

Floristic Study of Marakan Protected Region (West Azerbaidgan Province)

¹Abdollah Hassanzadeh Gortapeh, ²Jamileh Panahy and ¹Farshid Talet

¹Agricultural and Natural Research Institute, Urmia, West Azerbaidgan, Iran

²Department of Biology, Science College, Urmia University, Urmia, Iran

Abstract: Marakan protected region with an area of 105069 ha, is located in North West of Iran (west Azerbaidgan province), between 38° 42' to 39° 6' north latitude and 45° 5' to 45° 37' east longitude. In this study flora of this region was determined by using available references. We encountered 282 Species that belongs to 167 Genera and 47 Families. The largest families of region are: *Asteraceae* with 43 species, *Fabaceae* with 28 sp., *Poaceae* with 26 sp. and *Rosaceae* with 25 sp. The life form spectrum was characterized according Raunkier's system. The life form spectrum observed was: Therophyte 31.91%, Hemichryptophyte 26.95%, Chamaephyte 16.31%, Phanerophyte 15.06% and Cryptophyte 9.26%. The phytocarya distribution of species are as follow: IT 65.25%, Es 5.31%, Med 1.06%, IT, Es 19.15%, IT, Med 2.85%, Es, Med 1.78%, Endm 4.25%, Cosm 0.35%.

Key words: Flora, plant species, life form, Marakan, Iran

INTRODUCTION

The diversity of plant life is an essential underpinning of most of our terrestrial ecosystems. Humans and most other animals are almost totally dependent on plants, directly or indirectly. Another important role of plant life is the provision of ecosystem services the protection of water sheds, stabilization of slopes, improvement of soils, moderation of climate and the provision of a habitat for much of our wild fauna.

While it is generally accepted today that the conservation of all biodiversity should be our goal, understanding the natural distribution of plants (Floristic studies) is central to conserving biodiversity and managing ecosystems for long-term viability and sustainability. Iran is a country with high divers Climate and Topography, which leads to diversity in natural and biological resources. Therefore, for management in order to conservation of this diversity, prevention from destruction of habitats, determining the native and resistant species and endangered species and supporting them, recognition of medicinal plants for proper use of them, Floristic studies is necessary. Nowadays, many studies in this field have been doing by researchers, such as: plant species of Vanak-Semirom-Isfahan (Parishani, 2003), Floristic study of Palangdarreh-Qom (Mirzaei, 2001), Floristic study of Dalamper-West Azerbaijan (Shaikhi, 2005), Floristic study of National park of Urmia Lake (Biabani, 2000), Floristic study of

Ghasemloo (Shohada) Valley, Forest reservoir (Malekmohammady, 2006). While this sort of studies is very useful for planning with refer to protection, reclamation and management of valuable species, present study was done in Mirabad region in 2005-2006.

MATERIALS AND METHODS

Marakan protected region with 105069 ha area, is located in North West of Iran (West Azerbaidgan province). This region is situated between 38° 42' to 39° 6' north latitude and 45° 5' to 45° 37' east longitude. Northern boundary of this region, limited with the Aras boundary river that lies between Iran and Azerbaijan Republic. From west it leads to Garaziadin and from east to main road that, branches from Jolfa. And the southern portion of this region is erosive plains of Goturkay River. The altitude in this region is varying between 830 m in eastern portion and 2054 m in northern portion. The mean annual rainfall is: 281.1 mm and mean annual temperature is 11°C. In order to presentation the Flora of Marakan, at first related information such as: Meterological statistics, Topographic maps, results of other studies and etc. were gathered. Then the specimens were collected in different seasons. The samples transferred to the herbarium and were pressed and recognized according to the Flora of Iran; Assadi (1988-2002), Flora of Iran, Rechinger (1963-2000) Flora of Iran, Parsa (1943-1950) Flora of Turkey, Davis (1965-1988) Colored Flora, Ghahreman

(1975-2000), Astragalus communities of Iran, Masoumiramak (1986-2000) and Flora of Iran, Mobayen

(1980-1996). In this manner, geographical plant distribution also determined according these Flora.

Determining the life form was done by Raunckier's classification (Raunckier, 1934), Endemic species of Iran was determined according to Red data book of Iran. Jalili and Jamzad (1999) and then floristic list of this region provided in a Table 1. The abbreviations used in the text and the floristic list is as follow: Th.: Therophyte, He.: Hemicryptophyte, Ch.: Chamaephyte, Ph.: Phanerophyte, Cr.: Cryptophyte, IT.: Irano-Turanian, ES.: Euro-Siberian, Med.: Mediterranean, Endm.: Endemic.

RESULTS

The results of study show that about 282 species belong to 167 Genera and 47 Families have been recognized. The biggest plant family of the region is *Asteraceae* with 43 species. *Fabaceae* with 28 sp., *Poaceae* with 26 sp. and *Rosaceae* with 25 sp. are in the next order (Fig. 1).

Among the existing genera, there are 101 genera with 1 species, 37 genera with 2 sp., 16 genera with 3 sp., 9 genera with 4 sp., 3 genera with 5 sp. and 1 genera with 8 sp. *Astragalus* with 8 species is the biggest genera (Fig. 2).

The life form spectrum of plant species is as follow: Therophyte 31.91%, Hemicryptophyte 26.95%, Chamaephyte 16.31%, Phanerophyte 15.06% and Cryptophyte 9.26% (Fig. 3).

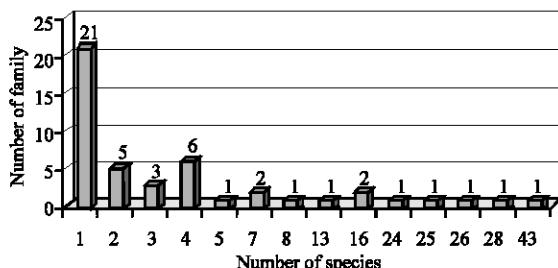

Fig. 1: The column chart of frequency of species in family

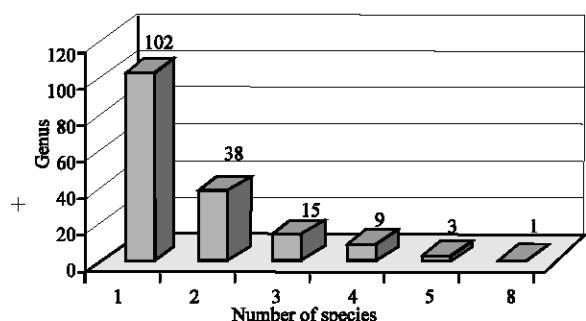

Fig. 2: The column chart of frequency of species in Genus

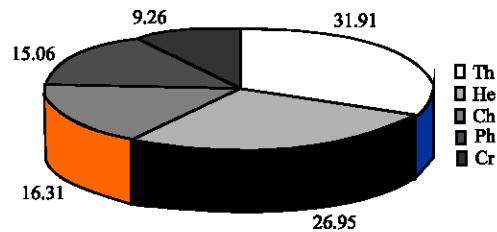

Fig. 3: The pie chart of life form of species of Marakan

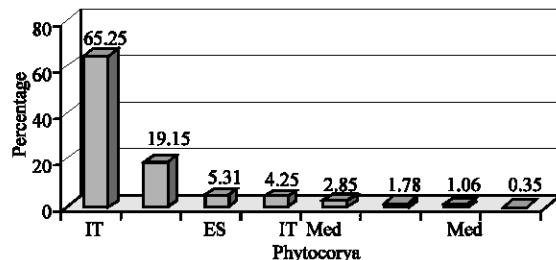

Fig. 4: The column chart of percentage of phytocorya of species in Marakan

The phytocorya distribution of species are as follow: IT 65.25%, Es 5.31%, Med 1.06%, IT,ES 19.15%, IT, Med 2.85%, Es,Med 1.78%, Endm 4.25%, Cosm 0.35% (Fig. 4).

DISCUSSION

It is concluded from the results of the study that the study area is very rich with refer to plant diversity. This conclusion is supported by the existence 47 families, 167 genera and 282 species.

Among all plants Th with 31.91% is dominant and He with 26.95% is in the next order. In fact life forms of the plants indicate the possibility of adaptation of plants to environmental factors especially climatic condition. According to Mobayen (1980-1996) the frequency of Th plants is due to Mediterranean climate and the frequency of He is due to cold and temperate climate. On the whole the frequency of Th and He among the plants of the region shows that the effect from two types of climate-Mediterranean and cold temperate- affected them.

Therophyte adapted to the dryness of the region and shortage rainfall. Because these plants spend vegetative period in the form of seed (Asri, 2003).

Hemicryptophyte adapted to condition of area. They adapted and developed themselves to area by using different ways such as: reserving water, using ground water, reducing their water need by loosing their leaves and reduction of vegetative growth.

Dominance of Hemicryptophyte and Therophyte clearly indicate the adaptation of these plants to aridity of area.

The low percentage of Cryptophyte, Champhyte, Phanerophyte shows that they are not adapted to existence climate and edaphical situations. Each plant species has its special ecological area with a known tolerance to life conditions of area. Therefore, the geographical distribution of plant species depending on life conditions of area and adaptation of plants to area (Asri, 2003).

Astragalus diversity with its 8 species in this area which is mountainous shows that Astragalus has adapted to the mountainous conditions.

The phytocarya distribution of plants reflects the climate conditions. Considering to this fact that 65.25% plant species in a region are IT elements, so we can conclude that this region belong to IT. IT (the Irano-Touranian region) is characterized by low rainfall and a long dry season.

The existence endemic species indicate diversity in Iran climate.

The existence of *Asteraceae* family with large diversity is the result of destruction in this region. It is experiently understood that the increasing of the number of some plant families including compositae accompanied with destruction in area; Following studies support the mentioned fact (Vakili *et al.*, 2001; Archibald, 1995). Significantly the presence of these species: *Stachys inflate*, *Teucrium polium*, *Teucrium orientale*, *Phlomis olivieri* and *Euphorbia* sp. Are indication of destruction in no protected portions of this region (Mozaffarian, 2000) According to rich biodiversity of study area which resulted from floristic study, it is quite possible to concentrate the improving practices and reclamate to area again.

About 87 medicinal species were determined in this area that was shown in Table 1. Some of most important species are as follow: *Achillea millefolium*, *Elaeagnus angustifolia*, *Glycyrrhiza glabra*, *Mililotus officinalis*, *Mentha longifolia*, *Stachys lavandulifolia*, *Thymus kotschyanus*, *Ziziphora clinopodioides*, *Descurainia Sophia*.

The number of endemic species of Iran in this region is 12 conclude: *Alcea ficiifolia*, *Alcea koelzii*, *Allocrusa persica*, *Allysum bracteatum*, *Amygdalus urmiensis*, *Coronilla varia*, *Dianthus orientalis*, *Dianthus szowitsianus*, *Glycyrrhiza glabra*, *Heliotropium dissittiflorum*, *Nepeta humilis* and *Phlomis olivieri*. The following species naturally form forests in this region: *Amygdalus* sp., *Cotonaster* sp., *Cerasus* sp., *Cydonia oblonga*, *Malus orientalis*, *Prunus domestica*, *Pr. Spinosa*, *Rosa* sp., *Pistacia mutica*, *Pistacia atlantica*, *Salix alba*, *S. nigra*, *Elaeagnus angustifolia*, *Juniperus* sp., *Morus alba*, *Morus nigra*, *Juglans regia*, *Berberis vulgaris*, *Fraxinus excelsior*, *Tamarix rosea*,

Pupulus alba, *Pupulus nigra*, *Zygophullum fabago*. There are only some cultivated forests near the Aras barrier that is about 354.18 ha. These forest composed of: *Robinia pseudacacia*, *Ulmus procera*, *Catalpa bignonioides* and *Fraxinus nigra*.
