

CHECKLIST OF LIVERWORTS AND HORNWORTS OF BANKS PENINSULA

David Glenny

Landcare Research, Lincoln

This article contains a list of liverworts and hornworts known from Banks Peninsula Ecological Region, divided into three sub-lists for the Port Hills, Herbert, and Akaroa Ecological Districts (Table 1, page 13).

Regional lists of liverworts

Few regional liverwort species lists have been published in New Zealand. They exist for a number of island groups, Snares Islands (Fineran 1969), Auckland Islands (Fineran 1971), Antipodes Islands (Glenny et al. 1996), Rangitoto Island (Braggins 2007), Three Kings Islands (Braggins 1987), Kermadecs (Campbell 1977), and Chatham Islands (Glenny et al. in prep.), but only one list for a large main island area: Fiordland (Lewington 2006).

The list in this paper is the first for an ecological region on the drier eastern side of New Zealand. It shows the character of the liverwort flora at the opposite extreme to the rich and luxuriant flora of the western provinces of New Zealand, and for a region that has had its forests much reduced by fire and conversion to pasture.

Banks Peninsula already has lists of mosses (Macmillan 1996) and lichens (Lintott & Lintott 1996).

Method

This list used as a starting point Rodney Lewington's 2007 Hinewai checklist and 2008 Stony Bay Stream checklist (for the recent addition to Hinewai Reserve of land in Stony Bay). It was then extended by searching the Allan Herbarium (CHR), Landcare Research, for specimens of other species. I then began adding to the list by doing fieldtrips to make the list more comprehensive: Mt Cavendish, Sugarloaf, Coopers Knob, Omahu Reserve, Mt Herbert, Herbert Scenic Reserve in Kaituna Valley, Mt Fitzgerald and Hikuika Stream, Ellangowan Scenic Reserve, Carews Peak Reserve, Hinewai including Stony Bay Stream, Armstrong Reserve, The Monument, Nikau Palm Gully, Bossu Road, and Devils Gap Reserve. These searches yielded about 72 species additional to those already known from existing collections and from Rodney Lewington's 2007 and 2008 Hinewai checklists.

All entries list vouchers, and all vouchers have been seen and their identity checked by me, unless stated otherwise. Rodney Lewington's vouchers for his Hinewai list were deposited in CHR, but they are incomplete. For names where there is no voucher at CHR ("n.v." in the list) the names are from Lewington (2007; 2008). CHR records can be seen for most of the collections cited at: <http://scd.landcareresearch.co.nz/Search/Search/CHR>

Names used in the list are those on the Landcare Research site *Nga Tipu o Aotearoa* (<http://nzflora.landcareresearch.co.nz/>). Otahuna, a collecting locality, is the valley north of Gibraltar Rock. Two Beckett collections are from Tarawera. This, according to Andersen (1927), is what is now called Mt Sinclair.

Collectors on Banks Peninsula

AJF: Allan Fife, BHM: Bryony Macmillan, DG: David Glenny, DRG: David Given, GB: Garth Brownlie, HDW: Hugh Wilson, HMH: Helen Hodgson, JDL: John Lovis, JL: Jette Lewinsky, JMB: John Blackburn, JT: Jane Taylor, KMc: Kate McCombs, LBM: Lucy Moore, LRS: LR Stemmer, MJP: Murray Parsons, MJS: Margaret Simpson, RJL: Rodney Lewington, RM: Ruth Mason, RMS: Rudolf Schuster, n.v. = no voucher at CHR, not seen.

Composition of the flora and rarity

The total number of species is ca. 201 (32% of the New Zealand total of 634 species), comprised of 197 liverworts and 4 hornworts.

For comparison, 234 species of moss have been recorded from Banks Peninsula Ecological Region (Macmillan 1996). This is 43% of the 542 moss species known from New Zealand (Glenny & Fife 2012).

Eighty-five species are known from single records on the Peninsula, 40% of the species recorded. Is this a reflection of few collections, or of true rarity on the Peninsula? Sources of single records are, in order of numbers of species: Mt Herbert 16, Stony Bay Stream 8, Hinewai Reserve 7, Mt Fitzgerald 6, Okuti Valley 4, Armstrong Reserve 3, Carews Peak 3, Omaha Reserve 3, The Monument 2, Kaituna Valley 2, Lighthouse Road 2, Bossu Road 1. Many of the species in Mt Herbert Reserve may be confined to that area. In other cases, for instance the two species only known from The Monument, it seems likely they have been overlooked at other sites. There are habitats that are very restricted in size, for instance the richest part of Stony Bay Stream that has seven single-specimen records. The forested stream habitat is only c. 50 m wide and surrounded by gorse scrub. It would once have been a habitat that occurred in similar streams along the eastern bays of the Peninsula.

Three to four species are undescribed: *Porella* aff. *viridissima* (Fig. 1, page 6) and *Siphonolejeunea* sp. (a) which is known from eastern provinces from East Cape to the Remarkables and Chatham Islands. There is an undescribed *Cephaloziella* on Stony Bay Peak and Flag Peak. There is a *Lophozia* species on Carews Peak that appears to be undescribed. The Stony Bay Peak material of *Paracromastigum macrostipum* differs somewhat from North Island specimens (from the Volcanic Plateau and Kaimai Range) and may be a distinct species.

Figure 1 The undescribed *Porella* aff. *viridissima*. Young shoots are a more pure green than in *P. elegantula*, which has yellow-brown pigments.

It is only a matter of time before the introduced *Marchantia polymorpha* is found on the Peninsula as it is sometimes spread by planting out of native plants raised in nurseries for conservation or landscaping projects (e.g. at Tai Tapu, Osterholts Road bridge, 2013, DG11739).

Unusual distributions

Bazzania adnexa is an extremely abundant species west of the Main Divide, but there are no records from Canterbury other than on Banks Peninsula where it is only known from Stony Bay Valley.

Cephaloziella aenigmatica is on a road bank at Reynolds Valley Road. The type and sole other specimen is from Mt Euclid in the Paparoa Range.

Herbertus oldfieldianus occurs in Ellangowan Scenic Reserve, Mt Herbert, and Mt Fitzgerald. The nearest site not on the Peninsula is at Arthur's Pass.

Lejeunea subelobata is known from four collections on Banks Peninsula, otherwise in New Zealand it is known only from Northland and Auckland (it also occurs in Australia).

Lepidolaena berggrenii occurs on Mt Herbert, and is a New Zealand endemic known only from two North Island localities, three South Island localities (all in the Southern Alps), and one Stewart Island locality.

Metzgeria consanguinea was reported by So (2002) for New Zealand from Sugarloaf, based on a Jack Elix specimen at Canberra Herbarium. This was

reported in error for *M. crassipilus* but according to So (M. So pers. comm.) the species is likely to be in New Zealand. The species appears to be present on Mt Cavendish Bluffs, even though I have been unable to find it on Sugarloaf. The Port Hills occurrence seems to be the sole New Zealand location.

Metzgeria scobina is at Cloud Farm at 620 m. Elsewhere in New Zealand it is known from Ruahine Range, Arthur Range, and Westland (Lake Kaniere, Lake Matheson). Overseas it is known from the Paleotropics (Indonesia, Malaysia, New Guinea).

Porella aff. *viridissima* (Fig. 1, page 6) is known from Banks Peninsula, Mt Cass, Catlins, Chatham Island, and Campbell Island, and on Norfolk Island. The species is quite abundant in damp places on the Port Hills, less common at the wetter eastern end of the Peninsula. It also occurs in Christchurch Botanic Gardens in the Cockayne Memorial Garden, probably transported on a boulder from Banks Peninsula. It appears to be undescribed.

Rectolejeunea ocellata which is known from Nikau Palm Gully is a rare New Zealand endemic known otherwise from Raoul Island, and a number of North Island localities (Maunganui Bluff, Anaura Bay, Morere Bush, Lake Wairarapa, Porirua, and Wellington).

Riccia nigrella and *R. spongiosula* are two Australian species that were found on the northern slopes of the Otahuna Valley north of Gibraltar Rock in 2009 (Glenny et al. 2009), at NZMG E2478655 N5727787. They occur within an area only about 50 m x 50 m with *Riccia sorocarpa* and *Plagiochasma rupestre* (Fig 2). Searching nearby has failed to find further plants. They seem most likely to be new colonisers from spores that have blown from Australia. If

Figure 2 *Plagiochasma rupestre* plants collected at Orton Bradley Park. This is a species that has only occasionally been found on the Peninsula.

they are from wind-blown spores, it is unexpected that two new colonisers have established so close to each other, but no other explanation of their presence suggests itself.

Tricholepidozia lindenbergii var. *papillata* is present in Stony Bay Stream. It was previously known only from the type from Whareorino Forest, south of Kawhia. The habitat is very similar in both cases, a protected overhanging soil bank.

Factors influencing distribution

Liverworts need both moisture and light, while soil fertility seems never to be a limiting factor on Banks Peninsula. Most liverworts are intolerant of long dry periods. They are most luxuriant and diverse in places unaffected by dry spells and are therefore most abundant and diverse in high rainfall areas. Rainfall is higher on the peaks and interior of the Peninsula, and cloud keeps ridgetops and peaks damp even during summer. Rainfall is also higher in the south-east of the Peninsula than the north-west, and this is reflected in the number of species that are known only from Hinewai Reserve and Armstrong Reserve. Secondly, slopes and cliffs facing south have a much more abundant and diverse flora, especially at higher altitudes, because they receive less sun, resulting in lower temperatures and less evaporation of soil moisture. Streams with permanent water flow have a more abundant and diverse flora. A forest canopy helps to prevent drying out of sites by restricting light reaching the forest floor, but a dense and high forest canopy limits the diversity of species by filtering too much light. Liverworts compete with mosses, which are more dry-tolerant, but the mosses also form thick, single-

Figure 3 *Porella elegantula*, growing with a lichen (*Pseudocyphellaria* sp.).

species mats in constantly wet sites such as cliffs under waterfalls (e.g. *Echinodium hispidum*), and in doing so outcompete liverworts.

Species that are common at the foot of bluffs where met by forests of five-finger, mahoe etc., on the main ridge of the Port Hills are *Balantiopsis diplophylla* var. *hockenii*, *Symphyogyna hymenophyllum*, *Lepidolaena taylorii*, *Marsupidium perpusillum*, *Plagiochila aculeata*, *Porella elegantula* (Fig. 3), and *Solenostoma inundatum*. Sites close to the ridges have a higher diversity of liverworts than the valley forests suggesting they are kept more constantly damp from low cloud cover and lower temperatures. The best places to search are at the foot of forested bluffs on their south side, where there are high light levels but some protection from drying by the adjacent forest. Good examples of such bluffs with forest at their feet are on the south side of The Monument, the south side of Sugarloaf, and Ellangowan Scenic Reserve.

In the valleys throughout, common species are *Monoclea forsteri* (lining waterways, especially where there is splashing), the epiphytes *Metzgeria furcata*, *Frullania deplanata*, *F. monocera*, and *Lejeunea primordialis*. The epiphytic flora on Banks Peninsula is not diverse.

Rock outcrops

The rock outcrops with the most diverse liverwort flora are types 1–4 in the classification of Wiser & Buxton (2009). These are outcrops at higher elevation, with larger faces, high rainfall, and taller vegetation. Indication of good liverwort habitat is the presence of *Anaphaliooides bellidioides*, *Polystichum vestitum*, *Ourisia lactea*, *Podocarpus hallii*, *Phormium cookianum*, any *Hymenophyllum* species, *Huperzia varia*, *Microsorum pustulatum*, and *Asplenium flabellifolium*. Not mentioned by Wiser & Buxton (2009) but very important for a diverse liverwort flora is aspect: the best bluffs for liverworts face south. Outcrops like Gibraltar Rock that are devoid of liverworts characteristically have *Vittadinia australis*, *Carex breviglumis*, *Vicia sativa*, and *Linum monogynum*, indicator species of Wiser & Buxton's (2009) communities 5–7.

Effect of altitude

High points in the districts are:

Port Hills Ecological District: Coopers Knob 573 m, Cass Peak 546 m, Sugarloaf 496 m, and Mt Pleasant 499 m.

Herbert Ecological District: Mt Herbert 920 m, Bradley 855 m, Sinclair 841 m, Mt Fitzgerald 826 m, Carews Peak 794 m, and The Monument 711 m.

Akaroa Ecological District: Flag Peak 809 m, Stony Bay Peak 806 m, Lavericks Peak 755 m, Ellangowan 739 m, and Duvauchelle 738 m.

Eighty of the 198 species (32%) have been found only on ridges or outcrops over 500 m.

Wet forests in valleys

Valleys with streams that flow throughout summer and have forest cover have a rich flora quite different from the rock outcrops. Some of this flora is on boulders in the stream beds, some on soil banks overhanging streams, and quite a lot of it is on the base of trees and on rotten logs near or bridging the streams. This flora is richest in Stony Bay Stream and Armstrong Reserve. A higher diversity of species can be found in the upper catchments at 400–600 m than at lower altitudes. At higher altitudes, the canopy is lower, and is sometimes less dense, allowing more light to the forest floor. For instance, in Armstrong Reserve, the richest area for liverworts has very sparse but large red beech trees, and a low canopy of five-finger, *Fuchsia*, and wineberry above the stream. The latter two species are deciduous, allowing more light into the stream bed during winter. Snow break also opens the canopy at higher altitudes.

Open habitat flora that is visible in Spring

Exotic grasses and some herbs like vetch shade soil bank habitats and use soil moisture in summer, but some species of dry sites (e.g. *Targionia hypophylla*) complete reproduction by Spring before herbs smother the sites and the winter accumulation of soil moisture is used up. Species that behave in this way are *Targionia hypophylla*, *Plagiochasma australe*, *Asterella australis* (Fig. 4), and the four *Riccia* species.

Figure 4 *Asterella australis* with archegoniophores, collected at Orton Bradley Park and growing among *Plagiochasma*. The *Asterella* heads are conspicuous but the thalli are hidden by the larger *Plagiochasma*. The archegoniophores have black capsules partly hidden by the white perianth segments that are joined at their tips.

Conservation implications

Large number of species occur in all three Ecological Districts (EDs) or are likely to be there (e.g. if they are unrecorded from Herbert ED but known from Port Hills and Akaroa EDs). This indicates that the drier valleys of the Port Hills are worth conserving almost as much as the higher rainfall areas in the south-east. The Omahu Reserve and Ahuriri Reserve are the most valuable reserves in Port Hills ED for liverworts.

However, there is a part of the flora that is confined to the south-eastern valleys, especially Stony Bay Valley (Armstrong Reserve and the Stony Bay extension of Hinewai Reserve). The reserves in that valley are particularly valuable for that reason.

Rock outcrops at high altitude are particularly valuable, especially their south faces. Mt Herbert's south face is the outstanding habitat of this kind. Mt Herbert Reserve is the most valuable reserve for liverworts on Banks Peninsula, especially the high altitude parts. This is reflected in the 16 liverwort species that are known each from a single collection from the reserve.

Species present on the Peninsula that have a rare or threatened status in the national listing (Glenny et al. 2011) are:

At Risk, Naturally Uncommon: *Austrolejeunea hispida*, *Chiloscyphus erosus*, *Lepidozia elobata*, *Metzgeria scobina*, and *Rectolejeunea ocellata* (listed as *Microlejeunea ocellata*).

Taxonomically indeterminate species At Risk, Relict: *Porella* aff. *viridissima*, and Naturally Uncommon: *Siphonolejeunea* sp. (a).

There are two actions needed on Banks Peninsula to preserve the liverwort flora. One is the maintenance of reserve boundary fences. Where fences are down the effect of sheep trampling the ground vegetation inside the reserve is obvious. The more important one is fire control: many reserves are vulnerable to fire in dry periods (winter or summer), as shown by the fire that started with a lightning strike on the ridge between Hinewai valley and Stony Bay valley several years ago. However, native scrub and forest is making a come-back on Banks Peninsula as a result of the banning of fire as a farming practice. The natural regeneration of woody plants that is occurring over most parts of the Peninsula will greatly increase the available forest habitat for liverworts in the coming decades.

Table 1: Liverworts and hornworts known from Banks Peninsula Ecological Region.

HORNWORTS

Anthoceros laminiferus

Port Hills: CHR264936 LBM Dry Bush Valley

Akaroa: CHR528932 HDW Okuti Valley

Megaceros pellucidus

Port Hills: DG10731 Omaha Reserve, 360 m

Herbert: CHR528929 JDL Packhorse Saddle; DG10884 Mt Herbert, 800 m

Akaroa: RJL Hinewai n.v.; DG10854 Duvauchelle Peak, 600 m

Megaceros flagellaris

Port Hills: DG10735 Omaha Reserve, 360 m; DG11201 Otahuna, 140 m

Herbert: DG10859 Orton Bradley Park, 60 m; DG11556a Mt Herbert Scenic Reserve, 700 m

Akaroa: CHR592401 RJL Hinewai; CHR264814 LBM Carews Peak, 660 m; DG11026 Peraki Saddle, 620 m; DG11753 Nikau Palm Gully, 304 m

Phaeoceros carolineanus

Port Hills: CHR161297 BHM Dyers Pass Rd; DG10762 Rhodes Spring, 500 m

Herbert: CHR528930 HDW Kaituna Valley, DG10955 Mt Fitzgerald, 550 m

LIVERWORTS

Acrobolbus concinnus

Herbert: DG5987 Montgomery Scenic Reserve, 500 m

Acromastigum colensoanum

Akaroa: CHR592402 RJL Hinewai; DG11229 Stony Bay Stream, 210 m;

DG11245 Armstrong Reserve, 600 m

Published by Lewington (2008) as *A. aff. colensoanum*; voucher CHR592402 says “smaller than usual”.

Andrewsianthus cuspidatus

Herbert: DG11591 The Monument, 670 m

Aneura lobata* ssp. *australis

Herbert: DG10882a Mt Herbert, 800 m

Akaroa: DG10853 Duvauchelle Peak, 600 m

Aneura orbiculata

Herbert: CHR267918 BHM Prices Valley

Akaroa: DG11236 Stony Bay Stream, 380 m

Aneura* aff. *novoguineensis

Herbert: DG11017 Mt Fitzgerald, 760 m

Akaroa: DG11025 Peraki Saddle, 620 m

Asterella australis

Port Hills: CHR241499 LRS Redcliffs; DG10717 Sugarloaf, 400 m; DG11208

Otahuna, 250 m; DG11817 near Coopers Knob, 420 m; DG11850 Omaha

Reserve, 170 m

Herbert: CHR163372 BHM The Monument; DG10887 Orton Bradley Park, 300m

Asterella tenera

Port Hills: DG10732 Omaha Reserve, 360 m

Herbert: CHR240604 BHM Kaituna Valley; CHR267915 BHM Prices Valley, 70 m; DG10862 Orton Bradley Park, 800 m

Akaroa: CHR592403 RJL Hinewai; DG11238 Stony Bay Valley, 450 m

Austrolejeunea olgae

Port Hills: DG11203 Otahuna, 140 m

Herbert: DG5671 Kaituna V, 360 m; DG11022 Mt Fitzgerald, 500 m

Akaroa: CHR592404 RJL Hinewai; DG5658 Okuti Valley; DG11263 Armstrong Reserve, 600 m; DG11867b pro parte, Devils Gap, 543 m

Austrolejeunea hamata

Akaroa: CHR592439 RJL Hinewai; DG11874b Devils Gap, 393 m

Austrolejeunea hispida

Herbert: DG10891c Orton Bradley, 300 m

Balantiopsis diplophylla* var. *diplophylla

Port Hills: DG10761 Rhodes Spring, 500 m; CHR528945 HDW Plot 476, 500 m

Herbert: DG10938 Kaituna Valley, 380 m; DG10956 Mt Fitzgerald, 550 m; DG11559 Mt Herbert, 666 m

Akaroa: DG10799, Hinewai, 400 m; CHR351452 JL Peraki Reserve

Balantiopsis diplophylla* var. *hockenii

Port Hills: DG10718 Sugarloaf, 400 m; DG10746 Cass Peak, 520 m

Herbert: DG10992 Mt Fitzgerald, 760 m

Akaroa: DG11853 Gap Road, 555 m

Balantiopsis montana

Akaroa: DG11224 Stony Bay Stream, 210 m

Bazzania adnexa

Akaroa: RJL Hinewai n.v.; DG11255 Armstrong Reserve, 600 m

Lewington (2007) mentions *Bazzania* aff. *adnexa*: from Hinewai Reserve, Stony Bay Gully, on a buttress of *Nothofagus fusca*. I consider this is *B. adnexa*, a variable species.

Cephaloziella aenigmatica

Akaroa: DG11045 Okuti Valley, 400 m

Cephaloziella muelleriana

Port Hills: DG10730b Omaha Reserve, 360 m

***Cephaloziella* sp.**

Port Hills: DG10259 Ahuriri Reserve, 340 m

Akaroa: CHR459851 p.p., S Huang & AJF, Hinewai, 400 m (included in specimen of *Solenostoma inundatum*)

***Cephaloziella* sp.**

Akaroa: DG10813, Stony Bay Peak, 760 m; DG11269 Flag Peak, 740 m

Shoots are green without secondary pigments, 200 µm wide, leaves 100 µm long, highly toothed (spinose), conduplicate, walls thin, trigones absent, underleaves bifid, stellate multicellular gemmae at shoot apex.

Chandonanthus squarrosus

Akaroa: CHR514721 BHM Hinewai

Cheilolejeunea mimosa

Port Hills: DG10719 Sugarloaf, 400 m; DG10964 Mt Cavendish Bluffs, 350 m

Herbert: DG10877 Mt Herbert, 800 m; DG11001 Mt Fitzgerald, 760 m

Chiloscyphus anisolobus

Herbert: DG10991 Mt Fitzgerald, 760 m

Chiloscyphus aperticaulis

Herbert: CHR528910 HDW Mt Fitzgerald, 490 m

Chiloscyphus austriogenus

Herbert: CHR528907 HDW Mt Fitzgerald, 490 m

Chiloscyphus bispinosus

Port Hills: CHR384148 AJF Godley Head; DG10728 Omaha Reserve, 360 m;
 DG10763 Rhodes Spring, 500 m
 Herbert: DG11004 Mt Fitzgerald, 760 m
 Akaroa: CHR573793! RJL Hinewai, CHR406329 AJF Reynolds Valley Rd

Chiloscyphus canaliculatus

Port Hills: KW Allison H6345, Bridle Path near Summit Road (cited in Engel 2010, p. 106); CHR349463 AJF, Bridle Path
 Herbert: DG11555 Mt Herbert, 700 m
 Akaroa: DG11042 Carews Peak, 660 m; DG11910 Saddle Hill, 740 m

Chiloscyphus cuspidatus

Port Hills: DG10751 Cass Peak, 520 m; DG10954 Bowenvale Valley, 400 m
 Herbert: DG10941 Kaituna Valley, 360 m; DG11580 The Monument, 668 m
 Akaroa: CHR348608 JL Otepatotu; DG10817 Cloud Farm, 620 m

Chiloscyphus erosus

Port Hills: DG10711 Sugarloaf, 400 m; DG10747 Omaha Reserve, 360 m
 Akaroa: CHR571423 RJL Hinewai; DG9275 Okuti Valley, 250 m

Chiloscyphus helmsianus

Akaroa: DG9212 Hinewai, 300 m

The way to find this inconspicuous species is to rub the bases of tree fern trunks with your hands and smell your hands for the pungent stink-bug smell produced by this species.

Chiloscyphus herzogii

Akaroa: RJL Stony Bay Stream, n.v.

Chiloscyphus latus

Herbert: BHM 79/251 Prices Valley, 60 m (cited in Engel 2010, p. 31); DG10957 Mt Fitzgerald, 550 m
 Akaroa: CHR592407 RJL Hinewai, CHR163384 BHM near Cabstand; DG11230 Stony Bay Stream, 210 m

Chiloscyphus mittenianus* var. *mittenianus

Herbert: DG10883 Mt Herbert, 800 m; DG11628 Mt Herbert, 797 m

Chiloscyphus muricatus

Port Hills: CHR527791 HDW south of Gibraltar Rock, CHR607121 BHM Coopers Knob; DG10712 Sugarloaf, 400 m
 Herbert: DG10930 Kaituna Valley, 380 m, CHR257058 BHM Prices Valley, 70 m
 Akaroa: CHR592408 RJL Hinewai; DG5651 Okuti Valley, 190 m; DG10817 Cloud Farm 620 m, CHR406352 AJF Wainui, 100 m; DG11748 Nikau Palm Gully, 420 m

Chiloscyphus novae-zeelandiae* var. *grandistipulus

Akaroa: CHR405371 AJF Kinloch Road, det. JJ Engel

Chiloscyphus novae-zeelandiae* var. *novae-zeelandiae

Port Hills: CHR528921 HDW above Teddington near Gebbies Pass, Plot 0257, 180 m

Herbert: DG10885 Mt Herbert, 800 m

Akaroa: CHR571428 RJL Hinewai

Chiloscyphus parvispineus

Herbert: DG11556b Mt Herbert, 700 m

Chiloscyphus perpusillus

Herbert: DG11586 The Monument, 668 m

Riccardia* aff. *pseudodendroceros

Herbert: DG10861 Mt Herbert, 800 m

The specimen lacks swollen epidermal cells of the type mentioned in the protologue. Its dimensions fit no others except *R. cochleata*, but it lacks the thicker walled, angled wing cells of that species. *Riccardia pseudodendroceros* is only known from the type from Mt Euclid, Paparoa Range. It may be that the Mt Herbert specimen represents a new species to New Zealand. The thallus is wide for a *Riccardia* and thin (300 µm), but not thin enough to be *R. pennata* (thallus 120–175 µm thick) although it looks like it and is in tussockland habitat that is preferred by *R. pennata*.

Schistochila kirkiana

Herbert: DG11003 Mt Fitzgerald, 760 m

Schistochila repleta

Akaroa: DG11235 Stony Bay Stream, 380 m. The specimen lacks leaf lamellae, but the amount of material is very limited. It is most likely to be *S. repleta*.

Siphonolejeunea nudipes* var. *nudipes

Port Hills: DG10716 Sugarloaf, 400 m

Herbert: DG10923 Kaituna Valley, 370 m; DG11576 The Monument, 652 m;
DG11600 Herbert Scenic Reserve, 699 m

Akaroa: DG5952 Hinewai; DG10848 Hinewai, 440 m, DG5995 Peraki Saddle,
500 m

Siphonolejeunea nudipes* var. *magnicarinata

Akaroa: DG11237a Stony Bay Stream, 380 m

***Siphonolejeunea* sp. (a)**

Port Hills: DG5998 Sugarloaf, 350 m

Herbert: DG10858 Orton Bradley Park, 60 m

Akaroa: DG5951 Hinewai; DG11217 Stony Bay Stream, 120 m

Solenostoma inundatum

Port Hills: DG10726 Sugarloaf, 400 m

Herbert: DG10898 pro parte Mt Herbert, 840 m

Akaroa: CHR163135 BHM Stony Bay Peak; DG11036 Carews Peak, 660 m; DG11852 Gap Road, 555 m

Solenostoma rufiflorum

Akaroa: DG11745b Lighthouse Road, 630 m

Symphyogyna hymenophyllum

Port Hills: DG10743 Omahu Reserve, 360 m

Herbert: CHR527792 HDW head of Purau Bay, 560 m; DG10876 Mt Herbert; DG10994 Mt Fitzgerald, 760 m

Akaroa: CRH242200 BHM Carews Peak Reserve; CHR16383 MJS6290 Long Bay Road-Purple Peak Road junction; CHR592441 RJL Hinewai; DG11892 Bossu Road near Peraki Saddle, 540 m

Symphyogyna subsimplex

Akaroa: CHR608271 RJL Hinewai

Symphyogyna tenuinervis

Port Hills: DG10733 Omahu Reserve, 360 m

Herbert: CHR267916 BHM Prices Valley; DG11021 Mt Fitzgerald, 500 m

Akaroa: CHR592436 RJL Hinewai; DG9276 Okuti Valley, 250 m

Symphyogyna undulata

Herbert: CHR425916 GB Okuti Valley

***Syzygiella colorata* (= *Jamesoniella colorata*)**

Port Hills: CHR528952 HDW Mt Pleasant; DG10759 Cass Peak, 520 m

Herbert: DG10880 Mt Herbert, 800 m; DG10988 Mt Fitzgerald, 740 m; DG11588a The Monument, 670 m

Akaroa: DG10833 Ellangowan, 630 m; DG10807 Stony Bay Peak, 760 m

***Syzygiella sonderi* (= *Cryptochila grandiflora*)**

Herbert: KWAllison H6680 at CHR, TWN Beckett Mt Sinclair ("Tarawera"); DG10905 Mt Herbert, 840 m; DG11002a Mt Fitzgerald, 760 m

***Syzygiella tasmanica* (= *Jamesoniella tasmanica*)**

Akaroa: DG11240 Stony Bay Stream, 450 m

Targionia hypophylla

Akaroa: DG11252 Armstrong Reserve, 600 m; DG10806 Stony Bay Peak, 760 m; DG11037a Carews Peak, 660 m

Zoopsis argentea* var. *argentea

Akaroa: DG11231 Stony Bay, 210 m; DG11251b Armstrong Reserve, 600 m

Zoopsis leitgebiana

Port Hills: DG10745 Omaha Reserve, 360 m

Herbert: DG10882a Mt Herbert, 800 m; DG10929 Kaituna Valley, 370 m; DG11006 Mt Fitzgerald, 760 m

Akaroa: DG11244 Armstrong Reserve, 600 m; DG11223 Stony Bay Stream, 210 m

New records for Hinewai Reserve, Akaroa, since Lewington (2007, 2008)

Aneura orbiculata – DG11236 Stony Bay Stream

Balantiopsis montana – DG11224 Stony Bay Stream

Cephaloziella sp., spinose – DG10813 Stony Bay Peak

Chandonanthus squarrosus – CHR514721 BHM Stony Bay Peak, 1997

Chiloscyphus helmsianus – DG9212 South Track

Frullania falciloba – DG10804 Stony Bay Peak

Heteroscyphus compactus, Hinewai, West Track, kanuka forest. RJL 15408, 7/1/05. Det. by RJL.

Isotachis montana – AJF CHR462543. Common on track banks

Lejeunea oracola – DG11237a Stony Bay Stream

Lejeunea subelobata – RJL CHR592421

Paracromastigum aff. *macrostipum* – DG10815 Stony Bay Peak

Plagiochila circumdentata – DG10805 Stony Bay Peak

Porella aff. *viridissima* – DG10843 Boundary Falls

Schistochila aff. *repleta* – DG11235 Stony Bay Stream

Siphonolejeunea nudipes var. *magnicarinata* – DG11237a Stony Bay Stream

Siphonolejeunea sp. (a) – DG5951

Syzygiella tasmanica – Stony Bay Stream DG11240

Targionia hypophylla – CHR164050 BHM Stony Bay Peak,

Trichocolea hatcheri – DG10842 Hinewai Falls

Tricholepidozia lindenbergii var. *papillata* – DG11234 Stony Bay Stream

Re-identification of names in Lewington (2007)

Clasmatocolea inflexispina: CHR592411 is *Triandrophylloides subtrifidum*

Frullania aterrima var. *aterrima*: CHR592414 RJL Hinewai is *F. media*

Pallavicinia lyellii: all 3 specimens in CHR from Hinewai are *P. xiphoides*

Radula buccinifera: specimen from Hinewai is *R. strangulata*
