# 1. Introduction

## 1.1. Project Background

The Battler prospect (Battler) is located approximately 14.5 km south-southwest of Southern Cross (Figure 1). Battler is composed of two major tenements; M77/166 contains the proposed minesite and associated infrastructure, with the surrounding P77/3645 expected to experience minor (if any) impact. Previous mining has occurred within two tenements (M77/1025 and M77/1044) that occur within M77/166. For the purposes of this survey and report, these historical tenements are treated as part of M77/166.

IMD Gold Mines Ltd is investigating the potential for further mining at Battler and contracted Bioscope Environmental (Bioscope) to manage the mining approvals process. Bioscope initially contracted Western Botanical to conduct a Level 1 flora and vegetation survey of Battler, conducted 29<sup>th</sup> September to 1<sup>st</sup> October 2015, in accordance with Guidance Statement 51 (EPA 2004). An additional focus of the survey was to map, quantify, and assess the regional distribution of the Priority 2 species *Acacia concolorans* previously recorded at Battler.

Identification of collected specimens from this initial survey revealed the existence of additional priority species at Battler. A second field survey was performed during 21<sup>st</sup> – 23<sup>rd</sup> October 2015 to map and quantify these additional priority species.

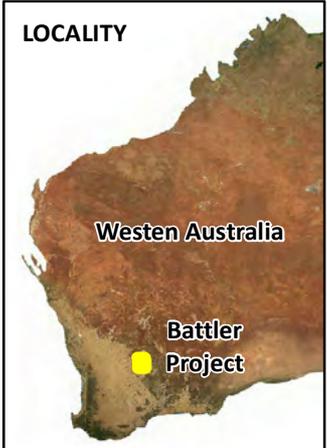

## 1.2. Previous Surveys of Battler

Botanica Consulting (2011) (Botanica) conducted a Level 1 flora and vegetation survey of the Battler site in 2010. Botanica reported two vegetation communities comprising of 50 flora taxa, including the Priority 2 species *Acacia concolorans* and three weeds (*Carrichtera annua*, *Medicago minima*, and *Centaurea melitensis*).

Though not encountered within the Botanica survey a DEC (Department of Environment and Conservation) record of the Priority 1 species *Goodenia heatheriana* was reported as being within the project area. Additionally, the Botanica report highlighted the potential for Priority 1 species *Millotia newbeyi* to be within the Battler project area.

As part of the 2011 survey, Botanica conducted searches of DEC/DpAW databases and found no Threatened or Priority Ecological Communities, no Threatened flora (Declared Rare Flora), and no Ecologically Sensitive Areas at Battler.

## 2. Methods

### 2.1. Desktop Assessment

To gather background information and to enhance field team member knowledge of Battler's local flora, the following sources were accessed prior to fieldworks:

- A NatureMap (Government of Western Australia 2015a) search results for records of flora occurring within 20 km of Battler.
- DPaW TEC and PEC descriptions (DPaW 2015).
- Botanica Consulting (2011). *Level 1 Flora and Vegetation Survey: Battler*. Consultant report prepared for Southern Cross Goldfields Ltd.
- Bureau of Meteorology online climate data (BOM 2015).
- FloraBase location records of priority flora expected to be encountered.
- The Western Australian Herbarium reference and research flora specimen collections.

### 2.2. Field Survey

Two spring fieldtrips (29<sup>th</sup> September – 1<sup>st</sup> October and 21<sup>st</sup> – 23<sup>rd</sup> October) were conducted as part of the survey, both consisting of the same two senior botanists (Section 5.0).

The first day of survey (29<sup>th</sup> September) was devoted to visiting and quantifying known populations of *Acacia concolorans* (P1) to the south of Battler. This regional work was invaluable to the field team's knowledge of the taxon and the team's ability to confirm/repudiate the previous record of *A. concolorans* at Battler.

The remainder of the first fieldtrip was spent surveying Battler by walking individual transects; spaced 25 m apart on tenement M77/166, and 50 m apart on the remainder untraversed portions of tenement P77/3645.

Changes in vegetation associations were waypointed using GPS units (Garmin GPSmap76 ± 5 m accuracy) to assist placement of vegetation map boundaries. Relevés were conducted for newly encountered vegetation associations and periodically conducted to verify or modify re-encountered associations. Specimens were taken for most flora encountered (excluding very obvious taxa) to ensure priority species were not overlooked and to help form a full species list for the Battler project.

The second fieldtrip focused on targeted searching for priority species identified subsequent to the first survey and during the second fieldtrip; *Hydrocotyle corynophora* (P1), *Goodenia heatheriana* (P1), *Gnephosis intonsa* (P3), and *Phlegmatospermum eremaeum* (P3). Plant numbers of these annuals were estimated using a combination of 'extrapolated count' and 'estimate' methods (as per DEC n.d.). Since all target priority species were annuals occurring in wet depressions, the search was heavily focused on areas of Battler where such habitat occurs.

Additionally, searches were conducted outside of and adjacent to Battler in areas most likely containing suitable habitat.

### **2.3. Flora Specimen Identification**

Flora specimens collected during fieldworks were identified using the resources of Western Botanical's herbarium and the Western Australian Herbarium. Mike Hislop and Rob Davis of the Western Australian Herbarium performed confirmation of identification for specimens of key importance to the Battler project; *Goodenia heatheriana*, *Hemigenia* sp. Newdegate (E. Bishop 75), *Hydrocotyle corynophora*, and *Teucrium* sp. dwarf (R. Davis 8813).

### 3. Results and Discussion

#### 3.1. Biogeography

Battler is located within the Coolgardie region and Southern Cross (COO2) subregion as described by the Interim Biogeographic Regionalisation for Australia system. The subregion is characterised by gently undulating uplands dissected by broad valleys with bands of low greenstone hills (Cowan *et al.* 2001). Vegetation of COO2 includes *Eucalyptus* woodlands (*Eucalyptus salmonophloia*, *E. salubris*, *E. transcontinentalis*, *E. longicornis*) with granite basement outcrops supporting stands of *Acacia acuminata* and *E. loxophleba* (Cowan *et al.* 2001).

Battler lies just within the western portion of the Great Western Woodlands area as defined within DEC 2010. The Great Western Woodlands covers an area of almost 16 million hectares and is considered the largest remaining area of intact Mediterranean woodland (DEC 2010).

Priority Ecological Communities of relevance or close proximity to Battler include (DPaW 2015):

- Red Morrel Woodlands of the Wheatbelt – Unspecified locations within the Wheatbelt DPaW regional boundary.
- Parker Range Vegetation Complex – Approximately 35 km SE of Battler.
- Eucalypt Woodlands of the Western Australian Wheatbelt. Within Avon Wheatbelt IBRA region, approximately 12 km west of Battler.

Results of the NatureMap search (Appendix 1) found 475 flora taxa within 20 km of Battler, including two Threatened (Declared Rare Flora) species (*Daviesia microcarpa*, *Eucalyptus crucis* subsp. *crucis*) and 20 Priority species.

Rainfall data (BOM 2015) for nearby Southern Cross Airport shows an above average season for the Battler during the year previous to the survey (Figure 2). Total rainfall for the previous 12 months was 368.8 mm compared to the historical mean of 305.6 mm. Rainfall in August prior to the survey was 2.73 times the historical mean.

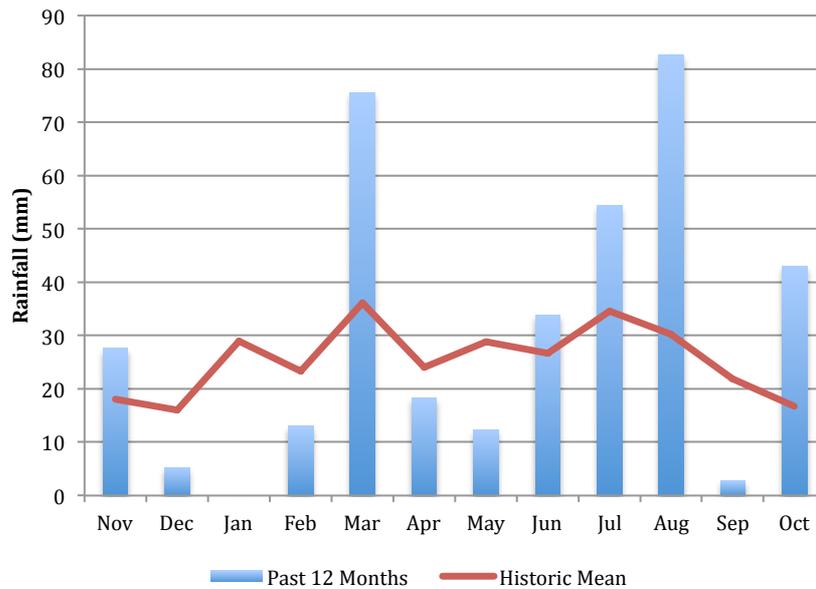

Figure 2. Recent and historical mean rainfall recorded at Southern Cross Airport (BOM 2015).

### 3.2. *Acacia concolorans* Regional Survey

Western Botanical botanists conducted a regional survey of known *Acacia concolorans* (P2) locations up to approximately 100 km south of Battler in order to address uncertainty over its presence at Battler. Attempts were made to visit seven of the nine known locations, with five being visited due to access limitations. *Acacia concolorans* plants (Plate 1) were found in abundance and widely distributed at two of the five visited locations. This survey resulted in improved familiarity with the taxon and confirmed identity differentiation from other closely related *Acacia* species. *Acacia concolorans* differs from *A. intricata* in having a smaller and more upright habit, thicker and more robust branches, and sparser phyllodes that are associated with strong pungent stipules.

At Battler, the three locations of *A. concolorans* reported by Botanica (2011) were revisited. Despite searching at and around these locations, no plants of *A. concolorans* were found. Additionally, no *A. concolorans* plants were encountered at or near Battler by Western Botanical during the survey works. However, all three previously reported locations of *A. concolorans* did contain numerous plants of *A. intricata*, a species similar in appearance. It is therefore likely that the previously reported occurrences of *A. concolorans* at Battler were due to misidentification of *A. intricata*.

**Plate 1. Examples of *Acacia concolorans* plants encountered during regional survey.**

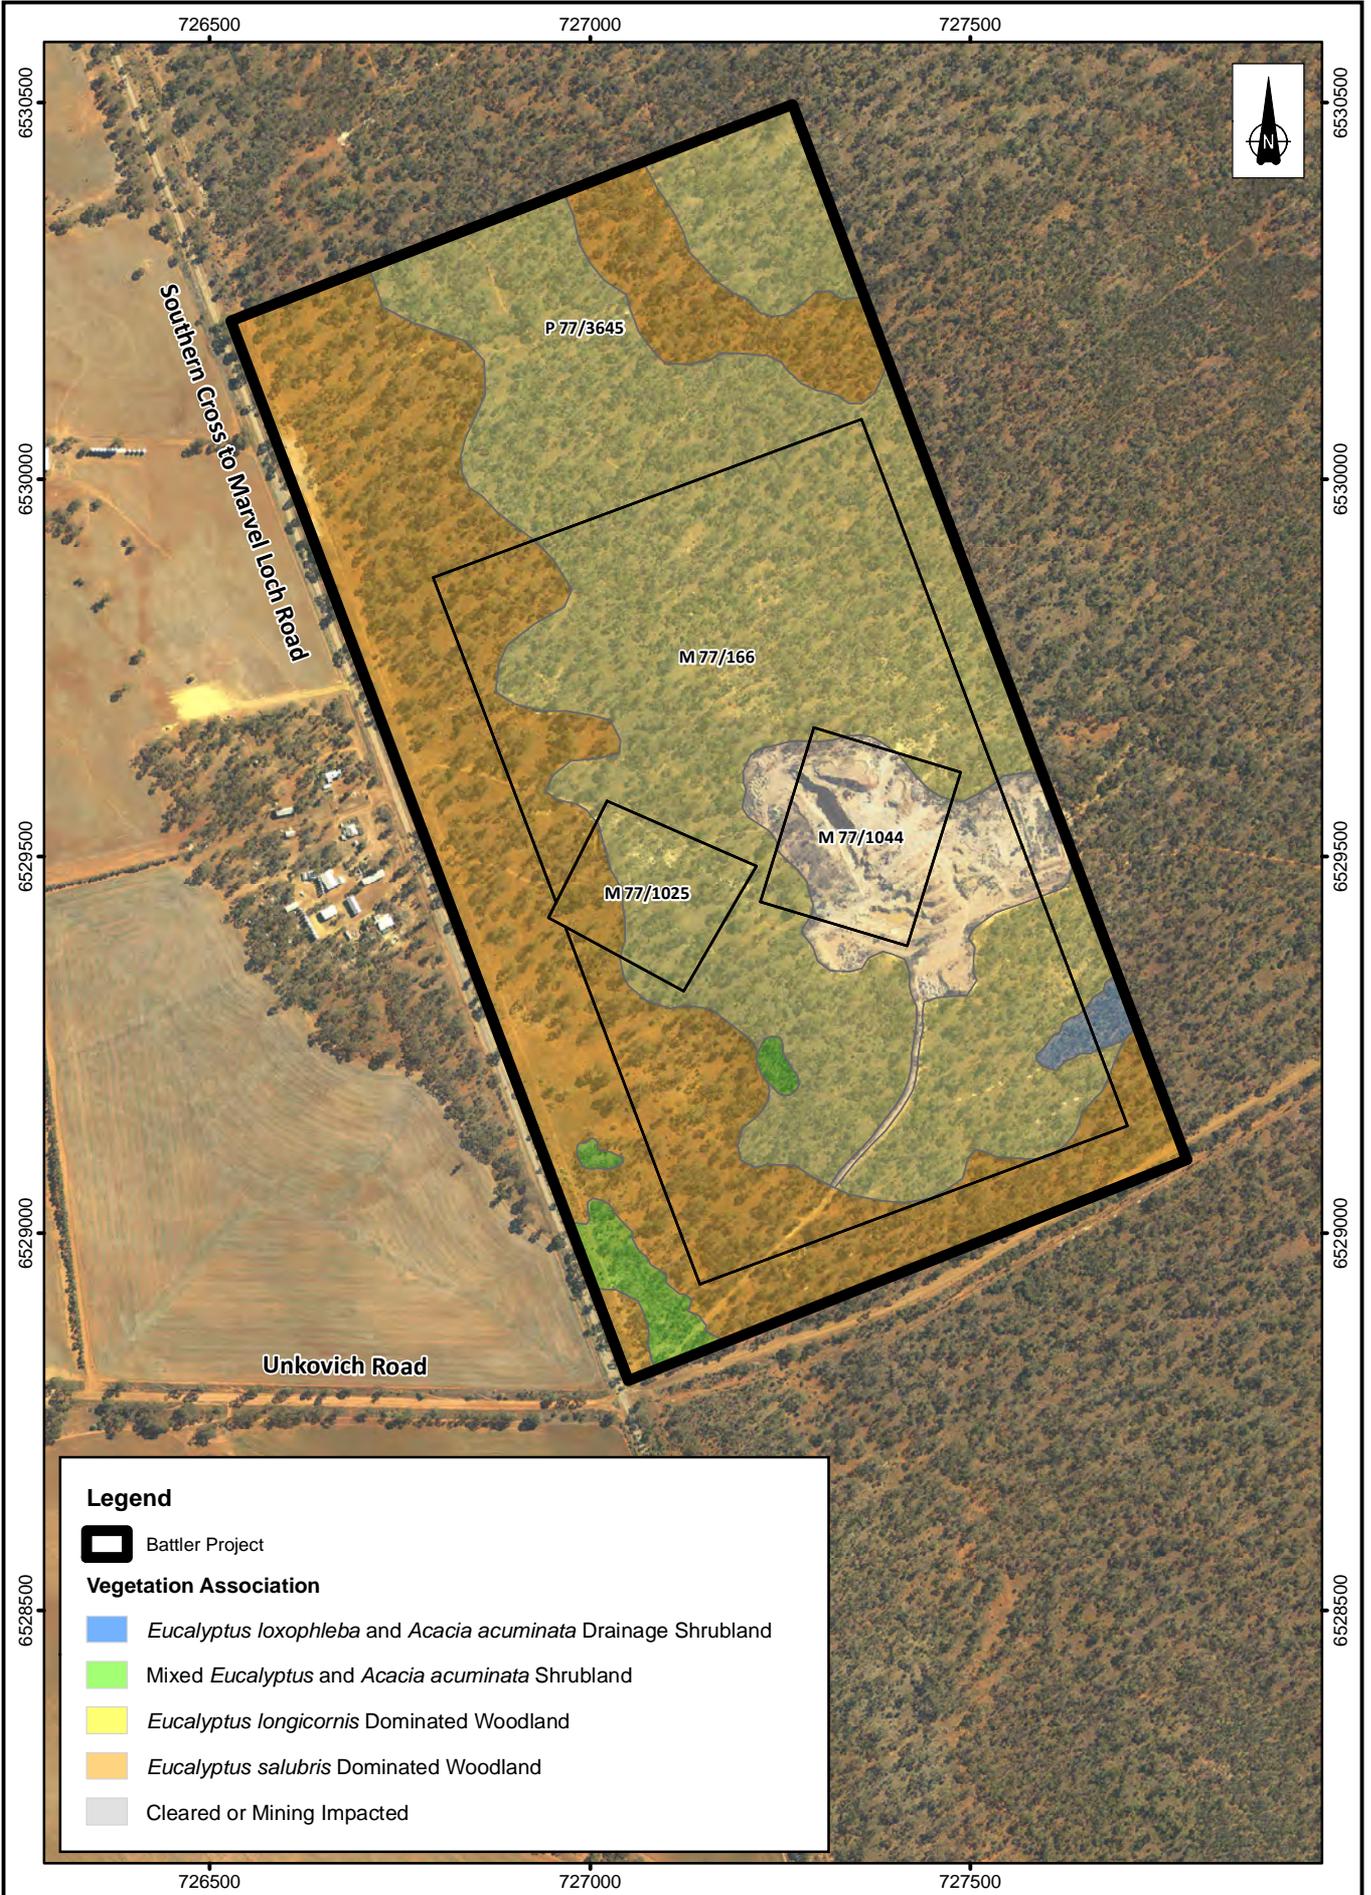

### **3.3. Vegetation Mapping**

The vegetation map of Battler resulting from the field survey is presented in Figure 3. The five vegetation associations (one representing mined and/or cleared areas) below were identified and are described in detail within the following headings.

- *Eucalyptus longicornis* Dominated Woodland
- *Eucalyptus salubris* Dominated Woodland
- *Eucalyptus loxophleba* & *Acacia acuminata* Drainage Shrubland
- Mixed *Eucalyptus* & *Acacia acuminata* Shrubland
- Cleared or Mining Impacted

The two major vegetation associations at Battler, ‘*Eucalyptus longicornis* Dominated Woodland’ and ‘*Eucalyptus salubris* Dominated Woodland’ continue and extend outside of the Battler project area and appear common in the local region.

**Figure 3. Vegetation Map of Battler project and surrounds.**

### 3.3.1. *Eucalyptus longicornis* Dominated Woodland

*Eucalyptus longicornis* (dominant), *E. salubris*, and *E. calycogona* subsp. *calycogona* open woodland from 6 to 15 m over *Melaleuca pauperiflora* subsp. *fastigiata* and *Santalum apiculatum* sparse tall shrubland from 3 to 4 m over *Eremophila scoparia*, *Atriplex vesicaria*, *A. bunburyana* open shrubland from 0.6 to 1.5 m over *Maireana georgei*, *Enchylaena tomentosa*, *Zygophyllum* spp. sparse low shrubland (Plate 2).

*Eucalyptus longicornis* Dominated Woodland is widespread at Battler, occurring on higher flat areas and associated long gentle slopes. Higher in the landscape than the *Eucalyptus salubris* Dominated Woodland (see next entry), this association is drier and contains fewer wet depressions and lower densities of annuals and weeds.

The priority three species *Phlegmatospermum eremaeum* was recorded within this vegetation association at one isolated location just outside the boundary of tenement M77/166 (see Section 3.5).

Plate 2. Examples of *Eucalyptus longicornis* Dominated Woodland vegetation association.

### 3.3.2. *Eucalyptus salubris* Dominated Woodland

*Eucalyptus salubris* (dominant), *E. calycogona* subsp. *calycogona*, and *E. longicornis* open woodland from 6 to 15 m over *Exocarpos aphyllus*, *Atriplex nummularia* isolated shrubs from 2 to 3 m over *A. vesicaria*, *Ptilotus* sp. Goldfields (R. Davis 10796), *Zygophyllum apiculatum* (with *Acacia erinacea*, *A. merrallii*, *A. intricata* in southern areas) sparse shrubland (Plate 3).

Being lower in the landscape this vegetation association contains frequent wet depressions that support a host of annual species, commonly including; *Gnephosis intonsa* (P3), *Goodenia pinnatifida*, *Rhodanthe chlorocephala* subsp. *rosea*, *Leucochrysum fitzgibbonii*, and *Podolepis capillaris*. Some localised wet depressions within this vegetation association were found to support *Hydrocotyle corynophora* (P1) and *Goodenia heatheriana* (P1).

Weeds were common within this association at the time of the survey, particularly toward the western boundary in closer proximity to farmland. Of the weeds *Carrichtera annua* (Wards Weed) was most prevalent in dense patches within wet depressions. Other weeds scattered in low densities included; *Brassica tournefortii* (Mediterranean Turnip), *Arctotheca calendula* (Cape Weed), *Medicago minima* (Small Burr medic), *Centaurea melitensis* (Maltese Cockspur), *Sonchus oleraceus* (Common Sowthistle), and *Avena barbata* (Bearded Oat).

**Plate 3. Examples of *Eucalyptus salubris* Dominated Woodland vegetation association.**

### **3.3.3. *Eucalyptus loxophleba* & *Acacia acuminata* Drainage Shrubland**

Emergent *Eucalyptus loxophleba* subsp. *lissophloia* (6 to 10 m) over *Acacia acuminata* (3 to 4 m) tall shrubland over *Beyeria sulcata*, *Alyxia buxifolia*, *Philotheca brucei* open shrubland (2 to 3 m), over a very sparse ground layer of *Podolepis lessonii* and *Trachymene cyanopetala* (Plate 4).

This vegetation association is restricted to one area located toward the south-eastern portion of Battler. It represents a reasonably large internal drainage area that is likely seasonably inundated.

No priority species or weed species were recorded within this association at the time of survey.

**Plate 4. Examples of *Eucalyptus loxophleba* & *Acacia acuminata* Drainage Shrubland vegetation association.**

#### **3.3.4. Mixed *Eucalyptus* & *Acacia acuminata* Shrubland**

*Eucalyptus corrugata*, *E. yilgarnensis*, and *E. oleosa* subsp. *oleosa* open woodland (6 to 10 m) over *Acacia acuminata* (3 to 4 m) tall shrubland over *Hybanthus floribundus*, *Beyeria sulcata*, *Trymalium myrtillus* subsp. *myrtillus* shrubland (0.6 to 2.5 m) over *Lepidosperma* aff. *fimbriatum* (species of interest) sparse sedgeland (Plate 5).

This vegetation association occurs on the low hill rise within the south-western portion of the project area with a disjunct patch occurring on an small isolated rise further toward the centre of the project area.

The Priority 1 species *Hemigenia* sp. Newdegate and the species of interest *Lepidosperma* aff. *fimbriatum* both appear restricted to this vegetation association. In the case of *H.* sp. Newdegate,

its identity was not determined until after the second field survey and it may therefore be more abundant within this vegetation association than currently reported.

**Plate 5. Examples of Mixed *Eucalyptus* & *Acacia acuminata* Shrubland vegetation association.**

### **3.3.5. Cleared or Mining Impacted**

This association is represented by the historical mine and associated vehicle tracks. These areas have had most native vegetation previously removed with some natural revegetation subsequently occurring across the historical mine (primarily chenopods of *Atriplex* spp., *Sclerolaena* spp. and *Enchylaena tomentosa*). Common weeds within this association include *Hordeum leporinum* (Barley grass) throughout, *Moraea setifolia* along vehicle tracks, and infrequently scattered *Arctotheca calendula* (Cape weed).

### 3.4. Overview of Flora

A total of 140 flora taxa were recorded during the survey effort, comprising of 36 families, 92 genera and 140 species. A full species list is presented in Appendix 2. The survey season quality was considered excellent with an unexpectedly high number of species recorded for Battler's small project area. Family Asteraceae was represented by 26 taxa (18% of flora), followed by Chenopodiaceae with 17 taxa (12% of flora) and Fabaceae with 15 taxa (11% of flora).

No Threatened (Declared Rare Flora) were found at or adjacent to Battler. Five priority species were found, including three Priority 1 and two Priority 3 species. An additional Priority 1 species was found outside of Battler approximately 1 km to the east. One species of interest (due to unresolved taxonomy) was also found at Battler. Sixteen weed species were recorded during the survey.

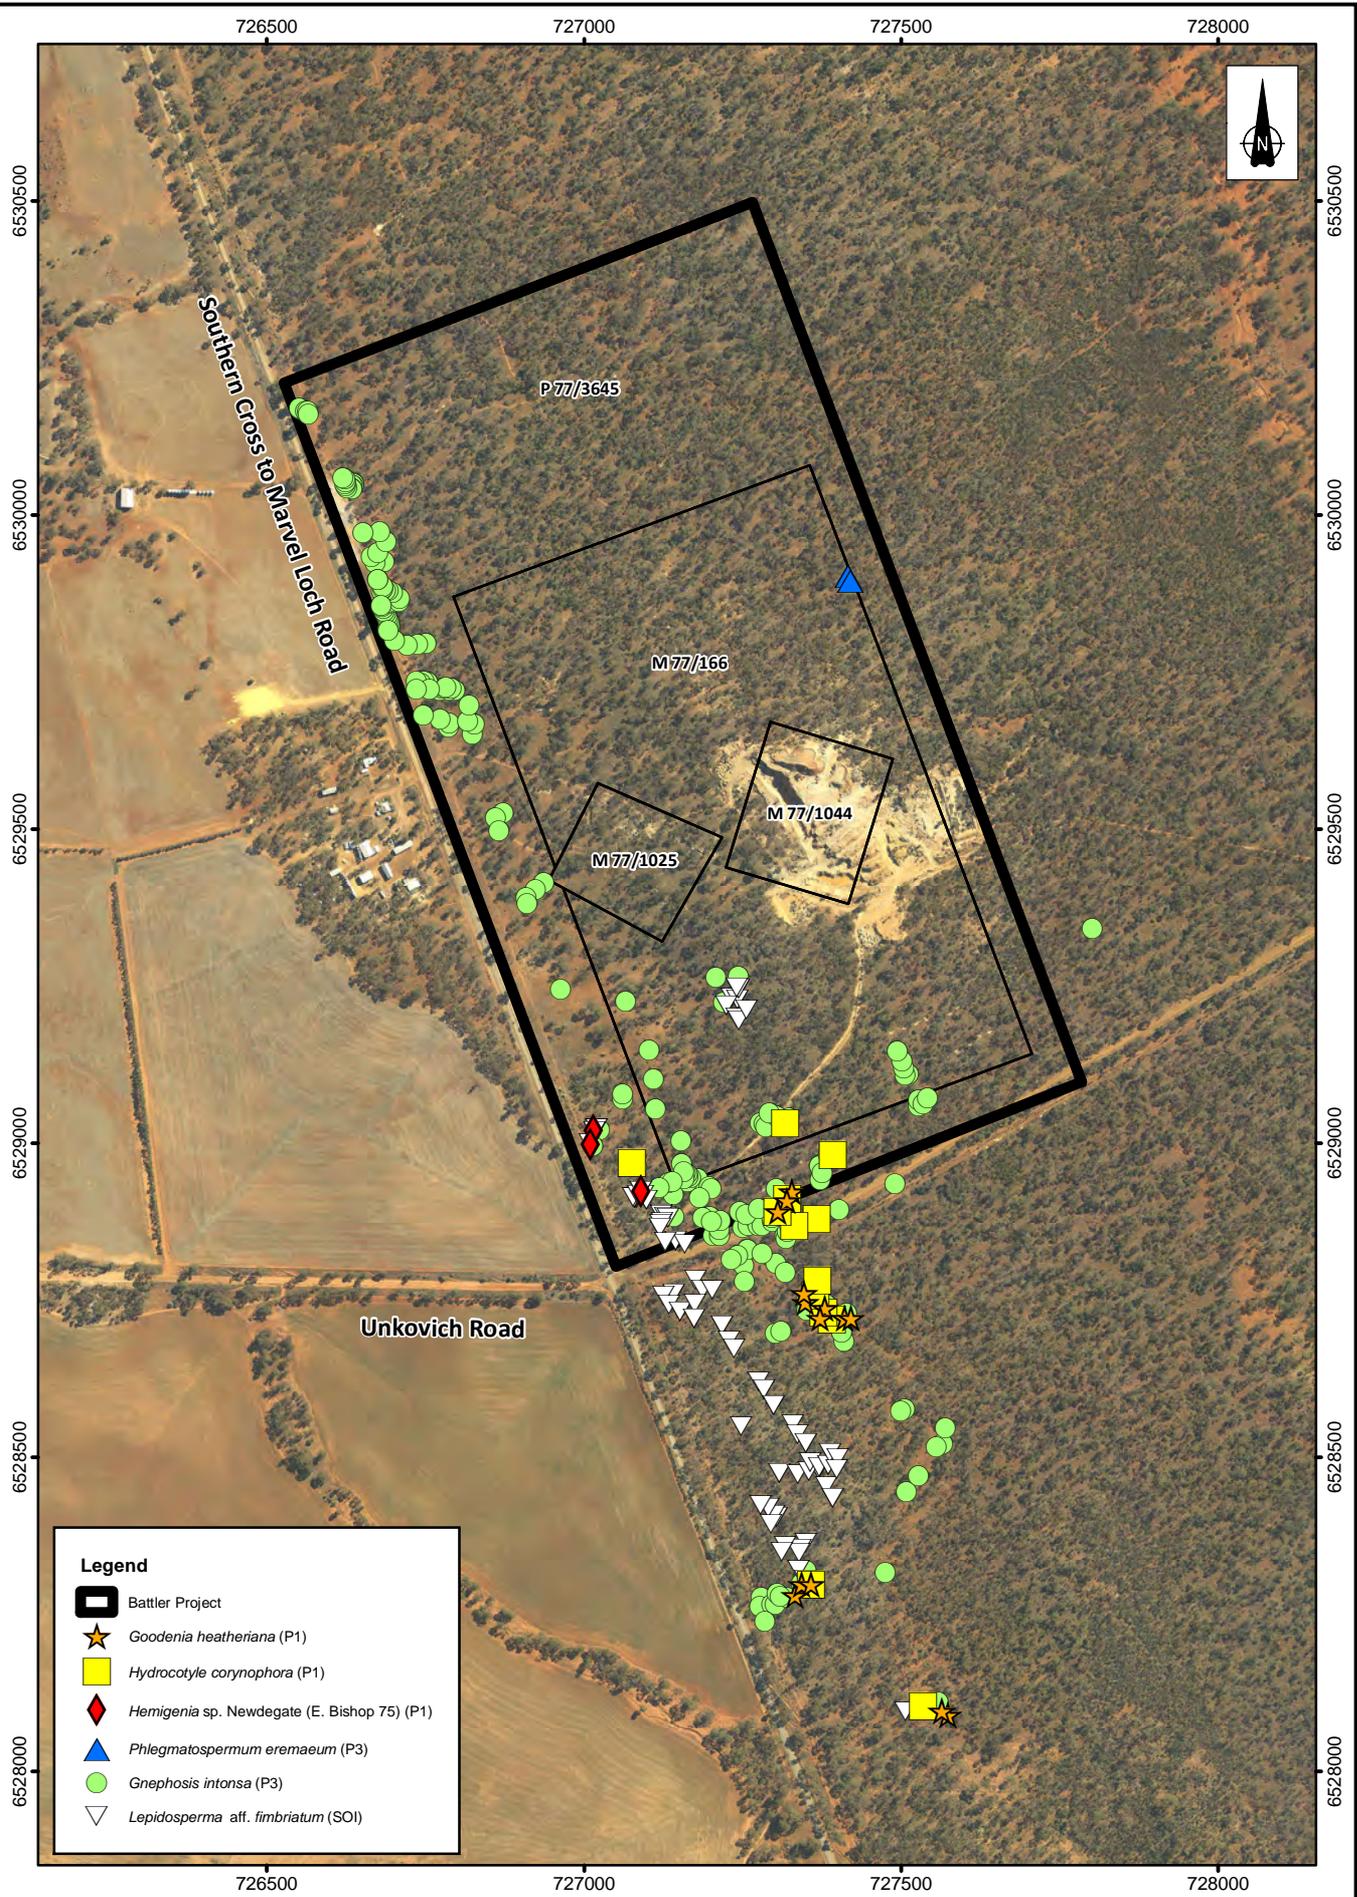

Three specimens could not be identified due to insufficient material (*Acacia* sp. Indeterminate, *Swainsona* sp. Indeterminate, and *Thysanotus* sp. Indeterminate). It is unlikely that any of these three specimens are Threatened or Priority flora. No priority species of *Swainsona* or *Thysanotus* were listed by the NatureMap search (Appendix 1). Likewise, *Acacia* sp. Indeterminate does not resemble any of the priority species listed by the NatureMap search (Appendix 1).

Both significant flora and weeds are addressed in their separate sections below.

### 3.5. Significant Flora

Recorded significant flora locations within and adjacent to Battler are presented in Figure 4 with all coordinates and plant count data presented in Appendix 3. Table 1 summarises the percentages of significant flora recorded within and outside of the Battler project area.

**Figure 4. Map of significant flora (Priority and of interest) locations recorded at and adjacent to Battler.**

### 3.5.1. *Hydrocotyle corynophora* (Priority 1)

*Hydrocotyle corynophora* is a sprawling rosetted annual (Plate 6) that inhabits wet depressions and wetter flat areas. Prior to Western Botanical's *H. corynophora* was known only from a single collection in 1896 from an uncertain location. The records within and south of Battler currently represent the only known locations of this poorly known species. The conservation status of *H. corynophora* may be upgraded by DPaW from Priority 1 to Threatened due to its recent re-discovery.

One hundred and fifteen plants of *H. corynophora* were found at a single location within the south of tenement M77/166. One hundred and three plants were found at three locations within tenement P77/3645. A further 1,897 plants were found south of the Battler project.

As *H. corynophora* is restricted to wet depressions and wetter flat areas, alteration of surface hydrology may impact on this poorly understood species.

**Plate 6. Photos of *Hydrocotyle corynophora* (P1) showing growth habit and inflorescence.**

### 3.5.2. *Goodenia heatheriana* (Priority 1)

*Goodenia heatheriana* is a sprawling rosette annual herb growing to 15 cm high (Plate 7). It is known from six locations within records of the Western Australian Herbarium (1998-), highly restricted to a small geographic area within the Coolgardie IBRA region. It is distinguished from other similar *Goodenia* species by its distinctive glandular hairs on the abaxial surface of petals.

No *Goodenia heatheriana* plants were recorded within tenement M77/166. Ten plants at one location were recorded just within the southern boundary of tenement P77/3645. A further 5,520 plants were recorded adjacent and south of Battler, typically in wet depressions on lower slopes and low hilltops.

**Plate 7. Photos of *Goodenia heatheriana* (P1) showing glandular hairs on flower (at bottom of petal) and divided rosette leaves.**

### 3.5.3. *Hemigenia* sp. Newdegate (E. Bishop 75) (Priority 1)

*Hemigenia* sp. Newdegate is a low shrub growing to 45 cm with bright blue/purple flowers (Plate 8). It is known from five locations within records of the Western Australian Herbarium (1998-), restricted to the southwest portion of Coolgardie and western portion of Mallee IBRA regions.

Fifteen plants were recorded at Battler within the southwest corner of tenement P77/3645, with all plants confined to the 'Mixed *Eucalyptus* & *Acacia acuminata* Shrubland' vegetation association. The identity of this species was not known until after the field surveys, and may therefore be more abundant within this vegetation association than currently reported.

**Plate 8. Photo of *Hemigenia* sp. Newdegate (E. Bishop 75) (P1) showing habit and bright blue/purple flowers.**

### 3.5.4. *Teucrium* sp. dwarf (R. Davis 8813) (Priority 1)

*Teucrium* sp. dwarf (R. Davis 8813) is a compact dwarf shrub to 15 cm high (Plate 9). Within records of the Western Australian Herbarium (1998-) it is known from three locations and restricted to the south of the Coolgardie IBRA region.

One record of *Teucrium* sp. dwarf was recorded approximately 1 km east of Battler (GDA 94, 50 J 0728615 6529357) during priority species searches. No plants of *T.* sp. dwarf were found within or immediately adjacent to Battler.

**Plate 9. Scan of the collected *Teucrium* sp. dwarf (R. Davis 8813).**

### **3.5.5. *Gnephosis intonsa* (Priority 3)**

*Gnephosis intonsa* is a grey-white, prostrate to ascending annual herb typically growing to 4 cm but notably higher with good rainfall (Plate 10). Within records of the Western Australian Herbarium (1998-) it is widely distributed within the Coolgardie IBRA region and known within the Murchison, Mallee, and Esperance Plains regions.

The field surveys found that *Gnephosis intonsa* is widespread and very abundant within wet depressions of the ‘*Eucalyptus salubris* Dominated Woodland’ vegetation association, both within Battler and the surrounding area.

**Plate 10. Photos of *Gnephis intonsa* (P3) showing a single plant and multiple plants within wet depression.**

### **3.5.6. *Phlegmatospermum eremaeum* (Priority 3)**

*Phlegmatospermum eremaeum* is a prostrate to spreading annual herb typically growing to 10 cm high (Plate 11). It is widely but sparsely distributed across semi-arid areas of southern Western Australia (Western Australian Herbarium 1998-).

At Battler forty-four plants were recorded at one location (two patches) immediately inside the northern portion of tenement M77/166's eastern boundary, within the '*Eucalyptus longicornis* Dominated Woodland' vegetation association. Due to GPS error ( $\pm 5$  m) it is possible the plants may be outside M77/166 and within P77/3645. Where found, it grew within one metre of a eucalypt tree trunk. Priority searching at and around the known location and within the vegetation association did not find additional plants.

**Plate 11. Photo of dense patch of *Phlegmatospermum eremaeum* (P3) in litter under eucalypts.**

### **3.5.7. *Calotis erinacea* (Species of Interest)**

*Calotis erinacea* is a branched, straggling perennial herb growing to height (length) of 0.8 m. This species is common and widespread, inhabiting most of inland Australia, extending south into Victoria, and also with a disjunct presence in the South West of Western Australia. It is considered a Species of Interest due to the record at Battler representing a 250 km range extension from populations previously recorded in the South West of Western Australia. While a specimen was collected at Battler, the overall distribution within the project area was not assessed.

### **3.5.8. *Lepidosperma* aff. *fimbriatum* (Species of Interest)**

*Lepidosperma* aff. *fimbriatum* is a strap-leaved sedge growing to 45 cm (Plate 12). It is considered a Species of Interest due to unresolved taxonomy, having affinity to both *L. diurnum* and *L. fimbriatum*. Though matching specimens are held within Western Australian Herbarium, this taxon is not currently formally recognised within Western Australia's Census of Vascular Flora, and thus is not a priority species.

At Battler it is restricted to the 'Mixed *Eucalyptus* & *Acacia acuminata* Shrubland' vegetation association for which it is a characteristic species of the ground layer. Additionally, this *Lepidosperma* was found in relatively high numbers south of the Battler project.

**Plate 12. Scan of *Lepidosperma* aff. *fimbriatum* (Species of Interest) and photo showing growth habit at bottom right.**

### 3.6. Weeds

Sixteen weed species were recorded during the survey. None of these weed species are listed as a Declared Pest in Western Australia and none are listed as a Weed of National Significance (Government of Western Australia 2015b, Australian Weeds Committee 2015).

The majority of weed species were encountered infrequently and were sparsely distributed within Battler. Generally, weeds were more abundant along the western side of the project area (likely due to proximity to farmland west of Forrestiana-Southern Cross Road). Table 2 presents a summary of the more frequently encountered weed species and their abundance and distribution at Battler.

Of the weeds, *Carrichtera annua* was the most widespread and abundant, frequently occurring within wet depressions and other wetter areas or the two *Eucalypt* woodland vegetation associations.

**Table 2. Summary of key weed species (more abundant) recorded at Battler.**

Weed Species Name	Distribution and Abundance Notes
<i>Brassica tournefortii</i>	Common but sparsely distributed as isolated plants throughout Battler, with increased density toward the western third of the project area.
<i>Carrichtera annua</i>	Common and often dominant in wet depressions throughout Battler. More frequently found in the <i>Eucalyptus salubris</i> dominated woodland where wet depressions are more abundant and along drainage lines associated with roads and tracks.
<i>Centaurea melitensis</i>	Small isolated patches scattered within the <i>Eucalyptus salubris</i> dominated woodland along the western boundary of Battler.
<i>Hordeum leporinum</i>	Common within areas heavily disturbed by historical mining. Some infrequent occurrences on/near the powerline track along the western boundary of Battler.
<i>Moraea setifolia</i>	Common along tracks and ditches within and around areas heavily disturbed by historical mining.

### 3.7. Vegetation Condition

The overall vegetation condition for Battler is considered 'Good' on the Keigheri Condition Scale (see Appendix 4) due to the presence of weeds and disturbance from previous mining. The north-northeastern quarter of Battler area approaches a condition of 'Very Good', containing fewer weeds than the remainder of the project area. The historically mined areas previously cleared of most vegetation and mined are considered 'Completely Degraded', containing little of the original vegetation and significant weed coverage.

### 3.8. Limitations

Western Botanical notes the following limitations for the Level 1 survey of the Battler project:

- While the spacing of transects and resolution of targeted searching conducted is considered high intensity for a Level 1 survey, some occurrences/locations of priority species may still remain unrecorded.
- Plant counts for significant flora are to be considered estimates, particularly for annual species where large numbers were present.
- The detection of *Goodenia heatheriana* during the second fieldtrip (20 days after the first fieldtrip when it was not yet flowering) highlights the importance of timing for botanical surveys. Though the surveys performed were fairly comprehensive, it is still possible that other species remain undetected due to timing of fieldtrips.
- Previous mining activity and refuse heaps provided a hazard for botanists during the survey and prevented some small areas from being fully surveyed. Such areas were typically heavily disturbed and unlikely to contain priority flora.
- For the majority of the survey the accuracy of GPS units used was consistently noted at  $\pm 5$  m. However, reduced accuracy (to  $\pm 30$  m) and jumping/shifting location on GPS displays was observed in some areas of Battler that contained moderate slopes and/or denser tree coverage.

475.	4391 <i>Zygophyllum glaucum</i> (Pale Twinleaf)			

**Conservation Codes**

- T - Rare or likely to become extinct
- X - Presumed extinct
- IA - Protected under international agreement
- S - Other specially protected fauna
- 1 - Priority 1
- 2 - Priority 2
- 3 - Priority 3
- 4 - Priority 4
- 5 - Priority 5

<sup>1</sup> For NatureMap's purposes, species flagged as endemic are those whose records are wholly contained within the search area. Note that only those records complying with the search criterion are included in the calculation. For example, if you limit records to those from a specific datasource, only records from that datasource are used to determine if a species is restricted to the query area.

## **Appendix 2. Flora Species List.**

Family	Species Name	Notes
Aizoaceae	<i>Mesembryanthemum nodiflorum</i>	Weed
Casuarinaceae	<i>Allocasuarina helmsii</i>	
Amaranthaceae	<i>Ptilotus aervoides</i>	
Amaranthaceae	<i>Ptilotus carlsonii</i>	
Amaranthaceae	<i>Ptilotus gaudichaudii</i> var. <i>parviflorus</i>	
Amaranthaceae	<i>Ptilotus holosericeus</i>	
Amaranthaceae	<i>Ptilotus</i> sp. Goldfields (R. Davis 10796)	
Apiaceae	<i>Daucus glochidiatus</i>	
Apiaceae	<i>Trachymene cyanopetala</i>	
Apocynaceae	<i>Alyxia buxifolia</i>	
Araliaceae	<i>Hydrocotyle corynophora</i>	Priority 1
Asparagaceae	<i>Arthropodium curvipes</i>	
Asparagaceae	<i>Thysanotus</i> sp. Indeterminate	Insufficient material to ID
Asteraceae	<i>Actinobole uliginosum</i>	
Asteraceae	<i>Angianthus tomentosus</i>	
Asteraceae	<i>Arctotheca calendula</i>	Weed
Asteraceae	<i>Asteridea athrxioides</i>	
Asteraceae	<i>Brachyscome iberidifolia</i>	
Asteraceae	<i>Calotis erinacea</i>	Range Extension
Asteraceae	<i>Calotis hispidula</i>	
Asteraceae	<i>Centaurea melitensis</i>	Weed
Asteraceae	<i>Erymophyllum ramosum</i> subsp. <i>ramosum</i>	
Asteraceae	<i>Gnephosis intonsa</i>	Priority 3
Asteraceae	<i>Hyalosperma glutinosum</i> subsp. <i>glutinosum</i>	
Asteraceae	<i>Hypochaeris glabra</i>	Weed
Asteraceae	<i>Lawrencella rosea</i>	
Asteraceae	<i>Leucochrysum fitzgibbonii</i>	
Asteraceae	<i>Olearia muelleri</i>	
Asteraceae	<i>Olearia pimeleoides</i>	
Asteraceae	<i>Podolepis capillaris</i>	
Asteraceae	<i>Podolepis lessonii</i>	
Asteraceae	<i>Podotheca gnaphalioides</i>	
Asteraceae	<i>Pogonolepis muelleriana</i>	
Asteraceae	<i>Rhodanthe chlorocephala</i> subsp. <i>rosea</i>	
Asteraceae	<i>Rhodanthe citrina</i>	
Asteraceae	<i>Rhodanthe pygmaea</i>	
Asteraceae	<i>Senecio pinnatifolius</i>	
Asteraceae	<i>Siloxerus pygmaeus</i>	
Asteraceae	<i>Sonchus oleraceus</i>	Weed
Brassicaceae	<i>Brassica tournefortii</i>	Weed

Family	Species Name	Notes
Brassicaceae	<i>Carrichtera annua</i>	Weed
Brassicaceae	<i>Phlegmatospermum eremaeum</i>	Priority 3
Brassicaceae	<i>Stenopetalum filifolium</i>	
Brassicaceae	<i>Stenopetalum lineare</i> var. <i>lineare</i>	
Caryophyllaceae	<i>Stellaria filiformis</i>	
Chenopodiaceae	<i>Atriplex bunburyana</i>	
Chenopodiaceae	<i>Atriplex nummularia</i>	
Chenopodiaceae	<i>Atriplex semilunaris</i>	
Chenopodiaceae	<i>Atriplex stipitata</i>	
Chenopodiaceae	<i>Atriplex vesicaria</i>	
Chenopodiaceae	<i>Chenopodium curvispicatum</i>	
Chenopodiaceae	<i>Enchylaena lanata</i>	
Chenopodiaceae	<i>Enchylaena tomentosa</i> var. <i>tomentosa</i>	
Chenopodiaceae	<i>Eriochiton sclerolaenoides</i>	
Chenopodiaceae	<i>Maireana brevifolia</i>	
Chenopodiaceae	<i>Maireana georgei</i>	
Chenopodiaceae	<i>Maireana thesioides</i>	
Chenopodiaceae	<i>Maireana tomentosa</i> subsp. <i>tomentosa</i>	
Chenopodiaceae	<i>Maireana trichoptera</i>	
Chenopodiaceae	<i>Rhagodia drummondii</i>	
Chenopodiaceae	<i>Sclerolaena diacantha</i>	
Chenopodiaceae	<i>Sclerolaena fusiformis</i>	
Colchicaceae	<i>Wurmbea densiflora</i>	
Convolvulaceae	<i>Wilsonia humilis</i>	
Cyperaceae	<i>Lepidosperma</i> aff. <i>fimbriatum</i>	Species of Interest
Dilleniaceae	<i>Hibbertia exasperata</i>	
Euphorbiaceae	<i>Beyeria sulcata</i> var. <i>brevipes</i>	
Euphorbiaceae	<i>Spergularia rubra</i>	Weed
Fabaceae	<i>Acacia acuminata</i>	
Fabaceae	<i>Acacia colletioides</i>	
Fabaceae	<i>Acacia erinacea</i>	
Fabaceae	<i>Acacia intricata</i>	
Fabaceae	<i>Acacia merrallii</i>	
Fabaceae	<i>Acacia rendlei</i>	
Fabaceae	<i>Acacia</i> sp. Indeterminate	Insufficient Material to ID
Fabaceae	<i>Acacia tetragonophylla</i>	
Fabaceae	<i>Daviesia</i> aff. <i>rubiginosa</i>	Leaves longer than typical
Fabaceae	<i>Eutaxia neurocalyx</i> subsp. <i>neurocalyx</i>	
Fabaceae	<i>Medicago minima</i>	Weed

Family	Species Name	Notes
Fabaceae	<i>Mirbelia microphylla</i>	
Fabaceae	<i>Senna artemisioides</i> subsp. <i>filifolia</i>	
Fabaceae	<i>Swainsona</i> sp. Indeterminate	Insufficient Material to ID
Fabaceae	<i>Templetonia sulcata</i>	
Geraniaceae	<i>Erodium cygnorum</i>	
Goodeniaceae	<i>Goodenia heatheriana</i>	Priority 1
Goodeniaceae	<i>Goodenia pinnatifida</i>	
Goodeniaceae	<i>Scaevola spinescens</i> (broad leaf form)	
Haloragaceae	<i>Haloragis trigonocarpa</i>	
Iridaceae	<i>Moraea setifolia</i>	Weed
Lamiaceae	<i>Hemigenia</i> sp. Newdegate (E. Bishop 75)	Priority 1
Lamiaceae	<i>Prostanthera semiteres</i> subsp. <i>semiteres</i>	
Lamiaceae	<i>Westringia rigida</i>	
Loranthaceae	<i>Amyema miquelii</i>	
Malvaceae	<i>Commersonia craurophylla</i>	
Malvaceae	<i>Lawrencia diffusa</i>	
Myrtaceae	<i>Eucalyptus calycogona</i> subsp. <i>calycogona</i>	
Myrtaceae	<i>Eucalyptus corrugata</i>	
Myrtaceae	<i>Eucalyptus loxophleba</i> subsp. <i>lissophloia</i>	
Myrtaceae	<i>Eucalyptus oleosa</i> subsp. <i>oleosa</i>	
Myrtaceae	<i>Eucalyptus salmonophloia</i>	
Myrtaceae	<i>Eucalyptus salubris</i>	
Myrtaceae	<i>Eucalyptus vittata</i>	
Myrtaceae	<i>Eucalyptus yilgarnensis</i>	
Myrtaceae	<i>Melaleuca hamata</i>	
Myrtaceae	<i>Melaleuca pauperiflora</i> subsp. <i>fastigiata</i>	
Plantaginaceae	<i>Plantago drummondii</i>	
Poaceae	<i>Amphipogon caricinus</i> subsp. <i>caricinus</i>	
Poaceae	<i>Aristida contorta</i>	
Poaceae	<i>Austrostipa elegantissima</i>	
Poaceae	<i>Austrostipa hemipogon</i>	
Poaceae	<i>Austrostipa nitida</i>	
Poaceae	<i>Austrostipa trichophylla</i>	
Poaceae	<i>Avena barbata</i>	Weed
Poaceae	<i>Eriachne pulchella</i> subsp. <i>pulchella</i>	
Poaceae	<i>Hordeum leporinum</i>	Weed
Poaceae	<i>Parapholis incurva</i>	Weed
Poaceae	<i>Pentameris airoides</i> subsp. <i>airoides</i>	Weed
Poaceae	<i>Rytidosperma caespitosum</i>	
Poaceae	<i>Vulpia myuros</i>	Weed

Family	Species Name	Notes
Portulacaceae	<i>Calandrinia eremaea</i>	
Primulaceae	<i>Lysimachia arvensis</i>	Weed
Proteaceae	<i>Grevillea obliquistigma</i> subsp. <i>obliquistigma</i>	
Rhamnaceae	<i>Cryptandra connata</i>	
Rhamnaceae	<i>Trymalium myrtillus</i> subsp. <i>myrtillus</i>	
Rutaceae	<i>Phebalium megaphyllum</i>	
Rutaceae	<i>Phebalium tuberosum</i>	
Santalaceae	<i>Exocarpos aphyllus</i>	
Santalaceae	<i>Santalum acuminatum</i>	
Sapindaceae	<i>Dodonaea stenozyga</i>	
Scrophulariaceae	<i>Eremophila decipiens</i> subsp. <i>decipiens</i>	
Scrophulariaceae	<i>Eremophila glabra</i>	
Scrophulariaceae	<i>Eremophila interstans</i> subsp. <i>interstans</i>	
Scrophulariaceae	<i>Eremophila rugosa</i>	
Scrophulariaceae	<i>Eremophila scoparia</i>	
Solanaceae	<i>Lycium australe</i>	
Solanaceae	<i>Solanum hoplopetalum</i>	
Violaceae	<i>Hybanthus floribundus</i> subsp. <i>curvifolius</i>	
Zygophyllaceae	<i>Zygophyllum apiculatum</i>	
Zygophyllaceae	<i>Zygophyllum eremaeum</i>	
Zygophyllaceae	<i>Zygophyllum glaucum</i>	

### **Appendix 3. Significant Flora Locations and Plant Counts.**

All data presented within GDA94 datum. Includes only data from survey results.

Significant Species	Location Coordinates	Number of Plants
<i>Gnephosis intonsa</i> (P3)	50 J 727323 6529040	2000

## **Appendix 4. Keighery Vegetation Condition Scale.**

**Keighery Vegetation Condition Scale developed by Keighery (1994) (as presented in Government of Western Australia (2000)).**

Pristine	Pristine or nearly so, no obvious signs of disturbance
Excellent	Vegetation structure intact, disturbance affecting individual species and weeds are non-aggressive species
Very Good	Vegetation structure altered, obvious signs of disturbance. For example, disturbance to vegetation structure caused by repeated fires, the presence of some more aggressive weeds, dieback, logging and grazing
Good	Vegetation structure significantly altered by very obvious signs of multiple disturbances. Retains basic vegetation structure or ability to regenerate it. For example, disturbance to vegetation structure caused by very frequent fires, the presence of some very aggressive weeds at high density, partial clearing, dieback and grazing.
Degraded	Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching good condition without intensive management. For example, disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds, partial clearing, dieback and grazing.
Completely Degraded	The structure of the vegetation is no longer intact and the area is completely or almost completely without native species. These areas are often described as "parkland cleared" with the flora comprising weed or crop species with isolated native trees or shrubs.
