PLATE 101

WOODSIA MACROCHL-fflNA Mettenius

POLYPODIACE^E

WOODSIA MACROCHUENA Mettenius ex Kuhn, Journ. Bot. (1868) 270; Linnsea 36: 126 (1869); C. Chr. Ind. Fil. 657 (1905); Suppl. III. 195 (1934); Fomin, Fl. Sib. et Orient. Extr. 5: 10 c. fig. (1930); Ching, Sinensis 3: 143. 1932.

Woodsia insularis Hk. et Bak. (non Hance, 1861) Syn. Fil. 47 (1867).

Woodsia Brandtii Franch. et Sav. Enum. Pl. Jap. 2: 205, 616 (1879).

Woodsia japonica Makino, Bot. Mag. Tokio 18: 134 (1904); Ogata, Ic. Fil. Jap. 3: t. 149 (1930).

Woodsia sinuata Makino, Bot. Mag. Tokio 11: 64 (1897, non 1904); Christ, Bull. Acad. Géogr. Bot. 20: 157 (1909, non 1902).

Woodsia frondosa Christ in Fedde. Report. Sp. Nov. 5: 12 (1908).

Rhizome short, erect, densely radicose, apex densely clothed in bright brown, lanceolate, acuminate, sparsely fimbriate scales; *fronds* fasciculated, stipe 2-10 cm long, straminous or brownish, scaly at base, hirsute upwards, lamina 5-12 cm long, 2-4 cm broad, pinnate under pinnatifid acutish apex, *pinnse* 5-12-jugate, the lower ones free, subsessile, the upper ones adnate, the basal pair springs from the prominent articulation of stipe, always somewhat smaller than those above, deflexed, ovate-deltoid, with more or less auriculate anterior base, the middle pinnae 1.2-2 cm long, oblong-ovate, adnate with wingless rachis between contiguous pairs, lobato-sinuate or pinnatifid into oblong sinuate segments, rachis and both sides moderately clothed in ferruginous needle-like, articulated appressed hairs, no trace of scales; *texture* herbaceous, soft; *veins* in segments pinnate; *sori* large, terminal on veinlets, 1-2 to each lobe, or 4-6 to each segment, *indusium* cup-shaped, large, membranaceous, setose hairy, irregularly 4-6 eroded at top; *sporangia* shortly stipitate.

Shantung: Chefoo, Schottmuller (type), August, 1861; B. Drug 285, Sept. 17, 1907; A. C. Mainrjay 13, August-Sept. 1862; Cowdry 6U (1920); Forbes 2233 (1881); Wei-hai-wei, C. G. Matthew, Sept. 1906. Shansi: E. Licent (without locality). Manchuria: Swinhce 6516 in herb. Hance. Port Arthur: Miss Mbller, Oct. 28, 1928.

Corea: Ouen San, U. Faurie 101 (type of *W. frondosa*). Quelpaert: U. Faurie 5610, 2172 (f. typica).

Japan: Prov. Chochiou, Kramer 1569 (type of *W. Brandtii*); C. G. Matthew, July 23, 1906.

For further comment and discussion about this distinct but hitherto much neglected fern, readers are referred to my paper on the genus *Woodsia* in *Sinensis* 3: pp. 143.

Plate IOI. Fig. i. Habit sketch, f. typica (natural size). 2. Upper middle pinna, showing venation and sori (x 6^{1/2}). 3. Sorus with indusium (x 20). 4. the same, cut vertically (x 20). 5. Scales and hair from the base of stipe (x 16). 6-7. Hairs from rachis and leaf surfaces (x 30). 8. Basal pinnae attached to the articulation of stipe (x 20). 9. Sporangium (greatly enlarged). 10. Spores (greatly enlarged).

百零一圖
* *m & m* (水龍骨科)

WOODSIA MACROCHLAENA Mettonius

地下莖短而直立，頂部具淺黃色之披針形密鱗片；葉簇生，柄長二至十公分，淡黃綠色，基部具鱗片，上部遍被剛毛，葉體長五至十二公分，寬約二至四公分，一回羽狀分裂，下部小葉幾無柄，基部一對着生於葉柄頂部之節上，較小，下向，上部小葉與中肋合生，長約一。二至二公分，梢圓卵形，波狀分裂，或深裂，中肋及兩面被短剛毛，不具鱗片，紙質；葉脈羽狀分裂；子囊羣形圓，着生於側脈之頂，蓋為圓杯形，膜質，被剛毛，頂部開裂，口具四至六數鋸齒。

分布：山東北部，河北，陝西，東三省；朝鮮及日本亦產之。

本種為亞洲東北部特有之種，最初在山東煙台發現，現為華北常見之品。

圖註：1. 本種全形(自然大)，2. 中部小葉，表明其葉脈及子囊羣着生狀(放大六倍)，3. 子囊羣與蓋(放大二十倍)，4. Ri » afittWCA ^ iUMS) » 5. 葉柄基部之鱗片及剛毛(放大十六倍)，

PLATE 102

WOODSIA MANCHURIENSIS Hooker

POLYPODIACE^E

WOODSIA MANCHURIENSIS Hooker, 2nd. Cent. Ferns t. 98 (1861); Syn. Fil. 48 (1867); Milde, Fil. Europ. et Atlant. 168 (1867); Christ, Farnkr. d. Erde 283 (1897); Diols in Engl. u. Prantl: Nat. Pflanzenfam. 1: 4. 161 (1899); C. Chr. Ind. Fil. 657 (1905); Fomin, Fl. Sib. et Orient. Extr. 5: 9 (1930); Ogata, Ic. Fil. Jap. 5: t. 249 (1933).

Diacalpe manchuriensis Trev. Nuov. Giorn. Bot. Soc. Ital. 7: 160 (1875).

Physematvwm manchuriensis Nakai, Bot. Mag. Tokio 39: 176 (1925).

Woodsia insularis Hance. Ann. Sci. Nat. IV. 15: 228 (1861); Diels in Engl. u. Prantl: 'Nat. pflanzenfam. 1: 4. 161 (1899).

Rhizome short, erect; *scales* light brown, thin, ovate-lanceolate, acuminate, clothing the apex; *fronds* cespitose, stipe short, terete, 2-5 cm long, glossy, stramineous, sparsely scaly, lamina lanceolate, 10-30 cm long, 2-4 cm broad, or even broader, membranaceous, clear light green, glabrous on both sides, deeply bipinnatifid under pinnatifid acuminate apex, rachis glabrous, deeply sulcate above; *pinnae* 15-40-jugate, oblique, sessile, the lower ones much abbreviated and opposite, the upper ones alternate, 1-3 cm long, oblong-obtuse, base truncate, deeply pinnatifid; *segments* 5-8-jugate, oblique, oblong-ovate, obtuse, entire or slightly sinuate; *veins* pinnate, 2-3-jugate, veinlets fine, oblique, fall short of the margin with enlarged apex; *sori* large, on the anterior basal veinlets of each segment, below the sinus, *indusium* large, globose, gray, thin membranaceous, opening with a toothed edge of the contracted mouth at the top.

Shantung: Chefoo, Hancock 11; W. R. Carles, Sept. 1889; E. Faber 1060, Oct. 1898; Tai-Shan, Jacob 39, July 11, 1923; K. S. Hao 1730, July 10, 1931 (partly). Manchuria: C. Wilford 1094 (type), July-August, 1859; H. E. M. James, May-August, 1886; Komarov 2\ Chien-shan, /. Ross 594 (1877); Kirin, F. H. Chen 201 (1931). Hopei: Tsang-ho, M. S. Clemens 6038A, August 9, 1913; Changli, M. S. Clemens, Oct. 13, 1913.

Also Corea and Japan.

One of the most distinct species of the subgenus *Physematium*, characterized by light green, membranaceous glabrous leaves and large, membranaceous sac-like indusium opening by the contracted mouth at the top. Its occurrence in North China is said to be by no means common. *W. insularis* Hance, based upon Clarke's plant from Sagalien, only represents a small form of this species, evidently growing in a dry situation.

Plate 102. Fig. 1. Habit sketch (natural size). 2. Pinna, showing venation and position of sori (x 5). 3. Sorus with one side of the indusium removed (x 50). 4. Spores (greatly enlarged). 5. Scale from rhizome (x 30).

IB — W * 二 圖

PLATE 103

DAVALLIA MARIESII Moore

POLYPODIACE^E

DAVALLIA MARIESII Moore ex Baker, Ann. Bot. 5: 201 (1891); C. Chr. Ind. Fil. 212 (1905); Nakai, Bot. Mag. Tokio 39: 120 (1925).

Davallia btdlata Franch. et Sav. Enum. PL Jap. 2: 208 (1877); Christ in Warburg, Monsunia 1: 86 (1900).

Rhizome thick, 7 mm across, long-creeping, densely scaly; *scales* large, imbricate, lanceolate from broadly ovate base, fimbriate, ferruginous on the growing **tip**, but whitish on the old part; *frond* far apart, articulated at base, stipe **6-10** cm long, straminous, naked, terete underneath, grooved on the upper side, lamina deltoid-pentagonal, 8-14 cm long and broad, shortly acuminate, tripinnate; *pinnae* 6-7-jugate, rather shortly petiolate, the basal ones much the largest, deltoid, 5-7 cm long and broad; *pinnules**6-7-jugate, shortly petiolulate on narrowly winged rachilet, the lower basal ones the largest, oblong-ovate, 2.5-4 cm long, 1-1.5 cm broad/ovate-oblong, base cuneate-decurrent, deeply pinnatifid into 5 linear, blunt or bifid uni-nerved segments[^], *texture* coriaceous, glabrous on both sides; *indusium* brown, tubular, coriaceous, twice as long as broad, overtopped by two horns of generally unequal length.

Shantung: Chefoo mountains, Fober 58; Carles (1888); R. Zimmermann 545, May 5, 1902; Maingay 5 (1862); Hancock 5; Tsingtau, Lao Shan, F. H. Sha 528 in herb. Shantung Univ., July 18, 1932; Yuchiaho, Mooping, T. N. Liou 905, May 27, 1930. Kiangsu: Haichow, Hai-shan, Jacob 7, 86, 890.

Japan: Ex Hort. Veitch (type); Nagasaki, Maximowicz 116 (1863).

Corea: Taquet 2330; Söul, Warburg.

Formosa: Hancock 115, 119.

This fern is a native of the northeastern Asia and a close relative of *D. bullata* Wall, of Eastern India, which differs, however, in larger and less divided frond, shorter, rufo-brown and very shaggy scales with scarious margin and in more shortly petiolate basal pinnae. The difference in the scale between this and the Indian species was first noted by Moore himself, as shown by an enlarged sketch on the type sheet in the herbarium at Kew.

Plate 103. Fig. 1. Habit sketch (natural size). 2. Ultimate pinnule, showing venation and shape of indusium (x 10). 3. Scale from rhizome (x 10).

第一百零三圖
*m m # *# m OX HE #* (科)

DAVALLIA MARIESII Moore

地下莖肥大，*sits*，*S3-*，*if*，具披針形之密鱗片，長達一粉餘，灰白色或白銹黃色；葉散生，葉柄長六至十粉，稍褐色，光滑，葉體呈五角形，長寬各八至十四粉，尖頭，三回分裂，一回小葉六至七對，具短柄，基部一對最大，長寬各五至七粉，二回小葉六至七對，具短柄，中肋具狹翅，基部一對較大，卵圓形，長二·五至四粉，寬一至一·五粉，自基部漸狹，深裂，裂片約五數，線形，鈍頭，或二裂，具一葉脈；革質，兩面光滑；子囊羣近於葉緣，蓋為管狀，革質，黃色，長二倍於寬，端部具小角狀葉質。

分布：山東及江蘇北部沿海；日本，朝鮮及台灣亦產之。

此為亞洲東北部特有之種，與印度北部產之*Davallia bullata* Wall. *fo①*，然葉體形小而分裂較甚，莖上鱗片亦較長，且呈瓦覆狀，故得區別。

圖註： 1. 本種全形(自然大) * 2. *MWhm* * 表示其葉脈及子囊羣蓋形狀(放大十倍) * 3. 1F
莖上之鱗片(放大十倍)。

PLATE 104

DAVALLIA ORIENTALIS C. Christensen

POLYPODIACE^E

DAVALLIA ORIENTALIS C. Christensen ex Wu, Bull. Dept. Biol. Sun Yatsen Univ. No. 3: 104 t. 43 (1932); No. 6: 4 (1933); Ind. Fil. Suppl. III. 68 (1934).

Davallia elegans Hk. (non Sw, 1801) *Floral. Hongk.* in *Journ. Bot.* (1857) 333; *Syn. Fil.* 95 (1867); *Benth. Fl. Hongk.* 461 (1861).

DavaUia divaricata Christ (non Bl. 1828). *Bull. Soc. Fr. et Belg.* 28: 260 (1898); *Dunn & Tutch. Fl. Kwangt. & Hongk.* 337 (1912); *Merr. Enum. Hainan PI.* in *Lingnan Sci. Journ.* 5: 11 (1927).

Davallia denticulala Merr. I.e. (non Mett. 1867).

Rhizome thick as a small finger, fleshy, wide-creeping, densely clothed in bright brown lanceolate *scales* to 1 cm long or longer; *frond* far apart, stipe glabrous brown, terete below, deeply bisulcate above, 30-60 cm long, 4 mm thick at the base, lamina ample, 60-90 cm each way, deltoid, 4-pinnate or 5-pinnatifid; *pinnse* about 10-jugate, alternate, long-petiolate, the basal ones much the largest, deltoid 20-30 cm long, 12-18 cm broad, acuminate, the upper ones gradually smaller, the middle ones broadly lanceolate, 15 cm long, 6 cm broad, with about 10 pairs of *pinnules*, which are petiolulate, the anterior basal one much the largest, deltoid acuminate, the others smaller with unequal base; *pinnules* of 2nd. order sessile 1-1.5 cm long, pinnatifid into elongate denticulate *segments*; *texture* rigidly coriaceous, glossy; *veinlets* in the segments oblique, one to each tooth; *sori* submarginal, one to each tooth, *indusium* tubular, twice as long as broad, apex truncate, with projecting teeth above.

Hainan- Yih Tsoh Mao, *F. A. McClure* 9717 (type) J Nodoa, Lin Fa Ling, *W Y Chun* 1799; *McClure* 7919; Five Finger Mt., *McClure* 8463, 8678; Hung Mo Shan, *W T Tsana* 17771. Kwangtung: Man Sei Ho, *Tutcherl0505*; Lohfau Shan, *Ford U8S3V N". K. Chun* J,1276; Swatow, *Dalziel*, Sept, 1899. Hongkong: *Champion* 552; *Matthew* 72 (1905); May 18, 1904; April 12, 1907; *C. Wright* (1853-56); Lantao Island, *C. I. Tso* (1929); *Borther* (1856); *Alexander* Kwangsi: Yao Shan, *S S Sin* 3698, Sept. 26. 1928, Lin-yen Hsien, outside of the south city gate, *R. C. Ching* 6665, 6761; Seh Fang Dar Shan, on the border of Tonkin, *R. C. Ching* 1860. Yunnan: Szemeo, *Henry* 13141.

Tonkin- Mt. Bana, *Clemens* 3855; environs de Chobo, *Pételot*, April 14, 1926; Chapa. *Petelot* 3306; Cao-Bang, *PStelot* 2740; *Billet* 4182; *Bon* 3257.

The present species has hitherto been generally considered as identical with the Malesia-Polynesian *D. divaricata* Bl. from which it differs in thinner leaves, greenish color, even when dried, much longer and more ascending soriferous veinlets and in longer, narrower indusium with exerted sterile margin as high as the sorus itself.

Swartz cited Canton as the type locality for his *D. etegans* (*Syn. Fil.* pp. 132, 347), but this is certainly wrong, for his species, actually based upon Thunberg's plant from Java, agrees exactly with *D. denticulata*, of Malesia-Polynesia, not known from China. The same mistake was since repeated by Hooker, Benthem and other authors on the flora of South China.

Plate 104. Fig. 1. Habit sketch (natural size). 2. pinnule of 2nd. order (x 8). 3. Sorus, with part of indusium removed (x 25). 4. Scale from rhizome (x 12).

第一百零三圖
華南骨碎補(水龍骨科)

DAVALLIA ORIENTALIS C. Christensen

地下莖大如小指，肉質，蔓生，橫行，具光亮鑄黃色之披針形密鱗片，長逾一粉；葉散生，柄長三十至六十粉，自基部以上光滑，黃褐色，葉體大，長寬約各六十至九十粉，呈三角形，漸尖頭，四回羽狀分裂，一回小葉約十對，互生，具長柄，基部一對最大，長三角形，長二十至三十粉，寬十二至十八粉，漸尖頭，上部各對漸小，中部一對為寬披針形，長十五粉，寬六粉，具二回小葉約十對，HB+I長約一。五粉，無柄，羽狀，
分離，每一數至一鋸齒；子囊羣近於葉緣，每鋸齒一個，蓋管狀，長二倍於寬，端呈截形，其上具小角形之葉質。

分布：廣東，*mm*，香港，瓊洲島及雲南南部；交趾安南亦產之。

本種為亞洲南部大陸特有之種，形體極類馬來羣島所產之 *Davallia divaricata* Bl. 所不同者，為其較薄之葉質，子囊羣管較狹長，子囊羣着生之葉脈亦較長而幾為向上。

圖註：1. 本種*^ (a 然大)，2. 二回小葉(放大八倍)，3. 子囊羣及一部分之蓋(放大二十五倍)，4. 地下莖上之鱗片(放大十二fS)。

PLATE 105

HUMATA ASSAMICA (Bedd.) C. Christensen

POLYPODIACE^E

HUMATA ASSAMICA (Bedd.) C. Christensen, Contr. U. S. Nat. Herb. 26: 293 (1931); Ind. Fil. Suppl. III. 112 (1934).

Acrophorus assamicus Bedd. Ferns Brit. Ind. t. 94 (1866).

Leucostegia assamica J. Sm. Hist. Fil. 84 (1875); Bedd. Handb. Ferns, Brit. Ind. etc. 51 (1883); Suppl. 13 (1892).

DavaUia assamica Baker in Hk. Syn. Fil. ed. 1. 452 (1868); ed. 2. 467 (1873); Clarke, Trans. Linn. Soc. II. Bot. 1: 445 (1880).

Davallia micans Mett. ex Baker in Hk. Syn. Fil. ed. 1. 95 (1867).

Humata micans Diels in Engl. u. Prantl; Nat. Pflanzenfam. 1: 4. 209 (1899).

Rhizome thick, wide-creeping, densely scaly; scales large, lanceolate, acuminate, hair-pointed, spread, silvery-brown, denticulate; frond far apart, stipe slender, firm, naked, rufo-straminous, 5-10 cm long, lamina lanceolate, 15-28 cm long 5-7 cm broad, acuminate, base hardly narrowed, tripinnatifid; pinnae 20-30-jugate, alternate, lanceolate-falcate, shortly petiolate, unequal at base, the basal ones deltoid-lanceolate, with subequal and cordate base, to 4 cm long, 2.5 cm broad at the base, acuminate, rachis narrowly winged from the middle upward; pinnules 7-10-jugate, sessile, ovate-oblong, 1.2 cm long, 5-8 mm broad, the lower ones deeply pinnatifid with 5-7 segments, of which the lowest are pinnatifid, the upper ones 3-2-dentate, rachilets with a few large, brown, broadly ovate appressed scales underneath, surfaces naked, glossy in living state; texture coriaceous; veinlets hardly distinct, pinnate or bifurcate in segment; sori submarginal in ultimate lobes, mostly with a horn above, indusium suborbicular, broader than deep, glossy, rounded and free all around, except the broad base which is attached to the leaf tissue.

Yunnan: Shweli-Salween divide, G. Forrest 24500; South of Tcngyueh, G. Forrest 26681, June, 1925; between Tengyueh and the Burmese border, J. F. Rock 7312; between Kambaiti and Tengyueh, J. F. Rock 7580; Salwin, H. Handel-Mazzetti 9564.

Bothan: Mishee, Griffith', Jordon (type).

Munipore: Clarke and also Upper Burma: Forrest 26604.

This distinct species which was previously known only from Bothan and Munipore of North-western India, is very near *H. Griffithiana* of the same region, differing mainly in its lanceolate and shortly petiolate fronds and in the presence of a few large broadly ovate scales on the lower part of rachilets underneath. Our plate based upon Forrest No. 26681.

The genus *Humata* is closely related to both *Davallia* and *Leucostegia*, from the former it differs chiefly in thick leathery, shining, pale-colored reniform or suborbicular indusium attached only by its broad base, generally less divided frond of more rigid texture and the pale-colored scales on the rhizome, from the latter, in somewhat dimorphous and less divided frond of more thick texture and glossy leathery indusium. In fact, its affinity to *Leucostegia* seems to be too close to warrant a generic separation, particularly when the present species is taken into consideration.

Plate 105. Fig. 1. Habit sketch (natural size). 2. Pinnule from the middle pinna (x 8). 3. Scale from rhizome (x 14). 4. Scale from the lower part of rachilet underneath (x 14).

ICONES FILICUM SINICARUM

ABTHBOPTERIS OBLITERATA (R. Br.) J. Smith

POLYPODIACE^E

ARTHROPTERIS OBUTERATA (R. Br.) J. Smith, Cat. Cult. Ferns 62 (1827); C Chr. Ind Fil. 63 (1905); v.A.v.R. Handb. Mai. Ferns 155 (1908); Bonap. Notes Pterid Pt. 14: 103 (1923); Merr. Enum. Hainan PI. in Lingnan Sci. Journ 5 11 (1927).

Nephrodium obliteratum R. Br. Prod. Fl. Novae-Holl. 148 (1810).

Aspidium obliteratum Spr. Syst. Veg. 4: 99 (1827).

Nephrolepis oblitterata J. Sm. Journ. Bot. 4: 197 (1841); Hk. Sp. Fil. 4: 154 (1862); Bedd. Ferns S. Ind. t. 251 (1864).

Nephrolepis ramosa Moore, Ind. Fil. 105 (1858); Hk. et Bak. Syn. Fil. 91 (18&7Y ^{R&M}
₍₁₈₈₃₎) Handb. Ferns, Brit. Ind. etc. 285 (1883).

Arthropteris ramosa Mett. Novara Exp. Bot. 1: 214 (1876); Diels in Engl. u. Pratl- Nat Pflanzenfam. 1: 4. 208 (1899).

Rhizome slender, wide-creeping on the trunk of trees, to several m tall sparsely scaly; frond far apart, alternate, stipe 1-2 cm long, articulated to a prominent pseudopodium, lamina lanceolate, 20-40 cm long, 4-6 cm broad, simple pinnate under the distinct smaller end-pinna; pinnae numerous, alternate, 3-4 cm long, 1 cm broad, the lower ones smaller, deflexed, lanceolate-oblong, with deltoid auricle at the anterior base, obliquely cut away at the posterior base, apex bluntish or roundish, margin undulate-crenate towards apex, subsessile and articulated to the rachis, which is densely pustulately hirsute above with thick rod-like unicellular clear hairs, the same type of hairs also sparsely present on the midrib above; texture herbaceous; veins distinct, forked, ended some distance below the margin; sori round, terminating the anterior basal veinlet of each group, indusium reniform reddish-brown, persistent.

Hainan: Nodoa, Sha Po Shan, F. A. McClure 8157 (1921). Kwanesi- Bako Shan, south of Pei-seh, JR. C. Ching 7530 (1928).

Tonkin: Cao-Bang, Bourret 132.

Also Malesia-Polynesia, Ceylon, the Philippines, Australia and tropical Africa.

A very variable fern in respect to the shape and size of pinna* • very rare on the mainland, R. C. Ching No. 7530 and Bourret No. 132 are the only specimens seen by me.

The genus *Arthropteris* now comprising about 10 species chiefly in the tropical Asia, has been generally considered as closely related to *NLJ** / . Schott; and this is true only in so far as the articulated pinna type XZ and soral conditions are concerned, but in point of anatomical features and particularly, toe type of stelar structure in rhizome, it shows a marked *izztorn* that genus, nor is it comparable with *Oleandra* Cav. in this respect, to which H also held as a close relative by workers* to-day. Meanwhile, I consider it one of the fern genera incertae sedis. wuuor it one of

Plate 106. Fig. 1. Habit sketch (natural size). 2. Pinna, showing venation and sori (x 2).
3. Sorus with indusium (x 16). 4. Scale from scandent rhizome (x 40).

第一百零六圖

簾蕨(水龍骨科)

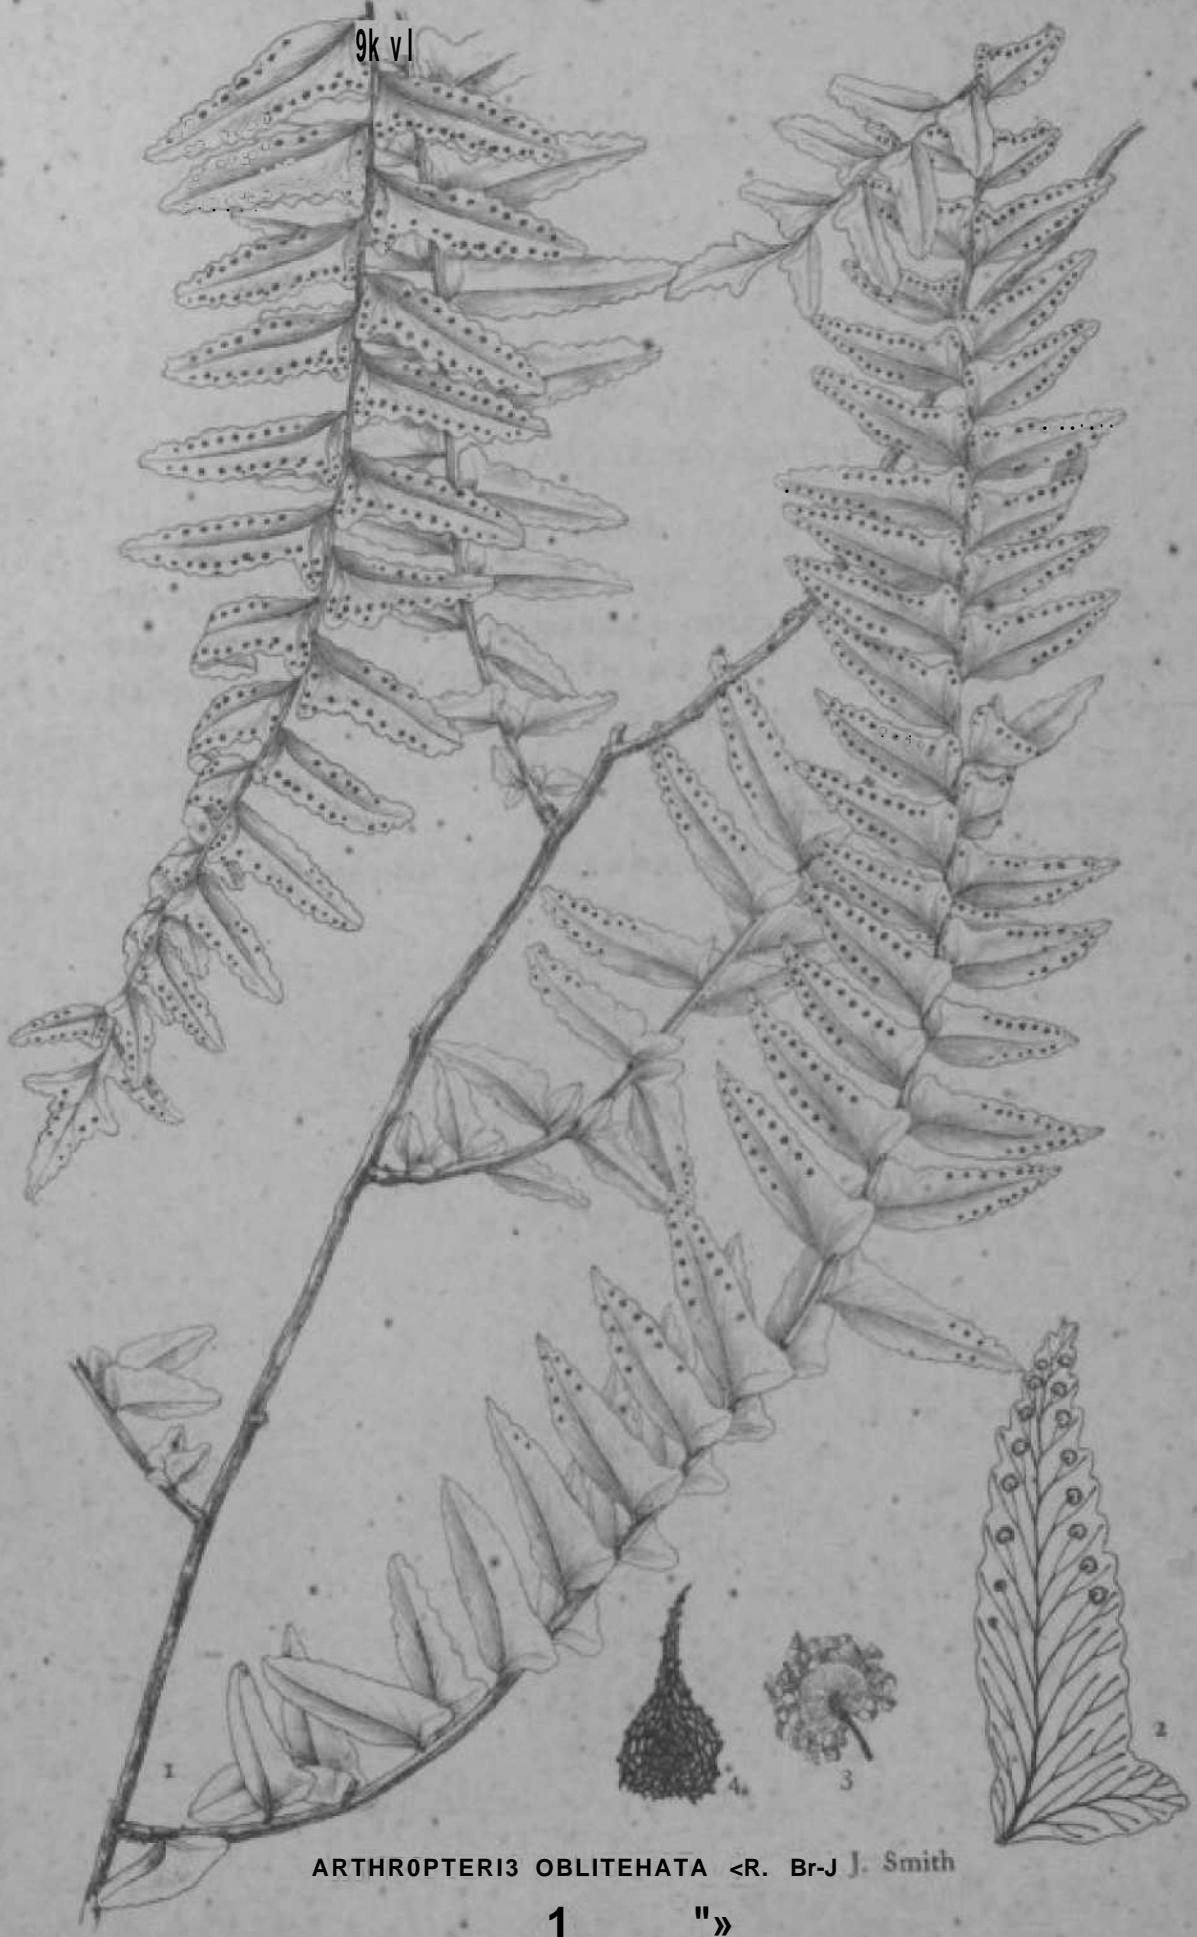

ARTHROPTERIS OBLITERATA (R. Br.) J. Smith

地上莖蔓生，緣樹幹上升，高可達十數尺；鱗片疏生；葉散生，葉柄長一至二分，節狀着生於莖上，葉體披針形，長二十至四十分，寬四至六分，一回奇數羽狀分裂，小葉數十對，長三至四分，寬約一分，頂部一葉與下部數對較小，梢圓披針形，上基部耳形突出，下基部呈斜形，鈍頭或圓頭，葉緣呈波狀，幾無柄，節狀着生於具密腺毛之中肋，兩面光滑，惟主脈上面略具腺毛；葉脈明顯，分叉，不達於緣葉，紙質；子囊羣圓形，着生於每一上基部葉脈之端，蓋腎形，紅褐色。

分布：廣布於安南，交趾，馬來及南洋羣島，菲列浦，澳大利亞及非洲熱帶；最近發現於我國之瓊州島及廣西西南部之八角山，然不多見也。

本種為本屬在亞洲熱帶大陸僅見之種，其特異點為其簾形之地上莖緣樹幹或懸崖上升，葉與小葉均節狀着生，易於脫落是也。

圖註： 1. 本種全形(自然大)， 2. 小葉，表明其葉脈及子囊羣之位置(放大二倍)， 3. 子囊羣(放大十六倍)， 4. 3tt3KJh;2:tJV C 放大四十倍)。

Antigrama sibirica J. Sm. Hist. Fil. 331 (1875).

Phyllitis sibirica O. Ktze, Rev. Gen. Pl. 2: 818 (1891).

Asplenium rhizophyllum L. Sp. Pl. 2: 1078 (1753), pro parte.

Camptosorus rhizophyllus var. *sibiricus* Christ ex Leveille, Bull. Acad. Geogr. Bot. (1910) 4.

Rhizome short, erect, densely radicose; scales at the apex dense, lanceolate, hair-pointed, fusco-brown, iridescent; fronds fasciculated, dimorphous, sterile ones ovate, rounded or acute, 1-4 cm long on stipes 1-5 cm long, herbaceous, green; fertile, ones lanceolate, longer-stipitate, apex generally elongate and rooting, base not auricled but narrowed gradually or shortly cuneate; venation sub-biseriately reticulated along the prominent midrib, free towards margin, green and alabroš except the underside being sparsely glandular; sori elongate, 1- or irregularly 2-seriate along midrib, indusium membranaceous, gray, some opening towards and some against, the midrib, and still others, towards each other as in *Phyllitis*; spores bilateral, echinose.

Hopei (formerly Chihli): Peiping, Bushell, Oct. 1882; Forbes (1882); Carles July 16, 1882; I-yuan-kou, Clemens 37036 (1913); Pin-chow, Wang-mu Kou, Chanet 451; Peitaiho, Cowdry 447; Siawutai Shan, C. L. Li; ibid., C. W. Wang 60589 (1933). Johoh: David. Shantung: Chef00, Fdber (1890); Swinhce (1873); Hancock 17 (1875). Warburg; Wei-hai-wei, C. G. Matthew 410 (1904); Tai-shan, C. Y. CMao 21*86 (1929). Jacob 7; H. S. Hao 1810, July 13, 1931; Tsingtau, C. L. Tso (1933). Mongolia: Peitche-ly, E. Licent (1927). Manchuria: Maximowicz 410 (1860); James, Mav-Au^ust 1886; Ross, Oct. 1887; Webster, May, 1885; Komarov 36; Kirin, in the vicinity of Chingpohu, //, W. Kung 2104, August 14, 1931; Fengtien, H. W. Kung 876, August 1, 1930.

Corea: Taquet 2479.

Port Arthur: Miss Höller (1926).

Also Japan, Siberia and Kamschatka.

The chief interest of this peculiar-looking little fern lies in its remarkable walking ability, that is, its frond generally prolongates into an elongate whip-like viviparous tip, by means of which it spreads itself all about. The second species of the genus is *C. rhizophyUus* (L.) Link, of North America, which differs from our fern in larger size, deeply auriculato-cordate base of frond and 2-3 rows of sori on each side of midrib.

Athyrium nigripes Christ (non Moore, 1857), Bull. Acad. Geogr. Bot. (1909) 174; C. Chr. Acta Hort. Gothob. 1: 76 (1924)-

Rhizome oblique, densely scaly; *stipes* blackish or dark brown, linear-lanceolate, extending upwards some distance above the base of stipe; *fronds* cespitose, stipe 25-30 cm long, 3 mm thick above the base, stramineo-rufescens, naked, lamina 30-35 cm long, 20-25 cm broad, bipinnate; *lateral pinnae* 10-jugate below the caudato-acuminate pinnatifid apical part, very shortly petiolate with truncate base, elongate-lanceolate, long-acuminate, the basal ones only slightly shorter than those next above and decidedly narrowed towards the base, *i.e.* the basal pair of pinnules reduced, 10-12 cm long, 2.5-4 cm broad at the middle, rachis straminous, glossy, shaded purplish, particularly towards the base, which is subglabrous with short, sparse glandular hairs and provided with appressed spines on the upper side; *pinnules* 14-17-jugate under the long-acuminate pinnatifid apex, 1.3-2.5 cm long, deltoid, acute or shortly acuminate, base strongly unequal, *i.e.* deltoidly auriculated above, obliquely cuneate below, with straight anterior side, sessile, rather regularly serrate with short, cuspidate teeth; *veins* distinct, forked, or pinnate in the auricle; *texture* rigidulously herbaceous, glabrous, except the rachis which is shortly glandular hairy above; *sori* elongate, oblique to costule, *indusium* membranaceous, brownish-gray.

Kweichow: Pin-fa, Cavalerie 2600, 544; Kwei-yang, Bodinier 2008; Ganchow, Cavalerie 3769; Sanhoa, Y. Tsiang 6414, 6448; Chengfeng, Y. Tsiang 4568; Tuyun, Y. Tslang 5810.. Hupeh: Henry 5163. Szechwan: Mt. Omei, W. P. Fang 2762, 3119; Nanchuan, Rosthorn 1752 (type of *A. violascens*); W. P. Fang 5709; Kuan Hsien, W. P. Fang 2161; Harry Smith 4888; Tchen-kou-tin, Farges 245. Anhwei: Hwang Shan, S. S. Chien 1235. Kwangtung: North River, C. L. Tso 20681.

Japan: C. G. Matthew 241 (1903), *forma typica*.

Type from Japan, now found to be a common fern throughout the Yangtze valley. Authors on Chinese ferns have generally considered this identical with *Athyrium nigripes* (Bl.) Moore of Malesia-Polynesia, with which our fern has, in fact, nothing to do at all. The present species constitutes the type for the group of about ten closely related members in West China and North-western India, and holds an intermediate position between *A. Mackinnoni* (Hope) and *A. mengtzeense* Hieron. of the same region. The Japanese *A. rigescens* Makino appears hardly distinct from our fern (Cf. Ogata, Ic. Fil. Jap. 5: t. 216).

Plate 109. Fig. 1. Habit sketch (natural size). 2. Pinnule (x 7). 3. Scale from the base of stipe (x 20).

ATHYRIUM OÖBINOIANUM (Kunze) Moore

POLYPOBIACE^:

ATHYRIUM GÖRINGIANUM (Kunze) Moore, Ind. Fil. 185 (1860); C. Chr. Tnd. Fil. 143 (1905): Ogata, Ic. Fil. Jap. 2: t. 5S (1929).

Aspidium Göringianum Kunze, Bot. Zeit. (1848) 557.

Lastrea Göringianum Moore, Ind. Fil. 93 (1858).

Dryopteris Göringiana Koidz. Bot. Mag. Tokio 43: 382 (1929); Acta Phytotax. et Geobot. 1: 233 f. 9-10 (1932).

Athyrium filix-foemina Christ (non Roth, 1799) in Warburg, Monsunia 1: 75 (1900).

Athyrium iseicum Ros. in Fedde, Repert. Sp. Nov. 13: 124 (1913); C. Chr. Ind. Fil. Suppl. II. 7 (1916).

Rhizome oblique; *scales* brown, thin, lanceolate; *fronds* craspedote, stipe 16-30 cm long, pale straminous, glossy above the blackish scaly base, terete underneath, broadly flattened above, lamina oblong-ovate, 20-28 cm long, 12-16 cm broad, acuminate, tripinnatifid; *pinnae* 10-14-jugate, alternate, petiolate, obliquely patent, the basal ones somewhat shorter than those next above, 7-10 cm long, 3-4 cm broad, base cordate, apex acuminate; *pinnules* 8-11-jugate, shortly petiolulate, alternate, 1.5-2 cm long, oblong, acute or bluntish, base subunequal, pinnatifid nearly down to costule into 4-6 oblong serrato-incised blunt segments, with one simple veinlet to each tooth; texture soft herbaceous, light green, rachis and rachilets are provided with characteristic spines on the upper side; *sori* elongate or horse-shoe-shaped, *indusium* thin, grayish-brown, large; *spores* reniform, smooth.

Chekiang: Ningpo, Tien-tai Shan, Hancock 12. (1877); C. Y. Chiao 14437; K. K. Tsoong 3713- Szechwan: Mt. Omei, W. P- Fang 2672, 3800 in herb. West China Acad. Sci. Yunnan: H. T. Tsai 52696. Fukien: Lin Fa Shan, S. T. Dunn 3844, June 6, 1904. Kiangsi: Kiukiang, Lu-shan, Incense Mill, DeVol, Aug. 5, 1933; Kiangs'u: Wusih, Wei-shan, R. C. Ching 3427. Kwangtung: Lohfau Shan, C. O. Levine & McClure 6833, 6929; Levine 1518; Merrill 10344 (1916); Gerlach (without locality).

Japan: Göring 115 (type) (1844); Ise, Sakura 47 (type of *A. iseicum*).

A native of Japan and Eastern China and was generally considered in the past as identical with *A. nigripes* (BL), from which it differs in ampler frond as long as the stipe, incised or, at least, dentate-incised ultimate pinnules and not strictly costular sori. A still closer ally is *A. strigillosum* Moore from North-western India and West China, which differs only in less divided frond and subcostular sori with uniform asplenoid indusium.

Plate no. Fig. 1. Habit sketch (natural size). 2. Pinnule, showing venation and types of indusia (x 8). 3. Scale from the base of stipe (x 16).

ASPLENIUM SARELI^{II} Hooker

POLYPODIACE.E

ASPLENIUM SARELI^{II} Hooker in Blakiston, Five Months on the Yangtze 363 (1862); C. Chr. Ind. Fil. 130 (1905).

Asplenium Saulii Baker in Hk. Syn. Fil. ed. 2. 216 (1874); Christ, Farnkr. d. Erde 203 (1897); Diels in Engl. u. Prantl: Nat. Pflanzenfam. 1: 4. 240 (1899); Ogata, Ic. Fil. Jap. 1: t. 8 (1928).

Asplenium Blakistoni Baker in Hk. Syn. Fil. 216 (1867); Hk. Ic. PI. t. 1015, 1016 (1867).

Asplenium pekinense Makino (non Hance, 1867), Bot. Mag. Tokio 9: 245 (1895).

Rhizome short, erect, densely scaly at the apex; scales lanceolate-subulate, black; fronds caespitose, stipe 5-10 cm long, slender, naked or sparsely scaly, green, lamina deltoidly ovate-oblong, 5-13 cm long, 2.5-5 cm broad or broader at base, acuminate, tripinnate, the basal pinnae much the largest, ovate, with unequal base, 1.5-3 cm long, 1-2 cm broad, ultimate pinnules linear, 2-3-fid, with a fine tooth, with 1-2 elongate sori, indulum thin, gray, entire; texture herbaceous, glabrous on both sides, color green even upon drying.

Szechwan: *Blakiston* (type), without exact locality; Mt. Omei, E. Faber 1007, ibid., E. H. Wilson 5358, 5262 (ad f. typica). Hupeh: Patung, A Henry 3789; Ichang, Nanto, Henry 219; Ou-pan Shan, Silvestri 3249, 3248 (1905); Nang Hsien, Silvestri 4029, 4030, 4032, 4033. Kiangsu: Nanking, She Er Tung, R. C. Ching 3499 (1927); DeVol 63, August 13, 1933; L F. Zee 11 in herb. Univ. Nanking; I-shing Y. L. Keng 2690. Kiangsi: Fengcheng, Y. Tsiang 10285. Kweichow: San-hoa, Y. Tsiang 6243 | Pachai, Y. Tsiang 6158; Tsunyi, Y. Tsiang 5298.

Also Japan.

This distinct fern, common throughout the Yangtze valley, is closely related to *A. varinm* Wall, from Northern India and West China, which differs in much narrower and bipinnate frond of a different outline with broadly oblong ultimate pinnules without so sharp teeth as in our fern. In the general shape of front, it appears very much like a small form of *A. tenui folium* Don, differs in much thicker texture of front and entirely different shape of ultimate pinnules. *A. pekinense* Hance, common in North and Central China, seems to be specially distinct from our fern by its much reduced lower pinnae.

Plate in. Fig. 1. Habit sketch (natural size). 2. The same, forma typica. 3. Pinnule of first order (x 6). 4. Scales from rhizome (x 27).

第一百十一圖
* * *m & mot m* # (科)
ASPLENIUM SARELII Hooker

地下莖短而直立，端具點褐色狹披針形之密鱗片；葉簇生，柄長五至十公分，光滑或略具鱗片，葉體為三角卵圓形，長五至十三公分，寬二·五至五公分，或較寬，三回分裂，一回小葉約十對，基部一對最大，卵形，長一·五至三公分，寬一至二公分，基部不等，末回小葉為披針形，二至三裂，端具尖鋸齒；子囊羣—5—2，細長，蓋膜質，全緣；葉為紙質，兩面光滑，淡綠色。

分布 ，湖北，江蘇，江西，貴州；日本亦產之。

此為揚子江流域習見之種，形體變異甚大，與此種最相似者為 *Asplenium pekineense* Hance. 然本種基部一回小葉較位於上部者較大，故得區別。

圖註： 1. 本種全形(自然大)， 2. 同上，模式， 3. 一回小葉(放大六倍)， 4. 基部鱗片(放大二十七倍)。

ASPLENIUM SARELII Hooker

華中鐵角蕨

ICONES FILICUM SINICARUM

PLATE 112

ASPLENIUM SAMPSONI Hance

POLYPODIACE^E

ASPLENIUM SAMPSONI Hance, Ann. Sci. Nat. V. 5: 257 (1866); C. Chr. Ind. Fil. 130 (1905).

Asplenium Belangeri Dunn & Tutch. (non Kze. 1848) Fl. Kwangt. & Hongk. 344 (1912).

Rhizome thick, short, erect, densely scaly; *scales* blackish, lanceolate, dense at apex; *fronds* caespitose, stipe fleshy, 3-6 cm long, sparsely clothed in blackish, irregularly armed scales, lamina lanceolate, 13-25 cm long, 2-4 cm broad, acuminate, gradually narrowed towards base; *pinnse* 17-28-jugate, patent, subsessile, the lower ones gradually reduced into a broadly deltoid outline below 1 cm long, the middle ones 1.5-2.5 cm long, 1 cm broad, oblong, obtuse, base unequal, being auricled at anterior side, deeply pinnatifid; *segments* 5-8-jugate, linear, pectinate, uni-nerved, the anterior basal one generally 2-3-forked; *texture* herbaceous, green; *sori* linear, one to each segment, *indusium* membranaceous, entire, open upward.

Kwangtung: Kai Kun Shek, *T. Sampson* 11165 (type), in herb. Hance, June, 1867; *K. K. Wang* 436 (1928). Kwangsi: Lungchow, *Morse* 14. Kweichow: *Esquirol* 3731 (without exact locality).

This distinct endemic species is closely related to *A. Belangeri* (Bory) Kze. of tropical Asia, to which it was reduced by Baker (Cf. Syn. Fil. 223), from which it differs, however, in much smaller size with narrowly lanceolate frond, gradually narrowed towards the short fleshy scaly stipe, which is, as rachis, sparsely clothed in black, irregularly armed and distinctly reticulated scales. From *A. prolongatum* Hk., our fern differs in non-prolongated, and rooting apex of frond of a lanceolate outline, on much shorter stipe, and in very patent or subhorizontally spread, more copiously and regularly pinnatifid pinnse, of which the lower ones are gradually shortened.

Plate 112. Fig. 1. Habit sketch (natural size). 2. The same, a larger form. 3. A middle pinna, showing venation and sorus (x 16). 4. Scale from rhizome (x 50). 5. The same from stipe (x 76). 6. Scales from rachis (x 60).

第一百十二圖
嶺南鐵角蕨(水龍骨科)
ASPLENIUM SAMFSONI Hance

地下莖肥短而直立，端具黑色披針形之鱗片；葉簇生，柄肉質，長三至六分，略具黑色分叉鱗片，葉體為倒披針形，長十三至二十五分，寬二至四分，漸尖頭，向基部漸狹，二回羽狀分裂，一回小葉十七至二十八對，開張，裂無柄，位於下部者為三角形，較上部者為小，中部小葉長一·五至二·五分，寬約一分，橢圓形，鈍頭，基部不等，羽狀深裂，裂片五至八對， mm ，具單脈，位於基部上方者通常二至三裂；紙質，綠色；子囊羣狹長，每裂片一數，蓋膜質，全緣，向上方開。

分布：廣東，廣西，貴州。

此為我國南部特有之種，其形體極類亞洲熱亞產之 *Asplenium Belangeri* (Bory)，而葉體較小，且呈倒披針形，向下部漸狹，故易區別。

圖註：1.本種全形(自然大)，2.同上，大形，3.中部一小葉，表示其葉脈及子囊羣(放大十六倍)，4.地下莖上之鱗片(放大五十倍)» 5.葉柄上之鱗片(放大七十六)» 6.中肋上之鱗片(放大六十倍。)

POLYPODIACE.E

ASPLENIUM CRINICAULE Hance, Ann. Sci. Nat. V. 5: 254 (1866); Hk. et Bak. Syn. Fil. 208 (1867); Clarke, Tran. Linn. Soc. II. Bot, 1: 479 (1880); Bedd. Handb. Ferns, Brit. Ind. 150 (1883); Christ, Bull. Herb. Boiss. 6: 959 (1898); Diels in Engl. u. Prantl: Nat. Pflanzenfam. 1: 4. 239 (1899); C. Chr. Ind. Fil. 106 (1905); Wu, Bull. Dept. Biol. Sun Yatsen Univ. No. a: 190 t. 87 (1932).

Asplenium Hancei Baker in Hk. Syn. Fil. ed. i. 208 (1867); Kuhn, Bot. Zeit. (1869) 130.

Asplenium Beddomei Mett. ex Kuhn, Linnaea 36: 93 (1869).

Asplenium falcatum Bedd. (non Lam., nee Thbg.) Ferns S. Ind. t. 141 (1864).

Asplenium polytrichum Christ, Bull. Acad. Géogr. Bot. (1909), Mém. XX. 172.

Asplenium adiantoides Wu, Bull. Dept. Biol. Sun Yatsen Univ. No.⁴ 3: t. 88-90 (1932).

Rhizome short, erect, densely scaly; fronds cespitose, stipe 7-10 cm long, dark-brown, densely scaly throughout the rachis; scales dark rufous-brown, iridescent, clathrate, subulate from broad and often branched base, caducous, lamina lanceolate, caudate-acuminate, 10-30 cm long, 4-7 cm broad, simple pinnate; pinnae lanceolate, acuminate, 2-4 cm long, the lower ones gradually abbreviated, ovate-rhomboid with obtuse apex, base unequal, obliquely truncate above, cuneate below, margin irregularly erose-dentate; texture herbaceous, color opaque; veins flabellately forked, channelled; sori linear, oblique to costa, indusium firm, entire, lower ones often open towards each other.

Kwangtung: Ting-wu Shan, Sampson 11203 (type) in herb. Hance, June 15, 1866; Whampoa, Hance; Ford 228 in herb. Hongkong; Lokchong, C. L. Tso 21332; Swatow, Thai-yong, Dalziel, July, 1899. Hongkong: Dr. Harland 91; Hanc* 741H (1357); Tai-mo Shan, Matthew, Oct. 15, 1907. Fukien: Yengping, H. II. Chung 2992; Amoy, De Grijs 1198 in herb. Hance; T. S. Dunn 777, May 15, 1905. Kwang-si: Yao Shan, S. S. Sin 331 (1928); Seh-feng Dar Shan, R. C. Ching 8436; Lu-chcn, R. C. Ching 5551. Yunnan: Mengtze, Hancock 182; Szemeo, Henry 11939, 11939B_f, 11939C. Kweichow: Pin-fa, Cavalerie 2844 (type of *A. polytrichum*); Tsin-gay, I. Laborde, Jan. 14, 1898; Tu-shan, Y. Tsiang 6954.

Also Northern India and Neilgherries.

A very variable fern as to the size and shape of pinnae, as has been well illustrated by Wu by half dozen plates under different names. In type, the pinnae are 4-5 cm long. *A. Hancei* Baker from Kwangtung represents a small form, 15 cm long with lamina 2-3 pm broad, pinnae ovate-oblong with crenate margin. Habit exactly similar to *A. planicaule* Wall., which differs in glabrous stipe and rachis. I have strongly suspected (Cf. Blot, Asplen., d. Tonkin p. 36) that the present species from mainland may after all prove to be a geographic form of *A. pellucidum* Lam. of Malesia-Polynesia and also frequent in Annam, which differs from our fern only in elongate lanceolate, acuminate pinnae, of which the lower ones are even more strongly reduced into an ovate outline.

Plate 114. Fig. 1. Habit sketch (natural size). 2. Pinna, showing venation and position of sori (x 2). 3. Scale from rhizome (x 16). 4. Scales from stipe and rachis (x 10). 5. A small form with short obtuse pinna: (natural size).

第一 - I t 0 圖
毛鐵角蕨(水龍骨科)

ASPLENIUM CRINICAULE Hance

地下莖短而直立，端具黑色披針形密鱗；葉簇生，柄長七至十粉，具深褐色細長鱗片，富於折光性，葉體闊披針形，長十至三十粉，寬四至七粉，一回羽狀分裂，小葉十至二十對，位於下部者漸短，中部者長二至四粉，卵狀方形，鈍頭或極尖頭，基部不等，葉緣具不整齊之鈍鋸齒，厚紙質，乾則呈黯褐色，中肋鱗片疏生，久則脫落，葉脈扇形分叉，上下面呈溝脊形；子囊狹長，斜出，蓋為厚膜質，全緣，向上開，其位於下部者，常相對開。

分布： $am > \#?t \gg mm \cdot mm \gg$ 貴州；印度亦產之。

本種最初於廣東發現，現則南部各省均產之，極似馬來羣島產之 *Asplenium pellueidum* Lam. 或即為該種地理分佈之一變形耳。

圖註：1. 本種全形(自然大)，2. 小葉，表明其葉脈及子囊羣之位置(放大二倍)，3. 地下莖上之鱗片(放大十六倍)，4. 葉柄上之鱗片(放大十倍)，5. 本種小形全形(自然大)。

PLATE 115

ASPLENIUM SAXICOLA Rosenstock

POLYPODIACE^E

ASPLENIUM SAXICOLA Rcsenstock in Fedde, Repert. Sp. Nov. 13: 122 (1913); C. Chr. Ind. Fil. Suppl. II. 7 (1916).

Asplenium comptum Hance, Ann. Sci. Nat. V. 5: 255 (1866); Kuhn, Bot. Zeit. (1869) 131; C. Chr. Ind. Fil. 105 (1905); Blot. Bull. Soc. Hist. Nat. Toulouse (1932) 39 (non Kze. 1852).

Asplenium dimidiatum var. *comptum* Baker in Hk. Syn. Fil. ed. 2. 486 (1874).

Aspknium a'ffine var. *sinense* Christ, Bull. Acad. Géogr. Bot. (1905) 243.

Asplenium dimidiatum Christ, (non Sw. 1788) Bull. Herb. Boiss. 7: 9 (1899); Bull. Acad. Géogr. Bot. (1910) 13; Bonap. Notes, Pterid. Pt. 14: 117 (1923).

Rhizome short, erect or oblique, densely scaly; *scales* dark rufous-brown, linear-lanceolate, subulate towards apex; *fronds* subcespitoso, stipe 10-20 cm long, dark straminous, sparsely scaly throughout rachis, lamina 12-28 cm long, 7-11 cm broad, simple pinnate with distinct end-pinna; *pinnae* 5-12-jugate, long-petiolate, the lower ones much the largest, gradually diminished towards apex, rhomboid with attenuate base and gradually acuminate towards apex, the lower ones often 1-2-lobed, margin erose-dentate; *texture* coriaceous, glabrous on both sides; *venation* distinctly canaliculated on both sides; *sori* linear, oblique, *indusium* of the same shape, brown, thick, entire, the lower ones open towards each other.

Kwangtung: Kai Kun Sheh, West River, *Sampson 1190* in herb. Hance (type of *A. comptum*); North River, *C. Ford* (1879); 226 (1888); Lien-chow, *Matthew*, Nov. 30, 1907; Yun Fou Hsien, West River, *K. K. Wang 434*; *K. K. Tsoong 4298*. Kwang-si: Wang-chin, Lu-chen, *R. C. Ching 5473*; Lan-lon, *R. C. Ching 6398*; Lung-chow, *Morse 40*; Lin Shan Hsien, *Sin & Wang 51* (1927). Kweichow: Tcehn-feng Hsien, *Cavalerie 3852* (type); **Tien-sen Kou, Cavalerie 1853** (type of *A. affine* var. *sinense*); **Tseh-heng, Y. Tsiang 9247**; **Kouy-houa, Cavalerie 1215**; **Kwei-yang, Esquirol 901**; Gan-chow, *Michel 992, 1000*; Tchen-lin, *Michel 1051*. Yunnan: Mengtze, *Henry 11542*.

Tonkin: Dong Dang, *Balansa 99*; Lang-nac, *Colani 3346*, frequent.

This is another of the distinct but little known Chinese species by Hance, but, unfortunately, his name, *A. comptum*, has to become invalidated by Kunze. Our fern is closely related to *A. dimidiatum* Sw. of tropical America, to which it was referred as a variety by Baker, as identical by Christ and others, but differs in long-petiolate pinnae with erose-dentate (not lacerate) margin. The type from Kweichow has lateral pinnae tend to lobato-pinnate; the same form is also seen from Kwangtung.

Plate 115. Fig. 1. Habit sketch (natural size). 2. Pinna, showing venation and sori (x 2). 3. Scale from rhizome (x 10).

Woodwardia radicans var. *auriculata* Kuhn, Journ. Bot. (1868) 268.

Woodwardia radicans var. *orientalis* C. Chr. Ind. Fil. 658 (1905).

Woodwardia angustiloba Hance, Journ. Bot. (1868) 176.

Woodwardia japonica Hk. Journ. Bot. (1857) 341, pro parte.

Woodwardia radicans Christ (non Sm. 1793) iⁿ Warburg, Monsunia 1: 66 (1900).

Woodwardia prolifera Hk. et Am. in Bot. beech. Voy. 275 t. 56 (1836-40); Nakai, Bot. Mag Tokio 39: 105 (1925).

Woodwardia exaltata Nakai, Bot. Mag. Tokio 35: 149(1925).

Rhizome thick, woody, erect, densely clothed at apex in very large, bright brown, lanceolate acuminate, membranaceous scales 2-4 cm long; stipe cgespitose, thick, 30 cm long or longer, rufo-straminous, sparcely scaly throughout, lamina oblong-ovate, 30-50 cm long, 20 cm broad, bipinnatifid; pinnae 6-8-jugate under the deeply pinnatifid acuminate end-pinna with shortly decurrent base, subopposite, 10-13 cm long, 4-5 cm broad, broadly lanceolate, acuminate, base subequal or of ten strongly unequal, i.e. the lower basal 1-2 segments suppressed, leaving a wingless costa, the anterior basal segment more or less decurrent; segments oblong-lanceolate, shortly acuminate, sharply serrated; venation obscure, areolas imperfectly 2-rowed along costa; texture rigidly coriaceous; soi*i oblong-linear, immersed, uniseriate and close to costule, indusitum brown, thick, vaulted.

Fukien: Foo-chow, Gregory (1857) in herb. Hance (type of *W. angustiloba*); Warburg-, Santu Island, Matthew, Oct. 3, 1907; Dionglohsien, H. H. Chung 1244 Nan-ching, Schindler 407 | Yengping, H. H. Chung 2936| Chuan-chow, H. H. Chung 3082; Inghok, H. H. Chung 2639. Hongkong: Victoria Peak, Tutcher 670. Chekiang: Ningpo, Hancock (1877). Kwangtung: Swatow, Thai-yong, Dalziel, July, 1899; Nam-yung, S. P. Ko 50759; Lokchong, X. K. Chun 42727, 42462.

Also Japan, Formosa, Liu-kuu and the Philippines.

Type from Japan (leg. Thunberg) and was first identified by Houttuyn under *Blechnum radicans* var. In the herbarium Thunberg, there are "to be found four sheets of *Woodwardia*, of which only one marked ^ is the true *W. japonica*, while the other three are representing the present species. The type in herb. Swartz matches Houttuyn's figure exactly. Our fern has generally been considered as identical with *W. radicans* (L.) Sm. of Europe and America, but the differences between the two closely related species have already been contrasted by me (Cf. Bull. Fan Mem. Inst. Biol. 2: 6-7, pis. HI).

Var. **prolifera** Ching, Bull. Fan Mem. Inst. Biol. 2: 6 (1931); C. Chr. Ind. Fil. Suppl. 111:196(1934).

Woodwardia prolifera Hk. et Am. in Bot. Beech. Voy. 275 t. 56.

Woodwardia exaltata Nakai, Bot. Mag. Tokio 35: 149 (1921).

- Differs from the typical form only in the frond being copiously gemmiferous above.

Fukien: Foo-chow, Fortune (1853); C«rlt* (lbsō); Min-cho\\ //.. Chung 1905, 2086; Amoy. H. H. Chung 105. Kwangtung: Jao-ping, Lokchong, A\ K. Chun 42784. Liu-kuu: Beechey (type); C. Wright^ Formosa: Tamsui, Oldham 20, 245.

Ophioglossum zeylanicum Houtt. Nat. Hist. 14: 43 (1783); Pfl. Syst. 13: 47 t. 94 f. 1 (1786).

Leptochilus zeylanicus C. Chr. Ind. Fil. 388 (1905); Merr. Enum. PI. Hainan in Lingnan Sci. Journ. 5: 11 (1927); Ogata, Ic. Fil. Jap. 1: t. 32 (1928).

Acrostichum quercifolium Retz. Obs. Bot. 6: 39 (1791); Hk. Sp. Fil. 5: 279 (1864); Ic. PL J. 905; Fil. Exot. t. 80 (1858); Syn. Fil. 418 (1867); Dunn & Tutch. FL Kwangt. & Hongk. 255 (1912).

Gymnopteris quercifolia Bernh. in Schard. Journ. Bot. **1806**¹. 20 (1807); Presl, Tent. Pterid. 244 (1836); Bedd. Ferns S. Ind. t. 47 (18C3); Handb. Ferns, Brit. Ind. etc. 403 (1883); J. Sm. Hist. Fil. 138 (1875); Christ, Farnkr.d. Erde 49 (1897); Diels in Engl. u. Prantl: Nat. Pflanzenfam. 1: 4. 200 (1899).

Leptochilus quercifolius Féé, Acrost. **88** (1845).

Dendroglossum quercifolium F6e, Gen. Fil. 80 t. 7B. f. 1 (1850-52).

Rhizome creeping, slender, densely clothed in lanceolate, rufo-brown, rather thick scales; frond uniseriate, 1 cm apart, strongly dimorphous, sterile ones on stipe 3-5 cm long, angular, ferruginous-hairy, hairs soft, multi-cellular, spread, lamina ligulate with hastate base, 6-9 cm long, 2-3 cm broad, apex rounded, base cordate, generally with one free, deltoid blunt pinna on each side, the central part much the largest, inciso-crenate, lateral main veins distinct, intervening veinlets irregularly anastomosing with included forked veinlets, costa and veins underneath copiously provided with rufo-brown, spread long hairs, margin ciliate, subglabrous above; fertile frond on stipe 10-18 cm long, slender, subnaked, lamina trifoliolate, strongly contracted into linear segments, the lateral segment generally with one additional lobe below, the central segment much the longest, pinnatifid into a few shallow, roundish, remote lateral lobes; texture thin herbaceous; veins also reticulated but much simpler than in the sterile fronds; sort linear, continuous, uniseriate between costa and margin, confluent at last.

Hongkong: Matthew, Nov. 1907. Kwangtung: Lohfau Shan, Pakwan 92 in herb. Hance (1871). Kwangsi: Lungchow, Morse 5; Dar Wan, Tan-Ian, R. C. Ching 6553 (1928). Yunnan: Szemeo, Henry 13388. Hainan: Nodoa. F. A. McClure 7860.

Also Formosa, Tonkin, Southern India, Ceylon and Malesia-Polynesia.

The genus *Quercifilix*, of comparatively a recent date, contains only one terrestrial little fern, fairly common in South China, on shaded moist banks of river. Its affinity to *Tectaria* is obvious according to Copeland.

Leptochilus cuspidatus var. *crenata* Ros. Hedwigia 56: 348 (1915).

Leptochilus sp. Merr. Enum. PI. Hainan in Lingnan Sci. Journ. 5: 10 (1927).

Rhizome thick, creeping, densely scaly; scales fusco-brown, ovate-lanceolate, acuminate, peltately attached, clathrate, nearly entire; frond dimorphous, csespitose, stipe 30-60 cm long, terete underneath, bisulcate above, sparsely scaly, sterile lamina 20-50 cm long, 15-28 cm broad, oblong, impari-pinnate; pinnae 4-10-jugate under the free trifurcate terminal one, which often prolonged and rooting at apex, 9-20 cm long, 2.5-5 cm broad, broadly lanceolate, opposite, the upper ones smaller and alternate, acuminate, base roundish or rotundo-truncate, shortly petiolate, margin crenate throughout, the rounded lobes bluntly serrate with a prominent seta at the sinus, rachis roundish underneath, broadly bisulcate above, glabrous on both sides; lateral main veins distinct, patent, 7 ram apart, intervening veinlets angularly anastomosing in 3 rows of areolae between main veins and 2 rows from costa outwards, areolae shortly appendiculate or not, veinlets free towards margin; fertile frond similar to the sterile one but much contracted, 7-10 cm broad; pinna 6-8 cm long, about 1 cm broad; sori indefinite, following the course of veinlets, confluent all over the under surface at last; spores bilateral, ovoid, broadly winged all around.

Hainan: Five Finger Mt., F. A. McClure 8725, 9346, 9270, 9436 (type), Spring-May, 1922, shaded moist ravines; Tun Foo, Eryl Smith 1641, stream side, Jan. 14, 1923; Ling-shui Hsien, H. Fung 20146, May 3-20, 1932. Hongkong: Hance 23; Dr. Naumann 763 (1869); Schottmuller; Lamont 989; Dr. Harland; Bowring 22; Matthew 577; Robinson 8 (1925); Katsumatta 6692, June, 1909. Chekiang: Pin-yang, H. H. Hu 156. Kwangtung: Swatow, Thai-yong, Dalziel, April, 1901; Lohfau Shan, N. K. Chun 40626; Yao Shan, Ku Koong, Y. K. Wang 31559; Shek Mang Tai Shan, C. L. Tso 23591, August 7, 1933; Hu Lang Hong, W. Y. Chun 7117, August 23, 1931. Fukien: Foo-chow, Ku-shan, Metcalf 7380, Dec. 5, 1927, Alexander. Kwangsi: Yao Shan, S. S. Sin 714.

Formosa: Faurie 281 (*L. cuspidatus* var. *crenata*); Tatflsui, Hancock 15; Kee-lung, C. W. W. It ford 478.

Tonkin: Pételet, Jan. 1922, a sterile frond.

Our fern, which is found to be abundant in shaded ravines in the Island Hongkong, is closely related to *B. Quoyana* f(Gaud.) Ching from Malaya, differs chiefly in its not coadunate but free apical pinna and rotundo-cuneate base of the lateral pinna*.

Plate 120. Fig. 1-2. Habit sketch (natural size). 3. Sterile frond of a larger form (natural size). 4. Portion of sterile pinna, showing venation (x 5). 5. Portion of fertile pinna (x 5). 6. Spores (x 200). 7. Scale from rhizome (x 16).

第一百二十圖。
海南實蕨(水龍骨科)

BOLBITIS SUBCORDATA (Cop.) Ching

地下莖肥厚，橫行，具深褐色之卵披針形鱗片；葉簇生，二形，柄長三十至六十粉，略具鱗片，非子囊葉長二十至五十粉，寬十五至二十八粉，橢圓形，一回羽狀分裂，小葉四至十對，披針形，長九至二十粉，寬二·五至五粉，頂端小葉較大，且常伸長其端，入土著根，基部為圓截形，具短柄，漸尖頭，葉緣呈深波形，具鈍鋸齒，而於缺口處具一強大之短肉刺，厚紙質，淡綠色，兩面頗光滑；側脈明顯，小脈網狀，網眼三列，內具小短脈一或否，向葉緣分開；子囊葉與非子囊葉同形，惟葉柄長，小葉較狹，長六至八粉，寬約一粉，子囊葉初隨網脈分佈，繼則滿佈全面；孢子卵圓形，具闊翅。

分布：瓊州島，廣東， $mm \times nm \times mm$ ；台灣及交趾亦產之。

本種在香港及瓊州島極為普通，生於林中深溪邊，其葉端常延長向土中著根。

Aspidium eriocarpum Wall, List n. 342 (1828, nomen nudum); Mett. Farnagt. Pheg. u. Aspiri. 60 (1857).

Nephrodium eriocarpum Dene. Arch. Mus. 2: 185 (1841); Hk. Sp. Fil. 4: 141 (1862).

Lastrea eriocarpa Presl, Tent. Pterid. 77 (1836); Bedd. Ferns S. Ind. t. 95 (1862).

Nephrodium odoratum Baker in Hk. Syn. Fil. 280 (1867).

Dryopteris Fauriei Kodama in Matsum. Ic. Pl. Koish. 2: 11 t. 90 (1914). For further synonymy see C. Chr. Ind. Fil. p. 258.

Rhizome 4-6 mm thick, wide-creeping, densely clothed in bright brown linear-lanceolate scales to 3 cm long; frond approximate, stipe 10-25 cm long, straminous, densely clothed at the swollen base in a cushion of golden brown scales similar to those on rhizome, glabrous upwards, deeply grooved and hirsute above, lamina deltoid-pentagonal, 10-25 cm long and broad, 4-pinnatifid; pinnae 5-10-jugate, the basal ones much the largest, petiolate; pinnules of 2nd. order oblong, bluish, base rotundo-cuneate.. equal, decurrent above the middle, deeply pinnatifid into oblong, rounded lobato-serrate segments with roundish apex; texture herbaceous, both sides densely setose hairy; veins distinct, free, pinnate in segment; sori large, rounded, dorsal on veinlets, indusium large, rotundo-reniform, attached by a deep sinus, densely setose hairy.

Widely distributed in Malesia-Polynesia, Japan, the Philippines, French Indo-China, India, Arabia Abyssinia to South and East Africa, Cap Verde Islands and Maritius. In China, numerous specimens have been seen from Yunnan, Szechwan, Kweichow, Hupeh, Kwangtung, Kwangsi, Fukien, Kiangsu, Chekiang and Anhwei.

Type from Arabia and now found non-existent in the herb. Forskal in the Botanical Museum, Copenhagen. Though variable in size, degree of pinnation and density of pubescence, etc., the different geographic forms agree well with each other in all essential characters.

Plate ____ :^. i. Habit brach (natural size). 2. Ultimate pinnule, showing venation and sori (x 6). 3. Indusium (x 20). 4-5. Scales from the base of stipe (x 10). 6. Hairs from underside of lamina (x 30). 7. Spores (greatly enlarged).

第一百二十一圖
m & m (水龍骨科)

HYPODEMATIUM CRENATUM (Forsk.) Kuhn

地下莖橫行於岩隙中，密被鮮明紅棕色鱗質披針形之鱗片，長達二三粉；葉近生，柄長十至二十五粉，稻桿色，其基部為瘤狀膨大，為密鱗片所覆，不見也，葉體五角形，十至二十五粉或*iai: · mo.* 羽狀深裂，紙質，兩面被剛毛，一回小葉五至十對，具柄，基部一對最大，橢圓三角形，急尖頭，末回 *mnmmmm > mu*，具大鋸齒；葉脈明顯，開離，羽狀分叉；子囊羣圓形，着於葉脈上，蓋大，圓腎形，以下方缺口著生，具剛毛。

分布：本種廣佈於亞洲溫熱帶各地，達於非洲之東南部及南洋羣島；在我國之雲南，*mm»-ft* 州，湖北，*Sim*，廣西，福建，*triK*，*ffit*，安徽均產之。

本種之特徵為其好生於乾燥之石岩隙中，其葉柄之瘤狀基部為鮮紅棕色之大鱗片所覆被，昔人以之 *&•f* *Dryopteris* 屬，最近經余之研究，應另屬以待之也。

HYPODEMATUS CRENATUM (Fern) Kuhn.

锯齿蕨

PLATE 122

HYPODEMATIUM FORDII (Baker) ChingPOLYPODIACE^E

HYPODEMATIUM FORDII (Baker) Ching, comb. nov.

Nephrodium Fordii Baker, Journ. Bot (1889) 177; Dunn & Tutch. Fl. Kwangt. & Hongk. 348 (1912).

Dryopteris crenata C. Chr. Ind. Fil. 258 (1905), pro parte.

Dryopteris Fordii Ching, Sinensis 3: 330 (1933).

Dryopteris crenata var. *Fordii* C. Chr. Ind. Fil. Suppl. III. 86 (1934).

Rhizome slender, creeping, densely scaly; *scales* linear-lanceolate, golden brown, to 2 cm long; *frond* approximate, stipe 20-30 cm long, straminous, glossy, floxuose, the swollen base densely scaly, lamina deltoid-pentagonalous, 4-pinnatifid; *jjinnae* 6-9-jugate, petiolate, the basal ones much the largest, deltoid, short-acuminate; *pinnules* 6-jugate, petiolulate, deltoid-oblong, acute, base cordate; *pinnules* of 2nd. order oblong-ovate, the lower ones shortly petiolulate, the upper decurrent, deeply pinnatifid, with 3-6 pairs of oblong, rounded serrate or lobato-incised segments; *texture* thin herbaceous, both sides shortly glandular hairy; *veins* distinct, free, pinnate; *sort* rounded, dorsal on veinlets, *indusium* thin, membranaceous, gray, glandular hairy, rotundo-reniform, attached by a deep sinus, margin glandularly ciliate.

Kwangtung: North River, *C. Ford* 104 (type), Dec. 1888; Shiu-hing, Ting-wu Shan, *S. P. Ko* 50597, June 12, 1930.

This is a decidedly distinct fern, known so far only from Kwangtung, differing from the preceding species in its gracil habit, thinner leaves, slender stipe almost twice as long as lamina, very membranaceous grayish, smaller indusium with glandular margin, and in its decidedly different type of hairs, which are not needle-like, but only shortly glandular with rounded or clavate, lemon-yellow enlarged apices. Dunn an Tucher (*loc. cit.*) have distinguished this fern from the preceding by its "acute ultimate segments", neglecting altogether the characters as noted above

Plate 122. Fig. 1. Habit sketch (natural size). 2. The swollen basal part of stipe (natural size). 3. Ultimate pinnule, showing venation and sori (x 7). 4. Indusium (x 30). 5. PLATE 123

HYPODEMATIUM CYSTOPTEBOIDES Ching

POLYPODIACE^E

HYPODEMATIUM CYSTOPTEROIDES Ching, Sp. nov.

Aspidium crenatum Christ, Nuov. Giorn. Bot. Soc. Ital. n.s. (1897) 94; Bull. Bot. Soc. Ital. (1901) 297.

Status et configuratione cum // *Fordii* (Baker) e China australis valde congruens, differt; indusiis tenuissimis non rotundo-reniformibus sed valde varian-tibus, aut lanceolato-triangularibus, aut ovatis, aut ovato-triangularibus, basi vix cordatis, pinnulis anguste lanceolatis vel oblongo-lanceolatis, elongatis, sese multo separatis, longe acuminatis, basi magis cuneatis.

Rhizome slender, wide-creeping, densely scaly; scales rufo-brown, to 7 mm long, ovate-lanceolate, acuminate, entire, densely clothing the swollen base of stipe; frond approximate, long-stipitate, stipe 10-22 cm long, gracil, flexuose, pale-colored, naked through, lamina ovate-deltoid, 7-11 cm long and as broad, long-acuminate, tripinnate; lateral yinnae about 8-jugate under the pinnatifid acuminate apex, the basal ones much the largest, deltoid, opposite, to 10 cm long, 6 cm broad, basicopically produced, long-petiolate, the upper pinnae gradually abbreviated, ob-long-lanceolate or lanceolate, all shortly petiolate with equal, subcuneate base, rather wide apart from each other, the second pair of pinnae from the base to 6 cm long, 2 cm broad near the base, pinnate; pinnules 7-jugate, rather far apart, oblong-lanceolate, to 1.2 cm long with subequal, cuneate, decurrent base and bluntly dentate apex, pinnatifid to the costule into 6-7 pairs of oblong or sparsely dentate segments; veins forked, ending in blunt teeth; both sides sparsely glandular hairy; texture thin herbaceous, color green; sori 5-7 pairs to each segment, medium-sized, rounded, indusium whitish, membranaceous, cystopteroid, triangular-lanceolate or ovate-deltoid with broad and hardly cordate base, cucullately attached to the receptacle.

Shantung: Tsinan, A. P. Jacob 21 \ ibid. Chien Fo Shan, specimens ex herb. Dept. Biol. Cheeloo Univ. (without collector's name); Tai-shan, A. P. Jacob 1; Chefoo, E. Faber 1054 (herb. Kew, sub *Dryo-pteris crenata*). Shensi: Mt. Uan-san-pin propo "Pagoda", Giraldi, July 16, 1894; See-kin-tzuen, Giraldi, Dec. 28, 1895; Thse-paB-shan, Giraldi, August, 1896.

Our fern is more closely related to *H. Fordii* (Baker) than to *H. crenata* (Forsk.) in gracil habit and type of hairs, but differs in its long-acuminate apices of frond and of lateral pinnae, which are elongate oblong-lanceolate with cuneate base in the middle pinnae, and in its cystopteroid indusium, a character which alone marks this species very unique in the genus.

Plate 123. Fig. 1. Habit sketch (natural size). 2. Ultimate pinnule, showing venation and sori. 3. Scale from the swollen base of stipe (x 10). 4. Indusium (x 20). 5. Spores (enlarged).

第一百二十三圖
山東腫足蕨(水龍骨科)

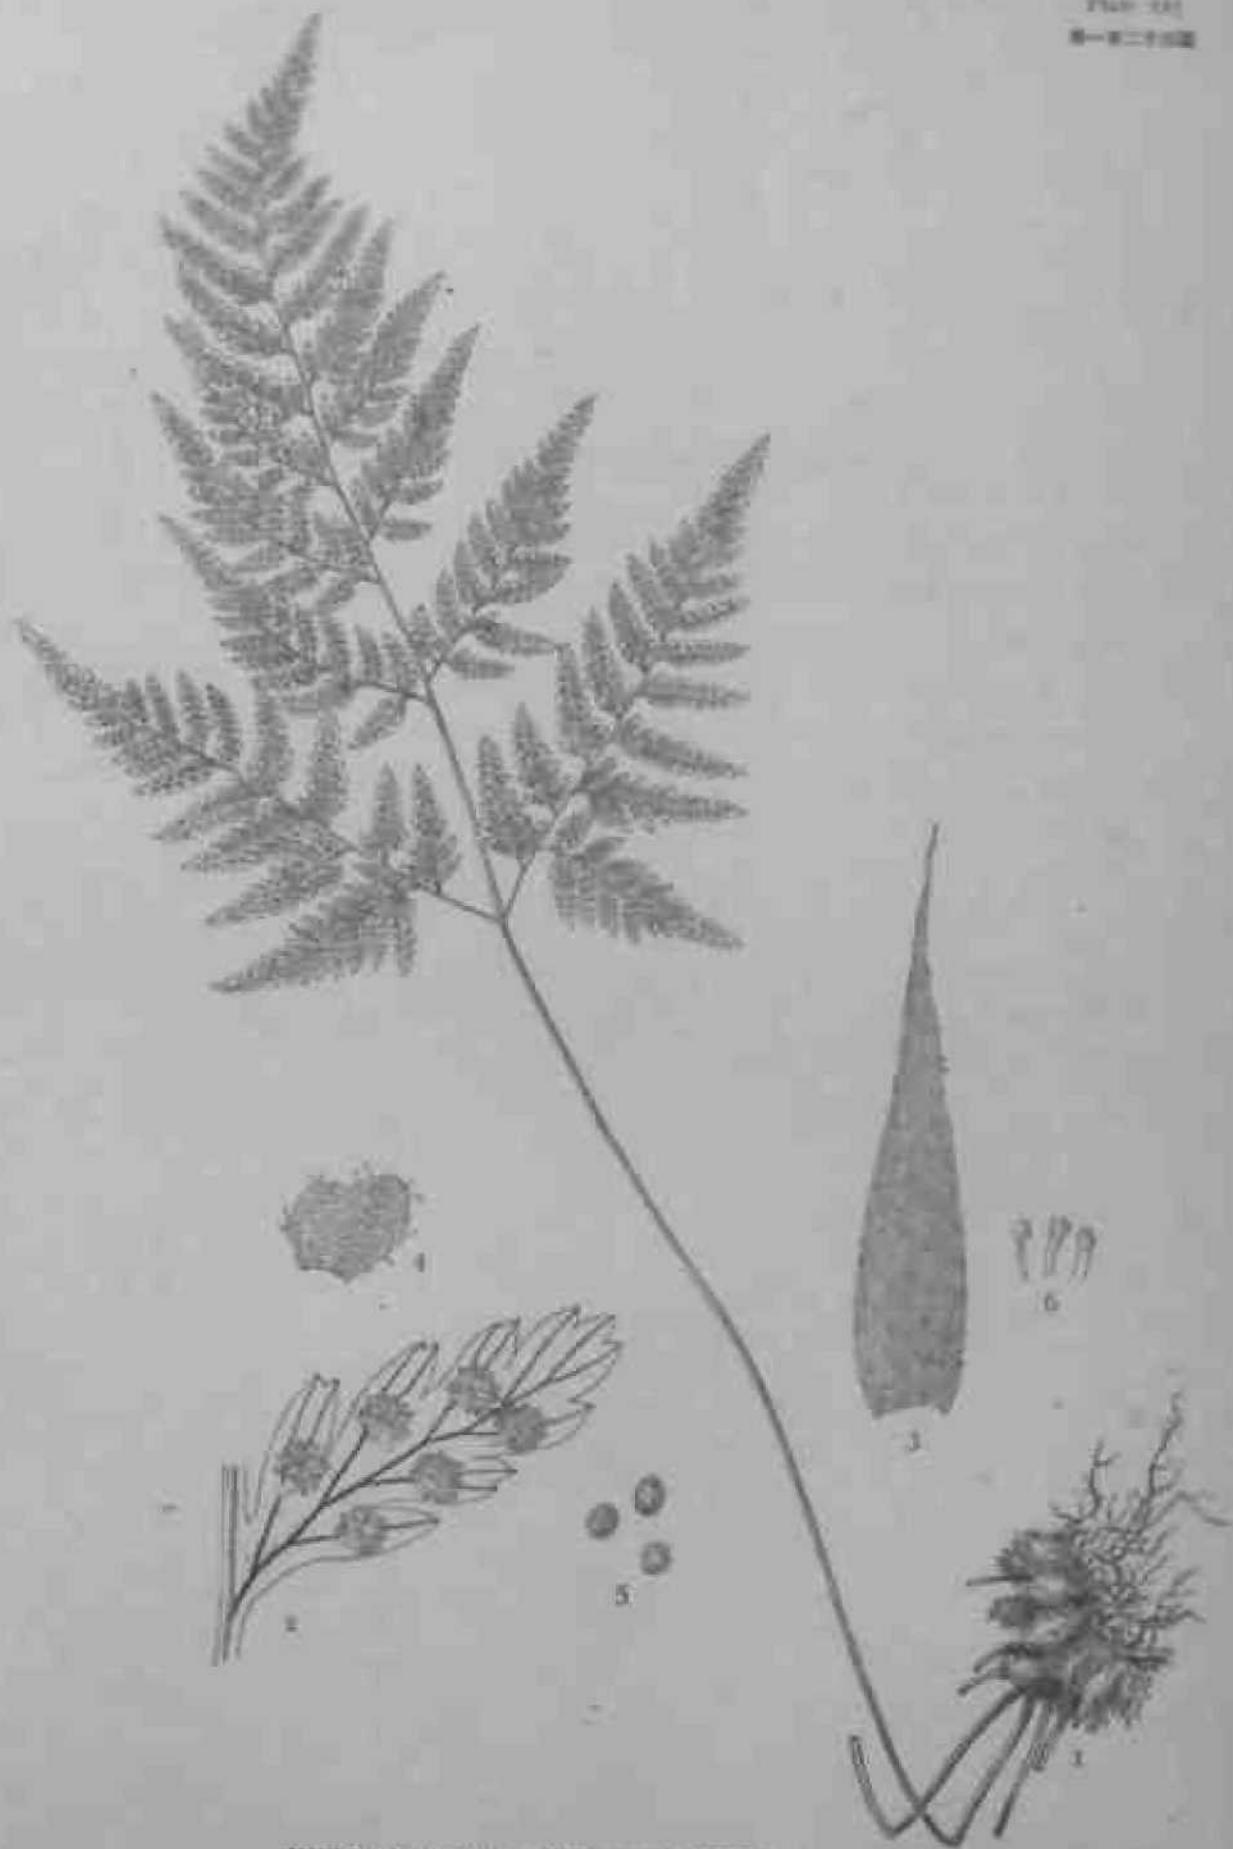

HYPODEMATIUM CYSTOPTEROIDES Ching

本種形體酷類前種，惟其小葉及子囊羣蓋之形體大異，其小葉為狹披針形，或橢圓披針形，彼此不如前種之密接，頂為長漸尖頭
其子囊羣蓋不為圓兜形，但為三角狀之披針形，或為卵形，或為卵狀三角形，絕類 *Cystopteris* «^ o

分布：山東之濟南，烟台，泰山，青島一帶及陝西中部，他處尚未之見也；此種為本屬分佈極北之一種，昔人誤認為腫足蕨，實則大異；其模式標本藏於濟南齊魯大學生物系。

Polystichum lonchitoides Nakai (non Diels, 1900), Bot. Mag. Tokio 23: 77 (1914).

Cyrtomium viltatum Christ ex Léveillé, Bull. Acad. Géogr. Bot. 'igio, non 1905).

Rhizome short, oblique or erect, densely scaly; scales large, 1 cm or longer, rufous-brown or atro-castaneous, glossy, ovate, acuminate; fronds cespitose, stipe 15-30 cm long, strong, densely clothed in the similar scales, which are mixed with others of linear outline, lamina oblong, 15-45 cm long, 10-17 cm broad, pinnate under the free hastate end-pinna; pinnae 10-20-jugate, alternate, lower ones hardly shortened, in typical form, up to 10 cm long, 2 cm broad, falcate, long-acuminate, shortly petiolate, base broadened, rounded or auricled above, margin finely serrate throughout; texture chartaceous, light green, not glossy in living state, rachis fibrillose-sclerous throughout; veins distinct, copiously reticulated, areoles hexagonal, oblique, each with 1-2 excurrent included soriferous veinlets; sori rounded, scattered over the underside, terminal or infra-apical on the veinlets, indusium large, coriaceous, grayish, rounded, peltately attached, depressed at centre, with wavy margin.

This is one of the most common ferns throughout the Yangtze valley and extends as far north as the southern part of Shensi and southwardly to the north of Canton (Lokchon^r. IF. T. Tsuny M7O6). Also Japan and southern Corea; recently known from Tonkin.

A very distinct but very variable fern, generally regarded hitherto as a variety of *C. falcatum*, from which it can be easily told apart by its much thinner leaves of a light green color, not glossy, in living state, its generally more numerous, lanceolate-falcate or sometimes oblong-ovate (as in var. *polypterum*) pinnae always with minutely and regularly serrate margin from the base upwards. Generally grown as pot plant.

PLATE 128

CYCLOPELTIS CRENATA (Fee) C. Christensen

POLYPODIACE^E

CYCLOPELTIS CRENATA (Fee) C. Christensen, Ind. Fil. Suppl. III. 64 (1934).

Hemicardion crenatum Fee, Gen. Fil. 283 t. 22A f. 1 (1850-52).

Hemicardion cochin-chinense F6e_t 1. c. (nom. nud.)

Cyclopetis Presliana C. Chr. Ind. Fil. 197 (1905), pro parte; Bonap. Notes Pterid. Pt. 7: 99, 153 (1918); Merr. Enum. Hainan Pl. in Lingnan Sci. Journ. 5: 9 (1927), non Berkeley, 1857.

Rhizome, short, thick, oblique, scaly; *scales* darkish brown, linear-subulate, 1.5-2 cm long, 1 mm broad, soft, with scarious margin; *fronds* caespitose, stipe 30-40 cm long, 5 mm thick above base, angular, straminous or brownish, fibrillose-scaly throughout the rachis, impari-pinnate; *lateral pinnae* 10-15-jugate, alternate, oblique, shortly petiolate, articulated to rachis, lower ones hardly shortened, about 5 cm apart from each other, the upper ones closer, 8-13 cm long, to 3 cm broad, lanceolate, acuminate, base unequal, *i.e.* the upperside oblique, the lower side cordate, with a rounded hamato-recurrent auricle against the rachis, margin sinuate, entire towards apex; *texture* chartaceous, green, costa fibrillose-scaly underneath; *veins* 4-forked, flexuose; *sori* large, rounded, dorsal on veinlets, 3-seriate on each side of costa, *indusium* large, coriaceous, dark brown, peltate, persistent; *spores* bilateral, broadly winged all around.

Hainan: Nodoa, Sha Po Ling, F. A. McClure 8164, 8168, 8196, moist shaded ravines of water edge; Katsumatta, in herb. Hongkong; Ling Shui Hsien, F. A. McClure 20068, May 4-20, 1932; Yai-chow, F. C. How 71124; C. Wang 33487, 34195; Eryl Smith 1620, 1633.

Cochin-China: Annam, Tourane, Gaudichaud (type); ibid., J. & S. M. Clemens 4168.

This decidedly distinct species, endemic in Cochin-China and the Island Hainan, has hitherto been considered as identical with *C. Presliana* (J. Sm.) Berkeley, now should be known as **C. Cummingiana** (Fee) Ching, comb. nov., as the species was actually first properly described by Fee under his genus *Hemicardion* in Gen. Fil. 283 t. 22A. f. 2, from the Philippine Islands and Malesia, which differs in more numerous lateral, narrower falcate and close pinnae, of which the lower ones are gradually shortened towards the very short stipe, with deeply cordate-auricled base at both sides and in much thicker leaves, turning blackish when dried.

Plate 128. Fig. i. Habit sketch (natural size). 2. Portion of pinna, showing venation and position of sori (x 3). 3. Scale from the base of stipe (x 10). 4. Basal part of pinnae, showing articulation to rachis (x 10). 5. Spores (enlarged).

POLYSTICHUM FIMBRIATUM Christ

POLYPODIACE[^]E

POLYSTICHUM FIMBRIATUM Christ, Bull. Acad. Géogr. Bot. (1906) 237; C. Chr. Ind. Fil. I. 64 (1912).

Rhizome thick, erect, clothed in a dense tuft of shining brown linear-subulate *scales* over 2 cm long; *fronds* caespitose, stipe 15-18 cm long, thick, densely clothed in large, ovate-acuminate, spread or deflexed, rufo-brown scales, lamina lanceolate, to 30 cm long, 5-6 cm broad, base truncate, apex short-acuminate, pinnate- *pinnae* 25-36-jugate, alternate, imbricate, very shortly petiolate, basal ones as long as those above, 2.5-3 cm long, 1.3 cm broad, oblong-falcate, blunt, base deltoidly auricled above (auricle sometimes free in the lower pinna), cuneate below with truncate upper inner edge parallel to, or imbricating on, the rachis, margin subentire with aristate teeth all around, rachis and underside of lamina copiously fibrillose scaly; *texture* thick coriaceous; *veins* prominent underneath, pinnate in auricles "and triforked upwards; *sori* rounded, uniseriate, nearer to the margin than to the costa, terminating the anterior basal veinlet of each group, *indusium* thick, brown, entire, rounded, peltately attached.

Kweichow: South of Tin-fan, *Cavalerie and Fortunat* 1842 (type), Oct. 1904; Ping-chow, *Y. Tsiang* 7134, Sept. 14. 1930.

This species represented so far only by two collections from the southern part of Kweichow, proves to be so remarkably distinct that there is no known Chinese species to which it can be closely compared. It belongs to the group of *P. nepalense* (Spreng) from which it differs altogether in densely scaly stipe and rachis in entire and aristately serrate pinnæ with blunt apices and without cartilaginous teeth and the characteristically ovate-cuspidate appressed scales on the underside of pinnae and in supramedial sori with coriaceous and much smaller indusia. In the gross habit, our fern appears related to *Cyrtomium nephrolepioides* Christ from the same region, but differs in its free venation, oblong-falcate pinnæ with unequal auricled base and different scale characters.

Plate 129. Fig. 1. Habit sketch (natural size). 2. Pinna (x 2). 3a-b. Scales from stipe (x 10).

POLYSTICHUM OMEIENSE C. Christen&en (non Christ, 1909). Ind. Fil. 67 (1905), 585 (1906); Acta Hort. Gothob 1: 72 (1924).

Aspidium carvifotium Baker, Journ. Bot. (1888) 228; Christ, Bull. Bot. Soc. Ital. (1901) 295; Bull. Acad. Géogr. Bot. (1906) 114 (non Kunze, 1851).

Polystichum carvifolium Christ, Bull. Herb. Boiss. 6: 969 (1898); Diels in Engl. Jahrb. 29: 194 (1900).

Polystichum Faberi Christ in Lecomte, Not. sysi. 1: 37 (1909).

Rhizome short, oblique, densely scaly at apex; *scales* small, brown, ovate-acuminate, subentire; *fronds* cespitose, 10-18 together, stipe to 13 cm long, straminous. terete, firm, sparsely clothed in small, ovate-acuminate, uniform scales, lamina slightly oblanceolate, 15-25 cm long, 4-7 cm broad, acuminate, finely tripinnate; *pinnae* numerous, close, alternate, subsessile, patent, lanceolate, 2-3 cm long, lower ones somewhat shortened and deflexed; *pinnules* 6-12-jugate, oblong-ovate, base long-attenuate and decurrent along deeply grooved and narrowly winged costa; *ultimate pinnules* 2-3-jugate, generally deeply bifid into linear-subulate uni-nerved *segments*, hardly over 1 mm broad, with sharp point; *texture* herbaceous, green, underside sparsely scaly; *sori* small, one to each segment, terminating the veinlet some distance below the apex of segment, *indusium** large, rounded, membranaceous, as bread as segment, soon falls off.

Szechwan: Mt. Omei, E. Faber 1027 (type); E. Faber 14 in herb. Hance; **ibid Scallan; Wilson 5267; W. P. Fang 494, 3155; Nanchuan, W. P. Fang 5836, 6118, 7446** (without exact locality). Yunnan: Mengtze, Henry 9050; Hancock 20 (1893). Kweichow: Pin-fa, Cavalerie 2426, 7094 (1907); Tou-shan, Cavalerie 2536.

This is one of the most distinct species of the group of *Polystichum* from West China and Himalaya, which is characterized by finely dissected fronds with linear-subulate uni-nerved entire and sharply pointed ultimate segments. *P. alcicorne* (Baker) from the same locality is a very close relative, which differs, however, in more coarsely dissected frond of a much stouter habit and in the presence on the stipe and rachis underneath of the large ovate, membranaceous brown persistent scales.

Plate 131. Fig. 1. Habit sketch (natural size). 2. Pinnule (x 14). 3. Indusium (x 45). 4. Scale from rhizome (x 40).

POLYSTICHUM OMEIENSE C. Chrislenseii

地下莖短而直立或斜出，端具棕色卵形小鱗片；葉多數簇生，柄長達十三分，稍褐色，堅實，葉體倒披針形，長十五至二十五分，寬四至七分，漸尖頭，細密三回羽狀分裂，一回小葉多數，密互生，*mmm*，開展，披針形，長二至三分，基部者稍短且下向；二回小葉六至十二對，卵圓形，基部漸狹，循中肋延長。

一小脈，不達於頂，紙質，綠色，下面略具小鱗片；子囊羣小圓形，每裂片一個，着生於葉脈之端，蓋圓形，厚膜質，與裂等寬或較寬，不久脫落。

分布：四川峨眉山，雲南之蒙自及貴州南部。

本種為我國西部高山特產，其葉體細密分裂成線形尖頭之小裂片，寬不及一厘，具一小脈，頂端著一個子囊羣。

圖註： 1. 本種全形(自然大)， 2. 二回小葉(放大十四倍)， 3. 子囊蓋(放大四十五倍)， 4. 莖下莖上之鱗片(放大四十倍)。

PLATE 132

PELLAEA. SMITHII C. Christensen

¹ POLYPODIACE^E

PELLAEA SMITHII C. Christensen, Acta Hort. Gothob. 1: 84 t. 18 (1924); Ind. Fil. Suppl. III 135 (1934).

Rhizome short, erect, densely scaly at the apex and the base of stipe; *scales* small, linear, rigid, brown, shining, the outer ones are often shining black; *fronds* numerous, caespitose, stipe 6-10 cm long, firm, rounded, sparsely scaly throughout, brownish-straminous, lamina ovate-oblong or deltoid, 4-6 cm long, 4 cm broad, coriaceous, bipinnate, rachis glandular, grooved above; *lateral-pinnae* 3-4-jugate under the pinnatifid deltoid apical part similar to the lateral ones, sessile, opposite or subopposite, deltoid, to 2 cm long and broad, the basal pair hardly larger than those above, pinnatifid to the costa into 3-5 pairs of linear entire, acute *segments* 1-1.5 cm long, 1-1.2 mm broad, the lower ones adnate, the upper ones decurrent, costa and costules deeply sulcate above, prominently raised underneath; *veins* in segments hidden, biforked, veinlets oblique; *sori* intra-marginal, distinct, terminating each veinlet, *indusium* linear, continuous till very apex, covering the entire under surface, gray at first, brown at last, persistent, with glandular-ciliate margin; *spores* small, minutely verrucose.

Szechwan bor-occid.: Hsu-ting, Harry Smith 4799 (type), on sunny rocks; E. H. Wilson 2664 (1908). Yunnan: east of Yung-ming, Forrest 21238, 10463.

This peculiarly distinct little fern is closely related to *P. nitidula* (Wall.) Baker from Northern Tndia and South-western China, differs in still simpler pin-nation, much lighter-colored stipe and rachis, which are only sparsely glandular, and in miu*^h broader indusiuni. As first observed by its author, all the specimens cited above are found to be fertile in every segment.

Plate 132. Fig. 1. Habit sketch (natural size). 2. Portion of segment, showing venation, indusium and position of son' (x 6). 3. Scale from rhizome (x 20).

PLATE 133

CHEILANTHES DUCLOUXII (Christ) Ching

POLYPODIACE^E

CHEILANTHES DUCLOUXII (Christ) Ching in C. Chr. Ind. Fil. Suppl. III. 54 (1934).

Doryopteris Duclouxii Christ, Bull. Acad. Géogr. Bot. (1902) 231; Bull. Soc. Bot. France 52:

Mém. 1. 58 (1905); C. Chr. Ind. Fil. 244 (1906); Acta Hort. Gothob. 1: 86 (1924).

Doryopteris muralis Christ, Bull. Acad. Géogr. Bot. (1904) in; C. Chr. Ind. Fil. 244 (1905).

Doryopteris Mairei Brause, Hedwigia 54: 206 t. 4. f. J. (1914).

Rhizome short, erect; *scales* at the apex blackish, lanceolate, rigid and opaque; *fronds* cespitose, stipe 14-25 cm long, glabrous, glossy, dark castaneous, terete throughout, lamina deltoid, semi-bipinnate, 9-17 cm each way, falvous, coriaceous, glabrous on both sides, rachis, costa and costules underneath shining castaneous; *lateral pinnae* 4-5-jugate under the lanceolate, entire or pinnatifid apical part, all connected by a narrow wing along rachis, or in full-grown plants the basal pair separated from those above by wingless rachis, basal pinnae much the largest, sub- or semi-deltoid, 5-7 cm long, 4-5 cm broad, semi-pinnatifid, i.e. only the lower side of costa with 3-5 lanceolate *segments*, of which the basal ones much the longest, 4-5 cm long, 5 mm broad above base, entire throughout, or sometimes with a few additional short segments on the lower side, while the upperside of costa is entire or irregularly pinnatifid with short segments; the upper lateral pinnae generally simple, entire, falcate, or sometimes the second pair also semi-pinnatifid; *veins* in segments free, dichotomously forked, hidden; *sort* terminating the veinlets, *indusium* gray, menibraceous, entire, continuous to the very apex of segment; *spores* spherical, echinose.

Yunnan: *Ducloux* (type), Dec. 23, 1896; Mengtze, *Hancock* 31; *Tanant* (1897); *Maire* 2746, 2737; *Forrest* 298; *Ducloux* 1351 (1909); *K. K. I'soong*; -*Makong*; *E. E. Maire*, pro parte. Szechwan: Ornei region, *H. D. Brown* 80 (1928). Kweichow:

Pin-fa, Cavalerie 4228, 1212 (type of *Dory, muralis*).

A distinct species but closely related to *Ch. argentea* var. *obscura* Christ, differs in larger size and less divided frond with lanceolate, subhorizontally patent pinnae of falvous color, of which the lower ones are seini-pinnatifid.

Var. **sulphurea** Ching, var. nov.

Doryopteris Duclouxii f. *argentea* Christ, Bull. Soc. Bot. France 52: Mém. 1. 58 ^1905).

Doryopteris Mairei Brause, Hedwigia 54: 206 t. 4. f. J (1914).

Differs from the type in frond being coated underneath with sulphur-yellow waxy powder.

Szechwan: *Nin-yuan Hsien*, *Harry Smith* 1830; *Wilson* 5297; *Handel-Mazzetti* 2790. Yunnan: Tali, *Forrest* 13499; Ngaykio, *Ducloux* 6343 (1909); Tchang Shan, *Ducloux* 3363; Nieou Ko Shan, *Ducloux* 6965; Pin-tchouan, *Ducloux* 6930; Mt. Mao Kou Tchang, near Ta-pin-tze, Tali, *Delavay* 9 (1883).

This variety must not be confused with *Ch. Veitchii* (Christ) Ching from Szechwan, with which it is very closely related in habit, from which it differs above all in stipe being not glossy black and fronds not so finely dissected.

Plate 133. Fig. 1. Habit sketch (natural size). 2. The same, a simpler form (natural size). 3. The same, a young plant (natural size). 4. Portion of segment, showing venation (x 6). 5. Scale from the base of stipe (x 15).

CHEILANTHES HANCOCKII Baker

POLYPODIACE^E

CHEILANTHES HANCOCKII Baker, Kew Bull. (1895) 54; Christ, Hull. Soc. Bot. France 52: Mém. 1. 58 (1905); C. Chr. Ind. Fil. 175 (1905); Suppl. III. 54 (1934).

Cheilanthes taliensis Christ, Bull. Soc. Bot. France 52: Mém. i. 58 (1905); C. Chr. Ind. Fil. 180 (1906); Acta Hort. Gothob. 1: 89 (1924); Contr. U. S. Nat. Herb. 26: 308 (1931).

Cheilanthes Henryi Christ, Bull. Acad. Géogr. Bot. 16: 133 (1906); C. Chr. Ind. Fil. Suppl. 1. 18 (1912).

Cheilanthes Wilsoni Christ, I.e. 132; C. Chr. Ind. Fil. Suppl. I. 18 (1912).

Cheilanthes Bonatiana Brause, Hedwigia 54: 203 t. 4 f. E (1914); C. Chr. Ind. Fil. Suppl. II. 8 (1916).

Rhizome short, erect, densely radicose; scales at the apex dark brown, lanceolate-subulate, rigid, extending upward to some distance above the base of stipe; fronds cespitose, stipe castaneous, terete throughout, 7-20 cm long, lamina pentagonal or subdeltoid, 7-14 cm long and broad, tripinnate or tripinnatifid; pinnae 5-7-jugate, the lower ones petiolate, far apart, opposite, the basal ones much the largest, deltoid, 5-12 cm long; pinnules 5-7-jugate, the lower basal one much the largest and basicoopically produced, 3-6 cm long, shortly petiolulate, the upper ones on the same side of costa sessile and adnate, gradually shortened, those on the upperside of costa are of about equal length, sessile, adnate, and much shorter than those below, alternate; ultimate pinnules oblong, blunt, lobato-incised with rounded lobes, or only crenate in small plants; rachis and rachilets deeply grooved above; texture herbaceous, veins distinct, 2-3-forked or simple towards apex in lobes; sori terminating the veinlets, distinct at first, finally subconfluent, indusium membranaceous, oblong-ovate, distinct or subcontinuous; spores bilateral, light brown.

Yunnan: Mengtze, Hancock 63 (type) (1893); Szemeo, Henry 12532 (type of *Ch. Henryi*); Shit Ping, Henry 13223; Ducloux 1342; Siao-su-long, E. E. Maire (November); 2749* 1342; Ducloux 1343 (pro parte): environs de Yunnan-sen, Ducloux & BoJinier 669 (1898); Tchang-shan, Ducloux 2361 (1906); Cavalric 4710 (1900-20); environs de Hay Tien, Ducloux 2427 (1904); Lao-kong Shan, Ducloux 5062; Tcheou Kia-tze-tang, Maire 1393 (type of *Ch. Bonatiana*); Tali, Delavay 1187 (type of *Ch. taliensis*); Likiang Snow Range, J. F. Rock 6000. 6047. Szechwan occid: Wilson 5290 (type of *Uh. Wilsoni*); Nui-yuan Hsien, at Lu-shan, Harry Smith 1831.

This distinct and endemic species belongs to the group of *Ch. tenuifolia* Sw. from which it differs altogether in the rigid, dark-brown lanceolate scales on rhizome, less divided lamina of a pentagonal outline, with ultimate segments of entirely different shape. All specimens cited above are very uniformly constant in all respects except size, in which the type represents a large form with pentagonal lamina and acuminate apex, on stipe twice as long; while *Ch. Wilsoni* and *Ch. taliensis* represent small, stunted form with less divided fronds.

Plate 134. Fig. 1. Habit sketch, smallr form (natural size). 2. segment, showing venation and sori (x 10). 3. Habit sketch frm co-type (natural size). 4. Scale from rhizomu (x 16).

Cheilanthes Fordii Baker, Journ. Bot. (1879) 304; Dunn & Tutch. Fl. Kwangt. & Hongk. 339 (1912).

Adiantopsis Fordii C. Chr. Ind. Fil. 22 (1905).

Cheilanthes Bockii Diels in Engl. Jahrb. 29: 199 (1900); C. Chr. Ind. Fil. 172 (1905); Acta Hort. Gothob. 1: 91 (1924).

Cheilanthes mysuriensis var. *Giraldii* Christ in Lecomte, Not. Syst. 1: 51 (1909).

Cheilanthes tenuifolia Hk. (non Sw.) in Blakiston, Five Months on the Yangtze 362 (1862).

Cheilanthes Boltoni Cop. in Perkins, Fragm. Fl. Phil. 186 (1905); C. Chr. Ind. Fil. 663 (1906).

Rhizome short, erect, densely scaly; *scales* rufo-brown, lanceolate-subulate; *fronds* tufted, stipe 2-5 cm long, dark castaneous, shining, terete with a channel above, densely scaly throughout, lamina lanceolate, 8-20 cm long or longer, 1.5-6 cm broad, shortly acuminate, sub-bipinnatifid; *pinnae* 10-15-jugate, subsessile, the lower ones more or less shortened, the middle ones 1.4 cm long, or longer, 0.5-2 cm broad, oblong-deltoid, acute or obtusish, pinnatifid nearly down to costa into 4-6 oblong, crenate or eroded *segments*, with 2-4 oblique and simple veinlets to each tooth, rachis more or less scaly, castaneous, costa of the same color underneath, both sides glabrous; *texture* herbaceous, greenish; *soft* globose, distinct on each crena with the reflexed margin of an oblong shape as *indusium*.

Numerous specimens have been seen from Chekiang (including type, leg. Alexander in Chusan Island), Kwangtung (including type of *Ch. Fordii*), Fukien, Kwangsi, Kiangsi, Hupeh, Ivweichow, Szechw^n (including type of *Ch. Bockii*, leg. Rosthorn 1766 in Nanchuan) and Kiangsu. A complete enumeration of the specimens from the above localities will be given later in my "Studies of Chinese Ferns."

Specimens from Japan (Nagasaki, leg. Maximowicz 25}, Tonkin (Balansa 129), Formosa and Luzon are also examined.

The present fern, now found to be very common in Eastern, Southern and Central China and Japan, has generally been considered as identical with *Ch. mysuriensis* Wall, of East India from which it differs in characters as already noted in my previous paper (Cf. Bull. Dept. Biol. Sun Yatsen Univ. No. 6: p. 26).

CHEILANTHES TRICHOPHYLLA Baker

POLYPODIACE^E

CHEILANTHES TRICHOPHYLLA Baker, Ann. Bot. 5: 211 (1891); Diels in Engl. u. Trantl: Nat. Pflanzenfam. 1: 4. 276 (1899); C. Chr. Ind. Fil. 180 (1905); Acta Hort. Gothob. 1: 91 (1924); Christ, Bull. Soc. Bot. France 52: Mém. 1. 59 (1905); Bull. Acad. Géogr. Bot. (1906) 133; Hand-Mzt. Symb. Sin. 6: 40 (1929).

Cheilanthes undulata Hope et C. H. Wright, Gard. Chron. III. 34: 397 (1903)

Rhizome short, oblique, densely radicose; *scales* at the apex dense, narrowly lanceolate, black, rigid; *fronds* subcaespitose, stipe 20-30 cm long, ebeneous or dark castaneous, terete, except a narrow groove above, densely clothed from the base upward and throughout the flexuose rachis in fine, reddish-brown, appressed articulated hairs, which also cover the both sides of leaves, lamina elongate-deltoid, 20-35 cm long, 7-15 cm broad at base, tripinnatilid; *pinnae* 6-10-jugate under the deltoid, pinnatifid apex, alternate, horizontally patent, or the lower ones more or less deflexed, all petiolate, the basal ones much the largest, 8-10 cm long, 5 cm broad, elongate-deltoid, on petiole 1 cm long; *pinnules* 4-5-jugate, alternate, broadly deltoid, shortly petiolulate, 2.5 cm long, 2 cm broad, base truncate, horizontally patent, pinnatifid to a short distance from costule into 2-4 pairs of oblong-lanceolate, blunt *segments*, of which the basal ones 1 cm long, 2-2.5 mm broad; *texture* herbaceous, brownish underneath, greenish above; *veins* flabellately forked, very oblique to the flexuose costule of segment; *indusium* narrow, brown, continuous, crenate, ciliate.

Yunnan: Lan Kong, Delavay (type); Ta-pin-tze, near Tali, Delavay 31, 1200, 1301; Yan-in-shan, Delavay 1165, 1174; Chonang-che-teon, Delavay 1165 (1883); Salwin, G. Forrest 18331 (1917-19); 1034; Handel-Mazzetti 6303 (1914-18); Pinchow, Ducloux 6986, 7042; environs de Yunnan-sen, Dudoux 6338; A. Henry 13220 (type of *Ch. undulata*). Szechwan: E. H. Wilson 5289 (1910). Tibet border: Capt. Kingdon Ward 225.

One of the most distinct endemic species of the genus, with which *Ch. Delarayi* Baker from the same locality is the only close relative, which differs in rachis and rachilets being not flexuose, glabrous surfaces of leaves and decidedly cordate pinnules. It appears to be a common fern in the north-western part of Yunnan, but not known elsewhere, besides Wilson's plant from western Szechwan.

Plate 136. Fig. 1. Habit sketch (natural size). 2. Segment, showing venation and position of sori (x 10). 3. Scale from rhizome (x 27). 4. Hairs from leaf surface (x 40).

CHEILANTHES TRICHOPHYLLA

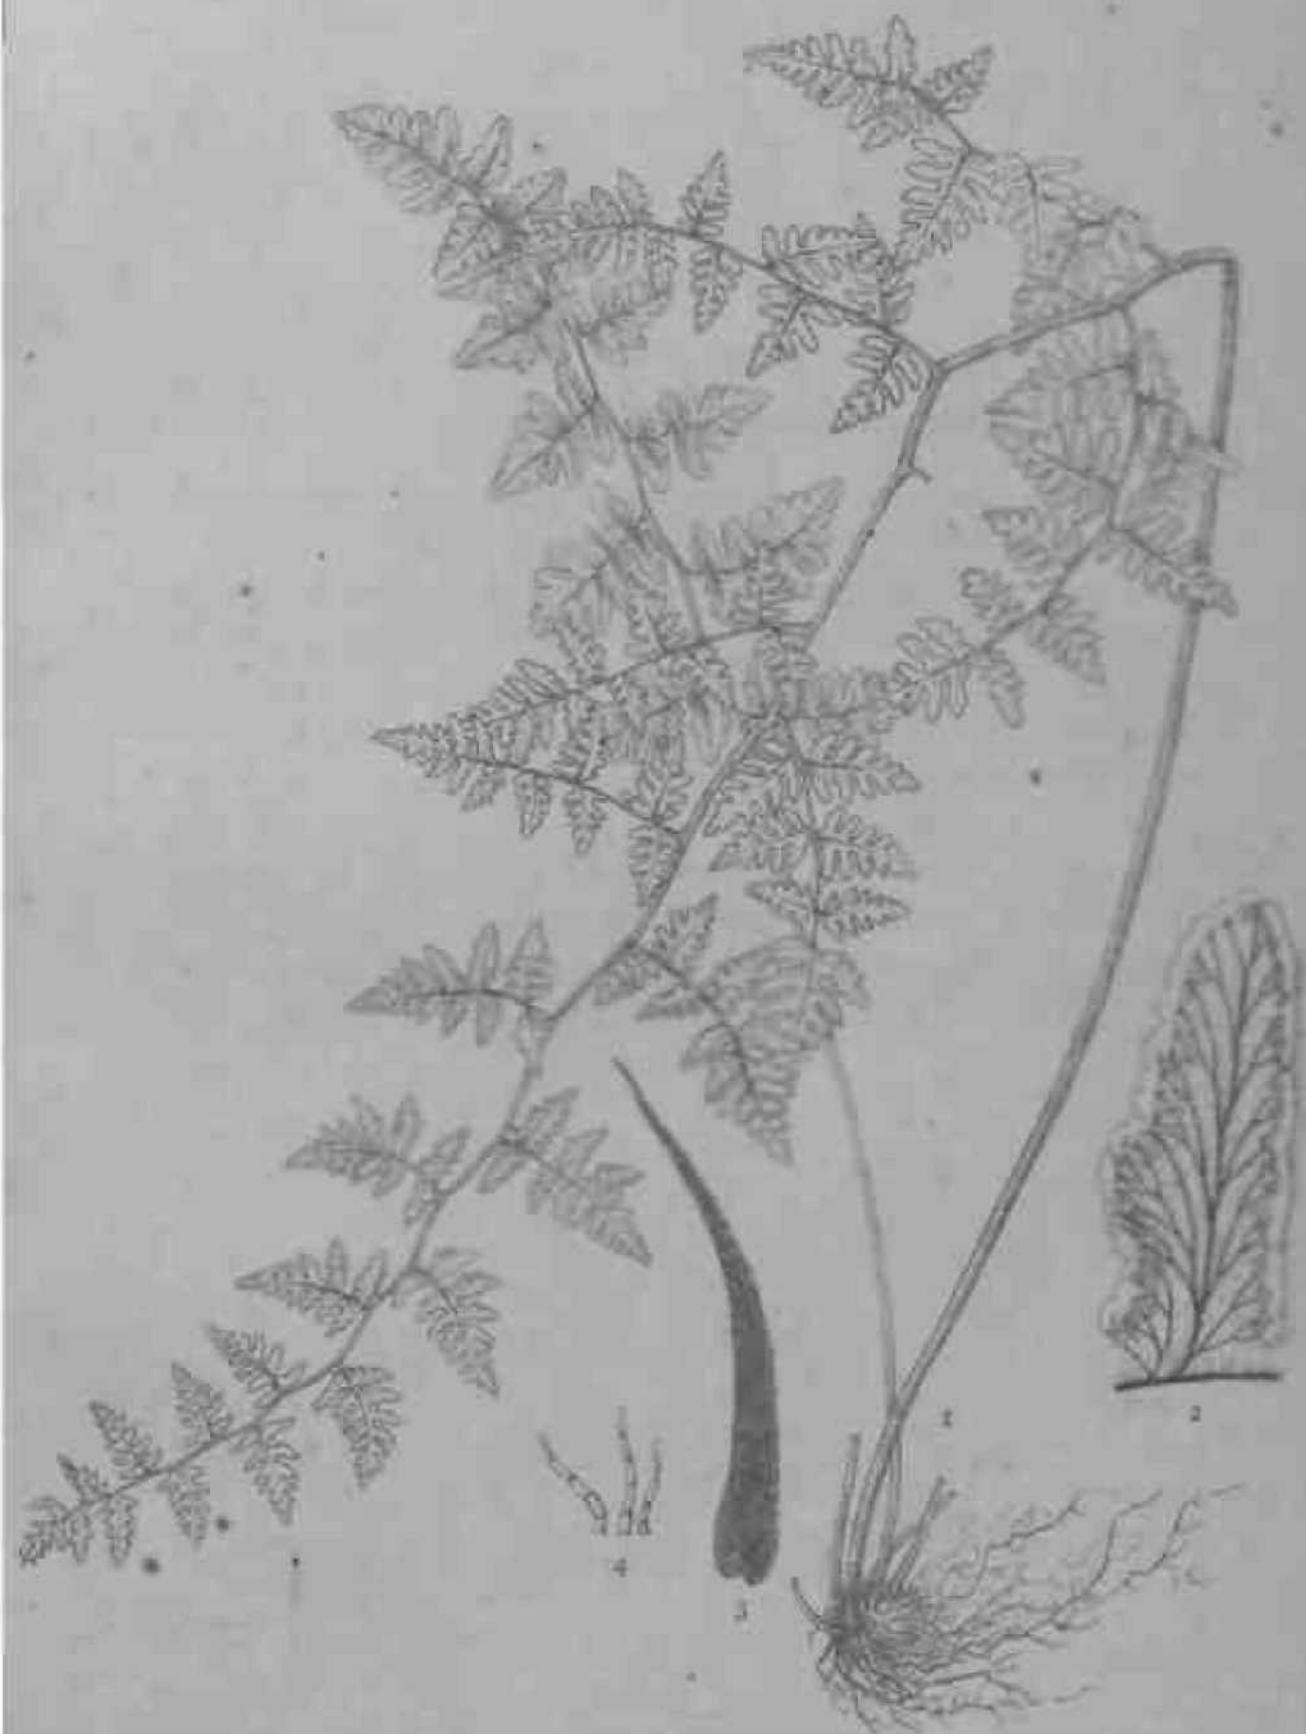

Baker

a, 上面具一淺溝槽，遍體被紅棕色之短毛，葉體為長三角形，長二十至三十五分，寬七至十五分，三回羽狀深裂，兩面被同樣之密毛，紙質，下面呈淡棕色，各位中肋呈強度曲折，一回小葉六至十對，互生，具柄，水平開展，或多少下向，頂部三角形，羽狀深裂，基部一對最大，長八至十分，寬五分，長三角形，柄長達一分，二回小葉四至二對，互生，長三角形，長達三分，寬約二分，基部截形，水平開展，羽狀深裂，裂片二至四對，橢圓披針形，鈍頂，位於基部者長達一分，寬約三毫米；葉脈扇狀三叉，斜向上出；子囊羣着生於葉邊小脈之端，蓋膜質，線形，通直，邊呈波狀，具撓毛。

分布：雲南，四川，及西藏東部。

本種為我國西部高山特產，極為奇特，與此相類者惟 *Ch. Delavayi* Baker，然其各位中肋不呈強度曲折，葉兩面頗光滑，末回小葉之基部呈心臟形，故易與本種區別。

圖註：1. 本種全形(自然大)，2. 裂片，表示其葉脈及子囊羣之位置(放大十倍)，3. 地下莖上之鱗片(放大二十七倍)，4. 葉面之紅棕色毛(放大四十倍)。

Adiantum monochlamys C. Chr. Bot. Gaz. 56: 331 (1913).

Rhizome wiry, wide-creeping, densely scaly at growing tip; scales nilide, atro-brown, ovate-lanceolate, entire; frond far apart, stipe slender, firm, terete, glossy, castaneous, 10-20 cm long, glabrous above the scaly base, lamina deltoid-ovate, much shorter than stipe, tripinnate; pinnae 3-5-jugate under elongate pinnatifid apex, all petiolate, basal ones much the largest, deltoid-lanceolate, to 7 cm long, 3-4 cm broad; pinnules oblong, petiolulate, obtuse, with 1-4 pairs of ultimate close pinnules which are of flabellate shape with rounded, aristately serrate outer margin, distinctly petiolulate, 4-7 mm each way, rachis, rachilets, costa and petiolules shining castaneous; texture crass herbaceous, surfaces glabrous, green above, more or less glaucous underneath; veins fine, flatly forked, more or less projecting out from the sharp teeth; sori medium-sized, generally solitary to each ultimate pinnule, indusium brown, thick, rotundo-reniform, 2-3 mm long, with the sterile margin on both sides aristately serrate.

Szechwan: Moupin, David (type) (1870); Tchen-kou-tin, Farges 689; Yenguen, Handel-Mazzetti 2789; Wilson 5254 (type of *A. aristatum*); Mo Tien Ling, F. T. Wang 22453; Teng-hsiang-ying, Harry Smith 1918; Drogochi, Harry Smith 4548. Yunnan: The Red River, Mo-soyu, Delavay 1698; Hokin, Delavay 1198; Lonkong, Yen-tze-hay, Delavay 1878, 1687; Teng Kou valley, Forrest 12483; Yun-peh Mt., Forrest 17049; Duclouoc 3368. Shensi: Lun-san lluo, Giraldi, Oct. 1893; Miao-nan Shan, Giraldi, Jan. 1899; Thai-pei Shan, Giraldi August, 1893; August 10-20, 1894 & 1895; Purdom 79 78; ibid., Hopingsze, K. S. Hao 4272, Sept. 12, 1932. Tibet Border: Capt. Kingdon Ward 479 (1913).

Burma: Simila, Burhe 23 (1807).

This distinct endemic species belongs to the group of *A. venustum* Don of Northern India. The underside of leaves sometimes appears conspicuously glaucous, or sometimes only bluish as in *A. aristatum*. *A. latedeltoideum* C. Chr. from the southern part of Shensi is only a somewhat ampler form; and most specimens from the same region have ultimate pinnules rolled up, due evidently to the dry habitat.

Plate 138. Fig. 1. Habit sketch (natural size). 2. Pinnule (x 8). 3-4. Scales from rhizome (x 25).

PLATE 140

PTERIS PAURIEI Hieronymus

POLYPODIACE^E

PTERIS FAURIEI Hieronymus, Hedwigia 55: 345 (1914); C. Chr. Ind. Fil. Suppl. II. 30 (1916).

Pteris quadriaurita Hk. Sp. Fil. 2: 179 (1852); Syn. Fil. 158 (1867); Diels in Engl. u. Prantl: Nat. Pflanzenfam. 1: 4. 292 (1899), pro parte.

Pteris quadriaurita Franch. et Saw (non Retz.) Enum. PI. Jap. 2: 214 (1877); Christ in Warburg, Monsunia 1: 69 (1900); Bull. Herb. Boiss. IV. 2: 612 (1904); Journ. d. Bot. France 19: 14 (1905); Bull. Acad. Géogr. Bot. (1910) 16; C. Chr. Acta Hort. Gothob. 1: 97 (1924).

Pteris biaurita C. Chr. Ind. Fil. 593 (1905). pro parte.

Pteris longipinnula Christ (non Wall. 1828), Bull. Acad. Geogr. liut. ^KJOOJ 130; ibid., (1910) 16.

Rhizome short, oblique, densely scaly; *scales* dark brown, lanceolate, rigid, appressed; *fronds* subcespitoso, stipe 30-40 cm long, rufo-straminous on the lower part, lighter-colored upwards, glabrous above the base, lamina broadly ovate-deltoid, 30-45 cm long, nearly as broad; *pinnae* 4-7-jugate under the free end-pinna, generally larger than those immediately below, the basal ones much the largest! deltoid, with 1-3 additional pinnules on the lower side of costa, all subsessile with shortly decurrent base, the middle ones 15-20 cm long, 4.5-6 cm broad, pinnatifid nearly down to costa into 20-30 pairs of linear-subfalcate, obtuse segments under the caudate, entire apex 2-4 cm long; *segments* 2.5-4 cm long, less than 1 cm broad at base with 13-17 pairs of biforked and very prominent *veins*, of which the posterior basal one springing from costa and 2-3-4-forked, the anterior basal one, from the costule of segment, biforked, with veinlets running to the margin some distance above the sharp, callous sinus; *texture* chartaceous, clear light green, glabrous on both sides, except a few brownish, thick, articulated hairs underneath, costa pale-colored, terete below, deeply sulcate and with one stout spine at the base of costule of segment above; *sori* continuous from near the sinus up to a short way from the sterile entire apex of segment, *indusium* membranaceous, gray, entire.

Numerous specimens have been seen from Kwangtung, Islands Hongkong and Hainan, Fukien, Chekiang, Hupeh, Yunnan, Szechwan and Kwangsi, besides Formosa, Japan, French Indo-China. A complete enumeration will appear later in my "Studies of Chinese Ferns."

The present species has previously been generally considered the same as *Pteris quadriaurita* Retz. from Ceylon, the type of which, T had a chance to examine some years ago, is very different from our fern in general habit, but perfectly identical with *Pteris otaria* Bedd. Ferns S. Ind. t. 41, 219. Our plate is based upon a specimen from Kwangtung (leg. Y. K. Wang No. 31655) and represents what Hieronymus has considered var. *rujida*. I.e. p. 346., a form, common in South China, which differs, according to its author, from the Formosan type (leg. Faurie No. 628) in clear light green leaves and more prominently raised veinlets on both sides; but ample material from the region has convinced me that a varietal name is hardly justified. It is possible, however, that some specimens from Szechwan and Kweichow which have more pairs of lateral pinnae* with much longer linear caudate apices, may prove specifically distinct from the form from South China.

Plate 140. Fig. 1. Habit sketch (natural size). 2. Two segments, showing venation and sori (x 4). 3. A portion of pinna, showing the stout spines at the base of costuleless above (x 2).

Hainan: Hoichow, *Hancock* 1 (1875); Dung Ka to Win Fa Shi, C. L. *Tso* & N. K. *Chun* 43728.

Widely distributed throughout tropical Asia, Australia and Polynesia. Very closely related to this fern is *Sch. heterophyllum* (Dry.), which differs in the lateral pinnae gradually decrescent towards the lobato-pinnatifid apex. Our fern is a very variable one as to the shape of frond, which varies from simple to fully pinnate with 10 pairs of pinnae of different width. Our plate is based upon a specimen from Kwangtung (leg. N. K. Chun 40990), which agrees very well with type from Island Maritius, now to be found in the herb. Swartz.

Plate 142. Fig. 1. Habit sketch (natural size). 2. Portion of pinna f x M *_f. The MUIL, NMUI open indusium (x 6). 4. Spores (x 500). 5. Scale from rhizome (x 10J).

第一百四十二圖

81 *SOHIZOLOMA ENSIPOLIUM* (Sw.) J. Smith

地下莖亞蔓生，具棕色狹披針形之密鱗片；葉近生，柄長六至二十粉，淡栗色，稍具光澤，光滑，葉體長十五至二十五粉，橢圓形，奇數一回羽狀分裂，間為線披針形之單葉；小葉一至十二對，具短柄或幾無柄，互生，長六至十三粉，寬一至二粉或較狹，線披針形，基部斜截形，兩面光滑，紙質，全緣（非子囊葉具鋸齒）；主脈明顯，側脈無，小脈網狀，網眼一至二列，斜出，內不具小脈，向葉邊分，蓋兩層，膜質，全緣，通直，向外開。

分布：廣佈

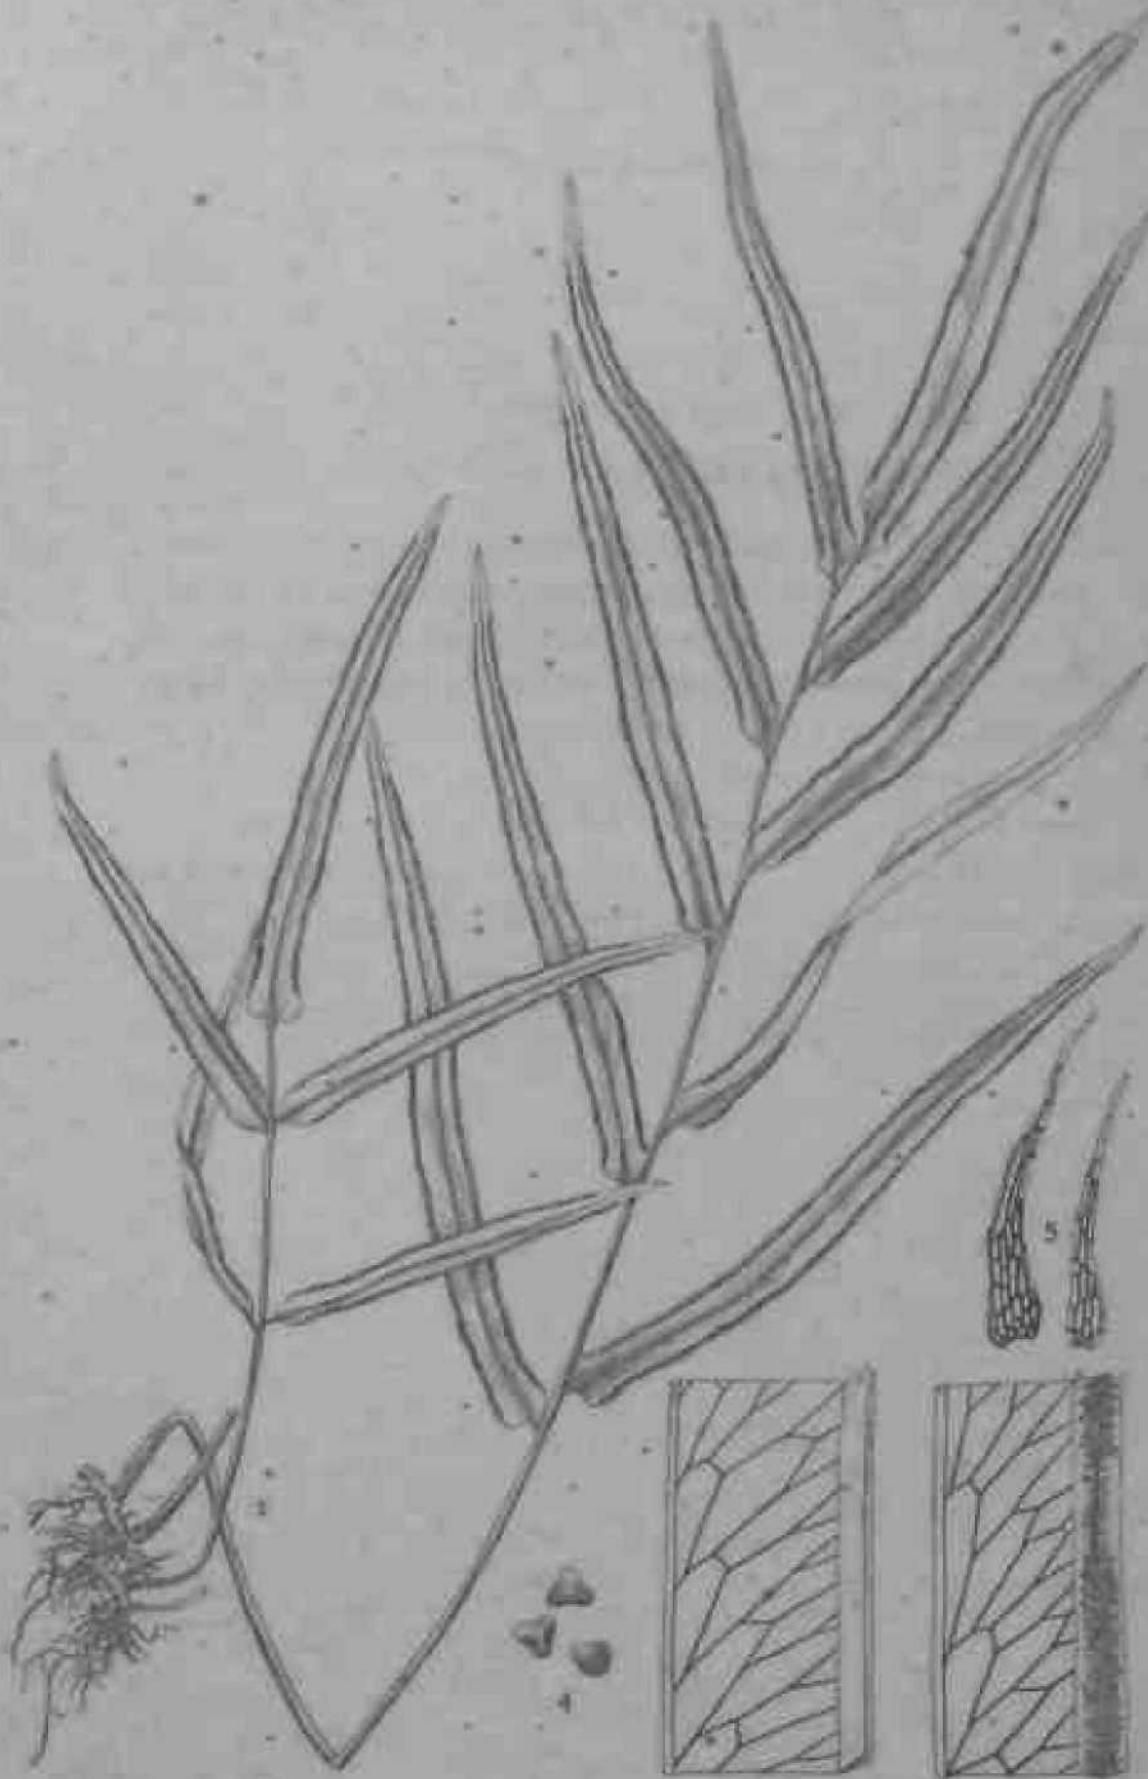

瓊洲島亦產之。

本種酷似 *Sch. heteropyllum* (Dry.), g ft TO * » AX 小葉成奇數，向葉端漸縮小是也。

Our plate represents the var. *glabra* from Mt. Omei (leg. W. P. Fang No. 2548). Hieronymus is right in separating the Chinese and Japanese plants as distinct from true *C. fraxinea* (Don) from the Himalayas and Malesia-Polynesia, which is characterized by entire pinnae of still larger size and much thicker texture, but I can not agree with him in regarding Rosthorn's plant No. 1699 from Nanchuan and Henry's No. 2204 from Ichang (*C. Rosthornii*) as specifically distinct from var. *willosa* of the present species by merely having "shorter, stiff and easily broken hairs, consisting of 2-4 cells" on the underside of pinnae, a character which seems to be too insignificant to justify a specific rank.

Plate 143. Fig. 1. Habit sketch (natural size). 2. Portion of pinna, showing serration and* extension of veinlets (x 12). 3. Scale from rhizome (x 12),

PLATE 145

ANTROPHYUM FORMOSANUM Hieronymus

POLYPODIACE^E

ANTROPHYUM FORMOSANUM Hieronymus, *Hedwigia* 57: 210 (1915); C. Chr. Ind. Fil. Suppj. II. 4 (1916).

Antrophyum plantagineum Christ (non Kaulf.), *Bull. Herb. Boiss.* II. 4: 610 (1914).

Rhizome short, erect, densely scaly at the base of stipe; *scales* lanceolate, fusco-brown, thin, iridescent, serrulate with hair-pointed tip; *fronds* fasciculated, sessile, lanceolate, 8-15 cm long, 1.2-1.8 cm broad, acuminate, gradually attenuate towards base; *texture* herbaceous, glabrous on both sides, no midrib; *venation* reticulated, fine but distinct against light; *sori* linear, following the course of grooved veins, *paraphyses* broad, ribbon-like.

Kwangtung: Lohfau Shan, *N. K. Chun* 4*480, July 2, 1930. Kwangsi: Yao Mar Shan, Lin-yin Hsien, *R. C. Ching* 7082 (1928).

Formosa: Kushaku, *Faurie* 675 (type), June, 1903; *Hancock* 2; *Steere*; Takow, *A. Henry*; *Swinhoe* (1870); *Play fair* (1889).

From other species of the genus known in the region, our fern can be easily distinguished by its very broad and ribbon-like paraphyses in the sori and much thinner fronds. Our plate is based upon a specimen from Kwangtung (leg. N. K. Chun 41480), which matches the type from Formosa very well.

Plate 145. Fig. 1. Habit sketch (natural size). 2. Portion of frond, showing venation and sori (x 3). 3. Scale from rhizome (*30). 4. Paraphyses from sorus (x 80).

PYRROSIA SHEARERI (Baker) Ching

地下莖肥厚，亞橫行，具銹黃色之披針形鱗片；葉亞簇生，柄長十八至三十公分，堅強，基部節狀着生，幼時具星芒狀之長足剛毛，旋脫落，葉體為披針形，長十五至三十公分，寬三至六公分，漸尖頭，向基部漸闊，呈不等耳形，厚革質，綠色，上面具小孔，初被星芒狀毛，漸變光滑，下面具淡黃色宿存之厚星芒狀毛，芒短而闊，在同一平面；側脈上下可見，斜出，小脈網狀，不見，網眼具小脈；子囊羣圓形，着生於小脈之端或端下，初甚明顯，旋呈亞合生。

分布：江西，湖南，浙江，貴州，《*'ra'u'mm*mm》廣東，廣西；台灣及交趾亦產之。
本種為本屬特異之種，在廬山最為普通，其形體頗似後種，惟葉下面之毛較厚而鬆，色鮮黃，其芒細長如針，且不在同一平面，故易與本種區別。

PYRROSIA DRAKEANA (Franch.) Ching

POLYPODIACE^E

PYRROSIA DRAKEANA (Franch.) Ching, Bull. Bot. Soc. China 1: 64 (1935).

Polypodium Drakeanum Franch. Nouv. Arch. Mus. II. 7: 165 (1883); Christ, Bull. Herb. Boiss. 6: 871 (1898).

Niphobolus Drakeanus Diels in Engl. Jahrb. 29: 206 (1900); Giesen. Farnagt. Niph. 117 (1901); Christ, Bull. Soc. Bot. France 52: Mém. 1. 24 (1905).

Cyclophorus Drakeanus C. Chr. Ind. Fil. 198 (1905); Contr. U. S. Nat. Herb. 26: 326 (1931).

Polypodium Shearerri Christ (non Baker), Nuov. Giorn. Bot. Soc. Ital. n.s. 4: 95 (1897).

Cyclophorus Shearerri C. Chr. Acta Hort. Gothob. 1: 105 (1924, non 1905), pro parte.

Niphobolus Shearerri Christ (non Diels), Bull. Soc. Bot. France 52: Mém. 1. 26 (1905).

Niphoholus inaequalis Christ, Bull. Soc. Bot. France 52: Mém. 1. 25 (1905); Bull. Acad. Géogr. Bot. (1906) 109.

Cyclophorus inaequalis C. Chr. Ind. Fil. 199 (1905).

Rhizome thick, short-creeping, densely scaly; *fronds* subcaespitose, stipe thick, stout, 13-17 cm long or much longer, ferruginously stellate hairy, lamina oblong-ovate or oblong-lanceolate, 13-16 cm long, or longer, to 6 cm broad, short acuminate, base obliquely truncate or rotundo-cuneate, slightly decurrent; *texture* rigidly coriaceous, upperside green and sparsely hairy when young, underside densely clothed in thick wooly brown persistent and loose indumentum consisting of long needle-like arms not on the same plan, midrib prominent on both sides, hairy underneath; *lateral main veins* scarcely visible; *sori* punctate, subconfluent at last.

Shensi merid: *David* (type), March, 1873; Chui-kio-suen, *Giraldi*, Sept. 29, 1897; *Purdom* 97; Thai-pei Shan, *Giraldi*. Kansu: Kua-tsa, *Meyer* 1818, Nov. 5, 1914; *Licent* 4934 (1919). Hupeh: Patung, *Henry* 3684'; *Wilson* 1909, 1727, 2629; *Henry* 1428 (type of *Niph. inaequalis*); Shin-Shan Hsien, S. S. *Chien* 8324 in herb. Univ. Nanking; Ichang, *Henry* 2569. Kweichow: Gan-pin, *Bodinier* 1743; Pin-fa, *Cavalerie* 512; *Esquirol* 635, 699; *Cavalerie* 1807, 1809.(without exact locality). Szechwan: Mt. Omei, *Wilson* 5323; *Faber* 1076; *Brown*; *W. P. Fang* 2710, on tree; Nan-chuan: *Bock & Kosthorn* 1713, 1059, 3123; Ta-chien-lu, *Harry Smith* 4930; *Prince Henri d'Orleans*; *Y. Chen*; *Pin-yi-pu*, *Harry Smith* 1984, 4930, 4825; *Moupin*, *David* (1870); *T. Tang* 787 (1932). Yunnan: Tsekou, *Monberg* 275 (1908); *Souliè* (1898); Mengtze, *Henry* 9114, 9116; *Hancock* 51 (Kew No); Salwin, *Forrest* 16195, 28940; Mekong, *Forrest* 13119 (1914), 19842, 19841; Kiang Yu Shan near Lan-pou, *Delavay* 1734; Ta-pin-tze, *Delavay* 3250, 4518; Pe-yen-tsin, *Simon Ten*; *Ducloux* 4984; In-on, *Maire*. Tibet orient.: *Souliè* 588.

A distinct pretty fern known only from mountains of comparatively high altitude in the western and north-western part of China; its distinction from *Py. Shearerri* (Baker) is already noted above. *Niph. inaequalis* Christ represents a slender form with lanceolate lamina on stipe nearly twice as long.

Plate 148. 1. Habit sketch (natural size). 2. Portion of lamina, showing venation (x 3). 3. Stellate hairs from the underside of lamina (x 20) 4. The same from stipe (x 20). 4. Scale from rhizome (x 10).

PYRROSIA DRAKEANA (Franch.) Ching

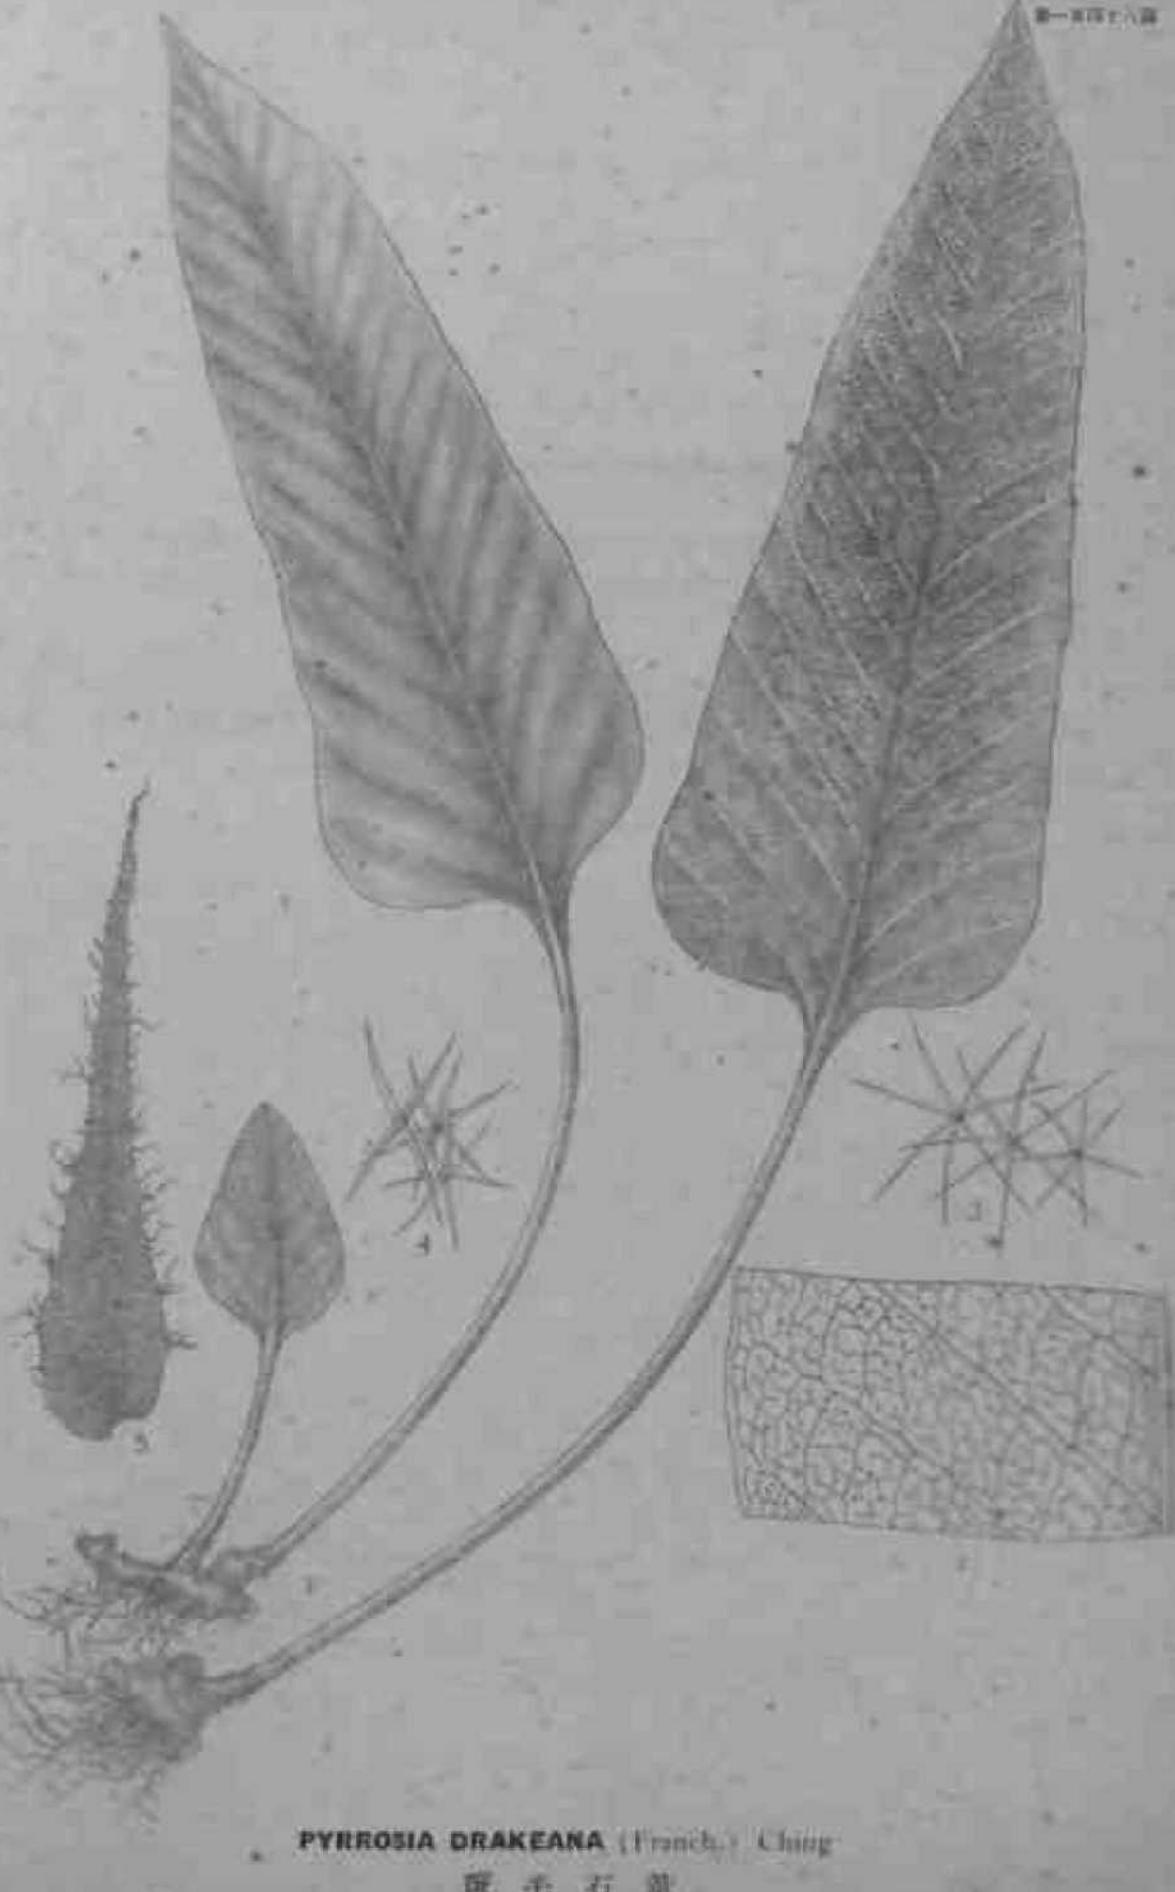

本種形體頗類前種，所異者為葉體較寬而葉柄較葉體為長，間有二倍之者，為其葉下面之毛較厚而鬆，且其芒細長如針，不在同一平面，故得易於識別，再本種之分佈概限於中國西南西北部之高山，與前者之限於中部及南部者顯然有別。

分布：陝西，湖北，四川，西康，雲南，西藏東部。

ARTHROMERIS HIMALAYENSIS (Hk.) Ching

POLYPODIACE^

ARTHROMERIS HIMALAYENSIS (Hk.) Ching, Contr. Inst. Bot. Nat. Acad. Peiping 2: *
99 (1933).

Polypodium himalayense Hk. Sp. Fil. 5: 91(1863); Syn. Fil. 369 (1867); Diels in Engl. u. Prantl:
Nat. Pflanzenfam. 1: 4. 321 (1899); Christ, Farnkr. d. Erde 114 (1897); Bull. Soc. Bot. France
52: Mém. 1. 19 (1905), pro parte; C. Chr. Ind. Fil. 533 (1905).

Pleopeltis himalayensis Bedd. Ferns Brit. Ind. t. 318 (1869); Handb. Ferns, Brit. Ind. etc. 372
(1883).

Polypodium venustum Wall. Cat. n. 305 (1828, nom. nud.); Clarke, Trans. Linn. Soc. II. Bot. 1:
566 (1880), non Desv. 1811.

Pleuridium venustum J. Sm. Cat. Cult. Ferns 10 (1857).

Arthromeris venusta J. Sm. Hist. Fil. 111 (1875).

Polypodium venustum var. *niphoboloides* Clarke, I.e. 567.

Rhizome thick, woody, wide-creeping, glaucous, sparsely scaly; *scales* linear from orbicular base, bright brown; *frond* far apart, stipe firm, glossy, dark straminous, 1-15 cm long, glabrous, lamina 20-45 cm long, 15-20 cm broad, imparipinnate; *pinnae* 1-5-jugate, articulated to rachis, opposite, 5-7 cm apart, sessile, 12-16 cm long, 3-4 cm broad, oblong-lanceolate, caudate, base roundish or subcordate, margin entire but wavy and provided with a very broad whitish membrane; *texture* subcoriaceous, both sides densely glandular hairy, costa underneath with long spread hairs; *lateral main veins* fine but distinct, areolae fine, with copious included veinlets; *sori* large, rounded, irregularly 2-seriate, of 3-4 each between main veins, exindusiate.

This distinct and pretty, fern can easily be distinguished from its relatives by oblong-lanceolate and caudate, densely glandular hairy pinnae with a very broad whitish membranaceous margin.

Yunnan: South of Red River, Manmei, Henry 9747 \ Tse-tchou-pa, Maire;
Song-san, Delavay 2612.

Sikkim-Himalayas, from 6,000 to 10,000 ft. elevation, common.

Var. **furcans** Ching, I.e. p. 100.

Habit of *Cyrtomium caryotidetum* Presl, with irregularly lacerato-forked pinnae.
Known only from Sikkim (leg. Duthie 5177).

Plate 149. Fig. 1. Habit sketch (natural size). 2. The same (natural size). 3. Portion of pinna, showing venation and sori (x 5). 4. Scale from rhizome (x 20). 5. Hairs from costa (x 80). 6. Glandular hairs from underside of lamina (x 80). 7. Rachis with articulated base of the lateral pinna (x 10).

ARTHROMERIS HIMALAYENSIS (Hk.) Ching

地下莖肉質，肥厚，蔓生，灰白色；鱗片疏生，線形，具卵圓形之基部，黃色；葉疏生，柄長達十五公分，堅實，深稻桿色，有光澤，光滑，葉體長二十至四十五公分，寬十五至二十公分，奇數羽狀分裂，小葉一至五對，節狀着生於中肋，對生，無柄，長十二至十六公分，寬三至四公分，闊披針形，尾狀，基部圓形或亞心臟形，全緣，具一極寬之薄膜質，兩面絨毛密生，側脈明顯，斜出，下面具長剛毛，小脈網狀，厚紙質；子囊羣圓形，呈不規則之二列，無蓋。

分布：雲南，緬甸及印度北部。

本種為本屬特殊之種，在我國惟雲南僅見之；此外尚有一種變種，產於西京，其小葉四緣深裂。

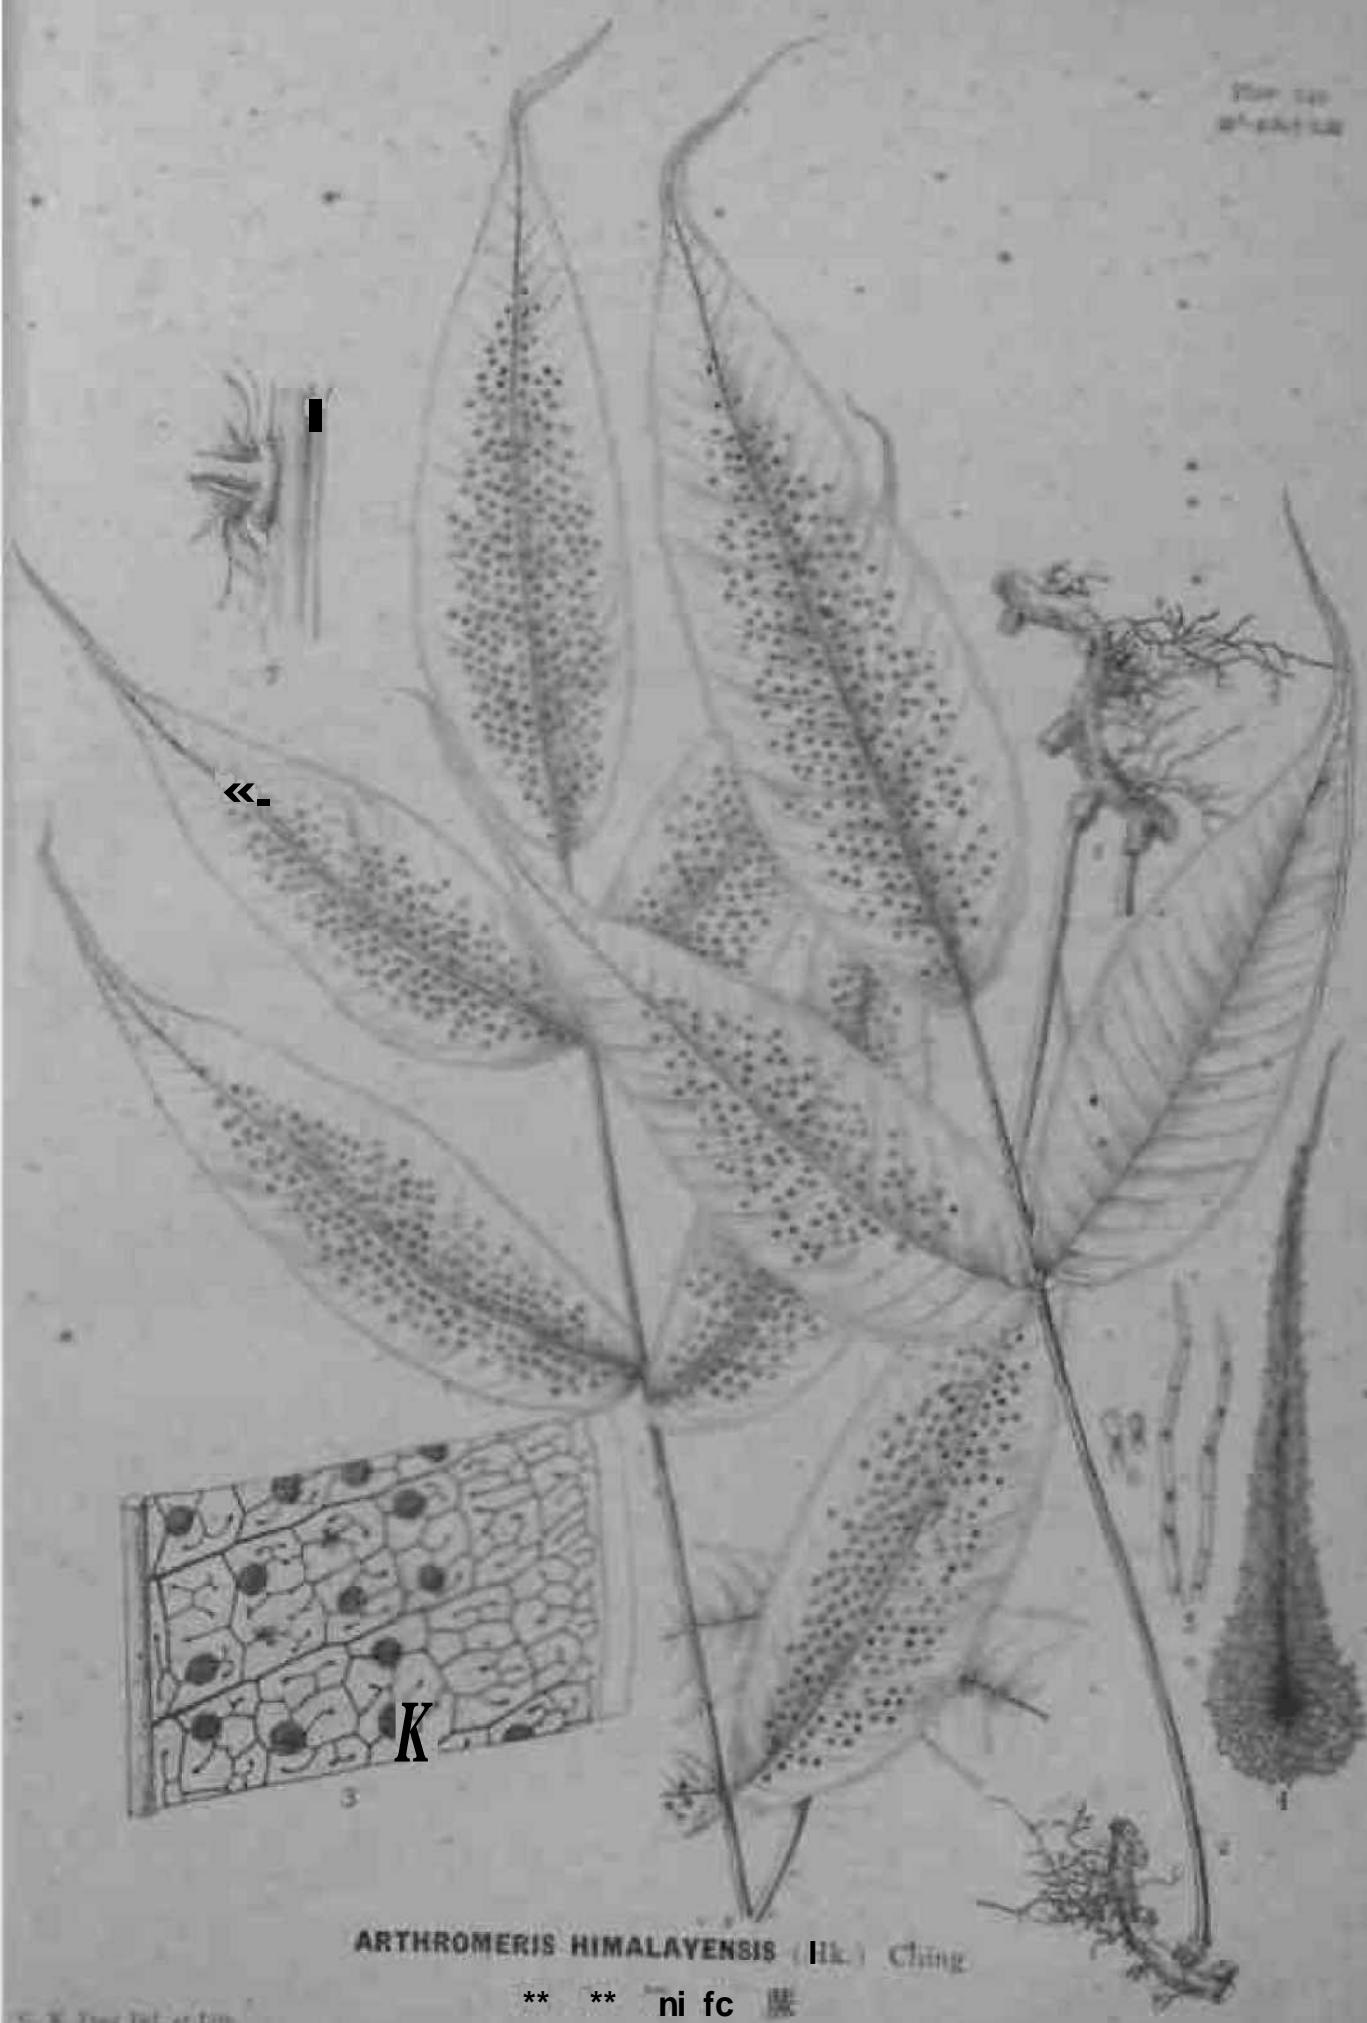

PLATE 150

ARTHROMERIS LUNGTAUENSIS Ching

POLYPODIACE^;

ARTHBOMERIS LUNGTAKENSIS Ching, Contr. Inst. Bot. Nat. Acad. Peiping 2: 08 (1933).

Polypodium lungtauense Ching in C. Chr. Ind. Fil. Suppl. III. 152 (1934).

Rhizome wide-creeping, 4-5 mm thick, terete, atratous; *scales* dense, ovate, acuminate, grayish-brown with scarious **margin**; *frond* far apart, stipe 3-10 cm **long**, dark straminous, terete, slender, naked, *Jamina* oblong or deltoid, 7-30 cm long, impari-pinnate; *pinnse* 1-3-8-jugate, the terminal pinna; similar to the lateral ones, which are patent, sessile, 6-10-16 cm long, 2-3 cm broad in the middle gradually acuminate, base equal, cordate, subamplexicaulous, margin entire with a cartilaginous line all around; *lateral veins* prominent, 4 mm apart, obliquely patent, transversal veinlets 4-6 between costa and margin, intervening veinlets anastomosing with included veinlets; *texture* chartaceous, brownish when dried both sides moderately villose; *sori* rather small, rounded, dark brown, bi-seriate of 3-4 each between main veins, glabrous, with a few protruding hairs from veinlets underneath.

Kwangtung: **Lungtau** Shan, In village, **To Rang Ping 12480 ex herb** Lingnan Univ., June 7, 1924: Tsungfa-Lungmoon Districts. **Tsang Wei Tak** *0508 May 1, 1932; Yiyuan, S. P. Ko 53074, July 13, 1933; Lohfau Shan, C. Ford 14 (1883). C. O. Levine & McClure 6828; Lemne 1545; B. C. Henry 22270 in herb. Hance May 1863.

A critical species, which differs from *A. himalayensis* (Hk.) in not densely pubescent surfaces of pinna of a different outline with a narrowly cartilaginous margin; from *A. Lehmanni* (Mett.) it differs in sparsely villose leaf surfaces and much smaller size.

Plate 150. Fig. i. Habit sketch (natural size). 2-3. The same (natural size). 4. Portion of pinna showing venation and sori (x 5). 5. Scale from rhizome (x 24). 6. Hair from lamina (x 60).
