ABSTRACT

According to specialty literature, *Campanula* Genus comprises approximately 400-600 species. A number of 130 species were found within the herbariums studied for this present paper (Al. Beldie Herbarium from Romania, The Royal Botanic Garden Edinburgh's herbarium, WU Herbarium from Wien and Harvard University Herbaria from the U.S.A.). The studied *Campanula* species are widespread on three continents: Europe, Asia and North America. A lot of species is endemic with seven of them found only in California. The most common species from the studied herbariums were: *C. rotundifolia* and *C. rapunculoides*, together with *C. sibirica*, *C. glomerata*, *C. stevenii*, *C. spatulata*, *C. collina* and *C. bellidifolia*. Al. Beldie Herbarium is an important resource as it contains some endemic species such as *C. carpatica* and *C. transsilvanica*. In addition, the species were mostly collected from Romania, as well as from other 13 European countries. As such, a detailed analysis of vouchers from different herbariums can bring new information regarding the number of species from a certain Genus, their spreading area or about their nomenclature.

KEY WORDS: *Campanula*, *herbarium*, *species*, *voucher*, *plants*.

INTRODUCTION

Campanula Genus belongs to the *Campanulaceae* Family and contains approximately 400-600 species that are spread out in the North hemisphere. The majority of species can be found in the Mediterranean and Balkan regions (Kuss *et al.*, 2007) being spread out in many types of habitats such as meadows, the steppe area, the alpine area, on cliffs or on verges. Only in Turkey, there are 66 endemic species (Erkara *et al.*, 2008). The genus is divided in more sections, each with its particularities (Park *et al.*, 2006; Alçitepe *et al.*, 2010). The species are annual, biennial or perennial, have variable dimensions and alternate, sessile leaves. The flowers resemble a bell and can stand alone or be attached to an inflorescence (Roquet *et al.*, 2008; Bogdanović *et al.*, 2014; Röper *et al.*, 2015).

Al. Beldie Herbarium (BUCF), owned by Marin Drăcea National Institute for Research and Development in Forestry from Bucharest is included in the list of renowned worldwide herbariums. The herbarium contains numerous vouchers belonging to varied genera such as: 17 *Amaranthus* species (Dincă *et al.*, 2018), 11 *Elymus* species (Pleșca *et al.*, 2019), 7 *Lycopodium* species (Vechiu *et al.*, 2018a), 80 *Trifolium* species (Cântar & Dincă, 2018), 41 *Polygonum* species (Vechiu *et al.*,

2018b), 33 *Orobanche* species (Scărlătescu *et al.*, 2017), 21 *Agrostis* species (Cântar & Dincă, 2019), 36 *Bronus* species (Tudor & Dincă, 2019) and the 58 *Cornus* species (Veciu & Dincă, 2019).

WU Herbarium from Wien was created in 1879 and had already 80.000 specimens in 1889. Today, the herbarium contains 1.400.000 specimens covering all worldwide plant groups (<https://herbarium.univie.ac.at/index.htm>).

The Harvard University Herbaria is one of the largest university herbarium collections in the world, and the third largest herbarium in the United States. It includes six collections and more than five million specimens of algae, bryophytes, fungi, and vascular plants, being a centre for botanic and biodiversity studies since the early 1800s (<https://huh.harvard.edu/>).

The Royal Botanic Garden Edinburgh's extensive Herbarium holds approximately 3 million preserved plant specimens, makes up two-thirds of the planet's flora and represents over 300 years of biodiversity (<https://data.rbge.org.uk/search/herbarium/>).

MATERIALS AND METHODS

The general data (number of species, widespread, morphology) were established after studying more specialty articles and websites.

The number of online vouchers from WU Herbarium, Harvard University Herbaria and the Scotland Herbarium were counted in order to create a precise statistic of species belonging to this genus. The plants from Al. Beldie Herbarium were inventories and transformed in a database with information from their labels (Herbarium/Botanic collection; name, harvesting date and place; the person who collected the plant and the voucher's conservation degree).

The species were grouped based on the herbariums where they were identified and based on the mentioned sources. In addition, their spreading was also added when it was needed. The spreading area was determined by using literature references and the <http://campanula.e-taxonomy.net/> website.

The name of the species present in the herbarium was verified with the help of the WCSP data base (<https://wcsp.science.kew.org>) which offers current data regarding the internationally accepted scientific names and synonyms.

RESULTS AND DISCUSSIONS

Al. Beldie Herbarium contains 476 samples of *Campanula* species, followed by 1.818 samples in Royal Botanical Garden Edinburgh, 2.369 samples in Harvard University Herbaria and 13.121 samples in Herbarium WU. The following table presents *Campanula* species from different herbarium and databases (Table 1).

TABLE 1. *Campanula* species present in different herbarium and databases

130	<i>Campanula zoysii</i> Wulfen	Austria, Italy, Slovenia	Yes	1	33		

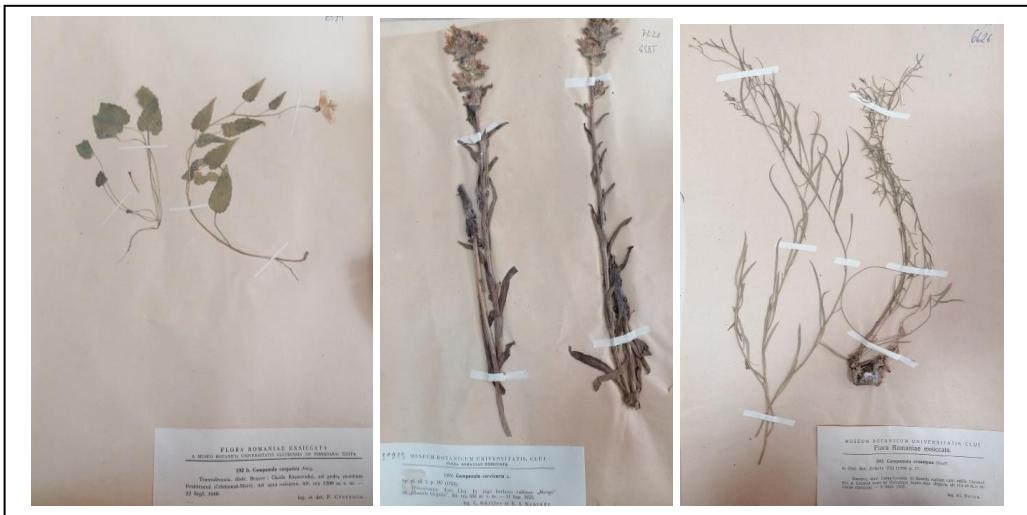

A large number of *Campanula* species are endemic such as in California (which records the largest number of endemic species – 7 inventoried species), Florida, Caucasus, Cape Verde, Czech Republic, Bosnia Herzegovina, Serbia, or Croatia.

As in the case of *Alnus* species (Dincă & Peticilă 2019), the collections of different herbariums presents species name that are actually forms or variations.

Even though it is considered an average collection, Al. Beldie Herbarium contains numerous *Campanula* species (Figure 1), and some specific to our area (such as *C. carpatica*, present with more vouchers than in any other international herbariums or *C. transsilvanica*). The *Campanula* species from BUCF Herbarium are mostly gathered from Romania (363 samples), and completed by other regions or countries (Austria, Bosnia, Bulgaria, Czech Republic, Croatia, Switzerland, France, Germany, Italy, Norway, Moldavia, Sweden, Spain).

The species from WU Herbarium that are very well represented when compared with other collections are the following: *C. alliarifolia*, *C. armena*, *C. bellidifolia*, *C. cespitosa*, *C. cochleariifolia*, *C. collina*, *C. erinus*, *C. glomerata*, *C.*

lactiflora, *C. latifolia*, *C. moravica*, *C. pendula*, *C. perscifolia*, *C. ramosissima*, *C. saxifraga*, *C. sibirica*, and *C. stevenii*.

Campanula carpatica

Campanula cervicaria

Campanula crassipes

The Harvard University Herbarium has numerous vouchers from species that are specific to North America, such as: *C. americana*, *C. divaricata*, *C. floridana*, *C. laevigata*, *C. parviflora*, *C. scandens*, and *C. uniformis*.

In comparison with the other analysed herbarium, the Edinburgh Herbarium has numerous samples of *C. barbata*, *C. cenisia*, *C. edulis*, *C. hispanica*, *C. lusitanica*, *C. medium*, *C. pallida*, and *C. rhomboidalis*.

The largest number of vouchers were identified for *C. rotundifolia* (1590), *C. rapunculoides* (1083) and *C. sibirica* (921), followed by *C. glomerata* (653), *C. stevenii* (603), *C. spatulata* (539), *C. collina* (523) and *C. bellidifolia* (518) (Figure 2). In comparison with the species described by Wikipedia (<https://en.wikipedia.org/wiki/Campanula>), we have identified only two new *Campanula* species present in the analysed herbarium. On the other hand, Wikipedia mentions four *Campanula* species that were not represented in any of the four analysed herbariums.

The *Campanula* species present in the four analysed herbariums are especially spread out in Europe and Asia and less in North America (Figure 3). From a geographic point of view, the majority of areas were located in the Caucasus, Balkans, and the United States, with lower percentages in the Carpathians, Alps or in Turkey (Figure 4).

DINCA & VECIU: A statistic of *Campanula* species based on vouchers from different Herbarium

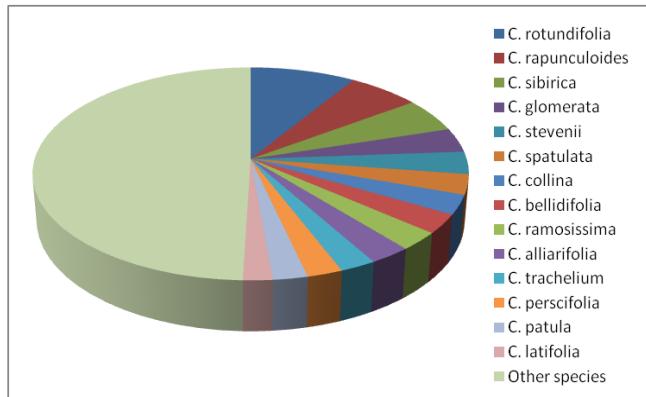

FIGURE. 2. *Campanula* species present in the four herbariums

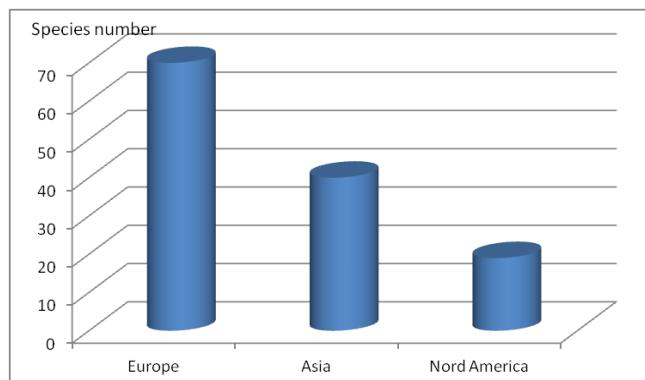

FIGURE. 3. Spread of analysed *Campanula* species on continents

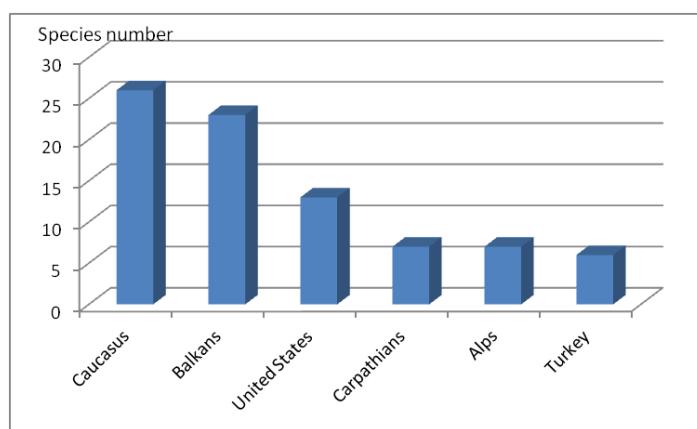

FIGURE. 4. Spread of analysed *Campanula* species on geographic areas

CONCLUSIONS

The present article has synthesized the *Campanula* species based on a number of reference herbariums. These resources are valuable in identifying a part of the total number of species present in this Genus. The spreading area of these species is large and includes endemic species for some regions (7 endemic species in California). The majority of plants were found in Europe, followed by Asia and North America.

A total number of 130 species were inventoried from 4 herbariums in reference with the 400-600 *Campanula* species mentioned by certain authors.

The following species were identified within all the studied herbariums: *C. gorganica* Ten., *C. medium* L., *C. patula* L., *C. persicifolia* L., *C. rapunculoides* L., *C. rotundifolia* L., *C. sibirica* L., *C. trachelium* L. and *C. uniflora* L.

Al. Beldie Herbarium is important because it contains endemic species such as *C. carpatica*, and *C. transsilvanica*. The species were mainly gathered from Romania as well as from other 13 European countries.

WU Herbarium contains the largest number of *Campanula* species, with the following ones as best represented: *C. alliarifolia*, *C. armena*, *C. bellidifolia*, *C. cespitosa*, *C. cochleariifolia*, *C. collina*, *C. erinus*, *C. glomerata*, *C. lactiflora*, *C. latifolia*, *C. moravica*, *C. pendula*, *C. persicifolia*, *C. ramosissima*, *C. saxifraga*, *C. sibirica*, and *C. stevenii*.

The Harvard University Herbarium contains numerous samples of *Campanula* species that are specific to North America: *C. Americana*, *C. divaricata*, *C. floridana*, *C. lasiocarpa*, *C. parryi*, *C. scouleri*, and *C. uniflora*.

While the Edinburgh Herbarium is represented by *C. barbata*, *C. cenisia*, *C. edulis*, *C. hispanica*, *C. lusitanica*, *C. medium*, *C. pallida*, and *C. rhomboidalis*.
