THIS BULLETIN IS DEDICATED TO ALLEN GRAFFHAM, who passed away this past year. Allen was a true pioneer in the fossil industry. He was one of the greatest fossil collectors the world has ever seen. He was a mainstay in the fossil business, with over 50 years as President of Geological Enterprises. I have hundreds of special memories of Allen, and most of you have your own anecdotes and warm memories of him as well. There will never be another Allen Graffham. He was truly one of a kind, and he will be missed. After 54 years, we continue to have the largest, most comprehensive inventory of fossils available for sale in the world today. You will see that we have added a ton of fantastic specimens to our inventory in the past 12 months. We hope you enjoy this new Bulletin and look forward to hearing from you throughout the coming year.

Donna Russell-President

The following insects are in amber from Colombia, South America. This amber was formed in an ancient tropical Rain Forest. It is important and unique in that aspect. The latest information indicates a Miocene age. The producing horizon dips sharply (40 degrees) and in places could be deeply buried. Present gathering is along stream cuts and river valleys. Ash falls over the amber beds give hope of an exact date if samples can be obtained. If these beds are involved in the Andean uplift, the age may well be in the neighborhood of 25 million years or more.

MISC. FOSSILS

PRECAMBRIAN

What was life like 560 million years ago? The Vendian marks the first appearance of a group of large fossils collectively known as the "Vendian biota" or "Ediacara fauna." The question of what these fossils are is still not settled to everyone's satisfaction. They have been considered algae, lichens, giant protozoans, or even a separate kingdom of life unrelated to anything living today. Some of these fossils are simple blobs that are hard to interpret and could represent almost anything. Some are similar to cnidarians, worms, or soft-bodied relatives of the arthropods. Others are less easy to interpret and may belong to extinct phyla. The following collection is from the White Sea Region of Russia. It is the most fascinating and finest collection from this locality that has ever been offered in the U.S.

The following fossils are from the Mt. Simon Formation of Wisconsin. They are thought to be Lower Upper Cambrian, 510 Million Years old. Fossils from this locality contain some of the best preserved jellyfish and trace fossils known on Earth. The Jellyfish are particularly outstanding as they are the largest jellyfish in the entire Fossil Record. One paper has been published on this incredible find. "STRANDED ON THE LATE CAMBRIAN SHORELINE: MEDUSA FROM CENTRAL WISCONSIN", G.S.A. February 2002. Many Paleontologists are studying this fauna and more information will follow. We are excited to be able to offer you the largest collection of these fossils available anywhere in the world!
