Bulletin of The Natural History Museum

Botany Series

VOLUME 28 NUMBER 2 26 NOVEMBER 1998

The *Bulletin of The Natural History Museum* (formerly: *Bulletin of the British Museum (Natural History)*), instituted in 1949, is issued in four scientific series, Botany, Entomology, Geology (incorporating Mineralogy) and Zoology.

The Botany Series is edited in the Museum's Department of Botany
Keeper of Botany: Dr S. Blackmore
Editor of Bulletin: Ms M.J. Short

Papers in the Bulletin are primarily the results of research carried out on the unique and ever-growing collections of the Museum, both by the scientific staff and by specialists from elsewhere who make use of the Museum's resources. Many of the papers are works of reference that will remain indispensable for years to come. All papers submitted for publication are subjected to external peer review for acceptance.

A volume contains about 160 pages, made up by two numbers, published in the Spring and Autumn. Subscriptions may be placed for one or more of the series on an annual basis. Individual numbers and back numbers can be purchased and a Bulletin catalogue, by series, is available. Orders and enquiries should be sent to:

Intercept Ltd.
P.O. Box 716
Andover
Hampshire SP10 1YG
Telephone: (01264) 334748
Fax: (01264) 334058
Email: intercept@andover.co.uk
Internet: <http://www.intercept.co.uk>

Claims for non-receipt of issues of the Bulletin will be met free of charge if received by the Publisher within 6 months for the UK, and 9 months for the rest of the world.

SYNOPSIS. *Brillantaisia* P. Beauv. is a genus of mainly woody herbs and subshrubs from tropical Africa and Madagascar. In this revision, a brief taxonomic history of *Brillantaisia* is presented, the morphological variation of the genus is described, and concepts of species and higher taxa are discussed. The Phylogenetic Species Concept of Nelson & Platnick is adopted as the criterion for species delimitation whilst hennigian monophlyy is the criterion used for recognition of higher taxa. Twelve species of *Brillantaisia* are delimited. The relations between the twelve species of *Brillantaisia* and eleven outgroup species representing the genera, *Duosperma*, *Dyschoriste*, *Eremomastax*, *Hygrophila*, *Mellera* and *Mimulopsis*, are investigated using cladistic methodology and a phylogeny is presented. The results of cladistic analysis show that *Brillantaisia* and six species of *Hygrophila* both belong within a monophyletic group based on a suite of pollen characters. *Brillantaisia* is a monophyletic genus based on the laterally compressed upper corolla lip, membranous hinge at the apex of the corolla tube and winged petiole. *Hygrophila* is paraphyletic, and until further studies are undertaken on that genus, the sister group to *Brillantaisia* remains unresolved. Within *Brillantaisia*, section *Stenanthium* of Lindau is monophyletic; however, subgeneric taxa are not formally recognized in this treatment. A taxonomic account of the twelve species of *Brillantaisia* is provided with illustrations, distribution maps and a key. The main taxonomic changes are that *B. stenopteris* is new to science; *B. riparia* is raised from a variety of *B. pubescens* to species level; *B. grottanelli* is recognized as distinct from *B. madagascariensis*; *B. kirungae*, *B. ulugurica* and *B. cicatricosa* are considered conspecific and *B. ovariensis* is circumscribed as a single widespread and variable species.

INTRODUCTION

The aim of this paper is to present a revision of *Brillantaisia* with a key for identification of species, addressing the following questions:

1. How many species are there in *Brillantaisia*?
2. Is the genus *Brillantaisia* monophyletic?
3. Are the subgeneric groups within *Brillantaisia* proposed by Lindau (1895a) monophyletic?
4. Is *Hygrophila* the sister group to *Brillantaisia*?
5. Is *Hygrophila* monophyletic?

Brillantaisia P. Beauv. is a genus of mainly woody herbs and subshrubs from tropical Africa and Madagascar. Plants of *Brillantaisia* generally have ovate leaves with a winged petiole, an open paniculate inflorescence of bilabiate purple flowers and capsules containing numerous seeds, each held on a hooked retinacula. At the outset of this study, there was no consensus concerning the delimitation of *Brillantaisia*, species boundaries within the genus or species relationships. The genus was thought to contain between 13 (Vollesen, pers. comm.) and 40 (Mabberley, 1987) species. The monospecific genus *Plaesianthera* (C.B. Clarke) Livera from Sri Lanka had recently been transferred to *Brillantaisia* as an Asian representative of the genus by Cramer (1991); however, this genus has been shown to be best placed within *Hygrophila* R. Br. (Sidwell, in press *a*) and is not discussed further in this paper. Prior to undertaking cladistic analyses, *Brillantaisia* is hypothesized as monophyletic (*sensu* Hennig, 1950, 1979), based on the presence of two posterior stamens, two staminodes and a laterally compressed upper corolla lip; the genus *Hygrophila* is hypothesized as the sister group to *Brillantaisia* based on previous classifications of Nees (1847), Bentham (1876), Lindau (1895a) and Bremekamp (1953, 1965), and the monophyly of the taxon Hygrophileae containing only *Brillantaisia* and *Hygrophila*, is provisionally accepted on the presence of four aperturate pollen (Scotland, 1992*a*, *b*, 1993; Furness, 1994) and a unique ndhF sequence (Scotland et al., 1995).

Taxonomic history

Brillantaisia was first described in 1818 by Ambroise Marie Palisot de Beauvois from a collection made near Agathon in Benin, West Africa (Palisot de Beauvois, 1818). A single species, *Brillantaisia owariensis* P. Beauv., was described as having a four angled stem, violet flowers in a panicle and ovate-lanceolate toothed leaves with an acute tip and a winged petiole. Thirty years later, Nees von Esenbeck (1847) overlooked the original publication of *Brillantaisia* and described two new genera of Acanthaceae from West Africa: *Belantheria* Nees and *Leucoraphis* Nees. Bentham (1849) recognized the oversight of Nees and transferred the two species of *Leucoraphis* to *Brillantaisia* as *B. larium* (Nees) Benth. and *B. vogeliana* (Nees) Benth. and synonymized *Belantheria belvisiana* Nees with *Brillantaisia owariensis*. In 1853, Hooker addressed the already problematic issue of species delimitation in *Brillantaisia*. He agreed with Bentham (1849) that the three species described by Nees (1847) should be placed within *Brillantaisia*; however, after observation of a newly introduced garden plant from Sierra Leone (Lindley, 1853), Hooker (1853) concluded that the separation of those species on leaf margin and leaf shape characters was invalid as the character variation previously used to distinguish between the

species could be seen on a single cultivated specimen. Hooker therefore united all the species recognized by Nees (1847) and Bentham (1849) under the earliest name, *Brillantaisia owariensis* P. Beauv.¹.

Since that time, many new species of *Brillantaisia* have been described (see Sidwell, 1997 for detailed discussion). Gustav Lindau was by far the most prolific describer of new species in the genus. Between 1893 and 1904 Lindau published descriptions of 25 new species of *Brillantaisia*. The first, largest and possibly most important of these publications was *Acanthaceae Africanae I* (Lindau, 1893), in which, ten new species of *Brillantaisia* were described. Characters used by Lindau at the species level included habit (herb or shrub), leaf shape (ovate or obovate), leaf base shape (cordate or not cordate), leaf apex shape (acuminate or not), cystoliths (present or absent), whole plant indumentum (pubescent or glabrous), sepal length (equal or unequal) and number of ovules. By the time of his account of Acanthaceae in Engler and Prantl's *Die Natürlichen Pflanzenfamilien* (Lindau, 1895a) Lindau had published fourteen names in *Brillantaisia*, and was the first and only worker to delimit subgeneric taxa within the genus. Lindau subdivided *Brillantaisia* into two sections: three species with spicate inflorescences were included in section *Stenanthium* Lindau, and nine species with paniculate inflorescences were mentioned in section *Euryanthium* Lindau. Section *Euryanthium* was further subdivided on leaf shape characters into Group A with lanceolate leaves (containing *B. lancifolia* Lindau) and Group B with non-lanceolate leaves (containing all other species with a paniculate inflorescence).

Brillantaisia is now generally considered to be more closely related to the genus *Hygrophila* R. Br. than to other members of the Acanthaceae because both genera possess a bilabiate corolla and numerous seeds. However, historically, the position of *Brillantaisia* within the Acanthaceae has been somewhat confused. Nees von Esenbeck (1847) was the first to produce a worldwide monograph of the Acanthaceae. He refined his work on Asian Acanthaceae (Nees, 1832), changing the rank of some taxa, and placed both *Brillantaisia* (as *Belantheria* and *Leucoraphis*) and *Hygrophila* in the subfamily Echmatocantheae (possessing retinacula), tribe Hygrophileae (corolla 5-parted; stamens 2 or 4; seeds numerous; fruits explosive), Subtribe I. This was the first grouping of *Brillantaisia* and *Hygrophila* in the same taxon. However, in the same year Lindley (1847) listed *Brillantaisia* as of unknown affinity and noted that three eminent botanists working on the Acanthaceae – Brown, Nees and Meisner – were unable to agree on subdivision of the family. Lindley (1847: 679) noted that ‘there are few natural Orders which now demand, in so eminent a degree, a searching investigation as that of Acanthads’. Bentham (1876) subdivided the Acanthaceae into five tribes using a combination of characters (corolla aestivation, ovule number, seed shape and retinacula type). *Brillantaisia* and *Hygrophila* were placed in tribe Ruellieae Benth. (aestivation contorted; seeds 2-many per locule; seeds laterally compressed; retinacula hooked), subtribe Hygrophileae (corolla two-lipped; filaments laterally connate). Baillon (1891) recognized six series in Acanthaceae and considered *Brillantaisia* sufficiently distinct to be placed in the monogeneric series Brillantaisées characterized by the presence of two fertile posterior stamens, a strongly bilabiate corolla and many seeds per capsule.

The research of Lindau (1895a) placed *Brillantaisia* and

¹ There remains some confusion here as Hooker did not explicitly state that *Belantheria* Nees and *Leucoraphis* Nees (separated on the presence or absence of staminodes) should be united under one species of *Brillantaisia*. Typographic error increases the confusion as two species of Bentham (1849), *Brillantaisia larium* and *Brillantaisia vogeliana*, are apparently mis-named by Hooker (1853), as ‘*Belantheria larium*’ and ‘*Belantheria vogeliana*’, two combinations which had never been formally published prior to that work. The lumping of *Brillantaisia larium*, *B. vogeliana* and *B. owariensis* by Hooker is not upheld in this work. Although leaf margin characters are very variable within the genus, there are other discrete morphological characters supporting the recognition of these three species as distinct.

Hygrophila in the Acanthoideae-Contortae-Hygrophileae having 'rippenpollen' with four equatorial apertures. Bremekamp (1965) also placed *Brillantaisia* with *Hygrophila*, in Acanthoideae-Ruelliae-Hygrophileae, a group with bilabiate flowers in cymes, stamens united into a single group, style not held in place by a row or bundles of trichomes and subglobose, banded, usually four-aperturate pollen. As mentioned above, recent studies confirmed the monophyletic nature of the group consisting of these two genera based on a pollen type not found elsewhere in Acanthaceae (Scotland, 1993) and a unique *ndhF* sequence (Scotland et al., 1995).

Since the time of Nees von Esenbeck (1847) no monographic work has been undertaken for *Brillantaisia* and the prolific description of species by Lindau (1893; 1894; 1895a, b, c, d; 1896; 1897; 1898; 1904) served to exacerbate difficulties in understanding the group. Several regional floras (Heine, 1966; Benoist, 1967; Champluvier, 1985; Vollesen, in prep. *a* & *b*) have addressed the problem of the number of species within *Brillantaisia* in Gabon, Madagascar, Rwanda and East Africa respectively. The authors of these works disagree in particular on the number of species in several morphologically distinct groups within *Brillantaisia*. Taxonomists working on *Brillantaisia* have tended to split it into poorly defined groups and formally name many slightly differing forms of the great morphological variation within the genus. Many new species of *Brillantaisia* have been described, often from little material and based on characters that are highly variable within the genus. Identification of specimens has been inconsistent and a study covering the entire range of geographical and morphological variation of the genus is essential to clarify this confusion.

MORPHOLOGY

Initially I considered it impossible to separate description of the morphological variation of *Brillantaisia* from discussion of the transformation of that information into comparative morphological data (characters and character states) for phylogenetic analysis. However, morphological data are analysed at two different levels in this study. Characters and character states of individual specimens are analysed when delimiting species of *Brillantaisia*, and characters and character states of taxa are analysed when forming hypotheses of relations among those species. In order to emphasize the filtering of data undertaken when transforming observation and description into comparative data, a descriptive approach to discussion of characters is presented prior to discussion of character coding for cladistic analysis. A purely descriptive morphological section provides an overview of the genus, directly comparable with many published monographic studies and some flora accounts for the Acanthaceae, recent examples of which include studies on *Justicia* (Graham, 1988), *Justicia* sect. *Harnieria* (Hedrén, 1989), *Justicia* sect. *Ansellia* (Ensermu, 1990), *Ruellia* (Ezcurra, 1993), *Strobilanthes* (Wood, 1995), *Dicliptera* (Balkwill et al., 1996) and *Phaulopsis* (Manktelow, 1996). Brief discussion of morphological variation is given here and species that exhibit the range of variation of a particular organ are used as examples. Herbarium specimens relevant to the discussion are referenced by collector's name, number and herbarium acronym (e.g. *Kibuwa* 5191, UPS).

The data were obtained through observation of herbarium specimens from BM*, BR*, C, DSM*, E*, ETH, FHO*, G, HBG, K*, LISC, M, MHU, MO*, NY, P*, PRE, S, SCA*, SRGH, W, WAG*, YA* and Z (abbreviations follow Holmgren et al., 1990). Visits have been made to the herbaria marked with an asterisk. Gross morphological features were measured on mature vegetative and reproductive

structures using a mm ruler or calipers which measure to 0.1 mm. Finer measurements were made using an 8 mm 0.1 graticule in a Leica Wild M8 dissecting microscope. Floral dissections were made after placing a flower into cold water and heating slowly until the water almost boiled. This usually took about 30 seconds and was sufficient to soften the delicate corolla. Boiling caused the corolla to disintegrate. Photographs were taken using a Nikon F-801s camera with FP4 black and white film and a Microtech MF80 fibre optic light source. Pollen preparations were acetolysed using a modification of Erdtman (1960) (see Sidwell, 1997). Light micrographs of pollen grains were taken using a Dialux 20EB photomicroscope. Scanning electron micrographs were taken at The Natural History Museum, London. Stubs were coated in gold-palladium 80:20% and viewed using an Hitachi S-800 SEM microscope with a working distance of 5–10 mm. Permanent slides of *Brillantaisia* wood were prepared according to Gourlay (pers. comm.); the stem was boiled for an hour, cut in transverse, tangential longitudinal and radial longitudinal sections on a sliding microtome and stained in safranin. The sections were passed through a dehydration series, washed three times in alcohol and mounted in Canada balsam.

Habit

Brillantaisia species range in habit from delicate herbaceous *Brillantaisia lancifolia* Lindau, approximately 50 cm high, to the large woody species *B. kirungae* Lindau which reaches 7 metres tall. Within this range, *Brillantaisia* species are mainly erect, perennial herbs around 1.5 metres tall which often become woody at the base of the stem. *Brillantaisia lamium*, *B. vogeliana* and *B. madagascariensis* T. Anderson ex Lindau, for example, are all erect, perennial herbs that produce adventitious roots at the lower nodes or along branches that touch the ground, enabling them to spread vegetatively. The terms herb, shrub and tree have been loosely applied by collectors to describe the habit of *Brillantaisia* species. For example, *B. madagascariensis* ranges in habit from a 'soft succulent herb' (Mooney 6071, S) or a 'perennial herb with creeping and ascending stems' (Friis & Vollesen 613, C) to a 'shrub to 2m tall' (*Kibuwa* 5191, UPS). According to the model of plant architecture, described by Weberling (1989) after Troll (1964), plants can be divided into four distinct and clearly defined zones: main florescence; enrichment zone; inhibition zone and innovation zone. This model was used by Manktelow (1996) in her monograph of *Phaulopsis* and can be applied to species of *Brillantaisia* (Fig. 1).

Figure 1 illustrates the architecture of *Brillantaisia* from the apex to the base of the plants as follows. The inflorescence is divided here into two distinct and more precisely defined parts: the terminal thyrsus with lateral dichasial branches forms the main florescence and flowering lateral branches (coflorescences) which 'repeat the structure of the main axis to some extent' (Weberling, 1989: 225) form the enrichment zone. These two parts are separated from one another by the basal internode (bi on Fig. 1), and the whole flowering region is termed a synflorescence. Below the enrichment zone, where the axillary buds do not develop into coflorescences, is the inhibition zone, and below that, the region of vegetative growth is termed the innovation zone. The innovation zone is considered the region of production of new shoots after flowering in perennial plants. *Brillantaisia lamium*, *B. vogeliana*, *B. owariensis* and *B. madagascariensis* all exhibit the type of growth pattern described above and illustrated in Figure 1A. Two species, *B. lancifolia* and *B. debilis* Burkhill have a main florescence and lack the enrichment zone (Fig. 1B). In the annual species, *B. pubescens* T. Anderson ex Oliv. inhibition of the lateral shoots does not occur, lateral coflorescences occur to the base of the plant and the inhibition and innovation zones

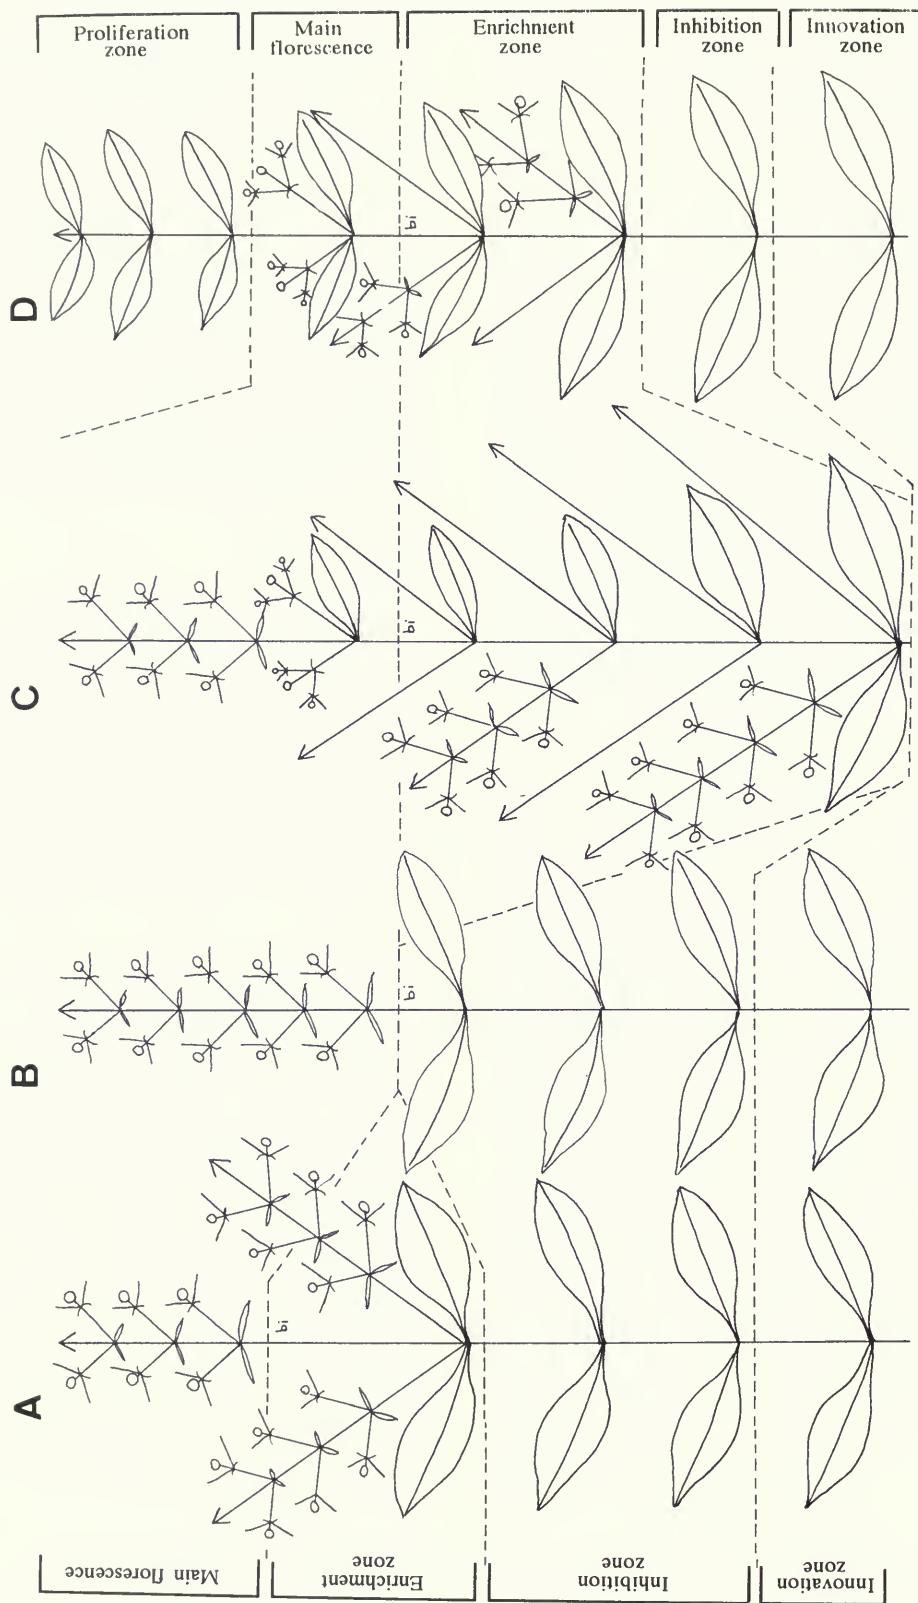

Fig. 1 Models of the architecture of *Brillantaisia* species. A. The model of Troll (1964) and Weberling (1989) with four zones, separated by dashed lines: the main fluorescence; enrichment zone; inhibition zone and innovation zone; B-D modifications of A; B lacking an enrichment zone; C lacking inhibition and innovation zones; D with a proliferation zone above the main fluorescence.

are absent (Fig. 1C). In two species of *Brillantaisia*, the main axis of the plant continues to grow vegetatively above the flowering region. This phenomenon is termed proliferation. Troll (1964) considered the type of vegetative growth seen in *B. oligantha* Milne-Redh. and occasionally in *B. riparia* (Vollesen & Brummitt) Sidwell to be late proliferation which 'consists of the return of the inflorescence apex to a vegetative condition' (Weberling 1989: 257; Fig. 1D). The robust *Brillantaisia kirungae* has been described as a 'very large, straggling, bushy herb' (Ball 62, SRGH), a 'robust subshrub' (Bridson & Lovett 544, MO) or even a 'small tree' (Thomas 3790, MO; White 13908, FHO). White's description of *B. kirungae* includes bole measurements which clearly indicate that the plant is a tree, 4 m high with a trunk 1.4 m tall and 12 cm in diameter at 70 cm height (White, 1984); however, such accurate measurement and application of terminology is unusual. I was unable to study this species in the field and the precise pattern of architecture of *B. kirungae* remains uncertain.

Indumentum

The variation of trichomes on different organs of Acanthaceae has been studied in some detail by previous researchers (e.g. Ahmad, 1976, 1978). Singh & Jain (1975) studied the structure and ontogeny of trichomes of Acanthaceae and classified them into forty types in two major groups: glandular and eglandular. Species of *Brillantaisia* possess both glandular and eglandular trichomes. Eglandular trichomes on *Brillantaisia* are of three types: simple filiform trichomes, three to nine cells long, tapering towards the apex; short uniseriate trichomes, two cells long, also tapering to the apex and unicellular trichomes with a rounded apex that is often purple. Glandular trichomes are stalked with a multicelled, capitate head (Selvaraj & Subramanian, 1983) and a two to many celled stalk. The number of cells in the head and stalk of glandular hairs varies continuously between organs and among individuals of *Brillantaisia*. Detailed discussion of indumentum types on the different parts of *Brillantaisia* plants is presented in Sidwell (1997).

Cystoliths

Calcium carbonate cystoliths are present in most members of Acanthaceae and were extensively documented in the last century by Hobein (1884). Recent studies by Inamdar et al. (1990) indicated that variation of cystolith morphology may be a useful taxonomic character above the generic level in Acanthaceae. The cystoliths of *Brillantaisia* are solitary, elongated and pointed at one end. All vegetative parts, bracts, bractlets and calyces are covered in this type of cystolith. The size of cystoliths in *Brillantaisia* varies intraspecifically and even within a single organ of one specimen.

Stem

In this work, the stem is treated as the axis of the plant below the main florescence and basal internode as shown in Figure 1 and is equivalent to the 'hypotagma' of Weberling (1989: 230). The stem is square towards the apex, longitudinally grooved on opposite sides and more rounded towards the base of the plant. The corners of the upper stem are usually slightly curved but may be sharply angled and winged. The stem is slightly swollen at or just below the nodes in all species. Below the basal internode the stem varies in diameter from 1–2 mm in *Brillantaisia debilis* to c. 10 mm in *B. kirungae*. In *B. madagascariensis*, *B. vogeliana* and *B. larium* adventitious roots may be produced at the lower nodes. The epidermal stem surface is covered in cystoliths, oriented parallel to the stem. Multicellular trichomes which may be glandular or eglandular are present on the upper stem and are particularly dense at the nodes.

Wood anatomy

A review of the wood anatomy of 38 species of Acanthaceae was written by Carlquist & Zona (1988). No species of *Brillantaisia* or *Hygrophila* were included in his survey which concluded that 'Woods of Acanthaceae are characterized by relatively narrow vessels with simple perforation plates and alternate lateral wall pitting, septate libriform fibers, scanty vasicentric axial parenchyma, rays both multiseriate and uniseriate, erect ray cells abundant in rays ... numerous small crystals or cystoliths in ray cells ... and nonstoried structure' (Carlquist & Zona, 1988: 201). The stems of plants of *Brillantaisia* often become lignified at the base, particularly in *B. owariensis* and *B. kirungae*. Data on woodiness are incomplete, however, as the lower stem and woody rootstock are very rarely collected on herbarium specimens. One specimen (Poulsen 523, FHO) included a collection of the lignified lower stem of *B. kirungae* 20 mm in diameter. This piece of stem showed a clear central pith with wood 7 mm thick and bark 1 mm thick. Transverse sections (Fig. 2A, B) show the vessels, which are relatively broad for the family, to be usually solitary and arranged radially with columns of parenchyma forming medullary rays between the regions of vessels. The vessels have simple perforation plates and minute pitting on the outer walls (Fig. 2F). The fibres are long, thin-walled, septate cells (Fig. 2C, E, F) between which are regions multiseriate rays characterized by a predominance of erect ray cells (Fig. 2C, D). Cystoliths are visible in ray cells but cannot be seen in the sections shown here.

Leaves

The leaves of *Brillantaisia* are characteristically ovate with a winged petiole. However, they vary enormously in size, shape, margin, the extent of the petiole wing and the distribution and density of trichomes on both surfaces. Leaf shape ranges from linear-lanceolate to broadly ovate (Fig. 3). The petiole may be unwinged, or winged to the base. The margin is often irregular, sometimes having dentate, crenate and serrate teeth and may be secondarily toothed. The leaf texture ranges from chartaceous in *B. vogeliana* to slightly coriaceous in *B. owariensis* and *B. kirungae*. The venation is eucamptodromus with tertiary veins becoming perpendicular to the midrib toward the apex of the leaf. In *B. kirungae*, the leaves often dry black. Some *Brillantaisia* species can be recognized to species level when sterile. For example, *B. larium* has perhaps the most characteristic leaves of all the species, with a usually cordate leaf base, an entire margin and an unwinged petiole (Fig. 3A). *Brillantaisia lancifolia* has lanceolate, entire leaves (Fig. 3I). Plants of *B. madagascariensis*, *B. debilis*, *B. oligantha*, *B. pubescens* and *B. riparia* all possess entire-margined, ovate leaves with a cuneate leaf base narrowly tapering into a winged petiole (Fig. 3B, F, G, H, L). The species with toothed leaves are very variable and relatively difficult to distinguish from one another. Leaves of *B. vogeliana* can be easily recognized by the presence of irregular teeth on the petiole wing, particularly where it widens into the lamina base (Fig. 3C), and by the rather open tertiary venation with unclear quaternary veins. Leaves of *Brillantaisia kirungae* are also characteristically grossly, irregularly toothed (Fig. 3E) and have prominent horizontal and vertical tertiary and quaternary veins giving a very close squared pattern. The leaves of *B. owariensis* exhibit a large range of leaf size, shape and margin type (e.g. Fig. 3K). The leaves often have prominent, parallel tertiary veins running between the secondary veins, with the quaternary veins not clear. Unfortunately, herbarium specimens tend not to show the extent of variation of leaf size in the genus. *Brillantaisia kirungae* and some forms of *B. owariensis* have very large lower leaves which have rarely been collected as they do not readily fit into a plant press.

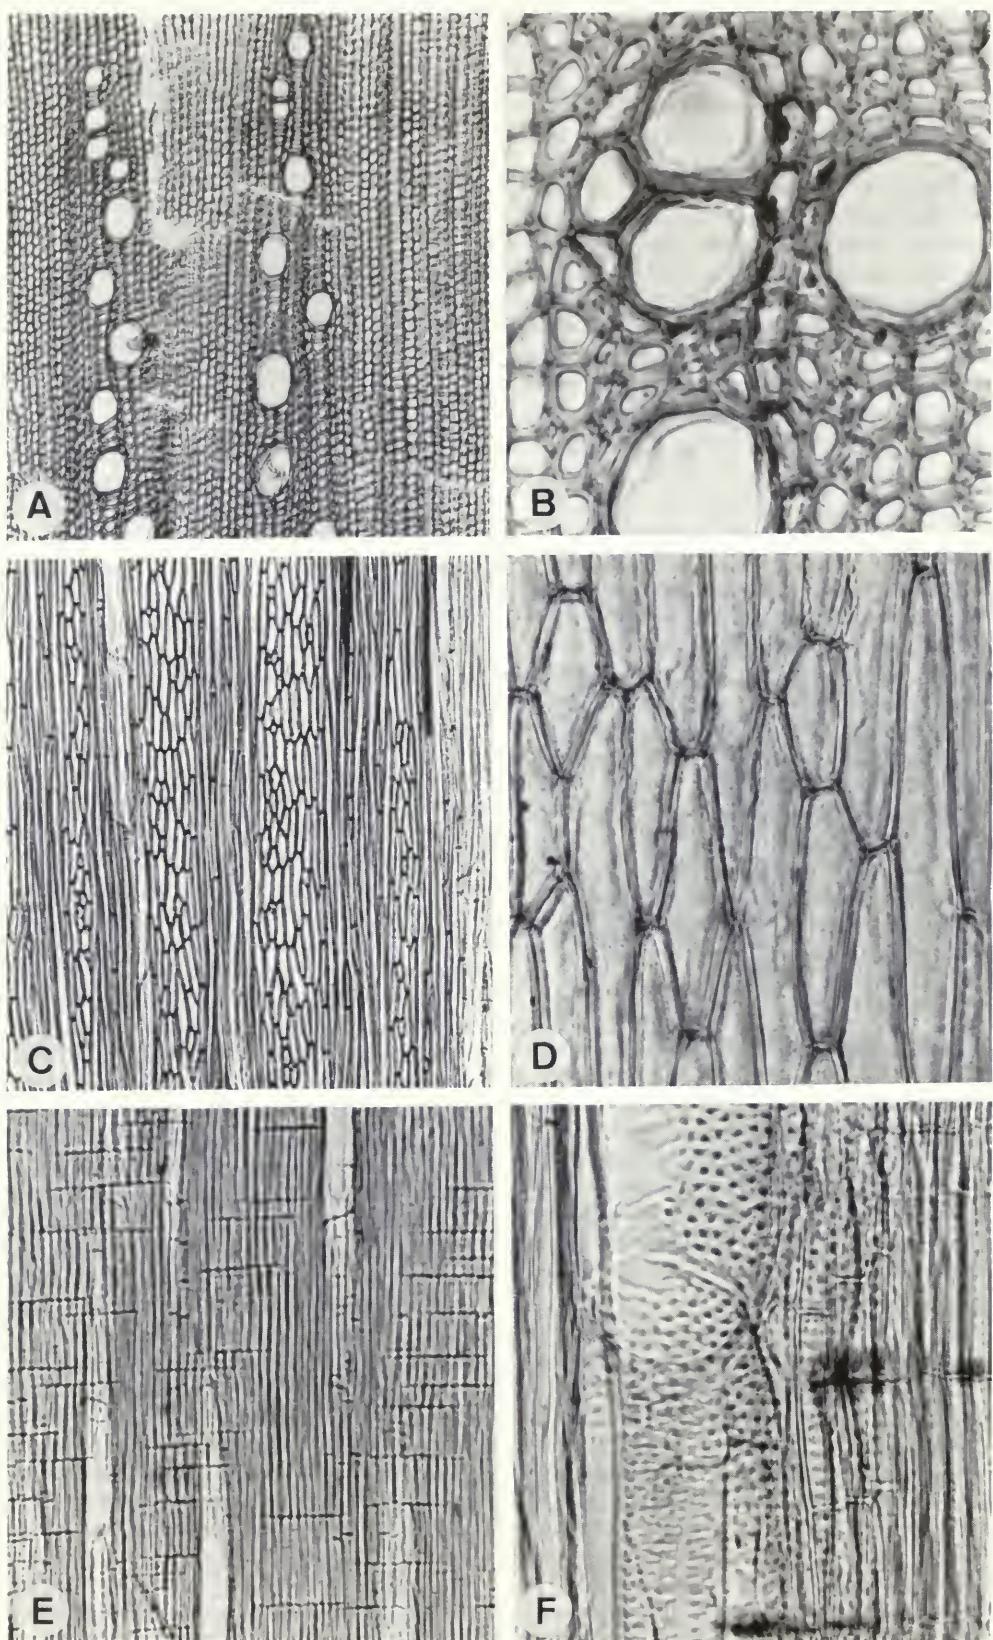

Fig. 2 Wood anatomy of *Brillantaisia kirungae* (Poulsen et al. 523, FHO, C, K). A. TS \times 50; B. TS \times 250; C. TLS \times 50; D. TLS \times 250; E. RLS \times 50; F. RLS \times 250.

Inflorescence

Brillantaisia inflorescences have been described in general terms as 'panicules' (Heine, 1966: 83), 'panicules terminales amples ou spiciformes, formes de cymes lâches ou contractées' (Benoist, 1967: 28) or 'large open or contracted panicles, rarely in spiciform racemes' (Vollesen, in prep. a). As with many genera of Acanthaceae, it is often difficult to pinpoint a precise division between the vegetative and floral parts of *Brillantaisia* plants and inflorescence structure and variation cannot be described by simply using the broad conventions of botanical terminology such as panicle, raceme, spike or cyme. Although several workers have studied the morphology of Acanthaceae inflorescences in detail, for example in the genera *Pseuderanthemum*, *Ruellia*, *Barleria* and *Lepidagathis* (Sell, 1969a), *Anisotes* (Baden, 1981), *Justicia* (Graham, 1988), *Duvernoia* and *Adhatoda* (Manning & Getliffe-Norris, 1985), *Ruellia* (Ezcurra, 1993), *Phaulopsis* (Manktelow, 1996) and *Dicliptera* (Balkwill, 1996) and discussed the problem of appropriate descriptive terminology, there has been no attempt to reach a consensus regarding the application of terms to the inflorescences of Acanthaceae. Several of these studies (Baden, 1981; Manning & Getliffe Norris, 1985; Graham, 1988) illustrated and discussed modifications of different inflorescence types from an 'ancestral' compound dichasium via 'elaboration', 'reduction' and 'condensation' (Graham, 1988: 555). Hedrén's (1989: 20) terminology for *Justicia* sect. *Harnieria* attempted to 'find a simple and consistent terminology for supposedly homologous structures'. However, his terms were different from those previously used for *Justicia* or other Acanthaceae and have not been generally applied at that level. The lack of generally applicable terminology and the lack of parallel usage of available terminology has meant that the easiest solution for each botanist working on Acanthaceae inflorescences has been to develop his or her own clear, explicit terminology for a particular group of plants. *Brillantaisia* inflorescences are described below in light of both important general works on inflorescence morphology (Rickett 1944, 1955; Troll, 1964; Sell, 1969a; Weberling, 1989) and the studies of Acanthaceae mentioned above.

The model of the habit of *Brillantaisia* species described above (Fig. 1A) is used as a starting point for understanding inflorescence architecture. The habit model divides the inflorescence into a terminal, main florescence and a lower enrichment zone of lateral coflorescences, the whole flowering region of a plant being termed a synflorescence (Fig. 4A–F). The basic 'unit' of Acanthaceae synflorescences is the dichasium, described by Rickett (1944: 216) as 'a cluster formed by a dichotomy beneath a terminal flower' which 'in its simplest form consists of three flowers' (Fig. 4A). In *Brillantaisia* synflorescences, the basic dichasium structure is repeated and modified so that in most species the amount of dichasial and monochasial branching increases, more or less regularly, down the synflorescence from the apex (Fig. 4A & B). Following the terminology of Weberling (1989: fig. 109) the main florescence of *Brillantaisia* is usually a regular, dichiasially branching thyrs or double thyrs (Fig. 4A). Below the main florescence, lateral coflorescences may be present (Fig. 4C). Plants of *B. madagascariensis* and *B. grottanellii* Pichi-Sermoli have very short lateral inflorescence branches, hence the spicate florescence on which Lindau based his sectional division of *Brillantaisia* mentioned above (Fig. 4D). The apex of the main florescence may return to indeterminate vegetative growth as in *B. oligantha* (Fig. 4E). In this case, the lateral dichasia are produced in the axil of a leaf rather than a bract and the question of whether the whole structure is the main florescence or a synflorescence of lateral dichasia arises once

again. Indeterminate main florescences may also have lower coflorescences as seen in *B. riparia* (Fig. 4F).

The development of a general terminology for Acanthaceae inflorescences to help clarify higher level homology assessment is considered essential, but beyond the boundaries of this study as it will require detailed ontogenetic, anatomical investigations across a wide range of taxa.

Bracts and bractlets

The bracts of *Brillantaisia* are paired at the nodes of the main florescence axis. In most species of *Brillantaisia* the bracts are foliose, becoming smaller towards the apex of the inflorescence. The bracts are often caducous, for example, *B. owariensis*, has large leaf-like bracts present in the young developing inflorescence which fall soon after the inflorescence opens. The bracts of *B. kirungae* are large, rounded at the apex, amplexicaul and pubescent with short trichomes. Amplexicaul bracts are not seen in other species of *Brillantaisia*. Hedrén (1989: 21) used the term bractole to refer to 'small, narrow bracts', differentiating them from 'leaf-like bracts'. His terminology is considered imprecise as 'bractole' specifically refers to 'a leaflike organ subtending a flower in an inflorescence that is itself subtended by a bract' (Blackmore & Tootill, 1984: 48) and does not refer to the size or shape of the organ. The bractlets of *Brillantaisia* do not subtend the flowers, but occur at the dichotomous branching of the dichasial florescence. The term bractlet is used (as by Daniel, 1984) in preference to the term bractole and refers to the second, third or higher order leaf-like structures at the nodes of the lateral branches of the main florescence or coflorescences. The bractlets of most species of *Brillantaisia* are linear, sessile, and rounded at the apex. Plants of *Brillantaisia pubescens* have shortly petiolate, rounded bractlets which are persistent and highly characteristic of the species.

Calyx

The calyx of *Brillantaisia* has five linear or spatulate, pubescent sepals that are united at the base. The upper adaxial sepal is usually larger than the other four although *B. lamium* and some forms of *B. owariensis* have five subequal sepals. In *B. kirungae*, the upper sepal may be several times wider and longer than lateral sepals. Plants of *B. pubescens*, *B. riparia* and *B. vogeliana* have clearly spatulate sepals. During fruit maturation, the calyx may lengthen significantly. In *B. pubescens*, the largest sepal is as long as the fruit. In *B. owariensis* the upper sepal is occasionally much longer than the fruit.

Corolla

The corolla of *Brillantaisia* has left contort aestivation (Scotland et al., 1994) common to all members of the Contortae *sensu* Lindau (1895a). The two lipped corolla of *Brillantaisia* is highly characteristic of the genus. The corolla tube is cylindrical, the upper lip is hooded and strongly laterally compressed, the lower lip is usually reflexed with three lobes at the apex. Between the base of the lower lip and the corolla tube is a region of membranous folded tissue which acts as a hinge allowing the corolla lobes to pivot on the corolla tube presumably facilitating pollination. Corolla morphology varies in the length and width of the tube, the ratio of the tube to the lobes, the shape of the lower lip, and the pubescence of the petals (see Figs 8–16). Corollas range in colour from deep purple to pink with white forms found occasionally in *B. vogeliana*, *B. lamium* and *B. madagascariensis*. The West African white-flowered *B. madagascariensis* was previously recognized, on the basis of this character alone, as a separate species.

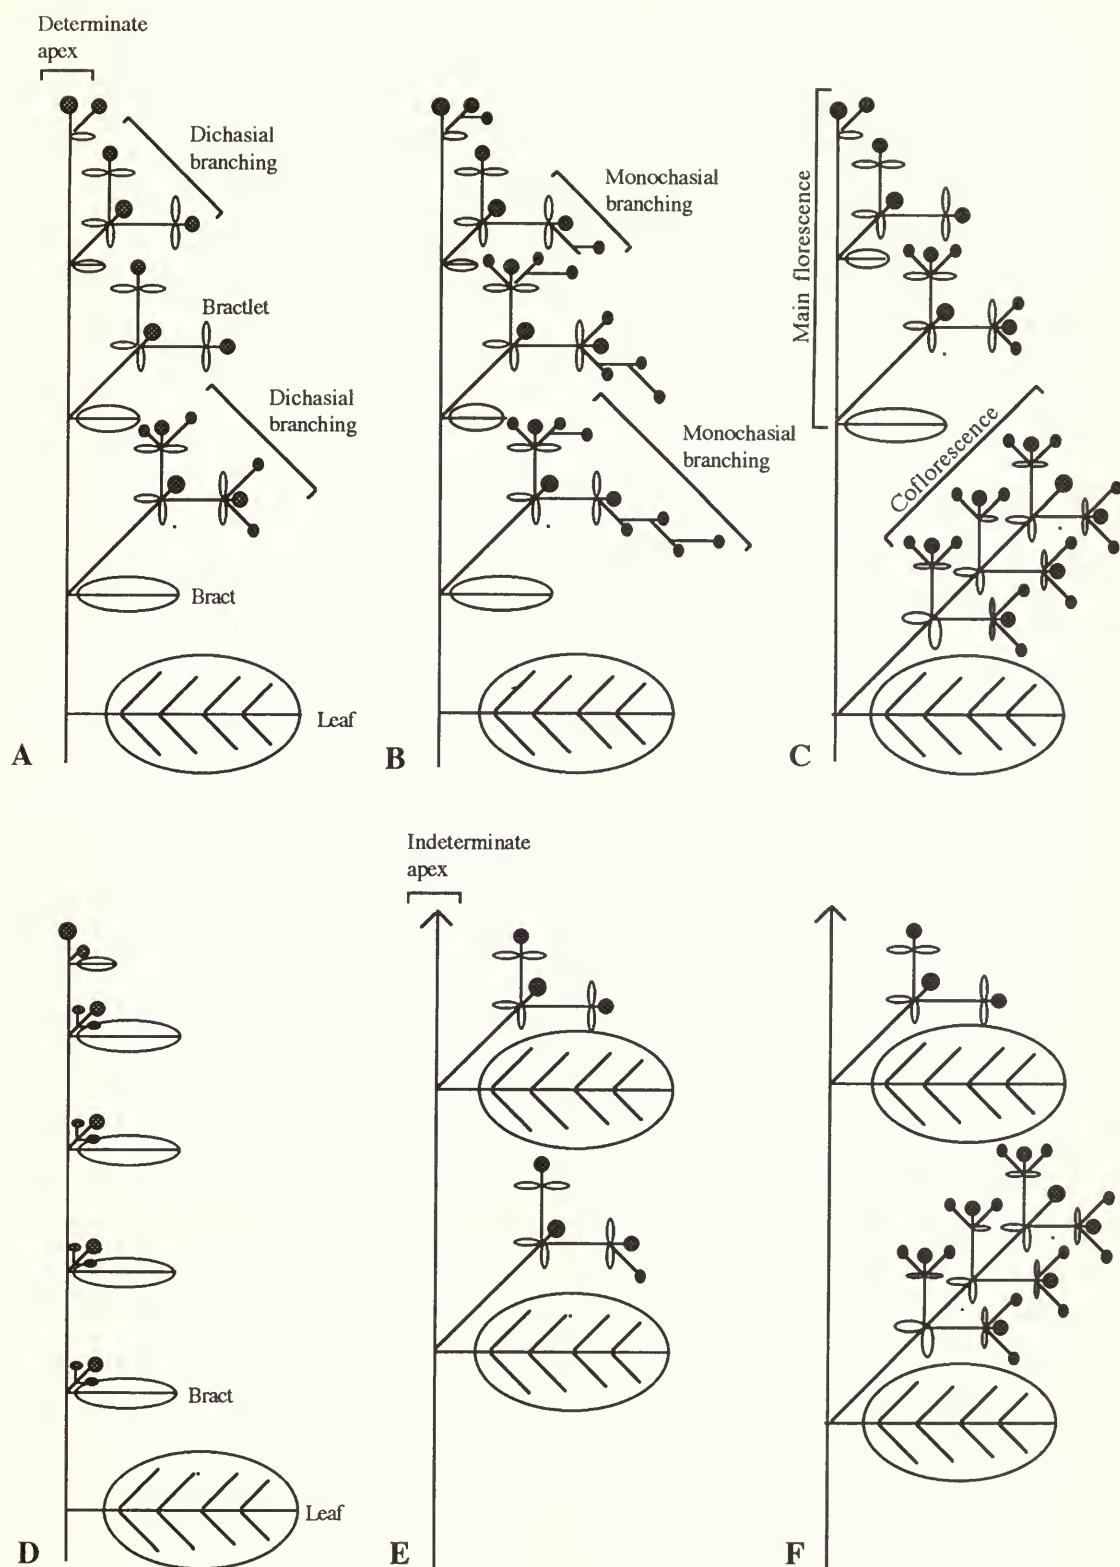

Fig. 4 Synflorescence structure of *Brillantaisia* species. A. basic structure of main florescence: determinate at the apex, with lateral branching once or twice dichasial; bracts on main axis foliose becoming smaller towards the apex, smaller foliose bractlets on lateral branches; B. main florescence with lateral branching both dichasial and monochasial; C. main florescence with lower lateral coflorescence repeating the structure of the main florescence, the whole forming a synflorescence; D. main florescence with reduced lateral branches forming a spike with large persistent bracts; E. main florescence with indeterminate apex; F. main florescence with indeterminate apex and lower lateral coflorescence.

Androecium

Species of *Brillantaisia* have two stamens and two staminodes. It is the two posterior stamens in *Brillantaisia* that are fertile, unlike other Acanthaceae with two stamens in which the anterior pair develop (e.g. Fig. 12C). This was mentioned by Lindau (1895a: 278) who stated ‘Die Reductionen im Andröecium gehen stets so vor sich, dass die hinteren Stb. zuerst zu Staminodien werden oder ganz verschwinden, nur bei *Brillantaisia* finden sich ausnahmsweise die beiden vorderen Stb. zu Staminodien umgebildet’. The fertile anthers are symmetrical, sagittate, dorsifixated and dehiscent through long lateral slits. The filaments are flattened towards the base, narrowing towards the anther and are almost as long as the corolla lobes and held in the upper hooded lip. The staminodes usually extend beyond the corolla tube and have a small flattened vestigial anther at the apex. In *B. pubescens* (Fig. 8E), *B. riparia* (Fig. 9B) and *B. oligantha* (Fig. 10B) the staminodes are minute or absent.

Pollen

The pollen grains of Acanthaceae are very variable and have been used extensively in taxonomic research on the family (Radlkofer, 1883; Lindau, 1895a; Bremekamp, 1944; Raj, 1961; De, 1960; Immelman, 1989; Scotland, 1991, 1992a, b, 1993; Furness, 1994). The pollen of *Brillantaisia* is usually oblate spheroidal but ranges from suboblate to spheroidal (terms according to Punt et al., 1994). Lindau (1895a) used the term rippenpollen to describe the usually oval-ellipsoidal grains with pseudocolpi and equatorial apertures found in *Brillantaisia*. Pollen grains of *Brillantaisia* are four-aperturate (see Fig. 5 and plates in Furness, 1994). The apertures are compound colporate structures consisting of an elongated colpus with a circular endoaperturate pore in the centre. Between the four apertures are pseudocolpi, similar to the colpi but lacking an endoaperture. The number of apertures on a pollen grain occasionally varies and may range from four to six within a single sample. In one pollen sample of *B. owariensis* studied by Furness (1994) all the pollen grains had five apertures, but this character has not been consistently found in other samples of the same species or elsewhere in the genus. Scanning electron micrographs (Fig. 5) clearly show that *Brillantaisia* pollen has raised bands of tectum with pseudocolpi between these bands. The columnellae are fused into a distinct bireticulate tectum in most species of *Brillantaisia* forming a primary reticulum with a smaller reticulate secondary tectum in the lumen (Fig. 5E). *Brillantaisia madagascariensis* has very characteristic pollen with irregularly clavate tectum ornamentation (Fig. 5A–C). *Brillantaisia grottanellii* is morphologically very similar to *B. madagascariensis*, however, investigation of pollen morphology showed this species to lack any tectal ornamentation (Fig. 5D–F). These data combined with gross morphological data, support recognition of *B. grottanellii* as a distinct species.

Gynoecium

The ovary of *Brillantaisia* species is cylindrical, 1–2 mm in diameter and up to 6 mm long and pointed at the apex, tapering to the base of the style (e.g. Fig. 9D). The ovary sits on an annular disc and has parietal placentation with two rows of ovules on each placental axis. *Brillantaisia* species have between twelve and sixty ovules in contrast to most other Acanthaceae which usually have just four ovules per ovary. The style is linear and with a small slightly flattened region at the apex forming the end stigma (Fig. 12D). Many species of Acanthaceae and related families have a simple bifid stigma whereas the second lobe of the stigma of *Brillantaisia* is reduced to a barely visible raised ‘tooth’ at the base of the receptive stigmatic surface.

Fruit

The fruit of *Brillantaisia* are dry, elastically dehiscent capsules with retinacula (Figs 8–16), characteristic of many members of the Acanthaceae (Sell, 1969b). The capsules are erect on the lateral synflorescence branches, each valve has a longitudinal groove from base to apex and within each valve, the seeds are held on two rows of dry, comparatively large, hook-shaped retinacula (Fig. 14A & E). The retinacula is a hardened outgrowth from the funicle of the developing embryo. The capsules of *Brillantaisia* are many seeded (Figs 8–16), compared to the capsules of most Acanthaceae which usually contain only 2 or 4 seeds. Often one or two ovules at the narrowed base or apex of the fruit do not develop into fully mature seeds. The fruit vary between species in size and the number of seeds per capsule and pubescence, for example: the fruit of *B. pubescens* are the smallest in the genus (Fig. 8F); plants of *B. vogeliana* have small fruit with up to 30 seeds per valve (Fig. 13A & C); plants of *B. kirungae* have large glandular pubescent fruit with 8–10 seeds per valve (Fig. 12E) and the fruit of *B. debilis* and *B. lamium* are glabrous (Figs 14A & 16C).

Seeds

Seed surface characters have been shown to be taxonomically useful at the species level in several groups of Acanthaceae including *Hypoestes* (Balkwill & Getliffe-Norris, 1985) and *Peristrophe* (Balkwill et al., 1986), and in the recognition of infrageneric taxa in *Justicia* (Immelman, 1990; Lester & Ezcurra, 1991) and *Siphonoglossa* (Immelman, 1990). The production of mucilage (myxospermy) is common in the Acanthaceae. The mucilage was considered by Kippist (1845) to come from pores in the ends of the seed trichomes. Grubert (1974) said the mucilage was produced by the seed coat.

The seeds of *Brillantaisia* were first described in detail by Schaffnit (1906). The seeds are flattened, asymmetrical, kidney-shaped and covered with long, hygroscopic trichomes which are adpressed when the seed is dry. When wet, the seeds produce mucilage and the hygroscopic trichomes rapidly expand. Trichomes of seeds of all *Brillantaisia* species are along, thin, single cell tapering towards and rounded at the apex with regular annular and occasionally spiral thickening from base to apex. Similar trichomes are common to all species of *Brillantaisia* and *Hygrophila* (Schaffnit, 1906), and were also reported in *Ruellia* by Kippist (1845).

CONCEPTS OF SPECIES AND HIGHER TAXA

The importance of explicitly stating the concepts and methods used for recognition of taxa in botanical monography was highlighted by Luckow (1995) and McDade (1995), among others, and has been discussed in relation to a revision of *Brillantaisia* in an earlier paper (Sidwell, in press b). Implicit taxonomic convention that the personal opinion of an expert botanist is sufficient to delimit taxa was deemed unacceptable for an unbiased scientific study of *Brillantaisia*. The literature on species concepts was carefully reviewed and evaluated and a brief outline of the conclusions of that paper is presented below. Above the level of species, relationships of higher taxa are hierarchical and all groups are recognized on the single criterion of Hennigian monophyly. Species are thought of as different from higher taxa and are delimited independently from considerations of monophyly and prior to any cladistic analysis. They are ‘consistent with cladistic theory but independent of constraints of autapomorphy’ (Nixon & Wheeler, 1990: 213) and can be

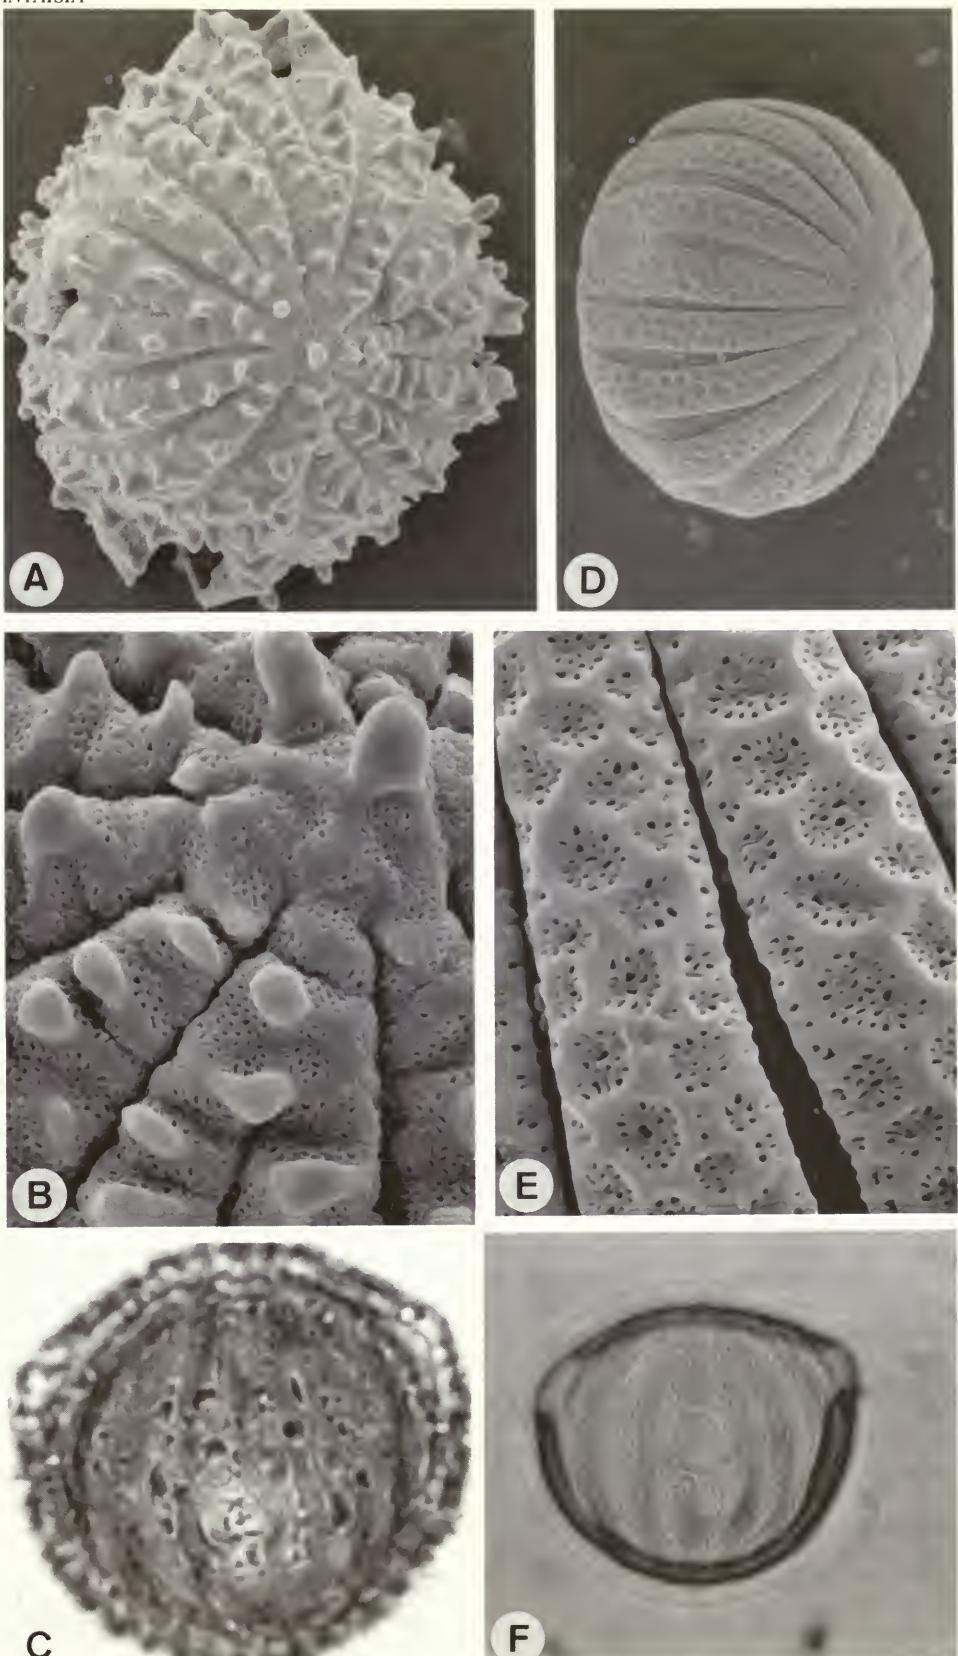

Fig. 5 The pollen of *Brillantaisia madagascariensis* and *B. grottanellii*. A–C *B. madagascariensis* pollen (Gutzwiler 841): A. SEM polar view $\times 1.5$ K; B. SEM close up of tectum $\times 7$ K; C. Light micrograph, equatorial view $\times 1$ K with clavate 'spines' on the tectum. D–F the smaller pollen of *B. grottanellii* (Ensermu et al. 821): D. SEM subpolar view $\times 1.5$ K; E. SEM close up of tectum $\times 7$ K; F. Light micrograph, equatorial view $\times 1$ K, with an even, non-spiny bireticulate tectum.

'recognized by either unique characters or unique combinations of characters' (Luckow, 1995: 595). Nelson & Platnick (1981) noted the fact that 'species' are only represented by the samples available to a particular biologist and that in practice 'those samples that a biologist can distinguish, and tell others how to distinguish (diagnose), are called species' (Nelson & Platnick, 1981: 11). However, they go on to point out that a pattern based species concept is incomplete without an element of process – that of self perpetuation – and state that '... species are simply the smallest detected samples of self-perpetuating organisms that have unique sets of characters' (Nelson & Platnick, 1981: 12).

The species of *Brillantaisia*

Twelve species of *Brillantaisia* were recognized. All twelve species could be recognized on the presence of unique sets of morphological characters; however, two kinds of species group are present. Seven of these species are monothetic, possessing a single character diagnostic for that species group and five species polythetic, lacking any single diagnostic character. As well as falling within the definition of a polythetic group, defined by the possession of a unique set of characters, *Brillantaisia owariensis* could also be considered a widespread and variable 'ochlo-species' (Sidwell, 1997). The term *ochlo*-species was first coined by White (1962: 79) to describe three species of *Diospyros* (Ebenaceae) which are all widespread and 'have very complicated variation patterns'. White wrote 'Some of their variation is closely correlated with geography, but most of it is not, so that the pattern is of the checkerboard type discussed by Mayr (1942: 37) but more complicated than any of his examples. Such species cannot be satisfactorily subdivided and could conveniently be distinguished from monotypic and polypotypic species by calling them *ochlo*-species' (White, 1962: 79). Without further extensive and detailed field study of numerous populations of *B. owariensis*, recognition of subspecific taxa remained informal.

RELATIONS OF THE SPECIES OF *BRILLANTAISSIA* 1: FORMULATION OF THE DATA MATRIX

Choice of outgroup

Multiple outgroups were chosen. Species were selected both from within the tribe Hygrophileae (*Hygrophila* species) and outside the tribe Hygrophileae. Within the tribe Hygrophileae, six species of *Hygrophila* were selected. These species represent the morphological and geographical variation of the genus, they are well delimited with no problems regarding species concept and they are represented by plenty of herbarium material at K and BM. Outside the tribe Hygrophileae, single species of the five genera considered most closely related to the Hygrophileae by Vollesen (pers. comm.) were included in the analysis.

Choice of characters

Stevens (1991), Wilkinson (1995) and Gift & Stevens (1997) all noted that individual scientists take very different approaches to character choice and character state delimitation and unfortunately, rarely explicitly state the criteria used at this stage of their research. Stevens (1984: 395) stated that 'the common meeting place of the systematist and morphologist is the analysis of similarity and its conversion into hypotheses of homology' and recently Pleijel (1995: 309) wrote that 'character coding represents the link between obser-

vation and analysis and greatly influences the results [of phylogeny reconstruction], but has nevertheless received little attention'. Thiele (1993: 275) described the method of converting description of morphology into comparative data for analysis as a filter that 'operates between the discovery of variation and the recording of that variation in the data matrix. Details of operation of the filter are often obscure...'. The main issues to be considered in coding morphological data for cladistic analysis are the coding of continuous versus discrete characters (e.g. Pimentel & Riggins, 1987; Cranston & Humphries, 1988; Chappill, 1989; Bateman et al., 1992; Gift & Stevens, 1997), the treatment of multistate versus binary data (compare Pimentel & Riggins, 1987; Pleijel, 1995; Wilkinson, 1995), ordered versus unordered characters (see Mickevich & Lipscomb, 1991: 127; Scotland, 1992c: 16; Quicke, 1993: 25 for illustrations of different character state transformation series), and missing entries in a data matrix (Doyle & Donoghue, 1986; Nixon & Davis, 1991; Platnick, 1991; Maddison, 1993).

In this study, 'ordinary character coding is based on the notion of character-state transformation series, in which states of the same character are seen as transformations of one another, and the whole assemblage of mutually transformable states forms a character' (de Pinna, 1996: 10). In this paper, the term binary refers only to presence/absence characters and not to two-state characters, for example 2 or 4 stamens. Multistate characters are consequently taken to be all characters with two or more states. This definition clarifies the difference between binary and two-state characters where the 0 may mean two completely different things: either 0 is the absence of character state 1 (binary), or 0 is the presence of a different character state homologous to 1 (two-state/multistate). Only discrete characters were selected for cladistic analysis. Continuously variable characters were excluded in this study because of subjectivity in coding character states (Pimentel & Riggins, 1987; Gift & Stevens, 1997) and because these data inflate tree length (Cranston & Humphries, 1988). All assumptions regarding the direction of transformation series were considered inappropriate prior to analysis (Hauser & Presch, 1991) and characters were treated as unordered throughout.

The data matrices

In preliminary analyses, discussed in Sidwell (1997), 48 characters were scored for 23 taxa forming a baseline data matrix from which all further analyses were derived. Missing data were present in 19/48 characters and in 19/23 taxa either because it was inapplicable to score a character for a particular taxon, or because a taxon was polymorphic for a particular character. In the analysis presented here, the baseline data matrix was transformed to remove both inapplicable and polymorphic missing data from the analyses. Three groups of characters were recoded to remove inapplicable missing data following Maddison (1993) and seven taxa, polymorphic for at least one character, were divided into monomorphic subunits following Nixon & Davis (1991). The 32 characters used in these analyses are presented in Table 1. The data matrix of 32 terminal units scored for the 32 characters is presented in Table 2.

RELATIONS OF THE SPECIES OF *BRILLANTAISSIA* 2: ANALYSIS OF THE DATA MATRIX

Data were analysed using the mh*bb* command of HENNIG86 version 1.5 (Farris, 1988). Tree Gardener version 2.2 (Ramos, 1997) was used to edit matrices, run HENNIG86 via a windows shell and to

Table 1 List of 32 characters, numbered 0–31 to fit with conventions of HENNIG86 (Farris, 1989), scored for cladistic analysis of 32 taxa of Acanthaceae listed in Table 2.

No.	Character description
0.	Inhibition and/or innovation zones below synflorescence: absent (0), present (1)
1.	Leaf blade shape: broadly ovate to ovate 1:1–2 (0), linear-lanceolate (1)
2.	Leaf margin: entire or subentire (0), strongly rather irregularly toothed (1)
3.	Leaf pubescence: glabrous (0), pubescent (1)
4.	Petiole: absent (0), present unwinged (1), present entire or subentire wing (2), present clearly toothed wing (3)
5.	Proliferation zone: absent (0), present (1)
6.	Main florescence shape: spicate (0), paniculate (1)
7.	Enrichment zone of axillary/lateral inflorescences: absent (0), present (1)
8.	Bract shape: broadly ovate/ovate/linear (0), obovate/rounded (1)
9.	Bract base: not clasping rachis (0), clasping rachis (1)
10.	Bract pubescence: eglandular (0), glandular (1)
11.	Sepal length: equal/subequal (0), unequal (1)
12.	Sepal shape: linear (0), spatulate (1)
13.	Sepal fusion: free (0), fused (1)
14.	Sepal width: upper sepal slightly wider than the lower four (0), upper sepal highly developed, usually twice as wide as the lateral sepals (1)
15.	Corolla shape: not bilabiate (0), bilabiate hooded but not laterally compressed (1), bilabiate hooded and laterally compressed (2),
16.	Corolla hinge: absent (0), present (1)
17.	Upper corolla lip pubescence: subglabrous (0), glandular pubescent (1)
18.	Stiff trichomes on lower corolla lip: absent (0), present (1)
19.	Stamen arrangement: four fertile stamens (0), two posterior stamens with staminodes ca 1mm long (1), two posterior stamens with staminodes >2mm long (2), two anterior stamens with no staminodes
20.	Anther spur: absent (0), present (1)
21.	Number of colporate apertures in pollen: three (0), four (1)
22.	Colpus size: long (0), short/very short (1)
23.	Paired aperture position: equatorial (0), opposite pairs at uneven height (1)
24.	Atrium at pore: absent (0), present (1)
25.	Pollen shape: spheroidal (0), prolate or subprolate (1)
26.	Collumellae shape: not branched at base (0), branched at base (1)
27.	Ornamentation: single reticulum (0), double reticulum (1)
28.	Spines on pollen: absent (0), present (1)
29.	Style: not persistent in fruit (0), persistent in fruit (1)
30.	Number of ovules in the fruit (both locules): less than ten (0), greater than 10 (1)
31.	Fruit trichomes: absent (0), present (1)

view trees. CLADOS (Nixon, 1992) was used to look at character distribution on the HENNIG86 trees. Two types of character transformations were plotted onto the trees using CLADOS: either as unique occurrences (synapomorphies) in black or white or convergence or parallelism (homoplasy) in grey. The values of tree length, consistency index (CI) and retention index (RI) are provided. All characters are treated throughout as unweighted.

Results

The analysis produced 122 equally parsimonious trees, 87 steps long, CI=0.42 and RI=0.76. Tree 25/122 is presented in Figure 6 and the strict consensus of these trees is presented in Figure 7. Apart from a few collapsed nodes, the consensus tree (Fig. 7) is very similar to the tree given in Figure 6, and the major clades are the

same in both trees. Although the consensus tree (Fig. 7) is accepted as a working hypothesis of the phylogeny of *Brillantaisia*, the results are discussed here with reference to the characters shown on the tree in Figure 6. The results show that *Brillantaisia* and six species of *Hygrophila* both belong within a monophyletic group, the tribe Hygrophileae, based on a suite of pollen characters [21(1); 22(0); 23(1); 24(0); 25(0); 26(0) & 27(1)] and an entire to subentire leaf margin [2(0)] (this character reverses further up the tree [2(1)] in the species *B. kirungae*, *B. owariensis* and *B. vogeliana*). The outgroup to the *Brillantaisia-Hygrophila* clade is a group with non-bilabiate corollas [15(0)] containing the species *Eremomastax speciosa*, *Mellera lobulata* and *Mimulopsis solmsii*. The ((*Brillantaisia-Hygrophila*) (*Eremomastax (Mellera-Mimulopsis)*)) clade is characterized by the presence of paniculate inflorescences [6(1)] and sepals which are free or fused only slightly at the base [13(0)].

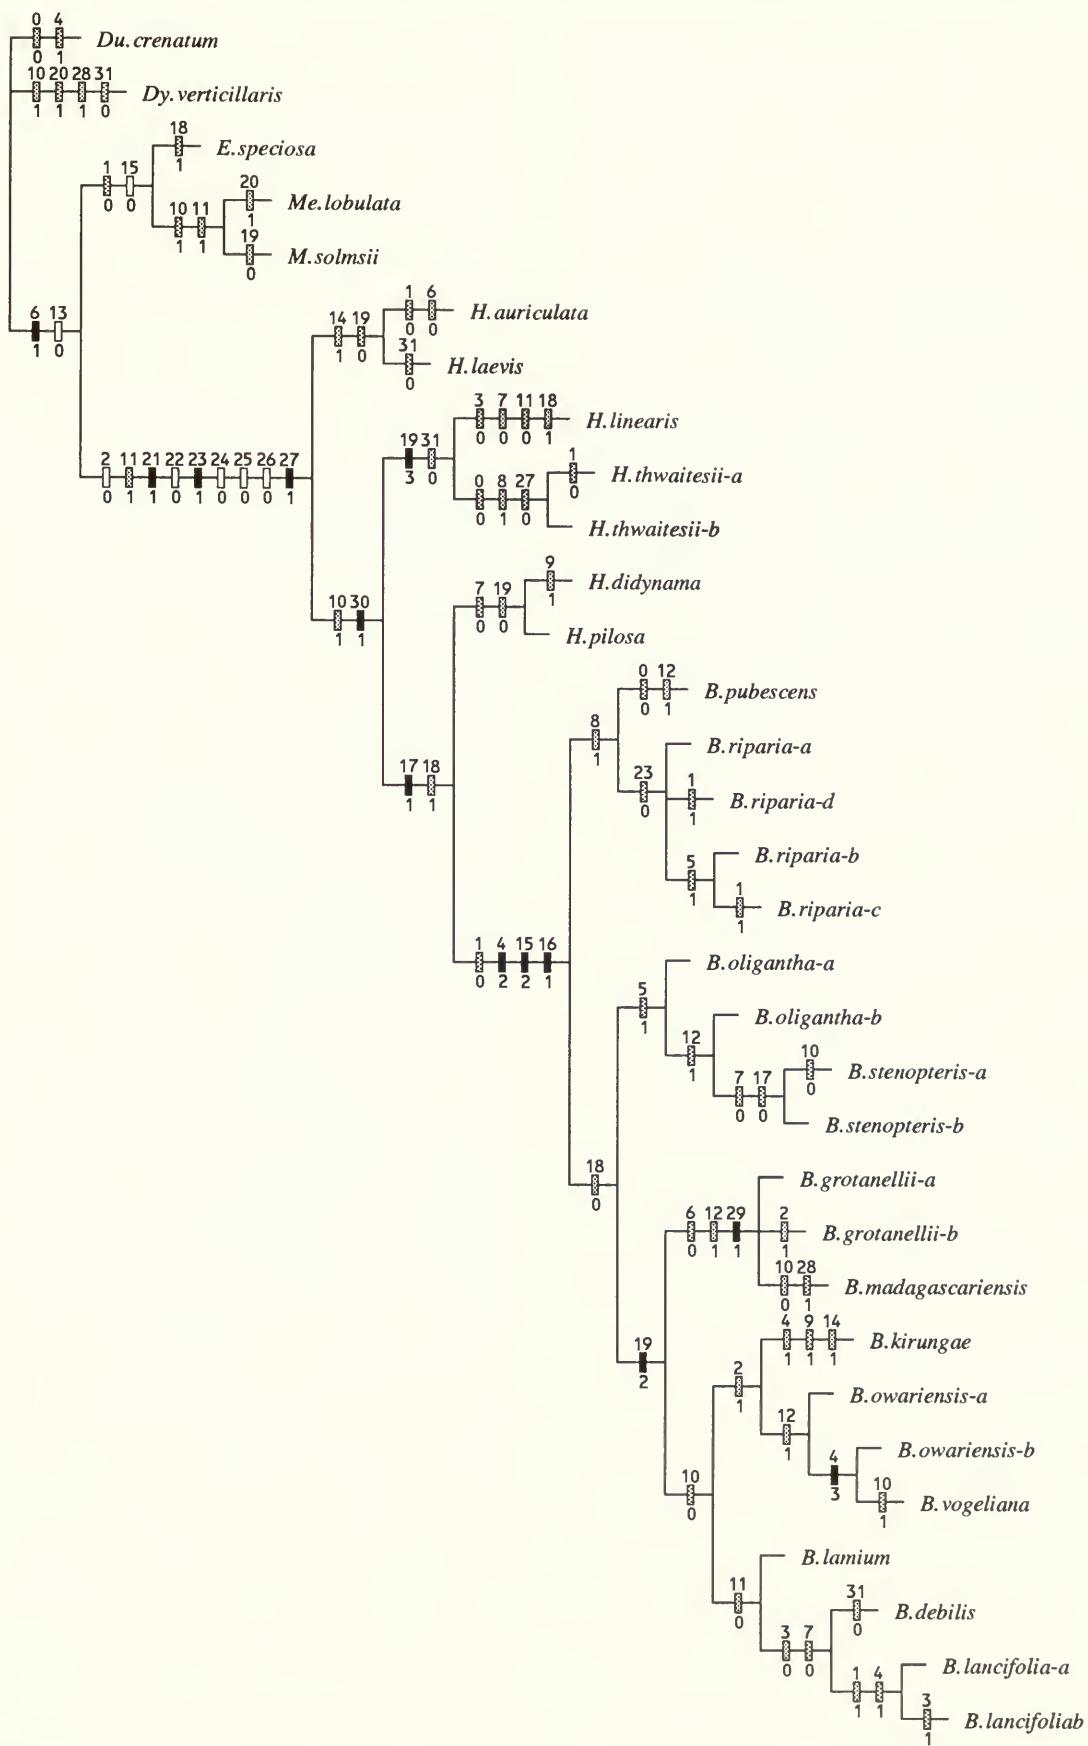

Table 2 Data matrix of 32 terminal units derived from recoding polymorphic missing data scored for the 32 morphological characters presented in Table 1.

Duosperma crenatum and *Dyschoriste verticillaris* form an unresolved outgroup to all other species in this analysis. Within the *Brillantaisia-Hygrophila* clade, the twelve species of *Brillantaisia* form a monophyletic genus based on a laterally compressed upper corolla lip [16(1)], a membranous hinge at the apex of the corolla tube [15(2)] and a winged petiole with an entire or subentire margin [4(2)]. Within *Brillantaisia*, a clade containing eight species is delimited on the presence of staminodes greater than 2 mm long [19(2)]. The other four species within the genus all have minute staminodes and form a partially unresolved outgroup to that clade. Section *Stenanthium* of Lindau, recognized by him as consisting of all species of *Brillantaisia* with spicate inflorescences (*B. grottanelli* and *B. madagascariensis*) is monophyletic in this analysis based on the persistence of the style in fruit [29(1)], a character which maybe an artifact of the maturity of specimens

examined for those species and requires reconsideration. Section *Stenanthium* of Lindau containing all other species of *Brillantaisia* is paraphyletic. Subgeneric taxa are not formally recognized in this account. The six species selected to represent *Hygrophila* form successive pairs of sister taxa to *Brillantaisia*. However, in this analysis, *Hygrophila* is paraphyletic and requires further study, including a more comprehensive cladistic analysis, before the precise sister group to *Brillantaisia* can be identified. *Hygrophila* is necessarily accepted as a paraphyletic genus for nomenclatural convenience, but it should be recognized as a diverse group, in need of revision, and is best conceived as comprising all members of the tribe Hyphileae that do not belong within *Brillantaisia*. Within the constraints of time and the Linnaean hierarchy, acceptance of well known groups which are paraphyletic is inevitable.

Fig. 6 One of 122 equally parsimonious trees (tree 25/122) produced from analysis of the data matrix in Table 1. Synapomorphic characters are shown by the black and white bars and homoplasious characters by the grey bars. Character numbers are given above each bar and the state of that character is given below each bar.

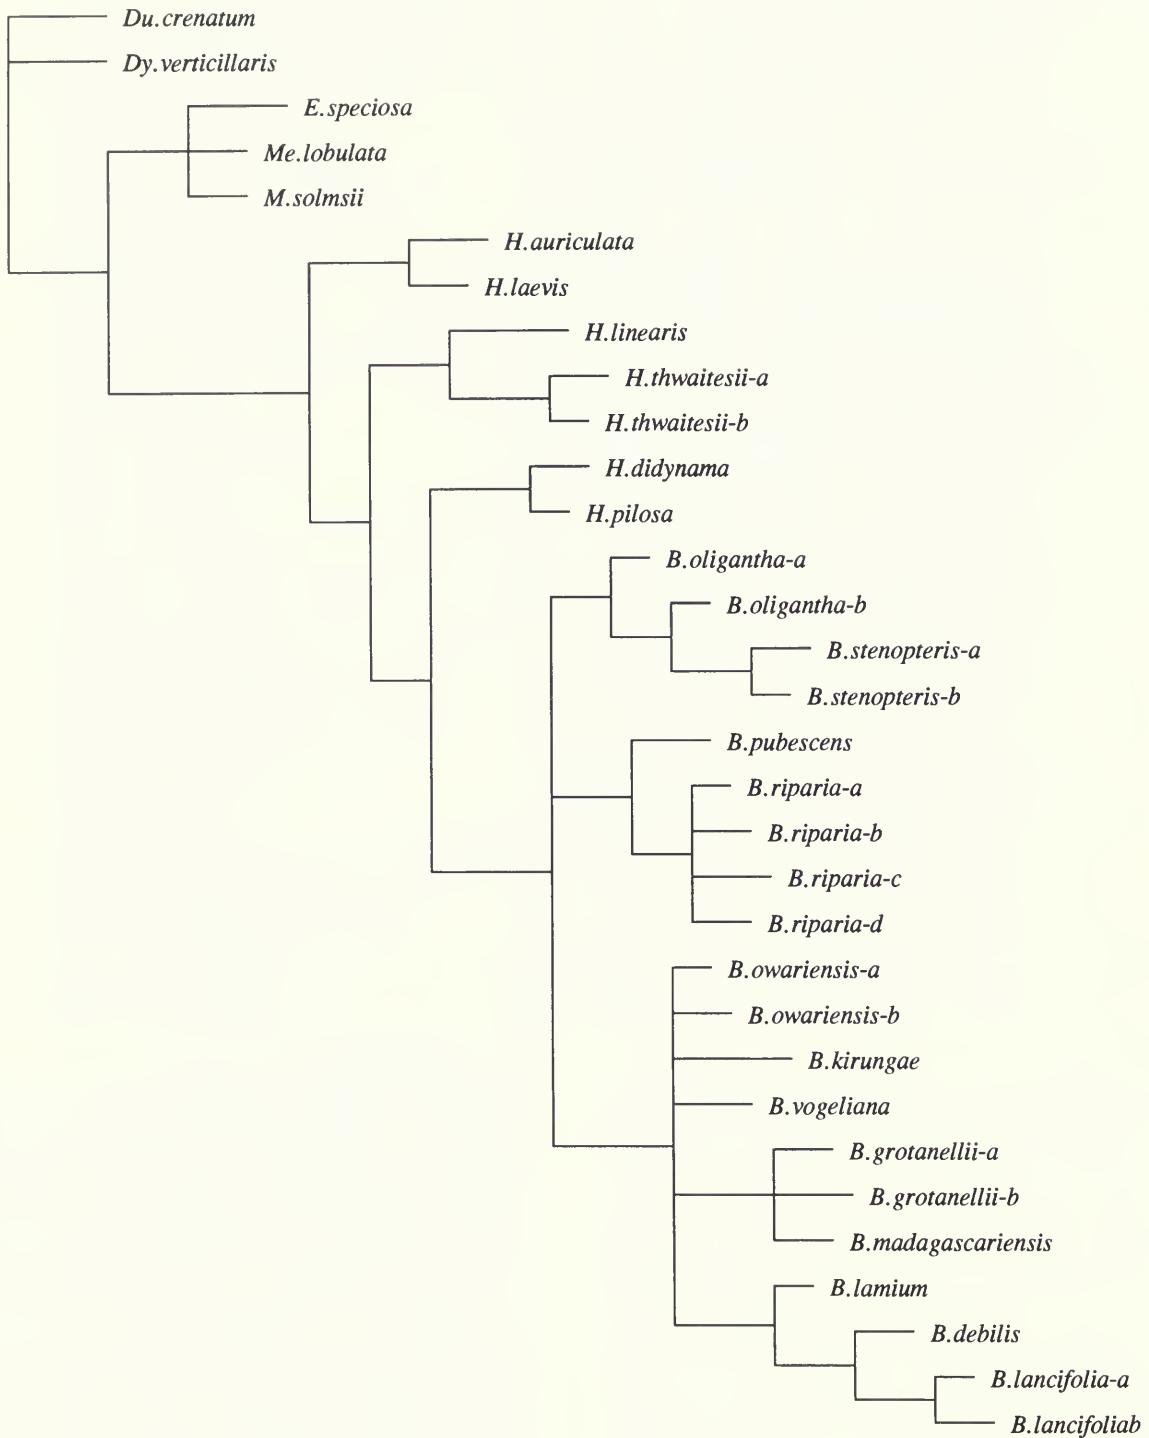

Fig. 7 Strict consensus of 122 trees produced from analysis of the data matrix in Table 1.

TAXONOMIC ACCOUNT

Brillantaisia P. Beauv., *Flore d'Oware* 2: 67. t. 100, fig. 2 (1818); Burkil in *Fl. trop. afr.* 5: 37 (1899); Durand & Durand, *Syll. fl. congol.*: 416–418 (1909); Chevalier, *Explor. bot. Afrique occ. fran^c.* 1: 493 (1920); Robyns, *Fl. parc nat. Albert* (1947); Heine in *Fl. W. trop. Afr.* 2nd ed., 2: 405 (1963); Heine in *Fl. Gabon* 13: 28 (1966); Benoist, *Fl. Madag. fam.* 182: 28 (1967); Agnew, *Upl. Kenya wild fls.* 583 (1974); Troupin, *Fl. pl. lign. Rwanda*: 84 (1982); Champluvier in *Fl. Rwanda* 3: 444 (1985). Type species: *Brillantaisia ovariensis* P. Beauv., *Flore d'Oware* 2: 68, t. 100, fig. 2 (1818).

Belantheria Nees in DC., *Prodr.* 11: 96 (1847). Type species: *Belantheria belvisiana* Nees in DC., *Prodr.* 11: 96 (1847).

Leucoraphis Nees in DC., *Prodr.* 11: 97 (1847). Type species: *Leucoraphis vogeliana* Nees in DC., *Prodr.* 11: 97 (1847).

Ruelliola Baillon in *Bull. Mens. Soc. Linn. Paris* 2: 852 (1890); Baillon, *Hist. pl.* 10: 427 (1891); Lindau in *Nat. Pflanzenfam.* 4(3b): 307 (1895). Type species: *Ruelliola grevei* Baillon in *Bull. Mens. Soc. Linn. Paris* 2: 852 (1890).

Erect to prostrate herbs to erect, sturdy shrubs. Stems square, usually swollen at the nodes, glabrous to densely pubescent; cystoliths longitudinal, narrowing towards one end. Leaves opposite, decussate, petiolate, broadly ovate to ovate, occasionally elliptic or linear-lanceolate; leaf base cordate or truncate to cuneate; apex acute or acuminate; margin entire to irregularly toothed; glabrous to pubescent above and below; indumentum of multicellular, eglandular trichomes, evenly pilose to dense and villose above, mainly on midrib and primary lateral veins below; cystoliths usually visible, with a hand lens, above and below over entire leaf surface. Petiole usually winged, lamina decurrent in top half of petiole, though occasionally broadly winged to base; petiole wing margin entire, occasionally toothed towards apex. Inflorescence a variously modified dichasium forming either a terminal thyrsus and/or lateral axillary thyrsus with vegetative growth occasionally continuing above flowering axes; dichasial branching usually lax, becoming monochasial towards base of inflorescence, occasionally contracted forming spike with flowers appearing in verticillasters. Bracts on main inflorescence axis ovate to broadly ovate, foliaceous, equal in size to the uppermost leaves at base of inflorescence, becoming smaller towards the apex of the inflorescence; bractlets on lateral inflorescence branches linear to obovate. Calyx with five equal or unequal, linear to spatulate sepals, dorsal sepal longer and usually broader than the four lateral sepals; usually hirsute, with glandular and eglandular trichomes. Corolla two-lipped, purple, magenta, blue or violet, occasionally white; corolla tube cylindrical, often paler than corolla lobes, with two brown-yellow markings in throat; upper lip hooded, laterally compressed, two-lobed at apex, often glandular pubescent on outer surface; lower lip broad, ridged and bullate above, reflexed at edges, three-lobed at apex, occasionally with stiff trichomes on adaxial surface, two membranous lateral pouches at base of lower lip form a hinge with the apex of the corolla tube. Androecium with two posterior stamens fertile; filaments white, flattened, often sparsely pubescent towards the base; anthers sagittate, dorsifixed; two anterior stamens reduced to slender staminodes, often with membranous vestigial anther at apex, occasionally minute or absent. Gynoecium with slender, linear style, often sparsely pubescent towards base; stigma a single flattened lobe at the end of the style, second, lower lobe reduced to minute tooth; ovary two-locular on annular disc, usually pubescent, placentation axial; ovules numerous. Fruit a linear, convex, two-valved capsule, pointed at apex with deep longi-

tudinal groove down centre of each valve, green with red apex when immature, brown to black when dry, glabrous or glandular and/or eglandular pubescent, elastically dehiscent. Seeds rounded to slightly kidney shaped, flattened, each held on a hardened, hook-shaped retinacula, covered with adpressed trichomes which are hygroscopic and expand rapidly, producing mucous when wet.

DISTRIBUTION. Throughout tropical Africa with two species extending to Madagascar.

HABITAT. The distribution of *Brillantaisia* species is centred in the Guineo-Congolian rain forests with species also occurring in montane rain forests and woodland throughout Africa. Plants of *Brillantaisia* are often found in mesic sites or rooted in water and when in drier savannah type vegetation only occur in shady, wetter places. In West Africa *Brillantaisia* is commonly found in disturbed areas (e.g. roadsides, plantations, farmland).

Brillantaisia is a genus of 12 species several of which are widespread and tend to be very variable morphologically, and is most diverse in the Guineo-congolian forests. Many species have previously been described in the genus based on local variation which has been shown to be continuous by extensive study of specimens. The variation within each species is discussed in detail after each description. A full list of specimens studied is provided in Sidwell (1997) and a constantly updated list is available from the author.

Key to fertile specimens of *Brillantaisia*

- Inflorescence a contracted thyrsus with short peduncles, forming a spike; flowers/fruit in verticillasters 2
- Inflorescence a lax thyrsus with elongated, clearly visible peduncles 3
- Bracts with glandular and eglandular trichomes, linear-ovate; style often pubescent towards apex 11. *B. grottanellii*
- Bracts lacking glandular trichomes, ovate to broadly ovate; style pubescent only at base 12. *B. madagascariensis*
- Bractlets obovate-rounded, shortly petiolate; corolla lips less than twice the length of the corolla tube; sepals spatulate; flowers with stiff, unicellular trichomes on inner surface of lower lobe 4
- Bractlets linear; corolla lips more than twice the length of the corolla tube; sepals linear or spatulate; flowers lacking unicellular trichomes on inner surface of lower lobe 5
- Flowers small, 12–25 mm long, inflorescence highly branched; leaves 1.25–1.8 times longer than wide 1. *B. pubescens*
- Flowers large, 30–40 mm long; inflorescence branched 3–4 times; leaves 1.9–3.0 times longer than wide 2. *B. riparia*
- Leaves lanceolate to elliptic, occasionally ovate, entire or barely crenate; inflorescence narrow terminal thyrsus branching 1–2 times 9. *B. lancifolia*
- Leaves ovate to broadly ovate, entire or clearly toothed; inflorescence lax, open, terminal or lateral thyrsus branching 2–many times 6
- Fruit glabrous or with a few erect trichomes at the apex; leaves entire or subentire 7
- Fruit pubescent; leaves toothed, or if leaves entire to subentire, inflorescences slender, lateral, thyrsus with apex usually reverting to vegetative growth 8
- Leaves pubescent particularly towards petiole; fruit 22–30 × 2–5 mm, with 14–16 seeds per locule 8. *B. larium*
- Leaves usually glabrous; fruit 18–22 × 1–2 mm, with 18–28 seeds per locule 10. *B. debilis*

8. Fruit with 8–10 very rarely to 16 seeds per locule; woody shrub or small tree, leaves often drying black 6. *B. kirungae*
 Fruit always with more than 12 seeds per locule; herb to 2 m tall, not drying black 9
9. Flowers 15–25 mm long (rarely to 35 mm); fruit with 20–24 seeds per locule; leaves thin, rather papery when dry, often toothed at the top of the petiole wing 7. *B. vogeliana*
 Flowers 30–45(–50) mm long; fruit with 12–20 seeds per locule; leaves not thin and papery when dry, petiole wing usually entire 10
10. Lower corolla lip with clearly visible multicellular trichomes on upper surface 3. *B. oligantha*
 Lower corolla lip glabrous 11
11. Leaf margin subentire or with small serrations; petiole wing tapering gradually to base of petiole; lower corolla lip strongly reflexed, centre of lower lip bent up to 90° 4. *B. stenopteris*
 Leaf margin usually strongly toothed; petiole wing tapering gradually to broad and toothed; lower corolla lip not strongly reflexed 5. *B. owariensis*

1. *Brillantaisia pubescens* T. Anderson ex Oliv. in *Trans. Linn. Soc. London* **29**: 125 (1875); Burkhill in *Fl. trop. afr.* **5**: 38 (1899); Durand & Durand, *Syll. fl. congol.*: 417 (1909); De Wild., *Contr. Fl. Katanga* **1**: 143 (1913); Benoist in *Cat. pl. madag.* **13** (1939); Vollesen in *Opera Bot.* **59**: 79 (1980); Vollesen & Brummitt in *Kew Bull.* **36**: 571 (1981). Type: Tanzania, Khutu, Kirengwe, Grant s.n. (K!-holotype).

Fig. 8. Map in Vollesen & Brummitt (1981: 571).

Brillantaisia rutenbergiana Vatke in *Abh. Natürwiss. Vereine, Bremen* **9**: 131 (1885); Palacky, *Cat. pl. madag.* **3**: 57 (1907). Type: Madagascar, Andranovaka, Rutenberg s.n. (P-holotype).

Ruelliola grevei Baillon in *Bull. Mens. Soc. Linn. Paris* **2**: 852 (1890); Baillon, *Hist. pl.* **10**: 427 (1891); Lindau in *Nat. Pflanzenfam.* **4**(3b): 307 (1895). Type: Madagascar, Greve 26 (P!-holotype; P!-isotype).

Brillantaisia anomala Lindau in *Pflanzenw. Ost-afr.* C: 366 (1895); Lindau in *Bot. Jahrb. Syst.* **24**: 312–313 (1898); Lindau in *Nat. Pflanzenfam.* **4**(3b): 296 (1895). Type: Mozambique, Villa Gouveia, de Carvalho s.n. (COI-holotype).

B. pubescens var. *rutenbergiana* (Vatke) Benoist in *Cat. pl. madag.* **13** (1939).

Hygrophila pubescens (T. Anderson ex Oliv.) Benoist in *Fl. Madag. fam.* **182** **1**: 36 (1967) non Nees (1847).

Icones: Anderson in *Trans. Linn. Soc. London* **29**: pl. 125 pro parte (1875); Benoist in *Fl. Madag. fam.* **182**. **1**: fig. IV 14–18 (1967).

Straggling annual, highly branched, aromatic herb, (0.3–)0.45–1 m tall, smelling minty or balsamic. *Stems* 2–5(–14) mm in diameter, covered in short glandular trichomes and longer fine, white eglandular trichomes. *Leaves* broadly ovate to ovate 50–110 × 85–160 mm, often caducous; leaf base cuneate to shortly attenuate, occasionally truncate; apex acute; margin entire, occasionally slightly crenate; indumentum of silky, eglandular trichomes above and below; lateral veins 7–9(–13) each side of midrib; petiole to 75 mm long, winged towards lamina, wing narrow, decurrent on petiole in upper $\frac{1}{2}$ – $\frac{1}{2}$. *Inflorescence* highly branched open thyrses with lateral inflorescences to base of stem, branches slender, rachis indumentum irregularly glandular-pubescent with longer eglandular trichomes. *Bracts* obovate to elliptic, to 35 × 45 mm, petiolate, irregular glandular pubescent on both surfaces; bractlets obovate-rounded, to 5 × 8 mm, persistent. *Sepals* unequal, spathulate, larger upper sepal 12–14 × 0.5 mm, 1.5–2 mm wide at broadened apex, smaller lateral sepals 8–10(–13) × < 0.5 mm, pubescence of slender eglandular trichomes with shorter glandular trichomes, denser towards spathulate apex. *Corolla* purple to pale purple/pink occasionally with white upper lip, tube 5–10 mm long; upper lip 8–13(–15) mm long, pubescent externally; lower lip 7–12(–15) mm; trichomes on lower lip white, purple at apex; apical lobes 1 × 1 mm, central lobe smaller. *Androecium* with filaments 6–8 mm long; anthers 1–2.5 mm long; staminodes minute < 0.5 mm long or absent, glabrous. *Gynoecium* with style 8–9 mm long; stigma 1 mm long; ovary 2–3 mm long, glandular pubescent. *Capsule* 10–15 × 2–2.5 mm with 8–16 seeds per locule, yellow brown when dried, sparsely glandular pubescent with longer eglandular trichomes towards the apex.

DISTRIBUTION. East and Central Africa, Malawi, Zambia, Zimbabwe, Mozambique and Tanzania, west to Zaire, Madagascar.

HABITAT. Sandy dry places, river beds, shade on forest floor or in savannah woodlands under, for example, *Adansonia digitata* and *Faidherbia albida* trees, or with *Acacia*, *Albizia*, *Parkia*, *Lepisanthes* and *Terminalia* (Abdallah & Vollesen 95/176 K). Locally common; 0–1000 m.

SELECTED COLLECTIONS

Table 3 Four characters that differ between plants of *Brillantaisia pubescens* and *B. riparia*.

Character	<i>B. pubescens</i>	<i>B. riparia</i>
Inflorescence type	very highly branched	branched 3-4 times
Corolla length	to 25 mm	30-40 mm long
Hinge at apex of corolla tube	not well developed	well developed
Leaf shape	ovate	elliptic

Fig. 8 *Brillantaisia pubescens* T. Anderson ex Oliv. A. Habit $\times 0.7$; B. Lower leaf $\times 0.7$; C. Bract and bractlets $\times 1$; D. Gynoecium $\times 3$; E. Corolla dissection showing androecium $\times 3$; F. Capsule $\times 4$.

Brillantaisia pubescens is one of the more distinctive species in the genus. The highly branched inflorescence, small flowers and rounded persistent bracts are not found elsewhere in *Brillantaisia*. *Brillantaisia pubescens* sensu lato was split into two subspecies by Vollesen & Brummitt (1981) on the basis of flower size. I consider the large flowered plants to be a different species (*B. riparia*) and treat *B. pubescens* s.s. as including only those plants with smaller flowers. Two specimens of *B. pubescens* have slightly larger flowers than most (Tinley 2639, SRGH; Thera & Kaunda 313, PRE); however, the leaf shape and venation are that of *B. pubescens* and this variation does not blur the boundary between *B. pubescens* and *B. riparia*. The original illustration of the small flowered *B. pubescens* by Fitch (Anderson 1875: pl. 125) almost certainly contributed to confusion over species delimitation as the type specimen was represented as having many more, larger flowers than it actually has. It appears that large flowered specimens of *B. riparia* have been identified as *B. pubescens* by reference to the illustration. There are several characters by which plants of the two taxa can be clearly distinguished (Table 3).

2. *Brillantaisia riparia* (Vollesen & Brummitt) Sidwell, comb. nov. Type: Malawi, 13 miles N. of Kasungu, Dwangwa River, Pawek 3908 (K!-holotype).

Fig. 9. Map in Vollesen & Brummitt (1981: 571).

Brillantaisia pubescens var. *riparia* Vollesen & Brummitt in *Kew Bull.* **36**: 571 (1981); Vollesen in *Opera Bot.* **59**: 79 (1980).

Icon: Anderson in *Trans. Linn. Soc. London* **29**: pl. 125 pro parte (1875).

Annual viscid-pubescent, aromatic, rather woody herbs to 0.5–1 m tall. Stems erect or ascending; pilose with eglandular and glandular trichomes. Leaves oblong, elliptic to ovate 20–25(–52) × 39–59(–95) mm, often fallen below; uppermost leaves of main axis oblong, 5–8 × 10–15 mm; base gradually tapering, cuneate; apex acute, rounded at tip; margin entire to slightly crenate; glabrous to pilose; lateral veins 4–9(–11) each side of midrib; petiole 14–22 mm long, lamina decurrent on petiole forming very narrow wing sometimes to base. Inflorescence leafy-bracteate terminal thyrses, with lower lateral panicles, occasionally with vegetative growth continuing at apex; rachis covered in short simple trichomes with longer fine, non glandular and stalked glandular trichomes. Bracts as leaves; bractlets elliptic-obovate, rounded at apex, margin entire, glandular trichomes and slender white trichomes above and below. Sepals unequal, larger upper sepal linear-spathulate, 14–18 × 1 mm; smaller lateral sepals spathulate, 9–14 × 0.5–1 mm. Corolla purple to blue-purple; corolla tube 13–15 × 2 mm; upper lip 20–25 mm long, glabrous; lower lip

20–25 mm long, glabrous below, with straight erect stiff trichomes on centre of inner surface, trichomes white with a dark purple-black tip; apical lobes 2 × 2–3 mm, triangular, rounded to blunt or notched at apex. Androecium with filaments (10–)20–22 mm long; anthers 4–5 mm long; staminodes 3–4 mm long, pale, translucent, difficult to see with the naked eye, broadened slightly at apex sometimes to curved vestigial anther. Gynoecium with style to 30 mm long, stiff upward pointing trichomes towards base; stigma 2 mm long; ovary 3 mm long glandular pubescent. Capsule 14–19 × 2 mm with 8–12 seeds per locule, light brown, covered with simple short trichomes and longer, glandular trichomes.

DISTRIBUTION. Mozambique and Malawi.

HABITAT. Damp, shady places; 1000 m.

SELECTED COLLECTIONS

MOZAMBIQUE: Vila Cabral, 8 September 1942, Mendonça 680 (LISC); Nampula, 3 October 1942, Mendonça 1219 (LISC); between Namapa and Chiure, 19 August 1948, Barbosa 1812 (LISC); Niassa, Vila Cabral, Meponda, 9 September 1958, Monteiro 46 (LISC). MALAWI: Kasungu, 27 August 1946, Brass 17442 (BM, MO, NY, SRGH, US); Machinga, 19 October 1979, Banda & Salubeni 1571 (MO, SRGH); Liawazi river, 3 September 1986, Kaunda & Usi 429 (MAL); Liwonde, 9 September 1988, Banda & Kaunda 3452 (MO).

Brillantaisia riparia was considered a variety of *B. pubescens* by Vollesen & Brummitt (1981). Due to the difference in flower size and shape, leaf shape, leaf venation and inflorescence structure, I consider *B. riparia* a separate species from *B. pubescens*. The two species are clearly very closely related yet are easily distinguished in the field. Brummitt (pers. comm.) noted that *B. riparia* should be compared with *B. oligantha*. *Brillantaisia riparia* and *B. oligantha* are superficially similar, both having lateral inflorescences, trichomes on the lower lip of the corolla and flowers of roughly equal size. However, there are several differences in gross morphology (Table 4) that clearly separate the two.

3. *Brillantaisia oligantha* Milne-Redhead in *Mem. New York Bot. Gard.* **9: 20–21 (1954); Binns, *Check List Herb. Fl. Malawi*: 12 (1968). Type: Malawi, Nchisi Mountain, 30 January 1946, Brass 17042 (K!-holotype; BM!, MO!-isotypes).**

Fig. 10. Map 1.

Viscid herb 0.3–1.8 m tall. Stems 2–2.5 mm across, slightly winged on angles of stem, pubescent, with straggling eglandular and shorter multicellular glandular trichomes. Leaves ovate to broadly ovate, 36–65(–130) × 87–160(–210) mm; leaf base cuneate to attenuate; apex acuminate; margin subentire to shallowly crenate or dentate; subglabrous to roughly pubescent; 7–10(–16) lateral veins each side

Table 4 Four characters that differ between plants of *Brillantaisia riparia* and *B. oligantha*.

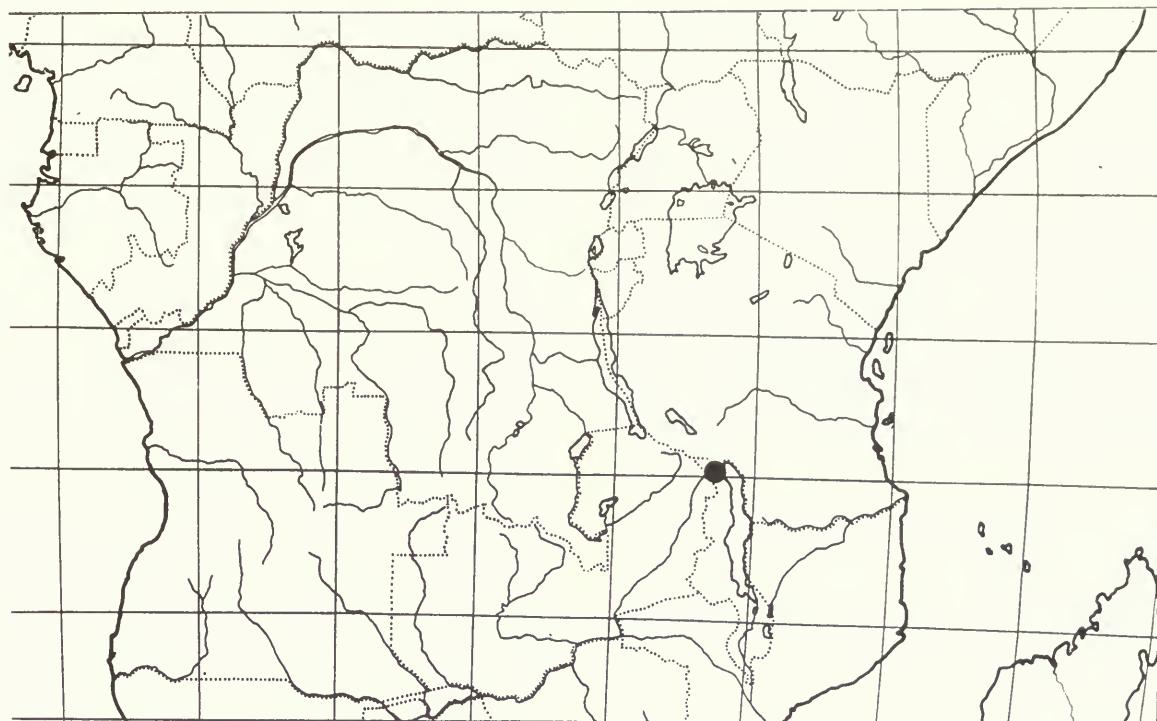

Character	<i>B. riparia</i>	<i>B. oligantha</i>
Inflorescence branching	stout, straight	slender, curving
Corolla tube	straight, long, narrow	inflated, short, broad,
Lower corolla lip trichomes	straight, single celled	multicellular
Lower corolla lip shape	gibbous, not strongly reflexed	strongly reflexed

Fig. 9 *Brillantaisia riparia* (Vollesen & Brummitt) Sidwell. A. Habit $\times 0.7$; B. Corolla dissection showing androecium $\times 2$; C. Capsule $\times 3.2$; D. Gynoecium $\times 2$; E. Bract and bractlets $\times 1$.

Fig. 10 *Brillantaisia oligantha* Milne-Redhead. A. Habit $\times 0.7$; B. Corolla dissection showing androecium $\times 2.5$; C. Capsule $\times 1.8$; D. Gynoecium and calyx $\times 2.5$; E. Bract and bractlets $\times 3$.

Map 1 The distribution of *Brillantaisia oligantha* Milne-Redhead.

of midrib; petiole (15–)40–70(–120) mm long, lamina decurrent on petiole forming a slender wing almost to the base of the petiole. Inflorescence lateral few flowered thyrses to 45–75 mm long, branches very slender, branching 3–4 times, rachis pubescent. Bracts as leaves; bractlets narrowly obovate (0.3–)1.5–4 × (0.8–)2–9 mm, glandular pubescent above and below. Sepals unequal; linear to spatulate, larger upper sepal 6–10 × 1 mm, smaller lateral sepals 5–9 × 0.5 mm, pubescent. Corolla deep blue to purple, sometimes tinged brown on the upper lip, corolla tube 3 × 7.5 mm; upper lip 13–17 mm long, sparsely pubescent outside; lower lip 14–18 mm long, strongly reflexed with lateral fold down centre and deep hinge at base, multicellular trichomes on inner surface; apical lobes to 2.5 × 3 mm. Androecium with filaments 10–15 mm long, pubescent at base; anthers 1–4 mm long; staminodes 1 mm long with small vestigial anther. Gynoecium with style 1–1.5 mm long, pubescent along the entire length; stigma 20–25 mm long; ovary 3 × 1 mm, covered in short glandular trichomes. Capsule 20–27 × 1–2 mm with 10–12 seeds per locule, very sparse, short, glandular trichomes.

DISTRIBUTION. Restricted to the Nchisi and Mughese mountain ranges in Malawi.

HABITAT. Shady places in wet forest, or in dry evergreen or semi-evergreen forest, also along roadsides in these areas. Locally common; 1000–1400 m.

SELECTED COLLECTIONS

MALAWI: Nchisi Mountain, 29 July 1946, Brass 17021 (NY); 30 July 1946, Brass 17042 (BM, K, MO); 10 July 1960, Chapman 827 (BM); 1 September 1970, Salubeni 1485 (SRGH); Salubeni 1487 (MAL, PRE, SRGH); Chitipa district, Mughese, 12 September 1977, Phillips 2836 (MO); Pawek 12984 (K, LISC, MAL, MHU, MO, SRGH).

Brillantaisia oligantha is an easily distinguished species, with lat-

eral axillary inflorescences only. The lower corolla lip is more strongly reflexed in *B. oligantha* than in other species of the genus and has multicellular trichomes on the adaxial surface. Previously thought to be restricted to the Nchisi mountains of Malawi, collections from Mughese in Malawi are clearly the same species. *Brillantaisia oligantha* can appear morphologically similar to *B. riparia*, both species having entire leaves and fine white silky trichomes on vegetative parts, however, *B. oligantha* has a much shorter, broader corolla tube, a more hooded upper lip, and a more slender, less branched inflorescence. This species is also closely related to *B. stenopteris* Sidwell, sp. nov. from Tanzania. However, the new species has larger flowers, lacks any trichomes on the lower lip of the corolla and is found in a different habitat to *B. oligantha*.

4. *Brillantaisia stenopteris* Sidwell, sp. nov. Type: Tanzania, Morogoro region, Kombola, 8 July, 1933, Schlieben 4068 (LISC!-holotype, MO!, PRE!-isotypes)

Fig. 11. Map 2.

Herba perennis usque ad 2 m alta. Folii lamina ovata vel latiovata 25–144 mm longa, 40–220 mm lata, apice acuminata, basi cuneata, margine obscure serrata, lamina 11–16 venatus, petiolo breviter decurrente; petiolo 15–90 mm longo. Inflorescentia ad 20 cm longa, cymosa, terminalis, interdum vegetativus ad apice. Corolla 24–30 mm longa, tubus circiter 8–9 mm longus; labium posticum 18–22 mm longum; labium anticum 17–23 mm longum, glabrum. Fructus incognitus. Species nova affinis *Brillantaisia oligantha* Milne-Redh. sed floribus majoribus et labium anticum sine pilis longis septatis differt.

Herbs to 2 m tall. Stems erect, 2 mm in diameter, pubescent, trichomes white, eglandular with shorter glandular trichomes. Leaves ovate to broadly ovate 25–140 × 40–220 mm; leaf base cuneate; apex

acuminate; margin serrate, occasionally subentire; adaxial surface subglabrous to roughly pubescent, abaxial surface with fine non glandular trichomes; 11–16 lateral veins on each side of the midrib; petiole 15–90 mm long, lamina decurrent on the petiole forming a narrow wing, often to the base of the petiole. *Inflorescence* open panicle, sometimes becoming vegetative at the apex, to (4)–7–20 cm long; lateral branches slender, few flowered. *Bracts* as leaves or ovate, sessile; bractlets ovate-linear 7–12 × 1–3 mm. *Calyx* unequal, sepals slightly spathulate, larger upper sepal 10–12 × 1–2 mm, smaller lateral sepals 8–10 × 1 mm; covered in long non glandular and short glandular trichomes. *Corolla* purple, corolla tube 8–10 × 3 mm, upper lip to 18–22 mm long, glandular pubescent outside; lower lip 17–23 mm long, glabrous on inner surface. *Androecium* with filaments 25 mm long; anthers 4 mm long; staminodes 1 mm long, minute, lacking vestigial anther. *Gynoecium* with style 30 mm long; stigma 4 mm long; ovary 6 mm long, densely pubescent. *Capsule* not known.

DISTRIBUTION. Restricted to the Morogoro region of Tanzania.

HABITAT. Rain forest; 1000 m.

COLLECTIONS EXAMINED

TANZANIA. Morogoro region, Kombola, 8 July 1933 Schlieben 4068 (LISC, MO, PRE); Kilosa district, 13 November 1987, Poçs et al. 8722 (UPS).

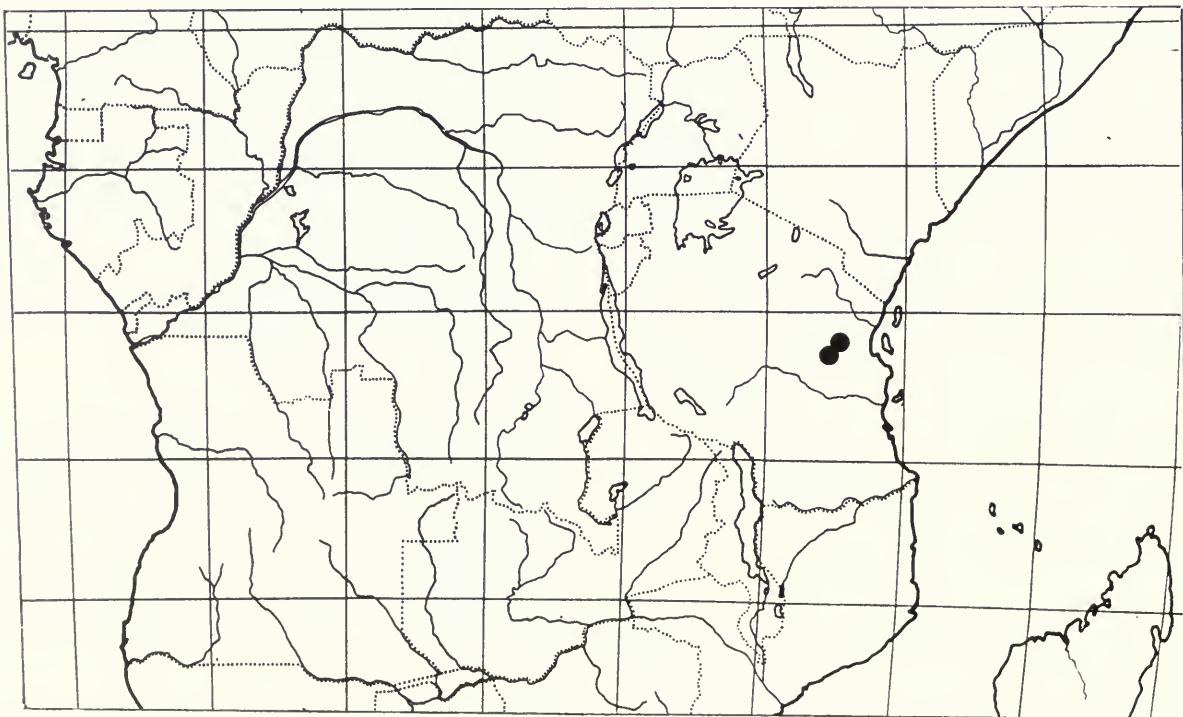

Brillantaisia stenopteris is very closely related to *B. oligantha* from the Nchisi and Mughese mountains in Malawi. The two species have similar ovate, cuneate leaves with a long slender petiole wing. However, they can be easily distinguished due to the larger flowers and absence of trichomes on the inner surface of the lower corolla lip of *B. stenopteris*. The corolla tube of *B. stenopteris* is longer and thinner than that of *B. oligantha*, resembling the corolla tube of *B. riparia*, which is also closely related to *B. stenopteris*.

Herbs or woody herbs to 1–3(–4) m tall, viscid, often aromatic. Stems 1–8(–15) mm in diameter, glabrous or pubescent towards apex. Leaves ovate to broadly ovate (35)–50–140(–210) × (25)–40–120(–185) mm; leaf base cordate to cuneate; apex acuminate sometimes markedly so; margin toothed, usually irregularly serrate, crenate towards apex with or without secondary toothing; eglandular pubescent above and below, sometimes densely pubescent; lateral veins 6–19 each side of the midrib; petiole (10)–30–90(–130) mm long, lamina decurrent in upper ½–¾ length of petiole, occasionally entire length of petiole. Inflorescence a many flowered terminal panicle (9)–15–40(–60) cm long with 4–18 nodes; rachis glandular pubescent. Bracts ovate, (3)–20–50(–75) × (5)–15–25(–40) mm, usually falling early; bractlets linear oblong, to 20 × 5 mm, eglandular pubescent. Sepals subequal to unequal, linear, (5)–9–15(–22) × 1 mm long, rounded to slightly spathulate at the apex, glandular pubescent. Corolla

pale purple to deep blue-purple often with yellow markings in throat; tube (5)–7–10(–14) × 2–6 mm long; upper lip (13)–18–30(–60) mm long, outer surface of upper lip glandular pubescent; lower lip (14)–18–30(55) mm long, glabrous; apical lobes (1)–2–5(–10) mm long; anthers (2)–5–7(–10) mm long; staminodes (10)–15–25(–30) mm long with small vestigial anther at the apex. Gynoecium with style (15)–20–35(–45) mm long; stigma 2–4(–6) mm long; ovary 3–7 mm long, pubescent. Capsule (15)–18–26(–33) × 2–3 mm with (10)–12–18(–24) seeds per locule; covered with eglandular and glandular trichomes.

DISTRIBUTION. Throughout tropical Africa.

HABITAT. Moist montane forest particularly in open shady places where competition is reduced in recently disturbed areas; 600–1600 m.

Brillantaisia owariensis is the most widespread and variable of all species in the genus and has caused many problems of species delimitation for botanists over the years. After extensive herbarium studies, supplemented by field work in Cameroon and Tanzania, I consider it impossible to split this group into discrete taxa and recognize it as a very diverse 'ochlo-species' (sensu White, 1962: 79) and accept that, although unsatisfactory, this is the only viable option without further extensive studies in the field. *Brillantaisia owariensis* sensu meo encompasses all fairly robust, woody *Brillantaisia* plants with a paniculate inflorescence, toothed leaves with a winged petiole and pubescent fruit. Morphological variation within the group appears more pronounced in certain parts of Africa. In East Africa, for example, clear morphological differences can be observed between different isolated groups and two representative specimens may look nothing like one another when the extremes of morphological variation are observed. However, when morphological variation is studied across the whole of Africa, character differences break down and distinct groups cannot be distinguished.

Variable characters include leaf shape, leaf base shape, leaf margin, number of lateral veins, calyx shape, inflorescence density, flower size, fruit length/width and fruit pubescence. The morphological variation within *Brillantaisia owariensis* is informally described below in terms of two main groups: the *nitens* group and the *patula* group.

Plants which tend to differ from typical *B. owariensis* in possessing rather finely toothed leaves, a somewhat narrow petiole wing, larger number of lateral nerves and a relatively dense inflorescence could be assigned to the *nitens* part of *Brillantaisia owariensis*. *Brillantaisia nitens* was described by Lindau (1893) as being distinct from all other Brillantasias due to the leaf pubescence, which is comparatively dense for the genus. Plants with characters of the *nitens* group tend to occur in the forests of Cameroon and further west in tropical Africa. Plants that are slightly more robust than typical *Brillantaisia owariensis*, with velvety-tomentose leaves, have previously been distinguished as *Brillantaisia bauchiensis* in Nigeria and *B. leonensis* in Sierra Leone. Specimens with longer calyx lobes and sub-persistent bracts were previously assigned to *B. mahonii*. Specimens from East Africa that generally have the same morphological characters as those of the *nitens* group, but differ in the presence of more persistent bracts, have often been identified as *B. nyanzarum*.

The *patula* group: The most distinct node of variation within *Brillantaisia owariensis* is seen on specimens that can be informally described as the *patula* group. These plants have a very open, lax, ‘zigzag’ inflorescence architecture and often have large flowers and a linear calyx. Specimens with these characteristics do not seem to be restricted to one area of Africa and have been collected from Guinea to Zaire and on São Tomé. Most *patula* specimens have been collected from the Congo basin. Leaves of the *patula* ‘node’ often, but not always, have a distinct wing to the base of the petiole (*Mocquerys* 115, Z; *Richards* 3018, BM) which is occasionally amplexicaul.

6. *Brillantaisia kirungae* Lindau in Götzen, Durch Afrika von Ost nach West, Sonderabdr.: 9 (1896); Burkhill in *Fl. trop. afr.* 5: 42 (1899); Durand & Durand, *Syll. fl. congol.*: 417 (1909); Robyns, *Fl. parc nat. Albert* 2: 269 (1947). Type: Zaire, Mount Kirunga, von Götzen 48 (B†-holotype).

B. cicatricosa var. *kivuensis* Mildbr. in *Bull. Jard. Bot. État* 17: 86 (1943); Robyns, *Fl. parc nat. Albert* 2: 270 (1947). Type: Zaire, Lake Magera, de Witte 1434 (BR!-holotype; BR!-isotype).

B. nitens sensu Agnew, *Upl. Kenya wild fls.*: 583 (1974), non Lindau (1893).

Icones: Champluvier in *Fl. Rwanda* 3: fig. 139, 1A–1D (1985); Fischer & Hinkel, *Nat. env. Rwanda*: fig. 68 (1992).

Stout shrubby herbs 1–2 m tall to shrubs or small trees 2–5(–7) m tall with bole 1.4 m high and 12 cm diameter, viscid and sometimes aromatic. Stems erect, 5–20(–120) mm across, shortly puberulent. Leaves, broadly ovate 60–320 × 50–240 mm; leaf base cordate or

truncate to attenuate or cuneate; apex acute to acuminate; margin irregularly toothed, teeth single or double, smaller becoming crenate towards the apex, rarely entire; puberulous; lateral veins 7–13 each side of the margin, lower laterals closer together; petiole (0–)10–140 mm long, lamina gradually decurrent on top ½–¾ of petiole, upper pair of leaves at base of inflorescence sessile. Inflorescence a terminal thyrs 15–25(–40) cm long, lateral branches erect, at 30–50 degrees to the main rachis, flowers crowded at end of lateral branches; rachis shortly pubescent; trichomes, red-brown, non glandular, sometimes straggly purple trichomes. Bracts broadly ovate to ovate, occasionally elliptic, base slightly amplexicaul, apex rounded to acute; bractlets ovate(-linear), falling late or remaining in fruit. Sepals unequal, larger upper sepal linear, rounded at tip or slightly spatulate, (8–)10–14(–19) × 1–3(–5) mm, often twice as wide as lateral sepals (clearly seen in bud), occasionally very large; smaller lateral sepals linear 8–15 × 1 mm; densely pubescent dorsally. Corolla pale blue to bright blue-purple or pink-purple, with darker markings on lower lip; corolla tube 6–10 × 3–6 mm, occasionally inflated; upper lip 19–35 × 6–10 mm, evenly covered in dense, eglandular and glandular trichomes; lower lip 19–40 × 10–18(–25) mm, ridged on upper surface; apical lobes triangular, 3–10 × 2–8 mm. Androecium with filaments 20–25(–30) mm long; anthers (3–)5–8 mm long; staminodes 8–12 mm, very slender often with well developed vestigial anther. Gynoecium with style 25–40 mm long; stigma 2 mm long; ovary 5–10 mm, covered in tangled glandular trichomes, sometimes also with non glandular trichomes. Capsule 30–40 × 2–5 mm with 8–10(–16) seeds per locule; black, glandular puberulous. Specimens often drying black.

DISTRIBUTION. East and central Africa, from Kenya south to Zimbabwe and Mozambique, west to Uganda and Eastern Zaire.

HABITAT. In gaps in mid altitude and montane forest, forming thickets, often along streams. Very local; 1000–3500 m.

Brillantaisia kirungae is the largest and most woody of the species of *Brillantaisia* and is easily recognized by the woody or shrubby habit; highly irregularly toothed leaves; large flowers in a crowded erect inflorescence; broad upper calyx lobe and large, few-seeded fruit. This species is rather variable in leaf shape and toothing (most collections lack the larger lower leaves, so measurements given above need refining after more field studies); the degree of contraction of the inflorescence; density of the indumentum on both the inflorescence and fruit; and flower size, particularly the size of the lobes at the apex of the lower lip. Previous treatments of *Brillantaisia kirungae* have all divided it into more than one species. For example,

Fig. 12 *Brillantaisia kirungae* Lindau. A. Habit $\times 0.7$; B. Lower leaf $\times 0.7$. C. Corolla dissection showing androecium $\times 1.4$; D. Gynoecium $\times 1.4$. E. Capsule $\times 1.4$; F. Bract and bractlets $\times 1$.

Burkill (1899) recognized four species: *Brillantaisia cicatricosa* with subglabrous sepals and numerous seeds; *B. kirungae* with lanceolate bracts; *B. ulugurica* with large flowers and large lobes at the apex of the lower corolla lip and a new species, *B. subulugurica* which was considered distinct from *B. ulugurica* due to the shorter corolla tube. More recently, Champluvier (1985) recognized two species, *B. kirungae* and *B. cicatricosa*, separated on the size of the upper sepal. All of the characters used by previous authors to divide this species are continuously variable when the entire geographical variation of the group is accounted for. In his treatment of the genus for the *Flora of Tropical East Africa* and *Flora Zambesiaca*, Vollesen (in prep *a & b*) recognizes two species within this group, *B. cicatricosa* and *B. ulugurica*. He considers plants of *B. cicatricosa* to have irregularly large-toothed leaves; smaller lower corolla lip lobes; smaller seeds, to lack glandular trichomes on the fruit and to have a more northerly distribution from Kenya, Uganda, Burundi, Rwanda and Zaire. *Brillantaisia ulugurica sensu* Vollesen is recognized as distinct on the basis of smaller irregular teeth on the leaves; leaf margin becoming entire towards the apex; larger lobes on the lower corolla lip; larger seeds; both glandular and non glandular trichomes on the fruit; and a more widespread geographical range in Uganda, Burundi, Zaire, Tanzania, Malawi, Mozambique, Zimbabwe and Zambia. Two characters used by Vollesen to distinguish *B. cicatricosa* from *B. ulugurica* are not overlapping or continuous in his species descriptions: seed size and fruit hair type. I have studied the two species across their entire range which includes specimens from Sudan and Angola. It appears that although some ‘cicatricosa-like’ specimens do have smaller flowers, deeply toothed leaves with a more cordate base, smaller seeds and no glandular trichomes on the capsule, these characters are continuously variable and there is no morphological data to support separation of the two species.

A new species from Tanzania was mentioned by Vollesen (in prep. *a*) as closely related to *Brillantaisia ulugurica*. Plants belonging to the new putative new species were recognized primarily by the presence of long, rather synthetic looking, purple, eglandular trichomes on the panicle and calyx, and by the larger capsule (no measurements given). Several intermediates between *B. ulugurica sensu* Vollesen, with short puberulent trichomes on the panicle and short glandular and eglandular trichomes on the calyx, and the purple haired sp. nov. cf. *B. ulugurica* have been studied (e.g. MOZAMBIQUE: Leach & Schelpe 11470; MALAWI: Chapman & Chapman 9271 Mt Mulanje; Burt Davy 1228) and I consider the variation to represent one species. Within the single species recognized in this treatment, plants with a more lax inflorescence, more slender sepals and smaller flowers tend to occur further north-north west (SUDAN, Gilo Village, Friis & Vollesen 58 C; RWANDA, Parc des Volcans, Van der Veken 10350, BR; UGANDA, Kanaba Pass, Makerere College 29) whereas larger more robust plants are more commonly from Malawi and Mozambique.

Typification of this species is somewhat problematic as mentioned by Champluvier (1985). I disagree with her decision to retain the epithet *cicatricosa*. Specimens of *B. kirungae* sensu meo have historically been named as *B. cicatricosa*, *B. kirungae*, or *B. ulugurica*, however, the type specimens of all three of these names were destroyed in Berlin. The protologue of the earliest name, *B. cicatricosa* Lindau, is somewhat ambiguous and does not fit the species description above. Although the Latin diagnosis of *B. cicatricosa* mentions the large upper sepal of this species, several characters do not fit the group well, notably subglabrous sepals and 16–20 seeds in the capsule. The original description of *B. cicatricosa* Lindau mentioned that the species was close to *B. pubescens* T. Anders., however without a type specimen of *B. cicatricosa* the variation observed by Lindau when he made this seemingly misplaced statement cannot be

checked. It may well be the case that Lindau based his observation on the illustration of Fitch in Anderson (1875) which has caused considerable confusion in *Brillantaisia* (see p. 86). *Brillantaisia cicatricosa* sensu Burkhill (1899) adds to the ambiguity of this name as he describes the species as having entire, glabrous leaves, a loose inflorescence, nearly glabrous sepals and 16–20 seeds, whereas the species recognized here has irregularly toothed pubescent leaves and a crowded inflorescence. A variety of *B. cicatricosa* Lindau was formally recognized by Mildbraed (1943) on the presence of glandular trichomes on the calyx. This taxon is illustrated in *Flore du Rwanda* (Champluvier, 1985) and clearly falls within *B. kirungae* as delimited here. However, I am not certain that Mildbraed saw the type specimens of *B. cicatricosa* or that he understood Lindau’s concept of that species. Therefore, as the protologue of *B. cicatricosa* Lindau is ambiguous and the description of *B. cicatricosa* by Burkhill does not fit this species, I treat this name as dubious, and use the second earliest name, *B. kirungae*, for this species.

Erect herbs to 0.2–1 m tall. Stems erect, 2–4 mm in diameter, branching near base, leaf petioles fused across each node, glabrous or shortly pubescent with a fringe of trichomes at the nodes. Leaves ovate to broadly ovate 35–100(–110) × 45–120(–150) mm, papery, bright green, paler below, evenly pilose; leaf base truncate or cordate, occasionally shortly attenuate; apex slightly acuminate, rounded; margin irregularly serrated, dentate at base of lamina around the widest part of the leaf, crenate towards the apex of the leaf; lateral veins 7–13 each side of midrib, prominent; petiole (30–)40–120 mm, lamina decurrent on upper third of petiole, wing often toothed at top. Inflorescence a terminal lax thyrsus (8–)12–20(–30) cm long, with smaller lateral inflorescences in axils of lower leaves; rachis shortly glandular pubescent with slender non glandular trichomes. Bracts to 7 × 15 mm, often falling early; bractlets linear elliptic to 2 mm long, glabrous with fringe of irregular glandular trichomes. Sepals unequal, slightly spatulate, larger upper sepal 6–15 mm long, smaller lateral sepals 6–10(–12) mm long, viscid glandular pubescent. Corolla clear

mauve-violet, white in throat with lateral yellow spots; corolla tube paler, tube 2–4 × 5–10 mm, slightly shorter than the calyx lobes; upper lip 11–15(–25) mm covered with glandular and non glandular trichomes on outer surface, more so towards the apex; lower lip 10–15(–25) mm long; apical lobes to 1 × 1 mm, central tooth broader than the laterals, glabrous. *Androecium* with filaments 12–17(–24) mm long, glabrous; anthers 2–4(–6) mm long; staminodes 6–10 mm long, flattened at tip to vestigial anther, glabrous. *Gynoecium* with style 15–20 mm long; stigma 1.5–3 mm long; ovary 3–4 mm long. *Capsule* (10–)17–21(–24) × 1–2 mm with 20–24 seeds in each locule, indumentum of slender white non glandular trichomes and short glandular trichomes.

DISTRIBUTION. Throughout West Africa and on the islands of the Gulf of Guinea across Central African Republic and Congo to Sudan, Uganda and Kenya.

HABITAT. A weedy species common in wasteland, clearings, plantations and along roadsides; 60–1200 m.

Brillantaisia vogeliana is often locally abundant as a weed along road and path sides and in clearings in secondary vegetation, small farms, plantations, etc. It is readily identified by leaves that are often cordiform, characteristically irregularly toothed and often with a toothed petiole; the highly branched inflorescence; relatively small flowers which are usually a clear mauve-violet and paler in the throat, and the pubescent fruit which have numerous seeds per locule. This species might be confused with *B. owariensis*, on the basis of the lax inflorescence and toothed leaves, and Vollesen tends to place East African specimens with rounded teeth and a wider inflorescence into that species. Plants of *B. vogeliana* differ, from those of *B. owariensis*, in possessing thinner, papery leaves with a more dentate, irregular leaf margin and pronounced dentate margin at the apex of the petiole wing; a more highly branched, slender inflorescence; smaller flowers and fruit with more seeds. A few specimens of *B. vogeliana* from the Congo basin have small flowers but larger leaves than typical *B. vogeliana* and seem to approach *B. owariensis*. White-flowered

forms of this species are fairly common. Exell (1944: 261) noted the two colour forms and stated 'They seem to be identical except for the flower-colour and they always grow together, the purple-flowered form being rather more common'.

Perennial herbs (7–)20–100(–200) cm tall, creeping to erect, occasionally climbing with adventitious roots at nodes. Stems 4.5 mm in diameter, occasionally with longitudinal wings on angles, glabrous to velvety-tomentose. Leaves ovate to broadly ovate (12–)25–80(–110) × (20–)45–100(–180) mm or rarely oblong and 55–90 × 20–30 mm, sparsely pilose to tomentose with white silky trichomes above, pilose to velvety-tomentose below; leaf base cordate, subcordate or truncate occasionally shortly attenuate; apex acute with short acuminate tip or obtuse and abruptly contracted to acuminate tip; margin entire, rarely subentire to slightly crenate; lateral veins 6–10(–13) each side of midrib; upper pair of leaves at base of terminal inflorescence sessile, petiole (0–)8–80(–110) mm long, unwinged or lamina decurrent close to apex of petiole. Inflorescence a terminal, open, branching thyrsus, 12.5–35 cm long,

Fig. 14 *Brillantaisia lamium* (Nees) Benth. A. Habit $\times 0.7$; B. Corolla dissection showing androecium $\times 2$; C. Gynoecium $\times 2$; D. Calyx $\times 2.5$; E. Capsule $\times 1.5$; F. Bract and bractlets $\times 1$.

often with smaller lateral panicles below, primary branches of inflorescence spreading almost at right angles to main axis, rachis usually sparsely covered in capitate glandular trichomes. *Bracts* ovate, adaxial surface pilose, often with slender multicellular trichomes, abaxial surface glabrous; bractlets rhomboid to linear, sessile, margin entire, adaxial surface covered with multicellular non-glandular trichomes, abaxial surface glabrous; becoming smaller and linear towards ends of lateral branches. *Sepals* sub-equal, linear, apex rounded, 4–7 mm long, green often tinged purplish; glabrous or with a few long glandular trichomes. *Corolla* deep bright blue-purple or violet occasionally pale lilac, one lip, often the upper; may be paler than the other; tube 5–8 × 2–4 mm, pale than lips, flushed inside with yellow, rarely completely white; upper lip (15–)22–30(–35) mm long, outer surface finely covered in glandular multicellular trichomes; lower lip (13–)19–27(–30) mm long, inner surface occasionally sparsely pubescent; apical lobe to 2 × 3 mm. *Androecium* with filaments 12–35 mm long, usually white; anthers 4.5–6 mm long; staminodes exserted for 4–5 mm from corolla tube, small vestigial anther. *Gynoecium* with style to 40 mm long, sparsely pubescent at base, stigma 3–5 mm long; ovary 3–4 mm long. Capsule 22–30 × (2–)3–5 mm with 14–16 seeds per locule, blunt tipped, green, tinged red at apex when immature, brown-black when mature and/or dried; glabrous or with a few erect, non-glandular trichomes at the apex, covered in black gland dots.

DISTRIBUTION. Throughout wet forest regions of west and central Africa, east to southern Sudan, through Zaire to northern Angola and through Uganda to northwest Tanzania.

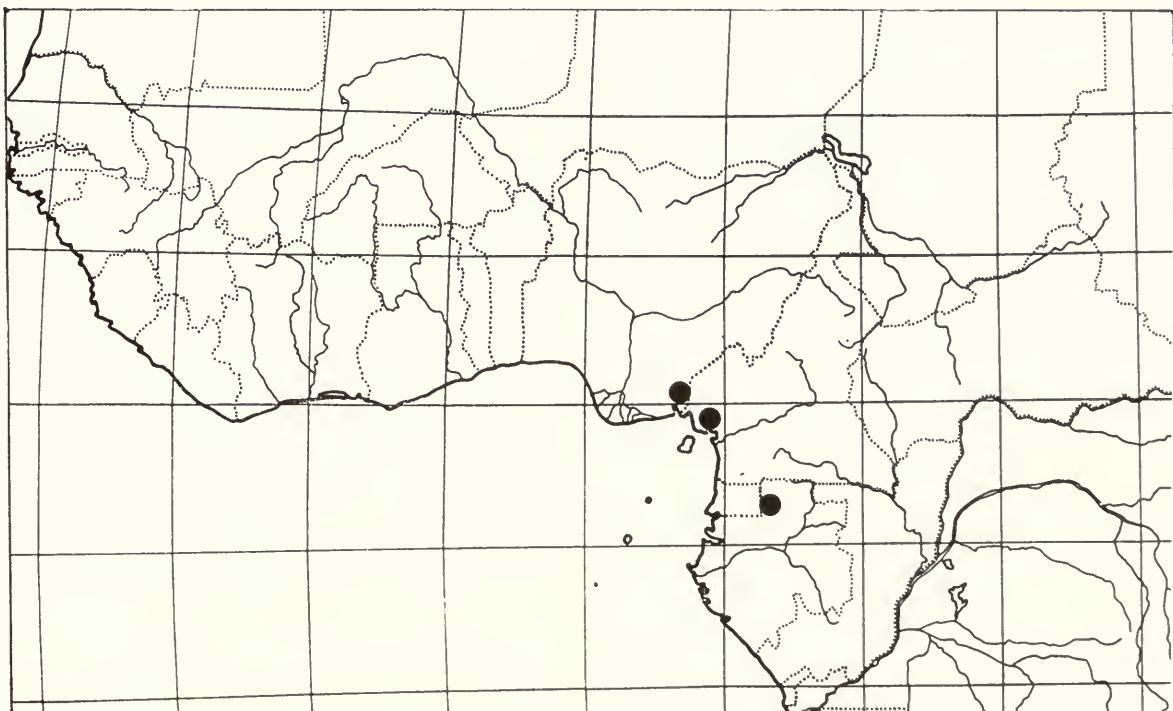

HABITAT. Forest clearings, shade beside rivers or streams, on lake shores or in swamps, often waterlogged/with roots in water, disturbed areas, roads, paths and plantations. In west Africa often very

weedy. ‘In moist exposed woody situations almost everywhere’ (on Princes Island, *Hiern*, 1900: 807). Common; 200–1600 m.

Brillantaisia lamium is a widespread species that is readily recognized by the cordate leaves with an entire margin and unwinged petiole. The inflorescence is open and rather sparsely flowered with

Map 3 The distribution of *Brillantaisia lancifolia* Lindau.

Fig. 15 *Brillantaisia lancifolia* Lindau. A. Habit $\times 0.7$; B. Corolla dissection showing androecium $\times 2$; C. Gynoecium $\times 2$; D. Calyx $\times 2$; E. Bract and bractlets $\times 2$; F. Capsule $\times 2.2$.

few lateral branches that tend to be at right angles to the central axis. Fruit are characteristically glabrous but occasionally with a tuft of trichomes at the apex.

East African specimens of *Brillantaisia lamium* are often far more robust and pubescent than West African representatives, which tend to be slender herbs; however, the variation appears to be continuous and there are no morphological and/or geographical data to support subdivision of the species. Vollesen (in prep. *a*) notes 'A similar pattern where eastern plants from higher altitudes have larger flowers than western lowland plants is known from other Acanthaceae, e.g. *Anisosepalum alboviolaceum*'. *Brillantaisia lamium* can form large weedy populations in areas of recently cleared vegetation or plantations of oil palm, cocoa or bananas, and in open grassy areas at higher altitude. In Cameroon slender low growing forms with very deep purple flowers were cultivated as an ornamental in small village compounds on Mount Cameroon. Collections from Kenya are of naturalized plants from Uganda and in swamp areas around Nairobi the species is now quite common.

9. *Brillantaisia lancifolia* Lindau in Engl. *Bot. Jahrb. Syst.* **17: 98 (1893); Burkhill in *Fl. trop. Afr.* **5**: 40 (1899); Benoist in *Bull. Soc. Bot. France* **60**: 335 (1913); Heine in *Fl. W. trop. Afr.* 2nd ed., **2**: 406 (1963); Heine in *Fl. Gabon* **13**: 86 (1966). Type: Gabon, Sierra del Crystal, Mann 1688 (B†-holotype, K!-lectotype, P!-isotype).**

B. talbotii S. Moore *Cat. pl. Talbot Oban distr.*: 75 (1913); Hutchinson & Dalziel in *Fl. W. trop. Afr.* **2**: 254 (1931). Type: S. Nigeria, Oban Talbot 2000 (BM!, K!-syntypes).

Icon: Heine, *Fl Gabon*, Acanthacées: **13**: pl. 19 figs 1–3 (1966).

Perennial herb to 0.3–0.5 m tall. Stems 2–3 mm in diameter, glabrous to densely pubescent, petiole bases fused forming ridge across nodes. Leaves ovate-elliptic to lanceolate 25–130(–190) × 8–30(–50) mm, smaller on axillary shoots, glabrous or very sparsely pubescent; base cuneate; apex acute; margin entire to very shallowly serrated or crenate, subentire towards apex, entire towards base; main lateral veins 5–8 on each side; petiole 5–22 mm long, unwinged, lamina decurrent at apex. Inflorescence a delicate, open, few-flowered panicle 50–150 mm long, rachis glandular pubescent. Bracts often caducous, linear-lanceolate, bractlets if present linear lanceolate with rounded apex, sparsely pubescent. Sepals unequal, linear, tapering gradually towards the apex, larger upper sepal 6–10 mm long, smaller lateral sepals to 5–8 mm long, pubescent, with capitate glandular trichomes. Corolla deep blue to violet, often with brown marking in throat; corolla tube 5–10 × 2 mm, pale purple sometimes tinged green; upper lip 10–15(–20) × 2–3 mm, glandular pubescent, particularly of edge of upper lip; lower lip 10–18 × 6–8 mm, apical teeth rounded-triangular 1–2 × 1 mm. Androecium with filaments to 20 mm long, anthers 3–4 mm long; staminodes usually prominent, around half length of the corolla lips. Gynoecium with style 15–28 mm, stigma 1 mm, ovary 3 mm long, shortly glandular pubescent. Capsule 15 × 1–1.5 mm with c. 9–10 seeds per locule, brown when dry, evenly glandular pubescent.

DISTRIBUTION. Restricted to a few montane regions in Nigeria, Cameroon and Gabon.

HABITAT. On damp rocks, in dark ravines or at edges of waterfalls; 300–700 m.

SELECTED COLLECTIONS

NIGERIA: Oban, 1912, Talbot 2000 (BM, K). CAMEROON: Ebone-Yabassi, 27 December 1967, Bamps 1632 (BR); Mount Cameroon, above Baioke,

Thomas 2775 (MO). GABON: Cristal Mts, 21 January 1968, Halle & Villiers 4626 (P); Haute-Ngounye, 7 June 1926, Le Testu 5943 (BM, BR, P).

Very few specimens have been collected of *Brillantaisia lancifolia*. However, from available material and without further opportunity for field study, I maintain this species as clearly distinct from all other species of *Brillantaisia*. *Brillantaisia lancifolia* has lanceolate leaves unlike any other species in the genus, the plants tend to be delicate and leafy, with numerous axillary vegetative shoots. The nodes are regularly spaced and the internodes rarely exceed 40 mm. The inflorescence is also very delicate with few flowers. Few of the specimens studied have fruit and additional counts of seeds per locule are needed. Two collections from Cameroon (*Leeuwenberg* 8994, WAG; *Hepper* 1332, S) are intermediate in leaf shape between *B. lancifolia* and the less woody forms of *B. owariensis*; these specimens have ovate-elliptic leaves with a cuneate leaf base. However, the flowers on these specimens are far larger than those of typical *B. lancifolia* and have been provisionally determined as part of the large and variable *B. owariensis* group.

10. *Brillantaisia debilis* Burkhill in *Fl. trop. Afr.* **5: 39 (1899); Benoist in *Bull. Soc. Bot. France* **60**: 335 (1913). Type: Cameroon, Efulen, Batanga, Bates 350 (K!-lectotype, BM!, MO!, Z!-isotypes).**

Fig. 16. Map 4.

Icon: Heine, *Fl Gabon*, Acanthacées: **13**: pl. 16 figs 1–3 (1966).

B. soyauxii sensu Heine in *Fl. Gabon* **13**: 84, pl. 17, figs 1–3 (1966) non Lindau (1893); non Burkhill (1899).

Leafy herbs 0.2–1 m tall. Stems 2–5 mm in diameter, often highly branched, rooting at nodes. Leaves elliptic-ovate to rhomboid, 45–110 × 25–58 mm, dull green, veins pale green to white; glabrous; lateral branches with smaller leaves 18–40 × 11–16 mm; leaf base cuneate; apex acuminate; margin entire to shallowly crenate; lateral veins 4–8 on each side of midrib; petiole 22–40(–80) mm, lamina decurrent towards base of petiole. Inflorescence a few flowered terminal panicle (50–)80–140(–180) mm long; rachis glabrous to glandular pubescent. Bracts ovate-obovate, 4–22 × 3–10 mm, rounded at apex; bractlets 1–5 mm long, narrowly oblong-obovate, glabrous to glandular pubescent, pedicel 1–2 mm long. Sepals subequal, linear, rounded at apex, 5–10 × 0.5–1 mm, pale green, fringed with unequal, purple, glandular trichomes. Corolla violet to deep bright purple with pale green or yellow spots in throat; tube 2–3 × 5–12 mm; upper lip 20–28 × 7–10 mm long, outer surface of upper lip covered in short entangled, glandular trichomes, more so at apex; lower lip 19–25 mm long, glabrous above, sparsely glandular pubescent below; apical lobes triangular to 2 × 2 mm. Androecium with filaments whitish to 20 mm long; anthers 3–4 mm long; staminodes 5 mm long, densely glandular with a small vestigial anther at apex. Gynoecium with style 25 mm long; stigma 2 mm long; ovary to 4 mm long, glabrous. Capsule 18–22 × 1–2 mm with 18–28 seeds per locule, brown, glabrous.

DISTRIBUTION. Cameroon and Gabon.

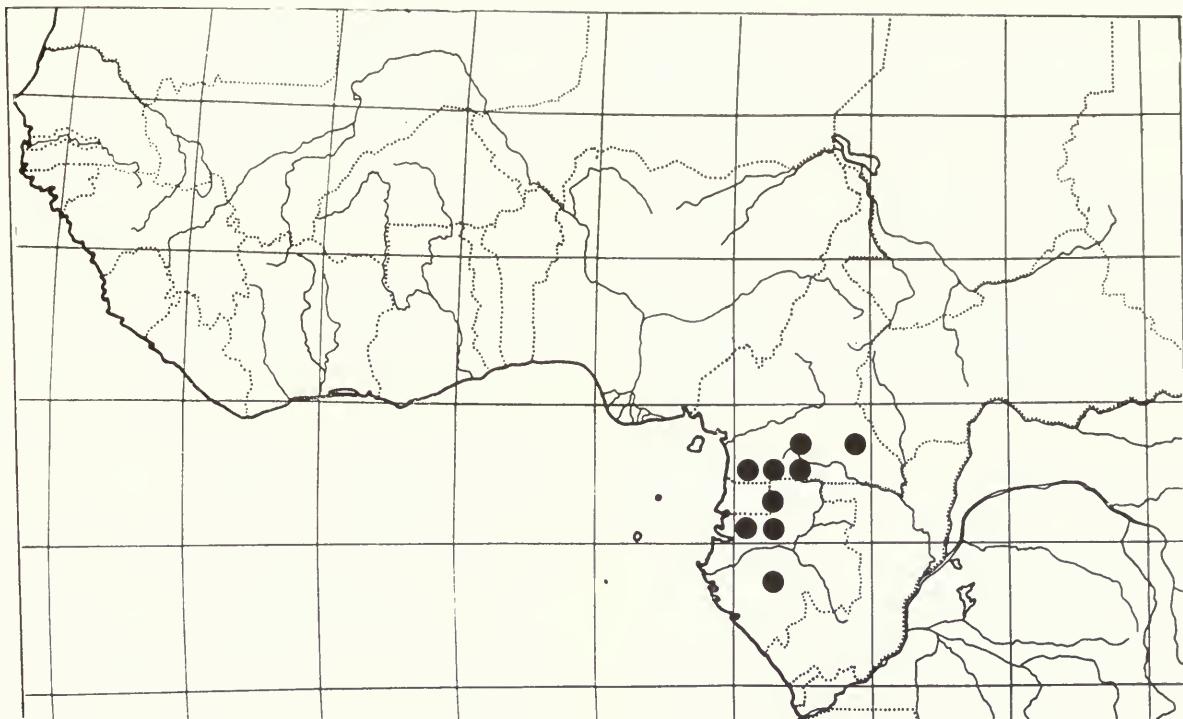

HABITAT. Along rivers in primary forest in rocky, mossy places. 400–500(–900) m.

Plants of *Brillantisia debilis* have few flowers and are often very leafy, the vegetative parts of plants of this species are entirely glabrous and the leaves are often purple underneath. The inflorescence may be glandular-pubescent on the rachis, peduncles, calyx and corolla. Many collections of this species have been mistakenly determined as *B. soyauxii*. In *Flore du Gabon*, Heine (1966) used the name *B. soyauxii* to describe a species which is glabrous except for the pedicels, calyx and, occasionally, the peduncles. The illustration of *B. soyauxii* in that work (Heine 1966: 87, 1–3) clearly fits the description of *B. debilis* given here. The type specimen of *B. soyauxii* has pubescent fruit, and a highly branched, many flowered inflorescence unlike *B. soyauxii* described in the *Flore du Gabon* (Heine 1966: 84–85) with few flowers and glabrous fruit. Other characters on the type specimen of *B. soyauxii* are inconsistent with the description of Heine (1966), including the larger, broader, spatulate upper calyx lobe and lower number of seeds in the fruit. Soyaux 454 is certainly a plant belonging to *B. vogeliana*.

11. *Brillantaisia grottanellii* Pichi-Sermoli in *Miss. Stud. Lago Tana 7. Recherche Botanique 1*: 254–255 (1951); Cufodontis, *Enum. pl. Aeth.*: 930 (1964). Type: Ethiopia, Tucur Dinghia forest, Pichi-Sermoli 2099 (FT-holotype, BM!-photo).

Map 5.

Erect aromatic herb to 1–2(–2.5) m tall. Stems 2–4 mm in diameter, rooting at nodes, covered in rather dense short, weak trichomes. Leaves ovate to broadly-ovate (35–)90–225(–250) × (10–)40–110(–150) mm, olive green to dull dark green above, paler below, glabrous to pubescent above and below; base cuneate; apex acuminate; margin crenate to serrate, occasionally serrulate; 8–13 veins each side of the midrib; petiole (10–)20–70(–110) mm, lamina decurrent along $\frac{1}{2}$ – $\frac{3}{4}$ length of petiole. Inflorescence a terminal spike (60–)80–200(–340) mm long with smaller lateral spikes below, flowers in distinct verticillasters, rachis often visible between verticillasters. Bracts ovate to linear-lanceolate, entire or crenate, rounded at apex, densely pubescent with glandular and eglandular trichomes, bractlets linear, trichomes as for bracts. Sepals subequal, linear rounded at apex, 0.5–1 × 12–20 mm, densely covered in long glandular and eglandular trichomes. Corolla dark blue-purple to violet or bright blue-lilac; tube 8–13 × (2–)3–5 mm; upper lip 20–30 × 4–6 mm covered in short glandular trichomes, which are slightly longer at the apex of the petals; lower lip 22–30 × 14–20 mm; apical lobes to 7 mm long, acute. Androecium with filaments 35–40 mm long; anthers 6–7 mm long; staminodes 5–10 mm long Gynoecium with style 35 mm long pubescent to stigma, stigma 4 mm long. Capsule 20–22 × 2–3 mm with 8 seeds per locule, brown-black, covered with sparsely glandular trichomes.

DISTRIBUTION. Ethiopia and possibly Sudan.

HABITAT. Montane forest, beside streams in shade, in disturbed ground, occasionally collected from plantations; 1500–2000 m.

SELECTED COLLECTIONS

ETHIOPIA: Kaffa Prov., Beletta forest, 13 February 1957, Mooney 6725 (ETH); Wellega region near Dembidollo, Anfilo, 6 March 1957, Mooney 6890 (S); 7 km NW of Tippi airstrip, 14 January 1962, Meyer 7995 (US); 35 km W of Lekemeti, 13 April 1966, de Wilde & de Wilde-Duyffes 10768 (MO, WAG); Kaffa Prov., Bonga, 9 January 1972, Ash 1454 (ETH, MO, UPS, WAG); Kaffa Prov., 57 km from Jimma on Sheki-Gogeb river track, 8

Table 5 Six characters which differ between plants of *Brillantaisia grottanellii* and *B. madagascariensis*.

Character	<i>B. grottanellii</i>	<i>B. madagascariensis</i>
Bract shape	lanceolate-ovate	broadly ovate-ovate
Glandular trichomes on bract	present	absent
Trichomes on style	along more than half length of style	at base of style only
Leaf margin	subentire-serrate	entire or crenate
Upper sepal shape	linear-spathulate	linear
Pollen ornamentation	smooth	irregularly spiny

December 1972, Friis et al. 1677 (C); Mt. Karkarha, 18 February 1976, Ash 3402 (MO, UPS); Gofa region, 10 km from Sawla, 27 December 1983 Ensermu & Zerihun 649 (C, ETH); 43 km from Mizan Teferi on road to Tepi, 27 January 1984, Ensermu et al. 745 (ETH); 37–41 km on the track from Gore to Masha, 1 February 1984, Ensermu et al. 821 (ETH); 27 km from Bebeka coffee plantation on road to Guraferda, 7 November 1985 Puff & Ensermu 861107-4/6 (ETH); Wellega Region, Bedelle/Arjo road–Didessa road crossing, 16 January 1990, Friis et al. 6023 (ETH); Kaffa Prov., Beletta forest, 18 January 1990, Friis et al. 6041 (ETH); SUDAN: Torit Distr., near Katire, 9 February 1950, Jackson 1144 (BM, MO), identity uncertain.

This species is clearly very closely related to *Brillantaisia madagascariensis* and, early in this study, was thought to be the same species. However, after detailed study of gross morphology and pollen characters, I recognize this species as distinct. Discussion with Dr Ensermu Kelbessa from Addis Ababa University who has studied these plants in the field convinces me that the *madagascariensis-grottanellii* group is best divided. Characters differentiating *B. grottanellii* from *B. madagascariensis* are shown in Table 5 and Figure 5.

12. *Brillantaisia madagascariensis* T. Anderson ex Lindau in *Bot. Jahrb. Syst.* **17**: 103 (1893); Burkhill in *Fl. trop. Afr.* **5**: 43 (1899); Palacky, *Cat. pl. Icones: Heine, *Fl Gabon, Acanthac  es*: **13**: pl. 18 figs 7–15 (1966); Benoist in *Fl. Madag. fam.* **182**, Acanthac  es: fig. IV 8–13 (1967).

Erect or scrambling much branched herb 0.2–2 m tall. Stems 2–5(–8) mm in diameter, shortly pubescent, more densely so at nodes, glabrous below. Leaves ovate to broadly ovate, 40–150(–180) × 30–90(–130) mm, lower leaves becoming much larger, to 400 × 500 mm, usually sparsely pubescent, with short white or translucent trichomes on midrib and main veins, occasionally densely pilose; leaf base attenuate, occasionally truncate or cordate; apex acute-acuminate; margin entire, occasionally slightly crenate; 8–12(–14) main lateral veins each side of midrib; petiole 6–90 mm long, winged for    of length. Inflorescence a terminal spike with smaller lateral spikes below (20–)40–220(–350) mm long, flowers crowded into dense verticillate whorls, rachis densely pubescent, not usually visible between verticillasters. Bracts ovate to elliptic, apex rounded to acuminate, green with purple tinge, persistent. Sepals subequal, slender tapering to apex or linear and rounded at the apex, occasionally spatulate, larger upper sepal 10–30 × 1–2 mm, very slightly longer than the other four; lateral sepals 8–25 × 1–2 mm; green, red to purple at apex, densely pubescent on abaxial surface, trichomes white, less dense shorter trichomes on adaxial surface. Corolla variable shades of blue-purple, violet, magenta or white, with lateral yellow spots in the throat; corolla tube to 15 mm long; upper lip 15–30 × 5–8 mm, glandular pubescent outside occasionally with long trichomes; lower lip 15–25 × 10–12 mm, apical lobes 2–5 × 2–3 mm,

often short, rounded-blunt but can be longer, narrowly triangular with acute apex. *Androecium* with filaments 20–22 mm long, white; anthers 3–6(–8) mm long, creamy yellow or brown, pubescent along one side; staminodes 5–10 mm long. *Gynoecium* with style 25 mm long, often persistent when corolla has fallen, stigma 2.5 mm long; ovary 3–5 mm long. *Capsule* 18–30 × 3–5 mm with 6–8 seeds per locule, black-brown, glandular puberulous with longer scattered eglandular trichomes.

DISTRIBUTION. Throughout West Africa through the Congo basin to Ethiopia and south into Tanzania, also in Madagascar.

HABITAT. Montane forest, often weedy in plantations, recently logged areas, clearings or pathsides; 500–1200 m.

SELECTED COLLECTIONS

LIBERIA: Yéképa, Yiti village, 24 January 1965, Adam 20734 (K, MO). BLOCCO: November 1911, Mildbraed 7126 (H). CAMEROON: 2°00'N 12°15'E, 2 January 1911, Mildbraed 4147 (H). TANZANIA: Mt Meru, Surra Forest, 10 November 1969, Richards 24663 (C, M); Mshituni, above tea estate N. of Derema, 5 October 1979, Kibuwa 5191 (UPS). MADAGASCAR: August 1902, Perrier 9227 (P); near Doanyanala, 25 January–25 February 1949, Humbert 23090 (P); 6 December 1963, Rakotozafy 287 (P).

Plants of this species are very distinctive in flower and fruit, with a narrowly spicate inflorescence, flowers in verticillasters, persistent bracts and linear, pubescent calyx lobes. *Brillantaisia verruculosa* has been upheld as a species by several recent workers, notably Heine (1966), solely on the basis of the floral colour being white rather than purple. White flowers are found in three other species of *Brillantaisia* and as this is the only character on which Heine split *B. madagascariensis*, I maintain this variation under the earliest name.

NOMEN DUBIUM

Brillantaisia cicatricosa Lindau in *Bot. Jahrb. Syst.* **20**: 4 (1895) nomen dubium; Lindau in *Pflanzenw. Ost-Afr.* **C**: 366 (1895); Burkhill in *Fl. trop. Afr.* **5**:39 (1899); Mildbraed, *Deutsch Zent. Afr. Exped.* (1922); Robyns, *Fl. parc. nat. Albert* **2**: 270 (1947); Troupin, *Fl. pl. lign. Rwanda*: 84 (1982); Champluvier in *Fl. Rwanda* **3**: 446 (1985); Fischer & Hinkel, *Nat. Env. Rwanda*: 81, fig. 68 (1992). Type: Zaire, W. slope of Ruwenzori Mountains, Buhtahu Valley, Stuhlmann 2301 (B[†]-holotype). Problems with the application of this name are described in detail above (p. 95).

Brillantaisia hirsuta T. Anderson in *Journ Agric.-Hort. Soc. NS* **1**: 267 (1868). This name refers to a plant introduced to the Royal Botanic Gardens, Calcutta from Kew and which cannot now be traced. Anderson wrote of this species that 'It is common on the

Map 5 The distribution of *Brillantaisia grottanellii* Pichi-Sermoli.

banks of streams in Western equatorial Africa. It differs from *B. owariensis* in its very prostrate habit, much smaller non decurrent leaves and in the smaller size of its flowers which are not glandular'. This description may refer to *Brillantaisia vogeliana* which has sparsely pubescent flowers, however, as this is the only information regarding the identity of the plant in Calcutta, application of this name remains uncertain.

Species transferred to *Hygrophila*

Brillantaisia borellii Lindau in *Bot. Jahrb. Syst.* **33**: 186 (1904). This species was considered to be very different from all other *Brillantaisia* species due to the presence of four fertile stamens, very narrow leaves and the lack of an upper corolla lip.

Brillantaisia didynama Lindau in *Bot. Jahrb. Syst.* **24**: 313 (1898).

Considered by Lindau to be clearly distinct from all other species of *Brillantaisia* by virtue of having four fertile stamens and very distinctive pollen, Lindau maintained this species within the genus and placed it close to *B. lancifolia* due to the few-flowered inflorescence and lanceolate leaves.

Brillantaisia thwaitesii Cramer in *Kew Bull.* **46**: 335–338 (1991).

Cramer transferred *Plaeisanthera thwaitesii* (C.B. Clarke) Livera to *Brillantaisia* as he considered it close to *Brillantaisia pubescens*. Recent studies (Sidwell, in press a) have shown that the species is best placed in *Hygrophila* until a greatly needed monograph of that genus is undertaken.

Species transferred to *Eremomastax*

Brillantaisia fulva Lindau in *Bot. Jahrb. Syst.* **24**: 313–314 (1898).

ACKNOWLEDGEMENTS. I would like to thank Robert Scotland and Kaj Vollesen for supervision throughout the course of my PhD study. Thanks also to John Baker, Ian Gourlay, Julie Hawkins, David Mabberley, Alison Strugnell and Rosemary Wise in Oxford; Alex Ball and Louisa Jones in the SEM unit at The Natural History Museum; everyone at Limbe Botanic Gardens and the National herbarium in Cameroon; Martin Cheek and Alan Paton at Kew and Axel Poulsen in Copenhagen. This research was funded by BBSRC research grant 93309762, with additional financial assistance from Wolfson College Oxford and the University of Oxford Hardship Fund. Funding to cover materials and tuition for all illustrations was received, with thanks, from the Linnean Society of London's A.G. Side fund for research in systematic biology.

SYSTEMATIC INDEX

Accepted names are in roman, and synonyms in italic; new names and principle references are in **bold**.

Belantheria Nees **83**
belvisiana Nees 83, 90
Brillantaisia P. Beauv. **83**
alata T. Anderson ex Oliv. 90
anomala Lindau 84
bagshawei S. Moore 104
bauchiensis Hutchinson & Dalziel 92
borellii Lindau 106
cicatricosa Lindau 95, 105
cicatricosa var. *kivuensis* Mildbr. 93
debilis Burkhill 83, **101**, 102, 103
dewevrei De Wild. & Th. Dur. 92
didyma Lindau 106
eninii Lindau 97
fulva Lindau 106
grandidentata S. Moore 93
grottanellii Pichi-Sermoli, 83, **103**, 105
hirsuta T. Anderson 105
kirungae Lindau 84, **93**, 94
lamium (Nees) Benth. 83, **97**, 98
lancifolia Lindau 83, 99, 100, **101**
leonensis Burkhill 92

madagascariensis T. Anderson ex Lindau 83, **104**
mahonii C.B. Clarke 92
majestica Wernham 104
mollerii Lindau 95
nitens Lindau 92
 sensu Agnew 93
nyanzarum Burkhill 92
oligantha Milne-Redhead 84, **86**, 88, 89
owariensis P. Beauv. 83, 84, **90**
 sensu Hook. 97
palisotii Lindau 97
patula T. Anderson 90
patula var. *welwitschii* Burkhill 92
preussii Lindau 95
pubescens T. Anderson ex Oliv. 83, **84**, 85
pubescens var. *riparia* Vollesen & Brummitt 86
pubescens var. *rutenbergiana* (Vatke) Benoist 84
riparia (Vollesen & Brummitt) Sidwell 83, **86**, 87
rutenbergiana Vatke 84
salviiflora Lindau 90
schumanniana Lindau 95
soyauxii Lindau 95

soyauxii *sensu* Heine 101
spicata Lindau 104
stenopteris Sidwell 84, **89**, 90, 91
subcordata De Wild. & T. Durand 97
subcordata var. *macrophylla* de Wild. & Th. Dur.
 97
subuligurica Burkhill 93
talbotii S. Moore 101
thwaitesii Cramer 106
ulugurica Lindau 93
verruculosa Lindau 104
vogeliana (Nees) Benth. 84, **95**, 96
Hygrophila 68
pubescens (T. Anderson ex Oliv.) Benoist 84
thwaitesii (Benth.) Heine 106
Leucoraphis Nees **83**
 lamium Nees 97
 vogeliana Nees 83, 95
Plaesianthera (C.B.Clarke) Livera 68, 106
 thwaitesii (C.B.Clarke) Livera 106
Ruellia Baillon 83
 grevei Baillon 83, 84

Seaweeds of the western coast of tropical Africa and adjacent islands: a critical assessment. IV. Rhodophyta (Florideae) 6. Genera [Q] R–Z, and an update of current names for non-geniculate Corallinales

WILLIAM J. WOELKERLING

Introduction	115
Species list	117
An update of current names for non-geniculate Corallinales reported from West Africa	129
Numerical list of references	141
References	143

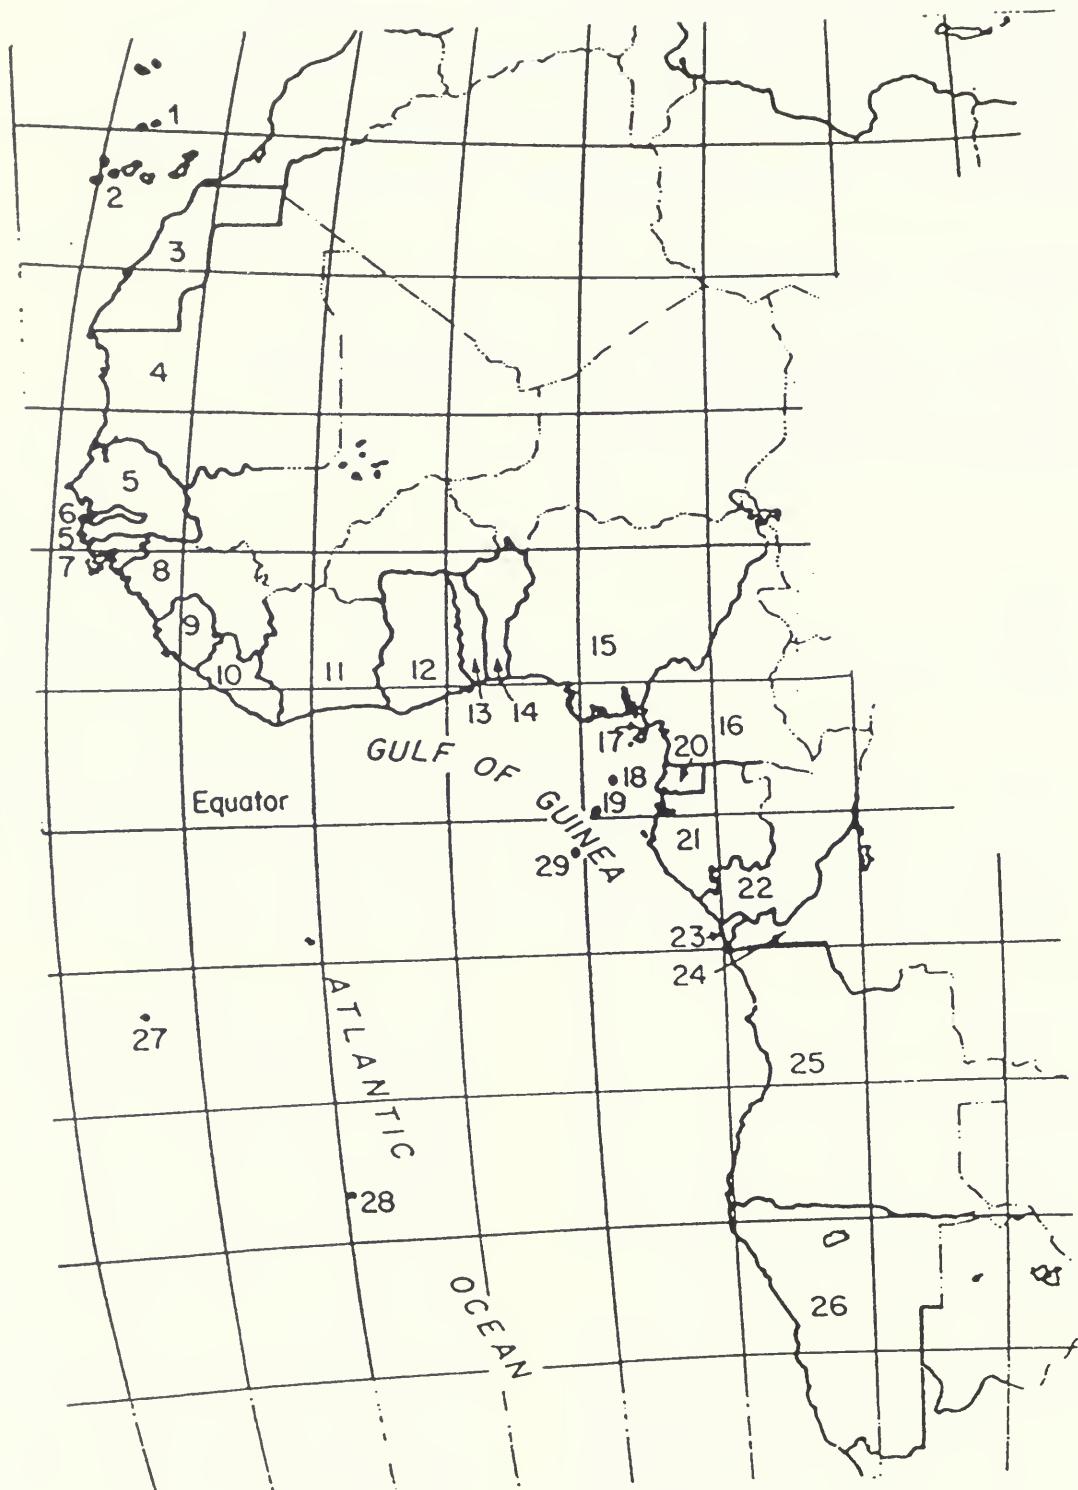

SYNOPSIS. This paper assembles and, so far as is possible without extended field and herbarium studies, examines critically the validity of records of marine and brackish-water Rhodophyta (Florideae) for the western coast of tropical Africa. The whole mainland coastline from the northern boundary of Western Sahara southwards to the southern boundary of Namibia, the oceanic islands from the Salvage Islands southwards to Ascension and St Helena, and all islands close to the African mainland coast are included in the area covered. Each species entry includes all traced records, the names which have previously been applied to it for the area, and additional comments or evaluation, as necessary. Comments are also provided at generic or generic group levels in very complex cases. All names used for non-geniculate Corallines in earlier papers in the series are updated.

INTRODUCTION

The area dealt with in this final part of the series is identical with that covered in earlier parts (Lawson & Price, 1969; Price et al., 1978, 1986, 1988, 1992; John et al., 1979, 1994; Lawson et al., 1995). Relevant country names employed and their earlier equivalents, and the names of island groups, are either listed in the legend or both listed and shown on the map in Fig. 1. Genera with the initial letters [Q]-R-Z and constituent species are listed alphabetically.

Each main entry in the first part of this paper consists of:

- The major bold heading, representing the currently-accepted name and authorities.
- Subsidiary italicized headings. These are in square brackets and essentially subdivide the overall entry. They represent the different ways in which the species has been referred to in past publications for the area. Incorrect citations from past literature have been maintained in these subsidiary heads so that there shall be no doubt as to which record we attribute to which species or lower taxon level; only when clarification was required have changes been made in subhead citation, in which case an explanation is given in intermediary or terminal notes.
- The distributional data, with countries and island groups arranged alphabetically. More generalized statements of distribution follow the specific country list. Complete distribution patterns require a scan of records under all names by which a species is known for this or adjacent areas. Hence, generalized distribution statements are included *verbatim* since it is not always clear for precisely which countries within the area they establish records. In all cases, numbers within parentheses after the names refer to corresponding numbers in the references. In the present reference list, for ease of readjustment from other parts, references have not been renumbered but simply omitted or added and additionally numbered appropriate. However, lists of references are only partially interchangeable between different parts of the overall list since some earlier parts had a different numbering system. Presentation of the references follows that from the previous part in having first a numerical sequence presenting only authors and dates, followed by separate listing of the full references in alphabetical order. Manuscript and expeditionary sources, as well as works currently in press are also included in the 'References'.
- Additional qualifying notes were required in many cases and may be found below whole entries or individual parts of entries to which they specifically refer. References in the notes are

cited by reference number when they contain species records and by author name, date of publication, and sometimes page numbers (after colon) when they do not.

Species nomenclature has been revised as far as possible and the complete author citation derived from Brummitt & Powell (1992) is given for each currently accepted combination. The subsidiary italicized headings and any other discarded combinations that require reference are included as cross-referencing entries to the currently accepted names in the overall list. The necessarily preliminary nature of all the treatments presented has been emphasized for each previously published part of the list and applies no less to this final contribution to the series. As indicated in previous parts, critical updating is kept firmly in mind for the whole work, although feasibility of that process will remain the final determinant at the appropriate time. We would appreciate notification of any detected errors and omissions in any of the parts.

SPECIES LIST

Reinboldiella poeppigiana (Grunow) J. Feldmann & Feldmann-Mazoyer

See *Cerium poeppigianum* Grunow.

Additional record: Cape Verde Islands (639).

Rhabdonia decumbens (Grunow) Grunow

Canaries (37;70;71;131;375;493;598).

Cape Verde Islands (37;70;131;375;598).

[As *Meristotheca?* *decumbens* Grunow]

Canaries (439).

[As *Rhabdonia decumbens* Grunow]

Canaries (191;227;493).

Note. For discussion on names, see *Meristiella echinocarpa* (Areschoug) Cheney & Gabrielson for Cape Verde Island specimens. Prud'homme van Reine et al. (663) have re-investigated the Macaronesian algae studied by Piccone (see 439, 450, 451) and Askenasy (see 37, 38) and concluded that Askenasy had erroneously identified both *Meristiella echinocarpa* (from the Cape Verde Islands) and *Meristotheca?* *decumbens* (from Madeira, the Canaries and also the Cape Verde Islands) as *Mychodea schrammii*.

Rhabdonia sp.

See *Gigartina flagelliformis* (Sonder) Sonder.

Rhodochorton sp.

See *Audouinella*.

Additional record: Cape Verde Islands (652).

Rhododiscus pulcherrimus P. & H. Crouan

Canaries (232B;598).

Note. Noted by Prud'homme van Reine (598) as '=*tetrasporophyte* of *Atractophora hypnoidea*' on basis on an abstract by Maggs et al. (1983) and a note by Irvine (273:35).

Rhodomela episcopalis Montagne

See *Halopitys incurvus* (Hudson) Batters.

Rhodomela lycopodioides (L.) C. Agardh

See *Fucus lycopodioides* Flor. Dan.

Note. On purely nomenclatural grounds the Bory (90) record for the Canaries would probably be attributable to *Rhodomela lycopodioides*. However, this is biogeographically extremely unlikely to be correct and the record may well represent a report of *Halopitys incurvus* (Hudson) Batters (q.v.).

Rhodomela pinastroides (Gmelin) C. Agardh

See *Halopitys incurvus* (Hudson) Batters.

Rhodomela pinastroides (Gmelin) C. Agardh var. *episcopalis* Montagne

See *Halopitys incurvus* (Hudson) Batters.

Rhodophyllum bifida (Goodenough & Woodward) Kützing

See *Rhodophyllum divaricata* (Stackhouse) Papenfuss.

Rhodophyllum capensis Kützing

See *Rhodophyllum reptans* (Suhr) Papenfuss.

Rhodophyllum divaricata (Stackhouse) Papenfuss

Canaries (18;380;633;745;747).

Mauritanie (624).

[As *Rhodophyllum bifida* (Goodenough & Woodward) Kützing]

Canaries (598).

'Nordwestafrika' (499).

Rhodophyllum gracilaroides M. Howe & W.R. Taylor

Ghana (290;292;299;350;376;377;586).

Sénégal (59;722).

'in tropical parts of the Atlantic Ocean.' (350;586).

'Tropical Africa (N. Gambia – Congo River)' (598).

Note. Bodard & Mollion (59) indicated that this alga is known otherwise only from Brazil, a comment clearly now outdated.

Rhodophyllum reptans (Suhr) Papenfuss

Namibia (36B;707).

[As *Rhodophyllum capensis* Kützing]

Namibia (500).

Rhodophysema africana D.M. John & G.W. Lawson

Angola (217;294;352;532;586).

Gabon (217;294;350;532;586).

'Tropical Africa (N. Gambia – Congo river)' (598).

[As *Rhodophysema* sp.]

Angola (352).

Fig. 1 The coastline of tropical West Africa and the offshore islands.

1, Salvage Islands; 2, Canary Islands; 3, Western Sahara [=former Spanish Sahara, Spanish West Africa] (includes the often quoted Río de Oro, the southern region of the country, but excludes Ifni); 4, Mauritanie; 5, Sénégal; 6, Gambia; 7, Guinea-Bissau [=Portuguese Guinea]; 8, Guinée; 9, Sierra Leone; 10, Liberia; 11, Côte d'Ivoire; 12, Ghana; 13, Togo; 14, Benin [=Dahomey]; 15, Nigeria; 16, Cameroun; 17,* Bioko [=Macias Nguema Biyogo, Fernando Póo]; 18, Príncipe; 19, São Tomé; 20,* Equatorial Guinea [=Spanish Guinea]; 21, Gabon; 22,** Republic of the Congo; 23, Cabinda; 24, Zaire [=Congo Republic]; 25, Angola; 26, Namibia [=South West Africa]; 27, Ascension Island; 28, St Helena; 29, Annobón [Paganú]. The Cape Verde Islands, which lie immediately to the west of Dakar (Sénégal), have been omitted from this map but are included in the species list that follows.

*Nos 17 (Bioko) and 20 (Spanish Guinea, = Rio Muni) are now jointly administered as Equatorial Guinea. Bioko is entered separately, where appropriate, in the species list.

**Loango, a name much used by earlier collectors such as Welwitsch, was formerly a coastal region of West Africa. Its application appears to have included much of the coastline of the Republic of the Congo (22), as well as of Cabinda (23) and Zaire (24). Because by far the longest and rockiest part of the Loango coast lies now within the Republic of the Congo we have attributed all marine algal records from Loango to the Congo.

Note. This species closely resembles *Rhodophysema elegans* (P. & H. Crouan ex J. Agardh) Dixon: see John & Lawson (294). For further information on the genus see South & Whittick (532) and Masuda & Ohta (1981).

Rhodothamniella codii (Crouan) J. Feldmann
See *Audouinella codii* (P. & H. Crouan) Garbary.

Rhodymenia ardissonae J. Feldmann
Canaries (634;635;648).

Rhodymenia caespitosa P.A. Dangeard
Canaries (635).

Rhodymenia capensis J. Agardh
See *Epymenia capensis* (J. Agardh) Papenfuss.

Rhodymenia corallicola Ardissonae
See *Rhodymenia ligulata* Zanardini.

Rhodymenia holmesii Ardissonae
Angola (unpublished).
Canaries (663).

Note. Many plants under this name from Angola appear to correspond rather closely to *Rhodymenia pseudopalmetta* var. *pseudopalmetta* [= *R. pseudopalmetta*], but a few with narrow fronds often tapering towards the rounded apices have sufficient development of apparent 'stolons' as processes from the frond to show strong resemblance to plants previously known as *R. pseudopalmetta* var. *ellisiae* (Duby) Guiry. This latter taxon is now placed in synonymy with *R. holmesii* Ardissonae. Prud'homme van Reine et al. (663) re-examined Piccone's specimens of *R. palmetta* (Esper) Greville and renamed some of them as *R. holmesii*, pointing out that this species was a new record for Macaronesia. In all probability, records for Namibia and Ascension given under *Schottera nicaeensis* (J.V. Lamouroux ex Duby) Guiry & Hollenberg should also be attributed here.

Rhodymenia ligulata Zanardini
'Subtropical Africa [Sénégal (N. of Gambia); Mauritania; former W. Sahara]' (598).
[As *Rhodymenia corallicola* Ardissonae]
Mauritanie (269;349;516).

Rhodymenia linearis J. Agardh
Namibia (36B;707).

Note. Wynne (36B) suggested that the general habit of this alga was similar to *Epymenia capensis* (J. Agardh) Papenfuss, save that the tetrasporangia did not occur in special proliferations but rather in rounded sori near the apices of frond segments. Stegenga et al. (707: 363-364), however, regard the differences between this alga and *Rhodymenia natalensis* as insignificant and have included all material in the latter species.

Rhodymenia multipartita (Clemente) Montagne
See *Gracilaria multipartita* (Clemente) Harvey.

Rhodymenia natalensis Kylin
Namibia (36B).
'Southern Africa' (707).

Note. Wynne (36B) expressed some reservations in assigning material to this species, due to the colder water conditions in Namibia compared to those of the eastern African coastline. Thalli are broader, with a more fan-shaped aspect, with larger tetrasporangia, and without the basal stoloniferous growths found in *Rhodymenia pseudopalmetta*, which *R. natalensis* otherwise resembles.

Rhodymenia palmata (L.) Greville
Canaries (401).
'... Atlantischen Ocean (Skandinavien bis zu dem Kanaren . . .)' (37).
'Coast of the Gulf of Guinea'. (269).
'... from the Canary Islands and Mediterranean Sea to the coasts of Norway and Ireland.' (268).
[As *Rhodymenia palmata* Greville]

Canaries (44).

[As *?Halymenia clavaeformis* Suhr]

Canaries (401).

[As *Rhodymenia palmata* (Esper) Greville]

Canaries (375).

Note. Montagne (401) commented that the Canarian material was a single juvenile individual sent by Despreaux to Webb under the name *Delesseria lactuca*. Børgesen (70) believed Montagne's record was a case of mistaken identification for *Rhodymenia palmata*. Possibly all these records relate to *Palmaria palmata* (L.) Kuntze but there are reservations. See the earlier note to *P. palmata*.

Rhodymenia palmetta (Esper) auct.

See *Rhodymenia pseudopalmetta* (J.V. Lamouroux) P.C. Silva.

Rhodymenia pseudopalmetta (J.V. Lamouroux) P.C. Silva

Angola (273;352).

Canaries (13;38B;38D;108;225;226;227;229;232B;273;306B;379;490;546;633;634;635;662;663;684;685;747).

Cape Verde Islands (38B;38D).

Gabon (294?;350?;586?).

Ghana (299;350;376;377;586;695).

Mauritanie (38B;38D;349;624).

Salvage Islands (38B;38D).

Sénégal (38B;38D;55;56;57;59;399;654;722).

Sierra Leone (295;350;586).

Western Sahara (38B;38D;349).

'... Afrique noire ...' (59).

'... Atlantique (de l'Angleterre aux Canaries) ...' (33).

'... in warm temperate and tropical seas.' (350;586).

'Subtropical Africa [Sénégal (N. of Gambia); Mauritania; former W. Sahara]' (598).

'Tropical Africa (N. Gambia - Congo river)' (598).

'... O. Atlántico (desde I. Británicas hasta Canarias) ...' (747).

[As *Rhodymenia pseudopalmetta* (J.V. Lamouroux) P.C. Silva var.] Sénégal (59).

[As *Rhodymenia palmetta* Esper]

Cape Verde Islands (145).

[As *Rhodymenia palmetta* (Esper) Greville]

Canaries (70;191;252;375;390;439 pro parte;499;547;663).

Cape Verde Islands (38;252;411;499).

Ghana (153;338;537).

Mauritanie (252).

Sénégal (123).

'From the English Coast to the Canary Islands . . .' (70).

'Nordwestafrika' (499).

'Westafrika' (499).

Note. Some specimens recorded in 439 are *Rhodymenia holmesii* (see 663).

[As *Rhodymenia palmetta* Greville]

Angola (42).

Guinea-Bissau (529).

[As *Rhodymenia palmetta* J. Agardh]

Angola (41).

[As *Rhodymenia palmetta* Greville var. *fusco-purpurea* P.A. Dangeard]

Sénégal (49;59;122;182).

[As *Rhodymenia palmetta* Greville var.]

Canaries (439).

[As *Rhodymenia palmetta*]

Sénégal (411).

Note. Irvine (273) commented: 'British Isles to at least Morocco; Azores; Canary Isles; Mediterranean and South African records doubtful. Records from elsewhere apply to other species of *Rhodymenia*'. Lawson & John (350,586) noted: 'Many plants from the region appear to correspond closely

with variety *pseudopalmata*, but a few of those with narrow fronds often tapering towards the rounded apices show some resemblance to *R. holmesii* Ardisson (= *R. pseudopalmata* variety *elisiae* (Duby) Guiry in Guiry & Hollenberg').

The record from Gabon (294,350,586) is doubtful because the specimens were sterile.

Rhodymenia pseudopalmetta (all varieties)

See *Rhodymenia pseudopalmata* (J.V. Lamouroux) P.C. Silva and *Rhodymenia holmesii* Ardisson.

Rhodymenia sp.

Canaries (633).

Guinée (529).

Namibia (312A;348).

Ricardia montagnei Derbès & Solier

See *Erythrocystis montagnei* (Derbès & Solier) P.C. Silva.

'... Atlantico desde Brest a las Canarias' (517).

'... de Brest aux Canaries ...' (89).

'From Brest to the Canary Islands ...' (71).

'Atlantic between the Canaries and the British Isles' (668).

'... l'océan Atlantique ... de Brest aux Canaries ...' (517).

'Subtropical Africa [Sénégal (N. of Gambia); Mauritania; former W. Sahara]' (598).

[As *Ryhifloea tinctoria*]

Canaries (237).

[As *Ryhifloca tinctoria*]

Canaries (237).

[As *Ryhifloces tinctores*]

Canaries (237).

[As *Rytiphlaea tinctoria* (Clemente) C. Agardh]

Canaries (229).

[As *Rytiphlaea tinctoria* C. Agardh]

Canaries (547).

[As *Rytiphlaea tinctoria* (Clemente) J. Agardh]

Canaries (663).

[As *Rytiphlafa tinctoria* (Clemente) C. Agardh]

Canaries (21).

[As *Rythypchlaea tinctoria* (Clemente) C. Agardh]

Canaries (229).

[As *Rytiphlaea tinctoria* (Clemente) C. Agardh]

Canaries (229).

[As *Rytiphlaea tinctoria* (Clemente) C. Agardh]

Canaries (13;177).

Salvage Islands (231).

'... Atlantic Ocean (... African coasts ...)' (177).

[As *Rytiphlaea tinctoria* C. Agardh]

Canaries (44).

Sarcodia ceylanica Harvey ex Kützing

[As *Sarcodia ceylanica* Harvey]

Sénégal (122;411).

Note. Various authors, including Silva et al. (1987) and Silva et al. (746), consider this variable alga to be equivalent to *Sarcodia montagneana* (J. Hooker & Harvey) J. Agardh.

Sarcomenia intermedia Grunow

Cape Verde Islands (38;191).

'... assez communes aux îles du Cap Vert' (38).

Note. Correct name is *Platysiphonia intermedia* (Grunow) Wynne. For nomenclature, see Silva et al. (746).

Sarcomenia miniata (C. Agardh) J. Agardh [or C. Agardh]

See *Platysiphonia delicatula* (Clemente) Cremades.

Sarcodiotheca divaricata W.R. Taylor

Canaries (664).

Schimmelmannia bollei Montagne

Canaries (227;410;502).

Cape Verde Islands (27;38;70;134;191;390;408;500;502;598;625).

Note. Børgesen (70), in explaining the citation of 'Cape Verde' instead of 'Canary' Islands stated: 'Schimmelmannia Bollei' Mont. is in Engler and Prantl, Pflanzenfam. I, 2, 1897, p. 507, said to occur "in den Gewässern der canarischen Inseln". Dr. O.C. Schmidt, Bot... Mus..., Dahlem bei Berlin, ... informed me that all the specimens found in the Museum originate from the Cape Verde Islands.'

Gil-Rodríguez & Afonso-Carrillo (227) indicated that Børgesen (71) had stated the Canaries record to be erroneous, so they listed the record but excluded the species from their catalogue as they believed it to be absent.

De Toni (134: 1527), commenting on the Bolle collections from St. Nicolas (C.V.I.), stated: 'Species tantum sterilis hucusque reperta, ita ut de affinitate vix dijudicare licet; quoad structuram haec potius ad *S. Frauenfeldii* quam ad *S. ornatum* adpropinquare videtur'.

Schimmelmannia ornata Schousboe

Canaries (389).

Note. This record probably represents the species referred to for the area as *S. bollei* Montagne.

Schizymenia dubyi (Chauvin ex Duby) J. Agardh

'... Atlantischer Ozean, von den englischen bis an die nordwestafrikanischen Küsten ...' (498;499).

Note. The southern limit of this species appears to be Morocco (34;118), but since Schmidt did not define what he meant by North West Africa it is just possible that he was including Western Sahara and/or Mauritanie. Tetrasporic phase is *Haematocelis rubens* J. Agardh (33;34).

Schizymenia obovata (J. Agardh) J. Agardh

Namibia (36B;348).

Note. Seagrief (570) gave *Platymenia undulata* var. *obovata* J. Agardh in synonymy, but Silva et al. (746) suggest *Schizymenia apoda* (J. Agardh) J. Agardh to be the correct name.

Schmitziella endophloea Bornet & Batters

Canaries (9;227;582;584).

Note. After studies of relevant type material, Woelkerling & Irvine (1982) concluded that *Schmitziella*, typified by *S. endophloea*, did not belong in the Corallinaceae and placed it next to the Acrochaetiaceae as a genus *incertae sedis*. Subsequently Pueschel (1989: 634), from studies of pit-plug structure and mode of tetrasporangial cleavage, considered that *Schmitziella* may

belong in the Gigartinales rather than the Corallinales or Acrochaetales. The taxonomic affinities of *Schmitziella* hence require further investigation. Woelkerling (730) provides information on material of this species in the Thuret-Bornet herbarium in PC.

Schmitziella sp.

Cape Verde Islands (366).

Note. The specimens upon which this record is based need examination in detail to determine their taxonomic disposition.

Schottera nicaeensis (J.V. Lamouroux ex Duby) Guiry & Hollenberg
Namibia (36B).

[As *Phyllophora palmettoides* var. *Nicaeensis* J. Agardh]

Ascension (37).

Note. According to Irvine (273: 94 et seq.) this should be included under *Rhodymenia holmesii*.

Scinaia

For a detailed revisionary treatment of the *Scinaia*-assemblage, see 271A.

Scinaia australis (Setchell) Huisman

Canaries (724).

Scinaia canaliculata J. Feldmann

Sénégal (48;55;59;722).

'... l'aire se limite au golfe du Bénin et à la Mauritanie ...' (59).

'Subtropical Africa [Sénégal (N. of Gambia); Mauritania; former W. Sahara]' (598).

Note. Bodard & Mollion (59: 214) referred to this species as 'Feldmann mscr', stating (p. 198) '...n'est pas décrit...'.

Scinaia (Pseudogliophlea) capensis

Note. See earlier entry for *Ginnania furcellata* Montagne.

Scinaia caribaea (W.R. Taylor) Huisman

Canaries (633;634;724).

Note. See Reyes et al. (724: 57) regarding the possibility that this record may represent *Scinaia halliae* (Setchell) Huisman.

Scinaia complanata (Collins) Cotton

Canaries (17;128A;598;635;648;662;724).

Salvage Islands (38B;38D;598).

Sénégal (48).

[As *Scinaia complanata* (f. typus)].

Sénégal (182).

'... largement répandue dans tout l'Atlantique boréal et dans les eaux tropicales' (59).

'Nordwestafrika', 'Westafrika' (499).

[As *Ginnania furcellata* (C. Agardh) Montagne = *Halymenia furcellata* Agardh]

Canaries (402).

[As *Scinaia furcellata* (Turner) Bivona var. *constricta* Pilger]

Annobon (Pagalú) (139;456;457;496).

[As *Ginnania furcellata* Montagne]

Canaries (401).

'... in mari atlantico ... ad oras ... Africae meridionalis ...' (318).

[As *Ginnania furcellata* (Turner)]

Sénégal (408).

[As *Scinaia pseudocrispa* (Clemente) Wynne]

Canaries (724).

Note. Nomenclature of this species has often been discussed. Dixon & Irvine (1970) were of the opinion that the epithets of *Scinaia forcillata* Bivona-Bernardi (1822: 232) and *S. furcellata* (Turner) J. Agardh (1851: 422) are orthographic variants and adopted *S. forcillata* as the correct name. However, according to Silva et al. (746) the two epithets have to be considered as distinct, with the result that the correct name is *S. furcellata*. The combination *Scinaia pseudocrispa* (Clemente) Wynne is therefore superfluous.

Scinaia halliae (Setchell) Huisman

See *Scinaia caribaea* (W.R. Taylor) Huisman.

Scinaia hormoides Setchell

[As *Sphondylothamnion multifidum* Nägeli]

Canaries (547).

Spongites

The concept of *Spongites* adopted in this paper is that of Penrose (1996b). Keys showing the relationships of *Spongites* to other genera of the subfamily Mastophoroideae (to which *Spongites* belongs) are provided by Penrose & Chamberlain (1993) and by Woelkerling (1996b), while Woelkerling (1985) gives an account of the original collections upon which Kützing (1841) based the genus and the six species he assigned to it. *Paragoniolithon* Adey et al. (1982: 12), based on *P. solubile* (Foslie & Howe) Adey, Townsend & Boykins (Basionym: *Goniolithon solubile* Foslie & Howe) is a heterotypic synonym of *Neogoniolithon* (see Woelkerling, 1988: 141).

Spongites absimile (Foslie & M. Howe) Afonso-Carrillo

Canaries (733).

[*Lithophyllum absimile* Foslie]

Cape Verde Islands (?365).

'Golfe de Guinée' (?366).

Note. Uncertainties surround the generic disposition of the type and of certain records of this taxon from tropical West Africa and adjacent islands.

The species was originally described as *Lithophyllum absimile* Foslie & M. Howe in Foslie (207: 7) based on material from Jamaica and was subsequently transferred to *Pseudolithophyllum* by Adey (1970: 12) and then to *Spongites* by Afonso-Carrillo (733: 98). As noted by Afonso-Carrillo (733: 97), the combination *Neogoniolithon absimile* (e.g., see Notoya, 1976a: 137, 1976b: 314; Cabioch, 1972: 272; Gil-Rodríguez & Afonso-Carrillo, 227: 36; South & Tittley, 1986: 44) has not been validated in accordance with ICBN Art. 33.2 (see Greuter, 1994); see under *Spongites wildpretii*. Afonso-Carrillo (733: 91-93, figs 1-6) provided an account of holotype material in TRH (see also Woelkerling, 678: 14), but noted (p. 97) that placement in *Spongites* was attended by some uncertainty since only senescent conceptacles were observed. Data on the vegetative thallus of the type provided by Afonso-Carrillo (733) suggest that the species most likely belongs to the Corallinaceae, subfamily Mastophoroideae (see Woelkerling, 1988: 115, 1996b: 237), but the absence of data on tetrasporangial conceptacle anatomy from the type precludes certain generic placement within the subfamily. Afonso-Carrillo (733) also concluded that Canary Island specimens referred to *absimile* by Lemoine (362) as well as plants deposited at TFC (Departamento de Botánica, Universidad de La Laguna, Canary Islands) [upon which some other records (Gil-Rodríguez & Afonso-Carrillo, 227: 36; Afonso-Carrillo, 576: 139; Afonso-Carrillo et al., 582: 30) presumably were based] did not belong to *Spongites absimile* but rather to *S. wildpretii* (see below).

Records of *Lithophyllum absimile* from the Cape Verde Islands (Lemoine, 365; 1071) and from the 'Golfe de Guinée' (Lemoine, 366) require verification from examination of relevant voucher material.

Spongites africanum (Foslie) Afonso-Carrillo, Chacana & Sansón

Cape Verde Islands (726).

Sénégal (726).

[As *Lithophyllum africanum* Foslie]

São Tomé (134?;197;265).

[As *Lithothamnion proboscideum* Foslie]

São Tomé (197).

[As *Porolithon africanum* (Foslie) Foslie]

Annobon (Pagalú) (139).

Bioko (350;586).

Cameroun (350;586).

Cape Verde Islands (598).

Mauritanie (349).

São Tomé (211;350;586).

‘... in warm temperate and tropical parts of the eastern Atlantic Ocean ...’ (350;586).

‘Subtropical Africa [Sénégal (N. of Gambia); Mauritania; former W. Sahara]’ (598).

‘Tropical Africa (N. Gambia – Congo river)’ (598).

Note. Based on examinations of the lectotype from Cap Vert, Sénégal (see Woelkerling, 678: 23-24) and specimens from the Cape Verde Islands, Afonso-Carrillo, Chacana & Sanson (726) transferred *Lithophyllum africanum* Foslie (199: 3) to *Spongites* as delimited by Penrose & Woelkerling (1988) and Woelkerling (1988). This concept of *Spongites* encompassed the genus *Hydrolithon* Foslie. Based on further studies, however, Penrose & Woelkerling (1992) concluded that *Spongites* and *Hydrolithon* should be treated as distinct genera based on differences in tetrasporangial conceptacle anatomy (see also Penrose & Chamberlain, 1993; Penrose, 1996a; Woelkerling, 1996b). Afonso-Carrillo (pers. comm.) suggested that the species probably belongs to *Hydrolithon* as delimited by Penrose, but formal transfer has not been effected. All specimens upon which published records of *Spongites africanum* and its homotypic synonyms from the West African region are based need to be checked to determine their status and disposition. This also applies to the types and other records (listed above) of *Lithophyllum africanum* f. *intermedium* and *L. africanum* f. *truncatum*, established concurrently with *L. africanum* by Foslie (199: 3). The types of both *Lithophyllum africanum* f. *intermedium* (see Woelkerling, 678: 127; 730.) and *L. africanum* f. *truncatum* (see Woelkerling, 678: 226) also come from Cap Vert, Sénégal.

The record under the name *Lithothamnion proboscideum* from São Tomé (Foslie, 197: 14) pertains to material Foslie (199: 3) subsequently referred to *Spongites africanum* (as *Lithophyllum*). Information relating to material identified as *Lithothamnion ponderosum* Foslie has been presented previously (John et al., 1994: 68).

Spongites fruticulosus Kützing

[As *Lithothamnion fruticulosum* (Kützing) Foslie]

Canaries (6).

Cape Verde Islands (210;366;598).

Mauritanie (349;356;359;360;366).

Sénégal (6;366).

[As *Lithothamnion fruticulosum* (Kützing) Foslie f. *crassiuscula*]

Cape Verde Islands (210).

Note. Status and disposition uncertain; TRH neotype (Woelkerling, 678: 66) from Brionic Islands, Adriatic Sea not studied in detail in a modern context; placement under *Spongites fruticulosus* in this paper does not imply synonymy with the type of the species.

[As *Lithothamnion fruticulosum* (Kützing) Foslie f. *clavulata*]

Cape Verde Islands (210).

Note. Status and disposition uncertain; TRH neotype (Woelkerling, 678: 51) from the Adriatic Sea not studied in detail in a modern context; placement under *Spongites fruticulosus* in this paper does not imply synonymy with the type of the species.

[As *Lithothamnium fruticulosum* Foslie]

Mauritanie (354).

‘Subtropical Africa [Sénégal (N. of Gambia); Mauritania; former W. Sahara]’ (598).

Note. The type of *Spongites fruticulosus*, which is also the type of the genus *Spongites*, has been studied by Woelkerling (1985: 135-139, figs 23-32), who (Woelkerling, 1988) placed the genus in the subfamily Mastophoroideae. As noted by Woelkerling (1985: 139), Kützing’s epithet *fruticulosum* has been widely misapplied to a species with multiporate tetrasporangial conceptacles belonging to the Corallinaceae, subfamily Melobesioideae and not to the subfamily Mastophoroideae. More recently, Woelkerling (729) concluded that at least some of the collections to which the epithet *fruticulosus* had been misapplied were conspecific with the type of *Lithothamnion fasciculatum* (Lamarck) Areschoug in J. Agardh. All specimens upon which published records of *Spongites fruticulosus* and its homotypic synonyms from the West African region are based now need to be checked to determine their status and disposition. Whether true *Spongites fruticulosus* occurs in the West African region is uncertain. Penrose (1991) provides an account of *S. fruticulosus* in southern Australia. Babbini & Bressan (753: 246) state ‘non ‘fruticulosa’’ emendavit Penrose 1981; ICBN 1994, art. 62.4’. Specimens from the Cape Verde Islands identified (210: 214) as *Lithothamnion fruticulosum* f. *clavulata* and as *L. fruticulosum* f. *crassiuscula* also need to be checked to determine their status and disposition.

Spongites wildpretii Afonso-Carrillo

Canaries (633;634;657;687;733;747).

[As *Lithophyllum absimile* Foslie]

Canaries (362;363).

[As *Neogoniolithon absimile* (Foslie & Howe) Cabioch nom. invalid]

Canaries (226;227;576;582;733).

Note. Afonso-Carrillo (733) based *Spongites wildpretii* on a series of collections from the Canary Islands, including ones earlier referred to *Lithophyllum absimile* or the invalid name *Neogoniolithon absimile* (see note under *Spongites absimile*). Subsequently, however, Keats & Chamberlain (754: 15, 18) and Chamberlain (702: 126) concluded that *Spongites wildpretii* is a heterotypic synonym of *Hydrolithon samoense* (Foslie) Keats & Y.M. Chamberlain based on examination of European specimens identified by Afonso-Carrillo but not listed by Keats & Chamberlain (754).

Sporolithon

Sporolithon is now placed in a distinct family of Corallinales, the Sporolithaceae Verheij (1993). Comments on the incorrect use of the name *Archaeolithothamnium* for species referable to *Sporolithon* are provided by Papenfuss (1968: 83), Woelkerling (1988: 220) and Moussavian & Kuss (1990: 932-934).

Sporolithon africanum (Foslie) Afonso-Carrillo

Canaries (11;582;726).

[As *Archaeolithothamnion (-ium) africanum* Foslie]

Canaries (6;70;139;191;205;212;227;361;363;365;366;493).

Cape Verde Islands (366).

Note. The combination *Sporolithon africanum* was first validly published by Afonso-Carrillo (11: 142). Wynne (1986: 2258), apparently unaware of the Afonso-Carrillo paper, subsequently proposed the same combination, crediting Tomita, who had first used it in an unpublished thesis in 1976. The combination also appeared in an unpublished thesis of Oliveira in 1977.

The holotype of *Sporolithon africanum* (from the Canary Islands) is divided between PC (Woelkerling, 730) and TRH (Woelkerling, 678: 23). Afonso-Carrillo (11: 142) examined the type but provided no details, and Townsend (1995) included comments on type material in a PhD thesis, but a published account of type material in a modern context has yet to appear. Other published records of the species from the West African region also require verification through re-examination of relevant voucher specimens. As noted by Afonso-Carrillo et al. (726: 133), Lemoine (353: 146), treated *S. africanum* (as *Archaeolithothamnum*) as a heterotypic synonym of *Lithophyllum africanum* Foslie (199: 3) [see account above of *Spongites africanum* (Foslie) Afonso-Carrillo, Chacana & Sanson].

Spriadia filamentosa (Wulfen) Harvey

Note on authorities. De Toni (133: 1427-1429) placed *Conferva pallens* Bory (90: 306, pl.V, figs 2A,B,C) in synonymy with *Spriadia filamentosa*. From the figures provided, there seems little reason to challenge this. The problem then arising is that of the earliest specific epithet for the taxon. Wulfen's *Cryptogamia Aquatica*, with the recognition of *Fucus filamentosus*, was dated 1803. Bory's work, dated the same year, states on the title page 'Germinal, An XI'. It will be necessary to establish the priority of these two works to assess correct nomenclature.

Note. Lawson & John (350;586) remarked that many of the early reports of this species from offshore islands in the Gulf of Guinea have been discounted by Steentoft (535) who believed them misidentifications of *Spriadia hypnoides* (q.v.). They therefore placed all reports of *S. filamentosa* from São Tomé under *S. hypnoides* until re-examination and (if needed) reaffirmation of the original determination is possible.

Namibia (167;348).

Note. Wynne (36B) has argued for the retention of *Tayloriella virgata* under *Polysiphonia virgata* (C. Agardh) Sprengel but as the above records were omitted from our earlier publication (Lawson et al., 1995) they are included here for completeness.

Tenarea Bory

Woelkerling et al. (1985) concluded that *Tenarea* included only one known species (*T. tortuosa* Bory) and that most other species referred to the genus belonged to *Lithophyllum* or *Titanoderma* (see entry for *Titanoderma* below). Further comments on *Tenarea* are provided by Woelkerling (1988: 106–109) and Athanasiadis (1995).

[As *Lithophyllum tortuosum* (Esper) H. Huvé]

Canaries (107).

Mauritanie (349).

Note. According to Babbini & Bressan (753: 192), this species is an 'espèce méditerranéenne' (thus a Mediterranean endemic species). Therefore, as also noted by Lawson & John (586: 210), these records appear doubtful but need to be checked against the relevant specimens. Esper's epithet *tortuosum* has been misapplied to a different species (see Huvé, 272; Woelkerling et al., 1985; Woelkerling, 730) commonly referred to *Lithophyllum*. *Tenarea tortuosa*, the type and only known true species of *Tenarea*, is known with certainty only from the eastern Mediterranean (Woelkerling, 1988: 109; Athanasiadis, 1995: 656). The earlier cross reference to *Lithophyllum cristatum* Meneghini f. *crassa* (Lloyd) Hauck (John et al., 1994: 61) does not involve any published records from the West African region but rather the opinion of Foslie (1898: 15) that f. *crassa*, based on *Melobesia crassa* Lloyd (see Woelkerling, 730), might be a heterotypic synonym of *Tenarea tortuosa*.

Titanoderma Nägeli

Titanoderma is considered here to be a heterotypic synonym of *Lithophyllum*; further comments appear under *Lithophyllum* (John et al., 1994: 59); see also Braga & Aguirre (1995: 270), Verheij (1994: 98) and Basso et al. (1996: 276). By contrast, Chamberlain (737: 204) has continued (see also Chamberlain, 1991 and Chamberlain & Irvine, 736) to maintain *Titanoderma* ‘pending more conclusive, probably genetic, data to determine their relationship . . .’. Babbini & Bressan (753: 150) follow Chamberlain & Irvine (736). Chamberlain (737: 204), however, has noted the difficulties in assigning species such as *Lithophyllum johansenii* Woelkerling & Campbell to *Lithophyllum* or *Titanoderma* as delimited in her studies; other examples are given by Campbell & Woelkerling (1990) and Woelkerling & Campbell (1992).

As stated by Chamberlain (737: 204; see also Braga & Aguirre, 1995: 271), two distinct lines of development can be identified in the ‘*Lithophyllum-Titanoderma* complex’: one in which the thallus includes a layer of palisade cells and one in which no such layer is present. In most attached species with a palisade layer, the thallus margin commonly does not immediately thicken while in species lacking a palisade layer, immediate thickening commonly does occur. While such trends may be interpreted in evolutionary terms, investing these with formal taxonomic status at genus level results in a situation where some species cannot be placed with certainty in either one genus or the other. For some attached species, including *Lithophyllum johansenii* and species mentioned by Campbell & Woelkerling (1990) and Woelkerling & Campbell (1992), known infraspecific variation precludes generic placement with certainty. For other species, known only from unattached specimens, information on the characters used by Chamberlain (737) for generic delimitation is lacking altogether, thus making generic placement purely conjectural. Of the eight British species placed by Chamberlain & Irvine (736) in *Lithophyllum* sensu Chamberlain, for example, the diagnostic characters of the genus as delimited by these authors (immediate thickening behind a bistratose margin and a basal layer of non-palisade cells – also see key on p. 30 of Chamberlain & Irvine, 736) are unknown for four (*L. dentatum*, *L. duckeri*, *L. fasciculatum*, *L. hibernicum*).

Investing apparent evolutionary trends in formal taxonomic terms at generic level in cases where it is presently impossible to draw firm boundaries or in cases where data on species are missing or are not apparent in any known specimens serves no useful purpose in either taxonomic or evolutionary terms, and it needlessly complicates the more practical matters of species placement and specimen identification. As noted by Braga & Aguirre (1995: 271), it is possible to recognize that two evolutionary lines are present within a single genus. If one wishes to emphasize in taxonomic terms that two

evolutionary lines are present within *Lithophyllum* sensu lato (i.e. sensu Woelkerling & Campbell, 1992 and Woelkerling, 1996a) without complicating the matters of species placement and naming as well as specimen identification, it is possible to recognize two subgenera, as has been done by some authors (e.g. Rosenvinge, 1917; Lemoine, 363; Newton, 1931).

Titanoderma byssoides (Lamarck) Y.M. Chamberlain & Woelkerling

See *Lithophyllum byssoides* (Lamarck) Foslie

The following are additional records:

[As *Lithophyllum byssoides* (Lamouroux) Heydrich]

Cape Verde Islands (38B;71;133).

Mauritania (6).

Salvage Islands (38B).

Sénégal (547).

‘Plante des Antilles et du Cap Vert, nouvelle pour les Canaries’ (547).

Note. The neotype mentioned under *Lithophyllum byssoides* (John et al., 1994: 60) has been superseded with the discovery of original Lamarck material, an account of which is provided by Woelkerling (729).

Titanoderma confine (P. & H. Crouan) J.H. Price, D.M. John & G.W. Lawson (as *confinis*)

Note. In an earlier paper in this series, John et al. (1994: 64) treated this taxon as a heterotypic synonym of *Lithophyllum pustulatum*, noting that Chamberlain (1991, as *Titanoderma*) recognized it as a distinct variety of that species, and noting that all published records from the West African region required confirmation. The additional record of Chamberlain & Irvine (736: 105, as *Titanoderma pustulatum* var. *confine*) from the Canary Islands also requires confirmation. Earlier West African records are given by John et al. (1994: 64). Woelkerling (1996a: 229) reaffirmed the earlier conclusion of Woelkerling & Campbell (1992) that, in contrast to British populations (Chamberlain, 1991), southern Australian populations were highly and continuously variable, making it impossible to recognize distinct varieties in that region.

Titanoderma corallinae (P. & H. Crouan) Woelkerling, Y.M. Chamberlain & P.C. Silva

See *Lithophyllum corallinae* (P. & H. Crouan) Heydrich

The following are additional records:

[As *Titanoderma corallinae* (P. & H. Crouan) Woelkerling, Y.M. Chamberlain & P.C. Silva]

Canaries (633;736).

‘British Isles to Canary Isles . . .’ (649).

Titanoderma cystoseirae (Hauck) Woelkerling, Y.M. Chamberlain & P.C. Silva

See *Lithophyllum cystoseirae* (Hauck) Heydrich

The following are additional records:

[As *Dermatolithon cystoseirae* (Hauck) H. Huvé]

Canaries (584).

Mauritania (367)

‘... au golfe de Guinée’ (367).

[As *Lithophyllum cystoseirae* (Hauck) Heydrich]

[As *Titanoderma papillosum* var. *cystoseirae* (Hauck) Me. Lemoine ex G.W. Lawson & D.M. John]

Annobon (Pagalú) (586).

Note. Woelkerling & Verheij (1995: 45) provide information on the lectotype.

Titanoderma geometricum (Me. Lemoine) J.H. Price, D.M. John & G.W. Lawson

See *Lithophyllum geometricum* Me. Lemoine

The following are additional records:

Cape Verde Islands (370).

Titanoderma halapalidoides (P. & H. Crouan) J.H. Price, D.M. John & G.W. Lawson
See *Lithophyllum pustulatum* (J.V. Lamouroux) Foslie

Note. In an earlier paper in this series, John et al. (1994: 64) treated this taxon as a heterotypic synonym of *Lithophyllum pustulatum*, noting that all published records from the West African region required confirmation. Earlier West African records are given by John et al. (1994: 64).

Chamberlain (1991, as *Titanoderma*) and Chamberlain & Irvine (736, as *Titanoderma*) recognized four distinct varieties of *pustulatum*, listing *T. halapalidoides* as a heterotypic synonym of *T. pustulatum* var. *macrocarpum*. In southern Australia, by contrast, Woelkerling & Campbell (1992, as *Lithophyllum*) and Woelkerling (1996a, as *Lithophyllum*) found that populations were highly and continuously variable, making it impossible to recognize distinct varieties for that region, and they listed *halapalidoides* as a heterotypic synonym of *Lithophyllum pustulatum*.

Titanoderma papillosum (Zanardini) J.H. Price, D.M. John & G.W. Lawson

See *Lithophyllum papillosum* (Zanardini ex Hauck) Foslie
The following are additional records:

[As *Lithophyllum papillosum* (Zanardini) Foslie]
Canaries (387).

[As *Lithophyllum (Dermatolithon) papillosum* (Zanardini) Foslie]
Canaries (70).

Note. Afonso-Carrillo et al. (582) considered this taxon (as *Goniolithon papillosum*) to be doubtfully present in the Canaries; records therefore necessitate confirmation, despite references given elsewhere.

Titanoderma polycephalum (Foslie) Woelkerling, Y.M. Chamberlain & P.C. Silva

See *Lithophyllum polycephalum* Foslie

The following are additional records:

[As *Goniolithon polycephalum* (Foslie) Afonso-Carrillo]
Cape Verde Islands (11;597).

pustulatum]

Canaries (736).

Sénégal (736).

[As *Titanoderma pustulatum* (J.V. Lamouroux) Nägeli var. *confine*]
Canaries (736).

Titanoderma sp.

See *Lithophyllum* spp.

The following is an additional record:

[As *Dermatolithon*]]

Canaries (18).

Trailliella intricata Batters

See *Bonnemaisonia hamifera* Hariot.

The following is an additional record:
Canaries (598).

Trematocarpus affinis (J. Agardh) De Toni

See *Trematocarpus flabellatus* (J. Agardh) De Toni

Note. *Trematocarpus affinis* (J. Agardh) De Toni and *T. flabellatus* (J. Agardh) De Toni are considered by Simons (1983: 808) to belong to different species. He is followed in this by Womersley (712).

Trematocarpus flabellatus (J. Agardh) De Toni

Namibia (348;707).

Trichogloeopsis pedicellata (M. Howe) I.A. Abbott & Doty

Canaries (38C;232B;598;635;745).

Tricleocarpa cylindrica (Ellis & Solander) Huisman & Borowitzka
Canaries (663;734).

Note. See under *Galaxaura cylindrica* (Ellis & Solander) Lamouroux and *G. oblongata* (Ellis & Solander) Lamouroux. For further information, see Huisman & Borowitzka (1990) and Huisman & Townsend (1993).

Tricleocarpa fragilis (L.) Huisman & Townsend

[As *Tricleocarpa (Galaxaura) oblongata* (Ellis & Solander) Huisman & Borowitzka]

Cape Verde Islands (713).

Note. See also under *Galaxaura cylindrica* (Ellis & Solander) Lamouroux and *G. oblongata* (Ellis & Solander) Lamouroux. In Otero-Schmitt (713) the authors are mistakenly given as ‘(Ellis et Solander) Huisman et Bornet’. Pérez & Afonso-Carrillo (734) state that the occurrence of *Tricleocarpa fragilis* (as *Tricleocarpa oblongata* (Ellis & Solander) Huisman & Borowitzka) has to be confirmed. They did not discover this species in many samples from the Canary Islands. However, they consider *Galaxaura fragilis* (Lamark) Lamouroux ex Decaisne to be synonymous with *Tricleocarpa cylindrica* while Huisman & Townsend (1993) consider *Tricleocarpa fragilis* to be synonymous with, and having priority over, the combination *Tricleocarpa oblongata* (Ellis & Solander) Huisman & Borowitzka.

Vickersia baccata (J. Agardh) Karsakoff

AN UPDATE OF CURRENT NAMES FOR NON-GENICULATE CORALLINES REPORTED FROM WEST AFRICA

In the second edition of the floristic account complementing this series of critical assessments (Price et al., 1986, 1988, 1992; John et al., 1994; Lawson et al., 1995; this paper), Lawson & John (586: 196) foreshadowed re-alignments and nomenclatural changes in species of coralline algae reported from tropical West Africa as a consequence of renewed taxonomic interest in the group. Since 1987, a number of changes in generic concepts have occurred, new families and subfamilies have been described, and the status and disposition of various species have been reassessed. While the status and disposition of many species reported from tropical west Africa still remain uncertain, and while most earlier records require confirmation, post-1987 studies on non-geniculate corallines have clarified the status and generic disposition of a number of species and infraspecific taxa based on types from or reported to occur in the West African region.

The following list summarizes the current situation for non-geniculate Corallinales mentioned in previous parts of the West African critical assessment series, including the floristic accounts of Lawson & John (350, 586). The list is organized alphabetically by specific epithet, with infraspecific taxa listed alphabetically within species. Generic names associated with specific and infraspecific taxa in the series are given in parentheses after the relevant epithet.

For each taxon, the following data are provided: references to the name in the West African critical assessment series and the floristic accounts (Lawson & John, 350, 586); current placement/name of the taxon; new records; and comments relating to that placement including information on type material. Records based on identifications only at genus level (e.g. *Choreonema* sp., *Mesophyllum* sp.) are not included.

Recently reported/new records are presented for the following taxa: *Hydrolithion boreale* (Foslie) Y.M. Chamberlain; *H. cruciatum* (Bressan) Y.M. Chamberlain; *H. farinosum* (J.V. Lamouroux) Penrose & Y.M. Chamberlain; *H. samoense* (Foslie) Keats & Y.M. Chamberlain; *Leptophyllum ferox* (Foslie) Y.M. Chamberlain & Keats; *L. foveatum* Y.M. Chamberlain & Keats; *Lithophyllum lobatum* Me. Lemoine; *L. neoatalyense* T. Masaki; *Lithoporella melobesioides* (Foslie) Foslie; *Lithothamnion coralliooides* (P. & H. Crouan) P. & H. Crouan; *L. sonderi* Hauck; *Mesophyllum engelhartii* (Foslie) W.H. Adey; *M. erubescens* (Foslie) Me. Lemoine; *M. lichenoides* (J. Ellis) Me. Lemoine; *Phymatolithon lenormandii* (Areschoug) W.H. Adey; *Pneophyllum fragile* Kützing.

absimile (Lithophyllum, Neogoniolithon, Spongites)

SERIES REFERENCES. John et al., 1994: 60, 77; this paper.

CURRENT PLACEMENT/NAME. *Spongites absimile* (Foslie & M. Howe) Afonso-Carrillo, according to Afonso-Carrillo (733), but see comments.

COMMENTS. Status and disposition of species uncertain; TRH holotype (Woelkerling, 678: 14) from Jamaica examined by Afonso-Carrillo (733) but placed with uncertainty in *Spongites*; see note to *Spongites absimile* (this paper) for further information.

accretum (Goniolithon, Lithophyllum, Neogoniolithon)

SERIES REFERENCES. Price et al., 1988: 230; John et al., 1994: 60, 77.

CURRENT PLACEMENT/NAME. *Neogoniolithon accretum* (Foslie & M. Howe) Setchell & L.R. Mason, according to Adey (1970: 8), but see comments.

COMMENTS. Status and disposition of species uncertain; conclusion of Adey (1970) requires verification via a modern, detailed study of the Florida US holotype in NY (Woelkerling, 678: 14).

accretum f./var. canariense/canariensis (Lithophyllum, Neogoniolithon)

SERIES REFERENCES. John et al., 1994: 60, 77 (under *Neogoniolithon accretum*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; holotype from Canary Islands divided between PC (Woelkerling, 730) and TRH (Woelkerling, 678) but not studied in detail in a modern context; placement under *Neogoniolithon accretum* (John et al., 1994: 77) in this series follows format conventions (John et al., 1994: 49) without implying synonymy with the type of the species.

adhaerens (Tenarea)

SERIES REFERENCES. John et al., 1994: 78 (under *Neogoniolithon hirtum*); this paper.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Neogoniolithon hirtum* (Me. Lemoine in Børgesen) Afonso-Carrillo, according to Afonso-Carrillo (11: 131).

COMMENTS. Conclusion of Afonso-Carrillo (11) based on examination of holotype (from Canary Islands) in C.

aequinoctiale (Lithophyllum, Porolithon)

SERIES REFERENCES. Lawson & John, 350: 243; Lawson & John, 586: 215; John et al., 1994: 60; Lawson et al., 1995: 111.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH holotype (Woelkerling, 678: 20) from São Tomé not studied in detail in a modern context; placement in *Porolithon* in this series based on pragmatic considerations explained under entry for genus (Lawson et al., 1995: 111).

africanum (Archaeolithothamnion, Sporolithon)

SERIES REFERENCES. Price et al., 1986: 17; this paper.

CURRENT PLACEMENT/NAME. *Sporolithon africanum* (Foslie) Afonso-Carrillo, according to Afonso-Carrillo (11: 142).

COMMENTS. Holotype from Canary Islands divided between PC (Woelkerling, 730) and TRH (Woelkerling, 678); conclusion of Afonso-Carrillo (11) based on examination of TRH portion of holotype.

africanum (Lithophyllum, Porolithon, Spongites)

SERIES REFERENCES. Lawson & John, 350: 244; Lawson & John, 586: 215; John et al., 1994: 60; Lawson et al., 1995: 112; this paper.

CURRENT PLACEMENT/NAME. *Spongites africanum* (Foslie) Afonso-Carrillo, Chacana & Sansón, according to Afonso-Carrillo et al. (726: 133), but see notes under main species entry in this paper.

COMMENTS. Conclusion of Afonso-Carrillo et al. (726) based on study of TRH holotype (Woelkerling, 678: 23-24) from Cap Vert, Sénégal.

africanum f. intermedia (Lithophyllum)

See under *Spongites africanum*.

africanum f. truncata (Lithophyllum)

See under *Spongites africanum*.

amplexifrons (Lithophyllum, Lithothamnion, Melobesia, Pneophyllum)

SERIES REFERENCES. John et al., 1994: 60, 66, 71; Lawson et al., 1995: 105.

CURRENT PLACEMENT/NAME. *Pneophyllum amplexifrons* (Harvey) Y.M. Chamberlain & R.E. Norris, according to Chamberlain & Norris (1994).

Additional records: Cape Verde Islands (625); pantropical (625). COMMENTS. Conclusion of Chamberlain & Norris (1994) based on study of TCD lectotype (Woelkerling & Campbell, 1992: 98) from South Africa.

angolense (Lithothamnion)

SERIES REFERENCE. John et al., 1994: 66.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; whereabouts of type material uncertain; protologue (Romanes, 677) based on fossil specimens from four localities.

aninae (Lithophyllum)

SERIES REFERENCE. John et al., 1994: 60.

CURRENT PLACEMENT/NAME. *Lithophyllum aninae* Foslie, accord-

ing to Adey (1970: 8), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a modern, detailed study of the TRH holotype (Woelkerling, 678: 27) from the Cape Verde Islands; holotype fragments in PC (Woelkerling, 730).

antarcticum (Lithothamnion)

SERIES REFERENCE. John et al., 1994: 66.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Synarthrophyton patena* (Hooker f. & Harvey in Harvey) R.A. Townsend; see May & Woelkerling (1988: 68).

COMMENTS. Delete from flora; no published record of occurrence from West African region found.

applicatum (Lithophyllum, Mesophyllum)

SERIES REFERENCES. John et al., 1994: 60, 73, 78 (under *Neogoniolithon hirtum*).

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Neogoniolithon hirtum* (Me. Lemoine in Børgesen) Afonso-Carrillo, according to Afonso-Carrillo (11: 131), but see comments.

COMMENTS. Conclusion of Afonso-Carrillo (11) based on examination of type material from Canary Islands in C; lectotype, however, apparently not yet designated (Woelkerling, 730, under *Lithophyllum applicatum*) and placement requires confirmation following lectotypification (John et al., 1994: 78).

atlantica (Lithoporella)

SERIES REFERENCE. John et al., 1994: 65.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Lithoporella melobesoides* (Foslie) Foslie, according to Lemoine (371: 44), but proposed synonymy not based on examination of type material (for data on type material, see Woelkerling, 678, 730).

COMMENTS. Delete from flora; no published record of occurrence from West African region found.

bisporum (Leptophyllum, Lithophyllum, Lithothamnion, Phymatolithon)

SERIES REFERENCES. John et al., 1994: 57, 60, 66; Lawson et al., 1995: 102.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; holotype from Canary Islands in PC (Woelkerling, 730) with fragments in TRH (Woelkerling, 678); not studied in detail in a modern context.

boergesenii (Goniolithon, Hydrolithon, Porolithon)

SERIES REFERENCES. Lawson & John, 350: 235; Lawson & John, 586: 206; Price et al., 1988: 230; Price et al., 1992: 131; Lawson et al., 1995: 112.

CURRENT PLACEMENT/NAME. *Hydrolithon boergesenii* (Foslie) Foslie, according to Woelkerling in Price et al. (1992: 131).

COMMENTS. Conclusion of Woelkerling (in Price et al., 1992) based on examination of TRH lectotype (Woelkerling, 678: 40) from US Virgin Islands.

boergesenii f./var. africana (Goniolithon, Porolithon)

SERIES REFERENCES. Price et al., 1992: 131 (under *Hydrolithon boergesenii*); Lawson et al., 1995: 112.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH holotype (Woelkerling, 678: 23) from São Tomé not studied in detail in a modern context; placement under *Hydrolithon boergesenii* in Price et al., (1992) follows format conventions (see Price et al., 1992: 123) without implying synonymy with the type of the species.

boreale (Hydrolithon)

SERIES REFERENCES. Not previously reported.

CURRENT PLACEMENT/NAME. *Hydrolithon boreale* (Foslie) Y.M. Chamberlain, according to Chamberlain (702: 116).

NEW RECORDS. Canaries (687;702).

COMMENTS. Conclusion of Chamberlain (702) based on study of TRH lectotype from Ireland.

bornetii (Leptophyllum, Lithothamnion)

SERIES REFERENCES. John et al., 1994: 57, 66.

CURRENT PLACEMENT/NAME. See comments.

COMMENTS. Based on a detailed study of type material in PC (Woelkerling, 730) and TRH (Woelkerling, 678), Chamberlain (1990) placed the species in *Leptophyllum*. Subsequently, Düwel & Wegeberg (1996) concluded from a study of relevant types that *Leptophyllum* constitutes a heterotypic synonym of *Phymatolithon*. Babbini & Bressan (753: 312), clearly without knowing the work of Düwel & Wegeberg (1996), considered the genus *Leptophyllum* as insufficiently characterized, and the species as dubious and rare. Evidence from the type of *bornetii* presented by Chamberlain (1990) strongly suggests that the species belongs to *Phymatolithon*, but it has yet to be validly transferred into that genus (comments on invalid transfers to *Phymatolithon* are provided under *Lithothamnion bornetii*; see John et al., 1994: 66).

brachycladum (Lithothamnion, Mesophyllum)

SERIES REFERENCES. Lawson & John, 350: 240; Lawson & John, 586: 210; John et al., 1994: 66, 73.

CURRENT PLACEMENT/NAME. *Mesophyllum brachycladum* (Foslie) W.H. Adey, according to Adey (1970: 22), but see comments.

COMMENTS. Status and disposition of species uncertain; holotype (Woelkerling, 678: 14) from St Helena Island mainly in BM with fragments in PC and TRH (Woelkerling, 678, 730) but not studied in detail in a modern context.

brassica-florida (Goniolithon, Lithothamnion, Melobesia, Neogoniolithon)

SERIES REFERENCES. Price et al., 1988: 231; John et al., 1994: 67, 71, 77, 78 (under *Neogoniolithon mamillare*).

Current name: *Neogoniolithon brassica-florida* (Harvey) Setchell & L.R. Mason, according to Woelkerling et al. (678: 324–326).

COMMENTS. Conclusion of Woelkerling et al. (678) based on a study of the BM lectotype from South Africa.

byssoides (Goniolithon, Lithophyllum, Titanoderma)

SERIES REFERENCES. Price et al., 1988: 231; John et al., 1994: 60; this paper.

CURRENT PLACEMENT/NAME. *Lithophyllum byssoides* (Lamarck) Foslie, according to Woelkerling (729).

COMMENTS. Conclusion of Woelkerling (729) based on a study of PC lectotype, said but not confirmed to come from the English Channel.

calcareum (Lithophyllum, Lithothamnion, Lythophyllum, Phymatolithon)

SERIES REFERENCES. John et al., 1994: 60, 67, 71; Lawson et al., 1995: 103.

CURRENT PLACEMENT/NAME. *Phymatolithon calcareum* (Pallas) W.H. Adey & D.L. McKibbin, according to Woelkerling & Irvine (1986a).

COMMENTS. Conclusion of Woelkerling & Irvine (1986a) based on a detailed study of the designated neotype (from Falmouth harbour, England) in BM.

calcareum f. crassa (Lithothamnion)

SERIES REFERENCE. Lawson et al., 1995: 103 (under *Phymatolithon calcareum*).

CURRENT PLACEMENT/NAME. *Lithothamnion calcareum* f. *crassa* (Philippi) Me. Lemoine, considered a heterotypic synonym of *Lithophyllum racemus* (Lamarcck) Foslie, according to Basso et al. (1996: 284–286).

COMMENTS. See comments for *Lithophyllum racemus*. Babbini & Bressan (753: 124, 128) listed *Lithophyllum crassum* Philippi as a synonym of *Lithophyllum racemus* (Lamarcck) Foslie (with a f. *crassa* (Philippi) Foslie) along with *Phymatolithon calcareum* f. *crassa* Me. Lemoine.

callithamnioides sensu Falkenberg (Melobesia)

SERIES REFERENCE. John et al., 1994: 71.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Application of name uncertain and apparently also commonly misapplied (see comments in Chamberlain, 94: 351–352; John et al., 1994: 71; Chamberlain, 702: 116–117 under *Hydrolithon boreale*). Babbini & Bressan (753: 200) classified this under *Hydrolithon farinosum* (P.V. Lamouroux) Penrose & Y.M. Chamberlain. Relevant collections of Falkenberg require re-investigation as a basis for resolving uncertainties.

canariense/canariensis (Lithophyllum, Lithothamnion, Mesophyllum)

SERIES REFERENCES. Lawson & John, 350: 241; Lawson & John, 586: 211; John et al., 1994: 60, 67, 74.

CURRENT PLACEMENT/NAME. *Mesophyllum canariense* (Foslie) Me. Lemoine, according to Reyes & Afonso-Carrillo (687).

COMMENTS. Conclusion of Reyes & Afonso-Carrillo (687) based on examination of TRH portion (Woelkerling, 678) of holotype (from Canary Islands); major portion of holotype now known to be in PC (Woelkerling, 730).

canariense var. difformis (Mesophyllum)

SERIES REFERENCE. John et al., 1994: 74 (under *Mesophyllum canariense*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; holotype from Canary Islands presumed to be in C but not studied in detail in a modern context; placement under *Mesophyllum canariense* (John et al., 1994: 74) in this series follows format conventions (John et al., 1994: 49) without implying synonymy with the type of the species.

canariense var. fasciata (Mesophyllum)

SERIES REFERENCE. John et al., 1994: 74 (under *Mesophyllum canariense*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; holotype from Canary Islands presumed to be in C but not studied in detail in a modern context; placement under *Mesophyllum canariense* (John et al., 1994: 74) in this series follows format conventions (John et al., 1994: 49) without implying synonymy with the type of the species.

capense/capensis (Lithophyllum, Lithothamnion)

SERIES REFERENCE. John et al., 1994: 60, 67.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; lectotype in CN (Woelkerling & Verheij, 1995: 38) from South Africa not studied in detail in a modern context; isolectotypes present in BM, L, and PC (Woelkerling & Verheij, 1995; Woelkerling, 1998b).

caribaeum (Lithophyllum, Neogoniolithon)

SERIES REFERENCE. John et al., 1994: 60, 77.

CURRENT PLACEMENT/NAME. *Neogoniolithon caribaeum* (Foslie) W.H. Adey, according to Adey (1970: 8), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a modern, detailed study of the TRH lectotype (Woelkerling, 678: 48) from the US Virgin Islands.

confervicola (Melobesia, Pneophyllum)

SERIES REFERENCES. John et al., 1994: 71; Lawson et al., 1995: 106.

CURRENT PLACEMENT/NAME. *Pneophyllum confervicola* (Kützing) Y.M. Chamberlain, according to Chamberlain (94: 385; 702: 137).

COMMENTS. Conclusions of Chamberlain (94;702) based on examination of holotype from Italy in L (Woelkerling & Verheij, 1995: 41).

confervicolum f. minutula (Pneophyllum)

SERIES REFERENCE. Lawson et al., 1995: 106 (under *Pneophyllum confervicola*).

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Pneophyllum confervicola* (f. *confervicola*), according to Chamberlain (1994b: 140).

COMMENTS. Conclusion of Chamberlain (702) based on examination (Chamberlain, 94: 394) of TRH holotype (Woelkerling, 678: 151) from Norway.

confine/confinis (Dermatolithon, Melobesia, Tenarea, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 71; this paper.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Lithophyllum pustulatum* (Lamouroux) Foslie, according to Woelkerling & Campbell (1992: 79). Although others (Chamberlain, 1991; Babbini & Bressan, 753: 181) list it as *Titanoderma pustulatum* var. *confine* (P. & H. Crouan) Y.M. Chamberlain.

COMMENTS. Conclusion of Woelkerling & Campbell (1992) takes account of study of PC lectotype by Chamberlain (1991, as

Titanoderma; lectotype (Woelkerling, 730) presumed (Chamberlain, 1991) to be from France.

conuncta (Lithoporella, Mastophora)

SERIES REFERENCE. John et al., 1994: 66, 71.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Lithoporella melobesioides* (Foslie) Foslie, according to Lemoine (371: 44), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Lemoine (371) not based on study of lectotype (from Cape Verde Islands) in TRH (Woelkerling, 678); also treated as a distinct species of *Lithoporella* (Adey, 1970: 15).

corallinae (Dermatolithon, Lithophyllum, Melobesia, Tenarea, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 60, 72; this paper.

CURRENT PLACEMENT/NAME. *Lithophyllum corallinae* (P. & H. Crouan) Heydrich, according to Woelkerling & Campbell (1992: 41).

COMMENTS. Conclusion of Woelkerling & Campbell (1992) based on an examination of the lectotype (from France) in CO and the earlier detailed study of the lectotype by Chamberlain (1991: 66, as *Titanoderma*).

coralliooides (Lithothamnion)

SERIES REFERENCE. John et al., 1994: 67.

CURRENT PLACEMENT/NAME. *Lithothamnion coralliooides* (P. & H. Crouan) P. & H. Crouan, according to Chamberlain & Irvine (701: 177).

NEW RECORD. Canaries (701).

COMMENTS. Conclusion of Chamberlain & Irvine (701) based on the selection and study of the neotype; information on isoneotypes in PC provided by Woelkerling (730).

corticiforme/corticiformis (Epilithon, Lithothamnion, Melobesia)

SERIES REFERENCES. Price et al., 1986: 89; John et al., 1994: 67, 72.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Melobesia membranacea* (Esper) J.V. Lamouroux, according to Chamberlain (94: 300, 306).

COMMENTS. Conclusion of Chamberlain (94) based on examination of the holotype (from an unnamed locality in the Atlantic Ocean) in L; additional information on holotype provided by Woelkerling & Verheij (1995: 42).

crassum (Lithothamnion)

SERIES REFERENCES. John et al., 1994: 67; Lawson et al., 1995: 103 (under *Phymatolithon calcareum*).

CURRENT PLACEMENT/NAME. *Lithothamnion crassum* Philippi considered a heterotypic synonym of *Lithophyllum racemus* (Lamarck) Foslie, according to Basso et al. (1996: 284–286) and Babbini & Bressan (753: 258).

COMMENTS. See comments for *Lithophyllum racemus*.

crispatum (Lithothamnion)

SERIES REFERENCE. John et al., 1994: 67.

CURRENT PLACEMENT/NAME. Not determined. Babbini & Bressan (753: 258), however, listed it as *Lithothamnion crispatum* Hauck; see comments.

COMMENTS. Status and disposition uncertain; lectotype from Adriatic Sea in L (Woelkerling & Verheij, 1995: 44) vegetatively concordant with *Lithothamnion*, but absence of reproductive material precludes certain generic placement; information on PC and TRH isolectotypes provided by Woelkerling (730).

crouanii (Lithophyllum)

SERIES REFERENCE. John et al., 1994: 61.

CURRENT PLACEMENT/NAME. *Lithophyllum crouanii* Foslie, according to Chamberlain et al. (1988).

COMMENTS. Conclusion of Chamberlain et al. (1988) based on examination of lectotype from England in TRH (Woelkerling, 678: 68).

cruciatum (Hydrolithon)

SERIES REFERENCES. not previously reported.

CURRENT PLACEMENT/NAME. *Hydrolithon cruciatum* (Bressan) Y.M. Chamberlain, according to Chamberlain (702: 120).

NEW RECORDS. Canaries (687;702).

COMMENTS. Conclusion of Chamberlain (702) requires confirmation via a study of the TSB holotype from Italy; type not seen by Chamberlain (702).

cystoseirae (Dermatolithon, Lithophyllum, Melobesia, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 61, 72; this paper.

CURRENT PLACEMENT/NAME. *Lithophyllum cystoseirae* (Hauck) Heydrich, according to John et al. (1994: 61).

COMMENTS. Conclusion of John et al. (1994) based on data on the lectotype from Italy in L (Woelkerling & Verheij, 1995: 45) provided by Huvé (272) and Athanasiadis (1989).

cystoseirae f./var. *saxicola* (Dermatolithon)

SERIES REFERENCE. John et al., 1994: 61 (under *Lithophyllum cystoseirae*).

CURRENT PLACEMENT/NAME. *Nom. nud.*; see comments.

COMMENTS. Name first coined by Huvé (272: 234) and mentioned by Lemoine (368: 6) but never validated with a description or designation of a type specimen in accordance with Articles 36 and 37 of the ICBN (see Greuter, 1994).

daedaleum (Lithophyllum)

SERIES REFERENCE. John et al., 1994: 61.

CURRENT PLACEMENT/NAME. *Lithophyllum daedaleum* Foslie & M. Howe, according to Adey (1970: 5), but see comments.

COMMENTS. Status and disposition uncertain; NY holotype (Woelkerling, 678: 27) from Puerto Rico not studied in detail in a modern context; information on isotypes and paratype at TRH, L, and PC provided by Woelkerling (678), Woelkerling & Verheij (1995) and Woelkerling (730).

decussatum f. *planiuscula* (Lithophyllum)

SERIES REFERENCE. John et al., 1994: 61 (as ‘*planiscula*’).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; holotype from Morocco in TRH (Woelkerling, 678: 173) not studied in detail in a modern context; West African record questionable (John et al., 1994: 61).

duckeri (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 61.

CURRENT PLACEMENT/NAME. *Lithophyllum duckeri* Woelkerling (1983a: 184), a *nom. nov.* for *Lithothamnion crassum* Philippi, considered a heterotypic synonym of *Lithophyllum racemus* (Lamarck) Foslie, according to Basso et al. (1996: 284–286).

COMMENTS. See comments for *Lithophyllum racemus*.

ectocarpon (*Lithothamnion*, *Mesophyllum*)

SERIES REFERENCE. John et al., 1994: 67, 74.

CURRENT PLACEMENT/NAME. *Mesophyllum ectocarpon* (Foslie) W.H. Adey, according to Adey (1970: 23), but see comments.

COMMENTS. Status and disposition uncertain; TRH lectotype (Woelkerling, 678: 27) from Cap Blanc, Sénegal not studied in detail in a modern context; placement in *Mesophyllum* somewhat in question (Adey, 1970: 23); information on isolectotype in L provided by Woelkerling & Verheij (1995: 51).

endophloea (*Schmitziella*)

See under *Schmitziella endophloea* Bornet ex Batters (see also Woelkerling & Irvine, 1982).

engelhartii (*Mesophyllum*)

SERIES REFERENCES. not previously reported.

CURRENT PLACEMENT/NAME. *Mesophyllum engelhartii* (Foslie) W.H. Adey, according to Woelkerling & Harvey (1993: 581).

NEW RECORD. Namibia (742).

COMMENTS. Conclusion of Woelkerling & Harvey (1993) based on study of TRH lectotype (Woelkerling 678: 84) from southern Australia.

erubescens (*Lithothamnion*, *Mesophyllum*)

SERIES REFERENCES. John et al., 1994: 67, 74.

CURRENT PLACEMENT/NAME. *Mesophyllum erubescens* (Foslie) Me. Lemoine, according to Keats & Chamberlain (755: 175).

ADDITIONAL RECORDS. Capé Verde Islands (625); pantropical (625).

NEW RECORD. Sénegal (755).

COMMENTS. Conclusion of Keats & Chamberlain (755) based on examination of holotype from Brasil in TRH (Woelkerling, 678: 85).

esperi (*Lithophyllum*, *Pseudolithophyllum*)

SERIES REFERENCES. John et al., 1994: 61; Lawson et al., 1995: 112.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; species based on a series of collections from Canary Islands (Lemoine, 362: 63) but not lectotypified and original collections not studied in detail in a modern context (John et al., 1994: 61).

expansa/expansum (*Crodelia*, *Lithophyllum*, *Pseudolithophyllum*)

SERIES REFERENCES. Price et al., 1986: 78; John et al., 1994: 62, 63 (under *Lithophyllum lobatum*), 75 (under *Mesophyllum lichenoides*); Lawson et al., 1995: 112.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Mesophyllum lichenoides*, according to Woelkerling (1983b: 307) and Lawson et al. (1995: 112), but see comments.

COMMENTS. Holotype from Sicily in L (Woelkerling & Verheij, 1995: 51) studied in detail by Woelkerling (1983b: 307) who suggested conspecificity with *Mesophyllum lichenoides*; disposition of plants referred to *Pseudolithophyllum expansum* (Philippi) Me. Lemoine sensu Lemoine discussed by Furnari et al. (1996). On the other hand, Babbini & Bressan (753: 130) listed this under *Lithophyllum frondosum* (Dufour) Furnari, Cormaci & Alongi f. *expansum* (Me. Lemoine) Babbini & Bressan, a name which has to be checked against the provisions of ICBN 1994 for acceptability (see Greuter, 1994)

expansum f. exigua (*Lithophyllum*)

SERIES REFERENCES. John et al., 1994: 75 (under *Mesophyllum lichenoides*); Lawson et al., 1995: 112 (under *Pseudolithophyllum expansum*).

CURRENT PLACEMENT/NAME. Not determined. Babbini & Bressan (753: 131) included this under *Lithophyllum frondosum* (Dufour) Furnari, Cormaci & Alongi without providing a statement on its taxonomic status. See comments.

COMMENTS. Status and disposition uncertain; holotype from Algeria in TRH (Woelkerling, 678) not studied in detail in a modern context; placement under *Mesophyllum lichenoides* in this series follows format conventions (John et al., 1994: 49; Lawson et al., 1995: 99) without implying synonymy with the type of the species.

expansum f. involvens (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 75 (under *Mesophyllum lichenoides*).

CURRENT PLACEMENT/NAME. Not determined. According to Babbini & Bressan (753: 138) f. *involvens* Vinassa = f. *exigua* Foslie under *Lithophyllum frondosum* (Dufour) Furnari, Cormaci & Alongi, but provided no statement on its taxonomic status; see comments.

COMMENTS. Status and disposition uncertain; type material from the Mediterranean Sea (Vinassa, 1892) not studied in detail in a modern context and whereabouts uncertain; placement under *Mesophyllum lichenoides* in this series follows format conventions (John et al., 1994: 49) without implying synonymy with the type of the species.

expansum f. stictaeformis (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 75 (under *Mesophyllum lichenoides*).

CURRENT PLACEMENT/NAME. Not determined. According to Babbini & Bressan (753: 131) this taxon can be included under *Lithophyllum frondosum* (Dufour) Furnari, Cormaci & Alongi. They did not provide a statement on its taxonomic status. See comments.

COMMENTS. Status and disposition uncertain; type material from the Mediterranean Sea (Areschoug, 1852: 517) not studied in detail in a modern context; placement under *Mesophyllum lichenoides* in this series follows format conventions (John et al., 1994: 49) without implying synonymy with the type of the species.

farinacea (Melobesia)

SERIES REFERENCES. Price et al., 1986: 92 (under *Fosliella farinosa*); John et al., 1994: 72.

COMMENTS. Epithet *farinacea* in the binomial *Melobesia farinacea* Lamouroux an orthographic variant of *Melobesia farinosa*; see following entry.

farinosa (Fosliella, Melobesia)

SERIES REFERENCES. Lawson & John, 350: 234; Price et al., 1986: 91; Lawson & John, 586: 205; John et al., 1994: 72.

CURRENT PLACEMENT/NAME. *Hydrolithon farinosum* (J.V. Lamouroux) Penrose & Y.M. Chamberlain, according to Penrose & Chamberlain (1993).

NEW RECORD. Canaries (702).

COMMENTS. Conclusion of Penrose & Chamberlain (1993) based on examination of lectotype (from an unspecified locality in the Mediterranean) in CN.

farinosa f. callithamnioides (Fosliella)

SERIES REFERENCES. Price et al., 1986: 91 (under *Fosliella farinosa*); Lawson & John, 586: 205.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; *Fosliella farinosa* f. *callithamnioides* (Foslie) Y.M. Chamberlain based on *Melobesia farinosa* f. *callithamnioides* Foslie (see Chamberlain, 94: 352 for details); taxon apparently not lectotypified (Chamberlain, 94: 352); name in the sense of Chamberlain (94) subsequently suppressed under *Hydrolithon boreale* (Chamberlain, 702: 116–117).

farinosa var. solmsiana (Fosliella, Melobesia)

SERIES REFERENCE. Price et al., 1986: 91, 92 (under *Fosliella farinosa*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; whereabouts of type material uncertain; additional comments provided by John et al., (1994: 72, under *Melobesia solmsiana*), Chamberlain (94: 351, under *Fosliella farinosa* f. *callithamnioides*), Taylor (1939, under *Fosliella farinosa* var. *solmsiana*) and Babbini & Bressan (753: 200, under *Hydrolithon farinosum*).

ferox (Leptophyllum)

SERIES REFERENCE. Not previously reported.

CURRENT PLACEMENT/NAME. Not determined; see comments.

NEW RECORD. Namibia (743).

COMMENTS. Placed in *Leptophyllum* by Chamberlain & Keats (743) based on study of TRH holotype (Woelkerling, 678: 92) from South Africa; *Leptophyllum* now considered a heterotypic synonym of *Phymatolithon* (Düwel & Wegeberg, 1996) but *ferox* not formally transferred to that genus; type and other collections cited by Chamberlain & Keats (743) require further study to determine generic placement.

floridanum (Lithothamnion, Mesophyllum)

SERIES REFERENCES. Lawson & John, 350: 241; Lawson & John, 596: 211; John et al., 1994: 67, 74.

CURRENT PLACEMENT/NAME. *Mesophyllum floridanum* (Foslie) W.H. Adey, according to Adey (1970: 24), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a modern, detailed study of the TRH holotype (Woelkerling, 678: 96) from Florida, U.S.A.; holotype fragment in PC (Woelkerling, 730).

foveatum (Leptophyllum)

SERIES REFERENCES. Not previously reported.

CURRENT PLACEMENT/NAME. Not determined; see comments.

NEW RECORD. Namibia (743).

COMMENTS. Originally described as a species of *Leptophyllum* (Chamberlain & Keats, 743) based on a holotype from South Africa deposited in L; *Leptophyllum* now considered a heterotypic synonym of *Phymatolithon* (Düwel & Wegeberg, 1996) but *foveatum* not formally transferred to that genus; type and other collections cited in protologue require further study to determine generic placement.

fragile (Pneophyllum)

SERIES REFERENCE. Lawson et al., 1995: 106.

CURRENT PLACEMENT/NAME. *Pneophyllum fragile* Kützing, according to Chamberlain (1983: 356) and Penrose & Woelkerling (1991: 495).

NEW RECORDS. Canaries (702; 740).

COMMENTS. Conclusions of Chamberlain (1983) and Penrose & Woelkerling (1991) based on study of L holotype (Woelkerling & Verheij, 1995: 53) from an unspecified locality in the Mediterranean Sea; holotype fragment also in PC (Woelkerling, 730).

fruticulosum/fruticulosus (Lithothamnion, Spongites)

SERIES REFERENCES. John et al., 1994: 67; this paper.

CURRENT PLACEMENT/NAME. *Spongites fruticulosus* Kützing, according to Woelkerling (1985: 135) and Penrose (1991).

COMMENTS. Conclusions of Woelkerling (1985) and Penrose (1991) based on study of L holotype (Woelkerling & Verheij, 1995: 54) from an unspecified locality in the Mediterranean Sea.

fruticulosum f. clavulata (Lithothamnion)

See under *Spongites fruticulosus*.

fruticulosum f. crassiuscula (Lithothamnion)

See under *Spongites fruticulosus*.

geometricum (Dermatolithon, Lithophyllum, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 62; this paper.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; type material from Canary Islands in C (unpublished data) not studied in detail in a modern context; species requires lectotypification (John et al., 1994: 62).

gracile (Lithophyllum)

SERIES REFERENCE. John et al., 1994: 62.

CURRENT PLACEMENT/NAME. *Lithophyllum gracile* Foslie, according to Adey (1970: 5), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a modern, detailed study of the TRH

holotype (Woelkerling, 678: 108) from the Cape Verde Islands.
hapalidiooides (*Dermatolithon*, *Lithophyllum*, *Tenarea*, *Titanoderma*)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 62, 64 (under *Lithophyllum pustulatum*); this paper.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Lithophyllum pustulatum* (J.V. Lamouroux) Foslie, according to Woelkerling & Campbell (1992: 79).

COMMENTS. Conclusion of Woelkerling & Campbell (1992) takes account of study of CHE lectotype from France by Chamberlain (1991: 34, under *Titanoderma pustulatum* var. *macrocarpum*); additional comments under *Titanoderma hapalidiooides* in this paper.

hapalidiooides f./var. **confinis** (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 64 (under *Lithophyllum pustulatum*).

CURRENT PLACEMENT/NAME. Homotypic synonym of *Melobesia confinis* P. & H. Crouan and thus a heterotypic synonym of *Lithophyllum pustulatum* (J.V. Lamouroux) Foslie, according to Woel-

kerling & Campbell (1992: 79). Babbini & Bressan (753: 181), however, consider it to belong to variety *confinis* of *Titanoderma pustulatum*.

COMMENTS. Conclusion of Woelkerling & Campbell (1992) takes account of study of PC lectotype by Chamberlain (1991, as *Titanoderma*); lectotype (Woelkerling, 730) presumed (Chamberlain, 1991) to be from France.

hauckii (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 62, 79 (under *Neogoniolithon mamillosum*).

CURRENT PLACEMENT/NAME. Avowed substitute name for *Lithothamnion mamillosum* Hauck, 1883 (non *L. mamillosum* Gümbel, 1871), according to Woelkerling & Verheij (1995: 57); additional data provided by John et al. (1994: 79, under *Neogoniolithon mamillosum*).

COMMENTS. See entry for *mamillosum* below.

hirtum (*Lithophyllum*, *Neogoniolithon*)

SERIES REFERENCE. John et al., 1994: 62, 78.

CURRENT PLACEMENT/NAME. *Neogoniolithon hirtum* (Me. Lemoine) Afonso-Carrillo, according to Afonso-Carrillo (11: 131), but see comments.

COMMENTS. Conclusion of Afonso-Carrillo (11) based on examination of type material from Canary Islands in C; lectotype, however, apparently not yet designated and placement in *Neogoniolithon* requires confirmation following lectotypification (John et al., 1994: 78).

hispanum (*Lithothamnion*)

SERIES REFERENCE. John et al., 1994: 67.

CURRENT PLACEMENT/NAME. Invalid name, according to John et al. (1994: 67).

COMMENTS. Original presentation (Gonzalez Henriquez, 235) lacks a description or diagnosis rendering name a *nomen nudum* and thus invalid in relation to ICBN Art. 32.1 (Greuter, 1994).

illitus (*Lithophyllum*, *Neogoniolithon*)

SERIES REFERENCE. John et al., 1994: 62, 78.

CURRENT PLACEMENT/NAME. *Neogoniolithon illitus* (Me. Lemoine) Afonso-Carrillo, according to Afonso-Carrillo (11: 133), but see comments.

COMMENTS. Conclusion of Afonso-Carrillo (11) based on examination of type material from Canary Islands in C, but lectotype apparently not yet designated and placement in *Neogoniolithon* requires confirmation following lectotypification (John et al., 1994: 78); syntype material also occurs in PC (Woelkerling, 730).

incrassans (*Lithophyllum*, *Lithothamnion*)

SERIES REFERENCES. John et al., 1994: 62, 65 (under *Lithophyllum vickersiae*), 67; Lawson et al., 1995: 113 (under *Pseudolithophyllum vickersiae*); this paper (under *Spongites africanum*).

CURRENT PLACEMENT/NAME. *Lithophyllum incrassans* Philippi, according to Woelkerling (1983b: 313–317).

COMMENTS. Conclusion of Woelkerling (1983b) based on study of holotype from Sicily in L (Woelkerling & Verheij, 1995: 58).

indicum (*Lithothamnion*)

SERIES REFERENCE. John et al., 1994: 67.

CURRENT PLACEMENT/NAME. *Lithothamnion indicum* Foslie, according to Wilks & Woelkerling (1995: 558).

COMMENTS. Conclusion of Wilks & Woelkerling (1995) based on study of TRH lectotype (Woelkerling, 678: 125) from Victoria, Australia.

irregularare/irregularis (*Lithophyllum*, *Lithothamnion*, *Pseudolithophyllum*, *Tenarea*)

SERIES REFERENCES. Lawson & John, 350: 245; Lawson & John, 586: 217; John et al., 1994: 62, 67; Lawson et al., 1995: 113; this paper.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; holotype from São Tomé in TRH (Woelkerling, 678: 130, under *Lithothamnion irregularare* Foslie) but not studied in detail in a modern context; additional comments provided by John et al. (1994: 62, under *Lithophyllum irregularare*).

kaiserii (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 63 (as ‘*kaiseri*’).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; species requires typification and then type requires study in detail in a modern context (John et al., 1994: 63); syntype material present in TRH (Woelkerling, 678: 132).

kotschyani (*Lithophyllum*)

SERIES REFERENCE. John et al., 1994: 63.

CURRENT PLACEMENT/NAME. *Lithophyllum kotschyani* Unger, according to Verheij (1994: 100).

COMMENTS. Conclusion of Verheij (1994) based on examination of holotype from Gulf of Bahrain in TRH (Woelkerling (678: 133).

lejolisi (*Fosiella*, *Heteroderma*, *Melobesia*, *Pneophyllum*)

SERIES REFERENCES. Lawson & John, 350: 235; Price et al., 1986: 92; Lawson & John, 586: 214; Price et al., 1992: 130; John et al., 1994: 72; Lawson et al., 1995: 106.

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Pneophyllum fragile* Kützing, according to Penrose & Woelkerling (1991: 496).

COMMENTS. Conclusion of Penrose & Woelkerling (1991) based on study of lectotype from France in CHE.

lenormandii (Lithothamnion, Phymatolithon)

SERIES REFERENCES. John et al., 1994: 67; Lawson et al., 1995: 103. Current placement/name: *Phymatolithon lenormandii* (Areschoug) W.H. Adey, according to Chamberlain & Irvine (701: 224) and Düwel & Wegeberg (1996: 476).

NEW RECORDS. Canaries (227;701).

COMMENTS. Conclusions of Chamberlain & Irvine (701) and Düwel & Wegeberg (1996) based on examination of LD lectotype (Woelkerling, 1988: 219) from France.

lenormandii f. squamulosa (Lithothamnion)

SERIES REFERENCE. Lawson et al., 1995: 103 (under *Phymatolithon lenormandii*).

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Phymatolithon lenormandii* (Areschoug) W.H. Adey f. *lenormandii*, according to Chamberlain & Irvine (701: 225, 230), but see comments. Babbini & Bressan (753: 295), however, consider it to belong to a separate forma, *squamulosa*.

COMMENTS. Conclusion of Chamberlain & Irvine (701) apparently not based on examination of TRH holotype from Norway (Woelkerling, 678: 206, under *Lithothamnion squamulosum*) and thus requires verification.

lenormandii f. sublaevis (Lithothamnion)

SERIES REFERENCE. Lawson et al., 1995: 103 (under *Phymatolithon lenormandii*).

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Phymatolithon lenormandii* (Areschoug) W.H. Adey f. *lenormandii*, according to Chamberlain & Irvine (701: 225, 230), but see comments.

COMMENTS. Conclusion of Chamberlain & Irvine (701) apparently not based on examination of TRH lectotype from England (Woelkerling, 678: 211) and thus requires verification.

leptothalloideum (Lithophyllum, Pseudolithophyllum)

SERIES REFERENCES. John et al., 1994: 63; Lawson et al., 1995: 113. Current placement/name: Not determined; see comments.

COMMENTS. Status and disposition uncertain; type material (whereabouts uncertain) from Annobon (Pagalú) (Pilger, 455) not studied in detail in a modern context.

lichenoides (Lithothamnion, Mesophyllum)

SERIES REFERENCE. John et al., 1994: 67, 74.

CURRENT PLACEMENT/NAME. *Mesophyllum lichenoides* (J. Ellis) Me. Lemoine, according to Woelkerling & Irvine (1986b).

NEW RECORD. Canaries (701).

COMMENTS. Conclusion of Woelkerling & Irvine (1986b) based on a detailed study of the BM neotype from England.

lobatum (Lithophyllum, Mesophyllum, Pseudolithophyllum)

SERIES REFERENCES. John et al., 1994: 63, 75; Lawson et al., 1995: 113.

CURRENT PLACEMENT/NAME. Not determined; see comments.

NEW RECORD. Canaries (744).

COMMENTS. Status and disposition uncertain; type material from Canary Islands in C (unpublished data) not studied in detail in a modern context; species requires lectotypification (John et al., 1994: 63).

mamillare/mamillaris (Goniolithon, Lithothamnion, Melobesia, Neogoniolithon, Porolithon)

SERIES REFERENCES. Lawson & John, 350: 241; Lawson & John, 586: 211; Price et al., 1988: 231; John et al., 1994: 67, 72, 78; Lawson et al., 1995: 112.

CURRENT PLACEMENT/NAME. Not determined; see comments.

Additional record: Cape Verde Islands (625); Pantropical (625).

COMMENTS. Status and disposition uncertain; lectotype (Printz, 212: pl. 47, legend to fig. 15) apparently missing (Woelkerling, 678: 144; John et al., 1994: 78) and thus not studied in detail in a modern context.

mamillosum (Goniolithon, Lithothamnion, Neogoniolithon)

SERIES REFERENCES. Price et al., 1988: 231; John et al., 1994: 67, 78.

CURRENT PLACEMENT/NAME. Current placement for *Lithothamnion mamillosum* Hauck, 1883 (non Gümbel, 1871) not determined; see comments.

COMMENTS. Status and disposition uncertain; lectotype at L (Woelkerling & Verheij, 1995: 64) from the Adriatic Sea not studied in detail in a modern context; see also entry for '*hauckii*' above.

mamillosum f. microcarpa (Goniolithon)

SERIES REFERENCE. John et al., 1994: 78 (under *Neogoniolithon mamillosum*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH lectotype (Woelkerling, 678: 149) from the Cape Verde Islands not studied in detail in a modern context; placement under *Neogoniolithon mamillosum* (John et al., 1994: 78) follows format conventions (John et al., 1994: 49) without implying synonymy with the type of the species.

marlothii (Lithophyllum)

SERIES REFERENCES. John et al., 1994: 63, 74 (under *Mesophyllum canariense*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; syntype material occurs in TRH (Woelkerling, 678) and PC (Woelkerling, 730) but lectotype not designated; additional comments provided by Chamberlain (738: 154).

mediterranea (Litholepis)

SERIES REFERENCE. John et al., 1994: 59.

CURRENT PLACEMENT/NAME. Not determined. In Babbini & Bressan (753: 170) as *Titanoderma mediterranea* (Foslie) Woelkerling. See comments.

COMMENTS. Status and disposition uncertain; TRH holotype (Woelkerling, 678) not examined in detail in a modern context; additional comments provided by John et al. (1994: 59) and by Woelkerling (730).

melobesioides (Lithoporella, Mastophora)

SERIES REFERENCE. John et al., 1994: 66, 71.

CURRENT PLACEMENT/NAME. *Lithoporella melobesioides* (Foslie) Foslie, according to Turner & Woelkerling (1982a, b).

NEW RECORDS. Cape Verde Islands (701). Sénégal (701).

COMMENTS. Conclusions of Turner & Woelkerling (1982a, b) based on detailed study of TRH lectotype (Woelkerling, 678: 148) from S. Nilandu, Maldive Islands.

membranacea/membranaceum (Epilithon, Lithothamnion, Melobesia)

SERIES REFERENCES. Price et al., 1986: 89; John et al., 1994: 67, 72.

CURRENT PLACEMENT/NAME. *Melobesia membranacea* (Esper) J.V. Lamouroux, according to Chamberlain (1985) and Wilks & Woelkerling (1991).

COMMENTS. Conclusions of Chamberlain (1985) and Wilks & Woelkerling (1991) based on studies of CN neotype (Chamberlain, 1985) from France; additional comments provided by John et al. (1994: 72).

mildbraedii (Lithophyllum, Pseudolithophyllum)

SERIES REFERENCES. Lawson & John, 350: 246; Lawson & John, 586: 217; John et al., 1994: 63; Lawson et al., 1995: 113.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; whereabouts of type material uncertain; protologue (Pilger, 455) based on a collection from Annobon (Pagalú).

minutula (Fosiella, Melobesia)

SERIES REFERENCES. Price et al., 1986: 92; John et al., 1994: 72; Lawson et al., 1995: 106 (under *Pneophyllum confervicola*).

CURRENT PLACEMENT/NAME. Heterotypic synonym of *Pneophyllum confervicola* (Kützing) Y.M. Chamberlain, according to Chamberlain (702: 137–141).

COMMENTS. Conclusion of Chamberlain (702) based on studies (Chamberlain, 702, 1994b) of TRH holotype (Woelkerling, 678) from Norway.

neoatalyense (Lithophyllum)

SERIES REFERENCES. Not previously reported.

CURRENT PLACEMENT/NAME. *Lithophyllum neoatalyense* T. Masaki, according to Chamberlain (737: 210).

NEW RECORD. Namibia (737).

COMMENTS. Conclusion of Chamberlain (737) based on study of HAK holotype from Japan.

nephalioides (Dermatolithon)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 64 (under *Lithophyllum pustulatum*).

CURRENT PLACEMENT/NAME. Orthographic variant of *Dermatolithon hapalidioides*, a heterotypic synonym of *Lithophyllum pustulatum*. Comments: See comments under entry for ‘hapalidioides’ above.

oligocarpum (Lithophyllum, Porolithon)

SERIES REFERENCES. John et al., 1994: 63; Lawson et al., 1995: 112. Current placement/name: Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH holotype (Woelkerling, 678: 163) from the Canary Islands not studied in detail in a modern context; PC holotype fragments apparently missing (Woelkerling, 730).

onkodes (Lithothamnion, Porolithon)

SERIES REFERENCES. Lawson & John, 350: 244; Lawson & John, 586: 216; John et al., 1994: 67; Lawson et al., 1995: 112.

CURRENT PLACEMENT/NAME. *Hydrolithon onkodes* (Heydrich) Penrose & Woelkerling, according to Penrose & Woelkerling (1992: 83).

COMMENTS. Conclusion of Penrose & Woelkerling (1992) based on study of TRH lectotype (Woelkerling, 678) from New Guinea and on earlier study of lectotype by Penrose & Woelkerling (1988); data on PC isolectotype provided by Woelkerling (730).

onkodes var. oligocarpa (Porolithon)

SERIES REFERENCE. Lawson et al., 1995: 112 (under *Porolithon oligocarpum*).

CURRENT PLACEMENT/NAME. Homotypic synonym of *Lithophyllum oligocarpum* Foslie.

COMMENTS. See comments under entry for *oligocarpum* above.

orbiculare (Credelia)

SERIES REFERENCE. Price et al., 1986: 79.

CURRENT PLACEMENT/NAME. Epithet *orbiculare* an orthographic variant of *orbiculatum* (see below).

COMMENTS. See comments for following entry.

orbiculatum (Lithophyllum, Lithothamnion, Pseudolithophyllum)

SERIES REFERENCES. John et al., 1994: 63, 68; Lawson et al., 1995: 113.

CURRENT PLACEMENT/NAME. *Lithophyllum orbiculatum* (Foslie) Foslie, according to Chamberlain et al. (1991).

COMMENTS. Conclusion of Chamberlain et al. (1991) based on study of TRH lectotype (Woelkerling, 678) from Norway; the binomial *Credelia orbiculare* (Foslie) Kylin (in Price et al., 1986: 79) pertains to *Lithophyllum orbiculatum*, but Kylin (281: 208) used the spelling *orbiculare* and not *orbiculatum*.

orotavicum (Goniolithon, Lithophyllum, Neogoniolithon)

SERIES REFERENCES. Price et al., 1988: 231; John et al., 1994: 63, 79.

CURRENT PLACEMENT/NAME. *Neogoniolithon orotavicum* (Foslie) Me. Lemoine, according to Adey (1970: 9) and Afonso-Carrillo (11: 133), but see comments.

COMMENTS. Conclusions of Adey (1970) and Afonso-Carrillo (11) based on examination of TRH portion of holotype (Woelkerling, 678) from the Canary Islands; placement in *Neogoniolithon* as delimited by Penrose (1992, 1996c) and by Penrose & Chamberlain (1993), however, requires confirmation; data on PC portion of holotype provided by Woelkerling (678).

papillosum (Dermatolithon, Goniolithon, Lithophyllum, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; Price et al., 1988: 231; John et al., 1994: 63; this paper.

CURRENT PLACEMENT/NAME. *Lithophyllum papillosum* (Zanardini ex Hauck) Foslie, according to Huvé (272) and Babbini & Bressan (753: 307), but see comments.

COMMENTS. Conclusion of Huvé (272) based on study of L lectotype (Woelkerling & Verheij, 1995) from the Adriatic Sea; placement in *Lithophyllum* as delimited by Woelkerling & Campbell (1992) and Woelkerling (1996a), however, requires confirmation; additional comments provided by John et al. (1994: 63) and Woelkerling (1988: 216–217).

papillosum var. cystoseirae (Dermatolithon, Titanoderma)

SERIES REFERENCES. John et al., 1994: 61 (under *Lithophyllum cystoseirae*); this paper (under *Titanoderma cystoseirae*).

CURRENT PLACEMENT/NAME. Homotypic synonym of *Lithophyllum cystoseirae* (Hauck) Heydrich.

COMMENTS. See comments under entry for ‘*cystoseirae*’ above and those by Babbini & Bressan (753: 307).

philippii (Lithothamnion, Mesophyllum)

SERIES REFERENCE. John et al., 1994: 68, 75.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH lectotype (Woelkerling, 678: 171) from Italy not studied in detail in a modern context; additional comments provided by John et al. (1994: 68).

phyllactidium (Hapalidium)

SERIES REFERENCE. Lawson et al., 1995: 106 (under *Pneophyllum confervicolum*).

CURRENT PLACEMENT/NAME. Superfluous name for *Phyllactidium confervicola* Kützing [basionym of *Pneophyllum confervicola* (Kützing) Y.M. Chamberlain], according to Woelkerling & Verheij (1995: 69).

COMMENTS. Nomenclatural data provided by Woelkerling & Verheij (1995); also see entry under ‘*confervicola*’ above.

polycephalum (Dermatolithon, Goniolithon, Lithophyllum, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; Price et al., 1988: 231; John et al., 1994: 64; this paper.

CURRENT PLACEMENT/NAME. *Lithophyllum polycephalum* Foslie, according to Woelkerling & Campbell (1992: 22–23).

COMMENTS. Conclusion of Woelkerling & Campbell (1992) based on examination of TRH holotype (Woelkerling, 678: 174) from the Cape Verde Islands; additional data on holotype provided by Chamberlain (737, as *Titanoderma*).

polyclonum (Dermatolithon, Lithophyllum, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 64; this paper.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH holotype (Woelkerling, 678: 175) fragmentary and not studied in detail in a modern context.

polymorphum (Lithothamnion, Phymatolithon)

SERIES REFERENCES. John et al., 1994: 68; Lawson et al., 1995: 103. Current placement/name: Superfluous name; see comments.

COMMENTS. *Phymatolithon polymorphum* (L.) Foslie, based on

Millepora polymorpha L., is a superfluous name for *Phymatolithon calcareum* (Pallas) W.H. Adey & D.L. McKibbin; details provided by Woelkerling & Irvine (1986a); epithet *polymorphum* widely misapplied (Woelkerling & Irvine, 1986a) to plants referable to *Phymatolithon purpureum* (P. & H. Crouan) Woelkerling & L. Irvine (see entry for *purpureum* below).

polymorphum f. sublaevis (Phymatolithon)

SERIES REFERENCE. Lawson et al., 1995: 103.

CURRENT PLACEMENT/NAME. Superfluous name for *Phymatolithon polymorphum* f. *papillata* Foslie, according to Woelkerling (678: 211); also see comments.

COMMENTS. Status and disposition of *Phymatolithon polymorphum* f. *papillata* Foslie uncertain; TRH lectotype (Woelkerling, 678: 168) from Helgoland, Germany not studied in detail in a modern context.

ponderosum (Lithophyllum, Lithothamnion)

SERIES REFERENCES. John et al., 1994: 62 (under *Lithophyllum incrustans*), 64, 68; this paper (under *Spongites africanum*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH holotype (Woelkerling, 678: 168) from São Tomé not studied in detail in a modern context; additional comments provided by John et al. (1994: 68).

proboscideum (Lithophyllum)

SERIES REFERENCES. John et al., 1994: 64; this paper (under *Spongites africanum*).

CURRENT PLACEMENT/NAME. *Lithophyllum proboscideum* Foslie, according to Adey (1970: 5), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a modern, detailed study of the lectotype from California, U.S.A. in TRH (Woelkerling, 678: 176); comments on West African record provided in this paper under entry for *Spongites africanum*.

purpureum (Phymatolithon)

SERIES REFERENCE. Lawson et al., 1995: 103.

CURRENT PLACEMENT/NAME. *Phymatolithon purpureum* (P. & H. Crouan) Woelkerling & L. Irvine, according to Woelkerling & Irvine (1986a).

COMMENTS. Conclusion of Woelkerling & Irvine (1986a) based on study of CO lectotype from France.

pustulata/pustulatum (Dermatolithon, Lithophyllum, Melobesia, Titanoderma)

SERIES REFERENCES. Price et al., 1986: 86; John et al., 1994: 64, 72; this paper.

CURRENT PLACEMENT/NAME. *Lithophyllum pustulatum* (J.V. Lamouroux) Foslie, according to Woelkerling & Campbell (1992: 78).

COMMENTS. Conclusion of Woelkerling & Campbell (1992) based on study of CN lectotype from France and from earlier study of lectotype by Woelkerling et al. (1985).

pustulatum f. australis (Lithophyllum)

SERIES REFERENCE. John et al., 1994: 64 (under *Lithophyllum pustulatum*).

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; TRH lectotype (Woelkerling, 678: 35) from Canary Islands not studied in detail in a modern context.

racemus (Lithophyllum, Lithothamnion)

SERIES REFERENCES. John et al., 1994: 64, 67, 74 (under *Mesophyllum brachycladum*).

CURRENT PLACEMENT/NAME. *Lithophyllum racemus* (Lamarck) Foslie, according to Basso et al. (1996).

COMMENTS. Conclusion of Basso et al. (1996) based on the selection and study of a neotype (from Capri, Italy) housed at the Dipartimento di Scienze della Terra, Istituto di Geologia e Paleontologia, Università di Milano, in Milano, Italy; heterotypic synonyms (according to Basso et al., 1996) include *Lithothamnion crassum* Philippi, *Lithothamnion calcareum* f. *crassa* (Philippi) Me. Lemoine, and *Lithophyllum duckeri* Woelkerling; all West African records under these names require checking to confirm identification as misapplication of epithets likely in some or all cases; further information on the Lamarck species provided by Woelkerling (729) under the basionym (*Millepora racemus*).

retusum (Lithophyllum)

SERIES REFERENCES. Lawson & John, 350: 237; Lawson & John, 586: 207; John et al., 1994: 65.

CURRENT PLACEMENT/NAME. *Lithophyllum retusum* (Foslie) Foslie, according to Adey (1970: 5), but see comments.

COMMENTS. Status and disposition uncertain, conclusion of Adey (1970) requires verification via a detailed modern study of holotype from São Tomé in TRH (Woelkerling, 678: 189); information on PC isotype provided by Woelkerling (730).

samoense (Hydrolithon)

SERIES REFERENCES. Not previously reported.

CURRENT PLACEMENT/NAME. *Hydrolithon samoense* (Foslie) Keats & Y.M. Chamberlain, according to Keats & Chamberlain (754: 15).

NEW RECORDS. Canaries (702;751).

COMMENTS. Conclusion of Keats & Chamberlain (754) based on study of TRH lectotype (Woelkerling, 678: 193) from Samoa.

sauvageauii (Lithoporella, Lithoporella, Melobesia)

SERIES REFERENCES. John et al., 1994: 59, 66, 72.

CURRENT PLACEMENT/NAME. *Lithoporella sauvageauii* (Foslie) W.H. Adey, according to Adey (1970: 15), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a detailed modern study of holotype from the Canaries in TRH (Woelkerling, 678: 195).

simile (Lithophyllum)

SERIES REFERENCES. Lawson & John, 350: 237; Lawson & John, 586: 208; John et al., 1994: 65.

CURRENT PLACEMENT/NAME. *Lithophyllum simile* Foslie, according to Adey (1970: 6), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a detailed modern study of holotype from São Tomé in TRH (Woelkerling, 678: 201).

solmsiana (Melobesia)

SERIES REFERENCES. Lawson & John, 350: 234; John et al., 1994: 72. Current placement/name: Not determined; see comments.

COMMENTS. Status and disposition uncertain; whereabouts of type material uncertain; additional comments provided by John et al. (1994: 72, under *Melobesia solmsiana*), Chamberlain (94: 351, under *Fosliella farinosa* f. *callithamnioides*) and Taylor (1939, under *Fosliella farinosa* var. *solmsiana*).

solmsii (Melobesia)

SERIES REFERENCES. Price et al., 1986: 92 (under *Fosliella farinosa*); John et al., 1994: 72.

CURRENT PLACEMENT/NAME. Invalid name, according to Woelkerling (678).

COMMENTS. Original presentation lacks a description or diagnosis rendering name invalid (Woelkerling, 730); name possibly a variant of *Melobesia solmsiana*, but contrary to John et al. (1994: 72, under *Melobesia solmsii*), cannot be considered a homotypic synonym.

solutum (Lithophyllum, Lithothamnion, Mesophyllum)

SERIES REFERENCE. John et al., 1994: 65, 68, 75.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; lectotype from Adriatic Sea in TRH (Woelkerling, 678: 203, under *Lithothamnion fruticosum* f. *soluta*) not studied in detail in a modern context; additional comments provided by John et al. (1994: 68).

sonderi (Lithothamnion)

SERIES REFERENCE. John et al., 1994: 68.

CURRENT PLACEMENT/NAME. *Lithothamnion sonderi* Hauck, according to Chamberlain (750: 191).

NEW RECORD. Canaries (750).

COMMENTS. Conclusion of Chamberlain (750) based on detailed study of lectotype in L (Woelkerling & Verheij, 1995: 77) from Helgoland, Germany.

stictaeformis (Melobesia)

SERIES REFERENCE. John et al., 1994: 73.

CURRENT PLACEMENT/NAME. Not determined; see comments.

COMMENTS. Status and disposition uncertain; protologue (Areschoug, 1852: 517) based on mediterranean material not studied in detail in a modern context; possible syntype material in TRH (Woelkerling, 678: 207); additional material presumed but not confirmed to be in LD (John et al., 1994: 73). See also discussion in Babbini & Bressan (753: 130, under *Lithophyllum frondosum*).

subtenellum (Goniolithon, Lithophyllum, Lithothamnion)

SERIES REFERENCES. Lawson & John, 350: 238; Lawson & John, 586: 208; Price et al., 1988: 231; John et al., 1994: 65, 68.

CURRENT PLACEMENT/NAME. *Lithophyllum subtenellum* (Foslie) Foslie, according to Adey (1970: 6), but see comments and also Babbini & Bressan (753: 268, under *Lithothamnion orbiculatum*).

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a detailed modern study of lectotype from France in TRH (Woelkerling, 678: 215).

tenuissimum (Lithothamnion, Phymatolithon)

SERIES REFERENCES. Lawson & John, 350: 242; Lawson & John, 586: 212; John et al., 1994: 68; Lawson et al., 1995: 103.

CURRENT PLACEMENT/NAME. *Phymatolithon tenuissimum* (Foslie) W.H. Adey, according to Adey (1970: 29), but see comments.

COMMENTS. Status and disposition uncertain; conclusion of Adey (1970) requires verification via a detailed modern study of holotype from São Tomé in TRH (Woelkerling, 678: 222); additional comments provided by Lawson et al. (352: 103) and Babbini & Bressan (753: 268, under *Lithothamnion tenuissimum*).

thuretii (Choreonema)

SERIES REFERENCE. Price et al., 1986: 69.

CURRENT PLACEMENT/NAME. *Choreonema thuretii* (Bornet) F. Schmitz, according to Woelkerling (1987).

COMMENTS. Conclusion of Woelkerling (1987) based on study of PC lectotype (Woelkerling, 730, under the basionym, *Melobesia thuretii* Bornet) from France.

tortuosa/tortuosum (Lithophyllum, Tenarea)

SERIES REFERENCES. Lawson & John, 350: 238; Lawson & John, 586: 210; John et al., 1994: 65; this paper.

CURRENT PLACEMENT/NAME. *Tenarea tortuosa* (Esper) Me. Lemoine, according to Woelkerling et al. (1985).

COMMENTS. Conclusion of Woelkerling et al. (1985) based on a detailed study of the FR lectotype from an unspecified locality in the Mediterranean Sea; additional comments provided under entry for *Tenarea tortuosa* in main part of this paper. Babbini & Bressan (753:

116, 192) cite *Tenarea tortuosa* (Esper) Me. Lemoine as an accepted species and as a synonym under *Lithophyllum lichenoides*.

vickersiae (Lithophyllum, Lithothamnion, Pseudolithophyllum)

SERIES REFERENCES. John et al., 1994: 65, 68; Lawson et al., 1995: 113.

CURRENT PLACEMENT/NAME. *Lithophyllum vickersiae* Me. Lemoine, but see comments.

COMMENTS. Status and disposition uncertain; placement here in *Lithophyllum* based on data on type material provided by Afonso-Carrillo (11: 139, as *Pseudolithophyllum*); protologue (Lemoine, 362: 42) based on seven collections from Canary Islands (all presumably in C) but lectotype not yet designated or studied in detail in a modern context; additional comments provided by John et al. (1994: 65).

wildpretii (Spongites)

See under *Spongites wildpretii*.

ACKNOWLEDGEMENTS. We acknowledge with thanks assistance from many sources, of which the principal are: (i) Department of Botany, The Natural History Museum, London, for provision of the necessary research facilities to continue the series of papers of which the present is the terminating part; (ii) A grant (for GWL) towards this work from The Systematics Association; and (iii) Marian Short, Department of Botany, The Natural History Museum, London, for her exceptionally careful work in editing this paper.

- 1852. *Species genera et ordines algarum . . . floridearum . . .* 2(2). Lundae.
- Notes. i) The Corallineae (Ordo XII, pp. 506–576) was by J.E. Areschoug. ii) Some versions of this second volume, Pars II, were issued as two separate texts – Pars II:1 being dated 1851 and Pars II:2 1852. iii) There are also internal differences of numbering of pages between copies. BM copy is numbered straight through from 337–720, including therein the Addenda [701–706] and Index [707–720]. In the copy from which the Cramer (1977) reprint was prepared, the Index [unnumbered, of 14 sides] is placed immediately after p. 700 and is followed by six sides [also unnumbered] of Addenda. Content of these unnumbered sides is exactly as the numbered BM pages. The BM copy of Vol. 2 Part 3 (1863) commences with pages headed ‘Ordo XIV. Wrangeliae’, and numbered 701–715; these are followed by ‘Ordo XV. Chondrieae’ [pp. 716–786]. All these latter pages [701–786], also so numbered, are in the Cramer (1977) version placed immediately after the unnumbered Addenda pages (see above) and before the title page to Vol. 2, Part 3, of 1863, thereby implying that the copy facsimiled was also so arranged. Pages from 787 to 1291 are in both cases in Vol. 2, Part 3, 1863. According to Stafler & Cowan (1976, *Taxonomic literature*, 2nd ed., 1: A–G, Utrecht), however, the pages 701–786 were already published in 1852, which means that all *Laurencia* names were published in 1852, not in 1863. Despite this, the Index in the end of the Cramer (1977) facsimile of Vol. 2, Part 3 (pp. 1279–1291) indicates the same page numbers as does the BM version. Both dated texts are indicated as the sources of data where the records occur in pp. 701–786 [textual pages]. The implication behind all this is that there may be yet other differently paged versions elsewhere.
- 1863. *Species genera et ordines algarum . . . floridearum . . .* 2(3). Lundae. Note. See notes under J.G. Agardh (1852).

- Benítez, A.J.** 1928(?). *Historia de las Islas Canarias (Edición ilustrada)* [I]. Santa Cruz de Tenerife.
- Note.* The work does not appear to be dated but the BM copy was received 3 July 1928 and 1928 has been impressed on the spine. The flora, entitled 'Fitografia Canaria . . .' and appearing on pp. 137–144, appears simply to be a list of plant names taken from Montagne (401) in Barker-Webb & Berthelot (q.v.). The reference to 'vol. I' indicates simply that only the first 528 of a total of more than 1000 pages were published.

- Soler-Onís, E., Haroun, R.J. & Prud'homme van Reine, W.F.** 1998. Mscr. *Sebdenia* in Macaronesia.
- Viera Rodríguez, A. & Prud'homme van Reine, W.F. 1995. *Sebdenia canariensis* sp. nov. (Sebdeniaceae, Gigartinales, Rhodophyta), una nueva alga roja de profundidad del Archipiélago Canario. *Résumenes de comunicaciones. XI Simposio Nacional de Botánica Criptogámica, Santiago de Compostela, 18–21 de Septiembre de 1995*: 15–16.
- Sonder, O.W.** 1852. Algae. *In* J.A. Schmidt, *Beiträge zur Flora der Cap Verdischen Inseln. Mit Berücksichtigung aller bis jetzt daselbst bekannten wildwachsenden und kultivirten Pflanzen Nach eigenen Untersuchungen und mit Benutzung der gewonnenen Resultate anderer Reisenden*: 125–127. Heidelberg.
- Sourie, R.** 1954. Contribution à l'étude écologique des côtes rocheuses du Sénégal. *Mémoires de l'Institut Français d'Afrique Noire* **38**: 1–342+[1].
- Note.* From the note on p. 117, it is clear that the algae were worked on mainly by J. Feldmann, but that Sourie took account of some of the views of Dangeard as expressed in the latter's memoir on the Cap Vert (Dakar) peninsula algae. Since the exact contribution of the various people involved is in doubt, we have left the reference in the name of Sourie, who seems to have exercised overall authorship.

- Trochain, J.** 1940. Contribution à l'étude de la végétation du Sénégal. *Mémoires de l'Institut Français d'Afrique Noire* **2**: [1–6]+1–433+[63].
- Note.* J. Feldmann clearly had a great deal to do with the main determinations on which the algal list (pp. 108–110) was based; since the extent to which the data were accepted or amended by Trochain is not clear, and since there are other parts to the text which seem definitely to have been attributable to Trochain, we have accepted the latter as overall author. For individual comments on species, the more correct authorship citation would undoubtedly be 'Feldmann, J., in Trochain, J.' etc.

Bulletin of The Natural History Museum Botany Series

Earlier Botany Bulletins are still in print. The following can be ordered from Intercept (address on inside front cover). Where the complete backlist is not shown, this may also be obtained from the same address.

Volume 21

- No. 1 Historical and taxonomic studies in the genus *Titanoderma* (Rhodophyta, Corallinales) in the British Isles. Y.M. Chamberlain. 1991. Pp. 1–80, 247 figs. £42.35
- No. 2 Early collections of the Holy Thorn (*Crataegus monogyna* cv. Biflora). A.R. Vickery. 1991. Pp. 81–83, 1 fig. A taxonomic study of the species referred to the ascomycete genus *Leptoraphis*. B. Aguirre-Hudson. 1991. Pp. 85–192, 76 figs. The typification and identification of *Calymperes crassilimbatum* Renaud & Cardot (Musc: Calymperaceae). L.T. Ellis. 1991. Pp. 193–194, 1 fig. £42.35

Volume 22

- No. 1 An account of southern Australian species of *Lithophyllum* (Corallinaceae, Rhodophyta). Wm. J. Woelkerling and S.J. Campbell. 1992. Pp. 1–107, 63 figs. £41.25
- No. 2 Palynological evidence for the generic delimitation of *Sechium* (Cucurbitaceae) and its allies. J.L. Alvarado, R. Lira-Saade & J. Caballero. 1992. Pp. 109–121. Seaweeds of the western coast of tropical Africa and adjacent islands: a critical assessment. IV. Rhodophyta (Florideae) 3. Genera H-K. J.H. Price, D.M. John & G.W. Lawson. 1992. pp. 123–146. Two new species of *Solanum* section *Geminata* (Solanaceae) from Cerro del Torr in western Colombia. S. Knapp. 1992. Pp. 147–152. *Fissidens ceylonensis* Dozy & Molkenb. (Musc: Fissidentaceae) and some allied taxa from southern India. L.T. Ellis. 1992. Pp. 153–156, 2 figs. New species of *Piper* (Piperaceae) from Central America. M. Tebbs. 1992. Pp. 157–158. Studies on the Cretan flora 1. Floristic notes. N.J. Turland. 1992. Pp. 159–164. Studies on the Cretan flora 2. The *Dianthus juniperinus* complex (Caryophyllaceae). N.J. Turland. 1992. Pp. 165–169. £41.25

Volume 23

- No. 1 Revision of *Piper* (Piperaceae) in the New World 3. The taxonomy of *Piper* sections *Lepianthes* and *Radula*. M.C. Tebbs. 1993. Pp. 1–50, 18 figs. Mounting techniques for the preservation and analysis of diatoms. S.J. Russell. 1993. Pp. 51–54. 1 fig. £43.25
- No. 2 New taxa of *Gentiana* (Gentianaceae) from Western China and the Himalayan region. T.-N. Ho and S.-W. Liu. 1993. Pp. 55–60, 2 figs. New combinations, names and taxonomic notes on *Gentianella* (Gentianaceae) from South America and New Zealand. T.-N. Ho and S.-W. Liu. 1993. Pp. 61–66. Studies in *Hypericum*: validation of new names. N.K.B. Robson. 1993. Pp. 67–70. Generic monograph of the Asteraceae-Anthemideae. K. Bremer and C.J. Humphries. 1993. Pp. 71–177. 12 figs. £43.25

Volume 24

- No. 1 Pre-Linnaean references for the Macaronesian flora found in Leonard Plukenet's works and collections. J. Francisco-Ortega, A. Santos-Guerra and C.E. Jarvis. Pp. 1–34. Studies on the lichen genus *Sticta* (Schreber) Ach.: II. Typification of taxa from Swartz's Prodromus of 1788. D.J. Galloway. Pp. 35–48.

Seaweeds of the western coast of tropical Africa and adjacent islands: a critical assessment. IV. Rhodophyta (Florideae) 4. Genera L–O. D.M. John, G.W. Lawson, J.H. Price, W.F. Prud'homme van Reine and W.J. Woelkerling. Pp. 49–90. Studies on the Cretan flora 3. Additions to the flora of Karpathos. N.J. Turland and L. Chilton. Pp. 91–100. £43.25

No. 2

Observations on the benthic marine algal flora of South Georgia: a floristic and ecological analysis. D.M. John, P.J.A. Pugh and I. Tittley. Pp. 101–114. Studies in *Pseudocycliphellaria* (Lichens) IV. Palaeotropical species (excluding Australia). D.J. Galloway. Pp. 115–160. Morphology and ecology of seedlings, fruits and seeds of Panama: Bixaceae and Cochlospermaceae. N.C. Garwood. Pp. 161–172. A study of *Bixa* (Bixaceae), with particular reference to the leaf undersurface indumentum as a diagnostic character. R.E. Dempsey and N.C. Garwood. Pp. 173–180. £43.40

Volume 25

- No. 1 A revision of *Rutilaria* Greville (Bacillariophyta). R. Ross. Pp. 1–94. William Roxburgh's St Helena plants. Q.C.B. Cronk. Pp. 95–98. £43.40
- No. 2 Seaweeds of the western coast of tropical Africa and adjacent islands: a critical assessment. IV. Rhodophyta (Florideae) 5. Genera P.G.W. Lawson, W.J. Woelkerling, J.H. Price, W.F. Prud'homme Van Reine and D.M. John. Pp. 99–122. A new species of *Odontorrhynchos* (Orchidaceae, Spiranthinae) from Bolivia. D.L. Szlachetko. Pp. 123–125. Linnaeus's interpretation of Prospero Alpino's *De plantis exoticis*, with special emphasis on the flora of Crete. N.J. Turland. Pp. 127–159. Book review. M.G. Gilbert. P. 161. £43.40

Volume 26

- No. 1 A morphological study of *Chaetoceros* species (Bacillariophyta) from the plankton of the Pacific ocean of Mexico. D.U. Hernández-Becerril. 1996. Pp. 1–73. £43.40
- No. 2 Studies in the genus *Hypericum* L. (Guttiferae) 6. Sections 20. *Myriandra* to 28. *Elodes*. N.K.B. Robson. 1996. Pp. 75–217. £43.40

Volume 27

- No. 1 Notes on the diatom species *Tetracyclus castellum* (Ehrenb.) Grunow with a description of *Tetracyclus pseudocastellum* nov. sp. D.M. Williams. Pp. 1–5. A new species of *Calymperes* (Musc: Calymperaceae) from Peninsular Malaysia. L.T. Ellis. Pp. 7–9. A phylogenetic conspectus of the tribe Hyoscyameae (Solanaceae). A.L. Hoare and S. Knapp. Pp. 11–29. A revision of *Solanum* section *Pteroidea*: Solanaceae. S. Knapp and T. Helgason. Pp. 31–73. 1997. £43.40
- No. 2 Systematics of *Pogostemon* (Labiateae) G.R. Bhatti and M. Ingrouille. Pp. 77–147. 1997. £43.40

Volume 28

- No. 1 Morphology and ecology of seedlings, fruits and seeds of Panamá: Vochysiaceae. N.C. Garwood. Pp. 1–16. A revision of the genus *Mandragora* (Solanaceae). S. Ungricht, S. Knapp and J.R. Press. Pp. 17–40. The pteridophytes of São Tomé and Príncipe (Gulf of Guinea). E. Figueiredo. Pp. 41–66. 1998. £43.40

CONTENTS

- 67 A revision of *Brillantaisia* (Acanthaceae)
K. Sidwell
- 115 Seaweeds of the western coast of tropical Africa and adjacent islands: a critical assessment.
IV. Rhodophyta (Florideae) 6. Genera [Q] R-Z, and an update of current names for non-geniculate
Corallinales
W.J. Woelkerling, G.W. Lawson, J.H. Price, D.M. John and W.F. Prud'homme van Reine
