(Received March 12, 2008; Accepted September 29, 2009)

**ABSTRACT.** A revision of *Clematis* (Ranunculaceae) in Taiwan is presented. Two new taxa, *C. chinensis* var. *tatushanensis* and *C. tashiroi* var. *huangii*, are described and a new distributional record for the Taiwan flora, *C. pseudootophora*, is reported. A key to the species of *Clematis* in Taiwan, distribution maps and taxonomic descriptions of the new taxa (including *C. chinensis* var. *chinensis* and *C. tashiroi* var. *tashiroi*) are also provided.

**Keywords:** *Clematis*; *Clematis chinensis* var. *tatushanensis*; *C. pseudootophora*; *C. tashiroi* var. *huangii*; Key; Ranunculaceae; Taxonomy; Taiwan.

## INTRODUCTION

*Clematis* is one of the largest genera in the Ranunculaceae. It is distinguished from other genera by the opposite leaves and usually viney habit (Chang et al., 1980; Tamura, 1995; Yang et al., 1996; Wang and Bartholomew, 2001). According to Liu and Hsieh (1976), Yang and Huang (1986, 1992, 1995), Yang et al. (1991, 1996) and Wang and Xie (2007), there are 20 taxa (including 15 species, 2 subspecies, and 3 varieties) in Taiwan.

This paper presents a revision of the genus *Clematis* in Taiwan. Two new taxa, *C. chinensis* var. *tatushanensis* and *C. tashiroi* var. *huangii*, are described and a new distributional record for the Taiwan flora, *C. pseudootophora*, is presented.

*Clematis chinensis* var. *chinensis*, usually found below 1,000 m throughout the island, has 5-leaflets. The new variety, *C. chinensis* var. *tatushanensis*, with 7, 9, 11, 15

or more leaflets, is found only below 500 m in the central part of the western Taiwan.

*Clematis tashiroi* var. *tashiroi* has dark purple flowers, while the new variety *C. tashiroi* var. *huangii* has yellow flowers. The latter variety was named as a cultivar, i.e. *C. tashiroi* ‘Yellow Flower’, by Lu et al. (2001).

*Clematis pseudootophora* was found in Ssuyuan Saddle area and is a new record for Taiwan. Formerly, *C. pseudootophora* was known to occur in central and eastern China (Provs. Guizhou, Hunan, Hubei, Jiangxi, Zhejiang and Fujian).

To account for these new additions to the flora of Taiwan, a key to all taxa of *Clematis* on this island (23 taxa, i.e. 16 species, 2 subspecies and 5 varieties) and their synonyms, as well as line drawings, color photographs, distribution maps and taxonomic descriptions of the new taxa (*C. chinensis* var. *chinensis* and *C. tashiroi* var. *tashiroi*) are also provided.

## Key to taxa of *Clematis* in Taiwan

1. Erect shrubs
  2. Leaflets more than 70 mm long; flowers pink ..... 14. *C. psilandra*
  2. Leaflets less than 35 mm long; flowers purple or blue ..... 18. *C. tsugetorum*

\*Corresponding authors: E-mail: aleck@mail.nmns.edu.tw.

1. Climbing vines
3. Leaves simple or ternately compound
4. Sepals spreading; stamens glabrous
5. Sepals more than 10 mm wide; achenes glabrous..... 11. *C. montana*
5. Sepals less than 8 mm wide; achenes pubescent
6. Leaflets less than 23 mm wide, narrowly ovate or narrowly oblong..... 4. *C. formosana*
6. Leaflets more than 25 mm wide, ovate or broadly ovate
7. Leaflets entire, unlobed, glabrous on both sides
8. Filaments curved ..... 3. *C. crassifolia*
8. Filaments smooth, straight..... 10. *C. meyeniana*
4. Sepals erect; stamens pubescent
9. Leaves simple ..... 7a. *C. henryi* var. *henryi*
9. Leaves ternately compound
10. Leaflets pubescent; flowers golden ..... 9. *C. leschenaultiana*
10. Leaflets glabrous; flowers white or yellow
11. Petioles connate at base and expanded; flowers yellow ..... 13. *C. pseudootophora*
11. Petioles free, not connate; flowers white ..... 7b. *C. henryi* var. *morii*
3. Leaves pinnately or biternately compound
12. Sepals (5-) 6 or more
13. Terminal leaflets less than 60 mm long; flowers pale pink ..... 1. *C. akoensis*
13. Terminal leaflets more than 70 mm long; flowers dark purple or yellow
14. Flowers dark purple..... 16a. *C. tashiroi* var. *tashiroi*
14. Flowers yellow ..... 16b. *C. tashiroi* var. *huangii*
12. Sepals 4
15. Leaflet margins serrate
16. Sepals erect; stamens pubescent ..... 8. *C. lasiandra*
16. Sepals spreading; stamens glabrous
17. Petioles joined at base and widely expanded
18. Flowers dark purple ..... 16a. *C. tashiroi* var. *tashiroi*
18. Flowers yellow ..... 16b. *C. tashiroi* var. *huangii*
17. Petioles free
19. Flowers c. 28-45 mm in diam., white ..... 12. *C. parviloba* ssp. *bartlettii*
19. Flowers c. 15-25 mm in diam., creamy ..... 6. *C. grata*
15. Leaflet margins entire
20. Flowers creamy; petioles stipulate ..... 5. *C. gouriana* ssp. *lishanensis*
20. Flowers white; petioles estipulate
21. Petiolules articulate; leaves coriaceous
22. Ovaries glabrous; fruits glabrous ..... 19a. *C. uncinata* var. *uncinata*
22. Ovaries pubescent; fruits pubescent ..... 19b. *C. uncinata* var. *okinawensis*
21. Petiolules not articulate; leaves chartaceous or subcoriaceous
23. Leaflets 5, rarely 7 or more
24. Ratios between length and width of leaflets 1.2-1.8 ..... 17. *C. terniflora* var. *garanbiensis*
24. Ratios between length and width of leaflets 2.0-3.2 ..... 2a. *C. chinensis* var. *chinensis*
23. Leaflets 7, 9, 15 or more
25. Ratios between length and width of leaflets 3.0-4.4 ..... 15. *C. tamurae*
25. Ratios between length and width of leaflets 1.5-2.3 ..... 2b. *C. chinensis* var. *tatushanensis*

## 2a. var. *chinensis* 威靈仙

Vines, scandent, perennial herbaceous. Stem and leaves green when fresh, turning black when dry. Stem sulcate, sparsely pubescent or glabrous. Leaves pinnately compound, chartaceous; petioles tendril-late, 30–65 mm long; stipules absent. Leaflets 5, (34-)42–65(-85) mm long, (8-)13–35(-56) mm wide, narrowly ovate or ovate-lanceolate, base obtuse, cuneate or cordate; rarely lobed, margin entire, apex acuminate; glabrous on both surfaces or sparsely pubescent on adaxial surface; main veins 3 to 5, adaxial nerves flat or sunken, abaxial nerves elevated; petiolulate. Inflorescence cymes, axillary or terminal; peduncles pubescent, trichotomously branched; bracts and bracteoles elliptic or oblong-lanceolate, adaxially sparsely pubescent or glabrous; abaxially densely pubescent. Flowers 10–22 mm in diam., spreading. Sepals white, 4, 5–12 mm long, 2–3 mm wide, elliptic to oblong, base cuneate, apex obtuse, mucronulate, glabrous or nearly so inside, densely velutinous outside. Stamens numerous, 4–8 mm long, glabrous, centripetal; anthers narrowly elliptic or linear, longitudinally dehiscent, 1.0–1.5 mm long; connective shortly excurrent beyond or equalling

pollen sacs; filaments linear, flat. Carpels numerous, white sericeous. Fruits 25–40 mm long; achenes 3.5–5.5 mm long, orbicular or broadly ovate, compressed laterally, dark brown with pale yellow velutinous hairs; style persistent, elongating and caudate after anthesis, with pale yellow hairs.

*Distribution.* Widely distributed in mainland China (Provs. Anhui, Fujian, Jiangxi, Henan, Hubei, Hunan, Guangdong, Guangxi, Sichuan, Guizhou, Yunnan, Shaanxi, Hong Kong), Taiwan, and northern Vietnam. In Taiwan growing throughout open lands and at forest margins; 500 to 1,800 m.

**2b. var. tatushanensis** T.Y.A. Yang, var. nov.—TYPE: TAIWAN. Taichung Hsien, Tachia Township, Mt. Tiechanshan, alt. 185 m, 5 June 2004, T.Y.A. Yang, Y.C. Chang & T.H. Wang 16659 (holotype: TNM; isotypes: A, BM, E, HAST, K, L, LE, MO, P, PE, TAI, TAIF, TI, TNM, TNS). 大肚山威靈仙 (新擬) Figures 1 & 4A

*A var. chinensi foliis pinnatis vel bipinnatis 7-9-11-15-foliolatis, ovatis vel ellipticis, fructu aureo-volutino differt.*

Leaves pinnately to bipinnately compound, chartaceous; petioles tendril-like, 25-70 mm long; leaflets (5)-7-9-11-(15 or more), (27)-36-57(-70) mm long, (12)-19-30(-41) mm wide, ovate to elliptic; sometimes lobed. Flowers 15-25 mm in diam. Sepals 4, white, spreading, 7-12 mm long, 2.5-5 mm wide. Stamens

**Figure 1.** Latitudinal and altitudinal distributions of *Clematis chinensis* var. *tatushanensis* (circles) and *Clematis tashiroi* var. *huangii* (squares).

numerous, 3.5-8 mm long, anthers 1.8-2.5 mm long. Fruits 25-45 mm long; achenes 4-5 mm long, dark brown, yellow or pale golden velutinous; style persistent, elongating and caudate after anthesis, with yellow or pale golden hairs.

**Distribution.** Endemic to Taiwan. Open land or forest margins; below 500 m in western Taiwan; now only in Hsinchu and Taichung counties.

**Additional specimens examined.** TAIWAN. HSINCHU HSIEN: Chupei Township, Hsienchiaoshih, 9 May 1998, Li 567 (TNM), 14 May 1995, Yang et al. 6233 (TNM). TAICHUNG CITY: Situn District, Taichung Metropolitan Park, 7 June 2004, Yang & Wu 16661 (TNM). TAICHUNG HSIEN: Chinshuei Township, Mt. Tatushan, Temple Nanshansi, 21 Dec 1984, Yang 937 (TNM), 20 Apr 1985, Yang & Hsu 1784 (TNM); Longchin Township, Mt. Tatushan, 16 June 1985, Yang & Hsu 2231 (TNM), 10 Sep 1985, Yang & Li 2515 (TNM), 18 June 1985, Yang 2232, 3042 (TNM), 31 May 1986, Yang 3038 (F.S. Hsu & Yu collected) (TNM); Shihkang Township, Lu 25538 (TAIF); Tachia Township, Mt. Tiechanshan, 5 June 2004, Yang et al. 16660 (TNM); Tatu Township, 4 Sep 1987, Yang 3719 (TNM).

I collected sterile materials of *Clematis chinensis* var. *tatushanensis* for the first time in December 1984 (Yang 937, TNM). Flowering specimens were available in 1985. I noted its resemblance to *C. chinensis* var. *chinensis*, but the leaflet number, 7-11 or more, is different from the latter. Since then, I found more populations of this new taxon. They have the same characters of pinnately to bipinnately compound leaves with elliptic leaflets. They also have fruit tails with golden bearded hairs and are readily distinguishable from *C. chinensis* var. *chinensis*. In addition, foliage of *C. chinensis* var. *chinensis* usually turns black when dried but that of the new taxon does not always turn black.

*Clematis szuyuanensis* T.Y.A. Yang, in scheda; TNM!

Vines, perennial, scandent, evergreen, woody. Stem sulcate, nearly glabrous. Leaves ternately compound, chartaceous; petioles tendril-like, 48-115 mm long, base connate and expanded. Leaflets 3, sometimes simple, (52-)65-88(-102) mm long, (13-)19-32(-41) mm wide, oblong, elliptic-lanceolate, narrowly ovate or ovate; base acute, obtuse or cordate, oblique usually on lateral segments, unlobed sometimes 3-lobed, margin serrate or entire, apex acuminate or acute, both surfaces glabrous or nearly so; main veins 3, adaxial nerves flat or sunken, abaxial nerves elevated; petiolule tendril-like. Flowers solitary or sometimes in cymules, 15-30 mm in diam., campanulate, pendent, both axillary and terminal; pedicels 22-61 mm long, glabrous or nearly so, trichotomously branched; bracts and bracteoles subulate or lanceolate, glabrous or nearly so on both sides. Sepals 4, pale yellow to yellow, 18-27 mm long, 6-8 mm wide, elliptic, oblong or ovate-oblong, base cuneate, apex acute, recurved at the tip; both surfaces glabrous except abaxial surface distally and adaxially margin velutinous. Stamens numerous, 10-16 mm long, pubescent; filaments widely linear, sparsely pubescent; anthers linear, dehiscence lateral and longitudinal, pubescent; connective excurrent beyond pollen sacs, 1 mm long, pubescent. Carpels numerous, sericeous. Fruits 45-65 mm long; achenes 3-5 mm long, obovate or narrowly obovate, convex or flat, yellowish brown or reddish brown, yellow velutinous; styles persistent, elongating and tail-like after anthesis, with pale yellow or yellow bearded hairs.

*Distribution.* Mainland China (Guizhou, Hunan, Hubei, Jiangxi, Zhejiang, Fujian) and Taiwan. In Taiwan found only at forest margins between 1,600 and 1,900 m in Ssuyuan Saddle area.

#### 16a. var. *tashiroi* 田代氏鐵線蓮 (琉球鐵線蓮)

Vines, perennial, scandent, woody. Stems green, sulcate, sparsely pubescent, glabrous at maturity. Leaves ternately or pinnately compound, subcoriaceous or chartaceous; petioles tendril-like, 52-94 mm long, joined at base and widely expanded; stipules absent. Leaflets 3 to 5, (43-)64-142(-225) mm long, (31-)45-84(-125) mm wide, cordate or ovate, base cordate, unlobe, margin sparsely serrulate, rarely entire, apex acuminate; both surfaces glabrous; main veins 5, adaxial nerves flat or sunken, abaxial nerves elevated; petiolulate. Inflorescence dichasia or cymes, axillary; peduncles glabrous, trichotomously branched; bracts and bracteoles elliptic-lanceolate or subulate, subcoriaceous, abaxially sparsely velutinous, adaxially glabrous. Flowers 30-50 mm in diam. Sepals 5-6, sometimes 4 or more than 6, dark purple, spreading, 18-30 mm long, 4-8 mm wide, oblong-lanceolate, base cuneate, apex acute; inside glabrous and outside densely velutinous. Stamens numerous, glabrous, centripetal, inner ones shortest 6-8 mm long, outer ones 15-22 mm long; filaments linear, flat; anthers narrowly elliptic or linear, dehiscence lateral and longitudinal; connective long excurrent beyond pollen sacs, 0.6-2 mm long. Carpels numerous, white sericeous. Fruits 46-74 mm long; achenes 6-8 mm long, narrowly ovoid or ellipsoid, compressed laterally, dark brown, sparsely velutinous; style persistent and elongating and caudate after anthesis, with white or pale yellow hairs.

*Distribution.* Taiwan and the Ryukyu Islands. In Taiwan, widely distributed from low to middle altitudes (50-2,800 m), around beaches, streamsides, in open land and forest margins.

*Additional specimens examined.* TAIWAN. TAIPEI CITY: Shihlin District, Chihsinshan, Shimada s.n., Sep 1916 (TAI). **16b. var. *huangii*** T.Y.A. Yang, var. nov. —TYPE: TAIWAN. Nantou Hsien, Lugu Township, on the way of Shanlinhsi (“Sun Link Sea”), between Chinese Zodiacial Signs “Ox” and “Tiger”, alt. 1,139 m., 3 Oct 2008, T.Y.A. Yang & S.C. Chen 20936 (holotype: TNM, isotypes: A, E, HAST, K, MO, P, PE, TAI, TAIF, TNM, TNS). 黃氏鐵線蓮 (新擬)

Figures 1 & 4C

A var. tashiroi calyce vitellino differt. Clematis tashiroi var. *huangii* differs from the typical varietyin having yellow calyx.

Leaves pinnately compound, subcoriaceous or chartaceous; petioles tendril-like, joined at base and widely expanded; leaflets 5. Inflorescence dichasia or cymes. Flowers 30-50 mm in diam. Sepals 4-6, sometimes more, yellow, turning brown or dark brown when dry, spreading; stamens glabrous; carpels white sericeous.

*Distribution.* Endemic to central and southern Taiwan, narrowly distributed in open land and at forest margins; 1,000-2,000 m.

*Additional specimen examined.* TAIWAN. NANTOU HSIEN: Lugu Township, Shanlinhsi, T.W. Hsu 14477 (TAIE). KAOHSIUNG HSIEN: Taoyuan Township, Prov. #20 Highway (cult. at Taipei Botanical Garden), Lu 25638 (TAIF). TAITUNG HSIEN: Haituan Township, Prov. #20 Highway, B. & S. Wynn-Jones 1423 (TNM). Fruiting material, collected at the same plant of holotype, 9 Dec 2008, Yang *et al.* 21190 (TNM).

Although var. *huangii* was published as a new cultivar (Lu *et al.*, 2001), it is found frequently in the field in Taiwan. I therefore propose it formally at the variety level. The varietal epithet commemorates Prof. Dr. T.C. Huang (TAI) in honor of his lifetime study of the flora of Taiwan.
