## PREFACE

IT has been my intention to publish a monograph of Decapod larvae which should contain a bibliography, a part dealing with a number of general questions relating to the post-embryonic development of Decapoda and Euphausiacea, and a series of sections describing the larvae of all the groups, so far as they are known.

I have always assumed that such a monograph would have to be produced at my own expense, and the possibility of its ever appearing is becoming, for obvious reasons, very remote. I therefore welcome the acceptance of the bibliography by the Ray Society for publication in their series as a separate work. Much of the proposed monograph has already been prepared, but it is most unlikely that it will ever appear.

As regards this bibliography, it is too much to hope that it is complete or free from error, and I ask forbearance for its shortcomings. Many of the references to older literature are now of little or no interest, but it is impossible to pick and choose what shall be included and what left out. I am, of course, greatly indebted to the bibliography compiled by Faxon in 1881, and some of the older references have been taken from it without verification; but the proportion of papers which I have not actually seen is small. I must express my thanks to Mr. F. C. Sawyer, Assistant Librarian in the British Museum (Natural History), who has cross-checked the references in the systematic part and corrected the titles of journals to conform with the World List of Scientific Periodicals.

All papers have been included which have come to my notice up to May, 1939; but I am aware that some may have been overlooked, since the Zoological Record, upon which one relies so much, has not yet dealt with the publications of 1938. It has been difficult, and in some cases impossible, to see a few of the papers listed. This is particularly true for papers published in

Japan, and the task of the bibliographer is also made unnecessarily hard by the fact that these papers may be entirely in Japanese, including title, description of plates, and name of journal.

The omission of the Euphausiacea from this bibliography cannot easily be justified; since they should, without doubt, be included in the Decapoda. On the other hand, they have so long been regarded as distinct and are, in fact, such a sharply separated group, that it is more convenient to keep them apart.

No attempt has been made to deal exhaustively with the literature of the artificial propagation of the Lobster and Crayfish, but a sufficient number of references is given for the subject to be followed up if desired.

ROBERT GURNEY.
