

Catalogue of the lichens of the Falkland Islands

by Clifford M. Wetmore*

*Biology Department, Wartburg College, Waverly, Iowa

In anticipation of future work on the lichens of the Falkland Islands I have begun by compiling a list of the lichen taxa previously reported from the Falkland Islands. This catalogue includes only the two large Islands (East Falkland and West Falkland) and the nearby small islands but not other island groups, such as the South Orkneys, which are included in the Dependencies of the Falkland Islands. Although a partial attempt at such a catalogue was published by Zahlbruckner (1917), he cited no literature to substantiate the taxa listed and his purpose was to list only taxonomically correct names instead of all names published, as does this catalogue.

This catalogue is the same type as my previous one for Tasmania (Wetmore, 1963). The purposes of this catalogue are primarily bibliographic rather than tazonomic and I attempt to accomplish the following: (1), to list all of the lichen names reported from the Falkland Islands in the literature together with the authors who reported them, (2), to bring together all known collector's names and the places where their lichens might be found.

This catalogue lists 239 specific and 52 infraspecific names in 52 genera. Of these, 78 taxa were described from material collected on the Falkland Islands and are preceded by asterisks (*). Nine more species are nomina nuda and one is listed as unknown and doubtful. All names have been included, even though they have been considered obvious synonyms. In all cases complete nomenclatural citations have been listed and I have checked all of these citations with the original publications unless noted otherwise. The citations are followed by references, in

chronological order, to the papers reporting the taxa from the Falklands. In the list of these references Zahlbruckner's Catalogus Lichenum Universalis (1922-40) has not been included unless it is the only report. An annotated bibliography of Falkland Island lichenology is included at the end of the paper.

The arrangement of taxa into genera (and in most cases the rank of the taxa) follows Zahlbruckner (1922-40) and the arrangement of genera and families follows Zahlbruckner (1926). Exceptions are the recognition of the Stereocaulaceae after Lamb (Canadian Jour. Bot., 29(5): 522-584. 1951), Baeomycetaceae after Rasanen (Acta Bot. Fenn., 33: 1-82. 1943). The Phyllopsoraceae has been included in the Lecideaceae and Candelariaceae is recognized as a distinct family. The Physciaceae and Teloschistaceae are used in their widest sense as recommended by Nannfeldt (Nova Reg. Soc. Sci. Ups., IV. 8 (2): 64-65. 1932), Hypogymnia and Menegazzia in the Parmeliaceae are recognized as distinct genera as well as Pseudocyphellaria in the Stictaceae and Neuropogon in the Usneaceae.

When names have been moved to genera where the combination has not been previously made, the generic name is included in parentheses. No new combinations are intended in this paper because some of them would be unnecessary and nomenclatural changes should follow, not precede taxonomic study.

In a few cases presumed typographical or orthographical errors have been noted and these are cross referenced in the catalogue. One name could not be located either in Zahlbruckner (1922-40) or Lamb (1963) and it could not be determined where it belongs in the classification of lichens and it has been listed at the end of the main listings in a separate list along with the nomina nuda.

In the preparation of this catalogue I have attempted to make it as complete as possible but errors may have crept in and I would appreciate any corrections or additions noted.

Historical

The Falkland Islands were discovered either in 1520 by Gomez (Portuguese) or in 1592 by Davis (English), which is part of the dispute on whether the Falklands belong to Argentina or Great Britain. Several voyages touched the Falklands in the next two centuries but apparently the first botanical explorations began in 1767-8 with Commerson, as naturalist on the expedition by Bougainville in the ships La Boudeuse and L'Etoile. Captain Cook's second voyage (1772-75) with Forster and Sparrman as collectors stopped at the Falklands. The first major botanical exploration was done by Gaudichaud as collector with Freycinet's voyage (1817-20) with the ships Uranie and Physicienne. The lichens were identified by Bory and Persoon and included in the reports published by Mirbel (1825) and Gaudichaud (1826). The ship La Coquille under the command of Duperry made a voyage from 1822 to 1825 which stopped at the Falklands and had Dumont D'Urville and Lesson as collectors. The lichens were identified by Bory and listed by Dumont D'Urville (1825). Charles Darwin visited the Falklands in 1834 on his voyage around the world with Captain Fitz Roy commanding the Adventure and Beagle and collected some lichens but no list was ever published. The voyage of the Erebus and Terror during 1839-43 under the command of Ross with J. D. Hooker brought back many lichens from the Falkland Islands. These were first identified by Taylor and a preliminary report was published by Hooker and Taylor (1844) mentioning some Falkland lichens. The lichen identifications were revised by Babington and his names are in ^{used} Hooker's report of this part of the voyage (Hooker, 1845-47) listing the lichens collected. Crombie (1877) identified and published records

of some lichens collected by Cunningham during the voyage of the Nassau, 1867-69. On the expedition by Nordenskjold, 1901-03, in the ship Antarctic, Skottsberg collected lichens on the Falklands which were identified and enumerated by Darbishire (1912). Cotton (1915) repeats Darbishire's list and adds a few new records. Skottsberg visited the Falklands again between 1907-09 and collected lichens which were identified and published by Zahlbruckner (1917). In Skottsberg's excellent botanical survey of the Falklands (Skottsberg, 1913) he uses the identifications of Darbishire. Appended to Zahlbruckner's paper (1917) is a list of the accepted lichen species known from the Falkland Islands, but without references as to whose reports the records were based. A few lichens collected in the Falklands by Lamb between 1931 and 1932^{and 1944 and 1946} are included in his first report on the lichens of the Discovery II expeditions. He has many more Falkland lichens which ^{in these years and also 1944 and 1946} he collected, which have not yet been reported (personal communication).

Various other collectors have spent some time on the Falklands and collected lichens outside of their main duties. One of the early collectors, Lechler, published an exsiccate of ~~#1/4~~ Falkland lichens (edited by Hohenacker) - Plantae Insularum Maclovianarum, however, I have not seen any of this set and so could not include this reference among the references cited after the taxa. Mrs. Eleanor Vallentin, a native of the Falkland Islands, collected some lichens which have been included in various papers. For a more complete listing of persons who have collected plants (and especially lichens) on the Falklands and the herbaria where their plant collections are preserved, see table 1. In most cases no organized reports (other than those mentioned above)^{dealing mainly with Falkland lichen} have been published concerning these miscellaneous collections. Occasional specimens are mentioned in scattered revisions and monographs and it seems fruitless to ~~#1/4~~ list every publication which mentions each collector in this table. Where known, the dates the collector spent on

the Falkland Islands are listed. The abbreviations of \neq herbaria follow
Lanjouw and Stafleu, Index Herbariorum, Part 1, Herbaria of the World
(*Regnum Vegetabile* 31, ed. 5. 1964).
