1 About SAP SuccessFactors OData APIs (V2)

The Open Data Protocol (OData) is a standardized protocol for creating and consuming data APIs.

OData builds on core protocols like HTTP, and commonly accepted methodologies like REST. The result is a uniform way to expose full-featured data APIs. OData provides both a standard for how to represent your data and a metadata method to describe the structure of your data, and the operations available in your API. This guide focuses on OData version 2.0.

The SAP SuccessFactors HCM suite OData API is a Web Service API feature based on the OData protocol. It's intended to enable access to SAP SuccessFactors data in the system. SAP SuccessFactors HCM suite OData API provides methods for create, read, update and delete operations.

Enabling OData V2 API

The OData v2 feature is enabled for all companies by default. If you want to turn off the feature, contact Product Support.

Related Information

[List of SAP SuccessFactors API Servers \[page 7\]](#)

1.1 List of SAP SuccessFactors API Servers

Learn about the API servers of your company instance and how to construct the endpoint URLs.

Endpoint URL Patterns

Restriction

We don't support IP addresses in URLs as part of our reference architecture. Use domain names instead. If you think you have a special case that requires IP addresses instead of domain names, contact Product Support.

Protocol	URL Pattern	Endpoint Example
OData v2	/odata/v2/	https://api17.sapsf.com/odata/v2/
OData v4	/odatav4/	https://api17.sapsf.com/odatav4/
REST	/rest/	https://api17.sapsf.com/rest/
SFAPI	/sfapi/v1/soap	https://api17.sapsf.com/sfapi/v1/soap
WSDL	/sfapi/v1/soap?wsdl	https://api17.sapsf.com/sfapi/v1/soap?wsdl

API Servers

Here's a list of API servers and mTLS certificate servers for SAP SuccessFactors data centers. Use search and filter to find the corresponding servers for your company.

To view the timezone information of an API server, go to your company login page or open your account on the header bar after login, and choose [Show version information](#).

2 Authentication

This document explains the types of authentication used to access OData API, how to enable session reuse for OData API access, and how to set exceptions for API login.

SAP SuccessFactors provides the following two types of authentication for OData API:

- HTTP Basic Authentication (deprecated): Requires username, company ID, and password to log in.
- OAuth 2.0: A more secure way to authenticate users without providing passwords.

⚠ Caution

HTTP Basic Authentication will soon be retired. Please migrate to OAuth as soon as possible. For detailed retirement plan, see the announcement in the SAP SuccessFactors Migrating Features guide.

2.1 Restricting Access

Use the Admin Center tools to control who can access APIs in your instance.

Context

API access restrictions can be set in several different tools in the Admin Center. Depending on the level of restrictions you want to set and which APIs you want to restrict access, choose the right tools.

If you want to ...	Use this tool
Restrict all API access through Basic Authentication	OData API Basic Authentication Configuration
Restrict all API access on the instance level	IP Restriction Management
Restrict all API access on the user level	Password & Login Policy Settings > Set API login exceptions...

Procedure

- To restrict API access through Basic Authentication, follow the instructions in [Restricting OData API Access through Basic Authentication \[page 14\]](#).
- To restrict API access on instance level, follow the instructions in [IP Restriction Management](#).
- To restrict API access for specific users, follow the instructions in [Restricting API Access by IP Addresses or IP Address Ranges \[page 14\]](#).

2.1.1 Restricting OData API Access through Basic Authentication

When HTTP Basic Authentication (Basic Auth) is used to access OData API, you can control which IP addresses are allowed the access using the OData IP allowlisting tool. Please note that this feature is called *OData API Basic Authentication Configuration* in the Admin Center and *OData IP Allowlisting* in the API Center.

You have the following options to limit the access of OData API using Basic Auth:

- *Always*: Users are allowed to log in using Basic Auth from any IP address.
- *Never*: No one is allowed to log in using Basic Auth.
- *Restrict access to below IPs*: Only users from specified IP addresses are allowed to log in using Basic Auth. With this option enabled, you can enter a list of IP addresses separated by comma. For example: **10.20.30.40**, **10.20.30.41**, **10.20.*.***.

Note

You can enter 4000 characters maximum in the input box.

If you use wildcards, you must enter all four bits of the IP address. For example, **10.10.*.*** is a valid entry and **10.10.*** isn't.

Note

The *OData IP Allowlisting* tool can only control OData API accesses using HTTP Basic Auth. To control all API accesses, use the *Password & Login Policy Settings* tool in Admin Center. For more information, see [Setting Password Policy and Exceptions for API Login](#).

Related Information

[HTTP Basic Authentication \(Deprecated\) \[page 16\]](#)

2.1.2 Restricting API Access by IP Addresses or IP Address Ranges

You can use Admin Center tools to restrict users' access to APIs based on IP allowlists.

Prerequisites

You have the following permissions:

- [Administrator](#) > [Manage System Properties](#) > [Password & Login Policy Settings](#)

- [Administrator](#) > [Manage System Properties](#) > [IP Restriction Management](#)

Context

Access to SAP SuccessFactors HCM suite APIs can be restricted by IP on the instance level and on the user level. There are several Admin Center settings you can use to achieve this:

- The [IP Restriction Management](#) tool allows you to set IP restriction on the instance-level for user login and API access. In the case of API access, this setting is overridden by the [Set API login exceptions](#) setting.
- The [Set API login exceptions](#) page under [Password & Login Policy Settings](#) allows you to set IP restriction on individual users. This setting applies to SF APIs, OData APIs, REST APIs, and OAuth Authentication APIs (`/oauth/token` and `/oauth/validate`). It overrides the [IP Restriction Management](#) setting for API access. If not set, the system falls back on [IP Restriction Management](#) to restrict API access.
- Additionally, you can restrict users' access to OData APIs using Basic Authentication. For more information, see the Related Information section.

Follow the instructions below to set IP restrictions for API access to your systems.

Procedure

- To set IP restrictions on the instance level, go to [Admin Center](#) > [IP Restriction Management](#), and add a single IP address or IP address range from where users are allowed access to your system, including API access.
- To set IP restriction by users, go to [Admin Center](#) > [Password & Login Policy Settings](#), and choose [Set API login exceptions...](#). Here, you can restrict API access by users based on a single IP address or IP address range. Complete the following information:

Option	Description
Username	Enter the username for whom you want to apply the policy.
Maximum password age (days)	Enter the number of days the password is valid for. To set a password to never expire, enter -1 .
<div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p>Note</p> <p>For security reasons, we do not recommend setting a password to never expire. This setting has no effect on API access using OAuth.</p> </div>	
IP address restrictions	Enter the IP addresses separated by comma. For example: 10.20.30.40, 10.20.30.1-10.20.30.10.

Option	Description
	<div data-bbox="857 268 1425 466" style="background-color: #f0f0f0; padding: 10px;"> <p>Note</p> <p>The maximum password age applies only when the user is accessing from the IP addresses specified here.</p> <p>Only IPv4 addresses are supported.</p> </div>

Related Information

[Restricting OData API Access through Basic Authentication \[page 14\]](#)

2.2 HTTP Basic Authentication (Deprecated)

HTTP Basic Authentication (Basic Auth) allows you to access OData API by providing username, company ID, and password information on an HTTP user agent, such as a web browser.

⚠ Caution

HTTP Basic Authentication will soon be retired. Please migrate to OAuth as soon as possible. For detailed retirement plan, see the announcement in the SAP SuccessFactors Migrating Features guide.

To log in with Basic Auth, you must have the [Allow Admin to Access OData API through Basic Authentication](#) permission and your client IP address is on the allow list to access the API server. For more information, see the Restricting API Access by IP section.

The authorization header of Basic Auth is constructed in the following way:

- Username, company ID, and password are combined into a string as such: `username@company ID:password`
- The resulting string literal is then encoded using Base64.
- The authentication method ("Basic") followed by a space is then put before the encoded string. For example, `Authorization: Basic QWxhZGRpbjpvY2VudHh1c2FtZQ==`

Restricting API Access by IP

HTTP Basic Authentication is generally considered less secure than authentication using OAuth 2.0. However, you can increase the security by controlling the API access based on clients' IP address in the following settings:

- [Admin Center](#) > [OData API Basic Authentication Configuration](#): This setting affects only the access to OData APIs using Basic Auth.

- [Admin Center](#) > [Password & Login Policy Settings](#) > [Set IP Login Exceptions](#) : This setting affects all OData API and SFAPI calls.

Related Information

[Restricting OData API Access through Basic Authentication \[page 14\]](#)

2.2.1 Permissions for Using HTTP Basic Authentication

Grant the required permissions to your role so that you can access OData APIs using HTTP Basic authentication.

Assign the [Allow Admin to Access OData API through Basic Authentication](#) permission under [Admin](#) > [Administrator Permissions](#) > [Manage Integration Tools](#)  to the relevant role so that you can access OData APIs using Basic Auth.

2.2.2 Authenticating from a Browser

You can use a web browser based authentication to enable querying..

To use this feature, you need:

1. Input URL of query OData in address bar. e.g. `https://<hostname>/odata/v2/Attachment?$top=1`
2. Enter your username and password when prompted.

You will not need to re-enter this information for subsequent queries until the browser is closed. If the user name and password verification fails, you will need to open a new window and try again

Note

When you query in atom format in Firefox, the xml result will not be displayed, because Firefox regards atom format as RSS content by default. You can check the result in JSON format or view the source code to check the query result.

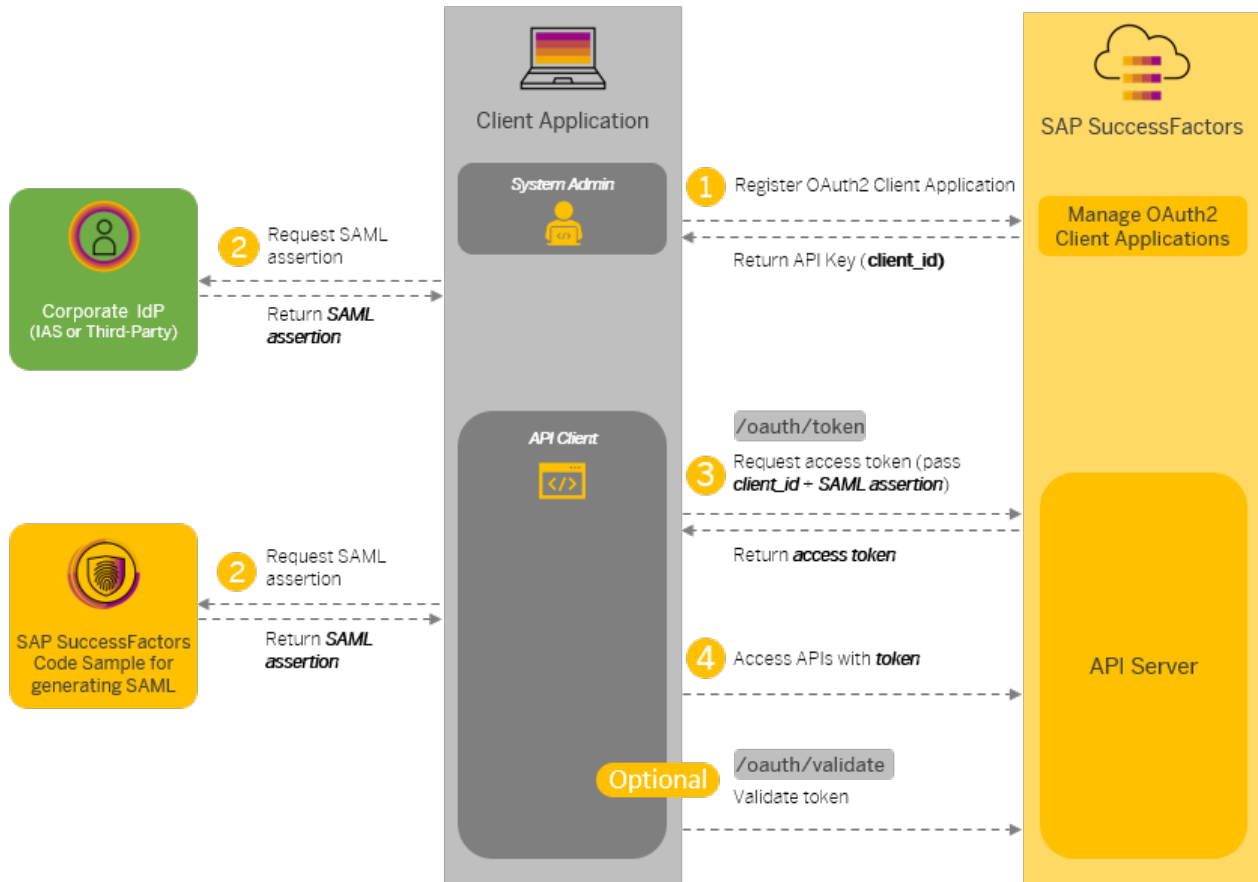

2.3 Authentication Using OAuth 2.0

Learn how to set up and use OAuth 2.0 for authenticating API users.

SAP SuccessFactors supports OAuth 2.0 to authenticate OData API and SFAPI users. Compared with HTTP Basic Auth, OAuth 2.0 is considered to be more secure in that it doesn't require users to provide their passwords during authentication. With OAuth 2.0, you can also use a third-party identity provider (IDP) for user management and provisioning.

Process Overview

The following diagram explains how OAuth 2.0 works with SAP SuccessFactors.

- [Registering Your OAuth2 Client Application \[page 19\]](#)
 - [Generating a SAML Assertion \[page 25\]](#)
 - [Requesting an Access Token \[page 28\]](#)
 - [Viewing the Validity of an Access Token \[page 30\]](#)
 - [Follow the documentation of the IdP for requesting SAML assertions. \[page 17\]](#)
1. Register your client application in SAP SuccessFactors to obtain an API key.
 2. Obtain a SAML assertion from your trusted IdP (recommended, for example, SAP Cloud Identity Services - Identity Authentication) or use the sample code to generate one. For more information on how to use SAP Cloud Identity Services as an IdP, see the Related Information section.
 3. Pass your SAML assertion and API key (in the client_id field) along with other information to generate an OAuth token.
 4. Use the generated token to call APIs.
 5. (Optional) Check whether your access token has expired or not.

Related Information

[SAP Cloud Identity Services - Identity Provisioning](#)

2.3.1 Registering Your OAuth2 Client Application

Register your client application so that you can authenticate API users using OAuth2. After you register an application, you'll get an exclusive API key for your application to access SAP SuccessFactors OData APIs.

Prerequisites

You have the [Manage Integration Tools](#) > [Manage OAuth2 Client Applications](#) permission.

Procedure

1. Log into your instance as an administrator.
2. Go to [Admin Center](#) > [API Center](#) > [OAuth Configuration for OData](#) and choose [Register Client Application](#). You can also access the tool by searching [Manage OAuth2 Client Applications](#) in Action Search.
3. On the new OAuth client registration screen, enter the following information:

Option	Description
Company	The name of your company. This value is prefilled based on the instance of the company currently logged in.
Application Name	(Required) A unique name of your OAuth client.
Description	(Optional) A description of your application.
Application URL	(Required) A unique URL of the page that the client wants to display to the end user. The page contains more information about the client application. This is needed for 3-legged OAuth, however it isn't currently supported.
Bind to Users	(Optional) You can enable this option to restrict the access of the application to specific users including business users and technical users.

Note

A business user in this context is a user who has permissions to call SAP SuccessFactors APIs for integration purposes.

Option	Description
	<p>A technical user is a system-generated user created for integrating SAP SuccessFactors with other SAP products and solutions.</p> <p>Refer to About Technical User for more information.</p>
<p>User IDs</p>	<p>(Required if you enabled the Bind to User option) Enter the user IDs separated by comma.</p> <p>The binding of business users and technical users works as follows:</p> <ul style="list-style-type: none"> • If you don't bind any user to the application, all business users can request OAuth tokens but technical users can't. • If you bind both business users and technical users to the application, only these users can request OAuth tokens. • If you bind only technical users to the application, these technical users and any business user can request OAuth tokens. • If you bind only business users to the application, only these users can request OAuth tokens. <div data-bbox="841 1045 1435 1213" style="border: 1px solid #ccc; padding: 5px;"> <p>Note</p> <p>Contact your system administrator or Product Support if you don't know the technical user ID of your instance.</p> </div>
<p>X.509 Certificate</p>	<p>(Required) The certificate corresponding to the private and public key used in the OAuth 2.0 authentication process. In this flow, SAP SuccessFactors require the public key and the client application has the private key. To register a client application, you must install the public key in SAP SuccessFactors.</p> <p>You can obtain a certificate from a trusted service provider, or generate a self-signed certificate using a third-party tool. Either way, the certificate must be encrypted using a secure signature algorithm. Although both RSA-1 and RSA-2 algorithms are supported, we recommend using RSA-2 for better security.</p> <p>If neither option is available, you can also generate an X.509 certificate in SAP SuccessFactors. If you choose to provide</p> <p>For more information, see the Related Information section of this topic.</p>

Option	Description
	<p>Note</p> <p>For better security, we recommend that you use a self-signed certificate or one from your trusted service provider.</p> <p>In a .pem file, the X.509 certificate is a BASE64-encoded string enclosed between -----BEGIN CERTIFICATE----- and -----END CERTIFICATE-----. Enter only the enclosed string without the beginning and ending lines. Otherwise, an error occurs.</p> <p>Caution</p> <p>When you change or regenerate an X.509 certificate for an application, the existing application client configurations are invalidated. This could lead to application failure until you update the configurations with the new certificate information.</p>

4. Choose [Register](#) to save your registration.

Results

You've successfully registered your client application for OAuth2 authentication. An API key is generated and assigned to your application. You can view the API key by choosing [View](#) on the registered application list.

You can also edit, disable, and delete an OAuth2 client registration.

Related Information

[Creating a X.509 Certificate Using Your Own Tools \[page 22\]](#)

[Creating an X.509 Certificate in SAP SuccessFactors \[page 24\]](#)

2.3.1.1 Creating a X.509 Certificate Using Your Own Tools

You can use tools such as OpenSSL to create an X.509 certificate.

Prerequisites

There are different tools you can use to create X.509 certificates. In this example, we'll show you how to use OpenSSL to create a certificate. For Windows users, download the tool at <https://www.openssl.org>. For Mac and Linux users, OpenSSL is available with the native command-line tools such as Terminal.

Context

X.509 certificates are used in many Internet protocols, including TLS/SSL. An X.509 certificate consists of a public key and a private key. The public key contains the identity information, such as a hostname, an organization, or an individual. The public/private key pair is used to establish secure communication between your application and SAP SuccessFactors.

Procedure

1. Go to the OpenSSL library in your command-line tool.

For Mac and Linux users, call OpenSSL directly in the command tool under the default path. For Windows users, the entry point is the openssl binary, located in the installation folder, for example: `C:\Program Files\OpenSSL-Win64\bin\`.

2. Use the `openssl` command to create an X.509 certificate. The example below shows how to create a certificate using the recommended SHA-2 signature algorithm:

```
$ openssl req -nodes -x509 -sha256 -newkey rsa:2048 -keyout private.pem -out public.pem
```

Note

`private.pem` and `public.pem` are the example names of the public/private key pair generated with this command. You can change them to any names of your choice.

Although SAP SuccessFactors support certificates signed using either SHA-1 or SHA-2 algorithms, we recommend that you use SHA-2 for better security.

3. Enter the following information when prompted:

Provide at least one of these values to create a certificate.

Option	Description
Country Name	Enter a two-letter country code of the entity to which the certificate is issued. A country code represents a country or a region. Example: AU
State or Province Name	Name of state or province of the entity to which the certificate is issued.
Locality Name	Name of locality of the entity to which the certificate is issued.
Organization Name	The entity to which the certificate is issued.
Organization Unit Name	The organization unit of the entity to which the certificate is issued.
Common Name	The hostname or IP address for which the certificate is valid. The common name (CN) represents the hostname of your application. It's technically represented by the commonName field in the X.509 certificate. The common name doesn't include any protocol, port number, or path. For example: www.bestrun.com
E-mail Address	Enter your e-mail address.

Results

A public/private key pair is generated and saved to the local drive with the names you specified in the command.

⚠ Caution

Only the public key is required when you register an OAuth2 client application in SAP SuccessFactors. The private key must be kept secure under all circumstances. Do not share the private key with others. If you lose the private key, you must create a new certificate.

Example of a public key:

```
-----BEGIN CERTIFICATE-----
MIIB9jCCAV+gAwIBAgIUUKR82LgtkNBccdyPYD26K87zZ+vYwDQYJKoZIhvcNAQEE
BQAwDTELMAkGA1UECwwCRVAvHhcNMTkwOTI2MDIwNDUyWhcNMTkwMDI2MDIwNDUy

```

2.3.1.2 Creating an X.509 Certificate in SAP SuccessFactors

You can create an X.509 certificate in SAP SuccessFactors HCM suite if you're unable to create a certificate using your own tools.

Context

⚠ Caution

We don't recommend creating the X.509 certificate in the API Center and downloading the private key. It's a less secure approach because downloading the private key increases the risk of exposing it. Only consider this approach if you're unable to create an X.509 certificate using your own tools.

Procedure

1. Log into your instance as an administrator.
2. Go to **Admin Center** > **API Center** > **OAuth Configuration for OData** and choose **Register Client Application**. You can also access the tool by searching **Manage OAuth2 Client Applications** in Action Search.
3. On the new OAuth client registration screen, choose **Generate X.509 Certificate** and enter the following information:

Option	Description
Issued By	Value set to SuccessFactors
Common Name	The hostname or IP address for which the certificate is valid. The common name (CN) represents the hostname of your application. It's technically represented by the commonName field in the X.509 certificate. The common name doesn't include any protocol, port number, or path. For example: www.bestrun.com
Organization	(Optional) The entity to which the certificate is issued.
Organization Unit	(Optional) The organization unit of the entity to which the certificate is issued.
Locality	(Optional) Name of locality of the entity to which the certificate is issued.
State/Province	(Optional) Name of state or province of the entity to which the certificate is issued.
Country	(Optional) Enter a two-letter country code of the entity to which the certificate is issued. A country code represents a country or a region. Example: AU
Validity	(Optional) The number of days for which you want the X.509 certificate to be valid. If left empty, the validity defaults to 365 days.

Option	Description
	<p>Note</p> <p>Validity check works only when the <i>Enable validity check</i> option is selected.</p>
Enable validity check	Indicates whether or not the system checks the validity of the certificate. If disabled, the certificate never expires. If checked, you can either specify the validity period in days in the <i>Validity</i> field, or leave it empty so that the validity defaults to 365 days.

4. Choose *Generate*.

Results

A new X.509 certificate is generated and filled in the *X.509 Certificate* field on the new OAuth2 client registration screen. Continue your registration in [Registering Your OAuth2 Client Application \[page 19\]](#) with this certificate.

⚠ Caution

Both the public key and private key are available to you in the generated certificate. You must save the private key before you register your client application. Only the public key is available for viewing when the client application is registered. The private key must be kept secure under all circumstances. Do not share the private key with others. If you lose the private key, you create a new one.

2.3.2 Generating a SAML Assertion

Generate a Security Assertion Markup Language (SAML) assertion for requesting an OAuth token. This topic explains how to generate a SAML assertion using the offline tool provided by SAP SuccessFactors.

Prerequisites

You've registered your application in [Manage OAuth2 Client Applications](#) and obtained the API key for the application.

Context

You have the following options to generate a SAML assertion:

- (Recommended) Use a corporate IdP, for example, SAP Identity Authentication Services, or a third-party IdP. Refer to the documentation of the corporate IdP for detailed instructions.

Note

Both SHA-2 and SHA-1 signing algorithms are supported. However, we recommend that you use SHA-2 for better security.

- Use the example code attached to [3031657](#) to generate SAML assertions for your application. This sample code provides a SAML generator tool that processes the input information offline and generates a SAML assertion without having to expose your private key to the Internet.

→ Remember

Any software coding and/or code snippets are examples. If you use any examples to help generate an SAML Assertion that will be used in a production environment, you are solely responsible for ensuring the security of such SAML Assertions. SAP does not warrant the correctness and completeness of the example code and such code is delivered "AS-IS". SAP shall not be liable for errors or damages caused by the use of example code unless damages have been caused by SAP's gross negligence or willful misconduct.

⚠ Caution

Do not use the `/oauth/idp` API to generate SAML assertions. This approach is unsecure and has been deprecated. For more information, see the Related Information section.

Required Elements for IdP-based SAML Assertions

If you choose to use an identity provider (IdP) to generate a SAML assertion, make sure that you follow the [SAML 2.0 standard](#) and include the following elements in the assertion:

→ Tip

SAML assertions are Base64-encoded. To view the detailed information in XML format, decode the assertion using a Base64 decode tool.

Required Elements for IdP-based SAML Assertions

Element	Description	Example
<code><saml2:Issuer></code>	Issuer information of the SAML assertion	<code><saml2:Issuer>www.myidp.com</saml2:Issuer></code>

Element	Description	Example
<p><saml2:Subject>, <saml2:NameID>, and Recipient</p>	<p>Enter the SAP SuccessFactors user ID that you use to access the APIs in the NameID element. The recipient attribute must be set as the URL of the API server from which you request the OAuth token.</p>	<pre><saml2:Subject> <saml2:NameID Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">admin </saml2:NameID> <saml2:SubjectConfirmation Method="urn:oasis:names:tc:SAML:2.0:cm:bearer"> <saml2:SubjectConfirmationData NotOnOrAfter="2020-08-21T09:23:24.511Z" Recipient="http://<api-server>/oauth/token"/> </saml2:SubjectConfirmationData> </saml2:SubjectConfirmation> </saml2:Subject></pre>
<p><saml2:AttributeStatement> and <saml2:Attribute></p>	<p>The AttributeStatement element must contain the API key (clientId) that you obtained after you register the client application in Registering Your OAuth2 Client Application [page 19].</p>	<pre><saml2:AttributeStatement> <saml2:Attribute Name="api_key"> <saml2:AttributeValue xsi:type="xs:string">NDU0MDE0MDkwYj***5YTE5MWIxMTNkNjc1Zg</saml2:AttributeValue> </saml2:Attribute> </saml2:AttributeStatement></pre>
<p><saml2:Conditions>, NotBefore, NotOnOrAfter, and <saml2:Audience></p>	<p>The NotBefore and NotOnOrAfter attributes in the <saml2:Conditions> element defines the validity period of the SAML assertion. The <saml2:Audience> element is used to tag the SAML assertion. Any value is accepted except empty value. For example, www.successfactors.com.</p>	<pre><saml2:Conditions NotBefore="2020-08-21T09:03:24.511Z" NotOnOrAfter="2020-08-21T09:23:24.511Z"> <saml2:AudienceRestriction> <saml2:Audience>www.successfactors.com</saml2:Audience> </saml2:AudienceRestriction> </saml2:Conditions></pre>

Element	Description	Example
<code><saml2:AttributeStatement></code> and <code><saml2:Attribute></code>	If you want to authenticate SAP SuccessFactors Learning users that don't also exist in platform, you must include an additional custom attribute called "external_user" with value "true".	<pre> <saml2:AttributeStatement > <saml2:Attribute Name= "external_user" > <saml2:AttributeValue xsi:type="xs:string">true </saml2:AttributeValue> </saml2:Attribute> </ saml2:AttributeStatement> </pre>

Related Information

[Deprecation of OAuth IdP API /oauth/idp](#)

2.3.3 Requesting an Access Token

With a SAML assertion, you can now call API `/oauth/token` to request an access token for authentication with the API server.

Prerequisites

The `/oauth/token` API follows IP restriction settings in the following tools:

- In [Admin Center](#) [Password & Login Policy Settings](#) [Set API login exceptions...](#), you can set access restriction for individual users by IP.
- In [Admin Center](#) [IP Restriction Management](#), you can set access restriction by IP on the instance level.

Before you request an OAuth token, check the above settings and make sure that the client IP address is allowed to access the corresponding API server. For more information about IP restrictions, see the related information section.

Note

If both instance-level and user-level IP restrictions are set, a user can access these APIs if either condition is met.

Context

The API returns the token type, expiration time in seconds, and the token value you can use to authorize API requests. An access token expires in 24 hours after it's generated.

Example

Here is a sample request:

HTTP Method	POST
URI	<code>https://<API-Server>/oauth/token</code>
Authentication	No Auth
Headers	<code>Content-Type: application/x-www-form-urlencoded</code>
Request Body	<p>Enter the following values in the format of x-www.-form-urlencoded:</p> <ul style="list-style-type: none">• <code>company_id</code>: Required. Your company ID.• <code>client_id</code>: Required. API key generated in Registering Your OAuth2 Client Application [page 19].• <code>grant_type</code>: Required. Set the value to "urn:ietf:params:oauth:grant-type:saml2-bearer".• <code>assertion</code>: Required. Enter the Base64-encoded assertion obtained from Generating a SAML Assertion [page 25].• <code>new_token</code>: Optional. If you have already requested an access token with the same SAML assertion and the token hasn't expired yet, your request returns the same token by default with the remaining time indicated in the <code>expires_in</code> field. You can use parameter <code>new_token=true</code> to force the server to generate a new access token valid for 24 hours.

Sample response:

```
{
  "access_token": "eyJ0b2t1bknvbnRlbnQ***ZMm5Td0ifQ==",
  "token_type": "Bearer",
  "expires_in": 86399
}
```

Related Information

[IP Restrictions](#)

2.3.4 Viewing the Validity of an Access Token

Use API `/oauth/validate` to verify if an access token is valid.

Prerequisites

The `/oauth/validate` API follows IP restriction settings in the following tools:

- In [Admin Center](#) > [Password & Login Policy Settings](#) > [Set API login exceptions...](#), you can set access restriction for individual users by IP.
- In [Admin Center](#) > [IP Restriction Management](#), you can set access restriction by IP on the instance level.

Before you use the API, check the above settings and make sure that the client IP address is allowed to access the corresponding API server. For more information about IP restrictions, see the related information section.

Note

If both instance-level and user-level IP restrictions are set, a user can access these APIs if either condition is met.

Context

An access token expires within 24 hours after it's generated. You can use this API to check if an access token is still valid.

Example

The following sample request shows how to validate an access token:

HTTP Method	GET
URI	<code>https://<API-Server>/oauth/validate</code>
Headers	<code>Authorization: Bearer <Your access token></code>

A valid token returns status 200 OK in the header. The response body contains the access token, token type, and expiry time in seconds. Example:

```
{
  "access_token": "<Your Bearer token>",
  "token_type": "Bearer",
  "expires_in": 86312
}
```

Related Information

[IP Restrictions](#)

2.4 Enabling Session Reuse

Enable session reuse to reduce the number of sessions and optimize the performance of API calls.

Context

OData API is not stateful. By default, each OData call needs to go through authentication and authorization. In reality, a user session is created for each API call. Creating user session is a resource-intensive process. Large number of concurrent API calls will stress the server and drastically increase response time. To optimize performance, we encourage you to reuse sessions whenever you can.

Procedure

1. Login providing the correct authentication information.

The first successful login returns a header, `Set-Cookie` and a CSRF token named `X-CSRF-Token`. For example:

```
HTTP/1.1 201 Created
Server: Apache-Coyote/1.1
X-Powered-By: Servlet 2.4; JBoss-4.3.0.GA_CP09 (build:
SVNTag=JBPAPP_4_3_0_GA_CP09 date=201011090309)/JBossWeb-2.0
Set-Cookie: JSESSIONID=2oeUIX5G1w14EZ XU7fDWMQ** .ps4bsfapi52t; Path=/odata
X-CSRF-Token: 97sHgXdBw6%2bCKGg3sWAahbT8ztI%3d
Location: https://<hostname>/odata/v2/User('admin')
DataServiceVersion: 1.0
SFODataServerTimeZone: America/Los_Angeles
Content-Type: application/atom+xml; charset=utf-8
Content-Length: 1518
Date: Thu, 14 Aug 2014 05:25:06 GMT
```

Note

As of 2019 Q2 Release, the path for OData sessions has changed from "/" to "/odata" to indicate that it's an OData session. Do not reuse sessions between different protocols (OData API and SFAPI).

2. Store the value of the cookie and CSRF token in the authorization header as a HTTP Cookie (header field names, `Cookie` and `X-CSRF-Token`) and use them in subsequent requests to reuse the session.

Example request header:

```
Cookie: JSESSIONID=2oeUIX5G1w14EZ XU7fDWMQ** .ps4bsfapi52t
X-CSRF-Token: 97sHgXdBw6%2bCKGg3sWAahbT8ztI%3d
```

Results

If the cookie and token are passed correctly, then the login procedure will reuse the session.

If the CSRF token is invalid, you can still reuse the session by providing the correct login credentials of the same user. Note that the login type must be the same as your first successful login.

Session reuse is not possible if you provide incorrect JSESSIONID or enter wrong credentials. The following chart describes how session reuse works:

ⓘ Note

- Because sessions use authentication information only once, subsequent requests are not aware of any newer permission changes. Similar to UI login, you need to log out and log in again to allow the latest permissions to take effect.
- An X-CSRF-Token is only valid within the session it was generated. Using the token in a non-matching session will result in an error.
- To optimize server resource, a session is only deactivated when the timeout limit is reached.
- If you have only one API client, we recommend reusing sessions whenever possible. If you have multiple clients running at the same time, reuse sessions within one client only. Do not reuse sessions across clients.

2.4.1 Validating a Reused Session

You can validate a reused session with function import `isValidSession`. If a session is valid (value of `name` property is `true`), you can reuse it for your subsequent requests.

To validate a session, make the following call:

HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/isValidSession</code>

If a session is valid, the following response will be returned:

```
{
  "d": {
    "name": true
  }
}
```

3 Permissions

List of permissions required for accessing OData API.

Two types of permissions can be set on the entity level:

- Query permissions
- Edit permissions

Query Permissions

There are three permission levels for querying OData API entities:

Permission Level	Description
Operation level	The operation-level permission checks whether the logged-in user can access the module to which the entities belong.
Row level	The row-level permission checks whether the logged-in user can query an entity.
Field level	The field-level permission checks whether the logged-in user can query a specific property in an entity.

The export permission follows these rules:

Permission Settings	Query Outcome
<i>Export</i> permission is enabled and query entity permission has no target population.	No row-level permission check is required. The user can query all entities.
<i>Export</i> permission is enabled and query entity permission has a target population.	Row-level permission check is required and only entities in the target population are returned.
<i>Export</i> permission is disabled.	Field-level permission check is performed and only fields that the user has permission to access are returned.

Edit Permissions

There are three permission levels for editing OData API entities:

Permission Level	Description
Operation level	The operation-level checks whether the logged-in user can access the module to which the entities belong.

Permission Level	Description
Row level	The row-level permission checks whether the logged-in user can edit an entity.
Field level	The field-level permission checks whether the logged-in user can edit a specific property of an entity.

The import permission follows these rules:

Permission Settings	Query Outcome
<i>Import</i> permission is enabled.	The user can edit all entities.
<i>Import</i> permission is disabled and the operation type is <i>Insert</i> or <i>Upsert</i> .	The operation can't be executed.
<i>Import</i> permission is disabled and the operation type is <i>Update</i> or <i>Merge</i> .	A field-level permission check is performed and the user is allowed to edit the fields for which they have permission. Note that entities that have a target population also require a row-level permission check before field-level permissions are checked.

4 Metadata

This section describes the OData v2 metadata in SAP SuccessFactors HCM suite.

The OData metadata is a static resource that describes the data model and type system understood by that particular OData service. You can use the metadata to learn how to query and navigate between the entities in the system. Metadata extensions provide additional metadata information, which gives you access to advanced operations such as data retrieval filtration.

Cache-Control for OData API \$metadata Operations

Entity Tag (ETag) is used to check if the metadata saved in client cache is the same as the one on the server. The value of max-age in the `Cache-Control` header is set to the lifecycle of the client metadata cache. If the cache is valid, no new request is sent to the server. When a client raises a request for metadata the first time, the server sends back a response with the latest metadata, along with a response header named ETag. The value of ETag is unique and matches the metadata version. This value is used for "If-None-Match" in the request header the next time the same request is raised. The server checks the "If-None-Match" value when a new request arrives. If its value is the same as the latest ETag generated by the server, the server simply sends back a status code of 304 (Not-Modified) instead of resending the entire metadata.

Metadata and the API

The OData metadata describes the capabilities of the API in your SAP SuccessFactors HCM suite instance. It contains the details of each entity that is accessible through the API, including fields, their names and labels, their data types, and the relationships (associations) between entities.

The OData metadata also describes the operations available in the API. The OData protocol specifies four basic database style operations: query, insert, update, and delete. SAP SuccessFactors has added a custom operation called "upsert" which performs an insert or update operations. Typically custom operations perform specific business transactions, especially if a custom API is easier to manage versus a database style approach against multiple entities.

Development Using OData Metadata and API

Regardless of which operations are used, SAP SuccessFactors HCM suite applies the appropriate business logic for each entity type. In other words, even though the operations appear to be database-centric, the API goes through the business logic in the application layer. The API doesn't go directly against the database, nor does it bypass the business logic layer. The entities in the API represent logical application objects familiar to an application user. Note that the entities don't represent the actual physical data storage implementation, which can be in a different structure.

Using the metadata for customized development is optional and considered advanced behavior for API clients. It can be critical to API client systems that need to write general code, which automatically adjusts to the system configuration. For example, if you're writing a middleware tool that allows runtime discovery of the SAP SuccessFactors HCM suite OData system, you can use the metadata to discover the entities and fields, and their data types.

Related Information

[Query Operations](#)

[Edit Operations](#)

4.1 Retrieving Metadata

Learn how to retrieve OData metadata in SAP SuccessFactors HCM suite.

There are two ways to retrieve OData metadata in SAP SuccessFactors HCM suite:

- The *OData API Data Dictionary* tool in *API Center* provides a user-friendly view of OData metadata. You can use the dictionary to look up EntitySets, Complex Types, and Function Imports that are available for your company. The dictionary also includes all properties, navigations, and supported operations of the APIs.
- You can also use API requests to query the entire OData metadata or a subset of the metadata.

⚠ Caution

Beta APIs are not available in the *OData API Data Dictionary*. To retrieve the metadata of beta APIs, change the endpoint to `/odata/v2/beta` in the examples below and request the metadata through an API call.

Retrieving Metadata Using `$metadata`

You can use the `$metadata` system query option to query the entire metadata document or the metadata document for a subset of entity types.

A metadata request using `$metadata` returns an XML serialization of the service, including the entity data model (EDM) and the service operation descriptions. The metadata response supports only `application/atom+xml` type.

- The following URI retrieves the entire OData metadata document:

```
https://<API-Server>/odata/v2/$metadata
```

- You can also request part of the metadata document by specifying a subset of entity types:

```
https://<API-Server>/odata/v2/<Entity1>,<Entity2>...<EntityN>/$metadata
```

For example, the following URI identifies the metadata of the User entity type:

```
https://<API-Server>/odata/v2/User/$metadata
```

The following query returns the metadata of the User and Photo entity types:

```
https://<API-Server>/odata/v2/User,Photo/$metadata
```

Specifying the Language for sap:label

The default language for all property labels (sap:label) in the metadata document is English (en-US). You can request the metadata in different languages by specifying the language with the `sap-language` parameter. For example, the following URI returns a metadata document with all labels in German:

```
https://<API-Server>/odata/v2/User/$metadata?sap-language=de-DE
```

Retrieving Metadata Using /Entity('EntityName')

You can also use `Entity('EntityName')` to query the metadata of a single entity type. This type of query allows you to specify the format of content using the `$format` query option.

The following example query retrieves the metadata document of the `User` entity type in JSON format:

```
https://<API-Server>/odata/v2/Entity('User')?$format=JSON
```

The returned metadata contains entity set information of navigation properties as shown in the snippet below:

```
{
  "aggregationRole": null,
  "businessKey": false,
  "defaultValue": null,
  "displayFormat": null,
  "elmStrength": "Unclassified",
  "fieldControl": null,
  "filterable": true,
  "fromRole": {
    "multiplicity": {
      "name": "ZERO_TO_ONE",
      "symbolString": "0..1"
    },

4.2 Refreshing Metadata

Refresh the OData v2 metadata so that you have the latest OData metadata information.

Context

Refreshing the metadata is required in the following scenarios:

- The data model has changed, for example, an API-related element is added or removed.
- A provisioning or Admin Center setting has changed that's related to OData APIs.
- The definition of an MDF object exposed to OData has changed.

Procedure

- Option 1: Use the refreshMetadata function import to refresh the metadata with an API call.

```
GET https://<api-server>/odata/v2/refreshMetadata
```

A successful operation returns HTTP status code 204 `No Content` with no response body.

- Option 2: Use the *API Center* tool to refresh metadata. For more information, see the Related Information section.

4.3 OData Annotations for EntitySet

The OData Metadata document for SAP SuccessFactors HCM suite contains the following information about the EntitySet extension.

The EntitySet SF Extension

ATTRIBUTE	DEFAULT	DESCRIPTION
sap:label	-	Description of the entity type.
sap:creatable	True	Instances of this entity type can be created.
sap:updatable	True	Instances of this entity type can be updated.

ATTRIBUTE	DEFAULT	DESCRIPTION
sap:upsertable	True	Instances of this entity type can be upserted.
sap:deletable	True	Instances of this entity type can be deleted.

❁ Example

```
<EntitySet Name="PicklistOption" EntityType="SFOData.PicklistOption"
sap:label="PicklistOption" sap:creatable="true" sap:updatable="true"
sap:upsertable="false" sap:deletable="false">
```

4.4 OData Annotations for Properties

The OData metadata document for SAP SuccessFactors HCM suite contains the following information about properties.

Annotations for OData Properties

Attribute	Default Value	Meaning
Nullable	true	Values of this property can be empty (null).
sap:required	false	Value of this property is required.
sap:creatable	true	Values of this property can be chosen by client when creating an instance.
sap:updatable	true	Values of this property can be changed.
sap:upsertable	true	Values of this property can be upserted.
sap:visible	true	Values of this property are visible to end user. The property can be used in the \$select system query option. If sap:field-control attribute is available for the property, the visibility is further determined by the value of sap:field-control.
sap:sortable	true	The property can be used in the \$orderby system query option.
sap:filterable	true	The property can be used in the \$filter system query option.
sap:label	-	Description of the property.

Attribute	Default Value	Meaning
<code>sap:field-control</code>	-	<p>A path expression that identifies a property containing a numeric value that controls visibility:</p> <ul style="list-style-type: none"> 0 = hidden: The property isn't visible on user interfaces. 1 = read-only: The property can't be changed. 3 = optional: The property may contain a null value (indicates writeable). 7 = mandatory: The property must contain a value (indicates writeable).

❖ Example

```
<Property Name="instrInterview" Type="Edm.String" Nullable="true"
sap:required="false" sap:creatable="true" sap:updatable="true"
sap:upsertable="true" sap:visible="true" sap:sortable="false"
sap:filterable="false" sap:field-control="jobReqPermissionsNav/instrInterview"
sap:label="Attach interview questions and supplementary companion documents:">
</Property>
```

4.5 OData Annotations for Navigation Properties

The OData metadata document for SAP SuccessFactors HCM suite contains the following information about navigation properties.

Annotations for OData Navigation Properties

Attribute	Default Value	Meaning
<code>sap:required</code>	false	Value of this navigation property is required.
<code>sap:creatable</code>	true	Values of this navigation property can be chosen by client when creating an instance.
<code>sap:updatable</code>	true	Values of this navigation property can be changed.
<code>sap:upsertable</code>	true	Values of this navigation property can be upserted.
<code>sap:visible</code>	true	Values of this navigation property are visible to end users. If <code>sap:field-control</code> attribute is available for the navigation property, the visibility is further determined by the value of <code>sap:field-control</code> .
<code>sap:sortable</code>	true	The navigation property can be used in the \$orderby [page 61] system query option.
<code>sap:filterable</code>	true	The navigation property can be used in the \$filter [page 64] system query option.

Attribute	Default Value	Meaning
<code>sap:field-control</code>	-	<p>A path expression that identifies a property containing a numeric value that controls visibility:</p> <ul style="list-style-type: none"> • 0 = hidden: The property isn't visible on user interfaces. • 1 = read-only: The property can't be changed. • 3 = optional: The property may contain a null value (indicates writeable). • 7 = mandatory: The property must contain a value (indicates writeable).

Example

```
<NavigationProperty Name="skillNav" sap:required="true" sap:creatable="true"
sap:updatable="true" sap:upsertable="true" sap:visible="true" sap:sortable="true"
sap:filterable="true" Relationship="SFOData.skillNav_of_SelfReportSkillMapping"
FromRole="SelfReportSkillMapping" ToRole="skillNav" sap:field-
control="SelfReportSkillMappingFieldControlsNav/skillNav"
sap:label="Skill"></NavigationProperty>
```

4.6 Metadata Enhancements for UI5 Smart Controls

SAP extensions and their properties for UI5 smart controls are described here.

For more information about Extensions Specification in OData, please visit <https://scn.sap.com/docs/DOC-44986>.

Entity Type

Name	Required	Default	Comment
<code>sap:content-version</code>	No		

Name	Required	Default	Comment
sap:semantics	No		values can be these: <ul style="list-style-type: none"> • vcard • vevent • vtodo • parameters • aggregate • variant

4.7 OData Service Catalog

The Service Catalog API provides a way to group APIs together in contextually-relevant groups, reducing the size of the \$metadata for each catalog.

⚠ Caution

This is an experimental feature and will be deprecated soon. Please stop using this API and choose other ways to generate OData metadata.

You can use the `http://<api-server>/odata/v2/CatalogService/$metadata` API call to generate a catalog of services.

Sample XML Response

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>
<edmx:Edmx Version="1.0" xmlns:edmx="http://schemas.microsoft.com/ado/2007/06/edmx"
xmlns:atom="http://www.w3.org/2005/Atom">
  <edmx:DataServices m:DataServiceVersion="2.0" xmlns:m="http://
schemas.microsoft.com/ado/2007/08/dataservices/metadata">
    <Schema Namespace="CATALOGSERVICE" xmlns="http://schemas.microsoft.com/ado/
2008/09/edm" xmlns:sf="http://www.successfactors.com/edm/sf" xmlns:sap="http://
www.successfactors.com/edm/sap">
      <EntityType Name="Service">
        <Key>
          <PropertyRef Name="ID"></PropertyRef>
        </Key>
        <Property Name="ID" Type="Edm.String" Nullable="false"></Property>
```

```

Property>      <Property Name="Description" Type="Edm.String" Nullable="true"></
Property>      <Property Name="Author" Type="Edm.String" Nullable="true"></
Property>      <Property Name="MetadataUrl" Type="Edm.String" Nullable="true"></
Property>      <Property Name="ServiceUrl" Type="Edm.String" Nullable="false"></
Property>      </EntityType>
                <EntityContainer Name="CATALOGSERVICE_Entities"
m:IsDefaultEntityContainer="true">
                  <EntitySet Name="Service" EntityType="CATALOGSERVICE.Service"
sap:creatable="true" sap:updatable="true" sap:upsertable="true"
sap:deletable="true"></EntitySet>
                </EntityContainer>
                <atom:link rel="self" href="https://<hostname>/odata/v2/CatalogService/
$metadata"></atom:link>
                <atom:link rel="latest-version" href="https://<hostname>/odata/v2/
CatalogService/$metadata"></atom:link>
                </Schema>
            </edmx:DataServices>
</edmx:Edmx>

```

Response Description

This XML output follows regular OData metadata format. It contains two parts:

1. An OData entity named 'Service'. Currently this entity is not accessible excepts it's definition in metadata.
2. Several `<atom:link>` links, each of which publishes a service URL. Each data center is be configured to publish different service URLs. The `self` and `latest-version` links always point to the catalog service itself.

5 Operations

OData v2 is a standardized protocol for accessing a database. OData entities are described in the metadata document. Accessing the entities is as simple as knowing the entity name, and then referencing the entity through an HTTP call. For example, all SAP SuccessFactors HCM suite solutions have a `User` Entity that represents a user account. To query user `cgrant`, you can use the following URL:

```
https://<api-server>/odata/v2/User('cgrant')
```

A query can be more complex by including filtering, paging, sorting, and joining of entities (known as expanding in OData).

OData protocol allows the service provider to decide which operations are supported. In SAP SuccessFactors HCM suite, the supported operations vary by entity. For example, the system does not allow user accounts to be deleted. User accounts can be removed from use only by setting them as inactive. Therefore the `User` entity does not support the delete operation.

This document does not cover the details of each entity behavior for all SAP SuccessFactors HCM suite solutions. Details for each entity are provided in the OData reference guides. The reference guides provide details about operations, business meaning and business logic, and configuration details such as security and custom-field configuration.

5.1 Composing the OData URI

In OData, a URI has the following structure:

```
http://<hostname>/odata/v2/EntitySet[(KeyPredicate)][/NavPropSingle][/  
NavPropCollection][/ComplexType][/Property]
```

- **EntitySet:** Name of the OData API entity. An entity set represents the resource exposed by the OData API.
- **KeyPredicate:** A predicate that identifies the key property of the entity. If an entity has a single key property, the key predicate may only include the value of the property. If the entity has a composite key, that is, the entity has multiple key properties, the key predicate must include the key/value pairs to identify an entry. Note that when a key predicate is present in a URI, the `$filter` query option will be disregarded.
- **navPropSingle:** The name of a navigation property defined by the entry associated with the prior path segment. The `navPropSingle` must identify a single entity (that is, have a "to 1" relationship).
- **NavPropCollection:** Same as `NavPropSingle` except it must identify a collection of entries (that is, have a "to many" relationship).
- **ComplexType:** The name of a property of the entity or complex type associated with the prior path segment.
- **Property:** The name of a property of the entity or complex type associated with the prior path segment.

The following table contains examples of a URI and a description of its composition:

Sample URI	Description
<code>http://<hostname>/odata/v2/User</code>	<ul style="list-style-type: none"> Identifies a <code>User</code> Collection. Described by the Entity type named "User" in the meta-data document.
<code>http://<hostname>/odata/v2/User('1')</code>	<ul style="list-style-type: none"> Identifies a single <code>User</code> entry with key value 1. Described by the Entity type named "User" in the service metadata document.
<code>http://<hostname>/odata/v2/User('1')/username</code>	<ul style="list-style-type: none"> Identifies the <code>username</code> property of the <code>User</code> entry with key value 1. Described by the Property named <code>username</code> on the <code>User</code> entity type in the metadata document.
<code>http://<hostname>/odata/v2/User('1')/proxy</code>	<ul style="list-style-type: none"> Identifies the collection of proxy associated with <code>User</code> entry with key value 1. Described by the Navigation Property named <code>proxy</code> on the <code>User</code> entity type in the metadata document.
<code>http://<hostname>/odata/v2/User('1')/proxy/\$count</code>	<ul style="list-style-type: none"> Identifies the number of proxy Entries associated with <code>User</code> 1. Described by the Navigation Property named "proxy" on the "User" entity type in the metadata document.
<code>http://<hostname>/odata/v2/User('1')/proxy('1')/hr/username</code>	<ul style="list-style-type: none"> Identifies the <code>username</code> of the <code>hr</code> for proxy 1 which is associated with <code>User</code> 1. Described by the Property named <code>username</code> on the <code>hr</code> entity type in the metadata document.
<code>http://<hostname>/odata/v2/User('1')/proxy('1')/hr/username/\$value</code>	Same as the URI above, but identifies the raw value of the <code>username</code> property.

Related Information

[Query with Key Predicate \[page 59\]](#)

5.2 Headers

A list of OData headers you can use and see in API requests and responses.

Common Headers

All standard OData headers are supported.

SAP SuccessFactors Custom Headers

Header	Type	Description
Company-Id	Response header	Represents the customer's company ID.
Server	Response header	Indicates from which server the response is returned. Possible values are: <ul style="list-style-type: none">• BizX: Indicates that the response is from an API server.• API Gateway: Indicates that the response is from the API Gateway. This often happens if the authentication fails in API Gateway.• <service-name>: If the value is a service name, then the response is sent from a microservice.
SFODataServerTimeZone	Response header	Timezone information of the OData API server.
successfactors-immutable-companyid	Response header	An immutable GUID that corresponds to the company ID.
successfactors-sourcetype	Request header	This header provides information about the source client where the API request is made.
x-correlation-id	Request and response header	<p>A unique GUID included in the header and log for each request for tracing purpose.</p> <p>By default, an ID is generated in the API Gateway and sent to the API server for each call. In rare cases when no GUID is generated, such as API Gateway timeout, you can also generate your own ID and include it in the request header.</p>

Header	Type	Description
X-SF-Correlation-Id	Request and response header	<div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p>⚠ Caution</p> <p>Header X-SF-Correlation-Id is deprecated. Please use x-correlation-id instead.</p> </div>
X-SF-Execution-Id	Request and response header	Execution ID of the integration process.
X-SF-Paging	Response header	<p>Indicates which type of pagination is used in the reponse payload. Possible values are:</p> <ul style="list-style-type: none"> • <code>snapshot</code>: Snapshot-based pagination is used. • <code>offset</code>: Client-side offset pagination is used. • For more information, see Snapshot-Based Pagination [page 86].
X-SF-Process-Name	Request and response header	Process name of the integration.
X-SF-Process-Id	Request and response header	GUID of the process of the integration.
X-SF-Client-Tenant-Id	Request and response header	Account ID of the integration.

5.3 Handling Special Characters

URLs are sent over the Internet using the ASCII character set. If a URL contains characters outside the ASCII set, the characters must be converted into a valid ASCII format. Percent encoding, also known as URL encoding, is a mechanism that encodes special characters into ASCII characters that can be understood. It is used in SAP SuccessFactors HCM suite OData API to handle special characters that appear in the URI or request/response body. In this topic, you'll find a list of special characters and when to encode them in OData API.

Reserved & unreserved characters

The characters allowed in a URI can be categorized into reserved characters and unreserved characters:

- Reserved characters are the characters for special use in defining the syntax of the URI, for example, the dollar sign ("\$") and the question mark ("?"). These special characters may need to be encoded under certain circumstances if you don't want them to be used in their special role.
- Unreserved characters serve no special purposes. They do not need to be percent-encoded.

List of special characters supported in SAP SuccessFactors HCM suite OData API

Percent encoding converts a special character into its corresponding ASCII value with a "%" followed by two hexadecimal digits. Below is a list of special characters supported in SAP SuccessFactors HCM suite OData API, their percent-encoded values, and how to use them:

Special Character	Percent-encoded Value	How to use it in key predicate	How to use it in \$filter
!	%21	As is or encode	As is or encode
#	%23	Encode	Encode
\$	%24	As is or encode	As is or encode
%	%25	Encode	As is or encode
&	%26	As is or encode	Encode
'	%27	Two apostrophes (")	Two apostrophes (")
(%28	As is or encode	As is or encode
)	%29	As is or encode	As is or encode
*	%2A	As is or encode	As is or encode
+	%2B	As is or encode	Encode
,	%2C	As is or encode	As is or encode
/	%2F	As is	As is or encode
:	%3A	As is or encode	As is or encode
;	%3B	Encode	As is or encode
=	%3D	As is or encode	As is or encode
?	%3F	Encode	As is or encode
@	%40	As is or encode	As is or encode
[%5B	Encode	Encode
]	%5D	Encode	Encode

Examples: When should I percent-encode special characters?

Depending on where the special characters appear, percent-encoding may or may not be needed when you compose a URI. Follow the rules listed in the table above, and refer to the use cases below as examples.

Using special characters in URI

You want to query cost center **CC#001**. The "#" character must be encoded in the URI:

```
https://<api-server>/odata/v2/FOCostCenter?$filter=externalCode eq 'CC%23001'&$select=externalCode,name&$format=JSON
```

In the response body, the externalCode is displayed as "CC#001":

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/
FOCostCenter(externalCode='CC#001',startDate=datetime'2013-01-01T00:00:00')",
          "type": "SFOData.FOCostCenter"
        },
        "externalCode": "CC#001",
        "name": "Special Character Test"
      }
    ]
  }
}
```

Using special characters in request body

Do not percent-encode special characters in the request body. In the following example, the externalCode of the cost center is **CC%23001** in the payload. This creates a cost center with externalCode **CC%23001** instead of **CC#001**.

```
{
  "__metadata": {
    "uri": "FOCostCenter(externalCode='CC%23001',startDate=datetime'2013-01-01T00:00:00')",
    "type": "SFOData.FOCostCenter"
  },
  "name": "Special Character Test",
  "status": "A"
}
```

When you query the entity, you need to encode the '%' into '%25' to filter the cost center in the result:

```
https://<api-server>/odata/v2/FOCostCenter?$filter=externalCode eq
'CC%2523001'&$select=externalCode,name&$format=JSON
```

In the response body, the externalCode is displayed as "CC%23001":

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/
FOCostCenter(externalCode='CC%23001',startDate=datetime'2013-01-01T00:00:00')",
          "type": "SFOData.FOCostCenter"
        },
        "externalCode": "CC%23001",
        "name": "Special Character Test"
      }
    ]
  }
}
```

Using the apostrophe (') in URI

If the value of a field includes an apostrophe ('), use two apostrophes in the URI. The following example shows how to create a cost center with externalCode **McDonald's**:

```
{
```

```

    "__metadata": {
      "uri": "FOCostCenter(externalCode='McDonald' 's',startDate=datetime'2013-01-01T00:00:00')",
      "type": "SFOData.FOCostCenter"
    },
    "name": "Special Character Test",
    "status": "A"
  }
}

```

Similarly, use two apostrophes to query the created cost center:

```

https://<api-server>/odata/v2/FOCostCenter?$filter=externalCode eq
'McDonald' 's' &$select=name,externalCode&$format=JSON

```

5.4 Date and Time

The SAP SuccessFactors HCM suite OData service supports both `Edm.DateTime` and `Edm.DateTimeOffset` data types of the OData protocol. These data types make it easy for integration clients to convert date and time values to different time zones as needed.

5.4.1 Working with the Edm.DateTime Data Type

In OData v2, `Edm.DateTime` is a primitive data type that represents date and time without time zone information.

Example of DateTime format

Atom Format

Input: In an edit operation, if the input value in Atom format is 2014-04-22T18:10:10, the API server stores the value as-is in the database.

Output: When requested, the exact same value is retrieved from the database and returned to client with no conversion.

JSON Format

Input: Convert the date and time to epoch format represented by milliseconds and then wrap it with `/Date(<milliseconds>)/` in JSON. For example, the epoch format for 2014-04-22T18:10:10 is 1398190210000, so the input date in JSON format is `/Date(1398190210000)/`. When the API server receives this value, it converts the epoch format to 2014-04-22T18:10:10, and stores it in the database.

Output: All `Edm.DateTime` values returned in JSON payloads are in epoch format.

Note

If a server has migrated to the UTC time zone, then any input to `Edm.DateTime` fields will be automatically converted to the UTC time, without time zone information. For example, a user from the GMT+0800 time zone

inputs 2014-04-22T18:10:10 to a server that's migrated to the UTC time zone, the time will be converted to UTC time as 2014-04-22T10:10:10 and saved.

Some modules store the date and truncate the time. In this case, for the input string **2014-04-22T18:10:10**, the stored value would be **2014-04-22T00:00:00**, and the retrieved value could be **2014-04-22T00:00:00**.

In a HANA-based instance, incorrect date time format such as **2014-04-22** is also accepted and treated as **2014-04-22T00:00:00**. In non-HANA instances, an error will occur.

Query Example

The following API call returns the most recent handling of date and time in JSON format:

Request:

```
https://<api-server>/odata/v2/User?$format=JSON&$filter=lastModified gt '2024-03-13T03:39:01'&$select=userId,firstName,lastModified
```

Response:

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://apisalesdemo2.successfactors.eu/odata/v2/User('1')",

```

5.4.2 Using the DateTimeOffset Format

DateTimeOffset takes time zone into account when converting dates.

Example of DateTimeOffset format (Server location is GMT-4:00)

Atom Format

Input: If input date is 2014-4-22T18:10:10-04:00, OData converts the input date to server time, because the input date has the same time zone with server time zone, there is no need for time conversion, and 2014-4-22T18:10:10 is stored.

If input date is 2014-4-22T23:10:10+01:00, OData convert the input date to server time, because the input date time zone is different from server time zone (input date is at GMT+1 time zone), the date is stored as 2014-4-22T18:10:10.

Output: If date in the database is 2014-4-22T18:10:10, it is returned as 2014-4-22T18:10:10-04:00.

JSON Format

Input: For input date 2014-4-22T18:10:10 in milliseconds of UTC is 1398219010000, so the input date string in json is `"/Date(1398219010000-0240)/"`

Output: If the date in the database is 2014-4-22T18:10:10, when retrieved, it is converted to milliseconds of UTC, `/Date(1398219010000-0240)/`.

Query Example for DateTimeOffset

The property `lastModifiedWithTZ` exposes handling of date and time at an entity level.

The following API call returns the most recent handling of date and time in Java data format:

```

https://<hostname>/odata/v2/User?
$format=json&$select=lastModifiedWithTZ&$filter=lastModifiedWithTZ%20ge%20datetimeoffset%272013-12-18T17:19:28-07:00%27&$top=200

```

Part of the response is:

```

"uri" : "https://<localhost>:443/odata/v2/User('eclark1')", "type" : "SFOData.User" },
"lastModifiedWithTZ" : "\Date(1392046843000-0480)\/"

```

Note

As of Release Q1 2019, DateTimeOffset values without timezone information are also accepted in query URLs and edit request payloads. The value will be processed by the server as UTC time.

5.5 Query Operations

Learn how query operations work in SAP SuccessFactors HCM suite OData API.

The query operation uses the GET HTTP method against a resource URI to retrieve data. You can query a single entry using a key predicate. You can refine query results with filters, sort them in a particular order, page large amount of data, and limit data size by specifying which properties to be returned. You can also expand to related entities and use date constraints to retrieve effective-dated entries.

[Query with Key Predicate \[page 59\]](#)

[System Query Options \[page 60\]](#)

[Pagination \[page 82\]](#)

The OData API provides several pagination options for query results.

5.5.1 Query with Key Predicate

In an OData URI, a key predicate identifies the key property or key properties of the resource specified. If an entity has a single key property, the key predicate may include only the value to be able to uniquely identify an entry. If an entity has multiple key properties, that is, a composite key, the key predicate must include all key/value pairs to be able to identify a unique entry.

Below are two examples of querying entries with a key predicate:

```
https://<API-Server>/odata/v2/FormHeader('123')
```

```
https://<API-Server>/odata/v2/PicklistLabel(locale='en_US',optionId='123')
```

Query with key predicate and system query options

A URI with key predicate identifies only one entry from the specified OData resource. Therefore, when a key predicate is present in a URI, the following system query options are ignored:

- \$filter
- \$top
- \$skip
- \$orderby

Parent topic: [Query Operations \[page 59\]](#)

Related Information

[System Query Options \[page 60\]](#)

[Pagination \[page 82\]](#)

[System Query Options \[page 60\]](#)

5.5.2 System Query Options

System query options are query string parameters that can be used to control the order and amount of data returned for the URI. All system query options start with the "\$" character. You can join multiple options with the "&" character. In this section, you'll learn how each system query options work and how they work together.

[\\$orderby \[page 61\]](#)

Use the `$orderby` system query option to specify an expression for determining what values are used to order the collection of entries identified by the URI.

[\\$top \[page 63\]](#)

This topic shows examples of the `$top` system query option used in a URI.

[\\$skip \[page 63\]](#)

This topic shows examples of the `$skip` system query option used in a URI.

[\\$filter \[page 64\]](#)

This topic shows examples of the logical operators, arithmetic operators, grouping operators, and customized operators including customized string functions that can be used with the `$filter` system query option.

[\\$expand \[page 70\]](#)

This topic shows examples of the `$expand` system query option used in a URI.

[\\$format \[page 71\]](#)

This topic shows examples of the `$format` system query option used in a URI and the Response received for each one.

[\\$select \[page 73\]](#)

You can use the `$select` system query option in a URI to specify a subset of properties to be returned by the OData service.

[\\$count \[page 74\]](#)

Use the `$count` system query option to identify the number of entries represented by the resource the URI.

[\\$inlinecount \[page 76\]](#)

Use the `$inlinecount` system query option to include a count number of the entries identified by the resource path section of the URI.

[Examples of Queries with Multiple Keywords \[page 77\]](#)

Examples of queries with multiple keywords.

Parent topic: [Query Operations \[page 59\]](#)

Related Information

[Query with Key Predicate \[page 59\]](#)

[Pagination \[page 82\]](#)

5.5.2.1 \$orderby

Use the `$orderby` system query option to specify an expression for determining what values are used to order the collection of entries identified by the URI.

The `$orderby` system query option only works when multiple entries are returned.

❖ Example

Query all users in the system and sort the results by the `username` property:

```
https://<API-Server>/odata/v2/User?$orderby=username
```

❖ Example

Query all users in the system and sort the results by the `username` property in ascending order:

```
https://<API-Server>/odata/v2/User?$orderby=username asc
```

❖ Example

Query all users in the system and sort the results by the `username` property in descending order, and subsequently sort the results by the `username` property of the user's HR:

```
https://<API-Server>/odata/v2/User?$orderby=username,hr/username desc
```

ⓘ Note

The system query option sorts the top level entity only; child entities aren't sorted. When using `$orderby` on a 1: many navigation properties, the order isn't predicable.

Sorting of String-Type Numeric Characters

Numbers of a string-type property are sorted in lexical order (lexicographic sorting) rather than by their numeric values. For example, if you sort a collection of entries by a string-type ID field in ascending order, ID "123" comes before ID "45".

❖ Example

Query `TodoEntryV2` and sort the results by the `categoryId` property in **ascending** order:

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/TodoEntryV2(185114M)",
          "type": "SFOData.TodoEntryV2"
        },
        "categoryId": "44"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/TodoEntryV2(185260M)",
          "type": "SFOData.TodoEntryV2"
        },
        "categoryId": "5"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/TodoEntryV2(162942M)",
          "type": "SFOData.TodoEntryV2"
        },
        "categoryId": "57"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/TodoEntryV2(185684M)",
          "type": "SFOData.TodoEntryV2"
        },
        "categoryId": "59"
      }
    ]
  }
}
```

5.5.2.2 \$top

This topic shows examples of the `$top` system query option used in a URI.

To learn about the OData System query options used in the example URIs in this section, visit www.odata.org, and search for "OData Version 2.0 Uri Conventions".

EXAMPLE URI	DESCRIPTION
<code>https://<API-Server>/odata/v2/User?\$top=5</code>	The first 5 <code>User</code> entries are returned and the entries are sorted using a schema determined by the OData service.
<code>https://<API-Server>/odata/v2/User?\$top=5&\$orderby=username desc</code>	The first 5 <code>User</code> entries are returned in descending order and sorted by the <code>username</code> property.

Parent topic: [System Query Options \[page 60\]](#)

Related Information

[\\$orderby \[page 61\]](#)

[\\$skip \[page 63\]](#)

[\\$filter \[page 64\]](#)

5.5.2.3 \$skip

This topic shows examples of the `$skip` system query option used in a URI.

To learn more about the OData System query options used in the example URIs in this section, visit www.odata.org, and search for "OData Version 2.0 Uri Conventions".

Example	Description
<code>/odata/v2/User?\$skip=2</code>	The set of <code>User</code> entries starting with the third user.
<code>/odata/v2/User?\$skip=2&\$top=2&\$orderby=username</code>	The third and fourth <code>User</code> entries from the collection of all <code>User</code> entities when the collection is sorted by <code>username</code> in ascending order.

[Examples of Queries with Multiple Keywords \[page 77\]](#)

5.5.2.4 \$filter

This topic shows examples of the logical operators, arithmetic operators, grouping operators, and customized operators including customized string functions that can be used with the `$filter` system query option.

You can use the `$filter` system query option in the URI to limit the number of results returned in an OData API query. For example, the following URI filters the status field in the User entity to return all active users:

```
https://<API-Server>/odata/v2/User?$filter=status eq 't'
```

Note

- You can only filter top-level entities and child entities that have 1:1 relationships with their parents. When you apply `$filter` on an entity that has one-to-many (1:M) relationship with its children, the child entities are not filtered. The query returns all parents with full list of child entities even though only one child meets the condition in the filter.
- When a key predicate is present in the URI, the `$filter` option is disregarded.

To learn more about the OData System query options used in the example URIs in this section, visit www.odata.org, and search for "OData Version 2.0 Uri Conventions".

Logical Operators

LOGICAL OPERATOR	DESCRIPTION	EXAMPLE
eq	Equal	Finds a User entity whose hr/username is cgrant (hr is the navigation property): <code>https://<API-Server>/odata/v2/User?\$filter=hr/username eq 'cgrant'</code> . Finds a User Entity whose username property is cgrant : <code>https://<API-Server>/odata/v2/User?\$filter=username eq 'cgrant'</code> .
ne	Not equal	<code>https://<API-Server>/odata/v2/User?\$filter=hr/username ne 'London'</code>
gt	Greater than	Finds a PickListLabel Entity whose id is greater than 2000: <code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id gt 2000</code>
ge	Greater than or equal	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id ge 10</code>
lt	Less than	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id lt 20</code>
le	Less than or equal	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id le 100</code>
and	Logical and	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id le 1005 and id gt 1000</code> to find PicklistLabel whose id is within range [1000,1005]
or	Logical or	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id le 3.5 or id gt 200</code>
not	Logical negation	<code>https://<API-Server>/odata/v2/User?\$filter=not endswith(username, 'grant')</code>

Note

There's a limit to the number of expressions you can use in a single query. This number varies from server to server. When the limit is reached, an error occurs. To solve this problem, reduce the number of expressions in your query.

Arithmetic Operators

ARITHMETIC OPERATOR	DESCRIPTION	EXAMPLE
add	Addition	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id add 5 gt 10</code>

ARITHMETIC OPERATOR	DESCRIPTION	EXAMPLE
sub	Subtraction	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id sub 5 gt 10</code>
mul	Multiplication	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id mul 2 gt 2000</code>
div	Division	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id div 2 gt 4</code>
mod	Modulo	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=id mod 2 eq 0</code>

Grouping Operator

GROUPING OPERATOR	DESCRIPTION	EXAMPLE
()	Precedence grouping.	<code>https://<API-Server>/odata/v2/PicklistLabel?\$filter=(id sub 5) gt 10</code>

Customized Operators

CUSTOMIZED OPERATOR	DESCRIPTION	EXAMPLE
in	In clause	Identifies <code>User</code> entities whose <code>userId</code> is equal to one specified by an <code>in</code> clause: <code>https://<API-Server>/odata/v2/User?\$filter=userId in 'ctsel', 'mhuang1', 'flynch1'&\$select=username,userId</code>

Note

Due to the limit of number of expressions (1000) in a list, OData API doesn't accept an IN clause exceeding 1000 expressions in `$filter`.

CUSTOMIZED OPERATOR	DESCRIPTION	EXAMPLE
like	Like clause	<p>Identifies <code>User</code> entities whose <code>userId</code> property cgrant may be retrieved with a <code>like</code> clause:</p> <pre>https://<API-Server>/odata/v2/User? \$filter=userId like 'cgrant'</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> property is equivalent to cgrant:</p> <pre>\$filter=userId eq 'cgrant'</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> property cgrant may be retrieved with a <code>like</code> clause:</p> <pre>https://<API-Server>/odata/v2/User? \$filter=userId like 'cgrant%'</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> property starts with cgrant:</p> <pre>\$filter=startswith(userId, 'cgrant')</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> property ends with cgrant:</p> <pre>https://<API-Server>/odata/v2/User? \$filter=userId like '%cgrant'</pre> <p>This is equivalent to</p> <pre>\$filter=endswith(userId, 'cgrant')</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> property contains string cgrant.</p> <pre>https://<API-Server>/odata/v2/User? \$filter=userId like '%cgrant%'</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> property contains string cgrant and is case insensitive.</p> <pre>https://<API-Server>/odata/v2/User? \$filter=tolower(userId) like ' %cgrant%'</pre> <pre>https://<API-Server>/odata/v2/User? \$filter=toupper(userId) like ' %cgrant%'</pre> <p>Identifies <code>User</code> entities whose <code>userId</code> is like cgrant and unions with <code>username</code> like cgrant.</p>

CUSTOMIZED OPERATOR	DESCRIPTION	EXAMPLE
		<pre>https://<API-Server>/odata/v2/User? \$filter=toupper(userId) like ' %cgrant%' or tolower(username) like '%cgrant%'</pre> <p>Identifies User entities whose userId is like cgrant and intersects with username like cgrant.</p> <pre>https://<API-Server>/odata/v2/User? \$filter=toupper(userId) like ' %cgrant%' and tolower(username) like '%cgrant%'</pre>

String Functions

In addition to operators, a set of functions is also defined for use with the `$filter` query option. The following table lists the available functions.

ⓘ Note

ISNULL or COALESCE operators are not defined. Instead, there's a null literal that can be used in comparisons. If your query contains a single quote, it must be escaped by another one if it appears with single-quoted string.

STRING FUNCTION	EXAMPLE
<code>bool endswith(string p0, string p1)</code>	<p>Finds all usernames that end with Futterkiste:</p> <pre>https://<API-Server>/odata/v2/User? \$filter=endswith(username, 'Futterkiste')</pre>
<code>bool startswith(string p0, string p1)</code>	<p>Finds all usernames that start with Alfr:</p> <pre>https://<API-Server>/odata/v2/User? \$filter=startswith(username, 'Alfr')</pre>
<code>bool substringof(string p0, string p1)</code>	<p>Case-insensitive search for username field:</p> <pre>https://<API-Server>/odata/v2/User? \$filter=substringof('futter', tolower(username)) eq true</pre>

STRING FUNCTION

EXAMPLE

`string tolower(string p0)`

Compare username in lower case to the literal value

futterkiste:

`https://<API-Server>/odata/v2/User?
$filter=tolower(username) eq 'futterkiste'`

`string toupper(string p0)`

Compare username in upper case to the literal value 'FUTTERKISTE':

`https://<API-Server>/odata/v2/User?
$filter=toupper(username) eq 'FUTTERKISTE'`

`string trim(string p0)`

Trim leading and trailing whitespaces before comparing values:

`https://<API-Server>/odata/v2/User?
$filter=trim(username) eq 'Futterkiste'`

The \$filter option can also be used in a query using a datetime parameter:

QUERY EXAMPLE

`https://<API-Server>/odata/v2/User?
$format=json&$select=lastModified&$filter=
lastModified%20ge%20datetime%272003-12-18T
17:19:28%27&$top=200`

The query returns last modified date in Java data format (the milliseconds since January 1, 1970, 00:00:00 GMT).

[Examples of Queries with Multiple Keywords \[page 77\]](#)

5.5.2.7 \$select

You can use the `$select` system query option in a URI to specify a subset of properties to be returned by the OData service.

The value of the `$select` query option is a list of comma-separated properties or navigation properties. By limiting the number of fields returned, this query option can reduce the query data size and improve performance.

To learn about the OData System query options used in the example URIs in this section, visit www.odata.org, and search for "OData Version 2.0 Uri Conventions".

The following set of examples uses the data model available at `https://<API-Server>/odata/v2/$metadata` to describe the semantics for a base set of URIs using the `$select` system query option. From these base cases, the semantics of longer URIs are defined by composing the rules below:

EXAMPLE URI	DESCRIPTION
<code>https://<API-Server>/odata/v2/User?\$select=username,userId</code>	<ul style="list-style-type: none"> username and <code>userId</code> property values are returned for each <code>User</code> entry. If the <code>\$select</code> query option had listed a property that identified a <code>Complex Type</code>, then all properties defined on the <code>Complex Type</code> must be returned.
<code>https://<API-Server>/odata/v2/User?\$select=username,proxy</code>	username property value and a link to the related proxy Entry is returned for each User.
<code>https://<API-Server>/odata/v2/User?\$select=username,proxy&\$expand=proxy/hr</code>	All the properties of the Entries identified by the <code>proxy</code> and <code>hr</code> navigation properties are returned.
<code>https://<API-Server>/odata/v2/User?\$select=username,proxy/username&\$expand=proxy</code>	In a response from an OData service, the <code>username</code> property is included and <code>proxy</code> Entries with a <code>username</code> property is included. But, instead of including the fully expanded proxy entries, each <code>proxy</code> contains a <code>user</code> property.

[\\$inlinecount \[page 76\]](#)

[Examples of Queries with Multiple Keywords \[page 77\]](#)

5.5.2.8 \$count

Use the `$count` system query option to identify the number of entries represented by the resource the URI.

The `$count` query option can be used standalone or with the `$filter` query option. When it's used to count filtered entries, it must be placed before the `$filter` option.

Here are some examples:

- The following query returns the total number of users in the system:

```
https://<API-Server>/odata/v2/User/$count
```

- If you add a `$filter` to the same query, the `$count` option returns the number of filtered results:

```
https://<API-Server>/odata/v2/User/$count?$filter=status eq 'F'
```

How Is the Count Calculated?

In SAP SuccessFactors OData API, the `$count` option calculates the number of identified entries after whatever business logic is implemented in the entity. Here are two examples to help you understand the design.

❖ Example

The following query returns the number of all active users in the system by default:

```
https://<API-Server>/odata/v2/User/$count
```

If you want to count both active and inactive users, apply a filter option and call out the status explicitly in the query:

```
https://<API-Server>/odata/v2/User/$count?$filter=status in 't', 'T', 'f', 'F'
```

❖ Example

The following query returns position entries that are active on the present date by default:

```
https://<API-Server>/odata/v2/Position/$count
```

If you want the number of all position entries including historical and future positions, you need to apply a time parameter to the query:

```
https://<API-Server>/odata/v2/Position/$count?toDate=9999-12-31
```

[Examples of Queries with Multiple Keywords \[page 77\]](#)

[\\$filter \[page 64\]](#)

5.5.2.9 \$inlinecount

Use the `$inlinecount` system query option to include a count number of the entries identified by the resource path section of the URI.

The `$inlinecount` calculates all entries identified by the resource path after applying any `$filter` query options. The difference between `$inlinecount` and `$count` is that `$count` only returns a count number in the response while `$inlinecount` returns both entries and the count number.

Parameter Values

<code>\$inlinecount</code> Value	Description
<code>none</code>	The response doesn't include a count. This is equivalent to a URI that doesn't include an <code>\$inlinecount</code> option.
<code>allpages</code>	The response includes a count of the number of entities in the collection identified by the URI after applying any filter query option in the URI.

Use Cases

The following query identifies a list of countries/regions with a count number at the end of the response:

```
https://<API-Server>/odata/v2/Country?$inlinecount=allpages
```

Here's a snippet of the response that contains the count number:

```
{
  "d": {
    "results": [
      ... ..
    ],
    "__count": "251"
  }
}
```

The following query identifies all users with last name `Smith` and the count number of the entries:

```
https://<API-Server>/odata/v2/User?$filter=lastName eq 'Smith'&$inlinecount=allpages
```

Sample response:

Sample Code

```
{
  "d": {
    "results": [
      ... ..
    ],
    "__count": "8"
  }
}
```

5.5.2.10.1 Query with nested-navigation properties with \$select

This topic explains the use of \$select in a query.

The following URIs are constructed differently but provide the same response:

```
http://<hostname>/odata/v2/User?$select=userId,username,hr&$format=json&$top=1
```

```
http://<hostname>/odata/v2/User?$select=userId,username,hr/manager/
proxy&$format=json&$top=1
```

Each URI identifies all `User` Entities. Instead of having the response contain all properties for each Entity, the \$select option ensures the response contains only the three properties specified in the URI. . You can specify a simple property, a navigation property, or a nested-navigation property. For a simple property, the response contains results. For a navigation property, the response is a deferred link , whatever the depth of the property.

Sample response:

```
{ "__metadata" : { "uri" : "http://localhost:8080/odata/v2/User('mhuang1')",
"type" : "SFOData.User" }, "userId" : "mhuang1", "username" : "mhuang",
"manager" : { "__deferred" : { "uri" : "http://localhost:8080/odata/v2/User('mhuang1')/
manager" } } }
```

5.5.2.10.2 Query with \$select and \$expand

The following example shows the \$select and \$expand options used together in a URI:

```
http://<hostname>/odata/v2/User?$select=userId,manager/hr/
manager&$format=json&$expand=manager/hr
```

The URI identifies all entities of a `User` Entity Set. The response is similar to the response from a URI that uses nested-navigation properties with the \$select option, but the \$expand option can make a difference in the results that appear in the response. For example:

- If a navigation property gets expanded, the property shows as a flat object.
- If a navigation property is not expanded, it shows as a deferred link.
- If the nested-navigation property `manager/hr/manager` gets expanded, it shows a manager object.
- Because the last entry in a nested navigation doesn't get expanded, the manager object is given a nested `hr` property. The `hr` property will have a deferred link named *manager* which refers to the actual object. Unselected properties of expanded objects will be trimmed..

Sample Response:

```
{
  "__metadata" : {
```

```

"uri" : "http://localhost:8080/odata/v2/User('asлива_upsert_JAM_200')", "type" :
"SFOData.User"
}, "userId" : "asлива_upsert_JAM_200", "manager" : {
  "__metadata" : {
    "uri" : "http://localhost:8080/odata/v2/User('asлива_upsert_JAM_201')",
    "type" : "SFOData.User"
  },
  "hr" : {
    "__metadata" : {
      "uri" : "http://localhost:8080/odata/v2/
User('asлива_upsert_b11_112_inline_manager11')", "type" : "SFOData.User"
    },
    "manager" : {
      "__deferred" : {
        "uri" : "http://localhost:8080/odata/v2/
User('asлива_upsert_b11_112_inline_manager11')/manager"
      }
    }
  }
}
}
}

```

5.5.2.10.3 Query links with \$select and \$expand

The following example shows \$select with \$expand:

```

http://<hostname>/odata/v2/User('asлива_upsert_JAM_200')/proxy?
$select=userId,manager/hr/manager&$format=json&$expand=manager/hr

```

In the response, the \$expand option expands the selected navigation property. Unselected data columns do not get expanded. Set entities of User/proxy are returned.

Sample Response:

```

[
  {
    "__metadata" : {
      "uri" : "http://localhost:8080/odata/v2/User('asлива_upsert_JAM_197')", "type" :
      "SFOData.User"
    }, "userId" : "asлива_upsert_JAM_197", "manager" : null
  },
  {
    "__metadata" : {
      "uri" : "http://localhost:8080/odata/v2/User('asлива_upsert_JAM_198')", "type" :
      "SFOData.User"
    }, "userId" : "asлива_upsert_JAM_198", "manager" : null
  },
  {
    "__metadata" : {
      "uri" : "http://localhost:8080/odata/v2/
User('asлива_upsert_b11_112_inline_proxy')", "type" : "SFOData.User"
    }, "userId" : "asлива_upsert_b11_112_inline_proxy", "manager" : null
  },
  {
    "__metadata" : {
      "uri" : "http://localhost:8080/odata/v2/
User('asлива_upsert_b11_112_inline_proxy_1')", "type" : "SFOData.User"
    }, "userId" : "asлива_upsert_b11_112_inline_proxy_1", "manager" : null
  }
]

```

5.5.2.10.4 Query with \$select, \$expand, and \$filter

The following example shows a query with multiple options:

```
https://<hostname>/odata/v2/User?$format=JSON&$select=userId,username,proxy/
userId,proxy/username&$expand=proxy&$filter=proxy/userId eq 'admin'
```

The response identifies a set of users who has a `proxy` with `userId` value `admin`. After the users are identified, the response expands the `proxy` navigation property and retrieves the columns as specified in the `$select` option.

Note

In a 1:M navigation relation, `$filter` only works on the base object. Expanded data will not be filtered. In this case, `$filter=proxy/userId eq 'admin'` serves as a search criteria to identify user 103004. In the response, both proxies of the user are retrieved.

Sample Response:

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/User('103004')",
          "type": "SFOData.User"
        },
        "userId": "103004",
        "username": "vwagner",
        "proxy": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<hostname>/odata/v2/User('admin')",
                "type": "SFOData.User"
              },
              "userId": "admin",
              "username": "admin"
            },
            {
              "__metadata": {
                "uri": "https://<hostname>/odata/v2/User('sfadmin')",
                "type": "SFOData.User"
              },
              "userId": "sfadmin",
              "username": "sfadmin"
            }
          ]
        }
      }
    ]
  }
}
```

Related Information

[\\$filter \[page 64\]](#)

[\\$expand \[page 70\]](#)

5.5.2.10.5 Query with \$top and \$skip

Using the `$top` and `$skip` options together in a request URI creates a pagination query. The response is a subset of the whole result, from `$skip` to `$top`. `$skip` indicates the starting row for the query. `$top` limits the size of the query.

For example, if the URI uses `$top=50`, `$skip=20`, the response is a subset from numbers 21 to number 70 of the whole result set.

5.5.2.10.6 Query with \$expand and \$orderby

When you use keywords `$expand` and `$orderby` in the same query, only the parent entities are sorted. Entities expanded through 1:n navigation properties aren't sorted. For example, in the following query tries to expand and sort the proxy users:

```
https://<hostname>/odata/v2/User?$format=JSON&$select=userId,username,proxy/
userId,proxy/username&$expand=proxy&$s=proxy/userId eq 'admin'&$orderby=proxy/
userId desc
```

Notice in the expanded results, the proxy users are not sorted in descending order by `userId`:

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/User('103004')",
          "type": "SFOData.User"
        },
        "userId": "103004",
        "username": "vwagner",
        "proxy": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<hostname>/odata/v2/User('admin')",
                "type": "SFOData.User"
              },
              "userId": "admin",
              "username": "admin"
            },
            {
              "__metadata": {
                "uri": "https://<hostname>/odata/v2/User('sfadmin')",
                "type": "SFOData.User"
              },
              "userId": "sfadmin",
              "username": "sfadmin"
            }
          ]
        }
      }
    ]
  }
}
```

```
}  
}
```

[\\$expand \[page 70\]](#)

5.5.3 Pagination

The OData API provides several pagination options for query results.

A single OData HTTP `GET` request can return at most 1,000 records. This is reasonable because most HTTP clients have a timeout limit of 2 - 5 minutes. They do not allow transactions to wait more than that. A request running longer than the limit gets an HTTP timeout error. Therefore, it is often required to tune complex queries and lower the data size for them to complete within the timeout restriction.

Pagination limits the maximum size of a query response to 1,000 records. The OData standard provides a ' `__next` ' link in your query response if there are more results in the database.

SAP SuccessFactors HCM suite OData API provides several pagination options for you to choose from. In this document, you'll find out how each pagination mechanism works, what are their advantages and disadvantages, and where to use which.

⚠ Restriction

Pagination only works for entity sets. Function imports do not support pagination.

[Client-Side Pagination \[page 83\]](#)

Client-side pagination uses query options on the client side to create an offset that restricts the amount of data returned from the server.

[Server-Side Pagination \[page 85\]](#)

Unlike client-side pagination, where the pagination is controlled by client-specified parameters, server-side pagination is controlled on the server side.

[How Do I Choose? \[page 90\]](#)

[Custom Page Size \[page 91\]](#)

The default and maximum page size for a paginated query is 1000 items. You can customize the page size by setting a different number with parameter `customPageSize`.

Parent topic: [Query Operations \[page 59\]](#)

Related Information

[Query with Key Predicate \[page 59\]](#)

[System Query Options \[page 60\]](#)

5.5.3.1 Client-Side Pagination

Client-side pagination uses query options on the client side to create an offset that restricts the amount of data returned from the server.

A client-side pagination query can be made using the following URI parameters:

- The `$top` parameter indicates the number of records to return in the batch. The default and maximum number is 1,000 records.
- The `$skip` parameter indicates the number of records in the full data set to skip before fetching data.

For example, a query with `$skip=2000&$top=500` returns the fifth page of data where the page size is 500.

Note

Client-side pagination doesn't guarantee that every page returns the exact number of records as you specified in the `$top` parameter because there might be dirty data and post-business rule validations might apply. This doesn't mean that the data is lost. The total number of records in the entire data set is not impacted. To avoid data issues, add an `$orderby` parameter to your query.

Here's a summary of the advantages and disadvantages of client-side pagination:

Advantages	Disadvantages
<ul style="list-style-type: none">• Faster initial page load• It works well with SAP UI5 list and table controls to fetch records on demand. UI5 automatically changes the <code>\$skip</code> value in order to scroll through the data set.• It allows reverse scrolling by decreasing <code>\$skip</code> values. This allows UI controls to avoid buffering all data as the user scrolls up and down.	<ul style="list-style-type: none">• Query rerun for each page For each page, the query is re-executed and then moves forward through the data set to reach the specified <code>\$skip</code> value. Not only is this inefficient but also it can lead to unstable results. The data set could be changing due to simultaneous creating, updating, or deleting of the data.• Potential duplicates If a record is inserted on a prior page after it has been read, it shifts the data set to the right, resulting the last record from the previous page to be pushed into the current page. This causes the page to be read again because the <code>\$skip</code> value of the current page is one record too small, resulting in duplicates in the total data set. You can avoid this issue using <code>\$orderBy=createdDateTime</code> to push newly created records to the end of the data set.• Potential data loss If a record is deleted from a prior page after it has been read, it shifts the data set to the left. The first record of the current page is lost because the <code>\$skip</code> value of the current page is one record too large. There's no good workaround when dealing with concurrent hard deletes from the data set. Note these potential data loss issues make "last modified since" queries especially unreliable. If a record is lost in a query, it can only be picked up by a later attempt after it's modified.

Parent topic: [Pagination \[page 82\]](#)

Related Information

[Server-Side Pagination \[page 85\]](#)

[How Do I Choose? \[page 90\]](#)

[Custom Page Size \[page 91\]](#)

5.5.3.2 Server-Side Pagination

Unlike client-side pagination, where the pagination is controlled by client-specified parameters, server-side pagination is controlled on the server side.

SAP SuccessFactors offer two types of server pagination: cursor-based pagination and snapshot-based pagination. You can specify the pagination method in the query by adding the parameter `&paging=cursor` or `&paging=snapshot`.

Both types of pagination return a `__next` parameter at the end of each query response that contains a `$skiptoken` value indicating the next page of data. Here are two examples of the `__next` link:

- Sample response in Atom format:

```
<link rel="next" href="https://<hostname>/odata/v2/User?
$skiptoken=eyJzdGFydFJvdYI6MTAwMCIwZW5kUm93IjoyMDAwfQ%3D%3D"></link>
```

⚠ Caution

Do not change the URL in the `__next` link. A modified URL can lead to unexpected results.

In the Atom format query responses, the ampersand "&" is automatically encoded as "&". If you choose Atom as the format of your query response and the `__next` URL contains an ampersand, the link doesn't work because the server doesn't recognize "&". You must decode the link before opening it. Alternatively, you can choose JSON as the response format.

- Sample response in JSON format:

```
"__next" : "https://<hostname>/odata/v2/User?
$format=JSON&$skiptoken=eyJzdGFydFJvdYI6MTAwMSwiZW5kUm93IjoyMDAxfQ%3D%3D"
```

[Cursor-based Pagination \[page 85\]](#)

[Snapshot-Based Pagination \[page 86\]](#)

Snapshot-based pagination is a server-side pagination that works by keeping a list of all business keys of the data set on the server.

Parent topic: [Pagination \[page 82\]](#)

Related Information

[Client-Side Pagination \[page 83\]](#)

[How Do I Choose? \[page 90\]](#)

[Custom Page Size \[page 91\]](#)

5.5.3.2.1 Cursor-based Pagination

Cursor-based pagination maintains a database "cursor" on the server throughout pagination HTTP requests. The cursor represents a pointer to the start of the next page in the full data set. This is enabled using the

`&paging=cursor` parameter. The server uses a `$skiptoken` value to continue pagination at the data set location indicated by the cursor. The query is processed by the database for the first request. Requests for subsequent pages reuse the query by accessing data using the cursor.

Note

Currently, cursor-based pagination is only supported in Employee Central EmpJob entity, User entity, MDF Generic Objects, and most EC Foundation Objects.

Below is a summary of the advantages and disadvantages of cursor-based pagination:

Advantages	Disadvantages
<ul style="list-style-type: none">Cursor-based pagination is faster than client offset pagination because the database query is only executed when the first page is requested. Subsequent pages are fetched from the location indicated by the <code>\$skiptoken</code> value.It will not suffer data loss and duplication issues exhibited by client offset pagination.	<ul style="list-style-type: none">Sorting is not supported. The <code>\$orderby</code> parameter cannot be used. An error will occur if it is attempted.Filter is not supported for MDF-based entities. This includes Position, custom Generic Objects, and entities for MDF-based features such as Time, Benefits, CRM, etc. It can only be used for full extracts and does not support "last modified since" delta queries.It does not support going backwards in the data set, making it not the ideal choice for UI consumption where UI5 control binding may require scrolling backwards for data not buffered in the control.

Parent topic: [Server-Side Pagination \[page 85\]](#)

Related Information

[Snapshot-Based Pagination \[page 86\]](#)

5.5.3.2.2 Snapshot-Based Pagination

Snapshot-based pagination is a server-side pagination that works by keeping a list of all business keys of the data set on the server.

During the first page request, a "snapshot" or list of all the business keys is created after executing the query on the base entity. Query option `$filter` is processed to filter the full data set and `$orderby` is executed to sort the full data set. Subsequent pages are fetched by selecting the set of business keys and fetching each record based on these keys.

For non-MDF based entities, you can enable snapshot-based pagination by adding parameter `&paging=snapshot` in a query. Here is an example:

```
/odata/v2/PerPerson?paging=snapshot&$filter=lastModifiedDateTime ge  
datetime'2001-07-01T17:19:28'&$orderby=personId
```

Below is a summary of the advantages and disadvantages of snapshot-based pagination:

Advantages	Disadvantages
<ul style="list-style-type: none">• Snapshot-based pagination can improve the performance of complex queries with large data volumes. For simple queries, consider other pagination options.• It doesn't suffer data loss and duplication issues exhibited by client offset pagination.• It fully supports filtering with <code>\$filter</code> and sorting with <code>\$orderby</code>.• It supports "last modified since" queries for all entity types.	<ul style="list-style-type: none">• Potential first-page timeouts for complex queries. When you execute a query, a snapshot is created during the first page by executing the full query. Therefore, the request of the first page takes longer than subsequent pages. It can lead to potential timeout errors for large data sets with complex filtering, sorting, and expanding options.• Snapshot-based pagination isn't the ideal choice for UI consumption because it doesn't support going backwards in the data set. UI control binding may require scrolling backwards for data not buffered in the control.• Snapshot-based pagination is inefficient for UI consumption. The snapshot is created for the entire data set. If you only view the first few pages, most of the snapshot is wasted.

Important Notes

Before you use snapshot-based pagination in your query, read the following important notes:

- Not all entities support snapshot-based pagination. If you attempt snapshot-based pagination on an entity that doesn't support the feature, the server automatically forces client offset pagination on the query. You can find out which type of pagination is used in the following custom headers of the query response from a non-MDF based entity:
 - If snapshot-based pagination is successful: `X-SF-Paging: snapshot`
 - If client offset pagination is successful as a fallback: `X-SF-Paging: offset`

Note

The custom header information is only available for successful snapshot-based pagination and forced client offset pagination when snapshot-based pagination isn't supported. If an entity is MDF-based, no paging header is returned.

- Querying entities that have multiple business keys can be slow if they aren't optimized for snapshot-based pagination.
- Do not use `&paging=snapshot` together with `$top` or `$skip`.
- A snapshot is deleted after 15 minutes if the next page isn't accessed. In rare cases, a snapshot may be lost on the cache server before the 15-minute limit is reached. In either situation, you need to request the entire snapshot again.

Snapshot-Based Pagination in MDF OData API

We've optimized all MDF entity types for snapshot-based pagination. There are two ways to enable snapshot-based pagination for MDF OData APIs:

- For integration admin users, they are granted with the [Admin access to MDF OData API](#) permission. These users are able to use snapshot-based pagination when querying all MDF OData APIs including their child entities.
- For other scenarios, you can enable snapshot-based pagination for individual MDF OData API in [Admin Center > Manage Data > Object Configuration](#). All API users can use snapshot-based pagination when querying this OData API but this configuration doesn't enable snapshot-based pagination for its child objects.

Although the snapshot-based pagination in MDF OData API is built based on the OData framework, it has its own specific logic and behaviors:

- Filter (`$filter`) and sort (`$orderby`) can only be applied to the first query. Queries to fetch subsequent pages can't be filtered or sorted.
- You can use multiple filter conditions on `lastModifiedDateTime` of the base entity and expanded entities. This applies to all types of navigation in MDF OData entities (excluding MDF Foundation Objects), such as picklist fields and entities with [Valid When](#) and [Composite](#) associations. For example:

```
/odata/v2/Position?paging=snapshot&$filter=parentPosition/lastModifiedDateTime le datetime'2001-07-01T17:19:28' or companyNav/lastModifiedDateTime ge datetime'2001-07-01T17:19:28'
```

Snapshot-Based Pagination in Employee Central OData API

As of 1H 2020 Release, the following Employee Central entities have been optimized for snapshot-based pagination:

- PerPersonal
- EmpJob
- EmpEmployment
- FOLocation
- FOPayGrade
- MDF Foundation Objects

Service Limits for Snapshot-Based Pagination

The following table summarizes the limits we currently have for snapshot-based pagination:

Operation	Default Limit
Maximum number of records expanded in a single query	300,000

Operation	Default Limit
Maximum number of consecutive "bad requests" within 30 minutes	10 (Company user level)
	5 (Entity level)

Expand Limit

The expand limit is intended to prevent excessive resource consumption and ensure better availability and performance for all customers. The default limit for the number of expanded records returned in a snapshot-based pagination query is 300,000. If this limit is reached, an error occurs.

❁ Example

This example query tries to expand a list of users' manager's direct reports:

```
/odata/v2/User?paging=snapshot&$filter=status eq 'T'&$expand=manager/directReports&$select=manager/directReports/userId
```

Under the expand limit, the total number of managers or direct reports expanded by **\$expand=manager/directReports** must not exceed 300,000.

Number of Consecutive "Bad Requests"

Snapshot-based pagination is intended for data sync and integration purposes where you pull data from the first page to the last. However, it often occurs that a user repeatedly requests for the first page of a paginated dataset and never reaches the subsequent pages. These requests are considered as bad requests because they waste server resources and could lead to performance issues.

To protect servers against intended or unintended bad requests, we've introduced a protection mechanism to regulate the usage of snapshot-based pagination. A quota is imposed on the company user level and the entity level to restrict the number of bad requests that can be made within a given period of time:

- The company user-level limit counts the number of consecutive bad requests made on all entities.
- The entity level limit counts the number of consecutive bad requests made on a single entity.

If the limit is reached, the user is blocked for 30 minutes during which the server rejects all subsequent requests and returns an error message in response.

The following table summarizes how this quota works:

Quota	Number of consecutive bad requests allowed within 30 minutes	Block time if the limit is reached
Company user level	10	30 minutes
Entity level	5	30 minutes

ⓘ Note

- Multiple bad requests on a single entity also count as one bad request on the company user level.
- Before the limit is reached, using `$skipToken` in the `__next` parameter to request the subsequent pages resets the count.
- If a user is blocked on the entity level, they still can access other entities.
- If a user is blocked on the company user level, they can't access any entities in this company.

❖ Example

You have made three bad requests on three different entities a, b, and c, and another two bad requests on entity d, the counts of consecutive bad requests are:

- Company user level: 4
- Entity level:
 - Entity a: 1
 - Entity b: 1
 - Entity c: 1
 - Entity d: 2

If you request for the second page of entity d now, the counts change to:

- Company user level: 0
- Entity level:
 - Entity a: 1
 - Entity b: 1
 - Entity c: 1
 - Entity d: 0

Related Information

[Cursor-based Pagination \[page 85\]](#)

5.5.3.3 How Do I Choose?

As a developer, you can choose among the different types of pagination based on their advantages and disadvantages. Here are our recommendations:

- Always use client offset pagination for UI consumptions. This is the only supported method on UI.
- Cursor-based pagination and snapshot-based pagination are recommended for integration use cases.
- Only use snapshot-based pagination for complex queries with large data volume, for example, a query that has complex sorting, filtering, and expanding options.
- We recommend that you tune your queries when you use snapshot-based pagination. If you have problems with first page performance for extremely large data sets, switch to cursor-based pagination if applicable.

[Server-Side Pagination \[page 85\]](#)

[Custom Page Size \[page 91\]](#)

5.5.3.4 Custom Page Size

The default and maximum page size for a paginated query is 1000 items. You can customize the page size by setting a different number with parameter `customPageSize`.

You can use `customPageSize` for both client and server paginations. Here are two examples:

Setting the page size to 50 in a client pagination query:

```
https://<hostname>/odata/v2/Photo?$format=JSON&$top=500&$skip=200&customPageSize=50
```

Setting the page size to 50 in a snapshot-based server pagination query:

```
https://<hostname>/odata/v2/Photo?$format=JSON&paging=snapshot&customPageSize=50
```

Note

The custom page size must be smaller than 1000. Page size larger than 1000 is ignored.

5.6 Edit Operations

Learn how edit operations work in SAP SuccessFactors HCM suite OData API.

Edit operations include insert, update (replace/merge), upsert (insert/update), and delete.

[Insert \[page 92\]](#)

You can use the insert operation to create an entry.

[Merge \[page 93\]](#)

[Replace \[page 94\]](#)

[Upsert \[page 95\]](#)

[Delete \[page 104\]](#)

[Edit Parameters \[page 105\]](#)

A list of common parameters and examples for edit operations.

5.6.1 Insert

You can use the insert operation to create an entry.

The insert operation uses HTTP method `POST` to create an entry. In an insert request, you must specify the name of the API in the URI.

Here is an example of an insert request and response.

Request:

Operation	Insert
HTTP Request	POST
URI	<code>https://<API-Server>/odata/v2/User</code>
Payload	<pre>{ "__metadata": { "uri": "User('paulchris')" }, "username": "paulchris", "password": "pwd", "hireDate": "/Date(978307200000)/", "gender": "M", "status": "active", "userId": "paulchris", "firstName": "Paul", "lastName": "Chris", "email": "paulchris@bestrun.com", "timeZone": "PST", "manager": { "__metadata": { "uri": "User('kevinsmith')" }, "username": "kevinsmith", "password": "pwd", "hireDate": "/Date(978307200000)/", "gender": "M", "status": "active", "userId": "kevinsmith", "firstName": "Kevin", "lastName": "Smith", "email": "kevinsmith@bestrun.com", "department": "Retail Banking", "timeZone": "PST" } }</pre>

Response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/User('paulchris')",
      "type": "SFOData.User"
    },
    "username": "paulchris",
    "password": "pwd",
    "hireDate": "/Date(978307200000)/",
    "gender": "M",
    "status": "active",
    "userId": "paulchris",
    "firstName": "Paul",
    "lastName": "Chris",
    "email": "paulchris@bestrun.com",
    "timeZone": "PST",
    "manager": {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/User('kevinsmith')",
        "type": "SFOData.User"
      },
      "username": "kevinsmith",
      "password": "pwd",
      "hireDate": "/Date(978307200000)/",
      "gender": "M",
      "status": "active",
      "userId": "kevinsmith",
      "firstName": "Kevin",
      "lastName": "Smith",
      "email": "kevinsmith@bestrun.com",
      "department": "Retail Banking",
      "timeZone": "PST"
    }
  }
}
```

[Replace \[page 94\]](#)

[Upsert \[page 95\]](#)

[Delete \[page 104\]](#)

[Edit Parameters \[page 105\]](#)

5.6.2 Merge

In certain cases, you might want to do an incremental update without replacing all the content of a data entity. To avoid overloading the `PUT` HTTP method, OData offers the merge operation to update a record. A merge request

updates only the properties provided in the request body, and leaves the data not mentioned in the request body in its current state.

A merge operation request is delivered using the `POST` HTTP method with special header `x-http-method`, as shown in the example below. In the request payload, you only include the fields you want to update.

HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/ User('ExistingUser')</code>
Headers	<code>x-http-method: MERGE</code>
Payload	<pre>{ "email": "newmail@bestrun.com" }</pre>

A successful operation returns status 200 OK with no payload.

For merging data that includes navigation properties, see the examples in [Updating Links \[page 114\]](#).

[Replace \[page 94\]](#)

[Upsert \[page 95\]](#)

[Delete \[page 104\]](#)

[Edit Parameters \[page 105\]](#)

5.6.3 Replace

The replace operation updates an existing record with the fields specified in the request payload and resets all other fields to their default value. In a replace request, you use the `PUT` HTTP method and identify the record to be updated by passing the key predicate in the request URI. Unlike the merge operation, you must provide all required fields in the request payload.

The replace request returns status 204 (No Content) to indicate success. No response body is returned.

The following table shows a sample replace request:

Operation	Replace
HTTP Method	PUT

URI

https://<API-Server>/odata/v2/
User('ExistUser')

Payload

```
{
  "__metadata": {
    "uri": "User('ExistUser')"
  },
  "username": "ExistUser",
  "password": "pwd",
  "hireDate": "/Date(978307200000)/",
  "gender": "M",
  "status": "active",
  "userId": "ExistUser",
  "firstName": "Paul",
  "lastName": "Chris",
  "email": "user@bestrun.com",
  "department": "Retail Banking",
  "timeZone": "PST",
  "hr": {
    "__metadata": {
      "uri": "User('HRUser')"
    }
  },
  "manager": {
    "__metadata": {
      "uri": "User('OldManager')"
    }
  }
}
```

[Merge \[page 93\]](#)

[Upsert \[page 95\]](#)

[Delete \[page 104\]](#)

[Edit Parameters \[page 105\]](#)

5.6.4 Upsert

The `upsert` operation is a custom function import to update or insert records. If the record specified in payload doesn't exist, the server inserts (creates) a new record; if a record exists, the upsert operation updates the record. You can use upsert to batch insert/update and inline-edit records. You can invoke the upsert operation using the HTTP method `POST`.

→ Remember

Any invalid property value leads to the failure of upserting a record.

The failure in upserting one record doesn't affect other records.

If business keys are provided in the request, they also appear in failed response.

For effective-dated entities, the failure of upserting one time slice causes all other time slices of the same external code to fail. See example 2 for more information.

5.6.4.1 HTTP Response Status Codes for Upsert

Depending on the request, the upsert operation returns the following values in the `httpCode` field of the response:

HTTP Code	Result	Sample Code
200	Successful.	<pre>{ "key": "newuser", "status": "OK", "editStatus": "UPSERTED", "message": null, "index": 0, "httpCode": 200, "inlineResults": null }</pre>

HTTP Code	Result	Sample Code
201	Successful. New record inserted.	<pre>{ "key": "newuser", "status": "OK", "editStatus": "INSERTED", "message": null, "index": 0, "httpCode": 201, "inlineResults": null }</pre>
204	Successful. An existing record has been updated.	<p>↔ Sample Code</p> <pre>{ "key": "cgrant", "status": "OK", "editStatus": "UPDATED", "message": null, "index": 1, "httpCode": 204, "inlineResults": null }</pre>
400	Failed. The request couldn't be understood by the server due to malformed syntax. Check the message field for detailed error information.	<pre>{ "key": null, "status": "ERROR", "editStatus": null, "message": "bad valueString ['AnotherManager'] as part of keyString ['AnotherManager']", "index": 1, "httpCode": 400, "inlineResults": null }</pre>
500	Failed. The request couldn't be processed due to unexpected server error.	<pre>{ "key": null, "status": "ERROR", "editStatus": null, "message": "Internal server error", "index": 0, "httpCode": 500, "inlineResults": null }</pre>

5.6.4.2 Example 1: Create and Update Users in One Upsert Request

The following code sample shows an upsert request that creates a new user, updates an existing user, and updates the manager of the existing user inline.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload

```
[
  {
    "__metadata": {
      "uri": "User('NewUser')"
    },
    "username": "NewUser",
    "password": "pwd",
    "hireDate": "/"
Date(978307200000)/",
    "gender": "M",
    "status": "active",
    "userId": "NewUser",
    "firstName": "Paul",
    "lastName": "Chris",
    "email": "user@bestrun.com",
    "department": "Retail Banking",
    "timeZone": "PST",
    "hr": {
      "__metadata": {
        "uri": "User('HRUser')"
      }
    },
    "manager": {
      "__metadata": {
        "uri":
"User('OldManager')"
      }
    }
  },
  {
    "__metadata": {
      "uri": "User('ExistUser')"
    },
    "username": "ExistUser",
    "password": "pwd",
    "hireDate": "/"
Date(978307200000)/",
    "gender": "M",
    "status": "active",
    "userId": "ExistUser",
    "firstName": "Chris",
    "lastName": "Paul",
    "email": "user@bestrun.com",
    "department": "Retail Banking",
    "timeZone": "PST",
    "hr": {
      "__metadata": {
        "uri": "User('HRUser')"
      }
    },
    "manager": {
      "__metadata": {
        "uri":
"User('OldManager')"
      },
      "username": "OldManager",
      "password": "pwd",
      "hireDate": "/"
Date(978307200000)/",
      "gender": "F",
      "status": "active",
      "userId": "OldManager",
      "firstName": "Paul",
      "lastName": "Chris",
      "email": "user@bestrun.com",
```

```

    "department": "Retail
Banking",
    "timeZone": "PST",
    "hr": {
      "__metadata": {
        "uri":
"User('HRUser')"
      }
    },
    "manager": {
      "__metadata": {
        "uri":
"User('AnotherManager')"
      }
    }
  }
}
]

```

Response

The operation returns a response body indicating all upsert results:

```

{
  "d": [
    {
      "key": "NewUser",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": null,
      "index": "0",
      "httpCode": 201,
      "inlineResults": null
    },
    {
      "key": "ExistUser",
      "status": "OK",
      "editStatus": "UPDATED",
      "message": null,
      "index": "1",
      "inlineResults": [
        {
          "results": [
            {
              "key": "OldManager",
              "status": "OK",
              "editStatus": "UPDATED",
              "message": null,
              "index": "0",
              "httpCode": 204,
              "inlineResults": null
            }
          ],
          "inlineProperty": "manager"
        }
      ]
    }
  ]
}

```

Parent topic: [Upsert \[page 95\]](#)

Related Information

[HTTP Response Status Codes for Upsert \[page 96\]](#)

[Example 2: Upsert Multiple Records of an Effective Dated Entity \[page 101\]](#)

[Example 3: Get a Faster Upsert Response by Specifying Entity Names in URI \[page 103\]](#)

5.6.4.3 Example 2: Upsert Multiple Records of an Effective Dated Entity

You can create historical information of an effective-dated record by upserting multiple time slices of the same external code in one request. Note that if one of these time slices fails, all other time slices of the same external code fail.

Request

In this example, the date format in the first time slice is incorrect.

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload

```
[{
  "__metadata":{
    "uri":"cust_TestObject(effectiveStartDate=datetime'2019-06-01T00:00:00',externalCode='SO-004')",
    },
    "externalCode":"SO-005",
    "effectiveStartDate":"/Date(1559347ABC)/",
    "cust_Category":"Cat A"
  },
  {
    "__metadata":{
      "uri":"cust_TestObject(effectiveStartDate=datetime'2019-07-01T00:00:00',externalCode='SO-004')",
      },
      "externalCode":"SO-005",
      "effectiveStartDate":"/Date(1561939200000)/",
      "cust_Category":"Cat B"
    },
    {
      "__metadata":{
        "uri":"cust_TestObject(effectiveStartDate=datetime'2019-08-01T00:00:00',externalCode='SO-004')",
        },
        "externalCode":"SO-005",
        "effectiveStartDate":"/Date(1564617600000)/",
        "cust_Category":"Cat C"
      }
    }
  ]
```

Response

The response shows ERROR status for the first time slice and ACCEPTED for the other two. All three time slices have failed.

```
{
  "d": [
    {
      "key": null,
      "status": "ERROR",
      "editStatus": null,
      "message": "Illegal DateTime value in JSON format: /Date(1559347ABC)/. Please follow the standard format: \"/Date(<ticks>)/\", <ticks> = number of milliseconds since midnight Jan 1, 1970.       "editStatus": null,
      "message": null,
      "index": 2,
      "httpCode": 202,
      "inlineResults": null
    }
  ]
}

```

Parent topic: [Upsert \[page 95\]](#)

Related Information

[HTTP Response Status Codes for Upsert \[page 96\]](#)

[Example 1: Create and Update Users in One Upsert Request \[page 98\]](#)

[Example 3: Get a Faster Upsert Response by Specifying Entity Names in URI \[page 103\]](#)

5.6.4.4 Example 3: Get a Faster Upsert Response by Specifying Entity Names in URI

When you start to make API calls, your first upsert operation tries to download the full set of OData metadata from the server and stores it in cache. Subsequent API calls use the cached metadata until it's refreshed. Due to its large size, downloading the full metadata can be time consuming. To get a faster response, you can explicitly include the entities to be upserted in the URI so that only the metadata of these entities are downloaded.

To do this, you include the entity names in the URI, separated by comma.

Note

If you want to inline edit an entity, you also need to include it in the URI.

This example shows how to create an activity for a user. In the request URI, only the metadata of the necessary entities are specified.

Request URI:

```
https://<API-Server>/odata/v2/User,Activity,ActivityStatus/upsert
```

Request Payload:

```

{
  "__metadata": {
    "uri": "Activity"
  },
  "activityName": "Test Activity",
  "activityStatusNav": {

```

```

    "__metadata":{
      "uri":"ActivityStatus"
    },
    "activityStatusId":"high",
    "colorRGBCode":"#a71927"
  },
  "subjectUserIdNav":{
    "__metadata":{
      "uri":"User('cgrant')"
    }
  }
}

```

[Example 2: Upsert Multiple Records of an Effective Dated Entity \[page 101\]](#)

5.6.5 Delete

The delete operation deletes an entry. In a delete request, you use the `DELETE` HTTP method and specify the entry to be deleted by passing the key predicate in the request URI.

Note

There are two types of delete operations: hard delete and soft delete. A hard delete permanently removes an entry from the database while a soft delete marks the entry as deleted. Soft deleted entries can be accessed with certain tools, for example, an audit report.

In Employee Central, soft deleted entries can even be queried if the instance is configured as such. For more information, see [Expanded Entities: Handling Deleted Objects](#).

Here's an example of a delete operation:

Operation	Delete
HTTP Method	<code>DELETE</code>
URI	<code>https://<API-Server>/odata/v2/ToDoEntryV2(18234M)</code>

A successful delete operation returns status 200 `OK` with no response payload.

5.6.6 Edit Parameters

A list of common parameters and examples for edit operations.

The parameters in this section apply to multiple or all SAP SuccessFactors HCM suite OData API entities unless otherwise specified in the topic. For entity-specific parameters, refer to the individual API reference topics.

Parent topic: [Edit Operations \[page 91\]](#)

Related Information

[Insert \[page 92\]](#)

[Merge \[page 93\]](#)

[Replace \[page 94\]](#)

[Upsert \[page 95\]](#)

[Delete \[page 104\]](#)

5.6.6.1 purgeType

`purgeType` is an optional parameter that determines whether an incremental or full update will be performed on an entity.

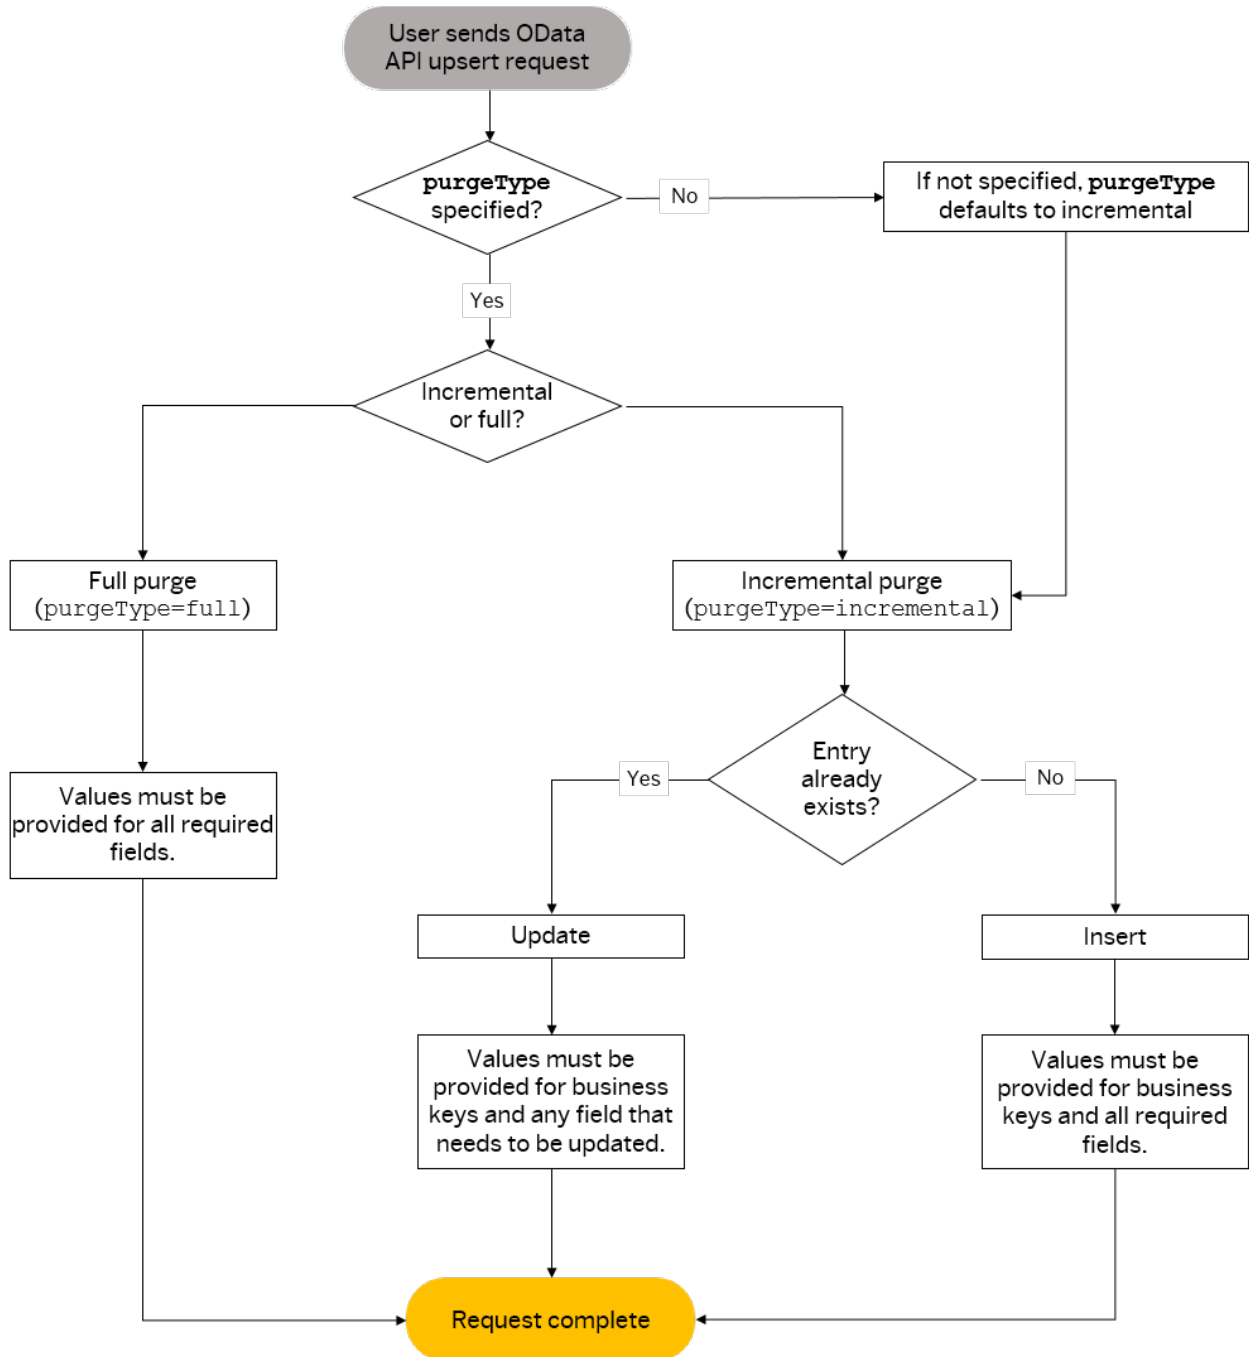

Parameter Values

Value	Description
<code>incremental</code> (default)	<p>The upsert operation purges and replaces only the data specified in the request payload.</p> <p>The default upsert behavior is incremental purge unless you specify <code>purgeType=full</code> in the request.</p>
<code>full</code> or <code>fullPurge</code>	<p>The upsert operation purges all existing data of the entry and creates new data specified in the request payload.</p> <div data-bbox="721 898 1425 1129"><p>⚠ Caution</p><p>If there are multiple time slices for the given record, the upsert operation with <code>purgeType=full</code> deletes all the time slices and creates new ones specified in the request. If you want to keep a particular time slice, make sure to include all of its data in the request payload. If some time slices are missing, then import engine will delete them.</p></div>
<code>record</code>	<p>Same behavior as incremental purge.</p> <p>This type of incremental purge is available only for MDF entities and the <code>User</code> entity.</p>

Mandatory Field Governance During Upsert

Since a full purge erases all existing data of an entry and creates new data, it follows the mandatory fields governance of the entity. Whether an entry exists or not in the database, you must provide all required fields in your

payload to be able to successfully upsert the entry. The following diagram helps you understand the purge behaviors of OData API:

5.6.6.2 strictTransactionIsolate

`strictTransactionIsolate` is an upsert parameter for determining if partial upsert applies during multiple-record upserts.

Parameter Values

⚠ Caution

The `strictTransactionIsolate` parameter is used to ensure data integrity during upsert. Using the parameter could result in performance degradation, the extent of which depends on the single record processing time and the batch size.

Value	Description
<code>false</code> (default)	Standard upsert behavior: one failed record during upsert causes all records to fail.
<code>true</code>	<ul style="list-style-type: none">When you upsert multiple records, the upsert status of one record doesn't affect the others.When you upsert multiple records in a <code>\$batch</code> request, if one record fails, the entire changeset rolls back.

Use Case

The value of `strictTransactionIsolate` can be applied in the following use cases:

- Multiple record upserts
- Upserts of entities that don't support full purge

If you upsert a single record, this parameter is ignored.

5.6.6.3 enableUpsertResponseExtensionInChangeset

Use the `enableUpsertResponseExtensionInChangeset` parameter to control whether all upsert error messages are returned in a `ChangeSet`.

Parameter Values

Value	Description
<code>false</code> (default)	When upsert errors occur in a batch <code>ChangeSet</code> , only the first error is returned.
<code>true</code>	When upsert errors occur in a batch <code>ChangeSet</code> , all errors are returned.

Use Case

In this example, the batch request contains an upsert operation that tries to create two users. In the upsert payload, neither user ID matches the key, so the upsert operation fails.

Request Payload

```
--batch_202010071357
Content-Type: multipart/mixed; boundary=changeset_202010071357
Content-Length: 100
--changeset_202010071357
Content-Transfer-Encoding: binary
Content-Type: application/http
POST upsert HTTP/1.1
Content-Type: application/json;charset=utf-8
accept:application/json
[
  {
    "__metadata": {
      "uri": "User('user1')"
    },
    "username": "content1",
    "password": "content1",
    "hireDate": "/Date(978307200000)/",
    "status": "active",
    "userId": "content1",
    "firstName": "content1",
    "lastName": "example1@abc.com",
    "department": "test",
    "timeZone": "PST"
  },
  {
    "__metadata": {
      "uri": "User('user2')"
    },
    "username": "content2",
    "password": "content2",
    "hireDate": "/Date(978307200000)/",
```

```

    "status": "active",
    "userId": "content2",
    "firstName": "content2",
    "lastName": "example2@abc.com",
    "department": "test",
    "timeZone": "PST"
  }
]
--changeset_202010071357--

--batch_202010071357--

```

Compare the following two responses when the parameter is set to different values.

Example request through URI /odata/v2/\$batch or /odata/v2/\$batch?

enableUpsertResponseExtensionInChangeset=false:

```

--batch_a89da8c8-82e1-4171-ac21-e69e474666e1
Content-Type: application/http
Content-Transfer-Encoding: binary
HTTP/1.1 500 Internal Server Error
Content-Type: application/json;charset=utf-8
DataServiceVersion: 1.0
X-SF-Record-Count-Recursive: 0
Content-Length: 265
{
  "error": {
    "code": "COE_GENERAL_SERVER_FAILURE",
    "message": {
      "lang": "en-US",
      "value": "ChangeSet index 1 - Key property (User/userId) doesn't match
the key in the __metadata uri; Key property (User/userId) doesn't match the key in
the __metadata uri"
    }
  }
}
--batch_a89da8c8-82e1-4171-ac21-e69e474666e1--

```

Example request through URI /odata/v2/\$batch?enableUpsertResponseExtensionInChangeset=true:

```

--batch_fe845a0f-d7be-42dd-8cdb-bc4096abef2f
Content-Type: application/http

[Batch Operations \[page 121\]](#)

5.7 Working with Links

You can use the `$links` system option to query, create, edit, and delete associations between OData entities.

The `$links` operation is a system-defined OData option that can be used to address associations between OData entities. An association is a relationship between one entity and another. The basic rules for addressing associations are shown in the following figure:

Note

Key predicate of the navigation property can be required, optional, or empty depending on the type of request and association.

For example, the URI below can be used to query a users manager:

```
https://<API-Server>/odata/v2/User('cgrant')/$links/manager
```

- `https://<API-Server>/odata/v2/User('cgrant')` identifies user with user ID **cgrant**.
- The `manager` navigation property describes the relationship of this user

[Querying Links \[page 112\]](#)

You can query links using the `$links` system option.

[Creating Links \[page 113\]](#)

You can associate one entity to another by creating links.

[Updating Links \[page 114\]](#)

You can update existing links by either replacing or merging them.

[Deleting Links \[page 116\]](#)

You can remove entity associations by deleting the links.

[Working with Links in Effective-Dated Entities \[page 117\]](#)

Special rules follow when you create and edit links for effective-dated entities, such as MDF entities.

5.7.1 Querying Links

You can query links using the `$links` system option.

To query the relationships between entities using `$links`:

```
https://<API-Server>/odata/v2/User('cgrant')/$links/matrixManager
```

The response returns the URI of the navigation property `manager`, not the entry itself:

```
<?xml version="1.0" encoding="utf-8"?>
<link xmlns="http://schemas.microsoft.com/ado/2007/08/dataservices">
  <uri>https://<API-Server>/odata/v2/User('manager1')</uri>
  <uri>https://<API-Server>/odata/v2/User('manager2')</uri>
</link>
```

You can also use `$format` to specify the response format:

```
https://<API-Server>/odata/v2/User('cgrant')/$links/matrixManager
```

Example response:

```
{
  "d": {
    "results": [
      {
        "uri": "https://<API-Server>/odata/v2/User('manager1') "
      },
      {
        "uri": "https://<API-Server>/odata/v2/User('manager2') "
      }
    ]
  }
}
```

[Updating Links \[page 114\]](#)

[Deleting Links \[page 116\]](#)

[Working with Links in Effective-Dated Entities \[page 117\]](#)

5.7.2 Creating Links

You can associate one entity to another by creating links.

You can create associations between entities by referencing one entity during the creation or modification of another, or by explicitly issuing a `POST` request against the URL of the `$links` option. The request must have the new URI in the request body following the appropriate format for stand-alone `$links` options in XML or JSON.

The example below adds a new matrix manager by creating a link between the user and the manager through navigation property `matrixManager`:

HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/ User('cgrant')/\$links/matrixManager</code>
Payload	ATOM: <pre><uri xmlns="http://schemas.microsoft.com/ado/ 2007/08/dataservices"> https://<api-server>/v2/User('EYtest02') </uri></pre> JSON: <pre>{ "uri": "User('manager2')" }</pre>

Different rules apply when you create links for MDF entities and non-MDF entities.

Rules for Creating Links for Non-MDF Entities

The following rules apply when you create links between non-MDF entities:

- A new link is always inserted for a 1:n association. If the same link already exists, the `POST` operation returns `204 No Content` without data change.
- The server always performs a replace operation for a 1:1 relationship. For example, if you create a manager link for a user who already has a manager, the new manager replaces the old manager.

Rules for Creating Links for MDF Entities

The following rules apply when you create links between MDF entities (including MDF Foundation Objects):

- You can't create links for MDF Generic Objects with composite type associations.
- A new link is always inserted for a 1:n association. If the same link already exists, the `POST` operation returns `204 No Content` without data change.

- For 1:1 relationship, if a link already exists, the POST operation fails.

Parent topic: [Working with Links \[page 111\]](#)

Related Information

[Querying Links \[page 112\]](#)

[Updating Links \[page 114\]](#)

[Deleting Links \[page 116\]](#)

[Working with Links in Effective-Dated Entities \[page 117\]](#)

5.7.3 Updating Links

You can update existing links by either replacing or merging them.

You use HTTP method PUT to update links between entities.

Replacing Links

You can replace links for 1:1 or 1:n associations using the PUT HTTP method.

- For 1:n associations, you must provide the key in the URI and replace it with the new entry in the request payload:

HTTP Method	PUT
URI	<code>https://<API-server>/odata/v2/ User('cgrant')/\$links/ matrixManager('manager1')</code>
Payload	<pre>{ "uri": "User('manager3')"</pre>

This request replaces **manager1** of user **cgrant** with **manager3**. Note that the user's other matrix manager links aren't impacted.

- For 1:1 associations, you don't provide any key in the URI. You provide only the new link in the request payload. This entry replaces the existing link.

HTTP Method	PUT
-------------	-----

URI	<code>https://<API-server>/odata/v2/ User('cgrant')/\$links/manager</code>
Payload	<pre>{ "uri": "User('manager1')" }</pre>

Note

For non-MDF entities, you can also use POST to replace a 1:1 link. It gets you the same result as PUT. For MDF entities, POST can only be used when there's no existing link.

Merging Links

You can use POST requests to add a new link to a 1:n relation. When you add a new link, it's merged with the existing links.

The example below adds a new matrix manager **manager3** to user **cgrant**.

HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/ User('cgrant')/\$links/matrixManager</code>
Payload	<pre>{ "uri": "User('manager3')" }</pre>

Parent topic: [Working with Links \[page 111\]](#)

Related Information

[Creating Links \[page 113\]](#)

[Deleting Links \[page 116\]](#)

[Working with Links in Effective-Dated Entities \[page 117\]](#)

5.7.4 Deleting Links

You can remove entity associations by deleting the links.

Using a `DELETE` request with the `$links` option, you can remove the association between two entries. The business key of the source and target entry must be provided in the URI. Upon success, the operation returns status `204 No Content`. No response body is returned.

Note

You can't use this API to delete proxy users. To delete proxy assignments using other options, see the Related Information section.

For example, the following request deletes the link between user `cgrant` and its matrix manager:

HTTP Method	DELETE
URI	<code>https://<API-Server>/odata/v2/ User('cgrant')/\$links/ matrixManager('manager1')</code>

Rules for Deleting Links of Non-MDF Entities

The following rules apply when you delete links of non-MDF entities:

- Business key is optional if you delete a link in a 1:1 association.
- If you want to delete a single link in a 1:n association, the key must be provided.
- If no key is provided in URI, all links are deleted.

Rules for Deleting Links of MDF Entities (Including MDF Foundation Objects)

The following rules apply when you delete links of MDF entities, including MDF Foundation Objects:

- Regardless of the association type, a business key must be provided.
- You can't delete multiple links in one request.

Parent topic: [Working with Links \[page 111\]](#)

Related Information

[Querying Links \[page 112\]](#)

[Creating Links \[page 113\]](#)

[Updating Links \[page 114\]](#)

5.7.5 Working with Links in Effective-Dated Entities

Special rules follow when you create and edit links for effective-dated entities, such as MDF entities.

Creating Links Between Two Effective-Dated Records

You can use `$links` to create references:

- Between effective-dated records, such as *Valid When* associations, a Picklist field, and Generic Object (GO) field.
- From an effective-dated record to a noneffective-dated record with a *Valid When* association
- From a noneffective-dated record to an effective-dated record with a *Valid When* association

When you create a link between two effective-dated records using `$links`, the following rules apply:

- The `effectiveStartDate` of the source timeslice must be later than the `effectiveStartDate` of the earliest timeslice in the target record. Otherwise, an error occurs. (See Example 1)
- You can only create links for source timeslices that are subsets of the target record. The target timeslice doesn't necessarily have to match the source timeslice. The link is created between the source timeslice and matching target timeslices. (See examples 2 and 3)

Example 1

In this example, you try to link a source entry to a target whose earliest timeslice has an `effectiveStartDate` later than the source record. It leads to an error.

HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/ cust_SourceObject(effectiveStartDate=datet ime '2019-06-01T00:00:00', externalCode='SO- 001')/\$links/cust_TargetNav</code>
Payload	<pre><uri xmlns="http://schemas.microsoft.com/ado/ 2007/08/dataservices"> https://<API-Server>/odata/v2/ cust_TargetObject(effectiveStartDate=dat etime '2019-07-01T00:00:00', externalCode= 'TO-001') </uri></pre>

- Source Record
- Target Record
- Link created

Sample response

```

{
  "error": {
    "code": "COE_GENERAL_BAD_REQUEST",
    "message": {
      "lang": "en-US",
      "value": "[COE0018]Invalid reference '(effectiveStartDate=2019-07-01, externalCode=TO-001)' for valid when association 'cust_TargetNav'."
    }
  }
}

```

Example 2

For the same objects, if you choose a different timeslice in the source entry that has a later effectiveStartDate, the link is created.

HTTP Method	POST
URI	https://<API-Server>/odata/v2/cust_SourceObject(effectiveStartDate=datetime'2019-07-01T00:00:00',externalCode='SO-001')/\$links/cust_TargetNav
Payload	<pre> <uri xmlns="http://schemas.microsoft.com/ado/2007/08/dataservices"> https://<API-Server>/odata/v2/cust_TargetObject(effectiveStartDate=datetime'2019-06-15T00:00:00',externalCode='TO-001') </uri> </pre>

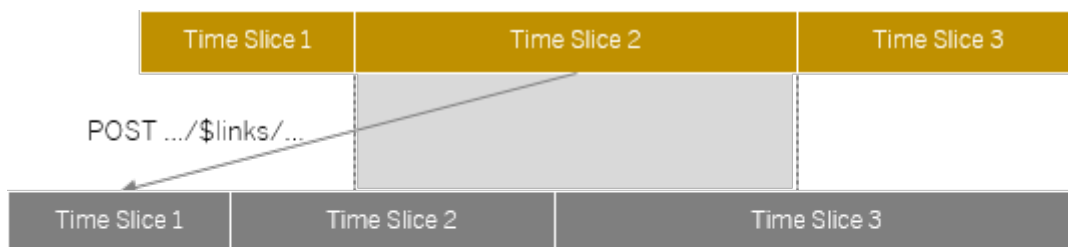

- Source Record
- Target Record
- Link created

A successful response returns status code [204](#) with no content.

Example 3

If the source timeslice is a subset of the target record, you can create links to any timeslice in the target. The link is created between the source timeslice and the matching target timeslices.

HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/cust_SourceObject(effectiveStartDate=datetime'2019-07-01T00:00:00',externalCode='SO-001')/\$links/cust_TargetNav</code>
Payload	<pre><uri xmlns="http://schemas.microsoft.com/ado/2007/08/dataservices"> https://<API-Server>/odata/v2/cust_TargetObject(effectiveStartDate=datetime'2019-05-01T00:00:00',externalCode='TO-001') </uri></pre>

- Source Record
- Target Record
- Link created

Deleting a Link

You can delete links between effective-dated records with `$link`. To delete a link, specify the target key predicate in the URI:

HTTP Method	DELETE
URI	<code>https://<API-Server>/odata/v2/ cust_SourceObject(effectiveStartDate=datetime'2019-07-01T00:00:00',externalCode='SO-001')/\$links/ cust_TargetNav(effectiveStartDate=datetime'2019-05-01T00:00:00',externalCode='TO-001')</code>

Note that you're not allowed to delete a link if:

- The field is required
- It's a required 1:1 association.
- The link you're trying to delete is the last existing link in a required 1:many association.

If you try to delete such a link, an error occurs:

```
{
  "error": {
    "code": "COE_GENERAL_BAD_REQUEST",
    "message": {
      "lang": "en-US",
      "value": "[COE0018]Required field 'cust_TargetObject' cannot be
deleted."
    }
  }
}
```

Creating Links Between Effective-Dated and Non-Effective-Dated Records

You can create links between an effective-dated record and a non-effective-dated record, and vice versa. There are no constraints on effective dates when you create such links.

Parent topic: [Working with Links \[page 111\]](#)

Related Information

5.8 Batch Operations

The OData protocol has introduced the batch operation that can combine multiple requests into a single request. An OData batch request is represented as a multipart MIME v1.0 message, a standard format allowing the representation of multiple parts, each of which may have a different content type, within a single request.

Batch Request Header

Batch requests are submitted as a single POST request to the `/odata/v2/$batch` URI. The request must include a content-type header specifying a content type of "multipart/mixed" and a boundary specification. This is an example for a batch request header:

Sample Code

```
POST /odata/v2/$batch
HOST: localhost
Content-Type: multipart/mixed; boundary=batch_36522ad7-
fc75-4b56-8c71-56071383e77b
```

The batch boundary must follow the pattern `[a-zA-Z0-9_\\-\\. '\\+]{1,70}` and it must not contain any special character in `() < > @ , ; : / " [] ? =`.

Note

The maximum number of requests allowed in a batch request is 180. An error occurs if this number is exceeded.

Batch Request Body

In a batch request, each ChangeSet and query request is represented as a distinct MIME part and is separated by the boundary maker defined in Content-Type. This is an example of a batch request body that includes these operations:

- Query user "admin"
- ChangeSet: Insert a new user
- Replace user "carla"
- Query the attachment.

Sample Code

```
--batch_36522ad7-fc75-4b56-8c71-56071383e77b
Content-Type: application/http
Content-Transfer-Encoding:binary
GET User('admin') HTTP/1.1
--batch_36522ad7-fc75-4b56-8c71-56071383e77b
Content-Type: multipart/mixed; boundary=changeset_77162fcd-b8da-41ac-
a9f8-9357efbbd621
```

```

--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd621
Content-Type: application/http
Content-Transfer-Encoding: binary
POST User HTTP/1.1
Content-Type: application/atom+xml;type=entry
<AtomPub representation of a new User>
--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd621
Content-Type: application/http
Content-Transfer-Encoding: binary
PUT User('carla') HTTP/1.1
Content-Type: application/json
<JSON representation of User carla>
--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd621--
--batch_36522ad7-fc75-4b56-8c71-56071383e77b
Content-Type: application/http
Content-Transfer-Encoding: binary
GET Attachment("invalidAttachmentId") HTTP/1.1
--batch_36522ad7-fc75-4b56-8c71-56071383e77b--

```

Batch Processing

Request parts in a batch are processed sequentially and independently of each other. A request part can be a query request or a ChangeSet. The OData batch process follows these rules:

- All operations in a single ChangeSet unit follow the all-or-nothing rule. Failure of a single unit causes the entire ChangeSet to fail. No partial changes are applied.
- Upsert operations in a ChangeSet also follow the all-or-nothing rule. If multiple records are processed in an upsert operation within a ChangeSet, the failure of one single record causes all other records to fail.
- Each ChangeSet is processed independently. The failure of one ChangeSet doesn't affect others.

Referencing Requests in a Change Set

If there's an insert request in the ChangeSet and the MIME part representing that request includes a Content-ID header, then the new entity that is created by the insert operation can be referenced by subsequent requests within that ChangeSet by referring to the Content-ID value prefixed with a "\$" character:

Sample Code

```

--batch_36522ad7-fc75-4b56-8c71-56071383e77b
Content-Type: multipart/mixed; boundary=changeset_77162fcd-b8da-41ac-
a9f8-9357efbbd621
--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd621
Content-Type: application/http
Content-Transfer-Encoding: binary
POST User HTTP/1.1
Content-Type: application/atom+xml;type=entry
Content-ID: 1
<AtomPub representation of a new User>
--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd621
Content-Type: application/http
Content-Transfer-Encoding: binary
POST $1 /Manager HTTP/1.1
Content-Type: application/atom+xml;type=entry
<AtomPub representation of a new user manager>

```

```
--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd621--  
--batch_36522ad7-fc75-4b56-8c71-56071383e77b--
```

This batch request:

1. Inserts a new User
2. Insert the User's Manager

Batch Response Header

The body of a batch response contains a response for each Query and ChangeSet request that makes up the batch request. The order of responses matches the order of requests. Each response includes a Content-Type header with a value of "application/http", and a and a Content-Transfer-Encoding MIME header with a value of "binary".

Sample Code

```
--batch_36522ad7-fc75-4b56-8c71-56071383e77b  
Content-Type: application/http  
Content-Transfer-Encoding: binary  
HTTP/1.1 200 Ok  
Content-Type: application/atom+xml;type=entry  
Content-Length: ###  
<AtomPub representation of the User entity with EntityKey admin>  
--batch_36522ad7-fc75-4b56-8c71-56071383e77b

Note

For a successful ChangeSet request, the response lists all the request responses included in the ChangeSet. For example, if a ChangeSet has three requests, then the response contains three responses in the ChangeSet body. However, if the ChangeSet fails, then only one response entry, which is the error in the problematic request is displayed. The ChangeSet response is then a non-ChangeSet response because it doesn't have the ChangeSet body.

[Upsert Behavior in a \\$batch ChangeSet \[page 124\]](#)

Learn how upsert works in a \$batch ChangeSet.

[Examples of \\$batch Request Bodies \[page 126\]](#)

Examples of \$batch requests are listed. Please strictly follow the format in the examples including the new lines and spaces.

Related Information

<http://www.odata.org/documentation/odata-version-3-0/batch-processing/> 

5.8.1 Upsert Behavior in a \$batch ChangeSet

Learn how upsert works in a \$batch ChangeSet.

Upsert operations in a \$batch ChangeSet follow the "all-or-nothing" rule. That means, if one record fails to upsert, all other changes will roll back.

Caution

Upsert parameter `strictTransactionIsolate` is ignored in a ChangeSet.

Adding Upsert Parameters

You can add upsert parameters in a \$batch ChangeSet. Here's an example:

```
--batch_202010071357
Content-Type: multipart/mixed; boundary=changeset_202010071357
Content-Length: 100
--changeset_202010071357
Content-Transfer-Encoding: binary
Content-Type: application/http
POST upsert?purgeType=full HTTP/1.1
Content-Type: application/json;charset=utf-8
accept:application/json
<JSON/Atom representation of an upsert operation>
--changeset_202010071357--

--batch_202010071357--
```

Returning All Upsert Errors in a ChangeSet

By default, if errors occur to an upsert operation in a \$batch ChangeSet, only the first error is returned no matter how many entities are in the upsert payload. However, you can use parameter

`enableUpsertResponseExtensionInChangeset` to control whether all error messages of an upsert operation in a `ChangeSet` are returned. To return all upsert error messages, set the parameter to true in the request.

This is an example of the complete upsert errors returned in batch operation:

```
{
  "error": {
    "code": "COE_GENERAL_SERVER_FAILURE",
    "message": {
      "lang": "en-US",
      "value": "ChangeSet index 1 - Upsert error"
    },
    "innererror": {
      "errordetails": [
        {
          "code": "cust_MDF35137/
effectiveStartDate=2000-01-01T00:00:00.000Z,cust_MDF35137/externalCode=P1",
          "message": "Invalid value 'DummyValue' for the Generic Object
field 'cust_gof'.;Invalid Picklist value: 'DummyValue'.;Invalid User ID: 'abc123'.",
          "severity": "error",
          "target": ""
        },
        {
          "code": "cust_MDF35137/
effectiveStartDate=2000-01-01T00:00:00.000Z,cust_MDF35137/externalCode=P1",
          "message": "Invalid value 'DummyValue' for the Generic Object
field 'cust_gof'.;Invalid Picklist value: 'DummyValue'.;Invalid User ID: 'abc123'.",
          "severity": "error",
          "target": ""
        },
        {
          "code": "cust_MDF35137/
effectiveStartDate=2001-01-01T00:00:00.000Z,cust_MDF35137/externalCode=P1",
          "message": "Invalid User ID: 'abc123'.",
          "severity": "error",
          "target": ""
        }
      ]
    }
  }
}
```

6 MDF OData API

This section provides information about MDF OData API entities including MDF Generic Object entities and MDF Foundation Object entities.

When you create a new MDF generic object (GO), you can choose whether you want to expose it to OData API. Once exposed, you can access the object through OData API calls. In this section, we'll introduce what you need to do to expose an MDF object, how to query and edit data through API calls, and what rules you need to follow when accessing MDF OData APIs.

In addition to GO entities, you'll also learn how MDF Foundation Object entities work. MDF Foundation Objects are Employee Central Foundation Objects which have been migrated to MDF and exposed to OData as OData API entities. Many MDF Foundation Objects adopt the same querying and editing behaviors as MDF Generic Objects. For more information, see [MDF Foundation Objects](#).

Before you proceed, make sure you have the basic knowledge of OData API and you're already familiar with configuring an MDF object definition:

- [OData Operations](#)
- [Configuring the Object Definition](#)

6.1 Exposing Custom MDF Objects to OData API

You can expose a custom MDF object to OData API by setting the *API Visibility* field when you create or edit the object definition.

Prerequisites

MDF is enabled for your company and you have the corresponding permissions to configure object definitions. For more information, see the *Enabling MDF* section of the *Implementing the Metadata Framework (MDF)* guide.

Context

The OData API exposes the object definition, field definition, rules, and conditions of an MDF object as OData metadata. This makes it easier for other modules to consume the data.

MDF entities that are associated with more than one parent will be exposed to OData API if one of the parents is exposed. For example, the Job Profile Builder entity makes its child objects exposed as API entities, such as job codes and competencies.

You can use the *API Visibility* field to control whether a custom MDF object is to be exposed to OData API or not, and whether it's editable or read only through API.

Procedure

1. Go to the *Configure Object Definitions* page and choose one of the following options:
 - To create a new object definition, select *Object Definition* in the *Create New* dropdown list.
 - To edit an existing custom object definition, select *Object Definition* in the *Search* dropdown list and type the name of the object definition to search. Click and open the object definition from the result list, and choose **Take Action > Make Correction**.
2. On the *Object Definition* screen, you have the following options in the *API Visibility* field. Choose either *Editable* or *Read Only* to allow OData API access to the object:
 - *Editable* - This option allows you to create and edit object instances through OData API.
 - *Read Only* - This option only allows you to query object instances through OData API.
 - *Not Visible* - The object isn't exposed to OData API.
3. In the *API Sub Version* field, choose the subversion for your object. For more information, see [API Subversioning \[page 131\]](#).
4. Proceed with the rest of the configuration tasks and choose *Save*.

Results

The custom MDF object is now exposed to OData. The OData metadata will be automatically refreshed shortly after and you're able to access the object through the corresponding OData API.

Note

Depending on the frequency of metadata refreshing job scheduled for your instance, the change may not take effect immediately. You can manually refresh the metadata using one of the following approaches:

- Go to **Admin Center > OData Metadata Refresh and Export** and choose *Refresh* to refresh the metadata.
- Send an API request to refresh the metadata:

```
GET https://<API-endpoint-URL>/odata/v2/refreshMetadata
```

6.1.1 API Subversioning

You can control whether you want to expose system fields of an MDF object to the OData API with API subversioning.

An MDF object contains a list of technical system fields. When exposed to OData API, all of them may not be needed. With the API subversioning feature, you can choose to hide these fields in the MDF OData API entity.

Depending on the *MDF system field in API Mode* Provisioning settings for your company, the system fields may be:

- Not exposed for all MDF entities regardless of the *API Sub Version* field setting in the MDF object definition
- Exposed for all MDF entities regardless of the *API Sub Version* field setting in the MDF object definition
- (By default) Dependent on the *API Sub Version* field setting of the MDF object definition

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

In *Configure Object Definitions*, you have the following options in the *API Sub Version* field:

- V1.0: System fields following the rules of the subversion are exposed.
- V1.1: System fields following the rules of the subversion are hidden.
- No Selection: The same as using V1.1.

ⓘ Note

The *API Sub Version* setting takes effect only when the Provisioning setting of MDF system field for API is set to be dependent on it. Otherwise, this field is ignored.

Selecting or changing to an API subversion can affect the metadata of the OData API. As a result, your API request may fail because a nonexisting property. We recommend that you check the metadata of the MDF OData API entity and compare it against your API request as a necessary troubleshooting step.

List of MDF System Fields

The following table lists all MDF system fields and whether they can be removed:

Field Name	Following the rule of subversions	Notes
mdfSystemCreatedBy	Yes	Equivalent to <code>createdBy</code> property in OData
mdfSystemCreatedDate	Yes	Equivalent to <code>createdDateTime</code> property in OData
mdfSystemLastModifiedby	Yes	Equivalent to <code>lastModifiedBy</code> property in OData

Field Name	Following the rule of subversions	Notes
mdfSystemLastModifiedDate	Yes	Equivalent to lastModifiedDateTime property in OData
mdfSystemLastModifiedDateWithTZ	Yes	Equivalent to lastModifiedDateTime property in OData
LastModifiedDateWithTZ	Yes	Equivalent to lastModifiedDateTime property in OData
mdfSystemEntityId	Depends	Exposed when the field name doesn't start with mdfSystem
mdfSystemRecordId	Depends	
<div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p>Note</p> <p>Users can overwrite the system field name during object definition. If the user-defined name doesn't start with mdfSystem, this field is exposed.</p> </div>		
mdfSystemObjectType	Yes	
mdfSystemStatus	Depends	Exposed when the field visibility is set to be visible
mdfSystemStatusNav	Depends	Exposed when the field visibility is set to be visible
mdfSystemRecordStatus	No	This field indicates pending data and won't be removed in OData API
mdfSystemVersionId	Yes	This field indicates a pending history record. Pending history records aren't supported in OData API.
mdfSystemEffectiveStartDate	Yes	This field can be removed when the MDF object isn't effective dated.
mdfSystemEffectiveEndDate	Yes	This field can be removed when the MDF object isn't effective dated.
mdfSystemTransactionSequence	Yes	This field can be removed when the effective dating of the MDF object isn't Multiple Changes Per Day.

6.2 MDF Foundation Object Entities

Employee Central Foundation Objects migrated to the Metadata Framework (MDF).

MDF Foundation Object entities are Employee Central Foundation Objects that have been migrated to the Metadata Framework (MDF) and exposed as OData API entities. MDF Foundation Object entities follow the general rules of MDF OData operations with a few exceptions.

Here's a list of MDF Foundation Object entities:

OData API Entity	MDF Foundation Object
FOBusinessUnit	Business Unit
FOCompany	Legal Entity
FOCostCenter	Cost Center
FODepartment	Department
FODivision	Division
FOJobCode	Job Classification
FOJobClassLocal<Country/Region>	Job Classification <Country/Region>
FOJobFunction	Job Function
FOLegalEntityLocal<Country/Region>	Legal Entity <Country/Region>
FOPayGroup	Pay Group

For more information, see [MDF Foundation Objects](#).

6.3 Data Mapping Between MDF and OData API

This topic contains information about the mapping of MDF objects to the OData API entities.

Each MDF object can be mapped to one OData entity only. Mapping an MDF object to multiple OData entities is not allowed. When an MDF object is exposed to OData API, the code of the MDF object is used as the name of the OData API entity type. In the following sections, you'll find detailed mapping relationships between an MDF object and its corresponding OData API entity.

Note

Composite objects with multiple parents will not be exposed to OData API.

If a parent object is not exposed to OData API, none of its composite children will be exposed regardless of their API visibility settings.

Mapping of General Terms

MDF Object Definition	OData API
Object	Entity Set or Entity Type
Field	Property/Navigation Property
Association	Navigation Property

Mapping of Attributes

The following table shows the mapping relationship between the MDF field/association attributes and OData entity set attributes.

Property Attribute of an OData Entity Type	Attribute of the Corresponding MDF Field/Association	Mapping Rule
Property name	Field/association name	<p>The following rules apply:</p> <ul style="list-style-type: none"> In general, the name of OData property attribute is the same as the attribute name of the MDF object. If an MDF field is linked to another object, or if it's an association, the name appears in OData with the 'Nav' suffix. See the Mapping of Data Types [page 136] section for more details. The following MDF field names are hardcoded and appear "as-is" in OData: <ul style="list-style-type: none"> createdBy createdDateTime lastModifiedBy lastModifiedDateTime
Property type	Field data type	For detailed mapping of data types, see Mapping of Data Types [page 136] .
Nullable	There is no equivalent attribute in MDF.	The <code>sap:nullable</code> property is always true.
Required	Required and Visibility	<p>When the API Visibility of the MDF object is set to Read Only, the values of <code>sap:required</code>, <code>sap:creatable</code>, <code>sap:updatable</code>, and <code>sap:upsertable</code> attributes are always false regardless of the field required and visibility settings.</p> <p>When the API Visibility of the MDF object is set to Editable, these field values correspond to the <i>Required</i> and <i>Visibility</i> attributes of the MDF fields.</p> <p>For a detailed mapping of these attributes, see the table below in Mapping of Edit Attributes.</p>
Creatable	Visibility	
Updatable	Visibility	
Upsertable	Visibility	
Visible	There is no equivalent attribute in MDF.	The <code>sap:visible</code> attribute is always true.
Sortable	There is no equivalent attribute in MDF.	The <code>sap:sortable</code> attribute is always true except for the CLOB-type field and localized property of a translatable field.
Filterable	There is no equivalent attribute in MDF.	The <code>sap:filterable</code> attribute is always true except for the CLOB-type field and localized property of a translatable field.

Mapping of Edit Attributes

The following table explains how the visibility and edit attributes of an MDF field works when exposed to OData API.

ⓘ Note

When a MDF field maps to both property and navigation property in OData, the *sap:required* attribute of these properties may take different values. These exception are documented in the notes below.

MDF Field Attribute		OData Property Attribute			
Required	Visibility	sap:required	sap:creatable	sap:updatable	sap:upsertable
Yes	Editable	true	true	true	true
		<h3>ⓘ Note</h3> <p>Exception: for properties mapped from Generic Objects, User, and Picklist, and navigation properties mapped from Enum type, the value is false.</p>			
Yes	Read Only	false	false	false	false
		<h3>ⓘ Note</h3> <p>Exception: this value is true for navigation properties that are mapped from associations and from these types: Attachment, Generic Object, Picklist, and User.</p>			

MDF Field Attribute		OData Property Attribute			
Required	Visibility	sap:required	sap:creatable	sap:updatable	sap:upsertable
Yes	Not Visible	false	false	false	false
		<div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p>Note</p> <p>Exception: this value is true for navigation properties that are mapped from associations and from these types: Attachment, Generic Object, Picklist, and User.</p> </div>			
No	Editable	false	false	false	false
No	Read Only	false	false	false	false
No	Not Visible	false	false	false	false

For transient fields and optimistic lock UUID, the following rules apply:

	sap:required	sap:creatable	sap:updatable	sap:upsertable	sap:sortable	sap:filterable
Transient fields (What is a transient field?)	false	false	false	false	false	false
Optimistic Lock UUID	false	false	true	true	false	false

Mapping of Data Types

The following table shows the mapping relationship between the data types of MDF fields and OData properties.

MDF Field Type	OData Property Type	Naming Rule	Max Length	Multiplicity (For Navigation Properties)
Attachment	Navigation property to the Attachment entity.	Add Nav suffix to MDF field name. Example: cust_MyAttachmentNav	N/A	*:1
	<div style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> <p>Note</p> <p>Inline editing of the attachment navigation property is not allowed. To add an attachment for an MDF entity, you first create the attachment with the Attachment OData API, and then add the attachment to the MDF entity. For more information, see Linking Attachments to an MDF Entity [page 188].</p> </div>			
Auto Complete	String	Same name as MDF field.	N/A	N/A
Auto Number	Int64	Same name as MDF field.	N/A	N/A
Boolean	Boolean	Same name as MDF field.	N/A	N/A
CLOB	String	Same name as MDF field.	N/A	N/A
	<p>You can use this data type to store a block of text. The advantage of this data type is that access is fast because an application program can access any portion of a CLOB object. Additionally, this data type provides large storage for a user-defined data type.</p>			
Date	DateTime	Same name as MDF field.	N/A	N/A

MDF Field Type	OData Property Type	Naming Rule	Max Length	Multiplicity (For Navigation Properties)
DateTime	DateTimeOffset	Same name with the following exceptions: <ul style="list-style-type: none"> MDF field <code>createdDate</code> maps to OData property type <code>createdDateTime</code> MDF field <code>lastModifiedDate</code> maps to OData property type <code>lastModifiedDateTime</code> 	N/A	N/A
Decimal	Decimal	Same name as MDF field.	N/A	N/A
Enum	One string property. One navigation property to the <code>MDFEnumValue</code> entity.	Property: same name as MDF field name. Navigation property: add <code>Nav</code> suffix to MDF field name. Example: <code>cust_MyEnumNav</code>	Same max length as defined in MDF field. Default value is 255.	*:1
Foundation Object	One string property. One navigation property to the Foundation Object entity.	Property: same name as MDF field. Navigation property: add <code>Nav</code> suffix to MDF field name. Example: <code>cust_MyObjectNav</code>	32	*:1
Generic Object	One string property. One navigation property to the Generic Object entity.	Property: same name as MDF field. Navigation property: add <code>Nav</code> suffix to MDF field name. Example: <code>cust_MyObjectNav</code>	128	If the source object is not effective dated and destination object is effective dated, or if the destination object is <code>PickListValue</code> the multiplicity is <code>*:*</code> . Otherwise, if the field is required, the multiplicity is <code>*:1</code> ; if it's optional, the multiplicity is <code>*:0..1</code> .

MDF Field Type	OData Property Type	Naming Rule	Max Length	Multiplicity (For Navigation Properties)
Number	Int64	Same name as MDF field.	N/A	N/A
Picklist	One string property. One navigation property to the destination picklist entity.	Property: same name as MDF field name. Navigation property: add Nav suffix to MDF field name. Example: <code>cust_MyPicklistNav</code>	N/A	If the source object is effective dated, the multiplicity is <code>*:*</code> . Otherwise, if the field is required, the multiplicity is <code>*:1</code> ; if it's optional, the multiplicity is <code>*:0..1</code> .
String	String	Same name as MDF field.	N/A	N/A
Time	Time On UI, times are entered and displayed in HH:MM:SS format, for example: 10:30:59 . In OData API, times are entered and displayed in duration format, for example: PT10H30M59S	Same name as MDF field.	N/A	N/A

MDF Field Type	OData Property Type	Naming Rule	Max Length	Multiplicity (For Navigation Properties)
Translatable	<p>One string property for default value, one string property for localized label, and a set of string properties representing labels in each locale with locale names added as suffixes.</p> <p>One navigation property to the <code>MDFLocalizedValue</code> entity.</p>	<p>Default value property: <code>add_defaultValue</code> suffix to MDF field name. Example, <code>cust_myLabel_defaultValue</code>.</p> <p>Localized value property: <code>add_localized</code> suffix to MDF field name. Example, <code>cust_myLabel_localized</code>.</p> <p>Locale properties: add locale suffixes to MDF field names. Examples: <code>cust_myLabel_en_US</code>, <code>cust_myLabel_zh_CN</code>.</p> <p>Navigation property: <code>add_translationTextNav</code> suffix to the MDF field name. Example: <code>cust_myLabel_translationTextNav</code>.</p>	Same max length as defined in MDF field. Default value is 255.	1:*

MDF Field Type	OData Property Type	Naming Rule	Max Length	Multiplicity (For Navigation Properties)
User	One string property. One navigation property to <code>User</code> entity.	Property: same name as MDF field name. Navigation property: add <code>Nav</code> suffix to MDF field name. Example: <code>cust_MyUserNav</code>	100	1:1 if the field is required; 1:0..1 if it's optional.

Note

The user-type audit fields `mdfSystemCreatedBy` and `mdfSystemLastModifiedBy` are mapped to the following read-only properties in OData API by default:

- Properties: `createdBy`, `lastModifiedBy`
- Navigation Properties: `createdByNav`, `lastModifiedByNav`

Reverse navigation is not allowed for the navigation properties.

MDF Field Type	OData Property Type	Naming Rule	Max Length	Multiplicity (For Navigation Properties)
-	wfRequestNav	When workflow-enabled MDF objects are exposed to OData, a wfRequestNav navigation property is added automatically to the OData API entity. You can use this navigation property to retrieve the related workflow information for pending data. For more information, see Data Mapping Between MDF and OData API [page 133] .	N/A	1:0..*

Mapping of Associations

The associations in an MDF object are mapped to navigation properties in OData API with the same names. The associations are mapped as shown in the following table.

MDF Association	Mapped to OData API	Multiplicity
Composite	A navigation property to the child MDF entity in the association.	If it's a 1:M association, or if the source object is not effective dated and destination object is effective dated, the multiplicity is 1:*. Otherwise, if the association is required, the multiplicity is 1:1; if it's optional, the multiplicity is 1:0..1.
Valid When	A navigation property to the referred MDF entity in the association.	If it's a 1:M association, or if the source object is not effective dated and destination object is effective dated, the multiplicity is *:*. Otherwise, if the association is required, the multiplicity is *:1; if it's optional, the multiplicity is *:0..1.

MDF Association	Mapped to OData API	Multiplicity
Join By Column	A navigation property to the referred destination entity.	<p>If it's a 1:M association, or if the source object is not effective dated and destination object is effective dated, the multiplicity is *:*</p> <p>Otherwise, if the association is required, the multiplicity is *:1; if it's optional, the multiplicity is *:0..1.</p>

Defining Key Properties for OData Entity

The key properties of an MDF OData API entity depend on the effective dating setting for the MDF object. The following table explains which MDF fields are used as keys in OData.

Note

The field names referred to in this table reflect the default names which correspond to the Database Field Name column. If you have changed the default names, the key property names should reflect these changes.

Effective Dating	Number of Keys	Key Properties
None	1	externalCode
Basic	2	externalCode effectiveStartDate
Multiple Changes Per Day	3	externalCode effectiveStartDate transactionSequence

Effective Dating	Number of Keys	Key Properties
From Parent	2 or more depending on the parent entity.	<p><code>externalCode</code></p> <p><code><ParentEntityName>_externalCode</code></p> <p><code><ParentEntityName>_effectiveStartDate</code> - Only available if the effective dating of parent entity is Basic or Multiple Changes Per Day</p> <p><code><ParentEntityName>_transactionSequence</code> - Only available if the effective dating of parent entity is Multiple Changes Per Day</p>

Note

In a multiple-level parent-child relation, the child inherits the `<ParentEntityName>_externalCode` key properties from all its ancestors. That means if there's a 3-level relationship, the "youngest" child will have two `<ParentEntityName>_externalCode` key properties in addition to its own `externalCode`, one from its parent, and the other from the parent's parent. However, there will be only one `<ParentEntityName>_effectiveStartDate` as the effective start date is the same for all entities in a composite association.

6.4 Locale Handling in MDF Entities

How MDF handles translatable text fields in OData API.

MDF exposes translatable text fields as OData properties. For each translatable field, these standard properties and navigation properties are available in the entity metadata:

- Property `<fieldname_defaultValue>` represents the default property value. You can assign a value to the property when you create an entry. Otherwise, it takes the value of the locale-specific property.
- Property `<fieldname_localized>`: represents the localized property value in the current locale. The localized value calculated following the rules described in [How Is the Localized Value Determined? \[page 145\]](#).
- Property `<fieldname_locale code>`: represents the localized value in the locale indicated by the locale code.
- Navigation property `<fieldnameTranslationTextNav>`: represents the association with entity `MDFLocalizedValue`, where the localized values of the properties are stored.

For example, a description field in an MDF object has a default property `<description_defaultValue>`, a localized property `<description_localized>`, several locale-specific properties such as `<description_en_US>`, `<description_de_DE>`, `<description_zh_CN>`, etc., and a navigation property `<descriptionTranslationTextNav>`.

All these properties and navigation properties can be queried and edited.

How Is the Localized Value Determined?

The system determines the value of the `<fieldname_localized>` field based on the following information:

- User locale. The user locale corresponds to the language setting in the global header bar under [Settings > Languages](#).
- Company locale. The company locale depends on the language setting of your company in Provisioning.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

- Value of the `<fieldname_defaultValue>` property.

Here's how the `<fieldname_localized>` property value is determined:

1. If the user's locale is available, it takes the property value that corresponds to the user's locale.
2. If user's locale isn't available, it takes the property value that corresponds to company's locale.
3. If neither locale is available, it takes the property value of `<fieldname_defaultValue>`.

ⓘ Note

Both queries and edits follow the same rules. If you edit the value of `<fieldname_localized>`, the corresponding field of the locale is also changed. For example, the `<name_localized>` field of the `FOBusinessObject` in your company comes from `en_US` field. If you modify this field with an API request, the new value is also reflected in the `<name_en_US>` field.

Example 1: Query an Entry's Localized Label

This type of request can be useful especially for UI consumption where you need to retrieve a record with the labels of the default locale. Here's a sample request using the `FOBusinessUnit` entity as an example:

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/FOBusinessUnit(externalCode='MC_AVIA',startDate=datetime'1900-01-01T00:00:00')?\$format=JSON&\$select=externalCode,name_localized</code>

Response

```
{
  "d": {
    "__metadata": {
```

```

    "uri": "https://<API-Server>/odata/v2/
FOBusinessUnit(externalCode='MC_AVIA',startDate=datetime'1900-01-01T00:00:00')",
    "type": "SFOData.FOBusinessUnit"
  },
  "externalCode": "MC_AVIA",
  "name_localized": "MC Aviation"
}
}

```

Example 2: Query All Labels of an Entry

You often find this type of usage in integration scenarios where you want to export the labels in all languages.

Request

Operation	Query
HTTP Method	GET
URI	<pre> https://<API-Server>/odata/v2/ FOBusinessUnit(externalCode='SVCS',startDa te=datetime'1900-01-01T00:00:00')/ nameTranslationTextNav?\$format=JSON </pre>

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('en_US')",
          "type": "SFOData.MDFLocalizedValue"
        },
        "locale": "en_US",
        "value": "Services"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('defaultValue')",
          "type": "SFOData.MDFLocalizedValue"
        },
        "locale": "defaultValue",
        "value": "Services"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('en_GB')",
          "type": "SFOData.MDFLocalizedValue"
        },
        "locale": "en_GB",
        "value": "Services"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('zh_CN')",
          "type": "SFOData.MDFLocalizedValue"
        }
      }
    ]
  }
}

```

```

    },
    "locale": "zh_CN",
    "value": "服务"
  },
  {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('pt_BR')",
      "type": "SFOData.MDFLocalizedValue"
    },
    "locale": "pt_BR",
    "value": "Serviços"
  },
  {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('ja_JP')",
      "type": "SFOData.MDFLocalizedValue"
    },
    "locale": "ja_JP",
    "value": "サービス統括本部"
  },
  {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('ru_RU')",
      "type": "SFOData.MDFLocalizedValue"
    },
    "locale": "ru_RU",
    "value": "Сервисы"
  },
  {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('es_ES')",
      "type": "SFOData.MDFLocalizedValue"
    },
    "locale": "es_ES",
    "value": "Servicios"
  },
  {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
MDFLocalizedValue('ko_KR')",
      "type": "SFOData.MDFLocalizedValue"
    },
    "locale": "ko_KR",
    "value": "서비스"
  }
]
}
}}

```

Example 3: Creating or Editing an Entry with Localized Texts

When you create or edit an entry, you can include the localized texts of translatable fields either through the local-specific properties or through inline-editing the `<fieldname>TranslationTextNav` navigation property. Here are some examples:

Request Info

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload example for upserting property values:

```
{
  "__metadata": {
    "uri": "FOBusinessUnit"
  },
  "externalCode": "SERVICE",
  "status": "A",
  "startDate": "/Date(1508375121000)/",
  "name_ko_KR": "서비스",
  "name_pt_BR": "Serviços",
  "name_de_DE": "Dienstleistungen",
  "name_zh_TW": "服務",
  "name_es_ES": "Servicios",
  "name_ru_RU": "Сервисы",
  "name_fr_FR": "Services",
  "name_ja_JP": "サービス統括本部",
  "name_en_US": "Services",
  "name_zh_CN": "服务"
}
```

Payload example for inline-upserting the navigation property:

Sample Code

```
{
  "__metadata": {
    "uri": "FOBusinessUnit"
  },
  "externalCode": "SERVICE",
  "status": "A",
  "startDate": "/Date(1508375121000)/",
  "nameTranslationTextNav": [
    {
      "locale": "ko_KR",
      "value": "서비스"
    },
    {
      "locale": "pt_BR",
      "value": "Serviços"
    },
    {
      "locale": "de_DE",
      "value": "Dienstleistungen"
    },
    {
      "locale": "zh_TW",
      "value": "服務"
    }
  ]
}
```

```

    {
      "locale": "es_ES",
      "value": "Servicios"
    },
    {
      "locale": "ru_RU",
      "value": "Сервисы"
    },
    {
      "locale": "fr_FR",
      "value": "Services"
    },
    {
      "locale": "ja_JP",
      "value": "サービス統括本部"
    },
    {
      "locale": "en_US",
      "value": "Services"
    },
    {
      "locale": "zh_CN",
      "value": "服务"
    }
  ]
}

```

Response

```

{
  "d": [
    {
      "key": "FOBusinessUnit/externalCode=SERVICE,FOBusinessUnit/
startDate=2017-10-19T00:00:00.000-04:00",
      "status": "OK",
      "editStatus": "UPsertED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}

```

6.5 MDF OData API Operations

Describes the MDF OData API behaviors with examples.

MDF OData API is based on SAP SuccessFactors HCM suite OData API framework, currently on OData Version 2.0. While the majority of MDF OData API operations follow the same rules defined by the framework, there are patterns specific to MDF when you use MDF OData API entities. In this section, you'll find out details about the specific patterns and how they affect your OData API usage.

Service Limit for Large MDF OData Requests

There's a service limit for large MDF OData requests. When you query or edit an MDF OData entity and the response returns a large number of records that exceed the system-defined limit, the request fails and an error occurs. You need to adjust the request parameters or payload so that the data size returned is within the limit. Depending on your request, the limit may vary.

→ Remember

The service limit is designed to optimize MDF OData performance while ensuring all MDF OData APIs continue to work in all instances. It has very little impact on your current integrations and UIs.

If you meet such an error, here are a few steps that can help solve the problem:

- Use pagination in your query if you haven't already.
- If you're already paging your query, try tuning down the page size.
- Include fewer records in your request payload.
- A rule of thumb is to cut the page or record size to half.

If you wish to change the limit, contact Product Support.

6.5.1 Permissions

Permissions required for accessing MDF OData API entities.

The following table lists the required permissions for users to query and edit MDF OData API entities:

Permission	Description
▶ Administrator Permissions > Manage Integration Tools > Allow Admin to Access OData API through Basic Authentication ▶	This permission allows users to access OData API entities through Basic Authentication. If you're using other authentication methods such as OAuth 2.0, this permission isn't required.
▶ Administrator Permissions > Metadata Framework > Admin access to MDF OData API ▶	This is the MDF OData admin permission that allows users to query and edit all MDF OData entities. It overrides all entity-level permissions. This permission is recommended only for integration scenarios. Permission roles granted with this permission can override other MDF data access permission configurations and save data without approvals.

Permission	Description
▶ Administrator Permissions > Metadata Framework ▶ Access to non-secured objects >	<p>This is the nonadmin MDF OData permission. This permission allows users to query and edit all nonsecured MDF OData entities.</p> <div data-bbox="818 405 1427 554" style="background-color: #f0f0f0; padding: 10px;"> <p>Note</p> <p>This permission isn't required for querying and editing secured MDF OData entities.</p> </div>
<p>Entity-level permissions for secured objects</p>	<p>If an MDF object is secured, an entity-level permission item is available under the corresponding permission category specified in object definition. You can enable view, edit, and import/export permission for this entity. You can also maintain field-level permission overrides.</p> <p>For more information, see Adding Security and Setting Up Security for Fields.</p>

6.5.2 Query Operation

This section contains information about query operations on MDF OData entities, including query parameters and examples. Note that only MDF-specific information is documented here. For more information on general OData API operations, refer to the OData Operations section.

[Query Parameters \[page 151\]](#)

A list of query parameters MDF OData API and usage examples.

6.5.2.1 Query Parameters

A list of query parameters MDF OData API and usage examples.

Parent topic: [Query Operation \[page 151\]](#)

6.5.2.1.1 asOfDate

Use the `asOfDate` parameter to query a single record that is effective on a specific date.

Parameter Values

Value	Description
<code><yyyy-mm-dd></code>	A numeric date value, for example: 2019-12-25

Note
Returns only one record that is effective on the specified date.

Note
Depending on the parameters you use, a query may return zero, one, or multiple records.
If the effective dating type of the entity is Multiple Changes Per Day (MCPD), the record with the largest sequence number is returned as the effective record of that date.
If you don't specify any date or date period, the query uses today's date as the `asOfDate` value and fetch the current effective record.

Use Case

Tip
When you query an effective-dated entity without any date parameters, the result returns a single record effective on the present date. It defaults to `&asOfDate=<today's date>`.

The `asOfDate` parameter retrieves the single records of an entity that is effective on the specified date.

Example:

```
https://<API-Server>/odata/v2/MDFEntity?$format=JSON&asOfDate=2018-11-07
```

Related Information

[Using asOfDate with \\$expand \[page 158\]](#)

6.5.2.1.2 fromDate

Use the `fromDate` parameter to query records that are effective after a specific date.

Parameter Values

Value	Description
<code><yyyy-mm-dd></code>	A numeric date value, for example: 2019-12-25

Note

Multiple records can be returned.

Note

Depending on the parameters you use, a query may return zero, one, or multiple records.

If the effective dating type of the entity is Multiple Changes Per Day (MCPD), the record with the largest sequence number is returned as the effective record of that date.

If you don't specify any date or date period, the query uses today's date as the `asOfDate` value and fetch the current effective record.

Use Case

The `fromDate` parameter retrieves all effective records of the entity in the specified time period. If the `mdfSystemEffectiveEndDate` of a record is later than the specified date, the record is returned.

Example:

```
https://<API-Server>/odata/v2/MDFEntity?$format=JSON&fromDate=2018-11-07
```

Related Information

[Using fromDate with \\$expand \[page 160\]](#)

6.5.2.1.3 toDate

Use the `toDate` parameter to query records that are effective before a specific date.

Parameter Values

Value	Description
<code><yyyy-mm-dd></code>	A numeric date value, for example: 2019-12-25

Note
Multiple records can be returned in the result.

Note
Depending on the parameters you use, a query may return zero, one, or multiple records.
If the effective dating type of the entity is Multiple Changes Per Day (MCPD), the record with the largest sequence number is returned as the effective record of that date.
If you don't specify any date or date period, the query uses today's date as the `asOfDate` value and fetch the current effective record.

Use Case

The `toDate` parameter retrieves all effective records of the entity before the specified date. If the `mdfSystemEffectiveStartDate` of a record is earlier than the specified date, the record is returned.

Example:

```
https://<API-Server>/odata/v2/MDFEntity?$format=JSON&toDate=2018-11-07
```

Related Information

[Using toDate with \\$expand \[page 163\]](#)

6.5.2.1.4 filterParentDate

Use the `filterParentDate` parameter to query a child of an effective-dated entity with date parameters.

In a composite MDF association, a child entity inherits its effective dating attribute from its parent. When you query a composite child entity, date parameters such as `fromDate`, `toDate`, and `asOfDate` are ignored. In order

for them to work, you must include parameter `filterParentDate` with value `true` in the query. This parameter allows you to filter the child entity based on the effective dates of its parent.

Parameter Values

Value	Description
<code>true</code>	Filter child entity based on the effective dates of parent.
<code>false</code> (Default)	Date parameters are ignored on child entities.

Use Case

See the topic in [Related Links](#) section for detailed use cases.

Related Information

[Querying the Child of an Effective Dated Entity \[page 166\]](#)

6.5.2.1.5 recordStatus

Use the `recordStatus` parameter to query normal, pending, or pending history data of an MDF entity.

Parameter Values

Value	Description
<code>normal</code> (default)	Parameter value to retrieve normal records. If <code>recordStatus</code> isn't specified, the query returns normal data by default.
<code>pending</code>	Parameter value to retrieve records pending approval.
<code>pendinghistory</code>	A record in pending history status can be: <ul style="list-style-type: none">• Declined by the approver• Canceled by the initiator of the workflow• Modified by the approver

⚠ Caution

To query records with pending and pendinghistory status, you must have the [Admin access to MDF OData API](#) permission.

Use Case

In MDF OData API entities, if workflow routing is configured for an object and the [Pending Data](#) option is enabled, data changes pending approval are stored as pending data. Once the data changes are approved, the records are saved as normal data. If a workflow is declined, canceled, or modified, a pending history is stored in the database. The following table explains how the parameter values map to the `mdfSystemRecordStatus` field of the MDF object:

Parameter Value	mdfSystemRecordStatus
normal	N
pending	P
pendinghistory	PH

You can use parameter `recordStatus` in an OData query to specify which type of data to retrieve.

- To retrieve normal records:

```
https://<API-Server>/odata/v2/cust_TestObject?$format=JSON&recordStatus=normal
```

- To retrieve pending records:

```
https://<API-Server>/odata/v2/cust_TestObject?$format=JSON&recordStatus=pending
```

- To retrieve pending history records:

```
https://<API-Server>/odata/v2/cust_TestObject?$format=JSON&recordStatus=pendinghistory
```

📌 Note

This parameter is required if you want to query the workflow information of an MDF entity by expanding `wfRequestNav`. For more information, see [Retrieving Workflow Information for Pending Data \[page 172\]](#).

Error Codes

Error Code	Description
COE_UNSUPPORTED_FEATURE	<p>[COE0025]Unsupported feature: Expand workflow navigation from normal data is NOT supported.</p> <p>If you try to expand wfRequestNav on a normal entry, this error occurs. wfRequestNav can only be expanded if it's a pending entry.</p>
COE_GENERAL_FORBIDDEN	<p>[COE0020]Non admin user is NOT allowed to query pending data.</p> <p>Only users with the Admin access to MDF OData API permission can query pending data.</p>
COE_GENERAL_FORBIDDEN	<p>[COE0025]Unsupported feature: Non admin user query pending history data is NOT supported.</p> <p>Only users with the Admin access to MDF OData API permission can query pending data.</p>

6.5.2.1.6 versionId

Use the `versionId` parameter to query a specific version of a pending record.

Parameter Values

Value	Description
<largest version ID> (default)	If versionId is not specified, the query returns the record with the largest version ID.
<user specified version ID>	The record with specified version ID is returned.

Use Case

Note

If you use `versionId` in a query, it returns pending data by default.

A record pending approval can have multiple versions. You can use parameter `versionId` to query a specific version of the record. Example:

```
https://<API-Server>/odata/v2/TestObject('Key1')?$format=JSON&versionId=2
```

6.5.2.2 Sample Operations

6.5.2.2.1 Using `asOfDate` with `$expand`

Getting to know how `asOfDate` impacts the query results when it's used in combination with `$expand` to query effective-dated entities and its associations.

Example Entities

Composite Association

When querying an effective-dated entity and expanding to a composite association with `asOfDate`, the restrictive criteria of the parameter only works on the base object. However, as a composite association, Entity D has an `effectiveDate` type "from parent", the expanded data is also effective on this date.

Request

Operation	Query
HTTP Method	GET
URI	<pre>https://<API-server>/odata/v2/EntityP? \$format=JSON&\$expand=CompositeAssociation&asOfDate=2020-08-15</pre>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-06-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P2",
        "cust_ParentChildComposite": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/cust_EntityD(cust_EntityP_effectiveStartDate=datetime'2020-06-01T00:00:00',cust_EntityP_externalCode='P',externalCode='D')",
                "type": "SFOData.cust_EntityD"
              },
              "externalCode": "D",
              "Record": "D2"
            }
          ]
        }
      }
    ]
  }
}
```

Valid-When Association

When querying an effective-dated entity and expanding to a valid-when association with the `&asOfDate`, the restrictive criteria of the parameter works on both the base object and the expanded data.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/EntityP?\$format=JSON&\$expand=ValidWhenAssociation&asOfDate=2020-08-15</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
```

```

    "__metadata": {
      "uri": "https://<API-server>/odata/v2/
cust_EntityP(effectiveStartDate=datetime'2020-06-01T00:00:00',externalCode='P')",
      "type": "SFOData.cust_EntityP"
    },
    "externalCode": "P",
    "Record": "P2",
    "cust_ParentChildValidWhen": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<API-server>/odata/v2/
cust_EntityC(effectiveStartDate=datetime'2020-08-01T00:00:00',externalCode='C')",
            "type": "SFOData.cust_EntityC"
          },
          "externalCode": "C",
          "Record": "C3"
        }
      ]
    }
  ]
}

```

Navigation to a Composite Association and Referred Generic Object

In a more complex navigation scenario with `$expand` where you need to navigate to a composite association and its referred generic object, the date parameters filter both the base object and the referred generic object. In the following example, parameter `&fromDate=2018-10-01` works on both `PickListV2` and `values/parentPickListValueNav`:

```

https://<hostname>/odata/v2/PickListV2?$format=JSON&$select=values/
parentPickListValueNav&$expand=values/parentPicklistValueNav&fromDate=2018-10-01

```

6.5.2.2.2 Using fromDate with \$expand

Getting to know how `&fromDate` impacts the query results when it's used in combination with `$expand` to query effective-dated entities and its associations.

Example Entities

Composite Association

When querying an effective-dated entity and expanding to a composite association with `&fromDate`, the restrictive criteria of the parameter only works on the base object. However, as a composite association, EntityD has an effectiveDate type "from parent", the expanded data is also effective on this date.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/EntityP?\$format=JSON&\$expand=CompositeAssociation&fromDate=2020-05-15</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-01-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P1",
        "cust_ParentChildComposite": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/EntityD(cust_EntityP_effectiveStartDate=datetime'2020-01-01T00:00:00',cust_EntityP_externalCode='P',externalCode='D')",
                "type": "SFOData.cust_EntityD"
              },
              "externalCode": "D",
              "Record": "D1"
            }
          ]
        }
      },
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-06-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P2",
        "cust_ParentChildComposite": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/EntityD(cust_EntityP_effectiveStartDate=datetime'2020-06-01T00:00:00',cust_EntityP_externalCode='P',externalCode='D')",
                "type": "SFOData.cust_EntityD"
              }
            }
          ]
        }
      }
    ]
  }
}
```

```
    },
    "externalCode": "D",
    "Record": "D2"
  }
]
}
}
```

Valid-When Association

When querying an effective-dated entity and expanding to a valid-when association with the &fromDate, the restrictive criteria of the parameter works on both the base object and the expanded data.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-server>/odata/v2/EntityP? \$format=JSON&\$expand=ValidWhenAssociation&fromDate=2020-05-15

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-01-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P1",
        "cust_ParentChildValidWhen": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/EntityC(effectiveStartDate=datetime'2020-01-01T00:00:00',externalCode='C')",
                "type": "SFOData.cust_EntityC"
              },
              "externalCode": "C",
              "Record": "C1"
            }
          ]
        }
      }
    ]
  },
  "__metadata": {
```

```

      "uri": "https://<API-server>/odata/v2/
EntityP(effectiveStartDate=datetime'2020-06-01T00:00:00',externalCode='P')",
      "type": "SFOData.cust_EntityP"
    },
    "externalCode": "P",
    "Record": "P2",
    "cust_ParentChildValidWhen": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<API-server>/odata/v2/
EntityC(effectiveStartDate=datetime'2020-05-01T00:00:00',externalCode='C')",
            "type": "SFOData.cust_EntityC"
          },
          "externalCode": "C",
          "Record": "C2"
        }
      ]
    }
  ]
}

```

6.5.2.2.3 Using toDate with \$expand

Getting to know how &toDate impacts the query results when it's used in combination with \$expand to query effective-dated entities and its associations.

Example Entities

Composite Association

When querying an effective-dated entity and expanding to a composite association with &toDate, the restrictive criteria of the parameter only works on the base object. However, as a composite association, EntityD has an effectiveDate type "from parent", the expanded data is also effective on this date.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-server>/odata/v2/EntityP? \$format=JSON&\$expand=CompositeAssociation&toDate=2020-07-01

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-01-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P1",
        "cust_ParentChildComposite": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/EntityD(EntityP_effectiveStartDate=datetime'2020-01-01T00:00:00',EntityP_externalCode='P',externalCode='D')",
                "type": "SFOData.cust_EntityD"
              },
              "externalCode": "D",
              "Record": "D1"
            }
          ]
        }
      },
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-06-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P2",
        "cust_ParentChildComposite": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/EntityD(EntityP_effectiveStartDate=datetime'2020-06-01T00:00:00',EntityP_externalCode='P',externalCode='D')",
                "type": "SFOData.cust_EntityD"
              },
              "externalCode": "D",
              "Record": "D2"
            }
          ]
        }
      }
    ]
  }
}
```

```
}
```

Valid-When Association

When querying an effective-dated entity and expanding to a valid-when association with the `&toDate`, the restrictive criteria of the parameter works on both the base object and the expanded data.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/EntityP?\$format=JSON&\$expand=ValidWhenAssociation&toDate=2020-07-01</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-01-01T00:00:00',externalCode='P')",
          "type": "SFOData.cust_EntityP"
        },
        "externalCode": "P",
        "Record": "P1",
        "cust_ParentChildValidWhen": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<API-server>/odata/v2/EntityC(effectiveStartDate=datetime'2020-01-01T00:00:00',externalCode='C')",
                "type": "SFOData.cust_EntityC"
              },
              "externalCode": "C",
              "Record": "C1"
            }
          ]
        }
      }
    ],
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/EntityP(effectiveStartDate=datetime'2020-06-01T00:00:00',externalCode='P')",
      "type": "SFOData.cust_EntityP"
    },
    "externalCode": "P",
    "Record": "P2",
    "cust_ParentChildValidWhen": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<API-server>/odata/v2/EntityC(effectiveStartDate=datetime'2020-05-01T00:00:00',externalCode='C')",
```

```

    "type": "SFOData.cust_EntityC"
  },
  "externalCode": "C",
  "Record": "C2"
}
]
}
}
}
}
}

```

6.5.2.2.4 Querying the Child of an Effective Dated Entity

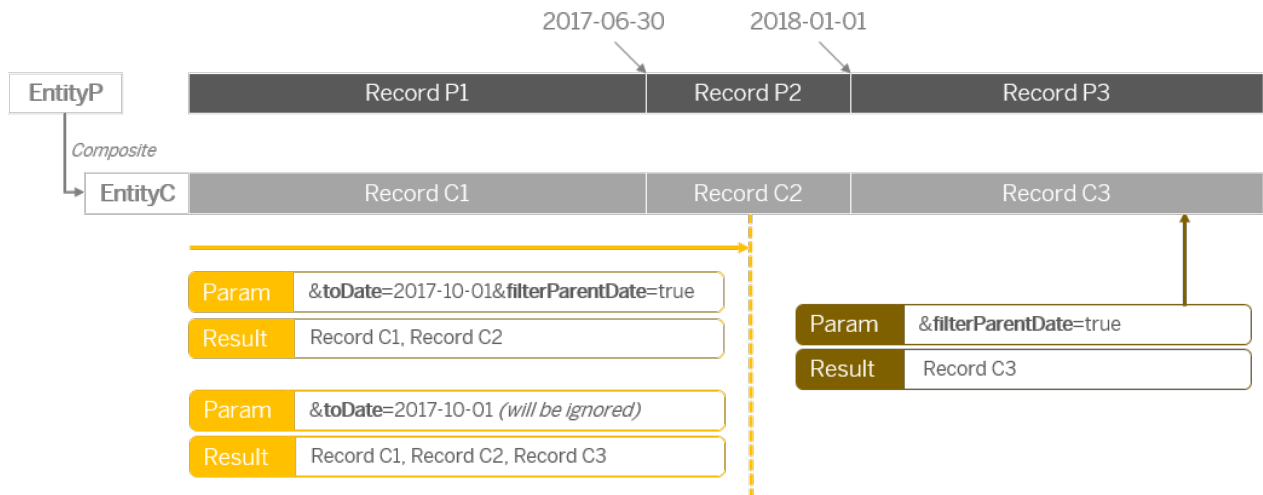

You can use parameter `filterParentDate` to query a child entity of an effective dated entity with date parameters.

In a composite MDF association, a child entity inherits its effective dating attribute from its parent. When you query a composite child entity, date parameters such as `fromDate`, `toDate`, and `asOfDate` will be ignored. In order for them to work, you must include parameter `filterParentDate` with value `true` in the query. This parameter allows you to filter the child entity based on the effective dates of its parent.

Note

`filterParentDate` is not a standard OData parameter.

In the example below, `EntityP` has a composite child `EntityC` which has three entries. The different results of the three queries explain how the `filterParentDate` parameter work:

Base URI: `https://<hostname>/odata/v2/EntityC?$format=JSON`

In the first example, the query contains a date parameter and the `filterParentDate` parameter. The date parameter works as intended and the query returns Record C1 and Record C2, both of which are effective in the specified date range (to 2017-10-01):

```

https://<hostname>/odata/v2/EntityC?
$format=JSON&toDate=2017-10-01&filterParentDate=true

```

The next example query contains only a date parameter. Without the `filterParentDate` parameter, the date parameter fails to work and is ignored. The result returns all available entries of the child entity:

```
https://<hostname>/odata/v2/EntityC?$format=JSON&toDate=2017-10-01
```

The last example query contains only the `filterParentDate` parameter. This will be treated as if the parent entity is filtered with the default date parameter, which equals to `&filterParentDate=true&asOfDate=<today's date>`. Therefore, the current effective entry Record C3 is returned.

```
https://<hostname>/odata/v2/EntityC?$format=JSON&filterParentDate=true
```

6.5.2.2.5 Querying Links of Effective Dated Entities With Composite Associations

You can use the `$links` option to query links of composite associations of an effective dated entity.

We use `PickListV2` and `PickListValueV2` as example.

Request

Operation	Query
HTTP Method	GET
URI	<pre>https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00', id='ExamplePicklist')/\$links/values</pre>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "uri": "https://<API-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='ExamplePicklist',externalCode='ExampleValue1')"
      },
      {
        "uri": "https://<API-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='ExamplePicklist',externalCode='ExampleValue2')"
      },
      {
        "uri": "https://<API-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='ExamplePicklist',externalCode='ExampleValue3')"
      },
      {
        "uri": "https://<API-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='ExamplePicklist',externalCode='ExampleValue4')"
      }
    ]
  }
}
```

```
}  
}
```

6.5.2.2.6 Filtering 1:M Composite Association

This topic shows examples of filtering parent and child entities whose association type is *Composite* and multiplicity is *One To Many*.

You can filter records of a parent entity based on properties of its child entities. When the parent and child entities have a one-to-many (1:M) relationship with its children, the query returns all parent records with full list of child entity records even though only one record of child entity meets the condition in the filter.

We use PickListV2 and PickListValueV2 as example entities. You can search for a picklist that contains a certain picklist value or you can search for a picklist whose parent picklist contains a certain picklist value.

Example 1: Search for a Picklist That Contains a Certain Picklist Value

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/PickList? \$format=JSON&\$filter=values/externalCode eq 'ABRAND' &\$expand=values</code>

Response

The query returns the picklist that has the said picklist value and a full list of child entity records if you choose to expand the association property.

Sample Code

```
{  
  "d": {  
    "results": [  
      {  
        "__metadata": {  
          "uri": "https://<api-server>/odata/v2/  
PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00',id='CARBRAND')",  
          "type": "SFOData.PickListV2"  
        },  
        "id": "CARBRAND",  
        "status": "A",  
        "values": {  
          "results": [  
            {  
              "__metadata": {  
                "uri": "https://<api-server>/odata/v2/  
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL  
istV2_id='CARBRAND',externalCode='ABRAND')",
```

Example 2: Search for a Picklist Whose Parent Picklist Contains a Certain Picklist Value

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/PickList? \$format=JSON&\$filter=parentPickListNav/values/externalCode eq 'ABRAND'&\$expand=values,parentPickListNav,parentPickListNav /values</code>

Response

The query returns the picklist whose parent picklist has the said picklist value and a full list of child entity records if you choose to expand association properties.

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/  
PickListV2(effectiveStartDate=datetime'2020-07-01T00:00:00',id='CARCOLOR')",
          "type": "SFOData.PickListV2"
        },
        "id": "CARCOLOR",
        "parentPickList": "CARBRAND",
        "status": "A",
        "values": {
          "results": [
            {
              "__metadata": {
                "uri": "https://<api-server>/odata/v2/  
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-01T00:00:00',PickL  
istV2_id='CARCOLOR',externalCode='Black')",
                "type": "SFOData.PickListValueV2"
              },
              "externalCode": "Black",
              "status": "A"
            },
            {
              "__metadata": {
                "uri": "https://<api-server>/odata/v2/  
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-01T00:00:00',PickL  
istV2_id='CARCOLOR',externalCode='Yellow')",
                "type": "SFOData.PickListValueV2"
              },
              "externalCode": "Yellow",
              "status": "A"
            }
          ]
        }
      },
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/  
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-01T00:00:00',PickL  
istV2_id='CARCOLOR',externalCode='Orange')",
          "type": "SFOData.PickListValueV2"
        }
      }
    ]
  }
}
```

```

        "type": "SFOData.PickListValueV2"
    },
    "externalCode": "Orange",
    "status": "A"
}
]
},
"parentPickListNav": {
    "__metadata": {
        "uri": "https://<api-server>/odata/v2/
PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00',id='CARBRAND')",
        "type": "SFOData.PickListV2"
    },
    "id": "CARBRAND",
    "values": {
        "results": [
            {
                "__metadata": {
                    "uri": "https://<api-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='CARBRAND',externalCode='ABRAND')",
                    "type": "SFOData.PickListValueV2"
                },
                "externalCode": "ABRAND"
            },
            {
                "__metadata": {
                    "uri": "https://<api-server>/odata/v2/

istV2_id='CARBRAND',externalCode='DBRAND')",
                    "type": "SFOData.PickListValueV2"
                },
                "externalCode": "DBRAND"
            },
            {
                "__metadata": {
                    "uri": "https://<api-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='CARBRAND',externalCode='EBRAND')",
                    "type": "SFOData.PickListValueV2"
                },
                "externalCode": "EBRAND"
            },
            {
                "__metadata": {
                    "uri": "https://<api-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickL
istV2_id='CARBRAND',externalCode='FBRAND')",
                    "type": "SFOData.PickListValueV2"
                },
                "externalCode": "FBRAND"
            }
        ]
    }
}

```

```
    "externalCode": "FBRAND"
  }
]
}
}
}
}
}
}
}
}
}
}
```

6.5.2.2.7 Retrieving Workflow Information for Pending Data

You can use the `wfRequestNav` navigation property and the `recordStatus` parameter to retrieve workflow information for pending data of MDF entities.

When an MDF Generic Object (GO) with workflow routing configured is exposed to OData, a navigation property named `wfRequestNav` is automatically added to the OData API entity. This navigation property allows you to retrieve the corresponding workflow information for pending data. Although `wfRequestNav` is available by default for all MDF OData API entities with a workflow routing, you can only expand it if the [Pending Data](#) option is enabled in the object definition.

Note

To enable workflow and pending data, associate the MDF generic object with a workflow and set the [Pending Data](#) field to **Yes** in [Configure Object Definitions](#).

Child entities in a composite association don't have the `wfRequestNav` property.

Since MDF OData API only supports workflow information on pending data, you must add the `recordStatus` parameter to specifically filter the pending records, and then expand the workflow information. The following examples show how to do this.

You can use `&recordStatus=pending` to filter all pending records of the entity, and then expand the workflow information:

```
https://<API-endpoint-URL>/odata/v2/cust_MDFEntity?
$format=JSON&recordStatus=pending&$expand=wfRequestNav
```

If you use a key predicate to query a single record, even if it's a pending record, you still need `&recordStatus=pending` to be able to expand the workflow information:

```
https://<API-endpoint-URL>/odata/v2/cust_MDFEntity('CC01')?
$format=JSON&recordStatus=pending&$expand=wfRequestNav
```

Error Codes

Error Code	Description
COE_UNSUPPORTED_FEATURE	<p>[COE0025]Unsupported feature: Expand workflow navigation from normal data is NOT supported.</p> <p>If you try to expand wfRequestNav on a normal entry, this error occurs. wfRequestNav can only be expanded if it's a pending entry.</p>

[recordStatus \[page 155\]](#)

6.5.2.2.8 Querying Effective-Dated Entities Using lastModifiedDateTime

You can use the lastModifiedDateTime field in a \$filter option to query the records of an effective-dated entity.

The value of lastModifiedDateTime in a request URI is in date/time format without timezone information:

`datetime'yyyy-mm-ddThh:mm:ss'`

For example: `$filter=lastModifiedDateTime gt datetime'2019-09-01T12:00:00'`.

You can use lastModifiedDateTime together with other time parameters such as fromDate, toDate, and asOfDate. You can also reverse the \$filter condition by placing the date/time value before lastModifiedDateTime to get different query results.

Using lastModifiedDateTime with Time Parameters

When you use both lastModifiedDateTime and a date parameter in the same request, the following rules apply:

- The lastModifiedDateTime filter finds all **external keys** that have at least one record satisfies the filter condition.
- The time parameter then filters all **records** under the external keys and returns the ones that satisfy the condition in the result.

This means that in the returned result, the lastModifiedDateTime value may or may not satisfy the filter condition in the request. The following example explains how it works:

Example

```
https://<API-Server>/odata/v2/EmpJob?$format=JSON&$filter=lastModifiedDateTime  
gt datetime'2017-01-01T00:00:00'&toDate=2019-01-01
```

In this example, you try to find all employees who have their job information changed after 2017-01-01 and pull their entire job history, including the ones that were last modified before 2017-01-01.

Placing lastModifiedDateTime Before or After DateTime Value

The position of date/time value in the lastModifiedDateTime filter determines how the server interprets the query. When the date/time value is placed after lastModifiedDateTime, the filter finds all external keys that satisfy the condition. When the date/time value is placed before lastModifiedDateTime, the filter works as you normally understand it: it returns all **records** with last modified date/time satisfying the filter.

In the previous example, if you want to display only the job history that were last modified after 2017-01-01, you can change the query by moving the date/time value before lastModifiedDateTime in the filter:

```
https://<API-Server>/odata/v2/EmpJob?  
$format=JSON&$filter=datettime'2017-01-01T00:00:00' gt  
lastModifiedDateTime&toDate=2019-01-01
```

6.5.3 Edit Operations

Parameters and examples of edit operations for MDF OData API entities, including insert, upsert, replace, merge, and delete operations.

MDF Upsert Operation

As of Q4 2019 Release, upsert operations on all MDF OData entities and MDF Foundation Objects can return business keys in the response if the keys are provided in the request. That includes both parent objects and child objects. This information helps you identify which record has been successfully upserted and which has failed.

6.5.3.1 Edit Parameters

6.5.3.1.1 workflowConfirmed

Use parameter `workflowConfirmed` to control whether or not the insert or upsert operation triggers a workflow.

Prerequisites

Either you've defined the workflow routing for the MDF object or you've associated the object with a business rule that triggers a workflow.

The API user doesn't have the [Admin access to MDF OData API](#) permission.

⚠ Caution

The parameter has no impact on admin users with the [Admin access to MDF OData API](#) permission. If an admin user creates or changes a record for a workflow-enabled entity, no workflow is triggered and the record is saved as normal data.

The parameter doesn't work with MDF Foundation Objects.

What Happens If Two Workflows Are Defined?

If the MDF object is associated with one workflow in the [Workflow Routing](#) field and another workflow through a business rule, the business rule-based workflow supersedes when the rule is triggered.

🔗 Example

Object `cust_ABC` is associated with two workflows: workflow **Manager** from object definition and workflow **EmployeeHR** from a business rule. When you change data that doesn't trigger the business rule, the **Manager** workflow applies. When you change data that triggers the business rule, the **EmployeeHR** workflow applies.

Parameter Values

Value	Description
<code>false</code> (default)	A workflow isn't triggered.
<code>true</code>	A workflow is triggered.

Use Case 1: Upsert a Record With `workflowConfirmed=true`

A typical scenario to use the `workflowConfirmed` parameter is on the UI where you create or edit a record. When you save the record, a dialog pops up for you to submit the changes for approval. If you submit, an API request is sent with `workflowConfirmed=true`:

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert?workflowConfirmed=true</code>
Payload	<pre>{ "__metadata": { "uri": "cust_TestObject('TO-001')" }, "externalCode": "TO-001", "externalName": "Test Object 001" }</pre>

Response

If the upsert operation is successful, a workflow request is created.

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 2: Upsert a Record With `workflowConfirmed=false`

As a user without the [Admin access to MDF OData API](#) permission, if you upsert a workflow-enabled entity without the `workflowConfirmed` parameter or set the parameter value to `false`, you get an error:

Request

Operation	Upsert
HTTP Method	POST

URI `https://<API-Server>/odata/v2/upsert?workflowConfirmed=false`

Payload

```
{
  "__metadata":{
    "uri":"cust_TestObject('TO-002')",
    "externalCode":"TO-002",
    "externalName":"Test Object 002"
  }
}
```

Response

```
{
  "d": [
    {
      "key": null,
      "status": "ERROR",
      "editStatus": null,
      "message": "To trigger workflow, please set the 'workflowConfirmed'
flag to true. with the index 0",
      "index": 0,
      "httpCode": 500,
      "inlineResults": null
    }
  ]
}
```

6.5.3.1.2 warningAcknowledged

Use parameter `warningAcknowledged` to skip warning messages during upsert of an MDF record.

Prerequisites

A business rule has been defined for the MDF object to raise a warning message.

The API user doesn't have the [Admin access to MDF OData API](#) permission.

Note

The parameter has no impact on admin users with the [Admin access to MDF OData API](#) permission. If an admin user creates or changes a record for an entity that triggers a warning message, the warning is skipped.

Parameter Values

Value	Description
<code>false</code> (default)	If the business rule is triggered, a warning message appears and the upsert fails.
<code>true</code>	No warning message appears even if the business rule is triggered. Upsert is successful.

Use Case 1: Upsert a Record With `warningAcknowledged=true`

A typical scenario to use the `warningAcknowledged` parameter is on the UI where you create or edit a record. When you save the record, a warning message pops up. If you choose OK, the warning is acknowledged and an API request is sent with `warningAcknowledged=true`.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/upsert&warningAcknowledged=true</code>
Payload	<pre>{ "__metadata": { "uri": "cust_TestObject('TO-001')", "externalCode": "TO-001", "externalName": "Test Object 001" } }</pre>

Response

If the upsert is successful, a record is created.

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 2: Upsert a Record With `warningAcknowledged=false`

As a user without the [Admin access to MDF OData API](#) permission, if you upsert a warning-enabled entity without the `warningAcknowledged` parameter or set the parameter value to `false`, you get an error:

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/upsert&warningAcknowledged=false</code>
Payload	<pre>{ "__metadata":{ "uri":"cust_TestObject('TO-002')", }, "externalCode":"TO-002", "externalName":"Test Object 002" }</pre>

Response

```
{
  "d": [
    {
      "key": null,
      "status": "ERROR",
      "editStatus": null,
      "message": "<user-defined message text>; To be able to save MDF object with warning, please set the 'warningAcknowledged' flag to true. with the index 0",
      "index": 0,
      "httpCode": 500,
      "inlineResults": null
    }
  ]
}
```

6.5.3.2 Sample Operations

6.5.3.2.1 Inserting An Entry to A Composite Child Entity

We use PickListValueV2 as the example of a composite child entity and show you how to insert an entry.

Use Case: Create a Picklist Value

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-server>/odata/v2/PickListValueV2

Payload

```
{
  "__metadata": {
    "uri":
    "PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')",
    "type": "SFOData.PickListValueV2"
  },
  "externalCode": "717011",
  "PickListV2_effectiveStartDate": "/Date(-2208988800000)/",
  "PickListV2_id": "OfficeLocation",
  "status": "A",
  "label_en_US": "Guangzhou"
}
```

Note

You must include at least one label property in the request payload.

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')",
      "type": "SFOData.PickListValueV2"
    },
    "status": "A",
    "label_en_US": "Guangzhou",
    "PickListV2_id": "OfficeLocation",
    "PickListV2_effectiveStartDate": "/Date(-2208988800000)/",
    "externalCode": "717011"
  }
}
```

6.5.3.2.2 Updating Picklist Values Using Upsert with Purge Type Parameters

You can use the `upsert` operation with the `purgeType` parameters to perform a full purge or an incremental update on an entity.

We use `PickListValueV2` as the example of a composite child entity and show you how to fully purge picklist values or update a picklist value of a picklist.

Deleting All Picklist Values

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/upsert?purgeType=full</code>
Payload	<pre>{ "__metadata": { "uri": "PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00',id='ExistingPickList')" }, "status": "A" }</pre>

Response

Sample Code

```
{
  "d": [
    {
      "key": "PickListV2/
effectiveStartDate=2020-07-17T00:00:00.000-04:00,PickListV2/id=ExistingPickList",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "statusCode": 200,
      "inlineResults": null
    }
  ]
}
```

The picklist now has no picklist values.

Replacing Old Picklist Values with New Ones

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-server>/odata/v2/upsert?purgeType=full
Payload	<pre>{ "__metadata": { "uri": "PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00',id='PickListExample')" }, "status": "A", "values": [{ "__metadata": { "uri": "PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickListV2_id='PickListExample',externalCode='NEWVALUE1')" }, "status": "A", "label_en_US": "New Value 1" }, { "__metadata": { "uri": "PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickListV2_id='PickListExample',externalCode='NEWVALUE2')" }, "status": "A", "label_en_US": "New Value 2" }] }</pre>

Response

Sample Code

```
{
  "d": [
    {
      "key": "PickListV2/effectiveStartDate=2020-07-17T00:00:00.000-04:00,PickListV2/id=PickListExample",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

All previous picklist values of the picklist are replaced with the two new values.

Updating the Label of an Existing Picklist Value

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-server>/odata/v2/upsert?purgeType=incremental or https://<API-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00',id='PickListExample')" }, "status": "A", "values": [{ "__metadata": { "uri": "PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickListV2_id='PickListExample',externalCode='NEWVALUE1')" }, "status": "A", "label_en_US": "New Label" }] }</pre>

Response

Sample Code

```
{
  "d": [
    {
      "key": "PickListV2/
effectiveStartDate=2020-07-17T00:00:00.000-04:00,PickListV2/id=PickListExample",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Only the label of picklist value "NEWVALUE1" is updated.

Related Information

[Upsert](#)

[Edit Parameter: purgeType](#)

6.5.3.2.3 Updating Picklist Values Using Merge

You can use the merge operation to incrementally update a property without providing all required properties in the payload.

We use `PickListValueV2` as the example of a composite child entity and show you how to update picklist values using merge.

Request

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/ PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickListV2_id='ExamplePicklist',externalCode='OldValue')</code>
Headers	<code>x-http-method: MERGE</code>
Payload	<pre>{ "externalCode": "NewValue" }</pre>

Response

A successful operation returns status 200 OK with no payload.

Related Information

[Merge](#)

6.5.3.2.4 Replacing Picklist Using Replace

You can use the replace operation to update an existing record with the fields specified in the request payload and resets all other fields to their default value. Unlike the merge operation, you must provide all required fields in the request payload.

We use `PickListV2` as an example to show you how to replace an old picklist with a new one. The example picklist had an old name and its display order was numeric.

Request

Operation	Replace
-----------	---------

HTTP Method	PUT
URI	<code>https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00' ,id='OldID')</code>
Payload	<pre>{ "id": "NewID", "status": "A" }</pre>

Response

A successful operation returns status 200 OK with no payload. In the updated version, the example picklist has no name and its display order is reset to the default value that is alphabetic.

Related Information

[Replace](#)

6.5.3.2.5 Deleting Picklist or Picklist Value

You can use the delete operation to delete an entry by passing the key predicate in the request URI.

We use `PickListV2` and `PickListValueV2` as examples to show you how to delete an entry.

Request

Deleting a Picklist

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00' ,id='ExamplePicklist')</code>

Deleting a Picklist Value

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<API-server>/odata/v2/ PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickListV2_id='ExamplePicklist',externalCode='ExampleValue')</code>

Response

A successful delete operation returns status 200 OK with no response payload. The picklist and picklist value specified in the URI are deleted from the system.

6.5.3.2.6 Creating Links for MDF Entities

You can use the `$links` option to create links for MDF entities.

Rules for Creating Links for MDF Entities

The following rules apply when you create links between MDF entities (including MDF Foundation Objects):

- You can't create links for MDF Generic Objects with composite type associations.
- A new link is always inserted for a 1:n association. If the same link already exists, the POST operation returns `204 No Content` without data change.
- For 1:1 relationship, if a link already exists, the POST operation fails.

Adding a Parent Picklist Using Links

We use `PickListV2` as the example to show you how to create links for MDF entities. You can't create a new picklist value by using the `$links` option because the association between `PickListV2` and `PickListValueV2` is composite.

Request

HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'2020-07-17T00:00:00' ,id='ChildPicklist')/\$links/parentPickListNav</code>
Payload	<div style="border: 1px solid #ccc; padding: 10px;"><p>↔ Sample Code</p><pre>{ "uri": "PickListV2(effectiveStartDate=datetime'2020-07-10T00:00:00',id='ParentPickList')" }</pre></div>

Response

A successful operation returns status 204 (No Content) with no payload. In the updated version, the child picklist is assigned with a parent picklist.

Related Information

[Working with Links](#)

6.5.3.2.7 Updating Parent Picklist Value Using Links

You can use the `$links` option to update links of noncomposite associations.

We use `PickListValueV2` as the example and updates the parent picklist value.

Note

You can't update picklist values of a picklist using the `$links` option because the association type between `PickListV2` and `PickListValueV2` is composite.

Request

HTTP Method	PUT
URI	<code>https://<API-server>/odata/v2/ PickListValueV2(PickListV2_effectiveStartDate=datetime'2020-07-17T00:00:00',PickListV2_id='ChildPicklist',externalCode='ExampleValue')/\$links/ parentPickListValueNav(PickListV2_effectiveStartDate=datetime'2020-07-10T00:00:00',PickListV2_id='ParentPicklist',externalCode='OldValue')</code>
Payload	<div><p>Sample Code</p><pre>{ "uri": "PickListV2(PickListV2_effectiveStartDate=datetime'2020-07-10T00:00:00',PickListV2_id='ParentPicklist',externalCode='NewValue')" }</pre></div>

Response

A successful operation returns status 204 (No Content) with no payload. In the updated version, the value of the child picklist is assigned with a new value from the parent picklist.

Related Information

[Working with Links](#)

6.5.3.2.8 Linking Attachments to an MDF Entity

How to link an attachment to an MDF OData API entity.

Context

The attachment navigation property in an MDF entity doesn't allow you to inline edit attachments. To link an attachment to an MDF entity, you first create the attachment object with the [Attachment](#) entity, and then link this object to the MDF entity.

ⓘ Note

You're not allowed to add the same attachment ID to multiple objects. If you want to link the same attachment to another object, upload it again to create a new attachment ID.

Procedure

1. Create an attachment object with the [Attachment](#) entity.

Sample Request:

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload

```
{
  "__metadata": {
    "uri": "Attachment"
  },
  "fileName": "Resume.pdf",
  "module": "RECRUITING",
  "userId": "cgrant",
  "viewable": true,
  "fileContent":
  "PHA+VGhp...KSHlsHcq9JS"
}
```

Sample Response:

```
{
  "d": [
    {
      "key": "Attachment/attachmentId=499",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": "Upserted successfully",
      "index": 0,
      "httpCode": 200,
    }
  ]
}
```

```

    "inlineResults": null
  }
]
}

```

2. Create a new entry or update an existing entry for the MDF entity with the new attachment created in the previous step.

Sample Request:

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>
Payload	<pre> { "__metadata": { "uri": "cust_TestMDFObject" }, "externalCode": "test entry 01", "effectiveStartDate": "/Date(1565222400000)/", "externalName": "Test MDF Entry 01", "cust_attachmentNav": { "__metadata": { "uri": "Attachment(499L)" } } } </pre>

6.5.3.2.9 Creating Self-Referenced Record Using Upsert

You can use the `upsert` operation to create a self-referenced record for custom entities whose effective dating type isn't MCPD.

Example Entity

We use `cust_EntityP` as the example entity.

- `cust_EntityP` is a custom entity.
- `cust_EntityP` has a *Generic Object* field `cust_goNav` and the *Valid Value Source* is `cust_EntityP` itself.
- The effective dating type of `cust_EntityP` isn't MCPD.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')" }, "cust_goNav": { "__metadata": { "uri": "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')" }, "externalCode": "ValueA" } }</pre>

Response

Sample Code

```
{
  "d": [
    {
      "key": "cust_EntityP/
effectiveStartDate=2020-07-17T00:00:00Z,cust_EntityP/externalCode=ValueA",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Wrong Method to Create Self-Referenced Record Using Insert

You can't create self-referenced record using insert.

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-server>/odata/v2/cust_EntityP
Payload	<pre>{ "__metadata": { "uri": "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')" }, "cust_goNav": { "__metadata": { "uri": "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')" }, "externalCode": "ValueA" } }</pre>

Response

Sample Code

```
{
  "error": {
    "code": "COE_GENERAL_BAD_REQUEST",
    "message": {
      "lang": "en-US",
      "value": "[COE0018]Record '(effectiveStartDate=2020-07-17, externalCode=ValueA)' of type 'cust_EntityP' already exists."
    }
  }
}
```

6.5.3.2.10 Upsert Self-Referenced Entity with Different Field Value in Payload

Refer to the sample operation for how the system handles different values of the self-referenced field in payload.

Example Entity

We use `cust_EntityP` as the example entity.

- `cust_EntityP` is a custom entity.
- `cust_EntityP` has a *Generic Object* field `cust_goNav` and the *Valid Value Source* is `cust_EntityP` itself.
- The effective dating type of `cust_EntityP` isn't MCPD.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')" }, "name": "A", "cust_goNav": { "__metadata": { "uri": "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')" }, "name": "B" } }</pre>

Response

The *name* of cust_EntityP's record **ValueA** is updated as **A**.

Sample Code

```
{
  "d": [
    {
      "key": "cust_EntityP/
effectiveStartDate=2020-07-17T00:00:00Z,cust_EntityP/externalCode=ValueA",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

6.5.3.2.11 Upsert Handling Different Field Values in Payload

Refer to the sample operation for how the system handles different values of the same *Generic Object* field in payload.

Example Entity

We use `cust_EntityP` as the example entity.

- `cust_EntityP` is a custom entity.
- `cust_EntityP` has a *Generic Object* field `cust_goNav` and the *Valid Value Source* is `cust_EntityC`.
- The effective dating type of both `cust_EntityP` and `cust_EntityC` isn't MCPD.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/upsert</code>

Payload

```
[
  {
    "__metadata": {
      "uri":
      "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')"
    },
    "cust_goNav": {
      "__metadata": {
        "uri":
        "cust_EntityC(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueB')"
      },
      "name": "Name A"
    }
  },
  {
    "__metadata": {
      "uri":
      "cust_EntityP(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueA')"
    },
    "cust_goNav": {
      "__metadata": {
        "uri":
        "cust_EntityC(effectiveStartDate=datetime'2020-07-17T00:00:00',externalCode='ValueB')"
      },
      "name": "Name B"
    }
  }
]
```

Response

The *name* of cust_EntityC's record **ValueB** is updated as **Name B**.

Sample Code

```
{
  "d": [
    {
      "key": "cust_EntityP/
effectiveStartDate=2020-07-17T00:00:00Z,cust_EntityP/externalCode=ValueA",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    },
    {
      "key": "cust_EntityP/
effectiveStartDate=2020-07-17T00:00:00.000Z,cust_EntityP/externalCode=ValueA",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 1,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

```
}  
  ]  
}
```

7 API Center

Describes the features of the API Center and required permissions .

The API center is a one-stop shop for accessing OData API tools. You'll find the API Center in the Admin Center. If you can't see it there, check that you have the permission for at least one of the tools hosted on the API Center. For more information, see [Permissions for API Center \[page 196\]](#).

Note

Users can only access tools for which they have permission. Otherwise the tools are displayed but they are greyed out.

Related Information

[Enabling API Audit Logs \[page 199\]](#)

[Creating and Editing Users Using an API Option Profile \[page 437\]](#)

[OData API Data Dictionary \[page 197\]](#)

[Restricting OData API Access through Basic Authentication \[page 14\]](#)

[OData API Metadata Management \[page 203\]](#)

[Permissions for API Center \[page 196\]](#)

[SFAPI Metering Details \[page 204\]](#)

7.1 Permissions for API Center

A list of role-based permissions required to access *API Center* tools.

The following role-based permissions are available under [Administrator Permissions](#) > [Manage Integration Tools](#) for *API Center* tools:

Permission	Description
Access to SFAPI Audit Log	Access the SFAPI Audit Log. Caution This permission allows user to view data sent in every SFAPI call. The data could be sensitive.

Permission	Description
Access to SFAPI Metering Details	Access the SFAPI Metering Details to see SFAPI usage statistics
Access to SFAPI Data Dictionary	Access SFAPI Data Dictionary.
Manage OAuth2 Client Applications	Manage OAuth2 client applications
Access to OData API Audit Log	Access to the OData API audit log tool
Manage OData API Basic Authentication	Manage OData API Basic Authentication settings
Access to OData API Version Control	Check the current OData API version and switch versions
Access to API Center	Access to API Center
Access to API Option Profile	Access the API option profile tool to manage processing parameters for the User entity.
Access to OData API Metadata Refresh and Export	Access the OData API Metadata Refresh and Export tool.
Access to OData API Data Dictionary	Access the OData API Data Dictionary tool.

7.2 Data Dictionary

7.2.1 OData API Data Dictionary

The OData API Data Dictionary is a UI-based tool to view OData metadata for entities, function imports, and complex types.

⚠ Caution

The OData API Data Dictionary only lists the APIs that are enabled in your company. Internal APIs, beta APIs, and APIs belonging to products that aren't enabled for your company can't be found here. To query the metadata of beta APIs, see the Metadata section.

Permission

You have the [Manage Integration Tools](#) > [Access to OData API Dictionary](#) permission.

📌 Note

To optimize performance, you can request to activate the Provisioning switch [Enable OData API Dictionary Cache](#) under [Web Services](#).

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

Features

In the OData API data dictionary, you can use *Search All*, or narrow your search to *Entity*, *Complex Type*, or *Function Import*.

Using the search filters *Entity*, *Complex Type*, or *Function Import* also lets you narrow your search by *Tag*, for example EC - Payment Information . This then ensures that under *Name*, you only see the entities available for this tag.

Information is displayed in a tabular form. A horizontal and vertical scroll bar are available to make viewing easier. The following columns are available and can be sorted alphabetically in ascending or descending order:

- *Property Name*
In addition to sorting alphabetically, you can also filter by a defined term.
- *Property Label*
- *Type*

These columns are fixed. However, the following columns can be arranged to meet your requirements:

- *sap.picklist*
- *Business Key*
- *Nullable*
- *sap: required*
- *sap: creatable*
- *sap: updatable*
- *sap: upsertable*
- *sap: visible*
- *sap: sortable*
- *sap: filterable*
- *sap: semantics*
- *sap: display-format*
- *sap: aggregation role*
- *DefaultValue*
- *MaxLength*
- *Precision*
- *Scale*
- *sap: inlineRequired*
- *Navigation Target*

7.2.2 Legacy SFAPI Data Dictionary

Lists all available SFAPI entities and the fields in each entity.

You can use the [Legacy SFAPI Data Dictionary](#) tool to look up SFAPI entities, supported operations, and field properties.

Note

In Admin Center, the tool is called [SFAPI Data Dictionary](#), but in API Center, it is called [Legacy SFAPI Data Dictionary](#).

To access the dictionary, you must have the [Admin Access to SFAPI Data Dictionary](#) permission under [Manage Integration Tools](#) available in both user-based and role-based permission systems.

The SFAPI Data Dictionary lists all available SFAPI entities in your company. You can expand any entity to see the supported operations, field names, and detailed attributes for each field in a table. The following attributes are available for an SFAPI entity:

- [Name](#)
- [Data Type](#)
- [Label](#)
- [Max Length](#)
- [Picklist ID](#)
- [Required](#)
- [Insertable](#)
- [Upsertable](#)
- [Updateable](#)
- [Selectable](#)
- [Filterable](#)
- [Sortable](#)
- [Sensitive](#)
- [Supported Operators](#)
- [Enumerations](#)

7.3 Enabling API Audit Logs

Enable API audit logs in [API Center](#) so you can view and download API transaction history for troubleshooting API issues.

Prerequisites

You have the following permissions:

- [Manage Integration Tools](#) > [Access to API Center](#) >
- [Manage Integration Tools](#) > [Access to OData API Audit Log](#) > for viewing OData API audit logs.
- [Manage Integration Tools](#) > [Access to SFAPI Audit Log](#) > permission for viewing SFAPI audit logs.

Note

The audit log can contain sensitive data. Make sure that the access to API audit logs is given only to trusted users. As a safety strategy, grant permission to developers only when necessary for development and debugging purposes, and then remove access when the tasks are finished. Note that removing a user's access to the audit log doesn't remove the data from the server.

Context

API Audit logs include API request and response information, including payloads. This information help developers diagnose issues happened during an API call.

Note

The maximum retention period for audit logs is 90 days.

When are audit logs purged?

The following limits apply to both OData and SFAPI audit logs:

- A default maximum log count for each company. The number varies from 10,000 to 500,000 depending on the Provisioning settings.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

- A default retention time of 90 days.

When either limit is reached, older audit log entries will be purged.

Additionally, audit data in preview instances is subject to the retention time defined in Auto Data Purge. For more information, see the Related Information section.

What information is logged?

Depending on the operation type and status, the information kept in the audit log varies. The following tables show what information is logged in SFAPI and OData API audit logs:

OData Audit Log

Condition		Result (Y = Logged, N = Not Logged)			
Operation Type	Operation Status	Request Header	Request Payload	Response Header	Response Payload
Query	Success	Y	N	Y	N

Condition		Result (Y = Logged, N = Not Logged)			
Operation Type	Operation Status	Request Header	Request Payload	Response Header	Response Payload
	Failure	Y	N	Y	N
Edit	Success	Y	N	Y	N
	Failure	Y	Y	Y	Y
	Including partial failure in \$batch and upsert				

Legacy SFAPI Audit Log

Condition		Result (Y = Logged, N = Not Logged)			
Operation Type	Operation Status	Request Header	Request Payload	Response Header	Response Payload
Query	Success	Y	N	Y	N
	Failure	Y	N	Y	N
Edit	Success	Y	Y	Y	Y
	Failure	Y	Y	Y	Y

Procedure

- Go to [Admin Center](#) > [API Center](#) > [Audit Log Settings](#) and turn on audit logs for SFAPI or OData API using the following options:

Option	Description
OData API Audit Log	Switch it on if you want to enable audit log for OData API.
Enable Payloads in OData API Audit Log for Edit Errors	Enable this option if you want to log request and response payloads for failed edit operations of OData API.
Enable All Payloads	If you choose this option, all payloads of query and edit operations for OData API are logged for the next 4 hours, regardless of whether it's successful or not.
SFAPI Audit Log	Switch it on if you want to enable audit log for SFAPI.

Option	Description
Enable Payloads in SFAPI Audit Log for Edit Operations	Enable this option if you want to log request and response payloads for all edit operations for SFAPI.
Enable Payloads in SFAPI Audit Log for Edit Operations	If you choose this option, all payloads of query and edit operations of SFAPI are logged for the next 4 hours, regardless of whether it's successful or not.

Audit log is enabled for SFAPI or OData API.

- Go to **Admin Center** > **API Center** and choose one of the following tools:
 - OData API Audit Log**: View OData API transaction history and payloads.
 - Legacy SFAPI Audit Log**: View SFAPI transaction history and payloads.
- On the audit log screen, use the filter section to filter or search for the transaction history. For each log, you can see the following information:
 - Log ID** (filterable, text only)
 - Login ID** (filterable, text only)
 - Session ID**
 - Request ID**
 - Status**
 - OData API Call**
 - Entity**
 - Request Time**
 - Responses (ms)** (filterable)
The response filter supports the following operations:
 - Equal to (=)
 - Greater than (>)
 - Less than (<)
 - Greater than or equal to (>=)
 - Less than or equal to (<=)
 - Not equal to (!=)
 - Range (...). Example: filter 100..200 means >=100 and <=200.
 - HTTP Message** (downloadable audit log detail with header and payload information)
- On the **HTTP Message** column, choose to display log details.

The detail screen contains request and response header information, and payload information if it's enabled. Switch tabs to view detailed information.

Request header:

```
GET https://<API-Server>/odata/v2/checkUserPermission?
%24format=json&accessUserId=%27extuser133%27&company=<CompanyID>&permLongValue=-1
L&permStringValue=%27cubetree_access%27&permType=%27cubetree%27
ip address: <Server IP>
host: <API-Server>
```

```
x-forwarded-for: <Server IP>
x-forwarded-port: 9003
x-forwarded-proto: http
authorization: Bearer *****
accept-encoding: gzip;q=1.0,deflate;q=0.6,identity;q=0.3
accept: */*
user-agent: Ruby
x-forwarded-host: <API-Server>
```

Response header:

```
X-Event-ID: EVENT-UNKNOWN-UNKNOWN-or3areboh40s-20200330013237-191176
CorrelationId: 2febeba5-963d-4f5e-b0b4-1ef2b3566878
Content-Type: application/json;charset=utf-8
DataServiceVersion: 1.0
Vary: Accept-Encoding
Content-Encoding: gzip
SFODataServerTimeZone: America/New_York
Status: 200
```

5. (Optional) Choose [Download](#) on each tab to download the log.

Related Information

[Impacts of Auto Data Purge](#)

7.4 OData API Metadata Management

You can use the OData API Metadata Management tool to refresh metadata cache and export OData API metadata.

To view OData API Metadata Refresh and Export, select the [OData API Metadata Management](#) link in [API Center](#). You will see two buttons:

- [Refresh](#)
- [Export](#)

Refresh and Export operations are described below:

Operation	Description
Refresh	Refreshes the metadata cache. The updated metadata is re-generated, and saved into the cache and is available for future operations such as export.
Export	Exports and downloads the metadata. The default export file name is <code>CompanyName-Metadate.xml</code>

In most cases, refresh is automatic, for example when an admin changes or creates an object definition in the Extension Center or in the Configure Object Definition page or when an Admin enables/disables a feature in the Upgrade Center leading to a change that requires a refresh of OData metadata.

Use the Refresh option whenever entities or fields are not reflecting the latest changes made to them.

📌 Note

A manual refresh is always required when a user with Provisioning access chooses to enable/disable a product feature or change the language packs via Provisioning leading to a corresponding OData API change. In this case, the change will only be effective after a manual refresh.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

7.5 SFAPI Metering Details

The SFAPI Metering Details tool gives you analytics on your API usage up to the last 30 days. You can use this page to see API call history analytics like how many times the API was called, or what was the total record counts accessed in your system.

Select one of the following dimensions (views) from the drop-down list to display the API call history:

- Call Count
- Processing Time (Avg)
- Processing Time (Total)
- Bandwidth (Avg)
- Bandwidth (Total)
- Bandwidth (Request Avg)
- Bandwidth (Request Total)
- Bandwidth (Response Avg)
- Bandwidth (Response Total)
- Record Count (Avg)
- Record Count (Total)
- Record Count (Request Avg)
- Record Count (Request Total)
- Record Count (Response Avg)
- Record Count (Response Total)

You can choose to display the API call history in the following time periods:

- 6 hours
- 12 hours
- 24 hours
- 2 days
- 4 days
- 7 days
- 15 days

- 30 days

8 HTTP Codes, Errors, Timeouts, and Access Limits

[Logon Errors \(LGN\) \[page 211\]](#)

A list of API authentication and authorization errors.

[OAuth 2.0 Errors \[page 216\]](#)

A list of error codes and messages related to OAuth 2.0.

[Timeouts \[page 220\]](#)

Understand the timeout scenarios during API calls and learn how to handle timeouts.

[Access Limits \[page 221\]](#)

Find out the access limits of OData v2 APIs in SAP SuccessFactors HCM suite.

8.1 HTTP Response Codes

List of HTTP response codes used in OData v2 APIs.

List of HTTP Response Codes

Code	Description	Available for Operation
200	Success response code that indicates a resource is retrieved.	Query Update Merge/replace Upsert Delete \$batch operation for merge, delete, and update
201	Success response code that indicates a resource is created.	Insert \$batch operation for insert Upsert

Code	Description	Available for Operation
400	Indicates that the server can't or won't process the request because of client error, such as malformed syntax.	Query Insert Update Merge/replace Upsert Delete
401	Indicates that the hasn't been completed due to authentication error.	Query Insert Update Merge/replace Upsert Delete
404	Indicates that the server can't find the requested resource.	Query Insert Update Merge/replace Delete
500	Indicates a server error.	Query Insert Update Merge/replace Delete

8.2 Common Errors (COE)

A list of common errors thrown by the OData v2 API framework.

HTTP Code	Error Code	Error Message Example	Solutions
N/A	COE0001 COE0002	Error messages related to missing permissions.	Assign the corresponding permissions.
400 404	COE0003	Bad property expression.	N/A
400	COE0005	The given value <a> for property is invalid. <c>. Please check the property in Admin Center > OData API Data Dictionary .	<ul style="list-style-type: none"> Check entity's property attribute in OData API Data Dictionary. Check the entity metadata and for the property attribute.
400	COE0007	Entity or function name <a> is not found. 	<ul style="list-style-type: none"> Check spellings. Check if a navigation is missing and add it in object definition. If there's a recent change in object definition in the data model, refresh the OData metadata.
400	COE0008	Invalid function import name: <a>. Please check the name in Admin Center > OData API Data Dictionary .	Enter the correct function name.
400	COE0009	Entity {0} is not insertable.	Do not insert records to this entity.
400	COE0010	Entity {0} is not updatable.	Do not update records of this entity.
400	COE0011	Entity {0} is not upsertable.	Do not upsert records of this entity.
400	COE0012	Entity {0} is not deletable.	Do not delete records of this entity.
400	COE0013	Entity {0} is not replaceable.	Do not replace records of this entity.
400	COE0014	Links {0} is not insertable.	Do not insert links.
400	COE0015	Links {0} is not updatable.	Do not update links.
400	COE0016	Links {0} is not upsertable.	Do not upsert links.
400	COE0017	Links {0} is not deletable.	Do not delete links.
400	COE0018	Bad request.	<ul style="list-style-type: none"> If it is a GET request, make sure the field names are correct and the navigation is properly formed. If it is a POST request, make sure the mandatory fields present in the request payload and verify the format in which the request is being sent.
400	COE0021	Invalid property names: {0}. Please check the property name in Admin Center > OData API Data Dictionary or entity metadata.	Enter a correct property name.

HTTP Code	Error Code	Error Message Example	Solutions
400	COE0022	Properties {0} are not accessible. Please check the property name in Admin Center > OData API Data Dictionary or the entity metadata.	Do not query inaccessible properties.
400	COE0023	Property {0} is not visible. Please check the visibility setting of the property in Admin Center > OData API Data Dictionary or the entity metadata.	Do not query invisible properties.
400	COE0024	Unsupported entity set category: <a>. Only public, restricted, internal, and beta categories are supported.	Query only supported categories.
400	COE0025	Unsupported feature: <detail error message>	<ul style="list-style-type: none"> • Check if the operation which is being carried on the entity is supported by the entity in the data dictionary. • Check if navigation is expanded without the base entity. • Check if you're expanding the wfRequestNav property of an MDF entity that does not have workflow enabled. If workflow is not enabled, you're not allowed to expand wfRequestNav.
400	COE0026	Unsupported locale: <a>. For a list of supported languages and locales, please visit 2269945	Use a supported locale.
400	COE0027	Please add required properties in payload. <a>. You can check which properties are required for an entity in Admin Center > OData API Data Dictionary or the entity metadata.	Check the dictionary and add required properties in the payload.
400 404	COE0028	Record for entity <a> with key does not exist. Please check the key value.	Change key value.
400	COE0029	A record for entity <a> with key already exists. Please use another key.	Change key value.
400	COE0030 COE0031 COE0032	<Message text from another module>. Please check the property setting in Admin Center > OData API Data Dictionary or the entity metadata.	Check the OData API Data Dictionary or entity metadata.
400	COE0033	Maximum length limit exceeded for field <a>: actual length: ; maximum length: <c>.	Reduce the length of the field value.

HTTP Code	Error Code	Error Message Example	Solutions
	COE0034	Property <a> is not inline-required. Please check the sap:inlineRequired setting of the property in Admin Center > OData API Data Dictionary or the entity metadata.	Check the OData API Data Dictionary or entity metadata.
	COE0035	Unable to parse option roleNames {0}. Please verify the format.	Verify the format of customOption roleNames.
400	COE0037	Entity <a> is not editable. Please check the entity setting in Admin Center > OData API Data Dictionary or the entity metadata.	Do not edit records for the entity.
	COE0038	Invalid service alias name: {0}. Please contract your system administrator to check the service alias name.	Use the correct alias name. For now, we only have three service aliases: _CPMEntityService, _FeatureProvisioningService, and _TodoEntryV2Service.
	COE0039	<Message text from another module>	Do not use service aliases along with entity/function/complexType.
503	COE0040	<Message text from another module>	Dependent on modules.
400	COE0041	The given value <a> for parameter is invalid. Please check the value type in Admin Center > OData API Data Dictionary and use the correct value in API request.	Enter the correct parameter value.
400	COE0042	Parameter {0} is missing. Please check required parameters in Admin Center > OData API Data Dictionary and add the required parameters in API request.	Add the required parameter and value.
454	COE0044	Expand size {0} exceeds the limit {1}.	Reduce \$expand size.
454	COE0046	Expand depth {0} of {1} exceeds the limit {2}.	Reduce \$expand depth.
400	COE0048	Property <a> is missing in function import payload. Please add required parameters in payload.	Add the missing property and its value to the payload.
400	COE0049	Value <a> for property in function import payload is invalid. Please correct the value in payload.	Enter the correct value for the property.
500	COE0050	The query has exceeded the <n>-minute timeout limit.	Retry.
503	COE0051	The server has run out of resource. Please retry after <n> minutes.	Retry.

HTTP Code	Error Code	Error Message Example	Solutions
454	COE0052	Expand limit of <n> records was exceeded. Please decrease the number of records to expand or use filters to narrow down the result.	Reduce the expand size.
	COE0053	Invalid service group name: <a>. Please contact your system administrator to check the service group name.	Enter a valid service group.

8.3 Logon Errors (LGN)

A list of API authentication and authorization errors.

HTTP Code	Error Code	Error String	Error Message	Solution
400	LGN0	CATE-	Internal: Invalid endpoint odata/v2/internal.	You're trying to access an OData API category that's not available in your instance. <ul style="list-style-type: none"> • If it's an internal category, you have no access to it. • If it's a test category, you can only access it in a test instance. • If it's a beta category, contact your system administrator and find out whether you have the access.
404	001	GORY _DE- NIED	You aren't allowed to access the internal category with an external request.	
			Test: Invalid endpoint odata/v2/test. The test category is not enabled in the production environment. Beta: Invalid endpoint odata/v2/beta. The beta category is not enabled. Please contact your system administrator to enable the OData API Public Beta Category.	

HTTP Code	Error Code	Error String	Error Message	Solution
403	LGN0002	ODATA_ADMIN_PERMISSION_REQUIRED	Authentication failed. You do not have the admin permission to access OData API. Please check the permission setting for your role at Manage Integration Tools > Allow Admin to Access OData API through Basic Authentication .	Assign the corresponding permission in RBP.
401	LGN0003	CREDENTIALS_MISSING	Authentication credentials are required. Please provide a valid username, password, and company ID.	Provide your credentials (<code><username>@<companyID>:<password></code>) and encode them using Base64 format.
401	LGN0004	AUTHENTICATION_DENIED	You are not allowed to access OData APIs using Basic Auth or OAuth on a non-API server. To do this, you need to switch to the corresponding API server. For a list of available servers, visit About SAP SuccessFactors OData APIs (V2) [page 7] .	Choose the right API server.
400	LGN0005	OAuth_TOKEN_FORMAT_INVALID	Wrong token format. Please check your token for OAuth authentication.	Follow the steps in Authentication Using OAuth 2.0 [page 17] to generate a new OAuth token.
401	LGN0006	INTERNAL_TOKEN_EXPIRED	Token {0} has expired. Please log in again or perform a getToken operation to refresh your access token.	Follow the steps in Authentication Using OAuth 2.0 [page 17] to generate a new OAuth token.
401 403	LGN0007	TOKEN_INVALID	Invalid OAuth token {0}. Please check the token value.	Follow the steps in Authentication Using OAuth 2.0 [page 17] to validate your token or generate a new OAuth token if needed.
401	LGN0008	COMPANY_NOT_FOUND	Company {0} not found. Make sure you have entered the correct company ID. Please note that the company ID is case-sensitive.	Enter the correct company ID.
401	LGN0009	ODATA_API_FEATURE_NOT_ENABLED	OData API is not enabled for this company. Please contact SAP support to enable the feature.	Contact Product Support to enable OData API for your company.

HTTP Code	Error Code	Error String	Error Message	Solution
401	LGN0010	BA-SIC_AUTH_OR_IP_DISABLE	Basic Authentication is disabled for company <companyID> or your IP <IP address> is not authorized to access OData API. To enable Basic Authentication, grant the permission to your role at Manage Integration Tools > Manage OData API Basic Authentication > . To authorize your IP address for OData API access, go to API Center > OData API IP Whitelisting > .	Assign the corresponding permission and add your IP address to the allowlist.
401	LGN0011	COMPANY_EXPIRED	Authentication failed. You have provided an expired company (status code = <code>). Please contact your system administrator to reset the expiry date.	Contact Product Support.
	LGN0012	COMPANY_INACTIVE	Authentication failed. You have provided an inactive company (status code = <code>). Please contact your system administrator to re-activate the company.	Contact your system administrator to re-activate the company.
401	LGN0013	IP_INVALID	Authentication failed. We have prevented an attempted login from unauthorized IP: <IP address> to company ID: <companyID> with username: <username> (status code = <code>). To authorize the login, add an exception in Admin Center > Company Settings > Password & Login Policy Settings > Set API Login Exceptions > . For more information, visit Restricting API Access by IP Addresses or IP Address Ranges [page 14] .	Add an exception as instructed.
401	LGN0014	ACCOUNT_LOCKED	Authentication failed. The user account is locked (status code = <code>). Please contact your system administrator to unlock your account.	Unlock the user.
401	LGN0015	CREDENTIALS_INVALID	Authentication failed. You have entered an incorrect username or password (status code = <code>).	Enter the correct username and password.

HTTP Code	Error Code	Error String	Error Message	Solution
401	LGN0016	USER_NO_LOGIN_PERMISSION	Authentication failed. The user has no login permission (status code = <code>). Please check if the following permissions are granted: <ul style="list-style-type: none"> ▶ General User Permission ▶ User Login ▶ For SFAPI: ▶ General User Permission ▶ SFAPI User Login ▶ For OData API: ▶ Manage Integration Tools ▶ Allow Admin to Access OData API through Basic Authentication ▶ 	Check permission and contact your system administrator to enable permission. If the user is locked, go to ▶ Admin Center ▶ Reset User Account ▶.
401	LGN0017	USER_NEEDS_VALIDATION	Authentication failed. Please validate your user account (status code = {0}).	Check if your user account is valid.
401	LGN0018	PASSWORD_EXPIRED	Authentication failed. The password has expired (status code = <code>). Please log in to SAP SuccessFactors and reset the password, or contact your system administrator.	Reset your password or contact your system administrator..
401	LGN0020	BASIC_AUTH_FORMAT_INVALID	Incorrect format for HTTP Basic Authentication. Please encode your credentials (<username>@<companyID> : <password>) using Base64 format. For more information, visit HTTP Basic Authentication (Deprecated) [page 16].	Enter the credentials in correct format.
400	LGN0023	GACE_FLAG_NOT_OPEN	Person-only is not supported when Global Assignment and Concurrent Employment features are not enabled. Please contact your system administrator to enable the features.	Contact your system administrator to turn on Global Assignment and Concurrent Employment features.
	LGN0024	EC_V2_NOT_OPEN	Employee Central V2 feature is not enabled. Please contact your system administrator to enable this feature.	Contact your system administrator to turn on Employee Central V2 feature.
401	LGN0025	COMPANY_INVALID	Authentication failed. The company ID is invalid (status code = <code>).	Enter a valid company ID.

HTTP Code	Error Code	Error String	Error Message	Solution
401	LGN0026	CRE-DEN-TIALS_IN-CON-SIS-TENT	Invalid X-CSRF-Token for the session. Please check your token or choose one of the following authentication options: 1) HTTP Basic Authentication 2) Authentication using OAuth 2.0 3) Reuse session. For more information, see https://help.sap.com/viewer/d599f15995d348a1b45ba5603e2aba9b/latest/en-US/4006ecf7444e4bc4aaa18c2364519126.html .	Check the X-CSRF-Token.
451	LGN0027	GEO_IP_BLOCKED	Module specific message.	Follow the instructions provided in the error message.
401	LGN0028	LOGIN_FAIL_ED_OR_SESSION_INVALID	Login failed or session already invalid. Please contact Product Support.	
401	LGN0029	SESSION_INVALID	The session provided in the request header is invalid. Please check the session or choose one of the following authentication options: 1) HTTP Basic Authentication 2) Authentication using OAuth 2.0 3) Reuse session. For more information, see https://help.sap.com/viewer/d599f15995d348a1b45ba5603e2aba9b/latest/en-US/4006ecf7444e4bc4aaa18c2364519126.html .	
401	LGN0030	BASIC_AUTH_NOT_ALLOWED	HTTP Basic Authentication (Basic Auth) is no longer supported in OData. Please choose OAuth 2.0 to authenticate users. For more information, see https://help.sap.com/viewer/d599f15995d348a1b45ba5603e2aba9b/latest/en-US/d9a9545305004187986c866de2b66987.html .	
401	LGN0031	JWT_GENERATION_ERROR	Unable to generate the JWT token. Please contact Product Support.	
401	LGN0032	JWT_PARSING_ERROR	Unable to parse the JWT token. Please contact Product Support.	
401	LGN0033	JWT_INVALID	Invalid JWT token: token expired or invalid. Please regenerate the JWT token.

8.4 OAuth 2.0 Errors

A list of error codes and messages related to OAuth 2.0.

HTTP Code	Error String	Error Message	Description
500	OAUTH2_ERROR_INVALID_CLIENT_INFO	Client information contains error.	
500	OAUTH2_ERROR_MISSING_REQUIRED_CLIENT_INFO_FIELD	Missing required field in client information.	
500	OAUTH2_ERROR_INVALID_CLIENT_INFO_FIELD	Some client information field contains an error.	
500	OAUTH2_ERROR_CLIENT_ALREADY_EXISTS	The client application (API key = "###") already exists.	
500	OAUTH2_ERROR_CLIENT_NOT_EXISTS	The client application (API key = "###") does not exist.	
500	OAUTH2_ERROR_UNABLE_TO_REGISTER_CLIENT	Unable to register client application.	
500	OAUTH2_ERROR_UNABLE_TO_DEREGISTER_CLIENT	Unable to deregister client application.	
500	OAUTH2_ERROR_INVALID_TOKEN_URL	The token URL is invalid.	Make sure that the token URL is in the correct format.
500	OAUTH2_ERROR_INVALID_X509_PRIVATE_KEY	The X.509 private key contains an error.	Check whether the X.509 private key and make sure it's valid.

HTTP Code	Error String	Error Message	Description
500	OAUTH2_ERROR_UNABLE_TO_GENERATE_SAML_ASSERTION	Unable to generate SAML assertion.	OAuth server is unable to construct a valid X.509 private key object.
500	OAUTH2_ERROR_UNABLE_TO_SIGN_SAML_ASSERTION	Unable to sign SAML assertion.	Failed to sign SAML assertion using the provided X.509 private key.
400	OAUTH2_ERROR_MISSING_REQUIRED_PARAM	Parameter "###" is required in the OAuth request.	For a GET access token request, <code>grant_type</code> , <code>client_id</code> , <code>company_id</code> and <code>assertion</code> fields are required. To generate a SAML assertion, <code>client_id</code> , <code>token_url</code> , <code>user_id</code> and <code>private_key</code> fields are required.
400	OAUTH2_ERROR_INVALID_GRANT_TYPE	The <code>grant_type</code> is not supported.	<code>grant_type</code> must be set to <code>urn:iETF:params:oauth:grant-type:saml2-bearer</code>
400	OAUTH2_ERROR_UNABLE_TO_COLLECT_SAML_ASSERTION	Unable to retrieve SAML assertion.	The SAML assertion is not Base64 encoded. Missing <code>Issuer</code> , <code>SubjectNameId</code> , <code>Audiences</code> , or <code>Recipients</code> in the assertion.
400	OAUTH2_ERROR_SAML_ASSERTION_EXPIRED	The provided SAML assertion is expired.	The SAML assertion usually expires in 5-10 minutes.
401	OAUTH2_ERROR_UNABLE_TO_VERIFY_SAML_ASSERTION	Unable to verify the signature of the SAML assertion.	SAML assertion is verified using the same X.509 certificate that was provided during OAuth client application registration.
401	OAUTH2_ERROR_UNABLE_TO_VALIDATE_SAML_ASSERTION	Unable to validate "###" in the SAML assertion.	The <code>Issuer</code> field in the assertion does not match the <code>API_KEY</code> . <code>Audiences</code> does not include <code>www.successfactors.com</code> . <code>Recipients</code> points to a different token host.
401	OAUTH2_ERROR_COMPANY_NOT_EXIST	Company "###" does not exist.	

HTTP Code	Error String	Error Message	Description
401	OAUTH2_ERROR_COMPANY_INACTIVE	Company "###" is not currently active.	
401	OAUTH2_ERROR_COMPANY_LICENSE_EXPIRED	Company "###" has expired license.	
401	OAUTH2_ERROR_API_KEY_NOT_EXIST	API key "###" does not exist in company "###".	
401	OAUTH2_ERROR_API_KEY_DISABLED	API key "###" has been disabled in company "###".	
401	OAUTH2_ERROR_AUTHENTICATION_FAILED	Unable to authenticate the client.	An OAuth server error occurred while authenticating access_token.
403	OAUTH2_ERROR_AUTHORIZATION_FAILED	Unable to authorize the client.	An OAuth server error occurred while authorizing access_token.
403	OAUTH2_ERROR_UNABLE_TO_SIGN_TOKEN	Unable to sign access token.	The OAuth server uses an SAP SuccessFactors server certificate to sign the access token. An error occurs if the access token has already been signed, or if the SAP SuccessFactors server certificate is missing.
403	OAUTH2_ERROR_UNABLE_TO_GRANT_TOKEN	Unable to grant access token.	Content is missing in the access token, or a runtime error happened while constructing the access token (this includes JSON-generation exceptions).
500	OAUTH2_ERROR_UNABLE_TO_BUILD_TOKEN_RESPONSE	Unable to build OAuth response.	
400	OAUTH2_ERROR_MISSING_REQUIRED_HEADER	Header "###" is required.	Missing Authorization header in validate token request, or when protected resources were accessed.
400	OAUTH2_ERROR_MISSING_ACCESS_TOKEN	Access token is required.	Authorization header is empty.
400	OAUTH2_ERROR_MUST_BE_BEARER_TOKEN	Access token has to be a Bearer token.	Authorization header is not a Bearer format.

HTTP Code	Error String	Error Message	Description
400	OAUTH2_ERROR_UNABLE_TO_COLLECT_TOKEN	Unable to retrieve access token.	The access token is missing content, or a parsing error happened while deserializing an access token in JSON format.
401	OAUTH2_ERROR_UNABLE_TO_VERIFY_TOKEN	Unable to verify the signature of the access token.	The access token has modified the HTTP MITMA. The SAP SuccessFactors server public key couldn't be found.
401	OAUTH2_ERROR_UNABLE_TO_VALIDATE_TOKEN	Unable to validate access token.	The Access token contains invalid content or has insufficient information (for example, missing <code>client_id</code> , <code>company_id</code> , and so on).
401	OAUTH2_ERROR_TOKEN_INVALID_APIKEY	The access token does not apply to API key "###".	
401	OAUTH2_ERROR_TOKEN_INVALID_COMPANY	The access token does not apply to company "###".	
401	OAUTH2_ERROR_TOKEN_INVALID_APPLICATION_NAME	The access token does not apply to application name "###".	Verify the application name specified during the OAuth client application registration.
403	OAUTH2_ERROR_TOKEN_REJECTED_OR_EXPIRED	The access token is either rejected or expired.	Token has expired (default is 24 hours).
403	OAUTH2_ERROR_INSUFFICIENT_PERMISSION_SCOPE	Insufficient permission scope.	
403	OAUTH2_ERROR_UNABLE_TO_GRANT_ACCESS	Unable to grant access.	External User.
500	OAUTH2_ERROR_UNABLE_TO_BUILD_RESPONSE	Unable to build token validation response.	
500	INTERNAL_ERROR	Internal error.

8.5 Timeouts

Understand the timeout scenarios during API calls and learn how to handle timeouts.

Timeout is a common error during API calls when a client waits for too long for the server to response. Timeouts can happen due to various reasons. In this topic, you'll learn the common timeout scenarios and how to handle timeouts.

Type	Timeout	Timeout Error Response (HTTP Code)	Solution
Session timeout	10 minutes (API server)	502	Retry is possible.
	30 minutes (CF server)		Avoid complex API calls with large data requests.
Gateway timeout	7 minutes	504	Retry gap is 5 minutes. Avoid complex API calls with large data requests.
Client timeout	Client-specific	Client-specific	Timeouts that occur on the client side are handled by the client. See client-specific guidelines on how to avoid them.

[Access Limits \[page 221\]](#)

8.6 Access Limits

Find out the access limits of OData v2 APIs in SAP SuccessFactors HCM suite.

Note

These are API framework access limits that apply to all APIs. Entity-specific access limits may also exist. If they do, you'll find the information in individual API references in this guide.

Operation	Limit
Rate limit for all OData v2 APIs	The limit varies from API to API. Please refer to the API reference for more information.
	<h3>Note</h3> <p>If the limit is exceeded, you'll receive an error with the <code>429 Too Many Requests</code> HTTP code response and a <code>Retry-After</code> header. Please note that the API Gateway manages all incoming API requests and applies load balancing to the traffic so that it's distributed to different API servers. The actual rate limit and <code>Retry-After</code> value may vary slightly depending on server conditions.</p>
Maximum number of expressions in the "in" clause of the <code>\$filter</code> query option	1000
Maximum number of records in upsert payload	1000
Maximum number of requests in a <code>\$batch</code> operation	180
Maximum API audit log count	The limit varies from 10,000 to 50,000 depending on the Provisioning setting. When the limit is reached, older audit logs are purged.
Audit log size limit for SFAPI edit responses	1 MB. SFAPI response payloads larger than 1 MB are not logged.

9 API Reference

9.1 Common Entities

9.1.1 Attachment

Use the `Attachment` entity to upload attachments to different modules with various data elements. For example, you can upload an attachment for `workPermitInfo` in Employee Central. Regardless of the business context, the attachment is managed by the platform attachment framework and can be accessed in [Manage Documents](#).

Permissions

Before you can use this API, make sure that the [Attachment Manager](#) is enabled in your instance and the following permissions are granted to your role:

Permission	Required Setting
Query permission	▶ Manage Integration Tools > OData API Attachment Export ▶
Edit permission	▶ Manage Integration Tools > OData API Attachment Import ▶

Note

Attachment navigated from other entities ignores these permission checks. It follows the permission of the source entity.

Supported Operations

Operation	Description
Query	Query an attachment record by attachment properties.
Insert	Insert a new attachment record.
Delete	Delete an attachment record.
Upsert	If the attachment record doesn't exist, insert a new one. Otherwise, an error message displays.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
attachmentId	ID of the attachment. This field is a business key.
externalId	External ID of the attachment. Either externalId or userId is required to upload an attachment.
fileName	The file name of the attachment is required and it must contain both the file name and the extension. For example: image_001.jpeg .
fileExtension	File extension is read from fileName. The following file extensions are supported: <ul style="list-style-type: none">• doc• doc• pdf• csv• htm• mle• ppt• xls• gif• png• jpg• jpeg• html• rtf• bmp• xlsx• docx• pptx• txt
fileContent	File content is required. The default size limit is 5M. In the payload, the file content is displayed as a base64-encoded string.

Note

If read audit is enabled in your instance, the `fileContent` property is hidden when you query attachments in Recruiting (module property value is RECRUITING).

Property	Description
module	<p>Indicates an SAP SuccessFactors product area. Use one of the following values:</p> <ul style="list-style-type: none"> • DEFAULT • COMPENSATION • GOAL_MANAGEMENT • EMPLOYEE_PROFILE • PM360_REVIEW • PERFORMANCE_MANAGER • RECRUITING • SUCCESSION • VARIABLE_PAY • HRIS • GENERIC_OBJECT • CDP • CALIBRATION • ONBOARDING • GDPR_IR • SPOT_AWARDS • OMP_ASSIGNMENTS • DYNAMIC_TEAMS • ALL
moduleCategory	<p>Module category is optional. If provided, use one of the following values:</p> <ul style="list-style-type: none"> • UNSPECIFIED • RESUME • COVERLETTER • HRIS_ATTACHMENT • PERFORMANCE_ASSESSMENTS • 360_MULTI_RATER_ASSESSMENTS • CERTIFICATIONS • PUBLICATIONS • USER_DEFINED • CANDIDATEHISTORY • ATTACHMENTS • APPLICATION_INTERVIEW_ATTACHMENTS • GENERICOBJECT_ATTACHMENT

Note

By giving values to the module and moduleCategory fields, you can upload an attachment to a specific SAP SuccessFactors domain. However, note that when you upload an attachment to Performance Management, it isn't associated with any forms. That means you can't use this API to directly upload an attachment to a Performance Management form.

Property	Description
deletable	These boolean-type fields are used to calculate the status of the attachment. When set to "TRUE", each field maps to a numeric value as listed below: <ul style="list-style-type: none"> viewable - 1 searchable - 2 deletable - 4 depreciable - 8
deprecable	
searchable	
viewable	
status	The status of an attachment is a numeric value resulted from the calculation of four fields: deletable, deprecable, searchable, and viewable. For example: <ul style="list-style-type: none"> If an attachment is viewable only, the status is 1. If an attachment is both viewable and deletable, the status is 5 (1 + 4). If an attachment is viewable, searchable, and deletable, the status is 7 (1 + 2 + 4).
userId	Either externalId or userId is required to upload an attachment.

Decoding Attachments

The response to a query contains a base64 encoded string, which represents the file content. The file content in the response isn't readable (as a doc or pdf) or visible (as an image). To view the file content, you need to decode it first. The code example below converts the base64 encoded string into the original attachment content: You can also implement the \$value extension for Attachment to get the file content directly with the expected file type.

```
import javax.ws.rs.core.Response;
import org.odata4j.repack.org.apache.commons.codec.binary.Base64;
// the input parameters are from properties of Attachment instance:
// fileContent -> base64String
// mimeType -> mimeType
// fileExtension -> fileExtension
protected Response getFileContent(String base64String, String mimeType, String
fileExtension) {
    byte[] bValue = Base64.decodeBase64(base64String);
    InputStream inputStream = new ByteArrayInputStream(bValue);

    return Response.ok(inputStream, mimeType).header("Content-Disposition", "Default"
+ "." + fileExtension).build();
}
```

Use Case 1: Query a Single Attachment by ID

Request

Query by attachment Id. You can use attachmentId as business key to query a single attachment entry.

Operation	Query
HTTP Method	GET

URI

https://<API-Server>/odata/v2/
Attachment('123')?\$format=JSON

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/Attachment(8105L)",
      "type": "SFOData.Attachment"
    },
    "attachmentId": "8105",
    "country": null,
    "fileName": "f3.jpg",
    "lastModifiedDateTime": "\/Date(1562740107000+0000)\/",
    "ownerIdType": null,
    "documentType": null,
    "deletable": false,
    "description": "des1",
    "mimeType": "image/jpeg",
    "moduleCategory": "PERFORMANCE_ASSESSMENTS",
    "ownerId": null,
    "deprecable": false,
    "piiFlag": -1,
    "fileExtension": "jpg",
    "documentEntityId": null,
    "module": "PERFORMANCE_MANAGER",
    "documentCategory": null,
    "externalId": "0",
    "userId": "cgrant",
    "searchable": false,
    "documentEntityType": null,
    "createdDate": "\/Date(1562740107000+0000)\/",
    "viewable": true,
    "fileSize": 7,
    "softDelete": false,
    "lastAccessed": null,
    "fileContent": "ZHV6aWVsZQ==\r\n",
    "imageConvertInProgress": false,
    "userNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/Attachment(8105L)/userNav"
      }
    },
    "candidateNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/Attachment(8105L)/
candidateNav"
      }
    }
  }
}
```

Use Case 2: Query All Attachments of a Module

You can query all attachments of a module using the \$filter query option.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/Attachment?\$filter=module eq 'EMPLOYEE_PROFILE'

Response

A successful response returns all available attachments within the specified module.

Use Case 3: Upload a Single Attachment

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/Attachment

Payload

```
{
  "__metadata": {
    "uri": "Attachment"
  },
  "userId": "cgrant",
  "fileName": "fl.jpg",
  "description": "des1",
  "fileContent": "ZHV6aWVsZQ==",
  "viewable": true,
  "deletable": false,
  "moduleCategory":
  "PERFORMANCE_ASSESSMENTS",
  "module": "PERFORMANCE_MANAGER"
}
```

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/Attachment(8106L)",
      "type": "SFOData.Attachment"
    },
    "userId": "cgrant",
    "fileName": "fl.jpg",
    "description": "des1",
    "fileContent": "ZHV6aWVsZQ==\r\n",
    "viewable": true,
    "deletable": false,
    "moduleCategory": "PERFORMANCE_ASSESSMENTS",
    "module": "PERFORMANCE_MANAGER",
    "attachmentId": "8106"
  }
}
```

Use Case 4: Upload Multiple Attachments

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert
Payload	

```
[{
  "__metadata": {
    "uri": "Attachment"
  },
  "userId": "cgrant",
  "fileName": "f2.jpg",
  "description": "des1",
  "fileContent": "ZHV6aWVsZQ==",
  "viewable": true,
  "deletable": false,
  "moduleCategory":
  "PERFORMANCE_ASSESSMENTS",
  "module": "PERFORMANCE_MANAGER"
},
{
  "__metadata": {
    "uri": "Attachment"
  },
  "userId": "cgrant",
  "fileName": "f3.jpg",
  "description": "des1",
  "fileContent": "ZHV6aWVsZQaFD==",
  "viewable": true,
  "deletable": false,
  "moduleCategory":
  "PERFORMANCE_ASSESSMENTS",
  "module": "PERFORMANCE_MANAGER"
}]
```

Response

```
{
  "d": [
    {
      "key": "Attachment/attachmentId=8107",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": "Upserted successfully",
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    },
    {
      "key": "Attachment/attachmentId=8108",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": "Upserted successfully",
      "index": 1,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 5: Upload Attachments to Entities Without Navigation Properties to Attachment

If you want to upload an attachment to an entity but it doesn't have any navigation property to `Attachment`, you can't directly upload it to the entity using the `Attachment` entity. The correct process to upload the attachment is:

1. Upload an attachment using the `Attachment` entity.
2. Associate the attachment with the target entity.

In the following example, we try to upload an attachment to the National ID block in People Profile using entities `Attachment` and `PerNationalId`.

Step 1: Create an attachment file using `Attachment` entity.

Sample request:

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "Attachment" }, "documentCategory": "NATIONAL_ID", "documentEntityId": "111", "documentEntityType": "PERSON", "fileContent": "ZHV6aW...VsZQ==", "fileName": "IDphoto.jpg", "module": "HRIS", "moduleCategory": "HRIS_ATTACHMENT", "userId": "sfadmin" }</pre>

Sample response:

<pre>{ "d": [{ "key": "Attachment/attachmentId=1234", "status": "OK", "editStatus": "UPSERTED", "message": "Upserted successfully", "index": 0, "statusCode": 200, "inlineResults": null }] }</pre>

The attachment ID returned in the response will be used in the upsert payload of the next step.

Step 2: Associate the national ID entity with the newly created attachment.

Use the attachment ID from the previous step to upsert the PerNationalId entity. Sample request:

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "PerNationalId(cardType='ssn', country='USA', personIdExternal='sfadmin')" }, "cardType": "ssn", "country": "USA", "personIdExternal": "sfadmin", "attachmentId": "1234", "isPrimary": true, "nationalId": "XXX-XX-XXXX" }</pre>

Sample response:

```
{
  "d": [
    {
      "key": "PerNationalId/cardType=ssn,PerNationalId/
country=USA,PerNationalId/personIdExternal=sfadmin",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Related Information

9.1.2 CompanyProvisioner

You can use this entity to get a list of users who have access to the company Provisioning.

Permissions

Grant one of the following permission to the user:

► [Admin Center Permissions](#) ► [Manage Upgrade Center](#) ►

► [Manage System Properties](#) ► [View Provisioning Access](#) ►

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Retrieve list of users who have company provisioning access

Request

Request Information

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/CompanyProvisioner?\$format=json</code>

Response

```
{
  "d" : {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/CompanyProvisioner('cgrant')",

```

```

        "type": "SFOData.CompanyProvisioner"
      },
      "id": "cgrant",
      "createdAdminAccountNumber": 0,
      "name": "Carla Grant",
      "email": "c.grant@bestrun.com",
      "status": "active"
    },
    {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/
CompanyProvisioner('sfadmin')",
        "type": "SFOData.CompanyProvisioner"
      },
      "id": "sfadmin",

      "status": "active"
    }
  ]
}

```

Related Information

[SAP Business Accelerator Hub: CompanyProvisioner](#)

9.1.3 CompetencyRating

This entity allows you to query and edit the competency rating information for a user. You can use this API to migrate employee competency ratings from SAP HCM to SAP SuccessFactors by creating competency rating records one by one or in bulks (using the upsert operation). You can also update or delete a specific competency rating record.

Permissions

To enable query operation, you need permission ► [Manage Integration Tools](#) ► [OData API Competency Rating Export](#) ►.

To enable edit operations, you need permission ► [Manage Integration Tools](#) ► [OData API Competency Rating Import](#) ►.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Note

Edit operations are only available for entries when the rating type is "Individual", the source type is "Live Profile", and the module is an API.

Properties and Navigation Properties

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
id	The ID of a competency rating record. This is the business key.
guid	GUID of the competency. You can find the GUID information of each competency in Competency Libraries .
rating	Rating score.
rater	User who gave the rating.
module	Indicates the module through which the rating was given. For example, value 21 represents API.
type	Indicates the type of rating. For example: value 1 indicates individual rating.
userId	The subject of the competency rating. The user ID corresponds to the user in navigation property userNav.

Navigation Properties

Navigation Property	Related Entity	Description
userNav	User [page 400]	<p>This relationship is used to navigate to the corresponding user entity.</p> <p>There's a one-to-many association between <code>User</code> and <code>CompetencyRating</code>. For each user there can be one or more competency ratings, and for each competency rating, there's only one corresponding user.</p>

Error Codes

HTTP Response	Description
400 Bad Request	Invalid input of source property value.

Note

We've changed the HTTP response code for invalid input of source property value from 500 Internal Server Error to 400 Bad Request in 1H 2021. If you want to continue receiving 500 Internal Server Error for such errors, contact Product Support.

Use Case 1: Get the Competency Ratings of a User

You can get the competency ratings of a user by filtering the `userId` or by expanding the `competencyRatingNav` navigation property from the `User` entity. Both URIs in this example return the same records.

Request

Operation	Query
HTTP Method	GET
URI	By filtering <code>userId</code> : <code>https://<API-Server>/odata/v2/CompetencyRating?\$filter=userId eq '314'</code> By expanding the <code>User</code> entity: <code>https://<API-Server>/odata/v2/User('314')/competencyRatingNav</code>

Response

            }
        },
        {
            "__metadata": {
                "uri": "https://<API-Server>/odata/v2/CompetencyRating(2671L)",
                "type": "SFOData.CompetencyRating"
            },
            "id": "2671",
            "lastModifiedDate": "/Date(1512173277000+0000)/",
            "rater": null,
            "module": 1,
            "rating": "-1972",
            "raterCategory": null,
            "lastModifiedWithTZ": "/Date(1512173277000+0000)/",
            "source": 1,
            "validFrom": "/Date(1514764800000)/",
            "type": 1,
            "scaleMax": "5",
            "userId": "314",
            "formContentId": "1429",
            "guid": "A006",
            "formDataId": "2309",
            "lastModified": "/Date(1512173277000)/",
            "scaleMin": "1",
            "status": "1",
            "validTo": "/Date(1546300799000)/",
            "userNav": {
                "__deferred": {
                    "uri": "https://<API-Server>/odata/v2/
CompetencyRating(2671L)/userNav"
                }
            }
        }
    ]
}

```

Use Case 2: Retrieve User Information of a Competency Rating

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ CompetencyRating('2676')/userNav? \$select=userId,defaultFullName

Response

```
{
```

```

    "d": {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/User('314')",
        "type": "SFOData.User"
      },
      "userId": "314",
      "defaultFullName": "Alin Schultz"
    }
  }
}

```

Use Case 3: Inserting a Competency Rating Record

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/ CompetencyRating
Payload	<pre> { "userId": "UserA", "type": 1, "source": 2, "module": 21, "guid": "A003" } </pre>

Response

```

{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/CompetencyRating(17999L)",
      "type": "SFOData.CompetencyRating"
    },
    "userId": "UserA",
    "type": 1,
    "source": 2,
    "module": 21,
    "guid": "A003",
    "id": "17999"
  }
}

```

Use Case 4: Update an Existing Record by Merging Values

Using the `x-https-method: MERGE` header, you can update a record by merging new property values with the existing ones. In the payload, you only need to specify the property values you want to update.

Request

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/CompetencyRating(17999L)</code>
Headers	<code>x-https-method: MERGE</code>
Payload	<pre>{ "rating": "4" }</pre>

Response

A successful operation returns status code 200 OK without a response body.

Use Case 5: Update an Existing Record by Replacing Values

You can update a record by purging existing values and replace them with the ones you specify in the payload.

Request

Operation	Replace
HTTP Method	PUT
URI	<code>https://<API-Server>/odata/v2/CompetencyRating(17999L)</code>
Payload	<pre>{ "rater": "admin" }</pre>

Response

A successful operation returns status code 200 OK without a response body.

Use Case 6: Create or Update a Record Using Upsert

The upsert operation allows you to create a new record (if it doesn't exist) or update one (if it exists). In this example, the request tries to create a new record and update an existing one at the same time.

Request

Operation	Upsert
HTTP Method	POST

URI

https://<API-Server>/odata/v2/upsert

Payload

```
[
  {
    "__metadata": {
      "uri": "CompetencyRating"
    },
    "userId": "UserA",
    "type": 1,
    "source": 2,
    "module": 21,
    "guid": "DM03",
    "rating": "5"
  },
  {
    "__metadata": {
      "uri":
"CompetencyRating(17999L)"
    },
    "rating": "5"
  }
]
```

Response

```
{
  "d": [
    {
      "key": "CompetencyRating/id=18000",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": "upserted successfully",
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    },
    {
      "key": "CompetencyRating/id=17999",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": "upserted successfully",
      "index": 1,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 7: Delete a Competency Rating Record

Request

Operation	Delete
HTTP Method	DELETE
URI	https://<API-Server>/odata/v2/ CompetencyRating(18000L)

Response

A successful operation returns status code 200 OK without a response body.

Related Information

[SAP Business Accelerator Hub: CompetencyRating](#)

9.1.4 Country

This entity stores information that is relevant for each country or region, such as currency and country code.

Permissions

Permission System	Required Setting
Role Based Permissions	For non-admin use: ▶ Metadata Framework ▶ Read/Write Permission ▶ For admin use: ▶ Metadata Framework ▶ Import Permission ▶

Supported Operations

Operation	Description
Query	Query a country/region record.
Insert	Create a country/region record.
Merge	Update a country/region record by merging data.
Replace	Update a country/region record by replacing data.
Delete	Delete a country/region record.
Upsert	Insert a country/region record.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) [▶ API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property Name	Description
code	A 3-character country code that represents a country or a region
currency	Currency of the country or region
externalName_<locale>	A string that represents the localized name of the country or region
isDRMEnabled	Indicates whether this field is enabled for data retention

Navigation Property	Related Entity	Description
currencyNav	Currency	Currency code of the country/region.
wfRequest	WfRequest	Workflow request information

Use Case 1: Create a Country/Region Record

Request

Operation	Insert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/Country</code>
Payload	<pre>{ "__metadata": { "uri": "Country(code='USA',effectiveStartDate=datetime'2019-01-01T00:00:00')", }, "code": "USA", "status": "A", "externalName_en_US": "United States" }</pre>

Response

<pre>{ "d": { "__metadata": { "uri": "https://<API-Server>/odata/v2/ Country(code='USA',effectiveStartDate=datetime'2019-01-01T00:00:00')", "type": "SFOData.Country" }, "status": "A", "externalName_en_US": "United States", "effectiveStartDate": "/Date(1546300800000)/", "code": "USA" } }</pre>

      }
    }
  }
}

```

Use Case 3: Update a Country/Region Record Using Merge

Request

Operation	Merge
HTTP Method	PUT
URI	<code>https://<API-Server>/odata/v2/Country(code='USA',effectiveStartDate=datetime'2019-01-01T00:00:00')</code>
Payload	<pre>"externalName_localized": "United States of America",</pre>

Response

A successful operation returns 200 OK status without response body.

9.1.7 Document Management Service (DMS)

This section provides information about OData API entities and function imports in Document Management Service (DMS).

9.1.7.1 getDocumentCategories

Use this function import to get a list of predefined and custom document categories in Document Management Service (DMS).

Parameters

Parameter	Data Type	Description
entityType	String	Use this parameter to return a list of document categories of the specified type.
excludeInactive	Boolean	true: exclude inactive categories false: include inactive categories

Use Case 1: Query All Document Categories in the Company

The following request returns all document categories in the company:

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ getDocumentCategories?\$format=JSON

Response

```
{
  "d": {
    "DocumentCategories": {
      "attachmentCategories": {
        "results": [
          {
            "active": true,
            "categoryCode": "CALIBRATION_SESSION",
            "categoryName": "CalibrationSession",

```

```
"results": [
  {

    "entityTypeCode": "CANDIDATE",
    "systemDefined": true
  }
]
```

9.1.8 Photo

The `Photo` entity allows you to query, import, update, and delete user photos in the system.

Permissions

If your local data privacy and protection compliance requires that you limit access to candidates' photos, then you can restrict access by setting the role-based permission of `Photo`. This means that `/odata/v2/Photo` queries must respect the role-based permission of `Photo`.

Permission System	Required Setting
-------------------	------------------

Role-based	View or edit permission for photo entity under <i>Employee Data</i> . The <code>Photo</code> permission checks target population.
------------	--

Note

Permission control of profile photos is based on persons. In case of multiple employments, if you have a permission to view or edit a photo related to any of the employments (user IDs) for an employee, then you can view or edit all photos of this employee.

→ Remember

If a data privacy consent statement on profile photos is enabled, in addition to the role-based permission of photos, the `/odata/v2/Photo` queries also respect each user's decision on whether to allow their profile photos to be used for other purposes. If a user has declined the statement, their photo records are not returned in the result.

Supported Operations

Operation	Description
Query	<p>The system stores several images for a single user's profile picture in different sizes to be used in different applications. For example, thumbnail size images are used in the org chart, quickcard and face page, while larger size images are used in People Profile. The different photo types are categorized by the <code>photoType</code> field. You can query for a specified <code>photoType</code>. All photos with the identified <code>photoType</code> for all active users are returned.</p> <ul style="list-style-type: none">• To retrieve photos for a given <code>userId</code> but different <code>photoType</code>, you need to specify the <code>userId</code> in the query.• To retrieve a single photo for a given <code>userId</code> and <code>photoType</code>, you need to put both of them into query criteria.• To retrieve photos for a given person UUID, you can use the property <code>personUUID</code> or the parameter <code>selected_person_uuid</code>.• To query the photo content in byte array format for a given person UUID, you can only use the <code>selected_person_uuid</code> parameter.
Insert	<p>When a photo is imported for a user, the system generates several internal images in different sizes and saves them in the database.</p>
Merge	<p>Updates a photo record in the database with specified photo properties.</p>
Replace	<p>Replaces a photo record in the database.</p>
Delete	<p>The system removes all the internally generated images when a photo is deleted for a user.</p>
Upsert	<p>If the photo doesn't exist, inserts a new one. Otherwise, update the photo record in database.</p>

For more information about supported operations for each photo type, see the **Photo Types** section.

Photo Entity Behavior

- If you use the property `personUUID` or the parameter `selected_person_uuid` to query profile photos of a person with multiple employments, which also means multiple user IDs, it returns only the entity records related to the main employment of the person.
- In case of multiple employments, if you add, change, or delete a profile photo related to one of the employments of a person, the change applies to all the employments.
- Only Upsert supports handling multiple records. All other operations can only handle a single record.
- Edit operations are only available for photos of `photoType` `LIVE_PROFILE` or `USER_EXPRESSIVE_PHOTO`.
- When a user inserts a `LIVE_PROFILE` photo, `ORG_CHART`, `QUICK_CARD`, `FACE`, `LIVE_PROFILE_SQUARE_60`, and `LIVE_PROFILE_SQUARE_30` photos are generated automatically.
- If a `LIVE_PROFILE` photo is deleted or updated, then `ORG_CHART`, `QUICK_CARD`, `FACE`, `LIVE_PROFILE_SQUARE_60` and `LIVE_PROFILE_SQUARE_30` photos are also deleted or updated.
- For `USER_EXPRESSIVE_PHOTO`, if the size of the photo isn't 980x580, the system raises an error.
- When Public Profile view is set to "Expressive", and user doesn't specify any background photo, querying `USER_EXPRESSIVE_PHOTO` with `userId`, returns the randomly assigned background photo, or default background photo according to the admin setting. If no random image is available, then the default background photo is returned.

Properties

To retrieve a particular photo, you must specify the `userId` or `personUUID` and `photoType`. These are the business keys for the `Photo` entity:

Property	Description
<code>photoId</code>	The unique ID of the photo.
<code>userId</code>	The user ID of the employee photo.
<code>personUUID</code>	The UUID of the person whose photos you want to query. This property is of string type and filterable only.
<code>photo</code>	base64 encrypted binary data (blob) of the photo.
<code>lastModified</code>	The date on which the photo was last modified.
<code>lastModifiedDateTime</code>	The date and time, with time zone information when the photo was last modified.
<code>photoType</code>	The type of photo.
<code>mimeType</code>	The MIME(Multi-Purpose Internet Mail Extensions) Type of the photo.
<code>width</code>	The width of the photo.
<code>height</code>	The height of the photo.
<code>photoName</code>	The name of the photo.

Photo Types

The following table lists the various photo types that are available:

Phototype Enumeration	Photo type ID	Max Width	Max Height	Supported Operations	Comments
LIVE_PROFILE	1	180	240	Query, Edit	Used as the source copy in user profile photo. Recommended aspect ratio is 3:4(w:h) and recommended minimum size is 180*240.
ORG_CHART	2	20	27	Query	System generated. Used as org chart image.
QUICK_CARD	3	60	80	Query	System generated. Used as quickcard of user in V11 theme.

Phototype Enumeration	Photo type ID	Max Width	Max Height	Supported Operations	Comments
FACE	7	45	60	Query	System generated. Used as quickcard of user in V12 theme.
LIVE_PRO-FILE_SQUARE_60	26	60	60	Query	System generated. Used as user profile photo.
LIVE_PRO-FILE_SQUARE_30	27	30	30	Query	System generated. Used as user profile photo.
USER_EXPRESSIVE_PHOTO	14	980	580	Query, Edit	Background image used in public profile page. It MUST be a 980*580 image, otherwise Upsert operation fails. If this photo is null, API retrieves a random photo instead. And if there's no random photo, API retrieves the default photo.

Support for Media Resource (MLE)

We now support the Query operation for a media resource. A media resource is typically a BLOB and is described by a Media Link Entity (MLE). MLE is special resource that contains metadata about a media resource. In the OData entity data model, it's an entity type with attribute "m.HasStream" set to True. Sample metadata for an MLE:

Sample Code

```
<EntityType Name="Photo" m:HasStream="true">
  <Key>
    <PropertyRef Name="photoType" />
    <PropertyRef Name="userId" />
  </Key>
  ...
  <Property...
  </Property>
  ...
</EntityType>
```

For a media resource entity, \$value is supported. A sample query `http://<api-server>/odata/v2/Photo(photoType=your_type, userId='your_id')/$value` returns the media resource (BLOB) with the corresponding content type in the response header. The content type is the 'mineType' property of the Photo instance.

Use Cases

API Call	Description
<code>http://<api-server>/odata/v2/Photo?\$top=10</code>	Query top 10 photos for information.
<code>http://<api-server>/odata/v2/Photo(photoType=1,userId='admin')</code>	Query a single photo with a given key.

Use Case 1: Query Photo Value with If-Modified-Since HTTP Header

As of Q4 2018, the `Photo` entity supports the standard HTTP request-header `If-Modified-Since`. With this header, the API call can identify whether a photo has been modified since the time specified in this field. This allows more efficient update of cached photos.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/Photo(photoType=1,userId='cgrant')/photo/\$value</code>
Headers	<code>Authorization: Basic <Base 64 encoded "user@company:password"></code> <code>If-Modified-Since: Wed, 10 Oct 2018 18:00:00 GMT</code>

If the photo has been modified after the given date, the query returns the 200 status code and the new photo value will be updated in the cache. If the photo hasn't been modified since the specified date, the query returns the 304 status code without photo content.

Note

The `If-Modified-Since` header only works when you query the content of the photo with `$value`.

The `If-Modified-Since` header must follow the date-time format: `If-Modified-Since: <day-name>, <day> <month> <year> <hour>:<minute>:<second> GMT`, in which:

- `<day-name>` must be a 3-letter abbreviation of weekdays.
- `<day>` must be 2-digit.
- `<month>` must be a 3-letter abbreviation of months.
- `<hour>:<minute>:<second>` must be in the 24-hour clock format.
- GMT is hard-coded and can't be changed.

Use Case 2: Query All Types of Photos for a Given Person UUID

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/Photo?\$filter=personUUID eq 'admin'&\$format=JSON

Response

```
{
  "d": {
    "results": [{
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/Photo(photoType=1,userId='example')",
        "type": "SFOData.Photo"
      },
      "photoType": 1,
      "userId": "example",
      "lastModifiedDate": "/Date(1619785118000+0000)/",
      "width": 180,
      "photo": "<base64 encoded photo content>",
      "photoId": "4607",
      "lastModified": "/Date(1619785118000)/",
      "lastModifiedWithTZ": "/Date(1619785118000+0000)/",
      "mimeType": "image/jpeg",
      "photoName": null,
      "height": 240,
      "userNav": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/Photo(photoType=1,userId='example')/userNav"
        }
      }
    }, {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/Photo(photoType=16,userId='example')",
        "type": "SFOData.Photo"
      },
      "photoType": 16,
      "userId": "example",
      "lastModifiedDate": "/Date(1619785118000+0000)/",
      "width": 980,
      "photo": "<base64 encoded photo content>",
      "photoId": "4706",
      "lastModified": "/Date(1619785118000)/",
      "lastModifiedWithTZ": "/Date(1619785118000+0000)/",
      "mimeType": "image/jpeg",
      "photoName": null,
      "height": 580,
      "userNav": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/Photo(photoType=16,userId='example')/userNav"
        }
      }
    }
  ]
}
```

Use Case 3: Query One Type of Photo with the Parameter `selected_person_uuid`

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/Photo(photoType=1,userId=' ')?selected_person_uuid=admin&\$format=JSON</code>

→ Tip

To query the photo content in byte array format for a given person UUID, follow this request:

```
https://<api-server>/odata/v2/Photo(photoType=1,userId=' ')/$value?  
selected_person_uuid=admin
```

Response

```
{  
  "d": {  
    "__metadata": {  
      "uri": "https://<api-server>/odata/v2/Photo(photoType=1,userId='example')",  
      "type": "SFOData.Photo"  
    },  
    "photoType": 1,  
    "userId": "example"f,  
    "lastModifiedDateTime": "/Date(1619785118000+0000)/",  
    "width": 180,  
    "photo": "<base64 encoded photo content>",  
    "photoId": "4607",  
    "lastModified": "/Date(1619785118000)/",  
    "lastModifiedWithTZ": "/Date(1619785118000+0000)/",  
    "mimeType": "image/jpeg",  
    "photoName": null,  
    "height": 240,  
    "userNav": {  
      "__deferred": {  
        "uri": "https://<api-server>/odata/v2/Photo(photoType=1,userId='example')/  
userNav"  
      }  
    }  
  }  
}
```

HTTP Status (Error) Codes

The OData User Photo API now returns new HTTP status codes as a part of an upsert response. The newly added status codes are 200, 201, 400, and 500. Usually, if the item gets inserted, the `httpCode` is 201, if the item gets updated, then the `httpCode` is 204, if we don't know the exact action, the `httpCode` is 200. For an error, the `httpCode` is 400 for a bad request exception. If the exception is recognized, the `httpCode` is set to 500.

Error Code	Description
400	User doesn't exist.
400	User isn't active.
400	Mismatched key.
400	Invalid photo type.
400	Photo record doesn't exist when an update is performed.
400	Photo record already exists when an insert is performed.
400	Photo data is empty.
400	Photo size is larger than 2 MB.
400	The photo type isn't 1 (live profile) or 14(expressive) when editing a photo entity.
403	The photo type is 14 (expressive) and public profile isn't enabled when editing a photo entity.
403	The photo type is 14 (expressive) and expressive mode isn't enabled for company when editing a photo entity.
403	The photo type is 14 (expressive) and public profile isn't in expressive mode for user when editing a photo entity.
403	The photo type is 14 (expressive) and uploading of background photo isn't allowed in admin tools when editing a photo entity.
400	The photo type is 14 (expressive) and edits other user's photo when editing a photo entity.
404	The requested photo isn't found.

Sample JSON with new http codes is:

```
{
  "d": [ {
    "key": "test_new_user_001",
    "status": "OK",
    "editStatus": "INSERTED",
    "message": null,
    "index": 0,
    "httpCode": 201,
    "inlineResults": null
  }, {
    "key": "test_existing_user_001",
    "status": "OK",
    "editStatus": "UPDATED",
    "message": null,
    "index": 1,
    "httpCode": 204,
    "inlineResults": null
  }, {
    "key": "upsert_user_0001",
    "status": "ERROR",
    "editStatus": null,
    "message": "Key property (User/userId) doesn't match the key in the __metadata
uri",
    "index": 2,
    "httpCode": 500,
    "inlineResults": null
  } ]
}
```

[SAP Business Accelerator Hub: Picklist](#)

9.1.9.1.2 PicklistOption

You can use this entity to query and edit the information of legacy picklist options.

Permissions

For more information, see [Legacy Picklists \[page 259\]](#).

Supported Operations

Query, Insert, Merge, Replace

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>externalCode</code>	External code of the picklist.
<code>id</code>	ID of the picklist.
<code>localeLabel</code>	Locale of the picklist option. You can use this field to retrieve the text label of a picklist option in the locale of the loggen-in user. If no label exists for that locale, the label of the default company locale will be returned. If that doesn't exist either, the en-US label will be returned. Note that this field is not filterable or sortable, and you need to explicitly add it to <code>\$select</code> to be able to retrieve labels. For example, <code>/odata/v2/PicklistOption?\$select=id,localeLabel</code> .
<code>maxValue</code>	Maximum allowed value of the picklist option.
<code>minValue</code>	Minimum allowed value of the picklist option.
<code>optionValue</code>	Value of the picklist option.
<code>sortOrder</code>	The order in which the picklist option is displayed.
<code>status</code>	Possible statuses: <ul style="list-style-type: none"> • ACTIVE: Indicates an active picklist option. • OBSOLETE: Indicates an obsolete picklist option. • DELETED: Indicates a deleted picklist option.

Navigation Properties

Navigation Property	Related Entity	Description
<code>childPicklistOptions</code>	PicklistOption	An association between a picklist option and its child options.
<code>parentPicklistOption</code>	PicklistOption	An association between a picklist option and its parent option.
<code>picklist</code>	Picklist	The picklist that the picklist option belongs to.
<code>picklistLabels</code>	PicklistLabel	Label of the picklist option.

Entity Relation Diagram

See [Legacy Picklists \[page 259\]](#) for more information.

Use Case 1: Querying a Picklist Option

This example shows how to query a picklist option with its business key.

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/PicklistOption(3968L)?\$format=json</code>

Response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/PicklistOption(3968L)",
      "type": "SFOData.PicklistOption"
    },
    "id": "3968",
    "minValue": "-1",
    "externalCode": null,
    "maxValue": "-1",
    "optionValue": "-1",
    "sortOrder": 4,
    "mdfExternalCode": "EmployeeType_Contractor",
    "status": "ACTIVE",
    "parentPicklistOption": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/PicklistOption(3968L)/parentPicklistOption"
      }
    },
    "picklistLabels": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/PicklistOption(3968L)/picklistLabels"
      }
    },
    "picklist": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/PicklistOption(3968L)/picklist"
      }
    },
    "childPicklistOptions": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/PicklistOption(3968L)/childPicklistOptions"
      }
    }
  }
}
```

Use Case 2: Modifying a Picklist Option with Merge

You can modify a picklist option with the `Merge` operation. This operation updates the existing values and creates new values if they don't exist. A successful operation returns the `200 OK` status code without response payload.

Operation	Merge
HTTP Method	PUT
URI	<code>https://<API-server>/odata/v2/ PicklistOption(281L)</code>
Payload	<pre>{ "__metadata": { "uri": "PicklistOption", "type": "SFOData.PicklistOption" }, "maxValue": "-1", "minValue": "-1", "status": "OBSOLETE" }</pre>

Use Case 3: Creating a New Picklist Option

This example shows how to create a new picklist option with the `Insert` operation.

Operation	Insert
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/ PicklistOption</code>

Payload

```
{
  "__metadata":{
    "uri":"PicklistOption",
    "type":"SFOData.PicklistOption"
  },
  "picklist":
  {
    "__metadata":{
      "uri":"Picklist('EmployeeType')",
      "type":"SFOData.Picklist"
    },
    "picklistLabels":
    {
      "__metadata":{
        "uri":"PicklistLabel",
        "type":"SFOData.PicklistLabel"
      },
      "label":"Contractor",
      "locale":"en_US"
    },
    "maxValue":"-1",
    "minValue":"-1",
    "status":"ACTIVE"
  }
}
```

Response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/PicklistOption(263L)",
      "type": "SFOData.PicklistOption"
    },
    "maxValue": "-1.0",
    "minValue": "-1.0",
    "status": "ACTIVE",
    "id": "263",
    "picklist": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/PicklistOption(263L)/picklist"
      }
    },
    "picklistLabels": {
      "__metadata": {
        "uri": "https://<API-server>/odata/v2/PicklistLabel(locale='en_US',optionId=263L)",
        "type": "SFOData.PicklistLabel"
      },
      "label": "Contractor",
      "locale": "en_US",
      "optionId": "263"
    }
  }
}
```

Use Case 4: Modifying a Picklist Option with Replace

You can modify a picklist option with the `Replace` operation. This operation removes all existing values and replaces them with the new values provided in the payload. A successful operation returns the `200 OK` status code without response payload.

Operation	Replace
HTTP Method	PUT
URI	<code>https://<API-server>/odata/v2/ PicklistOption(281L)</code>
Payload	<pre>{ "__metadata": { "uri": "PicklistOption", "type": "SFOData.PicklistOption" }, "maxValue": "-1", "minValue": "-1", "status": "ACTIVE" }</pre>

[PicklistLabel \[page 269\]](#)

[SAP Business Accelerator Hub: PicklistOption](#) 

9.1.9.1.3 PicklistLabel

Picklist labels are texts that describe a picklist option. Picklist labels are language dependent. Use this entity to view, create, and change legacy picklist labels.

Permissions

For more information, see [Legacy Picklists \[page 259\]](#).

Supported Operations

Query, Insert, Upsert, Merge, Replace

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
id	ID of the picklist label.
label	Picklist label text in the language of the specified locale.
locale	Locale of the picklist. This is a business key.
optionId	ID of the picklist option that the label describes. This is a business key.

Navigation Properties

Navigation Property	Related Entity	Description
picklistOption	PicklistOption	The picklist option that the label describes.

Entity Relation Diagram

See [Legacy Picklists \[page 259\]](#) for more information.

Use Case 1: Querying a Picklist Label

This example shows how to query a picklist label with its business keys.

Operation	Query
-----------	-------

HTTP Method	GET
URI	To query a single picklist label, provide the optionId and locale in the URI: <pre>https://<API-server>/odata/v2/ PicklistLabel(optionId=261L,locale='en_US')</pre>

Response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/
PicklistLabel(locale='en_US',optionId=261L)",
      "type": "SFOData.PicklistLabel"
    },
    "optionId": "261",
    "locale": "en_US",
    "id": "261",
    "label": "Contractor",
    "picklistOption": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/
PicklistLabel(locale='en_US',optionId=261L)/picklistOption"
      }
    }
  }
}
```

Use Case 2: Creating a Picklist Label

This example shows how to create a new picklist label using the Insert operation.

Operation	Insert
HTTP Method	POST
URI	<pre>https://<API-server>/odata/v2/ PicklistLabel</pre>
Payload	<pre>{ "__metadata": { "uri": "PicklistLabel(optionId=3965L, locale='en_US')", "type": "SFOData.PicklistLabel" }, "label": "Full Time Employee" }</pre>

Status code [201 Created](#) is returned upon success operation with the following example response:

```
{
  "d": {
```

```

    "__metadata": {
      "uri": "https://<API-server>/odata/v2/
PicklistLabel(locale='en_EN',optionId=3965L)",
      "type": "SFOData.PicklistLabel"
    },
    "label": "Full Time Employee"
  }
}

```

Use Case 3: Changing a Picklist Label with Merge

This example shows how to change a picklist label with `Merge`. This operation updates the existing values and creates new values if they don't exist. A successful operation returns the `200 OK` status code without response payload.

Operation	Merge
HTTP Method	PUT
URI	<p>You must provide the optionId and locale in the URI to replace a picklist label.</p> <pre> https://<API-server>/odata/v2/ PicklistLabel(optionId=3965L,locale='en_US ') </pre>
Payload	<pre> { "__metadata":{ "uri":"PicklistLabel(optionId=3965L,locale='en_US')", "type":"SFOData.PicklistLabel" }, "label":"Full Time Employee" } </pre>

Use Case 4: Changing a Picklist Label with Replace

This example shows how to change a picklist label with `Replace`. This operation removes all existing values and replaces them with the new values provided in the payload. A successful operation returns the `200 OK` status code without response payload.

Operation	Replace
HTTP Method	PUT

URI	<p>You must provide the optionId and locale in the URI to replace a picklist label.</p> <pre>https://<API-server>/odata/v2/PicklistLabel(optionId=3965L,locale='en_US')</pre>
Payload	<pre>{ "__metadata":{ "uri":"PicklistLabel(optionId=3965L,locale='en_US')", "type":"SFOData.PicklistLabel" }, "label":"Full Time Employee" }</pre>

Use Case 5: Creating and Updating Multiple Picklist Labels

You can use the `Upsert` operation to mass create and edit picklist labels. This example shows how to create a label in English and modify another label text in French with one API call:

Operation	Upsert
HTTP Method	POST
URI	<p>You must provide the optionId and locale in the URI to replace a picklist label.</p> <pre>https://<API-server>/odata/v2/upsert</pre>
Payload	<pre>[{ "__metadata":{ "uri":"PicklistLabel(optionId=261L,locale='en_US')", "type": "SFOData.PicklistLabel" }, "label":"Full Time Employee" }, { "__metadata":{ "uri":"PicklistLabel(optionId=261L,locale='fr_FR')", "type": "SFOData.PicklistLabel" }, "label":"Employé à Plein Temps" }]</pre>

Response:

```
{
  "d": [
    {
      "key": "PicklistLabel/locale=en_US,PicklistLabel/optionId=261",
      "status": "OK",
      "editStatus": "UPDATED",
      "message": "updated successfully",
      "index": 0,
      "httpCode": 204,
      "inlineResults": null
    },
    {
      "key": "PicklistLabel/locale=fr_FR,PicklistLabel/optionId=261",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": "inserted successfully",
      "index": 1,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}
```

ⓘ Note

You are only allowed to create and edit labels in the locales that are enabled in your instance.

Use Case 2: Create a Picklist Record

This example shows how to create a picklist record.

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-server>/odata/v2/PickListV2
Payload	<pre>{ "__metadata": { "uri": "PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00',id='OfficeLocation')" }, "effectiveStartDate": "/Date(-2208988800000)/", "id": "OfficeLocation", "status": "A" }</pre>

Response

<pre>{ "d": { "__metadata": { "uri": "https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00',id='OfficeLocation')", "type": "SFOData.PickListV2" }, "status": "A", "effectiveStartDate": "/Date(-2208988800000)/", "id": "OfficeLocation" } }</pre>

Use Case 3: Replace an Existing Picklist Record

This example shows how to replace an existing picklist record. This operation removes all existing values and replaces them with the new values provided in the payload. If a property is not present in the payload, it will be reset to the default value. A successful operation returns the [200 OK](#) status code without response payload.

Request

Operation	Replace
HTTP Method	PUT

URI	<code>https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00' ,id='sysJobCodes')</code>
-----	--

Payload	<pre>{ "__metadata": { "uri": "PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00',id='sysJobCodes')" }, "effectiveStartDate": "/Date(-2208988800000)/", "id": "sysJobCodes", "name": "StringType", "status": "A" }</pre>
---------	---

Use Case 4: Change an Existing Picklist Record with Merge

This example shows how to change an existing picklist record with `Merge`. This operation updates the existing values and creates new values if they don't exist. For other properties not mentioned in the payload, their values remain untouched. A successful operation returns the `200 OK` status code without response payload.

Request

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00' ,id='sysJobCodes')</code>
Headers	<code>x-http-method: MERGE</code>
Payload	<pre>{ "name": "Relationship" }</pre>

Use Case 5: Delete an Existing Picklist Record

This example shows how to delete an existing picklist record. A successful operation returns the `200 OK` status code without response payload.

Request

Operation	Delete
-----------	--------

HTTP Method	DELETE
URI	https://<API-server>/odata/v2/ PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00' ,id='sysJobCodes')

Use Case 6: Create or Update a Picklist Record with Upsert

This example shows how to update a picklist record with Upsert.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-server>/odata/v2/PickListV2/upsert
Payload	<pre>{ "__metadata": { "uri": "PickListV2(effectiveStartDate=datetime'1900-01-01T00:00:00',id='ACADEMICDEGREE')" }, "effectiveStartDate": "/Date(-2208988800000)/", "id": "ACADEMICDEGREE", "name": "FamilyMember", "status": "A" }</pre>

Response

<pre>{ "d": [{ "key": null, "status": "OK", "editStatus": "UPSERTED", "message": null, "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>
--

```

Use Case: Create a Picklist Value

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-server>/odata/v2/PickListValueV2
Payload	<pre>{ "__metadata": { "uri": "PickListValueV2(PickListV2_effectiveStartDate=datetime' 1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')", "type": "SFOData.PickListValueV2" }, "externalCode": "717011", "PickListV2_effectiveStartDate": "/ Date(-2208988800000)/", "PickListV2_id": "OfficeLocation", "status": "A", "label_en_US": "Guangzhou" }</pre>

Note

You must include at least one label property in the request payload.

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/
PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickList
V2_id='OfficeLocation',externalCode='717011')",
      "type": "SFOData.PickListValueV2"
    },
    "status": "A",
    "label_en_US": "Guangzhou",
    "PickListV2_id": "OfficeLocation",
    "PickListV2_effectiveStartDate": "/Date(-2208988800000)/",
    "externalCode": "717011"
  }
}
```

Use Case: Replace an Existing Picklist Value

This example shows how to replace an existing picklist value. This operation removes all existing values and replaces them with the new values provided in the payload. If a property is not present in the payload, it will be reset to the default value. A successful operation returns the **200 OK** status code without response payload.

Request

Operation	Replace
HTTP Method	PUT
URI	<code>https://<API-server>/odata/v2/ PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')</code>
Payload	<pre>{ "__metadata": { "uri": "PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')", "type": "SFODData.PickListValueV2" }, "externalCode": "717011", "PickListV2_effectiveStartDate": "/Date(-2208988800000)/", "PickListV2_id": "OfficeLocation", "status": "A", "label_en_US": "Shanghai" }</pre>

Use Case: Change an Existing Picklist Value with Merge

This example shows how to change an existing picklist value with `Merge`. This operation updates the existing values and creates new values if they don't exist. For other properties not mentioned in the payload, their values remain untouched. A successful operation returns the **200 OK** status code without response payload.

Request

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/ PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')</code>
Headers	<code>x-http-method: MERGE</code>
Payload	<pre>{ "label_zh_TW": "上海", }</pre>

Use Case: Delete an Existing Picklist Record

This example shows how to delete an existing picklist value. A successful operation returns the [200 OK](#) status code without response payload.

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<API-server>/odata/v2/ PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLoc',externalCode='717012')</code>

Use Case: Create or Update a Picklist Record with Upsert

This example shows how to update a picklist value with Upsert.

Request

Operation	UPSERT
HTTP Method	POST
URI	<code>https://<API-server>/odata/v2/PickListValueV2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "PickListValueV2(PickListV2_effectiveStartDate=datetime'1900-01-01T00:00:00',PickListV2_id='OfficeLocation',externalCode='717011')", "type": "SFOData.PickListValueV2" }, "externalCode": "717011", "PickListV2_effectiveStartDate": "/Date(-2208988800000)/", "PickListV2_id": "OfficeLocation", "status": "A", "label_en_US": "Beijing" }</pre>

Response

<pre>{ "d": [{ "key": null, "status": "OK", "editStatus": "UPsertED", "message": null, }] }</pre>

```
    "index": 0,  
    "httpCode": 200,

9.1.9.3 Query and Edit Behaviors of Entities with Picklist Fields

Guidelines for querying and editing the picklist fields in OData API entities.

An OData API entity may contain properties whose values come from a picklist. In SAP SuccessFactors, two types of picklists are available: legacy picklists and MDF picklists. Both picklists can be used to provide restricted values for an OData API entity. Because legacy and MDF picklists are designed differently, querying and editing behaviors of entities with picklist fields are also different. In this topic, you'll learn how to distinguish one type of picklist fields from the other and how to query/edit them.

How can I tell which type of picklist is used?

There are two ways to find out which type of picklist field is used in an entity:

- You can go to the [OData API Data Dictionary](#) to check the entity details.
- You can run an OData query and look at the entity metadata.

Checking the picklist type in OData API Data Dictionary

The [OData API Data Dictionary](#) provides all the information you need to identify which type of picklist is used in an entity. The following steps explain how to do this:

1. Go to [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#), and search for the entity.
2. Open the entity from search result, and locate the fields with values in the `sap:picklist` column. Note that for each picklist field, a string type property field and a navigation to the corresponding picklist object exist. The navigation property usually derives from the string field with a "Nav" suffix. For example, in the

Position entity, you'll see a string-type property called `employeeClass` and a navigation property called `employeeClassNav`. Both properties have the `sap:picklist` attribute with value `EmployeeClass`:

Property Name	Label	Type	sap:picklist	Business Key	Nullable	sap:required
effectiveStatus	Status	string		false	true	true
employeeClass	Employee Class	string	EmployeeClass	false	true	false
externalName_de_DE	Title	string		false	true	false
effectiveStatusNav	Status	MDFEnumValue		false	true	false
employeeClassNav	Employee Class	PickListValueV2	EmployeeClass	false	true	false
externalNameTranslatio...	Title	MDFLocalizedValue		false	true	false

3. The *Type* field of the navigation property may take these values:

- *PicklistOption*: This indicates legacy picklist.
- *PickListValueV2*: This indicates MDF picklist.

In the example above, the `Position` entity has an MDF picklist field as indicated by *PickListValueV2*.

Checking the picklist type in OData metadata

You can use an OData query to download the metadata of OData APIs and check the picklist type. Using entity `PerPersonal` and its `maritalStatus` property as an example, the following query shows how to retrieve the metadata:

```
https://<API-server>/odata/v2/PerPersonal,PicklistOption,PickListValueV2/$metadata
```

The result returns the metadata for three entities: `PerPersonal`, `PicklistOption`, and `PickListV2`. Note that both legacy and MDF picklist entities are included because we are not sure which type an entity is associated with. You can also download the entire OData metadata by not specifying any entity in the URI, but this could take considerably more time and thus is not recommended in this case.

In the returned metadata document, go to the `PerPersonal` section and you'll find the following information:

```
...
<Property Name="maritalStatus" Type="Edm.String" Nullable="true"
sap:required="false" sap:creatable="false" sap:updatable="false"
sap:upsertable="true" sap:visible="true" sap:sortable="true" sap:filterable="true"
MaxLength="50" sap:picklist="ecMaritalStatus" sap:label="Marital Status"></Property>
...
<NavigationProperty Name="maritalStatusNav"
sap:required="false" sap:creatable="false" sap:updatable="false"
sap:upsertable="false" sap:visible="true" sap:sortable="true"
sap:filterable="true" sap:picklist="ecMaritalStatus"
Relationship="SFOData.PerPersonal_maritalStatus_picklist" FromRole="PerPersonal"
ToRole="picklistoption" sap:label="Marital Status"></NavigationProperty>
...
<AssociationSet Name="PerPersonal_maritalStatus_picklist"
Association="SFOData.PerPersonal_maritalStatus_picklist">
  <End EntitySet="PerPersonal" Role="PerPersonal"></End>
  <End EntitySet="PicklistOption" Role="picklistoption"></End>
</AssociationSet>
```

Note that both property and navigation property lines have the same `sap:picklist="ecMaritalStatus"` attribute-value pair, which indicates a picklist object. The association information points to the legacy `PicklistOption` entity:

```
<End EntitySet="PicklistOption" Role="picklistoption"></End>
```

If you look at the the corresponding metadata of the `Position`, the association points to the MDF `PickListValueV2` entity:

```
...
<Property Name="jobLevel" Type="Edm.String" Nullable="true" sap:required="false"
sap:creatable="true" sap:updatable="true" sap:upsertable="true" sap:visible="true"
sap:sortable="true" sap:filterable="true" MaxLength="128" sap:picklist="JobLevel"
sap:label="Job Level"></Property>
...
<NavigationProperty Name="jobLevelNav" sap:required="false" sap:creatable="true"
sap:updatable="true" sap:upsertable="true" sap:visible="true"
sap:sortable="true" sap:filterable="true" sap:picklist="JobLevel"
Relationship="SFOData.jobLevelNav_of_Position" FromRole="Position"
ToRole="jobLevelNav" sap:field-control="PositionFieldControlsNav/jobLevelNav"
sap:label="Job Level"></NavigationProperty>
...
<Association Name="jobLevelNav_of_Position">
  <End Type="SFOData.Position" Multiplicity="*" Role="Position"></End>
  <End Type="SFOData.PickListValueV2" Multiplicity="0..1" Role="jobLevelNav"></
End>
</Association>
```

Which key property do I use: `optionId` or `externalCode`?

Since the two types of picklist entities (`PicklistOption`, `PickListValueV2`) use different fields as their key properties, when you query or edit an OData entity that contains a picklist field, bear in mind that query and edit behaviors follow the OData standard. That is, always use the key property to identify a unique record.

- For legacy picklist fields, use the `PicklistOption` property `id` to uniquely identify a record during query or edit operations.
- For MDF picklist fields, use the `PickListValueV2` property `externalCode` to uniquely identify a record in query or edit operations.

Data validation during edit

For some OData API entities, data validation is implemented to prevent values outside a picklist being saved. For example, the `jobLevel` property of the `Position` entity only accepts values that are defined in the `jobLevel` picklist object. If you try to upsert other values, an error will return:

Sample request to upsert a position record:

```
{
  "__metadata": {
    "uri": "Position(code='50014362',effectiveStartDate=datetime'1990-01-01T00:00:00') "
  },
  "jobLevel": "ABCDE "
```

```
}
```

Sample response:

```
{
  "d": [
    {
      "key": null,
      "status": "ERROR",
      "editStatus": null,
      "message": "Invalid Picklist value: 'ABCDE'. with the index 0",
      "index": 0,
      "httpCode": 500,
      "inlineResults": null
    }
  ]
}
```

For entities without data validation, values outside the picklist object can be accepted during edit operation. However, if you query the entity and expand to the picklist, nothing shows up because it is not a valid value defined in the picklist object. Although the OData returns positive result, the edit operation is unsuccessful.

Here's an example of upserting an invalid value to the `riskOfLoss` field of the `User` entity:

Example request payload for the upsert query:

```
{
  "__metadata": {
    "uri": "User('123456')"
  },
  "riskOfLoss": "Dummy Value"
}
```

OData returns successful response:

```
{
  "d": [
    {
      "key": "123456",
      "status": "OK",
      "editStatus": "UPDATED",
      "message": null,
      "index": 0,
      "httpCode": 204,
      "inlineResults": null
    }
  ]
}
```

Query the user and expand to the picklist value:

```
https://<API-server>/odata/v2/User('123456')?
$format=JSON&$select=riskOfLoss,riskOfLossNav&$expand=riskOfLossNav
```

Navigation property returns empty result:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/User('123456')",
      "type": "SFOData.User"
    },
    "riskOfLoss": "Dummy Value",
  }
}
```

```

    "riskOfLossNav": null
  }
}

```

If you upsert a valid value, the result will be something like this:

```

{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/User('123456')",
      "type": "SFOData.User"
    },
    "riskOfLoss": "5326",
    "riskOfLossNav": {
      "__metadata": {
        "uri": "https://<API-server>/odata/v2/PicklistOption(5326L)",
        "type": "SFOData.PicklistOption"
      },
      "id": "5326",
      "status": "ACTIVE",
      "sortOrder": 3,
      "minValue": "3",
      "mdfExternalCode": "riskOfLoss_High",
      "externalCode": null,
      "optionValue": "3",
      "maxValue": "3",
      "childPicklistOptions": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/PicklistOption(5326L)/
childPicklistOptions"
        }
      },
      "parentPicklistOption": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/PicklistOption(5326L)/
parentPicklistOption"

9.1.10 Role-Based Permissions (RBP)

This section contains a list of Role-Based Permissions (RBP) OData entities and function imports that are used to enable integration with third-party HRIS systems. You need the permission to access Manage Role-Based Permissions to use any of the RBP entities and function imports.

The Role-Based Permissions OData APIs enable you to:

- Query for a list of roles
- Query for a list of permission groups
- Create or delete a role
- Add a new permission group using named users, or criteria (dept = 1,2,3)
- Remove a user from a permission group
- Grant a role to a permission group.
- Remove a role from a permission group
- Query for a list of permitted fields in a dynamic group, and the permitted operators for each field

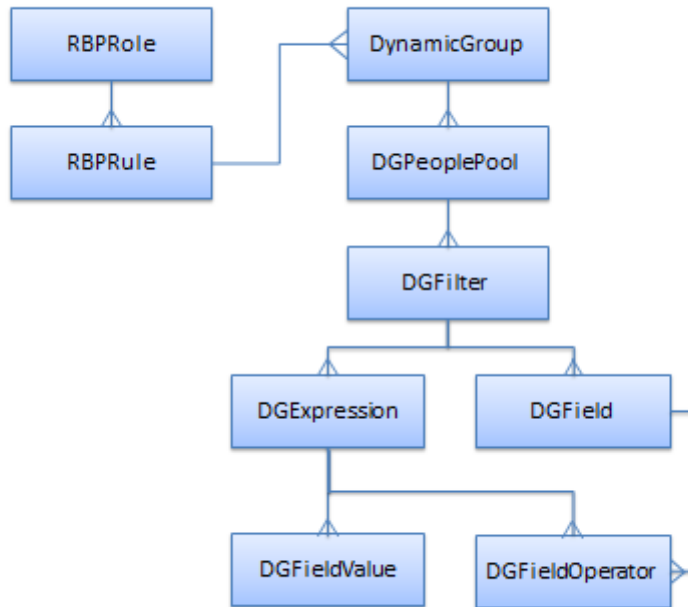

Note

It is important to note that RBP is the only permission model that is available to new customers. New customers cannot disable RBP to use legacy permissions. Existing customers, new companies of Professional Edition or free trial are not affected.

A key part of role based permissions are dynamic groups. Dynamic Groups are used to grant roles to users that are members of the dynamic group and used to define criteria about the users that are part of the group. Role based permissions also has other mechanisms to grant roles to users, through the employee hierarchy and user to user relationships like matrix manager or HR manager.

The include and exclude sections can have up to three People Pools. Each People Pool can contain one or more sets of field criteria by selecting a field from the dropdown labeled "Pick a category...". The fields here are called 'filter fields', and represent attributes about a User in the system. For example, a 'filter field' can be "Department" and criteria can be selected such that the group can include Users whose "Department" matches "Department1" and "Department2".

Entity Relation Diagram for Dynamic Groups

9.1.10.1 RBPRole

This entity lists the permitted roles in a Role-Based Permission (RBP) system. You can use this entity to query the list of roles that exist in the system. The roles are only created through the user interface. You can use this API to grant a role to a user.

Permissions

Permission System	Required Settings
Role-based	<ul style="list-style-type: none"> ▶ Admin Tools ▶ Set User Permissions ▶ Manage Role-Based Permission Access ▶ Role-Based Permission Admin (View) ▶ ▶ Admin Tools ▶ Set User Permissions ▶ Manage Role-Based Permission Access ▶ Role-Based Permission Admin (Edit) ▶

Supported Operations

Operation	Description
Query	Query a permission role.
Upsert	Insert/update a permission role..
Delete	Delete a permission role.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
rules	RBPRule	This is a navigation property for the RBPRule entity. There can be many rules for a single role.
permissions	RBPBasicPermission	This is a navigation property to basic permission entry. There can be many Basic permissions for a single role.

Use Case 1: Query Rules for a Given Role

This example shows how to query the rules for a given role.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/RBPRole(441L)?\$expand=rules</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/RBPRole(441L)",
      "type": "SFOData.RBPRole"
    }
  },
}
```

```

"roleId": "441",
"roleDesc": "System Admin",
"lastModifiedDate": "/Date(1568621503000)/",
"lastModifiedBy": "lily1109",
"roleName": "AdminAdmin",
"userType": null,
"permissions": {
  "__deferred": {
    "uri": "https://<API-server>/odata/v2/RBPRole(441L)/permissions"
  }
},
"rules": {
  "results": [
    {
      "__metadata": {
        "uri": "https://<API-server>/odata/v2/RBPRule(521L)",
        "type": "SFOData.RBPRule"
      },
      "ruleId": "521",
      "includeSelf": null,
      "excludeSelf": false,
      "relationRole": null,
      "accessGroupLevel": 0,
      "targetGroupLevel": 0,
      "myFilter": null,
      "targetUserType": null,
      "accessUserType": null,
      "status": 1,
      "accessGroups": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/RBPRule(521L)/
accessGroups"
        }
      },
      "targetGroups": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/RBPRule(521L)/
targetGroups"
        }
      },
      "roles": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/RBPRule(521L)/
roles"
        }
      }
    }
  ]
}
}
}
}

```

Use Case 2: Create a Permission Role

This example shows how to create a new permission role.

Request

Operation	Upsert
-----------	--------

HTTP Method	POST
URI	https://<API-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "RBPRole", "type": "SFOData.RBPRole" }, "roleDesc": "test122", "roleName": "test122" }</pre>

Response

<pre>{ "d": [{ "key": "RBPRole/roleId=119", "status": "OK", "editStatus": "UPSERTED", "message": "Upsert role successful.", "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>

Use Case 3: Delete a Specific Role

This example shows how to delete a specific role. A successful operation returns the 200 OK status code without response payload.

Request

Operation	Delete
HTTP Method	DELETE
URI	https://<API-server>/odata/v2/RBPRole(119L)

[Function Import \[page 329\]](#)

9.1.10.2 RBPRule

This entity represents rules in the Role-Based Permissions system. You can use this entity to query the list of rules for a given role or to list rules across all roles. You can use this entity to insert a new rule or update an existing role.

Permissions

Permission System	Required Setting
Role-based	Go to Admin Tools > Set User Permissions > Manage Role-Based Permission Access

Supported Operations

Operation	Description
Query	<p>You can query on the RBPRole entity and expand on the <code>RBPRole.rules</code> property to see the list of rules in a role.</p> <p>You can query the RBPRule entity to see the list of rules for all of the roles or you can filter the <code>RBPRule.roles/roleId</code> property to see which roles are limited to a specific RBPRole.</p>
Upsert	<p>You can insert or update a new rule using the upsert operation. You will have to specify the <code>roleId</code> for the rule you want to update. If you do not specify a <code>roleId</code>, a new rule will be created. Note that you must specify the parent RBPRole through the navigation property <code>RBPRule.roles/roleId</code>.</p>
Delete	<p>You can delete the RBP rule that is related to a role using the delete operation.</p>

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>roleId</code>	This is an internal key value is set by the system. It cannot be modified.
<code>accessGroupLevel</code>	Allows you to include the managers of the access group, up to the levels specified. Allowable values are 1,2,3 and 32767 (32767 means all level above)

Property	Description
targetGroupLevel	Allows you to include the managers of the access group, up to the levels specified. Allowable values are 1,2,3 and 32767 (32767 means all level above)
excludeSelf	Setting this property to True prevents the user from including him or herself from the target population of this rule.
includeSelf	Setting this property to True allows the user to include him or herself as a part of the target population of this rule.
myFilter	This property allows you to set a rule where the target population criteria is a value that matches the specified field value of the granted user. For example, you can set the target user population to all users that match the granted user's DEPARTMENT field. Accepted values for myFilter are: DEPARTMENT, DIVISION, LOCATION, and CUSTOM01 – 15.
relationRole	The property allows you to specify the rule through a pre-defined employee relationship. This property can take the following values: <ul style="list-style-type: none"> EM: Manager EH: HR Manager EX: Matrix Manager EA: Second Manager EC: Custom Manager GA_HOME: Global Assignment Home Manager GA_HOST: Global Assignment Host Manager GA_HOME_HR: Global Assignment Home HR Manager GA_HOST_HR: Global Assignment Host HR Manager
status	The status is set to active by default if a value is not specified when a rule is created, or the status can be set to inactive. Inactive rules allow you to deactivate a rule without deleting it.

Navigation Properties

Navigation Property	Related Entity	Description
accessGroups	DynamicGroup	A navigation property that lists the access groups assigned to this role.
roles	RBPRole	A navigation property that links backwards to the role(s) that use this rule.
targetGroups	DynamicGroup	A navigation property that lists the target groups assigned to this role.

Use Case 1: Query Roles for a Given Rule

This example shows how to query the roles for a given rule.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-server>/odata/v2/RBPRule(521L)?\$expand=roles

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-server>/odata/v2/RBPRule(521L)",
      "type": "SFOData.RBPRule"
    },
    "ruleId": "521",
    "includeSelf": null,
    "excludeSelf": false,
    "relationRole": null,
    "accessGroupLevel": 0,
    "targetGroupLevel": 0,
    "myFilter": null,
    "targetUserType": null,
    "accessUserType": null,
    "status": 1,
    "accessGroups": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/RBPRule(521L)/accessGroups"
      }
    },
    "targetGroups": {
      "__deferred": {
        "uri": "https://<API-server>/odata/v2/RBPRule(521L)/targetGroups"
      }
    },
    "roles": {
      "__metadata": {
        "uri": "https://<API-server>/odata/v2/RBPRole(441L)",
        "type": "SFOData.RBPRole"
      },
      "roleId": "441",
      "roleDesc": "System Admin",
      "lastModifiedDate": "/Date(1568621503000)/",
      "lastModifiedBy": "lily1109",
      "roleName": "AdminAdmin",
      "userType": null,
      "permissions": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/RBPRole(441L)/permissions"
        }
      },
      "rules": {
        "__deferred": {
          "uri": "https://<API-server>/odata/v2/RBPRole(441L)/rules"
        }
      }
    }
  }
}
```

Use Case 2: Update a Property for a Given Rule

This example shows how to update a property for a given rule.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "RBPRule(521L)" }, "ruleId": "521", "excludeSelf": false, "accessGroupLevel": 0, "targetGroupLevel": 0, "status": 1, "roles": { "__metadata": { "uri": "RBPRole(441L)", "type": "SFOData.RBPRole" } }, "accessGroups": { "__metadata": { "uri": "DynamicGroup(5360L)" } }, "targetGroups": { "__metadata": { "uri": "DynamicGroup(1586L)" } } }</pre>

Response

<pre>{ "d": [{ "key": "521", "status": "OK", "editStatus": "UPDATED", "message": "Update rule successful", "index": 0, "httpCode": 204, "inlineResults": null }] }</pre>
--

9.1.10.3 DynamicGroup

Use this entity to query, create, and update dynamic group definitions in Role-Based Permissions.

Permissions

Permission System	Required Setting
Role-based	▶ Set User Permissions > Manage Role-Based Permission Access ▶

Supported Operations

Operation	Description
Query	<p>Queries directly on the <code>DynamicGroup</code> entity result in a simple list of dynamic group definitions in the system, without having to retrieve the fully expanded group definition structure.</p> <p>Navigation properties can't be expanded. You must use the following custom functions to enable an expanded structure:</p> <ul style="list-style-type: none">• <code>getExpandedDynamicGroupById</code>• <code>getExpandedDynamicGroupName</code>
Upsert	<p>You can replace a dynamic group by providing a fully expanded entity that includes a complete dynamic group definition. You can also create a dynamic group by providing a fully expanded entity without a group ID. The <code>groupType</code> property is mandatory in the POST body of an upsert.</p> <p>For an example of the upsert operation, see the use case below.</p>

Note

When updating user information via user import tool, Manage Employee application or using an OData API call, dynamic groups are refreshed asynchronously, in a separate job. This allows the user import request to be completed in a timely manner.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
groupId	An internal key value set by the system. It can't be modified. The data type is Long.
groupName	User-provided name for the group.
groupType	The supported group types for RBP are permission and ectworkflow . Only query is supported for ectworkflow group type. groupType is required in the request payload of an upsert operation.
activeMembershipCount	The count of total active users that match the group definition criteria.
lastModifiedDate	The timestamp of the last modification to the group definition.
staticGroup	This indicates whether the permission group is static or dynamic. Allowed values are: <ul style="list-style-type: none">• <code>true</code>: indicates a static group.• <code>false</code>: indicates a dynamic group.• <code>null</code>: defaults to <code>false</code>.
totalMemberCount	The total number of members in the dynamic group.
createdBy	The userId who created the dynamic group.
userType	Indicates whether this is an internal or external user. Possible values are: <ul style="list-style-type: none">• <code>null</code>: internal user.• <code>ONB</code>: external user from Onboarding.• <code>LMS</code>: external user from Learning.

Navigation Properties

Navigation Property	Related Entity	Description
dgExcludePools	DGPeoplePool	This navigation property is a list of the people pools that make up the exclude rules. There can be a maximum of 3 exclude pools. Users that match the exclude pools criteria are excluded from the group definition. Dynamic groups first evaluate all members in the include pools, and then remove all members found in the exclude pools.

Navigation Property	Related Entity	Description
dgIncludePools	DGPeoplePool	This navigation property is a list of the people pools that make up the include rules. There can be a maximum of 3 include pools.

Use Case 1: Query a Dynamic Group with Group ID

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/DynamicGroup(2409L)

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/DynamicGroup(2409L)",
      "type": "SFOData.DynamicGroup"
    },
    "groupID": "2409",
    "groupName": "Organizational Design Expert CA",
    "groupType": "ectworkflow",
    "activeMembershipCount": 1,
    "createdBy": "Chris",
    "lastModifiedDate": "/Date(1505907023000)/",
    "staticGroup": false,
    "userType": null,
    "totalMemberCount": 1,
    "dgExcludePools": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/DynamicGroup(2409L)/
dgExcludePools"
      }
    },
    "dgIncludePools": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/DynamicGroup(2409L)/
dgIncludePools"
      }
    }
  }
}
```

Use Case 2: Query the People Pools of a Dynamic Group

The `<dgExcludePools>` and `<dgIncludePools>` navigation properties can't be expanded when you query a dynamic group. Instead, you use the `getExpandedDynamicGroupById` function import to do so. Here's an example:

Request

HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ getExpandedDynamicGroupById?groupId=2409L</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/DynamicGroup(2409L)",
      "type": "SFOData.DynamicGroup"
    },
    "groupID": "2409",
    "activeMembershipCount": 1,
    "createdBy": null,
    "groupName": "Organizational Design Expert CA",
    "groupType": "ectworkflow",
    "lastModifiedDate": "/Date(1505907023000)/",
    "staticGroup": false,
    "totalMemberCount": null,
    "userType": null,
    "dgIncludePools": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/  
DGPeoplePool('2409_1')",
            "type": "SFOData.DGPeoplePool"
          },
          "peoplePoolId": "2409_1",
          "filters": {
            "results": [
              {
                "__metadata": {
                  "uri": "https://<API-Server>/odata/v2/  
DGFilter('std_title_2409__1_0')",
                  "type": "SFOData.DGFilter"
                },
                "filterId": "std_title_2409__1_0",
                "expressions": {
                  "results": [
                    {
                      "__metadata": {
                        "uri": "https://<API-Server>/  
odata/v2/DGExpression('std_title_2409__1_0_0')",
                        "type": "SFOData.DGExpression"
                      },
                      "expressionID": "std_title_2409__1_0_0",
                      "operator": {
                        "__metadata": {
                          "uri": "https://<API-Server>/

      "index": 0,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}

```

Use Case 4: Create a Dynamic Group Definition

You use the upsert operation to create a group definition. Note the following:

- Don't provide a group ID in the request. Group IDs are system-generated.
- Users aren't validated in API calls. You must ensure that the user information is correct.

Request

Operation	Upsert
HTTP Method	POST
URI	<a href="https://<API-Server>/odata/v2/upsert">https://<API-Server>/odata/v2/upsert

Payload

```
{
  "__metadata": {
    "uri": "DynamicGroup"
  },
  "groupName": "HR Administrators",
  "groupType": "permission",
  "dgIncludePools": [
    {
      "__metadata": {
        "uri": "DGPeoplePool"
      },
      "peoplePoolId": "3600_1",
      "filters": [
        {

Related Information

[SAP Business Accelerator Hub: DynamicGroup](#)
[Function Import \[page 329\]](#)

9.1.10.4 DynamicGroupDefinition

This entity allows you to query the definition of a dynamic group. A dynamic group definition contains information of people pools that are included in and excluded from a group. Currently, the entity supports only dynamic groups defined in the *Manage Permission Groups* tool in *Admin Center*.

Required Settings

The following features must be enabled in *Platform Feature Settings*:

- *Role-based Permission*
- *Enable Dynamic Group Definition Report*
Enabling this feature will expose this entity in the OData metadata. Please note that it might take several minutes for the metadata to be refreshed.

To enable the features, go to [Admin Center](#) > [Company Settings](#) > [Platform Feature Settings](#) or enter *Platform Feature Settings* in action search.

Supported Operations

Operation	Description
Query	Query the definition of a dynamic group

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
group	DynamicGroup	Navigation to the related Dynamic Group.

Use Case: Query the Definition of a Single Dynamic Group

The following example shows how to query the definition of a single dynamic group by specifying the groupID:

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ DynamicGroupDefinition('1234')?\$format=JSON</code>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/DynamicGroupDefinition(1234L)",
      "type": "SFOData.DynamicGroupDefinition"
    },
    "groupID": "1234",
    "excludedPeoplePool1": null,
    "excludedPeoplePool2": null,
    "includedPeoplePool2": null,
    "excludedPeoplePool3": null,
    "includedPeoplePool1": "(Username = admin1, admin2, admin3, admin4,
admin5)",
    "includedPeoplePool3": null,
    "group": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/  
DynamicGroupDefinition(1234L)/group"
      }
    }
  }
}
```

You can use the `$filter` query option to query multiple definitions. Please note that the limit of items in an IN clause is 1000.

```
https://<api-server>/odata/v2/DynamicGroupDefinition?$format=JSON&$filter = groupID  
in 1234, 1235, 1236
```

Related Information

[SAP Business Accelerator Hub: RBPBasicPermission](#)

9.1.10.12 Function Import

The RBP APIs provide custom functions for querying and editing the expanded Dynamic Group entities in a single nested data structure that follows the data model.

The RBP APIs do not support operations on child entities of the DynamicGroup parent entity, with the exception of the DGField entity. Instead these entities are accessed in the context of the parent DynamicGroup entity using custom operations described here.

Custom Functions for Dynamic Groups

Function	Parameter(s)	Return Type	Description
getExpandedDynamic-GroupById	groupId (Long)	DynamicGroup	Returns the expanded DynamicGroup child entities for the group identified by the groupId. Only groups defined by filters with fields listed below are supported.
getExpandedDynamic-GroupByName	groupName (String)	DynamicGroup	Returns the expanded DynamicGroup child entities for the group(s) identified by groupName. Note that groupName is not guaranteed to be unique, so this method can return more than one DynamicGroup parent object.
getUserRolesByUserId	userId (String)	Permission-Roles	Returns permission role list for a specific user. If you are not an RBP administrator, you can only access your own permission role list. If you are an RBP administrator with "Role-Based Permission Admin (View)" or "Role-Based Permission Admin (Edit)" access, you can view the permission role list of any user you specified.
upsert		DynamicGroup	Returns a new or updated Dynamic Group. This is a POST action, with no parameters for this custom function. Data is passed in the post body as JSON format, which is the group definition. Sample group definition is show below:
getExpandedDynamic-GroupByNameAndSub-Type	group-Name(String) or group-Type(String)	DynamicGroup	Returns the expanded permission group child entities for the group identified by the groupName and groupType
updateStaticGroup	group-Name(String) action takes values "add" or "remove" UserId list (use first for duplicate and ignores incorrect User Id data)	Integer Add or remove a static group. Returns the number added or removed by using the function import.	Creates, removes or updates a static permission group. The behavior is similar to Delta Update of Import Static Permission Group Function. https://example.com/odata/v2/updateStaticGroup?groupId=1234L&action='add'&userIds='cgrant1' https://example.com/odata/v2/updateStaticGroup?groupId=1234L&action='remove'&userIds='cgrant1'

Function	Parameter(s)	Return Type	Description
checkUserPermission	<p>accessUserId (String)</p> <p>permType (String)</p> <p>permStringValue (String)</p> <p>permLongValue (Int)</p> <p>targetUserId (String)</p> <p>includeInactiveUser (Boolean)</p> <p>includeTBHUser (Boolean)</p>	Boolean (True or False)	<p>Return true/false whether access user has permission or not.</p> <ul style="list-style-type: none"> targetUserId is optional, when we need to specify one target user in the request, we need to add this parameter. If the target user is inactive, you need to also pass the includeInactiveUser parameter with its value set to true. If the target user is a TBH user, you need to also pass the includeTBHUser parameter with its value set to true. <p>Request Samples:</p> <pre> https://example.com/odata/v2/ checkUserPermission ? accessUserId='userA'&permType='user_admin' &permString Value='reset_account_user_admin'&permLongV alue=- 1L&targetUserId='active1' https://example.com/odata/v2/ checkUserPermission ? accessUserId='userA'&permType='user_admin' &permString Value='reset_account_user_admin'&permLongV alue=- 1L&targetUserId='inactive1'&includeInactiv eUser=true https://example.com/odata/v2/ checkUserPermission ? accessUserId='userA'&permType='user_admin' &permString Value='reset_account_user_admin'&permLongV alue=- 1L&targetUserId='TBH1'&includeTBHUser=true </pre>

Note

Currently, this function import does not support MDF object permission

Function	Parameter(s)	Return Type	Description
getDynamicGroupsByUser	userId (String) groupSubType (String)	A list of DynamicGroup	<p>Returns a list of the permission groups that a specific user belongs to.</p> <p>Request Sample:</p> <pre>https://<Hostname>/odata/v2/getDynamicGroupsByUser?userId='quickadd01'&groupSubType='permission'</pre> <p>Response Sample:</p> <div data-bbox="824 632 1427 1075" data-label="Code-Block"> <pre> { } Sample Code { "d": [{ "groupId": "1476", "groupName": "\$\$EVERYONE\$\$" }, { "groupId": "8748", "groupName": "0707-quickadd01- permission group" }] } </pre> </div> <div data-bbox="824 1094 1427 1289" data-label="Text"> <p>Note</p> <p>The custom function getDynamicGroupsByUser parameter 'groupSubType=permission' is necessary and it returns users assigned in a permission group as defined in the Admin Center's Manage Permission Groups screen.</p> </div>

Function	Parameter(s)	Return Type	Description
getUsersByDynamicGroup	groupId (Long) activeOnly	Boolean (True or False).	<p>groupId - Returns a list of all the users that belong to a specific permission group.</p> <p>activeOnly - If the value for this parameter is True, the function returns a list of all active users. If the value is False the function returns a list of all users (active and inactive users). If the value is empty, the value defaults to false and a list of all users is returned.</p> <p>Request Sample:</p> <pre>https://<Hostname>/odata/v2/getUsersByDynamicGroup?groupId=7228L</pre> <p>Response Sample:</p> <div data-bbox="824 730 1425 1123" data-label="Code-Block"> <pre> Sample Code { "d": [{ "firstName": "cgrant_f", "lastName": "cgrant_l", "middleName": "cgrant_m", "userId": "convert_cgrant1", "userName": "cgrant" }] } </pre> </div> <div data-bbox="824 1140 1425 1308" data-label="Text"> <p>Note</p> <p>The custom function getUsersByDynamicGroup parameter 'groupId' only supports Permission Groups as defined in the Admin Center's Manage Permission Groups screen.</p> </div>

Function	Parameter(s)	Return Type	Description
getUserRolesReport	userIds, includeOnlyUserAG	String	<p>Returns formatted XML content that contains all role and group details for the requested user. When TRUE you can use the includeOnlyUserAG parameter, to return only the role definition with access information only for the users you've passed through the parameter.</p> <p>Request Sample:</p> <pre>https://<Hostname>/odata/v2/getUserRolesReport?userIds='roml,admin'</pre> <p>Response Sample:</p> <div data-bbox="824 646 1425 913" data-label="Code-Block"> <pre> { } Sample Code { "d": { "getUserRolesReport": "<String value in XML format>" } } </pre> </div>
getPermissionMetadata	locale	String	<p>Returns all the permission categories and permissions for the company based on the locale setting.</p> <p>Request Sample:</p> <pre>https://<Hostname>/odata/v2/getPermissionMetadata?locale=en-US</pre> <p>Response Sample:</p> <div data-bbox="824 1207 1425 1495" data-label="Code-Block"> <pre> { } Sample Code { "d": { "getPermissionMetadata": "<String value in XML format>" } } </pre> </div>

Function	Parameter(s)	Return Type	Description
getUsersPermissions	locale userIds	String	<p>Returns all the permissions assigned to the user(s) based on the locale setting. Note: There is a maximum limitation of 100 users per invocation.</p> <p>Request Sample:</p> <pre>https://<Hostname>/odata/v2/getUsersPermissions?locale=en-US&userIds='admin,192'</pre> <p>Response Sample:</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p>↔ Sample Code</p> <pre>{ "d": { "getUsersPermissions": "<String value in XML format>" } }</pre> </div>
getRolesPermissions	locale roleIds	String	<p>Returns all the permissions assigned to the role(s) based on the locale setting. Note: There is a maximum limitation of 100 roles per invocation.</p> <p>Request Sample:</p> <pre>https://<Hostname>/odata/v2/getRolesPermissions?locale=en-US&roleIds='1,2'</pre> <p>Response Sample:</p> <div style="border: 1px solid #ccc; padding: 5px; background-color: #f9f9f9;"> <p>↔ Sample Code</p> <pre>{ "d": { "getRolesPermissions": "<String value in XML format>" } }</pre> </div>

Supported Fields for getExpandedDynamicGroupById

Only groups defined by filters with fields listed below are supported. If your group is defined with any other field filters like Employee Central related fields or team view fields, the OData custom function will raise an error:

username, department, division, location, custom01, custom02, custom03, custom04, ... custom15, benchStrength, citizenship, city, country, dateOfBirth, dateOfPosition, ethnicity, futureLeader, gender, hireDate,

impactOfLoss, jobCode, keyPosition, married, minority, nationality, newToPosition, reasonForLeaving, riskOfLoss, state, timeZone, title, zipCode, user

Sample JSON DynamicGroup Definition

Group with only "username" as a filter field for values of "cgrant" and "athompson"

```

9.1.11 TimeZone

You can use this entity to view, create, change, and delete time zone information.

Permissions

For non-admin use: [▶ Metadata Framework](#) [▶ Read/Write Permission](#) [▶](#)

For admin use: [▶ Metadata Framework](#) [▶ Import Permission](#) [▶](#)

Supported Operations

Query, Insert, Upsert, Merge, Replace, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) [▶ API Center](#) [▶ OData API Data Dictionary](#) [▶](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
countryNav	Country	An association between TimeZone and Country.
wfRequestNav	WfRequest	An association between TimeZone and Workflow Request.

Entity Relation Diagram

TimeZone	
effectiveStartDate	DateTime
externalCode	String(128)
countryNav	Country
effectiveStatusNav	MDFEnumValue
mdfSystemRecordStatusNav	MDFEnumValue

Use Case 1: Query a Timezone Record

This example shows how to query a timezone record with specific criteria.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')",
      "type": "SFOData.TimeZone"
    },
    "externalCode": "10010",
    "effectiveStartDate": "/Date(-2208988800000)/",
    "country": null,
    "lastModifiedDateTime": "/Date(1563167498000+0000)/",
    "name_localized": null,
    "mdfSystemEffectiveEndDate": "/Date(253402214400000)/",
    "name_it_IT": null,
    "utcDstOffset": "UTC+01:00",
    "createdDateTime": "/Date(1563167498000+0000)/",
    "name_fr_FR": null,
    "name_en_DEBUG": null,
    "name_en_US": null,
    "name_pt_BR": null,
    "name_fr_CA": null,
    "name_zh_CN": null,
    "name_defaultValue": null,
    "utcOffset": "+0100",
    "name_nl_NL": null,
    "lastModifiedBy": "lilily5",
    "mdfSystemRecordStatus": "N",
    "name_en_GB": null,
    "effectiveStatus": "A",
    "name_ar_SA": null,
    "name_de_DE": null,
    "createdBy": "lilily5",
    "name_es_ES": null,
    "comment": null,
    "name_es_MX": null,
    "supported": null,
    "nameTranslationTextNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')/nameTranslationTextNav"
      }
    },
    "createdByNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')/createdByNav"
      }
    }
  }
}
```

Payload

```
{
  "__metadata": {
    "uri":
      "TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')",
  },
  "effectiveStartDate": "/Date(-2208988800000)/",
  "externalCode": "10010",
  "effectiveStatus": "A",
  "utcDstOffset": "UTC+01:00",
  "utcOffset": "+0100"
}
```

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
      TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')",
      "type": "SFOData.TimeZone"
    },
    "effectiveStatus": "A",
    "utcDstOffset": "UTC+01:00",
    "utcOffset": "+0100",
    "externalCode": "10010",
    "effectiveStartDate": "/Date(-2208988800000)/"
  }
}
```

Use Case 3: Change an Existing Timezone Record with Merge

This example shows how to change an existing timezone record with `Merge`. This operation updates the existing values and creates new values if they don't exist. For other properties not mentioned in the payload, their values remain untouched. A successful operation returns the [200 OK](#) status code without response payload.

Request

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')</code>
Headers	<code>x-http-method: MERGE</code>
Payload	<pre>{ "comment": "This is a timezone" }</pre>

Use Case 4: Replace an Existing Timezone Record

This example shows how to replace an existing timezone record. This operation removes all existing values and replaces them with the new values provided in the payload. If a property is not present in the payload, it will be reset to the default value. A successful operation returns the [200 OK](#) status code without response payload.

Request

Operation	Replace
HTTP Method	PUT
URI	<code>https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')</code>
Payload	<pre>{ "__metadata": { "uri": "TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')" }, "effectiveStartDate": "/Date(-2208988800000)/", "externalCode": "10010", "effectiveStatus": "A", "utcDstOffset": "UTC+01:00", "utcOffset": "+0100", "name_zh_CN": "时区" }</pre>

Use Case 5: Delete an Existing Timezone Record

This example shows how to delete an existing timezone record. A successful operation returns the [200 OK](#) status code without response payload.

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<API-Server>/odata/v2/TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10011')</code>

Use Case 6: Create or Update a Timezone Record with Upsert

This example shows how to update a timezone record with Upsert.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/TimeZone/upsert
Payload	<pre>{ "__metadata": { "uri": "TimeZone(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='10010')" }, "effectiveStartDate": "/Date(-2208988800000)/", "externalCode": "10010", "effectiveStatus": "A", "utcDstOffset": "UTC+01:00", "utcOffset": "+0100", "comment": "This is a new timezone" }</pre>

Response

<pre>{ "d": [{ "key": null, "status": "OK", "editStatus": "UPSERTED", "message": null, "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>

[SAP Business Accelerator Hub: TimeZone](#)

9.1.12 To-Do

9.1.12.1 Todo

This entity represents the list of tasks (to-do items) assigned to a user. To-do items can be classified into different categories and mapped to different functional areas in the HCM Suite.

⚠ Caution

The `Todo` entity only allows you to query the logged-in user's to-do items. User authentication is required for every request. This means a new session is created on the server for each API call, and each session will trigger

an insert operation to the database for authentication audit. A high volume of simultaneous Todo requests occupies a great amount of resource and could drastically slow down system performance.

If you want to query the to-do items of multiple users in one request, please use `TodoEntryV2`.

If you choose to use `Todo`, we highly recommend that you keep the request frequency within a reasonable range to avoid performance issues, for example, less than 2 requests per second.

See for [List of To-Do Categories \[page 360\]](#) all to-do categories supported in the `Todo` API.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
categoryId	To-do category ID. It can be used as a filter. The API returns all to-do items if no categoryId is specified in the API call. You can use the orderby operation to sort the results.
categoryLabel	A string label that describes a to-do category name.
displayOrder	Display order of the given Todo. This can be either ascending or descending . e.g. <code>orderby=displayOrder%20desc</code>
status	Status of the to-do item. The following statuses are available: <ul style="list-style-type: none">• None (0): not visible to users.• New (1): not visible to users.• Current (2): indicates an active to-do item that is visible in the tile.• Done (3): indicates a completed to-do item. Once done, a to-do item disappears from the tile.
	Note Status 0 and 1 are only used in a few special scenarios such as multiple level approval.
todos	A list containing all to-do items for the current logged-in user.

Use Case 1: Query To-do Items

This example shows how to query a logged-in user's to-do items.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ToDo

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {

      "entries": null,
      "entryId": 22547,
      "name": "Finish Your Profile",
      "status": 2,
      "statusLabel": "Active",
      "stepDescAlt": "EMPFIL_EDU_FINISH_YOUR_PROFILE",
      "todoItemId": null,
      "url": "https://<API-Server>/sf/liveprofile?
company=PLTEYHANA"
    }
  ]
}

```

Use Case 2: Query To-do Items with \$filter

This example shows how to query a logged-in user's to-do items in the categoryId 19.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ToDo? \$filter=categoryId%20eq%20'19'

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/ToDo('19')",
          "type": "SFOData.Todo"
        },
        "categoryId": "19",
        "categoryLabel": "Employee Profile Complete",
        "displayOrder": 20,
        "todos": {
          "results": [
            {
              "categoryId": "19",
              "completedDate": null,
              "dueDate": null,
              "dueDateOffset": -2147483648,

```

```

"entries": null,
"entryId": 22547,
"name": "Finish Your Profile",
"status": 2,
"statusLabel": "Active",
"stepDescAlt": "EMPFIL_EDU_FINISH_YOUR_PROFILE",
"todoItemId": null,
"url": "https://<API-Server>/sf/liveprofile?
company=PLTEYHANA"
}
]
}
}
}
}
}
}
}
}
}

```

Use Case 3: Query To-do Items with \$orderby

This example shows how to query a logged-in user's to-do items which are ordered by categoryId in descending order.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ToDo? \$orderby=categoryId%20desc

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/ToDo('19')",
          "type": "SFOData.Todo"
        },
        "categoryId": "19",
        "categoryLabel": "Employee Profile Complete",
        "displayOrder": 20,
        "todos": {
          "results": [
            {
              "categoryId": "19",
              "completedDate": null,
              "dueDate": null,
              "dueDateOffSet": -2147483648,
              "entries": null,
              "entryId": 22547,
              "name": "Finish Your Profile",
              "status": 2,
              "statusLabel": "Active",
              "stepDescAlt": "EMPFIL_EDU_FINISH_YOUR_PROFILE",
              "todoItemId": null,
              "url": "https://<API-Server>/sf/liveprofile?
company=PLTEYHANA"
            }
          ]
        }
      }
    ]
  }
}

```

URI

https://<API-Server>/odata/v2/ToDo?
\$filter=status%20ne%20'2'

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/ToDo('0')",
          "type": "SFODData.ToDo"
        },
        "categoryId": "0",
        "categoryLabel": "Evaluate Performance",
        "displayOrder": 0,
        "todos": {

                    "formDataId": "4600",
                    "status": 1,
                    "statusLabel": "Upcoming",
                    "subjectFullName": "Erik Yao",
                    "subjectId": null,
                    "url": "https://<API-Server>/sf/pmreviews?
company=PLTEYHANA"
                  }
                ]
              }
            },
            {
              "entryId": 22551,
              "name": "Signature",
              "status": 1,
              "statusLabel": "Upcoming",
              "stepDescAlt": "Signature",
              "todoItemId": null,
              "url": "https://<API-Server>/sf/pmreviews?
company=PLTEYHANA"
            }
          ]
        }
      }
    ]
  }
}
```

Response Fields

Some of the tags in the response are described below:

Tag	Description
CategoryId	This is the ID of the category.
completedDate	If applicable, this is the completed date for the Todo item.
dueDate	If applicable, this is the due date for the Todo item.
dueDateOffSet	If applicable, this is the number of days until the Todo item is due.
entries	This is the list of Todos for one step in route map.
name	This is the name of the step or a learning item. For the "Profile Complete" Todo, this is set to "Finish Your Profile".
status	This is the Status Id of the Todo Form.
statusLabel	This is the Label associated with the status Id.
stepDescAlt	This is the Description of the step.
url	This is the relevant deeplink URL, if any, for the category.
subjectId	For the workflow Todo, the value of this tag is equal to the workflowId of the workflow item. This value of this tag is null for all other Todo types.

[How do I access my assigned workflow requests? \[page 1481\]](#)

9.1.12.2 TodoEntryV2

This entity represents the list of to-do items assigned to a user or multiple users. To-do items can be classified into different categories and mapped to functional areas in SAP SuccessFactors HCM suite. This entity can be used to query and edit the to-do items of a single user and multiple users. When querying or editing to-do items for multiple users, some prerequisites and conditions apply as described in the Permissions section.

Permissions

By default, this entity allows you to query the to-do items of the logged-in user only. To query or edit another user's to-do items, you need to have the right permissions.

Required Setting

► [Manage Integration Tools](#) ► [OData API Todo Export](#) ►

Note

Allows the user to query the to-do items of all users in the system.

Note

You can only query the to-do items of other users on an API server or a Job server. For non-mobile clients, you can add parameter `ignoretodoexport=true` in the URL to query to-do items assigned to the logged-in user.

► [Manage Integration Tools](#) ► [OData API TodoEntryV2 External Categories Import](#) ►

Allows the user to create and edit the to-do items of external categories for all users.

Note

External categories include category 41 and 57.

Supported Operations

Query, Insert, Upsert, Merge, Delete

Note

Editing operations are limited to categories 41 and 57 only.

Supported To-Do Categories

See [List of To-Do Categories \[page 360\]](#).

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
categoryId	To-do category ID. It can be used as a filter in the API call. If no ID is specified in the URI, the query returns to-do items of all categories.
linkUrl	The deep link of the to-do item. A deep link is a URL that takes you to the to-do item on the UI. You can use it to view the item and take actions.
mobileLinkUrl	The deep link of the to-do item for mobile clients. It's only valid for categories 38 and 44.
status	<p>The status of the to-do item. The following statuses are available:</p> <ul style="list-style-type: none">• None (0): To-do items in this status are not visible to users.• New (1): To-do items in this status are not visible to users.• Current (2): Indicates an active to-do item that is visible to users.• Done (3): Indicates a completed to-do item. <div data-bbox="532 800 1427 1087"><p>Note</p><p>Status 0 and 1 are only used in a few special scenarios such as multiple level approval.</p><p>Do not use <code>\$filter=status ne '<status>'</code> to exclude to-do items in a query. Instead, explicitly call out the statuses you want to retrieve.</p><p>When you query completed to-do items (status 3), only the ones completed in the past 30 days are returned.</p></div>
subjectId	<p>Subject ID of the to-do item. The subject of a to-do item can be a person or other non-person entities.</p> <div data-bbox="532 1205 1427 1568"><p>Note</p><p>When the subjectId represents a person, it returns the userId of the related user.</p><p>If you create a third-party to-do item for categoryId 57 (Service Now), subjectId is required and the value must be ServiceNow. Otherwise, you're not able to see the Service Now to-do item in the <i>Third-Party To-Do Items</i> tile.</p><p>For other cases, subjectId is the same as the workflow request ID, which takes you directly to <code>EmployeeTime</code> or <code>PerPersonal</code> rather than having to expand to <code>empWfRequest</code> or <code>WfRequest</code>.</p></div>
todoEntryId	-
todoEntryName	Descriptive name of the to-do item in the language of logged-in user's locale.
userId	ID of the user to whom the to-do item is assigned.

Navigation Properties

Navigation Property	Related Entity	Description
userNav	User [page 400]	Navigation to the corresponding user entity.
recruitingJobOffer-Nav	JobOffer [page 2815]	Navigation to the pending approval of a job offer. This navigation property only returns value when the categoryId is 11.
formContentNav	FormContent [page 2393]	Navigation to the pending approval of a performance review. This navigation property only returns value when the categoryId is 0, 2, or 3.
wfRequestNav	WfRequest	<p>Navigation to the pending approval of a workflow request. This navigation property only returns value for categoryId 14, 17, 18, 21, 24, 25, 29, 39, and 46.</p> <p>If you want to query the workflow information displayed on the Workflow Details page, expand further to navigation property <code>wfRequestUINav</code>. For example, you can define the navigation in the call as the following, <code>\$expand=wfRequestNav/wfRequestUINav</code>.</p> <p>For more information, see WfRequestUIData.</p>

Use Case 1: Search for To-Do Items

This example shows how to search for all to-do items in the Employee Profile Complete Category (categoryId: 19) with status 2.

Request

Operation	Query
HTTP Method	GET

URI

https://<api-server>/odata/v2/ToDoEntryV2?
\$format=json&\$filter=categoryId%20eq%20'19
'&status%20eq%20'2'

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/ToDoEntryV2(50M)",
          "type": "SFOData.ToDoEntryV2"
        },
        "todoEntryId": "50",
        "completedDateTime": null,
        "linkUrl": "https://<api-server>/sf/liveprofile?
selected_user=82094",
        "status": 2,
        "categoryId": "19",
        "categoryLabel": "Employee Profile Complete",
        "lastModifiedDateTime": "/Date(1458792000000+0000)/",
        "todoEntryName": "Finish Your Profile",
        "subjectId": "82094",
        "createdDate": "/Date(1420693200000+0000)/",
        "dueDate": null,
        "formDataId": null,
        "wfRequestNav": {
          "__deferred": {
            "uri": "https://<api-server>/odata/v2/ToDoEntryV2(50M)/
wfRequestNav"
          }
        },
        "formContentNav": {
          "__deferred": {
            "uri": "https://<api-server>/odata/v2/ToDoEntryV2(50M)/
formContentNav"
          }
        },
        "recruitingJobOfferNav": {
          "__deferred": {
            "uri": "https://<api-server>/odata/v2/ToDoEntryV2(50M)/
recruitingJobOfferNav"
          }
        },
        "userNav": {
          "__deferred": {
            "uri": "https://<api-server>/odata/v2/ToDoEntryV2(50M)/
userNav"
          }
        }
      }
    ]
  }
}
```

Use Case 2: Create a To-Do Item for User

This example shows how to use the API to create a new to-do item for user Tessa Walker.

Sample Request

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/ToDoEntryV2
Payload	<pre>{ "__metadata": { }, "todoEntryName": "To-do Item for Tessa", "status": 1, "categoryId": "41", "dueDate": "/ Date(1530590400000+0000)/", "userNav": { "__metadata": { "uri": "https://<api- server>/odata/v2/User('82094')", "type": "SFOData.User" } } }</pre>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/ToDoEntryV2(36609M)",
      "type": "SFOData.ToDoEntryV2"
    },
    "todoEntryName": "To-do Item for Tessa",
    "status": 1,
    "categoryId": "41",
    "dueDate": "/Date(1530590400000+0000)/",
    "todoEntryId": "36609",
    "userNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/ToDoEntryV2(36609M)/
userNav"
      }
    }
  }
}
```

Use Case 3: Query a To-Do Item and View its Related Objects

This example shows how to query a to-do item from the Performance Review area and expand the related form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ToDoEntryV2(36573M)?\$format=json&\$expand=formContentNav</code>

Sample Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/ToDoEntryV2(36573M)",
      "type": "SFOData.ToDoEntryV2"
    },
    "todoEntryId": "36573",
    "completedDateTime": "/Date(1530601140000+0000)/",
    "linkUrl": "https://<api-server>/sf/pmreview?fid=8401&company=DEMOCOMPANY&username=twalker&reqOrig=todoList&",
    "status": 3,
    "categoryId": "0",
    "categoryLabel": "Evaluate Performance",
    "lastModifiedDateTime": "/Date(1530590400000+0000)/",
    "todoEntryName": "Goal Setting",
    "subjectId": "82094",
    "createdDate": "/Date(1530590400000+0000)/",
    "dueDate": null,
    "formDataId": 9101,
    "wfRequestNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/ToDoEntryV2(36573M)/wfRequestNav"
      }
    },
    "formContentNav": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/FormContent(formContentId=12942L,formDataId=9101L)",
            "type": "SFOData.FormContent"
          },
          "formContentId": "12942",
          "formDataId": "9101",
          "status": "-1",
          "lastModifiedDate": "/Date(1530600927000+0000)/",
          "form360ReviewContentDetail": {
            "__deferred": {
              "uri": "https://<api-server>/odata/v2/FormContent(formContentId=12942L,formDataId=9101L)/form360ReviewContentDetail"
            }
          },
          "folders": {
            "__deferred": {
```

```

        "uri": "https://<api-server>/odata/v2/
FormContent(formContentId=12942L,formDataId=9101L)/folders"
      },
      "pmReviewContentDetail": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/
FormContent(formContentId=12942L,formDataId=9101L)/pmReviewContentDetail"
        }
      },
      "formHeader": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/
FormContent(formContentId=12942L,formDataId=9101L)/formHeader"
        }
      }
    }
  ],
  "recruitingJobOfferNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/ToDoEntryV2(36573M)/
recruitingJobOfferNav"
    }
  },
  "userNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/ToDoEntryV2(36573M)/
userNav"
    }
  }
}

```

Use Case 4: Create a To-Do Item for Service Now Category

This example shows how to create a to-do item for third-party application Service Now. Note that for the to-do item to appear in the [Third-Party To-Do Items](#) tile, you need to set the status value as **2** and subjectId value as **ServiceNow**.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Payload	<pre> { "__metadata": { "uri": "ToDoEntryV2" }, "todoEntryName": "New Service Now To-do Item", "status": 2, "categoryId": "57", </pre>

```

        "dueDate": "/"
Date(1535590400000+0000)/",
        "subjectId": "ServiceNow",
        "linkUrl": "https://
www.exampleURL.com",
        "userNav": {
            "__metadata": {
                "uri": "User('cgrant')"
            }
        }
    }
}

```

Response

```

{
  "d": [
    {
      "key": "TodoEntryV2/todoEntryId=22555",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": "Inserted Successfully.",
      "index": 0,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}

```

Use Case 5: Delete a To-Do Item

This example shows how to delete a to-do item.

Request

Operation	Delete
HTTP Method	DELETE
URI	https://<api-server>/odata/v2/ TodoEntryV2('12345')

Response

Successful deletion returns status 200 OK with no response payload.

[How do I access my assigned workflow requests? \[page 1481\]](#)

9.1.12.3 List of To-Do Categories

Learn about to-do categories that are included in the OData API.

→ Tip

To-do categories and category IDs are technical identifiers in the OData API, but they correspond to tasks on a person's To Do List.

Every to-do task is shown in the to-do panel. Each to-do task may also be shown in several other places, such as the home page or SAP Task Center.

[Where To-Do Tasks Are Shown \[page 376\]](#)

How to use the table:

- Use the search, filter, sort, and show/hide columns functionalities to adjust the table content.
- Use the *Navigation Property* column to find out which `ToDoEntryV2` navigation property can be expanded for more details of the to-do item.

99	Not applicable	Not applicable	Special values for APIs to filter categories 15, 16, and 26.	Yes	N/A	N/A	

Note

Available for Mobile only to integrate with SAP SuccessFactors Learning. `categoryId=99` must be specified in `$filter`. The Learning to-do items don't support selecting, pagination, or sorting. To-do items for all logged in users are returned. For other areas, logged in users can only see their own items.

9.1.13 Theming

This section contains OData API entities for SAP SuccessFactors themes.

9.1.13.1 ThemeInfo

The `ThemeInfo` entity returns key UI properties for the current theme, including public css, URL, and accessibility preferences.

Supported Operations

Operation	Description
Query	Retrieve the default theme information of the current instance.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
id	The ID for a stored theme. This can be a fixed string like <code>lightGrayPlacematBlueAccentNoTexture</code> for a predefined theme, or random generated characters for customized theme.
accessibilityPreferences	Additional properties selected by the currently logged in user for accessibility support.
lastModifiedDate	The last time the default theme was modified.
urls	URLs of the theme.

Use Case: Query the Default Theme Information of the Current Instance

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ThemeInfo

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {

        }
      }
    ]
  }
}
```

Related Information

[SAP Business Accelerator Hub: ThemeInfo](#)

9.1.13.2 ThemeConfig

The `ThemeConfig` entity returns details of global style settings available for theming, including all necessary theming information such as CSS values for color, style definition, and configurations.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
id	The ID of the theme.
themeConfiguration	A collection of theme configurations represented by Complex Type <code>GlobalThemeConfiguration</code> .

Use Case 1: Query Configurations of a Theme by ID

This example shows how to query the configurations of a theme by ID. If you don't specify any ID, the query returns the configurations of the default theme.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ThemeConfig('ldb6zn6vnq')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/ThemeConfig('ldb6zn6vnq')",
      "type": "SFOData.ThemeConfig"
    }
  }
}

9.1.13.3 ThemeTemplate

The `ThemeTemplate` entity returns current user's global theme template in escaped HTML format. It also includes JavaScript, CSS, images, and i18n to build the header and footer.

Supported Operations

Operation	Description
Query	Retrieve theme template details.

Parameters

Following is the list of parameters for setting up the query:

Parameter	Data Type	Required/Optional	Description
<code>moduleId</code>	String	Required	This is your module name. Examples: HOME , ADMIN , JAM . The main navigation menu automatically selects this module.
<code>useAbsPaths</code>	Boolean	Optional	Use absolute path or relative path for URLs in the template. Default value is true .
<code>layoutType</code>	String	Optional	Default value is minimize .

Note

Make sure the module you request is available in your instance.

Parameter	Data Type	Required/Optional	Description
breakdown	Boolean	Optional	<p>If true, the query breaks down the full theme template into four separate sections are returned: header, footer, scripts, and styles. The <code>template</code> property returns null value.</p> <ul style="list-style-type: none"> header: the HTML for only the header of the template. footer: the HTML for only the footer of the template. scripts: the HTML for all of the <code><script></code> tags needed for the template. This includes script js file and the html inline scripts. styles: the HTML for all of the <code><link></code> and <code><style></code> tags need for the template. This includes css files and the HTML inline styles. <p>Default value is false.</p>
includeTemplate	Boolean	Optional	<p>An additional parameter in addition to <code>breakdown</code> for debugging. If set to true, the query returns both the full template and the separate sections (if <code>breakdown=true</code>).</p> <p>Default is false.</p>

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
footer	Footer section of the template
header	Header section of the template.
id	Template ID.
scripts	Scripts part of the template.
styles	HTML script for styles, including CSS and inline styles.
template	Full template in HTML format.

Use Cases 1: Query a Theme Template by Module Name

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ThemeTemplate?moduleId=HOME</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/ThemeTemplate('1db6zn6vnq')",
      "type": "SFOData.ThemeTemplate"
    },
    "id": "1db6zn6vnq",
    "template": "<!DOCTYPE html PUBLIC ... ..</html>\n",
    "ui5BaseThemeRootUrl": "/public/ui-dcss/... ..merge_/ui/sapui5/
theming_aux!/ui/sapui5/main",
    "footer": null,
    "bodyStyleClass": null,
    "header": null,
    "langDir": "ltr",
    "styles": null,
    "locale": "en",
    "scripts": null
  }
}
```

Use Case 2: Query a Template with Options

Request

Operation	Query
-----------	-------

HTTP Method	GET
URI	https://<api-server>/odata/v2/ThemeTemplate? moduleId=HOME&useAbsPaths=true&breakdown=true

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/ThemeTemplate('1db6zn6vnq')",
          "type": "SFOData.ThemeTemplate"
        },
        "id": "1db6zn6vnq",
        "template": null,
        "ui5BaseThemeRootUrl": "https://<api-server>/public/ui-dcss/... .../merge_/ui/sapui5/theming_aux!/ui/sapui5/main",
        "footer": "",
        "bodyStyleClass": "sapUiBody globalBackground responsiveLayout ltr",
        "header": "<meta id=\"beginHead\" content=\"beginHead\" />
        >... ..\n
        ",
        "langDir": "ltr",
        "styles": "<link href=\"... />",
        "locale": "en",
        "scripts": "<script id=\"pageHeaderJsonDataScript\" ... ..</script>"
      }
    ]
  }
}
```

9.1.14 User Management

This section contains OData API entities for managing user information in SAP SuccessFactors, including users in SAP SuccessFactors HCM suite, Learning, and Onboarding 1.0.

9.1.14.1 User

The `user` entity represents an employment and contains a user's organizational information, including department, division, location, job code, manager, and other details, as well as some personal information, such as name, phone, and email.

Note

A person might have more than one user but only one login account. In some special cases, a person doesn't have login account. Please refer to [Differentiating Between Person, User, and Login Account](#) for more information about their relationships and differences.

The `user` entity lets you integrate data between SAP SuccessFactors HCM suite and your Human Resource Information System (HRIS) or payroll system. This data-transfer process allows single-source updates of your employee data. The updates you enter into your HRIS will be passed to SAP SuccessFactors HCM suite, eliminating duplicate entries between both systems.

To do this integration, you must export the defined data fields. These data can be imported to the tool either through the API using the `user` entity, or through a flat file, which is uploaded through the [Admin Tools](#) user interface.

The API can be accessed to upload the data in real time. You can automate the file-update process can be automated using a Secure File Transport Protocol (SFTP) process, executed according to your schedule to maintain synchronized data.

The User API can be used to process both active users and inactive users. For more information, see [Creating and Updating Inactive Users \[page 434\]](#).

Related Information

[SAP Business Accelerator Hub: User](#) 

9.1.14.1.1 Permissions

In this topic, you'll learn which permissions are needed to make API calls with the User entity.

Employee Import and Export Permissions

The employee import and export permissions can be granted to users to query and edit all fields of the User entity with a few exceptions. These are global permissions that overwrite field-level permissions if they are granted to the same user.

Employee Import or Import Employee Data

This permission allows users to edit all fields of all users. Depending on your system configuration, the permission is called either *Employee Import* or *Import Employee Data*:

If...		Then...
Employee Central is on,	and Admin Center > Manage Employee Central Settings > Enable Control on Basic User Import in Role Based Permissions is enabled,	you can enable the <i>Import Employee Data</i> and the <i>Basic User Import</i> permissions under Admin Center > Manage Permission Roles > Employee Central Import Settings .
	and Admin Center > Manage Employee Central Settings > Enable Control on Basic User Import in Role Based Permissions is NOT enabled,	you can't view or grant the Basic User Import permission under Admin Center > Manage Permission Roles > Employee Central Import Settings .
Employee Central is off,	and Admin Center > Platform Feature Settings > Enable Control on Employee Import in Role-Based Permissions is enabled,	you can enable the <i>Employee Import</i> permission under Admin Center > Manage Permission Roles > Manage User .
	and Admin Center > Platform Feature Settings > Enable Control on Employee Import in Role-Based Permissions is NOT enabled,	you can grant and remove Employee Import privilege to users under Admin Center > Manage Employee Import .

Employee Export

Users with the [Manage User > Employee Export](#) permission are able to query all fields of users, but row-level restrictions are applied based on the RBP settings for the user. That means that target population settings in RBP can also be applied.

If a user doesn't have *Employee Export* permission, row and field-level permission settings in RBP are followed.

Note

The *Employee Export* permission is required if you want to query inactive users.

The `password` field cannot be queried under any circumstance.

If a user is granted both the [Employee Export](#) permission in one role and field-level permissions in another role, only the [Employee Export](#) permission is followed. For example, you have [Employee Export](#) permission only for users in the IT department of your company. You will not be able to query any user from the HR department even though you are granted field-level view permissions to these users in another role. However, if you're granted the [Employee Export](#) permission in two roles, your permission will be the combination of these two roles.

In RBP, you have the option to exclude the granted user from having the permission rights on themselves. It allows you to prevent a user from querying their own data. This could be useful for example when you want to prevent a system admin from deleting their own documents. However, it could also lead to problems such as failure to load team members in My Team. Take these into consideration when you decide to enable this option.

Row-level Permissions

Row-level permissions are applied through the target population in RBP or through the Administrative Domain in user-based permission system to control which users' data can be accessed. Row-level permission works in conjunction with field-level permissions, the [Employee Export](#) permission, or the [Employee Import Permission](#).

Field-level Permissions

Field-level permissions allows users to view and edit individual fields as defined in the permission role. You can grant field-level permissions in RBP under [Employee Data](#). View and edit permissions can be granted to a user separately. Granting the edit permission of a field automatically grants the view permission.

If a user have both [Employee Export](#) permission and field-level permissions, the [Employee Export](#) permission overrides all field-level permissions.

Note

For users without the [Employee Export](#) permission, the [User Search](#) permission is a prerequisite for querying a user. If your user does not have this permission already, enable it at ► [General User Permission](#) ► [Company Info Access](#) ► [User Search](#) . This permission allows a user to query the following fields in addition to the ones enabled in [Employee Data](#):

- `userId`
- `lastModifiedDateTime`
- `sciLastModified`
- `lastModifiedWithTZ`
- `defaultFullName`
- `totalTeamSize`
- `lastModified`
- `teamMembersSize`

Depending on your system and data model configuration, the available fields may vary.

The `password` field is not available as a permission setting under [Employee Data](#). To change the password or create a new user, you must have the [Employee Import](#) or [Import Employee Data](#) permission.

Summary

The following table briefly summarizes when to choose which permissions for your user:

I want to ...	I need this permission
Create a new user	Employee Import or Import Employee Data
Change user password	
Modify all user fields	
Modify a few user fields	User Search , required field-level permissions, and set a proper target population.
Query all fields of all users	Employee Export
Query a few fields of a group of users	User Search , all required field-level permissions, and set a proper target population.
Delete a user	Employee Import or Import Employee Data or the edit permission to Status field under Employee Data You cannot hard-delete a user with the User entity. You can only set the status to inactive, which is in effect a soft delete. For more information of inactive user statuses, see Properties [page 405] . Note that user data can be purged separately by admin using the System Data Retention Management feature.

Error Messages

The following error messages related to permissions might occur:

Error Message	What can I do?
Insufficient row-level permissions.	Check the target population settings for your role, including the target population for field-level permissions. Alternatively, you can assign the Employee Import or Import Employee Data permission to your role.
Insufficient field-level permissions.	Check the permission settings for individual fields under Employee Data in RBP.
[LGN0002] Authentication failed. ...	Review the authentication information. For Basic Auth, make sure you have the Allow Admin to Access OData API through Basic Authentication permission.

SAP Business Accelerator Hub: Permissions 

9.1.14.1.2 Supported Operations

Supported operations of the `user` entity.

Operation	Description
Query	Retrieve user information.
Insert	Create a user.
Merge/Replace	Update user information by merging data or replacing data.
Upsert	If the user doesn't exist, the upsert operation creates a new user. If it exists, the upsert operation updates the user information.

Note

Inactive users are not returned by default. To query inactive users, you can explicitly include the status in a `$filter` or use a key predicate. If you want to query all users, use query option `$filter=status in 't','f','T','F','e','d'`. The query option `$orderby=status` applies to all users regardless of their statuses. For more information, see [Querying Different Types of Users \[page 421\]](#).

Note

The `user` entity doesn't support concurrent editing.

You can't use this API to create or edit external users (status `e` and `d`). To create or edit external users, use `ExternalUser` or `ExternalLearner`.

Caution

Before you insert or update employee information using OData API, check if an HRIS sync job is currently running in your instance. An active HRIS sync job can overwrite the values of certain fields, such as `<username>`. This can cause data inconsistency. We recommend that you avoid all API edit operations when an HRIS sync job is running.

Please contact your implementation partner to find out whether an HRIS sync job is scheduled for your instance. If you are no longer working with an implementation partner, contact Product Support.

Related Information

[Permissions \[page 401\]](#)

9.1.14.1.3 Properties

A list of properties in the `user` entity.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

The `userId`, `username`, and `status` properties are required. `userId` is a business key. Other fields can be configured as required if needed in your system.

Field-level permissions required for viewing and editing the property are listed in the *Required Permission* column. All permissions can be found under the *Employee Data* section of the permission role unless otherwise specified.

Property	Description	Required Permission
<code>userId</code>	User ID of the given user. <code>userId</code> is a business key.	<i>User ID</i>

Property	Description	Required Permission
<code>defaultFullName</code>	<p>Default full name of the user.</p> <p>This field is only available when at least one of these three fields is configured in the data model: <code>firstName</code>, <code>mi</code>, and <code>lastName</code>. If none of them are configured, <code>defaultFullName</code> is hidden in the User entity. The value of <code>defaultFullName</code> is a combination of the values of the three fields. For example, a user with first name Mary, middle name Jane, and last name Watson has a <code>defaultFullName</code> Mary Jane Watson.</p> <p>This field isn't editable.</p>	<p>One of the following permissions is required to view this field:</p> <ul style="list-style-type: none"> ▶ Manage User ▶ Employee Export ▶ General User Permission ▶ User Search <p>The User Search permission is a prerequisite for querying <code>defaultFullName</code>. You also need at least one of the following field-level permissions to have the default full name in the result:</p> <ul style="list-style-type: none"> ▶ Employee Data ▶ First Name ▶ Employee Data ▶ Middle Name ▶ Employee Data ▶ Last Name <p>User's default full name is determined by which permissions you have.</p>
<code>mi</code>	Middle name of the user.	Middle Name
<code>status</code>	<p>The following statuses are available for users:</p> <ul style="list-style-type: none"> t (active): Active users. f (inactive): Inactive users. T (active_external): Active external users for 360 Review. F (inactive_external): Inactive external users for 360 Review. e (active_external_suite): Active Learning and Onboarding users. d (inactive_external_suite): Inactive Learning and Onboarding users. <p>You can use either keys or values to filter the results of a query. The keys are case-sensitive but the values aren't. See Querying Different Types of Users [page 421] for examples.</p> <p>You can't use this API to create or edit users in status e or d. To do so, use ExternalUser [page 469].</p>	Status

Property	Description	Required Permission
teamMembersSize	<p>You can use this field to query the number of direct reports of a user.</p> <p>See Querying the Direct Reports of a User [page 425] for an example.</p>	<p>For mobile clients, no permission is required to view this field.</p> <p>For other clients, permission is required.</p>
username	Username.	<i>Username</i>
assignmentIdExternal	<p>Assignment ID of the user. An assignment ID defines the relationship between a person and a company.</p> <p>The property isn't available by default. To be able to see it, you must enable it in the data model first. For more information, see Assignment ID in User Management.</p>	No permission required.
password	<p>Use this field to reset user passwords. You can also use it to set the initial password for a user. However, for security reasons, we don't recommend this option.</p> <p>If a user's password is newly created or updated by an API admin, they're required to reset the password upon login. If a user updates their own password using API, they're not required to reset the password upon login.</p>	
lastModified	<p>Last modified date and time without time zone information.</p> <div style="border-left: 2px solid orange; padding-left: 10px; margin-top: 10px;"> <p>⚠ Caution</p> <p>Without time zone information, it can be difficult to understand the values of the property. Therefore, we don't recommend using <code>lastModified</code> in a filter. If you want to filter records by last modified date and time, use <code>lastModifiedDateTime</code> or <code>lastModifiedWithTZ</code> instead.</p> </div>	

Property	Description	Required Permission
lastModifiedDateTime and lastModifiedWithTZ	<p>Last modified date and time with time zone information. The two properties have the exact same value and are interchangeable. You can use either of them to filter records by their last modified date and time. For example:</p> <pre>/odata/v2/User? \$filter=lastModifiedDateTime ge datetimeoffset '2021-06-17T13:00:00Z'</pre>	
isPrimaryAssignment	This is a boolean field for querying whether an assignment is the primary assignment for employees who have multiple employments. This field is filterable.	No field-level permission required.
assignmentUUID	This is a filterable 32-byte UUID string field. It's a unique and stable identity for an assignment that could be specified when employee data is imported.	No field-level permission required.
gender	<p>Supported values are:</p> <ul style="list-style-type: none"> • M: Male • F: Female • U: Unknown • D: Undeclared • O: Others 	<p>As a prerequisite, enable the option to include additional gender values along with male and female in the Upgrade Center under Optional Upgrades Enhancement to Gender Values – Inclusion of Additional Gender Values Learn more & Upgrade Now Upgrade Now. Otherwise, the supported values are only Male and Female.</p>
displayName	An employee name that is configured and imported by admin to be displayed on UI or other communication channel such as message, alert, and email. This is an upsertable, updatable, filterable, and sortable field.	This field is always readable. You can configure write permission for this field.
pronouns	This is for configuring employee preferred pronouns, such as she/her/hers. There's no predefined values for the field. You can configure the values using the PersonPronouns picklist.	Pronouns
assignmentDisplayHeader	A title that is configured and imported by administrators to differentiate multiple employments. If Employee Central is on and employment differentiator is configured, this field is synced with employment differentiator.	Assignment Display Header

Note

When configure employee differentiator, avoid using picklists or fields that require additional permission control.

9.1.14.1.4 Navigation Properties

A list of navigation properties in the `User` entity.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Property	Related Entity	Description	Permission
competencyRatingNav	Competency-Rating	Competency rating of the user.	<ul style="list-style-type: none"> Manage Integration tools OData API Competency Rating Export for viewing Manage Integration tools OData API Competency Rating Import for editing
customManager	User	Custom manager of the user.	Custom Manager
empInfo	EmpEmployment	Employment information of the user.	<ul style="list-style-type: none"> Employment Details MSS for viewing Employment Details Edit for editing
hr	User	HR of the user.	Human Resource
manager	User	Manager of the user.	Manager
matrixManager	User	Matrix managers of the user.	Matrix Manager
proxy	User	Proxy of the user.	Proxy
secondManager	User	Second manager of the user.	Second Manager
userPermissionsNav	UserPermissions	<p>Expand this field to check logged-in user's permission for the fields of the queried user. This information can be used for integration purpose.</p> <p>For more information, see Field-Level Permission Control [page 410].</p>	N/A
directReports	User	Direct reports of the user.	These five properties do not have separate field permissions in the RBP role. They always show up in pairs. For example, once 'Manager' permission is checked, then di-
hrReports	User	HR reports of the user.	

Navigation Property	Related Entity	Description	Permission
secondReports	User	Second reports of the user.	rectReports for that user are visible to the user as well. The relationships are: <ul style="list-style-type: none"> • manager – directReports • hr – hrReports • secondManager – secondReports • customManager – customReports • matrixManager – matrixReports
customReports	User	Custom reports of the user.	
matrixReports	User	Matrix reports of the user.

[SAP Business Accelerator Hub: NavigationProperties](#)

9.1.14.1.5 Field-Level Permission Control

Understand how field-level permission control works in OData API for the `user` entity.

The fields in the `user` entity are configured in the Succession Data Model. It's a shared platform data model configuration framework typically configured by your SAP SuccessFactors HCM suite implementation representative in consultation with your organization and required business practices. It can also be configured by your company administrator using the *Manage Business Configuration* (BCUI) tool. The `user` entity exposes every `<standard-element>` and `<userinfo-element>` field that appears in the Succession Data Model.

The `user` entity has field-level permission control. When a user entity is queried, OData checks the logged-in user's permission against each property. This information can be used by integration as needed. For example, a user interface can display a field as a label if the field is read only, or display it as an input box if it's mandatory.

The following table lists the possible field permission values:

Value	Description
7	Mandatory: The property must contain a value (indicates writeable).
3	Optional: The property may contain a null value (indicates writeable).
1	Read-only: The property can't be changed.
0	Hidden: The property isn't visible on user interfaces.

The permission data is stored in OData entity `UserPermissions`. However, you can't query the entity directly. To query the field-level permission information of a user, you can expand the `userPermissionsNav` navigation property from a user:

```
https://<API-Server>/odata/v2/User('cgrant')?$expand=userPermissionsNav
```

A sample response is below:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/User('cgrant')",
      "type": "SFOData.User"
    },
    "userId": "cgrant",
    "...": "...",
    "userPermissionsNav": {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/UserPermissions(7)",
        "type": "SFOData.UserPermissions"
      },
      "userId": 7,
      "secondManager": 0,
      "businessPhone": 1,
      "...": "...",
      "firstName": 3,
      "username": 7
    },
    "...": "...",
  },
  "...": "...",
}
```

In the example, the permission data for the user 'cgrant' is displayed as an inline structure along with the user data. The field 'businessPhone' is read-only.

📌 Note

matrixReports and matrixManager are managed by the Matrix Manager permission and the Matrix Manager permission isn't used for this API.

Related Information

[UserPermissions \[page 448\]](#)

9.1.14.1.6 Parameters

9.1.14.1.6.1 apiOptionProfileID

The `apiOptionProfileID` parameter allows you to specify an API option profile in your API call. With an API option profile, additional processing parameters can be specified to control extra business logic when you perform edit operations with the User entity.

Parameter Values

Value	Description
<code>User defined value</code>	The parameter uses the API option profile ID that you define in the <i>Manage API Option Profile</i> tool in <i>API Center</i> . For more information, see Creating and Editing Users Using an API Option Profile [page 437] .

Use Case

For more information about using the `apiOptionProfileID`, see [Creating and Editing Users Using an API Option Profile \[page 437\]](#).

9.1.14.1.6.2 processInactiveEmployees

`processInactiveEmployees` is an exclusive parameter for the User entity. You can use this parameter when edit an inactive user.

Parameter Values

Value	Description
<code>false</code> (default)	You can edit only active users.
<code>true</code>	You can edit both active and inactive users.

Use Cases

By default, you can't edit users in statuses `inactive (f)` and `inactive_external (F)`. To edit inactive users, you need to either use the `processInactiveEmployees` parameter or an API option profile that allows editing of inactive users.

For detailed use cases, see [Processing Inactive Users](#).

9.1.14.1.6.3 replaceMatrixManager

The `replaceMatrixManager` parameter allows you to replace the values of a one-to-many (1:m) navigation property without overwriting other properties and navigation properties in the `User` entity, for example, `matrixManager`, `customManager`, and `proxy`.

Parameter Values

Value	Description
<code>false</code> (default)	The navigation property value in the request payload is added to the existing values.
<code>true</code>	The navigation property value in the request payload replaces the existing values.

Difference Between `purgeType` and `replaceMatrixManager`

Both `purgeType` and `replaceMatrixManager` are used to replace values in the `User` entity. It's important to understand the difference so that you know which one to choose in your scenario:

- Use `purgeType=record` if you want to erase all existing values and replace with the ones provided in the request payload.
- Use `replaceMatrixManager=true` if you want to replace only the values of the one-to-many navigation properties specified in the request payload, without changing the values of others.

Example 1: Replacing the Custom Managers of a User in an Upsert Operation

Request

In this example, user `cgrant` has two existing managers: `cmgr1` and `cmgr2`:

```
{
  "d": {
    "__metadata": {
```

```

    "uri": "https://<api-server>/odata/v2/User('cgrant')",
    "type": "SFOData.User"
  },
  "userId": "cgrant",
  "firstName": "Carla",
  "lastName": "Grant",
  "customManager": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/User('cmgr1')",
          "type": "SFOData.User"
        },
        "userId": "cmgr1"
      },
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/User('cmgr2')",
          "type": "SFOData.User"
        },
        "userId": "cmgr2"
      }
    ]
  }
}

```

The following request tries to replace the existing custom managers with new custom manager `cmgr3` using an upsert operation.

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert?replaceMatrixManager=true</code>
Payload	<pre> { "__metadata": { "uri": "User('cgrant')" }, "matrixManager": { "__metadata": { "uri": "User('cmgr3')" } } } </pre>

Response

```

{
  "d": [
    {
      "key": "cgrant",
      "status": "OK",
      "editStatus": "UPDATED",
      "message": null,
      "index": 0,
      "httpCode": 204,
      "inlineResults": null
    }
  ]
}

```

User cgrant now has cmgr3 as the only custom manager:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/User('cgrant')",
      "type": "SFOData.User"
    },
    "userId": "cgrant",
    "firstName": "Carla",
    "lastName": "Grant",
    "customManager": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/User('cmgr3')",
            "type": "SFOData.User"
          },
          "userId": "cmgr3"
        }
      ]
    }
  }
}
```

Example 2: Replacing the Custom Managers of a User in a Merge Operation

Request

In this example, user cgrant has two existing managers: cmgr1 and cmgr2:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/User('cgrant')",
      "type": "SFOData.User"
    },
    "userId": "cgrant",
    "firstName": "Carla",
    "lastName": "Grant",
    "customManager": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/User('cmgr1')",
            "type": "SFOData.User"
          },
          "userId": "cmgr1"
        },
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/User('cmgr2')",
            "type": "SFOData.User"
          },
          "userId": "cmgr2"
        }
      ]
    }
  }
}
```

The following request tries to replace the existing custom managers with new custom manager cmgr3 using a merge operation.

Operation	Merge
HTTP Method	POST
URI	https://<api-server>/odata/v2/ User('cgrant')?replaceMatrixManager=true
Header	x-http-method: MERGE
Payload	<pre>{ "__metadata":{ "uri":"User('cgrant')" }, "matrixManager":{ "__metadata":{ "uri":"User('cmgr3')" } } }</pre>

Response

The merge operation returns an empty response body with HTTP status code 200 OK.

User cgrant now has cmgr3 as the only custom manager:

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/User('cgrant')",
      "type": "SFOData.User"
    },
    "userId": "cgrant",
    "firstName": "Carla",
    "lastName": "Grant",
    "customManager": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/User('cmgr3')",
            "type": "SFOData.User"
          },
          "userId": "cmgr3"
        }
      ]
    }
  }
}
```

9.1.14.1.7 Business Rules for API Based File Transfers

This section describes business rules for API based file transfers.

Introduction

- The system has a base set of fields that are required, including the following: `externalId`, `username` and `status`. In addition to these fields, your system can be configured to require additional fields. These fields can be used in the system for reporting and managing security.
- If a field will not be populated, do not include that field in the API feed or the import file. If a field is included in either the API or the import file, and the field is blank (or if it is listed as null in the API) it will wipe out what is already in the database. Omit the field if you don't want to update it.

Rules for Strings

- All String field values are case sensitive. For example, if the `username` uses mixed case letters, the logon process will require that it be entered in mixed case.
- Data placed in the `Department`, `Division`, and `Location` fields are string values. They may contain a code or text name. The value entered will appear in drop-down menus.
- Field label values are limited to 100 characters. Field labels in the API are viewed through the `describeEx()` metadata, and are presented in the locale of the API user. In the file imports or exports, the field label values are presented as the second line header row. The field label values cannot be modified through the API or through the file feeds. The field label values are localizable, and are configured through a separate system setup process.
- Most string field data values are limited to 255 characters.

Rules for Fields

- The `username` field must use a unique name of each user. The name is used as the logon ID value and is visible in a variety of places to all end users. Because of its visibility, `username` must not contain confidential data, such as a social security number. Unlike `externalUserId`, this value can be updated if needed, (for example, a name change), provided the name is unique. Most customers choose to use the same `username` they use for their local network or email application.
- The `externalId` field must be unique for each user, and is used as a system field to link records. Its value is visible in a variety of places to all end users. Because of its visibility, `externalId` must not contain confidential data, such as social security number. This value must be passed with each employee data record during each upload. Take care in selecting this value because it this is a permanent decision. This value cannot be changed once set.
- Because the `jobCode` field is a string and is case sensitive, it must match exactly the case sensitivity of job codes designated for job roles. In Admin Tools, see [▶ Families and Roles ▶ -Managing Competencies and Skills](#). The `jobCode` determines competency mapping, which allows competencies to be populated on forms and

worksheets based on the value in the `jobCode` field. If the company is using job profiles, the value entered in this column will determine what set of competencies will be displayed on the appraisal form for that employee. This value may be the actual job code from the HRIS or a derived code. Many customers will choose to combine job codes into broad employee groups to make it easier to administrate competency sets that are common across roles in the same group. This decision should be made by the implementation team and based on the process involved.

- The `hireDate` field is used in for display purposes and to initiate an automatic form creation for a user. The value in the `hireDate` field does not have to be the actual hire date and may be a date derived from the HRIS system (for example, hire date + 90 days, last review date - 60 days, and so on), used to determine when a new document will be created for this employee. The system can be set to automatically generate a new form for this employee based on the month/day combination of this field value. For example, if Jim's hire date is 03/02/2002, the system can be set to automatically create a new appraisal form for Jim each March 2nd.
- The "Country" field can determine which of several possible Privacy Consent Statements will be presented to a new user. If the Privacy Consent feature is enabled, when users log in to the system the very next time, they will be directed to the data consent page - which can vary depending on the `COUNTRY` field. Users can then choose to accept or decline the terms presented. Use the names specified in the Country List at the end of this document.
- The `defaultLocale` field is not typically required. If present, `defaultLocale` will determine the languages experienced by the users (one language per user). Users can specify their locale preferences in the user options.
- The `timeZone` field is recommended for internal time/date stamps used in the `User` Entity. If a `timeZone` value is not loaded, the field will be automatically populated with a default of Eastern Standard Time. Records may be set to one value (For example, the time zone for the corporation headquarters) instead of different zones for each employee. To have the system automatically adjust for daylight savings time, use the time zone ID from the section on supported time zones instead of the three-letter abbreviation.

Rules for Administration

- The ability for the employee to edit data that's loaded into the employee record (on the [Personal Information](#) screen) is an option defined during initial set-up. We strongly recommend that edit permissions be disabled for any values you are importing from your HRIS system. This is necessary to maintain the sync of data with the HRIS. If a field is editable in the user interface, and you also import this field from your HRIS, any edits a user has made in the user interface will be overwritten by the next data load from the HRIS.
- The individual fields in the employee record can also be hidden during the initial setup so they will not display in the [Personal Information](#) screen. This means that the data transferred from the HRIS and associated with each individual can be used by more than one process, but the data won't be displayed on the [Personal Information](#) when accessed by the employee.
- If the [Department](#), [Division](#) or [Location](#) fields are not used, do not include them in the import file. The system will automatically assign `N/A` values in these fields. Security and report filtering settings are tied to these values..Having a common value such as `N/A` entered in those fields allows for the broadest reporting access to the data. Leaving it blank will limit reporting and security capabilities.
- You can define more custom fields to import additional information (FLSA code, and others) using what `Userinfo` custom fields. However, this data does not appear anywhere in the system, other than in the [Employee Profile](#) or in custom fields in a form. This data can also be used in [Organization Chart](#).
- For both the [Manager](#) and Custom Manager hierarchies, the individual at the top of the employee hierarchy (for example, the CEO) must have the value of `NO_MANAGER` (in all caps) listed in the `managerExternalId`

field, so that the system knows how to treat this individual in the routing chain. This value must be exactly `NO_MANAGER`. Other values, such as `NO_MGR` will fail.

- Because the data load validation process validates the `managerExternalId` and `hrExternalId` against the existing database, it is strongly recommended that new employees be added to the beginning of the data load file. This will allow the new employee to be loaded first in case the new employee is a manager or HR representative referenced later in the data file. This will improve processing speed.

Employee Relation Fields

There are five user-to-user relationship types that can be used to manage security, workflows, and reporting::

1. The Manager relationship creates the employee hierarchy. Loops are prevented (meaning a manager cannot report to themselves). Each employee must have a valid manager. Upon data load, the tool checks that each employee has a valid manager listed in their data record. This validation check is executed against the employees held within the SAP SuccessFactors HCM suite database. Therefore, the manager for each user record must refer to another existing user in the database.

Because this validation is done within a single API batch operation, you can insert new records for both an employee and their manager in a single API batch call. The manager can be set through two API fields:

- The `managerExternalId` field maps to the `externalId` of the `User` record for the employee's manager
 - The `managerId` field, which maps to the `id` field of the manager, which is an internal Id value. As a best practice, for simplicity we suggest using the `managerExternalId` instead of supplying both values.
2. The HR Manager relationship lets you apply security settings to allow the HR manager to access the user. The HR Manager is not enforced as a hierarchy. The HR manager can be set through two API fields:
 - The `hrExternalId` field maps to the `externalId` of the HR manager Entity.
 - The `hrId` field which maps to the `id` field of the HR manager Entity, which is an internal Id value.

Note

As a best practice, for simplicity we suggest using the `hrExternalId` instead of supplying both values.

3. The Second Manager relationship is another employee hierarchy, and loops are prevented (a manager cannot report to himself). This is typically used in compensation planning processes to freeze the hierarchy at a point in time from daily changes, usually to allow a focal review process against an unchanging employee hierarchy. The API provides only one field for this relationship, the `secondManagerExternalId` field, which maps to the `externalId` of the user record for the second manager.
4. The Matrix Manager and Custom Manager relationships are many-to-many, meaning a user can have multiple matrix or custom managers. The fields are `matrixManagerExternalIds` and `customManagerExternalIds`, which map to the `User.externalId` values of the intended matrix and custom manager user records. The syntax for these fields is to separate the manager IDs with pipe (|) characters. For example: `gsmith624 | sholmes423 | smaddox666`".

Best Practice Security Integration Recommendations

1. The Matrix and Custom Manager relationships can also be loaded separately from the `User` Entity in the `MatrixManager` and `CustomManager` API entities. This is useful to increase performance of the loads by providing delta updates instead of full load and replace of all relationships.

2. Each of the relationships are highly useful in translating between your HRIS organizational security structures into the SAP SuccessFactors HCM suite system, which does not have organizational structures. In the current security capabilities, your data feeds from the HRIS will typically transfer your organizational security access into a person-to-person mapping that will be loaded into these structures. For example, if your HRIS has a department hierarchy where *Dept1* contains *Dept2* and *Dept3*, and you want to grant an HR person access to the *Dept1* hierarchy, you can explode out the users that are assigned to the *Dept1* HRIS hierarchy and, as the HR person who needs access to these users, you can assign each of these users to an HR Manager, Matrix Manager, or Custom Manager .
3. An alternative to using Employee relationships to translate from your HRIS organizational security structures is to use one of the *CUSTOM01-15* fields to contain structural identifiers that can group people into substructures of your HRIS organizational structures. This is a translation from your HRIS hierarchical structures into flat identifiers, or tags. For example, if your organizational structure has a hierarchy where *Dept1* contains *Dept2*, and *Dept3*, and you grant users access to the *Dept1* hierarchy in your HRIS, you can tag all users in this hierarchy with a value of *Dept1-Hierarchy* in the *CUSTOM01* field , and grant security access rules through this tag . Then, if *Dept4* is added to the HRIS *Dept1* hierarchy, your data feed will update the appropriate users with the *Dept1-Hierarchy* tag, for those who match your new *Dept4* organization. You can, of course, also assign access directly to the departments field . But if new departments are added later, you will have to update security settings in SAP SuccessFactors HCM suite to grant access to them as well. This process will depend on how your organization is managed.

9.1.14.1.8 Importing and Exporting Employee Data Using OData API

There are several differences between importing and exporting of employee data between the OData API and file-based processes.

File-based process	OData process
Imports and exports of employee data are managed through two separate files: <ul style="list-style-type: none"> • (Basic) Employee Import/Export will access the core employee data fields used to create the user account and the core organizational fields required for security and core business processes. • Extended User Information Import/Export accesses many extended fields used in additional modules like Succession, Compensation and Recruiting. 	All fields in the Basic Employee Import/Export and the Extended User Information field are combined into the User entity.
Field names differ from between the OData API User entity and the Basic Employee Import. For details, see Business Rules for API Based File Transfers [page 417] .	See Business Rules for API Based File Transfers [page 417] .
Import of employee data are typically scheduled on a nightly basis, so the imports are not real-time.	Imports are real-time.

File-based process

Date-time formats must be **mm/dd/yyyy**.

Imports are unlimited in file size.

OData process

- OData API datetime formats are as follows: /Date(69422400000)/ for JSON and 2000-12-12T12:00 for Atom/XML
- Some API entities may take a date value tunnelled inside a string datatype.

For exceptions of date formats, refer to the documentation for the specific entity.

Imports are subject to the API batch size rules (maximum batch size of 1000)

Note

When updating user information via user import tool, Manage Employee application or using an OData API call, dynamic groups are refreshed asynchronously, in a separate job. This allows the user import request to be completed in a timely manner. However, the process of refreshing the dynamic groups varies in time from seconds to minutes. The delay time is dependent on the dynamic group number and the load of the Job server. This means that when you create a user, the user will not usually get the login access immediately.

9.1.14.1.9 Use Cases

9.1.14.1.9.1 Querying Different Types of Users

In SAP SuccessFactors, status values are used to identify the different types of users and their state of activeness in the system. Below is a list of available statuses and their meanings:

Status Value	Status Text	Description
t	active	Active users.
f	inactive	Inactive users.
T	active_external	Active external users for 360 Review.
F	inactive_external	Inactive external users for 360 Review.
e	active_external_suite	Active Learning and Onboarding users.
d	inactive_external_suite	Inactive Learning and Onboarding users.

In this topic, we'll show you a few examples on how to query users in different statuses.

Querying users with \$filter

A query without \$filter or key predicate will only return active users in status t and T. To query other types of users, you can specify the status value in the \$filter query option. Here's an example:

```
https://<API-server>/odata/v2/User?$filter=status in 'f','F','e','d'&$format=JSON
```

Note

Do not use query option \$filter=status ne '<status>' to query users. Instead, explicitly list the type of user statuses you want to retrieve.

Querying users by key predicate

When a key predicate is used, the query will return the matching entry regardless of user status. Below is an example of querying a user by key predicate:

```
https://<API-server>/odata/v2/User('cgrant')?$format=JSON
```

If you expand from a key predicate, you will only get expanded users in status t and T.

Querying users with \$expand

Using the matrixManager navigation property as an example, the following table summarizes the API behavior when queried using the \$expand system query option:

Query	Result	
/odata/v2/User? \$expand=matrixManager	User (t, T) Query returns users in status t and T by default.	matrixManager (t, T) \$expand returns users in status t and T by default.
/odata/v2/User('cgrant')? \$expand=matrixManager	Returns the single user identified by the key predicate regardless of its status.	matrixManager (t,T) Expands matrix managers in status t and T by default.
/odata/v2/User('cgrant')/ matrixManager? \$filter=status in 't'	Returns the matrix managers of the single user identified by the key predicate regardless of user status. \$filter option is ignored.	matrixManager (t,T) Expands matrix managers in status t and T by default.
/odata/v2/User? \$expand=matrixManager&\$filter=status in 't', 'T'	User (t, T) \$filter only works on the base object.	matrixManager (t, T) \$expand returns status t, T by default.

Query	Result	
<code>/odata/v2/User? \$expand=matrixManager&\$filter=status in 'f', 'F'</code>	User (f, F) \$filter only works on the base object.	matrixManager (t, T) \$expand returns status t, T by default.
<code>/odata/v2/User? \$expand=matrixManager&\$filter=matrixManager/status in 't', 'T'</code>	User (t, T, f, F, e, d) The filter condition returns a list of users who has a matrix manager in status t or T regardless of user status.	matrixManager (t, T, f, F, e, d) If a user meets the filter condition, all matrix managers of the user will be expanded regardless of the status.
<code>/odata/v2/User? \$expand=matrixManager&\$filter=matrixManager/status in 'f', 'F'</code>	User (t, T, f, F, e, d) The filter condition returns a list of users who has a matrix manager in status f or F regardless of user status.	matrixManager (t, T, f, F, e, d) If a user meets the filter condition, all matrix managers of the user will be expanded regardless of the status.

Querying users with \$orderby

The query option `$orderby=status` by default sorts all types of users by the `status` property. If you want to query an ordered list of only active users in status `t` and `T`, also use the `$filter` option as shown in the example below:

```
https://<API-server>/odata/v2/User?$filter=status in 't', 'T'&$orderby=status&$format=JSON
```

9.1.14.1.9.2 Querying the Primary Assignment of a User

The `user` entity allows you to query whether a user ID is the primary assignment of a user who has multiple employments.

Query the Primary Assignment of a User

The following query returns a `true` or `false` value of whether the `userId` specified in the URI is the primary assignment of the user.

Operation	Query
HTTP Method	GET
URI	<code>odata/v2/User(' {userId} ')? \$select=isPrimaryAssignment&\$format=json</code>

Sample response:

```
{
  "d": {
    "isPrimaryAssignment": true
  }
}
```

9.1.14.1.9.3 Upserting Assignment UUID for a New User

The `User` entity allows you to provide an assignment UUID when you create a new user.

Upserting an Assignment UUID for a User

You can provide an assignment UUID when you create a new user, but the assignment UUID you provided must be a 32-character UUID of capital letters.

Operation	Upsert
HTTP Method	POST
URI	<code>http://<API-Server>/odata/v2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "User('asmithDemol1022')" }, "firstName": "firstName", "status": "t", "username": "asmithDemol1022", "assignmentUUID": "F153C21FBA924477A59CB72F246A6C44" }</pre>

Sample response:

```
<?xml version="1.0" encoding="utf-8"?>
<feed xmlns="http://www.w3.org/2005/Atom" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">
  <entry>
    <content type="application/xml">
      <m:properties>
        <d:key>asmithDemol1022</d:key>
        <d:status>OK</d:status>
        <d:editStatus>INSERTED</d:editStatus>
        <d:message m:null="true"></d:message>
        <d:index m:type="Edm.Int32">0</d:index>
        <d:httpCode m:type="Edm.Int32">201</d:httpCode>
        <d:inlineResults m:type="Bag(SFOData.UpsertResult)"></d:inlineResults>
      </m:properties>
    </content>
  </entry>
</feed>
```

```
</entry>
</feed>
```

9.1.14.1.9.4 Querying the Assignment UUID of a User

The `User` entity allows you to query the assignment UUID of a user.

Query the Assignment UUID of a User

The following query returns a 32-byte UUID of the user whose `userId` is specified in the URI.

Operation	Query
HTTP Method	GET
URI	<code>odata/v2/User('{userId}')?
\$select=assignmentUUID&\$format=json</code>

Sample response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://localhost:443/odata/v2/User('asmith30')",
      "type": "SFOData.User"
    },
    "assignmentUUID": "91A4725C7965413FA92001007F65FE7A"
  }
}
```

9.1.14.1.9.5 Querying the Direct Reports of a User

The `User` entity allows you to query for the direct reports and the number of direct reports of a user.

Querying the direct reports of a user

The following query returns a list of users whose manager has the same `userId` as specified in the URI.

Operation	Query
HTTP Method	GET

URI	<code>https://<API-endpoint-URL>/odata/v2/User? \$filter=manager/userId eq 'cgrant'&\$format=JSON</code>
-----	--

Querying the number of direct reports of a user

If you need the number of direct reports of a user instead of the entire list, you can use the *teamMembersSize* property. Here is an example:

Operation	Query
HTTP Method	GET
URI	<code>https://<API-endpoint-URL>/odata/v2/ User('cgrant')/teamMembersSize? \$format=JSON</code>

Sample response:

Sample Code

```
{
  "d": {
    "teamMembersSize": 2
  }
}
```

Note

Please note that *teamMembersSize* only counts the number of direct reports, not all team members.

9.1.14.1.9.6 Querying a User's Employment Information

You can query a user's employment information by expanding the *emplInfo* navigation property.

Operation	Query
HTTP Method	GET
URI	<code>https://<API-endpoint-URL>/ odata/v2/User('cgrant')? \$expand=emplInfo&\$format=JSON</code>

In the example response below, navigation property *emplInfo* is expanded for user *cgrant*. Note that some information has been omitted to keep the response concise.

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-endpoint-URL>/odata/v2/User('cgrant')",
      "type": "SFOData.User"
    },
    "personIdExternal": "cgrant",
    "userId": "cgrant",
    <...>
    "empInfo": {
      "__metadata": {
        "uri": "https://<API-endpoint-URL>/odata/v2/
EmpEmployment(personIdExternal='cgrant',userId='cgrant')",
        "type": "SFOData.EmpEmployment"
      },
      "personIdExternal": "cgrant",
      "userId": "cgrant",
      "isECRecord": true,
      "lastModifiedDateTime": "/Date(1535081485000+0000)/",
      "serviceDate": null,
      "endDate": null,
      "bonusPayExpirationDate": null,
      "createdDateTime": "/Date(1530598322000+0000)/",
      "isContingentWorker": false,
      "prevEmployeeId": null,
      "regretTermination": null,
      "createdOn": "/Date(1530583922000)/",
      "lastDateWorked": null,
      "firstDateWorked": "/Date(1535068800000)/",
      "originalStartDate": null,
      "payrollEndDate": null,
      "benefitsEligibilityStartDate": null,
      "initialOptionGrant": null,
      "stockEndDate": null,
      "initialStockGrant": null,
      "employeeFirstEmployment": null,
      "benefitsEndDate": null,
      "eligibleForStock": null,
      "eligibleForSalContinuation": null,
      "assignmentClass": "ST",
      "lastModifiedBy": "cgrant",
      "okToRehire": null,
      "lastModifiedOn": "/Date(1535067085000)/",
      "createdBy": "admin",
      "professionalServiceDate": null,
      "salaryEndDate": null,
      "seniorityDate": null,
      "startDate": "/Date(1535068800000)/",
      "empGlobalAssignmentNav": {
        "__deferred": {
          "uri": "https://<API-endpoint-URL>/odata/v2/
EmpEmployment(personIdExternal='cgrant',userId='cgrant')/empGlobalAssignmentNav"
        }
      },
      "paymentInformationNav": {
        "__deferred": {
          "uri": "https://<API-endpoint-URL>/odata/v2/
EmpEmployment(personIdExternal='cgrant',userId='cgrant')/paymentInformationNav"
        }
      },
      "empJobRelationshipNav": {
        "__deferred": {
          "uri": "https://<API-endpoint-URL>/odata/v2/
EmpEmployment(personIdExternal='cgrant',userId='cgrant')/empJobRelationshipNav"
        }
      }
    }
  }
}
```

```

    },
    "personNav": {
      "__deferred": {
        "uri": "https://<API-endpoint-URL>/odata/v2/

userSysIdOfItDeclarationNav"
      }
    }
  }
}

```

9.1.14.1.9.7 Creating and Updating Users

The `User` entity allows you to create and update users with OData API calls.

Creating a User

The following example shows how to create a user with an API call:

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/upsert</code>
Payload	<pre>{ "__metadata":{ "uri":"User('acraig')", "type":"SFOData.User" }, "userId":"acraig", "assignmentIdExternal":"acraig", "status":"t", "password":"Abc123", "firstName":"Amy", "lastName":"Craig", "email":"amy.craig@bestrun.com" }</pre>

Note

Depending on the data model settings of your company, you may need to provide more required fields in the payload.

A successful operation returns status code 200 with the following response:

```
{
  "d": [
    {
      "key": "UserB",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": null,
      "index": 0,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}
```

Creating a User and Setting User's Manager

When you create a user, you can define its relationship with other roles by creating a link to another user. With one API call, a user can be created and linked to a manager, an HR, or any other roles. In this example, Amy Craig's manager is set when the user is created:

```
{
  "__metadata":{
    "uri":"User('acraig')",
    "type":"SFOData.User"
  },
  "userId":"acraig",
  "status":"t",
  "password":"Abc123",
  "firstName":"Amy",
  "lastName":"Craig",
  "email":"amy.craig@bestrun.com",
  "manager":{
    "__metadata":{
      "uri":"User('Manager_A')",
      "type":"SFOData.User"
    }
  }
}
```

Updating a User

You can use the same request to update a user if it already exists. The upsert operation allows you to both insert and update users.

Update a User with PUT

You can use a PUT request to update a user. This HTTP request replaces all property values including links in the existing entry with the values provided in the request payload. If a property is not present in the payload, it will be restored to the default value. A successful PUT request returns status code 204 with no response body.

In the following example, the field values of user **acraig** are purged and replaced with the values provided in the request payload:

Operation	Update
HTTP Method	PUT
URI	<code>https://<API-endpoint-URL>/odata/v2/ User(' <userId>')</code>

Payload

```
{
  "__metadata":{
    "uri":"User('acraig')",
    "type":"SFOData.User"
  },
  "userId":"acraig",
  "status":"t",
  "password":"Abc123",
  "firstName":"Amy",
  "lastName":"Craig",
  "username":"acraig",
  "email":"amy.craig1@abc.com"
}
```

Updating a User with Merge

Unlike PUT, a merge operation does not erase any existing information of an entry. Instead, it performs an incremental update only with the information provided in the request payload. In the following request, the user's email address is updated and a new middle name is created. Note that the merge operation is indicated in the X-HTTP-REQUEST request header of a POST request.

Operation	Merge
HTTP Method	POST
URI	https://<API-endpoint-URL>/odata/v2/ User(' <userId> ')
Headers	X-HTTP-METHOD: MERGE
Payload	<pre>{ "email":"acraig@bestrun.com", "mi":"Louise" }</pre>

A successful merge operation returns status code 200 OK with no response body.

9.1.14.1.9.8 Creating and Updating User Relations

You can create user relations by setting a link to another user.

A user represents an employee in a company and is related to other roles, such as manager, HR, etc. In OData API, these relations are indicated by links. A user may have a number of links to other roles. A link can be created, updated, and deleted. In this topic, we'll show you how to manage user relations through API calls, using the manager role as an example.

Setting a User's Manager

Let's start with a simple task to set a user's manager.

A user's manager can be set upon user creation or after it has been created. The following sample request uses the upsert operation that serves the purposes in both scenarios:

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/upsert</code>
Payload (JSON)	<pre>{ "__metadata": { "uri": "User('Super')", "type": "SFOData.User" }, "userId": "Super", "status": "t", "manager": { "__metadata": { "uri": "User('bchristl')", "type": "SFOData.User" } } }</pre>

A successful operation returns status code 200 with the following response:

Response (JSON)	<pre>{ "d": [{ "key": "Super", "status": "OK", "editStatus": "UPDATED", "message": null, "index": 0, "httpCode": 204, "inlineResults": null }] }</pre>
-----------------	--

Changing a User's Manager

You can use the same upsert operation above to change a user's manager, or you can use the merge operation to do this.

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/User('Super')</code>
Headers	<code>X-HTTP-METHOD: MERGE</code>

Payload

```
{
  "manager": {
    "__metadata": {
      "uri": "User('bgonzalez1)",
      "type": "SFOData.User"
    }
  }
}
```

A successful merge operation returns status code 200 OK with no response body.

Removing a User's Manager

Alternatively, you can use a PUT request to erase the manager of a user or delete the link between the two entries using `$links`. See [Setting and Updating User's Manager with \\$links \[page 434\]](#) for an example.

Setting a User's Matrix Manager

A user has a 1:n relation with its matrix managers. You can use the same approach to set a user's matrix manager as you set its manager. However, for subsequent upsert operations, if you pass a different matrix manager in the request payload, it will be added to the matrix manager list. If you want to replace the existing matrix managers with an upsert operation, use the `purgeType=record` parameter. Here's an example:

Operation	Merge
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/User('<userId>')</code>
Headers	<code>X-HTTP-METHOD: MERGE</code>
Payload	<pre>{ "matrixManager": { "__metadata": { "uri": "User('UserABC')", "type": "SFOData.User" } } }</pre>

A successful merge operation returns status code 200 OK with no response body.

Setting and Updating User's Manager with `$links`

You can set and update a user's manager with `$links`. Example:

HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/User('UserA')/\$links/manager('UserB')</code>
Headers	<code>Content-Type: Application/xml</code>
Payload	<pre><uri xmlns="http://schemas.microsoft.com/ado/2007/08/dataservices"> http://<API-endpoint-URL>/odata/v2/ User('UserB') </uri></pre>

To remove a user's manager, simply change the HTTP method to `DELETE` to delete the link to the manager.

9.1.14.1.9.9 Creating and Updating Inactive Users

Use the `apiOptionProfileID` or `processInactiveEmployees` parameter to create or update inactive users.

Context

User statuses `inactive(f)` and `inactive_external(F)` indicate that the users are inactive. By default, you can't create or update inactive users through the User OData entity directly. To be able to do so, you must include one of the following parameters in your request:

- Parameter `apiOptionProfileID` with the option *Process Inactive Employees* enabled.

Example request URI:

```
https://<API-server>/odata/v2/User?apiOptionProfileID=option001
```

For more information, see [Creating and Editing Users Using an API Option Profile \[page 437\]](#).

- Parameter `processInactiveEmployees`

This parameter supports Upsert, Insert, and Update operations. When used in conjunction with `$batch`, you can create new and update existing inactive users as well as active users. Example request URI:

```
https://<API-server>/odata/v2/User("12345"?processInactiveEmployees=true
```

Note

You can use both options in the same query. Inactive users are processed when either option allows it.

Related Information

[Optional Business Processing Parameters](#)

9.1.14.1.9.10 Upserting Users with Parameter `purgeType`

You can add parameter `purgeType=record` to your API call to purge the existing data of a user and upsert new data.

A few things that you should keep in mind when you use the `purgeType` parameter:

- This parameter only works with the upsert operation.
- With `purgeType=record`, your upsert request will erase all field values of the entry and replace them with new values in the request payload.
- You must provide all required fields in the payload when using `purgeType=record`.
- If the parameter value is not `record`, it will be ignored.
- You are not allowed to inline edit an entity when using `purgeType=record`.

Replace user data with new one

In the following example, the user's data is purged and updated with the values in the request payload. Note that all the fields not appearing in the request will have empty values.

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/upsert?purgeType=record</code>
Payload	<pre>{ "__metadata": { "uri": "User('acraig')", "type": "SFOData.User" }, "userId": "acraig", "status": "t", "password": "Abc123", "firstName": "Amy", "lastName": "Craig", "email": "amy.craig@bestrun.com" }</pre>

Update the value of a single field

If you just need to replace the value of a single field, you need to provide all existing field values in your request payload in addition to the field you want to update. For example, the following request updates the matrix manager of user with the specified value:

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-endpoint-URL>/odata/v2/upsert?purgeType=record</code>
Payload	<pre>{ "__metadata":{ "uri":"User('cgrant')", "type":"SFOData.User" }, ... <all existing fields and values> ... "matrixManager":[{ "__metadata":{ "uri":"User('UserA')", "type":"SFOData.User" } }, { "__metadata":{ "uri":"User('UserB')", "type":"SFOData.User" } }] }</pre>

Without the `purgeType=record` parameter, the above request will merge the two new matrix managers with the existing data.

You can also update a user's matrix manager list and update the matrix manager at the same time:

```
[{
  "__metadata":{
    "uri":"User('cgrant')",
    "type":"SFOData.User"
  },
  ...
  <all existing fields and values>
  ...
  "matrixManager":[{
    "__metadata":{
      "uri":"User('UserA')",
      "type":"SFOData.User"
    }
  },
  {
    "__metadata":{
      "uri":"User('UserB')",
      "type":"SFOData.User"
    }
  }
]
},
{
  ...
}
```

```

    "__metadata": {
      "uri": "User('UserA')",
      "type": "SFOData.User"
    },
    "userId": "UserA",
    "status": "t",
    "username": "UserA"
  }
  email": "usera@bestrun.com"
}
]

```

Note that inline upserting of a field is not allowed.

Related Information

[purgeType \[page 106\]](#)

9.1.14.1.9.11 Creating and Editing Users Using an API Option Profile

You can use the [Manage API Option Profile](#) tool to maintain API option settings and manage API option profiles for the `User` entity.

Prerequisites

You have the [Manage Integration Tools](#) > [Access to API Option Profile](#) permission assigned to your role.

Context

The `User` entity allows you to specify a few processing parameters to control extra business logic that can be optionally applied when you edit a user. For example, if you enable the [Process inactive employees](#) option in a profile. When you use this profile in a User API request, you're able to modify the information of an inactive user. The options are stored in API option profiles. You can choose different options to enable in different profiles.

Procedure

1. Go to [Admin Center](#) and search for [Manage API Option Profile](#).
2. On the [List API Option Profile](#) screen, a list of existing profiles is displayed. You can manage the list by editing, deleting, or adding new profiles. Choose [Add](#) to create a new profile.

- On the *Add API Option Profile* screen, select *User* from the *Entity Type* dropdown list and enter a profile ID and a description.

Note

Currently the OData API Option Profile tool supports only the User OData entity.

- The corresponding options to the selected entity are displayed on the right. Choose the ones you want to enable for this profile.

Option	Description
Use the user name	Choose the default password format for creating users. If no option is specified, the system uses user name as the default password option.
Use the UserID	
Use the e-mail address	Starting from Jun 19, 2020, you can only choose the system-generated password option when you create new profiles. Existing profiles that use user name, user ID, and e-mail as default password values continue to work.
Use a system-generated random password	

Default password format

Caution

We encourage you to review your existing API calls and stop using unsafe password options. You can either edit your API option profiles and change the password option to *Use a system-generated random password* or enable the *Use System Generated Password by Default* option in **Admin Center > Platform Feature Settings** to force all API calls to use the safe password option.

Users in instances provisioned after Aug 14 are required to log in to the system and reset their passwords after they are set by system administrators.

Option

Description

Send welcome email to new users

Choose this option if you want the system to automatically send welcome e-mails to users when they're created. If you choose system-generated passwords when creating users, this option is required so users can reset their passwords through a link in the e-mail.

Note

Welcome e-mails can't be sent to rehired employees. For security reasons, e-mails can only be sent to corporate e-mail accounts.

This option is ignored and e-mail notifications are sent to new users by default if the *Send Welcome Message* option is enabled in [Admin Center > Platform Feature Settings](#).

Validate Manager and HR fields

Choose this option if you want to validate if the manager and HR fields of the user are valid.

Process inactive Employees

This option allows you to edit employees in inactive status. You can also use parameter `processInactiveEmployees` for the same purpose.

Note

The Effective Dated Data Platform feature in Provisioning must be enabled for your instance.

Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

See [User](#) for more information.

Specify Form routing options

Option	Description
	Automatic insertion of new manager as next document recipient if not already
	Automatic Inbox Document Transfer To New Manager
<i>Automatic Manager Transfer</i>	Automatic En Route Document Transfer To New Manager
For each option, you can specify if you want to transfer the document to manager, matrix manager, or both.	Automatic Completed Document Copy to New Manager
	Automatic Process Owner Change To New Manager For In-Progress Documents When Old Manager is Process Owner (Only for 360)
	Automatic Process Owner Change To New Manager For Completed Documents When Old Manager is Process Owner (Only for 360)
	Remove Inactive Employees' In-Progress Documents
<i>Automatic Document Removal</i>	Remove Inactive Employees' Completed Documents
	Remove Inactive Employees' 360 Evaluation Documents

5. Add parameter `apiOptionProfileID=<profile ID>` to your URI when you insert, update, or upsert a user.

Operation	Insert
HTTP Method	POST

URI	<code>https://<API-Server>/odata/v2/User?apiOptionProfileID=ID01</code>
-----	---

Payload	<pre>{ "__metadata": { "uri": "User('acraig)", "type": "SFOData.User" }, "userId": "acraig", "username": "acraig", "status": "t", "firstName": "Amy", "lastName": "Craig", "email": "amy.craig@bestrun.com" }</pre>
---------	---

⚠ Caution

Multiple parameter values aren't supported. If you include multiple values of the same parameter, for example, `apiOptionProfile=ID01&apiOptionProfile=ID02`, only the first parameter value is processed.

Next Steps

We recommend all users log in to the system and reset their passwords to ensure account security.

9.1.14.1.9.12 Querying the Gender of a User

The `User` entity allows you to query the gender of a user.

Query the Gender of a User

The following query returns the gender of the user whose `userId` is specified in the URI.

Operation	Query
HTTP Method	GET
URI	<code>odata/v2/User('{userId}')?\$select=gender&\$format=json</code>

Sample response:

```
{
```

```

"d": {
  "__metadata": {
    "uri": "https://qaacand-api.hcm.ondemand.com/odata/v2/User('demo0701')",
    "type": "SFOData.User"
  },
  "gender": "M"
}

```

9.1.14.1.9.13 Inserting a Gender of a User

The `User` entity allows you to insert the gender of a user.

Inserting a Gender for a User

You can provide a gender when you create a new user, but the gender must be one of the following values:

- M: Male
- F: Female
- U: Unknown
- D: Undeclared
- O: Others

Operation	Insert
HTTP Method	POST
URI	odata/v2/User
Payload	<pre> { "__metadata": { "uri": "User('asmithDemo22')" }, "firstName": "firstName", "status": "t", "username": "asmithDemo22", "gender": "M" } </pre>
Response	
Status	Description
200	OK

9.1.14.1.9.14 Upserting an Existing User with Gender

The `User` entity allows you to upsert the gender of an existing user.

Upserting an Existing User with Gender

The following upsert operation updates the gender of the user whose `userId` is specified in the URI.

Operation	Upsert
HTTP Method	GET
URI	<code>odata/v2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "User('asmithDemo22')" }, "status": "t", "username": "asmithDemo22", "gender": "D" }</pre>

Sample response:

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>
<feed xmlns="http://www.w3.org/2005/Atom" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">
  <entry>
    <content type="application/xml">
      <m:properties>
        <d:key>asmithDemo22</d:key>
        <d:status>OK</d:status>
        <d:editStatus>UPDATED</d:editStatus>
        <d:message m:null="true"></d:message>
        <d:index m:type="Edm.Int32">0</d:index>
        <d:httpCode m:type="Edm.Int32">204</d:httpCode>
        <d:inlineResults m:type="Bag(SFOData.UpsertResult)"></d:inlineResults>
      </m:properties>
    </content>
  </entry>
</feed>
```

9.1.14.1.9.15 Querying the General Display Name of a User

The `User` entity allows you to query the general display name of a user.

Query the General Display Name of a User

The following query returns the general display name of the user whose `userId` is specified in the URI.

Operation	Query
HTTP Method	GET
URI	<code>odata/v2/User('{userId}')?\$select=displayName&\$format=json</code>

Sample response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://qa cand-api.hcm.ondemand.com/odata/v2/
User('asmithDemo22')",
      "type": "SFOData.User"
    },
    "displayName": "testDisplayName"
  }
}
```

9.1.14.1.9.16 Upserting New Users with General Display Name

The `User` entity allows you to insert a general display name of a user.

Inserting a General Display Name for a User

You can provide a general display name when you create a new user.

Operation	Upsert
HTTP Method	POST
URI	<code>odata/v2/upsert?\$format=json</code>

Payload

```
{
  "__metadata": {
    "uri": "User('displayName1')"
  },
  "userId": "displayName1",
  "username": "displayName1",
  "status": "t",
  "displayName": "Carla Grant"
}
```

Response

Status	Description
200	OK

Sample response:

```
{
  "d": [
    {
      "key": "displayName1",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": null,
      "index": 0,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}
```

9.1.14.1.9.17 Querying the Pronouns of a User

The `User` entity allows you to query the pronouns of a user.

Query the Pronouns of a User

The following query returns the pronouns of the user whose `userId` is specified in the URI.

Operation	Query
HTTP Method	GET
URI	<code>odata/v2/User('{userId}')? \$select=userId,pronouns&\$format=json</code>

Sample response:

```
{
  "d": {
```

```

    "__metadata": {
      "uri": "https://qaacand-api.hcm.ondemand.com/odata/v2/User('{userId}']",
      "type": "SFOData.User"
    },
    "userId": "{userId}",
    "pronouns": "19390"
  }
}

```

9.1.14.1.9.18 Upserting an Existing User with Pronouns

The `User` entity allows you to insert the pronouns of an existing user.

Upserting an Existing User with Pronouns

The following upsert operation updates the pronouns of the user whose `userId` is specified in the URI.

Note

Only fixed optionId of picklist PersonPronouns can be upserted. You can find the fixed optionId from the picklist center.

Operation	Upsert
HTTP Method	POST
URI	/odata/v2/upsert?\$format=json
Payload	<pre> { "__metadata": { "uri": "User('pronounsDemo1') " }, "userId": "pronounsDemo1", "username": "pronounsDemo1", "status": "t", "pronouns": "1390" } </pre>

Sample response:

```

{
  "d": [
    {
      "key": "pronounsDemo1",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": null,
      "index": 0,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}

```

```
}
```

9.1.14.1.9.19 Querying the Assignment Display Header of a User

The `User` entity allows you to query the assignment display header of a user.

Query the Assignment Display Header of a User

The following query returns the assignment display header of the user whose `userId` is specified in the URI.

Operation	Query
HTTP Method	GET
URI	<code>odata/v2/User('{userId}')?
\$select=assignmentDisplayHeader&\$format=json</code>

Sample response:

```
{
  "d": {
    "__metadata": {
      "uri": "https://qaacand-api.hcm.ondemand.com/odata/v2/
User('displayHeaderDemo1')",
      "type": "SFOData.User"
    },
    "userId": "displayHeaderDemo1",
    "assignmentDisplayHeader": "Developer"
  }
}
```

9.1.14.1.9.20 Upserting an Existing User with Assignment Display Header

The `User` entity allows you to upsert the assignment display header of an existing user.

Upserting an Existing User with Assignment Display Header

The following upsert operation updates the assignment display header of the user whose `userId` is specified in the URI.

Operation	Upsert
HTTP Method	POST
URI	/odata/v2/upsert?\$format=json
Payload	<pre>{ "__metadata": { "uri": "User('displayHeaderDemol') " }, "userId": "displayHeaderDemol", "username": "displayHeaderDemol", "status": "t", "assignmentDisplayHeader": "Developer" }</pre>

Sample response:

```
{
  "d": [
    {
      "key": "displayHeaderDemol",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": null,
      "index": 0,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}
```

9.1.14.2 UserPermissions

This entity contains information about a user's field-level permission of each property in the `User` entity.

Supported Operations

Query

ⓘ Note

You can't query this entity directly. You can only query user permissions by expanding the `userPermissionsNav` navigation property from the `User` entity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) [▶ API Center](#)

► [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

This entity contains the same properties as the `User` entity.

Field-Level Permission Values

Here's a list of possible values for field-level permissions:

Value	Description
7	Mandatory: The property must contain a value (indicates writeable).
3	Optional: The property may contain a null value (indicates writeable).
1	Read-only: The property can't be changed.
0	Hidden: The property isn't visible on user interfaces.

Use Case 1: Query the Field Level Permissions of a User

Request

Operation	<Your Input>
HTTP Method	<Your Input>
URI	<code>https://<API-Server>/odata/v2/User('admin')?\$format=JSON&\$expand=userPermissionsNav&\$select=userPermissionsNav/userId,userPermissionsNav/ethnicityNav,userPermissionsNav/salary,userPermissionsNav/defaultFullName</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/User('sfadmin')",
      "type": "SFOData.User"
    },
    "userPermissionsNav": {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/UserPermissions(7)",
        "type": "SFOData.UserPermissions"
      },
      "userId": 7,
      "defaultFullName": 1,
      "ethnicityNav": 3,
      "salary": 3
    }
  }
}
```

```
}  
}
```

Related Information

[Field-Level Permission Control \[page 410\]](#)

9.1.14.3 UserAccount

You can use this entity to get information about user accounts including login username, account status, account type, and so on. This entity supports data privacy and protection compliance by making sure that the user account information for a person is available in an OData API. It is used for information reporting and LMS.

Permissions

► [Manage User](#) ► [User Account OData entity](#) ►

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
accountStatus	<p>In OData API response, users will see:</p> <ul style="list-style-type: none">ACTIVE (equals 0)INACTIVE (equals 1) <p>In OData API filter request, we support both 'ACTIVE'/'INACTIVE' (case-insensitive) and 0/1. Filter supports "eq", "ne", and "in" operations.</p>
userType	<p>Supported values are:</p> <ul style="list-style-type: none">TECHNICAL: account type for technical usersEMPLOYEE: account type for internal employeesONBOARDEE: account type for onboardees from the Onboarding moduleEXTERNALLEARNER: account type for learners from the Learning moduleEXTERNALRATER: account type for external raters from the 360 Reviews module

Use Case: Query the Information about User Account

This example shows how to query the information about user account, including login username, account status, and so on.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/UserAccount('ind1')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/UserAccount('ind1')",
      "type": "SFOData.UserAccount"
    },
    "username": "ind1",
    "accountStatus": "ACTIVE",
    "userType": "EMPLOYEE",
    "defaultLocale": "bs_ID",
    "lastLoginFailedDateTime": null,
    "lastModifiedDateTime": "/Date(1390974210000+0000)/",
    "personIdExternal": "ind1",
  }
}
```

```

    "createdDateTime": "/Date(1270650283000+0000)/",
    "lastInactivationDateTime": null
  }
}

```

Use Case: Query User Account about the Employee Type

This example shows how to query user account the employee type.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/UserAccount?\$filter=userType eq 'employee'&\$format=JSON

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/UserAccount('cgrant')",

        "lastLoginFailedDateTime": null,
        "accountId": "91",
        "sapGlobalUserId": null,
        "lastModifiedDateTime": "/Date(1413236700000+0000)/",
        "personIdExternal": "cgrant1",
        "createdDateTime": "/Date(978307200000+0000)/",
        "lastInactivationDateTime": null,
        "user": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/UserAccount('cgrant')/
user
          }
        }
      }
    ]
  }
}

```

Data Privacy and Protection Compliance

This API supports the following use cases to support your data privacy and protection compliance:

- Data subject reporting: All data held about a person is available in this API.
- Access to the account status is essential for modules such as Learning (LMS) to understand the state of the userAccount. When the LMS user corresponds to a person in BizX, Learning requires a student level

status, indicating whether a student is active or not, account_status in USER_ACCOUNT will give Learning this information.

9.1.14.4 Learning and Onboarding Users

List of OData API entities for Learning and Onboarding users.

User Status

The following user statuses are available for Learning and Onboarding users:

- Status e (active_external_suite): Active Learning and Onboarding users.
- Status d (inactive_external_suite): Inactive Learning and Onboarding users.

Prerequisites

There're two prerequisites to use the External User or External Learner APIs:

- The [Enable External Learning User](#) option in [Provisioning](#) for the instance.
- Users have the user search and user import permissions as detailed in below table. You can restrict user searches to a target population.

To use this operation of the External User or External Learner APIs

You need these permissions

query

▶ [User Permissions](#) ▶ [General User Permission](#) ▶ [User Search](#) ▶

With the [User Search](#) permission, internal users can read entities of External User and External Learner using the External User or External Learner APIs.

upsert

If Employee Central is enabled, you can grant below permissions to the API users:

- ▶ [User Permissions](#) ▶ [General User Permission](#) ▶ [User Search](#) ▶
- ▶ [Employee Central Import Settings](#) ▶ [Import Employee Data](#) ▶
- ▶ [Employee Central Import Settings](#) ▶ [Basic User Import](#) ▶

To use this operation of the External User or External Learner APIs

You need these permissions

insert

If Employee Central isn't enabled and the [Admin Center > Platform Feature Settings > Enable Control on Employee Import in Role-Based Permissions](#) option is enabled, you can grant below permissions to the API users:

- [User Permissions > General User Permission > User Search](#)
- [Manage User > Employee Import](#)

If Employee Central is enabled, you can grant below permissions to the API users:

- [Employee Central Import Settings > Import Employee Data](#)
- [Employee Central Import Settings > Basic User Import](#)

If Employee Central is not enabled and the [Admin Center > Platform Feature Settings > Enable Control on Employee Import in Role-Based Permissions](#) option is enabled, you can grant below permissions to the API users:

- [Manage User > Employee Import](#)

External users don't need the [User Search](#) permission. They can access only their own data with the External User or External Learner APIs.

[ExternalLearner \[page 455\]](#)

You can use this entity to query data on external learners such as user information, personal information, email information, phone information, and address information. In Learning, external learners refers to users who are not employees but need access to the Learning module.

[ExternalUser \[page 469\]](#)

You can use this entity to query, create, and update users for onboarding in the system. Onboarding users are external users who are not yet employees but still require access to SAP SuccessFactors HCM suite. External users are represented by status e (active_external_suite) and d (inactive_external_suite). You can use this entity to create single users. Bulk creation is not supported.

[Function Imports \[page 479\]](#)

A list of function imports for external users.

[Error Codes for Learning and Onboarding User Entities \[page 482\]](#)

A list of error codes for Learning and Onboarding API responses.

9.1.14.4.1 ExternalLearner

You can use this entity to query data on external learners such as user information, personal information, email information, phone information, and address information. In Learning, external learners refers to users who are not employees but need access to the Learning module.

Permissions

To use this operation of the External User or External Learner APIs	You need these permissions
query	<p>▶▶ User Permissions ▶ General User Permission ▶ User Search ▶</p> <p>With the User Search permission, internal users can read entities of External User and External Learner using the External User or External Learner APIs.</p>
upsert	<p>If Employee Central is enabled, you can grant below permissions to the API users:</p> <ul style="list-style-type: none">▶▶ User Permissions ▶ General User Permission ▶ User Search ▶▶▶ Employee Central Import Settings ▶ Import Employee Data ▶▶▶ Employee Central Import Settings ▶ Basic User Import ▶ <p>If Employee Central isn't enabled and the ▶▶ Admin Center ▶ Platform Feature Settings ▶ Enable Control on Employee Import in Role-Based Permissions ▶ option is enabled, you can grant below permissions to the API users:</p> <ul style="list-style-type: none">▶▶ User Permissions ▶ General User Permission ▶ User Search ▶▶▶ Manage User ▶ Employee Import ▶
insert	<p>If Employee Central is enabled, you can grant below permissions to the API users:</p> <ul style="list-style-type: none">▶▶ Employee Central Import Settings ▶ Import Employee Data ▶▶▶ Employee Central Import Settings ▶ Basic User Import ▶

To use this operation of the External User or External Learner APIs

You need these permissions

If Employee Central is not enabled and the [Admin Center > Platform Feature Settings > Enable Control on Employee Import in Role-Based Permissions](#) option is enabled, you can grant below permissions to the API users:

- [Manage User > Employee Import](#)

Supported Operations

Property	Description
Query	Query external learner information.
Insert	Create an external learner.
Upsert	Create or update external learners.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

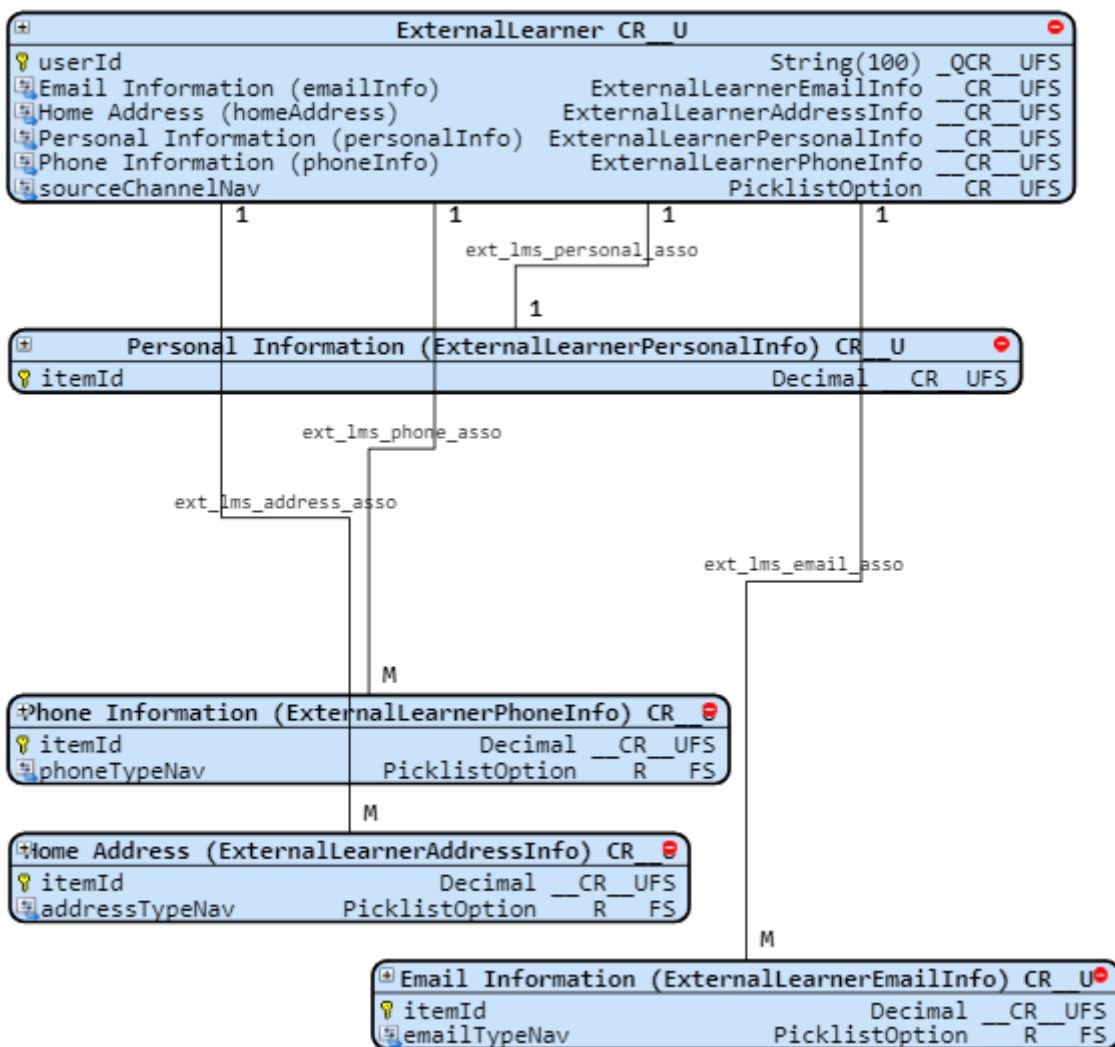

Operation	Description
userId	(Required) User ID
status	(Required) Status of the user. For external learning users, always enter status e .
productName	(Required) Enter LMS for all external learning users.
loginMethod	Login method for the user. Enter PWD (user/password) or SSO (single sign-on).
defaultLocale	Default locale of the user. If not specified, the locale is set to en_US.

Navigation Properties

Navigation Property	Target Entity	Description
emailInfo	ExternalLearnerEmailInfo [page 463]	Email info

Navigation Property	Target Entity	Description
homeAddress	ExternalLearnerAddressInfo [page 462]	Address info
personalInfo	ExternalLearnerPersonalInfo [page 464]	Personal info
phoneInfo	ExternalLearnerPhoneInfo [page 465]	Phone info
sourceChannelNav	Picklist	Picklist options for learning source channel

Entity Relationship Diagram

Use Case 1: Create an External Learner

This example shows how to create an external learner.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload

Sample Code

```
{
  "__metadata": {
    "uri":
"ExternalLearner('external1')"
  },
  "status": "e",
  "password": "PWD",
  "productName": "LMS",
  "defaultLocale": "zh_CN",
  "timeZone": "PST",
  "loginMethod": "PWD",
  "personalInfo": {
    "__metadata": {
      "uri":
"ExternalLearnerPersonalInfo"
    },
    "firstName": "Ming",
    "middleName": "Chen"
  },
  "emailInfo": {
    "__metadata": {
      "uri":
"ExternalLearnerEmailInfo"
    },
    "emailAddress":
"external1@abc.com",
    "emailType": "P",
    "isPrimary": true
  },
  "phoneInfo": {
    "__metadata": {
      "uri":
"ExternalLearnerPhoneInfo"
    },
    "countryCode": "086",
    "areaCode": "021",
    "phoneNumber": "97654321",
    "extension": "9879",
    "phoneType": "Business",
    "isPrimary": true
  },
  "homeAddress": [
    {
      "__metadata": {
        "uri":
"ExternalLearnerAddressInfo"
      },
      "addressType":
"shipping",
      "country": "CHN",
      "province": "Shanghai",
      "city": "Shanghai",
      "zipCode": "200000",
      "address1": "Chenhui
Road"
    }
  ]
}
```

Response

```
{
```

```

    "d": [
      {
        "key": null,
        "status": "OK",
        "editStatus": null,
        "message": null,
        "index": 0,
        "httpCode": 200,
        "inlineResults": null
      }
    ]
  }

```

Use Case 2: Update an External Learner

This example shows how to update an external learner. A successful operation returns status 200 OK.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert
Payload	

↔ Sample Code

```

{
  "__metadata": {
    "uri":
    "ExternalLearner('External01')",
    "type":
    "SFOData.ExternalLearner"
  },
  "userId": "External01",
  "status": "e",
  "productName": "LMS",
  "defaultLocale": "en_US"
}

```

Response

```

{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": null,
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}

```

Use Case 3: Query an External Learner by ID

This example shows how to query an external learner by `<userId>`.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ExternalLearner('external1')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/ExternalLearner('external1')",
      "type": "SFOData.ExternalUser"
    },
    "userId": "external1",
    "lastModifiedDate": "/Date(1574662814000+0000)/",
    "loginMethod": "PWD",
    "timeZone": "PST",
    "userName": "external1",
    "defaultLocale": "zh_CN",
    "is_deleted": null,
    "personGUID": "E764F7A932F1451FA93880E16A10BC92",
    "personIdExternal": "external1",
    "personId": "5287",
    "status": "e",
    "extEmailInfo": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/ExternalUser('external1')/extEmailInfo"
      }
    },
    "extPersonalInfo": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/ExternalUser('external1')/extPersonalInfo"
      }
    },

9.1.14.4.2 ExternalUser

You can use this entity to query, create, and update users for onboarding in the system. Onboarding users are external users who are not yet employees but still require access to SAP SuccessFactors HCM suite. External users are represented by status e (active_external_suite) and d (inactive_external_suite). You can use this entity to create single users. Bulk creation is not supported.

Permissions

To use this operation of the External User or External Learner APIs	You need these permissions
query	<p>▶▶ User Permissions ▶ General User Permission ▶ User Search ▶</p> <p>With the User Search permission, internal users can read entities of External User and External Learner using the External User or External Learner APIs.</p>
upsert	<p>If Employee Central is enabled, you can grant below permissions to the API users:</p> <ul style="list-style-type: none">▶▶ User Permissions ▶ General User Permission ▶ User Search ▶▶▶ Employee Central Import Settings ▶ Import Employee Data ▶▶▶ Employee Central Import Settings ▶ Basic User Import ▶ <p>If Employee Central isn't enabled and the ▶▶ Admin Center ▶ Platform Feature Settings ▶ Enable Control on Employee Import in Role-Based Permissions ▶ option is enabled, you can grant below permissions to the API users:</p> <ul style="list-style-type: none">▶▶ User Permissions ▶ General User Permission ▶ User Search ▶▶▶ Manage User ▶ Employee Import ▶

To use this operation of the External User or External Learner APIs

insert

You need these permissions

If Employee Central is enabled, you can grant below permissions to the API users:

- ▶ [Employee Central Import Settings](#) ▶ [Import Employee Data](#) ▶
- ▶ [Employee Central Import Settings](#) ▶ [Basic User Import](#) ▶

If Employee Central is not enabled and the ▶ [Admin Center](#) ▶ [Platform Feature Settings](#) ▶ [Enable Control on Employee Import in Role-Based Permissions](#) ▶ option is enabled, you can grant below permissions to the API users:

- ▶ [Manage User](#) ▶ [Employee Import](#) ▶

Supported Operations

Operation	Description
Query	Query an external user
Insert	Create a new external user
Upsert	Create or update an external user

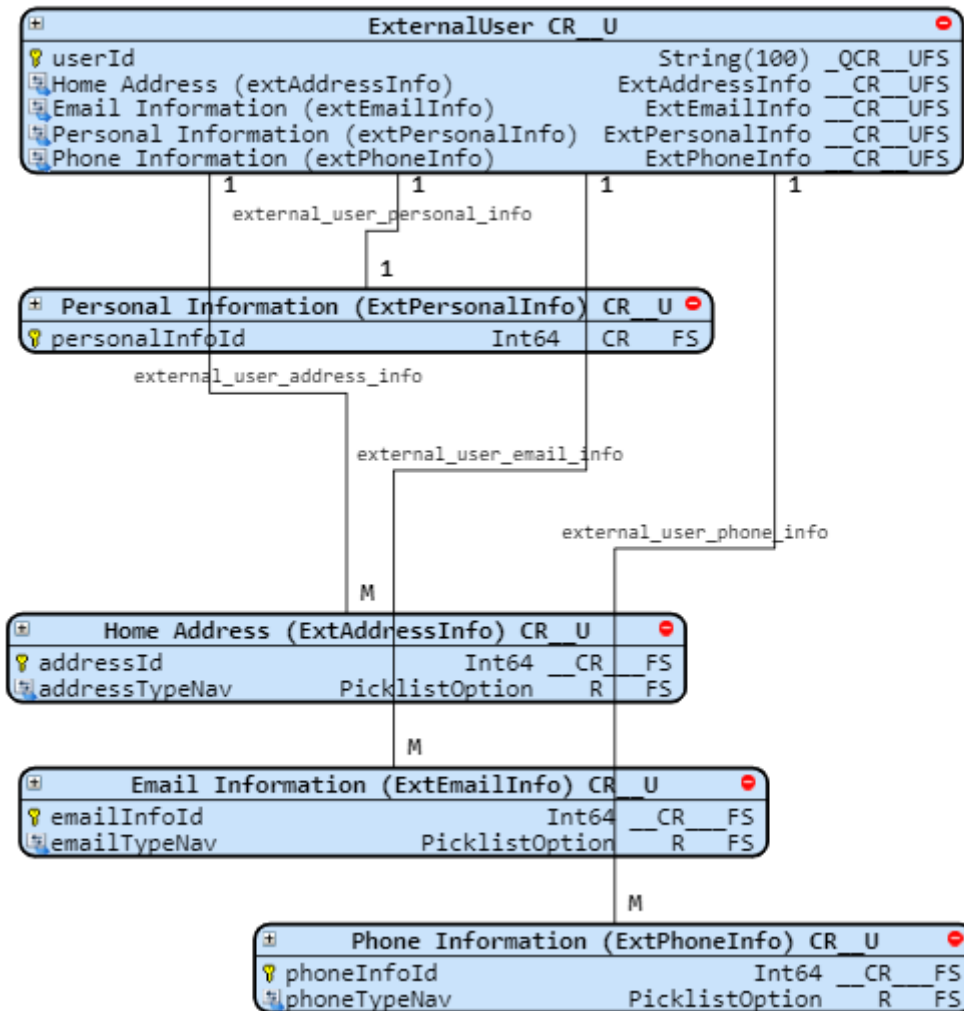

Note

ExternalUser can be used to update only users of status e and d. For other statuses, see the [User \[page 400\]](#) entity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ▶ [Admin Center](#) ▶ [API Center](#) ▶ [OData API Data Dictionary](#) ▶ or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Entity Relationship Diagram

Use Case 1: Query an External User Record

This example shows how to query an external user record.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ExternalUser('userIdVas909')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/ExternalUser('userIdVvas909')",
      "type": "SFOData.ExternalUser"
    },
    "userId": "userIdVvas909",
    "lastModifiedDate": "/Date(1567406836000+0000)/",
    "loginMethod": null,
    "timeZone": "US/Eastern",
    "userName": "userIdVvas909",
    "defaultLocale": "zh_CN",
    "is_deleted": null,
    "personGUID": "07D79655D2DB4C84974E4FDD4CFD4140",
    "personIdExternal": "userIdVvas909",
    "personId": "1885",
    "status": "e",
    "extEmailInfo": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/ExternalUser('userIdVvas909')/"
      }
    },
    "extPersonalInfo": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/ExternalUser('userIdVvas909')/"
      }
    },
    "extPhoneInfo": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/ExternalUser('userIdVvas909')/"
      }
    },
    "extAddressInfo": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/ExternalUser('userIdVvas909')/"
      }
    }
  }
}
```

Use Case 2: Create an External User Record

This example shows how to create an external user record. A successful operation returns status 201 created.

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/ExternalUser

Payload

```
{
  "__metadata": {
    "uri":
"ExternalUser('userIdVvas909')",
    "type": "SFOData.ExternalUser"
  },
  "userId": "userIdVvas909",
  "status": "e",
  "productName": "ONB",
  "defaultLocale": "zh_CN",
  "password": "pwd"
}
```

Note

Make sure to include the password in the payload.

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/ExternalUser('userIdVvas909')",
      "type": "SFOData.ExternalUser"
    },
    "userId": "userIdVvas909",
    "status": "e",
    "productName": "ONB",
    "defaultLocale": "zh_CN",
    "password": "pwd",
    "personGUID": "07D79655D2DB4C84974E4FDD4CFD4140",
    "personIdExternal": "userIdVvas909"
  }
}
```

Use Case 3: Update an External User Record

This example shows how to update an external user record. A successful operation returns status 200 OK.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/ ExternalUser/upsert

Payload

```
{
  "__metadata": {
    "uri":
"ExternalUser('userIdVWas109')",
    "type": "SFOData.ExternalUser"
  },
  "userId": "userIdVWas109",
  "status": "e",
  "productName": "ONB",
  "defaultLocale": "zh_CN"
}
```

Response

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": null,
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

9.1.14.4.3.1 getUsernameFormat

You can use this function import to get the user name format that is defined in SAP SuccessFactors HCM suite for the external user.

Parameters

Parameter	Type	Required?	Value
locale	String	Yes	Value of the locale

Use Case: Get the User Name Format

This example shows how to get the user name format that is defined in SAP SuccessFactors HCM suite for the external user. Locale is used by the message in the response.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ getUsernameFormat?locale='en_US'</code>

Response

```
{  
  "d": {
```

```

    "getUserNameFormat": "Please use the following character types: ['a' to
    'z', 'A' to 'Z', '0' to '9', '-', '_', '.', '@]."
  }
}

```

9.1.14.4.3.2 validateExternalUserIdAndUsername

You can use this function import to check if the user ID and user name entered for the external user are valid.

Parameters

Parameter	Type	Required?	Value
locale	String	No	Value of the locale
userId	String	Yes	Value of the user ID
username	String	No	Value of the user name

Use Case: Check if User ID and User Name for External User are Valid

This example shows how to check if the user ID and user name entered for the external user are valid. Locale is used by the message in the response.

Request

HTTP Method	GET
URI	<a href="https://<api-server>/odata/v2/validateExternalUserIdAndUsername?userId='cgrant'&locale='en_US'">https://<api-server>/odata/v2/validateExternalUserIdAndUsername?userId='cgrant'&locale='en_US'

Response

```

{
  "d": {
    "ValidateExternalUserIdAndUsernameResponse": {
      "result": "The validation is ok.",
      "status": "0",
      "userId": "cgrant"
    }
  }
}

```

9.1.14.4.3.3 validateExternalUserPassword

You can use this function import to check if the password for the external user is valid.

Parameters

Parameter	Type	Required?	Value
locale	String	No	Value of the locale
userId	String	No	Value of the user ID
password	String	Yes	Value of the password

Use Case: Check If Password for External User is Valid

This example shows how to check if the password for the external user is valid. Locale is used by the message in the response.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ validateExternalUserPassword? userId='cgrant' &password='pwd'</code>

Response

```
{
  "d": {
    "ValidateExternalUserPasswordResponse": {
      "errorMessage": null,
      "passwordHash": "cAzhQG9+JtI9r3kbja5EKvZIBWr0+GsnMo8Pa4422BE=\r\n",

[Function Imports \[page 479\]](#)

9.1.15 Function Imports for Common Entities

A list of function imports for common entities.

[checkUserPermissions \[page 485\]](#)

You can use this function import to check a user's permissions as defined in Role-Based Permissions, such as permissions to log in and change the password.

[convertAssignmentIdExternal \[page 487\]](#)

You can use the `convertAssignmentIdExternal` function import to change the assignment ID of a user. An assignment ID is an identifier assigned to the work relationship between a person and the company. The relationship could be an employment relationship, contingent relationship, pensioner relationship, intern, global assignment, or others.

[getExtEventMetaDataDefinition \[page 489\]](#)

You can use this function import to retrieve Intelligent Services metadata definition for externally allowed events.

[getPasswordPolicy \[page 491\]](#)

You can use this function import to retrieve the password policy defined in SAP SuccessFactors HCM suite.

[getSPMetadata \[page 493\]](#)

You can use this function import to generate the SAML2 SP metadata. This metadata can be used for IAS integrations (SAP Identity Authentication Service) and the new SSO in the Admin Center.

[getSFIDPCertType \[page 494\]](#)

You can use this function import to check the SAP SuccessFactors certificate signing type (either SHA-1 or SHA-2) being used for Identity Authentication and Identity Provisioning through SAP Cloud Identity Services.

[updateSFIDPCertType \[page 497\]](#)

You can use this function import to update the SAP SuccessFactors certificate signing type (from SHA-1 to SHA-2) used for Identity Authentication and Identity Provisioning through SAP Cloud Identity Services.

9.1.15.1 checkUserPermissions

You can use this function import to check a user's permissions as defined in Role-Based Permissions, such as permissions to log in and change the password.

Supported Operations

HTTP Method: POST

Return Type: string

Support Payload: true

Use Case: Check a User's Permission Information

You specify a user and the permissions in the request payload to query whether the permissions are granted to the user.

Request

HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/ checkUserPermissions</code>

Payload

```
{
  "username": "",
  "email": "",
  "userid": "sfadmin",
  "permissions": [
    {
      "type": "user",
      "string_value":
"user_login",
      "long_value": -1
    },
    {
      "type": "calibration_admin",
      "string_value":
"calibration_templates_admin",
      "long_value": 1
    }
  ]
}
```

The function import uses username, email, and user ID to identify a user. Provide at least one of them in the request payload. In case an email is mapped to multiple users, permission check result for all users will be returned.

Under the permissions section, pass the permission type, string value, and long value of the permission for checking. Always group permissions in brackets even if there is only one item.

Response

In this example, only one permission is returned in the response, which means the user does not have the admin access to Calibration templates.

```
{
  "d": {
    "checkUserPermissions": "{\"email\":\"\", \"permissions\":
[ { \"type\": \"user\", \"string_value\": \"user_login\", \"long_value\": -1 } ], \"username\":
\", \"userid\": \"sfadmin\"}"
  }
}
```

[updateSFIDPCertType \[page 497\]](#)

9.1.15.2 convertAssignmentIdExternal

You can use the `convertAssignmentIdExternal` function import to change the assignment ID of a user. An assignment ID is an identifier assigned to the work relationship between a person and the company. The relationship could be an employment relationship, contingent relationship, pensioner relationship, intern, global assignment, or others.

⚠ Caution

Not every SAP SuccessFactors area supports assignment ID. Before you change an assignment ID, read the [Important Notes About Assignment ID](#) to evaluate the risks associated with the inconsistencies. If assignment ID is not supported in the SAP SuccessFactors areas you've enabled, please don't make any changes to assignment ID at this time.

ℹ Note

You can use the `$batch` operation to change assignment IDs of multiple users in one request. The maximum number of entries allowed in a batch request is 180. For more information, see [OData \\$Batch Operation](#).

Permissions

► [Manage User](#) ► [Change Assignment ID](#) ►

Supported Operations

HTTP Method: GET

Return Type: string

Support Payload (`sap:support-payload`): false

Parameters

Parameter	Type	Required/Optional	Value
<code>oldAssignmentIdExternal</code>	String	Required	Value of the old assignment ID
<code>newAssignmentIdExternal</code>	String	Required	Value of the new assignment ID

Use Case: Change the Assignment ID of a Single User

This example shows how to change the assignment ID of a single user.

Request

HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/convertAssignmentIdExternal?oldAssignmentIdExternal='abc123'&newAssignmentIdExternal='xyz456'</code>

Response

```
{
  "d": {
    "convertAssignmentIdExternal": "xyz456"
  }
}
```

Error Codes

HTTP Code	Code	Message	Solution
400	COE_GEN- ERAL_FORBIDDEN	[COE0020] The 'Change Assignment ID' role-based permission is required.	Grant user the Change Assignment ID permission in RBP.

9.1.15.4 getPasswordPolicy

You can use this function import to retrieve the password policy defined in SAP SuccessFactors HCM suite.

Supported Operations

HTTP Method: GET

Return Type: collection(GetBizXActionResponse)

Support Payload (`sap:support-payload`): false

Parameters

Parameter	Type	Required/Optional	Value
locale	String	Required	Value of the locale

Use Case: Retrieve the Password Policy in en_US Locale

This example shows how to retrieve the password policy defined in SAP SuccessFactors HCM suite in en_US locale.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/getPasswordPolicy?locale='en_US'</code>

Reponse

```
{
  "d": {
    "getPasswordPolicy": "The requirements are: \n Passwords must be from 2 to
18 characters long.\n Passwords are case sensitive.\n They are not required to be
mixed case.\n Passwords do not have any character-type restrictions.\n Passwords
may contain any combination of letters and digits.\n "
  }
}
```

9.1.15.5 getSPMetadata

You can use this function import to generate the SAML2 SP metadata. This metadata can be used for IAS integrations (SAP Identity Authentication Service) and the new SSO in the Admin Center.

Supported Operations

HTTP Method: GET

Return Type: SPMetadataGenerator

Support Payload (`sap: support-payload`): false

Parameters

Parameter	Type	Required/Optional	Value
companyId	String	Required	Value of the company ID
dcDomain	String	Required	Value of the data center domain

Use Case: Retrieve SAML SP Metadata

This example shows how to retrieve SAML SP metadata.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/getSPMetadata?companyId=CDC84&dcDomain='https://<domain-name>'&\$format=json</code>

Response

```
{
  "d": {
    "SPMetadataGenerator": {
      "errorMessage": null,
      "result": "<?xml version='1.0' encoding='UTF-8'?><md:EntityDescriptor

9.1.15.6 getSFIDPCertType

You can use this function import to check the SAP SuccessFactors certificate signing type (either SHA-1 or SHA-2) being used for Identity Authentication and Identity Provisioning through SAP Cloud Identity Services.

Permissions

- [Manage Integration Tools](#) [OData API SAML2 Setting](#)

Supported Operations

HTTP Method: GET

Return Type: String

Support Payload: false

Parameters

Parameter	Data Type	Required/Optional	Description
acsurl	String Not null or empty	Required	Assertion Consumer Service URL. This is the url of SAP SuccessFactors IDP login response sent to the module as the Service Provider (SP). Use single quotes to mark the acsurl value.

Use Case: Retrieve SuccessFactors IDP Certification Type

This example shows how to retrieve SAP SuccessFactors Identity Provider (IDP) signing certificate type. (Both JSON and Atom formats are included below.)

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/getSFIDPCertType?acsurl='assertion_consumer_service_url'</code>

Response

Two types of response (Success and Failed) for this JSON request: `https://<api-server>/odata/v2/getSFIDPCertType?acsurl='https://<your_sample_url>.com'&format=json`

```
{
  "d": {
    "getSFIDPCertType": {
      "errorMessage": null,
      "result": {acsurl:"https://<your_sample_url>.com", certType:"sha2",
module:"lms"},
      "status": "Success"
    }
  }
}
```

```
{
  "d": {
```

```

    "getSFIDPCertType": {
      "errorMessage": "Invalid acsurl",
      "result": null,
      "status": "Failed"
    }
  }
}

```

Response

Two types of response (Success and Failed) for this Atom request: `https://<api-server>/odata/v2/getSFIDPCertType?acsurl='https://<your_sample_url>.com'&$format=atom`

```

<?xml version="1.0" encoding="utf-8"?>
<d:getSFIDPCertType m:type="SFOData.getSFIDPCertType"
xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://
schemas.microsoft.com/ado/2007/08/dataservices/metadata">
  <d:errorMessage m:null="true"/>
  <d:result>{"acsurl":"https://
<your_sample_url>.com", "certType":"sha1", "module":"lms"}</d:result>
  <d:status>Success</d:status>
</d:getSFIDPCertType>

```

```

<?xml version="1.0" encoding="utf-8"?>
<d:getSFIDPCertType m:type="SFOData.getSFIDPCertType"
xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://
schemas.microsoft.com/ado/2007/08/dataservices/metadata">
  <d:errorMessage>Invalid acsurl</d:errorMessage>
  <d:result m:null="true"/>
  <d:status>Failed</d:status>
</d:getSFIDPCertType>

```

Error Codes

Error Code	Description
acsurl cannot be null or empty	The acsurl cannot be null or empty for this GET API call.
invalid acsurl	SuccessFactors cannot find this acs url in the instance provisioning: Authorized Service Provider (SP) Assertion Consumer Service Settings.
dup acsurl	There are multiple acsurl configurations in Provisioning: Authorized Service Provider (SP) Assertion Consumer Service Settings. Please correct the configuration in Provisioning.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

Supported Operations

HTTP Method: POST

Return Type: String

Support Payload: true

Parameters

Parameter	Data Type	Required/Optional	Description
acsurl	String Not null or empty	Required	Assertion Consumer Service URL. This is the url of SAP SuccessFactors IDP login response sent to the module as the Service Provider (SP). Use single quotes to mark the acsurl value.
module	String Not null or empty	Required	The module or application name. Refer to the Application Names and Keys table below to identify your module's parameter value. Contact the SSO Engineering team if your module is not listed in the table below.
certType	String Not null or empty	Required	Please use "sha2" as the value for the sha2 certificate migration process.

Application Names and Keys

Application Name (Label in the UI)	Application Name (Key)
Learning	lms
Work Zone	workzone
Jam Collaboration	jam
SAP Cloud Platform Application	hcp
Workforce Analytics	wfa
Workforce Planning	wfp
EC Payroll	ecpayroll
SAP Analytics Cloud	sac
Fieldglass	fieldglass
Onboarding 1.0	onb
Recruiting Posting	rp
DocuSign	docusign
Workforce Software	workforce

Application Name (Label in the UI)	Application Name (Key)
Benefitfocus	benefitfocus
OpenText	opentext
Skillssoft	skillssoft
Kronos	kronos
BSI Tax Factory	bsi
Other Application	other

Use Case: Update SuccessFactors IDP Certification Type

This example shows how to update SAP SuccessFactors Identity Provider (IDP) signing certificate type.

Request

HTTP Method	POST
URI	https://<api-server>/odata/v2/updateSFIDPCertType
Payload	<pre>{ "acsurl": "https://<your_sample_url>.com", "module": "<your_application_name_key_from_the_table_above.>", "certType": "sha2" }</pre>

Response

<pre>{ "d": { "updateSFIDPCertType": { "errorMessage": null, "status": "Success" } } }</pre>
<pre>{ "d": { "updateSFIDPCertType": { "errorMessage": "Invalid module name", "status": "Failed" } } }</pre>

Error Codes

Error Code	Description
required parameters cannot be null or empty	The acsurl and module parameters cannot be null or empty for the UPDATE API call.

9.2 Calibration

9.2.1 CalibrationTemplate

The CalibrationTemplate entity is used to get basic information from calibration template table.

Supported Operations

Operation	Description
Query	Query basic information from calibration template table.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query an executiveReviewList using calibration template ID

This example shows how to query an executive review list by using calibration template ID.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/CalibrationTemplate(3261)?\$format=json&\$expand=executiveReviewerList</code>

Response

The response shows the executive review list of the calibration template with ID 3261.

9.2.2 CalibrationSession

The CalibrationSession Entity is used to get basic session information from calibration session table.

Supported Operations

Operation	Description
Query	Query basic information from calibration session table.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query session details and expand its calibration template using session ID

This example shows how to query session details and expand its calibration template by using session ID.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/CalibrationSession(1081)?\$format=json&\$expand=calTemplate</code>

Response

The response shows the details of session with ID 1081 and its calibration template.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/CalibrationSession(1081L)",
      "type": "SFOData.CalibrationSession"
    },
    "sessionId": "1081",
    "sessionDate": null,
    "sessionName": "PMT stack ranker",
  }
}
```

```

    "status": 1,

9.2.3 CalibrationSessionSubject

The CalibrationSessionSubject entity is used to get information about the subjects in a calibration session.

Supported Operations

Operation	Description
Query	Query information about the subjects in a calibration session.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query the details of subjects in a calibration session

This example shows how to query the details of subjects in a calibration session.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/CalibrationSessionSubject(10236)?\$format=json</code>

Response

The response shows the details of subjects in a calibration session.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/CalibrationSessionSubject(10236L)",

9.2.4 CalibrationSubjectRank

The CalibrationSubjectRank entity is used to get information about the subject rank in a calibration session.

Supported Operations

Operation	Description
Query	Query information about the subject rank in a calibration session.

Supported Operations

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query the calibration subject rank from a calibration session

This example shows how to query the calibration subject rank from a calibration session.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ CalibrationSubjectRank(102)?\$format=json</code>

Response

The response shows the calibration subject rank from a calibration session.

```
{
  "d": {
    "__metadata": {
      "uri": "https://api-server/odata/v2/restricted/  
CalibrationSubjectRank(102L)",
      "type": "SFOData.CalibrationSubjectRank"
    },
    "subjectRankId": "102",
    "rank": 1,
    "dataType": 10,
    "ratingValue": "1",
    "calSessionSubject": {
      "__deferred": {
        "uri": "https://api-server/odata/v2/restricted/  
CalibrationSubjectRank(102L)/calSessionSubject"
      }
    }
  }
}
```

9.2.5 CalibrationSubjectComment

The `CalibrationSubjectComment` entity is used to get comments made for subjects in calibration sessions.

Supported Operations

Query

Use Case 1: Query a single comment made for a calibration subject using comment ID

This example shows how to query a single comment made for a calibration subject using comment ID.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/CalibrationSubjectComment(12)?\$format=json</code>

Response

```
"d": {
  "__metadata": {
    "uri": "https://api-server/odata/v2/CalibrationSubjectComment(12L)",
    "type": "SFOData.CalibrationSubjectComment"
  },
  "subjectCommentId": "12",
  "reason": "Balance",
  "authorizedBy": "null",
  "createdBy": "null",
  "reasonId": "3",
  "lastModifiedBy": null,
  "comment": "Good job!",
  "status": null,
  "calSessionSubject": {
    "__deferred": {
      "uri": "https://api-server/odata/v2/CalibrationSubjectComment(12L)/calSessionSubject"
    }
  }
}
```

Use Case 2: Query all comments made for calibration subjects in a company

This example shows how to query all comments made for calibration subjects in a company.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/CalibrationSubjectComment?\$format=json

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/CalibrationSubjectComment(4L)",
          "type": "SFOData.CalibrationSubjectComment"

            "uri": "https://<api-server>/odata/v2/CalibrationSubjectComment(4L)/calSessionSubject"
          }
        }
      },
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/CalibrationSubjectComment(5L)",
          "type": "SFOData.CalibrationSubjectComment"
        },
        "subjectCommentId": "5",
        "reason": "Percentage Amount",
        "authorizedBy": "null",
        "createdBy": null,
        "reasonId": "5",
        "lastModifiedBy": null,
        "comment": "Good job!",
        "status": null,
        "calSessionSubject": {
          "__deferred": {
            "uri": "https://<api-server>/odata/v2/CalibrationSubjectComment(5L)/calSessionSubject"
          }
        }
      }
    ]
  }
}
```

9.3 Compensation

9.3.1 Reward and Recognition

OData APIs from Reward and Recognition enable customers to build custom extensions on top of the standard SAP SuccessFactors Reward and Recognition application.

You can use the following Spot Awards OData APIs.

Note

There is a *Redemption* OData API for processing refunds issued by external partners for the Rewards and Recognition module. Because the *Redemption* API is an OData v4, rather than an OData v2 API, information is published on the [SAP Business Accelerator Hub](#).

[SpotAward \[page 515\]](#)

The `SpotAward` entity represents the Spot Awards object.

[SpotAwardProgram \[page 520\]](#)

This entity represents the Spot Award Program.

[SpotAwardProgramAdvancedSettings \[page 522\]](#)

The `SpotAwardProgramAdvancedSettings` entity represents advanced settings for a Spot Award program.

[SpotAwardCategory \[page 524\]](#)

The `SpotAwardCategory` entity represents each award category within a Spot Award program.

[SpotAwardLevel \[page 527\]](#)

The `SpotAwardLevel` entity represents each award level within a Spot Award Program.

[SpotAwardEligibilityRule \[page 529\]](#)

This `SpotAwardEligibilityRule` entity represents each eligibility rule within a Spot Award Program.

[SpotAwardGuidelinesRule \[page 531\]](#)

The `SpotAwardGuidelineRule` represents each guideline rule within a Spot Award Program.

[SpotAwardBudget \[page 533\]](#)

The `SpotAwardBudget` entity represents the budget details of a budget holder for a Spot Award Program.

[UserRewardInfo \[page 535\]](#)

`UserRewardInfo` retrieves the total available reward balance for the input user, localized to the employee's defined locale. External partners use this information for redemption purposes.

[SpotAwardRedemption \[page 538\]](#)

Use `SpotAwardRedemption` to post redemption transaction information for Flex Rewards.

`SpotAwardRedemption` deducts redeemed amount, updates the user's flex reward balance, and inserts the redemption transaction details. You can also retrieve redemption transaction details from a record.

9.3.1.1 SpotAward

The SpotAward entity represents the Spot Awards object.

Permissions

Operation	Role	Required Role-based Permissions
When users query spot award objects	User	Enable View and Edit permissions from ▶ Miscellaneous Permissions > Spot Award >
When users create spot award objects	User	Enable View and Edit permissions from ▶ Miscellaneous Permissions > Spot Award >
When proxy users create spot awards for employees on behalf of nominators	Logged-in users	▶ Manage Spot Awards > Manage Spot Award Program > Enable edit permissions from ▶ Miscellaneous Permissions > Spot Award >
	Nominators	Enable edit permissions from ▶ Miscellaneous Permissions > Spot Award > The nominator should be assigned in the user's target population.

Supported Operations

Operation	Description
Query	Query an Spot Awards object
Insert	Create a Spot Awards object

Properties

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<Your Entity')?$format=json`

Use Case 1: Query for SpotAward with the externalcode as 30785

Request

Request Information

Operation	Query
HTTP Method	GET
URI	HTTPS://<api-server>/odata/v2/SpotAward('30785')?\$format=JSON

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/SpotAward(30785L)",
      "type": "SFOData.SpotAward"
    },
    "externalCode": "30785",
    "commentForApprovers": null,
    "nominatorId": "cgrant1",
    "lastModifiedDateTime": "/Date(1520933522000+0000)/",
    "currency": "USD",
    "level": "30782",
    "userId": "mhoff1",
    "approvalStatus": "APPROVED",
    "spotAwardProgram": "30778",
    "commentForReceiver": "Congrats",
    "approvedDate": "/Date(1520933522000+0000)/",
    "awardAmount": "0",
    "category": "30780",
    "createdDateTime": "/Date(1520933522000+0000)/",
    "guidelineAmount": "0",
    "budgetHolderId": null,
    "nominatorIdNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/SpotAward(30785L)/nominatorIdNav"
      }
    },
    "budgetHolderIdNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/SpotAward(30785L)/budgetHolderIdNav"
      }
    },
    "categoryNav": {
      "__deferred": {
```

<Payload>

Sample Code

```
[
  {
    "__metadata": {
      "uri": "SpotAward"
    },
    "awardAmount": 0,
    "guidelineAmount": 0,
    "category": "30780",
    "level": "30782",
    "commentForReceiver": "thank
you award!",
    "currency": "USD",
    "spotAwardProgram": "30778",
    "nominatorIdNav": {
      "__metadata": {
        "uri":
"User('cgrant1')"
      }
    },
    "userIdNav": {
      "__metadata": {
        "uri":
"User('vstokes1')"
      }
    },
    "budgetHolderIdNav": {
      "__metadata": {
        "uri":
"User('cgrant1')"
      }
    }
  }
]
```

Note

Editing a Spot Award objects is not supported.

Use Case: 3 Create a SpotAward for Program Type Thank You

When you create spot award programs of type thank you, the following three fields should be maintained with the given values.

- awardAmount: 0
- guidelineAmount: 0
- currency: None

Note

The budgetHolderId field is not required.

Request Information

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Payload	

Sample Code

```
[
  {
    "__metadata": {
      "uri": "SpotAward"
    },
    "awardAmount": 0,
    "guidelineAmount": 0,
    "category": "1",
    "level": "1",
    "commentForReceiver": "Congrats",
    "spotAwardProgram": "Thankyou",
    "currency": "None",
    "nominatorIdNav": {
      "__metadata": {
        "uri": "User('admin')"
      }
    },
    "userIdNav": {
      "__metadata": {
        "uri": "User('smormony1')"
      }
    }
  }
]
```

9.3.1.9 UserRewardInfo

`UserRewardInfo` retrieves the total available reward balance for the input user, localized to the employee's defined locale. External partners use this information for redemption purposes.

Supported Operations

Operation	Description
Query	Query for the total available reward balance, in the employee localized currency

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Querying the User's Total Available Reward Balance from a Default Wallet using key

Retrieve total available reward balance for the input user in the user's localized currency from the default wallet.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/UserRewardInfo('cgrant1')?\$format=json</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/UserRewardInfo('cgrant1')",
          "type": "SFOData.UserRewardInfo"
        },
        "userId": "cgrant1",
        "walletId": "Recognition Wallet",
        "availableAmount": "500",
        "currency": "USD"
      }
    ]
  }
}
```

Use Case 2: Querying the User's Total Available Reward Balance from the Custom Wallet using \$filter

Retrieve total available reward balance for the input user in the user's localized currency from the custom wallet.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/UserRewardInfo?\$format=json&\$filter=userId eq 'cgrant1' and walletId eq 'Milestone Wallet'</code>

Response

```
{
```

```

    "d": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/
UserRewardInfo('cgrant1')",
            "type": "SFOData.UserRewardInfo"
          },
          "userId": "cgrant1",
          "walletId": "Milestone Wallet",
          "availableAmount": "298",
          "currency": "USD"
        }
      ]
    }
  }
}

```

Use Case 3: Querying the User's Total Available Reward Balance from the Default Wallet using \$filter

Retrieve total available reward balance for the input user in the user's localized currency from the default wallet.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/UserRewardInfo? \$format=json&\$filter=userId eq 'cgrant1'

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/
UserRewardInfo('cgrant1')",
          "type": "SFOData.UserRewardInfo"
        },
        "userId": "cgrant1",
        "walletId": "Recognition Wallet",
        "availableAmount": "500",
        "currency": "USD"
      }
    ]
  }
}

```

9.3.1.10 SpotAwardRedemption

Use `SpotAwardRedemption` to post redemption transaction information for Flex Rewards. `SpotAwardRedemption` deducts redeemed amount, updates the user's flex reward balance, and inserts the redemption transaction details. You can also retrieve redemption transaction details from a record.

Permissions

Permission System	Required Settings
Role based	<p>Go to ► Miscellaneous Permissions ► Spot Award Redemption ►, and select <i>View</i> under <i>Visibility</i>.</p> <p>Go to ► Miscellaneous Permissions ► Spot Award Redemption ►, and select <i>Edit</i> under <i>Actions</i>.</p>

Supported Operations

Operation	Description
Insert	Insert a Spot Award Redemption Record.
Query	Query a Spot Award Redemption Record

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Inserting a Spot Award Redemption Record Redeemed using Default Wallet

Insert a Spot Award Redemption record for Orders (SpotAwardRedemptionOrder) and its corresponding Products (SpotAwardRedemptionProduct), that were redeemed using default wallet. Here, Recognition Wallet is the default wallet.

Request

Operation	Insert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/SpotAwardRedemption?\$format=json</code>
Payload	<pre>{ "vendorIdentifier": "BLACKHAWK", "vendorTransactionId": "123450", "totalOrderAmount": 20, "currency": "USD", "comments": "redeemed", "orders": [{ "quantity": 1, "orderAmount": 20, "product": { "productId": "4", "name": "E-Gift Voucher", "category": "category", "description": "description", "price": "20" } }], "userIdNav": { "__metadata": { "uri": "User('vstokes1')", "type": "SFOData.User" } } }</pre>

  }
}

```

Use Case 3: Inserting a Spot Award Redemption Record Redeemed using Custom Wallet

Insert a Spot Award Redemption record for Orders (SpotAwardRedemptionOrder) and its corresponding Products (SpotAwardRedemptionProduct), that were redeemed using a custom wallet.

To see the list of custom wallet configured in your instance, go to ► [Admin Center](#) ► [Manage Data](#) ► and search for *Wallet*. The configured list will be available in the dropdown.

Request

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/SpotAwardRedemption? \$format=json
Payload	<pre>{ "vendorIdentifier": "BLACKHAWK", "vendorTransactionId": "123450", "totalOrderAmount": 20, "currency": "USD", "comments": "redeemed", "wallet": "Recognition Wallet", "orders": [{ "quantity": 1, "orderAmount": 20, "product": { "productId": "4", "name": "E-Gift Voucher", "category": "category", "description": "description", "price": "20" } }], "userIdNav": { "__metadata": { "uri": "User('vstokes1')", "type": "SFOData.User" } } }</pre>

Response

9.3.1.10.1 SpotAwardRedemptionOrder

You can use this entity to retrieve Order related information for a Spot Award redemption.

Supported Operations

Operation	Description
Query	Query a Spot Award Redemption Order

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Querying a Spot Award Redemption Order

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/SpotAwardRedemptionOrder?\$format=json</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/SpotAwardRedemptionOrder(SpotAwardRedemption_externalCode=485574L,externalCode=485575L)",

}

```

9.3.1.10.1.1 SpotAwardRedemptionProduct

You can use this entity to retrieve Product related information corresponding to a Spot Award redemption order.

Supported Operations

Operation	Description
Query	Query a Spot Award Redemption Product.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Querying a Spot Award Redemption Product

Request

Operation	Query
HTTP Method	GET

URI

https://<api-server>/odata/v2/SpotAwardRedemptionProduct?
\$format=json

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/SpotAwardRedemptionProduct(SpotAwardRedemptionOrder_externalCode=485575L,SpotAwardRedemption_externalCode=485574L,externalCode=485576L)",
          "type": "SFOData.SpotAwardRedemptionProduct"
        },
        "externalCode": "485576",
        "SpotAwardRedemption_externalCode": "485574",
        "SpotAwardRedemptionOrder_externalCode": "485575",
        "lastModifiedDate": "/Date(1576114017000+0000)/",
        "productId": "4",

          }
        }
      }
    ]
  }
}
```

9.3.2 Function Imports

9.3.2.1 getMatchedGuideLineRuleInfo

Use `getMatchedGuideLineRuleInfo` to get an equivalent guidelines that match with each user being nominated.

It supports guidelines for multiple users based on program (external code), category (external code), and level (external code).

Note

As the API supports multiple users, and if guideline amounts are different for each user, the results are returned individually for each input user.

Supported Operations

HTTP Method: GET

Return Type: `GetMatchedGuideLineRuleInfoResponse`

Support Payload: false

Parameters

Parameter	Data Type	Required/Optional	Description
<code>category</code>	String	Required	It is an external code of the award category for which employees are recognized.
<code>level</code>	String	Required	It is an external code of the award level for which employees are recognized.
<code>programId</code>	String	Required	It is an external code of a spot award program that is being used during award nominations.
<code>userIds</code>	String	Required	A list of users for whom spot awards are being nominated.

Use Case: Querying the Matching Guidelines for Each Users

This example shows how to get the match guideline rules for the users being nominated.

Request

HTTP Method	GET
URI	https://<api-server>/odata/v2/getMatchedGuidelineRuleInfo?\$format=json&programId='Second'&userIds='rmaxx1,cgrant1'&category='1'&level='1'

Response

```
{
  "d": {
    "GetMatchedGuideLineRuleInfoResponse": {
      "userIdToMatchedGuideLineMap": {
        "results": [
          {
            "key": "rmaxx1",
            "value":
            "{\"currency\":\"USD\",\"maxRuleAmount\":11,\"minRuleAmount\":5,\"ruleAmount\":5,\"ruleAmountIncrement\":3}"
          },
          {
            "key": "cgrant1",
            "value":
            "{\"currency\":\"USD\",\"maxRuleAmount\":11,\"minRuleAmount\":5,\"ruleAmount\":5,\"ruleAmountIncrement\":3}"
          }
        ]
      }
    }
  }
}
```

9.3.2.2 isUserEligibleForSpotAwardProgram

The `isUserEligibleForSpotAwardProgram` checks if a user is eligible for award nomination for a specific program.

Supported Operations

HTTP Method: GET

Return Type: `IsUserEligibleForSpotAwardProgramResponse`

Support Payload: false

Parameters

Parameter	Data Type	Required/Optional	Description
programId	String	Required	It is an external code of a spot award program that is being used during award nominations.
userId	String	Required	A list of users for whom spot awards are being nominated.

Use Case: Querying a User's Eligibility for Nomination

This example shows how to check an user's eligibility for award nominations.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ isUserEligibleForSpotAwardProgram? \$format=json&programId='Second'&userId='rmaxx1'</code>

Response

```
{
  "d": {
    "IsUserEligibleForSpotAwardProgramResponse": {
      "isUserEligible": true
    }
  }
}
```

9.3.2.3 getEligibleSpotAwardsProgramCodes

The `getEligibleSpotAwardsProgramCodes` returns the list of all the programs for which a user is eligible to receive awards.

Supported Operations

HTTP Method: GET

Return Type: `GetEligibleSpotAwardsProgramCodesResponse`

Support Payload: false

Parameters

Parameter	Data Type	Required/Optional	Description
userId	String	Required	A list of users for whom spot awards are being nominated.

Use Case: Querying All Eligible Programs for a User

In below example, rmaxx1 can be only nominated for the **Second** program.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/getEligibleSpotAwardsProgramCodes?\$format=json&userId='rmaxx1'></code>

Response

```
{
  "d": {
    "GetEligibleSpotAwardsProgramCodesResponse": {
      "eligibleProgramCodes": {
        "results": [
          {
            "key": "Second",
            "value": "Second"
          }
        ]
      }
    }
  }
}
```

9.4 Employee Central

9.4.1 About Employee Central OData APIs

This guide contains all information about OData v2 APIs in Employee Central, including API references, use cases, and usage guidelines.

What is an Employee Central OData API?

Employee Central comprises of three types of objects:

- Employee objects contain personal and employment details for employees.
 - Personal objects are exposed as OData entities starting with *Per**. In People Profile, you can find the same personal information contained in person entities in the *Biographical Information* and *Personal Information* blocks.
 - Employment objects are exposed as OData entities usually starting with *Emp**. In People Profile, you can find the same employment information in *Employment Details (Emp*)* and *Job Information (EmpJob*)* blocks.
- Foundation objects contain organization, pay and job structure details of a company. Foundation objects are exposed as OData entities starting with *FO**.
- Metadata Framework (MDF) objects are used to extend the capability of the standard delivered foundation objects. In MDF, generic objects (both predelivered and custom objects) can be exposed as OData entities to extend Employee Central capabilities. In this guide, only API references of OData entities exposed by predelivered objects are listed.

Recommended Read

Before you dive into this guide, here are a few recommended resources to help you better understand and use Employee Central OData APIs. You can find the links to these resources in the Related Information section.

Resource	Description
SAP SuccessFactors HCM suite OData API: Developer Guide (v2)	General guidelines about OData v2 APIs in SAP SuccessFactors HCM suite, including general permissions, authentication, metadata, query and edit operations, as well as how to use the API Center tool to help you get your way around OData APIs.
SAP SuccessFactors HCM suite OData API: Reference Guide (v2)	A list of other OData v2 APIs in SAP SuccessFactors HCM suite.
Employee Central Compound Employee API	The SOAP-based Compound Employee API allows you to extract employee data out of Employee Central for data replication purpose.

Resource	Description
Implementing Employee Central Core	Learn what data Employee Central stores and what capabilities it offers so that you can better understand the Employee Central APIs.
SAP SuccessFactors HCM suite OData API: Reference Guide (v4)	Learn what OData v4 APIs are available in SAP SuccessFactors HCM suite. OData v4 is the latest version of the OData protocol that offers more features and capabilities.
SAP Business Accelerator Hub	A resource portal where you can find the specifications of all APIs offered by SAP and try them out in your own environment.

Related Information

[Implementing Employee Central Core](#)

[Employee Central Compound Employee API](#)

9.4.1.1 When are Employee Central OData APIs Used?

Note

Please don't use SOAP APIs or Ad hoc APIs for building new integrations in Employee Central. The only exception to this rule is the SOA-based Compound Employee API.

If your system cannot consume either OData APIs or SOAP for an initial data load, then you should consider importing and exporting employee data using a CSV. Automation via FTP would also be a possibility.

Scenario	Use OData API	Use CompoundEmployee API
Query only and employee master data has to be replicated in full, delta or snapshot mode for Employee Central entities	No	Yes
Replicate data in Admin Mode for read and write operations.	Yes	No
Support of Employee Central entities such as Foundation, Person, Employment, Time-Off, Time Sheet, Position Management	Yes	No

Scenario	Use OData API	Use CompoundEmployee API
Historical information?	Yes	No (because only partial historical information is available; not all objects are covered)
RBP checks	Yes	Yes
Support of MDF objects	Yes	No (because only user-based MDF objects are supported)
Usage in HCP	Yes	No
Concurrent user access with an extension platform to build your own UIs on top of Employee Central	Yes	No
Access MDF Data	Yes	No
Write or update data	Yes	No

9.4.1.2 Admin Mode and User Mode

There are two modes in Employee Central OData APIs which determine what a user or user group (in this context a user and user group are treated as one and the same) is authorized to view or do.

- User Mode**
Assigned permissions determine what entities can be viewed and what can be done with them. You sometimes see the term RBP mode but in this guide, we use the term user mode.
- Admin Mode**
The admin mode allows user full access to Employee Central OData API entities and operations. You only use this in a limited number of cases, mostly for technical integrations. Admin mode overrides any RBP settings. You sometimes see the term technical user or non-RBP mode, but in this guide we use the term admin mode.

Note

The upsert operation requires additional permission. See the Related Links section for more information.

Related Information

[Permission Settings \[page 554\]](#)

9.4.1.3 Provisioning Settings

Employee Central OData APIs are part of the Employee Central solution. You don't need to make any settings in Provisioning.

To have access to individual APIs, you also need the corresponding features enabled in Provisioning. For example if you're using Global Assignment, the corresponding Provisioning setting must be enabled. You can find more information in the implementation guides for your feature available on https://help.sap.com/hr_ec/.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

9.4.1.4 Permission Settings

Learn what role-based permissions are required before you can use Employee Central OData APIs.

This topic covers only the permissions required for accessing Employee Central OData APIs. For general permission settings, refer to the documentation in the Developer Guide in Related Information section.

The following tables are grouped by different entities and what a permission item allows user to do with those entities. Remember to read any additional information for the permission setting that is available in your system.

Employee Central HRIS (Person and Employment Objects) and Workflow OData APIs

Authorization/Action	In <i>Permission...</i> , choose	Additional Info
User Mode (Query Only)	<ul style="list-style-type: none">Effective-dated entities: ▶ User Permissions ▶ Employee Central Effective Dated Entities ▶Non effective-dated entities: ▶ User Permissions ▶ Employee Data ▶Workflow entities: ▶ Administrator Permissions ▶ Manage Workflows ▶ Manage Workflow Requests ▶	<p>You can grant view permissions at entity and field levels.</p> <p>Upsert, that is import information in your instance, is only available in Admin Mode.</p>

Authorization/Action	In <i>Permission...</i> , choose	Additional Info
Admin Mode (Query)	<ul style="list-style-type: none"> ▶ Administrator Permissions ▶ Employee Central API ▶ Employee Central HRIS OData API (read-only) ▶ 	<p>This permission allows users to query all HRIS objects and overrides entity-level and field-level view permissions.</p> <p>If you want to upsert HRIS objects, you need to have the Admin Mode (Upsert) authorization.</p>
Admin Mode (Upsert)	<ul style="list-style-type: none"> ▶ Administrator Permissions ▶ Employee Central API ▶ Employee Central HRIS OData API (editable) ▶ 	<p>This permission allows users to upsert all HRIS objects and overrides entity-level and field-level edit permissions.</p> <p>If you want to query HRIS objects, you need to have the entity-level or field-level view permissions, or have the Admin Mode (Query) authorization.</p>

Employee Central Foundation Objects OData APIs

Authorization/Action	In <i>Permission...</i> , choose	Additional Info
User Mode	<ul style="list-style-type: none"> ▶ Administrator Permissions ▶ Manage Foundation Objects Types ▶ 	<p>You can grant view and edit permissions at entity level.</p>
Admin Mode (Query)	<ul style="list-style-type: none"> ▶ Administrator Permissions ▶ Employee Central API ▶ Employee Central Foundation OData API (read-only) ▶ 	<p>This permission allows users to query all Foundation Objects and overrides entity-level view permissions.</p> <p>If you want to upsert Foundation Objects, you need to have the entity-level edit permissions or the Admin Mode (Upsert) authorization.</p>
Admin Mode (Upsert)	<ul style="list-style-type: none"> ▶ Administrator Permissions ▶ Employee Central API ▶ Employee Central Foundation OData API (editable) ▶ 	<p>This permission allows users to upsert all Foundation Objects and overrides entity-level edit permissions.</p> <p>If you want to query Foundation Objects, you need to have the entity-level view permissions or have the Admin Mode (Query) authorization.</p>

Migrated Foundation Objects (MDF FO) OData APIs

Authorization/Action	In <i>Permission...</i> , choose	Additional Info
User Mode	<ul style="list-style-type: none"> ▶▶ Administrator Permissions ▶ MDF Foundation Objects ▶ ▶▶ Administrator Permissions ▶ Metadata Framework ▶ Access to non-secured objects ▶ 	<p>You can grant view and edit permissions at entity level. To set field-level permissions that override entity-level permissions, select Field Level Overrides.</p>
Admin Mode (Query and Upsert)	▶▶ Administrator Permissions ▶ Metadata Framework ▶ Admin Access to MDF OData API ▶	<p>This permission allows users to query and upsert all Generic Objects and overrides entity-level and field-level permissions.</p>

Note

If you have the Admin Mode authorizations for Foundation Objects, you have the corresponding authorizations for Generic Objects without setting this permission.

Employee Data Import Permissions

The following permissions for Employee Data Import also apply to OData APIs.

Permission Type	Permission Category	Permission Name	Result
Administrator Permissions	Employee Central Import Settings	Enable Workflows for selected entities	Workflows attached with the selected Employee Central Import entities are triggered when you're importing employee data.
		Enable Business Rules for selected entities	Business rules attached with the selected Employee Central Import entities are triggered when you're importing employee data.

Permission Type	Permission Category	Permission Name	Result
		<i>Enable execution of rules against NO_OVERWRITE</i>	Business rules attached with the selected Employee Central Import entities will also update fields that are marked as 'NO_OVERWRITE' in your import file template.
		<i>Enable Forward Propagation during Incremental Import</i>	Data is propagated to effective dated records when you're importing data with the selected Employee Central Import entities.
		<i>Support cumulative update of country/region-specific data for global information import in full purge mode</i>	Country/region-specific data existing in the Employee Profiles is retained when you're importing Global Information in full purge mode.

Miscellaneous Permission Settings

Take a look at this table in case you need to arrange access to picklist management, SOAP APIs, API tools, or even restrict access.

Authorization/Action	In <i>Permission...</i> , choose	Additional Info
Picklist Handling in OData and SOAP	▶ Administrator Permissions > Manage System Properties ▶ Picklist Management and Picklists Mappings Set Up >	For more information, see picklists .
Access Employee Central HRIS SOAP APIs	▶ Administrator Permissions > Employee Central API ▶ Employee Central HRIS SOAP API >	You can grant access to Employee Central HRIS SOAP APIs here.

[Deprecation of HTTP Basic Authentication](#)

9.4.1.4.1 External Users' Access to Employee Central OData APIs

Now, external users are able to access some commonly used Employee Central entities.

External users, relative to internal users, aren't yet employees but still require access to SAP SuccessFactors HCM suite. External users are represented by status e (active_external_suite) and d (inactive_external_suite).

External users with required field-level permissions from [User Permission](#) > [Employee Data](#) can access the following Employee Central entities:

- PerPersonal
- PerPersonRelationship
- PerGlobalInfoXXX
- EmpEmployment
- EmpJob
- EmpJobRelationship
- EmpCompensation
- EmpGlobalAssignment

Note

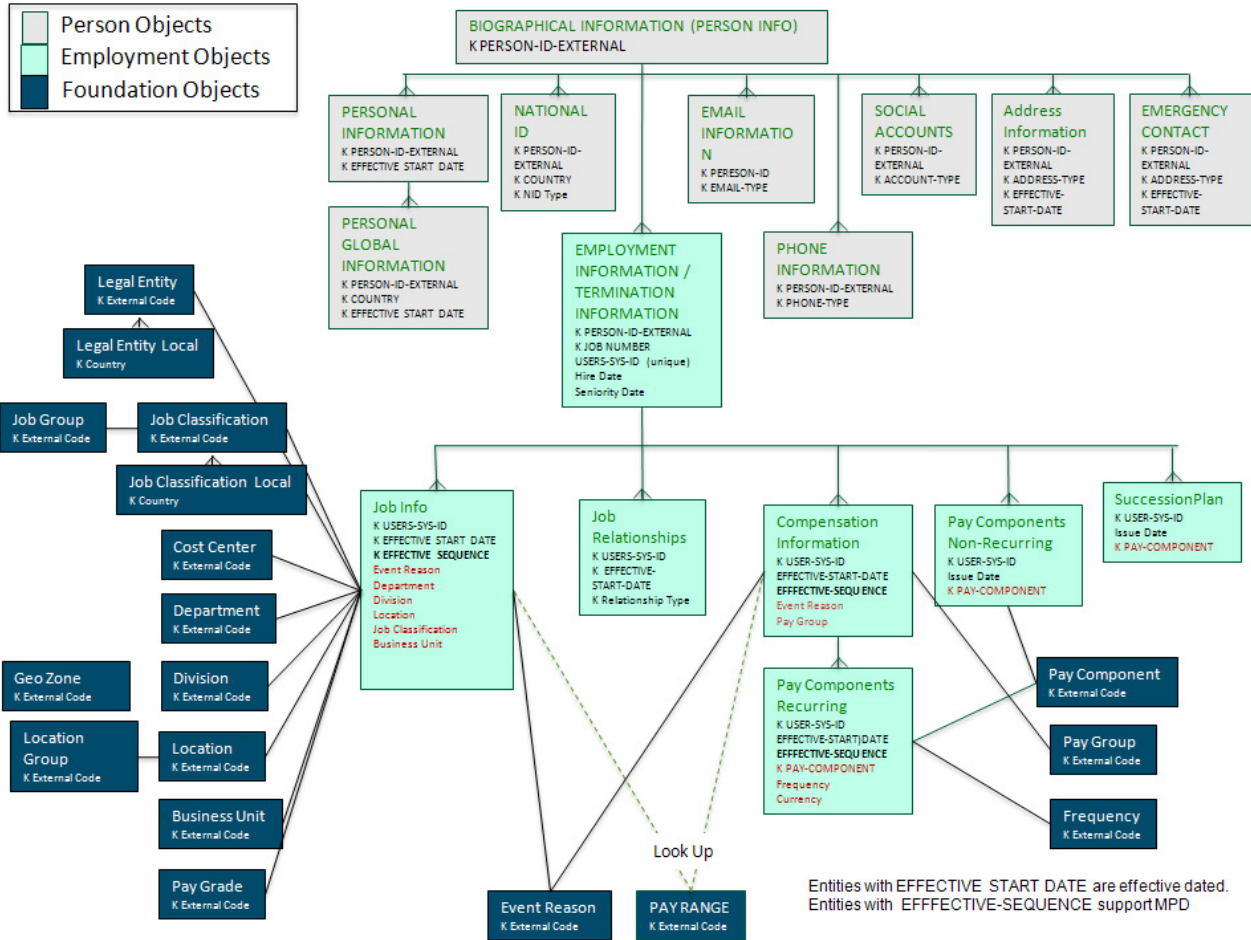

Only external user data are returned. External users cannot access internal user data via Employee Central OData APIs.

9.4.1.5 Employee Central Entity Relationships

Employee Central consists of employee entities and foundation entities:

1. Employee Entities: Describes person and employment objects.
2. Foundation Entities: Describes other general data such as organization, job code and pay component.

The following Entity Relation Diagram shows the relationship between the different entities. The Person and Employment objects make up Employee entities. In this diagram, the K fields denote business keys. The field names here are from the HRIS element.

Note

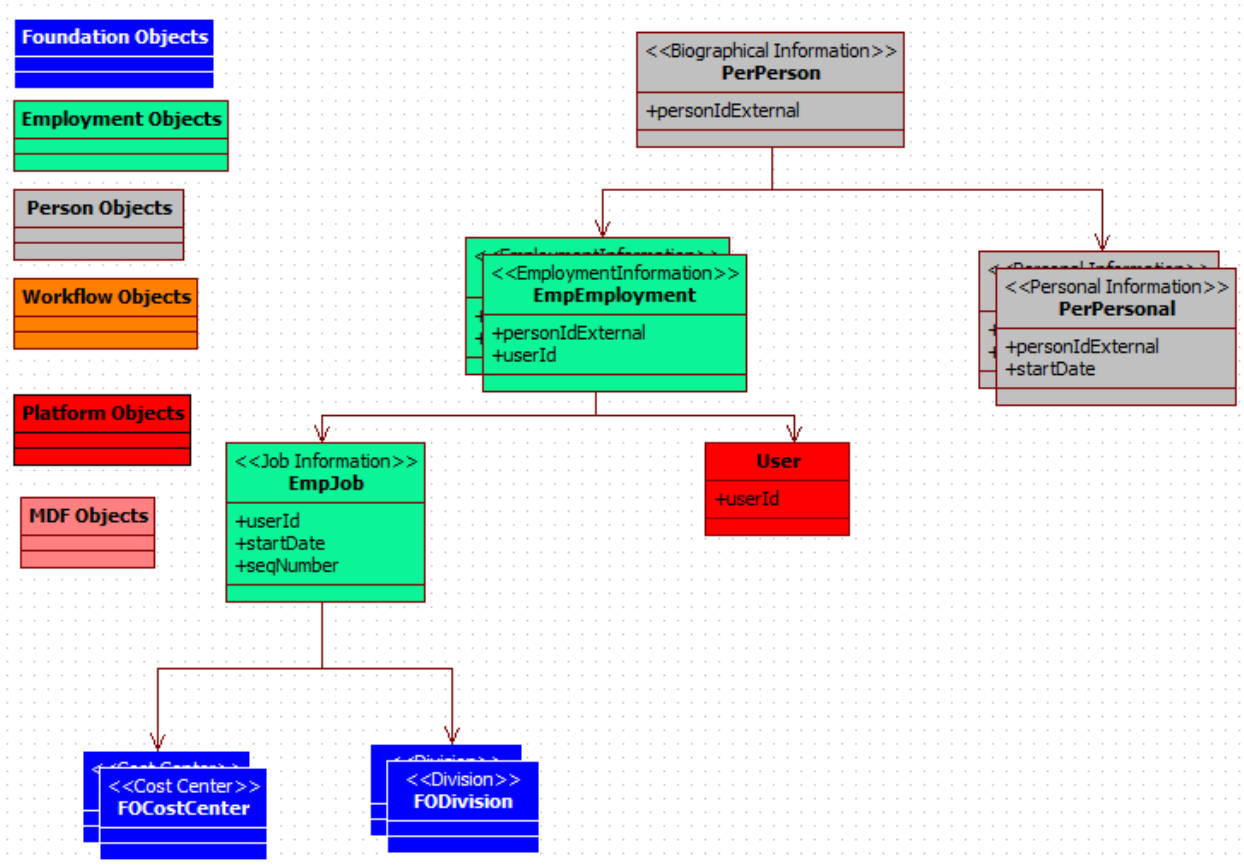

The images that follow are not complete but show a representation of some of the most important entities and their relationships within the Employee Central OData Structure. For a complete list of available entities, you can:

- use the OData API Dictionary Admin tool
- download the ODATA API metadata from the Admin Tools
- execute the following operation

```
odata/v2/$metadata
```

These OData entities are grouped as:

- Foundation Objects – Examples: FODepartment, FODivision, FOBusinessUnit
- Employment Objects - Examples: EmpJob, EmpEmployment, EmpCompensation
- Person Objects – Examples: PerPerson, PerPersonal, PerEmail
- Workflow Objects – Examples: WfRequest, WfRequestStep
- Platform Objects – Examples: User, Picklist
- MDF Objects – Example: Position

Overview of OData Structure

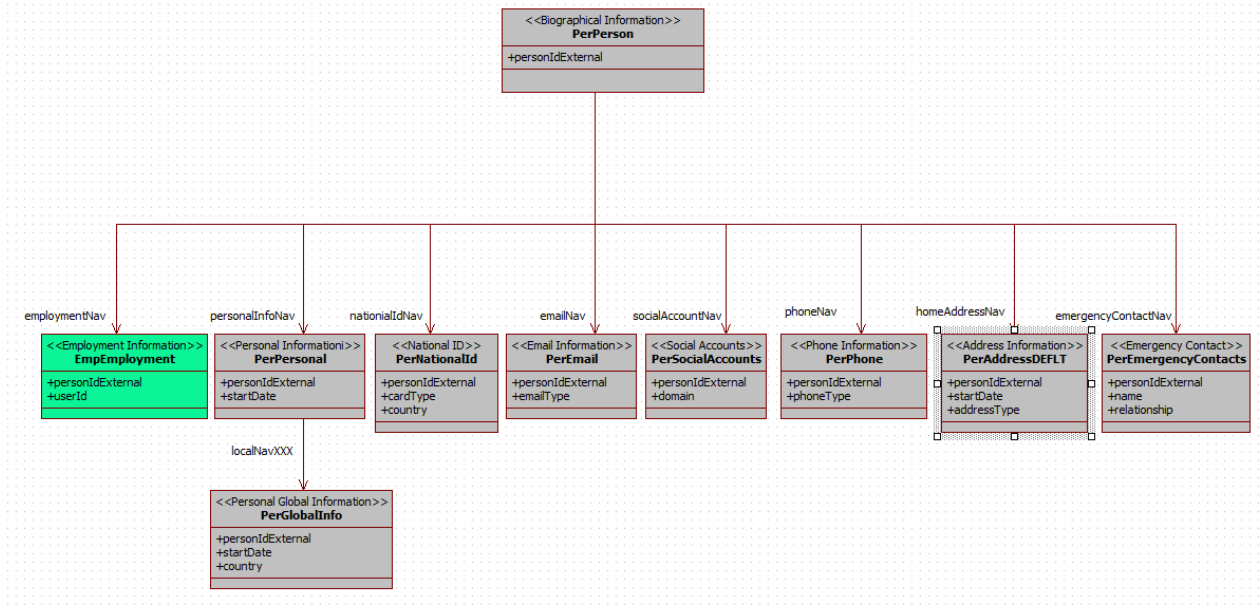

The next diagram shows the relationships for the PerPerson entity. Arrows in the picture denote navigations from one entity to another. The names written next to the arrows can be used to expand the target entity within an OData API request. For example:

```
odata/v2/PerPerson?$filter=personIdExternal+eq+'cgrant1'&$expand=emailNav
```

This request will return PerPerson entity for cgrant1 and all her emails embedded within the response for PerPerson entity. For more examples and their responses refer to the section on entities.

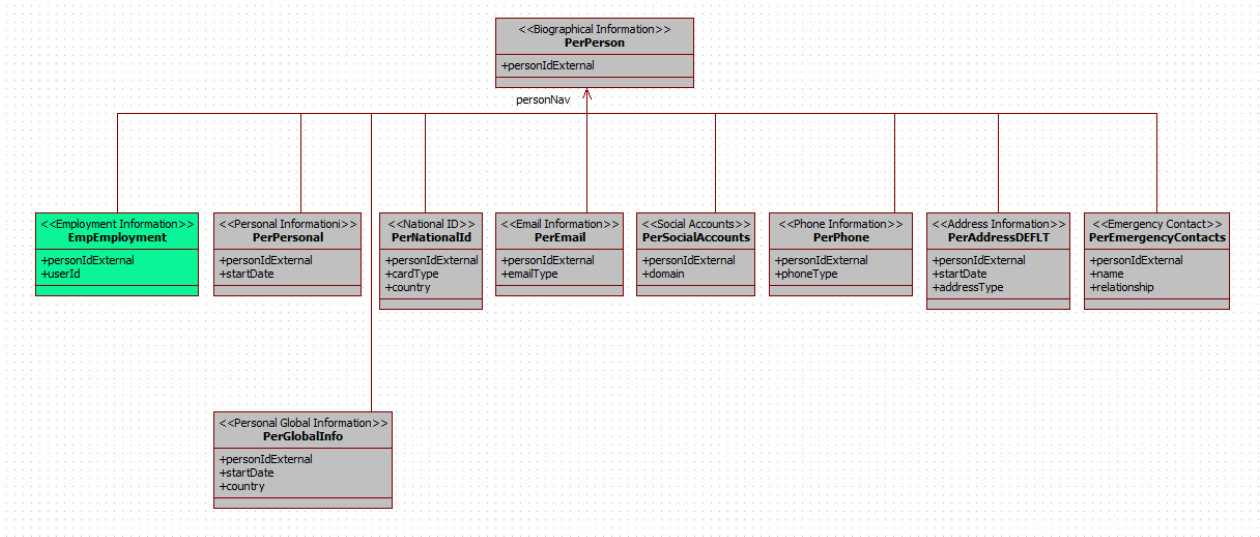

Note

The names within << >> provide the name used on the UI while the name next to the +sign denotes a business key. For example, <<PerAddressDEFLT>> is referred to on the UI as Address Information. It also shows that the following fields are used as business keys: personIdExternal, startDate, and addressType.

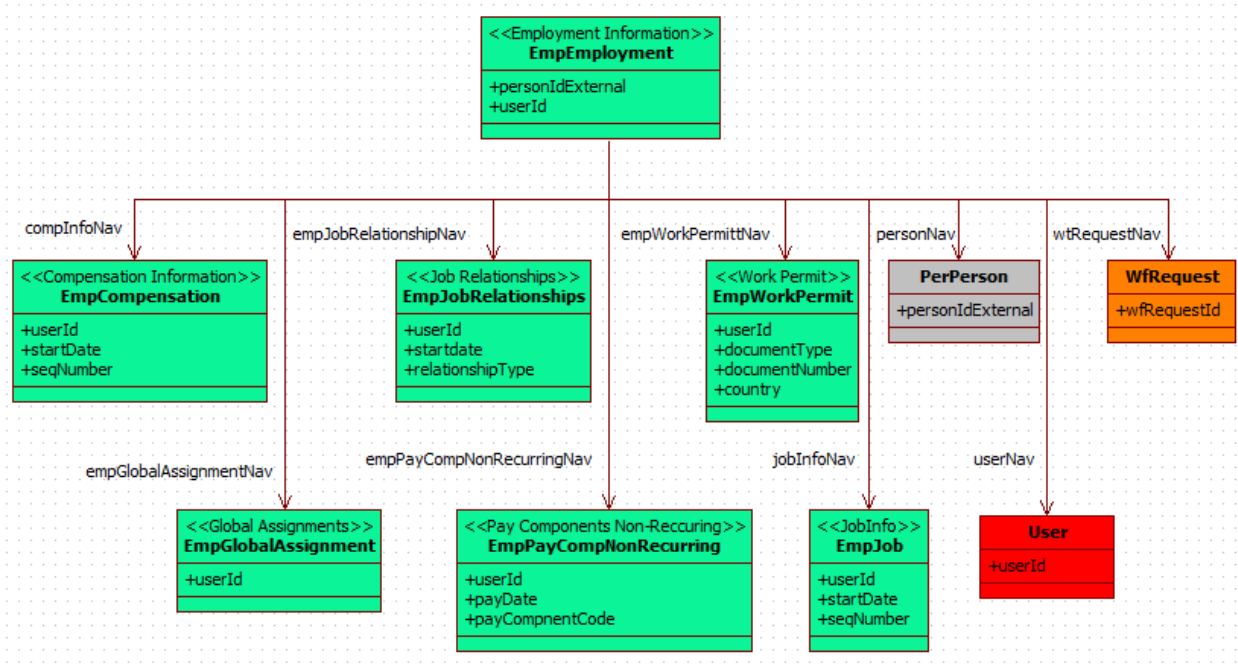

Navigations from the PerPerson Entity

The diagram above shows the major navigations going out of the PerPerson entity while the next diagram shows the major relationships navigating to the PerPerson entity.

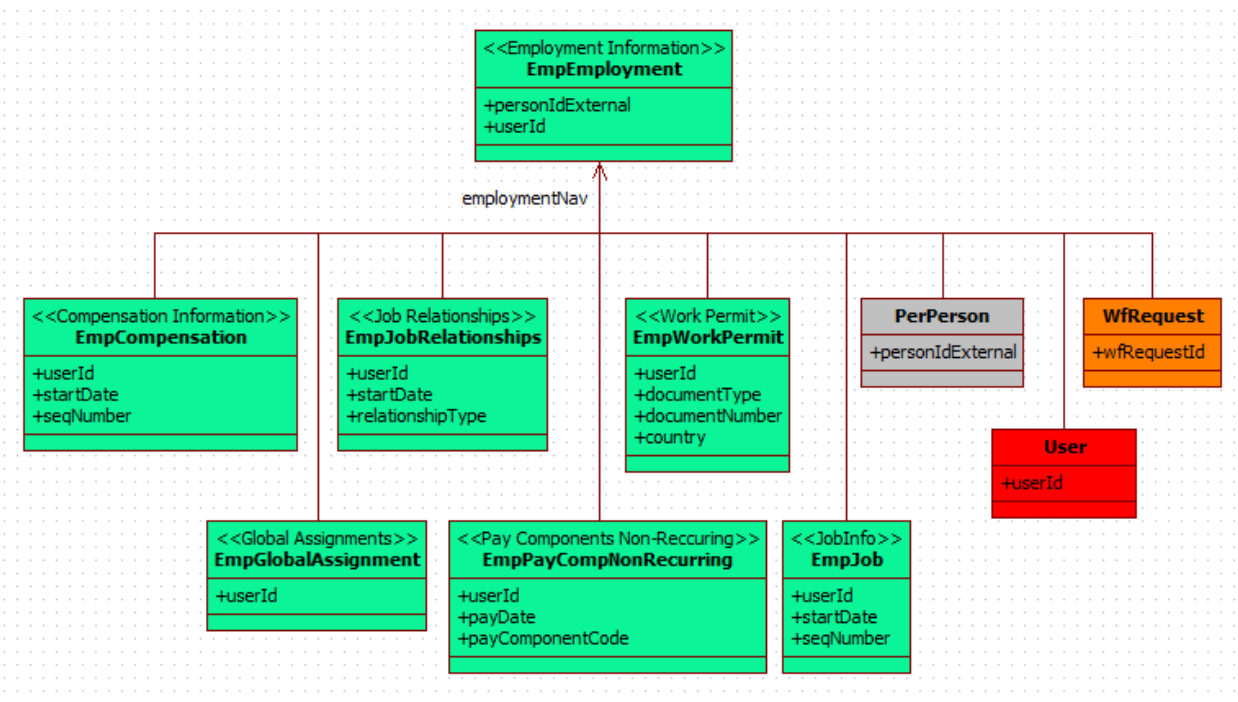

Navigations into the PerPerson Entity

Likewise, the next two diagrams show the navigations from and to the EmpEmployment entity.

Navigations from the EmpEmployment Entity

Navigations into the EmpEmployment Entity

The next two diagrams show the navigations from and to the EmpJob entity.

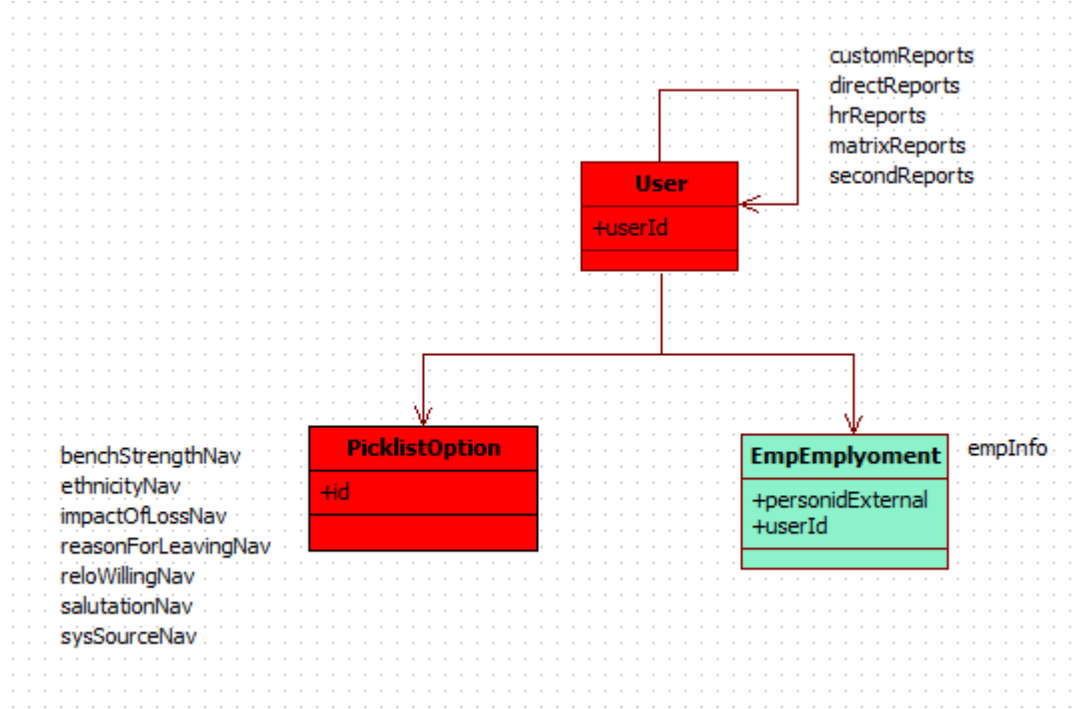

Navigations from the EmpJob Entity

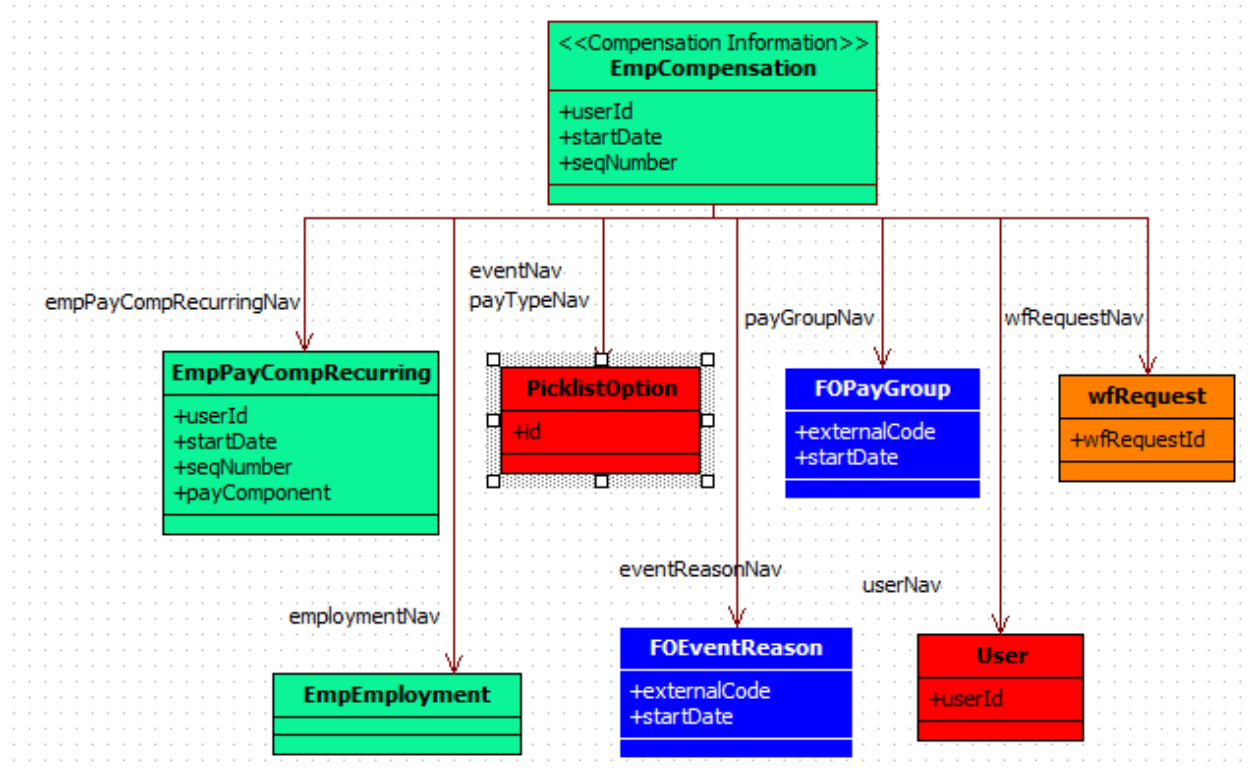

Navigations into the EmpJob Entity

The next diagram shows the relationship for the User entity. In this diagram, the names next to the PicklistOption box show fields of User entity that are navigating to the PicklistOption entity. Likewise, for User entity. Additionally, the arrow pointing back to itself shows that the User entity navigates back to the User entity. For example, the User entity of a manager navigates to the User entity of the direct report using the directReports navigation.

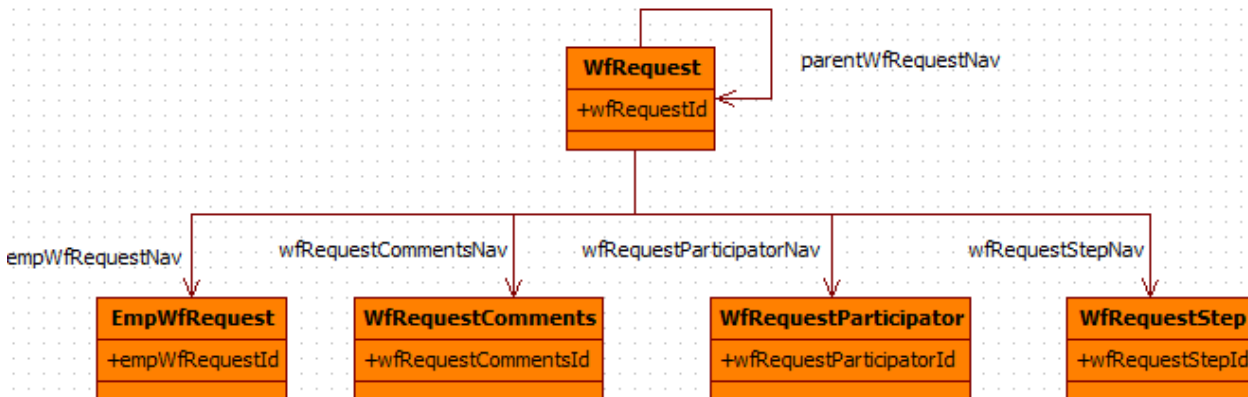

Navigations from the User Entity

The next diagram shows the relationship for the EmpCompensation entity.

Navigations from the EmpCompensation Entity

Navigations from the WfRequest Entity

9.4.1.6 Entity Association & Navigation

Odata APIs supports navigation for associated entities. For examples of supported scenarios, refer to the section describing the OData entity.

[Navigation to the Picklist entity \[page 566\]](#)

[Navigation to the User entity \[page 566\]](#)

[Navigation to MDF entity \[page 566\]](#)

[Foundation Object Navigation \[page 566\]](#)

[Navigation to Territory entity \[page 567\]](#)

[Country/Region Entity Navigation \[page 567\]](#)

[Person Entity Navigation \[page 567\]](#)

[Employment Entity Navigation \[page 568\]](#)

[Navigation from User and MDF Entities to Employee Central Entities \[page 568\]](#)

9.4.1.6.1 Navigation to the Picklist entity

For Employee Central fields configured as picklists in data model, navigation is available from Employee Central entities to the Picklist entity.

9.4.1.6.2 Navigation to the User entity

Employment related entities such as EmpJob, EmpEmployment and EmpCompensation can navigate to the User entity.

Foundation Object entities can also navigate to the User entity. For example, the manager of the Cost Center(costcenterManager) in the FOCostCenter entity or the head of the unit(headOfUnit) in the FODivision can navigate to the User entity. Custom field configured in the Corporate Data Model with Type=Worker can also navigate to the User entity.

9.4.1.6.3 Navigation to MDF entity

Fields in Employee Central referring to MDF objects such as the Position field in Job Information(EmpJob entity) can navigate to the position MDF entity. Custom fields configured as MDF type can also navigate to the related MDF entity.

9.4.1.6.4 Foundation Object Navigation

OData APIs support the following foundation object relationships by navigation:

- **Default foundation object navigation**
For example, in the Corporate Data Model, the costCenter field in the HRIS element Department (FODepartment entity) has a predefined relationship to the cost center.
- **Flexible foundation object navigation based on associations**
For example, associations can be defined in the Corporate Data Model to link FODepartment to FOGeozone which will also create navigations from FODepartment to FOGeozone.

Note

The navigations described for the Picklist entity, User entity and MDF entity (in the previous sections) are supported for foundation object navigation as well.

9.4.1.6.5 Navigation to Territory entity

In OData APIs, Employee Central fields related to country can navigate to the Territory Entity. For example, navigation to the Territory entity exists for the following cases:

- countryOfBirth in PerPerson
- country field in PerNationalIdCard
- FOJobClassLocal
- PerGlobalInfoUSA

9.4.1.6.6 Country/Region Entity Navigation

Country/region-specific entities are defined in country/region-specific data models. Examples of such entities are:

- FOJobClassLocal<Country/Region> (for example, FOJobClassLocalUSA)
- PerGlobalInfo<Country/Region> (for example, PerGlobalInfoUSA)

The parent entity can navigate to the country/region-specific child entity. For example:

- FOJobCode can navigate to the child entity FOJobClassLocal<Country/Region> (for example, FOJobClassLocalUSA)
- FOCompany can navigate to the child entity FOLegalEntityLocal<Country/Region> (for example, FOLegalEntityLocalUSA)
- PerPersonal can navigate to the child entity PerGlobalInfo<Country/Region> (for example, PerGlobalInfoUSA)

The OData API supports navigation from the country/region-specific entity to the territory entity to get detailed information about the country or region.

Some of the parent entities like FOLocation and PerPerson also provide navigation to address information. For example, FOLocation to FOCorporateAddressDEFLT and PerPerson to PerAddressDEFLT.

9.4.1.6.7 Person Entity Navigation

Person related entities such as PerPhone and PerEmail can navigate to the PerPerson entity; EmpEmployment can navigate to PerPerson too.

PerPerson can navigate to entities like:

- PerPersonal
- PerPhone
- PerEmail
- PerNationalId
- PerEmergencyContact
- EmpEmployment

9.4.1.6.8 Employment Entity Navigation

OData APIs support navigation from Employment related entities such as EmpJob, EmpCompensation to the EmpEmployment entity and vice-versa.

9.4.1.6.9 Navigation from User and MDF Entities to Employee Central Entities

OData APIs support navigation of the User Entity to the EmpEmployment entity.

MDF entities, depending on their configuration, can offer navigation to the User Entity and Employee Central Foundation Objects.

9.4.1.7 Country/Region-Specific Logic

This section describes the different types of country/region-specific logic for Employee Central entities and Foundation Objects (FO). The Employee Central country/region-specific configuration allows the use of different labels in the Succession Data Model and in the Country/Region-Specific Succession Data Model for one field.

Note

SOAP APIs have limitations in accessing country/region-specific information. We recommend you to use OData APIs that provide the same functionalities with better performance.

9.4.1.7.1 Country/Region-Specific Logic for EmpJob, EmpEmployment, and EmpCompensation

Even if you configure the labels and attributes of `jobInfo`, `employmentInfo`, or `compInfo` fields differently for countries and regions, there's only one configuration available in the metadata of OData API `EmpJob`,

`EmpEmployment`, or `EmpCompensation`. This is because we don't have a separate entity for each country or region.

→ Recommendation

If you use the metadata of the OData APIs in integrations or other scenarios, consider configuring the attributes identically or as the loosest for all countries and regions to avoid blocking your business.

Here're some rules to consider before you use the OData APIs:

- If a field label is configured differently by country or region, the APIs randomly use one of the configurations in metadata.
- If a field attribute, excluding `required` and `visibility`, is configured differently by country or region, the APIs randomly use a configuration in metadata.
- If the attribute `required` or `visibility` is configured differently in the Country/Region-Specific Succession Data Model, and not configured in the Succession Data Model, the APIs use the least restrictive configuration in metadata.

Related Information

[Country/Region-Specific Data Models](#)

[List of HRIS XML Elements and Attributes](#)

[EmpJob \[page 668\]](#)

[EmpEmployment \[page 653\]](#)

[EmpCompensation \[page 641\]](#)

9.4.1.7.2 PerGlobalInfo<Country/Region>

Countries or regions which have not been defined in the Country/region-Specific Succession Data Model for the HRIS element `globalInfo` aren't visible in OData as a `PerGlobalInfo<Country/Region>` entity. Because it is not possible to define the HRIS element `globalInfo` in the Succession Data Model, there is also no `PerGlobal` default entity.

For upsert, there is no restriction on the country or region entity used. For example, the `PerGlobalInfoUSA` entity can be used to upsert records for USA, India, and Germany.

9.4.1.7.3 FOCorporateAddressDEFLT / HrisEmergencyContactAddressDEFLT

You can define the attributes of the fields for these entities differently for countries and regions in the Succession Data Model and the Country/region-Specific Data Model. As it is not possible to have multiple entities per country or region, the OData API for these entities offers a single field for all countries and regions.

Here are some things to consider before you use the API:

- If a field is configured in both the Succession Data Model and Country/region-Specific Succession Data Model, the OData API exposes the field as is configured in the Succession Data Model.
- If a field is configured in the Country/region-Specific Succession Data Model for multiple countries or regions, the OData API exposes the field as is earliest configured for a country or region on the XML.
- The OData API checks the length for all country/region-specific configurations and uses the maximum length.
- If a field is configured as a picklist for all countries or regions in the Country/region-Specific Data Model, the OData API exposes the field as a picklist even if different picklists are used. For example, `custom_string1` can be defined for `corporateAddress` of DEU as `picklist=A1`, and it can be also defined for `corporateAddress` of `country=USA` as `picklist=B1`.
- If a field is configured with a different type (Worker / FO / MDF/picklist), the field is ignored in the OData API query. This applies to the following scenarios:
 - the Succession/Corporate Data Model and the Country/region-Specific Corporate Data Model have different types, OR
 - the Country/region-Specific Data Model for different countries and regions have different types defined for the same field. For example, type is defined as a picklist for USA and type is defined as a FO for DEU.

For `corporateAddress`, the parent entity: `FOLocation` has a field name, `<addressId>` which can uniquely identify the related `corporateAddress` field. The same goes for emergency contact's address info (`addressId`).

9.4.1.7.4 PerAddressDEFLT

You can define the attributes of the `PerAddressDEFLT` fields differently for countries and regions in the Succession Data Model and the Country/region-Specific Data Model. As it is not possible to have multiple entities per country or region, this OData API exposes a single entity `PerAddressDEFLT`, and offers a single field for all countries and regions.

Here are some things to consider before you use the API:

- If a field is configured in the Country/region-Specific Succession Data Model for multiple countries or regions, the OData API exposes the field as is earliest configured for a country or region on the XML.
- If a field is configured in both the Succession Data Model and Country/region-Specific Succession Data Model, the OData API exposes the field as is configured in the Succession Data Model.
- The OData API checks the length for all country/region-specific configurations and uses the maximum length.
- If a field is configured as a picklist for all countries or regions in the Country/region-Specific Data Model, the OData API exposes the field as a picklist even if different picklists are used. For example, `custom_string1` can be defined for `corporateAddress` of DEU as `picklist=A1`, and it can be also defined for `corporateAddress` of `country=USA` as `picklist=B1`.
- If a field is configured with a different type (Worker / FO / MDF / picklist), the field is ignored in the OData API query. This applies to the following scenarios:
 - the Succession/Corporate Data Model and the Country/region-Specific Corporate Data Model have different types, OR
 - the Country/region-Specific Data Model for different countries and regions have different types defined for the same field. For example, type is defined as a picklist for USA and type is defined as a FO for DEU.
- If there is no country-specific data defined for the HRIS element `homeAddress`, the definition specified in the Succession Data Model will be used.

9.4.1.7.5 FOLegalEntityLocal<Country/Region>

The same field can be defined differently in the Succession Data Model and the Country/region-Specific Data Model for attributes like visibility, required, picklist, and type. The OData API supports this by providing different entities for each country and region (FOLegalEntity<Country/Region>) and an entity FOLegalEntityDEFAULT for all countries and regions that have not been defined in the Country/region-Specific Data Model.

For FOLegalEntityLocal<Country/Region>, the parent entity FOCompany has three fields: `externalCode`, `startDate` and `country` which can uniquely identify the related legal entity local record.

9.4.1.7.6 FOJobClassLocal<Country/Region>

For the HRIS element `jobClassLocal`, the OData API provides the FOJobClassLocal<Country/Region> entity for each country or region defined in the Country/region-Specific Data model. For all other countries and regions not defined in the Country/region-Specific Data model, the FOJobClassLocalDEFAULT entity is used.

9.4.1.7.7 PerNationalId

This entity contains national identification card information for an employee. Only the format of the HRIS element `nationalId` can be defined in the Country/region-Specific Succession Data model. Other fields for the HRIS element `nationalId` must be defined in the Succession Data Model. There is no special handling required for National ID with respect to the OData API query operation.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
cardType	Type of the national ID. This is a business key.
country	Country of the employee. This is a business key.
personIdExternal	Person ID of the employee. This is a business key.
nationalId	National ID of the employee.

Use Case: Query the National ID information of an employee

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/PerNationalId(cardType='TFN',country='AUS',personIdExternal='106032')?\$format=JSON</code>

Response

9.4.1.8 Date Handling for Employee Central Entities

To understand date handling for Employee Central Entities, you need to understand the concepts of effective dating, multiple changes per day (MCPD) and last modified query behavior.

Take a look at the related topics, if these concepts are new to you.

Related Information

[Effective Dating \[page 573\]](#)

[Effective Dated Query in OData \[page 574\]](#)

[Multiple Changes Per Day \(MCPD\) Entities \[page 580\]](#)

[Effective-Dated Entities with \\$expand \[page 576\]](#)

[Last Modified Queries and Effective Dated Entities \[page 582\]](#)

9.4.1.8.1 Effective Dating

The effective dating mechanism enables entities to have an effective start date and an effective end date, and a record becomes effective between its start date and end date. Effective dating ensures that there is no time gap between records, and enable you to track historical data accurately.

Effective-Dated Entities

Effective-dated entities, including `EmpCompensation`, `EmpJob`, `EmpJobRelationships`, and `PerPersonal`, are usually featuring a business key `startDate`. However, for a few effective-dated entities like `EmpCostDistribution`, such business key is named `effectiveStartDate`, instead of `startDate`.

How Does It Work?

For an effective-dated entity, when you insert a new record, the end date of the previous record is automatically set to the day before the effective start date of the new record. And the new record is automatically assigned an end date of 12-31-9999.

Note

- When you insert a record for an effective-dated entity, do not provide the end date in your request URI. End dates are assigned by system automatically. If you provide a different end date, the system cannot accept the record and returns errors.
- Do not provide time in the start date or custom date type fields. Any time value in date type fields is regarded as "00:00:00".

UI Behavior

When you edit an existing record in an effective-dated entity, this is same as making an incremental upsert using the API with a new key (that is a new date or sequence number).

Corrections to effective-dated records become effective immediately.

[Effective Dated Query in OData \[page 574\]](#)

When querying an effective-dated entity, you can use parameters `asOfDate`, `fromDate`, and `toDate` as filters to query the history or future records.

[Effective-Dated Entities with \\$expand \[page 576\]](#)

Know about the behaviors when you query effective-dated entities with `$expand`.

[Multiple Changes Per Day \(MCPD\) Entities \[page 580\]](#)

Some effective-dated entities support multiple changes per day (MCPD).

[Last Modified Queries and Effective Dated Entities \[page 582\]](#)

Learn about how to query the last modified information of effective dated entities.

9.4.1.8.1.1 Effective Dated Query in OData

When querying an effective-dated entity, you can use parameters `asOfDate`, `fromDate`, and `toDate` as filters to query the history or future records.

There are two ways to query effective-dated entities. You can use either one but you cannot use both in one query. When you use these parameters, you need to define the date in the format YYYY-MM-DD, or errors occur.

- `asOfDate` query: Returns one single effective record as of the specified date.
- `fromDate` and `toDate` query (also known as date range query): Returns records effective between the specified date range.

If no `asOfDate` parameter or date range parameter is specified, by default `asOfDate = Today` (the current date of the query) is applied to the query. For example, if you query `EmpJob` with `https://<api-server>/odata/v2/EmpJob` on 2021-03-29, it returns the `EmpJob` record effective as of 2021-03-29.

The URI parameters `asOfDate`, `fromDate`, `toDate` are global Employee Central parameters but not standard OData parameters. They aren't preceded by the \$ symbol as other OData parameters. When you use these

parameters with `$expand`, they're applied to the root entity specified in the query request and also to the expanded entities. See Effective-Dated Entities with `$expand`.

Related Information

[Effective-Dated Entities with `\$expand` \[page 576\]](#)

9.4.1.8.1.1.1 `fromDate` and `toDate` (Date Range) Query

Use the date range parameters `fromDate` and `toDate` to query records of effective-dated entities that are effective between a defined time interval.

In a date range query, the returned records should have an effective start date no later than `toDate`, and an effective end date no earlier than `fromDate`. A query in which `fromDate` equals to `toDate` is also regarded as a date range query.

You can use the two parameters in pairs, or use either of them. If you only specify `fromDate` in the request, the system end date is used as `toDate`. And if you only specify a `toDate`, the system start date is used as `fromDate`. In this way an effective date range is defined.

Examples

Example 1: Use `fromDate` only

Request: `https://<api-server>/odata/v2/PerPersonal?fromDate=2020-12-31`

Results: Returns the `PerPersonal` records effective from 2020-12-31 to the system end date.

Example 2: Use `toDate` only

Request: `https://<api-server>/odata/v2/PerPersonal?toDate=2020-12-31`

Results: Returns the `PerPersonal` records effective from the system start date to 2020-12-31(included).

Example 3: Use in pairs

Request: `https://<api-server>/odata/v2/PerPersonal?fromDate=2010-12-31&toDate=2020-12-31`

Results: Returns the `PerPersonal` records effective from 2010-12-31 to 2020-12-31(included).

Example 4: Date range query with filters

Request: `https://<api-server>/odata/v2/PerPersonal?&$filter=startDate+gt+datetime'2012-10-30T00:00:00'&fromDate=01-01-1990&$select=startDate,createdOn,personIdExternal`

Results: Returns the `PerPersonal` records effective from 2012-10-30 to the system end date.

ⓘ Note

If you remove the `fromDate` parameter, fewer records are returned. This is because without any date range or `asOfDate` parameter specified, `asOfDate=Today` is applied before the filter is applied.

9.4.1.8.1.1.2 asOfDate Query

Use the `asOfDate` parameter to query records of effective-dated entities effective on a defined date.

In an `asOfDate` query, the returned records should have `asOfDate` between their effective start date and effective end date.

If no `asOfDate` parameter or date range parameter is specified, by default `asOfDate = Today` (the current date of the query) is applied to the query.

Examples

Example 1: Use `asOfDate`

Request: `https://<api-server>/odata/v2/PerPersonal?asOfDate=2020-02-16`

Results: Returns the `PerPersonal` records effective on 2020-02-16.

Example 2: No `asOfDate` or date range parameter

Request: `https://<api-server>/odata/v2/PerPersonal`

Results: Returns the `PerPersonal` records effective today.

Example 2: `asOfDate` query with filters

Request: `https://<api-server>/odata/v2/PerPersonal?&filter=standardHours+gt+'20'&asOfDate=2020-01-01`

Results: Returns the `PerPersonal` records that meet the requirements and are effective on 2020-01-01.

9.4.1.8.1.2 Effective-Dated Entities with `$expand`

Know about the behaviors when you query effective-dated entities with `$expand`.

You can use one of the following ways to query effective-dated entities with `$expand`.

- `asOfDate` query: Returns one single effective record as of the specified date. If no `asOfDate` parameter or date range parameter is specified, by default `asOfDate = Today` (the current date of the query) is applied to the query.
- `fromDate` and `toDate` query (date range query): Returns records effective between the specified date range.

For a `Picklist` field, the navigated entity is `PicklistValue`. When expanding a `Picklist` field, the `effectiveStartDate/effectiveEndDate` of the `Picklist` entity are used, because `PicklistValue` is not effective-dated.

9.4.1.8.1.2.1 Navigation from Effective-Dated Entities

Know about the behaviors when you query effective-dated entities with `$expand`.

Date Range Query

A few notes that apply:

- The date range parameters `fromDate` and `toDate` can only apply to the root entity.
- If all the navigated entities are effective dated, each navigated entity applies an query in which `asOfDate` = effective start date of its parent entity.
- If one or more navigated entities are not effective dated, each navigated entities before the first non effective-dated entity applies an query in which `asOfDate` = effective start date of its parent entity, and the other effective-dated entities apply an query in which `asOfDate` = Today (current date of the query).

Example 1: Navigation from `EmpJob` to `FODepartment` (both are effective-dated entities)

An employee whose User ID is "cgrant" has three `EmpJob` records as follows:

Record	User ID	StartDate	EndDate
3	cgrant	2020-03-08	9999-12-31
2	cgrant	2020-02-05	2020-03-07
1	cgrant	2020-01-08	2020-02-04

The user has four `FODepartment` records as follows:

Record	User ID	StartDate	EndDate
4	cgrant	2020-03-01	9999-12-31
3	cgrant	2020-01-29	2020-02-29
2	cgrant	2020-01-20	2020-01-28
1	cgrant	2020-01-02	2020-01-19

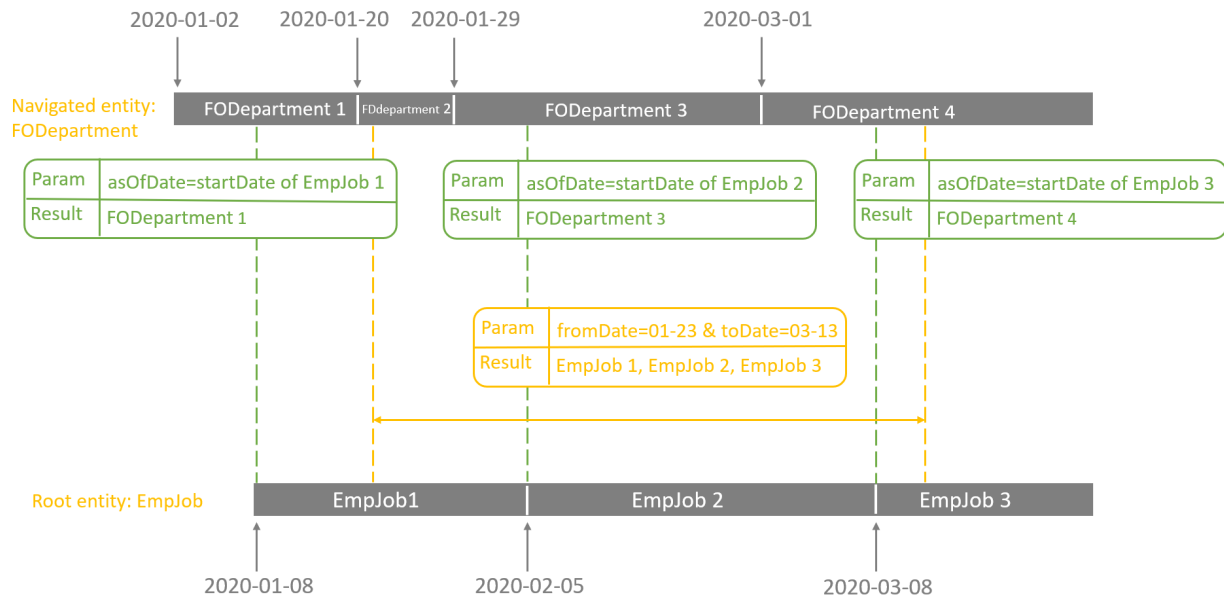

Request

```
https://<API-Server>/odata/v2/EmpJob?
fromDate=2020-03-15&toDate=2020-03-30&$expand=departmentNav
```

Result

EmpJob record 1 + FODepartment record 1, EmpJob record 2 + FODepartment record 3, EmpJob record 3 + FODepartment record 4.

The following diagram explains how these parameters work:

Example 2: Navigation from EmpJob to FODepartment and from FODepartment to FOCostCenter (all are effective-dated entities)

Request

```
https://<API-Server>/odata/v2/EmpJob?  
fromDate=2020-03-15&toDate=2020-03-30&$expand=departmentNav,departmentNav/costCenterNav
```

Result

This will return the same `EmpJob` and `FOCostCenter` records as in example 1. Each `FODepartment` record has one single `FOCostCenter` record that is effective as of the start date of the parent entity.

asOfDate Query

In a `asOfDate` query, the `asOfDate` parameter applies to all effective-dated objects in the request.

Example 3: Navigation from EmpJob to FODepartment (both are effective-dated entities)

Request

```
https://<API-Server>/odata/v2/EmpJob?asOfDate=2020-03-30&$expand=departmentNav
```

Result

EmpJob record 3 + FODepartment record 4

9.4.1.8.1.2.2 Navigation from Non-Effective-Dated Entities

Know about the behaviors when you query non-effective-dated entities with `$expand`.

Date Range Query

A few notes that apply:

- The date range parameters `fromDate` and `toDate` can only apply to the first effective-dated entity in a navigation path.
- For the entities after the first effective-dated entity in the navigation path:
 - If all the navigated entities are effective dated, then each navigated entity applies a query in which `asOfDate` = effective start date of its parent entity.
 - If not all navigated entities are effective dated, then each navigated entity before the first non-effective-dated entity applies a query in which `asOfDate` = effective start date of its parent entity, and the other effective-dated entities apply a query in which `asOfDate` = Today (current date of the query).

Example 1: Navigation from `EmpEmployment` (non-effective-dated entity) to `EmpJobRelationships` (effective-dated entity)

Request

```
https://<API-Server>/odata/v2/EmpEmployment?  
fromDate=2020-03-15&toDate=2020-03-30&$expand= empJobRelationshipNav
```

Result

This request returns the non-effective-dated `EmpEmployment` record, and the `EmpJobRelationships` records effective between 2020-03-15 and 2020-03-30.

Example 2: Navigation from `PerPerson` (non-effective-dated entity) to `EmpEmployment` (non-effective-dated entity) and then to `EmpJobRelationships` (effective-dated entity)

Request

```
https://<API-Server>/odata/v2/PerPerson?&$expand=employmentNav, employmentNav/  
empJobRelationshipNav$fromDate=2020-03-03&toDate=2020-03-27
```

Result

This request returns the non-effective-dated `PerPerson` and the non-effective-dated `EmpEmployment` records, with the `EmpJobRelationships` records effective between 2020-03-03 and 2020-03-27.

asOfDate Query

The `asOfDate` parameter applies to the effective-dated entities in the navigation path.

Example 1: Navigation from `EmpEmployment` (non-effective-dated entity) to `EmpJobRelationships` (effective-dated entity)

Request

```
https://<API-Server>/odata/v2/EmpEmployment?  
asOfDate=2020-03-15&$expand=empJobRelationshipNav
```

This request returns the non-effective-dated `EmpEmployment` record and the `EmpJobRelationships` record effective as of 2020-03-15.

9.4.1.8.1.3 Multiple Changes Per Day (MCPD) Entities

Some effective-dated entities support multiple changes per day (MCPD).

If you update an MCPD entity multiple times in one day, each update is assigned a sequence number, which provides a history of all changes made to the entity for that day. The following entities support MCPD:

- `EmpJob`
- `EmpCompensation`
- `EmpPayCompRecurring`

To see the MCPD entities in your own instance, you can check whether the entity has the business key `seqNumber`.

If you want to filter all history records for MCPD entities, make sure to enable the `seqNumber` property by setting `enabled="Yes"` in BCUI. For more information about using BCUI to modify your data model, see [Setting Up and Using Business Configuration UI \(BCUI\)](#).

Note

If `seqNumber` is disabled for MCPD entities, when you query history records, only one record is returned randomly of the day.

When you query MCPD entities:

- In date range queries, all records on the same day will be returned. Please note that there might be gaps in sequence numbers if records have been deleted.

→ Tip

If you want to retrieve only the last updated record for each day within a date range, you can use the boolean type property `effectiveLatestChange` as a filter.

- In `asOfDate` queries, only the record with the largest sequence number of the day will be returned.

Examples

The user "cgrant" has four `EmpJob` records and four `EmpCompensation` records as follows.

EmpJob Records

Record	User ID	StartDate	EndDate	SeqNumber
1	cgrant	2017-11-14	9999-12-31	1
2	cgrant	2017-11-02	2017-11-13	2
3	cgrant	2017-11-02	2017-11-02	1
4	cgrant	2005-09-01	2017-11-01	1

EmpCompensation Records

Record	User ID	StartDate	EndDate	SeqNumber
1	cgrant	2017-11-14	9999-12-31	1
2	cgrant	2017-11-02	2017-11-13	2
3	cgrant	2017-11-02	2017-11-02	1
4	cgrant	2005-09-01	2017-11-01	1

Example 1: Date range query of EmpJob

Request: `https://<api-server>/odata/v2/EmpJob?filter=userId+eq+'cgrant'&$fromDate=2017-03-15&toDate=2020-03-30`

Result: Record 1, 2, 3, and 4

Example 2: asOfDate query of EmpJob

Request: `https://<api-server>/odata/v2/EmpJob?filter=userId+eq+'cgrant'&$asOfDate=2017-11-02`

Result: Record 2

Example 3: Date range query with navigation from EmpEmpEmployment (non-effective-dated entity) to EmpJob (MCPD entity)

Request: `https://<api-server>/odata/v2/EmpEmployment?fromDate=2017-03-15&toDate=2020-03-30&$expand=jobInfoNav`

Result: One EmpEmployment record with the EmpJob records 1, 2, 3, and 4

Example 4: Date range query with navigation from EmpCompensation (MCPD entity) to EmpJob (MCPD entity)

Request: `https://<api-server>/odata/v2/EmpCompensation?filter=userId+eq+'cgrant'&$fromDate=2017-03-15&toDate=2020-03-30&$expand=jobInfoNav`

Result: The EmpCompensation record 1, 2, 3, and 4 with the the EmpJob records 1, 2, 4

Note

Both entities have multiple records on 2017-11-02. For EmpCompensation, the date range parameter are applied, so all records are returned. For EmpJob, the asOfDate parameters are applied, so only the record with the largest sequence number is returned.

[EmpPayCompRecurring \[page 688\]](#)

9.4.1.8.1.4 Last Modified Queries and Effective Dated Entities

Learn about how to query the last modified information of effective dated entities.

The fields `lastModifiedOn` and `lastModifiedDateTime` store the date and time of the last change or creation in two different formats. `lastModifiedOn` with the `DateTime` format represents the date information in UTC time, and `lastModifiedDateTime` with the `DateTimeOffset` format represents the date information with timezone offset information. For more information about the two formats, see the Related Information.

When you to create a last modified date query for an effective dated entity, you can use one of the following:

`lastModifiedDateTime` with date time offset 'YYYY-MM-DDTHH:MM:SSZ'

Or

`lastModifiedOn` with date time 'YYYY-MM-DDTHH:MM:SS'

Related Information

[Using the DateTime Format](#)

[Using the DateTimeOffset Format](#)

9.4.1.8.1.4.1 lastModifiedDateTime and \$filter

You can specify the `lastModifiedDateTime` field in a filter to query effective dated records based on the last modified date and time. The behavior and usage of `lastModifiedOn` is the same. Filters on both parameters work in the same way for all Employee Central effective dated entities.

How does it work?

When the `lastModifiedDateTime` is part of a filter, without the `fromDate` and `toDate` query options, the system handles the query using the `asOfDate eq (today's date)` option by default. That is, if any of the employee's records was updated or deleted, and the date satisfies the `lastModifiedDateTime` filter, the response contains only the current effective dated record of the employee. See Example 2 in the Examples section. For more information about using `asOfDate`, see [asOfDate Query \[page 576\]](#).

When you use the `lastModifiedDateTime` filter together with the `fromDate` or `toDate` query options, all the records that are effective in the `fromDate` or `toDate` time interval are returned. That is, if any of the employee's records was updated or deleted, and the date satisfies the `lastModifiedDateTime` filter, the response contains all the records that are effective in the time interval specified by the `fromDate` or `toDate` query options. See Example 3 in the Examples section. For more information about using `fromDate` and `toDate`, see [fromDate and toDate \(Date Range\) Query \[page 575\]](#).

Put `lastModifiedDateTime` on the left or right?

To meet various needs for individual users, the behavior of `lastModifiedDateTime` is different, depending on whether you put the `lastModifiedDateTime` parameter on the left or right. For example, two queries that contain `$filter=lastModifiedDateTime+ge+datetime'2018-03-01T00:00:00'` and `$filter=datetime'2018-03-01T00:00:00'+le+lastModifiedDateTime` return different results, even though the criteria looks the same. With `lastModifiedDateTime` in different positions, the search scope is as follows:

Position of <code>lastModifiedDateTime</code>	Search Scope	Corresponding Example
Left	Both entity records and audit logs	Example 4
<div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin: 10px 0;"> <p>Note</p> <p>Audit logs are considered in the <code>lastModifiedDateTime</code> filter query, but they won't be returned in the response.</p> </div>		
Right	Only entity records	Example 5

Examples

An employee whose User ID is "cgrant" has four `EmpJob` records:

Record	User ID	StartDate	EndDate	SeqNumber	LastModifiedDateTime
1	cgrant	2017-11-14	9999-12-31	1	2018-02-06T05:17:20
2	cgrant	2017-11-02	2017-11-13	2	2017-11-03T04:40:27
3	cgrant	2017-11-02	2017-11-02	1	2017-11-03T03:32:06

Record	User ID	StartDate	EndDate	SeqNumber	LastModifiedDate-Time
4	cgrant	2005-09-01	2017-11-01	1	2011-10-11T09:44:56

Example 1

Request: `https://<hostname>/odata/v2/EmpJob?userId+eq+'cgrant'`

Result: record 1.

The result contains only the current effective dated record, which is record 1.

Example 2

Request: `https://<hostname>/odata/v2/EmpJob?`

`$filter=lastModifiedDateTime+gt+datetimeoffset'2011-01-01T00:00:00Z'+and+userId+eq+'cgrant'`

Result: record 1.

The `asOfDate eq (today's date)` option is used by default. The result contains only the current effective dated record, which is record 1.

Example 3

Request: `https://<hostname>/odata/v2/EmpJob?`

`$filter=lastModifiedDateTime+gt+datetimeoffset'2018-01-01T00:00:00Z'+and+userId+eq+'cgrant'&fromDate=1990-01-01`

Result: record 1, record 2, record 3, record 4.

You can use `fromDate` and `toDate` to retrieve history records.

Then assume that the last record was deleted on March 2, 2018.

Example 4

After the last record was deleted on March 2, 2018, run the following query:

Request: `https://<hostname>/odata/v2/EmpJob?`

`$filter=lastModifiedDateTime+gt+datetimeoffset'2018-03-01T00:00:00Z'+and+userId+eq+'cgrant'`

Result: record 1.

Because the `lastModifiedDateTime` parameter is on the left side, the system first checks the entity records and finds that there is no record satisfying the filter. Then, the system checks the audit logs and finds that the last data change happened on March 2, 2018, which satisfies the filter. So the current effective dated record of "cgrant" is returned, which is record 1.

Example 5

Request: `https://<hostname>/odata/v2/EmpJob?`

`$filter=datetimeoffset'2018-03-01T00:00:00Z'+le+lastModifiedDateTime+and+userId+eq+'cgrant'`

Result: no record.

Because the `lastModifiedDate` parameter is on the right side, the system checks only the entity records, where no record satisfies the filter.

Note

- If an effective dated record is deleted, it cannot be found in the entity records, but it still exists in the audit logs.
- If all records of the employee were deleted, no record is returned in the response, no matter whether the `lastModifiedDate` parameter is on left or right. Because the entity is empty, no record can be returned by using the `asOfDate` option.

9.4.1.8.2 Getting your time zones right

It's crucial that you do not mix and match the different time zones otherwise you'll end up with inconsistencies so please take a minute to familiarize yourself with how we handle time zones. Different fields, for example, `<lastModifiedDate>`, `<lastModifiedDate>`, and so on represent different time zones and you need to be able to tell the difference.

What time zones do we have?

We represent the following time zones in our entities:

- UTC (Universal Time Clock)
- Server Time

Recommendation

To avoid inconsistencies, we recommend that you always use the UTC time zone.

How can I tell if a field is in the UTC or server time zone?

To know which field is in which time zone, you also need to know the oData protocol type that supports the field. We use:

- `Edm.DateTime` = server time zone
- `Edm.DateTimeOffset` = UTC

Edm.DateTime (= server time zone)

Usually, **but not always**, the following fields are of the type `Edm.DateTime` and are in the server time zone.

- `<createdDate>`
- `<createdOn>`
- `<lastModifiedDate>`
- `<lastModifiedOn>`

Note

`<createdOn>` and `<lastModifiedOn>` will represent UTC time after the server migrates to UTC.

Examples of exceptions

Here are few examples of exceptions where the fields `createdDate`, `createdOn`, or `lastModifiedDate` are not of the type `Edm.DateTime` but are of the type `Edm.DateTimeOffset`.

You must be sure to check entities on a case-by-case basis yourself. This list of exceptions is not exhaustive.

Entity	Field That is Not <code>Edm.DateTime</code> but <code>Edm.DateTimeOffset</code>
Attachment	<code>createdDate</code>
Background_*	<code>lastModifiedDate</code>

Edm.DateTimeOffset (=UTC)

Usually, **but not always**, the following fields are of the type `Edm.DateTimeOffset` and are in the UTC time zone.

- `<createdDateTime>`
- `<lastModifiedDateTime>`
- `<lastModifiedDatewithTZ>`
- `< lastModifiedWithTZ>`

Although there are currently no known exceptions to this rule, we recommend that you check the entities on a case-by-case basis yourself.

Example: PerPhone

Take a look at the snippet of code below – here you can clearly see that the different time zones are available in the entity as represented by the `<createdOn>`, `<createdDateTime>`, `< lastModifiedOn>`, and `<lastModifiedDateTime>`.

Sample Code

```
<m:properties>
  <d:personIdExternal>achin1</d:personIdExternal>
  <d:phoneType>5845</d:phoneType>
  <d:extension m:null="true" />
  <d:createdOn m:type="Edm.DateTime">2011-03-17T21:39:02</d:createdOn>
  <d:isPrimary m:type="Edm.Boolean">true</d:isPrimary>
  <d:phoneNumber>661 2000</d:phoneNumber>
  <d:createdBy>admin</d:createdBy>
  <d:lastModifiedBy>admin</d:lastModifiedBy>
  <d:createdDateTime m:type="Edm.DateTimeOffset">2011-03-18T01:39:02Z</
d:createdDateTime>
  <d:lastModifiedOn m:type="Edm.DateTime">2011-03-17T21:39:02</
d:lastModifiedOn>
  <d:lastModifiedDateTime m:type="Edm.DateTimeOffset">2011-03-18T01:39:02Z</
d:lastModifiedDateTime>
</m:properties>
```

9.4.1.9 Employee Central Entity Properties

Employee Central Entities allow you to create and manipulate employee data. Navigation in an entity represents associations between entities. Each entity can have the following properties.

- Effective dating

- Business keys
- Required/nullable attribute
- Processing parameters for upsert

You can determine the mapping relationship between the properties and HRIS fields by the property names and field identifiers. Converted from the identifiers of the corresponding HRIS fields, property names are generated by removing the underscores or hyphens in the field identifiers and capitalizing the first letters after underscores or hyphens. For example, the property **birthName** corresponds to the HRIS field **birth-name**.

9.4.1.9.1 Retrieving changes to records

If you need to retrieve changed records, then you will be wanting to use the lastmodifieddate in your query.

Business Case

You might need to retrieve changes to records when you are synchronizing systems using APIs, for example from a SF instance to a client local database.

How do I do that?

You can use a last modified query. Take a look at the example below

If you need to retrieve changes to records, then you will be wanting to use last modified query. For example if you want to sync EmpJob

Show me a use case

Operation	GET
URI	http://<Hostname>/odata/v2/EmpJob?fromDate=01-01-1900&\$filter=lastModifiedDateTime+gt+datetimeoffset'2016-02-01T12:40:03Z'

Sample Code

Extract from response to the above query focussing on the last modified information. Take note that the query is for records changed after 2016-02-01T12:40:03Z but that the request has returned last modified information that predates this.

```
<m:properties>
  <d:startDate m:type="Edm.DateTime">2015-08-01T00:00:00</d:startDate>
  <d:userId>215</d:userId>
  .....
  <d:lastModifiedDateTime m:type="Edm.DateTimeOffset">2015-08-13T14:01:06Z</
d:lastModifiedDateTime>
  .....
  <d:lastModifiedOn m:type="Edm.DateTime">2015-08-13T10:01:06</
d:lastModifiedOn>
  .....
</m:properties>
```

Why has this happened?

9.4.1.9.2 Business Keys

A business key is a set of fields that uniquely identifies a record in an entity. Each entity, at minimum, uses the following fields to make up a business key:

Entity Type	Business Key
Person Entity	person id external + effective start date
Employment Entity	user id + effective start date + sequence number
Foundation Entity	external code + effective start date

An individual entity can have additional fields that make up its business key. Fields that make up business keys are required fields and cannot be marked as nullable for all entities. A list of business keys for Employee Central objects is shown below:

Entity	Business Keys	Business key in Imports	Special Keys
PerAddress	person_id_external + effective_start_date + address_type	person_id_external + effective_start_date + address_type	
PerEmail	person_id_external + email_type	person_id_external + email_type	
PerEmergencyContacts	person_id_external + name + relationship	person_id_external + name + relationship	
PerNationalID	person_id_external + country + national_id_card_type	person_id_external + country + national_id_card_type	
PerPerson	person_id_external	user_sys_id + Person_id_external	
		Note for imports:	
		<ul style="list-style-type: none"> When user_id is given, it should be considered as the business key. When user_id is not given, it should consider Person_id_external as the business key. &&NO_OVERWRITE&& is supported for Person_id_external only when User_ID is given for existing users. 	
PerPersonal	person_id_external + effective_start_date	person_id_external + effective_start_date	First_Name + Last_Name

Entity	Business Keys	Business key in Imports	Special Keys
PerPhone	person_id_external + phone_type	person_id_external + phone_type	
PerSocialAccount	person_id_external + domain (yahoo, skype etc.)	person_id_external + domain (yahoo, skype etc.)	
PayComponentsNonRecurring	user_id + pay_component_code + pay_date	In the Incremental Load mode, if the sequence number field, <allow-import>=false: user_id + pay_date + pay_comp_code is the business key. <allow-import>=true: user_id + sequence_number (when the sequence number is included) is the business key.	
PayComponentsRecurring	user_id + effective_start_date + transaction_sequence_number + pay_component_code	user_sys_id + effective_start_date + transaction_sequence_number + pay_component_code	
PerDirectDeposit	person_id_external + deposit_type + routing_number + process_type + account_number	person_id_external + deposit_type + routing_number + process_type + account_type	
PerGlobalInfo	person_id_external + effective_start_date + country		
EmpCompensation	user_sys_id + effective_start_date + transaction_sequence_number	user_sys_id + effective_start_date + transaction_sequence_number	
EmpEmployment	person_id_external + user_sys_id	person_id_external + user_sys_id	
EmpJob	user_sys_id + effective_start_date + transaction_sequence_number	user_sys_id + effective_start_date + transaction_sequence_number	
EmpJobRelationships	user_sys_id + Relationship_type, effective_start_date	user_sys_id + relationship_type, effective_start_date	
EmpEmploymentTermination	Person_id_external + user_sys_id + effective_start_date	user_sys_id + effective_start_date	
EmpWorkPermit	users_sys_id + country + documentType + documentNumber + issueDate	users_sys_id + country + documentType + documentNumber + issueDate	
FOPayGroup	external_code + effective_start_date		

Entity	Business Keys	Business key in Imports	Special Keys
FOPayCalendar	paygroup_Code+ pay_period_begin_date+pay_period_end_date+off_cycle	paygroup_Code+ pay_period_begin_date+pay_period_end_date+off_cycle	
FOPayComponent	external_code + effective_start_date		
FOPayComponentGroup	external_code + effective_start_date		
FOFrequency	external_code		
FOCompany	external_code + effective_start_date		
FOLegalEntityLocal	external_code + effective_start_date + country		
FOBusinessUnit	external_code + effective_start_date		
FOCostCenter	external_code + effective_start_date		
FODepartment	external_code + effective_start_date		
FOJobCode	external_code + effective_start_date		
FOLocalJobClassification FO-JobClassLocal	external_code + effective_start_date + country		
FOJobFunction	external_code + effective_start_date		
FOPayRange	external_code + effective_start_date		
FOGeozone	external_code + effective_start_date		
FOLocationGroup	external_code + effective_start_date		
FOReason FOEventReason	external_code + effective_start_date		
FOPayGrade	external_code + effective_start_date		
FODivision	external_code + effective_start_date		
FOWorkflowStepConfig	external_code + step_number (this may change in 1207)		
FOWfConfig	external_code		
FODynamicRole	external_code		
FOLocation	external_code + effective_start_date		

ⓘ Note

It is important that the business keys be unique. It is recommended that business keys in data models be defined as `required=true`. In case, duplicate records are found, only one record will be returned and others ignored.

9.4.1.9.3 Property Attribute Configuration

For Employee Central entities, some property attributes can be configured by data model, but other property attributes are set by default and cannot be configured.

ⓘ Note

Please note these rules apply to most cases but not to all. You might be able to configure the same property attributes for some fields but not for other fields.

Entity-Level Configurable Property Attributes

- Label

Field-Level Configurable Property Attributes

- Label
- Required (This attribute is always set to "true" for business keys, which is different from the Employee Central SFAPI behavior.)
- Visible
- Upsertable
- Max length
- Picklist

Other Property Attributes

- Nullable (By default this attribute is set to "false" for business keys, and set to "true" for the other fields.)

9.4.1.9.4 Processing Parameters for Upsert

The Employee Central Upsert API supports the `purgeType` parameter to update a record incrementally or by full purge. If no parameters are provided, the system checks whether the entity being updated supports incremental update. If it does, an incremental update is performed. Else, the system performs a full purge on the record.

For more information, see [purgeType](#).

9.4.1.9.5 suppressUpdateOfIdenticalData

Note

The suppression is enabled by default and there is no option on the UI to disable it. In the 1H 2024 release, `suppressUpdateOfIdenticalData=false` is not supported. If you do not want the suppression, please contact Product Support.

Many a times, during replication, the source system does not have information about changes to a field or entity level. As a result, more than necessary data is transferred; in some cases, a full replication is triggered from the third-party system into Employee Central. This results in an update of records in Employee Central even if those records are not changed. If other integration transferring data out of Employee Central are based on the audit information in Employee Central they will always get data even if there was no change.

OData supports a mode called `suppressUpdateOfIdenticalData` which can be enabled to ensure that records are updated only if needed. This means that data will not be updated by imports/OData API calls if there is no change i.e. if the payload and the data in the system is the same. In such a case, there is no update to `last_modified` dates, no creation of audit information and no change to entity data.

It is available in full purge and incremental mode for the following entities:

- EmpBeneficiary
- EmpCompensation
- EmpEmployment
- EmpEmploymentTermination
- EmpGlobalAssignment
- EmpJob
- EmpJobRelationships
- EmpPensionPayout
- EmpWfRequest
- EmpWorkPermit
- EmpPayCompNonRecurring
- EmpPayCompRecurring
- PerAddressDEFLT
- PerBiographicalInfoLoc<Country/Region>
- PerEmail
- PersonEmpTerminationInfo

- PerEmergencyContacts
- PerGlobalInfo<Country/Region>
- PerNationalId
- PerPerson
- PerPersonal
- PerPersonRelationship
- PerPhone
- PerSocialAccount

A typical request with the `suppressUpdateOfIdenticalData` parameter would look like this:

```
http://<hostname>/odata/v2/upsert?purgeType=full&suppressUpdateOfIdenticalData=true
```

9.4.1.9.6 fileLocale

What is it?

A new url parameter, `fileLocale`, is now available for upserts. `en_US` is currently supported so in other words, like the UI and the import engine, OData APIs now support the internationalization of floating decimal points.

What's the benefit?

You'll be able to avoid roundtrip inconsistencies that arise when your API user locale is not `en_US`. Up to now, you could only address this problem by changing the user locale which in many cases is impractical.

How does it work?

When you're replicating data from 3rd party systems, the Employee Central system by default will always read data as if the locale is `en_US`. This is not problematic if the API user locale is also `en_US` and the upserted data uses US decimal notation.

If however, your API user locale is not `en_US` and is for example `de_DE`, you'd end up with roundtrip inconsistencies. This is because when an application reads data in a productive system using an OData API query and subsequently copies it into another system using an upsert statement, the number fields are rendered in the locale of the API user and in the case of user locale = `de_DE`, you'll end up with inconsistencies because `en_US` and `de_DE` use a different decimal notation.. `fileLocale=en_US` will solve this problem.

Good to know

If you API users locale is en_US, you will not need to use fileLocale=en_US.

How can I use it?

Add fileLocale=en_US to your upsert queries when your user locale is not en_US.

Show me a use case

Your API user locale is de_DE. So, when upserting, make sure to use the following:

Query: `https://<hostname>.com/odata/v2/upsert?fileLocale=en_US`

Payload:

Sample Code

```
{
  "__metadata": { "uri":"EmpEmployment" },
  "personIdExternal": "aaaa",
  "userId": "aaaa", "InitialOptionGrant": "224.8",
  "InitialStockGrant": "31,000"
}
```

9.4.1.10 Pagination

You can avoid lost or duplicated records by using cursor-based and snapshot-based pagination in some of the Employee Central entities.

Note

For more information about pagination options of OData API, see [Pagination](#).

Cursor-Based Pagination

You can use this feature for the following Employee Central entities:

EmpJob

EmpEmployment

EmpCompensation

EmpPayCompRecurring

EmpPayCompNonRecurring

FOLocation

Order of the records

\$orderby is no longer supported for these entities. Instead **paging=cursor** ensures that the primary key field is used to order records. This primary key is unique and ensures that records are not lost or duplicated during the call. The criteria for this primary key are as follows:

- It is unique and non-nullable
- It maps to a single column of the database table
- It is of the type integer, short, long, BigDecimal, or String

The following table shows what the primary key is for the entity along with the additional information of the table name and its type.

Entity Name	Table name	Primary key	Name/type
EmpJob	EMP_JOB_INFO_T	JOB_INFO_ID	internalId / Long
EmpEmployment	EMP_EMPLOYMENT_INFO	EMPLOYMENT_ID	internalId / Long
EmpCompensation	EMP_COMP_INFO_T	COMP_INFO_ID	internalId / Long
EmpPayCompRecurring	EMP_PAYCOMP_RECURRING_T	EMP_PAYCOMP_RECUR_ID	internalId / Long
EmpPayCompNonRecurring	EMP_PAYCOMP_NON_RECURRING	PAY_COMP_NON_RC_ID	InternalId / Long
FOLocation	FO_LOCATION_T	OBJECT_ID	objectId / Long

Snapshot-Based Pagination

Snapshot-based pagination is supported by all Employee Central entities. Entity types with multiple business keys might be slower if they are not optimized for snapshot-based pagination.

As of 1H 2020 Release, the following Employee Central entities have been optimized for snapshot-based pagination:

- PerPersonal
- EmpJob
- EmpEmployment
- FOLocation
- FOPayGrade
- MDF Foundation Objects

Use Cases

Below are examples of using snapshot-based and cursor-based pagination.

Query EmpJob with Snapshot-based Pagination

Request:

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/EmpJob?\$format=json&customPageSize=3&\$select=userId &paging=snapshot</code>

Response:

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/EmpJob(seqNumber=1L,startDate=datetime'2007-07-01T00%3A00%3A00',userId='dselig1')"
        },
        "userId": "dselig1"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/EmpJob(seqNumber=1L,startDate=datetime'2002-03-01T00%3A00%3A00',userId='sproctor1')"
        },
        "userId": "sproctor1"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/EmpJob(seqNumber=1L,startDate=datetime'2002-10-01T00%3A00%3A00',userId='tbotts1')"
        },
        "userId": "tbotts1"
      }
    ],
    "__next": "https://<API-Server>/odata/v2/EmpJob?customPageSize=3&$skiptoken=eyJzdGFydFJvdYI6MywiZW5kUm93Ijo2LCJwYWdpbmciOiJzbnFwc2hvdCI6InBhZ2VtaXplIjozLCJzbnFwc2hvdE5hbWUiOiJzbnFwc2hvdF8wYWVlMTAzZ18xNTRiXzQwNTVfOTM5MF84N2VlNTk2ZDkxZmZfcHM0YnNmYXBpNTN0XzZM4NCJ9&paging=snapshot&$format=json&$select=userId"
  }
}
```

Query FOLocation with Cursor-based Pagination

Request:

Operation	Query
HTTP Method	GET

URI `https://<API-Server>/odata/v2/FOLocation?
$format=json&customPageSize=3&$select=externalCode &paging=cursor`

Response:

```
{
  "d": {
    "results": [
      {
        "__metadata": {

}
```

9.4.1.11 Use `&&NO_OVERWRITE&&` When Upserting Entities

When you import employee data, you can perform a partial import, which is updating specific fields without overwriting the values of the other fields. In this case, you enter `&&NO_OVERWRITE&&` in the fields whose value you don't intend to modify.

Example: Upsert PerPersonal Without Overwriting the Values of the preferredName Field

Request

Operation	Upsert
HTTP Method	POST

URI

https://<API-Server>/odata/v2/upsert

Payload

```
{
  "__metadata": {
    "uri": "https://
<API-Server>/odata/v2/
PerPersonal(personIdExternal='109031',st
artDate=datetime'2019-10-22T00:00:00')",
    "type":
    "SFOData.PerPersonal"
  },
  "personIdExternal":
  "109031",
  "startDate": "/
Date(1571702400000)/",
  "&&NO_OVERWRITE&&"
}
```

Response

```
{
  "d": [
    {
      "key": "PerPersonal/personIdExternal=109031,PerPersonal/
startDate=2019-10-22T00:00:00.000-04:00",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Note

You can use `&&NO_OVERWRITE&&` only in string-type fields.

You can check whether an entity supports the use of `&&NO_OVERWRITE&&` in the [HRIS Element Information](#) section of the entity-level topic. Or you can find object information that cannot be uploaded using partial import on [Which object information cannot be uploaded using the Partial Import \(&&NO_OVERWRITE&&\)?](#).

9.4.2 Advances

Related Information

9.4.2.1 AdvancesAccumulation

This entity records the accumulation of the requested advance and remaining eligibility for the user. It is not an effective dated entity in the Advances module. This entity is created when an advance is approved by the supervisor.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Use Case: Get details of the accumulation of the requested advance and remaining eligibility for the user

9.4.4 Contingent Workforce

9.4.4.1 VendorInfo

You can use this entity to perform different operations on the vendor information of your contingent workforce.

Supported Operations

Query, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Get Vendor Information

A query operation on the `VendorInfo` entity returns all the information related to a given vendor.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/VendorInfo?\$format=json&\$top=1

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/VendorInfo(effectiveStartDate=datetime'2019-08-19T00:00:00',vendorCode='reee')",
          "type": "SFOData.VendorInfo"
        },
        "effectiveStartDate": "/Date(1566172800000)/",

Use Case 2: Creating or Updating Vendor Information

The following example shows how you can create a vendor information record or update an existing one using the `VendorInfo` entity.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/odata/v2/upsert</code>

Payload

```
{ "__metadata": {
  "uri": "https://
<API Server>/odata/v2/
VendorInfo(effectiveStartDate=datetime'2
019-08-19T00:00:00',vendorCode='reee')",
  "type":
  "SFOData.VendorInfo"
},
  "effectiveStartDate": "/
Date(1566172800000)/",
  "vendorCode": "reee",
  "vendorName": null,
  "effectiveStatus": "A"
}
```

Response

```
{
  "feed": {
    "entry": {
      "content": {
        "properties": {
          "key": {
            "_m:null": "true",

9.4.4.2 WorkOrder

You can use this entity to perform various operations pertinent to work orders of contingent workforce in your company.

Permissions

Permission System	Required Setting	Note
Role-based	Work Order	For information about setting up permissions, see Setting Permissions for Work Orders .

Supported Operations

Operation	Description
Query	Query a work order.
Insert	Create a work order.
Merge	Update a work order by merging property values.
Replace	Update a work order by replacing property values.
Upsert	Create new or update existing work orders.
Delete	Delete a work order.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query a Single Work Order

A query operation on the `workOrder` entity returns all the information related to a given work order.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/WorkOrder?\$format=json&\$top=1</code>

Response

Sample Code

```
{
  "d": {
    "results": [

        }
    }
}

```

Use Case 2: Creating or Updating a Work Order in Incremental Mode

The following example shows how you can create or update a work order in incremental mode. When you update work order information in incremental mode, only the information included in your payload will be updated in the system. All other work order information remains unchanged.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert?purgeType=incremental</code>
Headers	Content-Type: application/json

Payload

Sample Code

```
{
  "__metadata": {
    "uri": "WorkOrder(effectiveStartDate=datetime'2019-10-09T00:00:00',userSysId='cwkDemoKing')",
    "type": "SFOData.WorkOrder"
  },
  "effectiveStartDate": "\/Date(1569974400000)\/",
  "userSysId": "cwkDemoKing",
  "startDate": "\/Date(1569974400000)\/",
  "endDate": "\/Date(1577817000000)\/",
  "effectiveStatus": "A",
  "workOrderOwnerId": "GUNDALARAKES",
  "workOrderId": "WO_DemoKing_2",
  "vendor": "VEN02TEST",
  "workOrderName": "WO_DemoKing_2"
}
```

Response

Sample Code

```
<?xml version="1.0" encoding="utf-8"?>
<feed xmlns="http://www.w3.org/2005/Atom" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">
  <entry>
```

```

    <content type="application/xml">
      <m:properties>
        <d:key>WorkOrder/
effectiveStartDate=2019-10-02T00:00:00.000Z,WorkOrder/userSysId=cwkDemoKing</
d:key>
          <d:status>OK</d:status>
          <d:editStatus>UPsertED</d:editStatus>
          <d:message m:null="true"></d:message>
          <d:index m:type="Edm.Int32">0</d:index>
          <d:httpCode m:type="Edm.Int32">200</d:httpCode>
          <d:inlineResults m:type="Bag(SFOData.UpsertResult)"></
d:inlineResults>
        </m:properties>
      </content>
    </entry>
  </feed>

```

Use Case 3: Creating or Updating a Work Order in Full Purge Mode

The following example shows how you can create or update a work order in full purge mode. When you update work order information in full purge mode, all the existing work order information will be overwritten with the information included in your payload. Existing person related entities, if any, remain unchanged whereas, Job Information and Job Relationship information will be purged completely and must be imported again.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert?purgeType=full
Headers	Content-Type: application/json

Payload

Sample Code

```
{
  "__metadata": {
    "uri": "WorkOrder(effectiveStartDate=datetime'2019-10-09T00:00:00',userSysId='cwkDemoKing')",
    "type": "SFOData.WorkOrder"
  },
  "effectiveStartDate": "\/Date(1569974400000)\/",
  "userSysId": "cwkDemoKing",
  "startDate": "\/Date(1569974400000)\/",
  "endDate": "\/Date(1577817000000)\/",
  "effectiveStatus": "A",
  "workOrderOwnerId": "GUNDALARAKES",
  "workOrderId": "WO_DemoKing_2",
  "vendor": "VEN02TEST",
  "workOrderName": "WO_DemoKing_2"
}
```

Response

Sample Code

```
<?xml version="1.0" encoding="utf-8"?>
<feed xmlns="http://www.w3.org/2005/Atom" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">
  <entry>
    <content type="application/xml">
      <m:properties>

9.4.5.2 OneTimeDeduction

You can use this entity to obtain non-recurring (one-time) deductions for employees.

Permissions

Permission System	Required Setting
Role-based	▶ User Permissions > ▶ Miscellaneous Permissions > ▶ OneTimeDeduction >

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) > [▶ API Center](#) > [▶ OData API Data Dictionary](#) > or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Supported Operations

Operation	Description
Query	Query non-recurring deductions for employees.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) > [▶ API Center](#) > [▶ OData API Data Dictionary](#) > or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
<code>mdfSystemRecordStatusNav</code>	MDFEnumValue	Navigates to the ENUM data type values maintained by the MDF team for that entity.
<code>createdByNav</code>	User	Navigates to the User entity.
<code>lastModifiedByNav</code>	User	Navigates to the User entity.

Navigation Property	Related Entity	Description
userSysIdNav	User	Navigates to the User entity.
wfRequestNav	wfRequestNav	Navigates to the related MDF object WfRequest.
payComponentTypeNav	FOPayComponent	Navigates to the related MDF object FO-PayComponent.
advanceIdNav	NonRecurringPayment	Navigates to the related MDF object Non-RecurringPayment.
currencyNav	Currency	Navigates to the related MDF object Currency.
attachmentNav	Attachment	Navigates to the related MDF object Attachment.
auditUserSysIdNav	User	Navigates to the User entity.

Use Case 1: Querying a One-Time Deduction for an Employee

This example shows how you can query non-recurring expenses for an employee.

Request

Operation	Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
personIdExternal	This property is a unique identifier for employees. You can use this property to update or add the compensation information of an employee with only one active employment.
seqNumber	This string is automatically generated to specify the sequence of the record.
effectiveLatestChange	This boolean type property indicates whether a record is the latest effective one for a day. You can use this property as a filter to retrieve only the last updated record for each day in date range queries.
operation	To delete a record, use the upsert operation and set this property to DELETE.

Anything else I need to know about the fields?

When you make a last modified query, take a look at how this entity behaves with \$filter and lastModifiedOn: [lastModifiedDateTime and \\$filter \[page 582\]](#)

      }
    },
    "payTypeNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/public/
EmpCompensation(seqNumber=1L,startDate=datetime'2011-08-15T00:00:00',userId='rallen1
')/payTypeNav"
      }
    },
    "eventReasonNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/public/
EmpCompensation(seqNumber=1L,startDate=datetime'2011-08-15T00:00:00',userId='rallen1
')/eventReasonNav"
      }
    },
    "payGroupNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/public/
EmpCompensation(seqNumber=1L,startDate=datetime'2011-08-15T00:00:00',userId='rallen1
')/payGroupNav"
      }
    },
    "userNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/public/
EmpCompensation(seqNumber=1L,startDate=datetime'2011-08-15T00:00:00',userId='rallen1
')/userNav"
      }
    }
  }
}

```

```
}
  }
]
}
```

Use Case 2: Upsert the Compensation Information of an Employee

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "EmpCompensation(seqNumber=1L,startDate= datetime'2018-12-28T00:00:00',userId='us erIdVWas101')" }, "eventReason": "HIRNEW", "payrollId" : "777", "payrollSystemId": "USDDD" }</pre>

Response

```
{
  "d": [
    {
      "key": "EmpCompensation/seqNumber=1,EmpCompensation/
startDate=datetime'2018-12-28T00:00:00.000Z,EmpCompensation/userId=userIdVWas101",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 3: Delete an Employee Record

This example shows how to delete an employee's record. With the `Upsert` operation, the value `DELETE` can be passed to the `operation` field to delete the record.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "EmpCompensation(seqNumber=1L,startDate= datetime'2017-01-01T00:00:00',userId='80 300')" }, "operation": "DELETE", "eventReason": "DATACHG" }</pre>

Note
Remember to include the required property *eventReason* in the payload.

Request

```
{
  "d": [
    {
      "key": "EmpCompensation/seqNumber=1,EmpCompensation/
startDate=2017-01-01T00:00:00.000Z,EmpCompensation/userId=80300",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Then, you query the employee's record, and you will get the following response:

```
{
  "error": {
    "code": "NotFoundException",
    "message": {
      "lang": "en-US",
      "value": "EmpCompensation with key
(seqNumber=1L,startDate=datetime'2017-01-01T00:00:00',userId='80300') not found!"
    }
  }
}
```

Use Case 4: Upsert the Compensation Information of an Employee with Multiple User Ids

In case of an employee with multiple user IDs, you can import the compensation information by using the `personIdExternal` property.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "https://<api-server>/odata/v2/EmpCompensation" }, "userId": "&&USE_PERSON_ID_EXTERNAL&&", "startDate": "/" Date(1575936000000)/", "personIdExternal": "107030", "payGrade": "GR-12", "payGroup": "D2" }</pre>

Response

```
{
  "d": [
    {
      "key": "EmpCompensation/
startDate=2019-12-10T00:00:00.000Z,EmpCompensation/
userId=&&USE_PERSON_ID_EXTERNAL&&",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 5: Get the Latest Effective Compensation Information for Each Day Within a Date Range

`EmpCompensation` supports multiple changes per day (MCPD). In case an employee's compensation information is changed several times on a day, you can get the last updated one by using the boolean type property `effectiveLatestChange`.

For example, the user "cgrant" has four `EmpCompensation` records as follows. Record 2 and record 3 have the same start date, and the last updated record on that day is record 2, the one with the larger sequence number.

EmpCompensation Records

Record	User ID	StartDate	EndDate	SeqNumber
1	cgrant	2022-12-27	2023-01-02	1
2	cgrant	2022-11-11	2022-11-17	2
3	cgrant	2022-11-11	2022-11-11	1
4	cgrant	2022-10-27	2022-11-02	1

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ EmpCompensation?\$filter=userId eq 'cgrant'&\$fromDate=2022-11-01&toDate=2022- 12-31&\$filter=effectiveLatestChange eq true</code>

Response

Record 1, 2, and 4 are returned.

Note

If you don't use `effectiveLatestChange` as a filter in date range queries, all records within the date range are returned.

[Multiple Changes Per Day \(MCPD\) Entities \[page 580\]](#)

9.4.6.2.1 EmpCompensationCalculated

This entity exposes a transient value that you see in the Compensation Information section.

Supported Operations

Query: This entity can only be queried by expanding the `empCompensationCalculatedNav` navigation property of the `EmpCompensation` entity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query the Calculated Compensation Information by User ID

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/EmpCompensation?\$filter=userId eq 'TestUser'&\$expand=empCompensationCalculatedNav</code>

Response

Sample Code

Response

```
{

as1')/userNav"
      }
    }
  }
]
}

```

Additional Information

This transient value is calculated by:

- GetCompaRatioByUserDateAndSeq - This calculates the Compa-Ratio field that you see in the Compensation Information portlet.
- GetRangePenetrationByUserDateAndSeq - This calculates the Range Penetration field that you see on the Compensation Information portlet.
Neither Compa-Ratio nor Range Penetration is stored on the database so both fields are treated as transient fields. If you want to expose their values, you need to use empCompensationCalculated.

This API is designed for UI consumption and is not suitable for mass data replication.

Related Information

[SAP Business Accelerator Hub: EmpCompensationCalculated](#)
[Permission Settings \[page 554\]](#)

9.4.6.2.2 EmpCompensationGroupSumCalculated

This entity exposes a transient value that is calculated from the pay component group sums that are in the compensation information record. It is calculated by `GetEligiblePayComponentGroupsByUserDateAndSeq` and is for use in UI scenarios and is not suitable for mass data replication.

Supported Operations

Query

Note

Transient values are not stored to the database so you can't query them directly. Instead you have to treat `EmpCompensationGroupSumCalculated` as a child entity of `EmpCompensation`. In addition to `$expand`, you can also use the operators `$select` and `$format` with the GET operation. Note that `$filter`, `$orderby`, `$skip`, and `$top` are not supported.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
<code>amount</code>	The value calculated by <code>GetEligiblePayComponentGroupsByUserDateAndSeq</code>
<code>CurrencyCode</code>	Defines the currency being used
<code>errorCode</code>	Error Code "Success" indicates that the call has been successful and calculation results are returned.
<code>errorMessage</code>	Error Code "ErrorMximumRecord" indicates that the number of records called exceeds the maximum of 50 and the calls failed.

Use Case: Query the Calculated Group Sum of a User's Compensation Information

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ EmpCompensation(startDate=datetime'1997-01-01T00:00:00',userId='107030')? \$format=JSON&\$expand=empCompensationGroupSumCalculatedNav

Supported Operations

Operation	Description
Query	To query the employment information of a user
Upsert	To create or update employment information of a user

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
personIdExternal	Business key.
userId	Business key.
employmentId	An identifier of an employment record.
assignmentClass	<p>The assignment class can take one of these values:</p> <ul style="list-style-type: none">• ST: Standard• GA: Global Assignment• PP: Pension Payout• BN: Beneficiary <p>assignmentClass isn't upsertable. The value of this field will be propagated depending on the type of employment created. For example, when you create a new employment record using <code>EmpEmployment</code>, the assignmentClass value is <code>ST</code>. When you create a global assignment using <code>EmpGlobalAssignment</code>, an <code>EmpEmployment</code> record will also be created with assignmentClass <code>GA</code>.</p>

Property	Description
assignmentIdExternal	<p>This property specifies an Assignment ID that is used to identify users across SAP SuccessFactors HCM suite. The <code>assignmentIdExternal</code> field is always included in the response whether or not it is configured in Succession Data Model.</p> <p>When you create a new employment record, either leave this field empty or maintain the same value as <code>userId</code>. Otherwise, an error occurs.</p> <p>You can change Assignment ID only through the convertAssignmentIdExternal function import, instead of upserting the <code>EmpEmployment</code> entity.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>⚠ Caution</p> <p>Before you change assignment IDs, we recommend that you evaluate the risks associated with the inconsistencies. If assignment ID is not supported in the SAP SuccessFactors areas you've enabled, please don't make any changes to assignment ID at this time.</p> </div> <p>For more information, see Assignment ID.</p>
hiringNotCompleted	<p>This field indicates whether the employment record belongs to an employee or a candidate created in Onboarding. Possible values are:</p> <ul style="list-style-type: none"> true: The user hasn't completed the onboarding process. The employment record belongs to a candidate created in Onboarding. false: The user has completed the onboarding process. The employment record belongs to an employee. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>📌 Note</p> <p>This field is always "false" for the employment records created via Add New Employee. You cannot access these employment records saved in the draft status via APIs.</p> </div>
custom-string1, custom-string2, custom-string3	<p>These three custom string fields are filterable, so you can query <code>EmpEmployment</code> with filters on these fields rather than fetch all the records. In some cases they are used to store external system IDs.</p>
seniorityDate	<p>This filterable field specifies from which seniority starts.</p>
originalStartDate	<p>If an employee has been working for the company before, this filterable field specifies the start date of the first employment.</p>
benefitsEligibilityStartDate	<p>This filterable field specifies from which benefits eligibility starts.</p>

Property	Description
costAssignmentNav	You can use this property to navigate to EmpCostAssignment.
costDistributionNav	You can use this property to navigate to EmpCostDistribution.
onboardingInfoNav	You can use this property to navigate to OnboardingInfo.

Use Case 2: Retrieve the Employment Records of All Candidates Created in Onboarding

This query retrieves employment records for the candidates created in Onboarding:

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ EmpEmployment? \$format=JSON&\$filter=hiringNotCompleted eq 'true'&\$select=personIdExternal,userId,hir ingNotCompleted

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
EmpEmployment(personIdExternal='214',userId='214')",
          "type": "SFOData.EmpEmployment"
        },
        "personIdExternal": "214",
        "userId": "214",
        "hiringNotCompleted": true
      }
    ]
  }
}

```

```

    },
    {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/
EmpEmployment(personIdExternal='215',userId='215')",
        "type": "SFOData.EmpEmployment"
      },
      "personIdExternal": "215",
      "userId": "215",
      "hiringNotCompleted": true
    },
    {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/
EmpEmployment(personIdExternal='216',userId='216')",
        "type": "SFOData.EmpEmployment"
      },
      "personIdExternal": "216",
      "userId": "216",
      "hiringNotCompleted": true
    },
    {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/
EmpEmployment(personIdExternal='217',userId='217')",
        "type": "SFOData.EmpEmployment"
      },
      "personIdExternal": "217",
      "userId": "217",
      "hiringNotCompleted": true
    },
    {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/

        "type": "SFOData.EmpEmployment"
      },
      "personIdExternal": "229",
      "userId": "229",
      "hiringNotCompleted": true
    }
  ]
}

```

Use Case 3: Update External User Record with Employment-Related Information

Request

Request:

Operation	Upsert
HTTP Method	POST
URI	http://<API-Server>/odata/v2/upsert

Payload

```
{
  "__metadata": {
    "uri":
      "EmpEmployment(personIdExternal='userIdV
      Vas101',userId='userIdVWas101')"
  },
  "startDate": "/"
  Date(1388534400000)/",
  "personIdExternal": "userIdVWas101",
  "userId": "userIdVWas101"
}
```

Response

```
{
  "d": [
    {
      "key": "EmpEmployment/personIdExternal=userIdVWas101,EmpEmployment/
      userId=userIdVWas101",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

9.4.6.4 EmpEmploymentTermination

This entity contains employment or global assignment termination information for an employee.

HRIS Element Information

```
HRIS Element ID: employmentInfo
Business Keys: personIdExternal + userId + endDate
Effective-date:false
Foundation Type:false
Person Entity Element:false
Supports Incremental Load:true
```

```
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	To query the termination information of an employment record.
Upsert	To terminate the employment of an employee or to change the termination information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
endDate	Termination date. This is a business key.
personIdExternal	Person ID External. This is a business key.
userId	User ID. This is a business key.
eventReason	Reason for the employment termination. Event reasons are defined by the <code>FOEventReason</code> entity. For more information, see the related API documentation.

Note

This is a required field when you upsert a record. It's not viewable in query results.

Use Case 1: Get All Employees Terminated in 2014

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/EmpEmploymentTermination?\$filter=endDate lt datetime'2014-12-31T00:00:00' and endDate gt datetime'2014-01-01T00:00:00'&\$format=JSON</code>

Response

```
{
  "d": {

eller1',userId='186')/employmentNav"
                }
            }
        }
    ]
}

```

Use Case 2: Terminate Employment

You can terminate an employee by creating an `EmpEmploymentTermination` record using the upsert operation.

Note

When you create a new termination record, an `EmpJob` record is also created automatically. The new job record starts one day after the end date you specify in the termination payload.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "EmpEmploymentTermination" }, "personIdExternal": "1234567", "userId": "1234567", "endDate": "/Date(1558556800000)/", "eventReason": "TERRTMNT" }</pre>

Use Case 3: Reporting No-Shows

For termination scenarios, the end date can be any date on and after the hire date, whereas for no-shows, it should be always the same as hire date. We also include the event reason for these cases.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload

Sample Code

```
{
  "__metadata": {
    "uri": "EmpEmploymentTermination"
  },
  "personIdExternal": "1234567",
  "userId": "1234567",
  "endDate": "/Date(1558556800000)/",
  "eventReason": "NO_SHOW_EVENT_REASON"
}
```

[Terminating an Employee](#)

[Reporting No-Show New Hires](#)

9.4.6.5 EmpGlobalAssignment

This entity contains details about the global assignment for an employee. You can create a new global assignment by upserting this entity.

HRIS Element Information

```
HRIS Element ID: globalAssignmentInfo
Business Keys: userId
Effective-date:false
Foundation Type:false
Person Entity Element:false
Supports Incremental Load:true
Supports NO_OVERWRITE: No
Supports MCPD: false
```

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>userId</code>	Business key.
<code>assignmentClass</code>	Same field as in <code>EmpEmployment</code> except that the value for a global assignment is always GA (Global Assignment). This field is not upsertable.
<code>assignmentType</code>	Assignment type.
<code>assignmentIdExternal</code>	Assignment ID of the user. An assignment ID can be used to identify a user record in the company. When you create a new global assignment, either leave this field empty or maintain the same value as <code><userId></code> . Otherwise an error will occur. You're not allowed to change the value of this field by upserting <code>EmpGlobalAssignment</code> .

Caution

Before you change assignment IDs, we recommend that you evaluate the risks associated with the inconsistencies. If assignment ID is not supported in the SAP SuccessFactors areas you've enabled, please don't make any changes to assignment ID at this time.

For more information, see [Assignment ID](#).

Use Case 1: Query Global Assignment Information by `userId`

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>.com/odata/v2/EmpGlobalAssignment?\$filter=userId eq '183' &\$format=JSON</code>

Response

```
{
```

```

"d": {
  "results": [
    {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/
EmpGlobalAssignment('183')",
        "type": "SFOData.EmpGlobalAssignment"
      },
      "userId": "183",
      "startDate": "/Date(1417392000000)/",
      "payrollEndDate": null,
      "endDate": null,
      "lastModifiedDate": "/Date(1415696549000+0000)/",
      "lastModifiedOn": "/Date(1415678549000)/",
      "createdOn": "/Date(1415678549000)/",
      "assignmentClass": "GA",
      "personIdExternal": "ttest",
      "createdBy": "admin",
      "assignmentType": "6131",
      "plannedEndDate": "/Date(1446336000000)/",
      "createdDateTime": "/Date(1415696549000+0000)/",
      "lastModifiedBy": "admin",
      "customString1": null,
      "customString110": null,
      "userNav": {
        "__deferred": {
          "uri": "https://<API-Server>/odata/v2/
EmpGlobalAssignment('183')/userNav"
        }
      },
      "assignmentTypeNav": {
        "__deferred": {
          "uri": "https://<API-Server>/odata/v2/
EmpGlobalAssignment('183')/assignmentTypeNav"
        }
      },
      "employmentNav": {
        "__deferred": {
          "uri": "https://<API-Server>/odata/v2/
EmpGlobalAssignment('183')/employmentNav"
        }
      }
    }
  ]
}

```

Use Case 2: Create a New Global Assignment with Upsert

📌 Note

When you upsert this entity, a new global assignment is created, meaning that there is a new record in EmpGlobalAssignment and a new entry in the User entity for this employee. Since EmpGlobalAssignment and EmpEmployment share the same persistency, each global assignment appears as an Employment in EmpEmployment with the type global assignment.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "EmpGlobalAssignment" }, "assignmentType": "10322", "startDate": "/Date(1565172522000)/", "plannedEndDate": "/ Date(1566172522000)/", "personIdExternal": "cgrant", "userId": "cgrant-0717" }</pre>

Response

<pre>{ "d": [{ "key": "EmpGlobalAssignment/userId=cgrant-0717", "status": "OK", "editStatus": "UPSERTED", "message": null, "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>
--

9.4.6.6 EmpJob

This entity contains information such as the employee's manager, the department, or other information relating to the employee's job.

HRIS Element Information

HRIS Element ID: jobInfo

```
Business Keys: userId + startDate + seqNumber
Effective-date: true
Foundation Type: false
Person Entity Element: false
Supports Incremental Load: yes
Supports NO_OVERWRITE: yes
Supports MCPD: true
```

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
personIdExternal	This property is a unique identifier for employees. You can use this property to update or add the job information of an employee with only one active employment.
seqNumber	This string is automatically generated to specify the sequence of the record.
effectiveLatestChange	This boolean type property indicates whether a record is the latest effective one for a day. You can use this property as a filter to retrieve only the last updated record for each day in date range queries.
operation	To delete a record, use the upsert operation and set this property to DELETE.

Anything else I need to know about the fields?

When you make a last modified query, take a look at how this entity behaves with \$filter and lastModifiedOn: [lastModifiedDate and \\$filter \[page 582\]](#)

Use Case 1: Query Job Information by Company and Manager

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/EmpJob?\$filter=company eq 'ACE_USA' and managerId eq 'cgrant1'&\$select=employmentNav/personNav/personInfoNav/firstName,employmentNav/personNav/personInfoNav/lastName,company&\$format=JSON</code>

Response

        "employmentNav": {
          "__deferred": {
            "uri": "https://<api-server>/odata/v2/public/EmpJob(seqNumber=1L,startDate=datetime'2010-12-01T00:00:00',userId='rallen1')/employmentNav"
          }
        }
      }
    ]
  }
}
```

Use Case 2: Update Job Related Information

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert</code>

Payload

```
{
  "__metadata": {
    "uri":
      "EmpJob(seqNumber=1L,startDate=datetime'
      2018-12-28T00:00:00',userId='userIdVvas1
      01')",
    "type": "SFOData.EmpJob"
  },
  "userId": "userIdVvas101",
  "seqNumber": "1",
  "eventReason": "HIRNEW",
  "company": "ACE IT",
  "managerId": "snadmin",
  "timezone": "IST"
}
```

Response

```
{
  "d": [
    {
      "key": "EmpJob/seqNumber=1,EmpJob/
      startDate=2018-12-28T00:00:00.000Z,EmpJob/userId=userIdVvas101",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 3: Delete an Employee Record

This example shows how to delete an employee's record. With the upsert operation, the value DELETE can be passed to the `operation` field to delete the record.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert</code>

Payload

```
{
  "__metadata": {
    "uri":
    "EmpJob(seqNumber=2L,startDate=datetime'
    2017-01-01T00:00:00',userId='101028')"
  },
  "operation": "DELETE",
  "eventReason": "DATACHG"
}
```

Note

Remember to include the required property `eventReason` in the payload.

Response

```
{
  "d": [
    {
      "key": "EmpJob/seqNumber=2,EmpJob/
      startDate=2017-01-01T00:00:00.000Z,EmpJob/userId=101028",
      "status": "OK",
      "editStatus": "UPsertED",
      "message": null,
      "index": 0,
      "statusCode": 200,
      "inlineResults": null
    }
  ]
}
```

Then, if you query the employee's record, you will get the following response:

Sample Code

```
{
  "error": {
    "code": "NotFoundException",
    "message": {
      "lang": "en-US",
      "value": "EmpJob with key
      (seqNumber=2L,startDate=datetime'2017-01-01T00:00:00',userId='101028') not
      found!"
    }
  }
}
```

Use Case 4: Upsert Job Information of an Employee with Multiple User IDs

In case of an employee with multiple user IDs, you can import the job information by using the `personIdExternal` property.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert

Payload

Sample Code

```
{
    "__metadata": {
        "uri": "http://<api-server>/odata/v2/EmpJob",
    },
    "userId":
    "&&USE_PERSON_ID_EXTERNAL&&",
    "seqNumber": "2",
    "startDate": "/
Date(858556800000)/",
    "personIdExternal":
    "103049",
    "company": "1000",
    "eventReason": "DATACHG",
    "payGrade": "GR-11",
    "jobCode": "50070999",
    "jobTitle": "Management &
Planning",
    "timezone": "Europe/
Berlin"
}
```

Response

```
{
  "d": [
    {
      "key": "EmpJob/seqNumber=2,EmpJob/
startDate=1997-03-17T00:00:00.000Z,EmpJob/userId=&&USE_PERSON_ID_EXTERNAL&&",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 5: Get the Latest Effective Job Information for Each Day Within a Date Range

EmpJob supports multiple changes per day (MCPD). In case an employee's job information is changed several times on a day, you can get the last updated one by using the boolean type property `effectiveLatestChange`.

For example, the user "cgrant" has four `EmpJob` records as follows. Record 2 and record 3 have the same start date, and the last updated record on that day is record 2, the one with the larger sequence number.

EmpJob Records

Record	User ID	StartDate	EndDate	SeqNumber
1	cgrant	2017-11-14	9999-12-31	1
2	cgrant	2017-11-02	2017-11-13	2
3	cgrant	2017-11-02	2017-11-02	1
4	cgrant	2005-09-01	2017-11-01	1

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/EmpJob?\$filter=userId eq 'cgrant'&\$fromDate=2017-03-15&toDate=2020-03-30&\$filter=effectiveLatestChange eq true</code>

Response

Record 1, 2, and 4 are returned.

Note

If you don't use `effectiveLatestChange` as a filter in date range queries, all records within the date range are returned.

9.4.6.10 EmpWorkPermit

This entity contains information about work permits of an employee.

HRIS Element Information

```

HRIS Element ID: workPermitInfo
Business Keys: userId + country + documentType + documentNumber + issueDate
Effective-date: false
Foundation Type: false
Person Entity Element: false
Supports Incremental Load: yes
Supports NO_OVERWRITE: true
Supports MCPD: false

```

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

► [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

The information in this section is only applicable for customers who import work permits on the Centralized services. Other customers are not affected.

Importing work permits on the Centralized services is now based on user ID; previously, it's based on person ID. Because one person can have multiple user accounts, so you could end up purging work permit information of multiple users when you chose to purge data of one person. With a user ID-based importing process, you only purge work permit information for the particular user ID you specified.

The entity uses five fields to make up a business key: `userId`, `country`, `documentType`, `documentNumber`, and `issueDate`. Upserting a record with a duplicate business key will be blocked and trigger a validation error. Both the full-purge mode and the incremental load mode are supported.

Property	Description
<code>userId</code>	Part of business key. Cannot be empty.
<code>country</code>	Part of business key. Cannot be empty.
<code>documentType</code>	Part of business key. Cannot be empty.
<code>documentNumber</code>	Part of business key. Cannot be empty.
<code>issueDate</code>	Part of business key. Cannot be empty.
<code>expirationDate</code>	This property is filterable. You can use it to retrieve work permits that will expire in certain days and send notifications to the employees if needed.

Use Case 1: Query All Work Permits for USA

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/EmpWorkPermit?\$filter=country eq 'USA' & \$format=JSON</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/EmpWorkPermit(country='USA',documentNumber='gr',documentType='6148',issueDate=datetime'2022-07-06T00:00:00',userId='174')",
          "type": "SFOData.EmpWorkPermit"
        }
      }
    ]
  }
}
```

Use Case 2: Upsert a Work Permit Entry for User afong1

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "EmpWorkPermit" }, "country": "6057", "documentType": "6345", "documentNumber": "1234567", "userId": "afong1", "isValidated": true, "documentTitle": null, "issueDate": "/Date(1585699200000)/" }</pre>

Response

Sample Code

```
{
  "d": [
    {
      "key":
      "EmpWorkPermit/country=6057,EmpWorkPermit/documentNumber=1234567,EmpWorkPermit/
      documentType=6345,EmpWorkPermit/issueDate=2020-04-01T00:00:00.000Z,EmpWorkPermit/
      userId=afong1",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "statusCode": 200,
      "inlineResults": null
    }
  ]
}
```

[Permission Settings \[page 554\]](#)

9.4.6.11 EmpPayCompNonRecurring

This entity contains information about nonrecurring components of an employee's pay.

HRIS Element Information

```
HRIS Element ID: payComponentNonRecurring
Business Key: userId + payComponentCode + payDate
Effective-date: false
Foundation Type: false
Person Entity Element: false
Supports Incremental Load: true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Query, Upsert

Additional Business Key Property

Each payment record is associated with a sequence number, which enables you to have more than one pay component with the same code on the same pay date. You can define `sequenceNumber` as an additional key property through data model configuration. With or without the `sequenceNumber` property enabled, the business key and required fields for the entity are different.

<code>sequenceNumber</code> enabled?	Business Key	Required Fields
No	<code>userId</code> <code>payComponentCode</code> <code>payDate</code>	<code>user_sys_id</code> <code>pay-component-code</code> <code>pay_date</code>
Yes	<code>userId</code> <code>sequenceNumber</code>	<code>user_sys_id</code> <code>pay-component-code</code> <code>pay_date</code> <code>seqNumber</code>

Enabling Multiple Non-Recurring Pay Components with the Same User ID, Code, and Pay Date

If an employee has more than one `EmpPayCompNonRecurring` record with the same pay component code and the same pay date, and you want to retrieve all of the records, you **must** enable the additional key property `sequenceNumber`. Otherwise, you can retrieve only one of the records through `EmpPayCompNonRecurring`.

To enable `sequenceNumber`, add the following attributes to the `sequenceNumber` property in the data model from Provisioning:

```
<hris-field id="sequence-number" visibility="view" allow-import="true">
```

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

⚠ Caution

Once `sequenceNumber` is introduced as part of the business key, its value must be maintained. If the value isn't maintained in integrations that rely on the uniqueness of the pay component, these integrations could break.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
operation	To delete a record, use the upsert operation and set this property to DELETE.

Use Case: Query Payment Details Higher Than \$5,000

Request

The following request queries the value and the date of the payment, and first and last name of all payments higher than \$5000.

Operation	Query
HTTP Method	GET

URI

```
https://<API-Server>/odata/v2/  
EmpPayCompNonRecurring?$filter=value  
gt '5000' and currencyCode

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
personIdExternal	This property is a unique identifier for employees. You can use this property to update or add the recurring compensation information of an employee with only one active employment.
seqNumber	This property is automatically generated to specify the sequence of the record.
effectiveLatestChange	This boolean type property indicates whether a record is the latest effective one for a day. You can use this property as a filter to retrieve only the last updated record for each day in date range queries.

Property	Description
no-changes-until-date	This property shows how long a pay component is valid for. It is a transient field which is not stored in database, so it is not visible in OData API Data Dictionary . To configure this field, go to Admin Center > Manage Business Configuration .
operation	To delete a record, use the upsert operation and set this property to DELIMIT.

Use Case 1: Query the Record of an Annual Base Salary over 100,000 USD

Request

Operation	Query
HTTP Method	GET
URI	<pre>https://<api-server>/odata/v2/ EmpPayCompRecurring?\$filter=payComponent eq 'Base Salary' and paycompvalue ge '100000' and currencyCode eq 'USD' and frequency eq 'ANN'&\$format=JSON</pre>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://
<api-server>/odata/v2/EmpPayCompRecurring(payComponent='Base
Salary',seqNumber=1L,startDate=datetime'2011-03-19T00:00:00',userId='wsown1') "
        },
        "startDate": "/Date(1300492800000)/",
        "payComponent": "Base Salary",
        "userId": "wsown1",
        "seqNumber": "1",
        "paycompvalue": "100000",
        "currencyCode": "USD",
        "endDate": "/Date(253402300799000)/",

employmentNav"
        }
    }
}
]
}
}

```

Use Case 2: Upsert the Recurring Pay Component of an Employee with Multiple User Ids

In case of an employee with multiple user IDs, you can import the recurring compensation information by using the `personIdExternal` property.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert</code>

Payload

```
{
  "__metadata": {
    "uri": "https://<api-server>/
odata/v2/EmpPayCompRecurring"
  },
  "userId":
  "&&USE_PERSON_ID_EXTERNAL&&",
  "seqNumber": "1",
  "startDate": "/"
Date(1272672000000)/",
  "personIdExternal": "104038",
  "payComponent": "BASIC_BZ",
  "frequency": "MON",
  "paycompvalue": "15000"
}
```

Response

```
{
  "d": [
    {
      "key": "EmpPayCompRecurring/
payComponent=BASIC_BZ,EmpPayCompRecurring/seqNumber=1,EmpPayCompRecurring/
startDate=2010-05-01T00:00:00.000Z,EmpPayCompRecurring/
userId=&&USE_PERSON_ID_EXTERNAL&&",
      "status": "OK",
      "editStatus": "UPsertED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 3: Get the Latest Effective EmpPayCompRecurring Information for Each Day Within a Date Range

`EmpPayCompRecurring` supports multiple changes per day (MCPD). In case an employee's `EmpPayCompRecurring` information is changed several times on a day, you can get the last updated one by using the boolean type property `effectiveLatestChange`.

For example, the user "cgrant" has four `EmpPayCompRecurring` records as follows. Record 2 and record 3 have the same start date, and the last updated record on that day is record 2, the one with the larger sequence number.

`EmpPayCompRecurring` Records

Record	User ID	StartDate	EndDate	SeqNumber
1	cgrant	2022-12-27	2023-01-02	1
2	cgrant	2022-11-11	2022-11-17	2
3	cgrant	2022-11-11	2022-11-11	1
4	cgrant	2022-10-27	2022-11-02	1

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ EmpPayCompRecurring?\$filter=userId eq 'cgrant'&\$fromDate=2022-11-01&toDate=2022- 12-31&\$filter=effectiveLatestChange eq true</code>

Response

Record 1, 2, and 4 are returned.

Note

If you don't use `effectiveLatestChange` as a filter in date range queries, all records within the date range are returned.

[Multiple Changes Per Day \(MCPD\) Entities \[page 580\]](#)

9.4.6.13 EmpTimeAccountBalance

The `EmpTimeAccountBalance` entity provides time account balance information, enabling external systems like payrolls to capture this data. The most common use case for deriving time account balance information is to enrich the employee's pay slip with time off data.

Context Information

A prerequisite for this API is a configured Employee Central Time Off solution.

As the balance is not stored in Employee Central Time Off, the API needs to calculate the balance as of the specified date (balance as of date). The API therefore needs to determine the valid time accounts of the respective user (that is, employment) and time account type and calculate the balance by summing up the time account details.

The API currently returns only calculated data based on accrual runs already performed. Simulated data is not returned by the API.

For details, check the corresponding Implementation Information for Time Off available at <http://help.sap.com/cloud4hr?current=on-demand#section5>.

How is the balance calculated?

- **Determination of valid time accounts**

Balance is calculated based on time accounts for the requested time account type. The validity of a time account is derived from the bookable period. Time accounts are selected if the parameter `balanceAsOfDate` falls into the bookable period. Closed accounts are considered.

Note

Example

Vacation 2013 (Bookable period 1.1.2017-31.03.2018) Balance 5 days

Vacation 2018 (Bookable period 1.1.2018-31.03.2019) Balance 18 days

If the service is called with a balance as of date 1.3.2018, the system identifies two valid time accounts and returns both results. Result would be 2 records as above.

If the service is called with a balance as of date 1.8.2018, the system identifies only one valid time account. Result would be 18 days. One record is returned only.

- The balance considers all positive and negative bookings up to the selected date. This includes:
 - All accruals and entitlements
 - Manual adjustments (deduction and adding)
 - Carry forward values from period end processing (negative or positive)
 - All recalculation values for example due to an FTE change (negative and positive)
 - All taken leave up to the selected day
 - And all other bookings

Supported Operations

Query

Parameters

The entity has two required filters, to be used in `$filter`, which support `IN` and `EQ` operators only. The second optional parameter is a normal URL parameter which requires a date in format YYYY-MM-DD.

Name	Required	Description
timeAccountType as part of \$filter	Yes	List of time account types. Error if no time account type is provided.
balanceAsOfDate URL parameter	No	Balances as of Date If no date is passed, today will be used as the default effective date
userId as part of \$filter	Yes	List of users. Error if no user is provided.

⚠ Caution

The external code of the time account type is case sensitive. Make sure that the external code is correct.

⚠ Caution

When you use this entity in middleware or *Integration Center*, bulk data abstraction is not possible because userId is a mandatory field and giving all userId in the filter criteria will lead to a large query that would result in a failure.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

The following properties are returned for each record. The API might return several records per user and time account type provided in the filter. The unique key of the returned records is neither the userId nor the timeAccountType but the unique UUID of the TimeAccount Entity. This means that the API returns the balance for all relevant time accounts of the given users and adds additional information based on the returned time account.

Property	Description
timeAccount	Unique ID of the selected time accounts
timeAccountType	Time account type of the selected time accounts
timeUnit	Either days or hours
balance	Values as described below

Property	Description
userId	User ID from User Entity
accountClosed	Boolean value that indicates whether the corresponding account is closed already and can no longer be booked.

Use Case 1: Payroll Integration: Provide Time Account Balance Information for Payslip

Request

Operation	Query
HTTP Method	GET

}
}

```

Error Handling

Invalid userIDs or Time Account Types are not reported as errors and will lead to an empty result.

Related Information

[SAP Business Accelerator Hub: EmpTimeAccountBalance](#)

9.4.6.14 HireDateChange

This entity contains information about changing the hire date of an employee in Employee Central.

Permissions

You have the [Administrator Permissions](#) > [Metadata Framework](#) > [Hire Date Correction](#) permission.

The API can be used with the [Access to Non-Secured Object](#) permission if the Hire Date Correction object is not already secured.

However, to restrict the access to the Hire Date Correction object only, we recommend configuring the Hire Date Correction object as secured in the system. This means, in the object definition, in the [Security](#) section, the [Secured](#) field must be set to [Yes](#) and the [Permission Category](#) must be set to, for example, [Miscellaneous](#). Once the object definition is updated, the View, Edit, and Import/Export permissions must be granted in [User Permissions](#) > [Miscellaneous Permissions](#) > [Hire Date Correction](#).

Supported Operations

Query, Upsert, Insert, Delete

The Upsert operation supports the creation of new Hire Date Change objects only, meaning it does not support updates to existing Hire Date Change objects.

Use Case 1: Query the Hire Date Change of an Employee

In the following example, the hire date changes of an employee are queried. The filter query URI returns all changes for the given usersSysId.

Request

Operation	Query
HTTP Method	GET

URI

https://<api-server>/odata/v2/HireDateChange?
\$filter=usersSysId eq 'testUserSysID'&\$format=json

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')",
      "type": "SFOData.HireDateChange"
    },
    "code": "testCode",
    "originalHireDate": "\/Date(1914105600000)\/",
    "lastModifiedDate": "\/Date(1634286678000+0000)\/",
    "lastModifiedBy": "user",
    "createdDateTime": "\/Date(1634286678000+0000)\/",
    "mdfSystemRecordStatus": "N",
    "newHireDate": "\/Date(2229724800000)\/",
    "processingStatus": "SUCCESSFUL",
    "usersSysId": "testUserSysId",
    "createdBy": "user",
    "usersSysIdNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
      }
    }
  },
  "processingStatusNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
    }
  },
  "createdByNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
    }
  },
  "wfRequestNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
    }
  },
  "lastModifiedByNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
    }
  },
  "mdfSystemRecordStatusNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
    }
  }
}
```

Use Case 2: Insert a Hire Date Change of an Employee Using the Upsert Operation

In the following example, the Hire Date Change object is created. One advantage of using the upsert operation means that you can create multiple changes at once.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert?\$format=json</code>
Payload	<div data-bbox="602 699 1425 1566"><p>Sample Code</p><pre>{ "__metadata": { "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')", "type": "SFOData.HireDateChange" }, "code": "testCode", "newHireDate": "/Date(1666249310000)/", "usersSysIdNav": { "__metadata": { "uri": "https://<api-server>/odata/v2/User('testUser')" } } }, { "__metadata": { "uri": "https://<api-server>/odata/v2/HireDateChange('otherTestCode')", "type": "SFOData.HireDateChange" }, "code": "otherTestCode", "newHireDate": "/Date(1666249310000)/", "usersSysIdNav": { "__metadata": { "uri": "https://<api-server>/odata/v2/User('otherTestUser')" } } } }</pre></div>

Response

Sample Code
<pre>{ "d": [{ "key": "HireDateChange/code=testCode", "status": "OK", "editStatus": "UPSERTED", "message": null, "index": 0, }] }</pre>

```

    "statusCode": 200,
    "inlineResults": null
  },
  {
    "key": "HireDateChange/code=otherTestCode",
    "status": "OK",
    "editStatus": "UPSERTED",
    "message": null,
    "index": 1,
    "statusCode": 200,
    "inlineResults": null
  }
]
}

```

Use Case 3: Insert a Hire Date Change of an Employee Using the Insert Operation

In the following example, the hire date of an employee is changed.

Request

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/HireDateChange

Payload

Sample Code

```

{
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')",
    "type": "SFOData.HireDateChange"
  },
  "code": "testCode",
  "newHireDate": "/Date(1666249310000)/",
  "usersSysIdNav": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/User('testUser')",
    }
  }
}

```

Response

Sample Code

```

{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')",
      "type": "SFOData.HireDateChange"
    }
  }
}

```

```

    },
    "newHireDate": "\/Date(1579431065000)\/",
    "code": "testCode",
    "usersSysIdNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/HireDateChange('testCode')/"
      }
    }
  }
}

```

Use Case 4: Delete the Hire Date Change of an Employee

In the following example, the hire date of an employee is deleted.

Request

Operation	Delete
HTTP Method	DELETE
URI	https://<api-server>/odata/v2/HireDateChange('testCode')? \$format=json

Note

There is no response payload for the delete operation.

```

Use Case 2: Upserting Alternative Cost Distribution

Insert or update alternate cost distribution for an employee.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert?
Payload	<pre>{ "__metadata": { "uri": "/ EmpCostDistribution(effectiveStartDate=datetime'2021-03-26T00:00:00',usersSysId='<User-Id>')", "type": "SFOData.EmpCostDistribution" }, "usersSysId": <User-Id>, "effectiveStartDate": "/ Date(1616716800000)/", "items": [{ "__metadata": { "uri": "https://<API- Server>/odata/v2/ EmpCostDistributionItem(EmpCostDistribution_effectiveSta rtDate=datetime'2021-03-26T00:00:00',EmpCostDistribution _usersSysId='438',externalCode=147843L)", "type": "SFOData.EmpCostDistributionItem" }, "EmpCostDistribution_usersSysId": <User-Id>, "EmpCostDistribution_effectiveStartDate": "/ Date(1616716800000)/", "lastModifiedDate": "/ Date(1616733672000+0000)/", "costCenter": "MC_240001", "lastModifiedBy": "223344", "createdDateTime": "/ Date(1616733672000+0000)/", "mdfSystemRecordStatus": "N", "createdBy": "223344", "percentage": "1" }] }</pre>

Response

```
{
  "d": [
    {
      "key": "EmpCostDistribution/
effectiveStartDate=2021-03-26T00:00:00.000Z,EmpCostDistribution/usersSysId=<User-
Id>",
      "status": "OK",
      "editStatus": "UPsertED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 3: Modifying Alternative Cost Distribution

Change alternate cost distribution for an employee.

Request

Operation	Merge
HTTP Method	POST
URI	https://<api-server>/odata/v2/ EmpCostDistribution(effectiveStartDate=datetime'2021-03-26T 00:00:00',usersSysId='<User-Id>')
Header	x-http-method: MERGE Content-Type: application/json
Payload	<pre>{ "__metadata": { "uri": "/ EmpCostDistribution(effectiveStartDate=datetime'2021-03- 26T00:00:00',usersSysId='<User-Id>')", "type": "SFOData.EmpCostDistribution" }, "usersSysId": "<User-Id>", "effectiveStartDate": "/ Date(16167168004559)/", }</pre>

Use Case 4: Creating Alternative Cost Distribution

Insert alternative cost distribution for an employee

Request

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/EmpCostDistribution
Payload	<pre>{ "__metadata": { "uri": "/ EmpCostDistribution(effectiveStartDate=datetime'2021-03-29T00:00:00',usersSysId='<User-Id>')", "type": "SFOData.EmpCostDistribution" }, "usersSysId": "<User-Id>", "effectiveStartDate": "/ Date(16167164004879)/", "items": [{ "__metadata": { "uri": "https://<API- Server>/odata/v2/ EmpCostDistributionItem(EmpCostDistribution_effectiveSta rtDate=datetime'2021-03-29T00:00:00',EmpCostDistribution _usersSysId='<User-Id>',externalCode=147843L)", "type": "SFOData.EmpCostDistributionItem" }, "EmpCostDistribution_usersSysId": "<User-Id>", "EmpCostDistribution_effectiveStartDate": "/ Date(16167164004879)/", "costCenter": "MC_240001", "lastModifiedBy": "223344", "percentage": "48" }] }</pre>

Response

	<pre>{ "d": { "__metadata": { "uri": "https://<API-Server>/odata/v2/ EmpCostDistribution(effectiveStartDate=datetime'2482-04-25T00:00:00',usersSysId='<Us er-Id>')", "type": "SFOData.EmpCostDistribution" }, "usersSysId": "<User-Id>", "effectiveStartDate": "/Date(16167081600000)/", "items": { "__metadata": { "uri": "https://<API-Server>/odata/v2/ EmpCostDistributionItem(EmpCostDistribution_effectiveStartDate=datetime'2021-03-29T0 0:00:00',EmpCostDistribution_usersSysId='<User-Id>',externalCode=147843L)", "type": "SFOData.EmpCostDistributionItem" }, "EmpCostDistribution_usersSysId": "<User-Id>", "EmpCostDistribution_effectiveStartDate": "/Date(16167164004879)/", "costCenter": "MC_240001",</pre>
--	--

```
    "lastModifiedBy": "223344",  
    "percentage": "48"  
  }  
}
```

Use Case 5: Deleting Alternative Cost Distribution

Delete alternative cost distribution for an employee.

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<api-server>/odata/v2/ EmpCostDistribution(effectiveStartDate=datetime'2021-04-01T 00:00:00',usersSysId='<User-Id>')</code>

Related Information

[SAP Business Accelerator Hub: EmpCostDistribution](#)

9.4.6.15.1 EmpCostDistributionItem

The EmpCostDistributionItem entity is a composite child entity of the EmpCostDistribution entity and contains the individual alternative cost distribution for each employee.

Prerequisites

You've created the parent entity [EmpCostDistribution \[page 702\]](#).

Permissions

Permission System	Required Setting
Role-based	Administrator Permissions -> Metadata Framework -> Access to non-secured objects

Supported Operations

Query, Upsert, Insert, Merge, Replace, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
mdfSystemRecordStatusNav	MDFEnumValue	The ENUM data type values maintained by the MDF team for that entity.
mdfSystemStatusNav	MDFEnumValue	The ENUM data type values maintained by the MDF team for that entity.
createdByNav	User	Navigates to the User entity.
lastModifiedByNav	User	Navigates to the User entity.
costCenterNav	FOCostCenter	Represents the generic MDF object Cost-Center.

Use Case 1: Querying Alternate Cost Distribution Item

Query continuous requests about the alternate cost distribution item for an employee.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/EmpCostDistributionItem?\$filter=EmpCostDistribution_usersSysId eq <User-Id>&\$format=json

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/EmpCostDistributionItem(EmpCostDistribution_effectiveStartDate=datetime'2021-03-26T00:00:00',EmpCostDistribution_usersSysId='<User-Id>',externalCode=147843L)",
          "type": "SFOData.EmpCostDistributionItem"

9.4.6.16.1 SecondaryAssignmentsItem

A composite child of SecondaryAssignments. It can only be upserted with SecondaryAssignments. Along with SecondaryAssignments, it captures concurrent employment information. To be precise, the PerPerson entity has a navigation secondaryAssignmentsNav that lets you navigate to the entity SecondaryAssignments.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Note

Although all operations are supported, the only one that makes any business sense is upsert.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Upsert a Secondary Assignment

There is not often a business case for this operation but it has been provided to support the cloning or transfer of data between similar instances in a different environment. In this example, user system ID (represented by the externalcode) for the primary employment is PrimaryEmployment and the userSysID for secondary employment is represented by 301 (a number automatically generated when a secondary employment is created).

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>
Payload	<pre>{ "__metadata": { "uri": "SecondaryAssignments"}, "effectiveStartDate" : "/" Date(1420066800000)/", "externalCode" : "mjaschob", "allSfProcesses": { "__metadata": { "uri": "SecondaryAssignmentsItem"}, "SecondaryAssignments_effectiveStartDate " : "/"Date(1420066800000)/", "SecondaryAssignments_externalCode" : "mjaschob", "externalCode" : "myexternalcode55", "usersSysId" : "301" } }</pre>

Additional Information

You can see an example of SecondaryAssignmentsItem in use in [Differentiating primary from secondary employment during concurrent employment replication \[page 1539\]](#)

9.4.7 Employee Central for Public Sector

9.4.7.1 HDTempAssignment

The HDTempAssignment API allows you to retrieve or store Higher Duty or Temporary Assignment position, responsibility, and allowance details.

Supported Operations

Query, Insert, Upsert.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
usersSysIdNav	User	Quick card of user

Entity Relationship Diagram

The creation of a Higher Duty/Temporary Assignment employment is not supported via oData. After the employment is created, you can create or update new instances of HDTempAssignment using oData.

Use Case 1: Query Higher Duties/Temporary Assignment specific information

List all the Higher Duty/Temporary assignments of type "Fully Responsibility".

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/HDTempAssignment? \$filter=responsibilityType eq 'FULL_RESPONSIBILITY'</code>

Response

```

      "type": "SFOData.Position"
    }
  }
}
```

Additional Information

9.4.7.2 EmpCostAssignment

The EmpCostAssignment API allows you to define the primary assignment and secondary/alternative assignment of the cost center, fund, grant, functional area, budget period, and funds center for an employee.

Permissions

Permission System	Required Setting
Permission Role	Administrator Permissions -> Industry MDF Permissions -> Employee Cost Assignment

Supported Operations

Query, Insert, Upsert, Merge.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
items	EmpCostAssignmentItem	Contains individual cost assignment for an employee. Permission must set in Administrator Permissions -> Industry MDF Permissions -> Employee Cost Assignment.Cost Assignment (Employee Cost Assignment Item).
wrokerNav	User	
mdfSystemRecordStatusNav	MDFEnumValue	
createdByNav	User	
lastModifiedByNav	User	

Entity Relationship Diagram

Use Case 1: Query the Employee Cost Assignment record for a user

Query the Employee Cost Assignment record for a user.

Request

Operation	Query
HTTP Method	GET

```

Additional Information

9.4.7.3 EmpCostAssignmentItem

The EmpCostAssignmentItem entity is a composite child entity of the EmpCostAssignment entity containing individual cost assignment for an employee.

Supported Operations

Query, Insert, Upsert, Merge.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
costCenterNav	CostCenter	Cost Center

Additional Information

9.4.7.4 FundGO

An employee cost assignment refers to assignment of accounting objects for an employee. Fund is one of the standard accounting objects supported.

Permissions

► [Administrator Permissions](#) ► [Configure Public Sector Management Cost Objects](#)

Supported Operations

Query, Insert, Upsert, Merge, Replace, Delete.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	A combination of the identifiers for fundCode and fmArea

Property	Description
effectiveStatus	Status of the object. If set to Inactive, the object instance isn't used and not visible anywhere in the system, including the rule engine, configurable UI designer, and role-based permissions. Possible Values: <ul style="list-style-type: none"> • A – Active • I – Inactive
mdfSystemRecordStatus	Possible Values: <ul style="list-style-type: none"> • N - Normal Record • P - Pending Record • C - Correction • D - Soft Deleted Record • PH - Pending History Record • F - Full Purge Import in Progress
entityOID	This property stores the One Domain Model (ODM) object ID that is used in Master Data Integration.
entityUUID	System generated unique identifier
projectControllingObjectType	Only those Project Controlling Objects where the Project Controlling Object Type value is WBS element (PRN) are supported for Public Sector Cost Assignment.

Navigation Properties

Navigation Property	Related Entity	Description
createdByNav	User	
effectiveStatusNav	MDFEnumValue	
fundDescriptionTranslationTextNav	MDFLocalizedValue	
lastModifiedByNav	User	
mdfSystemRecordStatusNav	MDFEnumValue

<pre>{ "d": [{ "key": "FundCenterGO/ effectiveStartDate=2021-12-27T00:00:00.000Z,FundCenterGO/externalCode=test/test", "status": "OK", "editStatus": "UPSERTED", "message": null, "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>

Use Case 5: Delete a Fund Center record

Delete a Fund Center record

Request

Operation	Query
HTTP Method	DELETE
URI	<code>https://<API-Server>/odata/v2/FundCenterGO(effectiveStartDate=datetime'2022-01-01T00:00:00',externalCode='test/test')?\$format=JSON</code>

Response

9.4.7.6 GrantGO

An employee cost assignment refers to assignment of accounting objects for an employee. Grant is one of the standard accounting objects supported.

Permissions

▶ [Administrator Permissions](#) > ▶ [Configure Public Sector Management Cost Objects](#)

Supported Operations

Query, Insert, Upsert, Merge, Replace, Delete.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ▶ [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) ▶ or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
effectiveStatus	Status of the object. If set to Inactive, the object instance isn't used and not visible anywhere in the system, including the rule engine, configurable UI designer, and role-based permissions. Possible Values: <ul style="list-style-type: none">• A – Active• I – Inactive

Property	Description
mdfSystemRecordStatus	Possible Values: <ul style="list-style-type: none"> • N - Normal Record • P - Pending Record • C - Correction • D - Soft Deleted Record • PH - Pending History Record • F - Full Purge Import in Progress
entityOID	This property stores the One Domain Model (ODM) object ID that is used in Master Data Integration.
entityUUID	System generated unique identifier
projectControllingObjectType	Only those Project Controlling Objects where the Project Controlling Object Type value is WBS element (PRN) are supported for Public Sector Cost Assignment.

```

Use Case 5: Delete a Project Controlling Object record

Delete a Project Controlling Object record.

Request

Operation	Query
HTTP Method	DELETE
URI	http://<API-Server>/odata/v2/ProjectControllingObject(effectiveStartDate=datetime'2022-01-01T00:00:00',externalCode='test')?\$format=JSON?\$format=JSON

Response

9.4.8 Fiscal Year

9.4.8.1 FiscalYearVariant

This entity contains information about the fiscal year variant created for income tax declaration.

Supported Operations

Operation	Description
Query	You can query the fiscal year variant information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
externalCode	Business key
periods	This field contains period information of the fiscal year variant.

Use Case: Get the Fiscal Year Variant Information

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ FiscalYearVariant?\$top=10&\$format=JSON</code>

Response

```
{

9.4.8.2 FiscalYearToCountryMap

This entity contains the mapping information between a fiscal year variant and a country or a region.

Supported Operations

Operation	Description
Query	You can query the fiscal year variant mapping information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
externalCode	Business key

Property	Description
fiscalYearVariant	Fiscal year variant
country	The mapped country of the fiscal year variant

Use Case: Get the Fiscal Year Variant Mapping Information

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ FiscalYearToCountryMap? \$top=10&\$format=JSON

Response

```

9.4.9 Foundation

9.4.9.1 Foundation Object Structure in OData API

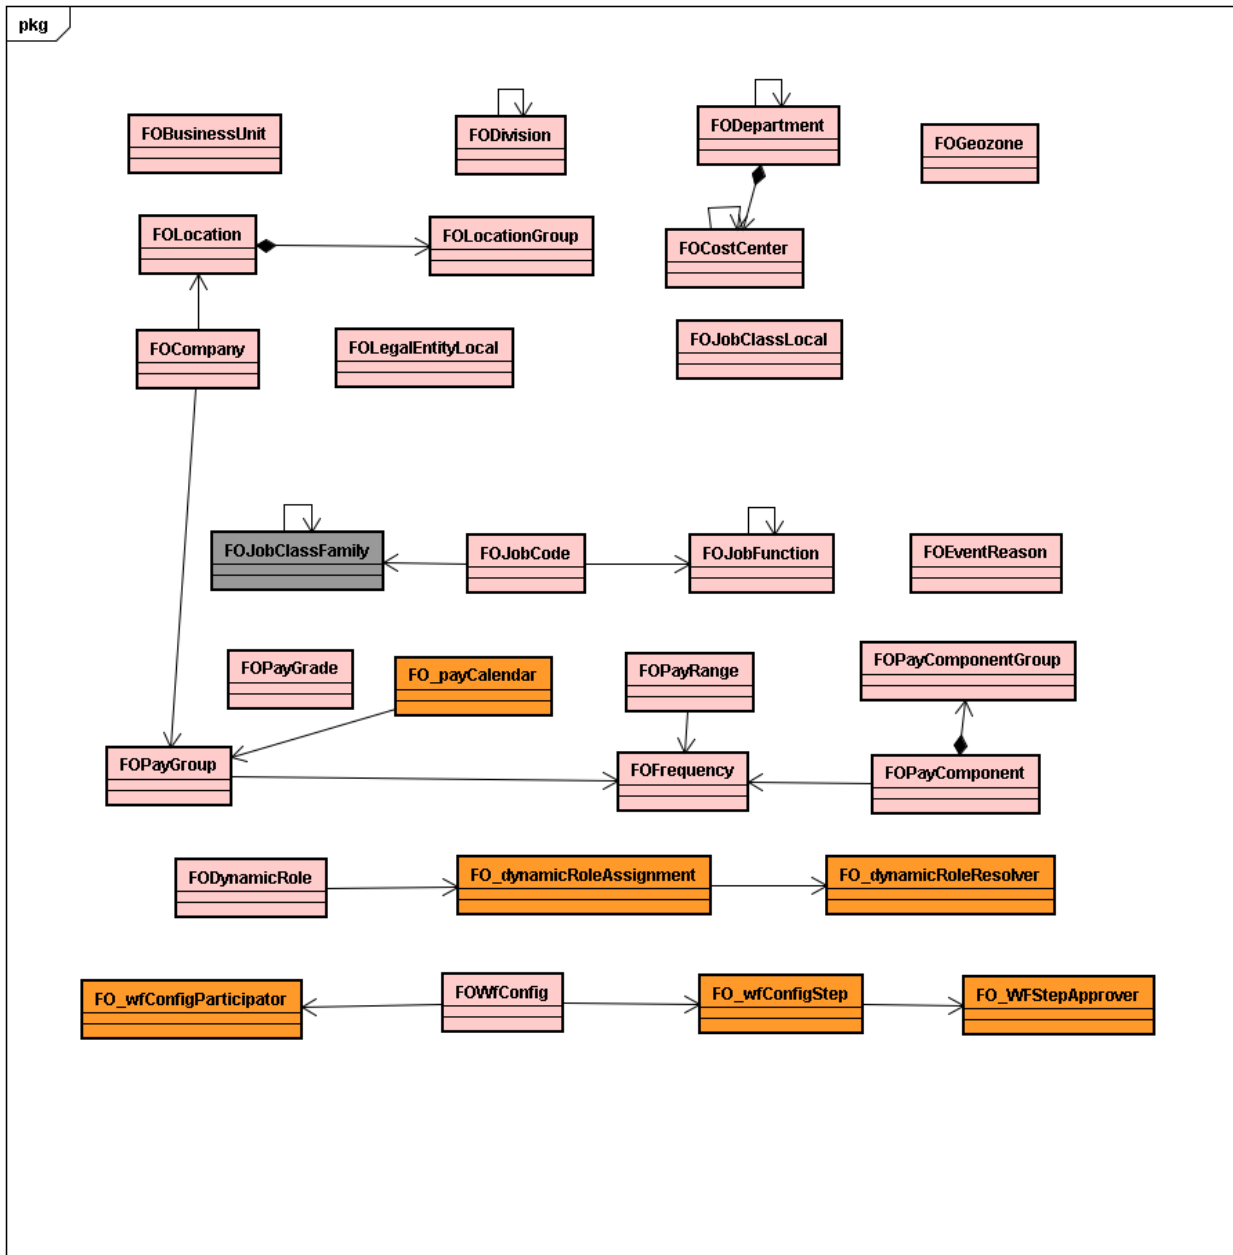

Flexible associations can be defined between two foundation objects in the Corporate Data Model. The example below shows a one to one relationship between location and geozone; a one to many relationship is defined between location and company. OData automatically creates navigations from the source entity to the target entities, based on the relationship defined.

```

<hris-element id="location">
  <hris-associations>
    <association id="id" multiplicity="ONE_TO_ONE" destination-
entity="geozone"/>
    <association id="id" multiplicity="ONE_TO_MANY" destination-
entity="company"/>
  </hris-associations>
</hris-associations>

```

The diagram below shows the default relationships between the different OData entities.

Note

Changing the associations in the Corporate Data Model might cause OData APIs to fail, more so when the association is deleted. This usually happens when association is already being used by the OData API.

9.4.9.2 FODynamicRole

You can use this entity to query, create, or modify a dynamic role that can be used as approvers in Employee Central workflows.

HRIS Element Information

```
HRIS Element ID: dynamicRole
Business Keys: dynamicRoleAssignmentId
Effective-date:false
Foundation Type:true
Person Entity Element:false
Supports Incremental Load:false
Supports NO_OVERWRITE: false
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can get the information of dynamic roles with <code>Job Info as Base Object</code> .
Upsert	You can create a new dynamic role or modify an existing role.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
<code>dynamicRoleAssignmentId</code>	This property is a unique ID for a dynamic role and is automatically generated.
<code>resolverType</code>	You can use this property to define the approver type in the Employee Central workflows. There are three approver types: Person, Dynamic Group, and Position.

Use Case 1: Query the Dynamic Roles that Use Position as Approver Type

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ FODynamicRole? \$format=JSON&\$filter=resolverType eq 'POSITION'&\$select=dynamicRoleAssignmentId ,resolverType</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/FODynamicRole(6M)"
        },
        "dynamicRoleAssignmentId": "6",
        "resolverType": "POSITION"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/FODynamicRole(21M)"
        },
        "dynamicRoleAssignmentId": "21",
        "resolverType": "POSITION"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/FODynamicRole(22M)"
        },
        "dynamicRoleAssignmentId": "22",
        "resolverType": "POSITION"
      }
    ]
  }
}
```

Use Case 2: Create a Dynamic Role

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/upsert</code>

Payload

```
{
  "__metadata": {
    "uri": "FODynamicRole"
  },
  "externalCode": "FACILITIES",
  "resolverType": "POSITION",
  "payGrade": "GR-10",
  "eventReason": "TRANINTL",
  "name": "New Dynamic Role (Test)",
  "position": "50014360"
}
```

Response

```
{
  "d": [
    {
      "key": "FODynamicRole/dynamicRoleAssignmentId=null",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,

9.4.9.3 FOEventReason

You can use this entity to define the event reasons why an event occurs, such as creating, changing, or deleting employee data. An event reason can change the employee status of employees when an event occurs for them.

HRIS Element Information

```
HRIS Element ID: eventReason
Business Keys: externalCode + startDate
Effective-date:true
Foundation Type:true
Person Entity Element:false
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can query the event reasons.
Upsert	You can create or update the event reasons.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
event	You can use this property to specify the event for which the event reason is created. Events are defined in the <code>PicklistV2</code> entity.
emplStatus	You can use this property to change the employee status after the event occurs. For example, if you make a data change and use the event reason with <code>emplStatus</code> as inactive, the status of the employee becomes inactive after the data change.

Use Case: Query the Event Reason by External Code

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/FOEventReason?\$filter=externalCode eq 'PAYMLA'&\$select=status,event,externalCode&\$format=JSON</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/FOEventReason(externalCode='PAYMLA',startDate=datetime'1970-01-01T00:00:00') "
        },
        "externalCode": "PAYMLA",

```

```
    "status": "A",
    "event": "2294"
  }
]
}
```

Related Information

[SAP Business Accelerator Hub: FOEventReason](#)

9.4.9.4 FOFrequency

This entity is used to define how an employee is paid, such as monthly or weekly.

HRIS Element Information

```
HRIS Element ID: frequency
Business Keys: externalCode
Effective-date: false
Foundation Type: true
Person Entity Element: false
Supports Incremental Load: true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can query the pay frequency information.
Upsert	You can create or update the pay frequency information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
annualizationFactor	You can use this property to define the times an employee is paid in one year. For example, set this property as 12 if the employee is paid monthly.

Use Case: Query the Pay Frequency by External Code

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/FOFrequency? \$filter=externalCode eq 'DLY'&\$select=externalCode,name,descriptio n,annualizationFactor&\$format=JSON</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/FOFrequency('DLY')"
        },
        "externalCode": "DLY",
        "description": "Daily",
        "name": "Daily",
        "annualizationFactor": "365"
      }
    ]
  }
}
```

Related Information

[SAP Business Accelerator Hub: FOFrequency](#)

9.4.9.5 FOGeozone

This entity enables you to group multiple company locations within the same cost-of-living areas as a Geo Zone. You can offset the impacts of higher or lower-than-average costs of living to pay range.

HRIS Element Information

```
HRIS Element ID: geozone
Business Keys: externalCode + startDate
Effective-date:true
Foundation Type:true
Person Entity Element:false
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can query a Geo Zone.
Upsert	You can create or update a Geo Zone.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
adjustmentPercentage	You can use this property to define the adjustment percentage of the Geo Zone compared to the average pay range, so as to offset the impact of higher or lower cost-of-living on the pay range.

Use Case: Query the Geo Zone for APAC

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/FOGeozone?
\$filter=externalCode eq
'APAC'&\$select=status,name,createdBy&\$format=JSON</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/

9.4.9.7 FOLocationGroup

You can use this entity to group multiple company locations for reporting or filtering purposes.

HRIS Element Information

```
HRIS Element ID: location groupGroup
Business Keys: externalCode + startDate
Effective-date:true
Foundation Type:true
Person Entity Element:false
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can query a location group.
Upsert	You can create or update a location group.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Get the Location Group of APAC Effective Within a Period

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ FOLocationGroup?\$filter=externalCode eq 'APAC'&\$select=status,name,createdBy&fromDate=2013-01-01&toDate=2014-01-01&\$format=JSON</code>

Response

```
{

9.4.9.8 FOPayComponent

You can use this entity to assign a pay component, that is a payment or deduction, to an employee. You can define the frequency and currency of the pay component.

HRIS Element Information

```
HRIS Element ID: payComponent
Business Keys: externalCode + startDate
Effective-date:true
Foundation Type:true
Person Entity Element:false
```

```
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD:false
```

Supported Operations

Operation	Description
Query	You can query a pay component.
Upsert	You can create or update a pay component.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
payComponentType	You can use this property to specify the type of the pay component as Amount or Percentage.
payComponentValue	You can use this property to specify the value of the pay component.
currency	You can use this property to specify the currency in which the pay component is paid. If no currency is specified, the local currency for the employee is used as default.
isEarning	You can use this property to define the pay component as an earning or a deduction.

Use Case: Get the Pay Component for Base Salary

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/FOPayComponent?\$filter=externalCode eq 'Base Salary'&\$format=JSON</code>

9.4.9.9 FOPayComponentGroup

This entity enables you to group multiple pay components for summations, totals, and annualizations. You can group pay components of different currencies and frequencies in one pay component group.

HRIS element information

```
HRIS Element ID: payComponentGroup
Business Keys: externalCode + startDate
Effective-date:true
Foundation Type:true
Person Entity Element:false
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD:false
```

Supported Operations

Operation	Description
Query	You can query a pay component group.
Upsert	You can create or update a pay component group.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
useForComparatioCalc	You can use this property to define whether the pay component group is used for the comp ratio calculation.

Property	Description
showOnCompUI	You can use this property to define whether the pay component group is displayed on the Comp UI.
useForRangePenetration	You can use this property to define whether the pay component group is used to determine how far an employee has progressed into a given pay range.

Use Case: Get the Pay Component Group for Base Salary

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ FOPayComponentGroup?\$filter=externalCode eq 'Base Salary'&\$select=externalCode&\$format=JSON

Response

9.4.9.12 FOWfConfig

This entity contains workflow configuration information, such as role and type of the workflow approver. .

HRIS element information

HRIS Element ID: wfConfig

```
Business Keys: externalCode
Effective-date:false
Foundation Type:true
Person Entity Element:false
Supports Incremental Load:true
Supports NO_OVERWRITE: false
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can query the workflow configuration information.
Upsert	You can create or update the workflow configuration information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
approverType	The type of the approver of the workflow step. For more information about workflow approvers, see Workflow Participant Types .
approverRole	The role of the approver of the workflow step. For more information about workflow approvers, see Workflow Participant Types .
actionType	Specifies how approvers are allowed to change content of a workflow transaction: <ul style="list-style-type: none">• No Edit Approvers do not have in-flight editing capability.• Edit with Route Change Approvers can edit a workflow and the workflow route will be recalculated when they submit the request.• Edit without Route Change Approvers can edit a workflow but the workflow route will not be recalculated when they submit the request.• Edit Attachments Only Approver can only edit the attachments of the workflow.

Property	Description
isDelegateSupported	You can set this property to Yes or No to enable or disable manual delegation or auto delegation of workflows.
skipType	You can defines how the system react when there is an empty position or dynamic group. Possible values are Stop the Workflow and Skip this Step .
applicationScenario	Indicates a business scenario where the workflow will be used. You can use this property as a filter if the Application Scenario field is added to the corporate data model template and its visibility is set to both.

9.4.9.13 FOWfConfigStepApprover

This entity contains information of step approver in a workflow.

Supported Operations

Operation	Description
Query	You can get the information of approver for a workflow step.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
externalCode	Business key.
stepNum	Business key. The order of the step in a workflow.
approverType	The type of the approver of the workflow step. For more information about workflow approvers, see Workflow Participant Types .
approverRole	The role of the approver of the workflow step. For more information about workflow approvers, see Workflow Participant Types .

Property	Description
actionType	<p>Specifies how approvers are allowed to change content of a workflow transaction:</p> <ul style="list-style-type: none"> • <i>No Edit</i> Approvers do not have in-flight editing capability. • <i>Edit with Route Change</i> Approvers can edit a workflow and the workflow route will be recalculated when they submit the request. • <i>Edit without Route Change</i> Approvers can edit a workflow but the workflow route will not be recalculated when they submit the request. • <i>Edit Attachments Only</i> Approver can only edit the attachments of the workflow.
skipType	<p>Determines how the system react when there is an empty position or dynamic group. Possible values are Stop the Workflow and Skip this Step.</p>
relationshipToApprover	<p>Specifies whether the approver is determined based on the subject user of the workflow (employee) or the workflow initiator. It is relevant only for approver types Role and Position Relationship. For more information about how it works with these two approver types, see Workflow Participant Types.</p>

Use Case: Get the Approver Information of the First Step in the Leave of Absence Workflow

9.4.9.14 Working with Migrated Foundation Objects (MDF FOs)

Contains information on working with FO (Foundation Objects) that have been migrated to MDF (Metadata Framework)

As part of the phased migration of Foundation Objects (FO) to Metadata Framework (MDF), the FOs Cost Center, Business Unit, Division, Department, Legal Entity, Job Classification, Job Function, Job Family, Pay Group, and PayCalendar have been migrated. After migration, these FOs are now Generic Objects.

For these newly created GOs, you can influence the way the fields behave in API queries. For example, if Division was not mapped, it would be displayed as any other MDF OData source, and you would still have the field *effectiveStartDate* in the API query. In element field mapping, *effectiveStartDate* is mapped to the HRIS element ID *start-date*. Here, we are telling the system that the original field name for *effectiveStartDate* is *startdate*. Likewise, *effectiveStatus* is mapped to *status*, *cust_string1* is mapped to *custom_string1*, *cust_string2* is mapped to *custom_string2*, and so on.

Let's see how it works for the various fields. The system searches the object definition and then the element type map. If there is a mapping in the Element Type Map (see *Element Field Map for EC Migration* section), it displays the field name from the map. For example, you define a new custom field called *cust_string7*.

The screenshot shows the 'Object Definition: Division (Division)' configuration page. It includes various settings like Code (Division), Effective Dating (Basic), API Visibility (Not Visible), Status (Active), and a list of fields. The 'Fields' table is highlighted, showing the mapping for *cust_string7*.

Name	Database Field Name	Maximum Length	Data Type	(16) More
effectiveStartDate	effectiveStartDate	255	Date	Details
mdfSystemEntityId	entityId	255	String	Details
mdfSystemRecordId	recordId	255	String	Details
mdfSystemObjectType	objectType	255	String	Details
mdfSystemProxyUser	proxyUser	255	String	Details
mdfSystemRecordStatus	recordStatusStr	255	Enum	Details
mdfSystemTransactionSequence	transactionSequence	255	Number	Details
mdfSystem/VersionId	versionId	255	Number	Details
externalCode	externalCode	32	String	Details
name	externalName	32	Translatable	Details
description	sfFields.sfField1	128	Translatable	Details
effectiveStatus	effectiveStatusStr	255	Enum	Details
effectiveEndDate	effectiveEndDate	255	Date	Details
headOfUnit	sfFields.sfField2	255	User	Details
parentDivision	sfFields.sfField3	255	Generic Object	Details
cust_string2	customFields.customField1		Foundation Object	Details
cust_string3	customFields.customField2		User	Details
cust_string4	customFields.customField3		Picklist	Details
cust_string5	customFields.customField4		Generic Object	Details
cust_string6	customFields.customField5	45	String	Details
cust_string7	customFields.customField6	45	String	Details
cust_date1	customFields.customField7		Date	Details

You can map *cust_string7* to *custom-string7* now. Hence, the field will be available in OData as *custom-string7*. If you do not map it, it will appear with the same name as in MDF definition. However, if it is mapped in the Element Type mapping, it will appear under the element map name.

Element Type Map for EC Migration: Division (division) Take Action ▾

* HRIS Element ID **division**
 Country Code for Country Specific Object
 GO Object Type **Division**

Element Field Map for EC Migration

HRIS Field Name	GO Field Name
created-on	createdDate
created-by	createdBy
last-modified-on	lastModifiedDate
last-modified-by	lastModifiedBy
externalCode	externalCode
name	name
start-date	effectiveStartDate
end-date	effectiveEndDate
description	description
status	effectiveStatus
headOfUnit	headOfUnit
parent	parentDivision
custom-string2	cust_string2
custom-string3	cust_string3
custom-string4	cust_string4
custom-string5	cust_string5
custom-string6	cust_string6
custom-string7	cust_string7
custom-date1	cust_date1
custom-date2	cust_date2
custom-long1	cust_long1

There are a few special handlings. In object definition, if you map a field that is translatable, for example, name or description, the behavior is the same as it was earlier. You will also have the field with the element map name. Additionally, you will have this field with the suffix for the language.

You have a picklist field and now you define a field in the object definition, for example, *cust_string4* is mapped to *custom-string4*.

Now you will have four attributes in OData. This entry means that you will have the following four fields:

- *cust_string4* (external code of picklist option)
- *customString4* (ECV2 option ID of picklist option)
- *cust_string4Nav* (navigation to MDF picklist option)
- *customString4Nav* (navigation to ECV2 picklist option)

The *cust_string4* and *cust_string4Nav* coming from the MDF object definition will be available even if you do not have an entry in the element type map.

If the element type map does not have *cust_string4*, that is, if it is not mapped there, you still have the *cust_string4* and *cust_string4Nav*

The *customString4* field contains the optionID of picklist option from ECV2. The *customString4Nav* field provides navigation to the old ECV2 picklist option. If you do not have an element type map, a default mapping is made available.

To delete a *cust_string*, select **Take Action > Make Correction**, and delete *cust_string4*.

The two extra fields will not be available now since there is no mapping.

Translations in OData API

Before the migration, migrated FOs exposed language-independent texts for *Name* and *Description*. In addition, it provided two links to FOTranslation to find the language-dependent texts for both fields. For example, the OData entities FOJobFunction and FOPayGroup provided the navigation attributes `nameTranslationNav` and `descriptionTranslationNav` to FOTranslation, if the translation of FOs is activated in Provisioning.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

After the migration, *Name* and *Description* will still be available for migrated FOs, to expose language-independent texts. In addition, the two navigation attributes will also be available. However, they will not be really linked to FOTranslation, but will always return an empty value. So the language-dependent texts will be integrated as additional attributes into the migrated FO Odata entity (for example FOJobFunction, FOPayGroup) in the standard MDF way.

Here is the work-around:

If you are not using FOTranslation for migrated FOs, de-select the FOTranslation navigation in Boomi. In case you are using FOTranslation for migrated FOs, you need to adapt the UI.

9.4.9.14.1 Basic Tasks

9.4.9.14.1.1 Viewing the Element Type Mapping

The element type mapping shows the mapping between HRIS field names and field names for the GOs. The steps to view the element type mapping for a migrated Foundation Object are described here

1. Navigate to *Admin Center*.
2. In the Tools Search field, enter **Manage Data**. The *Manage Data* page is displayed.
3. In the *Search* field, select *Element Type Map for EC Migration*.
4. Select the Foundation Object for which the mapping information is required. Now, the element map is available.

📌 Note

Not everyone can view the element Element Type Mapping. Grant the relevant permissions in [User Permissions](#) > [Miscellaneous Permissions](#) as follows:

- Element Type Map for EC Migration: Select View, Edit, Import/Export
- Element Type Map for EC Migration. Element Association Map for EC Migration (Element Association Map for EC Migration): Select View, Correct, Adjust Order, Delete, Import/Export
- Element Type Map for EC Migration. Element Field Map for EC Migration (Element Field Map for EC Migration): Select View, Correct, Adjust Order, Delete, Import/Export
- Element Type Map for EC Migration to EC2MDFElement FieldLocalizationMap (Element Localization Map for EC Migration): Select View, Correct, Adjust Order, Delete, Import/Export

9.4.9.14.1.2 Viewing the Object Definition

Describes how to view the object definition

1. Navigate to [Admin Center](#).
2. In the Tools Search field, type **Configure Object Definitions**. The [Configure Object Definitions](#) page is displayed.
3. From the [Search](#) dropdown, select [Object Definition](#).
4. Select the Foundation Object for which the information is required.

9.4.9.14.2 Associations

Let's say, in the object definition you have an association defined. The association is called [cust_toLegalEntity](#) and the definition is called [Legal Entity](#). In the Element Type map (under [Element Association Map for EC Migration](#) section), you have the association name [cust_toLegalEntity](#), which is mapped to HRIS destination entity [company](#). This association is handled in the same way as an association for an FO is defined in the Corporate Data Model. This means that you have the fields [companyFlx](#) and [companyFlxNav](#) in OData object definition. These fields will be available only if the association defined in the object definition is added to the Association Element Type map.

For GO associations, if the field is not in the association mapping, you will only have the field that has the same name as the association, for example, [cust_toLegalEntity](#). This field can be queried and upserted. If this field is added to the element association map, you will have the fields [companyFlxNav](#) and [companyFlx](#) for query and upsert respectively.

If you want to add an association or a field, and want the field to behave in the same way as before the migration, you must manually adjust the mapping objects.

9.4.9.14.3 Country/region-Specific Fields

Country/region-specific fields are fields of an object that are only relevant for specific countries or regions. For example, for legal entities in the US, you have to specify a Federal Reserve Bank ID, which is not relevant for legal entities in other countries or regions.

The only migrated FOs, which have country/region-specific fields, are Legal Entity (company) and Job Classification (jobCode).

In OData (as well as the MDF object model), these fields are not stored directly in the main entity (FO Company or FO Job Code). Instead, they are part of additional country/region-specific entities (see the sections [LegalEntity<Country/region>](#) and [JobClassification<Country/region>](#)). These country/region-specific entities can be reached from the main entity using navigation attributes.

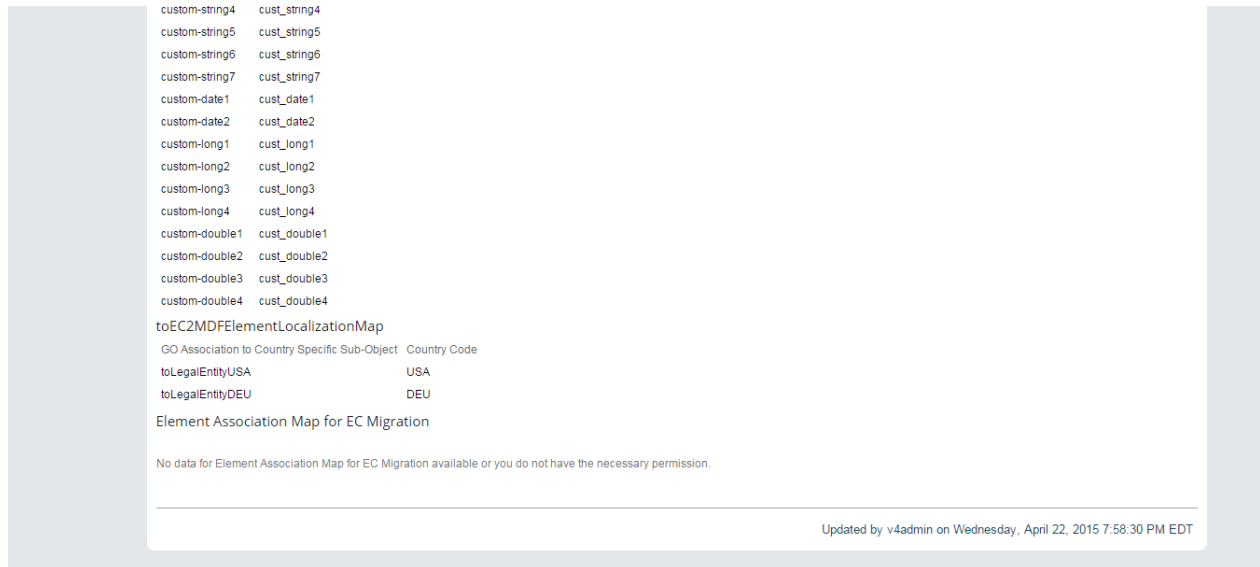

Points to note:

- For `FOCompany`, the navigation attributes for the delivered country or region specializations follow the naming conventions `toLegalEntity<Country/region>` (see the section [FOCompany](#)).
- For `FOJobCode`, there is an intermediate entity `JobClassificationCountry` (see section [JobClassificationCountry](#)).

So for example, you can reach the France-specific fields of a job classification along the path `FOJobCode/toJobClassificationCountry/toJobClassificationFRA`.

These navigation attributes and entity names differ from the legacy names. To ensure backward compatibility, you can activate the old behavior for individual countries or regions by maintaining the localization map in the element type map.

The following is an example of the element type map of Legal Entity (company):

Here, the localization map is maintained for two countries (USA and Germany). The effect of this is that, for these two countries, additional navigation attributes and target entities will be available in addition to the standard navigation attributes and entities described above. For USA, the effects are as follows:

- In addition to the standard entity `LegalEntityUSA`, there will be the backward-compatible entity `FOLegalEntityLocalUSA`. This means that the MDF object `LegalEntityUSA` has two different OData representations.
- In addition to the standard navigation attribute `toLegalEntityUSA` (with a target `LegalEntityUSA`), there is a navigation attribute `localNavUSA` (with a target `FOLegalEntityLocalUSA`).

Similarly, if you maintain the localization map for USA in the element type map of Job Classification (`jobCode`), the effects are as follows:

- In addition to the standard entity `JobClassificationUSA`, there will be the backward-compatible entity `FOJobCodeLocalUSA`. These are different representations of the same MDF object `JobClassificationUSA`.
- In addition to the standard navigation chain `toJobClassificationCountry/toJobClassificationUSA` (with target `JobClassificationUSA`), there is a shortcut navigation attribute called `localNavUSA` (with target `FOJobClassLocalUSA`).

If you do not maintain an element type map, you have the following localization mapping that is used (as a fall back):

For Legal Entity (company)

GO Association	Country/Region
<code>toLegalEntityARG</code>	ARG

GO Association	Country/Region
toLegalEntityDEU	DEU
toLegalEntityESP	ESP
toLegalEntityFRA	FRA
toLegalEntityUSA	USA

For Job Classification (jobCode)

GO Association	Country/Region
toJobClassificationCountry.toJobClassificationAUS	AUS
toJobClassificationCountry.toJobClassificationBRA	BRA
toJobClassificationCountry.toJobClassificationCAN	CAN
toJobClassificationCountry.toJobClassificationFRA	FRA
toJobClassificationCountry.toJobClassificationGBR	GBR
toJobClassificationCountry.toJobClassificationITA	ITA
toJobClassificationCountry.toJobClassificationUSA	USA

To add country/region-specific fields for a new country or region, refer to the section *Adding Country/region-Specific Fields for a New Country or Region*.

If you need the backward-compatible OData representation for a country added in this way, you must do the following:

- Maintain an entry in the localization map of the host element type map.
For this, you must add the association name for the new country or region and the ISO country code for it.
- Create an element type map for the new MDF object that you have created.
If you want to map the new country/region-specific fields to the legacy field names (for example, genericString1), you must maintain an element field map.

In the example for India (as in section *Adding Country/region-Specific Fields for a New Country or Region*), you must add the following:

- Localization Map of the Element Type Map of LegalEntity (company)
 - Association name: cust_toLegalEntityIND
 - Country: ITA
- Element Type Map for the new object cust_LegalEntityIND
 - HRIS element ID: legalEntityLocal#IND
 - Country code for country-specific object: IND
 - GO object type: cust_LegalEntityIND

[Adding Country/Region-Specific Fields for a New Country or Region \(For Legal Entity\) \[page 803\]](#)

9.4.9.14.3.1 Adding Country/Region-Specific Fields for a New Country or Region (For Legal Entity)

Assume that you want to add country/region-specific fields for a new country or region, let us take India for example. You need to follow these steps:

1. Create a new MDF object that holds the country/region-specific fields.
2. Assign this new object as a child object to LegalEntity.

Parent topic: [Country/region-Specific Fields \[page 800\]](#)

Related Information

[Adding Country/Region-Specific Fields for a New Country or Region \(For Job Classification\) \[page 808\]](#)

9.4.9.14.3.1.1 Step 1: Create a New MDF Object for the Country/Region-Specific Fields

Procedure

1. Navigate to the [Admin Center](#).
2. In the Tools Search field, type **Configure Object Definitions**. The [Configure Object Definitions](#) page is displayed.
3. From the [Create New](#) dropdown, select [Object Definition](#).
4. In the [Code](#) field, specify a code for the new object. It is recommended that you follow this naming convention: **cust_LegalEntity<Country Code>**. So, for this example, let's specify the code as **cust_LegalEntityIND**.
5. From the [Effective Dating](#) dropdown, select [From Parent](#).
6. In the [Label](#) field, specify a unique name. For this example, let's specify **Legal Entity India**.
7. Set [API Visibility](#) to [Editable](#).
8. In the [Fields](#) section, click [Details](#) against [externalCode](#).
9. Change the [externalCode](#) data type to [Number](#) and set its [Visibility](#) to [Not Visible](#).

9.4.9.14.3.2.2 Step 2: Assign the New Object to JobClassificationCountry

To assign the new country or region object to JobClassificationCountry, the steps are as follows:

Procedure

1. Navigate to the [Admin Center](#).
2. In the Tools Search field, type **Configure Object Definitions**. The [Configure Object Definitions](#) page is displayed.
3. From the *Search* dropdown, select [Object Definition](#).
4. Select [JobClassificationCountry](#) from the field next to it.
5. Select **Take Action** > **Make Correction**.
6. Scroll down to the associations section and add a new association. We suggest following this naming convention: **cust_toJobClassification<CountryCode>**. Following this naming convention, let's specify the name as **cust_toJobClassificationESP**.
 1. Multiplicity: One to One
 2. Destination Object: your newly created object (for example, Job Classification Spain)
 3. Type: Composite
 4. Details:
 1. Condition fieldID: country.code
 2. Condition Values: <Country Code>, in our example: ESP

9.4.9.14.4 Difference Between FO Upsert and MDF Upsert

Let's take an example. The FO Business Unit is associated to Legal Entity and you have an association to company 1. You do an upsert by specifying the start date and external code of the business unit. In this case, either the business unit is changed or a new one is created. Additionally, you list down the field that you want to change, for example, *companyFlx* for company 2 and a pipe-separated list of the association target for company 3. Now the existing association to company 1 is replaced and you have an association to company 2.

However, if you do an upsert through the MDF field *cust_toLegalEntity*, and specify company 1 and company 2, you will have three associations. The upsert through the MDF field will only add or merge the existing ones.

Hence for example, Position will behave in the MDF way (merge behavior), and Job Classification, which is not on MDF, will behave in the other manner (replacement).

9.4.9.14.5 CurrencyExchangeRate

This entity contains information about currency conversions based on the MDF object Currency Exchange Rate.

An example of the usage is given below:

The source currency is 1 unit of USD and the target currency is 1 unit of CAD. The exchange rate shows how much of the target currency (CAD) is needed to purchase one unit of the source currency (USD). Therefore, if the exchange rate is 1.0950, it costs 1.0950 Canadian dollars to purchase 1 U.S. dollar.

The currency exchange rate type DEFAULT corresponds to the Compensation legacy currency conversion table ECT_CONV_TABLE. The currency exchange rate type is defined as a picklist.

Object Information

```
MDF Object:CurrencyExchangeRate
Business Keys:sourceCurrency,targetCurrency,currencyExchangeRateType
Required
Fields:sourceCurrency,targetCurrency,effectiveStartDate,exchangeRate,currencyExchangeRateType
Full Purge:Yes
Incremental Purge:Yes
Effective-date:true
```

Supported Operations

Operation	Description
Query	Query currency exchange rate information.
Upsert	Create or update currency exchange rate information.

Operation	Description
Insert	Insert currency exchange rate information.
Merge	Update currency exchange rate information.
Replace	Replace existing currency exchange rate information with new information.
Delete	Delete currency exchange rate information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query Currency Exchange Rate Records

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/CurrencyExchangeRate?\$format=json&\$select=externalCode&\$top=3</code>

Response

```
{
  "d": {
    "results": [{
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-ARS-MYR')",
        "type": "SFOData.CurrencyExchangeRate"
      },
      "externalCode": "DEFAULT-ARS-MYR"
    }, {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-HKD-EUR')",
        "type": "SFOData.CurrencyExchangeRate"
      },
      "externalCode": "DEFAULT-HKD-EUR"
    }, {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-HKD-SGD')",

```

```

        "type": "SFOData.CurrencyExchangeRate"
      },
      "externalCode": "DEFAULT-HKD-SGD"
    }
  ]
}

```

Use Case 2: Get the Currency Exchange Rate USD to EUR

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ CurrencyExchangeRate(externalCode='DEFAULT-USD-EUR',effectiveStartDate=datetime'1900-01-01T00:00:00')?\$format=json

Response

```

{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-USD-EUR')",
      "type": "SFOData.CurrencyExchangeRate"
    },
    "effectiveStartDate": "\/Date(-2208988800000)\/",
    "externalCode": "DEFAULT-USD-EUR",
    "exchangeRate": "1.125",
    "targetCurrency": "EUR",
    "effectiveStatus": "A",
    "sourceCurrency": "USD",
    "currencyExchangeRateType": "DEFAULT",
    "sourceCurrencyNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-USD-EUR')/sourceCurrencyNav"
      }
    },
    "targetCurrencyNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-USD-EUR')/targetCurrencyNav"
      }
    },
    "currencyExchangeRateTypeNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='DEFAULT-USD-EUR')/currencyExchangeRateTypeNav"
      }
    },
    "effectiveStatusNav": {
      "__deferred": {

```

```

        "uri": "https://<API-Server>/odata/v2/
CurrencyExchangeRate(effectiveStartDate=datetime'1900-01-01T00:00:00',externalCode='
DEFAULT-USD-EUR')/effectiveStatusNav"
    }
}
}

```

Use Case 3: Update the Currency Exchange Rate USD to EUR

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert

Payload

```

{
  "__metadata": {
    "uri": "https://<API-
Server>/odata/v2/
CurrencyExchangeRate(effectiveStartDate=
datetime'1900-01-01T00:00:00',externalCo
de='DEFAULT-USD-EUR')",
    "type":
    "SFOData.CurrencyExchangeRate"
  },
  "exchangeRate": "1.125",
  "targetCurrency": "EUR",
  "effectiveStatus": "A",
  "sourceCurrency": "USD",
  "currencyExchangeRateType":
  "DEFAULT"
}

```

Response

```

{
  "d": [
    {
      "key": "CurrencyExchangeRate/
effectiveStartDate=1900-01-01T00:00:00.000-05:00,CurrencyExchangeRate/
externalCode=DEFAULT-ZAR-ARS",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}

```

Use Case 4: Delete the Currency Exchange Rate USD to EUR

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<API-Server>/odata/v2/ CurrencyExchangeRate(effectiveStartDate=da tetime'1900-01-01T00:00:00',externalCode=' DEFAULT-USD-EUR')</code>

Error Messages

The table below lists the error messages generated when using this API:

Error Message	Description
WORKSTRUCTURE_VALIDATION_EXCHANGE_RATE_MUST_BE_GREATER_THAN_ZERO	An exchange rate with source currency USD and target currency EUR must be greater than zero.
WORKSTRUCTURE_VALIDATION_IDENTICAL_SOURCE_TARGET_CURRENCIES_NOT_ALLOWED	Exchange rate with the same source currency and target currency is not allowed.
WORKSTRUCTURE_VALIDATION_REVERSE_RATE_OF_CURRENCY_PAIR_ALREADY_EXISTS	A reverse exchange rate with source currency USD and target currency EUR of currency exchange rate type DEFAULT already exists.
WORKSTRUCTURE_VALIDATION_RATE_OF_CURRENCY_PAIR_ALREADY_EXISTS	An exchange rate with source currency USD and target currency EUR of currency exchange rate type DEFAULT already exists.

9.4.9.14.6 FOBusinessUnit

The FOBusinessUnit entity represents the Generic Object Business Unit.

Object Information

```
MDF Object:BusinessUnit
Business Keys: externalCode + startDate
Effective-date:true
```

Supported Operations

Operation	Description
Query	Query business unit information.
Upsert	Create or update business unit information.
Insert	Insert business unit information.
Merge	Update business unit information.
Replace	Replace existing business unit information with new information.
Delete	Delete business unit information.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
mdfSystemRecordId	This property represents an MDF system field used as an identifier of an MDF record.

Use Case 1: Query the Information of Retail Business Unit

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/FOBusinessUnit? \$filter=externalCode eq 'RETAIL'&\$format=json

Response

9.4.9.14.7 FOCostCenter

The FOCostCenter entity represents the Generic Object Cost Center.

Object Information

```
MDF Object: CostCenter
Business Keys: externalCode + startDate
Effective-date:true
```

Supported Operations

Operation	Description
Query	You can query a cost center record.
Upsert	You can create or update a cost center record.
Insert	You can create a new cost center record.
Merge	You can update an existing cost center record.
Replace	You can replace an existing cost center record with a new record.
Delete	You can delete a cost center record.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
externalCode	This is a business key.
startDate	This is a business key.

Property	Description
entityUUID	This property is the same as the <code>mdfSystemEntityId</code> field in Generic Object Cost Center. You can use this property as a unique identifier of <code>FOCostCenter</code> entries during system integration.
entityOID	This property stores the One Domain Model (ODM) object ID that is used in master data integration.
mdfSystemRecordId	This property represents an MDF system field used as an identifier of an MDF record.

Use Case 1: Query a Cost Center Record by External Code and Start Date

Request

SAP Business Accelerator Hub: FODivision 

9.4.9.14.11 FOLegalEntityLocal<Country/Region>

This chapter covers several entities containing country/region-specific fields of legal entities. The country or region identifier in the entity name is the country/region ISO Code. For example, for Germany, the name of this entity is FOLegalEntityLocalDEU.

These entities are made available for backward-compatibility reasons only. For a particular country or region, the corresponding entity exists if the following pre-requisites are fulfilled:

- There is an MDF object modeled that holds the country/region-specific legal entity fields for this country or region.
- The **API Visibility** of the entity is different from *Not Visible*.
- The element type map contains information, which indicates that the backward-compatible entity should be offered for this country or region.

For more information, see the [Country/Region-Specific Fields](#) section.

By default, five such country/region-specific entities are pre-shipped. These are FOLegalEntityLocalARG, FOLegalEntityLocalDEU, FOLegalEntityLocalFRA, FOLegalEntityLocalESP, and FOLegalEntityLocalUSA.

Object Information

```
MDF Object:LegalEntity<Country/Region>
Business Keys: externalCode + startDate + country
Effective-date:true
```

Supported Operations

Query

Additional Country/Region-Specific Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

The country/region-specific properties for the five pre-shipped countries are listed below.

For Argentina:

Property Name in OData	Corresponding Field in Object Definition
genericString1	cuitCode

For Germany:

Property Name in OData	Corresponding Field in Object Definition
genericString1	taxUnit
genericString2	socialAccidentInsurance
genericString3	socialAccidentInsuranceRegistrationNumber

For Spain:

Property Name in OData	Corresponding Field in Object Definition
genericString1	certificadoDeldentificacionFiscal

For France:

Property Name in OData	Corresponding Field in Object Definition
genericNumber1	nafCode
genericNumber2	sirenCode

For USA:

Property Name in OData	Corresponding Field in Object Definition	Comments
genericNumber1	legalEntityType	The option ID of the legal entity type
genericString1	federalReserveBankID	
genericString2	fedReserveBankDistrict	
genericString3	employerID	
genericString4	eeoCompanyCode	
legalEntityType	legalEntityType	The external code of the legal entity type

Use Case: Get the External Code of Legal Entities in Canada

Error Codes

The table below lists different error codes generated when using this API.

AFFECTED_EXTERNAL_CODE_ERROR	This record cannot be saved since one or more records of this Code have reported errors.
END_DATE_EARLIER_THAN_START_DATE	Start date cannot be greater than end date.
INVALID_LEGACY_PICKLIST_OPTION_ID	This is an invalid picklist value in import file or database for String.

9.4.9.14.12 FOJobClassLocal<Country/Region>

Describes several entities containing country and region-specific fields of job classifications. The country identifier in the entity name is the country/region ISO Code. For example, for Brazil, the name of this entity will be FOJobClassLocalBRA.

These entities are made available for backward-compatibility reasons only. For a particular country or region, the corresponding entity exists if the following prerequisites are fulfilled:

- There is an MDF object modeled that holds the country/region-specific job classification fields for this country or region.
- The **API Visibility** of the entity is different from *Not Visible*.
- The element type map contains information, which indicates that the backward-compatible entity should be offered for this country or region.

By default, seven such country-specific entities are pre-shipped. These are FOJobClassLocalAUS, FOJobClassLocalBRA, FOJobClassLocalCAN, FOJobClassLocalGBR, FOJobClassLocalUSA, FOJobClassLocalITA, and FOJobClassLocalFRA. For more information, see the [Country/Region-Specific Fields](#) section.

Object Information

```
MDF Object: JobClassification<Country/Region>
Business Keys: externalCode + startDate + country
Effective-date:true
```

Supported Operations

Query

Additional Country/Region-Specific Properties

The country/region-specific properties for the seven pre-shipped countries are listed below.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Error Codes

The table below lists different error codes generated when using this API.

AFFECTED_EXTERNAL_CODE_ERROR	This record cannot be saved since one or more records of this Code have reported errors.
END_DATE_EARLIER_THAN_START_DATE	Start date cannot be greater than end date.

INVALID_LEGACY_PICKLIST_OPTION_ID

This is an invalid picklist value in import file or database for String.

9.4.9.14.14 FOJobFunction

The FOJobFunction entity represents the Generic Object Job Function.

Object Information

```
MDF Object:JobFunction
Business Keys: externalCode + startDate
Effective-date:true
```

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
mdfSystemRecordId	This property represents an MDF system field used as an identifier of an MDF record.

Use Case 1: Get the Job Function Information by External Code

[SAP Business Accelerator Hub: FOJobFunction](#) 

9.4.9.14.15 FOJobCode

The FO JobCode entity represents the Generic Object Job Classification.

Special Notes on FOJobCode Translation

Before the migration, you could handle the translatable fields in two ways. You would do translations for Job Code using Legacy Translations and FOTranslations. This is replaced with the MDF standard translation approach. Now translatable fields are handled in the same way as translatable fields in other migrated objects. This means that you have these additional fields such as name_en_US, name_en_GB, and so on in the object structure. To maintain backward compatibility, the old navigations to translations are maintained. However, they come with certain restrictions. Have a look:

Important changes to FOJobCode – name, description and custom string fields in APIs

- **Used locale to return data:** During migration of Job Code Translations, the Corporate Locale will be used to copy translations to the new persistency. While copying, the corporate language will be used to copy a default translations into the translatable fields of FO Job Code (such as name, description or custom string). After enabling the new translation feature, the SOAP and OData API will return those default values in the corporate language while it returned the values in the language of the API user before activating the feature. In case this corporate locale differs from the locale of the API user (can be seen in Employee Central UI through options for this user), the result of the translatable fields could differ. To avoid this, ensure that corporate language and API user language are the same before migrating or activating the new Job Code Translation feature in Provisioning. This is described later below.
- Before the migration, every custom string field of type *worker* was regarded as translatable if legacy translation was used. Thus, for every *worker* field, a navigation attribute was added leading to LocalizedData. After the migration, navigation attribute is still available, but this will not lead to any instance data.
- **Filters and sort on translation navigation:** After switching to the new Job Code Translation, the OData API will no longer support *filter*, and *order by* for the navigations of translatable fields in FO Job Code. Filter is still supported for default translation in field name. This means queries such as `/odata/v2/FOJobCode?$filter=nameTranslationNav/localizedDataTranslation+eq+'My Job Code'` will no longer be possible. Query such as `/odata/v2/FOJobCode?$filter=name+eq+'My Job Code'&$expand=nameTranslationNav` will still work.
- **Custom user ID fields:** If a custom string field was configured as of type *user*, the corresponding user ID was added to the translation table. With the new feature enabled, this user ID will now be returned in the corresponding field itself and is not available anymore in the translation table.

Important changes to LocalizedData – name, description and custom string fields in APIs

- **Top, skip, orderby, and query without filter:** After switching to the new Job Code Translation, the LocalizedData Entity can be queried using simple filter (using `eq` or `in`). However, there is no support anymore for query without filter or paging, and ordering or sorting. LocalizedData must be retrieved using the Job Code query using **expand** and not queried directly.
- **Shortcut access:** Direct access to the LocalizedData without **\$filter** such as `odata/vs2/LocalizedData(localizedDataCode=('TR:421';localizedDataLocale='en_GB'))` is not possible anymore. Use `odata/v2/LocalizedData?$filter=localizedDataCode+eq+'TR:421'+and+localizedDataLocale+eq+'en_GB'` instead or do a direct expand from FOJobCode entity.
- **Changed business keys:** LocalizedData will have a different code instead of `TR:11`. A number such as 34569811 originating from the new GOLocalizedData will be returned.
- **Null-values for a translation:** This happens if LocalizedData is not returned anymore by the OData API. This is also true for expanded navigations in FOJobCode.

Additional Information

Set API User and Corporate Locale (in Provisioning)

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

To minimize impact of change, make sure that you deal with setting the language as follows:

1. You have set the default language for your corporation in Provisioning.
2. You have set the user language under **Options > Change Language**. Make sure that the user language and the default language are the same.
3. Activate the Provisioning settings.

Object Information

```
MDF Object:JobClassification
Business Keys: externalCode + startDate
Effective-date:true
```

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Property	Description
localNavDEFAULT	Do not use this navigation property because it navigates to the empty entity <code>FOJobClassLocalDEFAULT</code> .
mdfSystemRecordId	This property represents an MDF system field used as an identifier of an MDF record.

      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}

```

Error Codes

The table below lists different error codes generated when using this API.

AFFECTED_EXTERNAL_CODE_ERROR	This record cannot be saved since one or more records of this Code have reported errors.
END_DATE_EARLIER_THAN_START_DATE	Start date cannot be greater than end date.
INVALID_LEGACY_PICKLIST_OPTION_ID	This is an invalid picklist value in import file or database for String.

Related Information

[SAP Business Accelerator Hub: FOJobCode](#)

9.4.9.14.16 FOPayGroup

The FOPayGroup entity represents the Generic Object Pay Group.

Object Information

```
MDF Object: PayGroup
Business Keys: externalCode + startDate
Effective-date: true
```

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
mdfSystemRecordId	This property represents an MDF system field used as an identifier of an MDF record.

Use Case 1: Get the Pay Group Information for China

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/FOPayGroup?\$format=json&\$filter=externalCode eq 'CN'

9.4.9.14.17 PayCalendar

This is a foundation object that describes a pay calendar for a particular pay group. This means it is the collection of all pay periods referring to the same pay group.

Object information

```
MDF Object: PayCalendar
Business Keys: payGroup
Effective-date: false
```

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Get the Pay Calendar for the APAC Pay Group

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/PayCalendar? \$format=json&\$filter=payGroup eq 'APAC_GROUP'

Response

```
{
  "__metadata": {
    "uri": "https://<API-Server>/odata/v2/PayCalendar('APAC_GROUP')",
    "type": "SFOData.PayCalendar"
  },

9.4.10.3 Benefit

This entity is used to create and configure benefits. It is used for reimbursements and allowances, such as medical bills, higher education, and a company car.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
benefitId	Benefit ID. This is a business key.

Property	Description
effectiveStartDate	The date and time the benefit is effective. This is a business key.

Use Case: Query a Benefit Entry by Key

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ Benefit(benefitId='746',effectiveStartDate= =datetime'2015-01-01T00:00:00')

Response

```

9.4.10.6 BenefitClaimAccumulation

This entity enables the accumulation of benefit claims so they can be tracked within a defined cycle.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>claimWindowStart</code>	The start date for the claim.
<code>claimWindowEnd</code>	The end date for the claim.
<code>remainingAmount</code>	The amount remaining after claim is made.
<code>accumulatedAmount</code>	The amount that has already been claimed.
<code>balanceCarryForwardAmount</code>	The amount that is carried forward.

Navigation Properties

Navigation Property	Related Entity	Description
<code>Benefit Claim Accumulation</code>	<code>benefitBalanceCarryForwardDetail</code>	Gets the <code>BalanceCarryForwardDetails</code> .
<code>Benefit Claim Accumulation</code>	<code>benefitClaims</code>	Gets the Benefit Employee Claim details.

Use Case: Get Vendor Information

A query operation on the `VendorInfo` entity returns all the information related to a given vendor.

9.4.10.14 BenefitEmployeeClaim

This entity stores the details of the claim transactions made by the employees for the various benefits in the company.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>claimDate</code>	The date the benefit is claimed.
<code>entitlementAmount</code>	The amount the employee is eligible to claim.
<code>totalAmount</code>	The amount that the employee is claiming for.
<code>benefitDataSourceWithExternalCode</code>	The list of benefits that the employee is eligible to claim for.

Navigation Properties

Navigation Property	Related Entity	Description
<code>BenefitEmployeeClaim</code>	<code>BenefitEmployeeClaimDetail</code>	Contains additional detail fields required during claim of a benefit.
<code>BenefitEmployeeClaim</code>	<code>BenefitFuelReimbursementClaimDetail</code>	Contains additional detail fields required during claim of the fuel benefit.
<code>BenefitEmployeeClaim</code>	<code>BenefitDependentDetail</code>	Contains additional fields required to capture the dependent information.
<code>BenefitEmployeeClaim</code>	<code>BenefitDocuments</code>	Stores information about policy documents, forms, useful links.

Navigation Property	Related Entity	Description
BenefitEmployeeClaim	BenefitLeaveTravelReimbursementClaim	Contains additional fields required to capture the leave travel information.
BenefitEmployeeClaim	BenefitFuelReimbursement	Contains additional fields required to capture the fuel reimbursement information.

Use Case: Get details of the claim transactions made by the employees

9.4.10.15 BenefitEnrollment

This entity contains a list of all the benefits for which an Employee is eligible. An employee uses this object to enroll for eligible benefits.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>entitlementAmount</code>	The entitlement amount of the benefit.
<code>benefitDataSourceWithExternalCode</code>	The data source field for benefits.
<code>effectiveStartDate</code>	The start date of enrollment.
<code>effectiveEndDate</code>	The end date of enrollment.
<code>amount</code>	The total amount for which user has enrolled.

Navigation Properties

Navigation Property	Related Entity	Description
BenefitEnrollment	BenefitCompanyCarEnrollment	This is additional field that contains company car enrollment details.
BenefitEnrollment	BenefitPensionFundEnrollmentContributionDetail	This field contains benefit pension fund related information.
BenefitEnrollment	BenefitPensionDependentNominees	This field contains the information about the Dependent Nominees.
BenefitEnrollment	BenefitPensionNonDependentNominees	This field contains the information about the Non Dependent Nominees.
BenefitEnrollment	BenefitPensionEnrollmentContributionDetail	This field contains the information related to pension enrollment contribution.
BenefitEnrollment	BenefitCompanyHousingEnrollment	This field contains company housing related information.

Use Case: Get the list of all the enrolled benefits for the employee

9.4.10.19 BenefitEnrollmentProcessConfiguration

This entity contains information about the enrolment processor type, enrolment screen configuration, and benefit groups. This entity is used for benefit enrolment configuration to meet a better user experience for Admins and End-end users.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
configurationCode	This field returns the external code or UUID.
configurationName	This field returns the name of the configured object.
effectiveFrom	This field returns effective From Date.
enrollmentProcessType	This field returns enrollment Process Type.
openEnrollmentSchedule	This field returns the Open enrollment Schedule period.
currency	This field returns currency.
workflow	This field returns workflow.
regularEnrollmentScreenConfiguration	This field returns the regular enrollment screen configuration.
offcycleEnrollmentScreenConfiguration	This field returns the off cycle enrollment screen configuration.
legalEntities	This field returns the legal entity.
benefitsGroups	This field returns the benefits group.

Navigation Properties

Navigation Property	Related Entity	Description
ConfigureBenefitsGroupforEnrollmentProcess	BenefitEnrollmentProcessConfiguration	Navigation to the composite child association which holds the list of benefit group style and benefits.

Use Case: Get the BenefitEnrollmentProcessConfigurationobjects Created in the System

This example shows how to get all the BenefitEnrollmentProcessConfigurationobjects created in the system..

9.4.10.20 BenefitEnrollmentProcessScreenTemplate

This entity contains information about the enrolment process screening template like regular and off cycle Enrollment Screen Configuration. This entity is used as a landing page for benefit enrollment process configuration.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>configurationCode</code>	This field returns the external code or UUID.
<code>effectiveFrom</code>	This field returns the effective from date.
<code>enrollmentProcessTitle</code>	This field returns enrollment process title.
<code>introductionTitle</code>	This field returns the Introduction title.
<code>introductionDescription</code>	This field returns the Introduction description.
<code>familyMembersReviewTitle</code>	This field returns the family member's review title.
<code>familyMembersReviewDescription</code>	This field returns the family member's review description.

Use Case: Get the BenefitEnrollmentProcessScreenTemplate Objects Created in the System

This example shows how to get all the BenefitEnrollmentProcessScreenTemplate objects created in the system.

9.4.10.24 BenefitsIntegrationOneTimeInfo

This entity contains information about one time integration information of a benefit. It is used for obtaining one time integration information of the saving plan.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
id	This field returns the external code or UUID.
workerId	This field returns the worker id.
benefit	This field returns benefit.
category	This field returns category of saving plan.
payCompDate	This field returns pay component Date.
payComponent	This field returns pay component.
value	This field returns amount.
currency	This field returns currency.
unitOfMeasure	This field returns unit of measure.
benefitEnrollment	This field returns benefit enrollment.
benefitSchedulePeriod	This field returns benefits schedule period.
reference	This field returns reference.

Use Case: Get the BenefitsIntegrationOneTimeInfo created in the system

9.4.10.26 BenefitsException

This entity contains information about all the exceptions that occur if the enrollment amount does not match the eligibility criteria or if the enrollment period has expired.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>exceptionStartDate</code>	The start date for benefits exception.
<code>exceptionEndDate</code>	The end date for benefits exception.

Navigation Properties

Navigation Property	Related Entity	Description
<code>BenefitException</code>	<code>BenefitExceptionDetails</code>	This contains the information related to different benefits and the schedule periods for which exception is granted.

Navigation Property	Related Entity	Description
BenefitException	BenefitProgramExceptionDetails	This contains the information related to different benefit programs and the schedule periods for which exception is granted.

Use Case: Get Details of Benefit exceptions that occur when the enrollment period has expired

9.4.10.44 BenefitProgramEnrollment

This entity contains the list of all of the benefit programs for which an employee is eligible.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
benefitProgramDataSourceWithExternalCode	The list of all benefit programs for which employee is eligible.
effectiveStartDate	The start date from which program enrollment is effective.
effectiveEndDate	The end date after which program enrollment is no longer active.
programAmount	The total amount for program enrollment.
programEntitlementAmount	The amount that employee is entitled to receive.

Navigation Properties

Navigation Property	Related Entity	Description
BenefitProgramEnrollment	BenefitProgramEnrollmentDetail	This field contains the information for benefit program enrollment.

Use Case: Get the list of all the program enrollments for which the employee is eligible

Request

Operation	Query
HTTP Method	GET

[SAP Business Accelerator Hub: BenefitProgramEnrollment](#)

9.4.10.45 BenefitProgram

This entity is a bucket or pool that contains more than one benefit.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
programName	The name of the program.
effectiveStartDate	The program start date.
amount	The cost of the program.
programEnrollmentWorkflowId	The enrollment workflow ID for the program.

Navigation Properties

Navigation Property	Related Entity	Description
BenefitProgram	benefits	Benefits associated to the program.
BenefitProgram	policyDocuments	Policy documents for the program.
BenefitProgram	forms	Forms related to the program.
BenefitProgram	usefullinks	Links associated to the program.

Use Case: get the list of all benefit programs in the system

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/BenefitProgram

9.4.10.53 BenefitSchedulePeriod

This is used for defining a period (set of dates) within which a particular benefit and claim is available for enrollment and eligible for an employee.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
periodName	The name of the period.

Property	Description
enrollmentWindowStartDate	The start date of the enrollment window.
enrollmentWindowEndDate	The end date of the enrollment window.
enrollmentEffectiveFrom	The day from which the enrollment is effective.
enrollmentValidityEndDate	The last day on which the enrollment is effective.
claimWindowStartDate	The start date of the claim.
claimwindowEndDate	The end date of claim.
balanceCarryForwardUptoDate	The balance of a claim that is allowed to carry forward to a specific date.

Use Case: Get details of the benefit schedule periods in the system

9.4.10.59 BenefitsIntegrationRecurringInfo

This entity contains Benefit Recurring amounts that aren't payments or deductions such as Employer contribution and Fixed amount imputed income. This can be used to replicate or integrate the benefit recurring amounts to the payroll system.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	The object is populated from code and hence external code is filled with UUID.
benefit	This holds the MDF reference to Benefit object.
payComponent	This holds the FO reference to PayComponentEO object.
benefitEnrollment	This holds the MDF reference to BenefitEnrollment object.
benefitSchedulePeriod	This holds the MDF reference to BenefitSchedulePeriod object.
unitOfMeasure	This holds the MDF reference to UnitOfMeasure object.
workerId	This holds Employee's Users Sys ID.
currency	This holds the MDF reference to Currency object.

Property	Description
frequency	This holds the FO reference to FrequencyEO object.

Use Case 1: Get the recurring amounts for an <employee> 'admin'

9.4.10.60 BenefitPensionAdditionalContributionLimits

This `BenefitPensionAdditionalContributionLimits` entity contains information about the minimum and maximum limits of Additional Voluntary Contribution (AVC) from an employee. Additional Voluntary Contribution is supported only for the pension/retirement plan type *Workplace* with contribution options as *Employee with Employer Match* or *Minimum and Maximum Limits*.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>contributionLimitId</code>	This field returns the external code or UUID.
<code>contributionLimitName</code>	This field returns the name of the configured object.

Property	Description
effectiveStartDate	This field returns the effective start date of the configured object.
currency	This field returns the currency maintained in the configured object.
minAdditionalContributionAmount	This field returns the minimum or lower limit of Additional Voluntary Contribution for the employee.
maxAdditionalContributionAmount	This field returns the maximum or upper limit of Additional Voluntary Contribution for the employee.

Use Case: Get the BenefitPensionAdditionalContributionLimits Objects Created in the System

This example show how to get all the BenefitPensionAdditionalContributionLimits objects created in the system.

9.4.10.68 EmployeeWithEmployerMatchContributions

This entity contains information about the matching employee and employer contribution percentages for pension plan type [Workplace](#).

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
configurationId	This field returns the external code or UUID.

Property	Description
configurationName	This field returns the name of the configured object.
employeeWithEmployerMatchContributionEntries	This field returns composite child association which holds the list of employee employer matching contribution percentage entries.

Use Case: Get the EmployeeWithEmployerMatchContributions Objects Created in the System

This example shows how to get all the EmployeeWithEmployerMatchContributions objects created in the system.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ EmployeeWithEmployerMatchContributions?\$format=json

Response

9.4.10.69 EmployeeWithEmployerMatchContributionEntries

This entity contains a single set of contribution values that matches one employee contribution percentage with the corresponding employer contribution percentage for pension plan type *Workplace*. An instance of this entity is a single entry in the parent entity EmployeeWithEmployerMatchContributions.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
eeERMatchValuesID	This is the external code and is populated automatically during creation of the parent object.
eeContributionPercentage	This is the contribution percentage from the employee.
erContributionPercentage	This is the contribution percentage from the employer.
isDefault	This represents whether an entry of this object shall be treated as the default entry for its parent object. It can be true for only one entry.

Use Case: Get the Employee and Employer Matching Contribution Entries

This example shows how to get all the employee and employer matching contribution entries.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ EmployeeWithEmployerMatchContributionEntries?\$format=json</code>

Response

9.4.10.71 InsuranceBenefitDetails

This entity contains information about the fields specific to insurance type benefits. This entity is used when a new insurance type benefit is created by admin users.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	This field returns the external code or UUID.
insuranceType	This field returns the insurance type.
nomineeRelevant	This field returns whether nominee is relevant or not.
decimalPrecisionSettingForContributionAmount	This field returns if decimal precision settings are applicable.

Property	Description
defaultPlan	This field returns the default insurance plan.
defaultEnrolleeOptions	This field returns the default enrollee options.
defaultCoverage	This field returns the default coverage.
insurancePlans	This field returns the list of insurance plans
insuranceFieldConfiguration	This field returns regular enrollment screen configuration.

Navigation Properties

Navigation Property	Related Entity	Description
InsuranceEnrollmentFieldsConfiguration	InsuranceBenefitDetails	Navigation to the composite child association which holds the list of enrolment fields and their visibility settings.

Use Case: Get the InsuranceBenefitDetails Object

This example shows how to get the InsuranceBenefitDetails object created in the system for a particular Insurance Benefit..

9.4.10.72 InsuranceEnrollmentFieldsConfiguration

This entity contains information about the visibility settings for insurance specific fields. This entity is used to hide or display insurance specific fields to the user based on configurations made.

This entity is used to hide or display insurance specific fields to the user based on configurations made.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
configurationId	This field returns the external code or UUID.
insuranceFieldName	This field returns the insurance field name to be hidden or displayed.
visibilitySettingsEnum	This field returns the Show or Hide setting for the insurance field.

Use Case: <Get the InsuranceEnrollmentFieldsConfiguration Object

This example shows how to get the InsuranceEnrollmentFieldsConfiguration object created in the system for a particular Insurance Benefit..

Request

Operation	Query
HTTP Method	GET
URI	https://<hostname>/odata/v2/ Benefit(benefitId='BEN_INS_TEST_API',effectiveStartDate=datetime'2022-11-21T00:00:00')/insuranceBenefitDetails/ insuranceFieldConfiguration?\$format=JSON

9.4.10.73 IRSPremiumTable

The `IRSPremiumTable` entity contains the age bracket for imputed income calculation for excess coverage along with exempt amount and factor. The IRS table is the basis for the imputed income calculation with monthly rates.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center ▶ API Center ▶ OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>configurationId</code>	This field returns the external code.
<code>configurationName</code>	This field returns the external name.
<code>effectiveStartDate</code>	This field returns the effective start date.
<code>exemptedAmount</code>	This field represents exempted amount.
<code>currency</code>	This field represents currency.

Property	Description
factor	This field represents factor.
ageVerificationDate	This field represents As of Day.
ageVerificationMonth	This field represents As of Month.
ageVerificationYear	This field represents As of Year.
imputedCostForAgeRanges	This field represents the imputed cost for age ranges.

Use Case: Get the IRS Premium Table Entries

This example shows how to get all the IRS Premium Table entries.

9.4.10.76 PensionBenefitDetails

This entity contains pension related details of a benefit. An instance of this entity is a single entry in the parent entity Benefit. This entity is used to represent a single entry pension details inside the parent entity Benefit.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
ageOfRetirement	This field returns retirement age.
country	This field returns Country.
employeeWithEmployerMatchContributions	This field returns contribution details for pension type 'Workplace' and contribution type 'Employee with Employer Match.'
multipleFundSelectionsAllowed	This field represents whether the benefit is with single or multiple pension funds.
pensionContributionOptions	This field represents the contribution option for pension type 'Workplace'.
pensionEligibilityRuleId	This field holds the rule to evaluate eligibility of pension and its applicable for pension type 'Workplace' and 'Savings Plan'
pensionMinMaxContributionLimits	This field return the contribution limit details for pension type 'Workplace' and contribution type 'Minimum and Maximum Limit'.
typeOfPension	It returns the pension type.
benefitSavingsPlanSubType	This field holds the savings plan subtype details for pension type 'Savings Plan'.
bandingsConfiguration	This field returns the bands based on Pensionable Earnings details for pension type 'Workplace' and contribution type 'Payroll Pensionable Earnings'

Navigation Properties

Navigation Property	Related Entity	Description
statutoryMinimumLookUp	BenefitPensionStatutoryMinimum- Lookup	Navigation to the composite child association which has pension statutory details.
pensionEnrollmentFieldsSetupList	PensionEnrollmentFieldsSetup	Navigation to the composite child association which has details for visibility setup of pension fields.
employerContributionDetail	PensionEmployerContributionDetail	Navigation to the composite child association which has details for employer contribution.
pensionFunds	BenefitPensionFund	Navigation to the composite child association which has details for pension fund.
pensionAdditionalEmployeeContributionDetail	PensionAdditionalEmployeeContributionDetail	Navigation to the composite child association which has additional contribution details(Additional Volunteer contribution) from employee.

Navigation Property	Related Entity	Description
pensionUKDetails	PensionUK	Navigation to the composite child association which has fields specific to GBR country.

Use Case: Get the Pension Benefit Details Entries

9.4.10.77 PensionBandingConfiguration

The `PensionBandingConfiguration` parent entity contains the configuration details of the bands based on payroll pensionable earnings. The entity is supported only for the pension/retirement plan type *Workplace* with contribution options as *Payroll Pensionable Earnings*.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>bandingConfigurationId</code>	This field represents the unique ID of object.
<code>bandingConfigurationName</code>	This field represents the object name.
<code>effectiveStartDate</code>	This field returns the effective start date.
<code>currency</code>	This field represents currency.
<code>pensionBandingConfigurationDetails</code>	This field represents the entity that contains the contribution guidelines based on the bands.

Use Case: Get the PensionBandingConfiguration Entries

This example shows how to get all the `PensionBandingConfiguration` entries from the system.

9.4.10.79 PensionEmployeeContributionDetail

This entity contains employee contribution details of pension. An instance of this entity is a single entry in the parent entity PensionBenefitDetails. This entity is used to represent a single entry of employee contribution inside the parent entity PensionBenefitDetails.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
employeeContributionType	This field returns the type of employee contribution.
employeeStatutoryMinimumAmount	This field holds the minimum amount of employee contribution as per statutory.
employeeStatutoryMinimumPercentage	This field holds the minimum percentage of employee contribution as per statutory.
employeeContributionAmount	This field holds the amount of employee contribution.
employeeContributionPercentage	This field holds the percentage of employee contribution.

Property	Description
employeeCanEditEmployeeContribution	It gives whether employee is allowed to edit employee contribution or not.
employeeContributionRule	This field holds the rule which evaluates the employee contribution.

Use Case: Get the Pension Employee Contribution Entries

  }
}
```

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
schemeType	It returns scheme type.
sconNumber	It returns SCON number.
qualifyingScheme	It returns qualifying scheme for pension.
taxationMode	It returns taxation mode.
retroCalculationMode	It returns retro calculation mode.
pensionSchemeStartDate	It returns the pension scheme start date.

Use Case: Get the UK Region Specific Pension Details Entries

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/PensionUK?\$format=json</code>

Response

```

9.4.10.85 SavingsAccountUSA

This entity contains information about the savingsplansubtype, contribution amounts, paycomponents and savingaccountdetails. This entity is used for getting savings account details for the country USA.

Note

This API is read-only. To create or edit data, please use imports function.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
savingsPlanSubType	This field returns savings plan sub type.
annualMinContributionAmount	This field returns the minimum annual contribution amount.
annualMaxContributionAmount	This field returns the maximum annual contribution amount.

Property	Description
beneficiaryRelevant	This represents boolean field which is specific for a savings-plansubtype HAS.
empAnnualLimitPayComponent	This field represents employee annual limit pay component.
annualMaxPayComponent	This field represents annual maximum pay component.
employerPayComponent	This field represents employer pay component.
isEmployerContributionRequired	This field is Boolean.
employerContributionHSA	This field represents employer contribution for HSA type.
savingsPlanCatchUpDetail	This field represents savings plan catchup details.
savingsAccountTierConfiguration	This field returns composite child association which contains coverage details and annual contribution amounts.
savingsAccountDeductionDetails	This field returns composite child association which contains savings account deduction details.

Navigation Properties

Navigation Property	Related Entity	Description
savingsAccountDeductionDetails	SavingsAccountUSA	Navigation to the composite child association which has savings account deduction details.
savingsAccountTierConfiguration	SavingsAccountUSA	Navigation to the composite child association which has coverage and contribution amounts detail.

Use Case: Get the SavingsAccountUSA Entries

This example shows how to get all the SavingsAccountUSA entries.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/SavingsAccountUSA?\$format=json</code>

[Bank \[page 1082\]](#)

This entity contains bank-related information such as Bank Name, BIC, Bank Address, and so on.

[PaymentInformationDetailV3GHA and PaymentInformationDetailV3SUR \[page 1085\]](#)

These entities store the country/region dependent fields for Payment Information Details for Ghana and Suriname. You can use these entities to create, modify or delete the PaymentInformationDetailV3's child objects PaymentInformationDetailV3GHA entity and PaymentInformationDetailV3SUR entity.

[PaymentInformationDetailV3ZAF \[page 1088\]](#)

You can use this entity to access the Payment Information Screen for South Africa (ZAF).

[PaymentInformationDetailV3MOZ \[page 1099\]](#)

This entity stores the country-dependent fields of payment information details for Mozambique. You can use this entity to create, modify or delete the PaymentInformationDetailV3's child objects.

[PaymentInformationDetailV3BOL \[page 1103\]](#)

These entities store the country/region dependent fields for Payment Information Details for Bolivia. You can use these entities to create, modify or delete the PaymentInformationDetailV3's child objects PaymentInformationDetailV3BOL entity.

[PaymentInformationDetailV3PRY \[page 1107\]](#)

These entities store the country/region dependent fields for Payment Information Details for Paraguay. You can use these entities to create, modify or delete the PaymentInformationDetailV3's child objects PaymentInformationDetailV3PRY entity.

9.4.11.1 Bank

This entity contains bank-related information such as Bank Name, BIC, Bank Address, and so on.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Querying Bank Details

The following example shows how to query bank details.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://api-server/odata/v2/Bank?\$format=json&\$select=externalCode,branch,city,postalCode,street,businessIdentifierCode&\$top=2</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://api-server/odata/v2/Bank('921')",
          "type": "SFOData.Bank"
        },
        "externalCode": "921",
        "routingNumber": "012-002",
        "bankBranch": null,
        "city": null,
        "street": null,
        "postalCode": null,
        "businessIdentifierCode": null,
        "bankName": "ANZ Martin Place and Pitt Street Martin Place",
        "bankCountry": "AUS",
        "effectiveStatus": "A"
      },
      {
        "__metadata": {
          "uri": "https://api-server/odata/v2/Bank('922')",
          "type": "SFOData.Bank"
        },
        "externalCode": "922",
        "routingNumber": "013-006",
        "bankBranch": null,
        "city": null,
        "street": null,
        "postalCode": null,
        "businessIdentifierCode": null,
        "bankName": "ANZ Melbourne (388 Collins)",
        "bankCountry": "AUS",
        "effectiveStatus": "A"
      }
    ]
  }
}
```

Use Case: Creating or Updating a Bank Object

The following example shows how to create or update bank details.

Request

Operation	Upsert
HTTP Method	POST
URI	https://api-server/odata/v2/upsert?\$format=json
Request Payload	

Sample Code

```
{
  "__metadata": {
    "uri": "https://api-server/odata/v2/Bank('12345')",
    "type": "SFOData.Bank"
  },
  "externalCode": "12345",
  "bankBranch": null,
  "city": null,
  "street": null,
  "postalCode": null,
  "businessIdentifierCode": null,
  "bankName": "Testing Bank of USA",
  "bankCountry": "USA",
  "effectiveStatus": "A"
}
```

Response

```
{
  "d": [
    {
      "key": "Bank/externalCode=12345",
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Additional Information

The property <bankCountry> stores the internal ID of the country MDF object.

Entity Relationship Diagram

Use Case 1: <Query the XXX for a single user>

The following example uses Mozambique as an example shows how to query the payment information details of one country for a single user.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/ PaymentInformationDetailV3(PaymentInformationV3_effectiveStart artDate=datetime'2019-09-04T00:00:00',PaymentInformationV3_ worker='155',externalCode=22890L)/ toPaymentInformationDetailV3MOZ?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://localhost:443/odata/v2/  
PaymentInformationDetailV3MOZ(PaymentInformationDetailV3_externalCode=22890L,Payment  
InformationV3_effectiveStartDate=datetime'2019-09-04T00:00:00',PaymentInformationV3_  
worker='155',externalCode=22916L)",
      "type": "SFOData.PaymentInformationDetailV3MOZ"
    }
  }
}
```

Payload

```
{
  "__metadata": {
    "uri":
      "PaymentInformationDetailV3MOZ(PaymentInformationDetailV3_externalCode=22890L,PaymentInformationV3_effectiveStartDate=datetime'2019-09-04T00:00:00',PaymentInformationV3_worker='155',externalCode=22916)"
  },
  "accountType": "SAVINGS"
}
```

Response

```
<?xml version="1.0" encoding="utf-8"?>

9.4.11.5 PaymentInformationDetailV3BOL

These entities store the country/region dependent fields for Payment Information Details for Bolivia. You can use these entities to create, modify or delete the PaymentInformationDetailV3's child objects PaymentInformationDetailV3BOL entity.

Permissions

Payment Information V3 is enabled for your company instance.

Supported Operations

Query, Upsert, Insert, Delete.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

9.4.11.6 PaymentInformationDetailV3PRY

These entities store the country/region dependent fields for Payment Information Details for Paraguay. You can use these entities to create, modify or delete the PaymentInformationDetailV3's child objects PaymentInformationDetailV3PRY entity.

Permissions

Payment Information V3 is enabled for your company instance.

Supported Operations

Query, Upsert, Insert, Delete.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

9.4.12 Payroll

9.4.12.1 DataReplicationProxy

You use this entity to store references to Employee Central Time data that are relevant for replication to your selected system/landscape, like Employee Central Payroll or SAP ERP HCM, and to identify all delta changes of your replicated time data. It only contains a limited number of references to available Employee Central Time objects.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Retrieving Data Replication Proxies

Request

Operation

Query

HTTP Method	GET
URI	https://<api-server>/odata/v2/ DataReplicationProxy?\$format=json

Response

```
{
  "d": {

9.4.12.2 EmployeePayrollRunResults

You use this entity to retain information about the employees replicated payroll run results for a particular period of time.

Permissions

- ▶ [User Permissions](#) ▶ [Miscellaneous Permissions](#) ▶

Supported Operations

Query, Insert, Upsert, Merge, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Cases

This is the query operation for EmployeePayrollRunResults entity which is further associated with EmployeePayrollRunResultsItems with 1:N relationship. This query is requesting the data for an employee called 'maryusa1' and in response, the required data will be retrieved.

Request

Operation	QUERY
URI	<code>https://<api-server>/odata/v2/ EmployeePayrollRunResults? \$format=json&\$filter=userId eq 'maryusa1'&\$expand=employeePayrollRunResul ts</code>
Headers	Authorization: Basic <Base 64 encoded ("user@com- pany:password")>

Additional Information

The *PayrollDataMaintenanceTaskConfiguration* entity is an external API for the Employee Central Payroll solution. It is used by the Employee Central Payroll system to upsert a JSON-Array of *PayrollDataMaintenanceTaskConfiguration* objects that are used for country/region-specific payroll configuration. It includes additional payroll-relevant tasks for the admin. For example, after a hire, there is additional payroll-relevant employee data that needs to be entered. It gives the admin a list of infotypes that need to be maintained to complete the payroll aspect of the new hire.

Additional information:

- Child MDF: *PayrollDataMaintenanceTaskTypeConfiguration*. It contains the enum of the task type (for example `new_hire`) and the list of infotypes that are required for the configuration of events.
- Grandchild MDF: *PayrollDataMaintenanceTaskTypeLinkConfiguration*. It contains the infotype details that are required for the configuration of events.

9.4.12.5 PayrollSystemConfiguration

You use this entity to fetch and display payroll system configuration objects in the Payroll Configuration UI like payroll system configuration data, payroll data maintenance task configuration data and payroll portlets data.

Supported Operations

Query, Insert, Upsert

Use Case: Creating and Updating Payroll System Configuration objects

Request

Operation	Upsert

9.4.12.6 SAPSystemConfiguration

The *SAPSystemConfiguration* entity is an external API for the Employee Central Payroll solution. It's used by the Employee Central Payroll system to fetch and display *SAPSystemConfiguration* objects. It's used to maintain data required to connect to payroll systems.

Permissions

Note

To be able to use this API, you must have Employee Central Payroll or Payroll Integration enabled in your instance. Contact Product Support to enable these features.

Supported Operations

Query, Insert, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Creating and Updating SAPSystemConfiguration Objects

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert</code>

Payload

```
[
  {
    "__metadata": {
      "uri": "SAPSystemConfiguration(externalCode='ABC/123')"
    },
    "payrollSystemUrl": "https://<api-server>",
    "payrollSystemClientId": "123"
  },
  {
    "__metadata": {
      "uri": "SAPSystemConfiguration(externalCode='DEF/456')"
    },
    "payrollSystemUrl": "https://<api-server>",
    "payrollSystemClientId": "456"
  }
]
```

Response

9.4.13 Person

9.4.13.1 PerAddressDEFLT

The `PerAddressDEFLT` contains information about a person's addresses.

HRIS Element Information

```
HRIS Element ID:homeAddress
Business Key: personIdExternal + effectiveStartDate + addressType
Permission Mode: HRIS element permission control
Effective-date:true
Foundation Type:false
Person Entity Element:true
Supports Incremental Load:true.
Supports NO_OVERWRITE: yes.
```

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
operation	To delete a record, use the upsert operation and set this property to DELIMIT.

Use Case 1: Query the Persons with a Specific Address

This example shows how to query all persons whose state in the business address is California.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/PerAddressDEFLT?\$filter=state eq 'CA' and addressType eq 'business'&\$select=state,address1,address2,personIdExternal&\$top=1&\$format=JSON</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          uri: "https://<API-Server>/odata/v2/public/PerAddressDEFLT(addressType='business',personIdExternal='jtong1',startDate=datetime'1993-02-15T00:00:00') "
        },
        type: " SFOData.PerAddressDEFLT "},
        personIdExternal: "jtong1"
        state: "CA"
        address1: "1500 Fashion Island Blvd."
        address2: "Ste. 300"
      }
    ]
  }
}
```

Use Case 2: Update the Home Addresses of an Employee

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert

Payload

```
{
  "__metadata": {
    "uri": "PerAddressDEFLT",
    "type": "SFOData.PerAddressDEFLT"
  },

```

Country/Region-Specific Logic

You can define the attributes of the `PerAddressDEFLT` fields differently for countries and regions in the Succession Data Model and the Country/region-Specific Data Model. As it is not possible to have multiple entities per country or region, this OData API exposes a single entity `PerAddressDEFLT`, and offers a single field for all countries and regions.

See [PerAddressDEFLT \[page 570\]](#) for more information.

9.4.13.2 PerBiographicalInfoLoc<Country/Region>

This entity contains the localized biographical information for an employee.

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
region-of-birth	To specify your region of birth. The input value can be either free text or a picklist according to your configurations.
place-of-birth	To specify your region of birth. The input value can be either free text or a picklist according to your configurations.

Navigation Properties

Navigation Property	Related Entity	Description
personNav	PerPerson	Navigation to the PerPerson entity that contains biographical information for the corresponding person
countryNav	Territory	Navigation to the Territory entity describing the country or region for PerGlobalInfo
regionOfBirthNav	PicklistOption	Navigation to the PicklistOption entity

Use Case 1: Query the Localized Biographical Information of an Employee

The example shows how to query the biographical information detail of an employee based in France.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/PerBiographicalInfoLocFRA(country='FRA',personIdExternal='sbaker1')?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://localhost:443/odata/v2/PerBiographicalInfoLocFRA(country='FRA',personIdExternal='sbaker1')",
      "type": "SFOData.PerBiographicalInfoLocFRA"
    }
  }
}
```

```

    },
    "country": "FRA",
    "personIdExternal": "sbaker1",
    "placeOfBirth": "Aubel",
    "lastModifiedDate": "/Date(1604044320000+0000)/",
    "createdBy": "admin",
    "lastModifiedBy": "admin",
    "createdDateTime": "/Date(1604035670000+0000)/",
    "regionOfBirth": "5344",
    "createdOn": "/Date(1604064470000)/",
    "lastModifiedOn": "/Date(1604073120000)/",
    "personNav": {
      "__deferred": {
        "uri": "https://localhost:443/odata/v2/
PerBiographicalInfoLocFRA(country='FRA',personIdExternal='sbaker1')/personNav"
      }
    },
    "countryNav": {
      "__deferred": {
        "uri": "https://localhost:443/odata/v2/
PerBiographicalInfoLocFRA(country='FRA',personIdExternal='sbaker1')/countryNav"
      }
    },
    "regionOfBirthNav": {
      "__deferred": {
        "uri": "https://localhost:443/
odata/v2/PerBiographicalInfoLocFRA(country='FRA',personIdExternal='sbaker1')/
regionOfBirthNav"
      }
    }
  }
}
}
}

```

Use Case 2: Update the Localized Biographical Information of an Employee

This example shows how to update the localized biographical information of an employee.

Request

Operation	Upsert
HTTP Method	POST
URI	http://<API-Server>/odata/v2/upsert
Payload	<pre> { "__metadata": { "uri": "PerBiographicalInfoLocUSA(country='USA',personIdExternal='456')" }, "placeOfBirth": "Boston", "regionOfBirth": "MA", "customLong1": "1234", "customDate1": "/Date(1496275200000)/", "customString1": "ABC" } </pre>

Response

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>

```

9.4.13.3 PerEmail

This `PerEmail` API enables you to read, update, create, or delete an employee's email address.

HRIS Element Information

```
HRIS Element ID:emailInfo
Business Keys: personIdExternal + emailType
Effective-date:false
Foundation Type:false
Person Entity Element:true
Supports Incremental Load: true
Supports NO_OVERWRITE: true
```

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
operation	To delete a record, use the upsert operation and set this property to DELETE.

Use Case 1: Get Email Addresses by Specific Criteria

The example shows how to get the Private and Primary email addresses.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/PerEmail?\$filter=emailType eq '8448' and isPrimary eq 'true'&\$select=emailAddress&\$format=JSON</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/PerEmail(emailType='8448',personIdExternal='109031')",
          "type": "SFOData.PerEmail"
        },
        "emailAddress": "Firstname.Lastname@bestrunsap.com"
      }
    ]
  }
}
```

Use Case 2: Update an Email Address

This example shows how to update a user's business Email address.

Request

Operation	Upsert
-----------	--------

HTTP Method

POST

URI

https://<API-Server>/odata/v2/Upsert

Payload

↔ Sample Code

```
{
  "__metadata": {
    "uri":
"PerEmail(emailType='8448',personIdExternal='109031')",
    "type": "SFOData.PerEmail"
  },
  "emailAddress":
"Marcushoff@samplecorporation.com"
}
```

Response

↔ Sample Code

```
{
  "d": [
    {
      "key": "PerEmail/emailType=8448,PerEmail/personIdExternal=109031",
      "status": "OK",

9.4.13.4 PersonEmpTerminationInfo

You can use the `PersonEmpTerminationInfo` API to expose the latest termination date of an employee.

Supported Operations

Operation	Description
Query	You query an employee's active employment counts, Person ID, and latest termination date via <code>\$expand</code> from the <code>PerPerson</code> entity, but not directly query the <code>PersonEmpTerminationInfo</code> entity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Retrieve the Latest Termination Date of a Specific Employee

This example shows how to retrieve the latest termination date of an employee with `$expand` from `PerPerson`. The latest termination date is represented by the `<latestTerminationDate>` field.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<API-Server>/odata/v2/PerPerson?\$format=json&\$expand=personEmpTerminationInfoNav &\$select=personEmpTerminationInfoNav&\$filter=personEmpTerminationInfoNav/personIdExternal+eq+'admin'</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
```

```

    "uri": "https://<API-Server>/odata/v2/PerPerson('admin')",
    "type": "SFOData.PerPerson"
  },
  "personEmpTerminationInfoNav": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
PersonEmpTerminationInfo('admin')",
      "type": "SFOData.PersonEmpTerminationInfo"
    },
    "personIdExternal": "admin",
    "activeEmploymentsCount": 1,
    "latestTerminationDate": null
  }
}
]
}
}

```

9.4.13.6 PerGlobalInfo<Country/Region>

This entity contains the global information for an employee.

HRIS Element Information

```
HRIS Element ID:globalInfo
Business Keys: personIdExternal + startDate + country
Effective-date:true
Foundation Type:false
Person Entity Element:true
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Query, Upsert

Properties and Navigation Properties

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
personIdExternal	The employee ID
country	The country or region where the employee works
createdOn	The date that the global information was added
createdBy	The ID of the person who created the global information entry
lastModifiedOn	The date that the global information was modified
lastModifiedBy	The ID of the person who made the last update to the global information entry
customString(1,20)	An optional field for a string with 1-20 characters
customDate(1,10)	An optional field for a date with 1-20 characters.
customLong(1,20)	An optional field for numbers with 1-20 characters

Property	Description
customDouble(1,20)	An optional field for a double precision decimal
endDate	The date the global information is set to inactive
operation	To delete a record, use the upsert operation and set this property to DELIMIT.

Navigation Properties

Navigation Property	Related Entity	Description
countryNav	Territory	Navigation to the Territory entity describing the country or region for PerGlobalInfo
personNav	PerPerson	Navigation to the PerPerson entity that contains biographical information for the corresponding person

Use Case 1: Get the Global Information of an Employee

This example shows how to get the global information of an employee based in USA.

Request

Operation	Query
HTTP Method	GET
URI	<pre>https://<API-Server>/odata/v2/PerGlobalInfoUSA(country='USA',personIdExternal='dr1sfmgr11',startDate=datetime'2001-01-05T00:00:00')&\$format=JSON</pre>

--

Related Information

[Permission Settings \[page 554\]](#)

9.4.13.8 PerPerson

You can use this OData API to display non-effective-dated biological information about an employee such as date and place of birth, and date of death.

HRIS Element Information

```
HRIS Element ID:personInfo
Business Keys: personIdExternal
Effective-date:false
Foundation Type:false
Person Entity Element:true
Supports Incremental Load:true
Supports NO_OVERWRITE: true
```

Supported Operations

Operation	Description
Query	
Upsert	Upsert is supported with an incremental purge

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
personIdExternal	Business key.
custom-string1, custom-string2, custom-string3	These three custom string fields are filterable, so you can query <code>PerPerson</code> with filters on these fields rather than fetch all the records. In some cases they are used to store external system IDs.

Navigation Properties

Navigation Property	Related Entity	Description
SecondaryAssignmentNav	SecondaryAssignments	Navigation to the SecondaryAssignments to know which employment contract is the primary one for replication scenarios
personEmpTerminationInfoNav	PersonEmpTerminationInfo	Navigation to the personEmpTerminationInfo to get the latest employment date for an employee.
personTypeUsageNav	PersonTypeUsage	Navigation to PersonTypeUsage. The PersonTypeUsage entity is used by the PerPerson entity to query person records, and can be filtered by person type.

Use Case 1: Get the First PerPerson Record

This example shows how to get the first record of an employee's information.

Request

Operation	Query
HTTP Method	GET
URI	http://<API-Server>/odata/v2/PerPerson?\$top=1&\$format=JSON

Response

```

Use Case 2: Add a New Employee

Refer to [PerPerson Upsert \[page 1522\]](#) for information on how you can use this entity to add a new employee.

Related Information

[SAP Business Accelerator Hub: PerPerson](#) 

[Permission Settings \[page 554\]](#)

[Adding a New Employee \[page 1521\]](#)

[PerPerson Upsert \[page 1522\]](#)

[PersonEmpTerminationInfo \[page 1154\]](#)

[Differentiating primary from secondary employment during concurrent employment replication \[page 1539\]](#)

9.4.13.8.1 generateNextPersonID

You use this API to generate the next person ID assigned for a new hire, incrementing it as required.

The generated IDs are used in the `User` entity (fields: `username` and `userID`), `PerPerson` entity (field: `personIdExternal`, `userID`), `Employment` entity (fields: `personIdExternal` and `userID`), `Person Objects` (field: `personIdExternal`), `Employment Objects` (field: `userID`).

Note

If you configure business rules for generating next person IDs, the rules are skipped in this API, which is different from the behaviors on the [Add New Employee](#) page.

Supported Operations

HTTP Method: POST

Return Type: `GenerateNextPersonIDResponse`

Support Payload (`sap:support-payload`): false

Use Case 1: Creating a Single ID

Use the `Insert` operation to create a single ID for a new hire.

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/generateNextPersonID?\$format=json

Response

```
{
  "d" : {
    "GenerateNextPersonIDResponse" : {
      "personID" : "214"
    }
  }
}
```

Use Case 2: Creating Multiple IDs

Use the Insert operation to create multiple IDs for new hires.

Note

When you generate more than one ID, use a \$BATCH statement to avoid too many roundtrips. Make sure that users use the generated IDs in a unique way. Any unused numbers will create gaps since the API generates the numbers in an incremental fashion.

Request

HTTP Method	POST
URI	https://<API-Server>/odata/v2/\$batch

Payload

```
--batch_36522ad7-fc75-4b56-8c71-56071383e77b

Related Information

[Permission Settings \[page 554\]](#)

9.4.13.9 PerPersonal

This entity contains an employee's personal information such as name, gender, and marital status.

HRIS Element Information

```
HRIS Element ID:personalInfo
Business Keys: personIdExternal + startDate
Effective-date:true
Foundation Type:false
Person Entity Element:true
Supports Incremental Load:true
Supports NO_OVERWRITE: true
Supports MCPD: false
```

Supported Operations

Operation	Description
Query	You can also choose whether to include or exclude internal and external user data from these queries. You can do this by using the filter described in Filtering out external user data [page 1527] .
Upsert	The Upsert operation requires two steps: first, upsert non-country/region-specific fields; then do upsert operation for the country or region. Note Person_id_external and start_date are required in the Upsert request.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
operation	To delete a record, use the upsert operation and set this property to DELETE.

Use Case 1: Query Personal Information of Specific Persons

Use the Query operation to get the First and Last name of all persons whose first or last name starts with "Ca".

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/PerPersonal?\$filter=firstName like 'Ca%' or lastName like 'Ca%'&\$select=firstName,lastName&\$format=JSON</code>

Response

[SAP Business Accelerator Hub: PerSocialAccount](#)
[Permission Settings \[page 554\]](#)

9.4.13.13 PersonKey

You can use this entity to expose the person UUID for integration and import scenarios.

Supported Operations

Operation	Description
Query	You query PersonKey via \$expand from the User entity. You can't query PersonKey directly.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description	Permission
UserAccountNav	UserAccount	Navigate to account information, for example, the user name and status of the account. You query the account information through \$expand from the User entity: \$expand= PersonKeyNav/UserAccountNav.	To run a query for account information, you also need the User Account OData entity permission. You can find it under ► Administrator Permissions ► Manage User ►.

Use Case: Retrieve the perPersonUuid

In integration and import scenarios, you can use `PersonKey` to retrieve the person UUID represented by the `<perPersonUuid>` field. This field is automatically populated by the system when a user is created. The value is immutable meaning that you can't change it.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/User('admin')?\$format=json&\$expand=personKeyNav&\$filter=personKeyNav/perPersonUuid eq '3A085DB0D9184B49B0E3E70D6F07EB1A'</code>

Response

```
{
  "d": {

9.4.14.3 Position

Use the `Position` entity to query position details, create, and edit positions.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
code	Business key
effectiveStartDate	Business key
businessUnit	The Business Unit in which this Job Posting belongs.

Property	Description
effectiveStatus	<p>Effective status of the position. Possible values:</p> <ul style="list-style-type: none"> • A: Active • I: Inactive <p>This field is required.</p>
employeeClass	<p>Employee class values can be found in MDF picklist EmployeeClass.</p>
externalName_<locale>	<p>A list of properties representing the external name of the position in different languages as indicated by the locale code.</p>
externalName_defaultValue	<p>Default external name of the position.</p>
location	<p>The code of the location in which this Job Posting is located.</p>
positionTitle	<p>This is a deprecated field. Please use externalName instead.</p>
standardHours	<p>The standard number of hours per week for this position.</p>

Navigation Properties

Navigation Property	Related Entity	Description
incumbentNav	User	<p>Information about the user stored in the incumbent field of the position.</p> <div style="border: 1px solid orange; padding: 5px; margin-top: 10px;"> <p>⚠ Caution</p> <p>This entry doesn't reflect whether the employee is assigned to the position. That information is stored in the employee's Job Information. The <i>incumbentNav</i> field is used by only Succession Management. Don't use it in Position Management.</p> </div>
parentPosition	Position	Parent position.
positionMatrixRelationship	PositionMatrixRelationship	Matrix relationship of the position
rightToReturn	RightToReturn	Indicates whether an employee on global assignment or leave of absence can return to their original position.
successorNav	Successor	Successor of the position.

Use Case 1: Querying Position Details by Keys

This examples show show to query the details of a position by its business keys.

Use Case 2: Creating a Position with Insert

This example shows how to create a position entry using insert.

Request

Operation	Insert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/Position
Headers	Accept: application/json Content-Type: application/json
Payload	<pre>{ "__metadata": { "uri": "Position" }, "code": "11223344", "effectiveStartDate": "/Date(1574245948000)/", "positionTitle": "HR Administrator", "effectiveStatus": "A" }</pre>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/Position(code='11223344',effectiveStartDate=datetime'2019-11-20T00:00:00')",
      "type": "SFOData.Position"
    },
    "positionTitle": "HR Administrator",
    "effectiveStatus": "A",
    "effectiveStartDate": "/Date(1574208000000)/",
    "code": "11223344"
  }
}
```

Use Case 3: Modifying a Position

You can modify a position by merging fields or by replacing existing fields. The example below shows how to do this using merge.

Request

Operation	Merge
HTTP Method	POST
URI	https://<API-Server>/odata/v2/ Position(code='11223344',effectiveStartDate=datetime'2019-11-20T00:00:00')
Headers	x-http-method: MERGE Content-Type: application/json
Payload	<pre>{ "comment": "Updating position location", "location": "1710-2009" }</pre>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/  
Position(code='11223344',effectiveStartDate=datetime'2019-11-20T00:00:00')",
      "type": "SFOData.Position"
    },
    "positionTitle": "HR Administrator",
    "effectiveStatus": "A",
    "effectiveStartDate": "/Date(1574208000000)/",
    "code": "11223344"
  }
}
```

9.4.14.4 Function Imports

9.4.14.4.1 getPositionObjectData

You can use this function import to get the data of a position object.

Supported Operations

HTTP Method: GET

Return Type: RuleFieldMappingBeanList

Support Payload: false

Parameters

Parameter	Type	Description	Required
positionId	Long	ID of the position object.	Yes
userId	String	ID of the user who occupies the position.	Yes

Use Case: Retrieve the Position Object Data of a User by Position ID

This example API call creates and returns a list of mapping of fields between SAP Fieldglass field names and position field values for the given position ID in user's locale by executing the rule defined in the Position Management Settings.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ getPositionObjectData? positionId=11545533L&userId=clewis1</code>

Response

```
<d:RuleFieldMappingBeanList xmlns:d="http://schemas.microsoft.com/ado/2007/08/  
dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/  
metadata" m:type="SFOData.RuleFieldMappingBeanList">  
  <d:ruleFieldMappings m:type="Bag(SFOData.RuleFieldMappingBean)">  
    <d:element>  
      <d:fieldName>fg_location</d:fieldName>  
      <d:fieldValue>NL_AMS</d:fieldValue>
```

```
</d:element>
<d:element>
  <d:fieldName>fg_jobTitle</d:fieldName>
  <d:fieldValue>Developer 1</d:fieldValue>
</d:element>
<d:element>
  <d:fieldName>OWNER</d:fieldName>
  <d:fieldValue>clewis1</d:fieldValue>
</d:element>
<d:element>
  <d:fieldName>TITLE</d:fieldName>
  <d:fieldValue>SF Analyst_DE</d:fieldValue>
</d:element>
</d:ruleFieldMappings>
</d:RuleFieldMappingBeanList>
```

9.4.15 Service Center

9.4.15.1 ServiceCenterConfiguration

You can use this entity to configure labels for the Landing page and Create Ticket page of the Ask HR application.

Permissions

► [User Permissions](#) ► [Miscellaneous Permissions](#) ► [Service Center Configuration](#) ►

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
LandingPageConfiguration	LandingPageConfiguration	Landing page configuration of Service Center
CreateTicketPageConfiguration	CreateTicketPageConfiguration	Create Ticket page configuration of Service Center

Use Case 1: Query Service Center Configuration

This example shows how to query the Service Center configuration.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/v2/ServiceCenterConfiguration?\$expand=landingPageConfiguration,createTicketPageConfiguration&\$format=json</code>

Response

```

Supported Operations

Query

Use Case 1: Query AskHR Landing Page Configuration

This example shows how to query the Landing page configuration.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/v2/LandingPageConfiguration? \$format=json

Response

```
{
  "d": {
    "results": [
      {

9.4.16 Time & Attendance Management

9.4.16.1 Time Off

In this section, you'll find the APIs available for Time Off. You can use Time Off to manage absences such as vacation, sick leave, and paid time off.

Before using any of the Time Off entities described here, you need to switch on Time Off in the Admin Center. For details of how to do this, take a look at the *Activating Time Management* documentation in the *Implementing Time Management in SAP SuccessFactors* guide.

In addition, you need to have permission to use the individual objects in question. For information on these permissions, take a look at the *Permissions in Time Off* documentation in the *Implementing Time Management in SAP SuccessFactors* guide.

Note

The following fields are set to *Visible* and *Read Only* by default: *CreatedDate*, *CreatedBy*, *LastModifiedDate*, and *LastModifiedBy*. The fields are set to *Read Only* for the *EmployeeTime*, *TimeAccountPayout*, and *TimeAccountPurchase* objects. It's possible that the fields are visible on the Manage Data user interface. If you'd like to hide them, follow the steps to hide the fields lined out in each object definition.

9.4.16.1.1 AbsenceCountingMethod

You can enter an absence counting method in a time type, to determine which days are included in calculating an absence taken of that time type. You can also determine the basis on which the calculation takes place and the weekdays to which the calculation base should apply.

Operations Allowed

Query

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations, and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
externalName	No	Yes	External Name for all relevant languages
countryRegion	No	No	Absence counting methods can be country/region-specific. If this one is, the relevant country/region appears here.
base	No	Yes	Option that is used for the absence calculation. Work Schedule / Calendar Days
monday	No	Yes	Yes/No whether the day is covered by this method.
tuesday	No	Yes	Yes/No whether the day is covered by this method.
wednesday	No	Yes	Yes/No whether the day is covered by this method.
thursday	No	Yes	Yes/No whether the day is covered by this method.
friday	No	Yes	Yes/No whether the day is covered by this method.
saturday	No	Yes	Yes/No whether the day is covered by this method.
sunday	No	Yes	Yes/No whether the day is covered by this method.
considerHolidays	No	Yes	Choose Yes here if you want to take account of holidays when calculating an absence.

9.4.16.1.2 AccrualCalculationBase

The entity is used to store reported times (per user and date). The records need to be provided to this storage from a data source outside Time Off, such as by import or integration using OData. The entity represents the raw data.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Code Examples

Example 1: Create a new entry

URI: `http://<api-server>/odata/v2/upsert`

Payload

```
{
  "__metadata" : {
    "uri" : "http://localhost:8080/odata/v2/AccrualCalculationBase(externalCode='country_2015-12-28')",
    "type" : "SFOData.AccrualCalculationBase"
  },
  "externalCode" : "country_2015-12-28",
  "userId" : "country",
  "actualQuantity" : 6,
  "date" : "\/Date(1451260800000)\/"
}
Response:
{
  "d" : [
    {
      "key" : null,
      "status" : "OK",
      "editStatus" : "UPSERTED",
      "message" : null,
      "index" : 0,
      "httpCode" : 200,
      "inlineResults" : null
    }
  ]
}
```

Example 2: Retrieve data

URI: `http://<api-server>/odata/v2/AccrualCalculationBase?$format=json`

Operation: GET

Response:

```
{
  "d" : {
    "results" : [
      {
        "__metadata" : {
```

```
"uri" : "https://localhost:443/odata/v2/
AccrualCalculationBase('country_2015-12-28')", "type" :
"SFOData.AccrualCalculationBase"
},
"externalCode" : "country_2015-12-28",
"mdfSystemEffectiveEndDate" : "\/Date(253402214400000)\/", "mdfSystemObjectType" :
"AccrualCalculationBase",
"mdfSystemVersionId" : null,
"lastModifiedDateTime" : "\/Date(1451465919000+0000)\/",
"date" : "\/Date(1451260800000)\/",
"mdfSystemTransactionSequence" : "1",
"mdfSystemRecordId" : "02114EA3DE97476A910F425807E9C03E",
"mdfSystemEntityId" : "A38105E8A5354C81A7AF20895B66924F",
"userId" : "country",
"mdfSystemStatus" : "A",
"lastModifiedDateWithTZ" : "\/Date(1451465919000+0000)\/",

9.4.16.1.6 EmployeeTime<Country/Region>

Country/region-specific entities for EmployeeTime are available. Take a look at the sub-sections to see which countries are supported with country/region-specific fields. These entities are child entities of EmployeeTime.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Australia: EmployeeTimeAUS

This entity contains Australia specific absence fields, which is used for requesting advance leave payment.

Canada: EmployeeTimeCAN

This entity contains three date fields specific to Canada, which is used for short term disability in Time.

Colombia: EmployeeTimeCOL

Admin can use this object to store Colombia-specific details of an EmployeeTime created for sick leave. It is used only when Colombia is the country in the time type and contains only the GO reference to the EmployeeTimeGroup used for linking of absences. This MDF is effective dated from parent.

Germany: EmployeeTimeDEU

This entity contains information about employee time created for sick leave. It is specific to Germany and is a child of the entity EmployeeTime.

Spain: EmployeeTimeESP

This entity contains information about employee time created for sick leave. It is specific to Spain and is a child of the entity EmployeeTime.

Mexico: EmployeeTimeMEX

This entity contains information about employee time created for sick leave. It is specific to Mexico and contains the field Reference Number which is only required for maintaining employee time in Mexico. Apart from this country/region-specific field, this object also holds the GO reference to the group Identical Sicknesses which is used for the linking of absences.

Sample Query for creating EmployeeTimeMex `http://<api-server>/odata/v2/EmployeeTime('<external-code of Employee Time>')/countryExtensionMEX`

Netherlands: EmployeeTimeNLD

This entity contains a Netherlands specific field to record the available working capacity of an employee when recovering from illness in Time Off

Poland: EmployeeTimePOL

This entity contains ZLA Code, ZLA Document Number, ZLA Issue Date and ZLA Delivery Date. This object is used to store the employee specific Time fields information for a Polish Employee.

USA: EmployeeTimeUSA

This entity contains three date fields specific to USA, which is used for short term disability in Time.

[EmployeeTimeAUS \[page 1235\]](#)

This entity contains Australia-specific absence fields, which are used for requesting advance leave payment.

[EmployeeTimeCAN \[page 1237\]](#)

This entity contains three date fields specific to Canada, which are used for short-term disability in Time Management.

[EmployeeTimeCOL \[page 1239\]](#)

This entity contains absence-related information for Colombia.

[EmployeeTimeDEU \[page 1242\]](#)

This entity contains information about absences for employees in Germany.

[EmployeeTimeESP \[page 1245\]](#)

This entity contains specific information for Spain related to absence.

[EmployeeTimeMEX \[page 1246\]](#)

This entity contains absence-related information for Mexico.

[EmployeeTimeNLD \[page 1247\]](#)

This entity contains a field specific to the Netherlands that is used to record the work capacity of an employee when recovering from illness in Time Management.

[EmployeeTimePOL \[page 1249\]](#)

This entity contains ZLA Code, ZLA Document Number, ZLA Issue Date and ZLA Delivery Date. This object is used to store the employee-specific Time Management fields information for an employee based in Poland.

[EmployeeTimeUSA \[page 1251\]](#)

This entity contains date fields specific to USA, which are used for short-term disability in Time Management.

9.4.16.1.6.1 EmployeeTimeAUS

This entity contains Australia-specific absence fields, which are used for requesting advance leave payment.

Supported Operations

Query, Insert, Upsert, Delete.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
requestLeaveAdvancePayment	The option to request the advance leave payment.
splitPaymentAcrossFinancialYear	The option to request the split of the payment across the financial year.

Use Case: Query the Advance Leave Payment information for an employee in Australia

This example shows how to query the advance leave payment information for an employee in Australia.

9.4.16.1.6.2 EmployeeTimeCAN

This entity contains three date fields specific to Canada, which are used for short-term disability in Time Management.

Supported Operations

Query, Insert, Upsert, Delete.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
disabilityPeriodOneEndDate	This field is used to record the end date of the first short-term disability absence.
disabilityPeriodTwoEndDate	This field is used to record the end date of the second short-term disability absence.
disabilityPeriodThreeEndDate	This field is used to record the end date of the third short-term disability absence.
refDisabilityPeriodOneEndDate	This field is used to record the reference end date of the first short-term disability period.
refDisabilityPeriodTwoEndDate	This field is used to record the reference end date of the second short-term disability period.
refDisabilityPeriodThreeEndDate	This field is used to record the reference end date of the third short-term disability period.
policyDeviation	This field is used to record a deviation from the policy for short-term disability absences.

Use Case: Getting the short-term disability absence information for an employee in Canada

Querying the short-term disability absence information for an employee based in Canada.

Related Information

[SAP Business Accelerator Hub: EmployeeTimeCOL](#)

9.4.16.1.6.4 EmployeeTimeDEU

This entity contains information about absences for employees in Germany.

Supported Operations

Query, Insert, Upsert, Delete.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center ▶ API Center ▶ OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
continuedPayCreditedDays	This field is used to record the days credited for continued pay.
identicalSicknessGroup	This field is used to record an identical sickness group.
overlappingSicknessGroup	This field is used to record an overlapping sickness group.
continuedPayEndDate	This field is used to record the end date of continued pay.
paySupplementStartDate	This field is used to record the start date of the sick pay supplement.
paySupplementEndDate	This field is used to record the end date of the sick pay supplement.
sicknessCertificateStartDate	This field is used to record the certified start date of the sickness.
refContinuedPayEndDate	This field is used to record the reference end date of continued pay.
refPaySupplementStartDate	This field is used to record the reference start date of the sick pay supplement.
refPaySupplementEndDate	This field is used to record the reference end date of the sick pay supplement.
deviationFromSickPayPeriods	This field is used to record a deviation from sick pay periods.

Use Case: Query the Continued Sick Pay Information for an employee in Germany

This example shows how to query the continued sick pay information for an employee in Germany.

Related Information

[SAP Business Accelerator Hub: EmployeeTimeDEU](#)

9.4.16.1.6.5 EmployeeTimeESP

This entity contains specific information for Spain related to absence.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Code Examples

Example: Retrieve data of the EmployeeTimeESP objects in JSON. (In this case there are no such objects)

URI: `http://<api-server>/odata/v2/EmployeeTimeESP?$format=json`

Method: GET

Response:

Sample Code

```
{  
  "d": {  
    "results": []  
  }  
}
```

9.4.16.1.6.6 EmployeeTimeMEX

This entity contains absence-related information for Mexico.

Supported Operations

Query, Insert, Upsert, Delete.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
referenceNumber	This field is used to record the first disability period end date for the short-term disability absence.
identicalSicknessGroup	This field is used to record the second disability period end date for the short-term disability absence.
daysAlreadyCumulatedForSameSickness	This field is used to record the third disability period end date for the short-term disability absence.

Use Case: Getting "prima vacacional" information for an employee based in Mexico

Querying the "prima vacacional" (annual entitlement) information for an employee based in Mexico.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/EmployeeTimeMEX?\$format=json</code>

Response

9.4.16.1.6.7 EmployeeTimeNLD

This entity contains a field specific to the Netherlands that is used to record the work capacity of an employee when recovering from illness in Time Management.

Supported Operations

Query, Insert, Upsert, Delete.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>workCapacityPercentageDuringIllness</code>	This field is used to store the percentage of an employee's (reduced) work capacity due to illness until they are able to return to their regular work schedule.

Use Case: Getting the available work capacity information for an employee in the Netherlands

Querying the work capacity information of an employee based in the Netherlands during a period of illness.

Request

Operation	Query
HTTP Method	GET

9.4.16.1.6.8 EmployeeTimePOL

This entity contains ZLA Code, ZLA Document Number, ZLA Issue Date and ZLA Delivery Date. This object is used to store the employee-specific Time Management fields information for an employee based in Poland.

Supported Operations

Query, Insert, Upsert, Delete

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

► [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
absenceCode	The reference code related to the absence.
zlaDocumentNumber	The document number from the ZLA sickness certificate.
zlaIssueDate	The date on which the illness was reported to the ZLA authority
zlaDeliveryDate	The date on which the ZLA certificate was delivered by the employee to the employer.

Use Case: Querying the ZLA information for an employee based in Poland

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/EmployeeTimePOL?format=json</code>

Response

```
{

9.4.16.1.6.9 EmployeeTimeUSA

This entity contains date fields specific to USA, which are used for short-term disability in Time Management.

Supported Operations

Query, Insert, Upsert, Delete.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
disabilityPeriodOneEndDate	This field is used to record the first disability period end date for the short-term disability absence.

Property	Description
disabilityPeriodTwoEndDate	This field is used to record the second disability period end date for the short-term disability absence.
disabilityPeriodThreeEndDate	This field is used to record the third disability period end date for the short-term disability absence.
refDisabilityPeriodOneEndDate	This field is used to record the reference end date of the first short-term disability period.
refDisabilityPeriodTwoEndDate	This field is used to record the reference end date of the second short-term disability period.
refDisabilityPeriodThreeEndDate	This field is used to record the reference end date of the third short-term disability period.
policyDeviation	This field is used to record a deviation from the policy for short-term disability absences.

Use Case: Getting short-term disability absence information for an employee in the USA

Querying the short-term disability absence information for an employee based in the USA.

9.4.16.1.8 EmployeeTimeGroup

The entity is used to group EmployeeTime objects for special use cases. Currently it is used for recurring absences and linking of absences.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	External Code. This is a business key and is required.
userId	External Name for all relevant languages. This field is required.
itemsCategory	This indicates what items this employee time group contains. Values: LINKED_ABSENCES or RECURRING_ABSENCES. This field is required.

Navigation Properties

Navigation Property	Related Entity	Description
items	EmployeeTimeGroupItem	Navigation to EmployeeTimeGroupItem
userIdNav	User	Navigation to User

Code Examples

URI: `http://<api-server>/odata/v2/EmployeeTimeGroup('76931234932b4666820c4be07a0a7c2a')?$expand=items&$format=JSON`

9.4.16.110 Holiday

You use the Holiday object to create holidays for inclusion in a holiday calendar.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Get Specified Holiday

Request Information

URI	<code>http://<api-server>/odata/v2/Holiday?\$format=json&\$filter=holidayCode%20eq%20'FR-Victory Day'</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

9.4.16.1.11 HolidayCategory

The entity contains information about the holiday category. This is used to classify holidays for time valuation purposes.

Supported Operations

Operation	Description
GET	Query a record

Properties

This table shows the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code for the holiday category
name	Yes	Yes	Name of the holiday category
description	No	No	Description for the holiday category
entityUUID	No	No	Reference to a holiday category object. Can be either FULL, HALF, or NONE

Note

If you have the SAP SuccessFactors Time Tracking subscription, it can also reference any create custom holiday categories created by you.

Use Case: Filter the holiday category using an external code

Get the details of the holiday category having the external code as Full.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/HolidayCategory? \$filter=externalCode%20eq%20'FULL'&\$format=json

```

Properties

This table shows the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code for Holiday Work Pattern.
mdfSystemEffectiveStartDate	Yes	Yes	The date from which this Holiday Planned Working Time Determination is applicable.
lastModifiedDateTime	Yes	No	Date and time when this object was last modified.
entityUUID	No	No	This is an ID generated by the system. It can't be changed and ensures that the object has a stable ID for integration purposes. The UUID stands for "Universally Unique Identifier"
holidayCategory	Yes	Yes	This is the holiday category for which you want to configure the impact on the Planned Working Time.
dayModelVariantIdentifier	Yes	No	This allows you to further specify the planned working time on a partial holiday. The Work Schedule Day Model Variant to be used on a partial holiday is based on this identifier.
lastModifiedBy	Yes	Yes	Name of the user who last modified this object.
createdDateTime	Yes	Yes	The date on which this entry was created.
holidayPlannedWorkingTime	Yes	Yes	The Holiday Planned Working Time based on the holiday category and holiday work pattern to define the impact of the holiday on the planned working time.

Property	Business Key	Required Field	Description
holidayWorkPattern	Yes	Yes	Holiday Work Pattern which groups employees based on their working pattern on holidays. Holiday Work Pattern is assigned to individual employees in the Job Information record.
mdfSystemRecordStatus	Yes	Yes	If the object is active or inactive. Default value is Active .

Use Case: Get the Holiday Planned Working Time Specification Details

9.4.16.14 HolidayWorkPattern

The entity contains information about the Holiday Work Pattern object. Holiday Work Pattern allows you to define regular work on public holidays for employees. It also allows you to group employees based on their working pattern on holidays. You can assign the holiday work pattern to an employee in the job information record for that employee.

Supported Operations

Operation	Description
GET	Query a record

Properties

This table shows the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code for Holiday Work Pattern.
externalName	Yes	Yes	A meaningful name for the holiday work pattern. For example, No work on holidays .
entityUUID	No	No	This is an ID generated by the system. It can't be changed and ensures that the object has a stable ID for integration purposes. The UUID stands for "Universally Unique Identifier"
mdfSystemRecordStatus	Yes	Yes	If the object is active or inactive. Default value is Active .

Use Case: Get the Holiday Work Pattern Details

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/restricted/ HolidayWorkPattern?\$format=json

Response

9.4.16.15 HolidayAssignment

The entity contains more information about a holiday. Information such as the date of the holiday, its class (full or half), and its category is stored in this entity.

Operations Allowed

Operation	Description
GET	Query a record

Properties

This table shows the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
date	Yes	Yes	Date of the holiday

Property	Business Key	Required Field	Description
holidayClass	No	No	<p>Defines whether the holiday is a non-working day, half working day or a normal workday. Can be either FULL, HALF, or NONE.</p> <div data-bbox="1130 485 1427 1020" style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p>Note</p> <p>Going forward, we intend to substitute Holiday Class with Holiday Category. If you are reading the holidayClass property for integration purposes using the HolidayCalendar or HolidayAssignment OData API, we recommend that you start consuming the holidayCategory property instead of holidayClass.</p> </div>
holidayCategory	No	No	<p>Reference to a holiday category object. Can be either FULL, HALF, or NONE.</p> <div data-bbox="1130 1171 1427 1430" style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p>Note</p> <p>If you have the Time Tracking subscription, it can also reference any custom holiday categories created by you.</p> </div>
holiday	No	No	Reference to a holiday object

Navigation Properties

Navigation Property	Related Entity	Description
holidayNav	Holiday	Navigation to the holiday
holidayClassNav	HolidayClass	Navigation to the holiday class

Navigation Propertz	Related Entity	Description
holidayCategoryNav	HolidayCategory	Navigation to the holiday category

Code Examples

Request for getting all holidays which are assigned for calendar 'HolidayCalendar_odata':

Query:

```
https://<hostname>/odata/v2/HolidayAssignment?$filter=HolidayCalendar_externalCode eq 'HOLIDAY_US'&$format=json
```

Response

Sample Code

```

9.4.16.17 PeriodicTimeAccountUpdateProfile

You can use this entity to specify how regularly you want a periodic update rule to be applied to each time account of a certain time account type. The profile can be assigned to multiple time account types.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code for Periodic Time Account Update Profile.
externalName	No	Yes	Meaningful name for the Periodic Time Account Update Profile.

Property	Business Key	Required Field	Description
frequencyUnit	No	Yes	You can set the update frequency unit as either weeks or months, and the periodic update can run in weekly, monthly, quarterly, half yearly, or yearly cycles. For example, if you set the update frequency unit as months and the update frequency quantity as 6, then your periodic update would run every 6 months.
frequencyQuantity	No	Yes	Specify how often the periodic account update should run. For example, if you select weeks as the update frequency unit and enter "4" here, the periodic account update will run every 4 weeks.
referenceDate	No	Yes	This is the root date from which all the update periods both past and future will be determined. For example, if you enter January 1 2020 in combination with a unit of time/frequency of 4 weeks, then the update periods would be January 1 to 28 2020, December 4 to 31 2019, and so on.
automationLevel	No	Yes	Specify whether periodic account updates should be done automatically or manually. If you choose No Automation, you need to go to Manage Time Off Calendars and create a time account change calendar for each periodic account update run. If you choose Automatic Periodic Updates, the time account change calendars are created and executed automatically.

Property	Business Key	Required Field	Description
offsetInDays	No	Yes	This offset determines when the time account change calendar for automatic periodic updates will be created and executed. For example, if you enter "3", then the account change calendar will be created and executed three days after each periodic update cycle. Please note that you have to enter at least a value of 1 here (no 0 or minus values).
updateRule	No	Yes	Enter the rule to be applied to the rule scenario for the periodic time account update.
country	No	No	Some profiles are country-specific or region-specific. If this one is, specify the relevant country or region here.

Use Case: Specify How Often Time Account Is Updated

Specify how often time account is updated.

9.4.16.18 ShiftClassification

This object defines the shift classification for either a whole work schedule or a day model. It only holds information.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

This table shows the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
externalName	No	Yes	External Name for all relevant languages
country	No	No	Absence counting methods can be country-specific. If this one is, the relevant country appears here.

Code Examples

URI: `http://<api-server>/odata/v2/restricted/ShiftClassification('LATE_SHIFT')?$format=JSON`

9.4.16.1.19 TemporaryTimeInformation

This object defines deviating time information for period for a user. It is used, for example, if an employee is on vacation and someone else needs to take over their work schedule for the vacation period.

Operations Allowed

Operation	Query
Get	Query a record
Create	Create a record
Update	Update a record
Upsert	Update an existing record or create a new one
Delete	Delete a record

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations, and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
startDate	No	Yes	This is the date from which the Temporary Time Information applies
endDate	No	Yes	This is the date from which the Temporary Time Information applies
comment	No	No	Optional comment field

Navigation Properties

Navigation Property	Related Entity	Description
workScheduleNav	WorkSchedule	Navigation to WorkSchedule
userIdNav	User	Navigation to User

Code Examples

URI: `http://<hostname>/odata/v2/restricted/`

`TemporaryTimeInformation('d9ad6aea798143d599c63e9f4f251048')?$format=JSON{`

Related Information

[SAP Business Accelerator Hub: TemporaryTimeInformation](#)

9.4.16.120 TimeAccount

When an employee has a time profile assigned with time types that refer to time account types, time accounts need to be created. This is done automatically when you assign a time profile to an employee's job information and also during the account creation calendar run.

Operation Allowed	Description
GET	Query a record
POST	Create a new record
PUT	Update an existing record
UPSERT/POST	Update an existing record or create a new one
DELETE	Delete a record

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations, and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
userId	No	No	If userId is entered the work schedule only applies to one particular employee

Property	Business Key	Required Field	Description
accountType	No	Yes	The time account type to which it belongs
startDate	No	Yes	Start date of the account
endDate	No	Yes	End date of the account
bookingStartDate	No	Yes	Start date for bookings for the account
bookingEndDate	No	Yes	End date for bookings for the account
accountClosed	No	No	Is the account closed?

Navigation Properties

Navigation Property	Related Entity	Description
timeAccountDetails	TimeAccountDetail	Bookings on the account

Code Examples

Example 1

Retrieve data of the time accounts for user Carla Grant of time account type sickness with all included bookings in JSON.

URI: [https://<hostname>/odata/v2/TimeManagementAlertMessage?](https://<hostname>/odata/v2/TimeManagementAlertMessage?TimeManagementAlert_externalCode='d1e3b9e5efa74860807b48af8462018d'&$format=json)

Example 2

Create a new time account for user Carla Grant of time account type Standard_ACM for the year 2018

URI: [http://<hostname>/odata/v2/TimeAccount?\\$format=json](http://<hostname>/odata/v2/TimeAccount?$format=json)

Method: POST

Body:

Sample Code

```

{
    "externalCode": "TA_odata",
    "startDate": "/Date(1514764800000)/",
    "endDate": "/Date(1546214400000)/",
    "userId": "cgrant1",
    "bookingEndDate": "/Date(1546214400000)/",
    "bookingStartDate": "/Date(1514764800000)/",
    "accountTypeNav": {
        "__deferred": {
            "uri": "https://<hostname>/odata/v2/
TimeAccountType('Standard_ACM') "
        }
    }
}

```

Response:

Sample Code

```

{
    "d": {
        "__metadata": {
            "uri": "https://<hostname>/odata/v2/TimeAccount('TA_odata')",
            "type": "SFOData.TimeAccount"
        },
        "startDate": "/Date(1514764800000)/",
        "endDate": "/Date(1546214400000)/",
        "userId": "cgrant1",
        "bookingEndDate": "/Date(1546214400000)/",
        "bookingStartDate": "/Date(1514764800000)/",
    }
}

```

```

        "externalCode": "TA_odata",
        "accountTypeNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/TimeAccount('TA_odata')/"
            }
        }
    }
}

```

Example 3: Close the time account for user Carla Grant of time account type Standard_ACM for the year 2018

URI: `http://<hostname>/odata/v2/TimeAccount('TA_odata')?$format=json`

Method: PUT

Body:

Sample Code

```

{
    "externalCode": "TA_odata",
    "startDate": "/Date(1514764800000)/",
    "endDate": "/Date(1546214400000)/",
    "userId": "cgrant1",
    "bookingEndDate": "/Date(1546214400000)/",

  "bookingStartDate": "/Date(1514764800000)/",
  "accountTypeNav": {
    "__deferred": {
      "uri": "https://<hostname>/odata/v2/
TimeAccountType('Standard_ACM') "
    }
  }
}

```

```
}
  }
}
```

Response:

Sample Code

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Example 5: Delete a time account

URI:

`http://<hostname>/odata/v2/TimeAccount('TA_odata')?$format=JSON`

Method: DELETE

Related Information

[SAP Business Accelerator Hub: TimeAccount](#)

9.4.16.1.21 TimeAccountDetail

The entity describes account bookings resulting from different scenarios such as leave request creation or manual adjustments.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

→ Tip

We recommend that you only use the OData API to create Time Account Details that use the [Manual Adjustment](#) booking type to adjust the time account accruals which have been calculated by Employee Central Time Off. The OData API is **not** intended to create Time Account Details with the [Accrual](#) or [Entitlement](#) posting types. These are calculated outside of the system, and Employee Central Time Off is not designed to support this use case.

→ Remember

To query TimeAccountDetails and use filtering you need to query the TimeAccountDetail, not the TimeAccount object with expand to timeAccountDetails.

Code Examples

Example 1: create a time account detail of "MANUAL_ADJUSTMENT" posting type

URI: `http://<api-server>/odata/v2/upsert`

Operation: POST

Headers: Authorization: Basic <Base 64 encoded ("user@company:password")> Accept: application/json

Content-Type: application/json;charset=utf-8

Payload:

```
{
  "__metadata" : {
    "uri" : "http://api-server/odata/v2/
TimeAccountDetail(TimeAccount_externalCode='1dfca28bf0c84c8b846719feffba225d',
externalCode='MyTimeAccountDetail')",
    "type" : "SFOData.TimeAccountDetail"
  }, "TimeAccount_externalCode" : "1dfca28bf0c84c8b846719feffba225d",
  "externalCode" : "MyTimeAccountDetail",
  "bookingUnit" : "DAYS",
  "referenceObject" : null,
  "bookingType" : "MANUAL_ADJUSTMENT",
  "bookingDate" : "\/Date(1420070400000)\/",
  "employeeTime" : null,
  "bookingAmount" : "2.0",
  "comment" : null
}
Response:
{
  "d" : [
    {
      "key" : null,
      "status" : "OK",
      "editStatus" : "UPsertED",
      "message" : null,
      "index" : 0,
      "httpCode" : 200,
      "inlineResults" : null
    }
  ]
}
```

Example 2: Retrieve data about the specific time account detail

URI: `http://api-server/odata/v2/`

`TimeAccountDetail(TimeAccount_externalCode='1dfca28bf0c84c8b846719feffba225d',externalCode='62d7d93618244c28922fdc4b94001e53')?$format=json`

Operation: GET

Headers: Authorization: Basic <Base 64 encoded ("user@company:password")>

```
Response:
{
  "d" : {
    "__metadata" : {
      "uri" : "https://api-server/odata/v2/

Related Information

[SAP Business Accelerator Hub: TimeAccountDetail](#)

9.4.16.122 TimeAccountPayoutProfile

The entity contains payout related information including workflow configuration.

Operations Allowed

Operation	Description
GET	Query a record

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations, and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
externalName	No	No	External name for the specified language
country/Region	No	No	TimeAccountPayoutProfiles can be country-specific or region-specific. If this one is, the relevant country/region appears here.

Property	Business Key	Required Field	Description
payComponentGroup	No	No	Contains an ID which references a PayComponentGroup. This field is required to calculate the standard rate for payout. When this field is maintained then the pay component used for payout is of amount type.
payComponent	No	No	Contains an ID which references a PayComponent. The pay component can be either an amount type or number type. This component is used to create a spot bonus when the payout request is approved or saved.
payComponentTerminationAccrualSeparated	No	No	Contains an ID which references a PayComponent. When this field is set it enables accrual payout when terminating. The pay component is an amount or number type. This component is considered when the payout is being made from the termination view in Time Off.
payComponentTermination	No	No	Contains an ID which references a PayComponent. When this field is set it enables termination entitlement payouts. The pay component is an amount or number type. This component is considered when the payout is being made from the termination view in Time Off.
workflowConfiguration	No	No	Contains an ID which references a workflow configuration.
payoutMessageText	No	No	This field is filled with instructional text and guidelines for your employees that get displayed on the UI when requesting a self-service payout.

Navigation Properties

Navigation Property	Related Entity	Description
countryNav	Country/Region	Navigates to a country/region
payComponentGroupNav	PayComponentGroup	Navigates to PayComponentGroup
payComponentNav	PayComponent	Navigates to the PayComponent which is normally used for payout
payComponentTerminationAccrualSeparatedNav	PayComponent	Navigates to the PayComponent which is used for accrual payout on termination
payComponentTerminationNav	PayComponent	Navigates to the PayComponent which is used for termination entitlement payouts

Code Examples

Simple request to get the TimeAccountPayoutProfile for 'PayoutProfileAmountBased_odata':

Query:

```
https://<hostname>/odata/v2/  
TimeAccountPayoutProfile('PayoutProfileAmountBased_odata')?$format=json
```

Response

Sample Code

```
{

Related Information

[SAP Business Accelerator Hub: TimeAccountPayoutProfile](#)

9.4.16.1.23 TimeAccountPostingRule

Time account posting rule associates a time type with a time account type to determine whether time accounts should be managed for the time type. For example, you can use it to enable automatic checks against a balance when time off is requested.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Code Example

Example – Retrieve data of the time account posting rule which belongs to the time type 'Vacation'

URI: `http://<api-server>/odata/v2/`

`TimeAccountPostingRule(TimeType_externalCode='Vacation',externalCode='Annually_VAC')?$format=json`

Headers: Authorization: Basic <Base 64 encoded ("user@company:password")>

Response:

```

{
  "d" : {
    "__metadata" : {

```

9.4.16.1.24 TimeAccountPurchaseProfile

This profile defines the configuration elements that determine how your leave purchase policy is implemented.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	External Code is a business key and is required.
countryRegion	TimeAccountPurchaseProfile can be country/region-specific. If this one is, the relevant country/region appears here.
externalName	External name for the specified language
workflowConfiguration	Contains an ID which references a workflow configuration.
allowDeductionStartDateSelection	Boolean. If true it allows users to select a deduction start date at the time of submitting the request. If set to false the Deduction Start Date is equal to the Approval Date.
equivalentUnits	The time interval that applies to the profile. Can have the values: <ul style="list-style-type: none">NONEWEEKS
deductionType	Describes how the deductions are assessed for this profile. Can have the values: <ul style="list-style-type: none">ONE_TIMEPRO_RATED This field is required.

Property	Description
deductionSchedule	Can have the values: <ul style="list-style-type: none"> PERIOD_IN_MONTH END_DATE This field is required.
helpText	Localized help text. Is shown on the self-service leave purchase request.
deductionPayComponents	Select deduction pay components previously created to assign to this profile.

Use Case: Query the TimeAccountPurchaseProfile

'TimeAccountPurchaseProfile_odata':

9.4.16.1.26 TimeAccountSnapshot

This MDF entity contains balance information for a specific time account for a user. It is created while running a snapshot job for leave liability-related calculation for the user.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Property	Related Entity
wfRequestNav	wfRequest
unitNav	MDFEnumValue
userIdnav	UserId
accountTypeNav	TimeAccountType

Use Case: Querying the time account of a user

Request

Operation	Query
HTTP Method	GET
URI	https://<<api-server>>/odata/v2/TimeAccountSnapshot?\$format=JSON&\$filter=userId eq '585'
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

```

9.4.16.1.271 RecalculationBasedField

The Recalculation Based Fields are part of the Time Account Type object. Recalculation Based Fields define for which job information fields a recalculation of accruals should be triggered.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Business Key	Required Field	Description
recalcField	Yes	Yes	Job information field for which a recalculation should be triggered.

Use Case: Define Fields for Recalculation

You want to define job information fields for recalculation.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/TimeAccountType('JM_TAT_ANNUALLY')?\$expand=recalculationBasedField&\$format=JSON</code>

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
includeInLeaveLoadingCalculations	The option to allow the Time Account Type to be included in the leave loading calculations.

Use Case : Querying the TimeAccountTypeAUS data for the user

Querying the Time Account Type information for an Australian employee.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/TimeAccountTypeAUS?\$format=json</code>

Response

```

9.4.16.129 TimeManagementAlert

Time Management alerts draw your attention to something you need to take care of in Time Management.

Operation Allowed	Description
GET	Query a record

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations, and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code

Property	Business Key	Required Field	Description
category	No	Yes	Category e.g. the origin of the time alert. Can have the values <ul style="list-style-type: none"> • ABSENCE_RECALCULATE • ACCRUAL_RECALCULATE • TRANSFERDATE_RECALCULATE • TIME_SHEET_RECALCULATE • TIME_SHEET_GENERATE or • TIME_SHEET_IMPORT
targetType	No	Yes	Affected target. Currently the only value is USER.
severity	No	Yes	Severity of the alert. Can be either: <ul style="list-style-type: none"> • ERROR or • WARNING
status	No	Yes	Status of the alert. Can be either <ul style="list-style-type: none"> • NEW or • CONFIRMED
date	No	Yes	Date on which the alert occurred
targetId	No	No	Id of the target of type targetType.

Navigation Properties

Navigation Property	Related Entity	Description
timeManagementAlertMessage	TimeManagementAlertMessage	Navigates to a list of TimeManagementAlertMessages.

Code Examples

Example for a request which gets all TimeManagementAlerts for the user with the user id "cgrant"

Query:

[https://<hostname>/odata/v2/TimeManagementAlert?targetId='cgrant'&\\$format=json](https://<hostname>/odata/v2/TimeManagementAlert?targetId='cgrant'&$format=json)

Response:

Sample Code

```
    "__metadata": {
      "uri": "https://<hostname>/odata/v2/
TimeManagementAlert('2fa03156e0b249feb4a12cdb4e0eac0e')",
      "type": "SFOData.TimeManagementAlert"
    },
    "externalCode": "2fa03156e0b249feb4a12cdb4e0eac0e",
    "date": "/Date(1531267200000)/",
    "concatenatedMessage": "Save Error: This is the text defined in
co_messageDefinition.",
    "severity": "ERROR",
    "targetId": "cgrant",
    "targetType": "USER",
    "category": "ACCRUAL_RECALCULATE",
    "severityName": "Error",
    "status": "NEW",
    "targetTypeNav": {

```

9.4.16.1.30 TimeManagementAlertMessage

This entity represents a message which is contained in a TimeManagementAlert.

Operation Allowed	Description
GET	Query a record

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations, and associations.

Property	Business Key	Required Field	Description
TimeManagementAlert_externalCode	Yes	Yes	Time Management Alert External Code
externalCode	Yes	Yes	External Code
messageKey	No	Yes	The technical name of the error message that is displayed localized in the alert tab.
messageParameter1	No	No	Optional message parameter
messageParameter2	No	No	Optional message parameter
messageParameter3	No	No	Optional message parameter
messageParameter4	No	No	Optional message parameter
messageParameter5	No	No	Optional message parameter
date	No	Yes	Date on which the message was raised
defaultMessageText	No	Yes	If the language-dependent message cannot be generated, this text is used by default.
employeeTime	No	No	If this time alert references an employee time object, the object appears here.
employeeTimeSheet	No	No	If this time alert references an employee time sheet object, the object appears here.
timeAccount	No	No	If this time alert references a time account type accrual transfer, the object appears here.

Property	Business Key	Required Field	Description
timeAccountTypeAccrual-Transfer	No	No	If this time alert references an employee time object, the object appears here.

Navigation Properties

Navigation Property	Related Entity	Description
timeAccountNav	TimeAccount	Navigation to the TimeAccount
employeeTimeNav	EmployeeTime	Navigation to the EmployeeTime
employeeTimeSheetNav	EmployeeTimeSheet	Navigates to the EmployeeTimeSheet

Code Examples

Request to get all messages for a TimeManagementAlert which has the externalCode 'd1e3b9e5efa74860807b48af8462018d':

Query:

https://<hostname>/odata/v2/TimeManagementAlertMessage?TimeManagementAlert_externalCode='d1e3b9e5efa74860807b48af8462018d'&\$format=json

Response:

```

Property	Business Key	Required Field	Description
offsetInDays	No	Yes	This offset determines when termination end handling is processed. For example, if the value is 14, then termination end handling will be processed 14 days after the employee's termination date.
automationLevelOfEmployeeTimeProcessing	No	Yes	The level is set to either no automation or full automation. In the case of full automation, during termination end handling, all absence requests overlapping with the termination date will be delimited. Absence requests starting after the termination date will be cancelled. In the case of no automation, an alert will be raised for each absence request that overlaps with, or starts after, the termination date.
automationLevelOfTimeAccountClosing	No	Yes	The level is set to either no automation or full automation. In the case of full automation, all open time accounts will be closed during termination end handling. In the case of no automation, no time accounts will be closed during termination end handling.
excludes	No	No	Time account types and event reasons for which the termination end handling is not executed can be excluded here.

Property	Business Key	Required Field	Description
activationStatus	No	Yes	<p>Setting for the activation status.</p> <ul style="list-style-type: none"> Active: The Termination End Handling process is generally applied. Inactive: The Termination End Handling process is generally not applied. Active for Configured Legal Entities Only: The Termination End Handling Configuration object is active only for certain legal entities.
countryConfiguration	No	No	List of country-specific Termination End Handling Configuration.

Use Case: Termination End Handling 1 Day After Termination Date

You want to schedule termination end handling to run 1 day after the employee's termination date.

9.4.16.1.32.1 TimeManagementTerminationEndHandlingExcludedTimeAccountType

This entity contains the time account types that you want to exclude from the termination end handling process. It is used in Time Management Termination End Handling Exclusion.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property			Description
externalCode	Yes	Yes	External Code for Time Management Termination End Handling Excluded Time Account Type.
time AccountType	No	Yes	Time account type excluded from termination end handling.

Use Case: Exclude Time Account Type

Use the entity to exclude a time account type from termination end handling.

Request
