Disclaimer

This document and its contents are to be treated as confidential and are published in accordance with and subject to an agreement between Botanica Consulting (BC) and the client for whom it has been prepared and is restricted to those issues that have been raised by the client in its engagement of BC. Neither this document nor its contents may be referred to or quoted in any manner (report or other document) nor reproduced in part or whole by electronic, mechanical or chemical means, including photocopying, recording or any information storage system, without the express written approval of the client and/or BC.

This document and its contents have been prepared utilising the standard of care and skill ordinarily exercised by Environmental Scientists in the preparation of such documents. All material presented in this document is published in good faith and is believed to be accurate at the time of writing. Any person or organisation who relies on or uses the document and its contents for purposes or reasons other than those agreed by BC and the client without primarily obtaining the prior written consent of BC, does so entirely at their own risk. BC denies all liability in tort, contract or otherwise for any loss, damage or injury of any kind whatsoever (whether in negligence or otherwise) that may be endured as a consequence of relying on this document and its contents for any purpose other than that agreed with the client.

Quality Assurance

An internal quality review process has been implemented to each project task undertaken by BC. Each document and its contents is carefully reviewed by core members of the Consultancy team and signed off at Director Level prior to issue to the client. Draft documents are submitted to the client for comment and acceptance prior to final production.

Executive Summary

Botanica Consulting was commissioned by Echo Resources Limited to undertake a Level 1 flora and fauna survey of the Julius Project haul road (referred to as the 'survey area'), located approximately 76km south-east of Wiluna, Western Australia. The survey was conducted on the 18th of February 2017 covering an area of approximately 109 ha. The survey area encompasses the entire boundary of L53/206, which is 28 km in length by 40 metres width.

Eight broad vegetation communities were identified within the survey area. These communities were identified within five landform types and comprised of one major vegetation group according to the National Vegetation Information System, Major Vegetation Group definition. These communities were represented by a total of 17 Families, 29 Genera and 65 Taxa. The broad scale terrestrial fauna habitats within the survey area have been identified as comprising a mosaic of clay-loam plains, drainage depressions, quartz-rocky plains, rocky hillslopes and sand-loam plains. With respect to native vertebrate fauna, 24 mammal (including eight bat species), 100 bird, 85 reptile and eight frog species have previously been recorded in the general area, some of which have the potential to occur in or utilise the survey area at times.

No Threatened Flora taxa, pursuant to subsection (2) of section 23F of the State *Wildlife Conservation (WC) Act 1950*¹, the Commonwealth *Environment Protection and Biodiversity Conservation (EPBC Act) 1999* and as listed by the Department of Parks and Wildlife (DPaW) were identified within the survey area. No Priority Flora taxa, as listed by the DPaW, were identified within the survey area. No threatened, migratory or priority fauna taxa were positively identified as being present during the field survey however the literature review identified 11 species as having been previously recorded or as being potentially present in the general vicinity of the survey area. The current status on site and/or in the general area of some species is difficult to determine, however, based on the habitats present and, in some cases, recent nearby records, two species of conservation significance (peregrine falcon and rainbow bee-eater) can be regarded as possibly utilising the survey area for some purpose at times.

Impacts on these species and fauna in general (including invertebrates) that may occur as a consequence of development at the site is considered unlikely to be significant. Populations of all species can be expected to persist in these areas with no change in any one species conservation status being significantly affected. This conclusion is primarily based on the relatively small size of the impact footprint and the extensive habitat connectivity with adjoining areas. Impacts on fauna and fauna habitat are therefore anticipated to be localised, small/negligible and as a consequence manageable.

None of the vegetation communities/ habitats within the survey area were found to have National Environmental Significance as defined by the Commonwealth EPBC Act 1999. No Threatened Ecological Communities (TEC) pursuant to Commonwealth or State legislation were recorded within the survey area. No Priority Ecological Communities (PEC) were recorded within the survey area. The survey area is not located within an Environmentally Sensitive Area (ESA) as listed under the *Environmental Protection (EP Act) 1986* or Schedule 1 Area as described in Regulation 6 and Schedule 1, clause 4 of the *Environmental Protection (Clearing of Native Vegetation) Regulations (EP Regulations) 2004*. The survey area is not located within a listed or proposed conservation area managed by DPaW. The nearest DPaW managed land is the Wanjarri Nature Reserve, which is listed as a "Class A" Nature Reserve, located approximately 26km south-west of the survey area.

¹ *Biodiversity Conservation Act 2016* received assent on 21 September 2016 with Parts of the Act coming into effect on 3 December 2016. Once fully enacted with enabling subsidiary regulations, it will replace the *Wildlife Conservation Act 1950*.

Based on the vegetation condition rating scale adapted from Keighery, 1994 and Trudgen, 1988 (ranging from 'pristine' to 'completely degraded') three vegetation communities were rated as 'good' and the remaining five vegetation communities were rated as 'very good'. No introduced taxa were identified within the survey area.

1 Introduction

1.1 Project Description

Botanica Consulting (BC) was commissioned by Echo Resources Limited (Echo) to undertake a Level 1 flora and fauna survey of the Julius Project proposed haul road (referred to as the 'survey area'), located approximately 76km south-east of Wiluna, Western Australia, Western Australia (Figure 1). The survey area encompasses the entire boundary of L53/206, which is 28 km in length by 40 metres width. The survey was conducted on the 18th February 2017 covering an area of approximately 109 ha.

1.2 Survey Objectives

The flora assessment was conducted in accordance with *Technical Guide - Terrestrial Flora and Vegetation Surveys for Environmental Impact Assessment – December 2016* (DPaW & EPA, 2016). The objectives of the assessment were to:

- Gather background information on flora and vegetation in the target area (literature review, database and map-based searches);
- Compile broad scale vegetation community flora maps and species list of the survey area;
- Document and map locations of any Threatened or Priority listed flora species located;
- Assess the regional and local conservation status of plant species and ecological communities within the survey area; and
- Identify and map occurrences of any “Declared and Environmental” weeds within the survey area.

The fauna assessment was conducted in accordance with the requirements of a Level 1 terrestrial fauna survey as defined in EPA Guidance Statement 56 (EPA 2004). The objectives of the assessment were to:

- Gather background information on fauna in the survey area (literature review, database and map-based searches);
- Delineate and characterise the faunal assemblages and fauna habitats present in the survey area;
- Document and map locations of any Threatened or Priority listed fauna species located; and
- Assess the regional and local conservation status of fauna species and fauna habitats within the survey area.

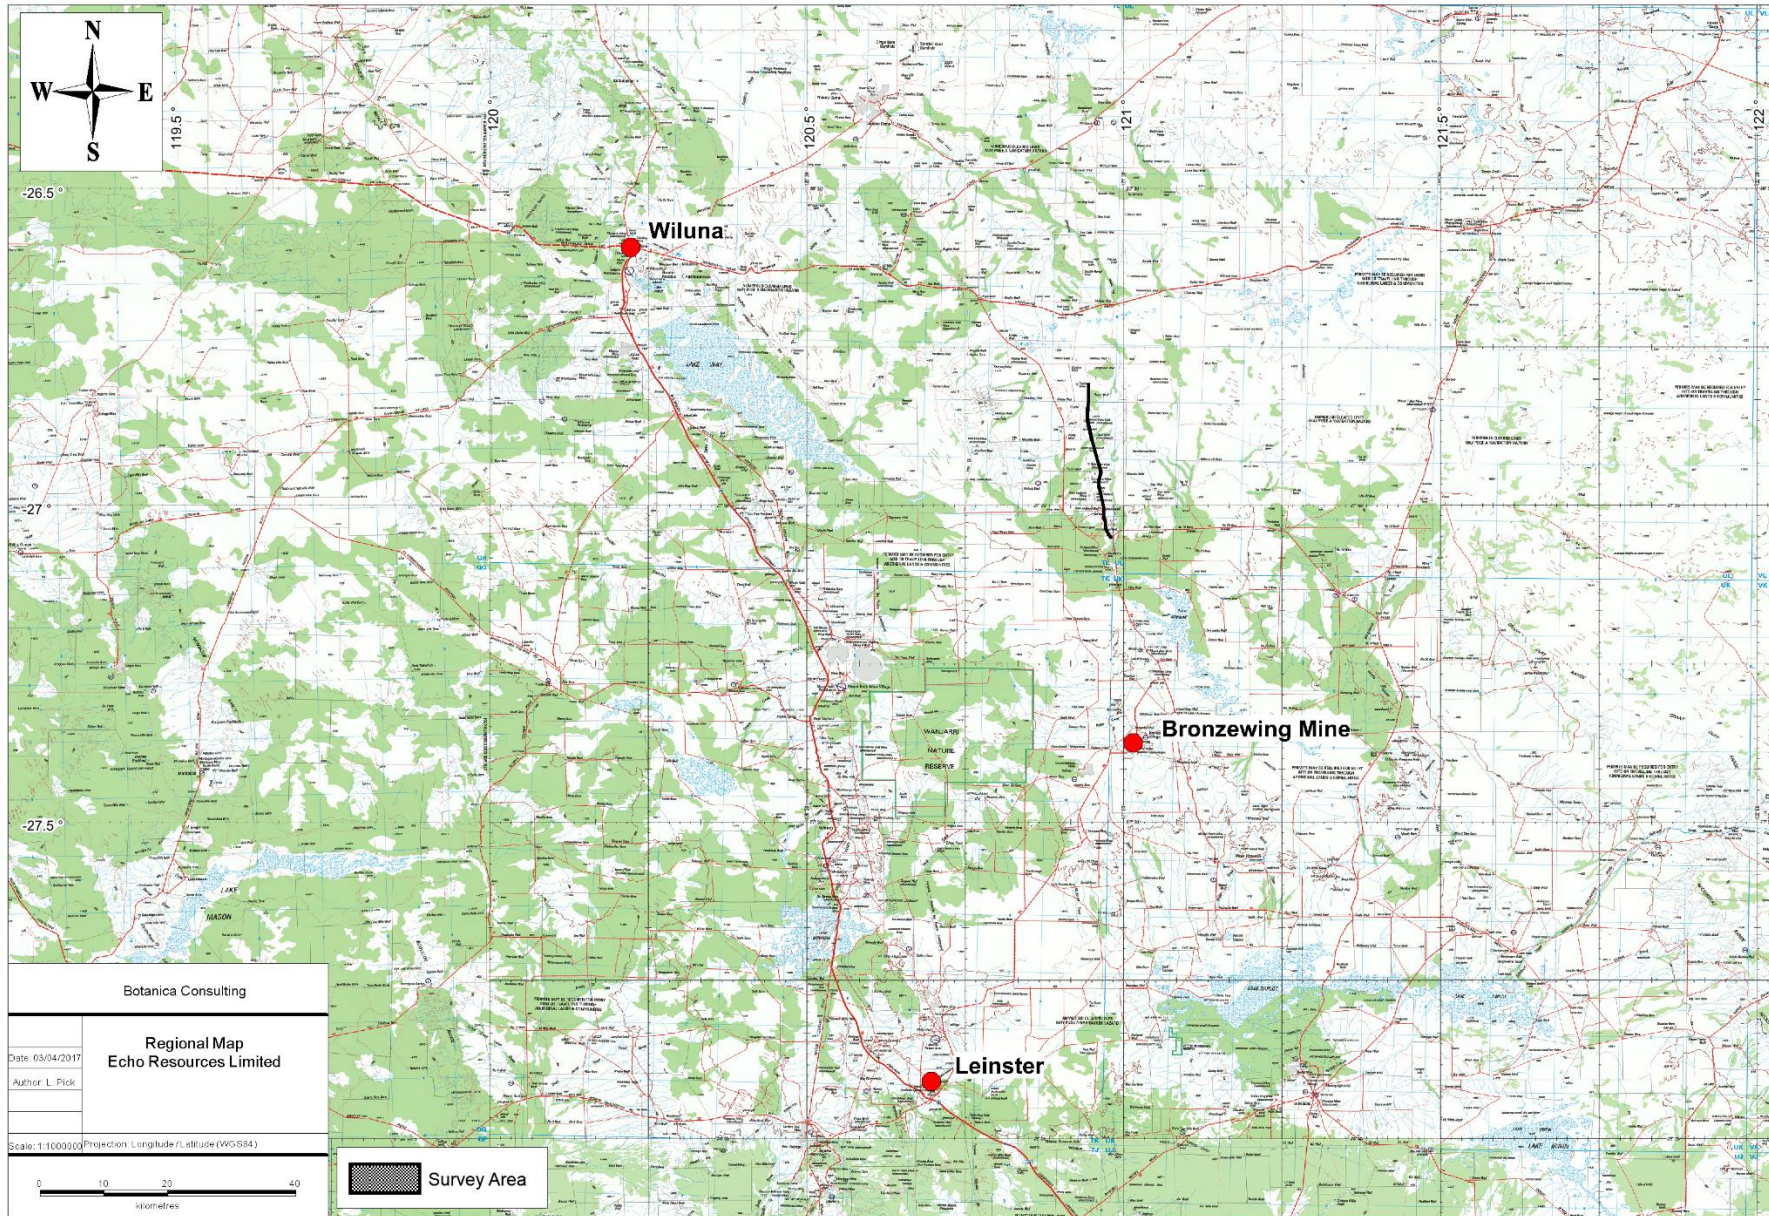

Figure 1: Regional map of the survey area

2 Regional Biophysical Environment

2.1 Regional Environment

The survey area lies within the Austin Botanical District of the Eremaean Province of WA. The Austin Botanical District consists of predominantly of Mulga low woodland on plains and reduces to scrub on hills (Beard, 1990).

Based on the Interim Biogeographic Regionalisation of Australia (IBRA) the Eremaean Province is divided into IBRA regions with the survey area located within the Murchison Bioregion of Western Australia. The Murchison Bioregion is further divided into two subregions, Eastern Murchison (MUR1) and Western Murchison (MUR2) with the survey area located within the Eastern Murchison subregion (Figure 2).

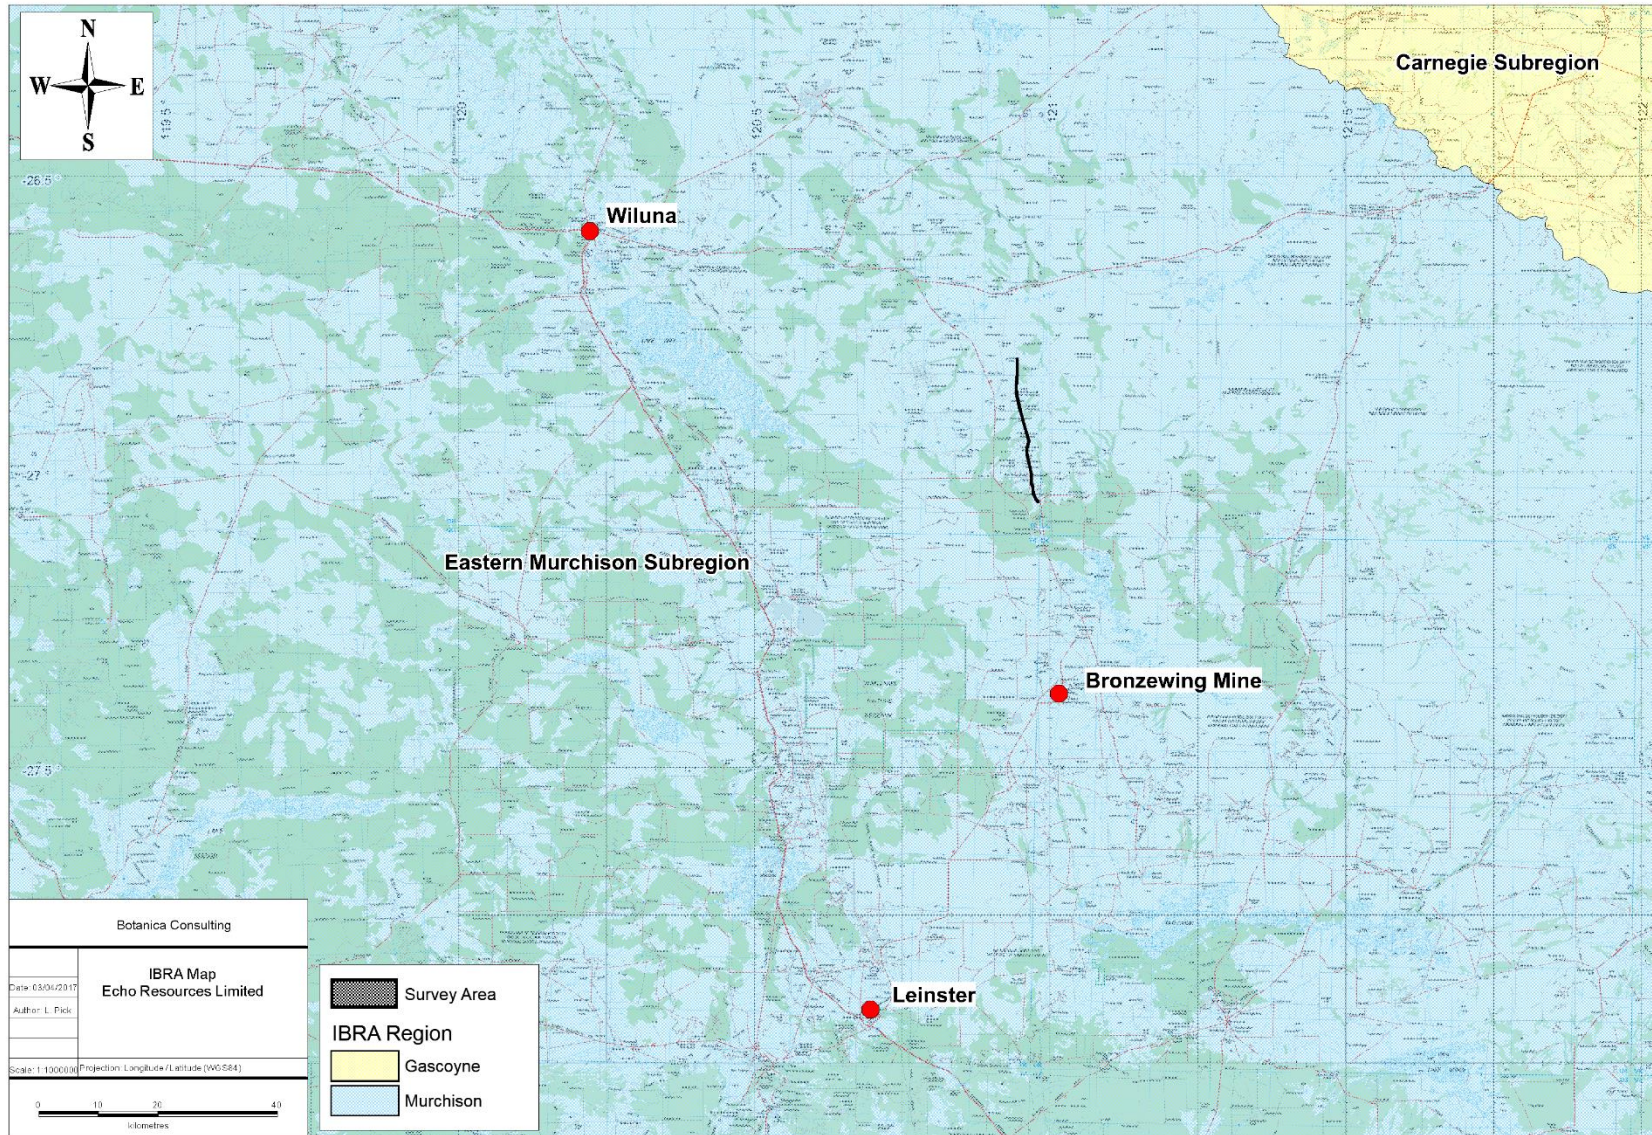

Figure 2: Map of IBRA Regions in relation to the survey area

2.2 Vegetation

Vegetation of the Eastern Murchison subregion in the Austin Botanical District is predominantly Mulga low woodlands on plains, often rich in ephemerals, which reduce to scrub on hills. It is also characterised by hummock grasslands, Saltbush shrublands and Samphire shrublands (Beard, 1990; Cowan, 2001).

The DAFWA GIS file (2011) indicates that the survey area is located within Pre-European Beard vegetation associations Wiluna 18, 29 and 39 (Figure 3). The extent of these associations as described by the DAFWA is shown in Table 1.

Areas retaining less than 30% of their pre-European vegetation extent generally experience exponentially accelerated species loss, while areas with less than 10% are considered “endangered” (EPA, 2000). Development within the survey area will not significantly reduce the extent of these vegetation associations.

Table 1: Remaining Beard Vegetation Associations within the survey area

| Vegetation Association | Pre-European Extent (ha) | Current Extent (ha) | Pre-European extent remaining (%) | % of Current extent within DPaw managed lands | Vegetation Description (Beard, 1990) |
|------------------------|--------------------------|---------------------|-----------------------------------|---|---|
| Wiluna 18 | 4273509.96 | 4256038.43 | 99.59 | 9.59 | Low woodland; mulga (<i>Acacia aneura</i>) |
| Wiluna 29 | 772,807.52 | 772,613.53 | 99.97 | 10.87 | Sparse low woodland; mulga, discontinuous in scattered groups |
| Wiluna 39 | 411,278.07 | 406,212.45 | 98.77 | 6.47 | Shrublands; mulga scrub |

Figure 3: Map of Pre-European Vegetation Associations in the vicinity of the survey area

2.3 Topography & Soils

The Eastern Murchison subregion lies on the northern parts of the ‘Southern Cross’ and ‘Eastern Goldfields’ Terrains of the Yilgarn Craton. This subregion is characterised by its internal drainage and extensive area of elevated red desert sandplains (Cowan, 2001). Another important feature of the system is the Salt Lake systems associated with the occluded Paleo within drainage system. Beard (1990) describes the topography of the region as undulating with occasional ranges of low hills and extensive sandplains located in the East. The dominant soil type is a shallow earthy loam, overlying red-brown hardpan. Red earthy sands can be found on the sandplains.

The survey area lies within the Murchison Province, which consists of Hardpan wash plains and sandplains (with some stony plains, hills, mesas and salt lakes) on the granitic rocks and greenstone of the Yilgarn Craton. The Murchison Province is located in the inland Mid-west and northern Goldfields between three Springs, the Gascoyne River, Wiluna, Cosmo Newberry and Menzies Soil types are dominated by red loamy earths, red sandy earths, red shallow loams, red deep sands and red-brown hardpan shallow loams with some red shallow sands and red shallow sandy duplexes present. Vegetation communities are dominated by Mulga shrublands with spinifex grasslands and some bowgada shrublands, Eucalypt woodlands and halophytic shrublands (DAFWA, 2014).

The Murchison province is further divided into seven soil-landscape zones, with the survey area located within the Salinaland Plains Zone (279). The Salinaland Plains Zone is characterised by sandplains (with hardpan wash plains and some mesas, stony plains and salt lakes) on granitic rocks (and some greenstone) of the Yilgarn Craton. Soils are characterised by red sandy earths, red deep sands, red shallow loams and red loamy earths with some red-brown hardpan shallow loams, Salt Lake soils and red shallow sandy duplexes. Vegetation consists of Mulga shrublands with spinifex grasslands (and some halophytic shrublands and Eucalypt woodlands). This zone is located in the northern Goldfields extending from Lakes Barlee and Lake Ballard to Wiluna and Laverton (Tille, 2016). The Salinaland Plains Zone is further divided into soil landscape systems with the survey area located within five soil landscape systems as shown in Table 2 and Figure 4 (DAFWA, 2014).

Table 2: Soil Landscape Systems within the survey area

| Soil Landscape System | Mapping Unit Code | Description |
|-----------------------|-------------------|---|
| Ararak System | 279Ar | Broad plains with mantles of ironstone gravel supporting mulga shrublands with wanderrie grasses. |
| Tiger System | 279Tg | Gravelly hardpan plains and sandy banks with mulga shrublands and wanderrie grasses. |
| Trennaman System | 279Tn | Sandy hardpan plains and broad drainage zones supporting groved mulga shrublands and wanderrie grasses. |
| Violet System | 279Vi | Gently undulating gravelly plains on greenstone, laterite and hardpan, with low stony rises and minor saline plains; supporting groved mulga and bowgada shrublands and occasionally chenopod shrublands. |
| Wiluna System | 279Wi | Low greenstone hills with occasional lateritic breakaways and broad stony slopes, lower saline stony plains and broad drainage tracts; supporting sparse mulga and other acacia shrublands with patches of halophytic shrubs. |

Figure 4: Map of Soil Landscape Systems within the survey area

2.4 Hydrology

According to the Geoscience Australia (2001) drainage/ inland water GIS database, there are no defined drainage lines or inland water sources (lakes/ playas) within the survey area (Figure 5). Groundwater Dependent Ecosystems (GDE) includes biological assemblages of species such as wetlands or woodlands that use groundwater either opportunistically or as their primary water source. For the purposes of this report, a GDE is defined as any vegetation community that derives part of its water budget from groundwater and must be assumed to have some degree of groundwater dependency. According to the BOM *Atlas of Groundwater Dependent Ecosystems* (BOM, 2017a) there are no GDE's within the survey area.

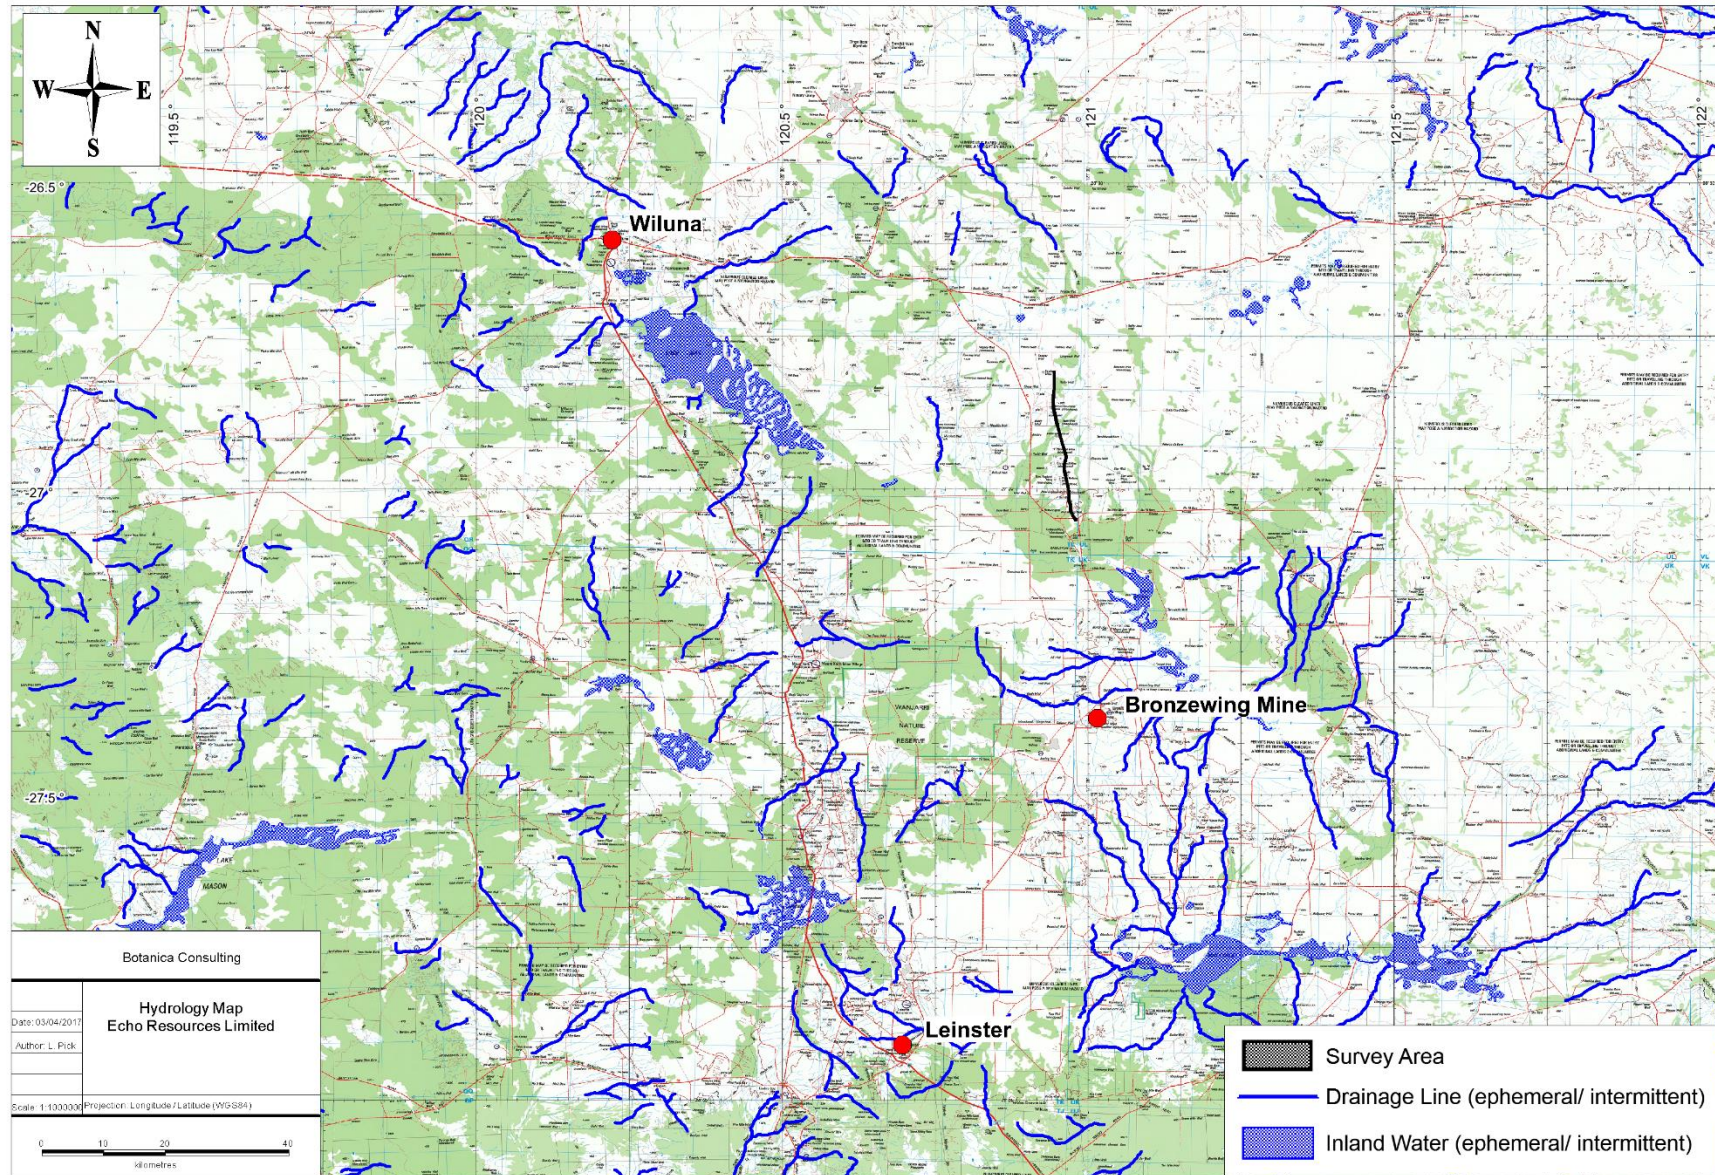

Figure 5: Surface hydrology within the survey area

2.5 Climate

The climate of the Eastern Murchison Subregion is characterised as arid with mainly winter rain averaging approximately 200mm per annum (Cowan, 2001). Monthly rainfall for the nearest active BoM weather station (Millrose Station) located approximately 44km north of the survey area is shown in Figure 6. Rainfall received at Millrose in January 2017, preceding the survey area was above average. Average weather conditions obtained from the Wiluna weather station, located approximately 76km north-west of the survey area is shown in Figure 7 (BOM, 2017b).

Figure 6: Monthly rainfall from January 2015 to January 2017² and mean monthly rainfall (March 1929 to January 2017) for the Millrose weather station #13006 (BOM, 2017b).

Figure 7: Mean monthly rainfall and maximum temperature for the Wiluna weather station #13012 (BOM, 2017c).

² No rainfall data recorded since Jan 2017

2.6 Land Use

The dominant land uses for the Eastern Murchison Subregion include Grazing – native pastures, UCL and Crown Reserves, Mining and Conservation (Cowan, 2001). The survey area is located on the boundary of the Barwidgee Pastoral Lease.

3 Survey Methodology

3.1 Desktop Assessment

Searches of the following databases were undertaken to aid in the compilation of a list of flora taxon within the survey area:

- DPaW's NatureMap Database (DPaW, 2016a); and
- DotEE Protected matters search tool (DotEE, 2016a).

The searches were conducted for an area encompassing a 40 km radius of the centre coordinates – -26.76417 S, 120.94639 E. It should be noted that these lists are based on observations from a broader area than the survey area (40km radius) and therefore may include taxon not present. The databases also often included very old records that may be incorrect or in some cases the taxa in question have become locally or regionally extinct. Information from these sources should therefore be taken as indicative only and local knowledge and information also needs to be taken into consideration when determining what actual species may be present within the specific area being investigated.

Prior to the field survey, a combined search of the DPaW's Flora of Conservation Significance databases (DPaW, 2016b) was undertaken within a 40km radius of the survey area. These significant flora species were examined on the Western Australian Herbarium's (WAHERB) web page prior to the survey, to familiarise staff with their appearance. Locations of Threatened Flora and Priority Flora were overlaid on aerial photography of the area. Vegetation descriptions and available images of the Priority Flora were also obtained from Florabase.

The conservation significance of flora and fauna was assessed using data from the following sources:

- EPBC Act. Administered by the Australian Government (DotEE);
- WC Act. Administered by the WA Government (DPaW);
- Red List produced by the Species Survival Commission (SSC) of the World Conservation Union (also known as the IUCN Red List – the acronym derived from its former name of the International Union for Conservation of Nature and Natural Resources). The Red List has no legislative power in Australia but is used as a framework for State and Commonwealth categories and criteria; and
- DPaW Priority Flora/ Fauna list. A non-legislative list maintained by DPaW for management purposes.

The EPBC Act also requires the compilation of a list of migratory species that are recognised under international treaties including the:

- Japan Australia Migratory Bird Agreement 1981 (JAMBA)³;
- China Australia Migratory Bird Agreement 1998 (CAMBA);
- Republic of Korea-Australia Migratory Bird Agreement 2007 (ROKAMBA); and

³ Species listed under JAMBA are also specially protected under Schedule 5 of the WC Act.

- Bonn Convention 1979 (The Convention on the Conservation of Migratory Species of Wild Animals).

All migratory bird species listed in the annexes to these bilateral agreements are protected in Australia as matters of national environmental significance (NES) under the EPBC Act.

Table 3 and Table 4 below provide the definitions of conservation significant flora and fauna.

Table 3: Definitions of Conservation Significant Flora

| Code | Category |
|--|---|
| State categories of threatened and priority species | |
| T | Threatened flora is flora that has been declared to be 'likely to become extinct or is rare, or otherwise in need of special protection', pursuant to section 23F (2) of the Wildlife Conservation Act. |
| P1 | Priority One – Poorly Known Taxa "Taxa which are known from one or a few (generally <5) populations which are under threat, either due to small population size, or being on lands under immediate threat. Such taxa are under consideration for declaration as 'rare flora', but are in urgent need of further survey." |
| P2 | Priority Two – Poorly Known Taxa "Taxa which are known from one or a few (generally <5) populations, at least some of which are not believed to be under immediate threat (i.e. not currently endangered). Such taxa are under consideration for declaration as 'rare flora', but urgently need further survey." |
| P3 | Priority Three – Poorly Known Taxa "Taxa which are known from several populations and the taxa are not believed to be under immediate threat (i.e. not currently endangered), either due to the number of known populations (generally >5), or known populations being large, and either widespread or protected. Such taxa are under consideration for declaration as 'rare flora' but needs further survey." |
| P4 | Priority Four – Rare Taxa "Taxa which are considered to have been adequately surveyed and which, whilst being rare (in Australia), are not currently threatened by any identifiable factors. These taxa require monitoring every 5 – 10 years." |
| P5 | Priority Five-Conservation Dependent Taxa Taxa that are not threatened but are subject to a specific conservation program, the cessation of which would result in the species becoming threatened within five years. |
| Commonwealth categories of threatened species | |
| Extinct | Taxa where there is no reasonable doubt that the last member of the species has died. |
| Extinct in the wild | Taxa where it is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form. |
| Critically endangered | Taxa that are facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with the prescribed criteria. |
| Endangered | Taxa which are not critically endangered and is facing a very high risk of extinction in the wild in the near future, as determined in accordance with the prescribed criteria. |
| Vulnerable | Taxa which are not critically endangered or endangered and is facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with the prescribed criteria. |

| Code | Category |
|------------------------|--|
| Conservation dependent | <p>Taxa which are the focus of a specific conservation program the cessation of which would result in the species becoming vulnerable, endangered or critically endangered; or (b) the following subparagraphs are satisfied:</p> <p>(i) the species is a species of fish;</p> <p>(ii) the species is the focus of a plan of management that provides for actions necessary to stop the decline of, and support the recovery of, the species so that its chances of long term survival in nature are maximised;</p> <p>(iii) the plan of management is in force under a law of the Commonwealth or of a State or Territory;</p> <p>(iv) cessation of the plan of management would adversely affect the conservation status of the species.</p> |

Table 4: Definitions of Conservation Significant Fauna

| Code | Category |
|--|--|
| State categories of threatened and priority species | |
| Schedule 1 | Critically Endangered – Threatened species considered to be facing an extremely high risk of extinction in the wild. |
| Schedule 2 | Endangered – Threatened species considered to be facing a very high risk of extinction in the wild. |
| Schedule 3 | Vulnerable – Threatened species considered to be facing a high risk of extinction in the wild. |
| Schedule 4 | Species which have been adequately searched for and there is no reasonable doubt that the last individual has died. |
| Schedule 5 | Birds that are subject to an agreement between the government of Australia and the governments of Japan (JAMBA), China (CAMBA) and The Republic of Korea (ROKAMBA), and the Bonn Convention, relating to the protection of migratory birds. |
| Schedule 6 | Fauna of special conservation need being species dependent on ongoing conservation intervention to prevent it becoming eligible for listing as threatened. |
| Schedule 7 | Fauna otherwise in need of special protection to ensure their conservation. |
| P1 | <p>Priority One – Poorly Known Taxa</p> <p>Species that are known from one or a few locations (generally five or less) which are potentially at risk. All occurrences are either: very small; or on lands not managed for conservation, e.g. agricultural or pastoral lands, urban areas, road and rail reserves, gravel reserves and active mineral leases; or otherwise under threat of habitat destruction or degradation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under immediate threat from known threatening processes. Such species are in urgent need of further survey.</p> |
| P2 | <p>Priority Two – Poorly Known Taxa</p> <p>Species that are known from one or a few locations (generally five or less), some of which are on lands managed primarily for nature conservation, e.g. national parks, conservation parks, nature reserves and other lands with secure tenure being managed for conservation. Species may be included if they are comparatively well known from one or more locations but do not meet adequacy of survey requirements and appear to be under threat from known threatening processes. Such species are in urgent need of further survey.</p> |
| P3 | <p>Priority Three – Poorly Known Taxa</p> <p>Species that are known from several locations and the species does not appear to be under imminent threat, or from few but widespread locations with either large population size or significant remaining areas of apparently suitable habitat, much of it not under imminent threat. Species may be included if they are comparatively well known from several locations but do not meet adequacy of survey requirements and known threatening processes exist that could affect them. Such species are in need of further survey.</p> |
| P4 | Priority Four – Rare, Near Threatened and other species in need of monitoring |

| Code | Category |
|--|--|
| | <p>(a) Rare: Species that are considered to have been adequately surveyed, or for which sufficient knowledge is available, and that are considered not currently threatened or in need of special protection, but could be if present circumstances change. These species are usually represented on conservation lands.</p> <p>(b) Near Threatened: Species that are considered to have been adequately surveyed and that do not qualify for Conservation Dependent, but that are close to qualifying for Vulnerable.</p> <p>(c) Species that have been removed from the list of threatened species during the past five years for reasons other than taxonomy.</p> |
| Commonwealth categories of threatened species | |
| Extinct | Taxa where there is no reasonable doubt that the last member of the species has died. |
| Extinct in the wild | Taxa where it is known only to survive in cultivation, in captivity or as a naturalised population well outside its past range; or it has not been recorded in its known and/or expected habitat, at appropriate seasons, anywhere in its past range, despite exhaustive surveys over a time frame appropriate to its life cycle and form. |
| Critically Endangered | Taxa that are facing an extremely high risk of extinction in the wild in the immediate future, as determined in accordance with the prescribed criteria. |
| Endangered | Taxa which are not critically endangered and is facing a very high risk of extinction in the wild in the near future, as determined in accordance with the prescribed criteria. |
| Vulnerable | Taxa which are not critically endangered or endangered and is facing a high risk of extinction in the wild in the medium-term future, as determined in accordance with the prescribed criteria. |
| Near Threatened | Taxa which has been evaluated but does not qualify for CR, EN or VU now but is close to qualifying or likely to qualify in the near future. |
| Least Concern | Taxa which has been evaluated but does not qualify for CR, EN, VU, or NT but is likely to qualify for NT in the near future. |
| Data Deficient | Taxa for which there is inadequate information to make a direct or indirect assessment of its risk of extinction based on its distribution and/or population status. |

A search of the DPaW PEC and TEC database was also conducted within a 40km radius of the survey area (DPaW, 2016c). Table 5 provides definitions for conservation significant communities.

Table 5: Definitions of Conservation Significant Communities

| Category Code | Category |
|--|--|
| State categories of Threatened Ecological Communities (TEC) | |
| | Presumed Totally Destroyed |
| PTD | <p>An ecological community will be listed as Presumed Totally Destroyed if there are no recent records of the community being extant and either of the following applies:</p> <p>records within the last 50 years have not been confirmed despite thorough searches or known likely habitats or;</p> <p>all occurrences recorded within the last 50 years have since been destroyed.</p> |
| CE | Critically Endangered |
| | <p>An ecological community will be listed as Critically Endangered when it has been adequately surveyed and is found to be facing an extremely high risk of total destruction in the immediate future, meeting any one of the following criteria:</p> |

| Category Code | Category |
|---|--|
| | <p>The estimated geographic range and distribution has been reduced by at least 90% and is either continuing to decline with total destruction imminent, or is unlikely to be substantially rehabilitated in the immediate future due to modification;</p> <p>The current distribution is limited i.e. highly restricted, having very few small or isolated occurrences, or covering a small area;</p> <p>The ecological community is highly modified with potential of being rehabilitated in the immediate future.</p> |
| E | <p>Endangered</p> <p>An ecological community will be listed as Endangered when it has been adequately surveyed and is not Critically Endangered but is facing a very high risk of total destruction in the near future. The ecological community must meet any one of the following criteria:</p> <p>The estimated geographic range and distribution has been reduced by at least 70% and is either continuing to decline with total destruction imminent in the short term future, or is unlikely to be substantially rehabilitated in the short term future due to modification;</p> <p>The current distribution is limited i.e. highly restricted, having very few small or isolated occurrences, or covering a small area;</p> <p>The ecological community is highly modified with potential of being rehabilitated in the short term future.</p> |
| V | <p>Vulnerable</p> <p>An ecological community will be listed as Vulnerable when it has been adequately surveyed and is not Critically Endangered or Endangered but is facing high risk of total destruction in the medium to long term future. The ecological community must meet any one of the following criteria:</p> <p>The ecological community exists largely as modified occurrences that are likely to be able to be substantially restored or rehabilitated;</p> <p>The ecological community may already be modified and would be vulnerable to threatening process, and restricted in range or distribution;</p> <p>The ecological community may be widespread but has potential to move to a higher threat category due to existing or impending threatening processes.</p> |
| Commonwealth categories of Threatened Ecological Communities (TEC) | |
| CE | <p>Critically Endangered</p> <p>If, at that time, an ecological community is facing an extremely high risk of extinction in the wild in the immediate future (indicative timeframe being the next 10 years).</p> |
| E | <p>Endangered</p> <p>If, at that time, an ecological community is not critically endangered but is facing a very high risk of extinction in the wild in the near future (indicative timeframe being the next 20 years).</p> |
| V | <p>Vulnerable</p> <p>If, at that time, an ecological community is not critically endangered or endangered, but is facing a high risk of extinction in the wild in the medium-term future (indicative timeframe being the next 50 years).</p> |
| Priority Ecological Communities (PEC) | |
| P1 | Poorly-known ecological communities |

| Category Code | Category |
|---------------|---|
| | Ecological communities with apparently few, small occurrences, all or most not actively managed for conservation (e.g. within agricultural or pastoral lands, urban areas, active mineral leases) and for which current threats exist. |
| P2 | <p>Poorly-known ecological communities</p> <p>Communities that are known from few small occurrences, all or most of which are actively managed for conservation (e.g. within national parks, conservation parks, nature reserves, State forest, un-allocated Crown land, water reserves, etc.) and not under imminent threat of destruction or degradation.</p> |
| P3 | <p>Poorly known ecological communities</p> <p>Communities that are known from several to many occurrences, a significant number or area of which are not under threat of habitat destruction or degradation or:</p> <p>Communities known from a few widespread occurrences, which are either large or within significant remaining areas of habitat in which other occurrences may occur, much of it not under imminent threat, or;</p> <p>Communities made up of large, and/or widespread occurrences, that may or not be represented in the reserve system, but are under threat of modification across much of their range from processes such as grazing and inappropriate fire regimes.</p> |
| P4 | <p>Ecological communities that are adequately known, rare but not threatened or meet criteria for near threatened, or that have been recently removed from the threatened list. These communities require regular monitoring.</p> |
| P5 | <p>Conservation Dependent ecological communities</p> <p>Ecological communities that are not threatened but are subject to a specific conservation program, the cessation of which would result in the community becoming threatened within five years.</p> |

3.1.1 Invertebrate Fauna of Conservation Significance

It can be difficult to identify what may be conservation significant invertebrate species (e.g. Short Range Endemics - SREs) as there are uncertainties in determining the range-restrictions of many species due to lack of surveys, lack of taxonomic resolutions within target taxa and problems in identifying certain life stages. Where invertebrates are collected during surveys, a high percentage are likely to be unknown, or for known species there can be limited knowledge or information on their distribution (Harvey 2002).

For this report, the review of potential terrestrial invertebrate species of conservation significance has included a search of the DPaW NatureMap database (DPaW 2016) and the DotE protected matters database (DotE 2016). Invertebrate surveys, assessments and reviews have been undertaken in nearby areas in the past, though most are not publically available or very difficult to source and therefore could not be referenced. Some of those available have been used to gauge the likely presence/absence of significant invertebrate assemblages in the wider area, though as with the databases searches some reports refer to species that would not occur in the survey area due to a lack of suitable habitat.

3.2 Field Assessment

BC conducted a Level 1 flora and fauna survey, covering an area of approximately 109 ha. The survey area encompasses the entire boundary of L53/206, which is 28 km in length by 40 metres width. The survey was completed on the 18th February 2017 with the area traversed on foot and 4WD by two staff members.

3.2.1 Flora Assessment

Prior to the commencement of field work, aerial photography was inspected and obvious differences in the vegetation assemblages were identified. The different vegetation communities identified were then inspected during the field survey to assess their validity. A handheld GPS unit was used to record the coordinates of the boundaries between vegetation communities. At each sample point, the following information was recorded:

- GPS location;
- Photograph of vegetation;
- Dominant species;
- Landform classification;
- Health Rating;
- Fauna habitat;
- Collection and documentation of unknown plant specimens; and
- GPS location, photograph and collection of flora of fauna of conservation significance if encountered.

Unknown specimens collected during the survey were identified with the aid of samples housed at the BC Herbarium and Western Australian Herbarium (WAHERB). Structural vegetation classification based on National Vegetation Information System (NVIS) Growth Form/ Height Classifications (provided in Appendix 1) was used to determine different vegetation communities based on the vegetation structure and dominant species. Similar vegetation communities were recognised visually in the field. Vegetation communities were classified in accordance with the NVIS to a minimum Level 5 classification which includes recording Dominant growth form, height, cover and species for the three traditional strata (i.e. Upper, Middle and Ground).

3.2.2 Fauna Assessment

Vegetation and landform units identified during the flora and vegetation survey have been used to define broad fauna habitat types across the site. This information has been supplemented with observations made during the fauna assessment.

The main aim of the fauna habitat assessment was to determine if it was likely that any species of conservation significance would be utilising the areas that maybe impacted on as a consequence of development at the site. The habitat information obtained was also used to aid in finalising the overall potential fauna list.

As part of the desktop literature review, available information on the habitat requirements of the species of conservation significance listed as possibly occurring in the area was researched. During the field survey the habitats within the survey area were assessed and specific elements identified, if present, to determine the likelihood of listed threatened species utilising the area and its significance to them.

Opportunistic observations of fauna species were made during all field survey work which involved a series of close spaced transects across the site during the day while searching microhabitats such as logs, rocks, leaf litter and observations of bird species with binoculars. Secondary evidence of a species presence such as tracks, scats, skeletal remains, foraging evidence or calls were also noted if observed/heard.

3.2.3 Personnel involved

Jim Williams - Environmental Consultant/Botanist (Diploma of Horticulture)
Lauren Pick - Senior Environmental Consultant (Bachelor of Science)
Greg Harewood - Zoologist (Bachelor of Science)

3.2.4 Scientific licences

Table 6: Scientific Licences of Botanica Staff coordinating the survey

| Licensed staff | Permit Number | Valid Until |
|----------------|---------------|-------------|
| Jim Williams | SL011451 | 21-05-2017 |
| Lauren Pick | SL011450 | 21-05-2017 |

3.3 Survey limitations and constraints

It is important to note that flora and fauna surveys will entail limitations notwithstanding careful planning and design. Potential limitations are listed in Table 7.

The conclusions presented in this report are based upon field data and environmental assessments and/or testing carried out over a limited period of time and are therefore merely indicative of the environmental condition of the site at the time of the field assessments. Also, it should be recognised that site conditions can change with time. Information not available at the time of this assessment which may subsequently become available may alter the conclusions presented.

Some flora species are reported as potentially occurring based on there being suitable habitat (quality and extent) within the survey area or immediately adjacent. The habitat requirements and ecology of many of the species known to occur in the wider area are however often not well understood or documented. It can therefore be difficult to exclude species from the potential list based on a lack of a specific habitats or microhabitats within the survey area. As a consequence of this limitation, the potential flora list produced is most likely an overestimation of those species that actually utilise the survey area for some purpose.

In recognition of survey limitations, a precautionary approach has been adopted for this assessment. Any flora and fauna species that would possibly occur within the survey area (or immediately adjacent), as identified through ecological databases, publications, discussions with local experts/residents and the habitat knowledge of the Author, has been listed as having the potential to occur.

Table 7: Limitations and constraints associated with the survey.

| Variable | Potential Impact on Survey | Details |
|---|----------------------------|---|
| Competency/ Experience | Not a constraint | The BC personnel that conducted the survey were regarded as suitably qualified and experienced. Coordinating Botanist/Zoologist: Jim Williams & Greg Harewood Field Staff: Jim Williams, Lauren Pick & Greg Harewood Data Interpretation: Jim Williams, Lauren Pick & Greg Harewood |
| Timing of survey, weather & season | Minor constraint | Fieldwork was conducted in February prior to the recommended DPaW/ EPA guidelines primary survey period (March-June, 6-8 weeks post wet season). However, the survey was conducted following high rainfall in January (post wet-season). |
| Area disturbance | Not a constraint | Area has been disturbed by existing pastoral and mining activities. However, vegetation was mostly intact. |
| Survey Effort/ Extent | Not a constraint | Survey intensity was appropriate for the size/significance of the area with a Level 1 survey completed to identify vegetation communities, fauna habitat and any Flora/Fauna of Conservation Significance. |
| Availability of contextual information at a regional and local scale | Not a constraint | Threatened flora database search provided by the DPaW was used to identify any potential locations of Threatened/Priority Flora species. DAFWA, DPaW and DotEE databases were reviewed to obtain appropriate regional desktop information on the biophysical environment of the local region. Results of previous flora/ fauna assessments within the local area were also reviewed to provide context on the local environment. |
| Completeness | Not a constraint | In the opinion of BC, the survey area was covered sufficiently in order to identify vegetation assemblages. Due to the extensive experience and familiarity of the BC staff with flora within the region, it is estimated that approximately 90% of the flora within the survey area was able to be fully identified. The vegetation communities for this study were based on visual descriptions of locations in the field. The distribution of these vegetation communities outside the survey area is not known, however vegetation communities identified were categorised via comparison to vegetation distributions throughout WA specified in the NVIS obtained from the Australian Government (DotEE, 2016b). |

4 Results

4.1 Desktop Assessment

4.1.1 Previous Surveys

Flora and fauna surveys, assessments and reviews have been undertaken in nearby areas in the past, though not all are publically available and could not be referenced. The most significant of those available have been used as the primary reference material for the flora and fauna as listed below.

- Animal Plant Mineral (2015), Vegetation Clearing Permit Application, Matilda Gold Project, Support Information for Matilda Mine Site Native Vegetation Clearing (Purpose) Permit Application, October 2015.

- ATA Environmental (2007), Golden West Resources Wiluna Project - Short Range Endemic (SRE) Invertebrate Survey. Unpublished letter report for Keith Lindbeck and Associates on behalf of Golden West Resources Ltd.
- BC (2015a), Level 2 Flora and Vegetation Survey of the North Laverton Gold Project. Prepared for Bullseye Mining Ltd.
- BC (2015b), Level 1 Flora & Vegetation Survey: Proposed Haul Roads for the North Laverton Gold Project. Prepared for Bullseye Mining Ltd.
- BC (2016), Level 1 Flora & Fauna Survey, Julius Project. Prepared for Echo Resources Limited.
- Blackwell, M. J. and Trudgen, M. E. (1980). Report on the Flora and Vegetation of the Lake Way Joint Venture Uranium Project Area: together with an assessment of the impact of this project upon the landscape, flora and vegetation of this area and its regeneration potential.
- Ecologia (1993), Bronzewing Gold Project. Notice of Intent. Botanical Assessment Survey. Report prepared for Great Central Mine.
- Hall, N.J., Newbey, K.R., McKenzie, N.L., Keighery, G.J., Rolfe, J.K & Youngson, W. K., (1993), The Biological survey of the Eastern Goldfields of Western Australia Part 7: Sandstone-Sir Samuel. Laverton-Leonora study area, West. Aust. Mus. Suppl. **47**.
- Halpern Glick Maunsell, (1997). Barwidgee Pastoral Lease *Mulgara Dasycercus cristicauda* Survey. Unpublished report prepared for Great Central Mines, November 1997.
- Harewood, G. (2015), Fauna Assessment, Laverton Gold Project. Unpublished report for Bullseye Mining Limited.
- Ninox Wildlife Consulting (1989), Vertebrate Fauna Assessment of the Proposed Mt McClure Gold Project. Unpublished report.
- Ninox Wildlife Consulting (1993), Vertebrate Fauna Assessment of the Proposed Bronzewing Gold Project. Unpublished report prepared for Signet Engineering Pty. Ltd. (February 1993).
- Ninox Wildlife Consulting (2007), A Vertebrate Fauna Survey of the Wiluna West Project Area Western Australia # 3. Unpublished report for Keith Lindbeck and Associates on behalf of Golden West Resources Ltd.
- Outback Ecology Services (OES) (2006), Report on the distribution of *Eremophila pungens* (P4) within the Bronzewing – Mt McClure Gold Project. Unpublished report prepared for View Resources Ltd (September 2006).
- Outback Ecology Services (OES) (2009), Lake Maitland Baseline Terrestrial Fauna Survey. Unpublished report for Mega Uranium Pty Ltd.
- Outback Ecology Services (OES) (2010), Application for a Purpose Permit to Clear Native Vegetation at the Bronzewing– Mt McClure Project: – Corboys Prospect M 53/15. Prepared for Navigator Resources Limited.

- Pringle, H. J. R, Van Vreeswyk, A. M. E. and Gilligan, S. A. (1994), An inventory and condition survey of the north-eastern Goldfields, Western Australia. Technical Bulletin No. 87. Department of Agriculture, Western Australia.
- Terrestrial Ecosystems (2011), Level 2 Fauna Risk Assessment for the Granny Deeps Project Area. Unpublished report for Barrick Gold Corporation.
- Trudgen, M. (1989). A Flora and Vegetation Survey of Part of the Cyprus Gold Mount McClure Gold Mining Leases. Report prepared for Cyprus Gold for inclusion in the Mt McClure Project Feasibility Study, Volume 2 Environmental Study.

Some of the abovementioned reports refer to flora and fauna surveys carried a considerable distance from the survey area being assessed and therefore, as with the databases searches, some refer to species that would not occur in the survey area due it being out of their normal range or due to a lack of suitable habitat (extent and/or quality) and this fact was taken into consideration when compiling the potential flora and fauna species list for the survey area.

4.1.2 Flora of Conservation Significance

The results of the combined search of the DPaW's Flora of Conservation Significance databases, NatureMap Database and Protected Matters search tool, recorded no Threatened Flora and no Priority Flora taxon within the survey area. One Threatened Flora taxon and 28 Priority Flora taxa were listed within a 40km radius of the survey area. These taxa were assessed and ranked for their likelihood of occurrence within the survey area (Table 8). The rankings and criteria used were:

- Unlikely: Area is outside of the currently documented distribution for the species/no suitable habitat (type, quality and extent) was identified as being present during the field/desktop assessment.
- Possible: Area is within the known distribution of the species in question and habitat of at least marginal quality was identified as being present during the field/desktop assessment, supported in some cases by recent records being documented from within or near the area.
- Known to Occur: The species in question was positively identified as being present during the field survey.

Table 8: Likelihood of Occurrence – Flora Species of Conservation Significance

| Taxon | Conservation Code | Description | Likelihood of Occurrence |
|---|-------------------|---|--------------------------|
| <i>Atriplex yeelirrie</i> | T | Subdioecious plant distinguished by its dome shaped habit and divaricate woody branches. Female plants have distinctive fan-like fruits (with or without appendages). Highly restricted distribution limited to two populations on Yeelirrie Station. | Unlikely |
| <i>Austroparmelina macrospora</i> | P3 | No description available | Possible |
| <i>Baeckea</i> sp. Sandstone (C.A. Gardner s.n. 26 Oct. 1963) | P3 | Upright shrub, ca 1 m high. Fl. white, Oct. Orange sand. Flats. | Unlikely |
| <i>Beyeria lapidicola</i> | P1 | No description available | Possible |

| Taxon | Conservation Code | Description | Likelihood of Occurrence |
|---|-------------------|---|--------------------------|
| <i>Calytrix praecipua</i> | P3 | Shrub, 0.3-0.7 m high. Fl. pink-white, Jun to Jul or Sep to Nov. Skeletal sandy soils over granite or laterite. Breakaways, outcrops. | Unlikely |
| <i>Calytrix verruculosa</i> | P3 | Shrub, 0.4-0.75 m high. Fl. pink/white, Aug or Oct. Sandy clay. | Possible |
| <i>Cratystylis centralis</i> | P3 | Much-branched, brittle, greyish shrub, to 1 m high. Red sandy loam with ironstone gravel. Flat plains, breakaway country. | Unlikely |
| <i>Eremophila arguta</i> | P1 | Shrub. | Possible |
| <i>Eremophila campanulata</i> | P3 | Low shrub, ca 0.3 m high, 0.4 m wide. Fl. purple-red, Sep. Stony red/brown clay. | Possible |
| <i>Eremophila congesta</i> | P1 | Upright shrub, to 1.2 m high. Fl. purple-blue, Aug to Sep. Lateritic outcrops in greenstone hills, stony quartzite slopes. | Unlikely |
| <i>Eremophila flaccida</i> subsp. <i>attenuata</i> | P3 | Erect, compact shrub, ca 0.5 m high. Fl. pink & blue, May. Stony clay over quartzite. Hillslopes, ridges. | Possible |
| <i>Eremophila gracillima</i> | P3 | Low flat shrub, ca 0.3 m high, 1.2 m wide. Fl. blue, Sep. Stony flats. | Possible |
| <i>Eremophila pungens</i> | P4 | Erect, viscid shrub, 0.5-1.5 m high. Fl. purple-violet, Jun to Aug. Sandy loam, clayey sand over laterite. Plains, ridges, breakaways. | Unlikely |
| <i>Euryomyrtus inflata</i> | P3 | Shrub, 0.3-0.7 m high, leaves dull green, fruits erect. Fl. white-pink, Jun to Jul. Deep red sand. Flat plain. | Possible |
| <i>Gunniopsis propinqua</i> | P3 | Prostrate annual or perennial, herb, 0.03-0.1 m high. Fl. white/pink, Aug to Sep. Stony sandy loam. Lateritic outcrops, winter-wet sites. | Unlikely |
| <i>Hemigenia exilis</i> | P4 | Erect, multi-stemmed shrub, 0.5-2 m high. Fl. blue-purple/white, Apr or Sep to Nov. Laterite. Breakaways, slopes. | Unlikely |
| <i>Hibiscus</i> sp. Wonganoo Station (K. Boladeras 125) | P1 | No description available | Possible |
| <i>Homalocalyx echinulatus</i> | P3 | Shrub, 0.45-1 m high. Fl. pink, Jun to Sep. Laterite. Breakaways, sandstone hills. | Unlikely |
| <i>Maireana prosthecochoaeta</i> | P3 | Open, densely-leaved shrub, 0.3-0.6 m high. Laterite. Hills, salty places. | Unlikely |
| <i>Neurachne lanigera</i> | P1 | Tufted perennial, grass-like or herb, 0.15-0.3 m high. Fl. other, Jul to Aug or Oct. Red sand, laterite. Rocky outcrops, plains. | Possible |
| <i>Olearia mucronata</i> | P3 | Densely branched, unpleasantly aromatic shrub, 0.6-1 m high. Fl. white & yellow, Aug to Dec or Jan. Schistose hills, along drainage channels. | Unlikely |
| <i>Prostanthera ferricola</i> | P3 | Erect, openly-branched shrub, 0.3-1 m high. Shallow red-brown skeletal sandy loam on banded ironstone, laterite, basalt or quartz. Gently inclined mid to | Unlikely |

| Taxon | Conservation Code | Description | Likelihood of Occurrence |
|---|-------------------|--|--------------------------|
| | | upper slopes of hills, rocky crests, outcrops. | |
| <i>Ptilotus luteolus</i> | P3 | No description available | Possible |
| <i>Sauropus</i> sp. Woolgorong (M. Officer s.n. 10/8/94) | P3 | Shrub, 0.3-1 m high. Fl. yellow, Jun. Red sand. Plains. | Possible |
| <i>Sida picklesiana</i> | P3 | No description available | Possible |
| <i>Stackhousia clementii</i> | P3 | Dense broom-like perennial, herb, to 0.45 m high. Fl. green/yellow/brown. Skeletal soils. Sandstone hills. | Unlikely |
| <i>Tecticornia</i> sp. Lake Way (P. Armstrong 05/961) | P1 | No description available | Possible |
| <i>Tribulus adelacanthus</i> | P3 | Prostrate herb, plants villous; leaflet pairs 3-6; fruits 5-winged, lacking spines, 10-14 mm high. | Possible |
| <i>Xanthoparmelia nashii</i> | P3 | No description available | Possible |

4.1.3 Vertebrate Fauna of Conservation Significance

The vertebrate fauna of conservation significance identified during the literature review as previously being recorded in the general area have been assessed and ranked for their likelihood of occurrence within the survey area itself (Table 9). The rankings and criteria used were:

- **Would Not Occur:** There is no suitable habitat for the species in the survey area and/or there is no documented record of the species in the general area since records have been kept and/or the species is generally accepted as being locally/regionally extinct (supported by a lack of recent records).
 - **Locally Extinct:** Populations no longer occur within a small part of the species natural range, in this case within 10 or 20km of the survey area. Populations do however persist outside of this area.
 - **Regionally Extinct:** Populations no longer occur in a large part of the species natural range, in this case within much of the Eastern Murchison Bioregion. Populations do however persist outside of this area.
- **Unlikely:** The survey area is outside of the current/main documented distribution for the species in question, or no suitable habitat (type, quality and extent) was identified as being present during the field assessment. Individuals of some species may occur occasionally as vagrants/transients especially if suitable habitat is located nearby but the survey area itself would not support a population or part population of the species
- **Possibly occurs:** The survey area is within the known distribution of the species in question and habitat of at least marginal quality was identified as likely to be present during the field survey and literature review, supported in some cases by recent records being documented in literature. In some cases, while a species may be classified as possibly being present at times,

habitat may be marginal (e.g. poor quality, fragmented, limited in extent) and therefore the frequency of occurrence and/or population levels may be low.

- **Known to Occur:** The species in question has been positively identified as being present (for sedentary species) or as using the survey area as habitat for some other purpose (for non-sedentary/mobile species) during field surveys. This information may have been obtained by direct observation of individuals or by way of secondary evidence (e.g. tracks, foraging debris, scats). In some cases, while a species may be classified as known to occur, habitat may be marginal (e.g. poor quality, fragmented, limited in extent) and therefore the frequency of occurrence and/or population levels may be low.

Table 9: Likelihood of Occurrence – Vertebrate Fauna Species of Conservation Significance

| Species | Conservation Status (see Table 4 for codes) | | | Potential Habitats Within Survey Area | | | Likelihood of Occurrence |
|---|--|--------|---------------|---------------------------------------|------------------|------------------------------|---|
| | EPBC Act | WC Act | DPAW Priority | Foraging Habitat | Breeding Habitat | Total Extent (ha) | |
| Malleefowl <i>Leipoa ocellata</i> | VU | S3 | - | Clay /Loam plains & Sand/Loam plains. | None | 28 ha (26% of total area). | Unlikely. Habitat very marginal in quality. North eastern limit of main documented range. Few nearby records. |
| Great Egret <i>Ardea alba</i> | Mig | S5 | - | None | | None | Would not occur. Outside current documented range. Preferred habitat absent. No previous records. |
| Peregrine Falcon <i>Falco peregrinus</i> | - | S7 | - | Air space above all habitats. | None | 109 ha (100% of total area). | Possible but probably only rarely. |
| Oriental Plover <i>Charadis veredus</i> | Mig | S5 | - | None | | 0 ha | Would not occur. Preferred habitat absent. No previous records. |
| Grey Wagtail <i>Motacilla cinerea</i> | Mig | S5 | - | None | | 0 ha | Would not occur. Preferred habitat absent. No previous records. |
| Yellow Wagtail <i>Motacilla flava</i> | Mig | S5 | - | None | | 0 ha | Would not occur. Preferred habitat absent. No previous records. |
| Princess Parrot <i>Polytelis alexandrae</i> | VU | - | P4 | None | | 0 ha | Unlikely. Outside normal range. Habitat appears unsuitable. No recent records in general area. |
| Night Parrot <i>Pezoporus occidentalis</i> | EN | S1 | - | None | | 0 ha | Unlikely Preferred habitat absent. No previous records in close proximity. |
| Fork-tailed Swift <i>Apus pacificus</i> | Mig | S5 | - | Air space above all habitats. | None | 109 ha (100% of total area). | Unlikely - flyover only on very rare occasions. No previous records nearby. |
| Rainbow Bee-eater <i>Merops ornatus</i> | Mig | S3 | - | Sand/Loam plains & Clay/Loam plains. | Sand/Loam Plains | 109 ha (100% of total area). | Possible |
| Brush-tailed Mulgara <i>Dasyercus blythi</i> | - | - | P4 | None | | 0 ha | Unlikely – Habitat appears unsuitable or marginal at best. |

4.1.1 Invertebrate Fauna of Conservation Significance

The NatureMap database search returned twenty-one invertebrate species records (DPaW 2017). None of these records are flagged as being “endemic to the query area” which indicates they have all been recorded outside of the 40km radius applied to the search. This supports a tentative conclusion none are likely to be SRE species and none have a distribution confined to the survey area alone.

A search of the federal EPBC Act database using the Protected Matters Search Tool (DotE 2016b) returned no reference to invertebrates.

There appears to be very few available terrestrial invertebrate fauna survey reports for the general area and only two were sourced (ATA 2007, Outback 2009).

ATA’s survey was carried out within Golden West Resources Wiluna Iron Ore Project area, which is located about 100km west of the Julius Project area. ATA conducted hand foraging for mygalomorph spiders, pseudo-scorpions and scorpions within Banded Ironstone Formation ranges, mulga woodlands and hummock grasslands. Ten spiders, but no pseudo-scorpions or scorpions were collected. Only one spider specimen was subsequently identified as being a mygalomorph spider and therefore of potential interest with respect to short range endemism. However, the specimen was a juvenile and could not be identified to species level and therefore its actual/possible SRE status was not determined.

ATA did however conclude that because the specimen was collected in a habitat unit that was widespread in the area the species in question was likely to have a wide distribution and its status was therefore unlikely to change as a consequence of mining, given the relatively small impact area (ATA 2007).

Outback carried out a fauna survey in 2008/2009 at the Lake Maitland Uranium Project area, which is located about 50 km south of the Julius Project area. The SRE component of this survey focused on invertebrate taxa that have characteristics which make them prone to short range endemism. The targeted taxa in the surveys were mygalomorph spiders, Myriopods (millipedes, centipedes), scorpions, pseudoscorpions and terrestrial snails.

The collected specimens were identified by taxonomic experts at the Western Australian Museum and the University of Western Australia. A number of mygalomorph taxa were collected in the Lake Maitland Project area that may have restricted ranges, however, Outback reported that it was difficult to make conclusive comments without a review of the genera and the further collection of representative male specimens from within and outside the Project area.

None of the species of pseudoscorpions, centipedes or terrestrial snails that were collected during the Lake Maitland Project area survey were considered to exhibit short range endemism, with most being widely distributed within the semi-arid zone of Western Australia. Some uncertainty relating to the status of two scorpion type species collected, “maitland1” and “maitland2” from the genus *Urodacus* was however reported. At the time of the survey the genus was under review and the taxonomy and possible SRE status of these specimens was therefore uncertain (Outback 2009). It is unclear if this uncertainty was ever resolved.

In conclusion Outback stated that if large areas, known to be inhabited by possible short range endemic taxa (specifically mygalomorph spiders), are to be impacted by the development, it would

be useful to establish whether populations of the species present also exist outside the areas of impact (Outback 2009).

With respect to the Julius Project haul road area the conclusions drawn during the course of these previous invertebrate studies in nearby areas can be applied in this instance. The vegetation and habitat assessment detailed in other sections of this report suggests that most areas represent common widespread vegetation/habitat units with no obvious boundaries or subdivisions present that would represent species isolators which would restrict certain invertebrate species to the survey area alone. Given the small area of impact of the proposed haul road and the lack of areas of high potential as suitable SRE habitat it is considered very unlikely that any one invertebrate species would be restricted to the survey area. It can therefore be expected that even the most restricted invertebrate species (if in fact present) will persist in adjoining areas despite the localised loss of some habitat within the survey area itself.

4.2 Field Assessment

4.2.1 Flora of Conservation Significance

Flora of conservation significance identified in the desktop assessment as potentially occurring within the survey area were targeted during the field assessment. No Threatened Flora taxa pursuant to subsection (2) of section 23F of the WC Act and the EPBC Act were identified within the survey area. No Priority Flora taxa were identified within the survey area.

4.2.1 Vertebrate Fauna of Conservation Significance

Fauna of conservation significance identified in the desktop assessment as potentially occurring within the survey area were targeted during the field assessment. No evidence of any threatened, migratory or priority fauna species utilising the survey area was observed.

4.2.2 Opportunistic Fauna Observations

Opportunistic fauna observations are listed in Appendix 6. A total of 16 native fauna species were observed (or positively identified from foraging evidence, scats, tracks, skeletons or calls) within or near the survey area over the survey period. Evidence of one introduced species (camel) using the survey area was also gathered. With the exception of the red kangaroo all observations of native fauna were of common, widespread bird species.

4.3 Vegetation Communities

Eight broad vegetation communities were identified within the survey area. These communities were identified within five landform types and comprised of one major vegetation group according to the NVIS, Major Vegetation Group (MVG) definition (Table 10). A map showing the vegetation communities present in the survey area is provided in Appendix 3. These communities were represented by a total 22 Families, 36 Genera and 74 Taxa, as listed in Appendix 4.

Table 10: Summary of vegetation communities and area within the survey area

| Landform | NVIS Major Vegetation Group | Vegetation Community | Vegetation Code | Area (Ha) | Area (%) |
|-----------------|-------------------------------------|--|-----------------|-----------|----------|
| Clay-Loam Plain | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia incurvaneura</i> over mid open shrubland of <i>Eremophila linearis</i> / <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low chenopod shrubland of <i>Maireana triptera</i> on clay-loam plain | CLP-AFW1 | 10 | 9.17 |
| | | Open low woodland of <i>Acacia pruniocarpa</i> over mid sparse shrubland of <i>Eremophila fraseri</i> / <i>Eremophila paisleyi</i> and low open tussock grassland of <i>Eragrostis eriopoda</i> on clay-loam plain | CLP-AFW2 | 12 | 11.01 |

| Landform | NVIS Major Vegetation Group | Vegetation Community | Vegetation Code | Area (Ha) | Area (%) |
|---------------------|-------------------------------------|--|-----------------|------------|------------|
| Drainage Depression | Acacia Forests and Woodlands (MVG6) | Open forest of <i>Acacia incurvaneura</i> over tall open shrubland of <i>Acacia ramulosa</i> var. <i>ramulosa</i> and low tussock grassland of <i>Eragrostis kennedyae</i> in drainage depression | DD-AFW1 | 13 | 11.93 |
| Quartz-Rocky Plain | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia incurvaneura</i> over mid open shrubland of <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low open tussock grassland of <i>Eragrostis eriopoda</i> on quartz-rocky plain | QRP-AFW1 | 33 | 30.28 |
| | | Low woodland of <i>Acacia incurvaneura</i> over mid open shrubland of <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low open shrubland of <i>Ptilotus obovatus</i> on quartz-rocky plain | QRP-AFW2 | 12 | 11.01 |
| Rocky Hillslope | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia incurvaneura</i> / <i>A. pruniocarpa</i> over mid open shrubland of <i>Scaevola spinescens</i> and low open tussock grassland of <i>Eriachne mucronata</i> / <i>Eragrostis eriopoda</i> on rocky hillslope | RH-AFW1 | 7 | 6.42 |
| | | Low woodland of <i>Acacia balsamea</i> over mid open shrubland of <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low open shrubland of <i>Ptilotus obovatus</i> / <i>Solanum lasiophyllum</i> on rocky hillslope | RH-AFW2 | 16 | 14.68 |
| Sand-Loam Plain | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia caesaneura</i> / <i>A. incurvaneura</i> over low open shrubland of <i>Eremophila forrestii</i> and low open tussock grassland of <i>Eragrostis eriopoda</i> on sand-loam plain | SLP-AFW1 | 6 | 5.50 |
| TOTAL | | | | 109 | 100 |

Clay-Loam Plain: Acacia Forests and Woodlands

**4.3.1 Low woodland of *Acacia incurvaneura* over mid open shrubland of *Eremophila linearis*/
Senna sp. Meekatharra (E. Bailey 1-26) and low chenopod shrubland of *Maireana triptera* on
 clay-loam plain (CLP-AFW1)**

The total flora recorded within this vegetation community was represented by a total of 8 Families, 12 Genera and 19 Taxa (Plate 1). No Threatened or Priority Flora taxa were identified within this vegetation community. No introduced taxa were recorded within this vegetation community. Dominant taxa from the vegetation assemblage are shown in Table 11. According to the NVIS, this vegetation community is best represented by the MVG 6- Acacia Forests and Woodlands (DotEE, 2017).

**Table 11: Vegetation assemblage for Low woodland of *Acacia incurvaneura* over low scrub of *Eremophila linearis*/
Senna sp. Meekatharra (E. Bailey 1-26) and dwarf scrub of *Maireana triptera* on
 clay-loam plain**

| Life Form/Height Class | Canopy Cover | Dominant taxa present |
|------------------------|--------------|---|
| Tree <10m | 10-30% | <i>Acacia incurvaneura</i> |
| Shrub 1-2m | 10-30% | <i>Eremophila linearis</i> <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) |
| Chenopod Shrub <1m | 30-70% | <i>Maireana georgei</i> |

4.4 Vegetation of Conservation Significance

No Threatened Flora, pursuant to subsection (2) of section 23F of the WC Act and the EPBC Act were identified within the survey area. No Priority taxa as listed by the DPaW were identified within the survey area. There were no TEC as listed under Commonwealth and State Legislation or PEC as listed by DPaW located within the survey area.

The survey area is not located within an ESA or Schedule 1 Area as listed under the EP Act or EP Regulations. The survey area is not located within a listed or proposed conservation area managed by DPaW. The nearest DPaW managed land is the Wanjarri Nature Reserve, which is listed as a “Class A” Nature Reserve, located approximately 26km south-west of the survey area. A map showing the survey area in relation to areas of conservation significance is provided in Appendix 2.

4.5 Vegetation Condition

Based on the vegetation condition rating scale adapted from Keighery, 1994 and Trudgen, 1988 (Appendix 5), three vegetation communities were rated as ‘good’ which depicts that vegetation structure has been impacted by more obvious signs of damage caused by human activity since European settlement, including some obvious impact on the vegetation structure such as that caused by low levels of grazing or slightly aggressive weeds. The remaining five vegetation communities were rated as ‘very good’ (Table 19) which depicts that vegetation has been subject to some relatively slight signs of damage caused by human activities since European settlement. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks. A map showing the vegetation condition within the survey area is provided in Figure 8.

Table 19: Vegetation condition within the survey area

| Landform | NVIS Major Vegetation Group | Vegetation Community | Vegetation Code | Condition Rating |
|---------------------|-------------------------------------|--|-----------------|------------------|
| Clay-Loam Plain | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia incurvaneura</i> over mid open shrubland of <i>Eremophila linearis</i> / <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low chenopod shrubland of <i>Maireana triptera</i> on clay-loam plain | CLP-AFW1 | Good |
| | | Open low woodland of <i>Acacia pruniocarpa</i> over mid sparse shrubland of <i>Eremophila fraseri</i> / <i>Eremophila paisleyi</i> and low open tussock grassland of <i>Eragrostis eriopoda</i> on clay-loam plain | CLP-AFW2 | Very Good |
| Drainage Depression | Acacia Forests and Woodlands (MVG6) | Open forest of <i>Acacia incurvaneura</i> over tall open shrubland of <i>Acacia ramulosa</i> var. <i>ramulosa</i> and low tussock grassland of <i>Eragrostis kennedyae</i> in drainage depression | DD-AFW1 | Very Good |
| Quartz-Rocky Plain | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia incurvaneura</i> over mid open shrubland of <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low open tussock grassland of <i>Eragrostis eriopoda</i> on quartz-rocky plain | QRP-AFW1 | Very Good |
| | | Low woodland of <i>Acacia incurvaneura</i> over mid open shrubland of <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low open shrubland of <i>Ptilotus obovatus</i> on quartz-rocky plain | QRP-AFW2 | Good |
| Rocky Hillslope | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia incurvaneura</i> / <i>A. pruniocarpa</i> over mid open shrubland of <i>Scaevola spinescens</i> and low open tussock grassland of <i>Eriachne mucronata</i> / <i>Eragrostis eriopoda</i> on rocky hillslope | RH-AFW1 | Very Good |

| Landform | NVIS Major Vegetation Group | Vegetation Community | Vegetation Code | Condition Rating |
|-----------------|-------------------------------------|--|-----------------|------------------|
| | | Low woodland of <i>Acacia balsamea</i> over mid open shrubland of <i>Senna</i> sp. Meekatharra (E. Bailey 1-26) and low open shrubland of <i>Ptilotus obovatus</i> / <i>Solanum lasiophyllum</i> on rocky hillslope | RH-AFW2 | Very Good |
| Sand-Loam Plain | Acacia Forests and Woodlands (MVG6) | Low woodland of <i>Acacia caesaneura</i> / <i>A. incurvaneura</i> over low open shrubland of <i>Eremophila forrestii</i> and low open tussock grassland of <i>Eragrostis eriopoda</i> on sand-loam plain | SLP-AFW1 | Good |

Figure 8: Vegetation condition within the survey area

4.6 Introduced Plants

No introduced taxa were recorded within the survey area; however, the survey took place after heavy rains and there were many small germinants and some of which may have been introduced.

4.7 Fauna Habitat

The broad scale terrestrial fauna habitats within the survey area presented below are based on vegetation and associated landforms identified during the flora and vegetation assessment. The extent of the identified fauna habitats and a summary description of each are provided in Table 20 below.

All of the broad scale fauna habitats identified appear to be widespread and well represented in areas surrounding the Julius Project haul road survey area.

Table 20: Main Terrestrial Fauna Habitats within the Proposed Haul Road Project survey area

| Fauna Habitat Description | Example Image |
|--|--|
| <p><u>Clay Loam Plains</u></p> <p><i>Acacia</i> Forests and Woodlands</p> <p>Total Area = 22 ha (~20%)</p> |  |
| <p><u>Drainage Depressions</u></p> <p><i>Acacia</i> Forests and Woodlands</p> <p>Total Area = 13 ha (~12%)</p> |  |

| Fauna Habitat Description | Example Image |
|--|--|
| <p><u>Quartz-Rocky Plains</u></p> <p><u>Acacia Forests and Woodlands</u></p> <p><u>Total Area = 45 ha (~41%)</u></p> |  |
| <p><u>Rocky Hillslope</u></p> <p>Acacia Forests and Woodlands</p> <p>Total Area = 23 ha (~21%)</p> |  |
| <p><u>Sand-Loam Plain</u></p> <p>Acacia Forests and Woodlands</p> <p>Total Area = 6 ha (~6%)</p> |  |

4.7.1 Fauna Inventory – Vertebrate Fauna

A list of expected vertebrate fauna species likely to occur in the survey area was compiled from information obtained during the literature review and is presented in Appendix 6. The results of some previous fauna surveys carried out in the general area are also summarised in this species listing as are the DPaW NatureMap database search results.

Table 21 summarises the numbers of potential species based on vertebrate class considered likely to be present in the general vicinity of the survey area based on the complete list held Appendix 6.

Not all species listed in existing databases and publications as potentially occurring within the region (i.e. EPBC Act Threatened Fauna and Migratory species lists, DPAW NatureMap Fauna Database and various publications) are considered likely to be present within the survey area. The list of potential fauna takes into consideration that firstly the species in question is not known to be locally/regionally extinct and secondly that suitable habitat for each species, as identified during the habitat assessment, is present within the survey area, though compiling an accurate list has limitations (see **Section 3.3 Survey limitations and constraints**).

Table 21: Summary of Potential Vertebrate Fauna Species

| Group | Total number of potential species | Potential number of <u>specially protected</u> species | Potential number of <u>migratory</u> species | Potential number of <u>priority</u> species | Number of species observed Level 1 Survey |
|-----------------------|-----------------------------------|--|--|---|---|
| Amphibians | 8 | 0 | 0 | 0 | 0 |
| Reptiles | 85 | 0 | 0 | 0 | 0 |
| Birds | 100 | 1 | 1 | 0 | 15 |
| Non-Volant Mammals | 25 ⁹ | 0 | 0 | 0 | 21 |
| Volant Mammals (Bats) | 8 | 0 | 0 | 0 | 0 |
| Total | 226⁹ | 1 | 1 | 0 | 17¹ |

Superscript = number of introduced species included in the total. Note: Where a species state and federal conservation status is different, the highest category is used.

Despite the omission of some species it should be noted that the list provided is still very likely an over estimation of the fauna species utilising the survey area (either on a regular or infrequent basis) as a result of the precautionary approach adopted for the assessment. At any one time only a subset of the listed potential species is likely to be present within the bounds of the survey area.

The literature review identified 11 threatened/specially protected, migratory or priority vertebrate fauna species as having been previously recorded or as being potentially present in the general vicinity of the survey area (see Table 21).

The current status on site and/or in the general area of some species is difficult to determine, however, based on the habitats present and, in some cases, recent nearby records, two species of conservation significance can be regarded as possibly utilising the survey area for some purpose at times, these being:

- *Falco peregrinus* Peregrine Falcon – S7 (WC Act)
 The species potentially utilises some sections of the survey area as part of a much larger home range, though records in this area are rare and while listed as a potential species, it can be expected to occur only very occasionally. Unlikely to breed within the survey area
- *Merops ornatus* Rainbow Bee-eater – S5 (WC Act), Migratory (EPBC Act)
 Common seasonal visitor to southern half of WA. Likely to use the survey area on occasions though it would not be specifically attracted to the site. Some potential for the species to breed in some sections of the survey area where ground conditions are suitable. Population levels would however not be significant as it usually breeds in pairs and rarely in small colonies (Johnstone and Storr 1998).

Habitat onsite for those species listed above, while considered possibly suitable, may be marginal in extent/quality and therefore the animals in question may only visit the area for short periods or as rare/uncommon vagrants.

A number of other species of conservation significance, while possibly present in the general area and/or the East Murchison region are not listed as potential species due to the survey area being outside of their currently recognised range, a lack of suitable habitat or known/very likely local or regional extinction (and no subsequent recruitment from adjoining areas).

Given the fauna habitats present within survey area appear to be widespread and well represented in areas surrounding the Julius Project haul road area it is considered unlikely that any significant impact on the status of any fauna species utilising the site will occur. While there will be some localised loss of habitat, fauna populations can be expected to persist despite development within the survey area proceeding.

5 Relevant Legislation and Compliance with Recognised Standards

5.1 Commonwealth Legislation

Commonwealth *Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)*

The aim of this Act is to protect matters of national environmental significance, and is used by the Commonwealth DoTEE to list threatened taxa and ecological communities into categories based on the criteria set out in the Act (www.environment.gov.au/epbc/index.html). The Act provides a national environmental assessment and approval system for proposed developments and enforces strict penalties for unauthorised actions that may affect matters of national environmental significance. There are nine matters of national environmental significance protected under this act including:

- world heritage properties
- national heritage places
- wetlands of international importance (often called 'Ramsar' wetlands after the international treaty under which such wetlands are listed)
- nationally threatened species and ecological communities
- migratory species
- Commonwealth marine areas
- the Great Barrier Reef Marine Park
- nuclear actions (including uranium mining)
- a water resource, in relation to coal seam gas development and large coal mining development.

The survey area does not have national environmental significance under the EPBC Act. There were no world/ national heritage places, wetlands of international importance, threatened flora species or communities, as listed under the *EPBC Act*, identified within the survey area.

The state and federally listed migratory bird, the rainbow bee-eater may occur with the survey area at times. This species is common in the southern part of the state during its spring/summer migration period. It is not a threatened species and is therefore not of specific concern. It's local and regional scale conservation status will not be impacted on by the proposal proceeding.

5.2 State Legislation

5.2.1 Clearing of Native Vegetation

Under Section 51C of the EP Act and the EP Regulations any clearing of native vegetation in Western Australia that is not eligible for exemption under Schedule 6 of the EP Act or under the EP Regulations requires a clearing permit from the DER or DMP. Under Section 51A of the EP Act native vegetation includes aquatic and terrestrial vegetation indigenous to Western Australia, and intentionally planted vegetation declared by regulation to be native vegetation, but not vegetation planted in a plantation or planted with commercial intent. Section 51A of the EP Act defines clearing as “*the killing or destruction of; the removal of; the severing or ringbarking of trunks or stems of; or the doing of substantial damage to some or all of the native vegetation in an area, including the flooding of land, the burning of vegetation, the grazing of stock or an act or activity that results in the above*”.

Exemptions under Schedule 6 of the EP Act and the EP Regulations do not apply for clearing an area exceeding 10ha per tenement, clearing in ESA's as declared under Section 51B of the EP Act or within Schedule 1 Areas as described in Regulation 6 and Schedule 1, clause 4 of the EP Regulations.

The survey area is not located within an ESA or Schedule 1 Area; however, a clearing permit is required as clearing will exceed 10ha.

5.2.2 Environmental Protection Act WA 1986

This Act pertains to the assessment of applications for clearing permits and aims to protect Threatened Flora/ Fauna and Threatened Ecological Communities from clearing. Threatened Ecological Communities are protected even where exemptions for a clearing permit may apply. The Act enforces both financial and/or imprisonment penalties on those who unlawfully damage a TEC.

The survey area does not contain any TEC or Threatened Flora. While some listed threatened/specially protected fauna species may occur in the area at times the proposed development is considered highly unlikely to significantly impact on any species given the large expanses of similar habitat in adjoining areas.

5.2.3 Wildlife Conservation Act WA 1950

This Act is used by the Western Australian DPaw to list flora/fauna taxa as being protected and the level of protection needed. Taxa are classified as ‘Threatened’ when their populations are geographically restricted or are threatened by local processes. Under this Act all native flora and fauna are protected throughout the State. Financial penalties are enforced under this Act if threatened taxa are collected without an appropriate licence.

The survey area does not contain any Threatened Flora listed under the WC Act 1950. The peregrine falcon (listed as fauna in need of special protection) potentially utilises some sections of the survey area as part of a much larger home range, though records in this area of its range are very uncommon. It would not breed in the survey area and probably only occurs rarely. No significant impact on this species or its preferred habitat is anticipated.

5.2.4 DPaW Priority lists

The DPaW lists 'Priority' flora and fauna taxa which are under consideration for declaration as Rare Flora or Fauna. Taxa classed as Priority 1-3 are in urgent need of further survey, whereas Priority 4 taxa are considered to have been adequately surveyed but may become vulnerable or rare in future years. Priority 4 taxa are also taxa that have been removed from the threatened taxa list in the past 5 years. Priority 5 taxa are those taxa which are not currently threatened but are subject to a specific conservation program, the cessation of which would result in the taxon likely to become threatened within 5 years. The DPaW also lists PECs, which identifies those communities that may need monitoring before possible nomination for TEC status. These priority taxa and communities have no formal legal protection until they are endorsed by the Minister as being Threatened.

Results of the database searches revealed 28 Priority Flora within a 40km radius of the survey area, of which 14 had the potential to occur within the survey area. No Priority Flora were identified within the survey area. A small number of priority fauna species have previously been recorded in the general area however none are considered likely to utilise the survey area primarily due to a total absence of suitable habitat.

5.1 Native Vegetation Clearing Principles

Based on the outcomes from the survey undertaken, as presented in this report, BC provides the following comments regarding the native vegetation clearing principles, listed under Schedule 5 of the EP Act (Table 22).

Table 22: Assessment of development within the survey area against native vegetation clearing principles

| Letter | Principle | Assessment | Outcome |
|--------|---|---|--|
| | Native vegetation should not be cleared if it: | | |
| (a) | comprises a high level of biological diversity. | Vegetation identified within the survey area is not considered to be of high biological diversity, and is well represented in the local area. | Clearing is unlikely to be at variance to this principle |
| (b) | comprises the whole or part of, or is necessary for the maintenance of, a significant habitat for fauna indigenous to WA. | No significant fauna habitat identified within the survey area. Fauna habitats are well represented outside of the survey area. | Clearing is unlikely to be at variance to this principle |
| (c) | includes, or is necessary for the continued existence of rare flora. | No Threatened Flora taxa, pursuant to subsection (2) of section 23F of the WC Act 1950 and the EPBC Act 1999 were identified within the survey area. | Clearing is unlikely to be at variance to this principle |
| (d) | comprises the whole or part of, or is necessary for the maintenance of a threatened ecological community (TEC). | No TEC listed under State and Commonwealth legislation occur within the survey area. | Clearing is unlikely to be at variance to this principle |
| (e) | is significant as a remnant of native vegetation in an area that has been extensively cleared | The survey area occurs within the pre-European Beard vegetation associations Wiluna 18, 29 and 39 which retain >98% of the original pre-European vegetation extent. | Clearing is unlikely to be at variance to this principle |
| (f) | is growing, in, or in association with, an environment associated | According to the Geoscience Australia database (2001), there are no defined drainagelines or inland waters (lakes/ playas) within the survey area. One drainage depression (ephemeral floodplain) was | Clearing is unlikely to be at variance to this principle |

| Letter | Principle | Assessment | Outcome |
|--------|--|--|--|
| | Native vegetation should not be cleared if it: | | |
| | with a watercourse or wetland | identified within the survey area. This drainage depression is only active after heavy or prolonged rainfall. Vegetation of this drainage depression comprised of Open forest of <i>Acacia incurvaneura</i> over tall open shrubland of <i>Acacia ramulosa</i> var. <i>ramulosa</i> and low tussock grassland of <i>Eragrostis kennedyae</i> . This vegetation is not considered riparian vegetation and is found in the surrounding areas. | |
| (g) | Native vegetation should not be cleared if the clearing of the vegetation is likely to cause appreciable land degradation. | The survey area occurs within the pre-European Beard vegetation associations Wiluna 18, 29 and 39 which retain >98% of the original pre-European vegetation extent. Clearing within these vegetation associations is not likely to lead to land degradation issues such as salinity, water logging or acidic soils. | Clearing is unlikely to be at variance to this principle |
| (h) | Native vegetation should not be cleared if the clearing of the vegetation is likely to have an impact on the environmental values of any adjacent or nearby conservation area. | The survey area is not located within any current or proposed Conservation Reserves managed by DPaW and listed by the EPA. | Clearing is unlikely to be at variance to this principle |
| (i) | Native vegetation should not be cleared if the clearing of the vegetation is likely to cause deterioration in the quality of surface or underground water. | According to the Geoscience Australia database (2001), there are no defined drainage lines or inland waters (lakes/ playas) within the survey area. One drainage depression (ephemeral floodplain) was identified within the survey area. This drainage depression is only active after heavy or prolonged rainfall. Vegetation of this drainage depression comprised of Open forest of <i>Acacia incurvaneura</i> over tall open shrubland of <i>Acacia ramulosa</i> var. <i>ramulosa</i> and low tussock grassland of <i>Eragrostis kennedyae</i> . This vegetation is not considered riparian vegetation and is found in the surrounding areas. Most rainfall is lost by evaporation or surface runoff. Only a small portion infiltrates the soil and recharges the groundwater. | Clearing is unlikely to be at variance to this principle |
| (j) | Native vegetation should not be cleared if clearing the vegetation is likely to cause, or exacerbate, the incidence of flooding | Rainfall is unreliable and highly variable with an average rainfall of 200mm and an evaporation rate of 2461mm. The region is not prone to flooding and does not contain riparian vegetation. | Clearing is unlikely to be at variance to this principle |

6 Conclusions and Recommendations

6.1 Conclusions

Eight broad vegetation communities were identified within the survey area. These communities were identified within five landform types and comprised of one major vegetation group. These communities were represented by a total of 17 Families, 29 Genera and 65 Taxa. The broad scale terrestrial fauna habitats within the survey area have been identified as comprising a mosaic of clay-loam plains, drainage depressions, quartz-rocky plains, rocky hillslopes and sand-loam plains. With respect to native vertebrate fauna, 24 mammals (including eight bat species), 100 bird, 85 reptile and eight frog species have previously been recorded in the general area, some of which have the potential to occur in or utilise the survey area at times.

No Threatened Flora taxa or Priority Flora taxa were identified within the survey area. No threatened, migratory or priority fauna taxa were positively identified as being present during the field survey however the literature review identified 11 species as having been previously recorded or as being potentially present in the general vicinity of the survey area. The current status on site and/or in the general area of some species is difficult to determine, however, based on the habitats present and, in some cases, recent nearby records, two species of conservation significance (peregrine falcon and rainbow bee-eater) can be regarded as possibly utilising the survey area for some purpose at times.

Impacts on these species and fauna in general (including invertebrates) that may occur as a consequence of development at the site is considered unlikely to be significant. Populations of all species can be expected to persist in these areas with no change in any one species conservation status being significantly affected. This conclusion is primarily based on the relatively small size of the impact footprint and the extensive habitat connectivity with adjoining areas. Impacts on fauna and fauna habitat are therefore anticipated to be localised, small/negligible and as a consequence manageable.

None of the vegetation communities within the survey area were found to have National Environmental Significance as defined by the Commonwealth EPBC Act. No TEC or PEC were identified within the survey area. The survey area is not located within an ESA, Schedule 1 Area or a Conservation Reserve/ DPaW managed land. Vegetation condition ranged from 'good' to 'very good'. No introduced taxa were identified within the survey area; however, the area comprised of several germinants some of which are potentially introduced species.

6.2 Recommendations

- Minimise disturbance to vegetation associated with the drainage depression
- Implement weed management/ vehicle hygiene procedures during clearing/ site access to prevent spread of introduced species.

Appendix 5: Vegetation Health Condition Scale adapted from Keighery 1994 and Trudgen 1988 (DPaW & EPA, 2016)

| Vegetation Condition Rating | South West and Interzone Botanical Provinces | Eremaean and Northern Botanical Provinces |
|-----------------------------|--|--|
| Pristine | Pristine or nearly so, no obvious signs of disturbance or damage caused by human activities since European settlement. | |
| Excellent | Vegetation structure intact, disturbance affecting individual species and weeds are non-aggressive species. Damage to trees caused by fire, the presence of non-aggressive weeds and occasional vehicle tracks. | Pristine or nearly so, no obvious signs of damage caused by human activities since European settlement. |
| Very Good | Vegetation structure altered, obvious signs of disturbance. Disturbance to vegetation structure caused by repeated fires, the presence of some more aggressive weeds, dieback, logging and grazing. | Some relatively slight signs of damage caused by human activities since European settlement. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks. |
| Good | Vegetation structure significantly altered by very obvious signs of multiple disturbances. Retains basic vegetation structure or ability to regenerate it. Disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds, partial clearing, dieback and grazing. | More obvious signs of damage caused by human activity since European settlement, including some obvious impact on the vegetation structure such as that caused by low levels of grazing or slightly aggressive weeds. |
| Poor | | Still retains basic vegetation structure or ability to regenerate it after very obvious impacts of human activities since European settlement, such as grazing, partial clearing, frequent fires or aggressive weeds. |
| Degraded | Basic vegetation structure severely impacted by disturbance. Scope for regeneration but not to a state approaching good condition without intensive management. Disturbance to vegetation structure caused by very frequent fires, the presence of very aggressive weeds at high density, partial clearing, dieback and grazing. | Severely impacted by grazing, very frequent fires, clearing or a combination of these activities. Scope for some regeneration but not to a state approaching good condition without intensive management. Usually with a number of weed species present including very aggressive species. |
| Completely Degraded | The structure of the vegetation is no longer intact and the area is completely or almost completely without native species. These areas are often described as 'parkland cleared' with the flora comprising weed or crop species with isolated native trees and shrubs. | Areas that are completely or almost completely without native species in the structure of their vegetation; i.e. areas that are cleared or 'parkland cleared' with their flora comprising weed or crop species with isolated native trees or shrubs. |
