Custom Solutions

Vision Mission Value Quality Statement:

Vision:

We design solutions for industry and for the success of our customers by:

- Optimizing the use of technology with applications
- Using an efficient, timely customized process to fill specific customer needs
- Increasing capacity and streamlining operations
 Breconing our reputation for reliability
- Preserving our reputation for reliability
 Expanding globally to support our customers and stay current with new technologies
- Leveraging and sharing our knowledge to meet challenges openly
- Nurturing a creative, cooperative culture committed to the individual and to providing the best solutions for the customers

Mission Statement:

Partnerships

Innovating products, processes and services to improve performance and efficiency in our industry.

Schroeder Industries Core | Shared Values: Honesty

Day-to-Day Behaviors:

- Tell the truth at all times, in all matters
- Have open lines of communication and share timely, accurate and thorough information with internal and external customers
- Do not steal and respect each other's and the Company's property

Teamwork

Day-to-Day Behaviors:

- Work as a team
- Cooperate within and between departments
- Coach and mentor; listen and share knowledge, experience and ideas
- Treat others with respect and consideration in all circumstances
- Invest in the development and growth of all team members
- Keep our work areas safe and clean

Leadership

Day-to-Day Behaviors:

- Recognize that we are empowered to act as leaders and participate in the decision making process
- Take responsibility for and have pride in our work
- Set goals and celebrate the efforts and accomplishments of our teammates
- Value our greater community and take leadership roles in our neighborhoods and for the environment

Ingenuity | Innovation

Day-to-Day Behaviors:

- Value innovative thinking and the generation and implementation of new ideas to solve customer (internal & external) problems
- Be flexible and adapt to new ideas and different ways of doing things
- Utilize available resources for new designs and innovations

Quality Policy:

Continuous improvement in our business to ensure a quality product, shipped on time, without compromise.

Limitations of Liability

The information contained in the catalog (including, but not limited to, specifications, configurations, drawings, photographs, dimensions and packaging) is for descriptive purposes only. Any description of the products contained in this catalog is for the sole purpose of identifying the products and shall not be deemed a warranty that the products shall conform to such description. No representation or warranty is made concerning the information contained in this catalog as to the accuracy or completeness of such information. Schroeder Industries LLC reserves the right to make changes to the products included in this catalog without notice. A copy of our warranty terms and other conditions of sale are available upon request. A placed order constitutes acceptance of Schroeder's terms and conditions.

Failure, improper selection or improper use of the products and/or systems described herein or related items can cause death, personal injury and property damage.

This catalog and other documentation from Schroeder Industries provides product information for consideration by users possessing technical expertise.

It is important that the user analyze all aspects of the specific application and review the current product information in the current catalog. Due to the variety of operating conditions and applications for these products, the user is solely responsible for making the final product selection and assuring that all performance, safety and warning requirements of the application are met.

The products described herein, including without limitation, product features, specifications, design, availability and pricing are subject to change at any time without notice.

Filter Housings: Flow vs. Operating Pressure

Note to the Reader

The aim of our catalog is to provide the information and guidance you'll need to make informed and appropriate choices for your filtration needs.

Illustrated and easy to understand, Section 1 is now widely used as a training tool by many companies, including original equipment manufacturers for whom Schroeder provides value-added products. The revised Section 1 continues to serve as an effective "primer" on contamination control fundamentals. In this section, we also provide filtration information and guidance for selecting the optimal filter and element media for your application.

Section 1 also explains recent changes in industry standards regarding how fluid cleanliness is defined and measured. Recent technological advancements in the measurement of microscopic particles, coupled with the establishment of a new standard test dust for calibration purposes, necessitated these changes. Although the new standards may seem confusing at first, they enable more accurate sizing

of dirt particles and reduce variability in output among different automatic particle counters. The end result is more reliable data for the user.

In Section 2, you'll find extensive technical data on Schroeder's Excellement® Z-Media®, which combines high efficiency, low pressure drop and exceptional dirt holding capacity. Schroeder's design engineers have also given special attention to developing more environmentally friendly products, such as Corecentric®

elements, which contain no metal and can be crushed, shredded or burned.

Sections 3 through 6 describe the types of contamination control products and accessories we offer. Whether your hydraulic system requires pressure filters, tank-mounted filters, return-line filters, or some combination of these, this updated catalog will help you find the right Schroeder filter to do the job. Of course, every filter comes with a Schroeder original element, available in a wide variety of media and micron ratings.

Dirt Alarm[®], BestFit[®], Excellement[®], DirtCatcher[®] and CoreCentric[®] are registered trademarks of Schroeder Industries.

Schroeder's web site, www.schroederindustries.com, is filled with helpful resources.

Replacing filter elements is simpler than ever before with our Online Cross-Reference Guide to BestFit[®] replacement elements. With this user-friendly guide you can match 41,000 filter elements from 150 other manufacturers with appropriate BestFit[®] replacements. Click the BestFit[®] link on our home page or got to the direct link at www.schroederindustries.info.

Corporate Overview

Schroeder Industries, an ISO 9001:2015 certified company, focuses on developing filtration and fluid service products for our customers in the fluid power industry and is proud of our proven track record of providing quality products over the last 75 years. The designs you see in this catalog are the result of thousands of hours of field testing and laboratory research...and decades of experience.

Schroeder was one of the first companies to demonstrate the need for, and benefits of, hydraulic filtration. We pioneered the development of micronic filtration, helping to set performance standards in industrial fluid power systems. As a result, Schroeder is now a leader in filtration and fluid conditioning—and the proof of our expertise lies in our broad mix of unsurpassed products. Our mission statement reflects our continuing commitment to excellence:

Partnerships

Innovating products, solutions, processes and services to improve performance and efficiency in industry.

We design solutions for industry and for the success of our customers by:

- Optimizing the use of technology with applications
- Using an efficient, timely customization process to fill specific customer needs
- Increasing manufacturing capacity and streamlining operations
- Preserving our reputation for reliability
- Expanding globally to support our customers and stay current with new technologies
- Leveraging and sharing our knowledge to meet challenges openly
- Nurturing a creative, cooperative culture committed to the individual and to providing the best solutions for our customers

Our goal is to be your filtration partner. Our expertise in filtration technology, our superior filter and element manufacturing capabilities, and our dedication to customer service and product support are the reasons we're considered experts in Advanced Fluid Conditioning Solutions[®].

We are committed to providing the best available filter products to meet necessary cleanliness levels at a competitive price. As a cost-effective quality producer, we can work with your purchasing department to supply contamination control technology or develop long-range pricing programs that can improve your company's bottom line.

Capabilities

Schroeder Industries has in place a strategically located international distribution network, supported by our professional and experienced sales and marketing team. Distributor personnel are trained in the important aspects of filter application by Schroeder in training sessions held at our factory and around the globe. The effectiveness of our product and service support is multiplied by utilizing Schroeder's extensive distributor network. All Schroeder Industries distributors meet very strict criteria to enhance our ability to serve the needs of our valued customers.

Schroeder's distributor network includes over 100 distributor locations throughout Europe, the United Kingdom, South Africa, Australia, Asia, North America and South America, so that customers worldwide can rely on Schroeder's exceptional support.

Schroeder Industries' corporate headquarters are located in Leetsdale, PA (USA) with an additional manufacturing facility in Cumberland, MD (USA). Filter housings and diagnostic and specialty products are manufactured at our Pittsburgh plant, while filter elements are manufactured in our Cumberland plant. Both facilities have the skilled workforce and the capacity to meet our customers' needs. Schroeder's research and development center as well as our contamination control laboratory are located at our corporate headquarters.

Schroeder's products, technical expertise, commitment to research and development, and ongoing improvements in manufacturing enable us to provide products and services that improve performance and efficiency in many major industries, including:

Engineering Laboratory

Schroeder Industries' products are continually tested using the latest ISO and NFPA test procedures in our engineering lab. Our dynamic test stands are in constant operation, subjecting our filter housings to cyclic pressure to verify their rated fatigue and burst pressures per NFPA Standard T2.6.1. Statistically sampled elements are tested to ensure fabrication integrity in the manufacturing process. They are also tested for efficiency and dirt-holding capacity in a multi-pass test stand, equipped with in-line particle counting capabilities, which are calibrated to ISO standards.

Extensive testing is conducted to ensure compatibility with various hydraulic fluids, including the newest fire-resistant fluids, per ISO 2943 Standard. Flow fatigue tests are run to evaluate the structural strength of elements, per ISO 3724 Standard.

Design and Testing Standards Filter Housings	s of Schroeder	Design and Testing Standar High Efficiency Elements	ds of Schroeder

An Open Invitation

We invite you to present us with any specific filtration challenge you may experience. Schroeder will design and make filters to meet your specific requirements. To find out more, and/or obtain a quote, call us to speak with a sales representative or technical specialist. They can help determine the optimal filtration strategy for a given system. While the quantity of any product manufactured to fit a customer's needs will determine the economic feasibility of a particular project, in many cases, we can offer modified products in relatively small quantities at competitive prices and short lead times.

Over the years, Schroeder design engineers have encountered virtually every type of hydraulic system. We are proud of our continuing success in providing "value-added products" for our customers, that is, making or modifying our products to meet their specific needs. When customers order products from Schroeder, they are assured of a reliable source of supply,

consistent and prompt service, and direct support. Pre and posttechnical service is provided to ensure customer satisfaction.

So if you're faced with a filtration dilemma, call us. Schroeder Industries: Advanced Fluid Conditioning Solutions[®].

Advanced Fluid Conditioning Solutions®

Contamination Control Fundamentals

Why Filter?

Over 70% of all hydraulic system failures are caused by contaminants in the fluid. Even when no immediate failures occur, high contamination levels can sharply decrease operating efficiency.

Contamination is defined as any substance which is foreign to a fluid system and damaging to its performance. Contamination can exist as a gas, liquid or solid. Solid contamination, generally referred to as particulate contamination, comes in all sizes and shapes and is normally abrasive.

High contaminant levels accelerate component wear and decrease service life. Worn components, in turn, contribute to inefficient system operation, seizure of parts, higher fluid temperatures, leakage, and loss of control. All of these phenomena are the result of direct mechanical action between the contaminants and the system components. Contamination can also act as a catalyst to accelerate oxidation of the fluid and spur the chemical breakdown of its constituents.

Filtering a system's fluid can remove many of these contaminants and extend the life of system components.

How a System Gets Contaminated

Contaminants come from two basic sources: they either enter the system from outside (ingestion) or are generated from within (ingression). New systems often have contaminants left behind from manufacturing and assembly operations. Unless they are filtered as they enter the circuit, both the original fluid and make-up fluid are likely to contain more contaminants than the system can tolerate. Most systems ingest contaminants through such components as inefficient air breathers and worn cylinder rod seals during normal operation. Airborne contaminants are likely to gain admittance during routine servicing or maintenance. Also, friction and heat can produce internally generated contamination.

Figure 1. Typical Examples of Wear Due to Contamination

Vanes for Vane Pump

Relief Valve Piston

Vane Pump Cam Ring

Size of Solid Contaminants

The size of solid particle contaminants is commonly measured in micrometers, μ m, (usually referred to as microns, μ). A micron is a unit of length equal to one millionth of a meter or about .00004 inch. Particles that are less than 40 μ cannot be detected by the human eye.

Substance	Microns	Inches
Grain of table salt	100 µ	.0039"
Human hair	70 µ	.0027 "
Talcum powder	10 µ	.00039"
Bacteria (average)	2μ	.000078"

Figure 2 shows the sizes of some common substances. To gain some perspective, consider the diameters of the following substances:

A *micron rating* identifies the size of particles that a particular filtration media will remove. For instance, Schroeder Z10 filter media is rated at β 10 \geq 1000, meaning that it can remove particles of 10 μ and greater at 99.9% efficiency.

12 SCHROEDER INDUSTRIES

Figure 2. Sizes of Known Particles in Inches and Microns

In hydraulic fluid power systems, power is transmitted and contained through a liquid under pressure within an enclosed circuit. These fluids all contain a certain amount of solid particle contaminants. The amount of particulate contaminants present in a hydraulic or lubrication system's fluid is commonly referred to as its cleanliness level.

ISO 4406:1999 provides guidelines for defining the level of contamination present in a fluid sample in terms of an ISO rating. It uses three scale numbers, representing the number of particles greater than or equal to 4 μ (c), 6 μ (c), and 14 μ (c) in size per 1 mL of sample fluid.

Figure 3 shows the graph used to plot particle counts per ISO 4406:1999.

2 Kim bin 28 000.000.1 20 \$49,000 26 305,000 25 160,000 24 10,000 20 46,000 30 10,000 10,000 100 1,000 15 1,500 11 1,000 640 16 120 18 1400 14 180 13 혲 20. 10 10 10 Example 8 25 larger than 4 project 4 13 0.64 larger than 6 µm(c) = ŝ. 0.30 \$ larger than 14 junicity = 616 4 0.08 3 0.04 150 Code = 22/11/1 2 0.00 0.01 谜. 8.60 reliantes) (reliantes) Con 14 genetices

- Reproducibility below scale number 8 is affected by the actual number of particles counted in the fluid sample. Raw counts should be more than 20 particles. If this is not possible, then refer to bullet below.
- When the raw data in one of the size ranges results in a particle count of fewer than 20 particles, the scale number for that size range shall be labeled with the symbol ≥.

EXAMPLE: A code of $14/12/\ge7$ signifies that there are more than 80 and up to and including 160 particles equal to or larger than 4 μ (c) per mL and more than 20 and up to and including 40 particles equal to or larger than 6 μ (c) per mL. The third part of the code, ≥7 indicates that there are more than 0.64 and up to and including 1.3 particles equal to or larger than 14 μ (c) per mL. The \ge symbol indicates that less than 20 particles were counted, which lowers statistical confidence. Because of this lower confidence, the 14 μ (c) part of the code could actually be higher than 7, thus the presence of the \ge symbol.

How Contaminants are Measured and Reported

ISO Scale Numbers– ISO 4406:1999

Cleanliness Levels– ISO 4406:1999

The following example shown in Figure 4 illustrates the cleanliness level, or ISO rating, of a typical petroleum-based fluid sample using the ISO Code 4406:1999 rating system.

The fluid sample contains a certain amount of solid particle contaminants, in various shapes and sizes.

Since the number of 4 μ (c) particles falls between 2500 and 5000, the first ISO range number is 19 using Table 1. The number of 6 μ (c) particles falls between 160 and 320 particles, so the second ISO range number is 15. The number of 14 μ (c) particles falls between 10 and 20, making the third range number 11. Therefore, the cleanliness level for the fluid sample shown in Figure 4 per ISO 4406:1999 is 19/15/≥11.

Figure 4. Determining the ISO Rating of a Fluid Using ISO 4406:1999

Sample	Fluid (1 mL)	If Particle Count Falls Between	Scale Number is*
Particle Number		2500-5000	19
Size	of Particles	160 220	15
≥ 4 µ(c)	3,000	100-320	15
\geq 5 μ (c)	700	10-20	11
≥ 6 µ(c)	200		
≥10 µ(c)			*Source: ISO 4406:19
≥14 µ(c)	15	The Sample Fluid is ISO T	9/15/≥11.
≥15 µ(c)		^Note: when the raw da	ita in one of the size
$>20 \mu(c)$	10	ranges results in a parti	cle count of rewer than
$>30 \mu(c)$	3	20 particles the range of	

Required Cleanliness Levels

The pressure of a hydraulic system provides the starting point for determining the cleanliness level required for efficient operation. Table 2 provides guidelines for recommended cleanliness levels based on pressure. In general, Schroeder defines pressure as follows:

_ow pressure:	0-500 psi (0-35 bar)
Medium pressure:	500-2999 psi (35-206 bar)
High pressure:	3000 psi (206 bar) and above

A second consideration is the type of components present in the hydraulic system. The amount of contamination that any given component can tolerate is a function of many factors, such as clearance between moving parts, frequency and speed of operation, operating pressure, and materials of construction. Tolerances for contamination range from that of low pressure gear pumps, which normally will give satisfactory performance with cleanliness levels typically found in new fluid (ISO 19/17/14), to the more stringent requirements for servo-control valves, which need oil that is eight times cleaner (ISO 16/14/11).

Today, many fluid power component manufacturers are providing cleanliness level (ISO code) recommendations for their components. They are often listed in the manufacturer's component product catalog or can be obtained by contacting the manufacturer directly. Their recommendations may be expressed in desired filter element ratings or in system cleanliness levels (ISO codes or other codes). Some typically recommended cleanliness levels for components are provided in Table 3.

Table 2. Cleanliness Level Guidelines Based on Pressure

System Type	Recommended Cleanliness Levels (ISO Code)
Low pressure – manual control (0 - 500 psi)	20/18/15 or better
Low to medium pressure – electrohydraulic controls	19/17/14 or better
High pressure – servo controlled	16/14/11 or better

Table 3. Recommended Cleanliness Levels (ISO Codes) for Fluid Power Components

Element Technical Data Fundamentals

Performance Specifications/ Filtration Ratings

Schroeder filter elements meet a wide variety of requirements in today's workplace, from the simplest to the most sophisticated fluid power systems. Established industry standards enable users to select the optimal filter element for any application.

When evaluating the performance of hydraulic filter elements, the most important parameters to consider are:

(a) efficiency

(b) beta stability

(c) dirt holding capacity

(d) pressure drop vs. flow

(a) *Efficiency*, or filtration ratio, expressed by "Beta" (ß) relates to how well an element removes contamination from fluid. Higher efficiency translates to cleaner oil, better protection of system components, less down time for repair, and lower maintenance costs.

(b) *Beta stability* is defined as an element's ability to maintain its expected efficiency as differential pressure across the element increases. Differential pressure will increase as contamination is trapped, or with an increase in fluid viscosity (cold start). Beta stability is important because it relates to how well an element will perform in service over time. When the element is loaded with contamination, or when it is subjected to cold starts, will it perform as well as it did when new?

(c) *Dirt holding capacity (DHC)* is the amount of contamination that an element can trap before it reaches a predetermined "terminal" differential pressure. Dirt holding capacity is related to element life. Since elements with higher DHC need changed less frequently, DHC has a direct impact on the overall cost of operation. When selecting filter elements, it is beneficial to compare DHC of elements with similar particle removal efficiency.

(d) *Pressure Drop vs. Flow* is simply a measure of resistance to fluid flow in a system. It is important to consider the initial pressure drop (Δ p) across the filter element (and housing). Ideally, a filter element should be sized so that the initial pressure drop across the clean element (plus the filter housing drop) is less than half the bypass valve setting in the filter housing.

When selecting a filter element for your system, be sure to consider all four of these performance criteria. If an element is strong in three areas, but weak in another, it may not be the right choice. At every level of filtration, Schroeder's Excellement[®] Z-Media[®] elements offer the best combination of high efficiency, high beta stability, high dirt holding capacity, and low pressure drop.

The Multi-pass Test

Filter element efficiency ratings, beta stability, and capacities are determined by conducting a multi-pass test under controlled laboratory conditions. This is a standard industry test with procedure published by the International Standards Organization (ISO 16889). The multi-pass test yields reproducible test data for appraising the filtration performance of a filter element including its particle removal efficiency. These test results enable the user to: (1) compare the quality and specifications offered by various filter element suppliers and (2) select the proper filter element to obtain the optimal contamination control level for any particular system.

Hydraulic fluid (Mil-H-5606) is circulated through a system containing the filter element to be tested. Additional fluid contaminated with ISO MTD Test Dust is introduced upstream of the element being tested. Fluid samples are then extracted upstream and downstream of the test element.

Dirt holding capacity is defined as the total grams of ISO MTD Test Dust added to the system to bring the test filter element to terminal pressure drop.

Figure 5. Multi-Pass Test Schematic

The filtration ratio (more commonly referred to as the Beta ratio) is, in fact, a measure of the particle capture efficiency of a filter element.

Per ISO 16889
$$\beta_{X(c)} = \frac{\text{number of particles upstream } @ x(c) \text{ microns}}{\text{number of particles downstream } @ x(c) \text{ microns}}$$

where x(c) is a specified particle size.

Example:
$$^{\beta}10 = \frac{400}{100} = 4$$

This particle capture efficiency can also be expressed as a percent by subtracting the number 1 from the Beta (in this case 4) and multiplying it by 100:

Efficiency_{10} =
$$\frac{(4-1)}{4}$$
 x 100 = 75%

The example is read as "Beta ten is equal to four, where 400 particles, 10 microns and larger, were counted upstream of the test filter (before) and 100 particles, 10 microns and larger, were counted downstream of the test filter (after)."

The filter element tested was 75% efficient in removing particles 10 microns and larger.

To calculate a filter element's percent efficiency, subtract 1 from the Beta, divide that answer by the Beta, then multiply by 100.

	Example
Step 1:	$^{\beta}$ 10(c) > +1000
Step 2:	1000 -1 = 999
Step 3:	999 ÷ 1000 = .999%
Step 4:	.999 x 100 = 99.9%

According to ISO 16889, each filter manufacturer can test a given filter element at a variety of flow rates and terminal pressure drop ratings that fit the application, system configuration and filter element size. Results may vary depending on the configuration of the filter element tested and the test conditions.

Currently, there is no accepted ISO, ANSI, or NFPA standard regarding absolute ratings. Some filter manufacturers use $\beta_X(c) \ge 75$ (98.7% efficiency) for their absolute rating. Others use $\beta_X(c) \ge 100$ (99.0% efficiency), $\beta_X(c) \ge 200$ (99.5% efficiency), or $\beta_X(c) \ge 1000$ (99.9% efficiency). Performance of Schroeder elements is shown in the Element Performance Chart for each filter housing in Sections 3 through 8 at a number of filtration ratios to allow the user to evaluate our performance against that of our competitors.

Efficiency

Efficiency /

(Beta)

Filtration Ratio

Filtration Ratio

Beta Stability

Beta stability is defined as an element's ability to maintain its expected efficiency as differential pressure across the element increases. Differential pressure will increase as contamination is trapped, or with an increase in fluid viscosity. An element's beta stability is displayed in the Filtration Ratio (Beta) vs. Differential Pressure curve from a typical multi-pass test report per ISO 16889. Good beta stability is demonstrated by consistent or improving efficiency as differential pressure builds across the element. Conversely, decreasing efficiency as pressure builds is a sign of poor stability. Poor beta stability is an indication of a filter element's structural deficiency. It is a sign of potential problems in a "real world" situation. Contamination, "cold starts", and flow surges can all create high differential pressure across an element that may cause efficiency to decrease if it is not structurally sound. In cases of "cold starts" and flow surges, the media structure in elements with poor stability can become permanently damaged in milliseconds. The result is lower efficiency and decreased system protection without warning to the operator. High beta stability results when an element is well-built with quality, durable materials. Strength of filter media and reinforcement layers, impervious seaming, proper end cap adhesion, and a rigidly supported structure all play a part in an element's beta stability. Excellement® media structure typically maintains beta stability over 100 psi.

Example of poor beta stability – efficiency declines as differential pressure increases.

Example of Excellement[®] beta stability – efficiency does not decline as differential pressure increases.

Microscopic Photo - 50x magnification

Top: competitor's media Bottom: Schroeder Excellement® Z-Media® Thin, weak media cannot withstand differential pressure as well as Z-Media®.

This photo shows a comparison of our competitors filtering layer media versus our Schroeder Excellement® Z-Media®. Schroeder Z-Media® offers better depth filtration to withstand a higher differential pressure and entrap more contaminant / particles.

Dirt holding capacity (DHC) is the amount of contaminant (expressed in grams) the element will retain before it goes into bypass. All other factors being equal, an element's DHC generally indicates how long the element will operate until it needs to be replaced. The element's life span is directly related to the cost of operating the filter.	Dirt Holding Capacity
Dirt holding capacity, sometimes referred to as "retained capacity," is a very important and often overlooked factor in selecting the right element for the application. The dirt holding capacity of an element is measured in grams of ISO medium test dust contaminant as determined from the multi-pass test (ISO 16889). When selecting filter elements, it is beneficial to compare the dirt holding capacities of elements with similar particle removal efficiencies.	
When sizing a filter, it is important to consider the initial differential pressure (ΔP) across the element and the housing. Elements offering a lower pressure drop at a high Beta efficiency are better than elements with a high ΔP at the same efficiency. At every level of filtration, Schroeder's Excellement [®] Z-Media [®] elements offer the best combination of high efficiency, high stability, high dirt holding capacity, and low pressure drop. The pressure drop of an element is determined by testing according to ISO 3968.	Pressure Drop
The collapse (crush) rating of a filter (determined by ISO 2941/ANSI B93.25) represents the differential pressure across the element that causes it to collapse. The collapse rating of a filter element installed in a filter housing, with a bypass valve, should be at least two times greater than the full flow bypass valve pressure drop. The collapse rating for filter elements used in filter housings with no bypass valve should be at least the same as the setting of the system relief valve upstream of the high-crush element. When a high collapse element becomes clogged with contamination all functions downstream of the filter will become inoperative.	Collapse Rating

Element Media Selection Considerations The Right Media for the Right Application = Job Matched Filtration

Filtration Application Guidelines

Selecting the proper Schroeder media for your application is easy if you follow these simple guidelines.

Step 1. Remember that the key to cost effective contamination control is to maintain the system's cleanliness at the tolerance level of the system's most sensitive component. So, the first step is to identify the most sensitive component.

Step 2. Determine the desired cleanliness level (ISO Code) for that component by referring to Figure 3 on page 13 or by contacting the component manufacturer directly.

Step 3. Identify the Schroeder filter medium referencing Table 6 that will meet or exceed the desired cleanliness level.

Step 4. Remember to regularly check the effectiveness of the selected media through the use of contamination monitoring equipment.

Table 6. Schroeder Element Media Recommendations

Desired Cleanliness Levels	Schroeder
(ISO Code)	Media
20/18/15-19/17/14	Z25
19/17/14-18/16/13	Z10
18/16/13-15/13/10	Z5
15/13/10-14/12/9	Z3
14/12/9-13/11/8	Z1

Effect of Ingression

Filter element life varies with the dirt holding capacity of the element and the amount of dirt introduced into the circuit. The rate of this ingression in combination with the desired cleanliness level should be considered when selecting the media to be used for a particular application. Table 7 provides recommendations accordingly.

The amount of dirt introduced can vary from day to day and hour to hour, generally making it difficult to predict when an element will become fully loaded. This is why we recommend specifying a Dirt Alarm[®].

Schroeder-designed Dirt Alarms[®] provide a vital measure of protection for your system by indicating when the filter element needs to be changed or cleaned. Schroeder filters are available with visual, electrical and electrical-visual combination Dirt Alarms[®]. These indicators may also be purchased as separate items. For more information on Dirt Alarms[®], see Appendix A.

Table 7. Recommended Schroeder Media to Achieve Desired Cleanliness Levels Based on Ingression Level

Desired Cleanliness Levels (ISO Code)	Ingression Rate	Schroeder Element Medium
20/18/15	High	Z25
19/17/14	Low	Z25
19/17/14	High	Z10
18/16/13	Low	Z10
18/16/13	High	Z5
15/13/10	Low	Z5
15/13/10	High	Z3
14/12/9	Low	Z3
14/12/9	High	Z1
13/12/9	Low	Z1

To obtain the desired cleanliness level (ISO Code) using the suggested Schroeder filter medium, it is recommended that a minimum of one-third of the total fluid volume in the system pass through the filter per minute. If fluid is filtered at a higher flow rate, better results may be achieved. If only a lesser flow rate can be filtered, a more efficient media will be required.

Systems operating in a clean environment, with efficient air-breather filters and effective cylinder rod wiper seals, may achieve the desired results at a lower turnover rate. Systems operating in a severe environment or under minimal maintenance conditions should have a higher turnover. Turnover must be considered when selecting the location of the system's filter(s).

Since the pressure drop versus flow data contained in our filter catalog is for fluids with a viscosity of 150 SUS (32.0 cSt), and a specific gravity of .86, we are often asked how to size a filter with a viscosity other than 150 SUS (32.0 cSt) or a specific gravity other than .86. In those instances where the viscosity or specific gravity is significantly higher, it may be necessary to use a larger element. To make this determination, we need to calculate the life of the element, using the following equation:

$$EL = RC - (H + E)$$

EL = Element Life (expressed in psi)	H = Housing pressure drop
RC = Relief valve cracking pressure	E = Element pressure drop

1. The housing pressure drop can be read directly from the graph. This value is not affected by viscosity or the number of elements in the housing, since housing flow is turbulent.

2. The element pressure drop is directly proportional to viscosity, since element flow is laminar.

Schroeder's "rule of thumb" for element life, as calculated from the above equation, is to work towards a differential pressure drop that is no more than half (50%) of the bypass setting.

The interval between element change outs can be extended by increasing the total filter element area. Many Schroeder filters can be furnished with one, two, or three elements or with larger elements. By selecting a filter with additional element area, the time between servicing can be extended for little additional cost.

Schroeder filters have been used successfully to filter a variety of fire resistant fluids for over five decades. Filtering these fluids requires careful attention to filter selection and application. Your fluid supplier should be the final source of information when using these fluids. The supplier should be consulted for recommendations regarding limits of operating conditions, material and seal compatibility, and other requirements peculiar to the fluid being used within the conditions specified by the fluid supplier.

High Water Content Fluids

Where:

High water content fluids consist primarily of two types: water and soluble mineral base oil, and water with soluble synthetic oil. The oil proportion is usually 5%, but may vary from as low as 2% to as high as 10%.

Standard Schroeder Z1, Z3, Z5, Z10, and Z25 elements are compatible with both types of high water content fluids. Filter sizing should be the same as with 150 SUS (32 cSt) mineral based hydraulic oil. Z1 and Z3 elements may be used; however, element change outs will be more frequent. Some special factors that need to be considered in the selection process include the following:

- All aluminum in the filter housing should be anodized. This can be accomplished by using the "W" adder as shown in the filter model number selection chart.
- When using 95/5 fluids, check with fluid supplier for compatibility with aluminum.
- Buna N or Viton[®] seals are recommended.
- The high specific gravity and low vapor pressure of these fluids create a potential for severe cavitation problems. Suction filters or strainers should not be used. The Schroeder Magnetic Separator (SKB), page 327, with its low pressure drop, is recommended for pump protection from ferrous or large particles.

Invert Emulsions

Invert emulsions consist of a mixture of petroleum based oil and water. Typical proportions are 60% oil to 40% water. Standard Schroeder filters with Z10 and Z25 media elements are satisfactory for use with these fluids. Filters should be sized conservatively for invert emulsions. These fluids are non-Newtonian—their viscosity is a function of shear. We recommend up to twice the normal element area be used as space and other conditions permit.

Amount of Fluid Filtered

Sizing a Filter Element

Fluid Compatibility: Fire Resistant Fluids Fluid Compatibility: Fire Resistant Fluids (cont.) Some special factors that need to be considered in the selection process include the following:

- Potential exists for cavitation problems with invert emulsions similar to high water based fluids.
 SKB suction separators are recommended for pump protection from ferrous or large particles.
- Buna N or Viton[®] seals are recommended.

Water Glycols

Water glycols consist of a mixture of water, glycol, and various additives. Schroeder Z3, Z5, Z10 and Z25 elements are satisfactory for use with these fluids. Some special factors that need to be considered in the selection process include the following:

- All aluminum in the filter should be anodized. This can be accomplished by using the "W" option as shown in the filter model number selection chart.
- Potential exists for cavitation problems with water glycols similar to high water based fluids. SKB suction separators are recommended for pump protection from ferrous or large particles.
- Buna N or Viton[®] seals are recommended.

Phosphate Esters

Phosphate esters are classified as synthetic fluids. All Schroeder filters and elements can be used with most of these fluids. Sizing should be the same as with mineral based oils of similar viscosity. Some special factors that need to be considered in the selection process include the following:

- For phosphate esters, specify EPR seals (designated by "H" seal option) for all elements. As a general rule, all Z-Media[®] (synthetic) is compatible and 10 and 25 µ only E media (cellulose) with phosphate esters.
- For Skydrol[®], only 3, 5, 10, and 25 μ Z-Media[®] (synthetic) should be used, and "H.5" should be designated as the seal option. The "H.5" seal designation calls for EPR seals and stainless steel wire mesh in element construction.

Pressure Drop Correction for Specific Gravity

Pressure drop curves shown in this catalog are predicated on the use of petroleum based fluid with a specific gravity of 0.86. The various fire resistant fluids discussed in this section have a specific gravity higher than 0.86, which affects pressure drop. Use the following formula to compute the correct pressure drop for the higher specific gravity:

Corrected pressure drop $= \frac{\text{Fluid specific gravity}}{0.86} \times \text{Catalog pressure drop}$

Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.

7 Steps to Selecting a Filter

In the new era, systems are getting smaller and more compact, causing flow rates in hydraulic reservoirs to decrease, as well as a tighter space for overall reservoir components.

Without a properly sized filter and element in your machine's reservoir, operators can experience occurrences such as: foaming, cavitation, shortened fluid lifespan, poor response time from hydraulic valves, increase in replacement filter elements, and more valve and pump repairs.

In this section, we will walk you through our 7 Steps for Choosing the Correct Filtration.

Example Parameters: A piston pump and servo system with 20 gpm (76 L/min) pump flow, 30 gpm (144 L/min) return flow, 4000 psi (275 bar) system pressure, and a total system volume of 60 gallons (227 liters), with a non-pressurized reservoir. The fluid is 150 SUS.

Step 1: "Operating Pressures"

Determine the operating pressure of the system you are looking to apply filtration to.

Step 2: "Flow Rate"

Look at all of the characteristics of the fluid that is needing the filtration, including the flow rate.

Step 3: "MVP Components"

Determine what component is the most critical to your operation.

Step 4: "ISO Level"

Reference our chart on page 13 to determine the recommended ISO level of your MVP component (determined in Step 3). This will help you select what media type will help you achieve your cleanliness goal.

Step 5: "Fluid Type"

Ask yourself "what type of fluid is being filtered?" and "what is my main contamination type?" (Reference contamination types on page 16).

Step 6: "Temperature"

Determine the highest and lowest temperatures of your operating fluid.

Step 7: "Piecing It All Together"

Based on the previous steps, you can now take the information learned, calculate overall system differential pressure, and determine the right choice for filtration.

By following these simple steps, we can guarantee you will see cleaner fluid. In addition, all major hydraulic components should be working to expectation, last longer, and ultimately save you and your company money.

Seven Steps to Selecting a Filter

Filter Selection Considerations

Filter Location

Pressure filtration: Pressure filters usually produce the lowest system contamination levels to assure clean fluid for sensitive high-pressure components and provide protection of downstream components in the event of catastrophic failures. Systems with high intermittent return line flows may need only be sized to match the output of the pump, where the return line may require a much larger filter for the higher intermittent flows. See Figure 6(a).

Return line filtration: Return line filters are often considered when initial cost is a major concern. A special concern in applying return line filters is sizing for flow. Large rod cylinders and other components can cause return line flows to be much greater than pump output. Return lines can have substantial pressure surges, which need to be taken into consideration when selecting filters and their locations. See Figure 6(b).

Re-circulating filtration: While usually not recommended as a system's primary filtration (due to the high cost of obtaining adequate flow rates) re-circulating, or off-line, filtration is often used to supplement on-line filters when adequate turnover cannot be obtained with the latter. It is also often an ideal location in which to use a water removal filter. Off-line re-circulating filters normally do not provide adequate turnover flow rates to handle the high contamination loading occasioned by component failures and/or inefficient maintenance practices. See Figure 6(c).

Suction filtration: Micronic suction filters are not recommended for open-loop circuits. The cavitation these filters can cause significantly outweighs any advantage obtained by attempting to clean the fluid in this part of the system. SKB magnetic suction separators are recommended, as they will protect the pump from large and ferrous particles, without the risks of cavitation.

Breather filtration: Efficient filter breathers are required for effective contamination control on non-pressurized reservoirs and should complement the liquid filtration component.

Multiple filtration: For systems incorporating large total fluid volumes, it may be necessary to employ filters in more than one location. Multiple pressure filters, pressure and return line filters, and recirculating filters are examples of multiple filtration applications.

24 SCHROEDER INDUSTRIES

Parameters: A piston pump and servo system with 20 gpm (76 L/min) pump flow, 30 gpm (114 L/min) return flow, 4000 psi (275 bar) system pressure, and total system volume of 60 gallons (227 liters), with a non-pressurized reservoir.

Filtration Selection Exercise

Step 1 example. The servo valve is the system's most sensitive component. Referring to Figures 2 and 3 (page 13), you can see that a cleanliness level (ISO Code) of 16/14/11 or better is recommended for a high pressure system containing a servo valve.

Step 2 example. Table 8 recommends the Schroeder Z5 element media or finer to achieve a cleanliness level of 16/14/11.

Step 3 example. A combination of a pressure filter upstream of the servo valve and a return line filter would provide cost effective contamination control for servo systems.

Step 4 example. Filter model DF40, shown on page 65, is selected as the appropriate pressure filter because of its 30 gpm and 4000 psi capacities. A look at the Element Selection Chart for the DF40 located on page 67 verifies that the CZ5 element will handle 20 gpm, and the appropriate model number is DF40-1CZ5.

The ZT in-tank return line filter is selected for the 30 gpm return flow and the Z5 media. As shown in the model selection chart for the ZT on page 266, the proper model number to meet the specifications is ZT-8ZZ5.

Step 5 example. Using our Accessories Catalog; L-4329, select the ABF-3/10-S breather/strainer.

Step 6 example. Implement the appropriate manufacturing, assembly and maintenance contamination control procedures.

Step 7 example. Check start-up and ongoing system cleanliness (ISO Codes). Schroeder offers oil sampling kits that can be forwarded to a lab for particle counting and determination of cleanliness levels.

Table 8. Schroeder Element Media Recommendations

Recommendations	
Desired Cleanliness Levels (ISO Code)	Schroeder Media
20/18/15-19/17/14	Z25
19/17/14-18/16/13	Z10
18/16/13-15/13/10	Z5
15/13/10-14/12/9	Z3
14/12/9-13/11/8	Z1

Rated Fatigue Pressure

The application of individual filters should take fatigue ratings into consideration when there are flow or pressure variations creating pressure peaks and shock loads.

Typical hydraulic systems that use highly repetitive operations include plastic injection molding machines, die-cast machines, and forging and stamping press systems. In these and other similar applications, rated fatigue pressure should be considered when selecting a filter.

It has been common practice in the fluid power industry to establish component ratings for maximum operating pressure based on the minimum yield pressure, which is usually one third of the minimum yield pressure for higher-pressure components and one fourth of the minimum yield pressure for lower-pressure components. This rating method has proved satisfactory for many years, but it does not directly address the subject of fatigue.

The National Fluid Power Association has introduced a method (NFPA T2.6.1) for verifying the fatigue pressure rating of the pressure-containing envelope of a metal fluid power component. In this method, components are cycled from 0 to test pressure for 1 million cycles (10 million cycles is optional). The rated fatigue pressure (RFP) is verified by testing. We establish the desired RFP from design, then we calculate the cycle testing pressure (CTP), and then conduct tests at CTP per 1,000,000 cycles.

The T2.6.1 Pressure Rating document is available from the National Fluid Power Association, 3333 N. Mayfair Road, Milwaukee, WI 53222-3219.

Model	Rated Fatigue Pressure psi (bar)	Model	Rated Fatigue Pressure psi (bar)

Manifold Mounting In some filtration applications, it is advantageous to have the inlet and outlet ports mount directly onto a block without any hydraulic hose in between. Schroeder offers several such manifold-mounted filter models, including NFS30, YF30, PF40, LC50 DF40, RFS50, KF30, TF50, KF50, KC50, and KFH50. Drawings for these porting options are labelled "Optional Subplate Porting" and are included on respective catalog pages.

No-Element Indicator

The No-Element Indicator is a unique, patented signaling device designed to alert the user if no filter element is present in the housing. This virtually eliminates any possible confusion on the part of the user that the filter contains an element and is functioning in a normal manner.

The tamper proof system utilizes a patented internal valve design. If the element is not installed in the housing, the valve restricts flow, causing a high pressure drop. The high pressure drop, in turn, causes the Schroeder Dirt Alarm[®] to indicate that the element is not installed in the housing.

The only way to deactivate the indicator is to install the element in the housing.

This feature is available in the following filter models: RT, TF1, KF3, CF40, DF40, CF60, TF50, KF30, KF50, KC50, KC65, and MKF50 that are equipped with a Schroeder Dirt Alarm[®]. No-element indicator is not available when the indicator is placed in the cap in base-ported filters.

26 SCHROEDER INDUSTRIES

Ordering Information

For each filter that is shown in Sections 3, 4, 5, and 6 there is a Model Number Selection Chart. This chart lists all the configurations and accessories available for that specific filter.

Model numbers for all Schroeder filters are formulated by listing the appropriate codes, from left to right, according to the designated boxes shown in the chart. The letter or letter/number combination identifies the basic filter series. For instance, as shown in Figure 7, KF30-3KZ3-P-D5 designates a KF30 high-pressure, base-ported filter with three synthetic 3 μ elements, Buna N seals, 1¹/₂" NPTF porting, and a visual cartridge Dirt Alarm[®]. Figure 7. Model Number Selection

How to Build a Valid Model Number for a Schroeder KF30:

Model Number Selection

NOTES:

Box 2. Number of elements must equal 1 when using KK or 27K elements. Replacement element part numbers are identical to contents of Boxes 2, 3, 4 and 5. Double and triple stacking of K-size elements can be replaced by single KK and 27K elements, respectively. ZW media not available in 27K length.

- Box 5. H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.
- Box 7. For options F & F32, bolt depth .75" (19 mm).

For option O, O-rings included; hardware not included.

- Box 8. X and 50 options are not available with KFN30.
- Box 9. Standard indicator setting for nonbypassing model is 50 psi unless otherwise specified.
- Box 10. Options N, G509 and G588 are not available with KFN30. N option should be used in conjunction with dirt alarm.

Element Selection Chart for Flow Requirements

For each filter shown in the catalog, there is an element selection chart to determine the correct element to be used for a particular flow requirement (see Figure 8 for an example). The chart uses a petroleum-based hydraulic fluid with 150 SUS viscosity.

The process involves the following: Determine the working pressure of the system (3000 psi in this example) and the maximum flow (75 gpm). Then select the media (Z-Media®), and the micron filtration (3 μ). For example, the filter selected, following the above steps, is a KF30-2KZ3-P-D5. If the system pressure is 5000 psi and all other parameters are the same, then the model number would be KF50-2KZ3-P-D5.

Element pressure drop information in this publication is based on the viscosity (150 SUS or 32 cSt) and specific gravity (0.86) of the most commonly used hydraulic oils.

If the viscosity or specific gravity of the fluid you are designing for is different from these, use the following formulas to obtain the correct ΔP values.

Corrected element $\Delta P =$	ΔP from curve	x —	SUS viscosity 150	— x —	specific gravity 0.86
		OR			
Corrected element $\Delta P =$	ΔP from curve	x —	cST viscosity 32	— x —	specific gravity 0.86

Correcting for Viscosity and Specific Gravity

Schroeder Element Media

Z-Media[®] Elements (Synthetic)

Schroeder

Synthetic Microglass Filtration Media

The special class of micro-glass and other fibers used in Z-Media[®] are manufactured with utmost precision, to specific thicknesses and densities, and bonded with select resins to create material with extra fine passages. No other filter media can provide the benefits of Schroeder's Excellement[®] Z-Media[®]: maximum dirt-holding capacity, superior particle capture, excellent beta stability, minimum pressure drop, high flow rate and low operating cost.

The typical multiple layer construction (shown in Figure 9) has evolved from comprehensive laboratory testing to provide extended element life and system protection. Each successive layer performs a distinct and necessary function. The outermost layer is designed to maintain element integrity. Beyond this layer is a spun bonded scrim, offering coarse filtration and protection for the filtering layers within. Multiple sheets of fine filtering media follow, providing intricate passageways for the entrapment of dirt particles. Together, the various layers of filter media provide the ideal combination for peak filtration performance.

Figure 9. Cutaway of Excellement® Z-Media®

Schroeder's complete line of quality filtration elements—including Schroeder's original element designs, BestFit[®] replacement elements, CoreCentric[®] coreless elements and DirtCatcher[®] —are manufactured with Excellement[®] Z-Media[®].

The better efficiencies, excellent stability, lower pressure drops, and higher dirt holding capacities provided by Excellement[®] Z-Media[®] mean cleaner oil, longer element life, and less downtime. They outlast, outperform, and excel in every measurable benchmark.

The Excellement[®] Z-Media[®] series of filter elements have been designed, tested, and proven to be the best performing elements available on the market today.

30 SCHROEDER INDUSTRIES

Better flow characteristics: Lower pressure drop and improved flow stability

- Improved efficiency: Cleans oil in less time and improved reliability
- Higher dirt holding capacity: Longer element life, lower maintenance costs (labor)and decreased inventory costs (parts)
- Multi-layer construction: Each layer performs a distinct function

ISO 13/11/8

Schroeder Z-Media[®] elements are tested under cyclic flow conditions to verify flow fatigue characteristics. Extra strength and rigidity are engineered into every one of these filter elements through the use of epoxy-coated steel wire mesh and additional support layers. (ZX Series high crush strength capabilities are available for 3000 psi applications.)

A wide range of Schroeder Z-Media[®] elements enable you to achieve the desired cleanliness level for your system. Developed through comprehensive laboratory testing and field performance studies, these elements have been proven effective. Shown in Table 10 are cleanliness levels that can be achieved using Z-Media[®] filter elements in various applications.

Table 11 shows the ISO 16889 filtration ratios (Betas) for Schroeder Z-Media[®] elements Z1, Z3, Z5, Z10 and Z25. Figure 10 depicts the information in Table 11 graphically and provides corresponding % efficiencies. The numbers contained in the tables are simply specific data points from the plots for the respective media shown. The filtration ratio (Beta) is shown on the left side and the equivalent particle capture efficiency (%) is shown on the right for particle sizes shown across the bottom. The filtration ratio (in Table 13) indicates the particle size at which the filtration ratio for the element is greater than a given number.

Table 11. Z-Media[®] Filtration Ratios

Floment	Filtration Ratio Per ISO 16889							
Media	βx(c) ≥ 75 (98.7%)	βx(c) ≥ 100 (99%)	βx(c) ≥ 200 (99.5%)	βx(c) ≥ 1000 (99.9%)				
Z1	<4.0	<4.0	<4.0	4.2				
Z3	<4.0	<4.0	<4.0	4.8				
Z5	<4.0	4.2	4.8	6.3				
Z10	6.8	7.1	8.0	10.0				
Z25	16.3	17.1	19.0	24.0				

Schroeder offers a line of high crush media elements with a collapse rating of 3000 psid for use in its non-bypass version of filter housings, which include the: NFN30, DFN40, CFN40, RFN60, CFN60, TFN50, KFN30, KFN50, KCN50, MKFN50, KCN65, FOF30, FOF60 and NOF30.

Features and Benefits

Excellement[®] Elements Have Improved Filtration Ratios

Series ZX High Collapse Elements (Synthetic)

Excellement Elements Have High Dirt Holding Capacities

Dirt holding capacity (DHC), simply stated, is the amount of solid contamination that an element can hold before the filter housing reaches its terminal bypass setting. The higher the dirt holding capacity, the longer the element will last. This translates to fewer element purchases, less frequent equipment shutdowns, decreased maintenance time, and reduced inventory. In short, it means money saved.

Table 12. Typical Dirt-Holding Capacities for Z-Media[®] Element (in grams)

Tuno	Element Size (Diameter x Length)								
Medium	2" x 6" 6R	3" x 8" 4" x 9 8T K		5" x 18" BB	6" x 39" Q				
Z1	15	51	112	268	1485				
Z3	15	52	115	275	1525				
Z5	16	59	119	301	1536				
Z10	14	55	108	272	1432				
Z25	15	56	93	246	1299				

The data shown represents the cumulative results of multi-pass tests in accordance with ISO 16889. Tests are conducted on a regular basis at Schroeder's own laboratory and at approved independent facilities.

A monetary value can be calculated for a filter element by considering its dirt holding capacity and efficiency in combination with its cost. To make this determination, first find out how much you're spending to clean your fluid to a desirable cleanliness level. Then figure out how much contamination (in grams) that the element is actually retaining. These two numbers will make it possible to calculate the grams of dirt per dollar spent. It's one thing to clean the oil, but it's another to clean the oil and simultaneously provide maximum element life. With Excellement[®] Z-Media[®], you don't need to sacrifice element life to achieve high efficiency.

We are confident that the high efficiencies, exceptional dirt holding capacities, and low pressure drops combined with Schroeder's competitive prices— make elements made with Excellement[®] Z-Media[®] the best value in the market today.

Figure 10. Z-Media® Excellement® Efficiency

Element Case Weights

In proportion to the high volume of filter elements we make and ship, one of the most frequently asked questions our order desk receives involves the weights of various cases of elements. In an effort to include this information in this edition of the catalog, we made the assumption that the various micron ratings within a media type weigh the same; i.e., a KZ1 weighs approximately the same as a KZ25.

The following table represents our findings given the above assumption.

		Case Lot	Weight (lb.)			Case Lot	Weight (lb.)			Case Lot	Weight (lb.)

Cost Per Gram Analysis/ Excellement® *Efficiency*

Far too often, customers make purchasing decisions based solely on price, only to be extremely disappointed with the poor quality delivered by low cost imitations. To make the matter worse, the customer often points an accusing finger at the filter housing manufacturer for poor performance, rather than the inadequate element they used as a replacement for the original Schroeder element.

GeoSeal[®] is a patented offering from Schroeder that provides a unique way for OEM's to retain replacement element business and to keep a filter's performance at the level that it was supplied. The idea is brilliantly simple: the critical sealing arrangement between a filter housing and its replacement element takes on a shape other than the standard circular arrangement. Specifically, the element grommet & mating bushing are given a new geometric shape. Figures 1 & 2 show the initial configuration being used.

Figure 2. Filter housing (cut-away) with GeoSeal bushing.

Availability

Currently, the GeoSeal[®] design is available on the K-size element and in the following Schroeder filter series: KF30, KF50, KC50, KC65, MKF50, K9, 2K9, 3K9, KF3, KL3, MLF1, KF5, RT, ZT, and LRT.

How To Order

To order the filter housing and element incorporated with the GeoSeal® design:

- "G" is added to the front of the housing model code (KF30, KF50, KC50, KC65, MKF50, KF3, KL3, MLF1, KF5, K9, 2K9, 3K9, RT, ZT, and LRT).
- "BG" is added to the element model code for RT (one end of the element has the GeoSeal[®]; the other end has an integrated bypass valve)

GeoSeal[®] Filters Selection Guide

		Pressure psi (bar)	Flow gpm (L/min)	Element Length/Size	Page

Private Labeled Elements

Schroeder offers a full line of branding solutions for air breathers, spin-ons, and replacement elements. Using the Element Private Label Form (L-2993), OEMs can obtain Schroeder elements with their very own custom logo (for Spin-on elements and air breathers, reference L-2994 on our website). Furnishing elements with custom branding enables OEMs to capture their aftermarket element business. Custom labeled products also protect against the use of unauthorized elements, thus reducing the potential of field warranty issues. Additionally, private branded products are proprietary and will not be shared with others without written consent from the OEM.

Steps for Establishing an Outer Wrap/End Cap Markings

- 1. Elements can be private labeled by marking the end caps, adding a private labeled plastic outerwrap, or both.
- 2. Customer name and part number will be etched on to one of the end caps with Schroeder date codes unless otherwise specified.

a. Logos can be laser etched onto the end cap if space allows on the desired element (a .DXF file of the logo is required).

 When requesting a plastic outer wrap, the customer must supply all artwork in a vector file format (.Al or .EPS).

- 4. Once the artwork is received, a RIP file (used to print the wrap) will be created and a sample swatch will be provided for customer approval (average lead time is approximately 2 weeks).
- 5. The sample printed polyester swatch will be sent to the customer for approval. The sample swatch can be temporarily wrapped around a SBF-9600-8 element, but this must be requested.
- 6. Once the customer has approved the sample, element part numbers (specific to element size) can be established and structured. Cost, delivery and required minimum quantity may depend on element size and private labeling style.

Packaging Capabilities

Schroeder has the ability to brand both individual and master cartons as requested. We can apply the customer name, part number, logo (black and white - .jpg file), and other customer texts. Bar coding and customer pre-printed boxes can also be requested (set up fees and minimum order quantities are required for customer pre-printed boxes).

Extra Aftermarket Retention Advantages:

Incorporating a private labeling program has shown that upwards of 60% of aftermarket element business is retained. Instituting of a private branding program also protects against the use of inferior and/or unqualified replacement element substitutions.

Anti-Static Pleat Elements

During the production of hydraulic oils, "additive packages" are introduced into the base oils to give the fluids certain characteristics they need for the demanding conditions of today's systems. The additives improve viscosity, reduce friction, prevent wear, and allow the fluid to tolerate high temperatures without oxidation. Some oils are produced with toxic aromatics and heavy metals, with a high electrical conductivity, but because of their toxicity and potential threat to the environment, they no longer comply with current, international environmental standards. Other groups of oils are produced with the appropriate, approved additive packages, often labeled as highly refined or synthetic. They contain no toxins or carcinogens, and are free of heavy metals, but due to their metal-free nature, they have a lower electrical conductivity rating. Low electrical conductivity means that any charges that are generated through the oil flow may not be dissipated quick enough, thus causing sparking. Ultimately, this can cause explosions in the reservoir or damages in vital hydraulic components, such as valves and filters.

The sparks can also interfere with or damage expensive electronic components, and form oil-ageing deposits, such as varnish. Varnish then settles on the oily surfaces of the vital components and has a detrimental effect on how well your machine functions. Potential consequences of varnish also includes seized valve spools, overheated solenoids, and extremely short filter element service life.

The Anti-Static Pleat Media (ASP[®]) element was developed to greatly reduce or eliminate electrostatic discharging problems that can occur during filtration of hydraulic and lube fluids. By combining proven Excellement[®] media and ASP[®] technology, it is now possible to offer both high filtration efficiency and electrical conductivity.

Other key areas that can contribute to Electrostatic Discharge:

- Filter Media media layer construction can influence high voltage charge
- Hydraulic Fluids group II and III have low conductivity
- Temperature higher voltage charge will generally exist with lower temperature

DirtCatcher® Elements

Patent # 7384547

DirtCatcher[®] elements from Schroeder offer a superior alternative to inside-out filtration. The patented outer shell prevents contaminants from falling back into the system during element changes while still providing the excellent dirt retention of Excellement[®] media. DirtCatcher[®] elements are currently available in single and double length K, BB, and 18L size elements, and feature Excellement[®] media within.

Currently, DirtCatcher[®] elements can be purchased separately or as part of our RT, KF3, KF8, BFT, and LRT filter assemblies.

The DirtCatcher[®] solution provides peace of mind to those concerned with dirt escaping from elements during the removal process while delivering all the advantages of Schroeder original (outside-in flow) elements:

- Better Pressure Drop
- Greater Surface Area
- Better Pleat Stability

This design is only available from Schroeder. It goes without saying that DirtCatcher's unique design also allows OEM's to retain 100% of after-market business.

Schroeder Industries manufactures over 2000 BestFit[®] performance replacement elements. In addition, Schroeder Industries produces all of the technical data to support the sale of these products. The BestFit[®] family consists of standard cartridge and spin-on replacements, CoreCentric[®] coreless elements, high collapse elements, and the melt-blown and spun-bonded process filtration elements. Most importantly, we offer the easiest way to determine the Schroeder equivalent of more than 42,000 competitive elements using the Schroeder online element search, accessible through our web site at www.schroederindustries.info.

Simply clicking on "BestFit[®] Element Cross Reference" on the Schroeder Industries home page (www.schroederindustries.com) allows you to match filter elements by entering either the manufacturer's name or part number.

There are two ways to search on the Schroeder BestFit[®] cross reference page. The first way is to type a competitor element part number in the search bar. When searching by competitor part number, the search will activate as soon as three characters are entered (no spaces or symbols). The second way is to use the two drop down menus to find the competitor and part number you are trying to cross. When a cross has been located, the results table includes the corresponding BestFit[®] replacement element, dimensions (inside diameter, outside diameter and length), element style (e.g., cartridge or spin-on), media type (metal mesh, water removal, synthetic glass, or paper) and performance specifications, including beta ratios and dirt holding capacity. Also, a link to the left of the results table links to a generalized element drawing with all of the desired information on it. If there is an element that cannot be crossed, Schroeder Industries can work with you in finding a replacement solution to your element problem!

Schroeder BestFit[®] element model codes are determined by replicating the element model code it is replacing. An example of a breakdown of the model code is shown below:

Schroeder BestFit® Model Code: SBF-9600-13Z10V

BestFit[®] High Performance Replacement Elements

CoreCentric[®] Coreless Element

Melt-Blown and Spun-Bonded Filter Elements For Process and Cutting Fluid

Applications

CORELESS ELEMENT WITH BACKBONE

The CoreCentric[®] Coreless element is an environmentally friendly, all plastic element (no metal parts) that can be crushed, shredded or burned. These alternative methods of disposal will not only greatly reduce solid waste volumes, but also reduce disposal costs simultaneously.

CoreCentric[®] Coreless elements are designed to ensure optimum performance and ease of service. Built with Excellement[®] Z-Media[®], CoreCentric[®] Coreless elements (QCL) fit in all Pall 8304 and 8314 housings and are available in the 8[°], 13[°], 16[°], and 39[°] lengths. Note: To ensure fast delivery, CoreCentric[®] elements are available with Viton[®] seals only.

CoreCentric[®] elements are designed with an integral patent design, cylindrical center core that provides column strength, added structural stability, and easy element removal. This core eliminates both the sticking and vertical sagging problems that can occur when using other manufacturer's coreless designs.

Schroeder's CoreCentric[®] elements are the only coreless element designed with backbone. We call it the "CORE ON CORE" element design.

Used in process and cutting fluid applications, melt-blown and spun-bonded elements are manufactured with either polypropylene or nylon filter media. Element fibers are blown onto and thermally bonded to a central support core with increasing fiber density towards the core, creating depth filtration. All layers are interlinked to offer maximum support while ensuring high void volume. The thermal bonding process minimizes media migration, providing consistent and reliable performance. They excel in dirt holding capacity and have low pressure drops. They also offer wide chemical compatibility, as well as being structurally sound and able to withstand high flow rates.

Melt-blown and spun-bonded elements fit most industrial housings incorporating the double open ended sealing arrangement, as well as standard polypropylene, PVC, and polycarbonate housings. In addition, these elements are available with end caps for most plug-in style O-ring fittings, making them ideally suited to more critical applications requiring the assurance of these double seals.

They have a wide range of applications including:

- Machine tool coolants
- Roll mill coolants
- EDM fluids
- Quench oils
- Electrophoretic paintsEtching solutions

Parts washing solvents

- Plating solutions
- Light oils
- Fuels
- High water containing fluids

Energy-Saving Filtration

The use of Schroeder's GREEN, Electric Drive (E-Drive) Media filtration technology guarantees safe and reliable equipment operation, all-while conserving the use of energy.

Part of Schroeder's Energy Saver initiative, filter elements made using the all-new E-Drive Media are characterized by an unusually low pressure drop, making them suitable for low energy requirements compared to conventional hydraulic elements under the same ambient conditions.

E-Drive Media is the clear choice for use in electric hydraulic drive motor-pump units. Use it for conserving energy bills and wherever high viscosity fluids are employed – especially at low temperatures that produce a cold start behavior.

Schroeder's E-Drive Energy Saving Features:

- Low resistance of flow to reduce the ΔP across the element.
- Constructed of multi-layered, synthetic fiber material with support.
- Great for cold start conditions where a low pressure drop is required.

Technical Specs:

- Element Collapse Rating: 145 psid (10 bar).
- Temperature Range: -22°F to 212°F (-30°C to 100°C).
- Flow Direction: Outside to Inside.

E-Drive Media is currently rated for 8, 10, & 15 µm filtration..

Electric Drive Elements

E Media Elements (Cellulose)

Recognized as one of the industry's most cost effective media available in the marketplace, Schroeder E media is an excellent choice for a wide variety of hydraulic system applications.

The E3 media is a specially designed mixture of cellulose and micro-glass, which provides both high dirt holding capacity and high particle capture efficiency, resulting in one of the industry's most cost effective cellulose media. Schroeder E10 media, used in the popular K10 element, is a standard for numerous industries, enabling continuous, trouble-free system operation.

Please note: The "E" identification for the media is not shown in the element model number. For example, our standard K3 and K10 elements are constructed with E media.

Table 14 shows the filtration ratios for Schroeder E media elements, while Figure 18 depicts this information graphically and provides corresponding % efficiencies for both the E3 and E10 media.

Table 14. E Media Efficiency Ratings per ISO 4572 without Antistatic Additive

	Filtration Ratios (Beta)						
Element Media	β _x ≥ 75 (98.7%)	β _X ≥ 100 (99%)	β _X ≥ 200 (99.5%)	ß ₃	⁶ 5	^ß 10	^β 20
E3	6.8	7.5	10.0	28	48	200	>1000
E10	15.5	16.2	18.0	—	1.3	10	400

The cost effectiveness of E media becomes even more apparent when dirt holding capacity is considered (see Table 15). The dollars spent per gram of dirt retained with an E media element makes it an excellent choice for many contamination control programs.

Figure 16. E Media Element Efficiencies Per ISO 4572

The data shown represents the cumulative results of E media multi-pass tests. Tests are conducted on a regular basis at Schroeder's own laboratory and at approved independent facilities. Tests are conducted without antistatic additive.

The data shown represents the cumulative results of E media multi-pass tests. Tests are conducted on a regular basis at Schroeder's own laboratory and at approved independent facilities. Tests are conducted without antistatic additive. Schroeder offers a line of metal reusable elements to meet specific application needs. These rugged elements are constructed of high-strength woven stainless steel wire mesh. The wire mesh and center tube are epoxy-bonded to the end caps.

The element design incorporates shallow pleats which provide an efficient flow pattern with optimum pressure drop. In addition, the shallow pleat construction simplifies the cleaning process. These elements may be cleaned using a liquid solution (either Kleenite or Oakite) or by ultrasonics. Request Schroeder's #L-2094 Data Sheet for details regarding recommended cleaning procedures.

Schroeder metal elements are available in a variety of sizes for 10, 25, 60, 150, and 260 μ filtration and are shown in Table 16. The size and type of wire mesh used for each micron rating are shown in Table 17.

Table 17. N	licron Ratings and Wire Mesh
10 µ	200 x 1400 twilled Dutch weave
25 µ	165 x 1400 twilled Dutch weave
60 µ	50 x 250 plain Dutch weave
150 µ	100 x 100 square Dutch weave
260 µ	60 x 60 square Dutch weave

Today's demand for the use of fire-resistant fluids that assure safe and dependable operation in an electrohydraulic control system (EHC) demand peak performing media. The change-over to Schroeder "F" Pack media from a traditional, high performance, synthetic media results in lower, clean pressure drop and higher efficiency. Most importantly, the change eliminates cast-off, or shedding of synthetic fibers, which can result in servo valve failure.

Construction

- Total stainless steel, sintered depth style media
- Pleated media
- Sintered construction prevents shedding of media
- Outside/in flow

Performance

- Extremely efficient: B3=1000 and B10=1000
- Excellent choice for use with phosphate esters and Fyrquel[®] fluids
- Operating temperature -20°F to 350°F with use of Viton[®] seals
- Element collapse rating 3000 psid for use at high differential pressures

M Media Elements (Reusable Metal)

F-Pack Media

W Media Elements (Water Removal)

Water can cause a host of contamination problems in hydraulic and lubrication systems. It can exist in a system in a dissolved state or in a free state. In a dissolved state, the fluid is holding the water. In a free state, the water is above the specific saturation point of the fluid, and thus cannot dissolve or hold more water. A mild discoloration of the fluid generally indicates that a free water condition exists in the system.

Schroeder's uniquely designed water removal elements employ a quick-acting water-absorbent polymer, capable of holding over 400 times its own weight in water. These elements are ideal for in-line use, re-circulating filter systems, or in portable filtration carts.

Water retention is positive, even under high pressure, so there is no downstream unloading. However, water retention capacity is dependent on the type of fluid and additives present in a system, its viscosity and its flow rate. As a result, retention capacity may be diminished by some additives present in the system, by a high viscosity, or a high flow rate.

Table 18 shows water holding capacity and Table 19 shows the pressure drops for select W media elements. (On net page)

For best results, flow rates through a single KW element should be 10 gpm (38 L/min) or less.

Aqua-Excellement™ High Efficiency Particulate Water Removal Media

Schroeder offers Aqua-Excellement[™] filter elements, which excel at removing both water and solid particulates from petroleum-based fluids. The filtering media incorporated into Aqua-Excellement[™] elements is referred to as ZW and includes layers of Schroeder's high efficiency Excellement[®] Z-Media[®] for capturing particulate contaminations in combination with water removal capabilities. The high efficiencies, outstanding beta stabilities, and excellent dirt holding capacities that Excellement[®] customers have become accustomed to are present in the new ZW media. Paired together, these two types of media make a winning combination and are highly effective at filtering out water and solids simultaneously.

Aqua-Excellement[™] elements are currently available in multiple sizes for both cartridge and spin on style. Equipped, with ZW media, Schroeder MFS/AMS series carts can be effectively utilized for on-site flushing applications for cleaning stagnant large volume reservoirs. When used on a kidney loop system installed on power units, the ZW media allows for smaller kidney loop system and lower dimensional clearance and weight. Other applications include mobile filtration systems and bulk transfer systems.

Schroeder Kidney Loop Systems and Mobile Filtration Carts can utilize the KZW cartridge elements

ZW Spin-On Elements

NOTE: When using any K-size housing do not exceed 14 gpm

Shown below is a breakdown of the layers of the new K-size ZW cartridge element.

- Epoxy-coated steel wire fabric providesmaximum support and rigidity.
- Two layers of Z-Media provide maximum efficiency and dirt-holding capacity with minimal pressure drop
- Water removal media
- Spun-bonded scrim provides downstream media support and increased stability
- Epoxy-coated steel wire fabric providesmaximum support and rigidity.

Total water injection flow rate: 2.0 ml/min.

Top-Ported Pressure Filter NF3

$\Delta \mathbf{P}_{\mathsf{housing}}$

NF30 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine ΔP_{filter} at 15 gpm (57 L/min) for NF301NZ10SD5 using 160 SUS (34 cSt) fluid.

5

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 7 psi (.48 bar) according to the graph for an NF30 housing.

10

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

15

Flow Rate [GPM]

20

25

Use the element pressure curve to determine $\Delta P_{element}$ at 15 gpm. In this, case, $\Delta P_{element}$ is 8 psi (.55 bar) according to the graph for an NZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V_f) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta P_{element} * V_f)$. The $\Delta P_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution: $\Delta \mathbf{P}_{\text{housing}} = 7 \text{ psi } [0.48 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 8 \text{ psi } [0.55 \text{ bar}]$

0

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1

$$\Delta \mathbf{P}_{filter} = 7 \text{ psi} + (8 \text{ psi} * 1.1) = 15.8 \text{ psi}$$

OR

 $\Delta P_{\text{filter}} = .48 \text{ bar} + (.55 \text{ bar} * 1.1) = 1.1 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

Element Performance Information & Dirt Holding Capacity

Manifold Mounted Pressure Filter NFS30

$\Delta \mathbf{P}_{\text{housing}}$

NFS30 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 15 gpm (57 L/min) for NFS301NZ10SO using 175 SUS (37.2 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 10 psi (.69 bar) on the graph for the NFS30 housing.

Use the element pressure curve to determine $\Delta P_{\text{element}}$ at 15 gpm. In this case, $\Delta P_{\text{element}}$ is 8 psi (.55 bar) according to the graph for the NZ10 element.

Because the viscosity in this sample is 175 SUS (37.2 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

OR

 $\Delta \mathbf{P}_{\text{housing}} = 10 \text{ psi } [.69 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 8 \text{ psi } [.55 \text{ bar}]$

 V_f = 175 SUS (37.2 cSt) / 150 SUS (32 cSt) = 1.2 $\Delta \mathbf{P}_{filter}$ = 10 psi + (8 psi * 1.2) = 19.6 psi

 $\Delta \mathbf{P}_{\text{filter}} = .69 \text{ bar} + (.55 \text{ bar} * 1.2) = 1.35 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

Ele.	$\Delta \mathbf{P}$	Ele.	$\Delta \mathbf{P}$

Top-Ported Pressure Filter

$\Delta \mathbf{P}_{\text{housing}}$

YF30 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 10 gpm (37.9 L/min) for YF304YZ10WSDRD5 using 200 SUS (42.6 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 10 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the YF30 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 10 gpm. In this case, $\Delta P_{element}$ is 8 psi (.55 bar) according to the graph for the 4YZ10 element.

Because the viscosity in this sample is 200 SUS (42.6 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 8 \text{ psi } [.55 \text{ bar}]$

 $V_f = 200 \text{ SUS } (42.6 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.3$ $\Delta \mathbf{P}_{\text{filter}} = 3 \text{ psi} + (8 \text{ psi} * 1.3) = 13.4 \text{ psi}$

△P_{filter} = .21 bar + (.55 bar * 1.3) = .93 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 15 gpm (57 L/min) for CFX301CZ5SD5 using 100 SUS (21.3 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 5 psi (.34 bar) on the graph for the CFX30 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 15 gpm. In this case, $\Delta P_{element}$ is 3 psi (.21 bar) according to the graph for the CZ5 element.

Because the viscosity in this sample is 100 SUS (21.3 cSt), we determine the Viscosity Factor (V_f) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta \mathbf{P}_{element} * V_f)$. The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 5 \text{ psi } [.34 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi } [.21 \text{ bar}]$

V_f = 100 SUS (21.3 cSt) / 150 SUS (32 cSt) = .67 △P_{filter} = .34 psi + (.21 psi * .67) = .48 psi OR

△P_{filter} = .34 bar + (.21 bar * .67) = .48 bar

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

$\Delta \mathbf{P}_{\mathsf{housing}}$

PLD $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 50 gpm (189 L/min) for PLD10DVZ1VF24VM using 200 SUS (42.6 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 8 psi (.55 bar) on the graph for the PLD housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 50 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 17.5 psi (1.2 bar) according to the graph for the 10DVZ1 element.

Because the viscosity in this sample is 200 SUS (42.6 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 8 \text{ psi} [.55 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 17.5 \text{ psi} [1.2 \text{ bar}]$

 $V_f = 200 \text{ SUS } (42.6 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.3$ $\Delta \mathbf{P}_{\text{filter}} = 8 \text{ psi} + (17.5 \text{ psi} * 1.3) = 30.8 \text{ psi}$

<u>OR</u> △P_{filter} = .55 bar + (1.2 bar * 1.3) = 2.1 bar Pressure Drop Information Based on Flow Rate and Viscosity

PL

Note:

If your element is not graphed, use the following equation: $\Delta P_{element} = Flow Rate \ x \ \Delta P_f. Plug this variable into the overall pressure drop equation.$

Top-Ported Pressure Filter CF40/DF40

Pressure

Information

and Viscosity

Drop

Based on Flow Rate

Exercise:

Determine ΔP_{filter} at 25 gpm (94.6 L/min) for CF401CZ10SD5 using 200 SUS (42.6 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 25 gpm. In this case, $\Delta P_{\text{housing}}$ is 4.5 psi (.31 bar) on the graph for the CF40 housing.

Use the element pressure curve to determine $\Delta P_{\text{element}}$ at 25 gpm. In this case, $\Delta P_{\text{element}}$ is 6 psi (.42 bar) according to the graph for the CZ10 element.

Because the viscosity in this sample is 200 SUS (42.6 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 4.5 \text{ psi} [.31 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 6 \text{ psi} [.42 \text{ bar}]$

 $V_f = 200 \text{ SUS } (42.6 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.3$

$$\Delta \mathbf{P}_{\text{filter}} = 4.5 \text{ psi} + (6 \text{ psi} * 1.3) = 12.3 \text{ psi}$$

OR

 $\Delta \mathbf{P}_{filter} = .31 \text{ bar} + (.42 \text{ bar} * 1.3) = .86 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

0/DF40 Top-Ported Pressure Filter

NOTES:

Box 2. Replacement element part numbers are identical to contents of Boxes 2, 3, 4 and 5.

Box 5. For options H, V, W, and H.5, all aluminum parts are anodized. H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.

- Box 6. B porting option supplied with metric mounting holes.
- Box 7. Options X and 50 are not available with CFN40 or DFN40.

Box 8. Standard indicator setting for nonbypassing model is 50 psi unless otherwise noted.

Box 9. N option is not available with CFN40 or DFN40. N option should be used in conjunction with dirt alarm.

Element Performance **Information & Dirt Holding Capacity**
Top-Ported Pressure Filter

$\Delta \mathbf{P}_{\mathsf{housing}}$

PF40 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 20 gpm (75.7 L/min) for PF405HZ3SD5S using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 20 gpm. In this case, $\Delta P_{\text{housing}}$ is 2.5 psi (.17 bar) on the graph for the PF40 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 20 gpm. In this case, $\Delta P_{element}$ is 15 psi (1 bar) according to the graph for the 5HZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

OR

 $\Delta \mathbf{P}_{\text{housing}} = 2.5 \text{ psi} [.17 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 15 \text{ psi} [1 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △ P_{filter} = 2.5 psi + (15 psi * 1.1) = 19 psi

 $\Delta \mathbf{P}_{filter} = .17 \text{ bar} + (1 \text{ bar} * 1.1) = 1.3 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

Manifold Mounted Pressure Filter RES50

$\Delta \mathbf{P}_{\text{housing}}$

RFS50 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 15 gpm (57 L/min) for RFS508RZ10VOD5 using 200 SUS (42.6 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 5 psi (.34 bar) on the graph for the RFS50 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 15 gpm. In this case, $\Delta P_{element}$ is 5 psi (.34 bar) according to the graph for the 8RZ10 element.

Because the viscosity in this sample is 200 SUS (42.6 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 5 \text{ psi } [.34 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 5 \text{ psi } [.34 \text{ bar}]$

 V_f = 200 SUS (42.6 cSt) / 150 SUS (32 cSt) = 1.3 ΔP_{filter} = 5 psi + (5 psi * 1.3) = 11.5 psi

<u>OR</u> ∆**P**_{filter} = .34 bar + (.34 bar * 1.3) = .78 bar Note:

If your element is	s not graphed, use

$\Delta \mathbf{P}_{\mathsf{housing}}$

CF60 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 ${\boldsymbol{\bigtriangleup}} {\boldsymbol{\mathsf{P}}}_{\mathsf{element}}$

Pressure Drop Information Based on Flow Rate and Viscosity

CF6

Λ	Pfilter	=	$\Delta \mathbf{P}_{\mathbf{h}}$	ousina	+	(∆P	element	*V _f)	
	- inter			DUSIIIU	-	·	element	- / /	

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 30 gpm (113.6 L/min) for CF601CCZ10SD5 using 175 SUS (37.2 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 30 gpm. In this case, $\Delta P_{\text{housing}}$ is 4 psi (.28 bar) on the graph for the CF60 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 30 gpm. In this case, $\Delta P_{element}$ is 3 psi (.21 bar) according to the graph for the CCZ10 element.

Because the viscosity in this sample is 175 SUS (37.2 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 4 \text{ psi } [.28 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi } [.21 \text{ bar}]$

V_f = 175 SUS (37.2 cSt) / 150 SUS (32 cSt) = 1.2 △ $P_{\text{filter}} = 4 \text{ psi} + (3 \text{ psi} * 1.2) = 7.6 \text{ psi}$ OR

△P_{filter} = .28 bar + (.21 bar * 1.2) = .53 bar

Note:

If your element is not graphed, use the following equation: $\Delta P_{element} = Flow Rate x \Delta P_f$ Plug this variable into the overall pressure drop equation.

NOTES:

- Box 2. Replacement element part numbers are identical to contents of Boxes 2, 3, 4 and 5. E media (cellulose) elements are only available with Buna N seals.
- Box 5. H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.
- Box 6. B porting option supplied with metric mounting holes.
- Box 8. Standard indicator setting for nonbypassing model is 50 psi unless otherwise specified.

Top-Ported Pressure Filter CTF60

CTF60 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine ΔP_{filter} at 50 gpm (189 L/min) for CTF608CTZ5S20D9 using 200 SUS (42.6 cSt) fluid.

Use the housing pressure curve to determine $\Delta \mathbf{P}_{\text{housing}}$ at 50 gpm. In this case, $\Delta \mathbf{P}_{\text{housing}}$ is 7 psi (.48 bar) on the graph for the CTF60 housing.

Use the element pressure curve to determine $\Delta P_{\text{element}}$ at 50 gpm. In this case, $\Delta P_{\text{element}}$ is 22 psi (1.5 bar) according to the graph for the 8CTZ5 element.

Because the viscosity in this sample is 200 SUS (42.6 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 7 \text{ psi} [.48 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 22 \text{ psi} [1.5 \text{ bar}]$

 $V_f = 200 \text{ SUS } (42.6 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.3$

$$\Delta \mathbf{P}_{filter} = 7 \text{ psi} + (22 \text{ psi} * 1.3) = 35.6 \text{ psi}$$

OR

 $\Delta P_{\text{filter}} = .48 \text{ bar} + (1.5 \text{ bar} * 1.3) = 2.4 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

Top-Ported Pressure Filter VF6

$\Delta \mathbf{P}_{\mathsf{housing}}$

VF60 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 40 gpm (151 L/min) for VF609VZ1S using 120 SUS (25.5 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 40 gpm. In this case, $\Delta P_{\text{housing}}$ is 6 psi (.42 bar) on the graph for the VF60 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 40 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 13 psi (.90 bar) according to the graph for the 9VZ1 element.

Because the viscosity in this sample is 120 SUS (25.5 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 6 \text{ psi } [.42 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 13 \text{ psi } [.90 \text{ bar}]$

V_f = 120 SUS (25.5 cSt) / 150 SUS (32 cSt) = .80 △ P_{filter} = 6 psi + (13 psi * .80) = 16.4 psi OR

 $\Delta \mathbf{P}_{filter} = .42 \text{ bar} + (..90 \text{ bar} * .80) = 1.14 \text{ bar}$

Note:

if your element is not graphed, use					
the following equation:					
$\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_f Plug$					
this variable into the overall					
pressure drop equation.

High-Flow, High Pressure Filter LW60

300 gpm

6000 psi 415 bar

1135 L/min

LW60

KF50

KC50

Features and Benefits

- Horizontal alignment allows straight-through flow, maximizing efficiency and minimizing pressure drop
- Propriety synthetic media designed specifically for the mining industry. Excellement-MD[™] provides level of filtration not achievable using alternative wire mesh elements because of their lack of absolute ratings
- Two-inch BSPP ports are easily adaptable to Super Stecko fittings commonly used underground
- Stainless steel bypass valve that ensures smooth integration with 95/5 fluid
- Non-bypassing version available with high crush (4500 psid) cleanable metal mesh (25 micron) element

Model No. of filter in photograph is LW6039ZPZ5VB32DPG.

High-Flow, High Pressure Filter

Dimensions:

High-Flow, High Pressure Filter LW60

$\Delta \mathbf{P}_{\mathsf{housing}}$

LW60 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

$\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 200 gpm (757 L/min) for LW6039ZPZ3VB32DPG using 75 SUS (16 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 200 gpm. In this case, $\Delta P_{\text{housing}}$ is .25 psi (.02 bar) on the graph for the LW60 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 200 gpm. In this case, $\Delta P_{element}$ is 12 psi (.83 bar) according to the graph for the 39ZPZ3 element.

Because the viscosity in this sample is 75 SUS (16 cSt), we determine the Viscosity Factor (V₄) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta \mathbf{P}_{element} * V_f)$. The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = .25 \text{ psi} [.02 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 12 \text{ psi} [.83 \text{ bar}]$

V_f = 75 SUS (16 cSt) / 150 SUS (32 cSt) = .50 △P_{filter} = .25 psi + (12 psi * .50) = 6.25 psi OR

 $\Delta \mathbf{P}_{filter} = .02 \text{ bar} + (.83 \text{ bar} * .50) = .44 \text{ bar}$

LW60 High-Flow, High Pressure Filter

Base-Ported Pressure Filter KF30/KF50

	Features and Benefits	100/150 gpm NF30
	 Base-ported pressure filter 	380/570 I /minNFS30
	Can be installed in vertical or horizontal position	
1 million 1	Meets HF4 automotive standard	KF30- 3000 psi ^{4F30}
1.1.2	 Element changeout from top minimizes oil spillage 	210 bar CFX30

Base-Ported Pressure Filter KF30/KF50

$\Delta \mathbf{P}_{\mathsf{housing}}$

KF30/KF50 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

KZ/KGZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

KKZ/KKGZ

Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 50 gpm (189.5 L/min) for KF301KZ10SD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the KF30 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 50 gpm. In this case, $\Delta P_{element}$ is 2.5 psi (.17 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi} [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2.5 \text{ psi} [.17 \text{ bar}]$

 $V_f = 160 \text{ SUS} (34 \text{ cSt}) / 150 \text{ SUS} (32 \text{ cSt}) = 1.1$

$$\Delta \mathbf{P}_{\text{filter}} = 3 \text{ psi} + (2.5 \text{ psi}^{1} \text{ i.i}) = 5.8 \text{ psi}$$

OR

 $\Delta \mathbf{P}_{filter} = .21 \text{ bar} + (.17 \text{ bar} * 1.1) = .40 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow \text{ Rate } x \Delta \mathbf{P}_{f}. \text{ Plug}$ this variable into the overall pressure drop equation.

$\bigtriangleup \bm{P}_{\bm{housing}}$

TF50 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 15 gpm (57 L/min) for TF501AZ10SD5 using 175 SUS (37.2 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 1.8 psi (.12 bar) on the graph for the TF50 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 15 gpm. In this case, $\Delta P_{element}$ is 3.8 psi (.26 bar) according to the graph for the AZ10 element.

Because the viscosity in this sample is 175 SUS (37.2 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * V_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 1.8 \text{ psi} [.12 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3.8 \text{ psi} [.26 \text{ bar}]$

 $V_f = 175 \text{ SUS } (37.2 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.2$ $\langle \mathbf{P}_{\text{subsc}} = 1.8 \text{ psi} + (3.8 \text{ psi} * 1.2) = 6.4 \text{ psi}$

 $\Delta \mathbf{P}_{filter} = .12 \text{ bar} + (.26 \text{ bar} * 1.2) = .43 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Element Collapse Rating: 150 psid (10 bar) for standard elements

3000 psid (210 bar) for high collapse (ZX) versions Flow Direction: Outside In

Element Nominal Dimensions: K:

3.9" (99 mm) O.D. x 9.0" (230 mm) long 3.9" (99 mm) O.D. x 18.0" (460 mm) long KK:

27K: 3.9" (99 mm) O.D. x 27.0" (690 mm) long

Element Performance **Information & Dirt Holding Capacity**
$\Delta \mathbf{P}_{\mathsf{housing}}$

KC50 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

KZ/KGZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

2KZ/KKGZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 50 gpm (189.5 L/min) for KC501KZ10SD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the KC50 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 50 gpm. In this case, $\Delta P_{element}$ is 2.5 psi (.17 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2.5 \text{ psi } [.17 \text{ bar}]$

 $V_f = 160 \text{ SUS} (34 \text{ cSt}) / 150 \text{ SUS} (32 \text{ cSt}) = 1.1$ $A_f = -2 \text{ sci} + (2.5 \text{ sci} + 1.1) = 5.8 \text{ sci}$

$$\Delta \mathbf{P}_{\text{filter}} = 3 \text{ psi} + (2.5 \text{ psi} * 1.1) = 5.8 \text{ psi}$$

OR

 $\Delta \mathbf{P}_{filter} = .21 \text{ bar} + (.17 \text{ bar} * 1.1) = .40 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate } x \Delta \mathbf{P}_{f} \text{ Plug}$ this variable into the overall pressure drop equation.

NOTES:

Box 2. Number of elements must equal 1 when using KK or 27K elements. Replacement element part numbers are identical to contents of Boxes 2, 3, 4 and 5. Double and triple stacking of K-size elements can be replaced by single KK and 27K elements, respectively. ZW media not available in 27K length. For standard elements, a plastic connector SAP P/N: 7630900 (LF-1997) is used to connect two or three K elements. For high collapse, a steel connector is required SAP P/N: 7608360 (LF-3255C).

Box 5. H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.

- Box 7. For option F, bolt depth .75" (19 mm). For option O, O-rings included; hardware not included.
- Box 8. X and 50 options are not available with KCN50.
- Box 9. Standard indicator setting for nonbypassing model is 50 psi unless otherwise specified.
- Box 10. Option N, are not available with KCN50/ GKC50. N option should be used in conjunction with dirt alarm.

Features and Benefits

 Base-ported high pressure dual filter manifold mounted 200 gpm <mark>760 L/min</mark>

5000 psi 345 bar

KF30

KF50

20-CRZX10

- Meets HF4 automotive standard
- Element changeout from top minimizes oil spillage
- Offered in pipe porting (contact factory for other porting options)
- No-Element indicator option available
- Available with non-bypass option with high collapse element
- Integral inlet and outlet female test points option available
- Double and triple stacking of K-size elements can be replaced by single KK or 27K-size elements
- G Available with quality-protected GeoSeal[®] Elements (GMKF50)

Model No. of filter in photograph are MKF504K10PD5 and MKC504K10PD5.

Pressure Drop Information Based on Flow Rate and Viscosity

4KZ/2KZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

6KZ/2-27KZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 100 gpm (379 L/min) for MKF504KZ10PD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 100 gpm. In this case, $\Delta P_{\text{housing}}$ is 8 psi (.55 bar) on the graph for the MKF50 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 100 gpm. In this case, $\Delta P_{element}$ is 8 psi (.14 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V₄) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, ($\Delta P_{element} * V_f$). The $\Delta P_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 8 \text{ psi } [.55 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi } [.14 \text{ bar}]$

Vf = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △P_{filter} = 8 psi + (2 psi * 1.1) = 10.2 psi

OR

 $\Delta P_{\text{filter}} = .55 \text{ bar} + (.14 \text{ bar} * 1.1) = .70 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

NOTES

- must equal 2 when using KK or 27K elements. Replacement element part numbers are identical to contents of Boxes 2, 3, 4 and 5. Double and triple stacking of K-size elements can be replaced by single KK and 27K elements, respectively. ZW media not available in 27K length. For standard elements, a plastic connector SAP P/N: 7630900 (LF-1997) is used to connect two or three K elements. For high collapse, a steel connector is required SAP P/N: 7608360 (LF-3255C).
- Box 5. H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.
- Box 7. 50 option is not available with MKFN50.
- Box 8. Standard indicator setting for nonbypassing model is 50 psi unless otherwise specified.
- Box 9. N option should be used in conjunction with dirt alarm.

Features and Benefits	100 apm	NF30
Base-ported high pressure filter	280 I /min	NFS30
Patented dirt-tolerant cap design		
 Can be installed in vertical or horizontal position 	6500 psi	YF30
Meets HF4 automotive standard	450 bar	CFX30
 Element changeout from top minimizes oil spillage 		PLD
 Offered in flanged porting 		CF40
No-Element indicator option available		DF40
 Available with non-bypass option with high collapse element 		PF40
Integral inlet and outlet female test points option available		RFS50
Double and triple stacking of K-size element can be replaced by single KK		RF60
or 27K-size element		CF60
G Available with quality-protected GeoSeal [®] Elements (GKC65)		CTF60
		VF60
		LW60

3000 psid (210 bar) for high collapse (ZX) versions Flow Direction: Outside In

Element Nominal Dimensions: K:

K: 3.9" (99 mm) O.D. x 9.0" (230 mm) long

KK: 3.9" (99 mm) O.D. x 18.0" (460 mm) long

27K: 3.9" (99 mm) O.D. x 27.0" (690 mm) long

$\Delta \mathbf{P}_{\mathsf{housing}}$

KC65 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

KZ/KGZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

2KZ/KKZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 50 gpm (189.5 L/min) for KC651KZ10FD9 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 4 psi (.27 bar) on the graph for the KC65 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 50 gpm. In this case, $\Delta P_{element}$ is 2.5 psi (.17 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 4 \text{ psi} [.27 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2.5 \text{ psi} [.17 \text{ bar}]$

 $V_f = 160 \text{ SUS } (34 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.1$

$$\Delta \mathbf{P}_{\text{filter}} = 4 \text{ psi} + (2.5 \text{ psi} * 1.1) = 6.8 \text{ psi}$$

OR

 $\Delta \mathbf{P}_{\text{filter}} = .27 \text{ bar} + (.17 \text{ bar} * 1.1) = .46 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = \text{Flow Rate } x \, \Delta \mathbf{P}_f. \text{Plug}$ this variable into the overall pressure drop equation.

Exercise:

Determine ΔP_{filter} at 100 gpm (379 L/min) for MKC654KZ10PD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 100 gpm. In this case, $\Delta P_{\text{housing}}$ is 8 psi (.55 bar) on the graph for the MKC65 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 100 gpm. In this case, $\Delta P_{element}$ is 8 psi (.14 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V₄) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{element} * V_f$). The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 8 \text{ psi } [.55 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi } [.14 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter} = 8 \text{ psi} + (2 \text{ psi} * 1.1) = 10.2 \text{ psi}$ <u>OR</u>

 $\Delta P_{\text{filter}} = .55 \text{ bar} + (.14 \text{ bar} * 1.1) = .70 \text{ bar}$

MKC65 Base-Ported Pressure Filter

NOTES:

Box 2. Number of elements must equal 2 when using KK or 27K elements. Replacement element part numbers are identical to contents of Boxes 2, 3, 4 and 5. Double and triple stacking of K-size elements can be replaced by single KK and 27K elements, respectively. ZW media not available in 27K length. For standard elements, a plastic connector SAP P/N: 7630900 (LF-1997) is used to connect two or three K elements. For high collapse, a steel connector is required SAP P/N: 7608360 (LF-3255C).

- Box 5. H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers. Skydrol[®] is a registered trademark of Solutia Inc.
- Box 8. Standard indicator setting for nonbypassing model is 50 psi unless otherwise specified.
- Box 9. N option should be used in conjunction with dirt alarm.

$\Delta \mathbf{P}_{\mathsf{housing}}$

HS60/MHS60 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

$$\Delta \mathbf{P}_{\text{filter}} = \Delta \mathbf{P}_{\text{housing}} + (\Delta \mathbf{P}_{\text{element}} * \mathsf{V}_f)$$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 30 gpm (113.7 L/min) for HS6013HZ10S24D13 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 30 gpm. In this case, $\Delta P_{\text{housing}}$ is 7 psi (.48 bar) on the graph for the HS60 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 30 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 2 psi (.14 bar) according to the graph for the 13HZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 7 \text{ psi} [.48 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi} [.14 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △ $P_{\text{filter}} = 7 \text{ psi} + (2 \text{ psi} * 1.1) = 9.2 \text{ psi}$ OR

 $\Delta \mathbf{P}_{filter} = .48 \text{ bar} + (.14 \text{ bar} * 1.1) = .63 \text{ bar}$

Note: If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate } x \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

Hydrostatic Base-Ported Filter KFH50

$\Delta \mathbf{P}_{\mathsf{housing}}$

KFH50 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

KZ

2KZ/KKZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS) Flow Rate [LPM]

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 30 gpm (113.7 L/min) for KFH501KZ10SD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 30 gpm. In this case, $\Delta P_{\text{housing}}$ is 9 psi (.62 bar) on the graph for the KFH50 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 30 gpm. In this case, $\Delta P_{element}$ is 1.5 psi (.10 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * V_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

OR

 $\Delta \mathbf{P}_{\text{housing}} = 9 \text{ psi } [.62 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 1.5 \text{ psi } [.10 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △ P_{filter} = 9 psi + (1.5 psi * 1.1) = 10.7 psi

 $\Delta \mathbf{P}_{filter} = .62 \text{ bar} + (.10 \text{ bar} * 1.1) = .73 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow \text{ Rate } x \Delta \mathbf{P}_f. \text{ Plug}$ this variable into the overall pressure drop equation.

$\Delta \mathbf{P}_{\mathsf{housing}}$

NOF30-05 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

1NNZX Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 5 gpm (19 L/min) for NOF301NNZX1005D5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 5 gpm. In this case, $\Delta P_{\text{housing}}$ is 5 psi (.34 bar) on the graph for the NOF30 housing.

Use the element pressure curve to determine $\Delta P_{\text{element}}$ at 5 gpm. In this case, $\Delta P_{\text{element}}$ is 3 psi (.21 bar) according to the graph for the NNZX10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * V_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 5 \text{ psi} [.34 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi} [.21 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △ P_{filter} = 5 psi + (3 psi * 1.1) = 8.3 psi

OR

 $\Delta \mathbf{P}_{\mathsf{filter}}$ = .34 bar + (.21 bar * 1.1) = .57 bar

High-Pressure Servo Sandwich Filter

NOF50

$\Delta \mathbf{P}_{\mathsf{housing}}$

NOF50 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

60 psi indicator should not be used beyond 7gpm 90 psi Indicator should not be used beyond 10 gpm

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 5 gpm (19 L/min) for NOF501SVZX10760D5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 5 gpm. In this case, $\Delta P_{\text{housing}}$ is 15 psi (1 bar) on the graph for the NOF30 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 5 gpm. In this case, $\Delta P_{element}$ is 3 psi (.21 bar) according to the graph for the SVZX10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * V_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 15 \text{ psi} [1 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi} [.21 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P**_{filter} = 15 psi + (3 psi * 1.1) = 18.3 psi <u>OR</u> △**P**_{filter} = 1 bar + (.21 bar * 1.1) = 1.2 bar

High-Pressure Sandwich Filter FOF60-30

5.00

3.00

$\Delta \mathbf{P}_{\mathsf{housing}}$

FOF60-03 $\Delta P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{element}$

Pressure Drop [PSID]

FXZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS) Flow Rate [LPM] 0 10 20 30 40 50 70.00 60.00 50.00

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 5 gpm (19 L/min) for FOF601FZX1003BD5 using 160 SUS (34 cSt) fluid.

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathsf{V}_f)$

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 5 gpm. In this case, $\Delta P_{\text{housing}}$ is 60 psi (4.1 bar) on the graph for the FOF60 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 5 gpm. In this case, $\Delta P_{element}$ is 22 psi (1.5 bar) according to the graph for the FZX10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * V_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

Exercise:

 $\Delta \mathbf{P}_{\text{housing}} = 60 \text{ psi} [4.1 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 22 \text{ psi} [1.5 \text{ bar}]$

 $V_f = 160 \text{ SUS} (34 \text{ cSt}) / 150 \text{ SUS} (32 \text{ cSt}) = 1.1$

△**P**_{filter} = 60 psi + (22 psi * 1.1) = 64.2 psi OR

 $\Delta \mathbf{P}_{filter} = 4.1 \text{ bar} + (1.5 \text{ bar} * 1.1) = 5.8 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

F

Features and Benefits

- Variety of differential indicator port options (visual and electrical indicators)
- Leak proof bar indicator, rugged visual indicator with protective aluminum shield is standard
- Proprietary bowl to element seal minimizes potential leakage point by use of one seal on element
- Cartridge style element (non spin-on) that is proprietary and patented with integrated bypass valve features
- Wide variety of media grades that can be application specific
- Light weight bowl design with replaceable element minimizes landfill waste
- Mounting interchangeability with competitor's filter head
- The inherent capability to pre-print the perforated outer element wrap provides a branding solution that helps to capture after-market replacement element sales
- Same day shipment model available (GH6 & GH9)

Initiative Part of Schroeder Industries Energy Savings Initiative

Element Performance **Information & Dirt Holding Capacity**

Pressure Drop Information (GH6 & GH9) Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 15 gpm (57 L/min) for GH6GZ10S12L using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 1.5 psi (0.10 bar) on the graph for the GH housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 15 gpm. In this case, $\Delta P_{element}$ is 4 psi (0.27 bar) according to the graph for the 6GZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, ($\Delta \dot{\mathbf{P}}_{element} * \boldsymbol{v}_{f}$). The $\Delta \dot{\mathbf{P}}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 1.5 \text{ psi} [0.10 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 4 \text{ psi} [0.27 \text{ bar}]$

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter} = 1.5 \text{ psi} + (4 \text{ psi} * 1.1) = 5.9 \text{ psi}$ <u>OR</u>

 $\Delta \mathbf{P}_{\text{filter}} = 0.10 \text{ bar} + (0.27 \text{ bar} * 1.1) = 0.40 \text{ bar}$

Note:

If your element is not graphed, you can obtain your $\Delta \mathbf{\tilde{P}}_{element}$ by multiplying the flow rate by the following: $\Delta \mathbf{P}_{element}$ Factors x **VP** (Visc. Factor) ΔP_{element} Factors @ 150 SUS (32 cSt)

Ele.	$\Delta \mathbf{P}$	Ele.	$\Delta \mathbf{P}$
6G3	0.60	9G3	0.35

$\Delta \mathbf{P}_{\mathsf{housing}}$

GH $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Drop Information (GH11 & GH14) Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 60 gpm (227.4 L/min) for GH11GZ10S24VA using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 60 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (0.21 bar) on the graph for the GH housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 60 gpm. In this case, $\Delta P_{element}$ is 5 psi (0.34 bar) according to the graph for the 11GZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [0.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 5 \text{ psi } [0.34 \text{ bar}]$

V $_{f}$ = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P** $_{filter}$ = 3 psi + (5 psi * 1.1) = 8.5 psi OR

 $\Delta \mathbf{P}_{\text{filter}} = 0.21 \text{ bar} + (0.34 \text{ bar} * 1.1) = 0.58 \text{ bar}$

Note:

If your element is not graphed, you can obtain your ΔP_{element} by multiplying the flow rate by the following: ΔP_{element} Factors x VP (Visc Factor) ΔP_{element} Factors @ 150 SUS (32 cSt)

RLT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

R

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 40 gpm (151.6 L/min) for RLT9VZ10S20D5 using 175 SUS (37.2 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 40 gpm. In this case, $\Delta P_{\text{housing}}$ is 4.5 psi (.31 bar) on the graph for the RLT housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 40 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 6 psi (.415 bar) according to the graph for the 9VZ10 element.

Because the viscosity in this sample is 175 SUS (37.2 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{v}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 4.5 \text{ psi} [.31 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 4 \text{ psi} [.27 \text{ bar}]$

 $𝒱_f = 175 \text{ SUS } (37.2 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.2$ △ $𝑌_{\text{filter}} = 4.5 \text{ psi} + (4 \text{ psi} * 1.2) = 9.3 \text{ psi}$ OR

△P_{filter} = .31 bar + (.27 bar * 1.2) = .63 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate } \mathbf{x} \ \Delta \mathbf{P}_{f} \ \text{Plug}$ this variable into the overall pressure drop equation. $\mathbf{Ele.} \ \Delta \mathbf{P} \ \mathbf{Ele.} \ \Delta \mathbf{P}$

$\Delta \mathbf{P}_{\mathsf{housing}}$

KF5 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

KF

$\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 50 gpm (189.5 L/min) for KF51KZ10S24D5 using 200 SUS (42.6 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the KF5 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 50 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 2 psi (.14 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 200 SUS (42.6 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi } [.14 \text{ bar}]$

 $𝒱_f = 200 \text{ SUS } (42.6 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.3$ △ $𝒫_{filter} = 3 \text{ psi} + (2 \text{ psi} * 1.3) = 5.6 \text{ psi}$ OR

 $\Delta P_{\text{filter}} = .21 \text{ bar} + (.14 \text{ bar} * 1.3) = .40 \text{ bar}$

Note: If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

Element Performance **Information & Dirt Holding Capacity**

K9 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 50 gpm (189.5 L/min) for K91KZ10BP16NP16ND5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 8 psi (.55 bar) on the graph for the K9 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 50 gpm. In this case, $\Delta P_{element}$ is 2 psi (.14 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 8 \text{ psi} [.55 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi} [.14 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{\text{filter}}$ = 8 psi + (2 psi * 1.1) = 10.2 psi

OR

 $\Delta P_{\text{filter}} = .55 \text{ bar} + (.14 \text{ bar} * 1.1) = .70 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate } x \Delta \mathbf{P}_{f} \text{ Plug}$ this variable into the overall pressure drop equation.

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine ΔP_{filter} at 50 gpm (189.5 L/min) for 2K9109DBBP16P16D5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 50 gpm. In this case, $\Delta P_{\text{housing}}$ is 16 psi (1.1 bar) on the graph for the 2K9 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 50 gpm for the first element. In this case, $\Delta \mathbf{P}_{element}$ is 2 psi (.14 bar) according to the graph for the KZ10 element.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element^2}$ at 50 gpm for the first element. In this case, $\Delta \mathbf{P}_{element}$ is 5 psi (.34 bar) according to the graph for the KZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 16 \text{ psi} [1.1 \text{ bar}] | \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi} [.14 \text{ bar}] | \Delta \mathbf{P}_{\text{element}} = 5 \text{ psi} [.34 \text{ bar}]$

V_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1

△P_{filter} = 16 psi + (2 psi * 1.1) + (5 psi * 1.1) = 23.7 psi OR

 $\Delta \mathbf{P}_{\text{filter}} = 1.1 \text{ bar} + (.14 \text{ bar} * 1.1) + (.34 * 1.1) = 1.6 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow \text{ Rate } x \Delta \mathbf{P}_{f}. \text{ Plug}$ this variable into the overall pressure drop equation.

NOTES:

- Box 2. Double and triple stacking of K-size elements can be replaced by KK and 27K elements, respectively. Number of elements must equal 1 when using KK or 27K elements. ZW media not available in 27K length.
- Box 4 Replacement element part & 5. numbers are identical to K9 replacement parts. Please reference page 184.
- Box 6. For options H, V, and H.5, all aluminum parts are anodized.
 H.5 seal designation includes the following: EPR seals, stainless steel wire mesh on elements, and light oil coating on housing exterior. Viton[®] is a registered trademark of DuPont Dow Elastomers.Skydrol[®] is a registered trademark of Solutia Inc.
- Box 10. Option UU not available in combination with indicator in block.

In-Line Filter **QF**

$\triangle \mathbf{P}_{\mathsf{housing}}$

QF5 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{element}$

16QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

39QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 100 gpm (379 L/min) for QF539QZ3P32UDPG using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 100 gpm. In this case, $\Delta P_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the QF5 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 100 gpm. In this case, $\Delta P_{element}$ is 1 psi (.07 bar) according to the graph for the 39QZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V_f) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta P_{element} * V_f)$. The $\Delta P_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 2 \text{ psi } [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 1 \text{ psi } [.07 \text{ bar}]$

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter} = 2 \text{ psi} + (1 \text{ psi} * 1.1) = 3.1 \text{ psi}$ OR

 $\Delta \mathbf{P}_{filter} = .14 \text{ bar} + (.07 \text{ bar} * 1.1) = .22 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_f$ Plug this variable into the overall pressure drop equation.

Cold Start Protection Inside-Out Flow Filter

$\triangle \mathbf{P}_{\text{housing}}$

QF5i $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 120 gpm (455 L/min) for QF5i16QCLIZ3P32 using 200 SUS (44 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 120 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the QF5i housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 120 gpm. In this case, $\Delta P_{element}$ is 6 psi (.415 bar) according to the graph for the 16QCLIZ3 element.

Because the viscosity in this sample is 200 SUS (44 cSt), we determine the **Viscosity Factor** (V_f) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta \mathbf{P}_{element} * \mathbf{V}_{f})$. The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi} [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 6 \text{ psi} [.415 \text{ bar}]$

 \mathbf{v}_{f} = 200 SUS (42.4 cSt) / 150 SUS (32 cSt) = 1.333

△P_{filter} = 3 psi + (6 psi * 1.333) = 11 psi OR

△P_{filter} = .21 bar + (.415 bar * 1.333) = .76 bar

Element Performance Information & Dirt Holding Capacity

In-Line Filter 3Q

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 100 gpm (379 L/min) for 3QF539QEDBVP32P3250DPG using 160 SUS (34 cSt) fluid.

100

50

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 100 gpm. In this case, $\Delta P_{\text{housing}}$ is 5.5 psi (.39 bar) on the graph for the 3QF5 housing.

150

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

200

Flow Rate [GPM]

250

300

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 100 gpm for the first element. In this case, $\Delta \mathbf{P}_{element}$ is 1 psi (.07 bar) according to the graph for the 39QZ25 element.

Use the element pressure curve to determine $\Delta P_{element^2}$ at 100 gpm for the first element. In this case, $\Delta P_{element}$ is 1 psi (.07 bar) according to the graph for the 39QZ10 element.

Use the element pressure curve to determine $\Delta P_{element^3}$ at 100 gpm for the first element. In this case, $\Delta P_{element}$ is 1 psi (.07 bar) according to the graph for the 39QZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

OR

 $\Delta \mathbf{P}_{\mathsf{housing}} = 5.5 \text{ psi} \left[.39 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{element}^3} = 1 \text{ psi} \left[.07 \text{ bar}\right] \mid \Delta \mathbf{P}_{\mathsf{elemen$

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1

1.00 0.00

0

 $\Delta \mathbf{P}_{filter} = 5.5 \text{ psi} + (1 \text{ psi} * 1.1) + (1 \text{ psi} * 1.1) + (1 \text{ psi} * 1.1) = 8.8 \text{ psi}$

 $\Delta \mathbf{P}_{filter}$ = .39 bar + (.07 bar * 1.1) + (.07 * 1.1) + (.07 * 1.1) = .62 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = \text{Flow Rate } x \, \Delta \mathbf{P}_{f}. \text{ Plug}$ this variable into the overall pressure drop equation.

In-Line Filter **QFD**

$\Delta \mathbf{P}_{\mathsf{housing}}$

QFD5 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

16QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

39QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 200 gpm (758 L/min) for QFD516QZ3F48D5C using 100 SUS (21.3 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 200 gpm. In this case, $\Delta P_{\text{housing}}$ is 5 psi (.34 bar) on the graph for the QFD5 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 200 gpm. In this case, $\Delta P_{element}$ is 7 psi (.48 bar) according to the graph for the 16QCZ3 element.

Because the viscosity in this sample is 100 SUS (21.3 cSt), we determine the Viscosity Factor (V) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta \mathbf{P}_{element} * \mathbf{V}_{f})$. The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 5 \text{ psi } [.34 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi } [.48 \text{ bar}]$

 \mathbf{v}_{f} = 100 SUS (21.3 cSt) / 150 SUS (32 cSt) = .67 △P_{filter} = 5 psi + (7 psi * .67) = 9.7 psi OR

△P_{filter} = .34 bar + (.48 bar * .67) = .66 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

In-Line Filter **QF1**5

$\Delta \mathbf{P}_{\mathsf{housing}}$

QF15 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

16QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

39QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 200 gpm (758 L/min) for QF1516QZ3D5C using 100 SUS (21.3 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 200 gpm. In this case, $\Delta P_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the QF15 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 200 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 7 psi (.48 bar) according to the graph for the 16QZ3 element.

Because the viscosity in this sample is 100 SUS (21.3 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi} [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi} [.48 \text{ bar}]$

V $_{f} = 100 \text{ SUS } (21.3 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = .67$ △**P**_{filter} = 2 psi + (7 psi * .67) = 6.7 psi <u>OR</u>

 $\Delta \mathbf{P}_{filter}$ = .14 bar + (.48 bar * .67) = .46 bar

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = \text{Flow Rate } x \, \Delta \mathbf{P}_{f}. \text{Plug}$ this variable into the overall pressure drop equation.

Base-Ported Filter **QLF15**

$\Delta \mathbf{P}_{\mathsf{housing}}$

QLF15 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{\mathsf{element}}$

16QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

39QCLQFZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS) Flow Rate [LPM]

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 200 gpm (758 L/min) for QLF1516QZ3D5C using 100 SUS (21.3 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 200 gpm. In this case, $\Delta P_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the QLF15 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 200 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 7 psi (.48 bar) according to the graph for the 16QZ3 element.

Because the viscosity in this sample is 100 SUS (21.3 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 2 \text{ psi} [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi} [.48 \text{ bar}]$

V_f = 100 SUS (21.3 cSt) / 150 SUS (32 cSt) = .67 △**P**_{filter} = 2 psi + (7 psi * .67) = 6.7 psi <u>OR</u> △**P**_{filter} = 14 bar + (.48 bar * .67) = .46 bar Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta P_{element} = Flow Rate \ x \ \Delta P_f. Plug this variable into the overall pressure drop equation.$

Stainless Steel Base-Ported Filter SSQLF15

$\Delta \mathbf{P}_{\mathsf{housing}}$

SSQLF15 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{\mathsf{element}}$

39QPMLZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 200 gpm (758 L/min) for SSQLF1516QZ3P48D9C using 100 SUS (21.3 cSt) fluid.

Use the housing pressure curve to determine $\Delta \mathbf{P}_{\text{housing}}$ at 200 gpm. In this case, $\Delta \mathbf{P}_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the SSQLF housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 200 gpm. In this case, $\Delta P_{element}$ is 7 psi (.48 bar) according to the graph for the 16QZ3 element.

Because the viscosity in this sample is 100 SUS (21.3 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 2 \text{ psi} [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi} [.48 \text{ bar}]$

V $_{f} = 100 \text{ SUS } (21.3 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = .67$ △**P** $_{\text{filter}} = 2 \text{ psi} + (7 \text{ psi} * .67) = 6.7 \text{ psi}$ <u>OR</u>

 $\Delta \mathbf{P}_{\mathsf{filter}}$ = .14 bar + (.48 bar * .67) = .46 bar

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = \text{Flow Rate } x \, \Delta \mathbf{P}_{f}. \text{Plug}$ this variable into the overall pressure drop equation.

Inline Return Filter

$\Delta \mathbf{P}_{\text{housing}}$

IRF $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

1KZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

2KZ/KKZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 70 gpm (265.3 L/min) for IRF2KZ10S20Y2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 70 gpm. In this case, $\Delta P_{\text{housing}}$ is 3.5 psi (.24 bar) on the graph for the IRF housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 70 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 2 psi (.14 bar) according to the graph for the 2KZ10 element.

Because the viscosity in this sample is 160 SUS (24 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3.5 \text{ psi} [.24 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 2 \text{ psi} [.14 \text{ bar}]$

 $V_f = 160 \text{ SUS } (34 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.1$ $\Delta P_{\text{max}} = 3.5 \text{ psi} + (2 \text{ psi} * 1.1) = 5.7 \text{ psi}$

$$\Delta r_{\text{filter}} = 5.5 \text{ psi} + (2 \text{ psi} = 1.1) = 5.7 \text{ psi}$$

OR

 $\Delta \mathbf{P}_{filter} = .24 \text{ bar} + (.14 \text{ bar} * 1.1) = .39 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note: If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

TF1

$\Delta \mathbf{P}_{\mathsf{housing}}$

TF1 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 15 gpm (57 L/min) for TF11AZ3PD5 using 175 SUS (37.2 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the TF1 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 15 gpm. In this case, $\Delta P_{element}$ is 7.5 psi (.52 bar) according to the graph for the AZ3 element.

Because the viscosity in this sample is 175 SUS (37.2 cSt), we determine the **Viscosity Factor (V_f)** by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7.5 \text{ psi } [.52 \text{ bar}]$

 $V_f = 175 \text{ SUS } (37.2 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.2$ △ $P_{\text{filter}} = 3 \text{ psi} + (7.5 \text{ psi} * 1.2) = 12 \text{ psi}$ OR

△P_{filter} = .21 bar + (.52 bar * 1.2) = .83 bar

Pressure Drop Information Based on Flow Rate and Viscosity

Note: If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate \times \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

KF3

$\Delta \mathbf{P}_{\mathsf{housing}}$

KF3 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

KZ

2KZ/KKZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS) Flow Rate [LPM]

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 70 gpm (265.3 L/min) for KF31KZ10SD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 70 gpm. In this case, $\Delta P_{\text{housing}}$ is 4 psi (.27 bar) on the graph for the KF3 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 70 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 3 psi (.21 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 4 \text{ psi } [.227 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi } [.21 \text{ bar}]$

V $_{f}$ = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P** $_{filter}$ = 4 psi + (3 psi * 1.1) = 7.7 psi OR

 $\Delta \mathbf{P}_{filter} = .27 \text{ bar} + (.21 \text{ bar} * 1.1) = .50 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note: If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

KL3

${\boldsymbol{\bigtriangleup}} {\boldsymbol{\mathsf{P}}}_{\text{housing}}$

KL3 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \boldsymbol{\mathcal{V}}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 70 gpm (265.3 L/min) for KL31KZ10P24D5L using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 70 gpm. In this case, $\Delta P_{\text{housing}}$ is 7 psi (.48 bar) on the graph for the KL3 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 70 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 3 psi (.21 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 7 \text{ psi } [.48 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi } [.21 \text{ bar}]$

V $_{f}$ = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P** $_{filter}$ = 7 psi + (3 psi * 1.1) = 10.7 psi OR

 $\Delta \mathbf{P}_{\text{filter}} = .48 \text{ bar} + (.21 \text{ bar} * 1.1) = .71 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f} \text{ Plug}$ this variable into the overall pressure drop equation.

LF1

$\Delta \mathbf{P}_{\mathsf{housing}}$

LF1-2" $\Delta P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

$\Delta \mathbf{P}_{element}$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 70 gpm (265.3 L/min) for LF118LCZ3P32D5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 70 gpm. In this case, $\Delta P_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the LF1 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 70 gpm. In this case, $\Delta P_{element}$ is 3.5 psi (.24 bar) according to the graph for the 18LCZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f}$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 2 \text{ psi } [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3.5 \text{ psi } [.24 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter}$ = 2 psi + (3.5 psi * 1.1) = 5.9 psi

OR

 $\Delta \mathbf{P}_{filter}$ = .14 bar + (.24 bar * 1.1) = .40 bar

Top-Ported Return Line Filter MLF

$\Delta \mathbf{P}_{\mathsf{housing}}$

MLF1 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{\mathsf{element}}$

4KZ/2KKZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

6KZ/2-27KZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 150 gpm (568.5 L/min) for MLF14K10PD using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta \mathbf{P}_{\text{housing}}$ at 150 gpm. In this case, $\Delta \mathbf{P}_{\text{housing}}$ is 15 psi (1 bar) on the graph for the MLF1 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 150 gpm. In this case, $\Delta P_{element}$ is 3 psi (.21 bar) according to the graph for the KKZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 15 \text{ psi} [1 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi} [.21 \text{ bar}]$

 $V_f = 160 \text{ SUS } (34 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.1$ △ $P_{\text{filter}} = 15 \text{ psi} + (3 \text{ psi} * 1.1) = 18.3 \text{ psi}$ <u>OR</u> △ $P_{\text{filter}} = 1 \text{ bar} + (.21 \text{ bar} * 1.1) = 1.2 \text{ bar}$ Pressure Drop Information Based on Flow Rate and Viscosity

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f}$. Plug this variable into the overall pressure drop equation.

$\Delta \mathbf{P}_{\mathsf{housing}}$

RLD $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

RI

$\Delta \mathbf{P}_{element}$

25DNZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

40DNZ Element Pressure Drop versus Flow Rate at 32 cSt (150 SUS)

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 70 gpm (265.3 L/min) for RLD25DNZ5VF2440VM using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 70 gpm. In this case, $\Delta P_{\text{housing}}$ is 14 psi (.96 bar) on the graph for the RLD housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 70 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 8 psi (.55 bar) according to the graph for the 25DNZ5V element.

Because the viscosity in this sample is 160 SUS (44 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f}$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 14 \text{ psi} [.96 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 8 \text{ psi} [.55 \text{ bar}]$

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter}$ = 14 psi + (8 psi * 1.1) = 22.8 psi

OR

 $\Delta \mathbf{P}_{filter}$ = .96 bar + (.55 bar * 1.1) = 1.6 bar

$\Delta \mathbf{P}_{\mathsf{housing}}$

GRTB $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

$\Delta \mathbf{P}_{\text{filter}} = \Delta \mathbf{P}_{\text{housing}} + (\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 80 gpm (303.2 L/min) for GRTB1KBGZ10PY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 80 gpm. In this case, $\Delta P_{\text{housing}}$ is 8 psi (.55 bar) on the graph for the GRTB housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 80 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 4 psi (.27 bar) according to the graph for the KBGZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{v}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 8 \text{ psi} [.55 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 4 \text{ psi} [.27 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{\text{filter}}$ = 8 psi + (4 psi * 1.1) = 12.4 psi

OR

 $\Delta \mathbf{P}_{\text{filter}}$ = .55 bar + (.27 bar * 1.1) = .85 bar

MiniMiser[™] Tank-Mounted Filter

$\triangle \mathbf{P}_{\mathsf{housing}}$

3TAZ

MTA $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

ΜΤ

$\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 10 gpm (37.9 L/min) for MTA3TAZ25P8Y5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 10 gpm. In this case, $\Delta P_{\text{housing}}$ is 4 psi (.27 bar) on the graph for the MTA housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 10 gpm. In this case, $\Delta P_{element}$ is 7 psi (.48 bar) according to the graph for the 3TAZ25 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V_f) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta \mathbf{P}_{element} * \mathbf{V}_{f})$. The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 4 \text{ psi } [.27 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi } [.48 \text{ bar}]$

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P**_{filter} = 4 psi + (7 psi * 1.1) = 11.7 psi

OR $\Delta \mathbf{P}_{filter} = .27 \text{ bar} + (.48 \text{ bar} * 1.1) = .80 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow Rate x \Delta \mathbf{P}_f Plug$ this variable into the overall pressure drop equation.

MTB

Element Nominal Dimensions:

MiniMiser[™] Tank-Mounted Filter

$\Delta \mathbf{P}_{\mathsf{housing}}$

MTB $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 10 gpm (37.9 L/min) for MTB3TBZ25P12Y5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 10 gpm. In this case, $\Delta P_{\text{housing}}$ is 1 psi (.07 bar) on the graph for the MTB housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 10 gpm. In this case, $\Delta P_{element}$ is 3 psi (.21 bar) according to the graph for the 3TBZ25 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

OR

 $\Delta \mathbf{P}_{\text{housing}} = 1 \text{ psi } [.07 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3 \text{ psi } [.21 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{\text{filter}}$ = 1 psi + (3 psi * 1.1) = 4.3 psi

 $\Delta P_{\text{filter}} = .07 \text{ bar} + (.21 \text{ bar} * 1.1) = .30 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

$\Delta \mathbf{P}_{\text{housing}}$

ZT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

$\Delta \mathbf{P}_{\text{filter}} = \Delta \mathbf{P}_{\text{housing}} + (\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine ΔP_{filter} at 30 gpm (119.7 L/min) for ZT8ZZ10SY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 30 gpm. In this case, $\Delta P_{\text{housing}}$ is 3.5 psi (.24 bar) on the graph for the ZT housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 30 gpm. In this case, $\Delta P_{element}$ is 3.5 psi (.24 bar) according to the graph for the 8ZZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f}$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3.5 \text{ psi} [.24 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 3.5 \text{ psi} [.24 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter}$ = 3.5 psi + (3.5 psi * 1.1) = 7.4 psi

OR

 $\Delta \mathbf{P}_{filter}$ = .24 bar + (.24 bar * 1.1) = .50 bar

Note: If your element is not graphed, use the following equation: $\Delta P_{element} = Flow Rate x \Delta P_{f}$ Plug this variable into the overall pressure drop equation.

Element Collapse Rating: 150 psid (10 bar) for standard elements Flow Direction: Outside In

Element Nominal Dimensions:

K: 3.9" (99 mm) O.D. x 9.0" (230 mm) long KK: 3.9" (99 mm) O.D. x 18.0" (460 mm) long

$\Delta \mathbf{P}_{\mathsf{housing}}$

KFT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{v}_{f})$

Exercise:

Determine ΔP_{filter} at 80 gpm (303.2 L/min) for KFT1KZ10S24S24NY2G820 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 80 gpm. In this case, $\Delta P_{\text{housing}}$ is 3.5 psi (.24 bar) on the graph for the KFT housing.

Use the element pressure curve to determine $\Delta P_{\text{element}}$ at 80 gpm. In this case, $\Delta P_{\text{element}}$ is 4 psi (.27 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 200 SUS (24 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3.5 \text{ psi} [.24 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 4 \text{ psi} [.27 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter}$ = 3.5 psi + (4 psi * 1.1) = 7.9 psi

OR

△P_{filter} = .24 bar + (.27 bar * 1.1) = .54 bar

Pressure Drop Information Based on Flow Rate and Viscosity

KF

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow \text{ Rate } x \Delta \mathbf{P}_f. \text{ Plug this variable into the overall pressure drop equation.}$

RT

$\triangle \mathbf{P}_{\mathsf{housing}}$

RT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine ΔP_{filter} at 80 gpm (303.2 L/min) for RT1KZ10S24S24NY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 80 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the RT housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 80 gpm. In this case, $\Delta P_{element}$ is 4 psi (.27 bar) according to the graph for the KZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 4 \text{ psi } [.27 \text{ bar}]$

V $_{f}$ = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P** $_{filter}$ = 3 psi + (4 psi * 1.1) = 7.4 psi OR

 $\Delta \mathbf{P}_{filter} = .21 \text{ bar} + (.27 \text{ bar} * 1.1) = .51 \text{ bar}$

RT

RT

$\Delta \mathbf{P}_{\mathsf{housing}}$

RTI $\triangle \mathbf{P}_{housing}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 80 gpm (303.2 L/min) for RTIKIZ10S20S20NY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 80 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the RTI housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 80 gpm. In this case, $\Delta P_{element}$ is 6.5 psi (.45 bar) according to the graph for the KIZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f}$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 6.5 \text{ psi } [.45 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter}$ = 3 psi + (6.5 psi * 1.1) = 10.2 psi

<u>OR</u>

 $\Delta \mathbf{P}_{filter}$ = .21 bar + (.45 bar * 1.1) = .71 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

$\Delta \mathbf{P}_{\mathsf{housing}}$

LRT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

$\Delta \mathbf{P}_{\text{filter}} = \Delta \mathbf{P}_{\text{housing}} + (\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 120 gpm (379 L/min) for LRT18LZ10S24S24NY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 120 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the LRT housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 120 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 4 psi (.27 bar) according to the graph for the 18LZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 8 \text{ psi } [.55 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 4 \text{ psi } [.27 \text{ bar}]$

V $_{f}$ = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P** $_{filter}$ = 3 psi + (4 psi * 1.1) = 7.4 psi OR

 $\Delta \mathbf{P}_{filter} = .21 \text{ bar} + (.27 \text{ bar} * 1.1) = .51 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate } x \Delta \mathbf{P}_{f} \text{ Plug}$ this variable into the overall pressure drop equation.

ART

$\Delta \mathbf{P}_{\mathsf{housing}}$

ART $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

$\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 120 gpm (379 L/min) for ART85Z10F43Y2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 120 gpm. In this case, $\Delta P_{\text{housing}}$ is 1 psi (.07 bar) on the graph for the ART housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 120 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 10 psi (.69 bar) according to the graph for the 85Z10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f}$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 1 \text{ psi } [.07 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 10 \text{ psi } [.69 \text{ bar}]$

 $𝒱_{f} = 160 \text{ SUS } (34 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.1$ △ $𝒫_{filter} = 1 \text{ psi} + (10 \text{ psi} * 1.1) = 12 \text{ psi}$

<u>OR</u>

 $\Delta \mathbf{P}_{filter} = .07 \text{ bar} + (.69 \text{ bar} * 1.1) = .83 \text{ bar}$

$\triangle \mathbf{P}_{\mathsf{housing}}$

BFT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 200 gpm (758 L/min) for BFT1BBZ10PY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 200 gpm. In this case, $\Delta P_{\text{housing}}$ is 1.5 psi (.10 bar) on the graph for the BFT housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 200 gpm. In this case, $\Delta P_{element}$ is 6 psi (.41 bar) according to the graph for the BBZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 1.5 \text{ psi} [.10 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 6 \text{ psi} [.41 \text{ bar}]$

 $\mathbf{v}_f = 160 \text{ SUS } (34 \text{ cst}) / 150 \text{ SUS } (32 \text{ cst}) = 1.1$

$$\Delta \mathbf{P}_{\text{filter}} = 1.5 \text{ psi} + (6 \text{ psi} * 1.1) = 8.1 \text{ psi}$$

OR

 $\Delta \mathbf{P}_{filter} = .10 \text{ bar} + (.41 \text{ bar} * 1.1) = .55 \text{ bar}$

Pressure Drop Information Based on Flow Rate and Viscosity

BF

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate x } \Delta \mathbf{P}_{f}$ Plug this variable into the overall pressure drop equation.

QT

$\Delta \mathbf{P}_{\text{housing}}$

QT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Flow (L/min)

Pressure Drop Information Based on Flow Rate and Viscosity

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 200 gpm (758 L/min) for QT16QZ3P48D5C using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 200 gpm. In this case, $\Delta P_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the QT housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 200 gpm. In this case, $\Delta P_{element}$ is 8 psi (.55 bar) according to the graph for the 16QZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_{f}$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 2 \text{ psi } [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 8 \text{ psi } [.55 \text{ bar}]$

 \mathbf{v}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{\text{filter}}$ = 2 psi + (8 psi * 1.1) = 10.8 psi

OR

△P_{filter} = .14 bar + (.55 bar * 1.1) = .75 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = \text{Flow Rate } x \, \Delta \mathbf{P}_{f}. \text{Plug}$ this variable into the overall pressure drop equation.

*KTK Dirty Box Pressure Drop is Customer Tank Design Dependant. Please account for this when designing system. Pressure Drop Information Based on Flow Rate and Viscosity

 $\triangle \mathbf{P}_{\mathsf{filter}} = \triangle \mathbf{P}_{\mathsf{housing}} + (\triangle \mathbf{P}_{\mathsf{element}} * \mathbf{V}_{f})$

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 80 gpm (303.2 L/min) for KTKKZ3 using 160 SUS (34 cSt) fluid.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 80 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 8 psi (.55 bar) according to the graph for the KZ3 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_{*f*}) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\mathsf{element}} = 8 \text{ psi } [.55 \text{ bar}]$

 $V_f = 160 \text{ SUS } (34 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.1$ △ $P_{\text{filter}} = (8 \text{ psi} * 1.1) = 8.8 \text{ psi}$ <u>OR</u> △ $P_{\text{filter}} = (.55 \text{ bar } * 1.1) = .61 \text{ bar}$

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = \text{Flow Rate } x \, \Delta \mathbf{P}_{f}. \text{ Plug this variable into the overall pressure drop equation.}$

Medium Pressure In-Tank Filter

$\Delta \mathbf{P}_{\mathsf{housing}}$

MRT $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

M

Exercise:

Determine ΔP_{filter} at 80 gpm (303.2 L/min) for MRT18LZ10S24S24 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 80 gpm. In this case, $\Delta P_{\text{housing}}$ is 1.5 psi (.10 bar) on the graph for the MRT housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 80 gpm. In this case, $\Delta P_{element}$ is 2.5 psi (.17 bar) according to the graph for the 18LZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{v}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 1.5 \text{ psi} [.10 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 6 \text{ psi} [.17 \text{ bar}]$

 $v_f = 160 \text{ SUS } (34 \text{ cst}) / 150 \text{ SUS } (32 \text{ cst}) = 1.1$

△P_{filter} = 1.5 psi + (2.5 psi * 1.1) = 4.3 psi OR

 $\Delta \mathbf{P}_{filter} = .10 \text{ bar} + (.17 \text{ bar} * 1.1) = .29 \text{ bar}$

Medium Pressure In-Tank Filter

NOTES:

part numbers are a combination of Boxes 2, 3, and 4 Example: 18L3

Accessories for Tank-Mounted Filters

The mounting ring is welded directly to the hydraulic reservoir. The filter is then mounted to the mounting ring with bolts converting the filter to a "weld in" design. The mounting ring eliminates the need to drill and tap the hydraulic reservoir.

Model Number	Part Number	A	В	с
ST, RT, RTI, LRT	A-LFT-813	7.00 (178)	5.00 (127)	1.00 (25)
ST, RT, RTI, LRT High Version	A-LFT-1448	7.00 (178)	5.00 (127)	1.50 (38)
ZT	A-LFT-1295	6.25 (159)	3.62 (92)	.88 (22)

The diffuser option (designated as D for outlet porting option in model number) is threaded to the bushing on the filter bowl below the outlet opening to help decrease turbulent flow in the hydraulic reservoir.

No other outlet port options are available if the diffuser is used.

Model Number	Part Number	NPTF
rt, kft	A-LFT-1506	1½"
LRT	A-LFT-1507	2 "

The check valve option (designated as C for outlet porting option in model number) makes it possible to service the filter without draining the oil from the reservoir when the filter is mounted below the oil level. It also prevents reservoir siphoning when system components are serviced.

The check valve can also be used on other reservoir return flow lines, where components upstream of the check valve can be serviced without the loss of reservoir oil. The spring setting is .75-1.00 psi cracking. Order by part number shown in chart.

No other outlet port options are available if the check valve is used.

Model Number	Part Number	NPTF	А
ST, KFT, RT	A-LFT-158Q-1	11/2"	2.34 (59)
LRT	A-LFT-880	2"	2.34 (59)
BFT	A-BFT-103	3"	4.50 (114)

The diffuser/check valve option (designated as CD for outlet porting option in model number) is threaded on to the outlet port and combines the advantages of both separate options in one assembly.

Available as a separate item with $1\frac{1}{2}$ " NPT female threads, order part number A-LFT-1208.

No other outlet port options are available if the check valve/ diffuser is used.

$\Delta \mathbf{P}_{\mathsf{housing}}$

PAF1 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\Delta \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine ΔP_{filter} at 10 gpm (37.9 L/min) for PAF16PZ25PY2 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 10 gpm. In this case, $\Delta P_{\text{housing}}$ is 2 psi (.14 bar) on the graph for the PAF1 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{\text{element}}$ at 10 gpm. In this case, $\Delta \mathbf{P}_{\text{element}}$ is 1.5 psi (.10 bar) according to the graph for the PZ25 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (V_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 2 \text{ psi } [.14 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 1.5 \text{ psi } [.10 \text{ bar}]$

 $v_f = 160 \text{ SUS } (34 \text{ cSt}) / 150 \text{ SUS } (32 \text{ cSt}) = 1.1$ $\Delta P_{\text{filter}} = 2 \text{ psi} + (1.5 \text{ psi} * 1.1) = 3.7 \text{ psi}$ <u>OR</u>

 $\Delta \mathbf{P}_{filter}$ = 14 bar + (.10 bar * 1.1) = .25 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{element} = Flow \text{ Rate } x \Delta \mathbf{P}_f. \text{ Plug}$ this variable into the overall pressure drop equation.

Spin-On Filter MAF

$\Delta \mathbf{P}_{\mathsf{housing}}$

MAF1 $\triangle P_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

Pressure Drop Information Based on Flow Rate and Viscosity

Exercise:

Determine $\Delta \mathbf{P}_{filter}$ at 40 gpm (151.6 L/min) for MAF17MZ10PY2 using 160 SUS (34 cSt) fluid.

20

30

Flow Rate [GPM]

 $\triangle \mathbf{P}_{\text{filter}} = \triangle \mathbf{P}_{\text{housing}} + (\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

40

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 40 gpm. In this case, $\Delta P_{\text{housing}}$ is 3 psi (.21 bar) on the graph for the MAF1 housing.

Use the element pressure curve to determine $\Delta P_{element}$ at 40 gpm. In this case, $\Delta P_{element}$ is 7 psi (.48 bar) according to the graph for the 7MZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the Viscosity Factor (V_f) by dividing the Operating Fluid Viscosity with the Standard Viscosity of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, ΔP_{filter} , is calculated by adding $\Delta P_{\text{housing}}$ with the true element pressure differential, $(\Delta \mathbf{P}_{element} * \mathbf{V}_{f})$. The $\Delta \mathbf{P}_{element}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 3 \text{ psi } [.21 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi } [.48 \text{ bar}]$

0

10

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 △**P**_{filter} = 3 psi + (7 psi * 1.1) = 10.7 psi

OR

 $\Delta \mathbf{P}_{filter} = .21 \text{ bar} + (.48 \text{ bar} * 1.1) = .74 \text{ bar}$

Spin-On Filter

MF2

$\Delta \mathbf{P}_{\mathsf{housing}}$

MF2 $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

$\triangle \mathbf{P}_{element}$

Pressure Drop Information Based on Flow Rate and Viscosity

$\Delta \mathbf{P}_{\text{filter}} = \Delta \mathbf{P}_{\text{housing}} + (\Delta \mathbf{P}_{\text{element}} * \mathbf{V}_{f})$

Exercise:

Determine ΔP_{filter} at 40 gpm (151.6 L/min) for MF27MZ10PD5 using 160 SUS (34 cSt) fluid.

Use the housing pressure curve to determine $\Delta P_{\text{housing}}$ at 40 gpm. In this case, $\Delta P_{\text{housing}}$ is 5 psi (.34 bar) on the graph for the MF2 housing.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 40 gpm. In this case, $\Delta \mathbf{P}_{element}$ is 7 psi (.48 bar) according to the graph for the 7MZ10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (**V**_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\triangle \mathbf{P}_{\text{filter}}$, is calculated by adding $\triangle \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\triangle \mathbf{P}_{\text{element}} * \mathbf{V}_f$). The $\triangle \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 5 \text{ psi} [.34 \text{ bar}] \mid \Delta \mathbf{P}_{\text{element}} = 7 \text{ psi} [.48 \text{ bar}]$

 \mathbf{V}_{f} = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.1 $\Delta \mathbf{P}_{filter}$ = 5 psi + (7 psi * 1.1) = 12.7 psi

<u>OR</u> ∆**P**_{filter} = .34 bar + (.48 bar * 1.1) = .87 bar

Note:

If your element is not graphed, use the following equation: $\Delta \mathbf{P}_{\text{element}} = \text{Flow Rate } x \Delta \mathbf{P}_{f} \text{ Plug}$ this variable into the overall pressure drop equation. **Ele.** $\Delta \mathbf{P}$

Fluid Compatibility

ST

$\Delta \mathbf{P}_{\mathsf{housing}}$

ST $\triangle \mathbf{P}_{\text{housing}}$ for fluids with sp gr (specific gravity) = 0.86:

 $\triangle \mathbf{P}_{element}$

 $\Delta \mathbf{P}_{\text{filter}} = \Delta \mathbf{P}_{\text{housing}} + (\Delta \mathbf{P}_{\text{element}} * \mathbf{v}_f)$

Exercise:

Determine $\Delta \mathbf{P}_{\text{filter}}$ at 15 gpm (57 L/min) for ST1KTZ10PY using 160 SUS (34 cSt) fluid.

Use the element pressure curve to determine $\Delta P_{\text{housing}}$ at 15 gpm. In this case, $\Delta P_{\text{housing}}$ is 1.5 psi (.10 bar) according to the graph for the ST element.

Use the element pressure curve to determine $\Delta \mathbf{P}_{element}$ at 15 gpm. In this case, $\Delta \mathbf{P}_{element}$ is .75 psi (.05 bar) according to the graph for the KZT10 element.

Because the viscosity in this sample is 160 SUS (34 cSt), we determine the **Viscosity Factor** (v_f) by dividing the **Operating Fluid Viscosity** with the **Standard Viscosity** of 150 SUS (32 cSt). To best determine your Operating Fluid Viscosity, please reference the chart in Appendix D.

Finally, the overall filter pressure differential, $\Delta \mathbf{P}_{\text{filter}}$, is calculated by adding $\Delta \mathbf{P}_{\text{housing}}$ with the true element pressure differential, ($\Delta \mathbf{P}_{\text{element}} * \boldsymbol{v}_f$). The $\Delta \mathbf{P}_{\text{element}}$ from the graph has to be multiplied by the viscosity factor to get the true pressure differential across the element.

Solution:

 $\Delta \mathbf{P}_{\text{housing}} = 1.5 \text{ psi} [.75 \text{ bar}] | \Delta \mathbf{P}_{\text{element}} = .75 \text{ psi} [.05 \text{ bar}]$

 v_f = 160 SUS (34 cSt) / 150 SUS (32 cSt) = 1.07 △ P_{filter} = 1.5 psi + (.75 psi * 1.07) = 2.3 psi

<u>OR</u> ∆P_{filter} = .10 bar + (0.05 bar * 1.07) = 0.15 bar

Magnet Inserts for Filters

Magnet Inserts for Filters

KF30, KF50, KC50, KC65 and TF50 are available with magnet inserts to trap ferrous material that passes through the filter element.

These inserts are removed with the element each time service is performed and cleaned before being reinserted with new elements.

Replacements are available by ordering parts:

	Single Element	Double Element	Triple Element
KF30, KF50, KC50, KC65, KF3, LF1, MLF1	A-LF-1592	A-LF-1593	A-LF-1594
TF50	A-TF-301-1	A-TF-302-1	

Filter Dirt Alarm[®] Selection Appendix A

Visual indicators provide an economical way to know at a glance when a filter element needs to be replaced. A variety of styles are available, ranging from gauges to mechanical pointers and pop-up cartridges.

Schroeder pointers use a tricolor disk to indicate the element condition. The pointer will reach the red section just before bypassing occurs.

In the case of a mechanical magnetic cartridge, a highly visible orange disk springs, or "pops up", at the pre-defined setting. Once activated, the orange signal continues to indicate a bypass or clogged condition, even following equipment shutdown, until it is manually reset. The pop-up indicator is interchangeable with other cartridge style indicators (electrical and electrical visual) available from Schroeder. A high pressure (>6000 psi working pressure) of the pop-up indicator is available and is noted below.

D—Tricolor Pointer Dirt Alarm[®] P/N 7619323 for plastic pointer only. For internal linkage and name plate, contact factory.

- Y—Vacuum Gauge mounted in porting head P/N 7631068
- YR—Same as Y but mounted on opposite side of standard location P/N 7631068

- D5—Red Pop Up Visual Indicator
- D5S*—D5 with Protective Shroud *To order Protective Shroud only, use SAP #7642053
- D5C—Same as D5 but mounted in cap
- D5R—Same as D5 but mounted on opposite side of standard location
- D9—Stainless Steel version of D5
- D9C—Stainless Steel version of D5 mounted in cap

- Y2—Back mounted 1/8" NPT Tricolor Glycerin-filled Gauge (0-60 psi) P/N 7627463 (0-100 psi) P/N 7631048
- Y2R—Same as Y2 but mounted on opposite side of standard location P/N 7627463
- Y2C—Bottom mounted ½" NPT Tricolor Gauge (0-60 psi) located in cap P/N 7626647
- Y5—Same as Y2 but located in cap P/N 7627463

LF-4209 (G2213): 0 - 30 psid; P/N 7626589

DPG—Standard Differential Pressure Gauge P/N 7628635 or 7626554

The thermal lockout feature prevents activation of the indicator below temperatures of 90°F (32°C). This is a welcome feature in mobile applications where fluid temperatures may be well below 90°F at equipment start-up, and will prevent the indicator from showing a premature need to change the element.

D8—Orange Pop Up Visual Indicator with Thermal Lock-out D8C—Same as D8 but mounted in cap

D8R—Same as D8 but mounted on opposite side of standard location

Visual

Visual with Thermal Lockout

Appendix A Filter Dirt Alarm[®] Selection

Electrical Visual

In addition to providing an electrical signal to provide a desired action, Schroeder electrical visual indicators also provide a visual indication of when an element needs to be changed. In the case of the MS and MS2 switches, the visual indicator is a color-coded disk, whereas the MS13 and MS14 dirt alarms provide a light.

MS—Cam operated electrical switch P/N 7627458 for switch only. For cam, color-coded disk, and mounting bracket, order P/N 7604908. For internal linkage, contact factory.

Code	Type of Contact	Electrical Rating	Connection
MS	SPDT	15 Amps @ 125/250 vac, 0.5 Amp @ 125 VDC	1/2" conduit, female

Electrical

The electrical indicators (MS Series) provide an electrical signal for activating various electric alarm systems or complete machine shutdown. These cartridge-style indicators are available on most Schroeder pressure, return line, and medium pressure filters and can be used for working pressures up to 6000 psi (415 bar) and cyclic conditions up to 4000 psi (276 bar).

- The design is modular; all electrical indicators consist of an MS10 indicator with the corresponding mating connector added to convert the MS10 to a MS5, MS11 etc.
- The standard micro switch for high current indicators is good for both AC and DC use. A separate micro switch with "gold" contacts is used for low current applications. This means that specification of AC or DC is no longer required (except for MS13 and MS14) in the indicator code or part number.
- Housings of all electrical indicators are made of aluminum.
- The indicator model tag includes the electrical wiring diagram.
- All of our indicators, with the exception of MS16, have a "ground" terminal.
- We are now able to offer the thermal lockout option to high current indicators.
- All indicators can be installed in a filter cap as the wiring harness can be disconnected at the "DIN" connector in order to remove the filter cap.
- All MS indicators have achieved the NEMA4X and IP65 ratings.
- Information on these indicators, including drawing, circuit diagram, and photograph is provided on the following pages.

A different set of electrical pressure switches is available for Schroeder tank-mounted filters, along with heavy duty versions.

Schroeder suction filters (ST and models that house the SKB magnetic suction strainer) can be equipped with a vacuum switch.

VS—Vacuum Switch (1/8" NPT, normally open) ES1—Heavy duty electrical pressure switch (1/8" NPT) with conduit connection (25psi bypass) P/N 7626636 (cracking over 25 psi) P/N 7626640 P/N 7601947 VSR—Same as VS but mounted on opposite side of (43 psi bypass) P/N 7626640 standard location P/N 7601947 (Black = common; Red = N.O.; Blue = N.C.) ES—Standard electrical pressure switch (1/8" NPT, ES1R—Same as ES1 but mounted on opposite side normally open) for tank-mounted filters of standard location P/N 7626636 P/N 7601943 (40 psi bypass) VS1—Heavy Duty Vacuum Switch (1/8" NPT) ESC—Electrical pressure switch (MTA & MTB only) P/N 7623755, LF Pressure Switch P/N 7601943 ES2— Super duty electric switch (1/8"NPT, normally ESR—Same as ES but mounted on opposite side of closed) with thermal lockout P/N 7626564 standard location P/N 7601943 ES3—Electric pressure switch (1/8"NPT) with DIN connector P/N 7626592 (Black = common; Red = N.O.; Blue = N.C.) Type of Contact Code **Electrical Rating** Connection 8 Amps @ 12 VDC, 1 Amp @ 120 VAC Screw Terminal with ES SPST 4 Amps @ 24 VDC, 0.5 Amp @ 240 VAC Rubber Boot 10 Amps @ 115 VAC ES1 SPDT 1/2" Conduit, Male 50mA-5A @ 24 VDC

Appendix B Viscosity Charts

Glossary of Standard Terms

ABSOLUTE FILTRATION RATING: The diameter of the largest hard spherical particle that will pass through a filter under specified test condition. This is an indication of the largest opening in the filter element. It does not indicate the largest particle that will pass through the element, since particles of greater length than diameter may pass.

CAVITATION: A localized condition within a liquid stream causing the rapid implosion of a gaseous bubble.

CELSIUS: A temperature scale. 0 Celsius (or 0 Centigrade) is the freezing point of water (32° F).

CENTIPOISE: A unit of absolute (dynamic) viscosity.

CENTISTOKE: A unit of kinematic viscosity.

CLEANLINESS LEVEL: The analog of contamination level.

COLLAPSE PRESSURE: The outside-in differential pressure that causes structural failure.

CONTAMINATION LEVEL: A quantitative term specifying the degree of contamination.

CONTAMINANT: Any material or substance which is unwanted or adversely affects the fluid power system or components, or both.

CONTAMINANT, BUILT-IN: Initial residual contamination in a component, fluid, or system. Typical built-in contaminants are burrs, chips, flash, dirt, dust, fiber, sand, moisture, pipe dope, weld spatter, paints and solvents, flushing solutions, incompatible fluids, and operating fluid impurities.

DEPTH (FILTER): A filter medium which primarily retains contaminant within tortuous passages.

DIRT CAPACITY (DUST CAPACITY)

(CONTAMINANT CAPACITY): The weight of a specified artificial contaminant which must be added to the fluid to produce a given differential pressure across a filter at specified conditions. Used as an indication of relative service life.

EFFICIENCY (FILTER): The ability, expressed as a percent, of a filter to remove specified artificial contaminant at a given contaminant concentration under specified test conditions.

Filter CONFIGURATIONS

Top-Ported Filter: Also known as a T-Ported or In-Line filter. All porting, the bypass valve, and indicators are located in the head. The head is permanently attached to the plumbing and the element is accessed by removing the bowl.

Base-Ported Filter: All porting, the bypass valve, and indicators are located in the base. The base is permanently attached to the plumbing and the element is removed through a cap, instead of removing the entire bowl.

Manifold Mounted Filter: Also known as a Sub-Plate filter. Most Base-Ported filters come with a manifold mount option. In some cases, a Top-Ported filter can also have a manifold mounting option. This allows the filter to be mounted directly onto a manifold, eliminating the need for hoses and fittings.

Cartridge Filter: Can be inserted directly into the manifold, eliminating the need for a separate housing or plumbing. Element is removed through a plug on the manifold.

Sandwich Filter: Is designed to be placed in between and directly interface with a manifold and stacked valves. Eliminates the need for hoses and fittings.

Duplex Filter: Made up of two or more filter assemblies. A valve allows the user to switch from one chamber to another. When one element is fully loaded, fluid is redirected though the second element. The loaded element can be changed without an interruption in flow. In the center position, the valve allows the oil to flow through both filters.

ELEMENT (CARTRIDGE): The porous device which performs the actual process of filtration.

FLOW, LAMINAR (STREAMLINE): A flow situation in which fluid moves in parallel lamina or layers. (See Reynold's number.)

FLOW, TURBULENT: A flow situation in which the fluid particles move in a random manner. (See Reynold's number.)

FLUID: A liquid, gas, or combination thereof.

FLUID POWER SYSTEM: A system that transmits and controls power through use of a pressurized fluid within an enclosed circuit.

INDICATOR: A device which provides external visual evidence of sensed phenomena.

INDICATOR, BY-PASS: An indicator which signals that an alternate flow path is being used.

INDICATOR, DIFFERENTIAL PRESSURE: An indicator which signals the difference in pressure between two points.

MICROMETER (MICRON)*: A unit of measurement one millionth of a meter long, or approximately 0.00003937 inch expressed in English Units. *Deprecated.

MIGRATION: Contaminant released downstream.

PRESSURE, CRACKING: The pressure at which a pressure-operated valve begins to pass fluid.

PRESSURE, DIFFERENTIAL (PRESSURE DROP): The difference in pressure between any two points of a system or a component.

PRESSURE, OPERATING: The pressure at which a system is operated.

PRESSURE, RATED FATIGUE: A pressure that a pressure-containing component is represented to sustain 10 million times without failure.

RATED FLOW: The maximum flow that the power supply system is capable of maintaining at a specific operating pressure.

REYNOLD'S NUMBER: A numerical ratio of the dynamic forces of mass flow to the shear stress due to viscosity. Flow usually changes from laminar to turbulent between Reynold's numbers 2,000 and 4,000.

Filter CLASSIFICATIONS Types

Low Pressure Filter*: Filter pressure range from 0 to 500 psi. Mostly applied in return line filtration where system pressure is at a low point.

Medium Pressure Filter*: Filter pressure range from 500 to 1500 psi. Often used in hydrostatic charge pressure applications.

High Pressure Filter*: Filter pressure range is 1500 psi and above. Mostly applied on the pressure side of the system where pressure is highest.

High Pressure Hydrostatic Filter: Used in high pressure hydrostatic closed loop systems. Allows for reverse flow through the system.

Bypass vs. Non-Bypass: The pressure rises as an element becomes loaded with contaminants. Standard filters are equipped with a bypass valve that redirects hydraulic fluid when the pressure drop reaches a predetermined level, so the element does not lose its structural integrity. The filter element is bypassed and fluid continues on through the system.

In non-bypass filters bypass is not optional. They are used to protect expensive components that are more sensitive to contaminants, and cannot be exposed to unfiltered fluid. The element is exposed to higher pressures, as there is no bypass. For that reason this type of filter requires a high crush element to guarantee its structural integrity.

Air Breather: Filters air that is drawn into a reservoir when the fluid level changes.

Desiccant Air Breather: In addition to filtering out particle contaminants, this breather also removes water vapor.

Schroeder Industries LLC wishes to thank both the National Fluid Power Association and Penton Publishing for the use of certain generic terms shown in this glossary. Excerpts taken from ANSI B93.2-1986/NFPA T3.10.3. 1967(R1980) and Penton Publishing's Fluid Power Handbook & Directory (2006-2007).

Other Product Line Catalogs

Filter Systems

The Filter Systems Catalog is designed to take the reader from the basic foundations of the principles of hydraulics found in the H&L catalog, to the tools required for troubleshooting and addressing the cleanliness or performance demands of any fluid system. We produce portable and permanent-mount pressure, flow and temperature evaluation instruments, oil cleanliness analysis devices, particle monitors and water-in-oil identification tools. We also produce a wide array of fluid conditioning tools — from standard in-line hydraulic filters, to sophisticated microprocessor-based instruments incorporating SMART[®] technology.

The products contained in the Fuels Catalog, address issues relating to mobile and stationary equipment working in some of the toughest conditions all over the world. Schroeder's Fuel Filtration line ensures the smooth running of equipment and protects both the engine and the whole drive system from damage, which addresses both onboard and bulk tank requirements.

Fuel Filtration

The keystone product of Schroeder Process Filtration is the RF3 automatic self-cleaning backflush filter. This filter along with bag filters, cartridge filters and custom designed systems allows Schroeder to offer you complete solutions to your process filtration needs. Our process filters are used to remove solid contamination from fluids and protect the integrity of high grade components that depend on low viscosity water or water-based fluids and emulsions. Schroeder offers high performance filters for all industrial sectors. Improvements in operational efficiency, reduced downtime, lower maintenance costs and reduce environmental impact can all be expected.

Best Filter Delivery Program

Schroeder Industries is pleased to announce the establishment of the Best Filter Delivery Program. We recognize that emergencies arise despite the best planning and forecasting efforts. To be able to offer support and service in these situations, we performed an analysis to determine our top selling filter model numbers. The result is a list of thirteen specific filter assemblies, comprising high pressure, medium pressure, return line, tank-mounted and spin-on models.

For all the models listed, guaranteed shipment is same day, provided we receive the purchase order by 1:00 pm EST. An option to specify element media other than that called for on the web page is available with a 5-day guaranteed ship date after receipt of order. No other substitutions are permitted.

At the onset of this program, a distributor/customer may be limited to a maximum quantity. This may be necessary to enable Schroeder to fulfill its guarantee of adequate inventory to all distributors alike.

The intent of this program is to provide our customers with access to the products they use most often. Therefore, as we witness shifts in filter usage, we will make changes to this list and update the corresponding web page accordingly.

We hope you and your customers find this new program useful in working through unforeseen crisis situations.

Family	Product	Specifications	Standard Part Number	Alternate Elements
High Pressure, Top-Ported	NF30	20 gpm, 3000 psi, SAE 1-1/16"-12 straight porting, cartridge dirt alarm	NF301NZ10SD5	N/A
High Pressure, Top-Ported	DF40	30 gpm, 4000 psi, SAE 1-5/16"-12 straight porting, cartridge dirt alarm	DF401CCZ3SD5	CC10, CCZ5
High Pressure, Base-Ported	GKF30	100 gpm, 3000 psi, 1 element, SAE 1-7/8"- 12 straight porting, cartridge dirt alarm	GKF301KGZ10SD5	KG3, KG10, KG25, KGZ1, KGZ3, KGZ25
Low Pressure, Tank-Mounted	ZT	40 gpm, 100 psi, SAE 1-5/16"-12 straight inlet port, rear mounted tricolor visible dirt alarm	ZT8Z10SY2	N/A
Low Pressure, Tank-Mounted	GRT	100 gpm, 100 psi, 2 SAE 1.5" inlet ports, tricolor visible dirt alarm	GRT1KBGZ10S24S24NY2 (GRT-6915)	K3, K10, K25, KZ1, KZ3, KZ25
Low Pressure, Tank-Mounted	GRT	100 gpm, 100 psi, 1 SAE 1.25" straight inlet port, tricolor visible dirt alarm	GRT1KBGZ10S20NNY2 (GRT-6916)	KBG3, KBG10, BG25, KBGZ1, BGZ3,KBGZ25
Low Pressure, Tank-Mounted	LRT	150 gpm, 100 psi, 2 SAE 1.5" straight inlet ports, tricolor visible dirt alarm	LRT18LZ10S24S24NY2 (LRT-1820)	N/A
Low Pressure, Spin-On	PAF1	20 gpm, 100 psi, 3/4" NPTF porting, tricolor visible dirt alarm	PAF16PZ10PY2	N/A
Low Pressure, Top-Ported	GKF3	100 gpm, 300 psi, 1 element, SAE 1-7/8"- 12 straight porting, cartridge dirt alarm	GKF31KGZ25SD5	KG3, KG10, KG25, KGZ1, KGZ3, KGZ25
Medium Pressure, Top-Ported	SRLT	25 gpm, 1400 psi, SAE 1-1/16"-12 straight porting, cartridge dirt alarm	SRLT6RZ10S12D5	6RZ3, 6RZ25
Medium Pressure, Top-Ported	RLT	70 gpm, 1000 psi, 9" element, SAE 1-5/8"- 12 straight porting, cartridge dirt alarm	RLT9VZ10S20D5	9V25, 9VZ25
