fringe-toed lizards.”⁵⁰ The authors of the biological report further state that “loss of occupied breeding and foraging habitat is considered to be a significant impact if left unmitigated since this habitat is declining in availability in the region.”⁵¹

Resolving this issue might be relatively straightforward if purchasing compensatory replacement habitat was all that was necessary. However, the issue is compounded because there will be significant indirect impacts to fringe-toed lizard habitat beyond the area of disturbance. As stated in the biological report:

“The installation of wind fencing is likely to disrupt source sand, wind transport, or sand transport corridors that are important to MFTL habitat in the dune ecosystem, resulting in an indirect impact to the species. In addition, the potential degradation or loss of habitat resulting from indirect impacts to this species would be significant if left unmitigated because similar or higher quality habitat is not common in the vicinity of the Project site. These indirect impacts would potentially impact offsite MFTL breeding habitat or burrows and adjacent foraging habitat.”⁵²

The SA/DEIS goes even further by concluding that these indirect impacts caused by the PSPP cannot be mitigated.⁵³

The level of impacts to the habitat of the MFTL is not known. No formal study of sand transport in the region around the BRSA has been conducted and, apparently, none are planned. (The *Aeolian Sand Mitigation Summary Report* prepared by Miles Kenney is completely inadequate. It is a crude estimate of what might happen and how the issue might possibly be resolved and is based on observations from completely different environments.⁵⁴) That there will be adverse impacts is not in dispute. When I visited the site on June 18, 2010, I found suitable MFTL habitat along most of the northern boundary of the disturbance area as well as the entire eastern boundary. This assessment supports the continuity of habitat suitability shown in Figure 11 of Dr. Kenney’s report.⁵⁵ It would appear that indirect impacts to MFTL habitat offsite could be substantial. Mitigation, therefore, would need to offset not just the loss of MFTL within the disturbance area but also large tracts of land along the northern and eastern boundaries of the project site.

⁵⁴ Aeolian Sand Mitigation Summary Report, Palen Solar Power Project prepared by Miles D. Kenney and dated May 14, 2010.

⁵⁵ Palen Solar Power Project Biological Technical Report, Riverside Co., CA, August, 2009, Figure 11.

Mitigation for Impacts to MFTL Habitat

In an attempt to mimic the natural movement of blowsand after construction of the PSPP, the Applicant proposes to mechanically transport wind-deposited sand along the 30-foot-tall fence at the northern and western edges of the PSPP site downwind to the eastern edge of the site.⁵⁶ The wind would then blow the mechanically deposited sand deeper into the Chuckwalla Valley. The assumption is that a constant supply of sand to the east of the Project site will maintain suitable habitat for populations the MFTL offsite. The mechanical movement of sand and grading of offsite habitat would be done on a “frequent” basis and for the life of the project.⁵⁷

6-196

The frequent use of heavy equipment to accomplish this task notwithstanding, the plan is, at best, an experiment. As stated in the sand mitigation report, previous studies involved “agricultural regions” and “shoreline beaches.”⁵⁸ No mention is made of projects in desert environments. This fact along with the lack of any comprehensive study of wind patterns in the Chuckwalla Valley, make any sand replenishment program very risky for the continued, offsite existence of the MFTL. The Applicant apparently desires that the PSPP be allowed to proceed in the hope that the sand program will work and that dune and hummock habitat to the east will not stabilize.

Realistically, there seem two viable alternatives that can resolve the issue of offsite damage to MFTL habitat: (1) Scale back the project footprint so the project does not intrude upon MFTL habitat. This would also reduce if not eliminate the project acting as an impediment to wind-carried sand, or (2) Acquire approximately 4,000 acres of privately held active dune and hummock habitat offsite. This acreage reflects the direct loss of aeolian habitat within the site boundaries as well as a comparable area of offsite habitat. As with the desert tortoise, suitable habitat (occupied by MFTL and connected or nearly connected to other habitat areas known to be occupied), would need to be located and willing sellers identified.

6-197

The Project Applicant is already faced with the acquisition of up to 19,729 acres as mitigation for impacts to the desert tortoise. The acquisition of another 4,000 acres of habitat as mitigation to impacts to MFTL cannot be piggy-backed onto tortoise mitigation. The lizard lives on a loose, unconsolidated sand substrate. The tortoise resides on compact soils that will not collapse as a tortoise digs its burrow. In both cases suitable habitat available for sale has not been identified. (A letter prepared by William Graham stating that there are thousands of acres of suitable MFTL habitat for acquisition is of no value since it is not known if the habitat is occupied by MFTL, possesses similar

functions and values offered by the habitat present onsite, or even if the land is available for sale.⁵⁹⁾

↑6-198
| cont.

A reduced footprint alternative to the Applicant’s proposal is described in the *Staff Assessment and Draft Environmental Impact Statement*.⁶⁰ Referred to as the “Reduced Acreage Alternative,” this alternative plan would dramatically reduce impacts to the MFTL and its habitat. It pulls most site development to the south and west, avoiding the primary aeolian deposits shown to support a population of the MFTL. It would, of course, substantially reduce or even eliminate the need to acquire compensatory mitigation habitat elsewhere.

| 6-199

SENSITIVE SPECIES – Plant Species

Ribbed Cryptantha and Harwood’s Milkvetch

Based upon the data presented in the BRTR⁶¹ and 2010 Plant Survey Results⁶² there will be significant impacts to the ribbed cryptantha and Harwood’s milkvetch. Both of these species are closely associated with the areas of loose sand that dominate the northeastern half of the project site. Both of these are considered sensitive species and require mitigation under CEQA. The arguments against relying upon the experimental sand replenishment program as mitigation in favor of the Reduced Acreage Alternative apply both to these two sensitive plant species as well as to the MFTL.

| 6-200

Coachella Valley Milk Vetch

After examining three freckled milkvetch subspecies from the project region, Mr. Andy Sanders decided that they were not the Coachella Valley milkvetch subspecies that has been listed as endangered by the USFWS. Participating agencies, therefore, elected to not conduct focused surveys for the Coachella Valley milkvetch in 2010. This decision was in error. The specimens examined by Mr. Sanders did not come from the PSPP site and Mr. Sanders acknowledged that additional examination might result in him changing his finding.⁶³ Furthermore, although Mr. Sanders is an excellent field taxonomist, he has never published a peer-reviewed taxonomy paper on the Coachella Valley milkvetch. His opinion is helpful but not definitive. Electing to not do a focused survey for an endangered plant species based upon such limited information is a serious oversight that must be corrected.

⁶² Preliminary Spring 2010 Survey Results Corrected and Preliminary Impact Calculations for Biological Resources, dated May 27, 2010.

⁶³ Ibid., p. 8.

Sensitive Plant Surveys in Fall

There are several sensitive ephemeral plant species surveys that appear only in late summer and fall and that may occur on the PSPP site. To date there have been no fall plant surveys. Since impacts to sensitive plant species are considered significant under CEQA, an attempt should be made to conduct such surveys. Until such an attempt has been made, the SA/DEIS is incomplete.

6-202

IMPACTS TO DESERT DRY WASH WOODLAND

The Project Applicant proposes to eliminate 256.7 acres of sensitive Dry Wash habitat including 133.1 acres of a sensitive plant community referred to as Desert Dry Wash Woodland.⁶⁴

6-203

My site visit on June 18, 2010, indicated that a number of ancient ironwood trees (*Olneya tesota*) are located within Desert Dry Wash Woodland habitat within the project boundaries. Some of these trees are likely to be hundreds of years old, and a few might have an age exceeding 1,000 years. A survey should be conducted to determine whether or not such ancient trees are present. If they are, they should be preserved in place.

The Desert Dry Wash Woodland present on the PSPP site is certainly among the densest stand of ironwood trees in California. In size and density it may also be the finest example of Desert Dry Wash Woodland dominated by ironwood anywhere in the California Deserts. The possible uniqueness of this stand may be a result of an unusually large watershed as a result of (1) the concentrating of flows from the Chuckwalla Mountains to the south via a few freeway culverts, (2) the expanse of the Chuckwalla Mountains themselves (probably the largest isolated drainage in the Colorado Desert), and (3) rapidly leveling topography north of Interstate 10 that allows runoff to spread over a large area near the center of the PSPP site, and (4) a near absence of competitors in the form of blue palo verde (*Cercidium floridum*) and smoke trees (*Psoralea argophylla*). Some effort should be made to determine the significance of the site ironwood forest with respect to other areas of ironwood concentration. If it is found to be truly unique, then it should be preserved on site since there could be no comparable compensatory mitigation lands.

6-204

If it is determined that impacts to the Dry Wash and Desert Dry Wash Woodland communities must be mitigated to a level of insignificance through the acquisition of replacement habitat, the ratio should be the maximum allowed under existing rules and regulations. The mitigation measure must also include specific performance standards, such as no net loss of habitat function and value, to ensure the replacement habitat actually mitigates the loss of the Desert Dry Wash Woodland onsite.

6-205

⁶⁴ Palen Solar Power Project Biological Technical Report, Riverside Co., California, August, 2009, p. 110.

USE OF CONTAMINENTS

The SA/DEIS states that both chemical dust control agents and weed eradication compounds will be used.⁶⁵ The use of chemical dust control agents or weed eradication compounds should be prohibited unless independent field studies have been done indicating the chemicals are harmless to wildlife.⁶⁶ Since it is highly unlikely that such studies have been done, the use of such chemicals should be strictly prohibited.

6-206

The Weed Management Plan (WMP)⁶⁷ contains over 50 pages describing the kind of weeds that may be present on the Project site, the importance of qualified staff in the use of toxic chemicals, and the importance of proper handling and application of herbicides. However, it says nothing of the actual qualifications needed by personnel, how the chemicals should be handled or how they should be applied. Less than a single page is allocated to what should be done in case of a toxic chemical spill. On that page it lists the equipment needed in case of a spill and includes such things as “bucket, dust pan, and a shovel.”⁶⁸ The WMP says absolutely nothing with regard to what is to be done if chemicals are misapplied or misused. The comprehensiveness of the WMP is probably best summarized in the statement below:

6-207

“The following general precautions will be implemented for pesticide application: It is the responsibility of the pesticide user to observe all directions, restrictions, and precautions on pesticide labels. It is dangerous, wasteful, and illegal to do otherwise.”⁶⁹

In other words, so long as everyone reads the directions on the label and knows that he or she will be blamed if they don’t, there will be no problem with herbicides or other toxic chemicals. This is naïve at best and intentionally misleading at worst.

If the weed problem cannot be controlled manually through the use of weed wrenches, hoes, shovels and hand pulling,⁷⁰ then a finding should be made that the introduction and spread of weed species as a result of the Project is a significant, adverse, and unavoidable impact.

CONCLUSIONS

I find it difficult to conceive that the Project Applicant can locate adequate compensatory mitigation habitat in the immediate region of the PSPP site. If this is the case, consideration may need to be given to the acquisition of habitat beyond the immediate region.

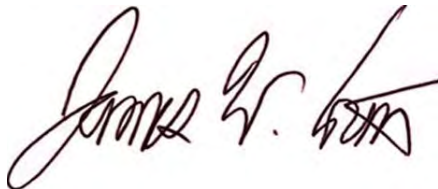

6-209

Based upon impacts to the MFTL and Desert Wash Woodland, serious consideration should be given to the Reduced Acreage Alternative discussed in detail in the SA/DEIS.⁷¹ This alternative would generate nearly as much energy as the proposed project (375 MW or 75%), avoids most of the MFTL habitat and also avoids the primary Desert Dry Wash Woodland occurring within the project boundaries. There is also some avoidance of desert tortoise habitat as well. The Reduced Acreage Alternative could be improved even further if all project acreage were pushed as far south as the initially proposed boundaries would allow.⁷²

6-210

This concludes my current comments regarding the findings and recommendations in the SA/DEIS, BRTR, and subsequent biological studies and findings completed in 2010.

Sincerely,

James W. Cornett

Subject: Comments on the Palen Solar Power Project -- Draft Environmental Impact Statement

Dear Mr. Holder:

Per your request, I have reviewed the Staff Assessment/Draft Environmental Impact Statement (hereinafter the SA/DEIS) for the Palen Solar Power Project (hereinafter the "PSPP") which would be located on public lands managed by the Bureau of Land Management (hereinafter the "BLM"). My review focuses on the Hazardous Materials, Waste Management and Worker Safety analyses of the SA/DEIS.

6-213

My qualifications to perform this review include over 25 years of experience in the assessment, cleanup, and regulation of hazardous waste. A summary of my education and experience is attached to this testimony as Attachment 1. My comments on the SA/DEIS, as follow, are based on my review of the SA/DEIS and my own investigations and analysis.

I. Introduction

I have been working for the California Unions for Reliable Energy ("CURE") as a consultant on the Application for Certification ("AFC") for the Palen Solar Power Project ("Project" or "PSPP") since the data adequacy phase. I have reviewed numerous documents and have conducted my own investigations and analyses regarding the Project's potential environmental and health and safety impacts. I have found that the SA/DEIS fails to adequately predict the severity of spills of hazardous materials and fails to provide for adequate response and monitoring of the spilled material and the chemical degradation products. The SA/DEIS also fails to plan for an adequate evaluation of potential unexploded ordnance at the project site.

6-214

II. Failure to Estimate Annual and Reasonably Foreseeable Spill Volumes

The Project proposes to use parabolic mirror solar trough technology. The SA/DEIS states that PSPP would circulate 1,300,000 gallons of Therminol VP-1 heat transfer fluid (HTF) through a piping system to generate high pressure steam.¹ This is the same technology and the same HTF used at the Luz Solar Energy Generating Stations (SEGS) III through IX facilities Kramer Junction, California.²

6-215

Past HTF spills at the SEGS facilities have generated significant quantities of contaminated soil and the generation of liquid waste. For example, a July 27, 2007 HTF spill of 30,000 gallons (more than the capacity of a backyard swimming pool) resulted in the offsite transport of 6,408 cubic yards of impacted soil for disposal (Attachment 2). Numerous other large spills have occurred at the SEGS facilities.

The SA/DEIS does require, in Condition of Certification HAZ-4, the use of isolation valves to limit the volume of a spill of HTF to 600 gallons.³ However, no drawings or design specifications are included in the SA/DEIS to evaluate if this requirement is attainable.

6-216

The SA/DEIS states that PSPP will include a land treatment unit (LTU) to bioremediate or land farm soil contaminated from releases of HTF.⁴ The SA/DEIS estimates that 1,500 cubic yards of HTF-contaminated soil would be sent each year to the LTU.⁵ The SA/DEIS does not state the capacity of the LTU nor is the capacity of the LTU stated in supporting documents, including the Application for Certification.

6-217

The SA/DEIS provides no analysis to support the estimate that no more than 1,500 cubic yards of HTF-contaminated soil would need to be treated per year in the LTU. Additionally, no attempt is made in the SA/DEIS or supporting documentation to quantify a reasonably foreseeable maximum spill volume and to identify measures that would be taken to respond to such a spill, including testing, transport, and disposal of the contaminated soil and of the spilled HTF in excess of the capacity of the LTU.

Failure to substantiate the annual estimate of HTF-contaminated soil and to identify a worst-case scenario is a significant shortcoming of the SA/DEIS. Large spills, on the order of tens of thousands of gallons as documented at SEGS may also occur at PSPP and could overwhelm the capacity of the LTU that is proposed to treat contaminated soil. For example, two past spills at SEGS generated large volumes of contaminated soil: a May 1999 spill of 21,000 gallons which generated 2,000 cubic yards of HTF-contaminated soil and the July 2007 spill of 30,000 gallons which generated more than 6,500 cubic yards of HTF-contaminated soil (Attachment 2).

6-218

Spills of HTF are likely to generate significant amounts of hazardous waste at PSPP, potentially in excess of the capacity of the LTU, as evidenced by records of spills at the analogous SEGS

¹ SA/DEIS, p. B.2-34

² http://en.wikipedia.org/wiki/Solar_Energy_Generating_Systems

³ SA/DEIS, p. C.4-22

⁴ *Id.* at p. B.1-7

⁵ *Id.* at p. C.13-16

facilities. The SA/DEIS makes no provisions for treatment or offsite disposal of contaminated soils that would exceed the LTU capacity. The SA/DEIS states only that 10 cubic yards of contaminated soil per year would require offsite disposal as hazardous waste.⁶

↑ 6-218
cont.

A revised SA/DEIS must be prepared to state the capacity of the LTU and to substantiate the annual estimates of HTF-contaminated soil that could be effectively treated in the LTU. A revised SA/DEIS must be prepared to identify reasonably foreseeable scenarios that would estimate maximum spill volumes of HTF and the amount of contaminated soil that would be generated by such spills.

6-219

III. Conditions of Certification are Inadequate to Mitigate Spills of Heat Transfer Fluid

The SA/DEIS defers the establishment of a concentration for HTF-contaminated soils that would define whether the waste is hazardous or non-hazardous. Condition of Certification WASTE-9 states:

The project owner shall submit to the Compliance Project Manager (CPM), BLM Authorized Office (AO) and Department of Toxic Substances Control (DTSC) for approval the applicant’s assessment of whether the HTF contaminated soil is considered hazardous or non-hazardous under state regulations. HTF-contaminated soil that exceeds the hazardous waste levels must be disposed of in accordance with California Health and Safety Code (HSC) Section 25203. HTF-contaminated soil that does not exceed the hazardous waste levels may be discharged into the land treatment unit (LTU).⁷

6-220

Because the concentration that would define whether HTF-contaminated soil is hazardous has yet to be established, the impact of such spills on the environment and the necessary response to such spills cannot be predicted at this time. The SA/DEIS must be revised to specifically define the concentration of HTF contamination that would result in hazardous waste. Condition of Certification WASTE-10, as proposed in the SA/DEIS, states:

The project owner shall ensure that all accidental spills or unauthorized releases of hazardous substances, hazardous materials, and hazardous waste are documented and remediated, and that wastes generated from accidental spills and unauthorized releases are properly managed and disposed of in accordance with all applicable federal, state, and local requirements.⁸

6-221

WASTE-10 is inadequate because the concentration that would establish whether a spill is hazardous has not been established. Because the concentration of hazardous waste has not been established, appropriate spill response cannot be specified in the SA/DEIS. A condition of certification should be included in a revised SA/DEIS to establish the concentration at which point soils contaminated with HTF would be considered hazardous. Without a hazardous waste criterion for HTF in soils, impacts cannot be adequately predicted, and response plans cannot be

⁶ *Id.* at p. C.13-17

⁷ *Id.* at p. C.13-32

⁸ *Id.* at p. C.13-33

formulated to address spills. Without this information, it is impossible to find that the potential impacts caused by HTF spills will be mitigated to less-than-significant levels.

↑ 6-221
| cont.

IV. Plans for Field Response to HTF Spills are Inadequate

A condition of certification must be prepared to identify specific measures to respond to spills of HTF, including field testing, staging of contaminated soils, and measures to address liquid HTF wastes that can be reasonably anticipated on the basis of experience at the SEGS facilities. The SA/DEIS states only that cleanup and temporary staging of HTF contaminated soils shall be conducted in accordance with a plan, an Operation Waste Management Plan, prepared as a requirement of Condition of Certification of WASTE-8.⁹ The Plan is to include:

a detailed description of all operation and maintenance waste streams, including projections of amounts to be generated, frequency of generation, and waste hazard classifications; management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods and companies providing treatment services, waste testing methods to ensure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/source reduction plans; information and summary records of conversations with the local Certified Unified Program Agency and the Department of Toxic Substances Control regarding any waste management requirements necessary for project activities. Copies of all required waste management permits, notices, and/or authorizations shall be included in the plan and updated as necessary; a detailed description of how facility wastes will be managed and any contingency plans to be employed, in the event of an unplanned closure or planned temporary facility closure; and a detailed description of how facility wastes will be managed and disposed upon closure of the facility.

6-222

WASTE-8, by simply requiring a plan, is insufficient in anticipating adequate response to HTF spills which include free liquids. At ambient temperatures, the HTF is of a liquid consistency at temperatures above 54 degrees Fahrenheit.¹⁰ As at the SEGS facilities, when spilled, the HTF will form wax-like piles of free standing liquids on the ground surface.¹¹ The piles are scooped up or are vacuumed in cleanup efforts documented at the SEGS facilities. The SA/DEIS makes no provisions for the management of the free standing liquids following a spill.

Additionally, the SA/DEIS makes no provisions for sampling HTF-contaminated soil at the point of the spill origin. The SA/DEIS states only that cleanup and temporary staging of HTF-contaminated soils shall be conducted in accordance with the approved Operation Waste Management Plan required in Condition of Certification of WASTE-8.¹² The SA/DEIS does not specifically provide for the handling of contaminated soil or contaminated HTF product which may be considered a hazardous waste at the point of the spill's origin. Further, movement of contaminated soil without testing prior to placement in the LTU may result in transport and

6-223

⁹ *Id.* at C.13-32
¹⁰ *Id.* at p. C.4-7
¹¹ *See* Attachment 2
¹² SA/DEIS, p. C.13-33

placement of hazardous waste which is prohibited by state law, as discussed further in section VIII below.

↑ 6-223
| cont.

As noted above, the Operation Waste Management Plan is to be prepared in the future and is thus not included in the SA/DEIS or other supporting materials; therefore, the adequacy of the response plans for HTF spills cannot be evaluated. The Operation Waste Management Plan, to include a corrective action plan for cleanup of spills of HTF-contaminated soils, should be prepared for evaluation in a revised SA/DEIS. The Operation Waste Management Plan should identify a numeric cleanup standard for HTF-contaminated soils to ensure the adequacy of cleanup in protecting human health and the environment at the point of spill origin. The plan should also include sampling procedures, cleanup goals, and methods for long term monitoring.

6-224

V. The Presence of Benzene as an HTF Degradation Product in Vapor and Soil May Put Workers and the Environment at Risk

Benzene is identified as a degradation product of Therminol VP-1.¹³ However, benzene is not identified in the SA/DEIS as a potential soil and groundwater contaminant and, because of this oversight and lack of mitigation, workers and the environment may be at risk from releases of HTF to soil.

6-225

The SA/DEIS states that because of the viscous and insoluble nature of HTF, it is not likely to mobilize from the soil downwards to the water table.¹⁴ While major components of HTF may be relatively immobile, benzene is mobile in the subsurface and may therefore contaminate underlying soil and groundwater. The SA/DEIS fails to consider benzene as a degradation product of the HTF in the subsurface and therefore fails to consider benzene as a potential soil and groundwater contaminant.

6-225

The SA/DEIS also fails to consider potential health impact from benzene exposure to workers who respond to HTF spills. Personnel who respond may be exposed to benzene vapors from the spilled HTF and from vapors that originate from HTF-contaminated soil, both at the spill origin and in the LTU. Additionally, workers may be exposed to benzene through dermal contact with the HTF.

6-226

Benzene is a known human carcinogen.¹⁵ Without proper precautions and protective equipment, including respirators and appropriate gloves and clothing, workers who respond to the spills may be exposed to benzene while breathing the vapor or when touching contaminated soil. Additionally, workers who tend to the HTF-impacted soil in the LTU may be at risk from inhalation of vapors and from dermal contact without precautions.

6-226

Condition of Certification WORKER SAFETY-2 only requires plans to be prepared and submitted to the CPM, to include an Operation Injury and an Illness Prevention Plan Hazardous Materials Management Program.¹⁶ This condition improperly defers the formulation of effective

6-227
↓

¹³ Response to Data request DR-PH-176, p. PH-4

¹⁴ SA/DEIS, p. B.2-41

¹⁵ <http://www.atsdr.cdc.gov/tfacts3.html>

¹⁶ SA/DEIS, p. C.14-30

mitigation that would protect worker safety from the hazards posed by HTF constituent elements, including benzene. 6-227
cont.

Measures to ensure that HTF components and byproducts, including benzene, do not pose a risk to worker safety and the subsurface environment must be prepared and incorporated into the appropriate plans. These plans must be included in a revised SA/DEIS to ensure an opportunity to review the adequacy of the protective measures. 6-228

VI. Analytical Methodology for Testing HTF-Contaminated Soil is Inappropriate

The SA/DEIS identifies EPA Method 8015 to be used in testing HTF-contaminated soil or another method to be reviewed and approved by regulatory agencies and the CPM.¹⁷ EPA Method 8015 is not an appropriate analytical testing methodology for the detection of benzene.¹⁸ Given that benzene is a known HTF degradation product, a method to detect benzene should be specified in the SA/DEIS for the analysis of benzene in HTF-contaminated soil. 6-229

At the proposed Abengoa solar thermal facility, the Lahontan RWQCB staff determined that EPA Method 8015 was not appropriate as the sole analytical method for Therminol VP-1.¹⁹ For soil testing at the LTU at Abengoa, the Lahontan RWQCB required analysis using EPA Method 1625B for HTF and Method 8260 for volatile degradation products of HTF such as benzene and toluene. 6-229

The main ingredients of Therminol VP-1, biphenyl and diphenyl oxide, are not considered to move readily through soil whereas benzene is known to move rapidly through soil. Therefore, monitoring for the presence of benzene with EPA Method 8260 is critical to determine if a release has occurred from the LTU. Appropriate analytical methodology must be incorporated into the SA/DEIS as a condition of certification. 6-229

VII. A Groundwater Monitoring Program has not been Prepared to Detect Releases from the LTU

The SA/DEIS or supporting materials provide no information about a groundwater monitoring well network that will be needed to ensure that releases of HTF and related contaminants, including benzene are detected and addressed. At other large solar projects undergoing licensing review by the CEC, groundwater monitoring well networks are detailed in a Report of Waste Discharge (ROWD), to be submitted to the Regional Water Quality Control Board.²⁰ No ROWD has been submitted for the PSPP. 6-230

Instead, the SA/DEIS states that a ROWD may be required by the Colorado River RWQCB and that PSPP will file the ROWD if required.²¹ Given that other projects included a ROWD, and 6-231

¹⁷ *Id.* at p. C.13-33

¹⁸ See for example <http://www.caslab.com/EPA-Method-8015B/>

¹⁹ <http://www.energy.ca.gov/sitingcases/abengoa/documents/others/2010-02-25-HTF-Conditions-From-James-Brathovde-TN-55665.pdf>

²⁰ See CEC web site (<http://www.energy.ca.gov/siting/solar/index.html>) for ROWDs for the Beacon Energy Solar Project and the Genesis Solar Energy Project

²¹ SA/DEIS, p. C.9-74

given the potential for groundwater contamination from HTF-contaminated soils in the LTU, a ROWD must be prepared and included in a revised SA/DEIS. The ROWD must be submitted for concurrent review by the RWQCB to ensure that monitoring provisions are adequate for the protection of the underlying groundwater.

↑
6-231

VIII. Plans for Staging HTF Spills may Violate the California Health and Safety Code

The LTU will be used for the staging of soil that is contaminated by HTF spills. The SA/DEIS states:

The LTU will be constructed with a 2-foot-thick clay layer on the floor (underlain by 3-feet of native soil that has been compacted to 95% compaction) that will serve as a protective barrier to the downward movement of contaminants from the LTU. Moreover, should any contaminants escape the LTU, the water table is approximately 195 feet beneath the LTU. In summary, because of the viscosity of HTF at ambient temperatures, the insolubility of HTF, the depth of the water table, and the placement of protective berms around the LTU, it is expected that surface water and groundwater quality beneath the site will not be impacted by LTU operation.²²

Section 25203 of the California Health and Safety Code prohibits the disposal of hazardous waste except at a hazardous waste facility. “Disposal” means either of the following:

- (1) The discharge, deposit, injection, dumping, spilling, leaking, or placing of any waste so that the waste or any constituent of the waste is or may be emitted into the air or discharged into or on any land or waters, including groundwaters, or may otherwise enter the environment.
- (2) The abandonment of any waste. (Health and Safety Code §25113(a).)

If a leak occurs, section 25123.3 of the California Health and Safety Code sets forth the requirements for temporarily staging waste. Temporary waste staging is appropriate for hazardous waste only if, among other criteria:

- the hazardous waste being accumulated does not contain free liquids;
- the hazardous waste is accumulated on an impermeable surface, such as high density polyethylene (HDPE) of at least 20 mills that is supported by a foundation, or high density polyethylene of at least 60 mills that is not supported by a foundation, among other requirements.

If any of the requirements are not met, then the Project must be regulated as a hazardous waste storage facility under Health and Safety Code Section 25200 et seq.

The staging area of the Project’s LTU as described in the SA/DEIS does not meet the requirements for a temporary staging area under Section 25123.3(a)(2) of the Health and Safety Code for two reasons. First, the hazardous waste being accumulated would likely contain free liquids. Spills of HTF will generate free liquids at temperatures above approximately 54 degrees

↓
6-232

²² *Id.* at p. C.9-45

Fahrenheit. The SA/DEIS makes no mention of liquid wastes that will be generated when HTF is spilled. Second, contaminated soil would not be “accumulated on an impermeable surface, such as high density polyethylene (HDPE) of at least 20 mills that is supported by a foundation, or high density polyethylene of at least 60 mills that is not supported by a foundation.” The SA/DEIS states only that the LTU will be underlain by a clay layer that will serve as a protective barrier to the downward movement of contaminants from the LTU.

↑
6-232
cont.

The SA/DEIS must incorporate as conditions of certification all measures necessary for compliance with all cited sections of the California Health and Safety Code, including preventing waste from containing free liquids and the use of an impermeable surface in the LTU.

IX. A UXO Survey Should be Conducted Under Regulatory Oversight

The SA/DEIS states that PSPP is near Palen Pass which was the site of some of the largest mock battles in the California-Arizona Maneuver Area during WW II.²³ Live-fire training occurred in camps and facilities in the area and land mines and other unexploded ordnance have been found in the former camps. Because of the proximity of the PSPP site to Palen Pass and the camps, the applicant plans to conduct pre-construction UXO surveys with qualified technicians (that meet Department of Defense requirements) and employ UXO experts during ground disturbances in areas that may contain UXO. The applicant also provided an outline for a UXO recognition training program in its response to staff data request WM-280. Accordingly, staff proposes Condition of Certification WASTE-1, which would formalize UXO training, investigation, removal, and disposal.²⁴

In addition to the proximity of the PSPP site to Palen Pass, the site is in close proximity to an area identified as a “gunnery range” on a map of the Desert Training Center/California Maneuver Area (Figure included as Attachment 3 is excerpted below – PSPP is depicted in orange).

6-233

Figure 1: Map of “Gunnery Range, CDC AAB” and the approximate location of PSPP

Additionally, a WWII-era map of the CAMA shows a feature, labeled No. 29, to be located in the vicinity or beneath the Project right of way (Figure included as Attachment 4 is excerpted below). The feature is identified as the Headquarters of the Army Ground Forces, 1943.²⁵

²³ *Id.* at p. C.13-10

²⁴ *Id.* at p. C.13-10

²⁵ The Desert Training Center/California Maneuver Area, 1942 – 1944, Volume 2, Historical and Archeological Contexts for the Arizona Desert. p.38, Prepared for the Bureau of Land Management

Figure 2: Headquarters, Army Ground Forces and the approximate location of PSPP

Given the intensity of the military maneuvers in the general vicinity of PSPP, the SA/DEIS must include a condition of certification that would require a UXO survey to be conducted for the project right of way and transmission line right of way under the oversight of the Department of Toxic Substances Control, the agency responsible for military site cleanup in the State of California. Without such regulatory oversight, the UXO survey may not be adequate to ensure construction worker safety.

6-234

Sincerely,

Matt Hagemann, P.G.

**Geologic and Hydrogeologic Characterization
Investigation and Remediation Strategies
Regulatory Compliance
CEQA Review
Expert Witness**

Education:

M.S. Degree, Geology, California State University Los Angeles, Los Angeles, CA, 1984.
B.A. Degree, Geology, Humboldt State University, Arcata, CA, 1982.

Professional Certification:

California Professional Geologist, License Number 8571.

Professional Experience:

Matt has 25 years of experience in environmental policy, assessment and remediation. He spent nine years with the U.S. EPA in the RCRA and Superfund programs and served as EPA's Senior Science Policy Advisor in the Western Regional Office where he identified emerging threats to groundwater from perchlorate and MTBE. While with EPA, Matt also served as a Senior Hydrogeologist in the oversight of the assessment of seven major military facilities undergoing base closure. He led numerous enforcement actions under provisions of the Resource Conservation and Recovery Act (RCRA) while also working with permit holders to improve hydrogeologic characterization and water quality monitoring.

Matt has worked closely with U.S. EPA legal counsel and the technical staff of several states in the application and enforcement of RCRA, Safe Drinking Water Act and Clean Water Act regulations. Matt has trained the technical staff in the States of California, Hawaii, Nevada, Arizona and the Territory of Guam in the conduct of investigations, groundwater fundamentals, and sampling techniques.

Positions Matt has held include:

- Founding Partner, Soil/Water/Air Protection Enterprise (SWAPE) (2003 – present);
- Senior Environmental Analyst, Komex H2O Science, Inc (2000 -- 2003);
- Executive Director, Orange Coast Watch (2001 – 2004);
- Senior Science Policy Advisor and Hydrogeologist, U.S. Environmental Protection Agency (1989–1998);
- Hydrogeologist, National Park Service, Water Resources Division (1998 – 2000);

- Adjunct Faculty Member, San Francisco State University, Department of Geosciences (1993 – 1998);
- Instructor, College of Marin, Department of Science (1990 – 1995);
- Geologist, U.S. Forest Service (1986 – 1998); and
- Geologist, Dames & Moore (1984 – 1986).

Senior Regulatory and Litigation Support Analyst:

With SWAPE, Matt's responsibilities have included:

- Manager of a project to evaluate numerous formerly used military sites in the western U.S.
- Manager of a project to provide technical assistance to a community adjacent to a former Naval shipyard under a grant from the U.S. EPA.
- Lead analyst in the review of numerous environmental impact reports under CEQA that identify significant issues with regard to hazardous waste, water resources, water quality, air quality, greenhouse gas emissions and geologic hazards.
- Lead analyst in the review of environmental issues in license applications for large solar power plants before the California Energy Commission.
- Stormwater analysis, sampling and best management practice evaluation at industrial facilities.
- Technical assistance and litigation support for vapor intrusion concerns.
- Manager of a comprehensive evaluation of potential sources of perchlorate contamination in Southern California drinking water wells.
- Manager and designated expert for litigation support under provisions of Proposition 65 in the review of releases of gasoline to sources drinking water at major refineries and hundreds of gas stations throughout California.
- Expert witness on two cases involving MTBE litigation.
- Expert witness and litigation support on the impact of air toxins and hazards at a school.
- Expert witness in litigation at a former plywood plant.

With Komex H2O Science Inc., Matt's duties included the following:

- Senior author of a report on the extent of perchlorate contamination that was used in testimony by the former U.S. EPA Administrator and General Counsel.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of MTBE use, research, and regulation.
- Senior researcher in the development of a comprehensive, electronically interactive chronology of perchlorate use, research, and regulation.
- Senior researcher in a study that estimates nationwide costs for MTBE remediation and drinking water treatment, results of which were published in newspapers nationwide and in testimony against provisions of an energy bill that would limit liability for oil companies.
- Research to support litigation to restore drinking water supplies that have been contaminated by MTBE in California and New York.
- Expert witness testimony in a case of oil production-related contamination in Mississippi.
- Lead author for a multi-volume remedial investigation report for an operating school in Los Angeles that met strict regulatory requirements and rigorous deadlines.
- Development of strategic approaches for cleanup of contaminated sites in consultation with clients and regulators.

Executive Director:

As Executive Director with Orange Coast Watch, Matt led efforts to restore water quality at Orange County beaches from multiple sources of contamination including urban runoff and the discharge of wastewater. In reporting to a Board of Directors that included representatives from leading Orange County universities and businesses, Matt prepared issue papers in the areas of treatment and disinfection of wastewater and control of the discharge of grease to sewer systems. Matt actively participated in the development of countywide water quality permits for the control of urban runoff and permits for the discharge of wastewater. Matt worked with other nonprofits to protect and restore water quality, including Surfrider, Natural Resources Defense Council and Orange County CoastKeeper as well as with business institutions including the Orange County Business Council.

Hydrogeology:

As a Senior Hydrogeologist with the U.S. Environmental Protection Agency, Matt led investigations to characterize and cleanup closing military bases, including Mare Island Naval Shipyard, Hunters Point Naval Shipyard, Treasure Island Naval Station, Alameda Naval Station, Moffett Field, Mather Army Airfield, and Sacramento Army Depot. Specific activities were as follows:

- Led efforts to model groundwater flow and contaminant transport, ensured adequacy of monitoring networks, and assessed cleanup alternatives for contaminated sediment, soil, and groundwater.
- Initiated a regional program for evaluation of groundwater sampling practices and laboratory analysis at military bases.
- Identified emerging issues, wrote technical guidance, and assisted in policy and regulation development through work on four national U.S. EPA workgroups, including the Superfund Groundwater Technical Forum and the Federal Facilities Forum.

At the request of the State of Hawaii, Matt developed a methodology to determine the vulnerability of groundwater to contamination on the islands of Maui and Oahu. He used analytical models and a GIS to show zones of vulnerability, and the results were adopted and published by the State of Hawaii and County of Maui.

As a hydrogeologist with the EPA Groundwater Protection Section, Matt worked with provisions of the Safe Drinking Water Act and NEPA to prevent drinking water contamination. Specific activities included the following:

- Received an EPA Bronze Medal for his contribution to the development of national guidance for the protection of drinking water.
- Managed the Sole Source Aquifer Program and protected the drinking water of two communities through designation under the Safe Drinking Water Act. He prepared geologic reports, conducted public hearings, and responded to public comments from residents who were very concerned about the impact of designation.
- Reviewed a number of Environmental Impact Statements for planned major developments, including large hazardous and solid waste disposal facilities, mine reclamation, and water transfer.

Matt served as a hydrogeologist with the RCRA Hazardous Waste program. Duties were as follows:

- Supervised the hydrogeologic investigation of hazardous waste sites to determine compliance with Subtitle C requirements.
- Reviewed and wrote "part B" permits for the disposal of hazardous waste.
- Conducted RCRA Corrective Action investigations of waste sites and led inspections that formed the basis for significant enforcement actions that were developed in close coordination with U.S. EPA legal counsel.
- Wrote contract specifications and supervised contractor's investigations of waste sites.

With the National Park Service, Matt directed service-wide investigations of contaminant sources to prevent degradation of water quality, including the following tasks:

- Applied pertinent laws and regulations including CERCLA, RCRA, NEPA, NRDA, and the Clean Water Act to control military, mining, and landfill contaminants.
- Conducted watershed-scale investigations of contaminants at parks, including Yellowstone and Olympic National Park.
- Identified high-levels of perchlorate in soil adjacent to a national park in New Mexico and advised park superintendent on appropriate response actions under CERCLA.
- Served as a Park Service representative on the Interagency Perchlorate Steering Committee, a national workgroup.
- Developed a program to conduct environmental compliance audits of all National Parks while serving on a national workgroup.
- Co-authored two papers on the potential for water contamination from the operation of personal watercraft and snowmobiles, these papers serving as the basis for the development of nation-wide policy on the use of these vehicles in National Parks.
- Contributed to the Federal Multi-Agency Source Water Agreement under the Clean Water Action Plan.

Policy:

Served senior management as the Senior Science Policy Advisor with the U.S. Environmental Protection Agency, Region 9. Activities included the following:

- Advised the Regional Administrator and senior management on emerging issues such as the potential for the gasoline additive MTBE and ammonium perchlorate to contaminate drinking water supplies.
- Shaped EPA's national response to these threats by serving on workgroups and by contributing to guidance, including the Office of Research and Development publication, Oxygenates in Water: Critical Information and Research Needs.
- Improved the technical training of EPA's scientific and engineering staff.
- Earned an EPA Bronze Medal for representing the region's 300 scientists and engineers in negotiations with the Administrator and senior management to better integrate scientific principles into the policy-making process.
- Established national protocol for the peer review of scientific documents.

Geology:

With the U.S. Forest Service, Matt led investigations to determine hillslope stability of areas proposed for timber harvest in the central Oregon Coast Range. Specific activities were as follows:

- Mapped geology in the field, and used aerial photographic interpretation and mathematical models to determine slope stability.

- Coordinated his research with community members who were concerned with natural resource protection.
- Characterized the geology of an aquifer that serves as the sole source of drinking water for the city of Medford, Oregon.

As a consultant with Dames and Moore, Matt led geologic investigations of two contaminated sites (later listed on the Superfund NPL) in the Portland, Oregon, area and a large hazardous waste site in eastern Oregon. Duties included the following:

- Supervised year-long effort for soil and groundwater sampling.
- Conducted aquifer tests.
- Investigated active faults beneath sites proposed for hazardous waste disposal.

Teaching:

From 1990 to 1998, Matt taught at least one course per semester at the community college and university levels:

- At San Francisco State University, held an adjunct faculty position and taught courses in environmental geology, oceanography (lab and lecture), hydrogeology, and groundwater contamination.
- Served as a committee member for graduate and undergraduate students.
- Taught courses in environmental geology and oceanography at the College of Marin.

Re: Spill Report for 5/22/99 Incident

Dear Ms. Ventura:

Attached is a report of the spill, which occurred at SEGS III on May 22. If you have any questions, please contact me at your convenience.

Sincerely,

A handwritten signature in black ink, appearing to read 'DM Rib (for D. Rib)'. The signature is written in a cursive, somewhat stylized script.

SPILL REPORT

OWNER: Kramer Junction Company

OPERATOR: KJC Operating Company

PERMITS: Board Order #6-97-58, WDID #6B364550002
(site and evaporation ponds)
Board Order #6-95-102, WDID #6B368909005
(bioremediation)

DATE: May 22, 1999

TIME: 11:30 a.m.

SITE ADDRESS: 41100 Highway 395

LOCATION: SEGS III solar field, northwest quadrant

MATERIAL SPILLED: Heat Transfer Fluid (HTF), Biphenyl-Diphenyl Oxide

APPROXIMATE VOLUME SPILLED: Approximately 21,000 gallons where released, at least 10,000 spilled to soil

APPROXIMATE VOLUME OF CONTAMINATED SOIL: Approximately 2000 cubic yards

CONTAMINATED SOIL DISPOSITION: Soil was removed and staged in the on-site bioremediation facility. The volume of the contaminated soil is beyond the current permit capacity of the bioremediation facility, so the soil will be sent to the TPS Technologies thermal treatment facility in Adelanto.

LRWQCB CONTACT: Diane Ventura at 12:55 on 5/24/99. Follow-up message left for Ms. Ventura on 6/1/99 at 12:50.

CIRCUMSTANCE OF SPILL:

The spill was caused by the failure of a "flexhose," which is the flexible connection between segments of the "Solar Collection Assemblies" (SCA) that allows each SCA to individually track the sun angle. This particular flexhose was at the end of a row where the local isolation valve is located, so it took longer to stop the leak by isolating a larger section of the solar field. There was a strong flow of HTF spilling onto the ground for about 15 minutes. There was a loss of approximately 21,000 gallons of HTF from the system, approximately 1,500 gallons of which was recovered from standing puddles. The HTF-contaminated soil in the area to a depth ranging from a few inches to several feet deep.

There is an ongoing program to replace the flexhoses with "balljoint" connections. This conversion is approximately 40% complete throughout the SEGS III-VII site. The flexhoses are periodically inspected, and most failures can be detected as they usually leak for several days before failing completely. Some failures can occur much more rapidly, as is thought to have happened in this case.

1.0 INTRODUCTION

Luz Solar Partners III through VII Ltd. Solar Electric Generating Systems (SEGS) III through VII sites are located at 41100 Highway 395 in Boron, California (Kramer Junction). The SEGS III through VII sites are authorized to operate soil bioremediation cells and a landfarm the location of which are shown on Figure 1. The treatment facilities were designed and constructed in accordance with the requirements of Title 23, subchapter 15, of the California Code of Regulations. Under the terms of Revised Waste Discharge Requirements (WDRs) Board Order No. 6-95-102 issued by the California Regional Water Quality Control Board - Lahontan Region (RWQCB), the bioremediation treatment facility is referred to as the "Bioremediation Unit" and the landfarm is referred to as the "Landfarm". The combined facilities are simply referred to as the "Facility". The bioremediation facility receives soils impacted with heat transfer fluid (HTF) for treatment whereas the landfarm contains a combination of partially and fully-remediated soils or soils staged for treatment in the bioremediation cells as shown on Figure 2.

Soil treatment within the bioremediation facility involves manipulation of environmental controls such as moisture content, soil nutrients (nitrate fertilizer), and aeration of the soils through weekly to bi-weekly tilling to achieve the desired conditions for enhancing biodegradation of the constituents of concern. Soils treated to below 1,000 parts per million (ppm) HTF may be transferred to the Landfarm where passive treatment (natural attenuation) is allowed to occur.

Periodic testing of the soils undergoing treatment is conducted and analyzed by an independent laboratory to confirm the concentration of HTF. Once treatment has been completed and soil HTF concentrations are below 100-ppm (the permitted limit), remediated soils are available for reuse within the sites.

2.0 HTF RELEASES AND TREATMENT MONITORING

During the First Semester of 2007 approximately 125-130 cubic yards of HTF-impacted soils were generated. These HTF-affected soils were the result of remedial actions related to unanticipated releases that occurred on-site on 27 March and 27 February 2007. In both instances recovery of free-standing HTF product was implemented as soon as the release area was secured. The largest release occurred on 27 February 2007 which involved approximately 1,000 gallons of HTF in the SEGS VI solar field. Removal of HTF-impacted soil is typically initiated once free product is removed, however in the case of the 27 February 2007 event soil removal was temporarily suspended on 28 February due to high winds.

During the Second Semester of 2007 a release of approximately 30,000 gallons occurred on 16 July 2007 in the SEGS VII Power Block resulting in the generation of approximately 6,558 cubic yards of HTF-impacted soils. Recovery of free-standing HTF product was implemented as soon as the release area was secured.

Notification of releases was made to the California Regional Water Quality Control Board – Lahontan Region (RWQCB), National Response Center, California Office of Emergency Services, San Bernardino County Fire Department Hazardous Materials Division, and California Energy Commission on 01 March 2007, 30 March 2007, and 17 July 2007.

Soils affected with HTF as a result of the releases were promptly excavated and transported to the Landfarm facility for temporary storage. In the case of the 16 July 2007 release at the SEGS VII Power Block, approximately 6,408 cubic yards of HTF-affected soils were removed and transported offsite to an approved disposal facility and another 150 cubic yards was taken to the Bioremediation facility on site. Soil samples were subsequently collected from the excavations to determine if further soil removal was required. Soil sampling reports were prepared for each of the releases that summarized the methods employed for sample collection and laboratory analytical results. These reports have previously been submitted to the RWQCB.

Releases that occurred during 2007 are summarized in Table 1 below.

Table 1: Summary of 2007 HTF Releases

Release Date	Location	Volume of HTF Released
27 February 2007	SEGS VI SCA 39P	1,000 gallons
27 March 2007	SEGS V SCA 23P	35 gallons
16 July 2007	SEGS VII Power Block	30,000 gallons

3.0 OPERATION AND MAINTENANCE REPORTING

FPL Energy Operating Services, Inc. has not experienced any technical issues since assuming operational control of the Facility. Visual observations indicate that the structure of the bioremediation Unit is in good working order and that no obvious defects or structural damage is evident.

The Bioremediation Unit is constructed with two rectangular cells and a row of concrete blocks dividing the facility into two portions, a north and south half. One half of the structure is typically used to store HTF-impacted material prior to treatment and the other half for active soil remediation.

Visual inspection of the primary concrete containment structure was last conducted in 2007 on 31 December. No structural damage or signs of weakening or failure were visible at the time of inspection.

The drainage sumps for the Bioremediation Unit are checked approximately once a week. No significant accumulation of water has been noted in the sumps, suggesting that no leakage is occurring.

4.0 SAMPLING SUMMARY AND LABORATORY ANALYTICAL RESULTS

On 08 March 2007 Northstar Environmental Remediation (Northstar) conducted a random sampling of soil from the Landfarm. Northstar also collected compliance soil samples from the Bioremediation Unit on 11 June 2007. The sampling was performed to determine the concentration of HTF in impacted soils undergoing treatment. The 08 March soil samples were collected from materials which were generated from the February HTF release at SEGS VI and which were subsequently stored on plastic sheeting in the Landfarm. Remaining soil in the Landfarm represents materials generated from an accidental HTF release at SEGS III in October 2005 which was subsequently tested and found to be below the 1,000 mg/kg limit.

On 19 December 2007 Northstar collected the annual "unsaturated zone monitoring system" soil sample at a depth equal to approximately one foot below the native ground surface grade (approximately 5.5 feet below the top of the landfarm for HTF. Both HTF analytes were found to be non-detectable as shown on Table 2.

The results of the laboratory analytical analyses for the First Semester 2007 reporting period are summarized in Table 2. Laboratory reports for the First Semester sampling events were previously included in the First Semester 2007 report. Laboratory data sheets and chain-of-custody record for the annual landfarm "unsaturated zone monitoring" soil sampling event are included in Appendix A.

Soil samples were collected using a stainless-steel hand-auger, and stainless-steel drive sampler equipped with clean 2-inch diameter by six-inch long stainless-steel sample sleeves. Samples were first collected in the stainless steel sleeves and then immediately transferred into laboratory-supplied, certified clean glass jars and properly labeled. The samples were then placed into a cooler, chilled with ice in sealed Ziploc™ bags and transported under chain-of-custody to Del Mar Analytical Laboratories in Irvine, California for analysis of HTF component concentrations using EPA Method 8015 Modified for HTF. Soil was collected from four randomly selected locations in the Bioremediation Unit, composited in the field and submitted to the laboratory to be analyzed as one representative sample. The same procedure was followed for the Landfarm soil sample.

All equipment was cleaned using non-phosphate detergent and triple-rinsed with deionized water between sampling locations in order to prevent cross-contamination.

Table 2: Laboratory Analytical Results

Sample Identification	Date	1,1'-Biphenyl (mg/kg)	1,1'-Oxybisbenzene (mg/kg)
LF-1 ¹	08 March 2007	7,900	8,200
LF-2 ¹	08 March 2007	6,200	6,200
LF-3 ¹	08 March 2007	1,700	1,800
BRN (EAST) 6-11-07 ²	11 June 2007	ND	2.1
BRN (WEST) 6-11-07 ²	11 June 2007	ND	33
KJ-LF-5.5'-12-19-07	19 December 2007	ND	ND

Notes:

¹ sample collected from the Landfarm facility between SEGS III & IV

² sample collected from the Bioremediation facility between SEGS VI & VII

Samples analyzed by EPA Method 8015B Modified for HTF. The analytes 1, 1'-Biphenyl and 1, 1'-Oxybisbenzene are components of the HTF used at the site. ND = Not Detectable

The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of TestAmerica and its client. This report shall not be reproduced, except in full, without written permission from TestAmerica. The Chain of Custody, 1 page, is included and is an integral part of this report.

This entire report was reviewed and approved for release.

CASE NARRATIVE

SAMPLE RECEIPT: Samples were received intact, at 4°C, on ice and with chain of custody documentation.

HOLDING TIMES: All samples were analyzed within prescribed holding times and/or in accordance with the TestAmerica Sample Acceptance Policy unless otherwise noted in the report.

PRESERVATION: Samples requiring preservation were verified prior to sample analysis.

QA/QC CRITERIA: All analyses met method criteria, except as noted in the report with data qualifiers.

COMMENTS: No significant observations were made.

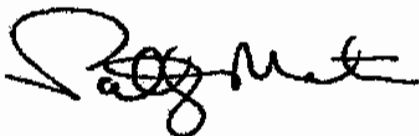

SUBCONTRACTED: No analyses were subcontracted to an outside laboratory.

NOTIFICATION OF LAKE OR STREAMBED ALTERATION

7. PRIOR NOTIFICATION OF ORDER

A. Has a notification previously been submitted to, or a Lake or Streambed Alteration Agreement previously been issued by, the Department for the project described in this notification?		
<input type="checkbox"/> Yes <i>(Provide the information below)</i> <input checked="" type="checkbox"/> No		
Applicant: _____	Notification Number: _____	Date: _____
B. Is this notification being submitted in response to an order, notice or other directive ("order") by a court or administrative agency (including the Department)?		
<input checked="" type="checkbox"/> No <input type="checkbox"/> Yes <i>(Enclose a copy of the order, notice, or other directive. If the directive is not in writing, identify the person who directed the applicant to submit this notification and the agency he or she represents, and describe the circumstances relating to the order)</i>		
<input type="checkbox"/> Continued on additional pages(s)		

8. PROJECT LOCATION

A. Address or description of project location. <i>(Include a map that marks the location of the project with a reference to the nearest city or town, and provide driving directions from a major road or highway)</i>				
The proposed Palen Solar Power Plant (PSPP or Project) is located approximately 10 miles east of Desert Center, and 0.5 mile north of the Interstate 10 (I-10) corridor in eastern Riverside County, California (Attachment 1, Figure 1). The disturbance area (area inside and outside the fence line that will be disturbed by the Project) is composed of a large, contiguous area of approximately 5,212 acres of undeveloped land administered by the Bureau of Land Management (BLM), with the exception of one 40-acre private parcel that is being purchased by the Applicants (Attachment 1, Figure 2). The Project site is undeveloped and vacant. To get to the proposed PSPP disturbance area from I-10, take the Corn Springs Road Exit going north and continue onto a dirt service road.				
<input type="checkbox"/> Continued on additional pages(s)				
B. River, stream, or lake affected by the project.		Corn Springs Wash and other unnamed desert washes. Hydrologic Areas in proximity to the PSPP are shown in Attachment 1, Figure 3.		
C. What water body is the river, stream or lake tributary to?		Not applicable		
D. Is the river or stream segment affected by the project listed in the state or federal Wild and Scenic Rivers Acts?		<input type="checkbox"/> Yes <input checked="" type="checkbox"/> No <input type="checkbox"/> Unknown

10. PROJECT DESCRIPTION

A. Describe the project in detail. Photographs of the project location and immediate surrounding area should be included.

- Include any structures (e.g., rip-rap culverts, or channel clearing) that will be placed, built, or completed in or near the stream, river, or lake
- Specify the type and volume of materials that will be used.
- If water will be diverted or drafted

Enclose diagrams, drawings, plans and/or maps that provide all the following: site specific construction details; the dimensions of each structure and/or extent of each activity in the bed, channel, bank or floodplain; and overview of the entire project area (i.e., "birds-eye view") showing the location of each structure and/or activity, significant area features, and where the equipment/machinery will enter and exit the project area.

Solar Millennium LLC and Chevron Energy Solutions (the Applicants) are proposing to construct two commercial solar thermal electric power-generating stations, collectively referred to as the Palen Solar Power Project (PSPP or Project). The Project would be located on an approximately 5,212-acre parcel managed by the Bureau of Land Management, pursuant to a right-of-way (ROW) grant from BLM. The total disturbance area would be approximately 3,899 acres. The facility footprint would occupy approximately 2,974 acres of the ROW. In addition to solar fields and a main power-generating facility, the site would include a main office building and parking lot, a main warehouse with laydown area, onsite access roads, a tie-in switchyard, a bioremediation area, and a transmission line and substation. Attachment 1, Figure 4 illustrates the location of the proposed solar facilities.

The Project would use solar parabolic trough technology to generate electricity. With this technology, arrays of parabolic mirrors collect heat energy from the sun and refocus the radiation on a receiver tube located at the focal point of the parabola. A heat transfer fluid (HTF) is heated to high temperature (750 degrees Fahrenheit [°F]) as it circulates through the receiver tubes. The heated HTF is then piped through a series of heat exchangers where it releases its stored heat to generate high-pressure steam. The steam is then fed to a traditional steam turbine generator where electricity is produced.

The Project would have a nominal output of 500 MW, produced by two adjacent, identical, and independent 250-MW units, referred to as Units 1 and 2. The two power units would share a main office building, main warehouse/maintenance building, parking lot, onsite access roads, bioremediation area for HTF-contaminated soil, and central internal switchyard. Units 1 and 2 would have their own solar field composed of piping loops arranged in parallel groups, and its own power block centrally located within the solar field. Each solar field would cover approximately 1,380 acres. Each power block would have its own HTF pumping and freeze protection system, solar steam generator, steam turbine generator, an air-cooled condenser (ACC) for cooling, transmission lines and related electrical system, and auxiliary equipment (e.g., water treatment system, emergency generators).

The Project would require a new transmission line to interconnect to the regional transmission grid. The transmission line is proposed to be constructed in a 40.4-acre area and to extend south approximately 1.2 miles from the boundary of the Project Disturbance Area across I-10 and turning west for a short distance to just past Chuckwalla Road. The substation would be constructed in a 34.7-acre area immediately west of the southern end of the transmission line.

Access to the PSPP would be via a new 1,350-foot-long, 24-foot-wide paved access road from Corn Springs Road. Only a small portion of the overall facility footprint would be paved, primarily the site access road, the service roads to the power blocks, and portions of the power blocks themselves. The remaining portions of the power blocks would be gravel surfaced. In total, each power block would be approximately 18.4 acres with approximately 6 acres of paved area. The solar field would remain unpaved and without a gravel surface to prevent rock damage from mirror wash vehicle traffic; a dust suppression coating would be used on the dirt roadways within and around the solar field. The Project solar field and support facilities perimeter would be secured with 8-foot-tall chain-link metal-fabric security fencing, with 1 foot barbed wire or razor wire on top. Controlled access gates would be located at the site entrance.

NOTIFICATION OF LAKE OR STREAMBED ALTERATION

The existing topographic conditions of the facility footprint show an average slope of approximately 1 foot every 330 feet (0.30 percent) toward the northeast, with a series of desert washes traversing the site (e.g., a primary wash and a few secondary washes). Drainage across the undeveloped property is concentrated in these washes, until the drainage features disappear and flows fan out across the landscape as sheet flow. Development of the site would include intercepting the storm flows in three washes at the Project boundaries, channelizing and rerouting the flows around and through the site, and then returning the flows to their sheet flow regime on the north side of the site. The channel segments would be designed to meet Riverside County requirements, as well as biological considerations such as wildlife movement. Jurisdictional waters of the State are illustrated in Figure 5 of Attachment 1.

As part of the PSPP, the series of desert washes that crosses the disturbance area from southwest to northeast would be rerouted into three channels on the west side, center, and east side of the disturbance area, corresponding to the three bridges that direct flow passing under I-10 (Attachment 1, Figure 4). These channels would intercept flows prior to their entry to the site and convey them in realigned channels to approximately the same locations where they exit the site under existing conditions. Outlets for each channel would end in diffusers.

The west and east channels would be located entirely outside of the proposed perimeter fencing. The center channel inlets and outlets would be located outside of perimeter fencing. The remainder of the center channel would be located within the perimeter fence. Additional fencing will be located along the top of the channel just beyond the maintenance road. The channels would be constructed with native material, and scour protection (i.e., rip-rap) would be added to the channel sides and bottoms in stress areas such as curves and slope transitions. No scour protection is proposed for the channel bottom in the straight sections of the channels. This is to allow the low flows to meander across the bottom, replicating as nearly as possible the flow regimes under current conditions.

The power plant units would be graded generally following the existing contours of the site to minimize the amount of disturbance and allow a balanced distribution of material. Runoff from the units would be collected in a series of swales and small channels that would direct the flow to the appropriate perimeter channel. The power block areas that are centrally located within the two power plant units would have their own detention/water quality basins within the block, from which flows would be directed to the nearest downstream channel. The PSPP would employ a comprehensive system of management controls, including site-specific best management practices (BMPs), to minimize storm water contact with contaminants.

The preliminary site grading plan is designed to be balanced; no import or export of soil is expected for general earthwork. The grading plan does not currently allow for any soil shrinkage or other losses. The grading plan will be adjusted to account for any loss in elevation that could occur. Engineered fill would be provided as required for equipment and structure foundations as/if recommended by the geotechnical report. Additionally, granular material may need to be imported for road base and possible use below foundations. Mass grading of the site would occur at the beginning of the construction period and last approximately 24 months. The total earth movement required is estimated to be 4.5 million cubic yards.

To facilitate dust and contaminant removal, treated water would be used to spray-clean the solar mirrors on a periodic basis, determined by a reflectivity monitoring program. This operation is generally done at night and involves a water truck spraying treated water on the mirrors in a drive-by fashion. Rinsate from the washing operation is expected to evaporate on the mirror surface with no appreciable runoff.

Sanitary wastewater would be collected for treatment in septic tanks and disposed of via leach fields. Based on an estimate of 5,500 gallons of sanitary wastewater production per day, a total leach field area of approximately 11,000 square feet would be required, spread out among three or more locations. The leach fields would consist of buried perforated pipes. The power-generation cycle would not produce cooling-tower blow-down because the plant would be dry cooled.

Site photographs are included in Attachment 1, Figures 5a through 5i.

Supplemental Engineering Data for the Project is included as Attachment 2. For a more detailed Project Description, refer to the PSPP Biological Resources Technical Report (Attachment 3) and Supplemental Biological Resources Technical Report (Attachment 4).

Comment Letter 6

NOTIFICATION OF LAKE OR STREAMBED ALTERATION

B. Specify the equipment and machinery that will be used to complete the project.	
Heavy equipment, such as bulldozers, cranes, scrapers, rollers, backhoes, concrete trucks, and dump trucks, would be employed during site preparation and construction of the proposed Project. Project construction would require an average of 566 employees over the entire 39-month construction period, with staff requirements peaking at approximately 1,140 workers in Month 17 of construction. This would include equipment and machinery operators, construction management personnel, surveyors, and qualified construction monitors.	
C. Will water be present during the proposed work period (specified in box 4.D) in the stream, river, or lake (specified in box 8.B)	<input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (<i>Skip to box 11</i>) The Project plans to conduct initial site preparation and construction of the rerouted washes when the channels are dry; however, the Project would prefer to have the option to conduct work any time of year.
D. Will the proposed project require work in the wetted portion of the channel?	<input checked="" type="checkbox"/> Yes (<i>Enclose a plan to divert water around work site</i>) <input type="checkbox"/> No The Project would require work within the washes as part of rerouting the existing channel. The washes are only wet when a storm event results in surface flow; therefore, work in the wetted portion of the channel would only occur if work is being performed during a storm event that results in surface flow. Attachment 1, Figure 4 illustrates the plan to permanently divert water around the site by rerouting the wash.

11. PROJECT IMPACTS

A. Describe impacts to the bed, channel, and bank of the river, stream or lake, and the associated riparian habitat. Specify the dimensions of the modifications in length (linear feet) and area (square feet or acres) and the type and volume of material (cubic yards) that will be moved, displaced, or otherwise distributed, if applicable.														
Attachment 1, Figure 5 illustrates State waters within the PSPP disturbance area. The proposed PSPP would result in permanent impacts to 347.9 acres of State waters, including 154.0 acres of desert dry wash woodland (141.0 acres direct and 13.0 acres indirect) and 193.9 acres of unvegetated ephemeral dry wash (161.8 acres direct and 32.1 indirect).														
For a complete description of the jurisdictional features within the Project disturbance area, see Attachment 5, Delineation of Jurisdictional Waters of the State. Project impacts are detailed in the Biological Resources Technical Report (Attachment 3) and Supplemental Biological Resources Technical Report (Attachment 4).														
B. Will the project affect any vegetation?	<input checked="" type="checkbox"/> Yes (<i>Complete the tables below</i>) <input type="checkbox"/> No													
<table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 35%;">Vegetation Type</th> <th style="width: 35%;">Temporary Impact</th> <th style="width: 30%;">Permanent Impact</th> </tr> </thead> <tbody> <tr> <td rowspan="2" style="text-align: center; vertical-align: middle;">Desert dry wash woodland</td> <td>Linear feet: none</td> <td>Linear feet: 10,488</td> </tr> <tr> <td>Total area: none</td> <td>Total area: 141.0 acres direct; 13.0 acres indirect</td> </tr> <tr> <td rowspan="2" style="text-align: center; vertical-align: middle;">Unvegetated ephemeral dry wash</td> <td>Linear feet: none</td> <td>Linear feet: 22,285</td> </tr> <tr> <td>Total area: none</td> <td>Total area: 161.8 acres direct; 32.1 indirect</td> </tr> </tbody> </table>	Vegetation Type	Temporary Impact	Permanent Impact	Desert dry wash woodland	Linear feet: none	Linear feet: 10,488	Total area: none	Total area: 141.0 acres direct; 13.0 acres indirect	Unvegetated ephemeral dry wash	Linear feet: none	Linear feet: 22,285	Total area: none	Total area: 161.8 acres direct; 32.1 indirect	<p>^a Downstream waters containing wash dependent vegetation would likely be indirectly impacted by the rerouting of the on-site washes. The data presented here represent the full complement of washes downstream that may be indirectly impacted; however, a full determination of this impact will rely on hydrologic studies that are still in progress. It is anticipated that the indirect permanent impact estimate will be refined and potentially decrease due to rerouted drainages delivering water back into the secondary wash on the northern boundary of the project.</p> <p style="text-align: right;"><input type="checkbox"/> Continued on additional page(s)</p>

NOTIFICATION OF LAKE OR STREAMBED ALTERATION

C. Are any special status animal or plant species, or habitat that could support such species, known to be present on or near the project site?

Yes (*List each species and/or describe the habitat below*) No Unknown

Special-status species that occur or have the potential to occur in proximity to the PSPP are summarized below. The Biological Resources Study Area (BRSA) includes the Project disturbance area and the survey buffer. Refer to the PSPP Biological Resources Technical Report (Attachment 3) and Supplemental Biological Resources Technical Report (Attachment 4) for more detail on the survey buffer and an analysis of impacts related to the species discussed below.

Special-Status Plant Species

Based on regional databases; site-specific habitat evaluations by Project biologists; and literature review, including a California Natural Diversity Database (CNDDB) records search, it was determined that no State-listed plant species have been recorded near the BRSA or have potential to occur in the BRSA. No State-listed plant species were detected within the BRSA.

Special-Status Wildlife Species

Desert tortoise (DT; *Gopherus agassizii*), listed as threatened under the California Endangered Species Act (CESA), were detected within the BRSA during surveys. No live DT were observed within the disturbance area, but active burrows were noted within the BRSA. The Project disturbance area is considered suitable habitat for DT, but is generally of low quality, with the exception of the transmission line corridor, where vegetation observed is of higher quantity and quality, and a larger amount of DT sign was observed. Moderate population density is expected in the Project disturbance area based on the habitat quality and survey results.

Although one individual Swainson's hawk (State-listed as threatened) was observed on site, there is no suitable nesting habitat within the disturbance area and, based on the time of year of the observation, the individual was assumed to be migrating through the area. The disturbance area has limited resources required for Swainson's hawk migration and, therefore, the area would not be considered a major migration corridor.

Eight other California Department of Fish and Game (CDFG) non-listed special-status wildlife species were observed within the BRSA:

- American badger (*Taxidea taxus*)
- Desert kit fox (*Vulpes macrotis arsipus*)
- Loggerheaded shrike (*Lanius ludovicianus*)
- Mojave fringe-toed lizard (*Uma scoparia*)
- Northern harrier (*Circus cyaneus*)
- Purple martin (*Progne subis*)
- Western burrowing owl (*Athene cunicularia hypugaea*)
- Vaux's swift (*Chaetura vauxi*)

Desert kit fox burrows, complexes, and scat, and American badger dens and animal burrows showing evidence of predation by badgers were detected within the BRSA during surveys. Mojave fringe-toed lizard was detected throughout the BRSA. Two western burrowing owl pairs, a CDFG State Species of Special Concern, and eight active burrows were observed within the disturbance area.

An additional two CDFG special-status species (Nelson's bighorn sheep [*Ovis canadensis nelsonii*] and pallid bat [*Antrozous pallidus*]) have a moderate potential to occur, and three special-status species (Gila woodpecker [*Melanerpes uropygialis*], gilded flicker [*Colaptes chrysoides*], and crissal thrasher [*Toxostoma crissale*]) have a low potential to occur.

Comment Letter 6

NOTIFICATION OF LAKE OR STREAMBED ALTERATION

D. Identify the source(s) of information that supports a "yes" or "no" answer above in Box 11.C.
Please see : <ul style="list-style-type: none">• Attachment 3, PSPP Biological Resources Technical Report (August 2009)• Attachment 4, PSPP Supplemental Biological Resources Technical Report (November 2008) <p style="text-align: right;"><input type="checkbox"/> Continued on additional pages(s)</p>
E. Has a biological study been completed for the project site?
<input checked="" type="checkbox"/> Yes (Enclose the biological study) <input type="checkbox"/> No
Please see Attachment 3, PSPP Biological Resources Technical Report (August 2009), and Attachment 4, PSPP Supplemental Biological Resources Technical Report (November 2008)
<i>Note: A biological assessment or study may be required to evaluate potential impacts on biological resources.</i>
F. Has a hydrological study been completed for the project or project site?
<input checked="" type="checkbox"/> Yes (Enclose the hydrological study) <input type="checkbox"/> No
Please see Attachment 2, Supplemental Engineering Narrative, and Attachment 6, Conceptual Drainage Plan
<i>Note: A hydrological study or other information on the site hydraulics (e.g., flows, channel characteristics, and/or flood recurrence intervals) may be required to evaluate potential project impacts on hydrology.</i>

12. MEASURES TO PROTECT FISH, WILDLIFE, AND PLANT RESOURCES

A. Describe the techniques that will be used to prevent sediment entering watercourses during and after construction.
A preliminary Drainage, Sediment, and Erosion Control Plan (DSECP), the California Energy Commission's equivalent of a Storm Water Pollution Prevention Plan, has been prepared and is included as Attachment 7. The DSECP identifies project design features and BMPs that will be used to effectively manage drainage-related issues (e.g., erosion and sedimentation) during construction grading and for long-term operations. These BMPs include the following: <ul style="list-style-type: none">• Employee Training Program• Erosion and Sediment Control• Good Housekeeping Programs• Preventive Maintenance Programs• Structural BMPs• Equipment and Vehicle Management Practices• Spill Prevention and Response Programs• Inspection Programs
B. Describe project avoidance and/or minimization measures to protect fish, wildlife, and plant resources.
Chapter 5 of Attachment 3, Biological Resources Technical Report, and Attachment 4, Supplemental Biological Resources Technical Report, describes in detail the avoidance and minimization measures to protect special-status plant and animal species. Project design features that avoid and minimize impacts to these species include the following: <ul style="list-style-type: none">• Employee Training Program• Preconstruction Clearance Surveys for Sensitive Species• Tortoise-Proof Fencing Around Perimeter of Project• Biological Monitoring During Construction by Qualified Biologists• Trash Abatement Program

Comment Letter 6

NOTIFICATION OF LAKE OR STREAMBED ALTERATION

- Established Parking and Staging Areas
- Spill Prevention and Response Programs
- Seasonally Dependent Avoidance Measures for Occupied Burrowing Owl Burrows
- Testing and Reporting Program for Evaporation Ponds

Note that this SAA does not address potential impacts to special-status species. This will be addressed through the Section 2081 process with CDFG.

C. Describe any project mitigation and/or compensation measures to protect fish, wildlife, and plant resources.

The Project has developed compensation measures to address impacts to waters of the State. A Conceptual Mitigation Plan for the proposed approach to compensate for impacts to waters of the State is included as Attachment 8. This plan discusses potential options for mitigation on site and off site.

In addition, compensation for potential impacts to special-status species is described in detail in Chapter 5 of the Biological Resources Technical Report (Attachment 3), the Supplemental Biological Resources Technical Report (Attachment 4), and in the Section 2081 draft application anticipated to be submitted to CDFG in December 2009.

ENVIRONMENTAL EVALUATION OF PROJECT
UPDATES

PALEN SOLAR POWER PROJECT (09-AFC-7) CEC STAFF ASSESSMENT – ENGINEERING CHANGES
Response Date: May 4, 2010

Minor Changes to the Palen Solar Power Project

Palen Solar I, LLC (PSI) has made various minor modifications to the Palen Solar Power Project (PSPP) since the Application for Certification (AFC) was submitted in August 2009. These minor changes are not reflected in the March 2010 Staff Assessment/Draft Environmental Impact Statement and reflect further definition of linear facilities and other changes required by other regulatory agencies and our construction team. The following pages briefly describe the various changes and evaluate their environmental implications for the PSPP, i.e., the effects of these changes (if any) on the existing analysis of Project impacts.

The PSPP Project changes discussed below include:

- Addition of an Onsite Concrete Batch Plant During Construction;
- Addition of Evaporation Ponds to process Industrial Wastewater Flows;
- Revision to Construction Water Requirements, Number of Groundwater Wells, and Construction Water Storage Approach
- Finalization of the Gen-Tie Line Route to the Southern California Edison (SCE) Red Bluff Substation;
- Changes to the Layout of Project Facilities;
- Addition of a Temporary Construction Power Line from Offsite;
- Relocation of the Existing SCE 161-kV Power Line;
- Refinement of Daily Construction Schedule;
- Finalization of the Telecommunications Line;
- Revised List of Water Treatment Chemicals, and
- Addition of an Onsite Fuel Depot

ADDITION OF CONCRETE BATCH PLANT

With the anticipated requirement for approximately 125,000 cubic yards of concrete for each of the two solar plants of the PSPP, PSI has decided to include an on-site concrete batch plant to provide a cost-effective and reliable source of concrete for the solar field and power block foundations and pads. The batch plant will have a production capacity of 150 cubic yards per hour and is expected to operate 10 hours per day, five days a week. Night operation of the batch plant will be required to overcome the difficulty of performing concrete placement in extremely high ambient temperatures (see **Refinement of Daily Construction Schedule** below).

The plant will consist of a series of storage bins and sand/aggregate piles, conveyors, ice storage and chipper, and provision for dust control. It requires a 75-kilowatt power supply of line power (or a diesel generator). Concrete will be transported from the batch plant to the on-site placement area(s) via a fleet of eight cement trucks. The proposed batch plant is portable and will be moved to a number of different locations to support current work activities. Likely deployment locations are the two power blocks and the Project's main warehouse area. (See drawing provided at the end of this document of the Temporary Construction Facilities for batch plant location.)

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

Implications for Project Impact Analysis:

PSI has evaluated the overall elapsed time for a standard ready mix truck to travel from an existing commercial ready mix facility in Blythe to the Project site with allowances for the time required to pass through security, on-road travel and offroad travel within the site and determined that the time exceeds the recommended time between concrete preparation and pour. Thus, PSI has determined that a temporary concrete batch plant will be required onsite for Project construction.

Providing the concrete batch plant onsite does not change the amount of concrete required for Project construction. It merely means that the raw materials (cement, sand, aggregate, etc.), and plant components (storage bins, mixers, etc.) will be delivered to the site rather than having ready mix concrete trucks deliver concrete product from an offsite batch plant location. An onsite batch plant will not disturb land outside the current, surveyed disturbance area boundaries for PSPP.

Air pollutant emissions for the batch plant are estimated using EPA AP-42 emission factors for each individual step in the concrete production process. Emissions are estimated for storage piles (sand, gravel, cement additive), weigh hopper loading, conveyor transfers, silo loading and discharge, and mixer loading. The weigh hopper loading and conveyor transfers for sand and gravel will operate with water sprays for dust emissions control, and both the silo and the mixer loading will operate with baghouse dust controls. Daily emissions are estimated based on a maximum production volume for the batch plant of 150 cubic yards per hours, 10 hours per day, with a total concrete requirement of 125,000 cubic yards per power block.

In addition, the batch plant will require 75-kW of temporary construction power (see **Addition of a Temporary Construction Power Line from Offsite** below) and will require the dedicated operation of one front-end loader. Emissions for the generator, if required, are based on Tier 2 engine emission factors and emissions from the front-end loader are based on the OFFROAD emissions model. Emission estimates for the Batch Plant are shown in Table Air-1. Detailed emission calculations are provided in the spreadsheet titled Batch Plant Emissions provided in Appendix C.

The batch plant emissions were incorporated into the revised ambient air quality modeling that was conducted for the construction phase of the PSPP. Please see the air quality evaluation below under the heading titled **"Revision of Daily Construction Schedule"** below for a discussion of the modeling procedure and results.

Batch plant operations require water and batch plant needs are included in a revised Project construction water volume of 5,750 acre-feet. A separate discussion is provided below of the changes in Project water requirements under the heading **Revision to Construction Water Requirements, Number of Groundwater Wells, and Construction Water Storage Approach**). That section addresses changes to the Chuckwalla Valley Groundwater Basin water balance and cumulative impacts assessment and the potential impact to adjacent water supply wells from increased Project groundwater pumping during construction.

The batch plants, along with the other Project construction activities, would be regulated under Riverside County noise ordinance requirements for construction activities. The County noise ordinance establishes limits for construction activities within ¼ mile of an existing residence. Because batch plant operations would not occur near the boundary of the PSPP site, they also would not occur within ¼ mile of the nearest residence. The County noise ordinance does not limit construction noise levels. Batch plant noise levels would be approximately 90 dBA Leq at 50 feet

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

(depending on design). The batch plant noise levels are somewhat higher than the construction noise levels addressed at the site boundary in the AFC noise analysis. However, the fact that this source would be located away from the boundary of the remote PSPP site allows greater distance for noise attenuation. Project noise impacts would not be substantially different because of the temporary onsite operation of a concrete batch plant.

With respect to hazardous materials issues, batch plant operations will require use of some low toxicity hazardous materials, such as fly ash and/or calcium chloride. However, the impacts of the temporary use of these materials would not substantially affect Project hazardous materials impacts and they would remain less than significant.

From the waste management perspective, batch plant operations will generate minimum amounts of waste concrete (i.e., daily clean out of cement trucks) and bag house or other dust control equipment particulates. The batch plant will recycle materials (e.g., sand, gravel, and water) wherever possible to minimize the volume of waste. Project waste management impacts would remain less than significant.

The onsite batch plant would eliminate the ready mix concrete truck trips associated an offsite batch plant. This would be offset by truck trips delivering concrete making materials to the site. Overall, Project traffic impacts would be unchanged.

Because no additional land disturbance would result from the onsite batch plant, impacts would be unchanged with respect to biological, cultural, and other natural resources.

ADDITION OF EVAPORATION POND(S) TO MANAGE INDUSTRIAL WASTEWATER FLOWS

As previously proposed, reject water from the Project's water treatment system (reverse osmosis [RO]) concentrate would have been used for on-site dust suppression, however, this approach was found to be problematic by the RWQCB because of their designation of the RO concentrate as a waste stream, which effectively eliminates the option of land disposal. Subsequently, PSI decided to abandon this approach. Instead, after first maximizing the amount of recycling of waste streams through use of the High Efficiency Reverse Osmosis (HERO) system for recovery, PSI has decided to use evaporation ponds to manage on-site industrial waste streams. Ongoing Project design development has determined that waste streams such as blowdown from the small wet auxiliary cooling tower and blowdown from the HTF-to-steam heat exchanger may in certain cases not be recoverable in the HERO system and these streams will be sent to the on-site evaporation pond(s).

PSI plans to construct two 4-acre evaporation ponds in each power block. Two ponds were selected for reliability. The plant will utilize one of the two ponds for approximately 24 months, and then switch to the other. When one pond requires maintenance or solids removal, PSPP can still operate with the other pond. The evaporation ponds will be double-lined and will meet all applicable regulatory requirements for surface impoundments and will be covered with narrow-mesh netting to prevent access by ravens and migratory birds.

Implications for Project Impact Analysis:

The proposed evaporation ponds will disturb no additional land surface areas beyond what was previously analyzed. While the residue in the evaporation ponds represent an additional waste

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

stream that will require offsite disposal, the volume and infrequency of such disposal would not change the Project's less-than-significant waste management impacts.

A primary concern with evaporation ponds is potential biological resources implications. Incorporation of evaporation ponds into the Project design potentially could modify Project impacts in two ways, both related to the attraction posed by the ponds to avian species. First, the ponds may attract ravens in numbers beyond those afforded by the normal, arid conditions extant in the Project vicinity. A larger raven population increases the potential for predation of juvenile desert tortoises. The ponds also represent an attractant to other migratory and resident avian species. Chemicals present in the evaporation pond water potentially could be harmful to these species. In addition, measures taken to prevent access to water surfaces may themselves put birds at risk.

Biological resources mitigation planning for the PSPP already includes development of a Raven Management Plan. This Plan will be revised to incorporate measures that will be taken to prevent potential adverse effects to desert tortoises as a result of a subsidized raven population. The Plan will entail exclusion netting designed to prevent access to the water surface by ravens. The Raven Management Plan will also detail the measures taken to preclude access to the water surface by other avian species, and to prevent avian species from being harmed in any way by the exclusion devices.

Evaporation ponds, along with the Project's proposed Land Treatment Unit (LTU) have the potential to impact underlying groundwater and surface water quality. A report of waste discharge (ROWD) has been submitted describing the design, operation, management and detection monitoring program for the LTU. At this time, the evaporation pond design is still under development; a complete description of this Project element, including pond design, construction and maintenance, wastewater process and characterization along with a detection monitoring program will be part of the ROWD application to the Colorado River Basin Regional Water Quality Control Board, which is anticipated in May of 2010.

Construction and operation of the evaporation ponds will not affect the type or quantity of hazardous materials used by the PSPP. The waste streams sent to the evaporation ponds will be the same with or without evaporation ponds. At least a portion of the discharge from the Project's auxiliary cooling towers and boilers will be routed to the evaporation ponds. Blowdown that bypasses the HERO and is discharged to the evaporation ponds will still contain solids and other chemicals (e.g., corrosion inhibitor), which means the blow down will be classified as a designated liquid waste. Solids (suspended and total dissolved solids) will be present and unchanged whether the blowdown is routed completely through the HERO or a portion of the blowdown is routed to the HERO and the evaporation ponds. As mentioned above concerning potential water resources impacts, the operator of an evaporation pond is required to submit a Report of Waste Discharge (ROWD) and obtain Waste Discharge Requirements (WDRs) from the RWQCB. The WDR will describe the design criteria, monitoring and sampling protocol, and other management criteria to minimize a release to the environment. The waste volumes associated with periodic cleanout of the dried evaporation pond residues would not significantly affect available disposal facilities.

Onsite evaporation ponds will not have a substantial effect on the Project's air quality impacts. The process of evaporation ponds construction is expected to have minimal effect on Project construction phase air quality impacts. Earthwork (cut and fill, grading, and compaction), and other activities (e.g., truck trips delivering clay for pond liners) associated with pond construction would slightly change Project construction emissions. Air quality impacts of evaporation pond operation would be minimal.

4

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

REVISION TO CONSTRUCTION WATER REQUIREMENTS, NUMBER OF GROUNDWATER WELLS, AND CONSTRUCTION WATER STORAGE APPROACH

There has been no change in the Project's plan to supply construction and operation phase water to the Project from onsite wells. The anticipated Project construction water demand is now 5,750 acre-feet (average of ~3.4 million gallons per calendar day over the 39-month construction period). This is an increase from the estimate of 1,500 acre-feet included in the PSPP AFC. Expected water usage during Project operation has not changed. The Project (both solar units) will require a total of approximately 300 acre-feet per year (afy).

To supply the needed quantity of water and inconsideration of the proposed change in the construction water volume and based on the uncertainty in well yield due to the limited number of well tests performed to date, PSI proposes to install and operate up to 10 wells on site. The wells will be located within the Power Block and elsewhere within the Solar Field to provide primary and secondary water supply to the Project. This is an increase in the number of on-site wells compared to the number proposed in the AFC.

Water for construction activities including dust control, soil excavation and compaction, equipment flushing, etc., will be stored onsite in temporary tanks. The temporary tanks are envisioned as "Baker Tanks," which are steel fixed axle tanks /vehicles that can be pulled to the site and set at any convenient location. Upon completion of the Project activity, the tanks are removed from the site in the same manner.

Implications for Project Impact Analysis:

The change in proposed construction water supply represents an increase of about 12 times over the previously estimated volume of about 480 acre-feet per year for 39 months, for a total of approximately 1,500 AF over the entire construction period. The impacts from the change were evaluated using the Cumulative Impacts Assessment spreadsheet (AFC Table 5.17-12 (rev 2)) and the numerical groundwater model provided in the data response of March 12, 2010. The cumulative impacts assessment was modified only changing the construction water volume to the proposed 1,917 acre-feet per year over a 3-year period beginning in 2011. The recharge and discharge elements (i.e., mesa "inflow and "outflow") were not changed over the water balance provided in Table Soil and Water-194-2 (rev1) (see March 2010 submittal [not included as no changes were made to table]) under the assumption that the infiltration would be about 5% of precipitation. The forecast shows that the Project during construction will account for about 68% of the total water used by renewable energy projects proposed in the Chuckwalla Valley Groundwater Basin for an approximately three-year period starting in 2011.

The Project's operational water volume is unchanged and accounts for about 1% to 2% of the total renewable water use, and represents about a 3% to 18% increase in total demand in the Chuckwalla Valley Groundwater Basin under an assumption of no change in the base year inflow and outflow estimates. By comparison, the proposed operational volume represents about 2.4% of the estimated recharge. While the cumulative forecast from all the current and future sources results in a short-term net annual deficit, depending on the assumption of aquifer storage, the cumulative decline across the Chuckwalla Valley Groundwater Basin is between about 0.5 and 2 feet. It would be anticipated that the water level decline would be greater in areas of higher water demand. As noted in the AFC, the proposed water use for the Project alone represents about 0.1% of the available water in storage in the Chuckwalla Valley Groundwater Basin. Given its fractional

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

contribution to the total water use, the Project does not represent a cumulatively considerable contribution to the water resource impacts to the Chuckwalla Valley Groundwater Basin.

The groundwater model provided in the Data Response submitted March 12, 2010, was revised to reflect an updated volume of construction water supply for the PSPP. Table Soil and Water 207-1 (rev2), "Pumping Schedule for Numerical Groundwater Modeling", was modified to incorporate the change in the construction water volume over the volume proposed in the AFC. For the numerical simulations, the total water volume (5,750 acre-feet) was applied over a 3-year period as a conservative estimate of the construction water impacts as the Project construction period is proposed at 39 months. No other changes were made in the operational water volume (300 acre-feet per year) or aquifer characteristics, or transmissivity zoning as provided for the Data Response (see Figure DR S&W 207-3, March 2010). While the operational volume was not changed, the full volume of water for construction and operation was segregated and applied through pumping wells at four locations within the Project footprint (Figure Soil and Water-1).

The revision to the construction volume was simulated for both the Project Only and Cumulative Impacts scenarios (Run 7 and Run 15 from prior modeling, March 2010). The model configuration and zonation (i.e., distribution) of transmissivity and storage coefficient were not changed over the configurations provided in March 2010 Data Response (i.e., no changes were made to Figure DR S&W 207-3). Run 7 (Project only) and Run 15 (Cumulative Impacts) were updated only with the change to the construction water volume as shown on Table Soil and Water 207-1 (rev2). The transmissivity distribution was not changed from the distribution to provide a comparative assessment between the previous modeling and the updated version with the change in the construction water volume. As noted previously, the transmissivity distribution was mapped in a conservative sense, in that lower range values were applied over larger areas which would tend to produce a larger cone-of-depression. It is important to emphasize that the numerical modeling is a 2-D simulation and as such the transmissivity values are uniformly applied through the model domain and assumed constant through the vertical extent of saturated sediments. This represents a conservative approach to the analysis of water supply and impacts from the Project, as it presumes through-going uniformity of aquifer characteristics that are not documented in the hydrostratigraphy for the Basin. The Basin shows significant heterogeneity and possibly higher transmissive sediments at depth below the Project and in the central portion of the Basin.

The model results are shown in Table DR-Soil and Water 207-2 (rev2). As can be seen in the results, the maximum drawdown occurs at the end of construction (see Figure Soil and Water-2 and Soil and Water-4). During the operational period, the pumping rate drops and is distributed uniformly in the area of the Power Blocks, as such so does the drawdown. It is also noted that at the end of operation, the drawdown is slightly larger than at the middle of operation due to prolonged pumping (see Table DR-Soil and Water 207-2 (rev2)). The impact to adjacent water supply wells was also assessed using the radius of influence from the construction and operational pumping wells to the 5-foot drawdown and 1-foot drawdown contours. The maximum distance at 1 foot drawdown for the Project occurs at the end of operation for either scenario, though there is no drawdown above 5 feet predicted beyond the Project footprint (see Figure Soil and Water-3 and Soil and Water-5). Additionally, during construction no offsite water supply wells are predicted to be affected by project pumping causing a drawdown of 5 feet or more (Figure Soil and Water-2 and Soil and Water-4). The scenarios modeled reveal that no offsite well is expected to be affected to a drawdown of 5-feet or more by the Project pumping.

In a numerical groundwater flow model, inflows and outflows of the model domain can be obtained using the model flow budget for each simulation. The cumulative difference between the inflows

PALEN SOLAR POWER PROJECT (09-AFC-7) CEC STAFF ASSESSMENT – ENGINEERING CHANGES
Response Date: May 4, 2010

and outflows is the storage change for the aquifer. As can be seen from Table DR-Soil and Water 207-2 (rev2), the largest net storage change occurs at the end of operation for either model scenario. Assuming a total recoverable storage of 15,000,000 acre-ft in the basin (DWR, 1979), the impact of basin storage over the full term of the Project (30 years) is insignificant even for the largest storage change at the end of operation (0.97%).

The numerical modeling files are provided in Appendix Soil and Water-E. which accompanies this submittal.

IDENTIFICATION OF GEN-TIE LINE ROUTE TO THE TWO PROPOSED SCE RED BLUFF SUBSTATION SITE LOCATION OPTIONS

PSI plans to provide a 230-kV transmission line connection to the proposed SCE Red Bluff substation (RBSS). The proposed 230/500-kV RBSS will be constructed, owned, operated, and maintained by SCE. Since there are two RBSS locations currently being considered by SCE, both along the Devers-Palo Verde transmission line corridor, PSI has identified two gen-tie route options that correspond to each of the proposed RBSS locations under consideration by SCE. Both of the RBSS sites are currently under consideration by SCE are located due west of the PSPP site. These two transmission corridor options are shown in Figure Trans-1 and are designated as options RBSS 1 and RBSS 2. The proposed RBSS 1 location is the one nearest to the PSPP site, located approximately three miles west of the PSPP site boundary, and about half a mile south of I-10 along the Devers-Palo Verde 500-kV transmission line corridor. The proposed RBSS 2 site is located farther from PSPP, approximately nine miles west of the PSPP site boundary, and about one mile south of I-10 also along the Devers-Palo Verde 500kV transmission line corridor.

Starting at the PSPP central switchyard metering point located near the northern boundary of the Unit #2 solar field centerline, the proposed PSPP transmission line would run north approximately ¼ mile until it exits the site boundary. At that point it jogs WNW for about a mile, and then runs due west for about a ¼ mile, and then SW for about half a mile. From there it proceeds due west for approximately 2 ½ miles where it reaches a point approximately ¾ mile north of the proposed RBSS 1 site location. The RBSS 2 transmission corridor option would continue to proceed due west from this point. The first option for the proposed transmission line would, therefore, approach RBSS 1 from the east and would tie-in to the 230-kV bus from the northern end of the substation. The alignment of this proposed corridor option would total approximately 5 ¼ miles.

For RBSS 2, the transmission line would continue to proceed due west from the point located ¾ miles directly north of the proposed RBSS 1 site for an additional three miles, where it jogs NW for about ½ mile and then proceeds another 2 ¾ miles to a point approximately one mile directly north of the proposed RBSS 2 site location. Therefore, the transmission line would approach the proposed RBSS 2 substation from the east and then tie-in to the 230-kV bus from the northern end of the substation, as in the RBSS 1 option. The alignment of this proposed route would total approximately 11 ¾ miles.

Either Red Bluff Substation location is expected to occupy a total of approximately 90 acres. Substation components would include an undetermined number of 230-kV and 500-kV lines, 230/500-kV transformer banks, circuit breakers, switchgear, and a microwave tower. A road would be included to provide vehicular access to the substation. The location and length of this road would be contingent upon the final location chosen for the RBSS. Land disturbance would be limited to the actual structure locations, construction staging areas, and access road. The RBSS will

7:

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

be provided with a perimeter security wall, a minimum of eight feet in height, topped with a minimum of three strands of barbed wire.

Implications for Project Impact Analysis:

Selection of either of these routes between the PSPP plant site and the Red Bluff Substation will not substantially modify previous analyses with respect to air quality or water resources. Previous analyses in these disciplines have included a gen-tie line between PSPP and the RBSS and the differences between the selected route and the routes previously evaluated do not substantially change air emissions or water supply needs. The final selection of RBSS is expected to be identified in Desert Sunlight's DEIS this spring. PSI prefers the eastern option for RBSS due to its closer proximity to the project site and resulting lower cumulative environmental impacts for transmission lines in the area.

With respect to biological resources, portions of the gen-tie line outside the PSPP plant site were located outside the areas surveyed for biological resources in 2009. Full protocol-level biological surveys for these additional areas are currently underway for both of the proposed RBSS transmission line corridor options. It is anticipated that transmission line pole locations and access road construction will result in modest increases in impacts to Sonoran Creosote Bush Scrub and Desert Dry Wash Woodland vegetation. The current surveys will ensure a level of biological resource data that matches that derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. In addition, any necessary additional mitigation provisions will be calculated.

With respect to cultural resources, portions of the gen-tie line outside the PSPP plant site are outside the area surveyed for cultural resources in 2009. Cultural resource surveys for these additional areas are currently underway in order to ensure a level of cultural resource data matching that derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. The resources encountered will be incorporated into Project cultural resources evaluation and treatment programs.

With respect to transmission line safety and nuisance impacts, the electromagnetic field (EMF) is a function of the physical configuration of the transmission line and the voltage and current levels. An EMF study was prepared for a line voltage of 230-kV. No significant transmission line-related impacts were identified as a result of the Project studies and, as such, no additional mitigation is required. The double circuit PSPP transmission lines will operate at 230-kV and will have a conductor surface electric field strength significantly below 15 kV per centimeter because of the large ("Bluebird") conductor chosen for the project. Radio frequency interference and audible noise levels are not expected to be a concern during operation of the line.

CHANGES TO POWER BLOCK LAYOUT

Minor refinements have been made to the power block layouts for each of the two plants to be constructed at PSPP. Generally, these updates include a slightly enlarged ACC for improved STG performance in hot weather; adding new, lower capacity water tanks that have a smaller diameter but are slightly taller than described in the AFC; and relocation and expansion of the water treatment area, which has been shifted to make room for the center header. In addition, the entire power block is reversed north to south from the orientation presented in the AFC.

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

These changes are reflected in attached drawing 2008-045E-PP-001-ALT, Plot Plan Air Cooled Condenser Option (Power Block Layout_ RevE.pdf) for a revised plot plan and power block layout.

Implications for Project Impact Analysis:

The proposed layout changes do not involve disturbance of any previously undisturbed ground surface areas. Thus, they would have no implications for existing analyses related to biological, cultural, or other natural resources. The changes would not substantially affect water use during construction or operation; The relatively minor changes to the sizes and layout of facilities within the PSPP site will not substantially change the existing visual resources impact analysis. Relatively small changes to power block facilities in the interior of the roughly 3,000-acre plant site will be virtually unnoticeable from offsite locations.

The following paragraphs address the air quality implications of several proposed minor changes to the Project's emission sources, source locations, and modeling requirements, including:

- Reconfiguration of the power blocks;
- Increase in hours of operation of the cooling tower;
- Correction to the number of mirror wash events used in the air quality impacts analysis;
- Change to the maintenance vehicle travel within the solar field;
- Elimination of the vehicle travel associated with the use of RO concentrate for dust suppression; and
- Modeling to assess EPA's new 1-hour NO₂ standard (effective date April 12, 2010).

The reconfiguration of the power block by itself would be expected to have a negligible impact to the air quality impacts analysis. Moving an emission source relative to the fence line or other receptors would be expected to change the modeling results at any specific receptor; however, given the distance from the power block to the fence line, any changes in equipment location within the power block would have a negligible impact to a receptor at or beyond the fence line more than 1,000 meters away.

PSI has determined that the wet cooling tower used for heat rejection of the lube oil and generator cooling loops will have to operate 24 hours per day rather than 16 hours per day as was stated in the AFC. PSI expects that the cooling tower will not operate at full capacity during the additional 8 hours per day; however, emissions are estimated based on full load operation. The revised cooling tower emissions are shown in Table Air-2. The ambient air quality modeling analysis has been revised based on the emission increase. Modeling results are discussed and presented below.

The AFC and subsequent Data Request responses contain inconsistent information regarding the frequency of mirror washing; the AFC Project Description stated once per week during the winter months and twice per week during the summer months and the AFC air quality analysis was based on washing once per month during the winter and twice per month during the summer. PSI has confirmed that the AFC Project Description more accurately reflects the anticipated wash schedule. The emission estimates for mirror washing have been revised to reflect the more frequent wash schedule; the emission estimates are shown in Table Air-3. The modeling results have also been revised based on the correct wash schedule; modeling results are discussed and presented below.

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

PSI has developed a more comprehensive understanding of the maintenance inspection requirements for the solar field and has revised the maintenance vehicle mileage and corresponding emission estimates accordingly. Simply put, the maintenance inspection vehicles would travel perpendicular to the solar troughs and piping in the vicinity of the connectors rather than parallel to the troughs and piping. In this way, the travel distance for inspections and corresponding vehicle emissions are reduced substantially compared to initial estimates; the emission estimates are also shown in Table Air-3.

As noted elsewhere, PSI no longer proposes to use RO concentrate for dust suppression and instead will direct this wastewater stream to the evaporation ponds for disposal. Consequently, water truck use for dust suppression activities will not be required, and the emissions associated with water truck use would not occur. The maintenance vehicle emission estimates shown in Table Air-3 have been revised to eliminate the emissions associated with water truck use, and the ambient air quality modeling results have been revised based on this Project change; modeling results are discussed and presented below.

Finally, EPA has adopted a new ambient air quality standard for a one-hour averaging period for NO₂, effective April 12, 2010. The Applicant has prepared a modeling analysis for the 1-hour NO₂ standard to demonstrate compliance with this requirement.

The worst-case normal operations emissions of the Project ancillary sources were modeled along with vehicular emissions from the solar field maintenance vehicles. The emission rates used in the modeling were adjusted from those presented in the AFC and subsequent Data Request responses as discussed above. As was established in the modeling submitted as part of Attachment DR-AIR-5 to the Data Request responses in January 2010, there are no emissions sources within six miles of the PSPP site that emit more than five tons per year of any criteria pollutant. As a result, no modeling was performed of non-project sources beyond the addition of ambient background concentrations. The maximum modeled concentrations for Project emissions are summed with ambient background concentrations for comparison to the CAAQS/NAAQS in Table Air-4.

As shown in Table Air-4, the total concentrations comprised of maximum modeled impacts plus ambient background concentrations are below the CAAQS/NAAQS for all pollutants with the exception of the 24-hour PM10 CAAQS and NAAQS, and the annual PM10 CAAQS.

For the PM10 impacts, the ambient background already exceeds the standards and Project contributions are relatively small (28 percent and nine percent of the 24-hour and annual PM10 CAAQS, respectively). Note that identifying appropriate background data for use in this analysis is difficult because while the Project site is in a part of Riverside County designated as attainment for PM10, the available background data are from monitoring stations that are located to the west in parts of Riverside County or other counties that are designated non-attainment for PM10. Additionally, the closest monitors are located in urban/industrial / agricultural areas which are unlikely to represent background pollutant concentrations in the Project area which is undeveloped desert.

A discussion of the modeling methodology and the modeling results are provided in the Modeling report provided as Appendix A to this submittal. An archive of the modeling file is provided as Appendix B to this submittal.

ADDITION OF A TEMPORARY CONSTRUCTION POWER LINE FROM OFFSITE

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

Construction power will be provided to the site from Southern California Edison. Two alternative sources of construction power are being investigated: a feed from the existing 12.47-kV distribution line that feeds the microwave tower located southwest of the Corn Springs Road interchange (see Figure Palen Telecom and Power Routing 2), and a new 12.47 kV transmission line routed down the project transmission line right-of-way from Desert Center Rice Road. If the 12.47-kV distribution line located near the microwave tower South of I10 is the selected source, then the line will be extended under I-10 and routed into the PSPP site along the site access road. The Project will include construction of a 12.47-kV internal distribution system and step down transformers to provide power as needed to construction operations.

Implications for Project Impact Analysis:

Using temporary line power rather than portable generators lowers Project air quality impacts during construction. Emissions from power line construction would minimally increase emissions. However, installation of the temporary power lines would reduce the need for portable diesel-fueled generators and thus reduce NOx, SOx, VOC, CO and PM10 emissions during the construction period compared to the Project as described in the AFC. Lower air quality impacts are anticipated as a consequence of this Project change.

With respect to biological resources, the temporary construction power line corridor is outside the area surveyed for biological resources in 2009. Full protocol-level biological surveys of the proposed alignments are currently underway. Potential biological impacts are expected to be minimal as this improvement consists of the blading and paving of an existing dirt road segment, approximately one mile in length, and the temporary installation of wooden poles. The current biological surveys will ensure a level of biological resource data that matches the data derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. In addition, any necessary additional mitigation provisions will be calculated.

With respect to cultural resources, the temporary construction power line corridor is outside the area surveyed for cultural resources in 2009. Cultural resource surveys for these additional areas are currently underway. These surveys will ensure a level of cultural resource data that matches the data derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. The resources encountered will be incorporated into the Project's cultural resources evaluation and treatment programs.

RELOCATION OF THE EXISTING SCE 161-KV POWER LINE

There is an existing Southern California Edison (SCE) 161-kV Eagle Mountain-Blythe power line which runs in a northwesterly direction across the southwest portion of the PSPP site. PSI is working with SCE to relocate the SCE line within the BLM ROW. Figure T-Line 1, Palen 161-kV T-Line Relocation, provides an overview of the proposed relocation. The transmission line relocation is part of ongoing Project activities. The AFC identified this relocation as part of the proposed PSPP project. PSI is now making a slight alternation to the route of the relocated line to accommodate one 90-degree turn outside the fenceline rather than two 135-degree turns. This change was recently requested by Southern California Edison.

SCE will be required to remove approximately 6,200 feet of existing conductor, seven 65-foot

//

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

H-frame structures, one 65-foot three pole structure, and associated hardware and guying. The relocated power line will require SCE to install approximately 18 65-foot H-frame structures, three 65-foot three pole structures, approximately 8,000 feet of conductor, and associated hardware and guying. Because of the relatively limited size of the project, the temporary equipment and material staging area would be limited to 20 acres. An unimproved spur road would be required to access the relocated transmission line segments and structure locations.

New structure locations would first be graded and/or cleared of vegetation to provide a level and vegetation-free surface for footing and structure construction. Site preparation would also be required for the assembly of the structures to provide a level and vegetation-free area for the laydown, assembly, and erection of the structures. This laydown area would be approximately 150 feet by 75 feet (0.26 acre).

Implications for Project Impact Analysis:

Relocation of the Eagle Mountain-Blythe 161-kV line will not substantially impact air quality or water resources. Emissions associated with installation of power poles would represent a minimal increase in construction emissions and water consumption. The primary areas of concern with respect to the final gen-tie line route are biological and cultural resources because the selected route includes areas not previously surveyed for biological and cultural resources. The impacts to water resources are expected to be minimal given the relatively short run and limited soil compaction required to install the spur road, laydown area, and pole structures.

With respect to biological resources, portions of the 7,900-foot corridor proposed for the relocated line are outside the area surveyed for biological resources in 2009. Full protocol-level biological surveys for these additional areas are currently underway. It is anticipated that transmission line pole locations and access road construction will result in modest increases in impacts to Sonoran Creosote Bush Scrub and Desert Dry Wash Woodland vegetation. The current surveys will ensure a level of biological resource data matching that derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. In addition, any necessary additional mitigation provisions will be calculated.

With respect to cultural resources, portions of the 7,900-foot corridor are outside the area surveyed for cultural resources in 2009. Cultural resource surveys for these additional areas are currently underway in order to ensure a level of cultural resource data matching that derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. The resources encountered will be incorporated into Project cultural resources evaluation and treatment programs.

REFINEMENT OF THE DAILY CONSTRUCTION SCHEDULE

Based on refinements to the Project construction plan, PSI has determined that certain construction activities would have to be conducted at night in order to meet the Project schedule. For instance, it has been determined that concrete pours should be conducted at night; the high ambient temperatures during the daytime hours would jeopardize the quality of the concrete, as concrete cannot be poured if it is too hot.

PSI also believes that solar collector assembly work would have to be conducted 24 hours per day to meet the construction schedule. In addition, to provide a more comfortable work environment,

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

PSI would like to allow for certain other low-noise construction activities to be conducted at night, including pulling wire and welding. These activities would require operation of the concrete batch plant, generators, light plants, welders, forklifts, possibly small cranes, and miscellaneous other equipment.

Implications for Project Impact Analysis:

The resource areas potentially affected by the requested change in daily work schedule are primarily noise and air quality. Noise impacts potentially could be different because the additional work hours would occur outside normal work hours and include nighttime hours where ambient noise levels are lower than during the day. Also, the impacts of Project emissions on ambient air quality are affected by meteorological conditions. There are calm atmospheric conditions during non-daylight hours including the hours around dawn and dusk that must be taken into account when analyzing the impacts of construction activities in those times of the day.

With respect to noise impacts, PSI is willing to accept a limitation on construction activities outside the already proposed work hours that is consistent with the intent of Riverside County Noise Ordinance. This ordinance prohibits construction activities outside of specified hours within 1/4 mile of an existing residence, and PSI has recommended modification of a Condition of Certification NOISE-6 to make this limitation explicit.

In the AFC and subsequent responses to Staff Data Requests, PSI had proposed to limit construction activities to eight hours per day during the winter months and 10 hours per day during the summer months. Under the original plan, only limited construction activities would occur at night, or during the early morning or late afternoon hours when stable atmospheric conditions prevail. PSI provided ambient air quality modeling to demonstrate that under these circumstances, Project construction would not cause adverse air quality impacts.

Based on a review of the modeling results, the Applicant determined that the majority of the modeled impacts from construction activities were due to the heavy earthwork that would occur near the Project fence line. To evaluate the potential impact of the limited nighttime operations, we have assumed that no earthwork would occur outside of the daytime schedule previously evaluated, and thus emissions from graders, scrapers and dump trucks would not occur. All other construction equipment is assumed to be operational. The emissions from the non-earthwork equipment were evaluated using the modeling approach and methods described in the AFC and DR responses.

The results of the revised construction modeling are shown in Table Air-5. As shown in the table, all impacts, when added to the appropriate ambient backgrounds, are below their respective NAAQS/CAAQS with the exception of 24-hour and annual PM10, and 1-hour NO₂.

In the case of annual PM10 impacts, the maximum modeled annual mean for PM10 exceed the CAAQS when background concentrations are added because the PM10 air quality monitoring station data used for this Project show that the annual PM10 CAAQS is already exceeded in the area where the data were collected. Annual PM10 Project impacts represent only 17.7 percent of the CAAQS for annual PM10 and only 10.4 percent of the total impact to the annual PM10 concentrations when the worst-case background is considered.

For 24-hour PM10, the air quality monitoring station data used for this Project also shows that the CAAQS are already exceeded in the area where the data were collected. Project impacts by themselves are below the NAAQS and exceed the CAAQS on only one 24-hour period out of the

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

1,095 days modeled. In that instance, the CAAQS is exceeded at 4 receptors with a maximum concentration of 51.88 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) compared to the CAAQS of $50 \mu\text{g}/\text{m}^3$. The four receptors are directly along the fence line to the north of the construction sources and within the PSPP right-of-way (ROW), with the diffuser area blocking public access to that fence line. Along with the very conservative nature of the modeling, the remoteness of the location and the extreme unlikelihood that the public would be at that location for any amount of time, the PM10 impacts are not expected to pose a risk to public health.

For 1-hour NO_2 , a total of 907 hours, or 3.4 percent of the 26,304 hours modeled, indicated impacts which, when added to the maximum ambient background concentration over the most recent three years of available data, exceeded the 1-hour NO_2 CAAQS. As an additional refinement, time-matched background data was added to each modeled impact, and the sum compared to the 1-hour NO_2 CAAQS. The results of those added values are shown in Table Air-5. Of the 907 hours that were examined, it was found that only five hours out of the three-years modeled (less than one percent), when added to their time matched ambient background, would exceed the CAAQS, with a maximum total concentration of $397 \mu\text{g}/\text{m}^3$. These impacts occurred on or within 200 meters of the fence line directly to the north of the solar array installation sources after dark. Again, because of the remoteness of the location, the fact that the impacts that exceed the CAAQS occur at night, and the inherently conservative nature of the modeling, the NO_2 impacts are not expected to pose a risk to public health.

Note that identifying appropriate background data for use in this analysis is difficult because while the Project site is in a part of Riverside County designated as attainment for PM10, the available background data are from monitoring stations that are located to the west in parts of Riverside County or other counties that are designated non-attainment for PM10. Additionally, the closest monitors are located in urban / industrial / agricultural areas which are unlikely to represent background pollutant concentrations in the Project area which is undeveloped desert.

Because these results represent the worst-case location for the modeled sources, the limited number of hours (less than one percent of the hours modeled) in which exceedances occur, the limited duration of the construction causing these impacts, the fact that what exceedances do occur do so within the Project ROW, and the likelihood that the background concentrations used in the analysis exceed the actual background levels in the Project area, the adverse impact to the public from construction activities within the constraints outlined in this discussion is expected to be minimal.

FINALIZATION OF THE TELECOMMUNICATIONS LINE

The Project will obtain telecommunications service from the telecommunications service provider that serves the Desert Center area. Voice and data communications would be provided by a new twisted pair telecommunications cable. The routing of this cable will exit the Project site in the right-of-way for the site access road, cross under I-10 west of the Corn Springs Road interchange and proceed to the microwave repeating tower located approximately 700 feet south of the freeway (see Figure Palen Telecom and Power Routing 2). At the microwave tower additional equipment will be installed to connect project communications with the telecom provider's network. Wireless telecom equipment will be used to support communication with Staff dispersed throughout the project site. The project would utilize electronic telemetry systems to control equipment and facilities operations for the site.

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

Implications for Project Impact Analysis:

The addition of new telecommunications equipment to the PSPP would not substantially change project impacts in any of the topical areas addressed in the AFC. The installation of this line is not expected to have an adverse impact to air quality resources because the construction requirements do not differ significantly from the construction plan and associated emissions presented in the AFC, and there are no operating emissions associated with this equipment.

With respect to biological resources, the telecommunications line corridor is outside the area surveyed for biological resources in 2009. Full protocol-level biological surveys of the proposed alignments are currently underway. Potential biological impacts are expected to be minimal as this improvement consists of trenching and burying the lines in the drainage ditch under the freeway approximately 30 inches deep while taking adequate steps to avoid erosion. The current biological surveys will ensure a level of biological resource data that matches the data derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. In addition, any necessary additional mitigation provisions will be calculated.

With respect to cultural resources, the telecommunications line corridor is outside the area surveyed for cultural resources in 2009. Cultural resource surveys for these additional areas are currently underway. These surveys will ensure a level of cultural resource data that matches the data derived from the 2009 surveys. Upon completion of these surveys, the results and the related impact analyses will be forwarded to the CEC and other reviewing agencies. The resources encountered will be incorporated into evaluation and treatment programs.

REVISED LIST OF WATER TREATMENT CHEMICALS

Additional water treatment chemicals will be required for the boiler, RO system, clarifier, multimedia filters, and cooling towers. These additional water treatment chemicals (beyond what has already been provided in AFC Table 5.6-3) include soda ash, lime, sodium hypochlorite, coagulant, magnesium chloride, polymer, anti-scalant, sodium bisulfate, corrosion inhibitor, dispersant, sodium hydroxide, scale inhibitor, biodispersant, phosphate, amine, and hydrazine. Currently, detailed engineering changes to the water treatment process are being prepared, and we expect the revised Table 5.6.3 showing all additional process chemicals including quantities, hazardous material and CAS #s, relative toxicity and hazard class, RQ, PEL, storage description and capacity, and storage practices/special handling precautions, etc. will be provided to the CEC.

Implications for Project Impact Analysis:

Listed additional hazardous materials are typical water treatment chemicals; however, hazardous materials, such as sodium hydroxide, in sufficient concentration and quantity may trigger risk management plan or California Accidental Release Prevention requirements. All hazardous materials storage or process vessels will be designed in conformance with applicable American Society of Mechanical Engineers codes. Bulk storage tanks or totes will have secondary containment structures capable of holding the tank or tote volume plus an allowance for precipitation. Concrete containment structures will be coated with a chemical resistant coating to ensure long-term integrity of the containment structure.

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

As with all other aspects of the PSPP, appropriate safety programs will be developed to address hazardous materials storage and use, emergency response procedures, employee training requirements, hazard recognition, fire safety, first aid/emergency medical procedures, hazardous materials release containment/control procedures, hazard communications training, Personal Protective Equipment training, and release reporting requirements. In short, the additional chemicals on site would not affect Project impacts.

ADDITION OF AN ON-SITE FUEL DEPOT DURING CONSTRUCTION

A fuel depot will be constructed to refuel, maintain, and wash construction vehicles. It will occupy an area of approximately 75 feet x 150 feet and will consist of a fuel farm with two 2000-gallon on-road vehicle diesel tanks, two 8,000-gallon off-road vehicle diesel tanks, one 500-gallon gasoline tank, and a wash water holding tank. Each diesel tank would be subdivided into two compartments, an 8,000-gallon compartment for off-road diesel fuel and a 2,000-gallon compartment for on-road diesel fuel. The fuel farm will include secondary spill containment; a covered maintenance area, also with secondary containment; and a concrete pad for washing vehicles. (Please see the attached Figure Depot-1, Fuel Depot Layout for a generalized layout of the proposed fuel depot.)

Implications for Project Impact Analysis:

The gasoline storage tank is subject to air permit requirements under SCAQMD rules; the diesel tanks are exempt from permit requirements in the SCAQMD pursuant to Rule 219(E)(14)(c).

The emissions from the two 10,000-gallon diesel storage tanks and the 500-gallon gasoline storage tank proposed for PSPP were calculated using EPA's TANKS 4.09D tank emission estimation program and the maximum annual fuel usage during the construction and operational phases of the project. The maximum annual fuel usage was calculated from the CO₂ emissions derived from the OFFROAD2007 and EMFAC2007 models for each equipment and vehicle type used during the construction of the project. The CO₂ emissions were divided by the ARB's default CO₂ emission factor, which is based on the carbon content of the fuel, to estimate the fuel consumption. This method was selected to calculate fuel usage because the OFFROAD2007 model incorporates fuel economy and average load rates into the emission factors, so additional adjustments are not required. To prevent the underestimation of annual emissions, it was assumed that the maximum monthly fuel usage for the construction of the project would occur every month. The maximum annual gasoline and diesel usage from the operation of PSPP was taken from the GHG emissions calculations submitted in the DR responses, using the same method as described for construction. Note that this method would overestimate the fuel throughput and corresponding tank emissions during both construction and operations because some of the equipment is expected to be refueled offsite. Fuel Depot emissions are summarized in Table Air-6. The VOC emissions from these tanks are not expected to cause or contribute to a significant adverse air quality impact.

As noted in the PSPP AFC (page 5.6-12), diesel fuel is the hazardous material with the greatest potential for environmental consequences during Project construction due to the volume of diesel fuel that will be used in construction equipment and the frequent refueling that will be required). When refueling is needed, vehicles will enter a dedicated refueling area where secondary containment is present to minimize the impact to the environment. A dedicated location increases the ability to effectively manage spills, leaks, storage, handling, loading/unloading, and other activities associated with vehicle fueling. Any fuel spilled will be contained and promptly cleaned up

**PALEN SOLAR POWER PROJECT (09-AFC-7)
CEC STAFF ASSESSMENT – ENGINEERING CHANGES**

Response Date: May 4, 2010

with no contaminated soil generated. If anything, this Project change is expected to decrease the potential for environmental impacts associated with refueling spills.

**Survey Approach and Methodologies for the
Solar Millennium Parabolic Trough
Palen Solar Power Project
2010**

Biological Resource Survey Approach

After submittal of the Application for Certification (AFC) documents to the California Energy Commission (CEC) in 2009, an alternative site configuration was proposed for the Palen Solar Power Project (PSPP). Additionally, various Project design refinements were made related to potential transmission line routes and the substation area.

Additional biological surveys are needed in 2010 to gather data concerning an alternative site configuration and changes in linears in support of Project review, approval, and permitting. The following biological resource surveys will be conducted at the Project site during 2010: desert tortoise (*Gopherus agassizii*; DT) survey, burrowing owl (*Athene cunicularia*; WBO) survey, botanical survey (vegetation community mapping and rare plant surveys), golden eagle (*Aquila chrysaetos*; GOEA) survey, and jurisdictional waters delineation.

All protocols to be implemented in 2010, and described herein, are consistent with 2009 survey protocols, with the exception of a few modifications to the DT protocol, rare plant surveys, and jurisdictional waters surveys. DT protocol surveys for 2010 were initiated earlier than in 2009, and earlier than specified in established protocols (with U.S. Fish and Wildlife Service concurrence; see "Desert Tortoise Protocol" below). Botanical surveys in 2010 will address additional special-status plant species not previously included in 2009 surveys (see "Botanical Surveys" below). The jurisdictional waters delineation in 2010 will also include surveys of a 250-foot buffer of Project and Alternative disturbance areas not included in the 2009 surveys (see "Jurisdictional Waters Delineation" below).

Some survey protocols have already been initiated in 2010 at the Project site. DT surveys were initiated on March 16, 2010. Botanical surveys were initiated on March 8, 2010. GOEA surveys have also been initiated. Jurisdictional waters delineation surveys have been completed. WBO surveys have not yet been initiated at the PSPP site but are anticipated to begin during the week of April 26, 2010.

In general, surveys at the Project site will occur within 1) proposed Project disturbance areas (based on footprint refinements) and, 2) Project disturbance area buffer zones that were not previously surveyed in 2009. At the PSPP site, surveys will additionally occur within 3) proposed Project Alternative site disturbance areas (or Alternative disturbance areas) and 4) Alternative disturbance area buffer zones that were not previously surveyed in 2009.

A detailed description of the survey locations and methods for each biological resource survey being implemented in 2010 is provided below.

Biological Resource Survey Protocols

This section identifies the specific locations in which biological resource surveys have already been completed (e.g., survey extent [2009]) and will be conducted in 2010 (e.g., survey areas [spring 2010] and buffer survey areas [spring 2010]) at the Project site (Figures P-1 through P-4; see Attachment 1 for all figures), and describes the detailed survey methodologies (i.e., protocols) that will be implemented in 2010. If Project or Alternative disturbance areas are further modified after the date listed on this

document, survey areas and protocols may be modified accordingly to meet the purpose and intent of documenting and evaluating the environmental baseline for biological resources on the Project site.

Desert Tortoise Protocol

DT surveys will include a combination of Presence-or-Absence surveys (i.e., 100 percent coverage surveys), and additional transect-based sign surveys within a Project buffer zone. DT Presence-or-Absence surveys will occur in suitable habitat within proposed Project disturbance areas and Alternative disturbance areas for which surveys were not previously conducted in 2009 (Figure P-1). Sign surveys will occur along CEC-required buffer transects (placed at 1,000-foot, 0.75-mile, and 1-mile intervals from disturbance areas) that were not previously surveyed in 2009 (Figure P-1); see below for more complete description of CEC-required buffer transects. A habitat assessment for DT has already been completed at the Project site in February 2010 and areas to be surveyed in 2010 were determined to be potentially suitable for DT.

Presence-or-Absence Surveys

Presence-or-Absence surveys (100 percent coverage surveys) for DT during 2010 will follow the guidelines published in the 1992 U.S. Fish and Wildlife Service (USFWS) survey protocol (USFWS 1992), with the following exception: no surveys of the five zone of influence (ZOI) transects that are typically required outside of and parallel to the disturbance area at 100, 300, 600, 1,200, and 2,400 feet will be conducted. Use of the USFWS 1992 protocol with the exception of ZOI transects (as occurred in 2009), rather than the revised 2009 protocol (USFWS 2009), was agreed upon by USFWS, California Department of Fish and Game (CDFG), U.S. Bureau of Land Management (BLM), and CEC in 2009 prior to survey initiation per an email communication dated March 10, 2009, from Julie Vance (refer to Section 2.2.1 of the AFC).

In accordance with the 1992 USFWS protocol, previously unsurveyed portions of the Project disturbance area at the Project site will be surveyed using transects spaced approximately 30 feet apart along transects oriented north to south or along transects that are parallel to the edges of the disturbance areas. The survey will be conducted by slowly and systematically walking linear transects while surveyors visually search for DT and sign. Particular emphasis will be placed on searching around the bases of shrubs and along the banks of shallow washes. All types of DT sign (live tortoises, shells, bones, scutes, limbs, scat, burrows, pellets, tracks, egg shell fragments, drinking sites etc.) will be recorded using a Global Positioning System (GPS) unit. If vegetation or topography reduces the surveyor's ability to see DT sign, the spacing between survey transects will be reduced, as necessary. This would occur in areas with high vegetation density or where topography obscures the surveyor's ability to see DT sign.

Any DTs observed will be measured at middle carapace length (MCL) and evaluated for health. Photographs of DT observations will be taken when possible (e.g., animal not deep in burrow). Photographs of large carcasses and/or unusual sign will also be taken. Burrows, scat, and shell remains will be classified using the Information Index for Desert Tortoise Sign: Burrows and Dens, Scats and Shell Remains as in the USFWS protocol (USFWS 1992).

DT Presence-or-Absence surveys were initiated on March 16, 2010 (with wildlife agency approval; see discussion below) at the PSPP site; at this time mean daily temperatures had reached a minimum of approximately 65°F, adequate annual forage was available for DTs, and evidence of DT activity was observed at the nearby Blythe Solar Power Project site. The proposal to initiate Presence-or-Absence surveys at the PSPP site earlier than the March 25 to May 31 survey period, as stated in the USFWS 1992 protocol, or the April through May survey period as stated in the USFWS 2009 protocol (USFWS 2009), was presented in a letter to Pete Sorenson at the USFWS (dated March 2, 2010, attached) with subsequent USFWS concurrence via email from Pete Sorenson on March 16, 2010. DT surveys will continue roughly until the end of April or until the survey effort is completed (prior to May 31).

After completion of Presence-or-Absence surveys, results will be used to calculate estimated adult DT (> 160-mm MCL) abundance within disturbance areas surveyed in 2010. Abundance estimates will be calculated according to the 2009 survey protocol (*Preparing for Any Action That May Occur within the Range of the Mojave Desert Tortoise (Gopherus agassizii)* [USFWS 2009]) if protocol assumptions are met (e.g., minimum of 20 DTs are detected within the survey area).

Buffer Transect Sign Surveys

To comply with the recommendations of the draft CEC *Recommended Biological Resources Field Survey Guidelines for Large Solar Projects* (CEC 2007a), transects outside of and parallel to proposed Project disturbance areas will also be surveyed for DT and their sign (Figure P-1). These CEC-required buffer transects will be placed at 3,960 feet (0.75 mile) and 5,280 feet (1 mile) from and parallel to the edge of nonlinear portions of disturbance areas as well as at 1,000 feet from the edge of linear portions of disturbance areas (e.g., transmission line). Surveys along buffer transects will be conducted in a similar fashion as for transects described for Presence-or-Absence surveys, by slowly and systematically walking linear transects while surveyors visually search for DT, their sign, or other special-status species and their sign. Particular emphasis will be placed on searching around the bases of shrubs and along the banks of shallow washes. These transects are more broadly focused than the DT Presence-or-Absence protocol transects, described above, and are not a part of the 1992 USFWS DT protocol requirements. However, they provide additional information on DT occurrence and habitat suitability as well as other biological resources in the area surrounding Project or Alternative disturbance areas.

Western Burrowing Owl Protocol

WBO surveys will focus on suitable habitat in proposed Project disturbance areas Alternative disturbance areas, and surrounding buffer zones that were not surveyed in 2009 (Figure P-2). Surveys will follow the *Burrowing Owl Survey Protocol and Mitigation Guidelines* prepared by The California Burrowing Owl Consortium (CBOC) (1993). In accordance with the protocol, a habitat assessment (Phase I survey) for WBO will be conducted in previously unsurveyed portions of the Project and Alternative disturbance areas and in the surrounding 150-meter (approximately 492-foot) buffer zone. Following the Phase I survey, a focused burrow survey (Phase II survey) and WBO survey (Phase III survey) will be conducted in suitable habitat within proposed disturbance areas and the surrounding 492-foot buffer zone. Also, a more general survey of habitat suitability and occurrence of WBO, other special-status species, and sign will be conducted within a 1-mile CEC buffer surrounding disturbance areas (according to the CEC's Draft *Recommended Biological Resources Field Survey Guidelines for Large Solar Projects* [CEC 2007a]), if accessible to the biologists conducting the surveys (see "General Biological Survey Details," below).

The following describes, in more detail, the WBO survey approach and methodology that will be followed in 2010, and is consistent with surveys conducted in 2009.

Phase I Survey: Habitat Assessment

A habitat assessment (Phase I survey) for WBO will be conducted by qualified biologists in early spring 2010. The unsurveyed portions of proposed Project and Alternative disturbance areas and the surrounding 150-meter (approximately 492-foot) buffer zone will be evaluated for suitability for WBO, as well as unsurveyed areas within a 1-mile buffer of proposed disturbance areas. Suitable habitat for WBO includes open habitat with available burrowing opportunities, including agricultural fields (active and fallow), Mojave creosote scrub, desert saltbush, ephemeral washes, and ruderal areas. Suitable habitat will be mapped in the field using high-resolution field maps and GPS units. Any WBOs or WBO sign (e.g., whitewash, pellets, feathers) observed during the Phase I survey will be recorded and mapped.

Phase II Survey: Burrow Mapping

The Phase II burrow survey will be initiated in early spring and will mostly be conducted concurrently with focused Presence-or-Absence DT surveys. The Phase II burrow survey will occur in suitable WBO habitat within previously unsurveyed portions of proposed Project and Alternative disturbance areas, as well as within the 492-foot buffer zone, as required by the CBOC protocol. Where the Phase II burrow survey is conducted concurrently with Presence-or-Absence DT surveys, it will be conducted along pedestrian transects spaced at a maximum of 10 meters (approximately 30 feet) apart; otherwise, spacing between transects may extend up to 30 meters (approximately 100 feet), in accordance with the CBOC protocol. Biologists conducting the Phase II survey will record and map potentially suitable burrows (based on burrow dimensions and characteristics); they will also record and map WBO observations, presence and types of WBO sign (e.g., whitewash, pellets, feathers) observed, and active or potentially active WBO burrows (based on the presence and quality of sign at suitable burrows). These features will be recorded electronically using GPS units and on data forms; WBO observations and potentially active burrows will also be mapped on field maps. Phase II burrow data will also include the type of burrow, if known (e.g., kit fox [*Vulpes macrotis*]; DT), and a GPS identity code.

Phase III Survey: Burrowing Owl Surveys, Census, and Mapping

Phase III surveys will be initiated and completed during the peak breeding season (April 15 through July 15, as defined in the CBOC protocol) and will continue until all burrows with WBO sign have been visited on four separate days. Phase III surveys are intended to determine owl presence on the site and how the site is being used by WBO. It is anticipated that surveys will be completed by the end of May 2010. During the first survey visit of Phase III, previously mapped (during Phase II) suitable burrows will be surveyed by biologists carefully approaching on foot to determine the presence of WBOs and/or WBO sign, in order to assess potential burrow status. Subsequent survey visits (i.e., visits 2–4) will focus on burrows with WBO sign. Based on 2009 survey results, the Project sites are known to include several burrows with WBO sign that is old and degraded, sparse, and absent of any indication of current or recent use. Although all burrows with confirmed WBO sign (including those with old, degraded or sparse sign) will be surveyed four times, only burrows with sign of current or recent occupancy by WBOs will be identified as "potentially active" for purposes of this survey. For any potentially active WBO burrows (i.e., burrows with sign of current or recent occupancy by WBO) identified during visit 1, the burrow areas will be observed during subsequent visits (i.e., visits 2–4) using binoculars or a spotting scope, using the vehicle as a blind (if possible); all other burrows with sign will be approached on foot. It is important to minimize disturbance near active/occupied burrows; if WBOs are detected in association with a burrow, attempts will be made to determine the burrow status without approaching the burrow too closely on foot.

Phase III surveys will be conducted between 1 hour before and 2 hours after sunrise, and between 2 hours before and 1 hour after sunset. Phase III surveys will not be conducted during inclement weather (e.g., wind speeds > 20 miles per hour, heavy rain or fog, etc.). Field data recorded during each survey visit will include date; survey number; weather conditions (temperature, wind, precipitation, cloud cover); surveyor name; start and stop times for each survey visit; location of burrows surveyed during each visit; the suitability of each burrow, based on burrow dimensions and characteristics (collected during first visit to the burrow); presence, absence, and type of WBO sign (if present) at each burrow; occupancy status (active, potentially active, inactive, based on presence and condition of sign); documentation of any WBO detections, including abundance, age, sex, and behavior; and other wildlife species observed. Photographs will be taken of all potentially active burrow locations. In addition, photographs of individual WBOs and active burrows would be taken, if possible without disturbing owls. Any special-status species or their sign observed during these surveys will be recorded electronically using GPS and on data forms.

Botanical Surveys

Botanical surveys in 2010 will include vegetation community mapping (to be conducted during spring) and rare plant surveys (to be conducted during spring and fall, depending on the timing and amount of 2010

precipitation). Vegetation community mapping will occur within proposed Project disturbance areas, Alternative disturbance areas, and within associated one-mile CEC buffers that either were not previously surveyed or need to be resurveyed using a smaller minimum mapping unit (MMU) (refer to "survey areas (Spring 2010)" and "buffer survey areas (Spring 2010)" on Figure P-3). Rare plant surveys will occur within the Project (or Alternative) disturbance areas and associated 1-mile CEC buffer areas that were not previously surveyed in 2009 (refer to "survey areas (Spring 2010)" and "buffer survey areas (Spring 2010)" on Figure P-3).

Additionally, rare plant surveys at the PSPP site will also occur within proposed disturbance areas (Project or Alternative) and associated one-mile CEC buffer areas (Figure P-3) that were previously surveyed in 2009 (i.e., refer to "survey extent (2009)" on Figure P-3), to the extent necessary, to comply with the December 2009 CEC data request for consideration of 15 additional special-status plant species and detailed mapping of ribbed cryptantha (*Cryptantha costata*).

Botanical surveys were initiated on the PSPP site on March 8, 2010.

Vegetation Community Mapping

Vegetation community mapping during spring 2010 will be conducted in accordance with the same methods as 2009 mapping efforts, with minor updates based on 2009 field experience. These updates include the following topics:

- **Scale of field maps:** Field maps used for vegetation mapping will have a scale of 1 inch = 700 feet. Maps at a 200-foot scale (used in 2009) were determined to exceed the resolution of the aerial imagery available and were found to be too cumbersome given the large size of the Project sites being surveyed.
- **Clarification of mapping intensity:** Similar to 2009, survey intensity in 2010 will vary according to the MMU of disturbance areas versus the 1-mile CEC buffers; areas with smaller MMUs (disturbance areas) will be surveyed with greater intensity than areas with larger MMUs (1-mile CEC buffer areas). To accomplish this, field biologists will walk transects at a spacing that allows visual coverage of all unique vegetation signatures having an area equal to or greater than the defined MMU size.

A detailed methodology for 2010 vegetation community mapping is provided below.

Field biologists will use orthotopographic maps at a scale of 1 inch equals 700 feet for both vegetation mapping and recording rare plant points or polygons (see "Rare Plant Surveys" below). If rare plants are documented during vegetation mapping, these sites will be noted and revisited during focused rare plant surveys in order to map plants in more detail and accurately delineate species populations using GPS equipment. Vegetation communities will be classified according to Holland (1986). Sawyer and Keeler-Wolf (1995) and CDFG (2003) classifications will be used to provide additional detail where appropriate, such as denoting special or sensitive vegetation communities that are either known or believed to be of high priority for inventory in the California Natural Diversity Database (CNDDDB) due to their unique nature, limited distribution (i.e., rarity), or importance for special status wildlife species.

Vegetation mapping within proposed Project (or Alternative) disturbance areas may be conducted concurrently with rare plant surveys, by having surveyors walk meandering transects; transect spacing will be based on habitat complexity and topography, and will be close enough to allow visual coverage of vegetation signatures at the minimum mapping unit (0.01 acre for riparian areas and 1.0 acre for all other cover types within proposed disturbance areas [Project or Alternative]). Within the buffer, the MMU for all land cover types, including riparian, will be 1.0 acre. Vegetation mapping within the 1-mile CEC Project (or Alternative) buffer areas will therefore be conducted by walking transects within native habitat that are spaced wider than those walked within disturbance areas, but allow visual coverage of vegetation

signatures that are 1.0 acre in size or larger. Developed land and agricultural areas will be surveyed by a combination of walking transects and selecting key vantage points from existing dirt access roads.

Dominant plant species present within each riparian and upland vegetation community mapped on site will be recorded according to the 50/20 dominance rule (U.S. Army Corps of Engineers [USACE] 1987). According to this rule, dominant plant species are defined as those that, when ranked in order of abundance, collectively make up 50 percent relative cover. Each dominant species individually makes up at least 20 percent relative cover, or is needed to surpass the 50 percent relative cover threshold. Once the dominant plant species are identified according to this method, they will be grouped according to relative cover: species below 20 percent, species ranging from 20 to 50 percent cover, and species exceeding 50 percent cover.

Additionally, a description of each vegetation community mapped on site will be recorded including the extent of disturbance, presence of special soils, potential jurisdictional waters, and habitat suitability for rare plant species (see "Rare Plant Surveys", below). Invasive species listed by the California Invasive Plant Council (Cal-IPC) as A-1, A-2, and B status species (Cal-IPC 2009) will be noted when occurring in high concentrations (approximately 108 square feet and larger) and in nearly monotypic stands. Potential invasive plant species that may be encountered during 2010 surveys on the Project site include tamarisk (*Tamarix* spp.), Saharan mustard (*Brassica tournefortii*), Mediterranean grass (*Schismus* sp.), red brome (*Bromus madritensis*), and cheat grass (*Bromus tectorum*).

Rare Plant Surveys

Rare plant surveys during spring 2010 will be conducted in accordance with the same methods as 2009 surveys, with updates based on 2009 field experience and CEC guidance. These updates include the following:

- **Survey intensity:** Detailed descriptions are now provided to explain the differences between survey intensity within the disturbance area versus that in the 1-mile CEC buffer, especially with respect to habitat suitability.
- **Habitat suitability:** methods for determining habitat suitability have been enhanced at the request of CEC.
- **Complete tracklog:** each biologist will have a GPS unit recording their path during surveys, and these data will be compiled and submitted with the deliverable.
- **Search image:** biologists will visit reference sites and/or herbaria specimens to obtain a search image for each targeted California Native Plant Society (CNPS) List 1B or List 2 plant species during the reconnaissance phase of surveys.
- **Coachella Valley milkvetch (*Astragalus lentiginosus* var. *coachellae*) focused surveys:** if suitable habitat is defined within the disturbance areas and surrounding 1-mile CEC buffers, these areas will be intensively surveyed according to the Coachella Valley milkvetch survey plan (described below). The need for focused Coachella Valley milkvetch surveys is unlikely based on research to date (see below). The survey plan has been created as a precaution.
- **Deliverable enhancements:** the botanical survey report will include all raw field data as attachments and will contain discussion of special status plant species occurrences with respect to onsite conditions as well as known species ranges and suitable habitats.
- **Fall surveys:** while late-season surveys were not feasible in 2009 due to limited rainfall, 2010 may have adequate late-summer rainfall to warrant fall surveys and additional consideration has been given to four fall-blooming special status plant species.

A detailed methodology for 2010 rare plant surveys is provided below, which includes 2009 methods as well as the updates noted above.

Rare plant surveys will follow survey guidelines from the following resources: 1) Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed, and Candidate Plants (USFWS 2000); 2) Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (CDFG 2009)¹; 3) CNPS Botanical Survey Guidelines (CNPS 2001); and 4) Survey Protocols for Survey and Manage Strategy 2: Vascular Plants (Whiteaker et al. 1998).

Target species for rare plant surveys will include special-status plant species that meet at least one of the following criteria:

- Covered under the Federal or California Endangered Species Act (ESA and CESA, respectively) (CDFG 2009)
- Listed as rare under the California Native Plant Protection Act (Fish and Game Code Section 1900 et seq.)
- BLM sensitive species (BLM Sensitive) (BLM 2009)
- CNPS List: 1A (presumed extinct in California), 1B (rare, threatened, and endangered in California and elsewhere), or 2 (rare, threatened, or endangered in California, but more common elsewhere) species are considered special status plant species if they meet the definitions of Sec. 1901, Chapter 10 (Native Plant Protection Act) or Sections 2050 through 2098 (CESA) (CNPS 2009)
- CNPS List: 3 (plants about which we need more information a review list), or 4 (plants of limited distribution—a watch list was also recorded here) (CNPS 2009)
- Locally significant species, covered under the Northern and Eastern Colorado Desert Coordinated Management Plan (NECO) (BLM 2002) or the West Mojave Plan (WEMO) (BLM 2005)

At the direction of BLM, cottontop cactus (*Echinocactus polycephalus*), hedgehog cactus (*Echinocereus* spp.), and all varieties of California barrel cactus (*Ferocactus cylindraceus*) encountered on site will also be recorded and mapped during rare plant surveys (LaPre 2009). The CEC has identified 15 additional target species above and beyond those considered in 2009 to be specifically targeted during 2010 rare plant surveys, 11 of which have potential to occur on the Project site (see Attachment 2). Attachment 2 contains the complete list of plant species that will be targeted during 2010 rare plant surveys.

Rare plant surveys will be "intuitive controlled" (per Whiteaker et al. 1998). The surveys will be conducted by walking transects placed systematically throughout disturbance areas (Project and Alternative) and associated 1-mile CEC buffers while searching for target plant species and suitable habitats. In disturbance areas not previously surveyed during 2009, botanists will traverse all representative habitats, providing complete visual coverage in areas determined to be suitable for target plant species (including microhabitats) (see Attachment 2 for target plant list). This will include closely spaced transects in the desert washes, incised channels, and sandy dune habitats (50-100 feet, possibly less depending on topographic complexity) and wider spacing in the flat creosote bush scrub and desert pavement (approximately 100-200 feet, or more depending on visibility). Transects will follow topographic relief rather than predefined survey grids, for the purpose of providing focused coverage of the desert washes.

1. This document replaced the DFG document entitled "Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened and Endangered Plants and Natural Communities."

Resurveys will occur as many times as necessary to ensure the blooming periods of all target rare plant species have been covered.² Additionally, disturbance areas that were previously surveyed in 2009 would be revisited systematically, as deemed appropriate based on field conditions, in order to comply with the December 2009 CEC data request for consideration of 15 additional special-status plant species and detailed mapping of ribbed cryptantha (*Cryptantha costata*).

In the 1-mile CEC buffer areas, suitable habitats associated with the major desert washes or sandy dune habitats will also be surveyed with complete visual coverage but the areas may not be resurveyed with the same rigor as the disturbance area and isolated microhabitats (areas much less than 1 acre in size and not associated with the desert washes or larger dune complexes) may not be examined with complete visual coverage at the discretion of the lead field botanist.

Suitable habitats will be determined based on geography, slope aspect, soil substrate, vegetation community, associated plant species, and familiarity with each species based on reference populations and historical surveys conducted in the region. Unsuitable habitats may be traversed while traveling between areas of suitable habitat, providing partial survey coverage in these areas. Each field botanist will carry a GPS to record their path through the Project site(s) each day.

The exception to the "intuitive controlled" method described above is with respect to the Coachella Valley milkvetch surveys. This federally endangered plant species must receive more focused attention in areas of suitable habitat where the species has potential to occur. Andrew Sanders has determined that Coachella Valley milkvetch is not currently documented outside of the Coachella Valley area. To reach this conclusion, Mr. Sanders thoroughly reviewed the vouchered collections (identified as Coachella Valley milkvetch) from the Desert Center area (Dice 980324-2; Dice 980324-3; and Sears 1173) and other collection data (e.g., <http://ucjeps.berkeley.edu/consortium/> and University of California at Riverside (UCR) herbaria specimens). After careful consideration, Mr. Sanders found the Desert Center collections (i.e., all Coachella Valley milkvetch collections outside the Coachella Valley) to be *Astragalus lentiginosus* var. *variabilis* rather than *A. lentiginosus* var. *coachellae*.

Therefore, focused surveys for Coachella Valley milkvetch will not be necessary at the PSPP site unless the species is observed on site or Andrew Sanders encounters additional information leading to a reversal of his findings. Prior to the end of the survey window for Coachella Valley milkvetch (late May), a letter from Andrew Sanders will be provided to USFWS, CDFG, CEC, and BLM to finalize and defend the treatment of Coachella Valley milkvetch during 2010 rare plant surveys.

In the event that focused surveys for Coachella Valley milkvetch do occur, a survey plan has been prepared and is located below (see "Supplemental Survey Methods for Coachella Valley Milkvetch (if Necessary)", below).

The timing of rare plant surveys will be based on the most phenologically appropriate time for each target plant species; surveys will occur when reproductive structures (i.e., flowers and fruits) and distinctive leafy parts are present and easily identifiable. When possible, known locations of rare plants in the vicinity of the Project site will be visited to verify the status of these species during the 2010 growing season

-
2. In DR-BIO-81 of the AECOM Response to the CEC Data Request (December 2009), it was suggested that biologists should walk 10-20 meter parallel transects within all habitats of the disturbance areas, regardless of habitat suitability. This approach has been revised, since habitat complexity will dictate how far each botanist will be able to see and will therefore dictate the necessary spacing. AECOM botanists have consulted with regional experts including Andy Sanders and David Silverman to conclude that intuitive controlled surveys per Whiteaker et al. 1998 are sufficient for documenting a complete floral inventory on site (including the target special status plant species).

(germinating, flowering, seeding, etc.). If reference site visits are not possible, specimens from the UCR Herbarium will be studied to inform field biologists of important keying characters.

In general, the ideal survey window for 2010 will be closely associated with the rainfall pattern, considering both rainfall totals and the timing of precipitation. Several survey visits may be necessary to accommodate the distinct phenologies of each target rare plant species with potential to occur on the Project site, including surveys during both spring and fall (if rainfall is sufficient for fall-blooming species). It is anticipated that approximately 2-5 survey visits may be necessary to complete rare plant surveys.

During rare plant surveys (spring or fall) each field botanist will record a complete floral inventory, including the phenology(ies) observed (to document the blooming period and calibrate the timing of additional surveys). Plant nomenclature will follow that of *The Jepson Desert Manual* (Baldwin et. al. 2002). Additionally, scientific names will be used in all records to avoid confusion between taxa. Time will be allotted as necessary to confirm the identity of unknown species to the taxonomic level necessary to determine whether it is a target rare plant species or not (e.g., genus, species, or subspecies/variety).

If a target rare plant population is located, the population will be assessed for vigor and possible threats (e.g., off-road vehicle activity and invasive plants) and the number of individuals will be counted (or subsampled and population size estimated in the event of large populations). All sensitive plant locations identified will be recorded directly with submeter handheld GPS units and will be subsequently mapped on aerial photo-based field maps (700-foot scale orthotopographic maps). Rare plant detections will be mapped either as individual point locations (for single plants) or as occupied polygons (for groups of plants). The threshold distance for distinguishing point locations from polygons will be 7 meters; for example, plants occurring within 7 meters of each other will be included in a polygon, and plants beyond the 7-meter threshold will be documented using individual points).

In addition to mapping special status species occurrences, suitable habitat for the target species will be assessed and mapped. In many cases, not enough information is known about microhabitat preferences of a species to define its habitat beyond the level of vegetation communities.

CNDDDB forms will be completed and submitted to CDFG (as publically available data) for all special-status plant species observed. Voucher specimens of special-status plant species will be collected if it is determined that such collection would not jeopardize the existing population. These collections will be submitted to the UCR herbarium.

Additional Survey Considerations

During vegetation mapping and rare plant surveys, field botanists will document any creosote bush rings observed if they are readily distinguishable.

Regional experts will be consulted for guidance through all phases of survey work for concurrence with the methods employed by AECOM survey teams. This includes botanists such as David Silverman (of Xeric Specialties Consulting) and Andrew Sanders (of the UCR Herbarium). These experts will receive copies of this methodology for approval, and once in the field they will train crews on species identification, conduct expert habitat assessments, and provide guidance on optimal survey timing for the targeted special status plant species.

Supplemental Survey Methods for Coachella Valley Milkvetch (if Necessary)

All surveys for rare plants will be conducted in compliance with the standardized guidelines issued by the regulatory agencies (USFWS 2000, CDFG 2000, and the CNPS 2001). The species specific methods presented below are intended to be a supplement to the standardized guidelines.

Surveys for Coachella Valley milkvetch will be conducted from approximately February through May 2010, depending upon climactic conditions. The number of surveys required will depend upon the phenology of the populations at the reference sites. It is presumed that two to three separate surveys will be required. Prior to initiating surveys, vouchered specimens deposited at the UCR herbarium will be studied to insure survey personnel are familiar with the species. Visits to one or more known locations of Coachella Valley milkvetch will be conducted to determine current phenology and detectability.

Systematic surveys will be conducted to detect presence and determine distribution of Coachella Valley milkvetch within the survey area. The survey area will only include areas of suitable Coachella Valley milkvetch habitat along the substation and transmission line disturbance area and buffer area. For systematic surveys, biologists will walk parallel transects 5 to 10 meters apart throughout the entire survey area. The survey transects will be recorded with a GPS track log using a submeter handheld GPS. Survey crews will include at least one member who has seen Coachella Valley milkvetch in its natural habitat. Other survey members will be trained using photographs and/or herbarium specimens.

If Coachella Valley milkvetch is detected within the survey area results will be recorded as described below. One herbarium specimen will be deposited at the UCR herbarium, if it is determined that collection will not jeopardize the existing population.

Jurisdictional Waters Delineation

A formal delineation for potential jurisdictional waters of the United States and of the State was completed in April 2010 at the Project site within portions of the disturbance area (Project and Alternative), and within a 250-foot buffer of these areas, for which surveys were not previously conducted in 2009 (Figure P-4). Additionally a qualitative functions and values assessment for ambient conditions and projected post-project conditions of these areas was also completed.

Formal Delineations for Potential Jurisdictional Waters of the United States

Jurisdictional waters of the United States are defined in 33 CFR. 328.3 (Definitions). Previously unsurveyed portions of the proposed Project disturbance area and Alternative disturbance area at the Project site have the potential for the presence of, at a minimum, two types of federally regulated waters, warranting the following:

1. Formal delineations for waters of the United States in the form of wetlands based on the three-parameter method.³ The three-parameter method for identifying and delineating wetlands is outlined in and in accordance with Federal guidance and procedure following the *Corps of Engineers Wetlands Delineation (Manual)* (Environmental Laboratory 1987) and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (2008 Supplement) (Environmental Laboratory 2008).⁴
 2. Formal delineations for other waters of the United States to define and identify the jurisdictional lateral extent of nonwetland waters using field indicators of ordinary high water mark (OHWM) as defined by 33 CFR 238.3(e), Federal guidance and procedure outlined in *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States: A Delineation Manual* (USACE 2008), and *Distribution of Ordinary High Water Mark*
-
3. The three-parameter method is the simultaneous presence (co-occurrence) of wetland hydrology, hydric soil, and hydrophytic vegetation.
 4. The Manual and 2008 Supplement are guidance documents for delineating jurisdictional waters in the form of wetlands only.

(OHWM) indicators and their reliability in identifying the limits of "Waters of the United States" (Lichvar et al. 2006).

3. Other relevant Federal guidance and procedural documents (e.g., Regulatory Guidance Letter, Special Public Notices, and USACE Los Angeles District specific guidance)

Formal Delineations for Potential Jurisdictional Waters of the State

The California Code of Regulations (Title 14 CCR 1.72) defines a stream as: "...a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation." Under Section 1600 *et seq.* of the California Fish and Game Code (CFGC), CDFG regulates activities that would alter the flow, bed, channel, or bank of streams and lakes. The limits of CDFG jurisdiction are defined in CFGC Section 1600 *et seq.* as the "bed, channel or bank of any river, stream or lake designated by the department in which there is at any time an existing fish or wildlife resource or from which these resources derive benefit." However, in practice, CDFG usually extends its jurisdictional limit and assertion to the top of a bank of a stream, the bank of a lake, or outer edge of the riparian vegetation, whichever is wider.

CFGC Section 1602(a) is based on Title 14 CCR 720: "For the purpose of implementing Sections 1601 and 1603 of the Fish and Game Code which requires submission to the department of general plans sufficient to indicate the nature of a project for construction by or on behalf of any person, governmental agency, state or local, and any public utility, of any project which will divert, obstruct or change the natural flow or bed of any river, stream or lake designated by the department, or will use material from the streambeds designated by the department, all rivers, streams, lakes, and streambeds in the State of California, including all rivers, streams and streambeds which may have intermittent flows of water, are hereby designated for such purpose".

Boundaries for xeric riparian waters of the State will be determined (and recorded) by the presence of shelving and/or scour resulting in an established bank, bed, and channel of an ephemeral wash feature and its associated riparian areas (where applicable). In specific areas within the ephemeral wash channels, where evidence of shelving or scour is absent, subsurface investigations will be undertaken to identify established channel banks. Although some portions of the ephemeral washes present shelving with smooth-toe transitions, these features are composed of friable sand and are evidence of recent sand deposition covering the bank features.

For wetlands and other aquatic habitats occurring in California, CDFG relies on the USFWS wetland definition and classification system, which is based on *Classification of Wetland and Deepwater Habitats of the United States* (Cowardin et al. 1979). Therefore, jurisdictional wetland delineations within disturbance areas will be conducted based on the one-parameter⁵ method outlined in CDFG/USFWS guidance documents and classification manual(s) to define presence and State jurisdictional extent. The Cowardin method requires diligence to avoid false positive conclusions (e.g., concluding that an area with no transitional relation to the aquatic system is a wetland based on presence of vegetation equally likely to be found in wetland or nonwetland circumstances).

Functions and Values Assessments

A qualitative assessment of the functions and values will also be conducted for ephemeral stream (i.e., xeric riparian) features identified in unsurveyed portions of proposed Project and Alternative disturbance

5. For Federal jurisdictional waters, a determination for the presence of wetland is based on the presence of three parameters occurring simultaneously at the area of investigation and study. These three wetland parameters are 1) hydrophytic vegetation, 2) hydric soils, and 3) wetland hydrology. Therefore, for State-defined wetlands, only one of these three wetland criteria is required to be present for the State to consider an aquatic feature a wetland.

areas at the Project site. This qualitative assessment utilized the Hydrogeomorphic Approach (HGM) to assess the physical, chemical, and biological functions and values of xeric riparian features utilizing a synthesis of the methodologies and definitions outlined in:

1. *A Hydrogeomorphic Classification for Wetlands* as a guide (Brinson et al. 1995)
2. *An Approach for Assessing Wetland Functions Using Hydrogeomorphic Classification, Reference Wetlands, and Functional Indices* (Smith et al. 1995)
3. *Wetland Values: Concepts and Methods for Wetlands Evaluation* (USACE 1979)
4. *The Ecological and Hydrological Significance of Ephemeral and Intermittent Streams in the Arid and Semi-arid American Southwest* (U.S. Environmental Protection Agency [USEPA] 2008)
5. USEPA Watershed Academy: *Wetland Functions and Values* (USEPA 2009)
6. U.S. Geologic Survey (USGS) Water Supply Paper 2425: *Wetland Functions, Values, and Assessment* (USGS 1996)

The assessment will be based on observations made during above-mentioned jurisdictional delineation field surveys and other resource surveys (e.g. cultural, botanical, and wildlife) occurring in 2010. The assessment is intended to quantitatively evaluate ambient and projected post-project desert aquatic (including xeric riparian) features without a reference site. Since the assessment will not be based on a comparison to an actual reference site in the field, the qualitative rankings of variables used for the assessment of the quality of functions and values will be confined to the quality of the habitats within the study area.

Brinson et. al. (1995), Smith et al. (1995), and USEPA (2008) will be used as the primary guidance documents for assessing xeric riparian function, which include assessment of the following four major functional categories:

1. Hydrologic Function
2. Biogeochemical Function
3. Plant Habitat Function
4. Animal Habitat Function

USACE (1979), USEPA (2009) and USGS (1996) will be used as the primary guidance documents for assessing xeric riparian values, which include assessment of the following seven major value categories:

1. *Aquifer Recharge (including Base Flow and Water Supply)*
2. Flood Protection
3. Water Quality
4. Economic
5. Aesthetic
6. Recreational
7. Cultural

Xeric riparian values 1 through 4 will be incorporated within xeric riparian functions because wetland values also arise from the many ecological functions associated with wetlands (USEPA 2009). Xeric riparian values 5 through 7 will be ascertained through subjective review during the jurisdictional

delineation field assessment, a review of related documents such as cultural resources reports, the Riverside or Kern County General Plans, and speaking with resource agency personnel.

Golden Eagle Surveys

A GOEA field survey will be conducted in 2010 of the PSPP site within proposed Project and Alternative disturbance areas and within an associated buffer zone; however, these surveys are being conducted by an entity other than the AECOM Team.

Helicopter-and ground-based raptor surveys shall be conducted, following the USFWS interim guidelines for GOEA surveys (USFWS 2010), to record and report occupancy (Phase 1) and productivity (Phase 2) of resident golden eagles including, but not limited to, the following:

- individual activities,
- nests and territories on and surrounding the subject solar farm project, and within an approximate 10-mile radius of the proposed Project (assumed USFWS requirement)

The first survey (Phase 1 helicopter survey) has already been completed and a second survey (Phase 2) will begin a minimum of 30 days after the Phase 1 survey was conducted.

General Biological Survey Details

In addition to above-described protocols, the following general surveys actions/approaches will be taken by the AECOM survey team.

- While conducting biological resource surveys at the Project site in 2010 (e.g., DT surveys, WBO surveys, vegetation mapping and rare plant surveys, etc.) biologists will also be looking for and recording occurrences of all sensitive, listed, or other special-status wildlife species or their sign, including but not limited to:
 - Potential bat roosting sites—caves, abandoned buildings, cliffs etc.
 - Nelson's bighorn sheep
 - American badger (*Taxidea taxus*)
 - Mohave ground squirrel
 - Desert kit fox (*Vulpes macrotis*)
 - Mojave fringe-toed lizard (*Uma scoparia*)
 - Loggerhead shrike (*Lanius ludovicianus*)
 - Bendire's thrasher (*Toxostoma bendirei*)
 - Crissal thrasher (*Toxostoma crissale*)
 - Gilded flicker (*Colaptes chrysoides*)
 - Gila woodpecker (*Melanerpes uropygialis*)
 - Raptors
 - Northern harrier (*Circus cyaneus*)
 - White-tailed kite (*Elanus leucurus*)
 - Cooper's hawk (*Accipiter cooperii*)
 - Peregrine falcon (*Falco peregrinus*)
 - Prairie falcon (*Falco mexicanus*)
 - Swainson's hawk
 - Golden eagle
 - Ferruginous hawk (*Buteo regalis*)

- All surveyors will be given Desert Tortoise Awareness training.
- All surveyors will be briefed on potential rare plants within their survey area, including descriptions and photographs/drawings. Biologists will record coordinates and take photographs of any potential occurrences of rare plants and communicate this information to an AECOM Team botanist for verification immediately.
- Within areas of the 1-mile disturbance area (Project or Alternative) survey buffer not previously surveyed, a more general survey of habitat suitability and occurrence of special-status species and their sign will be conducted (according to the CEC's Draft Recommended Biological Resources Field Survey Guidelines for Large Solar Projects [CEC 2007]), if accessible to the biologists conducting the surveys.

3. Sensitivity Status Key

ESA Federal Endangered Species Act (ESA) Threatened

CNPS California Native Plant Society Lists:

- 1B: Considered rare, threatened, or endangered in California and elsewhere
- 2: Plants rare, threatened, or endangered in California, but more common elsewhere
- 3: Plants for which we need more information – Review list
- 4: Plants of Limited Distribution – A Watch list

Decimal notations: .1 – Seriously endangered in California, .2 – Fairly endangered in California, .3 – Not very endangered in California

BLM Special Status Plants (Palm Springs Field Office)

NECO Special-status species considered in analysis of the Northern and Eastern Colorado Coordinated Management Plan (BLM 2002).

Comment Letter 6

4. Based on the known blooming periods of these plant species, many of these species are opportunistic with respect to rainfall. While they have been listed in this table as occurring Spring, Fall, or Both, actual blooming times will correlate more closely with the climate than the calendar. Field surveys will be comprehensive, not selective; all plants on this list will be considered during all surveys, regardless of the probability of finding them. A complete floral inventory will be recorded for the site as well.

April 22, 2010

Mr. Rick York
California Energy Commission
1516 Ninth Street, MS-40
Sacramento, CA 95814-5512

Subject: Biological Survey Methodologies for the Palen Solar Power Project Site, 2010

Dear Mr. York:

On behalf of Solar Millennium, LLC, AECOM is submitting to the California Energy Commission (CEC) the attached summary of biological resource survey studies and methodologies planned or currently being implemented for 2010 for the Palen Solar Power Project (Project) in the Colorado Desert area of California. The plant site is located near Desert Center, in eastern Riverside County. The purpose of this letter is to inform CEC and relevant resource agencies of our biological survey approach and methodologies for this Project site in 2010.

As a result of Project modifications and the development of Project alternatives (as required by the Bureau of Land Management [BLM] environmental review process) that occurred after surveys were completed in 2009, the AECOM Team is undertaking additional technical surveys and studies in 2010. *These additional surveys are necessary to satisfy Data Requests issued by the CEC during the Applications for Certification (AFC) process and to support related environmental documentation for this Project, as required for Project approval.* Survey results will also be used to update environmental baseline information to support permit applications to other federal, state, and local agencies. In particular the survey results will be used to update and fully characterize the existing biological resource conditions on the project site (including alternatives) as requested by the CEC in its Data Requests, to support determinations regarding Project (or alternative) impacts, to further formulate mitigation requirements, and to provide specific data needs of reviewing agencies.

Key to providing Project updates in support of necessary Project approvals and permits described above is the collection of data concerning the occurrence and distribution of biological resources within previously unsurveyed portions of the Project site (including alternatives) and associated buffers. The biological surveys and data collection planned and currently being implemented for 2010 take into account the physical characteristics of areas to be surveyed, the life histories of the target species, and the guidelines and protocols promulgated by the resource agencies.

Consistent with what was requested by the agencies in 2009, the AECOM Team is providing a written summary of the 2010 survey approach and methodologies, together with a detailed map of areas planned for survey at the Project site. Maps of planned survey areas for each biological resource at the Project site are enclosed. Please note that the maps showing planned survey areas are consistent with current Project (and alternative) design and may change with further refinement of the Project or alternative. In the event that the Project site or alternative are further modified after submittal of this letter, survey areas may be adjusted accordingly to meet the same purpose and intent of documenting and evaluating the environmental baseline for biological resources on the Project site. Biological surveys have already been initiated at the Project site (see attached document).

In submitting this information, it is our hope to keep CEC, and the other resource management agencies (BLM, CDFG, and USFWS) that have been involved in the review and approval of this Project, apprised of our efforts related to biological resource surveys on this Project site. It is Solar Millennium's desire to ensure that the surveys conducted at the Project reflect the most current CEC

Mr. Rick York
California Energy Commission
April 22, 2010
Page 2

and resource agency guidance and that the methodologies being implemented are communicated to CEC and resource agencies early in the survey season.

Please call Bill Graham at (619) 233-1454 if you have any questions.

Sincerely,

William Graham
Principal

Ms. Susan Sanders
California Energy Commission
1516 Ninth Street
Sacramento, California 95814

Dear Ms. Sanders:

Subject: Palen Solar Power Project (09-AFC-7) – Preliminary Spring 2010 Survey Results for Desert Tortoise, Rare Plants and Jurisdictional Waters

On behalf of Palen Solar I, LLC, AECOM is submitting preliminary results of biological surveys conducted for desert tortoise (*Gopherus agassizii*; DT), rare plants, and jurisdictional waters for the Palen Solar Power Project. This information was requested at the Palen and Blythe Staff Workshops conducted on April 28 and 29, 2010.

The preliminary results are presented in the tables and figures attached. Table 1 presents a summary of the observations of DT sign and DT occurrences noted during spring 2010 surveys. Table 2 presents the rare plant population counts observed during spring 2010 surveys. Results from the fall and spring 2009 surveys are not included in DT and rare plant tables or the figures attached. However, the Jurisdictional Waters map does include results from the 2009 surveys and a table presenting the results of both survey years is provided in the figure. Please note that the totals provided in the tables herein are simply the results of our observations. These tables do not represent total impacts nor is this an impact analysis. Comprehensive technical reports and impact analyses are currently being prepared and will be submitted to the CEC in early June.

Please let us know if you have any questions.

Sincerely,

Bill Graham
Vice President

Subject: Palen Solar Power Project (09-AFC-7) – Preliminary Spring 2010 Survey Results Corrected and Preliminary Impact Calculations for Biological Resources

Dear Ms. Sanders:

On behalf of Palen Solar I, LLC, AECOM is submitting preliminary results of biological surveys conducted in spring 2010 for desert tortoise (*Gopherus agassizii*; DT), rare plants, jurisdictional waters, and incidental wildlife occurrences for the Palen Solar Power Project. This information was requested at the Palen and Blythe Staff Workshops conducted on April 28 and 29, 2010.

Preliminary survey results for DT, rare plants and jurisdictional waters were submitted to the CEC on May 7, 2010. The results provided herein supersede the results provided on May 7, 2010. The preliminary survey results are presented in figures and tables attached. Table 1 and Figure 1 present a summary of observations of DT sign and DT occurrences noted during spring 2010 surveys. Table 2 and Figure 2 present the rare plant population counts observed during spring 2010 surveys. Figure 3 presents the results of a formal jurisdictional delineation of waters of the State. Table 3 and Figure 4 present incidental wildlife occurrences observed during protocol surveys for DT, rare plants, western burrowing owl, and jurisdictional waters. Results from the fall and spring 2009 surveys are not included in the tables and figures for DT, rare plants or incidental wildlife occurrences. However, the jurisdictional waters figure does include results from the 2009 surveys and a table presenting the results of both survey years is provided in the figure. Please note that the results provided in Tables 1 through 3 and Figures 1, 2 and 4 are simply the results of our observations within the 100 percent coverage study area and associated buffers. These tables and figures do not represent total impacts within disturbance areas because we surveyed wider corridor widths and additional areas for contingency in the engineering design that ultimately will not be disturbed.

Figure 5 presents the additional disturbance areas surveyed in 2010 for an access road, transmission line corridor, and additional project components that are outside the 2009 project footprint. Therefore, the total Project Disturbance Area has been revised to be 4,051.1 acres. This total is still preliminary and subject to further refinement in the engineering design. A revised total disturbance area will be provided in final technical reports to be submitted to the CEC in early June.

Figure 6 present preliminary direct impacts to all cover types, including state waters, resulting from the revised Project Disturbance Area. These impact calculations are still preliminary and subject to further refinement in the engineering design. Revised impact calculations will be provided in final technical reports to be submitted to the CEC in early June.

Please let us know if you have any questions.

Sincerely,

Mr. Bill Graham
Principal

Attorneys for the CALIFORNIA UNIONS
FOR RELIABLE ENERGY

The following is the Declaration of:

Alfredo Acosta Figueroa
424 North Carlton Ave.
Blythe, Ca 92225
Phone: (760) 922-6422
E-mail: lacunadeaztlan@aol.com

Submitted To:
California Energy Commission
Hearing Room B
1516 Ninth Street
Sacramento, Ca 95814

I Alfredo Acosta Figueroa, a native of the Colorado River, born in Blythe, California, Elder/Historian and a Chemehuevi Tribal Sacred Site Monitor hereby declare:

That I for the past 55 years have been studying "The Aztec Place of Origin," Aztlán/Chicomoztoc/Hue-Hue-Tlapallan, here in the surrounding Palo Verde/Parker Valleys. The author of the book "Ancient Footprints of the Colorado River," published in May 2002.

That in 1975 we organized opposition against the Sun Desert Nuclear Power Plant proposed to be built at the base of the Sacred Mule Mountains ("Calli" in Nahuatl & "Hamoc-Avi" in Mojave) stopping the project in 1979.

That in 1992 we organized the Colorado River Anti-Ward Valley Coordinating Committee and after 8-years stopped the proposed Ward Valley Nuclear Toxic Dump located in between the Sacred Turtle and Avi-Kawme (Spirit Mountain located 15 miles west of Laughlin, Nevada) Mountains.

That in 2000 we organized La Cuna de Aztlán Sacred Sites Protection Circle under the auspices of La Escuela de la Raza Unida, said circle is comprised of 15 individuals dedicated to physically protecting the Sacred Sites and that on February 15, 2008 were given a Memorandum of Understanding together with the Southern Low Desert Resource Conservation & Development Council to partnership for protection of cultural resources, that included the Blythe Giant Intaglios, other geoglyphs and several hundred Sacred Sites that are located along the Colorado River from Needles, Ca down to Yuma, Az.

I hereby state:

That we oppose the certification by the California Energy Commission and the issuing of public land by the Bureau of Land Management to the following proposed solar power projects:

- 1) Genesis Solar Energy Project: 09-AFC-8
- 2) Solar Millennium Blythe Project: 09-AFC-6
- 3) Solar Millennium Palen Project: 09-AFC-7

Our investigations concerning the above projects are located in Eastern Riverside County along the I-10 corridor that is the most Sacred area of the North American Continent. It is the area where the Aztec Calendar is geographically outlined and located. The area entails from the Kofa Mountains in Arizona, west to the human head image (Copill-Quetzalli) on the crest of the San Jacinto Mountains above the city of Palm Springs, Ca.

The proposed Blythe Solar Power Project is overlaid on more than 25 large geoglyphs that we have found throughout the area. They include the world known image of Kokopilli, Cicimitl (The Great Spirit that takes human spirits to their final resting place in the Topock Maze, "Mictlan"). Included in the area is the image of Tosco, over 5 large windrow mazes, a 9-level pyramid and over 25 Sacred images (that we have not yet deciphered).

The main East/West & North/South trails all lead to and from the Blythe Giant Intaglios. One trail leads to Kokopilli and Cicimitl which traverses west through the south end of the McCoy Mountains to the McCoy Springs. Here the image of Quetzalcoatl takes a bath then goes to the Palen Mountains "Hue-Hue-Tlapallan" (Reddish Earth), where he is led to the underworld by Xolotl (The Dog), as shown in the petroglyphs at the Palen Mountain Mural Wash.

The trail comes down from the Palen Mountain Wash and meets with another trail from the McCoy Springs area that is in the Genesis project. The trail then runs west along the plains of the Palen Mountains then crossed southwest towards the Chuckawalla Mountains where it meets the main trail coming west from the Mule Mountains towards Desert Center, Ca. These two trails meet at the proposed Palen Mountain Project and the southwest trail leads towards Corn Springs (Tula) located in the center of the Chuckwalla Mountains.

On February 2009, we took 2 archeologists, Jeffery Adams and Joe that had contacts with the BLM to document all the geoglyphs along the Colorado River which included the Sacred Sites of Kokopilli and Cicimitl.

On March 2, 2010 we took John Kalish, Bureau of Land Management Field Manager and George Kline, archeologist of the Palm Springs, California office to the Blythe Power Project area and took them on an onsite tour which included 5 large geoglyphs and the images of Kokopilli and Cicimitl. Unfortunately, we have not yet received a report of the investigations.

Please feel free to contact me with any questions regarding the Sacredness of the areas.

Sincerely,

Alfredo Acosta Figueroa

DOCKET
09-AFC-7
DATE <u>MAR 22 2010</u>
RECD. <u>APR 01 2010</u>

Dear Mr. Solomon:

The Colorado River Board of California (Board), created in 1937, is the State agency charged with safeguarding and protecting the rights and interests of the State, its agencies and citizens, in the water and power resources of the seven-state Colorado River System.

The Board has received and reviewed the California Energy Commission's (CEC) documents Nos. Docket 09-AFC-6 and 09-AFC-7: Request for Agency Participation in the Review of the Blythe and the Palen Solar Power Projects in Riverside County, California, Distribution of Application for Certification. Both the Blythe and the Palen Solar Power Projects are proposed to be located in the Southern California inland desert. The applicants for both the Blythe and the Palen Projects are seeking a right-of-way grant for approximately 9,400 acres and 5,200 acres, respectively, of Federal lands that are administered by the Bureau of Land Management (BLM). The total water consumption during the operational period for the Blythe and the Palen Projects is estimated to be 628 and 314 acre-feet per year over the 30-year license period, respectively. In addition during construction, the water use is estimated to be 3,164 and 1,560 acre-feet for the two projects, respectively. The water supply for each project will be pumped groundwater from on-site wells.

According to the Consolidated Decree of the Supreme Court of the United States in the case of *Arizona v. California, et al.* entered March 27, 2006, (547 U.S. 150 (2006)), the consumptive use of water means "diversion from the stream less such return flow thereto as is available for consumptive use in the United States or in satisfaction of the Mexican treaty obligation" and consumptive use "includes all consumptive uses of water of the mainstream, including water drawn from the mainstream by underground pumping." Also, pursuant to the 1928 Boulder Canyon Project Act (BCPA) and the Consolidated Decree, no water shall be delivered from storage or used by any water user without a valid contract between the Secretary of the Interior and the water user for such use, i.e., through a BCPA Section 5 contract. Within California, BCPA Section 5 contracts have previously been entered into between users of Colorado River mainstream water and the Secretary of the Interior for water from the Colorado River that exceeds California's basic entitlement to use Colorado River water as set forth in the Consolidated Decree. Thus, no additional Colorado River water is available for use by new

PROOF OF SERVICE (REVISED 4/5/10) FILED WITH
ORIGINAL MAILED FROM SACRAMENTO ON 4/15/10

California Energy Commission
March 22, 2010
Page 2

project proponents along the Colorado River, except through the contract of an existing BCPA Section 5 contract holder, either by direct service or through an exchange of non-Colorado River water for Colorado River water.

The Federal lands proposed for both the Blythe and Palen Projects are located within the "Accounting Surface" area designated by U.S. Geological Survey Water Investigation Report Nos. 94-4005 and 00-4085 (USGS Report). This USGS Report indicates that the aquifer underlying lands located within the "Accounting Surface" is considered hydraulically connected to the Colorado River and groundwater withdrawn from lands underlying the "Accounting Surface" would be replaced by Colorado River water, in total or in part. This means that if it is determined that these wells are, in fact, pumping Colorado River water, a contract with the Secretary of the Interior is required before such a use is deemed to be a legally authorized use of this groundwater.

On November 9, 2009, the Board received applications for Lower Colorado Water Supply Project water for the Blythe and the Palen Solar Power Projects from the projects' consultant/proponent, Mr. Josef Eichhammer of Solar Millennium, LLC. This project, enacted by Congress on November 14, 1986, as the Lower Colorado Water Supply Project Act of 1986 (Act) authorized construction of the Lower Colorado Water Supply Project (LCWSP) and appropriated funds for the U.S. Bureau of Reclamation (Reclamation) to construct Phase I of the Project. The LCWSP consists of well field facilities in the Sand Hills along the All-American Canal in Imperial County. The LCWSP is authorized to provide exchange water up to a total amount of 10,000 acre-feet per year for nonagricultural use to those users of Colorado River water along the Colorado River, who do not have an existing Section 5 BCPA contractual entitlement or whose entitlement to use Colorado River is insufficient to meet their needs. Under a "first come first serve" priority basis, the Board has reviewed applications that it has received and, to date, recommended to Reclamation that applicants for LCWSP water in the amount of about 7,500 acre-feet per year are eligible to receive LCWSP water. At this time, the capacity to pump the fully authorized volume of 10,000 acre-feet of water per year has not been constructed. Furthermore, when the Congress passed the Act authorizing the LCWSP, water for large scale solar power/energy projects was not envisioned. Considering these two factors it does not appear that LCWSP water is a viable option for the Blythe and Palen Projects.

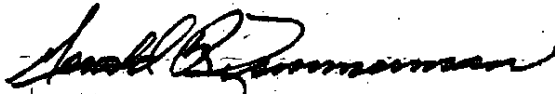

Based upon the applications for LCWSP water that were received from Solar Millennium for the Blythe and the Palen Solar Power Projects, several meetings and telephone conference calls have been held among the solar power projects consultants/proponents, Reclamation, BLM, Board's staff, and others. As a result of discussions in these meetings, the Board's staff has identified a preferred option for obtaining a legally authorized and reliable water supply for both the Blythe and the Palen Solar Power Projects over the life of the project that fits into the timeframe that has been established by Solar Millennium. That option involves obtaining water through an existing Section 5 BCPA contract holder, The Metropolitan Water District of Southern California (MWD). Although other options may be available, they, in the Board's opinion, could not be implemented in a timely manner and address the requirement that water consumptively used

California Energy Commission
March 22, 2010
Page 3

from the Colorado River must be through a Section 5 BCPA contractual entitlement.

If you have any questions or need further information, please contact me at (818) 500-1625.

Sincerely,

Gerald R. Zimmerman

DECLARATION OF SERVICE

I, Hilarie Anderson, declare that on April 15, 2010, I served and filed a copy of the attached Letter from the Colorado River Board of California. The original document, filed with the Docket Unit, is accompanied by a copy of the most recent Proof of Service list, located on the web page for this project at: [http://www.energy.ca.gov/sitingcases/solar_millennium_palen]

The documents have been sent to both the other parties in this proceeding (as shown on the Proof of Service list) and to the Commission's Docket Unit, in the following manner:

(Check all that Apply)

FOR SERVICE TO ALL OTHER PARTIES:

- sent electronically to all email addresses on the Proof of Service list;
- by personal delivery;
- by delivering on this date, for mailing with the United States Postal Service with first-class postage thereon fully prepaid, to the name and address of the person served, for mailing that same day in the ordinary course of business; that the envelope was sealed and placed for collection and mailing on that date to those addresses **NOT** marked "email preferred."

AND

FOR FILING WITH THE ENERGY COMMISSION:

- sending an original paper copy and one electronic copy, mailed and emailed respectively, to the address below (**preferred method**);

OR

- depositing in the mail an original and 12 paper copies, as follows:

CALIFORNIA ENERGY COMMISSION
 Attn: Docket No. 09-AFC-7
 1516 Ninth Street, MS-4
 Sacramento, CA 95814-5512
docket@energy.state.ca.us

I declare under penalty of perjury that the foregoing is true and correct, that I am employed in the county where this mailing occurred, and that I am over the age of 18 years and not a party to the proceeding.

Original Signature in Dockets
Hilarie Anderson

Renewable Siting Criteria for California Desert Conservation Area

Environmental stakeholders have been asked by land management agencies, elected officials, other decision-makers, and renewable energy proponents to provide criteria for use in identifying potential renewable energy sites in the California Desert Conservation Area (CDCA). Large parts of the California desert ecosystem have survived despite pressures from mining, grazing, ORV, real estate development and military uses over the last century. Now, utility scale renewable energy development presents the challenge of new land consumptive activities on a potentially unprecedented scale. Without careful planning, the surviving desert ecosystems may be further fragmented, degraded and lost.

The criteria below primarily address the siting of solar energy projects and would need to be further refined to address factors that are specific to the siting of wind and geothermal facilities. While the criteria listed below are not ranked, they are intended to inform planning processes and were designed to provide ecosystem level protection to the CDCA (including public, private and military lands) by giving preference to disturbed lands, steering development away from lands with high environmental values, and avoiding the deserts' undeveloped cores. They were developed with input from field scientists, land managers, and conservation professionals and fall into two categories: 1) areas to prioritize for siting and 2) high conflict areas. The criteria are intended to guide solar development to areas with comparatively low potential for conflict and controversy in an effort to help California meet its ambitious renewable energy goals in a timely manner.

Areas to Prioritize for Siting

- Lands that have been mechanically disturbed, i.e., locations that are degraded and disturbed by mechanical disturbance:
 - Lands that have been “type-converted” from native vegetation through plowing, bulldozing or other mechanical impact often in support of agriculture or other land cover change activities (mining, clearance for development, heavy off-road vehicle use).¹
- Public lands of comparatively low resource value located adjacent to degraded and impacted private lands on the fringes of the CDCA:²
 - Allow for the expansion of renewable energy development onto private lands.
 - Private lands development offers tax benefits to local government.
- Brownfields:
 - Revitalize idle or underutilized industrialized sites.
 - Existing transmission capacity and infrastructure are typically in place.
- Locations adjacent to urbanized areas:³
 - Provide jobs for local residents often in underserved communities;
 - Minimize growth-inducing impacts;

- Provide homes and services for the workforce that will be required at new energy facilities;
- Minimize workforce commute and associated greenhouse gas emissions.
- Locations that minimize the need to build new roads.
- Locations that could be served by existing substations.
- Areas proximate to sources of municipal wastewater for use in cleaning.
- Locations proximate to load centers.
- Locations adjacent to federally designated corridors with existing major transmission lines.⁴

High Conflict Areas

In an effort to flag areas that will generate significant controversy the environmental community has developed the following list of criteria for areas to avoid in siting renewable projects. These criteria are fairly broad. They are intended to minimize resource conflicts and thereby help California meet its ambitious renewable goals. The criteria are not intended to serve as a substitute for project specific review. They do not include the categories of lands within the California desert that are off limits to all development by statute or policy.⁵

- Locations that support sensitive biological resources, including: federally designated and proposed critical habitat; significant⁶ populations of federal or state threatened and endangered species,⁷ significant populations of sensitive, rare and special status species,⁸ and rare or unique plant communities.⁹
- Areas of Critical Environmental Concern, Wildlife Habitat Management Areas, proposed HCP and NCCP Conservation Reserves.¹⁰
- Lands purchased for conservation including those conveyed to the BLM.¹¹
- Landscape-level biological linkage areas required for the continued functioning of biological and ecological processes.¹²
- Proposed Wilderness Areas, proposed National Monuments, and Citizens' Wilderness Inventory Areas.¹³
- Wetlands and riparian areas, including the upland habitat and groundwater resources required to protect the integrity of seeps, springs, streams or wetlands.¹⁴
- National Historic Register eligible sites and other known cultural resources.
- Locations directly adjacent to National or State Park units.¹⁵

EXPLANATIONS

¹ Some of these lands may be currently abandoned from those prior activities, allowing some natural vegetation to be sparsely re-established. However, because the desert is slow to heal, these lands do not support the high level of ecological functioning that undisturbed natural lands do.

² Based on currently available data.

³ Urbanized areas include desert communities that welcome local industrial development but do not include communities that are dependent on tourism for their economic survival.

⁴ The term "federally designated corridors" does not include contingent corridors.

⁵ Lands where development is prohibited by statute or policy include but are not limited to: National Park Service units; designated Wilderness Areas; Wilderness Study Areas; BLM National Conservation Areas; National Recreation Areas; National Monuments; private preserves and reserves; Inventoried Roadless Areas on USFS lands; National Historic and National Scenic Trails; National Wild, Scenic and Recreational Rivers; HCP and NCCP lands precluded from development; conservation mitigation

banks under conservation easements approved by the state Department of Fish and Game, U.S. Fish and Wildlife Service or Army Corps of Engineers a; California State Wetlands; California State Parks; Department of Fish and Game Wildlife Areas and Ecological Reserves; National Historic Register sites.

⁶ Determining “significance” requires consideration of factors that include population size and characteristics, linkage, and feasibility of mitigation.

⁷ Some listed species have no designated critical habitat or occupy habitat outside of designated critical habitat. Locations with significant occurrences of federal or state threatened and endangered species should be avoided even if these locations are outside of designated critical habitat or conservation areas in order to minimize take and provide connectivity between critical habitat units.

⁸ Significant populations/occurrences of sensitive, rare and special status species including CNPS list 1B and list 2 plants, and federal or state agency species of concern.

⁹ Rare plant communities/assemblages include those defined by the California Native Plant Society’s Rare Plant Communities Initiative and by federal, state and county agencies.

¹⁰ ACECs include Desert Tortoise Desert Wildlife Management Areas (DWMAs). The CDCA Plan has designated specific Wildlife Habitat Management Areas (HMAs) to conserve habitat for species such as the Mohave ground squirrel and bighorn sheep. Some of these designated areas are subject to development caps which apply to renewable energy projects (as well as other activities).

¹¹ These lands include compensation lands purchased for mitigation by other parties and transferred to the BLM and compensation lands purchased directly by the BLM.

¹² Landscape-level linkages provide connectivity between species populations, wildlife movement corridors, ecological process corridors (e.g., sand movement corridors), and climate change adaptation corridors. They also provide connections between protected ecological reserves such as National Park units and Wilderness Areas. The long-term viability of existing populations within such reserves may be dependent upon habitat, populations or processes that extend outside of their boundaries. While it is possible to describe current wildlife movement corridors, the problem of forecasting the future locations of such corridors is confounded by the lack of certainty inherent in global climate change. Hence the need to maintain broad, landscape-level connections. To maintain ecological functions and natural history values inherent in parks, wilderness and other biological reserves, trans-boundary ecological processes must be identified and protected. Specific and cumulative impacts that may threaten vital corridors and trans-boundary processes should be avoided.

¹³ Proposed Wilderness Areas: lands proposed by a member of Congress to be set aside to preserve wilderness values. The proposal must be: 1) introduced as legislation, or 2) announced by a member of Congress with publicly available maps. Proposed National Monuments: areas proposed by the President or a member of Congress to protect objects of historic or scientific interest. The proposal must be: 1) introduced as legislation or 2) announced by a member of Congress with publicly available maps. Citizens' Wilderness Inventory Areas: lands that have been inventoried by citizens groups, conservationists, and agencies and found to have defined “wilderness characteristics.” The proposal has been publicly announced.

¹⁴ The extent of upland habitat that needs to be protected is sensitive to site-specific resources. For example: the NECO Amendment to the CDCA Plan protects streams within a 5-mile radius of Townsend big-eared bat maternity roosts; aquatic and riparian species may be highly sensitive to changes in groundwater levels.

¹⁵ Adjacent: lying contiguous, adjoining or within 2 miles of park or state boundaries. (Note: lands more than 2 miles from a park boundary should be evaluated for importance from a landscape-level linkage perspective, as further defined in footnote 12).

Subject Comments on Palen Solar Power Plant DEIS

Dear Ms. Shaffer:

Attached please find Western Watersheds Project's comments on the Draft Environmental Impact Statement/Staff Assessment for the Chevron Energy Solutions/Solar Millennium Palen Solar Power Plant (PSPP) and Possible California Desert Conservation Area Plan Amendment.

Could you please respond to this email to confirm that you received and could open the attached file?

Thank you.

Michael Connor

Re: Draft Environmental Impact Statement/Staff Assessment for the Chevron Energy Solutions/Solar Millennium Palen Solar Power Plant (PSPP) and Possible California Desert Conservation Area Plan Amendment.

Dear Ms. Shaffer:

On behalf of Western Watersheds Project and myself, please accept the following comments on the Draft Environmental Impact Statement/Staff Assessment for the Chevron Energy Solutions/Solar Millennium Palen Solar Power Plant (Palen Solar Power Plant) and Possible California Desert Conservation Area Plan Amendment.

Western Watersheds Project works to protect and conserve the public lands, wildlife and natural resources of the American West through education, scientific study, public policy initiatives, and litigation. Western Watersheds Project and its staff and members use and enjoy the public lands, including the lands at issue here, and its wildlife, cultural and natural resources for health, recreational, scientific, spiritual, educational, aesthetic, and other purposes.

Western Watersheds Project submitted scoping comments for this project on December 23, 2009. We have attached a copy of those comments to this letter. We hereby incorporate by reference the entire contents of that scoping letter into these comments.

The Palen Solar Power Plant is a massive project will have significant direct, indirect and cumulative impacts on some of the desert's most sensitive biological resources and on important cultural resources. Specific issues of concern that we have identified in the DEIS include:

(1) Range of Alternatives.

The NEPA implementing regulations specify that NEPA documents must analyze a full range of alternatives. Based on the information and analysis presented in the sections on the Affected Environment (40 C.F.R. § 1502.15) and the Environmental Consequences (40 C.F.R. § 1502.16), the NEPA document should present the environmental impacts of the proposed action and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public. In order to comply with the spirit and letter of NEPA, the EIS must consider alternatives that meet the project goals and not simply propose “straw man” alternatives that can then be dismissed from further consideration.

7-01

The DEIS should be revised to include alternatives that meet the project need but that avoid the significant impacts to biological resources and to ecological processes that they depend upon such as sand flow.

(2) Desert Tortoise.

The NEPA requires agencies to take a “hard look” at the environmental effects of a project. This requires the BLM to describe, clearly characterize and identify the direct, indirect and cumulative effects.

As we outlined in our scoping comments, the proposed project site is within California’s Colorado Desert and within the Eastern Colorado Desert Tortoise Recovery Unit as identified in the 1994 Desert Tortoise (Mojave Population) Recovery Plan. We raised the concern that the Palen project would disrupt connectivity between the Eastern Colorado Recovery Unit and the Northern Colorado Recovery Unit. This could reduce gene flow and impair desert tortoise recovery.

7-02

The DEIS takes the position outlined in the draft (i.e. not final) revised recovery plan that California’s desert tortoise population be treated as a single recovery unit. This is a scientifically controversial position since there is data indicating that tortoises from the 1994 Northern and Eastern Colorado Recovery Units are discernible using genetic analysis (see Murphy et al, 2007¹). However, whether or not there is a scientific basis for the 1994 recovery units being combined into a single recovery unit the issue of loss of connectivity remains. This has not been addressed in the DEIS.

As we stated in our scoping comments:

“The Palen site is a particular concern. This habitat provides crucial connectivity between the desert tortoises in the Eastern Colorado Recovery Unit and those in the Northern Colorado Recovery Unit. The project places connectivity between the two recovery units at risk.

The Project Applicant’s application states that,

¹ Murphy, R. W., Berry, K. H., Edwards, T. and Mcluckie, A. M. 2007. A Genetic Assessment of the Recovery Units for the Mojave Population of the Desert Tortoise, *Gopherus agassizii*. *Chelonian Conservation and Biology* 6(2): 229–251.

“The PSPP would have less than significant impacts on biological resources with implementation of avoidance, minimizations, and mitigation measures, except for unmitigable significant impacts to desert tortoise (DT) and Mojave fringe-toed lizard (MFTL) movement.” (Application at 5.3-1, emphasis added)

↑
7-02
cont.

One of the objectives for desert tortoise recovery in the 2002 Northern and Eastern Colorado Desert Management Plan (NECO) is “e. Mitigate effects on tortoise populations and habitat outside DWMAs to provide connectivity between DWMAs.” (NECO at 2-17). Clearly then, use of the Palen project location is incompatible with the biological goals and objectives of the NECO Plan. Construction of a this proposed power plant would thus be incompatible with the CDCA Plan, the governing land use plan.

7-03

Maintaining connectivity is important especially given the threats posed by global climate change. As the USFWS 2008 Draft Revised Recovery Plan notes,

“Climatic regimes are believed to influence the distribution of plants and animals through species-specific physiological thresholds of temperature and precipitation tolerance. Warming temperatures and altered precipitation patterns may result in distributions shifting northward and/or to higher elevations, depending on resource availability (Walther et al. 2002). We may expect this response in the desert tortoise to reduce the viability of lands currently identified as “refuges” or critical habitat for the species.” (USFWS 2008 at 133)”

7-04

In addition, a portion of the Palen project site is designated as desert tortoise critical habitat. The EIS should also consider the status of the tortoises in the affected recovery units. The latest reports from the Desert Tortoise Recovery Office cite a 37% decline in tortoise density between 2005 and 2007.²

7-05

The DEIS should be revised to take the requisite “hard look” at all the direct, indirect and cumulative impacts of the proposed project and all associated infrastructure including roads, facilities and transmission lines on the desert tortoise.

7-06

(3) Mojave Fringe-toed lizard.

The DEIS describes the Palen Project has having unmitigable significant impacts to the sand transport corridor. This will have serious impacts on the Mojave fringe-toed lizard. The FLPMA precludes the BLM from authorizing projects that will result in undue degradation and the BLM is also precluding from authorizing actions that could propel the listing of this sensitive species under the Endangered Species Act.

7-07

The DEIS should be revised to take a hard look at impacts to the Mojave fringe-toed lizard and explain the minimization and avoidance measures that will adopted if this project is approved that will reduce impacts to sand transport to less than significant.

7-08

² USFWS. 2009. Range-wide Monitoring of the Mojave Population of the Desert Tortoise: 2007 Annual Report. Report by the Desert Tortoise Recovery Office, U.S. Fish and Wildlife Service, Reno, Nevada.

(4) Streambed Alteration.

Desert washes, drainage systems, and washlets are very important habitats for plants and animals in arid lands. Water concentrates in such places, creating greater cover and diversity of shrubs, bunch grasses, and annual grasses and forbs. The topography is often more varied, as are soil types and rock types and sizes, creating diverse sites for burrows, caves, and other shelters. The resulting “habitats” tend to attract more birds, mammals, reptiles, and invertebrates. For example, desert tortoises spend disproportionately more time in washes than they do on “flat” areas.³ There must be full mitigation for impacts to streambeds as required under the California Fish and Game Code.

7-09

Western Watersheds Project thanks you for the opportunity to submit comments on the DEIS for the proposed Palen solar power plant project. Please keep Western Watersheds Project on the list of interested public for this project. If we can be of any assistance or provide more information please feel free to contact me by telephone at (818) 345-0425 or by e-mail at <mjconnor@westernwatersheds.org>.

Re: Notice of Intent to Prepare Two Environmental Impact Statements/ Staff Assessments for the Proposed Chevron Energy Solutions/Solar Millennium Palen and Blythe Solar Power Plants, Riverside County, CA and Possible Land Use Plan Amendments.

Dear Ms. Roberts and Mr. Solomon:

On behalf of Western Watersheds Project and myself, please accept the following scoping comments as you embark on the preparation of Environmental Impact Statements ("EIS") for the proposed Proposed Chevron Energy Solutions/Solar Millennium Palen and Blythe Solar Power Plants, Riverside County, CA and Possible Land Use Plan Amendments.

Western Watersheds Project works to protect and conserve the public lands, wildlife and natural resources of the American West through education, scientific study, public policy initiatives, and litigation. Western Watersheds Project and its staff and members use and enjoy the public lands, including the lands at issue here, and its wildlife, cultural and natural resources for health, recreational, scientific, spiritual, educational, aesthetic, and other purposes.

According to the scoping notice, the Bureau of Land Management ("BLM") and the California Energy Commission ("CEC") are developing a PSA, EIS and possible plan amendment for two separate right-of-way (ROW) authorizations filed by Chevron Energy Solutions/Solar Millennium (CESSM) to construct and operate the Palen and Blythe solar thermal power plants in eastern Riverside County, California with an expected combined

capacity of 1,452 megawatts (MW) using solar parabolic trough generating stations. Approximately 10,100 acres of BLM-administered public land are needed to develop the two projects.

These massive projects will have significant direct, indirect and cumulative impacts on some of the desert's most sensitive resources including species listed under the Endangered Species Act such as desert tortoise and on important cultural resources.

Specific issues of concern that should be addressed in the NEPA documents to ensure compliance with NEPA and to ensure that NEPA's requisite "hard look" at the environmental impacts include:

(1) Range of Alternatives.

The NEPA implementing regulations specify that NEPA documents must analyze a full range of alternatives. Based on the information and analysis presented in the sections on the Affected Environment (40 C.F.R. § 1502.15) and the Environmental Consequences (40 C.F.R. § 1502.16), the NEPA document should present the environmental impacts of the proposed action and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decisionmaker and the public

In order to comply with the spirit and letter of NEPA, the EIS must consider alternatives that meet the project goals and not simply propose "straw man" alternatives that can then be dismissed from further consideration. We suggest that the agencies consider the following reasonable alternatives in addition to any proposed action:

- (a) "No Action Alternative" as is required by NEPA.
- (b) Alternative sites on public lands with fewer resource conflicts.
- (c) Alternative that features technology that requires significantly less water.
- (d) A private lands alternative under which the project is built on private lands only.
- (e) A distributed energy alternative using "roof top" solar to avoid the need for construction of a power plant.

Full analysis of these alternatives will help clarify the need for the proposed project, provide a baseline for identifying and fully minimizing resource conflicts, facilitate compliance with the BLM's FLPMA requirement to prevent the unnecessary and undue degradation of public lands and its resources, and will help provide a clear basis for making an informed decision.

(2) Desert Tortoise.

The NEPA/CEQA documents must describe, clearly characterize and identify the desert tortoise population that will be impacted by each alternative if the agencies are to take NEPA's requisite "hard look" at the environmental effects.

The proposed project sites are within California's Colorado Desert and both projects lie within the Eastern Colorado Desert Tortoise Recovery Unit.

A portion of the Palen project site is designated as desert tortoise critical habitat. The Project Applicants for both the Palen and the Blythe Projects describe the project sites as having low tortoise densities. Additional surveys should be conducted to confirm this. The EIS should also consider the status of the tortoises in the affected recovery units. The latest reports from the Desert Tortoise Recovery Office cite a 37% in tortoise density between 2005 and 2007.¹

Both the Palen and Blythe Projects would disrupt connectivity between the Eastern Colorado Recovery Unit and the Northern Colorado Recovery Unit. This could reduce gene flow and impair desert tortoise recovery.

The Palen site is a particular concern. This habitat provides crucial connectivity between the desert tortoises in the Eastern Colorado Recovery Unit and those in the Northern Colorado Recovery Unit. The project places connectivity between the two recovery units at risk.

The Project Applicant's application states that,

"The PSPP would have less than significant impacts on biological resources with implementation of avoidance, minimizations, and mitigation measures, except for unmitigable significant impacts to desert tortoise (DT) and Mojave fringe-toed lizard (MFTL) movement." (Application at 5.3-1, emphasis added)

One of the objectives for desert tortoise recovery in the 2002 Northern and Eastern Colorado Desert Management Plan (NECO) is "e. Mitigate effects on tortoise populations and habitat outside DWMAs to provide connectivity between DWMAs." (NECO at 2-17). Clearly then, use of the Palen project location is incompatible with the biological goals and objectives of the NECO Plan. Construction of a this proposed power plant would thus be incompatible with the CDCA Plan, the governing land use plan.

Maintaining connectivity is important especially given the threats posed by global climate change. As the USFWS 2008 Draft Revised Recovery Plan notes,

"Climatic regimes are believed to influence the distribution of plants and animals through species-specific physiological thresholds of temperature and precipitation tolerance. Warming temperatures and altered precipitation patterns may result in distributions shifting northward and/or to higher elevations, depending on resource availability (Walther et al. 2002). We may expect this response in the desert tortoise to reduce the viability of lands currently identified as "refuges" or critical habitat for the species." (USFWS 2008 at 133)

The NEPA/CEQA documents should provide a review of the direct, indirect and cumulative impacts of the proposed project on the tortoise of the Eastern Colorado and Northern

¹ USFWS. 2009. Range-wide Monitoring of the Mojave Population of the Desert Tortoise: 2007 Annual Report. Report by the Desert Tortoise Recovery Office, U.S. Fish and Wildlife Service, Reno, Nevada.

Colorado Recovery Units, and all associated infrastructure including the roads and transmission lines.

(3) Other Sensitive species and Rare Plants.

A number of sensitive species of wildlife and rare plants occur on the project or in the vicinity including the Mojave fringe-toed lizard and Harwoods' milkvetch.

The Palen Project Applicant's application describes impacts to Mojave fringe-toed lizard movement as significant and unmitigable. The EIS must explain how this project could move forward without the agencies propelling a listing of this species under the Endangered Species Act.

We are unaware of any extent occurrences of Harwoods' milkvetch on private lands. In light of this, the EIS must explain how this project could move forward without the agencies propelling a listing of this species under the Endangered Species Act.

The EIS should carefully consider and analyze impacts to all State protected species such as burrowing owl, sensitive species, rare plants and Unusual Plant Assemblages (UPA) that would be affected by the project. It should provide detailed vegetation and wildlife maps to facilitate public input into the process.

(4) Invasive Species.

Invasive weeds grow easily wherever the natural vegetation and biological soil crusts are disturbed. The disturbance to the soil and natural vegetation that will occur as a result of the construction and maintenance of this transmission project must not be allowed to establish a "weed corridor" across the landscape. Once established, weeds are almost impossible to remove permanently.

Invasive plants and weeds are threats to native habitat, rare plants, and sensitive species. They pose an immense fire hazard. Using chemicals to kill weeds requires exposing the environment, species, and watershed area to a toxic substance which can be the source of further damage to environmental and human health. Manual weed control requires much human effort, machinery, and can cause even more disturbance, leading to erosion, disturbance, and, in some cases, more weeds. The EIS should carefully consider how invasive plants and weeds will be managed and controlled.

(5) Hazards and Hazardous Materials.

The EIS should disclose any potentially toxic or hazardous wastes that may be associated with these projects during project construction, operation, and maintenance including pesticides and herbicides.

(6) Fire Prevention and Suppression.

The EIS should address the effects that each alternative for each project may have on wildfire risks. Wildfires are becoming increasingly common in the Mojave Desert facilitated by the spread of invasive weeds and climate change. Wildfires can result in type conversion of large expanses of habitat. Wildfires could be caused by construction or operation of the transmission lines. Development of roads and transmission lines could encourage increased motorized vehicle access which increases fire risk especially when coupled with the spread of invasive weeds.

(7) Desert Washes, Ephemeral Streams and Soils.

Desert washes, drainage systems, and washlets are very important habitats for plants and animals in arid lands. Water concentrates in such places, creating greater cover and diversity of shrubs, bunch grasses, and annual grasses and forbs. The topography is often more varied, as are soil types and rock types and sizes, creating diverse sites for burrows, caves, and other shelters. The resulting “habitats” tend to attract more birds, mammals, reptiles, and invertebrates. For example, desert tortoises spend disproportionately more time in washes than they do on “flat” areas.² The wash habitat impacted by each alternative should be evaluated and appropriate mitigations made for stream bed alterations.

Soil erosion on low fill slopes and steeply graded areas could result in sedimentation of water bodies. Changes in hydrology and soil movements may impact rare plants and habitats for sensitive species, and may impact burrowing species such as the desert tortoise.

(8) Cultural & Paleontological Resources.

The EIS should discuss and analyze impacts to cultural and paleontological resources. The Mojave Desert is rich in structures and artifacts of significant cultural value that are irreplaceable once lost. The areas around dry lake beds are particularly rich in archaeological sites. Construction of structures and access roads could damage or destroy historic and archaeological sites, traditional cultural properties, or areas containing paleontological resources. Temporary use of staging areas and conductor pull sites could damage or destroy historic and archaeological sites, traditional cultural properties, or areas containing paleontological resources. Building new transmission lines through previously undisturbed areas could cause physical damage to artifacts and sites, expose cultural resources to looters, and could increase fires due to soil disturbance and subsequent weed invasion placing these cultural resources at risk of future damage.

(9) Global Climate Change.

Department of the Interior Order No. 3226 mandates that the BLM must consider the impacts of each proposed alternative with respect to global climate change in its NEPA reviews. The agencies should use the recently released USGS desert tortoise habitat model to determine likely changes in desert tortoise habitat quality in the area and the importance of the desert

² Jennings, B.J. 1997. Habitat Use and Food Preferences of the Desert Tortoise, *Gopherus agassizii*, in the Western Mojave Desert and Impacts of Off-Road Vehicles. Proceedings: Conservation, Restoration, and Management of Tortoises and turtles—An International Conference, pp. 42–45. New York Turtle and Tortoise Society.

tortoise habitat. In addition to addressing climate change in the cumulative effects analysis, the EIS should address the carbon footprint of the project and any losses to carbon storage and sequestration it will engender.

(10) Visual Resources.

The public lands provide significant value as visual resources. The EIS should fully review the impacts of each alternative on visual resources.

(11) Water Issues.

The EIS must provide information on the water needs of these power plants both in the construction and operation phases and the source of these waters. The EIS must fully analyze impacts to the local and regional water reserves.

(12) Cumulative Effects.

The EIS must consider the cumulative effects of this project in combination with all the other consumptive uses that are occurring on these public lands including livestock grazing, off road vehicle activity, and mining. New transmission line projects have the potential to open up more lands to energy (or other) development, placing wide swaths of habitat at risk, and greatly increase degradation and fragmentation of habitats and important wild land areas and have lasting and damaging impacts. The project will also facilitate and will act cumulatively with the many other energy developments that are planned for the area including utility-scale solar energy plants. All these activities will impact the same biological, cultural, geologic, and visual resources as the proposed project.

(13) Monitoring Programs.

The NEPA/CEQA documents must explain the monitoring programs that will be in place to monitor the short and long term impacts of the project. This should include the timelines, and estimated costs and sources of funding for the monitoring programs.

(14) Mitigation.

BLM is obligated under FLPMA to “minimize adverse impacts on the natural, environmental, scientific, cultural, and other resources and values (including fish and wildlife habitat) of the public lands involved.” [43 U.S.C. §1732(d)(2)(a)] Other laws, including the Endangered Species Act and the California Endangered Species Act also entail the need for mitigations to minimize impacts. BLM is required to consider measures to mitigate potential environmental consequences in its NEPA analysis. [40 C.F.R. § 1502.16] The NEPA implementing regulations define "Mitigation" to include:

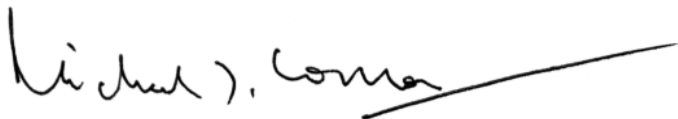

- (a) Avoiding the impact altogether by not taking a certain action or parts of an action.

- (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
 - (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
 - (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
 - (e) Compensating for the impact by replacing or providing substitute resources or environments.
- [40 C.F.R. §1508.20]

The EIS should describe the restoration and rehabilitation activities that will be required for habitat disturbed during construction. For example, construction material yards will lose their native vegetation, have their soils compacted, and increase the amount of wind and water erosion while leaving these areas at an increased risk of weed invasion. Transporting materials, labor, and equipment in and out of construction areas will also have their own set of impacts that must be minimized. Construction may also require the use of “temporary” roads that will require extensive rehabilitation if they are not to become permanent intrusions on the landscape. Rehabilitation of desert habitat is a long, slow and uncertain process.

Western Watersheds Project thanks you for the opportunity to submit scoping comments on the proposed solar plant project. Please keep Western Watersheds Project on the list of interested public for this project. If we can be of any assistance or provide more information please feel free to contact me by telephone at (818) 345-0425 or by e-mail at <mjconnor@westernwatersheds.org>.

To Whom it May Concern:

Notice of Availability of the Draft Environmental
Impact Statement/Staff Assessment for the Chevron Energy Solutions/Solar
Millennium Palen Solar Power Plant and Possible California Desert Conservation
Area Plan Amendment; CEC Docket No. 09-AFC-7, BLM Docket No. CACA 48810

The Metropolitan Water District of Southern California (Metropolitan) reviewed the Draft Environmental Impact Statement/Staff Assessment (collectively, "DEIS") for the Chevron Energy Solutions/Solar Millennium Palen Solar Power Plant and Possible California Desert Conservation Area Plan Amendment (Project). The U.S. Bureau of Land Management (BLM) is the lead agency under the National Environmental Policy Act (NEPA) for the DEIS and the California Energy Commission (CEC) is the lead agency (for licensing thermal power plants 50 megawatts and larger) under the California Environmental Quality Act (CEQA) and has a certified regulatory program under CEQA. Under its certified program, CEC is exempt from having to prepare an environmental impact report. Its certified program, however, requires environmental analysis of the project or a "staff assessment," including an analysis of alternatives and mitigation measures to minimize any significant adverse effect the project may have on the environment.

Metropolitan is pleased to submit comments for consideration by BLM and CEC during the public comment period for the DEIS and staff assessment.¹ In sum, Metropolitan provides these comments to ensure that any potential impacts on its facilities in the vicinity of the Project and on the Colorado River water resources are adequately addressed.

8-01

Background

¹ Comments on the DEIS and Revised Staff Assessment are due July 1, 2010 per the Federal Register notice. 75 Fed. Reg. 16786 (April 2, 2010). This comment deadline applies to the CEC's Revised Staff Assessment anticipated to be issued June 18, 2010 regardless of whether it is finalized separately from BLM's DEIS as the relevant comment periods may not be reduced or altered retroactively.

Alan Solomon, Allison Shaffer
June 15, 2010
Page 2

Metropolitan is a public agency and regional water wholesaler. It is comprised of 26 member public agencies serving more than 19 million people in six counties in Southern California. One of Metropolitan's major water supplies is the Colorado River via Metropolitan's Colorado River Aqueduct (CRA). Metropolitan holds an entitlement to water from the Colorado River. The CRA consists of tunnels, open canals and buried pipelines. CRA-related facilities also include above and below ground reservoirs and aquifers, access and patrol roads, communication facilities, and residential housing sites. The CRA, which can deliver up to 1.2 million acre-feet of water annually, extends 242 miles from the Colorado River, through the Mojave Desert and into Lake Mathews. Metropolitan has five pumping plants located along the CRA, which consume approximately 2,400 gigawatt-hours of energy when the CRA is operating at full capacity.

Concurrent with its construction of the CRA in the mid-1930s, Metropolitan constructed 305 miles of 230 kV transmission lines that run from the Mead Substation in Southern Nevada, head south, then branch east to Parker, California, and then west along Metropolitan's CRA. Metropolitan's CRA transmission line easements lie on federally-owned land, managed by BLM. The transmission lines were built for the sole and exclusive purpose of supplying power from the Hoover and Parker projects to the five pumping plants along the CRA.

Metropolitan's ownership and operation of the CRA and its 230 kV transmission system is vital to its mission to provide Metropolitan's 5,200 square mile service area with adequate and reliable supplies of high-quality water to meet present and future needs in an environmentally and economically responsible way.

Project Understanding

Solar Millennium LLC and Chevron Energy Solutions, the joint developers of this project, propose to construct, own, and operate the Palen Solar Power Project. The Project is a concentrated solar thermal electric generating facility with two adjacent, independent, and identical solar plants of 250 megawatt (MW) nominal capacity each for a total capacity of 500 MW nominal.

The Project will utilize solar parabolic trough technology to generate electricity. With this technology, arrays of parabolic mirrors collect heat energy from the sun and refocus the radiation on a receiver tube located at the focal point of the parabola. A heat transfer fluid (HTF) is heated to high temperature (750 degrees Fahrenheit) as it circulates through the receiver tubes. The heated HTF is then piped through a series of heat exchangers where it releases its stored heat to generate high-pressure steam. The steam is then fed to a traditional steam turbine generator where electricity is produced.

The project water needs would be met by use of groundwater pumped from one of two wells on the plant site. Water for domestic uses by project employees would also be provided by onsite groundwater treated to potable water standards. During construction, the Project proponent anticipates using up to 1,500 acre-feet of water. Following construction and for long-term

Alan Solomon, Allison Shaffer
June 15, 2010
Page 3

operations, the average total annual water usage for all four units combined is estimated to be about 300 acre-feet per year (afy).

The project site would be located approximately 10 miles east of Desert Center, along Interstate 10 approximately halfway between the cities of Indio and Blythe, in Riverside County, California. An application has been filed with BLM for a right-of-way (ROW) grant of approximately 5,200 acres.

Land Use Issues: Potential Impacts on Metropolitan Facilities

Although Metropolitan has not yet identified any direct impacts, the Project is in the general vicinity of Metropolitan facilities, perhaps as close as 0.3 miles. As described above, Metropolitan currently has a significant number of facilities, real estate interests, and fee-owned rights-of-way, easements, and other properties (Facilities) located on or near BLM-managed land in southern California that are part of our water distribution system. Metropolitan is concerned with potential direct or indirect impacts that may result from the construction and operation of any proposed solar energy project on or near our Facilities. In order to avoid potential impacts, Metropolitan requests that the final EIS and staff assessment include an assessment of potential impacts to Metropolitan’s Facilities with proposed measures to avoid or mitigate significant adverse effects.

8-02

Metropolitan is also concerned that locating solar projects near or across its electrical transmission system could have an adverse impact on Metropolitan’s electric transmission-related operations and Facilities. From a reliability and safety aspect, Metropolitan is concerned with development of any proposed projects and supporting transmission systems that would cross or come in close proximity with Metropolitan’s transmission system. Metropolitan requests that the final EIS and staff assessment analyze and assess any potential impacts to Metropolitan’s transmission system.

8-03

Water Resources: Potential Impacts on Colorado River and Local Water Supplies

Metropolitan is also concerned about the Project’s potential direct and cumulative impacts on water supplies, specifically potential impacts on Colorado River and local groundwater supplies. As noted above, Metropolitan holds an entitlement to imported water supplies from the Colorado River. Water from the Colorado River is allocated pursuant to federal law and is managed by the Department of the Interior, Bureau of Reclamation (USBR). In order to lawfully use Colorado River water, a party must have an entitlement to do so. See Boulder Canyon Project Act of 1928, 43 U.S.C. §§617, et seq.; Arizona v. California, 547 U.S. 150 (2006).

8-04

As noted above, the Project proposes to use approximately 1,500 af of water during construction and 300 acre-feet per year (afy) for long-term operations, using groundwater from a groundwater basin that is hydrogeologically connected to the Colorado River, within an area referred to as the “accounting surface.” The extent of accounting surface area for the Colorado River was determined by the U.S. Geological Survey (USGS) and USBR as part of an on-going rule-making process. See Notice of Proposed Rule Regulating the Use of the Lower Colorado River

Alan Solomon, Allison Shaffer
June 15, 2010
Page 4

Without an Entitlement, 73 Fed. Reg. 40916 (July 16, 2008); USGS Scientific Investigation Report No. 2008-5113. To the extent the Project uses Colorado River water, it must have a documented right to do so.

↑ 8-04
cont.

Entities in California are using California's full apportionment of Colorado River water, meaning that all water is already contracted and no new water entitlements are available in California. In addition, the California contractors have agreed in the 1931 Seven Party Agreement to prioritize the delivery of California's Colorado River water among themselves. Under this priority agreement, the following alternatives identified in SOIL&WATER-15 are no longer available to Proponents to mitigate impacts to Colorado River water resources:

The [mitigation] activities shall include the following water conservation projects: payment for irrigation improvements in Palo Verde Irrigation District, payment for irrigation improvements in Imperial Irrigation District, purchase of water rights within the Colorado River Basin that will be held in reserve, and/or BLM's Tamarisk Removal Program.

8-05

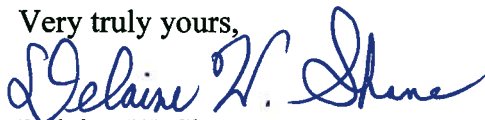

Instead, Proponents would have to obtain water from the existing junior priority holder, Metropolitan, which has the authority to sell water for power plant use. Mitigation measure SOIL&WATER-15 should be revised accordingly. Metropolitan is willing to discuss the exchange of a portion of its water entitlement subject to any required approvals by Metropolitan's Board of Directors and so long as the Proponents agree to provide a replacement supply through an agreement with Metropolitan. Proponents must fully address the impacts on Colorado River water resources and provide full mitigation for such impacts, including replacement of supply.

Additionally, CEC and BLM should assess the potential cumulative impacts of the use of the scarce Colorado River and local groundwater supplies in light of other pending renewable energy projects within the Colorado River Basin and the local groundwater regions. Metropolitan requests that the final EIS and staff assessment address the Proponent's water supply and any potential direct or cumulative impacts from this use.

8-06

We appreciate the opportunity to provide input to your planning process and we look forward to receiving future environmental and related documentation on this project. If we can be of further assistance, please contact Dr. Debbie Drezner at (213) 217-5687.

Very truly yours,

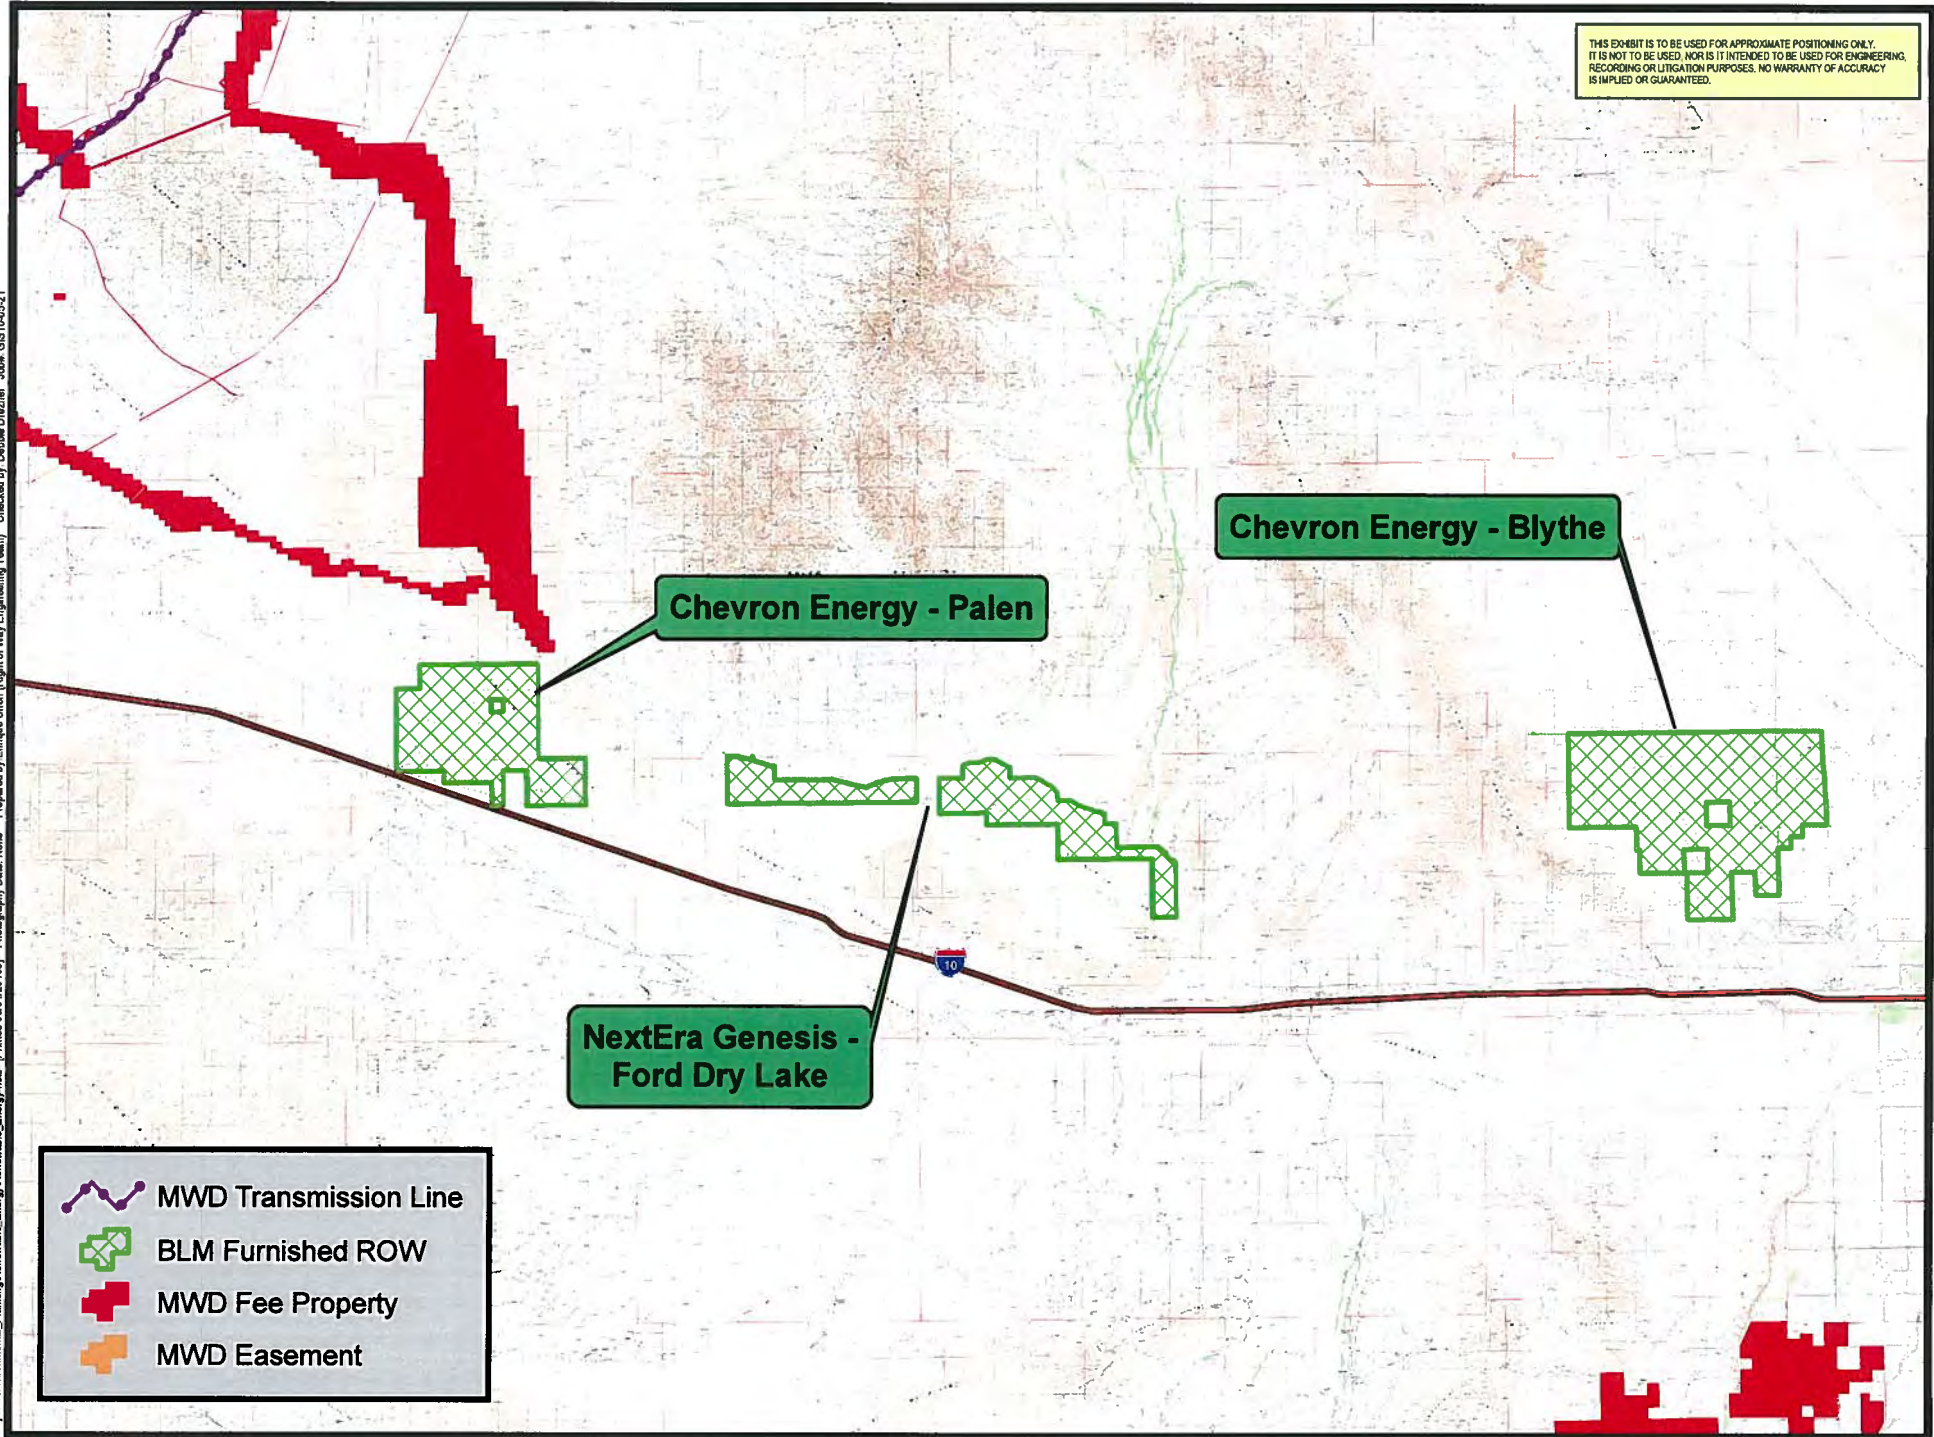

Delaine W. Shane
Manager, Environmental Planning Team

Subject: Draft Environmental Impact Statements for the Solar Millennium and Chevron Energy Solutions 1) Blythe Solar Power Project [CEQ#20100085] and 2) Palen Solar Power Project [CEQ#20100102], Riverside County, California

Dear Mr. Kalish:

The U.S. Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statements (DEIS) for the Solar Millennium and Chevron Energy Solutions 1) Blythe Solar Power Project and 2) Palen Solar Power Project in Riverside County, California. Our comments are provided pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act.

EPA supports the development of renewable energy resources in an expeditious and well planned manner. Using renewable energy resources, such as solar power, can assist the nation in meeting its energy requirements while minimizing the generation of greenhouse gases. While renewable energy facilities offer many environmental benefits, appropriate siting and design of such facilities is of paramount importance if the nation is to make optimum use of its renewable energy resources without unnecessarily depleting or degrading its water resources, wildlife habitats, recreational opportunities, and scenic vistas.

The Bureau of Land Management has identified thirty-four proposed renewable energy projects as "fast track" projects that are expected to complete the environmental review process and be ready to break ground by December 2010 in order to be eligible for funding under the American Recovery and Reinvestment Act. We are aware that many more projects that have not been designated "fast-track" are also being considered by BLM. Many, if not all, of these projects, fast track or otherwise, are proposed for previously undeveloped sites on public lands. In making its decisions regarding whether or not to grant rights-of-way for such projects, we recommend that BLM consider a full range of reasonable alternatives to minimize the adverse environmental impacts. Such alternatives could include alternative technologies or altered

10-1
↓

project footprints at the proposed location, as well as alternate sites, such as closed landfill or other disturbed sites that may offer advantages in terms of availability of infrastructure and less vulnerable habitats. Given the large number of renewable energy project applications currently under consideration, particularly in the Desert Southwest, we encourage BLM to apply its land management authorities in a manner that will promote a long-term sustainable balance between available energy supplies, energy demand, and protection of ecosystems and human health.

↑ 10-1
cont.

On December 11, 2009, EPA provided separate scoping comments for the Blythe Solar Power Project and the Palen Solar Power Project which included detailed recommendations regarding purpose and need, range of alternatives, water resources, and other resource areas of concern. On June 15, 2010, we requested and received an extension on the Blythe Solar Power Project so that we could complete our reviews and prepare a single letter to convey our comments on both of these solar trough projects, which are in close proximity to each other. We appreciate your willingness to provide us with additional time to complete our review. We have rated the Blythe and Palen Solar Power Projects and DEISs as *Environmental Concerns – Insufficient Information* (EC-2). Please see the enclosed “Summary of EPA Rating Definitions.”

In the enclosed detailed comments, we provide specific recommendations regarding analyses and documentation needed to assess potential significant impacts from the proposed Projects. Specifically, EPA is concerned with the: 1) mitigation for impacts to biological resources and special status species, 2) current justification for the Project purpose and need, 3) facility siting and 4) mitigation for ephemeral wash and groundwater impacts.

In addition, the Blythe and Palen Solar Power Project DEISs evaluate Reconfigured Alternatives and Reduced Acreage Alternatives which would significantly reduce adverse impacts to state waters and higher quality desert tortoise and burrowing owl habitat. The Reduced Acreage Alternative for Blythe would generate 750 megawatts (MW) of power while reducing impacts to habitat by 40% and avoiding 305 acres of state waters which provide valuable hydrologic, biogeochemical, plant and wildlife functions. The Reduced Acreage Alternative for Palen would generate 375 MW of power while avoiding 242 acres of state waters and nearly 1,800 acres of desert tortoise habitat. Fewer direct adverse impacts would significantly reduce required mitigation security payments and adverse cumulative impacts. We encourage BLM to select the Reduced Acreage Alternatives for Blythe and Palen if it chooses to grant right-of-way permits and amend the California Desert Conservation Area Plan for the Projects.

EPA appreciates the opportunity to provide input on these Projects and the multitude of DEISs under preparation for renewable energy projects in our Region. We are available to further discuss all recommendations provided. When the FEISs are released for public review, please send one hard copy and one CD of each to the address above (Mail Code: CED-2). If you

have any questions, please contact me at 415-972-3521, or contact Stephanie Skophammer, the lead reviewer for these Projects. Stephanie can be reached at 415-972-3098 or skophammer.stephanie@epa.gov.

Sincerely,

For

Kathleen M. Goforth, Manager
Environmental Review Office (CED-2)
Communities and Ecosystems Division

Enclosures: Summary of EPA Rating Definitions
Detailed Comments

Michael Picker, Office of the Governor

SUMMARY OF EPA RATING DEFINITIONS*

This rating system was developed as a means to summarize the U.S. Environmental Protection Agency's (EPA) level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the Environmental Impact Statement (EIS).

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that should be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the Council on Environmental Quality (CEQ).

ADEQUACY OF THE IMPACT STATEMENT

"Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, Policy and Procedures for the Review of Federal Actions Impacting the Environment.

U.S. EPA DETAILED COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENTS FOR THE SOLAR MILLENNIUM AND CHEVRON ENERGY SOLUTIONS BLYTHE AND PALEN SOLAR POWER PROJECTS, RIVERSIDE COUNTY, CALIFORNIA, JULY 1, 2010.

Project Description

Palo Verde Solar I and Palen Solar I, wholly owned subsidiaries of Solar Millennium, have submitted right-of-way (ROW) applications to the Bureau of Land Management (BLM) to construct separate concentrated solar thermal parabolic trough power plant facilities with a combined capacity of 1,500 megawatts (MW). Chevron Energy Solutions and Solar Millennium have a joint development agreement. The proposed projects lie in the southwestern deserts of California, approximately 40 miles from one another in Riverside County. Blythe Solar Power Project would consist of two 500 MW dry-cooled facilities that would use 600 acre feet per year (afy) of groundwater from onsite wells and be located on approximately 7,030 acres of public land near the Community of Blythe, CA. Palen Solar Power Project is also a dry-cooled facility, consisting of two 250 MW units on approximately 3,000 acres near Desert Center, CA, and would use 300 afy of groundwater from two onsite wells. Each facility is expected to operate for approximately 30 years.

Except where noted otherwise, all of the comments below apply to both Projects.

Ephemeral Washes and Drainage

Demonstrate that the proposed drainage plans will not disrupt downstream flows, functions, or values. The Blythe DEIS states that surface hydrology in the Project disturbance area is from storm water runoff originating in unnamed ephemeral washes west of the Project site from the McCoy Mountains. These washes are a component of the large alluvial fan that generally comprises the Palo Verde Mesa (p. C.2-16). The applicant's drainage plan proposes to replicate existing flow patterns and volume with five engineered channels adjacent to, through, or across the Project site with diffusers at the end which would restore sheet flow down slope of Project (p. C.2-54).

The Palen DEIS states that 364 acres of state jurisdictional waters will be impacted and that surface hydrology in the Project area is influenced largely by stormwater runoff off the northeastern flank of the Chuckwalla Mountains (p. C.2-20). The drainage plan for the Palen Project includes replicating existing flow patterns and volume of three channels; but channel design has yet to be finalized (p. C.2-67).

Recommendations:

Demonstrate that downstream flows will not be disrupted due to proposed changes to natural washes nor the excavation of large amounts of sediment.

10-2

Discuss the feasibility of utilizing existing drainage channels on site. Discuss the feasibility of utilizing more natural features, such as earthen berms or channels, rather than concrete-lined channels, if proposed.

10-3

Include the finalized drainage plan for each project in its respective Final Environmental Impact Statement (FEIS), to facilitate assessment of impacts and effectiveness of mitigation measures.

10-4

Provide more detailed information about fencing and its potential effects. The DEIS does not provide detailed information about fencing nor the effects of fencing on drainage systems and wildlife. In this region, storms can be sudden and severe, resulting in flash flooding. Fence design must address hydrologic criteria, as well as security performance criteria. The National Park Service recently published an article¹ on the effects of the international boundary pedestrian fence on drainage systems and infrastructure. We recommend that BLM review this article to ensure that such issues are adequately addressed. Fencing should also be designed to effectively preclude wildlife access, injury, and mortality.

10-5

Recommendation:

Provide more detailed information about fencing and its potential effects on drainage systems within the FEIS. Ensure that the fencing proposed for this project will meet appropriate hydrologic, wildlife protection and movement, and security performance standards.

Biological Resources

Describe the final biological resources mitigation commitments and how they will be funded and implemented. The Palen DEIS Biological Resources Table 6 (p. C.2-65) summarizes the recommended mitigation acreage for the proposed project, including 4,740 acres for desert tortoise, 3,011 acres for the Mojave fringe-toed lizard and 585 acres for direct impacts to State waters. The applicant proposes to achieve a 1.5:1 compensation ratio for desert wash woodland and a 0.5:1 ratio for unvegetated ephemeral swales. The Blythe project DEIS proposes to acquire 7,040 acres for desert tortoise (p. C.2-60), and achieve a 1.5:1 compensation ratio for desert wash woodland and a 1:1 ratio for vegetated ephemeral swales (p. C.2-54). For both projects, the costs associated with desert tortoise compensatory mitigation include an acquisition fee of \$500 per acre, an initial habitat improvement cost of \$330 per acre, and a long-term management endowment of \$1,450 per acre (for total of \$2,280 per acre security fee).

10-6

Detailed mitigation measures are determined on a project specific basis, and must be contained in each project's environmental analyses and decision documents. Project proponents have a number of options by which they can fulfill their mitigation requirements. The California Renewable Energy Action Team (REAT) recently announced a Memorandum of Agreement (MOA) with the National Fish and Wildlife Foundation for operation of the Renewable Energy Action Team Mitigation Account (REAT Account). The REAT Account is designed to help project proponents and the State and Federal governments more effectively implement biological resources mitigation for renewable energy projects in the Mojave and Colorado Desert region of southern California. It also will aid project proponents in carrying out contracting and construction activities in a timely manner per requirements for American Recovery and

¹ National Park Service, August 2008, Effects of the International Boundary Pedestrian Fence in the Vicinity of Lukeville, Arizona, on Drainage Systems and Infrastructure, Organ Pipe Cactus National Monument, Arizona,

Reinvestment Act (ARRA) funding eligibility. Use of the REAT Account is only one of several options available to the proponent, and participation is voluntary.

↑
10-6
cont.

Recommendations:

The FEISs should describe the final biological resources mitigation commitments for both projects and how they would be funded and implemented. They should state whether and how the Project applicant would utilize the REAT account or other mechanism.

Include, in the FEISs, mitigation plans for unavoidable impacts to waters of the State and biological resources such as desert tortoise, desert kit fox, burrowing owls, Nelson's bighorn sheep, golden and bald eagles, and their habitats. Such mitigation plans are described briefly in the sections BIO-1 to 24 in the Palen and Blythe DEISs; further details should be provided in the FEISs. Specifically, if the applicant is to acquire compensation lands, the location(s) and management plans for these lands should be fully disclosed.

10-7

All mitigation commitments should be included in the Record of Decision (ROD).

Groundwater

Further describe groundwater mitigation and detail its effectiveness in minimizing groundwater withdrawal. Both the Palen and Blythe proposed projects could impact water resources, and BLM and CEC staff have proposed mitigation measures to reduce identified groundwater impacts to levels that are less than significant (p. C.9-1). The Soil and Water Resources section C.9 of the Palen and Blythe DEISs references these mitigation measures, but a discussion of the effectiveness and the impacts of the mitigation is not included.

10-8

The Palen DEIS acknowledges that, due to the high volume of projects in the region, cumulative impacts to groundwater could be significant and may place the Palen project's Chuckawalla basin in overdraft condition. Overdraft is described as the amount of water withdrawn exceeding the amount of water that recharges the basin (p. C.9-38). Although the amount of water in basin storage greatly exceeds the potential overdraft, the Palen DEIS notes that a drop in groundwater levels could impact basin wells and lower the water table (C.9-40). Such basin balance analyses for the Palo Verde Mesa Basin are not provided in the Blythe DEIS.

10-9

Recommendation:

The Blythe FEIS should include a basin balance analysis for the Palo Verde Mesa Groundwater Basin.

Impacts to groundwater in the Chuckawalla Valley Groundwater Basin (Palen) and the Palo Verde Mesa Groundwater Basin (Blythe) should be minimized as much as possible. This may involve altering project design, implementing recycled water techniques, as well as considering reduced acreage alternatives. The FEISs should describe the effectiveness of, and commitments to, the mitigation and monitoring plans described in

10-10
↓

the Mitigation Measures C.9.12 Soil&Water-1 to 11 (Palen) and C.9.10 Soil&Water-1 to 17 (Blythe).

10-10
cont.

The Blythe FEIS should also further describe the estimation of the impacts from withdrawing groundwater that is recharged by the Colorado River (p. C.9-108) and the effectiveness of the mitigation proposed. The expected effectiveness of the mitigation must be documented and committed to, and the FEIS should clarify whether or not an entitlement to water from the Colorado River aquifer would be needed. This information should be made available in the FEIS and the ROD.

10-11

10-12

Purpose and Need

Update the discussion regarding the need for the proposed project. In the last three years, there has been tremendous growth in renewable energy, and decline in the more traditional sectors, including the postponement/indefinite delay and modification of large coal-fired power plants. Many factors have triggered this shift, including concerns about global warming and climate change. These events have spawned an unprecedented increase in the number of applications submitted to BLM for large-scale renewable energy projects on public lands in the desert southwest. BLM has received over 470 renewable energy project applications, to date, with a projected capacity of 97,000 MW of electricity².

EPA believes the discussion in the Blythe and Palen DEISs regarding the purpose and need for the proposed Project should be expanded to include more robust information regarding the *need* for the proposed project. As indicated in our scoping comments dated December 11, 2009, the DEIS should briefly discuss the proposed project in the context of the larger energy market that this project would serve; identify potential purchasers of the power produced; and discuss how the project will assist the State and nation in meeting renewable energy portfolio standards and goals.

10-13

Recommendation:

Update the discussion regarding the *need* for the individual proposed projects, utilizing more accurate, robust, and up-to-date references.

Re-state the Purpose and Need to allow analysis of all reasonable alternatives. The DEISs for Blythe and Palen present separately the purpose and need statements for BLM, Department of Energy (DOE), CEC, and project applicant. The BLM defines its purpose and need narrowly as approval or disapproval of the application for a ROW grant to construct, operate and decommission a solar power generation facility and associated infrastructure. Thus, BLM states that all site alternatives proposed to be located on lands not under the jurisdiction of BLM are considered unreasonable because none would accomplish the need to respond to Palo Verde Solar I ROW request (p. B.2-1) or Palen Solar I ROW request (p. B.2-2). The DOE's purpose and need would be to comply with its mandate under the Energy Policy Act (EPA) to select eligible projects that meet the goals of the EPA, and is contingent upon the decision to

10-14

² "Secretary Salazar, Senator Reid Announce 'Fast-Track' Initiatives for Solar Energy Development on Western Lands", U.S. Department of Interior, News Release, June 29, 2009. http://www.blm.gov/wo/st/en/info/newsroom/2009/june/NR_0629_2009.html

enter into negotiation of a loan guarantee. CEC's purpose and need is to certify the construction, modification, and operation of thermal electric power plants 50 MW or larger (p. A-3).

The Purpose and Need for each project should be stated broadly enough to allow for the analysis of a full scope of alternatives, including off-site locations, environmentally preferable on-site alternatives, or other modes of renewable energy generation. The Purpose and Need should focus on the underlying problem(s) to be addressed, such as a lack of capacity to serve an increasing demand for energy, or the need to develop sufficient renewable energy to meet State renewable portfolio standards. Council on Environmental Quality (CEQ) regulations and guidance state that an environmental impact analysis shall include reasonable alternatives not within the jurisdiction of the agency (1502.14c) and "reasonable alternatives include those that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant" (NEPA's 40 Most Asked Questions 2a)³.

10-14
cont.

Recommendations:

We recommend that the Purpose and Need be stated, in each FEIS, in a manner that is broad enough for analysis and consideration of a full range of reasonable alternatives for addressing the underlying need. Reasonable alternatives may include off-site locations, environmentally preferable on-site alternatives, or other modes of renewable energy generation.

Each FEIS should describe BLM's options for acting upon an application for a right-of-way grant. For instance, describe the extent of BLM's authority to require the adoption of a "modified" project design or alternate site on BLM land, to deny an application, or to select another ROW application submitted by the same applicant or its corporate owner.

10-15

Describe the number of total renewable energy applications that are likely to proceed, any utility purchase agreements, and how generated power will be bought, sold, and used. The DEISs for Blythe and Palen state that the need for the proposed action has its basis in State and Federal orders and laws regarding renewable energy generation. The cumulative scenario describes the large number of renewable energy projects proposed on BLM land in California, Nevada, and Arizona, which are in various stages of environmental review or under construction. Presumably, some of these or other renewable energy facilities will be constructed pursuant to the joint Department of Energy (DOE)/BLM Programmatic Solar DEIS (PEIS) effort as well as the Desert Renewable Energy Conservation Plan (DRECP) process.

10-16

Recommendations:

To the extent practicable, each FEIS should discuss how many of the total renewable energy applications received by BLM are likely to proceed pursuant to the joint Department of Energy (DOE)/BLM Programmatic Solar DEIS effort and the Desert Renewable Energy Conservation Plan (DRECP) process, and the level of energy production those applications represent.

³ <http://ceq.hss.doe.gov/nepa/regs/40/1-10.HTM#2>

We recommend that each FEIS include additional information on the utility purchase agreements for the proposed power, and provide a description of how the power would be bought, sold, and used so that the reader can better evaluate the tradeoffs between resource protection and power generation.

10-17

Project Siting

Describe the criteria used to identify and compare siting locations. Provide a comparison of life-cycle costs and other regional projects. EPA continues to recommend the identification of potential project site locations that have been previously disturbed or contaminated. For example, the EPA’s Re-Powering America initiative works to identify disturbed and contaminated lands appropriate for renewable energy development. For more information on this initiative visit <http://www.epa.gov/oswerepa/>. EPA strongly encourages BLM to promote the siting of renewable energy projects on disturbed, degraded, and contaminated sites before considering siting on large tracts of undisturbed public lands. We also recommend consideration of each proposed renewable energy project in comparison with others proposed in the desert southwest region and their adverse effects on waters of the State, jurisdictional waters of the United States, biological resources, air quality, and visual and cultural resource impacts.

10-18

Recommendations:

Each FEIS should describe the criteria used to identify and compare siting locations for renewable energy facilities, and to ascertain whether or not any disturbed sites are available that would be suitable for the proposed project.

10-19

We recommend reconsideration of alternatives such as the Private Land and Reduced Acreage Alternatives (for the Blythe and Palen projects) that would avoid and minimize adverse effects on biological, cultural, and visual resources. Fewer adverse impacts would significantly reduce required mitigation security payments and adverse cumulative impacts.

10-20

Each FEIS should include a table comparing the life-cycle costs of the different alternatives. Include information on the cost of the land, different project design criteria that would be required, acquisition effort, scheduling effects, and cost of mitigation.

10-21

Each FEIS should demonstrate that the approved project site is consistent with the Desert Renewable Energy Conservation Plan for the Mojave and Colorado Desert Regions. At a minimum, the FEIS should describe and commit to a process to ensure approved projects are consistent with the Desert Renewable Energy Conservation Plan.

10-22

Climate Change

The DEISs present a brief discussion on climate change but do not include measures to avoid, minimize, or mitigate the effects of climate change on the proposed projects (Appendix Air-1). Scientific evidence supports the concern that continued increases in greenhouse gas emissions

10-23

resulting from human activities will contribute to climate change. Effects on weather patterns, sea level, ocean acidification, chemical reaction rates, and precipitation rates can be expected. ↑ 10-23
| cont.

Recommendations:

Consider how climate change could affect each proposed project, specifically within sensitive areas, and assess how the impacts of the proposed project could be exacerbated by climate change. | 10-24

Identify strategies to more effectively monitor for climate change impacts in the surrounding area, such as monitoring groundwater change or special status species. | 10-25

Briefly discuss the climate change *benefits* of solar energy. We suggest quantifying the greenhouse gas emissions that would be produced by other types of electric generating facilities (solar, geothermal, natural gas, coal-burning, and nuclear) generating comparable amounts of electricity, and compiling and comparing these values. | 10-26

General Comments

Commit to compliance with LORS and mitigation requirements prior to Project approval. The Palen and Blythe DEISs state that there are technical areas currently undetermined with respect to mitigation of potential impacts and/or conformance with applicable laws, ordinances, regulations and standards (LORS) (Executive Summary, p. 15). These undetermined technical areas include biological resources, cultural resources, land use, soil and water resources, traffic and transportation, and transmission system engineering (Blythe) and air quality, cultural resources, soil and water resources, and transmission system engineering (Palen). Since neither project is already identified in the California Desert Conservation Area Plan, a Plan amendment is required. The amendment process includes a determination that the proposed amendment is in accordance with applicable laws and regulations. | 10-27

Recommendation:

We recommend the FEISs include a firm commitment to the determination of compliance with LORS and mitigation requirements prior to final decisions on the projects and finalization of the CEC Conditions of Certification. |

Complete all surveys and analyses to ascertain impacts to Cultural Resources. Include this information in each FEIS. The DEISs for the Palen and Blythe Projects state that current data have been analyzed; but, due to a lack of data, the impacts to cultural resources are indeterminate. | 10-28

Recommendation:

EPA recommends that all surveys be completed and all impacts to cultural resources be assessed for the Blythe and Palen projects and that this information be made available in the FEISs. |

Describe the reasonably foreseeable development and population growth as a result of proposed projects. The Blythe and Palen projects are located within approximately 40 miles of one another and the region anticipates an influx of hundreds of workers. Blythe Project construction will require an average of 604 workers over the 5 year construction period with a peak at approximately 1,004 workers in spring 2012 (Executive Summary p. 3). The Palen Project construction will demand an average of 566 employees over the 3 year construction period and peak at approximately 1,140 workers, also in spring 2012 (Executive Summary p. 3). The DEISs for both projects state that construction workers would be from the local counties of La Paz, AZ, Riverside, CA, and San Bernardino, CA.

Recommendation:

We recommend that the FEISs for both projects contain analyses of the impacts of workers to the areas of Desert Center and Blythe, CA. The documents should provide an estimate of the amount of growth, likely location(s), the impacts on municipal services, and the biological and environmental resources at risk. The documents should also include a discussion of potential transit options (including formal Rideshare, Carpooling, and Bussing) to transport workers from the nearest population centers to the remote project sites as well as other measures to facilitate accessibility to the job sites and reduce greenhouse gas emissions resulting from worker transportation.

10-29

APPENDIX C

Applicant Proposed Measures

This page intentionally left blank

APPLICANT PROPOSED MEASURES

The Applicant has adopted, with minor revision to reflect changes in technology, many of the BLM-identified mitigation measures and CEC-approved Conditions of Certification and Compliance Verifications for the PSPP. Most of these measures originally appeared in the CEC's Revised Staff Assessment, Commission Decision, and the BLM's PSPP PA/FEIS. Such measures are identified in the Draft SEIS as Applicant Proposed Measures (APMs) for the PSEGS. These APMs have been proposed to reduce or avoid potential impacts that could result from the PSEGS. The APMs would be implemented like other elements of the PSEGS.

The table below presents the specific APMs, the method of verification, and the governmental agency charged with oversight. The Applicant has chosen to present these measures in the style of the documents from which they first appeared. As such, some of the measures reference tables and figures associated with the original documents. Whenever possible, the BLM has added clarifying references. The full text of the documents identified in these references is available online, as an Appendix to this Draft SEIS, or upon request, as specified below.

- **PSIII Revised Plan of Development (2013)**

Available from the BLM upon request. Please contact Frank McMenimen, Project Manager, by mail: 1201 Bird Center Drive, Palm Springs, California 92262; phone: (760) 833-7150; or email: fmcmenimen@blm.gov.

APPLICANT PROPOSED MEASURES

Applicant Proposed Measures	Verification	Responsible Agency
GENERAL CONDITIONS		
<p>COMPLIANCE-1, Unrestricted Access: BLM's AO, responsible BLM staff, the CPM, responsible Energy Commission staff, and delegated agencies or consultants shall be guaranteed and granted unrestricted access to the power plant site, related facilities, project-related staff, and the records maintained on-site, for the purpose of conducting audits, surveys, inspections, or general site visits. Although BLM's AO and the CPM will normally schedule site visits on dates and times agreeable to the project owner, BLM's AO and the CPM reserve the right to make unannounced visits at any time.</p>		CEC
<p>COMPLIANCE-2, Compliance Record: The project owner shall maintain project files on-site or at an alternative site approved by BLM's AO and the CPM for the life of the project, unless a lesser period of time is specified by the conditions of certification. The files shall contain copies of all "as-built" drawings, documents submitted as verification for conditions, and other project-related documents. As-built drawings of all facilities including linear facilities shall be provided to the BLM AO for inclusion in the BLM administrative record within 90 days of completion of that portion of the facility or project. BLM and Energy Commission staff and delegate agencies shall, upon request to the project owner, be given unrestricted access to the files maintained pursuant to this condition.</p>		CEC
<p>COMPLIANCE-3, Compliance Verification Submittals: Each condition of certification is followed by a means of verification. The verification describes the Energy Commission's procedure(s) to ensure post-certification compliance with adopted conditions. The verification procedures, unlike the conditions, may be modified as necessary by BLM's AO and the CPM.</p> <p>Verification of compliance with the conditions of certification can be accomplished by the following:</p> <ol style="list-style-type: none"> 1. Monthly and/or annual compliance reports filed by the project owner or authorized agent, reporting on work done and providing pertinent documentation, as required by the specific conditions of certification; 2. Appropriate letters from delegate agencies verifying compliance; 3. BLM and Energy Commission staff audits of project records; and/or 4. BLM and Energy Commission staff inspections of work, or other evidence that the requirements are satisfied. <p>Verification lead times associated with start of construction may require the project owner to file submittals during the certification process, particularly if construction is planned to commence shortly after certification.</p> <p>A cover letter from the project owner or authorized agent is required for all compliance submittals and correspondence pertaining to compliance matters. The cover letter subject line shall identify the project by AFC and BLM case file numbers, the appropriate condition(s) of certification by condition number(s), and a brief description of the subject of the submittal. The project owner shall also identify those submittals not required by a condition of certification with a statement such as: "This submittal is for information only and is not required by a specific condition of certification." When submitting supplementary or corrected information, the project owner shall reference the date of the previous submittal and BLM/CEC submittal number.</p> <p>The project owner is responsible for the delivery and content of all verification submittals to the BLM's AO and CPM, whether such condition was satisfied by work performed by the project owner or an agent of the project owner.</p>		CEC

APPLICANT PROPOSED MEASURES

Applicant Proposed Measures	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>All hardcopy submittals shall be addressed to each of the following:</p> <p style="padding-left: 40px;">John Kalish, Field Manager Dale Rundquist, CPM (CACA-48810) (09 AFC 7C) U.S. Bureau of Land Management California Energy Commission Palm Springs-South Coast Field Office 1516 Ninth Street, MS 2000 1201 Bird Center Drive Palm Springs, CA 92262 Sacramento, CA 95814</p> <p>Those submittals shall be accompanied by a searchable electronic copy, on a CD or by e-mail, as agreed upon by BLM's AO and the CPM.</p> <p>If the project owner desires BLM and/or Energy Commission staff action by a specific date, that request shall be made in the submittal cover letter and shall include a detailed explanation of the effects on the project if that date is not met.</p>		
<p>COMPLIANCE-4, Pre-Construction Matrix and Tasks Prior to Start of Construction: Prior to commencing construction, a compliance matrix addressing only those conditions that must be fulfilled before the start of construction shall be submitted by the project owner to BLM's AO and the CPM. This matrix will be included with the project owner's first compliance submittal or prior to the first pre-construction meeting, whichever comes first. It will be submitted in the same format as the compliance matrix described below. In order to begin any on-site mobilization or surface disturbing activities on public land, the BLM AO must approve a written Notice to Proceed (NTP). NTPs will be phased as appropriate to facilitate timely implementation of construction.</p> <p>Construction shall not commence until the pre-construction matrix is submitted, all pre-construction conditions have been complied with, and BLM's AO and the CPM have issued a letter and BLM has issued a NTP to the project owner authorizing construction. Various lead times for submittal of compliance verification documents to BLM's AO and the CPM for conditions of certification are established to allow sufficient BLM and Energy Commission staff time to review and comment and, if necessary, allow the project owner to revise the submittal in a timely manner. This will ensure that project construction may proceed according to schedule.</p> <p>Failure to submit compliance documents within the specified lead-time may result in delays in authorization to commence various stages of project development.</p> <p>If the project owner anticipates commencing project construction as soon as the project is certified, it may be necessary for the project owner to file compliance submittals prior to project certification. Compliance submittals should be completed in advance where the necessary lead time for a required compliance event extends beyond the date anticipated for start of construction. The project owner must understand that the submittal of compliance documents prior to project certification is at the owner's own risk. Any approval by Energy Commission staff is subject to change, based upon BLM's ROW Grant and the Energy Commission Decision.</p>		CEC

APPLICANT PROPOSED MEASURES

Applicant Proposed Measures	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>Compliance Reporting</p> <p>There are two different compliance reports that the project owner must submit to assist BLM's AO and the CPM in tracking activities and monitoring compliance with the terms and conditions of BLM's ROW Grant and the Energy Commission Decision. During construction, the project owner or authorized agent will submit monthly compliance reports. During operation, an annual compliance report must be submitted. These reports, and the requirement for an accompanying compliance matrix, are described below. The majority of the conditions of certification require that compliance submittals be submitted to BLM's AO and the CPM in the monthly or annual compliance reports.</p>		
<p>COMPLIANCE-5, Compliance Matrix: A compliance matrix shall be submitted by the project owner to BLM's AO and the CPM along with each monthly and annual compliance report. The compliance matrix is intended to provide BLM's AO and the CPM with the current status of all conditions of certification in a spreadsheet format. The compliance matrix must identify:</p> <ol style="list-style-type: none"> 1. the technical area; 2. the condition number; 3. a brief description of the verification action or submittal required by the condition; 4. the date the submittal is required (e.g., 60 days prior to construction, after final inspection, etc.); 5. the expected or actual submittal date; 6. the date a submittal or action was approved by the Chief Building Official (CBO), BLM's AO, CPM, or delegate agency, if applicable; and 7. the compliance status of each condition, e.g., "not started," "in progress" or "completed" (include the date). 8. if the condition was amended, the date of the amendment. <p>Satisfied conditions shall be placed at the end of the matrix.</p>		CEC
<p>COMPLIANCE-6, Monthly Compliance Report: The first monthly compliance report is due one month following the Energy Commission business meeting date upon which the project was approved, unless otherwise agreed to by BLM's AO and the CPM. The first monthly compliance report shall include the AFC and BLM case file numbers and an initial list of dates for each of the events identified on the Key Events List. The Key Events List Form is found at the end of this section.</p> <p>During pre-construction and construction of each power plant, the project owner or authorized agent shall submit an original and an electronic searchable version of the monthly compliance report within 10 working days after the end of each reporting month or other period of time agreed to by BLM's AO and the CPM. Monthly compliance reports shall be clearly identified for the month being reported. The reports shall contain, at a minimum:</p> <ol style="list-style-type: none"> 1. A summary of the current project construction status, a revised/updated schedule if there are significant delays, and an explanation of any significant changes to the schedule; 		CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>2. Documents required by specific conditions to be submitted along with the monthly compliance report. Each of these items must be identified in the transmittal letter, as well as the conditions they satisfy and submitted as attachments to the monthly compliance report;</p> <p>3. An initial, and thereafter updated, compliance matrix showing the status of all conditions of certification (fully satisfied conditions do not need to be included in the matrix after they have been reported as completed);</p> <p>4. A list of conditions that have been satisfied during the reporting period, and a description or reference to the actions that satisfied the condition;</p> <p>5. A list of any submittal deadlines that were missed, accompanied by an explanation and an estimate of when the information will be provided;</p> <p>6. A cumulative listing of any approved changes to conditions of certification;</p> <p>7. A listing of any filings submitted to, or permits issued by, other governmental agencies during the month;</p> <p>8. A projection of project compliance activities scheduled during the next two months. The project owner shall notify BLM's AO and the CPM as soon as any changes are made to the project construction schedule that would affect compliance with conditions of certification;</p> <p>9. A listing of the month's additions to the on-site compliance file; and</p> <p>10. A listing of complaints, notices of violation, official warnings, and citations received during the month, a description of the resolution of the resolved actions, and the status of any unresolved actions.</p> <p>All sections, exhibits, or addendums shall be separated by tabbed dividers or as acceptable by BLM's AO and the CPM.</p>		
<p>COMPLIANCE-7: Annual Compliance Report: After construction of each power plant is complete or when a power plant goes into commercial operations, the project owner shall submit annual compliance reports instead of monthly compliance reports. The reports are for each year of commercial operation and are due to BLM's AO and the CPM each year at a date agreed to by BLM's AO and the CPM. Annual compliance reports shall be submitted over the life of the project unless otherwise specified by BLM's AO and the CPM. Each annual compliance report shall include the AFC and BLM case file numbers, identify the reporting period and shall contain the following:</p> <p>1. An updated compliance matrix showing the status of all conditions of certification (fully satisfied conditions do not need to be included in the matrix after they have been reported as completed);</p> <p>2. A summary of the current project operating status and an explanation of any significant changes to facility operations during the year;</p> <p>3. Documents required by specific conditions to be submitted along with the annual compliance report. Each of these items must be identified in the transmittal letter, with the condition it satisfies, and submitted as attachments to the annual compliance report;</p>		CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>4. A cumulative listing of all post-certification changes by the Energy Commission or changes to the BLM ROW grant or approved POD by BLM, or cleared by BLM's AO and the CPM;</p> <p>5. An explanation for any submittal deadlines that were missed, accompanied by an estimate of when the information will be provided;</p> <p>6. A listing of filings submitted to, or permits issued by, other governmental agencies during the year;</p> <p>7. A projection of project compliance activities scheduled during the next year;</p> <p>8. A listing of the year's additions to the on-site compliance file;</p> <p>9. An evaluation of the on-site contingency plan for unplanned facility closure, including any suggestions necessary for bringing the plan up to date [see Compliance Conditions for Facility Closure addressed later in this section]; and</p> <p>10. A listing of complaints, notices of violation, official warnings, and citations received during the year, a description of the resolution of any resolved matters, and the status of any unresolved matters.</p>		
<p>COMPLIANCE-8: Confidential Information: Any information that the project owner deems confidential shall be submitted to the Energy Commission's executive director with an application for confidentiality pursuant to Title 20, California Code of Regulations, section 2505(a). Any information that is determined to be confidential shall be kept confidential as provided for in Title 20, California Code of Regulations, section 2501 et. seq.</p> <p>Any information the ROW holder deems confidential shall be submitted to the BLM AO with a written request for said confidentiality along with a justification for the request in accordance with 43 CFR 2804.13. All confidential submissions to BLM should be clearly stamped "proprietary information" by the holder when submitted.</p>		CEC
<p>COMPLIANCE-9, Reporting of Complaints, Notices, and Citations: Prior to the start of construction, the project owner must send a letter to property owners living within one mile of the project notifying them of a telephone number to contact project representatives with questions, complaints or concerns. If the telephone is not staffed 24 hours per day, it shall include automatic answering with date and time stamp recording. All recorded complaints shall be responded to within 24 hours. The telephone number shall be posted at the project site and made easily visible to passersby during construction and operation. The telephone number shall be provided to BLM's AO and the CPM who will post it on the Energy Commission's web page at: http://www.energy.ca.gov/sitingcases/power_plants_contacts.html.</p> <p>Any changes to the telephone number shall be submitted immediately to BLM's AO and the CPM, who will update the web page.</p> <p>In addition to the monthly and annual compliance reporting requirements described above, the project owner shall report and provide copies to BLM's AO and the CPM of all complaint forms, including noise and lighting complaints, notices of violation, notices of fines, official warnings, and citations, within 10 days of receipt. Complaints shall be logged and numbered. Noise complaints shall be recorded on the form provided in the NOISE conditions of certification. All other complaints shall be recorded on the complaint form (Attachment A).</p>		CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>COMPLIANCE-10, Planned Closure: In order to ensure that a planned facility closure does not create adverse impacts, a closure process that provides for careful consideration of available options and applicable laws, ordinances, regulations, standards, and local/regional plans in existence at the time of closure, will be undertaken. To ensure adequate review of a planned project closure, the project owner shall submit a revision or update to the approved Closure, Revegetation and Rehabilitation Plan to BLM and the Energy Commission for review and approval at least 12 months (or other period of time agreed to by BLM's AO and the CPM) prior to commencement of closure activities. The project owner shall file 50 copies and 50 CDs with the Energy Commission and 10 copies and 10 CDs with BLM (or other number of copies agreed upon by BLM's AO and the CPM) of a proposed facility closure plan/Closure, Revegetation and Rehabilitation Plan.</p> <p>The plan shall:</p> <ol style="list-style-type: none"> 1. identify and discuss any impacts and mitigation to address significant adverse impacts associated with proposed closure activities and to address facilities, equipment, or other project related materials that must be removed from the site; 2. identify a schedule of activities for closure of the power plant site, transmission line corridor, and all other appurtenant facilities constructed as part of the project; 3. address conformance of the plan with all applicable laws, ordinances, regulations, standards, and local/regional plans in existence at the time of facility closure, and applicable conditions of certification; and. 4. Address any changes to the site revegetation, rehabilitation, monitoring and long-term maintenance specified in the existing plan that are needed for site revegetation and rehabilitation to be successful. <p>Prior to submittal of an amended or revised Closure, Revegetation and Restoration Plan, a meeting shall be held between the project owner, BLM's AO and the Energy Commission CPM for the purpose of discussing the specific contents of the plan.</p> <p>In the event that there are significant issues associated with the proposed facility Closure, Revegetation and Restoration plan's approval, or the desires of local officials or interested parties are inconsistent with the plan, BLM's AO the CPM shall hold one or more workshops and/or BLM and the Energy Commission may hold public hearings as part of its approval procedure.</p> <p>As necessary, prior to or during the closure process, the project owner shall take appropriate steps to eliminate any immediate threats to public health and safety and the environment, but shall not commence any other closure activities until BLM and the Energy Commission approve the facility Closure, Revegetation and Restoration plan.</p>		CEC
<p>COMPLIANCE-11, Unplanned Temporary Closure: In order to ensure that public health and safety and the environment are protected in the event of an unplanned temporary facility closure, it is essential to have an On-Site Contingency Plan in place. The On-Site Contingency Plan will help to ensure that all necessary steps to mitigate public health and safety impacts and environmental impacts are taken in a timely manner.</p> <p>The project owner shall submit an On-Site Contingency Plan for BLM's AO and CPM review and approval. The plan shall be submitted no less than 60 days (or other time agreed to by BLM's AO and the CPM) after approval of any NTP or letter</p>		CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>granting approval to commence construction for each phase of construction. A copy of the approved plan must be in place during commercial operation of the facility and shall be kept at the site at all times.</p> <p>The project owner, in consultation with BLM's AO and the CPM, will update the On-Site Contingency Plan as necessary. BLM's AO and the CPM may require revisions to the On-Site Contingency Plan over the life of the project. In the annual compliance reports submitted to the Energy Commission, the project owner will review the On-Site Contingency Plan, and recommend changes to bring the plan up to date. Any changes to the plan must be approved by BLM's AO and the CPM.</p> <p>The On-Site Contingency Plan shall provide for taking immediate steps to secure the facility from trespassing or encroachment. In addition, for closures of more than 90 days, unless other arrangements are agreed to by BLM's AO and the CPM, the plan shall provide for removal of hazardous materials and hazardous wastes, draining of all chemicals from storage tanks and other equipment, and the safe shutdown of all equipment. (Also see specific conditions of certification for the technical areas of Hazardous Materials Management and Waste Management.)</p> <p>In addition, consistent with requirements under unplanned permanent closure addressed below, the nature and extent of insurance coverage, and major equipment warranties must also be included in the On-Site Contingency Plan. In addition, the status of the insurance coverage and major equipment warranties must be updated in the annual compliance reports.</p> <p>In the event of an unplanned temporary closure, the project owner shall notify BLM's AO and the CPM, as well as other responsible agencies, by telephone, fax, or e-mail, within 24 hours and shall take all necessary steps to implement the On-Site Contingency Plan. The project owner shall keep BLM's AO and the CPM informed of the circumstances and expected duration of the closure.</p> <p>If BLM's AO and the CPM determine that an unplanned temporary closure is likely to be permanent, or for a duration of more than six months, a Closure Plan consistent with the requirements for a planned closure shall be developed and submitted to BLM's AO and the CPM within 90 days of BLM's AO and the CPM's determination (or other period of time agreed to by BLM's AO and the CPM).</p>		
<p>COMPLIANCE-12, Unplanned Permanent Closure: The On-Site Contingency Plan required for unplanned temporary closure shall also cover unplanned permanent facility closure. All of the requirements specified for unplanned temporary closure shall also apply to unplanned permanent closure.</p> <p>In addition, the On-Site Contingency Plan shall address how the project owner will ensure that all required closure steps will be successfully undertaken in the event of abandonment.</p> <p>In the event of an unplanned permanent closure, the project owner shall notify BLM's AO and the CPM, as well as other responsible agencies, by telephone, fax, or e-mail, within 24 hours and shall take all necessary steps to implement the On-Site Contingency Plan. The project owner shall keep BLM's AO and the CPM informed of the status of all closure activities.</p> <p>To ensure that public health and safety and the environment are protected in the event of an unplanned permanent closure, the project owner shall submit an On-Site Contingency Plan no less than 60 days after a NTP is issued for each phase of development.</p>		CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>COMPLIANCE 13, Post-Certification Changes to the Decision: Amendments, ownership Changes, Staff Approved Project Modifications and Verification Changes: The project owner must petition the Energy Commission pursuant to Title 20, California Code of Regulations, section 1769, in order to modify the project (including linear facilities) design, operation or performance requirements, and to transfer ownership or operational control of the facility. The BLM ROW holder must file a written request in the form of an application to the BLM AO in order to change the terms and conditions of their ROW grant or POD. Written requests will be in a manner prescribed by the BLM AO. Implementation of a project modification without first securing BLM approval may result in financial and other liabilities in accordance with 43 CFR 2808.</p> <p>It is the responsibility of the project owner to contact BLM's AO and the CPM to determine if a proposed project change should be considered a project modification pursuant to section 1769. Implementation of a project modification without first securing Energy Commission staff approval may result in enforcement action that could result in civil penalties in accordance with section 25534 of the Public Resources Code.</p> <p>A petition is required for amendments and for staff approved project modifications as specified below. Both shall be filed as a "Petition to Amend." Staff will determine if the change is significant or insignificant. For verification changes, a letter from the project owner is sufficient. In all cases, the petition or letter requesting a change should be submitted to BLM's AO and the CPM, who will file it with the Energy Commission's Dockets Unit in accordance with Title 20, California Code of Regulations, section 1209.</p> <p>The criteria that determine which type of approval and the process that applies are explained below. They reflect the provisions of Section 1769 at the time this condition was drafted. If the Commission's rules regarding amendments are amended, the rules in effect at the time an amendment is requested shall apply.</p> <p>Amendment</p> <p>The project owner shall petition the Energy Commission, pursuant to Title 20, California Code of Regulations, Section 1769(a), when proposing modifications to the project (including linear facilities) design, operation, or performance requirements. If a proposed modification results in deletion or change of a condition of certification, or makes changes that would cause the project not to comply with any applicable laws, ordinances, regulations or standards, the petition will be processed as a formal amendment to the Energy Commission's final decision, which requires public notice and review of the BLM-Energy Commission staff analysis, and approval by the full Energy Commission. The petition shall be in the form of a legal brief and fulfill the requirements of Section 1769(a). Upon request, the CPM will provide you with a sample petition to use as a template.</p> <p>The ROW holder shall file an application to amend the BLM ROW grant for any substantial deviation or change in use in accordance with the regulations at 43 CFR 2807.20. The requirements to amend a ROW grant are the same as when filing a new application including paying processing and monitoring fees and rent.</p> <p>Staff Approved Project Modification</p> <p>Modifications that do not result in deletions or changes to conditions of certification, and that are compliant with laws, ordinances, regulations and standards, may be authorized by BLM's AO and the CPM as a staff approved project modification (SAPM) pursuant to section 1769(a) (2). Once staff files an intention to approve the proposed project</p>		CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GENERAL CONDITIONS (cont.)		
<p>modifications, any person may file an objection to staff’s determination within 14 days of service on the grounds that the modification does not meet the criteria of section 1769 (a)(2). If a person objects to staff’s determination, the petition must be processed as a formal amendment to the decision and must be approved by the full commission at a noticed business meeting or hearing. BLM and the Energy Commission intend to integrate a process to jointly approve SAPMs to avoid duplication of approval processes and ensure appropriate documentation for the public record.</p> <p>Change of Ownership</p> <p>Change of ownership or operational control also requires that the project owner file a petition pursuant to section 1769(b). This process requires public notice and approval by the full Commission and BLM. The petition shall be in the form of a legal brief and fulfill the requirements of Section 1769(b). Upon request, the CPM will provide you with a sample petition to use as a template. The transfer of ownership of a BLM ROW grant must be through the filing of an application for assignment of the grant in accordance with 43 CFR 2807.21.</p> <p>Verification Change</p> <p>A verification may be modified by BLM’s AO and the CPM without requesting an amendment to the ROW Grant or Energy Commission decision if the change does not require modifying any conditions of certification and provides an effective alternate means of verification.</p>		
FACILITY DESIGN		
<p>GEN-1, California Building Standards Code: The project owner shall design, construct, and inspect the project in accordance with the 2007 California Building Standards Code (CBSC), also known as Title 24, California Code of Regulations, which encompasses the California Building Code (CBC), California Building Standards Administrative Code, California Electrical Code, California Mechanical Code, California Plumbing Code, California Energy Code, California Fire Code, California Code for Building Conservation, California Reference Standards Code, and all other applicable engineering LORS in effect at the time initial design plans are submitted to the CBO for review and approval (the CBSC in effect is the edition that has been adopted by the California Building Standards Commission and published at least 180 days previously). The project owner shall ensure that all the provisions of the above applicable codes are enforced during the construction, addition, alteration, moving, demolition, repair, or maintenance of the completed facility. All transmission facilities (lines, switchyards, switching stations and substations) are covered in the conditions of certification in the Transmission System Engineering section of this document.</p> <p>In the event that the initial engineering designs are submitted to the CBO when the successor to the 2007 CBSC is in effect, the 2007 CBSC provisions shall be replaced with the applicable successor provisions. Where, in any specific case, different sections of the code specify different materials, methods of construction or other requirements, the most restrictive shall govern. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern.</p> <p>The project owner shall ensure that all contracts with contractors, subcontractors, and suppliers clearly specify that all work performed and materials supplied comply with the codes listed above.</p>	<p>Within 30 days following receipt of the certificate of occupancy, the project owner shall submit to the CPM a statement of verification, signed by the responsible design engineer, attesting that all designs, construction, installation, and inspection requirements of the applicable LORS and the Energy Commission’s decision have been met in the area of facility design. The project owner shall provide the CPM a copy of the certificate of occupancy within 30 days of receipt from the CBO.</p> <p>Once the certificate of occupancy has been issued, the project owner shall inform the CPM at least 30 days prior to any construction, addition, alteration, moving, demolition, repair, or maintenance to be performed on any portion(s) of the completed facility that requires CBO approval for compliance with the above codes. The CPM will then determine if the CBO needs to approve the work.</p>	CEC

FACILITY DESIGN (cont.)		
<p>GEN-2, Schedule of Facility Design Submittals: Before submitting the initial engineering designs for CBO review, the project owner shall furnish the CPM and the CBO with a schedule of facility design submittals, and master drawing and master specifications lists. The schedule shall contain a list of proposed submittal packages of designs, calculations, and specifications for major structures and equipment. To facilitate audits by Energy Commission staff, the project owner shall provide specific packages to the CPM upon request.</p>	<p>At least 60 days (or a project owner and CBO approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO and to the CPM the schedule, the master drawings, and master specifications list of documents to be submitted to the CBO for review and approval. These documents shall be the pertinent design documents for the major structures, systems, and equipment defined above in Condition of Certification GEN-2. Major structures and equipment may be added to or deleted from the list only with CPM approval. The project owner shall provide schedule updates in the monthly compliance report.</p>	CEC
<p>GEN-3, Payments to the CBO: The project owner shall make payments to the CBO for design review, plan checks, and construction inspections, based upon a reasonable fee schedule to be negotiated between the project owner and the CBO. These fees may be consistent with the fees listed in the 2007 CBC, adjusted for inflation and other appropriate adjustments; may be based on the value of the facilities reviewed; may be based on hourly rates; or may be otherwise agreed upon by the project owner and the CBO.</p>	<p>The project owner shall make the required payments to the CBO in accordance with the agreement between the project owner and the CBO. The project owner shall send a copy of the CBO's receipt of payment to the CPM in the next monthly compliance report indicating that applicable fees have been paid.</p>	CEC
<p>GEN-4, Resident Engineer: Prior to the start of rough grading, the project owner shall assign a California- registered architect, or a structural or civil engineer, as the resident engineer (RE) in charge of the project. All transmission facilities (lines, switchyards, switching stations, and substations) are addressed in the conditions of certification in the Transmission System Engineering section of this document.</p> <p>The RE may delegate responsibility for portions of the project to other registered engineers. Registered mechanical and electrical engineers may be delegated responsibility for mechanical and electrical portions of the project, respectively. A project may be divided into parts, provided that each part is clearly defined as a distinct unit. Separate assignments of general responsibility may be made for each designated part.</p> <p>The RE shall:</p> <ol style="list-style-type: none"> 1. Monitor progress of construction work requiring CBO design review and inspection to ensure compliance with LORS; 2. Ensure that construction of all facilities subject to CBO design review and inspection conforms in every material respect to applicable LORS, these conditions of certification, approved plans, and specifications; 3. Prepare documents to initiate changes in approved drawings and specifications when either directed by the project owner or as required by the conditions of the project; 4. Be responsible for providing project inspectors and testing agencies with complete and up-to-date sets of stamped drawings, plans, specifications, and any other required documents; 5. Be responsible for the timely submittal of construction progress reports to the CBO from the project inspectors, the contractor, and other engineers who have been delegated responsibility for portions of the project; and 	<p>At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, the resume and registration number of the RE and any other delegated engineers assigned to the project. The project owner shall notify the CPM of the CBO's approvals of the RE and other delegated engineer(s) within 5 days of the approval.</p> <p>If the RE or the delegated engineer(s) is subsequently reassigned or replaced, the project owner has 5 days to submit the resume and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within 5 days of the approval.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
FACILITY DESIGN (cont.)		
<p>6. Be responsible for notifying the CBO of corrective action or the disposition of items noted on laboratory reports or other tests when they do not conform to approved plans and specifications.</p> <p>The resident engineer (or his delegate) must be located at the project site, or be available at the project site within a reasonable period of time, during any hours in which construction takes place.</p> <p>The RE shall have the authority to halt construction and to require changes or remedial work if the work does not meet requirements.</p> <p>If the RE or the delegated engineers are reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer.</p>		
<p>GEN-5, California Registered Engineer Assignments: Prior to the start of rough grading, the project owner shall assign at least one of each of the following California registered engineers to the project: a civil engineer; a soils, geotechnical, or civil engineer experienced and knowledgeable in the practice of soils engineering; and an engineering geologist. Prior to the start of construction, the project owner shall assign at least one of each of the following California registered engineers to the project: a design engineer who is either a structural engineer or a civil engineer fully competent and proficient in the design of power plant structures and equipment supports; a mechanical engineer; and an electrical engineer. (California Business and Professions Code section 6704 et seq., and sections 6730, 6731 and 6736 require state registration to practice as a civil engineer or structural engineer in California). All transmission facilities (lines, switchyards, switching stations, and substations) are handled in the conditions of certification in the Transmission System Engineering section of this document.</p> <p>The tasks performed by the civil, mechanical, electrical, or design engineers may be divided between two or more engineers, as long as each engineer is responsible for a particular segment of the project (for example, proposed earthwork, civil structures, power plant structures, equipment support). No segment of the project shall have more than one responsible engineer. The transmission line may be the responsibility of a separate California registered electrical engineer.</p> <p>The project owner shall submit, to the CBO for review and approval, the names, qualifications, and registration numbers of all responsible engineers assigned to the project.</p> <p>If any one of the designated responsible engineers is subsequently reassigned or replaced, the project owner shall submit the name, qualifications and registration number of the newly assigned responsible engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer.</p> <p>A. The civil engineer shall:</p> <ol style="list-style-type: none"> 1. Review the foundation investigations, geotechnical, or soils reports prepared by the soils engineer, the geotechnical engineer, or by a civil engineer experienced and knowledgeable in the practice of soils engineering; 2. Design (or be responsible for the design of), stamp, and sign all plans, calculations, and specifications for proposed site work, civil works, and related facilities requiring design review and inspection by the CBO. At a minimum, these include: grading, site preparation, excavation, compaction, construction of secondary containment, foundations, erosion and sedimentation control structures, drainage facilities, underground utilities, culverts, site access roads and sanitary sewer systems; and 	<p>At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, resumes and registration numbers of the responsible civil engineer, soils (geotechnical) engineer and engineering geologist assigned to the project.</p> <p>At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of construction, the project owner shall submit to the CBO for review and approval, resumes and registration numbers of the responsible design engineer, mechanical engineer, and electrical engineer assigned to the project.</p> <p>The project owner shall notify the CPM of the CBO's approvals of the responsible engineers within 5 days of the approval.</p> <p>If the designated responsible engineer is subsequently reassigned or replaced, the project owner has 5 days in which to submit the resume and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within 5 days of the approval.</p>	<p>CEC</p>

FACILITY DESIGN (cont.)		
<p>3. Provide consultation to the RE during the construction phase of the project and recommend changes in the design of the civil works facilities and changes to the construction procedures.</p> <p>B. The soils engineer, geotechnical engineer, or civil engineer experienced and knowledgeable in the practice of soils engineering, shall:</p> <ol style="list-style-type: none"> 1. Review all the engineering geology reports; 2. Prepare the foundation investigations, geotechnical, or soils reports containing field exploration reports, laboratory tests, and engineering analysis detailing the nature and extent of the soils that could be susceptible to liquefaction, rapid settlement or collapse when saturated under load; 3. Be present, as required, during site grading and earthwork to provide consultation and monitor compliance with requirements set forth in the 2007 CBC (depending on the site conditions, this may be the responsibility of either the soils engineer, the engineering geologist, or both); and 4. Recommend field changes to the civil engineer and RE. <p>This engineer shall be authorized to halt earthwork and to require changes if site conditions are unsafe or do not conform to the predicted conditions used as the basis for design of earthwork or foundations.</p> <p>C. The engineering geologist shall:</p> <ol style="list-style-type: none"> 1. Review all the engineering geology reports and prepare a final soils grading report; and 2. Be present, as required, during site grading and earthwork to provide consultation and monitor compliance with the requirements set forth in the 2007 CBC (depending on the site conditions, this may be the responsibility of either the soils engineer, the engineering geologist, or both). <p>D. The design engineer shall:</p> <ol style="list-style-type: none"> 1. Be directly responsible for the design of the proposed structures and equipment supports; 2. Provide consultation to the RE during design and construction of the project; 3. Monitor construction progress to ensure compliance with engineering LORS; 4. Evaluate and recommend necessary changes in design; and 5. Prepare and sign all major building plans, specifications, and calculations. <p>E. The mechanical engineer shall be responsible for, and sign and stamp a statement with, each mechanical submittal to the CBO, stating that the proposed final design plans, specifications, and calculations conform to all of the mechanical engineering design requirements set forth in the Energy Commission's decision.</p> <p>F. The electrical engineer shall:</p> <ol style="list-style-type: none"> 1. Be responsible for the electrical design of the project; and 2. Sign and stamp electrical design drawings, plans, specifications, and calculations. 		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
FACILITY DESIGN (cont.)		
<p>GEN-6, Certified Special Inspector: Prior to the start of an activity requiring special inspection, including prefabricated assemblies, the project owner shall assign to the project, qualified and certified special inspector(s) who shall be responsible for the special inspections required by the 2007 CBC. All transmission facilities (lines, switchyards, switching stations, and substations) are handled in conditions of certification in the Transmission System Engineering section of this document.</p> <p>A certified weld inspector, certified by the American Welding Society (AWS), and/or American Society of Mechanical Engineers (ASME) as applicable, shall inspect welding performed on-site requiring special inspection (including structural, piping, tanks and pressure vessels).</p> <p>The special inspector shall:</p> <ol style="list-style-type: none"> 1. Be a qualified person who shall demonstrate competence, to the satisfaction of the CBO, for inspection of the particular type of construction requiring special or continuous inspection; 2. Inspect the work assigned for conformance with the approved design drawings and specifications; 3. Furnish inspection reports to the CBO and RE. All discrepancies shall be brought to the immediate attention of the RE for correction, then, if uncorrected, to the CBO and the CPM for corrective action; and 4. Submit a final signed report to the RE, CBO, and CPM, stating whether the work requiring special inspection was, to the best of the inspector's knowledge, in conformance with the approved plans, specifications, and other provisions of the applicable edition of the CBC. 	<p>At least 15 days (or project owner- and CBO-approved alternative time frame) prior to the start of an activity requiring special inspection, the project owner shall submit to the CBO for review and approval, with a copy to the CPM, the name(s) and qualifications of the certified weld inspector(s), or other certified special inspector(s) assigned to the project to perform one or more of the duties set forth above. The project owner shall also submit to the CPM a copy of the CBO's approval of the qualifications of all special inspectors in the next monthly compliance report.</p> <p>If the special inspector is subsequently reassigned or replaced, the project owner has 5 days in which to submit the name and qualifications of the newly assigned special inspector to the CBO for approval. The project owner shall notify the CPM of the CBO's approval of the newly assigned inspector within 5 days of the approval.</p>	CEC
<p>GEN-7, Design and/or Construction Discrepancy: If any discrepancy in design and/or construction is discovered in any engineering work that has undergone CBO design review and approval, the project owner shall document the discrepancy and recommend required corrective actions. The discrepancy documentation shall be submitted to the CBO for review and approval. The discrepancy documentation shall reference this condition of certification and, if appropriate, applicable sections of the CBC and/or other LORS.</p>	<p>The project owner shall transmit a copy of the CBO's approval of any corrective action taken to resolve a discrepancy to the CPM in the next monthly compliance report. If any corrective action is disapproved, the project owner shall advise the CPM, within 5 days, of the reason for disapproval and the revised corrective action to obtain CBO's approval.</p>	CEC
<p>GEN-8, CBO Final Approval: The project owner shall obtain the CBO's final approval of all completed work that has undergone CBO design review and approval. The project owner shall request the CBO to inspect the completed structure and review the submitted documents. The project owner shall notify the CPM after obtaining the CBO's final approval. The project owner shall retain one set of approved engineering plans, specifications, and calculations (including all approved changes) at the project site or at another accessible location during the operating life of the project. Electronic copies of the approved plans, specifications, calculations, and marked-up as-builts shall be provided to the CBO for retention by the CPM.</p>	<p>Within 15 days of the completion of any work, the project owner shall submit to the CBO, with a copy to the CPM, in the next monthly compliance report, (a) a written notice that the completed work is ready for final inspection, and (b) a signed statement that the work conforms to the final approved plans. After storing the final approved engineering plans, specifications, and calculations described above, the project owner shall submit to the CPM a letter stating both that the above documents have been stored and the storage location of those documents.</p> <p>Within 90 days of the completion of construction, the project owner shall provide to the CBO three sets of electronic copies of the above documents at the project owner's expense. These are to be provided in the form of "read only" (Adobe .pdf 6.0) files, with restricted (password-protected) printing privileges, on archive quality compact discs.</p>	CEC

Conditions of Certification	Verification	Responsible Agency
FACILITY DESIGN (cont.)		
<p>CIVIL-1, Submittals to the CBO: The project owner shall submit to the CBO for review and approval the following:</p> <ol style="list-style-type: none"> 1. Design of the proposed drainage structures and the grading plan; 2. An erosion and sedimentation control plan; 3. Related calculations and specifications, signed and stamped by the responsible civil engineer; and 4. Soils, geotechnical, or foundation investigations reports required by the 2007 CBC. 	<p>At least 15 days (or project owner- and CBO-approved alternative time frame) prior to the start of site grading the project owner shall submit the documents described above to the CBO for design review and approval. In the next monthly compliance report following the CBO's approval, the project owner shall submit a written statement certifying that the documents have been approved by the CBO.</p>	<p>CEC</p>
<p>CIVIL-2, Unforeseen adverse soil or geologic conditions: The resident engineer shall, if appropriate, stop all earthwork and construction in the affected areas when the responsible soils engineer, geotechnical engineer, or the civil engineer experienced and knowledgeable in the practice of soils engineering identifies unforeseen adverse soil or geologic conditions. The project owner shall submit modified plans, specifications, and calculations to the CBO based on these new conditions. The project owner shall obtain approval from the CBO before resuming earthwork and construction in the affected area.</p>	<p>The project owner shall notify the CPM within 24 hours, when earthwork and construction is stopped as a result of unforeseen adverse geologic/soil conditions. Within 24 hours of the CBO's approval to resume earthwork and construction in the affected areas, the project owner shall provide to the CPM a copy of the CBO's approval.</p>	<p>CEC</p>
<p>CIVIL-3, Inspections and Discrepancy Reports: The project owner shall perform inspections in accordance with the 2007 CBC. All plant site-grading operations, for which a grading permit is required, shall be subject to inspection by the CBO.</p> <p>If, in the course of inspection, it is discovered that the work is not being performed in accordance with the approved plans, the discrepancies shall be reported immediately to the resident engineer, the CBO, and the CPM. The project owner shall prepare a written report, with copies to the CBO and the CPM, detailing all discrepancies, non-compliance items, and the proposed corrective action.</p>	<p>Within five days of the discovery of any discrepancies, the resident engineer shall transmit to the CBO and the CPM a non-conformance report (NCR), and the proposed corrective action for review and approval. Within five days of resolution of the NCR, the project owner shall submit the details of the corrective action to the CBO and the CPM. A list of NCRs, for the reporting month, shall also be included in the following monthly compliance report.</p>	<p>CEC</p>
<p>CIVIL-4, Final Grading Plan Approval: After completion of finished grading and erosion and sedimentation control and drainage work, the project owner shall obtain the CBO's approval of the final grading plans (including final changes) for the erosion and sedimentation control work. The civil engineer shall state that the work within his/her area of responsibility was done in accordance with the final approved plans.</p>	<p>Within 30 days (or project owner- and CBO-approved alternative time frame) of the completion of the erosion and sediment control mitigation and drainage work, the project owner shall submit to the CBO, for review and approval, the final grading plans (including final changes) and the responsible civil engineer's signed statement that the installation of the facilities and all erosion control measures were completed in accordance with the final approved combined grading plans, and that the facilities are adequate for their intended purposes, along with a copy of the transmittal letter to the CPM. The project owner shall submit a copy of the CBO's approval to the CPM in the next monthly compliance report.</p>	<p>CEC</p>
<p>STRUC-1, Structure Approval: Prior to the start of any increment of construction of any major structure or component listed in Facility Design Table 2 of condition of certification GEN 2, above, the project owner shall submit to the CBO for design review and approval the proposed lateral force procedures for project structures and the applicable designs, plans and drawings for project structures. Proposed lateral force procedures, designs, plans and drawings shall be those for the following items (from Table 2, above):</p>	<p>At least 60 days (or project owner- and CBO-approved alternative time frame) prior to the start of any increment of construction of any structure or component listed in Facility Design Table 2 of condition of certification GEN 2,above, the project owner shall submit to the CBO the above final</p>	<p>CEC</p>

<p>1. Major project structures;</p> <p>2. Major foundations, equipment supports, and anchorage; and</p> <p>3. Large field-fabricated tanks.</p> <p>Construction of any structure or component shall not begin until the CBO has approved the lateral force procedures to be employed in designing that structure or component.</p> <p>The project owner shall:</p> <ol style="list-style-type: none"> 1. Obtain approval from the CBO of lateral force procedures proposed for project structures; 2. Obtain approval from the CBO for the final design plans, specifications, calculations, soils reports, and applicable quality control procedures. If there are conflicting requirements, the more stringent shall govern (for example, highest loads, or lowest allowable stresses shall govern). All plans, calculations, and specifications for foundations that support structures shall be filed concurrently with the structure plans, calculations, and specifications; 3. Submit to the CBO the required number of copies of the structural plans, specifications, calculations, and other required documents of the designated major structures prior to the start of on-site fabrication and installation of each structure, equipment support, or foundation; 4. Ensure that the final plans, calculations, and specifications clearly reflect the inclusion of approved criteria, assumptions, and methods used to develop the design. The final designs, plans, calculations, and specifications shall be signed and stamped by the responsible design engineer; and 5. Submit to the CBO the responsible design engineer's signed statement that the final design plans conform to applicable LORS. 	<p>design plans, specifications and calculations, with a copy of the transmittal letter to the CPM.</p> <p>The project owner shall submit to the CPM, in the next monthly compliance report, a copy of a statement from the CBO that the proposed structural plans, specifications, and calculations have been approved and comply with the requirements set forth in applicable engineering LORS.</p>	
<p>STRUC-2, Structure Document Submittal: The project owner shall submit to the CBO the required number of sets of the following documents related to work that has undergone CBO design review and approval:</p> <ol style="list-style-type: none"> 1. Concrete cylinder strength test reports (including date of testing, date sample taken, design concrete strength, tested cylinder strength, age of test, type and size of sample, location and quantity of concrete placement from which sample was taken, and mix design designation and parameters); 2. Concrete pour sign-off sheets; 3. Bolt torque inspection reports (including location of test, date, bolt size, and recorded torques); 4. Field weld inspection reports (including type of weld, location of weld, inspection of non-destructive testing (NDT) procedure and results, welder qualifications, certifications, qualified procedure description or number (ref: AWS); and 5. Reports covering other structural activities requiring special inspections shall be in accordance with the 2007 CBC. 	<p>If a discrepancy is discovered in any of the above data, the project owner shall, within 5 days, prepare and submit an NCR describing the nature of the discrepancies and the proposed corrective action to the CBO, with a copy of the transmittal letter to the CPM. The NCR shall reference the condition(s) of certification and the applicable CBC chapter and section. Within 5 days of resolution of the NCR, the project owner shall submit a copy of the corrective action to the CBO and the CPM.</p> <p>The project owner shall transmit a copy of the CBO's approval or disapproval of the corrective action to the CPM within 15 days. If disapproved, the project owner shall advise the CPM, within 5 days, the reason for disapproval, and the revised corrective action to obtain CBO's approval.</p>	CEC

<p>6. Title 24, California Code of Regulations, Part 6 (California Energy Code, for building energy conservation systems and temperature control and ventilation systems);</p> <p>7. Title 24, California Code of Regulations, Part 2 (California Building Code); and</p> <p>8. Riverside County codes.</p> <p>The CBO may deputize inspectors to carry out the functions of the code enforcement agency.</p>		
<p>MECH-2, Pressure Vessels: For all pressure vessels installed in the plant, the project owner shall submit to the CBO and California Occupational Safety and Health Administration (Cal-OSHA), prior to operation, the code certification papers and other documents required by applicable LORS. Upon completion of the installation of any pressure vessel, the project owner shall request the appropriate CBO and/or Cal-OSHA inspection of that installation.</p> <p>The project owner shall:</p> <ol style="list-style-type: none"> 1. Ensure that all boilers and fired and unfired pressure vessels are designed, fabricated, and installed in accordance with the appropriate section of the American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code, or other applicable code. Vendor certification, with identification of applicable code, shall be submitted for prefabricated vessels and tanks; and 2. Have the responsible design engineer submit a statement to the CBO that the proposed final design plans, specifications, and calculations conform to all of the requirements set forth in the appropriate ASME Boiler and Pressure Vessel Code or other applicable codes. 	<p>At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of on-site fabrication or installation of any pressure vessel, the project owner shall submit to the CBO for design review and approval, the above listed documents, including a copy of the signed and stamped engineer's certification, with a copy of the transmittal letter to the CPM.</p> <p>The project owner shall transmit to the CPM, in the monthly compliance report following completion of any inspection, a copy of the transmittal letter conveying the CBO's and/or Cal-OSHA inspection approvals.</p>	CEC
<p>MECH-3, HVAC and Refrigeration Systems: The project owner shall submit to the CBO for design review and approval the design plans, specifications, calculations, and quality control procedures for any heating, ventilating, air conditioning (HVAC) or refrigeration system. Packaged HVAC systems, where used, shall be identified with the appropriate manufacturer's data sheets.</p> <p>The project owner shall design and install all HVAC and refrigeration systems within buildings and related structures in accordance with the CBC and other applicable codes. Upon completion of any increment of construction, the project owner shall request the CBO's inspection and approval of that construction. The final plans, specifications and calculations shall include approved criteria, assumptions, and methods used to develop the design. In addition, the responsible mechanical engineer shall sign and stamp all plans, drawings and calculations and submit a signed statement to the CBO that the proposed final design plans, specifications and calculations conform with the applicable LORS.</p>	<p>At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of construction of any HVAC or refrigeration system, the project owner shall submit to the CBO the required HVAC and refrigeration calculations, plans, and specifications, including a copy of the signed and stamped statement from the responsible mechanical engineer certifying compliance with the CBC and other applicable codes, with a copy of the transmittal letter to the CPM.</p>	CEC
<p>ELEC-1, Electrical Construction: Prior to the start of any increment of electrical construction for all electrical equipment and systems 480 Volts or higher (see a representative list, below), with the exception of underground duct work and any physical layout drawings and drawings not related to code compliance and life safety, the project owner shall submit, for CBO design review and approval, the proposed final design, specifications, and calculations. Upon approval, the above listed plans, together with design changes and design change notices, shall remain on the site or at another accessible location for the operating life of the project. The project owner shall request that the CBO inspect the installation to ensure compliance with the requirements of applicable LORS. All transmission facilities (lines, switchyards, switching stations, and substations) are handled in conditions of certification in the Transmission System Engineering section of this document.</p>	<p>At least 30 days (or project owner- and CBO-approved alternative time frame) prior to the start of each increment of electrical construction, the project owner shall submit to the CBO for design review and approval the above listed documents. The project owner shall include in this submittal a copy of the signed and stamped statement from the responsible electrical engineer attesting compliance with the applicable LORS, and shall send the CPM a copy of the transmittal letter in the next monthly compliance report.</p>	CEC

TRANSMISSION SYSTEM ENGINEERING (cont.)		
<p>TSE-2, Engineer Assignments: Before the start of construction, the project owner shall assign to the project an electrical engineer and at least one of each of the following:</p> <p>a) a civil engineer;</p> <p>b) a geotechnical engineer or a civil engineer experienced and knowledgeable in the practice of soils engineering;</p> <p>c) a design engineer who is either a structural engineer or a civil engineer and fully competent and proficient in the design of power plant structures and equipment supports; or</p> <p>d) a mechanical engineer (Business and Professions Code Sections 6704 et seq. require state registration to practice as either a civil engineer or a structural engineer in California).</p> <p>The tasks performed by the civil, mechanical, electrical, or design engineers may be divided between two or more engineers as long as each engineer is responsible for a particular segment of the project, e.g., proposed earthwork, civil structures, power plant structures, or equipment support. No segment of the project shall have more than one responsible engineer. The transmission line may be the responsibility of a separate California registered electrical engineer. The civil, geotechnical, or civil and design engineer, assigned as required by Facility Design Condition GEN 5, may be responsible for design and review of the TSE facilities.</p> <p>The project owner shall submit to the CBO, for review and approval, the names, qualifications, and registration numbers of all engineers assigned to the project. If any one of the designated engineers is subsequently reassigned or replaced, the project owner shall submit the name, qualifications, and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer. This engineer shall be authorized to halt earth work and require changes; if site conditions are unsafe or do not conform to the predicted conditions used as the basis for design of earth work or foundations.</p> <p>The electrical engineer shall:</p> <ol style="list-style-type: none"> 1. be responsible for the electrical design of the power plant switchyard, outlet, and termination facilities; and 2. sign and stamp electrical design drawings, plans, specifications, and calculations. 	<p>Prior to the start of rough grading, the project owner shall submit to the CBO for review and approval, the names, qualifications, and registration numbers of all the responsible engineers assigned to the project. The project owner shall notify the CPM of the CBO's approvals of the engineers within five days of the approval.</p> <p>If the designated responsible engineer is subsequently reassigned or replaced, the project owner has 5 days in which to submit the name, qualifications, and registration number of the newly assigned engineer to the CBO for review and approval. The project owner shall notify the CPM of the CBO's approval of the new engineer within 5 days of the approval.</p>	CEC
<p>TSE-3, Design and/or Construction Discrepancies: If any discrepancy in design and/or construction is discovered in any engineering work that has undergone CBO design review and approval, the project owner shall document the discrepancy and recommend corrective action (2001 California Building Code, Chapter 1, section 108.4, approval required; Chapter 17, section 1701.3, Duties and Responsibilities of the Special Inspector; Appendix Chapter 33, section 3317.7, Notification of Noncompliance). The discrepancy documentation shall become a controlled document and shall be submitted to the CBO for review and approval and refer to this condition of certification.</p>	<p>The project owner shall submit a copy of the CBO's approval or disapproval of any corrective action taken to resolve a discrepancy to the CPM within 15 days of receipt. If disapproved, the project owner shall advise the CPM, within 5 days, the reason for the disapproval, along with the revised corrective action required to obtain the CBO's approval.</p>	CEC
<p>TSE-4, Power Plan Switchyard/Outlet Line and Termination Plans: For the power plant switchyard, outlet line and termination, the project owner shall not begin any construction until plans for that increment of construction have been approved by the CBO. These plans, together with design changes and design change notices, shall remain on the site for one year after completion of construction. The project owner shall request that the CBO inspect the installation to ensure compliance with the requirements of applicable LORS. The following activities shall be reported in the monthly compliance report:</p>	<p>Prior to the start of each increment of construction, the project owner shall submit to the CBO for review and approval the final design plans, specifications and calculations for equipment and systems of the power plant switchyard, and outlet line and termination, including a copy of the signed and stamped statement from the responsible</p>	CEC

	3. A summary of inspections of the completed transmission facilities, and identification of any nonconforming work and corrective actions taken, signed and sealed by the registered engineer in charge.	
AIR QUALITY		
<p>AQ-SC-1, Air Quality Construction Mitigation Manager (AQCMM): The project owner shall designate and retain an on-site AQCMM who shall be responsible for directing and documenting compliance with Conditions of Certification AQ SC3, AQ SC4 and AQ SC5 for the entire project site and linear facility construction. The on-site AQCMM may delegate responsibilities to one or more AQCMM Delegates. The AQCMM and AQCMM Delegates shall have full access to all areas of construction on the project site and linear facilities, and shall have the authority to stop any or all construction activities as warranted by applicable construction mitigation conditions. The AQCMM and AQCMM Delegates may have other responsibilities in addition to those described in this condition. The AQCMM shall not be terminated without written consent of the Compliance Project Manager (CPM).</p>	At least 60 days prior to the start of ground disturbance, the project owner shall submit to the BLM's Authorized Officer and CPM for approval, the name, resume, qualifications, and contact information for the on-site AQCMM and all AQCMM Delegates.	CEC
<p>AQ-SC-2, Air Quality Construction Mitigation Plan (AQCMP): The project owner shall provide an AQCMP, for approval, which details the steps that will be taken and the reporting requirements necessary to ensure compliance with Conditions of Certification AQ SC3, AQ SC4, and AQ SC5.</p>	At least 30 days prior to the start of any ground disturbance, the project owner shall submit the AQCMP to the BLM's Authorized Officer and CPM for approval. The AQCMP shall include effectiveness and environmental data for the proposed soil stabilizer. The BLM's Authorized Officer or CPM will notify the project owner of any necessary modifications to the plan within 15 days from the date of receipt.	CEC
<p>AQ-SC-3, Construction Fugitive Dust Control: The AQCMM shall submit documentation to the BLM's Authorized Officer and CPM in each Monthly Compliance Report that demonstrates compliance with the Air Quality Construction Mitigation Plan (AQCMP) mitigation measures for the purposes of minimizing fugitive dust emission creation from construction activities and preventing all fugitive dust plumes from leaving the project. Any deviation from the AQCMP mitigation measures shall require prior BLM Authorized Officer and CPM notification and approval.</p> <p>a. The main access roads through the facility to the power block areas will be either paved or stabilized using soil binders, or equivalent methods, to provide a stabilized surface that is similar for the purposes of dust control to paving, that may or may not include a crushed rock (gravel or similar material with fines removed) top layer, prior to initiating construction in the main power block area, and delivery areas for operations materials (chemicals, replacement parts, etc.) will be paved or treated prior to taking initial deliveries.</p> <p>b. All unpaved construction roads and unpaved operation and maintenance site roads, as they are being constructed, shall be stabilized with a non-toxic soil stabilizer or soil weighting agent that can be determined to be both as efficient or more efficient for fugitive dust control as ARB approved soil stabilizers, and shall not increase any other environmental impacts, including loss of vegetation to areas beyond where the soil stabilizers are being applied for dust control. All other disturbed areas in the project and linear construction sites shall be watered as frequently as necessary during grading (consistent with Biology Conditions of Certification that address the minimization of standing water); and after</p>	<p>The AQCMM shall provide the CPM a Monthly Compliance Report to include the following to demonstrate control of fugitive dust emissions:</p> <p>A. a summary of all actions taken to maintain compliance with this Condition;</p> <p>B. copies of any complaints filed with the District in relation to project construction; and</p> <p>C. any other documentation deemed necessary by the CPM or AQCMM to verify compliance with this Condition. Such information may be provided via electronic format or disk at the project owner's discretion.</p>	CEC

AIR QUALITY (cont.)		
<p>active construction activities shall be stabilized with a non-toxic soil stabilizer or soil weighting agent, or alternative approved soil stabilizing methods, in order to comply with the dust mitigation objectives of Condition of Certification AQ-SC4. The frequency of watering can be reduced or eliminated during periods of precipitation.</p> <p>c. No vehicle shall exceed 10 miles per hour on unpaved areas within the construction site, with the exception that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions.</p> <p>d. Visible speed limit signs shall be posted at the construction site entrances.</p> <p>e. All construction equipment vehicle tires shall be inspected and washed as necessary to be cleaned free of dirt prior to entering paved roadways.</p> <p>f. Gravel ramps of at least 20 feet in length must be provided at the tire washing/cleaning station.</p> <p>g. All unpaved exits from the construction site shall be graveled or treated to prevent track-out to public roadways.</p> <p>h. All construction vehicles shall enter the construction site through the treated entrance roadways, unless an alternative route has been submitted to and approved by the CPM.</p> <p>i. Construction areas adjacent to any paved roadway below the grade of the surrounding construction area or otherwise directly impacted by sediment from site drainage shall be provided with sandbags or other equivalently effective measures to prevent run-off to roadways, or other similar run-off control measures as specified in the Storm Water Pollution Prevention Plan (SWPPP), only when such SWPPP measures are necessary so that this Condition does not conflict with the requirements of the SWPPP.</p> <p>j. All paved roads within the construction site shall be swept daily or as needed (less during periods of precipitation) on days when construction activity occurs to prevent the accumulation of dirt and debris.</p> <p>k. At least the first 500 feet of any paved public roadway exiting the construction site or exiting other unpaved roads en route from the construction site or construction staging areas shall be swept as needed (less during periods of precipitation) on days when construction activity occurs or on any other day when dirt or runoff resulting from the construction site activities is visible on the public paved roadways.</p> <p>l. All soil storage piles and disturbed areas that remain inactive for longer than 10 days shall be covered, or shall be treated with appropriate dust suppressant compounds.</p> <p>m. All vehicles that are used to transport solid bulk material on public roadways and that have potential to cause visible emissions shall be provided with a cover, or the materials shall be sufficiently wetted and loaded onto the trucks in a manner to provide at least one foot of freeboard.</p> <p>n. Wind erosion control techniques (such as windbreaks, water, chemical dust suppressants, and/or vegetation) shall be used on all construction areas that may be disturbed. Any windbreaks installed to comply with this Condition shall remain in place until the soil is stabilized or permanently covered with vegetation.</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
AIR QUALITY (cont.)		
<p>AQ-SC-4, Dust Plume Response Requirement: The AQCMM or an AQCMM Delegate shall monitor all construction activities for visible dust plumes. Observations of visible dust plumes that have the potential to be transported (A) off the project site and within 400 feet upwind of any regularly occupied structures not owned by the project owner or (B) 200 feet beyond the centerline of the construction of linear facilities indicate that existing mitigation measures are not resulting in effective mitigation. The AQCMP shall include a section detailing how the additional mitigation measures will be accomplished within the time limits specified. The AQCMM or Delegate shall implement the following procedures for additional mitigation measures in the event that such visible dust plumes are observed:</p> <p>Step 1: The AQCMM or Delegate shall direct more intensive application of the existing mitigation methods within 15 minutes of making such a determination.</p> <p>Step 2: The AQCMM or Delegate shall direct implementation of additional methods of dust suppression if Step 1, specified above, fails to result in adequate mitigation within 30 minutes of the original determination.</p> <p>Step 3: The AQCMM or Delegate shall direct a temporary shutdown of the activity causing the emissions if Step 2, specified above, fails to result in effective mitigation within one hour of the original determination. The activity shall not restart until the AQCMM or Delegate is satisfied that appropriate additional mitigation or other site conditions have changed so that visual dust plumes will not result upon restarting the shutdown source. The owner/operator may appeal to the CPM or BLM Authorized Officer any directive from the AQCMM or Delegate to shut down an activity, if the shutdown shall go into effect within one hour of the original determination, unless overruled by the CPM or BLM Authorized Officer before that time.</p>	<p>The AQCMM shall provide the BLM's Authorized Officer and the CPM a Monthly Compliance Report (COMPLIANCE-6) to include:</p> <p>A. a summary of all actions taken to maintain compliance with this condition;</p> <p>B. copies of any complaints filed with the District in relation to project construction; and</p> <p>C. any other documentation deemed necessary by the CPM and AQCMM to verify compliance with this condition. Such information may be provided via electronic format or disk at the project owner's discretion.</p>	<p>CEC</p>
<p>AQ-SC-5, Diesel-Fueled Engine Control: The AQCMM shall submit to the CPM, in the Monthly Compliance Report, a construction mitigation report that demonstrates compliance with the AQCMP mitigation measures for purposes of controlling diesel construction-related emissions. Any deviation from the AQCMP mitigation measures shall require prior and CPM notification and approval.</p> <p>a. All diesel-fueled engines used in the construction of the facility shall have clearly visible tags issued by the on-site AQCMM showing that the engine meets the Conditions set forth herein.</p> <p>b. All construction diesel engines with a rating of 50 hp or higher shall meet, at a minimum, the Tier 3 California Emission Standards for Off-Road Compression-Ignition Engines, as specified in California Code of Regulations, Title 13, section 2423(b)(1), unless a good faith effort to the satisfaction of the CPM that is certified by the on-site AQCMM demonstrates that such engine is not available for a particular item of equipment. In the event that a Tier 3 engine is not available for any off-road equipment larger than 100 hp, that equipment shall be equipped with a Tier 2 engine, or an engine that is equipped with retrofit controls to reduce exhaust emissions of nitrogen oxides (NOx) and diesel particulate matter (DPM) to no more than Tier 2 levels unless certified by engine manufacturers or the on-site AQCMM that the use of such devices is not practical for specific engine types. For purposes of this Condition, the use of such devices is "not practical" for the following, as well as other, reasons.</p> <ol style="list-style-type: none"> 1. There is no available retrofit control device that has been verified by either the California Air Resources Board or U.S. Environmental Protection Agency to control the engine in question to Tier 2 equivalent emission levels and the highest level of available control using retrofit or Tier 1 engines is being used for the engine in question; or 2. The construction equipment is intended to be on site for 10 days or less. 3. The CPM may grant relief from this requirement if the AQCMM can demonstrate a good faith effort to comply with this requirement and that compliance is not practical. 	<p>The AQCMM shall include in the Monthly Compliance Report the following to demonstrate control of diesel construction-related emissions:</p> <p>A. A summary of all actions taken to control diesel construction related emissions;</p> <p>B. A list of all heavy equipment used on site during that month, including the owner of that equipment and a letter from each owner indicating that equipment has been properly maintained; and heavy earth-moving equipment and heavy duty construction-</p> <p>C. Any other documentation deemed necessary by the CPM, and the AQCMM to verify compliance with this Condition. Such information may be provided via electronic format or disk at the project owner's discretion.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
AIR QUALITY (cont.)		
<p>c. The use of a retrofit control device may be terminated immediately, provided that the CPM is informed within 10 working days of the termination and that a replacement for the equipment item in question meeting the controls required in item "b" occurs within 10 days of termination of the use, if the equipment would be needed to continue working at this site for more than 15 days after the use of the retrofit control device is terminated, if one of the following Conditions exists:</p> <ol style="list-style-type: none"> 1. The use of the retrofit control device is excessively reducing the normal availability of the construction equipment due to increased down time for maintenance, and/or reduced power output due to an excessive increase in back pressure. 2. The retrofit control device is causing or is reasonably expected to cause engine damage. 3. The retrofit control device is causing or is reasonably expected to cause a substantial risk to workers or the public. 4. Any other seriously detrimental cause which has the approval of the CPM prior to implementation of the termination. <p>d. All related trucks with engines meeting the requirements of (b) above shall be properly maintained and the engines tuned to the engine manufacturer's specifications.</p> <p>e. All diesel heavy construction equipment shall not idle for more than five minutes. Vehicles that need to idle as part of their normal operation (such as concrete trucks) are exempted from this requirement.</p> <p>f. Construction equipment will employ electric motors when feasible.</p>		
<p>AQ-SC-6, Emission Standards Vehicles: The project owner, when obtaining dedicated on-road or off-road vehicles for mirror washing activities and other facility maintenance activities, shall only obtain new model year vehicles that meet California on-road vehicle emission standards or appropriate U.S.EPA/California off-road engine emission standards for the model year when obtained.</p>	<p>At least 30 days prior to the start commercial operation, the project owner shall submit to the CPM a copy of the plan that identifies the size and type of the on-site vehicle and equipment fleet and the vehicle and equipment purchase orders and contracts and/or purchase schedule. The plan shall be updated every other year and submitted in the Annual Compliance Report.</p>	<p>CEC</p>
<p>AQ-SC-7, Operation Dust Control Plan: The project owner shall provide a site Operations Dust Control Plan, including all applicable fugitive dust control measures identified in the verification of AQ SC3 that would be applicable to minimizing fugitive dust emission creation from operation and maintenance activities and preventing all fugitive dust plumes from leaving the project site that:</p> <ol style="list-style-type: none"> A. describes the active operations and wind erosion control techniques such as windbreaks and chemical dust suppressants, including their ongoing maintenance procedures, that shall be used on areas that could be disturbed by vehicles or wind anywhere within the project boundaries; and B. identifies the location of signs throughout the facility that will limit traveling on unpaved portion of roadways to solar equipment maintenance vehicles only. In addition, vehicle speed shall be limited to no more than 10 miles per hour on these unpaved roadways, with the exception that vehicles may travel up to 25 miles per hour on stabilized unpaved roads as long as such speeds do not create visible dust emissions. 	<p>At least 30 days prior to start of commercial operation, the project owner shall submit to the CPM for review and approval a copy of the site Operations Dust Control Plan that identifies the dust and erosion control procedures, including effectiveness and environmental data for the proposed soil stabilizer, that will be used during operation of the project and that identifies all locations of the speed limit signs. Within 60 days after commercial operation, the project owner shall provide to the CPM a report identifying the locations of all speed limit signs, and a copy of the project employee and contractor training manual that clearly identifies that project employees and contractors are required to comply with the dust and erosion control procedures and on-site speed limits.</p>	<p>CEC</p>

Conditions of Certification	Verification	Responsible Agency
AIR QUALITY (cont.)		
<p>The site operations fugitive dust control plan shall include the use of durable non-toxic soil stabilizers on all regularly used unpaved roads and disturbed off-road areas, or alternative methods for stabilizing disturbed off-road areas, within the project boundaries, and shall include the inspection and maintenance procedures that will be undertaken to ensure that the unpaved roads remain stabilized. The soil stabilizer used shall be a non-toxic soil stabilizer or soil weighting agent that can be determined to be as efficient as or more efficient for fugitive dust control than ARB approved soil stabilizers, and that shall not increase any other environmental impacts including loss of vegetation to areas beyond where the soil stabilizers are being applied for dust control.</p> <p>The performance and application of the fugitive dust controls shall also be measured against and meet the performance requirements of condition AQ-SC4. The measures and performance requirements of AQ-SC4 shall also be included in the operations dust control plan.</p>		
<p>AQ-SC-8, CPM Copies of Documents: The project owner shall provide the CPM copies of all District issued Authority-to-Construct (ATC) and Permit-to-Operate (PTO) documents for the facility. The project owner shall submit to the CPM for review and approval any modification proposed by the project owner to any project air permit. The project owner shall submit to the CPM any modification to any permit proposed by the District or U.S. Environmental Protection Agency (U.S. EPA), and any revised permit issued by the District or U.S. EPA, for the project.</p>	<p>The project owner shall submit any ATC, PTO, and proposed air permit modifications to the CPM within 5five working days of its submittal either by 1) the project owner to an agency, or 2) receipt of proposed modifications from an agency. The project owner shall submit all modified air permits to the CPM within 15 days of receipt.</p>	<p>CEC</p>
<p>AQ-SC-9, VOC Emission Reduction Credit (ERC) Sources: The project owner shall provide a list of the proposed VOC emission reduction credit (ERC) sources that total at least 68 pounds per day, shall submit requests to modify this list, and shall submit documentation confirming that the ERCs have been surrendered as required by South Coast Air Quality Management District rules.</p>	<p>The project owner shall provide to the CPM the following:</p> <ul style="list-style-type: none"> A. The list of proposed emission reduction credit sources, with the amount of reduction, the location of reduction, the method of reduction and date of reduction prior to initiating construction. B. Documentation prior to the start of operation that demonstrates the emission reduction credits have been surrendered in a manner and timeframe that complies with district rules. C. Any requests to modify the list of emission reduction credits shall be provided no later than at least 30 days prior to their surrender. 	<p>CEC</p>
<p>AQ-SC-10, Water Quality and Annual Emissions: The project owner shall operate the cooling towers with high efficiency mist eliminators and shall determine and report water quality and annual emissions.</p>	<p>The project owner shall provide the following at least 30 days prior to installation of the cooling tower to the CPM for review and approval:</p> <ul style="list-style-type: none"> A. The manufacturer specifications for the cooling tower, that provides the number of cells and design recirculating water flow rate for the two cooling towers. B. The manufacturer specifications for the mist eliminators that provide a manufacturer guarantee that the mist eliminators will reduce drift to no more than 0.0005% of recirculating water flow. 	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
AIR QUALITY (cont.)		
	<p>The project owner shall provide the following in the Annual Compliance Reports:</p> <p>C. The sampling data for the recirculating water TDS concentration, performed at least quarterly, that demonstrates that the annual average TDS concentration was no more than 2,000 milligrams per liter (ppmw). D. The estimated annual particulate emissions from the cooling tower using the following equation: (annual gallons of water recirculated) x (0.000005 fraction mist) x (average annual TDS concentration in mg/l) / (1,000,000) x (8.34 lbs/gallon).</p>	
<p>AQ-SC-11, Assurance that Engine Operation will not Cause Exceedance of Ambient Air Quality Standards: The project owner shall use one of the following four options to assure that the operation of the emergency engines will not cause an exceedance of the state or federal 1-hour NO₂ ambient air quality standards:</p> <ol style="list-style-type: none"> 1) The project owner shall provide an air dispersion modeling analysis that demonstrates to Staff's satisfaction that the currently proposed or officially revised worst-case operating emissions would not have the potential to cause exceedances of the state or federal 1-hour NO₂ ambient air quality standards, or 2) The project owner shall procure emergency generator engines that meet ARB Tier 4 standards for NO_x emissions (0.5 grams per brake horsepower), or 3) In the event that Tier 4 engines are not available at the time of engine purchase, the project owner shall; a) provide documentation from engine manufacturers that Tier 4 engines are not available; and b) procure emergency engines that have a NO_x emissions guarantee of no more than 2.6 grams per brake horsepower, or 4) The project owner shall agree to limit the emergency generator engine testing duration to no more than 30 minutes per event and a testing frequency limited to the minimum required by engine manufacturer. <p>In no event shall the project owner propose the use of an emergency engine that does not meet the most strict applicable federal or state engine emission limit regulation without a signed waiver from U.S. EPA or ARB as appropriate. The project owner shall justify the date of engine purchase.</p>	<p>The project owner shall provide to the CPM the air dispersion modeling analysis, if performed, that demonstrates compliance with Part 1) of this Condition at least 30 days prior to purchasing the emergency engine generators for this project, or shall provide documentation to the CPM at least five days prior to purchasing the engine generators that demonstrates how they would comply with Part 2), or Part 3), or Part 4) of this Condition.</p>	CEC
BIOLOGICAL RESOURCES		
<p>BIO-1, Designated Biologist Selection and Qualifications: The Project owner shall assign at least one Designated Biologist to the Project. The Project owner shall submit the resume of the proposed Designated Biologist(s), with at least three references and contact information, to the Energy Commission Compliance Project Manager (CPM) and BLM's Authorized Officer for approval in consultation with CDFG and USFWS.</p> <p>The Designated Biologist must meet the following minimum qualifications:</p> <ol style="list-style-type: none"> 1. Bachelor's degree in biological sciences, zoology, botany, ecology, or a closely related field; 2. Three years of experience in field biology or current certification of a nationally recognized biological society, such as The Ecological Society of America or The Wildlife Society; 	<p>At least 30 days prior to construction-related ground disturbance, the Project owner shall submit the resumes of the Designated Biologists(s) along with the completed USFWS Desert Tortoise Authorized Biologist Request Form (www.fws.gov/ventura/speciesinfo/protocols_guidelines) and submit it to the USFWS and the CPM for review and final approval.</p> <p>No construction-related ground disturbance, grading, boring, or trenching shall commence until an approved Designated Biologist is available to be on site.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>3. Have at least one year of field experience with biological resources found in or near the Project area;</p> <p>4. Meet the current USFWS Authorized Biologist qualifications criteria (www.fws.gov/ventura/speciesinfo/protocols_guidelines), demonstrate familiarity with protocols and guidelines for the desert tortoise, and be approved by the USFWS; and</p> <p>5. Possess a California ESA Memorandum of Understanding pursuant to Section 2081(a) for desert tortoise.</p> <p>In lieu of the above requirements, the resume shall demonstrate to the satisfaction of the CPM, in consultation with CDFG and USFWS, that the proposed Designated Biologist or alternate has the appropriate training and background to effectively implement the conditions of certification.</p>	<p>If a Designated Biologist needs to be replaced, the specified information of the proposed replacement must be submitted to the CPM at least 10 working days prior to the termination or release of the preceding Designated Biologist. In an emergency, the Project owner shall immediately notify the CPM to discuss the qualifications and approval of a short-term replacement while a permanent Designated Biologist is proposed to the CPM for consideration.</p>	
<p>BIO-2, Designated Biologist Duties: The Project owner shall ensure that the Designated Biologist performs the activities described below during any site mobilization activities, construction-related ground disturbance, grading, boring or trenching activities. The Designated Biologist may be assisted by the approved Biological Monitor(s) but remains the contact for the Project owner, BLM's Authorized Officer and the CPM. The Designated Biologist Duties shall include the following:</p> <ol style="list-style-type: none"> 1. Advise the Project owner's Construction and Operation Managers on the implementation of the biological resources conditions of certification; 2. Consult on the preparation of the Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP) to be submitted by the Project owner; 3. Be available to supervise, conduct and coordinate mitigation, monitoring, and other biological resources compliance efforts, particularly in areas requiring avoidance or containing sensitive biological resources, such as special-status species or their habitat; 4. Clearly mark sensitive biological resource areas and inspect these areas at appropriate intervals for compliance with regulatory terms and conditions; 5. Inspect active construction areas where animals may have become trapped prior to construction commencing each day. At the end of the day, inspect for the installation of structures that prevent entrapment or allow escape during periods of construction inactivity. Periodically inspect areas with high vehicle activity (e.g., parking lots) for animals in harm's way; 6. Notify the Project owner and BLM's Authorized Officer and the CPM of any non-compliance with any biological resources condition of certification; 7. Respond directly to inquiries of BLM's Authorized Officer and the CPM regarding biological resource issues; 8. Maintain written records of the tasks specified above and those included in the BRMIMP. Summaries of these records shall be submitted in the Monthly Compliance Report and the Annual Compliance Report; 9. Train the Biological Monitors as appropriate, and ensure their familiarity with the BRMIMP, Worker Environmental Awareness Program (WEAP) training, and USFWS guidelines on desert tortoise surveys and handling procedures <www.fws.gov/ventura/speciesinfo/protocols_guidelines>; and 10. Maintain the ability to be in regular, direct communication with representatives of CDFG, USFWS, BLM's Authorized Officer and the CPM, including notifying these agencies of dead or injured listed species and reporting special-status species observations to the California Natural Diversity Data Base. 	<p>The Designated Biologist shall provide copies of all written reports and summaries that document biological resources compliance activities in the Monthly Compliance Reports submitted to the CPM. If actions may affect biological resources during operation a Designated Biologist shall be available for monitoring and reporting. During Project operation, the Designated Biologist shall submit record summaries in the Annual Compliance Report unless his or her duties cease, as approved by the CPM.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>BIO-3, Biological Monitor Selection and Qualification: The Designated Biologist shall submit the resume, at least three references, and contact information of the proposed Biological Monitors to BLM's Authorized Officer and the CPM. The resume shall demonstrate, to the satisfaction of the CPM, the appropriate education and experience to accomplish the assigned biological resource tasks. The Biological Monitor is the equivalent of the USFWS designated Desert Tortoise Monitor (USFWS 2008).</p> <p>Biological Monitor(s) training by the Designated Biologist shall include familiarity with the conditions of certification, BRMIMP, WEAP, and USFWS guidelines on desert tortoise surveys and handling procedures <www.fws.gov/ventura/speciesinfo/protocols_guidelines>.</p>	<p>The Project owner shall submit the specified information to the CPM for approval at least 30 days prior to the start of any site mobilization or construction-related ground disturbance, grading, boring, and trenching. The Designated Biologist shall submit a written statement to the CPM confirming that individual Biological Monitor(s) has been trained including the date when training was completed. If additional biological monitors are needed during construction the specified information shall be submitted to the CPM for approval at least 10 days prior to their first day of monitoring activities.</p>	CEC
<p>BIO-4, Biological Monitor Duties: The Biological Monitors shall assist the Designated Biologist in conducting surveys and in monitoring of site mobilization activities, construction-related ground disturbance, fencing, grading, boring, trenching, or reporting. The Designated Biologist shall remain the contact for the Project owner and the CPM.</p>	<p>The Designated Biologist shall submit in the Monthly Compliance Report to the CPM copies of all written reports and summaries that document biological resources compliance activities, including those conducted by Biological Monitors. If actions may affect biological resources during operation a Biological Monitor, under the supervision of the Designated Biologist, shall be available for monitoring and reporting.</p>	CEC
<p>BIO-5, Designated Biologist and Biological Monitor Authority: The Project owner's construction/operation manager shall act on the advice of the Designated Biologist and Biological Monitor(s) to ensure conformance with the biological resources conditions of certification. The Designated Biologist shall have the authority to immediately stop any activity that is not in compliance with these conditions and/or order any reasonable measure to avoid take of an individual of a listed species. If required by the Designated Biologist and Biological Monitor(s) the Project owner's construction/operation manager shall halt all site mobilization, ground disturbance, grading, boring, trenching and operation activities in areas specified by the Designated Biologist. The Designated Biologist shall:</p> <ol style="list-style-type: none"> 1. Require a halt to all activities in any area when determined that there would be an unauthorized adverse impact to biological resources if the activities continued; 2. Inform the Project owner and the construction/operation manager when to resume activities; and 3. Notify BLM's Authorized Officer and the CPM if there is a halt of any activities and advise them of any corrective actions that have been taken or would be instituted as a result of the work stoppage. <p>If the Designated Biologist is unavailable for direct consultation, the Biological Monitor shall act on behalf of the Designated Biologist.</p>	<p>The Project owner shall ensure that the Designated Biologist or Biological Monitor notifies the CPM and BLM immediately (and no later than the morning following the incident, or Monday morning in the case of a weekend) of any non-compliance or a halt of any site mobilization, ground disturbance, grading, construction, or operation activities. If the non-compliance or halt to construction or operation relates to desert tortoise or any other federal- or state- listed species, the Project owner shall also notify Carlsbad Office of the USFWS and the Ontario Office of the CDFG at the same time. The Project owner shall notify the CPM of the circumstances and actions being taken to resolve the problem.</p> <p>Whenever corrective action is taken by the Project owner, a determination of success or failure will be made by the CPM in consultation with BLM, USFWS and CDFG within 5 working days after receipt of notice that corrective action is completed, or the Project owner would be notified by the CPM that coordination with other agencies would require additional time before a determination can be made.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>BIO-6, Worker Environmental Awareness Program (WEAP): The Project owner shall develop and implement a Project-specific Worker Environmental Awareness Program (WEAP) and shall secure approval for the WEAP from BLM's Authorized Officer and the CPM. The WEAP shall be administered to all onsite personnel including surveyors, construction engineers, employees, contractors, contractor's employees, supervisors, inspectors, subcontractors, and delivery personnel. The WEAP shall be implemented during site preconstruction, construction, operation, and closure. The WEAP shall:</p> <ol style="list-style-type: none"> 1. Be developed by or in consultation with the Designated Biologist and consist of an on-site or training center presentation in which supporting written material and electronic media, including photographs of protected species, is made available to all participants; 2. Discuss the locations and types of sensitive biological resources on the Project site and adjacent areas, and explain the reasons for protecting these resources; provide information to participants that no snakes, reptiles, or other wildlife shall be harmed; 3. Place special emphasis on desert tortoise, including information on physical characteristics, distribution, behavior, ecology, sensitivity to human activities, legal protection, penalties for violations, reporting requirements, and protection measures; 4. Include a discussion of fire prevention measures to be implemented by workers during Project activities; request workers dispose of cigarettes and cigars appropriately and not leave them on the ground or buried; 5. Describe the temporary and permanent habitat protection measures to be implemented at the Project site; 6. Identify whom to contact if there are further comments and questions about the material discussed in the program; and 7. Include a training acknowledgment form to be signed by each worker indicating that they received training and shall abide by the guidelines. <p>The specific program can be administered by a competent individual(s) acceptable to the Designated Biologist.</p>	<p>At least 30 days prior to start of construction-related ground disturbance, the Project owner shall provide to the CPM for review and approval and to BLM, USFWS and CDFG a copy of the final WEAP and all supporting written materials and electronic media prepared or reviewed by the Designated Biologist and a resume of the person(s) administering the program.</p> <p>The Project owner shall provide in the Monthly Compliance Report the number of persons who have completed the training in the prior month and a running total of all persons who have completed the training to date. At least 10 days prior to construction-related ground disturbance activities the Project owner shall submit two copies of the approved final WEAP.</p> <p>Training acknowledgement forms signed during construction shall be kept on file by the Project owner for at least 6 months after the start of commercial operation.</p> <p>Throughout the life of the Project, the WEAP shall be repeated annually for permanent employees, and shall be routinely administered within 1 week of arrival to any new construction personnel, foremen, contractors, subcontractors, and other personnel potentially working within the Project area. Upon completion of the orientation, employees shall sign a form stating that they attended the program and understand all protection measures. These forms shall be maintained by the Project owner and shall be made available to the CPM, BLM, USFWS and CDFG and upon request. Workers shall receive and be required to visibly display a hardhat sticker or certificate that they have completed the training.</p> <p>During Project operation, signed statements for operational personnel shall be kept on file for 6 months following the termination of an individual's employment.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>BIO-7, Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP): The Project owner shall develop a Biological Resources Mitigation Implementation and Monitoring Plan (BRMIMP), and shall submit two copies of the proposed BRMIMP to the BLM-Authorized Officer and the CPM for review and approval. The Project owner shall implement the measures identified in the approved BRMIMP. The BRMIMP shall incorporate avoidance and minimization measures described in final versions of the Desert Tortoise Relocation Translocation Plan, the Raven Management Plan, the Closure, Conceptual Restoration Plan, the Burrowing Owl Mitigation and Monitoring Plan, and the Weed Management Plan.</p> <p>The BRMIMP shall be prepared in consultation with the Designated Biologist and shall include accurate and up-to-date maps depicting the location of sensitive biological resources that require temporary or permanent protection during construction and operation. The BRMIMP shall include complete and detailed descriptions of the following:</p> <ol style="list-style-type: none"> 1. All biological resources mitigation, monitoring, and compliance measures proposed and agreed to by the Project owner; 2. All biological resources conditions of certification identified as necessary to avoid or mitigate impacts; 3. All biological resource mitigation, monitoring and compliance measures required in federal agency terms and conditions, such as those provided in the USFWS Biological Opinion; 4. All sensitive biological resources to be impacted, avoided, or mitigated by Project construction, operation, and closure; 5. All required mitigation measures for each sensitive biological resource; 6. All measures that shall be taken to avoid or mitigate temporary disturbances from construction activities; 7. Duration for each type of monitoring and a description of monitoring methodologies and frequency; 8. Performance standards to be used to help decide if/when proposed mitigation is or is not successful; 9. All performance standards and remedial measures to be implemented if performance standards are not met; 10. Biological resources-related facility closure measures including a description of funding mechanism(s); 11. A process for proposing plan modifications to BLM's Authorized Officer and the CPM and appropriate agencies for review and approval; and 12. A requirement to submit any sightings of any special-status species that are observed on or in proximity to the Project site, or during Project surveys, to the California Natural Diversity Data Base (CNDDB) per CDFG requirements. 	<p>The Project owner shall submit the draft BRMIMP to the CPM and BLM at least 30 days prior to start of any preconstruction site mobilization and construction-related ground disturbance, grading, boring, and trenching. At the same time the Project owner shall provide to CDFG and USFWS a copy of all portions of the draft BRMIMP relating to desert tortoise and any other federal or state-listed species. The Project owner shall provide final BRMIMP to the CPM, BLM, CDFG and USFWS at least 7 days prior to start of any construction-related ground disturbance, grading, boring, and trenching. The BRMIMP shall contain all of the required measures included in all biological conditions of certification. No construction-related ground disturbance, grading, boring, or trenching may occur prior to approval of the final BRMIMP by the CPM and BLM.</p> <p>If any permits have not yet been received when the final BRMIMP is submitted, these permits shall be submitted to the CPM within 5 days of their receipt, and the BRMIMP shall be revised or supplemented to reflect the permit condition(s). The Project owner shall submit to the CPM and BLM the revised or supplemented BRMIMP within 10 days following the Project owner's receipt of any additional permits. Under no circumstances shall ground disturbance proceed without implementation of all permit conditions.</p> <p>To verify that the extent of construction disturbance does not exceed that described in these conditions, the Project owner shall submit aerial photographs, at an approved scale, taken before and after construction to the CPM, BLM, USFWS and CDFG. The first set of aerial photographs shall reflect site conditions prior to any preconstruction site mobilization and construction-related ground disturbance, grading, boring, and trenching, and shall be submitted prior to initiation of such activities. The second set of aerial photographs shall be taken subsequent to completion of construction, and shall be submitted to the CPM, BLM, USFWS and CDFG no later than 90 days after completion of construction. The Project owner shall also provide a final accounting in whole acres of vegetation communities/cover types present before and after construction. Construction acreages shall be rounded to the nearest acre.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
	<p>Any changes to the approved BRMIMP must be approved by the CPM and BLM in consultation with CDFG and USFWS.</p> <p>Implementation of BRMIMP measures (for example, construction activities that were monitored, species observed) shall be reported in the Monthly Compliance Reports by the Designated Biologist. Within 30 days after completion of Project construction, the Project owner shall provide to the CPM, for review and approval, a written construction termination report identifying which items of the BRMIMP have been completed, a summary of all modifications to mitigation measures made during the Project's preconstruction site mobilization and construction-related ground disturbance, grading, boring, and trenching, and which mitigation and monitoring items are still outstanding.</p>	
<p>Bio-8, Impact Avoidance and Minimization Measures: The Project owner shall undertake the following measures to manage the Project site and related facilities during construction, operation and maintenance in a manner to avoid or minimize impacts to biological resources:</p> <ol style="list-style-type: none"> 1. Limit Disturbance Areas. Minimize soil disturbance by locating staging areas, laydowns, and temporary parking or storage for linears in existing disturbed areas. Equipment maintenance and refueling shall not be conducted within 100 feet of any sensitive resource (for example, waters of the state, desert dry wash woodland, dune habitats and rare plant populations). Limit the width of the work area near sensitive resources. Avoid blading temporary access roads where feasible and instead drive over and crush the vegetation to preserve the seed bank and biotic soil crusts. The boundaries of all areas to be disturbed (including staging areas, access roads, and sites for temporary placement of spoils) shall be delineated with stakes and flagging prior to construction activities in consultation with the Designated Biologist. Spoils and topsoil shall be stockpiled in disturbed areas lacking native vegetation and which do not provide habitat for special-status species. Parking areas, staging and disposal site locations shall similarly be located in areas without native vegetation or special-status species habitat. All disturbances, Project vehicles and equipment shall be confined to the flagged areas. 2. Minimize Road Impacts. New and existing roads that are planned for construction, widening, or other improvements shall not extend beyond the flagged impact area as described above. All vehicles passing or turning around would do so within the planned impact area or in previously disturbed areas. Where new access is required outside of existing roads or the construction zone, the route shall be clearly marked (i.e., flagged and/or staked) prior to the onset of construction. 3. Minimize Traffic Impacts. Vehicular traffic during Project construction and operation shall be confined to existing routes of travel to and from the Project site, and cross country vehicle and equipment use outside designated work areas shall be prohibited. The speed limit shall not exceed 25 miles per hour within the Project area, on maintenance roads for linear facilities, or on access roads to the Project site. 	<p>All mitigation measures and their implementation methods shall be included in the BRMIMP and implemented. Implementation of the measures shall be reported in the Monthly Compliance Reports by the Designated Biologist. Within 30 days after completion of Project construction, the Project owner shall provide to the CPM, for review and approval, a written construction termination report identifying how measures have been completed. As part of the Annual Compliance Report, each year following construction the Designated Biologist shall provide a report to the CPM that describes compliance with avoidance and minimization measures to be implemented during operation (for example, a summary of the incidence of roadkilled animals during the year, implementation of measures to avoid toxic spills, erosion and sedimentation, efforts to enforce worker guidelines, etc.).</p> <p>No less than 30 days prior to construction-related ground disturbance the Project owner shall provide the CPM, USFWS and CDFG with plans showing the design of a culvert under the Project Site Access Road that would provide access for desert tortoise and other wildlife. No less than 30 days after of completion of construction of the Project site access road the Project owner shall provide as-built drawings of the culvert.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>4. Monitor During Construction. In areas that have not been fenced with desert tortoise exclusion fencing and cleared, the Designated Biologist shall be present at the construction site during all Project activities that have potential to disturb soil, vegetation, and wildlife. The Designated Biologist or Biological Monitor shall clear ahead of equipment during brushing and grading activities. If desert tortoises are found during construction monitoring, procedures outlined in BIO-9 shall be implemented.</p> <p>5. Minimize Impacts of Transmission/Pipeline Alignments, Roads, and Staging Areas. Staging areas for construction on the plant site shall be within the area that has been fenced with desert tortoise exclusion fencing and cleared. For construction activities outside of the plant site (transmission line, pipeline alignments) access roads, pulling sites, and storage and parking areas shall be designed, installed, and maintained with the goal of minimizing impacts to native plant communities and sensitive biological resources. Transmission lines and all electrical components shall be designed, installed, and maintained in accordance with the Avian Power Line Interaction Committee's (APLIC's) <i>Suggested Practices for Avian Protection on Power Lines</i> (APLIC 2006) and <i>Mitigating Bird Collisions with Power Lines</i> (APLIC 1994) to reduce the likelihood of large bird electrocutions and collisions. Where feasible avoid impacts to desert washes and special-status plants by adjusting the locations of poles and laydown areas, and the alignment of the roads and pipelines. Construction drawings and grading plans shall depict the locations of sensitive resources and demonstrate where temporary impacts to sensitive resources can be avoided and where they cannot.</p> <p>6. Avoid Use of Toxic Substances. Soil bonding and weighting agents used on unpaved surfaces shall be non-toxic to wildlife and plants.</p> <p>7. Minimize Lighting Impacts. Facility lighting shall be designed, installed, and maintained to prevent side casting of light towards wildlife habitat.</p> <p>8. Minimize Noise Impacts. A continuous low-pressure technique shall be used for steam blows, to the extent possible, in order to reduce noise levels in sensitive habitat proximate to the Project site. Loud construction activities (e.g., unsilenced high pressure steam blowing, pile driving, or other) shall be avoided from February 15 to April 15, when it would result in noise levels over 65 dBA in nesting habitat (excluding noise from passing vehicles). Loud construction activities may be permitted from February 15 to April 15 only if:</p> <p>a. The Designated Biologist provides documentation (i.e., nesting bird data collected using methods described in BIO-15 and maps depicting location of the nest survey area in relation to noisy construction) to the CPM indicating that no active nests would be subject to 65 dBA noise, OR</p> <p>b. The Designated Biologist or Biological Monitor monitors active nests within the range of construction-related noise exceeding 65 dBA. The monitoring shall be conducted in accordance with Nesting Bird Monitoring and Management Plan approved by the CPM. The Plan shall include adaptive management measures to prevent disturbance to nesting birds from construction related noise. Triggers for adaptive management shall be evidence of Project-related disturbance to nesting birds such as: agitation behavior (displacement, avoidance, and defense); increased vigilance behavior at nest sites; changes in foraging and feeding behavior, or nest site abandonment. The Nesting Bird Monitoring and Management Plan shall include a description of adaptive management actions, which shall include, but not be limited to, cessation of construction activities that are deemed by the Designated Biologist to be the source of disturbance to the nesting bird.</p>	<p>If loud construction activities are proposed between February 15 to April 15 which would result in noise levels over 65 dBA in nesting habitat, the Project owner shall submit nest survey results (as described in 8a) to the CPM no more than 7 days before initiating such construction. If an active nest is detected within this survey area the Project owner shall submit a Nesting Bird Monitoring and Management Plan to the CPM for review and approval no more than 7 days before initiating noisy construction.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>9. Avoid Vehicle Impacts to Desert Tortoise. Parking and storage shall occur within the area enclosed by desert tortoise exclusion fencing to the extent feasible. No vehicles or construction equipment parked outside the fenced area shall be moved prior to an inspection of the ground beneath the vehicle for the presence of desert tortoise. If a desert tortoise is observed outside the areas fenced with desert tortoise exclusion fencing it shall be left to move on its own. If it does not move within 15 minutes, a Designated Biologist or Biological Monitor under the Designated Biologist's direct supervision may move it out of harms way as described in the USFWS Desert Tortoise Field Manual (USFWS 2009a)</p> <p>10. Install Box Culvert. To provide for connectivity for desert tortoise and other wildlife, the Project owner shall install a box culvert suitable for passage by desert tortoise and other wildlife under the Project Site Access Road. The box culvert shall be a concrete structure no less than 4 feet high and 6 feet wide with 3:1 side slopes and shall maintain a minimum of 18 inches of native material on the floor of the culvert at all times to facilitate tortoise movement.</p> <p>11. Avoid Wildlife Pitfalls. To avoid trapping desert tortoise and other wildlife in trenches, pipes or culverts, the following measures shall be implemented:</p> <ul style="list-style-type: none"> a. Backfill Trenches. At the end of each work day, the Designated Biologist shall ensure that all potential wildlife pitfalls (trenches, bores, and other excavations) outside the area fenced with desert tortoise exclusion fencing have been backfilled. If backfilling is not feasible, all trenches, bores, and other excavations shall be sloped at a 3:1 ratio at the ends to provide wildlife escape ramps, or covered completely to prevent wildlife access, or fully enclosed with desert tortoise-exclusion fencing. All trenches, bores, and other excavations outside the areas permanently fenced with desert tortoise exclusion fencing shall be inspected periodically throughout the day, at the end of each workday, and at the beginning of each day by the Designated Biologist or a Biological Monitor. Should a tortoise or other wildlife become trapped, the Designated Biologist or Biological Monitor shall move the tortoise out of harm's way as described in the USFWS Desert Tortoise Field Manual (USFWS 2009a). Any wildlife encountered during the course of construction shall be allowed to leave the construction area unharmed. b. Avoid Entrapment of Desert Tortoise. Any construction pipe, culvert, or similar structure with a diameter greater than 3 inches, stored less than 8 inches aboveground and within desert tortoise habitat (i.e., outside the permanently fenced area) for one or more nights, shall be inspected for tortoises before the material is moved, buried or capped. As an alternative, all such structures may be capped before being stored outside the fenced area, or placed on elevated pipe racks. These materials would not need to be inspected or capped if they are stored within the permanently fenced area after the clearance surveys have been completed. <p>12. Minimize Standing Water. Water applied to dirt roads and construction areas (trenches or spoil piles) for dust abatement shall use the minimal amount needed to meet safety and air quality standards in an effort to prevent the formation of puddles, which could attract desert tortoises and common ravens to construction sites. A Biological Monitor shall patrol these areas to ensure water does not puddle and shall take appropriate action to reduce water application where necessary.</p> <p>13. Dispose of Road-killed Animals. Road killed animals or other carcasses detected by personnel on roads associated with the Project area will be reported immediately to a Biological Monitor or Designated Biologist (or Project Environmental Compliance Monitor, during Project operations), who will promptly remove the roadkill. For special-status species road-kill, the Biological Monitor or Designated Biologist (or Project Environmental Compliance Monitor, during Project operations) shall contact CDFG and USFWS within 1 working day of detection of the carcass for guidance on disposal or storage of the carcass; all other road kill shall be disposed of promptly. The Biological Monitor shall provide the special-status species record as described in BIO-11 below.</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>14. Minimize Spills of Hazardous Materials. All vehicles and equipment shall be maintained in proper working condition to minimize the potential for fugitive emissions of motor oil, antifreeze, hydraulic fluid, grease, or other hazardous materials. The Designated Biologist shall be informed of any hazardous spills immediately as directed in the Project Hazardous Materials Plan. Hazardous spills shall be immediately cleaned up and the contaminated soil properly disposed of at a licensed facility. Servicing of construction equipment shall take place only at a designated area. Service/maintenance vehicles shall carry a bucket and pads to absorb leaks or spills.</p> <p>15. Worker Guidelines. During construction all trash and food-related waste shall be placed in self-closing containers and removed daily from the site. Workers shall not feed wildlife or bring pets to the Project site. Except for law enforcement personnel, no workers or visitors to the site shall bring firearms or weapons. Vehicular traffic shall be confined to existing routes of travel to and from the Project site, and cross country vehicle and equipment use outside designated work areas shall be prohibited. The speed limit when traveling on dirt access routes within desert tortoise habitat shall not exceed 25 miles per hour.</p> <p>16. Implement Sediment Control Measures Near Desert Washes. Standard erosion control measures shall be implemented for all phases of construction and operation where sediment run-off from exposed slopes threatens to enter waters of the state. Sediment and other flow-restricting materials shall be moved to a location where they shall not be washed back into the stream. Areas of disturbed soils (access and staging areas) which slope toward drainages shall be stabilized to reduce erosion potential.</p> <p>17. Monitor Ground Disturbing Activities Prior to Pre-Construction Site Mobilization. If pre-construction site mobilization requires ground- disturbing activities such as for geotechnical borings or hazardous waste evaluations, a Designated Biologist or Biological Monitor shall be present to monitor any actions that could disturb soil, vegetation, or wildlife.</p> <p>18. Control Unauthorized Use of the Project Access Roads. The secondary access road shall be gated at both ends and restricted to emergency response personnel as per proposed COC WORKER SAFETY-6. The Project owner shall also monitor and control any unauthorized use of the Project roads with gates, signage, and fencing as necessary to minimize traffic-related roadkills and ORV disturbance off-roads.</p> <p>19. Implement Erosion Control Measures. All disturbed soils and roads within the Project site shall be stabilized to reduce erosion potential, both during and following construction. All areas subject to temporary disturbance shall be restored to pre-project grade and stabilized to prevent erosion and promote natural revegetation. Temporarily disturbed areas within the Project area include, but are not limited to: linear facilities, temporary access roads, temporary lay-down and staging areas. If erosion control measures include the use of seed, only locally native plant species from a local seed source shall be used. Local seed includes seeds from plants within the Chuckwalla Valley or Colorado River Hydrologic Units.</p> <p>20. Avoid Spreading Weeds. Prior to the start of construction, flag and avoid dense populations of highly invasive noxious weeds. If these areas cannot be avoided, they shall be pre-treated by the methods described in BIO-14 (Weed Management Plan). Noxious weeds and other invasive non-native plants in the temporarily disturbed areas shall be managed according to the requirements in BIO-14.</p> <p>21. Salvage Topsoil. Topsoil from the Project site shall be salvaged, preserved and re-used for restoration of temporarily disturbed areas. Salvaged topsoil shall be collected, stored and applied in a way that maintains the viability of seed and soil crusts. The Project owner shall excavate and collect the upper soil layer (the top 1 to 2 inches that includes the seed bank and biotic soil crust) as well as the lower soil layer up to a depth of 6 to 8 inches. The upper and lower soil layers shall be stockpiled separately in areas that will not be impacted by other grading, flooding, erosion, or pollutants. If the soil is to be stored more than 2 weeks it shall be spread out to a depth of no more than 6 inches to</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>maintain the seed and soil crust viability. The Project owner shall install temporary construction fencing around stockpiled topsoil, and signage that indicates whether the pile is the upper layer seed bank, or the lower layer, and clearly indicates that the piles are for use only in erosion control. After construction, the Project owner shall replace the topsoil in the temporarily disturbed areas in the reverse order of stockpiling, starting with the 6-8 inch layer of subsoil, and then the seed-containing upper layer using a harrow or similar equipment to thinly distribute the layer to depths no greater than 1 to 2 inches.</p> <p>22. Decommission Temporary Access Roads with Vertical Mulching. Discourage ORV use of temporary construction roads by installing vertical mulching at the head of the road to a distance necessary to obscure the road from view. Boulder barricades and gates shall not be used unless the remainder of the site is fenced to prevent driving around the gate or barricade. Designated ORV routes and roads shall not be closed.</p>		
<p>BIO-9, Desert Tortoise Protection: The Project owner shall undertake appropriate measures to manage the construction site and related facilities in a manner to avoid or minimize impacts to desert tortoise. Methods for clearance surveys, fence specification and installation, tortoise handling, artificial burrow construction, egg handling and other procedures shall be consistent with those described in the USFWS' 2009 Desert Tortoise Field Manual <http://www.fws.gov/ventura/speciesinfo/protocols_guidelines> or more current guidance provided by CDFG and USFWS. The Project owner shall also implement all terms and conditions described in the Biological Opinion prepared by USFWS. These measures include, but are not limited to, the following:</p> <ol style="list-style-type: none"> 1. Desert Tortoise Fencing along Interstate 10. To avoid increases in vehicular-related mortality from disruption of local movement patterns along the existing ephemeral wash systems, desert tortoise-proof fencing shall be installed along the existing freeway right-of-way fencing, on both sides of I 10, for the entire east-west dimension of the Project configuration. The tortoise fencing shall be designed to direct tortoises to existing undercrossing to provide safe passage under the freeway, and shall be regularly inspected and maintained for the life of the Project. 2. Desert Tortoise Exclusion Fence Installation. To avoid impacts to desert tortoises, permanent desert tortoise exclusion fencing shall be installed along the permanent perimeter security fence and temporarily installed along the utility corridors. The proposed alignments for the permanent perimeter fence and utility rights-of-way fencing shall be flagged and surveyed within 24 hours prior to the initiation of fence construction. Clearance surveys of the perimeter fence and utility rights-of-way alignments shall be conducted by the Designated Biologist(s) using techniques outlined in the USFWS' 2009 Desert Tortoise Field Manual. and may be conducted in any season with USFWS and CDFG approval. Biological Monitors may assist the Designated Biologist under his or her supervision. These fence clearance surveys shall provide 100 percent coverage of all areas to be disturbed and an additional transect along both sides of the fence line. This fence line transect shall cover an area approximately 90 feet wide centered on the fence alignment. Transects shall be no greater than 15 feet apart. All desert tortoise burrows, and burrows constructed by other species that might be used by desert tortoises, shall be examined to assess occupancy of each burrow by desert tortoises and handled in accordance with the USFWS' 2009 Desert Tortoise Field Manual. Any desert tortoise located during fence clearance surveys shall be handled by the Designated Biologist(s) in accordance with the USFWS' 2009 Desert Tortoise Field Manual. <ol style="list-style-type: none"> a. Timing, Supervision of Fence Installation. The exclusion fencing shall be installed prior to the onset of site clearing and grubbing. The fence installation shall be supervised by the Designated Biologist and monitored by the Biological Monitors to ensure the safety of any tortoise present. b. Fence Material and Installation. The permanent tortoise exclusionary fencing shall be constructed in accordance with the USFWS' 2009 Desert Tortoise Field Manual (Chapter 8 – Desert Tortoise Exclusion Fence). 	<p>All mitigation measures and their implementation methods shall be included in the BRMIMP and implemented. Implementation of the measures shall be reported in the Monthly Compliance Reports by the Designated Biologist. Within 30 days after completion of desert tortoise clearance surveys the Designated Biologist shall submit a report to BLM, the CPM, USFWS, and CDFG describing implementation of each of the mitigation measures listed above. The report shall include the desert tortoise survey results, capture and release locations of any relocated desert tortoises, and any other information needed to demonstrate compliance with the measures described above.</p> <p>Within 6 months of completion of desert tortoise exclusion fence for Phase 1, I-10 desert tortoise exclusion fencing shall be installed. Within 3 months of completion of I-10 desert tortoise exclusion fence construction, the Project owner shall provide the CPM, BLM, USFWS, and CDFG with maps as well as photographic documentation showing the design and location of the fencing on both sides of I-10 south of the Project site.</p> <p>The Project Owner shall provide evidence of approval from Caltrans for installation of desert tortoise fencing along I-10 within their right-of-way at least 30-days prior to construction of the fencing.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>c. Security Gates. Security gates shall be designed with minimal ground clearance to deter ingress by tortoises. The gates may be electronically activated to open and close immediately after the vehicle(s) have entered or exited to prevent the gates from being kept open for long periods of time. Cattle grating designed to safely exclude desert tortoise shall be installed at the gated entries to discourage tortoises from gaining entry</p> <p>d. Fence Inspections. Following installation of the desert tortoise exclusion fencing for both the permanent site fencing and temporary fencing in the utility corridors, the fencing shall be regularly inspected. If tortoise were moved out of harm's way during fence construction, permanent and temporary fencing shall be inspected at least two times a day for the first 7 days to ensure a recently moved tortoise has not been trapped within the fence. Thereafter, permanent fencing shall be inspected monthly and during and within 24 hours following all major rainfall events. A major rainfall event is defined as one for which flow is detectable within the fenced drainage. Any damage to the fencing shall be temporarily repaired immediately to keep tortoises out of the site, and permanently repaired within 48 hours of observing damage. Inspections of permanent site fencing shall occur for the life of the project. Temporary fencing shall be inspected weekly and, where drainages intersect the fencing, during and within 24 hours following major rainfall events. All temporary fencing shall be repaired immediately upon discovery and, if the fence may have permitted tortoise entry while damaged, the Designated Biologist shall inspect the area for tortoise.</p> <p>3. Desert Tortoise Clearance Surveys within the Plant Site. Clearance surveys shall be conducted in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009) (Chapter 6 – Clearance Survey Protocol for the Desert Tortoise – Mojave Population) and shall consist of two surveys covering 100 percent the project area by walking transects no more than 15-feet apart. If a desert tortoise is located on the second survey, a third survey shall be conducted. Each separate survey shall be walked in a different direction to allow opposing angles of observation. Clearance surveys of the plant site may only be conducted when tortoises are most active (April through May or September through October) unless the project receives approval from CDFG and USFWS. Clearance surveys of linear features may be conducted during anytime of the year. Any tortoise located during clearance surveys of the power plant site and linear features shall be translocated or relocated and monitored in accordance with the Desert Tortoise Relocation/Translocation Plan:</p> <p>a. Burrow Searches. During clearance surveys all desert tortoise burrows, and burrows constructed by other species that might be used by desert tortoises, shall be examined by the Designated Biologist, who may be assisted by the Biological Monitors, to assess occupancy of each burrow by desert tortoises and handled in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009). To prevent reentry by a tortoise or other wildlife, all burrows shall be collapsed once absence has been determined in accordance with the Desert Tortoise Relocation/Translocation Plan. Tortoises taken from burrows and from elsewhere on the power plant site shall be relocated or translocated as described in the Desert Tortoise Relocation/Translocation Plan.</p> <p>b. Burrow Excavation/Handling. All potential desert tortoise burrows located during clearance surveys would be excavated by hand, tortoises removed, and collapsed or blocked to prevent occupation by desert tortoises in accordance with the Desert Tortoise Relocation/Translocation Plan. All desert tortoise handling, and removal, and burrow excavations, including nests, would be conducted by the Designated Biologist, who may be assisted by a Biological Monitor in accordance with the USFWS Desert Tortoise Field Manual (USFWS 2009).</p> <p>4. Monitoring Following Clearing. Following the desert tortoise clearance and removal from the power plant site and utility corridors, workers and heavy equipment shall be allowed to enter the project site to perform clearing, grubbing, leveling, and trenching activities. A Designated Biologist or Biological Monitor shall be onsite for clearing and grading activities to move tortoises missed during the initial tortoise clearance survey. Should a tortoise be discovered, it shall be relocated or translocated as described in the Desert Tortoise Relocation/Translocation Plan.</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>5. Reporting. The Designated Biologist shall record the following information for any desert tortoises handled: a) the locations (narrative and maps) and dates of observation; b) general condition and health, including injuries, state of healing and whether desert tortoise voided their bladders; c) location moved from and location moved to (using GPS technology); d) gender, carapace length, and diagnostic markings (i.e., identification numbers or marked lateral scutes); e) ambient temperature when handled and released; and f) digital photograph of each handled desert. Desert tortoise moved from within project areas shall be marked and monitored in accordance with the Desert Tortoise Relocation/Translocation Plan.</p>		
<p>BIO-10, Desert Tortoise Relocation/Translocation Plan: The Project owner shall develop and implement a final Desert Tortoise Relocation/Translocation Plan (Plan) that is consistent with current USFWS approved guidelines, and meets the approval of the CPM. The Plan shall include guidance specific to each of the two phases of Project construction, as described in BIO-29 (Phasing), and shall include measures to minimize the potential for repeated translocations of individual desert tortoises. The goals of the Desert Tortoise Relocation/Translocation Plan shall be to: relocate/translocate all desert tortoises from the project site to nearby suitable habitat; minimize impacts on resident desert tortoises outside the project site; minimize stress, disturbance, and injuries to relocated/translocated tortoises; and assess the success of the translocation effort through monitoring. The final Plan shall be based on the draft Desert Tortoise Relocation/Translocation Plan prepared by the Applicant (AECOM 2010a, DR-BIO-55) and shall include all revisions deemed necessary by BLM, USFWS, CDFG and the Energy Commission staff.</p>	<p>At least 30 days prior to site mobilization, the Project owner shall provide the CPM with the final version of a Plan that has been reviewed and approved by the CPM in consultation with BLM, USFWS and CDFG. All modifications to the approved Plan shall be made only after approval by the CPM, in consultation with BLM, USFWS and CDFG.</p> <p>Within 30 days after initiation of relocation and/or translocation activities, the Designated Biologist shall provide to the CPM for review and approval, a written report identifying which items of the Plan have been completed, and a summary of all modifications to measures made during implementation of the Plan.</p>	CEC
<p>BIO-11, Desert Tortoise Compliance Verification: The Project owner shall provide Energy Commission, BLM, CDFG and USFWS staff with reasonable access to the Project site and compensation lands under the control of the Project owner and shall otherwise fully cooperate with the Energy Commission's and BLM's efforts to verify the Project owner's compliance with, or the effectiveness of, mitigation measures set forth in the conditions of certification. The Designated Biologist shall do all of the following:</p> <ol style="list-style-type: none"> 1. Notification. Notify the CPM at least 14 calendar days before initiating construction-related ground disturbance activities; immediately notify the CPM in writing if the Project owner is not in compliance with any conditions of certification, including but not limited to any actual or anticipated failure to implement mitigation measures within the time periods specified in the conditions of certification; 2. Monitoring During Grubbing and Grading. Remain on site daily while vegetation salvage, grubbing, grading and other ground- disturbance construction activities are taking place to avoid or minimize take of listed species, and verify personally or use Biological Monitors to check for compliance with all impact avoidance and minimization measures, including checking all exclusion zones to ensure that signs, stakes, and fencing are intact and that human activities are restricted in these protective zones. 3. Monthly Compliance Inspections. Conduct compliance inspections at a minimum of once per month after clearing, grubbing, and grading are completed and submit a monthly compliance report to the CPM, BLM, USFWS and CDFG during construction 4. Notification of Injured or Dead Listed Species. If an injured or dead listed species is detected within or near the Project Disturbance Area the CPM, BLM, the Ontario Office of CDFG, and the Carlsbad Office of USFWS shall be notified 	<p>No later than 2 days following the above required notification of a sighting, injury, kill, or relocation of a listed species, the Project owner shall deliver to the CPM, BLM, CDFG, and USFWS via FAX or electronic communication the written report from the Designated Biologist describing all reported incidents of injury, kill, or relocation of a listed species, identifying who was notified, and explaining when the incidents occurred. In the case of a sighting in an active construction area, the Project owner shall, at the same time, submit a map (e.g., using Geographic Information Systems) depicting both the limits of construction and sighting location to the CPM, BLM, CDFG and USFWS.</p> <p>No later than 45 days after initiation of Project operation the Designated Biologist shall provide the CPM and BLM a Final Listed Species Mitigation Report.</p> <p>Beginning with the first month after clearing, grubbing and grading are completed and continuing every month until construction is complete the Project owner shall submit a report describing the results of Monthly Compliance Inspections to the CPM, BLM, USFWS and CDFG.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>immediately by phone. Notification shall occur no later than noon on the business day following the event if it occurs outside normal business hours so that the agencies can determine if further actions are required to protect listed species. Written follow-up notification via FAX or electronic communication shall be submitted to these agencies within two calendar days of the incident and include the following information as relevant:</p> <p>a. Injured Desert Tortoise. If a desert tortoise is injured as a result of Project-related activities during construction, the Designated Biologist or approved Biological Monitor shall immediately take it to a CDFG-approved wildlife rehabilitation and/or veterinarian clinic. Any veterinarian bills for such injured animals shall be paid by the Project owner. Following phone notification as required above, the CPM, CDFG, and USFWS shall determine the final disposition of the injured animal, if it recovers. Written notification shall include, at a minimum, the date, time, and location, circumstances of the incident, and the name of the facility where the animal was taken.</p> <p>b. Desert Tortoise Fatality. If a desert tortoise is killed by Project- related activities during construction or operation, a written report with the same information as an injury report shall be submitted to the CPM, BLM, the Ontario Office of CDFG, and the Carlsbad Office of USFWS. These desert tortoises shall be salvaged according to guidelines described in <i>Salvaging Injured, Recently Dead, Ill, and Dying Wild, Free-Roaming Desert Tortoise</i> (Berry 2001). The Project owner shall pay to have the desert tortoises transported and necropsied. The report shall include the date and time of the finding or incident.</p> <p>5. Final Listed Species Report. The Designated Biologist shall provide the CPM and BLM a Final Listed Species Mitigation Report that includes, at a minimum: 1) a copy of the table in the BRMIMP with notes showing when each of the mitigation measures was implemented; 2) all available information about Project-related incidental take of listed species; 3) information about other Project impacts on the listed species; 4) construction dates; 5) an assessment of the effectiveness of conditions of certification in minimizing and compensating for Project impacts; 6) recommendations on how mitigation measures might be changed to more effectively minimize and mitigate the impacts of future Projects on the listed species; and 7) any other pertinent information, including the level of take of the listed species associated with the Project.</p> <p>6. Stop Work Order. The CPM may issue the Project owner a written stop work order to suspend any activity related to the construction or operation of the Project to prevent or remedy a violation of one or more conditions of certification (including but not limited to failure to comply with reporting, monitoring, or habitat acquisition obligations) or to prevent the illegal take of an endangered, threatened, or candidate species. The Project owner shall comply with the stop work order immediately upon receipt thereof.</p>		
<p>BIO-12, Desert Tortoise Compensatory Mitigation: To fully mitigate for habitat loss and potential take of desert tortoise, the Project owner shall provide compensatory mitigation per BIO-29 – Table 2 (see 2013 PSIII. LLC, Revised Plan of Development, p. 121), adjusted to reflect the final Project footprint. For purposes of this condition, the Project footprint means all lands disturbed in the construction and operation of the Palen Project, including all Project linears, as well as undeveloped areas inside the Project’s boundaries that will no longer provide viable long-term habitat for the desert tortoise. To satisfy this condition, the Project owner shall acquire, protect and transfer 5 acres of desert tortoise habitat for every acre of habitat within critical habitat and within the final Project footprint, and 1 acre of desert tortoise habitat for every acre of habitat outside of critical habitat but within the final Project footprint, and provide associated funding for the acquired lands, as specified below. Condition BIO-28 may provide the Project owner with another option for satisfying some or all of the requirements in this condition. In lieu of acquiring lands itself, the Project owner may satisfy the requirements of this condition by depositing funds into the Renewable Energy Action Team (REAT) Account established with the National Fish and Wildlife Foundation (NFWF), as provided below in section 3.i. of this condition.</p>	<p>If the mitigation actions required under this condition are not completed prior to the start of ground-disturbing activities, the Project owner shall provide the CPM and CDFG with an approved form of Security in accordance with this condition of certification no later than 30 days prior to beginning Project ground-disturbing activities. Actual Security shall be provided no later than 7 days prior to the beginning of Project ground-disturbing activities. If Security is provided, the Project owner, or an approved third party, shall complete and provide written verification to the CPM, CDFG, BLM and USFWS of the compensation lands acquisition and transfer within 18 months of the start of Project ground-disturbing activities.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>The timing of the mitigation shall correspond with the timing of the site disturbance activities as stated in BIO-29 (phasing). If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands include all of the following:</p> <ol style="list-style-type: none"> 1. Selection Criteria for Compensation Lands. The compensation lands selected for acquisition in fee title or in easement shall: <ol style="list-style-type: none"> a. be within the Colorado Desert Recovery Unit, with potential to contribute to desert tortoise habitat connectivity and build linkages between desert tortoise designated critical habitat, known populations of desert tortoise, and/or other preserve lands; b. provide habitat for desert tortoise with capacity to regenerate naturally when disturbances are removed; c. be prioritized near larger blocks of lands that are either already protected or planned for protection, such as DWMA within the Colorado Desert Recovery Unit (Chuckwalla DWMA as first priority, Chemehuevi DMWA as the second) or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation; d. be connected to lands with desert tortoise habitat equal to or better quality than the Project Site, ideally with populations that are stable, recovering, or likely to recover; e. not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible; f. not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration; g. not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat; and h. have water and mineral rights included as part of the acquisition, unless the CPM, in consultation with CDFG, BLM and USFWS, agrees in writing to the acceptability of the land. 2. Review and Approval of Compensation Lands Prior to Acquisition. The Project owner shall submit a formal acquisition proposal to the CPM, CDFG, USFWS, and BLM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for desert tortoise in relation to the criteria listed above. Approval from the CPM and CDFG, in consultation with BLM and the USFWS, shall be required for acquisition of all compensatory mitigation parcels. 3. Compensation Lands Acquisition Requirements. The Project owner shall comply with the following requirements relating to acquisition of the compensation lands after the CPM and CDFG, in consultation with BLM and the USFWS, have approved the proposed compensation lands: <ol style="list-style-type: none"> a. Preliminary Report. The Project owner, or approved third party, shall provide a recent preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the CPM and CDFG. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the CPM and CDFG, in consultation with BLM and the USFWS. For conveyances to the State, approval may also be required from the California Department of General Services, the Fish and Game Commission and the Wildlife Conservation Board. 	<p>The Project owner may elect to fund the acquisition and initial improvement of compensation lands through NFWF or other approved third party by depositing funds for that purpose into NFWF's REAT Account. Initial deposits for this purpose must be made in the same amounts as the Security required in section 3.h. of this condition. Payment of the initial funds for acquisition and initial improvement must be made at least 30 days prior to the start of ground-disturbing activities.</p> <p>No fewer than 90 days prior to acquisition of the property, the Project owner shall submit a formal acquisition proposal to the CPM, CDFG, USFWS, and BLM describing the parcels intended for purchase and shall obtain approval from the CPM and CDFG prior to the acquisition.</p> <p>No fewer than 30 days after acquisition of the property the Project owner shall deposit the funds required by Section 3e above (long term management and maintenance fee) and provide proof of the deposit to the CPM.</p> <p>The Project owner, or an approved third party, shall provide the CPM, CDFG, BLM, and USFWS with a management plan for the compensation lands within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan for the compensatory mitigation lands, in consultation with CDFG, BLM and the USFWS.</p> <p>Within 90 days after completion of all project related ground disturbance, the Project owner shall provide to the CPM, CDFG, BLM and USFWS an analysis, based on aerial photography, with the final accounting of the amount of habitat disturbed during Project construction. This shall be the basis for the final number of acres required to be acquired.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>b. Title/Conveyance. The Project owner shall transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement as required by the CPM and CDFG. Transfer of either fee title or an approved conservation easement will usually be sufficient, but some situations, e.g., the donation of lands burdened by a conservation easement to BLM, will require that both types of transfers be completed. Any transfer of a conservation easement or fee title must be to CDFG, a non-profit organization qualified to hold title to and manage compensation lands (pursuant to California Government Code section 65965), or to BLM under terms approved by the CPM and CDFG. If an approved non-profit organization holds title to the compensation lands, a conservation easement shall be recorded in favor of CDFG in a form approved by CDFG. If an approved non-profit holds a conservation easement, CDFG shall be named a third party beneficiary.</p> <p>c. Initial Habitat Improvement Fund. The Project owner shall fund the initial protection and habitat improvement of the compensation lands. Alternatively, a non-profit organization may hold the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code section 65965) and if it meets the approval of CDFG and the CPM. If CDFG takes fee title to the compensation lands, the habitat improvement fund must be paid to CDFG or its designee.</p> <p>d. Property Analysis Record. Upon identification of the compensation lands, the Project owner shall conduct a Property Analysis Record (PAR) or PAR-like analysis to establish the appropriate long-term maintenance and management fee to fund the in-perpetuity management of the acquired mitigation lands.</p> <p>e. Long-term Maintenance and Management Fund. In accordance with BIO-29 (phasing), the Project owner shall deposit in NFWF's REAT Account a capital long-term maintenance and management fee in the amount determined through the Property Analysis Record (PAR) or PAR-like analysis conducted for the compensation lands.</p> <p>The CPM, in consultation with CDFG, may designate another non-profit organization to hold the long-term maintenance and management fee if the organization is qualified to manage the compensation lands in perpetuity. If CDFG takes fee title to the compensation lands, CDFG shall determine whether it will hold the long-term management fee in the special deposit fund, leave the money in the REAT Account, or designate another entity to manage the long-term maintenance and management fee for CDFG and with CDFG supervision.</p> <p>f. Interest, Principal, and Pooling of Funds. The Project owner, the CPM and CDFG shall ensure that an agreement is in place with the long-term maintenance and management fee holder/manager to ensure the following conditions:</p> <p>i. Interest. Interest generated from the initial capital long-term maintenance and management fee shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action approved by CDFG designed to protect or improve the habitat values of the compensation lands.</p> <p>ii. Withdrawal of Principal. The long-term maintenance and management fee principal shall not be drawn upon unless such withdrawal is deemed necessary by the CDFG or the approved third-party long-term maintenance and management fee manager to ensure the continued viability of the species on the compensation lands. If CDFG takes fee title to the compensation lands, monies received by CDFG pursuant to this provision shall be deposited in a special deposit fund established solely for the purpose to manage lands in perpetuity unless CDFG designates NFWF or another entity to manage the long-term maintenance and management fee for CDFG.</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>iii. Pooling Long-Term Maintenance and Management Fee Funds. CDFG, or a CPM-and CDFG-approved non-profit organization qualified to hold long-term maintenance and management fees solely for the purpose to manage lands in perpetuity, may pool the endowment with other endowments for the operation, management, and protection of the compensation lands for local populations of desert tortoise. However, for reporting purposes, the long-term maintenance and management fee fund must be tracked and reported individually to the CDFG and CPM.</p> <p>g. Other expenses. In addition to the costs listed above, the Project owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to title and document review costs, expenses incurred from other state agency reviews, and overhead related to providing compensation lands to CDFG or an approved third party; escrow fees or costs; environmental contaminants clearance; and other site cleanup measures.</p> <p>h. Mitigation Security. The Project owner shall provide financial assurances in accordance with BIO-29 (phasing) to the CPM and CDFG with copies of the document(s) to BLM and the USFWS, to guarantee that an adequate level of funding is available to implement the mitigation measures described in this condition. These funds shall be used solely for implementation of the measures associated with the Project in the event the Project owner fails to comply with the requirements specified in this condition, or shall be returned to the Project owner upon successful compliance with the requirements in this condition. The CPM's or CDFG's use of the security to implement measures in this condition may not fully satisfy the Project owner's obligations under this condition. Financial assurance can be provided to the CPM and CDFG in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security"). Prior to submitting the Security to the CPM, the Project owner shall obtain the CPM's approval in consultation with CDFG, BLM and the USFWS, of the form of the Security. Security shall be provided as described in BIO-29 – Table 3 (see 2010 CEC PSPP Commission Decision, pp. 143, which would be updated to reflect current costs), and the beginning of the conditions of certification subsection. The actual costs to comply with this condition will vary depending on the final footprint of the Project and its two phases, and the actual costs of acquiring, improving and managing the compensation lands.</p> <p>i. NFWF REAT Account. The Project owner may elect to fund the acquisition and initial improvement of compensation lands through NFWF by depositing funds for that purpose into NFWF's REAT Account. Initial deposits for this purpose must be made in the same amounts as the security required in section 3.h., above, and may be provided in lieu of security. If this option is used for the acquisition and initial improvement, the Project owner shall make an additional deposit into the REAT Account if necessary to cover the actual acquisition costs and administrative costs and fees of the compensation land purchase once land is identified and the actual costs are known. If the actual costs for acquisition and administrative costs and fees are less than described in Biological Resources Table 6b (see 2010 CEC PSPP Revised Staff Assessment, Part II, pp. C.2-68 – C.2-72), the excess money deposited in the REAT Account shall be returned to the Project owner. Money deposited for the initial protection and improvement of the compensation lands shall not be returned to the Project owner.</p> <p>The responsibility for acquisition of compensation lands may be delegated to a third party other than NFWF, such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission and CDFG. Such delegation shall be subject to approval by the CPM and CDFG, in consultation with BLM and USFWS, prior to land acquisition, initial protection or maintenance and management activities. Agreements to delegate land acquisition to an approved third party, or to manage compensation lands, shall be implemented with 18 months of the Energy Commission's approval.</p>

BIOLOGICAL RESOURCES (cont.)		
<p>BIO-13, Raven Management Plan and Fee: The Project owner shall implement a Raven Monitoring, Management, and Control Plan (Raven Plan) that is consistent with the most current USFWS-approved raven management guidelines, and which meets the approval of the CMP, in consultation with USFWS and CDFG. The draft Common Raven Monitoring, Management, and Control Plan submitted by the Applicant (AECOM 2010a, Attachment DR-BIO-57) shall provide the basis for the final Raven Plan, subject to review, revisions and approval from the CPM, CDFG and USFWS. The Raven Plan shall include but not be limited to a program to monitor raven presence in the Project vicinity, determine if raven numbers are increasing, and to implement raven control measures as needed based on that monitoring. The purpose of the plan is to avoid any Project-related increases in raven numbers during construction, operation, and decommissioning. In addition, the Project owner shall also provide funding for implementation of the USFWS Regional Raven Management Program, as described below.</p> <ol style="list-style-type: none"> 1. The Raven Plan shall: <ol style="list-style-type: none"> a. Identify conditions associated with the Project that might provide raven subsidies or attractants; b. Describe management practices to avoid or minimize conditions that might increase raven numbers and predatory activities; c. Describe control practices for ravens; d. Establish thresholds that would trigger implementation of control practices; e. Address monitoring and nest removal during construction and for the life of the Project, and; f. Discuss reporting requirements. 2. USFWS Regional Raven Management Program. The Project owner shall submit payment to the project sub-account of the REAT Account held by the National Fish and Wildlife Foundation (NFWF) to support the USFWS Regional Raven Management Program. The one-time fee shall be as described by the USFWS in the <i>Renewable Energy Development and Common Raven Predation on the Desert Tortoise – Summary, dated May 2010</i> (USFWS 2010a) and the Cost Allocation Methodology for Implementation of the Regional Raven Management Plan, dated July 9, 2010) or more current guidance as provided by USFWS or CDFG (USFWS 2010b). 	<p>No less than 10 days prior to the start of any Project-related ground disturbance activities, the Project owner shall provide the CPM, USFWS, and CDFG with the final version of a Raven Plan. All modifications to the approved Raven Plan shall be made only with approval of the CPM in consultation with USFWS and CDFG.</p> <p>No less than 10 days prior to the start of any Project-related ground disturbance activities for each phase of Project construction as described in BIO-29, the Project owner shall provide documentation to the CPM, CDFG and USFWS that the one-time fee for the USFWS Regional Raven Management Program of has been deposited to the REAT-NFWS subaccount for the Project. Payment of the fees may be phased as described in BIO-29 – Table 3 (see 2010 CEC PSPP Commission Decision, p. 143, which would be updated to reflect current costs).</p> <p>Within 30 days after completion of Project construction, the Project owner shall provide to the CPM for review and approval, a written report identifying which items of the Raven Plan have been completed, a summary of all modifications to mitigation measures made during the Project's construction phase, and which items are still outstanding.</p> <p>As part of the annual compliance report, each year following construction the Designated Biologist shall provide a report to the CPM that includes: a summary of the results of raven management and control activities for the year; a discussion of whether raven control and management goals for the year were met; and recommendations for raven management activities for the upcoming year.</p>	<p>CEC</p>
<p>BIO-14, Weed Management Plan: The Project owner shall implement a Weed Management Plan (Plan) that meets the approval of the CPM. The objective of the Plan shall be to prevent the introduction of any new weeds and the spread of existing weeds as a result of Project construction, operation, and decommissioning. The Draft Weed Management Plan, submitted by the Applicant, shall provide the basis for the final Plan, subject to review and revisions from the CPM. The Plan shall include the following:</p> <ol style="list-style-type: none"> 1. Weed Plan Requirements. The Project owner shall provide a map to the CPM indicating the location of the Weed Management Area, which shall include all areas within 100 feet of the Project Disturbance Area, access roads, staging and laydown sites, and all other areas subject to temporary disturbance. The Project owner shall provide a Plan for the Weed Management Area includes at a minimum the following information: specific weed management objectives and measures for each target non-native weed species; baseline conditions; a map of the Weed Management Areas; map of existing populations of target weeds within 100 feet of the Project Disturbance Area and access roads; weed risk assessment; measures to prevent the introduction and spread of weeds; measures to minimize the risk of unintended 	<p>No less than 10 days prior to start of any Project-related ground disturbance activities, the Project owner shall provide the CPM with the final version of a Weed Management Plan that has been reviewed by BLM and Energy Commission staff. Modifications to the approved Weed Control Plan shall be made only with approval from the CPM in consultation with BLM.</p> <p>Within 30 days after completion of Project construction, the Project owner shall provide to the CPM for review and approval, a written report identifying which items of the Weed Management Plan have been completed, a summary of all modifications to mitigation measures made during the</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>harm to wildlife and other plants from weed control activities; monitoring and surveying methods; and reporting requirements. Weed control described in the Plan shall focus on prevention, early detection of new infestations, and early eradication for the life of the Project. Weed control along the Project linears shall be limited to the areas where soils were disturbed during construction. Weed monitoring shall occur a minimum of once per year during the early spring months (March-April) to detect seedlings before they set seed. The focus of the Plan shall be on avoiding the introduction of new invasive weeds or the spread of highly invasive species, such as Sahara mustard. Non-native species with low ecological risk, or that are very widespread, such as Mediterranean grass, shall be noted but control shall not be required. When detected, infestations of high priority species shall be eradicated immediately.</p> <p>2. Avoidance and Treatment of Dense Weed Populations. The Plan shall include a requirement to flag and avoid dense populations of the most invasive non-native weeds during any Project-related construction operation in or adjacent to infestations. If these areas cannot be avoided, they shall be pre-treated by one of the following methods: a) treating the infested areas in the season prior to construction by removing and properly disposing of seed heads by hand, prior to maturity, or spraying the new crop of plants that emerge in early spring, the season prior to construction, to reduce the viable seed contained in the soil, or b) removing and disposing the upper 2 inches of soil and disposing it offsite at a sanitary landfill or other site approved by the County Agricultural Commissioner, or burying the infested soil, e.g., under the solar facility or in a pit, and covering the infested soil with at least three feet of uncontaminated soil.</p> <p>3. Cleaning Vehicles and Equipment. The Plan shall include specifications and requirements for the cleaning and removal of weed seed and weed plant parts from vehicles and equipment involved in Project-related construction and operation. Vehicles and equipment working in weed-infested areas (including previous job sites) shall be required to clean the equipment tires, tracks, and undercarriage <i>before</i> entering the Project area and before moving to infested areas of the Project Disturbance Area to uninfested areas. Cleaning shall be conducted on all track and bucket/blade components to adequately remove all visible dirt and plant debris. Cleaning using hand tools, such as brushes, brooms, rakes, or shovels, is preferred. If water must be used, the water/slurry shall be contained to prevent seeds and plant parts from washing into adjacent habitat.</p> <p>4. Safe Use of Herbicides. The final Plan shall include detailed specifications for avoiding herbicide and soil stabilizer drift, and shall include a list of herbicides and soil stabilizers that will be used on the Project with manufacturer's guidance on appropriate use. The Plan shall indicate where the herbicides will be used, and what techniques will be used to avoid chemical drift or residual toxicity to special-status species and their pollinators, and consistent with the Nature Conservancy guidelines and the criteria under #2, below. Only weed control measures for target weeds with a demonstrated record of success shall be used, based on the best available information from sources such as The Nature Conservancy's The Global Invasive Species Team, California Invasive Plant Council: http://www.cal-ipc.org/ip/management/plant_profiles/index.php, and the California Department of Food & Agriculture Encycloweedia: http://www.cdffa.ca.gov/phpps/ipc/encycloweedia/encycloweedia_h_p.htm.</p> <p>5. The methods for weed control described in the final Plan shall meet the following criteria:</p> <p>a. Manual: Well-timed removal of plants or seed heads with hand tools; seed heads and plants must be disposed of in accordance with guidelines from the Riverside County Agricultural Commissioner.</p> <p>b. Chemical: Herbicides known to have residual toxicity, such as pre-emergents and pellets, shall not be used in natural areas or within the engineered channels. Only the following application methods may be used: wick (wiping onto leaves); inner bark injection; cut stump; frill or hack and squirt (into cuts in the trunk); basal bark girdling; foliar spot spraying with backpack sprayers or pump sprayers at low pressure or with a shield attachment to control drift, and only on windless days, or with a squeeze bottle for small infestations (see Nature Conservancy guidelines described above);</p>	<p>Project's construction phase, and which items are still outstanding.</p> <p>As part of the Annual Compliance Report, each year following construction the Designated Biologist shall provide a report to the CPM and BLM that includes: a summary of the results of noxious weeds surveys and management activities for the year; a discussion of whether weed management goals for the year were met; and recommendations for weed management activities for the upcoming year.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>c. Biological: Biological methods may be used subject to review and approval by CDFG and USFWS and only if approved for such use by CDFA, and are either locally native species or have no demonstrated threat of naturalizing or hybridizing with native species;</p> <p>d. Mechanical: Disking, tilling, and mechanical mowers or other heavy equipment shall not be employed in natural areas but hand weed trimmers (electric or gas-powered) may be used. Mechanical trimmers shall not be used during periods of high fire risk and shall only be used with implementation of fire prevention measures.</p>		
<p>BIO-15, Pre-Construction Nest Surveys and Avoidance Measures: Pre-construction nest surveys shall be conducted if construction activities would occur from February 1 through July 31. The Designated Biologist or Biological Monitor conducting the surveys shall be experienced bird surveyors familiar with standard nest-locating techniques such as those described in Martin and Guepel (1993). The goal of the nesting surveys shall be to identify the general location of the nest sites, sufficient to establish a protective buffer zone around the potential nest site, and need not include identification of the precise nest locations. Surveyors performing nest surveys shall not concurrently be conducting desert tortoise surveys. The bird surveyors shall perform surveys in accordance with the following guidelines:</p> <ol style="list-style-type: none"> 1. Surveys shall cover all potential nesting habitat in areas that could be disturbed by each phase of construction, as described in BIO-29 (Phasing). Surveys shall also include areas within 500 feet of the boundaries of the active construction areas (including linear facilities); 2. At least two pre-construction surveys shall be conducted, separated by a minimum 10-day interval. One of the surveys shall be conducted within the 14-day period preceding initiation of construction activity. Additional follow-up surveys may be required if periods of construction inactivity exceed three weeks, an interval during which birds may establish a nesting territory and initiate egg laying and incubation; 3. If active nests or suspected active nests are detected during the survey, a buffer zone (protected area surrounding the nest, the size of which is to be determined by the Designated Biologist in consultation with CDFG) and monitoring plan shall be developed. Nest locations shall be mapped and submitted, along with a report stating the survey results, to the CPM; and 4. The Designated Biologist or Biological Monitor shall monitor the nest until he or she determines that nestlings have fledged and dispersed; activities that might, in the opinion of the Designated Biologist, disturb nesting activities, shall be prohibited within the buffer zone until such a determination is made. 	<p>At least 10 days prior to the start of any Project-related ground disturbance activities during the nesting season, the Project owner shall provide the CPM a letter-report describing the findings of the pre-construction nest surveys, including the time, date, and duration of the survey; identity and qualifications of the surveyor (s); and a list of species observed. If active or suspected active nests are detected during the survey, the report shall include a map or aerial photo identifying the location or suspected location of the nest and shall depict the boundaries of the no-disturbance buffer zone around the nest(s) that would be avoided during Project construction.</p> <p>Each year during construction as part of the annual compliance report a follow-up report shall be provided to the CPM, BLM, CDFG, and USFWS describing the success of the buffer zones in preventing disturbance to nesting activity and a brief description of the outcome of the nesting effort (for example, whether young were successfully fledged from the nest or if the nest failed).</p>	CEC
<p>BIO-16, Avian Protection Plan</p>		CEC
<p>BIO-16A, Avian and Bat Habitat Compensation: To mitigate for potential avian and bat impacts, the Project owner shall provide compensatory mitigation prior to commercial operation of the first unit for 3,896 acres, adjusted to reflect the final Project footprint. For purposes of this condition, the Project footprint means all lands disturbed in the construction and operation of the PSEGS, including all Project linears, as well as undeveloped areas inside the Project's boundaries that will no longer provide viable long-term habitat for avian and bat species. To satisfy this condition, the Project owner shall acquire, protect and transfer 1 acre of habitat for every acre of habitat within the final Project footprint, and provide associated funding for the acquired lands, as specified below. Condition BIO-28 may provide the Project owner with another option for satisfying some or all of the requirements in this condition. In lieu of acquiring lands itself, the Project</p>	<p>If the mitigation actions required under this condition are not completed prior to commercial operation of the first unit, the Project owner shall provide the CPM and CDFW with an approved form of Security in accordance with this condition of certification no later than 30 days prior to commercial operation of the first unit. Actual Security shall be provided no later than 7 days prior to commercial operation of the first unit. If Security is provided, the Project owner, or an</p>

<p>owner may satisfy the requirements of this condition by depositing funds into the Renewable Energy Action Team (REAT) Account established with the National Fish and Wildlife Foundation (NFWF), as provided below in section 3.i. of this condition.</p> <p>The timing of the mitigation shall correspond with commercial operation of the first unit. If compensation lands are acquired in fee title or in easement, the requirements for acquisition, initial improvement and long-term management of compensation lands include all of the following:</p> <ol style="list-style-type: none"> 1. Selection Criteria for Compensation Lands. The compensation lands selected for acquisition in fee title or in easement shall: <ol style="list-style-type: none"> a. be reasonably biologically comparable to the habitat lost or degraded by the Project footprint to assist in the conservation and enhancement of avian and bat populations in the vicinity of the project and throughout the region; b. be prioritized near larger blocks of lands that are either already protected or planned for protection, such as DWMAs within the Colorado Desert Recovery Unit, or which could feasibly be protected long-term by a public resource agency or a non-governmental organization dedicated to habitat preservation; c. not have a history of intensive recreational use or other disturbance that does not have the capacity to regenerate naturally when disturbances are removed or might make habitat recovery and restoration infeasible; d. not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration; e. not contain hazardous wastes that cannot be removed to the extent that the site could not provide suitable habitat; and f. have water and mineral rights included as part of the acquisition, unless the CPM, in consultation with CDFW, BLM and USFWS, agrees in writing to the acceptability of the land. 2. Review and Approval of Compensation Lands Prior to Acquisition. The Project owner shall submit a formal acquisition proposal to the CPM, CDFW and BLM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for avian and bat species in relation to the criteria listed above. Approval from the CPM and CDFW, in consultation with BLM and USFWS, shall be required for acquisition of all compensatory mitigation parcels. 3. Compensation Lands Acquisition Requirements. The Project owner shall comply with the following requirements relating to acquisition of the compensation lands after the CPM and CDFW, in consultation with BLM and USFWS, have approved the proposed compensation lands: <ol style="list-style-type: none"> a. <i>Preliminary Report.</i> The Project owner, or approved third party, shall provide a recent preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the CPM and CDFW. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the CPM and CDFW, in consultation with BLM and the USFWS. For conveyances to the State, approval may also be required from the California Department of General Services, the Fish and Game Commission and the Wildlife Conservation Board. 	<p>approved third party, shall complete and provide written verification to the CPM, CDFW, BLM and USFWS of the compensation lands acquisition and transfer within 18 months after commercial operation of the first unit.</p> <p>The Project owner may elect to fund the acquisition and initial improvement of funds for that purpose into NFWF's REAT Account. Initial deposits for this purpose must be made in the same amounts as the Security required in section 3.h. of this condition. Payment of the initial funds for acquisition and initial improvement must be made at least 30 days prior to commercial operation of the first unit.</p> <p>No fewer than 90 days prior to acquisition of the property, the Project owner shall submit a formal acquisition proposal to the CPM, CDFW, USFWS, and BLM describing the parcels intended for purchase and shall obtain approval from the CPM prior to the acquisition.</p> <p>No fewer than 30 days after acquisition of the property the Project owner shall deposit the funds required by Section 3e above (long term management and maintenance fee) and provide proof of the deposit to the CPM.</p> <p>The Project owner, or an approved third party, shall provide the CPM, CDFW, BLM, and USFWS with a management plan for the compensation lands within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan for the compensatory mitigation lands, in consultation with CDFW, BLM and the USFWS.</p> <p>Within 90 days after completion of all project related ground disturbance, the Project owner shall provide to the CPM, CDFW, BLM and USFWS an analysis, based on aerial photography, with the final accounting of the amount of habitat disturbed during Project construction. This shall be the basis for the final number of acres required to be acquired.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>b. <i>Title/Conveyance.</i> The Project owner shall transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement as required by the CPM and CDFW. Transfer of either fee title or an approved conservation easement will usually be sufficient, but some situations, e.g., the donation of lands burdened by a conservation easement to BLM, will require that both types of transfers be completed. Any transfer of a conservation easement or fee title must be to CDFW, a non-profit organization qualified to hold title to and manage compensation lands (pursuant to California Government Code section 65965), or to BLM under terms approved by the CPM and CDFW. If an approved non-profit organization holds title to the compensation lands, a conservation easement shall be recorded in favor of CDFW in a form approved by CDFW. If an approved non-profit holds a conservation easement, CDFW shall be named a third party beneficiary.</p> <p>c. <i>Initial Habitat Improvement Fund.</i> The Project owner shall fund the initial protection and habitat improvement of the compensation lands. Alternatively, a non-profit organization may hold the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code section 65965) and if it meets the approval of CDFW and the CPM. If CDFW takes fee title to the compensation lands, the habitat improvement fund must be paid to CDFW or its designee.</p> <p>d. <i>Property Analysis Record.</i> Upon identification of the compensation lands, the Project owner shall conduct a Property Analysis Record (PAR) or PAR-like analysis to establish the appropriate long-term maintenance and management fee to fund the in-perpetuity management of the acquired mitigation lands.</p> <p>e. <i>Long-term Maintenance and Management Fund.</i> In accordance with BIO-29 (phasing), the Project owner shall deposit in NFWF's REAT Account a capital long-term maintenance and management fee in the amount determined through the Property Analysis Record (PAR) or PAR-like analysis conducted for the compensation lands.</p> <p>The CPM, in consultation with CDFW, may designate another non-profit organization to hold the long-term maintenance and management fee if the organization is qualified to manage the compensation lands in perpetuity. If CDFW takes fee title to the compensation lands, CDFW shall determine whether it will hold the long-term management fee in the special deposit fund, leave the money in the REAT Account, or designate another entity to manage the long-term maintenance and management fee for CDFW and with CDFW supervision.</p> <p>f. <i>Interest, Principal, and Pooling of Funds.</i> The Project owner, the CPM and CDFW shall ensure that an agreement is in place with the long-term maintenance and management fee holder/manager to ensure the following conditions:</p> <p>i. <i>Interest.</i> Interest generated from the initial capital long-term maintenance and management fee shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action approved by CDFW designed to protect or improve the habitat values of the compensation lands.</p> <p>ii. <i>Withdrawal of Principal.</i> The long-term maintenance and management fee principal shall not be drawn upon unless such withdrawal is deemed necessary by the CDFW or the approved third-party long-term maintenance of the species on the compensation lands. If CDFW takes fee title to the compensation lands, monies received by CDFW pursuant to this provision shall be deposited in a special deposit fund established solely for the purpose to manage lands in perpetuity unless CDFW designates NFWF or another entity to manage the long-term maintenance and management fee for CDFW.</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>iii. Pooling Long-Term Maintenance and Management Fee Funds. CDFW, or a CPM and CDFW-approved non-profit organization qualified to hold long-term maintenance and management fees solely for the purpose to manage lands in perpetuity, may pool the endowment with other endowments for the operation, management, and protection of the compensation lands for avian and bat species. However, for reporting purposes, the long-term maintenance and management fee fund must be tracked and reported individually to the CDFW and CPM.</p> <p>g. <i>Other expenses.</i> In addition to the costs listed above, the Project owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to title and document review costs, expenses incurred from other state agency reviews, and overhead related to providing compensation lands to CDFW or an approved third party; escrow fees or costs; environmental contaminants clearance; and other site cleanup measures.</p> <p>h. <i>Mitigation Security.</i> The Project owner shall provide financial assurances prior to commercial operation of the first unit to the CPM and CDFW with copies of the document(s) to BLM and the USFWS, to guarantee that an adequate level of funding is available to implement the mitigation measures described in this condition. These funds shall be used solely for implementation of the measures associated with the Project in the event the Project owner fails to comply with the requirements specified in this condition, or shall be returned to the Project owner upon successful compliance with the requirements in this condition. The CPM's or CDFW's use of the security to implement measures in this condition may not fully satisfy the Project owner's obligations under this condition. Financial assurance can be provided to the CPM and CDFW in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security"). Prior to submitting the Security to the CPM, the Project owner shall obtain the CPM's approval in consultation with CDFW, BLM and the USFWS, of the form of the Security. Security shall be in the amount shown in BIO-29, Table 3 (see 2010 CEC PSPP Commission Decision, p. 143, which would be updated to reflect current costs). The actual costs to comply with this condition will vary depending on the final footprint of the completed Project, and the actual costs of acquiring, improving and managing the compensation lands.</p> <p>i. <i>NFWF REAT Account.</i> The Project owner may elect to fund the acquisition and initial improvement of compensation lands through NFWF by depositing funds for that purpose into NFWF's REAT Account. Initial deposits for this purpose must be made in the same amounts as the security required in section 3.h. above, and may be provided in lieu of security. If this option is used for the acquisition and initial improvement, the Project owner shall make an additional deposit into the REAT Account if necessary to cover the actual acquisition costs and administrative costs and fees of the compensation land purchase once land is identified and the actual costs are known. If the actual costs for acquisition and administrative costs and fees are less than described in Biological Resources Table 6b (see 2010 CEC PSPP Revised Staff Assessment, Part II, pp. C.2-68 – C.2-72), the excess money deposited in the REAT Account shall be returned to the Project owner. Money deposited for the initial protection and improvement of the compensation lands shall not be returned to the Project owner.</p> <p>The responsibility for acquisition of compensation lands may be delegated to a third party other than NFWF, such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission and CDFW. Such delegation shall be subject to approval by the CPM and CDFW, in consultation with BLM and USFWS, prior to land acquisition, initial protection or maintenance and management activities. Agreements to delegate land acquisition to an approved third party, or to manage compensation lands, shall be implemented within 18 months of the Energy Commission's approval of the third party.</p>		

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>BIO-16B, Avian Enhancement and Conservation Measures: The Project owner shall implement the following measure to conserve and enhance avian populations in the vicinity of the project and throughout the region:</p> <p>(a) Regional Avian Electrocutation Risk and Cable Collision Avoidance Measures. Consistent with the DRECP framework (DRECP 2012), the project owner shall, prior to the commencement of commercial operations at the facility, fund the retrofitting of non-compliant utility poles in the vicinity of the project to APLIC (2006) standards or fund the installation of bird diverters in the vicinity of the Project. A total amount of \$300,000 will be provided for these enhancements. The funding shall be provided to an independent third party who will perform the actual retrofitting, pursuant to a Retrofit Plan approved by the CPM.</p> <p>The Retrofit Plan will develop a tiered approach to minimizing electrocution and collision risk, wherein the first funding is applied to retrofit poles in areas where either mortalities are highest or area use is highest. The second tier of retrofitted poles would be areas of lesser importance. If funds remain available after first and second tier poles have been retrofitted, then the CPM may apply the remaining funds to other avian protection objectives outlined by the DRECP. As an alternative to the Retrofitting Plan and the use of a CPM-approved third party, the total funding can be accomplished by making a payment in the amount of \$300,000 to the National Fish and Wildlife Foundation's Bald and Golden Eagle Protection Act account.</p> <p>(b) Additional Migratory Bird Conservation: The Project owner shall, prior to the commencement of commercial operations at the facility, pay \$500,000 to fund the activities of a CPM approved third party that will perform additional bird migratory bird conservation measures. Such measures shall be approved by the CPM and may include, but not be limited to: (i) restoration of degraded habitat with native vegetation; (ii) restoration of agricultural fields to bird habitat; (iii) management of agricultural fields to enhance bird populations; (iv) invasive plant species and artificial food or water source management; (v) control and cleanup of potential avian hazards, such as lead or microtrash; (vi) retrofitting of buildings to minimize collisions; (vii) retrofitting of conductors and above ground cables to minimize collisions; (viii) animal control programs; (ix) support for avian and bat research and/or management efforts conducted by entities approved by the CPM within the Project's mitigation lands or other approved locations; (x) funding efforts to address avian diseases or depredation due to the expansion of predators in response to anthropomorphic subsidies that may adversely affect birds that use the mitigation lands or in other approved locations; and (xi) contribute to the Migratory Bird Conservation Fund managed by the Migratory Bird Conservation Commission.</p>	<p>No later than 30 days prior to beginning of Project ground-disturbing activities, the Project owner shall provide written verification of an approved form of Security in accordance with this condition of certification. Actual Security shall be provided no later than 7 days prior to the beginning of Project ground-disturbing activities. Prior to commercial operation, the Project owner shall provide the funding to the independent third party selected by the CPM.</p>	
<p>BIO-16C, Avian and Bat Surveys, Monitoring and Adaptive Management: The Project owner shall perform preconstruction baseline surveys prior to surface disturbance of avian and bat species for use in development of a Bird and Bat Conservation Strategy (BBCS). The Project owner shall prepare a BBCS and submit it to the CPM and BLM for approval and to CDFW and USFWS for review and comment. The BBCS shall provide for the following:</p> <ul style="list-style-type: none"> • Survey and monitor onsite and offsite avian use and behavior to document species composition on and offsite, compare onsite and offsite rates of avian and bat use, document changes in avian and bat use over time, and evaluate the general behavior of birds in and near the facility. • Implement an onsite and offsite avian and bat mortality and injury monitoring program to identify the extent of potential avian or bat mortality or injury from collisions with facility structures or from elevated levels of solar flux that may be encountered within the facility airspace, including: <ul style="list-style-type: none"> – assessing levels of collision-related mortality and injury with heliostats, perimeter fences and power tower structures; 	<p>The BBCS shall be submitted to the CPM for review and approval and to CDFW and USFWS for review and comment no less than 120 days prior to the commercial operation of the first unit. The Project owner shall provide the CPM with copies of any written or electronic transmittal from the USFWS or CDFW related to the BBCS within 30 days of receiving any such transmittal. Survey reports shall be submitted to the CPM after each season and in an annual summary report throughout the course of the three-year study period and as set forth in the approved monitoring study plan. The reports will include all monitoring data required as part of the monitoring program. Each year throughout the minimum three year monitoring period, the</p>

BIOLOGICAL RESOURCES (cont.)		
<ul style="list-style-type: none"> - calculating rates of solar flux-related avian mortality and injury, if any; - documenting seasonal, temporal, and weather-related patterns associated with collision- or solar flux-related mortality and injury; and - documenting spatial patterns that may be associated with collision- or flux-related mortality and injury. - documenting spatial patterns that may be associated with avoidance of the facility. <ul style="list-style-type: none"> • Identify conservation measures to minimize impacts and evaluate the effectiveness of those measures • Implement an adaptive management and decision-making framework for reviewing, characterizing, and responding to quantitative survey and monitoring results. <p>Preconstruction Baseline Surveys</p> <p>The project owner shall perform avian use and behavior surveys of the facility site prior to construction. Surveys of avian use and behavior shall be conducted using standard point count protocols. The objective of the surveys shall be to estimate the spatial and temporal use of the facility and surrounding area by resident and migrating birds and to document the preconstruction avian community.</p> <p>The preconstruction baseline surveys will include, at least:</p> <ul style="list-style-type: none"> • Species present, by season, including migration, nesting wintering • Abundance by unit effort, unit time, or other acceptable metric of abundance, by season • Use of the project area and that portion of the surrounding area in which indirect effects could occur (species-specific). <p>The surveys will be sufficiently robust in design, including but not limited to, sampling schedule, sampling intervals, replicates, spatial layout, seasonal and annual variability, and statistics. All surveys will be project-relevant; data collection that is immaterial to baseline survey objectives and goals will not be included. Preconstruction surveys shall employ the following methods:</p> <p>Diurnally active and nesting avian surveys will be conducted using accepted, standard point count protocols (e.g., BLM 2009, Ralph et al. 1995, Ralph et al 1993, Smith et al. 1998) to identify seasonal and annual raptor and songbird species composition, rates of use (including nesting), types of use, and changes in use over time. The spatial design will include the entire area of effect, plus control areas, and employ a stratified-random approach to ensure sampling of all biologically relevant factors and project impacts. The first stratum will be biologically relevant features, such as proximity to vegetation types that may affect prey abundance and capture probability. The second stratum will attend to the specific aspects of the power towers and solar field, as well as the interface between the solar field and native habitat. To ensure entire area of effect coverage, a grid will overlay the entire project footprint and extended area of effect around the project disturbance area. Within these three strata, a sufficient number of transects (replicates) will be randomly sited to provide robust statistical results. Ten percent of the area is a suggested level of sampling that would provide sufficient information to answer the study questions as well as provide a basis to assess future sampling during the monitoring phase (see below). Point count locations would be spaced 500 ft apart along each transect. Each solar field has a radius of approximately one mile. Because the study would extend to indirect-effect areas outside the boundary, this design would result in 10, 1.25 to 1.5-mile-long transects (depending on access outside the project) for</p>	<p>Designated Biologist or other qualified biologist that may be identified by the Designated Biologist shall submit an Annual Report to the CPM, CDFW and USFWS by January 31 of each calendar year, summarizing all available bird and bat mortality data (species, date and location collected, evidence of injury and cause of death) collected over the course of the year. The report also shall summarize any additional wildlife mortality or injury documented on the project site during the year, regardless of cause, and assess any adaptive management measure implemented during the prior year as approved by the CPM. After the third year of the monitoring program, the CPM shall meet and confer with the project owner to determine of the study period should be extended based on data quality and sufficiency for analysis or if needed to document efficacy of any adaptive management measures undertaken by the Project owner. The study period may be extended up to five years from the commencement of facility operations. If a carcass of a golden eagle or any state or federally listed threatened or endangered species is found at any time by the monitoring study or Project operations staff, the Project owner, Designated Biologist, or other qualified biologist that may be identified by the Designated Biologist shall contact CDFW and USFWS by email, fax or other electronic means within one working day of any such detection.</p>	

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>the both solar fields combined, five per solar field, with 15 sampling points per transect. Point counts would be 10 minutes long at each point and conducted during the greatest bird activity period – daybreak to approximately three hours past daybreak. Survey points will also include two-hour segments throughout the middle portion of the day (approximately 1000 h to 1600 h, depending on time of year) when diurnal raptors are generally considered most active. The surveys will be conducted weekly during the most intensive spring nesting and migration period (March 1 to May 1), twice monthly during the remainder of spring (May and June) and during fall (September 1 to December 1) and once per month during summer (June 1 to September 1) and winter (December 1 to February 1). Sampling will be rotated so that all points are evaluated equally throughout each sampling period.</p> <p>Nocturnal sampling will be conducted for nocturnally migrating birds during the spring and fall migration periods to assess the level of migratory activity and need for further nocturnal sampling. Bat acoustic sampling also will be implemented in this baseline stage to identify species present and assess risk potential.</p> <p>The survey will occur for one year prior to construction. If construction schedules dictate that an entire year of sampling is not possible, then at least one important migratory and activity season will be captured, preferably spring.</p> <p>Preconstruction surveys shall include collecting data from the spring migratory and activity season.</p> <p>BBCS Components</p> <p>The BBCS shall include the following components to be implemented after commercial operation of the Project:</p> <ol style="list-style-type: none"> 1. Preconstruction Baseline survey results. A description and summary of the baseline survey methods and results. 2. Avian and bat use and behavior surveys. Avian and bat use behavior surveys shall be conducted. The program will outline survey methodology and field documentation, the identification of appropriate onsite and offsite survey locations, control sites, and the seasonal considerations. Prey abundance surveys will also be conducted to identify the locations and changes in the abundance of prey species. Bat acoustic sampling may be implemented depending on results of the baseline study. 3. Golden eagle nest monitoring, including a summary of available information concerning golden eagle nesting activity in the project vicinity shall be prepared and annual pedestrian and/or helicopter surveys of golden eagle nesting sites within a 10-mile radius of the Project site 4. Avian and bat mortality and injury monitoring: An avian and bat injury and mortality monitoring program shall be implemented, including: <ol style="list-style-type: none"> (a) Onsite monitoring that will systematically survey representative locations within the facility sufficient to ensure that the estimated coefficient of variation (the standard deviation divided by facility-wide estimates) of facility wide fatality estimates will be less than 25 percent over a reasonable range of potentially low, medium and high impact rates, account for potential spatial bias and allow for the extrapolation of survey results to unsurveyed areas, and the survey interval based on scavenger and searcher efficiency trials and detection rates. (b) Offsite monitoring, to the extent that access can be reasonably and feasibly obtained by the Project owner, of one or more locations adjacent to the project facilities using the same or comparable methods as implemented for the onsite monitoring to monitor the extent to which avian species potentially injured by collisions or solar flux traverse to and can be detected within adjacent areas. 		

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>(c) Low-visibility and high-wind weather event monitoring to document potential weather-related collision risks that may be associated with the power towers at the facility, including foggy, highly overcast, or rainy night-time weather typically associated with an advancing frontal system, and high wind events in which 40 miles per hour winds are sustained for period of greater than 4 hours, including survey frequency, location and methods.</p> <p>(d) Scavenger and searcher efficiency trials to document the extent to which avian or bat fatalities remain visible over time and can be detected within the project area and to adjust the survey timing and survey results to reflect scavenger and searcher efficiency rates.</p> <p>(e) Statistical methods used to generate facility estimates of potential avian and bat impacts based on the observed number of detections during standardized searches in the monitoring season for which the cause of death can be determined and is determined to have been facility-related.</p> <p>(f) Field detection and mortality or injury identification, cause attribution, handling and reporting protocols consistent with applicable legal requirements.</p> <p>5. Survey schedule and period. All surveys and monitoring studies included in the BBCS shall be conducted for three years following commercial operation and approval of the BBCS by the CPM. At the end of the three-year period, the project owner and the CPM shall meet and confer to determine whether the survey program shall be continued for subsequent periods, up to a maximum of five years. The monitoring program may be modified with the approval of the CPM in response to survey results, identified scavenging efficiency rates, or other factors to increase monitoring accuracy and reliability or in accordance with the adaptive management decision-making framework included in the BBCS.</p> <p>6. Adaptive management. An adaptive management program shall be developed to identify and implement reasonable and feasible measures that would reduce any biologically significant detected levels of avian or bat mortality or injury attributable to project operations and facilities. Any such impact reduction measures must be commensurate (in terms of factors that include geographic scope, costs, and scale of effort) to the level of avian or bat mortality or injury that is specifically and clearly attributable to the Project facilities. The adaptive management program shall include the following element:</p> <p>(a) Reasonable measures for characterizing the extent and significance of detected mortality and injuries clearly attributable to the Project facilities.</p> <p>(b) Measures that the project owner will implement to adaptively respond to detected mortality and injuries attributable to the Project, including passive avian diverter installations along the perimeter or at other locations within the project to avoid site use, the use of sound, light or other means to discourage site use consistent with applicable legal requirements, onsite prey or habitat control measures consistent with applicable legal requirements, and additional perch and nest proofing of Project facilities.</p> <p>(c) A decision-making framework that facilitates concurrent Project owner, CPM, and state and federal wildlife agency review of seasonal and annual survey results, the effectiveness of the adaptive management measures implemented by the Project owner, modification of the surveys in response to the results, if necessary, and the identification of additional mitigation responses that are commensurate with the extent of impacts that may be identified in the monitoring studies.</p>

BIOLOGICAL RESOURCES (cont.)		
<p>BIO-17, American Badger and Desert Kit Fox Impact Avoidance and Minimization Measures: The project owner shall develop and implement an American Badger and Desert Kit Fox Mitigation and Monitoring Plan (plan). The objective of the plan shall be to avoid direct impacts to the American badger and desert kit fox as a result of construction of the power plant and linear facilities, as well as during project operation and decommissioning. The final plan is subject to review and comment by BLM and revision and approval by the CPM, in consultation with CDFW. The final plan shall include, but is not limited to, the following procedures and impact avoidance measures:</p> <ol style="list-style-type: none"> 1. Describe pre-construction survey and clearance field protocol, to determine the number and locations of single or paired kit foxes or badgers on the project site that would need to be passively relocated and the number and locations of desert kit fox or badger burrows or burrow complexes that would need to be collapsed to prevent re-occupancy by the animals. 2. Complete pre-construction den surveys for any new construction activity. Biological Monitors shall perform pre-construction surveys for badgers and kit fox dens in the Project area, including areas within 100 feet of all Project facilities, utility corridors, and access roads. Surveys may be concurrent with desert tortoise surveys. If dens are detected, each den shall be classified as inactive non-natal, inactive natal, potentially active, or definitely active non-natal, or active natal den. 3. The plan will include details on monitoring requirements, types and methods of passive hazing, and methods and timing of den excavation, including, but not limited to the following: <ol style="list-style-type: none"> a. Inactive non-natal and inactive natal dens that would be directly impacted by construction activities shall be excavated by hand and backfilled to prevent reuse by badgers or kit fox b. Potentially and definitely active dens that would be directly impacted by construction activities shall be monitored by the Biological Monitor for three consecutive nights using a tracking medium (such as diatomaceous earth or fire clay) and/or infrared camera stations at the entrance. If no tracks are observed in the tracking medium or no photos of the target species are captured after three nights, the den shall be excavated and backfilled by hand. If tracks are observed, the den shall be progressively blocked with natural materials (rocks, dirt, sticks, and vegetation piled in front of the entrance) for the next three to five nights to discourage the badger or kit fox from continued use. After verification that the den is unoccupied it shall then be excavated and backfilled by hand to ensure that no badgers or kit fox are trapped in the den. BLM approval may be required prior to release of badgers on public lands. c. <i>Active natal dens.</i> During denning season (American badger – March to August, and desert kit fox – February to June), any active natal dens that are detected in the preconstruction surveys shall have a buffer zone of 300 feet to 500 feet surrounding the den, pending approval from the CPM in consultation with CDFW, and monitoring measures shall be implemented. Discovery of an active natal den that could be impacted by the project shall be reported to the CPM and CDFW within 24-hours of the discovery. A detailed description outlining the types and methods of monitoring must be included in the plan. The den location shall be mapped and submitted along with a report stating the survey results to the CPM and CDFW. The Designated Biologist shall monitor the natal den until he or she determines that the pups have dispersed. No disturbance will be allowed for any animal associated with a natal den and any activities that might disturb denning activities shall be prohibited within the buffer zone. Once the pups have dispersed, various passive hazing methods may be used to discourage den reuse. A detailed description of the types of passive hazing to be used must be included in the plan; however, approval must be granted by the CPM, in consultation with CDFW prior to implementation. After verification that the den is unoccupied, it shall then be excavated by hand and backfilled to ensure that, no badgers or kit fox are trapped in the den. 	<p>No fewer than 30 days prior to the start of any construction-related ground disturbance activities associated with the new project related facilities, the project owner shall provide the CPM, BLM, and CDFW with a draft American Badger and Desert Kit Fox Mitigation and Monitoring Plan for review and comment.</p> <p>No fewer than 10 days prior to start of any ground disturbance activities associated with the new project-related facilities, the project owner shall provide an electronic copy of the CPM-approved final plan to the CPM and CDFW and implement the plan.</p> <p>The project owner shall submit a report to the CPM and CDFW within 30 days of completion of any badger and kit fox surveys. The report shall describe survey methods, results, impact avoidance and minimization measures implemented, and the results of those measures.</p> <p>No later than 2 days following a phone notification of an injured, sick, or dead American badger or desert kit fox, the project owner shall provide to the CPM and CDFW, via FAX or electronic communication, a written report from the Designated Biologist describing the incident of sickness, injury, or death of an American badger or desert kit fox, when the incident occurred, and who else was notified.</p> <p>Beginning with the first month after start of construction and continuing every month until construction is completed, the Designated Biologist shall include a summary of events regarding the American badger and desert kit fox in each MCR.</p> <p>No later than 45 days after initiation of project operation, the Designated Biologist shall provide the CPM a final American Badger and Desert Kit Fox Mitigation and Monitoring Plan that includes: 1) a discussion of all mitigation measures that were and currently are being implemented; 2) all information about project-related kit fox and badger injuries and/or deaths; 3) all information regarding sick kit fox and badger found within the project site and along related linear facilities; and 4) recommendations on how mitigation measures might be changed to more effectively minimize and mitigate the impacts of future projects on the American badger and desert kit fox.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>d. <i>Exception for American badger.</i> In the event that passive relocation techniques fail for badgers outside the denning season, or during the denning season individual badgers can be verified to not have a litter, then live-trapping can be employed to safely perform active removal. This approach will be agreed to, in principle, ahead of clearance surveys, and refined for individual situations in discussions with the CPM and CDFW.</p> <p>4. Address other factors and procedures that may affect the success of kit fox and American badger relocation offsite, such as:</p> <ul style="list-style-type: none"> a. Qualitative discussion of availability of suitable habitat on off-site surrounding lands within 10 miles of the project boundary, and quantitative evaluation of unoccupied desert kit fox burrows available on surrounding lands within 1 mile of the project boundary (e.g., by inventorying burrow numbers in selected representative sample areas); b. Estimates of the distances kit foxes would need to travel across the project site and across adjacent lands to safely access suitable habitat (including burrows) off-site; c. Proposed scheduling of the passive relocation effort; d. Methods to minimize likelihood that the animals will return to the project site; e. Descriptions of any proposed or potential ground disturbing activities related to kit fox relocation, and locations of those activities (e.g., artificial burrow construction); f. A monitoring and reporting plan to evaluate success of the relocation efforts and any subsequent re-occupation of the project site; and g. A plan to subsequently relocate any animals that may return to the site (e.g., by digging beneath fences). <p>5. Notify the CPM and CDFW if injured, sick, or dead American badger and desert kit fox are found. If an injured, sick, or dead animal is detected on any area associated with the solar project site or associated linear facilities, the CPM and the Ontario CDFW Office shall be notified immediately by phone. Written follow-up notification via FAX or electronic communication shall be submitted to the CPM and CDFW within 24 hours of the incident and shall include the following information as appropriate:</p> <ul style="list-style-type: none"> a. <i>Injured animals.</i> If an American badger or desert kit fox is injured because of any project-related activities, the Designated Biologist or approved Biological Monitor shall immediately notify the CPM and CDFW personnel regarding the capture and transport of the animal to CDFW-approved wildlife rehabilitation and/or veterinarian clinic. Following the phone notification, the CPM and CDFW shall determine the final disposition of the injured animal, if it recovers. A written notification of the incident shall be sent to the CPM and CDFW containing, at a minimum, the date, time, location, and circumstances of the incident. b. <i>Sick animals.</i> If an American badger or desert kit fox is found sick and incapacitated on any area associated with the solar project site or associated linear facilities, the Designated Biologist or approved Biological Monitor shall immediately notify the CPM and CDFW personnel for immediate capture and transport of the animal to a CDFW-approved wildlife rehabilitation and/or veterinarian clinic. Following the phone notification, the CPM and CDFW shall determine the final disposition of the sick animal, if it recovers. If the animal dies, a necropsy shall be performed by a CDFW-approved facility to determine the cause of death. The project owner shall pay to have the animal transported and a necropsy performed. A written notification of the incident shall be sent to the CPM and CDFW and contain, at a minimum, the date, time, location, and circumstances of the incident. 		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>c. <i>Fatalities</i>. If an American badger or desert kit fox is killed because of any project-related activities during construction, operation, and decommissioning, or is found dead on the project site or along associated linear facilities, the Designated Biologist or approved Biological Monitor shall immediately refrigerate the carcass and notify the CPM and CDFW personnel within 24 hours of the discovery to receive further instructions on the handling of the animal. If the animal is suspected of dying of unknown causes, a necropsy shall be performed by a CDFW-approved facility to determine the cause of death. The project owner shall pay to have the animal transported and a necropsy performed.</p> <p>6. Additional protection measures to be included in the plan and implemented:</p> <p>a. All pipes within the project disturbance area must be capped and/or covered every evening or when not in use to prevent desert kit foxes or other animals from accessing the pipes.</p> <p>b. All water sources shall be covered and secured when not in use to prevent drowning.</p> <p>c. The project owner shall coordinate with CDFW to identify any additional fence design features to maximize the effectiveness of the fence to exclude kit foxes from the project.</p> <p>d. Incorporate and implement the CDFW Veterinarian's guidance regarding impact avoidance measures including measures to prevent disease spread among desert kit foxes.</p> <p>e. Include measures to reduce traffic impacts to wildlife if the project owner anticipates night-time construction. The plan must also include a discussion of what information will be provided to all night-time workers, including truck drivers, to educate them about the threats to kit fox, what they need to do to avoid impacts to kit fox, and what to report if they see a live, injured, or dead kit fox.</p>		
<p>BIO-18, Burrowing Owl Impact Avoidance, Minimization, and Compensation Measures: The Project owner shall implement the following measures to avoid, minimize and offset impacts to burrowing owls:</p> <p>1. Pre-Construction Surveys. The Designated Biologist or Biological Monitor shall conduct pre-construction surveys for burrowing owls no more than 30 days prior to initiation of construction activities. Surveys shall be focused exclusively on detecting burrowing owls, and shall be conducted from two hours before sunset to 1 hour after or from 1 hour before to 2 hours after sunrise. The survey area shall include the Project Disturbance Area and surrounding 500 foot survey buffer for each phase of construction in accordance with BIO-29 (phasing).</p> <p>2. Implement Burrowing Owl Mitigation Plan. The Project owner shall implement measures described in the final Burrowing Owl Mitigation Plan. The final Burrowing Owl Mitigation Plan shall be approved by the CPM, in consultation with BLM, USFWS and CDFG, and shall:</p> <p>a. identify suitable sites within 1 mile of the Project Disturbance Areas for creation or enhancement of burrows prior to passive relocation efforts;</p> <p>b. provide guidelines for creation or enhancement of at least two natural or artificial burrows per relocated owl;</p> <p>c. provide detailed methods and guidance for passive relocation of burrowing owls occurring within the Project Disturbance Area; and</p> <p>d. describe monitoring and management of the passive relocation effort, including the created or enhanced burrow location and the project area where burrowing owls were relocated from, and provide a reporting plan.</p>	<p>If pre-construction surveys detect burrowing owls within the Project Disturbance Area and relocation of the owls is required, within 30 days of completion of the burrowing owl pre-construction surveys the Project owner shall submit to the CPM, BLM, CDFG, and USFWS a Burrowing Owl Mitigation Plan. The Burrowing Owl Mitigation Plan shall identify suitable areas for construction of burrows and the other passive relocation as described above. As part of the Annual Compliance Report each year following construction for a period of five years, the Designated Biologist shall provide a report to the CPM, BLM, USFWS and CDFG that describes the results of monitoring and management of the burrowing owl burrow creation or enhancement area(s).</p> <p>If pre-construction surveys detect burrowing owls within 500 feet of proposed construction activities, at least 10 days prior to the start of any Project-related site disturbance activities the Designated Biologist shall provide to the CPM, BLM, CDFG, and USFWS documentation indicating that non-disturbance buffer fencing has been installed as described above. The Project owner shall report monthly to</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>3. Implement Avoidance Measures. If an active burrowing owl burrow is detected within 500 feet from the Project Disturbance Area the following avoidance and minimization measures shall be implemented:</p> <ul style="list-style-type: none"> a. Establish Non-Disturbance Buffer. Fencing shall be installed at a 250-foot radius from the occupied burrow to create a non- disturbance buffer around the burrow. The non-disturbance buffer and fence line may be reduced to 160 feet if all Project- related activities that might disturb burrowing owls would be conducted during the non-breeding season (September 1 through January 31). Signs shall be posted in English and Spanish at the fence line indicating no entry or disturbance is permitted within the fenced buffer. b. Monitoring: If construction activities would occur within 500 feet of the occupied burrow during the nesting season (February 1 – August 31) the Designated Biologist or Biological Monitor shall monitor to determine if these activities have potential to adversely affect nesting efforts, and shall make recommendations to minimize or avoid such disturbance. <p>4. Acquire Burrowing Owl Habitat. The Project owner shall acquire, in fee or in easement land suitable to support a resident population of burrowing owls and shall provide funding for the enhancement and long-term management of these compensation lands. The responsibilities for acquisition and management of the compensation lands may be delegated by written agreement to CDFG or to a third party, such as a non-governmental organization dedicated to habitat conservation, subject to approval by the CPM, in consultation with CDFG and USFWS prior to land acquisition or management activities. Additional funds shall be based on the adjusted market value of compensation lands at the time of construction to acquire and manage habitat.</p> <ul style="list-style-type: none"> a. Criteria for Burrowing Owl Mitigation Lands. The terms and conditions of this acquisition or easement shall be as described in BIO-12 [Desert Tortoise Compensatory Mitigation], with the additional criteria to include: 1) mitigation land per BIO-29 - Table 2 (see 2010 CEC PSPP Commission Decision, pp. 142 – 143), that must provide suitable habitat for burrowing owls, and 2) the acquisition lands must either currently support burrowing owls or be within dispersal distance from areas occupied by burrowing owls (generally approximately five miles). The burrowing owl mitigation lands may be included with the desert tortoise mitigation lands ONLY if these two burrowing owl criteria are met. If the burrowing owl mitigation land is separate from the acreage required for desert tortoise compensation lands, the Project owner shall fulfill the requirements described below in this condition. b. Security. If the burrowing owl mitigation land is separate from the acreage required for desert tortoise compensation lands the Project owner or an approved third party shall complete acquisition of the proposed compensation lands within the time period specified for this acquisition (see the verification section at the end of this condition). Alternatively, financial assurance can be provided by the Project owner to the CPM and CDFG, according to the measures outlined in BIO-12. The amount of the Security shall be as described in BIO-29 – Table 3 (see 2010 CEC PSPP Commission Decision, p. 143, which would be updated to reflect current costs) for the proposed Project or any of the Project alternatives. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the CPM in the form of an irrevocable letter of credit, a pledged savings account or another form of security (“Security”) prior to initiating ground-disturbing Project activities. Prior to submittal to the CPM, the Security shall be approved by the CPM, in consultation with CDFG and the USFWS to ensure funding. The final amount due will be determined by an updated appraisal and PAR analysis conducted as described in BIO-12. 	<p>the CPM, BLM, CDFG and USFWS for the duration of construction on the implementation of burrowing owl avoidance and minimization measures. Within 30 days after completion of construction the Project owner shall provide to the CPM and CDFG a written report identifying how mitigation measures described in the plan have been completed.</p> <p>No less than 30 days prior to the start of Project ground-disturbing activities the Project owner shall provide the CPM with an approved form of Security in accordance with this condition of certification. Actual Security for acquisition of 78 acres of burrowing owl habitat shall be provided no later than 7 days prior to the beginning of Project ground-disturbing activities.</p> <p>No fewer than 90 days prior to the land or easement purchase, as determined by the date on the title, the Project owner shall provide the CPM with a management plan for review and approval, in consultation with CDFG, BLM, and USFWS, for the compensation lands and associated funds.</p> <p>No later than 18 months from initiation of construction, the Project owner shall provide written verification to the CPM that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient.</p>

BIOLOGICAL RESOURCES (cont.)		
<p>BIO-19, Special-Status Plant Impact Avoidance, Minimization and Compensation: This condition contains the following four sections:</p> <p>Section A: Special-Status Plant Impact Avoidance and Minimization Measures contains the Best Management Practices and other measures designed to avoid accidental indirect impacts to plants during construction, operation, and closure. The measures are required for special-status plants located outside of the Project Disturbance Area and within 100 feet of the Project Disturbance Area. The same measures shall also be implemented for plants within the Project Disturbance Area that are avoided pursuant to Section C of this condition.</p> <p>Section B: Conduct Late Season Botanical Surveys describes guidelines for conducting summer-fall 2010 surveys to detect special-status plants that would have been missed during the spring 2010 surveys.</p> <p>Section C: Avoidance Requirements for Special-Status Plants Detected in the Summer/Fall 2010 Surveys outlines the level of on-site avoidance required for any special-status plants detected during the summer-fall surveys, and specifies when off-site mitigation is required.</p> <p>Section D: Off-Site Compensatory Mitigation for Special-Status Plants describes performance standards for off-site mitigation through acquisition or restoration/enhancement.</p> <p>“Project Disturbance Area” encompasses all areas to be temporarily and permanently disturbed by the Project, including the plant site, linear facilities, and areas disturbed by temporary access roads, fence installation, construction work lay-down and staging areas, parking, storage, or by any other activities resulting in disturbance to soil or vegetation. The term “Permanent Project Disturbance Area” refers only to the solar facility; “linears” includes transmission lines, laydown areas, pipelines, and access roads.</p> <p>The Project owner shall implement the following measures in Section A, B, C, and D to avoid, minimize, and compensate for direct, indirect, and cumulative impacts to special-status plant species:</p> <p>Section A: Special-Status Plant Impact Avoidance and Minimization Measures</p> <p>To protect all special-status plants located outside of the Project Disturbance Area and within 100 feet of the permitted Project Disturbance Area from accidental and indirect impacts during construction, operation, and closure, the Project owner shall implement the following measures:</p> <ol style="list-style-type: none"> 1. Designated Botanist. An experienced botanist who meets the qualifications described in Section B-2 below shall oversee compliance with all special-status plant avoidance, minimization, and compensation measures described in this condition throughout construction and closure. The Designated Botanist shall oversee and train all other Biological Monitors tasked with conducting botanical survey and monitoring work. During operation of the Project, the Designated Biologist shall be responsible for protecting special-status plant occurrences within 100 feet of the Project boundaries. 2. Special-Status Plant Impact Avoidance and Minimization Measures. The Project owner shall incorporate all measures for protecting special-status plants in close proximity to the site into the BRMIMP (BIO-7). These measures shall include the following elements: <ol style="list-style-type: none"> a. Site Design Modifications: i) Incorporate s modifications to site design or construction techniques to minimize direct and indirect impacts to special-status plants along the Project linears to include: limiting the width of the work area; adjusting the location of staging areas, lay downs, spur roads and poles or towers; driving and crushing vegetation as an alternative to blading temporary roads to preserve the seed bank, and minor adjustments to the alignment of the roads and pipelines within the constraints of the ROW; ii) These modifications shall be clearly depicted on the grading and construction plans, and on report-sized maps in the BRMIMP. 	<p>The Special-Status Plant Impact Avoidance and Minimization Measures shall be incorporated into the BRMIMP as required under Condition of Certification BIO-7.</p> <p>The Project owner shall notify the CPM and the BLM State Botanist no less than 14 days prior to the start of late-season surveys and provide a target list of late season special-status plants that will be considered. Concurrently, the Project owner shall coordinate with BLM to obtain a permit for seed collection. Seed collection is required for all special-status plants located within the Project Disturbance Area and shall be conducted according to the specifications in Section D.III.1 of this condition and with all terms and conditions of the BLM permit.</p> <p>Raw GPS data, metadata, and CNDDDB field forms shall be submitted to the CPM within two weeks of the completion of each survey. A preliminary summary of results for the late summer/fall botanical surveys, prepared according to guidelines in Section B of this condition, shall also be submitted to the CPM and BLM’s State Botanist within two weeks following the completion of the surveys. If surveys are split into more than one period, then a summary letter shall be submitted following each survey period. The Final Summer-Fall Botanical Survey Report, GIS shape files and metadata shall be submitted to the BLM State Botanist and the CPM no less than 30 days prior to the start of ground-disturbing activities. The Final Report shall include a detailed accounting of the acreage of Project impacts to special-status plant occurrences.</p> <p>For any special-status plant species located within the Project Disturbance Area, the Project owner shall submit to the CPM to less than 30 days prior to the start of ground-disturbing activities proof, in the form of a letter or receipt, of the seed or other propagules collected pursuant to Section D.III #1 of this Condition.</p> <p>The draft conceptual Special-Status Plant Mitigation Plan, as described under Section C.4 of this condition, shall be submitted to the CPM for review and approval no less than 30 days prior to the start of ground-disturbing activities.</p> <p>The Project owner shall immediately provide written notification to the CPM, CDFG, USFWS, and BLM State Botanist if it detects a State- or Federal-Listed Species, or BLM Sensitive Species at any time during its late</p>	<p>CEC</p>

BIOLOGICAL RESOURCES (cont.)		
<p>b. Establish Environmentally Sensitive Areas (ESAs). Prior to the start of any ground- or vegetation-disturbing activities, the Designated Botanist shall establish ESAs to protect avoided⁷ special-status plants located outside of the Project Disturbance Areas and within 100 feet of the boundary of construction. This includes plant occurrences identified during the spring 2009- 2010 surveys and the late season 2010 surveys. The locations of ESAs shall be clearly depicted on construction drawings, which shall also include all avoidance and minimization measures on the margins of the construction plans. The boundaries of the ESAs shall be placed a minimum of 20 feet from the uphill side of the occurrence and 10 feet from the downhill side. Where this is not possible due to construction constraints, other protection measures such as silt-fencing and sediment controls may be employed to protect the occurrences. Equipment and vehicle maintenance areas, and wash areas, shall be located 100 feet from the uphill side of any ESAs. ESAs shall be clearly delineated in the field with temporary construction fencing and signs prohibiting movement of the fencing or sediment controls under penalty of work stoppages and additional compensatory mitigation. ESAs shall also be clearly identified (with signage or by mapping on site plans) to ensure that avoided plants are not inadvertently harmed during construction, operation, or closure.</p> <p>c. Special-Status Plant Worker Environmental Awareness Program (WEAP). The WEAP (BIO-6) shall include training components specific to protection of special-status plants as outlined in this condition.</p> <p>d. Herbicide and Soil Stabilizer Drift Control Measures. Special- status plant occurrences within 100 feet of the Project Disturbance Area, and any occurrences avoided within the Project Disturbance Area³ shall be protected from herbicide and soil stabilizer drift. The Weed Control Program (BIO-14) shall include measures to avoid chemical drift or residual toxicity to special-status plants consistent with guidelines such as those provided by the Nature Conservancy's The Global Invasive Species Team⁸, the U.S. Environmental Protection Agency, and the Pesticide Action Network Database⁹.</p> <p>e. Erosion and Sediment Control Measures. Erosion and sediment control measures shall not inadvertently impact special-status plants by using invasive or non-native plants in seed mixes, introducing pest plants through contaminated seed or straw, accidental burial by mulches, etc. These specifications shall be incorporated in the Drainage, Erosion, and Sedimentation Control Plan required under SOIL&WATER-1.</p> <p>f. Locate Staging, Parking, Spoils, and Storage Areas Away from Special-Status Plant Occurrences. Areas for spoils, equipment, vehicles, and materials storage areas; parking; equipment and vehicle maintenance areas, and wash areas shall be placed at least 100 feet from any ESAs. These specifications shall be incorporated in the Drainage, Erosion, and Sedimentation Control Plan required under SOIL&WATER-1.</p> <p>g. Pre-Construction Seed Collection. For all significant impacts to special-status plants, mitigation shall include seed collection from the affected special-status plants population on-site prior to construction to conserve the germplasm and provide a seed source for restoration efforts. Seed collection shall follow the guidelines described in Section D.III.3 of this condition.</p> <p>h. Monitoring and Reporting Requirements. The Designated Botanist, or BM under supervision of the Designated Botanist, shall conduct weekly monitoring of the ESAs that protect special-status plant occurrences during construction and decommissioning activities.</p> <p>Section B: Conduct Late-Season Botanical Surveys</p> <p>The Project owner shall conduct late-summer/fall botanical surveys for late-season special-status plants prior to start of construction or by the end of 2010, as described below:</p>	<p>summer/fall botanical surveys or at any time thereafter through the life of the Project, including conclusion of Project decommissioning.</p> <p>No less than 30 days prior to the start of ground-disturbing activities the Project owner shall submit grading plans and construction drawings to the CPM which depict the location of Environmentally Sensitive Areas and the Avoidance and Minimization Measures contained in Section A of this Condition, and under Section C.1-3.</p> <p>If compensatory mitigation is required, pursuant to Section C.1-3, no less than 30 days prior to the start of ground-disturbing activities the Project owner shall submit to the CPM the form of Security adequate to acquire compensatory mitigation lands and/or undertake habitat enhancement or restoration activities, as described in this condition. Actual Security shall be provided 7 days prior to start of ground-disturbing activities.</p> <p>No fewer than 90 days prior to acquisition of compensatory mitigation lands, the Project owner shall submit a formal acquisition proposal and draft Management Plan for the proposed lands to the CPM, with copies to CDFG, USFWS, and BLM, describing the parcels intended for purchase and shall obtain approval from the CPM prior to the acquisition. No fewer than 90 days prior to acquisition of compensatory mitigation lands, the Project owner shall submit to the CPM and obtain CPM approval of any agreements to delegate land acquisition to an approved third party, or to manage compensation lands; such agreement shall be executed and implemented within 18 months of the start of ground disturbance.</p> <p>No fewer than 30 days after acquisition of the property the Project owner shall deposit the funds required by Section I e above (long term management and maintenance fee) and provide proof of the deposit to the CPM.</p> <p>The Project owner or an approved third party shall complete the acquisition and all required transfers of the compensation lands, and provide written verification to the CPM of such completion no later than 18 months after the start of Project ground-disturbing activities. If NFWF or another approved third party is being used for the acquisition, the Project owner shall ensure that funds</p>

BIOLOGICAL RESOURCES (cont.)		
<ol style="list-style-type: none"> 1. Survey Timing. Surveys shall be timed to detect: a) summer annuals triggered to germinate by the warm, tropical summer storms (which may occur any time between June and October), and b) fall-blooming perennials that respond to the cooler, later season storms (typically beginning in September or October). For those species that are identified by vegetative characteristics, surveys do not have to be timed for blooming or fruiting. The surveys shall not be timed to coincide with the statistical peak bloom period of the target species but shall instead, if possible, be based on plant phenology and the timing of a significant storm event (e. g., a 10mm or greater rain or multiple storm events of sufficient volume to trigger germination as determined by a qualified botanist.). If possible, surveys shall occur at the appropriate time to capture the characteristics necessary to identify the taxon. Construction is authorized to commence following a 2010 late season survey. 2. Surveyor Qualifications and Training. Surveys shall be conducted by a qualified botanist knowledgeable in the complex biology of the local flora, and consistent with CDFG (2009) and BLM (2009) guidelines for surveyor qualifications. Each surveyor shall be equipped with a GPS unit and record a complete tracklog; these data shall be compiled and submitted along with the Summer-Fall Survey Botanical Report (described below). Prior to the start of surveys, all crew members shall, at a minimum, visit reference sites (where available) and/or review herbarium specimens of all BLM Sensitive plants, CNPS List 1B or 2 (Nature Serve rank S1 and S2) or proposed List 1B or 2 taxa, and any new reported or documented taxa, to obtain a search image. Because the potential for range extensions is unknown, the list of potentially occurring special-status plants shall include all special-status taxa known to occur within the Sonoran Desert region and the eastern portion of the Mojave in California. The list shall also include taxa with bloom seasons that begin in fall and extend into the early spring as many of these are reported to be easier to detect in fall, following the start of the fall rains. 3. Survey Coverage. The survey coverage or intensity shall be in accordance with BLM Survey Protocols (issued July 2009)¹⁰, which specify that intuitive controlled surveys shall only be accomplished by botanists familiar with the habitats and species that may reasonably be expected to occur in the project area. 4. Pre-Construction Seed Collection. For all significant impacts to special-status plants, mitigation shall include seed collection from the affected special-status plants population on-site prior to construction to conserve the germplasm and provide a seed source for restoration efforts. Seed collection shall be conducted during the late-season surveys follow the guidelines described in Section D.III.3 of this condition. 5. Documenting Occurrences. If a special-status plant is detected, the full extent of the population onsite shall be recorded using GPS in accordance with BLM survey protocols. Additionally, the extent of the population within one mile of Project boundaries shall be assessed at least qualitatively to facilitate an accurate estimation of the proportion of the population affected by the Project. For populations that are very dense or very large, the population size may be estimated by simple sampling techniques. When populations are very extensive or locally abundant, the surveyor must provide some basis for this assertion and roughly map the extent on a topographic map. All but the smallest populations (e.g., a population occupying less than 100 square feet) shall be recorded as area polygons; the smallest populations may be recorded as point features. All GPS-recorded occurrences shall include: the number of plants, phenology, observed threats (e.g., OHV or invasive exotics), and habitat or community type. The map of occurrences submitted with the final botanical report shall be prepared to ensure consistency with definition of an occurrence by CNDDDB, i.e., occurrences found within 0.25 miles of another occurrence of the same taxon, and not separated by significant habitat discontinuities, shall be combined into a single 'occurrence'. The Project owner shall also submit the raw GPS shape files and metadata, and completed CNDDDB forms for each 'occurrence' (as defined by CNDDDB). 	<p>needed to accomplish the acquisition are transferred in timely manner to facilitate the planned acquisition and to ensure the land can be acquired and transferred prior to the 18-month deadline. If habitat enhancement is proposed, no later than six months following the start of ground-disturbing activities, the Project owner shall obtain CPM approval of the final Habitat Enhancement/Restoration Plan, prepared in accordance with Section D, and submit to the CPM or a third party approved by the CPM Security adequate for long-term implementation and monitoring of the Habitat Enhancement/Restoration Plan.</p> <p>Enhancement/restoration activities shall be initiated no later than 12 months from the start of construction. The implementation phase of the enhancement project shall be completed within five years of initiation. Until completion of the five-year implementation portion of the enhancement action, a report shall be prepared and submitted as part of the Annual Compliance Report. This report shall provide, at a minimum: a summary of activities for the preceding year and a summary of activities for the following year; quantitative measurements of the Project's progress in meeting the enhancement project success criteria; detailed description of remedial actions taken or proposed; and contact information for the responsible parties.</p> <p>If a contingency measure is required, as described in Section D.III of this condition, the Project owner shall submit commence no later than six months following the start of ground-disturbing activities. The draft study shall be submitted to the CPM and BLM State Botanist for review and approval no more than two years following the start of ground-disturbing activities. The final study shall be submitted no more than 30 months following the start of ground-disturbing activities. If a Distribution Study is implemented as contingency mitigation, the study shall be initiated no later than 6 months from the start of construction. The implementation phase of the study shall be completed within two years of the start of construction.</p> <p>Within 18 months of ground-disturbing activities, the Project owner shall transfer to the CPM or an approved third party the difference between the Security paid and the actual costs of (1) acquiring compensatory mitigation lands,</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>6 Reporting. Raw GPS data, metadata, and CNDDDB field forms shall be provided to the CPM and the BLM State Botanist within two weeks of the completion of each survey. If surveys are split into two or more periods (e.g., a late summer survey and a fall survey), then a summary letter shall be submitted following each survey period. The Final Summer-Fall Botanical Survey Report shall be prepared consistent with CDFG guidelines (CDFG 2009), and BLM 2009 guidelines and shall include all of the following components:</p> <ul style="list-style-type: none"> a. the BLM designation, NatureServe Global and State Rank of each species or taxon found (or proposed rank, or CNPS List); b. the number or percent of the occurrence that will be directly affected, and indirectly affected by changes in drainage patterns or altered geomorphic processes; c. the habitat or plant community that supports the occurrence and the total acres of that habitat or community type that occurs in the Project Disturbance Area; d. an indication of whether the occurrence has any local or regional significance (e.g., if it exhibits any unusual morphology, occurs at the periphery of its range in California, represents a significant range extension or disjunct occurrence, or occurs in an atypical habitat or substrate); e. a completed CNDDDB field form for every occurrence (occurrences of the same species within one-quarter mile or less of each other combined as one occurrence, consistent with CNDDDB methodology), and f. two maps: one that depicts the raw GPS data (as collected in the field) on a topographic base map with Project features; and a second map that follows the CNDDDB protocol for occurrence mapping. <p>Section C: Avoidance Requirements for Special-Status</p> <p><i>Plants Detected in the Summer/Fall 2010 Surveys</i></p> <p>The Project owner shall apply the following avoidance and mitigation standards for impacts to late blooming special-status plants that might be detected during late summer/fall season surveys. The Project owner shall immediately notify the CDFG, USFWS, BLM State Botanist, and the CPM if any State- or Federal-listed species or BLM Sensitive species are detected. Avoidance and/or the off-site mitigation measures described in Section D below would reduce impacts to these special-status plant species to less-than-significant levels. Plants shall be considered impacted if they are within the Project footprint, or if they would be affected by Project-related hydrologic changes or changes to the local sand transport system Downstream/ downwind impacts from altered hydrology or geomorphic processes shall be considered direct impacts.</p> <p>1. Mitigation for CNDDDB Rank 1-Equivalent Plants (Critically Imperiled). Species that are not federally or state listed but are CNDDDB Rank 1 plants first will be evaluated using all available data to determine if they meet the definition of a CNDDDB Rank 1 species (i.e., a Rank 1-equivalent species). If late blooming CNDDDB Rank 1-equivalent species are detected within the Project Disturbance Area, complete avoidance is mandatory along the linears and within construction laydown areas. The Project owner shall limit the width of the work area; adjusting the location of staging areas, lay downs, spur roads and poles or towers; driving and crushing vegetation as an alternative to blading temporary roads, and other construction or design modifications as necessary to achieve avoidance of any Rank 1-equivalent plants detected.</p> <p>If late-season Rank 1-equivalent plants are detected on the solar facility, the Project owner shall avoid all plants around the perimeter of the facility as necessary to achieve 75 percent avoidance of the local population of the affected species. The local population shall be measured by the number of individuals occurring on the Project Site and within</p>	<p>completing initial protection and habitat improvement, and funding the long-term maintenance and management of compensatory mitigation lands; and/or (2) implementing and providing for the long-term protection and monitoring of habitat enhancement or restoration activities.</p> <p>Implementation of the special-status plant impact avoidance and minimization measures shall be reported in the Monthly Compliance Reports prepared by the Designated Botanist. Within 30 days after completion of Project construction, the Project owner shall provide to the CPM, for review and approval, in consultation with the BLM State Botanist, a written construction termination report identifying how measures have been completed.</p> <p>The Project owner shall submit a monitoring report every year for the life of the project to monitor effectiveness of protection measures for all avoided special- status plants to the CPM and BLM State Botanist. The monitoring report shall include: dates of worker awareness training sessions and attendees, completed CNDDDB field forms for each avoided occurrence on-site and within 100 feet of the Project boundary off-site, and description of the remedial action, if warranted and planned for the upcoming year. The completed forms shall include an inventory of the special-status plant occurrences and description of the habitat conditions, an indication of population and habitat quality trends.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>the immediate watershed of the Project for wash dependent-species or species of unknown dispersal mechanism, or within the local sand transport corridor for wind dispersed species. Measurement of percent avoidance shall be based on population for perennials and on habitat for annuals (habitat containing the species' micro-habitat preferences, such as "fine silts and moist depressions"). Avoidance within the central portion of the solar facility is not recommended because it would create fragmented conditions that would not sustain persistence of the affected species. For all portions of the local population not avoided, the Project owner shall implement off-site mitigation at a ratio of 3:1. The off-site mitigation may include land acquisition or implementation of a restoration/enhancement program for the species, and shall meet the performance standards described in section D of this Condition. The Applicant must demonstrate, subject to review and approval by the CPM, that the impacts, after mitigation, will not cause a loss of viability for that species. The Project owner shall prepare and implement a Special-Status Plant Mitigation Plan (Plan). The content of the Plan and definitions shall be as described above in subsection C.3, below.</p> <p>2. Mitigation for CNDDDB Rank 2-Equivalent Plants (Imperiled). Species that are CNDDDB Rank plants first will be evaluated using all available data to determine if they meet the definition of a CNDDDB Rank 2 species (i.e., a Rank 2-equivalent species). If late-season CNDDDB Rank 2-equivalent species are detected within the Project Disturbance Area avoidance is mandatory along the linears and construction laydown areas, unless such avoidance would create greater environmental impacts in other resource areas (e.g., cultural resource sites). The Project owner shall limit the width of the work area, adjusting the location of staging areas, lay downs, spur roads and poles or towers; driving and crushing vegetation as an alternative to blading temporary roads, and other construction or design modifications as necessary to achieve avoidance of any Rank 2-equivalent plants detected.</p> <p>If late-season Rank 2-equivalent plants are detected on the solar facility, the Project owner shall implement off-site mitigation, at a ratio of 2:1, for any impacts exceeding 25 percent of the local population. The off-site mitigation may include land acquisition or implementation of a restoration/enhancement program for the species, and shall meet the performance standards described in section D of this Condition. The Project owner must demonstrate, subject to review and approval by the CPM, that the impacts, after mitigation, will not cause a loss of viability for that species. The Project owner shall prepare and implement a Special-Status Plant Mitigation Plan (Plan). The content of the Plan and definitions shall be as described above in subsection C.3, below.</p> <p>3. Mitigation for CNDDDB Rank 3-Equivalent Plants (Vulnerable). If CNDDDB Rank 3 plants are detected (which constitutes most CNPS List 4 plants), mitigation is not required unless the occurrence has local or regional significance, in which case the plant occurrence shall be treated as a CNDDDB Rank 2 plant if it meets the definition of a CNDDDB Rank 2 species; avoidance and mitigation would be as described above under C.2. A plant occurrence would be considered to have local or regional significance if:</p> <ol style="list-style-type: none"> It occurs at the outermost periphery of its range in California; It occurs in an atypical habitat, region, or elevation for the taxon that suggests that the occurrence may have genetic significance (e.g., that may increase its ability to survive future threats), or; It exhibits any unusual morphology that is not clearly attributable to environmental factors that may indicate a potential new variety or sub-species. <p>4. Prepare Special-Status Plant Mitigation Plan. If the project will impact any CNDDDB Rank 1-equivalent or Rank 2-equivalent plants, or Rank 3 plants of local or regional significance that also meet the definition of a CNDDDB Rank 2 species, or new taxa, the Project owner shall prepare and implement a Special-Status Plant Mitigation Plan (Plan).</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>Compensatory mitigation, as described in Section D of this condition, and at a mitigation ratio of 3:1 for Rank 1 plants, and 2:1 for Rank 2 plants and Rank 1 plants of local or regional significance, and new taxa. The Plan shall include, at a minimum, the following components and definitions:</p> <ul style="list-style-type: none"> a. A description of the occurrences of the affected special-status species, ecological characteristics such as soil, hydrology, and other micro-habitat requirements, ecosystem processes required for maintenance of the species or its habitat, reproduction and dispersal mechanisms, pollinators, local distribution, a description of the extent of the population off-site, the percentage of the local population affected, and a description of how these occurrences would be impacted by the Project, including direct and indirect effects. Occurrences shall be considered impacted if they are within the Project footprint, and if they would be affected by Project-related hydrologic changes or changes to the local sand transport system. b. A description of the avoidance and minimization measures that would achieve complete avoidance of occurrences on the Project linears and construction laydown areas. If avoidance is also required on the solar facility (Rank 1-equivalent species), provide a description of the measures that would be implemented to avoid or minimize impacts to occurrences on the solar facility. "Avoidance" shall include protection of the ecosystem processes essential for maintenance of the protected plant occurrence, and protection of the seed bank. Isolated 'islands' of protected plants disconnected by the Project from natural fluvial, aeolian (wind), or other processes essential for maintenance of the species, shall not be considered avoidance. c. If off-site mitigation is also required, pursuant to C.1 –C.3 above, the Plan shall include a description of the proposed mitigation (acquisition or restoration/enhancement) and demonstrate how the mitigation will meet the performance standards described in Section D of this condition. <p>For CNDDDB Rank 1-equivalent plants that cannot be avoided (i.e., plants located in the central portion of the solar facility), the Plan must demonstrate that the impacts (after mitigation) will not cause a loss of viability for that species. The assessment of viability shall include: <i>i</i>) current literature compilation and review on the affected species, it's documented and reported occurrences, range and distribution, habitat, and the ecological conditions needed to support it; <i>ii</i>) consultation with scientists and others with expertise and local knowledge of the species to gather unpublished data and other information to supplement the literature review findings, and (if available) <i>iii</i>) information on species' habitat relationships, demographics, genetics, and risk factors.</p> <p>Section D: Off-Site Compensatory Mitigation for Special- Status Plants</p> <p>Where compensatory mitigation is required under the terms of Section C, above, the Project owner shall mitigate Project impacts to special- status plant occurrences with compensatory mitigation. Compensatory mitigation shall consist of acquisition of habitat supporting the target species, or restoration/enhancement of populations of the target species, and shall meet the performance standards for mitigation described below. In the event that no opportunities for acquisition or restoration/enhancement exist, the Project owner can fund a species distribution study designed to promote the future preservation, protection or recovery of the species. Compensatory mitigation shall be at a ratio of 3:1 for Rank 1-equivalent plants, with three acres of habitat acquired or restored/enhanced for every acre of habitat occupied by the special status plant that will be disturbed by the Project Disturbance Area (for example if the area occupied by the special status plant collectively measured is 1/4 acre than the compensatory mitigation will be 3/4 of an acre). The mitigation ratio for Rank 2-equivalent plants shall be 2:1. So, for the example above, the mitigation ratio would be one-half acre for the Rank 2-equivalent plants.</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>The Project owner shall provide funding for the acquisition and/or restoration/enhancement, initial improvement, and long-term maintenance and management of the acquired or restored lands. The actual costs to comply with this condition will vary depending on the Project Disturbance Area, the actual costs of acquiring compensation habitat, the actual costs of initially improving the habitat, the actual costs of long-term management as determined by a Property Analysis Record (PAR) report, and other transactional costs related to the use of compensatory mitigation. The Project owner shall comply with other related requirements in this condition:</p> <p>I. Compensatory Mitigation by Acquisition: The requirements for the acquisition, initial protection and habitat improvement, and long-term maintenance and management of special-status plant compensation lands include all of the following:</p> <ol style="list-style-type: none"> 1. Selection Criteria for Acquisition Lands. The compensation lands selected for acquisition may include any of the following three categories: <ol style="list-style-type: none"> a. Occupied Habitat, No Habitat Threats. The compensation lands selected for acquisition shall be occupied by the target plant population and shall be characterized by site integrity and habitat quality that are required to support the target species, and shall be of equal or better habitat quality than that of the affected occurrence. The occurrence of the target special-status plant on the proposed acquisition lands should be viable, stable or increasing (in size and reproduction). b. Occupied Habitat, Habitat Threats. Occupied compensation lands characterized by habitat threats may also be acquired as long as the population could be reasonably expected to recover with habitat restoration efforts (e.g., OHV or grazing exclusion, or removal of invasive non-native plants) and is accompanied by a Habitat Enhancement/Restoration Plan as described in Section D.II, below. c. Unoccupied but Adjacent. The Project owner may also acquire habitat for which occupancy by the target species has not been documented, if the proposed acquisition lands are adjacent to occupied habitat. The Project owner shall provide evidence that acquisitions of such unoccupied lands would improve the defensibility and long-term sustainability of the occupied habitat by providing a protective buffer around the occurrence and by enhancing connectivity with undisturbed habitat. This acquisition may include habitat restoration efforts where appropriate, particularly when these restoration efforts will benefit adjacent habitat that is occupied by the target species. 2. Review and Approval of Compensation Lands Prior to Acquisition. The Project owner shall submit a formal acquisition proposal to the CPM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands for special-status plants in relation to the criteria listed above, and must be approved by the CPM. 3. Management Plan. The Project owner or approved third party shall prepare a management plan for the compensation lands in consultation with the entity that will be managing the lands. The goal of the management plan shall be to support and enhance the long-term viability of the target special-status plant occurrences. The Management Plan shall be submitted for review and approval to the CPM. 4. Integrating Special-Status Plant Mitigation with Other Mitigation lands. If all or any portion of the acquired Desert Tortoise, Waters of the State, or other required compensation lands meets the criteria above for special-status plant compensation lands, the portion of the other species' or habitat compensation lands that meets any of the criteria above may be used to fulfill that portion of the obligation for special-status plant mitigation. 		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>5. Compensation Lands Acquisition Requirements. The Project owner shall comply with the following requirements relating to acquisition of the compensation lands after the CPM, has approved the proposed compensation lands:</p> <ul style="list-style-type: none"> a. Preliminary Report. The Project owner, or an approved third party, shall provide a recent preliminary title report, initial hazardous materials survey report, biological analysis, and other necessary or requested documents for the proposed compensation land to the CPM. All documents conveying or conserving compensation lands and all conditions of title are subject to review and approval by the CPM. For conveyances to the State, approval may also be required from the California Department of General Services, the Fish and Game Commission and the Wildlife Conservation Board. b. Title/Conveyance. The Project owner shall acquire and transfer fee title to the compensation lands, a conservation easement over the lands, or both fee title and conservation easement, as required by the CPM. Any transfer of a conservation easement or fee title must be to CDFG, a non-profit organization qualified to hold title to and manage compensation lands (pursuant to California Government Code section 65965), or to BLM or other public agency approved by the CPM. If an approved non-profit organization holds fee title to the compensation lands, a conservation easement shall be recorded in favor of CDFG or another entity approved by the CPM. If an entity other than CDFG holds a conservation easement over the compensation lands, the CPM may require that CDFG or another entity approved by the CPM, in consultation with CDFG, be named a third party beneficiary of the conservation easement. The Project owner shall obtain approval of the CPM of the terms of any transfer of fee title or conservation easement to the compensation lands. c. Initial Protection and Habitat Improvement. The Project owner shall fund activities that the CPM requires for the initial protection and habitat improvement of the compensation lands. These activities will vary depending on the condition and location of the land acquired, but may include trash removal, construction and repair of fences, invasive plant removal, and similar measures to protect habitat and improve habitat quality on the compensation lands. The costs of these activities would use the estimated cost per acre for Desert Tortoise mitigation as a best available proxy, at the ratio of 3:1 for Rank 1-equivalent plants and 2:1 for Rank 2-equivalent plants, but actual costs will vary depending on the measures that are required for the compensation lands. A non-profit organization, CDFG or another public agency may hold and expend the habitat improvement funds if it is qualified to manage the compensation lands (pursuant to California Government Code section 65965), if it meets the approval of the CPM in consultation with CDFG, and if it is authorized to participate in implementing the required activities on the compensation lands. If CDFG takes fee title to the compensation lands, the habitat improvement fund must be paid to CDFG or its designee. d. Property Analysis Record. Upon identification of the compensation lands, the Project owner shall conduct a Property Analysis Record (PAR) or PAR-like analysis to establish the appropriate amount of the long-term maintenance and management fund to pay the in-perpetuity management of the compensation lands. The PAR or PAR-like analysis must be approved by the CPM before it can be used to establish funding levels or management activities for the compensation lands. e. Long-term Maintenance and Management Funding. The Project owner shall deposit in NFWF's REAT Account a capital long-term maintenance and management fee in the amount determined through the Property Analysis Record (PAR) or PAR-like analysis conducted for the compensation lands. 		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>The CPM, in consultation with CDFG, may designate another non-profit organization to hold the long-term maintenance and management fee if the organization is qualified to manage the compensation lands in perpetuity. If CDFG takes fee title to the compensation lands, CDFG shall determine whether it will hold the long-term management fee in the special deposit fund, leave the money in the REAT Account, or designate another entity to manage the long-term maintenance and management fee for CDFG and with CDFG supervision. Interest, Principal, and Pooling of Funds. The Project owner shall ensure that an agreement is in place with the long-term maintenance and management fund (endowment) holder/manager to ensure the following requirements are met:</p> <ul style="list-style-type: none"> i. Interest. Interest generated from the initial capital long-term maintenance and management fund shall be available for reinvestment into the principal and for the long-term operation, management, and protection of the approved compensation lands, including reasonable administrative overhead, biological monitoring, improvements to carrying capacity, law enforcement measures, and any other action that is approved by the CPM and is designed to protect or improve the habitat values of the compensation lands. ii. Withdrawal of Principal. The long-term maintenance and management fund principal shall not be drawn upon unless such withdrawal is deemed necessary by the CPM or by the approved third-party long-term maintenance and management fund manager, to ensure the continued viability of the species on the compensation lands. iii. Pooling Long-Term Maintenance and Management Funds. An entity approved to hold long-term maintenance and management funds for the Project may pool those funds with similar funds that it holds from other projects for long-term maintenance and management of compensation lands for special-status plants. However, for reporting purposes, the long-term maintenance and management funds for this Project must be tracked and reported individually to the CPM. f. Other Expenses. In addition to the costs listed above, the Project owner shall be responsible for all other costs related to acquisition of compensation lands and conservation easements, including but not limited to the title and document review costs incurred from other state agency reviews, overhead related to providing compensation lands to CDFG or an approved third party, escrow fees or costs, environmental contaminants clearance, and other site cleanup measures. g. Mitigation Security. The Project owner shall provide financial assurances to the CPM to guarantee that an adequate level of funding is available to implement any of the mitigation measures required by this condition that are not completed prior to the start of ground-disturbing Project activities. Financial assurances shall be provided to the CPM in the form of an irrevocable letter of credit, a pledged savings account or another form of security ("Security") approved by the CPM. The amount of the Security shall use the estimated cost per acre for Desert Tortoise mitigation as a best available proxy, at a ratio of 3:1 for Rank 1 plants and 2:1 for Rank 2 plants, for every acre of habitat supporting the target special-status plant species which is significantly impacted by the project. The actual costs to comply with this condition will vary depending on the actual costs of acquiring compensation habitat, the costs of initially improving the habitat, and the actual costs of long-term management as determined by a PAR report. Prior to submitting the Security to the CPM, the Project owner shall obtain the CPM's approval of the form of the Security. The CPM may draw on the Security if the CPM determines the Project owner has failed to comply with the requirements specified in this condition. The CPM may use money from the Security solely for implementation of the requirements of this condition. The CPM's use of the Security to implement measures in this condition may not fully satisfy the Project owner's obligations under this condition, and the Project owner remains responsible for satisfying the obligations under this condition if the Security is insufficient. The unused Security shall be returned to the Project owner in whole or in part upon successful completion of the associated requirements in this condition. 		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>h. NFWF REAT Account. The Project owner may elect to comply with the requirements in this condition for acquisition of compensation lands, initial protection and habitat improvement on the compensation lands, or long-term maintenance and management of the compensation lands by funding, or any combination of these three requirements, by providing funds to implement those measures into the Renewable Energy Action Team (REAT) Account established with the National Fish and Wildlife Foundation (NFWF). To use this option, the Project owner must make an initial deposit to the REAT Account in an amount equal to the estimated costs (as set forth in the Security section of this condition) of implementing the requirement. If the actual cost of the acquisition, initial protection and habitat improvements, or long-term funding is more than the estimated amount initially paid by the Project owner, the Project owner shall make an additional deposit into the REAT Account sufficient to cover the actual acquisition costs, the actual costs of initial protection and habitat improvement on the compensation lands, and the long-term funding requirements as established in an approved PAR or PAR-like analysis. If those actual costs or PAR projections are less than the amount initially transferred by the Applicant, the remaining balance shall be returned to the Project owner.</p> <p>The responsibility for acquisition of compensation lands may be delegated to a third party other than NFWF, such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission. Such delegation shall be subject to approval by the CPM, in consultation with CDFG, BLM and USFWS, prior to land acquisition, enhancement or management activities. Agreements to delegate land acquisition to an approved third party, or to manage compensation lands, shall be executed and implemented within 18 months of the start of ground disturbance.</p> <p>II. Compensatory Mitigation by Habitat Enhancement/Restoration: As an alternative or adjunct to land acquisition for compensatory mitigation the Project owner may undertake habitat enhancement or restoration for the target special-status plant species. Habitat enhancement or restoration activities must achieve protection at a 3:1 ratio for Rank 1 plants and 2:1 for Rank 2 plants, with improvements applied to three acres, or two acres, respectively, of habitat for every acre special-status plant habitat directly or indirectly disturbed by the Project Disturbance Area (for example if the area occupied by the special status plant collectively measured is 1/4 acre than the improvements would be applied to an area equal to 3/4 of an acre at a 3:1 ratio, or one-half acre at a 2:1 ratio). Examples of suitable enhancement projects include but are not limited to the following: i) control unauthorized vehicle use into an occurrence (or pedestrian use if clearly damaging to the species); ii) control of invasive non-native plants that infest or pose an immediate threat to an occurrence; iii) exclude grazing by wild burros or livestock from an occurrence; or iv) restore lost or degraded hydrologic or geomorphic functions critical to the species by restoring previously diverted flows, removing obstructions to the wind sand transport corridor above an occurrence, or increasing groundwater availability for dependent species.</p> <p>If the Project owner elects to undertake a habitat enhancement project for mitigation, the project must meet the following performance standards: The proposed enhancement project shall achieve rescue of an off-site occurrence that is currently assessed, based on the NatureServe threat ranking system¹⁷ with one of the following threat ranks: a) long-term decline >30%; b) an immediate threat that affects >30% of the population, or c) has an overall threat impact that is High to Very High. "Rescue" would be considered successful if it achieves an improvement in the occurrence trend to "stable" or "increasing" status, or downgrading of the overall threat rank to slight or low (from "High" to "Very High").</p> <p>If the Project owner elects to undertake a habitat enhancement project for mitigation, they shall submit a Habitat Enhancement/Restoration Plan to the CPM for review and approval, and shall provide sufficient funding for implementation and monitoring of the Plan. The amount of the Security shall use the estimated cost per acre for Desert Tortoise mitigation as a best available proxy, at the ratio of 3:1 for Rank 1 plants and 2:1 for Rank 2 plants, for every acre of habitat supporting the target special-status plant species which is directly or indirectly impacted by the project. The amount of the security may be adjusted based on the actual costs of implementing the enhancement, restoration and monitoring. The</p>		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>implementation and monitoring of the enhancement/restoration may be undertaken by an appropriate third party such as NFWF, subject to approval by the CPM. The Habitat Enhancement/Restoration Plan shall include each of the following:</p> <ol style="list-style-type: none"> 1. Goals and Objectives. Define the goals of the restoration or enhancement project and a measurable course of action developed to achieve those goals. The objective of the proposed habitat enhancement plan shall include restoration of a target special- status plant occurrence that is currently threatened with a long-term decline. The proposed enhancement plan shall achieve an improvement in the occurrence trend to “stable” or “increasing” status, or downgrading of the overall threat rank to slight or low (from “High” to “Very High”). 2. Historical Conditions. Provide a description of the pre-impact or historical conditions (before the site was degraded by weeds or grazing or ORV, etc.), and the desired conditions. 3. Site Characteristics. Describe other site characteristics relevant to the restoration or enhancement project (e.g., composition of native and pest plants, topography and drainage patterns, soil types, geomorphic and hydrologic processes important to the site or species. 4. Ecological Factors. Describe other important ecological factors of the species being protected, restored, or enhanced such as total population, reproduction, distribution, pollinators, etc. 5. Methods. Describe the restoration methods that will be used (e.g., invasive exotics control, site protection, seedling protection, propagation techniques, etc.) and the long-term maintenance required. The implementation phase of the enhancement must be completed within five years. 6. Budget. Provide a detailed budget and time-line, and develop clear, measurable, objective-driven annual success criteria. 7. Monitoring. Develop clear, measurable monitoring methods that can be used to evaluate the effectiveness of the restoration and the benefit to the affected species. The Plan shall include a minimum of five years of quarterly monitoring, and then annual monitoring for the remainder of the enhancement project, and until the performance standards for rescue of a threatened occurrence are met. At a minimum the progress reports shall include: quantitative measurements of the projects progress in meeting the enhancement project success criteria, detailed description of remedial actions taken or proposed, and contact information for the responsible parties. 8. Reporting Program. The Plan shall ensure accountability with a reporting program that includes progress toward goals and success criteria. Include names of responsible parties. 9. Contingency Plan. Describe the contingency plan for failure to meet annual goals. 10. Long-term Protection. Include proof of long-term protection for the restoration site. For private lands this would include conservations easements or other deed restrictions; projects on public lands must be contained in a Desert Wildlife Management Area, Wildlife Habitat Management Area, or other land use protections that will protect the mitigation site and target species. <p>III. Contingency Measures:</p> <ol style="list-style-type: none"> 1. Preservation of the Germplasm of Affected Special-Status Plants. For all significant impacts to special-status plants, mitigation shall also include seed collection from the affected special-status plants population on-site prior to construction to conserve the germplasm and provide a seed source for restoration efforts. The seed shall be collected under the supervision or guidance of a reputable seed storage facility such as the Rancho Santa Ana Botanical Garden Seed Conservation Program, San Diego Natural History Museum, or the Missouri Botanical Garden. The costs 		

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>associated with the long-term storage of the seed shall be the responsibility of the Project owner. Any efforts to propagate and reintroduce special- status plants from seeds in the wild shall be carried out under the direct supervision of specialists such as those listed above and as part of a Habitat Restoration/Enhancement Plan approved by the CPM.</p> <p>2. Compensatory Mitigation by Conducting or Contributing to a Management Plan for the Affected Species. Subject to approval of the CPM, as a contingency measure in the event there are no opportunities for mitigation through acquisition or restoration/enhancement to meet the obligations for off-site mitigation as described in Section C.1-3 of this condition, a Management Plan for the affected special-status plant species may be conducted or funded. The goal of the Management Plan is to devise a science-based, region-wide strategy to ensure the long- term viability of the affected species, and to acquire, protect, and restore existing populations and the habitat that supports them. The information gathered shall be used to develop conservation approaches to address the identified risk factors. These approaches include land allocations, restoration needs, identifying and preserving important refugia to facilitate species dispersal and maintain biodiversity in the face of climate change, recommending Best Management Practices or other measures that could be used to minimize threats, and identifying planning needs at the regional level. The results of the study would also be provided to the resource agencies, conservation organizations, and academic institutions, as well as the state’s Natural Diversity Database and Consortium of California Herbaria.</p> <p>3. Under this contingency measure, the Project owner shall acquire all available information on the distribution, status or health of known occurrences, ecological requirements, and ownership and management opportunities of the affected special-status plant species and other special status plants known to occur in the Chuckwalla Valley. Some of these late blooming species are only known from a few viable occurrences in California, and historic occurrences that have not been re-located or surveyed since they were first documented. At a minimum, the study shall include the following:</p> <p>a. Occurrence and Life History Review. The Study shall include an evaluation of all documented, historical and reported localities for the affected species, and a review of current information on the species life history. This would include a review of the CNDDDB database, records from regional and national herbaria, literature review, consultation with U.C. Riverside, San Diego Natural History Museum, and other educational institutions or natural heritage organizations in California, Arizona, and Nevada, etc.), other biotechnical survey reports from the region, and information from regional botanical experts.</p> <p>b. Conduct Site Visits to Documented and Reported Localities. Documented and reported occurrences would be evaluated in the field during the appropriate time of the year for each late blooming species. If located, these occurrences would be evaluated for population size (area and quantity), population trend, ecological characteristics, soils, habitat quality, potential threats, degree and immediacy of threats, ownership and management opportunities. GPS location data would also be collected during these site visits.</p> <p>c. Survey Surrounding Areas. Areas surrounding the occurrences that contain habitat suitable to support the affected species shall be surveyed to determine the full extent of its range and distribution. If additional populations are found, collect data (GPS and assessment) on these additional populations consistent with III.2 above.</p> <p>d. Prepare Report on Status, Distribution, and Management Needs. A report shall be prepared that contains the results of the surveys and assessment. The report shall contain the following components: a) Range and Distribution (including maps and GPS data); b) Abundance and Population Trends; c) Life History; d) Habitat Necessary for Survival; d) Factors Affecting Ability to Survive and Reproduce; e) Degree and Immediacy of Threat; f) Ownership and Management Opportunities for Protection or Recovery; g) Sources of Information, and g) Conclusions. The conclusions shall contain an explanation of whether the species’ survival is threatened by any of the following factors: i) present or threatened modification or destruction of its habitat; ii) competition; iii) disease; iv) other natural</p>

BIOLOGICAL RESOURCES (cont.)		
<p>occurrences (such as climate change) or human-related activities. This valuable information will provide a better understanding of the ecological factors driving the distribution of these species, and will identify opportunities for mitigation and management opportunities for recovery. All data from this study will be submitted for incorporation into the CNDDDB system and the study report will be made available to resource agencies, and conservation groups, and other interested parties.</p> <p>e. The cost to implement or fund the study shall be no greater than the cost for acquisition, enhancement, and long-term management of compensatory mitigation lands based on the specifications and standards for acquisition or restoration/enhancement described above under D.I and D.II.</p>		
<p>BIO-20, Sand Dune/Mojave Fringe-Toed Lizard Mitigation: To mitigate for habitat loss and direct impacts to Mojave fringe-toed lizards the Project owner shall provide compensatory mitigation, which may include compensation lands purchased in fee or in easement in whole or in part, at the following ratios:</p> <p>3:1 mitigation for direct impacts to stabilized and partially stabilized sand dunes (per BIO-29 – Table 2 or final acreage impacted by the Project footprint);</p> <p>1:1 mitigation for direct impacts non-dune Mojave fringe-toed lizard habitat (per BIO-29 – Table 2 or final acreage impacted by the Project footprint); and</p> <p>0.5:1 mitigation for indirect impacts to stabilized and partially stabilized sand dunes (per BIO-29 – Table 2 or final acreage impacted by the Project footprint).</p> <p>If compensation lands are acquired, the Project owner shall provide funding for the acquisition in fee title or in easement, initial habitat improvements, and long-term maintenance and management of the compensation lands. In addition, the compensation lands must include, at a minimum, the number acres of stabilized and partially stabilized sand dune habitat shown in BIO-29 Table 2 (see 2010 CEC PSPP Commission Decision, pp. 142 – 143).</p> <p>1. Criteria for Compensation Lands: The compensation lands selected for acquisition shall:</p> <ol style="list-style-type: none"> Provide suitable habitat for Mojave fringe-toed lizards, and, aside from the minimum amount of stabilized and partially stabilized sand dunes, may include stabilized and partially stabilized desert dunes, sand drifts over playas, or Sonoran creosote bush scrub; Be within the Palen or Chuckwalla valleys with potential to contribute to Mojave fringe-toed lizard habitat connectivity and build linkages between known populations of Mojave fringe-toed lizards and preserve lands with suitable habitat; Be prioritized near larger blocks of lands that are either already protected or planned for protection, or which could feasibly be protected long-term by a public resource agency or a non- governmental organization dedicated to habitat preservation; Provide quality habitat for Mojave fringe-toed lizard that has the capacity to regenerate naturally when disturbances are removed; Not have a history of intensive recreational use or other disturbance that might make habitat recovery and restoration infeasible; Not be characterized by high densities of invasive species, either on or immediately adjacent to the parcels under consideration, that might jeopardize habitat recovery and restoration; 	<p>No later than 30 days prior to beginning Project ground-disturbing activities, the Project owner shall provide written verification of an approved form of Security in accordance with this condition of certification. Actual Security shall be provided no later than 7 days prior to the beginning of Project ground- disturbing activities for each Project phase as described in BIO-29. The Project owner, or an approved third party, shall complete and provide written verification of the proposed compensation lands acquisition within 18 months of the start of Project ground-disturbing activities for each Project phase.</p> <p>No less than 90 days prior to acquisition of the property, the Project owner shall submit a formal acquisition proposal to the CPM, CDFG, and USFWS describing the parcels intended for purchase.</p> <p>The Project owner, or an approved third party, shall provide the CPM, BLM, and CDFG, with a management plan for the compensation lands and associated funds within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan, in consultation with BLM and CDFG.</p> <p>Within 90 days after completion of Project construction, the Project owner shall provide to the CPM and CDFG an analysis with the final accounting of the amount (detailed by habitat type) of Mojave fringe-toed lizard habitat disturbed during Project construction.</p> <p>The Project owner shall provide written verification to the CPM, and CDFG that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient no later than 18 months from the start of ground-disturbing activities.</p>	<p>CEC</p>

BIOLOGICAL RESOURCES (cont.)		
<p>g. Not contain hazardous wastes that cannot be removed to the extent the site is suitable for habitat;</p> <p>h. Have water and mineral rights included as part of the acquisition, unless the CPM, in consultation with CDFG, BLM and USFWS, agrees in writing to the acceptability of the land; and</p> <p>i. Be on land for which long-term management is feasible.</p> <p>2. Security for Implementation of Mitigation: The Project owner shall provide financial assurances to the CPM to guarantee that an adequate level of funding is available to implement the acquisitions and enhancement of Mojave fringe-toed lizard habitat as described in this condition. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the CPM according to the measures outlined in BIO-12, and within the time period specified for this assurance (see the verification section at the end of this condition). The final amount due will be determined by an updated appraisal and a PAR analysis conducted as described in BIO-12, but current estimates are included in Biological Resources Tables 22 and 23 located at the beginning of the conditions of certification subsection (see 2010 CEC PSPP Revised Staff Assessment, Part II, pp. C.2-250 – C.2-251).</p> <p>3. Preparation of Management Plan: The Project owner shall submit to the CPM, BLM, and CDFG a draft Management Plan that reflects site-specific enhancement measures for the Mojave fringe-toed lizard habitat on the acquired compensation lands. The objective of the Management Plan shall be to enhance the value of the compensation lands for Mojave fringe-toed lizards, and may include enhancement actions such as weed control, fencing to exclude livestock, erosion control, or protection of sand sources or sand transport corridors.</p>		
<p>BIO-21, Mitigation for Impacts to State Waters: The Project owner shall implement the following measures to avoid, minimize and mitigate for direct and indirect impacts to waters of the state and to satisfy requirements of California Fish and Game Code sections 1600 and 1607.</p> <p>1. Acquire Off-Site State Waters: The Project owner shall acquire, in fee or in easement, a parcel or parcels of land that includes state jurisdictional waters per BIO-29 – Table 2 (see 2010 CEC PSPP Commission Decision, pp. 142 – 143), or the area of state waters directly or indirectly impacted by the final Project footprint. The Project footprint means all lands disturbed by construction and operation of the Palen Project, including all linears. The parcel or parcels comprising the ephemeral washes shall include desert dry wash woodland per BIO-29 – Table 2, or the acreage of desert dry wash woodland impacted by the final Project footprint at a 3:1 ratio. The terms and conditions of this acquisition or easement shall be as described in Condition of Certification BIO 12, and the timing associated with BIO-29 (phasing). The current estimated costs are included in BIO-29 – Table 3 (see 2010 CEC PSPP Commission Decision, p. 143, which would be updated to reflect current costs) located at the beginning of the Conditions of Certification subsection. Mitigation for impacts to state waters shall occur within the Chuckwalla, East Salton Sea, Hayfield, Rice, or portion of Whitewater within the NECO, Hydrologic Units (HUs) or the Palo Verde Watershed and be prioritized within the Chuckwalla HU in the Palen or adjacent watersheds.</p> <p>2. Security for Implementation of Mitigation: The Project owner shall provide financial assurances to the CPM and CDFG to guarantee that an adequate level of funding is available to implement the acquisitions and enhancement of state waters as described in this condition. These funds shall be used solely for implementation of the measures associated with the Project. Financial assurance can be provided to the CPM and CDFG in the form of an irrevocable letter of credit, a pledged savings account or Security prior to initiating ground-disturbing Project activities. Prior to submittal to the CPM, the Security shall be approved by the CPM, in consultation with CDFG, to ensure funding. The final amount due shall be determined by updated appraisals and the PAR analysis conducted pursuant to BIO-12.</p>	<p>No less than 30 days prior to the start of construction-related ground disturbance activities potentially affecting waters of the state, the Project owner shall provide written verification (i.e., through incorporation into the BRMIMP) to the CPM that the above best management practices will be implemented. The Project owner shall also provide a discussion of work in waters of the state in Annual Compliance Reports for the duration of the Project.</p> <p>No less than 30 days prior to beginning of Project ground-disturbing activities for each project phase as described in BIO-29, the Project owner shall provide to the CPM design drawings demonstrating how pre-development drainage patterns (location and volume of flows) to drainages downstream of the Project boundaries will be unaffected. At the same time the Project owner shall provide design drawings for temporary and permanent stream crossings.</p> <p>No less than 30 days prior to beginning Project ground-disturbing activities, the Project owner shall provide the form of Security in accordance with this condition of certification. No later than 7 days prior to beginning Project ground-disturbing activities, the Project owner shall provide written verification of the actual Security. The Project owner, or an</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>3. Preparation of Management Plan: The Project owner shall submit to the CPM and CDFG a draft Management Plan that reflects site- specific enhancement measures for the drainages on the acquired compensation lands. The objective of the Management Plan shall be to enhance the wildlife value of the drainages, and may include enhancement actions such as weed control, fencing to exclude livestock, or erosion control. 4. Code of Regulations: The Project owner shall provide a copy of this condition (Condition of Certification BIO-21) from the Energy Commission Decision to all contractors, subcontractors, and the Applicant's Project supervisors. Copies shall be readily available at work sites at all times during periods of active work and must be presented to any CDFG personnel upon demand. The CPM reserves the right to issue a stop work order or allow CDFG to issue a stop work order after giving notice to the Project owner and the CPM, if the CPM in consultation with CDFG, determines that the Project owner has breached any of the terms or conditions or for other reasons, including but not limited to the following:</p> <ul style="list-style-type: none"> a. The information provided by the Applicant regarding impacts to waters of the state is incomplete or inaccurate; b. New information becomes available that was not known in preparing the terms and conditions; or c. The Project or Project activities as described in the Revised Staff Assessment have changed. <p>5. Road Crossings at Streams. The Project owner shall preserve pre- development downstream flows and sediment transport in washes crossed by permanent roads by incorporating culverts and Arizona crossings at stream crossings. Arizona crossings are the preferred option and shall be employed wherever such crossings do not present a safety hazard and where the roadbed elevation allows the construction of such crossings. Drainages that have been graded for temporary construction access shall be restored to original contours and surface drainage patterns and shall be revegetated according to specifications in BIO-8.</p> <p>6. Best Management Practices: The Project owner shall also comply with the following conditions to protect drainages near the Project Disturbance Area:</p> <ul style="list-style-type: none"> a. The Project owner shall minimize road building, construction activities and vegetation clearing within ephemeral drainages to the extent feasible. b. The Project owner shall not allow water containing mud, silt, or other pollutants from grading, aggregate washing, or other activities to enter ephemeral drainages or be placed in locations that may be subjected to high storm flows. c. The Project owner shall comply with all litter and pollution laws. All contractors, subcontractors, and employees shall also obey these laws, and it shall be the responsibility of the Project owner to ensure compliance. d. Spoil sites shall be located at least 30 feet from the boundaries and drainages or in locations that may be subjected to high storm flows, where spoils might be washed back into drainages. e. Raw cement/concrete or washings thereof, asphalt, paint or other coating material, oil or other petroleum products, or any other substances that could be hazardous to vegetation or wildlife resources, resulting from Project-related activities, shall be prevented from contaminating the soil and/or entering waters of the state. These materials, placed within or where they may enter a drainage, shall be removed immediately. f. No broken concrete, debris, soil, silt, sand, bark, slash, sawdust, rubbish, cement or concrete or washings thereof, oil or petroleum products or other organic or earthen material from any construction or associated activity of whatever nature shall be allowed to enter into, or placed where it may be washed by rainfall or runoff into, waters of the state. 	<p>approved third party, shall complete and provide written verification of the proposed compensation lands acquisition within 18 months of the start of Project ground-disturbing activities.</p> <p>The Project owner, or an approved third party, shall provide the CPM, BLM, CDFG, and USFWS with a management plan for the compensation lands and associated funds within 180 days of the land or easement purchase, as determined by the date on the title. The CPM shall review and approve the management plan, in consultation with CDFG and the USFWS.</p> <p>Within 90 days after completion of Project construction, the Project owner shall provide to the CPM, BLM, USFWS, and CDFG an analysis with the final accounting of the amount of jurisdictional state waters disturbed during Project construction.</p> <p>The Project owner shall provide written verification to the CPM, BLM, USFWS and CDFG that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient no later than 18 months of the start of Project ground-disturbing activities.</p> <p>The Project owner shall notify the CPM and CDFG, in writing, at least five days prior to initiation of Project ground-disturbing activities in jurisdictional state waters and at least five days prior to completion of Project activities in jurisdictional areas. The Project owner shall notify the CPM and CDFG of any change of conditions to the Project, impacts to state waters, or the mitigation efforts.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>g. When operations are completed, any excess materials or debris shall be removed from the work area. No rubbish shall be deposited within 150 feet of the high water mark of any drainage.</p> <p>h. No equipment maintenance shall occur within 150 feet of any ephemeral drainage where petroleum products or other pollutants from the equipment may enter these areas under any flow.</p> <p>7. Changes of Conditions. A notifying report shall be provided to the CPM and CDFG if a change of conditions is identified. As used here, change of condition refers to the process, procedures, and methods of operation of a Project; the biological and physical characteristics of a Project area; or the laws or regulations pertinent to the Project as defined below. A copy of the notifying change of conditions report shall be included in the annual reports or until it is deemed unnecessary by the CPM, in consultation with CDFG.</p> <p>a. Biological Conditions: a change in biological conditions includes, but is not limited to, the following: 1) the presence of biological resources within or adjacent to the Project area, whether native or non-native, not previously known to occur in the area; or 2) the presence of biological resources within or adjacent to the Project area, whether native or non-native, the status of which has changed to endangered, rare, or threatened, as defined in section 15380 of Title 14 of the California Code of Regulations.</p> <p>b. Physical Conditions: a change in physical conditions includes, but is not limited to, the following: 1) a change in the morphology of a river, stream, or lake, such as the lowering of a bed or scouring of a bank, or substantial changes in stream form and configuration caused by storm events; 2) the movement of a river or stream channel to a different location; 3) a reduction of or other change in vegetation on the bed, channel, or bank of a drainage, or 4) changes to the hydrologic regime such as fluctuations in the timing or volume of water flows in a river or stream.</p> <p>c. Legal Conditions: a change in legal conditions includes, but is not limited to, a change in Regulations, Statutory Law, a Judicial or Court decision, or the listing of a species, the status of which has changed to endangered, rare, or threatened, as defined in section 15380 of Title 14 of the California Code of Regulations.</p>		
<p>BIO-22, Decommissioning and Reclamation Plan: Upon Project closure the Project owner shall implement a final Decommissioning and Reclamation Plan. The Decommissioning and Reclamation Plan shall include a cost estimate for implementing the proposed decommissioning and reclamation activities, and shall be consistent with the guidelines in BLM's 43 CFR 3809.550 et seq.</p>	<p>No fewer than 30 days prior to the start of Project-related ground disturbing activities or alternate date as agreed to with the BLM, the Project owner shall provide to the CPM (for review) and BLM (for review and approval) a draft Decommissioning and Reclamation Plan. The plan shall be finalized prior to the start of commercial operation and reviewed every five years thereafter and submitted to the CPM for review and to the BLM for approval. Modifications to the approved Decommissioning and Reclamation Plan shall be made only after approval from the BLM. The Project owner shall provide a copy of the approved Decommissioning and Reclamation Plan and any BLM approved revisions to the CPM.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>BIO-23, Groundwater-Dependent Vegetation Monitoring: The Project owner shall prepare a Groundwater-Dependent Vegetation Monitoring Plan for monitoring the Project effects of groundwater pumping on groundwater dependent vegetation. The monitoring shall encompass the area depicted in <i>Figure Soil and Water-3 (Project Only Revised Operational Water Supply End of 30 Years)</i> within the 0.1-foot drawdown polygon of the Model Predicted Drawdown (Galati & Blek 2010i). The vegetation and groundwater data collected as part of the Plan shall be used to determine if remedial action is required, as described in BIO-24.</p> <p>The Project owner may forgo development of a Groundwater Dependent Vegetation Monitoring Plan, or may cease implementation of such a plan, by providing evidence to the CPM that the source of water for the GDEs is a shallow perched water-bearing zone rather than the regional groundwater system and that the shallow perched water-bearing zone is unrelated and not influenced by the regional groundwater system that the Project owner proposes to use for water as described below under 15a – 15d.</p> <p>The Project owner shall develop and implement a Groundwater- Dependent Vegetation Monitoring Plan (Plan) that meets the performance standards described below and includes the following components:</p> <ol style="list-style-type: none"> 1. Monitoring Objectives and Performance Standards. The objectives of the Plan shall be to monitor the Project effects of groundwater pumping on vegetation and groundwater-dependent ecosystems (GDEs) and, in conjunction with the remedial action described in BIO-24, to ensure that the Project groundwater pumping has a less than significant effect on biological resources. Monitoring shall be conducted at a level of detail adequate for detecting adverse effects, as reflected in vegetation attributes and groundwater levels in the shallow (alluvial) aquifer. The baseline for groundwater levels shall be the lowest baseline water level as measured at the Project site prior to the start of groundwater pumping. 2. Location of Monitoring Plots. The monitoring plots shall be established within the area depicted in <i>Figure Soil and Water -3 (Project Only Revised Operational Water Supply End of 30 Years)</i> within the Model Predicted Drawdown showing the 0.1-foot drawdown polygon (Galati & Blek 2010i). The majority of the plots shall be in the area north and east of the Project site, where groundwater-dependent ecosystems (GDEs) and the intersection of the ground surface and shallow groundwater are located, in the topographic lows in the valley. 3. Monitoring Plots and Controls. Because of the variation in vegetation types and depth to groundwater within the predicted groundwater drawdown zone, the study design shall treat the monitoring plot with a corresponding control plot as a pair (versus comparing the mean of all treatment plots to the mean of all control plots). The “control” plots shall consist of the data collected at the same plot during the baseline (pre-disturbance) monitoring for a pre-disturbance vs. post-disturbance comparison. Appropriate statistical methods shall be used to analyze the differences between the control and monitoring plots (for example, a one-tailed paired-sample statistical test (Manly 2008)18). 4. Off-Site Reference Plots: Off-site monitoring plots shall be established as reference sites to distinguish changes in plant vigor seen at the site from the effects of a region-wide drought. The off- site reference plots can be located within Chuckwalla Valley but shall be within areas that would not be affected hydrologically by groundwater pumping for the Project or other projects or agricultural operations. Off-site monitoring reference plots shall be located in the same general hydrologic and geologic setting (i.e., playa margins), in the same climatic region (Sonoran Desert region of California), and contain the same natural communities or vegetation alliances as those to which they are being compared. Impacts from pests and diseases, if present, must also be considered and excluded or adjusted for as part of the analysis. Data on climate and surface runoff in the study area shall be collected to identify “drought” conditions and correlate groundwater changes and weather changes. 	<p>At least 30 days prior to operation of project pumping wells, the Project owner shall submit to the CPM and BLM for review and approval a draft Groundwater-Dependent Vegetation Monitoring Plan (Plan). The final plan shall incorporate recommendations from the peer review and shall be submitted to the CPM and BLM no less than 15 days prior to the start of groundwater pumping.</p> <p>No less than 15 days prior to the start of groundwater pumping the Project owner shall submit as-built drawings indicating the location and depth of piezometers, and shall provide evidence that the piezometers are operational.</p> <p>Baseline groundwater and groundwater-dependent vegetation monitoring shall begin 15 days prior to construction and shall occur every year during the same one to two week time period in early spring (March) and post-monsoon (September).</p> <p>The First Annual Monitoring Report shall be provided to the CPM and BLM no later than January 31 following the first year of data collection, and shall include an assessment of whether the sampling design would provide statistically adequate monitoring data and whether modifications to the monitoring design would be needed. If the first Annual Monitoring Report recommends a revised sampling design, the Project owner shall submit the revised Plan to the CPM and BLM no later than March 1.</p> <p>Thereafter the Project owner shall submit a Groundwater-Dependent Vegetation Annual Monitoring Report to the CPM and BLM no later than January 31 of each year for the duration of Project operation.</p> <p>If the project owner elects to prepare a geologic and groundwater investigation (as described in Subsection 15 a-d of this condition) to determine if the source of water for the GDEs is a shallow perched water-bearing zone rather than the regional groundwater system, and that the shallow perched water-bearing zone is not hydraulically connected to the regional groundwater system that the Project owner proposes to use for water supply, the project owner shall submit the resumes of at least two independent, qualified peer reviewers 45 days prior to submittal of the report to the</p>	<p>CEC</p>

BIOLOGICAL RESOURCES (cont.)		
<p>5. Sample Size and Design The number of monitoring sites shall be established using appropriate statistical methods (for example, by a “priori power analysis” (Elzinga et al. 1998)) and shall be sufficient to achieve adequate (90%) statistical power. Following collection of the baseline data a statistical analysis shall be conducted to refine the power analysis and evaluate the adequacy of the sampling design. If the analysis of baseline data indicates that the sampling design is insufficient to achieve adequate statistical power, the design shall be modified (for example, by adding additional monitoring sites).</p> <p>6. Water Table Monitoring. The Project owner shall install piezometers at each of the dominant vegetation community types within or near the monitoring plots. The number, location, depth and monitoring frequency of the piezometers shall be sufficient to establish the effect of Project groundwater pumping on the shallow aquifer water levels. At a minimum, each piezometer shall be monitored twice per year, in early spring (March) and post-monsoon (September). The piezometers shall be designed to monitor the maximum expected fluctuation in the water table and to last the duration of the Project. Data collected from the Project wells and piezometers for SOIL & WATER-4 (Groundwater Level Monitoring, Mitigation, and Reporting) and S&W-6 (groundwater monitoring for the evaporation ponds and land treatment unit) shall be used to refine the modeling of the predicted groundwater drawdown and zone of influence after two years of data collection following the start of groundwater production. The Project owner shall submit to the CPM, for review and approval, a report on the results of the refined modeling. The report shall include all calculations and assumptions made in development of report data and interpretations, and all well monitoring data and piezometer data collected and used in the calculations. If the results indicate that the drawdown and zone of influence is greater than the effect predicted in the GRI, and the GDE are found to be drawing groundwater that is hydraulically connected to the regional groundwater system, then the project owner will submit a revised monitoring plan for GDE areas outside of the original monitoring area.</p> <p>7. Soil Monitoring. Soil salinity and pH shall be monitored annually at every monitoring plot. The Plan shall describe the monitoring devices and techniques used to collect and interpret this data, relative to ecosystem function. One soil core sample per community type shall be collected as part of the baseline data to establish the approximate rooting depth of the phreatophytes, and thereafter shall be repeated every five years. The coring method must provide a continuous core that will provide visual examination of roots and root nodules, soil profile, and soil moisture.</p> <p>8. Baseline and Long-term Data Collection. At a minimum, baseline data shall be collected at all monitoring sites prior to the start of pumping; however, vegetation data collected from sites farther from the nearest wells will allow for the collection of multiple years of “pre-disturbance” data. Although the Project proposes to begin construction (and pumping) by December 2010, it appears that the effects of pumping would not reach the areas supporting the GDEs or phreatophytic plants for several years (see C.9 Soil and Water Resources). Because the proposed well in the northeast portion of the Project (Soil & Water Figure 1, Galati & Blek 2010i) is located in very close proximity to known phreatophytes, this well shall not be used within the first 3 years of the Project in order to allow an adequate period for baseline data collection in the area northeast of the Project. Subject to approval by the CPM, if groundwater pumping ceases or is replaced by other water sources, groundwater and vegetation monitoring shall continue for a period of 5 years or until refined modeling indicates that the groundwater levels have returned to baseline levels and the decline in plant vigor has been restored to pre-disturbance conditions.</p> <p>9. Target Vegetation Population. The monitoring sites shall include GDEs and other vegetation potentially affected by the drawdown that occur within the zone of influence. The following phreatophytes have been documented to occur around Palen Lake: honey mesquite (<i>Prosopis glandulosa</i>); iodine bush (<i>Allenrolfea occidentalis</i>), bush seep-weed (<i>Suaeda moquini</i>), jackass clover (<i>Wislizenia refracta</i>), four-wing saltbush (<i>Atriplex canescens</i>), allscale (<i>A. polycarpa</i>), spinescale (<i>A. spinifera</i>), a potentially new taxon of saltbush (<i>Atriplex</i> sp. nov. Andre), ironwood (<i>Olneya</i></p>	<p>CPM and BLM for review and approval. The Project owner must submit the results of their investigation, subject to review and approval by the CPM, prior to the start of construction or Project groundwater use.</p> <p>If the refined modeling conducted according subsection 6 of this condition indicates that the drawdown and zone of influence is greater than the effect predicted in the GRI, and the GDE are found to be drawing groundwater that is hydraulically connected to the regional groundwater system, then the Project owner shall submit a revised monitoring plan for GDE areas outside of the original monitoring area. The Revised Monitoring Plan shall be submitted no later than January 31 in the third year following the start of groundwater pumping and well monitoring.</p>

BIOLOGICAL RESOURCES (cont.)		
<p><i>tesota</i>), palo verde (<i>Cercidium microphyllum</i>), cat's claw (<i>Acacia greggii</i>), and smoke tree (<i>Psoralea argemone</i>). The final number of each community type sample needed shall be based on the <i>priori</i> power test conducted after the first year of baseline data collection.</p> <p>10. Fine-Scale Vegetation Mapping. Within the monitoring sites vegetation shall be mapped to the alliance level, consistent with classification protocol in the <i>Manual of California, 2nd edition</i> (Sawyer et al. 2009) but any important associations shall also be mapped. Mapping shall be done using minimum 1 meter resolution color orthophotos or higher resolution infrared imagery. The mapping shall also be used to determine the acreages of GDEs and establish the amount of security to be deposited in the event that adverse effects are detected during the monitoring. Boundaries of the permanent plots and any off-site reference sites shall be recorded using GPS technology and depicted on the geo-referenced aerials. GIS shapefiles and metadata shall be submitted along with the draft Plan and any subsequent revisions to the Plan (i.e., following the collection of baseline data and subsequent power analysis).</p> <p>11. Guidelines for the Monitoring Plan. The Groundwater-Dependent Vegetation Monitoring Plan (Plan) shall be prepared with guidance from <i>Measuring and Monitoring Plant Populations</i> (Elzinga et al. 1998). The Plan shall provide a detailed description of each of the following components:</p> <ul style="list-style-type: none"> a. Sampling Design. The sampling design shall include a description of: a) the populations (vegetation types) sampled; b) number, size, and shape of the sampling units; c) layout of the sampling units; d) methods for permanently marking plots in the field; e) monitoring schedule/frequency; f) vegetation and other attributes sampled; and g) sampling objectives (target/threshold, change/trend-based) for each attribute. b. Habitat Function and Values. The Plan shall describe the hydrologic, geologic/geomorphic, geochemical, biological and ecological characteristics of the GDEs, and shall also describe whether species are obligate or facultative; root growth and water acquisition characteristics; morphological adaptations to the desert environment; reproduction and germination characteristics; general and micro-habitat preferences; obligate or facultative halophytes and phreatophytes; role in the morphology of dunes; and importance to wildlife, etc. c. Field techniques for measuring vegetation. This will include the vegetation (or other) attributes selected based on a demonstrated knowledge of the biology and morphology of the species, and include a discussion of the limitations involved in each measurement. Examples of appropriate field techniques for measuring drought response include: percent dieback; live crown density; crown height and width, percent cover of live (versus dead or residual) vegetation, percent cover/frequency of associated species; percent composition of native versus non-native species; and percent cover based on wetland status codes (OBL, FACW, FAC, FACU, UPL19) and status as phreatophytes or halophytes. Photo monitoring shall not be considered an acceptable monitoring method but may be useful to conduct periodically (e.g., every 3 to 5 years). d. Data Management. Including how the data will be recorded in the field (e.g., using a GPS data dictionary), processed and stored. e. Training of personnel. Describe minimum standards for training and monitoring personnel. f. Statistical analysis. Describe statistical methods used to analyze the monitoring data (incorporating the minimum standards for statistical power and error rate described above). <p>12. Peer Review of the Plan. The draft Plan shall undergo a peer review by recognized experts, which shall include one or more scientists with expertise in: the preparation of monitoring plans for plant populations; the physiological responses of desert phreatophytes to drought stress; assessing the effects of groundwater withdrawal on vegetation in the desert</p>

BIOLOGICAL RESOURCES (cont.)		
<p>region; and biostatistics. The Project owner shall provide the resumes of suggested peer reviewers to the CPM for review and approval.</p> <p>13. Annual Monitoring Report. Annual Monitoring Reports shall be submitted to the CPM and BLM and shall include, at a minimum: a) names and contact information for the responsible parties and monitoring personnel; b) summaries of the results of the monitoring as required in Soil&Water-4 and Soil&Water-6; c) piezometer monitoring results, and a comparison of predicted versus actual water table declines; d) summary of the results of vegetation, groundwater, and soil monitoring data compared to the baseline data for each plot (pre- versus post-disturbance comparison); e) description of sampling and monitoring techniques used for each attribute; f) description of the data management and statistical analysis; g) photos; h) conclusions and recommendations for remedial action, if the monitoring data indicates that the threshold described below has been met. The first Annual Monitoring Report shall include an appropriate statistical analysis using the first year baseline monitoring data to assess whether the sampling design was adequate to provide statistically meaningful data, as described above. If warranted, the first year Annual Monitoring Report shall include recommendations for revisions to the Plan based on this analysis.</p> <p>14. Threshold for Remedial Action: The Project owner shall implement remedial action, as described in Condition of Certification BIO-24, if the monitoring described in BIO-23 detects a decline in plant vigor of 20 percent or more compared to the same plots pre-disturbance AND also detects a decline in the alluvial (shallow) aquifer confirmed by two consecutive annual water monitoring events in any amount greater than the lowest baseline water level as measured prior to groundwater pumping. If regional drought, off-site pumping or other activities unrelated to the Project are also contributing to the decline in water table, the Project owner shall only be responsible for the portion of the effect that can be statistically demonstrated to be the result of Project pumping. To determine whether declines in plant vigor are related to Project pumping as opposed to regionwide drought or offsite pumping conditions the Project owner shall install a network background monitoring piezometers and incorporate these data in the assessment of Project-related effects on GDEs.</p> <p>15. To understand the source of the water for the GDEs, the Project owner shall prepare a groundwater investigation work plan for submittal to the CPM that will outline steps to determine if the source of water for the GDEs is a shallow perched water-bearing zone rather than the regional groundwater system, and that the shallow perched water-bearing zone is not hydraulically connected to the regional groundwater system. The groundwater investigation will be comprised of the following components:</p> <ul style="list-style-type: none"> a. A continuous soil coring program at five locations to be identified based on field mapping of GDEs in the area shown on the Figure <i>Soil and Water-3 (Project Only Revised Operational Water Supply End of 30 Years)</i> within the 0.1-foot drawdown polygon of the Model Predicted Drawdown (Galati & Blek 2010i). One of the five borings will be drilled adjacent to a GDE containing mesquite, and the other four located to provide an assessment of the range of plant communities within GDEs in the area of interest (i.e., to assess the variability of GDE plant type water requirements and root zone depth). b. The soil cores shall extend a minimum of 20 feet below the deepest root zones of the GDEs investigated to demonstrate separation between the shallow and regional water zones. At a minimum the soil cores shall show that 20 feet of unsaturated conditions are present below the deepest root zones of the plant communities investigated. The soil cores will be logged by a professional geologist in the State of California, and the coring program will be overseen by a qualified biologist with experienced in the plant communities identified within each GDE. c. A sampling plan for selective analysis of soil moisture content and saturation will also be conducted for each soil core advanced adjacent to a GDE. The number and frequency of soil samples shall be established to confirm field 		

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>observations of soil moisture content in the shallow water-bearing zone, through the root zone and in the deeper sediments below the root zone above the regional water table. Soil samples shall be analyzed for moisture content after ASTM Method D2216.</p> <p>d. Depending on the results of the soil coring program, piezometers may be installed as monitoring points for the regional water table and to monitoring changes in the shallow water-bearing zone from Project pumping. In the report of results from the soil coring program, a water-level monitoring program shall be proposed if it is shown that the regional water table is in direct hydraulic connection to the source of water to the GDE's. If the field data clearly shows an unsaturated zone of 20 feet or more below the deepest root zones of the GDEs, then piezometers will not be installed.</p> <p>If the results of the pre-construction field observations and soil sampling demonstrate 20 feet or more of unsaturated sediments between the deepest root zones of the GDEs and the regional water table, there will be no requirements to implement any of the underlying conditions as provided for in BIO-23 and BIO-24, as sufficient evidence will have been provided to demonstrate that the groundwater is not the source for the GDE's.</p> <p>If the refined modeling of the predicted groundwater drawdown and zone of influence after two years of data collection (following the start of groundwater production), as described in Subsection 6 of this condition and in SOIL&WATER-4 and SOIL&WATER-6, indicates the drawdown or zone of influence would be greater than predicted in the Project owner's Groundwater Resources Investigation (GRI), and the GDE are found to be drawing groundwater that is hydraulically connected to the regional groundwater system, then the project owner will submit a revised monitoring plan for GDE areas outside of the original monitoring area.</p>		
<p>BIO-24, Remedial Action and Compensation for Adverse Effects to Groundwater-Dependent Biological Resources: If monitoring detects Project-related adverse impacts to groundwater dependent ecosystems (GDEs), as described in BIO-23 and the impacts are shown to be the result of a decline in the regional groundwater table due to Project pumping, the Project owner shall determine which well(s) are the source of the adverse impacts and shall implement remedial measures as outlined below. If regional drought, off-site pumping or other activities unrelated to the Project are also contributing to the decline in water table, the Project owner shall only be responsible for the portion of the effect that can be demonstrated to be the result of Project pumping. The remedial measures shall be implemented with the objective of restoring the groundwater levels to the baseline described in BIO-23, and shall compensate for impacts to GDEs with off-site habitat acquisition or restoration. The Project owner shall do all of the following:</p> <p>1. Modification and/or Cessation of Pumping: The Project owner shall provide to the CPM evidence based on groundwater monitoring and modeling indicating which wells are likely to be causing adverse impacts to GDEs. The Project owner shall initially modify operation of those wells to reduce the offsite drawdown in the areas of the GDEs.</p> <p>Remedial Action Plan: The objective of remedial action shall be restoration of the spring groundwater table in the alluvial (shallow) aquifer to baseline levels, as described in BIO-23. The Remedial Action Plan shall include one or more of the following measures: 1) Begin rotational operation of the site water supply wells reducing pumping in wells that are the most proximal to the GDEs, 2) reducing the pumping rate in the wells that have been identified as the cause of the drawdown in the area of the GDEs, 3) focus pumping on wells on the southern portion of the project site away from the GDEs 4) cease operation of the well(s) that are the cause of the drawdown. Groundwater water level monitoring shall increase to a frequency necessary to document change and recovery in the drawdown from the changes in the pumping program.</p>	<p>No more than 30 days following submission of the Groundwater Dependent Vegetation Annual Monitoring Report the Project owner shall submit to the CPM for review and approval a draft Remedial Action Plan if that report indicates that the threshold for remedial action as described in BIO-23 has been met. At the same time the Project owner shall submit written evidence that the Project wells responsible for impacts to groundwater levels and GDEs have modified their operation or ceased operation.</p> <p>A final Remedial Action Plan shall be submitted to the CPM within 30 days of receipt of the CPM's comments on the draft plan. No later than 6 months following approval of the final Remedial Action Plan, the Project owner shall provide to the CPM written documentation of the effectiveness of the completed remedial action.</p> <p>No more than 30 days following submission of the Groundwater-Dependent Vegetation Annual Monitoring Report, the Project owner shall provide to the CPM a final accounting of the amount of GDE habitat affected by Project groundwater pumping.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>The Remedial Action Plan shall include a water level monitoring program of sufficient frequency to document changes in operation of the water supply wells, and demonstrate that the water table has been restored to baseline levels.</p> <p>The Project owner shall use the following guidelines for determining if an ecosystem (or species) is phreatophytic (Brown et al 2007; LeMaite et al 1999; Froend & Loomes 2004):</p> <ol style="list-style-type: none"> a. It is not known or documented to depend on groundwater, based on scientific literature or expert opinion (local knowledge can be useful in making a determination as some species' dependence varies by setting); b. The species are not known to have roots extending over a meter in depth; c. The community does not occur in an area where the water table is known to be 'near' the surface (relative to the documented rooting depths of the species); d. The herbaceous or shrub vegetation is not still green and/or does not have a high leaf area late in the dry season (compared to other dry areas in the same watershed that do not have access to groundwater). <p>2. Compensate for Loss of Ecosystem Function. If the decline in the water table in the alluvial (shallow) aquifer is accompanied by a corresponding decline in plant vigor greater than 20 percent (as described in BIO-23), the Project owner shall compensate for the loss of habitat functions and values in the affected groundwater- dependent ecosystems. The amount of compensation shall be at a 3:1 ratio based on area of affected area, using mapping as described in BIO-23. The Project owner shall acquire, in fee or in easement, a parcel or parcels of land that include an amount of groundwater-dependent vegetation that is of the same habitat-type as the community affected (e.g., mesquite woodland, alkali sink scrubs, or microphyll woodland) and of an equal or greater habitat quality. The compensation lands shall be located within the watersheds encompassing the Chuckwalla or Palen valleys. As an alternative to habitat compensation, the Project owner may submit a plan that achieves restoration of lost habitat function and value at another location within the Chuckwalla Groundwater Basin that contains the same habitats as those affected.</p> <ol style="list-style-type: none"> a. Review and Approval of Compensation Lands Prior to Acquisition or Restoration. The Project owner shall submit a formal acquisition proposal to the CPM describing the parcel(s) intended for purchase. This acquisition proposal shall discuss the suitability of the proposed parcel(s) as compensation lands in relation to the criteria listed above. Approval from the CPM shall be required for acquisition of all compensatory mitigation parcels. b. Preparation of Management Plan: The Project owner shall submit to the CPM and CDFG a draft Management Plan that reflects site-specific enhancement measures for the acquired compensation lands. The objective of the Management Plan shall be to maintain the functions and values of the acquired GDE plant communities and may include enhancement actions such as weed control, fencing to exclude livestock, or erosion control. c. Delegation of Acquisition. The responsibility for acquisition of compensation lands may be delegated to NFWF or another third party other than NFWF, such as a non-governmental organization supportive of desert habitat conservation, by written agreement of the Energy Commission. Such delegation shall be subject to approval by the CPM prior to land acquisition, enhancement or management activities. 	<p>No more than 6 months following submission of the Groundwater-Dependent Vegetation Annual Monitoring Report the Project owner shall submit a formal acquisition or restoration proposal to the CPM, describing the mitigation parcels intended for purchase or restoration. The acquisition/restoration proposal shall describe how the proposed parcels meet the acquisition or restoration criteria described in this condition.</p> <p>No fewer than 90 days prior to compensatory acquisition or restoration, the Project owner shall submit to the CPM and obtain CPM approval of any agreements to delegate land acquisition to an approved third party, or to manage compensation lands; such agreement shall be executed and implemented no more than months following approval of the acquisition proposal. The Project owner shall provide written verification to the CPM that the compensation lands or conservation easements have been acquired and recorded in favor of the approved recipient no later than 18 months from submission of the Groundwater-Dependent Vegetation Annual Monitoring Report.</p>	

APPLICANT PROPOSED MEASURES

BIOLOGICAL RESOURCES (cont.)		
<p>BIO-25, Golden Eagle Inventory and Monitoring: The Project owner shall implement the following measures to avoid or minimize Project-related construction impacts to golden eagles.</p> <ol style="list-style-type: none"> 1. Annual Inventory During Construction. For each calendar year during which construction will occur an inventory shall be conducted to determine if golden eagle territories occur within one mile of the Project boundaries. Survey methods for the inventory shall be as described in the Interim Golden Eagle Inventory and Monitoring Protocols; and Other Recommendations (Pagel et al. 2010) or more current guidance from the USFWS. 2. Inventory Data: Data collected during the inventory shall include at least the following: territory status (unknown, vacant, occupied, breeding successful, breeding unsuccessful); nest location, nest elevation; age class of golden eagles observed; nesting chronology; number of young at each visit; digital photographs; and substrate upon which nest is placed. 3. Determination of Unoccupied Territory Status: A nesting territory or inventoried habitat shall be considered unoccupied by golden eagles ONLY after completing at least 2 full surveys in a single breeding season. In circumstances where ground observation occurs rather than aerial surveys, at least 2 ground observation periods lasting at least 4 hours or more are necessary to designate an inventoried habitat or territory as unoccupied as long as all potential nest sites and alternate nests are visible and monitored. These observation periods shall be at least 30 days apart for an inventory, and at least 30 days apart for monitoring of known territories. 4. Monitoring and Adaptive Management Plan: If an occupied nest is detected within one mile of the Project boundaries, the Project owner shall prepare and implement a Golden Eagle Monitoring and Adaptive Management Plan for the duration of construction to ensure that Project construction activities do not result in injury or disturbance to golden eagles. The monitoring methods shall be consistent with those described in the Interim Golden Eagle Inventory and Monitoring Protocols; and Other Recommendations (Pagel et al. 2010) or more current guidance from the USFWS. The Monitoring and Management Plan shall be prepared in consultation with the USFWS. Triggers for adaptive management shall include any evidence of Project-related disturbance to nesting golden eagles, including but not limited to: agitation behavior (displacement, avoidance, and defense); increased vigilance behavior at nest sites; changes in foraging and feeding behavior, or nest site abandonment. The Monitoring and Adaptive Management Plan shall include a description of adaptive management actions, which shall include, but not be limited to, cessation of construction activities that are deemed by the Designated Biologist to be the source of golden eagle disturbance. 	<p>No fewer than 30 days from completion of the golden eagle inventory the project owner shall submit a report to the CPM, BLM, CDFG, and USFWS documenting the results of the inventory.</p> <p>If an occupied nest is detected within one mile of the Project boundary during the inventory the Project owner shall contact staff at the USFWS Carlsbad Office and CDFG within one working day of detection of the nest for interim guidance on monitoring and nest protection. The project owner shall provide the CPM, CDFG, and USFWS with the final version of the Golden Eagle Monitoring and Management Plan within 30 days after detection of the nest. This final Plan shall have been reviewed and approved by the CPM in consultation with USFWS and CDFG.</p>	CEC
<p>BIO-26, Evaporation Pond Netting and Monitoring: The Project owner shall cover the evaporation ponds prior to any discharge with 1.5-inch mesh netting designed to exclude birds and other wildlife from drinking or landing on the water of the ponds. Netting with mesh sizes other than 1.5-inches may be installed if approved by the CPM in consultation with CDFG and USFWS. The netted ponds shall be monitored regularly to verify that the netting remains intact, is fulfilling its function in excluding birds and other wildlife from the ponds, and does not pose an entanglement threat to birds and other wildlife. The ponds shall include a visual deterrent in addition to the netting, and the pond shall be designed such that the netting shall never contact the water. Monitoring of the evaporation ponds shall include the following:</p> <ol style="list-style-type: none"> 1. Monthly Monitoring. The Designated Biologist or Biological Monitor shall regularly survey the ponds at least once per month starting with the first month of operation of the evaporation ponds. The purpose of the surveys shall be to 	<p>No less than 30 days prior to operation of the evaporation ponds the project owner shall provide to the CPM as-built drawings and photographs of the ponds indicating that the bird exclusion netting has been installed. For the first year of operation the Designated Biologist shall submit quarterly reports to the CPM, BLM, CDFG, and USFWS describing the dates, durations and results of site visits conducted at the evaporation ponds. Thereafter the Designated Biologist shall submit annual monitoring reports with this information. The quarterly and annual reports shall fully describe any</p>	CEC

BIOLOGICAL RESOURCES (cont.)		
<p>determine if the netted ponds are effective in excluding birds, if the nets pose an entrapment hazard to birds and wildlife, and to assess the structural integrity of the nets. The monthly survey shall be conducted in 1 day for a minimum of 2 hours following sunrise (i.e., dawn), a minimum of 1 hour mid-day (i.e., 1100 to 1300), and a minimum of 2 hours preceding sunset (i.e., dusk) in order to provide an accurate assessment of bird and wildlife use of the ponds during all seasons. Surveyors shall be experienced with bird identification and survey techniques. Operations staff at the Project site shall also report finding any dead birds or other wildlife at the evaporation ponds to the Designated Biologist within 1 day of the detection of the carcass. The Designated Biologists shall report any bird or other wildlife deaths or entanglements within 2 days of the discovery to the CPM, CDFG, and USFWS.</p> <p>2. Dead or Entangled Birds. If dead or entangled birds are detected, the Designated Biologist shall take immediate action to correct the source of mortality or entanglement. The Designated Biologist shall make immediate efforts to contact and consult the CPM, CDFG, and USFWS by phone and electronic communications prior to taking remedial action upon detection of the problem, but the inability to reach these parties shall not delay taking action that would, in the judgment of the Designated Biologist, prevent further mortality of birds or other wildlife at the evaporation ponds.</p> <p>3. Quarterly Monitoring. If after 12 consecutive monthly site visits no bird or wildlife deaths or entanglements are detected at the evaporation ponds by or reported to the Designated Biologist, monitoring, as described in paragraph 1, can be conducted on a quarterly basis.</p> <p>4. Biannual Monitoring. If after 12 consecutive quarterly site visits no bird or wildlife deaths or entanglements are detected by or reported to the Designated Biologist and with approval from the CPM, USFWS, and CDFG, future surveys may be reduced to 2 surveys per year, during the spring nesting season and during fall migration. If approved by the CPM, USFWS, and CDFG, monitoring outside the nesting season may be conducted by the Environmental Compliance Manager.</p> <p>5. Modification of Monitoring Program. CDFG or USFWS may submit a request for modifications to the evaporation pond monitoring program based on information acquired during monitoring, and may also suggest adaptive management measures to remedy any problems that are detected during monitoring or modifications if bird impacts are not observed. Modifications to the evaporation pond monitoring described above and implementation of adaptive management measures shall be made only after approval from the CPM, in consultation with USFWS and CDFG.</p>	<p>bird or wildlife death or entanglements detected during the site visits or at any other time, and shall describe actions taken to remedy these problems. The annual report shall be submitted to the CPM, BLM, CDFG, and USFWS no later than January 31 of every year for the life of the project.</p>	
<p>BIO-27: <i>Staff and the Applicant have agreed to delete this condition.</i></p>		
<p>BIO-28, In-Lieu Fee Mitigation Option: The Project owner may choose to satisfy its mitigation obligations by paying an in-lieu fee instead of acquiring compensation lands, pursuant to Fish and Game code sections 2069 and 2099 or any other applicable in-lieu fee provision, provided that the Project's in-lieu fee proposal is found by the Commission to mitigate the impacts identified herein. If the in-lieu fee proposal is found by the Commission to be in compliance, and the Project Owner chooses to satisfy its mitigation obligations through the in-lieu fee, the Project Owner shall provide proof of the in-lieu fee payment to the CPM prior to construction related ground disturbance.</p>	<p>If electing to use this provision, the Project owner shall notify the Commission and all parties to the proceeding that it would like a determination that the Project's in-lieu fee proposal would mitigate for the impacts identified herein. Prior to construction related ground disturbance the Project Owner shall provide proof of the in lieu fee payment to the CPM.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
BIOLOGICAL RESOURCES (cont.)		
<p>BIO-29, Project Construction Phasing Plan:</p> <p>The Project Owner shall provide compensatory mitigation for the total Project Disturbance Area and may provide such mitigation in two phases as described in Figure 1 in the Supplement to the Petition For Amendment dated February 8, 2013. For purposes of this condition, the Project Disturbance Area means all lands disturbed in the construction and operation of the PSEGS or its phases, including all linears and ancillary facilities, as well as undeveloped areas inside the Project's boundaries that would no longer provide viable long-term habitat.</p> <p>The disturbance area for each project Phase and resource type is provided in BIO-29 Table 1 on page 120 of the February 8, 2013 Revised Plan of Development for the PSEGS (Palen Solar III, LLC, 2013) (the "POD"). Mitigation is shown in BIO-29 Table 2 (POD, p. 121), and mitigation security is shown in BIO-29 Table 3, below. This table shall be refined prior to the start of each construction phase with the disturbance area adjusted to reflect the final Project footprint for each phase. Prior to initiating each phase of construction the Project owner shall submit the actual construction schedule, a figure depicting the locations of proposed construction and amount of acres to be disturbed. Mitigation acres are calculated based on the compensation requirements for each resource type as described in the above Conditions of Certification – BIO-12 (Desert Tortoise), BIO-20 (Mojave Fringe-toed Lizard), BIO-18 (Western Burrowing Owl), and BIO-22 (State Waters). Compensatory mitigation for each phase shall be implemented according to the timing required by each condition. (See BIO-29 Table 1, Table 2, and Table 3 in the CEC Amendment to Final Decision) (see 2010 CEC PSPP Commission Decision, pp. 141- 143, which would be updated to reflect proposed area of disturbance and current costs).</p>	<p>The Project owner shall not disturb any area outside of the area that has been approved for that phase of construction and for the previously approved phases of construction.</p> <p>No less than 30 days prior to the start of desert tortoise clearance surveys for each phase, the Project owner shall submit a description of the proposed construction activities for that phase to CDFG, USFWS and BLM for review and to the CPM for review and approval. The description for each phase shall include the proposed construction schedule, a figure depicting the locations of proposed construction, and amount of acres of each habitat type to be disturbed.</p> <p>No less than 30 days prior to beginning Project ground-disturbing activities for each phase, the Project owner shall provide the form of Security in accordance with this Condition of Certification in the amounts described in BIO-29 Table 3. No later than 7 days prior to beginning Project ground-disturbing activities for each phase, the Project owner shall provide written verification of the actual Security. The Project owner, or an approved third party, shall complete and provide written verification of the proposed compensation lands acquisition within 18 months of the start of Project ground-disturbing activities for each phase.</p>	<p>CEC</p>
<p>WIL-1: Desert Kit Fox Protection. To avoid direct impacts to desert kit fox from disease transmission, the Applicant shall implement the following measures:</p> <ol style="list-style-type: none"> Baseline Kit Fox Population and Health Survey: A qualified biologist familiar with desert kit foxes shall direct a baseline study of desert kit fox populations on the Project site and the anticipated relocation/receiving area(s) at least 60 days prior to initiation of construction activities. The study shall characterize the population size and distribution of the kit fox population on the site and receiving areas. The receiving area would be determined following the initial survey of the Project site, and based on the location and number of Project site kit foxes. The initial survey to locate, map and describe kit fox burrows may occur as part of the desert tortoise clearance, an intensive survey that is completed using two passes spaced at 5 m intervals. Pending CDFW approval, the baseline survey may include a testing component in which the researchers trap and test a representative subsample of the population for canine distemper, and generally describe animal health on the site and receiving areas. The baseline kit fox census and health findings shall be summarized in a report that informs will be used to inform site management of kit foxes during preconstruction surveys. Alternately, the Applicant may coordinate with and fund studies by federal or State wildlife health officials (e.g., the CDFW Wildlife Investigations Lab) to establish baseline health conditions at the site and in the receiving area. Prepare Desert Kit Fox Management Plan: At least 45 days prior to construction, the Applicant shall prepare a Desert Kit Fox Management Plan that: 1) incorporates baseline desert kit fox survey and health survey findings into a cohesive management strategy that minimizes disease risk to kit fox populations; 2) provides a program for tagging, radio- 	<p>A qualified biologist familiar with desert kit foxes shall direct a baseline study of desert kit fox populations on the Project site and the anticipated relocation/receiving area(s) at least 60 days prior to initiation of construction activities.</p>	<p>BLM</p>

<p>tracking and monitoring of a subset of kit foxes that are anticipated to be during the construction phase to provide understanding of how displacement affects displaced foxes, and foxes in the receiving area.; 3) specifically identifies preconstruction survey methods for kit foxes and large carnivores (e.g., badgers) in the Project area; 4) describes preconstruction and construction-phase relocation methods from the site, including the possibility for passive and active relocation from the site (and outlines identified CDFW permit and MOU requirements for active relocation), and; 5) coordinates survey findings prior to and during construction to meet the information needs of wildlife health officials in monitoring the health of kit fox populations. The Plan shall include contingency measures that would be performed if canine distemper were documented in the Project area or in potential relocation areas, and measures to address potential kit fox reoccupancy of the site (as documented at the Genesis site). The contents and requirements of the Plan shall be subject to review and approval by the BLM Authorized Officer (BLM AO) in consultation with USFWS and CDFW.</p> <p>3. Implement Desert Kit Fox Management Plan: If canine distemper is not identified in the Project area or relocation areas during baseline surveys, the mitigation strategy may utilize passive means or active means with appropriate CDFW authorization to relocate kit foxes from the site as described in APM BIO-17.</p> <p>4. Measures to Minimize Canine Disease Transmission. The approach below assumes that canine distemper is not detected during baseline surveys. Additionally, the following measures are required to reduce the likelihood of distemper transmission:</p> <ul style="list-style-type: none"> i. No pets shall be allowed on the site prior to or during construction, with the possible exception of kit fox scat detection dogs during preconstruction surveys, and then only with prior CDFW approval; ii. Any kit fox hazing activities that include the use of animal repellents such as coyote urine must be cleared through CDFW prior to use, and; iii. Any sick or diseased kit fox, or documented kit fox mortality shall be reported to CDFW and the BLM AO within 24 hours of identification. If a dead kit fox is observed, it shall be retained and protected from scavengers until CDFW determines if the collection of necropsy samples is justified. 		
CULTURAL RESOURCES		
<p>CUL-1, Prehistoric Trails Network Cultural Landscape (PTNCL) Documentation and NRHP Nomination: The project owner shall contribute to a special fund set up by the Energy Commission and/or BLM to finance the completion of the PTNCL Documentation and Possible NRHP Nomination program presented in the Palen Solar Power Project (PSPP) Revised Staff Assessment (RSA).</p> <p>The amount of the contribution shall be \$35 per acre that the project encloses or otherwise disturbs. Any additional contingency contribution is not to exceed an amount totaling 20 percent of the original contribution. The contribution to the special fund may be made in installments at the approval of the CPM, with the first installment to constitute one-third of the total original contribution amount. If a project is not certified, or if a project owner does not build the project, or, if for some other reason deemed acceptable by the CPM, a project owner does not participate in funding the PTNCL documentation and possible NRHP nomination program, the other project owner(s) may consult with the CPM to adjust the scale of the PTNCL documentation and possible NRHP nomination program research activities to match available funding. A project owner that funds the PTNCL documentation and possible NRHP nomination program, then withdraws, will be able to reclaim their monetary contribution, to be refunded on a prorated basis.</p>	<p>No later than 10 days after receiving notice of the successful transfer of funds for any installment to the Energy Commission's and/or BLM's special PTNCL fund, the project owner shall submit a copy of the notice to the Energy Commission's Compliance Project Manager (CPM).</p>	<p>CEC</p>

CULTURAL RESOURCES (cont.)		
<p>Required Cultural Resources Technical Specialists: The project owner shall ensure that the CRS obtains the services of a qualified prehistoric archaeologist to conduct the research specified in CUL-11 and CUL-12. The Project Prehistoric Archaeologist's (PPA) training and background must meet the U.S. Secretary of the Interior's Professional Qualifications Standards for prehistoric archaeology, as published in Title 36, Code of Federal Regulations, part 61, and the résumé of the PPA must demonstrate familiarity with similar artifacts and environmental modifications (deliberate and incidental) to those associated with the prehistoric and protohistoric use of the Chuckwalla Valley. The PPA must meet OSHA standards as a "Competent Person" in trench safety. The project owner shall ensure that the CRS obtains the services of a qualified historical archaeologist to conduct the research specified in CUL-13 and CUL-14. The Project Historical Archaeologist's (PHA) training and background must meet the U.S. Secretary of Interior's Professional Qualifications Standards for historical archaeology, as published in Title 36, Code of Federal Regulations, part 61. The résumés of the CRS, alternate CRS, the PPA, and the PHA shall include the names and telephone numbers of contacts familiar with the work of these persons on projects referenced in the résumés and demonstrate to the satisfaction of the CPM that these persons have the appropriate training and experience to undertake the required research. The project owner may name and hire the CRS, alternate CRS, the PPA, and the PHA prior to certification.</p> <p>Field Crew Members and Cultural Resources Monitors: CRMs and field crew members shall have the following qualifications:</p> <ol style="list-style-type: none"> 1. A B.S. or B.A. degree in anthropology, archaeology, historical archaeology, or a related field, and one year experience monitoring in California; or 2. An A.S. or A.A. degree in anthropology, archaeology, historical archaeology, or a related field, and four years experience monitoring in California; or 3. Enrollment in upper division classes pursuing a degree in the fields of anthropology, archaeology, historical archaeology, or a related field, and two years of monitoring experience in California. 	<p>remain halted until there is a CRS or alternate CRS to make a recommendation regarding significance.</p> <ol style="list-style-type: none"> 4. At least 20 days prior to data recovery on known archaeological sites, the CRS shall provide a letter naming anticipated field crew members for the project and attesting that the identified field crew members meet the minimum qualifications for cultural resources data recovery required by this Condition. 5. At least 20 days prior to ground disturbance, the CRS shall provide a letter naming anticipated CRMs for the project and attesting that the identified CRMs meet the minimum qualifications for cultural resources monitoring required by this Condition. 6. At least five days prior to additional CRMs beginning on-site duties during the project, the CRS shall provide letters to the CPM identifying the new CRMs and attesting to their qualifications. 	
<p>CUL-4, Project Documentation for Cultural Resources Personnel: Prior to the start of ground disturbance, the project owner shall provide the CRS, the PPA, and the PHA with copies of the AFC, data responses, confidential cultural resources documents, the Revised Staff Assessment (RSA), RSA Errata, and the Commission Decision for the project. The project owner shall also provide the CRS, the PPA, the PHA, and the CPM with maps and drawings showing the footprints of the power plant, all linear facility routes, all access roads, and all laydown areas. Maps shall include the appropriate USGS quadrangles and maps at an appropriate scale (e.g., 1:2400 or 1" = 200') for plotting cultural features or materials. If the CRS requests enlargements or strip maps for linear facility routes, the project owner shall provide copies to the CRS and CPM. The CPM shall review map submittals and, in consultation with the CRS, approve those that are appropriate for use in cultural resources planning activities. No ground disturbance shall occur prior to CPM approval of maps and drawings, unless such activities are specifically approved by the CPM. If construction of the project would proceed in phases, maps and drawings not previously provided shall be provided to the CRS, the PPA, the PHA, and CPM prior to the start of each phase. Written notice identifying the proposed schedule of each project phase shall be provided to the CRS and CPM. Weekly, until ground disturbance is completed, the project construction manager shall provide to the CRS and CPM a schedule of project activities for the following week, including the identification of area(s) where ground disturbance will occur during that week. The project owner shall notify the CRS and CPM of any changes to the scheduling of the construction phases.</p>	<ol style="list-style-type: none"> 1. Preferably at least 115 days, but in any event no less than 60 days prior to the start of ground disturbance, the project owner shall provide the AFC, data responses, confidential cultural resources documents, the Revised Staff Assessment (RSA), RSA Errata, and the Commission Decision for the project to the CRS, if needed, and to the PPA, and the PHA. The project owner shall also provide the subject maps and drawings to the CRS, PPA, PHA, and CPM. Staff, in consultation with the CRS, PPA, and PHA, will review and approve maps and drawings suitable for cultural resources monitoring and data recovery activities. 2. At least 15 days prior to the start of ground disturbance, if there are changes to any project-related footprint, the 	CEC

CULTURAL RESOURCES (cont.)		
<p>11. The commitment of the project owner to pay all curation fees for artifacts recovered and for related documentation produced during cultural resources investigations conducted for the project shall be stated. The project owner shall identify a curation facility that could accept cultural resources materials resulting from PSPP cultural resources investigations.</p> <p>12. The CRS shall attest to having access to equipment and supplies necessary for site mapping, photography, and recovery of all cultural resource materials (that cannot be treated prescriptively) from known CRHR-eligible archaeological sites and from CRHR eligible sites that are encountered during ground disturbance.</p> <p>13. The contents, format, and review and approval process of the final Cultural Resource Report (CRR) shall be described.</p>		
<p>CUL-6, Cultural Resources Report (CRR): The project owner shall submit the final Cultural Resources Report (CRR) to the CPM for review and approval and to the BLM Palm Springs archaeologist for review and comment. The final CRR shall be written by or under the direction of the CRS. The final CRR shall report on all field activities including dates, times and locations, results, samplings, and analyses. All survey reports, revised and final Department of Parks and Recreation (DPR) 523 forms, data recovery reports, and any additional research reports not previously submitted to the California Historical Resource Information System (CHRIS) and the State Historic Preservation Officer (SHPO) shall be included as appendices to the final CRR. If the project owner requests a suspension of ground disturbance and/or construction activities, then a draft CRR that covers all cultural resources activities associated with the project shall be prepared by the CRS and submitted to the CPM and to the BLM Palm Springs archaeologist for review and approval on the same day as the suspension/extension request. The draft CRR shall be retained at the project site in a secure facility until ground disturbance and/or construction resumes or the project is withdrawn. If the project is withdrawn, then a final CRR shall be submitted to the CPM for review and approval at the same time as the withdrawal request.</p>	<ol style="list-style-type: none"> 1. Within 30 days after requesting a suspension of construction activities, the project owner shall submit a draft CRR to the CPM for review and approval. 2. Within 180 days after completion of ground disturbance (including landscaping), the project owner shall submit the final CRR to the CPM for review and approval and to the BLM Palm Springs archaeologist for review and comment. If any reports have previously been sent to the CHRIS, then receipt letters from the CHRIS or other verification of receipt shall be included in an appendix. 3. Within 10 days after the CPM and the BLM Palm Springs archaeologist approve the CRR, the project owner shall provide documentation to the CPM confirming that copies of the final CRR have been provided to the SHPO, the CHRIS, the curating institution, if archaeological materials were collected, and to the Tribal Chairpersons of any Native American groups requesting copies of project-related reports. 	CEC
<p>CUL-7, Worker Environmental Awareness Program (WEAP): Prior to and for the duration of ground disturbance, the project owner shall provide Worker Environmental Awareness Program (WEAP) training to all new workers within their first week of employment at the project site, along the linear facilities routes, and at laydown areas, roads, and other ancillary areas. The training shall be prepared by the CRS, may be conducted by any member of the archaeological team, and may be presented in the form of a video. The CRS shall be available (by telephone or in person) to answer questions posed by employees. The training may be discontinued when ground disturbance is completed or suspended, but must be resumed when ground disturbance, such as landscaping, resumes.</p> <p>The training shall include:</p>	<ol style="list-style-type: none"> 1. At least 30 days prior to the start of ground disturbance, the CRS shall provide the training program draft text and graphics and the informational brochure to the CPM for review and approval. 2. At least 15 days prior to the start of ground disturbance, the CPM will provide to the project owner a WEAP Training Acknowledgement form for each WEAP trained worker to sign. 	CEC

CULTURAL RESOURCES (cont.)		
<ol style="list-style-type: none"> 1. A discussion of applicable laws and penalties under the law; 2. Samples or visuals of artifacts that might be found in the project vicinity; 3. A discussion of what such artifacts may look like when partially buried, or wholly buried and then freshly exposed; 4. A discussion of what prehistoric and historical archaeological deposits look like at the surface and when exposed during construction, and the range of variation in the appearance of such deposits; 5. Instruction that the CRS, alternate CRS, and CRMs have the authority to halt ground disturbance in the area of a discovery to an extent sufficient to ensure that the resource is protected from further impacts, as determined by the CRS; 6. Instruction that employees are to halt work on their own in the vicinity of a potential cultural resources discovery and shall contact their supervisor and the CRS or CRM, and that redirection of work would be determined by the construction supervisor and the CRS; 7. An informational brochure that identifies reporting procedures in the event of a discovery; 8. An acknowledgement form signed by each worker indicating that they have received the training; and 9. A sticker that shall be placed on hard hats indicating that environmental training has been completed. 10. No ground disturbance shall occur prior to implementation of the WEAP program, unless such activities are specifically approved by the CPM. 	<ol style="list-style-type: none"> 3. Monthly, until ground disturbance is completed, the project owner shall provide in the Monthly Compliance Report (MCR) the WEAP Training Acknowledgement forms of workers who have completed the training in the prior month and a running total of all persons who have completed training to date. 	
<p>CUL-8, Construction Monitoring Program: The project owner shall ensure that the CRS, alternate CRS, or CRMs, to prevent construction impacts to undiscovered resources and to ensure that known resources are not impacted in an unanticipated manner, monitor full time all ground disturbance. Full-time archaeological monitoring for this project shall be the archaeological monitoring of the earth-removing activities in the areas specified in the previous paragraph, for as long as the activities are ongoing. Where excavation equipment is actively removing dirt and hauling the excavated material farther than 50 feet from the location of active excavation, full-time archaeological monitoring shall require at least two monitors per excavation area. In this circumstance, one monitor shall observe the location of active excavation and a second monitor shall inspect the dumped material. For excavation areas where the excavated material is dumped no farther than 50 feet from the location of active excavation, one monitor shall both observe the location of active excavation and inspect the dumped material. A Native American monitor shall be obtained to monitor ground disturbance in areas where Native American artifacts may be discovered. Contact lists of interested Native Americans and guidelines for monitoring shall be obtained from the Native American Heritage Commission. Preference in selecting a monitor shall be given to Native Americans with traditional ties to the area that shall be monitored. If efforts to obtain the services of a qualified Native American monitor are unsuccessful, the project owner shall immediately inform the CPM. The CPM will either identify potential monitors or will allow ground disturbance to proceed without a Native American monitor. The research design in the CRMMP shall govern the collection, treatment, retention/disposal, and curation of any archaeological materials encountered.</p>	<ol style="list-style-type: none"> 1. At least 30 days prior to the start of ground disturbance, the CPM will provide to the CRS an electronic copy of a form to be used as a daily monitoring log. 2. Monthly, while monitoring is on-going, the project owner shall include in each MCR a copy of the monthly summary report of cultural resources-related monitoring prepared by the CRS and shall attach any new DPR 523A forms completed for finds treated prescriptively, as specified in the CRMMP. 3. At least 24 hours prior to implementing a proposed change in monitoring level, the project owner shall submit to the CPM, for review and approval, a letter or e-mail (or some other form of communication acceptable to the CPM) detailing the CRS's justification for changing the monitoring level. 	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
CULTURAL RESOURCES (cont.)		
<p>On forms provided by the CPM, CRMs shall keep a daily log of any monitoring and other cultural resources activities and any instances of noncompliance with the Conditions and/or applicable LORS. Copies of the daily monitoring logs shall be provided by the CRS to the CPM, if requested by the CPM. From these logs, the CRS shall compile a monthly monitoring summary report to be included in the MCR. If there are no monitoring activities, the summary report shall specify why monitoring has been suspended. The CRS or alternate CRS shall report daily to the CPM on the status of the project's cultural resources-related activities, unless reducing or ending daily reporting is requested by the CRS and approved by the CPM.</p> <p>In the event that the CRS believes that the current level of monitoring is not appropriate in certain locations, a letter or e-mail detailing the justification for changing the level of monitoring shall be provided to the CPM for review and approval prior to any change in the level of monitoring. The CRS, at his or her discretion, or at the request of the CPM, may informally discuss cultural resources monitoring and mitigation activities with Energy Commission technical staff. Cultural resources monitoring activities are the responsibility of the CRS. Any interference with monitoring activities, removal of a monitor from duties assigned by the CRS, or direction to a monitor to relocate monitoring activities by anyone other than the CRS shall be considered non-compliance with these Conditions. Upon becoming aware of any incidents of non-compliance with the Conditions and/or applicable LORS, the CRS and/or the project owner shall notify the CPM by telephone or e-mail within 24 hours. The CRS shall also recommend corrective action to resolve the problem or achieve compliance with the Conditions. When the issue is resolved, the CRS shall write a report describing the issue, the resolution of the issue, and the effectiveness of the resolution measures. This report shall be provided in the next MCR for the review of the CPM.</p>	<ol style="list-style-type: none"> 4. Daily, as long as no cultural resources are found, the CRS shall provide a statement that "no cultural resources over 50 years of age were discovered" to the CPM as an e-mail or in some other form of communication acceptable to the CPM. 5. At least 24 hours prior to reducing or ending daily reporting, the project owner shall submit to the CPM, for review and approval, a letter or e-mail (or some other form of communication acceptable to the CPM) detailing the CRS's justification for reducing or ending daily reporting. 6. No later than 30 days following the discovery of any Native American cultural materials, the project owner shall submit to the CPM copies of the information transmittal letters sent to the Chairpersons of the Native American tribes or groups who requested the information. Additionally, the project owner shall submit to the CPM copies of letters of transmittal for all subsequent responses to Native American requests for notification, consultation, and reports and records. 7. Within 15 days of receiving them, the project owner shall submit to the CPM copies of any comments or information provided by Native Americans in response to the project owner's transmittals of information. 	
<p>CUL-9, Authority to Halt Construction; Treatment of Discoveries: The project owner shall grant authority to halt ground disturbance to the CRS, alternate CRS, PPA, PHA, and the CRMs in the event of a discovery. Redirection of ground disturbance shall be accomplished under the direction of the construction supervisor in consultation with the CRS.</p> <p>In the event that a cultural resource over 50 years of age is found (or if younger, determined exceptionally significant by the CPM), or impacts to such a resource can be anticipated, ground disturbance shall be halted or redirected in the immediate vicinity of the discovery sufficient to ensure that the resource is protected from further impacts. Monitoring and daily reporting, as provided in other Conditions, shall continue during the project's ground-disturbing activities elsewhere. The halting or redirection of ground disturbance shall remain in effect until the CRS has visited the discovery, and all of the following have occurred:</p> <ol style="list-style-type: none"> 1. The CRS has notified the project owner, and the CPM has been notified within 24 hours of the discovery, or by Monday morning if the cultural resources discovery occurs between 8:00 AM on Friday and 8:00 AM on Sunday morning, including a description of the discovery (or changes in character or attributes), the action taken (i.e., work stoppage or redirection), a recommendation of CRHR eligibility, and recommendations for data recovery from any cultural resources discoveries, whether or not a determination of CRHR eligibility has been made. 	<ol style="list-style-type: none"> 1. At least 30 days prior to the start of ground disturbance, the project owner shall provide the CPM and CRS with a letter confirming that the CRS, alternate CRS, PPA, PHA, and CRMs have the authority to halt ground disturbance in the vicinity of a cultural resources discovery, and that the project owner shall ensure that the CRS notifies the CPM within 24 hours of a discovery, or by Monday morning if the cultural resources discovery occurs between 8:00 AM on Friday and 8:00 AM on Sunday morning. 2. Within 48 hours of the discovery of a resource of interest to Native Americans, the project owner shall ensure that the CRS notifies all Native American groups that expressed a desire to be notified in the event of such a discovery. 	CEC

CULTURAL RESOURCES (cont.)		
<p>2. If the discovery would be of interest to Native Americans, the CRS has notified all Native American groups that expressed a desire to be notified in the event of such a discovery.</p> <p>3. The CRS has completed field notes, measurements, and photography for a DPR 523 “Primary” form. Unless the find can be treated prescriptively, as specified in the CRMMP, the “Description” entry of the DPR 523 “Primary” form shall include a recommendation on the CRHR eligibility of the discovery. The project owner shall submit completed forms to the CPM.</p> <p>4. The CRS, the project owner, and the CPM have conferred, and the CPM has concurred with the recommended eligibility of the discovery and approved the CRS’s proposed data recovery plan, if any, including the curation of the artifacts, or other appropriate mitigation; and any necessary data recovery and mitigation have been completed.</p>	<p>3. Unless the discovery can be treated prescriptively, as specified in the CRMMP, completed DPR 523 forms for resources newly discovered during ground disturbance shall be submitted to the CPM for review and approval no later than 24 hours following the notification of the CPM, or 48 hours following the completion of data recordation/recovery, whichever the CRS decides is more appropriate for the subject cultural resource.</p>	
<p>CUL-10, Flag and Avoid: If resources within the transmission line corridor can be spanned rather than impacted, or in the event that new resources are discovered during construction where impacts can be reduced or avoided, the project owner shall:</p> <ol style="list-style-type: none"> 1. Ensure that a CRS, alternate CRS, PPA, or CRM re-establish the boundary of each site, add a 10-meter-wide buffer around the periphery of each site boundary, and flag the resulting space in a conspicuous manner; 2. Ensure that a CRM enforces avoidance of the flagged areas during PSPP construction; and 3. Ensure, after completion of construction, boundary markings around each site and buffer are removed so as not to attract vandals. 	<p>Within 90 days of the completion of Project construction, the project owner shall submit for CPM review and approval a letter, with photograph and maps, evidencing the removal of boundary markings.</p>	<p>CEC</p>
<p>CUL-11, Data Recovery for Simple Prehistoric Sites: (Sparse Lithic Scatters, Cairns, and Pot Drops) The project owner shall ensure the CRMMP includes a data recovery plan for the resource type “simple prehistoric sites,” consisting of sites SMP-P-1015, SMP-P-1016, SMP-P-2014, SMP-P-2015, and SMP-P- 001. This site list may be revised only with the agreement of the CRS and the CPM. The data recovery plan shall include the use of the CARIDAP protocol on sites that qualify, how to proceed if features or other buried deposits are encountered, and the materials analyses] and laboratory artifact analyses that will be used. The plan shall also specify in detail the location recordation equipment and methods used and describe any post-processing of the data. If allowed by the BLM, prior to the start of ground disturbance within 30 meters of the site boundaries of each of these sites, the project owner shall ensure that the CRS, the PPA, and/or archaeological team members implement the plan, which, for sites where CARIDAP does not apply, shall include, but is not limited to the following tasks:</p> <ol style="list-style-type: none"> 1. Use location recordation equipment that has the latest technology with sub-meter accuracy (such as UTM 11 North or California Teale Albers) to add to the original site maps the following features: seasonal drainages, site boundaries, location of each individual artifact, and the boundaries around individual artifact concentrations; 2. Request the PTNCL PG, or equivalent qualified person approved by the CPM and hired by the project owner should the PTNCL geoarchaeologist not be available, to identify the specific landform for each site and its relationship to specific ancient lakeshores of Palen Dry Lake; if a lakeshore is present within 100 meters of the site boundary, include it on the site map; 	<ol style="list-style-type: none"> 1. At least 45 days prior to ground disturbance, the project owner shall notify the CPM that data recovery for small sites has ensued. 2. After the completion of the excavation of the first 1-meter-by-1-meter excavation unit at each of the subject sites, the CRS shall notify the CPM regarding the presence or absence of subsurface deposits and shall make a recommendation on the site’s CRHR eligibility. 3. Within one week of the completion of data recovery at a site, the project owner shall submit a letter report written by the PPA or CRS for review and approval of the CPM. When the CPM approves the letter report, ground disturbance may begin at this site location. 	<p>CEC</p>

CULTURAL RESOURCES (cont.)		
<ol style="list-style-type: none"> 3. Map and field-record all lithic artifacts (numbers of flakes, the reduction sequence stage each represents, cores, tool blanks, finished tools, hammerstones, and concentrations, and the material types of each) and the other types of prehistoric artifacts present. 4. Map any differential distribution of artifacts and suggest explanations for the distribution 5. Assess the integrity of the site and provide the evidence substantiating that assessment; 6. Collect for dating and source analyses any obsidian artifacts; 7. Field record the surface location of all other artifacts and collect all ceramic artifacts and botanical and faunal remains for laboratory analysis and curation; 8. Surface scrape to a depth of 5 centimeters a 5-meter-by-5-meter area centered on the artifact concentration, field-record the lithic artifacts as to location, material type, and the reduction sequence stage each represents, record the location of all other artifacts, and retain the obsidian and ceramic artifacts and botanical and faunal remains for laboratory analysis and curation; 9. Excavate one 1-meter-by-1-meter unit in 10-centimeter levels until the unit reaches a depth of 20 centimeters below any anthropogenic materials, placing the unit in the part of the site with the highest artifact density and recording its locations on the site map; 10. Place one 1-meter-by-1-meter excavation unit, as described above, in the center of each concentration if multiple artifact concentrations have been identified; 11. Notify the CPM by telephone or e-mail that subsurface deposits were or were not encountered and make a recommendation on the site's CRHR eligibility; 12. If no subsurface deposits were encountered, and the CPM agrees the site is not eligible for the CRHR, data recovery is complete; 13. If subsurface deposits are encountered, test the horizontal limits of the site by excavating additional 1-meter-by-1-meter excavation units in 10-centimeter levels until the unit reaches a depth of 20 centimeters below any anthropogenic materials, using a shovel or hand auger, or other similar technique, at four spots equally spread around the exterior edge of each site, recording the locations of these units on the site map; 14. Sample the encountered features or deposits, using the methods described in the CRMMP, record their locations on the site map, retain samples, such as flotation, pollen, and charcoal, for analysis, and retain all artifacts for professionally appropriate laboratory analyses and curation, until data recovery is complete; 15. Present the results of the CUL-11 data recovery in a letter report by the PPA or CRS, which shall serve as a preliminary report. Letter reports may address one site, or multiple sites depending on the needs of the CRS. The letter report shall be a concise document that provides description of the schedule and methods used in the field effort, a preliminary tally of the numbers and types of features and deposits that were found, a discussion of the potential range of error for that tally, a map showing the location of excavation units including topographic contours and the site landforms, and a discussion of the CRHR eligibility of each site and the justification for that determination;

CULTURAL RESOURCES (cont.)		
10. The project owner shall ensure that the PHA analyzes all recovered data and writes or supervises the writing of a comprehensive final report. This report shall be included in the CRR (CUL-6). Relevant portions of the information gathered shall be included in the possible NRHP nomination for the DTCCL (funded by CUL-2).		
CUL-15, Data Recovery on Historic-Period Roads: The project owner shall ensure that a qualified architectural historian (must meet the U.S. Secretary of the Interior’s Professional Qualifications Standards for historian, as published in Title 36, Code of Federal Regulations, part 61) conducts research and writes a report on the age and use of SMP-H-1032. The project owner shall provide the historian’s report to the DTCCL PI-Historian for possible use in the DTCCL NRHP nomination, if appropriate. The project owner may undertake this task prior to Energy Commission certification of the project.	<ol style="list-style-type: none"> 1. At least 15 days prior to ground disturbance, the project owner shall submit to the CPM the historian’s report documenting the age and historical use of the road. 2. Within 15 days after the CPM approves the report, the project owner shall forward it to the DTCCL PI-Historian. 	CEC
CUL-16, Compliance with BLM Programmatic Agreement: If provisions in the BLM PSPP Programmatic Agreement and associated implementation and monitoring programs conflict with or duplicate these Conditions of Certification, the BLM provisions shall take precedence. Provisions in these Conditions that are additional to or exceed BLM provisions and represent requirements under the Energy Commission’s CEQA responsibilities shall continue to apply to the project’s activities, contingent on BLM’s approval as authorized by federal law.		CEC
HAZARDOUS MATERIALS MANAGEMENT		
HAZ-1, Hazardous Material Requirements: The project owner shall not use any hazardous material not listed in, or in greater quantities or strengths than those identified by chemical name in Table 4.11-1 of Section 4.11, <i>Public Health and Safety</i> , unless approved in advance by the Compliance Project Manager (CPM).	The project owner shall provide to the CPM, in the Annual Compliance Report, a list of hazardous materials contained at the facility.	CEC
HAZ-2, Hazardous Materials Business Plan (HMBP): The project owner shall concurrently provide a Hazardous Materials Business Plan (HMBP), and Spill Prevention, Control, and Countermeasure Plan (SPCC), and a Process Safety Management Plan (PSMP) to the Riverside County Department of Environmental Health (RCDEH), to the Hazardous Materials Division of the Riverside County Fire Department (RCFD), and the CPM for review. After receiving comments from the RCDEH, Hazardous Materials Division of the RCFD and the CPM, the project owner shall reflect all received recommendations in the final documents. If no comments are received from the county within 30 days of submittal, the project owner may proceed with preparation of final documents upon receiving comments from the CPM. Copies of the final HMBP, RCFD shall then be provided to the Hazardous Materials Division of the Fire Department for information and to the CPM for approval.	At least 30 days prior to receiving any hazardous material on the site for commissioning or operations, the project owner shall provide a copy of a final Hazardous Materials Business Plan, Spill Prevention, Control, and Countermeasures Plan, and the Process Safety Management Plan to the CPM for approval.	CEC
HAZ-3, Safety Management Plan: The project owner shall develop and implement a Safety Management Plan for the delivery and handling of liquid and gaseous hazardous materials delivered by tanker truck or pipeline. The plan shall include procedures, protective equipment requirements, training and a checklist. It shall also include a section describing all measures to be implemented to prevent mixing of incompatible hazardous materials. This plan shall be applicable during construction, commissioning, and operation of the power plant.	At least 30 days prior to the delivery of any liquid or gaseous hazardous material to the facility, the project owner shall provide a Safety Management Plan as described above to the CPM for review and approval.	CEC/BLM

HAZARDOUS MATERIALS MANAGEMENT (cont.)		
<p>HAZ-5, Construction Site Security Plan: Prior to commencing construction, a site-specific Construction Site Security Plan for the construction phase shall be prepared and made available to the CPM for review and approval. The Construction Security Plan shall include the following:</p> <ol style="list-style-type: none"> 1. perimeter security consisting of fencing enclosing the construction area; 2. security guards; 3. site access control consisting of a check-in procedure or tag system for construction personnel and visitors; 4. written standard procedures for employees, contractors and vendors when encountering suspicious objects or packages on site or off site; 5. protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency; and 6. evacuation procedures. 	<p>At least 30 days prior to commencing construction, the project owner shall notify the CPM that a site-specific Construction Security Plan is available for review and approval.</p>	<p>CEC</p>
<p>HAZ-6, Operation Security Plan: The project owner shall also prepare a Operation Security Plan for the operational phases and shall be made available to the CPM for review and approval. The project owner shall implement site security measures that address physical site security and hazardous materials storage. The level of security to be implemented shall not be less than that described below (as per NERC 2002).</p> <p>The Operation Security Plan shall include the following:</p> <ol style="list-style-type: none"> 1. Permanent full perimeter fence or wall, eight feet tall around the Power Block and Solar Field; 2. Main entrance security gate, either hand operatable or motorized; 3. Evacuation procedures; 4. Protocol for contacting law enforcement and the CPM in the event of suspicious activity or emergency; 5. Written standard procedures for employees, contractors, and vendors when encountering suspicious objects or packages on site or off site; 6. A statement (refer to sample, ATTACHMENT A), signed by the project owner certifying that background investigations have been conducted on all project personnel. Background investigations shall be restricted to determine the accuracy of employee identity and employment history and shall be conducted in accordance with state and federal laws regarding security and privacy; <p>A statement(s) (refer to sample, ATTACHMENT B), signed by the contractor or authorized representative(s) for any permanent contractors or other technical contractors (as determined by the CPM after consultation with the project owner), that are present at any time on the site to repair, maintain, investigate, or conduct any other technical duties involving critical components (as determined by the CPM after consultation with the project owner) certifying that background investigations have been conducted on contractors who visit the project site. Background investigations shall be restricted to ascertaining the accuracy of employee identity and employment history, and shall be conducted in accordance with state and federal law regarding security and privacy;</p>	<p>At least 30 days prior to the initial receipt of hazardous materials on site, the project owner shall notify the CPM that a site-specific operations site security plan is available for review and approval. In the annual compliance report, the project owner shall include a statement that all current project employee and appropriate contractor background investigations have been performed, and that updated certification statements have been appended to the operations security plan. In the annual compliance report, the project owner shall include a statement that the operations security plan includes all current hazardous materials transport vendor certifications for security plans and employee background investigations.</p>	<p>CEC</p>

Conditions of Certification	Verification	Responsible Agency
HAZARDOUS MATERIALS MANAGEMENT (cont.)		
<p>7. Site access controls for employees, contractors, vendors, and visitors;</p> <p>8. Closed circuit TV (CCTV) monitoring system, recordable, and viewable in the power plant control room and security station (if separate from the control room) with cameras capable of viewing, at a minimum, the main entrance; and</p> <p>9. Additional measures to ensure adequate perimeter security consisting of either:</p> <p style="margin-left: 20px;">A. Security guard present 24 hours per day, seven days per week; or</p> <p style="margin-left: 20px;">B. Power plant personnel on site 24 hours per day, 7 days per week, and one of the following:</p> <p style="margin-left: 40px;">1) The CCTV monitoring system required in number 8 above shall include cameras that are able to pan, tilt, and zoom (PTZ), have low-light capability, are recordable, and are able to view 100% of the perimeter fence to the power block, the outside entrance to the control room, and the front gate from a monitor in the power plant control room; OR</p> <p style="margin-left: 40px;">2) Perimeter breach detectors or on-site motion detectors for the power block.</p> <p>The project owner shall fully implement the security plans and obtain CPM approval of any substantive modifications to those security plans. The CPM may authorize modifications to these measures, or may require additional measures, such as protective barriers for critical power plant components (e.g. transformers, gas lines, compressors, etc.) depending upon circumstances unique to the facility or in response to industry-related standards, security concerns, or additional guidance provided by the U.S. Department of Homeland Security, the U.S. Department of Energy, or the North American Electrical Reliability Council, after consultation with both appropriate law enforcement agencies and the applicant.</p>		
PUBLIC HEALTH AND SAFETY		
<p>PUBLIC HEALTH-1, Cooling Water Management Plan: The Project owner shall develop and implement a Cooling Water Management Plan to ensure that the potential for bacterial growth in cooling water is kept to a minimum. The Plan shall be consistent with either staff's "Cooling Water Management Program Guidelines" or with the Cooling Technology Institute's "Best Practices for Control of Legionella" guidelines but in either case, the Plan must include sampling and testing for the presence of Legionella bacteria at least every 6 months. After 2 years of power plant operations, the Project owner may ask the CPM to re-evaluate and revise the Legionella bacteria testing requirement.</p>	<p>At least 60 days prior to the commencement of cooling tower operations, the Cooling Water Management Plan shall be provided to the CPM for review and approval.</p>	<p>CEC</p>
LAND USE, RECREATION, AND WILDERNESS		
<p>LAND-1, Submittals to the CPM Prior to Construction: Prior to the start of construction, the Applicant shall provide to the Compliance Project Manager (CPM) documentation of the U.S. Bureau of Land Management (BLM) Right-of-Way grant and the BLM-approved project-specific amendment to the California Desert Conservation Area Plan (CDCA) permitting the construction/operation of the proposed Palen Solar Power Project.</p>	<p>Prior to the start of construction, the Applicant shall submit to the CPM a copy of the BLM approved project specific amendment to the CDCA Plan permitting the Palen Solar Power Project.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
NOISE		
<p>NOISE-1, Public Notification Process: At least 15 days prior to the start of ground disturbance, the project owner shall notify all residents within one mile of the project site and the linear facilities, by mail or by other effective means, of the commencement of project construction. At the same time, the project owner shall establish a telephone number for use by the public to report any undesirable noise conditions associated with the construction and operation of the project. If the telephone is not staffed 24 hours a day, the project owner shall include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This telephone number shall be posted at the project site during construction where it is visible to passersby. This telephone number shall be maintained until the project has been operational for at least one year.</p>	<p>Prior to ground disturbance, the project owner shall transmit to the compliance project manager (CPM) a statement, signed by the project owner's project manager, stating that the above notification has been performed, and describing the method of that notification. This communication shall also verify that the telephone number has been established and posted at the site, and shall provide that telephone number.</p>	CEC
<p>NOISE-2, Noise Complaint Process: Throughout the construction and operation of the project, the project owner shall document, investigate, evaluate, and attempt to resolve all project-related noise complaints. The project owner or authorized agent shall:</p> <ol style="list-style-type: none"> 1. use the Noise Complaint Resolution Form (below), or a functionally equivalent procedure acceptable to the CPM, to document and respond to each noise complaint; 2. attempt to contact the person(s) making the noise complaint within 24 hours; 3. conduct an investigation to determine the source of noise in the complaint; 4. if the noise is project related, take all feasible measures to reduce the source of the noise; and 5. submit a report documenting the complaint and actions taken. The report shall include: a complaint summary, including the final results of noise reduction efforts and, if obtainable, a signed statement by the complainant stating that the noise problem has been resolved to the complainant's satisfaction. 	<p>Within five days of receiving a noise complaint, the project owner shall file a Noise Complaint Resolution Form, shown below, with both the local jurisdiction and the CPM, that documents the resolution of the complaint. If mitigation is required to resolve the complaint, and the complaint is not resolved within a 3-day period, the project owner shall submit an updated Noise Complaint Resolution Form when the mitigation is performed and complete.</p>	CEC
<p>NOISE-3, Employee Noise Control Program: The project owner shall submit to the CPM for review and approval a noise control program. The noise control program shall be used to reduce employee exposure to high (above permissible) noise levels during construction in accordance to the applicable OSHA and Cal-OSHA standards.</p>	<p>At least 30 days prior to the start of ground disturbance, the project owner shall submit the noise control program to the CPM. The project owner shall make the program available to Cal-OSHA upon request.</p>	CEC
<p>NOISE-4, Noise Restrictions: The project design and implementation shall include appropriate noise mitigation measures adequate to ensure that the operation of the project will not cause the noise levels due to plant operation alone, during the daytime hours of 7 a.m. to 10 p.m. to exceed an average of 42 dBA Leq measured at or near monitoring location LT1.</p> <p>No new pure-tone components shall be caused by the project. No single piece of equipment shall be allowed to stand out as a source of noise that draws legitimate complaints.</p> <p>A. When the project first achieves a sustained output of 85% or greater of rated capacity, the project owner shall conduct a 25 hour community noise survey at monitoring location LT1, or at a closer location acceptable to the CPM. This survey shall also include measurement of one-third octave band sound pressure levels to ensure that no new pure-tone noise components have been caused by the project.</p>	<p>The survey shall take place within 30 days of the project first achieving a sustained output of 85% or greater of rated capacity. Within 15 days after completing the survey, the project owner shall submit a summary report of the survey to the CPM. Included in the survey report will be a description of any additional mitigation measures necessary to achieve compliance with the above listed noise limit, and a schedule, subject to CPM approval, for implementing these measures. When these measures are in place, the project owner shall repeat the noise survey.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
NOISE (cont.)		
<p>The measurement of power plant noise for the purposes of demonstrating compliance with this condition of certification may alternatively be made at a location, acceptable to the CPM, closer to the plant (e.g., 400 feet from the plant boundary) and this measured level then mathematically extrapolated to determine the plant noise contribution at the affected residence. The character of the plant noise shall be evaluated at the affected receptor locations to determine the presence of pure tones or other dominant sources of plant noise.</p> <p>B. If the results from the noise survey indicate that the power plant noise at the affected receptor site exceeds the above value during the above time period, mitigation measures shall be implemented to reduce noise to a level of compliance with this limit.</p> <p>C. If the results from the noise survey indicate that pure tones are present, mitigation measures shall be implemented to eliminate the pure tones.</p>	<p>Within 15 days of completion of the new survey, the project owner shall submit to the CPM a summary report of the new noise survey, performed as described above and showing compliance with this condition.</p>	
<p>NOISE-5, Occupational Noise Survey: Following the project's attainment of a sustained output of 85% or greater of its rated capacity, the project owner shall conduct an occupational noise survey to identify any noise hazardous areas in the facility.</p> <p>The survey shall be conducted by a qualified person in accordance with the provisions of Title 8, California Code of Regulations, sections 5095 5099 (Article 105) and Title 29, Code of Federal Regulations, section 1910.95. The survey results shall be used to determine the magnitude of employee noise exposure.</p> <p>The project owner shall prepare a report of the survey results and, if necessary, identify proposed mitigation measures to be employed in order to comply with the applicable California and federal regulations.</p>	<p>Within 30 days after completing the survey, the project owner shall submit the noise survey report to the CPM. The project owner shall make the report available to OSHA and Cal-OSHA upon request.</p>	CEC
<p>NOISE-6, Construction Restrictions: Heavy equipment operation and noisy construction work relating to any project features shall be restricted to the times delineated below, unless a special permit has been issued by the County of Riverside:</p> <p>Mondays through Fridays: June through September: 6 a.m. to 7 p.m. October through May: 6 a.m. to 6 p.m.</p> <p>Saturdays: 9 a.m. to 5 p.m.</p> <p>Sundays and Federal holidays: No Construction Allowed</p> <p>Haul trucks and other engine-powered equipment shall be equipped with adequate mufflers. Haul trucks shall be operated in accordance with posted speed limits. Truck engine exhaust brake use shall be limited to emergencies.</p>	<p>Prior to ground disturbance, the project owner shall transmit to the CPM a statement acknowledging that the above restrictions will be observed throughout the construction of the project.</p>	CEC
<p>NOISE-7, High-Pressure Steam Blow Requirements: If a traditional, high-pressure steam blow process is used the project owner shall equip steam blow piping with a temporary silencer that quiets the noise of steam blows to no greater than 89 dBA measured at a distance of 100 feet. The steam blows shall be conducted between 8:00 a.m. and 5:00 p.m. unless arranged with the CPM such that offsite impacts would not cause annoyance to receptors. If a low-pressure, continuous steam blow process is used, the project owner shall submit to the CPM a description of the process, with expected noise levels and planned hours of steam blow operation.</p>	<p>At least 15 days prior to the first steam blow, the project owner shall notify all residents or business owners within one mile of the project site boundary. The notification may be in the form of letters, phone calls, fliers, or other effective means as approved by the CPM. The notification shall include a description of the purpose and nature of the steam blow(s), the planned schedule, expected sound levels, and explanation that it is a one-time activity and not part of normal plant operation.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
SOIL AND WATER		
<p>SOIL&WATER-1, Drainage Erosion and Sedimentation Control Plan (DESCP): Prior to site mobilization, the project owner shall obtain the Compliance Project Manager (CPM) approval of the Drainage Erosion and Sedimentation Control Plan (DESCP) for managing stormwater during Project construction and operations as normally administered by the County of Riverside. The DESC P must ensure proper protection of water quality and soil resources, demonstrate no increase in off-site flooding potential, include provisions for sediment and stormwater retention from both the power block, solar fields and transmission right of way to meet any Riverside County requirements, address exposed soil treatments in the solar fields for both road and non-road surfaces, and identify all monitoring and maintenance activities. The plan must also cover all linear project features such as offsite transmission mains. The DESC P shall contain, at minimum, the elements presented below that outline site management activities and erosion and sediment-control Best Management Practices (BMP) to be implemented during site mobilization, excavation, construction, and post construction (operating) activities.</p> <p>A. Vicinity Map – A map(s), at a minimum scale 1 inch to 500 feet, shall be provided indicating the location of all Project elements (construction sites, laydown area, pipelines) with depictions of all significant geographic features including swales, storm drains, and sensitive areas.</p> <p>B. Site Delineation – All areas subject to soil disturbance for the proposed Project (Project phases, laydown area, all linear facilities, landscaping areas, and any other Project elements) shall be delineated showing boundary lines of all construction areas and the location of all existing and proposed structures, pipelines, roads, and drainage facilities.</p> <p>C. Watercourses and Critical Areas – The DESC P shall show the location of all nearby watercourses including swales, storm drains, and drainage ditches. It shall indicate the proximity of those features to the proposed Project construction, laydown, and landscape areas and all transmission and pipeline construction corridors.</p> <p>a. The DESC P shall describe how the project will avoid or minimize impacts to Palen-McCoy Valley sand corridor,</p> <p>b. All proposed linear features (with the exception of Power Pylons) shall be constructed flush with the surrounding ground surface and without ground level obstructions.</p> <p>D. Drainage Map – The DESC P shall provide a topographic site map(s), at a minimum scale of 1 inch to 200 feet, showing existing, interim, and proposed drainage swales and drainage systems and drainage-area boundaries. On the map, spot elevations are required where relatively flat conditions exist. The spot elevations and contours shall be extended off site for a minimum distance of 100 feet.</p> <p>E. Drainage of Project Site Narrative – The DESC P shall include a narrative of the drainage measures necessary to protect the site and potentially affected soil and water resources within the drainage downstream of the site. The narrative shall include the summary pages from the hydraulic analysis prepared by a professional engineer and erosion control specialist. The narrative shall state the watershed size(s) in acres that was used in the calculation of drainage features.</p> <p>F. Clearing and Grading Plans – The DESC P shall provide a delineation of all areas to be cleared of vegetation and areas to be preserved. The plan shall provide elevations, slopes, locations, and extent of all proposed grading as shown by contours, cross sections, or other means. The locations of any disposal areas, fills, or other special features shall also be shown. Existing and proposed topography shall be illustrated by tying in proposed contours with existing topography.</p> <p>G. Clearing and Grading Narrative – The DESC P shall include a table with the estimated quantities of material excavated or filled for the site and all Project elements (Project site, laydown area, transmission and pipeline corridors, roadways, and bridges) whether such excavation or fill is temporary or permanent, and the amount of such material to be imported or exported.</p>	<p>No later than 30 days prior to start of site mobilization, the Project owner shall submit a copy of the final DESC P to the County of Riverside, the CRBRWQCB, and the CPM for review and comment and to the County of Riverside and the CRBRWQCB if required. The CPM shall consider comments if received by the county and CRBRWQCB before approval of the DESC P.</p> <p>The DESC P shall be consistent with the grading and drainage plan and relevant portions of the DESC P shall clearly show approval by the chief building official. The DESC P shall be a separate plan from the SWPPP developed in conjunction with any National Pollutant Discharge Elimination System (NPDES) permit for construction Activity. The project owner shall provide in the monthly compliance report with a narrative on the effectiveness of the drainage, erosion, and sediment-control measures and the results of monitoring and maintenance activities. Once operational, the project owner shall update and maintain the ESCP for the life of the Project and shall provide in the annual compliance report information on the results of monitoring and maintenance activities.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
SOIL AND WATER (cont.)		
<p>H. Soil Wind and Water Erosion Control – The plan shall address exposed soil treatments to be used during construction and operation of the proposed Project for both road and non-road surfaces including specifically identifying all chemical based dust palliatives, soil bonding, and weighting agents appropriate for use at the proposed Project site that would not cause adverse effects to vegetation. BMPs shall include measures designed to prevent wind and water erosion including application of chemical dust palliatives after rough grading to limit water use. All dust palliatives, soil binders, and weighting agents shall be approved by the CPM prior to use.</p> <p>I. Best Management Practices Plan – The DESCP shall identify on the topographic site map(s) the location of the site specific BMPs to be employed during each phase of construction (initial grading, Project element excavation and construction, and final grading/stabilization). BMPs shall include measures designed to control dust, stabilize construction access roads and entrances, and control stormwater runoff and sediment transport.</p> <p>J. Best Management Practices Narrative – The DESCP shall show the location (as identified in (I) above), timing, and maintenance schedule of all erosion- and sediment-control BMPs to be used prior to initial grading, during all Project element (site, pipelines) excavations and construction, final grading/stabilization, and operation. Separate BMP implementation schedules shall be provided for each Project element for each phase of construction. The maintenance schedule shall include post-construction maintenance of structural-control BMPs, or a statement provided about when such information would be available.</p> <p>K. Project Schedule – The DESCP shall identify on the topographic site map the location of the site-specific BMPs to be employed during each phase of construction (initial grading, Project element construction, and final grading/stabilization). Separate BMP implementation schedules shall be provided for each Project element for each phase of construction.</p> <p>L. Erosion Control Drawings – The erosion-control drawings and narrative shall be designed, stamped and sealed by a professional engineer or erosion control specialist.</p> <p>M. Agency Comments – The DESCP shall include copies of recommendations, conditions, and provisions from the County of Riverside, California Department of Fish and Game (CDFG), and Colorado River Basin Regional Water Quality Control Board (CRBRWQCB).</p> <p>N. Monitoring Plan: Monitoring activities shall include routine measurement of the volume of accumulated sediment in the onsite drainage ditches, and stormwater diversions. The monitoring plan shall be part of the Channel Monitoring and Maintenance Plan, SOIL&WATER-12.</p>		
<p>SOIL&WATER-2, Groundwater Wells, Pre-Well Installation: The project owner proposes to construct and operate up to ten (10) onsite groundwater water supply wells that produce water from the CVGB. The project owner shall ensure that the wells are completed in accordance with all applicable state and local water well construction permits and requirements. Prior to initiation of well construction activities, the project owner shall submit for review and comment a well construction packet to the County of Riverside and fees normally required for the county's well permit, with copies to the CPM. The Project shall not construct a well or extract and use groundwater until approval has been issued by the County and the CPM to construct and operate the well. Wells permitted and installed as part of preconstruction field investigations that subsequently are planned for use as project water supply wells require CPM approval prior to their use to supply water to the project.</p> <p>Post-Well Installation. The project owner shall provide documentation as required under County permit conditions to the CPM that the well has been properly completed. In accordance with California's Water Code section 13754, the driller of the well shall submit to the DWR a Well Completion Report for each well installed. The project owner shall ensure the Well</p>	<p>The project owner shall do all of the following:</p> <ol style="list-style-type: none"> a. No later than 60 days prior to the construction of the onsite groundwater production wells, the project owner shall submit to the CPM a copy of the water well construction packet submitted to the County of Riverside. b. No later than 30 days prior to the construction of the onsite groundwater production wells, the project owner shall submit a copy of written concurrence received from the County of Riverside that the proposed well construction activities comply with all county well requirements and meet the requirements established by the county's water 	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
SOIL AND WATER (cont.)		
<p>Completion reports are submitted. The project owner shall ensure compliance with all county water well standards and the County requirements for the life of the wells, and shall provide the CPM with two (2) copies each of all monitoring or other reports required for compliance with the County of Riverside water well standards and operation requirements, as well as any changes made to the operation of the well.</p>	<p>well permit program. The CPM will provide approval to the project owner of the well location and operation within 10 days of receipt of the County of Riverside's concurrence with the proposed well construction activities.</p> <p>c. No later than 60 days after installation of each well at the Project site, the project owner shall ensure that the well driller submits a Well Completion Report to the DWR with a copy provided to the CPM. The project owner shall submit to the CPM together with the Well Completion Report a copy of well drilling logs, water quality analyses, and any inspection reports. Additionally no later than 60 days after installation of each well (including closure of any associated mud pits) the project owner shall submit documentation to the CPM and the CRBWQCB that well drilling activities were conducted in compliance with Title 23, California Code of Regulations, Chapter 15, Discharges of Hazardous Wastes to Land, (23 CCR, sections 2510 et seq.) and that any onsite drilling sumps used for Project drilling activities were removed in compliance with 23 CCR section 2511(c).</p> <p>d. During well construction and for the operational life of the well, the project owner shall submit two copies each to the CPM of any proposed well construction or operation changes.</p>	
<p>SOIL&WATER-3, Construction and Operation Water Use: The proposed Project's use of groundwater during construction shall not exceed 400 afy (total of 1,130 af during the 34 months) during construction and 201 afy during operation. Water quality used for project construction and operation shall be reported in accordance with Condition of Certification SOIL&WATER-18 to ensure compliance with this condition.</p> <p>Prior to the use of groundwater for construction, the project owner shall install and maintain metering devices as part of the water supply and distribution system to document Project water use and to monitor and record in gallons per day the total volume(s) of water supplied to the Project from this water source. The metering devices shall be operational for the life of the Project.</p>	<p>At least 60 days prior to the start of construction of the proposed Project, the project owner shall submit to the CPM a copy of evidence that metering devices have been installed and are operational. Beginning six months after the start of construction, the project owner shall prepare a semi-annual summary of amount of water used for construction purposes. The summary shall include the monthly range and monthly average of daily water usage in gallons per day.</p> <p>The project owner shall prepare an annual summary, which shall include daily usage, monthly range and monthly average of daily water usage in gallons per day, and total water used on a monthly and annual basis in acre-feet. For years subsequent to the initial year of operation, the annual summary shall also include the yearly range and yearly average water use by source. For calculating the total water use, the term "year" shall correspond to the date established for the annual compliance report submittal.</p>	CEC

Conditions of Certification	Verification	Responsible Agency
SOIL AND WATER (cont.)		
<p>SOIL&WATER-4, Groundwater Level Monitoring, Mitigation and Reporting: The project owner shall submit a Groundwater Level Monitoring, Mitigation, and Reporting Plan to the CPM for review and approval in advance of construction activities and prior to the operation of onsite groundwater supply wells. The Groundwater Level Monitoring, Mitigation, and Reporting Plan shall provide detailed methodology for monitoring background and site groundwater levels. Monitoring shall include pre-construction, construction, and Project operation water use. The plan shall establish pre-construction and Project related groundwater level and water quality trends that can be quantitatively compared against observed and simulated trends near the Project pumping wells and near potentially impacted existing wells.</p> <p>A. Prior to Project Construction</p> <ol style="list-style-type: none"> 1. A well reconnaissance shall be conducted to investigate and document the condition of existing water supply wells located within 3 miles of the project site, provided that access is granted by the well owners. The reconnaissance shall include sending notices by registered mail to all property owners within a 3 mile radius of the project area. 2. Monitor to establish preconstruction conditions. The monitoring plan and network of monitoring wells shall make use of existing wells in the basin that would satisfy the requirements for the monitoring program. The monitoring network shall be defined by the groundwater model developed for the AFC as the area predicted to show a water level change of 1 foot or more at the end of construction and at the end of operation and any monitoring wells that are installed to comply with Waste Discharge Requirements issued by the Energy Commission for the evaporation ponds and land treatment unit associated with the Project. The projected area of groundwater drawdown shall be refined on an annual basis during project construction and every three (3) years during project operations using the data acquired as part of Condition of Certification SOIL&WATER-4 as well as the numerical groundwater model developed as part of the AFC and subsequent Data Responses by the applicant. If the area predicted to show a water level change of 1 foot increases, the project owner will be required to submit a revised monitoring plan with additional monitoring wells (if required). 3. Identified additional wells shall be located outside of this area to serve as background monitoring wells. Abandoned wells, or wells no longer in use, that are accessible and provide reliable water level data within the potentially impacted area shall also be included as part of the monitoring network. A site reconnaissance shall be performed to identify wells that could be accessible for monitoring. As access to these wells is available, historic water level, water quality, well construction and well performance information shall be obtained for both pumping and non-pumping conditions. 4. As access allows, measure groundwater levels from the off-site and on-site wells within the network and background wells to provide initial groundwater levels for pre-project trend analysis. 5. Construct water level maps within the CVGB within 5 miles of the site from the groundwater data collected prior to construction. Update trend plots and statistical analyses, as data is available. <p>B. During Construction:</p> <ol style="list-style-type: none"> 1. Collect water levels from wells within the monitoring network and flows from seeps and or springs on a quarterly basis throughout the construction period and at the end of the construction period. Perform statistical trend analysis for water levels. Assess the significance of an apparent trend and estimate the magnitude of that trend. 	<p>The project owner shall do all of the following:</p> <p>At least 60 days prior to operation of the site groundwater supply wells, the project owner shall submit to the CPM, a comprehensive report presenting all the data and information required in item A above. The CPM will provide comments to the plan 15 days following submittal, and the final plan shall be approved 15 days prior to operation of the site groundwater supply wells. The project owner shall submit to the CPM all calculations and assumptions made in development of the report data and interpretations. During Project construction, the project owner shall submit to the CPM quarterly reports presenting all the data and information required in item B above. The quarterly reports shall be provided 30 days following the end of the quarter. The project owner shall also submit to the CPM all calculations and assumptions made in development of the report data and interpretations.</p> <p>No later than March 31 of each year of construction or 60 days prior to Project operation, the project owner shall provide to the CPM for review and approval, documentation showing that any mitigation to private well owners during Project construction was satisfied, based on the requirements of the property owner as determined by the CPM.</p> <p>During Project operation, the project owner shall submit to the CPM, applicable quarterly, semi-annual and annual reports presenting all the data and information required in item C above. Quarterly reports shall be submitted to the CPM 30 days following the end of the quarter. The fourth quarter report shall serve as the annual report and shall be provided on January 31 in the following year.</p> <p>The project owner shall submit to the CPM all calculations and assumptions made in development of report data and interpretations, calculations, and assumptions used in development of any reports.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
SOIL AND WATER (cont.)		
<p>C. During Operation:</p> <ol style="list-style-type: none"> 1. On a quarterly basis for the first year of operation and semiannually thereafter for the following four years, collect water level measurements from any wells identified in the groundwater monitoring program to evaluate operational influence from the Project. Quarterly operational parameters (i.e., pumping rate) of the water supply wells shall be monitored. Additionally, quarterly groundwater-use in the CVGB shall be estimated based on available data. 2. On an annual basis, perform statistical trend analysis for water levels data and comparison to predicted water level declines due to project pumping. Analysis of the significance of an apparent trend shall be determined and the magnitude of that trend estimated. Based on the results of the statistical trend analyses and comparison to predicted water level declines due to Project pumping, the project owner shall determine the area where the Project pumping has induced a drawdown in the water supply at a level of 5 feet or more below the baseline trend. 3. If water levels have been lowered more than 5 feet below presite operational trends, and monitoring data provided by the project owner show these water level changes are different from background trends and are caused by Project pumping, then the project owner shall provide mitigation to the impacted well owner(s). Mitigation shall be provided to the impacted well owners that experience 5 feet or more of Project-induced drawdown if the CPM's inspection of the well monitoring data confirms changes to water levels and water level trends relative to measured pre-project water levels, and the well (private owners well in question) yield or performance has been significantly affected by Project pumping. The type and extent of mitigation shall be determined by the amount of water level decline induced by the Project, the type of impact, and site specific well construction and water use characteristics. If an impact is determined to be caused by drawdown from more than one source, the level of mitigation provided shall be proportional to the amount of drawdown induced by the Project relative to other sources. In order to be eligible, a well owner must provide documentation of the well location and construction, including pump intake depth, and that the well was constructed and usable before Project pumping was initiated. The mitigation of impacts shall be determined as follows: <ol style="list-style-type: none"> a. If Project pumping has lowered water levels by 5 feet or more and increased pumping lifts, increased energy costs shall be calculated. Payment or reimbursement for the increased costs shall be provided at the option of the affected well owner on an annual basis. In the absence of specific electrical use data supplied by the well owner, the project owner shall use SOIL&WATER-5 to calculate increased energy costs. b. If groundwater monitoring data indicate Project pumping has lowered water levels below the top of the well screen, and the well yield is shown to have decreased by 10% or more of the pre-Project average seasonal yield, compensation shall be provided for the diagnosis and maintenance to treat and remove encrustation from the well screen. Reimbursement shall be provided at an amount equal to the customary local cost of performing the necessary diagnosis and maintenance for well screen encrustation. Should the well yield reductions be recurring, the project owner shall provide payment or reimbursement for periodic maintenance throughout the life of the Project. If with treatment the well yield is incapable of meeting 110% of the well owner's maximum daily demand, dry season demand, or annual demand the well owner should be compensated by reimbursement or well replacement as described under Condition 3.c. c. If Project pumping has lowered water levels to significantly impact well yield so that it can no longer meet its intended purpose, causes the well to go dry, or cause casing collapse, payment or reimbursement of an amount equal to the cost of deepening or replacing the well shall be provided to accommodate these effects. Payment or reimbursement shall be at an amount equal to the customary local cost of deepening the existing well or constructing a new well of comparable design and yield (only deeper). The demand for water, which determines the 	<p>After the first five year operational and monitoring period, the project owner shall submit a 5 year monitoring report to the CPM that includes all monitoring data collected and a summary of the findings. The CPM will determine if the water level measurements and water quality sampling frequencies should be revised or eliminated.</p>	

APPLICANT PROPOSED MEASURES

SOIL AND WATER (cont.)		
<p>required well yield, shall be determined on a per well basis using well owner interviews and field verification of property conditions and water requirements compiled as part of the pre-project well reconnaissance. Well yield shall be considered significantly impacted if it is incapable of meeting 110% of the well owner's maximum daily demand, dry-season demand, or annual demand – assuming the pre-project well yield documented by the initial well reconnaissance met or exceeded these yield levels.</p> <p>d. The project owner shall notify any owners of the impacted wells within one month of the CPM approval of the compensation analysis for increased energy costs.</p> <p>e. Pump lowering – In the event that groundwater is lowered as a result of Project pumping to an extent where pumps are exposed but well screens remain submerged the pumps shall be lowered to maintain production in the well. The Project shall reimburse the impacted well owner for the costs associated with lowering pumps.</p> <p>f. Deepening of wells – If the groundwater is lowered enough as a result of Project pumping that well screens and/or pump intakes are exposed, and pump lowering is not an option, such affected wells shall be deepened or new wells constructed. The project owner shall reimburse the impacted well owner for all costs associated with deepening existing wells or constructing new wells shall be borne by the project owner.</p> <p>4. After the first five-year operational and monitoring period the CPM shall evaluate the data and determine if the monitoring program for water level measurements should be revised or eliminated. Revision or elimination of any monitoring program elements shall be based on the consistency of the data collected. The determination of whether the monitoring program should be revised or eliminated shall be made by the CPM.</p> <p>5. If mitigation includes monetary compensation, the project owner shall provide documentation to the CPM that compensation payments have been made by March 31 of each year of Project operation or, if lump-sum payments are made, payment is made by March 31 following the first year of operation only. Within 30 days after compensation is paid, the project owner shall submit to the CPM a compliance report describing compensation for increased energy costs necessary to comply with the provisions of this condition.</p> <p>6. At the end of every subsequent five-year monitoring period, the collected data shall be evaluated by the CPM and they shall determine if the sampling frequency should be revised or eliminated.</p> <p>7. During the life of the Project, the project owner shall provide to the CPM all monitoring reports, complaints, studies and other relevant data within 10 days of being received by the project owner.</p>		
<p>SOIL&WATER-5, Increased Energy Costs : Where it is determined that the project owner shall reimburse a private well owner for increased energy costs identified as a result of analysis performed in Condition of Certification SOIL&WATER-4, the project owner shall calculate the compensation owed to any owner of an impacted well as described below. Increased Cost for Energy = Change in lift/total system head x total energy consumption x costs/unit of energy</p> <p>Where:</p> <p>Change in lift (ft) = calculated change in water level in the well resulting from project total system head (ft) = elevation head + discharge pressure head elevation head (ft) = difference in elevation between wellhead discharge pressure gauge and water level in well during pumping.</p> <p>discharge pressure head (ft) = pressure at wellhead discharge gauge (psi) X 2.31</p>	<p>The project owner shall do all of the following:</p> <ol style="list-style-type: none"> 1. No later than 30 days after CPM approval of the well drawdown analysis, the project owner shall submit to the CPM for review and approval all documentation and calculations describing necessary compensation for energy costs associated with additional lift requirements. 2. The project owner shall submit to the CPM all calculations, along with any letters signed by the well owners indicating agreement with the calculations, and the name and phone numbers of those well owners that do not agree with the calculations. 	<p>CEC</p>

SOIL AND WATER (cont.)		
<p>The project owner shall submit to the CPM for review and approval the documentation showing which well owners must be compensated for increased energy costs and that the proposed amount is sufficient compensation to comply with the provisions of this condition.</p> <ol style="list-style-type: none"> Any reimbursements (either lump sum or annual) to impacted well owners shall be only to those well owners whose wells were in service within six months of the Commission decision and within a 5-mile radius of the project site. The project owner shall notify all owners of the impacted wells within one month of the CPM approval of the compensation analysis for increase energy costs. Compensation shall be provided on either a one-time lump-sum basis, or on an annual basis, as described below. <p>Annual Compensation: Compensation provided on an annual basis shall be calculated prospectively for each year by estimating energy costs that will be incurred to provide the additional lift required as a result of the project. With the permission of the impacted well owner, the project owner shall provide energy meters for each well or well field affected by the project. The impacted well owner to receive compensation must provide documentation of energy consumption in the form of meter readings or other verification of fuel consumption. For each year after the first year of operation, the project owner shall include an adjustment for any deviations between projected and actual energy costs for the previous calendar year.</p> <p>One-Time Lump-Sum Compensation: Compensation provided on a one-time lump-sum basis shall be based on a well-interference analysis, assuming the maximum project-pumping rate of 300 afy. Compensation associated with increased pumping lift for the life of the project shall be estimated as a lump sum payment as follows:</p> <ol style="list-style-type: none"> The current cost of energy to the affected party considering time of use or tiers of energy cost applicable to the party's billing of electricity from the utility providing electric service, or a reasonable equivalent if the party independently generates their electricity; An annual inflation factor for energy cost of 3%; and A net present value determination assuming a term of 30 years and a discount rate of 9%; 	<p>Compensation payments shall be made by March 31 of each year of project operation or, if lump-sum payment is selected, payment shall be made by March 31 of the first year of operation only. Within 30 days after compensation is paid, the project owner shall submit to the CPM a compliance report describing compensation for increased energy costs necessary to comply with the provisions of this condition.</p>	
<p>SOIL&WATER-6, Water Discharge Requirements: The project owner shall comply with the requirements specified in Appendix B, C, and D. These requirements relate to discharges, or potential discharges, of waste that could affect the quality of waters of the state, and were developed in consultation with staff of the State Water Resources Control Board and/or the applicable California Regional Water Quality Control Board (hereafter "Water Boards"). It is the Commission's intent that these requirements be enforceable by both the Commission and the Water Boards. In furtherance of that objective, the Commission hereby delegates the enforcement of these requirements, and associated monitoring, inspection and annual fee collection authority, to the Water Boards. Accordingly, the Commission and the Water Board shall confer with each other and coordinate, as needed, in the enforcement of the requirements. The project owner shall pay the annual waste discharge permit fee associated with this facility to the Water Boards. In addition, the Water Boards may "prescribe" these requirements as waste discharge requirements pursuant to Water Code Section 13263 solely for the purposes of enforcement, monitoring, inspection, and the assessment of annual fees, consistent with Public Resources Code Section 25531, subdivision (c).</p>	<p>The Project owner shall follow the groundwater quality monitoring requirements as provided in SOIL&WATER-18 by providing Groundwater Quality Monitoring and Reporting Plan 90 days prior to operation of water supply wells for construction activities. The plan shall provide methods and procedures for monitoring background water quality, and site groundwater quality related to operation of the waste management units. Well locations, groundwater sampling procedures and analytical methods shall be provided consistent with requirements stipulated in the Waste Discharge Requirements provided in Appendix B, C and D.</p> <p>No later than 60 days prior to any wastewater discharge or use of land treatment units, the project owner shall provide documentation to the CPM, with copies to the CRBRWQCB,</p>	<p>CEC</p>

SOIL AND WATER (cont.)		
	<p>demonstrating compliance with the WDRs established in Appendices B, C, and D. Any changes to the design, construction, or operation of the evaporation basins, treatment units, or storm water system shall be requested in writing to the CPM, with copies to the CRBRWQCB, and approved by the CPM, in consultation with the CRBRWQCB, prior to initiation of any PSPP Soil and Water Opening Testimony Page 5 changes. The project owner shall provide to the CPM, with copies to the CRBRWQCB, all monitoring reports required by the WDRs, and fully explain any violations, exceedances, enforcement actions, or corrective actions related to construction or operation of the evaporation basins or treatment units.</p>	
<p>SOIL&WATER-7, Septic System and Leach Field Requirements: The project owner shall comply with the requirements of the County of Riverside Ordinance Code Title 8, Chapter 8.124 and the California Plumbing Code (California Code of Regulations Title 24, Part 5) regarding sanitary waste disposal facilities such as septic systems and leach fields. The septic system and leach fields shall be designed, operated, and maintained in a manner that ensures no deleterious impact to groundwater or surface water. Compliance shall include an engineering report on the septic system and leach field design, operation, maintenance, and loading impact to groundwater.</p>	<p>The project owner shall submit all necessary information and the appropriate fee to the County of Riverside and the CRBRWQCB to ensure that the project has complied with county and state sanitary waste disposal facilities requirements. Written assessments prepared by the County of Imperial and the CRBRWQCB regarding the project's compliance with these requirements must be submitted to the AO and CPM for review and approval 30-days prior to the start of power plant operation.</p>	CEC
<p>SOIL&WATER-14, Mitigation of Impacts to the Palo Verde Mesa Groundwater Basin: To mitigate the impact from Project pumping, the Project owner shall identify and implement offset measures to mitigate the increase in discharge from surface water to groundwater that affects recharge in the Palo Verde Valley Groundwater Basin (USGS). The project owner shall implement SOIL&WATER-17 to evaluate the change in recharge over the life of the project including any latency effects from Project pumping. The activities shall include the following water conservation projects: payment for irrigation improvements in Palo Verde Irrigation District, payment for irrigation improvements in Imperial Irrigation District, purchase of water rights within the Colorado River Basin that will be held in reserve, and/or BLM's Tamarisk Removal Program or other proposed mitigation activities acceptable to the CPM. The activities proposed for mitigation shall be outlined in a Water Offset Plan that will be provided to the CPM for review and approval and which shall include the following at a minimum:</p> <ul style="list-style-type: none"> A. Identification of the water offsets as determined in SOIL&WATER-17; B. Demonstration of the Project owner's ability to conduct the activity; C. Whether any governmental approval of the identified offset will be needed, and if so, whether additional approval will require compliance with CEQA or NEPA; D. Demonstration of how much water is provided by each of the offset measures; E. An estimated schedule for completion of the activities; 	<p>The project Owner shall submit a Water Offset Plan to the CPM for review and approval thirty (30) days before the start of extraction of groundwater for construction or operation.</p> <p>The Project owner shall implement the activities reviewed and approved in the Water Offset Plan in accordance with the agreed upon schedule in the Water Offset Plan. If agreement with the CPM on identification or implementation of offset activities cannot be achieved the Project owner shall immediately halt construction or operation until the agreed upon activities can be identified and implemented.</p>	CEC

SOIL AND WATER (cont.)		
<p>SOIL&WATER 17, Estimation of Surface Water Impacts: To further assess the impacts from Project pumping, the Project owner shall estimate the increase in discharge from surface water to groundwater that affects recharge in the Palo Verde Valley Groundwater Basin (PVVGB)(USGS). This estimate may be used for determining the appropriate offset volume in accordance with SOIL&WATER-14. The Project owner shall do the following to provide an estimate for review and approval by the CPM:</p> <ol style="list-style-type: none"> 1. The Project owner shall conduct a detailed analysis of the affect from Project pumping on at the end of the 30 year operational period the change in groundwater outflow from the Chuckwalla Valley Groundwater Basin to the Palo Verde Valley and how the change in outflow may affect recharge of surface water to the PVVGB from the Project's groundwater extraction activities. The detailed analysis shall include: <ol style="list-style-type: none"> a. The conceptual model developed in the AFC and the Staff Assessment, for the Chuckwalla Valley Groundwater Basin and the Palo Verde Valley, and any changes resultant from further analysis in support of numerical modeling; b. The use of an appropriately constructed groundwater model 1.) for the eastern portion of the Chuckwalla Valley Groundwater Basin that describes the effect from Project pumping on the outflow of groundwater to the Palo Verde Valley, and 2.) an appropriately constructed groundwater model of the Palo Verde Valley, inclusive of the mesa and floodplain. The models shall be coupled as appropriate to determine the effect from Project pumping on the surface water recharge in the Palo Verde Valley. Each model shall be constructed in consideration of the following: <ol style="list-style-type: none"> i. Horizontal and vertical geometry information gained through on- and offsite investigations conducted as part of the hydrogeological field investigations for the AFC, and any subsequently documented investigation performed as part of the model development ; ii. Aquifer properties developed as part of the AFC and any subsequently documented investigations performed as part of the model development, and an assessment of aquifer properties available from other published sources. The properties used shall be representative of the available data; and iii. The modeling effort shall include a sensitivity analysis where in the most sensitive variables will be identified and varied within a reasonable range outside of the calibration value to provide an assessment of the range of potential impacts from the Project pumping on the recharge from the Palo Verde Valley Groundwater Basin. c. Reporting of the results of the modeling effort d. Estimation of the increased contribution of surface water discharge to groundwater and the change in recharge to the Palo Verde Valley Groundwater Basin attributable to Project groundwater pumping. 2. The analysis shall include the following elements: <ol style="list-style-type: none"> a. The change in groundwater flux to the regional aquifer from surface water sources attributable to Project pumping in afy for the life of the Project (30 years) until pre-project (within 95%) conditions are achieved; b. A sensitivity analysis that would provide a range in the potential changes in flux relative to variation in the key model variables within each model as a result of Project pumping for life of the Project until pre-project (within 95%) conditions are achieved; 3. The project owner shall present the results of the conceptual model, numerical model, transient runs and sensitivity analysis in a report for review and approval by the CPM. The report shall include all pertinent information regarding the development of the numerical models. The report shall include as discussion of the following as appropriate to each model: 	<p>Within thirty (30) days following certification of the proposed Project, the project owner shall submit to the CPM for their review and approval a report detailing the results of the modeling effort. The report shall include the estimated amount of change in discharge from surface water to groundwater within the Palo Verde Valley due to Project pumping. This estimate shall be used for determining the appropriate volume of water for offset in accordance with SOIL&WATER-14.</p>	<p>CEC</p>

TRAFFIC AND TRANSPORTATION (cont.)		
<p>TRANS-3, Repair and Restoration of Roads: The project owner shall restore all public roads, easements, and rights-of-way that have been damaged due to project-related construction activities to original or near-original condition in a timely manner, as directed by BLM's Authorized Officer and the CPM. Repair and restoration of access roads may be required at any time during the construction phase of the project to assure safe ingress and egress.</p>	<p>At least 30 days prior to the start of mobilization, the project owner shall photograph or videotape all affected public roads, easements, and right-of-way segments and/or intersections and shall provide the CPM and the affected local jurisdictions and Caltrans (if applicable) with a copy of these images. The project owner shall rebuild, repair and maintain all public roads, easements, and rights-of-way in a usable condition throughout the construction phase of the project.</p> <p>At least 30 days prior to the start of site mobilization, the project owner shall consult with the County of Riverside and Caltrans District 8 and notify them of the proposed schedule for project construction. The purpose of this notification is to request that the County of Riverside and Caltrans consider postponement of public right-of-way repair or improvement activities in areas affected by project construction until construction is completed and to coordinate with the project owner regarding any concurrent construction-related activities that are planned or in progress and cannot be postponed.</p> <p>Within 60 calendar days after completion of construction, the project owner shall meet with the CPM, the County of Riverside, and Caltrans District 8 to identify sections of public right-of-way to be repaired. At that time, the project owner shall establish a schedule to complete the repairs and to receive approval for the action(s). Following completion of any public right-of-way repairs, the project owner shall provide to the CPM a letter signed by the County of Riverside and Caltrans District 8 stating their satisfaction with the repairs.</p>	
<p>TRANS-4, Traffic Control Plan (TCP): Prior to the start of construction of the PSPP, the project owner shall prepare and implement a Traffic Control Plan (TCP) for the PSPP's construction and operations traffic. The TCP shall address the movement of workers, vehicles, and materials, including arrival and departure schedules and designated workforce and delivery routes. The project owner shall consult with the County of Riverside and the California Department of Transportation (Caltrans) District 8 office in the preparation and implementation of the Traffic Control Plan (TCP). The project owner shall submit the proposed TCP to the County of Riverside and the Caltrans District 8 office in sufficient time for review and comment, and to the Energy Commission Compliance Project Manager (CPM) for review and approval prior to the proposed start of construction and implementation of the plan. The CPM shall review and approve the TCP or identify any material deficiencies within thirty (30) days of receipt. The project owner shall provide a copy of any written</p>	<p>At least 60 calendar days prior to the start of construction, including any grading or site remediation on the power plant site or its associated easements, the project owner shall submit the proposed TCP to the County of Riverside and the Caltrans District 8 office for review and comment and to the CPM for review and approval. The project owner shall also provide the CPM with a copy of the transmittal letter to the County of Riverside and the Caltrans District 8 office requesting review and comment.</p>	CEC

TRAFFIC AND TRANSPORTATION (cont.)		
<p>comments from the County of Riverside and the Caltrans District 8 office and any changes to the TCP to the CPM prior to the proposed start of construction. The Traffic Control Plan (TCP) shall include:</p> <ol style="list-style-type: none"> 1. A work schedule and end-of-shift departure plan designed to ensure that stacking does not occur at intersections necessary to enter and exit the project sites. The project owner shall consider using one or more of the following measures designed to prevent stacking: staggered work shifts, off-peak work schedules, and/or restricting travel to and departures from each project site to 10 or fewer vehicles every three minutes during peak travel hours on I- 10. 2. Provisions for an incentive program, such as employer-sponsored commuter checks, to encourage construction workers to carpool and/or use van or bus service. 3. Limitation of truck deliveries at the project site to only off-peak hours. 4. A heavy-haul plan addressing the transport and delivery of heavy and oversized loads requiring permits from the California Department of Transportation (Caltrans) or other state or federal agencies. 5. Timing of heavy equipment and building material delivery to the sites 6. Parking for workforce and construction vehicles. 7. Emergency vehicle access to the project site. 8. Provisions for redirection of construction traffic with a flag person as necessary to ensure traffic safety and minimize interruptions to non-construction related traffic flow. 9. Placement of signage, lighting, and traffic control devices at the project construction site and laydown areas. 10. Placement of signage along northbound Corn Springs Road and at the entrance of each of the I-10 westbound and eastbound offramps at Corn Springs Road notifying drivers of construction traffic throughout the duration of the construction period. 11. Placement of signage to redirect traffic from Corn Springs Road during construction activities related to roadway realignments and pipeline installation in and across the Corn Springs Road right-of-way 12. Temporary closing of travel lanes, if necessary. 13. Access to adjacent residential and commercial property during the construction of all linears 		
<p>TRANS-5, Encroachment Permits: The project owner or contractor shall comply with Caltrans' and other relevant jurisdictions' limitations for encroachment into public rights-of-way and shall obtain necessary encroachment permits from Caltrans and any other relevant jurisdictions.</p>	<p>In the MCRs, the project owner shall report permits received during that reporting period. In addition, for at least six months after the start of commercial operation, the project owner shall retain copies of permits and supporting documentation on-site for CPM inspection if requested.</p>	<p>CEC</p>

Conditions of Certification	Verification	Responsible Agency
TRAFFIC AND TRANSPORTATION (cont.)		
<p>TRANS-6, Heliostat Positioning Plan: The project owner shall prepare and implement a Heliostat Positioning Plan that would minimize potential for human health and safety hazards and bird injury or mortality from solar radiation exposure. The Heliostat Positioning Plan shall accomplish the following:</p> <ol style="list-style-type: none"> 1) Identify the heliostat movements and positions (including reasonably possible malfunctions) that could result in potential exposure of observers at various locations including in aircraft, motorists, pedestrians and hikers in nearby wilderness areas to reflected solar radiation from heliostats; 2) Assess the effects of the potential glint and glare associated with the proposed heliostat positions and movements determined through Item 1. The assessment shall quantify the potential glint and glare effects and determine public health, safety, and visual impacts at KOPs identified in the PSEGS Draft SEIS. In addition, the analysis shall identify the maximum project-related glint and glare that could be experienced by motorists along I-10. The assessment shall be conducted by qualified individuals using appropriate and commonly accepted software and procedures. The assessment results must be made available to the BLM in advance of project approval. If the project design is changed during the siting and design process such that substantial changes to glint and glare effects may occur, glint and glare effects shall be recalculated, and the results shall be made available to BLM; 3) Describe within the HPP how programmed heliostat operation would address potential human health and safety hazards at locations of observers, and would limit or avoid potential for harm to birds; 4) Prepare a monitoring plan that would: a) obtain field measurements in candela per meters squared and watts per meter squared to validate that the Heliostat Positioning Plan would avoid potential for human health and safety hazards consistent with the methodologies detailed in the 2010 Sandia Lab document presented by Clifford Ho, et al1, including those referenced studies and materials within related to ocular damage, and b) provide requirements and procedures to document, investigate and resolve legitimate human health and safety hazard complaints prioritizing localized response (e.g., screening at location of complaint) regarding daytime intrusive light. 5) The monitoring plan should be made available to interested parties including CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group and be updated on an annual basis for the first 5 years, and at 2-year intervals thereafter for the life of the project. 	<p>Within 90 days before commercial operation, the project owner shall submit a Heliostat Positioning Plan (HPP) to the CPM for review and approval. The project owner shall also submit the plan to potentially interested parties that may include CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group for review and comment and forward any comments received to the CPM.</p>	
<p>TRANS-7, Power Tower Luminance Monitoring Plan: The project owner shall prepare a Power Tower LMVR Plan to provide procedures to conduct measurements and to document complaints regarding distraction effects to aviation, vehicular and pedestrian traffic associated with the PSEGS solar receiver tower. The Power Tower LMVR Plan shall include provisions for the following:</p> <ol style="list-style-type: none"> 1) Provide measurement data within 30 days to potentially interested parties that may include CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group for review and comment, and to the CPM for review and approval. 2) Measurement of luminance at the locations where any distraction effects have been reported and at the locations nearest the solar receiver tower from the four sides of the power plant boundary, and the nearest public road, which may be substituted for one of the sides of the solar receiver tower during the time of day when values would be highest; 3) Measurement of luminance using an illuminance meter, photometer, or similar device and reporting of data in photometric units (candelas per meter squared and watts per meter squared); the measurements are intended to 	<p>No later than 60 days prior to RSEP commercial operation, the project owner shall provide a Power Tower LMVR Plan applicable to PSEGS for review and approval by the CPM. The plan shall specify procedures to document and investigate complaints regarding intrusive light, and report these to the CPM within 10 days of receiving a complaint.</p> <p>The project owner shall measure the intensity of the luminance of light in candelas per meter squared and watts per meter squared reflected from the solar receiver tower according to the following:</p> <p>A. Within 90 days following commercial operation;</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
TRAFFIC AND TRANSPORTATION (cont.)		
<p>provide a relative and quantifiable measure of luminance that can be associated with any observed and reported distraction effect from the solar receiver tower.</p> <p>4) Provisions for documenting reported distraction and if the solar receiver tower is identified as a safety concern; the project owner shall consider reasonable localized mitigation measures that are technically and financially feasible. The localized mitigation measures may include signage for or screening of the affected area or other reasonable measures.</p> <p>5) Post-mitigation verification; Within 30 days following the implementation of mitigation measures designed to reduce localized impact of the solar receiver tower, the project owner shall repeat the luminance measurements to demonstrate the effectiveness of mitigation measures and provide the new measurement data for review and comment by interested parties that may include CalTrans, CHP, FAA, and the Department of Defense (DOD) Southwest Renewable Energy Work Group, and for review and approval by the CPM.</p>	<p>B. If a major design change is implemented that results in an increase of the reflective luminance of the PSEGS solar receiver tower; and</p> <p>C. After receiving a complaint regarding a distraction associated with the central solar receiver from a location where previous measurements were not taken.</p>	
<p>TRANS-8, Solar Receiver Tower Obstruction Marking and Lighting: The project owner shall install obstruction marking and lighting on the solar receiving tower, consistent with both the FAA and DOD requirements, as expressed in the following documents:</p> <ul style="list-style-type: none"> • FAA Advisory Circular 70/7460-1K, Change 2: Obstruction Marking and Lighting, 24-hour medium-strobes; • Air Force Aviation Safety: Flight Safety Flash 09-01; and • FAA Safety Alert for Operators (SAFO) 09007. <p>Temporary lighting shall be installed on the top of the structure once the construction height has exceeded 200 feet AGL, activated within five days of installation, and maintained in operation 24 hours a day, 7 days a week until construction is complete. Permanent lighting consistent with all requirements shall be installed and activated within five days of completion of construction. Lighting shall be operational 24 hours a day, 7 days a week, for the life of the project and until such time as the tower no longer exists at a height exceeding 200 feet AGL. Upgrades to the required lighting configurations, types, location, or duration shall be implemented consistent with any changes to FAA or DOD obstruction marking and lighting requirements.</p>	<p>At least 60 days prior to the start of construction, the project owner shall submit final design plans for the power plant solar receiving tower that depict the required air traffic obstruction marking and lighting to the CPM for approval.</p> <p>Within five days of completion of the solar receiving tower to a height exceeding 200 feet AGL, the project owner shall install and activate temporary obstruction marking and lighting at the top of the structure and shall maintain temporary lighting at the top of said structure until construction of the tower is complete. The project owner shall inform the CPM in writing within 10 days of the time the lighting is first installed and activated.</p> <p>Within five days of completion of the tower construction, the project owner shall install and activate permanent obstruction marking and lighting consistent with both FAA and DOD requirements and shall inform the CPM in writing within 10 days of installation and activation. The lighting shall be inspected and approved by the CPM (or designate inspector) within 30 days of activation.</p>	
TRANSMISSION LINE SAFETY AND NUISANCE		
<p>TLSN-1, EMF Reduction Guidelines: The project owner shall construct the proposed transmission line (anywhere along the area identified by the applicant as available for its routing) according to the requirements of (a) California Public Utility Commission's GO-95, GO-52, GO-131-D, Title 8, and Group 2, (b) the High Voltage Electrical Safety Orders, sections 2700 through 2974 of the California Code of Regulations, and (3) Southern California Edison's EMF reduction guidelines.</p>	<p>At least 30 days before starting the transmission line or related structures and facilities, the project owner shall submit to the Compliance Project Manager (CPM) a letter signed by a California registered electrical engineer affirming that the lines will be constructed according to the requirements stated in the condition.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
TRANSMISSION LINE SAFETY AND NUISANCE (cont.)		
<p>TLSN-2, Measurements of Electric and Magnetic Fields: The project owner shall use a qualified individual to measure the strengths of the electric and magnetic fields from the line at the points of maximum intensity along the route for which the applicant provided specific estimates. The measurements shall be made before and after energization according to the American National Standard Institute/Institute of Electrical and Electronic Engineers (ANSI/IEEE) standard procedures. These measurements shall be completed no later than 6 months after the start of operations.</p>	<p>The project owner shall file copies of the pre-and post-energization measurements with the CPM within 60 days after completion of the measurements.</p>	CEC
<p>TLSN-3, Transmission Line Distance from Combustible Material: The project owner shall ensure that the rights-of-way of the proposed transmission line are kept free of combustible material, as required under the provisions of section 4292 of the Public Resources Code and section 1250 of Title 14 of the California Code of Regulations.</p>	<p>During the first five years of plant operation, the project owner shall provide a summary of inspection results and any fire prevention activities carried out along the right-of-way and provide such summaries in the Annual Compliance Report on transmission line safety and nuisance-related requirements.</p>	CEC
<p>TLSN-4, Grounding Permanent Metallic Objects: The project owner shall ensure that all permanent metallic objects within the right-of-way of the project-related lines are grounded according to industry standards regardless of ownership.</p>	<p>At least 30 days before the lines are energized, the project owner shall transmit to the CPM a letter confirming compliance with this condition.</p>	CEC
VISUAL RESOURCES		
<p>VIS-1, Surface Treatment of Project Structures and Buildings: The project owner shall treat the surfaces of all project structures and buildings visible to the public such that a) their colors minimize visual intrusion and contrast by blending with (matching) the existing characteristic landscape colors; b) their colors and finishes do not create excessive glare; and c) their colors and finishes are consistent with local policies and ordinances. The transmission line conductors shall be non-specular and non-reflective, and the insulators shall be non-reflective and non-refractive. Grouped structures shall be painted the same color to reduce visual complexity and color contrast.</p> <p>Following in-field consultation with the Energy Commission/BLM Visual Resources specialist and other representatives as deemed necessary, the project owner shall submit for Compliance Project Manager (CPM) review and approval, a specific Surface Treatment Plan that will satisfy these requirements. The treatment plan shall include:</p> <p>A. A description of the overall rationale for the proposed surface treatment, including the selection of the proposed color(s) and finishes based on the characteristic landscape. Colors will be fielded tested using the actual distances from the KOPs to the proposed structures, using the proposed colors painted on representative surfaces;</p> <p>B. A list of each major project structure, building, tank, pipe, and wall; the transmission line towers and/or poles; and fencing, specifying the color(s) and finish proposed for each. Colors must be identified by vendor, name, and pantone number; or according to a universal designation system;</p> <p>C. One set of color brochures or color chips showing each proposed color and finish;</p> <p>D. A specific schedule for completion of the treatment; and</p>	<p>At least 90 days prior to specifying to the vendor the colors and finishes of the first structures or buildings that are surface treated during manufacture, the project owner shall submit the proposed treatment plan to BLM's Authorized Officer and the CPM for review and approval and simultaneously to Riverside County for review and comment. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a plan with the specified revision(s) for review and approval by BLM's Authorized Officer and the CPM before any treatment is applied. Any modifications to the treatment plan must be submitted to BLM's Authorized Officer and the CPM for review and approval.</p> <p>Prior to the start of commercial operation, the project owner shall notify BLM's Authorized Officer and the CPM that surface treatment of all listed structures and buildings has been completed and they are ready for inspection and shall submit to each one set of electronic color photographs from the same key observation points identified in (d) above. The project owner shall provide a status report regarding surface treatment maintenance in the Annual Compliance Report.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
VISUAL RESOURCES (cont.)		
<p>E. A procedure to ensure proper treatment maintenance for the life of the project. The project owner shall not specify to the vendors the treatment of any buildings or structures treated during manufacture, or perform the final treatment on any buildings or structures treated in the field, until the project owner receives notification of approval of the treatment plan by BLM's Authorized Officer and the CPM. Subsequent modifications to the treatment plan are prohibited without BLM's Authorized Officer and CPM approval.</p>	<p>The report shall specify a): the condition of the surfaces of all structures and buildings at the end of the reporting year; b) maintenance activities that occurred during the reporting year; and c) the schedule of maintenance activities for the next year.</p>	
<p>VIS-2, Revegetation of Disturbed Soil Areas: The project owner shall revegetate disturbed soil areas to the greatest practical extent, as described in Condition of Certification BIO 8. In order to address specifically visual concerns, the required Closure, Revegetation and Rehabilitation Plan shall include reclamation of the area of disturbed soils used for laydown, project construction, and siting of the substation and other ancillary operation and support structures.</p>	<p>Refer to Condition of Certification BIO 8.</p>	<p>CEC</p>
<p>VIS-3, Temporary and Permanent Exterior Lighting: In addition to measures identified in VIS-6, and to the extent feasible, consistent with safety and security considerations, the project owner shall design and install all permanent exterior lighting and all temporary construction lighting such that a) lamps and reflectors are not visible from beyond the project site, including any off-site security buffer areas; b) lighting does not cause excessive reflected glare; c) direct lighting does not illuminate the nighttime sky, except for required FAA aircraft safety lighting (which should be an on-demand, visual warning system that is triggered by radar technology if allowed by FAA regulations and if the cost is no more than \$1 million for both towers); d) illumination of the project and its immediate vicinity is minimized, and e) the plan complies federal and state OSHA and with local policies and ordinances. The project owner shall submit to BLM's Authorized Officer and the CPM for review and approval, and simultaneously to the County of Riverside and NPS Joshua Tree NP (see VIS-6) for review and comment a lighting mitigation plan that includes the following:</p> <p>A. Location and direction of light fixtures shall take the lighting mitigation requirements into account;</p> <p>B. Lighting design shall consider setbacks of project features from the site boundary to aid in satisfying the lighting mitigation requirements;</p> <p>C. Lighting shall incorporate fixture hoods/shielding, with light directed downward or toward the area to be illuminated;</p> <p>D. Light fixtures that are visible from beyond the project boundary shall have cutoff angles that are sufficient to prevent lamps and reflectors from being visible beyond the project boundary, except where necessary for security;</p> <p>E. All lighting shall be of minimum necessary brightness consistent with operational safety and security; and</p> <p>F. Lights in high illumination areas not occupied on a continuous basis (such as maintenance platforms) shall have (in addition to hoods) switches, timer switches, or motion detectors so that the lights operate only when the area is occupied.</p>	<p>At least 90 days prior to ordering any permanent exterior lighting or temporary construction lighting, the project owner shall contact BLM's Authorized Officer the CPM, and NPS Joshua Tree NP to discuss the documentation required in the lighting mitigation plan. At least 60 days prior to ordering any permanent exterior lighting, the project owner shall submit to BLM's Authorized Officer and, the CPM for review and approval and simultaneously to the County of Riverside and NPS Joshua Tree NP for review and comment a lighting mitigation plan. If BLM's Authorized Officer and the CPM determine that the plan requires revision, the project owner shall provide to BLM's Authorized Officer and the CPM a revised plan for review and approval by BLM's Authorized Officer and the CPM.</p> <p>The project owner shall not order any exterior lighting until receiving BLM Authorized Officer and CPM approval of the lighting mitigation plan.</p> <p>Prior to commercial operation, the project owner shall notify BLM's Authorized Officer and the CPM that the lighting has been completed and is ready for inspection. If after inspection, BLM's Authorized Officer and the CPM notify the project owner that modifications to the lighting are needed, within 30 days of receiving that notification the project owner shall implement the modifications and notify BLM's Authorized Officer and the CPM that the modifications have been completed and are ready for inspection.</p> <p>Within 48 hours of receiving a lighting complaint, the project owner shall provide BLM's Authorized Officer and the CPM with a complaint resolution form report as specified in the Compliance General Conditions including a proposal to</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
VISUAL RESOURCES (cont.)		
	<p>resolve the complaint, and a schedule for implementation. The project owner shall notify BLM's Authorized Officer and the CPM within 48 hours after completing implementation of the proposal. A copy of the complaint resolution form report shall be submitted to BLM's Authorized Officer and the CPM within 30 days.</p>	
<p>VIS-4, Project Design: To the extent possible, the project owner will use proper design fundamentals to reduce the visual contrast to the characteristic landscape. These include proper siting and location; reduction of visibility; repetition of form, line, color (see VIS 1) and texture of the landscape; and reduction of unnecessary disturbance. Design strategies to address these fundamentals will be based on the following factors:</p> <p>Earthwork: Select locations and alignments that fit into the landforms to minimize the size of cuts and fills. Avoid hauling in or hauling out of excess earth cut or fill. Avoid rounding and/or warping slopes. Retain existing rock formations, vegetation, and drainage. Tone down freshly broken rock faces with emulsions or stains. Use retaining walls to reduce the amount and extent of earthwork. Retain existing vegetation by using retaining walls or fill slopes, reducing surface disturbance, and protecting roots from damage during excavations. Avoid soil types that generate strong color contrasts. Reduce dumping or sloughing of excess earth and rock on downhill slopes.</p> <p>Vegetation Manipulation: Retain as much of the existing vegetation as possible. Use existing vegetation to screen the development from public viewing. Use scalloped, irregular cleared edges to reduce line contrast as determined in VIS-1. Use irregular clearing shapes to reduce form contrast. Feather and thin the edges of cleared areas and retain a representative mix of plant species and sizes.</p> <p>Structures: Minimize the number of structures and combine different activities in one structure. Use natural, self-weathering materials and chemical treatments on surfaces to reduce color contrast. Bury all or part of the structure. Use natural appearing forms to complement the characteristic landscape. Screen the structure from view by using natural land forms and vegetation. Reduce the line contrast created by straight edges.</p> <p>Signs: The use of signs and project construction signs shall be minimized. Necessary signs shall be made of nonglare materials and utilize unobtrusive colors. The reverse sides of signs and mounts shall be painted or coated by using the most suitable color selected from the BLM Standard Environmental Color Chart to reduce color contrasts with the existing landscape; however, placements and design of any signs required by safety regulations must conform to regulatory requirements.</p> <p>Linear Alignments: Use existing topography to hide induced changes associated with roads, lines, and other linear features. Select alignments that follow landscape contours. Avoid fall-line cuts and bisecting ridge tops. Hug vegetation lines and avoid open areas such as valley bottoms. Cross highway corridors and less sharp angles. The visual color contrast of graveled surfaces shall be reduced with approved color treatment practices.</p> <p>Construction: No paint or permanent discoloring agents shall be applied to rocks or vegetation to indicate surveyor construction activity limits. All stakes and flagging shall be removed from the construction area upon completion of construction and disposed of in an approved facility.</p> <p>Reclamation and Restoration: Reduce the amount of disturbed area and blend the disturbed areas into the characteristic landscape. Replace soil, brush, rocks, and natural debris over disturbed area. Newly introduced plant species should be of a form, color, and texture that blends with the landscape.</p>	<p>As early as possible in the site and facility design, the project owner shall meet with the CPM to discuss incorporation of these above factors into the design plans. At least 90 days prior to final site and facility design, the project owner shall contact the CPM to review the incorporation of the above factors into the final facility and site design plans. If the CPM determines that the site and facility plans require revision, the project owner shall provide to the CPM a revised plan for review and approval by the CPM.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
VISUAL RESOURCES (cont.)		
<p>VIS-5 (Previously Identified as BLM-VIS-1), Power Block and Power Tower Appearance: In addition to the measures identified in VIS-1, the project owner shall paint power blocks structures and other vertical construction shadow gray as shown on the BLM Color Chart. The solar tower can be left untreated concrete. The backs of heliostat mirrors shall also be designed to minimize reflectivity.</p>	Refer to VIS-1.	CEC
<p>VIS-6 (Previously Identified as BLM-VIS-2), Consultation with NPS Night Sky Program Manager: In addition to the measures identified in VIS-3, the project owner shall consult with the National Park Service Night Sky Program Manager in the development of the lighting plan, and comply with stricter standards for light intensity. Any such lighting plan shall not conflict with federal requirements for lighting. All permanent light sources shall be below 3,500 Kelvin color temperature (warm white) and shall have cutoff angles not to exceed 45 degrees of nadir. All lights, temporary and permanent, are to be fully shielded such that the emission of light above the horizontal will be prevented. Prior to construction, the Applicant and SCE shall submit to the BLM, CPUC, and NPS Joshua Tree NP for review and approval a Lighting Mitigation Plan that includes the following:</p> <ol style="list-style-type: none"> 1. Specification that LPS or amber LED lighting will be emphasized, and that white lighting (metal halide) would (a) only be used when necessitated by specific work tasks, (b) not be used for dusk-to-dawn lighting, and (c) would be less than 3500 Kelvin color temperature; 2. Specification and map of all lamp locations, orientations, and intensities, including security, roadway, and task lighting; 3. Specification of each light fixture and each light shield; 4. Total estimated outdoor lighting footprint, expressed as lumens or lumens per acre; 5. Definition of the threshold for substantial contribution to light pollution in JTNP, in coordination with the Night Sky Program Manager (see below); 6. Specifications on the use of portable truck-mounted lighting; 7. Specification of motion sensors and other controls to be used, especially for security lighting; 8. Surface treatment specification that will be employed to minimize glare and skyglow; 9. Results of a Lumen Analysis (based on final lighting plans), in consultation with the NPS Night Sky Program Manager (Chad Moore – (970) 491-3700), in order to determine the extent of night lighting exposures in the surrounding NPS lands. If the lighting exposure on NPS lands exceeds the allowable threshold (which is to be determined in consultation with the NPS Night Sky Program Manager), additional control measures will be instituted to reduce the lighting exposures to levels below the action threshold; and 10. Documentation that the necessary coordination with the NPS Night Sky Program Manager has occurred. 	Refer to VIS-3.	CEC
WASTE		
<p>WASTE-1, Training and Reporting Plan: The project owner shall prepare a UXO Identification, Training and Reporting Plan to properly train all site workers in the recognition, avoidance and reporting of military waste debris and ordnance. The project owner shall submit the plan to the Compliance Project Manager (CPM) and BLM Authorized Office (AO) for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:</p>	The project owner shall submit the UXO Identification, Training and Reporting Plan to the CPM for approval no later than 30 days prior to the start of site mobilization. The results of geophysical surveys shall be submitted to the CPM within 30 days of completion of the surveys.	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
WASTE (cont.)		
<ol style="list-style-type: none"> 1. A description of the training program outline and materials, and the qualifications of the trainers; and 2. Identification of available trained experts that will respond to notification of discovery of any ordnance (unexploded or not); and 3. Work plan to recover and remove discovered ordnance, and complete additional field screening, possibly including geophysical surveys to investigate adjacent areas for surface, near surface or buried ordnance in all proposed land disturbance areas. 		
<p>WASTE-2, Resume of Professional Engineer or Geologist: The project owner shall provide the résumé of an experienced and qualified Professional Engineer or Professional Geologist to the Compliance Project Manager (CPM) and BLM Authorized Office (AO) for review and approval. The résumé shall show experience in remedial investigation and feasibility studies. This Professional Engineer or Professional Geologist shall be available during site characterization (if needed), excavation, grading, and demolition activities. The Professional Engineer or Professional Geologist shall be given authority by the project owner to oversee any earth-moving activities that have the potential to disturb contaminated soil and impact public health, safety, and the environment.</p>	At least 30 days prior to the start of site mobilization the project owner shall submit the resume to the CPM for review and approval.	CEC
<p>WASTE-3, Inspection and Reporting of Potentially Contaminated Soil: If potentially contaminated soil is identified during site characterization, excavation, grading, or demolition at either the proposed site or linear facilities—as evidenced by discoloration, odor, detection by handheld instruments, or other signs—the Professional Engineer or Professional Geologist shall inspect the site; determine the need for sampling to confirm the nature and extent of contamination; and provide a written report to the project owner, representatives of Department of Toxic Substances Control (DTSC) or Regional Water Quality Control Board (RWQCB), the Compliance Project Manager (CPM) and the BLM Authorized Office (AO) stating the recommended course of action.</p> <p>Depending on the nature and extent of contamination, the Professional Engineer or Professional Geologist shall have the authority to temporarily suspend construction activity at that location for the protection of workers or the public. If in the opinion of the Professional Engineer or Professional Geologist significant remediation may be required, the project owner shall contact the CPM, AO and representatives of the DTSC or RWQCB for guidance and possible oversight.</p>	The project owner shall submit any reports filed by the Professional Engineer or Professional Geologist to the CPM within five days of their receipt. The project owner shall notify the CPM within 24 hours of any orders issued to halt construction.	CEC
<p>WASTE-4, Construction Waste Management Plan: The project owner shall submit a Construction Waste Management Plan to the Compliance Project Manager (CPM) and the BLM Authorized Office (AO) for review and approval prior to the start of construction. The plan shall contain, at a minimum, the following:</p> <ol style="list-style-type: none"> 1. a description of all construction waste streams, including projections of frequency, amounts generated and hazard classifications; 2. a survey of structures to be demolished that identifies the types of waste to be managed; 3. a reuse/recycling plan for construction and demolition materials that meets or exceeds the 50 percent waste diversion goal established by the Integrated Waste Management Compliance Act; and, 4. management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods, and companies providing treatment services, waste testing methods to assure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/reduction plans. 	The project owner shall submit the Construction Waste Management Plan to the CPM for approval no less than 30 days prior to the initiation of construction activities at the site.	CEC

Conditions of Certification	Verification	Responsible Agency
WASTE (cont.)		
<p>WASTE-5, Hazardous Waste Generator Identification Number: The project owner shall obtain a hazardous waste generator identification number from the United States Environmental Protection Agency (USEPA) prior to generating any hazardous waste during project construction and operations.</p>	<p>The project owner shall keep a copy of the identification number on file at the project site and provide documentation of the hazardous waste generation and notification and receipt of the number to the CPM in the next scheduled Monthly Compliance Report after receipt of the number. Submittal of the notification and issued number documentation to the CPM is only needed once unless there is a change in ownership, operation, waste generation, or waste characteristics that requires a new notification to USEPA. Documentation of any new or revised hazardous waste generation notifications or changes in identification number shall be provided to the CPM in the next scheduled compliance report.</p>	CEC
<p>WASTE-6, Notification of Impending Waste Management-Related Enforcement Action: Upon notification of any impending waste management-related enforcement action by any local, state, or federal authority, the project owner shall notify the Compliance Project Manager (CPM) of any such action taken or proposed against the project itself, or against any waste hauler or disposal facility or treatment operator with which the owner contracts, and describe how the violation will be corrected.</p>	<p>The project owner shall notify the CPM in writing within 10 days of receiving written notice from authorities of an impending enforcement action. The CPM shall notify the project owner of any changes that will be required in the way project-related wastes are managed as a result of a finalized action against the project.</p>	CEC
<p>WASTE-7, Operation Waste Management Plan: The project owner shall submit the Operation Waste Management Plan to the CPM for review and approval. The plan shall contain, at a minimum, the following:</p> <ol style="list-style-type: none"> 1. a detailed description of all operation and maintenance waste streams, including projections of amounts to be generated, frequency of generation, and waste hazard classifications; 2. management methods to be used for each waste stream, including temporary on-site storage, housekeeping and best management practices to be employed, treatment methods and companies providing treatment services, waste testing methods to ensure correct classification, methods of transportation, disposal requirements and sites, and recycling and waste minimization/source reduction plans; 3. information and summary records of contacts with the local Certified Unified Program Agency and the Department of Toxic Substances Control regarding any waste management requirements necessary for project activities. Copies of all required waste management permits, notices, and/or authorizations shall be included in the plan and updated as necessary; 4. a detailed description of how facility wastes will be managed and any contingency plans to be employed, in the event of an unplanned closure or planned temporary facility closure; and 5. a detailed description of how facility wastes will be managed and disposed upon closure of the facility. 	<p>The project owner shall submit the Operation Waste Management Plan to the CPM for approval no later than 30 days prior to the start of project operation. The project owner shall submit any required revisions to the CPM within 20 days of notification from the CPM that revisions are necessary.</p> <p>The project owner shall also document in each Annual Compliance Report the actual volume of wastes generated and the waste management methods used during the year, provide a comparison of the actual waste generation and management methods used to those proposed in the original Operation Waste Management Plan, and update the Operation Waste Management Plan as necessary to address current waste generation and management practices.</p>	CEC
<p>WASTE-9: The project owner shall ensure that all accidental spills or unauthorized releases of hazardous substances, hazardous materials, and hazardous waste are documented and remediated, and that wastes generated from accidental spills and unauthorized releases are properly managed and disposed of in accordance with all applicable federal, state, and local LORS and requirements. For the purpose of this Condition of Certification, "release" shall have the definition in Title 40 of the Code of Federal Regulations, Part 302.3.</p>	<p>No later than 30 days of the date that a project-related hazardous substance release was discovered, the project manager shall provide a copy of the accidental spill or unauthorized release documentation to the CPM.</p>	CEC

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
WASTE (cont.)		
	<p>The project owner shall document management of all accidental spills and unauthorized releases of hazardous substances, hazardous materials, and hazardous wastes that occur on the project property or related linear facilities. The documentation shall include, at a minimum, the following information: location of release; date and time of release; reason for release; volume released; how release was managed and material cleaned up; amount of contaminated soil and/or cleanup wastes generated; if the release was reported; to whom the release was reported; release corrective action and cleanup requirements placed by regulating agencies; level of cleanup achieved and actions taken to prevent a similar release or spill; and disposition of any hazardous wastes and/or contaminated soils and materials that may have been generated by the release.</p>	
<p>WASTE-10: The project owner shall ensure that none of the project's non- hazardous, non-recyclable, and non-reusable construction and operation wastes shall be diverted to or deposited at either the Desert Center Landfill or the Oasis Sanitary Landfill.</p>	<p>The project owner shall provide documentation of all project- related solid waste disposal activities and identify the landfills receiving project- related wastes in the Annual Compliance Report submitted to the CPM.</p>	<p>CEC</p>
WORKER SAFETY		
<p>WORKER SAFETY-1, Project Construction Safety and Health Program: The project owner shall submit to the Compliance Project Manager (CPM) a copy of the Project Construction Safety and Health Program containing the following:</p> <ol style="list-style-type: none"> 1. a Construction Personal Protective Equipment Program; 2. a Construction Exposure Monitoring Program; 3. a Construction Injury and Illness Prevention Program; 4. a Construction heat stress protection plan that implements and expands on existing Cal OSHA regulations as found in 8 CCR 3395; 5. a Construction Emergency Action Plan; and 6. a Construction Fire Prevention Plan. <p>The Personal Protective Equipment Program, the Exposure Monitoring Program, the Heat Stress Protection Plan, and the Injury and Illness Prevention Program shall be submitted to the CPM for review and approval concerning compliance of the program with all applicable safety orders. The Construction Emergency Action Plan and the Fire Prevention Plan shall be submitted to the Riverside County Fire Department for review and comment prior to submittal to the CPM for approval.</p>	<p>At least 30 days prior to the start of construction, the project owner shall submit to the CPM for review and approval a copy of the Project Construction Safety and Health Program. The project owner shall provide a copy of a letter to the CPM from the Riverside County Fire Department stating the fire department's comments on the Construction Fire Prevention Plan and Emergency Action Plan.</p>	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
WORKER SAFETY (cont.)		
<p>WORKER SAFETY-2, Project Operations and Maintenance Safety and Health Program: The project owner shall submit to the CPM a copy of the Project Operations and Maintenance Safety and Health Program containing the following:</p> <ol style="list-style-type: none"> 1. an Operation Injury and Illness Prevention Plan, including measures to prevent exposure to Valley Fever; 2. an Operation heat stress protection plan that implements and expands on existing Cal OSHA regulations (8 CCR 3395); 3. a Best Management Practices (BMP) for the storage and application of herbicides; 4. an Emergency Action Plan; 5. Hazardous Materials Management Program; 6. Fire Prevention Plan that includes the fuel depot should the project owner elect to maintain and operate the fuel depot during operations (8 Cal Code Regs. § 3221) as well as the fire protection measures described in this Decision and any necessary upgrades required by current applicable LORS; and 7. Personal Protective Equipment Program (8 Cal Code Regs, §§ 3401-3411). <p>The Operation Injury and Illness Prevention Plan, Emergency Action Plan, Heat Stress Protection Plan, BMP for Herbicides, and Personal Protective Equipment Program shall be submitted to the CPM for review and comment concerning compliance of the programs with all applicable safety orders. The Fire Prevention Plan and the Emergency Action Plan shall also be submitted to the Riverside County Fire Department for review and comment.</p>	<p>At least 30 days prior to the start of first-fire or commissioning, the project owner shall submit to the CPM for approval a copy of the Project Operations and Maintenance Safety and Health Program. The project owner shall provide a copy of a letter to the CPM from the Riverside County Fire Department stating the fire department's comments on the Operations Fire Prevention Plan and Emergency Action Plan.</p>	<p>CEC</p>
<p>WORKER SAFETY-3, Construction Safety Supervisor: The project owner shall provide a site Construction Safety Supervisor (CSS) who, by way of training and/or experience, is knowledgeable of power plant construction activities and relevant laws, ordinances, regulations, and standards; is capable of identifying workplace hazards relating to the construction activities; and has authority to take appropriate action to assure compliance and mitigate hazards. The CSS shall:</p> <ol style="list-style-type: none"> 1. have overall authority for coordination and implementation of all occupational safety and health practices, policies, and programs; 2. assure that the safety program for the project complies with Cal/OSHA and federal regulations related to power plant projects; 3. assure that all construction and commissioning workers and supervisors receive adequate safety training; 4. complete accident and safety-related incident investigations and emergency response reports for injuries and inform the CPM of safety-related incidents; and 5. assure that all the plans identified in Conditions of Certification Worker Safety-1 and -2 are implemented. 	<p>At least 30 days prior to the start of site mobilization, the project owner shall submit to the CPM the name and contact information for the Construction Safety Supervisor (CSS). The contact information of any replacement CSS shall be submitted to the CPM within one business day. The CSS shall submit in the Monthly Compliance Report a monthly safety inspection report to include:</p> <ol style="list-style-type: none"> A. A record of all employees trained for that month (all records shall be kept on site for the duration of the project); B. A summary report of safety management actions and safety-related incidents that occurred during the month; C. A report of any continuing or unresolved situations and incidents that may pose danger to life or health; and D. A report of accidents and injuries that occurred during the month. 	<p>CEC</p>

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
WORKER SAFETY (cont.)		
<p>WORKER SAFETY-4, Safety Monitor: The project owner shall make payments to the Chief Building Official (CBO) for the services of a Safety Monitor based upon a reasonable fee schedule to be negotiated between the project owner and the CBO. Those services shall be in addition to other work performed by the CBO. The Safety Monitor shall be selected by and report directly to the CBO and will be responsible for verifying that the Construction Safety Supervisor, as required in Condition of Certification WORKER SAFETY-3, implements all appropriate Cal/OSHA and Energy Commission safety requirements. The Safety Monitor shall conduct on-site (including linear facilities) safety inspections at intervals necessary to fulfill those responsibilities.</p>	<p>At least 30 days prior to the start of construction, the project owner shall provide proof of its agreement to fund the Safety Monitor services to the CPM for review and approval.</p>	CEC
<p>WORKER SAFETY-5, Automatic External Defibrillator (AED): The project owner shall ensure that a portable automatic external defibrillator (AED) is located on site during construction and operations and shall implement a program to ensure that workers are properly trained in its use and that the equipment is properly maintained and functioning at all times. During construction and commissioning, the following persons shall be trained in its use and shall be on site whenever the workers that they supervise are on site: the Construction Project Manager or delegate, the Construction Safety Supervisor or delegate, and all shift foremen. During operations, all power plant employees shall be trained in its use. The training program shall be submitted to the CPM for review and approval.</p>	<p>At least 60 days prior to the start of site mobilization, the project owner shall submit to the CPM proof that a portable automatic external defibrillator (AED) exists on site and a copy of the training and maintenance program for review and approval.</p>	CEC
<p>WORKER SAFETY-6, Emergency Access Point: The project owner shall:</p> <p>A. Provide a secondary site access gate for emergency personnel to enter the site. This secondary site access gate shall be at least one-quarter mile from the main gate.</p> <p>B. Provide a second access road which provides entry to the site. This road shall be at a minimum an all-weather gravel road, at least 20 feet wide, and shall come from the Interstate-10 right-of-way to the project site at the location of where the fence line of the eastern solar field comes the nearest to the I-10 right-of-way, if approved by Caltrans, a locked gate shall be placed in the I-10 right-of-way fence. The RCFD, the California Highway Patrol, and the Riverside County Sheriff's Department shall be given access to the gate.</p> <p>C. Maintain the main access road and provide a plan for construction and implementation.</p> <p>Plans for the secondary access gate, the method of gate operation, and maintenance of the roads shall be submitted to the Riverside County Fire Department for review and comment and to the CPM for review and approval.</p>	<p>At least 60 days prior to the start of site mobilization, the project owner shall submit to the RCFD and the CPM preliminary plans showing the location of a secondary site access gate to the site, a description of how the secondary site access gate will be opened by the fire department and other emergency services, and a description and map showing the location, dimensions, and composition of the main road, and the gravel road to the secondary site access gate.</p> <p>At least 30 days prior to the start of site mobilization, the project owner shall submit the secondary site access gate final plans plus the road maintenance plan to the CPM for review and approval. The final plan submittal shall also include a letter containing comments from the Riverside County Fire Department or a statement that no comments were received.</p>	
<p>WORKER SAFETY-7, Fire Protection/Response Infrastructure: [To be replaced with a condition that summarizes the agreement with Riverside County that will be finalized after the fire needs assessment is performed and submitted to Riverside County for review.]</p>		
<p>WORKER SAFETY-9, Dust Control Plan: The project owner shall develop and implement an enhanced Dust Control Plan that includes the requirements described in Conditions AQ-SC3 and AQ-SC4, and additionally requires:</p> <p>A. Site worker use of dust masks (NIOSH N-95 or better) whenever visible dust is present;</p> <p>B. Implementation of Rule 402 of the Kern County Air Pollution Control District (as amended Nov. 3, 2004); and</p>	<p>At least 30 days prior to the commencement of site mobilization, the enhanced Dust Control Plan shall be provided to the CPM for review and approval.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
WORKER SAFETY (cont.)		
<p>C. Implementation of enhanced dust control methods (increased frequency of watering, use of dust suppression chemicals, etc. consistent with AQ-SC4) immediately whenever visible dust persists in the breathing zone of the workers, or when PM10 measurements obtained when implementing B (above) indicate an increase in PM10 concentrations due to project activities of 50 µg/m3 or more.</p>		
<p>WORKER SAFETY-10, Joint Training with RCFD: The project owner shall participate in annual joint training exercises with the Riverside County Fire Department (RCFD). The project owner shall coordinate this training with other Energy Commission-licensed solar power plants within Riverside County such that this project shall host the annual training on a rotating yearly basis with the other solar power plants.</p>	<p>At least 10 days prior to the start of commissioning, the project owner shall submit to the CPM proof that a joint training program with the RCFD is established. In each January Monthly Compliance Report during construction and the Annual Compliance Report during operation, the project owner shall include the date, list of participants, training protocol, and location of the annual joint training.</p>	
GEOLOGY, PALEONTOLOGY, AND MINERALS		
<p>GEO-1, Soils Engineering Report: The Soils Engineering Report required by Section 1802A of the 2007 CBC should specifically include laboratory test data, associated geotechnical engineering analyses, and a thorough discussion of potential hydrocompaction or dynamic compaction; the presence of expansive clay soils; and the presence of corrosive soils. The report should also include recommendations for ground improvement and/or foundation systems necessary to mitigate these potential geologic hazards, if present.</p>	<p>The project owner shall include in the application for a grading permit a copy of the Soils Engineering Report which addresses the potential for liquefaction; settlement due to compressible soils, ground water withdrawal, hydro-compaction, or dynamic compaction; and the possible presence of expansive clay soils, and a summary of how the results of the analyses were incorporated into the project foundation and grading plan design for review and comment by the Chief Building Official (CBO). A copy of the Soils Engineering Report, application for grading permit and any comments by the CBO are to be provided to BLM's Authorized Officer and the CPM at least 30 days prior to grading.</p>	
<p>PAL-1, Paleontological Resources Specialist (PRS): The project owner shall provide the compliance project manager (CPM) with the resume and qualifications of its paleontological resource specialist (PRS) for review and approval. If the approved PRS is replaced prior to completion of project mitigation and submittal of the Paleontological Resources Report, the project owner shall obtain CPM approval of the replacement PRS. The project owner shall keep resumes on file for qualified paleontological resource monitors (PRMs). If a PRM is replaced, the resume of the replacement PRM shall also be provided to the CPM.</p> <p>The PRS resume shall include the names and phone numbers of references. The resume shall also demonstrate to the satisfaction of the CPM the appropriate education and experience to accomplish the required paleontological resource tasks.</p> <p>As determined by the CPM, the PRS shall meet the minimum qualifications for a vertebrate paleontologist as described in the Society of Vertebrate Paleontology (SVP) guidelines of 1995. The experience of the PRS shall include the following:</p> <ol style="list-style-type: none"> 1. Institutional affiliations, appropriate credentials, and college degree; 2. Ability to recognize and collect fossils in the field; 	<ol style="list-style-type: none"> (1) At least 60 days prior to the start of ground disturbance, the project owner shall submit a resume and statement of availability of its designated PRS for on-site work. (2) At least 20 days prior to ground disturbance, the PRS or project owner shall provide a letter with resumes naming anticipated monitors for the project, stating that the identified monitors meet the minimum qualifications for paleontological resource monitoring required by the condition. If additional monitors are obtained during the project, the PRS shall provide additional letters and resumes to the CPM. The letter shall be provided to the CPM no later than one week prior to the monitor's beginning on-site duties. 	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GEOLOGY, PALEONTOLOGY, AND MINERALS (cont.)		
<p>3. Local geological and biostratigraphic expertise;</p> <p>4. Proficiency in identifying vertebrate and invertebrate fossils; and</p> <p>5. At least three years of paleontological resource mitigation and field experience in California and at least one year of experience leading paleontological resource mitigation and field activities.</p> <p>The project owner shall ensure that the PRS obtains qualified paleontological resource monitors to monitor as he or she deems necessary on the project. Paleontologic resource monitors (PRMs) shall have the equivalent of the following qualifications:</p> <ol style="list-style-type: none"> 1. BS or BA degree in geology or paleontology and one year of experience monitoring in California; or 2. AS or AA in geology, paleontology, or biology and four years' experience monitoring in California; or 3. Enrollment in upper division classes pursuing a degree in the fields of geology or paleontology and two years of monitoring experience in California. 	<p>(3) Prior to the termination or release of a PRS, the project owner shall submit the resume of the proposed new PRS to the CPM for review and approval.</p>	
<p>PAL-2, Materials for PRS and CPM: The project owner shall provide to the PRS and the CPM, for approval, maps and drawings showing the footprint of the power plant, construction lay-down areas, and all related facilities. Maps shall identify all areas of the project where ground disturbance is anticipated. If the PRS requests enlargements or strip maps for linear facility routes, the project owner shall provide copies to the PRS and CPM. The site grading plan and plan and profile drawings for the utility lines would be acceptable for this purpose. The plan drawings should show the location, depth, and extent of all ground disturbances and be at a scale between 1 inch = 40 feet and 1 inch = 100 feet. If the footprint of the project or its linear facilities changes, the project owner shall provide maps and drawings reflecting those changes to the PRS and CPM.</p> <p>If construction of the project proceeds in phases, maps and drawings may be submitted prior to the start of each phase. A letter identifying the proposed schedule of each project phase shall be provided to the PRS and CPM. Before work commences on affected phases, the project owner shall notify the PRS and CPM of any construction phase scheduling changes.</p> <p>At a minimum, the project owner shall ensure that the PRS or PRM consults weekly with the project superintendent or construction field manager to confirm area(s) to be worked the following week and until ground disturbance is completed.</p>	<ol style="list-style-type: none"> (1) At least 30 days prior to the start of ground disturbance, the project owner shall provide the maps and drawings to the PRS and CPM. (2) If there are changes to the footprint of the project, revised maps and drawings shall be provided to the PRS and CPM at least 15 days prior to the start of ground disturbance. (3) If there are changes to the scheduling of the construction phases, the project owner shall submit a letter to the CPM within 5 days of identifying the changes. 	
<p>PAL-3, Paleontological Resources Monitoring and Mitigation Plan (PRMMP): The project owner shall ensure that the PRS prepares, and the project owner submits to the CPM for review and approval, a paleontological resources monitoring and mitigation plan (PRMMP) to identify general and specific measures to minimize potential impacts to significant paleontological resources. Approval of the PRMMP by the CPM shall occur prior to any ground disturbance. The PRMMP shall function as the formal guide for monitoring, collecting, and sampling activities and may be modified with CPM approval. This document shall be used as the basis of discussion when on-site decisions or changes are proposed. Copies of the PRMMP shall reside with the PRS, each monitor, the project owner's on-site manager, and the CPM.</p> <p>The PRMMP shall be developed in accordance with the guidelines of the Society of Vertebrate Paleontology (SVP 1995) and shall include, but not be limited, to the following:</p> <ol style="list-style-type: none"> 1. Assurance that the performance and sequence of project-related tasks, such as any literature searches, pre-construction surveys, worker environmental training, fieldwork, flagging or staking, construction monitoring, mapping and data recovery, fossil preparation and collection, identification and inventory, preparation of final reports, and transmittal of materials for curation will be performed according to PRMMP procedures; 	<p>At least 30 days prior to ground disturbance, the project owner shall provide a copy of the PRMMP to the CPM. The PRMMP shall include an affidavit of authorship by the PRS and acceptance of the PRMMP by the project owner evidenced by a signature.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GEOLOGY, PALEONTOLOGY, AND MINERALS (cont.)		
<p>2. Identification of the person(s) expected to assist with each of the tasks identified within the PRMMP and the conditions of certification;</p> <p>3. A thorough discussion of the anticipated geologic units expected to be encountered, the location and depth of the units relative to the project when known, and the known sensitivity of those units based on the occurrence of fossils either in that unit or in correlative units;</p> <p>4. An explanation of why, how, and how much sampling is expected to take place and in what units. Include descriptions of different sampling procedures that shall be used for fine-grained and coarse-grained units;</p> <p>5. A discussion of the locations of where the monitoring of project construction activities is deemed necessary, and a proposed plan for monitoring and sampling;</p> <p>6. A discussion of procedures to be followed in the event of a significant fossil discovery, halting construction, resuming construction, and how notifications will be performed;</p> <p>7. A discussion of equipment and supplies necessary for collection of fossil materials and any specialized equipment needed to prepare, remove, load, transport, and analyze large-sized fossils or extensive fossil deposits;</p> <p>8. Procedures for inventory, preparation, and delivery for curation into a retrievable storage collection in a public repository or museum, which meet the Society of Vertebrate Paleontology's standards and requirements for the curation of paleontological resources;</p> <p>9. Identification of the institution that has agreed to receive data and fossil materials collected, requirements or specifications for materials delivered for curation and how they will be met, and the name and phone number of the contact person at the institution; and</p> <p>10. A copy of the paleontological conditions of certification.</p>		
<p>PAL-4, Approved Weekly Training Pertaining to Ground Disturbance: Prior to ground disturbance and for the duration of construction activities involving ground disturbance, the project owner and the PRS shall prepare and conduct weekly CPM-approved training for the following workers: project managers, construction supervisors, foremen, and general workers involved with or who operate ground-disturbing equipment or tools. Workers shall not excavate in sensitive units prior to receiving CPM-approved worker training. Worker training shall consist of an initial in-person PRS training or may utilize a CPM-approved video or other presentation format during the project kick off for those mentioned above. Following initial training, a CPM-approved video or other approved training presentation/materials, or in-person training may be used for new employees. The training program may be combined with other training programs prepared for cultural and biological resources, hazardous materials, or other areas of interest or concern. No ground disturbance shall occur prior to CPM approval of the Worker Environmental Awareness Program (WEAP), unless specifically approved by the CPM. The WEAP shall address the possibility of encountering paleontological resources in the field, the sensitivity and importance of these resources, and legal obligations to preserve and protect those resources.</p> <p>The training shall include:</p> <p>1. A discussion of applicable laws and penalties under the law;</p>	<p>(1) At least 30 days prior to ground disturbance, the project owner shall submit the proposed WEAP, including the brochure, with the set of reporting procedures for workers to follow.</p> <p>(2) At least 30 days prior to ground disturbance, the project owner shall submit the training program presentation/materials to the CPM for approval if the project owner is planning to use a presentation format other than an in-person trainer for training.</p> <p>(3) If the owner requests an alternate paleontological trainer, the resume and qualifications of the trainer shall be submitted to the CPM for review and approval prior to installation of an alternate trainer. Alternate trainers shall not conduct training prior to CPM authorization.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
<p>GEOLOGY, PALEONTOLOGY, AND MINERALS (cont.)</p>		
<ol style="list-style-type: none"> 2. Good quality photographs or physical examples of vertebrate fossils for project sites containing units of high paleontologic sensitivity; 3. Information that the PRS or PRM has the authority to halt or redirect construction in the event of a discovery or unanticipated impact to a paleontological resource; 4. Instruction that employees are to halt or redirect work in the vicinity of a find and to contact their supervisor and the PRS or PRM; 5. An informational brochure that identifies reporting procedures in the event of a discovery; 6. A WEAP certification of completion form signed by each worker indicating that he/she has received the training; and 7. A sticker that shall be placed on hard hats indicating that environmental training has been completed. 	<p>(4) In the monthly compliance report (MCR), the project owner shall provide copies of the WEAP certification of completion forms with the names of those trained and the trainer or type of training (in-person or other approved format) offered that month. The MCR shall also include a running total of all persons who have completed the training to date.</p>	
<p>PAL-5, Paleontological Monitoring Activities: The project owner shall ensure that the PRS and PRM(s) monitor consistent with the PRMMP all construction-related grading, excavation, trenching, and augering in areas where potential fossil-bearing materials have been identified, both at the site and along any constructed linear facilities associated with the project. In the event that the PRS determines full-time monitoring is not necessary in locations that were identified as potentially fossil bearing in the PRMMP, the project owner shall notify and seek the concurrence of the CPM. The project owner shall ensure that the PRS and PRM(s) have the authority to halt or redirect construction if paleontological resources are encountered. The project owner shall ensure that there is no interference with monitoring activities unless directed by the PRS. Monitoring activities shall be conducted as follows:</p> <ol style="list-style-type: none"> 1. Any change of monitoring from the accepted schedule in the PRMMP shall be proposed in a letter or email from the PRS and the project owner to the CPM prior to the change in monitoring and will be included in the monthly compliance report. The letter or email shall include the justification for the change in monitoring and be submitted to the CPM for review and approval. 2. The project owner shall ensure that the PRM(s) keep a daily monitoring log of paleontological resource activities. The PRS may informally discuss paleontological resource monitoring and mitigation activities with the CPM at any time. 3. The project owner shall ensure that the PRS notifies the CPM within 24 hours of the occurrence of any incidents of non-compliance with any paleontological resources conditions of certification. The PRS shall recommend corrective action to resolve the issues or achieve compliance with the conditions of certification. 4. For any significant paleontological resources encountered, either the project owner or the PRS shall notify the CPM within 24 hours, or Monday morning in the case of a weekend event, where construction has been halted because of a paleontological find. <p>The project owner shall ensure that the PRS prepares a summary of monitoring and other paleontological activities placed in the monthly compliance reports. The summary will include the name(s) of PRS or PRM(s) active during the month; general descriptions of training and monitored construction activities; and general locations of excavations, grading, and other activities. A section of the report shall include the geologic units or subunits encountered, descriptions of samplings within each unit, and a list of identified fossils. A final section of the report will address any issues or concerns about the project relating to paleontologic monitoring, including any incidents of non-compliance or any changes to the monitoring plan that have been approved by the CPM. If no monitoring took place during the month, the report shall include an explanation in the summary as to why monitoring was not conducted.</p>	<p>The project owner shall ensure that the PRS submits the summary of monitoring and paleontological activities in the MCR. When feasible, the CPM shall be notified 10 days in advance of any proposed changes in monitoring different from the plan identified in the PRMMP. If there is any unforeseen change in monitoring, the notice shall be given as soon as possible prior to implementation of the change.</p>	

APPLICANT PROPOSED MEASURES

Conditions of Certification	Verification	Responsible Agency
GEOLOGY, PALEONTOLOGY, AND MINERALS (cont.)		
<p>PAL-6, Implementation of PRMMP: The project owner, through the designated PRS, shall ensure that all components of the PRMMP are adequately performed including collection of fossil materials, preparation of fossil materials for analysis, analysis of fossils, identification and inventory of fossils, the preparation of fossils for curation, and the delivery for curation of all significant paleontological resource materials encountered and collected during project construction.</p>	<p>The project owner shall maintain in his/her compliance file copies of signed contracts or agreements with the designated PRS and other qualified research specialists. The project owner shall maintain these files for a period of three years after project completion and approval of the CPM-approved paleontological resource report (see Condition of Certification PAL-7). The project owner shall be responsible for paying any curation fees charged by the museum for fossils collected and curated as a result of paleontological mitigation. A copy of the letter of transmittal submitting the fossils to the curating institution shall be provided to the CPM.</p>	
<p>PAL-7, Paleontological Resources Report (PRR): The project owner shall ensure preparation of a Paleontological Resources Report (PRR) by the designated PRS. The PRR shall be prepared following completion of the ground-disturbing activities. The PRR shall include an analysis of the collected fossil materials and related information and submit it to the CPM for review and approval. The report shall include, but is not limited to, a description and inventory of recovered fossil materials; a map showing the location of paleontological resources encountered; determinations of sensitivity and significance; and a statement by the PRS that project impacts to paleontological resources have been mitigated below the level of significance.</p>	<p>Within 90 days after completion of ground-disturbing activities, including landscaping, the project owner shall submit the PRR under confidential cover to the CPM.</p>

Air Quality Laws, Regulations, and Policies

APPLICABLE LAWS, REGULATIONS, POLICIES, AND EXECUTIVE ORDERS

AIR QUALITY	
Federal	
40 CFR Part 52	<p>Nonattainment New Source Review (NSR) requires a permit, Best Available Control Technology (BACT) and Offsets. Permitting and enforcement is delegated to the Mojave Desert Air Quality Management District (MDAQMD).</p> <p>Prevention of Significant Deterioration (PSD) requires major sources or major modifications to major sources to obtain permits for attainment pollutants. The PSPP is a new source that does not have a rule listed emission source; thus, the PSD trigger levels are 250 tons per year for NOx, VOC, SOx, PM10 PM2.5 and CO.</p>
40 CFR Part 60	<p>New Source Performance Standards (NSPS), Subpart Dc Standards of Performance for Small Industrial-Commercial-Institutional Steam Generation Units. Establishes recordkeeping and reporting requirements for natural gas-fired steam-generating units.</p> <p>Subpart IIII Standards of Performance for Stationary Compression Ignition Internal Combustion Engines. Establishes emission standards for compression-ignition internal combustion engines, including emergency generator and fire water pump engines.</p>
40 CFR Part 93	General Conformity requires a determination of conformity with the State Implementation Plan for a project that requires a Federal approval if the project's annual emissions are above specified levels.
State	
California Health & Safety Code §§ 40910-40930	Permitting of source needs to be consistent with Air Resource Board (ARB) approved Clean Air Plans.
Health & Safety Code § 41700	Restricts emissions that would cause nuisance or injury.
Title 17 California Code of Regulations (CCR) § 93115	Airborne Toxic Control Measure for Stationary Compression Ignition Engines limits the types of fuels allowed, establishes maximum emission rates, and establishes recordkeeping requirements on stationary compression ignition engines, including emergency generator and fire water pump engines.
Rule 201 and 203 Permits Required	Requires a Permit to Construct before construction of an emission source occurs. Prohibits operation of any equipment that emits or controls an air pollutant without first obtaining a permit to operate.
Local (South Coast Air Quality Management District, SCAQMD)	
Regulation XIII-NSR	Requires pre-construction review for all proposed new or modified stationary sources. Review includes a BACT determination, mitigation analysis, air quality impact analysis, etc.
Regulation XIV-Rule 1401-Toxics NSR	Requires pre-construction review for all proposed new or modified stationary sources emitting toxic pollutants. Establishes risk significance levels and review procedures.
Regulation XXX-Title V	Implements the provisions of the federal operating permits program and the requirements of the CAA Title V.
Regulation XXXI-Acid Rain Permit Program	Implements the provisions of the federal Acid Rain Program. See rule provisions Subpart A-I.
Rule 401-Visible Emissions	Limits visible emissions from applicable processes to values no darker than Ringelmann #1 for periods greater than 3 minutes in any hour.
Rule 402-Nuisance	Prohibits emissions in quantities that would adversely affect public health, other businesses, or property.
Rule 403-Fugitive Dust	Limits fugitive PM emissions from construction and construction related activities.
Rule 404-Particulate Matter	Limits PM concentration in exhaust from boilers, heaters, IC engines, etc.
Rule 409-Combustion Contaminants	Limits PM emissions from combustion sources.
Rule 429-Nox Exemptions for Startup/Shutdown	Provides NOx emissions exemptions for boiler subject to Rule 1146 for periods of startup and shutdown.

APPLICABLE LAWS, REGULATIONS, POLICIES, AND EXECUTIVE ORDERS (Continued)

Applicable LORS	Description
AIR QUALITY (cont.)	
Local (South Coast Air Quality Management District, SCAQMD) (cont.)	
Rule 431-Sulfur Content of Fuels (431.1-431.3)	Limits the sulfur content of fuels combusted in stationary sources.
Rule 433-Natural Gas Quality	Applies to all natural gas distribution system operators that convey natural gas to end users within the District.
Rule 442-Organic Solvents	Limits emissions of VOC from materials or processes using VOC containing products.
Rule 463-Storage of Organic Liquids	Limits VOC emissions from the storage and transfer of VOC containing materials.
Rule 474-Fuel Burning Equipment-NOx	Limits NOx emissions from non-mobile fuel burning equipment.
Regulation IX-NSPS	New Source Performance Standards (NSPS) Potentially applicable Subparts: Db, Dc, IIII.
Rule 1110.2-Gaseous and Liquid Fueled Engines	Limits NOx, VOC, and CO emissions from gaseous and liquid fueled IC engines.
Rule 1121-NOx Control from NG Fired Water Heaters	Limits NOx emissions from natural gas fired residential type water heaters.
Rule 1146-NOx Emissions from IIC Boilers and Process Heaters	Limits NOx from boilers, steam generators, and heaters rated at greater than 5 mmbtu/hr.
Rule 1171-Solvent Cleaning Operations	Limits VOC, TAC, and SODS emissions from solvent use in cleaning operations activities.
Regulation XIX-Federal Conformity	Implements the General Conformity requirements of 40 CFR Parts 6 and 51.

Any equip type described under Load Factor as "On Road" on Table E.5-7 were assigned Usage Factors and Load Factors based on the SCAQMD CEQA Handbook data tables. Load and use factors not counted in Hp-Hr calculations, since these parameters are accounted for in the SCAQMD emissions factors (2013).

CONSTRUCTION PHASE - Site Prep (Grading) for Both Power Blocks and Solar Field Roads (All Phases)

MRI Level 2 Analysis (Refs 1, 3-7)

Acres Subject to Construction Grading/Earthwork Disturbance Activities:	337.2	
Max Acres Subject to Construction Disturbance Activities on any day:	34	
Emissions Factor for PM10 Uncontrolled, tons/acre/month:	0.0144	
PM2.5 fraction of PM10 (per CARB CEIDARS Profiles):	0.21	
Activity Levels:		
Hrs/Day:	10	
Days/Wk:	5	
Days/Month:	21	
Const Period, Months:	16	1.3 years
Const Period, Days:	336	
Wet Season Adjustment: (Per AP-42, Section 13.2.2, Figure 13.2.2-1, 12/03)		
Mean # days/year with rain >= 0.01 inch:	20	
Mean # months/yr with rain >= 0.01 inch:	0.67	
Adjusted Const Period, Months:	15.11	
Adjusted Const Period, Days:	309	

Controls for Fugitive Dust:

Proposed watering cycle: 3 times per day

SCAQMD Mitigation Measures, Table XI-A, 4/07

3 watering cycles/10 hour construction shift yields a 61% reduction, 2 watering cycles/10 hour shift should yield a 40%+ reduction. Speed control of onsite const traffic from 35 to 15 mph yields a 57% reduction (use 50% control as conservative in desert area).

Calculated % control based on mitigations proposed:	81	% control
Conservative control % used for emissions estimates:	80	% control
	0.2	release fraction

Emissions: Controlled	PM10	PM2.5
tons/month	0.098	0.021
tons/period	1.480	0.311
Max lbs/day	9.3	1.958

Soil Handling Emissions (Cut and Fill): (2)

Total cu.yds of soil handled:	213067	Mean annual wind speed, mph:	7.8
Total tons of soil handled:	550991.262	Avg. Soil moisture, %:	5
Total days soil handled:	309	Avg. Soil density, tons/cu.yd:	1.3
Tons soil/day:	1781	k factor for PM10:	0.35
Control Eff, watering, %	80	Number of Drops per ton:	2
Release Fraction:	0.2	Calc 1 wind	1.783
		Calc 2 moisture	3.607
		Calc 3 int	0.494
		Calc 4 PM10 lb/ton	0.0006
		PM2.5 fraction of PM10:	0.210

Emissions:	PM10	PM2.5
tons/period	0.03	0.01
tons/month	0.00	0.00
max lbs/day	0.20	0.04

Emissions Totals:		PM10	PM2.5
	tons/period	1.5110	0.3173
	tons/month	0.1000	0.0210
	max lbs/day	9.52	2.00

Methodology References:

(1) MRI Report, South Coast AQMD Project No. 95040, March 1996, Level 2 Analysis Procedure.

MRI Report factor of 0.011 tons/acre/month is based on 168 hours per month of const activity.

For an activity rate of 210 hrs/month, the adjusted EF would be 0.0144 tons/acre/month.

Construction days/month:	21		Local	0.28 g/m ²	
Adj. Construction months/period:	31.20		Rural	1.6 g/m ²	
Control Applied to Trackout:	Sweeping and Cleaning (water washing)				
Control Efficiency, %	80	0.8	Release Factor =	0.2	

* PM2.5 fraction of PM10 assumed to be 0.169 (CARB CEIDARS updated fraction values) for paved roads.

** 1 controlled ingress/egress point is planned for site construction

EPA, AP-42, Section 13.2.1, Proposed revisions dated 9/2008.

Use silt loading factor from default values for road type if no site specific data is available.

Trackout effects approximately 0.05 mi. of roadway arriving and departing from the site access point.

Plant access road will be paved prior to main site construction period.

Vehicle count = delivery trucks plus 10 misc support vehicles X 2

Worker vehicles not counted for trackout, as they do not access main site.

Department of Defense Non-Objection Letter

This page intentionally left blank

OFFICE OF THE UNDER SECRETARY OF DEFENSE

3000 DEFENSE PENTAGON
WASHINGTON, DC 20301-3000

ACQUISITION,
TECHNOLOGY
AND LOGISTICS

17 August 2012

Krista Kisch
Vice President – Project Development
Bright Source, Inc.
1999 Harrison St.
Suite 2150
Oakland, CA 94612

Dear Ms. Kisch:

At your request, the DoD Siting Clearinghouse has coordinated an initial review of your proposal for two solar towers at the proposed Palen Towers project in Riverside County, California. While we predict the project will impact the training we conduct in military training routes VR-296, VR-1265, VR-1268, and IR-218, we believe those impacts can be mitigated. Therefore, the Department of Defense will not oppose construction of the project; however, we ask you to continue to coordinate with us as you make micrositing decisions. Your continued cooperation will help us preserve our military's operational, training, and testing capabilities.

Note that this informal review by the DoD does not constitute an action under 49 U.S.C. § 44718 and that neither the DoD nor the Secretary of Transportation are bound by the determination made under the informal review. Please call me at (703) 697-7301 with any questions, and feel free to share this letter with any of your investors or community partners.

Sincerely,

A handwritten signature in cursive script that reads "Michael A. Aimone".

Michael A. Aimone, P.E.
Executive Director,
DoD Siting Clearinghouse

Draft Fire Safety Plan

This page intentionally left blank

Fire Safety Plan Palen Solar Electric Generating System (PSEGS)

*****DRAFT*****

Fire Prevention – General Requirements

Palen Solar Holdings, LLC (PSH), along with its contractors and subcontractors, will develop, implement and maintain strict housekeeping practices as an integral part of an overall PSEGS Fire Prevention program. General requirements will include:

- Combustible and flammable waste must not be allowed to accumulate in any work area.
- Scrap and combustible materials must be removed from structures, partly completed buildings and completed buildings as soon as it is generated.
- Flammable and combustible materials must not be stacked or stored against any temporary or permanent building, structure or storage facility.
- Rags, fabric and timber contaminated with any hydrocarbon product must be contained in a closed metal container and removed daily from the workplace to a safe disposal area.
- During periods when the risk of fire is high efforts will be made to limit activities with inherent fire risks including hot work (grinding, cutting, welding), chainsaw/chipping operations, etc.
- Smoking will be strictly prohibited in specific areas including inside all buildings and within 30 feet of any combustible material storage area. These areas will be clearly identified.

Material Storage

Materials will be stored in a manner so as not to obstruct access to fire protection equipment, control valves, fire doors, alarm devices or panels, electrical panels, motor control centers (MCCs) or aisles and hallways that serve as a means of exit. A minimum clearance of 36 inches (91 cm) shall be maintained in all aisle ways leading to an exit. Also, materials will not obstruct sprinkler heads. A minimum clearance of 18 inches (46 cm) will be maintained from sprinkler heads.

Materials in work areas will be limited to actual needs and will be stored in a manner to protect combustible material from ignition sources. Materials will not be stored within 6 feet (1.8 m) of any inside opening or hoist way.

Storage areas will be kept clean, and materials will be neatly stacked or placed. Construction materials shall be stored or placed in an orderly manner. Storage quantities will be minimized. Fire loads imposed by boxed materials (insulation) will be regulated by the Environmental, Safety and Health Department.

Flammable and Combustible Liquids

Flammable liquids (e.g., gasoline, acetone, denatured alcohol) will not be used for cleaning. Flammable/combustible solvents will not be used near ignition sources.

Flammable liquids will be handled and used only in approved, properly labeled safety cans. Only approved containers and portable tanks will be used for the storage and handling of flammable and combustible liquids. Approved metal safety cans will be used for the handling of flammable liquids in quantities greater than 1 US gallon (3.8 L). This rule will not apply to those flammable liquid materials that are highly viscous (extremely hard to pour); such materials may be used and handled in their original shipping containers. For quantities of 1 US gallon (3.8 L) or less, only the original container or approved metal safety cans will be employed for storage, use and handling.

Approved, properly labeled storage cabinets will be supplied for the storage of flammable liquids in quantities exceeding 15 U.S. gallons (12.9 UK gallons).

Flammable and combustible liquids will not be stored in areas used as exits, stairways or passageways, and will not adversely affect a means of egress.

Portable storage tanks will be maintained in a diked area, with provisions made for the handling of spills and groundwater protection. The proximity of tanks to buildings and flammables will comply with local, state and federal regulations.

Smoking will be prohibited where refueling activities are in progress. Clear and legible signs will be posted.

No equipment will be fueled while the engine is running.

Fuel cans shall be placed on the ground for filling to avoid the build-up of a static charge generated by the fuel flowing into the can.

The use of cellular phones or other types of radio-frequency (RF) generating devices (pagers, two-way radios, etc.) shall not be permitted during any fueling operations.

Combustible liquids, including oil or grease, will be stored in containers or storage tanks labeled with contents and tank capacity. Each tank will be:

- Capable of withstanding working pressures and stresses compatible with the type of liquid stored,
- Maintained in a manner that prevents leakage,
- Located in an area free of combustible materials, and
- Vented or otherwise constructed to prevent development of pressures or vacuum as a result of filling, emptying or changes in atmospheric temperature.

Permanent storage areas will be provided for containment or removal of the contents in the event of a tank rupture.

All piping valves and fittings will be capable of withstanding working pressures and stresses compatible with the type of liquid stored and will be maintained in a manner to prevent leaks.

Fuel lines will be equipped with valves capable of stopping the flow of fuel at the source and will be located and maintained to minimize fire hazards. This does not apply to fuel lines on self-propelled equipment.

Particular care will be taken when welding and cutting in locations where combustibles are exposed. When such welding or cutting is done, the surrounding area will be inspected. Combustible material will be removed or protected with fire-resistant blankets or equivalent, and an adequate number of approved fire extinguishers will be immediately available. Flammable liquids will be transferred from one container to another only when containers are electrically interconnected (bonded).

The dispensing units will be protected against collision damage.

Compressed Gas Cylinders

Compressed gas cylinder valves will be closed whenever:

- Work is finished
- The cylinders are empty, or
- The cylinders are moved.

Gauges will be removed and valve protection caps in place before moving cylinders, except when cylinders are secured in a carrier designed for such use.

Compressed gas cylinders will not be hoisted by the valve cap or by means of magnets or slings.

Compressed gas cylinders will be secured in an upright position at all times, except for short periods when being carried or hoisted.

Cylinders will be transported in an upright position and will not be hauled in equipment beds or truck beds on their side. Cylinders lifted from one elevation to another will be lifted only in racks or containers designed for that purpose.

Compressed gas cylinders will be stored/located to avoid exposure to sparks, hot slag or flames. If these cannot be avoided, fire-resistant shields will be provided.

Compressed gas cylinders will not be used as, or placed where they may become part of, an electrical circuit.

Compressed gas cylinders will not be taken into a confined space.

Compressed gas cylinders will not be used as rollers.

Cylinders in storage will be separated (oxygen from fuel gas) by a 5-foot-high (1.5 meters) barrier with a 1-hour fire rating or by a distance of 20 feet (6.1 meters).

Welding gases will be stored in isolated areas and segregated by type of gas.

Cylinders will be stored in well-protected, ventilated, dry locations, at least 20 feet (6.1 meters) from highly combustible materials, and away from egress routes such as stairways and elevators.

Bars will not be used to pry or loosen protective caps. Warm water will be used to loosen caps when frozen.

Damaged or defective cylinders will not be used, but will be tagged and returned to the vendor.

Oxygen cylinders will be kept free of oil and grease.

Compressed gas cylinders will be used and stored in an upright position.

All compressed gas cylinders will be secured in place during use and storage. Securing shall be around the body of the cylinder, midway between top and bottom. Securing around the cylinder neck or by its cap shall be prohibited.

Cylinders will be returned to the main storage area when empty.

If a key wrench is required, it will be in place on the valve of acetylene bottles at all times during use.

The valves of compressed gas cylinders will be completely closed when not in use.

Compressed gas cylinders will not be transported with gauges attached. The gauges will be removed from cylinders and protective caps installed during transportation.

Hot Work

Before Hot Work can be carried out in any construction area, welding fabrication area or shop, the area must be cleared of all combustible and flammable material.

A suitable fire extinguisher must be located within easy reach of operations.

Valves on fuel gas will not be opened more than 1½ turns. If a special key is required for closing the valve, the key will be left in position on the stem at all times or until the task is completed and the caps are replaced.

Fuel gas hose and oxygen hoses will be easily distinguishable and will not be interchangeable. Fuel gas cylinders will not be placed in confined spaces. Fuel gas hoses will be removed from confined spaces when not in use.

When fuel gas rigs are to be used in confined spaces, the atmosphere will be monitored to ensure that a flammable and/or oxygen enriched atmosphere is not created.

Hoses and torches will be inspected before use, and defective hoses will be removed from service.

Boxes used to store fuel gas hoses that have been in use will be ventilated.

Torches will be ignited by friction lighters or other approved devices only.

Cylinders, all hose apparatus, and connectors will be kept free of oil and grease and not handled with oily or greasy hands or gloves.

Oxygen/fuel gas systems will be equipped with approved back-flow valves, flash back arresters and pressure relief devices.

Fuel gas/oxygen equipment will be disconnected from the source when left unattended, such as at lunch or at completion of the task. Torches will not be left inside a confined space unattended.

All employees will use the proper personal protective equipment and clothing when performing or assisting in cutting and welding operations (burning glasses, shields, moleskin suits or flame resistant coveralls and gloves, etc.).

Welding leads and equipment will be properly maintained and inspected before use. Defective equipment will not be used and will be reported to supervision.

Arc welding and cutting operations, including grinding, will be shielded by non-combustible or flameproof screens, shields or other safeguards for the protection of personnel or materials exposed to sparks, slag, falling objects or the ultraviolet (UV)/infrared (IR) radiation of the arc.

Pipelines containing flammable liquids or gases, or electrical cables will not be used as a ground.

The frame of all arc welding or cutting machines will be effectively grounded when the machine's power outlets are being employed as a power source if ground fault interrupter (GFCI) (ELCB) is not being used.

If electrode holders are to be left unattended, the electrodes will be removed and the holder placed where it is protected from unintentional contact.

A fire resistant container will be provided for spent electrode stubs.

Welding machines will be turned off when being moved or when the welder must leave his/her work for any length of time.

No welding or cutting will be done where flammable paints, compounds or dust may create a hazard.

A fire extinguisher with a 30-lb. (13.6 kg) Class A, B, C rating will be at the work location during welding, cutting, soldering, etc.

If normal fire prevention methods are not sufficient to adequately ensure the prevention of fires, additional personnel will be added (fire watch) to guard against potential fires.

Fire Watches will be trained and will remain at the location a sufficient amount of time, as required by the governing standards (e.g., HSE requires minimum 60 minutes; OSHA requires minimum 30 minutes, etc.) after work is stopped to ensure that no possibility of fire exists. In the absence of an existing standard, it shall be as defined in the project's ES&H Execution Plan.

Tanks, vessels, drums, etc., which have contained flammable or toxic liquids will be filled with water or thoroughly cleaned before welding, cutting or heating is undertaken on them. If a toxic material is involved, the ES&H Department will evaluate the operation.

Sufficient ventilation will be provided as needed to maintain welding fumes and smoke below permissible exposure limits. Where sufficient ventilation cannot be achieved, alternative methods will be developed.

Where a preservative coating is present, the coating will be removed or alternative methods used for a sufficient distance in each direction to prevent appreciable heating of the coating.

All cutting, welding or burning operations to be done within confined spaces require a Hot Work Permit, a Confined Space Entry Permit and authorization from the general contractor.

Hot Work at height and from scaffolding presents special hazards. The controls are as follows:

- All work must be coordinated with other Subcontractors working in the area.
- Areas beneath Hot Work must be cleared of all combustible and flammable materials.
- Fire retardant material must be used to cover scaffold boards and to enclose operations.
- Fire retardant material must be removed at the end of every shift to expose scaffold boards or combustible materials.

Hot Work within completed and substantially completed buildings, structures adjacent to fuel and gas lines, control facilities, electricity substations, electrical equipment and distribution lines will be subject to the strict application and conditions of a Hot Work Permit.

- A Fire Watch will remain on-guard at the site of Hot Work activity a sufficient amount of time, as required by the governing standards (e.g., HSE requires minimum 60 minutes; OSHA requires minimum 30 minutes, etc.) after work is finished at the end of the shift or as per Permit requirements. In the absence of an existing standard, it shall be as defined in the project's ES&H Execution Plan.

Temporary Buildings

No temporary building will be erected where it will adversely affect any means of exit. Clearance will be maintained around lights and heating units to prevent ignition of combustible materials.

Temporary buildings, when located within another building or structure, will be of either non-combustible construction or of combustible construction having a fire resistance of not less than one hour.

If a temporary building is not located inside another structure and is not employed for the

storage, handling or use of flammable or combustible liquids, flammable gases, explosives or blasting agents, or similar hazardous occupancies, then said building will be placed at a distance of not less than 10 feet (3 meters) from another building or structure. Groups of temporary buildings not exceeding 2,000 square feet (185.8 square meters) in aggregate will, for the purpose of this section, be considered a single temporary building.

Inspection & Testing

General and specific inspection schedules will be developed and implemented.

General inspections will be conducted weekly covering all construction areas, storage and lay down areas, fabrication and painting areas.

All inspections will be conducted to an agreed standard and recorded using an Inspection Checklist Record.

High activity and high-risk areas, such as substantially completed and completed buildings, fuel oil and gas feed stock and storage facilities and power distribution areas, will be inspected daily or more frequently, dependent on activity and risk.

Inspections required by Hot Work Permit will be carried out as per Permit requirements. The Project ES&H Execution Plan shall specify the format for its Hot Work Permit.

Training

Fire prevention and fire precautions training will be given to all Supervisors, Foremen, Fire Watches, Authorized Hot Work Permit Applicants, Security personnel, Stores personnel, and selected employees at the HHSEGS Project Site. The training program will include:

- Checking portable fire extinguishers
- Hazard recognition and risk potential
- Inspection methods
- Hot Work Permit requirements
- Emergency fire procedures
- Selection and use of portable fire extinguishers
- Equipment refueling procedures, and
- Storage and handling of flammable and combustible liquids.

Note: All training and retraining will be recorded.

Electrical Equipment

Electrical installation will be performed by a competent electrician and will conform to electrical codes.

Flexible cables, tools and equipment including welding equipment must be inspected regularly for damage.

Only approved connectors may be used on electric arc welding leads.

All electrical equipment must be isolated after working hours or when not in use.

Task lighting, particularly halogen lamps, must be clear of combustible materials when in use.

Mobile Plant and Portable Equipment

Mobile plant must not be refuelled while the engine is running. Approved type of filling and fuel dispensing equipment must be used.

A suitable portable fire extinguisher should be placed adjacent to electric arc welding sets, electricity generating sets, air compressors and gas burning equipment.

All mobile plant and fuel trucks should carry or have a suitable portable fire extinguisher attached.

Unless fit for purpose, internal combustion engines on mobile plant such as excavators, tractors, trucks and cranes, must be switched off when not in use.

All internal combustion, stationary or mobile, shall be equipped with spark arrestors.

Light trucks and cars shall be used only on designated roadways that have been cleared of vegetation.

Fire Protection Equipment

Firefighting equipment (hose, nozzles, fire buckets, fire extinguishers) will be available when the project begins.

Fire extinguishers will be conspicuously marked, and clear access to each will be maintained. Employees will be trained in the use of fire extinguishers.

Fire extinguishers will be inspected, tested and maintained in accordance with applicable codes/standards, such as National Fire Protection Association (NFPA) standards or international equivalent.

Each fire extinguisher will be replaced immediately after discharge with another fire extinguisher that is fully charged and of the proper size and type.

A temporary or permanent water supply of sufficient volume, pressure and duration will be made available.

If sprinkler systems are being installed, their installation will closely follow construction and they will be placed in service as soon as practical or as local/state building codes require.

Charged fire hoses will be made available during demolition operations involving combustible materials.

Smoking will be permitted only in designated areas. Smoking will be prohibited at or in the vicinity of operations that constitute a fire hazard. A sign reading "No Smoking or Open Flame" will be conspicuously posted.

Electrical wiring and equipment for light, heat or power purposes will be installed in compliance with government requirements.

During construction, all contractor facilities will be kept free from accumulation of unnecessary combustible materials. Weeds and grass will be kept down, and a regular procedure will be established for the periodic cleanup of the entire area.

Portable heaters, regardless of fuel source, will be equipped with an approved automatic device to shut off the flow of gas to the main burner and pilot, if used, in the event of flame failure. Heaters having inputs above 50,000 Btu per hour will be equipped with either a pilot, which must be lighted and proved before the main burner can be turned on, or an electrical ignition system.

Portable electric heaters will be equipped with a tip alarm and an automatic shut-off that will turn the heater off when tipped.

Fire Emergencies

All fires and other emergencies, regardless of the size and/or circumstance(s), shall be immediately reported utilizing the 911 system.

Employees shall be trained in proper reporting procedures such as the nature of the emergency, the exact location, a contact person/callback number and any other important information.

VISUAL CONTRAST RATING WORKSHEET

Date 4/21/2013

District Palm Springs - South Coast

Resource Area Chuckwalla - Palen

Activity (program) Solar Energy

SECTION A. PROJECT INFORMATION

<p>1. Project Name Palen Solar Electric Generating System (PSEGS)</p>	<p>4. Location Township 5 South</p>	<p>5. Location Sketch</p> 
<p>2. Key Observation Point KOP 3 Coxcomb WA (JTNP)</p>	<p>Range 17E</p>	
<p>3. VRM Class VRI Class III VRM Class (Not disclosed by BLM)</p>	<p>Section Multiple Sections</p>	

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LANDWATER	2. VEGETATION	3. STRUCTURES
FORM	Planar, gently sloping ground plane, flat dry lakebed, faintly pyramidal mountains in the background.	Rounded irregular scrub and small trees	Trapezoidal roadbed and cylindrical power line wood poles cross the view in the foreground.
LINE	Horizontal lines of vehicle tracks in foreground. Sinuous line of small wash in foreground. Jagged line of mountains in background.	Irregular but distinct horizontal line where scrub gives way to dry lakebed. Dark diagonal line of agriculture in background.	Faint horizontal and vertical lines of road and electrical poles. Intermittently visible horizontal lines of conductors.
COLOR	Beige, light brown mottled ground plane. Distinct change sand color in middleground.	Relatively green to grey-green creosote scrub. More verdant green approaching dry lakebed.	Grey asphalt roadbed. Dark brown utility poles. Faint silver grey conductors.
TEXTURE	Slightly coarse foreground, smooth flat middleground. Very smooth dry lakebed	Medium coarse random foreground. Gradation to more ordered continuous middleground. Smooth texture in dry lakebed.	Smooth textured road and wood poles.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

It is approximately 10.0 miles from KOP-3 to the center of the proposed project (Background distance zone)

	1. LANDWATER	2. VEGETATION	3. STRUCTURES
FORM	No change.	No change.	Two power towers create new vertical cylindrical forms and two elevated air cooled condensers create rectangular forms approximately 10.0 miles away in the background distance zone.
LINE	No change.	No change.	Two power towers create new vertical lines that barely intersect the horizon of the background mountains. Two elevated air cooled condensers create horizontal lines at the base of the towers.
COLOR	No change.	No change.	Two power towers and two elevated air cooled condensers are medium grey at this distance.
TEXTURE	No change.	No change.	Two power towers and two elevated air cooled condensers are smooth textured.

	Line				X				X		X			
	Color				X				X			X		
	Texture				X				X			X		

SECTION D. (Continued)

Comments from item 2.

The BLM did not respond in a timely manner to a request for a management decision on the final adopted Visual Resource Management Class (VRM Class) or the Interim Visual Resource Management Class (IVRM) designations for the project area. For this analysis, we had to move forward using the presumption that the Visual Resource Inventory Class (VRI Class) has been adopted as the VRM Class. The VRI Class for this area is III.

In determining whether the proposed action would conform to the assigned VRM class, the four levels of contrast roughly correspond with the four VRM classes. This means that a “strong” contrast rating may be acceptable in an area with VRM Class IV, but probably would not meet the objectives of a VRM Class I, II, or III area. Similarly, a “weak” contrast rating may be acceptable in an area with VRM Class II, but probably would not meet the objectives of a VRM Class I area. The table below shows the correlation between contrast rating and determining whether VRM objectives are met.

Degree of Contrast	VRM Class	Definition
None	Class I Preserve	The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. (This classification is usually applied to wilderness areas, wild and scenic rivers, and other similar situations.)
Weak	Class II Retain	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Moderate	Class III Partially Retain	The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
Strong	Class IV Major Modification	The objective of this class is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

The proposed project as seen from KOP-3 will create moderate visual contrasts of form and line, and weak visual contrasts of color and texture. This equates to a rating somewhere between Class II (retention of landscape character) and Class III (partial retention of landscape character).

Therefore, the proposed project will comply with the definition of Class III, above, as seen from KOP-3 at Coxcomb Mtn. WA in the Joshua Tree National Park.

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

VIS-1, Surface Treatment of Project Structures and Buildings

VIS-2, Re-vegetation of Disturbed Soil Areas

VIS-3, Temporary and Permanent Exterior Lighting

VIS-4, Project Design

TRANS-6, Heliostat Positioning Plan

AQ-SC3, Construction Fugitive Dust Control

AQ-SC4, Dust Plume Response Requirement

BIO-8, Impact Avoidance and Minimization Measures

BIO-22, Decommissioning and Reclamation Plan

BLM-VIS-1, Component Color Treatments

BLM-VIS-2, Consultation with the NPS Night Sky Program Manager

No additional mitigation measures beyond these are required because of the view from KOP-3 Coxcomb WA (JTNP).

SECTION D. CONTRAST RATING SHORT TERM LONG TERM

SECTION D. (Continued)

Comments from item 2.

The BLM did not respond in a timely manner to a request for a management decision on the final adopted Visual Resource Management Class (VRM Class) or the Interim Visual Resource Management Class (IVRM) designations for the project area. For this analysis, we had to move forward using the presumption that the Visual Resource Inventory Class (VRI Class) has been adopted as the VRM Class. The VRI Class for this area is III.

In determining whether the proposed action would conform to the assigned VRM class, the four levels of contrast roughly correspond with the four VRM classes. This means that a “strong” contrast rating may be acceptable in an area with VRM Class IV, but probably would not meet the objectives of a VRM Class I, II, or III area. Similarly, a “weak” contrast rating may be acceptable in an area with VRM Class II, but probably would not meet the objectives of a VRM Class I area. The table below shows the correlation between contrast rating and determining whether VRM objectives are met.

Degree of Contrast	VRM Class	Definition
None	Class I Preserve	The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. (This classification is usually applied to wilderness areas, wild and scenic rivers, and other similar situations.)
Weak	Class II Retain	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Moderate	Class III Partially Retain	The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
Strong	Class IV Major Modification	The objective of this class is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

The proposed project as seen from KOP-7 will create moderate visual contrasts of form and line, and weak visual contrasts of color and texture. This equates to a rating somewhere between Class II (retention of landscape character) and Class III (partial retention of landscape character).

Therefore, the proposed project will comply with the definition of Class III, above, as seen from KOP-7 at Big Wash in Joshua Tree National Park.

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

VIS-1, Surface Treatment of Project Structures and Buildings

SECTION D. (Continued)

Comments from item 2.

The BLM did not respond in a timely manner to a request for a management decision on the final adopted Visual Resource Management Class (VRM Class) or the Interim Visual Resource Management Class (IVRM) designations for the project area. For this analysis, we had to move forward using the presumption that the Visual Resource Inventory Class (VRI Class) has been adopted as the VRM Class. The VRI Class for this area is III.

In determining whether the proposed action would conform to the assigned VRM class, the four levels of contrast roughly correspond with the four VRM classes. This means that a “strong” contrast rating may be acceptable in an area with VRM Class IV, but probably would not meet the objectives of a VRM Class I, II, or III area. Similarly, a “weak” contrast rating may be acceptable in an area with VRM Class II, but probably would not meet the objectives of a VRM Class I area. The table below shows the correlation between contrast rating and determining whether VRM objectives are met.

Degree of Contrast	VRM Class	Definition
None	Class I Preserve	The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. (This classification is usually applied to wilderness areas, wild and scenic rivers, and other similar situations.)
Weak	Class II Retain	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Moderate	Class III Partially Retain	The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
Strong	Class IV Major Modification	The objective of this class is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

The proposed project as seen from KOP-8 will create moderate visual contrasts of form and line, and weak visual contrasts of color and texture. This equates to a rating somewhere between Class II (retention of landscape character) and Class III (partial retention of landscape character).

Therefore, the proposed project will comply with the definition of Class III, above, as seen from KOP-8 at Dragon Wash in Joshua Tree National Park.

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

VIS-1, Surface Treatment of Project Structures and Buildings

VIS-2, Re-vegetation of Disturbed Soil Areas

VIS-3, Temporary and Permanent Exterior Lighting

VIS-4, Project Design

TRANS-6, Heliostat Positioning Plan

AQ-SC3, Construction Fugitive Dust Control

AQ-SC4, Dust Plume Response Requirement

BIO-8, Impact Avoidance and Minimization Measures

BIO-22, Decommissioning and Reclamation Plan

BLM-VIS-1, Component Color Treatments

BLM-VIS-2, Consultation with the NPS Night Sky Program Manager

No additional mitigation measures beyond these are required because of the view from KOP-8 at Dragon Wash (JTNP).

VISUAL CONTRAST RATING WORKSHEET

Date 4/25/2013

District Palm Springs - South Coast

Resource Area Chuckwalla - Palen

Activity (program) Solar Energy

SECTION A. PROJECT INFORMATION

<p>1. Project Name Palen Solar Electric Generating System (PSEGS)</p>	<p>4. Location Township 5 South</p>	<p>5. Location Sketch</p>
<p>2. Key Observation Point KOP 9 Alligator Rock ACEC (BLM)</p>	<p>Range 17E</p>	
<p>3. VRM Class VRI Class III VRM Class (Not disclosed by BLM)</p>	<p>Section Multiple Sections</p>	

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LANDWATER	2. VEGETATION	3. STRUCTURES
FORM	Gently sloping ground plane, pyramidal mountains in the background.	Rounded irregular creosote scrub and more vertical small trees in foreground. Middleground beyond is obscured. Background vegetation is not evident.	Cylindrical forms of transmission line tubular steel poles.
LINE	Linear, sloping drainage rills in foreground. Jagged silhouettes of mountains in background.	Converging line by banded vegetation patterns/	Horizontal transmission line conductors with strong vertical line of tubular steel poles with less dominant horizontal cross-arms and 6 weak horizontal lines of transmission line conductors.
COLOR	Tan colored sand in foreground. Becoming grey green with creosote scrub in the middleground. Background colors muted blue greys.	Relatively green to grey-green creosote scrub becoming obscured and indistinct farther away with distinct line of unvegetated dry lakebed.	Black to dark grey transmission line conductors. Dark browns of the vertical transmission line tubular steel poles.
TEXTURE	Smooth sloping foreground, middleground obscured. Smooth textured dry lakebed at the base of the rugged textured mountains in the background.	Medium coarse random texture in foreground. Gradation to more continuous medium middleground texture, with background vegetation indistinguishable.	Smooth textured transmission line conductors and tubular steel poles.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

It is approximately 11.1 miles from KOP-9 to the center of the proposed project (Background distance zone)

	1. LANDWATER	2. VEGETATION	3. STRUCTURES
FORM	No change.	No change.	Two power towers create new vertical cylindrical forms approximately 11.1 miles away in the background distance zone.
LINE	No change.	No change.	Two power towers create weak new vertical lines in the landscape. These new lines do not protrude above the horizon in this sloping and relatively horizontal landscape.
COLOR	No change.	No change.	Two power towers are medium grey at this distance.
TEXTURE	No change.	No change.	Two power towers are smooth textured.

SECTION D. (Continued)

Comments from item 2.

The BLM did not respond in a timely manner to a request for a management decision on the final adopted Visual Resource Management Class (VRM Class) or the Interim Visual Resource Management Class (IVRM) designations for the project area. For this analysis, we had to move forward using the presumption that the Visual Resource Inventory Class (VRI Class) has been adopted as the VRM Class. The VRI Class for this area is III.

In determining whether the proposed action would conform to the assigned VRM class, the four levels of contrast roughly correspond with the four VRM classes. This means that a “strong” contrast rating may be acceptable in an area with VRM Class IV, but probably would not meet the objectives of a VRM Class I, II, or III area. Similarly, a “weak” contrast rating may be acceptable in an area with VRM Class II, but probably would not meet the objectives of a VRM Class I area. The table below shows the correlation between contrast rating and determining whether VRM objectives are met.

Degree of Contrast	VRM Class	Definition
None	Class I Preserve	The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. (This classification is usually applied to wilderness areas, wild and scenic rivers, and other similar situations.)
Weak	Class II Retain	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Moderate	Class III Partially Retain	The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
Strong	Class IV Major Modification	The objective of this class is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

The proposed project as seen from KOP-9 will create weak visual contrasts of form, line, color, and texture. This equates to a rating of VRM Class II (retention of landscape character).

Therefore, the proposed project will comply with the definition of Class III, above, as seen from KOP-9 at Alligator Rock ACEC (BLM).

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

<p>2. Key Observation Point KOP 10 I-10 Freeway Eastbound</p>	<p>Range 17E</p>	
<p>3. VRM Class VRI Class III VRM Class (Not disclosed by BLM)</p>	<p>Section Multiple Sections</p>	

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

1. LANDWATER		2. VEGETATION	3. STRUCTURES
FORM	Trapezoidal roadbed, sloping planer middleground, pyramidal mountains in the background. There is no water visible in this landscape.	Rounded irregular creosote scrub and small trees in foreground. Beyond is gradating into mottled middleground and background.	Linear road. Jumbled vertical mass of geometric lattice towers at the electrical substation and seen against the horizon elsewhere. Vehicle motion on roadway attracts attention.
LINE	Jagged silhouettes of mountains. Strong middleground horizon line.	Indistinct vegetation lines	Strong vertical line of lattice towers and tubular steel poles, and converging lines of Interstate 10 roadway. Moderately strong horizontal line of the perimeter wall of the electrical substation.
COLOR	Heavy grey green creosote scrub vegetation obscures tan colored sand ground plane.	Mottled tans in foreground to grey greens in the middleground to blue green of the background.	Dark grey roadway surface. Glaring white to grey of the electrical substation transmission towers. Dark browns of the vertical tubular steel poles on both sides of the highway.
TEXTURE	Smooth sloping foreground and middleground obscured by coarse textured creosote scrub. Texture of distant mountains is indistinguishable.	Medium coarse random foreground. Gradation to more continuous middleground and background vegetation indistinguishable.	Smooth roadbed of Interstate 10. Lattice texture of the transmission towers within the electrical substation.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

It is approximately 6.9 miles from KOP-10 to the center of the proposed project (Background distance zone).

1. LANDWATER		2. VEGETATION	3. STRUCTURES
FORM	No change.	No change.	Two power towers create new vertical cylindrical forms and one of the elevated air cooled condensers creates a rectangular form approximately 6.9 miles away in the background distance zone.
LINE	No change.	No change.	Two power towers create strong new vertical lines in the landscape that protrude above the horizon in this sloping and relatively horizontal landscape. An elevated air cooled condenser creates a horizontal line at the base of one of the towers.
COLOR	No change.	No change.	Two power towers and the elevated air cooled condenser are medium grey at this distance.
TEXTURE	No change.	No change.	Two power towers and the elevated air cooled condenser are smooth textured.

SECTION A. PROJECT INFORMATION

1. Project Name Palen Solar Electric Generating System (PSEGS)		4. Location Township 5 South	5. Location Sketch 
2. Key Observation Point KOP 12 Chuckwalla-Mtn WA (BLM)		Range 17 E	
3. VRM Class VRI Class III VRM Class (Not disclosed by BLM)		Section Multiple Sections	

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LANDWATER	2. VEGETATION	3. STRUCTURES
FORM	Planar foreground with deeply incised drainage feature with pyramidal mountains in the background. There is no water visible in this landscape.	Rounded irregular scrub in foreground. Conspicuously unvegetated dry lakebed. Beyond is gradating into lightly mottled background mountains mostly devoid of vegetation.	Dirt road serpentine from foreground to the middleground. Transmission line towers and highway discernible in the middleground due to motion associated with the traffic.
LINE	Sinuuous line of drainage feature and highway. Strong complex lines in the background where bajada meets the mountains beyond.	Distinct vegetation lines where vegetation intersects dry lakebed.	Strong horizontal lines of the highway and moderate vertical lines of transmission line towers.
COLOR	Mottled dark brown patina of the desert varnish of the bajada. Sand colored lake bed. With the pinkish browns of the mountains in the background.	Yellow greens of the creosote bushes blend into the brownish greens as the vegetation blends into the backgrounds grey greens.	Sand colored aggregate road. Brown colored transmission line towers.
TEXTURE	Jumbled rough moderately coarse foreground. Smooth fine textured lake bed. Complex coarse rugged mountains	Medium coarse random foreground. Smooth unvegetated lakebed and background vegetation indistinguishable.	Lattice texture of the transmission towers.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

It is approximately 4.6 miles from KOP-12 to the center of the proposed project (Foregr'd/Middlegr'd distance zone).

	1. LANDWATER	2. VEGETATION	3. STRUCTURES
FORM	Middleground has new horizontal form of heliostat fields occupying a portion of the bajada in front of the dry lakebed area. These forms are often mistaken for a natural body of water when seen at middleground or background distances.	Barren bajada in front of the dry lakebed is converted to heliostat fields. Foreground and background vegetation forms remain unchanged.	Two 750-foot tall power towers are cylindrical in form; the elevated air cooled condensers are rectangular in form; and the heliostat fields are horizontal in form.
LINE	New horizontal line created by heliostat fields in the middleground, similar to a natural water body. Sinuous line of drainage feature and highway remains.	Distinct vegetation lines where vegetation intersects the new horizontal heliostat fields, which lie at the base of backdrop mountains.	Strong vertical lines of the two power towers and strong horizontal lines of the air cooled condensers and heliostat fields make horizontal line of the highway and vertical lines of transmission towers become moderate in contrast.
COLOR	Heliostat mirrors reflect both sky and sunlight in the environment, creating a shiny silver and/or blue color, often mistaken for a natural body of water when seen at middleground or background distances.	Tan color of bajada is converted to shiny silver and/or blue color of the heliostat fields.	Two 750-foot tall cylindrical power towers and the elevated air cooled condensers are warm grey in color; heliostat fields are shiny silver and/or blue in color.
TEXTURE	Heliostat fields resemble natural body of water and are smooth textured.	No change in vegetation texture.	Heliostat fields, the elevated air cooled condensers and the two power towers are smooth textured.

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. SECTION D. (Continued)

Comments from item 2.

The BLM did not respond in a timely manner to a request for a management decision on the final adopted Visual Resource Management Class (VRM Class) or the Interim Visual Resource Management Class (IVRM) designations for the project area. For this analysis, we had to move forward using the presumption that the Visual Resource Inventory Class (VRI Class) has been adopted as the VRM Class. The VRI Class for this area is III.

In determining whether the proposed action would conform to the assigned VRM class, the four levels of contrast roughly correspond with the four VRM classes. This means that a “strong” contrast rating may be acceptable in an area with VRM Class IV, but probably would not meet the objectives of a VRM Class I, II, or III area. Similarly, a “weak” contrast rating may be acceptable in an area with VRM Class II, but probably would not meet the objectives of a VRM Class I area. The table below shows the correlation between contrast rating and determining whether VRM objectives are met.

Degree of Contrast	VRM Class	Definition
None	Class I Preserve	The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. (This classification is usually applied to wilderness areas, wild and scenic rivers, and other similar situations.)
Weak	Class II Retain	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Moderate	Class III Partially Retain	The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
Strong	Class IV Major Modification	The objective of this class is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

The two power towers will protrude above the horizon and will attract attention and produce strong “line” contrasts. Form contrasts are moderate, and color and texture contrasts are weak as seen from the westbound freeway. The two visible power towers will create a major modification of the existing character of the Chuckwalla Valley as seen from the freeway. The proposed project will be a new dominant feature of the landscape visible for miles along the freeway. The project will change the character of the area, and will dominate the view and become the major focus of viewer attention as seen from KOP-13.

The visual character of this portion of the desert will change from open space to that of a developed landscape. The overall visual impact of the proposed project is expected to strongly alter the existing undeveloped scenic quality of this naturally evolving landscape, and convert it to an industrialized solar-electric landscape. However, some viewers may see the development of a solar resource facility as a point of positive visual interest. Taken as a whole, visual impacts to KOP-13 resulting from the proposed project are expected to be significant and un-mitigable, per BLM VRM standards, guidelines, and best management practices (BMPs).

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

SECTION D. (Continued)

Comments from item 2.

The BLM did not respond in a timely manner to a request for a management decision on the final adopted Visual Resource Management Class (VRM Class) or the Interim Visual Resource Management Class (IVRM) designations for the project area. For this analysis, we had to move forward using the presumption that the Visual Resource Inventory Class (VRI Class) has been adopted as the VRM Class. The VRI Class for this area is III.

In determining whether the proposed action would conform to the assigned VRM class, the four levels of contrast roughly correspond with the four VRM classes. This means that a “strong” contrast rating may be acceptable in an area with VRM Class IV, but probably would not meet the objectives of a VRM Class I, II, or III area. Similarly, a “weak” contrast rating may be acceptable in an area with VRM Class II, but probably would not meet the objectives of a VRM Class I area. The table below shows the correlation between contrast rating and determining whether VRM objectives are met.

Degree of Contrast	VRM Class	Definition
None	Class I Preserve	The objective of this class is to preserve the existing character of the landscape. This class provides for natural ecological changes; however, it does not preclude very limited management activity. The level of change to the characteristic landscape should be very low and must not attract attention. (This classification is usually applied to wilderness areas, wild and scenic rivers, and other similar situations.)
Weak	Class II Retain	The objective of this class is to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.
Moderate	Class III Partially Retain	The objective of this class is to partially retain the existing character of the landscape. The level of change to the characteristic landscape should be moderate. Management activities may attract attention but should not dominate the view of the casual observer. Changes should repeat the basic elements found in the predominant natural features of the characteristic landscape.
Strong	Class IV Major Modification	The objective of this class is to provide for management activities which require major modification of the existing character of the landscape. The level of change to the characteristic landscape can be high. These management activities may dominate the view and be the major focus of viewer attention. However, every attempt should be made to minimize the impact of these activities through careful location, minimal disturbance, and repeating the basic elements.

The strong contrasts of form, line, and color created by the proposed project will create a major modification of the existing character of the Chuckwalla Valley and Palen Dry Lake, as seen against the backdrop of the Chuckwalla Mountains. The proposed project will be a new dominant feature of the landscape visible from travel routes and use areas in the viewshed. The project will change the existing visual character of the viewshed. The two 750-foot-tall solar power towers are the most visually noticeable elements, and from this view at KOP-15, the heliostat fields are highly visible too. The project will change the character of the area, and will dominate the view and become the major focus of viewer attention as seen from KOP-15.

The visual character in the area of Palen Dry Lake will change from open space desert to that of a developed landscape. The overall visual impact of the proposed project is expected to completely alter the existing undeveloped scenic quality of this naturally evolving landscape, and convert it to an industrialized solar-electric landscape. However, some viewers may see the development of a solar resource facility as a point of positive visual interest. Taken as a whole, visual impacts to KOP-15 resulting from the proposed project are expected to be significant, and un-mitigable, per BLM VRM standards, guidelines, and best management practices (BMPs). Therefore, the proposed project will not comply with the definition of Class III, above, as

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

VIS-1, Surface Treatment of Project Structures and Buildings

VIS-2, Re-vegetation of Disturbed Soil Areas

VIS-3, Temporary and Permanent Exterior Lighting

VIS-4, Project Design

TRANS-6, Heliostat Positioning Plan

AQ-SC3, Construction Fugitive Dust Control

AQ-SC4, Dust Plume Response Requirement

BIO-8, Impact Avoidance and Minimization Measures

BIO-22, Decommissioning and Reclamation Plan

BLM-VIS-1, Component Color Treatments

BLM-VIS-2, Consultation with the NPS Night Sky Program Manager

No additional mitigation measures beyond these are required because of the view from KOP-15 in the Palen / McCoy WA.

UNITED STATES
DEPARTMENT OF THE INTERIOR
BUREAU OF LAND MANAGEMENT

VISUAL CONTRAST RATING WORKSHEET

Date 4/28/2013

District Palm Springs - South Coast

Resource Area Chuckwalla - Palen

Activity (program) Solar Energy

SECTION A. PROJECT INFORMATION

<p>1. Project Name Palen Solar Electric Generating System (PSEGS)</p>	<p>4. Location Township 5 South</p>	<p>5. Location Sketch</p> 
<p>2. Key Observation Point KOP 17 Bradshaw Trail, Mule Mtn. (LTVA)</p>	<p>Range 17E</p>	
<p>3. VRM Class VRI Class III VRM Class (Not disclosed by BLM)</p>	<p>Section Multiple Sections</p>	

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

1. LANDWATER		2. VEGETATION	3. STRUCTURES
FORM	Planar ground plane in foreground. Pyramidal mountains in background.	Sparsely rounded clumpy vegetation in foreground. Taller line of riparian woodland blocks middleground. Indistinct vegetation forms in background.	Linear fence line in foreground. Geometric outhouses partially screened by creosote scrub.
LINE	Jagged silhouettes of distant mountains.	Horizontal line of riparian woodland obscures the middleground.	Horizontal fence line, with vertical fence posts, vertical and diagonal lines of out houses.
COLOR	Tan desert sands blue grey mountains	Grey-green creosote scrub. Green riparian canopy.	Rust colored fence. Tan outhouses with black vent pipes
TEXTURE	Smooth foreground. Rugged rough background mountains	Coarse and irregular creosote scrub and riparian vegetation.	Smooth textured outhouses.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

It is approximately 23.0 miles from KOP-17 to the center of the proposed project (Seldom Seen distance zone).

1. LANDWATER		2. VEGETATION	3. STRUCTURES
FORM	No change.	No change.	No change.
LINE	No change.	No change.	No change.
COLOR	No change.	No change.	No change.
TEXTURE	No change.	No change.	No change.

SECTION D. CONTRAST RATING SHORT TERM LONG TERM (NO CONTRAST – NOT VISIBLE)

1. DEGREE OF CONTRAST		FEATURES												2. Does project design meet visual resource management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)	
		LAND/WATER BODY (1)				VEGETATION (2)				STRUCTURES (3)					
		Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	3. Additional mitigating measures recommended? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No (Explain on reverse side)	
					X				X				X		
					X				X				X		
			X				X				X				
ELEMENTS	Form				X				X				X	Evaluator's Names Lee Roger Anderson, CA LLA #1586 Peter Langenfeld Timothy R Zack Thomas Cherry, PLA, ASLA	Date 5/23/2013
	Line				X				X				X

	Texture				X				X				X		

SECTION D. (Continued)

Comments from item 2.
 The proposed project is not visible from KOP-17.

Additional Mitigating Measures (See item 3)

The PSPP EIS identified these Mitigation Measures to aid in reducing visual impact by reducing contrast.

The implementation of mitigation measures imposed by the Energy Commission as Conditions of Certification for the project also would avoid or reduce impacts on the quality of the human environment. These mitigation measures are summarized here in connection with the impacts they would address, and are set forth in full in Appendix B – APPLICANT PROPOSED MEASURES.

VIS-1, Surface Treatment of Project Structures and Buildings

VIS-2, Re-vegetation of Disturbed Soil Areas

VIS-3, Temporary and Permanent Exterior Lighting

VIS-4, Project Design

TRANS-6, Heliostat Positioning Plan

AQ-SC3, Construction Fugitive Dust Control

AQ-SC4, Dust Plume Response Requirement

BIO-8, Impact Avoidance and Minimization Measures

BIO-22, Decommissioning and Reclamation Plan

BLM-VIS-1, Component Color Treatments

BLM-VIS-2, Consultation with the NPS Night Sky Program Manager

No additional mitigation measures beyond these are required because of the view from KOP-17 Bradshaw Trail, Mule Mtn. (LTVA).
