

# VOACANGA THOU.

A. J. M. LEEUWENBERG

*Department of Plant Taxonomy  
Agricultural University, Wageningen, The Netherlands*

Received 4-II-1985  
Data of publication 16-VIII-1985

PHOT. 1. *Voacanga africana* (Leeuwenberg 8660, phot. T. BALTUSSEN).

## INTRODUCTION

The present paper is a monographic revision of the genus *Voacanga*, and the study is based mainly on the examination of herbarium material. In addition, the author has had the opportunity of observing living plants belonging to 6 of the 12 species maintained here – 5 in the wild in Africa and one on Java.

It has been possible to trace almost all the type specimens of the names and synonyms discussed in the present revision. For practical reasons, two keys are provided – one for the species indigenous in Africa and the other for those found in Asia.

## HISTORY OF THE GENUS

DU PETIT THOUARS (1806), who described the genus, named it from the Madagascan words *voa* (= fruit) and *acanga* (= guinea fowl) because of the spotted fruits. The first species, *V. thouarsii*, appeared in ROEMER & SCHULTES (1819).

The genus was described independently by BLUME (1826) as *Orchipeda*, on the basis of *O. foetida* from Java, by HOCHSTETTER (1841) as *Annularia*, with *A. natalensis* from Natal, by HARVEY (1842) as *Piptolaena*, with *P. dregei* from Natal as basis, by MIQUEL (1857) as *Pootia*, founded on *P. grandifolia* from Java. ENDLICHER (1842) added the illegitimate synonym *Cyclostigma* to HOCHSTETTER's *Annularia*. Subsequently, TEIJSMANN (1863) added a second species to *Pootia* which was transferred by MIQUEL (1864) to *Orchipeda*; finally, ROLFE (1883) reduced this last genus name to a synonym of *Voacanga*. Since 1883 all later taxa have been described directly as species of *Voacanga*.

## GEOGRAPHICAL DISTRIBUTION

The genus *Voacanga* comprises 12 species, 7 in Africa and 5 in Asia. None of the species occurs in both continents. Of the African species, *V. thouarsii* is the most widely distributed, being found throughout tropical Africa in marshes and along creeks in deciduous forest and in not too dry savannas. The second one, *V. africana*, occurs almost as widely but is not found on Madagascar. It grows in secondary, bush-like vegetation and in open situations – in the coastal forests especially, often gregariously (West Africa); but it is also encountered in gallery forests in the savannas. *V. caudiflora* and *V. psilocalyx*, from west and east of the Dahomey gap, respectively, grow almost exclusively in the undergrowth of the humid forest. *V. bracteata*, whose area of distribution overlaps and is much greater than that of the previous two species together occurs in a comparable biotope but requires somewhat less humidity. *V. chalotiana*, present only in central Africa; probably has a preference for light shade (forest, secondary forest, gallery forest). *V. pachyceras* is only known from Zaïre and grows on river banks and in marshes.

All five of the Asian species are found within the region covered by the Flora Malesiana, but only on the islands. They occur in light forest or secondary vegetation, often along rivers. *V. grandifolia* is the most widely distributed and is known from Indonesia (except Sumatra and Kalimantan) and Papua-New Guinea; several more or less aberrant specimens come from Mindanao (Philippines). The areas of distribution of the other four species are much smaller. *V. globosa* and *V. megacarpa* are endemic in the Philippines. *V. foetida* is known from Sumatra and West-Java; there are also two collections from the south-eastern point of Borneo. *V. havilandii* has by far the smallest distribution of all the known *Voacanga* species and so far has only been collected in Sarawak.

## RELATIONSHIPS WITH OTHER GENERA

*Voacanga* belongs to the tribe *Tabernaemontaneae* of the subfamily *Plumerioideae* (for the description and synonymy, see LEEUWENBERG, 1984). As is evident from the strikingly uniform habit and seeds, as well as the flowers and fruit, the genus is closely related to *Tabernaemontana*.

The two genera may be distinguished as follows:

Pistil head coherent with the anthers and therefore style and pistil head shed with the corolla; calyx also shed along with the corolla (Asian species and *V. pachyceras* and *V. thouarsii*) or some time after, at least before the fruit matures; in the latter case corolla tube up to 1.4 x as long as the calyx (exceptions to this last character: *V. bracteata* and *V. chalotiana*). . . . . **Voacanga**  
Pistil head not coherent with the anthers and therefore pistil still complete after the corolla has been shed; calyx persistent even under the fruit (probable exceptions: a few American species); corolla tube probably never less than 2 x as long as the calyx . . . . . **Tabernaemontana**

## ECONOMIC INTEREST

For some years several hundred tonnes of the seeds of the African species *V. africana* and *V. thouarsii* have been collected for the industrial production of the alkaloid tabersonine, which is of considerable indirect medical importance (see the chapter on the phytochemistry of the genus).

In most African languages the two species just mentioned have the same vernacular name as the *Tabernaemontana* species that occur in the same biotope. Sometimes, *Tabernaemontana* is called the male and *Voacanga* the female. The seeds of *Tabernaemontana* are difficult to distinguish from those of *Voacanga*, but are usually larger. Like the two *Voacanga* species discussed above, the following *Tabernaemontana* species have a subglobose mericarp: *T. brachyantha*, *T. contorta*, *T. crassa*, *T. africana* (= *T. longiflora*), and *T. pachysiphon*; of these, *T. crassa* and *T. pachysiphon* have the widest distribution and the latter

has the greatest ecological similarity to *V. africana*. The foregoing *Tabernaemontana* and *Voacanga* species can be distinguished as follows:

Mericarps with dark green and pale green spots, 3–10 cm in diameter, dehiscent; pericarp 5–15 cm thick; pulpy aril orange; corolla tube up to 1.1 x as long as calyx; style and stigma shed with corolla; calyx shed with corolla (*V. thouarsii*) or shortly after (*V. africana*); leaves herbaceous, pale green and acuminate (*V. africana*) or coriaceous, glaucous, and obtuse or rounded (*V. thouarsii*) . . . . . the 2 *Voacanga* spp.

Mericarps pale green or glaucous all over, mostly larger, up to 15 cm in diameter (orange and smaller in *T. africana*); pericarp mostly thicker (up to 4 cm in *T. pachysiphon*), dehiscent or not; pulpy aril white, cream, or nearly so; style and stigma not shed with the corolla; calyx persistent, even under the fruit; leaves coriaceous, mostly larger, dark green, and mostly acuminate . . . . . the 5 *Tabernaemontana* spp.

### INTERRELATIONSHIPS OF THE SPECIES

The morphology of the species suggests the relationships shown in the diagram below. The obvious feature of the scheme is that the most widely distributed species show more similarities with other species than do the less widely distributed ones.

*Pootia* Miq., Versl. en Med. Kon. Akad. Wetensch. 6: 192. 1857; in Fl. Ned. Indië 2: 417. 1857. Type species: *P. grandifolia* Miq. (= *V. grandifolia* (Miq.) Rolfe).

Shrubs or trees, repeatedly dichotomously branched and with 2 inflorescences in the forks when flowering. Bark usually with some white latex. Branchlets terete, mostly deeply sulcate when dry, with white latex. Leaves opposite, those of a pair equal or unequal, usually petiolate; petioles or leaf bases of a pair connate into a short ocrea, with a single row of colleters in the axils; blade elliptic or obovate or narrowly so, cuneate at the base or decurrent into the petiole. Inflorescence usually long-pedunculate, cymose, usually fairly lax. Bracts deciduous or less often more or less persistent, leaving conspicuous scars. Flowers actinomorphic, often fragrant. Calyx green, campanulate to cylindrical, usually shed with the corolla, inside with colleters; lobes subequal. Corolla mostly creamy or yellow; tube shorter or only slightly longer than the calyx, twisted, variously shaped; lobes in bud overlapping to the left, spreading or recurved. Stamens exserted or included; anthers sessile, narrowly triangular, acuminate at the sterile apex, sagittate at the base, glabrous, introrse. Pistil glabrous; ovary usually broadly ovoid; carpels free or connate at the base, rarely entirely fused, surrounded by a ring-shaped entire or lobed disk; disk adnate to abaxial sides of the carpels; style connecting the carpels at the apex, thickened at the apex; pistil head with a thin, recurved, undulate, entire, lobed, or fimbriate ring at the base, ovoid, with 5 short lateral lobes, coherent with the connectives of the anthers; stigmoid apex short. Style and stigma shed together with the corolla. Fruit two free or less often partly or completely united carpels; wall soft, carnose, often thickish, creamy or yellow. Seeds surrounded by a yellow or orange pulpy aril, usually numerous, large, obliquely ellipsoid or less often reniform, rough, at the hilar side with one deep groove to half their width, less deeply grooved at the other sides, with a minutely tuberculate or honeycomb-like structure; endosperm copious, starchy, creamy to white, ruminant, surrounding the spathulate creamy to white embryo.

An Old World genus of 12 species, 7 of which in Africa and the others in 'Malesia' (= the Flora Malesiana area).

## KEY TO THE AFRICAN SPECIES

1. Leaves obtuse or rounded at the apex, mostly narrowly obovate, thickly coriaceous and glaucous; inflorescence few-flowered; calyx closely clasping the corolla tube, shed with the corolla; corolla lobes wider than long, emarginate; carpels pale and dark green-spotted, subglobose. Swamps or river banks . . . . . 7. *V. thouarsii*
- Leaves acuminate, – if obtuse – herbaceous to fairly thinly coriaceous and never glaucous; inflorescence many-flowered; calyx lobes mostly recurved; corolla lobes subacute to rounded; carpels spotted (*V. africana*) or not, subglobose or not . . . . . 2
2. Calyx (when lobes erect) 5–7.5 mm long; lobes 1.5–2.5 x as long as the tube, 2.5–3.5 x as long as wide; carpels partly united; leaves long-petiolate, with a fishbone-like venation. Congo, Zaïre . . . . . 4. *V. chalotiana*
- Calyx (when lobes erect) 7–22 mm long; lobes up to 1.2 x as long as the tube; in each calyx at least one lobe as long as wide or even wider than long; carpels free; leaves fairly shortly petiolate, with less regular venation . . . . . 3
3. Carpels pale and dark green-spotted, subglobose; bracts deciduous when buds open; calyx lobes mostly recurved; corolla lobes 1.4–2.5 x as long as the tube; usually many flowers open at a time; common bush plant . . . . . 1. *V. africana*
- Carpels not spotted, mostly yellow or orange, subglobose or not; bracts persistent at anthesis or not; calyx usually erect (recurved only in *V. bracteata*); corolla lobes – if more than 1.3 x as long as the tube – plant in forest understorey; usually 1–2 flowers open at a time in a single inflorescence 4
4. Corolla lobes 4–10 x as long as wide, 16–23 mm long, forming in bud a cylindrical head 3.5–6 x as long as wide; calyx much wider than the slender corolla tube; calyx lobes 0.2–0.3 x as long as the tube; bracts persistent at anthesis. Sierra Leone-Ghana . . . . . 3. *V. caudiflora*
- Corolla lobes 0.8–1.2 x as long as wide and 2.5–7 x 3–8 mm or (only in plants from Nigeria eastwards) up to 4.4 x as long as wide and 7–18 mm long, forming in bud a conical or ovoid head; calyx lobes from 0.4 x as long as the tube; bracts often deciduous . . . . . 5
5. Bracts persistent; corolla lobes 0.2–0.5 x as long as the tube, 0.8–1.2 x as long as wide, often turning dark brown at anthesis, forming a usually broadly ovoid head in bud . . . . . 2. *V. bracteata*
- Bracts often deciduous; corolla lobes 0.5–1.8 x as long as the tube, 1.25–4.4 x as long as wide, white to pale yellow, not turning brown at anthesis, forming an almost conical head in bud . . . . . 6
6. Stamens distinctly included; carpels almost cylindrical, parallel; calyx shed with the corolla. Zaïre . . . . . 5. *V. pachyceras*
- Stamens exserted or barely included; carpels ovoid or nearly so, divergent; calyx deciduous after the corolla has been shed. Nigeria-Congo . . . . . 6. *V. psilocalyx*

## KEY TO THE ASIAN SPECIES

1. Sepals almost free, narrowly oblong. Philippines . . . . 12. **V. megacarpa**  
Sepals connate into a more or less cylindrical calyx with short lobes . . . . 2
2. Leaves pubescent beneath; corolla tube 7–11 mm long, lobes 2–3 x as long as wide. Sarawak . . . . . 11. **V. havilandii**  
If leaves pubescent beneath, corolla tube 9–24 mm long and lobes 0.8–1.5 x as long as wide . . . . . 3
3. Calyx narrowly cylindrical, closely clasping the corolla tube, usually 3.5–7.5 x as long as wide; corolla tube narrowly cylindrical, often much longer, lobes rhombic or nearly so, acute or obtuse. Philippines . . . . . 9. **V. globosa**  
Calyx amply cylindrical or campanulate, usually not clasping the corolla tube, 1–3 x as long as wide; corolla tube cylindrical or not; lobes obovate, rounded to emarginate . . . . . 4
4. Flowers large; calyx 22–37 mm long; corolla 65–100 mm long (lobes suberect), tube 28–42 mm long, infundibuliform; lobes 37–58 mm long. Sumatra, Java, and S. Kalimantan . . . . . 8. **V. foetida**  
Flowers much smaller; calyx 10–20 mm long; corolla (lobes spreading or recurved) tube 9–25 mm long, cylindrical, bottle-shaped or conical; lobes 9–30 (40) mm long . . . . . 10. **V. grandifolia**

*V. angustifolia* K. Schum., l.c. Type: Tanzania: T4: Kavenda, Boehm 60a (holotype not seen, destroyed in B; no isotype seen).

*V. glabra* K. Schum. in Engler & Prantl, Nat. Pflanzenf. 4(2): 149. 1895. Type: Cameroun: Mungo, Buchholz s.n. (holotype not seen, destroyed in B; lectotype: K). Homotypic synonym: *V. africana* var. *glabra* (K. Schum.) Pichon, Bull. Mus. Nat. Hist. Nat. Paris sér. 2. 19: 412. 1947.

FIG. 1. *Voacanga africana*. 1, flowering branch ( $\times \frac{1}{3}$ ); 2, leaf ( $\times \frac{1}{3}$ ); 3 and 5, flower buds ( $\times \frac{1}{3}$ ); 4 and 6, flowers ( $\times \frac{1}{3}$ ); 7, flower with incomplete corolla lobes ( $\times 2$ ); 8 and 12, pistils ( $\times 4$ ); 9, opened flower ( $\times 2$ ); 10–11, stamens ( $\times 4$ ); 13, pistil head ( $\times 8$ ); 14, dehisced fruit ( $\times \frac{1}{3}$ ); 15, seeds ( $\times 2$ ) with more enlarged detail of testa. All from coll. Leeuwenberg: 1, 9–13 from 9485; 2–4 from 11927; 5–8 from 9256; 14–15 from 8660.

*V. puberula* K. Schum. in Engler & Prantl. loc. cit.; Staph. tom. cit. 156. Type: Gabon: Estuaire: Loango, Chinchocho, Soyaux 41 (holotype not seen, destroyed in B; lectotype: K). Homotypic synonym: *V. schweinfurthii* var. *puberula* (K. Schum.) Pichon, tom. cit. 413, partly, excl. of syn. *V. diplochlamys*.

*V. schweinfurthii* var. *parviflora* K. Schum. in Engler, Bot. Jahrb. 23: 226. 1896. Type: Togo: Misahöhe, near Kununlu, Baumann 464 (holotype not seen, destroyed in B; lectotype: K; isotype: NH).

*V. angolensis* Staph. ex Hiern, Cat. Welw. Afr. Pl. 1: 668. 1898; Staph., tom. cit. 154. Type: Angola: Cuanza Norte: Ambaca District, between Ngombe and Puri-Cacarombola, Welwitsch 5978 (BM, lectotype; isotypes: COI, K, LISU, MO). Homotypic synonym: *V. spectabilis* Staph., tom. cit. 155. The holotype of this name is the lectotype of the preceding one.

*V. lutescens* Staph., tom. cit. 157. Type: Mozambique: Manica e Sofala: between Lupata and Sena, Kirk 31 (K, lectotype). Homotypic synonym: *V. africana* var. *lutescens* (Staph.) Pichon, tom. cit. 412.

*V. magnifolia* Wernham in Cat. Talbot's Nigerian Pl. 62. 1913. Type: Nigeria: Cross River State: Oban, Talbot 1053 (BM, holotype; isotype: K).

*V. eketensis* Wernham, Journ. Bot. 52: 25. 1914. Type: Nigeria: Cross River State: Eket District, Talbot 3388 (BM, holotype; isotype: MO).

*V. glaberrima* Wernham, loc. cit. Type: Nigeria: Cross River State: Eket District, Talbot 3389 (BM, holotype).

*V. bequaerti* De Wild., Pl. Bequaert. 1: 402. 1922. Type: Zaïre: VI: between Walikale and Lubutu, Bequaert 6577 (BR, holotype).

*V. lemosii* Philipson in Exell, Cat. Vasc. Pl. S. Tomé 241. 1944. Type: São Tomé: between Paga-fogo and St. Catarina, Lemos s.n. (COI, holotype, not seen; isotype seen: K).

*V. africana* var. *auriculata* Pichon, loc. cit. Type: Tanzania: T4: Sagara, Sacleux 2222 (P, holotype).

Shrub-like tree or shrub 1–10 (25) m high. Trunk terete, 2–30 (40) cm in diameter; bark pale grey-brown, smooth or near the base shallowly fissured, with some white latex. Branches lenticellate; branchlets glabrous, puberulous, or pubescent, with more latex than in the bark. Leaves shortly petiolate or sessile; petiole glabrous to pubescent, up to 2 cm long (oarea not widened into intrapetiolar stipules); blade usually pale green when plant in flower, when in fruit usually darker, especially above, herbaceous when fresh, membranaceous to papery when dry, variable in shape and size, elliptic to narrowly elliptic, 1.5–3.5(4) x as long as wide, 7–41.5 x 3–20 cm (sometimes a little smaller), cuneate or decurrent into the petiole or base, not connate-perfoliate when sessile, acuminate with an often blunt apex or less often acute or obtuse in some leaves, glabrous on both surfaces to pubescent beneath all over and on the midrib above, with 8–22 secondary veins on each side; tertiary venation inconspicuous. Inflorescences usually long-pedunculate, 6–25 x 4–15 cm, usually many-flowered, fairly lax, 3.5–15.5 cm long incl. peduncle; peduncle pale green and glabrous to sparsely pubescent as branches and pedicels, usually slender; pedicels 3–20 mm long.

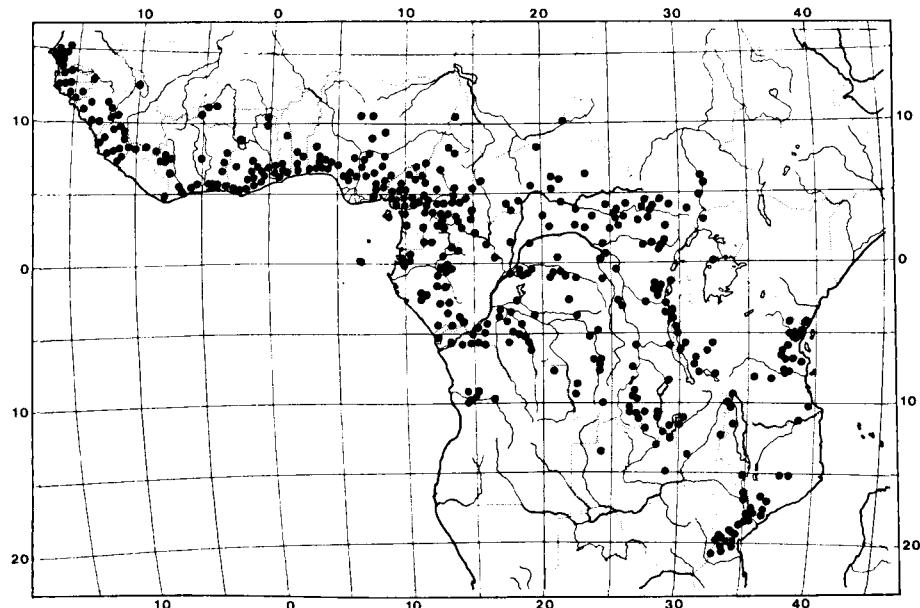

Bracts deciduous, usually all shed before the first bud reaches full size, about as long as the calyx, ovate, obtuse, with a few persistent colleters at the edges of the axils, upper bracts often narrower. *Flowers* malodorous. *Calyx* pale green (paler inside), 7–19 mm long (when lobes erect), deciduous after the corolla has been shed and before the fruit develops, glabrous or puberulous out- and inside, inside with a belt of colleters from 1–2 mm above the base of the tube to 1–2 mm below the base of the lobes, (the uppermost collet near the edge of the base of the lobes and the remainder are arranged irregularly or in 1–3 rows above each other); tube cyathiform, 3.5–9 mm long; lobes 0.8–1.3 x as long as the tube, broadly ovate to oblong 0.7–1.3 (1.7) x as long as wide, 3.5–8 x 3.5–8 mm, obtuse, rounded, truncate, retuse, or emarginate at the apex, entire, imbricate in bud, usually partly recurved. *Corolla* creamy, greenish-creamy, yellow, or less often white, in the mature bud 17–31 mm long incl. the lobes (the lobes  $\frac{1}{2}$ – $\frac{3}{4}$  of the bud length, being 8.5–19 mm, forming an almost conical head with a blunt apex), glabrous or less often minutely puberulous on both sides and inside often pubescent from about 5 mm above base to the insertion of the stamens, tube slightly shorter to slightly longer than the calyx (when the lobes erect), 7–15 mm long, almost cylindrical, twisted from 2–3 mm above the base, contracted at the base, in the middle, and at the mouth; lobes in bud twisted, obovate, narrowly obovate, or elliptic, 1.4–2.5 x as long as the tube, (1.1)1.5–2.2 x as long as wide, 12–37 x 7–16 mm, rounded or obtuse and usually with an upcurved margin at the apex, entire, spreading and often recurved later. *Stamens* exserted for 0.5–1.2 mm or occasionally just included, inserted 2–3 mm below the corolla mouth; anthers sessile, 4–5 x 1.3–2.5 mm, at the apex for about 0.5 mm sterile, glabrous, usually twisted with the corolla. *Pistil* 7–12.5 mm long (when style straightend out); ovary 1.6–2.5 x 1.7–3 x 1.2–2 mm, of two carpels; disk entire, ring-shaped, 0.8–1.2 mm high; style split at the base, narrowly obconical, 4–8 mm long, twisted and at the base curled, at the apex slightly narrower than the pistil head; pistil head 1–1.7 x 1–1.7 mm, with an undulate entire ring 1.7–3 mm in diameter. *Ovules* about 200 in each carpel. *Fruit* of two separate mericarps of which often only one developing; mericarps dark and very pale green-spotted, obliquely subglobose, often slightly wider than long and laterally compressed, 3–8 x 3–8 x 2.5–7 cm, 2-valved; wall 5–15 mm thick, creamy inside and on section; aril orange. *Seeds* many, dark brown, dull, obliquely ellipsoid, 7–10 x 3.5–5 x 3–4 mm, laterally with 4–5 grooves, rough, minutely tuberculate.

**Distribution:** Tropical Africa (continent and the isles in the Gulf of Guinea).

**Ecology:** Bush or light forest, in savanna areas in gallery forests. Common (in West Africa especially near the coast). Alt. 0–1100 m. Flowering mainly at the end of the dry season.

**Vernacular names** (If the language is not known, the locality is indicated with 'near').

Mali: Kombrocina (near Fangala Kouta).

Burundi: Umdwedwe (near Bururi, also used for *V. thou.*).

Angola: Béta (near Lohanda R.), Muluanda (near Malanje).

Tanzania: T3: Mbewe, Mlambe (Kikondei, Mbelewele (near Makuyuni), Mbere mbere (near Usambara Mts.). T4: Ikoliyoko, Luliyolwakape (Kitongwe), Nachankana (Chifipa), Munamba (Mambwe). T6: Mtengolengo (Luguru), Mboke (Vidunda). T7: Mandungulembe (Nyaky).

Zambia: Chipolo (Wemba), Mn-papal (Lunda).

Mozambique: Zambesia: Iragaraga (near Mocuba). Manica e Sofala: Mcauau (near Inhamitanga, also used for *Tabernaemontana elegans*). Muchenga (Chindao, Chixanga), Phonda (Chindao), Ntchinga, Nienza (Cafre).

Malawi: Cinyimbire (Tonga).

#### A selection of the ca. 920 specimens examined:

Senegal: Rufisque (fl. May) Adam 1263 (MO, P); Mbissel, Fatick (fl. Apr.) Adam 13456 (MO); Casamance, Heudelot 568 (G, P); Sédiou, Berhaut 6121 (P).

Gambia: near Albreda (fl. June) Heudelot 89 (BM, FI-W, G, K, P); Abuko Nat. Res. (fl. July) Starin 77 (K).

Mali: Fangala Kouta (fl., fr. Nov.) R. Dubois 24 (P).

Guinea Bissau: Xime, Bafata (fl. Mar.) Espírito Santo 496 (LISJC); Bissau, Stoetzel 19 (HBG), 21 (HBG); Caxamba, Bedanda (fl. Jan.) Alves Pereira 2716 (K); Cacine (bud Apr.) Roberty 17565 (G).

Guinea Conakry: Conakry (fl. Apr.) Debeaux 320 (BM, K, LE, LISU, P); Ditinn (fl. Apr.) Chevalier 13464bis (P); Boké, Parisse 50 (P); Konkoré R. (fl. Sept.) Pobéguin K 16 (K, P); Mt. Gangan (fl. May) Roberty 17786 (G); Timbo (fl. Mar.) Chevalier 12521 (BR, K, P); Mamou (bud Feb.) Cochet 28 (P); Macenta, Ziama Mts. (fl. Apr.) Adam 4294 (MO); Lola (fl. Mar.) Chevalier 20974 (P).

Sierra Leone: Lungi Peninsula (fl. Apr.) Morton SL 1231 (FHI, GC, K, WAG); Bafodeya (fl. Apr.) Scott Elliot 5484 (BM, K, lectotype); Ninia Talla (fl. Feb.) Scott Elliot 4903 (K, paratype); Koyema, Tingi Mts. (fl. Apr.) Morton & Gledhill SL 1814 (FHI, GC, K, WAG); Bwedu, Kisi country (fl. Apr.) Deighton 3195 (K); Kambui Res. (fl. Apr.) Lane Poole 251 (K); Juring (fl. Dec.) Deighton 303 (K).

Liberia: W Prov.: Kolahun, Karmadhun (imm. fr. Nov.) Baldwin 10193 (K); E Prov.: Diebla, Webo (fr. July) Baldwin 6342 (K).

Ivory Coast: Nouba Mt., Nuon R. source (fl. Apr.) Fleury in Chevalier 21106 (P); Kpangouin (fl. Jan.) Bamps 1889 (BR, UCJ); near Guiglo, Aubréville 2021 (P); 5 km W of Soubré (imm. fr. Aug.)

May) Leeuwenberg 12134 (WAG); Monogaga (fl. Apr.) Geerling & Bokdam 2391 (BR, K, LD, MO, PRE, WAG); 3 km S of Niambézaria (fl. Mar.) Leeuwenberg 12076 (UCJ, WAG); km 9 Divo-Gagnoa Rd. (fl. Mar.) Leeuwenberg 12033 (UCJ, WAG); 2 km SE of Youhouli, along road to Dabou (fl. Mar.) Leeuwenberg 12078 (UCJ, WAG); near Brafouédi (fl. Apr.) Leeuwenberg 3333 (UC, WAG); km 12 Bouaké-Yamoussoukro Rd., Leeuwenberg 12243 (WAG); Banco For. Res. (fl. Jan.) De Wit 9065 (WAG); km 10 Aboisso-Maféré Rd. (fl. Mar.) Leeuwenberg 12022 (UCJ, WAG); E of Bingerville (fl. Apr.) Leeuwenberg 3166 (BR, COI, K, L, UC, WAG); km 6 Abengourou-Akoupé Rd., Leeuwenberg 12269 (WAG); km 7 Tankassé-Agnibilekrou Rd., Leeuwenberg 12267 (WAG); km 16 Bondoukou-Gouméré Rd., Leeuwenberg 12263 (WAG).

Upper Volta: Sindou (fl. June) Leeuwenberg 4324 (B, BR, K, MO, P, WAG); near Bobo-Dioulasso (fl. Oct.) Koechlin 7000 (P).

Ghana: Northern: Gambaga (fl. Apr.) Morton GC 9021 (GC, K); Naburinu (fl. May) Kitson 737 (K); Bole Distr. (fl. May) Kambonga 38 (KUM). Brong-Ahafo: Asukese F.R., Enti GC 39948 (GC). Ashanti: 2 km SW of Ejura (bud Mar.) Leeuwenberg 11987 (GC, WAG); Kumasi (fl. Apr.) Vigne 1087 (BM, FHO, K, KUM, US); Eyan (fl. Apr.) Vigne 1122 (A, FHO, KUM); Amentia (fl. Dec.) Vigne 1494 (K, KUM, P). Western: Jewi Wharf (fl., few fr., Mar.) Leeuwenberg 11142 (GC, WAG); Essiama (fl. Feb.) Irvine 2351 (E, GC, K, MO, P); 8 km from Sekondi on road to Accra (fl. Mar.) Morton GC 6629 (GC, K, WAG). Central: Birim Res. (fl. Apr.) Vigne 2886 (FHO, GC, KUM); Cape Coast (fl. Mar.) Apprey Ogoe 184 (CCG); W of Sukrong (Sukunu), along Nswawam-Asamankese Road (fl. Mar.) Leeuwenberg 12003 (GC, WAG). Eastern: between Pepease and Nkwantanang (fl. Apr.) Morton A 790 (GC); Akropong, Akwapim (fl., fr., Aug.) Irvine 773 (FHO, GC); Osenasi (fl. Feb.) Deakin 90 (GC); N of Mankesim on road to Swedru (fl. Feb.) Leeuwenberg 11049 (GC, WAG); Aburi (fl. Apr.) Hall & Benson GC 46153 (MO, US, WAG). Volta: Kpandu (fl. Mar.) Leeuwenberg 11186 (GC, WAG); Peki (fl. Nov.) W.H. Johnson 814 (GC, K); Dzodze (immr. fr. July) Akpabla 56 (GC).

Togo: Misahöhe, near Kununlu, Baumann 464 (K, NH, lectotype of *V. schweinfurthii* var. *parviflora*); Adétikopé, 20 km N of Lomé (fl. Mar.) Ern 3295 (WAG); Aledjo Mts., Kersting 75 (A).

Benin: Cabolé, cercle de Savalou (fl. May) Chevalier 23782 (P); Boguila, near Abomey (fl. Feb.) Chevalier 23201 (P); E. of Agoué, 3 km E of frontier with Togo (fl. Feb.) Leeuwenberg 11924 (WAG); 2 km N of Sakété (fl. Feb.) Leeuwenberg 11927 (WAG).

Nigeria: Kaduna State: Kan Gimí (fl. May) Keay FHI 22940 (FHI, FHO, K); Birnin Gwari (fl. Apr.) Meikle 1376 (BR, K, P); Nimbia F.R. (fl. Apr.) Latilo FHI 47416 (FHI, K, P). Niger State: Cece stream, Lapai Distr. (fl. Apr.) Abiai FHI 7043 (FHI, FHO, K). K wara State: Lokoja, Patti Ridge (fl. Apr.) W.R. Elliot 48 (FHI, K). Oyo State: Shabe Rock (fl. Apr.) Hambler 1065 (BM, BR); Ogun R., on the Oyo-Iseyin Rd. (fl. Mar.) Onochie FHI 31548 (FHI, FHO, K, P); 24 km S of Ilesha (fr. Sept.) Akpaba FHI 18461 (FHI); Amo (fl. Apr.) Wimbush 15 in FHI 39624 (FHI, K); S of Ibadan Univ. Campus (fl. Apr.) Van Meer 690 (FHI, WAG). Ogun State: Abeokuta, Barter 3376 (K); km 4 Ilaro-Papalanto Rd. (fl. Apr.) Leeuwenberg 11334 (FHI, WAG); km 3 Ipokia-Ijofin Rd. (fl., fr. Apr.) Leeuwenberg 11346 (FHI, WAG). Lagos State: Lagos (fl. May) Dalziel 1001 (BM, K, MO, NY); Epe (fr. Aug.) J.B. Gillett 15274 (K). Ondo State: Idanre (fl. Jan.) Brennan 8712 (FHI, FHO, K, P). Bendel State: Igobazuwa (fl. May) Eimunjeze & Oguntayo FHI 70170 (FHI, K, MO, P); Ekenwan (fl. Mar.) R. Ross 177 (BM, MO, S); Ehor (fl. Mar.) Leeuwenberg 11255 (FHI, WAG); Asaba (fl. May) Ainslie 293 (FHO). Benue State: Idah (fl. Mar.) F. White 8664 (FHO); between Gudi and Keffi (fl. Apr.) Keay & Jones FHI 37642 (FHI, K); Nupe, Barter 1327 (K, P); between Angmekka and Odeafa (fl. Apr.) Dundas 1933/1A (BM, FHO, PR); 15 km N of Makurdi (fl. Mar.) J.A.D. Jackson 389 in FHI 57240 (FHI, FHO, K). Anambra State: Onitsha, Kennedy 2505 (FHO); Enugu (fl. Mar.) Lowe FHI 50256 (BR, FHI). Imo State: Afikpo (fl. Apr.) Jones 1402 (FHI); Arochukwu (fl. Jan.) Okafur & Latilo FHI 57641 (FHI). Rivers State: Degema, Talbot 3835 (BM, K). Cross River State: Eket Distr., Talbot 3247 (BM), 3388 (BM, MO, type of *V. eketensis*), 3389 (BM, type of *V. glaberrima*); km 10 Gron-Uyo Rd. (fl. Apr.) Van Meer 1202 (FHI, WAG); Oban, Talbot 1053 (BM, K, type of *V. magnifolia*); km 120 Calabar-Mamfé Rd. (fl. Apr.) Van Meer 1342 (FHI, WAG). Gongola State: Abong, Div. of Mambilla L.A. (fl. May) Chapman 3114 (FHI, K); Gashaka-Gangumi F.R. (fl. May) Chapman 4931 (K).

Cameroun: Sud-Ouest: between 3 Corners and Otu, Mamfè Distr. (fl. Mar.) Latilo & Oguntayo FHI 67766 (FHI, K, WAG); Ntali Mts., 30 km SE of Mamfè (fr. June) Villiers 1455 (WAG);

Johann-Albrechtshöhe, Staudt 859 (BM, FHO); Mungo, Buchholz s.n. (K, type of *V. glabra*); Victoria (fl. Feb.) Maitland 422 (B, FHI, K); Bibundi (fl. Mar.) Jungner 90 (BR, FI, LD, S, UPS); Mt. Koupé (fl. Jan.) Leeuwenberg 9256 (WAG). Nord-Ouest: Fang, Bamenda (fl. Mar.) Johnstone 168/31 (FHI, FHO). Littoral: near Douala (imm. fr. June) Fleury in Chevalier 33287 (P, WAG); Manengouba Mts. (fr. Nov.) Leeuwenberg 8660 (WAG), (fr. Sept.) 10329 (WAG, YA); 3 km NE of Baré (fl. Jan.) Leeuwenberg 9323 (WAG); 5 km N of Dibombé, a village on km 11 Loum-Yabassi Rd. (fl. Mar.) Leeuwenberg 9485 (WAG); Solé-Koum path, 20 km NW of Yabassi (fl. Mar.) Letouzey 14427 (P, YA); km 9 Masok-Kopongo Rd. (fl. Apr.) Leeuwenberg 5309 (BR, K, MO, P, WAG, YA). Nord: Ngomo, 25 km NNE of Nkambe (fl. fr. Nov.) Satabie 71 (P, WAG); km 20 of Bankim-Foumban Rd. (imm. fr. July) Leeuwenberg 10155 (WAG); near Boubala Lakes (fr. Dec.) Letouzey 2564 (P, YA); Geri, 40 km SSE of Poli (fl. Apr.) Fotius 2651 (P, WAG); Buffle Noir, Benoué Nat. Park (fl. May) Geerling & Néné 4723 (WAG); ibid. (fr. Oct.) P. Wit & M. Stark 2942 (WAG); near Mogodé, Letouzey 7004 (P, YA). Centre-Sud: km 2 Kribi-Yaoundé Rd. (fl. Nov.) Endengle 81 (P, YA); Golep Mt., 38 km N of Bafia (fl. Apr.) Type: Sierra Leone: Bagru R., Mann 858 (K, lectotype).

Heterotypic synonyms: *V. diplochlamys* K.Schum. in Engler & Prantl, Nat. Pflanzenf. 4(2): 149. 1895; Stapf in Fl. Trop. Afr. 4(1): 160. 1902; H. Huber, l.c., syn. nov. Type: Cameroun: Barombi, Preuss 14 (holotype not seen, destroyed in B; lectotype K!).

*V. bracteata* var. *lanceolata* Stapf, tom. cit. 161. Type: Cameroun: Yaoundé, Zenker 694b (K, lectotype; isotypes: S, WU).

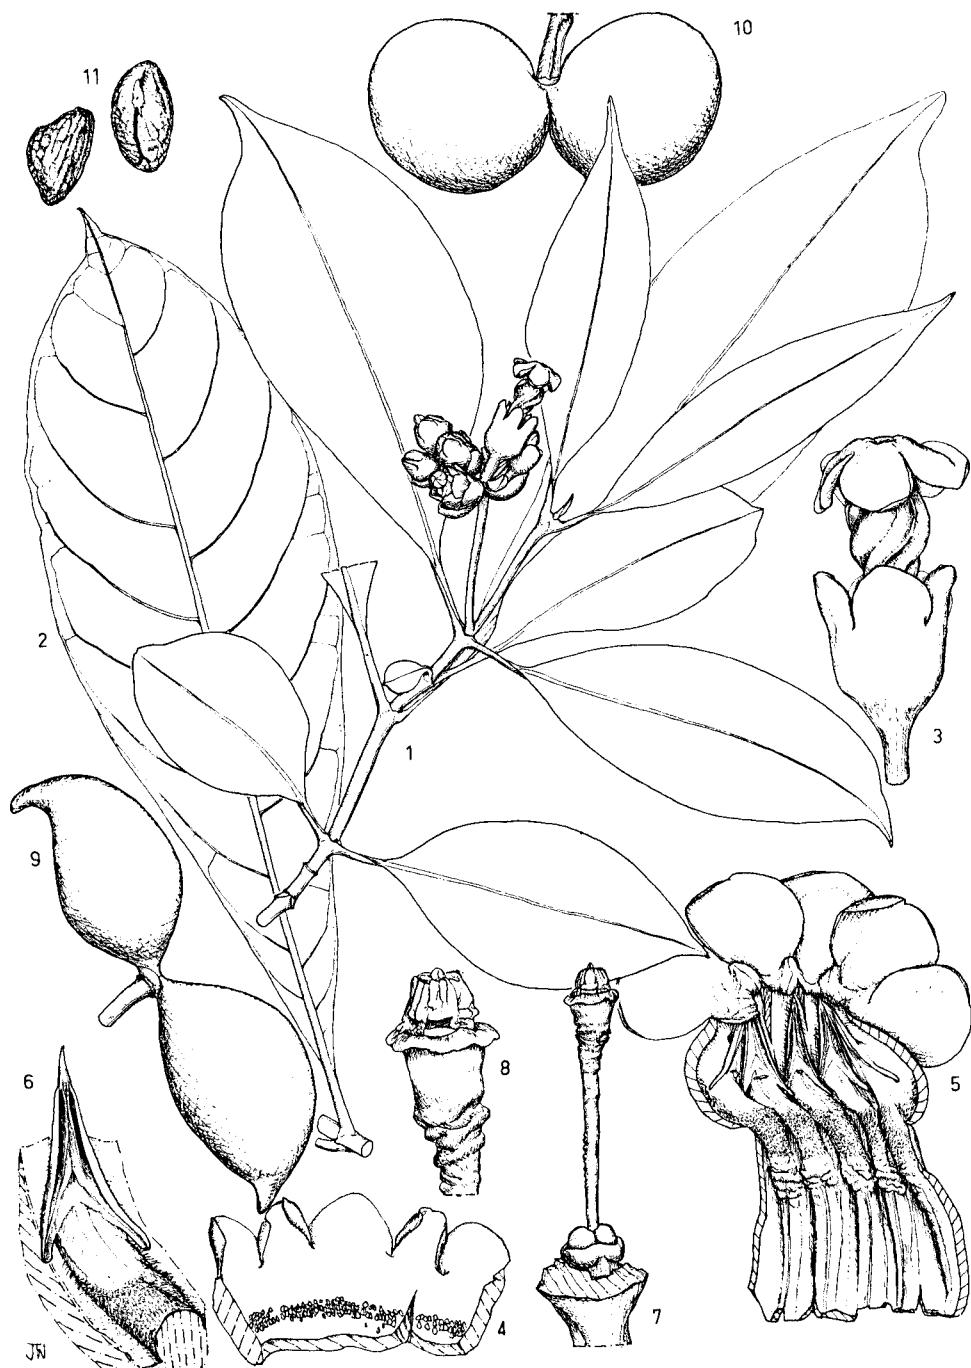

*V. talbotii* Wernham in Cat. Talbot's Nigerian Pl. 63. 1913. Type: Nigeria: Cross River State: Oban, Talbot 1624 (BM, holotype).

*V. micrantha* Pichon, Bull. Mus. Hist. Nat. Paris sér. 2. 19: 410. 1948, syn. nov. Type: Gabon: Nyanga, Le Testu 1370 (P, holotype; isotype: BM).

Missapplied name: *V. obanensis* Wernham, tom. cit. 62. Type: Nigeria: Cross River State, Oban, Talbot 2071, partly (BM, holotype, being *V. psilocalyx*; the K and Z sheets being *V. bracteata*).

Shrub or small tree, 1–6 m high. Trunk terete, 2–20 cm in diameter; bark pale grey, smooth, without latex, lenticellate. Branches lenticellate, with white latex; branchlets glabrous or sometimes minutely pubescent at the apex. Leaves petiolate; petiole glabrous or sometimes minutely pubescent, 2–30 mm long (oc-

FIG. 2. *Voacanga bracteata*. 1, flowering branch ( $\times \frac{1}{3}$ ); 2, leaf ( $\times \frac{1}{3}$ ); 3, flower ( $\times 2$ ); 4, opened calyx ( $\times 2$ ); 5, opened corolla ( $\times 3$ ); 6, stamen ( $\times 6$ ); 7, pistil ( $\times 3$ ); 8, pistil head ( $\times 6$ ); 9–10, fruits ( $\times \frac{1}{2}$ ); 11, seeds ( $\times 2$ ). 1, 3–8, 10–11 from Breteler & de Wilde 753/78; 2 from Bos 2283; 9 from de Koning 1610.

rea not or slightly widened into intrapetiolar stipules); blade often thinly coriaceous when fresh, membranaceous to papery when dry, elliptic or narrowly elliptic, variable in shape and size, 2–4 x as long as wide, 5–22 x 1.5–9 cm or sometimes some smaller, acuminate to almost caudate at the apex, glabrous on both surfaces or sometimes minutely pubescent beneath, especially on the costa, with 5–14 secondary veins on either side; tertiary venation inconspicuous. *Inflorescence* mostly long-pedunculate, 4–12 x 2–5 cm, drooping, few- to rather many-flowered, with first ramifications sometimes rather lax and other more congested. Peduncle slender, 1.7–10 cm long, pale green and glabrous or pubescent as branches and pedicels; pedicels 2–10 mm long. Bracts persistent or only lower deciduous, about as long as the calyx, ovate, concave, obtuse, glabrous or minutely pubescent outside, with a few colleters in the axils. *Flowers* with a faint odour. *Calyx* pale green, campanulate or nearly so, 8–12 (17) mm long (when lobes erect), persistent, often even under the fruit, outside glabrous or minutely pubescent, inside with a narrow belt of many crowded colleters in about 2–3 rows, being 1–2.5 mm wide and situated 0–1 mm above the base or sometimes with a 3 mm wide zone of more or less scattered colleters 1–4 mm above the base; tube cup-shaped, 4–6.5 (9.5) mm long; lobes 0.8–1.2 x as long as the tube, suborbicular or often some oblong, 0.9–1.5 x as long as wide, 7–7.5 x 3–7.5 mm, obtuse or rounded at the apex, imbricate in bud, erect or spreading to recurved. *Corolla* white or pale yellow, often with a brown centre, or entirely medium brown, often starting white or yellow and turning brown at anthesis, in the mature bud 12–22 mm long incl. the lobes (the lobes 1/5–1/3 of the bud length, forming an ovoid or broadly ovoid head, 1–1.5 x as long as wide, 3–5 x 2.5–4 mm, with a blunt apex), glabrous outside, inside with a pubescent belt from 5–9 mm above the base, being at or near the second constriction, to the insertion of the stamens and usually with some minute hairs near the base of the lobes; tube 0.8–2 x as long as the calyx (when the lobes erect), 10–17 mm long, more or less bottle-shaped, twisted from slightly above the middle to about 2 mm below the mouth, contracted at the base, about in the middle, and at the mouth, at the base 2–4 mm, above 3–5 mm, at the second constriction (being 5–9 mm above the base) 2–3 mm, above 3–6 mm, and at the mouth 1.5–2 mm wide; lobes (= free parts of limb) twisted, obovate or broadly obovate, 0.2–0.5 x as long as the tube, 0.8–1.2 x as long as wide, 2.5–8 x 3–7 mm, rounded to retuse, recurved. *Stamens* barely included or barely exserted, inserted 2.5–4 mm from the corolla mouth; anthers 4–5.5 x 1.5–2 mm, at the apex for 0.5–0.7 mm sterile, glabrous, usually twisted with the corolla. *Pistil* 9–13 mm long (when style straightened out); ovary of two carpels 1–1.8 x 0.9–2 x 0.5–1.2 mm; disk entire or slightly sinuate, 0.3–1 mm high; style occasionally split at the base for 0.3 mm, narrowly obconical, 7–10 mm long, twisted and sometimes curled at the base, at the base about 0.5 mm wide, at the apex slightly narrower than the pistil head; pistil head 1.5–3 x 1.5–3 mm, with an entire or slightly sinuate ring 1.5–3 mm in diameter. Ovules 50–70 in each carpel. *Fruit* of two separate mericarps usually both developing; mericarps yellow or less often white or orange, not spotted, obliquely subglobose to ovoid, or half-moon-shaped, 1–2.7

$x$  as long as wide and 1–2.7  $x$  as long as thick, as wide as thick or slightly wider, 26–60  $\times$  15–35  $\times$  15–30 mm, rounded to acute at the apex (when dry usually acuminate), smooth (when dry bumpy by the seeds), 2-valved (but not seen open); wall 2–6 mm thick; aril orange. Seeds many, dark brown to black, 7–10  $\times$  4–4.5  $\times$  3.5–4 mm, with a more or less honeycomb-like structure; embryo straight, 5 mm long; cotyledons orbicular, 2 mm long; rootlet 0.5–0.6 mm in diameter.

**Distribution:** Tropical West and Central Africa.

**Ecology:** Understorey of moist forests. Alt 0–1100 m. Probably continuously flowering and fruiting.

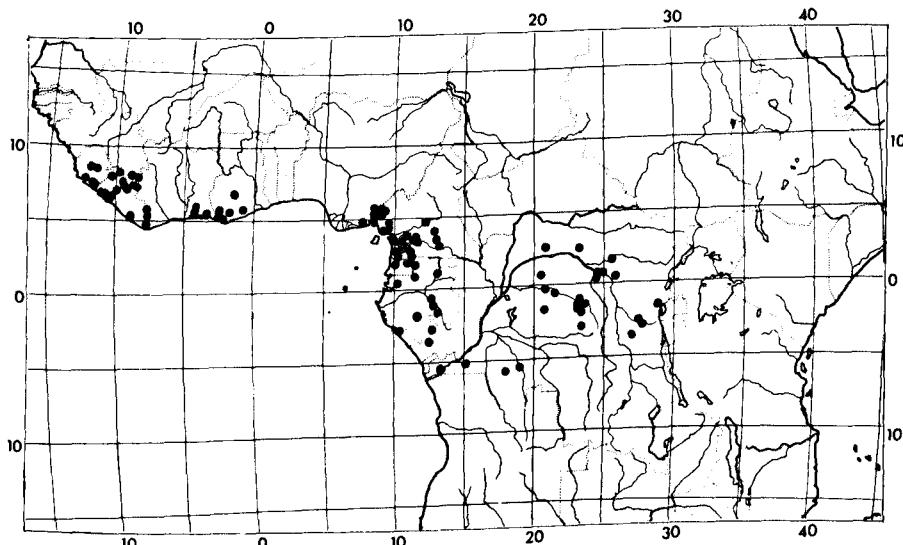

#### Vernacular names

Cult.: Ivory Coast: Adiopodoumé, Leeuwenberg 12171 (WAG).

Notes. Specimens of *V.bracteata* in (young) bud or without corollas may be confused with *V.caudiflora* and *V.psilocalyx*. In the case of such incomplete specimens the arrangement of the colleters may be conclusive – they form a 1–2.5 mm wide belt comprising 2–3 dense rows situated 0–1 mm above the base, while in the other two species they are clearly separated from each other and are scattered over a wider zone (see figs. 2, 3 and 6).

### 3. *Voacanga caudiflora* Stapf in Fl.Trop.Afr.4(1): 603. 1904; H.Huber in Fl.W. Trop.Afr. 2nd ed. 2: 67. 1963.

Fig. 3, p. 28; Map 3, p. 29

Type: Liberia, about 30 km from Karka Town, A.Whyte s.n. (K, holotype).

Shrub or treelet 1–6 m high, trunk 2–5 cm in diameter; bark fairly smooth, pale grey-brown. Branches lenticellate; branchlets glabrous. Leaves shortly petiolate; petiole glabrous, 3–20 mm long (ocrea not widened into intrapetiolar stipules); blade thinly or softly coriaceous when fresh, membranaceous or papery when dry, variable in size, narrowly elliptic or narrowly obovate, (2.5)3–6.5 x as long as wide, (4.5)10–28 x 1.5–8 cm, long-acuminate at the apex, glabrous on both surfaces; with 5–12 secondary veins on either side; tertiary venation inconspicuous. Inflorescences mostly long-pedunculate, 8–20 x 3–8 cm, drooping, few-flowered, lax. Peduncle slender, 2.5–15 cm long, pale green and glabrous; pedicels slender, glabrous, 10–28 mm long. Bracts persistent or deciduous, broadly ovate, concave, about as long as the calyx, rounded. Flowers: Calyx pale green or greenish-white, campanulate, much wider than the corolla tube, 11–19 x 5–9 mm, deciduous after the corolla has been shed, and before the fruit develops, outside glabrous, inside with a belt of scattered colleters in basal 2–4 mm; tube campanulate (2–4 x as long as the lobes) 8–13 mm long; lobes 0.2–0.3 x as long as the tube, broadly ovate to oblong, even in a single flower, 0.7–2 x as long as wide, 3–6 x 2.5–5.5 mm, rounded, erect. Corolla white, creamy or yellow, in the mature bud 16–30 mm long incl. the lobes (the lobes 0.4–0.55 of the bud length, forming an almost cylindrical head, 3.5–6 x as long as wide, 9–12 x 1.5–3 mm, with a blunt apex), glabrous outside, inside with a 1 mm wide pubescent belt just below the insertion of the stamens; tube 1.1–1.4

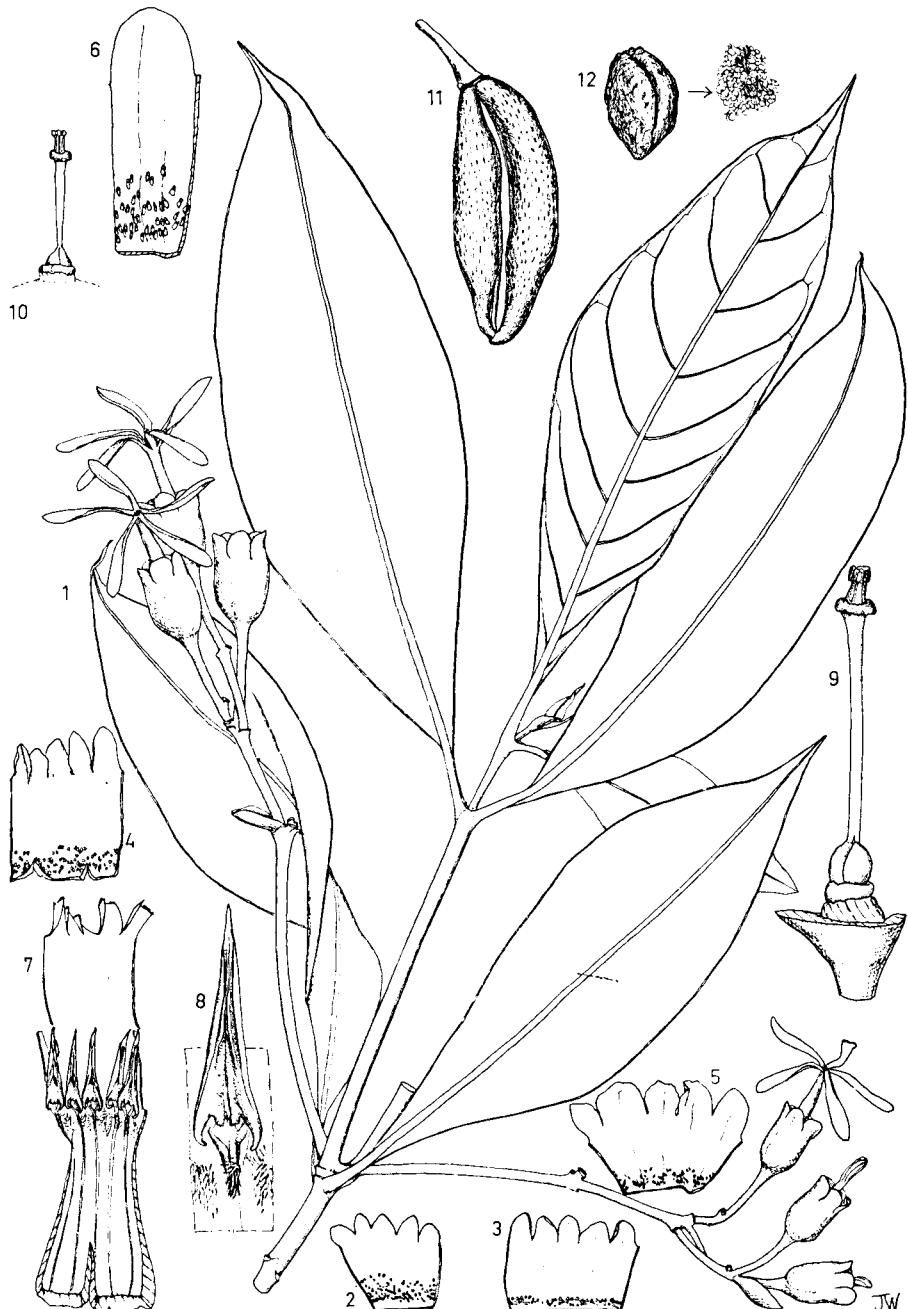

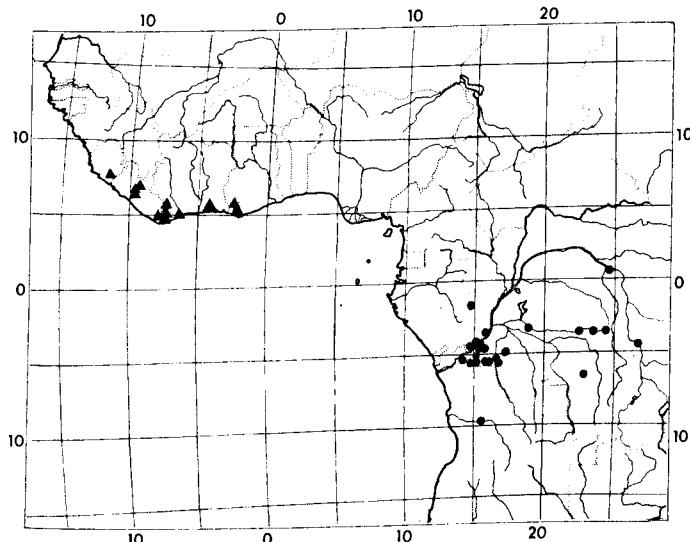

FIG. 3. *Voacanga caudiflora*. 1, flowering branch ( $\times \frac{1}{3}$ ); 2–5, opened calyces ( $\times 1$ ); 6, calyx segment inside ( $\times 3$ ); 7, opened corolla ( $\times 2$ ); 8, stamen ( $\times 6$ ); 9–10, pistils ( $\times 3$ ); 11, fruits ( $\times \frac{1}{3}$ ); 12, seed ( $\times 2$ ) with more enlarged detail of testa. 1, 5 from Bos 1957; 2, 10 from Ake Assi 3203; 3 from Stoop-v. d. Kasteel 299; 6 from Vigne 3160; 4, 7–9 from Jansen 2238; 11–12 from Leeuwenberg 12279.

$\times$  as long as the calyx (when the lobes erect), 16–24 mm long, almost cylindrical, contracted just below the insertion of the stamens (being 5–14 mm above the base or at 0.3–0.6 of the length of the tube), at the base 2–4 mm, at the constriction 1.5–2.5 mm, just above 2.5–3.5 mm, and at the throat 2–2.5 mm wide, slightly twisted for the entire length; lobes twisted, narrowly elliptic to strap-shaped, 0.9–1.3  $\times$  as long as the tube, 4–10  $\times$  as long as wide, 16–23  $\times$  2.5–4 mm, obtuse, spreading to recurved. *Stamens* distinctly included (apex of anther 3–6 mm below the corolla mouth), inserted 7–10 mm below the mouth; anthers 6  $\times$  1.2–1.5 mm, at the apex for 1 mm sterile, glabrous, not twisted. *Pistil* 7–21 mm long; ovary of two carpels, 1.5–2  $\times$  0.8–1.5  $\times$  0.8 mm; disk annular, slightly sinuate, 0.4–0.5 mm high; style not split at the base, almost cylindrical, slightly widened just below the pistil-head, 4.5–18 mm long, not bumpy, not twisted, at the base about 0.5 mm thick; pistil head 1–1.5  $\times$  0.6–1.5 mm, with a shortly lobed ring, 1.3–2.5 mm in diameter. Ovules 30–50 in each carpel. *Fruit* of two separate mericarps; mericarps yellow or orange, narrowly ellipsoid, 2–4.5  $\times$  as long as wide, 4–6  $\times$  1.2–2  $\times$  1.2–2 cm, acuminate at both ends, with an obscure line of dehiscence, several-to many-seeded. *Seed* dark brown, 9  $\times$  5  $\times$  4.5 mm, with a minute honeycomb-like structure; embryo straight, 5.5 mm long; cotyledons orbicular, 2 mm long; rootlet 0.6 mm in diameter.

**Distribution:** Sierra Leone, Liberia, Ivory Coast, Ghana.

**Ecology:** Understory of moist forest or bush in the moist forest area. Alt. 0–150 m. Probably continuously flowering and fruiting. Mainly collected from September to February.

4. **Voacanga chalotiana** Pierre ex Stapf in Fl. Trop. Afr. 4(1): 158. 1902.

Fig. 4, p. 31; Map 3, p. 29

Type: Congo: Brazzaville, Chalot 5 (P, holotype; isotype: K).

Tree 6–30(35) m high, entirely glabrous except for inner side of the corolla tube. Trunk 10–80 cm in diameter; bark pale grey-brown, shallowly fissured, 0.8–1.8 cm thick, with stony orange-brown inclusions, with few white latex; inner bark yellow. Branches with some large lenticels; branchlets glabrous. Leaves long-petiolate; petiole 10–30 mm long (ocrea narrow); blade chartaceous when dry, narrowly elliptic, 2.8–4 x as long as wide, 5.5–21 x 1.5–6.5 cm, acuminate at the apex, glabrous on both surfaces, with 10–25 fish-bone-like secondary veins on either side; tertiary venation rather conspicuous, reticulate. Inflorescences long-pedunculate, 10–17 x 6–15 cm, lax. Peduncle 2.5–8.5 cm long; pedicels 6–15 mm long. Bracts deciduous, ovate to obovate, acuminate or nearly so, with a single row of large colleters in the axils; lower up to 7 x 5 mm, other smaller.

Flowers: Calyx green(?), 5–7.5 mm long (when lobes erect), inside barely above the base with 4 or 5 large colleters in a single row opposite the lobes (all 20 to 25 colleters together shape an almost uninterrupted ring); tube cup-shaped, 2–3 mm long; lobes 1.5–2.5 x as long as the tube, narrowly triangular to almost oblong, 2.5–3.5 x as long as wide, 3–6 x 1.3–2 mm obtuse, recurved. Corolla (in bud pale yellow), white or creamy, often(?) with an ochraceous throat, in the mature bud 13–18 mm long incl. the lobes (the lobes 0.55–0.66 of the bud length, being 7.5–12 mm, forming an almost conical head with a blunt apex), glabrous outside, inside in tube appressed-pubescent with hairs directed downwards at the edges and bases of the filament ridges starting at 1.5–2 mm from the base and in between; tube inflated, 2–3.2 x as long as the calyx tube, 5–7

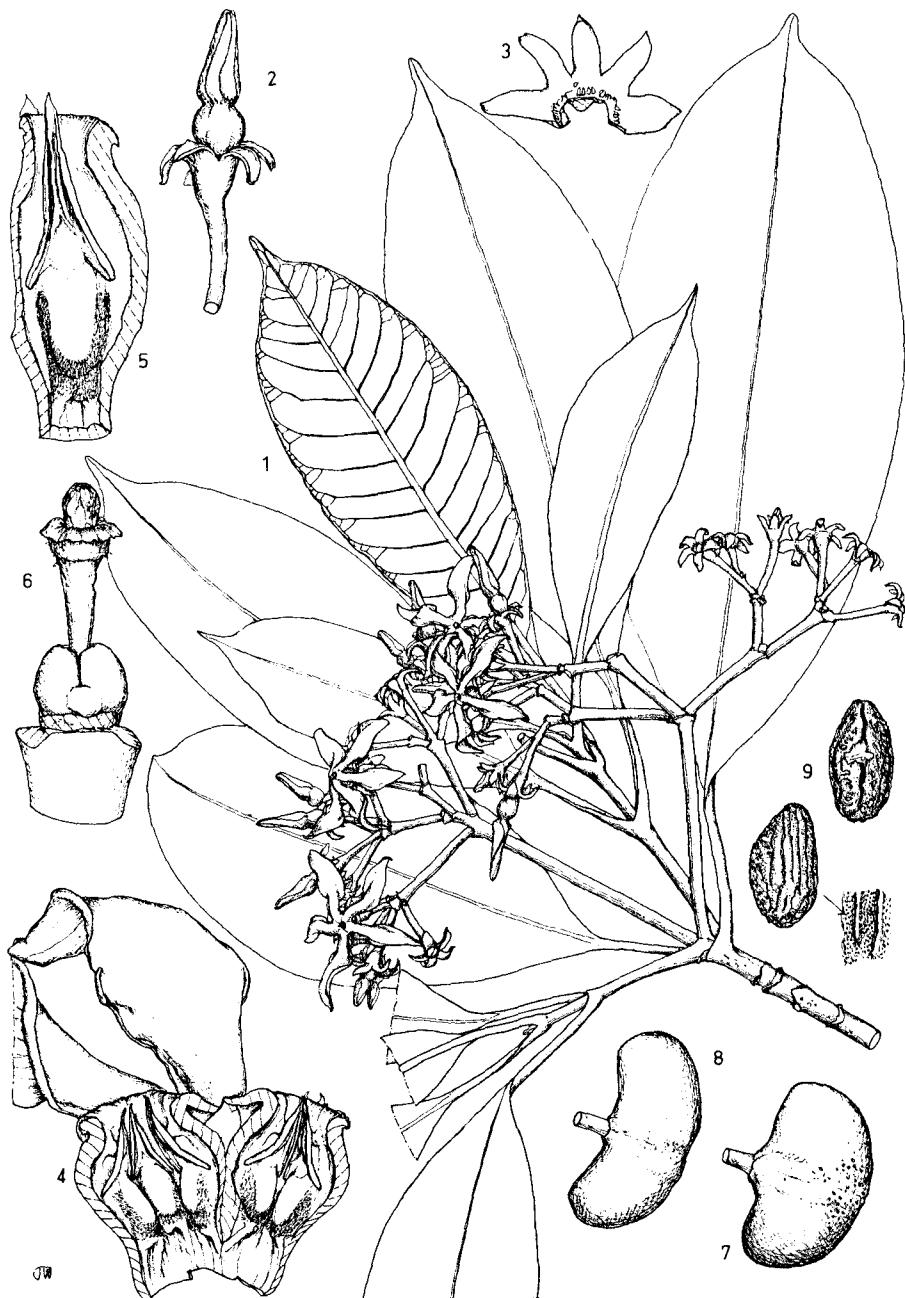

FIG. 4. *Voacanga chalotiana*. 1, flowering branch ( $\times \frac{1}{3}$ ); 2, flower bud ( $\times 2$ ); 3, opened calyx ( $\times 2$ ); 4, opened corolla ( $\times 4$ ); 5, stamen ( $\times 8$ ); 6, pistil ( $\times 6$ ); 7-8, fruits ( $\times \frac{1}{3}$ ); 9, seeds ( $\times 3$ ) with more enlarged detail of testa. 1 from J. Louis 3488; 2-6 from Bamps 610; 7 from Evrard 2278; 8-9 from J. Louis 4314.

mm long, with basal narrow part (partially in calyx) at base 2–3 mm wide, at widest point 3.5–4.5 mm wide, contracted again at the mouth; lobes not twisted, and at the base ventricose, obliquely oblong, 1.9–3 x as long as the tube, 2.4–3 x as long as wide, 11–18 x 4–6 mm, subacute or obtuse, spreading and soon afterwards recurved. *Stamens* exserted for 0.7–1.2 mm, inserted 2 mm below the corolla mouth; anthers 3–3.8 x 1.4–1.6 mm, at the apex for 0.6 mm sterile, glabrous. *Pistil* 5.1–6.1 mm long; ovary 1.7–2 x 1.5–1.7 x 1.2–1.5 mm, composed of 2 carpels being connate at the base for 0.4–0.8 mm; style not split at the base, 2.2–2.8 x 0.3 mm, slightly thickened at the apex; pistil head 0.6–0.8 x 0.6 x 0.8 mm, with a ring 1.2–1.5 x 0.5–0.8 mm. Ovules about 120–150 in each carpel. *Fruit* transversely broadly elliptic, immature often slightly bilobed, mature dark green or yellow and yellow-spotted at the apex and dark green at the base, not or barely lobed, 2.5–3 x 4.5–6.5 x 2–3 cm, with apices of carpels spreading or slightly recurved, transversely dehiscent; wall about 4 mm thick; aril bright yellow. *Seeds* dark brown, 6 x 3 x 2.5 mm, minutely tuberculate; embryo small, straight, 2.5 mm long; cotyledons orbicular, 0.8 mm long; rootlet 0.3 mm in diameter.

**Distribution:** Congo, Zaïre, Angola.

**Ecology:** Forests, often secondary, or gallery forests. Alt. up to 500 m. Probably flowering and fruiting the whole year.

Frutex vel arbor parva ramis lenticellatis bifurcatis. Folia anguste elliptica apice acuminata. Inflorescentia pauciflora. Bracteae deciduae calice longitudine

FIG. 5. *Voacanga pachyceras*. 1, flowering branch ( $\times \frac{1}{3}$ ); 2, flower without calyx ( $\times \frac{1}{3}$ ); 3–5, calyces inside ( $\times 1$ ); 6, part of calyx inside ( $\times 2$ ); 7, opened corolla ( $\times 3$ ); 8, pistil ( $\times 3$ ); 9, fruit ( $\times \frac{1}{3}$ ); 10, transverse section of mericarp ( $\times 2$ ); 11, seeds ( $\times 2$ ) with more enlarged detail of testa. 1, 4 and 6 from Maudoux 325; 2–3, 8–11 from Léonard 1449; 5 from Evrard 5200.

circiter aequantes. Calyx tubo campanulato. Corolla alba tubo gracili lobis obovatis vel ellipticis. Stamina inclusa. Ovarium carpellis duabus inter se liberis compositum disco annulari circumdate. Fructus folliculis duabus parallelibus erectis cornis crassis simillimus compositus.

Type: Zaïre: VI: Yandja Lake, near Isangi, J. Léonard 1449 (BR, holotype).

Shrub or small tree 1–5 mm high. Trunk 2–3 cm in diam. (or more?). Branches lenticellate; branchlets glabrous or minutely pubescent at the apex. *Leaves* petiolate; petiole glabrous or with a few hairs, 4–20 mm long (ocrea slightly widened into intrapetiolar stipules); blade chartaceous to membranaceous when dry, narrowly elliptic, 3–4 x as long as wide, 3.5–24 x 1–6.5 cm, acuminate at the apex, glabrous above, pubescent or glabrous beneath; with 5–14 secondary veins on either side; tertiary venation inconspicuous. *Inflorescences* mostly long-pedunculate, erect, 7–12 x 3–7 cm, few-flowered. Peduncle fairly stout, 3–8 cm long, glabrous; pedicels glabrous, 7–18 mm long. Bracts deciduous, ovate, concave, acuminate, about as long as the calyx, glabrous outside. *Flowers*: *Calyx* pale green, campanulate or nearly so, 15–22 mm long (when lobes erect), shed with the corolla, outside glabrous or minutely papillose, inside with a (1)5–7 mm wide belt of small scattered colleters 2–3 mm above the base, not touching each other and never reaching the lobes; tube campanulate or nearly so, 7–13.5 mm long; lobes 0.4–0.9 x as long as the tube, broadly ovate to oblong even in a single flower, 0.7–1.4 x as long as wide, 6–8.5 x 6–11 mm, rounded or acute, erect. *Corolla* white, in the mature bud 20–37 mm long incl. the lobes (the lobes 0.35–0.45 of the bud length, forming an almost conical head 2–2.6 x as long as wide, 7–17 x 3–7 mm, with a blunt apex), glabrous outside, inside with a pubescent belt from 3–5 mm above the base to the insertion of the stamens; tube 1–1.25 x as long as the calyx (when the lobes erect), 17–24 mm long, more or less bottle-shaped, almost cylindrical at the basal third, then gradually widened towards the middle and from there less gradually narrowed to a narrow cylindrical part below the throat, at the base 3–4 mm, at the middle 5.5–8 mm, and at the throat 2–3 mm wide, twisted from the base to the middle; lobes twisted, obovate to elliptic, 0.5–1.1 x as long as the tube, 1.25–2(3) x as long as wide, 10–22 x 4–15 mm, rounded at the apex, spreading. *Stamens* included, apex of anther 4–6 mm below the corolla mouth, inserted 10–12 mm below the mouth; anthers 7–9 x 2–3 mm, at the apex for 1 mm sterile, glabrous, mostly twisted at the base with the corolla. *Pistil* 11–14.5 mm long; ovary of 2 carpels, 1.5–2 x 1.5–2 x 1 mm; disk annular, slightly sinuate, 0.5–0.6 mm high; style not split at the base, very narrowly obconical, 7.5–11.5 mm long, bumpy, twisted, at the base 0.5 mm thick, at the apex slightly narrower than the pistil head; pistil head 1.5–2 x 1.3–1.5 mm, with an undulate or shortly lobed ring, 2.2–3.2 mm in diameter. Ovules 70–100 in each carpel. *Fruit* of 2 separate mostly erect mericarps usually both developing; mericarps whitish, narrowly ellipsoid, 45 x 15 x 15 mm or perhaps smaller, acuminate at both ends, with an obscure line of dehiscence, several-to many-seeded. *Seed* dark brown, 9 x 3 x 3 mm, with a minute honeycomb-like structure.

**Distribution:** Only known from 12 collections made in Zaïre.

**Ecology:** Riverine or swamp forests. Alt. 0–500 m.

**Etymology:** *Παχύς* thick; *κέρας*, horn; the fruits resembling thick antelope horns.

*V. pachyceras* bears some slight resemblance to *V. globosa* and *V. thouarsii* in respect of the dehiscence (shedding) of the calyx. However, it differs from both of them, among other things, by having narrowly ellipsoid instead of subglobose carpels. In addition, in *V. pachyceras* the calyx is much wider than the corolla tube, while in the other two species it clasps the corolla tube.

MAP 4. *Voacanga pachyceras*.

On the other hand, *V. pachyceras* more nearly resembles *V. psilocalyx* through the flowers and to a lesser extent the leaves. The latter, however, has a calyx which persists for some time after the corolla has been shed; moreover, its stamens are barely or not, rather than distinctly, included. Likewise, the corolla tube differs to a greater or lesser extent depending on the insertion of the stamens. Finally, the carpels of *V. pachyceras* are erect or suberect, while those of *V. psilocalyx* are spreading.

**6. *Voacanga psilocalyx* Pierre ex Stapf in Fl. Trop. Afr. 4(1): 159. 1902; H. Huber in Fl. W. Trop. Afr. 2nd ed. 2: 67. 1963.** **Fig. 6, p. 37; Map 5, p. 39**

Type: Gabon: near Libreville, Klaine 1377 (P, lectotype; isotypes: A, BR, K).

Heterotypic synonyms: *V. zenkeri* Stapf, l.c., partly (as for lectotype; the paratype is *V. bracteata*). Type: Cameroun: Bipindi, Zenker 1807 (K, lectotype; isotypes: BM, E, G, GOET, HBG, L, LE, M, P, S, W, WU, Z). Homotypic synonym: *V. bracteata* var. *zenkeri* (Stapf) H. Huber, l.c. partly (excl. of Talbot 1290, Richards 5225, and Tamajong FHI 22133), syn. nov.

*V. obanensis* Wernham, Cat. Talbot's Nigerian Pl. 62. 1913. Type: Nigeria: Cross River State (BM, holotype; the K and Z sheets of this number are *V. bracteata*).

Shrub or treelet 0.80–3 m high. Trunk terete, 2–3 cm in diameter; bark pale brown, smooth, with white latex. Branches lenticellate; branchlets glabrous or sometimes minutely pubescent at the apex. Leaves petiolate; petiole glabrous or less often minutely pubescent, 2–30 mm long (ocrea slightly widened into intrapetiolar stipules); blade often coriaceous when fresh, membranaceous to papery when dry, elliptic, narrowly elliptic or oblong, variable in shape and size, 2–4.5 x as long as wide, 6–32 x 2–11 cm, acuminate to caudate at the apex, glabrous on both surfaces or less often minutely pubescent beneath, with 5–14 secondary veins on either side; tertiary venation inconspicuous. Inflorescences mostly long-pedunculate and often drooping, 6–20 x 3–8 cm, few- to fairly many-flowered; fairly lax at the base, higher up congested. Peduncle slender, 3–17 cm long, pale green and glabrous or less often minutely pubescent as branches and pedicels; pedicels 5–20 mm long. Bracts persistent at anthesis, later deciduous, ovate, concave, acute or obtuse, about as long as the sepals, glabrous or puberulous outside, with a few colleters in the axils. Flowers sweet-scented. Calyx pale green, campanulate or nearly so, 10–19 mm long (when lobes erect), deciduous after the corolla has been shed and before the fruit develops, outside glabrous or minutely pubescent, inside with a 1–5 mm wide belt of scattered small colleters not touching each other from 0–4 mm to 4–8 mm above the base,

FIG. 6. *Voacanga psilocalyx*: 1, flowering branch ( $\times \frac{1}{2}$ ); 2–3, calyces inside ( $\times 1$ ); 4, flower without calyx ( $\times 1$ ); 5–7, corolla lobes ( $\times 2$ ); 8, corolla inside ( $\times 3$ ); 9, pistil ( $\times 3$ ); 10, pistil head ( $\times 6$ ); 11, fruit ( $\times \frac{3}{2}$ ); 12, seed ( $\times 2$ ) with more enlarged detail of testa; 13, section of seed showing embryo ( $\times 2$ ). 1–2, 4–5 and 8–10 from van Meer 1265; 3, 7 from Bouquet 732; 6 from Leeuwenberg 5571; 11–13 from Breteler 5647.

never reaching the lobes; none of the upper colleters close to the base of the edge of the lobes as the upper side of the belt is fairly straight; tube cup-shaped, 5.5–10 mm long; lobes 0.7–1 x as long as the tube, broadly ovate or often some oblong, 0.6–1 x as long as wide even in a single flower, 4–7.5 x 3.5–6 mm, obtuse or rounded, erect or apically slightly spreading. *Corolla* white, creamy, or pale yellow, in the mature bud 13–28 mm long incl. the lobes (the lobes 0.34–0.63 of the bud length, forming an almost conical to ovoid head, 1.3–2.8 x as long as wide, 5–14 x 3–9 mm, with a blunt apex), glabrous outside, inside with a pubescent belt from 4–7 mm above the base to the insertion of the stamens (being the part of the corolla partly incrassate below the insertion of the stamens); tube 1–1.3 x as long as the calyx (when the lobes erect), 11–20 mm long, more or less bottle-shaped, mostly contracted just below the middle and at 1–3 mm below the mouth, at the base 2–4.5 mm, above 3–5.5 mm, at the second constriction 2.5–4 mm, again above 4.5–7 mm, and at mouth 2–2.5 mm wide, twisted from barely below the second constriction to almost near the third (1–4 mm below the mouth); lobes twisted, elliptic, narrowly elliptic, or less often obovate (the latter only observed in large flowers), 0.6–1.8 x as long as the tube, 1.4–4.4 x as long as wide, 7–18 x 2.5–13 mm, obtuse or rounded, spreading and often later recurved. *Stamens* exserted for 0.5–1.5 mm, less often barely included, inserted 2–6 mm below the corolla mouth; anthers 4–7.5 x 1.5–3 mm, at the apex for 0.5–1 mm sterile, glabrous, mostly twisted with the corolla. *Pistil* 9–13 mm long; ovary of two carpels 1–2 x 1.5–2 x 0.7–1 mm; disk annular, slightly sinuate, 0.5–1 mm high; style not or hardly split at the base, narrowly to very narrowly obconical, bumpy, 6.5–10 mm long, twisted and often at the base curled, at the base about 0.5 mm in diameter and at the apex slightly narrower than the pistil head; pistil head 1–2 x 1–1.5 mm, with an undulate entire or lobed ring 1.8–3.2 mm in diameter. Ovules 35–100 in each carpel. Fruit of 2 separate mericarps usually both developing; mericarps yellow or orange(?), ellipsoid, 3–7.5 x 1.5–3 x 1.5–3 cm, recurved, often stipitate, acuminate at the apex or not, with an obscure line of dehiscence. *Seeds* many, dark brown, 8–9 x 4–5 x 3.5–4.5 mm, with a minute honeycomb-like structure.

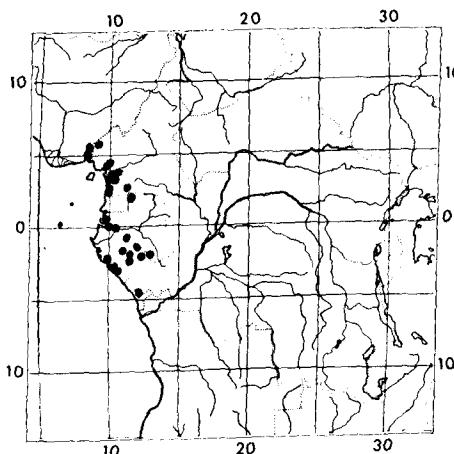

**Distribution:** Nigeria (Cross River State), Cameroun, Gabon, Congo.

**Ecology:** Forest understorey or gallery forest. Alt. 0–600 m. Probably flowering almost the whole year.

A selection of the ca. 75 specimens examined:

**Nigeria:** Cross River State: Ekinta R. For. Res., van Meer 1265 (FHI, WAG), 1380 (FHI, WAG), 1458 WAG, 1590 (FHI, WAG); Oban, Talbot 290 (BM, K), 302 (BM, K), 2071 party (BM, type of *V. obanensis*); Eket Distr., Talbot s.n. (BM).

**Cameroun:** Nord-Ouest: Abonando, Rudatis 46 (G, K, W, Z). Littoral: km 24 Douala-Edea Rd. (route Razel), Leeuwenberg 6432 (P, WAG); SE of Tissongo Lake, 35 km SW of Edéa, Letouzey 12653 (YA); 3 km E of km 21 Yabassi-Douala Rd., Leeuwenberg 6407 (WAG). Madag. 169: 219, pl. 35 (partly, excl. of leaves and fruit). 1976; Leeuwenberg in Fl. Zamb. 7(2): 437. 1985.

Fig. 7, p. 40; Map 6, p. 43

Type: Madagascar: sin. loc., Herb. Du Petit-Touars s.n. (P, holotype).

Homotypic synonyms: *Orchipeda thouarsii* (Roem. & Schult.) Baron, Revue Madag. 10 Mar. 1905 (year 7): 249; *Tabernaemontana thouarsii* (Roem. & Schult.) Palacky, Cat. Pl. Madag. 3: 30. 1907.

Heterotypic synonyms: *Voacanga dregei* E.Mey., Comm. Pl. Afr. Austr. 189. 1838. Type: South Africa: Natal: between Umtentu and Umzimkulu Rs., Drège anno 1837 (K, lectotype; isotypes: MEL, OXF, S). Homotypic synonyms: *Piptolaena dregei* (E.Mey.) A.DC., Prodr. 8: 358. 1844; *Voacanga thouarsii* var. *dregei* (E.Mey.) Pichon, Bull. Mus. Nat. Hist. Nat. Paris sér. 2. 19: 415. 1947.

*Annularia natalensis* Hochst., Flora 24: 670. 1841. Type: South Africa: Natal: near Umlazi R., Krauss 27 (holotype not seen, destroyed in B; lectotype: BM, other isotypes seen: FI-W, G, K, M, MO, TCD, W). Homotypic synonym (illegitimate): *Cyclostigma natalense* (Hochst.) Hochst. ex Endl., Gen. Pl. Suppl. 2: 56. 1842; Flora 27: 828. 1844.

*Voacanga obtusa* K.Schum. in Engler & Prantl. Nat. Pflanzenf. 4 (2): 149. 1895; Stapf. tom. cit. 153. Type: Zaïre: VII: Niamniam Land, Mbruole R., Schweinfurth 3741 (holotype not seen, destroyed in B; lectotype: K; other isotypes seen: P, S). Homotypic synonym: *V. thouarsii* var. *obtusa* (K.Schum.) Pichon, loc. cit.

Usually small tree, 2–15 (20) m high. Trunk terete, 4–40 (80) cm in diameter; bark pale grey-brown, smooth, with small lenticels, with some white latex. Branches with or without large lenticels; branchlets glabrous or minutely puberulous, with much latex. Leaves shortly petiolate; petiole 8–25 mm long, glabrous or minutely puberulous at the base (ocrea widened into intrapetiolar stipules); blade often slightly glaucous with the costa often pale, often thickly coriaceous (also when fresh), narrowly obovate or less often narrowly elliptic, 2–4 x as long as wide, 6–25 x 2–9 cm, obtuse or rounded, glabrous and mostly with numerous minute pits on both surfaces; secondary veins 12–20 on each side, inconspicuous in fresh leaves; tertiary venation inconspicuous. Inflorescences long-pedunculate, fairly lax, without peduncle 4–7 x 4–7 cm, few-flowered, monochasial or nearly so. Peduncle 5–14 cm long, stout, glabrous; pedicels 8–15 mm long except for the thickened 2–5 mm long apex, often minutely puberulous above. Bracts deciduous, ovate, rounded at the apex, with a single row of large colleters in the axils; lower up to 10 x 7 mm, others smaller. Flowers sweet-scented. Calyx pale to dark green, with hyaline margin, fleshy, clasping the corolla tube and shed together with the corolla, from abscission layer 13–25 mm long, 7–13 mm wide, outside minutely papillose except for the glabrous apices

FIG. 7. *Voacanga thouarsii*. 1, flowering branch ( $\times \frac{1}{2}$ ); apex of branchlet ( $\times \frac{1}{2}$ ); 3, flower bud ( $\times \frac{1}{2}$ ); 4, calyx inside ( $\times \frac{1}{2}$ ); 5–6, opened corollas ( $\times \frac{1}{2}$ ); 7, stamen ( $\times 4$ ); 8, corolla mouth showing anther apices ( $\times 2$ ); 9, pistil ( $\times 2$ ); 10, pistil head ( $\times 4$ ); 11, pistil base with high disk ( $\times 1$ ); 12 as 11, but above ( $\times 1$ ); 13, longitudinal section of flower base without calyx ( $\times 2$ ); 14, fruit ( $\times \frac{1}{2}$ ); 15, seed ( $\times 2$ ) with more enlarged detail of testa. All from coll. Leeuwenberg: 1, 5 from 11904; 2 from 11206; 3–4 and 6–13 from 9371; 14–15 from 10726.

of the lobes, inside with several irregular rows of colleters in the lower half of the tube; tube tun-shaped to cylindrical, 2.5–4 x as long as the lobes, 10–16 mm long; lobes usually broadly ovate, 3–10 x 4–10 mm, rounded, erect. *Corolla* pale yellow with the tube often pale green, creamy, or white, carnosé, in the mature bud 29–33 mm long incl. the lobes (the lobes 0.4–0.6 of the bud length being 13–19 x 10–13 mm, forming an almost conical head with a blunt apex), glabrous on both sides; tube as long as the calyx or slightly longer, almost cylindrical, 17–23 mm long, twisted, widest around the ovary and there 5–8 mm wide, contracted above, narrowest just below the insertion of the stamens and there 4–6 mm wide, widened and thickened at the insertion of the stamens, inside with 5 small incrassations in the mouth (touching the connectives); lobes not twisted, broadly obovate, 1.1–1.3 x as long as the tube, 1.2–1.5 x as wide as long, 19–30 x 28–43 mm, with basal portion about 3–5 x 3–5 mm, abruptly widened from there, at the apex emarginate, spreading to recurved. *Stamens* exserted for 2–3 mm (seemingly more in dried specimens), inserted 3–4 mm below the mouth of the corolla; anthers 6–7 x 3 mm, at the apex sterile for 0.5–1 mm, glabrous. *Pistil* about as long as the corolla tube, 17–23 mm long; ovary of 2, separate carpels 2–3 x 2–3.5 x 1–1.7 mm; disk annular, lower or higher than the ovary, 2–4.5 mm high, shallowly to deeply 5-lobed; style not split at the base, 12–19 x 1 mm, more or less gradually thickened at the apex; pistil head capitate, 1–1.6 x 1–1.6 mm, with a ring 1.5–2 x 3–4 mm, long fimbriate at the base. Ovules about 80 in each carpel. *Fruit* of two free subglobose mericarps; mericarps slightly longer than wide and about as thick as wide, 4–10 cm diameter, pale and dark green-spotted, also when mature; wall creamy inside and on section, 5–15 mm thick; aril orange. *Seeds* dark brown, obliquely ovoid or ellipsoid, 8–9.5 x 6–6.5 x 4–5 mm, densely papillose and shallowly grooved all over.

**Distribution:** Tropical Africa inclusive of Madagascar.

**Ecology:** Moist places, swamps or creek banks in mostly semi-deciduous forest and not too dry savannas. Alt. 0–1600 m.

## 8. *Voacanga foetida* (Bl.) Rolfe, Journ. Bot. London 21: 202. 1883.

Fig. 8, p. 48; Map 7, p. 50

Basionym: *Orchipeda foetida* Bl., Bijdr. 1027. 1826; Rumphia 4: 26, t. 179. f. 2, t. 180. 1849; Miquel, Fl. Ind.Bat. 2: 416. 1857.

(*Dicrus foetidus* Reinw. in Blume, Cat. Gew. Buitenz. 47. 1823, nomen).

Type: Indonesia: Java, sin. loc., Blume s.n. (L 898. 112-361, holotype; isotypes: MEL, P, U and perhaps also NY, W).

Shrub or small tree with a wide crown, 3-20 m high, with white latex; trunk 20-40 cm in diameter or less, terete or nearly so; bark smooth, pale grey. Branches pale grey-brown, lenticellate; branchlets glabrous. Leaves petiolate; petiole 5-15 mm long, glabrous (ocrea widened into intrapetiolar stipules); blade papery when dry, elliptic, narrowly elliptic or narrowly ovate, 1.9-3.5 x as long as wide, 7-34 x 3-11 cm, acuminate or apiculate at the apex (occasionally rounded), glabrous on both surfaces; secondary veins 7-17 on either side, gradually upcurved and forming an angle of 70-80° with the costa; tertiary venation not very conspicuous, reticulate. Inflorescence pedunculate, lax, 12-21 x 5-10 cm, few-flowered, cymose. Peduncle 5-11 cm long, fairly stout, glabrous; pedicels 10-30 mm long, glabrous. Bracts deciduous, oblong, rounded at the apex, about 0.4 x as long as the calyx. Flowers slightly malodorous. Calyx green, fleshy, campanulate, clasping the corolla tube and shed together with the corolla, from

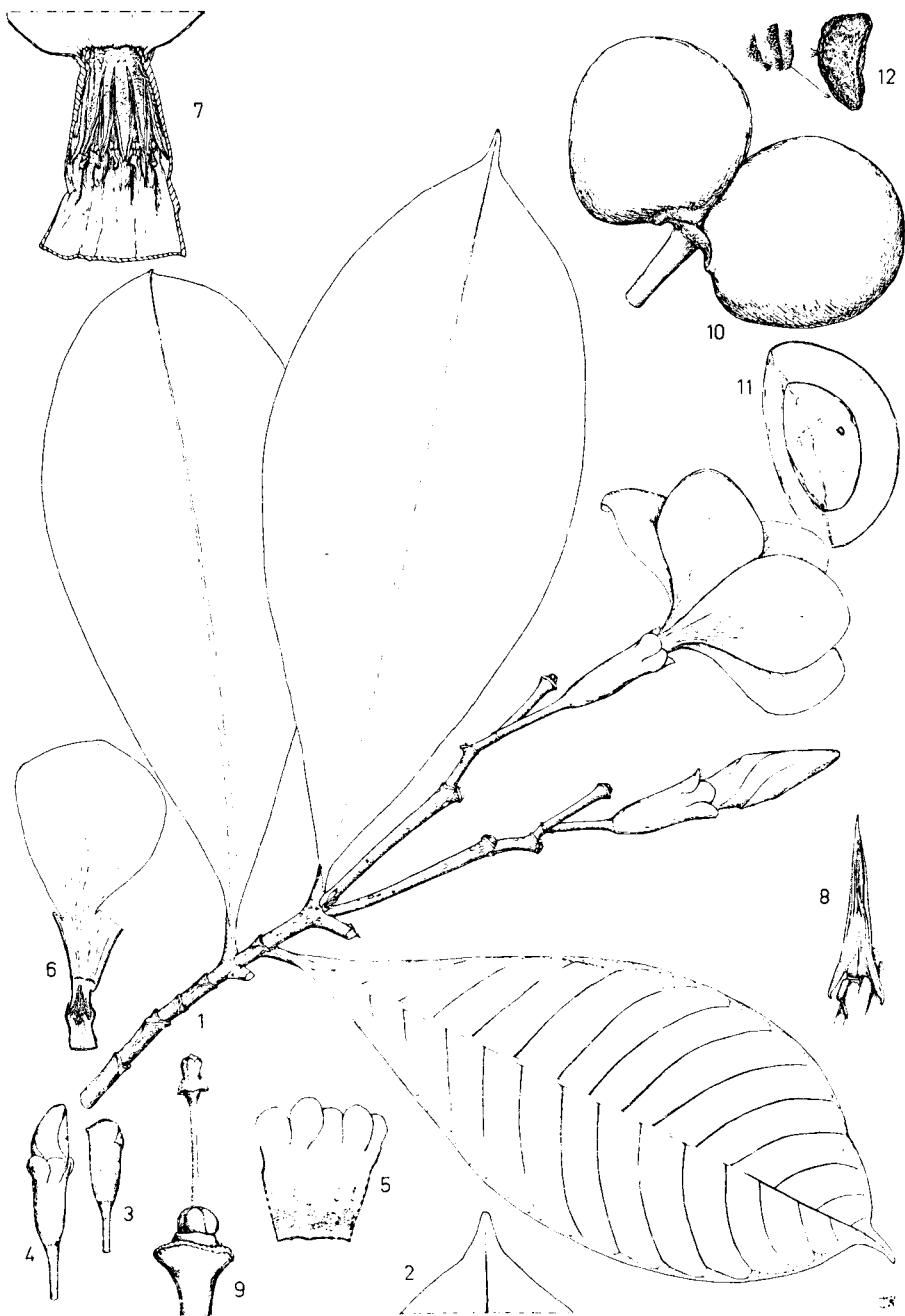

FIG. 8. *Voacanga foetida*. 1, flowering branch ( $\times \frac{1}{2}$ ); 2, leaf apex ( $\times \frac{1}{2}$ ); 3-4 flower buds ( $\times \frac{1}{2}$ ); 5, calyx inside ( $\times \frac{1}{2}$ ); 6, corolla segment inside ( $\times \frac{1}{2}$ ); 7, corolla tube inside ( $\times \frac{1}{2}$ ); 8, stamen ( $\times 3$ ); 9, pistil ( $\times 2$ ); 10, fruit ( $\times \frac{1}{2}$ ); 11, section of mericarp ( $\times \frac{1}{2}$ ); 12, seed ( $\times 3$ ) with more enlarged detail of testa. 1 from Grasshoff 982; 2-8 from van Steenis 2377; 10-12 from spirit coll. Leiden 463/2470.

abscission layer 20–37 mm long, at the mouth 9–16 mm wide, at the base 6–9 mm wide, outside glabrous and minutely dotted, inside with an irregular 2–7 mm wide belt of scattered colleters 1–4 mm above the base; tube 2.9–4.5 x as long as the lobes, 15–28 mm long; lobes unequal, obovate, suborbicular or semi-circular, 0.4–2 x as long as wide, 5–12 x 5–11 mm, rounded, erect. *Corolla* white, creamy or sometimes pale yellow, 65–100 mm long, in the mature bud about twice as long as the calyx incl. the lobes (the lobes about half of the bud length, forming a conical head), glabrous on both sides; tube 0.9–1.2 x as long as the calyx, 28–42 mm long, infundibuliform, not twisted, at the base 5–7 mm wide, contracted just below the insertion of the stamens and there 3–5 mm wide, at the mouth 12–30 mm wide, inside with a faecal annulus 1–2 mm above the anthers and from there gradually widened to the mouth, and also with 5 oblong incrassations below the anthers; lobes slightly twisted, obovate, 1.2–1.8 x as long as the tube, 1.3–1.7 x as long as wide, 37–58 x 22–37 mm, rounded, entire, slightly spreading. *Stamens* deeply included, inserted 7–10 mm from the corolla base; anthers 7–8 x 2–3 mm, at the apex sterile for 0.5–1 mm, glabrous. *Pistil*: ovary of 2 separate carpels being about 2 x 2 x 1 mm; disk annular, about 0.5 mm high, entire; style not split at the base, thickened at the apex; pistil head capitate, about 1.7 x 1.2 mm, with a ring about 0.7 x 2 mm, being fimbriate at the base. *Fruit* of 2 free subglobose mericarps; mericarps slightly longer than wide and about as thick as wide, 6–11 cm in diameter, green with small grey warts; wall 10–15 mm thick; aril orange(?). *Seed* dark brown, 10–12 x 5–7 x 4–6.5 mm, densely papillose and shallowly grooved all over; embryo almost straight, 7.5 mm long; cotyledons orbicular, 4.5 mm long, rounded at the apex, deeply cordate at the base, palmately veined; rootlet 4 x 0.8 mm.

**Distribution:** Java, Sumatra and S. Kalimantan.

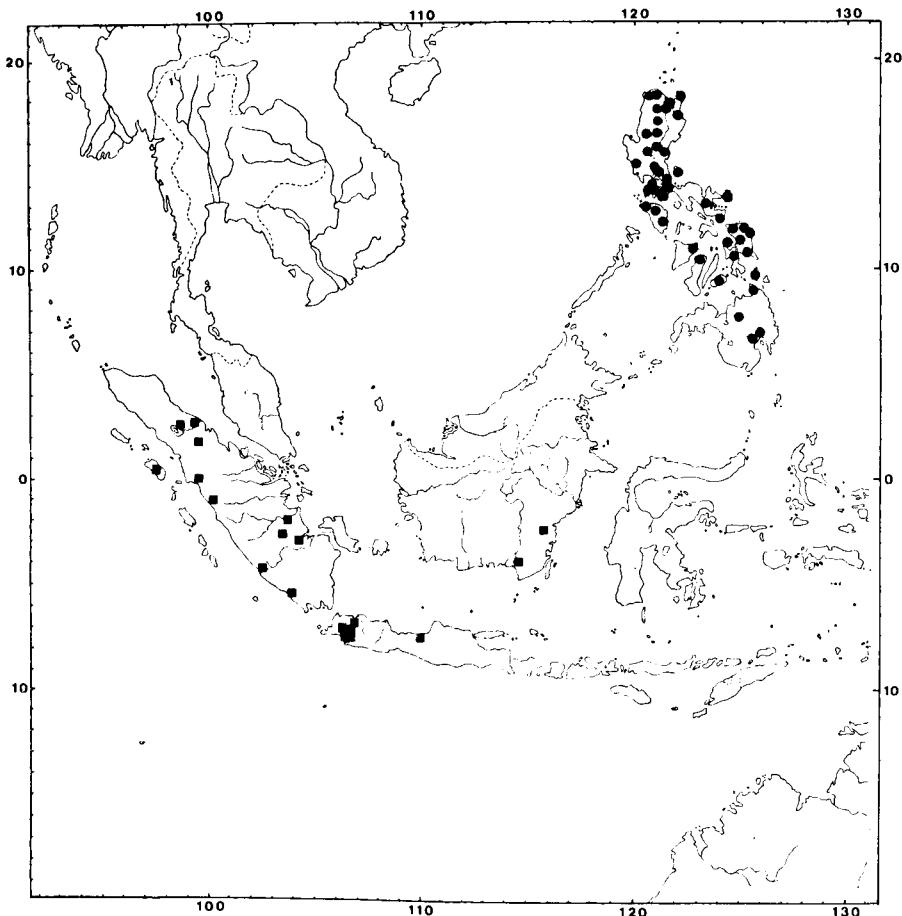

**Ecology:** Light forest. Alt. 0–600 m.

**Vernacular names (new Indonesian spelling of 1972):**

Type: Philippines: Luzon, Laguna Prov., Los Baños, comm. Gates & Catalan in Merrill, Pl. Blancoanae 462 (W, neotype (open flower); isoneotypes (buds): BM, BO, F, K, L, MO, NY, P, US).

Heterotypic synonyms: *V. cumingiana* Rolfe, Journ. Linn. Soc. 21: 313. 1884.

Type: Philippines: Island of Negros, Cuming 1806 (K, holotype; isotypes: BM, W).

*V. dolichocalyx* Quisumbing & Merrill, Philip. Journ. Sci. 37: 192. 1928.

Types: Philippines: Luzon, Tayabas Prov., Casiguran, Ramos & Edaño BS 45264 (NY, lectotype; isotypes: K, US); Luzon, Ilocos Norte Prov., Bangui, McGregor BS 43584 (HBG, paratype).

*V. latifolia* Quisumbing & Merrill, tom. cit. 193. Type: Philippines: Luzon, Isabela Prov., San Mariano, Ramos & Edaño BS 47070 (Holotype not seen, destroyed in PNH; lectotype: A; isotypes: NY, UC).

Shrub or small tree, 1–15 m high, with abundant white latex; trunk 1–20 cm in diameter; bark pale grey-brown, fairly smooth, lenticellate. Branches pale grey-brown, lenticellate; branclets glabrous. Leaves petiolate; petiole 5–30 mm long, glabrous (ocrea widened into intrapetiolar stipules); blade subcoriaceous when fresh, papery when dry, narrowly elliptic or narrowly obovate, 2–4 x as long as wide, 4–25 x 1–9 cm, apiculate or acuminate at the apex, cuneate or decurrent into the petiole, glabrous on both surfaces; secondary veins 6–15 on either side; forming an angle of 70–80° with the costa and gradually upcurved; tertiary venation inconspicuous. Inflorescence pedunculate, lax, 6–17 x 5–10 cm, few-flowered, cymose, Peduncle 2–5 cm long, fairly stout, glabrous; pedicels 8–30 mm long, glabrous. Bracts deciduous, oblong, about 1 cm long, acute or acuminate. Flowers sweet-scented, very variable in size, even in a single inflorescence. Calyx green, fleshy, clasping the corolla tube and shed together with the corolla, (2)3.5–7.5 x as long as wide, from abscission layer 8–50 mm long, cylindrical or nearly so, 4–10 mm wide, glabrous outside, inside with 2–6 more or less wavy rows of colleters at the base; tube 5.5–12 x as long as the lobes, 7–45 mm long, usually partly torn at one side by the developing corolla; lobes variable in shape, suborbicular to semicircular, 1–3 x as wide as long, 1–6 x 2–6 mm, rounded, erect. Corolla white or creamy, in the mature bud about 30–65 mm long incl. the lobes (the lobes  $\frac{1}{2}$  of the bud length, being 12–25 x 4–11 mm, forming an ovoid head with a blunt apex), glabrous on both sides; tube 1–3 x as long as the calyx, almost cylindrical 24–50 mm long, not twisted, widest around the ovary and there 4–7 mm wide, slightly contracted just below the insertion of the stamens and there 3–5 mm wide, inside with 5 incrassations about 4 x 1.2 x 1 mm just below the stamens; lobes twisted, rhombic or almost elliptic, 0.6–1.4 x as long as the tube, 1.5–2.7 x as long as wide, 16–55 x 8–40 mm, obtuse or acute, spreading. Stamens included for 2–10 mm, inserted 9–15 mm below the mouth of the corolla; anthers 4–8 x 1.5–3 mm, at the apex sterile for 0.5–1.2 mm, glabrous. Pistil: ovary of 2 separate carpels 2–3 x 2–3 x 1–1.5

mm, rounded; disk annular, about 1 mm high, entire above, with 5 lateral lobes; style about 1 mm in diameter, thickened just below the pistil head; pistil head 1–1.5 x 0.8–1 mm, with a ring 1–2 x 1.5–2.5 mm, being long-fimbriate at the base. *Fruit* of 2 free subglobose mericarps; mericarps slightly longer than wide and about as thick as wide, 4–6 cm in diameter, green, plain, with a granular skin; wall about 3–5 mm thick; aril pale orange. *Seed* dark brown, 9–10 x 4–5 x 3–5 mm, with a minute honeycomb-like structure; embryo slightly curved, 7 mm long; cotyledons orbicular, cordate at the base, rounded at the apex, 3.5 mm long; rootlet 4 x 0.6 mm.

### Distribution: Philippines.

*Ecology:* Forest or bush. Alt. 0–300 m.

### Vernacular names

*Orchipeda papuana* F.v.Muell., Descr. Notes Papuan Pl. 7: 30. 1886.

Type: Papua New Guinea: Fly R., d'Albertis, F. v. Mueller anno 1876 (MEL, holotype). Homotypic synonym: *Voacanga papuana* (F.v.Muell.) K.Schum. in Engler & Prantl, Nat. Pflanzenf. 4.2: 149. 1895; Boerlage, Handl. Fl. Ned. Ind. 2: 396. 1899 (superfluous comb.), syn. nov.

FIG. 10. *Voacanga grandifolia*. 1, flowering branch ( $\times \frac{1}{2}$ ); 2, part of branch with leaf bases ( $\times \frac{1}{2}$ ); 3, flower without calyx ( $\times \frac{3}{2}$ ); 4, opened calyx ( $\times \frac{3}{2}$ ); 5, calyx segment inside ( $\times 1$ ); 6, opened corolla ( $\times \frac{3}{2}$ ); 7, part corolla tube inside ( $\times 4$ ); 8, pistil ( $\times 2$ ); 9, ovary with disk above ( $\times 2$ ); 10, fruit ( $\times \frac{3}{2}$ ); 11, dried fruit on section ( $\times \frac{3}{2}$ ); 12, seed ( $\times 2$ ) with more enlarged detail of testa; 13, seed on section with rootlet in cavity for embryo and the deep groove ( $\times 2$ ). 1, 10-13 from Colfs 105; 2-9 from Burck 396.

*Voacanga versteegii* Mgf., Nova Guinea 14: 287. 1927. Type: Indonesia: Irian Yaya, Merauke, Versteeg 1881 (L. holotype; isotype: BO), syn. nov.

*V. grandifolia* var. *glabrifolia* Bakh.f. in Backer, Bekn. Fl. Java 7, fam. 172: 22. 1948 (provisional ed., Dutch descr. only); Fl. Java 3: 229. 1965 (English descr. only), syn. nov. (nom.inval.). Type: Indonesia: Java, Rogodjampi District, Rogodjampi-Balak For., Koorders 126 (L, holotype; isotype: BO).

Shrub or small tree 2–15 m high. Trunk 10–20 cm in diameter (or more). Bark pale brown, smooth or slightly rough, with pustular lenticels, shallowly fissured, inner bark pale orange-brown or straw-coloured; sapwood and wood creamy. Branches lenticellate; branchlets glabrous. Leaves sessile and even connate-perfoliate to 50 mm long-petiolate; petiole glabrous or pubescent; blade herbaceous when fresh, papery or chartaceous when dry, elliptic, narrowly elliptic, or narrowly obovate, 2–4 x as long as wide, 8–40 x 2–14 cm, acuminate or acute at the apex, glabrous or sometimes sparsely pubescent above, glabrous or pubescent beneath; secondary veins 10–20 on either side; tertiary venation reticulate. Inflorescence long-pedunculate, few- to many-flowered, 8–30 x 5–20 cm, dichotomous in first branchings and further more or less monochasial. Peduncle 4–20 cm long, fairly stout, glabrous; pedicels 5–30 mm long, glabrous. Bracts deciduous, about as long as the calyx, ovate, rounded or acute. Flowers fragrant (sweet-scented or malodorous). Calyx green, nearly cylindrical, fleshy, not clasping the corolla tube and shed together with the corolla, from abscission layer 1–3 x as long as wide and 10–20 x 4–12(15) mm, outside glabrous, inside with a wavy 1–8 mm wide belt of scattered colleters 0–2 mm above the base; tube 1.5–5 x as long as the lobes, 7–14 mm long; lobes obovate, suborbicular or semi-circular, 0.5–1.7 x as long as wide, 2.5–6 x 2.5–8 mm, rounded, erect. Corolla white, creamy, or sometimes yellow, in the mature bud 20–45 mm long incl. the lobes (the lobes 0.45–0.6 of the bud length being 10–25 x 4–15 mm, forming an ovoid head with a blunt apex), glabrous on both sides; tube 0.7–2 x as long as the calyx, almost cylindrical to bottle-shaped, 9–24 mm long, twisted or sometimes not, 3–9 mm wide, contracted just below the insertion of the stamens and there 2–5 mm wide, inside with a faecal annulus; lobes slightly twisted, 0.8–2.2 x as long as the tube, elliptic or obovate, 0.8–1.5 x as long as wide, 9–40 x 10–37 mm, rounded, truncate, or emarginate at the apex, spreading to recurved. Stamens slightly (2 mm) exserted to barely included, inserted 2–7 mm below the mouth of the corolla; anthers 3–6 x 1.2–2.5 mm, at the apex sterile for 0.5–0.8 mm, glabrous. Pistil about as long as the corolla tube; ovary of two separate carpels 1–2 x 1.5–3 x 0.8–2 mm; disk annular, 5-lobed, 0.5–1 x as high

FIG. 11. *Voacanga grandifolia*. 1, flowering branch ( $\times \frac{1}{2}$ ); 2–3, opened calyces ( $\times 1$ ); 4, part of corolla inside ( $\times 1$ ); 5, corolla lobe ( $\times \frac{3}{2}$ ); 6, part of corolla tube inside ( $\times 4$ ); 7, pistil ( $\times 1$ ); 8, pistil head ( $\times 3$ ); 9, fruit (only one mericarp developed); 10, seed ( $\times 1$ ) with more enlarged detail of testa; 11, cleft seed with embryo and hilum ( $\times 2$ ). 1, 9 from van Royen & Sleumer 5792; 2 from Brass 7735; 3–4 and 7–8 from Forbes 480; 5–6 from Womersley & Jones NGF 8806; 10–11 from Floyd NGF 7284.

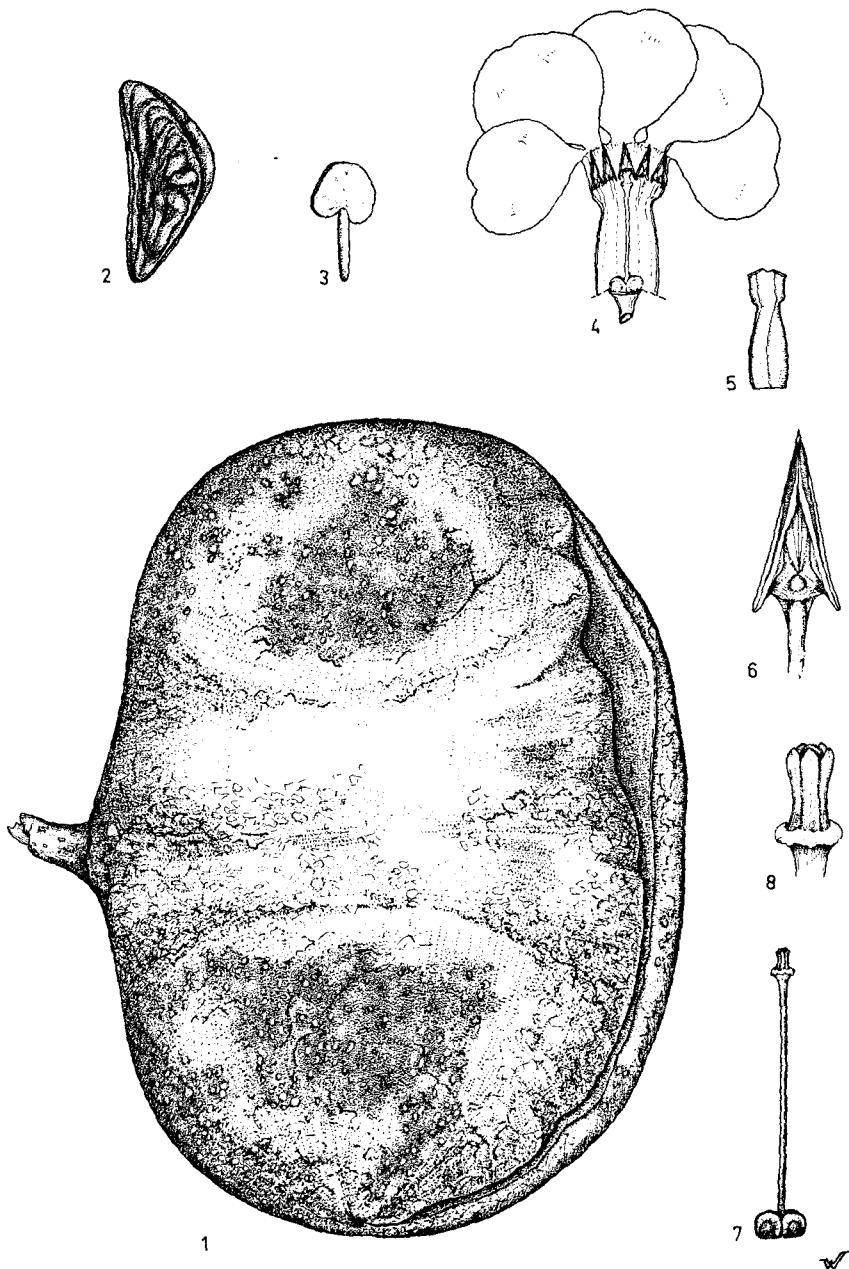

FIG. 12. *Voacanga grandifolia*. 1, fruit ( $\times \frac{3}{4}$ ); 2, seed ( $\times 2$ ); 3, embryo ( $\times 2$ ); 4, opened corolla with pistil ( $\times 1$ ); 5, corolla tube outside ( $\times 1$ ); 6, stamen ( $\times 6$ ); 7, pistil ( $\times 3$ ); 8, pistil head ( $\times 12$ ). 1-3 from van Balgooy et al. 2957; 4-8 from de Vogel 5181.

as the ovary; style not split at the base thickened at the apex; pistil head capitate, 0.6–1.5 x 0.6–1.2 mm, with a ring 0.5–1 x 1.5–2.5 mm, being fimbriate at the base. *Fruit* of two free, partly or completely united carpels (all observed on a single tree, Leeuwenberg 13121, cult. hedge in Bapakan, S of Yogyakarta), separate carpels subglobose, slightly longer than wide and about as thick as wide and 3–6 cm in diameter, fused carpels shaping a laterally compressed transversely elliptic fruit up to 12 x 15 x 10 cm; fruit outside pale yellow or dark green, with many small pale grey-brown warts; wall 5–25 mm thick; aril orange. *Seed* dark brown, 8–13 x 4–7 x 3–6 mm, densely papillose all over; embryo slightly curved, 6–7.5 mm long; cotyledons suborbicular, 2.7–4 x 2.7–4 mm, truncate at the apex, cordate at the base; rootlet 4 x 0.6–0.8 mm.

**Distribution:** Indonesia (from Central Java and Sulawesi East) and Papua New Guinea.

**Ecology:** Bush or light forest, often on heavy clay on river and creek banks. Alt. 0–1000 m. Probably flowering and fruiting the whole year.

#### Vernacular names

Philippines: Abubu (Lan.), Panggi, Tapadak (Maranao).

Indonesia: Java: Kalak kambing, Lakambing, Lekambing, Lokambing, Kalantong, Alakantong, Olak-ontong (Javanese), Pong-kapong (Madurese).

Notes. *V. grandifolia* is not only the most widespread of the Asian species but it is also the most variable. The leaves can be sessile, as in many specimens from Java and a few from New Guinea, and there is considerable variation in size. Also the flowers exhibit great variation in size. Mostly, the fruits are composed of two separate mericarps, but they can also be united (Van Balgooy et al. 2957, fig. 12). Fruit with completely separate, partially separate, and completely united carpels have been observed on one and the same tree (Leeuwenberg 13121).

Dried specimens of *Tabernaemontana aurantiaca* Gaud. from New Guinea

are often confused with those of *V. grandifolia*, as their leaves are very similar and the two plants often grow side by side. However, the branches of the *Tabernaemontana* species are usually thinner and the two species differ considerably in flowers and fruits:

Calyx about 2 mm long, persistent; corolla tube much longer than the calyx; fruit bright orange, smooth, mostly subglobose or pear-shaped, indehiscent, with white spongy pulp not separable from the very thin wall; when dried, still more or less spongy . . . . . *Tabernaemontana aurantiaca*

Calyx 10–20 mm long and shed with the corolla; corolla tube 0.7–2 x as long as the calyx; fruit pale yellow or dark green, with many small pale grey-brown warts, subglobose or nearly so, dehiscent; pulpy aril surrounding seeds easily separated from the thick fruit wall, never spongy . . . *Voacanga grandifolia*

11. *Voacanga havilandii* Ridl., Kew Bull. 1926: 473. 1926.

Fig. 13, p. 64; Map 9, p. 65

Type: Malaysia: Sarawak: Kuching, Haviland 593 (K, holotype: isotype: SAR).

Heterotypic synonym: *V. borneensis* Mgf., Mitt. Bot. Staatssamml. München 1: 28. 1950. Type: Malaysia: Sarawak, Kuching, Beccari 3601 (M, holotype; isotypes: FI (Beccari coll. no. 6431), K, LE; paratype of *V. havilandii*).

Small tree, 4–15 m high. Trunk 10–45 cm in diameter; bark lenticellate. Branches with white latex, pale grey-brown, with a few large lenticels; branchlets glabrous. Leaves petiolate; petiole 4–25 mm long, glabrous or with a few hairs beneath (ocrea widened into intrapetiolar stipules); blade thinly coriaceous when dry, elliptic, obovate, or narrowly so, 1.5–4 x as long as wide, 4–24 x 1.7–9.5 cm, acuminate or apiculate at the apex, glabrous and with indented (dry) more or less reticulate venation above, hirsute-pubescent beneath; with 7–14 secondary veins on either side, with an almost straight angle on the midrib. Inflorescence several-flowered, with peduncle 10–30 x 10–20 cm, lax. Bracts deciduous (not seen), with a few persistent colleters in the axils. Peduncle slender, 4.5–16 cm long, glabrous or hirsute-pubescent as its branches and the pedicels. Pedicels 1–2 cm long. Calyx green, campanulate or nearly so, 6–12 x 4–6 mm, shed with the corolla, outside glabrous or sparsely pubescent, inside with a wavy belt of colleters in 2–4 irregular rows (dense or not) at the base, with the tops of the waves alternating with the calyx lobes; tube campanulate, 3–9.5 mm long; lobes 0.15–1.2 x as long as the tube, subequal to unequal, transversely elliptic to suborbicular, 0.6–1.2 x as long as wide, 1.5–4 x 2–5 mm, rounded or truncate, with a diaphanous margin, erect. Corolla white or creamy, in the mature bud 17–22 mm long incl. the lobes (the lobes 0.5–0.65 of the bud length, forming an ovoid or ellipsoid head, 2–2.2 x as long as wide, 10–14 x 5–6 mm, with a blunt apex), glabrous on both sides; tube 0.6–1.8 x as long as the calyx, 7–11 mm long, almost cylindrical, not or slightly twisted for the entire length, contracted at the base, just below the insertion of the stamens and at the mouth, where contracted 1.7–2

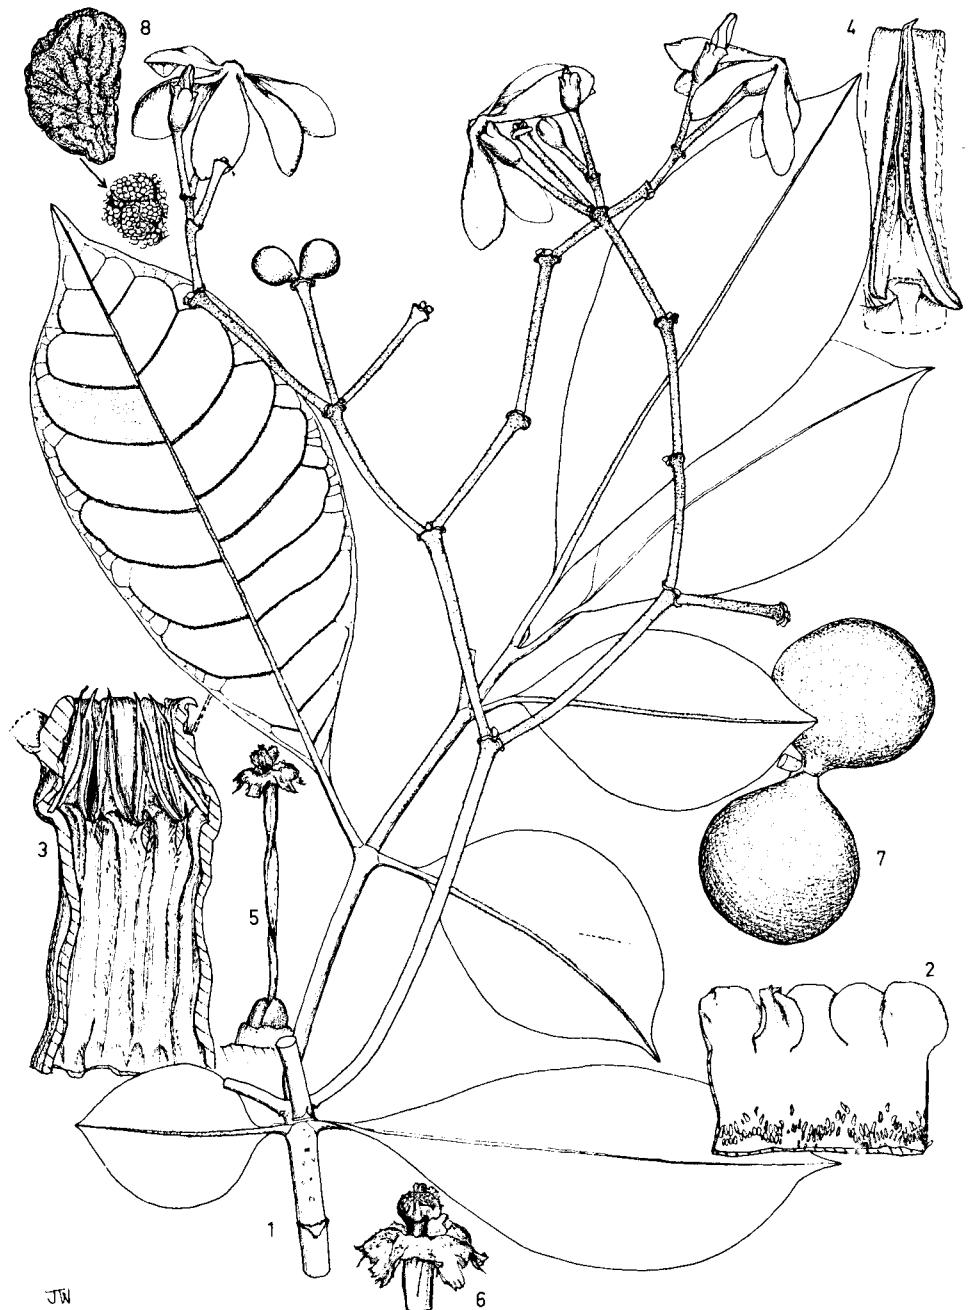

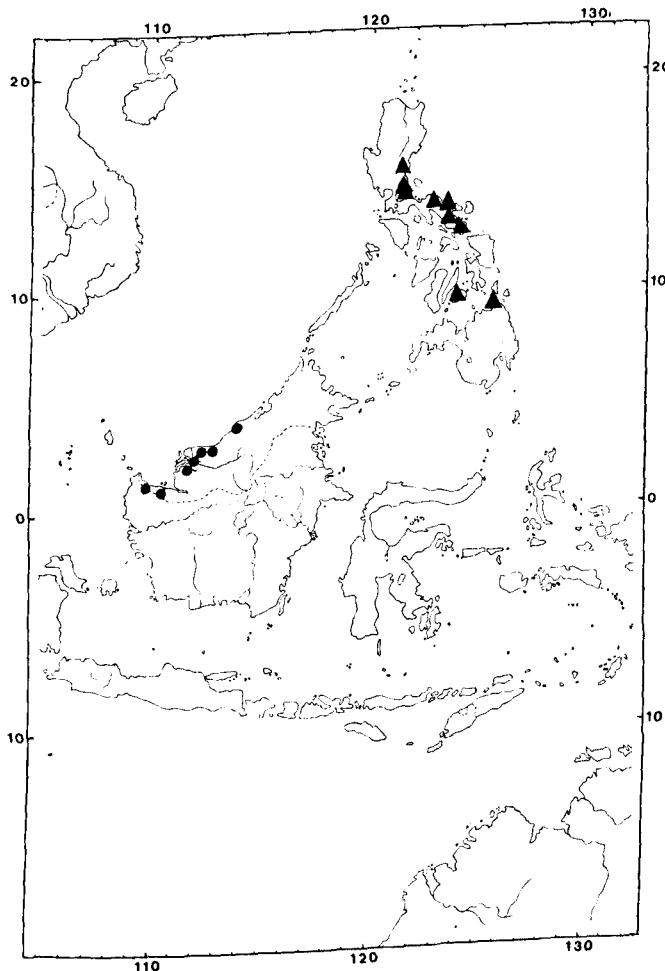

FIG. 13. *Voacanga havilandii*. 1, flowering branch ( $\times \frac{1}{3}$ ); 2, calyx inside ( $\times 3$ ); 3, corolla tube inside ( $\times 6$ ); 4, stamen ( $\times 12$ ); 5, pistil ( $\times 6$ ); 6, pistil head ( $\times 12$ ); 7, fruit ( $\times \frac{1}{3}$ ); 8, seed ( $\times 2$ ) with more enlarged detail of testa. 1-6 from Chai & Paie S 29303; 7 from Anderson S 25967; 8 from Rena George S 39934.

mm and around the anthers 2.5–3 mm wide; lobes slightly twisted, narrowly obovate or elliptic, 1.9–3 x as long as the tube, 2–3 x as long as wide, 15–24 x 7–11 mm, rounded, spreading and often later recurved. Stamens barely included to 2 mm exserted, inserted 2–3.5 mm below the corolla mouth; anthers 3.5 x 1.2–1.5 mm, at the apex for 0.5 mm sterile, glabrous, not twisted. Pistil glabrous, 7–12 mm long; ovary of two separate carpels, 1–2 x 1.5–2 x 1–1.5 mm; disk sinuate, 0.4–0.8 mm high; style not split at the base; almost cylindrical, 4.5–9 mm long, not twisted, at the base about 0.3 mm wide and at the apex slightly narrower than the pistil head; pistil head 0.7–1 x 0.7–1 mm, with an undulate entire ring 1.5–2 mm in diameter. Fruit of two separate mericarps; mericarps dark green, obliquely subglobose, about 3.5–5 cm in diameter; wall greenish; aril orange-red. Seeds many, dark brown, 9–10 x 6–6.5 x 3.5–5 mm,

MAP 9. ● *Voacanga havilandii* and ▲ *V. megacarpa*.

irregularly bumpy, minutely tuberculate; embryo slightly curved, creamy to white, 5 mm long; cotyledons orbicular, 2.5 mm long; rootlet 0.7 mm in diameter.

**Distribution:** only known from Sarawak.

**Ecology:** Bush or forest understorey, at low elevations, near rivers.

#### Vernacular names

Kayu susu (means milk wood = wood with latex, used for more Apocynaceae); Pelir kambing (Iban), Medang jong kong.

#### 12. *Voacanga megacarpa* Merrill, Philip. Journ. Sci. 7: 336. 1912.

**Fig. 14, p. 67; Map 9, p. 65**

**Types:** Philippines: Luzon, Tayabas Prov., Tununi R., Foxworthy BS 12343 (PNH, not seen, destroyed; no isotype seen). Luzon, Tayabas Prov., Binangongan, Whitford 829 (US, lectotype; isotype: P, was paratype). Luzon, Tayabas Prov., Baler, McGregor BS 10668 (US, paratype); Luzon, Camarines Prov., Tinambuc, Aguilar FB 14256 (BR, paratype).

Small tree 2–9 m high; trunk 6–30 cm in diameter. Branches lenticellate; branchlets glabrous. *Leaves* shortly petiolate; petiole 15–30 mm long, glabrous (oarea widened into intrapetiolar stipules); blade elliptic, obovate or narrowly so, 1.7–3.5 x as long as wide, (6)8–40 x (3)3.5–17 cm, apiculate or acuminate at the apex, cuneate or rounded at the base, thinly papery when dry, glabrous on both sides; secondary veins 12–18 on either side, rather straight, forming an angle of 60–70° with the costa; tertiary venation inconspicuous. *Inflorescence* long-pedunculate, lax, 13–40 x 10–25 cm, several-flowered, mostly several times dichotomously branched and further on more or less monochasial. Peduncle 8.5–19 cm long, stout, glabrous; pedicels 6–22 mm long, glabrous. Bracts deciduous and leaving conspicuous scars, sepal-like and of about the same size. *Flowers:* Sepals green(?), connate at the base for 1–2 mm, not covering each other in open flowers, narrowly oblong, 3–6 x as long as wide, 12–30 x 2.5–6

FIG. 14. *Voacanga megacarpa*. 1, flowering branch ( $\times \frac{1}{2}$ ); 2, leaf apex ( $\times \frac{1}{2}$ ); 3, flower without calyx ( $\times \frac{1}{2}$ ); 4-6, calyces inside ( $\times 1$ ); 7, partly torn corolla tube inside with incomplete lobe ( $\times \frac{1}{2}$ ); 8-9, stamens ( $\times 3$ ); 10-11, pistils ( $\times 1$ ); 12, seed ( $\times 1$ ) with more enlarged detail of testa. 1 from Mendoza PNH 18518; 2-4, 11 from Hallier 10 June 1903; 5, 9 and 12 from Elmer 15028; 6-8 and 10 from Ramos & Edano BS 45424.

mm, obtuse, acute or acuminate, inside with 1–3 dense rows of colleters at the extreme base, erect, entire. *Corolla* white, in the mature bud about twice as long as the sepals, incl. the lobes (lobes about 1/3 of the bud length, forming an ovoid head with a blunt apex), glabrous on both sides; tube 1.1–1.3 x as long as the sepals, almost cylindrical, 23–40 mm long, about 5–7 mm wide; not or only in upper part slightly twisted; lobes not twisted, obcordate, 0.5–1 x as long as the tube, about 1–1.5 x as wide as long, 16–37 x 19–37 mm, at the apex emarginate, entire, spreading to recurved. *Stamens* included for 4–7 mm, inserted 9–13 mm below the mouth of the corolla; anthers sessile, narrowly triangular, 5–8 x 2–2.5 mm, acuminate at the apex (sterile part 0.8–1 mm), glabrous. *Pistil* glabrous, 15–28 mm long; carpels 2, separate, about 2.5 x 2.5 x 1.5 mm; disk annular, about half as high as the ovary, entire; style cylindrical; pistil head 1–1.2 x 1–1.2 mm, with a 5-lobed ring 2 x 0.5 mm. *Fruit* of 2 free suglobose mericarps (being probably about 7 cm in diameter). *Seed* 9–10 x 4–5 x 3–4 mm, densely papillose and shallowly grooved all-over; embryo spathulate.

**Distribution:** only known from the Philippines.

**Ecology:** secondary forest at low elevation.

## INDEX OF EXSICCATAE

The numbers in parentheses correspond with the species-number of the revision. Only numbered collections have been listed.

If a collector gathered a part of his collection together with others using a single number series, only his name is cited in this list: e.g. Ramos & Edaño is cited as Ramos, and Torre & Correira as Torre.

- African species: 1. *V. africana*, 2. *V. bracteata*,  
3. *V. caudiflora*, 4. *V. chalotiana*, 5. *V.  
pachyceras*, 6. *V. psilocalyx*, 7. *V. thouarsii*.
