## PREFACE

This review brings together as much as possible data on *Gonystylus* species other than *G. bancanus* from various places and institutions for addressing the gap in our knowledge about the taxa that included in CITES Appendix II. The additional knowledge on *Gonystylus* species other than *G. bancanus* can be used for enhancing institutional capacity in CITES implementation, which is one of the objectives of ITTO-CITES Indonesia's work Programme for 2008.

During this review, several facts have been encountered as follows:

- The data availability of non-*Gonystylus bancanus* species is extremely limited compared to the enormous data of *G. bancanus*. Much of the collected digital data and printed materials are only about taxonomy, ecology and distribution of the species. Data on potential uses of non-*Gonystylus bancanus* species and its population and growing stock are very rare or unavailable.
- All herbaria databases were developed based on the *Gonystylus* specimens collected before 1980's and only few specimens in the database that have been collected after 1980's. This condition shows the urgent for new field collection if we would like to obtain the most recent population distribution status.
- Observation on specimens and specimen's databases showed a significant number of unidentified *Gonystylus* species (still labeled as *Gonystylus* sp.). It is explained that such of condition is caused by a non-user friendly identification keys or in other words, the available identification keys are not easy to use. This situation increases the number of unidentified *Gonystylus* specimens.

However, under those limited circumscription, this review aims to provide a preliminary data about biological, ecological and potential aspects of *Gonystylus* species other than *G. bancanus* that have been heavily studied and traded. Review activities across a wide range of topics on *Gonystylus* spp. biology, ecology and potency and other issues of current concern, will make this report valuable for opening our limited knowledge as well as triggering our concern on the taxa.

Finally, we would like to thank all parties that have been contributed to the review process and to the completion of this report.

### The Team

## **ACKNOWLEDGMENT**

One of former colleague from Australia said that “all good things must come to an end”, and now after two months struggling, it is time for the Review team leader to acknowledge (on behalf of all team members) all of the institutions and to the persons of those who have patiently and generously assisted this project to completion.

Foremost, we wish to express my gratitude to the International Timber Trade Organization (ITTO) for providing funding for the team, in the duration of the project, and to the Project Coordinator, Ir. Tajudin E. Komar, M.Sc. and his staff for providing an extra guidance during the work.

We also thank the numbers of people and institutions (including herbaria) who were contributed material as well as sharing database and data from specimens for this review; i.e. Dr. Dr. Kade Sidiyasa (WAN, Samboja, East Kalimantan), Dr. Eko Baroto Walujo (BO, Cibinong, West Java), Dra. Marfu'ah, MP (BZF, Bogor, West Java), Dr. Campbell O. Webb (Arnold Arboretum Harvard), Global Biodiversity Information Facilities (GBIF), Species 2000, and TROPICOS.

Finally, our gratefulness indeed goes to each of team members Abdulrokhman Kertonogoro, S.Si, Alex Sumadijaya, S.Si, Mr. Sutiyono, Dra. Marfu'ah Wardani, MP, Dra. Titi Kalima, M.Si and Ir. Bugris Yafid, M.Si for their immense support during the weeks of duress we experienced through much of this project.

### **Authors**

## EXECUTIVE SUMMARY

The genus *Gonystylus*, consisting of 29 species and 1 variety that distributed throughout the Malesian area (including Indonesia) with the majority of species found in Borneo. Several species are commercially traded (CITES 2004). Fifteen species in the genus, including *G. bancanus*, are classified as vulnerable in the IUCN's Red List of Threatened Species due to observed, inferred or projected habitat loss and over-exploitation. Following this circumscription, a literature review on biology, ecology and potential uses of *Gonystylus* species other than *G. bancanus* have been conducted.

The results of the review shows that flowering season for *Gonystylus* species is vary between February-March as well as May to October. The flowering and fruiting periods of ramin in Sumatera occur between August and October, although ramin trees sometimes produce flower and fruit in May. Meanwhile in Kalimantan, flowering and fruiting periods of ramin occur between January-May. However, the knowledge on flower biology and pollination syndrome of genus *Gonystylus* is still lacking. Thus, further studies are very crucial to be conducted.

Habitat preference of *Gonystylus* species ranged from primary non-inundated rainforest at low and medium elevations to 1500 m. It is associated with different tree species as reported by many authors. In most habitats, ramin is principally associated with *Shorea albida*, *Dactylocladus stenostachys*, *Dyera lowii*, *Cratoxylum arborescens*, *Palaquium* spp., and *Calophyllum* spp. The species are distributed throughout the Malesian with the vast majority of species is found on Borneo. Distribution's exception occurs in Central and East Java and the Lesser Sunda Islands, although, a single specimen of *G. macrophyllum* from Flores was found during the review. *Gonystylus* distribution continues eastward towards the Solomon Islands, Nicobar and Fiji. The distribution trends show the decreasing number of species towards eastern part of Malesian region. Based on the specimen distribution data, a series of distribution map are provided of which West and East Kalimantan are recommended as the main targeted areas for further ground and stock survey following by other potential areas.

The slow natural regeneration capability has been recorded for *Gonystylus* from the literatures as well as from direct tree diameter measurement in the field. Tree diameter only increased 3 cm since 12 years ago. The current circumscription must be considered in the future development of conservation efforts and in the sustainable use and trade for *Gonystylus* species. Despite this slow growth, ramin whitish timber is highly prized and popular for various wood-work and wood craft. Several *Gonystylus* species also produce non-timber forest products such as medicine, poison and incense that are valuable for the local people income. Based on the review's finding and the limited data during the study, several recommendations have been proposed.

## I. INTRODUCTION

### 1.1. Background

The genus *Gonystylus*, consisting of about 30 species, is distributed throughout the Malesian area (Indonesia, Malaysia, the Philippines, Papua New Guinea, Singapore and Brunei Darussalam) with the majority of species found in Borneo. Six species (*Gonystylus affinis*, *G. bancanus*, *G. forbesii*, *G. macrophyllus*, *G. maingayi* and *G. velutinus*) are known to be commercially valuable, of which *G. bancanus* is the most heavily traded (CITES 2004).

Fifteen species in the genus, including *G. bancanus*, are classified as vulnerable in the IUCN's Red List of Threatened Species due to observed, inferred or projected habitat loss and over-exploitation. Logging-both selective logging and clear-cutting is recognized as the major threat to these species (IUCN 2004 and 2008). As a result of over-exploitation, ramin has become scarce throughout most of its original range. Excessive logging and destruction of peat swamps have led to commercial extinction in several areas such as in Peninsular Malaysia and Sarawak.

Populations of *Gonystylus* throughout Indonesia have also declined due to over-exploitation (Soehartono and Mardiaستuti 2002). This decline is evident in Indonesia's annual ramin production, which fell from more than 665,000 m<sup>3</sup> in 1994 to just 131,000 m<sup>3</sup> in 2000, a decline of more than 80% in 6 years Even at these levels, Indonesia's ramin harvest in 2000 far exceeded the annual allowable cut of 24,000 m<sup>3</sup> authorized by the Ministry of Forestry. This decline is mainly due to the naturally slow regeneration process of ramin, thus its natural populations have yet to recover. Much of Indonesia's remaining ramin is found in national parks and protected areas that provide vital habitat for many other threatened species, including the orangutan and Sumatran tiger (both on Appendix I). Therefore, conservation efforts are urgently required and several are still on going to support sustainable use of ramin.

Following the conservation efforts, off those more than 30 species of *Gonystylus* occur in Malesian Region including Indonesia, only *Gonystylus bancanus* has been widely explored for its biological, ecological and economical status. Knowledge on other species within the Genus is still extremely limited especially on many aspects, such as biology, ecology and

their potential uses although *Gonystylus* species in Indonesia already included in Appendix III (2001) and up-listed in Appendix II (2004) of the Convention on International Trade of Endangered Species of Wild Flora and Fauna (CITES). The circumscription of insufficient information on biology, ecology and their potential of *Gonystylus* species other than *G. bancanus* have created impediments for their conservation, artificial propagation as well as their sustainable use. Therefore, a thorough review is utterly required for *Gonystylus* species other than *G. bancanus* in Indonesia in order to meet CITES regulation.

## **1.2. Objectives**

The general objective of this review is to contribute to the exploratory assessment on the population distribution and potential uses of non-*Gonystylus bancanus* species in Indonesia. Meanwhile, the specific objective of this review is to provide a preliminary or basic data on biology, ecology and uses of non-*Gonystylus bancanus* species that is useful for the conservation efforts and the prevention of further loss of *Gonystylus* species in Indonesia and for enhancing institutional capacity in CITES implementation.

## **1.3. Methodology**

The activity 1.1 of the project is mainly focused to the data collecting of the biological and taxonomical, habit and habitat, distribution and potential aspects of non-*Gonystylus bancanus* species. The limited amount of time, data types and data sources availability have influenced the structure and the composition of team members as well as the amount of data gathered.

The review team comprises of 3 researchers from Research Centre for Biology, Indonesian Institute of Sciences (LIPI) and 3 researchers from the Centre for Forest and Nature Conservation Research and Development (P3HKA). This team also assisted by a senior librarian and a treasurer.

The data collecting process has been conducted through literature study, internet and worldwide on-line database searching and downloading, herbarium specimens study and resource person interviews (in the field and in

the related institutions). Thus, data obtained could be categorized into printed and digital publications, specimens and interview notes and digital data from databases. The member of the team visited various herbaria for the literature and specimens studies\_such as Herbarium Bogoriense (BO), Herbarium Wanariset (WAN) and Herbarium Forest Research and Development Center and Nature Conservation (BZF) (figure 1).

**Figure 1.**  
Mr. Bugris Yafid and  
Ms. Titi Kalima observed  
herbarium specimens  
and recorded all  
associated data

The team also visited a range of libraries such as library of Bogor Agricultural Institute (IPB), University of Indonesia (UI), Forest Research and Development Center and Nature Conservation (P3HKA), SEAMEO-BIOTROP, Bogor Bibliotheca (BB), Wetland Indonesia, CIFOR, National Library, Department of Agriculture, FORDA, and others in the duration of the project (figure 2).

**Figure 2.**  
Mr. Sutiyono studies references in library and record all associated data as well as obtained printed materials

In adjunct to the literature study, an interview to Dr. Campbell O. Webb and rapid field survey has been conducted for seven days (29 January to 4 February 2009) at Resort Panti, Gunung Palung National Park, West Kalimantan (**figure 3**) to obtain rough estimation of *Gonystylus* species growth rate through bole diameter measurement. The bole diameter measurements resulted from the previous ecological study by scientists from the Arnold Arboretum, Harvard University, 15-years ago was used as field reference.

**Figure 3.**  
Dr. Teguh Triono (second from right) team leader, with field team at Gunung Palung National Park, West Kalimantan for rapid field survey on *Gonystylus* spp.

Following the rapid survey, an interview and discussion has also been conducted with another resource person. Resource person is a person that has more knowledge about biological and taxonomical, habit and habitat, distribution and potential uses aspects of non-*Gonystylus bancanus* species. Interviewed with Dr. Kade Sidiyasa has been conducted in Herbarium Wanariset Samboja, East Kalimantan 2-5 March 2009 (see figure 4).

**Figure 4.**  
Ms. Titi Kalima  
(wearing veil)  
interviewed Dr. Kade  
Sidiyasa (sitting in  
front) about  
*Gonystylus* species  
distribution in  
Kalimantan

After a series of data collecting works, one fact and one impediment have been encountered. These fact and impediment are:

1. The data availability of non-*Gonystylus bancanus* species is extremely limited compare to the enormous data of *G. bancanus*. Much of the collected digital data and printed materials are about taxonomy, ecology and distribution of the species. Data on potential uses of non-*Gonystylus bancanus* species and its population and growing stock are very few or unavailable.
2. All herbaria databases were developed based on the *Gonystylus* specimens collected before 1980's and only few specimens in the database that have been collected after 1980's. This condition shows the urgent for new field collection if we would like to obtain the real recent population distribution status. The age of the data became main

consideration of the team because this data need to be scrutinized before it could be plotted onto distribution map. Under limited time, we decided to present these specimen data in table format in the appendices.

Under these impediment and limitations, data and information about non-*Gonystylus bancanus* species collected in the duration of the project (Activity 1.1) are described in the following sections.

## II. BOTANICAL INFORMATION

### 2.1. Taxonomy of Genus and Selected Species

#### 2.1.1. Characteristic of the Genus

*Gonytulus* is a member of sub-family Gonystyloidea, family Thymelaeaceae and the order of Myrtales (Myrtiflorae). Sub-family Gonystyloideae is characterized by its leaves that usually with translucent gland dots, flower with short tube (petals usually 7-40; inserted at base of tube; stamens 8-80 with horseshoe-shaped anthers, ovary chambers that usually 3-5, style thread-like and small stigma) and a capsule type fruit (Whitmore 1983).

The genus *Gonystylus* in Malesia consists of 29 species and 1 variety (Shaw 1953). Species-species in genus *Gonystylus* are distributed throughout the Malesian area. Diagnostic characters of this genus as follows:

Small to medium-sized trees, up to 42 m tall, occasionally shrubs; bole cylindrical, alignment, straight, branchless for up to 21 m and up to 60(-120) cm in diameter, buttresses are thick if present, sometimes fluted at base; bark surface smooth to cracked, shallowly fissured or scaly, dull grey to red-brown or dark brown, occasionally with white patches, inner bark yellow, brown, pink or orange, laminated or fibrous, with glistening slightly irritating fibres on the cut surface; twigs striate, black or chocolate brown, pendulous, sometimes puberulous-velutinous when young but glabrescent. **Leaves** alternate, simple and entire, papery to thick-leathery, often sparsely hirsute below, especially on the midrib; petiole short glabrous to velutinous, pellucid-punctate; stipules absent. **Inflorescence** usually terminal, paniculate, few-branched with short lateral branches; bracts minute, very early caducous. **Flower** bisexual, actinomorphic, long-pedicelled; calyx more or less cupular, divided to about 1/4—1/3 in 5 petaloid thick tough lobes, densely setulose-hairy inside; corolla consisting of a ring of 7-40 small, more or less rudimentary petals, often shortly united at base; stamens about equal in number to the petals, rarely twice as many, anthers basifixd on short filaments and folded backwards; ovary sessile, globose, densely hispid-setulose, (2-)3-4(-8)-locular, style filiform, glabrous or pubescent, wiry, sinuate-contorted, stigma punctiform to capitate. **Fruit** globose, or rarely lanceolate, woody, 2-5-valved and dehiscent capsule, 1-5-seeded. **Seed** large, up to 4 cm long, with a smooth softly coriaceous testa, partly enclosed in a thin aril, with thick horny cotyledons and lacking endosperm.

Germination type hypogeall, with a tap-root emerging from one pole of the seed, the hypocotyl rupturing the testa and the shoot emerging through the slit; leaves arranged spirally, lower ones sometimes subopposite (Soerianegara and Lemmens, 1994),

Genus *Gonystylus* has several vernacular names. In Indonesia, this genus is called as gaharu buaya (Sumatra, Kalimantan), medang keladi (Kalimantan). Meanwhile, in Malaysia, this genus is known as melawis (Peninsular Malaya) and gaharu buaya (Sarawak). It is called as lanutan bagyo, anauan (general) in Philippines (Soerianegara and Lemmens, 1995). Ramin is a trade name for woods of some *Gonystylus* species such as *Gonystylus affinis* Radlk., *G. bancanus* (Miq.) Kurz, *G. forbesii* Gilg, *G. macrophyllus* (Miq.) Airy Shaw, *G. maingayi* Hook.f and *G. velutinus* Airy Shaw (Soerianegara and Lemmens 1995).

There is some debate about taxonomic position of genus *Gonystylus*. The genus is treated as a member of the family Thymelaeaceae, with the related small genera Aetoxylon and Antyxa. However, some authors place it as Gonystylaceae equal to the Thymelaeaceae. They regard it as more related to Tiliaceae or Flacourtiaceae.

In regards to identification the characteristic colours of the foliage in dry condition provides a useful diagnostic character for species identification. The identification of saplings is often difficult because of the differences in habit of young and mature plants. The absence of resin canals precludes confusion with any dipterocarp timber (Soerianegara and Lemmens 1994).

### **2.1.2. Characteristic of the Selected Species**

The *Gonystylus* (non-*Gonystylus bancanus*) species descriptions in this section are selected from the 29 species and 1 variety from Malesian region described by Airy Shaw (see Airy Shaw 1953, 1972 and 1973, for complete species description). The 11 species chosen here are the species that produce major commercial timber (Soerianegara and Lemmens, 1994).

### **1. *Gonystylus affinis* Radlk.**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 357; Tree Flora of Malaya, Vol. 2 (1983) 388; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 226; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 452.

Tree of up to 33 m tall, bole up to 90 cm in diameter, fluted, bark surface smooth to shallowly fissured and sloughing in square scales, reddish to brown, occasionally with white patches, inner bark, pink: leaves elliptical to almost oblong, 9-19 cm x 3.5-8.5 cm. broadly cuneate to rounded at base, shortly caudate-acuminate at apex, margin markedly revolute, glabrous above, often rather persistently tomentellous below, especially on the midrib, petiole 10-15(-20) mm long; inflorescence 8-15 cm long, densely fulvous-tomentellous; petals about 20, filiform-subulate, glabrous; fruit globose, up to 4 cm in diameter.

### **2. *Gonystylus brunnescens* Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 356; Whitemore, Tree Flora of Malaya, Vol. 2 (1983) 388; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 227; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 456.

Medium-sized to large tree up to 86(-45) m tall, bole fluted, up to 95 cm in diameter bark surface fissured. roughly cracking to slightly scaly with elongated scales, brown, inner bark pink, sapwood yellow; leaves elliptical to oblong, 12-26 cm x 4-10 cm, cuneate to rounded at base, rounded or subacute at apex, glabrous, petiole 12-15 mm long; inflorescence 4-11 cm long, finely pubescent or ferrugineous-to-mentellous; petals 25-30, subulate-filiform glabrous outside, rather densely retrorse-hispid inside; fruit ovoid, up to 6 cm in diameter.

### **3. *Gonystylus confusus* Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 357; Whitemore, Tree Flora of Malaya, Vol. 2 (1983) 391; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 228.

Small to medium tree up to 30 m tall, bole up to 70 cm in diameter, bark surface not fissured, with elongated, adherent scales, dull grey and green or dark brown, inner bark yellow and pink; leaves oblanceolate-oblong or rarely oblong, 8-27 cm x 2-9 cm, cuneate to rounded at base, cuspidate to shortly acuminate at apex glabrous except for a few adpressed hairs near the midrib below, petiole 8-17 mm long; inflorescence 6-20 cm long; calyx lobes not reflexed, petals about 30, subulate-filiform glabrous, ovary with 3 small abortive styles around the base of the functional style; fruit subglobose, 4-10 cm in diameter.

#### **4. *Gonystylus consanguineus* Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 6 (1972) 979; Whitemore, Tree Flora of Malaya, Vol. 2 (1983) 388; Soerianegara & Lemmens, PROSEA 5,1 (1994) 228; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 458.

Medium-sized to large tree up to 40 m tall, bole branchless for up to 30 in, up to 80 cm in diameter, fluted at base and with small buttresses, bark surface not fissured; smooth or with elongated scales, red-brown to dark brown; inner bark laminated, cream to ochre, sapwood pale yellow; leaves elliptical to oblong, 10-25 cm x 5-9 cm, broadly cuneate at base, abruptly caudate-acuminate at apex, glabrous or sparsely hairy on the midrib below, petiole 7-12 mm long. Inflorescence 10-13 cm long; calyx lobes finally reflexed, petals about 30, small, glabrous.

#### **5. *Gonystylus forbesii* Gilg.**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 357; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 228; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 461.

Medium-sized to fairly large tree of up to 40 m tall, bole often rather poorly shaped, up to 85 cm in diameter, angular, usually fluted at the base but not buttressed, bark surface rather dark brown, inner bark orange-yellow, sapwood white, often with faint longitudinal streaks; leaves elliptical, often almost rhomboid, 4-10(-11.5) cm x 25-5 cm, usually markedly cuneate at base, cuneate-acuminate or sometimes rounded and caudate at apex,

glabrous or thinly puberulous below; petiole 9-11 mm long; inflorescence 5-15 cm long; calix lobes reflexed, petals about 10, ovate-deltoid tomentellous throughout and setulose inside: fruit oblong-ellipsoid, about 3 cm in diameter.

## **6. *Gonystylus keithii* Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 356; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 228; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 458.

Shrub or small to medium-sized tree of up to 26 m tall, bole up to 90 cm in diameter; leaves elliptical-oblong to oblanceolate 3-24 cm x 4-9 cm; cuneate at base and gradually narrowed at apex practically glabrous throughout, petiole 1-1.5 cm long; inflorescence 8-13 cm long; calix lobes strongly revolute, petals 20-22, subulate, retrorse-setulose inside.

## **7. *Gonystylus lucidulus* Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 6 (1972) 981; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 229; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 463.

Medium-sized to large tree of up to 36 m tall, bole branchless for up to 27 m, up to 40 cm in diameter, fissured, bark surface scaly, dark brown, inner bark pale brown, sap-wood pale yellow or yellow; leaves oblong to elliptical-oblong, 10-20 cm x 5-8 cm, rounded at base and broadly but abruptly caudate, glabrous, petiole 12-18 mm long; inflorescence up to 18 cm long; fruit lanceolate-ovoid, 1.7 cm in diameter.

## **8. *Gonystylus macrophyllus* (Miq.) Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 354; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 229; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 464.

Medium-sized to large tree of up to 45 m tall, bole up to 100 cm in diameter; leaves exceedingly variable in size and shape, oblong, elliptical,

obovate or sublanceolate, 2-40 cm x 2-15 cm, cuneate to rounded at base, acuminate to rounded or even retuse at apex, glabrous, petiole up to 25 mm long; inflorescence elongate, up to 20 cm long; calyx lobes not reflexed, petals 20-40, narrowly subulate, glabrous; fruit subglobose, up to 7 cm in diameter.

### **9. *Gonystylus maingayi* Hook.f.**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 359; Whitemore, Tree Flora of Malaya, Vol. 2 (1983) 391; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 229; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 465.

Medium-sized to large tree of up to 40 m tall, bole branchless for up to 31 m, up to 75 cm in diameter, sometimes with a fluted base, bark surface cracking to fissured and scaly, pale grey to dark brown or red-brown, inner bark orange; leaves elliptical-oblong, 7-12(-17) cm x 2.5-4.5(-6) cm, cuneate to rounded at base, narrowed and acuminate at apex, adult leaves glabrous but midrib thinly puberulous below, petiole 8-15 mm long; inflorescence about 20 cm long; calix lobes revolute, petals 10-12, triangular-subulate to ovate-acuminate, glabrous; fruit ovoid to rounded, 2.5-3 cm in diameter.

### **10. *Gonystylus velutinus* Airy Shaw**

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 359; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 229; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 473.

Medium-sized to fairly large tree of up to 35 m tall, bole up to 70 cm in diameter; leaves elliptical, oblong-elliptical or lanceolate-elliptical, 8-11 (-13) cm x 3.5-5 cm, cuneate to subrotundate at base, shortly and narrowly cuspidate-acuminate at apex, usually more or less pubescent below, petiole 7-11 mm long; inflorescence 7-12 cm long; calyx lobes strongly revolute, petals 7-8, deltoid, acute; fruit lanceolate-oblong, 1.2 -2.5 cm in diameter.

## 11. *Gonystylus xylocarpus* Airy Shaw

Reference: Airy Shaw, Fl. Mal. I, Vol 4 (1953) 355; Soerianegara & Lemmens, PROSEA 5, 1 (1994) 230; Soepadmo, Saw & Chung, Tree Flora of Sabah and Sarawak, Vol. 5 (2004) 473.

Medium-sized to fairly large tree of up to 36 m tall, bole cylindrical, up to 75 cm in diameter, fluted at base, bark surface flaky, dark to red-brown; leaves broadly elliptical, 10-17 cm x 4.5-9 cm, rounded at base and shortly subapiculate to rounded at apex, the midrib sparsely puberulous below; inflorescence up to 18 cm long; calyx lobes recurved, petals 35-40, narrowly subulate, glabrous; fruit globose, up to 7.6 cm in diameter.

### 2.2. Phenology

Many authors have mentioned that flowering season for *Gonystylus* species is vary (Airy Shaw 1953; Alrasyid and Soerianegara 1978; Partomihardjo 2005; Partomihardjo 2006, 2007). According to these authors, ramin usually blossom between February-March as well as Mei to October. Alrasyid and Soerianegara (1978) reported that ramin tree was fruiting between April-May. In addition to Alrasyid and Soerianegara, Airy Shaw (1953) mentioned that fruiting season also happens between May to June.

Partomihardjo (2006) has observed *Gonystylus* flowering period based on 55 herbarium specimens deposited in Herbarium Bogoriense, Bogor. His study showed that flowering and fruiting periods of ramin in Sumatera occur between August and October, although ramin trees sometimes produce flower and fruit in May. Meanwhile in Kalimantan, flowering and fruiting periods of ramin occur between January-May. Ramin's fruit ripe 2-3 months after anthesis.

Bogor  
Botanical  
Garden

Following those field and herbarium observations, Harun (2009, pers. comm.), a staff of Bogor Botanical Garden mentioned that fruiting season for *Gonystylus velutinus* collection in Bogor Botanical Garden is between January-March. Meanwhile, the flowering period for *G. macrophyllus* in the Garden is between January-late-April. He also noted that the death of one

*G. macrophyllus* tree in the Garden's collection has been affected the fruiting of the remaining tree. The remaining *G. macrophyllus* tree has not yet produced fruit since the lost of another tree several years ago. This carefully observation could lead to the need of studying flower biology and pollination mechanism of the *Gonystylus* species.

Flower biology and pollination syndrome are very important for determining regeneration capability and population dynamics (Partomihardjo 2005). A study on pollen morphology of the family Thymelaeaceae including genus *Gonystylus* has been done by Nowicke *et al.* (1985). However, the knowledge on flower biology and pollination syndrome of genus *Gonystylus* is still lacking. Thus, further studies are very crucial to be conducted.

### III. ECOLOGY

#### 3.1. Habitat Preference

The species of *Gonystylus* typically found in primary non-inundated rainforest at low and medium elevations, reaching 1200 m altitude in Sumatra and 1500 m in Borneo and the Philippines (Soerianegara and Lemmens, 1994). Different to *G. bancanus* (the most commercial species), other *Gonystylus* species have different range of habitat as summarized in Table 1 below.

**Table 1.** Habitat preference of *Gonystylus* species

No.	Species	Habit	Habitat
1	<i>Gonystylus acuminatus</i> Airy Shaw	Small tree 25 m by 50 cm	Primary lowland rainforest, at 150 m asl.
2	<i>Gonystylus affinis</i> Radlk.	Small tree up to 24 m	Primary open rainforest, up to 240 m asl.
3	<i>Gonystylus affinis</i> Radlk. var. <i>elegans</i> Airy Shaw	Small tree up to 24 m	Primary open rainforest, up to 240 m asl.
4	<i>Gonystylus areolatus</i> Domke ex. Airy Shaw	Small tree; ≤ 20 cm diameter	Lowland rainforest
5	<i>Gonystylus augescens</i> Ridl.	Small tree; ≤ 20 cm diameter	Lowland rainforest
6	<i>Gonystylus bancanus</i> (Miq.) Kurz.	Medium tree up to 42 m by 120 cm	Peat swamp forest
7	<i>Gonystylus borneensis</i> (Tiegh.) Gilg.	Shrubs/Small tree, diameter up to 60 cm	Lowland rainforest
8	<i>Gonystylus brunescens</i> Airy Shaw	Small tree 10-20 m	Non-inundated rainforest, up to 345 m asl.
9	<i>Gonystylus calophylloides</i> Airy Shaw	Small tree up to 6 m, ≤ 20 cm diameter	Banks of rocky stream at 210 m asl.
10	<i>Gonystylus calophyllus</i> Gilg.	Shrubs / Small tree, ≤ 20 cm diameter	Lowland rainforest
11	<i>Gonystylus confusus</i> Airy Shaw	Small tree 30 m by 60 cm	Non-inundated rainforest to hill-side
12	<i>Gonystylus consanguineus</i> Airy Shaw	Medium tree 16-40 m	Primary and disturbed rainforest

Literature Review on *Gonystylus* spp. other than *Gonystylus bancanus*:  
Botany, Ecology and Potency

13	<i>Gonystylus costalis</i> Airy Shaw	Small tree 4-5 m, ≤ 20 cm diameter	Primary rainforest, on ridge with sandy clay soil at 210 m asl.
14	<i>Gonystylus decipiens</i> Airy Shaw	Medium tree 25-30 m	Primary rainforest, on sand stone, up to 500 m asl.
15	<i>Gonystylus eximius</i> Airy Shaw	Small tree, ≤ 20 cm diameter	Lowland rainforest, on slope near river banks to 240 m asl.
16	<i>Gonystylus forbesii</i> Gilg.	Medium tree 40 m by 85 cm	Non-inundated primary rainforest, up to 1210 m asl.
17	<i>Gonystylus glaucescens</i> Airy Shaw	Small tree 10 m, ≤ 20 cm diameter	Sandstone ridge at 400 m
18	<i>Gonystylus keithii</i> Airy Shaw	Shrubs / Small tree 25 m by 90 cm	Non-inundated rain forest up to 410 m
19	<i>Gonystylus lucidulus</i> Airy Shaw	Medium tree up to 36 m	Lowland Dipterocarp forest (30-270 m)
20	<i>Gonystylus macrophyllus</i> (Miq.) Airy Shaw	Medium tree, up to 45 m tall by 1 m diameter	Low land primary forest, medium altitude
21	<i>Gonystylus maingayi</i> Hook. f.	Small tree up to 27 m	Primary rain forest up to 150 m ( <i>peat swamp</i> )
22	<i>Gonystylus micranthus</i> Airy Shaw	Small tree 18 m by 60 cm	Unknown/primary lowland forest <i>marsh</i>
23	<i>Gonystylus nervosus</i> Airy Shaw	Small tree 4-5 m, ≤ 20 cm diameter	Primary rain forest on limestone hills
24	<i>Gonystylus nobilis</i> Airy Shaw	Medium tree 24 m	Primary lowland Dipterocarp
25	<i>Gonystylus pendulus</i> Airy Shaw	Small tree 10 m by 12 cm	Evergreen rain forest at 360 m
26	<i>Gonystylus reticulatus</i> (Elm.) Merr.	Small slender tree, ≤ 20 cm diameter	Evergreen rain forest
27	<i>Gonystylus spectabilis</i> Airy Shaw	Medium tree up to 24 m	Presumably rain-forest on ridge at 195
28	<i>Gonystylus stenosepalus</i> Airy Shaw	Small tree	Unknown (primary forest)
29	<i>Gonystylus velutinus</i> Airy Shaw	Medium tree 35 m by 70 cm	Primary rain forest low alt. non-inundation
30	<i>Gonystylus xylocarpus</i> Airy Shaw	Small tree to medium	Rain forest at low altitude (heat forest)

Source and modified from: Airy Shaw (1953,1972 and 1973), Sidiyasa (2005), Bismarck et al. (2005).

The most widespread species *G. macrophyllus* occurs in primary forest at low and medium altitudes, ascending to 1200 m in Sumatra and to 1500 m in Sabah and the Philippines (Airy Shaw 1953; Soerianegara and Lemmens, 1994). It might well prove that the present concept of this species is too wide and that several distinct species can be recognized especially from the eastern Malesian region. On the other hand, *G. maingayi* occurs in primary lowland rain forest and in peat swamp forest up to 150(-200) in altitude and *G. velutinus* occurs scatteredly.

**Figure 7.**

*macrophyllus* at Cabang Panti,  
Gunung Palung National Park,  
West Kalimantan

### 3.2. Associated Species

It is mentioned in the previous sub-section that *Gonystylus* species are typically found in primary non-inundated rainforest at low and medium elevations to 1500 m asl. It is associated with different tree species as reported by many authors. In most habitats, ramin is principally associated

with *Shorea albida*, *Dactylocladus stenostachys*, *Dyera lowii*, *Cratoxylum arborescens*, *Palaquium* spp., and *Calophyllum* spp. (Soerianegara and Lemmens 1994).

Bismark *et al.* (2005) based on cruising result, reported that ramin in Riau Sumatra has a community association with meranti (*Shorea* spp.), durian burung (*Durio* spp.), bintangur (*Calophyllum retusum*), balam (*Alseodaphne macrocarpa*), rengas (*Gluta rengas*), arang-arang (*Diospyros paniculata*), pisang-pisang (*Mezzettia parviflora*), punak, jangkang, medang (*Cryptocarya* spp.), geronggang (*Cratoxylon* spp.), and darah-darah (*Horsfeldia globularis*).

Additionally, Bismark *et al.* (2005) also reported that in Central Kalimantan, in Forest Concession of Koperasi Serba Usaha Bajenta (1999), ramin has association with geronggang (*Cratoxylon* spp.), bintangur (*Calophyllum* spp.), jelutung (*Dyera costulata*), alau (*Dacrydium pectinatum*), nyatoh (*Palaquium* spp.), kayu malam (*Diospyros pseudomalabarica*), tumuh (*Combretocarpus rotundatus*), kapur naga (*Dryobalanops* spp.), pisang-pisang (*Mezzettia leptopoda*), mahang (*Tetrastroemia* spp.) jambu (*Eugenia* spp.), and gemur (*Alseodaphne coriacea*). Some tree species also associated with ramin in West Kalimantan such as geronggang (*Cratoxylon arborescens*), punak (*Tetramerista glabra*), belangiran (*Shorea balangeran*), kapur (*Dryobalanops* spp.), bintangur (*Calophyllum* spp.) and gelam tikus (*Melaleuca leucadendron*).

In accordance to Bismark *et al.*'s studies, Sidiyasa (2005), from direct observation in Kabupaten Kapuas, Central Kalimantan reported that ramin trees also associated with *Koompassia malaccensis*, *Mezzettia parviflora*, *Diospyros siamang*, *Aglaiia rubiginosa* and *Mussaendaopsis beccariana*.

### 3.3. Population Distributions

The *Gonystylus* species are distributed almost throughout the Malesian. Airy Shaw (1953, 1972 and 1973) has mentioned this area with the distribution exception; i.e. Central and East Java and the Lesser Sunda Islands. However, a single specimen of *G. macrophyllus* from Flores was found among of Herbarium Bogoriense (BO) specimens studied (see Appendix 3). *Gonystylus* distribution continues eastward towards the Solomon Islands, Nicobar and Fiji.

The vast majority of species is found on Borneo (27), especially in Sarawak, Peninsular Malaysia and Sumatra (Table 2).

**Table 2.** Distribution and number of *Gonystylus* species in Malesian Region

Island/Area	Number of species	Number of endemics
Malay Peninsula	7	0
Sumatra	7	0
Java	1	0
Borneo	27	19
Philippines	2	1
Sulawesi	1	0
Mollucas	1	0
New Guinea	1	0

Source : Airy Shaw (1953, 1972 and 1973), Sidiyasa (2005).

Note : Borneo; includes Sarawak, Sabah, Brunei Darussalam and Kalimantan.

The distribution trends show the decreasing number of species towards eastern part of Malesian region. Distribution detail of each species summarized in Table 3.

**Table 3.** List of *Gonystylus* species and its distribution

No.	Species	Distribution
1	<i>Gonystylus acuminatus</i> Airy Shaw	Malaya, Sumatra, Sarawak
2	<i>Gonystylus affinis</i> Radlk.	Malaya, Sarawak, West Kalimantan
3	<i>Gonystylus affinis</i> Radlk. var. <i>elegans</i> Airy Shaw	Sarawak
4	<i>Gonystylus areolatus</i> Domke ex. Airy Shaw	Sarawak
5	<i>Gonystylus augescens</i> Ridl.	Sarawak, West Kalimantan
6	<i>Gonystylus bancanus</i> (Miq.) Kurz.	Malaya, Sumatra, Bangka, Borneo
7	<i>Gonystylus borneensis</i> (Tiegh.) Gilg.	Sarawak, Sabah, Central Kalimantan
8	<i>Gonystylus brunescens</i> Airy Shaw	Malaya, Brunei Darussalam, Sabah, West Kalimantan, East Kalimantan
9	<i>Gonystylus calophylloides</i> Airy Shaw	Sarawak
10	<i>Gonystylus calophyllus</i> Gilg.	Sarawak
11	<i>Gonystylus confusus</i> Airy Shaw	Malaya, Sumatra (Aceh), West Kalimantan
12	<i>Gonystylus consanguineus</i> Airy Shaw	Sarawak, Sabah, West Kalimantan, East Kalimantan
13	<i>Gonystylus costalis</i> Airy Shaw	Sarawak
14	<i>Gonystylus decipiens</i> Airy Shaw	Sarawak
15	<i>Gonystylus eximus</i> Airy Shaw	Sarawak
16	<i>Gonystylus forbesii</i> Gilg.	Sumatra (including Mentawai Islands), Sabah, South Kalimantan
17	<i>Gonystylus glaucescens</i> Airy Shaw	East Kalimantan
18	<i>Gonystylus keithii</i> Airy Shaw	Sarawak, Sabah, Kalimantan
19	<i>Gonystylus lucidulus</i> Airy Shaw	Sarawak, Brunei Darussalam
20	<i>Gonystylus macrophyllus</i> (Miq.) Airy Shaw	Nicobar, Malesia (except Central and East Java, Bali and Nusa Tenggara), Solomon, Fiji
21	<i>Gonystylus maingayi</i> Hook. f.	Malaya, Sumatra, Brunei Darussalam, Sarawak, Sabah
22	<i>Gonystylus micranthus</i> Airy Shaw	Sarawak, South Kalimantan
23	<i>Gonystylus nervosus</i> Airy Shaw	Sarawak
24	<i>Gonystylus nobilis</i> Airy Shaw	Sarawak
25	<i>Gonystylus pendulus</i> Airy Shaw	Sarawak
26	<i>Gonystylus reticulatus</i> (Elm.) Merr.	Philippines
27	<i>Gonystylus spectabilis</i> Airy Shaw	Sarawak, West Kalimantan
28	<i>Gonystylus stenosepalus</i> Airy Shaw	Sarawak, Sabah
29	<i>Gonystylus velutinus</i> Airy Shaw	Sumatra (including Bangka & Belitung)
30	<i>Gonystylus xylocarpus</i> Airy Shaw	Sarawak, West Kalimantan

Source : Airy Shaw (1953,1972 & 1973), Sidiyasa (2005), Result from study by team at West Kalimantan.

Note : Borneo; includes Sarawak, Sabah, Brunei Darussalam and Kalimantan.

In regards to population distribution data status, the review team has encountered several facts as follows:

- Available data is very insufficient in term of data number and data age. Most of species data collected from three herbaria is very limited except data for the widely distributed *G. macrophyllus* due to the vast number of specimens represented this species. On the other hand, the majority of specimens were collected before 1990's and only a small proportion of specimens of non-*G. bancanus* species collected after 1990's.
- In many specimens, locality details did not recorded and written, therefore, many of these specimens are less informative for tracing the potential distribution location for *Gonystylus* species. Furthermore, additional information on specimen labels is also lacking. Of the more than 200 herbarium specimens in Herbarium Bogoriense, only 55 specimens have phenological note as it has mention in phenological study by Partomihardjo (2006).
- Observation on specimens and specimen's databases showed a significant number of unidentified *Gonystylus* species (still labeled as *Gonystylus* sp.). Our national resource person, Dr. Kade Sidiyasa from Herbarium Wanariset Samboja has explained that such of condition is caused by a non-user friendly identification keys or in other words, the available identification keys are not easy to use. This situation increase the number of unidentified *Gonystylus* specimens.

Based on this circumscription, a series of data updating process are utterly required and should be placed as the prioritize activity for *Gonystylus* study. However, under the limited data condition, a series of distribution map are provided in Appendix 4.

## IV. POTENCY

### 4.1. Regeneration Potential

Regeneration capability of the forest tree species is very dependant to the successful reproduction cycle that started from flower formation to the seedling development (Partomihardjo 2005). The failure in one of the reproduction steps could fatally affected regeneration process and the development of the new tree stand (Smith 1986 in Ashton 1998), although this processes are also environmentally influenced.

Slow natural regeneration capability has been recorded for *Gonystylus* (Tim Ramin 2003, 2004, 2005; Partomihardjo 2005). This is proven by lack of seedlings under parent trees. Population of ramin shows abnormality in which it has more large individuals compared with smaller trees (Sutisna *et al.*, 1988; Daryono 1996).

**Figure 8.**  
*Gonystylus confusus* (X) at Cabang Panti, Gunung Palung National Park, West Kalimantan, measured during author's visit

An example of the slow growing *Gonystylus* has also found during the review process. In the duration of the review, a brief survey on *Gonystylus* species has been conducted during discussion with Dr. Campbell O. Webb at Cabang Panti, Ginung Palung National Park, West Kalimantan. During the visit, a measurement has been taken on *G. confusus* (see figure 8) tree diameter in a 40x40 m<sup>2</sup> plot (GP23 SS/BB 97 40). The result was compared to the previously recorded data of Dr. Webb from 12 years ago and showed that tree diameter has increased 3 cm within 12 years period.

The current circumscription must be considered in the future development of conservation efforts and in the sustainable use and trade for *Gonystylus* or ramin species. Over exploitation combined with the slow growing habit could lead to the severe depletion of the species.

## 4.2. Timber and Other Potential Uses

The available information about potential uses of *Gonystylus* species non-*G. bancanus* is very limited compare to the data on the uses of *G. bancanus*. Of those 11 species other than *G. bancanus* are traded under ramin name for their valuable wood (Soerianegara and Lemmens 1994; CITES 2004; Sidiyasa 2005).

The ramin whitish timber is highly prized and popular as a decorative cabinet timber, furniture, interior decoration such as wall paneling, flooring, toys, broom handles and other non-impact handles, Venetian blind slats, dowels, rulers, picture frames and drawing boards. Ramin is also used for general light construction such as door and window frames, mouldings, skirtings, ceilings, partitions, stair treads and counter tops. (Various other applications are planks, barrels, and shipboards. (Soerianegara and Lemmens 1994).

Despite producing timber, several *Gonystylus* species also produce non-timber forest products such as medicine, poison and incense that are valuable for the local people income (Sidiyasa 2005). The infected heartwood of *G. macrophyllus* and several other species is use for incense (just like *Aquilaria* spp.). The pounded fruit of *G. keithii* mixed with wood and ashes can be use for fish poison. Meanwhile decoction of *G. confusus* root as well as several other species can be use for protective medicine in administered after childbirth (Airy Shaw 1953; Soerianegara and Lemmens 1994; Sidiyasa 2005).

## V. CONCLUSIONS AND RECOMMENDATIONS

### 5.1. Conclusions

- Genus *Gonystylus*, comprises 29 species and 1 variety distributed throughout Malesian region (including Indonesia) with center of diversity in Borneo. The centres for distribution of the genus in Indonesia are in Sumatera (Aceh, North Sumatra, West Sumatra, Riau, Jambi, Bangka and Belitung and Lampung) and Kalimantan (West Kalimantan, Central Kalimantan and East Kalimantan).
- Besides *G. bancanus* there are other 5 species *Gonystylus* (*Gonystylus affinis*, *G. forbesii*, *G. macrophyllus*, *G. maingayi* and *G. velutinus*) in international trade of those 11 species that produce commercial timber and 2 species (*G. micranthus* dan *G. xylocarpus*) that locally use.
- *Gonystylus* species usually occur in non-inundated lowland forest up to 1500 m asl, except *Gonystylus brunnescens*, *G. micranthus* & *G. maingayi* that prefers more wet or damp areas. Unlike *G. bancanus* that is usually dominant in peat swamp, several *Gonystylus* species (e.g. *G. velutinus* and *G. confusus*) occur scatteredly.
- Flowering and fruiting season of *Gonystylus* species is varied every year. Flowering and fruiting season occur between February-March and May-October. Flowering season in Sumatera occur between August-October, meanwhile in Kalimantan, the blossoming period happens between January-May.
- The slow regeneration process on *Gonystylus* became a barrier for its natural population recovery. Together with the insufficient knowledge on flower biology and pollination syndrome, the slow regeneration process could create a major obstacle for the species conservation and sustainable use.

## 5.2. Recommendations

- Conduct series of studies on biology (including phenology and breeding), ecology and potency for *Gonystylus* species other than *G. bancanus*. Data and information resulted from this proposed study will be useful for assessing species status in IUCN redlist and CITES appendices.
- Forming a *clearing house* mechanism (CHM) for data sharing and updating among of the involved institutions and stake holders related to genus *Gonystylus* in specific and other species included in CITES appendices in general. This data can be functioned as reference data for CITES implementation in Indonesia.
- Form a team to monitor and conduct a thorough study on the stock and distribution of *Gonystylus* species other than *G. bancanus* in the field, following the previously existed national team for *G. bancanus*.
- West Kalimantan and East Kalimantan are highly recommended as the main targeted area for ground survey of *Gonystylus* non-bancanus, following by other potential distribution areas.
- Develop an effective method or technology in order to accelerate ramin's growth rate and to overcome the natural slow growing barrier. Furthermore, the existing seed stands should be protected and seedling seed orchard as well as clonally seed orchard should be developed.
