Itatiaia National Park was the first National Park established in Brazil, in a region of Atlantic Rainforest in the *Serra da Mantiqueira*, in Rio de Janeiro State. It is the most important bryoflora conservation area in Brazil, with high levels of diversity, endemism and threatened species. Itatiaia means “many-pointed-rock” in the Amerindian Tupi dialect. The park was created in 1937 to preserve part of the biological heritage of the *Serra da Mantiqueira* and covers an area of 30,000 hectares between Rio de Janeiro and Minas Gerais States. Itatiaia National Park harbors a unique bryoflora due to presence of different forest formations and well-defined climatic and vegetation bands: Montane Forest, Upper Montane Forest, and High-Altitude Fields (*Campos de Altitude*). The bryophyte diversity comprises 519 taxa in 213 genera and 81 families (57% of the total of the Brazilian bryoflora).

Landscapes of Itatiaia National Park: Pico das Agulhas Negras; Maciço das Prateleiras; road of Brejo da Lapa; Brejo da Lapa; Poço Maromba; Véu de Noiva waterfall; and Três Picos forest.
