'RESEARCH DATA' SERIES

FRIM Research Data is a scientific publication of the Forest Research Institute Malaysia (FRIM) that contains data in the raw or semi-analysed form. In publishing these data FRIM's objective is to make available such data to as wide audience as possible. In sharing such data, we hope the fullest use could be made of such data.

In this first issue we publish partially analysed data in the form of distribution maps and stand tables of woody species contained in a 50-ha research plot at Pasoh Forest Reserve, a lowland dipterocarp forest in Peninsular Malaysia. Background to this study is provided in the text of the publication. The original data set is available in FRIM and scientists who have an interest in that data set are welcome to obtain copies of that data at a nominal price.

In the use of data from the FRIM Research Data series, due acknowledgement is expected to be given to both the author of the data and the FRIM Research Data series. A standard version of the acknowledgement is provided at the end of the text of this publication.

FRIM encourages sharing of data among scientists for the advancement of science. It is hoped that the FRIM Research Data series will pave the way for such cooperation among scientists locally as well as beyond borders of this publication. We welcome scientists and researchers to work in collaboration with us on the use of these data and would appreciate potential users to communicate with us to determine FRIM's own area of research so as to avoid possible duplication of effort. We would also appreciate users of these data to inform us of their interest to send us copies of publications arising from use of this data.

FRIM hopes to publish various data sets from time to time in order to help expand knowledge and science in forestry and related areas.

FOREWORD

In 1985, the Forest Research Institute Malaysia (FRIM), in collaboration with the National Science Foundation (NSF) and the Smithsonian Tropical Research Institute (STRI), both of the U.S.A., started a tree population study in Pasoh Forest Reserve in Negeri Sembilan. A 50-ha plot was established, and all woody plants of 1 cm diameter and greater measured, position mapped and the plants tagged and identified. In 1990, all the woody plants were remeasured, recruitment into the minimum diameter class recorded and mortality of previously enumerated plants also noted.

A total of 335,240 juvenile and mature trees were recorded in the plot in the initial census. These were from 814 species. This number is almost a third of the total for the whole of Peninsular Malaysia. More woody species occur in the plot than on all of North America north of Mexico. This species richness is a unique feature of the lowland mixed dipterocarp forests of the Far East which are structurally the most complex and floristically the most diverse terrestrial ecosystems in the world.

The study plot in Pasoh is only the second of its kind anywhere. A similar plot established in 1980 on Barro Colorado Island in Panama contains a much smaller number of tree species and individuals. The purpose of these large-plot studies is to investigate quantitative and long-term population dynamics of trees. In particular, the studies would provide information on requirements for successful recruitment and maximum sustained growth and productivity of timber and other goods. Long-term, large-scale tropical forest studies such as these offer the best hope of acquiring the basic and applied information needed for the conservation and management of these forests. They will also act as controls for silvicultural experiments, and sensitive monitors of the impact of global climatic and atmospheric changes on the forest resource.

The global loss of biological diversity resulting from tropical deforestation is a key issue, not only at scientific fora, but also at meetings of governments. There is now enormous political pressure upon national and international organisations to act to remedy the problem of loss of biodiversity. Results from FRIM's study indicate the extent of diversity of tree species that is present in our forest, and the potential loss if deforestation is not kept in check.

That the forest helps to conserve wildlife, genetic resources, and provide natural habitats for the country's unique flora and fauna is well known. The use of rain forest plants in traditional medicine, and the potential of such plants being developed into pharmaceutical products, have long been recognised. There are about 1300 species of flowering plants and 76 species of ferns in Malaysian forests that are of medicinal importance. Besides being a location of active research on timber tree species, the plot at Pasoh will serve as an 'outdoor laboratory' for active research on some of these medicinal plants as well as on fruit tree species. Research to resolve fundamental questions about geographical differences in species diversity of tropical trees and tropical forest regeneration will also be the focus of research in this 'outdoor laboratory'.

Several scientific papers based on the first census data have already been published. Others are in the process of being prepared. It is our intention that interested members of the international scientific community participate in the studies at Pasoh. To that end we are in this volume publishing partially analysed data in the form of a distribution map and stand table of each of the species in the 50-ha plot. We hope that this information, widely distributed, would help to stimulate further ideas and hypotheses, and lead to further work in the plot as well as to more complete analyses of the data.

I wish to thank our foreign collaborators on this project, Dr. P. S. Ashton, Dr. S. P. Hubbell, Dr. J. V. LaFrankie and Dr. J. Klahn, for their efforts, the National Science Foundation (USA), Conservation, Food and Health Foundation, Inc. (USA), UNESCO-MAB, UNESCO-ROSTSEA, Smithsonian Tropical Research Institute (USA) and the Malaysian Government for providing funds, and various individuals in FRIM, especially of the Ecology and Botany sections, for their respective roles in plot establishment, tree enumeration, tree identification and data entry management and analyses.

DR. SALLEH MOHD. NOR
DIRECTOR GENERAL
FRIM

BACKGROUND

In 1985, the Forest Research Institute Malaysia established a 50-ha permanent plot at Pasoh Forest Reserve in the state of Negeri Sembilan, Peninsular Malaysia. In the plot, every tree 1 cm diameter and larger at breast height was tagged, measured, identified to species and mapped to the nearest 10 cm during the initial census. More than one million data were collected over three years employing more than thirty people. All the methods used in developing both the field site and resulting database are described in Manokaran *et al.* (1990).

The objective of the plot is a quantitative and long-term investigation into the structure and dynamics of trees. Recensus at 5-year intervals will provide the dynamic data. One recensus has already been carried out in 1990.

In this volume, we present the stand table and distribution map of each of the species recorded in the plot at the first census. A contour map of the plot is also provided to assist in interpreting the distribution of the species.

In our publications so far, the total number of species in the plot had been reported as 820. After rechecking in the field, both during recensus in 1990, and subsequently in 1991, the number has been revised to 814. The stand tables and distribution maps in this publication are therefore for 814 species. These are listed in the Index to the Species. The number of genera now stands at 290 in 78 families.

In addition to revising the number of species, we also have revised upwards the total number of trees from 329,000 to 335,240. The total number of trees in each family and species, if there was any change, was also revised. All this information, current at the time of publication, is provided in the List of Species which also gives the stature class for each species, the classes assigned by Kochummen *et al.* (1990) according to the criteria described by them.

Pasoh Forest Reserve is a lowland dipterocarp forest (Symington 1943) and is part of the lowland evergreen rain forest formation (Burtt-Davy 1938). This forest formation in Peninsular Malaysia is characterised by family dominance of the Dipterocarpaceae. The forest at Pasoh was described as 'Red Meranti-Keruing' of the Central and Southern type by Wyatt-Smith (1961, 1987) because species of Dipterocarpus (Keruing) and Shorea (Red meranti group) are common. Salleh (1968) described it to be 'Mixed Red Meranti' forest merging to 'Red Meranti' forest. The forest itself may be regarded as composed of three layers, namely, the emergent layer of trees, usually with spreading crowns nestling above but in

contact with those of the main canopy, the main-storey trees forming a continuous canopy at 20-30 m height, and the understorey trees below the main canopy.

Some analyses of the first census data have already been carried out and the results published, or presented at scientific meetings. The information can be sourced in Kochummen *et al.* (1990), Manokaran and LaFrankie (1990), Manokaran *et al.* (1991), Saw *et al.* (1991) and Kochummen *et al.* (in press). Manokaran *et al.* (1990) gives a complete list of the species in the plot at 15 November 1989. Below we reproduce part or whole of the abstract of each of these papers as background information for this present publication.

Kochummen *et al.* (1990): The diversity of tree flora of Pasoh Forest Reserve was high based on an enumeration of all trees \geq 1 cm diameter at breast height in a 50-ha plot; there were 820 species, 294 genera and 78 families. Mean density for trees $>$ 10 cm dbh was 530 trees per hectare representing about 210 species. The most diverse families were Euphorbiaceae, Myrtaceae and Lauraceae. The most abundant families across all size classes were Euphorbiaceae, Dipterocarpaceae and Annonaceae. Among trees larger than 30 cm dbh, the Dipterocarpaceae was the most abundant family, followed by Leguminosae and Burseraceae. The forest was without dominant species. The most abundant species, Xerospermum noronhianum (Sapindaceae), accounted for only 2.5% of the total number of trees, and 2.3% of trees over 10 cm dbh. Likewise, for trees over 30 cm dbh, the most abundant species, Shorea leprosula (Dipterocarpaceae), accounted for only 3.9% of the total. The common species of canopy and emergent trees at Pasoh are also widespread throughout Malaya and are characteristic of the primary rain forest, whereas species that indicate early succession or large gaps were rare in the plot. On floristic evidence, the forest bounded by the 50-ha plot is a homogeneous example of the Malayan south-central lowland rain forest.

Manokaran and LaFrankie (1990): Based on an enumeration of all trees \geq 1 cm diameter at breast height in a 50-ha plot in Pasoh Forest Reserve, mean densities were 6769 trees per hectare \geq 1 cm dbh, 530 trees per hectare \geq 10 cm dbh, and 3.0 trees per hectare $>$ 90 cm dbh. Mean basal area was 30.5 sq. metres per hectare for all trees, and 25.2 sq. metres for trees \geq 10 cm dbh. Ground slope had a very weak negative correlation with density of small trees ($<$ 10 cm dbh) and a very weak positive correlation with density of large trees ($>$ 30 cm dbh). Compared with other primary forests in

Malaysia, Pasoh was relatively dense in smaller trees and relatively sparse in very large trees. The forest within the 50-ha plot was generally homogeneous, with no evidence of major disturbance, and it is likely representative of mean conditions of lowland forest in south-central Malay Peninsula.

Manokaran et al. (1991): In a mapped inventory of all trees \geq 1 cm diameter at breast height in a 50-ha plot in Pasoh Forest Reserve, the Dipterocarpaceae ranks 10th in diversity with 30 species among the 78 families represented, ranks second in frequency with 496 trees per hectare, and ranks first in basal area with 6.89 sq. metres per hectare, or 24% of the total. Within the family itself, the proportions of saplings ($1 < 5$ cm dbh), small poles ($5 < 10$ cm), large poles ($10 < 30$ cm) and adults (> 30 cm dbh) are 79.0%, 10.8%, 6.9% and 3.3% respectively. Maps of the commoner species indicate patchiness in distribution for some species and randomness for others. The size, design, and implementation of the 50-ha plot was successful in gaining a sample of 100-5000 trees for 22 of 30 species of Dipterocarpaceae, and long-term demographic studies of these species are now possible.

Saw et al. (1991): In an inventory of all trees of 1 cm diameter at breast height and larger in a 50-ha plot at Pasoh Forest Reserve, a primary lowland rain forest in Peninsular Malaysia, 76 species of the 820 species in the plot are known to bear edible fruit. Especially diverse were the wild species of mango (Mangifera, Anacardiaceae, 12 spp.), mangosteen (Garcinia, Clusiaceae, 13 spp.), breadfruit (Artocarpus, Moraceae, 10 spp.) and rambutan (Nephelium, Sapindaceae, 5 spp.). Median population size for all species of fruit trees was 3.0 trees per hectare and 0.2 adult trees per hectare. Direct economic value of wild fruit trees was small; only one species has been very much collected and sold, Parkia speciosa (Leguminosae), amounting to less than US\$ 20 per hectare per year. The potential value of the species as genetic resources is very large; 24 species are cultivated, 38 edible species are congeneric with cultivated crops and at least 10 other species bear inedible fruit but are related to cultivated crops. It is concluded that the Peninsular Malaysian rain forest is exceedingly rich in wild fruit trees, that these normally live at low densities and that their principal economic value is as genetic resources.

Kochummen et al. (in press): Of the 3197 species of trees and shrubs (excluding monocotyledon) found in the Malay Peninsula, 802 (25%) were found in a 50-ha plot in

primary lowland forest in Pasoh, Negeri Sembilan in an enumeration of all trees and shrubs greater than 1 cm diameter at breast height (340,000 individuals). The 802 species include about half of the species that might be expected for a lowland forest in Negeri Sembilan state. Only 21 species (2.5%) were new to science, 3 spp. were new to the Peninsula, 3 spp. were previously thought to be restricted west of the main range, and 11 spp. were previously thought to be exceedingly rare. Family differences in representation were notable, e.g. Dipterocarpaceae was represented by 30 of 156 Malayan species, whereas Burseraceae by 21 of 35 Malayan species. The significance for conservation policy is two-fold: on the one hand, small reserves may include a surprisingly large percentage of the region's tree and shrub flora, e.g. the 50-ha plot included all 12 possible species of Mangifera (Anacardiaceae), an important fruit tree resource, and 8 of 10 possible species of Ixora (Rubiaceae) an important horticultural resource. On the other hand, many species are represented by too few individuals to be assured of their long-term conservation.

As mentioned in the Foreword, the 50-ha plot study at Pasoh Forest Reserve is the largest and most intensive of tree population samples outside of the Neotropics. The objective of this publication is to provide partially analysed information to as wide an audience as possible in the hope that this would help stimulate ideas and hypotheses for further analyses and further work. The Director-General of FRIM is to be contacted for participation in studies in the 50-ha plot and in further analyses of the data.

ACKNOWLEDGEMENTS

The large-scale forest plot at Pasoh Forest Reserve is an ongoing project of the Malaysian Government, directed by the Forest Research Institute Malaysia through its Director-General, Salleh Mohd. Nor, under the leadership of N. Manokaran, P. S. Ashton and S. P. Hubbell. Supplemental funds are very gratefully acknowledged from the following sources: National Science Foundation (USA) BSR Grant INT-84-12201 to Harvard University through P. S. Ashton and S./ P. Hubbell; Conservation, Food and Health Foundation, Inc. (USA); United Nations, through the Man and Biosphere Program, UNESCO-MAB grants 217.651.5, 217.652.5, 243.027.6, 213.164.4, and also UNESCO-ROSTSEA grant 243.170.6.; and the continuing support of the Smithsonian Tropical Research Institute (USA), Barro Colorado Island, Panama.

K. M. Kochummen gratefully acknowledges the support of Senior Fellowship awarded by the Smithsonian Tropical Research Institute, 1987-1990.

We would like to thank Chong Phang Fee, Chan Yee Chong, Dasima Ramudin and Saripah Barom for assistance in the preparation of the stand tables and distributions maps for publication.

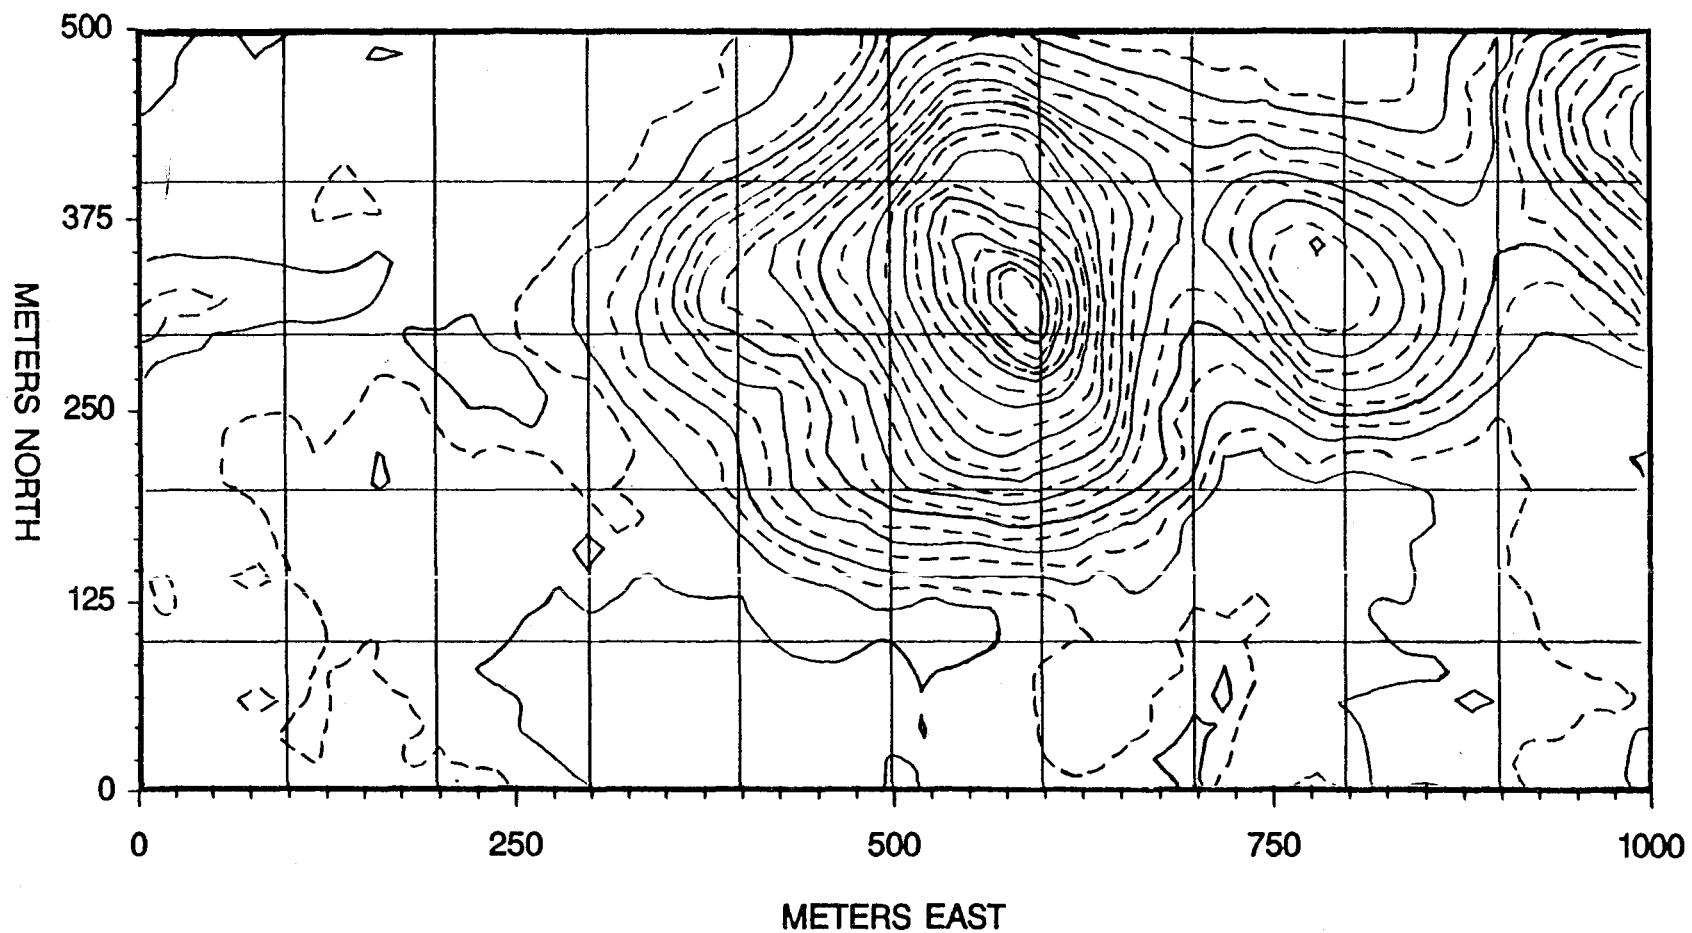

Figure 1. Topographic map of the PFR 50 ha plot, at 1 m contour intervals, and gridded at 1 ha units.

THE DATA: SOME EXPLANATIONS

A total of 814 species representing 78 families are presented in alphabetical order. The section on Index to the Species which follows provides the pagination for the species.

Legend:

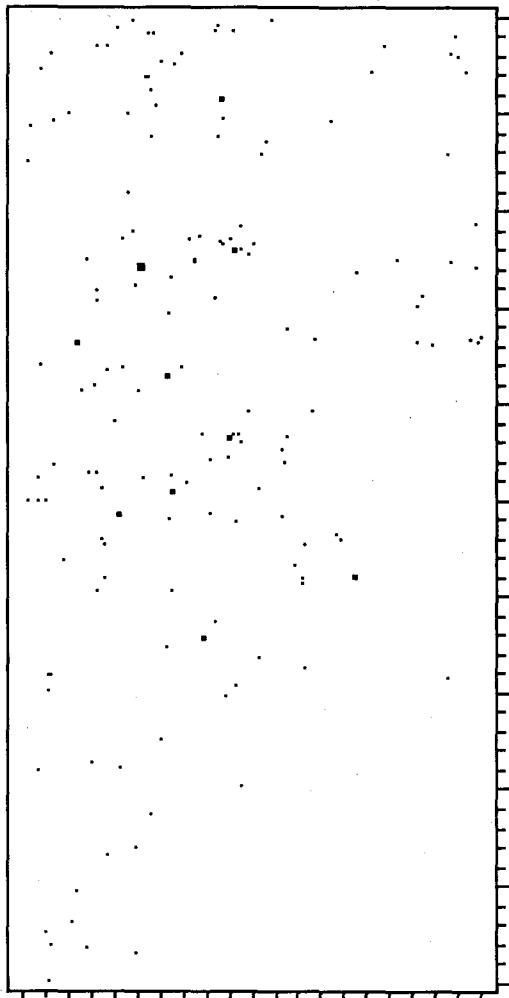

smallest marker	$1 < 10 \text{ cm dbh}$
medium-sized marker	$10 < 30 \text{ cm dbh}$
largest marker	$\geq 30 \text{ cm dbh}$

When trees are very close together, the markers representing these trees will overlap. In such cases, the total number of markers on the map will be less than the total number of trees indicated in the stand table.

For common species, this will not be readily apparent when the map is compared with the stand table. For uncommon species, the inconsistency in the number of markers and the total number of trees in the stand table will be immediately obvious. An example is Teijmanniodendron simplicifolium, the number of markers on the map totalling 11 but the total numbers of trees in the stand table being 13.

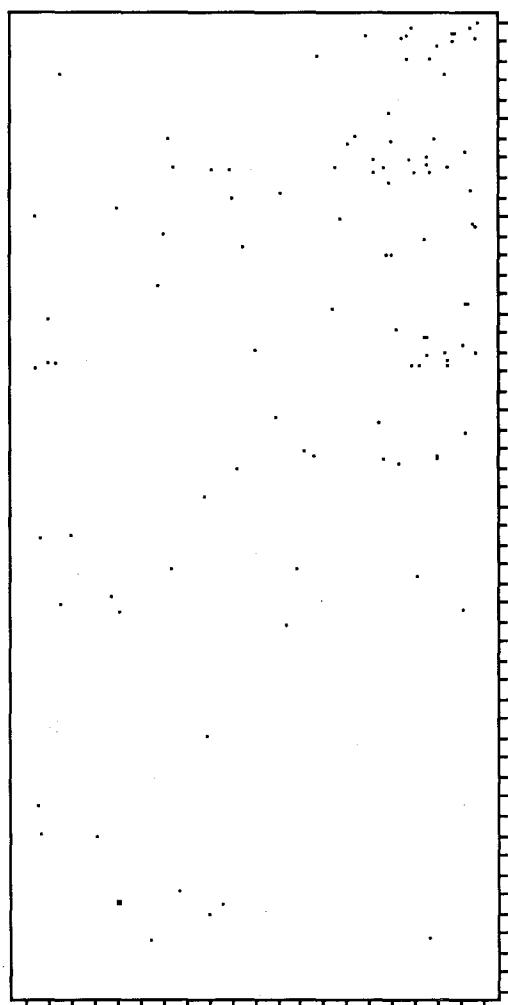

Reference to coordinates in the raw data will verify the close positions of the neighbouring trees concerned.

	857	1	1

STAPHYLEACEAE

TURPINIA OVALIFOLIA	1		U
	1	1	1

STERCULIACEAE

HERITIERA ELATA	186		C
HERITIERA JAVANICA	32		E
HERITIERA SIMPLICIFOLIA	458		E
LEPTONYCHIA GLABRA	121		S
PTEROZYMBIUM TUBULATUM	50		C
SCAPHIUM LINEARICARPUM	134		C

<i>SCAPHIUM MACROPODUM</i>	806		C
<i>STERCULIA COCCINEA</i>	414		T
<i>STERCULIA CORDATA</i>	10		C
<i>STERCULIA HISPIDISSIMA</i>	39		U
<i>STERCULIA MACROPHYLLA</i>	5		C
<i>STERCULIA PARVIFLORA</i>	274		C
<i>STERCULIA RUBIGINOSA</i>	144		U
<i>STERCULIA SPECIES 1</i>	1		U
	2674	5	14
STYRACACEAE			
<i>STYRAX BENZOIN</i>	69		C
	69	1	1
SYMPLOCACEAE			
<i>SYMPLOCOS CERASIFOLIA</i>	125		C
<i>SYMPLOCOS COCHINCHINENSIS</i>	20		U
<i>SYMPLOCOS CRASSIPES</i>	531		U
<i>SYMPLOCOS OPHIRENSIS</i>	3		U
<i>SYMPLOCOS RUBIGINOSA</i>	6		U
	685	1	5
THEACEAE			
<i>GORDONIA SINGAPOREANA</i>	25		C
<i>PYRENARIA ACUMINATA</i>	79		U
<i>TERNSTROEMIA CORNERI</i>	40		U
	144	3	3
THYMELIACEAE			
<i>AQUILARIA MALACCENSIS</i>	125		C
<i>GONYSTYLUS MAINGAYI</i>	331		C
	456	2	2
TILIACEAE			
<i>GREWIA ANTIDESMAEFOLIA</i>	11		C
<i>GREWIA BLATTAEFOLIA</i>	821		U
<i>GREWIA FIBROCARPA</i>	155		T
<i>GREWIA LAURIFOLIA</i>	159		C
<i>GREWIA MIQUELIANA</i>	1470		U
<i>PENTACE STRYCHNOIDES</i>	630		C
<i>PENTACE TRIPTERA</i>	115		C
<i>SCHOUTENIA ACCRESCENS</i>	472		C
	3833	3	8

TRIGONIACEAE

TRIGONIASTRUM HYPOLEUCUM	367		C
--------------------------	-----	--	---

367	1	1
-----	---	---

ULMACEAE

CELTIS RIGRESCENS	4		U
GIRONNIERA NERVOSA	757		U
GIRONNIERA PARVIFOLIA	3960		U
GIRONNIERA SUBAEQUALIS	685		C
TREMA TOMENTOSA	2		U
	5408	3	5

VERBENACEAE

CALICARPA MAINGAYI	57		T
CLERODENDRON NUTANS	3		S
CLERODENDRUM DEFLEXUM	170		S
CLERODENDRUM LAEVIFOLIUM	87		T
TEIJSMANNIODENDRON CORIACEUM	227		C
TEIJSMANNIODENDRON SIMPLICIFOLIUM	13		T
VITEX PINNATA	2		U
VITEX QUINATA	27		U
	586	4	8

VIOLACEAE

RINOREA ANGUIFERA	8259		T
RINOREA HORNERI	33		S
RINOREA SCLEROCARPA	245		T
	8537	1	3
