SUMMARY

One of the genera of the Phaseoleae subtribe Cajaninae (Leguminosae-Papilionoideae), *Dunbaria*, has long been incompletely known. In the present revision twenty species are recognized. One species, *Dunbaria floresiana*, was newly described, and six species had to be provided with a new combination. Several names had to be sunk into synonymy, including some well-known ones, like *Dunbaria longeracemosa*, which is synonymous to the earlier and poorly known *D. bella*. Most *Dunbaria* species have an Asian distribution, some species are found in Australia and on New Guinea. The area extends from 72 to 143 degrees Eastern longitude, and from 38 degrees North to 13 degrees South of the equator. All species are climbers and grow in semi-deciduous forests, scrub or grassland vegetations of the semi-arid or moist tropical habitats. One species, *D. villosa*, occurs in East Asia including Japan. Most species occur between 0 and 1200 m a.s.l., some reach 2000 m, rarely species are restricted to high elevations. *Dunbaria* species may be useful for breeding programmes of pigeonpea, *Cajanus cajan* (L.) Millsp., as the genera are related.

RESUMÉ

Un des genres de la sous-tribu des Cajaninées, tribu des Phaseolées (Légumineuses-Papilionoidées), *Dunbaria*, était généralement mal connu. La présente révision reconnaît vingt espèces. Une espèce, *Dunbaria floresiana*, a été nouvellement décrite, et six espèces ont reçu une nouvelle combinaison. Plusieurs noms devraient être réduits à la synonymie, y inclus *Dunbaria longeracemosa*, espèce bien connue, laquelle était décrite plus tard que la malconnu *D. bella* qui a la priorité. La plupart des espèces de *Dunbaria* sont distribuées en Asie, quelques-uns on trouve en Australie et au Nouvelle Guinée. L'aire s'étend de 72 à 143 degrées Est, et de 38 degrées Nord à 13 degrées Sud de l'équateur. Toutes les espèces sont des grimpeurs et poussent dans les forêts semi-caducifoliées, les broussailles ou les savanes des tropiques semi-arides ou humides. Une espèce, *D. villosa* est distribuée en Asie de l'Est y inclus le Japon. La plupart des espèces se trouvent entre 0 et 1200 m de altitude, parfois jusqu'au 2000 m, rarement une espèce se trouve uniquement à grande altitude. La relation (morphologique) avec le pois d'Angole, *Cajanus cajan* (L.) Millsp. indique qu'une utilisation de *Dunbaria* comme géniteur serait possible, bien que des hybrides interspécifiques ne sont pas encore réussites.

1 INTRODUCTION

During a revision of the genus *Cajanus* DC. sensu lato (incl. *Atylosia* Wight & Arn.) (van der Maesen, 1986), attention was drawn to *Dunbaria*. *Dunbaria* does not include cultivated species, but the morphological similarities to *Cajanus*, hence the possibility to place the genus in a secondary or tertiary gene pool of the cultivated pigeonpea, *Cajanus cajan* (L.) Millsp., expresses the close relationship to *Cajanus*. At least some species have the facies of climbing *Cajanus*. Also some species of *Rhynchosia* have undoubtedly a strong relationship to *Cajanus*. Fairly recently the genus *Dunbaria* Wight & Arnott (Leguminosae - Phaseoleae - Cajaninae) has been reviewed for the Flore du Cambodge, du Laos et du Viet-nam (Thuan, 1979). Species distributed outside Indo-China were not treated. Thothathri and Satyanarayana (1983) worked with the genus while reviewing the subtribe Cajaninae for the Flora of India, and published some new names. In a thesis Satyanarayana (1994) presented all Cajaninae occurring in India. Even though Indo-China is probably the area of greatest diversity, a review of all species has not been available and an integrated treatment appeared necessary. The study is based on a morphological study of herbarium material and a few living plants. The work was carried out at the Herbarium Vadense (WAG), where the loans of the materials were placed, and during study visits to Kew, Paris, St. Louis, Kunming, Beijing and New York. The typification and synonymy were verified, distribution and phenology data complete the detailed morphological descriptions. Illustrations and distribution maps show habitus and repartition of the species.

Those specimens that I have been able to collect in the Indian subcontinent are lodged at the ICRISAT Reference Herbarium in the Genetic Resources Unit, and duplicates are available at WAG, K and/or CAL. The genetic resources scientists of the Centro Internacional de Agricultura Tropical, Cali, Colombia, sent specimens for identification, and samples of *Dunbaria villosa* and *D. incana* produced plants that could be studied in vivo.

2 HISTORY OF THE GENUS *DUNBARIA* Wight & Arn.

The history of the genus *Dunbaria* is relatively uncomplicated. In 1834 Wight and Arnott described the genus in their *Prodromus* for the Flora of peninsular India, to accommodate those "Euphaseoleae" with large flowers, flat pods, without conspicuous external delineations of the pod valves between the (more than 2-3) seeds. They commemorated George Dunbar (Coddington, Berwickshire, Scotland 1784 - Edinburgh 1851), who became Professor of Greek Philology in 1806 at Edinburgh, Scotland. In his youth he was a gardener, but a fall from a tree incapacitated him for physical labour, so he studied Greek instead (Backer 1936). Apparently he was a long-standing friend and colleague.

Originally the genus comprised of 3 species, the last (*Dunbaria latifolia*) supposedly scarcely different from the second (*D. ferruginea*), and later put into synonymy with it by Baker (1876). Important additions were made by Bentham (1852, 3 species), Miquel (1855, 6 species), Baker (1876, 2 species), and Gagnepain (1912, 3 species). Several authors added one or a few species for Indo-China, Malesia and Japan. Some specific epithets were later reduced to the synonymy of others. Thuan (1979) included 10 species in his treatment for the Flora of Laos, Cambodia and Vietnam. Thuan (1979) and Verdcourt (1979) estimated that about 15 species could be recognized in *Dunbaria*. Up to 1988 the Index Kewensis listed 37 species and 7 synonyms in *Dunbaria*. The present treatment considers that 16 out of the 37 remaining validly published binomials can be maintained. The number of recognized species is 20, of which 1 is described as new. In his *Commentationes de Leguminosarum Generibus* Bentham (1837, and again in 1865) listed "? *Dunbaria*" under subtribe "Euphaseoleae" (now Phaseoleae), the presence of vesicular glands had not been introduced as subtribal characteristic for "Cajaninae", nor were they described by Wight and Arnott (1834) for any of their "Euphaseoleae". In 1852 Bentham outlined the close relationship of *Cajanus*, *Dunbaria*, *Fagelia* and *Atylosia*, and mentioned the resinous glands. The presence of these glands still constitutes the main differentiating (signal) character for the subtribe Cajaninae.

As with several other phaseoloid legume genera, some species have been insufficiently collected, which does not necessarily mean that they are rare. To the general collectors they usually are "one of the many yellow-flowering bean-like vines", and tend to be under-

collected. Being legumes, animals probably feed on them for protein-rich fodder, probably with reasonable or even good palatability.

3 RELATIONSHIPS OF *DUNBARIA* IN THE SUBTRIBE CAJANINAE

The circumscription of the subtribe Cajaninae as a natural group within the Phaseoleae tribe of the Leguminosae-Papilionoideae has been outlined in detail (Lackey 1977, 1982), and the case for merging *Atylosia* with *Cajanus* has been explained earlier (van der Maesen 1986, p. 16-36). In relation to the other genera *Dunbaria* is a member of Baudet's (1978) group of Cajanastrae, with a multi-ovuled ovary and mainly Asian distribution. Notable characters are the glandular-dotted foliage and calyces, bulbous-based hairs, stipels small or lacking, absence of bracteoles, flowers yellow with or without red or purplish streaks or flush, inflorescence nodes not swollen, seeds often strophiolate, consisting of two parallel flaps, style often swollen in the middle (Lackey 1977). The flat pods stand most of the species apart from e.g. *Cajanus*. Some *Dunbaria* have slight impressions between the seeds. *Dunbaria* spp. are sturdy or weak climbers or trailers, no shrubby species are extant.

Some intergeneric pollination attempts with *Cajanus* spp. have been made, in particular with *Dunbaria ferruginea*, at ICRISAT, Patancheru near Hyderabad, Andhra Pradesh, India. So far no hybrids were obtained; the only negative evidence to indicate the presence of a strong intergeneric cross-incompatibility.

It appears no *Dunbaria* species have been cytologically investigated, as Lackey (1977) did not locate data, nor could I locate published records. Thuan (1975) did not have *Dunbaria* seeds at his disposal. It would be surprising if chromosome numbers in *Dunbaria* would turn out to be anything else but $2n = 22$. From seeds obtained from CIAT (courtesy Dr. Schultze-Kraft), seedlings were grown and root tips were examined cytologically to check this hypothesis, but no proper metaphases could be obtained.

The pollen morphology of 14 *Dunbaria* species (actually 12, two species are *Cajanus* spp.) has been investigated by Thuan (1973). The pollen grains are suboblate to spherical (P/E 0.78–0.94), subtriangular in polar view, tricolporate, of medium size (diameter 30 – 45 μ) with a 1.5 – 2.5 μ thick exine layer. The sculpture of the ectexine is reticulate. The two species since relegated to *Cajanus* (*C. heynei* (Wight & Arn.) Maesen (as *D. heynei* Wight & Arn.), and *C. grandiflorus* (Benth. ex Bak.) Maesen (as *D. pulchra* Benth. ex Bak.) fit well in the range, and point once more to the natural alliance of the Cajaninae. Thuan (1973) also forwarded the theory that *Dunbaria*

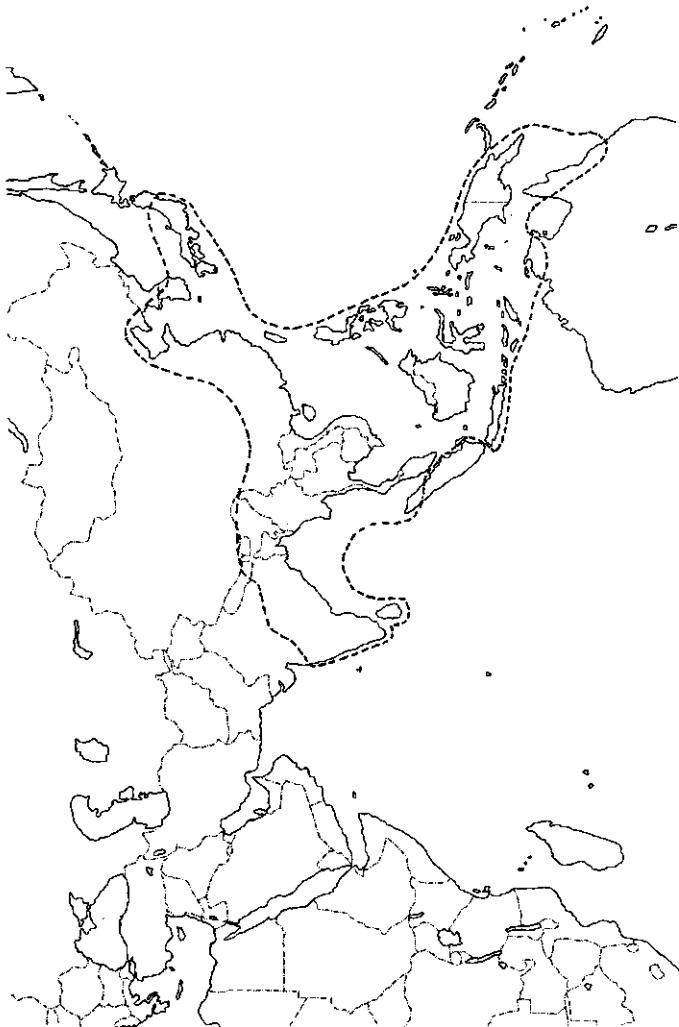

originated in Indonesia, and spread west to India and north to Indo-China where more species developed out of the more primitive woody (tree!) forms with large and thick leaflets, large flowers, sturdy "spiny" pods, pollen with coarsely reticulate tectum and long ectoaperture. More herbaceous species were the result, having fine twining branches, small flowers and small glabrescent pods, and pollen with more finely reticulate tectum and residual ectoaperture. I remark that the morphology of *D. glandulosa* (Dalzell & A. Gibson) Prain belies this general trend (sturdy climbers with large showy flowers), and also in Indonesia slender twiners are present.

4 GEOGRAPHICAL DISTRIBUTION AND ECOLOGY

Dunbaria species are bean-like climbers of semi-deciduous forests, grassland or scrub habitats mainly in the tropics and semi-arid tropics. Particularly open spaces and forest edges are preferred, just as most sun-loving climbing legumes. Some occur in wet habitats of more moist forests. Road and river sides, and forest fringes are places where *Dunbaria* spp. are most likely to be found. The species are distributed in Asia and Australia. Endemism is found in *D. floresiana* of Flores, Indonesia, *D. glabra* from Vietnam, *D. gracilipes* from Burma, while several species are of restricted regional occurrence, such as in Yunnan and Thailand, or Indo-China. Disjunct distribution is found in *D. debilis*, that occurs in Assam and Yunnan as well as in the Northern Territory of Australia and Papua New Guinea, where this species had subsequently been described as *D. singuliflora*. *D. glandulosa* is disjunct in its distribution too: the Western and Eastern Ghats of India, E. Nepal and E. Bangladesh/Burma/Thailand. It is likely that the areas in between have become unsuitable for these species in the distant or more recent past, respectively. Indications for long-distance dispersal are unknown.

D. villosa is the most northerly distributed species, it reaches 38° N in Japan, hence it is adapted to temperate as well as to tropical conditions e.g. in N. Sumatra. Southern limits are approximately 13° S, and the species can be found between 72° and 143° E. No indications are found that some species have enlarged their area in recent times, as is the case with recent herbarium records of e.g. *Cajanus scarabaeoides* (L.) Thouars.

Adding up, the largest diversity of *Dunbaria* species is found in Indo-China and China, in Vietnam 11 species are found, followed by Thailand and (mainly southern) China with 10 species. Indonesia harbours 9 species, India and Laos both 7. Keen collectors are bound to discover more locations for species of this genus. Map 1 gives a generalized outline of the distribution of the genus.

Map 1. Generalised distribution of the genus *Dunbaria* in Asia. So far *Dunbaria* species have not been found in S
Sumatra and Kalimantan/Borneo.

5 DESCRIPTION OF THE GENUS *DUNBARIA*

Dunbaria Wight & Arnott, Prodr. 258 (1834); Bentham & Hooker f., Gen. Pl. 1: 541 (1865); Baker, in Hook.f. Fl. Brit. Ind. 2: 217 (1876); Taubert, in Engl. & Prantl, Nat. Pflz.fam. 3-3: 372 (1894); Gagnepain in Lecomte, Fl. Ind. Gén. Indo-Chine 2: 282 (1916); Hutchinson, Gen. Fl. Pl. Dicots 1: 422 (1964); Thuan, Fl. Camb., Laos, Viet-nam 17: 115 (1979); Lee Shukang, Fl. Reip. Pop. Sin. 41: 307-314 (1995).

Type species: *Dunbaria ferruginea* Wight & Arnott (redesignated; see Satyanarayana 1993:165). The type species indicated by Hutchinson (1964): *D. heynei* Wight & Arn. has been placed in *Cajanus* (van der Maesen, 1986), so the only remaining species in the original genus description is the proper candidate for the type.

Robust or tender perennial climbers or trailing legumes, usually with short indumentum. Vesicular glands greenish yellow to orange or red, blackish in sicco. *Stems* and *branches* 0.5–8 (–20) m. Stipules triangular to narrow-elliptic, often caducous. *Leaves* pinnately trifoliolate, leaflets elliptic, ovate or rhomboid, glabrous or hairy, pubescence below denser than on upper surface, venation consisting of a midrib, 2 opposite lateral veins at the base, and 4–8 lateral veins of which the lowest pair above the leaf base is (sub)opposite; stipellae present, sometimes absent. *Flowers* in axillary pedunculate or almost sessile pseudoracemes, up to 35 cm long, entirely yellow, or yellow with flag dorsally red or purple, veined or not. Bracts small, always caducous, bracteoles absent. Calyx teeth acute to elongate, two upper ones more or less connate. Corolla persistent in some species, vexillum 0.8–3 cm long, obovate-orbicular, reflexed, clawed and auriculate at the base, with or without two callosities near the base. Wings elongate-obovate, auriculate, keel curved, in some species circinnato-rostrate. Ovary sessile or stalked, ovules (3–)4–10, style thickened above the middle or not, upcurved, lower part hairy, upper part glabrous, not bearded near the stigma. Stamens 9 fused, vexillar stamen free, anthers uniform. *Fruit* a pod, linear-oblong, flat-compressed, 3–9 cm long, 0.4–1.5 cm wide, ± depressed between the seeds but without sharp transverse lines, more or less septate between the seeds, valves curling when ripe. *Seeds* flattened-orbicular, sometimes squarish, longest axis 3–7 mm, brown to black, variegated or not, strophiole vestigial, in some species conspicuous.

The characteristics of the species are clearly more uniform than those in *Cajanus*.

6 SECTIONAL ARRANGEMENT

Bentham (1852) divided the genus into two sections: Sect. 1. *Eudunbaria* with marcescent petals, and Sect. 2. *Rhynchoslobium* with petals deciduous before maturation of the pods. Only *D. ferruginea* remains in the first section, of which the name should be corrected to Sect. *Dunbaria*. Bentham placed *D. cumingiana*, *D. conspersa* and *D. punctata* in his second section. Baker (1876) maintained these taxa as subgenera *Eudunbaria* and *Rhynchoslobium* (not *Rhynchoslobium*), adding a few species. No subsequent authors, except for Satyanarayana (1993), used the subdivision. If so required, the species could be assigned to the sections, that I consider rather artificial. No other species than *D. ferruginea* has marcescent corollas, leaving sect. *Dunbaria* (= *Eudunbaria*) monotypic. The flower size, as Baker added, is no good character either to distinguish subgeneric taxa.

7 KEYS TO THE SPECIES OF *DUNBARIA*

Analytical key

- 1a. Corolla of mature flower bud almost straight, persisting with developing pod, keel not circinnato-rostrate... **6. *D. ferruginea***
- 1b. Corolla of mature flower bud falcate, only staminal tube remaining with ripening pod, keel usually circinnato-rostrate..... **2**
- 2a. Ovary and pod stipitate, stipe 2–20 mm **3**
- 2b. Ovary and pod (sub) sessile, stipe 0–1 mm **7**
- 3a. Leaflets more or less trilobed, quite often broader than long, pods with stipe 2–6 (–10) mm, trailing or climbing herb.....
..... **20. *D. villosa***
- 3b. Leaflets not trilobed, or base truncate if so, usually longer than broad, pods short- or long-stipitate, 4–20 mm..... **4**
- 4a. Stipe 10–20 mm, pods 5–9 cm long, 8–11-seeded, pods without long bulbous-based hairs **5**
- 4b. Stipe 4–12 mm, pods at most 6.5 cm long, 5–9-seeded, pods with long caducous long bulbous-based hairs **6**
- 5a. Stipe 10–20 mm, pods glabrous, straw-coloured (light brown), 8–11-seeded, inflorescence semi-sessile, 0.5–1.5 cm, 2–4-flowered, upper and lateral calyx lobes about as long as tube.....
..... **15. *D. podocarpa***
- 5b. Stipe 5–14 mm, pods thinly short- and grey-hairy, dark brown, inflorescence lax, clearly pedunculate, 4–12 cm, 3–5-flowered, calyx lobes longer than the tube **13. *D. lecomtei***
- 6a. Stipe 5–10 (–12) mm, ripe pods dark brown or black, 4.5–6.5 x 0.7–1.0 cm, seeds (5–)6–9(–10), terminal leaflets truncate or cuneate-truncate at the base..... **19. *D. truncata***
- 6b. Stipe 4–6 mm, pods straw-coloured, 3–5 x 0.5–0.6 cm, seeds 4–6, terminal leaflets cuneate at the base..... **2. *D. circinalis***
- 7a. Trailing herbs, flowers solitary or few in sessile racemes, branches filiform, 0.5 mm diameter, leaflets 1–3 (–4.5) cm long
..... **8**
- 7b. More robust climbers, flowers in extended pseudoracemes, branches thicker than filiform, > 1mm diameter, leaflets 4–16 cm long **9**
- 8a. Leaflets small, elliptic, much narrower than long, 1–3 x 0.3–1 cm, coriaceous, peduncle 0.5–2 mm, 1-flowered, pedicel 2–7 mm
..... **5. *D. debilis***
- 8b. Leaflets quite rhomboid, 1–3(–4.5) X 1–3(–3.5) cm, membranous, peduncle 1–2(–5) mm, 1–3 flowered..... **16. *D. punctata***

- 9a. Pedicels slender, 8–17 mm, vexillum dark purplish red, terminal leaflet 4–6 X 3.5–5 cm, apex long-acuminate, inflorescence very slender, 5–16 cm, flowering at the end, 6–15 flowers.....
.....11. *D. gracilipes*
- 9b. Pedicels robust, shorter, 1–7 mm, at maturity sturdy, vexillum yellow with or without red, inflorescence more sturdy.....10
- 10a. Calyx with long bulbous-based hairs.....11
- 10b. Calyx without long bulbous-based hairs18
- 11a. Leaflets coriaceous, shining and glabrous above, ovary short-hairy.....9. *D. glabra*
- 11b. Leaflets membranous, dull green, (short-, thin-) pubescent above, ovary long-hairy.....12
- 12a. Inflorescence long, 16–35 cm, lateral branches c. 10 cm.....13
- 12b. Inflorescence shorter, 1–13 (rarely up to 20) cm.....15
- 13a. Inflorescence long-hairy with golden hairs, pods large, 8–10 x 1.5 cm, c. 10 seeds.....14. *D. longicarpa*
- 13b. Inflorescence glabrous or short-hairy, pods narrower, 0.8–1.2 cm, 5–10 seeds.....14
- 14a. Leaflets large, top leaflets ovate, 6–16 X 3.5–8.5 cm, thin-membranous, vexillum 1.2–2 cm long and wide, inflorescence thinly hairy, long-pedunculate, pods with c. 5 seeds... 17. *D. rubella*
- 14b. Leaflets 4–9.5 cm long and wide, broad-ovate to rounded, sub-coriaceous, vexillum 3–4 cm long and wide, inflorescence almost glabrous, pods with c. 10 seeds.....10. *D. glandulosa*
- 15a. Leaflets densely villous, inflorescences 1–7 cm, vexillum 15–18 mm long, dorsally red, pods 4–5 x 0.6–0.7 cm, c. 6–8 seeds.....
.....3. *D. crinita*
- 15b. Leaflets laxly short-pubescent, inflorescences 4–20 cm, vexillum 12–22 mm long, dorsally red or yellow, pods 4–6 x 0.6–0.9 cm, c. 7–12 seeds.....16
- 16a. Leaflets broad-ovate, 5–7 cm long, tip long-acuminate, base truncate.....7. *D. floresiana*
- 16b. Leaflets ovate, 5–13 cm, tip acuminate, base cuneate17
- 17a. Leaflets 6–13 cm long, pods with short grey and long yellow bulbous-based hairs.....8. *D. fusca*
- 17b. Leaflets 5–8 cm long, pods with only short grey hairs
.....18. *D. trichodon*
- 18a. Leaflets coriaceous, elliptic, apex obtuse, vexillum green to purple red or maroon black, veined, wings yellow to orange, keel green to greenish yellow, inflorescence to 35 cm
.....1. *D. bella*

- 18b. Leaflets membranous, cordate to ovate, apex acuminate, whitish pubescent below, vexillum yellow to maroon, veined or not, wings yellowish, keel yellow or greenish white 19
- 19a. Terminal leaflet rhomboid-ovate, base cuneate, green and sparsely grey-pubescent above, whitish-pubescent below, calyx without short bulbous-based hairs, vexillum dorsally uniformly maroon-coloured, ventrally yellowish..... 12. *D. incana*
- 19b. Terminal leaflet broad-ovate, base rounded to truncate, dark green, shiny and puberulous to sparsely pubescent above, sparsely to densely short and grey-pubescent below, calyx sometimes with some short bulbous-based hairs, vexillum with conspicuous purplish veins on both sides..... 4. *D. cumingiana*

Short synoptic key

Ovate leaflets: 3, 4, 6, 7, 8, 9, 10, 14, 15, 17, 18, 19.

Elliptic leaflets: 1, 5.

Rhomboïd leaflets: 2, (3), (6), (10), 11, 12, 13, 16, 20.

Very large flowers, vexillum 18-30 mm long: 4, 6, 7, 10, 13, 14, (17).

Bulbous-based hairs on calyx: 3, 7, 8, 9, 10, 14, 17, 18.

No bulbous-based hairs on calyx: 1, 2, 4, 5, 6, 11, 12, 13, 15, 19, 20.

Bulbous-based hairs on pods: 2, 3, 4, 7?, 8, 10, 17, 19.

No bulbous-based hairs on pods: 1, 5, 6, 9, 11, 12, 13, 14, 15, 16, 18, 20.

8 ALPHABETICAL TREATMENT OF THE SPECIES

1. *Dunbaria bella* Prain

Fig. 1, p. 18, Map 2, p. 19

J. Asiatic Soc. Bengal 66-2: 434-435 (1897).

Type: Burma, Lwekaw or Laikaw, S Shan States, *Abdul Khalil (King's collector) s.n.* (K, lecto; isolecto: CAL, here designated). Paratype: Burma, Tenasserim, *Gallatly s.n.* (CAL, not seen).

Heterotypic synonyms: *Dunbaria longeracemosa* Craib, Kew Bull. 1910: 277; Craib, Kew Bull. 1911-1: 41; Craib, Contrib. Fl. Siam., Univ. Aberdeen Stud. 57: 67 (1912); Hosseus, Beih. Bot. Centrbl. 28 Abt. 2: 397 (1911); Thuan, Pollen et Spores 15-3/4: 374-376 (1973). Type: Thailand, deciduous jungle, Doi Sootep, 300-900 m, *Kerr 917* (lecto: K; iso: BM, K, TCD). Paratype: Thailand, Kan Phra Dang, *Hosseus 148* (BM, E, K, L, M).

Phaseolus fuscus Hosseus non Wall. Beih. Bot. Centrbl. 27 Abt.2: 495 (1910).

Perennial climber, vigorous, branches up to 6 mm diameter, striate, growing from a woody rootstock, 2 cm diameter. *Branches* and petioles glabrescent, *Indumentum* sparse, short, grey, sometimes brown red, vesicular glands orange to brown. *Stipules* triangular, deciduous. *Leaf petiole* 1.2-4 cm long, glabrescent, rachis 1-1.8 cm, sometimes longer than or similar to the petiole, grooved above, petiolules 2-4 mm. *Leaflets* coriaceous, puckered and dark green above, dull light green below, turning dirty yellow with age; veins short-pubescent above and below, raised below; top leaflet elliptic with obtuse or short-acuminate apex to narrowly elliptic with acute apex, base rounded to broad-cuneate, 6-19 cm long, 2-8 cm wide, side leaflets obliquely so, 5-16.5 cm long, 2-7.5 cm wide, 2 basal opposite lateral veins, c. 10 other secondary veins alternate, stipellae minute setae, 1 mm, or absent. *Pseudoracemes* unbranched, 9-35 cm or more, with many flowers. *Bracts* caducous, triangular, pubescent, c. 4 mm long, 2 mm wide. *Pedicels* slender, 2-3 mm in flower, recurved and sturdy in fruit, up to 8 mm long. *Flowers* pretty, mature flower buds falcate. *Corolla* multi-coloured. *Calyx* velvety, green to red and dark red, orange glands visible, interior glabrous, margin hairy, tube c. 4 mm, teeth obtuse, c. 2 mm, the upper ones fused, the lowest one acute, c. 11 mm. *Vexillum* reniform, folded outside plane, dorsally pale green to purple red or very dark maroon-black, ventrally purple-striped, base violet-brown, c. 13 mm

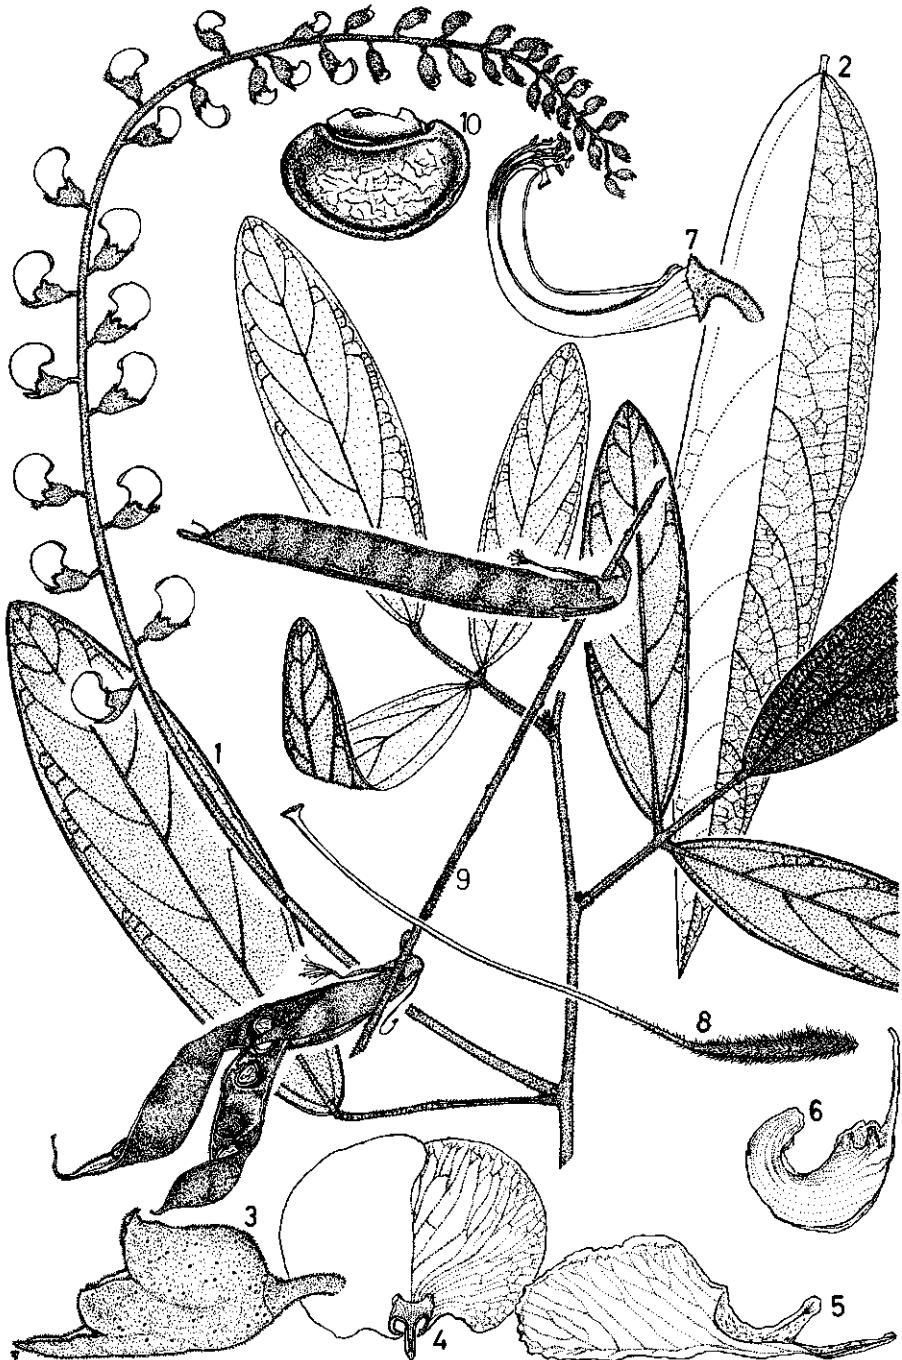

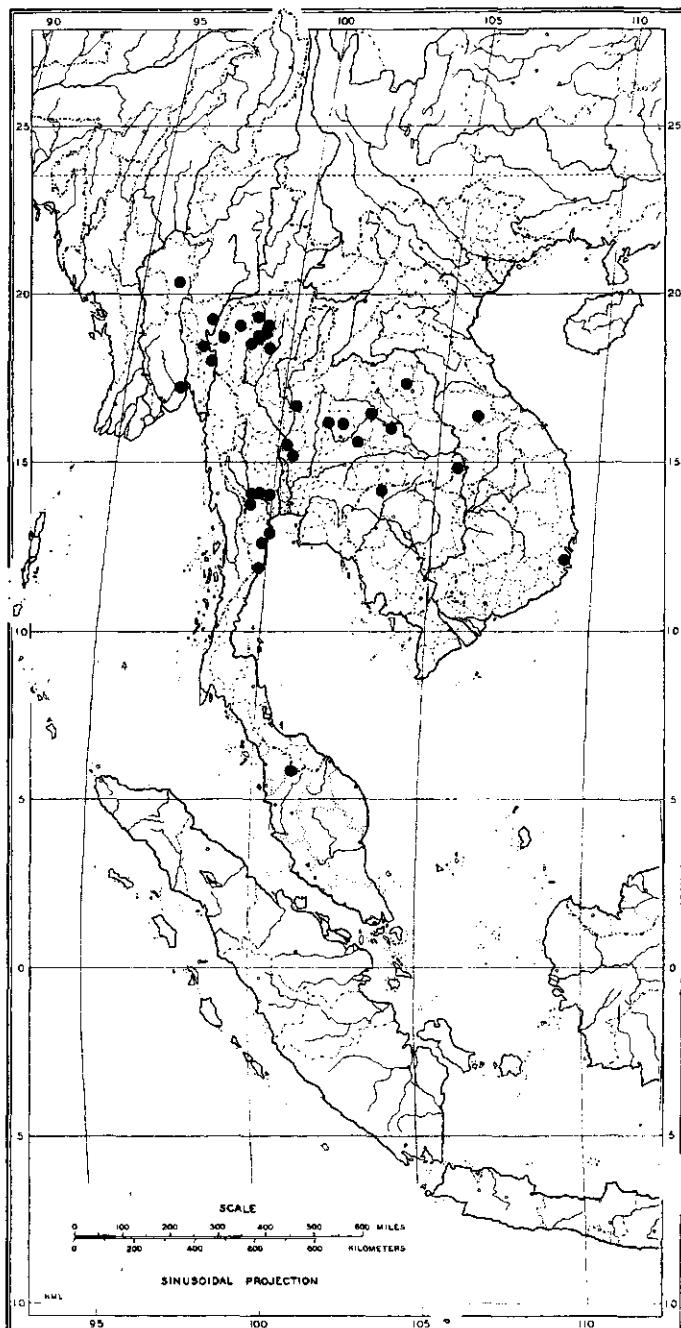

Fig. 1. *Dunbaria bella*: 1. habit, 0.66 X; 2. leaflet, 0.66 X; 3. calyx, 4 X; 4. flag, 2 X; 5. wing, 4 X; 6. keel, 2 X; 7. staminal tube, 2 X; 8. pistil, 4 X; 9. pods, 0.66 X; 10. seed, 4 X. - 1, 9 & 10: Poilane 14387, 2: Micholi s.n., 3-8: BR no. E 37 (Khon Kaen). Drawn by Mrs. Y.F. Tan.

long, 16 mm wide, base clawed, reinforced, biauriculate, two callosities near the base; *alae* obovate, yellow to orange, c. 13 mm long, 5 mm wide, long auricle at the ventral side, dorsally a short auricle, and two bulges on the margin; *keel* strongly curved, circinnato-rostrate, green to greenish yellow, longest dimension c. 13 mm. *Ovary* hairy, linear, hairy, densely yellow-glandular, c. 6 mm long, 1 mm wide, style curved, c. 18 mm, basal part hairy, stigma stamp-shaped. *Stamens* c. 23 mm, tube bent, terminal 6–8 mm free, 4 filaments slightly shorter, free stamen geniculate near the base, anthers basidorsifix, yellow, pollen dirty white. *Pods* linear to somewhat falcate, cm long, cm wide, short-velvety, sutures marked, valves curling when ripe. *Seeds* 8–12, reniform, red brown to brown, c. 6 mm long, 4 mm wide, 2 mm thick, strophiole narrow, vestigial.

Distribution: Burma, Cambodia, Laos, Thailand, Vietnam.

Ecology: straggling in scattered shrubs, dry deciduous jungle, moist savanna, also clearings in *Pinus-Dipterocarpus* forest, open forests, on clay and sandy soils, limestone, common or not. Altitude: 0–800 m.

Flowering: Aug. (Hongkong); Sept.-Dec.(-Feb.).

Fruiting: (Oct.-)Nov.-Dec.(Jan.).

Vernacular names: Thailand: Dank kung, Dok klang (Chieng-mai); Nguang chang (Petchaburi); Khang kang (Lampun). Laos: Khang luay, Ta Gyed lin (Laotian name cf. Hosseus 148).

Specimens examined:

BURMA: Laikaw or Lwekaw, S Shan State, *Abdul Khalil*, King's collector dd. 1893 (Lecto: CAL, iso: K); Pegu Yomay & Tenasserim, *Beddome* 2289 (BM); Kyaukhet Taung, Thaungyin distr., *Maung Ba Pe* 12983 (DD, K); Salween valley, Karen Ywathit, *Micholi* 22-12-1912 (K).

CAMBODIA: betw. Thmor Pouk and Benteai Chhma, foot of Dangrek nr border of Battambang and Siem Reap prov., *Poilane* 14387 (P).

Notes: A very distinct species, relatively well collected. Regrettably the wellknown name *Dunbaria longeracemosa* is antedated by *D. bella*. The length of the flower stalk and the shape of the coriaceous leaflets were taken by Craib as distinction from *D. bella*. However, indumentum, flowers and fruits are identical. The length of the inflorescence is variable, and not a good character to separate the species, e.g. Sørensen et al. 5413 has very long pseudoracemes. Even in the same specimen both elliptic and narrow-elliptic leaflets exist with apex obtuse, rounded to acute, sometimes acuminate (e.g. Kerr s.n. from Doi Sutep, 3-12-1911, BM). The length of the entire climber is rarely reported: 1 m to 3.3 m, but it seems likely that this sturdy plant may grow much taller. The protogues do not give an indication either.

Uses: Mention is made once of the use of flowers as a vegetable (apparently like those of *Sesbania grandiflora*) in Thailand, Anam ka Lampoon 16 (L). In Laos the plant is medicinal (Vidal 1090).

2. *Dunbaria circinalis* (Benth.) Baker
Fig. 2, p. 23, Map 3, p. 24

in J.D. Hooker, Fl. Brit. India 2: 219 (1876); Kurz, J. Asiatic Soc. Bengal 45-2: 255-256 (1876); Backer, Voorl. Schoolfl. Java 92 (1908); Koorders, Exk.fl. Java 404 (1912); Boldinh, Zakfl. Landbouwstr. Java 120 (1916); Y.C. Wu, Engl. Bot. Jahrb. 71: 184 (1940); Wang & Tang, Ill. treatm. princip. pl. China. Legumin. 688 (1955); Verdcourt, Manual New Guinea Legumes 544 (1979); Khoi & Yakovlev, Bot. Zh. (Leningr.) 67: 1541 (1982); Lee Shukang, Fl. Reip. Pop. Sin. 41: 312-313 (1995). Most of the publications outside the Indian subcontinent refer to *Dunbaria truncata*.

Basionym: *Atylosia circinalis* Benth. in Miq., Pl. Jungh. 244 (1852), based on *Phaseolus circinalis* Ham. ex Wall., Cat. 5594 (1831).

Type: India, Assam, Goalpara, *Hamilton in Herb. Wallich* 5594 ex parte (holo: K; iso: K).

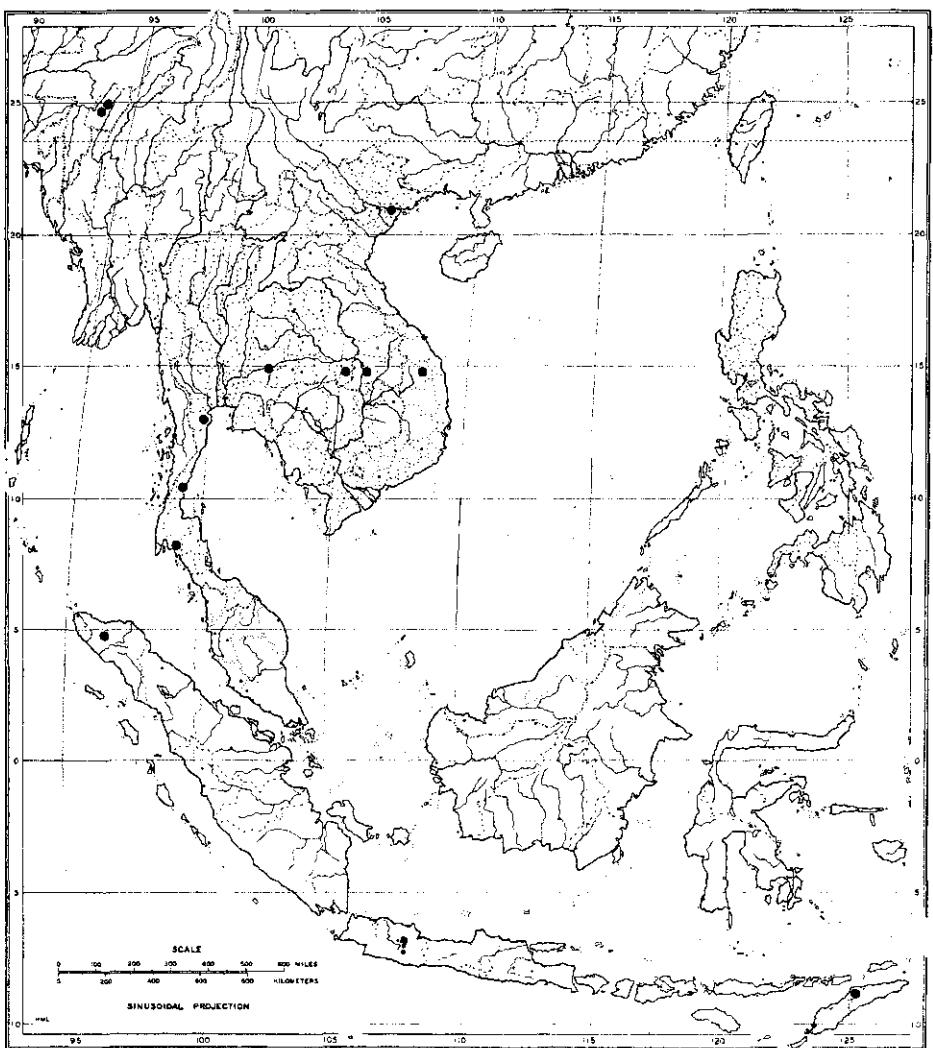

Homotypic synonym: *Phaseolus circinalis* Ham. ex Wall. nom. nud., *Wall. Cat.* 5594 (1831).

Heterotypic synonym: *Dunbaria thorelii* Gagnep., Lecomte Not. Syst. 3: 194 (1916); id. Fl. Gén. Indoch. 2: 284 (1916); Thuan, Pollen et Spores 15-3/4: 370-372; Thuan, Fl. Cambodge, Laos, Vietnam 17: 120 (1979). Type: Laos, Bassac, Mekong area, *Thorel s.n.* (holo: P; iso: P).

Perennial climber. Branches slender, length not reported, to 2 mm diameter. *Indumentum* sparsely grey-hairy, more densely on calyx and leaf veins. *Stipules* triangular or narrowly so, to linear, hairy, 1-2 mm long. *Leaf petiole* slender, striate, 1-3 cm, rachis 0.5-1.5 cm. *Leaflets*: top leaflet rhomboid to rounded, acuminate, 2-4.5 cm long, 2-4 (-4.5) cm wide, apex blunted-acute, tipped with a small mucro, base broadly to narrowly cuneate, dark green above, olive-green below, side leaflets obliquely so, 1.2-3 cm long, 1.2-2.5 cm wide, both sides with many yellow to orange glands, petiolules 1-2 mm, stipellae minute, c. 0.5 mm, sometimes falling. *Pseudoracemes* (5-)8-12(-20) cm long, peduncle unbranched or with a second slender peduncle branched off from a trifoliolate bract, buds crowded at the curled end, *bracts* narrowly elliptic, dorsally hairy, early caducous, 3-7 mm long. *Flowers* c. 12-20. *Corolla* yellow, quite persistent. *Calyx* densely orange-glandular, pubescent, interior sparsely pubescent, tube 2.5-4.5 mm, teeth very narrow-

Fig. 2. *Dunbaria circinalis*: 1. habit, 0.66 X; 2. calyx, 4 X; 3. flag, 2 X; 4. wing, 2 X; 5. keel, 2 X; 6. staminal tube, 2 X; 7. pistil, 4 X; 8. pods, 0.66 X; 9. seed, 6 X. – 1, 8 & 9: Marcan 541, 2-8: Kerr 8101. Drawn by Mrs. Y.F. Tan.

Map 3. Distribution of *Dunbaria circinalis* in S and SE Asia

elliptic, acuminate, upper teeth 6–7 mm, connate for a third to a half of their length, lateral teeth c. 5 mm long, lower tooth c. 6–7 mm. *Vexillum* rounded, 10–14 mm long, c. 9–11 mm wide, base clawed, biauriculate, auricles not reinforced, no crest or callosities, apex folded, emarginate, *alae* obovate, 9–13 mm long, c. 4.5 mm wide, base bent, c. 2–4 mm, ventral side 1 long auricle, dorsal side 1 short auricle, *keel* circinnato-rostrate, longest dimension 10–15 mm, ventral sutures adnate, base narrow, c. 3–6 mm. *Ovary* linear, c. 5–6 mm, silvery hairy, with yellow glands, about 6 ovules, stalk 1 mm, style to 16 mm, stigma terminal, oblique. *Stamens* c. 13–19 mm long, tube curved upwards, upper 7 mm of filaments free, anthers basidorsifix, enclosed in the rostrum of the keel. *Pods* 3–5 cm long, 0.5–0.6 cm wide, straw-coloured, stipitate, stalk 4–6 mm, 1–3 mm of style remaining at the apex. *Seeds* (4–)5–6, black or brown with black mosaic, squarish-rounded, to c. 4 mm long and wide, 2.5 mm thick, strophiole divided.

Distribution: NE India, Thailand, Laos, Indonesia (Timor).

Ecology: a climber in scrub jungle, along roadsides. Altitude: 50–200 m (India, Timor), 50–1200 m (Thailand).

Flowering: Oct.–Dec., May (mainland Asia), April (Timor).

Fruiting: Aug., Jan. (mainland Asia), April (Timor).

Vernacular names: –

Specimens examined:

INDIA: Herb. Hamilton, Wallich 5594 (K-Wall.); Assam: Kistopore, Cachar, Clarke 7009 (BM); Lakhipur on the Barak river, Gage s.n. (G); Assam sine loc., Jenkins s.n. (DD, G, L, P); Sikkim: Terai, Sukna, Clarke 36641 A (K), 36641 D (G); West Bengal: Nilpara, W Duars, Haines 511 (K).

INDONESIA: Timor, de Castro s.n. (BO); NW Timor, Lalian, Kooy 98 (L); Lalian, Kooy 102 (L); Sumatra, Aceh, Balek, Jeswiet 623=1832 (sterile, WAG).

THAILAND: Chumphon, CIAT 17329 (CIAT, WAG); Qak tong Chai, Korat, Kerr 8101 (BM, K); Sakeo, Krabin, Kerr 9792 (K, TCD); E Prov., Ubon Ratchabani, Det Udom distr., Koyama et al. T30777 (L); Petchaburi, Marcan 541 (BM, K).

VIETNAM: Sept Pagodas, Tonkin, Sergent Mouret 47 (P); Dac Dao, Miang Giang, Gialai - Kontum, Tran Ngoc Ninh 175 (LE).

Sine loc.: Kurz s.n. (BO).

Notes: The complex around *Dunbaria circinalis* was difficult to comprehend. Study of live material would be ideal to unravel the populations. The material has not earlier been studied for the entire range of habitats.

Baker (1876) correctly placed "*Atylosia circinnalis*" Benth. in

Dunbaria, the pods do not have linear depressions, but the pod valves show bulges where the seeds develop. Baker considered specimens of what I think to be *Dunbaria truncata* as part of *D. circinalis* due to inadequate material (Craib, 1923). A manuscript name shows that Bentham (or Baker?) at one time thought those specimens, *Helper 1709* and *Griffith s.n.* from Burma, to be distinct, but he included them in the species as treated for the Flora of British India. I restrict *D. circinalis* to the Indian-Indochinese and Timorese populations with narrow straw-coloured, c. 6-seeded pods with yellow-brown long bulbous-based straggly hairs on short-grey-pubescent pod valves. Also, Baker did not see *D. podocarpa*, he could only quote Kurz's description; the holotype arrived in Kew from Calcutta in June 1878, two years after the second volume of the Flora of British India was published. Prain did not discuss *Dunbaria podocarpa* nor *D. circinalis*. Gagnepain and Thuan only treated *D. podocarpa* and *D. thorelii* Gagnep., the latter is conspecific with *D. circinalis*. *Dunbaria circinalis* seems to secrete more sticky matter from glands and glandular hairs on inflorescences and pods than *D. truncata*, seen the several fragments sticking to those parts, and the shiny material on the pod valves.

The species has not been collected in India in recent times (Satyanarayana, 1993), but from Thailand, Vietnam and Indonesia samples were collected in the last decennia. *D. circinalis* remains a poorly collected species.

3. *Dunbaria crinita* (Dunn) Maesen comb. nov.

Fig. 3, p. 27, Map 4, p. 28

Basionym: *Atylosia crinita* Dunn, J. Bot. 47: 198 (1909).

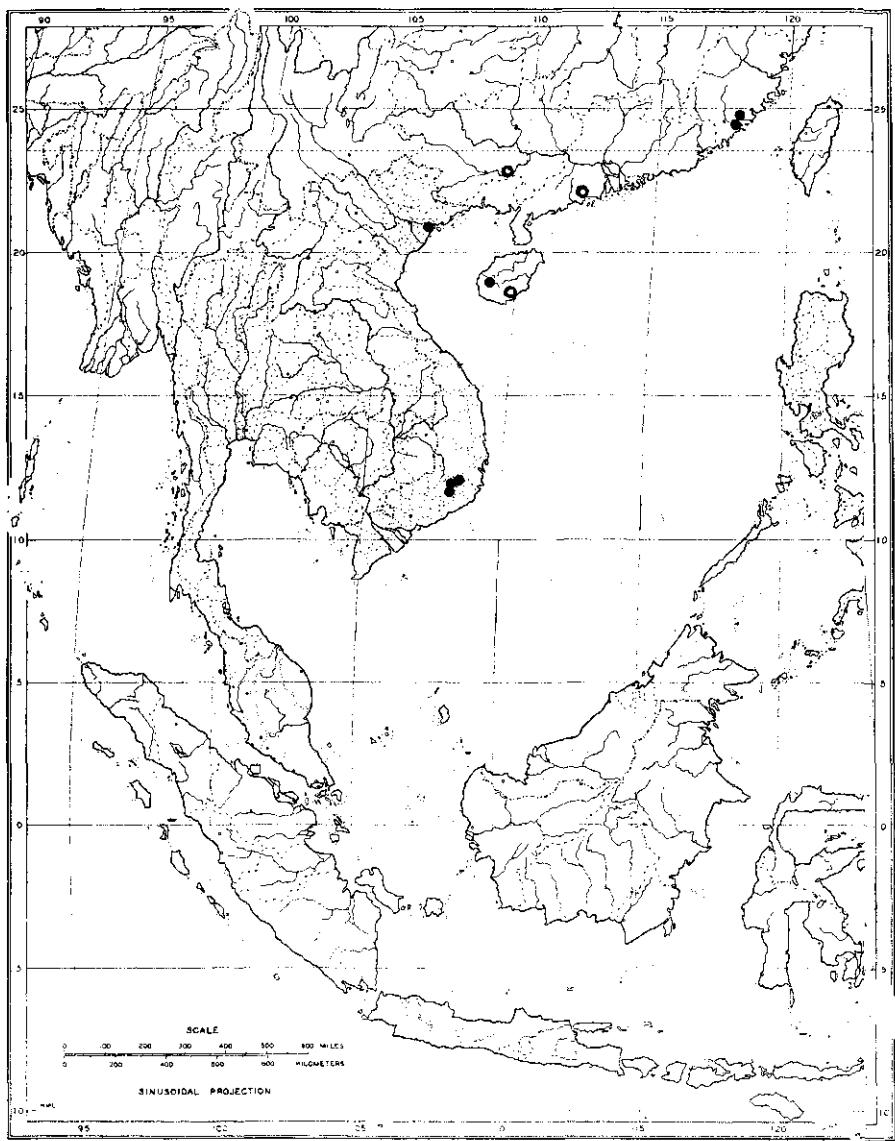

Lectotype: China, Lienchow River, *Ford* 13-8-1887 (lecto: BM, here designated). Paratype: China, Hainan prov., *Ford* 366, Aug. 1893 (HK, not seen, NY).

Heterotypic synonym: *Dunbaria flavescens* Nguyen Van Thuan, Adansonia, sér. 2, 16-4: 512 (1977); id., Fl. Cambodge, Laos, Viet-nam 17: 124 (1979). Type: Vietnam, Lam Dong, Dalat Region, 1000 m, *Lichy* 3 (P, holo; iso: P). Paratypes: Vietnam, Lam Dong, road on Mont de l'Elephant, Kampot, along Prenn stream, *Evrard* 1226 (P); Vietnam, N of Dalat, prov. Haut-Donaï, *Poilane* 30398 (AAU, BKF, K, P); Vietnam, Lang Anh, prov. Haut Donaï, *Poilane* 21044 (P).

Fig. 3. *Dunbaria crinita*: 1. leaf and inflorescence, 0.66 X; 2. detail of lower leaflet surface, 2 X; 3. calyx, 1.5 X; 4. flag, 1.5 X; 5. wing, 1.5 X; 6. keel, 1.5 X; 7. staminal tube, 1.5 X; 8. pistil, 4 X; 9. pods, 0.66 X; 10. detail of base of pod, 1 X. — 1-10: Lichy 3. Source: Fl. Cambodge, Laos, Viet-nam 17: 127 (1979). Drawn by Mrs. H. Lamourdedieu. Reproduced by permission from Mus. Nat. Hist. Natur., Paris.

Perennial climber, branches striate, to 3 m. Indumentum densely velvety, grey, with short hairs on upper surface of leaves, branch ribs long retrorsely hairy, short-hairy between ribs. *Stipules* caducous, triangular, 1–3 mm long. *Leaf petiole* striate, 3–4.5 cm, rachis 0.8–1.5 cm. *Leaflets* dark green above, grey-green below, both sides with many reddish vesicular glands; top leaflet ovate to ovate-elliptic, 5–8 cm long, 3–4 cm wide, apex acute, base rounded, side leaflets obliquely so, 4–6 cm long, 2.5–3.5 cm wide, petiolules 2–3 mm, stipellae hairy, setaceous, caducous or invisible between indumentum. *Pseudoracemes* not branched, to 7 cm. *Bracts* early caducous, 2–4 mm, glandular, setaceous. *Flowers* 10–20 or more, singly or in pairs. *Corolla* yellow, vexillum dorsally red or purple. *Calyx* glandular, tube c. 4 mm, teeth triangular, upper teeth connate but free at the tip, lateral teeth acute to rounded, 2–3 mm, lower tooth longest, 4–5 mm, margin hairy, bulbous-based golden hairs conspicuous esp. at bud stage. *Vexillum* rounded, 15–18 mm long, c.

Map 4. Distribution of *Dunbaria crinita* in China and Vietnam (●),
probable locations (○)

15 mm wide, base clawed, biauriculate, apex rounded, emarginate; *alae* obovate, to 15–17 mm long, 5 mm wide, base narrow, c. 6 mm, dorsal side 1 short auricle, ventral side 1 long auricle; *keel* circinnato-rostrate, pouched, longest dimension c. 15–17 mm, ventral sutures adnate, base clawed, c. 5 mm. *Ovary* linear, 6–7 mm, grey silken-hairy, glandular, c. 6–8 ovules, stalk 1 mm, style 17–20 mm, stigma oblique, terminal. *Stamens* c. 22–25 mm, upper half of filaments curved, upper 10 mm free, anthers basidorsifix, enclosed in the rostrum of the keel. *Pods* sessile, linear, tapering at the ends, 4–5 cm long, 0.6–0.7 cm wide, with short hairs and bulbous-based long caducous hairs. *Seeds* 6–8, red brown to brown with black mosaic, orbicular, c. 4 mm long, 4 mm wide, 2 mm thick, strophiole conspicuous, divided.

Distribution: China: Guangdong, Guangxi and Hongkong, Vietnam.

Ecology: weedy places in pine forest, in thickets or fields, e.g. on red soils. Altitude: 0–1500 m.

Flowering: Aug. - Sept.

Fruiting: Oct.

Vernacular names: China: Ye tau fa (Poon Yuen).

Specimens examined:

CHINA: Guanxi/Kwangsi prov.: Tung Loo, E Tang Lan, R.C. Ching 6526 (A, W). Guangdong/Kwangtung prov.: Lienchow river, Ford 59, 13-8-1887, fr. cult. in Bot. Gdn Hongkong (lecto BM; isolecto K); Cult. in Hongkong Bot. Gdn, grown from seeds from Hainan (probably Ford 59?), Ford 613 (K); Poon Yuen distr., Levine et al. 2180, coll. Ah To (A); Hainan prov.: Shun Cheong, Ford 358, Chinese collector (K); Yaichow, H.Y. Liang 62648 (A, NY). Hongkong: New Territories, Wah Shan Kuek, Shiu Ying Hu 10901 (K); Kamtin, Un-Loong, Y. W. Taam 1615 (A, G, NY, US); Shek Kong catchment area, J.P.W. Woo 369 (P). VIETNAM: Type and paratypes of *D. flavescens* (see above).

Notes: Before I studied *Dunbaria* in its entirety, I considered *Atylosia crinita* as a synonym of *Dunbaria fusca* (van der Maesen 1986). The Flora of China (Lee Sukiang, 1995) lists *D. crinita* as synonym of *D. fusca*. Since the type material of *A. crinita* is conspecific with the *D. fusca* segregate *D. flavescens* Thuan, a new combination is necessary as the epithet *crinita* has priority. Judging from the rather limited material, I concur with Thuan, that the taxon merits specific status. The place of the species is open to discussion, as depressions on the pod valves between the seeds are present, but not sharp: *Dunbaria* or *Cajanus*? However, the very rostrate-

circinate keel points more to *Dunbaria*. The relationship to *Dunbaria fusca* is obviously close. In addition to the dense indumentum and ovate-elliptic leaflets with an acute tip, *D. crinita* differs from *D. fusca* by the flower colour: its standard petal is (dorsally) red, in *D. fusca* all petals are yellow, only *Evraud 2424* has yellow-purplish flowers, but is otherwise *D. fusca*. The flowers of *Taam 1615* are reported to be yellow, but have dried up quite dark. The upper sepal of *D. crinita* (= *flavescens*) is not always divided, so this character to key out the species from *D. fusca* (with 4 sepals) is not unambiguous.

In 1973 Thuan described the pollen of *D. flavescens*, of which the protologue was issued in 1977 only.

4. *Dunbaria cumingiana* Benth. Fig. 4, p. 31, Map 5, p. 32

in Miquel, Pl. Jungh. 242 (1852); Miquel, Fl. Ind. Bat. 1: 177 (1855); Merrill, Enum. Philipp. Legumes, Philipp. J. Sci. 5: 127 (1910); Merrill, Enum. Philipp. Pl. 2: 314 (1923); Verdcourt, Manual New Guinea Legumes 544 (1979).

Type: Philippines, Luzon, Prov. Tayabas, *Cuming 819* (K, holo; iso: BM, K, MEL, P, W).

Heterotypic synonyms: *Dunbaria discolor* Harms & K. Schum., Fl. Deutsch. Schutzgeb. Südsee 369-370 (1901). Lectotype: Papua New Guinea, betw. Finschhafen & Gibuni, in Bumi valley, *Lauterbach 457* (B, lecto; designated here). Paratypes: woods nr Finschhafen, *Lauterbach 418* (B, para); Stephansort, Lewandowski 22 (B, para); Schumann river bank, 300 m, *Lauterbach 2419* leg. Kersting (not seen).

D. merrillii Elmer, Leaflets Philipp. Bot. 1: 225 (1907) as *Dumbaria*; Merrill, Enum. Philipp. Legumes, Philipp. J. Sci 5: 127 (1910); Merrill, Enum. Philipp. Fl. Pl. 2:315 (1923). Type: Philippines, Luzon, Baguio in Benguet prov., *Elmer 8502* (K, lecto; iso: BO, E, G, L, LY, NY, US, W).

Perennial climber, robust. *Stems* to several m long, to 4 mm in diameter, branched. *Indumentum* short-cinereous, from sparse to dense. *Stipules* very narrow-elliptic, caducous, 2-4 mm long. *Leaf petiole* slender, ribbed, pubescent, 3-6 cm, rachis 1.2-2 cm long. *Leaflets* dark green and puberulous-shiny to sparsely pubescent above with few glandular dots, grey-green below with sparse to

Drawn by Mrs. Y.F. Tan.

Map 5. Distribution of *Dumbaria cumingiana* in SE Asia and Papua New Guinea

dense pubescence, giving a whitish appearance, densely gland-dotted; 2 major lateral veins from the base, c. 6 alternate alternate veins; top leaflet broadly ovate, 3–7 cm long and wide, apex acuminate or acute, base rounded to truncate; side leaflets obliquely so, 2–6 cm long, 2–5 cm wide; petiolules 2–5 mm long, hairy; stipellae hairy, narrow-elliptic, minute to 2 mm long. *Pseudoracemes* lax, simple or with a few branches, (5–)10–20 cm long, up to c. 20 flowers. *Bracts* very narrow-elliptic to setaceous, hairy, soon dropping, c. 1 mm; pedicels thin at first, to 6–7 mm, in fruit sturdy and 8–12 mm long. *Mature flower buds* falcate. *Corolla* yellow to yellowish orange, vexillum veined purple and dorsally flushed purple or green. *Calyx* pubescent, inside too, tube to 6 mm long, teeth broad-triangular, upper teeth connate, c. 2 mm long, incised at the tip, lateral teeth 2 mm, lower tooth 3 mm. *Vexillum* obovate, falcate until widely opened, 18–25 mm long, 14–20 mm wide, clawed, strongly auricled at the base, two callosities not very conspicuous; *alae* yellow, narrow-obovate, 18–23 mm long, to 6 mm wide, one dorsal auricle of c. 3 mm long; *keel* yellow, curved, clawed, longest dimension 18 mm, 9 mm wide. *Ovary* linear, c. 8 mm, densely pubescent with or without bristly hairs developing, glandular dots dense, yellow, c. 9 ovules, style up to 23 mm, upper 10 mm curved upwards, after anthesis stylar canal plainly visible, stigma an oblique knob, terminal. *Stamens* with filament tube to 25 mm, free part upcurved, filaments unequal, 7–10 mm, anthers basidorsifix. *Pods* slightly falcate, brown to dark brown, 6–8 cm long, c. 1 cm wide, densely puberulous and sparsely to densely covered with yellowish bristly hairs and glandular dots, bristles caducous or sometimes lacking, stipe c. 1–2 mm, base of style persistent. Valves strongly curling and glabrous when ripe. *Seeds* 7–9, roundish compressed, brown, up to c. 7 mm long, 5.5 mm wide and 2–3 mm thick, hilum with narrow papery vestigeal strophiole.

Distribution: Indonesia, Papua New Guinea, Philippines.

Ecology: climber in forests along lake or in river valleys, also in disturbed open areas, forming tangled masses over shrubs and trees. Altitude: 0–600? m.

Flowering and fruiting: almost throughout the year.

Vernacular names: Indonesia: Kacang meraya; Philippines: Mang; Ayemik; Igorot: Kalat; Ilocano: Bangbangnau, Marapatam.

Specimens examined:

INDONESIA: Saleyer Isl., *Docters van Leeuwen* 1692 (U); Irian Jaya, Bivak Hollandia (now Jayapura), *Gjellerup* 165b (BO, K, L, U); Lamala, Kalibambang, E Sulawesi, *Kaudern* 370 (AAU, L, NY, S); N Sulawesi, Dumoga-Bone National Park, by Tumpah River, *Jon Martin* 4635 (BM); Amasing, Batjan, Moluccas, *Nedi* 149 (BO, L); Cyclope Mts, Hollandia (Jayapura) - Sentani rd, Lake Sentani, Irian Jaya, *van Royen & Sleumer* 5803 (BO, L); Seran (Seram) nr Maneo, *Rutten* 309 (BO); S. Sulawesi, Soroako, S shore of Lake Matano, *de Vogel* 5771 (L, NSW); Seram, *de Vriese s.n.* (L).

PAPUA NEW GUINEA: Garabinumu, *Carr* 12960 (K, NY); Kokoda sea front, 400 m, *Carr* 16289 (B, BM, L); NE of Manumu village, *Isles & Vinas NGF* 33892 (A, L); Gewam, subprov. Lae, prov. Albay, *Mendoza* 18414 (K); Cagayan prov., *Ramos* 7411 (LY, US); Cagayan prov., *Ramos* 7872 (LE); Bangui, prov. Ilocos Norte, *Ramos* 27432 (P, US); San Mariano, prov. Isabela, *Ramos & Edaño s.n.* (B); Siargao Island, *Ramos & Pascasio* 34867 (P); Casiguran, prov. Tayabas *Ramos & Edaño* 45505 (LE). Mindoro: Randan Mt. Bulalacao, *Ebalo* 244 (A); Mt. Yagaw E slope, Mansalay, *Sulit & Conklin* 16882 (L). Polillo island: NE forest, Karlagan, *Fox* 327 (A).

Notes: Merrill (1910) already mentioned the possible conspecificity of *D. cumingiana* and *D. merrillii*. Only the more dense and whitish pubescence of the lower surface of the leaflets separated the latter from the first. The structure of the hairs on the leaflets is similar, the colour is silvery, so increasing density makes the surface from pale green to white, in several gradations. Habit, flower and pod characters do not differ, although in specimens with sparsely or densely haired leaflets the (caducous) yellow bristly hairs on the pods are obviously more sparse when mature or are indeed entirely lacking. Even *Cuming* 819, the type of *Dunbaria cumingiana*, has the occasional bristle. Elmer did not have mature pods in the type material of *D. merrillii*. The specimens issued as *D. merrillii* by Elmer (no 15579) hardly have denser indumentum than the common

specimens of *D. cumingiana*. A study of possible seasonal fluctuations in leaf background colour in different accessions may serve to remove further reservations against the merger of the species, such as the existence of different vernaculars e.g. in Ilocano. *Elmer 8502* appears not to be present in PNH or US, therefore the duplicate at K was selected as lectotype for *D. merrillii*.

In some specimens (*Nedi 149*) the vesicular glands are almost invisible on the lower side of leaflets, black remnants perhaps indicate a fungus infection. The calyx shows reddish glands, however.

5. ***Dunbaria debilis* Baker** Fig. 5, p. 36, Map 6a, 6b, p. 37, 38

in J.D. Hooker, Fl. Brit. Ind. 2: 218 (1876); Clarke, J. Linn. Soc. 25-1: 17 (1889).

Lectotype: India, Meghalaya, Khasi Mts, Nunklow, alt. 4–5000 ft, *Hooker f. & Thomson 1930* (K, *lectotypus novus*). Paratype: ibid., Ponerang, *Hooker f. & Thomson s.n.* (K); Ponerang, *Lobb s.n.* (K).

Heterotypic synonyms: *Dunbaria singuliflora* F. Muell., J. Roy. Soc. N.S. Wales 24: 74 (1890-91); Lazarides et al. Checklist Fl. Kakadu NT, Austral.: 14 (1988); Verdcourt, Manual N. Guinea Legumes 545 (1979). Lectotype: Australia NT, Port Darwin, Arnhem's Land, *Holtze NI043* (fl. 1890) (MEL, lecto; isolecto: K). Paratype: ibid., *Holtze s.n.* 1890 (fr.) (MEL).

Dunbaria parvifolia X.X. Chen, Acta Bot. Yunnan. 3-4: 435 (1981); Lee Shukang, Fl. Reip. Pop. Sin. 41: 310 (1995). Type: China, Guangxi, Yongning Xian, *Q. Li et al. 2-0008* (Herb. Inst. Med. Pharm. Sci. Guangxi Chuang Auton. Reg. Nanning, holo, not seen).

Perennial climber, woody rootstock with filiform stems, indumentum dense, short. Vesicular glands yellow to brown. *Branches* to 0.7 m long, striate, up to 2 mm thick. *Stipules* setaceous, 1–5 mm long. *Leaf petiole* grooved above, narrowly winged, 3–16 mm, rachis 1–3 mm, with wings somewhat spoon-shaped. *Leaflets* coriaceous, grey-green above, whitish grey-green below, top leaflet elliptic to narrow-elliptic, 1–3 cm long, 0.3–1 cm wide, apex rounded-emarginate to acute-cuspidate, base slightly cordate, prominently veined, 2 laterals at the base, c. 4–5 alternate lateral

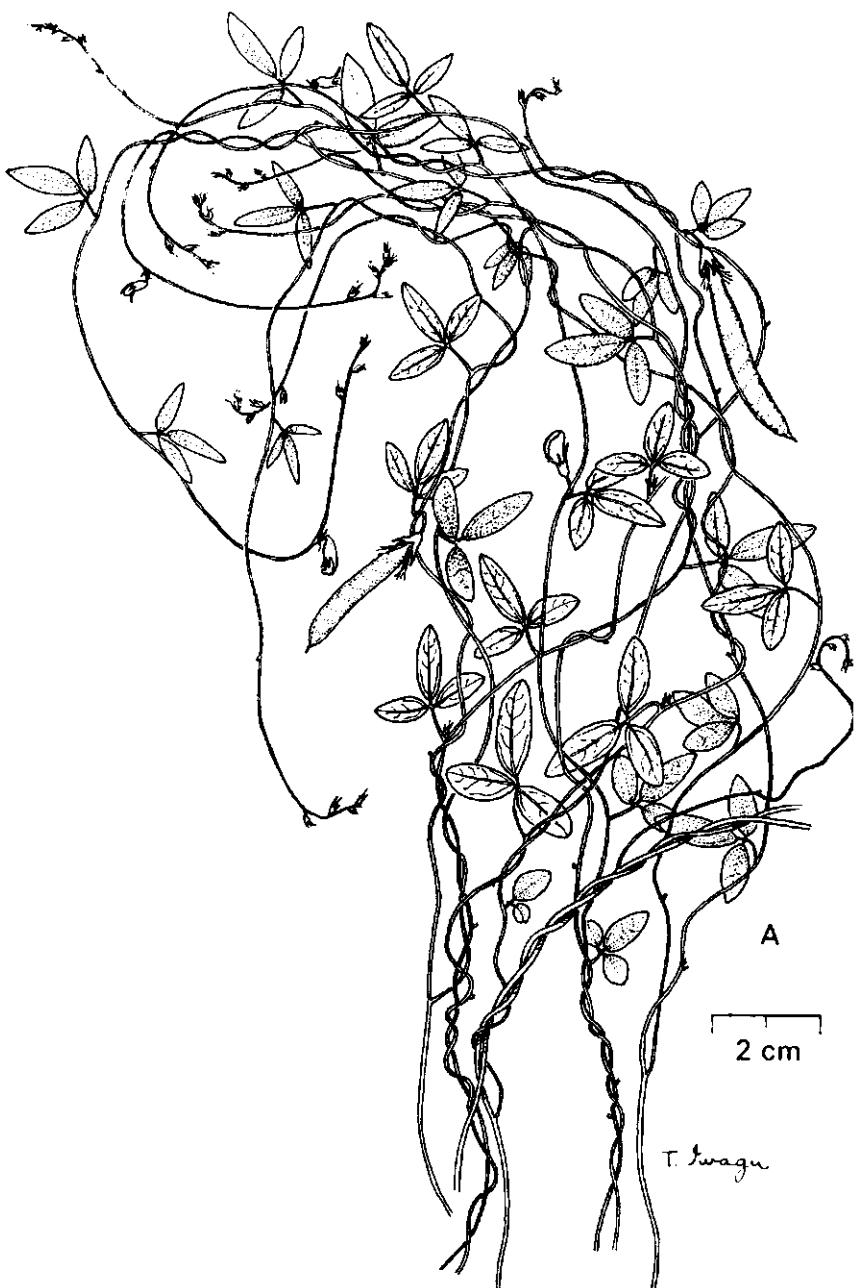

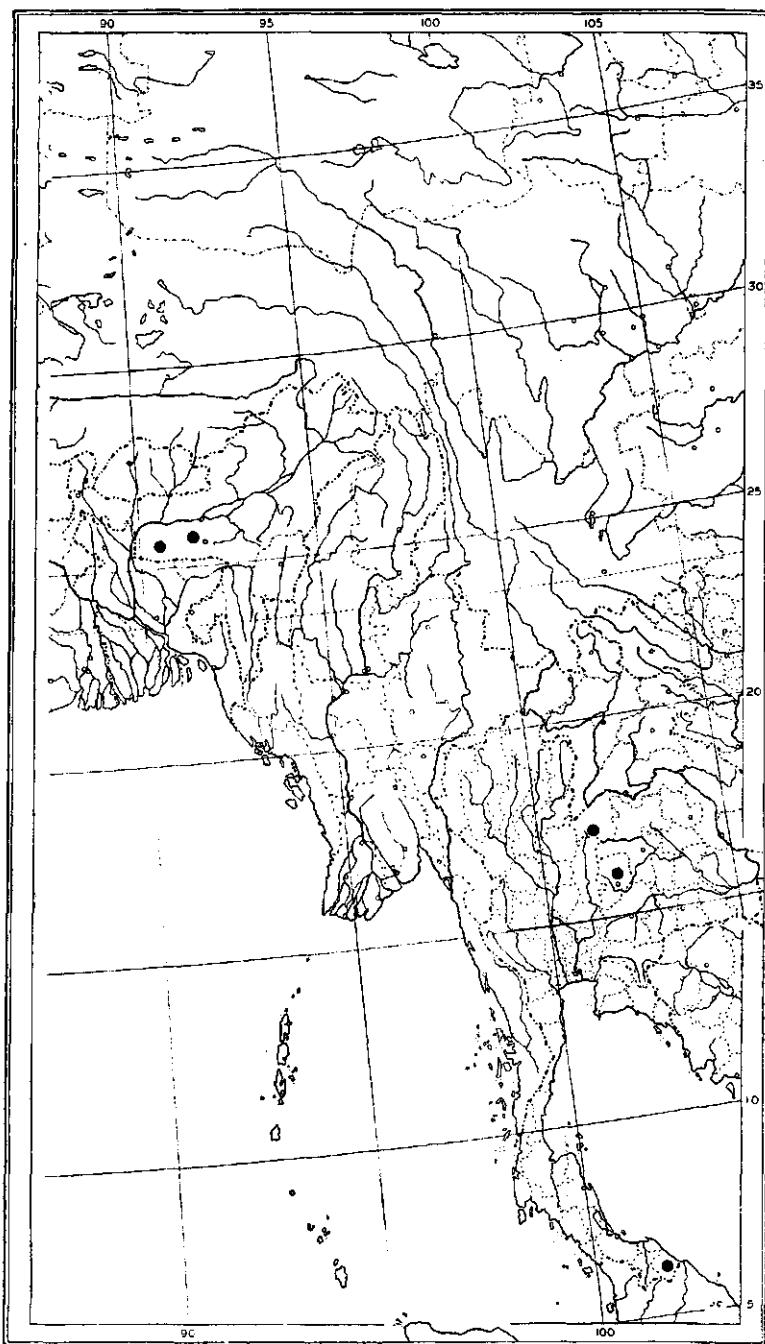

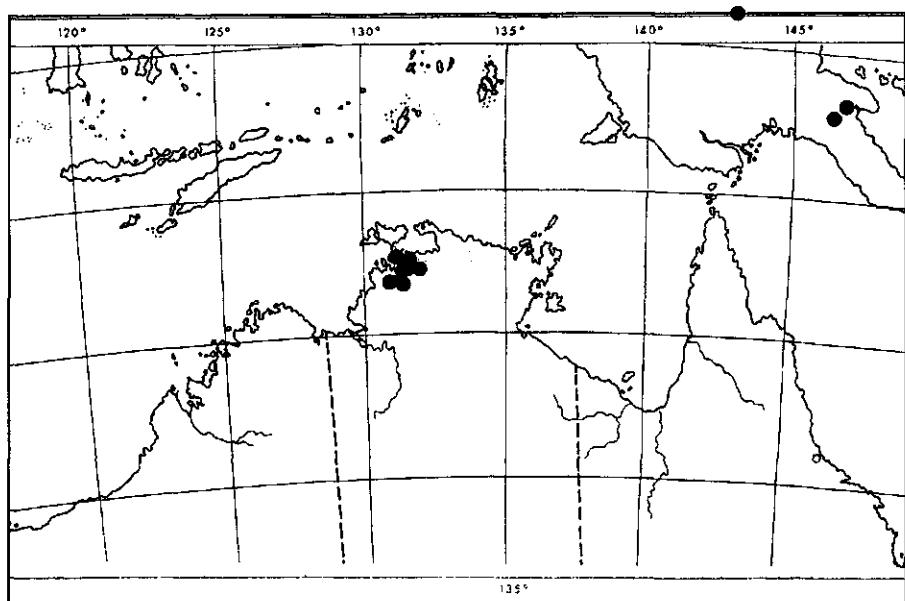

Fig. 5. *Dunbaria debilis*: 1. habit. Source: B. Verdcourt, A Manual of New Guinea Legumes p. 546 (1979), drawn by Mr. T. Iwagu. Reproduced by permission from the Papua New Guinea Forest Research Institute.

AUSTRALIA

Map 6b. Distribution of *Dunbaria debilis* in Australia

veins; side leaflets obliquely so, 0.7–2.3 cm long, 0.2–0.9 cm wide; petiolules hairy, c. 1 mm; stipellae none. *Pseudoracemes* axillary, single-flowered. *Bracts* setaceous, caducous, c. 1 mm. Peduncles 0.5–2 mm, pedicels slender, 4–7 mm. *Corolla* yellowish. *Calyx* tube c. 2 mm, upper teeth connate except at the very tip, c. 3 mm, lateral teeth triangular, c. 2 mm, lower tooth narrow-elliptic, c. 4 mm. *Vexillum* rounded, c. 8–10 mm long and wide, apex emarginate, base clawed, reinforced with two auricles, no callosities; *alae* long-ovoblate, 2 mm wide, 8 mm long; *keel* strongly curved, longest dimension 8–10 mm, basal suture adnate. *Ovary* elliptic, densely short grey-pubescent, glandular, c. 5 mm, style c. 8 mm, base pubescent, upper part curved and flattened, stigma terminal. *Stamens* c. 12 mm, upper 5 mm of filaments curved upward and free, anthers basifix. *Pods* sessile, flat, linear, (3–)4–5 cm long, 4.5–7.5 mm wide, base of style persisting, sutures sturdy, valves curling when ripe. *Seeds* (6–)7–10, roundish, laterally compressed, brown to black, minutely pitted, c. 3 X 3 X 2 mm, strophiole narrow, divided.

Distribution: China: Guangxi; NE India: Meghalaya, Sikkim and West Bengal; Australia: N. Territories; Papua New Guinea.

Ecology: creeping or climbing in grassland (in Australia with *Themeda*), *Eucalyptus tetrodonta* etc. woodland, rare to locally common, on red earth, gravelly or sandy laterites. In India the Terai has black vertisols, no details about soils are given. Altitude: 0–1300 m, perhaps 2000 m.

Flowering: Sept. (India); Oct., Jan., Feb. (Australia); June & Dec. (New Guinea).

Fruiting: Oct.-Dec. (India); Jan.-March (Austr.); June & Dec. (PNG).

Vernacular names: -

Specimens examined:

AUSTRALIA: Northern Territory: Bachelor Farm nr Darwin, *Allen* 4 (K); 4.3 m NW Pine Creek, *Chippendale* 7598 (BRI); Alligator Creek, 12° 40' S, 132° 10' E, *Dunlop & Taylor* 6094 (DNA); Port Darwin, *Holtze* N1043 (fl.) (MEL, lecto *D. singuliflora*); ibid., *Holtze* s.n. (fr) (K, MEL, LE, paratypes *D. singuliflora*); 33 km N Adelaide River, 13° 08' S, 131° 06' E, *Maconochie* 2343 (K, L, MO); Port Darwin (Palmerston), *F. von Mueller* 133 (G); J. PAPUA NEW GUINEA: Morobe district: Markham Point, 6° 45' S, 147° 00' E, *Henty NGF* 11674 (A, K); ibid., 7° 00' S, 146° 58' E, *Streimann* 47798 (BRI, K, L); Sepik district: Kungingini rd, Maprik subdistr., in hayfield, *Womersley & Simmonds* 6869 (BRI); Kaiser Wilhelmsland, location not deciphered, *Schlechter* 18405 (K).

THAILAND: E Prov.: Chaiyaphum, Tunkamang, *Geesink et al.* 7074 (BKF, K, L, P); E Prov.: Thung Kra Mang, *Larsen et al.* 31628 (BKF, K); Peninsular: Yala Prov., *Sangkhachand et al.* 1523 (BKF 72881).

Notes: Von Mueller (1891) described his *D. singuliflora* as nearest allied to *D. debilis*. Protogues and material seen leave no reason to keep *D. debilis* and *D. singuliflora* separate. The disjunct distribution and probable ecological differences between the regions are very peculiar indeed, for plants so strikingly similar in morphology.

In NE India the species occurs both at low and high altitudes.

In his protologue Von Mueller did not indicate a type specimen for *Dunbaria singuliflora* from Port Darwin, Arnhem's Land, but his

handwriting with the flowering specimen Holtze N1043 in the type cover at MEL leaves no doubt. The other, fruiting, syntype specimens are designated herewith as paratypes.

Verdcourt (1979) wondered if the Papuan material, that has narrower fruits than the *D. singuliflora* type from Port Darwin, is distinct at varietal level. The pods are within the range of variation, and look more like those of Indian specimens. I do not distinguish a variety.

The protologue and illustration of *D. parvifolia* X.X. Chen does not offer characteristics to distinguish this species from *D. debilis*.

Non-fruiting plants of *Dunbaria debilis* sometimes cause confusion with *Cajanus scarabaeoides*. It has clearer green or black glandular dots, smaller and narrower leaflets (but some *C. scarabaeoides* material is very similar) and very short fine hairs. The branches are more filiform.

6. *Dunbaria ferruginea* Wight & Arn.

Fig. 6, p. 41; Map 7, p. 42

Wight & Arnott, Prodr. Fl. Pen. Ind. Or. 258 (1834); Bentham, Pl. Jungh. 1: 242 (1855); Miquel, Fl. Ind. Bat. 1-1: 179 (1855); Baker, Fl. Brit. Ind. 2: 217 (1876); Trimen, Handb. Fl. Tamilnadu Carnatic 3-1: 403 (1983); Matthews, Illustrations Fl. Tamilnadu Carnatic 198 (198x).

Type: Peninsular India, *Wight herb. prop.* 878 p.p. (lecto: K; isolecto: G). Paratypes: *Cylista? ferruginea* nom. nud., *Herb. Madras* (CAL?, MH? not seen); "Collaea venosa" Graham, *Wallich* 5573 (BM, K); Nilgiris, *Heyne s.n.* (BM).

Perennial climber, indumentum short-tomentose, ferruginous when young, paler to grey when old. Vesicular glands yellow, sometimes orange when old. *Branches* to c. 8 m long, 2-5 mm diameter, hardly striate. *Stipules* triangular, quite caducous, c. 2-3 mm long, 1 mm wide, hairy. *Leaf petiole* striate, grooved above, 2-5 cm, rachis 0.7-2 cm long, petiolules 2-4(-5) mm. *Leaflets* dark green, sparsely short-pubescent above, sparsely to densely rusty brown tomentose below, especially on the veins, midrib and 2 major

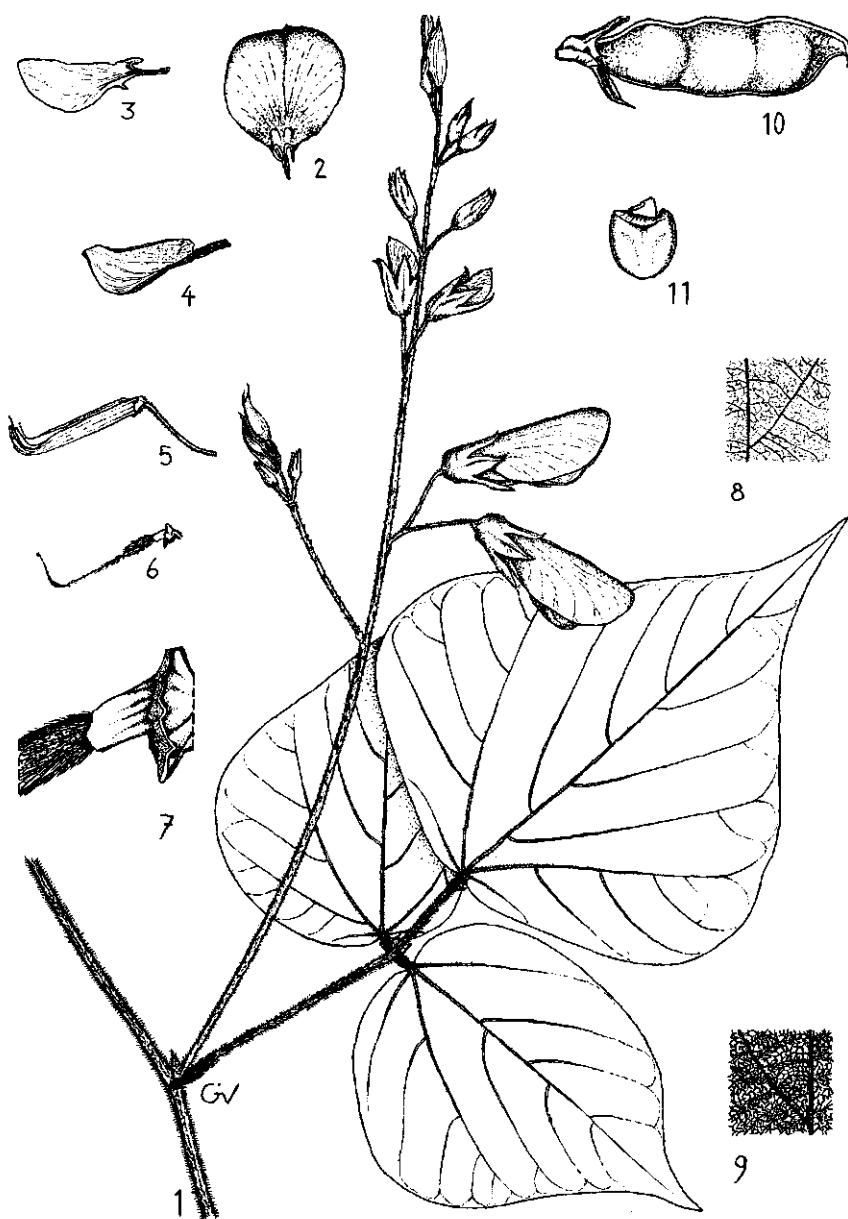

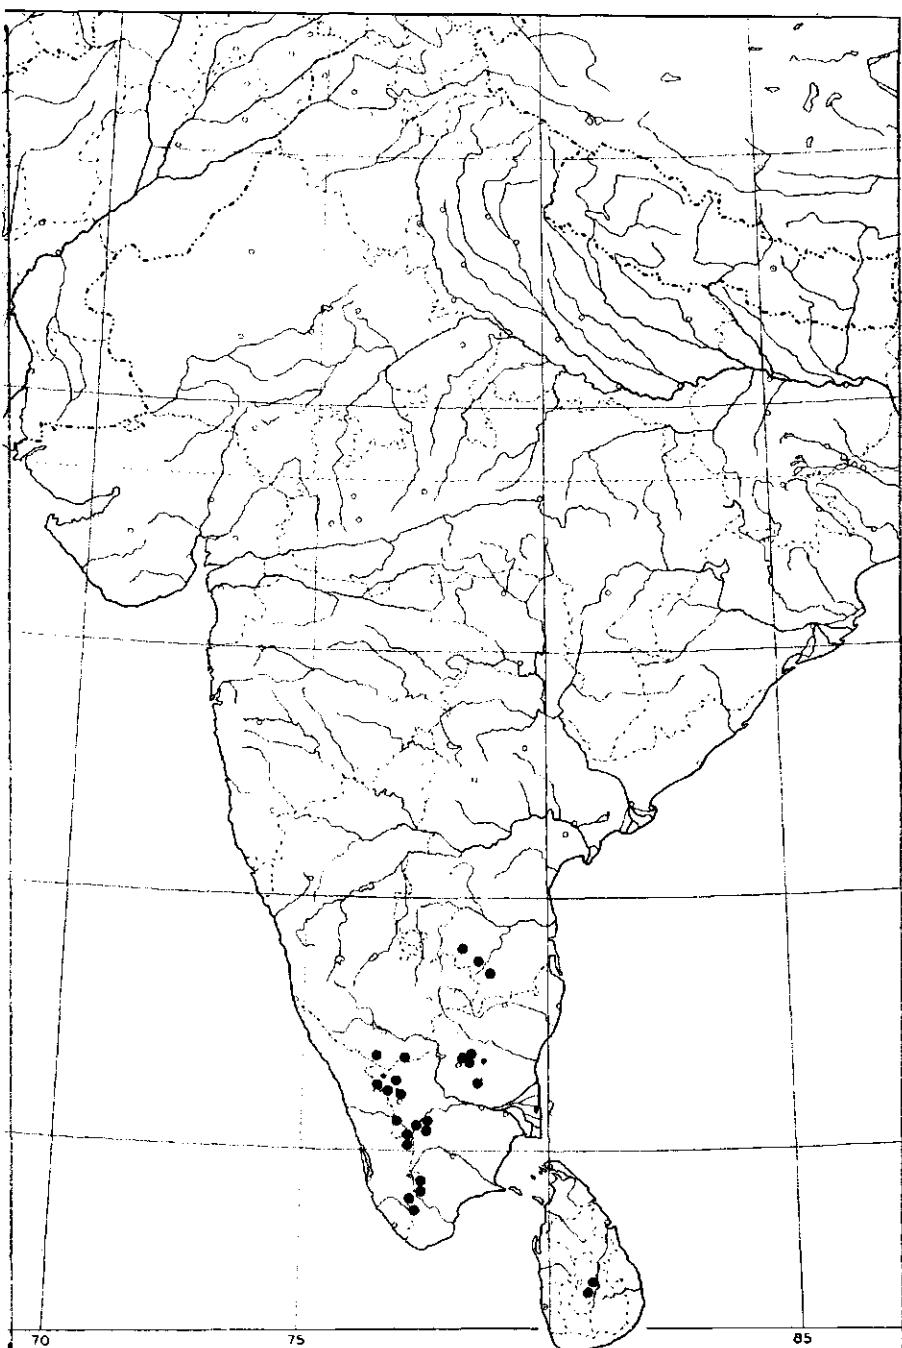

Fig. 6. *Dunbaria ferruginea*: 1. flowering branch, 0.66 X; 2. flag, 0.66 X; 3. wing, 0.66 X; 4. keel, 0.66 X; 5. staminal tube, 0.66 X; 6. pistil, 0.66 X; 7. base of pistil, showing disk, 4 X; 8. detail of upper leaflet surface, 1.32 X; 9. detail of lower leaflet surface, 1.32 X; 10. pod without marcescent corolla, 1 X; 11. seed, 2 X. – 1-9: van der Maesen 4812, 10 & 11: van der Maesen 3561. Drawn by Mr. G. Vonk.

Map 7. Distribution of *Dunbaria ferruginea* in S India and Sri Lanka

laterals from the base, c. 5–7 major secondary veins, alternate or subopposite, stipellae linear to narrow-triangular, 1–3 mm long, caducous. Top leaflet ovate to rounded-ovate, 4–10 cm long, 2.5–6 cm wide, apex acuminate-cuspidate, base rounded to truncate; side leaflets obliquely so, 3–7.5 cm long, 2.5–6 cm wide; hairy-setaceous, 2–3 mm. *Pseudoracemes* simple or with one branch, peduncles 6–20 cm long, many-flowered, pedicels 8–20 mm, thin at first, flowers often attached in pairs. *Bracts* narrow-elliptic to linear, up to 10 mm long, 4 mm wide, very caducous. *Calyx* pubescent, inside glabrous, tube 4–7 mm, teeth acute to narrow-elliptic, 6–8 mm, subequal, the upper ones connate except at the tip. *Vexillum* yellow, dorsally red, obovate, c. 25–28 mm long, 22 mm wide, apex rounded, base clawed, reinforced, biauriculate, two callosities; *alae* yellow, elongate-obovate, c. 25 mm long, 8 mm wide, clawed, with an auricle each side, near the largest auricle a bump; *keel* curved, largest dimension c. 26 mm. Ovary densely hairy, covered with pale yellow glands, c. 8 mm, 5–6 ovules, style c. 20 mm, basal 14 mm hairy, upper 6 mm curved upward and flattened at the bend, stigma terminal. *Stamens* 25–28 mm, free part c. 3–5 mm, anthers uniform, dorsifix. *Pods* oblong, 2.5–4.3 cm long, 0.8–1.2 mm wide, petals marcescent, sutures prominent, tipped with remnant of style, ripe seeds visible by faint bulges, valves pubescent, glabrous with age except the sutures, glands conspicuous, valves curling when mature, inside vaguely septate, 3–5 seeds. *Seeds* roundish-compressed, brown with black mosaic to black, c. 5 mm long, 4 mm wide and 3 mm thick, hilum with a narrow papery vestigial strophiole.

Distribution: S India, Sri Lanka.

Ecology: along forest edges, in the hills, climbing in shrubs and trees. Quite a common climber in the semi-deciduous forests of south Peninsular India, flowering and seeding prolifically.

Altitude: 800–2000 m.

Flowering: (Aug.–) Nov.–March (–May).

Fruiting: (Dec.–) Jan.–March (–Apr).

Vernacular names: Masukkodi (Tamil); Goradiye (Sri Lanka).

Notes: *Dunbaria latifolia* Wight & Arn. (1834) was put into synonymy with *D. ferruginea* by Baker (1876), despite the peculiar number of 1-2 seeds per pod. That taxon does not belong in *Dunbaria* but in *Rhynchosia* (see *van der Maesen* 1995); *R. courtallensis* Maesen. At first glance the similarity is striking, and Wight & Arnott noted that their *D. ferruginea* material was not perfect.

The occurrence of *D. ferruginea* in Vietnam was reported by Nguyen Dang Khoi and Yakovlev (1982) from Gialai-Kontum, Dac Choong, 18-3-1978, L.K. Bien 488 (HN, HM, LE). The specimen in LE with flowers and bracts but without fruit turned out to be *Cajanus crassus* (Prain ex King) Maesen.

7. *Dunbaria floresiana* Maesen spec. nov.

Fig. 7, p. 45, Map 8, p. 46

Herba scandens ramis aliquantum fortibus. Indumentum sparse cinereo-pubescent foliolus subtus densius. Calyx pilis multis flavidis basi incrassatis. Stipulae deciduae. Foliae rhachis carinatus pilosus.

Type: Indonesia, Flores, distr. Manggarai, Ruteng e.a., Verheyen 388 (L, holo).

Perennial climber. Branches rather vigorous. *Indumentum* sparsely grey-pubescent, more dense on lower side of leaflets, calyx with many bulbous-based yellowish hairs. *Stipules* caducous, leaving a hairy scar. *Leaf petiole* grooved, hairy, c. 4 cm, rachis c. 1.5 cm. *Leaflets* green above, grey-green below, orange-red glandular dotted both sides, top leaflet broadly ovate, 5–7 cm long, 5–6 cm wide, apex long-acuminate, small mucro, base rounded, almost cordate; side leaflets obliquely so, 5–6 cm long, 3.5–4 cm wide; petiolules long, c. 4 mm, hairy; stipellae not seen. *Pseudoracemes* 4–10 cm, branched, 4–6 flowers per branch. *Bracts* ovate, acuminate, glabrous inside, hairy outside, 5 mm long, 2.5 mm wide. *Flowers* 1 or 2 per node. *Corolla* yellow with red-veined vexillum. *Calyx* short grey-hairy with many long yellowish bulbous-based hairs, tube c. 6 mm, teeth short-triangular, in bud overlapping, upper ones connate except at the tip, c. 4 mm long, lateral teeth c. 4 mm, lower tooth c. 6 mm. *Vexillum* broadly rotundate, incl. claw c. 22 mm long, c. 20 mm wide, top emarginate, base clawed, biauriculate, with a protruding single notched crest near the base; *alae* narrowly obovate, c. 18 mm long and 7 mm wide, base clawed, ventrally long-auriculate; *keel* falcate, longest dimensions c. 21 mm, 7 mm wide, long-clawed. *Ovary* with a short stalk, linear, c. 7 mm long, 2 mm wide, long yellowish hairy, densely covered with yellow glands, with c. 7 ovules, style c. 14 mm, curved upward, sparsely hairy all along, stigma terminal, oblique. *Stamens* c. 23 mm, last 5 mm upcurved and free, anthers basidorsifix. *Pods* not known in ripe stage. *Seeds* 6–7.

Distribution: Indonesia: Flores.

Ecology: ? Altitude: 1000–1200 m.

Flowering: May.

Fruiting: ?

Vernacular names: Wasé lintjor?

Specimens examined: INDONESIA: known only from the type.

Note: *Dunbaria floresiana* is closely allied to *Dunbaria cumingiana* by the habit, leaves and inflorescence. It could also be a new *Cajanus*, as no ripe pods are available. Both species differ as follows:

- Indumentum sparse or dense, very short, hairs not bulbous-based....
.....*D. cumingiana*
- Indumentum on calyx of short densely placed hairs mixed with long stiff to straggly bulbous-based hairs.....*D. floresiana*

side; *keel* strongly curved (90°), c. 17 mm long, claw 5 mm. *Ovary* linear, c. 6 mm long, 1 mm wide, hairy, densely yellow-glandular, style perpendicularly upcurved, c. 19 mm, stigma terminal, oblique. *Stamens* c. 25 mm, tube bent, terminal 8 mm free, anthers dorsifix. *Pods* linear, 6–8 cm long, c. 1 cm wide, glandular and very short-pubescent, almost glabrous, sutures thickened. *Seeds* c. 7, ovoid, brown, 4 X 2 mm (teste Thuan).

Distribution: Vietnam.

Ecology: in dune thickets, forests, on clayey and rocky soils, along coast and on small coastal islands. Altitude: low.

Flowering: March, April, July.

Fruiting: July.

Vernacular names: (Day) chim bim (Phu Khanh), Day dau ma, Cay dau hoang (Binh Tri Thien, Vietnamese), Re dao, Re mo, Re ma (Phu Khanh, Moïo or proto-indochinois).

Specimens examined:

VIETNAM; type and paratypes cited above. Cape Baudoin, *Anon.* dd. 1868 (P); Phu Khanh: Nha-Trang, Hon Tre, *Averyanov & Kudryavtzeva* 260 (LE); Phu Khanh: Nha-Trang & vicinity, *Robinson* 1259 (P).

Notes: the paratype *Poilane* 2510 from Gia Ray, prov. Dong Nai, "ntir nar", cannot be accepted as such, since it is a specimen of *Pueraria phaseoloides* (Roxb.) Benth. var. *phaseoloides*. Thuan (1979) qualifies the occurrence as frequent. The ovary is short-hairy (*Eberhardt* 1624, P), not glabrous as described by Thuan. The pollen was described by Thuan already in 1973, but the proper protologue was first published in 1979.

10. *Dunbaria glandulosa* (Dalzell & A. Gibson) Prain

annotated). See notes.

Homotypic synonym: *Atylosia glandulosa* (Dalzell & A. Gibson) Dalzell, J. Linn. Soc. 13:185 (1873).

Heterotypic synonym: *Atylosia rostrata* Baker, Fl. Brit. Ind. 2: 216 (1876); Prain, J. Asiatic Soc. Bengal 66: 433 (1897); Talbot, Trees Bombay Pres. 134 (1894); Nairne, Fl. Plants W India 90 (1894). Type: India, Concan, Stocks s.n., most likely the fruiting material issued as "*Dunbaria rostrata* Benth.", Malabar Concan etc. Regio trop., Coll. Stocks, Law etc. Herb. Ind. Or. Hook. fil. & Thomson (holo: K, not seen; iso: A, BM, C, G, L, P, TCD, W).

Perennial tall woody climber. *Indumentum* sparse, on upper surface of leaflets on veins, on undersurface also scattered. Vesicular glands brown red, sometimes shrivelled to opaque-yellow and hardly visible in old specimens. *Branches* up to at least 5 mm diameter, striate, downy at first. *Stipules* caducous, triangular, up to 4 mm long, 2 mm wide. *Leaf petiole* grooved above, 3–8 cm, rachis (1–)1.5–2.7 cm. *Leaflets* green above, pale green below, subcoriaceous; top leaflet broad-ovate to roundish, acuminate, apex rounded-cuspidate, base cordate to truncate, (2.5–)4–9.5 cm long, 4–9.5 cm wide; side leaflets obliquely so, 2.5–8 cm long, 3–7.5 cm wide; petiolules 2–4 mm, grey pubescent; stipellae absent. *Pseudoracemes* usually not branched, (10–)16–30 cm long, lax, branches c. 10 cm if present, almost glabrous. *Bracts* ovate-rostrate, small, 4 X 1.5 mm, early caducous. Pedicels thin, more sturdy in fruit, 1–1.8 cm long, inserted alone or in pairs. *Calyx* red-glandular, with a few bulbous-based hairs, concentrated near the base, inside glabrous, tube c. 5 mm, lateral and upper connate teeth broad-obtuse, c. 2 mm, lower one rostrate, up to c. 5 mm. *Corolla* yellow. *Vexillum* rounded, when fully expanded 2–3 cm long, 3–4 cm wide, apex emarginate, base clawed, reinforced, with 2 narrow auricles, no callosities; *ala* obovate, clawed, with one narrow auricle, up to 2 cm long, 1.2 cm wide; *keel* curved, adnate, largest dimension c. 2 cm. *Ovary* sessile, densely yellow-hairy, with yellow glands, c. 10–15 mm, style c. 27 mm, slender, basal 8 mm pubescent, stigma terminal, globose. *Stamens* c. 28 mm, terminal 8 mm free, quite persistent, anthers dorsifix. *Pods* linear, 7–8.5 cm long, 0.8–1.2 cm wide, depressed but not lineate between seeds, sparsely covered with bulbous-based hairs of 2 mm, glands few. *Seeds* 8–10, roundish-compressed, dark brown to black, pitted, c. 4 X 4 X 2 mm, strophiole narrow.

Distribution: Bangladesh, Burma, India, Nepal, Thailand.

Ecology: climber in scrub jungle. Altitude: 0–800 m.

Flowering and fruiting: (Aug.–) Sept.–Nov.

Vernacular names: Ran warwa, Rata warwa, Ghansod (W India).

Specimens examined:

INDIA: sine loc., Asia, *Hügel* 2306 (W). Maharashtra: Thana distr., Pawai Lake, *Ackland* 354 (BLAT); Jungar, Inam forest, Bassein, *Ryan* 1324 (BSI); Ghanosi, *Ryan* 1360 (BSI); Virar, Bassein, *Ryan* 1413 (BSI); Nawghar, Bassein, *Ryan* 1504 (BSI); Tamil Nadu: Jubbulpore (Jabalpur, not Madhya Pradesh), Anaimalai Hills, *Beddome* 2295 (BM).

NEPAL: Dhankuta, Nepal Valley, 26° 59' N, 87° 23' E, *Williams & Stainton* 8369 (BM, K). THAILAND: Den Jaya, *Franck* 489 (C); Chiangmai scrub jungle, *Kerr* 1398 (BM, C, K, L, P, TCD); Maehongsong, *Larsen* 34277 (AAU, BKF, K, P); Ban Taklee, *Marcan* 1087 (BM, C); Aran(ya) Pratet, *Put* 2042 (BM, C, K, L, E, TCD).

Specimens quoted by Prain, not seen (CAL?) and partly annotated in BLAT: BANGLADESH: Mymensingh, *Clarke* 7800.

BURMA: S Shan States, Lwekaw, *King's collectors* s.n.

INDIA: Andhra Pradesh: Godavari jungles, *Beddome* s.n. Madhya Pradesh: Sagor, *Jerdon*. Maharashtra: Borivli National Park, Aarey Milk Colony, Goregaon, Tungar Hill, Andheri to Vinayak, Nr Andheri Makal Caves, Salsette, Sakinaka to Pawai Lake, Vehr Lake along Pawai S banks, Jogeshwari (BLAT).

Notes: Quite a rare climber with conspicuous large bright yellow flowers, with a peculiar wide but disjunct distribution. Baker indeed mentioned that "the flowers [are] much the most showy in the genus [*Atylosia*]". Dalzell claimed the presence of stipellae, Baker and Talbot described the leaflets exstipellate, I have not seen stipellae either.

It is entirely possible that the type of *Atylosia rostrata* is also the type of *Dunbaria glandulosa*, but the indication Malwan & Wagotun, S Concan (the location of the type), I have not seen on any of Stocks's specimens from the Concan area.

Uses: In W India the juice of the pressed leaves or the roots is taken against diarrhoea.

11. *Dunbaria gracilipes* Lace Fig. 11, p. 59, Map 10, p. 60

Lace, Kew Bull. 1914: 152-153 (1914).

Type: Burma, Ani Sakan nr Maymyo, 900 m, *Lace 5494* (E: holo; iso: CAL, E, K).

Homotypic synonym: *Dunbaria maymyoensis* P. Satyanarayana & Thothathri syn. nov., Bull. Bot. Surv. India 27-1/4: 152-153 (1985, publ. 1987) (CAL: holo; iso: E, K).

Perennial climber. Branches slender, finely ribbed, up to 3 mm diameter. Indumentum short, grey, dense on stem ribs, lower leaf surface and calyx, vesicular glands orange-red. Stipules narrow-elliptic, 2-3 mm long, c. 1 mm wide. Leaf petiole striate, canaliculate above, 3-4.5 cm, rachis part 1-1.5 cm. Leaflets rhomboid, thinly pubescent and hardly glandular above, densely pubescent with longer hairs and many glands below; top leaflet rhomboid, 4-6 cm long, 3.5-5 cm wide, apex long-acuminate, cuspidate, rarely blunt, base cuneate; side leaflets obliquely so, 3.5-5 cm long, 2-3 cm wide; petiolules 2-3 mm; stipellae c. 1 mm, often caducous. Pseudoracemes slender, 5-16 cm long, with 6-15 flowers, sometimes a few on a weak lateral, pedicels slender, 0.8-1.7 cm. Bracts ovate to very narrow-elliptic, hairy, 3-5 mm long, 1-2 mm wide, very caducous. Flowers with dark red-purple corolla. Calyx green or purple, tube c. 4-5 mm, teeth narrow-elliptic, upper teeth c. 2-4 mm, quite free, lateral ones 3 mm, lowest tooth 4-5 mm. Vexillum rounded, curved, c. 1.2-1.4 cm long, 1.1-1.2 cm wide, apex emarginate, base clawed, biauriculate, no callosities; alae obovate-falcate, auriculate, c. 1.2 cm; keel falcate, c. 1.1 cm. Ovary linear, grey-pubescent and gland-dotted, c. 10 mm long, style c. 8-15 mm, hairy at the base, swollen at the distal 5 mm, stigma terminal, swollen. Stamens c. 15 mm, upper 5 mm free and curved upward, anthers basidorsifix. Pods linear, c. 5 cm long, 0.8 cm wide (not fully ripe), sessile, 8-10-seeded. Seeds not available in ripe stage.

Distribution: Upper Burma.

Ecology: along streams and watercourses in a limestone region, scrambling on bushes in thin forest and open places. Altitude: 400-1160 m.

Flowering: Sept.-Oct.

Fruiting: Oct.-Nov.

Vernacular names: -

Pseudarthria timoriensis Zoll. & Moritzi, Nat. & Geneesk. Arch. Neerl. Indië 3: 63 (1846), *nomen nudum*, erroneously taking for its basionym *Desmodium timoriense* DC. (as "Armosiense") from Timor, Java ad rupes prope Waringin, Pr. Besoeki. Reference specimen Java, Zollinger 2771 (P).

Heterotypic synonyms: *Dunbaria scortechinii* Prain, J. As. Soc. Beng. 66-2: 44; 435 (1897); Burkill, Gdn Bull. Strait Settl. 1-9: 312 (1910); Craib, Fl. Siam. Enum. 1-3: 463 (1928); Burkill & Haniff, Gdn Bull. Strait Settl. 6: 190 (1930); Merrill & Chun, Sunyatsenia 2: 250 (1935); Wu, Y.C. Engl. Bot. Jahrb. 71: 184 (1940). Type: Malaysia, Perak, Dijong, Scortechini 1841 (lecto: BM, here designated). Paratypes: Malaysia, Perak, Kunstler 908 (BM); ibid., Ulu Bubong, Kunstler = King's Collector 10852 (K).

D. harmandii Gagnep., Not. Syst. 3: 192 (1915); id., Fl. Gén. Indoch. 2: 288 (1916); Pham Hoang Ho, Ill. Fl. S. Vietnam ed.2, 1: 877, fig. 2205 (1970). Type: Vietnam, Tourane, Harmand s.n. (lecto: P). Paratype: Indo-China, without location, Pierre s.n. (E, P).

Perennial climber. Branches to 8 m long, up to 0.5 cm diameter, ridged when young. *Indumentum* of young branches, undersurface of leaflets and calyces densely light grey, short-velvety. Vesicular glands reddish, initially yellow on calyx and pods. *Stipules*

Map 11. Distribution of *Dunbaria incana* in SE Asia

caducous. *Leaf petiole* grooved above, 2–8.5 cm, rachis 0.8–1.5 cm. *Leaflets* green, thinly glabrescent above, grey-velvety hairy below, top leaflet rhomboid-ovate, 4–12 cm long, 3–9 cm wide, apex cuspidate-acuminate, base broad to narrowly cuneate, with 3 major veins from the base and 5–7 secondary veins; side leaflets obliquely so, 3.5–6 cm long, 3–9 cm wide; petiolules 1–3 mm, stipellae minute, obscure, hairy-setaceous. *Pseudoracemes* (6–)14–25(–30) cm, unbranched, sturdy, peduncle white-hairy. *Bracts* ovate to narrow elliptic, glandular and hairy outside, thinly hairy inside, 3–9 mm long, 1–3 mm wide, early caducous. *Flowers* c. (10–)15–20, mainly distally, crowded at first, lax when developed, 1–2 per node, pedicel 1–4 mm. *Corolla* with vexillum dorsally brown red, purple or crimson, ventrally yellowish with purple veins; *alae* pale yellowish green; *keel* greenish or white. *Calyx* yellowish green to reddish, orange-glandular, short-pubescent inside and outside, tube c. 5 mm long, upper teeth triangular, c. 2 mm, connate except 1 mm at apex, lateral teeth triangular, c. 2 mm, lower tooth narrow-elliptic, c. 4 mm. *Vexillum* rotundate, twisted, c. 12–17 mm long, 14–18 mm wide, apex emarginate, base clawed, reinforced, biauriculate, with a narrow rim-callosity near the base; *alae* obovate, with claw c. 12–13 mm long, 5 mm wide, biauriculate, ventral side with long auricle; *keel* circinnato-rostrate, c. 10 mm in diameter, length of curvature c. 28 mm, ventral sutures adnate, claw c. 7 mm, with a lateral pouch. *Ovary* linear, c. 6 mm long, 1.5 mm wide, white-hairy and yellow-glandular, style c. 19 mm, curved, stigma oblique, terminal. *Stamens* with curved tube, fused part c. 18 mm, 5–7 mm free part, free stamen geniculate at the base, c. 20 mm long, anthers basidorsifix. *Pods* linear to slightly falcate, (4–)5.5–6.5 cm long, 7–8 mm wide, tipped with 5 mm style, dark brown, short grey hairs, orange glands. *Seeds* 7–8(–10), reniform, brown to black, c. 4 mm long, 5 mm wide, 3 mm thick, strophiole narrow, divided.

Distribution: China (Hainan), Indonesia (Java and Sumatra), Malaysia, Papua New Guinea, Thailand, Vietnam.

Ecology: twining on bamboo clumps and thickets, in forests, along rivers, tidal areas, limestone hills, on waste grounds. Altitude: 0–400 (–1000) m.

Flowering: (Jan.–) March–May (Hainan), June, Sept.–Dec. (Indonesia), Feb.–March, July, Sept. (Malaysia), Aug. (Papua New Guinea), Oct.–Dec, Febr., June, Aug. (Thailand), Feb.–March, June, Sept. (Vietnam).

Fruiting: as for flowering, up to a month or two later.

Vernacular names: Tampong urat, Patong urat (Malaysia). Khow fang, Tan wa pla, Yan tua raet (Thai), Pep pa (Lao), (Dây) bu, (Dây) dâu hoang, (Dây) móc (Binh Tri Thien, Vietnamese), Re ma nai (Thuân Hai, Proto-indochinese).

Notes: The designation by Thuan of the type of *Dunbaria nivea* has to be rejected, as *Zollinger* 2771 (a rather poor specimen) does not bear the locality Cikoya, and originates from Besuki, E Java (Moritzi 1846). Pasted over the name *Pseudarthria timorensis* Zoll. & Moritzi, of which nomen nudum it is a reference sheet, is a label *Dunbaria nivea* Miquel, attestedly in Miquel's handwriting. *Zollinger* 303, the type of *Phaseolus incanus*, is the proper choice, as it was collected from Cikoya, the type locality. Miquel did not state a collection number in his protologue, nor did he quote the epithets of Zollinger and Moritzi. The holotype of *D. incana* is the lectotype of *D. nivea*. It is the specimen with flowers and fruit and the most complete label written by Moritzi, who distributed the Zollinger collections. Miquel studied the fragments of *Zollinger* 303, and has seen Zollinger's private set (marked HZ) for the Flora Ind. Bat., donated via de Franqueville to the Paris Herbarium. I have not seen Zollinger 303 specimens marked HZ, hence my choice of the Paris *Zollinger* 303 sheet as lectotype for *D. nivea*.

Few of the at least 20 flowers per peduncle set fruit, so usually not more than 4-5 pods can be seen on an inflorescence. Plants grown from seed (CIAT ex Thailand) in a greenhouse did not flower in 1990, nor in the first half of 1991, despite reasonable vegetative development. It flowered during the spring of 1993, but produced no seeds.

Uses: In Malaysia the pounded leaves are used as poultice to cure fever, itches and cuts ("Tampong urat") (Burkill & Hanef 1930).

13. *Dunbaria lecomtei* Gagnep. Fig. 12, p. 66, Map 12, p. 67

in Lecomte, Not. Syst. 3: 193 (1916); Gagnepain, Fl. Gén. Indo-Chine 2: 286-288 (1916); Thuan, Pollen et Spores 15-3/4: 378, 380-381 (1973); Thuan, Fl. Laos, Cambodge, Viet-nam 17: 119-120 (1979). Type: Vietnam, Phan-Rang to Dran, *Lecomte & Finet* 1481 (holo: P).

Heterotypic synonym: *Dunbaria villosa* var. *peduncularis* Handel-Mazetti *syn. nov.*, Symb. Sinic. 7-3: 582 (1933); Wu, C.Y., Index Fl. Yunnan. 1: 598 (1984). Type: China, Yunnan, Tshuhsitung to Gwangdong, *Handel-Mazetti* 4858 (holo: W; iso: E).

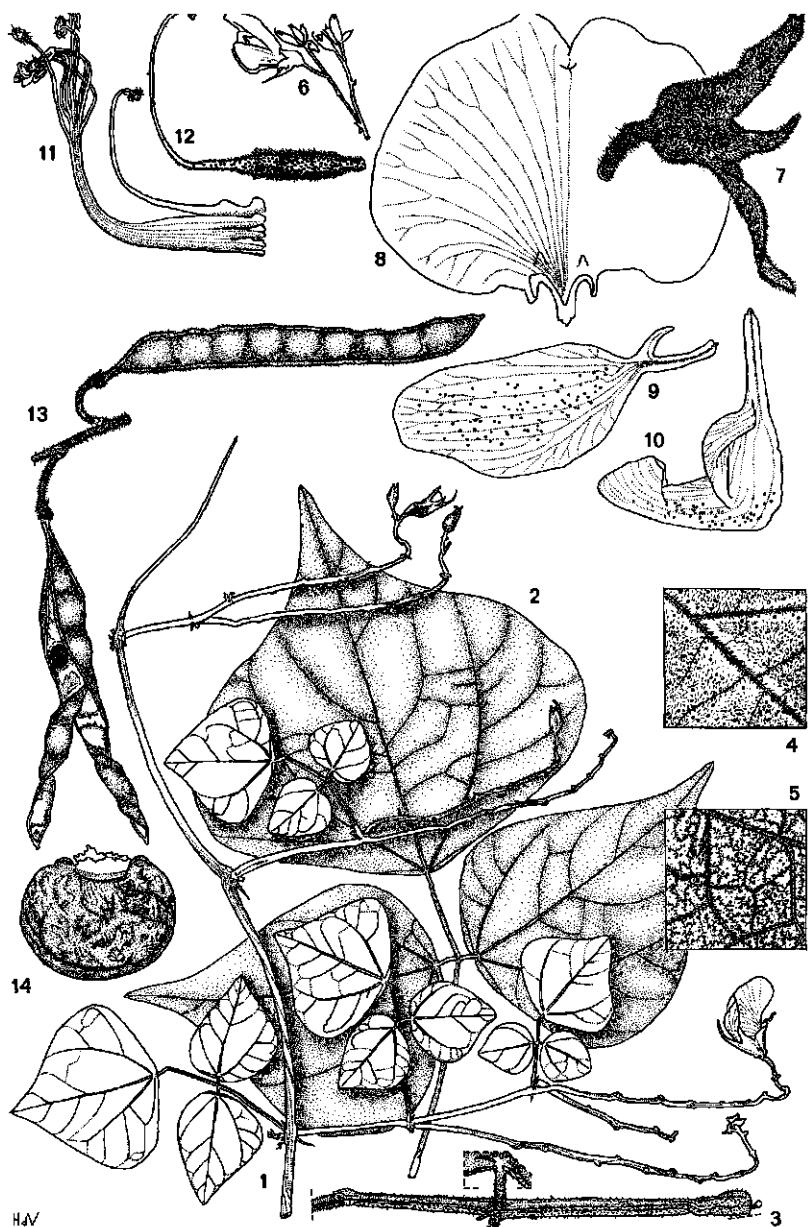

Fig. 12. *Dunbaria lecomtei* 1. habit, 0.66 X; 2. leaf, 0.66 X; 3. petiole, 2 X; 4. detail of upper leaflet surface, 4 X; 5. detail of lower leaflet surface, 4 X; 6. part of inflorescence, 0.66 X; 7. calyx, 2 X; 8. flag, 2 X; 9. wing, 2 X; 10. keel, 2 X; 11. staminal tube, 2 X; 12. pistil, 3 X; 13. pods, 0.66 X; 14. seed, 4 X. – 1 & 3: Evrard 131, 2: Henry 12384, 4-12: Handel-Mazetti 4858, 13 & 14: Vu Van Chong 1162. Drawn by Mr. H. de Vries.

Perennial climber, several m. *Branches* to at least 1.5 mm thick, grooved, glabrescent. *Indumentum* short, grey, rather thin, shorter on upper side of leaflets, glands orange red. *Stipules* ovate-acuminate, 3–5 mm long, 1–2 mm wide, striate, persistent. *Leaf petiole* grooved, 2–5 cm long, rachis 1–1.5 cm long. *Leaflets* green and thinly glandular above, dull to grey-green below and densely glandular; top leaflet ovate-rhomboid, 4.5–9 cm long, 3.5–8.5 cm wide, apex acute, hardly mucronate; side leaflets obliquely so, 3–7 cm long, 2–5.5 cm wide; petiolules 1–2 mm, hairy; stipellae setaceous, 1 mm, caducous. *Pseudoracemes* slender, lax, 4–12 cm. *Bracts* ovate, 7 mm long, grey-hairy, early caducous. *Flowers* 3–5(–6) rather close together at top of raceme. *Corolla* yellow, petals sparsely covered with caducous vesicular glands. *Calyx* short grey-pubescent, with somewhat longer bulbous-based hairs, yellow to brown glands, tube c. 6 mm, upper teeth 9–10 mm, narrow-elliptic, connate except 0.5 mm at the tip, lateral teeth acuminate, c. 6 mm, lower tooth curved, narrow-elliptic, c. 9 mm. *Vexillum* rotundate or folded, up to 22 mm long and wide, base clawed, 3 mm, biauriculate, crests thin, transparent; *alae* oblique-ovate, 2.4 cm long, 7 mm wide, one prominent auricle of 2 mm; *keel* circinnato-rostrate, c. 2 cm long, 5 mm wide, rostrum folded, keel petals joined at the base, claw 7 mm. *Ovary* pedicellate, c. 6–9 mm long, 9–10 ovules, grey-pubescent, yellow and orange glands very prominent, style 12 mm, basal 3 mm pubescent, upper half not flattened, curved upward, stigma oblique. *Stamens* c. 25 mm long, free part 6–9 mm, upper 15 mm upcurved, free stamen geniculate, anthers basifix. *Pods* linear, slightly falcate, brown, 8–9 cm long, thinly short grey-pubescent, stipe 0.5–1.4 cm, c. 9 seeds. *Seeds* roundish-compressed, c. 5 mm long, 4 mm wide, 2.5 mm thick, strophiole narrow, divided.

Distribution: China, Vietnam.

Ecology: climber on trees, open forests. Altitude: 50?–1500 m.

Flowering: Sept.–Nov.

Fruiting: Nov.

Vernacular names: (Dai) Trung Chau (Lam Dong, Vietnam)

Specimens examined:

CHINA, Yunnan: between Tsuyung and Guangdung, Handel-Mazzetti 4858 (type of *D. villosa* (Thunb. ex Murray) Makino var. *peduncularis* Hand.-Maz.) (holo: W); Szemao S Mts, Henry 12384 (K) & 12384A (E, K).

VIETNAM: Annam, nr Tourane, *d'Alleizette* juin 1090 (L); Lam Dong, Lang Hanh forest, Vu Van Chong 1162 (P); mangrove at 10 km from the Cape, Saigon road,

Evrard 131 (AAU, BKF, K, P); Phan-rang to Dran, *Lecomte & Finet* 1481 (holo: P).

Notes: Mentioned as *D. circinalis* in Index Florae Yunnanensis (C.Y. Wu, 1984). Young specimens are similar to the more robust specimens of *D. villosa*, but have longer pseudo-racemes. Full-grown specimens have the facies of *D. podocarpa*, but again the inflorescences are much longer. The petals and staminal tube may be marcescent, just as in *D. podocarpa*. It is not unlikely that this species may be found in Thailand and Laos.

14. *Dunbaria longicarpa* (Thuan) Maesen stat. nov.

Fig. 9 & 13, p. 52 & 70, Map 12, p. 67

Basionym: *Dunbaria fusca* (Wall.) Kurz var. *longicarpa* Thuan, Fl. Cambodge, Laos, Viet-nam 17: 125 (1979). Type: Vietnam, Gia Lai to Cong Tum: Dak Ha to Dak To, 1600 m, 1-10-1930, *Poilane* 18403 (holo: P; iso: P). Paratypes: Laos, Attopeu: Muong Mai to Phu Da Phuk, 700 m, *Poilane* 15974 (P); type location betw. Dak Ha and Dah To, 900 m, 3-10-1930, *Poilane* 18468 (P).

Perennial climber. Branches 3-4 m long. *Indumentum* bristly, grey, particularly on veins of lower leaflet surface, inflorescence, calyx and bracts velvety with long golden bulbous-based hairs. *Stipules* caducous, base c. 3 mm wide. *Leaf petiole* canaliculate, striae inconspicuous, petiole 2.5-6 cm, rachis 1.5-2.5 cm. *Leaflets* top leaflet narrow-ovate to ovate, 8-12(-14) cm long, 5-7.5 cm wide, side leaflets obliquely so, 7-11 cm long, 5-7.5 cm wide, petiolules 3-4 mm, grey-hairy, stipellae setaceous, c. 2-3 mm. *Pseudoracemes* not branched, 20-35 cm, flowers c. 20, very fragrant, peduncle golden-hairy at the flowering part. *Bracts* velvety, ovate-acuminate, 7-15 mm long, glandular, densely grey-hairy. *Corolla* yellow, *Calyx* glandular, tube 5-6 mm, teeth narrow-elliptic, upper teeth fused except at the tip, c. 3 mm, lateral teeth c. 7 mm, lower tooth c. 9 mm. *Corolla* yellow, *Vexillum* broad-ovate, c. 20 mm long and wide, twisted, base clawed, 2 auricles, 2 protruding callosities nr the base, apex deeply emarginate; *alae* long-obovate, c. 15 mm long, 5 mm wide, base clawed, dorsal side 2 auricles, one of 3 mm, ventral side one small auricle; *keel* hooked, frontally adnate, longest dimension c. 15 mm, base clawed. *Ovary* linear, c. 7 mm, glandular, densely hairy, style 22 mm, lower 7 mm hairy, stigma

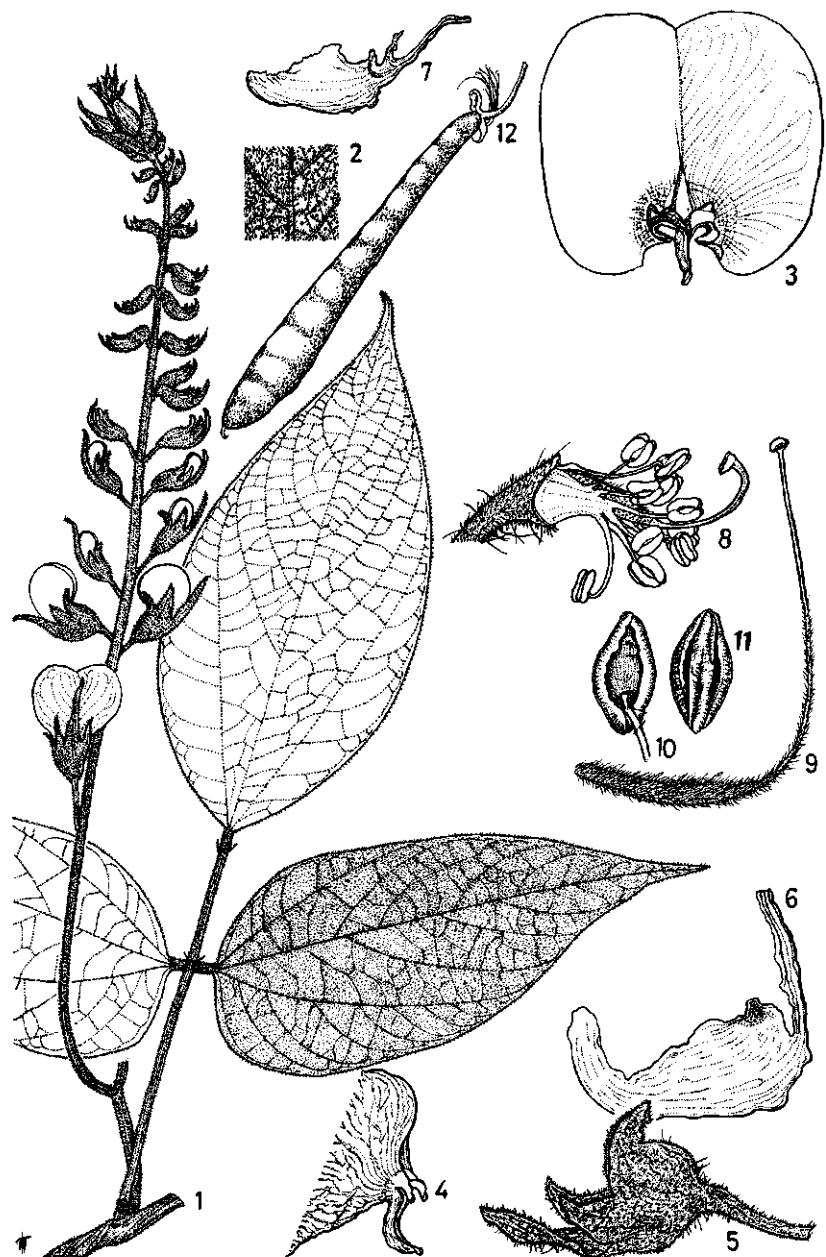

Fig. 13. *Dunbaria longicarpa* 1. flowering branch, 0.66 X; 2. detail of lower leaflet surface, 2 X; 3 & 4. flag, 2 X; 5. calyx, 2 X; 6. keel, 2 X; 7. wing, 2 X; 8. staminal tube of young flower, 6 X; 9. pistil, 4 X; 10 & 11. anthers, 20 X; 12. pod, 0.66 X; 13. seed, 4 X. — 1, 8-11: Poilane 18399, 3-7: Poilane 15974, 12: after Fl. Cambodge, Laos, Viet-nam 17:123. Drawn by Mrs. Y.F. Tan.

oblique-terminal. *Stamens* c. 26 mm, upper 13 mm free, marcescent, anthers (basi)dorsifix. *Pods* linear, 8 cm long, 1.5 cm wide. *Seeds* 8–10, strophiolate, c. 6 mm long and wide, c. 2 mm thick.

Distribution: Laos, Vietnam.

Ecology: young forests, acid clay soils. Altitude: 600–1600 m.

Flowering: Sept.

Fruiting: Oct.

Vernacular name: –

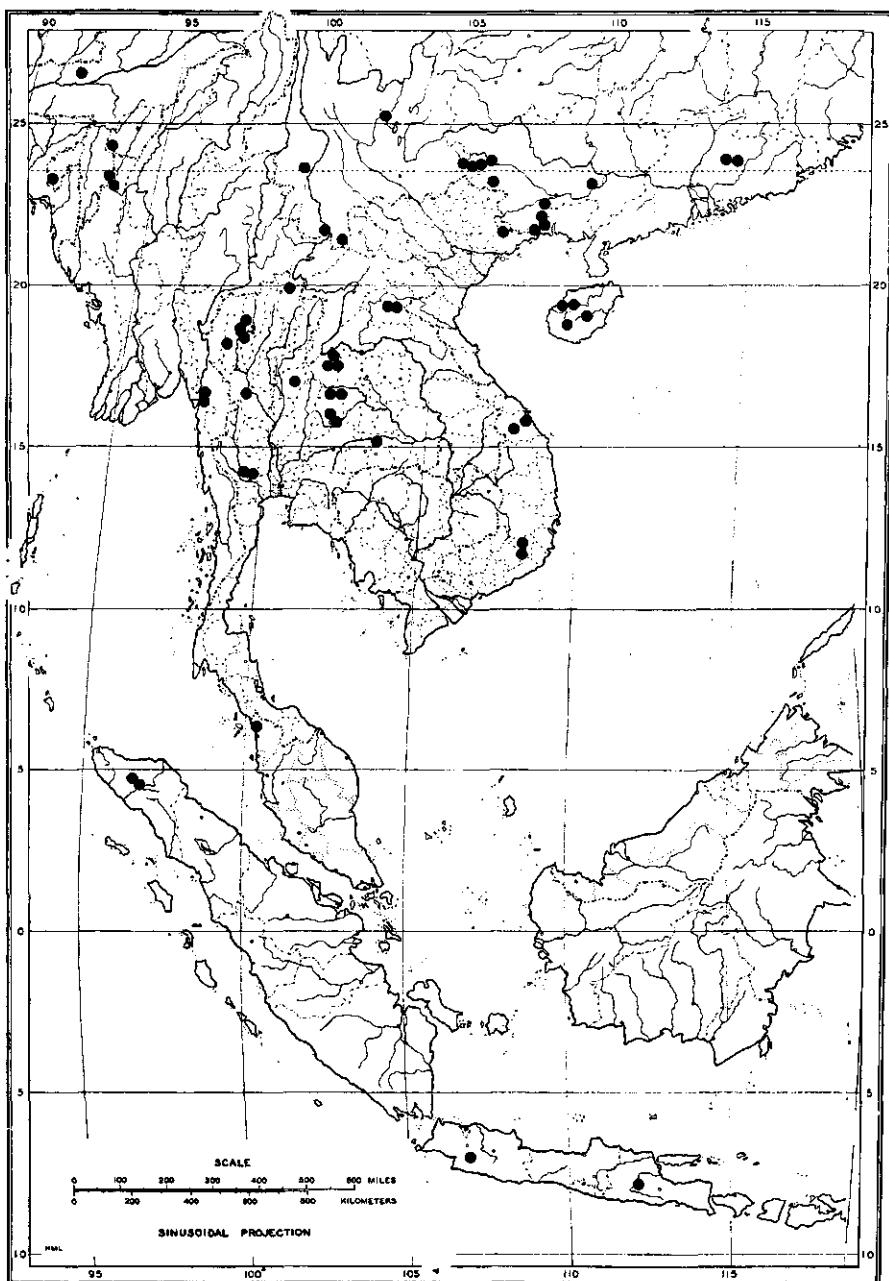

Specimens examined: type and paratype material quoted above.

Notes: If *Dunbaria crinita* (= *D. flavescentia*) is considered not to be conspecific with *D. fusca*, to which it is very close, *D. fusca* var. *longicarpa* Thuan ought to be recognized as a species too. The differences with typical *D. fusca* are more numerous than Thuan mentioned: not only the pod is longer, wider and thicker with 10 seeds compared to 5 or 6, but the inflorescence is much larger, and the indumentum is velvety on the peduncle and calyx in addition to the presence of long yellow hairs. The *longicarpa* bracts are much larger and do not shed as soon. The three mentioned species are obviously quite closely related, and *D. glabra* also forms part of this species aggregate or series.

As a coincidence, all specimens belonging to this species have been collected exclusively by Poilane.

15. *Dunbaria podocarpa* Kurz Fig. 17, p. 94, Map 13, p. 72

J. As. Soc. Beng. 43-2: 185 (1874); Kurz, J. As. Soc. Beng. 45-2: 455 (1876); Baker in Hooker, Fl. Brit. India 2: 218 (1876); Craib, Kew Bull. 1911-1: 41; Craib, Contrib. Fl. Siam, Univ. Map 13. Distribution of *Dunbaria podocarpa* in S and SE Asia

(holo: K)

Synonym: *Vigna retusa* Williams non Walp., nom. nud., Bull. Herb. Boiss. 2nd series 5: 21 (1905); Hosseus, Beih. Bot. Centr.bl. 28: 397 (1911). Based on *E. Candler*, Tavoy to Bangkok, dd. 1898 (K).

Perennial climber, branches to c. 3 m, to c. 3 mm diam. *Indumentum* tomentose to velvety in various densities, densest on lower surface of leaves. *Stipules* narrow-triangular, 3-5 mm long, 1 mm wide, caducous. *Leaf petiole* striate, 1-3.5 cm, suprajugal part 0.4-1 cm, top leaflet broad-ovate, acuminate, 3.5-8 cm long, 2.5-7 cm wide, base almost truncate to rounded or broad-cuneate, apex quite acute, sometimes obtuse, usually (short) mucronate, dark green-tomentose above, grey-green and more hairy below, both sides with many reddish vesicular glands; side leaflets obliquely so, 2.5-5 cm long, 1.8-4 cm wide, petiolules 1-2 mm; stipellae hairy, inconspicuous between hairs, c. 0.5 mm, caducous. *Pseudoracemes* short, peduncle not branched, 0.5 -1.5 cm, with 2-4 flowers. *Bracts* early caducous, ovate narrow-elliptic, c. 1 mm, pedicels 4-6 mm. *Corolla* creamy or pale yellow to yellow, marcescent. *Calyx* glandular, silvery pubescent, interior adpressed short-hairy, tube c. 4-6 mm long, upper teeth triangular, connate or almost connate, c. 3-6 mm long, lateral teeth triangular-acuminate, 3-7 mm, lower tooth narrow-elliptic, 6-10 mm long. *Vexillum* rounded, 15-18 mm long, c. 15 mm wide, base clawed, reinforced-biauriculate, 2 sickle-shaped callosities, apex rounded, folded, emarginate; *alae* obovate, incl. base 15-18 mm long, 5-6 mm wide, base narrow, c. 6 mm, dorsal side with 1 short auricle, ventral side with 1 long auricle; *keel* circinnato-rostrate, longest dimension c. 17 mm, ventral sutures adnate, base narrow, c. 6 mm. *Ovary* linear, c. 6-7 mm, stalked, grey silken hairy, glandular, about 9 ovules, style 17-20 mm, stigma oblique, terminal. *Stamens* c. 22-25 mm, upper half of filaments curved, upper 10 mm free, anthers basidorsifix, enclosed in the rostrum of the keel. *Pods* brown, short grey-pubescent, falcate, conspicuously long-stipitate, stalk (0.8-)1-2 cm, pod 5-8 cm long, 0.9-1 cm wide, style -10 mm remaining or breaking off. *Seeds* 8-11, black or dark brown, orbicular, c. 3.5 mm long, 4 mm wide and 2.5 mm thick, strophiole narrow, divided.

Distribution: Burma, Cambodia, China: Guangxi, Guangdong, Hainan, Hongkong; Laos; Malaysia; India: Meghalaya, Assam, W

Bengal; Indonesia: Sumatra, Java; Thailand; Vietnam.

Ecology: edges of *Pinus*, *Lithocarpus*, *Dipterocarpus* forests, in thickets, grasslands, also fire-affected ones, near marshes, along rivers, in evergreen and mixed jungle. Peat and sandstone soils. Altitude: 0-1700 m.

Flowering: over long periods. China: April-Sept., India: Aug., Nov., March, Indo-China: Feb.-July, Sept.-Nov., Indonesia: July, Aug.

Fruiting: China: June-Sept., Dec., Feb., India: Nov., April, Indo-China: Oct. - Jan., March, and quite probably some of the other months.

Vernacular names: Shaan lok tan (cantonese), Mahé Kwang (Lao, Chiengmai), Dau ma (Vietnam), Re (sa) mian (Lam dong, proto-indochinois).

Notes: see also notes under *Dunbaria circinalis*. Thuan (1979)
 described the *D. podocarpa* inflorescences as 10-12 cm, while these
 are only 0.5-1.5 cm, apparently a printing error perpetuated in his
 key. The *Helper* specimens no 82 issued in 1937 by the National

Museum of Prague, determined by K. Biswas as *Dunbaria podocarpa*, and reported from the Calcutta area, are *Dunbaria truncata*. These are possibly from the same population as *Helper* 1709 from Tenasserim, and not from Calcutta.

16. *Dunbaria punctata* (Wight & Arn.) Benth.

finely ribbed. *Indumentum* short, grey, dense on veins of lower leaf surface and pod sutures. *Vesicular glands* conspicuous, orange to red, black when dried. *Stipules* narrow-elliptic, c. 2 mm. *Leaf petiole* striate, canaliculate above, petiole 1–2 cm, rachis 0.5–1 cm. *Leaflets* green above, greyish green below and more densely glandular, top leaflet rhomboid, slightly acuminate, apex obtuse or acute, mucronulate, often as wide as long, sometimes longer than wide, 1–3 (–4.5) cm long, 1–3 (–3.5) cm wide, side leaflets obliquely so, 1.2–2(–3) cm long and wide, petiolules 1 mm, stipellae minute setae, c. 1 mm, hairy. *Pseudoracemes* axillary, sessile to short, peduncle 1–2(–5) mm, pedicel 1–2 mm. *Bracts* minute, narrow-elliptic, c. 1 mm, sometimes quite persistent. *Flowers* 1–3 together. *Corolla* yellow. *Calyx* pubescent, densely glandular, tube 3–4 mm, teeth narrow-elliptic, tip acute, upper teeth connate except at the tip, c. 2

mm, lateral teeth c. 1.5 mm long, lowest tooth 3–4 mm. *Vexillum* rounded, 6–8 mm long and wide; *alae* obovate, c. 6 mm long, c. 2 mm wide, ventral side auriculate near the claw; *keel* boat-shaped, longest dimension c. 6–10 mm, basal suture adnate. *Ovary* c. 3.5 mm long, linear to ovate, whitish silken-hairy, style c. 3–7 mm, base hairy, upper 4 mm glabrous, curved, stigma terminal, oblique. *Stamens* quite persistent, c. 4–7 mm fused, c. 1–4 mm free, tube curved upward, anthers basidorsifix. *Pods* sessile, flat, linear or slightly falcate, (chestnut)brown, 3–4(–6) cm long, 0.6–0.8 (–10) mm wide, valves curling when ripe. *Seeds* (5–)6–8, (irregularly) rounded, 3–4 mm long and wide, 2–2.5 mm thick, light brown to dark red-brown, variegated with black, strophiole divided, prominent, 1 mm thick, 2 mm long, funicle sometimes persistent.

Distribution: Australia: Queensland; Bangladesh; Burma; China: Fujian, Guangdong, Guizhou, Guangxi, Hainan, Hongkong, Jiangxi; Laos; India: Assam, Manipur, Meghalaya, Sikkim, West Bengal, Tamil Nadu; Indonesia; Nepal; Philippines; Thailand; Vietnam.

Ecology: scandent in shrubs and hedges, trailing and climbing in (tall) grasses, fire-influenced open forests, mixed jungle, in open deciduous dipterocarp forest, rarely in ruderal places or along roadsides, sometimes in cultivated fields, on sandy steep slopes on decomposed granite with *Themeda australis* in *Eucalyptus drepanophylla* and *Edichromophloa* woodland. Altitude: 0–300 (–1200 m).

Flowering: Australia: May–July, China: Aug.–Oct., Indian subcontinent and Indo-China: Sept.–Oct. (–Nov.), Indonesia: March–April, Philippines: Sept.–Oct.

Fruiting: Australia: May–July, China: Sept.–Oct., Indian subcontinent and Indo-China: Sept.–Nov., Indonesia: April–May, Philippines: Sept.–Oct.

Vernacular names: China: Nodoa, Sai Ngau Kok Tau, Tianxingcao. Vietnam: Jörai: Röbei tökvih, Röbei atau.

Notes: For the time being I reject Merrill's decision to apply the epithet *rotundifolia* to the species earlier generally known as *Dunbaria conspersa*. Loureiro's protologue of *Indigofera rotundifolia*, whence the name came, described a two-seeded pod, pointing more to a *Rhynchosia*. Merrill (1935) stated that no other legume species fitted Loureiro's description but for the *Dunbaria conspersa* with more than two seeds. Loureiro's specimen is not preserved, Merrill (1920, 1935) nor Wu (1940), nor Thuan (1979) have seen it either. Wu adopted *D. conspersa*, Thuan settled for *D. rotundifolia*. The similarity between Loureiro's vernacular "o tam sin" and Levine 1111 "chin tang" need not be decisive, it is likely that small twining *Dunbaria* and *Rhynchosia* species receive similar vernacular names. "Chin tang" means green vine, in the Guangdong area more often applied to *Sinomenium acutum* (Thunb.) Rehder & Wilson, Menispermaceae (T.L. Wu, pers. comm.), so this vernacular is obviously of quite general application. Loureiro nor Merrill (1955) mentioned *Rhynchosia minima* (L.) DC., a species which is not recorded from Kwangtung (now Guangdong), where Loureiro's material came from, or its basionym *Dolichos minimus* L. That species has the general facies of *Dunbaria punctata*, and would fit Loureiro's description better. Rather than neotypifying Loureiro's *Indigofera rotundifolia* with a specimen of a species not well fitting the short description, I prefer to apply the next oldest epithet used by Wight and Arnott: *punctata*, listed as *Dolichos? punctatus*. When Bentham made the combination *Dunbaria punctatus*, he did not see material of the Indian *Dolichos punctata* of Wight and Arnott ("mihi ignota"), and applied Graham's nomen nudum *Dolichos conspersus* (Wallich

5542, 1831-32) for the species. As a basionym the validly published epitheton *punctata* is the correct choice. The type specimen Wight 996, however, remains mysteriously untraceable.

The identity of Loureiro's *Indigofera rotundifolia* also remains a problem. In Guangdong 20 species of *Indigofera* are listed (Tropicos database based on information by Te-Chao Che and Te-Lin Wu), and one of these may fit Loureiro's description. Loureiro mentioned that the species resembled *Indigofera procumbens* L. from the Cape of Good Hope, but that species has long pseudoracemes with many flowers and rhomboid rather than rotundate leaflets. The yellow flowers of Loureiro's plant may also point to another genus: most *Indigofera* species have purple or pink flowers. Craib (1913) judged from the description that *I. rotundifolia* probably does not belong to *Indigofera*. I verified the four 3-5-foliolate *Indigofera*'s from China cf. Craib: all have more than two seeds. Loureiro must have known *Indigofera* quite well as a genus, as it was established at his time.

Uses: In Jiangxi, China, the whole plant is used to treat snake bites (Yue 2201).

17. *Dunbaria rubella* Span. ex Miquel

Fig. 14, p. 84, Map 15, p. 85

Miquel, Fl. Ind. Bat. 1-1: 178 (1855); Backer, Beknopte Fl. Java (war edition) 5: 139 (1941); Backer, F. Java 1: 635 (1963). Type: Indonesia, Java, Spanoghe, Icon. ined. pl. jav. no. 10, c. 1836 (holo: L).

Perennial climber. Branches to 3 m, up to 3-4 mm in diameter, faintly grooved, branched. *Indumentum* short on branches, absent to very sparse and short on leaves, dense short grey and few long golden hairs on calyx, pods densely so. *Stipules* caducous, leaving a rim of 2-3 mm. *Leaf petiole* slender, ribbed, glandular-dotted and short-pubescent, 2.5-8 cm, rachis 1-2.5 cm. *Leaflets* membranous, dark green above, glabrous to laxly short-bristly, rough to the touch, hardly glandular, light green below, mainly on the veins sparsely pubescent, red glandular dots abundant; top leaflet ovate, 6-16 cm long, 3.5-8.5 cm wide, apex acute, hardly acuminate at the very tip, with a small mucro, base truncate; side leaflets oblique.

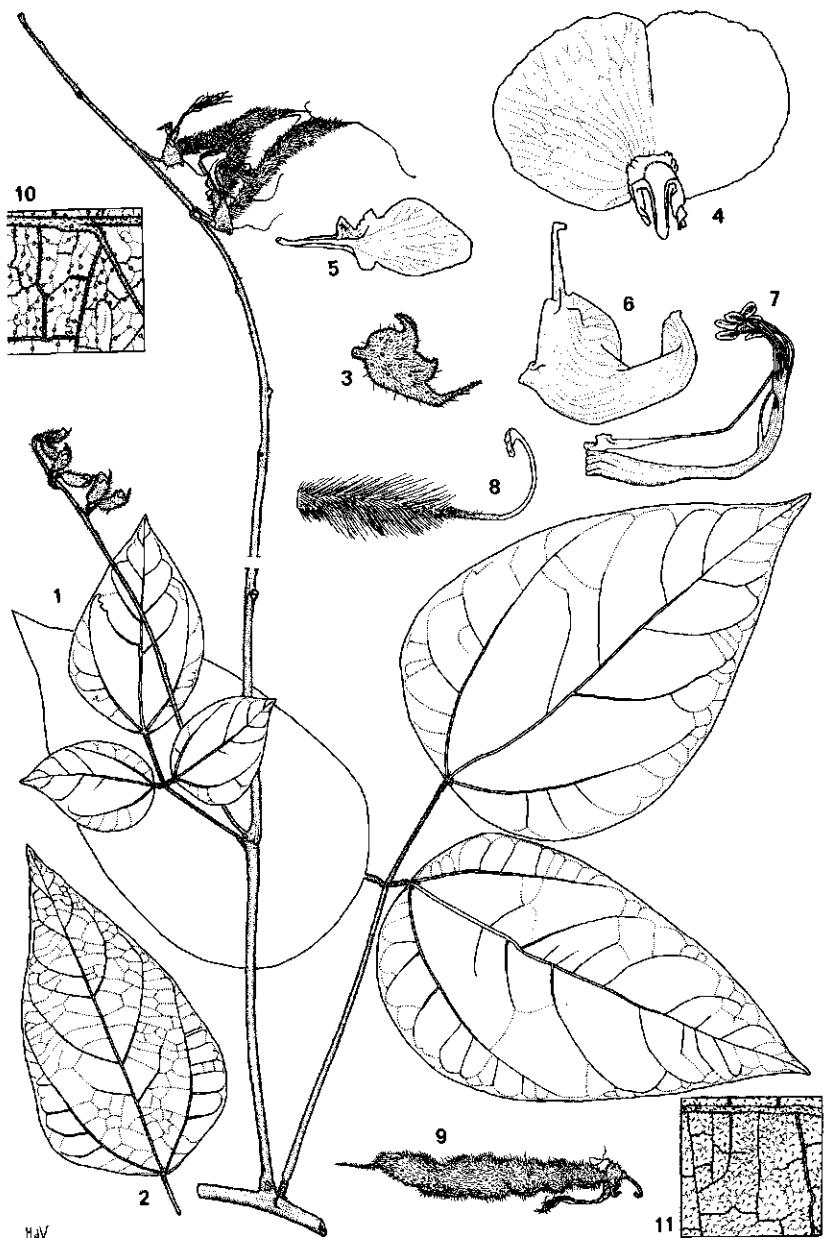

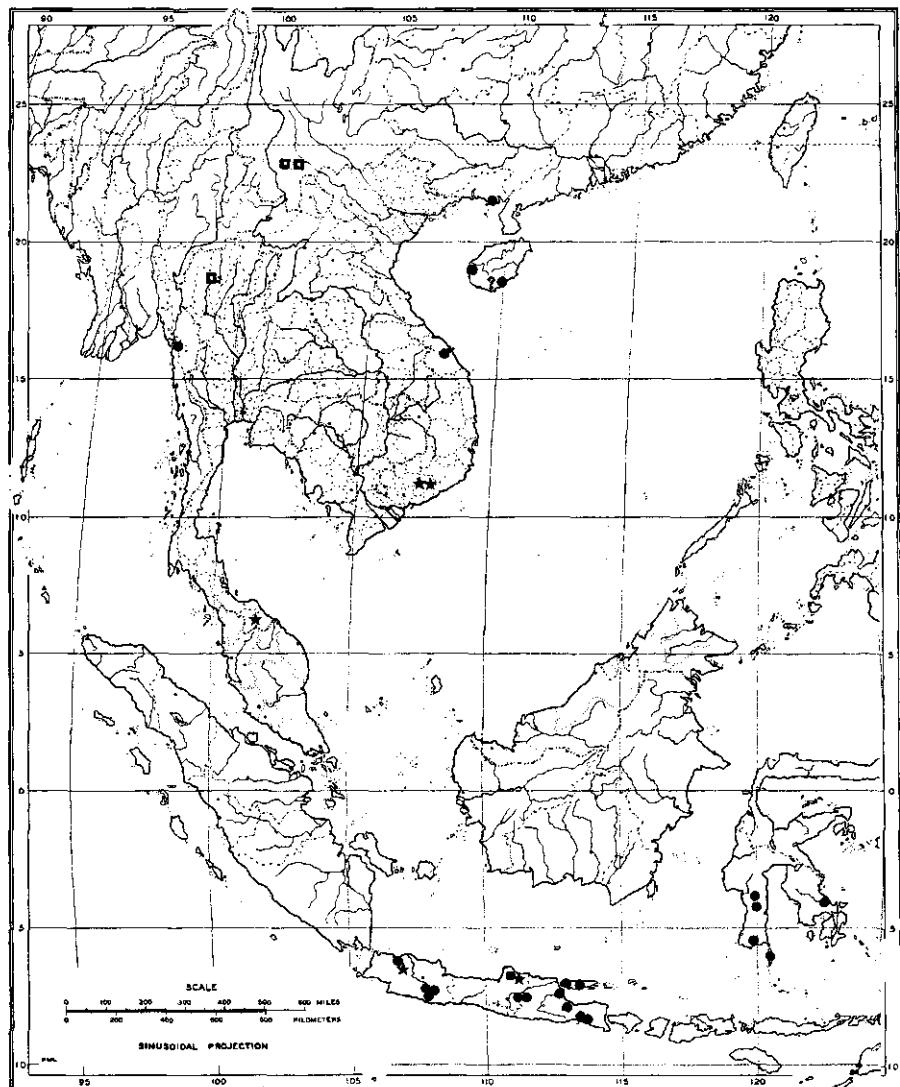

Fig. 14. *Dunbaria rubella* 1. habit with flower buds and young pods, 0.66 X; 2. lower leaflet surface, 0.66 X; 3. calyx, 2 X; 4. flag, 2 X; 5. wing, 2 X; 6. keel, 2 X; 7. staminal tube, 2 X; 8. pistil, 2 X; 9. pod, 0.66 X; 10. detail of lower leaflet surface, 4 X; 11. detail of upper leaflet surface, 4 X. — 1, 3-11: Soegandiredja 256, 2: Sangkachand et al. 1523 (BKF 72881). Drawn by Mr. H. de Vries.

Map 15. Distribution of *Dunbaria rubella* (★), *D. trichodon* (□) and *D. truncata* (●)

quely so, 5–11 cm long, 2.5–7 cm wide; petiolules 2–4 mm, hairy; stipellae less than 1 mm. *Pseudoracemes* lax, simple, 16–32 cm, flowers 10 or more, 1–2 per node. *Bracts* ovate-acuminate, short-hairy, glandular, caducous, c. 4 mm long, 1–2 mm wide; pedicels 4–8 mm. *Mature flower buds* falcate. *Corolla* yellow, flag dark yellow veined red. *Calyx* densely short-grey and laxly golden long-pubescent, "bumped" above, tube to 5 mm, upper teeth connate or almost so, 2–3 mm, lateral teeth triangular, 2–3 mm, lower tooth narrow-elliptic, 6–8 mm long. *Vexillum* rotundate-falcate, c. 12–20 mm long and wide, apex emarginate, clawed, auricled at the base, two callosities almost touching each other; *alae* obovate, c. 10 mm long, 3–4 mm wide, one dorsal and one ventral auricle 1 mm; *keel* circinnato-rostrate, longest dimension 12(–20?) mm, 6 mm wide, pouched near claw, ventrally adnate. *Ovary* linear, c. 5 mm, densely yellow-pubescent, glandular dots orange, 5–6 ovules, style c. 11 mm, stigma terminal, hooked. *Stamens* tube c. 8 mm, free part c. 8 mm, upcurved, anthers dorsi- to basidorsifix. *Pods* slightly falcate, golden brown hairs and short grey pubescence underneath, sessile, 6–8 cm (not fully mature), tipped with 1–2 cm style. *Seeds* c. 5, immature.

Distribution: Indonesia, Thailand, Vietnam.

Ecology: in forest and thickets, on clay soil. Altitude: low, 150 m.

Flowering: Apr.–May (Indonesia), Dec.–Jan. (Vietnam).

Fruiting: May–June (Indonesia), Jan., Feb. (Vietnam).

Vernacular names: Rawehah mè (Java)

Specimens examined:

INDONESIA: Java: Depok c. 20 km N of Bogor, Backer 22109 (BO, L); Depok., Soegandiredja 256 (BO, L); Japara, Java, Teysmann s.n. (BO).

THAILAND: Peninsula, Yala Prov. Sangkhachand et al. 1523 (BKF).

VIETNAM: km 152 on Route 20 from Ho Chi Minh City (Saigon) few km from Haut-Donai Prov. limits, Poilane 23357 (P); Foret de Blao, Schmid 3-12-1960 (P).

Notes: Quite easily mistaken for the sometimes very similar *Cajanus goensis*. *Dunbaria rubella* has smaller flower bracts, shorter lateral calyx teeth, a circinnato-rostrate keel longer than the wings, much thinner leaf indumentum, very conspicuous glands on the leaves, and flat pods.

The type is Spanoghe's unissued *Icones* no 10 (completed by c. 1836) on which Miquel based his protologue. His description lacks the typical spirally twisted keel, otherwise the description offers

enough differences with *Cajanus goensis* Dalzell, the species so similar. I have not seen ripe pods, but the twisted keel is a character available in some *Dunbaria* species. The illustration, however, is much more like *Cajanus goensis*. The stipellae, impressions on the pod, "bad representation of the tube of the stamens" (as noted in the legend by a hand unknown) and of the keel are not typical for the sheets Backer identified. As in the water painting *Cajanus goensis* also has rarely orange-yellow flowers, whereas *D. rubella* (Backer 22109) has yellow flowers. *D. rubella* alae are much smaller than the keel, in *C. goensis* they are similar in size, as already Backer (1941, 1963) remarked. *D. rubella*'s indumentum is short and sparse, absent on upper leaf surface, in *C. goensis* short and more dense, present on upper leaf surface. Neotypification is not called for, even if the type, as a painting, is rather a-typical. I concur with Backer's concept of the species, and as the protologue is applicable, this rare species should maintain its name.

18. *Dunbaria trichodon* (Dunn) Maesen comb. nov.

Fig. 15, p. 88, Map 15, p. 85

Basionym: *Atylosia trichodon* Dunn, J. Linn. Soc. Bot. 35: 491 (1903); van der Maesen, Agric. Univ. Wageningen Papers 85-4: 213 (1986). Type: China, Yunnan, Szemao W Mts, A. Henry 12474 (K, holo; iso: E, NY).

Perennial climber. Branches finely ribbed, to at least 2 mm diameter. *Indumentum* greyish, sparse, more dense on ribs and leaf veins, vesicular glands brown. *Stipules* narrow-elliptic, quite persistent, up to 7 mm long and 1–2 mm wide. *Leaf petiole* striate, canaliculate above, petiole 3–5 cm, rachis 0.7–1.5 cm. *Leaflets* membranous, dark green above, olive-green and gland-dotted above; top leaflet ovate, long-acuminate, 5–8 cm long, 3–4 cm wide, apex narrow, base cuneate; side leaflets obliquely so, 3.5–5 cm long, 2–3 cm wide; petiolules c. 2 mm, stipellae minute, caducous. *Pseudoracemes* 5–20 cm, very lax, 5–9-flowered, 1 or 2 flowers per node. *Bracts* ovate to narrow-elliptic, hairy, veined, up to 10 mm long, 3–4 mm wide, apex with 1–3 teeth. *Flowers* with yellow *corolla*, red veined. *Calyx* tube narrow, c. 4 mm long, teeth narrow-acuminate, upper teeth connate except near the tip, 5–6 mm, lateral teeth c. 5 mm, lower tooth c. 7 mm. *Vexillum* broad-rotundate, apex

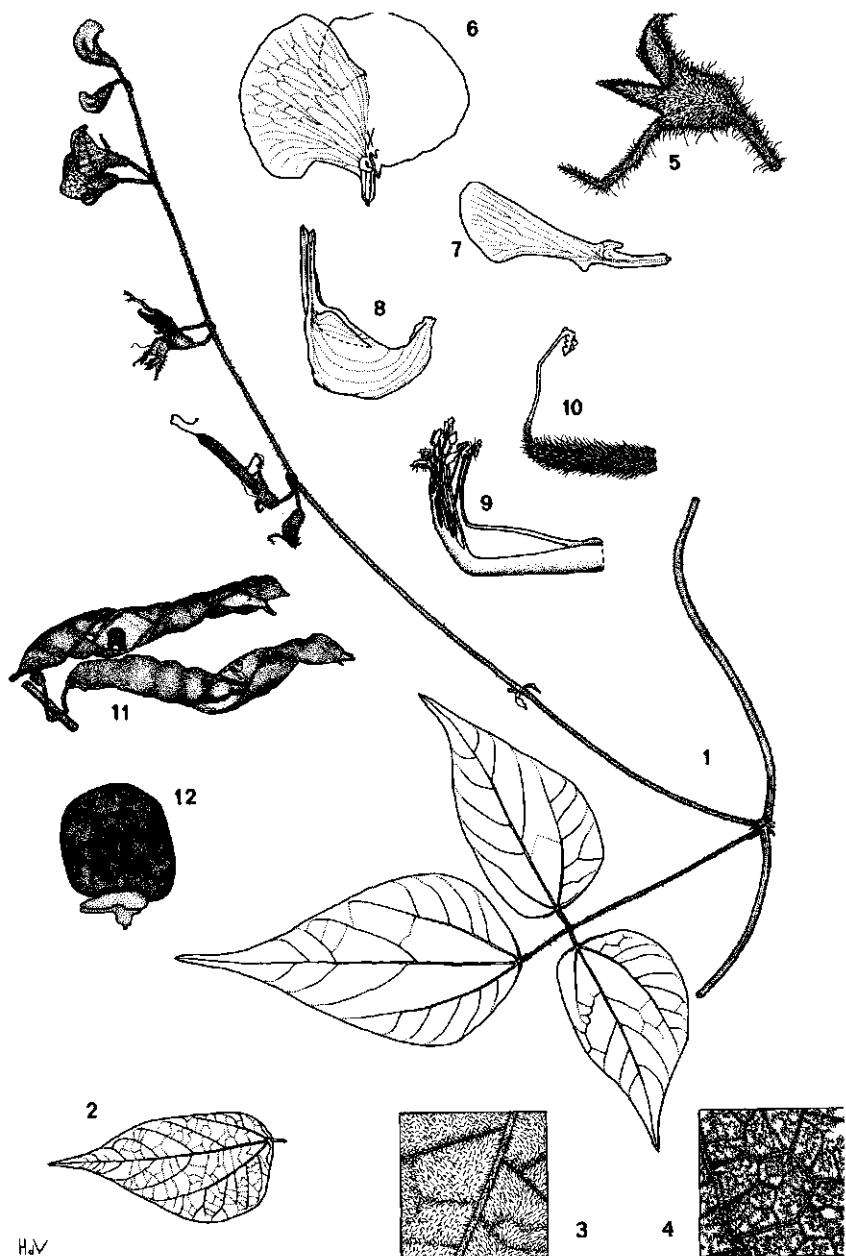

Fig. 15. *Dunbaria trichodon* 1. branch with inflorescence, 0.66 X; 2. leaflet from below, 0.66 X; 3. detail of upper leaflet side, 4 X; 4. detail of lower leaflet side, 4 X; 5. calyx, 2 X; 6. flag, 2 X; 7. wing, 3 X; 8. keel, 2 X; 9. staminal tube, 2 X; 10. pistil, 2 X; 11. pods, 0.66 X; 12. seed, 4 X. – 1-4: A. Henry 12474, 5-10: Kerr 2289, 11 & 12: A. Henry 12474A. Drawn by Mr. H. de Vries.

emarginate and folded outside plane, c. 12 mm long, 14 mm wide, base clawed, biauriculate, no callosities; *alae* obovate, 12 mm long, 4 mm wide, long-clawed, 4 mm, one auricle both margins; *keel* strongly curved, rostrate but not circinate, longest dimension c. 13 mm, base clawed, 5 mm. *Ovary* linear, c. 8 mm, yellow-glandular and white-hairy, style c. 8 mm, glabrous except near the ovary, upper 4 mm thickened, stigma terminal, oblique. *Stamens* 14–16 mm, upper 3–7 mm free and upcurved, anthers basidorsifix. *Pods* linear, sessile, c. 7 cm long, c. 9 mm wide, softly pubescent, with 10–12 seeds. *Seeds* squarish-rounded: truncate near hilum, rounded other end, c. 4 mm long and wide, 3 mm thick, red-brown with black variegation, strophiole divided, 2 mm long, 1 mm wide.

Distribution: Yunnan-China, Thailand.

Ecology: evergreen jungle, climbing in undergrowth. Altitude: c. 1600 m.

Flowering: Dec. in Thailand.

Fruiting: Oct.–Nov. in Yunnan.

Specimens examined:

CHINA: Yunnan: Szemao W Mts, 5000 ft, A. Henry 12474 (K, holo; iso: E); Szemao E Mts, 5000 ft, Henry 12474A (K, US).

THAILAND: Doi Sutep, 5000 ft, Kerr 2289 (BM, K).

Notes: I designated the Kew specimen of *Henry 12474* as holotype, because both flowers and some juvenile pods are present. The fruiting specimens *Henry 12474A* (apparently collected later) from the Szemao E Mts do not form part of the type material but are completely identical. The unsharp depressions on the pods made me decide to transfer this species to *Dunbaria* (van der Maesen 1986). *Dunbaria trichodon* appears very little collected, and is almost only known from the protologue.

19. *Dunbaria truncata* (Miquel) Maesen comb. nov.

Fig. 16, p. 90, Map 15, p. 85

Basionym: *Dolichos truncatus* Miquel, Fl. Ind. Bat. 1-1: 186 (1855). Type: Indonesia, Java, nr Prowoto in Demak area, Horsfield s.n. (holo: BM, iso: K, U).

Heterotypic synonyms: *Dunbaria henryi* Y.C. Wu, Engl. bot.

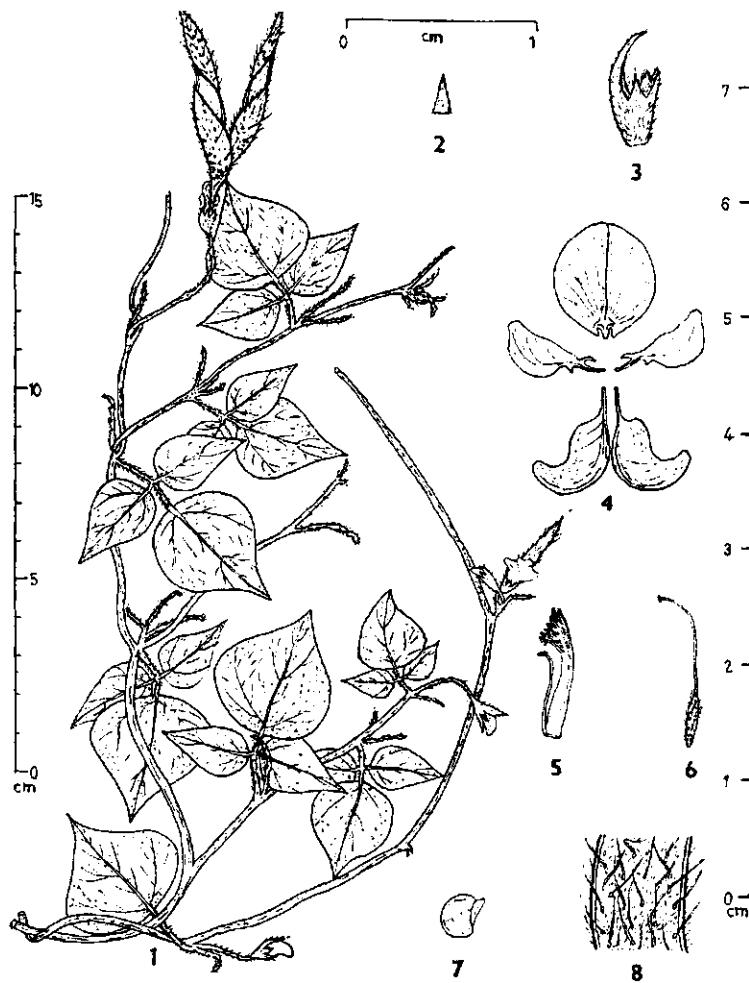

Fig. 16. *Dunbaria truncata* 1. habit, enlargements see bar; 2. stipule; 3. calyx; 4. flag; wings, and spread-out keel; 5. staminal tube; 6. pistil; 7. surface of pod, showing bulbous-based as well as simple hairs. – 1-9: Meebold 16757? Source: Journal of Japanese Botany 12:364 (1983) (as *D. burmanica* Thoth. & Satyanar.) reproduced by permission.

Jahrb. 71: 183 (1940); Lee Shukang, Fl. Reip. Pop. Sin. 41: 313-314 (1995). Type: China, Hainan, Aug. Henry 8029 (lecto: K, iso: G). Paratype: Vietnam, Tourane & vicinity, J. & M.S. Clemens 3191 (BM, C, G, MO, P, U, US, W).

Dunbaria burmanica Thoth. & P. Satyanat., J. Jap. Bot. 58-12:

363 (1983). Type: Burma, Moulmein, *Meebold* 16757 (holo: CAL, not seen; iso: S). Paratypes: Burma, Tenasserim and Andamans, *Helper* 1709 (CAL, not seen); Moulmein Cole, *Falconer* 579 & 565 (CAL, not seen); "Bengalia circa Calcuttam", wrong label for *Helper* 157 (CAL, not seen).

Perennial climber, 1 – several m. *Branches* up to 3 mm diameter, thin and twining at the end. *Indumentum* sparse, thinly short-pubescent, on young parts, leaf veins and pods, pods moreover with, sometimes without, thin long hairs. *Stipules* triangular to narrow-elliptic, thinly pubescent, 1–2 mm. *Leaf petiole* striate, grooved above, petiole (1–)2–3(–5.5) cm, rachis (0.5–)1–1.5(–3) cm. *Leaflets*: top leaflet triangular to ovate, acuminate, 1.5–4(–7) cm long, 2–5(–8) cm wide, base truncate to broad-cuneate or rounded, apex acuminate, tip obtuse with a small mucro (acute in India and Burma), rarely with 1–2 lateral acute lobes, side leaflets obliquely so, 1.2–3(–5) cm long, 1.3–2.7(–5) cm wide, petiolules 1–2(–5) mm stipellae setaceous, c. 1 mm, very caducous. *Pseudoracemes* short to medium, 1–2 per leaf axil, sometimes branched once, 2–10 cm, 4–6(–12) flowers. *Bracts* ovate, c. 2 mm long, hairy outside, caducous. *Corolla* yellow, persistent for some time. *Calyx* pubescent, interior glabrescent, tube c. 5 mm, teeth narrow-triangular, upper teeth connate, or incised at the top, c. 4 mm; lateral teeth c. 3–4 mm, lower tooth narrow-elliptic, 6–7 mm. *Vexillum* rotundate to reniform, 12–16(–18) mm long and wide, clawed, auricles pointed, reinforced, a narrow crest near the base, apex clearly emarginate; *alae* narrow-obovate, c. 12–14 mm long, 4–4.5 mm wide, ventral side with 1 prominent auricle, basal side 1 faint bulge in the margin; *keel* circinnato-rostrate, longest dimension 12–17 mm, claw 6 mm, basal suture adnate. *Ovary* short- or long grey-pubescent, c. 4–6 mm, with yellow glands, style 16 mm, basal 4–9 mm hairy, distal 5 mm flattened, stigma terminal, oblique. *Stamens* c. 15–20 mm, curved upwards in the middle, upper 7–8 mm free, anthers basidorsifix. *Pods* stipitate, broad-falcate, 4.5–6.5 cm long, 0.7–1.0 cm wide, stipe 5–10(–12) mm, dark brown to black, orange-glandular, short grey-pubescent and with (Indonesia) or without (Celebes, Hainan) long golden hairs. *Seeds* (5–)6–9(–10), squarish-rounded, black, c. 4.5 mm long and wide, 3 mm thick, strophiole narrow, around the hilum but divided with age.

Distribution: Burma, China, Indonesia, Papua New Guinea.

Ecology: in thickets and secondary forest, near rivers, along roadsides. Altitude: 0-850 m.

Flowering: Indonesia: Nov.-Feb., May, June. Vietnam: May-June.

Fruiting: Indonesia: Nov., Jan.-May. Vietnam: May-June.

Vernacular names: Madura: Kacoliping, Java: Kachangan.

Specimens examined:

BURMA: Moulmeyn, *Griffith* 99 (K); as "Bengal circ. Calcuttam", *Helfer* 82 (A, BM, BR, C, E, G, L, P, S, US); Tenasserim, *Helfer E.I.C.* 1709 (paratype of *D. burmanica* Thoth. & P. Satyanat.: K, P, W).

VIETNAM: Tourane & vicinity, *J. & M.S. Clemens* 3191 (paratype *D. henryi* Wu (BM, C, G, MO, NY, P, U, US, W)).

Notes: *Dolichos truncatus* Miquel was put into synonymy with *Dunbaria circinalis* (Benth.) Bak. by Backer (1963), apparently not earlier, but the name had been considered a synonym a long time as herbarium labels prove. Now the major part of the Indonesian and Burmese specimens earlier considered *D. circinalis* are judged to constitute a separate taxon, the next oldest available epithet is *truncata*. *Dunbaria henryi* Wu also belongs to *D. truncata*. Wu described *Dunbaria henryi* as near to *D. villosa*, because of the medium-length inflorescence and near to *D. podocarpa* for the long-stipitate pod. The difference with *D. circinalis* should be that no more than 3-4 flowers are produced by *D. henryi*, and pods are not yellow-hispid and long-hairy but just pubescent. *D. henryi* has broad-ovate deltoid leaflets as in *D. truncatus*. The broad, 8-10-seeded

pods with yellow bulbous-based hairs on otherwise glabrous or very short-hairy surface, and the rather short usually branched inflorescences separate this species from the Indochinese and East Indian *D. circinalis*. The Burmese populations are very close to *D. podocarpa*, but differ by the short (not almost sessile) inflorescences and the caducous bulbous-based long hairs where *podocarpa* has short hairs more or less densely distributed on the pods. The leaflets are less manifestly truncate than the Indonesian and Hainan specimens. See also notes under *podocarpa* and *circinalis*.

20. *Dunbaria villosa* (Thunb. ex Murray) Makino

Fig. 17, p. 94, Map 16, p. 95

Map 16. Distribution of *Dunbaria villosa* from Japan to Indonesia

Perennial climber, small vine climbing in grasses and shrubs. *Branches* delicate to 1.5(–2.5) mm diameter, ribbed. *Indumentum* short, whitish, sparse. *Stipules* small, c. 1 mm long, to sometimes 5 mm, triangular, persistant or caducous. *Leaf petiole* ribbed, 15–30 mm, rachis 8–15 mm, petiolules 1.5–2 mm. *Leaflets* three-lobed, rather unequal, dark green and with few glands above, greyish green and densely red-glandular below, three major veins from the base, top leaflet rhomboid to deltoid, 1.5–3(–5) cm long, 2–4 (–5) cm wide, apex obtuse, sometimes acute, with a small mucro, base rounded to broad-cuneate, side leaflets obliquely so, 1–2.5 cm long and wide, stipellae 0.5 mm, inconspicuous, hairy. *Pseudoracemes* slender, peduncle (1–)3–7(–9) cm long, (1–)2–8(–11) flowers, pedicels 2–9 mm. *Bracts* obtuse, c. 1 mm long, caducous. *Corolla* yellow. *Calyx* densely short-pubescent, inside glabrous, tube c. 4 mm, teeth long-triangular, (2–)3–9 mm, about equal in bud stage, upper teeth connate except c. 2 mm at the tip, lower tooth longest, up to 9 mm. *Vexillum* obovate, c. 16 mm long, 12–13 mm wide, apex rounded-emarginate, base clawed, reinforced, auriculate, two narrow callosities; *alae* elongate-obovate, c. 12 mm long, 3–5 mm wide, clawed, with a long auricle at the ventral side, and a small lobe or pouch dorsally; *keel* curved, tip funnel-shaped and folded back (circinnato-rostrate), c. 12 mm longest dimension, c. 5 mm wide. *Ovary* c. 6 mm, densely hairy, glands colourless, 6–8 ovules, style c. 19 mm, basal 10 mm hairy, upper 7 mm curved upwards, stigma terminal, oblique. *Stamens* c. 19 mm, free part 7–8 mm, curved upwards, anthers basifix. *Pods* brown, linear-falcate, 3.5–4.5 cm long, 7–8 mm wide, pubescent when developing, short-pubescent when grown, no bulbous-based hairs, stalk 2–6(–10) mm. *Seeds* (4–)6–7(–8), squarish-ovoid, 4 X 4 X 3 mm, black to brown with or without black mosaic, strophiole divided, quite conspicuous when fresh.

Distribution: Burma, China, India, Indonesia, Japan, Korea, Laos, Philippines, Thailand, Vietnam.

Ecology: twining herb in grasses, hedges, thickets; on slopes, near tombs in graveyards, roadsides, along riverbanks, on sandy and rocky soils. Sometimes fairly common, and forming dense tangles covering shrubs. **Altitude:** 0–700 m. Peculiarly few specimens have labels quoting altitudes. Once (*Yü 10520*) an altitude of 3000 m on Mt Kaakerpu in Yunnan was indicated.

Flowering: Aug. to Oct. in most areas, more rarely also

during June-July, December, in Hainan Feb.-May.

Fruiting: (Aug.-) Sept.-Oct., in Hainan Feb., May.

Vernacular names: Yeh pien tou (wild *Dolichos*) (Yangtze, China). Hime kudzu, Hime kuromaki, Kap tsai t'ang, Kima kudzu, Kitsino mame, No-azuki, No-azuki Zoku, Tankirimame (Japan); Dau ma (common for several climbing legumes), day giay dau, dau co dat (Vietnam).

Thua-thieu, *Eberhardt* 2641 (P); W of Ca Na, Prov. Thuan Hai, *Evrard* 2498 (P); Tourane (Da Nang), *Gaudichaud* 248 (P); Mts de Pursat, *Godefroy-Lebeuf* s.n. (K); Nha Trang, *Hayata* 454 (P); Tom pa nr Khatrang (Nha Trang) (P); Tourane, *Lazaret* 12-11-1911 (P); Cochinchine, L. *Pierre* s.n. (A, BM, E, GH, US); Cap St. Jacques, *Poilane* 625 (P); Tourane, *Poilane* 1450, 28889 (P); Ninh Hoa nr Nha Trang, *Poilane* 3156, 4734, 6063 (P); Ca Na, *Poilane* 8473, 8691 (P); Mt Bach Ma, S of Huê, *Poilane* 27835 (P); Cap St. Jacques, *Talmy* 111 (P).

Notes: *Poilane* 625 from Cap St. Jacques, Vietnam, are glabrous specimens with longer inflorescences and somewhat larger flowers than average. The flowers are described as fragrant. The flowers and stipitate pods are quite different from those in *D. glabra*. Seeds of *Dunbaria villosa*, obtained through CIAT from Indonesia, produced plants in 1990. The plants were kept in a greenhouse. After the winter the plants flowered and pods set after hand-pollination early 1991. Short days obviously induced flowering, otherwise flowering might have occurred late 1990.

9 EXCLUDED SPECIES AND REJECTED NAMES

Dunbaria acuminatissima Miquel, Fl. Ind. Bat. 1-1: 180 (1855), type: Java, nr Surakarta, *Horsfield s.n.* (holo: BM?); *Rhynchosia acuminatissima* Miquel, Fl. Ind. Bat. 1-1: 171 (1855), type: Java, prov. Bandung, *Zollinger s.n.* (holo: L? P?).

Dunbaria barbata Benth. in Miquel, Pl. Jungh. 1: 242 (1852); *Cajanus goensis* Dalzell in Hook. Kew J. 2: 264 (1850); van der Maesen, Agric. Univ. Wageningen Papers 85-4: 117 (1986). Type: Burma, Kogun ad ripas Saluan in Martabania 1827, Wallich 5548 (holo: K) (*Dolichos barbatus* Wall. nom. nud.).

Dunbaria calycina Miquel, Fl. Ind. Bat. 1: 180 (1855); *Cajanus goensis* Dalzell in Hook. Kew J. 2: 264 (1850); van der Maesen, Agric. Univ. Wageningen Papers 85-4: 117 (1986). Type: Indonesia, Java, nr Surakarta, *Horsfield L 123* (holo: K; iso: BM, CAL, U).

Dunbaria heynei Wight & Arn., Prodr. 1: 258 (1834); *Cajanus heynei* (Wight & Arn.) Maesen, Agric. Univ. Wageningen Papers 85-4: 129 (1986). Type: India, 28 Dec. 1816, Wallich 5572 A (holo: K; iso: K).

Dunbaria horsfieldii Miquel, Fl. Ind. Bat. 1: 179 (1855); *Cajanus crassus* (Prain ex King) Maesen, Agric. Univ. Wageningen Papers 85-4: 112 (1986). Syn. nov., designated here. Type: Indonesia, *Horsfield L 127* (holo: K; iso: BM, CAL, GH, MEL, U).

Dunbaria latifolia Wight & Arn., Prod. 258 (1834); *Rhynchosia courtallensis* Maesen, Rheedia 5-1: 54-59 (1995). Type: Peninsular India, *Wight Herb. Propr. 878 pro parte* (holo: K; iso: A, BM, C, E, G, P).

Dunbaria oblonga Arn., Nov. Act. Nat. Cur. 18: 333 (1836); *Cajanus heynei* (Wight & Arn.) Maesen, Agric. Univ. Wageningen Papers 85-4: 129 (1986). Type: *Walker-Arnott, Ceylon no. 207* (holo: E).

Dunbaria polysperma Miquel, Fl. Ind. Bat. 1: 179 (1855), Koorders, Exk.Fl. Java 404 (1912); *Cajanus crassus* (Prain ex King) Maesen, syn. nov. See Backer, Beknopte Fl. Java 5: (1941). Type: Indonesia, E Java, Trètès, near waterfall, *Zollinger 2266* (holo: P; iso: G, U).

In U the type material sheet contains a few leaves of *C. crassus* and an infructescence of *Pueraria phaseoloides* (Roxb.) Benth. (cf. Backer).

Dunbaria pulchra Benth. ex Bak. in Hooker, Fl. Brit. India 2: 218 (1876); *Cajanus grandiflorus* (Benth. ex Bak.) Maesen, Agric. Univ. Wageningen Papers 85-4: 125 (1986). Type: India, lower hills of Sikkim, 1000-2000 ft, Hooker fil. s.n. (holo: K; iso: GH, K, P).

Dunbaria spanoghei Miquel, Fl. Ind. Bat. 1-1: 178 (1855).
Type: Spanoghe icon. ined. 9 (c. 1836); *Dunbaria heynei* (non Wight & Arn.) Spanoghe.

Dunbaria stipulata Thuan, Adansonia sér. 2, 16-4: 514 (1977);
Cajanus goensis Dalzell in Hook. Kew J. 2: 264 (1850); van der Maesen, Agric. Univ. Wageningen Papers 85-4: 119 (1986).

10 ACKNOWLEDGEMENTS

I am greatly indebted to the directors or curators of the following herbaria for sending the material on loan for an extended period of time, and for their assistance and advice:

I am grateful to my colleagues for various support, in particular Dr. J.J. Bos, who read the manuscript and made valuable comments, especially for the keys. Dr. A.J.M. Leeuwenberg assisted with the Latin description. I also acknowledge the advice from other colleagues in Wageningen, Kew, Leiden, Brussels, Paris, Florence, Kunming and Beijing, New York, St. Louis and other institutes visited. In particular the discussions with Dr. Frits Adema in Leiden and Dr. Roger Polhill, Dr. Mike Lock, Dr. B. Verdcourt, Dr. H. Beentje, Prof.dr. Frank Bisby and Dr. Nigel Maxted in the U.K. I appreciated very much.

The assistance and the facilities provided during July/August 1996 by Prof. Wu Sugong and Mr. Yang Yongping in Kunming and Xishuangbanna, and the arrangements in Beijing by Mrs Gao Fangyou and Mr. Fu Zhenwen, I gratefully acknowledge.

The new illustrations were prepared by Ms. Yuen Tan, Mr. H. de Vries and Mr. G. Vonk, and their skills provide a most valuable contribution to this revision. The drawings by Mile Lamourdedieu prepared for the Flore du Cambodge, du Laos et du Viêt-nam were put at my disposal by the kind permission of Prof. dr. Ph. Morat in Paris. Permission to reproduce the figure by P. Satyanarayana were granted by that author and the Journal of Japanese Botany. Dr. O.G. Gideon, Papua New Guinea Forest Research Institute, permitted the use of the drawing by T. Iwagu.
