

ANNOTATED LIST OF UTAH TORTRICID MOTHS: A PROVISIONAL COMPILATION

Jerry A. Powell
Essig Museum of Entomology
University of California, Berkeley

Microlepidoptera have been relatively neglected in Utah compared to several other western states. During the early part of the descriptive era for western Nearctic micros, 1879-1929, Colorado and California attracted more visitors who collected small moths. California, British Columbia, and Washington had resident microlepidopterists through parts of the 1880s to early 20th century, and there have been greater efforts by visiting collectors in Arizona in recent decades than has been true for Utah.

Tom Spalding was the major pioneer for discovery of Tortricidae in Utah. He collected Lepidoptera beginning about 1900, particularly at Stockton, Tooele Co. and Eureka, Juab Co., where he worked night shifts at the entrance to mines. According to Tanner (1929), Spalding moved to Provo in 1905 and established a collecting cabin at Vineyard, on the sand dunes about five miles northwest of Provo. He collected numerous species of moths at these and other sites, which he sold to collectors in the eastern U. S.

Most of the Tortricidae went to W. D. Kearnott of Montclair, New Jersey, and Wm. Barnes of Decatur, Illinois. Kearnott (1907) described 10 species of Tortricidae collected by Spalding and listed several others in Utah, which he described from Colorado and California. The Barnes collection, which later went to the Smithsonian Institution, was studied by Heinrich (1923, 1926) in his monographs of Olethreutinae and by subsequent tortricid taxonomists. Heinrich described 13 species based on Spalding's specimens and listed numerous others from Utah. In total, 14 species of Lepidoptera were named as patronyms honoring Spalding, including three tortricids.

The first treatment specifically of Utah Microlepidoptera was by Annette Braun, who spent about seven weeks in the vicinity of Logan during the summer of 1924 and recorded 113 species, including many new (Braun 1925). Although she did not describe new Tortricidae, she recorded 40 species, including five from immediately adjacent sites in Idaho. Many were new for Utah. Her collection subsequently went to the Philadelphia Academy of Sciences.

Another notable contributor to knowledge of Utah microlepidoptera was G. F. Knowlton, an entomologist with the Utah State University Extension Service, who deposited specimens in the Utah State U. and Brigham Young U. collections and sent unprocessed insect specimens to Berkeley during 1956 to 1961. I pinned samples of Tortricidae from his light trap collections, primarily from Ogden and Hooper, Weber Co. and Spanish Fork and Benjamin, Utah Co. At least one species, *Clepsis penetralis* Razowski, was described from that material, which included many other tortricids.

Knowlton and Phillips (1980) compiled a mimeographed list of Utah moths in the Utah State University collection. Gillette et al. (1990, 1996), published a list of Utah Lepidoptera that includes 13 species of Tortricidae, of which 10 were not recorded by Heinrich or Braun. Johnson (2003) summarized Utah records and listed 25 species of Tortricidae. These lists evidently were compiled independent of previous literature, and no collection data are given for individual species.

Methods

This list is compiled from the above publications and several taxonomic papers cited in the individual species accounts, and from previously unpublished specimen records from several museums. I made 11 brief visits to Utah, between late May and September, 1965 to 2006, several times accompanied by Liz Randal, David Powell, John DeBenedictis, or Felix Sperling. We collected moths on about 35 dates in 14 counties, primarily in the Wasatch Range and in the south, Garfield, Kane, Piute, and Washington counties. My material is deposited in the Essig Museum of Entomology, University of California, Berkeley.

J. J. Kruse and I prepared genitalic dissections necessary for identifications. In general nearly all of my records for Tortricinae, excepting Cochylini, are included, whereas identifications and data from Olethreutinae are less complete. Most of my Cochylini remain unidentified, as is true of this group for most western collections.

I have not captured data systematically from collections that likely contain specimens which would provide unpublished records (e.g., LACM, USNM, and the institutional collections in Utah). However, I include a number of records from specimens in various institutions, based on identifications I have made over the past 40 years. Paul Opler provided records of Tortricidae from the CSU and USNM collections.

I use the nomenclature of Powell (1983) or updated to more recent taxonomic works, but I

made no attempt to confirm identifications of most published records. In a few instances reports that may be based on misidentifications are so indicated. I have not made a systematic search of the literature, and no doubt there are additional published records. For the most part we are not burdened with the arbitrary nomenclature of subspecies in North American Tortricidae. However, I have included subspecific designations for a few species where the names have been treated at the species level in past literature and/or controversy as to their specific status persists.

Acronyms for institutional collections are as follows:

AMNH - American Museum of Natural History, New York

CAS - California Academy of Sciences, San Francisco

CSU - C. P. Gillette Museum, Colorado State U., Ft. Collins

EME - Essig Museum of Entomology, U. California, Berkeley

LACM - Los Angeles County Museum, Los Angeles

RL - Ron Leuschner, Manhattan Beach, CA

USNM - U.S. National Museum of Natural History, Washington, D.C.

Results and Discussion

The present list contains 178 species, or 15% of the estimated 1,200 described species of Tortricidae in America north of Mexico. We think about 90% of the species known in collections for several tribes are described, but many species in collections await description, particularly in Eucosmini and Cochylini. Based on the proportional representation of butterflies known in Utah, 156 of the 760 species in America north of Mexico (21%) (Gillette et al. 1996, Miller & Brown 1983), we might expect to find at least 20% of the described Tortricidae (240 species) occurring in the State, in addition to undescribed species. Similarly, Utah has about 60% as many butterflies as California and therefore might be expected to have about 260 species of Tortricidae (i. e., 60% of the 438 tortricid total known in California, Table 1). It seems likely that Utah, with a great diversity of desert, Great Basin, montane, and boreal habitats of Rocky Mountain affinities, is home to 250-300 species of Tortricidae. Hence, this list can be viewed as a work in progress. Both the field collections and assessment of material already in collections lag well behind those of larger Lepidoptera in Utah.

As would be expected, the richness of tortricid species and intensity of inventory effort have

combined to create a disharmonious distribution among the records compiled so far. No tortricid is recorded in 3 of Utah's 29 counties (Carbon, Millard, Morgan) and fewer than 5 species are known in 12 counties. The lists for only 10 counties include 20 or more species and more than 30 species for only 5 (Cache, Garfield, Sanpete, Tooele, and Utah), with more than 40 species known only from Sanpete and Utah Counties. However, there are many additional collection records for species listed from Utah without locality data. For example, Heinrich (1923, 1926) recorded at least 37 species of Olethreutinae for Utah whose type localities are elsewhere, and several species of Tortricinae are listed by State only (Knowlton and Phillips 1980, Gillette et al. 1990, Powell 1964).

OLETHREUTINAE

Bactrini

Bactra furfurana (Haworth, 1811) TL: England

Cache Co.? (Braun 1925: 198); Utah Co., Weber Co. (EME)

[=Argyrotaenia cockerellana; of authors, not Kearfott., 1907, TL: CO]
UT (Powell 1964); Iron, Juab, Kane, Sanpete, Tooele counties, paratypes; Piute Co.
(EME)
Archips argyrosipilus (Walker, 1863) TL: GA
Cache Co. (Braun 1925: 201); Knowlton & Phillips 1980. [The name *vividanus*
(Dyar, 1902) (TL CO) may be applicable. See Powell & De Benedictis (1995) for
discussion of the status of names in western members of the complex.]
Archips griseus (Robinson, 1869) TL: [?ID]
UT (Johnson 2003, from Knowlton & Phillips 1980)
Archips cerasivoranus (Fitch, 1856) TL: NY
Cache Co. (Braun 1925, EME); Piute Co. (EME)
Archips negundanus (Dyar, 1902) TL:
Cache, Piute, Utah, Weber Cos. (EME); UT (Knowlton & Phillips 1980)
Archips alberta (McDunnough, 1923) TL: Canada, AB
UT (USNM)
Choristoneura conflictana (Walker, 1863) TL: CANADA
UT (Powell 1964: 135); Beaver, Grand, Kane, Piute, Summit, Sanpete, Utah
Co.(EME)
Choristoneura rosaceana (Harris, 1841) TL: MA
Utah Co. (EME); UT (Knowlton & Phillips 1980); Sanpete Co. (EME)
Choristoneura zapulata (Robinson, 1869) TL:
Utah Co. (Powell 1964: 166)
Choristoneura occidentalis Freeman, 1967 TL: WA
Cache Co. (Braun 1925: 201, as *fumiferana*); Kane Co., Utah Co. (De Benedictis
1995); Beaver, Duchesne, Piute, Sanpete Co. (EME); Rockwell
Choristoneura lambertiana (Busck, 1915) TL: OR
Kane Co. (De Benedictis 1995); Duchesne, Piute, Sanpete Wayne (EME); Rockwell
Choristoneura retiniana spaldingiana Obraztsov, 1962: 6 TL: Provo, Utah Co.

Powell (2006) Tortricid moths of Utah

- Kane Co. (De Benedictis 1995: 134); Sanpete, Piute Co. (EME)
Cudonigera houstonana (Grote) TL: TX
San Juan Co. (CSU), Sanpete Co. (EME)
Clepsis peritana (Clemens, 1860) TL: not specified
Cache Co. (Braun 1925: 201); Grand, Tooele, Washington Co. (EME)
Clepsis penetralis Razowski, 1979: 121 TL: Cache Co., Logan
Duchesne, Garfield, Tooele, Uintah, Weber Cos. (EME)
Clepsis virescana (Clem., 1865) TL: not specified
UT (Powell 1964: 233); Garfield, Kane, Piute, Sanpete, Utah Co. (EME); Iron Co.
(EME; LACM)
Clepsis persicana forbesi Obraztsov, 1962 TL: B.C.
Duchesne Co., Sanpete Co., Tooele Co. (Obraztsov, 1962b: 25); Duchesne, Sanpete,
Summit, Utah Co. (EME)
Clepsis clemensiana (Fern., 1879) TL:
UT (Powell 1964: 239); Weber Co. (EME)
Xenotemna pallorana (Rob., 1869) TL: PA
Utah Co., Weber Co. (EME)

Sparganothidini

- Sparganothis distincta (Walsingham, 1884) TL:
Cache Co. (Braun 1925: 201)
Sparganothis senecionana (Walsingham, 1879) TL: CA
Tooele Co. (AMNH; EME), Utah Co. (AMNH); Garfield, Juab, Kane Cos. (EME)
Sparganothis tunicana (Walsingham, 1879) TL: CA
Bear Lk., IDA (Braun 1925: 201, as *californiana* Walsingham)
Sparganothis directana (Walker)
Summit Co. (EME)
Platynota labiosana (Z., 1875) TL:
Washington Co. (EME)
Platynota nigrocervina (Walsingham, 1895) TL:
Cache Co. (Braun)
Synnomma lynosyrana Walsingham, 1879 TL: CA

Emery Co. (EME)

Cochylini

Aethes ?deutchiana (Zett., 1840) TL: Europe

Cache Co. (Braun 1925: 202) [the ID was doubted by Braun but may be correct according to present concepts]

Recavicula hospes (Walsingham, 1884) TL: NC

UT (USNM); Utah Co., Weber Co. (EME)

“*Cochylis*” *angulatana* (Rob., 1869) TL:

Cache Co. (Braun 1925: 202)

“*Cochylis*” *grandis* (Busck, 1907) TL:

UT (USNM)

Eugnosta mexicana (Busck, 1907) TL:

UT (USNM); Sanpete, Summit Co. (EME)

Henricus infernalis (Heinrich) TL: NM

Sanpete Co. (EME)

Saphenista campicolana (Walsingham, 1879) TL:

Cache Co. (Braun 1925: 202); Sanpete, Summit Co. (EME)

Phtheochroa aureoalbida (Walsingham, 1895) TL:

Cache Co. (Braun 1925: 202); Garfield, Sanpete Co. (EME)

Phtheochroa aegrana (Walsingham) TL: CA

?ID: Summit, Utah Co. (EME)
