APPLICATION FOR EXTENSION OF PATENT TERM UNDER 35 U.S.C. §156

Dear Sir:

The University of Western Australia hereby requests an extension of the patent term of the above-identified patent under 35 U.S.C. §156. The instant request for patent term extension is timely because it is being submitted within the sixty-day period beginning on the date the product received permission under the provision of law under which the applicable regulatory review period occurred for commercial marketing or use. 35 U.S.C. §156(d)(1). Applicants represent that The University of Western Australia is empowered to request the instant patent term extension because The University of Western Australia is the sole owner of the instant patent, as evidenced by the assignment recorded at: Reel 035009 and Frame 0811 on February

23, 2015 from inventors Stephen Donald Wilton, Sue Fletcher, and Graham McClorey to The University of Western Australia.

I, Amy E. Mandragouras, represent that I am a registered practitioner appointed by the patent owner of record, The University of Western Australia, and am filing this Application for Extension of Patent Term on behalf thereof. A Power of Attorney, authorizing me to act on behalf of The University of Western Australia is attached hereto as Exhibit A.

Sarepta Therapeutics, Inc. and Sarepta International CV (collectively, "Sarepta") are the exclusive licensees of U.S. Patent No. 9,018,368 by virtue of an Amended and Restated Exclusive License Agreement effective as of November 24, 2008 and restated as of April 10, 2013. Sarepta was the marketing applicant of the approved product, EXONDYS 51TM (eteplirsen) injection, before the Food and Drug Administration. Applicants submit that there has been an agency relationship between The University of Western Australia and Sarepta during the regulatory review period of EXONDYS 51TM (eteplirsen) injection. To show that The University of Western Australia is authorized to rely upon the activities of Sarepta before the Food and Drug Administration, a copy of a letter from Sarepta specifically authorizing The University of Western Australia to rely upon such activities and file this Extension of Patent Term based on the regulatory review period of EXONDYS 51TM (eteplirsen) injection is attached as Exhibit B. 37 C.F.R. § 1.730 and M.P.E.P. 2752.

[REMAINDER OF PAGE INTENTIONALLY LEFT BLANK]

(1) The approved product, EXONDYS 51[™] (eteplirsen) injection, is an antisense oligonucleotide of the phosphorodiamidate morpholino oligomer (PMO) subclass.

The chemical names of eteplirsen include:

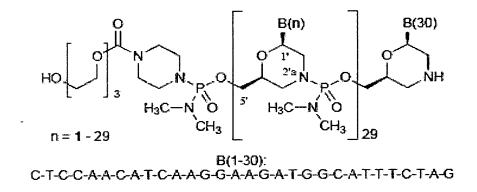

RNA, [*P*-deoxy-*P*-(dimethylamino)](2',3'-dideoxy-2',3'-imino-2',3'-seco)(2'a \rightarrow 5')(C-m5U-C-C-A-A-C-A-m5U-C-A-A-G-A-G-A-m5U-G-G-C-A-m5U-m5U-m5U-C-m5U-A-G), 5'-[*P*-[4-[[2-[2-(2-hydroxyethoxy)ethoxy]ethoxy]carbonyl]-1-piperazinyl]-*N*,*N*-dimethylphosphonamidate]

and

P,2',3'-trideoxy-P-(dimethylamino)-5'-O-{P-[4-(10-hydroxy-2,5,8- trioxadecanoyl)piperazin-1vl]-N.N-dimethylphosphonamidoyl}-2',3'-imino-2',3'- secocytidylyl-(2'a \rightarrow 5')-P,3'-dideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secothymidylyl- (2'a→5')-P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secocytidylyl-(2'a-5')- P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3' $secocytidylyl-(2'a \rightarrow 5')-P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secoadenylyl (2'a \rightarrow 5')$ -P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secoadenylyl- $(2'a \rightarrow 5')$ -P,2',3'trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secocytidylyl-(2'a→5')-P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secoadenylyl-(2'a→5')-P,3'-dideoxy-P- (dimethylamino)-2',3'imino-2',3'-secothymidylyl-(2'a-5')-P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3' $secocytidylyl-(2'a \rightarrow 5')-P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secoadenylyl (2'a \rightarrow 5')$ -P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secoadenylyl- $(2'a \rightarrow 5')$ -P,2',3'trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secoguanylyl-(2'a→5')-P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secoguanylyl-(2'a→5')-P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secoadenylyl-(2'a →5')-P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3'secoadenylyl- $(2'a \rightarrow 5')$ -P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secoguanylyl- $(2'a \rightarrow 5')$ -P,2',3'-trideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secoadenylyl-(2'a \rightarrow 5')-P,3'dideoxy-P- (dimethylamino)-2',3'-imino-2',3'-secothymidylyl-(2'a→5')-P,2',3'-trideoxy-P-(dimethylamino)-2',3'-imino-2',3'-secoguanylyl-(2'a→5')-P,2',3'-trideoxy-P- (dimethylamino)-

2',3'-imino-2',3'-secoguanylyl-(2'a \rightarrow 5')-*P*,2',3'-trideoxy-*P*- (dimethylamino)-2',3'-imino-2',3'-secoadenylylsecocytidylyl-(2'a \rightarrow 5')-*P*,2',3'-trideoxy-*P*- (dimethylamino)-2',3'-imino-2',3'-secoadenylyl-(2'a \rightarrow 5')-*P*,3'-dideoxy-*P*- (dimethylamino)-2',3'-imino-2',3'-secothymidylyl-(2'a \rightarrow 5')-*P*,3'-dideoxy-*P*-(dimethylamino)-2',3'-imino-2',3'-secothymidylyl-(2'a \rightarrow 5')-*P*,3'-dideoxy-*P*-(dimethylamino)-2',3'-imino-2',3'-secothymidylyl-(2'a \rightarrow 5')-*P*,2',3'-trideoxy-*P*- (dimethylamino)-2',3'-imino-2',3'-secocytidylyl-(2'a \rightarrow 5')-*P*,3'-dideoxy-*P*-(dimethylamino)- 2',3'-imino-2',3'secothymidylyl-(2'a \rightarrow 5')-*P*,2',3'-trideoxy-*P*-(dimethylamino)- 2',3'-isecoadenylyl-(2'a \rightarrow 5')-2',3'-dideoxy-2',3'-isecoguanosine.

The chemical structure of eteplirsen is:

(2) The approved product, EXONDYS 51[™] (eteplirsen), was subject to regulatory review under the Federal Food, Drug, and Cosmetic Act (FDCA), Section 505(b).

(3) The approved product, EXONDYS 51[™] (eteplirsen), received permission for commercial marketing or use under Section 505(b) of the Federal Food, Drug and Cosmetic Act (FDCA) on September 19, 2016. A copy of the Approval Letter from the Food and Drug Administration is attached as Exhibit C.

(4) The active ingredient in EXONDYS 51[™] is eteplirsen, which on information and belief, has not been approved for commercial marketing or use under Section 505 of the Federal

4

Food, Drug, and Cosmetic Act prior to the approval of NDA 206488 for EXONDYS 51[™] by the Food and Drug Administration on September 19, 2016. A copy of the package insert describing the approved product is attached as Exhibit D.

(5) This application for extension of patent term under 35 U.S.C. §156 is being submitted within the sixty-day period pursuant to 37 C.F.R. 1.720(f), said period will expire on November 17, 2016, if September 19, 2016, is day one (1) of the sixty (60) day period.

(6) The complete identification of the patent for which a term extension is being sought is as follows:

Inventors:	Stephen Donald Wilton; Sue Fletcher; Graham McClorey
Patent No.:	9,018,368
Issue Date:	April 28, 2015
Expiration Date:	June 28, 2025 (subject to a terminal disclaimer over U.S.
	Patent Nos: 7,807,816, 7,960,541, and 8,486,907)

(7) A true and complete copy of the patent for which an extension is being sought is attached as Exhibit E.

(8) No reexamination certificate or certificate of correction has been issued on this patent. A copy of the terminal disclaimer filed on February 26, 2015 over U.S. Patent Nos. 7,807,816, 7,960,541, and 8,486,907 is attached as Exhibit F. A copy of the maintenance fee statement indicating payment of the four-year maintenance fee is due by April 29, 2019 is attached as Exhibit G.

(9) Claims 1 and 2 of U.S. Patent No. 9,018,368 claim the active ingredient of the approved product, which is EXONDYS 51[™]. A complete claim chart that lists each applicable claim of U.S. Patent No. 9,018,368 and demonstrates the manner in which each applicable claim reads on the approved product is attached as Exhibit H.

5

(10) The relevant dates and information pursuant to 35 U.S.C. §156(g) to enable the Secretary of Health and Human services to determine the applicable regulatory review period are as follows:

Investigational New Drug Application (IND 77,429) for EXONDYS 51[™] was submitted on August 2, 2007 and became effective on June 25, 2010. A copy of the IND submission letter and a copy of the letter from the Food and Drug administration establishing the effective date of the IND are attached as Exhibits I and J, respectively.

New Drug Application (NDA 206488) for EXONDYS 51[™] was submitted to FDA on a rolling basis, and the submission of the NDA was completed on June 26, 2015. A copy of the NDA submission letter and a copy of the letter from the Food and Drug Administration confirming the completion of the application and submission of the NDA on this date are attached as Exhibits K and L, respectively.

New Drug Application (NDA 206488) for EXONDYS 51[™] was approved on September 19, 2016. A copy of the Approval Letter from the Food and Drug Administration is attached as Exhibit C.

[REMAINDER OF PAGE INTENTIONALLY LEFT BLANK]

(11) A brief description of the significant activities undertaken by the marketing applicant, Sarepta Therapeutics, Inc., during the applicable regulatory review period with respect to EXONDYS 51^{TM} and the dates applicable to these significant activities are set forth in a chronology of events at Exhibit M.

[REMAINDER OF PAGE INTENTIONALLY LEFT BLANK]

(12)(i) U.S. Patent No. 9,018,368 is eligible for extension of the patent term under 35

U.S.C. §156 because it satisfies all of its requirements for such extension. For the convenience of the Patent and Trademark Office, the requirements for extension of a patent under 35 U.S.C. §156 are presented in a format which follows Section 156 of Title 35 of the United States Code.

(a) 35 U.S.C. §156 - U.S. Patent No. 9,018,368 claims the product
 EXONDYS 51[™].

(b) 35 U.S.C. §156(a)(1) - U.S. Patent No. 9,018,368 has not expired before submission of the instant application.

(c) 35 U.S.C. §156(a)(2) – The term of U.S. Patent No. 9,018,368 has never
 been extended under 35 U.S.C. §156(e)(1).

(d) 35 U.S.C. §156(a)(3) – The application for extension is submitted by the owner of record of the patent in accordance with the requirements of paragraph (1) through (4) of 35 U.S.C. §156(d) and the rules of the Patent and Trademark Office.

 (e) 35 U.S.C. §156(a)(4) – The product EXONDYS 51[™] has been subject to a regulatory review period before its commercial marketing or use.

(f) 35 U.S.C. §156(a)(5)(A) – The permission for the commercial marketing or use of the product EXONDYS 51[™] after the regulatory review period is the first permitted commercial marketing or use of the product EXONDYS 51[™] under the provision of the Federal Food, drug, and Cosmetic Act (i.e., Section 505) under which such regulatory review period occurred.

(g) 35 U.S.C. §156(c)(4) – No other patent has been extended under 35
 U.S.C. §156(e)(i) for the same regulatory review period for any product, including the product
 EXONDYS 51TM. Applicants draw the Office's attention to the "Notice Regarding Multiple
 Applications" herein below.

(12)(ii) The length of the extension of patent term of U.S. Patent No. 9,018,368 claimed by Applicants is that period authorized by 35 U.S.C. §156(c), which has been calculated to be <u>481 days</u>. The length of the extension was determined pursuant to Section 1.775 of Title 37 of the Code of Federal regulations as follows:

(a) The length of the regulatory review period under 37 C.F.R. 1.775(c) is calculated as beginning on June 25, 2010 and ending on September 19, 2016, which is a total of 2,279 days, which is the sum of (1) and (2) below:

(1) The number of days in the "Testing Phase" under 35 U.S.C. \$156(g)(1)(B)(i), which is calculated to be <u>1.827 days</u>, which is the period beginning on the date an exemption under subsection (i) of Section 505 of the Federal Food, drug, and Cosmetic Act became effective for the approval of EXONDYS 51^{TM} , which is June 25, 2010, and ending on the date an application was initially submitted for the product EXONDYS 51^{TM} under such section, which is June 26, 2015; and

(2) The number of days in the "Approval Phase" under 35 U.S.C. 156(g)(1)(B)(ii), which is calculated to be <u>452 days</u>, which is the number of days in the period beginning on the date the application was initially submitted for the approved product EXONDYS 51[™] under subsection (b) of Section 505 of the Federal Food, Drug, and Cosmetic Act, which is June 26, 2015, and ending on the date such application was approved under such section, which is September 19, 2016.

(b) The term of the patent as extended is determined by:

(1) Subtracting from the length of the regulatory review period under
 37 C.F.R. §1.775(c) calculated according to sub-paragraph (12)(ii)(a) above (2,279 days), the
 sum of the periods (A) to (C) below, which is calculated to be 1,798 days, to arrive at a period of
 481 days:

(A) The number of days in the regulatory review period which were on and before the date on which the patent issued (April 28, 2015), which is calculated to be 1,769 days; and

(B) The number of days in the regulatory review period during which applicant did not act with due diligence, which is zero (0) days; and

(C) One-half the number of days remaining in the regulatory review period determined by sub-paragraph (12)(ii)(a)(1) (i.e., the Testing Phase) after that period is reduced in accordance with the determinations of sub-paragraphs (12)(ii)(b)(1)(A) and (12)(ii)(b)(1)(B) immediately above ignoring any half-days (one-half of 58 (i.e., 1,827 days-1,769 days)), which is 29 days.

(c) The number of days as determined in sub-paragraph (12)(ii)(b) (481 days)
when added to the expiration date of the original term of U.S. Patent No. 9,018,368 (June 28, 2025) would result in the date of October 22, 2026.

(d) Adding fourteen (14) years to the date of approval of the application
under subsection (b) of Section 505 of the Federal Food, Drug, and Cosmetic Act (September 19, 2016) is determined to be September 19, 2030.

(e) Comparing the date for the end of the period obtained pursuant to subparagraph (12)(ii)(c), which is October 22, 2026, with the date for the end of the period obtained pursuant to sub-paragraph (12)(ii)(d), which is September 19, 2030, the earlier of October 22, 2026 is selected.

(f) Because U.S. Patent No. 9,018,368 was issued after September 24, 1984, the dates under sub-paragraphs (12)(f)(1) and (12)(f)(2) are determined:

10

(1) the date obtained by adding five (5) years to the original expiration
 date of U.S. Patent No. 9,018,368 as shortened by any terminal disclaimer, which is June 28,
 2030; and

(2) the date obtained in sub-paragraph (12)(ii)(e), which is October22, 2026.

(g) Comparing the date determined under sub-paragraph (12)(ii)(f)(1) and (12)(ii)(f)(2) and selecting the earlier date results in a selection of October 22, 2026.

(h) In summary, Applicants' calculation of the extension of the patent term under 35 U.S.C. 156 for U.S. Patent No. 9,018,368 results in a period of extension of 481 days, thereby extending the patent term from June 28, 2025 to <u>October 22, 2026</u>.

(13) Applicants acknowledge a duty to disclose to the Director of the United States Patent and Trademark Office and the Secretary of Health and Human Services any information which is material to the determination of entitlement to the extension sought.

Notice Regarding Multiple Applications

Applicants are contemporaneously filing an application for term extension on one additional patent that it owns (U.S. Patent No. 7,807,816; Reissue Application No. 15/349,535) based on the same regulatory review period for EXONDYS 51TM. Applicants will make an election of only one patent in accordance with 37 C.F.R. §1.785(b) upon receipt of notice of final determination in these applications from the U.S. Patent and Trademark Office.

11

(14) The Commissioner is hereby authorized by this paper to charge the required fee of \$1,120.00 under 37 C.F.R. 1.20(j)(1) or any additional amount due or credit any overpayment to Deposit Account 12-0080.

EXHIBIT B

In re patent of Stephen Donald Wilton et al. USP 9,081,368 B2 Approved Product: EXONDYS 51[™] (eteplirsen) Application for Patent Term Extension Customer No. 123147

November 10, 2016

Via First Class Mail

The University of Western Australia 35 Stirling Highway Crawley, WA 6009 Australia

Attn: Director, Office of Industry and Innovation

Re: U.S. Patent No. 7,807,816 B2 Issued: October 5, 2010 U.S. Patent No. 9,018,368 B2 Issued: April 28, 2015 Inventor(s): Stephen Donald Wilton et al. Assignee: The University of Western Australia Titled: Antisense Oligonucleotides for Inducing Exon Skipping and Methods of Use Thereof

Dear Sir:

As you know, Sarepta Therapeutics, Inc. ("Sarepta") received approval of its NDA for EXONDYS 51TM (eteplirsen) on September 19, 2016 from the U.S. Department of Health and Human Services, Food and Drug Administration ("FDA"). In addition, The University of Western Australia ("UWA") will timely file an Application for Patent Term Extension Under 35 U.S.C. §156 in the United States Patent and Trademark Office in connection with the above-identified patents.

This letter serves to acknowledge the "agency relationship" (as defined in section 2752 of the Manual of Patent Examining Procedure) between UWA as the owner of the above-identified patents and Sarepta as the marketing applicant before the FDA during the regulatory review period. This letter further specifically authorizes UWA as the applicant for Patent Term Extension to rely on the activities of Sarepta as the marketing applicant before the FDA.

If you have any questions, please do not hesitate to contact me.

Very Truly Yours,

[Signature Page Follows]

In re patent of Stephen Donald Wilton et al. USP 9,081,368 B2 Approved Product: EXONDYS 51[™] (eteplirsen) Application for Patent Term Extension Customer No. 123147 Exhibit C

Food and Drug Administration Silver Spring MD 20993

NDA 206488

ACCELERATED APPROVAL

Sarepta Therapeutics, Inc. Attention: Shamim Ruff, MSc. Sr. Vice President, Regulatory Affairs and Quality 215 First Street, Suite 415 Cambridge, MA 02142

Dear Ms. Ruff:

Please refer to your New Drug Application (NDA) dated June 26, 2015, received June 26, 2015, and your amendments, submitted under section 505(b) of the Federal Food, Drug, and Cosmetic Act (FDCA) for Exondys 51 (eteplirsen) Injection, 50 mg per mL.

We acknowledge receipt of your major amendment dated January 8, 2016, which extended the goal date by three months.

This new drug application provides for the use of Exondys 51 (eteplirsen) Injection, 50 mg per mL, for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping.

APPROVAL & LABELING

We have completed our review of this application, as amended. It is approved under the provisions of accelerated approval regulations (21 CFR 314.500), effective on the date of this letter, for use as recommended in the enclosed agreed-upon labeling text. Marketing of this drug product and related activities must adhere to the substance and procedures of the referenced accelerated approval regulations.

CONTENT OF LABELING

As soon as possible, but no later than 14 days from the date of this letter, submit the content of labeling [21 CFR 314.50(1)] in structured product labeling (SPL) format using the FDA automated drug registration and listing system (eLIST), as described at http://www.fda.gov/ForIndustry/DataStandards/StructuredProductLabeling/default.htm. Content of labeling must be identical to the enclosed labeling (text for the package insert). Information

on submitting SPL files using eLIST may be found in the guidance for industry titled "SPL Standard for Content of Labeling Technical Qs and As" at

http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/U CM072392.pdf.

The SPL will be accessible via publicly available labeling repositories.

NDA 206488 Page 2

CARTON AND IMMEDIATE CONTAINER LABELS

Submit final printed carton and container labels that are identical to the carton and immediate container labels submitted on March 28, 2016, as soon as they are available, but no more than 30 days after they are printed. Please submit these labels electronically according to the guidance for industry titled "Providing Regulatory Submissions in Electronic Format – Human Pharmaceutical Product Applications and Related Submissions Using the eCTD Specifications (June 2008)." Alternatively, you may submit 12 paper copies, with 6 of the copies individually mounted on heavy-weight paper or similar material. For administrative purposes, designate this submission "Final Printed Carton and Container Labels for approved NDA 206488." Approval of this submission by FDA is not required before the labeling is used.

Marketing the product(s) with FPL that is not identical to the approved labeling text may render the product misbranded and an unapproved new drug.

In addition, we refer to your June 10, 2016, submission in which you commit to implement the carton container label revisions requested in our June 6, 2016, correspondence. Specifically, you agree to remove the reference to the compendial grades from the carton labels at the time of next printing, but no later than 120 days post-approval, and to notify us of this change via submission of a "Changes Being Effected" supplemental application.

PRODUCT QUALITY

Based on evaluation of the stability data provided, an expiration dating period of 18 months is established for eteplirsen injection when stored refrigerated (5°C).

RARE PEDIATRIC DISEASE PRIORITY REVIEW VOUCHER

We also inform you that you have been granted a rare pediatric disease priority review voucher, as provided under section 529 of the FDCA. This priority review voucher (PRV) has been assigned a tracking number: PRV NDA 206488. All correspondences related to this voucher should refer to this tracking number.

This voucher entitles you to designate a single human drug application submitted under section 505(b)(l) of the FDCA or a single biologic application submitted under section 351 of the Public Health Service Act as qualifying for a priority review. Such an application would not have to meet any other requirements for a priority review. The list below describes the sponsor responsibilities and the parameters for using and transferring a rare pediatric disease priority review voucher:

- The sponsor who redeems the priority review voucher must notify FDA of its intent to submit an application with a priority review voucher at least 90 days before submission of the application, and must include the date the sponsor intends to submit the application. This notification should be prominently marked, "Notification of Intent to Submit an Application with a Rare Pediatric Disease Priority Review Voucher."
- This priority review voucher may be transferred, including by sale, by you to another sponsor of a human drug or biologic application. There is no limit on the number of

times that the priority review voucher may be transferred, but each person to whom the priority review voucher is transferred must notify FDA of the change in ownership of the voucher not later than 30 days after the transfer. If you retain and redeem this priority review voucher, you should refer to this letter as an official record of the voucher. If the priority review voucher is transferred, the sponsor to whom the priority review voucher has been transferred should include a copy of this letter (which will be posted on our Web site as are all approval letters) and proof that the priority review voucher was transferred.

- FDA may revoke the priority review voucher if the rare pediatric disease product for which the priority review voucher was awarded is not marketed in the U.S. within 1 year following the date of approval.
- The sponsor of an approved rare pediatric disease product application who is awarded a priority review voucher must submit a report to FDA no later than 5 years after approval that addresses, for each of the first 4 post-approval years:
 - the estimated population in the U.S. suffering from the rare pediatric disease for which the product was approved (both the entire population and the population aged 0 through 18 years),
 - o the estimated demand in the U.S. for the product, and
 - the actual amount of product distributed in the U.S.
- You may also review the requirements related to this program at <u>http://www.gpo.gov/fdsys/pkg/PLAW-112publ144/pdf/PLAW-112publ144.pdf1</u> (see Section 908 of FDASIA on pages 1094-1098 which amends the FD&C Act by adding Section 529). Formal guidance about this program will be published in the future.

ACCELERATED APPROVAL REQUIREMENTS

Products approved under the accelerated approval regulations, 21 CFR 314.510, require further adequate and well-controlled clinical trials to verify and describe clinical benefit. You are required to conduct such clinical trials with due diligence. If postmarketing clinical trials fail to verify clinical benefit or are not conducted with due diligence, we may, following a hearing in accordance with 21 CFR 314.530, withdraw this approval. We remind you of your postmarketing requirement specified in your submission dated August 4, 2016. This requirement, along with required completion dates as agreed upon on September 16, 2016, is listed below.

3095-1 In order to verify the clinical benefit of eteplirsen, conduct a 2-year randomized, double-blind, controlled trial of eteplirsen in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping. Patients should be randomized to the approved dosage of eteplirsen (30 mg/kg weekly) or to a dosage that provides significantly higher exposure, e.g., 30 mg/kg daily. The primary endpoint will be the North Star Ambulatory Assessment.

Draft Protocol Submission:	10/2016
Final Protocol Submission:	04/2017
Trial Completion:	11/2020
Final Report Submission:	05/2021

You should allow sufficient time for the Agency to review, provide feedback, and come to concurrence on the protocol prior to initiation of the trial.

. •

NDA 206488 Page 4

Submit clinical protocol to your IND 077429 for this product. In addition, under 21 CFR 314.81(b)(2)(vii) and 314.81(b)(2)(viii) you should include a status summary of each requirement in your annual report to this NDA. The status summary should include expected summary completion and final report submission dates, any changes in plans since the last annual report, and, for clinical studies/trials, number of patients entered into each study/trial.

Submit final reports to this NDA as a supplemental application. For administrative purposes, all submissions relating to this postmarketing requirement must be clearly designated "Subpart H Postmarketing Requirement(s)."

REQUIRED PEDIATRIC ASSESSMENTS

Under the Pediatric Research Equity Act (PREA) (21 U.S.C. 355c), all applications for new active ingredients, new indications, new dosage forms, new dosing regimens, or new routes of administration are required to contain an assessment of the safety and effectiveness of the product for the claimed indication(s) in pediatric patients unless this requirement is waived, deferred, or inapplicable.

Because this drug product for this indication has an orphan drug designation, you are exempt from this requirement.

POSTMARKETING REQUIREMENTS UNDER 505(0)

Section 505(0)(3) of the FDCA authorizes FDA to require holders of approved drug and biological product applications to conduct postmarketing studies and clinical trials for certain purposes, if FDA makes certain findings required by the statute.

We have determined that an analysis of spontaneous postmarketing adverse events reported under subsection 505(k)(1) of the FDCA will not be sufficient to identify an unexpected serious risk of carcinogenicity or an unexpected serious risk of immunogenicity.

Furthermore, the new pharmacovigilance system that FDA is required to establish under section 505(k)(3) of the FDCA will not be sufficient to assess this serious risk.

Therefore, based on appropriate scientific data, FDA has determined that you are required to conduct the following:

3095-2 A two-year carcinogenicity study of intravenously administered eteplirsen in rat.

The timetable you submitted on September 16, 2016, states that you will conduct this study according to the following schedule:

Draft Protocol Submission:	12/2016
Final Protocol Submission:	03/2017
Study Completion:	04/2020
Final Report Submission:	06/2020

3095-3 A 26-week carcinogenicity study of eteplirsen, administered by a clinically relevant route, in an appropriate transgenic mouse model.

The timetable you submitted on September 16, 2016, states that you will conduct this study according to the following schedule:

Draft Protocol Submission:	10/2016
Final Protocol Submission:	01/2017
Study Completion:	05/2018
Final Report Submission:	06/2018

You should allow sufficient time for the Agency to review, provide feedback, and come to concurrence on these protocols prior to beginning the studies.

- 3095-4 A study to evaluate:
 - 1. patient immune responses, including IgM and IgG isotypes, to eteplirsen, its induced dystrophin protein, and full length dystrophin;
 - 2. the impact of immune responses on product PK and clinical efficacy and safety.

The assays for antibodies to eteplirsen, the induced dystrophin, and full length dystrophin should be performed with sampling times optimized to detect early, peak, and late antibody responses, and should be fully validated.

- 3. for subjects whose serum screens positive for antibodies, the samples should be tested for neutralizing activity, to product activity, and/or product uptake. Antibody titer and persistence should be monitored throughout the duration of the study.
- 4. in patients who seroconvert, antibody levels should be monitored until they return to baseline.
- 5. for patients developing hypersensitivity responses, assays to evaluate IgE responses including skin testing or RAST assays should be developed and employed.

Until these assays have been fully validated and reviewed by FDA, sufficient samples should be banked and stored under appropriate conditions so as to allow for re-testing if deemed necessary.

The timetable you submitted on September 16, 2016, states that you will conduct this study according to the following schedule:

Draft Protocol Submission:	01/2017
Final Protocol Submission:	08/2017
Study Completion:	12/2017
Final Report Submission:	02/2018

Additional guidance for immunogenicity assay development, though more specific for therapeutic protein products, may be found in the draft guidance: "Assay Development and Validation for Immunogenicity Testing of Therapeutic Protein Products NDA 206488 Page 6

<u>http://www.fda.gov/downloads/Drugs/.../Guidances/UCM192750.pdf</u>. You should allow sufficient time for the Agency to review, provide feedback, and come to concurrence on the protocols prior to initiation of the studies.

Submit the protocols to your IND 077429, with a cross-reference letter to this NDA. Submit all final reports to your NDA. Prominently identify the submission with the following wording in bold capital letters at the top of the first page of the submission, as appropriate: "Required Postmarketing Protocol Under 505(0)," "Required Postmarketing Final Report Under 505(0)," "Required Postmarketing Final Report Under 505(0)."

Section 505(0)(3)(E)(ii) of the FDCA requires you to report periodically on the status of any study or clinical trial required under this section. This section also requires you to periodically report to FDA on the status of any study or clinical trial otherwise undertaken to investigate a safety issue. Section 506B of the FDCA, as well as 21 CFR 314.81(b)(2)(vii) requires you to report annually on the status of any postmarketing commitments or required studies or clinical trials.

FDA will consider the submission of your annual report under section 506B and 21 CFR 314.81(b)(2)(vii) to satisfy the periodic reporting requirement under section 505(o)(3)(E)(ii) provided that you include the elements listed in 505(o) and 21 CFR 314.81(b)(2)(vii). We remind you that to comply with 505(o), your annual report must also include a report on the status of any study or clinical trial otherwise undertaken to investigate a safety issue. Failure to submit an annual report for studies or clinical trials required under 505(o) on the date required will be considered a violation of FDCA section 505(o)(3)(E)(ii) and could result in enforcement action.

POSTMARKETING COMMITMENTS SUBJECT TO REPORTING REQUIREMENTS UNDER SECTION 506B

We remind you of your postmarketing commitments:

3095-5 Conduct a 2-year controlled trial in patients who have a confirmed mutation of the DMD gene that is amenable to exon 45 or 53 skipping with a phosphorodiamidate morpholino oligomer (PMO) designed to bind to a regulatory site governing splicing of the corresponding exon. The trial should include at least two well-separated doses of each PMO, with the high dose designed to provide the greatest dystrophin response possible, based upon preliminary dose-finding, with an expectation of acceptable tolerability. The primary objective of this study will be to evaluate the effect of the two PMO doses (combined-active group) compared to control on the North Star Ambulatory Assessment. The secondary objective will be to evaluate dystrophin levels as percent of normal by Western blot, with tissue to be obtained by needle biopsy.

The timetable you submitted on September 16, 2016, states that you will conduct this study according to the following schedule:

NDA 206488 Page 7

Draft Protocol Submission:	12/2016
Final Protocol Submission:	04/2017
Trial Completion:	04/2021
Final Report Submission:	10/2021

A double-blind, placebo-controlled trial design should be used, if feasible, as this would be most informative. If it is not feasible to include a placebo group, an untreated concurrent control group may be considered, with appropriate care to reduce bias in outcome assessments given the lack of randomization and blinding. You should allow sufficient time for the Agency to review, provide feedback, and come to concurrence on the protocol prior to initiation of the trial.

POSTMARKETING COMMITMENTS NOT SUBJECT TO THE REPORTING REQUIREMENTS UNDER SECTION 506B

We remind you of your postmarketing commitments:

3095-6 Evaluate possible reasons for the upward trend in assay results from drug product stability studies. Initial investigations are expected to focus on any potential degradants that could co-elute with the main peak, re-authentication of the concentration of the reference standard solution, and quality attributes of the IP-HPLC reagents. Identify any other potential causes for the upward trend observed in the drug product stability.

The timetable you submitted on September 16, 2016, states that you will conduct this study according to the following schedule:

Final Protocol Submission:	11/2016
Study Completion:	06/2017
Final Report Submission:	08/2017

If you believe proposed changes to your manufacturing and control procedures are warranted based on the data derived from this study, we request that you submit the final report for this study as a supplement to your approved NDA.

3095-7 Revalidate the suitability in-process (b)(4) used during drug product manufacture with respect to the accuracy of the method and the robustness of the method in terms of (b)(4) Explore additional possible root causes for the bias in the in-process (b)(4) results and the release (b)(4) results

The timetable you submitted on September 16, 2016, states that you will conduct this study according to the following schedule:

Final Protocol Submission:	11/2016
Study Completion:	06/2017
Final Report Submission:	08/2017

If you believe proposed changes to your manufacturing and control procedures are warranted based on the data derived from this study, we request that you submit the final report for this study as a supplement to your approved NDA.

Submit clinical protocols to your IND 077429 for this product. Submit nonclinical and chemistry, manufacturing, and controls protocols and all postmarketing final reports to this NDA. In addition, under 21 CFR 314.81(b)(2)(vii) and 314.81(b)(2)(viii) you should include a status summary of each commitment in your annual report to this NDA. The status summary should include expected summary completion and final report submission dates, any changes in plans since the last annual report, and, for clinical studies/trials, number of patients entered into each study/trial. All submissions, including supplements, relating to these postmarketing commitments should be prominently labeled "Postmarketing Commitment Protocol," "Postmarketing Commitment Final Report," or "Postmarketing Commitment Correspondence."

PROMOTIONAL-MATERIALS

Under 21 CFR 314.550, you are required to submit, during the application pre-approval review period, all promotional materials, including promotional labeling and advertisements, that you intend to use in the first 120 days following marketing approval (i.e., your launch campaign). If you have not already met this requirement, you must immediately contact the Office of Prescription Drug Promotion (OPDP) at (301) 796-1200. Please ask to speak to a regulatory project manager or the appropriate reviewer to discuss this issue.

As further required by 21 CFR 314.550, submit all promotional materials that you intend to use after the 120 days following marketing approval (i.e., your post-launch materials) at least 30 days before the intended time of initial dissemination of labeling or initial publication of the advertisement. We ask that each submission include a detailed cover letter together with three copies each of the promotional materials, annotated references, and approved package insert (PI)/Medication Guide/patient PI (as applicable).

Send each submission directly to:

OPDP Regulatory Project Manager Food and Drug Administration Center for Drug Evaluation and Research Office of Prescription Drug Promotions (OPDP) 5901-B Ammendale Road Beltsville, MD 20705-1266

Alternatively, you may submit promotional materials for accelerated approval products electronically in eCTD format. For more information about submitting promotional materials in eCTD format, see the draft Guidance for Industry (available at: http://www.fda.gov/downloads/Drugs/GuidanceComplianceRegulatoryInformation/Guidances/U CM443702.pdf).

NDA 206488 Page 9

REPORTING REQUIREMENTS

We remind you that you must comply with the reporting requirements for an approved NDA (21 CFR 314.80 and 314.81).

MEDWATCH-TO-MANUFACTURER PROGRAM

The MedWatch-to-Manufacturer Program provides manufacturers with copies of serious adverse event reports that are received directly by the FDA. New molecular entities and important new biologics qualify for inclusion for three years after approval. Your firm is eligible to receive copies of reports for this product. To participate in the program, please see the enrollment instructions and program description details at

http://www.fda.gov/Safety/MedWatch/HowToReport/ucm166910.htm.

POST APPROVAL FEEDBACK MEETING

New molecular entities and new biologics qualify for a post approval feedback meeting. Such meetings are used to discuss the quality of the application and to evaluate the communication process during drug development and marketing application review. The purpose is to learn from successful aspects of the review process and to identify areas that could benefit from improvement. If you would like to have such a meeting with us, call the Regulatory Project Manager for this application.

PDUFA V APPLICANT INTERVIEW

FDA has contracted with Eastern Research Group, Inc. (ERG) to conduct an independent interim and final assessment of the Program for Enhanced Review Transparency and Communication for NME NDAs and Original BLAs under PDUFA V ('the Program'). The PDUFA V Commitment Letter states that these assessments will include interviews with applicants following FDA action on applications reviewed in the Program. For this purpose, first-cycle actions include approvals, complete responses, and withdrawals after filing. The purpose of the interview is to better understand applicant experiences with the Program and its ability to improve transparency and communication during FDA review.

ERG will contact you to schedule a PDUFA V applicant interview and provide specifics about the interview process. Your responses during the interview will be confidential with respect to the FDA review team. ERG has signed a non-disclosure agreement and will not disclose any identifying information to anyone outside their project team. They will report only anonymized results and findings in the interim and final assessments. Members of the FDA review team will be interviewed by ERG separately. While your participation in the interview is voluntary, your feedback will be helpful to these assessments.

FDA BENEFIT-RISK FRAMEWORK APPLICANT INTERVIEW

FDA has also contracted with Eastern Research Group, Inc. (ERG) to conduct an assessment of FDA's initial phase implementation of the Benefit-Risk Framework (BRF) in human drug review. A key element of this evaluation includes interviews with applicants following FDA approval of New Molecular Entity (NME) New Drug Applications (NDAs) and original Biologic

NDA 206488 Page 10

License Applications (BLAs). The purpose of the interview is to assess the extent to which the BRF provides applicants with a clear understanding of the reasoning behind FDA's regulatory decisions for NME NDAs and original BLAs.

ERG will contact you to schedule a BRF applicant interview and provide specifics about the interview process. Your responses during the interview will be confidential with respect to the FDA review team. ERG has signed a non-disclosure agreement and will not disclose any identifying information to anyone outside their project team. They will report only anonymized results and findings in the interim and final reports. Members of the FDA review team will be interviewed by ERG separately. While your participation in the interview is voluntary, your feedback will be helpful to this evaluation.

If you have any questions, contact Fannie Choy, Regulatory Project Manager, by phone or email at (301) 796-2899 or fannie.choy@fda.hhs.gov.

Sincerely,

{See appended electronic signature page}

Janet Woodcock, M.D. Director Center for Drug Evaluation and Research

EXHIBIT D

In re patent of Stephen Donald Wilton et al. USP 9,081,368 B2 Approved Product: EXONDYS 51[™] (eteplirsen) Application for Patent Term Extension Customer No. 123147

Exhibit D

HIGHLIGHTS OF PRESCRIBING INFORMATION These bighlights do not include all the information needed to use EXONDYS 51[™] safely and effectively. See full prescribing information for EXONDYS 51.

EXONDYS 51 (eteplirsen) injection, for intravenous use Initial U.S. Approval: 2016

Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping. This indication is approved under accelerated approval based on an increase in dystrophin in skeletal muscle observed in some patients treated with EXONDYS 51 *[see Clinical Studies (14)]*. A clinical benefit of EXONDYS 51 has not been established. Continued approval for this indication may be contingent upon verification of a clinical benefit in confirmatory trials. (1)

-----DOSAGE AND ADMINISTRATION -----

30 milligrams per kilogram of body weight once weekly (2.1)

Administer as an intravenous infusion over 35 to 60 minutes (2.1, 2.3)
 Dilution required prior to administration (2.2)

------ DOSAGE FORMS AND STRENGTHS-

Injection:

- 100 mg/2 mL (50 mg/mL) in single-dose vial (3)
- 500 mg/10 mL (50 mg/mL) in single-dose vial (3)

------ CONTRAINDICATIONS -

None (4)

To report SUSPECTED ADVERSE REACTIONS, contact Sarepta Therapeutics, Inc. at 1-888-SAREPTA (1-888-727-3782) or FDA at 1-800-FDA-1088 or <u>www.fda.gov/medwatch</u>.

FULL PRESCRIBING INFORMATION

1 INDICATIONS AND USAGE

EXONDYS 51 is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping. This indication is approved under accelerated approval based on an increase in dystrophin in skeletal muscle observed in some patients treated with EXONDYS 51 *[see Clinical Studies (14)]*. A clinical benefit of EXONDYS 51 has not been established. Continued approval for this indication may be contingent upon verification of a clinical benefit in confirmatory trials.

2 DOSAGE AND ADMINISTRATION

2.1 Dosing Information

The recommended dose of EXONDYS 51 is 30 milligrams per kilogram administered once weekly as a 35 to 60 minute intravenous infusion.

If a dose of EXONDYS 51 is missed, it may be administered as soon as possible after the scheduled time.

2.2 Preparation Instructions

EXONDYS 51 is supplied in single-dose vials as a preservative-free concentrated solution that requires dilution prior to administration. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. Use aseptic technique.

- a. Calculate the total dose of EXONDYS 51 to be administered based on the patient's weight and the recommended dose of 30 milligrams per kilogram. Determine the volume of EXONDYS 51 needed and the correct number of vials to supply the full calculated dose.
- b. Allow vials to warm to room temperature. Mix the contents of each vial by gently inverting 2 or 3 times. Do not shake.
- c. Visually inspect each vial of EXONDYS 51. EXONDYS 51 is a clear, colorless solution that may have some opalescence. Do not use if the solution in the vials is discolored or particulate matter is present.
- d. With a syringe fitted with a 21-gauge or smaller non-coring needle, withdraw the calculated volume of EXONDYS 51 from the appropriate number of vials.
- e. Dilute the withdrawn EXONDYS 51 in 0.9% Sodium Chloride Injection, USP, to make a total volume of 100-150 mL. Visually inspect the diluted solution for particulates.
- f. EXONDYS 51 contains no preservatives and should be administered immediately after dilution. Complete infusion of diluted EXONDYS 51 solution within 4 hours of dilution. If immediate use is not possible, the diluted solution may be stored for up to

24 hours at 2°C to 8°C (36°F to 46°F). Do not freeze. Discard unused EXONDYS 51.

2.3 Administration Instructions

Application of a topical anesthetic cream to the infusion site prior to administration of EXONDYS 51 may be considered.

EXONDYS 51 is administered via intravenous infusion. Flush the intravenous access line with 0.9% Sodium Chloride Injection, USP, prior to and after infusion.

Infuse the diluted EXONDYS 51 solution over 35 to 60 minutes. Do not mix other medications with EXONDYS 51 or infuse other medications concomitantly via the same intravenous access line.

3 DOSAGE FORMS AND STRENGTHS

EXONDYS 51 is a clear and colorless solution that may have some opalescence, and is available as follows:

- Injection: 100 mg/2 mL (50 mg/mL) solution in a single-dose vial
- Injection: 500 mg/10 mL (50 mg/mL) solution in a single-dose vial

4 **CONTRAINDICATIONS**

None.

6 ADVERSE REACTIONS

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

In the EXONDYS 51 clinical development program, 107 patients received at least one intravenous dose of EXONDYS 51, ranging between 0.5 mg/kg (0.017 times the recommended dosage) and 50 mg/kg (1.7 times the recommended dosage). All patients were male and had genetically confirmed Duchenne muscular dystrophy. Age at study entry was 4 to 19 years. Most (89%) patients were Caucasian.

EXONDYS 51 was studied in a double-blind, placebo-controlled study for 24 weeks (Study 1), followed by an open label extension (Study 2). In Study 1, 12 patients were randomized to receive weekly intravenous infusions of EXONDYS 51 (n=8) or placebo (n=4) for 24 weeks. All 12 patients continued in Study 2 and received open-label EXONDYS 51 weekly for up to 208 weeks.

In Study 1, 4 patients received placebo, 4 patients received EXONDYS 51 30 mg/kg, and 4 patients received EXONDYS 51 50 mg/kg (1.7 times the recommended dosage). In Study 2, 6

patients received EXONDYS 51 30 mg/kg/week and 6 patients received EXONDYS 51 50 mg/kg/week [see Clinical Studies (14)].

Adverse reactions that occurred in 2 or more patients who received EXONDYS 51 and were more frequent than in the placebo group in Study 1 are presented in Table 1 (the 30 and 50 mg/kg groups are pooled). Because of the small numbers of patients, these represent crude frequencies that may not reflect the frequencies observed in practice. The 50 mg/kg once weekly dosing regimen of EXONDYS 51 is not recommended [see Dosage and Administration (2.1)].

The most common adverse reactions were balance disorder and vomiting.

Table 1.Adverse Reactions in DMD Patients Treated with 30 or 50 mg/kg/week1EXONDYS 51 with Incidence at Least 25% More than Placebo (Study 1)

Adverse Reactions	EXONDYS 51 (N=8)	Placebo (N=4)
	%	%
Balance disorder	38	0
Vomiting	38	0
Contact dermatitis	25	0

 $\frac{1}{50 \text{ mg/kg/week}} = 1.7 \text{ times the recommended dosage}$

געריה הגיאיר שעאני - אארה בההביל יערים אות הארייה בהיי

In the 88 patients who received \geq 30 mg/kg/week of EXONDYS 51 for up to 208 weeks in clinical studies, the following events were reported in \geq 10% of patients and occurred more frequently than on the same dose in Study 1: vomiting, contusion, excoriation, arthralgia, rash, catheter site pain, and upper respiratory tract infection.

There have been reports of transient erythema, facial flushing, and elevated temperature occurring on days of EXONDYS 51 infusion.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

There are no human or animal data available to assess the use of EXONDYS 51 during pregnancy. In the U.S. general population, major birth defects occur in 2 to 4% and miscarriage occurs in 15 to 20% of clinically recognized pregnancies.

8.2 Lactation

Risk Summary

There are no human or animal data to assess the effect of EXONDYS 51 on milk production, the presence of eteplirsen in milk, or the effects of EXONDYS 51 on the breastfed infant.

The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for EXONDYS 51 and any potential adverse effects on the breastfed infant from EXONDYS 51 or from the underlying maternal condition.

8.4 Pediatric Use

1987), J. (1992), A. (2007)

۰.4

entre de la s

۰.

EXONDYS 51 is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping, including pediatric patients [see Clinical Studies (14)].

Intravenous administration of eteplirsen (0, 100, 300, or 900 mg/kg) to juvenile male rats once weekly for 10 weeks beginning on postnatal day 14 resulted in renal tubular necrosis at the highest dose tested and decreased bone densitometry parameters (mineral density, mineral content, area) at all doses. The kidney findings were associated with clinical pathology changes (increased serum urea nitrogen and creatinine, decreased urine creatinine clearance). No effects were observed on the male reproductive system, neurobehavioral development, or immune function. An overall no-effect dose was not identified. Plasma eteplirsen exposure (AUC) at the lowest dose tested (100 mg/kg) was similar to that in humans at the recommended human dose (30 mg/kg).

8.5 Geriatric Use

DMD is largely a disease of children and young adults; therefore, there is no geriatric experience with EXONDYS 51.

8.6 Patients with Renal or Hepatic Impairment

EXONDYS 51 has not been studied in patients with renal or hepatic impairment.

10 OVERDOSAGE

There is no experience with overdose of EXONDYS 51.

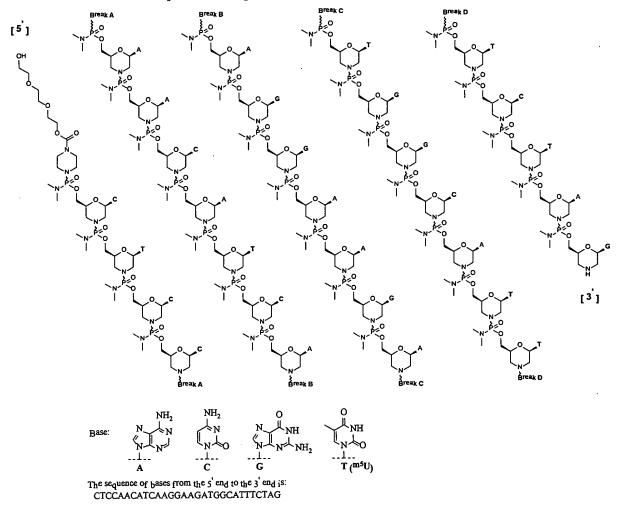

11 DESCRIPTION

EXONDYS 51 (eteplirsen) injection is a sterile, aqueous, preservative-free, concentrated solution for dilution prior to intravenous administration. EXONDYS 51 is clear and colorless, and may have some opalescence. EXONDYS 51 is supplied in single dose vials containing 100 mg or 500 mg eteplirsen (50 mg/mL). EXONDYS 51 is formulated as an isotonic, phosphate buffered saline solution with an osmolality of 260 to 320 mOsm and a pH of 7.5. Each milliliter of EXONDYS 51 contains 50 mg eteplirsen; 0.2 mg potassium chloride, 0.2 mg potassium phosphate monobasic, 8 mg sodium chloride, and 1.14 mg sodium phosphate dibasic, anhydrous, in water for injection. The product may contain hydrochloric acid or sodium hydroxide to adjust pH.

Eteplirsen is an antisense oligonucleotide of the phosphorodiamidate morpholino oligomer (PMO) subclass. PMOs are synthetic molecules in which the five-membered ribofuranosyl rings

found in natural DNA and RNA are replaced by a six-membered morpholino ring. Each morpholino ring is linked through an uncharged phosphorodiamidate moiety rather than the negatively charged phosphate linkage that is present in natural DNA and RNA. Each phosphorodiamidate morpholino subunit contains one of the heterocyclic bases found in DNA (adenine, cytosine, guanine, or thymine). Eteplirsen contains 30 linked subunits. The molecular formula of eteplirsen is $C_{364}H_{569}N_{177}O_{122}P_{30}$ and the molecular weight is 10305.7 daltons.

The structure and base sequence of eteplirsen are:

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Eteplirsen is designed to bind to exon 51 of dystrophin pre-mRNA, resulting in exclusion of this exon during mRNA processing in patients with genetic mutations that are amenable to exon 51 skipping. Exon skipping is intended to allow for production of an internally truncated dystrophin protein, which was evaluated in Study 2 and Study 3 [see Clinical studies (14)].

12.2 Pharmacodynamics

All EXONDYS 51-treated patients evaluated (n=36) were found to produce messenger ribonucleic acid (mRNA) for a truncated dystrophin protein by reverse transcription polymerase chain reaction.

In Study 2, the average dystrophin protein level in muscle tissue after 180 weeks of treatment with EXONDYS 51 was 0.93% of normal (i.e., 0.93% of the dystrophin level in healthy subjects). Because of insufficient information on dystrophin protein levels before treatment with EXONDYS 51 in Study 1, it is not possible to estimate dystrophin production in response to EXONDYS 51 in Study 1.

In Study 3, the average dystrophin protein level was 0.16% of normal before treatment, and 0.44% of normal after 48 weeks of treatment with EXONDYS 51 [see Clinical studies (14)]. The median increase in truncated dystrophin in Study 3 was 0.1% [see Clinical Studies (14)].

12.3 Pharmacokinetics

Following single or multiple intravenous infusions of EXONDYS 51 in male pediatric DMD patients, plasma concentration-time profiles of eteplirsen were generally similar and showed multi-phasic decline. The majority of drug elimination occurred within 24 hours. Approximate dose-proportionality and linearity in PK properties were observed following multiple-dose studies (0.5 mg/kg/week [0.017 times the recommended dosage] to 50 mg/kg/week [1.7 times the recommended dosage]). There was no significant drug accumulation following weekly dosing across this dose range. The inter-subject variability for eteplirsen C_{max} and AUC range from 20 to 55%.

Following single or multiple intravenous infusions of EXONDYS 51, the peak plasma concentrations (C_{max}) of eteplirsen occurred near the end of infusion (i.e., 1.1 to 1.2 hours across a dose range of 0.5 mg/kg/week to 50 mg/kg/week).

Distribution

In vitro investigation suggested that plasma protein binding of eteplirsen in human ranges between 6 to 17%. The mean apparent volume of distribution (Vss) of eteplirsen was 600 mL/kg following weekly intravenous infusion of EXONDYS 51 at 30 mg/kg.

Twenty-four hours after the end of the infusion, mean concentrations of eteplirsen were 0.07% of C_{max} . Accumulation of eteplirsen during once weekly dosing has not been observed.

Elimination

The total clearance of eteplirsen was 339 mL/hr/kg following 12 weeks of therapy with 30 mg/kg/week.

Metabolism

Eteplirsen did not appear to be metabolized by hepatic microsomes of any species tested, including humans.

Excretion

Renal clearance of eteplirsen accounts for approximately two-thirds of the administered dose within 24 hours of intravenous administration. Elimination half-life $(t_{1/2})$ of eteplirsen was 3 to 4 hours.

Specific Populations

Age:

The pharmacokinetics of eteplirsen have been evaluated in male pediatric DMD patients. There is no experience with the use of EXONDYS 51 in patients 65 years of age or older.

Sex:

Sex effects have not been evaluated; EXONDYS 51 has not been studied in female patients.

Race:

Potential impact of race is not known because 89% of the patients in studies were Caucasians.

Renal or Hepatic Impairment:

EXONDYS 51 has not been studied in patients with renal or hepatic impairment.

Drug Interaction Studies

In vitro data showed that eteplirsen did not significantly inhibit CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, CYP2D6, or CYP3A4/5. Eteplirsen did not induce CYP2B6 or CYP3A4, and induction of CYP1A2 was substantially less than the prototypical inducer, omeprazole. Eteplirsen was not a substrate nor did it have any major inhibitory potential for any of the key human transporters tested (OAT1, OAT3, OCT1, OCT2, OATP1B1, OATP1B3, P-gp, BCRP, MRP2 and BSEP). Based on *in vitro* data on plasma protein binding, CYP or drug transporter interactions, and microsomal metabolism, eteplirsen is expected to have a low potential for drug-drug interactions in humans.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Carcinogenicity studies have not been conducted with eteplirsen.

Mutagenesis

Eteplirsen was negative in *in vitro* (bacterial reverse mutation and chromosomal aberration in CHO cells) and *in vivo* (mouse bone marrow micronucleus) assays.

Impairment of Fertility

Fertility studies in animals were not conducted with eteplirsen. No effects on the male reproductive system were observed following intravenous administration of eteplirsen (0, 5, 40, or 320 mg/kg) to male monkeys once weekly for 39 weeks. Plasma eteplirsen exposure (AUC)

in monkeys at the highest dose tested was 20 times that in humans at recommended human dose (30 mg/kg).

an survey survey and departure departments in the second

14 CLINICAL STUDIES

EXONDYS 51 was evaluated in three clinical studies in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping.

In Study 1, patients were randomized to receive weekly infusions of EXONDYS 51 (30 mg/kg, n=4); EXONDYS 51 (50 mg/kg, n=4), or placebo (n=4) for 24 weeks. The primary endpoint was dystrophin production; a clinical outcome measure, the 6-minute walk test (6MWT), was also assessed. The 6MWT measures the distance that a patient can walk on a flat, hard surface in a period of 6 minutes. Patients had a mean age of 9.4 years, a mean 6-minute walk distance (6MWD) at baseline of 363 meters, and were on a stable dose of corticosteroids for at least 6 months. There was no significant difference in change in 6MWD between patients treated with EXONDYS 51 and those treated with placebo.

All 12 patients who participated in Study 1 continued treatment with open-label EXONDYS 51 weekly for an additional 4 years in Study 2. The 4 patients who had been randomized to placebo were re-randomized 1:1 to EXONDYS 30 or 50 mg/kg/week such that there were 6 patients on each dose. Patients who participated in Study 2 were compared to an external control group. The primary clinical efficacy outcome measure was the 6MWT. Eleven patients in Study 2 had a muscle biopsy after 180 weeks of treatment with EXONDYS 51, which was analyzed for dystrophin protein level by Western blot. Study 2 failed to provide evidence of a clinical benefit of EXONDYS 51 compared to the external control group. The average dystrophin protein level after 180 weeks of treatment with EXONDYS 51 was 0.93% of the dystrophin level in healthy subjects. Because of insufficient information on dystrophin protein levels before treatment with EXONDYS 51 in Study 1, it is not possible to estimate dystrophin production in response to EXONDYS 51 in Study 1.

In Study 3, 13 patients were treated with open-label EXONDYS 51 (30 mg/kg) weekly for 48 weeks and had a muscle biopsy at baseline and after 48 weeks of treatment. Patients had a mean age of 8.9 years and were on a stable dose of corticosteroids for at least 6 months. Dystrophin levels in muscle tissue were assessed by Western blot. In the 12 patients with evaluable results, the pre-treatment dystrophin level was $0.16\% \pm 0.12\%$ (mean \pm standard deviation) of the dystrophin level in a healthy subject and $0.44\% \pm 0.43\%$ after 48 weeks of treatment with EXONDYS 51 (p < 0.05). The median increase after 48 weeks was 0.1%.

Individual patient dystrophin levels from Study 3 are shown in Table 2.

Table 2.Western Blot Results: EXONDYS 51-Treated (Week 48) vs Pre-treatmentBaseline (% Normal Dystrophin) (Study 301)

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied

EXONDYS 51 injection is supplied in single-dose vials. The solution is clear and colorless, and may have some opalescence.

- Single-dose vials containing 100 mg/2 mL (50 mg/mL) eteplirsen NDC 60923-363-02
- Single-dose vials containing 500 mg/10 mL (50 mg/mL) eteplirsen NDC 60923-284-10

16.2 Storage and Handling

Store EXONDYS 51 at 2°C to 8°C (36°F to 46°F). Do not freeze. Protect from light and store EXONDYS 51 in the original carton until ready for use.

Manufactured for: Sarepta Therapeutics, Inc. Cambridge, MA 02142 USA EXHIBIT E

Laboratory Notebook Entry: General RNA recovery, pp. 2, Exhibit No. 1176 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

Laboratory Notebook Entry: Lab-on-a-Chip Analysis, pp. 3, Exhibit No. 1184 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

Larsen et al., "Antisense properties of peptide nucleic acid," Biochim. Et Biophys. Acta, vol. 1489, pp. 159-166 (1999), Exhibit No. 1190 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

List of Publications for Matthew J. A. Wood, M.D., D. Phil., 11 pages, (Exhibit No. 2124 filed in interferences 106,007 and 106,008 on Feb. 17, 2015.

Lu et al, Massive Idiosyncratic Exon Skipping Corrects the Nonsense Mutation in Dystrophic Mouse Muscle and Produces Functional Revertant Fibers by Clonal Expansion, 98:1 The Journal of Cell Biology, 985-995, Mar. 6, 2000 ("Lu et al."), Exhibit No. 1082 filed in interferences 106,007 and 106,008 on Dec. 23, 2014.

Lyophilisation of Oligonucleotides, pp. 2, Exhibit No. 1133 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

Matthews et al., "Expanded Sequence Dependence of Thermodynamic Parameters Improves Prediction of RNA Secondary Structure," J. Mol. Biol., vol. 288, pp. 911-940 (1999), Exhibit No. 1212 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

Morcos, Paul A., "Gene switching: analyzing a broad range of mutations using steric block antisense oligonucleotides," Methods in Enzymology, vol. 313:174-189 (1999).

Oberbauer, "Renal uptake of an 18-mer phosphorothioate oligonucleotide," Kidney Int'l, vol. 48, pp. 1226-1232 (1995), Exhibit No. 1191 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

Oligonucleotide Cleavage and Deprotection Laboratory Notebook Entry, pp. 1, Exhibit No. 1138 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

"Efficacy Study of AVI-4658 to Induce Dystrophin Expression in Selected Duchenne Muscular Dystrophy Patients" Clinical Trials.gov dated Jan. 22, 2013.

3rd Declaration of Erik J. Sontheimer, Ph.D. ("3rd S. Decl."), Pages 123, Exhibit No. 1186 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

King et al., "A Dictionary of Genetics," Oxford University Press, 4th Ed. (1990), Exhibit No. 1189 filed in Interferences 106,007 and 106.008 on Feb. 17, 2015.

A Comparative Study on AONs between 20 and 50 Nucleotides Designed to Induce the Skipping of Exon 53 from the Dystrophin Pre-mRNA, pp. 6, Exhibit No. 1128 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

A Comparative Study on AONs Between 20 and 50 Nucleotides Designed to Induce the Skipping of Exon 51 from the Dystrophin Pre-mRNA, pp. 6, Exhibit No. 1127 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

Analysis of Second PCR Product by Gel Electrophoresis, pp. 1, Exhibit No. 1182 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1958 Mass Spectrometry Data, pp. 7, Exhibit No. 1146 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1958 UPLC Data, pp. 2, Exhibit No. 1157 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1959 Mass Spectrometry Data, pp. 5, Exhibit No. 1147 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1959 UPLC Data, pp. 2, Exhibit No. 1158 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1960 Mass Spectrometry Data, pp. 8, Exhibit No. 1148 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1960 UPLC Data, pp. 2, Exhibit No. 1159 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1961 Mass Spectrometry Data, pp. 5, Exhibit No. 1149 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1961 UPLC Data, pp. 2, Exhibit No. 1160 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1962 Mass Spectrometry Data, pp. 7, Exhibit No. 1150 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1962 UPLC Data, pp. 2, Exhibit No. 1161 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1963 Mass Spectrometry Data, pp. 10, Exhibit No. 1151 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1963 UPLC Data, pp. 2, Exhibit No. 1162 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1964 Mass Spectrometry Data, pp. 13, Exhibit No. 1152 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1964 UPLC Data, pp. 2, Exhibit No. 1163 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1965 Mass Spectrometry Data, pp. 9, Exhibit No. 1153 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1965 UPLC Data, pp. 2, Exhibit No. 1164 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1966 Mass Spectrometry Data, pp. 8, Exhibit No. 1154 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1966 UPLC Data, pp. 2, Exhibit No. 1165 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1967 Mass Spectrometry Data, pp. 7, Exhibit No. 1155 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS1967 UPLC Data, pp. 2, Exhibit No. 1166 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS229 (h53AON1) HPLC Chromatograph pp. 2, Exhibit No. 1140 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS229 (h53AON1) HPLC Method Report, pp. 3, Exhibit No. 1139 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS229 (h53AON1) Mass Spectrometry Data, pp. 3, Exhibit No. 1142 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS229 (h53AON1) Synthesis Laboratory Notebook Entry, pp. 1, Exhibit No. 1137 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS229L (b53AON229L) Certificate of Analysis, pp. 1, Exhibit No. 1129 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

AON PS43 (h51AON1) Certificate of Analysis, pp. 2, Exhibit No. 1134 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AON PS43 (h51AON1) HPLC Chromatogram, pp. 1, Exhibit No. 1131 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

AON PS43 (h51AON1) HPLC Method Report, pp. 4, Exhibit No. 1130 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

AON PS43 (h51 AON1) Mass Spectrometry Data, pp. 3, Exhibit No.

1135 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015. AON PS43 (h51AON1) UPLC-UV Data, pp. 2, Exhibit No. 1136 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

AONs PS1958, PS1959, PS1960, PS1961, PS1962, PS1963, PS1964, PS1965, PS1966, and PS1967 HPLC Method Report, pp. 3, Exhibit No. 1143 filed in Interferences 106,007 and 106,008 on Feb. 16, 2015.

Bestas et al., "Design and Application of Bispecific Splice Switching Oligonucleotides," Nuc. Acid Therap., vol. 24, No. 1, pp. 13-24 (2014), Exhibit No. 1120 filed in interferences 106,007 and 106,008 on Feb. 17, 2015.

Claim Chart U.S. Appl. No. 11/233,495, pp. 57, Exhibit No. 1216 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

Claim Chart U.S. Appl. No. 13/550,210, pp. 45, Exhibit No. 1217 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

Claim Comparison Chart—Claims 11 and 29 in U.S. Appl. No. 13/550,210, pp. 1, Exhibit No. 1226 filed in Interferences 106,007 and 106,008 on Feb. 17, 2015.

University of Western Australia v. Academisch Ziekenhuis Leiden, Joint Stipulation regarding Time Periods 3-4, 4 pages, Patent Interference No. 106,007, (Doc 243), dated Jan. 29, 2015.

University of Western Australia v. Academisch Ziekenhuis Leiden, Joint Stipulation regarding Time Periods 3-4, 4 pages, Patent Interference No. 106,008, (Doc 247), dated Jan. 29, 2015.

ference No. 106,008, (Doc 247), dated Jan. 29, 2015. Heemskerk, Hans et al., "In Vivo Comparison of 2'-O-Methyl phhosphorothioate and Morpholino Antisense Oligonucleotides for Duchenne Muscular Dystrophy Exon Skipping," Journal of Gene Medicine, John Wiley & Sons, Inc, vol. 11(3):257-266 (2009). US Application for Letters Patent for U.S. Appl. No. 11/233,495 as-filed and preliminary amendment, 77 pages, dated Sep. 21, 2005 (Exhibit No. 2095 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

Preliminary Amendment for U.S. Appl. No. 12/198,007, 3 pages, dated Nov. 7, 2008 (Exhibit No. 2067 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Preliminary Amendment and application as-filed for U.S. Appl. No. 12/976,381, 68 pages, dated Dec. 22, 2010).

Preliminary Amendment for U.S. Appl. No. 12/976,381, 4 pages, dated Dec. 22, 2010 (Exhibit No. 2066 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US application as-filed and Preliminary Amendment for U.S. Appl. No. 13/550,210, 59 pages dated Jul. 16, 2012 (Exhibit No. 2087 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Preliminary Remarks for U.S. Appl. No. 14/198,992, 1 page, dated Mar. 6, 2014 (Exhibit No. 2097 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Proposed Terminal Disclaimer for U.S. Appl. No. 12/860,078, 2 pages, dated Oct. 17, 2014 (Exhibit No. 2001 filed in interferences 106008 on Oct. 17, 2014).

US Remarks for U.S. Appl. No. 14/248,279, 2 pages, dated Aug. 27, 2014 (Exhibit No. 2110 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Response and amendments for U.S. Appl. No. 13/550,210, 12 pages, dated Jan. 21, 2014 (Exhibit No. 2063 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US claim amendments for U.S. Appl. No. 13/550,210, 3 pages, dated May 12, 2014 (Exhibit No. 2078 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

U.S. Appl. No. 13/550,210, 12 pages; excerpts of prosecution history including: Response and Amendment dated May 12, 2014; Response to Non-Final Office Action dated Jan. 21, 2014; Second Preliminary Amendment dated Jan. 3, 2013 (Exhibit No. 2055 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Revised Figure 4H, U.S. Appl. No. 13/271,080, 1 page (Exhibit No. 1050 filed in interferences 106008, 106007 on Nov. 18, 2014). US Second Preliminary Amendment for U.S. Appl. No. 13/550,210, 5 pages, dated Jan. 3, 2013.

US Terminal Disclaimer for U.S. Appl. No. 14/248,279, 1 page, dated Aug. 7, 2014 (Exhibit No. 2109 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Terminal Disclaimer for U.S. Appl. No. 14/198,992, 1 page, dated Jul. 15, 2014 (Exhibit No. 2096 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Track One Request, Application as-filed, and Application Data Sheet for U.S. Appl. No. 14/248,279, 68 pages, dated Apr. 8, 2014 (Exhibit No. 2108 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Transmittal, application as-filed, and Preliminary Amendment for U.S. Appl. No. 11/570,691, 102 pages, dated Dec. 15, 2006 (Exhibit No. 2103 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Transmittal, application as-filed, and Preliminary Amendment for U.S. Appl. No. 13/271,080, 115 pages, dated Oct. 11, 2011 (Exhibit No. 2111 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Updated Filing Receipt for U.S. Appl. No. 13/550,210, 3 pages, dated Dec. 11, 2012 (Exhibit No. 2044 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Transmittal, application as-filed, and Preliminary Amendment for U.S. Appl. No. 13/270,992, 101 pages, dated Oct. 11, 2011 (Exhibit No. 2098 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

US Application as-filed for U.S. Appl. No. 14/198,992, 52 pages, dated Mar. 6, 2014 (Exhibit No. 2086 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

PCT Application as-filed for application No. PCT/NL03/00214, 64 pages, dated Sep. 21, 2005 (Exhibit No. 2042 filed in interferences 106008, 106013, 106007 on Nov. 18, 2014).

University of Western Australia v. Academisch Ziekenhuis Leiden, UWA Exhibit List, 7 pages, Patent Interference Nos. 106,007 and 106,008, dated Dec. 12, 2014.

ANTISENSE OLIGONUCLEOTIDES FOR INDUCING EXON SKIPPING AND METHODS OF USE THEREOF

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. patent application Ser. No. 13/741,150, filed Jan. 14, 2013, now pending, which application is a continuation of U.S. patent application Ser. No. 13/168,857, filed Jun. 24, 2011, abandoned, which application is a continuation of U.S. patent application Ser. No. 12/837,359, filed Jul. 15, 2010, now issued as U.S. Pat. No. 8,232,384, which application is a continuation of U.S. patent application Ser. No. 11/570,691, filed Jan. 15, 2008, now issued as U.S. Pat. No. 7,807,816, which application is a 35 U.S.C. §371 National Phase Application of PCT/AU2005/ 000943, filed Jun. 28, 2005, which claims priority to Australian Patent Application No. 2004903474, filed Jun. 28, 2004; which applications are each incorporated herein by reference ²⁰ in their entireties.

STATEMENT REGARDING SEQUENCE LISTING

The Sequence Listing associated with the application is provided in text format in liew of a paper copy, and is hereby incorporated by reference into the specification. The name of the text file containing the Sequence Listing is SequenceListing.txt. The text file is 61 Kilobytes, was created on Jun. 26, ³⁰ 2014 and is being submitted electronically via EFS-Web.

FIELD OF THE INVENTION

The present invention relates to novel antisense com-³⁵ pounds and compositions suitable for facilitating exon skipping. It also provides methods for inducing exon skipping using the novel antisense compounds as well as therapeutic compositions adapted for use in the methods of the invention.

BACKGROUND ART

Significant effort is currently being expended researching methods for suppressing or compensating for disease-causing mutations in genes. Antisense technologies are being devel- 45 oped using a range of chemistries to affect gene expression at a variety of different levels (transcription, splicing, stability, translation). Much of that research has focused on the use of antisense compounds to correct or compensate for abnormal or disease-associated genes in a myriad of different condi- 50 tions.

Antisense molecules are able to inhibit gene expression with exquisite specificity and because of this many research efforts concerning oligonucleotides as modulators of gene expression have focused on inhibiting the expression of targeted genes such as oncogenes or viral genes. The antisense oligonucleotides are directed either against RNA (sense strand) or against DNA where they form triplex structures inhibiting transcription by RNA polymerase II. To achieve a desired effect in specific gene down-regulation, the oligo- 60 nucleotides must either promote the decay of the targeted mRNA or block translation of that mRNA, thereby effectively preventing de novo synthesis of the undesirable target protein.

Such techniques are not useful where the object is to up-65 regulate production of the native protein or compensate for mutations which induce premature termination of translation

such as nonsense or frame-shifting mutations. Furthermore, in cases where a normally functional protein is prematurely terminated because of mutations therein, a means for restoring some functional protein production through antisense technology has been shown to be possible through intervention during the splicing processes (Sierakowska H, et al., (1996) Proc Natl Acad Sci USA 93, 12840-12844; Wilton S D, et al., (1999) Neuromusc Disorders 9, 330-338; van Deutekom J C et al., (2001) Human Mol Genet 10, 1547-1554). In these cases, the defective gene transcript should not be subjected to targeted degradation so the antisense oligonucleotide chemistry should not promote target mRNA decay.

In a variety of genetic diseases, the effects of mutations on the eventual expression of a gene can be modulated through a process of targeted exon skipping during the splicing process. The splicing process is directed by complex multi-particle machinery that brings adjacent exon-intron junctions in premRNA into close proximity and performs cleavage of phosphodiester bonds at the ends of the introns with their subsequent reformation between exons that are to be spliced together. This complex and highly precise process is mediated by sequence motifs in the pre-mRNA that are relatively short semi-conserved RNA segments to which bind the various nuclear splicing factors that are then involved in the splicing reactions. By changing the way the splicing machinery reads or recognises the motifs involved in pre-mRNA processing, it is possible to create differentially spliced mRNA molecules. It has now been recognised that the majority of human genes are alternatively spliced during normal gene expression, although the mechanisms invoked have not been identified. Using antisense oligonucleotides, it has been shown that errors and deficiencies in a coded mRNA could be bypassed or removed from the mature gene transcripts.

In nature, the extent of genetic deletion or exon skipping in the splicing process is not fully understood, although many instances have been documented to occur, generally at very low levels (Sherrat T G, et al., (1993) Am J Hum Genet 53, 1007-1015). However, it is recognised that if exons associated with disease-causing mutations can be specifically deleted from some genes, a shortened protein product can sometimes be produced that has similar biological properties of the native protein or has sufficient biological activity to ameliorate the disease caused by mutations associated with the target exon (Lu Q L, et al., (2003) Nature Medicine 9, 1009-1014; Aartsma-Rus A et al., (2004) Am J Hum Genet 74: 83-92).

This process of targeted exon skipping is likely to be particularly useful in long genes where there are many exons and introns, where there is redundancy in the genetic constitution of the exons or where a protein is able to function without one or more particular exons (e.g. with the dystrophin gene, which consists of 79 exons; or possibly some collagen genes which encode for repeated blocks of sequence or the huge nebulin or titin genes which are comprised of ~80 and over 370 exons, respectively).

Efforts to redirect gene processing for the treatment of genetic diseases associated with truncations caused by mutations in various genes have focused on the use of antisense oligonucleotides that either: (1) fully or partially overlap with the elements involved in the splicing process; or (2) bind to the pre-mRNA at a position sufficiently close to the element to disrupt the binding and function of the splicing factors that would normally mediate a particular splicing reaction which occurs at that element (e.g., binds to the pre-mRNA at a position within 3, 6, or 9 nucleotides of the element to be blocked).

For example, modulation of mutant dystrophin pre-mRNA splicing with antisense oligoribonucleotides has been reported both in vitro and in vivo. In one type of dystrophin mutation reported in Japan, a 52-base pair deletion mutation causes exon 19 to be removed with the flanking introns during the splicing process (Matsuo et al., (1991) J Clin Invest., 87:2127-2131). An in vitro minigene splicing system has been used to show that a 31-mer 2'-O-methyl oligoribonucleotide complementary to the 5' half of the deleted sequence in 10 dystrophin Kobe exon 19 inhibited splicing of wild-type premRNA (Takeshima et al. (1995), J. Clin. Invest., 95, 515-520). The same oligonucleotide was used to induce exon skipping from the native dystrophin gene transcript in human cultured lymphoblastoid cells.

Dunckley et al., (1997) Nucleosides & Nucleotides, 16, 1665-1668 described in vitro constructs for analysis of splicing around exon 23 of mutated dystrophin in the mdx mouse mutant, a model for muscular dystrophy. Plans to analyse these constructs in vitro using 2' modified oligonucleotides 20 targeted to splice sites within and adjacent to mouse dystrophin exon 23 were discussed, though no target sites or sequences were given.

2'-O-methyl oligoribonucleotides were subsequently reported to correct dystrophin deficiency in myoblasts from 25 the mdx mouse from this group. An antisense oligonucleotide targeted to the 3' splice site of murine dystrophin intron 22 was reported to cause skipping of the mutant exon as well as several flanking exons and created a novel in-frame dystro-30 phin transcript with a novel internal deletion. This mutated dystrophin was expressed in 1-2% of antisense treated mdx myotubes. Use of other oligonucleotide modifications such as 2'-O-methoxyethyl phosphodiesters are described (Dunckley et al. (1998) Human Mol. Genetics, 5, 1083-90).

Thus, antisense molecules may provide a tool in the treatment of genetic disorders such as Duchenne Muscular Dystrophy (DMD). However, attempts to induce exon skipping using antisense molecules have had mixed success. Studies on dystrophin exon 19, where successful skipping of that 40 exon from the dystrophin pre-mRNA was achieved using a variety of antisense molecules directed at the flanking splice sites or motifs within the exon involved in exon definition as described by Errington et al. (2003) J Gen Med 5, 518-527".

In contrast to the apparent ease of exon 19 skipping, the 45 first report of exon 23 skipping in the mdx mouse by Dunckley et al., (1998) is now considered to be reporting only a naturally occurring revertant transcript or artefact rather than any true antisense activity. In addition to not consistently generating transcripts missing exon 23, Dunckley et al., 50 (1998) did not show any time course of induced exon skipping, or even titration of antisense oligonucleotides, to demonstrate dose dependent effects where the levels of exon skipping corresponded with increasing or decreasing amounts of antisense oligonucleotide. Furthermore, this work 55 a single exon by joining together two or more antisense olicould not be replicated by other researchers.

The first example of specific and reproducible exon skipping in the mdx mouse model was reported by Wilton et al., (1999) Neuromuscular Disorders 9, 330-338. By directing an antisense molecule to the donor splice site, consistent and 60 efficient exon 23 skipping was induced in the dystrophin mRNA within 6 hours of treatment of the cultured cells. Wilton et al. (1999), also describe targeting the acceptor region of the mouse dystrophin pre-mRNA with longer antisense oligonucleotides and being unable to repeat the pub- 65 lished results of Dunckley et al., (1998). No exon skipping, either 23 alone or multiple removal of several flanking exons,

could be reproducibly detected using a selection of antisense oligonucleotides directed at the acceptor splice site of intron 22.

While the first antisense oligonucleotide directed at the intron 23 donor splice site induced consistent exon skipping in primary cultured myoblasts, this compound was found to be much less efficient in immortalized cell cultures expressing higher levels of dystrophin. However, with refined targeting and antisense oligonucleotide design, the efficiency of specific exon removal was increased by almost an order of magnitude (see Mann C J et al., (2002) J Gen Med 4, 644-654).

Thus, there remains a need to provide antisense oligonucleotides capable of binding to and modifying the splicing of a target nucleotide sequence. Simply directing the antisense oligonucleotides to motifs presumed to be crucial for splicing is no guarantee of the efficacy of that compound in a therapeutic setting.

SUMMARY OF THE INVENTION

The present invention provides antisense molecule compounds and compositions suitable for binding to RNA motifs involved in the splicing of pre-mRNA that are able to induce specific and efficient exon skipping and a method for their use thereof.

The choice of target selection plays a crucial role in the efficiency of exon skipping and hence its subsequent application of a potential therapy. Simply designing antisense molecules to target regions of pre-mRNA presumed to be involved in splicing is no guarantee of inducing efficient and specific exon skipping. The most obvious or readily defined targets for splicing intervention are the donor and acceptor splice sites although there are less defined or conserved motifs including exonic splicing enhancers, silencing elements and branch points.

The acceptor and donor splice sites have consensus sequences of about 16 and 8 bases respectively (see FIG. 1 for schematic representation of motifs and domains involved in exon recognition, intron removal and the splicing process).

According to a first aspect, the invention provides antisense molecules capable of binding to a selected target to induce exon skipping. For example, to induce exon skipping in exons 3 to 8, 10 to 16, 19 to 40, 42 to 44, 46, 47, and 50 to 53 in the Dystrophin gene transcript the antisense molecules are preferably selected from the group listed in Table 1A.

In a further example, it is possible to combine two or more antisense oligonucleotides of the present invention together to induce multiple exon skipping in exons 19-20, and 53. This is a similar concept to targeting of a single exon. A combination or "cocktail" of antisense oligonucleotides are directed at adjacent exons to induce efficient exon skipping.

In another example, to induce exon skipping in exons 19-20, 31, 34 and 53 it is possible to improve exon skipping of gonucleotide molecules. This concept is termed by the inventor as a "weasel", an example of a cunningly designed antisense oligonucleotide. A similar concept has been described in Aartsma-Rus A et al., (2004) Am J Hum Genet 74: 83-92).

According to a second aspect, the present invention provides antisense molecules selected and or adapted to aid in the prophylactic or therapeutic treatment of a genetic disorder comprising at least an antisense molecule in a form suitable for delivery to a patient.

According to a third aspect, the invention provides a method for treating a patient suffering from a genetic disease wherein there is a mutation in a gene encoding a particular

protein and the affect of the mutation can be abrogated by exon skipping, comprising the steps of: (a) selecting an antisense molecule in accordance with the methods described herein; and (b) administering the molecule to a patient in need of such treatment.

The invention also addresses the use of purified and isolated antisense oligonucleotides of the invention, for the manufacture of a medicament for treatment of a genetic disease.

The invention further provides a method of treating a con- 10 dition characterised by Duchenne muscular dystrophy, which method comprises administering to a patient in need of treatment an effective amount of an appropriately designed antisense oligonucleotide of the invention, relevant to the particular genetic lesion in that patient. Further, the invention 15 provides a method for prophylactically treating a patient to prevent or at least minimise Duchene muscular dystrophy, comprising the step of: administering to the patient an effective amount of an antisense oligonucleotide or a pharmaceutical composition comprising one or more of these biological 20 molecules.

The invention also provides kits for treating a genetic disease, which kits comprise at least a antisense oligonucleotide of the present invention, packaged in a suitable container and 25 instructions for its use.

Other aspects and advantages of the invention will become apparent to those skilled in the art from a review of the ensuing description, which proceeds with reference to the following figures.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 Schematic representation of motifs and domains involved in exon recognition, intron removal and the splicing process (SEQ ID NOS: 213 and 214). 35

FIG. 2. Diagrammatic representation of the concept of antisense oligonucleotide induced exon skipping to by-pass disease-causing mutations (not drawn to scale). The hatched box represents an exon carrying a mutation that prevents the translation of the rest of the mRNA into a protein. The solid 40 31 black bar represents an antisense oligonucleotide that prevents inclusion of that exon in the mature mRNA

FIG. 3 Gel electrophoresis showing differing efficiencies of two antisense molecules directed at exon 8 acceptor splice site. The preferred compound [H8A(-06+18)] induces strong 45 using antisense molecules H35A(+141+161), H35A(+116+ and consistent exon skipping at a transfection concentration of 20 nanomolar in cultured normal human muscle cells. The less preferred antisense oligonucleotide [H8A(-06+14)] also induces efficient exon skipping, but at much higher concentrations. Other antisense oligonucleotides directed at exon 8 50 50) directed at exon 36. either only induced lower levels of exon skipping or no detectable skipping at all (not shown).

FIG. 4 Gel electrophoresis showing differing efficiencies of two antisense molecules directed at internal domains ferred compound [H7A(+45+67)] induces strong and consistent exon skipping at a transfection concentration of 20 nanomolar in cultured human muscle cells. The less preferred antisense oligonucleotide [H7A(+2+26)] induces only low levels of exon skipping at the higher transfection concentra-60 tions. Other antisense oligonucleotides directed at exon 7 either only induced lower levels of exon skipping or no detectable skipping at all (not shown).

FIG. 5 Gel electrophoresis showing an example of low efficiency exon 6 skipping using two non-preferred antisense 65 molecules directed at human exon 6 donor splice site. Levels of induced exon 6 skipping are either very low [H6D(+04-

21)] or almost undetectable [H6D(+18-04)]. These are examples of non-preferred antisense oligonucleotides to demonstrate that antisense oligonucleotide design plays a crucial role in the efficacy of these compounds.

FIG. 6 Gel electrophoresis showing strong and efficient human exon 6 skipping using an antisense molecules [H6A (+69+91)] directed at an exon 6 internal domain, presumably an exon splicing enhancer. This preferred compound induces consistent exon skipping at a transfection concentration of 20 nanomolar in cultured human muscle cells.

FIG. 7 Gel electrophoresis showing strong human exon 4 skipping using an antisense molecule H4A(+13+32) directed at an exon 6 internal domain, presumably an exon splicing enhancer. This preferred compound induces strong and consistent exon skipping at a transfection concentration of 20 nanomolar in cultured human muscle cells,

FIG. 8 Gel electrophoresis showing (8B) strong human exon 11 skipping using antisense molecule H11A(+75+97) directed at an exon 11 internal domain; and (8A) strong human exon 12 skipping using antisense molecule H12A(+ 52+75) directed at exon 12 internal domain.

FIG. 9 Gel electrophoresis showing (9A) strong human exon 15 skipping using antisense molecules H15A(+48+71) and H15A(-12+19) directed at an exon 15 internal domain; and (9B) strong human exon 16 skipping using antisense molecules H16A(-12+19) and H16A(-06+25).

FIG. 10 Gel electrophoresis showing human exon 19/20 skipping using antisense molecules H20A(+44+71) and H20A(+149+170) directed at an exon 20 and a "cocktail" of antisense oligonucleotides H19A(+35+65, H20A(+44+71) 30 and H20A(+149+170) directed at exons 19/20.

FIG. 11 Gel electrophoresis showing human exon 19/20 skipping using "weasels" directed at exons 19 and 20.

FIG. 12 Gel electrophoresis showing exon 22 skipping using antisense molecules H22A(+125+106), H22A(+47+ 69), H22A(+80+101) and H22D(+13-11) directed at exon 22

FIG. 13 Gel electrophoresis showing exon 31 skipping using antisense molecules H31D(+01-25) and H31D(+03-22); and a "cocktail" of antisense molecules directed at exon

FIG. 14 Gel electrophoresis showing exon 33 skipping using antisense molecules H33A(+30+56) and H33A(+64+ 88) directed at exon 33.

FIG. 15 Gel electrophoresis showing exon 35 skipping 135), and H35A(+24+43) and a "cocktail of two antisense molecules, directed at exon 35.

FIG. 16 Gel electrophoresis showing exon 36 skipping using antisense molecules H32A(+49+73) and H36A(+26+

FIG. 17 Gel electrophoresis showing exon 37 skipping using antisense molecules H37A(+82+105) and H37A(+ 134+157) directed at exon 37.

FIG. 18 Gel electrophoresis showing exon 38 skipping within exon 7, presumably exon splicing enhancers. The pre- 55 using antisense molecule H38A(+88+112) directed at exon 38.

> FIG. 19 Gel electrophoresis showing exon 40 skipping using antisense molecule H40A(-05+17) directed at exon 40. FIG. 20 Gel electrophoresis showing exon 42 skipping

> using antisense molecule H42A(-04+23) directed at exon 42. FIG. 21 Gel electrophoresis showing exon 46 skipping using antisense molecule H46A(+86+115) directed a# exon 46

> FIG. 22 Gel electrophoresis showing exon 51, exon 52 and exon 53 skipping using various antisense molecules directed at exons 51, 52 and 53, respectively. A "cocktail" of antisense molecules is also shown directed at exon 53.

7

BRIEF DESCRIPTION OF THE SEQUENCE LISTINGS

-.

TABLE 1A

Description of 2'-O-methyl phosphorothioate antisense oligonucleotides that have been used to date to study induced exon skipping during the processing of the dystrophin pre-mRNA. Since these 2'-O-methyl antisense oligonucleotides are more RNA-like, U represents uracil. With other antisense chemistries such as peptide nucleic acids or morpholinos, these U bases may be shown as "T".

Since these 2'-O-methyl antisense oligonucleotides are more RNA-like, U represents uracil. With other antisense chemistries such as peptide nucleic acids or morpholinos, these U bases may be shown as "T".

DETAILED DESCRIPTION OF THE INVENTION

General

Those skilled in the art will appreciate that the invention described herein is susceptible to variations and modifications other than those specifically described. It is to be understood that the invention includes all such variation and modifications. The invention also includes all of the steps, features, compositions and compounds referred to or indicated in the

specification, individually or collectively and any and all 60 combinations or any two or more of the steps or features.

The present invention is not to be limited in scope by the specific embodiments described herein, which are intended for the purpose of exemplification only. Functionally equivalent products, compositions and methods are clearly within the scope of the invention as described herein.

Sequence identity numbers (SEQ ID NO:) containing nucleotide and amino acid sequence information included in 20

25

this specification are collected at the end of the description and have been prepared using the programme PatentIn Version 3.0. Each nucleotide or amino acid sequence is identified in the sequence listing by the numeric indicator <210> followed by the sequence identifier (e.g. <210>1, <210>2, etc.). 5 The length, type of sequence and source organism for each nucleotide or amino acid sequence are indicated by information provided in the numeric indicator fields <211>, <212> and <213>, respectively. Nucleotide and amino acid sequences referred to in the specification are defined by the 10 information provided in numeric indicator field <400> followed by the sequence identifier (e.g. <400>1, <400>2, etc.).

An antisense molecules nomenclature system was proposed and published to distinguish between the different antisense molecules (see Mann et al., (2002) J Gen Med 4, 644- 15 654). This nomenclature became especially relevant when testing several slightly different antisense molecules, all directed at the same target region, as shown below:

H#A/D(x:y).

The first letter designates the species (e.g. H: human, M: murine, C: canine) "#" designates target dystrophin exon number.

"A/D" indicates acceptor or donor splice site at the beginning and end of the exon, respectively.

(x y) represents the annealing coordinates where "-" or "+" indicate intronic or exonic sequences respectively. As an example, A(-6+18) would indicate the last 6 bases of the intron preceding the target exon and the first 18 bases of the target exon. The closest splice site would be the acceptor so 30 these coordinates would be preceded with an "A". Describing annealing coordinates at the donor splice site could be D(+2-18) where the last 2 exonic bases and the first 18 intronic bases correspond to the annealing site of the antisense molecule. Entirely exonic annealing coordinates that would be repre- 35 sented by A(+65+85), that is the site between the 65th and 85th nucleotide from the start of that exon.

The entire disclosures of all publications (including patents, patent applications, journal articles, laboratory manuals, books, or other documents) cited herein are hereby incorpo- 40 rated by reference. No admission is made that any of the references constitute prior art or are part of the common general knowledge of those working in the field to which this invention relates.

As used necessarily herein the term "derived" and "derived 45 from" shall be taken to indicate that a specific integer may be obtained from a particular source albeit not directly from that source.

Throughout this specification, unless the context requires o#herwise, the word "comprise", or variations such as "com- 50 prises" or "comprising", will be understood to imply the inclusion of a stated integer or group of integers but not the exclusion of any other integer or group of integers.

Other definitions for selected terms used herein may be found within the detailed description of the invention and 55 apply throughout. Unless otherwise defined, all other scientific and technical terms used herein have the same meaning as commonly understood to one of ordinary skill in the art to which the invention belongs.

Description of the Preferred Embodiment

When antisense molecule(s) are targeted to nucleotide sequences involved in splicing in exons within pre-mRNA sequences, normal splicing of the exon may be inhibited causing the splicing machinery to by-pass the entire mutated exon from the mature mRNA. The concept of antisense oli- 65 gonucleotide induced exon skipping is shown in FIG. 2. In many genes, deletion of an entire exon would lead to the

production of a non-functional protein through the loss of important functional domains or the disruption of the reading frame. In some proteins, however, it is possible to shorten the protein by deleting one or more exons, without disrupting the reading frame, from within the protein without seriously altering the biological activity of the protein. Typically, such proteins have a structural role and or possess functional domains at their ends. The present invention describes antisense molecules capable of binding to specified dystrophin pre-mRNA targets and re-directing processing of that gene. Antisense Molecules

According to a first aspect of the invention, there is provided antisense molecules capable of binding to a selected target to induce exon skipping. To induce exon skipping in exons of the Dystrophin gene transcript, the antisense molecules are preferably selected from the group of compounds shown in Table 1A. There is also provided a combination or "cocktail" of two or more antisense oligonucleotides capable of binding to a selected target to induce exon skipping. To induce exon skipping in exons of the Dystrophin gene transcript, the antisense molecules in a "cocktail" are preferably selected from the group of compounds shown in Table 1B. Alternatively, exon skipping may be induced by antisense oligonucleotides joined together "weasels" preferably selected from the group of compounds shown in Table 1C.

Designing antisense molecules to completely mask consensus splice sites may not necessarily generate any skipping of the targeted exon. Furthermore, the inventors have discovered that size or length of the antisense oligonucleotide itself is not always a primary factor when designing antisense molecules. With some targets such as exon 19, antisense oligonucleotides as short as 12 bases were able to induce exon skipping, albeit not as efficiently as longer (20-31 bases) oligonucleotides. In some other targets, such as murine dystrophin exon 23, antisense oligonucleotides only 17 residues long were able to induce more efficient skipping than another overlapping compound of 25 nucleotides.

The inventors have also discovered that there does not appear to be any standard motif that can be blocked or masked by antisense molecules to redirect splicing. In some exons, such as mouse dystrophin exon 23, the donor splice site was the most amenable to target to re-direct skipping of that exon. It should be noted that designing and testing a series of exon 23 specific antisense molecules to anneal to overlapping regions of the donor splice site showed considerable variation in the efficacy of induced exon skipping. As reported in Mann et al., (2002) there was a significant variation in the efficiency of bypassing the nonsense mutation depending upon antisense oligonucleotide annealing ("Improved antisense oligonucleotide induced exon skipping in the mdx mouse model of muscular dystrophy". J Gen Med 4: 644-654). Targeting the acceptor site of exon 23 or several internal domains was not found to induce any consistent exon 23 skipping.

In other exons targeted for removal, masking the donor splice site did not induce any exon skipping. However, by directing antisense molecules to the acceptor splice site (human exon 8 as discussed below), strong and sustained exon skipping was induced. It should be noted that removal of human exon 8 was tightly linked with the co-removal of exon 9. There is no strong sequence homology between the exon 8 60 antisense oligonucleotides and corresponding regions of exon 9 so it does not appear to be a matter of cross reaction. Rather the splicing of these two exons is inextricably linked. This is not an isolated instance as the same effect is observed in canine cells where targeting exon 8 for removal also resulted in the skipping of exon 9. Targeting exon 23 for removal in the mouse dystrophin pre-mRNA also results in

the frequent removal of exon 22 as well. This effect occurs in a dose dependent manner and also indicates close coordinated processing of 2 adjacent exons.

In other targeted exons, antisense molecules directed at the donor or acceptor splice sites did not induce exon skipping ⁵ while annealing antisense molecules to intra-exonic regions (i.e. exon splicing enhancers within human dystrophin exon 6) was most efficient at inducing exon skipping. Some exons, both mouse and human exon 19 for example, are readily skipped by targeting antisense molecules to a variety of ¹⁰ motifs. That is, targeted exon skipping is induced after using antisense oligonucleotides to mask donor and acceptor splice sites or exon splicing enhancers.

To identify and select antisense oligonucleotides suitable for use in the modulation of exon skipping, a nucleic acid sequence whose function is to be modulated must first be identified. This may be, for example, a gene (or mRNA transcribed form the gene) whose expression is associated with a particular disorder or disease state, or a nucleic acid molecule 20 from an infectious agent. Within the context of the present invention, preferred target site(s) are those involved in mRNA splicing (i.e. splice donor sites, splice acceptor sites, or exonic splicing enhancer elements). Splicing branch points and exon recognition sequences or splice enhancers are also potential 25 target sites for modulation of mRNA splicing.

Preferably, the present invention aims to provide antisense molecules capable of binding to a selected target in the dystrophin pre-mRNA to induce efficient and consistent exon skipping. Duchenne muscular dystrophy arises from muta- 30 tions that preclude the synthesis of a functional dystrophin gene product. These Duchenne muscular dystrophy gene defects are typically nonsense mutations or genomic rearrangements such as deletions, duplications or micro-deletions or insertions that disrupt the reading frame. As the 35 human dystrophin gene is a large and complex gene with the 79 exons being spliced together to generate a mature mRNA with an open reading frame of approximately 11,000 bases, there are many positions where these mutations can occur. Consequently, a comprehensive antisense oligonucleotide 40 based therapy to address many of the different disease-causing mutations in the dystrophin gene will require that many exons can be targeted for removal during the splicing process.

Within the context of the present invention, preferred target site(s) are those involved in mRNA splicing (i.e. splice donor 45 sites, splice acceptor sites or exonic splicing enhancer elements). Splicing branch points and exon recognition sequences or splice enhancers are also potential target sites for modulation of mRNA splicing.

The oligonucleotide and the DNA or RNA are complemen- 50 tary to each other when a sufficient number of corresponding positions in each molecule are occupied by nucleotides which can hydrogen bond with each other. Thus, "specifically hybridisable" and "complementary" are terms which are used to indicate a sufficient degree of complementarity or precise 55 pairing such that stable and specific binding occurs between the oligonucleotide and the DNA or RNA target. It is understood in the art that the sequence of an antisense molecule need not be 100% complementary to that of its target sequence to be specifically hybridisable. An antisense mol- 60 ecule is specifically hybridisable when binding of the compound to the target DNA or RNA molecule interferes with the normal function of the target DNA or RNA to cause a loss of utility, and there is a sufficient degree of complementarity to avoid non-specific binding of the antisense compound to non- 65 target sequences under conditions in which specific binding is desired, i.e., under physiological conditions in the case of in

vivo assays or therapeutic treatment, and in the case of in vitro assays, under conditions in which the assays are performed.

While the above method may be used to select antisense molecules capable of deleting any exon from within a protein that is capable of being shortened without affecting its biological function, the exon deletion should not lead to a reading frame shift in the shortened transcribed mRNA. Thus, if in a linear sequence of three exons the end of the first exon encodes two of three nucleotides in a codon and the next exon is deleted then the third exon in the linear sequence must start with a single nucleotide that is capable of completing the nucleotide triplet for a codon. If the third exon does not commence with a single nucleotide there will be a reading frame shift that would lead to the generation of truncated or a non-functional protein.

It wilt be appreciated that the codon arrangements at the end of exons in structural proteins may not always break at the end of a codon, consequently there may be a need to delete more than one exon from the pre-mRNA to ensure in-frame reading of the mRNA. In such circumstances, a plurality of antisense oligonucleotides may need to be selected by the method of the invention wherein each is directed to a different region responsible for inducing splicing in the exons that are to be deleted.

The length of an antisense molecule may vary so long as it is capable of binding selectively to the intended location within the pre-mRNA molecule. The length of such sequences can be determined in accordance with selection procedures described herein. Generally, the antisense molecule will be from about 10 nucleotides in length up to about 50 nucleotides in length. It will be appreciated however that any length of nucleotides within this range may be used in the method. Preferably, the length of the antisense molecule is between 17 to 30 nucleotides in length.

In order to determine which exons can be connected in a dystrophin gene, reference should be made to an exon boundary map. Connection of one exon with another is based on the exons possessing the same number at the 3' border as is present at the 5' border of the exon to which it is being connected. Therefore, if exon 7 were deleted, exon 6 must connect to either exons 12 or 18 to maintain the reading frame. Thus, antisense oligonucleotides would need to be selected which redirected splicing for exons 7 to 11 in the first instance or exons 7 to 17 in the second instance. Another and somewhat simpler approach to restore the reading frame around an exon 7 deletion would be to remove the two flanking exons. Induction of exons 6 and 8 skipping should result in an in-frame transcript with the splicing of exons 5 to 9. In practise however, targeting exon 8 for removal from the premRNA results in the co-removal of exon 9 so the resultant transcript would have exon 5 joined to exon 10. The inclusion or exclusion of exon 9 does not alter the reading frame. Once the antisense molecules to be tested have been identified, they are prepared according to standard techniques known in the art. The most common method for producing antisense molecules is the methylation of the 2' hydroxyribose position and the incorporation of a phosphorothioate backbone produces molecules that superficially resemble RNA but that are much more resistant to nuclease degradation.

To avoid degradation of pre-mRNA during duplex formation with the antisense molecules, the antisense molecules used in the method may be adapted to minimise or prevent cleavage by endogenous RNase H. This property is highly preferred as the treatment of the RNA with the unmethylated oligonucleotides either intracellularly or in crude extracts that contain RNase H leads to degradation of the pre-mRNA: antisense oligonucleotide duplexes. Any form of modified antisense molecules that is capable of by-passing or not inducing such degradation may be used in the present method. An example of antisense molecules which when duplexed with RNA are not cleaved by cellular RNase H is 2'-O-methyl derivatives. 2'-O-methyl-oligoribonucleotides 5 are very stable in a cellular environment and in animal tissues, and their duplexes with RNA have higher Tm values than their ribo- or deoxyribo-counterparts.

Antisense molecules that do not activate RNase H can be made in accordance with known techniques (see, e.g., U.S. 10 Pat. No. 5,149,797). Such antisense molecules, which may be deoxyribonucleotide or ribonucleotide sequences, simply contain any structural modification which sterically hinders or prevents binding of RNase H to a duplex molecule containing the oligonucleotide as one member thereof, which 15 structural modification does not substantially hinder or disrupt duplex formation. Because the portions of the oligonucleotide involved in duplex formation are substantially different from those portions involved in RNase H binding thereto, numerous antisense molecules that do not activate 20 RNase H are available. For example, such antisense molecules may be oligonucleotides wherein at least one, or all, of the inter-nucleotide bridging phosphate residues are modified phosphates, such as methyl phosphonates, methyl phosphorothioates, phosphoromorpholidates, phosphoropiperazi- 25 dates and phosphoramidates. For example, every other one of the internucleotide bridging phosphate residues may be modified as described. In another non-limiting example, such antisense molecules are molecules wherein at least one, or all, of the nucleotides contain a 2' lower alkyl moiety (e.g., C_1 - C_4 , 30 linear or branched, saturated or unsaturated alkyl, such as methyl, ethyl, ethenyl, propyl, 1-propenyl, 2-propenyl, and isopropyl). For example, every other one of the nucleotides may be modified as described.

While antisense oligonucleotides are a preferred form of 35 the antisense molecules, the present invention comprehends other oligomeric antisense molecules, including but not limited to oligonucleotide mimetics such as are described below.

Specific examples of preferred antisense compounds useful in this invention include oligonucleotides containing 40 modified backbones or non-natural inter-nucleoside linkages. As defined in this specification, oligonucleotides having modified backbones include those that retain a phosphorus atom in the backbone and those that do not have a phosphorus atom in the backbone. For the purposes of this specification, 45 and as sometimes referenced in the art, modified oligonucleotides that do not have a phosphorus atom in their internucleoside backbone can also be considered to be oligonucleosides.

In other preferred oligonucleotide mimetics, both the sugar 50 and the inter-nucleoside linkage, i.e., the backbone, of the nucleotide units are replaced with novel groups. The base units are maintained for hybridization with an appropriate nucleic acid target compound. One such oligomeric compound, an oligonucleotide mimetic that has been shown to 55 have excellent hybridization properties, is referred to as a peptide nucleic acid (PNA). In PNA compounds, the sugarbackbone of an oligonucleotide is replaced with an amide containing backbone, in particular an aminoethylglycine backbone. The nucleo-bases are retained and are bound 60 directly or indirectly to aza nitrogen atoms of the amide portion of the backbone.

Modified oligonucleotides may also contain one or more substituted sugar moieties. Oligonucleotides may also include nucleobase (often referred to in the art simply as 65 "base") modifications or substitutions. Certain nucleo-bases are particularly useful for increasing the binding affinity of

the oligomeric compounds of the invention. These include 5-substituted pyrimidines, 6-azapyrimidines and N-2, N-6 and O-6 substituted purines, including 2-aminopropyladenine, 5-propynyluracil and 5-propynylcytosine. 5-methylcytosine substitutions have been shown to increase nucleic acid duplex stability by 0.6-1.2° C. and are presently preferred base substitutions, even more particularly when combined with 2'-O-methoxyethyl sugar modifications.

Another modification of the oligonucleotides of the invention involves chemically linking to the oligonucleotide one or more moieties or conjugates that enhance the activity, cellular distribution or cellular uptake of the oligonucleotide. Such moieties include but are not limited to lipid moieties such as a cholesterol moiety, cholic acid, a thioether, e.g., hexyl-Stritylthiol, a thiocholesterol, an aliphatic chain, e.g., dodecandiol or undecyl residues, a phospholipid, e.g., di-hexadecylrac-glycerol or triethylammonium 1,2-di-O-hexadecyl-racglycero-3-H-phosphonate, a polyamine or a polyethylene glycol chain, or adamantane acetic acid, a palmityl moiety, or an octadecylamine or hexylamino-carbonyl-oxycholesterol moiety.

It is not necessary far all positions in a given compound to be uniformly modified, and in fact more than one of the aforementioned modifications may be incorporated in a single compound or even at a single nucleoside within an oligonucleotide. The present invention also includes antisense compounds that are chimeric compounds. "Chimeric" antisense compounds or "chimeras," in the context of this invention, are antisense molecules, particularly oligonucleotides, which contain two or more chemically distinct regions, each made up of at least one monomer unit, i.e., a nucleotide in the case of an oligonucleotide compound. These oligonucleotides typically contain at least one region wherein the oligonucleotide is modified so as to confer upon the increased resistance to nuclease degradation, increased cellular uptake, and an additional region for increased binding affinity for the target nucleic acid.

Methods of Manufacturing Antisense Molecules

The antisense molecules used in accordance with this invention may be conveniently and routinely made through the well-known technique of solid phase synthesis. Equipment for such synthesis is sold by several vendors including, for example, Applied Biosystems (Foster City, Calif.). One method for synthesising oligonucleotides on a modified solid support is described in U.S. Pat. No. 4,458,066.

Any other means for such synthesis known in the art may additionally or alternatively be employed. It is well known to use similar techniques to prepare oligonucleotides such as the phosphorothioates-and alkylated derivatives. In one such automated embodiment, diethyl-phosphoramidites are used as starting materials and may be synthesized as described by Beaucage, et al., (1981) Tetrahedron Letters, 22:1859-1862.

The antisense molecules of the invention are synthesised in vitro and do not include antisense compositions of biological origin, or genetic vector constructs designed to direct the in vivo synthesis of antisense molecules. The molecules of the invention may also be mixed, encapsulated, conjugated or otherwise associated with other molecules, molecule structures or mixtures of compounds, as for example, liposomes, receptor targeted molecules, oral, rectal, topical or other formulations, for assisting in uptake, distribution and/or absorption.

Therapeutic Agents

The present invention also can be used as a prophylactic or therapeutic, which may be utilised for the purpose of treatment of a genetic disease. Accordingly, in one embodiment the present invention provides antisense molecules that bind to a selected target in the dystrophin pre-mRNA to induce efficient and consistent exon skipping described herein in a therapeutically effective amount admixed with a pharmaceutically acceptable carrier, ⁵ diluent, or excipient.

The phrase "pharmaceutically acceptable" refers to molecular entities and compositions that are physiologically tolerable and do not typically produce an allergic or similarly 10 untoward reaction, such as gastric upset and the like, when administered to a patient. The term "carrier" refers to a diluent, adjuvant, excipient, or vehicle with which the compound is administered. Such pharmaceutical carriers can be sterile liquids, such as water and oils, including those of petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, sesame oil and the like. Water or saline solutions and aqueous dextrose and glycerol solutions are preferably employed as carriers, particularly for injectable solutions. Suitable pharmaceutical carriers are described 20 in Martin, Remington's Pharmaceutical Sciences, 18th Ed., Mack Publishing Co., Easton, Pa., (1990).

In a more specific form of the invention there are provided pharmaceutical compositions comprising therapeutically effective amounts of an antisense molecule together with 25 pharmaceutically acceptable diluents, preservatives, solubilizers, emulsifiers, adjuvants and/or carriers. Such compositions include diluents of various buffer content (e.g., Tris-HCl, acetate, phosphate), pH and ionic strength and additives 30 such as detergents and solubilizing agents (e.g., Tween 80, Polysorbate 80), anti-oxidants (e.g., ascorbic acid, sodium metabisulfite), preservatives (e.g., Thimersol, benzyl alcohol) and bulking substances (e.g., lactose, mannitol). The material may be incorporated into particulate preparations of 35 polymeric compounds such as polylactic acid, polyglycolic acid, etc. or into liposomes. Hylauronic acid may also be used. Such compositions may influence the physical state, stability, rate of in vivo release, and rate of in vivo clearance of the present proteins and derivatives. See, e.g., Martin, 40 Remington's Pharmaceutical Sciences, 18th Ed. (1990, Mack Publishing Co., Easton, Pa. 18042) pages 1435-1712 that are herein incorporated by reference. The compositions may be prepared in liquid form, or may be in dried powder, 45 such as lyophilised form.

It will be appreciated that pharmaceutical compositions provided according to the present invention may be administered by any means known in the art. Preferably, the pharmaceutical compositions for administration are administered by injection, orally, or by the pulmonary, or nasal route. The so antisense molecules are more preferably delivered by intravenous, intra-arterial, intraperitoneal, intramuscular, or subcutaneous routes of administration.

Antisense Molecule Based Therapy

Also addressed by the present invention is the use of anti- 55 (1989) Science, 244:1275-1280). sense molecules of the present invention, for manufacture of a medicament for modulation of a genetic disease. (1989) Science, 244:1275-1280). These approaches include intervention is the use of anti- 55 (1989) Science, 244:1275-1280).

The delivery of a therapeutically useful amount of antisense molecules may be achieved by methods previously published. For example, intracellular delivery of the antisense 60 molecule may be via a composition comprising an admixture of the antisense molecule and an effective amount of a block copolymer. An example of this method is described in US patent application US 20040248833.

Other methods of delivery of antisense molecules to the 65 nucleus are described in Mann C J et al., (2001) ["Antisenseinduced exon skipping and the synthesis of dystrophin in the

mdx mouse". Proc., Natl. Acad. Science, 98(1) 42-47J and in Gebski et al., (2003). Human Molecular Genetics, 12(15): 1801-1811.

A method for introducing a nucleic acid molecule into a cell by way of an expression vector either as naked DNA or complexed to lipid carriers, is described in U.S. Pat. No. 6,806,084.

It may be desirable to deliver the antisense molecule in a colloidal dispersion system. Colloidal dispersion systems include macromolecule complexes, nanocapsules, microspheres, beads, and lipid-based systems including oil-in-water emulsions, micelles, mixed micelles, and liposomes or liposome formulations.

Liposomes are artificial membrane vesicles which are useful as delivery vehicles in vitro and in vivo. These formulations may have net cationic, anionic or neutral charge characteristics and are useful characteristics with in vitro, in vivo and ex vivo delivery methods. It has been shown that large unilamellar vesicles (LUV), which range in size from 0.2-

4.0.PHI.m can encapsulate a substantial percentage of an aqueous buffer containing large macromolecules. RNA, and DNA can be encapsulated within the aqueous interior and be delivered to cells in a biologically active form (Fraley, et al., Trends Biochem. Sci., 6:77, 1981).

In order for a liposome to be an efficient gene transfer vehicle, the following characteristics should be present: (1) encapsulation of the antisense molecule of interest at high efficiency while not compromising their biological activity; (2) preferential and substantial binding to a target cell in comparison to non-target cells; (3) delivery of the aqueous contents of the vesicle to the target cell cytoplasm at high efficiency; and (4) accurate and effective expression of genetic information (Mannino, et al., Biotechniques, 6:682, 1988).

The composition of the liposome is usually a combination of phospholipids, particularly high-phase-transition-temperature phospholipids, usually in combination with steroids, especially cholesterol. Other phospholipids or other lipids may also be used. The physical characteristics of liposomes depend on pH, ionic strength, and the presence of divalent cations.

Alternatively, the antisense construct may be combined with other pharmaceutically acceptable carriers or diluents to produce a pharmaceutical composition. Suitable carriers and diluents include isotonic saline solutions, for example phosphate-buffered saline. The composition may be formulated for parenteral, intramuscular, intravenous, subcutaneous, intraocular, oral or transdermal administration.

The routes of administration described are intended only as a guide since a skilled practitioner will be able to determine readily the optimum route of administration and any dosage for any particular animal and condition. Multiple approaches for introducing functional new genetic material into cells, both in vitro and in vivo have been attempted (Friedmann (1989) Science. 244:1275-1280).

These approaches include integration of the gene to be expressed into modified retroviruses (Friedmann (1989) supra; Rosenberg (1991) Cancer Research 51(18), suppl.: 5074S-5079S); integration into non-retrovirus vectors (Rosenfeld, et al. (1992) Cell, 68:143-155; Rosenfeld, et al. (1991) Science, 252:431-434); or delivery of a transgene linked to a heterologous promoter-enhancer element via liposomes (Friedmann (1989), supra; Brigham, et al. (1989) Am. J. Med. Sci., 298:278-281; Nabel, et al. (1990) Science, 249: 1285-1288; Hazinski, et al. (1991) Am. J. Resp. Cell Molec. Biol., 4:206-209; and Wang and Huang (1987) Proc. Natl. Acad. Sci. (USA), 84:7851-7855); coupled to ligand-specific, cation-based transport systems (Wu and Wu (1988) J. Biol. Chem., 263:14621-14624) or the use of naked DNA, expression vectors (Nabel et al. (1990), supra); Wolff et al. (1990) Science, 247:1465-1468). Direct injection of transgenes into tissue produces only localized expression (Rosenfeld (1992) 5 supra); Rosenfeld et al. (1991) supra; Brigham et al. (1989) supra; Nabel (1990) supra; and Hazinski et al. (1991) supra). The Brigham et al. group (Am. J. Med. Sci. (1989) 298:278-281 and Clinical Research (1991) 39 (abstract)) have reported in vivo transfection only of lungs of mice following either 10 intravenous or intratracheal administration of a DNA liposome complex. An example of a review article of human gene therapy procedures is: Anderson, Science (1992) 256:808-813.

The antisense molecules of the invention encompass any 15 pharmaceutically acceptable salts, esters, or salts of such esters, or any other compound which, upon administration to an animal including a human, is capable of providing (directly or indirectly) the biologically active metabolite or residue thereof. Accordingly, for example, the disclosure is also 20 drawn to prodrugs and pharmaceutically acceptable salts of the compounds of the invention, pharmaceutically acceptable salts of such pro-drugs, and other bioequivalents.

The term "pharmaceutically acceptable salts" refers to physiologically and pharmaceutically acceptable salts of the 25 compounds of the invention: i.e., salts that retain the desired biological activity of the parent compound and do not impart undesired toxicological effects thereto.

For oligonucleotides, preferred examples of pharmaceutically acceptable salts include but are not limited to (a) salts 30 formed with cations such as sodium, potassium, ammonium, magnesium, calcium, polyamines such as spermine and spermidine, etc.; (b) acid addition salts formed with inorganic acids, for example hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, nitric acid and the like; (c) salts 35 formed with organic acids such as, for example, acetic acid, oxalic acid, tartaric acid, succinic acid, malefic acid, fumaric acid, gluconic acid, citric acid, malic acid, ascorbic acid, benzoic acid, tannic acid, palmitic acid, alginic acid, polygiutamic acid, naphthalenesulfonic acid, methanesulfonic 40 acid, p-toluenesulfonic acid, naphthalenedisulfonic acid, polygalacturonic acid, and the like; and (d) salts formed from elemental anions such as chlorine, bromine, and iodine. The pharmaceutical compositions of the present invention may be administered in a number of ways depending upon whether 45 local or systemic treatment is desired and upon the area to be treated. Administration may be topical (including ophthalmic and to mucous membranes including rectal delivery), pulmonary, e.g., by inhalation or insufflation of powders or aerosols, (including by nebulizer, intratracheal, intranasal, epidermal 50 and transdermal), oral or parenteral. Parenteral administration includes intravenous, intra-arterial, subcutaneous, intraperitoneal or intramuscular injection or infusion; or intracranial, e.g., intrathecal or intraventricular, administration. Oligonucleotides with at least one 2'-O-methoxyethyl modi- 55 completely reliable in designing antisense oligonucleotides fication are believed to be particularly useful for oral administration.

The pharmaceutical formulations of the present invention, which may conveniently be presented in unit dosage form, may be prepared according to conventional techniques well 60 known in the pharmaceutical industry. Such techniques include the step of bringing into association the active ingredients with the pharmaceutical carrier(s) or excipient(s). In general the formulations are prepared by uniformly and intimately bringing into association the active ingredients with 65 liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

Kits of the Invention

The invention also provides kits for treatment of a patient with a genetic disease which kit comprises at least an antisense molecule, packaged in a suitable container, together with instructions for its use.

In a preferred embodiment, the kits will contain at least one antisense molecule as shown in Table 1A, or a cocktail of antisense molecules as shown in Table 1B or a "weasel" compound as shown in Table 1C. The kits may also contain peripheral reagents such as buffers, stabilizers, etc.

Those of ordinary skill in the field should appreciate that applications of the above method has wide application for identifying antisense molecules suitable for use in the treatment of many other diseases.

EXAMPLES

The following Examples serve to more fully describe the manner of using the above-described invention, as well as to set forth the best modes contemplated for carrying out various aspects of the invention. It is understood that these Examples in no way serve to limit the true scope of this invention, but rather are presented for illustrative purposes. The references cited herein are expressly incorporated by reference.

Methods of molecular cloning, immunology and protein chemistry, which are not explicitly described in the following examples, are reported in the literature and are known by those skilled in the art. General texts that described conventional molecular biology, microbiology, and recombinant DNA techniques within the skill of the art, included, for example: Sambrook et al, Molecular Cloning: A Laboratory Manual, Second Edition, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y. (1989); Glover ed., DNA Cloning: A Practical Approach, Volumes I and II, MRL Press, Ltd., Oxford, U.K. (1985); and Ausubel, F., Brent, R., Kingston, R. E., Moore, D. D., Seidman, J. G., Smith, J. A., Struhl, K. Current Protocols in Molecular Biology. Greene Publishing Associates/Wiley Intersciences, New York (2002).

Determining Induced Exon Skipping in Human Muscle Cells

Attempts by the inventors to develop a rational approach in antisense molecules design were not completely successful as there did not appear to be a consistent trend that could be applied to all exons. As such, the identification of the most effective and therefore most therapeutic antisense molecules compounds has been the result of empirical studies.

These empirical studies involved the use of computer programs to identify motifs potentially involved in the splicing process. Other computer programs were also used to identify regions of the pre-mRNA which may not have had extensive secondary structure and therefore potential sites for annealing of antisense molecules. Neither of these approaches proved for reliable and efficient induction of exon skipping.

Annealing sites on the human dystrophin pre-mRNA were selected for examination, initially based upon known or predicted motifs or regions involved in splicing. 20Me antisense oligonucleotides were designed to be complementary to the target sequences under investigation and were synthesised on an Expedite 8909 Nucleic Acid Synthesiser. Upon completion of synthesis, the oligonucleotides were cleaved from the support column and de-protected in ammonium hydroxide before being desalted. The quality of the oligonucleotide synthesis was monitored by the intensity of the trityl signals upon each deprotection step during the synthesis as detected

in the synthesis log. The concentration of the antisense oligonucleotide was estimated by measuring the absorbance of a diluted aliquot at 260 nm.

Specified amounts of the antisense molecules were then tested for their ability to induce exon skipping in an in vitro 5 assay, as described below.

Briefly, normal primary myoblast cultures were prepared from human muscle biopsies obtained after informed consent. The cells were propagated and allowed to differentiate into myotubes using standard culturing techniques. The cells 10 were then transfected with the antisense oligonucleotides by delivery of the oligonucleotides to the dells as cationic lipoplexes, mixtures of antisense molecules or cationic liposome preparations.

The cells were then allowed to grow for another 24 hours, 15 after which total RNA was extracted and molecular analysis commenced. Reverse transcriptase amplification (RT-PCR) was undertaken to study the targeted regions of the dystrophin pre-mRNA or induced exonic re-arrangements.

For example, in the testing of an antisense molecule for 20 inducing exon 19 skipping the RT-PCR test scanned several exons to detect involvement of any adjacent exons. For example, when inducing skipping of exon 19, RT-PCR was carried out with primers that amplified across exons 17 and 21. Amplifications of even larger products in this area (i.e. 25 exons 13-26) were also carried out to ensure that there was minimal amplification bias for the shorter induced skipped transcript. Shorter or exon skipped products tend to be amplified more efficiently and may bias the estimated of the normal and induced transcript. 30

The sizes of the amplification reaction products were estimated on an agarose gel and compared against appropriate size standards. The final confirmation of identity of these products was carried out by direct DNA sequencing to establish that the correct or expected exon junctions have been 35 maintained.

FIG. 3 shows differing efficiencies of two antisense molecules directed at exon 8 acceptor splice site. H8A(-06+18) [SEQ ID NO:1], which anneals to the last 6 bases of intron 7 and the first 18 bases of exon 8, induces substantial exon 8 and 9 skipping when delivered into cells at a concentration of 20 nM. The shorter antisense molecule, H8A(-06+14) [SEQ ID NO: 4] was only able to induce exon 8 and 9 skipping at 300 nM, a concentration some 15 fold higher than H8A(-06+18), which is the preferred antisense molecule.

This data shows that some particular antisense molecules induce efficient exon skipping while another antisense molecule, which targets a near-by or overlapping region, can be much less efficient. Titration studies show one compound is able to induce targeted exon skipping at 20 nM while the less efficient antisense molecules only induced exon skipping at concentrations of 300 nM and above. Therefore, we have shown that targeting of the antisense molecules to motifs involved in the splicing process plays a crucial role in the overall efficacy of that compound.

Efficacy refers to the ability to induce consistent skipping of a target exon. However, sometimes skipping of the target exons is consistently associated with a flanking exon. That is, we have found that the splicing of some exons is tightly linked. For example, in targeting exon 23 in the mouse model of muscular dystrophy with antisense molecules directed at the donor site of that exon, dystrophin transcripts missing exons 22 and 23 are frequently detected. As another example, when using an antisense molecule directed to exon 8 of the human dystrophin gene, all induced transcripts are missing both exons 8 and 9. Dystrophin transcripts missing only exon 8 are not observed.

Table 2 below discloses antisense molecule sequences that induce exon 8 (and 9) skipping.

TABLE 2

	Antisense Oligonucleotide name	Sequence	Ability to induce skipping
1	H8A(-06 + 18)	5'-GAU AGG UGG UAU CAA CAU CUG UAA	Very strong to 20 nM
2	H8A(-03 + 18)	5'-GAU AGG UGG UAU CAA CAU CUG	Very strong skipping to 40 nM
3	H8A(-07 + 18)	5'-GAU AGG UGG UAU CAA CAU CUG UAA G	Strong skipping to 40 nM
4	H8A(-06 + 14)	5'-GGU GGU AUC AAC AUC Ugu aa	Skipping to 300 nM
5	H8A(-10 + 10)	5'-GUA UCA ACA UCU GUA Agc ac	Patchy/weak skipping to 100 nm

Once efficient exon skipping had been induced with one antisense molecule, subsequent overlapping antisense molecules may be synthesized and then evaluated in the assay as described above. Our definition of an efficient antisense molecule is one that induces strong and sustained exon skipping 60 at transfection concentrations in the order of 300 nM or less.

Antisense Oligonucleotides Directed at Exon 8

Antisense oligonucleotides directed at exon 8 were prepared and tested for their ability to induce exon skipping in 65 human muscle cells using similar methods as described above.

Antisense Oligonucleotides Directed at Exon 7

Antisense oligonucleotides directed at exon 7 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

FIG. 4 shows the preferred antisense molecule, H7A(+45+ 67) [SEQ ID NO: 6], and another antisense molecule, H7A (+2+26) [SEQ ID NO: 7], inducing exon 7 skipping. Nested amplification products span exons 3 to 9. Additional products above the induced transcript missing exon 7 arise from amplification from carry-over outer primers from the RT-PCR as well as heteroduplex formation.

Antisense Oligonucleotides Directed at Exon 6

Antisense oligonucleotides directed at exon 6 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above. 25

FIG. 5 shows an example of two non-preferred antisense molecules inducing very low levels of exon 6 skipping in One antisense oligonucleotide that induced very efficient exon 6 skipping in the canine model, C6A(+69+91) [SEQ ID

36

 NO: 14], would anneal perfectly to the corresponding region in human dystrophin exon 6. This compound was evaluated, found to be highly efficient at inducing skipping of that target exon, as shown in FIG. 6 and is regarded as the preferred compound for induced exon 6 skipping. Table 4 below discloses antisense molecule sequences for induced exon 6 skipping.

TABLE 4

cultured human cells. Targeting this exon for specific removal was first undertaken during a study of the canine model using the oligonucleotides as listed in Table 4, below. Some of the human specific oligonucleotides were also evaluated, as shown in FIG. 5. In this example, both antisense molecules target the donor splice site and only induced low levels of exon 6 skipping. Both H6D(+4-21) [SEQ ID NO: 17] and H6D(+18-4) [SEQ ID NO: 18] would be regarded as nonpreferred antisense molecules. Antisense Oligonucleotides Directed at Exon 4

Antisense oligonucleotides directed at exon 4 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

FIG. 7 shows an example of a preferred antisense molecule inducing skipping of exon 4 skipping in cultured human cells. In this example, one preferred antisense compound, H4A(+ 13+32) [SEQ ID NO:19], which targeted a presumed exonic splicing enhancer induced efficient exon skipping at a concentration of 20 nM while other non-preferred antisense oligonucleotides failed to induce even low levels of exon 4 skipping. Another preferred antisense molecule inducing skipping of exon 4 was H4A(+111+40) [SEQ ID NO:22], 5 which induced efficient exon skipping at a concentration of 20 nM.

Table 5 below discloses antisense molecule sequences for inducing exon 4 skipping.

Antisense Oligonucleotides Directed at Exon 3

Antisense oligonucleotides directed at exon 3 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

H3A(+30+60) [SEQ ID NO:23] induced substantial exon 3 skipping when delivered into cells at a concentration of 20 nM to 600 nM. The antisense molecule, H3A(+35+65) [SEQ ID NO: 24] induced exon skipping at 300 nM.

Table 6 below discloses antisense molecule sequences that 35 induce exon 3 skipping.

Antisense Oligonucleotides Directed at Exon 5

Antisense oligonucleotides directed at exon 5 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

H5A(+20+50) [SEQ ID NO:31] induces substantial exon 5 skipping when delivered into cells at a concentration of 100

25 nM. Table 7 below shows other antisense molecules tested. The majority of these antisense molecules were not as effective at exon skipping as H5A(+20+50). However, H5A(+15+ 45) [SEQ ID NO: 40] was able to induce exon 5 skipping at 300 nM.

Table 7 below discloses antisense molecule sequences that induce exon 5 skipping.

Antisense Oligonucleotides Directed at Exon 10

Antisense oligonucleotides directed at exon 10 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described 20 above.

H10A(-05+16) [SEQID NO:41] induced substantial exon 10 skipping when delivered into cells. Table 8 below shows other antisense molecules tested. The antisense molecules ability to induce exon skipping was variable. Table 8 below 25 discloses antisense molecule sequences that induce exon 10 skipping.

Antisense Oligonucleotides Directed at Exon 15

Antisense oligonucleotides directed at exon 15 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described ⁴⁰ above.

H15A(-12+19) [SEQ ID NO:63] and H15A(+48+71) [SEQ ID NO:64] induced substantial exon 15 skipping when delivered into cells at a concentration of 10 Nm, as shown in FIG. 9A. Table 13 below includes other antisense molecules tested at a concentration range of 5, 25, 50, 100, 200 and 300 Nm. These other antisense molecules were unable to induce exon skipping at any of the concentrations tested.

TABLE 13

SEQ ID	Antisense Oligonucleotide name	Sequence	Ability to induce skipping
63	H15A(-12+19)	GCC AUG CAC UAA AAA GGC ACU GCA AGA CAU U	Skipping at 5 Nm
64	H15A (+48+71)	UCU UUA AAG CCA GUU GUG UGA AUC	Skipping at 5 Nm
65	H15A(+08+28)	UTU CUG AAA GCC AUG CAC UAA	No skipping
63	H15A(-12+19)	GCC AUG CAC UAA AAA GGC ACU GCA AGA CAU U	No skipping
66	H15D(+17-08)	GUA CAU ACG GCC AGU UUU UGA AGA C	No skipping

Antisense Oligonucleotides Directed at Exon 16

Antisense oligonucleotides directed at exon 16 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described 5 above.

H16A(-12+19) [SEQ ID NO:67] and H16A(-06+25) [SEQ ID NO:68] induced substantial exon 16 skipping when delivered into cells at a concentration of 10 nM, as shown in FIG. 9B. Table 14 below includes other antisense molecules 10 tested. H16A(-06+19) [SEQ ID NO:69] and H16A(+87+ 109) [SEQ ID NO:70] were tested at a concentration range of 5, 25, 50, 100, 200 and 300 nM. These two antisense molecules were able to induce exon skipping at 25 nM and 100 nM, respectively. Additional antisense molecules were tested 15 at 100, 200 and 300 nM and did not result in any exon skipping.

TABLE 14

nucleotides was more efficient as can be seen in section 4 of FIG. 10 using a "cocktail" of antisense oligonucleotides H20A(+44+71) and H20A(+149+170). When the cocktail was used to target exon 19, skipping was even stronger (see section 5, FIG. 10).

FIG. 11 illustrates gel electrophoresis results of exon 19/20 skipping using "weasels" The "weasels" were effective in skipping exons 19 and 20 at concentrations of 25, 50, 100, 300 and 600 nM. A further "weasel" sequence is shown in the last row of Table 3C. This compound should give good results.

Antisense Oligonucleotides Directed at Exon 20

Antisense oligonucleotides directed at exon 20 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

SEQ ID	Antisense Oligonucleotide name	Sequ	ence	•							inć	lity to luce lpping

Antisense Oligonucleotides Directed at Exon 19

50

Antisense oligonucleotides directed at exon 19 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described 55 above.

H19A(+35+65) [SEQ ID NO:79] induced substantial exon 19 skipping when delivered into cells at a concentration of 10 nM. This antisense molecule also showed very strong exon skipping at concentrations of 25, 50, 100, 300 and 600 nM. 60

FIG. 10 illustrates exon 19 and 20 skipping using a "cocktail" of antisense oligonucleotides, as tested using gel electrophoresis. It is interesting to note that it was not easy to induce exon 20 skipping using single antisense oligonucleotides H20A(+44+71) [SEQ ID NO:81] or H20A(+149+170) 65 [SEQ ID NO:82], as illustrated in sections 2 and 3 of the gel shown in FIG. 10. Whereas, a "cocktail" of antisense oligo-

None of the antisense oligonucleotides tested induced exon 20 skipping when delivered into cells at a concentration of 10, 25, 50, 300 or 600 nM (see Table 15). Antisense molecules H20A(-11+17) [SEQ ID NO:86] and H20D(+08-20) [SEQ ID NO:87] are yet to be tested.

However, a combination or "cocktail" of H20A(+44+71) [SEQ ID NO: 81] and H20(+149+170) [SEQ ID NO:82] in a ratio of 1:1, exhibited very strong exon skipping at a concentration of 100 nM and 600 nM. Further, a combination of antisense molecules H19A(+35+65) [SEQ ID NO:79], H20A (+44+71) [SEQ ID NO:81] and H20A(+149+170) [SEQ ID NO:82] in a ratio of 2:1:1, induced very strong exon skipping at a concentration ranging from 10 nM to 600 nM.

TABLE 15

Antisense Oligonucleotides Directed at Exon 21

Antisense oligonucleotides directed at exon 21 were prepared and tested for their ability to induce exon skipping in ³⁵ human muscle cells using similar methods as described above.

H21A(+85+108) [SEQ ID NO:92] and H21A(+85+106) [SEQ ID NO:91] induced exon 21 skipping when delivered 40 into cells at a concentration of 50 nM. Table 16 below includes other antisense molecules tested at a concentration range of 5, 25, 50, 100, 200 and 300 nM. These antisense molecules showed a variable ability to induce exon skipping

60

Antisense Oligonucleotides Directed at Exon 22

Antisense oligonucleotides directed at exon 22 were prepared and tested for their ability to induce exon skipping in 65 human muscle cells using similar methods as described above. FIG. 12 illustrates differing efficiencies of two antisense molecules directed at exon 22 acceptor splice site. H22A(+ 125+106) [SEQ ID NO:96] and H22A(+80+101) [SEQ ID NO: 98] induce strong exon 22 skipping from 50 nM to 600 nM concentration. 5

H22A(+125+146) [SEQ ID NO:96] and H22A(+80+101) [SEQ ID NO:98] induced exon 22 skipping when delivered into cells at a concentration of 50 nM. Table 17 below shows 10 other antisense molecules tested at a concentration range of 50, 100, 300 and 600 nM. These antisense molecules showed a variable ability to induce exon skipping.

ΤА	BL.	E	17

Antisense Oligonucleotides Directed at Exon 36

35

Antisense oligonucleotides directed at exon 36 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

Antisense molecule H36A(+26+50) [SEQ ID NO:145] 40 induced exon 36 skipping when delivered into cells at a concentration of 300 nM, as shown in FIG. 16.

Antisense Oligonucleotides Directed at Exon 37

Antisense oligonucleotides directed at exon 37 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

FIG. 17 shows differing efficiencies of two antisense molcules directed at exon 37 acceptor splice site. H37A(+82+ 105) [SEQ ID NO:148] and H37A(+134+157) [SEQ ID NO:149] substantially induced exon 37 skipping when delivered into cells at a concentration of 10 nM. Table 31 below shows the antisense molecules tested.

TABLE 31

Antisense Oligonucleotides Directed at Exon 40

Antisense oligonucleotides directed at exon 40 were prepared and tested for their ability to induce exon skipping in 60 human muscle cells using similar methods as described above.

FIG. 19 illustrates antisense molecule H40A(-05+17) [SEQ ID NO:157] directed at exon 40 acceptor splice site. H40A(-05+17) and H40A(+129+153) [SEQ ID NO:158] 65 both substantially induced exon 40 skipping when delivered into cells at a concentration of 5 nM.

50

60

Antisense Oligonucleotides Directed at Exon 42

Antisense oligonucleotides directed at exon 42 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described 5 above.

FIG. 20 illustrates antisense molecule H42A(-04+23) [SEQ ID NO:159], directed at exon 42 acceptor splice site. H42A(-4+23) and H42D(+19-02) [SEQ ID NO:161] both induced exon 42 skipping when delivered into cells at a concentration of 5 nM. Table 34 below shows the antisense molecules tested and their ability to induce exon 42 skipping.

TABLE 34

SEQ ID	afigonucleotide name	Sequence	Ability to induce skipping

161	H42D(+19-02)	A CCU UCA GAG GAC UCC UCU UGC	Skipping to 5 nM

Antisense Oligonucleotides Directed at Exon 43

Antisense oligonucleotides directed at exon 43 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

H43A(+101+120) [SEQ ID NO:163] induced exon 43 $_{35}$ skipping when delivered into cells at a concentration of 25 nM. Table 35 below includes the antisense molecules tested and their ability to induce exon 43 skipping.

	TABL	Æ 35
--	------	------

Antisense Oligonucleotides Directed at Exon 44

Antisense oligonucleotides directed at exon 44 were prepared using similar methods as described above. Testing for the ability of these antisense molecules to induce exon 44 skipping is still in progress. The antisense molecules under review are shown as SEQ ID Nos: 165 to 167 in Table 1A.

Antisense Oligonucleotides Directed at Exon 45

Antisense oligonucleotides directed at exon 45 were prepared using similar methods as described above. Testing for the ability of these antisense molecules to induce exon 45 65 skipping is still in progress. The antisense molecules under review are shown as SEQ ID Nos: 207 to 211 in Table 1A.

Antisense Oligonucleotides Directed at Exon 46

Antisense oligonucleotides directed at exon 46 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described 5 above.

FIG. 21 illustrates the efficiency of one antisense molecule directed at exon 46 acceptor splice site. Antisense oligonucleotide H46A(+86+115) [SEQ ID NO:203] showed very strong ability to induce exon 46 skipping. Table 36 below includes antisense molecules tested. These antisense molecules showed varying ability to induce exon 46 skipping.

TAB	LE	36

SEQ ID	Antisense oligonucleotide name	Sequence	Ability to induce skipping
168	H46D(+16-04)	DUA CCU UGA CUU GCU CAA GC	No skipping

206	H46A(+50+77)	CUG CUU CCU CCA ACC AUA AAA CAA AUU C	Weak skipping

Antisense Oligonucleotides Directed at Exon 47

Antisense oligonucleotides directed at exon 47 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

H47A(+76+100) [SEQ ID NO:170] and H47A(-09+12) [SEQ ID NO:172] both induced exon 47 skipping when delivered into cells at a concentration of 200 nM. H47D(+25-02) [SEQ ID NO: 171] is yet to be prepared and tested.

Antisense Oligonucleotides Directed at Exon 50

Antisense oligonucleotides directed at exon 50 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

Antisense oligonucleotide molecule H50A(+02+30) [SEQ ID NO: 173] was a strong inducer of exon skipping. Further, H50A(+07+33) [SEQ ID NO:174] and H50D(+07-18) [SEQ ID NO:175] both induced exon 50 skipping when delivered into cells at a concentration of 100 nM.

Antisense Oligonucleotides Directed at Exon 51

Antisense oligonucleotides directed at exon 51 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above.

FIG. 22 illustrates differing efficiencies of two antisense molecules directed at exon 51 acceptor splice site. Antisense oligonucleotide H51A(+66+90) [SEQ ID NO:180] showed the stronger ability to induce exon 51 skipping. Table 37 below includes antisense molecules tested at a concentration range of 25, 50, 100, 300 and 600 nM. These antisense molecules showed varying ability to induce exon 51 skipping. The strongest inducers of exon skipping were antisense oligonucleotide H51A(+61+90) [SEQ ID NO: 179] and H51A (+66+95) [SEQ ID NO: 181].

TABLE 37

SEQ ID	Antisense oligonucleotide name	Sequence	Ability to induce skipping

Antisense Oligonucleotides Directed at Exon 52

Antisense oligonucleotides directed at exon 52 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above. 35

FIG. 22 also shows differing efficiencies of four antisense molecules directed at exon 52 acceptor splice site. The most effective antisense oligonucleotide for inducing exon 52 skipping was H52A(+17+37) [SEQ ID NO:188).

Table 38 below shows antisense molecules tested at a con-40 centration range of 50, 100, 300 and 600 nM. These antisense molecules showed varying ability to induce exon 50 skipping. Antisense molecules H52A(+12+41) [SEQ ID NO:187] and H52A(+17+37) [SEQ ID NO:188] showed the strongest exon 50 skipping at a concentration of 50 nM.

Antisense Oligonucleotides Directed at Exon 53 Antisense oligonucleotides directed at exon 53 were prepared and tested for their ability to induce exon skipping in human muscle cells using similar methods as described above. FIG. 22 also shows antisense molecule H53A(+39+69)

[SEQ ID NO:193] directed at exon 53 acceptor splice site. This antisense oligonucleotide was able to induce exon 53 skipping at 5, 100, 300 and 600 nM. A "cocktail" of three exon 53 antisense oligonucleotides: H53A(+23+47) [SEQ ID NO:195], H53A(+150+176) [SEQ ID NO:196] and H53D(+ 14-07) [SEQ ID NO:194], was also tested, as shown in FIG. 20 and exhibited an ability to induce exon skipping.

Table 39 below includes other antisense molecules tested at a concentration range of 50, 100, 300 and 600 nM. These antisense molecules showed varying ability to induce exon 53 skipping. Antisense molecule H53A(+39+69) [SEQ ID NO:193] induced the strongest exon 53 skipping.

TABLE	38

What is claimed is:

1. An antisense oligonucleotide of 30 bases comprising the ³⁵ base sequence CUCCAACAUC AAGGAAGAUG GCAU-UUCUAG (SEQ ID NO: 181), in which the uracil bases are thymine bases, wherein the antisense oligonucleotide is a morpholino antisense oligonucleotide, and wherein the antisense oligonucleotide is chemically linked to a polyethylene ⁴⁰ glycol chain.

2. A pharmaceutical composition comprising an antisense oligonucleotide of 30 bases comprising the base sequence

CUCCAACAUC AAGGAAGAUG GCAUUUCUAG (SEQ ID NO: 181), in which the uracil bases are thymine bases, wherein the antisense oligonucleotide is a morpholino antisense oligonucleotide, and wherein the antisense oligonucleotide is chemically linked to a polyethylene glycol chain, and a pharmaceutically acceptable carrier.

Re: IND 77,427 SN 000 and Fast-Track Designation Request

Dear Dr. Katz:

AVI BioPharma, Inc. (AVI), Portland, OR, is pleased to provide you with an Investigational New Drug Application for the clinical development of AVI-4658, a phosphorodiamidate Morpholino oligomer (PMO) in patients with Duchenne Muscular Dystrophy (DMD) a frame-shift mutation upstream of or just after exon 51. This mutation leads to either a profound reduction or absence of dystrophin in strated and cardiac muscles in DMD patients. Frame-shift mutations in one or more of 12 exons account for \geq 65% of the causes for this disease. Those with deletions of exons 50, 45-50, 48-50, 49-50, 52, and 52-63 could benefit from skipping exon 51, and account for the the majority (~12 to 18%) of all genetic-causes in DMD. A drug able to induce skipping of exon 51 is the initial focus of AVI's experimental therapeutic program to manage this disease.

AVI-4658 has been studied in muscle explants from DMD patients and confirmed to elicit *de novo* dystrophin production in this *ex vivo* model. The ability of other similar PMOs to elicit *de novo* dystrophin production in the *mdx* mouse DMD model and golden retriever and beagle dog models of DMD by a putative exon skipping mechanism have definitively been demonstrated by multiple investigators throughout the world. Therefore, AVI-4658 is a rational target in this DMD patient subpopulation. As you know, DMD is a severely debilitating and lethal disease afflicting males: death typically occurs by the early twenties.

Background

Duchenne Muscular Dystrophy (DMD) is the most common X-linked lethal pediatric disease, worldwide. It is exclusively a human disease without an identical correlate in animals. Dystrophin is a 427 kD protein that is an essential component of the sarcolemma and pivotal for overall striated muscle cell function. A mutation is located in the gene for dystrophin, and causes either nonsense or frame shift errors, resulting in early termination of the protein production pathway. Frame-shift mutations are the predominant cause of DMD, with duplications and a premature stop codon accounting for the remainder. These errors result in early termination of dystrophin production pathway. Frame-shift mutations in one or more of 12 exons account for \geq 65% of the causes for this disease. Those with deletions of exons 50, 45-50, 48-50, 49-50, 52, and 52-63 could benefit from skipping exon 51, and account for the the majority (**Counter**%) of all genetic-causes in DMD. A drug able to induce skipping exon 51 is the initial focus of AVI's experimental therapeutic program to manage this disease.

The consequence of a frame-shift mutation upstream of or just after exon 51 leads to prematurely aborted dystrophin production. This leads to either a profound reduction or absence of dystrophin in.

IND 77, 429 - SN 000

striated and cardiac muscles in DMD patients. The lack of functional dystrophin production leads to membrane leakage and fiber damage, ultimately leading to degeneration and death of the muscle fiber. This occurs despite the fact that there is a corresponding over-production of another plasmamembrane-bound protein (viz., utrophin) that performs similar tasks as dystrophin at the neuromuscular junction. The end result of a frame-shift mutation in exon 51 in the dystrophin gene is the same as all other causes of DMD; muscle wasting, progressive debilitation and early death.

The pathogenesis and natural course of DMD is relevant in rational clinical protocol design to assess potential therapeutically valuable experimental modalities. There is continuous strated muscle injury (inclusive of cardiac muscle cells) due to a lack of functional dystrophin within the sarcolemma. This causes on-going dystrophic charges in muscle cells: fat infiltration, fibrosis and death of affected muscle cells. Once the fatty infiltration has occurred, there is presumptively permanent muscle dysfunction and ultimately muscle wasting. Many early diagnoses of DMD occur in infancy due to the observation of weak neck muscle function. Thereafter, other DMD diagnoses occur because of muscle weakness of the legs and pelvis by the age of 5 years. There is also a relative "honeymoon" period among boys with DMD between early detection of the disease and until 7 years of age due to hypertrophy of viable muscle cells and bellies. It is assumed that this apparent improvement in muscle function relates to the effect of muscle conditioning due to mechanical stress. This phenomenon wanes as greater muscle wasting occurs:

There is eventually a progressive decline in the ability to walk independently, inability to run, difficulty getting out of a chair, and reduced physical stamina. By age 10 years, DMD patients are usually unable to walk well unless supported by braces and by age 12 years most (69%) are confined to a wheelchair: Even the function of hands and fingers is eventually impaired such that the patients are unable to use a 'joy" stick to maneuver their automated wheelchairs or to use other electronic devices. This is a well-recognized major quality of life problem that requires novel approaches to modulate this impairment. By or during the third decade, a fatal outcome will occur as a consequence of respiratory failure unless mechanical ventilation is utilized and/or cardiac causes. In summary, there is progressive muscle wasting in boys with DMD that is manifested over time in incremental muscle function decline. Proper design of clinical trials to provide benefit to the major subgroups of boys with DMD will entail different strategies.

These data provide the scientific basis to use a PMO to target a specific exon in DMD patients with a specific mutation. It may provide benefit by reducing the functional and respiratory decline and early death in this patient population. Ultimately, it may be prudent and therapeutically desired to use a PMO or PMOs to target multiple exons in a single patient, based on their specific genetic deletions. This strategy would set the stage for a personalized therapeutic approach for DMD patients.

The drug, AVI-4658, is a PMO and has a sequence designed to "skip" exon 51, thus theoretically enabling dystrophin production to occur in human striated muscle in DMD patients with a corresponding exon defect. A PMO platform process, in which the arrangement and number of the subunits affixed to the backbone vary, is used to produce AVI-4658. This PMO drug class has been the subject of three successful IND applications in the USA and a series of clinical studies in the United States and EU (see Table 1, below). A total of 19 studies in over 400 subjects have been performed in both healthy and patient populations. In general, this class of drugs has been well-tolerated without evidence of clinically significant toxicity.

FAST-TRACK DESIGNATION REQUEST

In addition to submitting this IND, we are also seeking Fast-Track Designation of AVI-4658 to induce exon skipping patients with due to a frame shift mutation upstream of or just after exon 51 of the dystrophin gene. We believe that AVI-4658 meets the requirements for Fast-Track Designation, as indicated below.

Duchenne Muscular Dystrophy is a Serious Life-Threatening Condition

Duchenne Muscular Dystrophy (DMD) is a devastating X-linked degenerative and lethal muscle disease in males due to mutation(s) of the dystrophin gene. Dystrophin is encoded by the largest gene in the human body. It has a long half-life and is required for proper muscle function. Without dystrophin, the connections between the muscle fibers and cell membrane are not properly aligned. This leads to uncontrolled leakage at the plasma membrane, eventually causing rupture of the muscle cell. Once rupture has occurred, calcium easily enters the muscle cell resulting in contraction, at the damaged sites and continued muscle fiber breakage. As this process is repeated, the muscle deteriorates, eventually becoming fibrotic and replaced by fat.

Therefore, DMD is a serious disease consistent with 21 CFR 312 81(a), in that patients with DMD experience a gradual loss of the ability to move their muscles starting early in life, ultimately resulting in early death. Patients are usually diagnosed between the ages of 2 to 5. By age 12, 69% of DMD patients solely rely on a wheel chair for mobility. There is no cure for DMD and there are no approved treatments to address the underlying cause of DMD at a genetic level. As such, care is palliative in hature, e.g., mechanical ventilation. These patients experience continued decline through their lives; death is usually due to respiratory or cardiac failure.

AVI-4658 is Intended to Treat a Serious Condition

AVI-4658 is to be used only in DMD patients with a mutation at or upstream of exon 51 of the dystrophin gene. The subunit sequence in AVI-4658 has been designed to "bridge" the missing exon (+66+95) thus enabling the mRNA to read the message, resulting in the expression of a truncated, yet functional dystrophin. Multiple animal model studies have shown that RMOs to read the message.

of the AVI-4658 clinical development program is to demonstrate that the induction of exon 51. skipping will allow truncated, yet functional dystrophin to be produced in these DMD patients. Thus, we believe the development program meets the definition of demonstrating "an effect on a serious aspect of the condition."

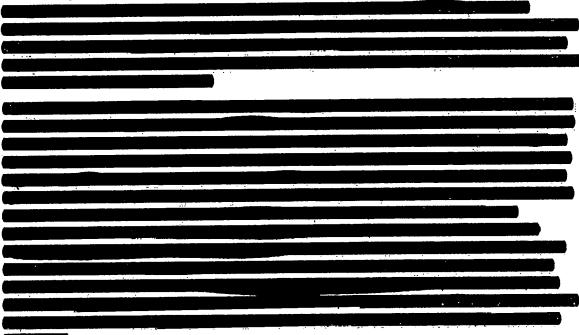

AVI-4658 has the Potential to Address an Unmet Medical Need

Although a variety of disease mitigating modalities have been tried, care remains palliative in nature. There are no therapeutic approaches that address the underlying genetic defect. The current standard of care consists of predhisone (up to 40 mg/day) and physical therapy. Although prednisone aids in addressing the inflammation associated with DMD; it does not ameliorate the continued decline of muscle activity over the course of the patient's life. As the disease progresses, supplemental oxygen and other respiratory treatments, mechanical ventilation, and cardiac therapeutics are required.

A number of approaches have attempted to address correction of the errant gene in DMD through myogenic or stem cell transplant, viral vector delivery of the gene correction, and PTC 124 which is a stop codon drug designed to address nonsense mutation in certain DMD patients. Preclinical research (see below) suggests that a PMO-based exon-skipping approach to DMD has potential to address the fundamental genetic problem of this disease.

AVI-4658 has the Potential to Address DMD

As the understanding of Duchenne Muscular Dystrophy (DMD) has grown, a variety of approaches to therapeutically address the underlying genetic basis for this lethal disease have advanced with technology. This has evolved from the understanding of the dystrophin gene: the concept of exonskipping, the application of antisense compounds to effect an exon skip in cell cultures of muscle explants from DMD patients, proof of concept in animal models of DMD, and finally, to conclusive evidence of the ability of antisense compounds to lead to a robust production of a functional truncated dystrophin.

The *mdx* mouse carries a nonsense mutation in exon 23 of its dystrophin gene. The skipping of this exon restores the reading frame and is associated with functional dystrophin production. The first studies were carried out in cultured myoblasts from the *mdx* mice. Subsequently, antisense compounds were administered intramuscularly to *mdx* mice. This administration was followed by the restoration of dystrophin expression at sarcolemma. A number of different antisense chemistries, including PMOs, have been used in these studies.

More recently, studies have been performed in the *mdx* mouse following the systemic administration of antisense via the intraperitoneal or intravascular route. For example, Alter *et al.*, repeated intravenous administration of a PMO at weekly intervals in the *mdx* mouse, resulting in dystrophin expression in dystrophin-deficient skeletal muscles and improvement in muscle function without

IND 77,429 - SN 000

evidence of adverse experiences. Intravenous administration of 20Me antisense targeting the abnormal exon 23 in this mdx mouse model has resulted in dystrophin-deficient muscle fibers maintaining dystrophin expression for at least 2 months after the last dose of drug administration. However the longevity of de novo dystrophin production was significantly improved following the administration of a PMO when compared to a 20Me-based antisense, with levels of expression that only start to decline after 14 weeks following a single intramuscular injection. A recent study reported similar results of antisense directed exon skipping to induce dystrophin expression in cultured myoblast cultures in a canine model of DMD (viz., golden retriever muscular dystrophy [GRMD]). Unlike the mdx mouse, which develops only limited weakness and does not die from the consequences of limited muscle weakness, GRMD dogs suffer a rapidly accelerated death due to muscle wasting with eventual fibrosis, contractures and weakness in all muscle groups. This DMD dog model is dinically more similar to DMD although there are a minimum of three defect dystrophin exons to account for this disease. In these experiments, relevant exon skips were followed by expression of dystrophin protein. Immunohistochemistry techniques were used to confirm dystrophin localized within the sarcolemma. Table 2 summarizes the results of these various published preclinical studies.

Page 5 of 7

IND 77, 429 - SN 000

In summary, it has been established in primary cell cultures both from animal models and DMD patients that antisense administration is effective at promoting exon skipping, resulting in significant *de novo* dystrophin production that is correctly localized at the sarcolemma. The efficacy by local and systemic delivery has been established in the *mdx* mouse including significant functional improvement of previously diseased affected muscle groups. The evidence from the preclinical studies suggests that the CTC CAA CAT CAA GGA AGA TGG CAT TTC TAG sequence (which targets nucleotides +66+95 of the dystrophin gene and is the sequence of AVI-4658), is a good choice for effectively skipping exon 51.

Experiments performed by groups in the United Kingdom and Australia comparing the relative efficacy of the 20Me modified phosphorothioate and PMO have been performed in cultured cells, and *in vivo* in a transgenic mouse model. The results of these experiments clearly indicate that the PMO was significantly more potent than the 20Me modified phosphorothioate antisense chemistry.

REMOVE FULL CLINICAL HOLD

AVI Biopharma Attention: Jacqueline A. Dombroski, Ph.D. Vice President, Regulatory Affairs and Quality Assurance 3450 Monte Villa Parkway Bothell, WA 98021

Dear Dr. Dombroski:

Please refer to your Investigational New Drug Application (IND) submitted under section 505(i) of the Federal Food, Drug, and Cosmetic Act for AVI-4658.

We also refer to your amendment dated May 21, 2010 which provide a complete response to our January 29, 2008, letter which cited the reasons for placing this IND on clinical hold and the information needed to resolve the clinical hold issues.

We have completed the review of your submission, and have concluded that your clinical trial may be initiated.

A letter providing non-hold comments and recommendations, regarding your study protocol, will follow in a separate communication.

As sponsor of this IND, you are responsible for compliance with the Federal Food, Drug, and Cosmetic Act and the implementing regulations (Title 21 of the Code of Federal Regulations).

Those responsibilities include (1) reporting any unexpected fatal or life-threatening adverse experience associated with use of the drug by telephone or fax no later than 7 calendar days after initial receipt of the information [21 CFR 312.32(c)(2)]; (2) reporting any adverse experience associated with use of the drug that is both serious and unexpected in writing no later than 15 calendar days after initial receipt of the information [21 CFR 312.32(c)(1)]; and (3) submitting annual progress reports [21 CFR 312.33].

In re patent of Stephen Donald Wilton et al. USP 9,081,368 B2 Approved Product: EXONDYS 51[™] (eteplirsen) Application for Patent Term Extension Customer No. 123147

26 June 2015

Product:

Billy Dunn, MD Director, Division of Neurology Drug Products, ODE I Food and Drug Administration Center for Drug Evaluation and Research Central Document Room 5901-B Ammendale Road Beltsville, MD 20705-1266

NDA-Number: NDA 206488 EXONDYS 51[™] (eteplirsen) Injection EXONDYS 51[™] is an exon skipping phosphorodiamidate **Proposed Indication:** morpholino oligomer (PMO) which restores the mRNA reading frame to produce dystrophin protein and is indicated for the treatment of Duchenne muscular dystrophy (DMD) in patients who have a confirmed mutation of the DMD gene that is amenable to exon 51 skipping. This indication is approved on an intermediate endpoint demonstrating delayed disease progression as measured by the 6 minute walk test. Continued benefit will be evaluated through confirmatory trials.

NDA Sequence Number: 0001

FINAL SUBMISSION OF ROLLING NDA Subject:

For the Attention of Fannie Choy, RPh, Regulatory Project Manager

Dear Dr. Dunn,

Pursuant to 21 CFR 314.50, Sarepta Therapeutics, Inc., (Sarepta) is submitting a New Drug Application for EXONDYS 51[™] (eteplirsen) Injection. The active pharmaceutical ingredient of EXONDYS 51 Injection is eteplirsen, an exon skipping phosphorodiamidate morpholino oligomer which restores the mRNA reading frame to induce the production of dystrophin protein.

An application for Priority Review Designation (Module 1.2) is included as part of this NDA submission. Investigation of eteplirsen (code name: AVI-4658) for DMD was designated as a Fast Track development program on 27 November 2007.

> 617.274.4000 215 First Street, Cambridge, MA 92142 SAREPTA COM

As agreed by Sarepta and the Division at the 19 May 2015 Type B pre-NDA meeting (Memorandum of Meeting Minutes dated 09 June 2015, Reference ID 3776938), this NDA is being submitted for rolling review; this submission provides the complete clinical content contained in Modules 2 and 5. Sequence No. 0000, dated 20 May 2015, contained the complete nonclinical and chemistry, manufacturing and controls content. This submission therefore completes the NDA.

As requested by the FDA at the meeting, we plan to amend this NDA

The Division agreed

that these items of data are not necessary for filing this NDA, but should be submitted as available.

The additional clinical items will be submitted on the following schedule:

NDA Amendment	Approximate Submission Date

Table 1:Planned Amendments to NDA 206,488

This NDA also contains reviewer's guides for the following topics:

- Clinical information
- Nonclinical information
- Chemistry, manufacturing, and controls information

As discussed at the pre-NDA meeting, we also plan to hold an orientation meeting with the Agency to facilitate navigation of the NDA contents in the second second

In parallel with this eCTD submission, we are sending an external hard drive containing as

requested at the 18 September 2014 Type B pre-NDA meeting (Memorandum of Meeting Minutes dated 20 October 2014, Reference ID 3645985). The drive is navigable via a hyperlinked table of contents, contained on the drive in both PDF and Excel format. The drive also contains a reviewer's guide for

Please do not hesitate to contact me by telephone at the submission of by electronic mail at the submission of the by telephone at the submission of the external drive, please contact the by telephone at the submission of by electronic mail at

Yours sincerely,

2

PRIORITY REVIEW DESIGNATION

Sarepta Therapeutics, Inc. Attention: Shamim Ruff, MSc. Vice President, Regulatory Affairs and Quality 215 First Street, Suite 415 Cambridge, MA 02142

Dear Ms. Ruff:

Please refer to your New Drug Application (NDA) dated June 26, 2015, received June 26, 2015, submitted under section 505(b) of the Federal Food, Drug, and Cosmetic Act (FDCA), for Exondys 51 (eteplirsen) injection, 50 mg/mL.

We also refer to your submissions dated June 25, 2015, July 13, 2015, July 24, 2015, and July 31, 2015.

We have completed our filing review and have determined that your application is sufficiently complete to permit a substantive review. Therefore, this application is considered filed 60 days after the date we received your application in accordance with 21 CFR 314.101(a). The review classification for this application is **Priority**. Therefore, the user fee goal date is February 26, 2016.

We are reviewing your application according to the processes described in the Guidance for Review Staff and Industry: Good Review Management Principles and Practices for PDUFA Products. Therefore, we have established internal review timelines as described in the guidance, which includes the timeframes for FDA internal milestone meetings (e.g., filing, planning, mid-cycle, team and wrap-up meetings). Please be aware that the timelines described in the guidance are flexible and subject to change based on workload and other potential review issues (e.g., submission of amendments). We will inform you of any necessary information requests or status updates following the milestone meetings or at other times, as needed, during the process. If major deficiencies are not identified during the review, we plan to communicate proposed labeling and, if necessary, any postmarketing requirement/commitment requests by January 25, 2016.

While conducting our filing review, we identified potential review issues that were communicated to you on August 6, 2015, by email.

NDA 206488 Page 2

If you have any questions, contact Fannie Choy, Regulatory Project Manager, by phone or email at (301) 796-2899 or <u>fannie.choy@fda.hhs.gov</u>.

Sincerely,
