NUT midline carcinoma as a primary lung tumor: a case report

<jtd.amegroups.com/article/view/17161/html> ▾

We **report a case** of NUT midline carcinoma presented as a primary **lung** tumor. Pneumonectomy was performed without any neoadjuvant therapy and it turned out to be a gross total resection. Even so, the prognosis is poor with a disease-free survival of 2 months and an overall survival of 6 months.

Simultaneous *Paragonimus* infection involving the breast and lung: A case report

Moon Young Oh, Ajung Chu, Jeong Hwan Park, Jong Yoon Lee, Eun Youn Roh, Young Jun Chai, Ki-Tae Hwang

Abstract

4 BACKGROUND

Paragonimiasis is a food-borne parasitic infection caused by lung flukes of the genus *Paragonimus*. Although the most common site of infection is the pleuropulmonary area, the parasite can also reach other parts of the body on its journey from the intestines to the lungs, ending up in locations such as the brain, abdomen, skin, and subcutaneous tissues. Ectopic paragonimiasis is difficult to diagnose due to the rarity of this disease.

CASE REPORT

Here, we report a rare case of simultaneous breast and pulmonary paragonimiasis in a woman presenting painless breast mass and lung nodule with a history of eating raw trout. To confirm the diagnosis, serologic testing and tissue confirmation of the breast mass were performed. The patient was treated with surgical resection of the mass and praziquantel medication.

CONCLUSION

Ectopic paragonimiasis is difficult to diagnose due to the rarity of this disease. Thus,

europepmc.org/articles/PMC2816346

And concomitant lung and pleura involvement is more common in hepatic paragonimiasis than in fascioliasis. Cystic lesions caused by *Paragonimus* do not coalesce while clusters of microabscesses coalesce into a larger abscess cavity in pyogenic abscess. And pyogenic abscess has no preponderance of the subcapsular area.

Paragonimus is a lung fluke (flatworm) that infects the lungs of humans after eating an infected raw or undercooked crab or crayfish. Less frequent, but more serious cases of paragonimiasis occur when the parasite travels to the central nervous system. Total of 90 cases of Paragonimus were reported to CDC from 24 states and the District of Poland.
