

fringed darter

Etheostoma crossopteryum

Kingdom: Animalia
Phylum: Chordata
Class: Actinopterygii
Order: Perciformes
Family: Percidae

ILLINOIS STATUS

common, native

FEATURES

The second dorsal fin of the breeding male fringed darter has a white edge. There are three branches per fin ray with the third branch much longer than the second. The typical number of rays is 12-13. There are usually nine dorsal spines. This species may attain a length of up to four inches.

BEHAVIORS

The fringed darter is present in the streams of the Cache River basin in southern Illinois where it lives in rocky pools and riffles. Small crustaceans and insects comprise its diet.
