosissima, longe exserta.** ***Gyncecei carpella*** **circiter 8, glabra, stylis stamina sequantibus.** ***Legumina*** **maturescentia stepe 3-5, stipitata, crassa, carnosa, vivide rubra, incurva, usque ad 6 poll, longa, dorso alte lobata, cito dehiscentia.** ***fSemina*** **nigra** ***(Comins)*** **ut videtur anguste ovoidea sed perfecta non visa.**

SOLOMON ISLANDS : **'only one tree known near the village of Madoa, TJlawa,'** ***C. B. Comins,*** **249.**

Archdeacon Comins, who has sent so many interesting plants to Kew from the Solomon Islands, states that the natives call this tree *Ai mahai,* which is the name they also give to *Pongamia glabra.* So far as I know, no good figure of the ripe fruit of one of these plurjcarpellary Mimoserc has hitherto been published. By soaking the specimen sent by Archdeacon Comins, the artist has been able to give a very fair representation of the pods, but perfect seeds are still wanting. The leaf, too, is not quite perfect, wanting the lower part of the petiole. *Hanscmanniaoblonga,* Hemsl. *(Kew Bulletin,* 1892, p. 125), is another tree of this affinity from the same source.—W. BOTTING HEMSLEY.

Fig. 1, a leaf wanting the lower Bart of the petiole; 2 and 3, quite young fl jwers; 4, a fully expanded flower; 5, gynasceum with parts of calyx and corolla, and one of the stylos full leegth; 6, au ovary} 7, a fruit j 8, a seed. ***AH except 6 and*** **6** ***natural***

THOMASSETIA SBYOHELLANA, *Hemd.*

TERHSTIHEMIACEJE.

Thomassetia, *Hemd.* Genus novum nulli propinquum, inter *Tern-strastniaceas* ob staruinodia insigne.

Flores hermaphroditi. *Sepala* 5, imbricata, rotundata, margine minute • denticulata. *Petala* 5, contorto-imbricata, nunc sinistrorsim nunc dextrorsim obtegentia, ovato-oblonga, obtusa, libera, glabra. *Stamina* 5, petalis alternantia et ea paulo excedentia; filamenta carnosa, ima basi inter se et cum staminodiis leviter cohserentia; antherse basi cordiformes, inter lobos basifixse, longitudinaliter dehis-centes. *Staminodia* circiter 15, dentiformia, in phalanges 5 inter stamina in eadem serie posita, persistentia, fructifera plus minusve aucta. *Ovarium* glabrum, 5-loculare ; ovula numerosissima, biseriatim superposita, ab axi pendula ; styli breves, ad apices connati, stigmatibus punctiformibus. *Fructus* capsularis, oblongo-ovoideus, ut videtur septicide dehiscens. *Semina* ovoidea, basi attenuata ; perispermium parcum vel tenue. *Embryo* rectus; cotyledones ovoidese; radicula brevissima. Arbor *parva, ramulis Jforiferis crassiusculis, novelli* glabris.* Folia *alterna, simplicia, distincte petwlata, coriacea, glc bra, oblongo-lanceolata vel oblanceolata, cum petiolo* 3-5 *poll, long a, obtusa vel rotundata^ basi subrotundata*$_y$ *margine cartMaginea, interdum obscure remoteque crenato-undulata, subtus pallidiora, venis primariis lateralibus utrinque circiter* 10 *in siccis sat conspicuis.* Pedunculi *axillares, compressi, circiter pollicares, recurvi, apice breviter bifurcati.* Flores *Jlavo-albidi*$_9$ 9-12 *lin. diametro, in/asciculos duos divergentes ad pedunculi apicem aggregate distincte pedicellati.* Fructus *bipolli-cariSy staminodiis auctis suffultus.*

T. seychellana, *Hemd. (species unica).*

SEYCHELLES : summit of Mount Sebert, Mahé, at 1,800 feet, //. *P. Tkomasset,* 33.

The specimen figured is all that I have seen of this interesting tree. The figure of the fruit is from a drawing by Mr. Thomasset, the collector of this and about fifteen other plants from the same island received at Kew for determination from the late Dr. Suhimper, of Basle. Mr. Thomasset is the appreciative possessor of the Cascade

Estate, in Mahé, which includes a considerable tract of original forest. Fortunately for science, Mr. Thomasset intends to preserve this interesting vegetation, and also to investigate thoroughly the natural history of the island.

After the figure here given was printed off, a coloured drawing was found at Kew which evidently represents the same genus and almost certainly the same species. It belongs to the Wallich collection, is numbered 187, and dated 1828, and on the back is the inscription ' of Mauritia,' probably written by the native Indian artist. The presumption is that it was made from a plant cultivated in the Calcutta Botanic Garden at that date. Search for specimens in the London herbaria has been made in vain, and Major Prain, who has kindly searched the Calcutta herbarium, has also been unsuccessful. Wallich's drawing has brought out more strongly some of the characteristics of the plant, especially the short bifurcation of the peduncle, by which the flowers are divided into two distinct clusters, which is not so evident in our imperfect specimen. The embryo, too, was described from his drawing.

The singular inflorescence, five stamens, and the presence of staminodia, which persist and grow out, are characters which render it difficult to determine the exact position of the genus ; but I think there is no alternative as to the natural order.—W. BOTTING HEMSLEY.

Fig. 1, a flower; 2, the same, from which some of the parts hare been removed to show the five stamens; 3, pistil and staminodia; 4, longitudinal section of the ovary; 5, cross-section of the same; 6, a fruit. *All except* 6 *enlarged.*

Calycis dentes breves vel ad tertiam partem fructus accedentes vel obsoleti. *Vetala* in acumen inflexa vel plana. *Fructus* ovatus vel oblongus, a latere compressus, ad commissuram ssepe angustam constrictus ; carpella teretia ; jugaprimariaaequalia, distantia, plus minus prominula, nonnunquam obscure scabrida; vittae 1-5, in quoque valleculo et rarius etiam sub jugis. *Carpophorum* bipartitum. *Semen* teres. Herbae *perennes.* Folia *pinnatim vel ternatim composite*.* Umbellae *multiradiatCB, regulares.* Umbellulee 1-4-, saepius *3-JtoreE incpqualiter radiata, nonnunquam racemos simulantes.* Involucri *bractece nullce vel paucce ; involucelli bracteolce seepius* 3.

C. **vulgaris,** *Dunn (sp. nov.). 1/erba* perennis, sesquipedalis. *Rhizoma* obliquum, 1-2-caule, radicibus carnosis cylindricis. *Caules* cavi, pauciramosi. *Folia radicafia* 1-2-ternata, 6-12 poll, longa; foliola papyracea, siipra glabra, in margine et infra in venulis setulosa, ovata, acuta, saepe 2-3-loba vel -partita, J-4 poll, longa, grossecrenatoserrata, serraturis apiculatis. *Folia caulina* similia sed minora et brevius petiolata vel sessilia. *Umbdlce.* caules ramosque terminantes, 15-30-radiatae; radii in fructu 2-pollicares; bractese paucss vel egentes. *Vmbellulai* insequaliter radiatte, trjflore; involucella 1-3-bracteolata. *Flares* albi vel dilute cserulei. *Calycis* dentes ovario sequantes, oblongi. *Petala* obovata vel oblonga, mucrone ssepe involuta. *Fedicelli* fructiferi ^-1 lin. longi, sa?pe ut fructus juga scaberuli. *Fructus* valleculae multivittatse, jugis prominulis. *Stylopodium* fructu 2-3-plo brevius.

EASTERN ASIA : India, Manipur, Ching Sow, at 8,000 feet, *Watt,* 6556. China, Yunnan, Fengchenlin, in forests at 7,000 feet, *Henry,* ^10675 ; Szechuen, Tatsienlu, 9,000 to 13,500 feet, *Pratt,* 831, Mount Omei, 4.000 to 8,000 feet, *Faber,* 60, 627, 632; Hupeh, Chienshih, //cwyj^384, 54 4J, 5444A, Paturig, *Henry,* 5406.

The name *Cryptotamiopsis* was first used by Franchet *(Bull. Soc. Philom. Paris,* sér. 8, vi. p. 119) to designate a group of *Euamminea*

having 2-4-flowered uinbellules and 1-3-vittate valiecules, resembling *Cryptotcenia* in habit, but intermediate between *Carum* and *Pimpinella.* These two genera, as represented in China, were united by Franchet and *Cryptoteeniopsis* used as a sectional name under the former. Five of the species placed by him in the section and three new ones, including that figured above, appear to form a natural genus, being distinguished from allied groups by the numerous regular umbel rays and by the few very irregular rays of their umbellules, and being moreover closely connected by habit and by minor characters. For this genus it is convenient to retain Franchet's sectional name.

Some of. the eight species alluded to have been referred by authors to *Carum* and some to *Pimpinella,* genera which are believed to be distinguishable from one another by the number of vittse and other characters, and from other genera partly by the relative size of the sepals and by the shape of the petals. In all these respects *Crypto-Ueniopsis* is remarkably variable, and its separation will confer more definiteness upon the limits of both genera.—S. T. DUNN.

CABLESIA SINENSIS, *Dunn.*

UMBELLIFERJB. Tribe AMMINE^E.

Carlesia, *Dunn.* Genus novum ex afinitate *Sii,* Linn., et *Pimpinellas,* Linn, a prirao habitu foliisque dissectis, a secundo involucro polyphyllo, dentibus calycis conspicuis, carpophoroque obsoleto differt.

***Calycis denies* prominentes. *Petala* basi contracta, acumine longo inflexo, quasi biloba. *Stylopodia* conica, a dorso compres&a. *Fructu 8* oblongo-ovatus apice vix contractus, transverse teres; mericarpia semiteretia; juga primaria obtusa; vittae in quaque vallecula 3, conspicuse, sub jugo 1, parva ; carpophorum obsoletum. *Semen* facie** planiusculum. Herba *perennut,* 6-12 *poll, alta, prater inflorescentiam ylabra.* **Radix** *crassa, apice cylindrical fibris plurimis coronata, multicaulis.* Caules, 2-4 *poll, longi$_9$ striati, ramosi, polypftylli.* Folia radicalia *multa, persistentia, caulium longiorum dimidium paullo excedentia, tripinnatisecta, lobis linearibus acutis margine invohitis; petioli laminas atquantes, basi breviter vaginantes.* Folia caulina *conformia-, minus dissecta, brevius petiolata.* Umbellse 10-20-*radiatce,* 1^ *poll, sub anthesi ad* 4 *poll, in fructu latcR; involucri bractece multce, lineares vel nonnunqiiam divisce, vadiis setulosis breviores.* Umbellulse *mult*florae; bracteolaefloribus fructuque paullo. excessce, lineares, acuUe.* Calycis dentes *lineares, 3-4-plo fructu breviores.* Petala *alba.* Styli *erecti, persistentes, fructui cequales.* Fructus *dense hirtellus, sine calycis deittibus l\ lin. longus.*

C. sinensis, *Dunn {species unica). Umbellifera* dubia *Athamanthat* affinis, *Hemsl. in Journ. Linn. Soc.* xxiii. p. 337.

CHINA : Shantung, frequent on rocks at 1,000 to 2,000 feet elevation in the Cbefoo Mountains, *Maingay* 49 ; *Faber* 234.

Maingay's specimen is so fragmentary that its affinities could not be determined for the *Index Flora Sinensis.* It bears several perfectly ripe fruits, however. These, together with Faber's excellent specimens in flower, make it evident that the Chefoo Mountains contain a member of a hitherto undescribed genus allied to *Sium* and to *Pimpinella.*

There is a special appropriateness in the dedication of this genus to Mr. W. R. Carles, C.M.G., F.K.G.S., latr 11.M. Coasul-General for

Tientsin and Peking, because his botanical explorations in China, which have resulted in the discovery of many new and interesting plants, began at Ghefoo, where he has twice been stationed in different official capacities.—S. T. DUNN.

SIEBEBA DEFLEXA, *Jtenth.*

UMBELLIFERA:.

Siebera deflexa, *Benth. FL Austral* ill. p. 355; *Ihmsl in Gar3. Chron.* 3rd series, xxx. (1901), p. 363. Trachymene deflexa, *Turcz. in Bull. Soc. Nat. Mosc.* 1849, ii. p. 31.

WEST AUSTRALIA : Fitzgerald River \ communicated by *A. Morrison.*

This little shrub has been figured on account of its producing an edible tuber. Some months ago Mr. A. Morrison, botanist to the Department of Agriculture, Perth, West Australia, sent the tuber and specimens of the plant here figured, with the information that the tubers were eaten ' by the natives, both raw and cooked in ashes, and also by settlers.[1] *JSiebera defltxa* is known to inhabit the southern coast region from King George's Sound to Israelite Bay—that is from about 118° to 123° E. long.; but this is probably the first record of its forming tubers, or, at least, of the tubers being connected with the plant. The tubers are known to the aborigines as ' yuke,' and in a later communication Mr. Morrison states, in answer to my inquiries, that he did not know whether the plant propagates itself from the tubers, that he did not remember having seen any buds on them, but he would endeavour to obtain further specimens. It is certainly an unusual thing for a woody plant to form separate tubers.—W. BOTTING HEMSLEY.

NOTE.—Since the above was passed for the press further material has been received from Mr. Morrison. It consists of four plants, two of which are bushy and densely branched ; the others have few branches, and one is evidently quite young. The aerial part is from six to nine inches high, and the underground part is from nine to fifteen inches long. Each plant bears one tuber near the extremity of its root-system, and the relatively slender, cylindrical axis is continued below each tuber, but only an inch or two. In the young plant the tuber is still plump; in the others it is more or less shrunk and exhausted. I suspect, therefore, that the tuber is the first product of germination, and the statement that the tubers are formed in strings is probably due to some mistake.—W. B. H.

Fig. 1, diagrammatic sketch by Mr. Morrison, showing that the tubers are formed in strings; 2, ᵬa*»e of a stem, apparentlj shewing sear where it had been attached to u tuber; 3, tuber; 4, leaves; 5, a male; 6, a fertile flower; 7, the same with petals and stamens removed; 8, a fruit. *All except* 1 *[reduced) and* 2 *ami* 3 *(natural site) enlarged.*

C. orientalis, *K. Schum. in Engl Pflanzenwett Ost-Afr. Teil C.* p. 315. Affinis C. *cymulosce,* Benth., sed paniculis multifioris, corollse et foliorum forma distincta.

Frutex inflorescentiis exceptis glaberrimus, ramis gracilibus cortice brunneo multilenticelloso tectis. *Folia* oblonga vel oblanceolata, obtuse acuminata, acumine Jineari ad 4 lin. longo, basi acuta vel subcuneata, 3-3| poll, longa, 1-1 i lin. lata, coriacea, superne lucidula, nervis secondariis utrinque 9-11 rectis obliquis ut venis pulchre anastomosantibus utrinque proniinentibus ; petiolus 3-4 lin. longus. *Inflorescentiw* axillares et terminates, composite paniculate, multiflone, contracts, vix 1 poll, longae, subpedunoulatse, tenuiter pubescentes ; bracteic ovatre, minutse; pedicelli)j~\ ^n- longi. *Calyx* \ lin. longus, tenuissiine pubescens, segmentis ovatis subacutis. *Corolla* extus minute puberula ; tubus infra medium inflatus, 2-2^ lin. longus, intus pubescens ; lobi lineari-oblongi, tubum sequantes vel paulo breviores. »*Antherce* orbiculari-cllipticu), minimre, } lin. haud attingentes ; filamenta tenuia antlieris paulo breviora. *Ovarium* glabrum, subovoideum ; stylus brevis; stigma capitatum, subconicum, apiculo 2-lobo brevi; loculi ob placentas a basi ad apicem coalitas 2 ; ovula in utraque placenta 9-12, 3-seriata. ***Hallier, f. Kautachuklianen in Jahrb. Hamburg. Wissensch, Aii8talt, xvii.*** (1899) 3. *Beih. p.* 121.

GERMAN EAST AFRICA : Bukoba on Lake Victoria, *Slnldmann,* 1131.

This species, which is the easternmost representative of the genus, approaches very closely to C *cymulosa,* Benth., from Sierra Leone, the species on which the genus was established. It differs from it in the rather narrower leaves with a more raised venation, in the many-flowered panicles, the more inflated corolla tube and broader corolla lobes and the very obtuse anthers. It has been pointed out by Bentham in Hooker and Bentham, *Genera Flantamim,* ii. p. 692, that the ovary of *Clitandra*—he knew then only 2 species, viz. C. *cymulosa* and another undescribed one, probably C. *Barteri* or C. *Mannii*—was imperfectly 2-locular, adding ' placentis valde prominentibus (medio tamen haud junctis ?)' There is no doubt that the placentas project in most species

very much—so much so, indeed, that they sometimes give, seen in cross-section, the impression of being fused into a septum, and in *C. cirrhosa* fusion actually takes place at the base and the top of the cavity of the ovary, the result being a perforated septum. In *C, orientails* this fusion has gone a step farther and become complete. The species is, however, in other respects so closely allied to *C. cymulosa* that there can be no doubt whatever about its congenerity with this species, the complete or incomplete partition of the ovary being evidently of no great taxonomic value in this group.—OTTO STAPF.

PARADOMBEYA BURMANICA, *Stapf.*

STERCULIACEJE. Tribe DOMBETEJE.

Paradombeya, *Stapf.* Genus novum affine *CorcJioropsi,* Sieb. & Zucc, et *Pentapeti)* L., ab ilia ovarii, ab hac andnecii structura, ab utraque ovulorum numero differt.

Calyx fere ad basin 5-partitus, herbaceus, glaber, receptaculis subcutaneis mucilagine repletis abundans, segmentis valvatis. *Petala*

Corrigenda.

SiDce the text accompanying Plate 2743 was printed, Anther material of *Paradombeya bvrmanica* has been received at Kew, consisting of excellent specimens collected by W. Boxall in the same locality. From these specimens and Mr. BoxalTs communication, it appears that P. *burmamca* is a shrub six feet or more in height, with leaves as much as *five* inches long and over one inch broad, furnished with 5-8 secondary nerves on each side. The flowers are Bnow-wbite in a fresh state, bnt yellow when dry, and crowded in axillary fascicles of 5-12, or more, all along the long slender branches.—OTTO STAPF.

uuiungu-jaiiueuiata, auuui vei suuauuimiiata, 2$ Jin. longa. *Petala* 3-3¡ lin. longa lataque. *Filamenta* imequalia, exteriora (uniuscujusque phalangis intermedia) breviora, antherae vix \ lin. longse. *Staminodia* 3 lin. longa. *Ovnriwn* 5-loculare.

BURMA : Upper Shan States, at Supmut, 3,500 feet, *H. II. Hildebrand.*

The diagram of the flower of *Paradombeya* is practically the same as that of *Pentapetes ;* but the staminal tube is very short, the filaments are much longer, the ovary cells easily separable from each other, and the

number of ovules in each cell only two, not many. The gener.il habit, the shape and texture of the leaves, and the character of the rather scanty tomentum point likewise to *Pentapetes* as a near ally. *Paradombeya* approaches at the same time rather closely to *Corchoropsis.* This differs, however, in having normally 10 fertile stamens and numerous ovules in each cell. The fruit of *Corclioropsis* is a long, cylindric, 3-locular capsule, containing numerous superposed seeds. The fact that there are, in *Paradombeya,* only two collateral ovules in each cell suggests, of course, a fruit of a structure different from that of *Corchoropsis.* This genus was placed in the Genera Flantarum near *Corchorus,* but the comparison with *Pentapetes* makes it evident that its place is by the side of it. *Domheya* has also almost the same diagram as *Paradombeya,* and in many species only two ovules in each cell, but the staminodes are here (always ?) episepalous, and the habit is quite different. *Melhania* again has epipetalous staminodes like *Pentapetes,* but only five perfect stamens and a very distinct habit.—OTTO STAPP.

Fig. 1, floral diagram; 2, a flower; 3, a petal; 4, part of the androecium; 5, pistil. ***All enlarged.***

PLATE 2743B.

PABADOMBETA SINENSIS, *Dunn.*

P. sinensis, *Dunn (sp. nov.)* a *P. burmanica,* Stapf, caulium foliorumque indumento stellate, bracteolis caducissimis, et ovario biloculari distincta.

Folia ovata, undulata et crenulata, longe acuminata, basi rotundata, 4-5 poll, longa, 1^-2 poll, lata, pube stellata primo tecta, mox glabra, nervis secundariis utrinque circa 10, imis e basi ortis, subsessilia. *Pedicetti* graciles, semipollicares in medio articulati ; bracteolse caducissimse. *Col yds segtnenta* ovata, acuminata, 2-lin. longa. *Petala* 2£ lin. longa lataque. *Antherce* apiculatae, £ lin. longa;, in phalanges 5 dispositse. *Staminodia* staminibus duplo longiora, petalis paullo breviora. *Ovarium* depresso-globosum, 2-loculare, loculis faciliter separabilibus, stylo quadrisulcato duplo brevius.

CHINA : Yunnanfu, *Ducloux,* 480.

This species was collected in a locality about 500 miles N.E. of that of the Shan plant. It resembles the latter very closely in habit, but differs in its two-celled ovary. Such a variation in the number of ovarian cells within the same genus is not without parallel among the Dombeyeap, for *Dombeya* itself includes species with 2- and 5-celled ovaries.—S. T. DUNN.

PLATE 2744.

PARAPODIUM CRISPUM, *If. E. Broivn.*

AscLEPiADACEiE. Tribe CYNANCIIEJB.

P. Crispum, *K E. Brown (sp. nov.)*; a P. *costato*, E. Mey., foliis angustioribus crispatis breviter petiolatis facile distinguitur.

Herba perennis, 5-8 poll. alta. *Caulis* erectus, validus, bifariara puberulus, foliosus. *Folia* patentia vel subincurvato-adscendentia, glabra ; petiolus 1-3 lin. longus; lamina 1J-3 poll, longa, 2-5 lin. lata, anguste vel lineari-lanceolata, acuta, basi breviter cuneata, marginibus crispato-undulata. *Umbellce* ad nodos laterales, pedunculate, 3-4-florse. *Pedunculi* \-2\ lin. longi. *Pedicelli* 3-4 lin. longi. *Sepala* 3-4 lin. longa, £ lin. lata, lanceolato-attenuata, acuta, glabra. *Corotta* glabra; tubus 1J lin. longus, globoso-campanulatus; lobi 2-2^ lin. longi, l|-lf lin. lati, ovato-lanceolati, subacuti, basi concavi, apice recurvi. *Cor once* lobi corollae tubo interne adnati, superne liberi, transverse oblongi, l£-li l*n- l[at]*« *Columna* staminum breviter stipitata, conica; anthene appendices oblongse, acute, conniventes, ad apicem crateriformem styli attingentes.—*Pachycarpus gomphocarpoides*^ E. Mey. in Herb. Drège, a, non descript. in Comm. PI. Afr. Austr. p. 213.

SOUTH AFRICA : on the Sneeuwberg Range, near Graaf Reinet, at 4,100 feet, *Bolus*; on grassy hills near Shiloh, at 4,000 feet, *Drège*.

Although the genus *Parapodium* was established by E. Meyer, on a South African plant collected by Drège, as long ago as 1836, it has escaped recognition by all subsequent authors, as Decaisne, Harvey, and Bentham and Hooker state that it was unknown to them. Yet specimens of the original species have existed in the Hookerian herbarium for about sixty years, one of them collected by Drège and distributed under a wrong name ; the other, collected by Burke in 1841, is named, in Decaisne's handwriting, *Parapodium costatum.* This specimen must have been quite overlooked by Bentham and Hooker, since I found it, together with the species described above, placed in the genus *Gomp/iocarpu8.* Schlechter, who has paid much attention to South African Asclepiadaceae, and has had the opportunity of seeing Drfege's herbarium, states (Engler's *Jahrb.* xxi., *Beibl* 54, p. 3) that Drège's specimen of *Parapodium costatum* is identical with *Asclepias* ***orbicularis,*** **Schltr.** ***(Xysmalobium orbiculare*** **Dietr.). If this is the**

case, the plant cannot be represented under its right name in Drège's herbarium, as the description of *Parajiodium costatum* does not at all agree with *Xyamalobium orbiculare*. But the peculiar and very distinct structural characters of *Parapodium* seem not to have been understood by Schlechter, since (Engler's *Jahrb.* xx., *Beibl.* 51, p. 41) he has redescribed *Parapodium costatum*, E. Mey., as the type of a new genus, under the name of *Ehombonema lurida*.

The position of *Parapodium*, in my opinion, should be immediately before *Xyttmafobium*, some species of which the two of *Parapodium* now known much resemble in habit.—K E. BROWN.

Fij. 1, part of corolla and corona, seen from within; 2. androccium and corona, seen from without; 3, a pair of pollen-masses. *All enlarged.*

PICRALIMA ELAINE AN A, *Pierre.*

APOCYNACEiE. Tribe PLUMERIOIDEiE.

P. klaineana, *Pierre in Bull. Soc. Linn. Paris,* 1896, 1278 *(species unica).*

Arbor 30-80 ped. alta, ramulis robustis teretibus exsiccando nigricantibus. *Folia* oblonga, magis minusve abrupte acuminata, basi rotundata vel subacuta, 5|-7 poll, longa, 2-3 poll, lata, subcoriacea, supra nitida, nervis secondariis utrinque circiter 20, interdum tertiariis parallelis similibus interjectis, sub ipso margine arcuatim connectis, venis prominulis areolas elongatas nervis subparallelas cingentibus; petiolus robustus, canalieulatus, ad 6 lin. longus, Imsi excavatus et glandibus stipatus. *Peduncuhis* robustus, *i*-\ poll, longus ; bracteas minufce vel vix ullrc; pedicelli 4-G lin. longi. *Sepala* ovato-oblonga, obtusa, 3 lin. longa, nitidula, intus basi multiglandulosa. *Corolla* alba ; tubus carnosulus, 7-9 lin. longus, extus glaber, intus versus medium laxe pubescens; lobi tubum sequantes, sinistrorsum obtegentes. *Antherte* oblongo-lineares, a stylo libene, .H lin. longae. *Carpella* secundum suturas ventrales cohaerentia; stylus cum stigmnte lasvi oblongo 4 lin. longus. *Mericarjna* baccata, ohovoidea-oblonga, divaricata, libera, 4-6 poll, longa, 3-4 poll. diam.; pericarpium crassum, carnosum, intus fibrosum. *Semina* in pulpa carnosa immersa, 1 poll, longa; testa coriacea, lievis; endosperma copiosum, carnosum.—K. Schum. in Engl. & Prantl, Pflanzenfam., Nachtr. p. 284, Ergänz. i. p. 60. *Talwnrmnontana nitida,* tttapf in Kew Bulletin, 1894, p. 22, et in De Wild. & Durand, Contrib. PI. Congo in Ann. Mus. Congo, Bot. Sei\ 2, i. fasc. i. p. 39 ; De Wild. & Durand, Reliquise Dewèvi-eanae in Ann. Mus. Congo, Bot. Ser. 3, fasc. ii. p. 153.

TROPICAL WEST and CENTRAL AFRICA : Upper Guinea, Old Calabar, *KM.* Cameroons, Ambas Bay, *Mann,* 710. Gaboon, Mount Bouët, near Libreville, *Jolly,* 27 ; *Klaine,* 299. Congo Free State, Middle and Upper Congo Region, Lukolela, *Den-tore,* 847. Lokandu, *Dewèvre,* 1113.

When I described this species as *Tabematmontana nitida* nearly eight years ago, I was already aware of the very heterogeneous character of the genus *Tabernamumtana* as generally understood ; but having then no time to examine it critically, T preferred to refer the

plant figured here to *Tabernwmonlana* in the wide sense of most authors. Pierre has since made it the type of a new genus. On further examination and after a general revision of the group of Tabernsemontanoideae, I have no hesitation in accepting Pierre's suggestion. More than that, the structure of the seeds differs so much from that of the Tatarnsemontanoidese that *Picralima* cannot even be referred to this tribe. It occupies, in fact, a rather isolated position in the Plumerioidese, perhaps approaching the *Landolphia* group more than any other.—OTTO STAPP.

PLATE 2750.

PROTARUM SECHELLARUM, *Engler.*

ARACEA. Tribe ARINEA.

P. Sechellarum, *Engler Jahrb.* xxx., *BeibL* 67, p. 42 j specie3 unica.

Herba tuberosa. *Folium* solitarium, inflorescentia cosetaneum, cataphyllo magno subtendens, subpedato-radiatisectum ; petiolus 8-12 poll. longus, crassus ; segmenta 4^-7 poll, longa, 1-1£ poll, lata, brevissime petiolulata, lanceolata, acuminata, basi acuta, glabra. *Pedunculus* 2-4| poll, longus. *Spatha* 6-7 poll, longa basi convoluta, lamina \\ poll, tota, cymbiformi acuta. *Spadix* sessilis, *fy* poll, longus ; pars feminea 7-8 lin longa ; pars organis neutris vestita 6 lin. longa, leviter constricta; pars mascula cylindrica, 1 poll, longa; appendix 1| poll, longa, i poll, crassa, conoidea, levis. *Flores feminei:* staminodia vel porianthii segmenta 4-6, oblonga, truncata, 4-6-angulata; ovarium ovoideum, uniloculare ; stigma sessile, 2-3-lobum j ovula 4, basilaria, erecta. *Organa 7ieutra* conferta, deplanata, lateraliter compressa. *Flores masculi:* stamina 3-6, in synandrium sessile lateraliter compressum truncatum crenulatum conuata.

SEYCHELLES : Cascade Estate, Mahé, *Thomasset.*

This is a very remarkable and anomalous genus, which does not fit well into any of the tribes as at present constituted. Engler associates it with the *Arinece,* from which group I do not propose to remove it, for in leaf and spathe it agrees with that tribe, but in the appearance ot the spadix and in the structure of the flowers it closely resembles the genus *Alocasia* of the tribe Colocasia; indeed, but for the presence of the staminodia (or perianth segments 1) surrounding the ovary, the floral structure would exactly agree with that of *Atoama,* whilst the spathe is much like .that of an *Arum,* and the leaf that of an *Ansmrm.* The material from which this plate and description were prepared was presented to Kew by Mr. H. P. Thomasset. The specimens described by Engler were collected in the same island by the late *ur.* n. Schimper.—N. E. BROWN.

(1891), p. 226; *7. elastica,* Klotzsch ex Dewevre, Zc. p. 46.

TROPICAL EAST AFRICA : British East Africa to the Shire Highlands, where the typical form grows.

The development of the important india rubber trade of East Africa was entirely due to the energy and sagacity of Sir John Kirk, AS early as 1868 he sent specimens of the present species and rubber maae from it to Kew. This is collected in a way which is perhaps unique in any rubber-yielding plant. Some of the milk from a wound is aUowea to coagulate. The pellet so Obtained is applied to a fresh «*_ gnd being turned with a rotary motion, the exuding milk is drawn oil like

silk from a cocoon.' It is said that by working hard one person can collect 5 lbs. of *rubber per diem.* According to Sir John Kirk, *Landolphia Kirkii*' yields the best rubber of the Zanzibar coast.' He had long endeavoured to induce the natives to collect it 'Every one was engaged in the slave-trade, and the experiment in consequence failed.' But it eventually' created a new trade for all those classes whose means of subsistence came to an end' with its suppression.—W. T. TIIISELTON-DYEH.

SAPIUM STYLABE, *Mnell Arg.*

EUPHORBIACE.E. Tribe CROTONEJE.

S. stylare (§ Emmenostylum, *sect, nov.), Mvell. Arg.* in Linnaea, xxxii. p. 119; a speciebus omnibus mihi cognitis lamina foliorum basi auri-eulata recedit—J&rcrccaWa *stylaris,* Muell. Arg. in DC. Prodr. xv. 2, **p. 1204. *Sapium biglandulomm* var. *moriiziannm* in Herb. Mus.** Brit, non Muell. Arg., vide sub tab. nostr. 2647.

VENEZUELA : near the former German colony of Tovar, south-west of Caracas, *A. Fendkr,* 1231 ; *C. Moritz,* 1775. ECUADOR : eastern side of the Andes, //. *Jumelle.*

A representation of this species, which is most nearly related to *S. verum,* Hemsl., plate 2647 of this work, is here given, because what appears to be the same has been sent by Prof. H. Jumelle to **Kew** for identification, with the information that it was from the eastern side of the Andes of Ecuador and yielded caoutchouc of inferior quality. Only leaves were sent, but they are so exactly like those of typical *S. stylare,* including the basal auricles, that I think the identification is beyond doubt. The leaves were sent under three names : ***caucho bianco, caucho verde,* and *caucho morado*; yet they are quite** indistinguishable from each other, and Prof. Jumelle *(Revue des Cultures Coloniales,* x. p. 170), while pointing out certain trivial differences in the colour of the bark and shape of the leaves, agrees that they are specifically the same. From Prof. Jumelle's sources of information this is the principal species of the Eastern Province of Ecuador, where it is never found below about 3300 ft, and ascends to upwards of 8000 ft. It flourishes best and yields the greatest quantity of rubber at elevations above 5000 ft., where the mean temperature ranges from 57° to 61° Fahr. Further particulars will be found in the publication cited.

It may be useful to add here some reference to what is known of the sfiecies of *Sapium* of the Western Provinces of Ecuador. Dr. Paul Preuss, formerly director of the Botanic Garden, Victoria, Cameroons, was deputed by the Berlin Colonial-wirtschaftliches Koniitee to visit America in the interests of tropical .agriculture, and in his excellent **report, *Expedition nach Central- und Siid-Amerika,* he describes and** figures the species of *Sapium* he met with in Western Ecuador. He states (p. 385) that ho met with three species of *Sapium,* two of which inhabited

the lowlands, and the third exclusively the highlands. The last is by far the most valuable, he adds, furnishing the true *caucho bianco* of commerce, and is probably the same as the virgin rubber tree of Colombia. The two species of the lowlands are the source of the *caucho andullo bianco* or *cauchillo,* and bear the name *polo de lecJie,* milktree, in common. The highland species was provisionally referred by Freuss to *S.vervm,* Hemsl. (plate 2647 of this work), aid the other two he described and figured under the names *8. utile* (t. 11, fig. 1) and *S. decipiens* (t. 12), why is inexplicable, because further on he states that they will certainly prove to be forms of one and the same species—[1] welche beide sich auch jedenfalls nur als Formen einer und derselben Art herausstellen werden.'

Through the kindness of Dr. I. Urban, the Assistant Director of the Berlin Botanic Garden, Preuss's specimens have been sent to Kew for comparison, and, so far as one can decide from leaves alone, I think the highland species is correctly referred to my *S. verum,* which is the only one besides *S. stylare* known to me as having persistent styles. In this connection it should be mentioned that the British Museum specimen cited in tho letterpress to plate 2647 as *Sapium biglandulosum,* var. *moritzianum,* Muell. Arg., is not that plant, but typical *8. stylare.*

With regard to *S. utile* and *S. decipiens,* they are undoubtedly the same, and the species should bear the former name. It is distinguished from all the other species Kew possesses from western South America by the petiolary glands being very much reduced or obsolete. A leaf from Moyobamba, Peru, sent to Kew by Prof. Junielle, is apparently *8. utile.*

From the foregoing it seems now an established fact that *S. stylare* and *S. verum* both extend from Colombia to Ecuador, and that the latter yields a superior quality of rubber.—W. BUTTING HKMSLEY.

T. Johnsoni, *C. II. Wright*; a *T. scleroxyloni,* K. Schum., floribus hermaphroditis, antheris bilocularibus, ovulis 4-6, differt.

Arbor alta, ligno molli. *Folia* palmatim 5-lobata, 5 poll, longa, 7^ poll, lata, basi cordata, apice obtusa, supra obscure pilosa, demu in glabra, subtus glaberrimo, nervis secundariis pinnatis, reticulatione minuta ; petiolus 3 poll, lor-gus. *Paniculm* axillares, petiolis brcviores, cymosre, circa 20-florae, bracteis deciduis ? *Calyx* 5 partitas, 7 lin. diam., utrinque dense appresseque rufo-sericeus; lobi ovati, acuti, valvati, patentes. *Petal a* obcordata, basi late unguiculata, 7 lin. longa, 7 lin. lata, utrinque pilosa, alba, basi purpurea. *Gynandrophorum* 1-2 lin. longum, pubescens. *Stamina* circa 20 ; filaraenta filiformia, libera vel basi brevissime connata; anther* 1 lin. longa;, dorsifixie, oblongse, curvatte, loculis 2 induplicatis demum e connectivo revolutim dehiscentibus ; staminodia 5, late ovalia, concava, glumacea, uninervia, glaberrima, 1^ lin. longa. *Carpella* 5, ad apicem gynandrophori, a staminodiis velata, libera, oblique lanceolata, 1 lin. longa, rufo-pubescentia; stylus subulatus ; ovula 4-6, ad "suturam ventralem affixa.

WEST AFRICA. Gold Coast: Anum, *W. H. Johnson,* 813. Native name * Owa wa.'

K. Schumann (in *Engl. Hot. Jahrb.* xxviii. p. 330) gives as a character of this genus (antheris monothecis,' but in the present plant the two Hat cells of the longitudinally curved anther are folded inwards so as to lie side by side ; dehiscence takes place by longitudinal slits close to the connective on the ventral side, and the wall of both anther-cells rolls back in such a manner as to give the appearance of an originally 1-celled anther. In spite of this and the flowers being hermaphrodite, I consider it better to place this plant in *Triplochiton* than to make it the type of a new genus.—C. H. WRIGHT.

Arbor 80-100 pedes alta, ramulis petiolisque canitie fulva obtectis, denique glabriusculis. *Folia* clliptica vel obovato-oblonga, ad 9 poll, longa, 7 poll, lata, breviter apiculata, basi rotundata, coriacea, utraque pagina glaberrima, nervis lateralibus utrinque ad 20 erecto-patentibus subtus prominentibus, petiolo tereti, ad 4 poll, longo, stipulis ignotis. *Kacemi* axillares, 1^-2 poll, longi, pauciflori. *Flares* breviter pedicellati, glabriusculi, | poll. lati. *Sepala* ovata, obtusa, fructu minime accreta, nequaquam recurva. *Petala* obovata, erosa, apice marginibusque incurvis. *Stamina* perplura, apiculo brevi munita; antheraa valvis exterioribus majoribus. *Ovarium* glabrum. *Fruotus* globosus, diametro sesquipollicaris, calyce persistente suffultus, pericarpio fibroso. *Semina* in fructu prsecoque germinantia. *Cotyledones* carnosse, petiolatae, orbiculares, ad basin auriculatre, plano-convexre, externe radiato-sulcatse, radiculam incurvam cVassam complectentes.— *Vateriojm's Seycliellarum,* Heim, Becherch. Dipt&ocarp. p. 94.

SEYCHELLES : near Port Glaud, Mah^, *J. Home*; Malie, without special locality, //. *P. Thomasset.*

This interesting species is the most western outlier of the order as now usually limited. The unexpected occurrence of so marked an Indo-Malayan type on a distant island composed of primary rocks is a fact of great interest in geographical botany. It was discovered in 1874 by Mr. John Home, F.L.S., late Director of Gardens and Forests, Mauritius. He describes it as attaining a height of from 80 to 100 feet. Its timber is valuable and 'is a favourite tree for making canoes.[1] When wounded the trunk exudes an inflammable resin, formerly used for incense. The tree is now becoming scarce and * large trees are now only found near Port Glaud (erroneously printed Port Glean in the *Flora of Mauritius)* and in very inaccessible parts of the forests at elevations of from 600 to 1000 feet.'—W. T. TIIISEI.-TON-DYER.

• *Flores* hermaphroditi (?), 5- rarissime 4-raeri. *Calyx* brevis, segmentis subrotundis imbricatis. *Petala* oblonga, imbricata, patula vel apice demum recurva. *Stamina* 10 (rarissime 8), basi disci extus inserta; filamenta brevia, linearia vel subulato-Hnearia incurva; antlierae magis minusve obcordata, inflexre, thecis lateralibus distinctid lateraliter dehiscentibus, connectivo inter et imprimis supra thecas dilatato et magis minusve obtuse bilobo. *Discus* carnosulus, cupuliformis, 20-lobatus, lobis staminibus oppositis brevioribus, ovarium ad medium cingens. *Carpel la* 5, libera ; unicum fertile subglobosum, dense tomentosum, stigmate subobliquo subterminali sessili inter pilos occulto, crctera sterilia, solida, oblonga, extus curvata, pilosa; ovulum carpelli fertilis a funiculo e basi lateris ventralis ascendente suspensum. *Fructus* drupaceus, sublentiformis, magis minusve obliquus, minute apiculatus, exocarpio tenui, endocarpio crustaceo. *Semen* lenticulare ; testa membranacea; cotyledones suborbiculares; radicula supera, accumbens. **Arbor** (?). Folia *alterna, coriacea, tcnuiter eleganterque reticulata, petiolata.* Flores *parvi, breviter pedwellati in paniculas breves multjfloras axittares conferti.*

A. astylum, *Stapf (species unica).* *Rami* juveniles dense fulvo-pubescentes, citissime glabrati, teretes. *Folia* elliptico-oblonga, brevifter et suboblique acuminata, basi subacuta, 1^-4 poll, longa, 1-2 poll, lata, in gemma subtus dense fulvo pubescentia, citissime glabrata, matura coriacea, nitida, nervis secundariis utrinque 9-10 uti reticulatione utrinque eleganter prominulis ; petiolus crassiusculus, ad \ poll, longus. *Paniculai* ad 1^ poll, longa?, densiuscul«, omnibus partibus fulvo-pubescentes, breviter pedunculate; bractese mininue, pedicelli circa \ lin. longi. *Calyx* ad ^ lin. longus; segmenta ciliolata, laxe pubescentia. *Petala* subacuta, viridula, vix 1 lin. longa. *Antliera* £-{· lin. longse. *Drupa* semipollicaris.

BORNEO : Sarawak, near Euchbg, *Ilaviland,* 2860.

Androtium (AI-4/I and *wriav)* has quite the facies of a *finchanania,* of which it has also the peculiar structure of the gynreceum in common.

It differs, however, from *Buchanania* in the curiously shaped, strongly inflexed anthers, and in the sossile stigmas. The barren carpels are approximately cylindric bodies with their slightly thickened and almost glabrous tips gently curved outside. The only fertile carpel is much stouter, almost globose, and densely covered with stiff hairs, which hide completely the small sessile stigma. After the fall of the corolla the fertile carpel soon outgrows the barren ones, losing at the same time the hairs when the stigma becomes visible. It had, however, in all the flowers I examined, the appearance of a rudimentary organ, although the carpel always contained an apparently perfect ovule. It may therefore be that most of the flowers are functionally male. I found, in fact, among the more advanced carpels or young fruits up to 1 lin. long, only one in which the ovule had started **growing into a seed.**—OTTO STAPP.

Fig. 1, a flower; 2, petals and portions of the andrœcium and disk; 3, portion of **disk separated; 4, a stamen; 5 and G, pistillodia; 7, fertile carpel; 8, section of ttie same showing the ovule; 9, a fruit; 10, an embryo.** ***All, except fig,* 9, *enlarged.***

ERYNGITTM CRASSISQUAMOSUM, *Hemsl.*

UMBELLIFERJB.

E. (§ Spinescentes) crassisquamosum, *Ilemsl. (sp. nov.)*; ab *E. pectinato,* Presi, capitulis minoribus numerosioribus, involucri bracteia inulto minoribus integris, carpellorum squamis majoribus differt.

***Herba* ut videtur saltern 2-3 ped. alta. *Caules* graciliusculi, recti, rigidi, striati, supra medium alternatim ramosi, ramis terminalibus subumbellatis ssepe tricephalis, pedunculis lateralibus multo brevioribus. *Folia* coriacea, pinnatim spinoso-lobata; radicalia falcata, caudata, 1-2 ped. longa, absque spinis 5-6 lin. lata, lobis vel spinis oppositis vel alternis linearibus longioribus 9-10 lin. longis basi ssepe spinula minuta ornatis ; caulina prope basin paucispinosa, inferiora longissime caudata. *Capitula* numerosa, globosa vel ellipsoidea, ssepius 6-9 lin. diametro maximo, pedunculis striatis vel sulcatis. *Involucri bractece* circiter 9, rigidse, 6-15 lin. longse, deflexse, integne. *Pcde<e* rigidissimse, acutissimse, flores superantes. *Calycis denies* late ovati, mucronati. *Petala* apice denticulata. *Stamina* quam petala inflexa duplo triplove longiora. *Styli* breviores vix divergentes. *Carpella* (matura non visa) undique squamis niagnis crassis spongiosis vestita; vittae dorsales 5, commissurales 0 *1—E. pectinatum*^ Seem. Bot. Voy. Herald, p. 294, non Presl.**

MEXICO : Sierra Madre, *Seemann,* 2136.

The name Sierra Madre has been given to several different ranges of mountains in Mexico, and old and new maps are not uniform in this respect. The Sierra Madre of Seeraann's journey is in Durango, or perhaps partly in Sinaloa. In the ' Royal Atlas' the mountain range on the confines of North Sonora and Chihuahua bears this name, as also a range in Guerrero, where E. W. Nelson collected.

***Eryngium crassisquamosum,* Hemsl., is one of several species which have been taken for *E. pectinatum,* Presl. Particulars on this point are given in the letterpress to plate 2766.**

The Mexican and Central American species of *Eryngium* may be roughly classified by their leaves«into four sections, namely: 1, *Inennes;* 2, *Setoso-dentata;* 3, *Aculeate*;* 4, *Spinescentes*; the last being more robust and rigidly spinous than section 3.

The following briefly described species belong to the *ftpiiMftcentes,* **and** are similar to *E. crassisquamosum,* Hemsl., especially in having narrow, undivided involucral bracts.

E. Palmeri, *Ilemsl* (sp. *nov.).*

Ihrba 4-5 ped. alta inflorescentia subternatim ramosa, caule graciliusculo. *Folia radicalia* fere linearia, 1-2 ped. longa, remotiuscule spinosa, spinis oppositis vel alternis s&pe spinula minuta basi ornatis; caulina pauca, multo minora, basi spinis confertis. *Capitula* subglobosa, 9-12 lin. diametro. *Involucri bractęce* circiter 9, insequilongse, fere acicnlares, edentate, longiores bipollicares. *Palece* flores excedentes. *Petala* apice denticulata. *Carpella* (matura non visa) squamis acutis vestita.

MEXICO : Bio Blanco, Jalisco, *Palmer^* 681.

Pringle's 7623, Hills near Guadalajara, Jalisco, and Nelson's 4003, near Huachinango, Jalisco, are probably this species, but I have before me only drawings of the specimens.

E. **globosum,** *Hemsl (sp. nov.).*

Species *E. Palmeri,,* Hemsl., similis sed gracilior, minus rigida, foliis usque ad apicem spinosis; spinis ssepius binis subsequalibus. *Capitula* pauca, globosa, 9-12 lip. diametro. *Involucri brackets* circiter 7, lanceolate, 2-3 lin. longse. *Petala* apice denticulata. *Carpella* immatura squamis acutis omnino vestita.

PLATE 2766.

EBYNGIUM PECTINATUM, *Presl*

UMBELLIFERA:.

E. (§ Spinescentes) pectinatnm, *Presl,* ex DC. Prodr. iv. p. 96; inter species hujus sectionis foliis radicalibus angustis recurvis, involucri bracteis angustis alte plurispinosis sat distincta.

Herba erecta, glabra, circiter 3 ped. alta, caule 3-4 lin. diametro, ramis alternis vel terminalibus ternis monocephalis. *Folia* rigida, pinnatim spinoso-lobata, lobis vel spinis longioribus sesquipollicuribus ; radicalia 10-15 poll, longa, absque spinis usque ad 6 lin. lata, supra medium saepius inermia, longe caudata, recurva, marginibus inflexa, spinis basi ssepe spinula minuta m unit is ; caulina similia, sursum gradatim minora spinis confertioribus. *Capitula* pauca, oblonga, vel subglobosa, maxima 1 poll, longa et 9 lin. lata, pedunculis saepius nudis. *Involucri bractece* saepius circiter 7-9, rigidissimse, 1-1 £ poll. longse, reflexre, utrimque 1- vel 2-spinosae, spinis 2-4 lin. longis. *Palem* rigidissimae, mucronatse, flores excedentes. *Calycis denies* late ovati, apiculati. *Petala* apice denticulata. *Stamina* quam petala inflexa multo longiora. *Styli* divergentes, quam stamina breviores. *Carpella* (matura non visa), apice tantum paucisquamosa; vitta? 5, quarum 2 commissurales, vel 6, 3 commissurales.

MEXICO : in terris Mexicanis occidentalibus, *Haenke;* Foret del Desierto Vie jo, Vallee de Mexico, *Bourgeau,* 1177; near Ozumba, State of Mexico, *Rose & Hay,* 5354.

Through the courtesy of Dr. Hitter von Beck, Professor of Botany in the German University at Prague, I have been able to examine the original specimen of *E. pectinatum,* Presl, and compare it with the rich material in the United States, Kew, and the British Museum herbaria, with quite satisfactory results, although the original specimen bears no flowers.* Haenke travelled only between Acapulco and the city of Mexico, and the other specimens cited above are from the same district, and Rose & Hay's is the one figured. *E. pectinatnm* is one of the most distinct species of the group to which it belongs, but botanists have named at least half-a-dozen different species *pectinatum;* the name being more or less applicable to the leaves in each instance.

E. pectinatum, Benth. PI. Hartw. p. 38=*E. columnare,* Hemsl. Ic. PI. t. 2511. *E. pectinatum,* Coulter et Rose in Donnell Smith

* **Admirably executed, almost facsimile drawings of this and many other specimens received on loan have been made by Miss M. Smith for the Kew collection.**

Enum. Fl. Guat. ii. p. £9=27. *guatemalense,* Hemsi. infra. *E. pectinatum,* Seem. Bot. Voy. Herald, p. 291 ; Hems]. Biol. Centr. Am. Bot. i. p. 561, quoad specimen a cl. Seemann lectum=jE[r]. *crassisquamosum,* Hemsl. t. 2765.

The following species belong to the *Spinescentes* and are similar to *E. pectvriatum,* Presl, especially in having spinously lobed involucral bracts.

E. guatemalense, *Hemsl. (sp. nov.).*

Herba robusta, probabiliter pluripedalis, caule juxta inflorescentiam circiter 9 lin. diametro. *Folia radicalia* 1-2 ped. longa, absque spin is usque ad 9 lin. lata, per totam longitudinem regulariter spinosa ; spinse sscpius 6-9 lin. longae, intervallis ssepius 4-6 lin. longis, basi spinula minuta ornatae. *Gapitida* numerosa, hemisphserica, maxima \\ poll, diametro. *Involucri bractece* circiter 10, lanccolatse, acute, integre, usque ad 1^ poll, longse. *Palete* flores parum excedentes.

GUATEMALA: mountains near Hacienda de Chancol, at 11,000 feet, *Nelson,* 3654 ; San Rafael, Zacatepequez, at 6500 feet, *Helmrich.*

E. fltenolobum, *Hemsl. (sp. nov.).*

Herba 3-4 pedalis, caule 3-4 lin. diametro, supra medium trifurco, ramis iterum trifurcis monocephalis. *Folia* angusta, fere linearia, radicalia usque 18 poll, longa, omnia confertim spinosa, spinis geminatis fere sequalibus tenuibus aciculatis. *Capitula* subglobosa, 9-12 lin. diametro, pedunculis nudis 3-4 poll, longis. *Involucri bractem* circiter 5, insequales, angusta;, maximse 1J-2 poll, longte, saepius trifidte, lobis vel spinis lateralibus multo brevioribus. *Palem* flores longe excedentes. *Carpel?a* (mat lira non visa) ad angulos paucisquamosa, squamis par vis. *Vittce* 6, quarum 3 commissurales.

MEXICO : near Cuernavaca, Morelos, *Rose <t Hoiigh^* 4393. Specimen in United States National Herbarium ; drawing of the same at Kew.

E. monocephaluin, *Cav. Ic. PL* vi. t. 553, p. 35.

MEXICO : Sierra de Pachuca, Hidalgo, at 10,000 feet, *Pringle,* 8217. Specimen in the United States National Herbarium ; drawing of the same at Kew.

This identification is included, because several other species have been mistaken for this.

E. longispuLum, *Coulter et Rose, ined.* ? from Pedregal, Valley of Mexico, *Pringle,* 4359, is another species of this affinity and most nearly related to *E. guatemalense,* Hemsl., differing in having narrower leaves, deflected involucral bracts, and relatively longer pales.—W. **BOTTING HEMSLEY.**

S. BRAZIL, Sellow.

Saldanhaa is one of the three genera separated by Bureau and [illegible] from *Cuspidaria* DC., and nt .Damon, on tna discovery 01 wieir iruita, num *•«««/"«««-»»«, —_~-i —-- -- first included only the two specios *S. laterijlora,* Bur., and *8.·Mn f e f ^ flora,* Bur., both from Brazil, to which Otto Kuntzo *(Bar. Gen.* 11. p. 480) added a third, *8. seemanruana,* from Panama and Trinidad, lhese three are the only undoubted species of *Saldanhcm* which we have seen. In 1893 Bureau transferred *Bignonia mynantha,* Cham., to *Saldanlina,* and finally in the *Flora Brasilimsis* Bureau and Schumann added *S. ,vraiensis* and two doubtful species, A *heterocalyx* ™ *S. bracteata;* at the same time, however, Schumann pointed out the

close affinity of ft *myriantha* and *8. pratensis* to each other, and observed that, till the nature of their fruit was known, it would remain doubtful whether they really belonged to the genus *Saldanhcea.* The valves of the fruit of *S. jrratenais* (Spruce, 4232), preserved in the Kew Museum, showed at once that a new genus would have to be created to receive that species and *S. myriantha.* Additional characters separating *Xyhphragma* from *Saldanhcea* are the straight anther lobes, letraquetrous style, and the large number of rows of ovules in each chamber of the ovary. The structure of the wood is essentially the same as in *Safdan/uva.* According to Spruce the main stem of *X. praten&e* measures a foot in diameter, and the flowers, which are purple, have a scent like that of the Primrose.—T. A. SPRAOUE.

Pew plante illustrate better than the speeies -^™*Z£& the confusion which prevailed in the *Siyn^acea-J^* to *«.r«^ of that order by Bureau and Bailjon,and more recent; by-.»ol um ,i. Ori_Rina,,y described from Guinna u n d e r ^ ^ ^ X_ce" K i e h a^^y, this plant now possesses fourteen otnei ·

are here reduced for the first time, while the remaining eleven have been verified. It actually appears in De' Candolle's *Prodromns* as seven distinct species belonging to three different genera, but, singularly enough, has not previously been figured.

When in fruit the finely warted convex valves of *Paragonia pyramidata* afford a ready means of identification ; in flower, it may bo recognised by the velvety corolla, the large cupular disc, and the very thick walls and small chambers of the ovary. The best description of *P. pyramidata* is that by Schumann in the *Flora Brasilienris.* The present figure is of im Thurn's Corentyne River specimen, except the fruit, which is Jenman's 1341.—T. A. SPRAGUE.

FORMOSA : Tamsui, *Oldham,* 648 ; Takow, cultivated in plantations tor the edible shoots, *Henry,* 1955. South Formosa, *Maries.*

The drawing was made from specimens, communicated by Dr.

F. Francescbi of the Southern California Acclimatizing Association, Santa Barbara, California. According to him, this bamboo, which has been under cultivation at Santa Barbara for the last seven years, was imported from Japan, where it appears not to be native, but is imported by nurserymen there from the island of Formosa or from some point on the coast of southern China. On comparison with Henry's and Maries's specimens quoted above, it proved to be practically identical with them. The original of *B. Oldhami* differs slightly in so far as the branches are considerably thicker and so hollow that they are easily compressed, whilst the bracts supporting the spikelets or clusters of spiSelets are on the whole broader or shorter. The specimen is, however, somewhat defective and, as Munro remarked, partly abnormal; but there seems to me sufficient evidence of the specific identity of Oldham's plant and the plant figured here. Some of Henry's specimens are moreover quite intermediate, particularly with respect to the habit of the flowering branches. The cultivated Californian specimen has the leaves almost glabrous, even in a young state, but the very scanty pubescence of some of them is of the same kind as in the other specimens. *B. Oldhami* has, like the allied *B. kingiana,* more the habit of a *Dendrocalamit8>* but the floral characters are those of *Banibusa,* as it is understood at present. I may mention here in connection with this resemblance, that a part of Hance's 1050 at Kew, which is quoted by Munro under *Dendrocalamns,* is in fact a *Bambusa,* so similar to *B. kingiana* that the small flowering branchlet of which it consists cannot be distinguished externally from it.—OTTO STAPF.

PLATE 2774.

RHOFALOCARPTJS LUCIDUS, *Bojer.*

RHOPALOCARPACEA:.

The illustration of this singular genus was taken vp partly in consequence of the original description having been entirely lost sight of, and partly in consequence of all subsequent descriptions being more or less incorrect or incomplete, or both. Even the generic name has suffered. Bojer first published the misprinted name *liapolocarpus lucidus* in 1837 *(Hortus Mauritianus,* p. 44) without any description, and most, if not all, subsequent writers on the genus knew only of this publication, and were content with altering the spelling to *Ropalocarpus.* But Bojer published (*Travaux de la Societe dUIistoire Naturelle de Vile Maurice,* 1846, pp. 149-151) a very full and generally accurate description of his proposed new genus. The early publications of the Society in question, which subsequently became the Royal Society of Arts and Sciences of Mauritius, are exceedingly rare, fragments only existing in the libraries of Kew, the Royal and Linnean Societies, but not the one containing Bojer's description. For a copy of this Kew is indebted to M. Casimir de Candolle of Geneva, and it is reproduced below with a few corrections of obvious misprints, but otherwise as copied.

' Rhopalocarpus *(Boj.)* qui in Hort. Mauritiano nonien *Rapolocanyua* male scrib. Ord. Tiliacearum *1*

[1] Rh. alabastris globulosis magnitudine pisi minimi, appresse pilosis. *Calyc%8* sepala 4, orbiculata, concava, subhyalina, ante cvolutionem sepalis 2 exterioribus 2 interim involventibus, denium reflexis caducis. *CorolUe* petala 4, sepalis alterna, linearia, tortuoso-plicata, albida, basi longe angusta, esquamosa, cum sepalis caduca. *Stamiiia* circiter 40, libera, toro brevi et sub disco crasso colorato inserta, filamcntis subpatentibus subulatis luteo-viridibus tarde deciduis. *Antherw* medifixfe, horizontales, ovatse, utrinque retusre, croceaj, facie supenia planae, 2-loculares, pollinis globosis vesiculosis. *Ovarium* 1, superum 1-loculare (rarius 2locul) loculis 1ovulatis, disco lato, ad ortum albo-pilosum, pilis rigidis postmodo in spinis lignosis evadentibus. *Stylus* stam. longior et crassior, apice geniculatus. *Stigma* acutum, rubrum. *Fructus* globosus, pollicem fere in diametro, albidus, 1-locularis, 1-spermus, spinis crebris acerosis circumdatus, indehiscens. Pericarpium sub-

lignosum, eoriaeeum, sed facile fractum. Endocarpium in fructu porrecto opaco-gelatiiiosum nuci adhterens, in fructu maturescente (ex succo) testaceo-luteum, ex succo proprio productum, liberum, aut passim pericarpio adhserens. Nux soliHa, altitudine latior, reniforrais, transverse posita, nigra, infra medium umbilico strophiolato donata, juxta insertionem pedunculi adhserens, cajt. libera in vacuo locata. Albumen corneum ; processibus pluriniis lignosis nigris in albumine immersis. Cotyledones foliacea?, tenues, in foramine albuminis multiplicatw. Embryo inferus rectus in regione umbilici situs. Radicula viridis.—Arbor madagascariensis, ramis elongatis nutantibus. *Folia* alterna, petiolata, elliptico-ovalia, integra, lucida, glaberrima, penninervia. Stipula intra axillam acuminata, decidua. *Flores* terminales, parvi, pedicellis verticillatis. *Fructus* sphaericus, spinosus, *jEsculum Hippocastanum* aspectu semulans, pedunculus solidus, poUicaris, apice accrescens, cum fructu spinoso exacte forma clavse antique exhiben3, unde nomen gen. *(Rhopalon)* clava, *(karpos)* fructus.

(**Bh. lucidus** *{Bqj.).* Caule arboreo, foliis elliptico-ovalibus rotusis, mucrone brevi calloso, margine subcartilagineis integris lucidis glaberrimis, nervis mediis latis albidis, lateralibus tenellis, stipulis intra axillas solitariis acuminatis deciduis, flores terminales, parvi, pedicellis verticillatis, basi bracteis latis abbreviatis persistentibus, fructus sphwrici spinosi 1-loculares 1-spermi, nuces reniformes, nigire.

'Arbor 20 -25 pedalis, trunco brevi recto, cortice lievi, ligno albo flexili. Rami veteres recti, juvenes elongafci patentes v. penduli, terotes, cinereo-albi, apice virides, albo-punctati, glabri, ramul is confertis floriferis. *Folia* alterna, elliptico-ovalia, ovata v. obovata, integra, retusa v. emarginata, interdum calloso-mucro'iata v. mutica, crassiuscula, haud coriacea, subpatentia, plana v. carinata, utrinque concoloria, lucida, glaberrima, 3 poll, longa (inclus. petiolo tenello 7 lin.) pollicem lata, interdum niinora, vetera margine chartacea; nervis mediis latis supra planis, subtus convexiusculis, albidis (ex sicco nigrescentibus) venis tenellis vix conspicuis. Stipula unica axillaris, triangularis, acuminatci, petiolo duplo brcviora, decidua. *Flores* ad extremitatem ramulorum orti, foliis breviores, parvi, fugacei. Pedunculi terminales v. axil lares, ra.'<nu1osi v. simplices, apice pedicellis ternis quaternis verticillatim umbellatis strictis subtriquetris 6-lin. longis glabris, basi bracteis abbreviatis membranaceis persistentibus. Sepala cruciatim opposita, orbiculata, vix line-am diametro, concava, viridi-lutea. *Petala* linearia, basi anguttiora, subsphacellata, aJbida, fugacea, sepalis duplo longiora, caduca. (Stam. Anth. Ovar. Styl. ut in gen.) Spinis fructus crebris conoideis duris acerosis lineam loDgis, passim brevioribus. *Fructus* maturus exsuccus albidus, 1-spermus, rarissime 2-spermus.[1]

MADAGASCAR : sandy plains in Bombatok Bay, Western Coast, Bojer, 1824. Since cultivated at Mauritius, Kew, Calcutta, and oblier places. Kew possesses one of Bojer's original specimens.

Some passages in the foregoing description are not very clear, and in some cases it either does not agree with that observed, or does not

cover the whole range of variation observed in the various organs. * or instance, the sepals are sometimes 3 + 3 with 3 petals, and the ovary is 2-3-celled with 2-4 ovules in each cell.

The seed is indeed very peculiar. It is a depressed spheroid, broadly nbbed with shallow, narrow furrows, and the attachment to the pericarp is broad. Testa of two distinct layers : outer somewhat fleshy ; inner thicker, hard and cartilaginous. At the top of the seed there is a circular projection corresponding to the chalazal point from which, and other points of the testa, nipple-like and club-shaped masses of tissue grow into the horny albumen. The minute embryo with johaceous, lobed and undulated cotyledons occupies a cavity at the base.

*Rhopalocarpu** has been doubtfully referred to the Tiliaceie, Cappandacere, Ternstrcemiacere, and Flacourtiacew. The late Dr. Baillon, who described two additional species—*R. tripHnervii** (' Aclansonia,' Xi L[O]871 1 P" 106) and *B. thonarsianns* (' Bull. Soc. Linn. Par.' i. [1883] p. «393)--remarked in the latter place that its position became more uncertain with increasing material, and I cannot suggest a more satisfactory solution of the question than separation. There arc at least four species in the Kew Herbarium, one of which is probably -ft *thouarsianus,* Bail]. The others are :

B. similis, *I/emsl. (sp. nov.);* foliis iis *R. lucidi,* Bojer, simillimi.? sed fructu verruculoso non echinato differt.

CENTRAL MADAGASCAR : *Rev. R. Baron,* 3361.

B.. longipetiolatus, *Hemsl (sp. nov.);* a *R. triplinervin,* Baill., foliis amplis fructu grosse vermcoso recedit.

Ramuli fructigeri sericeo-pubescentes. *Folium* unicum visum longe petiolatum, crassum, coriaceum, fere orbicularo, 15-6 poll, diminetro, margine undulatum, apice emarginatum, basi vix cordatum, a basi ad apicem trinerve, venis conspicue reticulatis; petiolus tere3, 2-} poll, longus. *Fructus* compressus, didymus et 2-locularis vel subglobosus et 1-locularis, immaturus usque ad \\ poll, latus, undique grosso irrcgulariterque spongioso-verrucosus.

NORTH MADAGASCAR : *Rev. R. Baron,* 6479.

Flowers are wanting of all the five species known except the original *R. lucidus.* For the fresh .specimens used in preparing the accompanying plate wo are indebted to Major Prain, Superintendent of the Royal Botanic Gardens, Calcutta, who took much trouble to procure flowers and ripe fruit.—W. BOTTING HEMSLEY.

Fig. 1, portion of branch with the baso of a petioJo and interpetiolar stipule (or connate stipules); 2, a tetramerous eatyx; 3, a petnl in which the mucilaginous (?) glands aro visible; 4, stamens; 5, disk and gymccoum; 6, longitudinal section of an ovary, showing basal attachment of the ovules; 7, cross section of a two-celled ovary; 8, cross section of a three-ceiled ovary; 9, a fruit in which the indurated nase of the style is lateral in consequence of the development of only one cell; 10, tne same laid open, showing the one seed and un almost obliterated second cell—the

large projection on tho right is part of the indurated, enlarged style-base; 11, upper part of the removed testa, seen from the outside; 12, the inside of tho same; 13, a' seed from which the testa has been n moved, showing the base; 14, the same, showing tho top with the stopper-like chalazal point; 15, vertical section of a seed, to show the intruded tissue from the chalazal end and other points, and the small embryo in a basal cavity;* 16, embryo. *All, except* 10, *lZ9and* 14, *mare or less enlarged:* 15, *slightly*; 16, *very much.*

*** The shading of this figure failed in the printing, so that this darker tissue has tho appearance of cavities.**

PLATE 2775.

CAROLINELLA COBDIFOLIA, *Hemsl*

PKIMULACɆ/E.

C. **cordifolia,** *llemnl. (sp. nov.)*; a speeiebus liucustiue cogiiitis fuliis amplis cordatis omnino differt.

Herba perennis, scapigera, novellis plus minusve ferruginco-tomentosis, denium fere undique glabra. *Folia* longe petiolata, papyracea; petiolus gracilis, plano-semiteres, pnguste alatus, 3·9 pull, longus ; lamina papyracea, elliptico ovato- vel rotundato cordata, lobis hasilaribus obtegentibus, margine setaceo-dcntkulata et obscuie lobulata, supra glabra vej cito glabrescentia, subtus pracipue tecus venas ferrugiueo-puberula, costa subtus elevata, venis piimariis lateralibus utrinque 7-9 prominulis. *ftcapi* quani folia semper bieviorcs, graciles, teretes, erecti, infra flores nudi. /*lores* rosci, eireiter 6 Jin. diametro, 7-8 lin. longi, cymoso-iaceinosi, cjmis fructiferis elongaiis, graciliter pedicellati, perlicellis brevioribus bracteis linearibus suffultis, (Jimorphi, alii staniinibus altius affixis stylo bre\i consociatis, alii staminibus medio tubo aftixis stylo elongato consociatis. *Calyx* minute puberulus, tubulosus, 5-costatus; lobi august i, acutissimi, erecti, tubo paullo breviores. *Corolla* sparsissime minuteque puberula, liypocrateriinorpha, limbi lobis sub quad rat is eiosis binu unidtnticulato. *Ovarium* glabrum. *Capxula* calyptratim dehiscens, ora demum fimbriata. *Sernina* ignota.

CHINA ; Mengting mountains, Yunnan, in forests at 7500 ft. ***A. Henry,* 10890.**

We have figured this second species of *Carolinella* in order to complete the generic character (given under plate 2726) which, after all amounts to little more than the calyptrate capsule, as distinguished **from *Primula.***

In answer to inquiries, Dr. Henry wrote :—•The *Carolimlla*, with large cordate leases, was collected by me in the district of Mengting, south of the Red River, in a direction somewhat south-west of Mengtze. This was the extreme limit reac·hed by me on a trip I made south of the Red River, after crossing the preat range, which is the watershed between the Red and the Black Rivers, in a densely wooded virgin forest country. I turned back after descending two or three miles of the southern slope of the range, exactly at the point where

T discovered this plant. It grew on the side of the bank down the mountain, in the shade of an immense tree with a trunk eight feet in diameter, and in other similar shaded places.'

A third species from the same source is :—

G. obovata, *Hemsl.* («p. *nov.) ;* foliis oblongo-obovatis facile distingaitur.

Herba perennis, acaulis, scapigera, fere omnino glabra. *Folia* breviter petiolata, papyracea, venoso-rugulosa, oblongo-obovat* vel obovata, cum petiolo 1 £-6 poll., saepissime 3-4 poll., longa, maxima supra medium 2 poll, lata, apice late rotundata, basi cuneata vel anguste rotundata, margine obscure crenulata et interdum plus minusve calloso-denticulate,; petiolus subteres, supra leviter canaliculatus. *Scapi* gracillimi, folia saepius superantes, infra floras nudi, erecli, teretes. *Flores* rosei, circiter 5 liu. diametro et 6 lin. longi, cymoso-umbellati, cymis 5-10-floris, graciliter pedicellati, pedicellis quam flores brevioribus bracteis parvis linearibus sutfultis, dimorphi ut in specie precedenti. *Calyx* glaber vel cito glabrescens, breviter tubulosus, 5-costatus, dentibus acutis tubo aequalibus. *Corolla* hypocraterimorpha, limbi lobis bilobulatis. *Ovarium* glabrum. *Capsula* ignota.

CHINA ; on cliffs in forests south-east of Mengtze, Yunnan, at 5000 ft., *A. Henry,* 10626, 10626 A, and 10626 B.

It is probable that a thorough study of the Primulaceae of China will lead to further generic alterations.—W. BOTTING HEMSLKY.

CALANDRINIA GBANULIFERA, *Benth.*

PORTCJLACACEA.

C. granulifera, *Benth. Fl. Austral,* vol. i.p. 176 ; species ramulis fructiferis recurvis et capsula nigra nitida poro apicali dehiscente insignis

***Herba* monocarpica, 2-4 poll, alta, a basi multiramosa, giabra, ramis gracillimis. *Folia* carnosa, radicalia rosulata, spathulata, integra, 6-8 lin. longa, caulina pauca, similia sed minora. *Flares* numerosi, albi, circiter 4 lin. diametro, unilateraliter cymoso-raccmosi, breviter pedi-ccllati, bracteis minutis cito deciduis. *tiepala* ovato-rotundata, circiter 1 lin. longa. *Petala* ssopius 7, angusta, 1^-2 lin. longa, acuta. *Stamina* petalis duplo plura. *Semina* numerosissima, *J$* poll, diametro.**

WEST AUSTRALIA : **Dedari, twenty-four miles west of Goolgardie, at about 1,400 feet above sea-level, *G. II. Thiselton-Dyer.***

Mr. Bentham described this plant from rather advanced specimens collected by Drummond on the Swan River. He states that the capsules are usually indehiscent, but after being steeped in water for some time they open at the top by a circular pore. There are also indications that they split into two or three valves at a later stage.

Plates 2776 to 2783 were drawn from specimens collected between Perth and Coolgardie, in 1903, by Mr. G. H. Thiselton-Dyer, son of the Director of Kew. Mr. Thiselton-Dyer, who is a mechanical engineer, and was engaged on the official tests of the pumping machinery for the Coolgardie Water Supply, makes no pretension to botanical knowledge, but in the very little leisure he had, he succeeded in drying a collection of about two hundred species of plants. Having no means of transporting large parcels, and acting on advice, he confined himself almost entirely to small and chiefly inconspicuous plants, which constitute a most interesting element in the flora of West Australia. This miniature collection contains a number of curious plants, including two new genera and a considerable number of new and very rare species. Some of them had been collected previously by Dr. L. Diels and Dr. E. Pritzel, though the descriptions were not actually published. To these gentlemen, who made very extensive collections during 1900-1902, as well as to Mr. S. Le Marchant Moore, who also collected in the same region, I am greatly indebted for assistance in determining a number of doubtful things. I wish also to record here the valuable assistance I have received from Mr. L. Farina* in comparing this and other Australian collections.—W. BOTTING HEMSLEY.

LEGUMINOSiE. Tribe PODALYRIKiB.

Erichsenia, *Hemsl.* Genus novum inter *Viminariam* et *Davieaiam* sed stipulis, calycis forma, sustivatione, etc. diftert.

Calyx subbilabiatus ; lobi leviter inaequales, rotundati, tubo riuplo breviores; labium superius sestivatione interius, loborum marginibus contiguis valvatis; labii inferioris lobus intermedius omnino exterior. *Petala* omnia unguiculata ; vexillum reniforme ; al« dolabriformes; carinse petala alis similia, ultra medium connata. *Stamina* libera, alterna breviora. *Ovarium* sessile, biovulatum ; ovula estrophiolata. *Legumen* **ignotum.—Fruticulus. Folia *alterna, simplicity rit/ida, stijmlala.* Stipulse *bracteiformes.* Flores *mediocres, racemosi, bracteati.***

E. uncinata, *Ifemsl.* (species unica). *Frutex* nanus, a basi ramosus, ut videtur, vagans et forsan interdum major quam specimina sub oculis. *Caides* ramique glabri$_t$ teretes, graciles, virides. *Folia* pauca, teretia, maxima semipollicaria, apice uncinata. *Flores* lutei, purpureo-striati, circiter semipollicares, pedicellati; bractea) variabiles, herbacese vel scariosje, medio unicostatas, pedicellos involventes, apice acuminate vel trideutatae, dente intermedio ssspe indurato uncinato, lateralibus mollibus herbac*is. *Calyx* pilis longis albis sericeis dense vestitus, oblique campanulatus, subbilabiatus, petalis plus quam dimidio brevior; lobi rotundati labii superioris majores. *Petala,* pneter vexillum, ciliolata. *Stamina* glabra, omnino inclusa; filamenta filiformia. *Ovarium* glabrum, obliquum, stylo filiformi curvato incluso; ovula 2, fcubcollateralia, distincte funiculata.

WEST AUSTRALIA: Railway between Cunderdin and Dedąri, ***G. II. Thiselton-Di/er.***

This genus is named after Mr. Frederik Ole Erichsen, with whom Mr. Thiselton-Dyer was associated as assistant at the official tests of the pumping machinery for the Coolgardie Water Supply. This gentleman assisted in forming the collection alluded to in the Jetterpress to plate 2776.

There is always some ri»k in establishing a new genus in such a natural order as the Leguminosae, but the present plant is a very distinct one, and, so far as i can ascertain, had not previously been collected.—W. BOTTING HEMSLEY.

PHYLLOTA GEOBGII, *Ilmal*

LEGUMINOSJE. Tribe PODALYRIE/E.

P. Georgii, *I/emsL* (sp. nov.); species ex affinitate P. *Luelimanni,* F. Muell., a qua foliis diinidio minoribus apice inermis differt.

Frutex nanus, ericoideus, multiramosus, ramis gracilibus pubescentibus. *Folia* conferta, subsessilia, crassiuscula, albido-pubescentia, mollia, oblonga, 1-2 lin. longa, secundum margines arete refloxa, obtusa; stipulrc uulke. *Flores* in ramorum apicibus densissime capitati, brevissime pedicellati, aureo-purpurei, 4-5 lin. longi; pedicelli bibracteolati, bracteolis linearibus calyce brevioribus. *Calyx* sericeo-hirsutus, fere sequaliter 5-lobatus, lobis tubo brevioribus obtusiusculis, 2 superioribus latioribus. *Petala* oninia distincte unguiculata, glabra ; vexillum reniforme, circiter 5 lin. diametro; alre et carinoe petala similia, dolabriformia, apice rotundata. *Stamina* inclusa, ima basi cohajrentia, filamentis filiformibus glabris, antheris conforniibus. *Ovarium* breviter stipitatum, pilosum, biovulatum, stylo filifonni glabro incluso. *Ovula* distincte funiculata, ut videtur, estrophiolata. *Leguinen* ignotum.

WEST AUSTRALIA : Railway between Cunderdin and Dedari, *G. IF. Th%8elton'Dy&r.*

In the absence of seed it is difficult to determine whether this plant should be referred to *Phyllota* or *Vultewtia* ; but the absence of stipules, the slight cohesion of the stamens, the distinctly stipitate ovary, and the apparently ecarunculate ovules point to the former genus, as characterised in Bentham and Hooker's * Genera Plantarum.'—W. BOTTING HEMSLEY.

VERTICORDIA ROEI, *Endl.*

MYRTACEÆ. Tribe CHAMJELAUCIE^.

V. Boei, *Endl. in Ann. Wiener Mus. der Naturgesch.* vol. ii. (1838), p. 194; species a *V. insigni* foliis parvis crassis concavo-convexid recedit.

Frutex nanus, glaber, dense ramosus, ramis gracilibus. *Folia* sessilia, crassa, concavo-convexa, ramis saepe arete appressa, 1-3 lin. longa, dorso carinata, obtusa vel subacuta, nunc conferta nunc quam internodii duplo triplove breviora. *Flares* albi, circiter 6 ^ lin. diametro,\n axillis f§liurum superiorum solitarii, pedicellati; pedicelli quam folia saspius duplo triplove longiores, interdum pollicarcs, apice cupulatim dilatati, articulati; bracteolse 2, herbaceaj, orbiculares, alabastrum includentes, ante anthesin caducre. *Calycis limbi* segmenta 10, biseriata, 5 exteriora arete reflexa, 5 interiora crecta, omnia profunde plumoso-fimbriata. *Petala* 5, quam sepala breviora, crassiora, ovalia, argute dentata vel simpliciter fimbriata. *Stamina* 10, brevis-8ima, cum staminodiis palmatitidis totidein alternantia. *Ovarinm* 10-coitatum, praisertim infra medium tomentosum, unilocularo, stylo brevissimo. *Ovula* 2, placentae basilari excentricaj collateraliter affixa.

WEST AUSTRALIA : Railway between Cunderdin and Dedari, *G.* If. *Thi&elton-Dyer.*

Bentham *(Fl. Austral* vol. iii. p. 28) dealt with *Vertkordia lioei,* Endl., as * appearing to be only a small-leaved varioty' of *V. inmjni8%* Endl., but with more complete materials there is no doubt that it is Rpecifically different. The late Sir Ferdinand Mueller called attention to this fact when sending a specimen from the sources of the Blackwood River, collected by Miss Cronin, in 1893, but I cannot find that he published anything about it. In the Botany of the Elder Expedition, by Mueller and Tate *(Trans. Boy. Soc. S. Australia,* vol. xvi. part 3 11896], p. 354), a specimen of this species is referred to *V. insignia.* This was collected by P. A. Gwynne, eighty miles north-east from Esperance Bay. There is also a specimen in the Kew Herbarium from the Oldfield Range, collected by G. Maxwell. An original specimen, collected by J. S. Roe, is labelled 'Interior, S.W. Australia.' Kew now possesses *V. lioei* from five different and distant localities, and all the specimens agree in character, except that the one from the Blackwood River has unusually long pedicels.—W. BOTTING HEMSLEY.

F'g. 1, a pair of leaves attached to branch; 2, a flower enclosed by brueteoles; 3, calyx-lobes, two of the reflcied outer series and one of the inner orect series; *i a petal; 5, one of the teeth; 6, #stamcnsand staminodes; 7, stamens; 8, pistil; 9i section of ovary, showing attachment of tho ovules. *A U enlarged.*

PLATE 2780.

MICROMYBTUS ERICHSENII, *Ihmsl.*

MYRTACEÆ. Tribe CIIAJLELAUCIE/E.

H. Eiichsenii, *Ilemsl. (sp. nov.)*; species *M. Drummondii* simillima sed ab ea pedicellis quam folia brevioribus floribus minoribus et staminibus 10 recedit.

Frutex glaber, dense ramosus, ramis virgabis. *Folia* ericiformia, conferta, oblongo-clavata, \~-\\ lin. longa, appressa, concavo-convcxa, subtus carinata, crebre nigro-punctata. *Floret* albi, circiter 1 lin. diametro, ad axillas solitarii, hreviter pedicellati, pedicellis apice articulati. *Cafycis tubus* 5-costatus; lobi minimi, rotundati. *Petal a* orbicularia, circiter i lin. diametro. *Stamina* 10, alterna sepalis opposita minora. *(foarium* 1-loculare; ovula 2, ad apicem placentae filiformis a basi ad apicem loculi adscendentis collateraliter pendula. *Frudus* indehiscons. *Semen* unicum. *Embryo* somini conforniis; cotyledoned miiiiinse; cotyledones ac hypocotyledon reflexa^, radicula **crassissima.**

WEST AUSTRALIA : Dedari, twenty four miles west of Cooigardie, about 1,400 feet above sea-level, *G. H. Thisclton-Dyer.*

The full description of this plant leaves it a little doubtful whether it is specifically different from *M. Drummondii,* Benth. The same thing was collected by R. Helms, of the Elder Exploring Expedition, 1891, at Gnarlbine (about 121° E. long, and 31° S. lat.), and by Pritzel (n. 863) east of Southern Gross. These localities are all in the same inland district, while Drummond's specimens are from the Swan River. The filiform basal placenta is not shown in our figure, having been at first overlooked in these exceedingly small structures.—W. **BOTTIKG HEMSLEY.**

Fig. 1, a leaf; 2, a flower; 3, the same, from which two of tho petals hare beon removed; 4, stamens; 5, section of ovary, showing ovules; 6, embryo. ***All enlarged.***

THISELTONIA DYEBI, *Hemsl*

COMPOSITE. Tribe HELICURYSEA.

Thiseltonia, *Hemsl* Genus novum ex affinitate *Pithocarjxe,* sed involucri bracteis omnibus latis tenuissimis glabris tt antheris ecaudatis diversum.

Capitula homogama, multiflora, discoidea, floribus hermaphroditis, omnibus, ut videtur, fertilibus. *Involucrum* hemisphaericum; bractese multiseriatre, imbricatrc, omnes tenues, ecostatse, breviter unguiculata, serierum 2 vel 3 exteriorum breviores, cordiformes, rubescentes, cetera albas, ovatse. *Receptaculum* fere planum, nudum. *Corolla* regulares, tubulosse. *Antherce* oblongse, apice connectivo producto membranaceo appendiculatfe, basi obtusiuscule breviterque mucronatse. *Styli rami* apice truncati, barbellati. *Achamia* calva.—Herba *nana, annua, gracillima, ramosa.* Folia *alterna, subulata.* Capitula *tenninalia, distincte pedunculata.* Floras *minuti, numerosimi.*

T. Dyeri, *Hemsl.* (species unica).

Herba annua, circiter 6 poll, alta, caulibus pluribus divaricatis fere filiformibus foliisque minute glanduloso-puberulis. *Folia* linear-subulata, semiteretia, maxima 6-8 lin. longa, vix acuta. *Capitula* 6-8 lin. diametro. *Involucri bractea* interiores lamina alba petaloidea, unguiculo scarioso parlucido medio costa viridi instructie. *CorolM tubus* sursum leviter dilatatus, glandulosus; limbi lobi ovato-lanceolati, acuti, patentes. *Achamia* minuta, oblonga (matura non visa) puberula, pappo nullo.

WEST AUSTRALIA : Dedari, twenty-four miles west of Coolgardie, at 1,400 feet above sea-level, *G. II. Thisdton-Dyer.*

The plant represented in the accompanying plate is the only one known to us, and Dr. Diels writes that it is totally unknown to them in Berlin. In habit it strongly resembles some of the *Heliptera,* but the absence of a pappus is important in classification, though we are not sure that *Thiseltonia* is best placed next to *Pithocarpa,* with which it agrees in the involucral bracts being very numerous and arranged in many series, and in having no pappus. The very minute flowers are difficult to examine in a dried, pressed condition, as the glandular corollas stick together in an almost solid mass.—W. BOTTING HEMSLEY.

Fig. 1, a leaf attached to a branch; 2, one of the outer bracts of the involucre; 3, one of the intermediate bracts of *the involucre; 4, a flower; 5, anthers; 6, style-arms. *All enlarged.*

PLATE 2783.

MICROCORYS DIELSII, *Ilemsl.*

LABIATE. Tribe PKOSTANTIIKRIMS.

Microcorys Dielsii, *Ihmsh ($p. nov.)*; species a *M. harhata* foliis complicatis et floribus inulto majoribns differt.

***Frutex* ramosus, ramis gracilibua rigidisque mirute puberulis. *Folia* opposita, breviter petiolata, rigidiuscula, linpari-f&lcata, -^-1 poll, longa, arete complicata (saltern in siccis), puberula, apice breviter uncinata. *Flores* axillares, solitarii, distincte pedicellatj, circiter semipollicares. *Bracteolm* 2, lineares, calyci propinquai et ejus tubum aquantes. *Calyx* sericeo-villosus, leviter obliquus, fere ivqualiter 5-dentatus ; dentes erecti, acuti, quam tubus paullo longiores. *Corolla* extus puberula, dUtincte bilabiata; tubus lat us, calycem vix excedens, intus hirsutus ; labiuin superius jrqualiter bilobatum, lobis rotundatjs crenulato-undulatis; labium inferius trilobatum, lobo intermedio majore obcordato, omnibus crenulato-undulatis. *Stamina* 4, di-dynama, inclusa, antica longiora ; filamenta basi dilatata, barbata ; anticorum anthera inajqualiter biloculares, loculis connectivo applanato separatis; posticorum anthera; unilcculares, connectivi appendice applanato cristato. *Discus* cupuliformis. *Kuculcu* juveniles apice pubescentcs, stylo filiformi glabro incluso.**

WEST AUSTRALIA: **Railway between Cunderdin and Dedari, *G. II. Thiselton-Dyer.***

I am a little doubtful about the genus of this plant, as the stamens are more like those of some of the species of *Uemigenia,* but the calyx is not two lipped. The genera of the *Prostantlwrea* are not well defined, and the discovery of new species invalidates some of the characters upon which they were founded. Mueller *(Fragm. 1'hytogr. Austral,* vol. xi. p. 20) reduces *llemiandra* to *Hemigenia* and transfers his *Microcorys loganiacea* to *Hemigenia. Colobandra, Atelandra,* and *Anisandra,* genera founded mainly on modifications of the anthers, had previously been reduced by Bentham *(FL Austral,* vol. v.). Many of the differences in the stamens appear to be of no more than specific value. *Prostanthera* is perhaps the best defined genus of the group. -

W. BOTTING HEM8LEY.

PLATE 2785.

LIRIODENDRON CHINENSE, *Sarg.*

MAGNOLIACEÆ. Tribe MAGNOLIEA.

I. chinense, *Sarg. Trees and Shrubs*, vol. i. part 3 (Nov. 14, 1903), p. 103, t. 51 ; The Chinese Tulip-tree, *Ileinsl. in Gard. Chron.*, Nov. 28, 1903, p. 370 ; L. sp. nov., *S. Moore in Jonrn. BoL* vol. xiii (1875), p. 225 ; L. Tulipifera, var. ?chinense, *HeimL in Journ. Linn. Soc.* vol. xxiii. (188G), p. 25 ; L. Tulipifera, var. sinensis, *Diela in Engler Bot. Jahrb.* vol. xxix. (1901), p. 322.

Species a *L. Tulipifera* floribus dimidio minoribus, petalis angustioribus divergentibus, carpellorum columna tardius soluta et carpellis maturis apice rotundatis rectisque differt.

CHINA : Lushan mountains, Kiukiang, Kiangsi, *Shearer*, 1875 ; *Maries*, 1877; Chienshih, Paokang, Hupeh, *A. Henri/*, 5836, 5836 A, 5836 B, 1885-1889 ; Western Hupeh, 1049, *E. If. Wilton*, 1900 ; Chenkoutin, Eastern Szochuen, *R. P. Farges.*

The Chinese Tulip-tree has been gradually revealed to Western botanists. Shearer sent foliage; then Messrs. J. Veitch & Sons presented Kew with a specimen bearing one flower, collected by Mr. Maries, who noted: 'I found it in flower at the south end of the mountains. I do not think it so good as the American. Green flowers, one at the end of each shoot. It is a fine spreading tree.[1]

It **was** only after the arrival of the very complete specimens collected by Dr. Henry and Mr. Wilson that we were in a position to decide on its status as a distinct species, and I communicated its differential characters to the * Gardeners[1] Chronicle,[1] as cited above, at the same time announcing a fuller description in this place. Shortly afterwards Professor Sargent's figure and description reached Kew, but as our drawings were already made, and they in some particulars supplement his, they are now published.

The plate was prepared from Mr. Wilson's specimens, and it may be added that the foliage of *L. chinense* is as variable in form as that of *L. Tuiijyifera.* Dr. Henry's 5836 B consists of leaves from a young tree, the largest being **a** foot across.—W. BOTTING HEHSLEY.

Fig. 1, back view of an anther; 2, front view of the game; 3, a young fruit; 4, a ripe fruit; 6, a detached carpel; 6j lower part of the same, from which the wall hM been removed, showing the aeeds. ***Figs* 3 *and* 4 *natural size; the rest ware or Im enlarged.***

PLATE 2736.

SWIETENIA MAHAGONI, *Jacq.*, var. PIL2ECOCI-FLORA, *Htmsl.*

(Planta juvenilia florigera.)

MELiACEiE. Tribe SWIETENIEJE.

S. Mahagoni, *Jacq. Enum. Syst. PL Carib.* p. 20; *Catnby, Nat. Ih*t. Carol,* vol. ii. p. et t. 81 ; Linn. Sp. PL ed. 2, p. 548; *Lam. Eneycl.* vol. iii. p. 678 (Mahogoni); *C.DC. in DC. Monogr. Phaner.* vol. i. p. 723, t. 8, f. 11 (Mahogani).

Planlm plures 6-10 poll, altse, florigerse in Horto Botanico Trinitensi educate in Herbario Kewensi conservatae sunt. *Canfis* simplex, gracillimus. *Folia* alterna, graciliter petiolata, simplicia, tenuia, glabra, iniima miuora, elliptica, utrinque rotundata, cetera lanceolata, 2-3 poll, longa, basi rotundata, apice acuminata. *Flores* pauci in foliorum superiorum axillis solitarii vel 2-5 aggregatė, graciliter pedicellati, 2-3 lin. diametro, pentameri, glabri. *Calycis fobi* orbicula'-es, interdum fere liberi, petala sequantes. *Petala* orbicukria, erectu. *Tubus stamineus* campanulatus, 10-dentatus, petalis paulo brevior; antherae 10, breviter exsertse, cassoe vèl polline imperfecto. *Discus* nullus. *Ovarinm* rudimentare, solidum, stylo brevissinio, stigmate amplo capitato.

The specimens illustrating this remarkable instance of precocious flowering were sent to Kew in 1896 by Mr. J. H. Hart, F.L.S., Superintendent of the Royal Botanic Gardens, Trinidad, with a clue to their identity; otherwise we might, perhaps, have remained ignorant of the fact up to the present time. A complete investigation and comparison leaves no doubt that these specimens are really juvenile mahogany plants.

In reply to our questions Mr. Hart writes : ' The conditions under ynich they were raised were of the ordinary type ; the seed was sown m boxes rather thickly. It is probable that at some stage they suffered from want of water. I cannot remember exactly what became of the plants, but I distinctly remember their taking on normal growth.[1]

So far as I know, nobody has published any general account of the precocious flowering of plante and its causes. All field botanists are familiar with starved seedlings of *Aira prwcox, Papaver Rh<ea8,* and numerous other plants flowering when less than an inch high; but there are many instances of preco-ious flowering which are not so

easily explained, and the phenomenon is evidently due to a variety of causes and conditions. Since I first examined the case here illustrated I have found records of several similar occurrences, and my colleagues have called my attention to others. Of course I cannot enter into particulars here, but I hope to treat the subject more fully in another place at an early date.

A. P. de Candolle *(Physiologie Ve'gdtale,* vol. ii. p. 468) mentions the case of a seedling rose producing a flower-bud immediately following the development of the primordial leaves, and he adds: * Et j'ai cu en fleur dans le jardin de Genève des pins des Canaries âgés de quatre ans, et hauts de trois pieds sculement, quoique cet arbre s'élève jusqu'à soixante pieds dans son sol natal.[1]

In the Kew Museum there is a drawing of a germinating coco-nut, representing three simple, bifid leaves and a small inflorescence growing out from the shell. At this stage the albumen would hardly be exhausted.

Several authors mention the common oak and *Ailantus cfandnlo&a* as occasionally flowering in the seed-beds. Möbius *(Ikitrage zur Lehre tier ForVpfianzumj der Gewdchse,* p. 89) states that they die soon after the event, but this does not appear to be without exception. Sargent *(Silva,* vol. viii. t. 396) figures and describes a variety of *Quercus virginiafia,* from one to two foot high, wliiuh is common in the Fine Barrens of the South-eastern States of North America. It spreads by underground stems and freely bears fruit, which is usually largor than that of large trees. Ordinary *Q. virginiatia* commonly grows from thirty to forty feet high, and occasionally sixty to seventy, with a trunk six or seven feet in diameter. Professor Sargent does not state the age at which seedlings of this variety bear flowers and fruit.

Another remarkable instance of precocious flowering is described and illustrated by our friend Mr. Ed. André *{Revue llorticole^* 1894, p. 370). It is a variety of the common lilac, which throws up thick, fleshy suckers bearing flowers a few inches above the soil, often before the appearance of any leaves. The flowers are equal in colour, size, and fragrance to those produced at the ends of the branches of the normally developed shrub. It is not merely a casual occurrence ; the phenomenon is a fixed peculiarity of the race or sport. I presume it can only be propagated vegetatively.

Sir Dietrich Brandis *(Tlie Indian Forester,* vol. xxv. p. 22) figures a bamboo, *Dendrocalamus strictus,* flowering when only thirteen months old and less than a foot high.

The most recent contribution to the records of this kind is by Dr. J. C. Costerus *(Recueil des Travaux Botaniques Nderlandais,* vol. i. p. 128) entitled ' Ptedogenesis ?' and relates to the flowering of seedling plants, two or three inches high, of *Melia arguta.*—W. BOTTING HEMSLEY.

CHINA: Szechuen: Moupin, *A.David',* Chengkou, *Farges,* 1120; chiefly near Tachienlu, *A. E. Pratt;* Mount Omei at 2,500 ft., *B. Falter,* 129 ; South Wushan, *A. Henry,* 7232, 7337; Yunnan, *Delavay,* 7349 ; forests north of Mengtze, at 7,000 ft., *A. Uwmj,* 10746. Hupeh : Hsingshan and Fang, *A. Henry,* 6455, 6918 ; W. Hupeh, *E. 11. WiUon,* 1048.

I have described this species of *Eupteha,* as I understand it, in con-

siderablc detail, because Professor Van Tieghem and Dr. H. Solereder have come to quite different conclusions, working partly with the same material. As may be gathered from the numerous collections cited above, Kew now possesses a very copious set of specimens, every one of which I have examined. The result is the combination of all the Chinese specimens under *E. davidiana,* from which *E. polyandry* Sieb. & Zucc, the original species, a native of Japan, is easily distinguished by its unequally toothed leaves and uniovulate carpels. *E. pldosperma,* Hook. f. & Thorns., a native of Mishmi, North-east of Assam, is certainly very near the Chinese *E. davidiana,* Baill., but I think it undesirable to follow Dr. Solereder in combining them. The imperfect Indian specimens are apparently those of a more robust species, having unequally toothed leaves and differently shaped carpels.

Professor Van Tiegheni's species are mainly founded on the relative lengths of filament and anther and the number of ovules in each carpel. With the permission of Professor Ed. Bureau and through the kind offices of Mr. J. Poisson, I have been able to examine the actual types of *E. Francheti* and *E. Delavayi,* Van Tiegh., in the Paris Herbarium. Moreover, Kew possesses specimens of Henry's No. 7337 and Pratt's No. 77, cited by Van Tieghem as belonging respectively to the species named. Briefly stated, the anthers of *E. Francheti* are sometimes even shorter than the filaments, and the carpels are often biovulate and the mature ones dispermous. My observations on these and other points have been verified for me by Miss M. Smith and Dr. O. Stapf. I also find that the filaments of some of the stamens in Delavay's No. 3749 are as long as the anthers, and I believe that their relative lengths are to some extent due to age. In all the numerous specimens examined the number of ovules or seeds, as the case might be, was variable ; in some usually one or two, in others usually two or three.

The accompanying plate was wholly prepared from Wilson's specimens, numbered 1048, and many more drawings were made than are here published. Miss Smith opened one ovary in which she found only ono ovule ; all the others contained either two or three ovules. I have not found a single instance of a solitary ovule, but Dr. Stapf, who examined several ovaries while I was writing the foregoing, found, in seven examined, one uniovulate, four biovulate, and two triovulate. Most of the ripe carpels in Wilson's specimens are three-seeded.

I may add that the leaves present no essential differences, and both Dr. Henry and Mr. Wilson, who are familiar with *Euptelea* in a living state, came independently to the conclusion that all our Chinese specimens belong to one species.—W. BOTTINO HEMSLEY.

SEYCHELLES : **not uncommon in the forest on the Cascade Estate, Mahé, //. *P. Thomasset,* 31 and 54.**

The late Dr. Baillon founded this genus *(Adansonia,* vol. iv. pp. 211-219, tt. 3 & 4) on specimens collected by Boivin in the islands of Mayotta and Nossibe*, west of Madagascar. Mr. Thomasset, who is to be congratulated on the number of novelties he has discovered in the virgin vegetation of his estate, first-sent male flowers only, and we were unable to say to what order they might belong. Baillon (*Histoire des Plantes,* vol. v. p. 336) describes the Madagascar species as 'arbor adspectu Artocarpearum nonnullarum,' and that was our first impres-

sion of the Seychelles species. However, Mr. Thomassct soon supplied complete specimens, which led to the identification of the genus. We are also indebted to him for the figure of the ripe fruit.

Baillon describes the normal male flowers as apetalous, and he also found rudimentary stamens in the female flowers.—W. BOTTING HEMSLKY.

Mr. Baker described this singular plant from flowering specimens.

and referred it without doubt to the Ternstroemiacese, and Prof. D. Oliver followed him in placing it in this order. Now, with the fruit before me, I cannot suggest any alternative, but it is not closely allied to any genus of Ternstroemiacere. Indeed, the position of the leaves and the structure of the flower and fruit present a combination of characters more or less exceptional in this natural order. For example, opposite leaves are exceptional in the genera *Marila* and *Haplodathrum* ; very numerous cells in the ovary and solitary ovules, exceptional in *Anthodiscus,* and a fruit with septicidal dehiscence from the base, exceptional in *Archytasa,* In each case the other characters are very different from those of *Medusagyne.* It has also been suggested that this genus might belong to the *Guttiferce,* but the anatomical characters, the seed, and the fruit are not those of that order.

Mr. L. A. Boodle, Assistant in the Jodrell Laboratory, Kew, who has partially studied the anatomy of *Medusagyne,* finds that it differs from the *Gutti/erce* in possessing no secretory cavities, and in the type of the stomata; the latter being usually surrounded by four to six epidermal cells. This type of stomata does not materially differ from that of certain Ternstrcemiacese ; but the isolated sclerenchymatous elements so characteristic in the mesophyll of that order are not present. The presence of cortical bundles in the stem of *Medusagyne* is an important deviation from the anatomical characters of both *Guttiferce* and *Ternstrcemiacece,* but in this point it agrees with the neighbouring *DipterocarpacecB.* From the last-named order *Medusagyne* differs in having no resin-canals, and in the structure of the petiole.

We are indebted to Mr. Thomasset for flowering specimens and two old seed-vessels, in one of which was a solitary, apparently not quite perfect seed ; but there being only one, it has been preserved intact. Consequently the embryo remains unknown ; but the probabilities are that the seed is exalbuminous. — W. BOTTING HEMSLEY.

LENTIBULARIACE.E.

V. Ecklonii, *Spreng. Syst.* iv. ii. p. 336 ; *Stapf in Thisdton-Dyer, Flora Capensis,* iv. p. 430; *U. capensi* affinis, sed corolla multo minoro labio infero breviter 3-lobo diversa.

Herba terrestris, perpusilla, inter muscos herbasque nanas vel in solo humido reptans, interdum cajspitosa; stolones tenuiter filiformes vel capillares; rhizoidea e pedunculi basi vel e stolonibus vel e foliis orta. *folia* secundum stolones sparsa vel pauca ad pedunculorum bases 8ubrosulata ; laminae anguste spathulato-lineares, obtusre, longe in petiolum attenuate eo incluso ad 5 lin. longse, £ lin. latae. *Ulricidi* e stolonibus foliisque orti, ovoideo-globosi, J-£ lin. longi, bilabiati, labiis fimbriatis. *Pedunculus* filiformis, rectus, simplex, 1-3 poll, altus, 1-6-florus, floribus distantibus ; bracteae bracteolaeque ovato-lanceo-latse vel lanceolatae £-$ lin. long*, bractere 1-2 infim« plerumquo steriles ; pedicelli brevissimi, tandem fere 1 lin. longi. *Srpala* orbicu-iana vel ovato-orbicularia, ad \ lin. longa. *Corolla* pallide purpurca ©1 alba et purpureo-venosa, palato luteo vel tota lutea, 2-2 i lin. longa; labium superum ovatum, emarginatum vel integrum, % lin. «ngum, inferum rotundatum, leviter 3-lobum, 1-1 \ liu. longum; palatum lreve, subbigibbosum ; calcar labium inferum requans vel Bupcruns, luvitor curvatum vol roctum. *Anthvrm* \-\ lin. longw.; nlamenta ^ lin. longa ; pollinis grana globosa, 30 *p.* dimoticntia, vittis nieridianis tenuibus circiter 6. *Stigma* sessile ; labiura supcrum lineare, quam inferum late orbiculare brevius. *Capsula* globosa, 1 lin. vel ultra dimetiens. *Semina* magis minusve globosa, hcvia, \ lin longa.—*U. capensis,* Spreng. Syst. v. p. 723, et aliorum (in parte; non Spreng. Syst. i. p. 50); *U. Lchmannii,* Benj. in But. Zeit. 1845, P- 213 (e descriptione); *U. extii*,* Kam. in Engl. Bot. Jahrb. xxxiii. P- 97 (in parte, non Oliv.); *U. delicata,* Kam. 1 c; *U. brwhyceras,* fcjchlecht. in Engl. Jahrb. xxvii. p. 191; *Antirrhinum aphyllum,* Linn. f. Suppl p. 280; *Limria aphylh,* Spreng. Syst. ii. p. 797.

SOUTH AFRICA : In boggy places or in wet sand, from German pouth-west Africa to the Cape, eastward as far as Northern Transvaal iu the north and (Sraaff Reinet and Uitenhage Divisions in the south.

Sprengel credited his *U. Ecklonii* with 'foliis linearibus acubis strictis persistentibus;' but from a specimen in Sonder's herbarium, named *U. Ecklonii* by Sprengel himself, it appears that the leaves described in this way were the leaves of a dwarf or seedling *Cyperacea,* with which the *Ulricularia* had been growing. *U. delicata,* Kam., seems to be merely a particularly dwarf state of *U* Ecklonii,* while Schlechter's *U. brachyceraa* is, in my opinion, a short-spurred state of the same species, analogous to the variety *hrevicalcarata* Oliv. of *U. capensis.* Schlechter's specimens of *U. brachyceras* (see fig. 14) were collected on Fackhuis Mountain, Clanwilliam Division. Drège found the same form, together with the normal one, near Ellebogensfonteinsberg, Little Namaqualand.—OTTO STAPP.

Fig. 1, flowering specimen; 2, specimen with the scape undeveloped; 3, bladder; 4, flower, typical form; 5, calyx; 6, upper lip cf corolJa; 7, lower lip of corolla; 8, pistil and stamens, side view; 9, pollen; 10, seed; 1], flower, very small stato *(U. delicatula,* Kam.); 12 and 13, upper and lowur lips of the same; 14, flower with sliort-epurrud corolla (*U. braetyecras,* Schlccht.). *All enlarged except* 1.

A. UTBICULABIA CAPENSIS, *Sp-eng.*

LENTIBULABIACEA:.

V. capensis, *Spreng. Syst.* i. p. 50; *Stapfin Thiselton-Dyer, Flora tapcnsis,* iv. p. 429; *U. Ecklonii* affinis, aed corolla mu!to majore labu) infero semi-orbiculari undulato vel vix lobato diversa.

Herba terrestris, pusilla; stolones et rhizoidea ut in *U. Ecklonii. Folia* et utriculi ut in *U. Ecklonii* (vide tab. 2793). *Pedunculus* filitormis vel subcapillaris, 2-8 poll, longus, rectus vel subflexuosus, simplex, rarius prope basin ramulo 1-2 additis, 1-6-florus, floribus distantibus; bracteae ovato-lanceolate vel lanceolate, iufimio 1-2 plerumque steriles, bracteoloe lanceolatae, £ lin. longse; pedicelli breves vel tandem ad vel ultra 1 lin. longi. *Sepcda* orbicularia vel ovato-orbicularia, §-$ lin. longa. *Corolla* palato amplo flavo excepto pallide purpurea, 3-5 lin. longa ; labium superum ovatum vel ovato-orbiculare, minute 2-lobum vel emarginatum, 1 lin. longum, labium inferum semi-orbiculare, 2^-4 lin. longum, latissimum, obsolete lobatum vel undulatum ; palatum lseve, leviter bigibbosum ; calcar tenue, ssepius acutum, rectum vel subcurvatum, subhorizontale vel deflexum, labium superum magis minusve sequans. *Antherce* circiter 3 «n. longae ; filamenta filiformia \ lin. longa; stigma sessile ; labium superum subulato-lineare vel filiforme, quam labium inferum late orbiculare brevius. *Capsula* globosa, ad 1J lin. dimetiens. *Semina* subglobosa velirregulariterobovoidea, £-£ lin. longa, tenuiter reticulata.—K *Sehmannii,* Kam. in Engl. Jahrb, xxxiii. p. 99; *U. Sprengelii,* Kam. 1. c p. 100; *V. Schinzii,* Kam. 1. c. p. 101.

SOUTH AFRICA : Western and South-western Divisions of Cape Colony, from Little Namaqualand to Uniondale Division.

Certain flowers from Giftberg and Modderfonteinberg have much reduced spurs (see fig. 10); they represent Oliver's var. *brevkalcarata* of *U. capensis* (Journ. Linn. Soc. ix. p. 154). There are, nowever, also perfectly normal specimens and intermediate states among the Giftberg collection.—OTTO STAPF.

j^g« 1, flowering specimen; 2,•portion of a stolon with leaf and bladders; «. bladder; 4, flower, typical form, front view; 5, flower, typical form, side view; 8tamens; 8, pistil, side view; 9, seed; 10, flower with short-spurred oila *Allenlarged^ceptl!*

B. UTRICULARIA SANDERSONII, *OUv.*

IT. Sondersonii, *OHv. in Journ. Linn. Soc.* ix. p. 155; *Stapf in Thiselton-Dyer, Flora Capensis,* iv. p. 431 ; e grege *U. capensia,* labio supero profunde 2-fido distinctissima.

***Ilerba* pusilla, terrestris; stolones capillares, parce ramosi. *Folia* pleraque per anthesin persistentia, rosulata et secundum stolones sparsa, obovata-orbicularia vel obovato-spatulata, apice rotundata, basi cuneata, maxima ad 2 lin. longa, ad 1^ lin. lata, plerumque multo minora; petioli brevissimi vel laminam cequantes. Utiiculi numerosi, e stolonibus foliisque orti, globosi vel ovoideo-globosi, g-& lin. longi, 2-labiati labiis ad margines et in faciebus glanduloso-fimbriatis. *Pedunculus* filiformis vel capillaris, ascendens vel erectus, 1J poll, longus, simplex, 1-3-florus, floribus sua longitudine vel minus distantibus; bracteae bracteoheque ovato-lanceolatae, g lin. longte, bracteae infimre 1-2 steriles ; pedicelli graciles, 1 lin. lonjji. *Sepala* elliptica vel orbicularia, superum infero longius latiusque, 1 lin. longum. *Corolla* purpurea, 6 lin. longa ; labium superum ultra 2 lin. longum, profunde 2-lobum, lobis ovato-oblongis; labium inferum, cuneato-suborbiculare, *2*\ lin. longum ; palatum subbigibbosum, laeve ; calcar gracile, curvatum, 4 lin. longum. *Antherce* ultra *I·* lin. longse ; filamenta linearia ; pollinis grana globosa, vittis circiter 9 meridianis, 30 /i diametro. *Stylus* stigma sequans, distinctus; stigmatis labium superum ovato-oblongum, quam inferum late ovatum vel orbiculare brevius. *Capsula* ignota. *Semina* globosa, tenuissime reticulata, \ lin. dimetientia.—*U. Treubii,* Kam. in Ann. Jard. Buitenz. 1898 ; Suppl. ii. p. 143.**

SOUTH-EAST AFRICA : **On wet rocks in Fondoland and Natal.**

There were among the specimens collected by Dr. Bolus at the mouth of St. John's River, Pondoland, a few seedling plants with the testa still attached to them (see figs. 12 and ID).—OTTO STAPF.

Fig. 11, flowering: specimen; 12, young specimen, attached to the seed, with the scape still undeveloped; 13, germinating seed (#, petiole of primary leaf ;&, stolon, cut; c, primary axis ?; *d,* rhizoid); 14, bladder; 15. flower; 16, upper corolla, Lp; 17, pollen; 18, pistil, back view. *All enlarged except* 11.

AFRICA : From the Transvaal to Fondoland and Natal (see Fl. Cap. I.e.). MADAGASCAR: East-Imerina, Andrangoloaka, *llildebrandt,* 3726, Parker, 5483 ; Ambohimitombo forest, *Forsyth Major*$_y$ 241; Central Madagascar, *Baron,* 4317.

Kamienski, in Engl. Bot. Jahrb. xxxiii. (1902), 102, quotes what he considers as the typical form of *U. prehensile* from ' Angola (Welwitsch, Iter angol. n. 261, Golungo),' and the variety *huiUensis* from 'Benguella (Welwitsch, Iter benguellense, n. 261, Dist. Huilla).[9] Specimens were actually distributed from Lisbon with the inscription [1] Welw. Iter Angolense, 261, *Utricularia prehensilis,* E. Mey., Golungo Alto;' but there is no such label in Welwitsch's collection at the British Museum, and the supposed Golungo Alto specimens are evidently also from Huilla.—OTTO STAFF.

Fig. 1, (lowering specimen, typical form; 2, fluwer; 3, sepals; 4, upper corolla lip; 5, lover corolla lip; 6, pistil and stamens, front view; 7, pollen; 8, beed ; 9, embryo; 10, flowering specimen, dwarf state with straight peduncle (var. *huiUensis,* Kam.); 11, stolen with very young peduncle, with a rosette of loaves an<! stolons at the base; 12, base of a pedune'e with rhizoids and stolons at the base; 13, end portion of a rhizoid; 14, bladder. *All enlarged except* 1 *and* 10.

ft., Calvinia, *Zeyher*; oort, near Carnarvon, *Burchell,* 2680; near ver, *Shaw.*

Hopetown, *BureheU,* 2663/2; on the Orange

The irenus *Rhiqozam.* comprises at least seven species, nativei of TrJpiTa^ SouS Africa. BurcheU founded the genus on J. *tomum* and *R. obavatum* ('Travels' vol. i. pp. 299,389). he says merely: • That part of it [the track] next to «ie abounded in bushes, three and four feet high, of *Rhigomm trichotomum,* whose stiff branches, constantly dividii and subdividing, in a most regular manner, »J>.fl«ees, present a very rare and curious ramification, and have ^^^i\^f name of 2)nd(>or»-Three-thorn.' Of *R. obovatum* he g;^*JJes following diagnosis :' Frut*x 6-pedalis. Ramuli alterni honzontales. Folia

er rgen that singular shrub

obovata.' The meagreness of these descriptions gave rise to confusion between the two species, and Fenzl *(Denkschr. Bot. Geaelhch. Reyensb.* iii. p. 201, t. 5) figured and described as *R, trichotomum* the true *R. obovatum,* Burch., a much more widely spread plant; and in this mistake he was followed by Bureau *(Monogr. Bignon.* 1.19), Schumann *(in Engl. & Prantl, Pfianzenfam.* iv. 3, B., p. 233), and other botanists.

The accompanying figure represents Shaw's Orange River specimen.

It will be useful to add a description of *R. obovatum.*

***Frutex* 5-8-pedalis, ramis alternis vel oppositis, ramulisque patentibus. *Folia* simplicia vel trifoliolata, fasciculate, tomentella, demum glabrescentia, petiolo gracili 1-3^ lin. longo, lamina obovata vel obovato-oblonga, nonnunquam emarginata, 3-7 lin. longa, 1^-3 lin. lata. *Florum fasciculi* semper laterales. *Calyx* breviter campanulatus, 2-2^ lin. longus, lobis leviter mucronulatis, costis inconspicuis, tomentellus, glandulosus. *Corolla* campanulato-infundibuliforniis, 7-8 lin. longa, lutea, parte cylindrica basali caiycem eequante, extus superne, intus ore et infra staminum insertionem pilosa ; lobi suborbiculares, 4 lin. diametro, ciliati. *Stamina* 6 lin. supra corollse basin inserta, filazuentis 3 lin. longis, antheris muticis, lobis inferne parallelis vel leviter divergentibus, 1 \-*2* lin. longis. *Ovarium* vix 1 lin. longum. *Copsula* elliptico-oblonga, 1-^-2 poll, longa, 7-10 lin. lata, rostro 5-6 lin. longo. *Semina* nucleo orbiculari, ala hyalina 2-2J lin. lata.**

SOUTH AFRICA : Between Spuigslang Fontein and the Vaal "River, Griqualand West, *Burchell*$_y$ 1713; near Hamapery, Bechuanaiand, *Bnrchell,* 2487/6. It also occurs in George, Uitenhage, Albany, British Kaffraria, Somerset, Graaff Reinet, and Aliwal North.—T. A. SPRAGUK.

***R. trichotomum*^ Burch.**

PLATE 2800.

MARKHAMIA PLATYCALYX, *Sjrrague.*

(With Parts of other Species.)

BIGXONIACEJE. Tribe TECOMEA.

Markhamia platycalyx, *Sprague. Arbor* 30-40-pedalis, ramulis quadrangularibus, novellis dense lepidotis. *Folia* \-*l* ped. longa, 2-4-juga; foliola breviter petiolulata, elliptico-oblonga vel obovata, apice breviter abrupte obtuseque acuminata', mucrouulata, basi cuneata, 2-5£ poll, longa, 1 \-*2%* poll, lata, integra vel serrata, serrulis nnnoribus interjectis, utrinque subtus densissime lepidota, glandulis patelliformibus prope nervum medium inspersis, subtus in axillis venarum pilosa, inconspicue reticulata, venis lateralibus subtus ut nervus medius valde prominentibus, utrinque 4-5; pseudostipulte foliaceae suborbiculares *i-l* poll, diametro. *Paniculce* terminates et axillares, e racemis cyraarum pluriflorarum composite ; pedicelli 3-5 lin. longi, ut rhachis nodi dense pubescentes. *Calyx* cynibiformis, apice breviter obtuseque cuspidatus, basi in pedicellum attenuatus, 7-8 lin. longus, postice ultra medium vel brevius fissus, extra pubescens, denseque lepidotus, intra iudumento sparsiore. *Corolla* lutea, intra antice rubro-vittata, breviter patenter pilosa, utrinque lepidota, conspicue venosa; tubus 1£-1£ poll, longus, supra campanulatus, parte basali cylindrica 4 lin. longa, 1£ lin. diametro; lobi obovato elliptic!', 6-7 lin. longi, utrinque glandulis magnis patelliformibus ornati. *Stamina* 4£ lin. supra corollie basin inserta, ń'lamentis basi valde incrassatis furfuraceo-pilosis, antherarum lobis 1} lin. longis. *Discus* cupularis, crassus, \\ lin. altus. *Ovarium* oblongum, 3^ Tin. longum, densissime lepidotum, brevissime pubescens ; stylus 1 poll, longus, stigmatis lobis ellipticis apice bifidis. *Capmla* circiter 1 ped. longa, 4£-5 lin. lata, minute puberula et lepidoia, valvis nervo medio valde prominente percursis. *Semina* 9 lin. longa, \\ lin. lata, nucleo 3.^ lin. longo.— *Dolichandrone platycalyx,* Baker in Kew Bull. 1894, p. 30.

UGANDA : Near Entebbe, 4,000 ft., *Malion* ; Usoga, *Scott-Elliot*^ 7208 ; Wimi Valley, 7,000 to 8,000 ft., *Scott-Elliot,* 7830; without precise locality, *Wilson,* 119.

In Uganda the native name of this tree is *Lusambia,* and it is said on the authority of Mr. John Mahon, to yield the finest of local timbers.

The only *Markhamia* with which it is likely to be confused is *M. Hildebrandtii (Dolichandrone Hildebrandtii^* Baker), which is distinguished by having an uncinate calyx and a more funnel-shaped corolla (fig. 9).

The genus is divided into two very natural sections according to the form of the pseudostipules. In seven of the ten species, including *M. platycalyXy* they are foliaceous and orjuLcular; in the remaining three they are conical or subulate, as shown in fig. 8. This character separates *M. lutea* and *M. tomentosa* at the first glance. These two species were described by Bentham, under *Spathodea,* in Hooker's [1] Niger Flora,' pp. 461-462, where the only character given to separate *Spathodea tomentosa* from *8. lutea* is the (soft, rusty down' on the under surface of the leaves of the former, contrasted with the puberulous or glabrous leaves of the latter. With the help of the additional material of the two species now in the Kew Herbarium, they may be defined as follows :—*M. lutea* has foliaceous orbicular pseudostipules, corymbose panicles, a lepidote calyx, and narrow lepidote capsules. *M. tomentosa* has conical pseudostipuTes, elongated oblong panicles, a tomentose calyx, and relatively broad, softly pubescent capsules. Yogel's specimen from Fatteh, on the Quorra, quoted by Bentham under his *Spathodea lutea,* is a glabrescent-leaved form of *M. tomentosa.* The original description of *Spathodea lutea* combines some-of the characters of *M. lutea* with others of *M. tomentosa.*—T. A. SPRAGUE.

Fig. 1, portion, of branch with leaf and pseudostipules; 2, inflorescence ; 3, portion of corolla, showing attachment of stamens; 4, anther ; 5, pistil and disk; 6, stigma; 7, cross section of ovary; 8, node and pseudostipules of *Markhamia lanata,* K. Schum.; 9, flower of *M. Hildebrandtii,* Sprague. *Figures* 1, 2, *and* 9 *natural size; the rest enlarged.*
