9.4.16.1.32.3 TimeManagementTerminationEndHandlingExclud edEventReason

This entity contains the event reasons you want to exclude from the termination end handling process. This entity is used in Time Management Termination End Handling Exclusion.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Business Key	Required	Description
externalCode	Yes	Yes	External Code for Time Management Termination End Handling Excluded Event Reason.
eventReason	No	Yes	Event reason excluded from termination end handling.

Use Case: Give Reasons for Excluding From Termination End Handling

Use event reasons to exclude items from termination end handling.

Request

Operation	Query>
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/TimeManagementTerminationEndHandlingExclusion('TERMINATION_END_HANDLING_EXCLUSION')?\$expand=excludedEventReasons&\$format=JSON</code>

9.4.16.1.32.4 TimeManagementTerminationEndHandlingLegalEntityConfiguration

This entity contains the termination end handling configuration specific to this legal entity. It is part of the Time Management Termination End Handling Configuration object.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property			Description
externalCode	Yes	Yes	External Code for Time Management Termination End Handling Legal Entity Configuration.
legalEntity	No	Yes	Legal Entity for which this termination end handling configuration is valid.
offsetInDays	No	Yes	This offset determines when the termination end handling is processed. For example, if the value is equal to 14, then the termination end handling will be processed 14 days after the employee's termination date.
automationLevelOfEmployeeTimeProcessing	No	Yes	The level is either set to no automation or full automation. In the case of full automation, during termination end handling, all absence requests overlapping with the termination date will be delimited. Absence requests starting after the termination date will be cancelled. In the case of no automation, an alert will be raised for each absence request that overlaps with or starts after the termination date.
automationLevelOfTimeAccountClosing	No	Yes	The level is either set to no automation or full automation. In case of full automation, all open time accounts will be closed during termination end handling. In case of no automation, no time account will be closed during termination end handling.

Property			Description
excludes	No	Yes	Time account types and event reasons for which the termination end handling is not executed can be excluded here.
activationStatus	No	Yes	This activation status has the following settings: Active and Excluded. If this activation status is set to Active, then the termination end handling configuration for that legal entity is overridden. If the activation status is set to Excluded, then the employees contained in that legal entity are excluded from termination end handling.

Use Case: Configure Termination End Handling for a Specific Legal Entity

Configure termination end handling for a specific legal entity.

This entity contains a Netherlands specific enum field which is used for tracking recovery from illness in Time Off.

[TimeTypeUSA \[page 1379\]](#)

This entity contains USA specific enum field, which is used for short term disability in Time.

9.4.16.1.34.1 TimeTypeAUS

This entity contains Australia specific fields, which is used to configure the advance leave payment for absences.

Supported Operations

Operation	Description
Query	This object is used to store the country specific Time Type fields information to allow the requesting of advance leave payment for Australia.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

► [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
leaveAdvancePaymentAllowed	The option to enable the option for advance leave payment for the absences.
splitAcrossFinancialYearAllowed	The option to enable the option for split advance payment across financial year for the absences.

Use Case: Getting the Time Type Information for an employee from Australia

Querying the Time Type information for an Australian employee

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-server>/odata/v2/TimeTypeAUS?\$format=json</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-server>/odata/v2/TimeTypeAUS(TimeType_externalCode='split_alp',externalCode=10468L)",

Use Case: Query Time Type Profile

Request

→ Tip

We recommend you to use the new syntax with \$filter as shown below for the "GET" operation.

Avoid using the earlier syntax with just the key, e.g: /odata/v2/TimeTypeProfile('CODE').

If you have already used the \$filter syntax, there are no issues and no adjustments to the API request are required.

This example retrieves data to get the single record with external code 'Vacation CLT' that is valid as of today.

Operation	Query
HTTP Method	GET
	https://<api-server>/odata/v2/TimeTypeProfile?\$filter=externalCode eq 'Vacation CLT'

📌 Note

Today means the date fetched from the tenantPreferredTimezone. If this is not configured, the system timezone is used.

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/TimeTypeProfile('Vacation

9.4.16.1.36 WorkSchedule

A work schedule defines the employee's working pattern. It is assigned to an employee's job information, showing how many days per week the employee is going to work.

There are three models for setting up a work schedule. You specify which one you want to use in the *Model* field. Your options are:

- Simple
- Period
- Schedule

Depending on the configuration, different fields are relevant for the work schedule.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

This table shows the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
externalName	No	No	If userId is entered the work schedule only applies to one particular employee.
startingDate	No	Yes	Starting date of the work schedule
countryRegion	No	No	Work schedules can be country/region specific.
flexibleRequestingAllowed	No	No	Flag whether flexible requesting is allowed for this work schedule
modelCategory	No	Yes	Work schedule model category: SIMPLE, PERIOD, or SCHEDULE

Property	Business Key	Required Field	Description
periodModel	No	Yes	The period models you have created and want to include in this work schedule
averageHoursPerDay	No	No	Average hours per day
averageHoursPerWeek	No	No	Average hours per week
averageHoursPerMonth	No	No	Average hours per month
averageHoursPerYear	No	No	Average hours per year
averageWorkingDaysPerWeek	No	No	Average working days per week
individualWorkSchedule	No	Yes	Flag whether this work schedule is an individual work schedule
searchString	No	No	Field is used to search for particular terms within existing work schedules
shiftClassification	No	No	Shift classification relevant for this work schedule
timeRecordingVariant	No	Yes	The specified time recording variant, either Duration or Clock Times
workScheduleDays	No	No	List of work schedule day definitions (only used for SIMPLE work schedule models)
workScheduleDayModels	No	No	List of work schedule day definitions (only used for PERIOD work schedule models)

Navigation Properties

Navigation Property	Related Entity	Description
userIdNav	User	Navigation to User
countryNav	Country	Navigation to Country

Navigation Property	Related Entity	Description
periodModel	WorkSchedule	Navigation to WorkSchedule
shiftClassificationNav	ShiftClassification	Navigation to ShiftClassification
workScheduleDays	Work Schedule Day	Navigation to
workScheduleDayModels	Work Schedule Day Model	

Use Case: Query Work Schedule

→ Tip

We recommend you to use the new syntax with \$filter as shown below for the "GET" operation.

Avoid using the earlier syntax with just the key, for example: /odata/v2/WorkSchedule('CODE').

If you have already used the \$filter syntax, there are no issues and no adjustments to the API request are required.

This example gets a single work schedule record with external code 'NORM' that is valid as of today.

Operation	Query
HTTP Method	GET
	https://<api-server>/odata/v2/WorkSchedule?\$filter=externalCode eq 'NORM'

ⓘ Note

Today means the date fetched from the tenantPreferredTimezone. If this not configured, the system timezone is used.

Code Examples

Example 1: Retrieve example work schedule defined as SIMPLE model (expand workScheduleDays)

URI: https://<api-server>/odata/v2/WorkSchedule?\$filter=externalCode eq 'WS_SIMPLE_TEST'&?\$expand=workScheduleDays &\$format=JSON

Method: GET

↗ Sample Code

```
{

Example 4: Create a work schedule defined as SCHEDULE model

URI: [http://<api-server>/odata/v2/WorkSchedule/?\\$format=JSON](http://<api-server>/odata/v2/WorkSchedule/?$format=JSON)

Method: POST

Body

Sample Code

```

{
  "externalCode": "5DAY8HOURo",
  "externalName_defaultValue": "5DAY8HOURo",
  "timeRecordingVariant": "DURATION",
  "startingDate": "/Date(1136073600000)/",
  "individualWorkSchedule": false,
  "modelCategory": "SCHEDULE",
  "periodModelNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/WorkSchedule('5DAY8HOUR')/
periodModelNav"
    }
  }
}

```

Response

Sample Code

```

{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/WorkSchedule('5DAY8HOURo')",
      "type": "SFOData.WorkSchedule"
    },
    "externalName_defaultValue": "5DAY8HOURo",
    "timeRecordingVariant": "DURATION",
    "startingDate": "/Date(1136073600000)/",
    "individualWorkSchedule": false,
    "modelCategory": "SCHEDULE",
    "externalCode": "5DAY8HOURo",
    "periodModelNav": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/WorkSchedule('5DAY8HOURo')/
periodModelNav"
      }
    }
  }
}

```

```

    }
  }
}

```

Example 5: Update a work schedule defined as SCHEDULE model

URI: `http://<api-server>/odata/v2/WorkSchedule('5DAY8HOURo')/?$format=JSON`

Method: PUT

Sample Code

```

{
  "externalCode": "5DAY8HOURo",
  "externalName_defaultValue": "5DAY8HOURo",
  "timeRecordingVariant": "DURATION",
  "startingDate": "/Date(1167609600000)/",
  "individualWorkSchedule": false,
  "modelCategory": "SCHEDULE",
  "periodModelNav": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/WorkSchedule('5DAY8HOUR')/"
    }
  }
}

```

Example 6: Upsert a work schedule defined as SCHEDULE model

URI: `http://<api-server>/odata/v2/upsert?$format=JSON`

Method: POST

Body:

Sample Code

```

{
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/WorkSchedule('5DAY8HOURo')",
    "type": "SFOData.WorkSchedule"
  },
  "externalCode": "5DAY8HOURo",

    "inlineResults": null
  }
]

```

Example 7: Delete a work schedule

URI: `http://<api-server>/odata/v2/WorkSchedule('5DAY8HOURo')?$format=JSON`

Method: DELETE

↔ Sample Code

Related Information

SAP Business Accelerator Hub: [WorkSchedule](#)

9.4.16.1.37 WorkScheduleDay

Work schedule day defines the working time on a day. This entity is only used for work schedule of type SIMPLE.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code
day	No	Yes	Day of the work schedule

Property	Business Key	Required Field	Description
workingHours	No	Yes	Working hours on that day as decimal value
hoursAndMinutes	No	No	Working hours on that day in hours and minutes

Code Examples

For code examples, please look at *Example 1* in the [WorkSchedule \[page 1384\]](#) documentation.

Related Information

[SAP Business Accelerator Hub: WorkScheduleDay](#) 

9.4.16.1.38 WorkScheduleDayModel

With a work schedule day model, you can define how the number of hours worked on a particular day should look. You can then use the day models in your work schedule if you choose the Period or Schedule models in your work schedule.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
countryNav	Country	Navigation to Country
shiftClassificationNav	ShiftClassification	Navigation to Shift Classification
segments	WorkScheduleDayModelAssignmentSegment	Navigation to WorkScheduleDayModelAssignmentSegment

Code Examples

Example 1: Retrieve a specific work schedule day model

Example 2: Create a work schedule day model

URI: [http://<api-server>/odata/v2/WorkScheduleDayModel?\\$format=JSON](http://<api-server>/odata/v2/WorkScheduleDayModel?$format=JSON)

Method: POST

Body:

Sample Code

```

{
  "externalCode": "DUR_odata",
  "externalName_defaultValue": "DUR_odata",
  "timeRecordingVariant": "DURATION",
  "workingHours": "8"
}

```

Response:

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/
WorkScheduleDayModel('DUR_odata')",
      "type": "SFOData.WorkScheduleDayModel"
    },
    "externalName_defaultValue": "DUR_odata",
    "timeRecordingVariant": "DURATION",
    "workingHours": "8",
    "externalCode": "DUR_odata"
  }
}
```

Example 3: Update a work schedule day model

URI: [http://<api-server>/odata/v2/WorkScheduleDayModel\('DUR_odata'\)?\\$format=JSON](http://<api-server>/odata/v2/WorkScheduleDayModel('DUR_odata')?$format=JSON)

Method: PUT

Body:

Sample Code

```
{
  "externalCode": "DUR_odata",
  "externalName_defaultValue": "DUR_odata",
  "timeRecordingVariant": "DURATION",
  "workingHours": "6"
}
```

Example 4: Upsert a work schedule day model

URI: [http://<api-server>/odata/v2/upsert?\\$format=JSON](http://<api-server>/odata/v2/upsert?$format=JSON)

Method: POST

Body:

Sample Code

```
{
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/
WorkScheduleDayModel('DUR_odata')",
    "type": "SFOData.WorkScheduleDayModel"
  },
  "externalCode": "DUR_odata",
  "externalName_defaultValue": "DUR_odata",
  "timeRecordingVariant": "DURATION",
  "workingHours": "4"
}
```

Response:

Sample Code

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Example 5: Delete a work schedule day model

URI: `http://<api-server>/odata/v2/WorkScheduleDayModel('DUR_odata')?$format=JSON`

Method: DELETE

Related Information

[SAP Business Accelerator Hub: WorkScheduleDayModel](#)

9.4.16.1.39 WorkScheduleDayModelAssignment

With a work schedule day model assignment, you can define how the number of hours worked on a particular day should look.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
dayModelNav	WorkScheduleDayModel	Navigation to WorkScheduleDayModel
segments	WorkScheduleDayModelAssignmentSegment	Navigation to WorkScheduleDayModelAssignmentSegment

Code Examples

For code examples, please read look at *Example 2* in the [WorkSchedule \[page 1384\]](#) documentation.

Related Information

[SAP Business Accelerator Hub: WorkScheduleDayModelAssignment](#)

9.4.16.1.40 WorkScheduleDayModelAssignmentSegment

A WorkScheduleDayModelAssignmentSegment is used within a WorkScheduleDayModelAssignment. Such a segment is used to define the working time as well as the unpaid breaks for a day.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	External Code. This is a business key and is required.
startTime	Start time of the segment. Required.

Property	Description
endTime	End time of the segment. Required.
duration	Duration in minutes between start time and end time
category	Work schedule segment model category. Can be SCHEDULED_WORKING_TIME or SCHEDULED_UNPAID_BREAK

Use Case: Retrieve the work schedule day model assignments and the corresponding segments for a defined work schedule

Request

Operation	Query
HTTP Method	GET
URI	<pre>https://<api-server>/odata/v2/ WorkSchedule('WS_PERIOD_TEST')? \$expand=workScheduleDayModels,workScheduleDayModels/ segments&\$format=JSON</pre>

Response

Sample Code

Related Information

[SAP Business Accelerator Hub: WorkScheduleDayModelAssignmentSegment](#)

9.4.16.1.41 WorkScheduleDayModelSegment

A WorkScheduleDayModelSegment used within a WorkScheduleDayModel. Such a segment is used to define the working time as well as the unpaid breaks for a day.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Code Examples

Example: Get the work schedule day model segments for a work schedule day model

URI: `http://<api-server>/odata/v2/WorkScheduleDayModel('08:00-16:00_15MB_60LB')? $expand=segments&$format=JSON`

9.4.16.1.42 WorkScheduleDayModelVariantAssignment

This entity used within a Work Schedule Day Model to configure a holiday as partial working day with fine-grained control to define working hours (absolute or proportional) and working timings (break).

Supported Operations

Query

Properties

Here you can see the required fields and business keys for this entity. Check the OData API dictionary in your instance to see the complete list of properties, and check your metadata for navigations and associations.

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External code for the Work Schedule Day Model Variant Identifier
variantIdentifier	No	Yes	Work Schedule Day Model Variant Identifier to associate with a Work Schedule Day Model Variant. This identifier is used in Holiday Planned Working Time Determination to define the Work Schedule Day Model Variant to be used on a specific holiday.

Property	Business Key	Required Field	Description
variantDayModel	No	Yes	Work Schedule Day Model Variant to associate with the identifier which will be used with specific holidays when defining Holiday Planned Working Time Determination.

Use Case: Get The Work Schedule Day Model Variant Assignment

9.4.16.1.43 WorkScheduleDayModelVariantIdentifier

This entity allows you to further specify the planned working time on a partial holiday. The Day Model Variant to be used on the partial holiday is based on this identifier. The Work Schedule Day Model Identifier is the link between Holiday Planned Working Time Specification and Day Model Variant.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code for the Work Schedule Day Model Variant Identifier.
externalName	No	No	Meaningful name for the Work Schedule Day Model Variant Identifier.
description	No	No	Contains more details about this Work Schedule Day Model Variant Identifier.

Use Case: Planned Working Time On Holiday

Plan working time for a holiday.

9.4.16.2.1 ExternalTimeData

The External Time Data object contains recorded time data from an external system so that it can be included in the Employee Central Payroll Time Sheet.

The entity must be used every time a customer wants to import external time data into the Employee Central system.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Cases

Let's look at some use cases.

Upsert Duration User

This upserts external data for a user who records time on a Duration basis.

Operation	Upsert
HTTP method	Post
URI	<code>http://<api-server>/odata/v2/upsert</code>
<Payload>	<div data-bbox="818 1205 1427 1625"><p>↔ Sample Code</p><pre>{ "__metadata": { "uri": "ExternalTimeData('test1')" }, "externalCode": "test1", "startDate": "\/ Date(151121880000)\/", "userId": "ashirly1", "hours": "8.5", "timeType": "HGB_WORK1" }</pre></div>
Form Encoding	Application/json

Note

No response is required here because for upserts just return a status 200 OK with a response body indicating all upsert results.

Upsert Clock Time User

This upserts external data for a user who records time on a Clock Time basis.

Operation	Upsert
HTTP method	Post
URI	http://<api-server>/odata/v2/upsert
<Payload>	<div data-bbox="836 472 1425 919"><h3>Sample Code</h3><pre>{ "__metadata": { "uri": "ExternalTimeData('test1')" }, "externalCode": "test1", "startDate": "\/Date(1511218800000)\/", "userId": "ashirly1", "startTime": "PT13H20M", "endTime": "PT13H50M", "timeType": "HGB_WORK1"}</pre></div>
Form Encoding	Application/json

Note

No response is required here because for upserts just return a status 200 OK with a response body indicating all upsert results.

Query to read External Time Data

Operation	Query
HTTP method	Get
URI	http://<api-server>/odata/v2/ExternalTimeData('test10001')
Form Encoding	Application/json

Sample Response

Sample Code

[SAP Business Accelerator Hub: ExternalTimeData](#)

9.4.16.2.2 ExternalTimeRecord

The entity represents a time record created outside of the Employee Central system.

Business Context

The *ExternalTimeRecord* OData API is used to import employee time records recorded in an external system into the Employee Central system. After import, the employee time records are converted into time sheet entries. These time records are later valuated within the Payroll Time Sheet and transferred to Employee Central Payroll.

This OData API performs mass replication of time records from an external time recording system into Employee Central. It is possible to use the \$BATCH directive, which we assume is the standard method to use this API.

Use Case: Creation of an external time record with external time segments

This is a sample use case for the *ExternalTimeRecord* OData API - the creation of an external time record with external time segments. This involves uploading an external time record containing time segments into the time sheet database in the SAP SuccessFactors system.

This use case provides an example of the following:

- Sending a POST request containing a JSON representation of both *External Time Record* and *External Time Segment* MDF entities
- The response to the POST request

OData API *ExternalTimeRecord* - creation of an external time record with external time segments.

Request Information

Operation	POST
URI	<code>http://<api-server>/odata/v2/upsert</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")> Content-Type: application/json charset: utf-8

Payload

Sample Code

```
{
  "__metadata": {
    "uri": "
ExternalTimeRecord('test1')"
  },
  "externalCode": "test1",
  "date": "\/Date(1453104229000)\/",
  "userId": "cgrant1",
  "externalTimeSegments": [
    {
      "externalCode": "",
      "hours": 4.0
    },
    {
      "externalCode": "",
      "hours": 4.0
    },
    {
      "externalCode": "",
      "hours": 1.0
    }
  ]
}
```

9.4.16.2.3 TimeCollector

Time collectors are configurable multi-purpose counters that are processed in time valuation.

During time valuation, time collectors can be created, augmented, or reset (to zero) as the result of time valuation operations ('collector update'). The frequency at which a collector is reset is configurable. Time collectors either contain a number of accumulated minutes ('direct counting') or the number of accumulated threshold events: the collector is increased by 1 if the threshold is surpassed or not ('event counting').

Time collectors are either transient during time valuation or they are written to the database for consumption by follow-up processes.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Code Examples

Retrieve all time collectors for user mhoff:

URI: [http://<api-server>/odata/v2/TimeCollector?\\$filter=userId eq 'mhoff1'&\\$format=JSON](http://<api-server>/odata/v2/TimeCollector?$filter=userId eq 'mhoff1'&$format=JSON)

Sample Code

```

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ▶ [Admin Center](#) ▶ [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
userId	The user whose working time or on-call time is recorded.
costCenter	The cost center to which the working time or on-call time is booked.
startTime	The start time of the working time or on-call time based on clock times.
endTime	The end time of the working time or on-call time recording based on clock times.
attendanceRequest	Reference to the attendance request if the workflow configuration is configured in the time type of the working time or on-call time recording.
physicalStartDate	The date on which the shift recording starts.
physicalEndDate	The date on which the shift recording ends.
correctionScenario	<p>The correction scenario manages if users of the time sheet UI can edit imported working times or on-call times.</p> <p>If the correction scenario is <i>External System</i>, the recording can only be edited in the external source system that it is imported from.</p> <p>If the correction scenario is <i>Time Sheet and External System</i> or <i>No Selection</i>, the recording is editable on the Time Sheet UI.</p>
originalStartTime	The start time of the working time or on-call time recording based on clock times without grace period rounding.
originalEndTime	The end time of the working time or on-call time recording based on clock times without grace period rounding.
originalPhysicalStartDate	The date on which the shift starts without grace period rounding.
originalPhysicalEndDate	The date on which the shift ends without grace period rounding.
timeType	The time type of the working time or on-call time recording.
timeRecordOrigin	This field is only filled if the record was created automatically during time sheet processing either by Time Sheet Import or Time Sheet Generation. <i>No Selection</i> means it is a manual recording.
pendingCancellation	A flag on an approved working time or on-call time recording indicating that a recording has been changed or canceled. If the corresponding time sheet amendment is approved, the approval status of this recording is set to <i>Canceled</i> .

Property	Description
approvalPeriodStatus	<p>The approval status of the working time or on-call time recording. Usually, the approval status is the same as the corresponding employee time sheet approval status. It can differ in a time sheet amendment scenario where unchanged working times and on-call times remain approved whereas changed working times or on-call times reflect the current status of the time sheet workflow.</p> <p>If the approval status is <i>Pending</i>, the corresponding employee time sheet is not approved yet.</p> <p>If the approval status is <i>Approved</i>, the corresponding employee time sheet is approved.</p> <p>If the approval status is <i>Canceled</i>, the employee time sheet was replaced by a new approved time sheet.</p> <p>If the approval status is <i>Inactive</i>, the employment of the user is inactive.</p>
date	The logical date of the working time or on-call time recording.
durationInMinutes	The duration of the working time or on-call time recording in minutes for both duration and clock time recorders.
attendanceRequestApprovalStatus	The approval status of the requested working time or on-call time. If no workflow is configured in the corresponding time type, the approval status is set to <i>Approval Not Required</i> . Otherwise, the attendance request approval status reflects the current status of the workflow.

Use Case: Query Existing Top 1 TimeRecording

The following example shows how to query all the time recordings in your company. For simplicity, we return only one random entry here. Please avoid querying all time recordings in the system because this results in bad performance and a lot of data transfer because the number of time recordings in a system can be huge.

9.4.16.2.7 AllowanceRecording

AllowanceRecording is the new persistency model of the previous entity Allowance. This entity contains allowance information for monthly time sheets.

Permissions

- [▶ Time Management Object Permissions](#) [▶ Allowance Recording](#) [▶](#)

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) [▶ API Center](#) [▶ OData API Data Dictionary](#) [▶](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
userId	The user whose allowance is recorded.
date	The date of the allowance recording.

Property	Description
value	The value of the allowance recording. Depending on the unit of the allowance type, the value is either shown in decimals or in hours in the time sheet UI.
allowanceType	The type of the allowance recording, for example, meal allowance or hardship allowance.
correctionScenario	<p>The correction scenario manages if users of the time sheet UI can edit imported allowance.</p> <p>If the correction scenario is <i>External System</i>, the recording can only be edited in the external source system that it is imported from.</p> <p>If the correction scenario is <i>Time Sheet and External System</i> or <i>No Selection</i>, the recording is editable on the Time Sheet UI.</p>
pendingCancellation	A flag on an approved allowance recording indicating that a recording has been changed or canceled. If the corresponding time sheet amendment is approved, the approval status of this recording is set to <i>Canceled</i> .
approvalPeriodStatus	<p>The approval status of the allowance recording. Usually, the approval status is the same as the corresponding employee time sheet approval status. It can differ in a time sheet amendment scenario where unchanged allowances remain approved whereas changed allowances reflect the current status of the time sheet workflow.</p> <p>If the approval status is <i>Pending</i>, the corresponding employee time sheet is not approved yet.</p> <p>If the approval status is <i>Approved</i>, the corresponding employee time sheet is approved.</p> <p>If the approval status is <i>Canceled</i>, the employee time sheet was replaced by a new approved time sheet.</p> <p>If the approval status is <i>Inactive</i>, the employment of the user is inactive.</p>

        "userIdNav": {
```

Custom Fields

If custom fields are properly configured on the **Allowance Recording** object through configure object definitions, those custom fields appear in the meta data with the corresponding data type and are returned within the response of API calls.

❖ Example

Configuration of a non-complex custom field

- Valid for non-complex data types such `string`, `date`, `dateTime`, `number`, or `decimal`.
- Within configure object definition: Define a custom field of type `String` with name `cust_string`
- Metadata:

```
<Property Name="cust_string" Type="Edm.String" Nullable="true"
sap:required="false" sap:creatable="false"
sap:updatable="false" sap:upsertable="false" sap:visible="true"
sap:sortable="true" sap:filterable="true"
MaxLength="255" sap:label="string"/>
```

- API-response: Returns the value of the string field

```
"cust_string": "myCustomStringField",
```

❖ Example

Configuration of a complex custom field

- Valid for complex data types such as `Generic Object`, `Picklist`, or `Foundation Object`
- Within configure object definition: Define a custom field of type `Picklist` with the name `cust_picklist`
- Metadata:

```
<Property Name="cust_picklist" Type="Edm.String" Nullable="true"
sap:required="false" sap:creatable="false" sap:updatable="false"
sap:upsertable="false" sap:visible="true" sap:sortable="true"
sap:filterable="true" MaxLength="128" sap:picklist="REGION"
sap:label="picklist"/>
```

- API-response: Returns the ID of the picklist and the navigation to the picklist

```
"cust_picklist": 143,
"cust_picklistNav": {
  "deferred": {
    "uri": "https://<api-server>/odata/v2/
TimeRecording('f3147e72d4384a1f96a6ce01c898861b')/cust_picklistNav"
  }
}
```

9.4.16.3 Time Sheet

In this section, you'll find the APIs available for Time Sheet. You can use Time Off to manage absences such as vacation, sick leave, and paid time off.

Before using any of the Time Sheet entities described here, you need to switch on **both** Time Off **and** Time Sheet in the Admin Center. For details of how to do this, take a look at the *Activating Time Management* documentation in the *Implementing Time Management in SAP SuccessFactors* guide.

In addition, you need to have permission to use the individual objects in question. For information on these permissions, take a look at the *Time Sheet Permissions* documentation in the *Implementing Time Management in SAP SuccessFactors* guide.

9.4.16.3.1 Allowance

The entity represents an allowance record for an employee.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External code for the allowance
date		Yes	Date of the recorded allowance. This date is used as booking date in the corresponding time valuation result.

Property	Business Key	Required Field	Description
value		No	Value of the allowance in unit Decimal. The unit of the allowance type defines if the value needs to be converted from Decimal to Hours.
allowanceType		Yes	Type of the allowance that defines the unit of the allowance.
costCenter		No	Deviating cost center of the allowance. The standard cost center of the employee can be found in the job information.
externalAllowanceCode		No	After the successful import of the external allowance, this field contains the external code of the external allowance.
correctionScenario		No	If equal to "External System" this allowance can only be edited in the external source system that it is imported from. If it is "Time Sheet and External System" this allowance is editable in the time sheet UI.

Use Case: Record Allowances

Record allowances, such as meal allowances, that are directly reported to payroll.

9.4.16.3.2 AvailableAllowanceType

You can use this entity to obtain information about the available allowance type, which is one of the time types that an employee is allowed to take. This information is assigned to an employee's job information.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Business Key	Required Field	Description
externalCode	Yes	Yes	External Code for the Available Allowance Type.
allowanceType	No	Yes	Type of the allowance. Examples are hardship or meal allowance.
enabledInEssScenario	No	Yes	If this field is true, the employee can record an allowance of this type. If this field is false, only a manager or HR admin can record an allowance of this type in the on-behalf scenario.
copyableInTimesheet	No	Yes	If this field is true, allowances of this type are considered while copying days in the time sheet. If this field is false, those allowances are skipped during copy.

Use Case: Specify Allowance Type

Request

Operation	Query
HTTP Method	GETt>
URI	<code>https://<api-server>/odata/v2/TimeTypeProfile?\$filter=externalCode eq 'CLT_STANDARD' & \$expand=availableAllowanceTypes & \$format=JSON</code>

```

9.4.16.3.3 ExternalAllowance

External allowances contain recorded allowances from an external system for inclusion in the Employee Central Time Sheet. You must use this entity every time you want to import external allowances.

Supported Operations

Query

Upsert

Insert

Replace (done using Upsert)

Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>deleteExternalAllowance</code>	The existing allowance will be removed from the time sheet and this entity will then be deleted automatically. Do not delete using Take Action > Permanently Delete Entry in the UI and avoid the direct DELETE operation.
<code>correctionScenario</code>	Select "EXTERNAL_SYSTEM" to ensure that the allowances can only be edited in the external source system that they are imported from. Select "TIME_SHEET_AND_EXTERNAL_SYSTEM" to make allowances editable in the target system too. If not maintained, the correction scenario value is defaulted to "TIME_SHEET_AND_EXTERNAL_SYSTEM"
<code>allowanceType</code>	Set the external code or UUID of an allowance type. This allowance type must be available in the user's time profile. You must maintain this field because there is no default import allowance type for allowances in the time profile.

Property	Description
value	Set the value of the imported allowance. The value must be greater than 0. If you select an allowance type with the unit "Hour(s)", enter the value in hours. In this case the value must not be greater than or equal to 100.

Use Case 1: Create/Update an External Allowance

Create or update an external allowance with only the required fields filled.

Request

Operation	Query
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Headers	
Payload	<pre>{ "__metadata": { "uri": "ExternalAllowance('testCreate')" }, "date": "/Date(1526976229000)/", "value": "1", "allowanceType": "MEAL_ALLOWANCE", "userIdNav": { "__deferred": { "uri": "http://<api-server>/odata/v2/restricted/User('awolter')" } } }</pre>

Response

```

      }
    }
  }
}

```

Use Case 4: Query to Delete an Existing External Allowance by External Code

Query to delete an existing external allowance by external code.

⚠ Caution

Apply this use case with care.

Request

Operation	Delete
-----------	--------

HTTP Method	DELETE
URI	https://<api-server>/odata/v2/ExternalAllowance(testCreate)?\$format=json

Response

Status 200, payload Empty

Additional Information

Note that, when you import external allowances, the processing of those entities to Allowance is either event-based, meaning that it is done immediately, or it is done with the next run of the Time Sheet Import External Times and Allowances job.

In the case of event-based processing of a user's external allowance, this also leads to an import of relevant external time data. Note that successful creation of external allowances does not guarantee a successful import of the same in a resulting Allowance object as error checks are done during the import process. Please check the Time Sheet Import Alerts.

⚠ Caution

Please use direct DELETE with care because this will only delete the external allowance and not the imported allowance on the time sheet.

9.4.17 Workflow

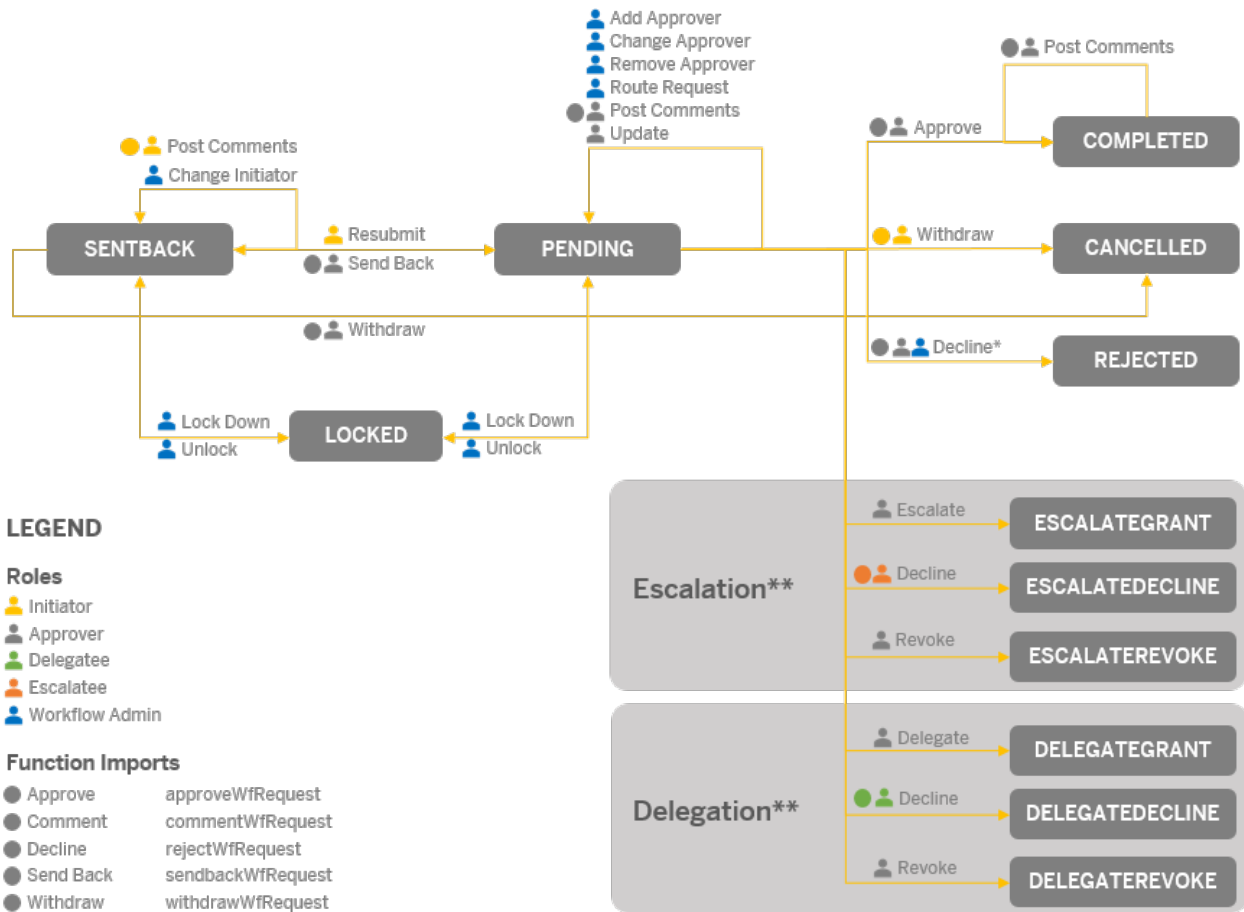

Workflow entities allow you to query the data of workflow requests, workflow steps, comments, participators, allowed actions, as well as other workflow information displayed on the Workflow Details page. You can also use the workflow function imports to change workflow statuses and post comments.

Permissions

Permission System	Required Setting
Role Based	<p>▸ Manage Workflows ▸ Manage Workflow Requests ▸</p> <p>This permission is required for the workflow admin role.</p>
User Based	N/A

Workflow Status Transition

The following diagram illustrates the status transition of a workflow request:

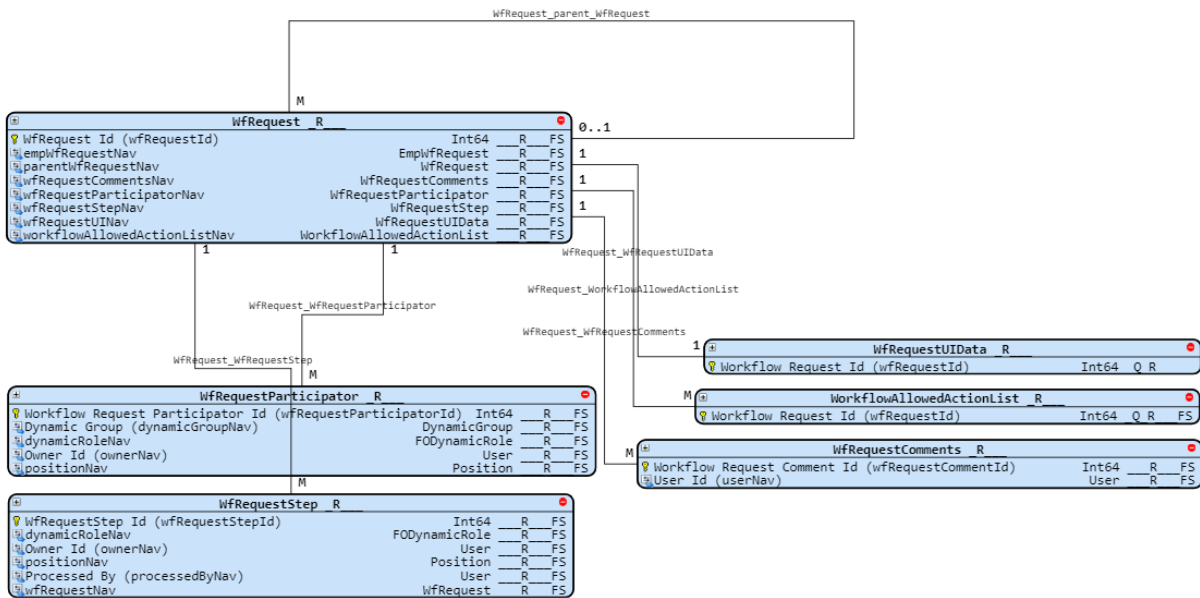

Note

* For Employee Central workflows, only the workflow admin can decline a request. For MDF workflows, the current approver can decline a request.

** In the case of escalation or delegation, the escalatee or delegatee becomes the current approver. The workflow request still follows its own course of status transition. Additional statuses are available to indicate the escalation or delegation progress.

Entity Relationship Diagram

9.4.17.1 WfRequest

This entity stores basic data of a workflow such as the overall status and the current step number. This is the workflow used by Employee Central as well as MDF objects.

Supported Operations

Operation	Description
Query	Query the information of workflow requests.

Edit operations are not supported by the entity itself. However, you can use the following function imports to modify your workflow requests:

- [approveWfRequest \[page 1508\]](#)
- [commentWfRequest \[page 1509\]](#)
- [rejectWfRequest \[page 1510\]](#)
- [sendbackWfRequest \[page 1511\]](#)
- [withdrawWfRequest \[page 1512\]](#)

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
wfRequestId	Workflow request ID. This is a business key.
module	The following values are available: <ul style="list-style-type: none"> HRIS: indicates an Employee Central workflow request. GENERIC_OBJECT: indicates an MDF workflow request.
parentWfRequestId	ID of the parent workflow request.
status	Status of the workflow request. Possible values are: <ul style="list-style-type: none"> PENDING: The workflow request is currently pending. SENTBACK: The workflow request has been sent back. LOCKED: The workflow request has been locked. REJECTED: The workflow has been rejected. CANCELLED: The workflow has been canceled. COMPLETED: The workflow has been completed. <p>For more information about workflow request statuses, see Workflow [page 1475].</p>
totalSteps	Total number of steps in the workflow request.
url	A deep link to the workflow details page.

Navigation Property

Navigation Property	Related Entity	Description
empWfRequestNav	EmpWfRequest [page 678]	Navigate to the workflow request related to an employee.
parentWfRequestNav	WfRequest	Navigate to the parent workflow request.
wfRequestCommentsNav	WfRequestComments [page 1484]	Navigate to the workflow request comments.
wfRequestParticipatorNav	WfRequestParticipator [page 1485]	Navigate to the workflow participators.
wfRequestStepNav	WfRequestStep [page 1487]	Navigate to the workflow request steps.
wfRequestUINav	WfRequestUIData [page 1489]	Navigate to the data as displayed on the Workflow Details page.
workflowAllowedActionListNav	WorkflowAllowedActionList [page 1492]	Navigate to the list of allowed action for the workflow request.

Entity Relation Diagram

For more information, see [Workflow](#) [page 1475].

Use Case 1: Querying the Basic Information of a Workflow

The following example shows how to query the basic information of a workflow by ID:

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/WfRequest(65L)?\$format=JSON</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<hostname>/odata/v2/WfRequest(65L)",
      "type": "SFOData.WfRequest"
    },
    "wfRequestId": "65",
    "lastModifiedDate": "/Date(1496851039000+0000)/",
    "lastModifiedBy": "101013",
    "module": "HRIS",
    "reminderSentDate": null,
    "totalSteps": 1,
    "createdDateTime": "/Date(1496851006000+0000)/",
    "createdOn": "/Date(1496851006000)/",
    "url": "https://<hostname>/sf/hrisworkflowapprove?workflowRequestId=V2-nlxRHnYcTrRljnB17z3o8Q%3D%3D&prevPage=HOME&company=BESTRUN&username=cgrant",
    "lastModifiedOn": "/Date(1496851039000)/",
    "parentWfRequestId": null,
    "createdBy": "adminJY",
    "currentStepNum": 1,
    "status": "COMPLETED",
    "wfRequestUINav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/WfRequest(65L)/wfRequestUINav"
      }
    },
    "parentWfRequestNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/WfRequest(65L)/parentWfRequestNav"
      }
    },
    "workflowAllowedActionListNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/WfRequest(65L)/workflowAllowedActionListNav"
      }
    },
    "empWfRequestNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/WfRequest(65L)/empWfRequestNav"
      }
    }
  }
}
```

```

    }
  },
  "wfRequestParticipatorNav": {
    "__deferred": {
      "uri": "https://<hostname>/odata/v2/WfRequest(65L)/
wfRequestParticipatorNav"
    }
  },
  "wfRequestCommentsNav": {
    "__deferred": {
      "uri": "https://<hostname>/odata/v2/WfRequest(65L)/
wfRequestCommentsNav"
    }
  },
  "wfRequestStepNav": {
    "__deferred": {
      "uri": "https://<hostname>/odata/v2/WfRequest(65L)/wfRequestStepNav"
    }
  }
}
}
}

```

Use Case 2: Querying All Pending Workflow Requests

This example shows how to query all workflow requests that were pending:

Request

Operation	Query
HTTP Method	GET
URI	https://<hostname>/odata/v2/WfRequest? \$format=JSON&\$filter=status eq 'PENDING'

Response

The response returns a full list of pending workflow requests in the system. For demonstration purpose, some results have been omitted:

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/WfRequest(162L)",
          "type": "SFOData.WfRequest"
        },
        "wfRequestId": "162",
        "lastModifiedBy": "80286",
        "status": "PENDING"
      },
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/WfRequest(41L)",
          "type": "SFOData.WfRequest"
        },
        "wfRequestId": "41",
        "lastModifiedBy": "101009",
        "status": "PENDING"
      }
    ]
  }
}

```

```

... ..
{
  "__metadata": {
    "uri": "https://<hostname>/odata/v2/WfRequest(740L)",
    "type": "SFOData.WfRequest"
  },
  "wfRequestId": "740",
  "lastModifiedBy": "athompson",
  "status": "PENDING"
},
{
  "__metadata": {
    "uri": "https://<hostname>/odata/v2/WfRequest(741L)",
    "type": "SFOData.WfRequest"
  },
  "wfRequestId": "741",
  "lastModifiedBy": "athompson",
  "status": "PENDING"
}
]
}

```

Related Information

[SAP Business Accelerator Hub: WfRequest](#)

[Function Imports \[page 1508\]](#)

[Permission Settings \[page 554\]](#)

[How do I access my assigned workflow requests? \[page 1481\]](#)

9.4.17.1.1 How do I access my assigned workflow requests?

Use the Todo entity to retrieve your assigned workflow requests. The Todo entity contains the list of tasks assigned to a user. You will find a workflow item in the following Todo task categories 14 (HRIS Employee Change Requests Category), 17 (Generic Object Category), 18 (Absence Management Category), 24 (IT Category), and 25 (Deductions Category).

Tell me more

To retrieve the assigned workflow requests, you have to:

1. Run a Todo query for the relevant task category (14, 17, 18, 24, or 25)
2. Query your workflow for the relevant subjectId.

Run a Todo query for the relevant task category (14, 17, 18, 24, or 25)

For this example, we'll use the task category 14 (HRIS Employee Change Requests Category):

Sample Request `https://<Hostname>/odata/v2/ToDo?$filter=categoryId eq '14'`

Sample Response

Sample Code

```
<m:properties>
<d:categoryId>14</d:categoryId>
<d:todos m:type="Bag(SFOData.ToDoBean)">
  <d:element>
    <d:categoryId>14</d:categoryId>
    <d:completedDate m:null="true" />
    <d:dueDate m:null="true" />
    <d:dueDateOffSet m:type="Edm.Int32">0</d:dueDateOffSet>
    <d:entries m:type="Bag(SFOData.ToDoEntry)">
      <d:element>
        <d:completedDate m:null="true" />
        <d:formDataId m:type="Edm.Int64">0</d:formDataId>
        <d:status m:type="Edm.Int32">2</d:status>
        <d:statusLabel>Active</d:statusLabel>
        <d:subjectFullName>New Hire , Tammy Aberts</d:subjectFullName>
        <d:subjectId>462</d:subjectId>
        <d:url>https://<hostname>/sf/hrisworkflowapprovalink?
workflowRequestId=V2-
ypU9jRAXxzV2pyMHsQn1BQ%3D%3D&prevPage=HOME&company=ACE1321&username=admin</d:url>
      </d:element>
    </d:entries>
    <d:entryId m:type="Edm.Int32">20375</d:entryId>
    <d:name>Requests Waiting for My Approval</d:name>
    <d:status m:type="Edm.Int32">2</d:status>
    <d:statusLabel>Active</d:statusLabel>
    <d:stepDescAlt>Requests Waiting for My Approval</d:stepDescAlt>
    <d:todoItemId m:null="true" />
    <d:url m:null="true" />
  </d:element>
</d:todos>
<d:categoryLabel>Employee Change Requests</d:categoryLabel>
<d:displayOrder m:type="Edm.Int32">14</d:displayOrder>
</m:properties>
```

Here you can see that there is one workflow item, subjectId 462, in the task category 14 (HRIS Employee Change Requests Category). Let's now look at our wfRequest query.

Query your workflow for the relevant subjectId

Sample Request `https://<Hostname>/odata/v2/WfRequest?$filter=wfRequestId eq '462'&$format=JSON`

Sample Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/WfRequest(462L)",
          "type": "SFOData.WfRequest"
        },
        "wfRequestId": "462",
        "module": "HRIS",
```

```

        "status": "PENDING",
        "currentStepNum": 1,
        "lastModifiedDate": "/Date(1391090611000+0000)/",
        "lastModifiedOn": "/Date(1391072611000)/",
        "totalSteps": 1,

        "url": "https://<hostname>/sf/hrisworkflowapproveLink?workflowRequestId=V2-ypU9jRaxxzV2pyMHSQn1BQ%3D%3D&prevPage=HOME&company=ACE1321&username=admin",
        "reminderSentDate": null,
        "createdOn": "/Date(1330523150000)/",
        "createdBy": "admin",
        "createdDateTime": "/Date(1330541150000+0000)/",
        "lastModifiedBy": "admin",
        "parentWfRequestId": null,
        "workflowAllowedActionListNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/WfRequest(462L)/workflowAllowedActionListNav"
            }
        },
        "wfRequestCommentsNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/WfRequest(462L)/wfRequestCommentsNav"
            }
        },
        "parentWfRequestNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/WfRequest(462L)/parentWfRequestNav"
            }
        },
        "wfRequestParticipatorNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/WfRequest(462L)/wfRequestParticipatorNav"
            }
        },
        "wfRequestStepNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/WfRequest(462L)/wfRequestStepNav"
            }
        },
        "empWfRequestNav": {
            "__deferred": {
                "uri": "https://<hostname>/odata/v2/WfRequest(462L)/empWfRequestNav"
            }
        }
    }
]
}

```

You can use the URL in the response to access your workflow item on the UI.

Note

We recommend that you use `ToDoEntryV2` instead of `ToDo`. The `ToDo` entity is user-centric and only returns the `ToDo`s for the API login user.

You can read up on the `ToDo` and `ToDoEntryV2` entities and what task categories are supported in [Related Information](#).

[Todo \[page 344\]](#)

9.4.17.2 WfRequestComments

The WfRequestComments entity represents WF_REQUEST_COMMENTS table in the SAP SuccessFactors database. This entity stores comments created for a workflow. This includes information about the initiator of the comment and the time it was created.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Cases

API Call	Description
<code>https://<api-server>.com/odata/v2/WfRequestComments?\$filter=(actionType eq 'INITIATE' or actionType eq 'DECLINE') and createdBy eq 'admin'&\$select=createdBy,actionType&\$format=JSON</code>	Get all comments created by admin which have the action type initiate or decline

>

Code Examples

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/WfRequestComments(46L)",
          "type": "SFOData.WfRequestComments"
        },
        "createdBy": "admin",
        "actionType": "INITIATE"
      }
    ]
  }
}
```

```

Related Information

[SAP Business Accelerator Hub: WfRequestParticipator](#)

[Permission Settings \[page 554\]](#)

9.4.17.4 WfRequestStep

This entity contains data of the steps in a workflow.

Supported Operations

Operation	Description
Query	You can query the information of a workflow step.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
wfRequestStepId	Business key.
approverType	The type of the approver of the workflow step. For more information about workflow approvers, see Workflow Participant Types .
role	This field contains a value only when <code>approverType</code> is "Role".
ownerId	If <code>approverType</code> is "Dynamic Group" or "Position", this field is null because this step has multiple owners.
actionType	Specify how approvers are allowed to change content of a workflow transaction: <ul style="list-style-type: none">No Edit Approvers do not have in-flight editing capability.Edit with Route Change Approvers can edit a workflow and the workflow route will be recalculated when they submit the request.Edit without Route Change Approvers can edit a workflow but the workflow route will not be recalculated when they submit the request.Edit Attachments Only Approver can only edit the attachments of the workflow.

Property	Description
relatedTo	<p>Determines the approver, based on attributes of the subject employee or data before or after the change. This field has two possible values, "Source" and "Target".</p> <p>For example, when an employee's position changes, the workflow may require the approval from the manager of the employee. Then <code>relatedTo</code> specifies:</p> <ul style="list-style-type: none"> <i>Source</i> The manager before the change <i>Target</i> The new manager after the change <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p>Note</p> <p>If a data change does not involve a manager change, the approval requests will be sent to the same person.</p> </div> <p>For more information about this property, see Creating an Individual Workflow.</p>

Use Case: Querying Completed Workflow Steps by Creator and Owner

Request

Operation	Query
HTTP Method	GET
URI	<pre>https://<API-Server>/odata/v2/WfRequestStep?\$filter=createdBy eq 'cgrant1' and ownerId eq 'cgrant1' and status eq 'COMPLETED'&\$select=wfRequestStepId,stepNum,ownerId,approverType&\$format=JSON</pre>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/WfRequestStep(1L)",
          "type": "SFOData.WfRequestStep"
        },
        "wfRequestStepId": "1",
        "stepNum": "1",
        "approverType": "ROLE",
        "ownerId": "cgrant1"
      }
    ]
  }
}
```

```
}
```

9.4.17.5 WfRequestUIData

This entity enables you to query the workflow data displayed on the Workflow Details page. You cannot query this entity on its own. You can only query the entity as a navigation property through other entities, for example, `TodoEntryV2`.

Supported Operations

Operation	Description
Query	Query operation is only possible when this entity is used as a navigation property under <code>WfRequest</code> entity, including its equivalent navigation property <code>wfRequestNav</code> . For example, you can query the corresponding workflow request data through <code>TodoEntryV2</code> by expanding its navigation properties: <code>\$expand=wfRequestNav/wfRequestUINav</code> .

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
<code>wfRequestId</code>	Id of the corresponding workflow request.
<code>operateUserName</code>	Name of the person who operated on the request.
<code>operateUserId</code>	userId of the person who operated on the request.
<code>subjectUserName</code>	Name of the person who is the subject of the request.

Property	Description
subjectUserId	userId of the person who is the subject of the request.
isObjectBase	Indicates whether the workflow is based on an MDF object.
objectType	Name of the MDF object the workflow is based on.
deeplink	A deep link to the workflow details page of the request.
todoSubjectLine	A description for the related to-do item.
operateType	Type of operation performed on the request.
actions	Possible actions for the workflow request. Note that the action is only available for the designated user in the workflow.

Use Case 1: Querying the Workflow Details of a To-Do Item

In this example, we try to query the to-do item [623M](#) and expand to its workflow request, and then further expands the wfRequestUINav navigation property to fetch the UI data.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/ToDoEntryV2(623M)?\$format=JSON&\$expand=wfRequestNav/wfRequestUINav</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<hostname>/odata/v2/ToDoEntryV2(623M)",
      "type": "SFOData.ToDoEntryV2"
    },
    "todoEntryId": "623",
    "lastModifiedDateTime": "/Date(1500336000000+0000)/",
    "dueDate": null,
    "todoEntryName": "Requests Waiting for My Approval",
    "categoryLabel": "Employee Change Requests",
    "completedDateTime": null,
    "mobileLinkUrl": null,
    "subjectId": "162",
    "createdDate": "/Date(1500336000000+0000)/",

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Retrieve Allowed Actions for a User

With this query, you're expanding the workflowAllowedAction list to see what actions a consumer can perform on workflow items that do not have the status completed and have been created by the user, User ID.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/WfRequest?\$filter=status+ne+'COMPLETED'+and+createdBy+eq+'<User ID>'&\$expand=workflowAllowedActionListNav, wfRequestStepNav&\$format=JSON</code>

Response

```
workflowAllowedActionListNav: {
  results: [1]
  0: {
    __metadata: {
      uri: "https://<hostname.com>/odata/v2/
WorkflowAllowedActionList(1563L)"
      type: "SFOData.WorkflowAllowedActionList"
    }-
    wfRequestId: "1563"
    allowResubmit: false
    allowReject: false
    allowDelegateGrant: false
    allowDelegateDecline: false
    allowApprove: false
    allowWithdraw: true
    allowSendback: false
    allowPostComment: true
    allowUpdateRequest: false
    allowDelegateRevoke: false
  }-
-
}
```

9.4.17.7 AutoDelegateConfig

This entity contains the workflow auto delegation configuration of a specified user.

Supported Operations

Operation	Description
Query	Queries the auto delegation configuration of a specified user
Upsert	If the record doesn't exist, the operation creates a record; if the record already exists, the operation updates it.
Insert	Creates an auto delegation configuration for a specified user
Merge	Updates the properties specified in the request and keeps value of other properties unchanged
Replace	Updates the properties specified in the request and clears value of other nonrequired properties
Delete	Deletes the auto delegation configuration of a specified user

Parameters

Parameter	Data Type	Required/Optional	Description
delegator	String	Required	A string that uniquely identifies a user whose auto delegation configuration you want to operate on
delegationStatus	String	Required	A string that indicates whether the delegator's auto delegation feature is set ON or OFF
startTime	datetimeoffset	Optional	The time from which auto delegation should be effective
endTime	datetimeoffset	Optional	The time after which auto delegation should be turned off
optimisticLockUUID	String	Optional	Version number of an existing record. We don't recommend that you add this parameter to the payload when you update or create a record.

Parameter	Data Type	Required/Optional	Description
autoDelegateDetails	AutoDelegateDetail	Optional	An array that contains all delegates of a specific delegator

Use Case 1: Querying the auto delegation configuration of user vicky

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/AutoDelegateConfig('vicky')?\$format=json

Response

```

      }
    }
  }
]
}
}

```

Use Case 3: Updating the auto delegation configuration of user vicky to set delegation status as OFF

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert?\$format=json
Payload	<pre> { "__metadata":{ "uri":"AutoDelegateConfig('vicky')"} , "delegationStatus": "OFF" } </pre>

Response

```

{
  "d": [
    {
      "key": "AutoDelegateConfig/delegator=vicky",
      "status": "OK",
      "editStatus": "UPsertED",
      "message": null,
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}

```

```
}
```

Use Case 4: Creating an auto delegation configuration for user vicky

Request

Operation	Insert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/AutoDelegateConfig? \$format=json</code>
Payload	<pre>{ "delegator": "vicky", "startTime": null, "delegationStatus": "ON", "endTime": null, "autoDelegateDetails": [{ "alwaysOn": true, "delegatee": "testemp5", "status": "ON" }] }</pre>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/AutoDelegateConfig('vicky')",
      "type": "SFOData.AutoDelegateConfig"
    },
    "startTime": null,
    "delegationStatus": "ON",
    "endTime": null,
    "delegator": "vicky",
    "autoDelegateDetails": {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/AutoDelegateDetail???",
        "type": "SFOData.AutoDelegateDetail"
      },
      "alwaysOn": true,
      "delegatee": "testemp5",
      "status": "ON"
    }
  }
}
```

Use Case 5: Updating the auto delegation configuration of user vicky to set delegation status as OFF and keep values of other fields unchanged

Request

Operation	Merge
HTTP Method	POST Header: X-HTTP-Method= MERGE
URI	https://<API-Server>/odata/v2/AutoDelegateConfig('vicky')?\$format=json
Payload	<pre>{ "delegationStatus": "OFF" }</pre>

Response

Use Case 6: Updating the auto delegation configuration of user vicky to set delegation status as OFF and clear values of other fields

Request

Operation	Replace
HTTP Method	PUT
URI	https://<API-Server>/odata/v2/AutoDelegateConfig('vicky')?\$format=json
Payload	<pre>{ "delegationStatus": "OFF" }</pre>

Response

Use Case 7: Deleting the auto delegation configuration of user vicky

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<API-Server>/odata/v2/AutoDelegateConfig('vicky')</code>

Response

Error Codes

Error	Description
NotFoundException	AutoDelegateConfig with key ('user') not found!
The error occurs when delegationStatus is assigned "null" as value.	delegationStatus is a required field/association in Object Auto-DelegateConfig.
The error occurs when start time is greater than end time or end time is a past time.	Enter a start time that is before the end time. Enter a future time as the end time.
This error occurs when you update a record and specify an optimisticLockUUID other than the existing record's optimisticLockUUID.	Your changes for AutoDelegateConfig data conflict with those made concurrently by another user. Please refresh and resubmit your changes.
COE_MISSING_REQUIRED_PROPERTIES	Please add required properties in payload. Required property delegationStatus is missing. You can check which properties are required for an entity in Admin Center > OData API Data Dictionary or the entity metadata. delegationStatus should be either ON or OFF when you create the auto delegation configuration.
COE_GENERAL_BAD_REQUEST	Enter a start time that is before the end time. Enter a future time as the end time.
COE_GENERAL_BAD_REQUEST	Delegatee is required.
COE_GENERAL_BAD_REQUEST	Record '(delegator=user)' of type 'AutoDelegateConfig' already exists.
COE_GENERAL_BAD_REQUEST	delegationStatus is a required field/association in Object Auto Delegate Config.
COE_GENERAL_BAD_REQUEST	Enter a start time that is before the end time. Enter a future time as the end time.
COE_MISSING_REQUIRED_PROPERTIES	Please add required properties in payload. Required property delegationStatus is missing. You can check which properties are required for an entity in Admin Center > OData API Data Dictionary or the entity metadata.

Error	Description
COE_GENERAL_BAD_REQUEST	Enter a start time that is before the end time. Enter a future time as the end time.
COE_RECORD_NOT_FOUND	Record for entity AutoDelegateConfig with key AutoDelegateConfig/delegator='user' does not exist. Please check the key value.

Related Information

[SAP Business Accelerator Hub: AutoDelegateConfig](#) 

9.4.17.8 AutoDelegateDetail

This entity contains delegatee details of the workflow auto delegation configuration of a specified user.

Supported Operations

Using the `Delete` operation of this entity may result in unexpected errors. For most cases, we recommend that customers use the `AutoDelegateConfig` entity instead.

Operation	Description
Query	Queries delegates of a specific user
Upsert	If the record doesn't exist, the operation creates a record; if the record already exists, the operation updates it.
Insert	Creates a delegatee for a specified user
Merge	Updates the properties specified in the request and keeps value of other properties unchanged
Replace	Updates the properties specified in the request and clears value of other nonrequired properties
Delete	This operation is NOT recommended.

Parameters

Parameter	Data Type	Required/Optional	Description
AutoDelegateConfig_delegate	String	Required	A string that uniquely identifies a user whose auto delegation configuration you want to operate on
status	String	Optional	Can be any of the following values: <ul style="list-style-type: none">• ON: The auto delegation request has been accepted. For a delegatee to be active, its status should be ON and alwaysOn true.• OFF: The delegatee isn't active.• PENDING: The <i>Allow Delegatees to Accept or Reject a Workflow Delegation Request</i> option is enabled and there is an auto delegation request awaiting response.• REJECTED: The auto delegation request has been rejected.• NONE: None of the above values are assigned.
alwaysOn	Bool	Optional	It's used together with status to determine whether a delegatee is an active delegatee.
delegatee	String	Required	Delegatee

Use Case 1: Querying all delegatees of user testemp1

This use case demonstrates how to retrieve all delegatees of a user through `AutoDelegateConfig`, instead of `AutoDelegateDetail`. This is a recommended practice.

Request

Operation Query

HTTP Method	GET
URI	https://<API-Server>/odata/v2/ AutoDelegateConfig('testemp1')/autoDelegateDetails

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/  
AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1',externalCode='f913dfa4044  
e4776a7ca191b8d818bcc')",
          "type": "SFOData.AutoDelegateDetail"
        },
        "externalCode": "f913dfa4044e4776a7ca191b8d818bcc",
        "AutoDelegateConfig_delegator": "testemp1",
        "alwaysOn": true,
        "delegatee": "testemp5",
        "status": "ON",
        "statusNav": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/  
AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1',externalCode='f913dfa4044  
e4776a7ca191b8d818bcc')/statusNav"
          }
        },
        "delegateeNav": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/  
AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1',externalCode='f913dfa4044  
e4776a7ca191b8d818bcc')/delegateeNav"
          }
        }
      }
    ]
  }
}
```

Use Case 2: Querying all delegates of user testemp1

This use case demonstrates how to retrieve all delegates of a user through `AutoDelegateDetail`. We recommend that you use `AutoDelegateConfig` instead, as shown in Use Case 1.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1', externalCode='f913dfa4044e4776a7ca191b8d818bcc')

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1',externalCode='f913dfa4044
e4776a7ca191b8d818bcc')",
      "type": "SFOData.AutoDelegateDetail"
    },
    "externalCode": "f913dfa4044e4776a7ca191b8d818bcc",
    "AutoDelegateConfig_delegator": "testemp1",
    "alwaysOn": true,
    "delegatee": "testemp5",
    "status": "ON",
    "statusNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/
AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1',externalCode='f913dfa4044
e4776a7ca191b8d818bcc')/statusNav"
      }
    },
    "delegateeNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/
AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1',externalCode='f913dfa4044
e4776a7ca191b8d818bcc')/delegateeNav"
      }
    }
  }
}
```

Use Case 3: Changing the active delegatee to 'testemp3' for user testemp1

Request

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert?\$format=json
Payload	<pre>{ "__metadata": { "uri": "AutoDelegateDetail(AutoDelegateConfig_delegator=' testemp1',externalCode='f913dfa4044e4776a7ca191b8d818bcc ')" }, "delegatee": "testemp3" }</pre>

Response

```
{
  "d": [
    {
```

```

"key": "AutoDelegateDetail/AutoDelegateConfig_delegator=testemp1,AutoDelegateDetail/
externalCode=f913dfa4044e4776a7ca191b8d818bcc",
  "status": "OK",
  "editStatus": "UPSERTED",
  "message": null,
  "index": 0,
  "httpCode": 200,
  "inlineResults": null
}
]
}

```

Use Case 4: Changing the active delegatee for user testemp1 and keeping values of other fields unchanged

Request

Operation	Merge
HTTP Method	POST Header: X-HTTP-Method= MERGE
URI	https://<API-Server>/odata/v2/ AutoDelegateDetail(AutoDelegateConfig_delegator='testemp1', externalCode=' f913dfa4044e4776a7ca191b8d818bcc')
Payload	<pre> { "delegatee": "testemp5" } </pre>

Response

Error Codes

Error	Description
NotFoundException	AutoDelegateDetail with key (AutoDelegateConfig_delegator='user', externalCode='UUID') not found!
The externalCode used when upserting already exists.	The delegation setup must be unique.
The status was set to "Pending" or "Rejected".	To save this auto delegation configuration, set the status to a value other than "Pending" or "Rejected".
COE_GENERAL_BAD_REQUEST	The delegation setup must be unique.
COE_GENERAL_BAD_REQUEST	To save this auto delegation configuration, set the status to a value other than "Pending" or "Rejected".
COE_GENERAL_BAD_REQUEST	Delegatee is required.

9.4.17.10 Function Imports

A list of function imports for processing workflow data.

9.4.17.10.1 approveWfRequest

Lets you approve a workflow request assuming that you have authorization to approve the next step in the workflow as described in the topic WorkflowAllowedActionList.

Supported Operations

HTTP Method: POST

Return Type: collection (WfRequestActionResponse)

Support Payload: false

Parameters

Parameter	Type	Description
wfRequestID	Long	A number, ending with L, that uniquely identifies the workflow request
comment	String	A note for extra information about the workflow item

Use Case: Approve a Workflow Request

Request

HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/ approveWfRequest?wfRequestId=1234L</code>

Response

```
<d:WfRequestActionResponse>  
  <d:element m:type="SFOData.WfRequestActionResponse">  
    <d:status>success</d:status>  
    <d:wfRequestId m:type="Edm.Int64">1234L</d:wfRequestId>  
  </d:element>  
</d:WfRequestActionResponse>
```

Error Codes

Error Code	Description
COE_GENERAL_BAD_REQUEST	Message will tell you if the error is due to lack of user authorization or if there is an issue with the workflow itself.

9.4.17.10.2 commentWfRequest

Lets you comment a workflow request and send email notifications, provided that you have authorization in the WorkflowAllowedActionList. Notifications are sent to previous step approvers, current step approvers, contributors, and the initiator.

Supported Operations

HTTP Method: POST

Return Type: collection (WfRequestActionResponse)

Support Payload: false

Parameters

Parameter	Description	Type
wfRequestID	A number, ending with L, that uniquely identifies the workflow request	Long
comment	A note for extra information about the workflow item	String

Use Case: Comment a Workflow Request

Request

HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/commentWfRequest?wfRequestId=1234L&comment='test'</code>

Response

```
<d:WfRequestActionResponse>
  <d:element m:type="SFOData.WfRequestActionResponse">
    <d:status>success</d:status>
    <d:wfRequestId m:type="Edm.Int64">1563</d:wfRequestId>
  </d:element>
</d:WfRequestActionResponse>
```

Error Codes

Error Code	Description
COE_GENERAL_BAD_REQUEST	Message will tell you if the error is due to lack of user authorization or if there's an issue with the workflow itself.

9.4.17.10.3 rejectWfRequest

This function import enables you to reject a workflow request assuming that you have authorization in `WorkflowAllowedActionList`, or you are a workflow admin user. To be a workflow admin, you need to have the role-based permission from [Manage Workflows](#) > [Manage Workflow Requests](#).

Supported Operations

HTTP Method: POST

Return Type: collection (WfRequestActionResponse)

Support Payload: false

Parameters

Parameter	Description	Type
wfRequestId	A number, ending with L, that uniquely identifies the workflow request	Long
comment	A note for extra information about the workflow item	String

Use Case: Reject a Workflow Request

Request

HTTP Method	POST
URI	https://<api-server>/odata/v2/ rejectWfRequest?wfRequestId=1234L

Response

```
<d:WfRequestActionResponse>  
  <d:element m:type="SFOData.WfRequestActionResponse">  
    <d:status>success</d:status>  
    <d:wfRequestId m:type="Edm.Int64">1234L</d:wfRequestId>  
  </d:element>  
</d:WfRequestActionResponse>
```

Error Codes

Error Code	Description
COE_GENERAL_BAD_REQUEST	Message will tell you if the error is due to lack of user authorization or if there is an issue with the workflow itself.

9.4.17.10.4 sendbackWfRequest

Lets you send back a workflow request assuming that you have authorization in the WorkflowAllowedActionList.

Supported Operations

HTTP Method: POST

Return Type: collection (WfRequestActionResponse)

Support Payload: false

Parameters

Parameter	Description	Type
wfRequestID	A number, ending with L, that uniquely identifies the workflow request	Long
comment	A note for extra information about the workflow item	String

Use Case: Send Back a Workflow Request

Request

HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/sendbackWfRequest?wfRequestId=1234L</code>

Response

```
<d:WfRequestActionResponse>
  <d:element m:type="SFOData.WfRequestActionResponse">
    <d:status>success</d:status>
    <d:wfRequestId m:type="Edm.Int64">1234L</d:wfRequestId>
  </d:element>
</d:WfRequestActionResponse>
```

Error Codes

Error Code	Description
COE_GENERAL_BAD_REQUEST	Message will tell you if the error is due to lack of user authorization or if there is an issue with the workflow itself.

9.4.17.10.5 withdrawWfRequest

Lets you withdraw a workflow request assuming that you have authorization in the WorkflowAllowedActionList.

Supported Operations

HTTP Method: POST

Return Type: collection (WfRequestActionResponse)

Support Payload: false

Parameters

Parameter	Description	Type
wfRequestID	A number, ending with L, that uniquely identifies the workflow request	Long
comment	A note for extra information about the workflow item	String

Use Case: Withdraw a Workflow Request

Request

HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/withdrawWfRequest?wfRequestId=1234L</code>

Response

```
<d:WfRequestActionResponse>  
  <d:element m:type="SFOData.WfRequestActionResponse">  
    <d:status>success</d:status>  
    <d:wfRequestId m:type="Edm.Int64">1234L</d:wfRequestId>  
  </d:element>  
</d:WfRequestActionResponse>
```

Error Codes

Error Code	Description
COE_GENERAL_BAD_REQUEST	Message will tell you if the error is due to lack of user authorization or if there is an issue with the workflow itself.

9.4.17.10.6 getWorkflowPendingData

You can use getWorkflowPendingData to query the changed data in a workflow that is not yet approved or rejected, as well as fully completed.

Note

As of Q2 2019, the getWorkflowPendingData API is converted from Beta to Public. If you are using the Beta version, please change the endpoint URL.

This API supports entities that are in the label: value pair format. Refer to the following list for the supported entities:

- EmpCompensation
- EmpEmployment
- EmpGlobalAssignment
- EmpJob

Note

For EmpJob, the DirectReportee, Reportee, Deactivate, and TimeBalanceSection attributes are not supported, because they do not have corresponding HRIS elements.

- EmpPensionPayout
- FOPayComponentGroup
- PerAddress
- PerGlobalInfo
- PerPerson
- PerPersonal
- PerPersonRelationship

The following entities are not supported, because there are multiple fields for each record:

- EmpJobRelationships
- EmpPayCompNonRecurring
- EmpPayCompRecurring
- EmpWorkPermit
- PerNationalId

Permissions

You have the [Employee Central API > Read Permission on All Employee Central HRIS OData Entities](#) permission.

Supported Operations

HTTP Method: POST

Return Type: collection (WfRequestPendingDataResponse)

Support Payload: false

Properties

Property	Description
fieldId	The ids of HrisElementField for only the work permit group and national id group of ESS workflow. For other groups, the value is null.
id	The HrisElementField id.
label	The HrisElementField label.
newValue	The new value.
oldValue	The original value.
payComponents	The value is not null only when the workflow involves compensation amount change.
type	For label: value pair change set, the value is null. For grid type of data, which means the data format is a table, the value is "grid".
title	The change set group title, which is the same as displayed in UI.
entityName	The OData entity name, which is the same as displayed in the Metadata file.
fieldName	The OData property name, which is the same as displayed in the Metadata file.

Parameters

Parameter	Description	Type	Required
wfRequestID	A number, ending with L, that uniquely identifies the workflow request	Long	Yes

Use Case: Get the pending data of a workflow request

Get the pending data of the workflow request <your_wfRequestID>, for example, 2621L

Sample Request

HTTP Method	POST
URI	http://<hostname>/odata/v2/beta/getWorkflowPending-Data?wfRequestId=2621L

Response

```
{
```

```

"d": [{
  "wfRequestId": "2621",
  "workflowAttributeGroups": {
    "results": [{
      "changeSet": {
        "results": [{
          "changeSet": {
            "results": []
          },
          "entityName": "EmpGlobalAssignment",
          "fieldId": null,
          "fieldName": "assignmentType",
          "id": "assignment-type",
          "label": "Assignment Type",
          "newValue": "Short-term assignment",
          "oldValue": null,
          "payComponents": null,
          "type": null
        }
      ]
    },
    "groups": {
      "results": [{
        "changeSet": {
          "results": []
        },
        "inlineGroups": {
          "results": [{
            "changeSet": {
              "results": [{
                "changeSet": {
                  "results": []
                },
                "entityName": "EmpJob",
                "fieldId": null,
                "fieldName": "company",
                "id": "company",
                "label": "Company",
                "newValue": "Ace Australia (ACE_AUS)",
                "oldValue": "",
                "payComponents": null,
                "type": null
              }
            ]
          }
        ],
        "subChangeSetGroups": {
          "results": []
        },
        "title": "Organizational Information"
      }...]
    },
    "subChangeSetGroups": {
      "results": []
    },
    "title": "Job Info "
  },
  {
    "changeSet": {
      "results": []
    },
    "inlineGroups": {
      "results": [{
        "changeSet": {
          "results": [{
            "changeSet": {
              "results": []
            },
            "entityName": "EmpJobRelationships",
            "fieldId": null,
            "fieldName": null,

```

```

    },
    "subChangeSetGroups": {
      "results": []
    },
    "title": "Global Assignment"
  }
}
}
}
}
}

```

You can map the change to an HRIS element using the `entityName` and `fieldName` fields.

9.4.17.10.7 changeWfRequestApprover

You can use `changeWfRequestApprover` to change the approver of a workflow step.

Permissions

- [Manage Workflows](#) > [Manage Workflow Requests](#) >

Parameters

Parameter	Data Type	Required/Optional	Description
<code>wfRequestId</code>	Long	Required	A number that uniquely identifies the workflow request
<code>wfRequestStepId</code>	Long	Required	A number that uniquely identifies the workflow step whose approver will be changed
<code>updateToUserId</code>	String	Optional	A string that uniquely identifies the new approver

Parameter	Data Type	Required/Optional	Description
editTransaction	String	Optional	<p>A string that indicates the new Edit Transaction type. Leave it empty to keep the current status. Possible values are:</p> <ul style="list-style-type: none"> • NO_EDIT: Approvers do not have in-flight editing capability. • EDIT_WITH_ROUTE: Approvers can edit a workflow and the workflow route will be recalculated when they submit the request. • EDIT_WITHOUT_ROUTE: Approvers can edit a workflow but the workflow route will not be recalculated when they submit the request. • EDIT_ATTACHMENT_ONLY: Approver can only edit the attachments of the workflow.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
WfRequestActionResponse	Reponse of the action.

Use Case 1: Changing the Approver of a Workflow Step

In this use case, we try to change the approver of step 12345 of workflow request 1234 to user1200.

Request

HTTP Method	POST
URI	https://<API-Server>/odata/v2/changeWfRequestApprover?workflowReqId=1234L&workflowReqStepId=12345L&userId='user1200'

Response

```
{
  "d": [
    {
      "status": "success",
      "wfRequestId": "1234"
    }
  ]
}
```

Error Codes

Error	Description
COE_GENERAL_BAD_REQUEST	A common message displays, indicating whether the error is due to lack of user authorization or caused by an issue with the workflow itself.

9.4.18 Business Examples

9.4.18.1 Adding a New Employee

If you want to save time when adding new employees to your organization, you can use the `Upsert` operation. This will prove less time-consuming than adding the employees one-by-one in the Employee Central UI.

At a minimum, you can insert the `PerPerson`, `EmpEmployment`, `EmpJob`, and `PerPersonal` entities to add an employee. The order in which you perform the `Upsert` operations is critical. Be sure to follow it.

1. `PerPerson`
2. `EmpEmployment`
3. `EmpJob`
4. `PerPersonal`

⚠ Caution

Before inserting or updating employee information using OData API, check whether an HRIS sync job is currently running in your instance. An active HRIS sync job may overwrite the values of certain fields, such

as username. This could lead to inconsistent user data. We recommend that you avoid all API edit operations when an HRIS sync job is running.

Please contact your Implementation Partner to find out whether an HRIS sync job is scheduled for your instance. If you are no longer working with an Implementation Partner, contact Product Support.

Related Information

[PerPerson Upsert \[page 1522\]](#)

[EmpEmployment Upsert \[page 1523\]](#)

[EmpJob Upsert \[page 1524\]](#)

[PerPersonal Upsert \[page 1526\]](#)

9.4.18.1.1 PerPerson Upsert

When you add a new employee, you need to upsert the PerPerson entity. The order in which you upsert your entities for adding a new employee is crucial and the PerPerson entity is the first one when you use the minimum number of entities to add a new employee. The other ones are EmpEmployment (2nd upsert), EmpJob (3rd upsert) and PerPersonal (4th upsert).

Sample OData Request

URI: `http://<api-server>/odata/v2/upsert`

HTTP Method: POST

Payload:

```
{
  "__metadata": {
    "uri": "PerPerson"
  },
  "personIdExternal": "grantcarla"
}
```

Form Encoding: application/json

Tip

To see the required fields for this entity for your instance, check your OData dictionary. There you'll see any other insertable fields available and you can add them to your payload, if required.

Response

When the insert is successful, you'll have the following response. Please note that the operation always returns status 200 (OK) with a response body indicating all `upsert` results. Individual `upsert` failures are not reported as errors.

Source Code

```
<feed>
```

```

<entry>
<content type="application/xml">
  <m:properties>
<d:key m:null="true" />
<d:status>OK</d:status>
<d:editStatus>UPSERTED</d:editStatus>
<d:message m:null="true" />
<d:index m:type="Edm.Int32">0</d:index>
<d:httpCode m:type="Edm.Int32">200</d:httpCode>
<d:inlineResults m:type="Bag(SFOData.UpsertResult)" />
  </m:properties>
</content>
</entry>
</feed>

```

Next step for adding a new employee: EmpEmployment Upsert

Related Information

[generateNextPersonID \[page 1170\]](#)

9.4.18.1.2 EmpEmployment Upsert

When you add a new employee, you need to upsert the EmpEmployment entity. The order in which you upsert your entities for adding a new employee is crucial and the EmpEmployment entity is the second one when you use the minimum number of entities to add a new employee. The other ones are PerPerson (1st upsert), EmpJob (3rd upsert), and PerPersonal (4th upsert).

Note

When you upsert EmpEmployment, the User entity is also created with the `userId` that you specify.

Sample OData Request

URI: `http://<api-server>/odata/v2/upsert`

HTTP Method: POST

Payload:

```

{ "__metadata": {
  "uri": "EmpEmployment(personIdExternal='grantcarla',userId='cgrant')",
},
  "startDate": "/Date(1388534400000)/",
  "personIdExternal": "grantcarla",
  "userId": "cgrant"
}

```

Form Encoding: application/json

Tip

To see the required fields for this entity, check the OData dictionary in your company instance. You can also see the other insertable fields and can add them to your payload, if required.

Response

When the insert is successful, you'll have the following response. Please note that the operation always returns status 200 (OK) with a response body indicating all `Upsert` results. Individual `Upsert` failures are not reported as errors.

Source Code

```
<feed>
<entry>
<content type="application/xml">

9.4.18.1.3 EmpJob Upsert

When you add a new employee, you need to upsert the EmpJob entity. The order in which you upsert your entities for adding a new employee is crucial and the EmpJob entity is the third one when you use the minimum number of entities to add a new employee. The other ones are PerPerson (1st upsert), EmpEmployment (2nd upsert), and PerPersonal (4th upsert).

Sample OData Request

URI: `http://<api-server>/odata/v2/upsert`

HTTP Method: POST

Payload:

```
{ "__metadata": {  
  "uri": "EmpJob"  
},  
  "jobCode": "ADMIN-1",  
  "userId": "cgrant",  
  "startDate": "/Date(1388534400000)/",  
  "eventReason": "HIRNEW",  
  "company": "ACE_USA",  
  "businessUnit": "ACE_CORP",  
  "managerId": "NO_MANAGER"  
}
```

Form Encoding: application/json

Tip

To see the required fields for this entity for your instance, check your OData dictionary. There you'll see any other insertable fields available and you can add them to your payload, if required.

Response

When the insert is successful, you'll have the following response. Please note that the operation always returns status 200 (OK) with a response body indicating all `Upsert` results. Individual `Upsert` failures are not reported as errors.

Source Code

```

9.4.18.2 Filtering out external user data

Boolean fields, includeAllRecords (added to EmpEmployment, PerAddressDEFLT, PerEmail, PerPhone, PerPerson, and PerPersonal) and isECRecord (added to EmpEmployment) are available for more flexible filtering.

Background

In this topic, we're talking about external and internal user data.

External user data refers to non-Employee Central user data. When non-Employee Central modules use Employee Central entities to store user data (for example, Recruiting might use PerPerson and PerPhone to store details about an applicant), this type of user data is known as external user data.

Internal user data refers to Employee Central users, that is employees, as well as any users that have a dependent relationship with an Employee Central user (for example, a spouse, a child, or, an emergency contact).

What's the benefit?

The Employee Central entities, EmpEmployment, PerAddressDEFLT, PerEmail, PerPhone, PerPerson, and PerPersonal are often reused by other non-Employee Central modules to store user data. This data is external user data. Up to now, you haven't been able to filter out this external user data for PerAddressDEFLT, PerEmail, PerPhone, or for PerPersonal. So, if, for example you're using Employee Central OData APIs for a scenario such as payroll replication, your response could include applicants from Recruiting. And, conversely, you have not been able to include external user data for EmpEmployment or PerPerson. Now, however, we're offering filterable and selectable fields to model queries to meet your requirements.

How does it work?

We're offering you the following Boolean fields to use with \$filter:

- isECRecord: Available for EmpEmployment.
isECRecord=true means that internal user data is returned; isECRecord=false means that external user data is returned.

- includeAllRecords: Available for EmpEmployment, PerAddressDEFLT, PerEmail, PerPhone, PerPerson, and PerPersonal.
includeAllRecords=true means that both internal and external records are returned.

For EmpEmployment, you can use this combination to return external user data:

isECRecord = false and includeAllRecords = true

Tell me more: Properties

Field	Type	Nullable	Required	Creatable	Updatable	Upsertable	Visible	Sortable	Filterable
includeAllRecords	Edm.Boolean	True	False	False	False	False	False	True	True
isECRecord	Edm.Boolean	True	False	False	False	False	True	False	True

Good to know

includeAllRecords works on the root entity only. If you specify it on the navigation entity, it won't work.

Works:

Query: `https://<hostname>.com/odata/v2/PerPerson?$expand=personalInfoNav&$filter=includeAllRecords eq true`

Query: `https://<hostname>.com/odata/v2/PerAddressDEFLT?$filter=includeAllRecords eq true`

Won't work - Raises an error message:

Query: `https://<hostname>.com/odata/v2/PerPerson?$expand=personalInfoNav&$filter=personalInfoNav/includeAllRecords eq true`

Error message: `Unsupported feature: Filter by nav/includeAllRecords is not supported.`

How can I use it?

This table tells you how to use the filters.

isECRecord and includeAllRecords in filters

Your want your query to return	You'll need to	Use the following filter
Internal user data	Filter out external user data	Option 1: isECRecord=true Option 2: isECRecord=true, includeAllRecords=false Option 3: includeAllRecords=false Option 4: includeAllRecords=true, isECRecord=true Option 5: no filter
External user data	Filter out internal user data	isECRecord=false, includeAllRecords=true
External and internal user data	Include external and internal user data	includeAllRecords= true

Note

Only available for EmpEmployment

Show me some use cases

Here are some queries and the responses.

Note

Please remember that includeAllRecords is a hidden field, so you won't see it in the response.

Filter out external user data for PerPhone

Query: `https://<hostname>.com/odata/v2/PerPhone?$filter=includeAllRecords eq false OR`

9.4.18.3 Exposing person UUID for integration and import scenarios

A person UUID (unique universal identifier) is now available for integration and import scenarios.

Background

We've introduced the concept of a person UUID for the entire SAP SuccessFactors HCM suite. When a new hire or user is created, the system generates this identifier – called "perPersonUuid". This field is immutable meaning that once the field is populated with a value, it cannot be changed.

What's the benefit?

In SAP SuccessFactors HCM suite, you can now expose perPersonUuid for integration and import scenarios for all employees. So even if the employment field IS_EC_SYSTEM_OF_RECORD=F and the record is for a non-Employee Central user, the perPersonUuid can be exposed.

How does it work?

perPersonUuid is a field in the new entity PersonKey.

perPersonUuid cannot be queried directly, but is available from the User entity with the new navigation personKeyNav.

perPersonUuid is exposed regardless of data model configuration, RBP settings, or provisioning settings.

perPersonUuid can also be added to PerPerson.

Good to know

- Minimum UI Version: v12.
- perPersonUuid is not available on the UI. It is for integration and import scenarios only.
- perPersonUuid maximum length is 32 characters.
- personKeyNav in the User entity is independent of the provisioning settings.
- Available in PerPerson as an upsertable and visible field.

ⓘ Note

Note - to add it to PerPerson, you have to:

- Add `<hris-field id="per-person-uuid" visibility="both">` to personInfo hris-element in your data model configuration.

- Enable RBP and EDDP in provisioning

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

- The only way to expose this field in a query is with \$expand from the User entity. If you try to query the entity directly, the error message <COE_UNSUPPORTED_FEATURE> is raised.

How can I use it?

To query it, personKeyNav has now been added to the User entity and you use \$expand to expose perPersonUuid.

Show me a use case: \$expand

Request: `https://<api-server>/odata/v2/User('admin')?
$format=json&$expand=personKeyNav&$select=personKeyNav`

Response

Sample Code

Extract from response

```

9.4.18.4 Using wfStepApproverNav for more detailed workflow configuration information

You can use wfStepApproverNav to get more detailed workflow information.

Background

FOWfConfig contains workflow information but - as with all entity fields - you can only read the fields that have the attribute visible=true. In FOWfConfig, this means that you couldn't read the following fields:

actionType, approverRole, approverType, context, relationshipToApprover, respectRBP, skipType, and stepNum

However, you can use this nav, wfStepApproverNav to navigate to FOWfConfigStepApprover where these fields have the attribute visible=true.

What's the benefit?

Being able to read these fields means that you can get much more detailed workflow information.

How can I use these fields in my workflow configurations?

You can access these fields for more detailed information as follows:

- With FOWfConfig, you can use \$expand=wfStepApproverNav.
- With FOWfConfigStepApprover, you can use a direct query.

9.4.18.5 Differentiating primary from secondary employment during concurrent employment replication

What's new?

The mdf entities, SecondaryAssignments and SecondaryAssignmentsItem are now available. This means that it is now possible to know which employment contract is the primary one for replication scenarios. In a nutshell you can now build a concurrent employment replication from Employee Central to other 3rd Party systems using OData APIs. Please note that secondary employment is also known as concurrent employment.

What's the benefit?

Previously it was not possible to differentiate primary from secondary employments using OData APIs. By offering SecondaryAssignments and SecondaryAssignmentsItems, important data has been made available in one single API call and you benefit from:

- Simplified API consumption
- Faster integration since you no longer have to deal with logic on middleware
- Extracting data from the integration center
- Not having to build multiple queries to identify secondary employments

How does it work?

The PerPerson entity now has a navigation secondaryAssignmentsNav that lets you navigate to the MDF entity SecondaryAssignments.

Tell me more

SecondaryAssignments has a business key externalCode (Person ID External) meaning that it references a person. It has a one to multiple association with the MDF entity SecondaryAssignmentsItem.

SecondaryAssignmentsItems contains the userSysId (Employment/User ID) – this is the unique user ID generated when a secondary employment is created. It is a child entity of SecondaryAssignments. These assignments are created and maintained automatically based on the creation or editing of Concurrent Employment.

Good to know

Both entities are effective-dated. If the concept of effective dating is new to you, please take a look at [Effective Dating](#) so that you can make the most out of this new entity.

How can I use it?

In the PerPerson entity, you use the secondaryAssignmentsNav, a visible, sortable, and filterable field to build a query that navigates to the entity SecondaryAssignments.

Show me a use case: GET

GET Operation: Retrieves the secondaryAssignmentsNav which in turn will return the SecondaryAssignmentsItems, that is information about the secondary employment.

9.4.19 FAQs

You can take a look at the tips and FAQs here to see if they can answer your questions or help you with your APIs. In some cases, you'll find a brief explanation, and others will guide you to existing topics for your answer.

9.4.19.1 Broken APIs: What causes them?

Sometimes a system is changed in a way that leads to an API breaking. More often than not, such incompatible changes are made during configuration of the system and not by the API consumers. Take a look at this list to see what actions could lead to an incompatible change - by avoiding these actions in the first place, you should be free of incompatible changes in your system.

Incompatible changes that might break APIs

- Removing any field that is exposed by an API from the MDF object definition or HRIS succession data model will break that API.
- Changing the visibility of any field that is exposed by an API in the MDF object definition or HRIS succession data model from visible/enabled to invisible/none will break that API
- Removing permissions or provisioning settings for OData APIs will break the API
- Renaming the identifier of customString field in the succession datamodel - this breaks the API because technically what is actually happening is the deletion of the customString field and creation of a new one.
- Changing the field type from picklist to string
- Deleting codes from picklists

In contrast to these incompatible changes, compatible changes will not break the APIs. Some examples of compatible changes include:

- Adding a new field
- Renaming a field label
- Changing the RBP setting for a field from read-only to view not allowed

9.4.19.2 Duplicate Records?

Tips on avoiding duplicate records

If your're having problems with duplicate records, take a look at these tips.

Duplicate Records: Checklist

Picklists

When you use a picklist label (picklistLabels) in a \$filter query, specify the locale to avoid duplicate records.

Background: When a picklist has more than one locale and this is not defined in a query, all the locales will be queried. This could result in duplicate records.

You must define the locale in your query as follows:

```
$filter=<entity>Nav/picklistLabels/locale eq 'en_US'
```

Paging

If pages have duplicates or missing records, one possible reason is undefined sorting. Try using orderBy on the whole business key to fix this issue.

9.4.19.3 Error message: Behavior in upsert statements

Upsert statements have a single record error message behavior; for each record that fails, an error message is issued.

Example: Wrong Gender

Sample Request: `https://<Hostname>/odata/v2/Upsert`

Content Type: Content-Type: application/json;charset=utf-8

Payload Information:

Sample Code

```
[  
  {  
    "__metadata" : {
```

```

"uri" : "https://<Hostname>/odata/v2/
PerPersonal(personIdExternal='aaaa',startDate=datetime'1990-01-01T00:00:00')",
"type" : "SFOData.PerPersonal"
}, "startDate" : "\/Date(63115200000)\/", "personIdExternal" : "aaaa",
"initials" : "LT", "gender" : "M", "namePrefix" : "LT"
}, {
  "__metadata" : {
    "uri" : "https://<Hostname>/odata/v2/
PerPersonal(personIdExternal='dddd',startDate=datetime'1990-01-01T00:00:00')",
    "type" : "SFOData.PerPersonal"
  }, "startDate" : "\/Date(63115200000)\/", "personIdExternal" : "dddd",
  "initials" : "LT", "gender" : "H", "namePrefix" : "LT"
}, {
  "__metadata" : {
    "uri" : "https://<Hostname>/odata/v2/
PerPersonal(personIdExternal='hhhh',startDate=datetime'1990-01-01T00:00:00')",
    "type" : "SFOData.PerPersonal"
  }, "startDate" : "\/Date(63115200000)\/", "personIdExternal" : "hhhh",
  "initials" : "LT", "gender" : "M", "namePrefix" : "LT"
}
}
]

```

Response:

Sample Code

```

```

9.4.19.4 Expanded entities: Handling deleted objects

Describes how deleted objects in \$expand can be handled as a change in certain Employee Central OData APIs.

The standard behavior in Employee Central OData API queries, such as the one below, is to ignore any records that have been deleted.

In this type of query `https://<hostname>/odata/v2/PerPerson?$expand=emailNav&$filter=personIdExternal eq '106015' and emailNav/lastModifiedDateTime ge datetimeoffset '2000-01-01T01:00:00.000Z'`, the standard behavior leads to an empty response in which all person and e-mail records are missing when the root entity is empty. This is because the engine is filtering for the e-mail info based on the last modified date - however since the object has been deleted, the system cannot find anything. You now have the chance to capture the deleted operation and update your response with an empty value for the deleted object, rather than just having an empty response. This ensures that any person synchronization is accurate.

To override this standard behavior, go to [Admin Center](#) > [Manage Employee Central Settings](#), and turn on the switch for *Consider Deletion of Expanded Entities As A Change*.

Supported Entities: PerEmail, PerPhone, PerAddressDEFAULT, EmpJobRelations, PerNationalId, EmpPayCompNonRecurring, PerEmergencyContact, and EmpWorkPermit.

Examples: With and without the feature "Consider Deletion of Expanded Entities As A Change"

Example: Without "Consider Deletion of Expanded Entities As A Change"

This query shows you any changes to the e-mail records for the employee and time frame specified:

```

https://<hostname>/odata/v2/PerPerson?$expand=emailNav&$filter=personIdExternal eq '106015' and emailNav/lastModifiedDateTime ge datetimeoffset '2000-01-01T01:00:00.000Z'

```

Sample Code

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://qaautocand-api.lab-rot.ondemand.com/odata/v2/PerPerson('106015')",
          "type": "SFOData.PerPerson"
        },

```

```

    "personIdExternal": "106015",
    "lastModifiedDate": "/Date(1441580677000+0000)/",
    "createdDateTime": "/Date(1441568467000+0000)/",
    "createdOn": "/Date(1441568467000)/",
    "countryOfBirth": "AUS",
    "lastModifiedBy": "admindlr",
    "perPersonUuid": "BE297AA97D004D29ADCBE89546F323EA",
    "lastModifiedOn": "/Date(1441580677000)/",
    "createdBy": "admindlr",
    "personId": "339",

    ....

    "emailNav": {
      "results": [
        {
          "__metadata": {
            "uri": "https://qaautocand-api.lab-
rot.ondemand.com/odata/v2/PerEmail(emailType='8448',personIdExternal='106015')",
            "type": "SFOData.PerEmail"
          },
          "emailType": "8448",
          "personIdExternal": "106015",
          "lastModifiedDate": "/Date(1441833666000+0000)/",
          "createdDateTime": "/Date(1441833666000+0000)/",
          "createdOn": "/Date(1441833666000)/",
          "emailAddress": "Jack.McAfee@bestrun.com",
          "customDouble1": null,
          "isPrimary": true,
          "customDate1": null,
          "lastModifiedBy": "admindlr",
          "customString5": null,
          "customString4": null,
          "customString3": null,
          "customString2": null,
          "customString8": null,
          "customString7": null,
          "customString6": null,
          "lastModifiedOn": "/Date(1441833666000)/",
          "customString1": null,
          "createdBy": "admindlr",
          "customLong1": null,
          "customString3Nav": {
            "__deferred": {
              "uri": "https://qaautocand-api.lab-rot.ondemand.com/odata/v2/
PerEmail(emailType='8448',personIdExternal='106015')/customString3Nav"
            }
          }
        },

        ....

      ]
    }
  ]
}

```

Example: Without "Consider Deletion of Expanded Entities As A Change" and after an agent has deleted the e-mail information for the employee in the system

Let's run the query again, `https://<hostname>/odata/v2/PerPerson? $expand=emailNav&$filter=personIdExternal eq '106015' and emailNav/lastModifiedDateTime ge datetimeoffset'2000-01-01T01:00:00.000Z'`

Sample Code

Response

```
{
  "d": {
    "results": []
  }
}
```

All records of the employee have been removed. This causes issues - if instead of e-mail information, for example, an address or a dependent is deleted - the system responds in the same way to the lastmodified query. Instead of updating the response with an empty value for deleted object, all records are removed.

Example: With "Consider Deletion of Expanded Entities As A Change" and after an agent has deleted the e-mail information for the employee in the system

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://qaautocand-api.lab-rot.ondemand.com/odata/v2/PerPerson('106015')",
          "type": "SFOData.PerPerson"
        },
        "personIdExternal": "106015",
        "lastModifiedDateTime": "/Date(1441580677000+0000)/",
        "createdDateTime": "/Date(1441568467000+0000)/",
        "createdOn": "/Date(1441568467000)/",
        "countryOfBirth": "AUS",
        "lastModifiedBy": "admindlr",
        "dateOfBirth": "/Date(-520387200000)/",
        "perPersonUuid": "BE297AA97D004D29ADCBE89546F323EA",
        "lastModifiedOn": "/Date(1441580677000)/",
        "createdBy": "admindlr",
        "regionOfBirth": null,
        "personId": "339",
        ....
        "emailNav": {
          "results": []
        }
      }
    ]
  }
}
```

```
}  
}
```

Instead of an empty response without any e-mail or person information, the e-mail information (the expanded entity that was deleted) has been updated with an empty value and the other information appears in the response.

9.4.19.5 How to have more than one pay component on the same pay date

When an employee is due more than one non-recurring payment on the same pay date, an additional business key, `sequenceNumber`, can be added to `EmpPayCompNonRecurring`.

You can configure the data model to add this field as an additional business key (as long as it is upsertable in the data model).

Related Information

[EmpPayCompNonRecurring \[page 685\]](#)

9.4.19.6 Linking to custom MDF objects

Explains how to link MDF objects to Employee Central OData APIs.

If you want to link to a custom MDF object, you will need a combination of UPSERT and POST. This is because the upserts for MDF objects and Employee Central OData APIs are not compatible.

Example

Let's assume that you want to add information about where an employee's office is located in the employee job information. To do this, you will need the following:

1. Create (Post) an MDF object for office.

ⓘ Note

This is a prerequisite. Even if you update the `EmpJob` entity with a business key for office and then upsert, the office will not be created. Updating the entity with the key allows you to link to an existing object only.

2. Add the business key for the MDF object (which already exists) to `EmpJob`

9.4.19.7 Performance: How to improve it

Here are some tips on how to improve API performance and consumption:

To be avoided	Try this instead
Too many deep filters in a query	Make sure you are using all the direct available fields in the entity
Massive result sets	Use \$select to limit the result set.
\$expand for unnecessary navigations	Do you really need those navigations? Are they directly available fields in the entity.
Merging API calls using navigation (if this is negatively impacting performance)	Use \$BATCH instead
Full loads	Use last modified queries
Calculated fields in expanded entities in empCompensation-Calculated and empCompensationGroupSumCalculated	Use rules instead in custom fields to persist the values
Writing data using incremental update	Use full purge instead, if possible.
Writing data including triggering of rules for job information (EmpJob)	Disable Triggering of Rules in Company and Logo settings and calculate values for rules in consumer.

9.4.19.8 Roundtrips: Why are there errors in some upserts?

If you're getting roundtrip errors, this might be down to a conflict between the user locale and the fileLocale.

You can resolve this problem by making sure that your user locale and fileLocale are both en_US. Take a look at [fileLocale \[page 593\]](#) for more information.

9.4.19.9 Side Effect: What Is It?

A side effect is sometimes triggered when an API consumer performs a write operation.

The side effects triggered by the write operation are different in the OData API from the side effects triggered in UI. Sometimes the difference is profound. For example, a workflow is triggered in the UI but not in the OData API. Sometimes the difference is minor. When an HRIS Sync is triggered directly in the UI but indirectly in the API or data imports via an asynchronous sync job sending e-mails when the job starts and finishes.

Take a look at these examples to get an overview of what side effects are triggered:

- Triggering of workflows: OData APIs and data imports have the same behaviors. For how to create an approval process by configuring workflows to review data being imported, see [Configuring Workflows for Data Imports](#).

- Triggering of business rules: OData APIs and data imports have the same behaviors. For how to configure business rules during data imports, see [Configuring Business Rules for Data Imports](#).

Note

You can use the *API* rule context to determine whether specific *OnChange* or *OnSave* rules are required to be triggered during an API upsert. For details, see [Adding Contexts for Business Rules](#).

- Triggering of HRIS sync: If there is at least one recurring HRIS Sync job configured in your company instance, an HRIS element import triggers an HRIS Sync job run. Only one HRIS Sync job can run at a time. For more information, see the EC Data Import or User Data Changes Through API section in [Triggering HRIS Sync](#).
- Triggering of Intelligence Services: Intelligence services are triggered by rules only. For the list of the Intelligent Services events published by Employee Central and how to configure rules for the events, see [Employee Central Events for Intelligent Services](#) and its child topics.
- Triggering of hard-coded business logic in Position Management, Global Assignment and Time Off: An asynchronous process synchronizes Position and Time-off data in these products and this event is hard-coded. The only OData API that can trigger this hard-coded business logic is EmpJob.

9.5 Employee Profile

9.5.1 People Profile Configuration Entities

You can use the Employee Profile configuration entities to query the configuration settings for People Profile, including settings for People Profile page, page header, sections, subsections, blocks, block links, fields, and MDF blocks. The values returned from these APIs correspond to the settings on the [Configure People Profile](#) page.

The following entities are available for the configuration:

- `EmployeeProfilePageConfig`: Settings in [General Settings](#)
- `EmployeeProfileHeaderConfig`: Settings in [Configure Header Fields](#)
- `EmployeeProfileSectionConfig`: Settings for a section
- `EmployeeProfileSubSectionConfig`: Settings for a subsection
- `EmployeeProfileBlockContent`: Content of a block
- `EmployeeProfileBlockLink`: URLs configured in a block
- `EmployeeProfileFieldConfig`: Field configuration in a block
- `MDFBlockConfig`: Settings for an MDF block

Supported Operations

Operation	Description
Query	Query the configuration settings on the Configure People Profile page.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Configuration of People Profile Page

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/EmployeeProfilePageConfig?\$format=JSON</code>

Response

```
{
  "d": {
    "results": [{
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/EmployeeProfilePageConfig('PP3Page')",
        "type": "SFOData.EmployeeProfilePageConfig"
      },
      "code": "PP3Page",
      "myNameUpdateDate": "\/Date(1624492800000)\/",
      "lastModifiedDateTime": "\/Date(1626253154000+0000)\/",
      "aboutMeVideoUpdateBy": "admin",
      "currentPeriodEndDate": "\/Date(1451520000000)\/",
      "isAllFieldsDefaultExpanded": false,
      "nameFormatCode": "NF2",
      "createdDate": "\/Date(1583284464000+0000)\/",
      "pptcSelectedSectionCode": "default_section1",
      "disableBGImageUploadByUser": true,
      "isPercentCompleteEnabled": true,
      "isHeaderOverlayDisabled": false,
      "currentPeriodStartDate": "\/Date(1420070400000)\/",
      "isAboutMeVideoEnabled": true,
      "isMyNameEnabled": true,
    }
  ]
}
```

URI

```
https://<api-server>/odata/v2/  
EmployeeProfileHeaderConfig(EmployeeProfilePageConfig_code=  
'PP3Page',code='PP3HeaderConfig')?$format=JSON
```

Response

```
{  
  "d": {  
    "__metadata": {  
      "uri": "https://<api-server>/odata/v2/  
EmployeeProfileHeaderConfig(EmployeeProfilePageConfig_code='PP3Page',code='PP3Header  
Config')",  
      "type": "SFOData.EmployeeProfileHeaderConfig"  
    },  
    "code": "PP3HeaderConfig",  
    "EmployeeProfilePageConfig_code": "PP3Page",  
    "profilePhotoEnabled": true,  
    "lastModifiedDate": "/Date(1626253154000+0000)/",

        }
      }
    }
  }
}

```

Use Case 3: Query the Configuration Settings of a Section

The following example shows how to query the configuration settings of a section on the [Configure People Profile](#).

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ EmployeeProfileSectionConfig (EmployeeProfilePageConfig_code='PP3Page',code='default_section3')?\$format=JSON

Response

```

{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_section3')",
      "type": "SFOData.EmployeeProfileSectionConfig"
    },
    "code": "default_section3",
    "EmployeeProfilePageConfig_code": "PP3Page",
    "lastModifiedDate": "/Date(1626253154000+0000)/",
    "titleForContingent_localized": null,
    "createdDateTime": "/Date(1583284464000+0000)/",
  }
}

```

```

"type": "CUSTOM_SCORECARD",
"order": "3",
"lastModifiedBy": "admin",
"mdfSystemRecordStatus": "N",
"titleForContingent_defaultValue": null,
"title_defaultValue": "Personal Information",
"createdBy": "admin",
"isEnabled": false,
"title_localized": "Personal Information",
"title_en_US": "Personal Information",
"titleForContingent_en_US": null,
"createdByNav": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/createdByNav"
  }
},
"subSections": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/subSections"
  }
},
"lastModifiedByNav": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/lastModifiedByNav"
  }
},
"mdfSystemRecordStatusNav": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/mdfSystemRecordStatusNav"
  }
},
"titleForContingentTranslationTextNav": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/titleForContingentTranslationTextNav"
  }
},
"typeNav": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/typeNav"
  }
},
"titleTranslationTextNav": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/
EmployeeProfileSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_
section3')/titleTranslationTextNav"
  }
}
}
}
}

```

Use Case 4: Query the Configuration Settings of a Subsection

The following example shows how to query the configuration settings of a subsection on the [Configure People Profile](#).

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ EmployeeProfileSubSectionConfig(EmployeeProfilePageConfig_code='PP3Page',code='default_section3')?\$format=JSON</code>

Response

```
{
  "d": {
    "results": [{
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/  
EmployeeProfileSubSectionConfig(EmployeeProfilePageConfig_code='PP3Page',EmployeeProfileSectionConfig_code='default_section1',code='default_subsection3')",
        "type": "SFOData.EmployeeProfileSubSectionConfig"
      },
      "code": "default_subsection3",
      "EmployeeProfileSectionConfig_code": "default_section1",
      "EmployeeProfilePageConfig_code": "PP3Page",
      "lastModifiedDate": "/Date(1626253154000+0000)/",
      "lastModifiedBy": "admin",
      "createdDateTime": "/Date(1583284464000+0000)/",
      "mdfSystemRecordStatus": "N",
      "type": "CUSTOM",
      "title_defaultValue": "Badges",
      "createdBy": "admin",
      "isEnabled": true,
      "title_localized": "Badges",
      "title_en_US": "Badges",
      "order": "14",
      "blocks": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/

  }
}
```

9.5.2 BadgeTemplates

This entity provides information about badge templates.

Supported Operations

Operation	Description
Query	Query badge templates.

Properties and Navigation Properties

Properties

Property	Description
badgeInstanceId	The unique identifier for a badge template record.
userId	The owner of the user badge template. The API returns templates for the currently logged in user if no userId is specified.
customBadge	True if the template is custom.
photo	A link to the photo associated with the template.

Navigation properties

None.

Use Case: Get All Badge Templates

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/BadgeTemplates?\$format=JSON</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
```

```

        "uri": "https://<API-Server>/odata/v2/BadgeTemplates(1)",
        "type": "SFOData.BadgeTemplates"
    },
    "badgeId": 1,
    "badgeTitle": "Great Work",
    "customBadge": false,
    "photo":<....>,
  {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/BadgeTemplates(2)",
      "type": "SFOData.BadgeTemplates"
    },
    "badgeId": 2,
    "badgeTitle": "Team Player",
    "customBadge": false,
    "photo":<....>
  }
}

```

9.5.3 UserBadges

This entity exposes user badge information for a specified user.

Supported Operations

Operation	Description
Query	Query badge information for a specified user.
Insert	Give a badge to another user (not to oneself).
Delete	Delete the badges given to the logged in user, or delete badges that the logged in user gave other users.
Merge	Update a user's badge information by merging data.
Replace	Update a user's badge information by replacing data.
Upsert	Create or update badge information for a user.

Properties and Navigation Properties

Properties

Property	Description
badgeInstanceId	The unique identifier for a user badge record.
userId	The unique ID for the badge owner. The API returns badges for the currently logged in user if no userId is specified.
badgeCreatorName	The name of the person who created the badge
badgeId	The ID of the badge.
badgeTitle	The title of the badge.
comment	Comment for the badge.
creatorUserID	The ID of the person who created the badge.
lastModified	The date and time on which the badge was created.
photo	The photo for the badge.

Navigation Properties

None.

Use Case 1: Get the Badge of an Administrator

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/UserBadges?\$filter=userId eq 'admin101'&\$format=json</code>

Response

```
{
  "d": {
    "results": [{
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/
UserBadges(badgeInstanceId=651,userId='admin101')",
        "type": "SFOData.UserBadges"
      },
      "badgeInstanceId": 651,
      "userId": "admin101",
      "creatorUserID": "admin",
      "badgeId": 1013,
    }
  ]
}
```

```

        "badgeCreatorName": "Emily a34399vbdf Clark",
        "badgeTitle": "test3",
        "photo": "/9j/4\r\n",
        "comment": "a",

            "type": "SFOData.UserBadges"
        },
        "badgeInstanceId": 648,
        "userId": "admin101",
        "creatorUserID": "admin",
        "badgeId": 1,
        "badgeCreatorName": "Emily a34399vbdf Clark",
        "badgeTitle": "Great Work",
        "photo": "iVg==\r\n",
        "comment": "ok\n",
        "lastModified": "\/Date(1626157430000)\/"
    }
}
}
}

```

Use Case 2: Grant a User a Badge

Operation	Insert
HTTP Method	POST

URI	<code>https://<api-server>/odata/v2/UserBadges?\$format=json</code>
Payload	<pre>{ "__metadata":{ "uri": "UserBadges" }, "badgeId": 3, "comment": "hello world!!", "badgeInstanceId": 9338, "userId": "cgrant" }</pre>

Use Case 3: Delete a User's Badge

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<api-server>/odata/v2/UserBadges(badgeInstanceId=2601,userId='cgrant')?\$format=json</code>

Related Information

[SAP Business Accelerator Hub: UserBadges](#)

9.5.4 Background Entities

Background entities allow you to read and edit background information. Each Background entity corresponds with a background element in the Succession Data Model.

A Background entity name consists of two parts:

- A prefix `Background_`
- A background element ID that is configured in the data model. Its first letter is converted to uppercase in an entity name.

❁ Example

If the background element ID is `insideWorkExperience`, then the entity name is `Background_InsideWorkExperience`.

Note

We convert the first letter of a background element ID to uppercase and use it as part of an entity name. So to avoid duplicate entity names, make sure that your data model does not have two background elements where the only difference between their background element ID is the letter case of the first letter.

Note

The fields that you've set to be hidden in the data model are now exposed through the Background OData APIs, but these fields are still hidden in the UI.

Permissions

Action	Permission	Description
For admins (Query Only)	Administrator Permissions > Manage User > Export Extended User Information	Allows you to query background information of all users by API Target populations defined for this permission are not considered in the query operations.
For users	User Permissions > Employee Data > Background > <background element>	Allows you to view and edit a certain type of background information of one or multiple users in your target population by API

Example

With this permission, you can use the query option `$filter=userId eq 'XXX'` to get background information about one specific user, or use the query option `$top=` to get background information records of multiple users.

If admins have both the admin and user permissions, the admin permission applies.

Supported Operations

Operation	Description
Query	<p>You can:</p> <ul style="list-style-type: none">Sort a resultQuery a user's background information, for example, logged in userQuery multiple users' background information a time by batch queryNavigation query
	<div><p>Note</p><p>When you query results for this entity, the order of all properties in each record has no relationship with order of each field as configured in the data model, or in the web UI display.</p></div>
Delete	Delete a background record.
Upsert	<p>Upsert a background record.</p> <ul style="list-style-type: none">When you update existing elements, use the existing <code>backgroundElementId</code> to identify an element.Background API supports batch upsert operation.
Insert	When you insert a new background element, make sure that all the <code>backgroundElementId</code> fields of the new elements are set to 0 in the payload. The system gives new <code>backgroundElementIds</code> to them automatically.

The following operations aren't supported:

- The API can't tell which picklist option ID belongs to which picklist ID, parent picklist ID, or child picklist.
- The API can't do the URL-LINK validation (Display Name required validation and URL regex validation)
- The API doesn't support Global Assignment for batch query operation.

Global Assignment operations are supported.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
userId	<p>A business key field.</p> <p>The owner of the background information. This field is required for insert, update, and delete operations.</p>

Property	Description
backgroundElementId	A business key field. Set the value of this property to 0 for an insert operation. Set it to its original value for an upsert (update) or delete operation.
bgOrderPos	The order of display in the UI for each record. This field is optional.
attachment	This field is required to update the attachment ID for background documents.

Navigation Properties

None by default. When some properties are configured as picklist, then the entity has some navigation properties.

Navigation Property	Related Entity	Description
attachmentNav	Attachment	Navigation to the Attachment entity.

Entity Relation Diagram

If some properties of this entity are configured as a picklist, then this entity has a one-to-one association with the PicklistOption entity. Otherwise, this entity has no relationship with other entities.

Use Case 1: Get the Internal Work Experiences of a User

The following example shows you how to get the internal work experiences of a user and their display order on the UI.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/Background_InsideWorkExperience?\$filter=userId eq '100259'&\$orderby=bgOrderPos desc&\$format=json</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/Background_InsideWorkExperience(backgroundElementId=72474L,userId='100259')",
          "type": "SFOData.Background_InsideWorkExperience"
        }
      }
    ]
  }
}
```

```

        "backgroundElementId": "72474",
        "userId": "100259",
        "endDate": "/Date(1451606400000)/",
        "lastModifiedDate": "/Date(1497561442000+0000)/",
        "bgOrderPos": "3",
        "department": null,
        "title": "Project Lead",
        "startDate": "/Date(1420070400000)/",

userIdNav"
            }
        }
    },
    {
        "__metadata": {
            "uri": "https://<api-server>/odata/v2/
Background_InsideWorkExperience(backgroundElementId=72475L,userId='100259')",
            "type": "SFOData.Background_InsideWorkExperience"
        },
        "backgroundElementId": "72475",
        "userId": "100259",
        "endDate": "/Date(1483228800000)/",
        "lastModifiedDate": "/Date(1497561442000+0000)/",
        "bgOrderPos": "2",
        "department": null,
        "title": "Senior Project Leader",
        "startDate": "/Date(1451865600000)/",
        "userIdNav": {
            "__deferred": {
                "uri": "https://<api-server>/odata/v2/
Background_InsideWorkExperience(backgroundElementId=72475L,userId='100259')/
userIdNav"
            }
        }
    },
    {
        "__metadata": {
            "uri": "https://<api-server>/odata/v2/
Background_InsideWorkExperience(backgroundElementId=72473L,userId='100259')",
            "type": "SFOData.Background_InsideWorkExperience"
        },
        "backgroundElementId": "72473",
        "userId": "100259",
        "endDate": null,
        "lastModifiedDate": "/Date(1497561356000+0000)/",
        "bgOrderPos": "1",
        "department": null,
        "title": "Project Manager",
        "startDate": "/Date(1483315200000)/",
        "userIdNav": {
            "__deferred": {
                "uri": "https://<api-server>/odata/v2/
Background_InsideWorkExperience(backgroundElementId=72473L,userId='100259')/
userIdNav"
            }
        }
    }
]
}

```

Use Case 2: Add a Record of Internal Work Experience

This example shows how to add a record of internal work experience.

Request

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/ Background_InsideWorkExperience? \$format=json
Payload	<pre>{ "__metadata":{ "uri": "Background_InsideWorkExperience" }, "userId": "US0019", "startDate": "/ Date(1512432000000)/", "title": "Program Manager", "department": "HR Management", "endDate": "/Date(1543968000000)/" }</pre>

Use Case 3: Update a Record of Internal Work Experience

This example shows how to update a record of internal work experience.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "Background_InsideWorkExperience" }, "backgroundElementId": "99", "userId": "US0019", "fromDate": "/Date(1543968000000)/", "department": "HR Management", "title": "Team Assistant", "thruDate": "/Date(1575504000000)/" }</pre>

Use Case 4: Add Multiple Records of Education

This example shows how to add two records of education background: one for a bachelor's degree and the other a master's degree.

→ Tip

The `strictTransactionIsolate=true` parameter is used for partial upsert so that the failure of one entry doesn't affect the upsert of other entries.

Set the value of the property `backgroundElementId` to `0` for an insert operation.

Request

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert?strictTransactionIsolate=true</code>
Payload	<pre>[{ "__metadata": { "uri": "https://<api-server>/odata/v2/Background_Education(backgroundElementId=0,userId='US0019')", "type": "SFOData.Background_Education" }, "degree": "11801", "major": "11876", "school": "University of Virginia", "bgOrderPos": "2", "startDate": "/Date(1378080000000)/", "endDate": "/Date(1449187200000)/" }, { "__metadata": { "uri": "https://<api-server>/odata/v2/Background_Education(backgroundElementId=0,userId='US0019')", "type": "SFOData.Background_Education" }, "degree": "11797", "major": "11877", "school": "University of Virginia", "bgOrderPos": "1", "startDate": "/Date(1251763200000)/", "endDate": "/Date(1373587200000)/" }]</pre>

Use Case 5: Delete Records of Internal Work Experience

This example shows how to delete a record of internal work experience.

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>https://<api-server>/odata/v2/ Background_InsideWorkExperience(background ElementId =2807L,userId='admin')? \$format=json</code>

[SAP Business Accelerator Hub: Background Entities](#) 

9.5.5 Trend Entities

Trend entities allow you to read and edit trend data. Trend data is the feedback or ratings provided by managers or other authorized employees. Each trend entity corresponds to a trend element (background rating element) in the Succession Data Model.

Depending on the configuration of the Data Model for your company, you can have up to six trend entities. You can configure one or more of the following six entities in the Succession Data Model:

- TrendData_SysOverallPerformance
- TrendData_SysOverallPotential
- TrendData_SysOverallObjective
- TrendData_SysOverallCompetency
- TrendData_SysOverallCustom1
- TrendData_SysOverallCustom2

Permissions

Trend API supports follows the same permission control as on the *People Profile* UI. Make sure that you have the permission over the user data you want to query.

Permission System	Required Setting	Description
Role-based	The permissions for the corresponding field under User Permissions > Employee Data	Allows you to view and edit a certain type of trend information of a user by API
	Administrator Permissions > Manage User > Export Extended User Information	Allows you to run a batch query on rating information of all users

Supported Operations

Operation	Description
Query	<p>Three kinds of query operations are supported:</p> <ul style="list-style-type: none"> Query a user's trend data. Sort a result. Expand to picklist or attachment entities. <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p>Note</p> <p>You can query data records from all modules and sources, for example, Performance Management and Calibration, and filter data records by modules and sources.</p> </div>
Upsert	Update or insert a single trend record or multiple trend records.
Delete	Delete a trend record.
Insert	Insert a single trend record or multiple trend records
Merge	Update a trend record by merging data.
Replace	Update a trend record by replacing data.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

The business key for each entity is its id.

The `required` attributes for the following properties are derived from your Succession Data Model.

- name
- description
- source
- module
- attachment1

Use Case 1: Query Trend Data by ID

This example shows how to get the TrendData_SysOverallCompetency record by its ID.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ TrendData_SysOverallCompetency(17892L)? \$format=JSON

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/  
TrendData_SysOverallCompetency(17892L)",
      "type": "SFOData.TrendData_SysOverallCompetency"
    },
    "id": "17892",
    "min": "1",
    "endDate": "\\Date(1593561599000)\\",
    "max": "3",
    "module": "Performance Manager",
    "name": null,
    "rating": "2",
    "description": null,
    "label": "Medium",
    "lastModified": "\\Date(1562825700000+0000)\\",
    "source": "Form",
    "userId": "cgrant",
    "startDate": "\\Date(1561939200000)\\"
  }
}
```

Use Case 2: Create a Record

This example shows how to create a TrendData_SysOverallCompetency record using upsert.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/ TrendData_SysOverallCompetency/upsert
Payload	<pre>{ "__metadata": { "uri": "TrendData_SysOverallCompetency", "type": "SFOData.TrendData_SysOverallCompetency" }, "userId": "admin", "endDate": "/Date(1539561599000)/", "rating": "2", "startDate": "/Date(1536883220000)/" }</pre>

Response

<pre>{ "d": [{ "key": "TrendData_SysOverallCompetency/id=17949", "status": "OK", "editStatus": "INSERTED", "message": null, "index": 0, "httpCode": 201, "inlineResults": null }] }</pre>

Use Case 3: Update an Existing Record

This example shows how to update an TrendData_SysOverallCompetency record.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/ TrendData_SysOverallCompetency/upsert
Payload	<pre>{ "__metadata": { "uri": "TrendData_SysOverallCompetency", "type": "SFOData.TrendData_SysOverallCompetency" }, }</pre>

```
"id": "236045",
"userId": "admin",
"endDate": "/Date(1539561599000)/",
"rating": "3",
"startDate": "/Date(1536883220000)/"
}
```

Response

```
{
  "d": [
    {
      "key": "TrendData_SysOverallCompetency/id=236045",
      "status": "OK",
      "editStatus": "UPDATED",
      "message": null,
      "index": 0,
      "httpCode": 204,
      "inlineResults": null
    }
  ]
}
```

Use Case 4: Upserting Multiple Records

This example shows how to upsert multiple TrendData_SysOverallCompetency records, where the first two are existing and the third one is new.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/ TrendData_SysOverallCompetency/upsert
Payload	

```
[{
  "__metadata": {
    "uri":
    "TrendData_SysOverallCompetency",
    "type":
    "SFOData.TrendData_SysOverallCompetency"
  },
  "id": "235873",
  "userId": "admin",
  "endDate": "/Date(1539561599000)/",
  "rating": "3",
  "startDate": "/Date(1536883220000)/"
},{
  "__metadata": {
    "uri":
    "TrendData_SysOverallCompetency",
    "type":
    "SFOData.TrendData_SysOverallCompetency"
  },
```

```

    "id": "236045",
    "userId": "admin",
    "endDate": "/Date(1539561599000)/",
    "rating": "1",
    "startDate": "/Date(1536883220000)/"
  }, {
    "__metadata": {
      "uri":
        "TrendData_SysOverallCompetency",
      "type":
        "SF0Data.TrendData_SysOverallCompetency"
    },
    "userId": "admin",
    "endDate": "/Date(1539561599000)/",
    "rating": "2",
    "startDate": "/Date(1536883220000)/"
  }
}]]

```

Response

Sample Code

```

{
  "d": [
    {
      "key": null,
      "status": "ERROR",
      "editStatus": null,
      "message": "Failed because the record does not exist or cannot be
edit",
      "index": 0,
      "httpCode": 500,
      "inlineResults": null
    },
    {
      "key": "TrendData_SysOverallCompetency/id=236045",
      "status": "OK",
      "editStatus": UPDATED,
      "message": null,
      "index": 1,
      "httpCode": 204,
      "inlineResults": null
    },
    {
      "key": "TrendData_SysOverallCompetency/id=236046",
      "status": "OK",
      "editStatus": "INSERTED",
      "message": null,
      "index": 2,
      "httpCode": 201,
      "inlineResults": null
    }
  ]
}

```

The first record is failed for following possible reasons: the trend record doesn't exist, it isn't from Live Profile, or the user has no permission to update it. The second record is updated successfully. The third record with no id means that it's a new record. It's created successfully with new id 236046.

Use Case 5: Delete Trend Data

This example shows how to delete an TrendData_SysOverallCompetency record.

Request

Operation	Delete
HTTP Method	DELETE
URI	https://<api-server>/odata/v2/ TrendData_SysOverallCompetency(<id>)

Related Information

[SAP Business Accelerator Hub: Trend Entities](#)

9.5.6 EPPublicProfile

This entity provides configuration information about the People Profile header, for example, "About Me" videos, "My Name" audio recordings, "Introduction" text, and permission of profile photos.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Get the Profile Header Information of a User

This example shows how to query the information of the People Profile header for a given user ID.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ EPPublicProfile?\$filter=userId eq 'adminbl'&\$format=json

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/  
EPPublicProfile('adminbl')",
          "type": "SFOData.EPPublicProfile"
        },

9.6 Execution Manager

9.6.1 EMEvent

You can use this entity to upsert an event for a new process or an existing process. For new processes, you can upsert the event along with its child entities, EMEventAttribute and EMEventPayload. Once the process is inserted, further events for this process can be inserted by only passing the URI identifying the particular process to which this event would belong, identified by its composite key.

Permissions

API Permissions

Permission System	Required Settings
Role based	▶ Admin Center Permissions ▶ Read Execution Manager Events ▶
	▶ Admin Center Permissions ▶ Read Execution Manager Event Payload ▶

Supported Operations

Operation	Description
Query	Query an entity
Insert	Create a record
Upsert	Create or update a record

Properties

The EMEvent entity holds the properties for a particular event, having associations to EMMonitoredProcess, EMEventAttribute and EMEventPayload. EMMonitoredProcess identifies the process to which a set of events belong. EMEventAttribute holds a set of attributes for a particular event. EMEventPayload can hold a payload for any particular event.

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<YourEntity')?$format=json`

Use Case 1: Upserting an event for a new process (along with child entities EMEventAttribute and EMEventPayload)

This is the upsertable/insertable entity. Its child entities can be inserted along with upsert/insert of this entity. For every entity EMEvent being upserted/inserted, a process entity EMMonitoredProcess is required. When an event is being upserted/inserted for the first time, the process entity has to be passed in an expanded form.

Request

Request Information

Operation	Upsert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert?\$format=JSON</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")> Content-Type: application/json;charset=utf-8

Sample Code

```

{
  "__metadata":{
    "uri":"https://<HOSTNAME>/odata/v2/EMEvent",
    "type":"SFOData.EMEvent"
  },
  "eventDescriptionMsgKey":null,
  "eventDescription":"Some event description related to the eventName",
  "eventTime":"/Date(1594367794530+0000)/",
  "eventName":"Appropriate event name",
  "eventType":"START",
  "process":{
    "__metadata":{
      "uri":"https://<HOSTNAME>/odata/v2/EMMonitoredProcess",
      "type":"SFOData.EMMonitoredProcess"
    },
    "processDefinitionId":"<PID>",
    "processInstanceId":"156620",
    "processType":"SCHEDULED_JOB",

              "message": "upserted successfully",  
              "index": 1,  
              "httpCode": 200,  
              "inlineResults": null  
            }  
          ]  
        },  
        {  
          "inlineProperty": "eventPayload",  
          "results": [  
            {  
              "key": null,  
              "status": "OK",  
              "editStatus": "UPSERTED",  
              "message": "upserted successfully",  
              "index": 0,  
              "httpCode": 200,  
              "inlineResults": null  
            }  
          ]  
        },  
        {  
          "inlineProperty": "process",  
          "results": [  
            {  
              "key": null,  
              "status": "OK",  
              "editStatus": "UPSERTED",  
              "message": "upserted successfully",  
              "index": 0,  
              "httpCode": 200,  
              "inlineResults": null  
            }  
          ]  
        }  
      ]  
    }  
  ]  
}
```

Use Case 2: Inserting an event which is associated with an existing process entity

The process can now be passed as a URI, identified by its composite key, as shown in this example:

Request

Request Information

Operation	Insert
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/EMEvent?\$format=JSON</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")> Content-Type: application/json;charset=utf-8

Sample Code

```

{
  "__metadata":{
    "uri":"https://<hostname>/
odata/v2/EMEvent",
    "type":"SFOData.EMEvent"
  },
  "eventDescriptionMsgKey":null,
  "eventDescription":"Some event
description related to the event
name",
  "eventTime":"/
Date(1594367794530+0000)/",
  "eventName":"Appropriate event
name",
  "eventType":"START",
  "process":{
    "__metadata":{
      "uri":"https://<hostname>/
odata/v2/
EMMonitoredProcess(processDefinition
d=<PID>,processInstanceId='156620',pr
ocessType='SCHEDULED_JOB')",
      "type":"SFOData.EMMonitoredProcess"
    },
    "processDefinitionId":<PID>,
    "processInstanceId":"156620",
    "processType":"SCHEDULED_JOB",
    "hasErrors":null,
    "hasWarnings":null,
    "processState":"COMPLETED",
    "coRelatorId":null,
    "moduleName":null,

Date(1594188117558+0000)/",
    "processDefinitionName":"USER
Info",
    "firstEventTime":"/
Date(1594188117450+0000)/",
    "processInstanceName":"User"
  },
  "eventAttributes":{
    "results":[
      {
        "__metadata":{
          "uri":"https://<hostname>/odata/v2/
EMEventAttribute",
          "type":"SFOData.EMEventAttribute"
        },
        "name":"frequency",
        "value":"daily"
      }
    ]
  },
  "eventPayload":{
    "__metadata":{
      "uri":"https://
<hostname>/odata/v2/EMEventPayload",
      "type":"SFOData.EMEventPayload"
    }
  }
}

```

```

    },
    "payload": "R9yZQ==",
    "type": "TEXT"
  }
}

```

Response

Sample Code

```

{
  "d": {
    "__metadata": {
      "uri": "https://<hostname>/odata/v2/EMEvent???",
      "type": "SFOData.EMEvent"
    },
    "eventDescriptionMsgKey": null,
    "eventDescription": "Some event description related to the event name",
    "eventTime": "/Date(1594367794530+0000)/",
    "eventName": "Appropriate event name",
    "eventType": "START",
    "process": {
      "__metadata": {
        "uri": "https://<hostname>/odata/v2/EMMonitoredProcess(processDefinitionId=<PID>,processInstanceId='156620',processType='SCHEDULED_JOB')",
        "type": "SFOData.EMMonitoredProcess"
      },
      "processDefinitionId": "<PID>",
      "processInstanceId": "156620",
      "processType": "SCHEDULED_JOB",
      "hasErrors": null,
      "hasWarnings": null,
      "processState": "COMPLETED",
      "coRelatorId": null,
      "moduleName": null,
      "lastEventTime": "/Date(1594188117558+0000)/",
      "processDefinitionName": "User Info",
      "firstEventTime": "/Date(1594188117450+0000)/",
      "processInstanceName": "User"
    },
    "eventAttributes": {
      "results": {
        {
          "__metadata": {
            "uri": "https://<hostname>/odata/v2/EMEventAttribute???",
            "type": "SFOData.EMEventAttribute"
          },
          "name": "frequency",
          "value": "daily"
        }
      }
    },
    "eventPayload": {
      "__metadata": {
        "uri": "https://<hostname>/odata/v2/EMEventPayload???",
        "type": "SFOData.EMEventPayload"
      },
      "payload": "R9yZ\r\n",
      "type": "TEXT"
    }
  }
}

```

Use Case 3: Querying an Event

The process can now be passed as a URI, identified by its composite key, as shown in this example:

Request

Request Information

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ EMEvent(91505L)?\$format=json
Payload	NA

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/EMEvent(91505L)",
      "type": "SFOData.EMEvent"
    },
    "id": "91505",
    "eventDescriptionMsgKey": null,
    "eventDescription": "Some event description related to the event name",
    "eventTime": "/Date(1594188117450+0000)/",
    "eventName": "startJob",
    "eventType": "START",
    "process": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/EMEvent(91505L)/process"
      }
    },
    "eventAttributes": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/EMEvent(91505L)/
eventAttributes"
      }
    },
    "eventPayload": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/EMEvent(91505L)/
eventPayload"
      }
    }
  }
}
```

Additional Information

9.6.2 EMEventAttribute

You can use this entity to get a list of attributes associated with an event. The attributes are key-value pairs for any particular event. The key for an event entity EMEvent is its eventId, which is generated when an event is processed and inserted into the database table. The event is identified by its eventId.

This entity is used to get a list of attributes associated with an event. The attributes are key-value pairs for any particular event.

Permission System	Required Settings
Role based	Admin Center Permissions > Read Execution Manager Events
	Admin Center Permissions > Read Execution Manager Event Payload

Supported Operations

Operation	Description
Query	Query an entity

Properties

The EMEvent entity holds the properties for a particular event, having associations to EMMonitoredProcess, EMEventAttribute, and EMEventPayload. EMEventAttribute holds a set of attributes for a particular event.

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<api-server>/odata/v2/Entity('<YourEntity')?$format=json`

Use Case: Query all attributes of an Event

Note

The key for an event entity EMEvent is its eventId, which is generated when an event is processed and inserted into the database table. The event is identified by its eventId. In the example request below, the eventId=91505L, which identifies an event with eventId=91505L and sends the payload for that event in the response

Request

Request Information

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/EMEvent(91505L)/eventAttributes?\$format=json</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/EMEventAttribute(16113L)",

```

```

        "type": "SFOData.EMEventAttribute"
    },
    "id": "16113",
    "name": "frequency",
    "value": "daily"
  }
]
}

```

Use Case: Query attribute with AttributeId of an Event

Note

Attribute id is generated when attribute is inserted in DB. In the example request below, the attributeId =91505L, which identifies an attribute with sends the attribute details corresponding to the Id.

Request

Request Information

Operation	Query
HTTP Method	GET
URI	http://<api-server>/odata/v2/EMEventAttribute(16112)?\$format=json
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```

{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/EMEventAttribute(16112L)",
      "type": "SFOData.EMEventAttribute"
    },
    "id": "16112",
    "name": "userName",
    "value": "admin"
  }
}

```

Additional Information

The EMEventAttribute entity is a child entity. The EMEvent entity is its parent entity.

9.6.3 EMEventPayload

Any data which is specific to an event and cannot be represented as a key-value pair is stored in this entity. The payload can contain any additional data related to the event. For example, it could be an XML file that is being processed, or it could be a JSON representation of the object that is being processed, or, in the case of an error event, it could even be a binary file or stack trace. Payload data is only meant for viewing. It cannot be used for filtering events or defining any criteria for applying actions.

Permissions

API Permissions

Permission System	Required Settings
Role based	Admin Center Permissions > Read Execution Manager Events
	Admin Center Permissions > Read Execution Manager Event Payload

Supported Operations

Operation	Description
Query	Query an entity

Properties

The EMEvent entity holds the properties for a particular event, having associations to EMMonitoredProcess, EMEventAttribute, and EMEventPayload. EMEventPayload can hold a payload for any particular event.

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<api-server>/odata/v2/Entity('<YourEntity')?$format=json`

Use Case: Query eventPayload for any event

Note

The key for an event entity EMEvent is its eventId, which is generated when an event is processed and inserted into the database table. The event is identified by its eventId. In the example request below, the eventId=91505L, which identifies an event with eventId=91505L and sends the payload for that event in the response.

Request

Request Information

Operation	Query
HTTP Method	GET
URI	http://<api-server>/odata/v2/EMEvent(91505L)/eventPayload?\$format=json
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/EMEventPayload(708L)",
      "type": "SFOData.EMEventPayload"
    },
    "id": "708",
    "fileName": "Payload.txt",
    "payload": "R9yZ\r\n",
    "mimeType": "text/plain",
    "type": "TEXT",
    "fileType": "txt"
  }
}
```

Use Case: Query eventPayload for an Event with PayloadId

Note

The key for an eventPayload entity EMEventPayload is its payloadId, which is generated when an event is processed and inserted into the database table. In the example request below EventPayloadId is 708, which identifies an event with eventId=14 and sends the Eventpayload corresponding to the Id.

Request

Request Information

Operation	Query
HTTP Method	GET
URI	http://<api-server>/odata/v2/EMEvent/EMEventPayload(708)?\$format=JSON
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/EMEventPayload(708L)",
      "type": "SFOData.EMEventPayload"
    },
    "id": "708",
    "fileName": "Payload.txt",
    "payload": "R9yZ\r\n",
    "mimeType": "text/plain",
    "type": "TEXT",
    "fileType": "txt"
  }
}
```

Additional Information

The EMEventPayload entity is a child entity. The EMEvent entity is its parent entity.

9.6.4 EMMonitoredProcess

You can use this entity to identify information about a process being logged in Execution Manager. Many events can correspond to a single process. This entity has a composite key, comprising: processType, processDefinitionId and processInstanceId. This entity is not upserted/inserted separately, but along with the first event associated with it.

Permissions

API Permissions

Permission System	Required Settings
Role based	Admin Center Permissions > Read Execution Manager Events
	Admin Center Permissions > Read Execution Manager Event Payload

Supported Operations

Operation	Description
Query	Query an entity

Properties

The EMEvent entity holds the properties for a particular event, having associations to EMMonitoredProcess, EMEventAttribute and EMEventPayload. EMMonitoredProcess identifies the process to which a set of events belong.

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<YourEntity')?$format=json`

Use Case: Query process with (processDeifinitionId, ProcessInstancelId and Process Type)

Note

An entity EMMonitoredProcess can be uniquely identified by (processDeifinitionId, ProcessInstancelId and Process Type).

Request

Request Information

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/EMMonitoredProcess(processDefinitionId=<PID>,processInstanceId='156620',processType='SCHEDULED_JOB')?\$format=JSON</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/EMMonitoredProcess(processDefinitionId=<PID>,processInstanceId='156620',processType='SCHEDULED_JOB')",
      "type": "SFOData.EMMonitoredProcess"
    },
    "processDefinitionId": "<PID>",
    "processInstanceId": "156620",
    "processType": "SCHEDULED_JOB",
    "hasErrors": null,
    "hasWarnings": null,
    "processState": "COMPLETED",
    "monitoredProcessId": "21800",
    "coRelatorId": null,
    "moduleName": null,
    "lastEventTime": "/Date(1594188117558+0000)/",
    "processDefinitionName": "User info",
    "firstEventTime": "/Date(1594188117450+0000)/",
    "processInstanceName": "User"
  }
}
```

Use Case: Query process details including event details

Note

All the details which includes Process details, event details, event attributes and event payload for a process can be fetched with below mentioned query.

Request

Request Information

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/EMEvent?\$orderby=eventTime%20desc&\$filter=(process/processType%20eq%20'SCHEDULED_JOB'%20and%20process/processDefinitionId%20eq%20<PID>%20and%20process/processInstanceId%20eq%20'156620')&\$format=json&\$expand=process</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

```

Use Case: Query process details with monitoredProcessID

Note

All the details which includes Process details, event details, event attributes and event payload for a process can be fetched with below mentioned query using monitored process id.

Request

Request Information

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/EMEvent?\$format=json&\$expand=eventAttributes,process&\$filter=process/monitoredProcessId eq '21800'
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/EMEvent(91388L)",
          "type": "SFOData.EMEvent"
        }
      }
    ]
  }
}

```

```

[SAP Business Accelerator Hub: CompetencyEntity](#)

9.7.1.1 Competency Entity Object Modeling

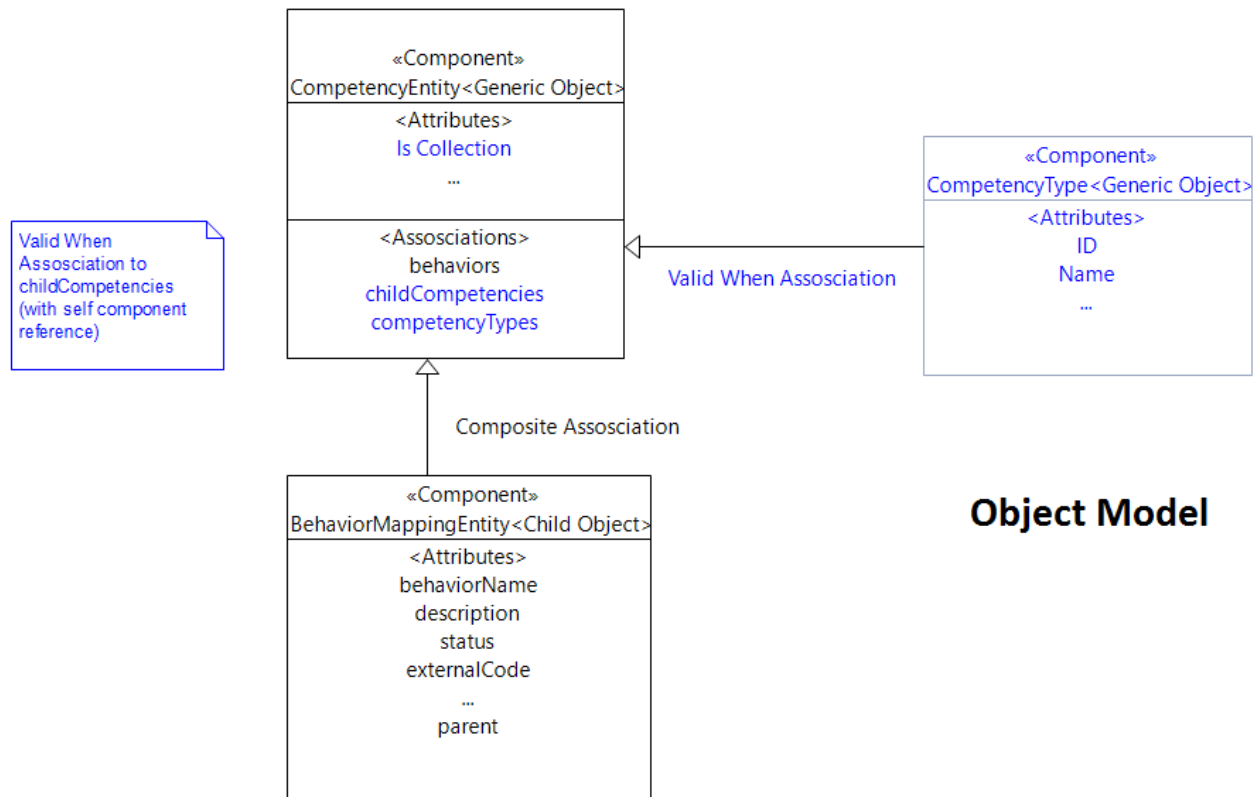

To support the organization of JPB competencies, CompetencyType is introduced and the CompetencyEntity now has the Boolean attribute IsCollection, a new composition child with CompetencyType object, and a new composition child object with CompetencyEntity (self-reference).

The underlying architecture is as follows:

- The CompetencyType is an MDF child entity for the CompetencyEntity

- To derive the competency types relating to the Competency object, CompetencyType has the fields ID and Name
- To derive the child competency entity pertaining to Competency object, the CompetencyEntity has the "IsCollection" Boolean attribute

This figure illustrates the above relationship.

Underlying Architecture of Competency Entity Object Modeling

9.7.2 CompetencyType

This entity is used as a 1:n association in CompetencyEntity and enables the association of competency types to the CompetencyEntity making it possible to organize competencies in the Job Profile Builder.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

► [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Retrieve List of CompetencyType Entities (from a created generic object using OData API)

Request Information

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/CompetencyType?\$format=JSON</code>

Response

Sample Code

Extract from response

```
Response:
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/CompetencyType(6746L)",
          "type": "SFOData.CompetencyType"
        },
        "ID": "6746",

[Organizing Job Profile Builder Competencies \[page 1648\]](#)

9.7.3 WorkerCompetency (Beta)

This entity defines the competencies that are assigned to an employee.

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Retrieving the top worker competency entity data from a generically created object

Operation	Query
URI	<code>https://<api-server>/odata/v2/beta/WorkerCompetency/?\$format=JSON&\$top=1</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>
HTTP Method	GET

Response

Sample Code

```
{
  "d": {
    "results": [
      {
```

```

    "__metadata": {
      "uri": "https://<api-server>/odata/v2/beta/
WorkerCompetency('1010388')",
      "type": "SFOData.WorkerCompetency"
    },
    "externalCode": "1010388",

9.7.5 RoleCompetencyBehaviorMappingEntity

The `RoleCompetencyBehaviorMappingEntity` entity can be used to map a behavior to a role through a competency. Behavior is added to a competency. When this competency is then mapped to a role, the behavior gets mapped to the role through the competency.

Supported Operations

Operation	Description
Query	Query <code>RoleCompetencyBehaviorMappingEntity</code> .
Upsert	Create new or update existing <code>RoleCompetencyBehaviorMappingEntity</code> .
Delete	Delete <code>RoleCompetencyBehaviorMappingEntity</code> . The entity mapping cannot be deleted unless the related <code>CompetencyEntity</code> associated with the behavior is deleted as well.

Properties and Navigation Properties

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
behaviorMappingEntityNav	BehaviorMappingEntity	This navigation is to support mapped competency behaviors. There is a one-to-many association between RoleEntity and RoleCompetencyBehaviorMappingEntity i.e for each RoleEntity, there can be zero or more RoleCompetencyBehaviorMappingEntity which means that zero or more behaviors can be mapped to a role using this navigation.
competencyNav	CompetencyEntity	This navigation is to support mapped competencies. There is a one-to-many association between RoleEntity and RoleCompetencyBehaviorMappingEntity i.e for each RoleEntity, there can be zero or more RoleCompetencyBehaviorMappingEntity which means that zero or more competencies can be mapped to a role using this navigation.

Use Case 1: Query for the first item in RoleCompetencyBehaviorMappingEntity

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ RoleCompetencyBehaviorMappingEntity/?\$format=JSON&\$top=1

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {

9.7.6 Organizing Job Profile Builder Competencies

Describes how support competency assignment for the Job Profile Builder (JPB) using the OData APIs, CompetencyEntity and CompetencyType .

What's the benefit?

If you want to assign competencies in the JPB, have more capabilities for assigning competencies and additional flexibility on how your competencies are organized in the JPB, then the Competency and CompetencyType entities can meet your requirements. Furthermore, you can use these OData APIs to create competency collections.

Competency Assignment: Details

- Assign competency to one or more persons via an automated process:
 - From a 3rd Party source. Mass upload is also supported
- Read assigned competencies by person
 - Can specify selection criteria to filter on any column
- Delete assigned competency by person and competency

Competency Collections: Details

Competency collections are made possible by building associations between CompetencyEntity and CompetencyType:

- 1: n association between one specific CompetencyEntity and other competency entities (see the Use Case Retrieving specific competency entity data for an example of childCompetencies) allowing groupings of multiple competency entities
- 1:n association between CompetencyEntity and CompetencyType allowing multiple groupings of competencyTypes

A precondition for these associations is that the property IsCollection in the CompetencyEntity has the attribute=true.

isCollection: Properties

Property Name	Type	Nullable	Required	Creatable	Updatable	Upsertable	Visible	Sortable	Filterable
isCollection	Edm.Boolean	true	false	true	true	true	true	true	true

These competency collections let you have a flat, non-hierarchical structure for organizing JPB competencies. And if, required, competency collections can also be used to store all your talent attributes in the competency framework.

Note

The competency collection will not impact the current JPB UI; all competencies created in the UI will populate the IsCollection field with the attribute=false. The system will maintain the default hierarchical competency library and category for competency collection if needed.

Use Case: Retrieving specific competency entity data

Operation: Query

Method: Post

Authorization: Basic

Request: `https://<hostname.com>/odata/v2/CompetencyEntity('XYZ')?$format=JSON`

    },
    "competencyTypes": [
      {
        "__metadata": {
          "type": "SFOData.CompetencyType",

```

Note

cust_CompetencyEntity will be replaced by a new MDF entity CompetencyEntity.

9.7.7 FamilyEntity

This entity is the primary classification of a job, which is also known as job family.

Permissions

You have the view permission for [Manage Job Profile Builder](#) > [Manage Job Profile Content](#).

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
rowId	The row ID.
internalId	The internal ID.
externalCode	The customer oriented ID or GUID.
name	The family name.
createdLocale	This property is only used for JDM1.0.

Property	Description
status	The status of the family.
createdBy	The person who created the family.
createdDate	The date on which the family was created.
lastModifiedBy	The person who last modified the family.
lastModifiedDate	The date on which the family was created.

Navigation Properties

Navigation Property	Related Entity	Description
competencies	FamilyCompetencyMappingEntity	A one-to-many association between FamilyEntity and FamilyCompetencyMappingEntity. For each FamilyEntity, there can be zero or more family competency mappings. All job roles(RoleEntity) under this family will automatically inherit these family level competencies.
skills	FamilySkillMappingEntity	A one-to-many association between FamilyEntity and FamilySkillMappingEntity. For each FamilyEntity, there can be zero or more family skill mappings. All job roles(RoleEntity) under this family will automatically inherit these family level skills.

Use Cases

API Call	Description
<code>/odata/v2/ FamilyEntity(externalCode='1000596')? &format=json&\$select=externalCode,name_en_ US</code>	Query family whose externalCode equals to 1000596, the return data will only include en_US locale values.
<code>/odata/v2/FamilyEntity?&\$format=json</code>	Query all families.

Related Information

[SAP Business Accelerator Hub: FamilyEntity](#)

9.7.8 JobDescTemplate

This entity stores the sections and styling information of a job profile in a Job Description template. The template is created for one or more job families.

Permissions

Permission Model	Permission Setting
Role-based	Manage Job Profile Templates

Supported Operations

Operation	Description
Query	Query a template by guid or business properties.

Properties

Property	Description
rowId	The row ID.
internalId	An internal ID.
externalCode	An external code.
title	The job description template title.
status	The status of the job template.
createdBy	The ID of the person who created the job description template.
createdDate	The date on which the job description template was created.
lastModifiedBy	The ID of the person who last modified the job description template.
lastModifiedDate	The date on which the job description template was modified.
subModule	Indicates the sub-job template that is used by RCM.

Navigation Properties

Navigation Property	Related Entity	Description
jdFamilyMappings	JDTemplateFamilyMapping	A one-to-many association between JobDescTemplate and JDTemplateFamilyMapping. For each JobDescTemplate, there can be one or more associated JDTemplateFamilyMappings.
sections	JobDescSection	A one-to-many association between JobDescTemplate and JobDescSection. For each JobDescTemplate, there can be zero or more associated JobDescSection.

Use Cases

The SAP SuccessFactors module Job Profile Builder owns the JobDescTemplate, and will write JobDescTemplate data into the GENERIC_OBJECT_T table. You can query JobDescTemplate using the JobDescTemplate oData API:

API Call	Description
<code>/odata/v2/JobDescTemplate(externalCode='1035402')?&\$format=json&\$expand=jdFamilyMappings,sections</code>	Queries the job the profile template with the external-Code"1035402". The returned data only includes en_US locale values.
<code>/odata/v2/JobDescTemplate?&\$format=json</code>	Queries all job profile templates.

Related Information

[SAP Business Accelerator Hub: JobDescTemplate](#)

9.7.9 JobProfile

This entity stores the detailed profiling information of a job. It inherits all of the competency and skill information from a job role and describes additional job information, such as education, certification, and physical requirements.

Permissions

Permission System	Required Setting
Role-based	<p>Go to » » <i>search type: Object Definition, search value: Job Profile</i> » <i>Take Action: Make correction</i> » <i>Security: change to</i> » <i>Yes</i> » <i>Permission Category: change to</i> » <i>Manage Job & Skill Profile Visibility</i> ». Click <i>Save</i>.</p> <p>Grant view permission for » <i>Manage Job & Skill Profile Visibility</i> » <i>Job Profile</i> »</p>

Supported Operations

Operation	Description
GET	Query a job profile by guid or business properties.
UPSERT/POST/MERGE/PUT	Update a job profile.

Properties

externalCode(guid) and business properties are required while querying profiles.

Property	Description
rowId	The row ID.
internalId	An internal ID.
externalCode	An external code.
template	A job template.

Property	Description
name	The job profile name.
draft	Indicates that the job profile has not been activated.
position	Indicates whether the profile is a role or position profile.
subModule	Indicates the sub-job profile type, like jobReqProfile which is used in RCM.

Navigation Properties

Navigation Property	Related Entity	Description
jobProfileRoleMappings	JobProfileRoleMappingEntity	A one-to-many association between JobProfile and JobProfileRoleMappingEntity. For each JobProfile, there has to be at least one associated JobProfileRoleMappingEntity. In JPB, a job profile is the extension of a job role.
certificationContents	CertificationContent	A one-to-many association between JobProfile and CertificationContent. For each JobProfile, there can be zero or more associated CertificationContents.

Navigation Property	Related Entity	Description
competencyContents	Competency-Content	A one-to-many association between JobProfile and CompetencyContent. For each JobProfile, there can be zero or more associated CompetencyContents.
educationDegreeContents	educationDegreeContents	A one-to-many association between JobProfile and EducationDegreeContent, for each JobProfile, there can be zero or more associated EducationDegreeContents.
educationMajorContents	educationMajorContents	A one-to-many association between JobProfile and EducationMajorContent. For each JobProfile, there can be zero or more associated EducationMajorContents.
employmentConditionContents	Employment-ConditionContent	A one-to-many association between JobProfile and EmploymentConditionContent. For each JobProfile, there can be zero or more associated EmploymentConditionContents.

Navigation Property	Related Entity	Description
jobResponsibilityContents	JobResponsibilityContent	A one-to-many association between JobProfile and JobResponsibilityContent, for each JobProfile, there can be zero or more associated JobResponsibilityContents.
interviewQuestionContents	InterviewQuestionContent	A one-to-many association between JobProfile and InterviewQuestionContent. For each JobProfile, there can be zero or more associated InterviewQuestionContents.
physicalReqContents	PhysicalReqContent	A one-to-many association between JobProfile and PhysicalReqContent. For each JobProfile, there can be zero or more associated PhysicalReqContents.
relevantIndustryContents	RelevantIndustryContent	A one-to-many association between JobProfile and RelevantIndustryContent. For each JobProfile, there can be zero or more associated RelevantIndustryContents.
skillContents	SkillContent	A one-to-many association between JobProfile and SkillContent. For each JobProfile, there can be zero or more associated SkillContents.

Navigation Property	Related Entity	Description
shortDescriptions	JobProfileLocalizedData	A one-to-many association between JobProfile and JobProfileLocalizedData. For each JobProfile, there can be zero or more associated JobProfileLocalizedData. Here the JobProfileLocalizedData is used to store short description information.
longDescriptions	JobProfileLocalizedData	A one-to-many association between JobProfile and JobProfileLocalizedData. For each JobProfile, there can be zero or more associated JobProfileLocalizedData. Here the JobProfileLocalizedData is used to store long description information.
headers	JobProfileLocalizedData	A one-to-many association between JobProfile and JobProfileLocalizedData. For each JobProfile, there can be zero or more associated JobProfileLocalizedData. Here the JobProfileLocalizedData is used to store header information.

Navigation Property	Related Entity	Description
footers	JobProfileLocalizedData	A one-to-many association between JobProfile and JobProfileLocalizedData. For each JobProfile, there can be zero or more associated JobProfileLocalizedData. Here the JobProfileLocalizedData is used to store footer information.
compDatas	JobProfileLocalizedData	A one-to-many association between JobProfile and JobProfileLocalizedData. For each JobProfile, there can be zero or more associated JobProfileLocalizedData. Here the JobProfileLocalizedData is used to store compensation information.

Use Cases

The SAP SuccessFactors module Job Profile Builder owns JobProfile, and will write JobProfile data into the GENERIC_OBJECT_T table. You can query JobProfile from the JobProfile OData API.

API Call	Description
<code>/odata/v2/JobProfile(externalCode='1035961')?&\$format=json&\$expand=positionNav</code>	Queries a job profile whose externalCode equals to 1035961 and expand position data.
<code>/odata/v2/JobProfile?&\$format=json</code>	Queries all job profiles.

Related Information

[SAP Business Accelerator Hub: JobProfile](#)

9.7.10 RoleEntity

The secondary classification of a job. It usually refers to a particular job title and is also called a job role.

Permissions

Permission Model	Permission Setting
Role-based	View permission for Manage Job Profile Builder Manage Job Profile Content

Supported Operations

Operation	Description
Query	Query a role by guid or business properties.

Properties

Property	Description
rowId	The row ID.
internalId	An internal ID.
externalCode	An external code.
name	The role name. A role only belongs to one family.
family	The family name.
createdLocale	The role created locale. This property used in JDM1.0.
status	The status of the role.
createdBy	The ID of the person who created the role.
createdDate	The date on which the role was created.

Property	Description
lastModifiedBy	The ID of the person who last modified the role.
lastModifiedDate	The date on which the role was modified.

Navigation Properties

Navigation Property	Related Entity	Description
jobCodeMappings	JobCodeMappingEntity	A one-to-many association between RoleEntity and JobCodeMappingEntity. For each RoleEntity, there can be zero or more mapped jobcodes. Jobcode(job classification) is usually used to connect to a certain employee in BizX.
roleSkillMappings	RoleSkillMappingEntity	A one-to-many association between RoleEntity and RoleSkillMappingEntity. For each RoleEntity, there can be zero or more role skill mappings.
roleCompetencyMappings	RoleCompetencyMappingEntity	A one-to-many association between RoleEntity and RoleCompetencyMappingEntity. For each RoleEntity, there can be zero or more role competency mappings.
roleTalentPoolMappings	RoleTalentPoolMappingEntity	A one-to-many association between FamilyEntity and RoleTalentPoolMappingEntity. For each RoleEntity, there can be zero or more role talent pool mappings. These mappings are used by SAP SuccessFactors module .

Use Cases

The SAP SuccessFactors module Job Profile Builder owns the RoleEntity, and will write RoleEntity data into the GENERIC_OBJECT_T table. You can query the RoleEntity using the RoleEntity oData API.

API Call	Description
<code>/odata/v2/RoleEntity(externalCode='1003068')?&\$format=json&\$select=externalCode,name_en_US,familyNav&\$expand=familyNav,familyNav/skills,familyNav/competencies</code>	Queries the role with the externalCode "1003068". The return data will only include en_US local values.
<code>/odata/v2/RoleEntity?&\$format=json</code>	Queries all roles.

Related Information

[SAP Business Accelerator Hub: RoleEntity](#) 

9.7.11 SkillEntity

This entity is a basic library that is used to describe skills are acquired through training. They are mapped to a job role or job family.

Permissions

Permission Model	Configuration
Role-based	View permission for  Manage Job Profile Builder  Manage Job Profile Content 

Supported Operations

Operation	Description
Query	Query a skill by guid or business properties.

Properties

Property	Description
rowId	The row ID.
internalId	An internal ID.
externalCode	An external code.
name	The skill name.
libName	The skill library name.
category	The skill category.
group	The skill group.
definition	The skill definition.
proLevel1	The skill proficiency level 1.

Property	Description
proLevel2	The skill proficiency level 2.
proLevel3	The skill proficiency level 3.
proLevel4	The skill proficiency level 4.
proLevel5	The skill proficiency level 5.
status	The status of the role.
createdBy	The ID of the person who created the skill.
createdDate	The date on which the skill was created.
lastModifiedBy	The ID of the person who last modified the skill.
lastModifiedDate	The date on which the skill was modified.

Use Cases

The SAP SuccessFactors module Job Profile Builder owns the SkillEntity, and writes SkillEntity data into the GENERIC_OBJECT_T table.

API Call	Description
<pre>/odata/v2/SkillEntity(externalCode='9043')? &\$format=json &\$select=externalCode,name_en_US ,libName_ en_US,category_en_US,group_en_US ,definiti on_en_US,proLevel1_en_US ,proLevel2_en_US, proLevel3_en_US ,proLevel4_en_US,proLevel5 _en_US</pre>	Queries skills with externalCode "9043". The return data only includes en_US locale values.
<pre>/odata/v2/SkillEntity?&\$format=json</pre>	Queries all skills.

Related Information

[SAP Business Accelerator Hub: SkillEntity](#) 

9.7.12 SkillProfile

This entity is the skill repository for a particular user. Upon creation, it automatically gets the user's skills defined in the corresponding job profile..

Permissions

You have the following permissions:

- Go to [Admin Tools](#) > [Configure Object Definition](#) > search type: *Object Definition*, search value: *Skill Profile* > [Take Action: Make correction](#) > [Security: change to](#) > [Yes](#) > [Permission Category: change to](#) > [Manage Job & Skill Profile Visibility](#).
- In RBP, grant the [View](#) permission for [Manage Job & Skill Profile Visibility](#) > [Skill Profile](#).

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
rowId	The row ID.
internalId	An internal ID.
externalCode	An external code.
createdBy	The ID of the person who created the skill.
createdDate	The ID of the person who created the skill.
lastModifiedBy	The ID of the person who last modified the skill.
lastModifiedDate	The date on which the skill was modified.

Navigation Properties

Navigation Property	Related Entity	Description
ratedSkills	RatedSkillMapping	A one-to-many association between SkillProfile and RatedSkillMapping. For each SkillProfile, there can be zero or more RatedSkillMappings.
selfReportSkills	SelfReportSkillMapping	A one-to-many association between SkillProfile and SelfReportSkillMapping, for each SkillProfile, there can be zero or more SelfReportSkillMappings.

Use Cases

API Call	Description
<code>/odata/v2/SkillProfile(externalCode='cgrant1')?&\$format=json&\$expand=externalCodeNav,ratedSkills,selfReportSkills</code>	Queries the skill profile whose externalCode(userId) is "cgrant1", expanding user, rated skills and self report skills.
<code>/odata/v2/SkillProfile?&\$format=json</code>	Queries all skill profiles.

Related Information

[SAP Business Accelerator Hub: SkillProfile](#)

9.7.13 PositionEntity

`PositionEntity` is an extension of `Position` that contains skills and competency information related to the position. The skills and competencies are expressed through navigation properties that points to `PositionSkillMappingEntity` and `PositionCompetencyMappingEntity`.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalCode	Business key.
status	This is a required field. Possible statuses are: <ul style="list-style-type: none">A: ActiveI: Inactive
position	External code of the related position.

Navigation Properties

Navigation Property	Related Entity	Description
positionCompetencyMappings	PositionCompetencyMappingEntity	Competencies required for the position.
positionSkillMappings	PositionSkillMappingEntity	Skills required for the position.
positionNav	Position	Related position information. This is a required navigation property when you create or edit a <code>PositionEntity</code> entry.

Use Case 1: Query a PositionEntity's Skill Information

In this example, we try to query a `PositionEntity` and its related skills and competency information.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/PositionEntity('1000580')?\$expand=positionSkillMappings&\$select=position,positionSkillMappings/skill</code>

Response

In this example, a list of skills are related to this position. You can further expand toSkillEntity for details.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/PositionEntity('1000580')",
      "type": "SFOData.PositionEntity"
    },
    "position": "50014345",
    "positionSkillMappings": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
39')",
            "type": "SFOData.PositionSkillMappingEntity"
          },
          "skill": "1000516"
        },
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
40')",
            "type": "SFOData.PositionSkillMappingEntity"
          },
          "skill": "1000524"
        },
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
41')",
            "type": "SFOData.PositionSkillMappingEntity"
          },
          "skill": "1000530"
        },
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
42')",
            "type": "SFOData.PositionSkillMappingEntity"
          },
          "skill": "1000529"
        },
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
43')",
            "type": "SFOData.PositionSkillMappingEntity"
          },
          "skill": "1000542"
        },
        {
          "__metadata": {
            "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
44')",
            "type": "SFOData.PositionSkillMappingEntity"
          },
          "skill": "1000528"
        }
      ]
    }
  }
}
```

```

        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
PositionSkillMappingEntity(PositionEntity_externalCode='1000580',externalCode='10071
45')",
          "type": "SFOData.PositionSkillMappingEntity"
        },
        "skill": "1000503"
      }
    ]
  }
}

```

Use Case 2: Creating a PositionEntity Record

This example shows how to create a `PositionEntity` record for an existing position using insert.

Request

Operation	Insert
HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/PositionEntity</code>
Payload	<pre> { "__metadata": { "uri": "PositionEntity" }, "status": "A", "positionNav": { "__metadata": { "uri": "Position(code='11223344',effectiveStartDate=datetime'20 19-11-20T00:00:00')" } } } </pre>

Response

```

{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/PositionEntity('1020939')",
      "type": "SFOData.PositionEntity"
    },
    "status": "A",
    "externalCode": "1020939",
    "positionNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/PositionEntity('1020939')/"
positionNav"
      }
    }
  }
}

```

Related Information

[SAP Business Accelerator Hub: PositionEntity](#)

9.7.14 PositionCompetencyMappingEntity

This entity contains the mapping relationship between a position and its required competencies.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
PositionEntity_externalCode	External code of the related <code>PositionEntity</code> entry. This is a business key.
externalCode	External code of the mapping entry. This is a business key.
status	Status of the position. Possible statuses are: <ul style="list-style-type: none">A: ActiveI: Inactive
rating_<locale>	A list of properties representing rating values in different locales.
rating_defaultValue	Default rating value.
weight_<locale>	A list of properties representing the weight values in different locales.
weight_defaultValue	Default weight value.

Navigation Properties

Navigation Property	Related Entity	Description
competencyNav	CompetencyEntity	Competency information of the position. This navigation property is required.

Use Case 1: Query a Competency Mapping by Key

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ PositionCompetencyMappingEntity(PositionEntity_externalCode= '1000580',externalCode='1007147')</code>

Response

Use Case 2: Query the Competency Mappings of a PositionEntity

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ PositionCompetencyMappingEntity(PositionEntity_externalCode ='1000580',externalCode='1007147')

Response

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
PositionCompetencyMappingEntity(PositionEntity_externalCode='1000580',externalCode='
1007147')",
          "type": "SFOData.PositionCompetencyMappingEntity"
        },
        "PositionEntity_externalCode": "1000580",
        "externalCode": "1007147"
      },
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
PositionCompetencyMappingEntity(PositionEntity_externalCode='1000580',externalCode='
1007146')",
          "type": "SFOData.PositionCompetencyMappingEntity"
        },
        "PositionEntity_externalCode": "1000580",
        "externalCode": "1007146"
      },
      {
        "__metadata": {

9.7.15 PositionSkillMappingEntity

This entity contains the mapping relationship between a position and its required skills.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
PositionEntity_externalCode	External code of the related <code>PositionEntity</code> entry. This is a business key.
externalCode	External code of the mapping entry. This is a business key.
status	Status of the position. Possible statuses are: <ul style="list-style-type: none">A: ActiveI: Inactive
rating_<locale>	A list of properties representing rating values in different locales.
rating_defaultValue	Default rating value.
weight_<locale>	A list of properties representing the weight values in different locales.
weight_defaultValue	Default weight value.

Navigation Properties

Navigation Property	Related Entity	Description
SkillNav	<code>SkillEntity</code>	Skill information of the position. This navigation property is required.

Use Case 1: Get Entities from `PositionSkillMappingEntity`

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ PositionSkillMappingEntity</code>

Response

```

9.8 Learning

9.8.1 SAP SuccessFactors Learning Micro Services List

Although we are not ready to deprecate OData services, we prefer that you use our micro-services because we plan to shift resources in the future to the preferred micro-services.

REST APIs for Microsoft Viva Learning Support

We have public APIs that can be used for Microsoft Viva Learning that to allow partners to both automate their extract configuration and to extract the customer data.

The APIs are:

Fetch Partner Configuration and Extract (/learning/public-api/rest/v1/lxpConfiguration)

- The **partnerID** parameter is required for this API and the API will return the details for only the requested partnerID.

Update Partner Configuration (/learning/public-api/rest/v1/lxpConfiguration)

- This API accepts the **partnerID**, **email**, **enabled**, **path**, **keyOwner**, and **encryptionKey** parameters.

Request Full Extract (/learning/public-api/rest/v1/adhocDataExtract)

- The **partnerID** parameter is required for this API. A full data extract can only be requested every 14 days.

You can see more details about the REST APIs in the details topics for each API in this guide.

Most Preferred Services

When you see a service that has the syntax `*-service`, you know it is part of the forward-looking microservices strategy that we are building. When possible, use these services because they are the most actively maintained.

Note

Any customizations/help needed in designing/editing a created Odata call that is within the limitations of the Odata Product. Please seek Professional Services or a Odata Engineer for further help, reference supporting customization documentation: <https://www.odata.org/>

Services List

Micro-Service	Why you use this service	Duplicate service to avoid
curriculum-service	A curriculum is a set of learning requirements that constitute a qualification. They are most often used when customers must qualify their users to a regulatory organization. Call this service to work with curricula entities.	
learningevent-service	A learning event is an observable moment of learning: a course that a user attended, a video watched, or a test passed. Call this service to work with the learning events.	
learningplan-service	A learning plan is the collection of courses or learning to-do items for a user. Call the learning plan service to interact with the assignments.	learningPlan
scheduledoffering-service	A scheduled offering is a course that is offered at a specific time and place (even if that place is a virtual meeting room). Call this service to work with these scheduled courses.	

Micro-Service	Why you use this service	Duplicate service to avoid
<code>search-service</code>	Use the search service to search for learning programs, learning items, or end users.	
<code>userassignment-service</code>	A user assignment is a course or other learning experience that a user needs to do but has not yet completed. They might have assigned it to themselves or it might have been assigned to them. Use this service to interact with the assignments of a user.	
<code>userlearning-service</code>	This service interacts with users' learning history: the courses that they have taken and were posted for record-keeping. Each user has a learning history.	<code>learningHistory</code>
<code>user-service</code>	This service interacts with users in the Learning Management System.	<code>userService</code>

Less Preferred Services

These services are less preferred because they do not fit the new standard (`*-service`) that we want to grow into with our microservices. They do not have a more preferred service that duplicates them, however, so customers use them because a preferred service is not available.

Services List

Micro-Service	Why you use this service	Duplicate service to avoid
<code>public/user/catalogSearch/v1</code>	Searches for catalogs, which are collections of course offerings. Users have access to one or more catalogs, which is how they can find learning opportunities.	<code>catalogSearch/v1</code>
<code>public/<admin or user>/learningEvent/v1</code>	<p>This service records internal learning events only: events that originated as learning items. The LMS already had a record of the course and you post a user's completion for that course.</p> <p>The alternative is an external event, which is outside of the LMS (like a seminar at a local university). External events are not handled by this service.</p>	

Micro-Service	Why you use this service	Duplicate service to avoid
<code>public/admin/userService/v1</code>	This allows you to interact with user records. We recommend that you use <code>user-service</code> instead.	<code>user/v1</code>
<code>public/user/itemAssignment/v1</code>	This allows a user to self assign a learning item.	
<code>public/user/curriculum/v1</code>	This service interacts with curricula. We recommend that you use <code>curriculum-service</code>	<code>curriculum/v1</code>
<code>public/admin/searchStudent/v1</code>	A user assignment is a course or other learning experience that a user needs to do but has not yet completed. They might have assigned it to themselves or it might have been assigned to them. Use this service to interact with the assignments of a user.	<code>searchStudent/v1</code>
<code>public/admin/searchItem/v1</code>	You can use this to search for learning items. We recommend <code>search-service</code> instead.	<code>learningHistory</code>
<code>public/admin/searchCurriculum/v1</code>	Use this service to search for curricula.	<code>searchCurriculum/v1</code>
<code>public/admin/financialtransactions/v1</code>	Use this to post financial transactions to an external financial system.	<code>financialtransactions/v1</code>
<code>public/admin/ocn/v1</code>	These services are specific to setting up Open Content Network (OCN) providers.	

9.8.1.1 `/learning/public-api/rest/v1/partnerExtractConfig` Metadata

Use the GET call to fetch the partner configuration data and perform an extract. Use the PUT request to update the partner configuration data.

Metadata Calls

Sample Code

```
GET /learning/public-api/rest/v1/partnerExtractConfig?partnerID=
```

PUT /learning/public-api/rest/v1/partnerExtractConfig

Headers

Header	Value
Authorization	Bearer oauth_token for LMS Admin with resource type as 'learning_public_api'

Response Fields

API Type	Name	Description
GET/PUT	operation	None.
GET/PUT	status	Field that has either SUCCESS or FAILED data.
GET	sftpPath	This is the customer's subfolder path.
GET	defaultSFTPPath	This is the default root folder path.
GET	email	This is the customer email.
GET	partnerID	The Partner ID for the supported partner.
GET	encryptionKey	The partner's PGP public encryption key.
GET	keyOwner	The user ID of the public key.
GET	enabled	Either true or false will be set as per the partner extract permission.
GET	lastSuccessfulTimestamp	Date of the last full extract requested.
GET	dataServicesStatus	Full extract request status reporting Success/Failure.
GET	extractRequestDate	Date of the new full extract request.
GET	sftpport	Port number for the SFTP.
GET	sftpuserID	UserID to login to the remote server.
GET	sftpprotocol	SFTP Protocol used to connect to the server.
GET	sftpserver	SFTP Server or Host details.

API Type	Name	Description
GET/PUT	errors	In case of a FAILED status, look for the errors field. This is an array of error messages where each of the error messages has an error code and error message.
GET/PUT	code	Error code showing the type of error message related to that code.
GET/PUT	message	Error message showing the type of error code related to that message.
GET/PUT	fieldName	Type of parameter passed in the partnerID.
GET/PUT	warnings	Either a null value or a warning message will display.

GET API for Adhoc Data Extract Status (Pending, Success, Failure) Details:

Scenario	Field Values
Invoking API 1 (configuring) for the first time	Successfultimestamp and Dataservicesstatus is null and Extractrequestdate will be empty.
Invoking API 2 (request for full extract)	<p>Within the first hour, Successfultimestamp will be empty, Dataservicesstatus will be PENDING and Extractrequestdate will be date that request was placed. Within 24 hours:</p> <ul style="list-style-type: none"> If extraction was successful, then Successfultimestamp will have the day of extract timestamp, Dataservicesstatus will show SUCCESS and Extractrequestdate will remain the same. If extraction fails, then Successfultimestamp will be empty, Dataservicesstatus will show FAILED and Extractrequestdate will remain the same.
Invoking API 2 (request for full extract) again after 14 days when previous call was successful	Within first hour, Successfultimestamp shows last successful timestamp from step 2, Dataservicesstatus will still show PENDING and Extractrequestdate will be new date. Status will follow the same process as outlined above.
Invoking API 2 (request for full extract) again after 14 days when previous call was failed	Within the first hour, Successfultimestamp will be empty, Dataservicesstatus will still show FAILED and Extractrequestdate will be the new date. Status will follow same process as outlined above.

Sample Responses and Examples

The following examples are provided to show you how to use the Partner Configuration and Extract APIs:

Example 1

```
GET /learning/public-api/rest/v1/partnerExtractConfig?partnerID=THIRD
```

The partnerID parameter is required and the API will return the details for only the requested partnerID.

Note

This API requires the Administrator to have the View System Configuration workflow.

Output Code

```
{ "restOperationStatusVOX": {
  "operation": null,
  "status": "SUCCESS",
  "data": { "REST_RETURN_DATA": {
    "path": "/partner/THIRD",
    "email": "john.smith@sap.com",
    "partnerID": "THIRD",
    "encryptionKey": "xxx",
    "keyOwner": "Smith, John <john.smith@sap.com>",
    "enabled": true,
    "lastSuccessfulTimestamp": 1688169600000,
    "dataServicesStatus": "SUCCESS",
    "extractRequestDate": 1693505484439,
    "sftpprotocol": "sftp",
    "sftpuserID": "dc25-qa",
    "sftpserver": "sftp25.sapsf.eu",
    "sftpport": "22"
  } },
  "errors": null,
  "warnings": null }}
```

Note

The path is constructed based on the configured default FTP path appended with the configured partner path.

Example 2

```
PUT /learning/public-api/rest/v1/partnerExtractConfig {
  "partnerID": "FIRST",
  "email": "john.smith@sap.com",
  "enabled": true,
  "path": "/FIRST",
  "keyOwner": "Smith, John <john.smith@sap.com>",
  "encryptionKey": "<ENCRYPTION_KEY>",
}
```

Output Code

```
{ "restOperationStatusVOX": {
  "operation": null,
  "status": "SUCCESS",
  "data": { "REST_RETURN_DATA": null
  } },
  "errors": null,
  "warnings": null }
```

```
"errors": null,
"warnings": null }}
```

Note

This API requires the Administrator to have the Edit System Configuration workflow. If the Administrator does not have the workflow and issues the above API, following response is provided:

Output Code

```
{ "restOperationStatusVOX": {
  "operation": null,
  "status": "FAILED",
  "data": null
} },
"errors": [
{
code": "500",
"message": "<li>You do not have permission to perform this action.</
li>",
"fieldName": "DomainServiceValidator"
} ],
"warnings": null }
```

Example 3

The fields `keyOwner` and `encryptionKey` are required fields along with `partnerID` for the first time. If the values for `keyOwner` and `encryptionKey` are already populated for a partner, then the update API only needs `partnerID`.

```
PUT /learning/public-api/rest/v1/partnerExtractConfig
{
"partnerID": "FIRST",
"keyOwner": "Smith, John <john.smith@sap.com>",
"encryptionKey": "<ENCRYPTION_KEY>"
}
```

Example 4

If only path has to be updated, then `PartnerID` needs to be sent along with the path (this is assuming that key owner and encryption key are already updated for the partner):

```
PUT /learning/public-api/rest/v1/partnerExtractConfig
{
"partnerID": "FIRST",
"path": "/FIRST"
}
```

Example 5

If a partner has to be enabled, then the `PartnerID` needs to be sent along with the `partnerEnabled` field. This field supports a Y or N value. You must include the prerequisite Authorization Bearer Token.

```
PUT /learning/public-api/rest/v1/partnerExtractConfig
{
"partnerID": "FIRST",
"partnerEnabled": "Y"
}
```

Example 6

If a partner has to be disabled, then the `partnerID` needs to be sent along with the `partnerEnabled` field. This field supports a Y or N value. You must include the prerequisite Authorization Bearer Token.

```
PUT /learning/public-api/rest/v1/partnerExtractConfig
{
  "partnerID": "FIRST",
  "partnerEnabled": "N"
}
```

Other Notes

If PartnerID "FIRST" already exists in the system, then other details will be updated. If the PartnerID "FIRST" does not exist, then we look for default PartnerIDs shipped with (PARTNER1ID, PARTNER2ID and PARTNER3ID) and replace the first partner details that we find with the partner details in the payload. Te default PartnerIDs PARTNER1ID, PARTNER2ID and PARTNER3ID represent empty slots to be replaced with an actual partner id which cannot be left blank.

For example, If this call is happening for the first time and the default PARTNER1ID is still in the configuration, then PARTNER1ID will be replaced with a new partner id coming in from the payload first, and then the rest all of the details are updated. On the next call if PartnerID is different than FIRST, then all the details under PARTNER2ID will be replaced, and so on.

If all the default partner ids are replaced, then a new partner can no longer be added using the above API. Existing partners can still be updated.

9.8.1.2 /learning/public-api/rest/v1/adhocDataExtract Metadata

Use the PUT call to perform a full data extract. You can only request a full data extract every 14 days.

Metadata Calls

Sample Code

```
PUT /learning/public-api/rest/v1/adhocDataExtract
```

Headers

Header	Value
Authorization	Bearer oauth_token for LMS Admin with resource type as 'learning_public_api'

Note

This API requires the Administrator to have the Edit System Configuration workflow.

Sample Responses

```
PUT /learning/public-api/rest/v1/adhocDataExtract?partnerID=FOURTH
```

The partnerID parameter is required and the API will return the details for only the requested partnerID.

↔ Output Code

Sample successful response:

```
{ "restOperationStatusVOX": {
  "operation": null,
  "status": "SUCCESS",
  "data": { "REST_RETURN_DATA": null
} },
"errors": null,
"warnings": null }
```

Sample failure response:

↔ Output Code

```
{ "restOperationStatusVOX": {
  "operation": null,
  "status": "FAILED",
  "data": null
} },
"errors": [
  {
    "code": "LMS_DS_004",
    "message": "The full extract process has failed. Please contact
Product Support.",
    "fieldName": "FOURTH"
  } ],
"warnings": null }
```

9.8.1.3 admin/curriculum-service/v1 Metadata

Call for the curriculum assignment metadata to see the parameters for the service.

Metadata Call

Use this metadata call when you want the assigner to be an administrator. For example, if you are building a web client to allow administrators to manage assignments, use this metadata call.

↔ Sample Code

```
GET /learning/odatav4/public/admin/curriculum-service/v1/$metadata
```

Headers

Header	Value
Authorization	Bearer oauth_token

Containers

Entity Sets

Name	Description	Type
Curricula		Namespace1_Alias.Curricula
UserCurriculumStatuses		Namespace1_Alias.UserCurriculumStatuses
CurriculumItemDetails		Namespace1_Alias.CurriculumItemDetail

Action Import

Name	Description	Action
No Action Import	No Action Import	No Action Import

Navigation Property Bindings

Path	Target
No Navigation Property Binding	No Navigation Property Binding

Entity Types

Curricula

Property Name	Description	Property Type
primaryKey		Edm.String
curricula	This entity assigns curricula to users.	Collection(Namespace1_Alias.Curricula)

UserCurriculumStatuses

Property Name	Description	Property Type
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
curriculumID	The Unique ID of a curriculum in the system.	Edm.String
curriculumStatus	This is the user's status in the curricula. The value can be complete or incomplete. Complete means that the user has completed the curriculum. Incomplete means that the user has at least one more requirement to complete.	Edm.String
assignmentDate	This is the assignment date of the curriculum.	Edm.Int64
expirationDate	This is the expiration date of the curriculum.	Edm.Int64
nextActionDate	The next action date of the curriculum.	Edm.Int64
remainingDays	The remaining days of the curriculum.	Edm.Int64
totalCount	This is the total amount of records found for this request	Edm.Int64
criteria	This is the search criteria for curriculum statuses.	Namespace1_Alias.criteria

Property Name	Description	Property Type
rootCurriculaID	This is the unique ID of the curriculum at the root of the curriculum structure. Curricula can be subcurricula and have parent curricula. This is the ID of the curriculum at the top of the hierarchy.	Edm.String

CurriculumItemDetail

Property Name	Description	Property Type
totalCount	This is the total amount of records found for this request	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
requirementGroupID		Edm.Int64
requirementGroupDesc		Edm.String
curriculumRequirementItems		Collection(Namespace1_Alias .CurriculumRequirementItems)
nextActionDate	The next date that the user must take action on this item.	Edm.Int64
curriculaID	The Unique ID of a curriculum in the system.	Edm.String
curriculaDesc	The plain text description of the curriculum that the system returns.	Edm.String

Property Name	Description	Property Type
htmlCurriculaDesc	The HTML description of the curriculum that the system returns.	Edm.String
rootCurriculaID	This is the unique ID of the curriculum at the root of the curriculum structure. Curricula can be subcurricula and have parent curricula. This is the ID of the curriculum at the top of the hierarchy.	Edm.String
itemTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
itemID	This is the unique ID of a learning item.	Edm.String
revDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
itemTitle	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
assignmentType	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	Edm.String
displayOrder	This is the order that users progress through the learning items within a curriculum.	Edm.Int64

Property Name	Description	Property Type
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
expiryDate	This is the date that the learning item expires within the curriculum.	Edm.Int64
requirementID	This is the unique ID of the requirement that the learning item fulfills within the curriculum.	Edm.String
requirementTypeID	This is the description of a requirement type.	Edm.String
requirementDesc	This is a description of the requirement. This helps you understand the requirement.	Edm.String
requirementSequenceNumber	This is the order of the requirement for the learning item within the curriculum. Requirements are ordered.	Edm.Int64
assignedDate	This is the assignment date of the curriculum.	Edm.Int64
numberOfHours	This is a number of hours of the type in hourTypeID. This is the number of hours required to meet a requirement of the curriculum.	Edm.Double
numberOfComponents	This is a number of learning items in a requirement for the curriculum. Sometimes users must complete - for example - five learning items in a curriculum to meet a requirement.	Edm.Int64
globalDisplayOrder	This is the order that entries for the curriculum will be displayed. Learning administrators create this order.	Edm.String

Property Name	Description	Property Type
hourTypeID	<p>This is the hour type that is a unit for numberOfHours and completedNumberOfHours. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard. Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class.</p>	Edm.String

Entity Types

UserTodoLearningItem

Property Name	Description	Property Type
sku	A Stock Keeping Unit (SKU) is a unique ID of an object in learning, used for commercial tracking, inventory, and account balancing.	Edm.String
cpnt_classification	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED. A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users don't enroll into a physical good, but do enroll into an instructor led course. You can't change the set of values for classification (they're set by the LMS). It can be one of the following values: BLENDED: Items are partly led by an instructor and partly online computer-based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: Courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom-based courses, but the classroom can be physical or virtual (a conference call).	Edm.String
isUserRequestsEnabled	If the value of this is true, then users can request to be enrolled.	Edm.Boolean

Property Name	Description	Property Type
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String

Property Name	Description	Property Type
status	<p>This is a comma-separated list of status entries. The following are the positions in the list and what you can expect in those positions. First position: Are the prerequisites satisfied for this learning plan item? The values can be Y or N. Second position: What is the enrollment status of the user for this learning plan item? Possible values are E, W, P, or N. E means that the user is enrolled. W means that the user is waitlisted. The waitlist is a queue of users who are next in line if a user withdraws from a course. P means that the user is pending enrollment. Pending users are most often in the middle of an approval process to enroll. N means that the user isn't enrolled. Third position: Is a Virtual Learning Service (VLS) time slot in session? The values can be Y or N. Fourth Position: Is there a time slot currently happening for this course? The values can be Y or N. Fifth position: The unique ID of the seat that the user is enrolled into. If the user isn't currently enrolled into a pertinent class, the value is -1. Sixth position: the online status of the learning item. Possible values are -1, -2, -3, -4, -5, or -6. -1 means that the online sections of the learning item are available to be launched by the user. -2 means that the online sections are available, but the user has been locked out of the online section for some reason and isn't allowed to launch it. -3 means that the online sections aren't available for some reason. -4 means that the user can launch the online sections, but only during the scheduled time. If the time slot is in session, the user can launch it. -5 means that the user can't launch the online content because there is a prerequisite that the user hasn't yet completed. The user must complete the prerequisite and then attempt again to launch the content. -6 means that the user has already launched the content and it is in</p>	Edm.String

Property Name	Description	Property Type
	<p>progress. Seventh position: The status of any courses that are scheduled for this learning item (any classes based on the learning item). Possible values are 10, 11, -1 or -3. 10 means that an class exists and the user can enroll. 11 means that a class exists, but the user can't enroll. Instead, the user can waitlist and will be enrolled if an enrolled user withdraws. -1 means that no classes are currently available. -3 means that the user hasn't met the prerequisites for enrollment so can't enroll.</p> <p>Eighth position: This is a unique ID (a key) that represents the association between a learning item or learning object to student. It is used when a component is assigned to a user. The system generates this unique ID to track the progress of the user in the course. Returns -1 if no key exists.</p> <p>Ninth position: Has the class for this learning item already started? The values can be Y or N.</p> <p>Tenth position: Does the user need to complete a survey for the learning item? A survey is a set of follow-up questions after the course is completed. The values can be Y or N.</p> <p>Eleventh position: Is task checklist enabled for this course? A task checklist is a standard operating procedure that someone - an observer - validates when watching a student complete a physical task. Students pass the task checklist when the observer sees the student do the tasks properly and in order. The values can be Y or N.</p> <p>Twelfth position: Are task checklist observers nominated for this course? This is a stage in the observation process. The values can be Y or N.</p> <p>Thirteenth position: Are task checklist observers present for this course? The values can be Y or N.</p> <p>Fourteenth position: Can users make a request that this course should be offered? The values can be Y or N.</p> <p>Fifteenth position: Are there any pending class withdraw requests for the course? When users want to with-</p>	

Property Name	Description	Property Type
	draw from the course, they can request that they be removed from the roster. The values can be Y or N. Sixteenth position: Are there any requests pending for the course by the user? The values can be Y or N. Seventeenth position: Can user request for task checklist observation for the course? The values can be Y or N.	
userID	The unique ID of this user.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String

Property Name	Description	Property Type
componentTypeDesc	The descriptions of item types can help you determine how the item type assigns credit.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.Int64
componentLength	The sum of the length of all time slots, in hours.	Edm.Double
contactHours	Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a learning item that is instructor-led with online content with 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led time slot, then the contact hours equals 6.	Edm.Double
creditHours	Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equal 45; however, the college grants 3 CREDIT HOURS for this class.	Edm.Double
cpeHours	CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification.	Edm.Double

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
assignedDate	This is the assignment date of the curriculum.	Edm.Int64
availableNewRevision	If the value of this is true, then the learning item has a newer revision than the revision assigned to the user.	Edm.Boolean
revisionNumber	null	Edm.String
requiredDate	This is the date that the user is required to complete this entity.	Edm.Int64
daysRemaining	This is the days remaining until the user is required to complete the learning item. If it is a negative number, then it is the days that the user is overdue.	Edm.Int64
addUser	The user type who added the learning item. A is an administrator and P is a user (for example, a manager).	Edm.String
addUserName	The username of the user who added this course to this user's assignments.	Edm.String
addUserTypeLabelID	The full name of the user type who added the learning item to the user. For example: Admin and User	Edm.String
orderItemID	The order ID associated with the learning item.	Edm.Int64
usedOrderTicketNumber	Used voucher number	Edm.String
usedOrderTicketSequence	Used voucher sequence	Edm.Int64
onlineLaunched	If the value of this is true, then the user has launched the online content at least once.	Edm.Boolean

Property Name	Description	Property Type
origin	How the learning item came to be on the users' learning plan. For example: Curriculum.	Edm.String
cdpGoalID	The continuous development plan goal ID associated with this learning item.	Edm.String
seqNumber	The sequence number of the learning item.	Edm.Int64
scheduleID	The unique ID of the class.	Edm.Int64
qualificationID	The Unique ID of a curriculum in the system. In the context of this entity, this is the curriculum ID that put the learning item on the users' learning assignments. The learning item is part of the curriculum, the curriculum is assigned, therefore the learning item is assigned.	Edm.String
rootQualificationID	This is the unique ID of the curriculum at the root of the curriculum structure. Curricula can be subcurricula and have parent curricula. This is the ID of the curriculum at the top of the hierarchy. In the context of this entity, this is the root curriculum ID that put the learning item on the users' learning assignments. The learning item is part of a curriculum structure (with this curriculum at its root), the curriculum structure is assigned, therefore the learning item is assigned.	Edm.String
qualTitle	The title of a curriculum in the system. In the context of this entity, this is the title of the curriculum that put the learning item on the users' learning assignments.	Edm.String
isRequired	If the value of this is true, then the learning item is required to be completed by the user.	Edm.Boolean
orderItemStatusTypeID	The unique type ID of the order's status. The order's status defines where it is in the process of being purchased.	Edm.String

Property Name	Description	Property Type
<code>showInCatalog</code>	If the value of this is true, then this appears in the users' learning library.	<code>Edm.Boolean</code>
<code>requirementTypeDescription</code>	This is the description of the requirement type. Requirement types define the conditions that users must meet to be considered complete in the requirement (for example, number of hours from a set of learning items).	<code>Edm.String</code>
<code>requirementTypeId</code>	This is the ID of the requirement type. Requirement types define the conditions that users must meet to be considered complete in the requirement (for example, number of hours from a set of learning items).	<code>Edm.String</code>
<code>hasOnlinePart</code>	If this is true, then the entity has some online sections.	<code>Edm.Boolean</code>
<code>itemDetailsDeeplink</code>	If you requested a deep link in your search for learning items, this is populated with the link to the learning item details page. Users click the link to see the details for this learning item. If they aren't already authenticated to the system, they must authenticate before they can see the page.	<code>Edm.String</code>
<code>courseDeeplink</code>	If you requested a deep link in your search for learning items, and if this learning item contains online content, then this is populated with the link to the online content. Users click the link to go to the online content for this learning item. If they aren't already authenticated to the system, they must authenticate before they can see the page.	<code>Edm.String</code>
<code>criteria</code>	This is the search criteria used to find learning items in users' learning plans.	<code>Namespace1_Alias.criteria</code>
<code>linkedSchedules</code>	This is a list of all the classes for this learning item for which the user is enrolled.	<code>Collection(Edm.Int64)</code>

Property Name	Description	Property Type
programType	This is the program type, which defines how a user progresses through the program. It can be scheduled, duration-based, or open-ended.	Edm.String
programEndDate	If this is program has a defined end date, this is that end date.	Edm.Int64
programStartDate	If this is program has a defined start date, this is that start date.	Edm.Int64
programDuration	If this is program has a duration (a time over which it should be completed) this is that duration.	Edm.Int64
programDurationType	This is the duration type.	Edm.String
programDeeplink	This is a deep link to the program. If users click the link, they first must authenticate to the system and then they can look at the program details.	Edm.String
vlsLink	This is the VLS link that learners can use to join a virtual meeting room (like WebEx, Adobe Connect, or Skype) for training. The link is for registered learners and learning items with a current or future time slot that is virtual.	Edm.String
studentSurveyID	This is a unique User Survey ID to uniquely identify the mapping between User and Survey.	Edm.Int64
itemSurveyID	This is a unique Item Survey ID to uniquely identify the mapping between Item and Survey.	Edm.Int64
surveyID	The unique ID of the Survey in the System	Edm.String
surveyLevel	The level of the Survey. The value of 1 indicates Item Evaluation Survey. The value of 3 indicates Follow up Evaluation Survey.	Edm.Int64
surveydesc	This is the Survey Description.	Edm.String
surveyStatusID	The Status of the survey assigned to User.	Edm.String

Property Name	Description	Property Type
surveyDeepLink	This is a deep link of the Survey. If users click the link, they first must authenticate to the system and then they can look at the survey details.	Edm.String
learnerActions		Collection(Namespace1_Alias.learnerActions)

LearningItemDetail

Property Name	Description	Property Type
pkID	This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.Int64

Property Name	Description	Property Type
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
description	This is the description of the learning item in the language of the current user (the user calling the web service). A description is intended to provide details to users so that they can decide if they're interested in the course. Descriptions can be translated using a key/value pair, where the key uniquely identifies a particular learning item's description and the values are each language's translation of the description. If you need the key that matches this value, look in Description-LabelKey.	Edm.String
htmlDescription	This is the description of the learning item, in the users' language, with HTML tags to format the description. Customers often use simple inline tags to bold and italicize words (for example).	Edm.String
revisionNo	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
sourceID	The source is the developer of the learning item or the organization or regulatory body that requires it. You can create or modify source IDs in the administration environment, in References: Learning: Item Sources.	Edm.String

Property Name	Description	Property Type
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and permission domain restrictions of the role ID that is associated with the administrator.	Edm.String
deliveryMethodID	This is the unique ID of a delivery method. A delivery method describes how a learning item will be delivered (for example, a book, PDF file, or online course). You can create or modify method IDs in the administration environment, in References: Learning: Delivery Methods	Edm.String
requirementTypeID	This is the unique ID of a requirement type. A requirement type is a way for companies to describe how a user can meet the requirement. For example, a user can finish a set number of hours from within a pool of learning items.	Edm.String
safetyRelated	If a learning item is safety-related (if safetyRelated is true) then the learning item is flagged as safety-related in searches and reports. This information is for administrative purposes. It isn't in the end-user interface by default.	Edm.Boolean
approved	If the user is approved to enroll into the learning item, the value is true. If the user isn't approved, the value is false.	Edm.Boolean
notActive	If the value is false then the user is active. If the value is true, then the user is inactive.	Edm.Boolean
reviserName	This is the name of the user who revised the learning item.	Edm.String
approvedBy	This is the name of the user who approved the learning item.	Edm.String

Property Name	Description	Property Type
approvalTimestamp	This is the time that the person in charge of the approval granted the approval for the entity.	Edm.Int64
lessonPlanFilename	This is the lesson plan that goes with the learning item. For example, it can be a valid URL to an online lesson plan or a name of a training document. Administrators or trainers can consult the lesson plan to help them prepare for the learning item.	Edm.String
targetAudience	This is a description of the intended target audience that the you can display in the user interface. It helps users understand who the course is planned to address.	Edm.String
contactName	The contact name is someone who can answer questions about the learning item.	Edm.String
contactHours	Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a learning item that is instructor-led with online content with 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led time slot, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, manager, or administrator records completion with the Record Learning wizard.	Edm.Double

Property Name	Description	Property Type
creditHours	Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equal 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, manager, or administrator records completion with the Record Learning wizard.	Edm.Double
cpeHours	CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, manager, or administrator records completion with the Record Learning wizard.	Edm.Double
defaultInitialNumber	The initial number is the number of days, weeks, months, quarters, or years that the user has in their initial retraining period for this learning item. Retraining periods apply when the learning item is a member of a curriculum. It is the grace period when users are first assigned a learning item. Although they might be required to retrain on the learning item every year, they might be assigned the curriculum (and learning item) in the last month of the year. The initial period gives them a grace period to complete the first training.	Edm.Int64
defaultInitialPeriodTypeID	This is the unit for the initial period (days, weeks months, quarters, or years).	Edm.String

Property Name	Description	Property Type
defaultInitialBasisTypeID	The basis type can be calendar or event. In a calendar basis type, the user must retrain on a learning item on a time-interval based on the calendar (like every month). In an event, the period is based on an event, like completing the first round of training.	Edm.String
initialPeriodLabelID	The label ID for the initial period, so that you can look up the language.	Edm.String
initialBasisLabelID	The label ID for the initial basis, so that you can look up the exact language.	Edm.String
defaultRetrainingNumber	After the initial period, users must retrain. This is the number of days, weeks, months, quarters, or years that the users have to complete the retraining on the learning item.	Edm.Int64
defaultRetrainingPeriodTypeID	The period that a user must retrain after the initial period. This can be days, weeks, months, quarters, or years.	Edm.String
defaultRetrainingBasisTypeID	The retraining period type can be either calendar or event. If it is calendar, then the user must retrain based on a time-based interval (such as annually, regardless of when the user completed the last training). If it is event, then the user must retrain based on an event (such as a year after completing the training).	Edm.String
retrainingPeriodLabelID	The label ID for the retraining period, so that you can look up the language.	Edm.String
retrainingBasisLabelID	The label ID for the training basis, so that you can look up the language.	Edm.String
comments	Comments from the instructor.	Edm.String
instructorMaterials	This is materials that the instructor should have for the learning item.	Edm.String
studentMaterials	This is materials that the student (learner) should have for the learning item.	Edm.String

Property Name	Description	Property Type
gradingOption	This is the grading option of the learning item. You can see the grading options in the administration environment on the learning item record in the Grading Options view.	Edm.Int64
createTimestamp	The time stamp, in Unix Epoch, that the learning item was created	Edm.Int64
componentGoals	These are the goals that are associated with this learning item.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
totalLength	This is the total length of time that the course takes. Typically, this is used for planning purposes.	Edm.Double
prepLength	This is the total length of time that it takes an instructor to prepare to teach the course. Typically, this is used for planning purposes.	Edm.Double
minEnrollment	This is the minimum number of users who must enroll into the course for the course to take place.	Edm.Int64
maxEnrollment	This is the maximum number of users who can enroll into the course.	Edm.Int64
enrollmentThresDays	This is the number of days before the course that the enrollment is closed for the course.	Edm.Int64
autoFillEnrollment	If the value is true, then when a slot opens in the enrollment list, it is filled automatically from the waitlist.	Edm.Boolean
waitlistRemainderSentTimestamp	The time that the remainder of users on the waitlist was sent as a reminder.	Edm.Int64
autoCompetency	If the value is true, then users are automatically evaluated in their competency at when they complete the course.	Edm.Boolean

Property Name	Description	Property Type
classification	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED. A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users don't enroll into a physical good, but do enroll into an instructor led course. You can't change the set of values for classification (they're set by the LMS). It can be one of the following values: BLENDED: Items are partly led by an instructor and partly online computer-based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: Courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom-based courses, but the classroom can be physical or virtual (a conference call).	Edm.String
chargebackMethod	This is unique ID of a chargeback method. Chargeback is a way to reconcile costs between organizations. One organization charges the cost of training back to another organization. This allows companies to balance the cost of training by putting the cost to organizations.	Edm.String
catalogSKU	A Stock Keeping Unit (SKU) is a unique ID of an object in learning, used for commercial tracking, inventory, and account balancing.	Edm.String

Property Name	Description	Property Type
<code>scheduleCanOverridePrice</code>	If this value is true, then each instance of a course (class) can override the price that is set in main copy of the course (learning item). If the value is false, then every course created from the main copy (learning item) inherits the price from the main copy.	Edm.Boolean
<code>productionReady</code>	If this value is true, then the learning item is ready to be assigned to users. If the value is false, then the learning item is under development and not yet ready for users.	Edm.Boolean
<code>studentCanRecordLearningEvents</code>	If the value of this is true, then the user can record learning events for this learning item. If the value is false, then only supervisors or administrators can record learning on the learning item. In SuccessFactors Learning, when someone records a learning event, they're posting a users' completion or inability to complete a course back to the LMS. For example, you can record the fact that a user attended the course and completed it. Or, you can record the fact that a user did NOT complete the event. Completion is a highly configurable part of the LMS, so your completion statuses (the thing you are posting/recording) will be your own and match your business process.	Edm.Boolean

Property Name	Description	Property Type
supervisorCanRecordLearningEvents	If the value of this is true, then the manager can record learning events for this learning item. If the value is false, then only administrators can record learning on the learning item. In most cases, when a manager can't record learning, a user can't record learning either. In SuccessFactors Learning, when someone records a learning event, they're posting a users' completion or inability to complete a course back to the LMS. For example, you can record the fact that a user attended the course and completed it. Or, you can record the fact that a user did NOT complete the event. Completion is a highly configurable part of the LMS, so your completion statuses (the thing you are posting/recording) will be your own and match your business process.	Edm.Boolean
approvalRequired	If the value of this is true, then the users require approval to enroll into the course. If the value is false, then approval isn't required.	Edm.Boolean
processDefinitionID	This is the unique ID of the approval process definition (as opposed to the ID of the instance of the approval).	Edm.String
processDescription	This is a description of the approval process. For example, Approval to Withdraw from Training.	Edm.String
sourceDescription	This is a field on learning items that typically describes the developer of the course. For example, if you use third parties to create course material for you, then the third party that developed THIS learning item can be recorded in source.	Edm.String

Property Name	Description	Property Type
domainDescription	This is the description of the security domain of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and permission domain restrictions of the role ID that is associated with the administrator.	Edm.String
deliveryMethodDescription	This is the description of a delivery method. A delivery method describes how a learning item will be delivered (for example, a book, PDF file, or online course). You can create or modify method IDs in the administration environment, in References: Learning: Delivery Methods	Edm.String
requirementTypeDescription	This is the description of a requirement type. A requirement type is a way for companies to describe how a user can meet the requirement. For example, a user can finish a set number of hours from within a pool of learning items.	Edm.String
chargeBackMethodLabelID	This is unique ID of a chargeback method LABEL. Because you can offer courses in many languages, you can describe the chargeback in many languages. The system uses this label ID to look up the correct string to describe the chargeback method in the users' language. Chargeback is a way to reconcile costs between organizations. One organization charges the cost of training back to another organization. This allows companies to balance the cost of training by putting the cost to organizations.	Edm.String

Property Name	Description	Property Type
componentClassificationLabelID	This is the unique ID of the label for the classification of this learning item. The LMS uses the label ID to look up the correct translation (string) of the classification for this user's language. For example, TIME-BASED is usually represented to English speakers as Instructor Led. The system uses an label ID to look up the string "Instructor Led." A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users don't enroll into a physical good, but do enroll into an instructor led course. You can't change the set of values for classification (they are set by the LMS). It can be one of the following values: BLENDED: Items are partly led by an instructor and partly online computer-based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: Courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom-based courses, but the classroom can be physical or virtual (a conference call).	Edm.String
forumID	Forums are deprecated. Instead, use SAP Jam. If your learning item is associated with a deprecated forum, the ID appears here.	Edm.Int64
rating	This is the rating that users have given the learning item.	Edm.Double
enableRating	If the value of this is true, then users can rate the learning item. If it is false, then users can't rate the learning item.	Edm.Boolean

Property Name	Description	Property Type
includePreviousRevisionRating	If the value of this is true, then the overall rating includes ratings given to previous revisions of the learning item. If it is false, then the ratings are calculated from the current revision only.	Edm.Boolean
shippingRequired	If this value is true, then the learning item has some component that must be shipped. This is often the case if the learning item is a physical good, like a book. If it is false, then there is nothing to ship. For example, if this learning item is an online course, there is nothing to ship.	Edm.Boolean
selfEnrollment	If this value is true, then users can enroll themselves into this entity. If false, then they can't enroll themselves. Enrollment isn't necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
isBlendedLearningRegisterRequired	If this value is true, then if the classification ID is BLENDED, then users must enroll for the learning item, even to see the online portions of the course. If it is false, then users can see the online portions without enrolling.	Edm.Boolean
eSigEnabled	If the value is true, then e-signatures are required for actions with this learning item. If false, then e-signatures aren't required. E-signatures are a secondary identity verification for things like recording the completion of a learning item. They are typically used by companies that are audited by an oversight organization for learning compliance.	Edm.Boolean

Property Name	Description	Property Type
<code>isUserRequestsEnabled</code>	If the value is true, then users can request a class of a learning item. If false, they can't request a new class. Users request classes when the current list of times that the learning item is offered does NOT include a time that they can attend the course. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a class.	Edm.Boolean
<code>userCanWaitlist</code>	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
<code>componentTypeDesc</code>	The descriptions of item types can help you determine how the item type assigns credit.	Edm.String
<code>enableOrder</code>	If the value of this is true, then orders can be created for the entity (users can order it). If it is false, then orders can't be created.	Edm.Boolean

Property Name	Description	Property Type
<code>checkAuthorizedInstructor</code>	If the value is true, then the primary instructor of the time slots must be authorized to teach the learning item. You set the learning items that an instructor is authorized to teach on the instructors' records. If it is false, then the primary instructor is not required to be authorized to teach the learning item. It is often false if you aren't using instructor records or you aren't keeping track of authorization to teach in the LMS.	<code>Edm.Boolean</code>
<code>checklistEnabled</code>	If the value of this is true, then task checklists are enabled for the learning item. Task checklists ask an observer to make sure that a user can complete a task in a series of steps.	<code>Edm.Boolean</code>
<code>isAuthorizedObserver</code>	If the value of this is true, then this user is an authorized observer for the task checklist attached to this learning item.	<code>Edm.Boolean</code>
<code>checklistCompletionStatusID</code>	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	<code>Edm.String</code>
<code>checklistFailureStatusID</code>	This is the task checklist failure status ID. It is the completion status that the user is assigned if they fail the task checklist.	<code>Edm.String</code>
<code>checklistObserverTypeID</code>	Observer types define the task checklist observer.	<code>Edm.String</code>
<code>thumbnailURI</code>	This is the URI that leads to the thumbnail image for this entity. Thumbnails are images that act like icons: they help users understand something about the entity from a glance.	<code>Edm.String</code>

Property Name	Description	Property Type
classificationLabelValue	<p>This is the translated name of the classification of this learning item. The LMS uses the label ID to look up the correct translation (string) of the classification for this user's language. For example, TIME-BASED is usually represented to English speakers as Instructor Led. The system uses a label ID to look up the string "Instructor Led" for English speaking users and returns the label value "Instructor Led." A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users don't enroll into a physical good, but do enroll into an instructor led course. You can't change the set of values for classification (they're set by the LMS). It can be one of the following values: BLENDED: Items are partly led by an instructor and partly online computer-based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: Courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom-based courses, but the classroom can be physical or virtual (a conference call).</p>	Edm.String
chargebackMethodLabelValue	<p>This is the description of the chargeback method in this user's language. Chargeback is a way to reconcile costs between organizations. One organization charges the cost of training back to another organization. This allows companies to balance the cost of training by putting the cost to organizations.</p>	Edm.String

Property Name	Description	Property Type
itemDetailsDeeplink	If you requested a deep link in your search for learning items, this is populated with the link to the learning item details page. Users click the link to see the details for this learning item. If they aren't already authenticated to the system, they must authenticate before they can see the page.	Edm.String
courseDeeplink	If you requested a deep link in your search for learning items, and if this learning item contains online content, then this is populated with the link to the online content. Users click the link to go to the online content for this learning item. If they aren't already authenticated to the system, they must authenticate before they can see the page.	Edm.String
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria
LearningItemPrerequisite		
Property Name	Description	Property Type
pkID	This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
prerequisitesGroupItem	A prerequisite is a learning item that must be complete before enrolling into this learning item. A group of prerequisites (prerequisite group) is an ordered list of prerequisites that users must complete in a given order. For example, to take a high-level Physics course, you probably need to start with introduction to physics and work through a series of prerequisites before you are ready for the high-level course. That series of courses is a prerequisite group.	Collection(Namespace1_Alias.prerequisitesGroupItem)
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

LearningItemDocument

Property Name	Description	Property Type
pkID	This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
documentID	This is the unique ID of the document record. Documents are managed as separate objects in the system and then associated with learning item.	Edm.String
reviewFlag	If the value of this is true, then the document should be reviewed for accuracy. Reviews are triggered when the document is revised. The review flag is set on the learning item or curricula, not on the document, because it is within the context of the learning item or curriculum that the document must be reviewed. Review to answer the question: does this new revision of the document fit with the current revision of the learning item or curriculum.	Edm.Boolean
documentTitle	This is the title of the document. The title is something that users recognize.	Edm.String
documentLocation	This is a brief description of where the document is located. For example, if it is stored at a URL on a content server, it might be that URL.	Edm.String
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

Scheduledoffering

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the unique ID of a learning item.	Edm.Int64
price	The price of the entity. For example, the price of a class: how much does it cost a user to enroll into and complete the class?	Edm.Double
instructors	This is an instructor. Instructors are tracked as resources in the Learning Management System (LMS) so that they can be matched to courses during a scheduling process. They can also be useful to advertise courses: courses with well known instructors tend to see greater enrollment.	Collection(Namespace1_Alias.instructors)
startDateTime	The start timestamp for this class in Unix Epoch Time.	Edm.Int64
endDateTime	The end timestamp for this class in Unix Epoch Time.	Edm.Int64

Property Name	Description	Property Type
days	This is the number of days that have time slots scheduled in a class. Days that do NOT have time slots are NOT included in the amount. For example, a course that begins on Monday and ends on Friday of the same week and has time slots on Monday, Wednesday, and Friday returns three days and not five. The days without time slots (Tuesday and Thursday) are NOT included in the amount.	Edm.Int64
locationDescription	This is a description of the location where the course is to take place. It helps users understand where to go for their course. A training location is a place inside a training facility. For example, a facility can be a building and the rooms inside the facility can be locations. This helps users understand both "I need to go to this building" and also "I need to go to this room inside the building."	Edm.String
facilityDescription	The brief description of the facility. A training location is a place inside a training facility. For example, a facility can be a building and the rooms inside the facility can be locations. This helps users understand both "I need to go to this building" and also "I need to go to this room inside the building."	Edm.String
scheduleStatus	This is the schedule status CODE, as opposed to the schedule status value. It is a number that can be -3, -6, 10, 11, 12, 13, or 14. Schedule status codes match values as follows. -3: Student hasn't finished all the prerequisites. -6: Schedule unavailable because the threshold waiting for the Component isn't reached. 10: Open Seats are available. 11: Open Seats and Slots are available. 12: No Open Seats. 13: No Open Seats, but there are open slots. 14: Student has already enrolled.	Edm.Int64

Property Name	Description	Property Type
selfEnrollable	If this value is true, then users can enroll themselves into this entity. If false, then they can't enroll themselves. Enrollment isn't necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
timeZoneID	This is the time zone of the entity.	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the class time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
maxEnrollment	This is the maximum number of users who can enroll into the course.	Edm.Int64
enrolledCount	This is the number of users who are currently enrolled.	Edm.Int64
enrollStatusTypeID	This is the registration type that has been assigned to the user.	Edm.String
enrollSeatID	If this user is already enrolled in this class, this value is the unique ID of the seat that the user occupies. If this user isn't enrolled in this class, then this value is null.	Edm.Int64
addUser	If this user is already enrolled in this class, this value is the unique ID of the seat that the user occupies. If this user isn't enrolled in this class, then this value is null.	Edm.String
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
chargebackMethod	This is unique ID of a chargeback method.	Edm.String

Property Name	Description	Property Type
<code>itemChargeBackMethod</code>	This is unique ID of a chargeback method. This is the chargeback method of the parent learning item, which the class inherits as a default but can be overridden by administrators.	<code>Edm.String</code>
<code>scheduleCanOverridePrice</code>	If this value is true, then each instance of a course (class) can override the price that is set in main copy of the course (learning item). If the value is false, then every course created from the main copy (learning item) inherits the price from the main copy.	<code>Edm.Boolean</code>
<code>timeZoneLabelValue</code>	This is the time zone of the entity, in a human readable format.	<code>Edm.String</code>
<code>scheduleStatusValue</code>	This is the schedule status TEXT VALUE, as opposed to the schedule status code. The text value tells you, in English, what the codes mean. Schedule status codes match values as follows. -3: Schedule unavailable because the threshold waiting for the Component isn't reached. -6: Student hasn't finished all the prerequisites. 10: Open Seats are available. 11: Open Seats and Slots are available. 12: No Open Seats. 13: No Open Seats, but there are open slots. 14: Student has already enrolled.	<code>Edm.String</code>
<code>currencyCode</code>	This is the currency code for this entity. The currency code is returned from the enumerated list of currency codes that you set up when you implemented the system. During implementation, we recommend that customers use ISO codes for currency, but it is NOT required.	<code>Edm.String</code>
<code>currencyDesc</code>	This is the currency description for this entity. You set up currency descriptions during implementation to help you understand the currency code. They can be any string that helps you understand the currency code.	<code>Edm.String</code>

Property Name	Description	Property Type
availableSeatCount	This is the number of available seats left in the class (the number of users who can still enroll in the class).	Edm.Int64
scheduledOfferingDeeplink	If you requested a deep link in your search for learning items, and if this learning item contains online content, then this is populated with the link to the online content. Users click the link to go to the online content for this learning item. If they aren't already authenticated to the system, they must authenticate before they can see the page.	Edm.String
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

Complex Types

criteria

Property Name	Description	Property Type
minRowNum	What is the minimum record to retrieve? Use the minimum and maximum records to create pages.	Edm.Int64
maxRowNum	What is the maximum record to retrieve? Use the minimum and maximum records to create pages.	Edm.Int64
qualItemsAndReqThresholdDays	If you provide a value, the system returns all items with a requiredDate (returned as part of the search) less than the current date plus the number of days you set in qualItemsAndReqThresholdDays. When the threshold isn't set, the required date is ignored. This check may be ignored if other criteria are met.	Edm.Int64

Property Name	Description	Property Type
targetUserID	If you are running the web service with an administrator user (user type is A), then send the user whose learning plan you want to retrieve. If you are running the web service with an end-user (user type is P), then don't pass it. The system reads the user ID from the authorization header.	Edm.String
targetPersonGUID	If you are running the web service with an administrator user (user type is A), then send the user's person GUID whose learning plan you want to retrieve. If you are running the web service with an end-user (user type is P), then don't pass it. The system extracts the person GUID from the authorization header.	Edm.String
retrieveLinkedSchedules	If set to true, then the service returns not only the learning items in the users' learning plans but also the classes that the users are enrolled into for those learning items. When true, the system runs a second query, which has a performance impact. Set to false for faster queries when you don't need the schedules.	Edm.String
includeDeeplink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean
includeVLSlink	This is the VLS link that learners can use to join a virtual meeting room (like WebEx, Adobe Connect, or Skype) for training. The link is for registered learners and learning items with a current or future time slot that is virtual.	Edm.Boolean
includeSurveys	If set to true, then the service returns the surveys associated with the users along the learning items assigned to him.	Edm.Boolean
includeLearnerActions	If set to true, the system returns actions available to the learner for each learning item in the results. If set to false, actions won't be included in results. Default is false.	Edm.Boolean

learnerActions

Property Name	Description	Property Type
actionText		Edm.String
actionName		Edm.String

lisCriteria

Property Name	Description	Property Type
itemID	This is the unique ID of a learning item.	Edm.String
itemTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
onlyShowInSystemLevelLocaleCurrency	If this value is true, then the search returns learning items in the system level currency. If false, then other currencies are returned.	Edm.Boolean
includeDeeplink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean
includeInstructorDetails	If set to true, then the search returns details about the instructor. This can be useful, for example, if you want to advertise the instructor in order to get learners excited about attending training under that instructor. If you aren't using instructors, set to false.	Edm.Boolean

prerequisitesGroupItem

Property Name	Description	Property Type
prerequisiteComplete	If the value of this is true, then this user has completed this prerequisite.	Edm.Boolean

Property Name	Description	Property Type
<code>isAvailableInStudentCatalog</code>	If the value of this is true, then this prerequisite is in this user's library. When it is in a user's library, they can access it and it doesn't need to be directly assigned.	<code>Edm.Boolean</code>
<code>isInLearningPlan</code>	If the value of this is true, then this prerequisite is already in this user's assignments.	<code>Edm.Boolean</code>
<code>prerequisiteCompleteInfo</code>	This is the completion information for this prerequisite for this user.	<code>Edm.String</code>
<code>prerequisiteCompletionDate</code>	This is the date that this user completed this prerequisite. If the value of this is null, then this user hasn't completed the prerequisite.	<code>Edm.Int64</code>
<code>prerequisiteGroupID</code>	This is the unique ID of the group that this prerequisite belongs to.	<code>Edm.String</code>
<code>groupName</code>	This is the name of group that this prerequisite belongs to.	<code>Edm.String</code>
<code>groupOrder</code>	Prerequisite groups can be sequenced. This is the sequence number of the prerequisite group.	<code>Edm.Int64</code>
<code>prerequisiteItemOrder</code>	Within the group, this is the sequence of the learning item.	<code>Edm.Int64</code>
<code>prerequisiteRevisionNumber</code>	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	<code>Edm.String</code>

Property Name	Description	Property Type
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
groupNameLabelKey	This is the unique ID of the group name label. The system uses this ID to look up the group name in this user's language.	Edm.String
prerequisiteComponentClassificationType	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED.	Edm.String
prerequisiteComponentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
prerequisiteComponentID	This is the unique ID of a learning item.	Edm.String
prerequisiteRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

instructors

Property Name	Description	Property Type
<code>instructorID</code>	This is the unique ID of an instructor in the Learning Management System. If the instructor is also a user (this is often the case when instructors are employees at the company), then keep in mind that this is their INSTRUCTOR ID as opposed to their LEARNER ID.	<code>Edm.String</code>
<code>lastName</code>	This is the family name of the instructor.	<code>Edm.String</code>
<code>firstName</code>	This is the given name of the instructor.	<code>Edm.String</code>
<code>middleInitial</code>	This is a middle initial of the instructor.	<code>Edm.String</code>
<code>primary</code>	If the value of this is true, then this is the primary instructor. If false, then the instructor is secondary. Primary instructors are usually the ones responsible for organizing the training, posting learning results, and hosting Virtual Learning Sessions (VLS). You can also require that primary instructors are qualified to instruct the learning item. Secondary instructors support the primary instructors.	<code>Edm.Boolean</code>

Actions

This `$metadata` does **not** contain actions.

9.8.1.8 admin/scheduledoffering-service/v1 Metadata

Call for the scheduled offering metadata to work with courses that are scheduled to occur at a given time and place, including who is enrolled and attendance in the course.

Metadata Call

Sample Code

```
GET /learning/odatav4/public/admin/scheduledoffering-service/v1/$metadata
```

Entity Types

EnrollmentListing

Property Name	Description	Property Type
enrollSeatID	This is the unique ID of the enrollment seat for the user in the current scheduled offering. The value is a number.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
firstName	The given name of a user.	Edm.String
middleInitial	The middle initial of a user.	Edm.String
lastName	The family name of a user.	Edm.String
enrollSlotID	This is the unique ID of the enrollment slot. A slot is a spot in a training course that a user can enroll into. For example, if a course (a scheduled offering) is limited to ten participants, it has ten slots. Each participant who enrolls is placed into a slot. If nine users enroll into the course, then nine of ten slots are occupied. Slots are important because you can reserve slots for users. You can, for example, say that a course has ten slots and five of them are reserved for users of a particular organization.	Edm.Int64
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64

Property Name	Description	Property Type
enrollStatID	This is the registration status for this user in this entity.	Edm.String
enrollDate	This is the date of enrollment - the date that the user was added to the entity.	Edm.Int64
comments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
shippingAddress	This is the street address used for shipping.	Edm.String
shippingCity	This is the city used in the shipping address.	Edm.String
shippingState	This is the state or province used in the shipping address.	Edm.String
shippingPostal	This is the postal code used in the shipping address.	Edm.String
shippingCountry	This is the country used in the shipping address.	Edm.String
shippingPhoneNo	This is the phone number that can contact someone at the shipping address for information about the shipment.	Edm.String
shippingFaxNo	This is the fax number where you can send documents at the shipping address. For example, a place to fax shipping labels.	Edm.String
shippingEmailAddress	This is the email address that can contact someone at the shipping address for information about the shipment.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
addUser	The user who added the entity.	Edm.String
cancelDate	If the user cancels, this is the date of the cancellation.	Edm.Int64

Property Name	Description	Property Type
orderItemID	The order ID associated with the learning item.	Edm.Int64
paymentOrderTicketNo	If this order is paid with a ticket, this is the number of the ticket.	Edm.String
ticketSequence		Edm.Int64
origin		Edm.String
withdrawPending	If the user is cancelling and that withdraw is pending, this is true.	Edm.Boolean
criteria	This is the search criteria for enrollments.	Namespace1_Alias.criteria
totalCount		Edm.Int64

EnrollmentListing

Property Name	Description	Property Type
enrollmentListing		Collection(Namespace1_Alias.EnrollmentListing)
criteria	This is the search criteria for enrollments.	Namespace1_Alias.criteria

SegmentAttendance

Property Name	Description	Property Type
segmentAttendances	This is a record of a user attending a segment of a course.	Collection(Namespace1_Alias.SegmentAttendances)

EnrollmentStatus

Property Name	Description	Property Type
primaryKey	This is a primary key for the wrapper. It must be included even though, as a collection, there is no primary key. Pass any value. It will be ignored. Convention, however, is to pass an empty primary key.	Edm.String

Property Name	Description	Property Type
enrollmentStatus	This is a full description of the enrollment status of a user in a course, including the user with the enrollment status. Registration status describes a user's state in the registration process. Each state has a type: Pending (User is awaiting approval to enroll), Waitlisted (The course is full and the user will be added if a space becomes available), Enrolled (User has a spot in the course), and Cancelled (User was enrolled but has withdrawn from the course). Each status is tied to a type. If companies use the default statuses, then they have a one-to-one match to the registration status and registration type (If the status is Pending, the type is Pending... if the status is Waitlisted, the type is Waitlisted, and so on). During implementation, we strongly recommend that companies use these four default registration statuses, to simplify their implementation. However, if they create new statuses based on a customization, those new statuses must be related to an existing type. For example, if they create a registration status called Priority Waitlist, that status must be tied to the Waitlist registration type. It must be tied to the Waitlist registration type so that the LMS knows what to do with users in this status. In this example, the LMS knows that users in Priority Waitlist should be on the waitlist for the course. The customization can do something special with users who are in Priority Waitlist and not standard Waitlist.	Collection(Namespace1_Alias.EnrollmentStatus)

Enrollment

Property Name	Description	Property Type
enrollments	An enrollment is a user in the LMS who has an enrollment status for a scheduled offering.	Collection(Namespace1_Alias.Enrollments)

UserScheduleBlock

Property Name	Description	Property Type
primaryKey	This is a primary key for the wrapper. It is required. Pass any value. It will be ignored. Convention is to pass an empty primary key.	Edm.String
userScheduleBlock	A schedule block is a way to PREVENT scheduling for a resource. For example, if an instructor is on leave, you can add a schedule block for the time that he or she is on leave. That schedule block prevents the instructor from being scheduled into courses during the time of the block.	Collection(Namespace1_Alias .UserScheduleBlock)

RefundPolicies

Property Name	Description	Property Type
privateKey		Edm.String
studentID		Edm.String
personGUID		Edm.String
refundPolicies	A refund policy defines what users can expect if they ask for a refund. For example, if they withdraw from a course within 24 hours of the start, how much refund can they expect?	Collection(Namespace1_Alias .RefundPolicies)
messages		Collection(Namespace1_Alias .Messages)

EnrollmentCancellations

Property Name	Description	Property Type

enrollmentCancellations		Collection(Namespace1_Alias .EnrollmentCancellations)
messages		Collection(Namespace1_Alias .Messages)

ScheduledToTeachClass

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
description	This is the description of the Scheduled Offering entity.	Edm.String
facilityID	This is the identifier of the Facility entity.	Edm.String
facilityDescription	The brief description of the facility.	Edm.String
timezoneID	This is the time zone of the entity.	Edm.String
totalCount	This is the total amount of records found for this request	Edm.Int32
sttcCriteria	This is the search criteria for scheduled to teach class.	Namespace1_Alias.sttcCriteria

Segment

Property Name	Description	Property Type
segmentNumber	This is the number of the Segment inside the Scheduled Offering.	Edm.Int64
startDate	The start timestamp for this segment. Returned in Unix Epoch.	Edm.Int64
endDate	The end timestamp for this segment. Returned in Unix Epoch.	Edm.Int64
primaryLocationID	Primary location ID of the scheduled offering.	Edm.String
primaryLocationDescription	Primary location description of the scheduled offering.	Edm.String
primaryInstructorID	Identifier of the Primary Instructor of the scheduled offering.	Edm.String

Property Name	Description	Property Type
primaryInstructorFirstName	First Name of the Primary Instructor of the scheduled offering.	Edm.String
primaryInstructorLastName	Last Name of the Primary Instructor of the scheduled offering.	Edm.String

Complex Types

EnrollmentListing

Property Name	Description	Property Type
enrollSeatID	This is the unique ID of the enrollment seat for the user in the current scheduled offering. The value is a number.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
firstName	The given name of a user.	Edm.String
middleInitial	The middle initial of a user.	Edm.String
lastName	The family name of a user.	Edm.String
enrollSlotID	This is the unique ID of the enrollment slot. A slot is a spot in a training course that a user can enroll into. For example, if a course (a scheduled offering) is limited to ten participants, it has ten slots. Each participant who enrolls is placed into a slot. If nine users enroll into the course, then nine of ten slots are occupied. Slots are important because you can reserve slots for users. You can, for example, say that a course has ten slots and five of them are reserved for users of a particular organization.	Edm.Int64

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
enrollStatID	This is the registration status for this user in this entity.	Edm.String
enrollDate	This is the date of enrollment - the date that the user was added to the entity.	Edm.Int64
comments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
shippingAddress	This is the street address used for shipping.	Edm.String
shippingCity	This is the city used in the shipping address.	Edm.String
shippingState	This is the state or province used in the shipping address.	Edm.String
shippingPostal	This is the postal code used in the shipping address.	Edm.String
shippingCountry	This is the country used in the shipping address.	Edm.String
shippingPhoneNo	This is the phone number that can contact someone at the shipping address for information about the shipment.	Edm.String
shippingFaxNo	This is the fax number where you can send documents at the shipping address. For example, a place to fax shipping labels.	Edm.String

Property Name	Description	Property Type
shippingEmailAddress	This is the email address that can contact someone at the shipping address for information about the shipment.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
addUser	The user who added the entity.	Edm.String
cancelDate	If the user cancels, this is the date of the cancellation.	Edm.Int64
orderItemID	The order ID associated with the learning item.	Edm.Int64
paymentOrderTicketNo	If this order is paid with a ticket, this is the number of the ticket.	Edm.String
ticketSequence		Edm.Int64
origin		Edm.String
withdrawPending	If the user is cancelling and that withdraw is pending, this is true.	Edm.Boolean
criteria	This is the search criteria for enrollments.	Namespace1_Alias.criteria
totalCount		Edm.Int64

criteria

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
skiptoken		Edm.String

SegmentAttendances

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
segmentID	This is the unique ID of a segment. A segment is one part of a course (a learning item or scheduled offering). For example, if a course meets over two days, each day can be a segment. This allows you to track attendance on a more granular level: you can see who attended (in this example) the first day and who attended the second day. You can also assign instructors per segment. It could be that one instructor teaches the first day and a different instructor teaches the second day.	Edm.Int64

Property Name	Description	Property Type
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
errorMessage	This includes any error messages.	Edm.String
EnrollmentStatus		
Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
newEnrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
registrationChangeTime	This is the time that a registration change occurred for purposes of auditing the change.	Edm.Int64

Property Name	Description	Property Type
timezone	This is the time zone for registration-ChangeTime. It is the time zone that the change is recorded in.	Edm.String
errorMessage	This contains any error messages.	Edm.String
cancellationReasonID	Cancellation reason ID while changing the user enrollment status to cancelled state. This is mandatory when Cancellation Reason setting is enabled for the Scheduled Offering.	Edm.String

Enrollments

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String

Property Name	Description	Property Type
enrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
notifyUser	If the value of this is true, and if the user has an email address on file, the user receives a notification of the enrollment.	Edm.Boolean
notifyInstructor	If the value of this is true, and if the instructor has an email address on file, the instructor receives a notification of the enrollment.	Edm.Boolean
notifySupervisor	If the value of this is true, and if the learning supervisor has an email address on file, the learning supervisor receives a notification of the enrollment.	Edm.Boolean
notifyContacts	If the value of this is true, and if the offering has a list of contact email addresses on file, the contacts receive a notification of the enrollment.	Edm.Boolean
comments	These are comments about the enrollment.	Edm.String
errorMessage	This contains error messages about the enrollment.	Edm.String
warningMessage	This contains warning messages about the enrollment.	Edm.String
warningOverride	If the value of this is true, then you can override warning messages.	Edm.Boolean

UserScheduleBlock

Property Name	Description	Property Type
userId	This is the user to whom the schedule block should be applied. This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String

Property Name	Description	Property Type
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
scheduleBlockId	The unique ID of the schedule block.	Edm.String
leaveStartDate	If the schedule block applies to a leave request, this is the start date of the leave.	Edm.Int64
leaveEndDate	If the schedule block applies to a leave request, this is the end date of the leave.	Edm.Int64
externalCode		Edm.String
iseRuleId		Edm.String
domain	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator. Defaults to PUBLIC.	Edm.String
active	If the value is true then the user is active. If the value is false, then the user is inactive. Defaults to true.	Edm.Boolean
errorMessage	This contains any error messages.	Edm.String
Messages		
Property Name	Description	Property Type
type		Edm.String
text		Edm.String

RefundPolicies

Property Name	Description	Property Type
chargeAmount	Refund charge amount	Edm.Double
chargePercentage		Edm.Int32
chargeCurrencyCode		Edm.String
scheduleID		Edm.Int64
sequenceID		Edm.Int32
messages		Collection(Namespace1_Alias.Messages)

EnrollmentCancellations

Property Name	Description	Property Type
cancelled		Edm.Boolean
chargeAmount	Enrollment cancellation charge amount	Edm.Double
chargePercentage		Edm.Int32
chargeCurrencyCode		Edm.String
scheduleID		Edm.Int64
sequenceID		Edm.Int32
messages		Collection(Namespace1_Alias.Messages)

instructors

Property Name	Description	Property Type
instructorID	This is the unique ID of an instructor in the Learning Mangement System. If the instructor is also a user (this is often the case when instructors are employees at the company), then keep in mind that this is their INSTRUCTOR ID as opposed to their LEARNER ID.	Edm.String
lastName	This is the family name of the instructor.	Edm.String
firstName	This is the given name of the instructor.	Edm.String
middleInitial	This is a middle initial of the instructor.	Edm.String

Property Name	Description	Property Type
<code>primary</code>	If the value of this is true, then this is the primary instructor. If false, then the instructor is secondary. Primary instructors are usually the ones responsible for organizing the training, posting learning results, and hosting Virtual Learning Sessions (VLS). You can also require that primary instructors are qualified to instruct the learning item. Secondary instructors support the primary instructors.	<code>Edm.Boolean</code>

`sttcCriteria`

criteria	This is the search critiera for enrollments.	Namespace1_Alias.criteria
totalCount		Edm.Int64

EnrollmentListing

Property Name	Description	Property Type
enrollmentListing		Collection(Namespace1_Alias.EnrollmentListing)
criteria	This is the search critiera for enrollments.	Namespace1_Alias.criteria

ScheduledOffering

Property Name	Description	Property Type
scheduleID		Edm.Int64
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String
typeComponent	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String

Property Name	Description	Property Type
activityOrComponentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
maximumEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
minimumEnrollment	This is the minimum amount of users who must enroll into the course for the course to take place.	Edm.Int64
contact	This is the person or group who can be contacted about this entity. For example, someone to call about details for a scheduled offering.	Edm.String
emailAddress	This is the email address of a person or group (distribution list) who can be contacted about this entity. For example, a distribution list of people who know about a scheduled offering.	Edm.String
phoneNo	This is the telephone number for a person or group (answering service) who can be contacted about this entity. For example, the phone number of a department that can answer questions about a scheduled offering.	Edm.String
faxNo	This is the fax number for a person or group who can be contacted about this entity. For example, your company might set up a fax number if you need to fax release forms to a department.	Edm.String
enrollmentCutoffDate	The date after which users are no longer allowed to enroll into the entity. Cut off dates give instructors time to look at a class roster and decide how to structure the course for that roster and give administrators some time to set things up before the course starts.	Edm.Int64

Property Name	Description	Property Type
<code>selfEnrollment</code>	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	<code>Edm.Boolean</code>
<code>scheduleDesc</code>	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	<code>Edm.String</code>
<code>comments</code>	This are the comments provided by the user in the comments field for each section.	<code>Edm.String</code>
<code>lastUpdateUser</code>	This is the user who most recently updated the entity.	<code>Edm.String</code>
<code>lastUpdateTimestamp</code>	This is the last time that the entity was updated. Returned in Unix Epoch.	<code>Edm.Int64</code>
<code>notActive</code>	If the value is false then the user is active. If the value is true, then the user is inactive.	<code>Edm.Boolean</code>
<code>scheduleEnrollStatus</code>	This is a description of the number of seats available, the seats filled, and the number of waitlisted users.	<code>Edm.String</code>
<code>enrollmentComments</code>	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	<code>Edm.String</code>
<code>revisionNo</code>	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	<code>Edm.String</code>
<code>enrollmentSeatID</code>	If this user is already enrolled in this scheduled offering, this value is the unique ID of the seat that the user occupies. If this user is not enrolled in this scheduled offering, then this value is null.	<code>Edm.Int64</code>

Property Name	Description	Property Type
studentEnrollmentStatusType LabelID	This is the registration status for this entity, with the key you need to translate it to this user's language.	Edm.String
studentEnrollmentStatusType	This is the registration type that has been assigned to the user.	Edm.String
studentEnrollmentStatus	This is the registration status for this user in this entity.	Edm.String
timeZoneID	This is the time zone of the entity.	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the scheduled offering time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
titleLabelKey	This is the ID that the LMS uses to look up the title of the entity and return a value that is translated to this users' language/locale.	Edm.String
timeZoneLabelValue	This is the time zone of the entity, in a human readable format.	Edm.String
enrolledCount	This is the number of users who are currently enrolled.	Edm.Int64
availableSeatCount	This is the number of available seats left in the scheduled offering (the number of users who can still enroll in the scheduled offering).	Edm.Int64

Property Name	Description	Property Type
<code>instructors</code>	This is an instructor. Instructors are tracked as resources in the Learning Management System (LMS) so that they can be matched to courses during a scheduling process. They can also be useful to advertise courses: courses with well known instructors tend to see greater enrollment.	<code>Collection(Namespace1_Alias.instructors)</code>

<code>criteria</code>		<code>Namespace1_Alias.criteria</code>
-----------------------	--	--

SegmentAttendance

Property Name	Description	Property Type
<code>segmentAttendances</code>	This is a record of a user attending a segment of a course.	<code>Collection(Namespace1_Alias.SegmentAttendances)</code>

EnrollmentStatus

Property Name	Description	Property Type
<code>primaryKey</code>	This is a primary key for the wrapper. It must be included even though, as a collection, there is no primary key. Pass any value. It will be ignored. Convention, however, is to pass an empty primary key.	<code>Edm.String</code>

Property Name	Description	Property Type
enrollmentStatus	This is a full description of the enrollment status of a user in a course, including the user with the enrollment status. Registration status describes a user's state in the registration process. Each state has a type: Pending (User is awaiting approval to enroll), Waitlisted (The course is full and the user will be added if a space becomes available), Enrolled (User has a spot in the course), and Cancelled (User was enrolled but has withdrawn from the course). Each status is tied to a type. If companies use the default statuses, then they have a one-to-one match to the registration status and registration type (If the status is Pending, the type is Pending... if the status is Waitlisted, the type is Waitlisted, and so on). During implementation, we strongly recommend that companies use these four default registration statuses, to simplify their implementation. However, if they create new statuses based on a customization, those new statuses must be related to an existing type. For example, if they create a registration status called Priority Waitlist, that status must be tied to the Waitlist registration type. It must be tied to the Waitlist registration type so that the LMS knows what to do with users in this status. In this example, the LMS knows that users in Priority Waitlist should be on the waitlist for the course. The customization can do something special with users who are in Priority Waitlist and not standard Waitlist.	Collection(Namespace1_Alias.EnrollmentStatus)

Enrollment

Property Name	Description	Property Type
enrollments	An enrollment is a user in the LMS who has an enrollment status for a scheduled offering.	Collection(Namespace1_Alias.Enrollments)

UserScheduleBlock

Property Name	Description	Property Type
primaryKey	This is a primary key for the wrapper. It is required. Pass any value. It will be ignored. Convention is to pass an empty primary key.	Edm.String
userScheduleBlock	A schedule block is a way to PREVENT scheduling for a resource. For example, if an instructor is on leave, you can add a schedule block for the time that he or she is on leave. That schedule block prevents the instructor from being scheduled into courses during the time of the block.	Collection(Namespace1_Alias .UserScheduleBlock)

RefundPolicies

Property Name	Description	Property Type
privateKey		Edm.String
studentID		Edm.String
personGUID		Edm.String
refundPolicies	A refund policy defines what users can expect if they ask for a refund. For example, if they withdraw from a course within 24 hours of the start, how much refund can they expect?	Collection(Namespace1_Alias .RefundPolicies)
messages		Collection(Namespace1_Alias .Messages)

EnrollmentCancellations

Property Name	Description	Property Type
studentID		Edm.String
personGUID		Edm.String
enrollmentCancellations		Collection(Namespace1_Alias .EnrollmentCancellations)
messages		Collection(Namespace1_Alias .Messages)

AvailableSeats

Property Name	Description	Property Type
scheduleID		Edm.Int64

Property Name	Description	Property Type
typeComponent	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
activityOrComponentID	This is the unique ID of a learning item.	Edm.String
maximumEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
minimumEnrollment	This is the minimum amount of users who must enroll into the course for the course to take place.	Edm.Int64
notActive	If the value is false then the user is active. If the value is true, then the user is inactive.	Edm.Boolean
enrollmentCutoffDate	The date after which users are no longer allowed to enroll into the entity. Cut off dates give instructors time to look at a class roster and decide how to structure the course for that roster and give administrators some time to set things up before the course starts.	Edm.Int64
selfEnrollment	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
scheduleDesc	This is a description of the scheduled offering.	Edm.String
comments	This is a comment about the entity.	Edm.String

Property Name	Description	Property Type
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
timeZoneID	This is the time zone of the lastUpdateTimestamp	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the scheduled offering time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
availableSeatCount	This is the number of available seats left in the scheduled offering (the number of users who can still enroll in the scheduled offering).	Edm.Int64
cancelled	If this value is true, then this is cancelled.	Edm.Boolean
cancelledDate	If this is cancelled, the date that it is cancelled.	Edm.Int64
closedDate	If this is closed, then this is the date that it closed.	Edm.Int64
closed	If this value is true, this is closed. A closed seat is not available.	Edm.Boolean
messages		Collection(Namespace1_Alias.Messages)

ScheduledToTeachClass

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
description	This is the description of the Scheduled Offering entity.	Edm.String
facilityID	This is the identifier of the Facility entity.	Edm.String
facilityDescription	The brief description of the facility.	Edm.String
timezoneID	This is the time zone of the entity.	Edm.String
totalCount	This is the total amount of records found for this request	Edm.Int32
sttcCriteria	This is the search criteria for scheduled to teach class.	Namespace1_Alias.sttcCriteria

Segment

Property Name	Description	Property Type
segmentNumber	This is the number of the Segment inside the Scheduled Offering.	Edm.Int64
startDate	The start timestamp for this segment. Returned in Unix Epoch.	Edm.Int64
endDate	The end timestamp for this segment. Returned in Unix Epoch.	Edm.Int64
primaryLocationID	Primary location ID of the scheduled offering.	Edm.String
primaryLocationDescription	Primary location description of the scheduled offering.	Edm.String
primaryInstructorID	Identifier of the Primary Instructor of the scheduled offering.	Edm.String

Property Name	Description	Property Type
primaryInstructorFirstName	First Name of the Primary Instructor of the scheduled offering.	Edm.String
primaryInstructorLastName	Last Name of the Primary Instructor of the scheduled offering.	Edm.String

Complex Types

EnrollmentListing

Property Name	Description	Property Type
enrollSeatID	This is the unique ID of the enrollment seat for the user in the current scheduled offering. The value is a number.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
firstName	The given name of a user.	Edm.String
middleInitial	The middle initial of a user.	Edm.String
lastName	The family name of a user.	Edm.String
enrollSlotID	This is the unique ID of the enrollment slot. A slot is a spot in a training course that a user can enroll into. For example, if a course (a scheduled offering) is limited to ten participants, it has ten slots. Each participant who enrolls is placed into a slot. If nine users enroll into the course, then nine of ten slots are occupied. Slots are important because you can reserve slots for users. You can, for example, say that a course has ten slots and five of them are reserved for users of a particular organization.	Edm.Int64

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
enrollStatID	This is the registration status for this user in this entity.	Edm.String
enrollDate	This is the date of enrollment - the date that the user was added to the entity.	Edm.Int64
comments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
shippingAddress	This is the street address used for shipping.	Edm.String
shippingCity	This is the city used in the shipping address.	Edm.String
shippingState	This is the state or province used in the shipping address.	Edm.String
shippingPostal	This is the postal code used in the shipping address.	Edm.String
shippingCountry	This is the country used in the shipping address.	Edm.String
shippingPhoneNo	This is the phone number that can contact someone at the shipping address for information about the shipment.	Edm.String
shippingFaxNo	This is the fax number where you can send documents at the shipping address. For example, a place to fax shipping labels.	Edm.String

Property Name	Description	Property Type
shippingEmailAddress	This is the email address that can contact someone at the shipping address for information about the shipment.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
addUser	The user who added the entity.	Edm.String
cancelDate	If the user cancels, this is the date of the cancellation.	Edm.Int64
orderItemID	The order ID associated with the learning item.	Edm.Int64
paymentOrderTicketNo	If this order is paid with a ticket, this is the number of the ticket.	Edm.String
ticketSequence		Edm.Int64
origin		Edm.String
withdrawPending	If the user is cancelling and that withdraw is pending, this is true.	Edm.Boolean
criteria	This is the search criteria for enrollments.	Namespace1_Alias.criteria
totalCount		Edm.Int64

criteria

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
skiptoken		Edm.String

criteria

Property Name	Description	Property Type
scheduleID		Edm.Int64

SegmentAttendances

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String

Property Name	Description	Property Type
segmentID	This is the unique ID of a segment. A segment is one part of a course (a learning item or scheduled offering). For example, if a course meets over two days, each day can be a segment. This allows you to track attendance on a more granular level: you can see who attended (in this example) the first day and who attended the second day. You can also assign instructors per segment. It could be that one instructor teaches the first day and a different instructor teaches the second day.	Edm.Int64
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
errorMessage	This includes any error messages.	Edm.String

EnrollmentStatus

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String

Property Name	Description	Property Type
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
newEnrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
registrationChangeTime	This is the time that a registration change occurred for purposes of auditing the change.	Edm.Int64
timezone	This is the time zone for registration-ChangeTime. It is the time zone that the change is recorded in.	Edm.String
errorMessage	This contains any error messages.	Edm.String
cancellationReasonID	Cancellation reason ID while changing the user enrollment status to cancelled state. This is mandatory when Cancellation Reason setting is enabled for the Scheduled Offering.	Edm.String

Enrollments

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
enrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
notifyUser	If the value of this is true, and if the user has an email address on file, the user receives a notification of the enrollment.	Edm.Boolean
notifyInstructor	If the value of this is true, and if the instructor has an email address on file, the instructor receives a notification of the enrollment.	Edm.Boolean
notifySupervisor	If the value of this is true, and if the learning supervisor has an email address on file, the learning supervisor receives a notification of the enrollment.	Edm.Boolean
notifyContacts	If the value of this is true, and if the offering has a list of contact email addresses on file, the contacts receive a notification of the enrollment.	Edm.Boolean
comments	These are comments about the enrollment.	Edm.String
errorMessage	This contains error messages about the enrollment.	Edm.String

Property Name	Description	Property Type
warningMessage	This contains warning messages about the enrollment.	Edm.String
warningOverride	If the value of this is true, then you can override warning messages.	Edm.Boolean

UserScheduleBlock

Property Name	Description	Property Type
userId	This is the user to whom the schedule block should be applied. This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
scheduleBlockId	The unique ID of the schedule block.	Edm.String
leaveStartDate	If the schedule block applies to a leave request, this is the start date of the leave.	Edm.Int64
leaveEndDate	If the schedule block applies to a leave request, this is the end date of the leave.	Edm.Int64
externalCode		Edm.String
iseRuleId		Edm.String

Property Name	Description	Property Type
domain	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator. Defaults to PUBLIC.	Edm.String

active	If the value is true then the user is active. If the value is false, then the user is inactive. Defaults to true.	Edm.Boolean
--------	---	-------------

errorMessage	This contains any error messages.	Edm.String
--------------	-----------------------------------	------------

Messages

instructors

Property Name	Description	Property Type
instructorID	This is the unique ID of an instructor in the Learning Management System. If the instructor is also a user (this is often the case when instructors are employees at the company), then keep in mind that this is their INSTRUCTOR ID as opposed to their LEARNER ID.	Edm.String
lastName	This is the family name of the instructor.	Edm.String
firstName	This is the given name of the instructor.	Edm.String
middleInitial	This is a middle initial of the instructor.	Edm.String
primary	If the value of this is true, then this is the primary instructor. If false, then the instructor is secondary. Primary instructors are usually the ones responsible for organizing the training, posting learning results, and hosting Virtual Learning Sessions (VLS). You can also require that primary instructors are qualified to instruct the learning item. Secondary instructors support the primary instructors.	Edm.Boolean

Entity Types

Program

Property Name	Description	Property Type
programID	This is the unique ID of a program in SAP SuccessFactors Learning. Learning programs are bundles of learning events like formal learning items, links to videos, and documents. For example, you can create a program called Employee Onboarding. The program could bundle some required learning items that all employees must complete, a link to a welcome video, a link to onboarding forms, and so on. You can then assign the program (the bundle) to employees.	Edm.String
programType	Learning program types describe how the user goes about completing a program. SCHEDULE_BASED - A scheduled program has fixed start and end dates. Scheduled programs require that if instructor-led or blended activities are selected, you must add Scheduled Offerings to the program. DURATION_BASED - A duration-based program has a fixed time limit. The start/end dates and times are determined by when the program is assigned to the user. OPEN_ENDED - An open-ended program is self-paced with no time limitations.	Edm.String
programTitle	This is the title of a program. Titles help users understand why they are assigned or why they might assign themselves a program.	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.	Edm.String

Property Name	Description	Property Type
active	If the value is true then the user is active. If the value is false, then the user is inactive.	Edm.Boolean
assignmentTypeID	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	Edm.String
duration	When you create a program that has a duration, this is the length of the program. For example, you can create a six week program. It applies only when the program is of type DURATION_BASED.	Edm.String
description	This is a description of the program. Descriptions help users understand why they are assigned or why they might assign themselves a program.	Edm.String
startDate	This is the start date of the program. It applies only when the program type is SCHEDULE_BASED. It is a fixed date assigned by the program's creator.	Edm.Int64
endDate	This is the end date of the program. It applies only when the program type is SCHEDULE_BASED. It is a fixed date assigned by the program's creator.	Edm.Int64
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64

Student

Property Name	Description	Property Type
scriteria		Namespace1_Alias.scriteria
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String

Property Name	Description	Property Type
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
empStatID	You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended).	Edm.String
empTypID	Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time").	Edm.String
regularTempID	Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers.	Edm.String

Property Name	Description	Property Type
fulltime	Is the user a full time employee?	Edm.String
jobLocID	The unique ID of the user's physical location.	Edm.String
jobPosID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name.	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.	Edm.String
orgID	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.	Edm.String
compID	This is the company ID of the entity.	Edm.String
lastName	The family name of a user.	Edm.String
firstName	The given name of a user., null (can't find the key in the label properties. Original key is First_Name, the passed in locale is null)	Edm.String
middleName	The middle initial of a user.	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
addr	The street address of a user.	Edm.String
city	The city of the user.	Edm.String

Property Name	Description	Property Type
state	The state or province of the user.	Edm.String
postal	The postal code of the user.	Edm.String
cntry	The country code of the user. Country codes are defined in the system.	Edm.String
superField	The user ID of the user's supervisor.	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date.	Edm.Int64
termDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date.	Edm.Int64
emailAddr	The user's email address.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
selfReg	Is the user self registered? Value can be Y for self registered or N for not self registered.	Edm.String
locked	Is the user locked out of the system?	Edm.String
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports.	Edm.String
roleID	This is the security role ID of the user.	Edm.String
profileStatus	The status column from pa_stud_tp table, indicating if the student is an active employee. EXPIRED	Edm.String
accountID	The financial account ID.	Edm.String
posNumID	The position number ID.	Edm.String

Property Name	Description	Property Type
<code>nativeDeeplinkUser</code>	If set to N then the user receives deep links that work in an integrated SuccessFactors HCM Suite environment. If set to Y, then the user receives links that work in a native learning environment (SuccessFactors Learning only).	<code>Edm.String</code>
<code>totalCount</code>		<code>Edm.Int64</code>

Item

Property Name	Description	Property Type
<code>icriteria</code>		<code>Namespace1_Alias.icriteria</code>
<code>itemID</code>	This is the unique ID of a learning item.	<code>Edm.String</code>
<code>itemTypeID</code>	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	<code>Edm.String</code>
<code>revisionDate</code>	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	<code>Edm.Int64</code>
<code>itemTitle</code>	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in <code>TitleLabelKey</code> .	<code>Edm.String</code>

Property Name	Description	Property Type
classificationID	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED.	Edm.String
sourceID	The source is the developer of the learning item or the organization or regulatory body that requires it. You can create or modify source IDs in the administration environment, in References: Learning: Item Sources.	Edm.String
deliveryMethodID	This is the unique ID of a delivery method. A delivery method describes how a learning item will be delivered (for example, a book, PDF file, or online course). You can create or modify method IDs in the administration environment, in References: Learning: Delivery Methods	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator. primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userCourse	This is one learning assignment made to one Learning Management System (LMS) user.	Collection(Namespace1_Alias.UserCourse)

Complex Types

UserCourse

Property Name	Description	Property Type
<code>componentTypeID</code>	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	<code>Edm.String</code>
<code>componentID</code>	This is the unique ID of a learning item.	<code>Edm.String</code>
<code>revisionDate</code>	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	<code>Edm.Int64</code>
<code>studentID</code>	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	<code>Edm.String</code>
<code>personGUID</code>	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	<code>Edm.String</code>
<code>assignmentType</code>	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	<code>Edm.String</code>

Property Name	Description	Property Type
assignmentDate	This is the assignment date of the curriculum.	Edm.Int64
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
errorMessage	This contains error messages.	Edm.String

Action: removeAssignment

This unassigns learning items from users.

For the action `removeAssignment`, `IsBound` is `false`

Return Type: `Collection(Namespace1_Alias.itemAssignment)`

Parameters of `removeAssignment`

Parameter Name	Description	Parameter Type
componentID	This is the unique ID of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
revisionDate	<code>sf.api.learning.members.Revision_Date</code>	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String

9.8.1.13 user/userlearning-service/v1 Metadata

This service interacts with users' learning history: the courses that they have taken and were posted for record-keeping. Each user has a learning history.

Metadata Call

<code>componentID</code>	<p>This is the unique ID of a learning item.,</p> <p>ID</p>	<code>Edm.String</code>
<code>revisionDate</code>	<p>This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.,</p> <p>Revision Date</p>	<code>Edm.Int64</code>
<code>title</code>	<p>This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in <code>TitleLabelKey</code>.,</p> <p>Title</p>	<code>Edm.String</code>
<code>revisionNumber</code>	<p>This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.</p>	<code>Edm.String</code>

Property Name	Description	Property Type
completionStatusID	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	Edm.String
provideCredit	If this value is true, then the course provided credit to the user. Your organization defines what credit means.	Edm.Boolean
studentComponentID	This string is used to identify the content assigned to a user and is used to generate the review content link for the completed learning item in the users' learning history.	Edm.Int64
instructorName	This is the name of the instructor who taught the course.	Edm.String
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete). Grade	Edm.String
totalHours	This is the total hours that a user earns for completing a course. Total Hours	Edm.Double
creditHours	Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard. Credit Hours	Edm.Double

Property Name	Description	Property Type
contactHours	<p>Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Contact Hours</p>	Edm.Double
cpeHours	<p>CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>CPE Hours</p>	Edm.Double
comments	<p>This is comments about the learning event.</p> <p>Comments</p>	Edm.String
esigUsername	<p>This is the e-signature user name entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.</p>	Edm.String
lastUpdateTimestamp	<p>This is the last time that the history record was updated. This is in Unix Epoch time.</p>	Edm.Int64

Property Name	Description	Property Type
esigMeaningCode	This is the e-signature meaning code entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that the user completed. A scheduled offering is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different scheduled offering of the course., Scheduled Offering ID	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.String
reviewContentAllowed	If the value of this is true, then the user can go back and review the content of the course.	Edm.Boolean
rating	This is the users' rating of the course from the course catalog.	Edm.Double
seqNum	This is a unique ID for each student item rating. You cannot use it.	Edm.String
enableRating	If you enable rating for a learning item, then this is true. If it is true, then when user complete the learning item, they can rate it. This rating is the stars rating that appears in the catalog to other users. If you were building a client that allows ratings, you would check this for a true value before allowing a user to rate completed learning items.	Edm.Boolean
formattedRevisionDate	This is the revision date formatted to the current users' preferences. Use it to display the format date.	Edm.String

Property Name	Description	Property Type
completionDate	This is the completion date in Unix Epoch time. A completion date is the date that the user completed the learning item., Completion Date	Edm.Int64
status	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.,For external events, this value is null.	Edm.String
ratingDate	This is the date that the user rated the learning item, in Unix Epoch time. If the user has not yet rated the learning item or if the user is not allowed to rate the learning item (enableRating is false) then this is null.	Edm.Int64
ratingPending	If the value of this is true, then the user has not rated the learning item.	Edm.Boolean
lastCompletionDate	This is the last date that the user completed the learning item. It is stored in the user rating table.	Edm.Int64
certificateLink	This is a link to the certificate of completion report. User can click this link to see their certificate of completion and print it. This user must have permission to print the certificate of completion. Most customers give their users permission to print certificates of completion.	Edm.String
onlineContentLink	This is a link to the online content so that users can review the content if they are allowed to review it.	Edm.String
criteria	A learning history is the list of completed learning by a user.	Namespace1_Alias.criteria
completionStatusDesc	Completion Status	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
completionDateTimeOffset	Completion Date	Edm.DateTimeOffset

Property Name	Description	Property Type
userLearningHistoryContentObjects	This has Content Object Information, Content Object(s)	Collection(Namespace1_Alias.UserLearningHistoryContentObjects)
userCompetencyAssessments	This has Competency Assessment Information, Competency Assessment Data	Collection(Namespace1_Alias.userCompetencyAssessments)
recordID	ID	Edm.String

learninghistory

Complex Types

criteria

Property Name	Description	Property Type
maxNumberToRetrieve	This is the maximum number of records to retrieve in the call.	Edm.Int32

Property Name	Description	Property Type
itemID	This is the unique ID of a learning item. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a scheduled offering. In most cases, a learning item is a course, either online or in a classroom, but you can also use learning items to track books that employees are required to read or Standard Operating Procedures (SOPs) that they are required to sign-off on and understand.	Edm.String
itemType	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
targetUserID	This is the user whose learning history you want to retrieve.	Edm.String
personGUID	null	Edm.String
fromDate	The start date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
toDate	The end date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64

Property Name	Description	Property Type
itemRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

includeDeepLink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean

Property Name	Description	Property Type
userProgram	A program is a set of courses arranged in a syllabus. It can have defined progression, but it is less structured, and therefore easier to configure, than curricula.	Collection(Namespace1_Alias.UserProgram)

Complex Types

UserProgram

Property Name	Description	Property Type
programID	This is the unique ID of a program in SAP SuccessFactors Learning. Learning programs are bundles of learning events like formal learning items, links to videos, and documents. For example, you can create a program called Employee Onboarding. The program could bundle some required learning items that all employees must complete, a link to a welcome video, a link to onboarding forms, and so on. You can then assign the program (the bundle) to employees.	Edm.String
programTypeID	Learning program types describe how the user goes about completing a program. SCHEDULE_BASED - A scheduled program has fixed start and end dates. Scheduled programs require that if instructor-led or blended activities are selected, you must add Scheduled Offerings to the program. DURATION_BASED - A duration-based program has a fixed time limit. The start/end dates and times are determined by when the program is assigned to the user. OPEN_ENDED - An open-ended program is self-paced with no time limitations.	Edm.String

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
assignmentTypeID	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	Edm.String
assignmentDate	This is the assignment date of the curriculum.	Edm.Int64
errorMessage	This contains error messages.	Edm.String

User

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
firstName	The given name of a user., First Name	Edm.String
lastName	The family name of a user., Last Name	Edm.String
middleInitial	The middle initial of a user., MI	Edm.String
gender	This is the gender of the user: M (male) or F (female). The users' gender controls, for example, how the user is addressed in notifications., Gender	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String

Property Name	Description	Property Type
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
employeeStatusID	You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended). Employee Status	Edm.String
employeeTypeID	Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time"). Employee Type	Edm.String
jobLocationID	The unique ID of the user's physical location. Job Location	Edm.String
jobPositionID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name. Job Code	Edm.String
jobTitle	Think of a user's job title as the title on a business card. Regardless of technical name of the job position, users typically know their jobs by more casual or more specific name. Job Title	Edm.String

Property Name	Description	Property Type
domainID	<p>This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.,</p> <p>Domain</p>	Edm.String
organizationID	<p>The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.,</p> <p>Organization</p>	Edm.String
roleID	<p>This is the security role ID of the user.,</p> <p>Role</p>	Edm.String
address	<p>The street address of a user.,</p> <p>Address</p>	Edm.String
city	<p>The city of the user.,</p> <p>City</p>	Edm.String
state	<p>The state or province of the user.,</p> <p>State / Province</p>	Edm.String
postal	<p>The postal code of the user.,</p> <p>Postal Code</p>	Edm.String
country	<p>The country code of the user. Country codes are defined in the system.,</p> <p>Country</p>	Edm.String

Property Name	Description	Property Type
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports., Region	Edm.String
emailAddress	The user's email address., Email Address	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date., Hire Date	Edm.Int64
dobDate	The user's date of birth., Date of Birth	Edm.Int64
terminationDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date., Termination Date	Edm.Int64
supervisorID	The user ID of the user's supervisor., Primary Supervisor	Edm.String
resumeLocation	The URI to the users' resume. This field was used for legacy Plateau Talent, so we recommend that you ignore it., Resume Location	Edm.String
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
accountCode	The user's account code. If you do not use commerce features, you can ignore this parameter. The account code must exist in the system.	Edm.String

Property Name	Description	Property Type
hasAccessToOrgFinancialAccount	If true, then this user has access to use the organization's financial accounts.	Edm.Boolean
timeZone	The user's time zone. Time zone is part of the user's overall locale (currency, time zone, and locale ID). You cannot pass time zone by itself, you must pass it and also pass locale and currency.	Edm.String
locale	The locale ID of the user. Locales are enumerated in References > Geography > Locales. The locale must exist in the system.	Edm.String
altSuperID1	The first alternate supervisor of the user.	Edm.String
altSuperID2	The second alternate supervisor of the user.	Edm.String
altSuperID3	The third alternate supervisor of the user.	Edm.String
shoppingAccountType	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. The shopping account type can be INTERNAL or EXTERNAL.	Edm.String
enableShoppingAccount	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. This is a flag to enable the shopping account. Values can be Y or N. If Y, then the shopping account is enabled for the user.	Edm.String

Property Name	Description	Property Type
positionNumberID	This is the unique ID of the user's job position. Job positions are enumerated in Users > Positions. The position must exist in the system. In most cases, each position is an instance of a job code and each position is occupied by one user. For example, if your company has ten civil engineers and all ten civil engineers share a job code, then you create ten positions, each associated with the one "civil engineer" job code. Positions are critical to workforce planning and succession planning because they describe how many positions exist for a job code and how many are open. Because they are hierarchical, positions show a career path.	Edm.String
includeInGovtReporting	This applies to customers using Training Planner. If you are not using Training Planner, you can ignore it. If set to Y, the user is included in Training Planner reports that must be submitted to government authorities (for example a 2483 report). If set to N, the user is not included in Training Planner reports. If null, the value defaults to N. If this value is N or null, the following fields are automatically nullified. If you pass a value for them, the system ignores it: legalEntityID, employeeClassID, hourlyRate, hourlyRateCurrency.	Edm.String
legalEntityID	This is the legal entity ID used for Training Planner reporting. If provided legal entity ID does not exist the system creates it. Legal entity IDs are enumerated in References > Learning > 2483 Legal Entity., Reporting Legal Entity	Edm.String
employeeClassID	This is the employee class ID used for Training Planner reporting. The employee class ID must exist in the system. Employee class IDs are enumerated in References > Users > 2483 Employee Class., Employee Class	Edm.String

Property Name	Description	Property Type
hourlyRate	The hourly rate of the user for Training Planner reporting., Hourly Rate	Edm.Double
hourlyRateCurrency	The currency for the hourly rate of the user for Training Planner reporting. The currency must exist in the system., Hourly Rate Currency	Edm.String
regularTempID	Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers. The values are enumerated in References > Users > Regular Temp. The value must exist in the system., Regular/Temp	Edm.String
fulltime	If set to Y, then the user is full time. If set to N, then the user is not full time. Defaults to Y., Is Full-Time	Edm.String
nativeDeeplinkUser	null	Edm.String
studentPhones	This is a list of users' phone numbers. For example, this list could contain work, home, and mobile numbers. , Phone Numbers	Collection(Namespace1_Alias.StudentPhones)
customColumn	A custom column is a custom pick list (or a custom enumerated list). It is unique in SAP SuccessFactors to Learning. You cannot use them in other areas of the suite. To understand how they are used, consider a customer that needs to supply safety equipment for training. They might want to know a person's general clothing size, shoe size, and so on. SAP SuccessFactors Learning does not have a placeholder to store such information, so the customer could create a CLOTHING SIZE and SHOE SIZE custom column., Additional User Information	Collection(Namespace1_Alias.CustomColumn)

Property Name	Description	Property Type
assignProfileID	The assignment profile ID of the user., Assignment Profile	Edm.String
currencyID	The unique ID of the user's currency. The currency must exist in the system., Currency	Edm.String
removeAltSuperID1	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID2	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID3	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String

Property Name	Description	Property Type
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite. External ID	Edm.String
gamificationStudentID	The user ID as it applies to the gamification server. Gamification User ID	Edm.String
createReferences	If true, then the API will have the ability to create user records with referenced entities that may not already exist in the LMS.	Edm.Boolean
genderDescription	Gender	Edm.String
hireDateTimeOffset	Hire Date	Edm.DateTimeOffset
terminationDateTimeOffset	Termination Date	Edm.DateTimeOffset
dobDateTimeOffset	Date of Birth	Edm.DateTimeOffset
disabilityClassificationDescription	Disability Classification	Edm.String
adjustedHourlyRate	Adjusted Hourly Rate	Edm.Double
adjustedHourlyRateCurrency	Adjusted Hourly Rate Currency	Edm.String
adjustedHourlyRateDisplay	Adjusted Hourly Rate	Edm.String
hourlyRateDisplay	Hourly Rate	Edm.String
jobPositionDescription	Job Code	Edm.String
jobGradeDescription	Job Grade	Edm.String
jobLocationDescription	Job Location	Edm.String
employmentTypeDescription	Employee Type	Edm.String

Property Name	Description	Property Type
employmentStatusDescription	Employee Status	Edm.String
regularTempDescription	Regular/Temp	Edm.String
fulltimeDescription	Is Full-Time	Edm.String
supervisorName	Supervisor	Edm.String
regionDescription	Region	Edm.String
organizationDescription	Organization	Edm.String
billingName	Billing Name	Edm.String
billingContactName	Billing Contact Name	Edm.String
billingAddress	Billing Address	Edm.String
billingAddress1	Billing Address Line 1	Edm.String
billingCity	Billing City	Edm.String
billingState	Billing State	Edm.String
billingPostal	Billing Postal	Edm.String
billingCountry	Billing Country	Edm.String
billingPhoneNumber	Billing Phone Number	Edm.String
billingFaxNumber	Billing Fax Number	Edm.String
billingEmailAddress	Billing Email Address	Edm.String
shippingName	Shipping Name	Edm.String
shippingContactName	Shipping Contact Name	Edm.String
shippingAddress	Shipping Address	Edm.String
shippingAddress1	Shipping Address Line 1	Edm.String
shippingCity	Shipping City	Edm.String
shippingState	State / Province	Edm.String
shippingPostal	Shipping Postal	Edm.String
shippingCountry	Shipping Country	Edm.String
shippingPhoneNumber	Shipping Phone Number	Edm.String

Property Name	Description	Property Type
shippingFaxNumber	Shipping Fax Number	Edm.String
shippingEmailAddress	Shipping Email Address	Edm.String
reportingLegalEntityDescription	Reporting Legal Entity	Edm.String
employeeClassDescription	Employee Class	Edm.String
userEmployments	This has User Employment Information, Employment Information	Collection(Namespace1_Alias.UserEmployments)
adminInformation	This has Admin Information, Admin Information	Namespace1_Alias.AdminInformation
instructorInformation	This has Instructor Information, Instructor Information	Namespace1_Alias.InstructorInformation
siteID	Site ID	Edm.String
validationWarningMsgs	null (can't find the key in the label properties. Original key is label.validationWarningMsgs, the passed in locale is null)	Collection(Edm.String)
totalCount		Edm.Int64

UserInfo

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userInfo		Collection(Namespace1_Alias.UserInfo)

itemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
personGUID	null	Edm.String
title	null, Title	Edm.String
recordType	null, Record Type	Edm.String
assignmentTypeDesc	Assignment Type	Edm.String
componentTypeDescription	Type	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
recordID	ID	Edm.String

UserCourse

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userCourse	This is one learning assignment made to one Learning Management System (LMS) user.	Collection(Namespace1_Alias.UserCourse)

removeItemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String

learninghistory

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey., Title	Edm.String

Property Name	Description	Property Type
revisionNumber	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
completionStatusID	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	Edm.String
provideCredit	If this value is true, then the course provided credit to the user. Your organization defines what credit means.	Edm.Boolean
studentComponentID	This string is used to identify the content assigned to a user and is used to generate the review content link for the completed learning item in the users' learning history.	Edm.Int64
instructorName	This is the name of the instructor who taught the course.	Edm.String
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete). Grade	Edm.String
totalHours	This is the total hours that a user earns for completing a course. Total Hours	Edm.Double

Property Name	Description	Property Type
creditHours	<p>Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Credit Hours</p>	Edm.Double
contactHours	<p>Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Contact Hours</p>	Edm.Double
cpeHours	<p>CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>CPE Hours</p>	Edm.Double

Property Name	Description	Property Type
comments	This is comments about the learning event., Comments	Edm.String
esigUsername	This is the e-signature user name entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
lastUpdateTimestamp	This is the last time that the history record was updated. This is in Unix Epoch time.	Edm.Int64
esigMeaningCode	This is the e-signature meaning code entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that the user completed. A scheduled offering is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different scheduled offering of the course., Scheduled Offering ID	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.String
reviewContentAllowed	If the value of this is true, then the user can go back and review the content of the course.	Edm.Boolean
rating	This is the users' rating of the course from the course catalog.	Edm.Double

Property Name	Description	Property Type
seqNum	This is a unique ID for each student item rating. You cannot use it.	Edm.String
enableRating	If you enable rating for a learning item, then this is true. If it is true, then when user complete the learning item, they can rate it. This rating is the stars rating that appears in the catalog to other users. If you were building a client that allows ratings, you would check this for a true value before allowing a user to rate completed learning items.	Edm.Boolean
formattedRevisionDate	This is the revision date formatted to the current users' preferences. Use it to display the format date.	Edm.String
completionDate	This is the completion date in Unix Epoch time. A completion date is the date that the user completed the learning item., Completion Date	Edm.Int64
status	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.,For external events, this value is null.	Edm.String
ratingDate	This is the date that the user rated the learning item, in Unix Epoch time. If the user has not yet rated the learning item or if the user is not allowed to rate the learning item (enableRating is false) then this is null.	Edm.Int64
ratingPending	If the value of this is true, then the user has not rated the learning item.	Edm.Boolean
lastCompletionDate	This is the last date that the user completed the learning item. It is stored in the user rating table.	Edm.Int64

Property Name	Description	Property Type
certificateLink	This is a link to the certificate of completion report. User can click this link to see their certificate of completion and print it. This user must have permission to print the certificate of completion. Most customers give their users permission to print certificates of completion.	Edm.String
onlineContentLink	This is a link to the online content so that users can review the content if they are allowed to review it.	Edm.String
criteria	A learning history is the list of completed learning by a user.	Namespace1_Alias.criteria
completionStatusDesc	Completion Status	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
completionDateTimeOffset	Completion Date	Edm.DateTimeOffset
userLearningHistoryContentObjects	This has Content Object Information, Content Object(s)	Collection(Namespace1_Alias.UserLearningHistoryContentObjects)
userCompetencyAssessments	This has Competency Assessment Information, Competency Assessment Data	Collection(Namespace1_Alias.userCompetencyAssessments)
recordID	ID	Edm.String

Complex Types

Messages

Property Name	Description	Property Type
code	Code received from the merge	Edm.String
message	Message of the code received	Edm.String

UserInfo

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personIdExternal	null	Edm.String
personGUID	null	Edm.String
alternateSupervisorIds	An alternate Learning supervisor is someone other than the supervisor who can assign learning or manage learning for the user.	Collection(Edm.String)
errorMessage	This contains any error messages.	Edm.String

StudentPhones

Property Name	Description	Property Type
phoneNumber	A telephone number., Telephone Number	Edm.String
phoneDescription	A description of a phone number., Template Description	Edm.String
phoneDisplay		Edm.String
__hashCodeCalc		Edm.Boolean

CustomColumn

Property Name	Description	Property Type
id	Deprecated -- the field represents an internal value which should not be exposed. Please stop using this field. It will be removed from the public API.	Edm.String
value	The value of the custom column. A custom column is an enumerated list that is custom to this customer.	Edm.String

Property Name	Description	Property Type
columnNumber	Column number of the custom column. A custom column is an enumerated list that is custom to this customer., Column Number	Edm.Int64
columnColumnName	null	Edm.String
customColumnDisplayValue	null, Additional Information	Edm.String
__hashCodeCalc		Edm.Boolean

UserCourse

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String

Property Name	Description	Property Type
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
assignmentType	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	Edm.String
assignmentDate	This is the assignment date of the curriculum.	Edm.Int64
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
errorMessage	This contains error messages.	Edm.String
UserEmployments		
Property Name	Description	Property Type
supervisorName	null, Supervisor	Edm.String
organizationDescription	null, Organization	Edm.String
jobCodeDescription	null, Job Code	Edm.String
jobTitle	null, Job Title	Edm.String
jobLocationDescription	null, Job Location	Edm.String

Property Name	Description	Property Type
regionDescription	null, Region	Edm.String
employmentTypeDescription	null, Employee Type	Edm.String
employmentStatusDescription	null, Employee Status	Edm.String
regularTempDescription	null, Regular/Temp	Edm.String
isFullTime	If set to true, then the user is full time. If set to false, then the user is not full time., Is Full-Time	Edm.Boolean

UserLearningHistoryContentObjects

Property Name	Description	Property Type
name	Name	Edm.String
score	Score	Edm.String

AdminInformation

Property Name	Description	Property Type
name	Name	Edm.String
emailAddress	Email Address	Edm.String
emailReplyAddress	Reply To Address	Edm.String
emailNickname	Email Nick Name	Edm.String

InstructorInformation

Property Name	Description	Property Type
name	Name	Edm.String
emailAddress	Email Address	Edm.String
biography	Biography	Edm.String
organization	Organization	Edm.String

Property Name	Description	Property Type
company	Company	Edm.String
shippingAddress	Shipping Address	Edm.String
shippingCity	Shipping City	Edm.String
shippingPostal	Shipping Postal	Edm.String
shippingState	Shipping State	Edm.String
shippingCountry	Shipping Country	Edm.String
shippingPhoneNumber	Shipping Phone Number	Edm.String
shippingFaxNumber	Shipping Fax Number	Edm.String
shippingEmailAddress	Shipping Email Address	Edm.String
instructorCustomColumns	This has Instructor Custom Column Information, Additional Instructor Information	Collection(Namespace1_Alias.instructorCustomColumns)

criteria

Property Name	Description	Property Type
maxNumberToRetrieve	This is the maximum number of records to retrieve in the call.	Edm.Int32

Property Name	Description	Property Type
itemID	This is the unique ID of a learning item. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a scheduled offering. In most cases, a learning item is a course, either online or in a classroom, but you can also use learning items to track books that employees are required to read or Standard Operating Procedures (SOPs) that they are required to sign-off on and understand.	Edm.String
itemType	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
targetUserID	This is the user whose learning history you want to retrieve.	Edm.String
personGUID	null	Edm.String
fromDate	The start date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
toDate	The end date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64

Property Name	Description	Property Type
itemRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

includeDeepLink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean
-----------------	--	-------------

instructorCustomColumns

Property Name	Description	Property Type

competencyAssessmentDateTimeOffset	Assessment Date	Edm.DateTimeOffset

AlternateSupervisor

Property Name	Description	Property Type
name	Name	Edm.String

Action: mergeUser

⚠ Caution

If you want to merge two users, please use the action import AI_mergeUser

This action import function replaces all the existing roles with the role IDs passed in the second parameter

For the action mergeUser, IsBound is false

Return Type: Namespace1_Alias.MergeUser

Parameters of mergeUser

Parameter Name	Description	Parameter Type
fromUserID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toUserID	This is the User ID that will receive the data from the other User	Edm.String
fromPersonGUID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toPersonGUID	This is the User ID that will receive the data from the other User	Edm.String

9.8.1.16 user/user-service/v1 Metadata

Use the user service v1 (called as user) to get approval information for the user.

Metadata Call

↗ Sample Code

```
GET /learning/odatav4/public/user/user-service/v1/$metadata
```

approve

Property Name	Description	Property Type
tapInstanceID	This is the unique ID of the approval process instance. Importantly, this is not the approval process ID as you would look it up in the administration environment but instead the particular instance of that process.	Edm.Int64
comments	This is a comment about the approval.	Edm.String

deny

Property Name	Description	Property Type
tapInstanceID	This is the unique ID of the approval process instance. Importantly, this is not the approval process ID as you would look it up in the administration environment but instead the particular instance of that process.	Edm.Int64
comments	This is a comment about the denial.	Edm.String

learningapproval

Property Name	Description	Property Type
tap_instance_id	This is the unique ID of the approval process instance. Importantly, this is not the approval process ID as you would look it up in the administration environment but instead the particular instance of that process.	Edm.Int64
front_header	This is a description of the approval process. For example Approval to Withdraw from Training.	Edm.String
itemName	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
userID	This is the unique ID of the user who is on the current step of the approval process.	Edm.String

Property Name	Description	Property Type
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
requestorFullName	This is the full name or the display name (if <i>General Display Name</i> is enabled) of the person who is making the approval request. It is useful for the approver to see who is making the request.	Edm.String
learningApprovalTodoAction	This is an action that an approver can take, like APPROVE or DENY the request.	Collection(Namespace1_Alias.learningApprovalTodoAction)
learningapprovaldetail		
Property Name	Description	Property Type

fromUserID	User to be deactivated in the merge	Edm.String
toPersonGUID	User to receive the Merge	Edm.String
toUserID	User to receive the Merge	Edm.String
mergeSuccess	Boolean that says if the operation returned Success of Failure	Edm.Boolean
attributes	Student Information	Collection(Edm.String)
learnigAssignments	Learning Items that are assigned to the Student	Collection(Edm.String)

Property Name	Description	Property Type
learningHistories	Learning Items that the Student finished	Collection(Edm.String)
competencies	Competencies of the Student	Collection(Edm.String)
assessments	Type of the Competencies Assessed to the Student	Collection(Edm.String)
registration	Enrollment in the Schedule Offering	Collection(Edm.String)
requests	Schedule Offering Requested	Collection(Edm.String)
orders	Purchase Orders of the Student	Collection(Edm.String)
messages		Collection(Namespace1_Alias.Messages)

User

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
firstName	The given name of a user., First Name	Edm.String
lastName	The family name of a user., Last Name	Edm.String
middleInitial	The middle initial of a user., MI	Edm.String
gender	This is the gender of the user: M (male) or F (female). The users' gender controls, for example, how the user is addressed in notifications., Gender	Edm.String

Property Name	Description	Property Type
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
employeeStatusID	You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended). Employee Status	Edm.String
employeeTypeID	Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time"). Employee Type	Edm.String
jobLocationID	The unique ID of the user's physical location. Job Location	Edm.String
jobPositionID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name. Job Code	Edm.String
jobTitle	Think of a user's job title as the title on a business card. Regardless of technical name of the job position, users typically know their jobs by more casual or more specific name. Job Title	Edm.String

Property Name	Description	Property Type
domainID	<p>This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.,</p> <p>Domain</p>	Edm.String
organizationID	<p>The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.,</p> <p>Organization</p>	Edm.String
roleID	<p>This is the security role ID of the user.,</p> <p>Role</p>	Edm.String
address	<p>The street address of a user.,</p> <p>Address</p>	Edm.String
city	<p>The city of the user.,</p> <p>City</p>	Edm.String
state	<p>The state or province of the user.,</p> <p>State / Province</p>	Edm.String
postal	<p>The postal code of the user.,</p> <p>Postal Code</p>	Edm.String
country	<p>The country code of the user. Country codes are defined in the system.,</p> <p>Country</p>	Edm.String

Property Name	Description	Property Type
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports., Region	Edm.String
emailAddress	The user's email address., Email Address	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date., Hire Date	Edm.Int64
dobDate	The user's date of birth., Date of Birth	Edm.Int64
terminationDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date., Termination Date	Edm.Int64
supervisorID	The user ID of the user's supervisor., Primary Supervisor	Edm.String
resumeLocation	The URI to the users' resume. This field was used for legacy Plateau Talent, so we recommend that you ignore it., Resume Location	Edm.String
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
accountCode	The user's account code. If you do not use commerce features, you can ignore this parameter. The account code must exist in the system.	Edm.String

Property Name	Description	Property Type
hasAccessToOrgFinancialAccount	If true, then this user has access to use the organization's financial accounts.	Edm.Boolean
timeZone	The user's time zone. Time zone is part of the user's overall locale (currency, time zone, and locale ID). You cannot pass time zone by itself, you must pass it and also pass locale and currency.	Edm.String
locale	The locale ID of the user. Locales are enumerated in References > Geography > Locales. The locale must exist in the system.	Edm.String
altSuperID1	The first alternate supervisor of the user.	Edm.String
altSuperID2	The second alternate supervisor of the user.	Edm.String
altSuperID3	The third alternate supervisor of the user.	Edm.String
shoppingAccountType	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. The shopping account type can be INTERNAL or EXTERNAL.	Edm.String
enableShoppingAccount	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. This is a flag to enable the shopping account. Values can be Y or N. If Y, then the shopping account is enabled for the user.	Edm.String

Property Name	Description	Property Type
positionNumberID	This is the unique ID of the user's job position. Job positions are enumerated in Users > Positions. The position must exist in the system. In most cases, each position is an instance of a job code and each position is occupied by one user. For example, if your company has ten civil engineers and all ten civil engineers share a job code, then you create ten positions, each associated with the one "civil engineer" job code. Positions are critical to workforce planning and succession planning because they describe how many positions exist for a job code and how many are open. Because they are hierarchical, positions show a career path.	Edm.String
includeInGovtReporting	This applies to customers using Training Planner. If you are not using Training Planner, you can ignore it. If set to Y, the user is included in Training Planner reports that must be submitted to government authorities (for example a 2483 report). If set to N, the user is not included in Training Planner reports. If null, the value defaults to N. If this value is N or null, the following fields are automatically nullified. If you pass a value for them, the system ignores it: legalEntityID, employeeClassID, hourlyRate, hourlyRateCurrency.	Edm.String
legalEntityID	This is the legal entity ID used for Training Planner reporting. If provided legal entity ID does not exist the system creates it. Legal entity IDs are enumerated in References > Learning > 2483 Legal Entity., Reporting Legal Entity	Edm.String
employeeClassID	This is the employee class ID used for Training Planner reporting. The employee class ID must exist in the system. Employee class IDs are enumerated in References > Users > 2483 Employee Class., Employee Class	Edm.String

Property Name	Description	Property Type
hourlyRate	The hourly rate of the user for Training Planner reporting., Hourly Rate	Edm.Double
hourlyRateCurrency	The currency for the hourly rate of the user for Training Planner reporting. The currency must exist in the system., Hourly Rate Currency	Edm.String
regularTempID	Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers. The values are enumerated in References > Users > Regular Temp. The value must exist in the system., Regular/Temp	Edm.String
fulltime	If set to Y, then the user is full time. If set to N, then the user is not full time. Defaults to Y., Is Full-Time	Edm.String
nativeDeeplinkUser	null	Edm.String
studentPhones	This is a list of users' phone numbers. For example, this list could contain work, home, and mobile numbers. , Phone Numbers	Collection(Namespace1_Alias.StudentPhones)
customColumn	A custom column is a custom pick list (or a custom enumerated list). It is unique in SAP SuccessFactors to Learning. You cannot use them in other areas of the suite. To understand how they are used, consider a customer that needs to supply safety equipment for training. They might want to know a person's general clothing size, shoe size, and so on. SAP SuccessFactors Learning does not have a placeholder to store such information, so the customer could create a CLOTHING SIZE and SHOE SIZE custom column., Additional User Information	Collection(Namespace1_Alias.CustomColumn)

Property Name	Description	Property Type
assignProfileID	The assignment profile ID of the user., Assignment Profile	Edm.String
currencyID	The unique ID of the user's currency. The currency must exist in the system., Currency	Edm.String
removeAltSuperID1	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID2	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID3	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String

Property Name	Description	Property Type
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite. External ID	Edm.String
gamificationStudentID	The user ID as it applies to the gamification server. Gamification User ID	Edm.String
createReferences	If true, then the API will have the ability to create user records with referenced entities that may not already exist in the LMS.	Edm.Boolean
genderDescription	Gender	Edm.String
hireDateTimeOffset	Hire Date	Edm.DateTimeOffset
terminationDateTimeOffset	Termination Date	Edm.DateTimeOffset
dobDateTimeOffset	Date of Birth	Edm.DateTimeOffset
disabilityClassificationDescription	Disability Classification	Edm.String
adjustedHourlyRate	Adjusted Hourly Rate	Edm.Double
adjustedHourlyRateCurrency	Adjusted Hourly Rate Currency	Edm.String
adjustedHourlyRateDisplay	Adjusted Hourly Rate	Edm.String
hourlyRateDisplay	Hourly Rate	Edm.String
jobPositionDescription	Job Code	Edm.String
jobGradeDescription	Job Grade	Edm.String
jobLocationDescription	Job Location	Edm.String
employmentTypeDescription	Employee Type	Edm.String

Property Name	Description	Property Type
employmentStatusDescription	Employee Status	Edm.String
regularTempDescription	Regular/Temp	Edm.String
fulltimeDescription	Is Full-Time	Edm.String
supervisorName	Supervisor	Edm.String
regionDescription	Region	Edm.String
organizationDescription	Organization	Edm.String
billingName	Billing Name	Edm.String
billingContactName	Billing Contact Name	Edm.String
billingAddress	Billing Address	Edm.String
billingAddress1	Billing Address Line 1	Edm.String
billingCity	Billing City	Edm.String
billingState	Billing State	Edm.String
billingPostal	Billing Postal	Edm.String
billingCountry	Billing Country	Edm.String
billingPhoneNumber	Billing Phone Number	Edm.String
billingFaxNumber	Billing Fax Number	Edm.String
billingEmailAddress	Billing Email Address	Edm.String
shippingName	Shipping Name	Edm.String
shippingContactName	Shipping Contact Name	Edm.String
shippingAddress	Shipping Address	Edm.String
shippingAddress1	Shipping Address Line 1	Edm.String
shippingCity	Shipping City	Edm.String
shippingState	State / Province	Edm.String
shippingPostal	Shipping Postal	Edm.String
shippingCountry	Shipping Country	Edm.String
shippingPhoneNumber	Shipping Phone Number	Edm.String

Property Name	Description	Property Type
shippingFaxNumber	Shipping Fax Number	Edm.String
shippingEmailAddress	Shipping Email Address	Edm.String
reportingLegalEntityDescription	Reporting Legal Entity	Edm.String
employeeClassDescription	Employee Class	Edm.String
userEmployments	This has User Employment Information, Employment Information	Collection(Namespace1_Alias.UserEmployments)
adminInformation	This has Admin Information, Admin Information	Namespace1_Alias.AdminInformation
instructorInformation	This has Instructor Information, Instructor Information	Namespace1_Alias.InstructorInformation
siteID	Site ID	Edm.String
validationWarningMsgs	null (can't find the key in the label properties. Original key is label.validationWarningMsgs, the passed in locale is null)	Collection(Edm.String)
totalCount		Edm.Int64

UserInfo

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userInfo		Collection(Namespace1_Alias.UserInfo)

itemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
personGUID	null	Edm.String
title	null, Title	Edm.String
recordType	null, Record Type	Edm.String
assignmentTypeDesc	Assignment Type	Edm.String
componentTypeDescription	Type	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
recordID	ID	Edm.String

UserCourse

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userCourse	This is one learning assignment made to one Learning Management System (LMS) user.	Collection(Namespace1_Alias.UserCourse)

removeItemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	null	Edm.String

UserInformation

Property Name	Description	Property Type
userSearchCriteria		Namespace1_Alias.userSearchCriteria
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
isFullTime	If set to true, then the user is full time. If set to false, then the user is not full time., Is Full-Time	Edm.Boolean
alternateSupervisor	This DTO holds Alternate Supervisor Information	Collection(Namespace1_Alias.AlternateSupervisor)
firstName	The given name of a user., First Name	Edm.String
lastName	The family name of a user., Last Name	Edm.String
middleInitial	The middle initial of a user., MI	Edm.String
gender	This is the gender of the user: M (male) or F (female). The users' gender controls, for example, how the user is addressed in notifications., Gender	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String

Property Name	Description	Property Type
employeeStatusID	<p>You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended).,</p> <p>Employee Status</p>	Edm.String
employeeTypeID	<p>Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time").,</p> <p>Employee Type</p>	Edm.String
jobLocationID	<p>The unique ID of the user's physical location.,</p> <p>Job Location</p>	Edm.String
jobPositionID	<p>The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name.,</p> <p>Job Code</p>	Edm.String
jobTitle	<p>Think of a user's job title as the title on a business card. Regardless of technical name of the job position, users typically know their jobs by more casual or more specific name.,</p> <p>Job Title</p>	Edm.String
domainID	<p>This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.,</p> <p>Domain</p>	Edm.String

Property Name	Description	Property Type
organizationID	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space., Organization	Edm.String
roleID	This is the security role ID of the user., Role	Edm.String
address	The street address of a user., Address	Edm.String
city	The city of the user., City	Edm.String
state	The state or province of the user., State / Province	Edm.String
postal	The postal code of the user., Postal Code	Edm.String
country	The country code of the user. Country codes are defined in the system., Country	Edm.String
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports., Region	Edm.String
emailAddress	The user's email address., Email Address	Edm.String

Property Name	Description	Property Type
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date., Hire Date	Edm.Int64
dobDate	The user's date of birth., Date of Birth	Edm.Int64
terminationDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date., Termination Date	Edm.Int64
supervisorID	The user ID of the user's supervisor., Primary Supervisor	Edm.String
resumeLocation	The URI to the users' resume. This field was used for legacy Plateau Talent, so we recommend that you ignore it., Resume Location	Edm.String
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
accountCode	The user's account code. If you do not use commerce features, you can ignore this parameter. The account code must exist in the system.	Edm.String
hasAccessToOrgFinancialAccount	If true, then this user has access to use the organization's financial accounts.	Edm.Boolean
timeZone	The user's time zone. Time zone is part of the user's overall locale (currency, time zone, and locale ID). You cannot pass time zone by itself, you must pass it and also pass locale and currency.	Edm.String
locale	The locale ID of the user. Locales are enumerated in References > Geography > Locales. The locale must exist in the system.	Edm.String

Property Name	Description	Property Type
altSuperID1	The first alternate supervisor of the user.	Edm.String
altSuperID2	The second alternate supervisor of the user.	Edm.String
altSuperID3	The third alternate supervisor of the user.	Edm.String
shoppingAccountType	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. The shopping account type can be INTERNAL or EXTERNAL.	Edm.String
enableShoppingAccount	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. This is a flag to enable the shopping account. Values can be Y or N. If Y, then the shopping account is enabled for the user.	Edm.String
positionNumberID	This is the unique ID of the user's job position. Job positions are enumerated in Users > Positions. The position must exist in the system. In most cases, each position is an instance of a job code and each position is occupied by one user. For example, if your company has ten civil engineers and all ten civil engineers share a job code, then you create ten positions, each associated with the one "civil engineer" job code. Positions are critical to workforce planning and succession planning because they describe how many positions exist for a job code and how many are open. Because they are hierarchical, positions show a career path.	Edm.String

Property Name	Description	Property Type
<code>includeInGovtReporting</code>	This applies to customers using Training Planner. If you are not using Training Planner, you can ignore it. If set to Y, the user is included in Training Planner reports that must be submitted to government authorities (for example a 2483 report). If set to N, the user is not included in Training Planner reports. If null, the value defaults to N. If this value is N or null, the following fields are automatically nullified. If you pass a value for them, the system ignores it: <code>legalEntityID</code> , <code>employeeClassID</code> , <code>hourlyRate</code> , <code>hourlyRateCurrency</code> .	<code>Edm.String</code>
<code>legalEntityID</code>	This is the legal entity ID used for Training Planner reporting. If provided legal entity ID does not exist the system creates it. Legal entity IDs are enumerated in References > Learning > 2483 Legal Entity., Reporting Legal Entity	<code>Edm.String</code>
<code>employeeClassID</code>	This is the employee class ID used for Training Planner reporting. The employee class ID must exist in the system. Employee class IDs are enumerated in References > Users > 2483 Employee Class., Employee Class	<code>Edm.String</code>
<code>hourlyRate</code>	The hourly rate of the user for Training Planner reporting., Hourly Rate	<code>Edm.Double</code>
<code>hourlyRateCurrency</code>	The currency for the hourly rate of the user for Training Planner reporting. The currency must exist in the system., Hourly Rate Currency	<code>Edm.String</code>

Property Name	Description	Property Type
regularTempID	<p>Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers. The values are enumerated in References > Users > Regular Temp. The value must exist in the system.,</p> <p>Regular/Temp</p>	Edm.String
fulltime	<p>If set to Y, then the user is full time. If set to N, then the user is not full time. Defaults to Y.,</p> <p>Is Full-Time</p>	Edm.String
nativeDeeplinkUser	<p>null</p>	Edm.String
studentPhones	<p>This is a list of users' phone numbers. For example, this list could contain work, home, and mobile numbers. ,</p> <p>Phone Numbers</p>	Collection(Namespace1_Alias.StudentPhones)
customColumn	<p>A custom column is a custom pick list (or a custom enumerated list). It is unique in SAP SuccessFactors to Learning. You cannot use them in other areas of the suite. To understand how they are used, consider a customer that needs to supply safety equipment for training. They might want to know a person's general clothing size, shoe size, and so on. SAP SuccessFactors Learning does not have a placeholder to store such information, so the customer could create a CLOTHING SIZE and SHOE SIZE custom column.,</p> <p>Additional User Information</p>	Collection(Namespace1_Alias.CustomColumn)
assignProfileID	<p>The assignment profile ID of the user.,</p> <p>Assignment Profile</p>	Edm.String
currencyID	<p>The unique ID of the user's currency. The currency must exist in the system.,</p> <p>Currency</p>	Edm.String

Property Name	Description	Property Type
removeAltSuperID1	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID2	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID3	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite., External ID	Edm.String
gamificationStudentID	The user ID as it applies to the gamification server., Gamification User ID	Edm.String

Property Name	Description	Property Type
createReferences	If true, then the API will have the ability to create user records with referenced entities that may not already exist in the LMS.	Edm.Boolean
genderDescription	Gender	Edm.String
hireDateTimeOffset	Hire Date	Edm.DateTimeOffset
terminationDateTimeOffset	Termination Date	Edm.DateTimeOffset
dobDateTimeOffset	Date of Birth	Edm.DateTimeOffset

shippingState	State / Province	Edm.String
shippingPostal	Shipping Postal	Edm.String
shippingCountry	Shipping Country	Edm.String
shippingPhoneNumber	Shipping Phone Number	Edm.String
shippingFaxNumber	Shipping Fax Number	Edm.String
shippingEmailAddress	Shipping Email Address	Edm.String
reportingLegalEntityDescription	Reporting Legal Entity	Edm.String
employeeClassDescription	Employee Class	Edm.String
userEmployments	This has User Employment Information, Employment Information	Collection(Namespace1_Alias.UserEmployments)
adminInformation	This has Admin Information, Admin Information	Namespace1_Alias.AdminInformation
instructorInformation	This has Instructor Information, Instructor Information	Namespace1_Alias.InstructorInformation

Property Name	Description	Property Type
siteID	Site ID	Edm.String
validationWarningMsgs	null (can't find the key in the label properties. Original key is label.validationWarningMsgs, the passed in locale is null)	Collection (Edm.String)
totalCount		Edm.Int64

learninghistory

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey., Title	Edm.String

Property Name	Description	Property Type
revisionNumber	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
completionStatusID	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	Edm.String
provideCredit	If this value is true, then the course provided credit to the user. Your organization defines what credit means.	Edm.Boolean
studentComponentID	This string is used to identify the content assigned to a user and is used to generate the review content link for the completed learning item in the users' learning history.	Edm.Int64
instructorName	This is the name of the instructor who taught the course.	Edm.String
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete). Grade	Edm.String
totalHours	This is the total hours that a user earns for completing a course. Total Hours	Edm.Double

Property Name	Description	Property Type
creditHours	<p>Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Credit Hours</p>	Edm.Double
contactHours	<p>Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Contact Hours</p>	Edm.Double
cpeHours	<p>CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>CPE Hours</p>	Edm.Double

Property Name	Description	Property Type
comments	This is comments about the learning event., Comments	Edm.String
esigUsername	This is the e-signature user name entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
lastUpdateTimestamp	This is the last time that the history record was updated. This is in Unix Epoch time.	Edm.Int64
esigMeaningCode	This is the e-signature meaning code entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that the user completed. A scheduled offering is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different scheduled offering of the course., Scheduled Offering ID	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.String
reviewContentAllowed	If the value of this is true, then the user can go back and review the content of the course.	Edm.Boolean
rating	This is the users' rating of the course from the course catalog.	Edm.Double

Property Name	Description	Property Type
seqNum	This is a unique ID for each student item rating. You cannot use it.	Edm.String
enableRating	If you enable rating for a learning item, then this is true. If it is true, then when user complete the learning item, they can rate it. This rating is the stars rating that appears in the catalog to other users. If you were building a client that allows ratings, you would check this for a true value before allowing a user to rate completed learning items.	Edm.Boolean
formattedRevisionDate	This is the revision date formatted to the current users' preferences. Use it to display the format date.	Edm.String
completionDate	This is the completion date in Unix Epoch time. A completion date is the date that the user completed the learning item., Completion Date	Edm.Int64
status	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.,For external events, this value is null.	Edm.String
ratingDate	This is the date that the user rated the learning item, in Unix Epoch time. If the user has not yet rated the learning item or if the user is not allowed to rate the learning item (enableRating is false) then this is null.	Edm.Int64
ratingPending	If the value of this is true, then the user has not rated the learning item.	Edm.Boolean
lastCompletionDate	This is the last date that the user completed the learning item. It is stored in the user rating table.	Edm.Int64

Property Name	Description	Property Type
certificateLink	This is a link to the certificate of completion report. User can click this link to see their certificate of completion and print it. This user must have permission to print the certificate of completion. Most customers give their users permission to print certificates of completion.	Edm.String
onlineContentLink	This is a link to the online content so that users can review the content if they are allowed to review it.	Edm.String
criteria	A learning history is the list of completed learning by a user.	Namespace1_Alias.criteria
completionStatusDesc	Completion Status	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
completionDateTimeOffset	Completion Date	Edm.DateTimeOffset
userLearningHistoryContentObjects	This has Content Object Information, Content Object(s)	Collection(Namespace1_Alias.UserLearningHistoryContentObjects)
userCompetencyAssessments	This has Competency Assessment Information, Competency Assessment Data	Collection(Namespace1_Alias.userCompetencyAssessments)
recordID	ID	Edm.String

Complex Types

Messages

Property Name	Description	Property Type
code	Code received from the merge	Edm.String
message	Message of the code received	Edm.String

UserInfo

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personIdExternal	null	Edm.String
personGUID	null	Edm.String
alternateSupervisorIds	An alternate Learning supervisor is someone other than the supervisor who can assign learning or manage learning for the user.	Collection(Edm.String)
errorMessage	This contains any error messages.	Edm.String

criteria

Property Name	Description	Property Type
maxNumberToRetrieve	This is the maximum number of records to retrieve in the call.	Edm.Int32

Property Name	Description	Property Type
itemID	This is the unique ID of a learning item. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a scheduled offering. In most cases, a learning item is a course, either online or in a classroom, but you can also use learning items to track books that employees are required to read or Standard Operating Procedures (SOPs) that they are required to sign-off on and understand.	Edm.String
itemType	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
targetUserID	This is the user whose learning history you want to retrieve.	Edm.String
personGUID	null	Edm.String
fromDate	The start date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
toDate	The end date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64

Property Name	Description	Property Type
itemRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

includeDeepLink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean
-----------------	--	-------------

Action: mergeUser

⚠ Caution

If you want to merge two users, please use the action import AI_mergeUser

This action import function replaces all the existing roles with the role IDs passed in the second parameter

For the action mergeUser, IsBound is false

Return Type: Namespace1_Alias.MergeUser

Parameters of mergeUser

Parameter Name	Description	Parameter Type
fromUserID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toUserID	This is the User ID that will receive the data from the other User	Edm.String
fromPersonGUID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toPersonGUID	This is the User ID that will receive the data from the other User	Edm.String

Entity Types

CatalogItem

Property Name	Description	Property Type
sku	A Stock Keeping Unit (SKU) is a unique ID of an object in learning, used for commercial tracking, inventory, and account balancing.	Edm.String

Property Name	Description	Property Type
inventoryType	This is a way to categorize your inventory. Each catalog entry has an inventory type, which can be one of the following: COMPONENT, MATERIAL, QUALIFICATION, or PROGRAM. COMPONENT means a Learning Item (a course in your catalog). MATERIAL means A book, video, or other physical object used for learning. QUALIFICATION means a curriculum (a group of courses, most often used by customers who are held to compliance by a regulator). PROGRAM means a Program (Learning programs afford flexibility to organizations that want to design a timeline of learning, or a syllabus of learning).	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
componentID	null	Edm.String
componentTypeDesc	The descriptions of item types can help you determine how the item type assigns credit.	Edm.String
componentClassification	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED.	Edm.String
qualID	The Unique ID of a curriculum in the system.	Edm.String

Property Name	Description	Property Type
price	The price of the entity. For example, the price of a class: how much does it cost a user to enroll into and complete the class?	Edm.Double
isBlendedLearningRegisterRequired	The price of the entity. For example, the price of a class: how much does it cost a user to enroll into and complete the class?	Edm.Boolean
enableOrder	If this value is true, then if the classification ID is BLENDED, then users must enroll for the learning item, even to see the online portions of the course. If it is false, then users can see the online portions without enrolling.	Edm.Boolean
chargebackMethod	The Chargeback method will return one of the following digits: 1, 2, 3, or 4. 1 means No Charge. 2 means Charge Buyer's Authorized Account Code. 3 means Charge Buyer's Specified Account Code. 4 means Distribute Charges to Buyer's Specified Account Code.	Edm.String
scheduleCanOverridePrice	If this value is true, then each instance of a course (class) can override the price that is set in main copy of the course (learning item). If the value is false, then every course created from the main copy (learning item) inherits the price from the main copy.	Edm.Boolean
catalogItemFlagID	Catalog flags help users understand why an item has been featured. Each company has a slightly different understanding of what each flag means, but they generally mean the following. New: The learning item has been added to the catalog recently. Revised: The learning item has been in the catalog, but a new revision of the learning item has been released. Featured: The learning item has been featured for some reason, but it is neither new or revised.	Edm.String

Property Name	Description	Property Type
catalogItemFlagReason	Administrators can type short text to describe why they have flagged an item in the catalog.	Edm.String
componentSource	This is a field on learning items that typically describes the developer of the course. For example, if you use third parties to create course material for you, then the third party that developed THIS learning item can be recorded in source.	Edm.String
title	This is the title of the entity translated to the users' locale.	Edm.String
description	This is the description of the learning item in the language of the current user (the user calling the web service). A description is intended to provide details to users so that they can decide if they are interested in the course. Descriptions can be translated using a key/value pair, where the key uniquely identifies a particular learning item's description and the values are each language's translation of the description. If you need the key that matches this value, look in Description-LabelKey.	Edm.String
titleLabelKey	This is the ID that the LMS uses to look up the title of the entity and return a value that is translated to this users' language/locale.	Edm.String
descriptionLabelKey	Descriptions can be translated using a key/value pair, where the key uniquely identifies a particular learning item's description and the values are each language's translation of the description. The web service returns the value for this user's language (locale) in Description. This is the key that you would use to look up the value that is plain text (stripped of inline HTML elements).	Edm.String

Property Name	Description	Property Type
htmlDescriptionLabelKey	Administrators can add inline HTML tags to descriptions. Descriptions can be translated using a key/value pair, where the key uniquely identifies a particular learning item's description and the values are each language's translation of the description. The web service returns the value for this user's language (locale) in Description. This is the key that you would use to look up the value <emphasis>that includes inline HTML elements.	Edm.String
hasPriceInPreferredCurrency	If the value is true, then learning administrators have defined a price in the current user's preferred currency. If the value is false, then the user's preferred currency does not appear in the list of price currencies for the course or class (learning item or class).	Edm.Boolean
isRatingEnabled	If the value is true, then users can rate the course in the catalog. Peer ratings help users decide which courses benefit them the most. If the value is false, then users cannot rate the course.	Edm.Boolean
averageRating	This is the User Average Rating, if applicable.	Edm.Double
totalRating	This is the User Total Rating, if applicable.	Edm.Double
ratingInMap		Collection(Namespace1_Alias.RatingInMap)
catalogItemStatus	This entity describes the relationship between the current user, the catalog, and the instance of the catalog item (course, book, video, and so on).	Namespace1_Alias.CatalogItemStatus
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64
totalLength		Edm.Double
startDate	This is the start date of a program in catalog. For all other types of entities (item, curricula, and so on) this is null.	Edm.Int64

Property Name	Description	Property Type
endDate	This is the end date of a program in catalog. For all other types of entities (item, curricula, and so on) this is null.	Edm.Int64
duration		Edm.Int64
durationType		Edm.String
learnerActions		Collection(Namespace1_Alias.learnerActions)

Complex Types

criteria

Property Name	Description	Property Type
courseCategory	This is a category set by the administrator. Categories help organize the catalog for your company.	Edm.String

Property Name	Description	Property Type
showBlended	If set to true, the search looks for courses of classification BLENDED. A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users do not enroll into a physical good, but do enroll into a an instructor led course. You cannot change the set of values for classification (they are set by the LMS). It can be one of the following values: BLENDED: Blended items are partly led by an instructor and partly online computer based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: External Courses are courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom based courses, but the classroom can be physical or virtual (a conference call).	Edm.Boolean
showSchedules	If this is set to true, the system returns item records that have schedule offerings and does not return any other records. Also, if you set it to true, the system does NOT return the details of the offering. If this is set to false, the system returns all the records. Default is false.	Edm.Boolean
selectedSubjectAreaID	A subject area is a tag on a course. For example, you can tag courses as SALES or IT. You can then search for all subject areas tagged with the SALES subject ID.	Edm.String
selectedDeliveryMethodIDs	A delivery method is a category of how a company delivers a course. Companies set their own delivery methods.	Collection(Edm.String)

Property Name	Description	Property Type
<code>selectedComponentSourceIDs</code>	A source identifies the developer of a course. Users see the source, so they can decide if they like courses developed by a particular source, they can search for additional courses by that same source.	<code>Collection(Edm.String)</code>
<code>selectedStartDate</code>	The start date of the course. By default, this is null, so the start date is not limited. We recommend you send a start date of today to find courses that the user can enroll into.	<code>Edm.Int64</code>
<code>selectedEndDate</code>	This is the end date of the course.	<code>Edm.Int64</code>
<code>selectedFacilityIDs</code>	A facility is a group of locations where training takes place. For example, a facility can be a building and the locations can be rooms in the building. Searching by facility helps users find training in a place they can easily attend instructor led training.	<code>Collection(Edm.String)</code>
<code>offeringsInMyRegion</code>	If you use regions, users can search for courses in their region. A region is a group of facilities. For example, if your facilities are buildings where training takes place, your regions can be metropolitan areas where you have facilities. For example, New York, Tokyo, Frankfurt, and so on. When users in the New York region search for courses in their region, the system returns courses in facilities that are in the New York region: close to the user who is running the search. By default, the search uses a value of false: the search is NOT limited by region.	<code>Edm.Boolean</code>
<code>selectedRegionID</code>	Users can also search in specific regions outside their own. If a user often travels from New York to Frankfurt, the user might want to search his or her own region but also in Frankfurt.	<code>Edm.String</code>
<code>searchPhrase</code>	A text phrase that the system matches to courses in the catalog.	<code>Edm.String</code>

Property Name	Description	Property Type
pageSize	The amount of records that the search should return in one page. By default, the value is 500.	Edm.Int64
page	The page that the search should return.	Edm.Int64
sortOption	This is the column that you want to sort your results by. To sort by title, the value is 0 (zero). To sort by price, the value is 1. By default, the sort is by title.	Edm.Int32
locale	This is the locale that you want to search. For example, English finds U.S. English (en-US) and Brazilian Portuguese finds Brazilian Portuguese (pt-BR). To see the full list of locale IDs, go to References > Geography > Locales.	Edm.String
includeLearnerActions	If set to true, the system returns actions available to the learner for each learning item in the results. If set to false, actions will not be included in results. Default is false.	Edm.Boolean

RatingInMap

Property Name	Description	Property Type
key		Edm.String
value		Edm.Double

CatalogItemStatus

Property Name	Description	Property Type
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
hasCurriculaAssigned	Does this learning item have curricula attached to it? In Catalog Item Status, THIS LEARNING ITEM is a unique term. It means the learning item that was returned through a catalog for this user.	Edm.Boolean

Property Name	Description	Property Type
hasOnlinePart	If the learning item is assigned to a user and if it is online (computer based) or blended (some instructor segments and some online segments), then this is true. Otherwise, it is false.	Edm.Boolean
addUser	The user type who added the learning item. A is an administrator and P is a user (for example, a supervisor).	Edm.String
addUsername	The username of the user who added this course to this users's assignments.	Edm.String
isPrerequisitesSatisfied	If the value of this is true, then the user has completed the prerequisites for the learning item. Users must complete the prerequisites for some item to launch the content or enroll in the course.	Edm.Boolean
enrollmentStatusType	This field describes where the user is in the enrollment process. The possible values of this field are: E - User is actively enrolled in the system. This value is returned in some other services as ENROLL. W - User is waitlisted. Users on the waitlist become enrolled when enrolled users withdraw from the course. This value is returned in some other services as WAITLIST. P - User is pending enrollment. Users are most often pending because their enrollment is in the middle of an approval process. This value is returned in some other services as PENDING. C - The user has withdrawn, been withdrawn, or the enrollment has been cancelled for any reason. This value is returned in some other services as CANCELLED.	Edm.String
hasVLSInsession	If the value of this is true, then the course has a Virtual Learning Service (VLS) in session. A VLS session is a virtual meeting with the instructor through a meeting room vendor like WebEx or Adobe Connect.	Edm.Boolean

Property Name	Description	Property Type
hasPertinentScheduleSegmentInSession	If the learning item has a class based on it, then this field tells you if there is a segment in session or not. Returns true if there is a segment in session. Else returns false.	Edm.Boolean
hasPertinentScheduleStarted	The value of this is true if the current time is between the a segment's scheduled start time and end time. Otherwise the value of this is false. This tells you if a part of the course is in session.	Edm.Boolean
pertinentScheduleEnrollmentSeatID	This is the unique ID of the enrollment seat for the user in the current class. The value is a number.	Edm.Int64
onlineStatus	This is the online status for the learning item. It describes whether the online content can be launched by the user and how it can be launched. The values can be a negative number: -1 means available. The content can be launched immediately. -2 means locked out. The content would otherwise be available, but the administrator or the system has locked the user out and the user cannot launch it. -3 means not available. The content is not available. This could be because there is no online content for the course -4 means launch during session. The content can be launched only during the time that is scheduled for the course. -5 means that the prerequisites have no been satisfied. The content is not available because the user has not satisfied a prerequisite. When the user satisfies the prerequisite the content becomes available unless some other reason blocks availability (for example, the content can also be launched during the session only). -6 means in progress. The user has already launched the content and is in the process of completing it.	Edm.Int64

Property Name	Description	Property Type
availableScheduleStatus	This describes the users' status for enrollment into a class (a set class time) for the course. The values can be negative numbers. -10 means that the user can enroll into the class. -11 means that the user can waitlist into the class. A waitlist is a way for users to indicate interest. When a spot opens up in the class, users from the waitlist are first in line to be enrolled. -1 means that there is no available class for this course.	Edm.Int64
studentComponentID	This is a unique ID (a key) that represents the association between a learning item or learning object to student. It is used when a component is assigned to a user. The system generates this unique ID to track the progress of the user in the course.	Edm.Int64
isCheckListEnabled	If the value of this is true, then the course has a task checklist associated with it. A task checklist is an exam that requires an observer to watch the user accomplish a task or set of tasks.	Edm.Boolean
isObserversNominated	If the value of this is true, then the current user can nominate the observers for his or her task checklist.	Edm.Boolean
isChecklistObservationStarted	If the value of this is true, then this user has already started the task checklist.	Edm.Boolean
isUserTheChecklistObservee	If the value of this is true, then the current user is the user being tested by the task checklist.	Edm.Boolean

sortOption	This is the column that you want to sort your results by. To sort by title, the value is 0 (zero). To sort by price, the value is 1. By default, the sort is by title.	Edm.Int32
locale	This is the locale that you want to search. For example, English finds U.S. English (en-US) and Brazilian Portuguese finds Brazilian Portuguese (pt-BR). To see the full list of locale IDs, go to References > Geography > Locales.	Edm.String
includeLearnerActions	If set to true, the system returns actions available to the learner for each learning item in the results. If set to false, actions will not be included in results. Default is false.	Edm.Boolean

RatingInMap

Property Name	Description	Property Type
key		Edm.String
value		Edm.Double

CatalogItemStatus

Property Name	Description	Property Type
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
hasCurriculaAssigned	Does this learning item have curricula attached to it? In Catalog Item Status, THIS LEARNING ITEM is a unique term. It means the learning item that was returned through a catalog for this user.	Edm.Boolean

Property Name	Description	Property Type
hasOnlinePart	If the learning item is assigned to a user and if it is online (computer based) or blended (some instructor segments and some online segments), then this is true. Otherwise, it is false.	Edm.Boolean
addUser	The user type who added the learning item. A is an administrator and P is a user (for example, a supervisor).	Edm.String
addUsername	The username of the user who added this course to this users's assignments.	Edm.String
isPrerequisitesSatisfied	If the value of this is true, then the user has completed the prerequisites for the learning item. Users must complete the prerequisites for some item to launch the content or enroll in the course.	Edm.Boolean
enrollmentStatusType	This field describes where the user is in the enrollment process. The possible values of this field are: E - User is actively enrolled in the system. This value is returned in some other services as ENROLL. W - User is waitlisted. Users on the waitlist become enrolled when enrolled users withdraw from the course. This value is returned in some other services as WAITLIST. P - User is pending enrollment. Users are most often pending because their enrollment is in the middle of an approval process. This value is returned in some other services as PENDING. C - The user has withdrawn, been withdrawn, or the enrollment has been cancelled for any reason. This value is returned in some other services as CANCELLED.	Edm.String
hasVLSInsession	If the value of this is true, then the course has a Virtual Learning Service (VLS) in session. A VLS session is a virtual meeting with the instructor through a meeting room vendor like WebEx or Adobe Connect.	Edm.Boolean

Property Name	Description	Property Type
hasPertinentScheduleSegmentInSession	If the learning item has a class based on it, then this field tells you if there is a segment in session or not. Returns true if there is a segment in session. Else returns false.	Edm.Boolean
hasPertinentScheduleStarted	The value of this is true if the current time is between the a segment's scheduled start time and end time. Otherwise the value of this is false. This tells you if a part of the course is in session.	Edm.Boolean
pertinentScheduleEnrollmentSeatID	This is the unique ID of the enrollment seat for the user in the current class. The value is a number.	Edm.Int64
onlineStatus	This is the online status for the learning item. It describes whether the online content can be launched by the user and how it can be launched. The values can be a negative number: -1 means available. The content can be launched immediately. -2 means locked out. The content would otherwise be available, but the administrator or the system has locked the user out and the user cannot launch it. -3 means not available. The content is not available. This could be because there is no online content for the course -4 means launch during session. The content can be launched only during the time that is scheduled for the course. -5 means that the prerequisites have no been satisfied. The content is not available because the user has not satisfied a prerequisite. When the user satisfies the prerequisite the content becomes available unless some other reason blocks availability (for example, the content can also be launched during the session only). -6 means in progress. The user has already launched the content and is in the process of completing it.	Edm.Int64

Property Name	Description	Property Type
availableScheduleStatus	This describes the users' status for enrollment into a class (a set class time) for the course. The values can be negative numbers. -10 means that the user can enroll into the class. -11 means that the user can waitlist into the class. A waitlist is a way for users to indicate interest. When a spot opens up in the class, users from the waitlist are first in line to be enrolled. -1 means that there is no available class for this course.	Edm.Int64
studentComponentID	This is a unique ID (a key) that represents the association between a learning item or learning object to student. It is used when a component is assigned to a user. The system generates this unique ID to track the progress of the user in the course.	Edm.Int64
isCheckListEnabled	If the value of this is true, then the course has a task checklist associated with it. A task checklist is an exam that requires an observer to watch the user accomplish a task or set of tasks.	Edm.Boolean
isObserversNominated	If the value of this is true, then the current user can nominate the observers for his or her task checklist.	Edm.Boolean
isChecklistObservationStarted	If the value of this is true, then this user has already started the task checklist.	Edm.Boolean
isUserTheChecklistObservee	If the value of this is true, then the current user is the user being tested by the task checklist.	Edm.Boolean

recordLearningEvent

Property Name	Description	Property Type
recordLearningEvents	Various people in your organization post learning events to SAP SuccessFactors Learning: users can post the completion of self-assigned courses, and supervisors and administrators can post the completion of courses for users. Exactly how each user role can post learning events depends on your configuration.	Collection(Namespace1_Alias.recordLearningEvents)

Complex Types

recordLearningEvents

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
completionStatusID	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	Edm.String

Property Name	Description	Property Type
revisionNumber	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
scheduleID	This is the unique ID of the class that the user completed. A class is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different class of the course.	Edm.Int64
errorMessage		Edm.String
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
completionDate	A completion date is the date that the user completed the course. When you return it through a web service, it is in Unix Epoch format.	Edm.Int64
completionTimeZoneID	This is the time zone which will be used for computing the completion time of the learning event in the system.	Edm.String

Property Name	Description	Property Type
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete).	Edm.String
creditHours	Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
cpeHours	CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
contactHours	Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double

Property Name	Description	Property Type
totalHours	This is the total hours that a user earns for completing a course.	Edm.Double
instructorName	This is the name of the instructor who taught the course.	Edm.String
comments	This is comments about the learning event.	Edm.String

User

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
firstName	The given name of a user., First Name	Edm.String
lastName	The family name of a user., Last Name	Edm.String
middleInitial	The middle initial of a user., MI	Edm.String
gender	This is the gender of the user: M (male) or F (female). The users' gender controls, for example, how the user is addressed in notifications., Gender	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String

Property Name	Description	Property Type
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
employeeStatusID	You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended). Employee Status	Edm.String
employeeTypeID	Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time"). Employee Type	Edm.String
jobLocationID	The unique ID of the user's physical location. Job Location	Edm.String
jobPositionID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name. Job Code	Edm.String
jobTitle	Think of a user's job title as the title on a business card. Regardless of technical name of the job position, users typically know their jobs by more casual or more specific name. Job Title	Edm.String

Property Name	Description	Property Type
domainID	<p>This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and permission domain restrictions of the role ID that is associated with the administrator.,</p> <p>Domain</p>	Edm.String
organizationID	<p>The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.,</p> <p>Organization</p>	Edm.String
roleID	<p>This is the security role ID of the user.,</p> <p>Role</p>	Edm.String
address	<p>The street address of a user.,</p> <p>Address</p>	Edm.String
city	<p>The city of the user.,</p> <p>City</p>	Edm.String
state	<p>The state or province of the user.,</p> <p>State / Province</p>	Edm.String
postal	<p>The postal code of the user.,</p> <p>Postal Code</p>	Edm.String
country	<p>The country code of the user. Country codes are defined in the system.,</p> <p>Country</p>	Edm.String

Property Name	Description	Property Type
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports., Region	Edm.String
emailAddress	The user's email address., Email Address	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date., Hire Date	Edm.Int64
dobDate	The user's date of birth., Date of Birth	Edm.Int64
terminationDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date., Termination Date	Edm.Int64
supervisorID	The user ID of the user's supervisor., Primary Supervisor	Edm.String
resumeLocation	The URI to the users' resume. This field was used for legacy Plateau Talent, so we recommend that you ignore it., Resume Location	Edm.String
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
accountCode	The user's account code. If you do not use commerce features, you can ignore this parameter. The account code must exist in the system.	Edm.String

Property Name	Description	Property Type
hasAccessToOrgFinancialAccount	If true, then this user has access to use the organization's financial accounts.	Edm.Boolean
timeZone	The user's time zone. Time zone is part of the user's overall locale (currency, time zone, and locale ID). You cannot pass time zone by itself, you must pass it and also pass locale and currency.	Edm.String
locale	The locale ID of the user. Locales are enumerated in References > Geography > Locales. The locale must exist in the system.	Edm.String
altSuperID1	The first alternate supervisor of the user.	Edm.String
altSuperID2	The second alternate supervisor of the user.	Edm.String
altSuperID3	The third alternate supervisor of the user.	Edm.String
shoppingAccountType	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. The shopping account type can be INTERNAL or EXTERNAL.	Edm.String
enableShoppingAccount	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. This is a flag to enable the shopping account. Values can be Y or N. If Y, then the shopping account is enabled for the user.	Edm.String

Property Name	Description	Property Type
positionNumberID	This is the unique ID of the user's job position. Job positions are enumerated in Users > Positions. The position must exist in the system. In most cases, each position is an instance of a job code and each position is occupied by one user. For example, if your company has ten civil engineers and all ten civil engineers share a job code, then you create ten positions, each associated with the one "civil engineer" job code. Positions are critical to workforce planning and succession planning because they describe how many positions exist for a job code and how many are open. Because they are hierarchical, positions show a career path.	Edm.String
includeInGovtReporting	This applies to customers using Training Planner. If you are not using Training Planner, you can ignore it. If set to Y, the user is included in Training Planner reports that must be submitted to government authorities (for example a 2483 report). If set to N, the user is not included in Training Planner reports. If null, the value defaults to N. If this value is N or null, the following fields are automatically nullified. If you pass a value for them, the system ignores it: legalEntityID, employeeClassID, hourlyRate, hourlyRateCurrency.	Edm.String
legalEntityID	This is the legal entity ID used for Training Planner reporting. If provided legal entity ID does not exist the system creates it. Legal entity IDs are enumerated in References > Learning > 2483 Legal Entity., Reporting Legal Entity	Edm.String
employeeClassID	This is the employee class ID used for Training Planner reporting. The employee class ID must exist in the system. Employee class IDs are enumerated in References > Users > 2483 Employee Class., Employee Class	Edm.String

Property Name	Description	Property Type
hourlyRate	The hourly rate of the user for Training Planner reporting., Hourly Rate	Edm.Double
hourlyRateCurrency	The currency for the hourly rate of the user for Training Planner reporting. The currency must exist in the system., Hourly Rate Currency	Edm.String
regularTempID	Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers. The values are enumerated in References > Users > Regular Temp. The value must exist in the system., Regular/Temp	Edm.String
fulltime	If set to Y, then the user is full time. If set to N, then the user is not full time. Defaults to Y., Is Full-Time	Edm.String
nativeDeeplinkUser	null	Edm.String
studentPhones	This is a list of users' phone numbers. For example, this list could contain work, home, and mobile numbers. , Phone Numbers	Collection(Namespace1_Alias.StudentPhones)
customColumn	A custom column is a custom pick list (or a custom enumerated list). It is unique in SAP SuccessFactors to Learning. You cannot use them in other areas of the suite. To understand how they are used, consider a customer that needs to supply safety equipment for training. They might want to know a person's general clothing size, shoe size, and so on. SAP SuccessFactors Learning does not have a placeholder to store such information, so the customer could create a CLOTHING SIZE and SHOE SIZE custom column., Additional User Information	Collection(Namespace1_Alias.CustomColumn)

Property Name	Description	Property Type
assignProfileID	The assignment profile ID of the user., Assignment Profile	Edm.String
currencyID	The unique ID of the user's currency. The currency must exist in the system., Currency	Edm.String
removeAltSuperID1	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID2	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID3	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String

Property Name	Description	Property Type
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite. External ID	Edm.String
gamificationStudentID	The user ID as it applies to the gamification server. Gamification User ID	Edm.String
createReferences	If true, then the API will have the ability to create user records with referenced entities that may not already exist in the LMS.	Edm.Boolean
genderDescription	Gender	Edm.String
hireDateTimeOffset	Hire Date	Edm.DateTimeOffset
terminationDateTimeOffset	Termination Date	Edm.DateTimeOffset
dobDateTimeOffset	Date of Birth	Edm.DateTimeOffset
disabilityClassificationDescription	Disability Classification	Edm.String
adjustedHourlyRate	Adjusted Hourly Rate	Edm.Double
adjustedHourlyRateCurrency	Adjusted Hourly Rate Currency	Edm.String
adjustedHourlyRateDisplay	Adjusted Hourly Rate	Edm.String
hourlyRateDisplay	Hourly Rate	Edm.String
jobPositionDescription	Job Code	Edm.String
jobGradeDescription	Job Grade	Edm.String
jobLocationDescription	Job Location	Edm.String
employmentTypeDescription	Employee Type	Edm.String

Property Name	Description	Property Type
employmentStatusDescription	Employee Status	Edm.String
regularTempDescription	Regular/Temp	Edm.String
fulltimeDescription	Is Full-Time	Edm.String
supervisorName	Supervisor	Edm.String
regionDescription	Region	Edm.String
organizationDescription	Organization	Edm.String
billingName	Billing Name	Edm.String
billingContactName	Billing Contact Name	Edm.String
billingAddress	Billing Address	Edm.String
billingAddress1	Billing Address Line 1	Edm.String
billingCity	Billing City	Edm.String
billingState	Billing State	Edm.String
billingPostal	Billing Postal	Edm.String
billingCountry	Billing Country	Edm.String
billingPhoneNumber	Billing Phone Number	Edm.String
billingFaxNumber	Billing Fax Number	Edm.String
billingEmailAddress	Billing Email Address	Edm.String
shippingName	Shipping Name	Edm.String
shippingContactName	Shipping Contact Name	Edm.String
shippingAddress	Shipping Address	Edm.String
shippingAddress1	Shipping Address Line 1	Edm.String
shippingCity	Shipping City	Edm.String
shippingState	State / Province	Edm.String
shippingPostal	Shipping Postal	Edm.String
shippingCountry	Shipping Country	Edm.String
shippingPhoneNumber	Shipping Phone Number	Edm.String

Property Name	Description	Property Type
shippingFaxNumber	Shipping Fax Number	Edm.String
shippingEmailAddress	Shipping Email Address	Edm.String
reportingLegalEntityDescription	Reporting Legal Entity	Edm.String
employeeClassDescription	Employee Class	Edm.String
userEmployments	This has User Employment Information, Employment Information	Collection(Namespace1_Alias.UserEmployments)
adminInformation	This has Admin Information, Admin Information	Namespace1_Alias.AdminInformation
instructorInformation	This has Instructor Information, Instructor Information	Namespace1_Alias.InstructorInformation
siteID	Site ID	Edm.String
validationWarningMsgs	null (can't find the key in the label properties. Original key is label.validationWarningMsgs, the passed in locale is null)	Collection(Edm.String)
totalCount		Edm.Int64

UserInfo

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userInfo		Collection(Namespace1_Alias.UserInfo)

itemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
personGUID	null	Edm.String
title	null, Title	Edm.String
recordType	null, Record Type	Edm.String
assignmentTypeDesc	Assignment Type	Edm.String
componentTypeDescription	Type	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
recordID	ID	Edm.String

UserCourse

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userCourse	This is one learning assignment made to one Learning Management System (LMS) user.	Collection(Namespace1_Alias.UserCourse)

removeItemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	null	Edm.String

UserInformation

Property Name	Description	Property Type
userSearchCriteria		Namespace1_Alias.userSearchCriteria
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
isFullTime	If set to true, then the user is full time. If set to false, then the user is not full time., Is Full-Time	Edm.Boolean
alternateSupervisor	This DTO holds Alternate Supervisor Information	Collection(Namespace1_Alias.AlternateSupervisor)
firstName	The given name of a user., First Name	Edm.String
lastName	The family name of a user., Last Name	Edm.String
middleInitial	The middle initial of a user., MI	Edm.String
gender	This is the gender of the user: M (male) or F (female). The users' gender controls, for example, how the user is addressed in notifications., Gender	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String

Property Name	Description	Property Type
employeeStatusID	<p>You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended).,</p> <p>Employee Status</p>	Edm.String
employeeTypeID	<p>Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time").,</p> <p>Employee Type</p>	Edm.String
jobLocationID	<p>The unique ID of the user's physical location.,</p> <p>Job Location</p>	Edm.String
jobPositionID	<p>The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name.,</p> <p>Job Code</p>	Edm.String
jobTitle	<p>Think of a user's job title as the title on a business card. Regardless of technical name of the job position, users typically know their jobs by more casual or more specific name.,</p> <p>Job Title</p>	Edm.String
domainID	<p>This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and permission domain restrictions of the role ID that is associated with the administrator.,</p> <p>Domain</p>	Edm.String

Property Name	Description	Property Type
organizationID	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space., Organization	Edm.String
roleID	This is the security role ID of the user., Role	Edm.String
address	The street address of a user., Address	Edm.String
city	The city of the user., City	Edm.String
state	The state or province of the user., State / Province	Edm.String
postal	The postal code of the user., Postal Code	Edm.String
country	The country code of the user. Country codes are defined in the system., Country	Edm.String
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports., Region	Edm.String
emailAddress	The user's email address., Email Address	Edm.String

Property Name	Description	Property Type
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date., Hire Date	Edm.Int64
dobDate	The user's date of birth., Date of Birth	Edm.Int64
terminationDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date., Termination Date	Edm.Int64
supervisorID	The user ID of the user's supervisor., Primary Supervisor	Edm.String
resumeLocation	The URI to the users' resume. This field was used for legacy Plateau Talent, so we recommend that you ignore it., Resume Location	Edm.String
comments	This are the comments provided by the user in the comments field for each section.	Edm.String
accountCode	The user's account code. If you do not use commerce features, you can ignore this parameter. The account code must exist in the system.	Edm.String
hasAccessToOrgFinancialAccount	If true, then this user has access to use the organization's financial accounts.	Edm.Boolean
timeZone	The user's time zone. Time zone is part of the user's overall locale (currency, time zone, and locale ID). You cannot pass time zone by itself, you must pass it and also pass locale and currency.	Edm.String
locale	The locale ID of the user. Locales are enumerated in References > Geography > Locales. The locale must exist in the system.	Edm.String

Property Name	Description	Property Type
altSuperID1	The first alternate supervisor of the user.	Edm.String
altSuperID2	The second alternate supervisor of the user.	Edm.String
altSuperID3	The third alternate supervisor of the user.	Edm.String
shoppingAccountType	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. The shopping account type can be INTERNAL or EXTERNAL.	Edm.String
enableShoppingAccount	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. This is a flag to enable the shopping account. Values can be Y or N. If Y, then the shopping account is enabled for the user.	Edm.String
positionNumberID	This is the unique ID of the user's job position. Job positions are enumerated in Users > Positions. The position must exist in the system. In most cases, each position is an instance of a job code and each position is occupied by one user. For example, if your company has ten civil engineers and all ten civil engineers share a job code, then you create ten positions, each associated with the one "civil engineer" job code. Positions are critical to workforce planning and succession planning because they describe how many positions exist for a job code and how many are open. Because they are hierarchical, positions show a career path.	Edm.String

Property Name	Description	Property Type
<code>includeInGovtReporting</code>	This applies to customers using Training Planner. If you are not using Training Planner, you can ignore it. If set to Y, the user is included in Training Planner reports that must be submitted to government authorities (for example a 2483 report). If set to N, the user is not included in Training Planner reports. If null, the value defaults to N. If this value is N or null, the following fields are automatically nullified. If you pass a value for them, the system ignores it: <code>legalEntityID</code> , <code>employeeClassID</code> , <code>hourlyRate</code> , <code>hourlyRateCurrency</code> .	<code>Edm.String</code>
<code>legalEntityID</code>	This is the legal entity ID used for Training Planner reporting. If provided legal entity ID does not exist the system creates it. Legal entity IDs are enumerated in References > Learning > 2483 Legal Entity., Reporting Legal Entity	<code>Edm.String</code>
<code>employeeClassID</code>	This is the employee class ID used for Training Planner reporting. The employee class ID must exist in the system. Employee class IDs are enumerated in References > Users > 2483 Employee Class., Employee Class	<code>Edm.String</code>
<code>hourlyRate</code>	The hourly rate of the user for Training Planner reporting., Hourly Rate	<code>Edm.Double</code>
<code>hourlyRateCurrency</code>	The currency for the hourly rate of the user for Training Planner reporting. The currency must exist in the system., Hourly Rate Currency	<code>Edm.String</code>

Property Name	Description	Property Type
regularTempID	<p>Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers. The values are enumerated in References > Users > Regular Temp. The value must exist in the system.,</p> <p>Regular/Temp</p>	Edm.String
fulltime	<p>If set to Y, then the user is full time. If set to N, then the user is not full time. Defaults to Y.,</p> <p>Is Full-Time</p>	Edm.String
nativeDeeplinkUser	<p>null</p>	Edm.String
studentPhones	<p>This is a list of users' phone numbers. For example, this list could contain work, home, and mobile numbers. ,</p> <p>Phone Numbers</p>	Collection(Namespace1_Alias.StudentPhones)

Property Name	Description	Property Type
siteID	Site ID	Edm.String
validationWarningMsgs	null (can't find the key in the label properties. Original key is label.validationWarningMsgs, the passed in locale is null)	Collection (Edm.String)
totalCount		Edm.Int64

learninghistory

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey., Title	Edm.String

Property Name	Description	Property Type
revisionNumber	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
completionStatusID	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	Edm.String
provideCredit	If this value is true, then the course provided credit to the user. Your organization defines what credit means.	Edm.Boolean
studentComponentID	This string is used to identify the content assigned to a user and is used to generate the review content link for the completed learning item in the users' learning history.	Edm.Int64
instructorName	This is the name of the instructor who taught the course.	Edm.String
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete). Grade	Edm.String
totalHours	This is the total hours that a user earns for completing a course. Total Hours	Edm.Double

Property Name	Description	Property Type
creditHours	<p>Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Credit Hours</p>	Edm.Double
contactHours	<p>Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Contact Hours</p>	Edm.Double
cpeHours	<p>CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>CPE Hours</p>	Edm.Double

Property Name	Description	Property Type
comments	This is comments about the learning event., Comments	Edm.String
esigUsername	This is the e-signature user name entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
lastUpdateTimestamp	This is the last time that the history record was updated. This is in Unix Epoch time.	Edm.Int64
esigMeaningCode	This is the e-signature meaning code entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
scheduleID	This is the unique ID of the class that the user completed. A class is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different class of the course., Scheduled Offering ID	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.String
reviewContentAllowed	If the value of this is true, then the user can go back and review the content of the course.	Edm.Boolean
rating	This is the users' rating of the course from the course catalog.	Edm.Double
seqNum	This is a unique ID for each student item rating. You cannot use it.	Edm.String

Property Name	Description	Property Type
<code>enableRating</code>	If you enable rating for a learning item, then this is true. If it is true, then when user complete the learning item, they can rate it. This rating is the stars rating that appears in the catalog to other users. If you were building a client that allows ratings, you would check this for a true value before allowing a user to rate completed learning items.	<code>Edm.Boolean</code>
<code>formattedRevisionDate</code>	This is the revision date formatted to the current users' preferences. Use it to display the format date.	<code>Edm.String</code>
<code>completionDate</code>	This is the completion date in Unix Epoch time. A completion date is the date that the user completed the learning item., Completion Date	<code>Edm.Int64</code>
<code>status</code>	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.,For external events, this value is null.	<code>Edm.String</code>
<code>ratingDate</code>	This is the date that the user rated the learning item, in Unix Epoch time. If the user has not yet rated the learning item or if the user is not allowed to rate the learning item (<code>enableRating</code> is false) then this is null.	<code>Edm.Int64</code>
<code>ratingPending</code>	If the value of this is true, then the user has not rated the learning item.	<code>Edm.Boolean</code>
<code>lastCompletionDate</code>	This is the last date that the user completed the learning item. It is stored in the user rating table.	<code>Edm.Int64</code>
<code>certificateLink</code>	This is a link to the certificate of completion report. User can click this link to see their certificate of completion and print it. This user must have permission to print the certificate of completion. Most customers give their users permission to print certificates of completion.	<code>Edm.String</code>

Property Name	Description	Property Type
onlineContentLink	This is a link to the online content so that users can review the content if they are allowed to review it.	Edm.String
criteria	A learning history is the list of completed learning by a user.	Namespace1_Alias.criteria
completionStatusDesc	Completion Status	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
completionDateTimeOffset	Completion Date	Edm.DateTimeOffset

criteria

Property Name	Description	Property Type
maxNumberToRetrieve	This is the maximum number of records to retrieve in the call.	Edm.Int32
itemID	This is the unique ID of a learning item. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a class. In most cases, a learning item is a course, either online or in a classroom, but you can also use learning items to track books that employees are required to read or Standard Operating Procedures (SOPs) that they are required to sign-off on and understand.	Edm.String
itemType	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
targetUserID	This is the user whose learning history you want to retrieve.	Edm.String
personGUID	null	Edm.String
fromDate	The start date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
toDate	The end date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64

Property Name	Description	Property Type
itemRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

includeDeepLink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean

Action: mergeUser

⚠ Caution

If you want to merge two users, please use the action import AI_mergeUser

This action import function replaces all the existing roles with the role IDs passed in the second parameter

For the action mergeUser, IsBound is false

Return Type: Namespace1_Alias.MergeUser

Parameters of mergeUser

Parameter Name	Description	Parameter Type
fromUserID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toUserID	This is the User ID that will receive the data from the other User	Edm.String
fromPersonGUID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toPersonGUID	This is the User ID that will receive the data from the other User	Edm.String

Entity Types

UserTodoLearningItem

Property Name	Description	Property Type
sku	A Stock Keeping Unit (SKU) is a unique ID of an object in learning, used for commercial tracking, inventory, and account balancing.	Edm.String
cpnt_classification	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED. A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users do not enroll into a physical good, but do enroll into a an instructor led course. You cannot change the set of values for classification (they are set by the LMS). It can be one of the following values: BLENDED: Blended items are partly led by an instructor and partly online computer based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: External Courses are courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom based courses, but the classroom can be physical or virtual (a conference call).	Edm.String
isUserRequestsEnabled	If the value of this is true, then users can request to be enrolled.	Edm.Boolean

Property Name	Description	Property Type
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String

Property Name	Description	Property Type
status	<p>This is a comma separated list of status entries. The following are the positions in the list and what you can expect in those positions.</p> <p>First position: Are the prerequisites satisfied for this learning plan item? The values can be Y or N.</p> <p>Second position: What is the enrollment status of the user for this learning plan item? Possible values are E, W, P, or N. E means that the user is enrolled. W means that the user is waitlisted. The waitlist is a queue of users who are next in line if a user withdraws from a course. P means that the user is pending enrollment. Pending users are most often in the middle of an approval process to enroll. N means that the user is not enrolled.</p> <p>Third position: Is a Virtual Learning Service (VLS) segment in session? The values can be Y or N.</p> <p>Fourth Position: Is there a segment currently happening for this course? The values can be Y or N.</p> <p>Fifth position: The unique ID of the seat that the user is enrolled into. If the user is not currently enrolled into a pertinent class, the value is -1.</p> <p>Sixth position: the online status of the learning item. Possible values are -1, -2, -3, -4, -5, or -6.</p> <p>-1 means that the online sections of the learning item are available to be launched by the user. -2 means that the online sections are available, but the user has been locked out of the online section for some reason and is not allowed to launch it. -3 means that the online sections are not available for some reason. -4 means that the user can launch the online sections, but only during the scheduled time. If the segment is in session, the user can launch it. -5 means that the user cannot launch the online content because there is a prerequisite that the user has not yet completed. The user must complete the prerequisite and then attempt again to launch the content. -6 means that the user has already launched the content</p>	Edm.String

Property Name	Description	Property Type
	<p>and it is in progress. Seventh position: The status of any courses that are scheduled for this learning item (any classes based on the learning item). Possible values are 10, 11, -1 or -3. 10 means that an offering exists and the user can enroll. 11 means that an offering exists, but the user cannot enroll. Instead, the user can waitlist and will be enrolled if an enrolled user withdraws. -1 means that no classes are currently available. -3 means that the user has not met the prerequisites for enrollment so cannot enroll. Eighth position: This is a unique ID (a key) that represents the association between a learning item or learning object to student. It is used when a component is assigned to a user. The system generates this unique ID to track the progress of the user in the course. Returns -1 if no key exists. Ninth position: Has the class for this learning item already started? The values can be Y or N. Tenth position: Does the user need to complete a survey for the learning item? A survey is a set of follow-up questions after the course is completed. The values can be Y or N. Eleventh position: Is task checklist enabled for this course? A task checklist is a standard operating procedure that someone - an observer - validates when watching a student complete a physical task. Students pass the task checklist when the observer sees the student do the tasks properly and in order. The values can be Y or N. Twelfth position: Are task checklist observers nominated for this course? This is a stage in the observation process. The values can be Y or N. Thirteenth position: Are task checklist observees present for this course? The values can be Y or N. Fourteenth position: Can users make a request that this course should be offered? The values can be Y or N. Fifteenth position: Are there any pending class withdraw requests for the course?</p>	

Property Name	Description	Property Type
	When users want to withdraw from the course, they can request that they be removed from the roster. The values can be Y or N.,Sixteenth position: Are there any requests pending for the course by the user? The values can be Y or N.,Seventeenth position: Can user request for task checklist observation for the course? The values can be Y or N.	
userID	The unique ID of this user.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personExternalID	This is a mutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM Suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String

Property Name	Description	Property Type
componentTypeDesc	The descriptions of item types can help you determine how the item type assigns credit.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.Int64
componentLength	The sum of the length of all segments, in hours.	Edm.Double
contactHours	Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6.	Edm.Double
creditHours	Credit hours are the number of hours that a user earns for completing a history record. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class.	Edm.Double
cpeHours	CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification.	Edm.Double

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
assignedDate	This is the assignment date of the curriculum.	Edm.Int64
availableNewRevision	If the value of this is true, then the learning item has a newer revision than the revision assigned to the user.	Edm.Boolean
revisionNumber	null	Edm.String
requiredDate	This is the date that the user is required to complete this entity.	Edm.Int64
daysRemaining	This is the days remaining until the user is required to complete the learning item. If it is a negative number, then it is the days that the user is overdue.	Edm.Int64
addUser	The user type who added the learning item. A is an administrator and P is a user (for example, a supervisor).	Edm.String
addUserName	The username of the user who added this course to this users's assignments.	Edm.String
addUserTypeLabelID	The full name of the user type who added the learning item to the user. For example: Admin and User	Edm.String
orderItemID	The order ID associated with the learning item.	Edm.Int64
usedOrderTicketNumber	Used voucher number	Edm.String
usedOrderTicketSequence	Used voucher sequence	Edm.Int64
onlineLaunched	If the value of this is true, then the user has launched the online content at least once.	Edm.Boolean

Property Name	Description	Property Type
origin	How the learning item came to be on the users' learning plan. For example: Curriculum.	Edm.String
cdpGoalID	The continuous development plan goal ID associated with this learning item.	Edm.String
seqNumber	The sequence number of the learning item.	Edm.Int64
scheduleID	The unique ID of the class.	Edm.Int64
qualificationID	The Unique ID of a curriculum in the system..In the context of this entity, this is the curriculum ID that put the learning item on the users' learning assignments. The learning item is part of the curriculum, the curriculum is assigned, therefore the learning item is assigned.	Edm.String
rootQualificationID	This is the unique ID of the curriculum at the root of the curriculum structure. Curricula can be subcurricula and have parent curricula. This is the ID of the curriculum at the top of the hierarchy..In the context of this entity, this is the root curriculum ID that put the learning item on the users' learning assignments. The learning item is part of a curriculum structure (with this curriculum at its root), the curriculum structure is assigned, therefore the learning item is assigned.	Edm.String
qualTitle	The title of a curriculum in the system..In the context of this entity, this is the title of the curriculum that put the learning item on the users' learning assignments.	Edm.String
isRequired	If the value of this is true, then the learning item is required to be completed by the user.	Edm.Boolean
orderItemStatusTypeID	The unique type ID of the order's status. The order's status defines where it is in the process of being purchased.	Edm.String

Property Name	Description	Property Type
<code>showInCatalog</code>	If the value of this is true, then this appears in the users' learning catalog.	<code>Edm.Boolean</code>
<code>requirementTypeDescription</code>	This is the description of the requirement type. Requirement types define the conditions that users must meet to be considered complete in the requirement (for example, number of hours from a set of learning items).	<code>Edm.String</code>
<code>requirementTypeId</code>	This is the ID of the requirement type. Requirement types define the conditions that users must meet to be considered complete in the requirement (for example, number of hours from a set of learning items).	<code>Edm.String</code>
<code>hasOnlinePart</code>	If this is true, then the entity has some online sections.	<code>Edm.Boolean</code>
<code>itemDetailsDeeplink</code>	If you requested a deep link in your search for learning items, this is populated with the link to the learning item details page. Users click the link to see the details for this learning item. If they are not already authenticated to the system, they must authenticate before they can see the page.	<code>Edm.String</code>
<code>courseDeeplink</code>	If you requested a deep link in your search for learning items, and if this learning item contains online content, then this is populated with the link to the online content. Users click the link to go to the online content for this learning item. If they are not already authenticated to the system, they must authenticate before they can see the page.	<code>Edm.String</code>
<code>criteria</code>	This is the search criteria used to find learning items in users' learning plans.	<code>Namespace1_Alias.criteria</code>
<code>linkedSchedules</code>	This is a list of all the classes for this learning item for which the user is enrolled.	<code>Collection(Edm.Int64)</code>

Property Name	Description	Property Type
programType	This is the program type, which defines how a user progresses through the program. It can be scheduled, duration-based, or open-ended.	Edm.String
programEndDate	If this is program has a defined end date, this is that end date.	Edm.Int64
programStartDate	If this is program has a defined start date, this is that start date.	Edm.Int64
programDuration	If this is program has a duration (a time over which it should be completed) this is that duration.	Edm.Int64
programDurationType	This is the duration type.	Edm.String
programDeeplink	This is a deep link of the program. If users click the link, they first must authenticate to the system and then they can look at the program details.	Edm.String
vlsLink	This is the VLS link that learners can use to join a virtual meeting room (like WebEx, Adobe Connect, or Skype) for training. The link is for registered learners and learning items with a current or future segment that is virtual.	Edm.String
studentSurveyID	This is a unique User Survey ID to uniquely identify the mapping between User and Survey.	Edm.Int64
itemSurveyID	This is a unique Item Survey ID to uniquely identify the mapping between Item and Survey.	Edm.Int64
surveyID	The unique ID of the Survey in the System	Edm.String
surveyLevel	The level of the Survey. The value of 1 indicates Item Evaluation Survey. The value of 3 indicates Follow up Evaluation Survey.	Edm.Int64
surveydesc	This is the Survey Description	Edm.String
surveyStatusID	The Status of the survey assigned to User.	Edm.String

Property Name	Description	Property Type
surveyDeepLink	This is a deep link of the Survey. If users click the link, they first must authenticate to the system and then they can look at the survey details.	Edm.String
learnerActions		Collection(Namespace1_Alias.learnerActions)

LearningItemDetail

Property Name	Description	Property Type
pkID	This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.Int64

Property Name	Description	Property Type
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
description	This is the description of the learning item in the language of the current user (the user calling the web service). A description is intended to provide details to users so that they can decide if they are interested in the course. Descriptions can be translated using a key/value pair, where the key uniquely identifies a particular learning item's description and the values are each language's translation of the description. If you need the key that matches this value, look in Description-LabelKey.	Edm.String
htmlDescription	This is the description of the learning item, in the users' language, with HTML tags to format the description. Customers often use simple inline tags to bold and italicize words (for example).	Edm.String
revisionNo	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
sourceID	The source is the developer of the learning item or the organization or regulatory body that requires it. You can create or modify source IDs in the administration environment, in References: Learning: Item Sources.	Edm.String

Property Name	Description	Property Type
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and permission domain restrictions of the role ID that is associated with the administrator.	Edm.String
deliveryMethodID	This is the unique ID of a delivery method. A delivery method describes how a learning item will be delivered (for example, a book, PDF file, or online course). You can create or modify method IDs in the administration environment, in References: Learning: Delivery Methods	Edm.String
requirementTypeID	This is the unique ID of a requirement type. A requirement type is a way for companies to describe how a user can meet the requirement. For example, a user can finish a set amount of hours from within a pool of learning items.	Edm.String
safetyRelated	If a learning item is safety related (if safetyRelated is true) then the learning item is flagged as safety-related in searches and reports. This information is for administrative purposes. It is not in the end-user interface by default.	Edm.Boolean
approved	If the user is approved to enroll into the learning item, the value is true. If the user is not approved, the value is false.	Edm.Boolean
notActive	If the value is false then the user is active. If the value is true, then the user is inactive.	Edm.Boolean
reviserName	This is the name of the user who revised the learning item.	Edm.String
approvedBy	This is the name of the user who approved the learning item.	Edm.String

Property Name	Description	Property Type
approvalTimestamp	This is the time that the person in charge of the approval granted the approval for the entity.	Edm.Int64
lessonPlanFilename	This is the lesson plan that goes with the learning item. For example, it can be a valid URL to an online lesson plan or a name of a training document. Administrators or trainers can consult the lesson plan to help them prepare for the learning item.	Edm.String
targetAudience	This is a description of the intended target audience that the you can display in the user interface. It helps users understand who the course is planned to address.	Edm.String
contactName	The contact name is someone who can answer questions about the learning item.	Edm.String
contactHours	Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the history record (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double

Property Name	Description	Property Type
creditHours	Credit hours are the number of hours that a user earns for completing a history record. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the history record (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
cpeHours	CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the history record (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
defaultInitialNumber	The initial number is the number of days, weeks, months, quarters, or years that the user has in their initial retraining period for this learning item. Retraining periods apply when the learning item is a member of a curriculum. It is the grace period when users are first assigned a learning item. Although they might be required to retrain on the learning item every year, they might be assigned the curriculum (and learning item) in the last month of the year. The initial period gives them a grace period to complete the first training.	Edm.Int64
defaultInitialPeriodTypeID	This is the unit for the initial period (days, weeks months, quarters, or years).	Edm.String

Property Name	Description	Property Type
defaultInitialBasisTypeID	The basis type can be calendar or event. In a calendar basis type, the user must retrain on a learning item on a time-interval based on the calendar (like every month). In an event, the period is based on an event, like completing the first round of training.	Edm.String
initialPeriodLabelID	The label ID for the initial period, so that you can look up the language.	Edm.String
initialBasisLabelID	The label ID for the initial basis, so that you can look up the exact language.	Edm.String
defaultRetrainingNumber	After the initial period, users must retrain. This is the number of days, weeks, months, quarters, or years that the users have to complete the retraining on the learning item.	Edm.Int64
defaultRetrainingPeriodTypeID	The period that a user must retrain after the initial period. This can be days, weeks, months, quarters, or years.	Edm.String
defaultRetrainingBasisTypeID	The retraining period type can be either calendar or event. If it is calendar, then the user must retrain based on a time-based interval (such as annually, regardless of when the user completed the last training). If it is event, then the user must retrain based on an event (such as a year after completing the training).	Edm.String
retrainingPeriodLabelID	The label ID for the retraining period, so that you can look up the language.	Edm.String
retrainingBasisLabelID	The label ID for the training basis, so that you can look up the language.	Edm.String
comments	Comments from the instructor.	Edm.String
instructorMaterials	This is materials that the instructor should have for the learning item.	Edm.String
studentMaterials	This is materials that the student (learner) should have for the learning item.	Edm.String

Property Name	Description	Property Type
gradingOption	This is the grading option of the learning item. You can see the grading options in the administration environment on the learning item record in the Grading Options view.	Edm.Int64
createTimestamp	The time stamp, in Unix Epoch, that the learning item was created	Edm.Int64
componentGoals	These are the goals that are associated with this learning item.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
totalLength	This is the total length of time that the course takes. Typically, this is used for planning purposes.	Edm.Double
prepLength	This is the total length of time that it takes an instructor to prepare to teach the course. Typically, this is used for planning purposes.	Edm.Double
minEnrollment	This is the minimum amount of users who must enroll into the course for the course to take place.	Edm.Int64
maxEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
enrollmentThresDays	This is the amount of days before the course that the enrollment is closed for the course.	Edm.Int64
autoFillEnrollment	If the value is true, then when a slot opens in the enrollment list, it is filled automatically from the waitlist.	Edm.Boolean
waitlistRemainderSentTimestamp	The time that the remainder of users on the waitlist was sent as a reminder.	Edm.Int64
autoCompetency	If the value is true, then users are automatically evaluated in their competency at when they complete the course.	Edm.Boolean

Property Name	Description	Property Type
classification	<p>This is the unique ID of the classification for a learning item. It can be:</p> <p>It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED. A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users do not enroll into a physical good, but do enroll into an instructor led course. You cannot change the set of values for classification (they are set by the LMS). It can be one of the following values: BLENDED: Blended items are partly led by an instructor and partly online computer based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: External Courses are courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom based courses, but the classroom can be physical or virtual (a conference call).</p>	Edm.String
chargebackMethod	<p>This is unique ID of a chargeback method. Chargeback is a way to reconcile costs between organizations. One organization charges the cost of training back to another organization. This allows companies to balance the cost of training by putting the cost to organizations.</p>	Edm.String
catalogSKU	<p>A Stock Keeping Unit (SKU) is a unique ID of an object in learning, used for commercial tracking, inventory, and account balancing.</p>	Edm.String

Property Name	Description	Property Type
<code>scheduleCanOverridePrice</code>	If this value is true, then each instance of a course (class) can override the price that is set in source copy of the course (learning item). If the value is false, then every course created from the source copy (learning item) inherits the price from the source copy.	Edm.Boolean
<code>productionReady</code>	If this value is true, then the learning item is ready to be assigned to users. If the value is false, then the learning item is under development and not yet ready for users.	Edm.Boolean
<code>studentCanRecordLearningEvents</code>	If the value of this is true, then the user can record history records for this learning item. If the value is false, then only supervisors or administrators can record learning on the learning item. In SuccessFactors Learning, when someone records a history record, they are posting a users' completion or inability to complete a course back to the LMS. For example, you can record the fact that a user attended the course and completed it. Or, you can record the fact that a user did NOT complete the event. Completion is a highly configurable part of the LMS, so your completion statuses (the thing you are posting/recording) will be your own and match your business process.	Edm.Boolean

Property Name	Description	Property Type
supervisorCanRecordLearningEvents	If the value of this is true, then the supervisor can record history records for this learning item. If the value is false, then only administrators can record learning on the learning item. In most cases, when a supervisor cannot record learning, a user cannot record learning either. In SuccessFactors Learning, when someone records a history record, they are posting a users' completion or inability to complete a course back to the LMS. For example, you can record the fact that a user attended the course and completed it. Or, you can record the fact that a user did NOT complete the event. Completion is a highly configurable part of the LMS, so your completion statuses (the thing you are posting/recording) will be your own and match your business process.	Edm.Boolean
approvalRequired	If the value of this is true, then the users require approval to enroll into the course. If the value is false, then approval is not required.	Edm.Boolean
processDefinitionID	This is the unique ID of the approval process definition (as opposed to the ID of the instance of the approval).	Edm.String
processDescription	This is a description of the approval process. For example Approval to Withdraw from Training.	Edm.String
sourceDescription	This is a field on learning items that typically describes the developer of the course. For example, if you use third parties to create course material for you, then the third party that developed THIS learning item can be recorded in source.	Edm.String

Property Name	Description	Property Type
domainDescription	This is the description of the security domain of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and permission domain restrictions of the role ID that is associated with the administrator.	Edm.String
deliveryMethodDescription	This is the description of a delivery method. A delivery method describes how a learning item will be delivered (for example, a book, PDF file, or online course). You can create or modify method IDs in the administration environment, in References: Learning: Delivery Methods	Edm.String
requirementTypeDescription	This is the description of a requirement type. A requirement type is a way for companies to describe how a user can meet the requirement. For example, a user can finish a set amount of hours from within a pool of learning items.	Edm.String
chargeBackMethodLabelID	This is unique ID of a chargeback method LABEL. Because you can offer courses in many languages, you can describe the chargeback in many languages. The system uses this label ID to look up the correct string to describe the chargeback method in the users' language. Chargeback is a way to reconcile costs between organizations. One organization charges the cost of training back to another organization. This allows companies to balance the cost of training by putting the cost to organizations.	Edm.String

Property Name	Description	Property Type
componentClassificationLabelID	This is the unique ID of the label for the classification of this learning item. The LMS uses the label ID to look up the correct translation (string) of the classification for this user's language. For example, TIME-BASED is usually represented to English speakers as Instructor Led. The system uses an label ID to look up the string "Instructor Led.".A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users do not enroll into a physical good, but do enroll into a an instructor led course. You cannot change the set of values for classification (they are set by the LMS). It can be one of the following values: BLENDED: Blended items are partly led by an instructor and partly online computer based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: External Courses are courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom based courses, but the classroom can be physical or virtual (a conference call).	Edm.String
forumID	Forums are deprecated. Instead, use SAP Jam. If your learning item is associated with a deprecated forum, the ID appears here.	Edm.Int64
rating	This is the rating that users have given the learning item.	Edm.Double
enableRating	If the value of this is true, then users can rate the learning item. If it is false, then users cannot rate the learning item.	Edm.Boolean

Property Name	Description	Property Type
includePreviousRevisionRating	If the value of this is true, then the overall rating includes ratings given to previous revisions of the learning item. If it is false, then the ratings are calculated from the current revision only.	Edm.Boolean
shippingRequired	If this value is true, then the learning item has some component that must be shipped. This is often the case if the learning item is a physical good, like a book. If it is false, then there is nothing to ship. For example, if this learning item is an online course, there is nothing to ship.	Edm.Boolean
selfEnrollment	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
isBlendedLearningRegisterRequired	If this value is true, then if the classification ID is BLENDED, then users must enroll for the learning item, even to see the online portions of the course. If it is false, then users can see the online portions without enrolling.	Edm.Boolean
eSigEnabled	If the value is true, then e-signatures are required for actions with this learning item. If false, then e-signatures are not required. E-signatures are a secondary identity verification for things like recording the completion of a learning item. They are typically used by companies that are audited by an oversight organization for learning compliance.	Edm.Boolean

Property Name	Description	Property Type
<code>isUserRequestsEnabled</code>	If the value is true, then users can request a class of a learning item. If false, they cannot request a new offering. Users request classes when the current list of times that the learning item is offered does NOT include a time that they can attend the course. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a class.	Edm.Boolean
<code>userCanWaitlist</code>	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
<code>componentTypeDesc</code>	The descriptions of item types can help you determine how the item type assigns credit.	Edm.String
<code>enableOrder</code>	If the value of this is true, then orders can be created for the entity (users can order it). If it is false, then orders cannot be created.	Edm.Boolean

Property Name	Description	Property Type
<code>checkAuthorizedInstructor</code>	If the value is true, then the primary instructor of the segments must be authorized to teach the learning item. You set the learning items that an instructor is authorized to teach on the instructors' records. If it is false, then the primary instructor is not required to be authorized to teach the learning item. It is often false if you are not using instructor records or you are not keeping track of authorization to teach in the LMS.	<code>Edm.Boolean</code>
<code>checklistEnabled</code>	If the value of this is true, then task checklists are enabled for the learning item. Task checklists ask an observer to make sure that a user can complete a task in a series of steps.	<code>Edm.Boolean</code>
<code>isAuthorizedObserver</code>	If the value of this is true, then this user is an authorized observer for the task checklist attached to this learning item.	<code>Edm.Boolean</code>
<code>checklistCompletionStatusID</code>	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	<code>Edm.String</code>
<code>checklistFailureStatusID</code>	This is the task checklist failure status ID. It is the completion status that the user is assigned if they fail the task checklist.	<code>Edm.String</code>
<code>checklistObserverTypeID</code>	Observer types define the task checklist observer.	<code>Edm.String</code>
<code>thumbnailURI</code>	This is the URI that leads to the thumbnail image for this entity. Thumbnails are images that act like icons: they help users understand something about the entity from a glance.	<code>Edm.String</code>

Property Name	Description	Property Type
classificationLabelValue	<p>This is the translated name of the classification of this learning item. The LMS uses the label ID to look up the correct translation (string) of the classification for this user's language. For example, TIME-BASED is usually represented to English speakers as Instructor Led. The system uses a label ID to look up the string "Instructor Led" for English speaking users and returns the label value "Instructor Led." A learning item classification is a category of a course, one that explains - in general terms - how the course is offered. It used by the LMS for business rules. For example, users do not enroll into a physical good, but do enroll into a an instructor led course. You cannot change the set of values for classification (they are set by the LMS). It can be one of the following values: BLENDED: Blended items are partly led by an instructor and partly online computer based training. Often the online portion is self-paced. CONTINUOUS ONLINE ACCESS: Online courses are always available to users. EXTERNAL-COURSE: External Courses are courses that have come in through the Open Content Network (OCN). PHYSICAL GOOD: Other courses that are most often a physical material like a book or CD. TIME-BASED: Instructor-led courses are classroom based courses, but the classroom can be physical or virtual (a conference call).</p>	Edm.String
chargebackMethodLabelValue	<p>This is the description of the chargeback method in this user's language. Chargeback is a way to reconcile costs between organizations. One organization charges the cost of training back to another organization. This allows companies to balance the cost of training by putting the cost to organizations.</p>	Edm.String

Property Name	Description	Property Type
itemDetailsDeeplink	If you requested a deep link in your search for learning items, this is populated with the link to the learning item details page. Users click the link to see the details for this learning item. If they are not already authenticated to the system, they must authenticate before they can see the page.	Edm.String
courseDeeplink	If you requested a deep link in your search for learning items, and if this learning item contains online content, then this is populated with the link to the online content. Users click the link to go to the online content for this learning item. If they are not already authenticated to the system, they must authenticate before they can see the page.	Edm.String
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

LearningItemPrerequisite

Property Name	Description	Property Type
pkID	This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
prerequisitesGroupItem	A prerequisite is a learning item that must be complete before enrolling into this learning item. A group of prerequisites (prerequisite group) is an ordered list of prerequisites that users must complete in a given order. For example, to take a high level Physics course, you probably need to start with introduction to physics and work through a series of prerequisites before you are ready for the high level course. That series of courses is a prerequisite group.	Collection(Namespace1_Alias.prerequisitesGroupItem)
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

LearningItemDocument

Property Name	Description	Property Type
pkID	This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
documentID	This is the unique ID of the document record. Documents are managed as separate objects in the system and then associated with learning item.	Edm.String
reviewFlag	If the value of this is true, then the document should be reviewed for accuracy. Reviews are triggered when the document is revised. The review flag is set on the learning item or curricula, not on the document, because it is within the context of the learning item or curriculum that the document must be reviewed. Review to answer the question: does this new revision of the document fit with the current revision of the learning item or curriculum.	Edm.Boolean
documentTitle	This is the title of the document. The title is something that users recognize.	Edm.String
documentLocation	This is a brief description of where the document is located. For example, if it is stored at a URL on a content server, it might be that URL.	Edm.String
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

Scheduledoffering

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the unique ID of a learning item.	Edm.Int64
price	The price of the entity. For example, the price of a class: how much does it cost a user to enroll into and complete the class?	Edm.Double
instructors	This is an instructor. Instructors are tracked as resources in the Learning Management System (LMS) so that they can be matched to courses during a scheduling process. They can also be useful to advertise courses: courses with well known instructors tend to see greater enrollment.	Collection(Namespace1_Alias.instructors)
startDateTime	The start timestamp for this class in Unix Epoch Time.	Edm.Int64
endDateTime	The end timestamp for this class in Unix Epoch Time.	Edm.Int64

Property Name	Description	Property Type
days	This is the amount of days that have segments scheduled in a class. Days that do NOT have segments are NOT included in the amount. For example, a course that begins on Monday and ends on Friday of the same week and has segments on Monday, Wednesday, and Friday returns three days and not five. The days without segments (Tuesday and Thursday) are NOT included in the amount.	Edm.Int64
locationDescription	This is a description of the location where the course is to take place. It helps users understand where to go for their course..A training location is a place inside a training facility. For example, a facility can be a building and the rooms inside the facility can be locations. This helps users understand both "I need to go to this building" and also "I need to go to this room inside the building."	Edm.String
facilityDescription	The brief description of the facility..A training location is a place inside a training facility. For example, a facility can be a building and the rooms inside the facility can be locations. This helps users understand both "I need to go to this building" and also "I need to go to this room inside the building."	Edm.String
scheduleStatus	This is the schedule status CODE, as opposed to the schedule status value. It is a number that can be -3, -6, 10, 11, 12, 13, or 14..Schedule status codes match values as follows. -3: Student has not finished all the pre-requisites. -6: Schedule unavailable because the threshold waiting for the Component is not reached. 10: Open Seats are available. 11: Open Seats and Slots are available. 12: No Open Seats. 13: No Open Seats, but there are open slots. 14: Student has already enrolled.	Edm.Int64

Property Name	Description	Property Type
selfEnrollable	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
timeZoneID	This is the time zone of the entity.	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the class time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
maxEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
enrolledCount	This is the number of users who are currently enrolled.	Edm.Int64
enrollStatusTypeID	This is the registration type that has been assigned to the user.	Edm.String
enrollSeatID	If this user is already enrolled in this class, this value is the unique ID of the seat that the user occupies. If this user is not enrolled in this class, then this value is null.	Edm.Int64
addUser	If this user is already enrolled in this class, this value is the unique ID of the seat that the user occupies. If this user is not enrolled in this class, then this value is null.	Edm.String
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
chargebackMethod	This is unique ID of a chargeback method.	Edm.String

Property Name	Description	Property Type
itemChargeBackMethod	This is unique ID of a chargeback method.,This is the chargeback method of the parent learning item, which the class inherits as a default but can be overridden by administrators.	Edm.String
scheduleCanOverridePrice	If this value is true, then each instance of a course (class) can override the price that is set in source copy of the course (learning item). If the value is false, then every course created from the source copy (learning item) inherits the price from the source copy.	Edm.Boolean
timeZoneLabelValue	This is the time zone of the entity, in a human readable format.	Edm.String
scheduleStatusValue	This is the schedule status TEXT VALUE, as opposed to the schedule status code. The text value tells you, in English, what the codes mean.,Schedule status codes match values as follows. -3: Schedule unavailable because the threshold waiting for the Component is not reached. -6: Student has not finished all the prerequisites. 10: Open Seats are available. 11: Open Seats and Slots are available. 12: No Open Seats. 13: No Open Seats, but there are open slots. 14: Student has already enrolled.	Edm.String
currencyCode	This is the currency code for this entity. The currency code is returned from the enumerated list of currency codes that you set up when you implemented the system. During implementation, we recommend that customers use ISO codes for currency, but it is NOT required.	Edm.String
currencyDesc	This is the currency description for this entity. You set up currency descriptions during implementation to help you understand the currency code. They can be any string that helps you understand the currency code.	Edm.String

Property Name	Description	Property Type
availableSeatCount	This is the number of available seats left in the class (the number of users who can still enroll in the class).	Edm.Int64
scheduledOfferingDeeplink	If you requested a deep link in your search for learning items, and if this learning item contains online content, then this is populated with the link to the online content. Users click the link to go to the online content for this learning item. If they are not already authenticated to the system, they must authenticate before they can see the page.	Edm.String
lisCriteria	The lisCriteria search criteria stands for learning item search (lis) criteria. It finds a specific learning item based on identifying criteria.	Namespace1_Alias.lisCriteria

Complex Types

criteria

Property Name	Description	Property Type
minRowNum	What is the minimum record to retrieve? Use the minimum and maximum records to create pages.	Edm.Int64
maxRowNum	What is the maximum record to retrieve? Use the minimum and maximum records to create pages.	Edm.Int64
qualItemsAndReqThresholdDays	If you provide a value, the system returns all items with a requiredDate (returned as part of the search) less than the current date plus the amount of days you set in qualItemsAndReqThresholdDays. When the threshold is not set, the required date is ignored.	Edm.Int64

Property Name	Description	Property Type
targetUserID	If you are running the web service with an administrator user (user type is A), then send the user whose learning plan you want to retrieve. If you are running the web service with an end-user (user type is P), then do not pass it. The system reads the user ID from the authorization header.	Edm.String
targetPersonGUID	If you are running the web service with an administrator user (user type is A), then send the user's person GUID whose learning plan you want to retrieve. If you are running the web service with an end-user (user type is P), then do not pass it. The system extracts the person GUID from the authorization header.	Edm.String
retrieveLinkedSchedules	If set to true, then the service returns not only the learning items in the users' learning plans but also the classes that the users are enrolled into for those learning items. When true, the system runs a second query, which has a performance impact. Set to false for faster queries when you do not need the schedules.	Edm.String
includeDeeplink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean
includeVLSlink	This is the VLS link that learners can use to join a virtual meeting room (like WebEx, Adobe Connect, or Skype) for training. The link is for registered learners and learning items with a current or future segment that is virtual.	Edm.Boolean
includeSurveys	If set to true, then the service returns the surveys associated with the users along the learning items assigned to him.	Edm.Boolean
includeLearnerActions	If set to true, the system returns actions available to the learner for each learning item in the results. If set to false, actions will not be included in results. Default is false.	Edm.Boolean

learnerActions

Property Name	Description	Property Type
actionText		Edm.String
actionName		Edm.String

lisCriteria

Property Name	Description	Property Type
itemID	This is the unique ID of a learning item.	Edm.String
itemTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
onlyShowInSystemLevelLocaleCurrency	If this value is true, then the search returns learning items in the system level currency. If false, then other currencies are returned.	Edm.Boolean
includeDeeplink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean
includeInstructorDetails	If set to true, then the search returns details about the instructor. This can be useful, for example, if you want to advertise the instructor in order to get learners excited about attending training under that instructor. If you are not using instructors, set to false.	Edm.Boolean

prerequisitesGroupItem

Property Name	Description	Property Type
prerequisiteComplete	If the value of this is true, then this user has completed this prerequisite.	Edm.Boolean

Property Name	Description	Property Type
<code>isAvailableInStudentCatalog</code>	If the value of this is true, then this prerequisite is in this user's catalog. When it is in a user's catalog, he or she can access it and it does not need to be directly assigned.	<code>Edm.Boolean</code>
<code>isInLearningPlan</code>	If the value of this is true, then this prerequisite is already in this user's assignments.	<code>Edm.Boolean</code>
<code>prerequisiteCompleteInfo</code>	This is the completion information for this prerequisite for this user.	<code>Edm.String</code>
<code>prerequisiteCompletionDate</code>	This is the date that this user completed this prerequisite. If the value of this is null, then this user has not completed the prerequisite.	<code>Edm.Int64</code>
<code>prerequisiteGroupID</code>	This is the unique ID of the group that this prerequisite belongs to.	<code>Edm.String</code>
<code>groupName</code>	This is the name of group that this prerequisite belongs to.	<code>Edm.String</code>
<code>groupOrder</code>	Prerequisite groups can be sequenced. This is the sequence number of the prerequisite group.	<code>Edm.Int64</code>
<code>prerequisiteItemOrder</code>	Within the group, this is the sequence of the learning item.	<code>Edm.Int64</code>
<code>prerequisiteRevisionNumber</code>	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	<code>Edm.String</code>

Property Name	Description	Property Type
title	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
groupNameLabelKey	This is the unique ID of the group name label. The system uses this ID to look up the group name in this user's language.	Edm.String
prerequisiteComponentClassificationType	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED.	Edm.String
prerequisiteComponentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
prerequisiteComponentID	This is the unique ID of a learning item.	Edm.String
prerequisiteRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

instructors

Property Name	Description	Property Type
<code>instructorID</code>	This is the unique ID of an instructor in the Learning Management System. If the instructor is also a user (this is often the case when instructors are employees at the company), then keep in mind that this is their INSTRUCTOR ID as opposed to their LEARNER ID.	<code>Edm.String</code>
<code>lastName</code>	This is the family name of the instructor.	<code>Edm.String</code>
<code>firstName</code>	This is the given name of the instructor.	<code>Edm.String</code>
<code>middleInitial</code>	This is a middle initial of the instructor.	<code>Edm.String</code>
<code>primary</code>	If the value of this is true, then this is the primary instructor. If false, then the instructor is secondary. Primary instructors are usually the ones responsible for organizing the training, posting learning results, and hosting Virtual Learning Sessions (VLS). You can also require that primary instructors are qualified to instruct the learning item. Secondary instructors support the primary instructors.	<code>Edm.Boolean</code>

Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.,</p> <p>Title</p>	Edm.String
revisionNumber	<p>This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.</p>	Edm.String
completionStatusID	<p>This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.</p>	Edm.String
provideCredit	<p>If this value is true, then the course provided credit to the user. Your organization defines what credit means.</p>	Edm.Boolean
studentComponentID	<p>This string is used to identify the content assigned to a user and is used to generate the review content link for the completed learning item in the users' learning history.</p>	Edm.Int64
instructorName	<p>This is the name of the instructor who taught the course.</p>	Edm.String

Property Name	Description	Property Type
grade	<p>This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete),.</p> <p>Grade</p>	Edm.String
totalHours	<p>This is the total hours that a user earns for completing a course.,</p> <p>Total Hours</p>	Edm.Double
creditHours	<p>Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class.,The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.,</p> <p>Credit Hours</p>	Edm.Double
contactHours	<p>Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led time slot, then the contact hours equals 6.,The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.,</p> <p>Contact Hours</p>	Edm.Double

Property Name	Description	Property Type
cpeHours	<p>CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification.,The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.,</p> <p>CPE Hours</p>	Edm.Double
comments	<p>This is comments about the learning event.,</p> <p>Comments</p>	Edm.String
esigUsername	<p>This is the e-signature user name entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.</p>	Edm.String
lastUpdateTimestamp	<p>This is the last time that the history record was updated. This is in Unix Epoch time.</p>	Edm.Int64
esigMeaningCode	<p>This is the e-signature meaning code entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.</p>	Edm.String
scheduleID	<p>This is the unique ID of the class that the user completed. A class is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different class of the course.,</p> <p>Scheduled Offering ID</p>	Edm.Int64

Property Name	Description	Property Type
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.String
reviewContentAllowed	If the value of this is true, then the user can go back and review the content of the course.	Edm.Boolean
rating	This is the users' rating of the course from the course catalog.	Edm.Double
seqNum	This is a unique ID for each student item rating. You cannot use it.	Edm.String
enableRating	If you enable rating for a learning item, then this is true. If it is true, then when user complete the learning item, they can rate it. This rating is the stars rating that appears in the catalog to other users. If you were building a client that allows ratings, you would check this for a true value before allowing a user to rate completed learning items.	Edm.Boolean
formattedRevisionDate	This is the revision date formatted to the current users' preferences. Use it to display the format date.	Edm.String
completionDate	This is the completion date in Unix Epoch time. A completion date is the date that the user completed the learning item., Completion Date	Edm.Int64
status	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.,For external events, this value is null.	Edm.String
ratingDate	This is the date that the user rated the learning item, in Unix Epoch time. If the user has not yet rated the learning item or if the user is not allowed to rate the learning item (enableRating is false) then this is null.	Edm.Int64

Property Name	Description	Property Type
ratingPending	If the value of this is true, then the user has not rated the learning item.	Edm.Boolean
lastCompletionDate	This is the last date that the user completed the learning item. It is stored in the user rating table.	Edm.Int64
certificateLink	This is a link to the certificate of completion report. User can click this link to see their certificate of completion and print it. This user must have permission to print the certificate of completion. Most customers give their users permission to print certificates of completion.	Edm.String
onlineContentLink	This is a link to the online content so that users can review the content if they are allowed to review it.	Edm.String
criteria	A learning history is the list of completed learning by a user.	Namespace1_Alias.criteria
completionStatusDesc	Completion Status	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
completionDateTimeOffset	Completion Date	Edm.DateTimeOffset
userLearningHistoryContentObjects	This has Content Object Information, Content Object(s)	Collection(Namespace1_Alias.UserLearningHistoryContentObjects)
userCompetencyAssessments	This has Competency Assessment Information, Competency Assessment Data	Collection(Namespace1_Alias.userCompetencyAssessments)
recordID	ID	Edm.String

Complex Types

criteria

Property Name	Description	Property Type
maxNumberToRetrieve	This is the maximum number of recors to retrieve in the call.	Edm.Int32
itemID	This is the unique ID of a learning item..A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a class..In most cases, a learning item is a course, either online or in a classroom, but you can also use learning items to track books that employees are required to read or Standard Operating Procedures (SOPs) that they are required to sign-off on and understand.	Edm.String

Property Name	Description	Property Type
itemType	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
targetUserID	This is the user whose learning history you want to retrieve.	Edm.String
personGUID	null	Edm.String
fromDate	The start date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
toDate	The end date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
itemRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
includeDeepLink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean

UserLearningHistoryContentObjects

Entity Types

Student

Property Name	Description	Property Type
<code>studentID</code>	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	<code>Edm.String</code>
<code>personGUID</code>	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	<code>Edm.String</code>
<code>personExternalID</code>	This is a mutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	<code>Edm.String</code>

Property Name	Description	Property Type
empStatID	You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended).	Edm.String
empTypID	Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time").	Edm.String
regularTempID	Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers.	Edm.String
fulltime	Is the user a full time employee?	Edm.String
jobLocID	The unique ID of the user's physical location.	Edm.String
jobPosID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name.	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.	Edm.String

Property Name	Description	Property Type
orgID	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.	Edm.String
compID	This is the company ID of the entity.	Edm.String
lastName	The family name of a user.	Edm.String
firstName	The given name of a user., null (can't find the key in the label properties. Original key is First_Name, the passed in locale is null)	Edm.String
middleName	The middle initial of a user.	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
addr	The street address of a user.	Edm.String
city	The city of the user.	Edm.String
state	The state or province of the user.	Edm.String
postal	The postal code of the user.	Edm.String
cntry	The country code of the user. Country codes are defined in the system.	Edm.String
superField	The user ID of the user's supervisor.	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date.	Edm.Int64
termDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date.	Edm.Int64

Property Name	Description	Property Type
emailAddr	The user's email address.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
selfReg	Is the user self registered? Value can be Y for self registered or N for not self registered.	Edm.String
locked	Is the user locked out of the system?	Edm.String
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports.	Edm.String
roleID	This is the security role ID of the user.	Edm.String
profileStatus	The status column from pa_stud_tp table, indicating if the student is an active employee. EXPIRED	Edm.String
accountID	The financial account ID.	Edm.String
posNumID	The position number ID.	Edm.String
nativeDeeplinkUser	If set to N then the user receives deep links that work in an integrated SAP SuccessFactors HCM suite environment. If set to Y, then the user receives links that work in a native learning environment (SAP SuccessFactors Learning only).	Edm.String
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64

fulltime	Is the user a full time employee?	Edm.String
jobLocID	The unique ID of the user's physical location.	Edm.String
jobPosID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name.	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.	Edm.String
orgID	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.	Edm.String
compID	This is the company ID of the entity.	Edm.String
lastName	The family name of a user.	Edm.String

Property Name	Description	Property Type
firstName	The given name of a user., null (can't find the key in the label properties. Original key is First_Name, the passed in locale is null)	Edm.String
middleName	The middle initial of a user.	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
addr	The street address of a user.	Edm.String
city	The city of the user.	Edm.String
state	The state or province of the user.	Edm.String
postal	The postal code of the user.	Edm.String
cntry	The country code of the user. Country codes are defined in the system.	Edm.String
superField	The user ID of the user's supervisor.	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date.	Edm.Int64
termDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date.	Edm.Int64
emailAddr	The user's email address.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
selfReg	Is the user self registered? Value can be Y for self registered or N for not self registered.	Edm.String
locked	Is the user locked out of the system?	Edm.String

Property Name	Description	Property Type
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports.	Edm.String
roleID	This is the security role ID of the user.	Edm.String
profileStatus	The status column from pa_stud_tp table, indicating if the student is an active employee. EXPIRED	Edm.String
accountID	The financial account ID.	Edm.String
posNumID	The position number ID.	Edm.String
nativeDeeplinkUser	If set to N then the user receives deep links that work in an integrated SAP SuccessFactors HCM suite environment. If set to Y, then the user receives links that work in a native learning environment (SAP SuccessFactors Learning only).	Edm.String
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64

Complex Types

criteria

Property Name	Description	Property Type
learnerID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
learnerIDOperator		Edm.String

Property Name	Description	Property Type
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personGUIDOperator		Edm.String
personExternalID	This is a mutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personExternalIDOperator		Edm.String
lastName	The family name of a user.	Edm.String
lastNameOperator		Edm.String
firstName	The given name of a user.	Edm.String
firstNameOperator		Edm.String
middleInit	The middle initial of a user.	Edm.String
middleInitOperator		Edm.String
isActive	If the value is true then the user is active. If the value is false, then the user is inactive.	Edm.Boolean
isActiveOperator		Edm.String

Property Name	Description	Property Type
domainIDs	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator.	Collection(Edm.String)
domainIDsOperator		Edm.String
organizationIDs	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space.	Collection(Edm.String)
organizationIDsOperator		Edm.String
jobPositionIDs	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name.	Collection(Edm.String)
jobPositionIDsOperator		Edm.String

Actions

This \$metadata does **not** contain actions.

9.8.1.28 user/v1 Metadata Call

We recommend that you use the most current user service to add and update users.

Metadata Call

Sample Code

```
GET /learning/odatav4/user/v1/$metadata
```

Caution

We recommend that you add or update users centrally in the SAP SuccessFactors system of record and allow the data to flow into the LMS through standard means. When you update users through Learning, you update the user as a student, but not as a SAP SuccessFactors user - what you change is available only to the LMS, and it is possible that shared data is overwritten from the system of record.

Headers

Header	Value
Authorization	Bearer oauth_token
Content-Type	application/json;odata.metadata=minimal

Containers

Entity Sets

Name	Description	Type
MergeUsers	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.MergeUser

Name	Description	Type
Users	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.User
UserInfos	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.UserInfo
itemAssignments	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.itemAssignment
UserCourses	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.UserCourse
removeItemAssignments	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.removeItemAssignment

Name	Description	Type
UserInformation	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.UserInformation

learninghistorys	This is a set of assignments that you want to make to users. Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Namespace1_Alias.learninghistory
------------------	--	----------------------------------

Action Import

Name	Description	Action
AI_mergeUser	This action import function replaces all the existing roles with the role IDs passed in the second parameter	Namespace1_Alias.mergeUser

Navigation Property Bindings

Path	Target
learningAssignment	itemAssignments
learninghistory	learninghistorys

Entity Types

MergeUser

Property Name	Description	Property Type
fromPersonGUID	User to be deactivated in the merge	Edm.String
fromUserID	User to be deactivated in the merge	Edm.String
toPersonGUID	User to receive the Merge	Edm.String
toUserID	User to receive the Merge	Edm.String

Property Name	Description	Property Type
mergeSuccess	Boolean that says if the operation returned Success or Failure	Edm.Boolean
attributes	Student Information	Collection(Edm.String)
learnigAssignments	Learning Items that are assigned to the Student	Collection(Edm.String)
learningHistories	Learning Items that the Student finished	Collection(Edm.String)
competencies	Competencies of the Student	Collection(Edm.String)
assessments	Type of the Competencies Assessed to the Student	Collection(Edm.String)
registration	Enrollment in the Schedule Offering	Collection(Edm.String)
requests	Schedule Offering Requested	Collection(Edm.String)
orders	Purchase Orders of the Student	Collection(Edm.String)
messages		Collection(Namespace1_Alias.Messages)

User

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID. User ID	Edm.String
firstName	The given name of a user., First Name	Edm.String
lastName	The family name of a user., Last Name	Edm.String
middleInitial	The middle initial of a user., MI	Edm.String

Property Name	Description	Property Type
gender	This is the gender of the user: M (male) or F (female). The users' gender controls, for example, how the user is addressed in notifications., Gender	Edm.String
notActive	notActive can be (Y or N) or (Yes or No). The value N and the value No mean that the user is active. The value Y and the value Yes mean that the user is inactive.	Edm.String
hasAccess	Does the user have access to the Learning Management System (LMS)?	Edm.String
employeeStatusID	You can associate employees with a status that identifies their standing in the company (for example, full-time, on leave, or suspended)., Employee Status	Edm.String
employeeTypeID	Users have an employee type, such as contractor, consultant, salaried, or part-time. You can use the employee type as an attribute to match users for an assignment profile or as search criteria when you execute a search (for example, you could run an Account Data report for users whose employee type is "full-time")., Employee Type	Edm.String
jobLocationID	The unique ID of the user's physical location., Job Location	Edm.String
jobPositionID	The unique job CODE of the user. This can be confusing because it is sometimes returned with POSITION in the parameter name., Job Code	Edm.String

Property Name	Description	Property Type
jobTitle	Think of a user's job title as the title on a business card. Regardless of technical name of the job position, users typically know their jobs by more casual or more specific name., Job Title	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator., Domain	Edm.String
organizationID	The unique ID of the organization that the entity belongs to. Organizations define a structure to your users, and users' organization controls how the system recognizes them. For example, you can reserve space for an organization in a course. Users belonging to the organization can occupy the reserved space., Organization	Edm.String
roleID	This is the security role ID of the user., Role	Edm.String
address	The street address of a user., Address	Edm.String
city	The city of the user., City	Edm.String
state	The state or province of the user., State / Province	Edm.String
postal	The postal code of the user., Postal Code	Edm.String

Property Name	Description	Property Type
country	The country code of the user. Country codes are defined in the system., Country	Edm.String
regionID	Users, instructors, and training facilities are associated with regions. The system uses regions to find training close to users. For example, courses taking place in a facility that is in the same region as the user. Companies can also use region to inform some reports., Region	Edm.String
emailAddress	The user's email address., Email Address	Edm.String
hireDate	The user's hire date. Hire date can be used to assign training. For example, a learning administrator might assign an onboarding program for all users hired after a given date., Hire Date	Edm.Int64
dobDate	The user's date of birth., Date of Birth	Edm.Int64
terminationDate	The date that the user separated from the company. The termination date cannot be in the future and it cannot be before the hire date., Termination Date	Edm.Int64
supervisorID	The user ID of the user's supervisor., Primary Supervisor	Edm.String
resumeLocation	The URI to the users' resume. This field was used for legacy Plateau Talent, so we recommend that you ignore it., Resume Location	Edm.String
comments	This are the comments provided by the user in the comments field for each section.	Edm.String

Property Name	Description	Property Type
accountCode	The user's account code. If you do not use commerce features, you can ignore this parameter. The account code must exist in the system.	Edm.String
hasAccessToOrgFinancialAccount	If true, then this user has access to use the organization's financial accounts.	Edm.Boolean
timeZone	The user's time zone. Time zone is part of the user's overall locale (currency, time zone, and locale ID). You cannot pass time zone by itself, you must pass it and also pass locale and currency.	Edm.String
locale	The locale ID of the user. Locales are enumerated in References > Geography > Locales. The locale must exist in the system.	Edm.String
altSuperID1	The first alternate supervisor of the user.	Edm.String
altSuperID2	The second alternate supervisor of the user.	Edm.String
altSuperID3	The third alternate supervisor of the user.	Edm.String
shoppingAccountType	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. The shopping account type can be INTERNAL or EXTERNAL.	Edm.String
enableShoppingAccount	Shopping account is used by commerce features. If you do not use commerce, this does not apply to you. This is a flag to enable the shopping account. Values can be Y or N. If Y, then the shopping account is enabled for the user.	Edm.String

Property Name	Description	Property Type
positionNumberID	This is the unique ID of the user's job position. Job positions are enumerated in Users > Positions. The position must exist in the system. In most cases, each position is an instance of a job code and each position is occupied by one user. For example, if your company has ten civil engineers and all ten civil engineers share a job code, then you create ten positions, each associated with the one "civil engineer" job code. Positions are critical to workforce planning and succession planning because they describe how many positions exist for a job code and how many are open. Because they are hierarchical, positions show a career path.	Edm.String
includeInGovtReporting	This applies to customers using Training Planner. If you are not using Training Planner, you can ignore it. If set to Y, the user is included in Training Planner reports that must be submitted to government authorities (for example a 2483 report). If set to N, the user is not included in Training Planner reports. If null, the value defaults to N. If this value is N or null, the following fields are automatically nullified. If you pass a value for them, the system ignores it: legalEntityID, employeeClassID, hourlyRate, hourlyRateCurrency.	Edm.String
legalEntityID	This is the legal entity ID used for Training Planner reporting. If provided legal entity ID does not exist the system creates it. Legal entity IDs are enumerated in References > Learning > 2483 Legal Entity., Reporting Legal Entity	Edm.String
employeeClassID	This is the employee class ID used for Training Planner reporting. The employee class ID must exist in the system. Employee class IDs are enumerated in References > Users > 2483 Employee Class., Employee Class	Edm.String

Property Name	Description	Property Type
hourlyRate	The hourly rate of the user for Training Planner reporting., Hourly Rate	Edm.Double
hourlyRateCurrency	The currency for the hourly rate of the user for Training Planner reporting. The currency must exist in the system., Hourly Rate Currency	Edm.String
regularTempID	Companies use the regular temp ID to search and report on users in categories of their regular and temporary work. For example, a company might want to define several types of temporary workers. The values are enumerated in References > Users > Regular Temp. The value must exist in the system., Regular/Temp	Edm.String
fulltime	If set to Y, then the user is full time. If set to N, then the user is not full time. Defaults to Y., Is Full-Time	Edm.String
nativeDeeplinkUser	null	Edm.String
studentPhones	This is a list of users' phone numbers. For example, this list could contain work, home, and mobile numbers. , Phone Numbers	Collection(Namespace1_Alias.StudentPhones)
customColumn	A custom column is a custom pick list (or a custom enumerated list). It is unique to SAP SuccessFactors Learning. You cannot use them in other areas of the suite. To understand how they are used, consider a customer that needs to supply safety equipment for training. They might want to know a person's general clothing size, shoe size, and so on. SAP SuccessFactors Learning does not have a placeholder to store such information, so the customer could create a CLOTHING SIZE and SHOE SIZE custom column., Additional User Information	Collection(Namespace1_Alias.CustomColumn)

Property Name	Description	Property Type
assignProfileID	The assignment profile ID of the user., Assignment Profile	Edm.String
currencyID	The unique ID of the user's currency. The currency must exist in the system., Currency	Edm.String
removeAltSuperID1	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID2	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
removeAltSuperID3	If you send a user ID in this field, and if the user ID is an alternate supervisor of this user, the alternate supervisor is removed.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String

Property Name	Description	Property Type
personExternalID	This is a mutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite. External ID	Edm.String
gamificationStudentID	The user ID as it applies to the gamification server. Gamification User ID	Edm.String
createReferences	If true, then the API will have the ability to create user records with referenced entities that may not already exist in the LMS.	Edm.Boolean
genderDescription	Gender	Edm.String
hireDateTimeOffset	Hire Date	Edm.DateTimeOffset
terminationDateTimeOffset	Termination Date	Edm.DateTimeOffset
dobDateTimeOffset	Date of Birth	Edm.DateTimeOffset
disabilityClassificationDescription	Disability Classification	Edm.String
adjustedHourlyRate	Adjusted Hourly Rate	Edm.Double
adjustedHourlyRateCurrency	Adjusted Hourly Rate Currency	Edm.String
adjustedHourlyRateDisplay	Adjusted Hourly Rate	Edm.String
hourlyRateDisplay	Hourly Rate	Edm.String
jobPositionDescription	Job Code	Edm.String
jobGradeDescription	Job Grade	Edm.String
jobLocationDescription	Job Location	Edm.String
employmentTypeDescription	Employee Type	Edm.String

Property Name	Description	Property Type
employmentStatusDescription	Employee Status	Edm.String
regularTempDescription	Regular/Temp	Edm.String
fulltimeDescription	Is Full-Time	Edm.String
supervisorName	Supervisor	Edm.String
regionDescription	Region	Edm.String
organizationDescription	Organization	Edm.String
billingName	Billing Name	Edm.String
billingContactName	Billing Contact Name	Edm.String
billingAddress	Billing Address	Edm.String
billingAddress1	Billing Address Line 1	Edm.String

billingPhoneNumber	Billing Phone Number	Edm.String
billingFaxNumber	Billing Fax Number	Edm.String
billingEmailAddress	Billing Email Address	Edm.String
shippingName	Shipping Name	Edm.String
shippingContactName	Shipping Contact Name	Edm.String
shippingAddress	Shipping Address	Edm.String
shippingAddress1	Shipping Address Line 1	Edm.String
shippingCity	Shipping City	Edm.String
shippingState	State / Province	Edm.String
shippingPostal	Shipping Postal	Edm.String
shippingCountry	Shipping Country	Edm.String
shippingPhoneNumber	Shipping Phone Number	Edm.String

Property Name	Description	Property Type
shippingFaxNumber	Shipping Fax Number	Edm.String
shippingEmailAddress	Shipping Email Address	Edm.String
reportingLegalEntityDescription	Reporting Legal Entity	Edm.String
employeeClassDescription	Employee Class	Edm.String
userEmployments	This has User Employment Information, Employment Information	Collection(Namespace1_Alias.UserEmployments)
adminInformation	This has Admin Information, Admin Information	Namespace1_Alias.AdminInformation
instructorInformation	This has Instructor Information, Instructor Information	Namespace1_Alias.InstructorInformation
siteID	Site ID	Edm.String
validationWarningMsgs	null (can't find the key in the label properties. Original key is label.validationWarningMsgs, the passed in locale is null)	Collection(Edm.String)
totalCount		Edm.Int64

UserInfo

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userInfo		Collection(Namespace1_Alias.UserInfo)

itemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete., Type	Edm.String
componentID	This is the unique ID of a learning item., ID	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time., Revision Date	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID., User ID	Edm.String
personGUID	null	Edm.String
title	null, Title	Edm.String
recordType	null, Record Type	Edm.String
assignmentTypeDesc	Assignment Type	Edm.String
componentTypeDescription	Type	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
recordID	ID	Edm.String

UserCourse

Property Name	Description	Property Type
primaryKey	Even when an entity is a collection (a wrapper for many entities), you must supply a primary key in both the GET URL and any body of the request (for example, in PUT or POST). This value is ignored in wrapper entities but it is required.	Edm.String
userCourse	This is one learning assignment made to one Learning Management System (LMS) user.	Collection(Namespace1_Alias.UserCourse)

removeItemAssignment

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	null	Edm.String

learninghistory

Property Name	Description	Property Type
componentTypeID	<p>Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.,</p> <p>Type</p>	Edm.String
componentID	<p>This is the unique ID of a learning item.,</p> <p>ID</p>	Edm.String
revisionDate	<p>This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.,</p> <p>Revision Date</p>	Edm.Int64
title	<p>This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.,</p> <p>Title</p>	Edm.String
revisionNumber	<p>This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.</p>	Edm.String
completionStatusID	<p>This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.</p>	Edm.String

Property Name	Description	Property Type
provideCredit	If this value is true, then the course provided credit to the user. Your organization defines what credit means.	Edm.Boolean
studentComponentID	This string is used to identify the content assigned to a user and is used to generate the review content link for the completed learning item in the users' learning history.	Edm.Int64
instructorName	This is the name of the instructor who taught the course.	Edm.String
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete). Grade	Edm.String
totalHours	This is the total hours that a user earns for completing a course., Total Hours	Edm.Double
creditHours	Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class.,The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard., Credit Hours	Edm.Double

Property Name	Description	Property Type
contactHours	<p>Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>Contact Hours</p>	Edm.Double
cpeHours	<p>CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.</p> <p>CPE Hours</p>	Edm.Double
comments	<p>This is comments about the learning event.</p> <p>Comments</p>	Edm.String
esigUsername	<p>This is the e-signature user name entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.</p>	Edm.String
lastUpdateTimestamp	<p>This is the last time that the history record was updated. This is in Unix Epoch time.</p>	Edm.Int64

Property Name	Description	Property Type
esigMeaningCode	This is the e-signature meaning code entered by the user recording the learning event. E-signatures are a way for validated customers to verify users' identities. If you are not a validated customer, then this does not apply to you.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that the user completed. A scheduled offering is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different scheduled offering of the course., Scheduled Offering ID	Edm.Int64
componentKey	This is the unique key for the item. It is used in some parts of application such as bookmarking where we need to save multiple entities' primary keys. It must be a long number.	Edm.String
reviewContentAllowed	If the value of this is true, then the user can go back and review the content of the course.	Edm.Boolean
rating	This is the users' rating of the course from the course catalog.	Edm.Double
seqNum	This is a unique ID for each student item rating. You cannot use it.	Edm.String
enableRating	If you enable rating for a learning item, then this is true. If it is true, then when user complete the learning item, they can rate it. This rating is the stars rating that appears in the catalog to other users. If you were building a client that allows ratings, you would check this for a true value before allowing a user to rate completed learning items.	Edm.Boolean
formattedRevisionDate	This is the revision date formatted to the current users' preferences. Use it to display the format date.	Edm.String

Property Name	Description	Property Type
completionDate	This is the completion date in Unix Epoch time. A completion date is the date that the user completed the learning item., Completion Date	Edm.Int64
status	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.,For external events, this value is null.	Edm.String
ratingDate	This is the date that the user rated the learning item, in Unix Epoch time. If the user has not yet rated the learning item or if the user is not allowed to rate the learning item (enableRating is false) then this is null.	Edm.Int64
ratingPending	If the value of this is true, then the user has not rated the learning item.	Edm.Boolean
lastCompletionDate	This is the last date that the user completed the learning item. It is stored in the user rating table.	Edm.Int64
certificateLink	This is a link to the certificate of completion report. User can click this link to see their certificate of completion and print it. This user must have permission to print the certificate of completion. Most customers give their users permission to print certificates of completion.	Edm.String
onlineContentLink	This is a link to the online content so that users can review the content if they are allowed to review it.	Edm.String
criteria	A learning history is the list of completed learning by a user.	Namespace1_Alias.criteria
completionStatusDesc	Completion Status	Edm.String
revisionDateTimeOffset	Revision Date	Edm.DateTimeOffset
completionDateTimeOffset	Completion Date	Edm.DateTimeOffset

Property Name	Description	Property Type
userLearningHistoryContentObjects	This has Content Object Information, Content Object(s)	Collection(Namespace1_Alias .UserLearningHistoryContent Objects)
userCompetencyAssessments	This has Competency Assessment Information, Competency Assessment Data	Collection(Namespace1_Alias .userCompetencyAssessments)
recordID	ID	Edm.String

Complex Types

Messages

Property Name	Description	Property Type
code	Code received from the merge	Edm.String
message	Message of the code received	Edm.String

UserInfo

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personIdExternal	null	Edm.String
personGUID	null	Edm.String
alternateSupervisorIds	An alternate Learning supervisor is someone other than the supervisor who can assign learning or manage learning for the user.	Collection(Edm.String)
errorMessage	This contains any error messages.	Edm.String

StudentPhones

Property Name	Description	Property Type
phoneNumber	A telephone number., Telephone Number	Edm.String
phoneDescription	A description of a phone number., Template Description	Edm.String
phoneDisplay		Edm.String
__hashCodeCalc		Edm.Boolean

CustomColumn

Property Name	Description	Property Type
iD	Deprecated -- the field represents an internal value which should not be exposed. Please stop using this field. It will be removed from the public API.	Edm.String
value	The value of the custom column. A custom column is an enumerated list that is custom to this customer.	Edm.String
columnNumber	Column number of the custom column. A custom column is an enumerated list that is custom to this customer., Column Number	Edm.Int64
columnColumnName	null	Edm.String
customColumnDisplayValue	null, Additional Information	Edm.String
__hashCodeCalc		Edm.Boolean

UserCourse

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
assignmentType	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	Edm.String
assignmentDate	This is the assignment date of the curriculum.	Edm.Int64
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
errorMessage	This contains error messages.	Edm.String

criteria

Property Name	Description	Property Type
maxNumberToRetrieve	This is the maximum number of records to retrieve in the call.	Edm.Int32

Property Name	Description	Property Type
itemID	This is the unique ID of a learning item. A learning item is a unit of learning that you can track in the Learning Management System (LMS). You can think of this as a university course catalog: each course, like Introduction to Wave Physics is a learning item. Those learning items can be tracked to see who has completed Introduction to Wave Physics. And Introduction to Wave Physics can be offered at multiple times to fit different student schedules. Each of those instances is a scheduled offering. In most cases, a learning item is a course, either online or in a classroom, but you can also use learning items to track books that employees are required to read or Standard Operating Procedures (SOPs) that they are required to sign-off on and understand.	Edm.String
itemType	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
targetUserID	This is the user whose learning history you want to retrieve.	Edm.String
personGUID	null	Edm.String
fromDate	The start date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64
toDate	The end date of the range that you want to retrieve learning history. This is in Unix Epoch time.	Edm.Int64

Property Name	Description	Property Type
itemRevisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64

includeDeepLink	If this value is true, then the search returns a deep link to the entities it returns.	Edm.Boolean

Action: mergeUser

⚠ Caution

If you want to merge two users, please use the action import AI_mergeUser

This action import function replaces all the existing roles with the role IDs passed in the second parameter

For the action mergeUser, IsBound is false

Return Type: Namespace1_Alias.MergeUser

Parameters of mergeUser

Parameter Name	Description	Parameter Type
fromUserID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toUserID	This is the User ID that will receive the data from the other User	Edm.String
fromPersonGUID	This is the User ID that will be deactivate and have its content merged.	Edm.String
toPersonGUID	This is the User ID that will receive the data from the other User	Edm.String

CurriculumStatus

Property Name	Description	Property Type
curriculumStatus	null	Edm.String
expirationDate	This is the expiration date of the curriculum.	Edm.Int64
nextActionDate	This is the next date that the user must take action to complete a learning item associated with the curriculum.	Edm.Int64
remainingDays	This is the number of days remaining on the curriculum for the user.	Edm.Int32
csCriteria		Namespace1_Alias.csCriteria

CurriculumItemStatus

Property Name	Description	Property Type
curriculaID	The Unique ID of a curriculum in the system.	Edm.String
curriculaDesc	The plain text description of the curriculum that the system returns.	Edm.String
htmlCurriculaDesc	The HTML description of the curriculum that the system returns.	Edm.String
rootCurriculaID	This is the unique ID of the curriculum at the root of the curriculum structure. Curricula can be subcurricula and have parent curricula. This is the ID of the curriculum at the top of the hierarchy.	Edm.String
itemTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
itemID	This is the unique ID of a learning item.	Edm.String
revDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
itemTitle	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String

Property Name	Description	Property Type
assignmentType	This is the assignment type of the entity, which is enumerated in SAP SuccessFactors Learning Administration, in the References section, in the Learning group.	Edm.String
displayOrder	This is the order that users progress through the learning items within a curriculum.	Edm.Int64
completionDate	A completion date is the date that the user completed the course. When you return it through a web service, it is in Unix Epoch format.	Edm.Int64
completionStatus	Completion status is a central element of SAP SuccessFactors Learning. It determines whether your users receive credit for their courses. For example, when learning administrators record learning for an employee, they can record a completion status of pass or fail.	Edm.String
requiredDate	The date that this is required to be complete. Users see this date as their deadline in their assignments.	Edm.Int64
expiryDate	This is the date that the learning item expires within the curriculum.	Edm.Int64
failureCompletionStatusId	This is the failure status ID that a user was given for the learning item. This applies if the user was given a failure status.	Edm.String
failureDate	This is the date that a user was given a failure status for the learning item. This applies if the user was given a failure status.	Edm.Int64
requirementID	This is the unique ID of the requirement that the learning item fulfills within the curriculum.	Edm.String
requirementTypeID	This is the description of a requirement type.	Edm.String
requirementDesc	This is a description of the requirement. This helps you understand the requirement.	Edm.String

Property Name	Description	Property Type
requirementSequenceNumber	This is the order of the requirement for the learning item within the curriculum. Requirements are ordered.	Edm.Int64
nextAction	The next date that the user must take action on this item.	Edm.String
assignedDate	This is the assignment date of the curriculum.	Edm.Int64
curriculumRequirementItem		Collection(Namespace1_Alias.CurriculumRequirementItem)
numberOfHours	This is a number of hours of the type in hourTypeID. This is the number of hours required to meet a requirement of the curriculum.	Edm.Double
numberOfComponents	This is a number of learning items in a requirement for the curriculum. Sometimes users must complete - for example - five learning items in a curriculum to meet a requirement.	Edm.Int64
completedNumberOfHours	This is a number of hours of the type in hourTypeID. This is the number of hours that the user has completed to meet a requirement.	Edm.Double
completedNumberOfComponents	This is a number of learning items in a requirement that users have completed. Sometimes users must complete - for example - five learning items in the curriculum to meet a requirement. They might have completed three of those five learning items. In this case, the value is 3.	Edm.Double
globalDisplayOrder	This is the order that entries for the curriculum will be displayed. Learning administrators create this order.	Edm.String

Property Name	Description	Property Type
hourTypeID	<p>This is the hour type that is a unit for numberOfHours and completedNumberOfHours. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard. Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class.</p>	Edm.String

Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in TitleLabelKey.	Edm.String
classificationID	This is the unique ID of the classification for a learning item. It can be: It can be one of the following values: BLENDED, CONTINUOUS ONLINE ACCESS, EXTERNAL-COURSE, PHYSICAL GOOD, or TIME-BASED.	Edm.String
sourceID	The source is the developer of the learning item or the organization or regulatory body that requires it. You can create or modify source IDs in the administration environment, in References: Learning: Item Sources.	Edm.String
deliveryMethodID	This is the unique ID of a delivery method. A delivery method describes how a learning item will be delivered (for example, a book, PDF file, or online course). You can create or modify method IDs in the administration environment, in References: Learning: Delivery Methods	Edm.String
domainID	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator. No Navigation Property Binding	No Navigation Property Binding

Entity Types

recordLearningEvent

Property Name	Description	Property Type
recordLearningEvents	Various people in your organization post learning events to SAP SuccessFactors Learning: users can post the completion of self-assigned courses, and supervisors and administrators can post the completion of courses for users. Exactly how each user role can post learning events depends on your configuration.	Collection(Namespace1_Alias.recordLearningEvents)

Complex Types

recordLearningEvents

Property Name	Description	Property Type
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
completionStatusID	This is the task checklist completion status ID. It is the completion status that the user is assigned if they pass the task checklist.	Edm.String
revisionNumber	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that the user completed. A scheduled offering is a course that took place at one place and time. For example, you can have one course called Business Writing that is offered every month. Each month is a different instance of Business Writing, and therefore a different scheduled offering of the course.	Edm.Int64
errorMessage		Edm.String

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM Suite, you want to get the Person GUID or Person External ID.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SuccessFactors HCM Suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM Suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
completionDate	A completion date is the date that the user completed the course. When you return it through a web service, it is in Unix Epoch format.	Edm.Int64
completionTimeZoneID	This is the time zone which will be used for computing the completion time of the learning event in the system.	Edm.String
grade	This is the grade that the user earned for completing the course. Grades are defined by your company. They can be numeric (1-10) or codes (Like A-F or Pass/Fail/Incomplete).	Edm.String

Property Name	Description	Property Type
creditHours	Credit hours are the number of hours that a user earns for completing a learning event. For example, in many U.S. colleges, students attend a single class for 15 weeks, 3 days each week, and 1 hour each day. In this case, the total hours equals 45; however, the college grants 3 CREDIT HOURS for this class. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
cpeHours	CPE is an abbreviation for "Continuing Professional Education" and refers to learning activities that users perform to maintain and expand the skills that their profession demands. Therefore, CPE hours are very much like credit hours, but the accumulation of CPE hours often leads to a professional certification. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
contactHours	Contact hours are the total number of hours that you expect a user to have contact with an instructor. For example, if you set up a blended learning item that has 8 total hours and, for 6 of those hours, you expect the user to be in an instructor-led segment, then the contact hours equals 6. The hours can be inherited from the learning event (the course) or they can be specified when a user, supervisor, or administrator records completion with the Record Learning wizard.	Edm.Double
totalHours	This is the total hours that a user earns for completing a course.	Edm.Double
instructorName	This is the name of the instructor who taught the course.	Edm.String

Property Name	Description	Property Type
comments	This is comments about the learning event.	Edm.String

Actions

This `$metadata` does **not** contain actions.

9.8.1.35 admin/catalog-service/v1 Metadata

Call to see the parameters for the catalog service. Pagination of results is only supported for the full feed. Results produced using the `/fromDate` criteria will not be paginated.

Metadata Call

Use this metadata call when you want the see the catalog or schedule details.

Sample Code

```
GET /learning/odatav4/public/admin/catalog-service/v1/$metadata
```

Note

The previous version of the API, which returned the catalog's contents as a single object, is no longer supported.

Here are the following endpoints for the Catalog Feed portion of `GET /learning/odatav4/public/admin/catalog-service/v1/$metadata`:

- **Catalog Details:** `/learning/odatav4/public/admin/catalog-service/v1/CatalogsFeed?$filter=criteria/catalogID eq 'perf-catalog' and criteria/localeID eq 'English'`
- **Catalog Courses:** `/learning/odatav4/public/admin/catalog-service/v1/CatalogsFeed('perf-catalog')/CoursesFeed?$filter=criteria/localeID eq 'English'`
- **Catalog Curricula:** `/learning/odatav4/public/admin/catalog-service/v1/CatalogsFeed('perf-catalog')/CurriculaFeed?$filter=criteria/localeID eq 'English'`
- **Catalog Programs:** `/learning/odatav4/public/admin/catalog-service/v1/CatalogsFeed('perf-catalog')/ProgramsFeed?$filter=criteria/localeID eq 'English'`
- **Catalog Collections:** `/learning/odatav4/public/admin/catalog-service/v1/CatalogsFeed('perf-catalog')/CollectionsFeed?$filter=criteria/localeID eq 'English'`

9.8.1.36 admin/financialtransactions/v1 Metadata

Call metadata to get the search properties for a financial transactions web service client.

Metadata Call

Sample Code

```
GET /learning/odatav4/public/admin/financialtransactions/v1/$metadata
```

Headers

Header	Value
Authorization	Bearer oauth_token

Search Properties

Search Parameter	Description
transactionID	This is the unique ID of the financial transaction. You can see the ID in the <i>ID</i> column in Commerce > Financial Transactions .
orderNo	This is the order number of the transaction. Orders are part of the purchasing process. Each order follows a process from submitted to complete.
controllingArea	This is the controlling area to which the company code belongs. SAP SuccessFactors Learning stores your controlling areas as a field on account codes so that you can retrieve transactions with this filter. Administrators add the correct controlling area in Commerce > Account Codes > Summary .

Search Parameter	Description
maxPageSize	This is used for server-side pagination. It tells the server the maximum size of records you want in a page of transactions.
paymentMethod	The method of payment for the transaction. Possible values: CHARGEBACK, CREDIT CARD, or PURCHASE ORDER.
cutOffDate	<p>If a transaction occurred before the date that you pass in <code>cutOffDate</code>, it won't be returned. You can use <code>cutOffDate</code> as a watermark: remember the last cut off date that you sent to return only those transactions that you have not seen yet.</p> <p>Set the default cut off date in System Admin > Configuration > System Configuration > FINANCIAL. Set <code>financialTransactionAPICutOffDate</code> to the default.</p> <p>This is in Unix Epoch time.</p>
limit	This is used for client-side pagination. We pass it to <code>\$top</code> , which is standard OData. It defines the number of the top record in a page, starting at the <code>\$skip</code> count. For example, if you want pages of 10, the first call passes 10, the second call passes 20, and so on.
skip	This is used for client-side pagination. We pass it to <code>\$skip</code> , which is standard OData. It defines the records to skip before counting towards <code>\$top</code> . For example, if you want pages of 10, the first call passes 0 (skip no records before fetch), the second call passes 10, and so on.
showTotalCount	If you pass <code>true</code> , the system returns the total transactions in the page. By default, it is <code>false</code> .

9.8.2 Common Use Cases for Learning OData APIs

9.8.2.1 Managing Learning Assignments

9.8.2.1.1 Assigning or Unassigning SAP SuccessFactors Learning Courses to Users v1

Use the learning item assignment web service to manage the assignment of learning items (courses) to users. This is v1 of learning assignment.

Learning items are a core object in SAP SuccessFactors Learning. Managing how they are assigned to users is the core function of the application. The learning assignment web service assigns and removes the assignment from users.

⚠ Caution

We recommend that you use a later version of this the `itemAssignment` service. It simplifies the calls to a single service and adds better support for assignment and unassignment.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

[POST Assignments as User or Supervisor v1 \[page 2126\]](#)

Assign learning to users as a user (self-assignment) or supervisor. This is the v1 version of this web service.

[POST Assignments as Administrators v1 \[page 2127\]](#)

Assign learning to users as an administrator. This is the v1 version of this web service.

[POST Remove Assignment as User or Supervisor v1 \[page 2128\]](#)

Remove learning item assignments as a user (removing self-assignment) or supervisor. This is v1 of this web service.

[POST Remove Assignment as Administrator v1 \[page 2129\]](#)

Remove learning item assignments as an administrator. This is v1 of this web service.

Related Information

[Assigning or Unassigning SAP SuccessFactors Learning Items to Users v2 \[page 2131\]](#)

9.8.2.1.1.1 POST Assignments as User or Supervisor v1

Assign learning to users as a user (self-assignment) or supervisor. This is the v1 version of this web service.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Assignment by Users or Supervisors

↔ Sample Code

```
POST /learning/odatav4/public/user/itemAssignment/v1/itemAssignments
```

To add a self-assignment, POST as the user who wants to self-assign. In the body of the post, send the learning item ID, the learning item type, and the revision date. Together, these values uniquely identify a learning item. You do not need to identify the user because the user is identified by the authorization.

↔ Sample Code

```
{
  "componentTypeID": "COURSE",
  "componentID": "WRT-849",
  "revisionDate": 1428506077000
}
```

To add a supervisor assignment, POST as the supervisor or alternate supervisor. In the body of the post, send the learning item ID, the learning item type, the revision date, and the user to be assigned the learning item.

↔ Sample Code

```
{
  "componentTypeID": "COURSE",
  "componentID": "WRT-849",
  "revisionDate": 1428506077000
  "studentID": "jdoe"
}
```

```
}
```

[POST Remove Assignment as User or Supervisor v1 \[page 2128\]](#)

[POST Remove Assignment as Administrator v1 \[page 2129\]](#)

9.8.2.1.1.2 POST Assignments as Administrators v1

Assign learning to users as an administrator. This is the v1 version of this web service.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- **The users themselves:** When a user assigns learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- **Supervisors:** If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another user's record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the user's catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- **Administrators:** If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Assignment by Administrators

↔ Sample Code

```
POST /learning/odatav4/public/admin/userService/v1/itemAssignments
```

To add an administrator assignment, POST as the administrator. In the body of the post, send the learning item ID, the learning item type, the revision date, and the user to be assigned the learning item.

Sample Code

```
{
  "componentTypeID": "COURSE",
  "componentID": "WRT-849",
  "revisionDate": 1428506077000
  "studentID" : "jdoe"
}
```

Parent topic: [Assigning or Unassigning SAP SuccessFactors Learning Courses to Users v1 \[page 2125\]](#)

9.8.2.1.1.3 POST Remove Assignment as User or Supervisor v1

Remove learning item assignments as a user (removing self-assignment) or supervisor. This is v1 of this web service.

You can build a client to remove learning item, curriculum or program assignments for users through one of these users:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. Users can remove a self-assigned learning item, curriculum, or program. If you authorize to the web service as an individual user, your client can enable the user to remove self-assignments.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisors to remove assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrators to remove assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Removing Assignment by Users or Supervisors

Sample Code

```
POST /learning/odatav4/public/user/itemAssignment/v1/AI_removeAssignment
```

To remove a self-assignment, POST as the user who wants to remove the self-assignment. In the body of the post, send the learning item ID, the learning item type, and the revision date. Together, these values uniquely identify a learning item. You do not need to identify the user because the user is identified by the authorization.

Sample Code

```
{
  "componentTypeID": "COURSE",
  "componentID": "WRT-849",
  "revisionDate": 1428506077000
}
```

To remove a supervisor assignment, POST as the supervisor or alternate supervisor. In the body of the post, send the learning item ID, the learning item type, the revision date, and the user to be assigned the learning item.

Sample Code

```
{
  "componentTypeID": "COURSE",
  "componentID": "WRT-849",
  "revisionDate": 1428506077000
  "studentID" : "jdoe"
}

9.8.2.1.2 Assigning or Unassigning SAP SuccessFactors Learning Items to Users v2

Use the learning item assignment web service to manage the assignment of courses (learning items) to users. This is v2 of learning assignment.

Learning items are a core object in SAP SuccessFactors Learning. Managing how they are assigned to users is the core function of the application.

The advantage to using v2 of this web service is that it gives you more information in the assignment and it allows you to pass an array of assignments.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

[Assign Learning Items as Users or Managers \(UserCourses\) v2 \[page 2131\]](#)

Assign learning to users as a user (self-assignment) or manager. This is the v2 version of this web service.

[Assign Learning Items as Administrators \(UserCourses\) v2 \[page 2134\]](#)

Assign learning to users as an administrator. This is the v2 version of this web service.

9.8.2.1.2.1 Assign Learning Items as Users or Managers (UserCourses) v2

Assign learning to users as a user (self-assignment) or manager. This is the v2 version of this web service.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Assignment by Users

↔ Sample Code

```
POST /learning/odatav4/public/user/userassignment-service/v2/UserCourses
```

To add a self-assignment, POST as the user who wants to self-assign. In the body of the post, send the learning item ID, the learning item type, and the revision date of the learning items that you want to assign, as an array. Together, these values uniquely identify a learning item. You do not need to identify the user because the user is identified by the authorization.

↔ Sample Code

```
{
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1428506077000
    }
  ]
}
```

The system returns the array with the assignment information. The `assignmentDate` is the current date and time.

↔ Sample Code

```
{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
    }
  ]
}
```

```

    "personGUID" : ""
    "personExternalID" : ""
    "assignmentType": "OPT",
    "requiredDate": 1458055380000,
    "assignmentDate": 1456894800000
  }
]
}

```

Assignment by Managers

↔ Sample Code

```
POST /learning/odatav4/public/user/userassignment-service/v2/UserCourses
```

To add a manager assignment, POST as the supervisor or alternate manager. In the body of the post, send the course to be assigned, the assignment information, and the user to be assigned the learning item.

↔ Sample Code

```

{
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
      "assignmentType": "OPT",
      "requiredDate": 1458055380000,
      "assignmentDate": 1456894800000
    }
  ]
}

```

The system returns the array with the assignment information. The `assignmentDate` is the current date and time.

↔ Sample Code

```

{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
      "personGUID": ""
      "personExternalID": ""
      "assignmentType": "OPT",
      "requiredDate": 1458055380000,
      "assignmentDate": 1456894800000
    }
  ]
}

```

[Unassign Learning Items as Administrators v2 \[page 2138\]](#)

9.8.2.1.2.3 Unassign Learning Items as Users and Supervisors v2

Remove learning item assignments as a user (removing self-assignment) or as a supervisor. This is v1 of this web service.

You can build a client to remove learning item, curriculum or program assignments for users through one of these users:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. Users can remove a self-assigned learning item, curriculum, or program. If you authorize to the web service as an individual user, your client can enable the user to remove self-assignments.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisors to remove assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrators to remove assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

→ Remember

In OData, each entity type/set needs to have primary key. `PUT` calls must have a primary key in both the URL of the `PUT` and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Remove Assignment by Users

↻ Sample Code

```
PUT /learning/odatav4/public/user/userassignment-service/v2/UserCourses('')
```

To remove an assignment you can `PUT` as the user who wants to remove the assignment. In the body of the post, send the learning item ID, the learning item type, and the revision date of the learning items that you want to remove, as an array. Together, these values uniquely identify a learning item. You do not need to identify the user because the user is identified by the authorization.

↻ Sample Code

```
{  
  "primaryKey": ""  
  "userCourse": [  
    {  
      "learningItemID": "1234567890"  
      "learningItemTypeID": "1234567890"  
      "revisionDate": "2017-01-01T00:00:00Z"  
    }  
  ]  
}
```

```

    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1428506077000
    }
  ]
}

```

The system returns the array with the assignment information. The `assignmentDate` is the current date and time.

↔ Sample Code

```

{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
      "personGUID": ""
      "personExternalID": ""
      "assignmentType": "OPT",
      "requiredDate": 1458055380000,
      "assignmentDate": 1456894800000
    }
  ]
}

```

Assignment by Supervisors

↔ Sample Code

```
PUT /learning/odatav4/public/user/userassignment-service/v2/UserCourses('')
```

To remove a supervisor assignment, PUT as the supervisor or alternate supervisor. In the body of the post, send the course to be removed, the assignment information, and the user to be unassigned from the learning item.

↔ Sample Code

```

{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
      "assignmentType": "OPT",
      "requiredDate": 1458055380000,
      "assignmentDate": 1456894800000
    }
  ]
}

```

The system returns the array with the assignment information. The `assignmentDate` is the current date and time.

Sample Code

```
{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
      "personGUID": ""
      "personExternalID": ""
      "assignmentType": "OPT",
      "requiredDate": 1458055380000,
      "assignmentDate": 1456894800000
    }
  ]
}
```

9.8.2.1.2.4 Unassign Learning Items as Administrators v2

Remove learning item assignments as an administrator. This is v1 of this web service.

You can build a client to remove learning item, curriculum or program assignments for users through one of these users:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. Users can remove a self-assigned learning item, curriculum, or program. If you authorize to the web service as an individual user, your client can enable the user to remove self-assignments.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisors to remove assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrators to remove assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

→ Remember

In OData, each entity type/set needs to have primary key. PUT calls must have a primary key in both the URL of the PUT and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Assignment by Administrators

↔ Sample Code

```
PUT /learning/odatav4/public/admin/user-service/v2/UserCourses('')
```

To remove an administrator assignment, PUT as the administrator. In the body of the post, send the learning item information, the assignment information, and the user to be unassigned the learning item.

↔ Sample Code

```
{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1456081860000,
      "studentID": "JDOE",
      "assignmentType": "OPT",
      "requiredDate": 1458055380000,
      "assignmentDate": 1456894800000
    },
    {
      "componentTypeID": "COURSE",
      "componentID": "ABC-123",
      "revisionDate": 1456179900000,
      "studentID": "BCHEN"
    }
  ]
}
```

The system returns the array with the assignment information. The `assignmentDate` is the current date and time.

↔ Sample Code

```
{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
```

```
    "componentID": "WRT-849",
    "revisionDate": 1456081860000,
    "studentID": "JDOE",
    "personGUID": ""
    "personExternalID": ""
    "assignmentType": "OPT",
    "requiredDate": 1458055380000,
    "assignmentDate": 1456894800000
  }
]
```

9.8.2.1.3 Assigning or Unassigning SAP SuccessFactors Learning Programs to Users

Assign or remove the assignment of learning programs to users through a web service.

Learning programs are bundles of learning items that can be assigned to users as a bundle. Managing how they are assigned to users is the core function of the application. The learning program assignment web service assigns and removes the assignment from users.

Curricula also bundle courses together, but do so with more complex assignment rules.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- **The users themselves:** When a user assigns learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- **Supervisors:** If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another user's record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the user's catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- **Administrators:** If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

9.8.2.1.3.1 Assign Programs as Users or Supervisors v1

Assign learning programs to users as a user (self-assignment) or supervisor.

You can build a client to assign learning items, curricula, or programs to users through one of these assigners:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. If you authorize to the web service as an individual user, your client can enable the user to self-assign.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisor assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrator assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Assignment by Users

Sample Code

```
POST /learning/odatav4/public/user/userassignment-service/v1/UserPrograms
```

To add a self-assignment, POST as the user who wants to self-assign. In the body of the post, send the program ID and the type. Optionally, you can send the assignment type and date.

Sample Code

```
{
```

```

"userProgram": [
  {
    "programID": "WBTPRO-931",
    "programTypeID": "OPEN_ENDED",
    "assignmentType": "OPT",
    "assignmentDate": 1458248400000
  }
]
}

```

The system returns the array with the assignment information.

Sample Code

```

{
  "primaryKey": ""
  "userProgram": [1]
    0: {
      "programID": "WBTPRO-931"
      "programTypeID": "OPEN_ENDED"
      "studentID": ""
      "personGUID": ""
      "personExternalID": ""
      "assignmentTypeID": "OPT"
      "assignmentDate": 1458248400000
      "errorMessage": null
    }
}

```

Assignment by Supervisors

Sample Code

```
POST /learning/odatav4/public/user/userassignment-service/v1/UserPrograms
```

To add an assignment as a supervisor, POST as the assignee's supervisor. In the body of the post, send the program ID and the type. Optionally, you can send the assignment type and date.

Sample Code

```

{
  "userProgram": [
    {
      "programID": "WBTPRO-931",
      "programTypeID": "OPEN_ENDED",
      "studentID": "JDOE",
      "assignmentType": "OPT",
      "assignmentDate": 1458248400000
    }
  ]
}

```

The system returns the array with the assignment information.

Sample Code

```
{
  "primaryKey": ""
  "userProgram": [1]
    0: {
      "programID": "WBTPRO-931"
      "programTypeID": "OPEN_ENDED"
      "studentID": ""
      "personGUID": ""
      "personExternalID": ""
      "assignmentTypeID": "OPT"
      "assignmentDate": 1458248400000
      "errorMessage": null
    }
}
```

9.8.2.1.3.3 Unassign Programs as users or Supervisors v1

Unassign learning programs to users as a user (self-assignment) or supervisor.

You can build a client to remove learning item, curriculum or program assignments for users through one of these users:

- The users themselves: When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. Users can remove a self-assigned learning item, curriculum, or program. If you authorize to the web service as an individual user, your client can enable the user to remove self-assignments.
- Supervisors: If you authorize to the web service as a user who is a learning manager, your client can enable supervisors to remove assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- Administrators: If you authorize to the web service as an administrator, your client can enable administrators to remove assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

→ Remember

In OData, each entity type/set needs to have primary key. `PUT` calls must have a primary key in both the URL of the `PUT` and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Unassignment by Users

↻ Sample Code

```
PUT /learning/odatav4/public/user/userassignment-service/v1/UserPrograms('')
```

To remove a self-assignment, `PUT` as the user who wants to self-assign. In the body of the post, send the program ID and the type. Optionally, you can send the assignment type and date.

↻ Sample Code

```
{
  "primaryKey": ""
  "userProgram": [
    {
      "programID": "WBTPRO-931",
      "programTypeID": "OPEN_ENDED",
      "assignmentType": "OPT",
      "assignmentDate": 1458248400000
    }
  ]
}
```

```
]
}
```

The system returns the array with the assignment information.

Sample Code

```
{
  "@odata.context": "$metadata#UserPrograms/$entity"
  "primaryKey": ""
  "userProgram": [1]
    0: {
      "programID": "WBTPRO-931"
      "programTypeID": "OPEN_ENDED"
      "studentID": null
      "assignmentTypeID": "OPT"
      "assignmentDate": 1458248400000
      "errorMessage": null
    }
}
```

Assignment by Supervisors

Sample Code

```
PUT /learning/odatav4/public/user/userassignment-service/v1/UserPrograms('')
```

To remove an assignment as a supervisor, PUT as the assignee's supervisor. In the body of the post, send the user, program ID, and the type.

Sample Code

```
{
  "primaryKey": ""
  "userProgram": [
    {
      "programID": "WBTPRO-931",
      "programTypeID": "OPEN_ENDED",
      "studentID": "JDOE",
      "assignmentType": "OPT",
      "assignmentDate": 1458248400000
    }
  ]
}
```

The system returns the array with the unassignment information.

Sample Code

```
{
  "@odata.context": "$metadata#UserPrograms/$entity"
  "primaryKey": ""
  "userProgram": [1]
    0: {
      "programID": "WBTPRO-931"
```

```
"programTypeID": "OPEN_ENDED"  
"studentID": "JDOE"  
"assignmentTypeID": "OPT"  
"assignmentDate": 1458248400000  
"errorMessage": null  
}  
}
```

9.8.2.1.3.4 Unassign Programs as Administrators v1

Unassign learning programs to users as a user (self-assignment) or supervisor.

You can build a client to remove learning item, curriculum or program assignments for users through one of these users:

- **The users themselves:** When a users assign learning items, curricula, or programs to themselves, that is called self-assignment. Users can remove a self-assigned learning item, curriculum, or program. If you authorize to the web service as an individual user, your client can enable the user to remove self-assignments.
- **Supervisors:** If you authorize to the web service as a user who is a learning manager, your client can enable supervisors to remove assignments. A supervisor user ID is one that appears on another users' record in the summary section as the supervisor. Users can also have alternate supervisors defined. When a supervisor assigns learning, he or she assigns from their supervisor's catalog and not the users' catalogs. Put another way, a supervisor might have access to learning items or programs that employees do not.
- **Administrators:** If you authorize to the web service as an administrator, your client can enable administrators to remove assignments. Learning administrators are often responsible for entire organizations.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

→ Remember

In OData, each entity type/set needs to have primary key. `PUT` calls must have a primary key in both the URL of the `PUT` and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Unassignment by Administrators

Sample Code

```
PUT /learning/odatav4/public/admin/user-service/v1/UserPrograms('')
```

To remove an assignment as a supervisor, PUT as an administrator. In the body of the post, send the user ID, program ID, and the type.

Sample Code

```
{
  "primaryKey": ""
  "userProgram": [
    {
      "programID": "WBTPRO-931",
      "programTypeID": "OPEN_ENDED",
      "studentID": "JDOE",
      "assignmentType": "OPT",
      "assignmentDate": 1458248400000
    }
  ]
}
```

The system returns the array with the assignment information.

Sample Code

```
{
  "primaryKey": ""
  "userProgram": [1]
    0: {
      "programID": "WBTPRO-931"
      "programTypeID": "OPEN_ENDED"
      "studentID": ""
      "personGUID": ""
      "personExternalID": ""
      "assignmentTypeID": "OPT"
      "assignmentDate": 1458248400000
      "errorMessage": null
    }
}

9.8.2.1.4 Learning Curriculum Assignment Web Service

The learning curriculum assignment web service assigns curricula to users.

Curricula are bundles of courses that can be assigned as a bundle to users. They are typically used by companies that have complex rules for assignment: rules that are written by an oversight agency. This web service makes the assignment.

An alternative way to assign bundles to users is through learning programs.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Assignment by Users

↔ Sample Code

```
POST /learning/odatav4/public/user/curriculum-service/v1/Curricula
```

To add a self-assignment, POST as the user who wants to self-assign.

↔ Sample Code

```
{
  "primaryKey": "",
  "curricula": [
    {
      "qualificationID": "CUR-123",
      "assignmentDate": 1428506077000,
      "priority": 2
    }
  ]
}
```

The system returns the assignment information.

↔ Sample Code

```
{
  "value": [
    {
      "studentID": "",
      "personGUID": "",
      "personExternalID": "",
      "qualificationID": "",
      "assignmentDate": 1199125800000,
      "priority": 1,
      "criteria": null
    }
  ]
}
```

Assignment by Supervisors

↔ Sample Code

```
POST /learning/odatav4/public/user/curriculum-service/v1/Curricula
```

To add an assignment as a supervisor, POST as the assignee's supervisor.

Sample Code

```
{
  "primaryKey": "",
  "curricula": [
    {
      "studentID": "JDOE",
      "qualificationID": "CUR-123",
      "assignmentDate": 1428506077000,
      "priority": 2
    }
  ]
}
```

The system returns the assignment information.

Sample Code

```
{
  "value": [
    {
      "studentID": "",
      "personGUID": "",
      "personExternalID": "",
      "qualificationID": "",
      "assignmentDate": 1199125800000,
      "priority": 1,
      "criteria": null
    }
  ]
}
```

When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Unassignment by Users

Sample Code

```
PUT /learning/odatav4/public/user/curriculum-service/v1/Curricula('')
```

To remove a self-assignment, PUT as the user who wants to self-assign.

Sample Code

```
{
  "primaryKey": "",
  "curricula" : [
    {
      "studentID": "user01",
      "personGUID": "",
      "personExternalID": "",
      "qualificationID": "qual-01"
    },
    {
      "studentID": "user01",
      "personGUID": "",
      "personExternalID": "",
      "qualificationID": "qual-02"
    }
  ]
}
```

The system returns the assignment information.

Sample Code

```
{
  "value": [
    {
      "studentID": "",
      "personGUID": "",
      "personExternalID": "",
      "qualificationID": "",
      "assignmentDate": 1199125800000,
      "priority": 1,
      "criteria": null
    }
  ]
}
```

Unsignment by Supervisors

Sample Code

```
PUT /learning/odatav4/public/user/curriculum-service/v1/Curricula('')
```

To remove an assignment as a supervisor, PUT as the assignee's supervisor.

Sample Code

```
{
  "primaryKey": "",
  "curricula" : [
    {
      "studentID": "user01",
      "personGUID": "",
      "personExternalID": "",

9.8.2.1.5 Getting Users' Learning Plan Information with a Web Service

Find the courses, programs, and other learning objects on users' learning plans.

You often want to get users' learning assignments (their learning plans) so that you can see what they are assigned. This is often a first call to match one user with the courses, programs, and other objects on their *My Assignments* tile. After returning their assignments, you can return the objects that are on users' learning plans, look for available scheduled offerings for the learning item assignments, and so on.

You can see users' learning plans in the administration environment in ► [Users](#) ► [Users](#) ► [Assignments](#) ►. Users know their learning plan as the courses in their *My Assignments* tile.

[Get Learning Assignments \[page 2158\]](#)

Get users' learning plans through a search.

[Get Available Scheduled Offerings Sample Call \[page 2160\]](#)

Use this sample call to see how you can structure your call to the Get Available Scheduled Offering web service.

[Get Learning Item Details \[page 2161\]](#)

Get the details of a learning item.

[Get Learning Item Prerequisites \[page 2163\]](#)

Get the prerequisites for a learning item.

[Get Documents Related to Assigned Learning Items \[page 2165\]](#)

Get the documents related to a learning item on users' learning plans.

9.8.2.1.5.1 Get Learning Assignments

Get users' learning plans through a search.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

↗ Sample Code

```
GET /learning/odatav4/public/user/learningPlan/v1/UserTodoLearningItems
?$filter=criteria/maxRowNum eq 10 and
criteria/retrieveLinkedSchedules eq 'true' and
criteria/includeVLSlink eq true and
criteria/includeSurveys eq true
```

Unlike other sample calls, we include `MaxRowNum` as a criteria because it is a special case. Unlike other OData services that page with the `$top`, `$skip`, and `$count` parameters, this service uses `MaxRowSize`. We strongly recommend that you limit your calls to a reasonable size of rows.

Response: UserTodoLearningItems

↗ Output Code

```

9.8.2.1.6 Getting Users' Learning History with a Web Service

Use the learning history web service to return the list of courses that a user has been assigned and then completed.

When users finish a course and learning events are recorded, the course is added to users' learning history. You can retrieve users' learning history when you want to report on the courses that they completed and when.

[Get Learning History \[page 2166\]](#)

Learning history is the set of courses, or learning items, that users have finished (successfully or unsuccessfully).

9.8.2.1.6.1 Get Learning History

Learning history is the set of courses, or learning items, that users have finished (successfully or unsuccessfully).

Sample Code

```
GET /learning/odatav4/public/user/learningHistory/v1/learninghistories?
$filter=criteria/maximumToRetrieve eq 10 and
criteria/includeDeepLink eq true
```

Response: learninghistories

Output Code

```

9.8.2.2 Managing LMS Users

9.8.2.2.1 Searching for SAP SuccessFactors Learning Users with a Web Service

Use student search to find end-users in SAP SuccessFactors Learning.

The name **student** is a way of distinguishing the types of users in SAP SuccessFactors Learning. The Student Search web service finds end-users who are assigned learning as opposed to administrators who set up the learning or instructors who teach courses.

In most cases, every person in your company is a student, even if individuals are also administrators and instructors. When you search for students, you return information that applies to the people in your company in the role of a learning. For example, student search does **not** return the facilities that a person usually teaches in because "facilities that a person usually teaches in" is an attribute of that person as an instructor, not a student.

[GET Students Call \[page 2168\]](#)

9.8.2.2.2 Adding and Updating SAP SuccessFactors Learning LMS Users through Web Services

Use the add and update LMS user web services to add and update SAP SuccessFactors Learning users.

We recommend the add and update LMS users for native SAP SuccessFactors Learning users. If you are in an integrated environment, consider how your user data syncs from the tables of record.

⚠ Caution

We recommend that you add or update users centrally in the SAP SuccessFactors system of record and allow the data to flow into the LMS through standard means. When you update users through Learning, you update the user as a student, but not as a SAP SuccessFactors user - what you change is available only to the LMS, and it is possible that shared data is overwritten from the system of record.

[Add and Update User Data Structures \[page 2170\]](#)

By understanding the users' data structures, you can more easily write web service clients.

[POST SAP SuccessFactors Learning User Sample Call \[page 2171\]](#)

We recommend that you use the most current user service to add users.

[PUT SAP SuccessFactors Learning User Sample Call \[page 2172\]](#)

We recommend that you use the most current user service to update users.

Related Information

[user/v1 Metadata Call \[page 2064\]](#)

9.8.2.2.2.1 Add and Update User Data Structures

By understanding the users' data structures, you can more easily write web service clients.

When you add or update users, you should understand how the data behaves. You don't need to know the exact data structures, just how you need to treat them:

- User data is like data members on a user object. For example, you can think of a user's first name as a private data member of a user class.
- User phone numbers are like a hashmap of phone numbers where the hashmap is a data member of the user object: each entry in the hashmap is identified by a phone number and a description of the phone number. You can add, for example, Mobile Phone and Office Phone to the list of users' phone numbers.
- User custom columns are like a subclass to the user class: each entry has multiple data members, and the members can be more complex than a simple string. For example, you can create custom columns with enumerated values like T-Shirt size (Small, Medium, or Large). You can think of the value data member in this case like an array.

Look in the administration environment to understand how phone numbers and custom columns work, and the specific phone numbers and custom columns for your company. If you do not have access to the administration environment, someone can look for you and provide the information. To understand the kind of phone numbers that your company typically records, look in [Users > Users > Phone Numbers](#). To understand valid values for custom columns, look in [System Admin > Custom Columns > User](#).

9.8.2.3 Managing User Enrollment and Attendance Through Web Services

Manage enrollment and attendance through web services when you want to change users' relationship to a live event (a class): their attendance, placement, or completion.

Enrollment and attendance in class - live learning events led by an instructor - define a relationship between a user and that class. For example, the user can be enrolled into the class or that enrollment can be canceled. Instructors might want a list of all users enrolled (a course roster) and might want to mark who was enrolled and then attended the event. These are all stories about connecting users to live events or looking for users in live events.

Note

Enrollment for a reserved seat isn't supported by the API. You can enroll a user for a general seat through the API or for a reserved seat through the UI.

[Enrolling Users into Classes \[page 2176\]](#)

The learning curriculum assignment enrolls users into classes of a course.

[Getting a Course Roster \[page 2180\]](#)

Get the list of users on a roster for a particular class.

[Modifying Enrollment Status with a Web Service \[page 2184\]](#)

Modify enrollment status when users need to withdraw from a course, administrators need to edit the registration of a scheduled offering, or supervisors need to enroll or withdraw users.

[Getting Classes with a Web Service \[page 2188\]](#)

Use the get scheduled offering web service to return a class when you know its unique ID.

[Marking Attendance for Users in Courses \[page 2190\]](#)

Use the mark segment attendance web service to record the attendance for each segment of a scheduled offering.

[admin/scheduledoffering-service/v1 Metadata Call \[page 2194\]](#)

Call for `admin/scheduledoffering-service/v1` to manage scheduled offerings as an administrator.

[user/scheduledoffering-service/v1 Metadata Call \[page 2214\]](#)

Call for `user/scheduledoffering-service/v1` to manage classes as a user or manager.

9.8.2.3.1 Enrolling Users into Classes

The learning curriculum assignment enrolls users into classes of a course.

SAP SuccessFactors Learning manages the schedules of learners, instructors, equipment, locations, and so on. A critical part of managing the schedules is enrolling users into classes of a course. A user enrolled in a January class of a course has a different schedule than the user enrolled in the February offering of the same course. With the web service, you can enroll users into particular classes of a course.

Note

Enrollment for a reserved seat isn't supported by the API. You can enroll a user for a general seat through the API or for a reserved seat through the UI.

[Enroll into Classes as Users or Managers \[page 2177\]](#)

Enroll users into classes as a user (self-enrollment) or manager.

[Enrolling Users into Classes as Administrators \[page 2179\]](#)

Enroll users into classes as an administrator.

9.8.2.3.1.1 Enroll into Classes as Users or Managers

Enroll users into classes as a user (self-enrollment) or manager.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

↗ Sample Code

```
POST /learning/odatav4/public/user/scheduledoffering-service/v1/Enrollments
```

Enrollment by managers or users post to the same URL. The difference is the user who posts. If users are self-enrolling, they can post as themselves and `studentID` is not required. To post as managers, `studentID` is required.

Sample POST Body: Enrollments

↗ Sample Code

This example shows posting as an administrator or manager for two users with IDs `user-1` and `user-2`.

```
{
  "enrollments" : [
    {
```

```

    "scheduleID":3421 ,
    "studentID": "User-1",
    "enrollmentStatusID": "ENROLL",
    "notifyUser":true,
    "comments": "User is enrolled",
    "notifyInstructor": true,
    "notifySupervisor":true,
    "notifyContacts": true
  } ,
  {
    "scheduleID":3421 ,
    "studentID": "User-2",
    "enrollmentStatusID": "ENROLL",
    "notifyUser":true,
    "comments": "User is enrolled",
    "notifyInstructor": true,
    "notifySupervisor":false,
    "notifyContacts": false
  }
]
}

```

Response: Enrollments

The system returns the assignment information.

Sample Code

```

{
  "enrollments" : [
    {
      "scheduleID":3421 ,
      "studentID": "User-1",
      "enrollmentStatusID": "ENROLL",
      "notifyUser":true,
      "comments": "User is Enrolled",
      "notifyInstructor": true,
      "notifySupervisor":true,
      "notifyContacts": true,
      "errorMessage": "",
      "warningMessage": "",
      "warningOverride": ""
    } ,
    {
      ...
    }
  ]
}

```

Parent topic: [Enrolling Users into Classes \[page 2176\]](#)

Related Information

[Enrolling Users into Classes as Administrators \[page 2179\]](#)

9.8.2.3.1.2 Enrolling Users into Classes as Administrators

Enroll users into classes as an administrator.

Sample Code

```
POST /learning/odatav4/public/admin/scheduledoffering-service/v1/Enrollments
```

To enroll as an administrator, POST as an administrator. The URL that you post to is different from the URL that you post to for users and managers, but the JSON is the same.

Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

In OData, each entity type/set needs to have primary key. PUT calls must have a primary key in both the URL of the PUT and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Sample POST Body: Enrollments

Sample Code

This example shows posting as an administrator or manager for two users with IDs `User-1` and `User-2`.

```
{
  "enrollments" : [
    {
      "scheduleID":3421 ,
      "studentID": "User-1",
      "enrollmentStatusID": "ENROLL",
      "notifyUser":true,
      "comments": "User is enrolled",
      "notifyInstructor": true,
      "notifySupervisor":true,
      "notifyContacts": true
    } ,
    {
      "scheduleID":3421 ,
      "studentID": "User-2",
      "enrollmentStatusID": "ENROLL",
      "notifyUser":true,
      "comments": "User is enrolled",
      "notifyInstructor": true,
      "notifySupervisor":false,
      "notifyContacts": false
    }
  ]
}
```

Response: Enrollments

The system returns the assignment information.

Sample Code

```
{
  "enrollments" : [
    {
      "scheduleID":3421 ,
      "studentID": "User-1",
      "enrollmentStatusID": "ENROLL",
      "notifyUser":true,
      "comments": "User is Enrolled",
      "notifyInstructor": true,
      "notifySupervisor":true,
      "notifyContacts": true,
      "errorMessage": "",
      "warningMessage": "",
      "warningOverride": ""
    },
    {
      ...
    }
  ]
}
```

9.8.2.3.2 Getting a Course Roster

Get the list of users on a roster for a particular class.

You often want to get the enrollment list before you take other actions. For example, you might get the enrollment list to see who is in a class before you modify the enrollment status. You might also get the enrollment list again to verify that the change took effect.

Another common case for get enrollment list is to get a roster for an instructor. Although this would duplicate the functionality of the instructor dashboard, it is possible that you want to develop a secondary way of getting the roster. You might also want to share the enrollment list with the rest of the participants.

9.8.2.3.3 Modifying Enrollment Status with a Web Service

Modify enrollment status when users need to withdraw from a course, administrators need to edit the registration of a scheduled offering, or supervisors need to enroll or withdraw users.

Enrollment status defines where users are in the registration process. For example, they can be registered for the course or withdrawn from the course. You modify their enrollment status to change where they are in the process. For example, you might want to withdraw users from a course. You can change their enrollment status from registered to withdrawn.

[Modify Enrollment Status as Users and Managers \[page 2185\]](#)

Call the modify enrollment status when users need to withdraw from a course or managers need to enroll or withdraw users.

[Changing Enrollment Status as Administrators \[page 2186\]](#)

Change the enrollment of users from administrators.

9.8.2.3.3.1 Modify Enrollment Status as Users and Managers

Call the modify enrollment status when users need to withdraw from a course or managers need to enroll or withdraw users.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

→ Remember

In OData, each entity type/set needs to have primary key. `PUT` calls must have a primary key in both the URL of the `PUT` and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

↔ Sample Code

```
PUT /learning/odatav4/public/user/scheduledoffering-service/v1/  
EnrollmentStatuses('')
```

Users must have permission to withdraw from classes and managers (or alternate managers and Human Resource Business Partners) must have permission to access registration.

Call PUT: EnrollmentStatuses

↔ Sample Code

```
{  
  "primaryKey": "",  
  "enrollmentStatus": [  
    {  
      "scheduleID": 3421,  
      "userID": "User-1",  
      "newEnrollmentStatusID": "CANCELLED",  
      "registrationChangeTime": 1458593685000,  
    }  
  ]  
}
```

```
    "timezone": "US/Eastern"
  }
]
}
```

Response: EnrollmentStatuses

The system returns the assignment information.

Sample Code

```
{
  "primaryKey": "",
  "enrollmentStatus": [
    {
      "scheduleID": 3421,
      "userID": "User-1",
      "newEnrollmentStatusID": "CANCELLED",
      "registrationChangeTime": 1458593685000,

9.8.2.3.4 Getting Classes with a Web Service

Use the get scheduled offering web service to return a class when you know its unique ID.

A scheduled offering is a course that has been scheduled to take place at a particular time and place. For example, if you schedule an orientation course every month, then the single orientation course has twelve scheduled offerings per year. It is offered in January, February, March, and so on.

You have two ways of getting a class:

- You know the unique ID of the class and you want to return that single offering. For example, you want to return the **January** offering for an orientation course.
- You know the learning item information and you want to return all offerings for that learning item. For example, you know the ID, type, and revision date of an orientation course and you want to see when it is offered.

[Get Scheduled Offering as Users or Supervisors \[page 2188\]](#)

Use this sample call to see how you can structure your call to get a single scheduled offering with a web service.

9.8.2.3.5 Marking Attendance for Users in Courses

Use the mark segment attendance web service to record the attendance for each segment of a scheduled offering.

Scheduled offerings are a course that takes place at a specific time. A user can attend, for example, a January offering of a course or a February offering of the same course. Each scheduled offering is composed of one or more segments. For example a course that takes place over three days can be three segments, one for each day.

When you mark attendance, you mark it on the individual **segments**. For example, a user might attend the first two segments but miss the third. Depending on your company's policies, segment attendance can matter. For example, you might mark the user complete if the user attends more than half of the segments in the offering and passes the exams.

[Mark Time Slot Attendance as Instructors \[page 2190\]](#)

9.8.2.3.5.1 Mark Time Slot Attendance as Instructors

Marking learners as attending time slots as an instructor.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

→ Remember

In OData, each entity type/set needs to have primary key. PUT calls must have a primary key in both the URL of the PUT and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Sample Code

```
POST /learning/odatav4/public/user/scheduledoffering-service/v1/SegmentAttendances
```

To mark attendance as an instructor, you must have your instructors configured in the system and they must have permission to record attendance.

Mark Attendance as Called by Administrator

Sample Code

```
POST /learning/odatav4/public/admin/scheduledoffering-service/v1/SegmentAttendances
```

POST Call: segmentAttendances

Sample Code

```
{
  "segmentAttendances" : [
    {
      "scheduleID": 3750,
      "userID": "User-1",
      "segmentID": 1,
      "comments": "User Attended Segment"
    },
    {
      "scheduleID": 3750,
      "userID": "User-2",
      "segmentID": 1,
      "comments": "User Attended Segment"
    }
  ]
}
```

Response: segmentAttendances

The system returns the assignment information.

Sample Code

```
{
  @odata.context: "$metadata#SegmentAttendances/$entity"
  "segmentAttendances" : [
    {
```

```

    "scheduleID": 3750,
    "userID": "User-1",
    "segmentID": 1,
    "comments": "User Attended Segment"
  },
  {
    "scheduleID": 3750,
    "userID": "User-2",
    "segmentID": 1,
    "comments": "User Attended Segment"
  }
]
}

```

Attendance Parameters

Attendance Parameters

Parameter	Description
scheduleID	<p>This is the unique ID of the scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.</p> <p>This parameter is required.</p>
userID	<p>The unique User ID of the user to be enrolled.</p> <p>Although <code>userID</code> is not required by the web service at the <code>user</code> service, this parameter is required by the business case. You do not usually want users marking their own attendance. If you do not supply a user ID, you are telling the web service to mark the instructor as attending the time slot. This would be unusual.</p>
segmentNumber	<p>This is the unique ID of the time slot within the class.</p> <p>This parameter is required.</p>
Comments	<p>Any comments about the enrollment.</p> <p>This parameter is optional.</p>

Related Information

[Mark Attendance as an Administrator \[page 2193\]](#)

9.8.2.3.5.2 Mark Attendance as an Administrator

Mark learners as attending time slots as an administrator.

Sample Code

```
POST /learning/odatav4/public/admin/scheduledoffering-service/v1/SegmentAttendances
```

In OData, each entity type/set needs to have primary key. `PUT` calls must have a primary key in both the URL of the `PUT` and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Administrators must have permission to mark attendance.

POST Call: segmentAttendances

Sample Code

```
{
  "segmentAttendances" : [
    {
      "scheduleID": 3750,
      "userID": "User-1",
      "segmentID": 1,
      "comments": "User Attended Segment"
    },
    {
      "scheduleID": 3750,
      "userID": "User-2",
      "segmentID": 1,
      "comments": "User Attended Segment"
    }
  ]
}
```

Response: segmentAttendances

The system returns the assignment information.

Sample Code

```
{
  @odata.context: "$metadata#SegmentAttendances/$entity"
  "segmentAttendances" : [
    {
      "scheduleID": 3750,
      "userID": "User-1",
      "segmentID": 1,
      "comments": "User Attended Segment"
    }
  ]
}
```

```

    },
    {
      "scheduleID": 3750,
      "userID": "User-2",
      "segmentID": 1,
      "comments": "User Attended Segment"
    }
  ]
}

```

9.8.2.3.6 admin/scheduledoffering-service/v1 Metadata Call

Call for `admin/scheduledoffering-service/v1` to manage scheduled offerings as an administrator.

Use this metadata call when you want to modify the enrollment status of users. Segments are not a supported entity in this API. This API does not support the commerce flow.

Sample Code

```
GET /learning/odatav4/public/admin/scheduledoffering-service/v1/$metadata
```

Entity Types

EnrollmentListing

Property Name	Description	Property Type
enrollSeatID	This is the unique ID of the enrollment seat for the user in the current scheduled offering. The value is a number.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
enrollSlotID	This is the unique ID of the enrollment slot. A slot is a spot in a training course that a user can enroll into. For example, if a course (a scheduled offering) is limited to ten participants, it has ten slots. Each participant who enrolls is placed into a slot. If nine users enroll into the course, then nine of ten slots are occupied. Slots are important because you can reserve slots for users. You can, for example, say that a course has ten slots and five of them are reserved for users of a particular organization.	Edm.Int64

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
enrollStatID	This is the registration status for this user in this entity.	Edm.String
enrollDate	This is the date of enrollment - the date that the user was added to the entity.	Edm.Int64
comments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
shippingAddress	This is the street address used for shipping.	Edm.String
shippingCity	This is the city used in the shipping address.	Edm.String
shippingState	This is the state or province used in the shipping address.	Edm.String
shippingPostal	This is the postal code used in the shipping address.	Edm.String
shippingCountry	This is the country used in the shipping address.	Edm.String
shippingPhoneNo	This is the phone number that can contact someone at the shipping address for information about the shipment.	Edm.String
shippingFaxNo	This is the fax number where you can send documents at the shipping address. For example, a place to fax shipping labels.	Edm.String

Property Name	Description	Property Type
shippingEmailAddress	This is the email address that can contact someone at the shipping address for information about the shipment.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
addUser	The user who added the entity.	Edm.String
cancelDate	If the user cancels, this is the date of the cancellaton.	Edm.Int64
orderItemID	The order ID associated with the learning item.	Edm.Int64
paymentOrderTicketNo	If this order is paid with a ticket, this is the number of the ticket.	Edm.String
ticketSequence		Edm.Int64
origin		Edm.String
withdrawPending	If the user is cancelling and that withdraw is pending, this is true.	Edm.Boolean
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64

EnrollmentListing

Property Name	Description	Property Type
enrollmentListing		Collection(Namespace1_Alias.EnrollmentListing)
criteria		Namespace1_Alias.criteria

ScheduledOffering

Property Name	Description	Property Type
scheduleID		Edm.Int64
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String

Property Name	Description	Property Type
typeComponent	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
activityOrComponentID	This is the unique ID of a learning item.	Edm.String
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
maximumEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
minimumEnrollment	This is the minimum amount of users who must enroll into the course for the course to take place.	Edm.Int64
contact	This is the person or group who can be contacted about this entity. For example, someone to call about details for a scheduled offering.	Edm.String
emailAddress	This is the email address of a person or group (distribution list) who can be contacted about this entity. For example, a distribution list of people who know about a scheduled offering.	Edm.String

Property Name	Description	Property Type
phoneNo	This is the telephone number for a person or group (answering service) who can be contacted about this entity. For example, the phone number of a department that can answer questions about a scheduled offering.	Edm.String
faxNo	This is the fax number for a person or group who can be contacted about this entity. For example, your company might set up a fax number if you need to fax release forms to a department.	Edm.String
enrollmentCutoffDate	The date after which users are no longer allowed to enroll into the entity. Cut off dates give instructors time to look at a class roster and decide how to structure the course for that roster and give administrators some time to set things up before the course starts.	Edm.Int64
selfEnrollment	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
scheduleDesc	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String
comments	These are internal comments about the entity. In general, they are not for users. Instead they are administrators' comments to themselves.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
notActive	If the value is false then the user is active. If the value is true, then the user is inactive.	Edm.Boolean

Property Name	Description	Property Type
scheduleEnrollStatus	This is a description of the number of seats available, the seats filled, and the number of waitlisted users.	Edm.String
enrollmentComments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
revisionNo	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
enrollmentSeatID	If this user is already enrolled in this scheduled offering, this value is the unique ID of the seat that the user occupies. If this user is not enrolled in this scheduled offering, then this value is null.	Edm.Int64
studentEnrollmentStatusTypeLabelID	This is the registration status for this entity, with the key you need to translate it to this user's language.	Edm.String
studentEnrollmentStatusType	This is the registration type that has been assigned to the user.	Edm.String
studentEnrollmentStatus	This is the registration status for this user in this entity.	Edm.String
timeZoneID	This is the time zone of the entity.	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the scheduled offering time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean

Property Name	Description	Property Type
titleLabelKey	This is the ID that the LMS uses to look up the title of the entity and return a value that is translated to this users' language/locale.	Edm.String
timeZoneLabelValue	This is the time zone of the entity, in a human readable format.	Edm.String
enrolledCount	This is the number of users who are currently enrolled.	Edm.Int64
availableSeatCount	This is the number of available seats left in the scheduled offering (the number of users who can still enroll in the scheduled offering).	Edm.Int64
instructors		Collection(Namespace1_Alias.instructors)
criteria		Namespace1_Alias.criteria

SegmentAttendance

totalCount		Edm.Int64

criteria

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
skiptoken		Edm.String

criteria

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64

SegmentAttendances

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64

Property Name	Description	Property Type
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
segmentID	This is the unique ID of a segment. A segment is one part of a course (a learning item or scheduled offering). For example, if a course meets over two days, each day can be a segment. This allows you to track attendance on a more granular level: you can see who attended (in this example) the first day and who attended the second day. You can also assign instructors per segment. It could be that one instructor teaches the first day and a different instructor teaches the second day.	Edm.Int64
comments	These are internal comments about the entity. In general, they are not for users. Instead they are administrators' comments to themselves.	Edm.String
errorMessage	This includes any error messages.	Edm.String

EnrollmentStatus

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64

Property Name	Description	Property Type
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
newEnrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
registrationChangeTime	This is the time that a registration change occurred for purposes of auditing the change.	Edm.Int64
timezone	This is the time zone for registration-ChangeTime. It is the time zone that the change is recorded in.	Edm.String
errorMessage	This contains any error messages.	Edm.String

Enrollments

Property Name	Description	Property Type
scheduleID	This is the unique ID of a scheduled offering. A scheduled offering is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February scheduled offerings (for example), the scheduled offering ID of the January instance is different from the February instance.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
enrollmentStatusID	This is the registration status for this user in this entity.	Edm.String

Property Name	Description	Property Type
notifyUser	If the value of this is true, and if the user has an email address on file, the user receives a notification of the enrollment.	Edm.Boolean
notifyInstructor	If the value of this is true, and if the instructor has an email address on file, the instructor receives a notification of the enrollment.	Edm.Boolean
notifySupervisor	If the value of this is true, and if the learning supervisor has an email address on file, the learning supervisor receives a notification of the enrollment.	Edm.Boolean
notifyContacts	If the value of this is true, and if the offering has a list of contact email addresses on file, the contacts receive a notification of the enrollment.	Edm.Boolean
comments	These are comments about the enrollment.	Edm.String
errorMessage	This contains error messages about the enrollment.	Edm.String
warningMessage	This contains warning messages about the enrollment.	Edm.String
warningOverride	If the value of this is true, then you can override warning messages.	Edm.Boolean

UserScheduleBlock

Property Name	Description	Property Type
userId	This is the user to whom the schedule block should be applied.,This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String

Property Name	Description	Property Type
personExternalID	This is a mutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
scheduleBlockId	The unique ID of the schedule block.	Edm.String
leaveStartDate	If the schedule block applies to a leave request, this is the start date of the leave.	Edm.Int64
leaveEndDate	If the schedule block applies to a leave request, this is the end date of the leave.	Edm.Int64
externalCode		Edm.String
iseRuleId		Edm.String
domain	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator. Defaults to PUBLIC.	Edm.String

Property Name	Description	Property Type
active	If the value is true then the user is active. If the value is false, then the user is inactive.,Defaults to true.	Edm.Boolean

errorMessage	This contains any error messages.	Edm.String
--------------	-----------------------------------	------------

Messages

Property Name	Description	Property Type
type	This is the type of message.	Edm.String
text	This is the text of the message.	Edm.String

RefundPolicies

Property Name	Description	Property Type
chargeAmount	When processing a refund, this is the amount to charge according to the cancellation policies you set up in the Learning Management System (LMS). You get an amount when the cancellation policy charges a fixed amount for canceling.	Edm.Double
chargePercentage	When processing a refund, this is the charge percentage according to the cancellation policies you set up in the Learning management System. You get a percentage when the cancellation policy charges a percentage of the cost for canceling.	Edm.Int32
chargeCurrencyCode	When processing a refund, this is the currency for the transaction.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that is the subject of the refund.	Edm.Int64
sequenceID	Not used.	Edm.Int32
messages		Collection(Namespace1_Alias.Messages)

EnrollmentCancellations

Property Name	Description	Property Type
cancelled	If true, then the enrollment is cancelled.	Edm.Boolean
chargeAmount	When processing a refund, this is the amount to charge according to the cancellation policies you set up in the Learning Management System (LMS). You get an amount when the cancellation policy charges a fixed amount for canceling.	Edm.Double

Property Name	Description	Property Type
chargePercentage	When processing a refund, this is the charge percentage according to the cancellation policies you set up in the Learning management System. You get a percentage when the cancellation policy charges a percentage of the cost for canceling.	Edm.Int32
chargeCurrencyCode	This is the currency code of the transaction.	Edm.String
scheduleID	This is the unique ID of the scheduled offering that	Edm.Int64
sequenceID	This is not used.	Edm.Int32
messages		Collection(Namespace1_Alias.Messages)

instructors

Property Name	Description	Property Type
instructorID	This is the unique ID of an instructor in the Learning Management System. If the instructor is also a user (this is often the case when instructors are employees at the company), then keep in mind that this is their INSTRUCTOR ID as opposed to their LEARNER ID.	Edm.String
lastName	This is the family name of the instructor.	Edm.String
firstName	This is the given name of the instructor.	Edm.String
middleInitial	This is a middle initial of the instructor.	Edm.String
primary	If the value of this is true, then this is the primary instructor. If false, then the instructor is secondary. Primary instructors are usually the ones responsible for organizing the training, posting learning results, and hosting Virtual Learning Sessions (VLS). You can also require that primary instructors are qualified to instruct the learning item. Secondary instructors support the primary instructors.	Edm.Boolean

9.8.2.3.7 user/scheduledoffering-service/v1 Metadata Call

Call for `user/scheduledoffering-service/v1` to manage classes as a user or manager.

Use this metadata call when you want to modify the enrollment status of users. This API does not support the commerce flow.

Sample Code

```
GET /learning/odatav4/public/user/scheduledoffering-service/v1/$metadata
```

Entity Types

EnrollmentListing

Property Name	Description	Property Type
enrollSeatID	This is the unique ID of the enrollment seat for the user in the current class. The value is a number.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
enrollSlotID	This is the unique ID of the enrollment slot. A slot is a spot in a training course that a user can enroll into. For example, if a course (a class) is limited to ten participants, it has ten slots. Each participant who enrolls is placed into a slot. If nine users enroll into the course, then nine of ten slots are occupied. Slots are important because you can reserve slots for users. You can, for example, say that a course has ten slots and five of them are reserved for users of a particular organization.	Edm.Int64
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64

Property Name	Description	Property Type
enrollStatID	This is the registration status for this user in this entity.	Edm.String
enrollDate	This is the date of enrollment - the date that the user was added to the entity.	Edm.Int64
comments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
shippingAddress	This is the street address used for shipping.	Edm.String
shippingCity	This is the city used in the shipping address.	Edm.String
shippingState	This is the state or province used in the shipping address.	Edm.String
shippingPostal	This is the postal code used in the shipping address.	Edm.String
shippingCountry	This is the country used in the shipping address.	Edm.String
shippingPhoneNo	This is the phone number that can contact someone at the shipping address for information about the shipment.	Edm.String
shippingFaxNo	This is the fax number where you can send documents at the shipping address. For example, a place to fax shipping labels.	Edm.String
shippingEmailAddress	This is the email address that can contact someone at the shipping address for information about the shipment.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
addUser	The user who added the entity.	Edm.String
cancelDate	If the user cancels, this is the date of the cancellation.	Edm.Int64

Property Name	Description	Property Type
orderItemID	The order ID associated with the learning item.	Edm.Int64
paymentOrderTicketNo	If this order is paid with a ticket, this is the number of the ticket.	Edm.String
ticketSequence		Edm.Int64
origin		Edm.String
withdrawPending	If the user is cancelling and that withdraw is pending, this is true.	Edm.Boolean
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64

EnrollmentListing

Property Name	Description	Property Type
enrollmentListing		Collection(Namespace1_Alias.EnrollmentListing)
criteria		Namespace1_Alias.criteria

ScheduledOffering

Property Name	Description	Property Type
scheduleID		Edm.Int64
description	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String
typeComponent	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
activityOrComponentID	This is the unique ID of a learning item.	Edm.String

Property Name	Description	Property Type
revisionDate	This is the revision date of this entity. Learning items often have revision dates that correspond to a regulator's revision of compliance measures. Each later revision date is a later iteration of a learning item. The revision date is in Unix Epoch time.	Edm.Int64
maximumEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
minimumEnrollment	This is the minimum amount of users who must enroll into the course for the course to take place.	Edm.Int64
contact	This is the person or group who can be contacted about this entity. For example, someone to call about details for a class.	Edm.String
emailAddress	This is the email address of a person or group (distribution list) who can be contacted about this entity. For example, a distribution list of people who know about a class.	Edm.String
phoneNo	This is the telephone number for a person or group (answering service) who can be contacted about this entity. For example, the phone number of a department that can answer questions about a class.	Edm.String
faxNo	This is the fax number for a person or group who can be contacted about this entity. For example, your company might set up a fax number if you need to fax release forms to a department.	Edm.String
enrollmentCutoffDate	The date after which users are no longer allowed to enroll into the entity. Cut off dates give instructors time to look at a class roster and decide how to structure the course for that roster and give administrators some time to set things up before the course starts.	Edm.Int64

Property Name	Description	Property Type
selfEnrollment	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
scheduleDesc	This is a description of the entity. In most cases, the description is available to users to tell them about the entity.	Edm.String
comments	These are internal comments about the entity. In general, they are not for users. Instead they are administrators' comments to themselves.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
notActive	If the value is false then the user is active. If the value is true, then the user is inactive.	Edm.Boolean
scheduleEnrollStatus	This is a description of the number of seats available, the seats filled, and the number of waitlisted users.	Edm.String
enrollmentComments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
revisionNo	This is the revision number of this entity. Each revision date has a revision number. Users sometimes know the revision number of training instead of the revision date. For example, they might know that they want revision 2 of a training, regardless of the date that it was revised.	Edm.String
enrollmentSeatID	If this user is already enrolled in this class, this value is the unique ID of the seat that the user occupies. If this user is not enrolled in this class, then this value is null.	Edm.Int64

Property Name	Description	Property Type
studentEnrollmentStatusTypeLabelID	This is the registration status for this entity, with the key you need to translate it to this user's language.	Edm.String
studentEnrollmentStatusType	This is the registration type that has been assigned to the user.	Edm.String
studentEnrollmentStatus	This is the registration status for this user in this entity.	Edm.String
timeZoneID	This is the time zone of the entity.	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the class time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
titleLabelKey	This is the ID that the LMS uses to look up the title of the entity and return a value that is translated to this users' language/locale.	Edm.String
timeZoneLabelValue	This is the time zone of the entity, in a human readable format.	Edm.String
enrolledCount	This is the number of users who are currently enrolled.	Edm.Int64
availableSeatCount	This is the number of available seats left in the class (the number of users who can still enroll in the class).	Edm.Int64
instructors		Collection(Namespace1_Alias.instructors)
criteria		Namespace1_Alias.criteria

Property Name	Description	Property Type
studentID		Edm.String
enrollmentCancellations		Collection(Namespace1_Alias.EnrollmentCancellations)
messages		Collection(Namespace1_Alias.Messages)

AvailableSeats

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
typeComponent	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
componentTypeID	Item type IDs are a critical categorization in because they determine how users are marked complete for a learning item. One item type can have completion statuses of pass and fail while another might have completion statuses of pass, fail and incomplete.	Edm.String
activityOrComponentID	This is the unique ID of a learning item.	Edm.String
maximumEnrollment	This is the maximum amount of users who can enroll into the course.	Edm.Int64
minimumEnrollment	This is the minimum amount of users who must enroll into the course for the course to take place.	Edm.Int64
notActive	If the value is false then the user is active. If the value is true, then the user is inactive.	Edm.Boolean
enrollmentCutoffDate	The date after which users are no longer allowed to enroll into the entity. Cut off dates give instructors time to look at a class roster and decide how to structure the course for that roster and give administrators some time to set things up before the course starts.	Edm.Int64

Property Name	Description	Property Type
selfEnrollment	If this value is true, then users can enroll themselves into this entity. If false, then they cannot enroll themselves. Enrollment is not necessarily automatic when this value is true. There could be an approval process attached to enrollment.	Edm.Boolean
scheduleDesc	This is a description of the class.	Edm.String
comments	This is a comment about the entity.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
timeZoneID	This is the time zone of the lastUpdateTimestamp	Edm.String
displayInScheduleTimeZone	If this value is true, then the times of the entity are in the class time zone. If this value is false, then the times are in the users' time zones.	Edm.Boolean
userCanWaitlist	If this value is true, then the user can get on the wait list for the course. If someone withdraws from the course, the system picks users in the order that they went onto the wait list. In a literal sense, this user can move himself/herself to the registration status of Waitlisted.	Edm.Boolean
availableSeatCount	This is the number of available seats left in the class (the number of users who can still enroll in the class).	Edm.Int64
cancelled	If this value is true, then this is cancelled.	Edm.Boolean
cancelledDate	If this is cancelled, the date that it is cancelled.	Edm.Int64
closedDate	If this is closed, then this is the date that it closed.	Edm.Int64
closed	If this value is true, this is closed. A closed seat is not available.	Edm.Boolean
messages		Collection(Namespace1_Alias.Messages)

Complex Types

EnrollmentListing

Property Name	Description	Property Type
enrollSeatID	This is the unique ID of the enrollment seat for the user in the current class. The value is a number.	Edm.Int64
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
enrollSlotID	This is the unique ID of the enrollment slot. A slot is a spot in a training course that a user can enroll into. For example, if a course (a class) is limited to ten participants, it has ten slots. Each participant who enrolls is placed into a slot. If nine users enroll into the course, then nine of ten slots are occupied. Slots are important because you can reserve slots for users. You can, for example, say that a course has ten slots and five of them are reserved for users of a particular organization.	Edm.Int64
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
enrollStatID	This is the registration status for this user in this entity.	Edm.String
enrollDate	This is the date of enrollment - the date that the user was added to the entity.	Edm.Int64

Property Name	Description	Property Type
comments	These are comments about the enrollment for the user. They could explain, for example, why an administrator made an exception for enrolling a particular user.	Edm.String
shippingAddress	This is the street address used for shipping.	Edm.String
shippingCity	This is the city used in the shipping address.	Edm.String
shippingState	This is the state or province used in the shipping address.	Edm.String
shippingPostal	This is the postal code used in the shipping address.	Edm.String
shippingCountry	This is the country used in the shipping address.	Edm.String
shippingPhoneNo	This is the phone number that can contact someone at the shipping address for information about the shipment.	Edm.String
shippingFaxNo	This is the fax number where you can send documents at the shipping address. For example, a place to fax shipping labels.	Edm.String
shippingEmailAddress	This is the email address that can contact someone at the shipping address for information about the shipment.	Edm.String
lastUpdateUser	This is the user who most recently updated the entity.	Edm.String
lastUpdateTimestamp	This is the last time that the entity was updated. Returned in Unix Epoch.	Edm.Int64
addUser	The user who added the entity.	Edm.String
cancelDate	If the user cancels, this is the date of the cancellation.	Edm.Int64
orderItemID	The order ID associated with the learning item.	Edm.Int64
paymentOrderTicketNo	If this order is paid with a ticket, this is the number of the ticket.	Edm.String

Property Name	Description	Property Type
ticketSequence		Edm.Int64
origin		Edm.String
withdrawPending	If the user is cancelling and that withdraw is pending, this is true.	Edm.Boolean
criteria		Namespace1_Alias.criteria
totalCount		Edm.Int64

criteria

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
skiptoken		Edm.String

criteria

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64

SegmentAttendances

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
segmentID	This is the unique ID of a segment. A segment is one part of a course (a learning item or class). For example, if a course meets over two days, each day can be a segment. This allows you to track attendance on a more granular level: you can see who attended (in this example) the first day and who attended the second day. You can also assign instructors per segment. It could be that one instructor teaches the first day and a different instructor teaches the second day.	Edm.Int64
comments	These are internal comments about the entity. In general, they are not for users. Instead they are administrators' comments to themselves.	Edm.String
errorMessage	This includes any error messages.	Edm.String

EnrollmentStatus

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64
userID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
newEnrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
registrationChangeTime	This is the time that a registration change occurred for purposes of auditing the change.	Edm.Int64
timezone	This is the time zone for registration-ChangeTime. It is the time zone that the change is recorded in.	Edm.String
errorMessage	This contains any error messages.	Edm.String

Enrollments

Property Name	Description	Property Type
scheduleID	This is the unique ID of a class. A class is an instance of a learning item (a course, usually) that is scheduled to take place at a given date and time. Therefore, although the learning item ID is the same for its January and February classes (for example), the class ID of the January instance is different from the February instance.	Edm.Int64

Property Name	Description	Property Type
studentID	This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
enrollmentStatusID	This is the registration status for this user in this entity.	Edm.String
notifyUser	If the value of this is true, and if the user has an email address on file, the user receives a notification of the enrollment.	Edm.Boolean
notifyInstructor	If the value of this is true, and if the instructor has an email address on file, the instructor receives a notification of the enrollment.	Edm.Boolean
notifySupervisor	If the value of this is true, and if the learning supervisor has an email address on file, the learning supervisor receives a notification of the enrollment.	Edm.Boolean
notifyContacts	If the value of this is true, and if the offering has a list of contact email addresses on file, the contacts receive a notification of the enrollment.	Edm.Boolean
comments	These are comments about the enrollment.	Edm.String
errorMessage	This contains error messages about the enrollment.	Edm.String
warningMessage	This contains warning messages about the enrollment.	Edm.String
warningOverride	If the value of this is true, then you can override warning messages.	Edm.Boolean

UserScheduleBlock

Property Name	Description	Property Type
userId	This is the user to whom the schedule block should be applied.,This is the unique ID of a user in the Learning Management System (LMS). This is recognized within the LMS only. If you want an ID that is recognized throughout SAP SuccessFactors HCM suite, you want to get the Person GUID or Person External ID.	Edm.String
personExternalID	This is a mutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON GUID, which is used throughout SAP SuccessFactors HCM suite but is immutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
personGUID	This is an internally generated, immutable identifier for one person across all of SAP SuccessFactors HCM suite. This is different from an LMS user ID (often called STUDENT ID). The student ID is used only within the Learning Management System (LMS). It is also different from the PERSON ID, which is used throughout SAP SuccessFactors HCM suite but is mutable. In most cases, you use the person ID when you want to call a single user throughout the suite.	Edm.String
scheduleBlockId	The unique ID of the schedule block.	Edm.String
leaveStartDate	If the schedule block applies to a leave request, this is the start date of the leave.	Edm.Int64
leaveEndDate	If the schedule block applies to a leave request, this is the end date of the leave.	Edm.Int64
externalCode		Edm.String
iseRuleId		Edm.String

Property Name	Description	Property Type
domain	This is the security domain ID of the entity. You can associate a record with an access domain to control the administrators who can access the record. What an administrator can access and do for a record depends on how you configured the entity, function, and workflow domain restrictions of the role ID that is associated with the administrator. Defaults to PUBLIC.	Edm.String

active	If the value is true then the user is active. If the value is false, then the user is inactive. Defaults to true.	Edm.Boolean
--------	---	-------------

errorMessage	This contains any error messages.	Edm.String
--------------	-----------------------------------	------------

Messages

Property Name	Description	Property Type
type	This is the type of message.	Edm.String
text	This is the text of the message.	Edm.String

RefundPolicies

Property Name	Description	Property Type
chargeAmount	When processing a refund, this is the amount to charge according to the cancellation policies you set up in the Learning Management System (LMS). You get an amount when the cancellation policy charges a fixed amount for canceling.	Edm.Double
chargePercentage	When processing a refund, this is the charge percentage according to the cancellation policies you set up in the Learning management System. You get a percentage when the cancellation policy charges a percentage of the cost for canceling.	Edm.Int32
chargeCurrencyCode	When processing a refund, this is the currency for the transaction.	Edm.String
scheduleID	This is the unique ID of the class that is the subject of the refund.	Edm.Int64
sequenceID	Not used.	Edm.Int32
messages		Collection(Namespace1_Alias.Messages)

EnrollmentCancellations

Property Name	Description	Property Type
cancelled	If true, then the enrollment is cancelled.	Edm.Boolean
chargeAmount	When processing a refund, this is the amount to charge according to the cancellation policies you set up in the Learning Management System (LMS). You get an amount when the cancellation policy charges a fixed amount for canceling.	Edm.Double
chargePercentage	When processing a refund, this is the charge percentage according to the cancellation policies you set up in the Learning management System. You get a percentage when the cancellation policy charges a percentage of the cost for canceling.	Edm.Int32
chargeCurrencyCode	This is the currency code of the transaction.	Edm.String
scheduleID	This is the unique ID of the class that	Edm.Int64
sequenceID	This is not used.	Edm.Int32
messages		Collection(Namespace1_Alias.Messages)

instructors

Property Name	Description	Property Type
instructorID	This is the unique ID of an instructor in the Learning Manganement System. If the instructor is also a user (this is often the case when instructors are employees at the company), then keep in mind that this is their INSTRUCTOR ID as opposed to their LEARNER ID.	Edm.String
lastName	This is the family name of the instructor.	Edm.String
firstName	This is the given name of the instructor.	Edm.String
middleInitial	This is a middle initial of the instructor.	Edm.String

Property Name	Description	Property Type
primary	If the value of this is true, then this is the primary instructor. If false, then the instructor is secondary. Primary instructors are usually the ones responsible for organizing the training, posting learning results, and hosting Virtual Learning Sessions (VLS). You can also require that primary instructors are qualified to instruct the learning item. Secondary instructors support the primary instructors.	Edm.Boolean

9.8.2.4 Finding Learning and Course Information

9.8.2.4.1 Searching for Learning Items with a Web Service

Learning items are the basic unit of tracking in the Learning Management System (LMS), and they are usually courses that you offer, so this is a core search process in the LMS.

Because learning items are the core tracking unit of the Learning Management System (LMS), searching for them is a common use case. But before you search for learning items individually, first consider other ways of searching. For example, if you want to build an integration into users' existing course catalogs, we recommend that you use the catalog search instead. Or, if you want to see the learning items assigned to a user, get the users' learning assignments.

[Get Learning Items \[page 2234\]](#)

Get learning items (courses) through a search.

9.8.2.4.1.1 Get Learning Items

Get learning items (courses) through a search.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

↗ Sample Code

```
GET /learning/odatav4/public/admin/searchItem/v1/Items?
$filter=criteria/domainIDs eq 'PUBLIC' and
criteria/itemTypeIDs eq 'COURSE' and
criteria/active eq true
```

Response: Items

↗ Output Code

```

9.8.2.4.2 Searching Learning Management System Catalogs

Use the learning catalog search to search the SAP SuccessFactors Learning courses and other learning objects that users have access to.

Users have a learning catalog, which is the collection of learning objects that are available to them. You search the catalog to return specific learning items that are of interest to the user. When you call it as a user, the results are specific to that user's catalog access.

[Catalog Search Average Ratings Sort and Filter \[page 2235\]](#)

Use the average ratings sort of the learning catalog search to sort courses by rating as well as filtering unrated courses for inclusion in the search.

[Get Catalog Items \[page 2236\]](#)

Get catalog items through a search.

[Get Catalog Details \[page 2238\]](#)

Get catalog details such as curricula, programs, collections, and items.

[Get Catalog Class Details \[page 2240\]](#)

Get catalog class schedule details through a search.

9.8.2.4.2.1 Catalog Search Average Ratings Sort and Filter

Use the average ratings sort of the learning catalog search to sort courses by rating as well as filtering unrated courses for inclusion in the search.

You can now sort catalog search results by rating. Rated courses appear first, then courses enabled for rating but not yet rated, and finally, courses that are not enabled for rating. If you are a user with thousands of learning items in a catalog, the *Average Ratings* sort search will limit the results to those that contain the highest match of the combined search terms rather than taking each individual term into account. This alternative catalog search engine process is based on a progressive "and" relationship of search terms instead of an occurrence-based "or" style process.

You can also filter catalog search results by average rating with an option to include unrated courses. The filter displays the number of courses available for each filter option to assist you in selecting a rating threshold. You have the option to clear a filter if you do not wish to use it. If the search results do not contain any rated courses, the *Average Rating* filter will not appear.

The Average Ratings sort search and filter are available on the PC for the user catalog as well as manager tools, site catalog, and training planner. Administrators can configure the catalog sort by and filter features independently.

9.8.2.4.3 Searching for Curricula with a Web Service

Search curricula to find basic information about the curricula in your system.

Searching for curricula is often the first action in a process that works with curricula. For example, if you want to assign curricula, you might first search for the curricula that are in the system to get the exact curriculum that you want to assign.

Curricula build the qualifications of your users, particularly when that qualification is critical to users' function in your company or organization. You often use curricula when you have oversight: when you or a third party can audit you to make sure that your users have been trained properly to be qualified.

9.8.2.5 Posting Learning Events to the LMS with a Web Service

You post learning events to SAP SuccessFactors Learning to indicate that the user has finished a learning item and is complete, passed, failed, or some other completion status.

Various people in your organization post learning events to SAP SuccessFactors Learning: users can post the completion of self-assigned courses, and supervisors and administrators can post the completion of courses for users. Exactly how each user role can post learning events depends on your configuration.

[Limitations for Record Learning Event to Learning History Web Service \[page 2244\]](#)

We have built the Record Learning Event to Learning History web service with some limitations which affect how you should build your web service client.

[Setting Course Defaults for Learning Completion \[page 2245\]](#)

Set course defaults for learning completion to change how new courses behave by default when learners and their managers want to claim credit for their completed courses.

[Post Learning Events as Users or Supervisors with a Web Service \[page 2247\]](#)

Post learning events to learning history as a user or a supervisor.

[Post Learning Events as Administrators with a Web Service \[page 2248\]](#)

Post learning events to learning history as administrators.

9.8.2.5.1 Limitations for Record Learning Event to Learning History Web Service

We have built the Record Learning Event to Learning History web service with some limitations which affect how you should build your web service client.

Limitations or Assumptions for Record Learning to Learning History

Limitation or Assumption	Note
E-Signatures not supported	We do not support e-signatures because e-signatures have special identity verification rules that should be handled within SAP SuccessFactors Learning and not by an outside client.
Financial actions not supported	Financial actions (such as tallying the cost of an event and how it is distributed among the participants) is not supported. Use the record learning wizard (financial) in SAP SuccessFactors Learning administration.
Updates to history records not supported	If the web service client makes a mistake when recording the history record, it can be corrected or deleted in SAP SuccessFactors Learning administration.
Users cannot record for classes	If you call the web service as an administrator, you can record history records based on a class. If you call the web service as a user or manager, you cannot record learning based on the class.
Array limiting	Each API call is an array of 10 users and their learning items that should be posted to SAP SuccessFactors Learning. If you pass more than 10 combinations of learning items and users in an array, the web service will not work synchronously and you can see performance degradation.
Call limiting	We do not support more than 100 calls a minute.
Attachments	We do not support attachments.
Enumerated list discovery	We do not support the discovery of enumerated lists. For example, you cannot get a list of completion status values that are permitted when you post an event to SAP SuccessFactors Learning.
Event post permissions	The user role calling the web service must have permission, for the associated learning item, to post the results of a history record.

[Post Learning Events as Users or Supervisors with a Web Service \[page 2247\]](#)

[Post Learning Events as Administrators with a Web Service \[page 2248\]](#)

[Setting Course Defaults for Learning Completion \[page 2245\]](#)

9.8.2.5.2 Setting Course Defaults for Learning Completion

Set course defaults for learning completion to change how new courses behave by default when learners and their managers want to claim credit for their completed courses.

Prerequisites

You can insert an approval process between the moment that users post history records and the time that the record is included in their learning history. For example, you might want a manager to verify that the user has attended a seminar before the user gets credit in learning history. If you want to use approval processes, create an approval process before you set course defaults for learning completion.

Context

Individual courses have two process control flags: *Managers can Add to Learning History* and *User can Add to Learning History*. They control whether learners, their managers, or both can post completion for a course. Most companies have a policy about who can post completion and want to set the default value for all new courses in their system. You can globally control the default settings for these two flags.

Procedure

1. Go to SAP SuccessFactors Learning Administration and then go to ► [System Administration](#) ► [Security](#) ► [Role Management](#) ►.
2. Find and open each learner and manager role that you use, and then for each go to [Permissions](#).
 - If you want to allow the role to post their own completion for internal learning events, add Access Add to Learning History.
 - If you want to allow the role to post their own completion for external learning events, add Access Add to Learning History for External History Records.
 - If you want to allow the role to post completion of internal learning events for direct reports, add Access Direct Report to Add History Records.

- If you want to allow the role to post completion of external internal learning events for direct reports, add Access Direct Report to Add External History Records.
- If you want to prevent the role from posting their completion, remove the permissions.

Even if you disable all users from posting their completion status, you should still set the default for future courses. When, for example, you set all future courses to prevent, by default, learners from posting their own learning completion, you signal to learning administrators that users can't do it. Please be aware, however, that if you disable it at the security permission, the role can't add their own completion regardless of the setting in the course.

3. Go to [System Administration](#) > [Application Administration](#) > [User Settings](#) > [User Adding History Record Defaults](#).
4. Decide who can post completion by default for all new courses.

Option	Description
User can add history records for items	Select this if you want all new courses to default to allowing learners to post their own completion. User can Add to Learning History is selected by default for all new courses.
Managers can add history records for items	Select this if you want all new courses to default to allowing managers to post completion for their direct reports. Managers can Add to Learning History is selected by default for all new courses.

5. Decide whether learners need an approval process to finalize their posting.

Option	Description
Require approval when users add to learning history for internal learning	When selected, if users attempt to post course completion, they must first get approval. You associate an approval process with this control.
Require approval when users add to learning history for external learning	When selected, if users attempt to post completion for external learning, they must first get approval. You associate an approval process with this control.

9.8.2.6 Purchasing and Approvals

9.8.2.6.1 Financial Transactions

Use the financial transactions web services to access the data in the financial transactions table of SAP SuccessFactors Learning.

If you are using the commerce features of SAP SuccessFactors Learning, your financial transactions are stored with SAP SuccessFactors Learning. You can see them in the administration environment by going to ► [Commerce](#) ► [Financial Transactions](#) ►. There, you can approve financial transactions and repost any transactions that a financial controller rejects.

SAP SuccessFactors Learning offers these web services to access your financial transactions and bring the data into your financial software.

- Financial Transactions Query web service gets your financial transactions. You can filter the transactions to get a subset of transactions. You can filter by the transaction attributes, by courses, or by cost and profit centers.
- Financial Transaction Posting Status Update web service posts the results of your work in your financial software. You can close out transactions on the SAP SuccessFactors Learning side.

Related Information

[The Importance of Account Code Type, Company Code, and Controlling Area \[page 2249\]](#)

[Transactions That Can Be Queried \[page 2250\]](#)

[Fixing and Reposting Financial Transactions \[page 2251\]](#)

[Approving Learning Financial Transactions \[page 2250\]](#)

9.8.2.6.1.1 The Importance of Account Code Type, Company Code, and Controlling Area

If you're using finance features, you likely pull data from the transactions table, where account code type, company code, and controlling area are important categorization tools.

External financial systems need attributes to categorize transactions. The attributes help the external system categorize the transaction. You might want to see all transactions in a given company code, for example, or all transactions of a given account code type.

SAP SuccessFactors Learning doesn't use account code type, company code, or controlling area for itself. We simply make them available on the accounts. Your particular values for these three fields will depend on your external financial system.

9.8.2.6.1.2 Transactions That Can Be Queried

For a transaction to be returned, it must have been approved and have both a profit center and a cost center associated.

We exclude transactions that **don't**:

- Have the status approved
- Have a both a profit center and a cost center associated

9.8.2.6.1.3 Approving Learning Financial Transactions

Approve Learning financial transactions to mark them for posting to your financial system.

Procedure

1. Go to SAP SuccessFactors Learning Administration and then go to ► [Finance](#) ► [Financial Transactions](#) ▾.
2. Find financial transactions in the [Non-Approved](#) or [Both](#) status.

→ Tip

If you don't see the financial transactions search filter, click [Add/Remove Criteria](#).

3. Look at the transactions and decide which transactions you want to approve.

Approved transactions can be fetched by your external financial system. The external financial system fetches them through SAP SuccessFactors Learning web services. Even if you don't have an external financial system, approval is still useful for your records.

4. For the transactions that you want to approve, select the [Approve](#) check box.

→ Tip

To approve all in a page, select the check box in the heading of the [Approve](#) column.

5. Click [Save](#).

9.8.2.6.1.4 Fixing and Reposting Financial Transactions

Fix and repost financial transactions when your external financial system rejects the transaction.

Prerequisites

To repost financial transactions, you must be posting them to an external financial system. You must also have the security permission: Manage Financial Transactions Posting.

Context

If you post financial transactions to an external system, SAP SuccessFactors Learning makes all approved transactions available. Your financial controllers, however, might view a transaction that posted to the financial system and reject it. If the transaction is rejected, it returns to ► [Learning Administration](#) ► [Finance](#) ► [Financial Transactions](#) ► with a failed or rejected status and a reason for the rejection. For example: "invalid account code".

Note

Both the exact status and the reason differ depending on your external financial system and company policy.

Procedure

1. Go to SAP SuccessFactors Learning administration and then go to ► [Finance](#) ► [Financial Transactions](#) ►.
2. Use the search criteria to narrow the list of financial transactions.

→ Tip

Look for approved financial transactions over a recent time frame.

3. Look in the [Posting Status](#) column for FAILED.

→ Remember

The status FAILED is common, but the exact text depends on your financial system. For example, your financial system might use the phrase REJECTED instead. We represent the exact string that your financial system sends us because it has a specific meaning in your business case, but this means that these instructions can't know the exact text.

4. Look in the same column for the reason that the failed transaction was rejected, and then investigate and fix the transaction.
5. After you fix the transaction, go back to ► [Finance](#) ► [Financial Transactions](#) ►, find the transaction, select [Retry](#), and then click [Save](#).

Next Steps

When you select [Retry](#) and save, SAP SuccessFactors Learning marks the transaction for retry the next time the financial system fetches the transactions. Depending on how you built your client to get the transactions, there could be a delay between marking the transaction for retry and the client getting the transaction.

9.8.2.6.1.5 admin/financialtransactions/v1 Metadata

Call metadata to get the search properties for a financial transactions web service client.

Metadata Call

Sample Code

```
GET /learning/odatav4/public/admin/financialtransactions/v1/$metadata
```

Headers

Header	Value
Authorization	Bearer oauth_token

Search Properties

Search Parameter	Description
transactionID	This is the unique ID of the financial transaction. You can see the ID in the <i>ID</i> column in Commerce > Financial Transactions .
orderNo	This is the order number of the transaction. Orders are part of the purchasing process. Each order follows a process from submitted to complete.

Search Parameter	Description
controllingArea	This is the controlling area to which the company code belongs. SAP SuccessFactors Learning stores your controlling areas as a field on account codes so that you can retrieve transactions with this filter. Administrators add the correct controlling area in Commerce > Account Codes > Summary .
maxPageSize	This is used for server-side pagination. It tells the server the maximum size of records you want in a page of transactions.
paymentMethod	The method of payment for the transaction. Possible values: CHARGEBACK, CREDIT CARD, or PURCHASE ORDER.
cutOffDate	<p>If a transaction occurred before the date that you pass in <code>cutOffDate</code>, it won't be returned. You can use <code>cutOffDate</code> as a watermark: remember the last cut off date that you sent to return only those transactions that you have not seen yet.</p> <p>Set the default cut off date in System Admin > Configuration > System Configuration > FINANCIAL. Set <code>financialTransactionAPICutOffDate</code> to the default.</p> <p>This is in Unix Epoch time.</p>
limit	This is used for client-side pagination. We pass it to <code>\$top</code> , which is standard OData. It defines the number of the top record in a page, starting at the <code>\$skip</code> count. For example, if you want pages of 10, the first call passes 10, the second call passes 20, and so on.
skip	This is used for client-side pagination. We pass it to <code>\$skip</code> , which is standard OData. It defines the records to skip before counting towards <code>\$top</code> . For example, if you want pages of 10, the first call passes 0 (skip no records before fetch), the second call passes 10, and so on.
showTotalCount	If you pass <code>true</code> , the system returns the total transactions in the page. By default, it is <code>false</code> .

9.8.2.6.1.9 GET Financial Transactions Response Parameters

General Transaction Information

When you get financial transaction information, you see basic information about the transaction record itself.

Transaction Response Parameters

Parameter	Description
transactionID	This is the unique ID of the transaction.
transactionDate	This is the date, in Unix Epoch format, that the transaction took place.
transactionCurrency	This is the ISO currency code for the transaction. SAP SuccessFactors Learning supports a set of currencies that you can find in References > Commerce .
transactionAmount	The amount of money that was exchanged in the transaction. The currency for the amount is returned in <code>transactionCurrency</code> .
orderNo	This is the order number associated with the transaction.
studentID	This is the user ID associated with the transaction: the user who "bought" the training.
organizationID	This is the organization that the user belongs to.

Parameter	Description
transactionType	The type of transaction for the line item: Adjust Refund, Adjust Charge, Cancel Refund, Cancel Charge Register, or Purchase.
itemKey	<p>This is the learning item's key. A learning item key is a concatenation of the learning item's unique ID, the learning item's type ID, and the learning item's revision date, separated by dashes. The key helps you uniquely identify one specific type and revision of a learning item.</p> <p>A learning item is the course, regardless of when it is scheduled. For example, a learning item can be "Writing for Business" regardless of whether it is scheduled on Tuesdays or Wednesdays.</p>
scheduleID	This is the unique ID of the scheduled offering. A scheduled offering is an instance of a learning item. For example, "Writing for Business" that takes place the first week of October, as opposed to another schedule of "Writing for Business" that takes place the first week of January.
paymentMethod	The method of payment for the transaction. Possible values: CHARGEBACK, CREDIT CARD, or PURCHASE ORDER.

Profit Center Parameters

Profit Center Response Parameters

Parameter	Description
profitCenterAccountInfo	This is an array of information about the profit center in the transaction.
financialAccountCode	This is the account code for the profit center. You can find accounts by going to Commerce > Account Codes .
accountID	This is the unique ID of the account for the profit center.
accountType	This identifies the type of cost collecting object. For example: Cost Center, WBS Element, and Internal Order. You define types to match your financial system in References > Commerce .
companyCode	This is company code of the profit center. You define the company code for the account by going to Commerce > Account Codes > Summary .

Parameter	Description
percentageDistribution	The percentage of the distribution to this profit center.

Cost Center Parameters

Cost Center Response Parameters

Parameter	Description
costCenterAccountInfo	This is an array of information about the cost center in the transaction.
financialAccountCode	This is the account code for the cost center. You can find accounts by going to Commerce > Account Codes .
accountID	This is the unique ID of the account for the cost center.
accountType	This identifies the type of cost collecting object. For example: Cost Center, WBS Element, and Internal Order. You define types to match your financial system in References > Commerce .
companyCode	This is company code of the cost center. You define the company code for the account by going to Commerce > Account Codes > Summary .
percentageDistribution	The percentage of the distribution from this cost center.

9.8.2.6.1.10 POST Financial Transactions Request Parameters

To post the results of financial transactions to SAP SuccessFactors Learning, you pass these parameters.

Post Financial Transaction Request Parameters

Parameter	Description
transactionID	This is the transaction ID that matches the transaction in the Learning Management System (LMS). This is an ID that you originally discovered with a GET, stored with your client through the financial system, and then return with the POST to update the same transaction.

Parameter	Description
status	The status can be SUCCESS or FAILED. If FAILED, administrators can go to Commerce > Financial Transactions to retry the transaction.
transactionPostingDate	The date, in Unix Epoch format, that the LMS should record as the posting date in its system.
error	If the status is FAILED, you can pass a reason in <code>error</code> . The learning administrators see it in Commerce > Financial Transactions . They can use the error to fix the transaction and retry.

9.8.2.6.1.11 POST Financial Transactions Sample Call and Payload

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

↻ Sample Code

```
POST learning/odatav4/public/admin/financialtransactions/v1/
FinancialTransactionPostingStatuses
HEADER: Authorization : Bearer {OAuth-Token}
```

↻ Sample Code

```
{
  "@odata.type": "#FinancialTransactionPostingStatuses",
  "postingStatuses": [
    {
      "transactionID": 5001,
      "status": "FAILED",
      "transactionPostingDate": 1394044200000
      "error" : "Invalid Account Code"
    }
  ]
}
```

9.8.2.6.2 SAP SuccessFactors Learning Approval Web Services

Use SAP SuccessFactors Learning approval web services to remotely manage the approval processes within SAP SuccessFactors Learning

In SAP SuccessFactors Learning, you often create approval processes so that users can seek approval to enroll in a course, withdraw from a course, and so on. Each person in the approval process can either approve or deny the request. For example, users sometimes must seek manager approval to enroll into a course that has a cost. In the application, the manager sees the request and can either approve it or deny it. The web service allows you to find the approvals for the manager and allows the manager to approve or deny the request.

[Writing an Approval Process System with Web Services \[page 2260\]](#)

Write an approval process system for SAP SuccessFactors Learning when you want to externalize the process by which users approve or deny requests that originate in SAP SuccessFactors Learning.

[GET SAP SuccessFactors Learning Approvals Sample Calls \[page 2262\]](#)

Call GET approvals when you want to see the approvals that are pending in SAP SuccessFactors Learning.

[GET SAP SuccessFactors Learning Approval Details \[page 2264\]](#)

Get the details of SAP SuccessFactors Learning approvals when you want to see additional details about a single approval process.

[POST Approval for SAP SuccessFactors Learning Approval Step \[page 2267\]](#)

Post approval for a SAP SuccessFactors Learning approval step when you want a user to approve a request and move it to the next step of the process.

[POST Denial for SAP SuccessFactors Learning Approval Step \[page 2268\]](#)

Post denial for a SAP SuccessFactors Learning approval step when you want a user to deny a request.

9.8.2.6.2.1 Writing an Approval Process System with Web Services

Write an approval process system for SAP SuccessFactors Learning when you want to externalize the process by which users approve or deny requests that originate in SAP SuccessFactors Learning.

Context

This applies when the approval process originates in SAP SuccessFactors Learning, but not in any of the other SAP SuccessFactors products. In the vast majority of cases, these are approval processes for learning requests: a user wants to enroll in a class and must seek approval before joining the roster.

Procedure

1. Write a call to get all approvals for the user.

In this case, a user is anyone with permission to log into SAP SuccessFactors Learning. In your organization that can include organization owners, supervisors, Human Resources Business Partners (HRBPs) and so on.

↔ Sample Code

```
GET /learning/odatav4/public/user/user-service/v1/learningapprovals
```

The result is a set of approval instances that are assigned to the current user. Each instance has an ID.

2. Get the details for an approval instance.

You get the instance details so that the user can make an informed decision about whether to approve or deny the request.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

↔ Sample Code

In this example, 1643 is the instance ID that you returned from the previous call.

```
GET /learning/odatav4/public/user/user-service/v1/learningapprovaldetails
?$filter=criteria/tapInstanceID eq 1643
```

3. As the user, post either approval or denial for the instance.

↔ Sample Code

```
POST /learning/odatav4/public/user/user-service/v1/approve
```

↔ Sample Code

```
POST /learning/odatav4/public/user/user-service/v1/deny
```

In the body of the post, provide the instance ID plus other information that the service allows.

↔ Sample Code

```
{
  "tapInstanceID" : 1643,
  ...
}
```

```
GET /learning/odatav4/public/user/user-service/v1/learningapprovals
```

JSON Response

Sample Code

```
{
  "@odata.context": "$metadata#learningapprovals",
  "value": [
    {
      "tap_instance_id": 1643,
      "front_header": "Learning Approval",
      "itemName": "Approval Item",
      "userID": "JDOE_Supervisor",
      "requestorFullName": "Bob Smith",
      "learningApprovalTodoAction": [
        {
          "type": "approve",
          "label": "Approve",
          "comment_required": null
        },
        {
          "type": "decline",
          "label": "Deny",

```

```

        "comment_required": null
      }
    ],
  },
  {
    "tap_instance_id": 22001,
    "front_header": "Learning Approval",
    "itemName": "SAP HANA Cloud Integration",
    "userID": "JDOE_Supervisor",
    "requestorFullName": "Barbara Smith",
    "learningApprovalTodoAction": [
      {
        "type": "approve",
        "label": "Approve",
        "comment_required": null
      },
      {
        "type": "decline",
        "label": "Deny",
        "comment_required": null
      }
    ]
  }
]
}

```

Approval Parameters

Approval Parameters

Parameter	Description
tap_instance_id	This is the unique ID of the approval process instance. Importantly, this is not the approval process ID as you would look it up in the administration environment but instead the particular instance of that process.
front_header	This is a description of the approval process. For example "Approval to Withdraw from Training".
itemName	This is the title of the learning item in the language of the current user (the user calling the web service). Titles can be translated using a key/value pair, where the key uniquely identifies a particular learning item's title and the values are each language's translation of the title. If you need the key that matches this value, and if the web service supports it, look in <code>TitleLabelKey</code> .
type	This is the type of approval process. For example, <code>Registration</code> is an approval process for users seeking approval to change their registration status.
userID	This is the unique ID of the user who is on the current step of the approval process.
requestorFullName	This is the full name of the person who is making the approval request. It is useful to the approver to see who is making the request.

Parameter	Description
learningApprovalTodoAction	This is an array of actions that the approver can take. In almost all cases, there are two actions: approve or deny.
type	This is the string that identifies what the approver can do. It is usually <code>approve</code> to approve the request or <code>deny</code> to deny the request.
label	This is the label that appears so that approvers know which choice they are making. For example, <code>Approve</code> or <code>Deny</code> .
comment_required	If <code>true</code> , then the approver is required to enter a comment when making this choice.

[POST Denial for SAP SuccessFactors Learning Approval Step \[page 2268\]](#)

9.8.2.6.2.5 POST Denial for SAP SuccessFactors Learning Approval Step

Post denial for a SAP SuccessFactors Learning approval step when you want a user to deny a request.

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

POST Denial as Called by Users or Supervisors

Sample Code

```
POST /learning/odatav4/public/user/user-service/v1/deny
```

JSON Request Body

Sample Code

```
{
  "tapInstanceID" : 182028,
  "comments" : "We do not have budget."
}
```

Denial Parameters

Denial Parameters

Parameter	Description
tapInstanceID	This is the unique ID of the approval process instance. Importantly, this is not the approval process ID as you would look it up in the administration environment but instead the particular instance of that process.
comments	Comment from the user in the step to describe why the process is denied.

Parent topic: [SAP SuccessFactors Learning Approval Web Services \[page 2260\]](#)

9.8.3 Throttling Limits for Learning OData APIs

To prevent SAP SuccessFactors Learning APIs from being overloaded by too many requests, we have introduced API throttling in SAP SuccessFactors Learning that helps to regulate the API usage.

URI	Maximum Calling Frequency (s)	Maximum Incoming Record Count	Maximum Outgoing Record Count
/odatav4/public/admin/searchItem/v1/Items	0.5	-	-
/odatav4/public/admin/searchCurriculum/v1/Curricula	0.5	-	-
/odatav4/public/admin/search-service/v1/Programs	0.5	-	-
/odatav4/public/admin/curriculum-service/v1/Curricula	5	10	-
/odatav4/public/admin/curriculum-service/v1/Curricula("")	5	10	-
/odatav4/public/admin/catalog-service/v1/\$metadata	-	1000	-
/odatav4/public/admin/user-service/v2/UserCourses	-	10	-
/odatav4/public/user/userassignment-service/v2/UserCourses	-	10	-
/odatav4/public/user/userassignment-service/v1/UserPrograms	-	10	-
/odatav4/public/admin/scheduledoffering-service/v1/SegmentAttendances	-	10	-
/odatav4/public/admin/scheduledoffering-service/v1/EnrollmentStatuses("")	-	10	-
/odatav4/public/admin/scheduledoffering-service/v1/Enrollments	-	10	-
/odatav4/public/admin/scheduledoffering-service/v1/UserScheduleBlocks	-	10	-
/odatav4/public/admin/scheduledoffering-	-	10	-

URI	Maximum Calling Frequency (s)	Maximum Incoming Record Count	Maximum Outgoing Record Count
service/v1/ UserScheduleBlocks("")			
/odatav4/public/user/ learningevent-service/v1/ ExternalLearningEvents	1	10	-
/odatav4/public/admin/ learningEvent/v1/ recordLearningEvents	-	10	-
/odatav4/public/admin/ scheduledoffering- service/v1/EnrollmentListings	0.5	-	-
/odatav4/public/user/ scheduledoffering- service/v1/EnrollmentListings	0.5	-	-
/odatav4/public/admin/ scheduledoffering-service/v1/ ScheduledToTeachClasses	0.5	-	-
/odatav4/public/user/ scheduledoffering-service/v1/ ScheduledToTeachClasses	0.5	-	-
/odatav4/public/admin/ curriculum-service/v1/ UserCurriculumStatuses	0.5	50	-
/odatav4/public/ admin/ocn/v1/OcnCourses	5	-	-

Note

If there are two or more third-party vendors updating an OCN course simultaneously, then it impacts the throttling limit.

Note

The maximum amount of outgoing records, if not specified, will default to 500.

Tip

In addition to the throttling limits referenced above, SAP SuccessFactors continuously performs security and performance monitoring of our data centers to ensure optimal operation. Please refer to [2804267](#) and design your web services client accordingly to ensure that your operations are not negatively impacted.

9.8.4 Background Knowledge for Learning Web Service Calls

9.8.4.1 Learning About Entities and Their Properties

To learn about SAP SuccessFactors Learning OData entities and their properties, you call the OData service metadata.

Context

We auto-generate the documentation for SAP SuccessFactors Learning entities from the source code. This has reduced our error rate for two reasons. First, we read some information directly from the code. The entity names and types, for example, cannot be wrong because they are read from code. Second, we expose our code comments to you so that you see what we see - you have the same knowledge as our own engineers without passing through a second source (a document).

Procedure

1. Decide on your business case or decide which service you want to look up.

We list common business cases and the services that you need to call for that case. For example, to construct a call to search students, you need the `searchStudent` service. [GET Students Call \[page 2168\]](#)

2. Write a `GET` call to the service's metadata.

Sample Code

```
GET /learning/odatav4/public/admin/searchStudent/v1/$metadata
```

3. Read the metadata to understand the names, types, relationships, and descriptions of the entities, entity sets, and properties.

```
<Property Name="chargebackMethodLabelValue" Type="Edm.String">
  <Annotation Term="Core.Description">
    <String>This is the description of the chargeback method in this user's
      language. Chargeback is a way to reconcile costs between organizations.
      One organization charges the cost of training back to another
      organization. This allows companies to balance the cost of training by
      putting the cost to organizations.</String>
  </Annotation>
</Property>
```

Example Property Metadata showing Name, Type, and Annotation

9.8.4.2 Pagination in SAP SuccessFactors Learning OData

To avoid pagination problems when calling SAP SuccessFactors Learning web services, we recommend using OData parameters to define your page sizes based on the records returned.

We set default page sizes for different web services based on the data returned or to protect the server from a call for too much data. In general, the page default page size is ten entities in a collection, but some web services might return different page sizes. For this reason, we do not recommend that you rely on the default page sizes.

Instead, use the standard OData pagination parameters to define the page sizes that you want. Use `$count` to get a count of the total records in your return, then use `$top` and `$skip` to page the results. You can also use `$count` to get a total count and to make sure that you have processed all records on the client.

9.8.4.3 Include Primary Key in PUT Calls

OData requires a primary key for PUT calls.

In OData, each entity type/set needs to have primary key. PUT calls must have a primary key in both the URL of the PUT and in the payload, this is per ODATA standard. When you update a collection of complex types, that collection does not have a primary key. But you still must provide a wrapper primary key. As a result, you provide an empty primary key in both places: the URL and the payload.

Sample Code

```
PUT /learning/odatav4/public/user/userassignment-service/v2/UserCourses('')
```

Sample Code

```
{
  "primaryKey": ""
  "userCourse": [
    {
      "componentTypeID": "COURSE",
      "componentID": "WRT-849",
      "revisionDate": 1428506077000
    }
  ]
}
```

9.8.4.4 Search Filter and Operator Support

SAP SuccessFactors Learning search web services support these OData criteria and operators.

Example

Sample Code

This codeblock contains line breaks to fit the formatting of the page.

```
GET /learning/odatav4/public/admin/searchStudent/v1/Students?
$filter=contains(criteria/learnerID,'sa-user') and
criteria/firstName eq 'user-cdp'
```

Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

Supported Operators

- eq
- ne
- lt
- le
- gt
- ge
- contains

Supported Filter

We currently support `contains` with an `and` operator.

List of Search Web Services

These are the web services that use the operators and filters:

- Student Search [Searching for SAP SuccessFactors Learning Users with a Web Service \[page 2167\]](#)

- Curricula Search [Searching for Curricula with a Web Service \[page 2242\]](#)
- Learning Item Search [Searching for Learning Items with a Web Service \[page 2233\]](#)

9.8.4.5 API Limits in Learning

API limits protect SAP SuccessFactors Learning services from overload.

We protect your services from purposeful or accidental overload by setting limits on:

- The volume of data sent to Learning
- The volume of data requested of Learning
- The frequency of calls to Learning (we can set a wait time between calls)

When you exceed a limit in one of your calls, we return an error to help you stay within the limit.

→ Tip

SAP SuccessFactors Learning monitors and adjusts limits to protect our customers' services. To ensure your operations are not negatively impacted, please retrieve data page by page in sequential order.

9.8.4.6 Search Criteria for Getting a Single Learning Item

The way that you call for a single learning item in SAP SuccessFactors Learning is unusual because it needs three data elements to return a single learning item.

In SAP SuccessFactors Learning, you cannot get a learning item simply by its unique ID. For example, you **cannot** make the following call, which would be a typical GET:

↗ Sample Code

```
GET /learning/odatav4/learningPlan/v1/LearningItemDetails('1147305822')
```

You cannot make such a call because, in addition to their ID, learning items have a type and a revision. You must pass all three to return a single, unique learning item. For example, this call returns a single revision and type of a single learning item.

↗ Sample Code

```
GET /learning/odatav4/learningPlan/v1/LearningItemDetails
?$filter=lisCriteria/itemID eq '1147305822'
and lisCriteria/itemTypeID eq 'COURSE'
and lisCriteria/revisionDate eq 1147304737000
```

→ Remember

URL syntax cannot have spaces. If you are testing the call, in a browser tool, substitute %20 for white space in the URL.

9.8.4.7 Rules for Choosing the Right ID in SAP SuccessFactors Learning Web Services

When you call a web service in SAP SuccessFactors Learning and you want to update a student record, you need to know which ID to use to uniquely identify the student.

If you have...	Then use the ID...	Because...
SAP SuccessFactors central user management but do not use Employee Central...	<code>stud_id</code>	The central SAP SuccessFactors <code>sysid</code> is the same as <code>stud_id</code> . You have a single user ID for all users and their student record ID (<code>stud_id</code>) matches it.
SAP SuccessFactors central user management, you do use Employee Central, but you do not use Global Assignment / Concurrent Employment..	<code>stud_id</code>	Your system behaves the same as the central user management without Employee Central. Global assignment / concurrent employment is the complicating factor.
SAP SuccessFactors central user management, you do use Employee Central, and you also use Global Assignment / Concurrent Employment..	<code>personGUID</code>	In a global assignment / concurrent employment configuration, your users can have multiple employment records. To provide flexibility for multiple employment records, the individual user is identified by a <code>personGUID</code> , which is updated from Employee Central.

9.8.4.8 How Users are Uniquely Identified in SAP SuccessFactors

To manage a balance between product profiles, employment assignment, and overall suite identity, SAP SuccessFactors uses an identity system with multiple IDs but only one Globally Unique Identifier (GUID).

The SAP SuccessFactors identity management system understands three types of user IDs. In most cases, users are aware of only one unique ID, administrators might be aware of two, and implementation partners might be aware of three.

- Person GUID is an **immutable**, unique identifier that stays with a person throughout their SAP SuccessFactors experience. This ID is internal to the system and tends to be unknown to users or managers.
- Person ID External is a **mutable**, unique identifier that stays with a person throughout their SAP SuccessFactors experience. This is the ID that most users and their managers know. In many parts of SAP SuccessFactors this is called simply the external ID because it is **external** to the particular module as opposed to a pillar profile ID, which is internal to the pillar.
- Pillar Profile IDs are used within individual SAP SuccessFactors product pillars. For example, SAP SuccessFactors Learning uses a student ID to understand a user as a student (as opposed to compensation manager, for example).

9.8.4.9 Specifying the User Type For the LMS API Call

If you want to change the default user type from `Admin` to `User` or `User` to `Admin` in the API call you can use the `actingAs` parameter to override the default user type.

Once you've received the token from the Platform Token Server you can call the API with the new parameter and value. If you don't change the user type the token user will validate as a `Student` by default.

Examples

Calling an API as a User:

```
/learning/odatav4/public/admin/curriculum-service/v1/UserCurriculumStatuses?actingAs=user
```

Calling an API as an Admin:

```
/learning/odatav4/public/admin/curriculum-service/v1/UserCurriculumStatuses?actingAs=admin
```

9.8.4.10 Call for Error Codes in SAP SuccessFactors Learning Web Services

If you build web services for SAP SuccessFactors Learning, you can return error codes to troubleshoot your development.

Parameter to Get Error Codes

In some SAP SuccessFactors Learning web services, you can set a parameter in your web service call to get error codes.

Output Code

```
operationStatusDetail=true
```

When you set `operationStatusDetail` to `true`, you return error information. When you set it to `false`, you do **not** return error information.

Sample Error Response

When you call for errors, and the web service returns an error, it returns a JSON structure.

Output Code

```
{
  "error": {
    "code": null,
    "message": "Failed to create user as the user id Yb-1234 already
exists.",
    "operationStatusDetail": {
      "status": "FAILED",
      "operation": null,
      "warnings": [],
      "errors": [
        {
          "code": "500",
          "message": "Failed to create user as the user id Yb-1234
already exists.",
          "fieldName": null
        }
      ]
    }
  }
}
```

9.8.4.11 Addition of Optional Fields to Web Services

SAP SuccessFactors Learning adds optional fields to web services without adding a new version of the web service.

APIs are an integral part of our product offering, so as our product evolves, so do our APIs. In any API-based integration, the provider and consumer are both equally responsible for following best implementation practices to ensure that the integration is scalable. It is, therefore, important for consumers of our APIs to understand that SAP SuccessFactors reserves the right to introduce optional API parameters without versioning up. We enhance APIs in their latest version without introducing new versions. To ensure your operations are not negatively impacted, please review the design of your clients to our web services.

9.8.4.12 Implications of Olingo Library Update from 4.0.0 to 4.2.0 for SAP SuccessFactors Learning

In Q4 2016, we update the Olingo library from 4.0.0 to 4.2.0 and we want you to understand the implications.

Olingo is a Java library that implements the Open Data Protocol (OData). The community is moving from Olingo 4.0.0 to Olingo 4.2.0 in anticipation of end of support for 4.0.0. Starting in Q4 2016, you will notice that Olingo 4.2.0 has become stricter. It prevents intermixing of data types, it does not allow short names, and it requires a namespace for the `has` operator. We have taken action to reduce the impact of these changes and give you time to transition to the stricter calls.

Intermixing Data Types now Prevented

Olingo 4.0.0 had a bug that allowed you to intermix data types. In Q4 2016 and later, if you intermix data types, your call will error. In the example below, `maxPageSize` is a **string**. The first call fails and the second works.

Sample Code

```
.../financialtransactions/v1/FinancialTransactions?$filter=criteria/maxPageSize
eq 1
.../financialtransactions/v1/FinancialTransactions?$filter=criteria/maxPageSize
eq '1'
```

Short Entity Names Deprecated

Olingo 4.0.0 allowed short entity names but Olingo 4.2.0 requires fully qualified entity names (or it can be removed). We understand that our documents showed the short name so clients were built with the short name. To compensate, we currently intercept the short name to avoid errors, but it is deprecated: we want customers to begin removing the short name. This issue affects insert or update (PUT or POST). GET calls are not affected.

Sample Code

This shows a short entity name (in `odata.type`) and so it is deprecated:

```
POST learning/odatav4/public/admin/financialtransactions/v1/
FinancialTransactionPostingStatuses
{"@odata.type": "#FinancialTransactionPostingStatuses", "postingStatuses": [...]}
```

Sample Code

This shows recommended calls to an entity type (first) and an entity set (second).

```
"@odata.type": "#com.sap.lms.odata.User"
"@odata.context": "$metadata#Users/$entity"
```

Sample Code

This shows an alternative to the recommended call. It is not wrong per Olingo 4.2.0. It removes the entity name rather than providing a fully qualified name.

```
POST learning/odatav4/public/admin/financialtransactions/v1/
FinancialTransactionPostingStatuses
{"postingStatuses": [...]}
```

Removal of `has` operator

After an investigation of calls into our API layer, we found zero calls with the `has` operator but found that `eq` operator is most commonly used. Olingo 4.2.0 strictly follows the Oasis standard, which means that if we allow `has`, then both `has` and `eq` must use a namespace.

Sample Code

```
$filter=criteria/learnerID has com.sap.lms.odata.ENString 'thomas'  
$filter=criteria/learnerID has Namespace1_Alias.ENString 'thomas'  
$filter=criteria/learnerID eq com.sap.lms.odata.ENString 'thomas'  
$filter=criteria/learnerID eq Namespace1_Alias.ENString 'thomas'
```

Given that we saw no calls with `has`, and given that its enablement would have meant major refactoring on the most commonly used `eq` call, we disabled `has` to protect the current usage of `eq`. We decided to reduce the impact to your clients. We will continue to work with the Olingo team to find a path forward.

As an alternative to the `has` operator, we recommend that you use the `contains` operator. It provides the same fuzzy searching as `has` but is easier to use. For example, you could search for all users whose student ID (learner ID) contains `thomas`.

Sample Code

```
$filter=contains(criteria/learnerID, 'thomas')
```

Impacts to OData Extensions

If you have built an SAP SuccessFactors Learning extension that extends the OData library, you must check that extension to make sure that it works properly after the update. Other types of extensions are not affected.

9.8.4.13 Use `remainingDays` to Look for Overdue Curricula

To avoid time zone issues, you can use `remainingDays` to find overdue curricula.

In the code example below, you see an assignment date, expiration date, and next action date, as well as the days remaining in the curricula. The easiest way to find overdue curricula is to look for negative days remaining.

Sample Code

```
{  
  "@odata.context": "$metadata#UserCurriculumStatuses",  
  "@odata.metadataEtag": "<etag>",  
  "value": [  
    {  
      "userID": "user",  
      "personGUID": null,  
      "curriculumID": "Curr-ID",  
      "curriculumStatus": "N",  
      "assignmentDate": 1520015400000,  
    }  
  ]  
}
```

```

    "expirationDate": 1523750400000,
    "nextActionDate": 1520899200000,
    "remainingDays": -8,
    "totalCount": null,
    "rootCurriculaID": null
  }
]
}

```

9.9 Onboarding

This section contains OData API entities for SAP SuccessFactors Onboarding 1.0, including Onboarding 1.0 entities, Onboarding 1.0 MDF entities, and Onboarding entities.

9.9.1 Onboarding 1.0

9.9.1.1 OnboardingCandidateInfo

OnboardingCandidateInfo is an MDF entity that maintains metadata about a candidate's onboarding activity. This entity can be used for querying onboarding activities by metadata.

Supported Operations

Query, Upsert, Update, Merge, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
applicantID	The external code for this entity. In RX-OB integration flow, this is set to the application-id of the candidate. In external-ATS – OB integration, this is generated using the rcm_job_application_seq sequence counter.

Property	Description
candidateID	In RX-OB integration flow, this is set to the id of the candidate. In external-ATS (xATS) – OB integration, this is generated using the rcm_job_application_seq sequence counter. (For xATS – OB flow, this is same as application ID.)
managerId	The user-id of the manager
hrManagerId	The user-id of the HR Manager
kmsUserId	The onboarding-activity-id; i.e, the hr-data-id of the onboarding activity.
userId	User-id of this candidate.
readytoHire	Whether or not the candidate ready to be hired. This is false by default. When paperwork-done notification under SF_Notifications feature in KMS is enabled (recommended configuration), it is set to true when NES step of onboarding activity is completed.
hired	Whether or not the candidate has been hired. Default is false. In OB – EC flow this is set to true when candidate is hired.
hireDate	The start date of the employee.
fName	First Name
lName	Last Name
email	Email address
division	Division
department	Department
location	Location
payGrade	Pay Grade
jobTitle	Job Title
internalHire	Whether or not the candidate is an internal hire. Default is false. In RX – OB flow, RX (RMK) sets this flag depending upon if the candidate is internal or external. For xATS – OB integrations: When SF_Notifications feature in KMS is enabled, this field is updated after the candidate-created, post-phv and paperwork-done notifications. (Note that once set to true, this flag cannot be set to false by notifications.)
fromExternalATS	Whether or not the candidate is from an external ATS (i.e, not from RX/RMK). In RX – OB flows, this is set to false otherwise it is true.

Navigation Properties

Navigation Property	Related Entity	Description
hrManagerIdNav	User	The HR manage related to this entity.
managerIdNav	User	The manager related to this entity.
userId	User	The user ID of the candidate.

Entity Relation Diagram

OnboardingCandidateInfo	
applicantId	String(128)
hrManagerIdNav	User
managerIdNav	User
mdfSystemRecordStatusNav	MDFEnumValue
mdfSystemStatusNav	MDFEnumValue
userIdNav	User

Use Cases

API Call	Description
<code>/odata/v2/OnboardingCandidateInfo?\$filter=applicantId eq '2443'</code>	Get OnboardingCandidateInfo object for applicant with application-id 2443.
<code>/odata/v2/OnboardingCandidateInfo?\$filter=readyToHire eq 'true' and hired eq 'false'</code>	Get candidates ready to be hired (but not yet hired).
<code>/odata/v2/OnboardingCandidateInfo?\$filter=createdDate ge datetime'2014-12-30T00:00:00'</code>	Get candidate data created on or after a given date.

There are two ways to trigger an update on an MDF entity using Odata.

- Post with X-HTTP-Method: MERGE naming the key in the Url and in the body and the fields that should be updated.

Sample Code

```
url: https://api4preview.sapsf.com/odata/v2/OnboardingCandidateInfo(applicantId=456)
body:
{
  "__metadata":
  { "uri": "OnboardingCandidateInfo(applicantId=456)" }
  ,
  "readyToHire": true
}
```

- Upsert without the X-HTTP-Method

Sample Code

```
url: https://<api-server>/odata/v2/upsert
body:
{
  "__metadata":
  { "uri": "OnboardingCandidateInfo(applicantId=456)" }
  ,
}
```

```
"readyToHire":true
}
```

Note

The upsert is more generic and can be used in this manner for all MDF entities. *applicantId* is the external code of the *OnboardingCandidateInfo*. So, in case another MDF entity is called, the external code of that entity must be used instead.

Related Information

[SAP Business Accelerator Hub: OnboardingCandidateInfo](#)

9.9.1.2 HRData

HRData is an entity that maintains the onboarding information of a candidate. This entity can be used to filter candidate information based on criteria and to update the candidate information.

Supported Operations

GET, PUT

Properties and Navigation Properties

There are separate Metadata API provided to the list of fields which can be queried:

Filter Fields: <https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/FilterFields>

Expand Tags: <https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags>

Update Fields: <https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/UpdateFields>

To obtain detailed information about the entity (HRData) properties from the OData API dictionary or to expose the entity metadata, use the following query:

[https://<api-server>/<partnername>/odata/v2/\\$metadata](https://<api-server>/<partnername>/odata/v2/$metadata)

Note

You must use an Onboarding api-server in all the queries.

Prerequisite: For GET operation

1. Get a valid authorization token.
Fetch a valid token, from the OData Authentication API, which is mentioned previously.
2. Setting up Index Fields.
To filter on a field, it should be part of the process's Index field. Index fields can be added/edited in [Super Admin Account Processes Index Fields of the process](#). This is mandatory param and must be passed.
3. Setting up Expand tags.
Name of the data-dictionary (data-dictionaries) whose fields should be returned in the response. One or more expand tags can be provided. When multiple tags are provided, fields of both the tags will be returned in the response. If certain specific fields are required then new data-dictionary need to be created.
4. Format for sending Request Params.

1. \$filter:

Filter Condition which needs be used to filter and get the HRData.

For filter param in the request:

Filter format: **FCode eq '<Code of Index Field>' and FVal <Condition to Use> '<Value to be checked>'**

Conditions:

- Multiple conditions can be joined with and/or.
- To filter using Date fields like startDate, HireDate use FValDt instead of FVal.
- To filter using Number/Decimal/Numeric fields like Payrate, Hours per day use FValNum instead of FVal.
- Supported string functions are substringof, startswith and endswith. Use them with FVal.
- Valid operators for Date, Number and string are Greater than (gt) or equal (ge), Lesser than (lt) or equal (le), not equal (ne) and equals (eq).
- All the above operators can be applied only for FVal, FValDt and FValNum.
- For FCode equals is the only operation allowed.

Examples:

- FCode eq 'FirstName' and FVal eq 'John'.
- (FCode eq 'LastName' and FVal eq 'Smith').
- ((FCode eq 'Payrate' and FValNum le 20) or (FCode eq 'StartDate' and FValDt gt datetime'2016-01-01T00:00:00.OZ')).
- ((FCode eq 'MiddleName' and substringof('Ch', FVal) eq true) and (FCode eq 'City' and startswith('Ca', FVal) eq false)).

The FCode, is code of the Index Field. To filter on a field, it should be part of the process's Index field. Index fields can be added/edited in ► [Super Admin](#) ► [Account](#) ► [Processes](#) ► [Index Fields of the process](#) ► . This is a mandatory parameter and must be passed.

2. \$select:

Fields that needs to come in the response and not return all the other fields of the HRData. These fields should be part of the HR Data.

Example:

\$select=FirstName,LastName

3. \$expand:

Name of the data-dictionary (data-dictionaries) whose fields should be returned in the response. One or more expand tags can be provided. When multiple tags are provided, fields of both the tags will be returned in the response.

Example:

\$expand=EC,Offboarding

4. \$top:
Maximum number of records to be returned as part of the response. The upper limit is 100.
Example:
\$top=50
5. \$skip:
Skip the number of records and fetch from the number provided.
Example:
\$skip=100

Request Information

Operation	GET
URI	<pre>https://<api-server>/<PartnerName>/odata/v2/HRData? \$filter=<Filter_Condition>&\$select=<Fields >&\$expand=<Tag Names>&\$top=<Number of Records>&\$skip=<Elements to skip></pre>
Description	Filter API to query for HR Data by querying on the fields of the HR Data.
Headers	Authorization: Token (Obtained from OData API Authentication).
Payload	No

Example:

```
https://<api-server>/<PartnerName>/odata/v2/HRData?$filter=(FCode eq 'LastName' and
FVal eq 'Smith')&$select=FirstName,LastName&$expand=EC,Offboarding&$top=50&$skip=100
```

Response

Sample Code

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/$metadata#HRData/
@Element",
  "hrdata": [
    {
      "hrDataId": "f6c71e0f-f7ce-44ab-a6f9-dae5ee9171b3", "HrdataDetails": [
        {
          "Key": "FirstName", "Value": "Johnathan"
        }, {
          "Key": "LastName", "Value": "Smith"
        }
      ]
    }, {
      "hrDataId": "1407e0f8-5a73-44dd-997b-ceba7cb57251", "HrdataDetails": [
        {
          "Key": "FirstName", "Value": "Trevor"
        }, {
          "Key": "LastName", "Value": "Smith"
        }
      ]
    }, {
      "hrDataId": "117b9794-db59-4373-9bb6-afbdd3cc5789", "HrdataDetails": [
        {
          "Key": "FirstName", "Value": "Graeme"
        }
      ]
    }
  ]
}
```

```

        "Key": "LastName", "Value": "Smith"
      }
    ], {
      "hrDataId": "b497178c-f262-4f72-8751-8ae07e52ce2a", "HrdataDetails": [
        {
          "Key": "FirstName", "Value": "John"
        }, {
          "Key": "LastName", "Value": "Smith"
        }
      ]
    }
  ], "nextLink": null
}

```

“nextLink” will point to next Page to further links. If this value is null, then it means no further pages are available.

Use Case: GET operation

Get operation is used to filter on the list of candidate using the Filter fields and also passing the fields which needs to be returned in the response.

Example:

```

https://<api-server>/<PartnerName>/odata/v2/HRData?$filter=(FCode eq 'LastName' and
FVal eq 'Smith')&$select=FirstName,LastName&$expand=EC,Offboarding&$top=50&$skip=100

```

In the above query, fields which are filtered are Last Name = ‘Smith’. The above will return the First Name and Last Name fields. Apart from this it will return all the fields present in tag EC and Offboarding. With the top 50, it means 50 number will be returned. With skip =100, first 100 records will be skipped.

Prerequisite: For PUT operation

1. Get a valid authorization token
Fetch a valid token, from the OData Authentication API, which is mentioned previously.
2. The fields that needs to be updated should be part of HrDataAPIUpdate Data dictionary.

Request Information

Operation	PUT
URI	https://<api-server>/<PartnerName>/odata/v2/HRData
Description	To update field for a HR Data based on the payload passed.
Headers	Authorization: Token (Obtained from OData API Authentication)
Payload	Yes

Request Payload Example:

Sample Code

```
{ [
  {
    "hrDataId": "f6c71e0f-f7ce-44ab-a6f9-dae5ee9171b3",
    "HrdataDetails": [
      {
        "Key": "FirstName",
        "Value": "Michael"
      }
    ]
  }
]
```

The HRData Id is mandatory. The fields, which needs to be updated should be provided in the above format. "Key" should have the name of the Field and "Value" should be the value of the field which needs to be updated.

Response

Sample Code

```
{
  [
    {
      "HrDataId": "f6c71e0f-f7ce-44ab-a6f9-dae5ee9171b3",
      "Status": "200"
    }
  ]
}
```

"Status": Informs whether the particular HRDataId is updated. This is provided for all HRDataId in case of bulk update. 200 – Success. 400, 403 – Failure

Additional Information

There is a status field available for each record set which indicates the success of the record. A value of 200 indicates a success, and a value of 400 or 403 indicates failure. Generally when the HRDataId/Update Field is invalid or not available, or if the payload is not in proper format, then 400 will be returned in the response.

If the candidate has completed the process, then 403 will be returned in the response as the Update is not allowed for such a candidate.

Use Case: PUT operation

Put operation is used to update a HRData for a candidate. The fields provided, will be updated and will be changed in the HRData of the candidate.

9.9.1.2.1 ExpandTags

This Entity provides the list and fields of all the Data-dictionary that are available in Onboarding. This metadata API provides the information on the data-dictionary.

Supported Operations

GET

Properties and Navigation Properties

Properties of the Expand Tags.

Property	Description
TagName	Name of the data-dictionary.
NavigationLink	Link to get the fields under the data-dictionary.

Properties of the Fields under the Tag.

Property	Description
TagName	Name of the data-dictionary.
Fields	List of fields under the data-dictionary..

Prerequisite: Get a valid authorization token

Fetch a valid token, from the OData Authentication API, which is mentioned previously.

Use Case: Get the List of Tags (Data – Dictionary) and Fields

When the above request is called, the list of the data-dictionary is returned. With each data-dictionary, a navigation link is returned. This navigation link, returns the list of fields for the Tag.

Request Information

Operation	GET
-----------	-----

URI	https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('ApplicationInfo')/Fields
Description	The Odata API will return the list of tag name and a navigation link to provide the fields under that tag.
Headers	Authorization: Token (Obtained from OData Authentication API)

Response

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/$metadata#ExpandTags",
  "value": [
    {
      "TagName": "ApplicationInfo",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('ApplicationInfo')/Fields"
    },
    {
      "TagName": "Base New Employee Data",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('Base New Employee Data')/Fields"
    },
    {
      "TagName": "Direct Deposit",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('Direct Deposit')/Fields"
    },
    {
      "TagName": "EC",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('EC')/Fields"
    },
    {
      "TagName": "EC-CandidateCreated",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('EC-CandidateCreated')/Fields"
    },
    {
      "TagName": "EC-PaperWorkDone",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('EC-PaperWorkDone')/Fields"
    },
    {
      "TagName": "EC-PostPHV",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('EC-PostPHV')/Fields"
    },
    {
      "TagName": "EC-UpdateHireDate",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('EC-UpdateHireDate')/Fields"
    },
    {
      "TagName": "EEO Info",
      "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('EEO Info')/Fields"
    },
    {

```

```

    "TagName": "Emergency Contact",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('Emergency Contact')/Fields"
  },
  {
    "TagName": "eWage",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('eWage')/Fields"
  },
  {
    "TagName": "HrDataAPIUpdate",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('HrDataAPIUpdate')/Fields"
  },
  {
    "TagName": "I-9",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('I-9')/Fields"
  },
  {
    "TagName": "I9 Info",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('I9 Info')/Fields"
  },
  {
    "TagName": "I9 Personal Information",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('I9 Personal Information')/Fields"
  },
  {
    "TagName": "Job Related Info",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('Job Related Info')/Fields"
  },
  {
    "TagName": "JobReq",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('JobReq')/Fields"
  },
  {
    "TagName": "Offboarding",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('Offboarding')/Fields"
  },
  {
    "TagName": "OfferInfo",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('OfferInfo')/Fields"
  },
  {
    "TagName": "Onboarding",
    "NavigationLink": "https://<api-server>/<PartnerName>/odata/v2/hrdata/
metadata/ExpandTags('Onboarding')/Fields"
  }
}

```

“NavigationLink” will provide the fields under that Tag Name, below is example for Application Info Tag Name, the navigation link is [https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags\('ApplicationInfo'\)/Fields](https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/ExpandTags('ApplicationInfo')/Fields).

On calling this API with same Authorization, the response is:

```

{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/
$metadata#Fields/@Element",
  "TagName": "ApplicationInfo",
  "Fields": [

```

```

"City",
"FirstName",
"Zip",
"Gender",
"VeteranStatus",
"EmergencyState",
"EmergencyAddress",
"EmergencyCity",
"Address2",
"DaytimePhoneAC",
"DaytimePhoneNum",
"EveningPhoneAC",
"EveningPhoneNum",
"EmergencyDaytimePhoneAC",
"EmergencyFirstName",
"EmergencyZip",
"MaritalStatus",
"State",
"LastName",
"Zip4",
"DateOfBirth",
"EMail",
"EmployeeId",
"EmergencyZip4",
"Address1",
"EmergencyDaytimePhoneNum",
"EmergencyLastName",
"MiddleName",
"Address2",
"EmergencyAddress2",
"Address3",
"EmergencyAddress3",
"Address4",
"EmergencyAddress4",
"Country",
"EmergencyCountry",
"DisabledPerson",
"Ethnicity",
"NeedAccomodation",
"DaytimePhoneAC",
"EveningPhoneAC",
"DaytimePhoneNum",
"EveningPhoneNum",
"Suffix",
"ApplicantId"
]
}

```

9.9.1.2.2 FilterFields

This entity provides the list of all the Index fields that can be filtered. It returns all the process and the index fields under the process. This metadata API provides the information on the data-dictionary.

Supported Operations

GET

Properties and Navigation Properties

Properties

Properties of the Expand Tags.

Property	Description
ProcessName	Name of the process..
QueryableFields	Index fields under the process that can be queried with OData API.

Prerequisite: Get a valid authorization token

Fetch a valid token, from the OData Authentication API, which is mentioned previously.

Request Information

Operation	Get list of filter fields
URI	<code>https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/FilterFields</code>
Description	The Odata API will return the list of processes and the Index fields in that Processes. The fields returned can be used in the Filter API as FCode.
Headers	Authorization: Token (Obtained from OData Authentication API)
Payload	No

Response

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/$metadata#FilterFields",
  "value": [
    {
      "ProcessName": "Onboarding",
      "QueryableFields": [
        "ProcessDueDate",
        "StartDate",
        "OrientationDate",
        "FirstName",
        "LastName",
        "MiddleName",
        "SSN",
        "JobTitle",
        "Department",
        "Location",
        "ManagerLoginName",
        "State",
        "Country",
        "Division",
        "Gender",
        "EthnicGroup",
      ]
    }
  ]
}
```

```

    "DeptCode",
    "DivCode",

    "DepartmentType",
    "BackgroundType",
    "PJCode",
    "AssociateUserId"
  ]
}
]
}

```

Use Case: Get the List of Index fields

When the above request is called, the list of the processes and the index fields under each process.

9.9.1.2.3 UpdateFields

This entity provides the list of fields of under HrDataAPIUpdate Data-dictionary. These are the fields under the HRData that can be updated using the OData API.

Supported Operations

GET

Properties and Navigation Properties

Properties

Properties of the Expand Tags.

Property	Description
Fields	Fields under the data-dictionary HrDataAPIUpdate. These fields can be updated in HRData using OData API.

Prerequisite:

1. Get a valid authorization token
Fetch a valid token, from the OData Authentication API, which is mentioned previously.
2. Fields under Data-dictionary HrDataAPIUpdate
Data-dictionary HrDataAPIUpdate will be present, fields need to be added under the data-dictionary.

Request Information

Operation	Get list of fields that can be updated
URI	<code>https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/UpdateFieldss</code>
Description	The Odata API will return the list of fields present under HrDataAPIUpdate tag
Headers	Authorization: Token (Obtained from OData Authentication API)
Payload	No

Response

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/hrdata/metadata/$metadata#UpdateFields/@Element",
  "Fields": [
    "FirstName",
    "LastName"
  ]
}
```

Use Case: Get the List of Fields under HrDataAPIUpdate tag

When the above request is called, the list of the data-dictionary is returned. With each data-dictionary, a navigation link is returned. This navigation link returns the list of fields for the Tag.

9.9.1.3 ODataAuthentication

This is an API to authenticate for other OData API calls. This API call is used to get the valid token and this token will be used as authentication in the OData API Calls to fetch the data. The user has to set a new Service Login-Set ODataService, and pass the credentials in the Request Header in the below format.

Supported Operations

Query

Properties and Navigation Properties

Properties

Property	Description
Token	Token which needs to be used as Authorization for subsequent Odata API calls.
ExpiryTimeStamp	Time within which the token needs to be used at least once, else token will be expired.

Prerequisite: Set up ODataService Login Set

The Service Login needs to be created Super Admin, under Account -> Service Login. New User Name and Password needs to be set for the new Service Login Set, ODataService.

Request Information

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/<PartnerName>/odata/v2/ODataAuthentication<></code>
Headers	Authorization: Basic <Base 64 encoded ({"Username": "<Service Login Username>", "Password": "<Service Login password>"})> OR Authorization: Basic Base 64 encoded (<Service Login Username>:<Service Login password>)

Response

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/$metadata#ODataAuthentication/@Element",
  "Token": "48c3alba-c23c-4f25-9570-24f08be8b073",
  "ExpiryTimeStamp": "2016-10-07T09:51:56.3886605+05:30"
```

```
}
```

9.9.1.4 OnboarderAttachment

The `OnboarderAttachment` entity lets you import attachments into the Onboarding panels. You can import attachments of the type: .pdf, .doc, .docx, .xls, .xlsx, .txt, .csv, .ppt; import image file of the type: gif, png, jpg, jpeg, bmp; Additionally you can also use the API to: import updated versions of an attachment that already exists; review the API response results; retrieve data regarding existing attachments in Onboarding to determine which new documents need to be attached, and which existing documents to update; import all types of documents from RCM except any document in HTML format; delete single or multiple attachments from Onboarding. All the attachments appear in the Panel. Depending on the file type, you can either only view them or download them. The functionality of the documents you attach using the API, mirrors the functionality of the documents that are manually attached. The attached document inherits the properties set in the Panel by the administrator like any manually attached document.

Supported Operations

Query, Update, Delete

Authentication

Obtain a token using the `odataAuthentication` API.

Use Case

Get all attachments for an Onboarder

Request

Request Information

Operation	GET
URI	<code>https://<api-server>/<PartnerName>/odata/v2/OnboarderAttachment?\$filter=HrDataId eq guid'90a72911-9444-4ad3-9698-035f6a528a16'</code>
Headers	Authorization: <Token obtained from OData Authentication API>

Response

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/
odata/v2/$metadata#OnboarderAttachment",
  "value": [
    {
      "HrDataId": "90a72911-9444-4ad3-9698-035f6a528a16",
      "AttachmentId": "de1d578c-4d42-4143-a35a-d3736a7f9843",
      "AttachmentName": "documentTwo.txt",
      "FormCode": "Blue",
      "AttachmentContent": "<base-64 encoded g-zip content",
      "AttachmentDetails": [
        {
          "Key": "ShowInWorkQueue",
          "Value": "True"
        },
        {
          "Key": "MimeType",
          "Value": "text/plain"
        }
      ]
    },
    {
      "HrDataId": "90a72911-9444-4ad3-9698-035f6a528a16",
      "AttachmentId": "15bc306b-4eaa-4019-b351-6f7eb74bbf3a",
      "AttachmentName": "documentTwo.xls",
      "FormCode": "Blue",
      "AttachmentContent": "<base-64 encoded gzip content",
      "AttachmentDetails": [
        {
          "Key": "ShowInWorkQueue",
          "Value": "True"
        },
        {
          "Key": "MimeType",
          "Value": "application/vnd.ms-excel"
        }
      ]
    }
  ]
}
```

Use Case

Get attachments for an onboarder and filter by form code

Request

Request Information

Operation	GET
URI	<pre>https://<api-server>/<PartnerName>/ odata/v2/OnboarderAttachment? \$filter=HrDataId eq guid'90a72911-9444-4ad3-9698-035f6a528a16' and FormCode eq 'Blue'</pre>

Response

Sample Code

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/
odata/v2/$metadata#OnboardeeAttachment",
  "value": [
    {
      "HrDataId": "90a72911-9444-4ad3-9698-035f6a528a16",
      "AttachmentId": "de1d578c-4d42-4143-a35a-d3736a7f9843",
      "AttachmentName": "documentTwo.txt",
      "FormCode": "Blue",
      "AttachmentContent": "<base-64 encoded g-zip content",
      "AttachmentDetails": [
        {
          "Key": "ShowInWorkQueue",
          "Value": "True"
        },
        {
          "Key": "MimeType",
          "Value": "text/plain"
        }
      ]
    },
    {

          "Key": "MimeType",
          "Value": "application/vnd.ms-excel"
        }
      ]
    }
  ]
}
```

Use Case

Get attachment by attachment ID

Request

Request Information

Operation

GET

URI	https://<api-server>/<PartnerName>/odata/v2/OnboarderAttachment
Headers	Authorization: <Token obtained from OData Authentication API>

Response

Sample Code

```
{
  "odata.metadata": "https://<api-server>/<PartnerName>/odata/v2/$metadata#OnboarderAttachment",
  "value": [
    {
      "HrDataId": "90a72911-9444-4ad3-9698-035f6a528a16",
      "AttachmentId": "15bc306b-4eaa-4019-b351-6f7eb74bbf3a",
      "AttachmentName": "documentTwo.xls",
      "FormCode": "Blue",
      "AttachmentContent": "<BASE-64 ENCODED G-ZIP CONTENT>"
      "AttachmentDetails": [
        {
          "Key": "ShowInWorkQueue",
          "Value": "True"
        },
        {
          "Key": "MimeType",
          "Value": "application/vnd.ms-excel"
        }
      ]
    }
  ]
}
```

Use Case

Post a single attachment - Allows to upload a new attachment for an onboarder. The attachment will be available on the Work Queue as well as on Panels for the onboarder.

Request

Request Information

Operation	POST
URI	https://<api-server>/<PartnerName>/odata/v2/OnboarderAttachment
Headers	Authorization: <Token obtained from OData Authentication API>

Payload

```
[
  {
    "HrDataId" :
    "90a72911-9444-4ad3-9698-035f6a528a16",
    "AttachmentName" :
    "documentTwo.xls",
    "FormCode" : "Blue",
    "AttachmentContent": "<base-64
    encoded g-zipped file content>"
  }
]
```

Response

Sample Code

```
[
  {
    "HrDataId": "90a72911-9444-4ad3-9698-035f6a528a16",

9.9.2 Onboarding 1.0 MDF Entities

9.9.2.1 OnboardingEquipment

The `OnboardingEquipment` MDF entity stores the information of a selected equipment such as laptop or secure id card. This entity is used when an actionable onboarding participant (for example, the hiring manager) maintains the Furnish Equipment activity in Onboarding New Hire Activities to store the information for the equipment.

Supported Operations

Query, Insert, Upsert, Merge, Replace, Delete

Note

All the operations are configured by API visibility which is pre-configured for this MDF object and cannot be changed. The API visibility can either be set as *Read-Only* or *Editable*. All the operations listed are supported but it is recommended to use only the Query and Update operations. The other operations might effect the status information that is communicated to the parent objects (`OnboardingEquipmentActivity`, `OnboardingNewHireActivitiesStep`).

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>equipmentId</code>	External Id of the Onboarding equipment entity.
<code>type</code>	Type of equipment (category), selected from <code>OnboardingEquipmentType</code> .
<code>value</code>	Value selected from the equipment category (for example, the value 'Lenovo' selected from the equipment category 'Laptop').
<code>comment</code>	Comment from an actionable onboarding participant
<code>workflow</code>	Workflow associated with that equipment

Navigation Properties

Navigation Property	Related Entity	Description
typeNav	OnboardingEquipmentType	Navigation to OnboardingEquipmentType entity.
valueNav	OnboardingEquipmentTypeValue	Navigation to OnboardingEquipmentTypeValue entity

Use Case - QUERY operation

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ OnboardingEquipment?\$filter=equipmentId eq '1157'

Response

9.9.2.4 OnboardingEquipmentTypeValue

The `OnboardingEquipmentTypeValue` MDF entity stores predefined equipment type value that can be selected in the `OnboardingEquipment` entity after selecting a type. This entity is used to provide equipment type values that can be selected in the Furnish Equipment activity in Onboarding New Hire Activities.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
code	External code of the Onboarding equipment type value.
description	External name of the equipment type value.
type	Equipment type the value belongs to.
equipmentNotRequired	flag showing if that equipment is required or not.

Navigation Properties

Navigation Property	Related Entity	Description
descriptionTranslationTextNav	Translatable	Navigation to Translatable entity.

Navigation Property	Related Entity	Description
typeNav	OnboardingEquipmentType	Navigation to OnboardingEquipmentType entity

9.9.2.10 OnboardingProcess

The `OnboardingProcess` MDF entity is the entry point for all activities for a candidate. This entity is created in background when a candidate is created in Onboarding.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>onboardingProcessId</code>	External Id of the process
<code>processConfig</code>	External Id of the process config entity that was used to copy default values from
<code>processStatus</code>	Status of the process
<code>externalName</code>	External name of the process
<code>candidateInfo</code>	External Id of the related candidate info

Navigation Properties

Navigation Property	Related Entity	Description
<code>newHireActivitiesStep</code>	<code>OnboardingNewHireActivitiesStep</code>	Navigation to entity <code>OnboardingNewHireActivitiesStep</code>

Use Case

Related Information

[SAP Business Accelerator Hub: OnboardingProcess](#)

9.9.2.11 OnboardingMeetingEvent

The `OnboardingMeetingEvent` MDF entity that allows a manager to maintain a meeting for a candidate before being hired. This entity is used when an actionable onboarding participant (for example, the hiring manager) maintains the Meeting activity in Onboarding New Hire Activities.

Supported Operations

Query, Upsert, Insert, Merge, Replace, Delete

Note

All the operations are configured by API visibility which is pre-configured for this MDF object and cannot be changed. The API visibility can either be set as *Read-Only* or *Editable*. All the operations listed are supported but it is recommended to use only the Query and Merge operations. The other operations might affect the status information that is communicated to the parent objects (`OnboardingEquipmentActivity`, `OnboardingNewHireActivitiesStep`).

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
ExternalCode	External Id of the meeting event
startDateTime	Start datetime of the meeting event
endDateTime	End datetime of the meeting event
subject	Subject of the meeting event
agenda	Agenda of the meeting event
location	Location of the meeting event
participantUserId1	User of the participant
participantUserId2	User of the participant

Property	Description
participantUserId3	User of the participant
participantUserId4	User of the participant
participantUserId5	User of the participant
onboardingProcessMeetingTypeConfig	External id of the meeting type config that was used for defaulting
send	Flag to show if the meeting event shall create an ICS file

Navigation Properties

Navigation Property	Related Entity	Description
participantUserId1Nav	User	Navigation to user entity
participantUserId2Nav	User	Navigation to user entity
participantUserId3Nav	User	Navigation to user entity
participantUserId4Nav	User	Navigation to user entity
participantUserId5Navagenda	User	Navigation to user entity
participantUserId5	User	Navigation to user entity

Use Case - UPDATE Operation

Request

In this example the key for `OnboardingMeetingEvent` is very long and therefore a space was added to fit it in the table. Use the key that was handed back in the GET Operation in the `<id>` tag.

Request Information

Operation	Merge
HTTP Method	POST
URI	<pre> https://<api-server>/odata/v2/ OnboardingMeetingEvent(OnboardingMeetingAc tivity_activityId=517L,OnboardingNewHireAc tivitiesStep_ processStepId=517L,OnboardingProcess_onboa rdingProcessId=517L,externalCode='517_f9ee 0114-b251-4ed2-b3ae-07ac32b60d58')? &\$format=json </pre>
Headers	X-HTTP-Method: MERGE
Payload	<pre> { "__metadata":{ "uri":"OnboardingMeetingEvent(Onboarding MeetingActivity_activityId=517L,Onboardi ngNewHireActivitiesStep_processStepId=51 7L,OnboardingProcess_ onboardingProcessId=517L,externalCode='5 17_f9ee0114-b251-4ed2- b3ae-07ac32b60d58')" }, "subject":"Team Meeting", "location":"Meeting Room 21" } </pre>

Response

A successful update will not result in any response payload, but you will get error messages in case a field can't be updated or the entity can't be found

Error Codes

Error Code	Description
401 Unauthorized	Authentication failed
404 Not Found	Entity ComplianceProcessTask with the given key is not found

9.9.3.7 ONB2Process

The `ONB2Process` MDF entity is the entry point for all Onboarding tasks in Onboarding.

Permissions

► [Onboarding 2.0 or Offboarding 2.0 Object Permissions](#) ► [ONB2Process](#) ►

Supported Operations

Query, Insert, Upsert, Merge, Replace, Delete

Note

Though we support Insert, Update, and Delete operations for `ONB2Process`, we do not recommend you use these operations. Instead you can use the function import `initiateOnboardingForUser` to initiate Onboarding, which in turn creates `ONB2Process`.

If you use the Insert, Update, and Delete operations for `ONB2Process`, the Onboarding Process for the new hire will not get initiated.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
processId	External key for the process.
user	External ID of the user the process was created for.
locale	Locale of the candidate.
activitiesConfig	External Id of the activity config entity used to copy default values during the creation of each entity.
targetDate	Candidate target hiring date.
processType	Determines if the process is used for Onboarding or Offboarding.
processStatus	Status of the process (not started, open, completed and canceled).
activitiesStatus	Overall status of the activities, showing if there are still open activities.
manager	Hiring manager of the candidate.
onboardingHireStatus	Shows the hire status of the candidate, hired or hireable.
onboardingInternalHire	Shows if a candidate is an internal hire.
onboardingRcmJobReqId	SAP SuccessFactors Recruiting job requisition ID.
onboardingRcmApplicationId	SAP SuccessFactors Recruiting application ID.
onboardingRcmOfferId	SAP SuccessFactors Recruiting offer ID.
onboardingRcmCandidateId	SAP SuccessFactors Recruiting candidate ID.
customDataCollectionConfig	External code of the custom data collection configuration.
employeePersonId	Person ID of the employee.
managerPersonId	Person ID of the manager.
cancelOnboardingReason	Reason for canceling the Onboarding process.

Property	Description
cancelOnboardingAdditionalComments	Additional comments for a canceled Onboarding process.

Navigation Properties

Navigation Property	Related Entity	Description
userNav	User	Navigation to the user entity of the candidate.
managerNav	User	Navigation to the user entity of the manager.
toEquipmentActivity	ONB2EquipmentActivity	Navigation to the Equipment Activity entity.

Use Case - QUERY operation

Related Information

[SAP Business Accelerator Hub: ONB2Process](#)

9.9.3.8 ONB2EquipmentActivity

The `ONB2EquipmentActivity` MDF entity allows actionable Onboarding participants to select equipment for a candidate before being hired. The entity is used when an Onboarding participant maintains the request equipment task in the Onboarding 2.0 [Onboard New Team Members Dashboard](#).

Permissions

► [Onboarding 2.0 or Offboarding 2.0 Object Permissions](#) ► [Equipment Task](#) ►

Supported Operations

Query, Insert, Update, Merge, Replace, Upsert, Delete

Note

Though we support Insert, Update, and Delete operations for `ONB2EquipmentActivity`, we do not recommend you use these operations. Instead you can use New Hire Activity creation to create the Equipment Activity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ► [Admin Center](#) ► [API Center](#) ► [OData API Data Dictionary](#) ► or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
activityId	External key for the Onboarding Equipment Activity.
process	Process entity the Equipment Activity belongs to.
optional	Shows if the activity is optional or mandatory.
dueDate	Date when the equipment activity is due.
lastNudgedBy	User ID of the last person who nudged an actionable Onboarding participant to complete the activity.

Property	Description
lastNudgedDate	Date when the last nudge was sent.
responsibleUsers	All users who are actionable Onboarding participants.
equipmentType	The equipment type of the equipment used in the activity, for example, laptop.
equipmentValue	The equipment value of the equipment type, for example, Lenovo T1000.
equipmentComment	Comment for the equipment activity.
equipmentStatus	Status of the equipment requested: not needed, not started, delivered, approved, rejected.
notNeededComment	Comment in case the equipment is not needed for the candidate.

Navigation Properties

Navigation Property	Related Entity	Description
lastNudgedByNav	User	Navigation to the user who nudged.
equipmentValueNav	ONB2EquipmentValue	Navigation to Equipment Value.
toEquipmentActivity	ONB2EquipmentType	Navigation to Equipment type.

Use Case - POST operation

Request

Operation	Merge
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/beta/ONB2EquipmentActivity('18252')</code>
Headers	X-HTTP-METHOD:MERGE
Payload	<pre>{ "__metadata": { "uri": "ONB2EquipmentActivity(activityId='18252')", }, "cust_orderStatus": "ordered" }</pre>

📌 Note

In the example payload, a customer field `cust_orderStatus` was added to the object definition of the `ONB2EquipmentActivity`. The field can now be used to write back a value from an external system. A successful update returns no response body.

Related Information

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
id	The ID of the form entry.
formId	The ID of the form.
country	Country associated with the form entry.
documentFlowStatus	Status of the document flow. The available statuses are IN_PROGRESS , COMPLETED , SIGNATURE_DECLINED , and SIGNATURE_VOIDED .
processStatus	Status of the compliance process. Only processes with COMPLETED status will be returned.

Property	Description
year	Year of the form entry.
formVersion	Form version associated with the entry.
initiatorId	The ID of the initiator.
createdDate	Created date of the compliance process.
processId	The ID of the compliance process.
state	Geographical state associated with the form entry.
user	User name of the new hire.
initiatorType	The initiator type, which will always be ONBOARDING in this case.

Navigation Properties

Navigation Property	Related Entity	Description
data	ComplianceFormDataRowValue	The OData entity corresponding to data stored in ComplianceUserData.
userNav	User	This entity contains the user details.

Use Case 1: Fetching Compliance Data of Users

This use case is about fetching the compliance data of users whose process status is Completed.

Error Codes

Error	Description
COE_GENERAL_BAD_REQUEST	OData requests for entity 'ComplianceFormDataFieldValue' aren't supported. Use navigation 'data' of entity 'ComplianceUserFormData' instead

Additional Information

- The maximum number of records returned in a single request is limited to 1000. To fetch more records in batches, use **top** and **skip** OData parameters.
- ComplianceFormDataFieldValue isn't queryable. Its count query will always be zero.
- Allowed filter operators are limited to: eq, ne, lt, gt, le, ge, and, or.

Note

- You can't fetch the Form I-9 data using the ComplianceUserFormData entity. However, you can use this entity to fetch data collected for other compliance forms.
- You can't fetch the status for the document flow of Form I-9 using the ComplianceUserFormData entity. To know the document flow status of Form I-9, use the Stories in People Analytics. For details, refer to **Stories in People Analytics for Onboarding** in the **Related Information** section.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [▶ Admin Center](#) ▶ [API Center](#) ▶ [OData API Data Dictionary](#) ▶ or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
id	External code of the object.
process	Related ONB2Process.
createdBy	User who created the data collection object.
createdDateTime	Date and time when the data collection object was created.
lastModifiedBy	User who last modified the data collection object.
lastModifiedDateTime	Date and time when the data collection object was last modified.
subjectUser	The user whom the data collection object is associated with.

Navigation Properties

Navigation Property	Related Entity	Description
createdByNav	User	Navigation to the user entity of the created user.
lastModifiedByNav	User	Navigation to the user entity of the last modified user.
processNav	ONB2Process	Navigation to the linked ONB2Process object.
subjectUserNav	User	Navigation to the user entity of the subject user.

Use Case 1: Fetching Data from Custom Object

The following use case is about fetching data from a custom object for a given ONB2Process.

Related Information

[SAP Business Accelerator Hub: ONB2DataCollectionUserConfig](#)

9.9.3.11 Function Import

9.9.3.11.1 createOnboarder

This function import enables you to create an onboarding external user record in the system with information collected from your external Applicant Tracking System (ATS). It also enables you to perform preliminary checks to understand if the onboarder is a new hire or a rehire and take actions as necessary.

Note

SAP SuccessFactors Onboarding supports both rehire on new employment and rehire with old employment information.

Note

If you want to create an onboarding external user record in the system with the information collected from your external ATS, it is recommended that you use the *createOnboarder* API instead of using the *ExternalUser* API.

Permissions

Permission System	Required Settings
Role based	Manage On/Offboarding > Initiate Onboarding API Permission

Supported Operations

HTTP Method: POST

Return Type: string

Support Payload: true

Parameters

Parameter	Type	Description	Mandatory or Optional?
username	String	This parameter holds the user name of the onboarder and should be unique.	Mandatory

Parameter	Type	Description	Mandatory or Optional?
userId	String	This parameter holds the User ID of the onboarder and should be unique.	Mandatory
password	String	This parameter holds the default password generated by the system.	Optional
Email	String	This parameter holds the email ID of the onboarder.	Mandatory
<div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p>Note</p> <p>The value should be in a valid email format.</p> </div>			
applicationId	String	This parameter holds the application ID of the onboarder, as generated from your external ATS.	Mandatory
shouldCreateNewHire	Boolean	This parameter holds a value that indicates whether the onboarder belongs to a new hire scenario.	Optional
isRehireOnOldEmployment	Boolean	This parameter holds a value that indicates whether the onboarder belongs to a rehire with old employment information scenario. If an old employment record associated with the onboarder is found, the employment is activated.	Optional
<div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p>→ Recommendation</p> <p>If you want to rehire an applicant on old employment, we recommend you to use the <code>hireType</code> parameter instead of <code>isRehireOnOldEmployment</code>. For more details, see the hireType row and the recommendation in Use Case 4: Create Onboarder as Rehire on Old Employment available below.</p> </div>			

Parameter	Type	Description	Mandatory or Optional?
userLocale	String	<p>This parameter holds the custom locale value when onboarding an external new hire. The new hire can see this updated locale after successfully logging into Onboarding.</p> <p>To view the welcome email and the password reset page as per the locale selected by the new hire during candidate profile creation, create a rule and include it in the corresponding email templates.</p> <p>The welcome email and password reset page (when opened from the welcome email) will appear in the default language that is set in the <i>Default Language</i> field of <i>Company Settings</i> in Provisioning.</p> <div data-bbox="818 995 1114 1251" style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>Note</p> <p>If you do not pass a locale value or enter an incorrect locale value, then the application retains the company default locale.</p> </div> <div data-bbox="818 1266 1114 1614" style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>Remember</p> <p>As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.</p> </div>	Optional
internalUserId	String	<p>This parameter holds a value for the internal user for whom legal entity transfer is intended.</p>	Optional

Parameter	Type	Description	Mandatory or Optional?
hireType	String	<p>This parameter holds a value which can be selected based on the hire type requirement. Available options include:</p> <ul style="list-style-type: none"> NEW_HIRE REHIRE_NEW_EMPLOYMENT REHIRE_OLD_EMPLOYMENT LEGAL_ENTITY_TRANSFER_NEW_EMPLOYMENT 	Optional

Use Case 1: Create an External User Record

As a part of this usecase, the API creates an external user record in the system. If successful, it creates an onboarding process ID required for initiating the onboarding process.

Request

HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/createOnboardee</code>
Payload	<div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p>↔ Sample Code</p> <pre>{ "userName": "AlbusD", "userId": "1234567", "email": "AlbusD@testCompany.com", "password": "Password", "applicationId": "12345" }</pre> </div>

Response

<div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p>↔ Sample Code</p> <pre><?xml version="1.0" encoding="utf-8"?> <d:createOnboardee xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">9FA5F6976E4642D8BD4541D245AA924B</d:createOnboardee></pre> </div>
--

Use Case 2: Check If the Onboarder Is a Rehire

The API checks if the onboarder is a rehire by verifying if the values that are already available in the system. The values supported to check for rehire are first name, last name, date of birth, and national ID details. If the details are available, a process ID is returned. This ID must be used in the following API request calls.

Request

HTTP Method	POST
URI	https://<API-Server>/odata/v2/ createOnboarder
Payload	<div data-bbox="820 661 1425 1123"><p>↗ Sample Code</p><pre>{ "userId": "400011", "email": "AlbusD@testCompany.com", "userName": "RL11", "password": "onb", "applicationId": "TAL11", "rehireCheckParams": { "firstName": "Albus", "lastName": "D", "dateOfBirth": "1991-01-06", "nationalIdDetails": { "TFN": "121 323 123" } } }</pre></div>

Response

<div data-bbox="191 1234 1425 1486"><p>↗ Sample Code</p><pre><?xml version="1.0" encoding="utf-8"?> <error xmlns="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata"> <code>REHIRE_USER_FOUND</code> <message lang="en-US">Matching User Id : TH123, User Status : terminated;</ message> </error></pre></div>

Use Case 3: Create Onboarder As Rehire

If the system finds the onboarder to be a rehire based on the specified criteria, the API can be used to create onboarder as a rehire candidate.

Request

HTTP Method	POST
-------------	------

URI	https://<API-Server>/odata/v2/ createOnboardee
Payload	<pre> ↔ Sample Code { "userId": "400011", "email": "AlbusD@testCompany.com", "userName": "RL11", "password": "onb", "applicationId": "TAL10", "rehireUser": "TH123" } </pre>

Response

<pre> ↔ Sample Code <?xml version="1.0" encoding="utf-8"?> <d:createOnboardee xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">3E2745238375404D864F001D6ACCC7CD</d:createOnboardee> </pre>

Use Case 4: Create Onboardee as Rehire on Old Employment

Use this API when an onboardee is created for the rehire based on the old employment.

Request

HTTP Method	POST
URI	https://<API-Server>/odata/v2/ createOnboardee

Payload

Sample Code

```
{
  "userId": "INACTIVE_EMPLOYEE_USER_ID",
  "email": "EMAIL_ID",
  "password": "PASSWORD",
  "userName": "USERNAME",
  "applicationId": "APPLICATION_ID",
  "hireType": "REHIRE_OLD_EMPLOYMENT"
}
```

Recommendation

If you want to rehire an applicant on old employment, we recommend you to select *REHIRE_OLD_EMPLOYMENT* as the value for the `hireType` parameter instead of entering *true* as the value for the `isRehireOnOldEmployment` parameter.

Response

Sample Code

```
<?xml version="1.0" encoding="utf-8"?>
<d:createOnboarder xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">TGA5F6975E4642D8BD4541D255AG924C</d:createOnboarder>
```

Use Case 5: Initiate Legal Entity Transfer for an Existing Employee

Use this API when you want to transfer an employee from one legal entity to another.

Request

HTTP Method	POST
URI	<code>https://<API-Server>/odata/v2/createOnboarder</code>

Payload

Sample Code

```
{
  "userId": "400011",
  "email":
  "AlbusD@testCompany.com",
  "password": "onb",
  "userName": "RL11",
  "applicationId": "TAL10",
  "hireType":
  "LEGAL_ENTITY_TRANSFER_NEW_EMPL",
  "internalUserId": "1234"
}
```

Response

Sample Code

```
<?xml version="1.0" encoding="utf-8"?>
<d:createOnboarder xmlns:m="http://schemas.microsoft.com/ado/2007/08/
dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/
dataservices">6FA56F6256E4665E8BD4541D876TA924B</d:createOnboarder>
```

Error Codes

The API validates mandatory parameters and existing data for user. Following are the error codes generated if the validation fails.

Error Code	Description
MANDATORY_PARAMETERS_MISSING	userId or UserName or email or password is missing or empty in the function import parameters.
INVALID_EMAIL	The email provided isn't in the valid format.
USER_ID_EXISTS	A record already exists for the userId provided.
USER_NAME_EXISTS	A record already exists for the userName provided.

9.9.3.11.2 initiateOnboardingForUser

After an external user record is created and Employee Central data is added to the record, you can use this function import to initiate onboarding process from an external Application Tracking System. It modifies the ONB2Process and ONB2ProcessTrigger MDF objects.

Note

We support rehiring on new employment and rehiring on old employment from an external Application Tracking System.

All Employee Central entities (PerPerson, EmpJob, EmpEmployment) should be upserted prior to this call for new hires.

Permissions

Permission System	Required Settings
Role based	Manage On/Offboarding2 > Initiate Onboarding API Permission

Supported Operations

HTTP Method: POST

Return Type: string

Support Payload: true

Parameters

Parameter	Description	Mandatory or Optional?
userId	This parameter holds the User ID of the new hire for whom the Onboarding process needs to be initiated.	Mandatory
atsApplicationId	This parameter holds the application ID of the new hire, as generated from your external ATS.	Mandatory
startDate	The start date of the user provided in the datetime format. This would be the date when all Employee Central records of the external user are effective.	Mandatory

Use Case: Initiating Onboarding process for external user

This use case is about initiating onboarding process for an external user. The use case validates mandatory parameters and existing data for the user. It creates necessary data for onboarding and triggers the BPE workflow for the onboarding process.

Sample Request

HTTP Method	POST
URI	https://<API-Server>/odata/v2/initiateOnboardingForUser
Payload	<pre>{ "userId": "john", "atsApplicationId": "john", "startDate": "2019-08-29T00:00:00" }</pre>

Sample Response

<pre><?xml version="1.0" encoding="utf-8"?> <d:initiateOnboardingForUser xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" xmlns:d="http://schemas.microsoft.com/ado/2007/08/ dataservices">9FA5F6976E4642D8BD4541D245AA924B </d:initiateOnboardingForUser></pre>
<p>Note</p> <p>The GUID in the response is the onboarding processId generated by the system.</p>

Additional Information

The API validates mandatory parameters and existing data for user. Following are the error codes generated if the validation fails.

Error Code	Description
MANDATORY_PARAMETERS_MISSING	userId or startDate is missing or empty in the function import parameters.
NOT_ONB_EXTERNAL_USER	The userId provided is not an external user Id or of type onboarding.
EC_DATA_MISSING	There is no data available in employee central entities for the userId provided.
MANDATORY_FIELDS_MISSING	Data is not available for one of the following fields in Employee Central. <ul style="list-style-type: none">personalInfo.first-name

Error Code	Description
	<ul style="list-style-type: none"> personalInfo.last-name jobInfo.company and corresponding country jobInfo.manager-id employmentInfo.start-date
OPEN_ONBOARDING_PROCESS_EXISTS	A new onboarding process cannot be initiated as an open onboarding process already exists for the <code>userId</code> provided.

9.9.3.11.3 updateFromExternalHrisONB

After a candidate is hired in the external Human Resources Information System (HRIS), you can use this function import to update the hiring data from the External HRIS system.

Permissions

Permission System	Required Settings
Role based	<p>▶ Manage Onboarding 2.0 or Offboarding 2.0 ▶ Update New Hire Data for External HRIS ▶</p> <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p>Note</p> <p>Define the target population to ensure that the permission works optimally. For more information, refer to Assigning External User Target Populations to Responsible Users' Permission Role topic.</p> </div>

Supported Operations

HTTP Method: POST

Return Type: string

Support Payload: true

Parameters

Parameter	Type	Description	Mandatory or Optional?
onbStableId	String	This parameter holds the master ID of the ONB2Process object of a new hire.	Mandatory
sourceOfRecord	String	This parameter holds the source of the record. <div data-bbox="818 604 1115 789" style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 5px;"> <p>Note</p> <p>The value should be defined in the Source of Record picklist.</p> </div>	Mandatory
hireStatus	String	This parameter holds the hire status of the candidate in the external Human Resource Information System. <div data-bbox="818 976 1115 1201" style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 5px;"> <p>Note</p> <p>Only the 'HIRED' status from the external Human Resources Information System is supported.</p> </div>	Mandatory
assignmentIdExternal	String	This parameter holds the external assignment ID.	Optional
personIdExternal	String	This parameter holds the external person ID.	Optional
userName	String	This parameter holds the user name of the new hire.	Mandatory

Use Case: Updating Hiring Data from External HRIS

This use case is about updating the hiring data to SAP SuccessFactors Onboarding from an external Human Resources Information System. It updates an existing record of hiring data for a candidate.

Sample Request

HTTP Method POST

URI

https://<API-Server>/odata/v2/
updateFromExternalHrisONB

Payload

↔ Sample Code

```
{
  "onbStableId":
  "D29528C23A034FFF935246661E5F7988",
  "hireStatus": "HIRED",
  "sourceOfRecord": "ONB",
  "userName": "extHrisInfoUser",
  "assignmentIdExternal":
  "extHrisInfoAssignExt005",
  "personIdExternal":
  "extHrisInfoPerExt005"
}
```

Sample Response

↔ Sample Code

```
<?xml version="1.0" encoding="utf-8"?>
<d:updateFromExternalHrisONB xmlns:m="http://schemas.microsoft.com/ado/2007/08/
dataservices/metadata"
xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices">
This request carried out your requirements successfully.</
d:updateFromExternalHrisONB>
```

Additional Information

The API validates the parameters and then adds or updates data. Following are the error codes generated if the validation fails.

Error Code	Description
ONB0001	Onboarding 2.0 is not enabled in Provisioning. → Remember As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.
ONB0002	The values provided for the mandatory parameters are invalid.
ONB0003	The <code>sourceOfRecord</code> value is invalid.
ONB0004	The values provided for the mandatory parameters are empty.
ONB0005	The <code>onbStableId</code> is invalid.

Error Code	Description
ONB0006	There's an existing record for the <code>personIdExternal</code> or <code>assignmentIdExternal</code> or <code>userName</code> in the system.
ONB0007	The candidate you're trying to hire isn't yet in Ready-to-Hire status.
ONB0008	Permission for accessing this API is missing. You do not have permission for invoking this API. Contact your system administrator to get the necessary permission.

9.10 Performance and Goals

9.10.1 Performance

9.10.1.1 Performance Management Form Entities

Form APIs provide the ability to query and update forms that are created for Performance Management or 360 Reviews.

Context

Form OData APIs enable you to:

- Query a list of form templates.
- Query a list of user form folders.
- Query form details, including the User Info section, Objective section, Competency section, Summary section, and Signature section on the form.
- Update ratings, comments, and custom element values on the form.

Normal users can only access the forms in their folders. The users, who have form OData Admin permission, can access all the forms, even the ones that aren't in their folders.

You can also check a user's target population and make sure they can only access the forms, whose owners are in their target population.

Permissions

If you have the following form OData admin permissions, you will be allowed to query the form data, but you will not be able to edit, add, or delete form data. You can only access the folders and forms, whose owner is in your target population.

Permission System	Required Settings	Note
Role-Based Permissions	<p>► Manage Documents ► Admin Access to Forms OData API ►</p> <p>If you want to fetch the deleted forms, select Include Deleted forms in Forms ODATA API.</p> <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>Note</p> <p>This permission works for the <code>FormHeader</code> API only. If you have the parent permission, Admin Access to Forms OData API, but don't have the Include Deleted forms in Forms ODATA API permission, you can use the <code>FormHeader</code> API to query active forms only. For other APIs, with the parent permission, you can query both active and deleted forms.</p> </div>	<p>Admin Access to Forms OData API allows you to query forms of all users, but this might be restricted by the specific form template permissions.</p>

9.10.1.1.1 FormHeader

You can use this entity to get the meta information of a specific form or a list of forms, for example, form data ID, start date, end date, and due date.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query the meta information of a specific form or a list of forms. <code>FormHeader</code> , that is <code>formDataId</code> , is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataStatus	<p>The status of form data. The field takes one of the following values:</p> <ul style="list-style-type: none">1: The form is in the modify stage.2: The form is in the rejected state.3: The form is in the completed stage.4: The form is deleted by the user or admins. <div data-bbox="862 600 1427 884" style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"><p>Note</p><p>To fetch the deleted forms, go to Admin Center > Manage Permission Roles > <Permission> > Administrator Permissions and select <i>Include Deleted forms in Forms ODATA API</i> under <i>Manage Documents</i>.</p></div> <ul style="list-style-type: none">5: The form is in the signature stage.6 (only for 360 Reviews): The form is in the evaluation stage.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query the Meta Information of a Form

The following example shows how to query the meta information of a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/FormHeader(272L)?\$format=json</code>

Response

```
{
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/FormHeader(272L)",
    "type": "SFOData.FormHeader"
  },
  "formDataId": "272",
  "formDataStatus": "1",
}
```

```

"formReviewDueDate": "/Date(1468886399000+0000)/",
"formTemplateId": "849",
"formTemplateType": "Review",
"formReviewStartDate": "/Date(1420070400000+0000)/",
"formOriginator": "TALRAJI",
"formSubjectId": "Testuser3908",
"creationDate": "/Date(1467617058000+0000)/",
"formReviewEndDate": "/Date(1451606399000+0000)/",
"rating": "0",
"isRated": false,
"formLastModifiedDate": "/Date(1467617058000+0000)/",
"formTitle": "1608 for User3908 Test",
"formContents": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/FormHeader(272L)/formContents"
  }
},
"formSubject": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/FormHeader(272L)/formSubject"
  }
},
"formRouteMap": {
  "__deferred": {
    "uri": "https://<api-server>/odata/v2/FormHeader(272L)/formRouteMap"
  }
}
}

```

Limitation

If you update the overall form rating to -1971 (Too New to Rate) or -1972 (Unrated) through the `FormUserRatingComment` entity, you get the rating as 0 when you query the `FormHeader` entity.

Related Information

[SAP Business Accelerator Hub: FormHeader](#) 

9.10.1.1.2 FormFolder

You can use this entity to query a list of form folders, including inbox, en route, and completed folders.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query a list of form folders.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query Form Folders

The following example shows how to query a list of form folders in a system.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/FormFolder?\$format=json</code>

Response

```
{
  "results": [
    {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/FormFolder(477L)",
        "type": "SFOData.FormFolder"
      },

Related Information

[SAP Business Accelerator Hub: FormFolder](#) 

9.10.1.1.3 FormContent

You can use this entity to query the form content of Performance Management and 360 Reviews forms, for example, form data ID, form content ID, last modified date, and status.

Permissions

For more information about permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query the form content of a form. FormContentId and formDataId are required for the query operation.

Properties and Navigation Properties

Property	Description
formContentId	Form content ID. This is a business key.
formDataId	Form data ID. This is a business key.
formSubjectId	Form subject ID.
lastModifiedDate	Last modified date and time with timezone information.

Property	Description
status	<p>Status of the form content. The status field takes one of the following values:</p> <ul style="list-style-type: none"> -1: Indicates the draft status. 3 (only for 360 Reviews): Indicates that the rater has completed their evaluation rating. 6 (only for 360 Reviews): Indicates that the form is in the evaluation stage. 7 (only for 360 Reviews): Indicates that the process owner can exclude a completed review from the overall rating calculation. 8 (only for 360 Reviews): Indicates that the participant has declined the review. 9 (only for 360 Reviews): Indicates that the process owner has removed a participant from the review. 10: Indicates that the form owner has viewed the form in the Inbox. 88 (only for 360 Reviews): A status exclusively for ad hoc forms. It indicates that the form was declined passively after reaching the due date.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query Form Content

The following example shows how to query the form content of a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/FormContent(formContentId=61L,formDataId=151L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormContent(formContentId=61L,formDataId=151L)",
      "type": "SFOData.FormContent"
    },
    "formContentId": "61",
    "formDataId": "151",
    "lastModifiedDate": "/Date(1495746637000+0000)/",
    "status": "-1",
    "folders": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/FormContent(formContentId=61L,formDataId=151L)/folders"
      }
    }
  },
}
```

```

    "formHeader": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/
FormContent(formContentId=61L,formDataId=151L)/formHeader"
      }
    },
    "pmReviewContentDetail": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/
FormContent(formContentId=61L,formDataId=151L)/pmReviewContentDetail"
      }
    },
    "form360ReviewContentDetail": {

9.10.1.1.6 FormCompetency

You can use this entity to get and update the basic information of competencies in Performance Management and 360 Reviews forms. The data of this entity comes from form content XML.

Note

If you've migrated to Talent Intelligence Hub, you can also use this entity to get and update the basic information of skills in Performance Management forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query the basic information of competencies in a specific form. FormContentId, formDataId, itemId, and sectionIndex are required for the query operation.

Operation	Description
Upsert	Update the self item comments, official ratings, and custom elements of competencies in a specific form.

Note

To update item comments in 360 Reviews forms, use self-RatingComment of FormCompetency. To update item ratings in 360 Reviews forms, use officialRating of FormCompetency.

Properties and Navigation Properties

Property	Description
itemIndex	The order of a competency in a form. You can use this property to set the order of competencies in a form.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. Related Information

[SAP Business Accelerator Hub: FormCompetencyBehavior](#)

9.10.1.1.8 FormCompetencySection

You can use this entity to get and update the basic information of competency sections in Performance Management and 360 Reviews forms. The data of this entity comes from form content XML.

Note

If you've migrated to Talent Intelligence Hub, you can also use this entity to get and update the basic information of skill sections in Performance Management forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query to identify a competency section in a specific form. FormDataId, formContentId, and sectionIndex are required for the query operation.
Upsert	Update the self item comments, official ratings, and custom elements of competencies in a specific form. FormDataId, formContentId, and sectionIndex are required for the upsert operation. Other than these values, you need key property values and comment/rating key values of entities to be saved.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Basic Information of a Competency Section

The following example shows how to query the basic information of a competency section.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/ FormCompetencySection(formContentId=17476L, formDataId=7153L,sectionIndex=3)? \$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/  
FormCompetencySection(formContentId=17476L,formDataId=7153L,sectionIndex=3)",
      "type": "SFOData.FormCompetencySection"
    },
    "sectionIndex": 3,
    "formContentId": "17476",
    "formDataId": "7153",
    "sectionDescription": "",
    "sectionWeightKey": "wf_sect_3_sectionWeight",
    "sectionWeight": "30.0",
    "sectionName": "Competencies",
    "sectionConfiguration": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/  
FormCompetencySection(formContentId=17476L,formDataId=7153L,sectionIndex=3)/  
sectionConfiguration"
      }
    },
    "selfRatingComment": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/  
FormCompetencySection(formContentId=17476L,formDataId=7153L,sectionIndex=3)/  
selfRatingComment"
      }
    },
    "competencies": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/  
FormCompetencySection(formContentId=17476L,formDataId=7153L,sectionIndex=3)/  
competencies"
      }
    },
    "othersRatingComment": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/  
FormCompetencySection(formContentId=17476L,formDataId=7153L,sectionIndex=3)/  
othersRatingComment"
      }
    }
  }
}
```

Use Case 2: Update the Rating Comment of a Competency Section

The following example shows how to update the rating comment of a competency section.

Request

Operation	Upsert
HTTP Method	POST
URI	http://<api-server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "FormPMReviewContentDetail(formContentId=17549L,formDataId=7182L)", "type": "SFOData.FormPMReviewContentDetail" }, "competencySections": [{ "__metadata": { "uri": "FormCompetencySection(formContentId=17549L,formDataId=7182L,sectionIndex=4)", "type": "SFOData.FormCompetencySection" }, "selfRatingComment": { "__metadata": { "uri": "FormUserRatingComment(formContentId=17549L,formDataId=7182L,itemId=-1L,ratingType='na',sectionIndex=4,userId='manager1')", "type": "SFOData.FormUserRatingComment" }, "commentKey": "wf_sect_4_sc_manager1_c", "comment": "Section comment for role specific competencies by Manager" } }] }</pre>

Response

<pre>{ "d": [{ "key": "FormPMReviewContentDetail/ formContentId=17549,FormPMReviewContentDetail/formDataId=7182", "status": "OK", "editStatus": "UPDATED", "message": null, "index": "0", "httpCode": "200", "inlineResults": null }] }</pre>

```
} ]
```

9.10.1.1.9 FormBehaviorRatingComment

You can use this entity to get and update the ratings and comments of competency behaviors in Performance Management and 360 Reviews forms. The data of this entity comes from form content XML.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query to identify a specific user's rating and comment of a competency behavior. FormDataId, formContentId, sectionIndex, itemId, userId, ratingType, and behaviorId are required for the query operation.
Upsert	Update a specific user's rating and comment of a competency behavior.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Self Rating and Comment of a Competency Behavior

The following example shows how to query a specific user's self rating and comment of a competency behavior.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/FormBehaviorRatingComment(formContentId=17536L,formDataId=7178L,behaviorId=46051L,itemId=7L,ratingType='na',sectionIndex=4,userId='user1')?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormBehaviorRatingComment(behaviorId=46051L,formContentId=17536L,formDataId=7178L,itemId=7L,ratingType='na',sectionIndex=4,userId='user1')",

9.10.1.1.10 FormObjective

You can use this entity to get and update the basic information of objectives in Performance Management forms. The data of this entity comes from form content XML.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query the basic information of objectives in a specific form. FormContentId, FormDataId, sectionIndex, and itemId are required for the query operation.
Upsert	Update the self rating comment, official rating, and custom element of objectives in a specific form.

Properties and Navigation Properties

Navigation Property	Related Entity	Description
comments	FormObjectiveComment	Navigation to the FormObjectiveComment entity
customElement	FormCustomElement	Navigation to the FormCustomElement entity
itemConfiguration	FormItemConfiguration	Navigation to the FormItemConfiguration entity
objectiveDetails	FormObjectiveDetails	Navigation to the FormObjectiveDetails entity
officialRating	FormUserRatingComment	Navigation to the FormUserRatingComment entity

Navigation Property	Related Entity	Description
otherDetails	FormObjectiveOtherDetails	Navigation to the FormObjectiveOtherDetails entity
othersRatingComment	FormUserRatingComment	Navigation to the FormUserRatingComment entity
selfRatingComment	FormUserRatingComment	Navigation to the FormUserRatingComment entity
metricLookupTables	FormObjectiveDetails	Currently, this navigation property is not supported.
milestones	FormObjectiveDetails	Currently, this navigation property is not supported.
targets	FormObjectiveDetails	Currently, this navigation property is not supported.
tasks	FormObjectiveDetails	Currently, this navigation property is not supported.

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Basic Information of an Objective

The following example shows how to query the basic information of an objective in a given form.

Request

Operation	Query
HTTP Method	GET

9.10.1.1.11 FormObjectiveDetails

You can use this entity to query the detailed information of objectives in Performance Management forms. The data of this entity comes from form content XML.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query to identify the detailed information of a specific objective in a specific form. FormDataId, formContentId, sectionIndex, itemId, and type are required for the query operation.

Note

Currently, type=1/2/3/4 is not supported.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query the Detailed Information of an Objective

The following example shows how to query the detailed information of a specific objective in a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/FormObjectiveDetails(formContentId=18442L,formDataId=10520L,itemId=4524L,sectionIndex=3,type=0)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormObjectiveDetails(formContentId=18442L,formDataId=10520L,itemId=4524L,sectionIndex=3,type=0)",
      "type": "SFOData.FormObjectiveDetails"
    },
    "sectionIndex": 3,
    "formContentId": "18442",
    "type": 0,
    "itemId": "4524",
    "formDataId": "10520",
    "value": "Персональная цель",

9.10.1.1.13 FormUserRatingComment

You can use this entity to get and update the ratings and comments of the objective, competency, custom, signature, and summary sections in Performance Management forms. The data of this entity comes from form content XML.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query to identify a specific user's rating and comment in a specific form. FormDataId, formContentId, sectionIndex, itemId, userId, and ratingType are required for the query operation.
Upsert	Update a specific user's rating and comment.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Rating and Comment of a Competency

The following example shows how to query a user's rating and comment of a competency in a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/FormUserRatingComment(formContentId=17617L,formDataId=7182L,itemId=7L,ratingType='na',sectionIndex=4,userId='user1')?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormUserRatingComment(formContentId=17617L,formDataId=7182L,itemId=7L,ratingType='na',sectionIndex=4,userId='user1')",
      "type": "SFOData.FormUserRatingComment"
    },
    "sectionIndex": 4,
    "formContentId": "17617",
    "userId": "user1",
    "ratingType": "na",
    "itemId": "7",
    "formDataId": "7182",
    "ratingPermission": "write",
    "commentLabel": "Managers Comments",
    "lastName": "LN",
    "commentKey": "wf_sect_4_c7_cmt_user1_c",
    "textRating": "Select a rating...",
    "ratingKey": "wf_sect_4_c7_cmt_user1_",
    "ratingLabel": "Self Rating",
    "rating": "-1972.0",
    "fullName": "User 1",
    "commentPermission": "write",
    "firstName": "FN",
    "comment": ""
  }
}
```

Use Case 2: Update the Rating and Comment of an Objective

The following example shows how to update a user's rating and comment of an objective in a given form.

Request

Operation	Upsert
HTTP Method	POST
URI	http://<api-server>/odata/v2/upsert

Payload

```

9.10.1.1.14 FormCustomElement

You can use this entity to get and update the basic information of custom elements added to objectives and competencies in Performance Management forms. The data of this entity comes from form content XML.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query to identify a custom element in a specific form. FormDataId, formContentId, sectionIndex, itemId, and elementKey are required for the query operation.
Upsert	Update the custom element value in a specific form. FormDataId, formContentId, sectionIndex, itemId, and elementKey are required for the upsert operation. Other than these values, you need key property values and key values of entities to be saved.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Basic Information of a Custom Element

The following example shows how to query the basic information of a custom element in a given form section.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/FormCustomElement(formContentId=17628L,formDataId=7176L,itemId=14L,sectionIndex=3,elementKey='ele_0')?\$format=json</code>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormCustomElement(elementKey='ele_0',formContentId=17628L,formDataId=7176L,itemId=14L,sectionIndex=3)",
      "type": "SFOData.FormCustomElement"
    },
    "sectionIndex": 3,
    "elementKey": "ele_0",
    "formContentId": "17628",
    "itemId": "14",

```

Use Case: Update the Manual Rating

This example shows how to update the manual rating in the Customized Weighted Rating section.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert
Payload	<pre> { "__metadata": { "uri": "FormCustomizedWeightedRatingSection(formDataId=17253L,formContentId=32492L)", "type": "SFOData.FormCustomizedWeightedRatingSection" }, "manualRating": { "__metadata": { "uri": "FormUserRatingComment(formContentId=32492L,formDataId=17253L,itemId=0L,ratingType='manual',sectionIndex=1,userId='')", "type": "SFOData.FormUserRatingComment" }, "ratingKey": "wf_sect_1_rating", "rating": "2.0" } } </pre>

Response

```

{
  "d": [
    {
      "key": "FormCustomizedWeightedRatingSection/
formContentId=32492,FormCustomizedWeightedRatingSection/formDataId=17253",
      "status": "OK",
      "editStatus": null,
      "message": "",
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}

```

```
}  
  ]  
}

9.10.1.1.30 FormAuditTrail

You can use this entity to get the audit trail information about Performance Management forms to track form routing details.

Permissions

To access all audit trail records of forms in the system, you should have the [Administrator](#) > [Manage Documents](#) > [Admin Access to Forms OData API](#) permission.

Supported Operations

Operation	Description
Query	Query to get the audit trail details about a given form. AuditTrailId is required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Audit Trail Details About a Form

The following example shows how to query the audit trail details about a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/ FormAuditTrail(auditTrailId=423L)? \$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormAuditTrail(423L)",
      "type": "SFOData.FormAuditTrail"
    },
    "auditTrailId": "423",
    "auditTrailRecipient": "101147",
    "auditTrailAction": "submit",
    "formContentId": "384",
    "formContentAssociatedStepId": "104654026225696",
    "auditTrailSender": "admin",
    "auditTrailLastModified": "/Date(1505201829000+0000)/",
    "auditTrailCoSender": null,
    "auditTrailComment": "Creation.",
    "formDataId": "87",
    "auditTrailSendProxy": null,
    "formContent": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/FormAuditTrail(423L)/  
formContent"
      }
    },
    "formHeader": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/FormAuditTrail(423L)/  
formHeader"
      }
    }
  }
}
```

Use Case 2: Retrieve Audit Trail Details from FormHeader

The following example shows how to retrieve the audit trail details about a given form from the parent entity FormHeader.

Request

Operation	Query
-----------	-------

HTTP Method

GET

URI

http://<api-server>/odata/v2/
FormHeader(formDataId=87L)?
\$expand=formAuditTrails&\$format=json

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormHeader(87L)",
      "type": "SFOData.FormHeader"

9.10.1.1.31 FormReviewFeedback

You can use this entity to get the request and response information about Ask for Feedback in Performance Management forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	Query to get the request and response information about Ask for Feedback in a given form. FeedbackId is required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Ask for Feedback Information

The following example shows how to query the request and response information about Ask for Feedback in a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/ FormReviewFeedback(feedbackId=2L)? \$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormReviewFeedback(2L)",
      "type": "SFOData.FormReviewFeedback"
    },
    "feedbackId": "2",
    "responseDate": "/Date(1497571200000)/",
    "subjectUserEmail": null,
    "pmFeedback": "feedback is updated",
    "requestUserEmail": null,
    "appraiserUserEmail": "r.dong@sap.com",
    "appraiserUserId": "<<Richard~r.dong@sap.com>>",
    "responseId": "1",
    "requestUserRole": "EM",

9.10.1.1.33 Function Import

Function imports modify an entity. You use them as you would use any OData API.

The following function imports can be used to route the form:

- [signForm \[page 2583\]](#)
- [sendToNextStep \[page 2483\]](#)
- [rejectForm \[page 2586\]](#)

All the above mentioned APIs return complex type object CORouteFormStatusBean.

Complex Type - CORouteFormStatusBean

Property	Description
status	To return status of function import API. Value can be either Success or Failure.

9.10.1.1.33.1 signForm

You can use this function import to sign Performance Management and 360 Reviews forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To sign a specific form when the form is at the signature stage. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.

Property	Description
comment	Indicates the comment provided by the signer. This is an optional field. If Disable Ask For Comment Routing is selected in Form Template Settings , this property is not allowed.

Use Case: Sign a Form

The following example shows how to use this function import to sign a form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/signForm?formDataId=1234L &comment='my comment'</code>

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
  <d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Error Codes

Error Code	Description
TWF_MISS_REQUIRE_PARAMETER_ERROR	FormDataId is not provided in the URL.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none"> Form is not found for the given formDataId. Form is found but the workflow action can't be operated. For example, form is in the En Route or Completed folder. Form is not at the signature stage. Form doesn't reach the exit date based on route map configuration. The signer provides a comment when Disable Ask For Comment Routing is selected in Form Template Settings.

9.10.1.1.33.2 sendToNextStep

You can use this function import to send Performance Management forms to the next step in route maps.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To send a specific form to the next step. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.
comment	Indicates the comment provided by the user. This is an optional field. If <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i> , this property is not allowed.
innerStepUserId	If the current step is the Iterative step, the property indicates a recipient user in the current step. In this case, if the property isn't specified, it's assumed that the recipient user isn't present and the form is sent to the next step outside the Iterative step.
nextStepEntryUser	If the next step is the Iterative step, the property indicates the first recipient user in the next step.

Use Case 1: Send a Form to the Next Step

The following example shows how to use this function import to send a specific form to the next step.

Request

Operation	Query
-----------	-------

HTTP Method	GET
URI	https://<hostname>/odata/v2/ sendToNextStep? formDataId=1234L &comment='my comment'

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
<d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Use Case 2: Send a Form to Another User in the Iterative Step

The following example shows how to send a specific form to another user in the iterative step.

Request

Operation	Query
HTTP Method	GET
URI	https://<hostname>/odata/v2/ sendToNextStep? formDataId=1234L &innerStepUserId='user1'

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
<d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Use Case 3: Send a Form to the Iterative Step

The following example shows how to send a specific form to the next step that is the iterative step.

Request

Operation	Query
HTTP Method	GET
URI	https://<hostname>/odata/v2/ sendToNextStep? formDataId=1234L &nextIStepEntryUser='user2'

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
  <d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Error Codes

Error Code	Description
TWF_MISS_REQUIRE_PARAMETER_ERROR	The current step is the Iterative step and innerStepUserId hasn't been given.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none">Form isn't found for the given formDataId.Form is found but the workflow action can't be operated. For example, form is in the En Route or Completed folder.Form isn't at the modify or rejected stage.The current step is the Iterative step and the innerStepId value is same as the current user.The user provides a comment when <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i>.

9.10.1.1.33.3 sendToPreviousStep

You can use this function import to send Performance Management and 360 Reviews forms to the previous step at the modify stage.

Permissions

Enable form routing to previous step is selected in *Form Template Settings*. For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To send a specific form to the previous step. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.
comment	Indicates the comment provided by the user. This is an optional field. If <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i> , this property is not allowed.
previousStepEntryUser	If the previous step is the Iterative step, the property indicates the first recipient user in the previous step.

Use Case: Send a Form to Previous Step

The following example shows how to use this function import to send a specific form to the previous step.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<Hostname>/odata/v2/sendToPreviousStep? formDataId=192L&comment=' test '</code>

Response

```
{
  "d": {
    "CORouteFormStatusBean": {
      "status": "Success"
    }
  }
}
```

Error Codes

Error Code	Description
COE_GENERAL_SERVER_FAILURE	General server-side error message.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none">Based on form configuration, the form can't be sent to the previous step at the current stage.User has no permission to execute this action on the form at the current step.

9.10.1.1.33.4 rejectForm

You can use this function import to reject Performance Management and 360 Reviews forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To reject a specific form when the form is at the signature stage. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.
comment	Indicates the comment for rejecting the form provided by the user. This is an optional field. If <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i> , this property is not allowed.

Use Case: Reject a Form

The following example shows how to use this function import to reject a specific form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/signForm?formDataId=1234L &comment='my comment'</code>

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
  <d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Error Codes

Error Code	Description
TWF_MISS_REQUIRE_PARAMETER_ERROR	FormDataId is not provided in the URL.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none">Form is not found for the given formDataId.Form is found but the workflow action can't be operated. For example, form is in the En Route or Completed folder.Form is not at the signature stage.Form doesn't reach the exit date based on route map configuration.The signer provides a comment when Disable Ask For Comment Routing is selected in Form Template Settings.

9.10.1.1.33.5 createPerformanceReviewForm

You can use this function import to launch Performance Management forms for single users. Before that, the start date, end date, and due date of performance review should be configured for the requested form template in [Form Template Settings](#).

Permissions

Only users who have permission to create forms are allowed to launch forms using this API. If they don't have permission to create requested forms, the forms are not created and the API returns formDataId as -1. For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To create a Performance Management form for a specific user at a time. FormSubjectId and formTemplateId are required for the query operation.

Properties and Navigation Properties

Property	Description
formSubjectId	Subject user ID for whom the form is launched. This is a mandatory field.
formTemplateId	ID of the selected form template. This is a mandatory field.
sendEmail	Default value for this field is false. If the value is true, email notification is sent to form subject.
enRouteCopy	Default value for this field is false. If the value is true, the copy of the form is created in the En Route folder.

Use Case: Create a Performance Management Form

The following example shows how to use this function import to create a Performance Management form for a user.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<Hostname>/odata/v2/ createPerformanceReviewForm? formSubjectId='wsown1'& formTemplateId=391L& sendEmail=true& enRouteCopy=false</code>

Response

Successful Response:

```
<d:CreatePerformanceReviewFormResponse  
m:type="SFOData.CreatePerformanceReviewFormResponse" xmlns:d="http://  
schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://  
schemas.microsoft.com/ado/2007/08/dataservices/metadata">  
  <d:formDataId m:type="Edm.Int64">7894</d:formDataId>  
  <d:status>SUCCESS</d:status>  
  <d:statusCode m:type="Edm.Int64">200</d:statusCode>  
</d:CreatePerformanceReviewFormResponse>
```

Failure Response:

```
<d:CreatePerformanceReviewFormResponse  
m:type="SFOData.CreatePerformanceReviewFormResponse">  
  <d:formDataId m:type="Edm.Int64">-1</d:formDataId>  
  <d:status>FAILURE</d:status>  
  <d:statusCode m:type="Edm.Int64">500</d:statusCode>  
</d:CreatePerformanceReviewFormResponse>
```

Error Codes

Error Code	Description
400	SC_BAD_REQUEST/Error code (400) indicates the following: <ul style="list-style-type: none">Requested form template is not a Performance Management form template.Form template is associated with an invalid rating scale.Form template is not associated with a route map.Overlapping forms exist for the given form template's review period.
403	SC_FORBIDDEN/Status code (403) indicates that the logged-in user doesn't have permission to launch forms using the requested form template.
404	SC_NOT_FOUND/Status code (404) indicates that the formTemplateId is invalid.

Error Code	Description
500	SC_INTERNAL_SERVER_ERROR/Status code (500) indicates that an error inside the server prevents launching the form.

9.10.1.2 360 Reviews Form Entities

360 Form OData APIs enables you to access form contents of a 360 form.

Permissions

Template configured permissions - Send Copy

Permission System	Required Settings
User based	Enable 360 Detailed Report Permission: Go to Admin Center > Form Template Settings > 360 Degree/Multi-Review , and enable 360 Detailed Report Permission for Process Owner, Manager/HR, Employee, Approvers and Users With Detailed 360 Reports Privilege.

Note

Selecting the *Enable Graphic Report(360)* option also enables you to choose the named view or anonymous view for the send copy employees.

Other Permissions

Permission System	Required Settings
User based	Enable Form Templates, Rating Scales, Routing Maps: Go to Admin Center > Manage Form Templates

Note

For information about other entities that can also be used in 360 forms, except for those described in this section, refer to:

- [FormCompetencySection](#) [page 2408]
- [FormCompetency](#) [page 2400]
- [FormCompetencyBehavior](#) [page 2404]
- [FormBehaviorRatingComment](#) [page 2411]

9.10.1.2.1 Form360ReviewContentDetail

You can use this entity to query basic information about different sections present in a 360 form. The data for this entity comes from form content XML.

Permissions

For more information about permissions, see [360 Reviews Form Entities](#).

Supported Operations

Operation	Description
Query	Query to identify a specific form content.

Note

Currently, this entity cannot fetch information from multiple forms. formContentId and formDataId are required to query a specific form content.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
originatorUser	User	Navigation to the corresponding user entity
subjectUser	User	Navigation to the corresponding user entity

Use Case 1: Query the basic information of a 360 form

The following example shows how to query the basic information of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ Form360ReviewContentDetail(formContentId=4779L,formDataId=2303L)?\$format=json

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/  
Form360ReviewContentDetail(formContentId=4779L,formDataId=2303L)",
      "type": "SFOData.Form360ReviewContentDetail"
    },
    "formContentId": "4779",
    "formDataId": "2303",
    "subjectUserName": "Wilma Sown",
    "originatorUserId": "cgrant1",
    "subjectUserId": "wsown1",
    "originatorUserName": "Charles Grant",
    "formTitle": "Multi-Rater for Wilma Sown",
    "summarySection": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
Form360ReviewContentDetail(formContentId=4779L,formDataId=2303L)/summarySection"
      }
    },
    "raterListSection": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
Form360ReviewContentDetail(formContentId=4779L,formDataId=2303L)/raterListSection"
      }
    },
    "compSections": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/

      }
    }
  }
}
```

Use Case 2: Query the summary section of a 360 form

The example shows how to query the summary section of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ Form360ReviewContentDetail(formContentId=4 779L,formDataId=2303L)/summarySection? \$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/  
FormSummarySection(formContentId=4779L,formDataId=2303L)",
      "type": "SFOData.FormSummarySection"
    },
    "formContentId": "4779",
    "formDataId": "2303",
    "sectDesc": "",
    "sectIndex": 5,
    "sectName": "Overall Average Rating",
    "overallAdjustedRating": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
FormSummarySection(formContentId=4779L,formDataId=2303L)/overallAdjustedRating"
      }
    },
    "sectConfig": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
FormSummarySection(formContentId=4779L,formDataId=2303L)/sectConfig"
      }
    },
    "selfRatingComment": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
FormSummarySection(formContentId=4779L,formDataId=2303L)/selfRatingComment"
      }
    },
    "calculatedFormRating": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
FormSummarySection(formContentId=4779L,formDataId=2303L)/calculatedFormRating"
      }
    },
    "overallFormRating": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/  
FormSummarySection(formContentId=4779L,formDataId=2303L)/overallFormRating"
      }
    },
    "othersRatingComment": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/

      }
    }
  }
}
```

```
}  
  }  
}
```

Use Case 3: Query the rater list of a 360 form

The following example shows how to query the rater list of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ Form360ReviewContentDetail(formContentId=3 4066L,formDataId=46047L)/raterListSection? \$format=json</code>

Response

```
{  
  "d": {  
    "results": [{  
      "__metadata": {  
        "uri": "https://<API-Server>/odata/v2/  
FormRaterListSection(formContentId=34066L,formDataId=46047L)",  
        "type": "SFOData.FormRaterListSection"  
      },  
      "formContentId": "34066",  
      "formDataId": "46047",  
      "mail": "foo@dummy.com",  
      "internalOrExternal": "internal",  
      "category": "Manager",  
      "participantName": "Alexander Thompson",  
      "manager": "dcortez1",  
      "division": "ACE Software",  
      "department": "N/A",  
      "company": "Company_ABC",  
      "cellPhone": "",  
      "jobCode": "DEPT-PRES",  
      "participantID": "athompson1",  
      "jobTitle": "Boutique Coffee Specialist"  
      "participantUser": {  
        "__deferred": {  
          "uri": "https://<API-Server>/odata/v2/  
FormRaterListSection(formContentId=34066L,formDataId=46047L)/participantUser"  
        }  
      }  
    }  
  ]  
}
```

Use Case 4: Query the competency sections of a 360 form

The following example shows how to query the competency sections of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/ Form360ReviewContentDetail(formContentId=3 4066L,formDataId=46047L)/ competencySections?\$format=json

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/  
FormCompetencySection(formContentId=34066L,formDataId=46047L,sectIndex=2)",
          "type": "SFOData.FormCompetencySection"
        },
        "sectIndex": 2,
        "formContentId": "34066",
        "formDataId": "46047",
        "sectDesc": "<font color=#000055 size=4><b>Competency Feedback</b></  
font>",
        "sectWeightKey": "wf_sect_2_sectweight",
        "sectWeight": null,
        "sectName": "Competency Feedback",
        "sectionConfig": {
          "__deferred": {
            "uri": "https://<API-Server>/  
odata/v2/FormCompetencySection(formContentId=34066L,formDataId=46047L,sectIndex=2)/  
sectionConfig"
          }
        },
        "selfRatingComment": {
          "__deferred": {
            "uri": "https://<API-Server>/  
odata/v2/FormCompetencySection(formContentId=34066L,formDataId=46047L,sectIndex=2)/  
selfRatingComment"
          }
        },
        "competencies": {
          "__deferred": {
            "uri": "https://<API-Server>/  
odata/v2/FormCompetencySection(formContentId=34066L,formDataId=46047L,sectIndex=2)/  
competencies"
          }
        },
        "othersRatingComment": {
          "__deferred": {
            "uri": "https://<API-Server>/

othersRatingComment"
          }
        }
      }
    ]
  }
}
```

Use Case 5: Query the objective sections of a 360 form

The following example shows how to query the objective sections of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/Form360ReviewContentDetail(formContentId=34066L,formDataId=46047L)/objectiveSections?\$format=json</code>

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/FormObjectiveSection(formContentId=34066L,formDataId=? ,sectIndex=5)",
          "type": "SFOData.FormObjectiveSection"
        },
        "sectIndex": 5,
        "formContentId": "34066",
        "formDataId": "46047",
        "sectDesc": "",
        "sectWeight": null,
        "sectName": "Objective",
        "objectives": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/FormObjectiveSection(formContentId=34066L,formDataId=46047L,sectIndex=5)/objectives"
          }
        },
        "sectionConfig": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/FormObjectiveSection(formContentId=34066L,formDataId=46047L,sectIndex=5)/sectionConfig"
          }
        },
        "selfRatingComment": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/FormObjectiveSection(formContentId=34066L,formDataId=46047L,sectIndex=5)/selfRatingComment"
          }
        },
        "othersRatingComment": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/FormObjectiveSection(formContentId=34066L,formDataId=46047L,sectIndex=5)/othersRatingComment"
          }
        }
      }
    ]
  }
}
```

Use Case 6: Query the rater section of a 360 form

The following example shows how to query the rater section of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/ Form360ReviewContentDetail(formContentId=3 4066L,formDataId=46047L)/ form360RaterSection?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/  
Form360RaterSection(formContentId=34066L,formDataId=46047L)",
      "type": "SFOData.Form360RaterSection"
    },
    "formContentId": "34066",
    "formDataId": "46047",
    "formStatus": 3,
    "formRating": "0.0/5.0",
    "formStatusDesc": "Completed",
    "form360Raters": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/

      }
    }
  }
}
```

Related Information

[SAP Business Accelerator Hub: Form360ReviewContentDetail](#)

9.10.1.2.2 FormReviewInfoSection

You can use this entity to query and update the information of the review information section in 360 Reviews forms. The data of this entity comes from content XML.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the review information section of a specific form. FormContentId and formDataId are required for the query operation. If the section is not configured in the form, the query result is null.
Upsert	Update the review information section of a specific form. FormContentId and formDataId are required for the upsert operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Review Information Section

The following example shows how to query the review information section of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/FormReviewInfoSection(formContentId=14686L,formDataId=16208L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/
FormReviewInfoSection(formContentId=146861L,formDataId=16208L)",
      "type": "SFOData.FormReviewInfoSection"
    },
    "formContentId": "146861",
    "formDataId": "16208",
    "sectionIndex": 4,
    "formDateFormat": "MM/dd/yyyy",
    "isDueDateValidationDisabled": false,
    "sectionName": "Review Information",
    "isReviewDatesEditable": true,
    "reviewStartDate": "08/13/2018",
    "reviewEndDate": "09/14/2018",
    "formOriginator": "User_ABC",
    "sectionDescription": "",
    "reviewDueDate": "09/14/2018"
  }
}
```

Use Case 2: Update the Review Information Section

The following example shows how to update the review information section of a specific 360 Reviews form.

Request

Operation	Upsert
HTTP Method	POST
URI	https://<api-server>/odata/v2/upsert? \$format=json
Payload	<pre>{ "__metadata": { "uri": "https://<api-server>/ odata/v2/ FormReviewInfoSection(formContentId=1468 61L,formDataId=16208L)", "type": "SFOData.FormReviewInfoSection" }, "formContentId": "146861", "formDataId": "16208", "formDateFormat": "MM/dd/yyyy", "reviewStartDate": "08/15/2018", "reviewEndDate": "09/15/2018", "reviewDueDate": "09/15/2018" }</pre>

Response

```
{
  "d": [{
```

```

        "key": "FormReviewInfoSection/
formContentId=146861,FormReviewInfoSection/formDataId=16208",
        "status": "OK", "editStatus": null, "message": "", "index": 0,
        "httpCode": 200, "inlineResults": null
    }
}

```

Use Case 3: Retrieve the Review Information Section from Form360ReviewContentDetail

The following example shows how to retrieve the review information section of a specific 360 Reviews form from the parent entity Form360ReviewContentDetail.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ Form360ReviewContentDetail(formDataId=16208L, formContentId=146861L)? \$format=json&\$expand=reviewInfoSection

Response

```

```

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formDataId, formContentId, and participantId cannot be null

9.10.1.2.3 FormReviewerInfoSection

You can use this entity to query the information of the reviewer information section of 360 Reviews forms. The data of this entity comes from content XML.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the reviewer information section of a specific form when the form is at the evaluation stage. FormContentId and formDataId are required for the query operation.

Properties and Navigation Properties

Navigation Property	Description
reviewerInfoElements	A list of reviewer information elements

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Reviewer Information Section

The following example shows how to query the reviewer information section of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/FormReviewerInfoSection(formContentId=146886L,formDataId=16212L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormReviewerInfoSection(formContentId=146886L,formDataId=16212L)",
      "type": "SFOData.FormReviewerInfoSection"
    },
    "formContentId": "146886",
    "formDataId": "16212",
    "sectionIndex": 2,
    "sectionName": "Reviewer",
    "sectionDescription": "",
    "reviewerInfoElements": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/FormReviewerInfoSection(formContentId=146886L,formDataId=16212L)/reviewerInfoElements"
      }
    }
  }
}
```

Use Case 2: Get Reviewer Details in the Reviewer Information Section

The following example shows how to query the reviewer details in the reviewer information section of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ FormReviewerInfoSection(formContentId=146886L,formDataId=16212L)? \$format=json&\$expand=reviewerInfoElements</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/  
FormReviewerInfoSection(formContentId=146886L,formDataId=16212L)",
      "type": "SFOData.FormReviewerInfoSection"
    },
    "formContentId": "146886",
    "formDataId": "16212",
    "sectionIndex": 2,
    "sectionName": "Reviewer",
    "sectionDescription": "",
    "reviewerInfoElements": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/  
FormCustomElement(elementKey='TITLE',formContentId=146886L,formDataId=16212L,itemId=

Supported Operations

Operation	Description
Query	Query the job description section of a specific form. FormContentId, formDataId, and sectionIndex are required for the query operation. If the section is not configured in the form, the query result is null.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query the Job Description Section

The following example shows how to query the job description section of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ FormJobDescSection(formDataId=161L,formContentId=681L,sectionIndex=1)?\$format=json

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/  
FormJobDescSection(formContentId=681L,formDataId=161L,sectionIndex=1)",
      "type": "SFOData.FormJobDescSection"
    },
    "sectionIndex": 1,
    "formContentId": "681",
    "formDataId": "161",
    "sectionName": "Job Description",
    "sectionDescription": "",
    "jobRoles": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/  
FormJobRole(formContentId=681L,formDataId=161L,roleId=45L)",
      }
    }
  }
}
```

Use Case 2: Retrieve the Job Description Section from Form360ReviewContentDetail

The following example shows how to retrieve the job description section of a specific 360 Reviews form from the parent entity Form360ReviewContentDetail.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ Form360ReviewContentDetail(formDataId=161L ,formContentId=681L)? \$format=json&\$expand=jobDescSection

Response

```
{
  "d": {
    "__metadata": {
```

```

    "uri": "https://<api-server>/odata/v2/
Form360ReviewContentDetail(formContentId=681L,formDataId=161L)",
    "type": "SFOData.Form360ReviewContentDetail"
  },
  "formContentId": "681",
  "formDataId": "161",
  "subjectUserName": "Steve Kerr",
  "originatorUserId": "skerr",
  "sectionsInSummaryView": null,
  "originatorUserName": "Steve Kerr",
  "formLocale": "en_US",
  "subjectUserGender": "M",
  "formMode": "EVALUATE",
  "subjectFirstName": "Steve",
  "subjectUserId": "skerr",
  "formTitle": "PM360 Review for Steve Kerr",
  "summarySection": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/
Form360ReviewContentDetail(formContentId=681L,formDataId=161L)/summarySection"
    }
  },
  "introductionSection": {
    "__deferred": {
      "uri": "https://<api-server>/odata/v2/

        }
    }
}
}
}

```

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formDataId and formContentId cannot be null.

9.10.1.2.5 FormJobRole

You can use this entity to query the job role information in the job description section of 360 Reviews forms. The data of this entity comes from content XML.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the job role information in the job description section of a specific form. FormContentId, formDataId, and roleId are required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query Job Role Information

The following example shows how to query the job role information in the job description section of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/FormJobRole(formDataId=161L,formContentId=681L,roleId=45L)?\$format=json</code>

Response

```
{
```

```

"d": {
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/
FormJobRole(formContentId=681L,formDataId=161L,roleId=45L)",
    "type": "SFOData.FormJobRole"
  },
  "formContentId": "681",
  "formDataId": "161",
  "roleId": "45",
  "roleDesc": "",
  "order": 0,
  "roleName": "Project Manager"
}
}

```

Use Case 2: Retrieve Job Role Information from FormJobDescSection

The following example shows how to retrieve the job role information from the parent entity FormJobDescSection.

Request

Operation	Query
HTTP Method	GET
URI	<a href="https://<api-server>/odata/v2/FormJobDescSection(formDataId=161L,formContentId=681L,sectionIndex=1)?\$format=json&\$expand=jobRoles">https://<api-server>/odata/v2/FormJobDescSection(formDataId=161L,formContentId=681L,sectionIndex=1)?\$format=json&\$expand=jobRoles

Response

```

{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/
FormJobDescSection(formContentId=681L,formDataId=161L,sectionIndex=1)",
      "type": "SFOData.FormJobDescSection"
    },
    "sectionIndex": 1,
    "formContentId": "681",
    "formDataId": "161",
    "sectionName": "Job Description",
    "sectionDescription": "",
    "jobRoles": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/
FormJobRole(formContentId=681L,formDataId=161L,roleId=45L)",
            "type": "SFOData.FormJobRole"
          },
          "formContentId": "681",
          "formDataId": "161",
          "roleId": "45",
          "roleDesc": "",
          "order": 0,
          "roleName": "Project Manager"
        }
      ]
    }
  }
}

```

```
}  
}
```

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formDataId, formContentId, and roleId cannot be null.

9.10.1.2.6 Form360SummaryViewSection

You can use this entity to query the summary section of 360 Reviews forms when the forms are at the evaluation stage. The data of this entity comes from content XML.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the summary section of a specific form. FormContentId and formDataId are required for the query operation. The form should be at the evaluation stage. If the form is at the modify stage, the query result is null.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Property	Related Entity	Description
categoryWeights	Form360SummaryViewCategory	The category weight data of the form
formRates	Form360SummaryViewRater	The rater data of the form

Use Case 1: Get the Information of the Summary Section

The following example shows how to query the summary section of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/Form360SummaryViewSection(formContentId=7L,formDataId=15L)?\$format=json

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360SummaryViewSection(formContentId=71L,formDataId=53L)",

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formDataId and formContentId can not be null.

9.10.1.2.7 Form360SummaryViewCategory

You can use this entity to query the information of category weights of 360 Reviews forms. The data of this entity comes from content XML.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query a specific category weight of a specific form. FormContentId, formDataId, and category are required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Get the Information of a Category Weight

The following example shows how to query a specific category weight of a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/Form360SummaryViewCategory(formContentId=71L,formDataId=53L,category='Manager')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360SummaryViewCategory(category='Manager',formContentId=71L,formDataId=53L)",
      "type": "SFOData.Form360SummaryViewCategory"
    },
    "category": "Manager",
    "formContentId": "71",
    "formDataId": "53",
    "categoryOrder": 0,
    "categoryWeight": "30.0%"
  }
}
```

Use Case 2: Retrieve All Category Weights from Form360SummaryViewSection

The following example shows how to retrieve all category weights of a specific 360 Reviews form from the parent entity Form360SummaryViewSection.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/Form360SummaryViewSection(formDataId=53L,formContentId=71L)?\$format=json&\$expand=categoryWeights</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360SummaryViewSection(formContentId=71L,formDataId=53L)",
      "type": "SFOData.Form360SummaryViewSection"
    },
    "formContentId": "71",
    "formDataId": "53",

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formdataId, formContentId, and category cannot be null.

9.10.1.2.8 Form360SummaryViewRater

You can use this entity to query the form rater informationin of a 360 form. The data of this entity comes from content XML.

Permissions

For more information about permissions, see [360 Reviews Form Entities](#).

Supported Operations

Operation	Description
Query	Query the form rater information of a specific form content. formContentId and formDataId are required to query the form rater information of a specific form content.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
participantUser	User	Navigation to the corresponding user entity

Use Case 1: Get the information of a form rater

The following example shows how to query the information of a 360 form rater.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/Form360SummaryViewRater(formContentId=71L,formDataId=53L)</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/Form360SummaryViewRater(formContentId=71L,formDataId=53L)",
      "type": "SFOData.Form360SummaryViewRater"
    },
    "formContentId": "71",
    "formDataId": "53",
    "formStatus": "3",
    "overallRatingDisplayString": "3.0/5.0",
    "maxRating": "5.0",
    "showContentLinkURL": "/printpreview?bplte_company=ERICCHEN&pp_pm_fdataid=53&pp_pm_fcontid=71&pp_pm_tm=1527216912340&pp_pm_tk=278652032914420829138967494267771883934674439727&pp_pm_mode=pp_pm_mode_setup",
    "participantId": "skerr",

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formDataId and formContentId can not be null

9.10.1.2.9 Form360RaterSection

You can use this entity to query the basic information about raters and ratings given in 360 Reviews forms. You can access this entity only after the modify stage. **Note:** We're considering ending our support and maintenance of this entity. We recommend that you use `Form360SummaryViewSection` instead, which provides similar functionality.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the basic information about raters and ratings given in a specific form. FormContentId and formDataId are required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query Basic Information About Raters and Ratings

The following example shows how to query the basic information about raters and ratings given in a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/Form360RaterSection(formContentId=34066L,formDataId=46047L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360RaterSection(formContentId=34066L,formDataId=46047L)",
      "type": "SFOData.Form360RaterSection"
    },
    "formContentId": "34066",
    "formDataId": "46047",
    "formStatus": 3,
    "formRating": "0.0/5.0",
    "formStatusDesc": "Completed",
    "form360Raters": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/Form360RaterSection(formContentId=34066L,formDataId=46047L)/form360Raters"
      }
    }
  }
}
```

Related Information

Related Information

[SAP Business Accelerator Hub: Form360Rater](#)
[Form360SummaryViewRater \[page 2525\]](#)

9.10.1.2.11 FormRaterListSection

You can use this entity to describe a list of raters in a 360 Form. This API allows an employee or a manager to modify the participants in Modify stage. So this API entity is only available in Modify stage. **Note:** We're considering ending our support and maintenance of this entity. We recommend that you use `Form360ParticipantSection` instead, which provides similar functionality.

Permissions

For more information about permissions, see [360 Reviews Form Entities](#).

Supported Operations

Operation	Description
Query	Query the rater list section of a specified form content. <code>formContentId</code> and <code>formDataId</code> are required to query the rater list section of a specified form content.

Note

You can use the following URI to pick a 360 form, view the details, and get the value for the two IDs: `https://<api-server>/odata/v2/FormHeader?$format=json&$filter= formTemplateType eq '360'`

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
participantUser	User	Navigation to the corresponding user entity

Use Case: Query the rater list of a 360 form

The following example shows how to query the rater list of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/FormRaterListSection(formContentId=34066L,formDataId=46047L)?\$format=json</code>

Response

Sample Code

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/FormRaterListSection(formContentId=34066L,formDataId=46047L)",
          "type": "SFOData.FormRaterListSection"
        },
        "formContentId": "34066",

9.10.1.2.17 Form360ParticipantCategory

You can use this entity to query the information of participant categories in 360 Reviews forms when the forms are at the modify stage.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the information of a participant category in a specific form. FormContentId, formDataId, and categoryValue are required for the query operation. If the form is not at the modify stage, the query result is null.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query a Participant Category

The following example shows how to query the information of a participant category in a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/Form360ParticipantCategory(formContentId=18386L,formDataId=10559L,categoryValue='EM')?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/
Form360ParticipantCategory(categoryValue='EM',formContentId=18386L,formDataId=10559L)
",
      "type": "SFOData.Form360ParticipantCategory"
    },
    "categoryValue": "EM",
    "formContentId": "18386",
    "formDataId": "10559",
    "categoryOrder": 2,
    "categoryLabel": "Manager"
  }
}
```

Use Case 2: Retrieve Participant Categories from Form360ParticipantConfig

The following example shows how to retrieve all participant categories in a specific 360 Reviews form from the parent entity Form360ParticipantConfig.

Request

Operation	Query
HTTP Method	GET
URI	http://<api-server>/odata/v2/ Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)? \$format=json&\$expand=participantCategories

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/
Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)",
      "type": "SFOData.Form360ParticipantConfig"
    },
    "formContentId": "18386",
    "formDataId": "10559",
    "participantCategories": {
      "results": [
        {
          "__metadata": {
            "uri": "https://<api-server>/odata/v2/
Form360ParticipantCategory(categoryValue='ED',formContentId=18386L,formDataId=10559L)
",
            "type": "SFOData.Form360ParticipantCategory"
          },
          "categoryValue": "ED",
          "formContentId": "18386",
          "formDataId": "10559",
          "categoryOrder": 3,
          "categoryLabel": "Direct Reports"
        }
      ]
    }
  }
}
```

```

    },
    {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/

9.10.1.2.18 Form360ParticipantSection

You can use this entity to query the basic information of the participant section in 360 Reviews forms.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the basic information of the participant section in a specific form. FormContentId and formDataId are required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query Basic Information of the Participant Section

The following example shows how to query the basic information of the participant section in a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/Form360ParticipantSection(formContentId=18386L,formDataId=10559L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360ParticipantSection(formContentId=18386L,formDataId=10559L)",
      "type": "SFOData.Form360ParticipantSection"
    },
    "formContentId": "18386",
    "formDataId": "10559",

9.10.1.2.19 Form360ParticipantDetail

The Form360ParticipantDetail entity contains one column information of 360 form participants. You can use this entity to query one column information of 360 form participants.

Supported Operations

Operation	Description
Query	Query one column information of participants in a 360 form. formContentId and formDataId are required to query the participant details of a specified form content.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
participantUser	User	Navigation to the corresponding user entity

Use Case 1: Retrieve 360 form participant details

The following example shows how to query the participant details of a given 360 form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/Form360ParticipantDetail(formContentId=18386L,formDataId=10559L,participantId='timw',columnKey='EMAIL')?\$format=json</code>

Response

```
{
```

```

    "d": {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/
Form360ParticipantDetail(columnKey='EMAIL',formContentId=18386L,formDataId=10559L,pa
rticipantId='I306459')",
        "type": "SFOData.Form360ParticipantDetail"
      },
      "columnKey": "EMAIL",
      "formContentId": "18386",
      "participantId": "I306459",
      "formDataId": "10559",
      "columnValue": "tim.wang@sap.com"
      "participantUser": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formDataId, formContentId, cannot be null
400 COE_GENERAL_BAD_REQUEST	[COE0018] The form [<formDataId> <formContentId>] is not in modify stage.

Limitation

The result of participantColumns is null if the 360 form is not in modify stage.

Additional Information

The 360 participant detail section entity is able to be accessed by querying directly Form360ParticipantDetail entity or expand via Form360Participant entity.

Related Information

[SAP Business Accelerator Hub: Form360ParticipantDetail](#) 

9.10.1.2.20 Form360ParticipantColumn

You can use this entity to query the column information of participant configuration in 360 Reviews forms when the forms are at the modify stage.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Query the column information of participant configuration in a specific form. FormContentId, formDataId, and columnKey are required for the query operation. If the form is not at the modify stage, the query result is null.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query Column Information

The following example shows how to query the column information of participant configuration in a specific 360 Reviews form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/Form360ParticipantColumn(formContentId=18386L,formDataId=10559L,columnKey='EMAIL')?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360ParticipantColumn(columnKey='EMAIL',formContentId=18386L,formDataId=10559L)",
      "type": "SFOData.Form360ParticipantColumn"
    },
    "columnKey": "EMAIL",
    "formContentId": "18386",
    "formDataId": "10559",
    "columnLabel": "Email",
    "columnOrder": 2
  }
}
```

Use Case 2: Retrieve All Column Information from Form360ParticipantConfig

The following example shows how to retrieve all column information of participant configuration from the parent entity Form360ParticipantConfig.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)?\$format=json&\$expand=participantColumns</code>

Response

```
{

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)",
      "type": "SFOData.Form360ParticipantConfig"
    },
    "formContentId": "18386",
    "formDataId": "10559",
    "participantColumns": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)/participantColumns"
      }
    },
    "participantCategories": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)/participantCategories"
      }
    }
  }
}
```

```
}
  }
}
```

Use Case 2: Retrieve Participant Configuration from Form360ParticipantSection

The following example shows how to retrieve the basic information of participant configuration from the parent entity Form360ParticipantSection.

Request

Operation	Query
HTTP Method	GET
URI	http://<api-server>/odata/v2/ Form360ParticipantSection(formContentId=18386L,formDataId=10559L)? \$format=json&\$expand=participantConfig

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/Form360ParticipantSection(formContentId=18386L,formDataId=10559L)",
      "type": "SFOData.Form360ParticipantSection"
    },
    "formContentId": "18386",
    "formDataId": "10559",
    "sectionIndex": 100,
    "sectionName": "Participant Section",
    "sectionDescription": "This is a participant section.<br/> You can config the participants for the evaluation.",
    "formParticipants": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/Form360ParticipantSection(formContentId=18386L,formDataId=10559L)/formParticipants"
      }
    },
    "participantConfig": {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)",
        "type": "SFOData.Form360ParticipantConfig"
      },
      "formContentId": "18386",
      "formDataId": "10559",
      "participantCategories": {
        "__deferred": {
          "uri": "https://<api-server>/odata/v2/Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)/participantCategories"
        }
      },
      "participantColumns": {
```

```

        "__deferred": {
          "uri": "https://<api-server>/odata/v2/
Form360ParticipantConfig(formContentId=18386L,formDataId=10559L)/participantColumns"
        }
      }
    }
  }
}

```

Error Codes

Error Code	Description
400 COE_GENERAL_BAD_REQUEST	[COE0018] formdataId and formContentId cannot be null.
400 COE_GENERAL_BAD_REQUEST	[COE0018] The form [<formDataId> <formContentId>] is not in modify stage.

9.10.1.2.23 Function Import

9.10.1.2.23.1 complete360

You can use complete360 to submit a 360 Reviews form in the Evaluation stage.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Supported Operations

Query

Parameters

Parameter	Data Type	Required/Optional	Description
formDataId	Long	Required	Indicates the form ID
comment	String	Optional	Indicates the comment provided by the user

Use Case: Submit a 360 Reviews Form in the Evaluation Stage

This example shows how to submit a 360 Reviews form in the Evaluation stage.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/complete360?formDataId=30172L&comment='test comment'</code>

Response

```
{
  "status": "Success"
}
```

Error Codes

Error Code	Description
TWF_INCORRECT_PARAMETER_ERROR	No 360 form was found.

9.10.1.2.23.2 validateForm360Data

You can use this function import to validate 360 Reviews forms when they're at the modify, evaluation, or signature stage.

Permissions

For more information on permissions, refer to [360 Reviews Form Entities \[page 2491\]](#).

Supported Operations

Operation	Description
Query	Validate a specific 360 Reviews form. FormDataId, formContentId, and workFlowOption are required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
formDataId	Indicates document ID. This is a required field.
formContentId	Indicates form content ID. This is a required field.
workFlowOption	There are three work flow options available: next_step , complete_360 , and sign . This is a required field.

Use Case: Validate a 360 Reviews Form

The following example shows how to validate a specific 360 Reviews form.

Request

Operation	Query
-----------	-------

HTTP Method	GET
URI	<pre>https://<api-server>/odata/v2/ validateForm360Data? \$format=json&formDataId=366L&formContentId =1480L&workFlowOption='next_step'</pre>

Response

Successful Response:

```
{
  "d": {
    "Form360DataValidationResult": {
      "errors": {
        "results": []
      },
      "status": "Success"
    }
  }
}
```

Failure Response:

```
{
  "d": {
    "Form360DataValidationResult": {
      "errors": {
        "results": [
          {
            "itemName": null,
            "message": "You must select at least 5 people to rater
list.",
            "sectionIndex": 6,
            "sectionName": "Rater List",
            "status": "ERROR"
          }
        ]
      },
      "status": "Failed"
    }
  }
}
```

Error Codes

Error Code	Description
COE_MISSING_REQUIRED_PARAMETER_ERROR	Valid value of form data ID should be provided.
COE_MISSING_REQUIRED_PARAMETER_ERROR	Valid value of form content ID should be provided.
COE_MISSING_REQUIRED_PARAMETER_ERROR	Valid value of work flow option should be provided.

9.10.1.2.23.3 signForm

You can use this function import to sign Performance Management and 360 Reviews forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To sign a specific form when the form is at the signature stage. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.
comment	Indicates the comment provided by the signer. This is an optional field. If <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i> , this property is not allowed.

Use Case: Sign a Form

The following example shows how to use this function import to sign a form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/signForm?formDataId=1234L &comment='my comment'</code>

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
```

```
<d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Error Codes

Error Code	Description
TWF_MISS_REQUIRE_PARAMETER_ERROR	FormDataId is not provided in the URL.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none">Form is not found for the given formDataId.Form is found but the workflow action can't be operated. For example, form is in the En Route or Completed folder.Form is not at the signature stage.Form doesn't reach the exit date based on route map configuration.The signer provides a comment when <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i>.

9.10.1.2.23.4 sendToPreviousStep

You can use this function import to send Performance Management and 360 Reviews forms to the previous step at the modify stage.

Permissions

Enable form routing to previous step is selected in *Form Template Settings*. For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To send a specific form to the previous step. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.
comment	Indicates the comment provided by the user. This is an optional field. If <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i> , this property is not allowed.
previousStepEntryUser	If the previous step is the Iterative step, the property indicates the first recipient user in the previous step.

Use Case: Send a Form to Previous Step

The following example shows how to use this function import to send a specific form to the previous step.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<Hostname>/odata/v2/sendToPreviousStep? formDataId=192L&comment='test'</code>

Response

```
{
  "d": {
    "CORouteFormStatusBean": {
      "status": "Success"
    }
  }
}
```

Error Codes

Error Code	Description
COE_GENERAL_SERVER_FAILURE	General server-side error message.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none">Based on form configuration, the form can't be sent to the previous step at the current stage.User has no permission to execute this action on the form at the current step.

9.10.1.2.23.5 rejectForm

You can use this function import to reject Performance Management and 360 Reviews forms.

Permissions

For more information on permissions, see [Performance Management Form Entities \[page 2387\]](#).

Supported Operations

Operation	Description
Query	To reject a specific form when the form is at the signature stage. FormDataId is required for the query operation.

Properties and Navigation Properties

Property	Description
formDataId	Indicates document ID. This is a mandatory field.
comment	Indicates the comment for rejecting the form provided by the user. This is an optional field. If <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i> , this property is not allowed.

Use Case: Reject a Form

The following example shows how to use this function import to reject a specific form.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<hostname>/odata/v2/signForm?formDataId=1234L &comment='my comment'</code>

Response

```
<d:CORouteFormStatusBean xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices" xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata" m:type="SFOData.CORouteFormStatusBean">
  <d:status>Success</d:status>
</d:CORouteFormStatusBean>
```

Error Codes

Error Code	Description
TWF_MISS_REQUIRE_PARAMETER_ERROR	FormDataId is not provided in the URL.
TWF_INCORRECT_PARAMETER_ERROR	You may get this error message due to the following reasons: <ul style="list-style-type: none">Form is not found for the given formDataId.Form is found but the workflow action can't be operated. For example, form is in the En Route or Completed folder.Form is not at the signature stage.Form doesn't reach the exit date based on route map configuration.The signer provides a comment when <i>Disable Ask For Comment Routing</i> is selected in <i>Form Template Settings</i>.

9.10.2 Goals

9.10.2.1 Goal_<GoalPlanID>

Goal entities include all standard fields and custom fields configured in goal plan templates. The entities are specified by goal plan id, which means one template has one entity corresponding to it. For example, for the goal template specified by goal plan id of 1, the corresponding entity is Goal_1.

Permissions

Permission System	Required Setting
Role-based	<ul style="list-style-type: none">Under Objective > Objective Plan Permissions, select <i>All</i> to grant permission for all goal plans, or select <i>Others</i> and choose the plans you want to grant permission for. This permission allows user to query, edit, and delete personal goals.To grant permission for creating, editing, and deleting group goals, grant Objective > New Group Objective Creation.To query soft deleted data, grant permission Objective > Admin Access for Goal ODATA API Export.

Querying Soft Deleted Data

Soft deleted data is the data that has been deleted but not fully purged from the system. As of Q3 2018 Release, if your user has the permission of admin access for Goal OData API export, the query result of this entity includes soft deleted data.

To grant the permission, enable [Objectives](#) > [Admin Access for Goal OData API Export](#) in RBP.

Supported Operations

Query, Insert, Merge, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
Id	Goal id
Type	Personal goal or new group goal
userId	Goal assignee
Flag	Public goal or private goal
mltAchievementType	Target achievement type for a goal.
category	Goal category.
guid	guid for the goal.
name	Goal name, sometimes relabeled as goal description. This is the only field that needs to be defined.
desc	Description of the goal.
weight	The value in this field is used to auto-populate the objective weight when the goal is added to a PM form. If configured as enum, the value is used in the form not the label, for example, <code><enum-value value="3"></code> ; if configured as text, the text value entered is used verbatim.
state	Typically presented as a drop down list of values with colors to report the goal state or status. It's used as such in dashboard reports. Limited to 128 characters. Often labeled "Status".
start	Goal start date - auto-populated with the start date defined in the <code><obj-plan-start></code> tag of the goal plan template. The format is defined by the selected language pack.
due	Goal due date - auto-populated with the due date defined in the <code><obj-plan-due></code> tag of the goal plan template. The format defined by the selected language pack.
startDateInUTC	Goal start date in UTC - auto-populated with the start date defined in the <code><obj-plan-start></code> tag of the goal plan template. The format is defined by the selected language pack.
dueDateInUTC	Goal due date in UTC - auto-populated with the due date defined in the <code><obj-plan-due></code> tag of the goal plan template. The format defined by the selected language pack.

Property	Description
done	Percentage done. Displayed as a whole number with a graphical "progress" bar.
metric	Used to describe how a goal will be measured, in other words, success criteria.
actualAchievement	Actual achievement.
actualAchievementText	Text for the actual achievement.
rating	rating
bizxStrategic	bizxStrategic
bizxActual	bizxActual
bizxTarget	bizxTarget
bizxPos	bizxPos
all custom field	All customer field

Navigation Properties

Navigation Property	Related Entity	Description
Tasks	COTGMMilestoneEntity	Goal and tasks association
milestones	COTGMMilestoneEntity	Goal and milestones association
targets	COTGMMilestoneEntity	Goal and targets association
metriclookup	COTGMMLTEntity	Goal and metriclookup association
Comment	COTGMCommentEntity	Goal and comment association

Entity Relationship Diagram

Use Case 1: Query goal details with ID

This example shows how to query goal details with ID.

Request

Operation	Query
HTTP Method	GET
URI	https://<API-Server>/odata/v2/Goal_18(8049L)?\$format=json

Response

The response shows details of the goal with id 8049.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/Goal_18(8049L)",
      "type": "SFOData.Goal_18"
    }
  },
}
```

```

    "id": "8049",
    "category": "Other",
    "name": "test",
    "metric": "test",
    "weight": "0.0",
    "start": "/Date(1514764800000)/",
    "due": "/Date(1546214400000)/",
    "done": "0.0",
    "state": "Not Started",
    "link": "[[]]",
    "bizxActual": null,
    "bizxTarget": null,
    "bizxPos": 2,
    "bizxStrategic": 0,
    "flag": 0,
    "modifier": "cgrant",

      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/Goal_18(8049L)/permissionNav"
      }
    }
  }
}

```

Use Case 2: Create a goal

This example shows how to create a goal.

Operation	Insert
HTTP Method	POST

URI

https://<API-Server>/odata/v2/Goal_18

Payload

```
{
  "userId": "cgrant",
  "type": "user",
  "flag": "0",
  "name": "goal name",
  "metric": "test",
  "weight": "1",
  "start": "/Date(1514764800000)/",
  "due": "/Date(1546214400000)/",
  "category": "Other"
}
```

Response

The response shows a new goal with id 8099 has been created.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/Goal_18(8099L)",
      "type": "SFOData.Goal_18"
    },
    "userId": "cgrant",
    "type": "user",
    "flag": 0,
    "name": "goal name",
    "metric": "test",
    "weight": "1.0",
    "start": "/Date(1514764800000)/",
    "due": "/Date(1546214400000)/",
    "category": "Other",
    "id": "8099"
  }
}
```

Use Case 3: Update a goal name using merge operation

This example shows how to update a goal name using merge operation

Operation

Merge

HTTP Method

POST

URI

https://<API-Server>/odata/v2/Goal_18(8099L)

Payload

```
{
  "name": "updated goal name"
}
```

Response

The response shows 200 OK.

Use Case 4: Replace goal details

This example shows how to update goal details using replace operation.

Operation	Replace
HTTP Method	PUT
URI	https://<API-Server>/odata/v2/Goal_18(8099L)
Payload	<pre>{ "category": "Other", "name": "Learning", "metric": "1" }</pre>

Response

The response shows 200 OK.

Use Case 5: Update a goal

This example shows how to update a goal using upsert operation.

Operation	Upsert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/upsert
Payload	<pre>{ "__metadata": { "uri": "Goal_18(8099L)" }, "name": "new goal name" }</pre>

Response

The response shows the upsert operation is successful.

<pre>{ "d": [{ "key": "Goal_18/id=8099", "status": "OK", "editStatus": null, "message": "upsert success", "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>

```
} ]
```

Use Case 6: Delete a goal

This example shows how to delete a goal.

Operation	Delete
HTTP Method	DELETE
URI	https://<API-Server>/odata/v2/Goal_18(8100L)

Response

The response shows 200 OK.

Related Information

[SAP Business Accelerator Hub: Goal_<GoalPlanID>](#)

9.10.2.2 GoalMilestone_<GoalPlanID>

GoalMilestone entities represent the milestone-based sub goal entities. The entities are specified by goal plan id, which means one template has one entity corresponding to it. For example, for the goal temple identified by goal plan id of 1, the corresponding entity is GoalMilestone_1.

Querying Soft Deleted Data

Soft deleted data is the data that has been deleted but not fully purged from the system. As of Q3 2018 Release, if your user has the permission of admin access for Goal OData API export, the query result of this entity includes soft deleted data.

To grant the permission, enable [► Objectives ► Admin Access for Goal OData API Export](#) in RBP.

Supported Operations

Query, Insert, Mert, Upsert, Replace, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case 1: Query milestones set in a goal

This example shows how to query milestones in a goal plan.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/GoalMilestone_18(1040L)</code>

Response

The response shows milestones set in the goal identified by id of 1040.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/GoalMilestone_18(1040L)",
      "type": "SFOData.GoalMilestone_18"
    },
    "id": "1040",
    "start": "/Date(1577750400000)/",
    "description": "Finish all Goals courses",
    "due": "/Date(1575158400000)/",
    "modifier": "congrant",
    "objId": "8050",
    "index": 0,
    "lastModified": "/Date(1567674211000)/",
    "permissionNav": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/GoalMilestone_18(1040L)/permissionNav"
      }
    }
  }
}
```

Use Case 2: Create a milestone for a goal

The response shows how to create a milestone for the goal identified by id of 1040.

Operation	Insert
HTTP Method	POST
URI	https://<API-Server>/odata/v2/GoalMilestone_18
Payload	<pre>{ "description": "Finish all sessions", "start": "/Date(1514764800000)/", "due": "/Date(1546214400000)/", "objId": "8050" }</pre>

Response

The response shows a new milestone identified by id of 8050 has been created.

<pre>{ "d": { "__metadata": { "uri": "https://<API-Server>/odata/v2/GoalMilestone_18(1043L)", "type": "SFOData.GoalMilestone_18" }, "description": "Finish all sessions", "start": "/Date(1514764800000)/", "due": "/Date(1546214400000)/", "objId": "8050", "id": "1043" } }</pre>

Use Case 3: Update a milestone using merge operation

This example shows how to update a milestone using merge operation

Operation	Merge
HTTP Method	POST
URI	https://<API-Server>/odata/v2/GoalMilestone_18(1040L)
Payload	<pre>{ "description": "Completion of all Goals courses" }</pre>

Response

The response shows 200 OK.

Use Case 4: Replace milestone details

This example shows how to update milestone details using replace operation.

Operation	Replace
HTTP Method	PUT
URI	https://<API-Server>/odata/v2/GoalMilestone_18(1040L)
Payload	<pre>{ "description": "Completion of all Goals courses", "index": 1 }</pre>

Response

The response shows 200 OK.

Use Case 5: Update a milestone

This example shows how to update a milestone using upsert operation.

Operation	Upsert
HTTP Method	POST
URI	
Payload	<pre>{ "__metadata": { "uri": "GoalMilestone_18(1043)" }, "description": "Mentoring new hires" }https://<API-Server>/odata/v2/upsert</pre>

Response

The response shows the upsert operation is successful.

<pre>{ "d": [{ "key": "GoalMilestone_18/id=1043", "status": "OK", "editStatus": null, "message": "upsert success", "index": 0, "httpCode": 200, "inlineResults": null }] }</pre>
--

```
}
```

Use Case 6: Delete a milestone

This example shows how to delete a milestone.

Operation	Delete
HTTP Method	DELETE
URI	<code>https://https://<API-Server>/odata/v2/GoalMilestone_18(1043)</code>

Response

The response shows 200 OK.

9.10.2.3 GoalMetricLookup_<GoalPlanID>

The GoalMetricLookup entities represent the metric lookup sub goal entities. The entities are specified by goal plan id, which means one template has one entity corresponding to it. For example, for the goal temple identified by goal plan id of 7, the corresponding entity is GoalMetricLookup_7.

Querying Soft Deleted Data

Soft deleted data is the data that has been deleted but not fully purged from the system. As of Q3 2018 Release, if your user has the permission of admin access for Goal OData API export, the query result of this entity includes soft deleted data.

To grant the permission, enable [► Objectives ► Admin Access for Goal OData API Export ►](#) in RBP.

Supported Operations

Query, Insert, Mert, Upsert, Replace, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

[Goal_<GoalPlanID> \[page 2588\]](#)

9.10.2.4 GoalComment

You can use the GoalComment entity to query, create, update and delete comments for a goal.

Supported Operations

Query, Insert, Replace, Upsert, Delete

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
Id	Comment id
objId	Goal id
lastModified	last modified date
commentator	commentator

Property	Description
content	content

Use Case 1: Query All Comments for a Goal

Request

Operation	Query
HTTP Method	GET
URI	http://<api-server>/odata/v2/GoalComment_9(222)

Response

The response shows details of the comment with id 222.

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/GoalComment_9(222L)",
      "type": "SFOData.GoalComment_9"
    },
    "id": "222",
    "commentator": "cgrant1",
    "objId": "752",
    "lastModified": "/Date(1638288711000)/",
    "content": "Comment from goalplan page"
  }
}
```

Use Case 2: Create New Comments for a Goal

Request

Operation	Insert
HTTP Method	POST
URI	http://<api-server>/odata/v2/GoalComment_9
Payload	<pre>{ "commentator": "cgrant1", "objId": "752", "content": "Comment from odata api" }</pre>

Response

The response shows a new comment with id 224 has been created.

```
{
```

```

    "d": {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/GoalComment_9(224L)",
        "type": "SFOData.GoalComment_9"
      },
      "commentator": "cgrant1",
      "objId": "752",
      "content": "Comment from odata api",
      "id": "224"
    }
  }
}

```

Use Case 3: Update Comments for a Goal

Request

Operation	Replace
HTTP Method	PUT
URI	http://<api-server>/odata/v2/GoalComment_9(223)
Payload	<pre> {"content": "update Comment from odata api"} </pre>

Response

The response shows 200 OK.

Use Case 4: Create or Update Comments for a Goal

Request

Operation	Upsert
HTTP Method	POST
URI	http://<api-server>/odata/v2/upsert
Payload	<pre> { "__metadata": { "uri": "http://<api-server>/odata/v2/GoalComment_9(224)" }, "content": "Upsert Comment from odata api" } </pre>

Response

The response shows the upsert operation is successful.

```
{
  "d": [
    {
      "key": "null",
      "status": "OK",
      "editStatus": null,
      "message": "upsert success",
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

Use Case 5: Delete Existing Comments for a Goal

Request

Operation	Delete
HTTP Method	DELETE
URI	http://<api-server>/odata/v2/ GoalComment_9(223)
Payload	<pre>{"content": "update Comment from odata api"}</pre>

Response

The response shows 200 OK.

9.10.2.5 GoalPlanTemplate

GoalPlanTemplate can be used to access goal plan templates.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

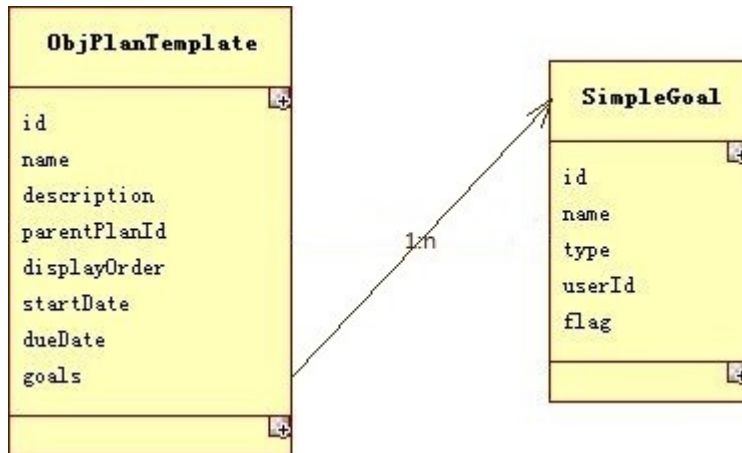

Properties

Property	Description
id	Id of the goal template
name	Name of the goal template
description	Description of the goal template
parentPlanId	Id of the parent goal plan.
displayOrder	Display order of the goal template
startDate	Goal start date
dueDate	Goal due date

Navigation Properties

Navigation Property	Related Entity	Description
goals	SimpleGoal	

Entity Relation Diagram

Use Cases

API Call	Description
<code>/odata/v2/GoalPlanTemplate</code>	Query all goal plan templates
<code>/odata/v2/GoalPlanTemplate?\$expand=goals</code>	Query all goal plan templates and expand associated goals
<code>/odata/v2/getDefaultGoalPlanTemplateId</code>	Query default goal plan template Id
<code>odata/v2/GoalPlanTemplate? \$format=json&\$expand=enums</code>	Get the lookup (including category name and id) and translations per template
<code>/odata/v2/GoalPlanTemplate(111L)? \$format=json&\$expand=enums</code>	Query to filter the enums by goal plan template id. Here, for example Goal template ID is 111.

Related Information

[SAP Business Accelerator Hub: Goal Plan Template](#)

9.10.2.6 GoalEnum

GoalEnum provides the lookup (including category name and id) and translations across templates.

Operations Allowed

Operation	Description
GET	Fetch a GoalPlanTemplate entity

Use Cases

API Call	Description
<code>/odata/v2/GoalEnum?\$format=json</code>	Get the lookup (including category name and id) and translations across template.
<code>/odata/v2/GoalEnum?\$format=json&\$filter=planId eq 38</code>	Query on GoalEnum and filter by planId.
<code>/odata/v2/GoalEnum?\$format=json&\$filter=fieldId eq state</code>	Query on GoalEnum and filter by fieldId

Related Information

[SAP Business Accelerator Hub: Goal Enum](#) 

9.10.2.7 GoalWeight

This entity contains the values of goal weight set in goal plan template. You can use this entity to retrieve the max and min values allowed for the sum of goal weights in a goal plan.

Supported Operations

Operation	Description
Query	Query the max and min values of goal weights set in a goal plan using planId and type.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
planId	The unique identifier for goal plan template.
type	The type of goal weight.
<div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"><p>Note</p><p>You can query the following three types of goal weight:</p><ul style="list-style-type: none">goalPlanperObjcategory</div>	
minValue	The min value of one type of goal weight in a goal plan. The value is a percentage.
maxValue	The max value of one type of goal weight in a goal plan. The value is a percentage.

Use Case: Query the Goal Weight Values Set in Goal Plan Template

This example shows how to get the max and min values allowed for the sum of goal weight in a goal plan using planId and type.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-endpoint-URL>/odata/v2/ GoalWeight(planId='41',type='goalPlan')</code>

Response

The response shows that for the queried goal plan, the minimum sum of goal weights allowed is 0%, and the maximum sum of goal weights allowed is 100%.

```
{
  "d": {
    "__metadata": {
      "uri": "https://API-endpoint-URL/odata/v2/  
GoalWeight(planId=41L,type='goalPlan')",
      "type": "SFOData.GoalWeight"
    },
    "planId": "41",
    "type": "goalPlan",
    "minValue": "0.0",
    "maxValue": "100.0"
  }
}
```

9.10.2.8 SimpleGoal

The SimpleGoal entity provides a way to expand all the goals within the Goal Plan of a user.

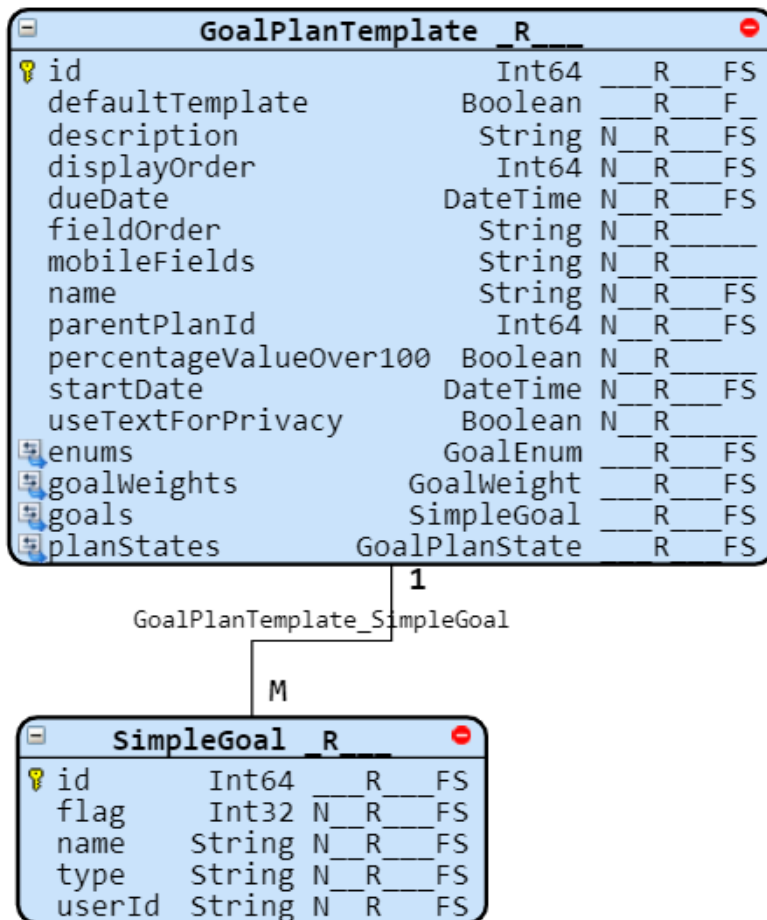

Supported Operations

Operation	Description
Query	The SimpleGoal entity can be expanded from the GoalPlanTemplate entity or queried with a goal ID. It fetches goal ID and goal name properties by expanding from the GoalPlanTemplate entity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

```

Related Information

[SAP Business Accelerator Hub: Simple Goal](#)

9.10.2.9 Function Imports

9.10.2.9.1 getDefaultGoalPlanTemplateId

You can use this function import to get the ID of the default goal plan template.

Permissions

For more information on permissions, see [Career Development Planning \[page 2862\]](#).

Supported Operations

HTTP Method: GET

Return Type: long

Support Payload: false

Use Case: Get the ID of the Default Goal Plan Template

The following example shows how to get the ID of the default goal plan template in your system.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/ getDefaultGoalPlanTemplateId?\$format=json</code>

Response

```
{
  "d": {
    "getDefaultDevGoalPlanTemplateId": "10"
  }
}
```

9.10.3 Workflow Entities

Talent form workflow APIs provide the ability to query and update the form workflow. Currently they support only PM v12 Acceleration forms.

Context

Talent form workflow OData APIs enable you to:

- Query form route map details. You can query route map, route step and route step details.
- Move the form to next step (C Step, I Step and Single Step send)
- Sign form (Single Step Only)
- Reject form (Single Step Only)

9.10.3.1 FormRouteMap

You can use this entity to query the route map of Performance Management forms.

Permissions

For more information on permissions, see [Workflow Entities \[page 2615\]](#).

Supported Operations

Operation	Description
Query	Query the route map of a specific form. FormDataId is required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query the Route Map of a Form

The following example shows how to use this entity to query the route map of a given form.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/ FormRouteMap(formDataId=7219L)? \$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/FormRouteMap(7219L)",
      "type": "SFOData.FormRouteMap"
    },
    "formDataId": "7219",
    "routeId": -1,
    "routeName": "",
    "routeStep": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/FormRouteMap(7219L)/routeStep"
      }
    }
  }
}
```

9.11 Recruiting

9.11.1 Job Requisition

9.11.1.1 JobRequisition

The job requisition entity contains core application data consisting of system, standard, and custom fields. The metadata shows the standard and custom fields configured in all the active templates. If a field (standard or custom) isn't configured in any of the active templates, then it doesn't show up in the metadata and not be a part of OData query.

Note

The Batch operation, Job Profile Builder and Recruiting Groups features aren't supported as of 1511 release.

The entity can't be filtered or sorted by these nonreportable custom fields. Reportable custom fields should be available within the entity and the entity can be sorted/filtered using the reportable custom fields.

If the same field (custom or standard) has been configured as different types (say text in one and picklist in another) in separate requisition templates, then the field shows up as String in the metadata. In this case, OData query returns the Option Id for the picklist field of the job requisition that was created using the template having the field configured as picklist.

If two custom fields with same field Id are defined in 2 different templates, then the metadata shows:

- One field in the metadata if the default label and field type are the same.
- One field in the metadata with two labels (comma separated) if the default labels are different.
- For now, the fields of type "JobCode" will show up as type string in the metadata.

This numerical value...	is mapped to...
0	Preapproved internal status of a job requisition
1	Approved internal status of a job requisition
2	Closed internal status of a job requisition

The system and calculated fields will always show up in the metadata irrespective of the template definition. Filled is an example of calculated field.

Permissions

Operator Permissions

By default, Recruiting operators can use OData APIs to view or edit relevant fields based on field-level permissions that are defined in job requisition templates. These field-level permissions allow Recruiting operators to perform the same actions using OData APIs as they perform on job requisitions in SAP SuccessFactors Recruiting.

Admin Permissions

The following permissions allow users to view and edit all fields in JobRequisition entity:

- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Requisition Export](#) >
- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Requisition Create](#) >
- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Requisition Update](#) >

Operations Allowed

Operation	Description
Query	Standard OData call to query the entity.
Insert	Creates a new job requisition.
Upsert	Updates the existing job requisitions.

Operation	Description
Merge	Updates a few fields of Job Requisition without changing the values of existing fields along with validation for required fields constraints.
Replace	Replace operation to update fields.
Delete	Unposts a job requisition.

Required Fields

Specify the jobReqId for Job Requisition Entity as the business key.

Properties

Property Name	Description
jobReqId	Job Requisition Id
templateId	Template Id
jobCode	Job Code

Property Name	Description
deleted	<p>Is Deleted</p> <p>Although <code><deleted></code> is defined as a String type property in the metadata, it accepts only the following numeric values while filtering:</p> <p>0 1</p> <p>When using this field as a filter, do not single quote the value in the filter expression. For example, you can mention as: <code>\$filter=deleted eq 1</code>.</p>
openingsFilled	Openings Filled

Note

The following Restore Team Admin Defaults fields listed in the OData API Dictionary are created by the system according to the field type operatorTeam that you configured on your Job Requisition template:

- restorevTeamAdminDefaults
- retoreoriginatorTeamAdminDefaults
- restorehiringManagerTeamAdminDefaults
- restorerecruiterTeamAdminDefaults
- restorecoordinatorTeamAdminDefaults
- restoresourcerTeamAdminDefaults
- restoresecondRecruiterTeamAdminDefaults
- restorevpOfStaffinTeamAdminDefaults

You cannot remove these fields as they are part of the metadata of the JobRequisition entity. However, when creating integrations using Job Requisition information, do not include the fields in the GET, UPDATE, or UPSERT operations.

Navigation Properties

ⓘ Note

To successfully work with any property of type **Attachment**, refer the [Attachment \[page 222\]](#) section with code samples.

ⓘ Note

The following entities are upsertable only via a parent entity, hence the sap:creatable, sap:updateable, sap:upsertable properties are set to false:

- JobRequisitionLocale
- JobReqScreeningQuestion
- JobRequisition
- JobRequisitionOperator
- JobRequisitionGroupOperator
- JobRequisitionAssessment
- JobReqFwdCandidates
- JobReqFOLocation
- JobReqGOPosition
- JobReqQuestions
- JobReqScreeningQuestionChoice

Use Cases

API Call	Description
<code>../odata/v2/JobRequisition('1234')</code>	Gets the job requisition where jobReqId is 1234

The query format to upsert or insert a job requisition using the Foundation Objects or Generic Objects fields is as follows:

-  Sample Code

```
{
  "__metadata":{
    "type":"SFODData.JobRequisition",
    "uri":"JobRequisition(1234)"
  },
  "location":"San Matao, CA",
  "jobReqLocale": {
    "jobTitle": "bbbb",
    "locale": "en_GB"
  },
  "interviewGuide":{
    "module":"RECRUITING",
    "fileContent":"XXXXXXXXXXXXAAAAA",
    "fileName":"Test.doc"
  },
  division_obj": {
    "__metadata":
    { "type": "SFODData.FODivision",
      "uri":
      "FODivision(externalCode='ENT') " }
  }
}
```

-  Sample Code

```
../odata/v2/JobRequisition
{
  "country":"US",
  "jobCode":"PM",
  "jobGrade":"1",
  "defaultLanguage": "en_US",
  "department":"Product
Management (PM)",
  "jobLevel":"1",
  "division":"Industries (IND)",
  "location":"San Mateo, CA",
  "statusSetId": "21",
  "appTemplateId": "792",
  "templateId": "1251",
  "jobReqLocale": {
    "jobTitle": "Teste API"
  },
  "recruiter": {
    "userName": "lokamoto"
  },
  "hiringManager": {
    "userName": "lokamoto"
  },division_obj": {
  "__metadata":
  { "type": "SFODData.FODivision",
    "uri":
```

API Call**Description**

```
"FODivision(externalCode='ENT')" }  
}  
}
```

Note

You can also use the following query format while using the Foundation Objects and Generic objects:

Sample Code

```
We also support:  
"division_obj":  
{ "externalCode": "ENT" }
```

```
../odata/v2/JobRequisition('1234')?  
$expand=hiringManager
```

Gets the job requisition along with the hiringManager where jobReqlid is 1234

Sample Code

```
../odata/v2/JobRequisition  
{  
  "country": "US",  
  "jobCode": "PM",  
  "jobGrade": "1",  
  "defaultLanguage": "en_US",  
  "department": "Product Management  
(PM)",  
  "jobLevel": "1",  
  "division": "Industries (IND)",  
  "location": "San Mateo, CA",  
  "statusSetId": "21",  
  "appTemplateId": "792",  
  "templateId": "1251",  
  "jobReqLocale": {  
    "jobTitle": "Teste API"  
  },  
  "recruiter": {  
    "userName": "lokamoto"  
  },  
  "hiringManager": {  
    "userName": "lokamoto"  
  }  
}
```

Inserts a job requisition with all required fields.

API Call**Description**

```
../odata/v2/upsert
{
  "__metadata": {
    "type": "SFOData.JobRequisition",
    "uri": "JobRequisition(1234)"
  },
  "location": "San Matao, CA",
  "jobReqLocale": {
    "jobTitle": "bbbb",
    "locale": "en_GB"
  },
  "interviewGuide": {
    "module": "RECRUITING",
  },
  "fileContent": "XXXXXXXXXXXXAAAA",
  "fileName": "Test.doc"
}
```

Update jobReqId 1234 on its location and adding a new title for a different locale and a document on the interview guide.

```
../odata/v2/JobRequisition
{
  "country": "US",
  "jobCode": "PM",
  "jobGrade": "1",
  "defaultLanguage": "en_US",
  "department": "Product Management
(PM)",
  "jobLevel": "1",
  "division": "Industries (IND)",
  "location": "San Mateo, CA",
  "statusSetId": "21",
  "appTemplateId": "792",
  "templateId": "1251",
  "internalStatus": "1",
  "jobReqLocale": {
    "jobTitle": "Teste API"
  },
  "recruiter": {
    "userName": "lokamoto"
  },
  "hiringManager": {
    "userName": "lokamoto"
  },
  "jobReqPostings": {
    "postStartDate": "\\Date(1439290950000)\\",
    "postEndDate": "\\Date(1439942399000)\\",
    "boardId": "_agency",
    "channelId": "1",
  }
}
```

Inserts a job requisition with internalStatus = 1 (Open) and creating a job requisition posting.

API Call**Description**

```
../odata/v2/JobRequisition
{
  "country": "US",
  "jobCode": "PM",
  "jobGrade": "1",
  "defaultLanguage": "en_US",
  "department": "Product Management
(PM)",
  "jobLevel": "1",
  "division": "Industries (IND)",
  "location": "San Mateo, CA",
  "statusSetId": "21",
  "appTemplateId": "792",
  "templateId": "1251",
  "jobReqLocale": {
    "jobTitle": "Teste API"
  },
  "recruiter": {
    "userName": "lokamoto"
  },
  "hiringManager": {
    "userName": "lokamoto"
  },
  "questions": [
    { "questionId": "42201" },
    { "questionId": "42193" }
  ]
}
```

Inserts a job requisition with all required fields and adding some questions.

```
.../odata/v2/
JobRequisitionPosting(jobPostingId=999L,
jobReqId=1234L)
```

(DELETE) Unposts a job requisition where jobPostingId = 999 and jobReqId = 1234

API Call**Description**

```

../odata/v2/JobRequisition
{
  "country": "US",
  "jobCode": "PM",
  "jobGrade": "2",
  "defaultLanguage": "en_US",
  "templateId": "1251",
  "appTemplateId": "792",
  "comments": "My comment",
  "statusSetId": "21",
  "department": "Product Management
(PM)",
  "jobLevel": "1",
  "division": "Industries (IND)",
  "location": "San Mateo, CA",
  "jobReqLocale": [
    {
      "jobTitle": "Test JP -
Denis",
      "locale": "ja_JP",
      "externalTitle": "Test JP"
    }, {
      "jobTitle": "Test KR- Denis",
      "locale": "ko_KR",
      "externalTitle": "Test KR"
    }
  ],
  "hiringManager": {
    "userName": "cgrant"
  },
  "recruiter": {
    "userName": "lokamoto"
  },
  "mfield1": [
    { "id": "1538" },
    { "id": "1542" }
  ]
}

```

Inserts a job requisition with multiple languages and multiple picklists.

```

../odata/v2/JobRequisition(1186)?
$format=json&$expand=jobReqPostings

```

Get the job requisition where jobReqId is 1186 with its corresponding Job Postings.

```

../odata/v2/JobRequisition(1186)?
$format=json&$expand=jobReqLocale

```

Get the job requisition where jobReqId is 1186 with Job Requisition Locale entity that shows multiple languages

```

.../odata/v2/
JobRequisitionPosting(jobPostingId=999L,jobReqId=1234L)

```

(DELETE) Unpost a job requisition where jobPostingId = 999 and jobReqId = 1234

API Call**Description**

```
../odata/v2/JobRequisition
{
  "country": "US",
  "jobCode": "PM",
  "jobGrade": "2",
  "defaultLanguage": "en_US",
  "templateId": "1251",
  "appTemplateId": "792",
  "comments": "My comment",
  "statusSetId": "21",
  "department": "Product Management
(PM)",
  "jobLevel": "1",
  "division": "Industries (IND)",
  "location": "San Mateo, CA",
  "jobReqLocale": [
    {
      "jobTitle": "Test JP -
Denis",
      "locale": "ja_JP",
      "externalTitle": "Test JP"
    }, {
      "jobTitle": "Test KR- Denis",
      "locale": "ko_KR",
      "externalTitle": "Test KR"
    }
  ],
  "hiringManager": {
    "userName": "cgrant"
  },
  "recruiter": {
    "userName": "lokamoto"
  },
  "mfield1": [
    { "id": "1538" },
    { "id": "1542" }
  ]
}
```

(POST) Insert a job requisition with multiple languages and multiple picklist.

API Call**Description**

```
../odata/v2/JobRequisition
{
  "__metadata":{
    "type":"SFOData.JobRequisition"
  },
  "country":"US",
  "jobCode":"IT-MGR",
  "jobGrade":"1",
  "templateId":"1251",
  "appTemplateId":"792",
  "statusSetId":"21",
  "department":"Product Management
(PM)",
  "jobLevel":"1",
  "division":"Industries (IND)",
  "location":"San Mateo, CA",
  "defaultLanguage":"en_US",
  "hiringManager":{
    "userName":"cgrant"
  },
  "recruiter":{
    "userName":"lokamoto"
  },
  "jobReqLocale": {
    "jobTitle": "Test API 3",
    "externalTitle": "Test",
    "locale": "en_US",
    "templateHeaderFooter" : "SAP
Demo"
  }
}
```

(POST) Create a new job requisition with a predefined header or footer template.

API Call**Description**

```
../odata/v2/upsert
{
  "__metadata":{
    "type":"SFOData.JobRequisition",
    "uri":"JobRequisition(1126L)"
  },
  "location":"San Mateo, CA",
  "jobReqLocale": {
    "locale": "en_US",
    "intJobDescHeader": "Etiam et
arcu mauris. Mauris viverra, lorem ut
tristique pharetra, ex diam vulputate
ante, vitae sollicitudin quam mi non
turpis",
    "intJobDescFooter": "Etiam et
arcu mauris. Mauris viverra, lorem ut
tristique pharetra, ex diam vulputate

turpis",
    "extJobDescFooter": "Etiam et
arcu mauris. Mauris viverra, lorem ut
tristique pharetra, ex diam vulputate
ante, vitae sollicitudin quam mi non
turpis"
  }
}
```

(POST) Update the internal and external headers and footers of the job requisition with id 1126.

API Call**Description**

```
{
  "__metadata": {
    "type": "SFOData.JobRequisition",
    "uri": "JobRequisition(1234)"
  },
  "country": "US",
  "jobCode": "IT-MGR",
  "jobGrade": "1",
  "templateId": "1251",
  "appTemplateId": "792",
  "statusSetId": "21",
  "department": "Product Management
(PM)",
  "jobLevel": "1",
  "division": "Industries (IND)",
  "location": "San Mateo, CA",
  "defaultLanguage": "en_US",
  "hiringManager": {
    "userName": "cgrant"
  },
  "recruiter": {
    "userName": "lokamoto"
  },
  "jobReqLocale": [
    {
      "jobTitle": "IT Manager",
      "locale": "en_US",
      "templateHeaderFooter": "
SAP Demo"
    },
    {
      "jobTitle": " IT Manager ",
      "externalTitle": "IT
Manager",
      "locale": "pt_BR",
      "extJobDescHeader": "BR
Etiam et arcu mauris. Mauris viverra,
lorem ut tristique pharetra, ex diam
vulputate ante, vitae sollicitudin quam
mi non turpis",
      "extJobDescFooter": "BR
Etiam et arcu mauris. Mauris viverra,
lorem ut tristique pharetra, ex diam
vulputate ante, vitae sollicitudin quam
mi non turpis"
    }
  ]
}
```

(POST) Create a job requisition with multiple locales and with internal and external header or filter.

.../odata/v2/reassignJobReq?
jobReqId=1106L&hiringManager=cgrant&recruiter=lokamoto&\$format=json

(GET) Reassign a job requisition where jobReqId is 1106. Update the hiringManager and the recruiter operators.

.../odata/v2/JobRequisition(581)?
\$format=json&\$expand=jobReqFwdCandidates/candidate

Get the Job Requisition and expand details of forwarded candidates.

.../odata/v2/addModifierToJobReq?
jobReqId=1106L&modifier=cgrant

(GET) Add a Modifier to a Job Requisition defined by jobReqId. The modifier field is the username of the desired modifier.

API Call	Description
<code>.../odata/v2/JobRequisition(581)? \$expand=currentOwner</code>	Get the currentOwner of the JobReq, that is, the user that is "Currently With" the JobReq.
<code>.../odata/v2/JobRequisition(581)? \$expand=currentOwner</code>	(GET) Send JobReq to the previous step. The user performing the GET request must be the "currentOwner" of the JobReq
<code>.../odata/v2/sendToNextStep? formDataId=7536L&comment='test comment' .../ odata/v2/sendToNextStep? formDataId=7536L&innerStepUserId='lokamoto &comment='test comment' .../odata/v2/ sendToNextStep? formDataId=7536L&innerStepUserId='lokamoto &nextIStepEntryUser='athompson1'&comment= 'test comment'</code>	(GET) Send JobReq to the next step must be performed by the "Currently With" user. The formDataId is the same as "Document ID". On C-Step, all users in step must perform this action. On I-Step, innerStepUserId is the id of the recipient user, nextIStepEntryUser is the id of the recipient user in next I step if next step is I step.
<code>.../odata/v2/signForm?formDataId=7536L</code>	(GET) Sign JobReq Form in the Signature Stage. The formDataId is the same as "Document ID" on the UI. Must be performed by the "Currently With" user.
<code>.../odata/v2/signForm?formDataId=7536L</code>	(GET) Reject JobReq form in the Signature Stage. The formDataId is the same as "Document ID" on the UI. Must be performed by the "Currently With" user.
<code>.../odata/v2/signForm?formDataId=7536L</code>	Get the Routemap info of the Job Requisition.
<pre>.../odata/v2/JobReqFwdCandidates { "jobReqId": 1216, "candidateId" : 1306, "status" : "Forwarded" }</pre>	(POST) Forward a single Candidate to a Job Requisition with status.
<pre>.../odata/v2/upsert [{ "__metadata":{ "type": "SFOData.JobReqFwdCandidates", "uri": "JobReqFwdCandidates" }, "jobReqId": 1205, "candidateId" : 468, "status" : "Default" }, { "__metadata":{ "type": "SFOData.JobReqFwdCandidates", "uri": "JobReqFwdCandidates" }, "jobReqId": 1203, "candidateId" : 642, "status" : "Forwarded" }]</pre>	(POST) Forward multiple Candidates to multiple Job Requisitions.

API Call	Description
<pre>.../odata/v2/ JobReqScreeningQuestion(jobReqId=1382L,order=1L, locale='en_US')? \$format=json&\$expand=choices</pre>	Get the English version of the first JobReqScreeningQuestion from JobReq with id 1382 expanding choices.
<pre>.../odata/v2/ JobReqScreeningQuestionChoice(optionId=54L,optionValue=3L, locale='en_US')? \$format=json</pre>	Get one JobReqScreeningQuestionChoice from SCALE_VALUE table.
<pre>.../odata/v2/JobRequisition(1382)? \$format=json&\$expand=jobReqScreeningQuestions</pre>	Get the JobRequisition expanding jobReqScreeningQuestions navigation.
<pre>.../odata/v2/JobRequisition(1382)? \$format=json&\$expand=jobReqScreeningQuestions/choices</pre>	Get the JobRequisition expanding ScreeningQuestions and choices.

```

(POST) Create or Update JobReqScreeningQuestion from JobRequisition.

API Call	Description
<pre> "questionName" : "This is multi choice question", "questionType" : "QUESTION_MULTI_CHOICE", "choices" : [{ "optionLabel" : "Yes 2" }, { "optionLabel" : "No 2" }] }] } </pre>	

Error Codes

Error Code	Description
<i>Permission not enabled</i> (not a specific code)	Recruiting OData API is not enabled in Provisioning. <div style="border: 1px solid #0070c0; padding: 5px; margin-top: 10px;"> <p>→ Remember</p> <p>As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.</p> </div>
<i>Edit permission not enabled</i> (not a specific code)	OData API Job Requisition <editType> permission in Admin Center isn't enabled
<i>System field not allowed to edit</i> (not a specific code)	System field <field> not editable
<i>Field required</i> (not a specific code)	<field> required.
<i>Field invalid</i> (not a specific code)	<field> invalid.
<i>Field invalid for template</i> (not a specific code)	Field <field> invalid for templateId <templateId>
<i>Locale not supported</i> (not a specific code)	Locale <locale> is not supported for templateId <templateId>
<i>Channel required</i> (not a specific code)	Property channelId must be informed when posting type is agency
<i>Invalid user</i> (not a specific code)	User <userId> is invalid for <field>
<i>Invalid number</i> (not a specific code)	<field> has an invalid number format

Error Code	Description
<i>Invalid date(not a specific code)</i>	<field> has a invalid date format.
<i>Invalid boolean(not a specific code)</i>	<field> has a invalid Boolean format
<i>Invalid template(not a specific code)</i>	Template Id <templateId> is invalid or inactive
<i>SCA error(not a specific code)</i>	Unable to insert job requisition because a SCA Error.
<i>Job Req not found(not a specific code)</i>	Job Requisition <jobReqId> wasn't found
<i>Min days posting error(not a specific code)</i>	This job must be posted for a minimum of <days> days
<i>Start date after end date error(not a specific code)</i>	JobRequisitionPosting/postStartDate must be before JobRequisitionPosting/postEndDate
<i>Invalid channel id(not a specific code)</i>	Field channelId <channelId> isn't valid for boardId <boardId>
<i>Invalid question id(not a specific code)</i>	Question Id <questionId> is invalid.
<i>Insert OK(not a specific code)</i>	Job Requisition has been inserted successfully
<i>Update OK(not a specific code)</i>	Job Requisition has been updated successfully
<i>Delete OK(not a specific code)</i>	Job Requisition has been deleted successfully
<i>Batch OK(not a specific code)</i>	Batch has been executed successfully
<i>Batch has errors(not a specific code)</i>	Batch was aborted because an error on another requisition
<i>Database batch requisition error(not a specific code)</i>	Database error when executing requisition batch operations
<i>Unexpected batch requisition error(not a specific code)</i>	Unexpected error occurred when executing requisition batch operations
<i>Error inserting batch requisition(not a specific code)</i>	Failed to batch insert requisition
<i>Error updating batch requisition(not a specific code)</i>	Failed to batch update requisition
<i>Reassigning job requisition OK(not a specific code)</i>	The job requisition has been reassigned
<i>Reassigning job requisition error(not a specific code)</i>	Failed to reassign the job requisition
<i>Reassigning sca error(not a specific code)</i>	Unable to reassign the Job Requisition because a SCA Error
<i>Reassigning no operators(not a specific code)</i>	At least one valid operator should be informed
<i>Unexpected error (not a specific code)</i>	Unexpected error occurred <exMessage>
<i>Modifier successfully added(not a specific code)</i>	Modifier has been successfully added.
<i>Add Modifier Job Req error(not a specific code)</i>	Failed to add Modifier to the job requisition.

Error Code	Description
<i>Add Modifier sca error(not a specific code)</i>	Unable to add Modifier to the Job Requisition due to an SCA Error
<i>User not found(not a specific code)</i>	User <user> wasn't found.
<i>Add Modifier not allowed(not a specific code)</i>	Can't add Modifier, Form Settings don't allow to add a Modifier
<i>Job Req not in modification stage(not a specific code)</i>	Can't add Modifier. The Job Requisition isn't in Modification stage
<i>Send Job Req Previous Step Success</i>	The job requisition has been sent to previous step
<i>Send Job Req Previous Step Missing JobReqId</i>	The job requisition Id hasn't been given
<i>Send Job Req Previous Step Not Enabled</i>	Send to previous step isn't enabled for job requisition template <templateId>
<i>Send Job Req Previous Step Invalid Status</i>	Incorrect job requisition status. Job requisition should be at modify/rejected stage
<i>Send Job Req Previous Step Comment Not Enabled</i>	Comment routing is not enabled for job requisition template <templateId>
<i>Send Job Req Previous Step User Error</i>	No job requisition step found for user <user>
<i>Send Job Req Previous Step Error</i>	Job requisition <jobReqId> cannot be sent to previous step
<i>Invalid Locale for JobReq Error</i>	Invalid locale <locale> for JobRequisition
<i>ScreeningQuestion not found Error</i>	JobReqScreeningQuestion with key (jobReqId=<jobReqId>,order=<order>,locale=<locale>) not found!
<i>Invalid question order Error</i>	Invalid order value for question order(s)=<orders>

Use Case 1:

Use this operation to retrieve all configured assessment details for all job requisitions.

Request

Operation	Insert
HTTP Method	POST
URI	<code>http://<hostname>/odata/v2/JobRequisition?\$format=json</code>

Response

Sample Code

```
{
  "__metadata": {
    "uri": "https://localhost:8080/odata/v2/JobRequisition",
    "type": "SFOData.JobRequisition"

[SAP Business Accelerator Hub: JobRequisition](#)

9.11.1.2 JobRequisitionAssessment

This entity lets you see the **Assessment Configured** status property within a job requisition so that the pipeline status at which one or many assessments are configured can be retrieved.

Permissions

Permission System	Required Settings
Role based	ODATA_API_Job_Req_Export

Supported Operations

Operation	Description
Query	Yes

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
assessmentAssociationId	Assessment Association ID, Primary Key
assessmentPackageCode	Assessment Package Code
jobReqId	Job Requisition ID
vendorCode	Vendor
appStatusSetItemId	Application Status Set Item ID
emailTemplateId	Email Template ID

Navigation Properties

Navigation Property	Related Entity	Description
createdByNav	User	Created by Navigation
lastModifiedByNav	User	Last Modified by Navigation

Use Case 1: Retrieve Assessment Details for all Job Requisitions

Use this operation to retrieve all configured assessment details for all job requisitions.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/JobRequisitionAssessment?\$format=json</code>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/JobRequisitionAssessment(1L)",
      "type": "SFOData.JobRequisitionAssessment"
    },
    "assessmentAssociationId": "1",
    "jobReqId": "402",
    "lastModifiedDate": "/Date(1562450400000+0000)/",
  }
}
```

```

    "createdBy": "athompson",
    "lastModifiedBy": "athompson",
    "createdDateTime": "/Date(1562450400000+0000)/",

    "assessmentPackageCode": "100010",
    "vedorCode": "PA"
  }
}

```

Use Case 2: Update assessment details

Use this operation to update assessment details of job requisitions by creating new entries instead of overwriting the existing configuration.

Request

Operation	Query
HTTP Method	UPSERT
URI	https://<api-server>/odata/v2/upsert? \$format=json

Response

Sample Code

```

{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPDATED",
      "message": "Job Requisition has been updated successfully",
      "index": 0,
      "httpCode": 204,
      "inlineResults": null
    }
  ]
}

```

Use Case 3: Delete Job Requisition Assessment

Request

Operation	Query
-----------	-------

HTTP Method	DELETE
URI	https://<api-server>/odata/v2// JobRequisitionAssessment(44)?\$format=json

Response

Sample Code

```
200K
No response payload is returned
```

9.11.1.3 JobReqFOLocation

You can use this entity to insert, update (through the parent JobRequisition entity) and read FO location list for a job requisition.

This entity should only be used when the location_obj field is defined on the Job Requisition template with multiselect value as true. If multiselect value is false, only one value can be used as part of the list, and it has to be marked as **primary**.

Permissions

Role Based permission attached to FO Location should be applicable.

Operations Allowed

Operation	Description
Query	Yes
Upsert	No (Only through parent entity : jobRequisition)
Insert	No (Only through parent entity : jobRequisition)

Properties

Property Name	Description
isPrimary	Is Primary location (insertable, updatable)
jobReqMultiSelectId	Key. Non editable, updatable
fieldName	Not editable, updatable
jobReqId	Reference to parent entity job requisition. Not editable, updatable.
parentFieldValue	For future use. Not insertable nor updatable.

Navigation Properties

Navigation Property	Related Entity	Description
value	FOLocation	Navigation to FOLocation

Use Cases

Request Information

Operation	Insert via parent JobRequisition entity
URI	<code>https://<api-server>/odata/v2/JobRequisition</code>

Payload

```
{
  "templateId": "2032",
  "jobReqLocale": {
    "jobTitle": "Created via oData API
30 Mar",
    "externalTitle": "Created via oData
API 30 Mar",

9.11.1.5 JobRequisitionFieldControls

You can use this entity to access all field permissions defined in the job requisition template for the operator role associated with the login user. This entity holds each field control permission for all the fields defined in the respective job requisition template.

Permissions

API Permissions

Permission System	Required Settings
Role based	None
User based	None

Please note that the query of this API is supported only via the \$expand of the JobRequisition entity.

Field-Level Permission Values

Here's a list of possible values for field-level permissions:

- 0 = hidden: The property isn't visible on user interfaces.
- 1 = read-only: The property can't be changed.
- 3 = optional: The property may contain a null value (indicates writeable).
- 7 = mandatory: The property must contain a value (indicates writeable).

Use Case

Request Information

Operation	Query (via \$expand of JobRequisition)
URI	<code>https://<api-server>/odata/v2/JobRequisition('621')?\$format=json&\$expand=JobRequisitionFieldControls&\$select=jobGrade,JobRequisitionFieldControls/jobGrade</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/JobRequisition(621L)",
      "type": "SFOData.JobRequisition"
    },
    "jobGrade": null,
    "JobRequisitionFieldControls": {
      "__metadata": {
        "uri": "https://<api-server>/odata/v2/JobRequisitionFieldControls(0)",
        "type": "SFOData.JobRequisitionFieldControls"
      },
      "jobGrade": 0
    }
  }
}
```

9.11.1.6 JobReqGOPosition

Use this entity to read, insert, and update one or more positions (values of the field **std_position_obj**) on the Job Requisition.

Permissions

The Position object should be available in one of the active Job Requisition templates. Ensure that the following permissions are enabled for OData user:

Permission System	Required Settings
Role based	The View Current option for Visibility has to be enabled for Position object.
Template based	Read/Write permission has to be enabled for the field std_position_obj on the Job Requisition template.

Supported Operations

Operation	Description
Query	Read the details of Positions used on the Job Requisition.
Insert	Only through parent JobRequisition entity.
Upsert	Only through parent JobRequisition entity.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
isPrimary	Describes a primary location or position of a job. (insertable, updatable)
jobReqMultiSelectId	Key. Noneditable, updatable
fieldName	Describes name of the Position Object. Noneditable and updatable.
jobReqId	Referenced to the parent entity job requisition. Noneditable and nonupdatable.
externalCode	Referenced to the Position Code

Note

The `externalCode` property in the Job Position Object list (`std_position_objlist`) is to update the position data using the Integration Center. This capability is available only when the `std_position_obj` field is configured as a `multiselect= false` in a job requisition XML template. For non Integration Center-related usages, use either the `value` or the `externalCode` fields to update the position data.

Note

If the Job Requisition template contains "`true`" for `std_position_obj`, a single value or multiple values of position can be upserted on the job requisition. While upserting with a single position, if `isPrimary` attribute isn't passed in the payload, or passed as `false`, then `isPrimary` is considered as "`true`".

Navigation Properties

Navigation Property	Related Entity	Description
Value	Position(MDF Entity)	This navigates to a Position

Use Case 1: Creating a Job Requisition for a Position

Insert a Job Requisition with position through JobRequisition entity.

Request

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/JobRequisition

Payload

```
{  "__metadata": {
    "uri": "JobRequisition(1668L)",
    "type": "SFOData.JobRequisition"
  },
  "std_position_objlist" : [
    {
      "isPrimary": true,
      "__metadata": {
        "type": "SFOData.JobReqGOPosition",
        "uri": "JobReqGOPosition"
      },
      "value" : { "code": "ALYST_AUS" }
    },
    {
      "isPrimary": false,
      "__metadata": {
        "type": "SFOData.JobReqGOPosition",
        "uri": "JobReqGOPosition"
      },
      "value" : { "code": "MGR_ACTNE" }
    }
  ]
}
```

Response

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPDATED",
      "message": "Job Requisition has been updated successfully",
      "index": 0,
      "statusCode": 204,
      "inlineResults": null
    }
  ]
}
```

```
} ]
```

Use Case 2: Getting a Position Object on the Job Requisition

Get Job Requisition Position Generic Object.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/JobReqGOPosition(19180L)?\$format=json</code>
Payload	<pre>{ "d": { "__metadata": { "uri": "https://<api-server>/odata/v2/JobReqGOPosition(19180L)", "type": "SFOData.JobReqGOPosition" }, "jobReqMultiSelectId": "19180", "jobReqId": "1402", "fieldName": "std_position_obj", "isPrimary": true, "value": { "__deferred": { "uri": "https://<api-server>/odata/v2/JobReqGOPosition(19180L)/value" } } } }</pre>

9.11.1.8 JobRequisitionLocaleFieldControls

This entity provides a way to access all fields permission defined in the job requisition template for locale based fields, for the operator role associated with login user. This entity holds each field control permission for all locale fields defined in the respective Job Req template..

Permissions

API Permissions

Permission System	Required Settings
Role based	None
User based	None

Supported Operations

Operation	Supported (Yes/No)
Query	Yes (Only through \$expand clause of JobRequisitionLocale entity)

Field-Level Permission Values

Here's a list of possible values for field-level permissions:

- 0 = hidden: The property isn't visible on user interfaces.
- 1 = read-only: The property can't be changed.
- 3 = optional: The property may contain a null value (indicates writeable).
- 7 = mandatory: The property must contain a value (indicates writeable).

Use Cases

Request Information

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/JobRequisitionLocale(7136L)?\$format=json&\$expand=jobReqLocalePermissionsNav</code>

Response:

Sample Code

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/JobRequisitionLocale(7136L)",
      "type": "SFOData.JobRequisitionLocale"
    },
    "jobReqLocalId": "7136",
    "intJobDescFooter": null,
    "extJobDescFooter": null,
    "status": null,
    "locale": "en_US",
    "externalTitle": "Demo The updated patch ticket56",
    "extJobDescHeader": null,
    "jobReqId": "7724",
    "intJobDescHeader": null,
    "externalJobDescription": "external updated via sfapi-onlyexternal
change",
    "jobDescription": "internal upadted via sfapi-SecondAttempt123",
    "jobTitle": "Demo The updated patch ticket56",
```

```

    "jobRequisition": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/
JobRequisitionLocale(7136L)/jobRequisition"
      }
    }
  }
}

```

9.11.1.9 JobRequisitionOperator

This entity represents the job requisition operator user data that includes user system id, first name, last name, email, fax, and phone number. If an operator is defined in any of the job requisition templates , then the operator has an entry in the JobRequisition entity.

Permissions

- ▶ [Recruiting Permissions](#) > [OData API Requisition Export](#) ▶
- ▶ [Recruiting Permissions](#) > [OData API Requisition Create](#) ▶
- ▶ [Recruiting Permissions](#) > [OData API Requisition Update](#) ▶

Supported Operations

Operation	Description
Query	Standard OData call to query the entity.
Insert, Upsert	Update or insert operation for the JobRequisitionOperator entity.

Properties

Property Name	Description
emailId	Operator email id
fax	Operator fax
firstName	Operator First Name

Property Name	Description
jobReqId	Job Requisition Id
lastName	Operator Last Name
phoneNumber	Operator phone number
usersSysId	Operator Users SysId
isOwner	Identifies the primary operator for a role in a job requisition. The <code>isOwner</code> value is set to <code>true</code> for the primary operators. Operators with "V" role will have an <code>isOwner</code> property set to <code>true</code> . <code>isOwner</code> property is a read-only field and cannot be updated.

Including the `usersSysId` in the entity key definition fetches details of a unique operator for a given role and job requisition. For your integrations, if you are using the following format in your GET query on the `JobRequisitionOperator` entity, then append the `usersSysId` property to the query to avoid errors in fetching the required data:

```
JobRequisitionOperator( jobReid={ jobReqId }, operatorRole= ' {operatorRole} ' ).
```

A code sample after you append the `usersSysId` to a GET query is as follows:

Sample Code

```
JobRequisitionOperator( jobReid={ jobReqId }, operatorRole= ' {operatorRole} ',
usersSysId= ' {<usersSysId> } ' )
```

Navigation Properties

Navigation Property	Related Entity	Description
userNav	User	User Navigation

9.11.1.10 JobRequisitionPostingFieldControls

You can use this entity to access all fields permission defined in the job requisition template for Job Posting based fields for the operator role associated with login user.

Field-Level Permission Values

Here's a list of possible values for field-level permissions:

- 0 = hidden: The property isn't visible on user interfaces.
- 1 = read-only: The property can't be changed.
- 3 = optional: The property may contain a null value (indicates writeable).
- 7 = mandatory: The property must contain a value (indicates writeable).

Use Case:

Request Information

Operation	Query (Only through Expands clause)
URI	<code>https://<api-server>/odata/v2/JobRequisition('1069')?\$format=json&\$expand=jobReqPostings,jobReqPostings/jobReqPostingPermissionsNav</code>

Response

9.11.1.11 JobRequisitionPosting

This entity represents the job requisition posting details.

Permissions

▶ [Recruiting Permissions](#) ▶ [OData API Requisition Export](#) ▶

▶ [Recruiting Permissions](#) ▶ [OData API Requisition Create](#) ▶

▶ [Recruiting Permissions](#) ▶ [OData API Requisition Update](#) ▶

Supported Operations

Operation	Description
Query	Standard OData call to query the entity.
Insert, Upsert	Update or insert operation for the JobRequisitionPosting entity.

Properties

Property Name	Description
agencyComment	Agency Comment
boardId	Job Board Id
boardName	Job Board Name
channelId	Job Channel Id
extPartnerAccountId	Ext Partner Account...
jobPostingId	Job Posting Id
jobReqId	Job Requisition Id
lastModifiedBy	Posting Last Modified by User
lastModifiedDateTime	Posting Last Modified by Date and Time
postEndDate	Posting End Date

Property Name	Description
postStartDate	Posting Start Date
postedBy	Job Posted By
postingStatus	<p>Job Posting Status</p> <p>The job posting statuses are mapped to a numeric value, and the mapping is as follows:</p> <ul style="list-style-type: none"> • 0 - The posting of the job failed. • 1 - The job is posted successfully. • 2 - The job post is updated. • 3- The job post is deleted. • 4- The posting of the job is pending. • 5- The reposting of the job is pending. • 6 - The reposting of the job is successful. • 7 - The job posting expired. <p>For example , to filter a job requisition based on the Posting Status "updated" , the query is: <code>https://apisalesdemo4.successfactors.com/odata/v2/JobRequisition?\$jobReqPostings&\$format=json&\$filter=jobReqPostings/postingStatus ne 2</code></p>

Navigation Properties

Navigation Property	Related Entity	Description
lastModifiedByNav	User	Last Modified by Navigation
postedByNav	User	Posted by Navigation
jobRequisition	JobRequisition	Job Requisition

Use Case

ⓘ Note

isPostingUpdatable attribute is added to JobRequisitionPosting entity which denotes whether a job posting row is update-able or not based on write / read permissions given in a job req template.

No additional permissions is needed for the new attribute to work in the JobRequisitionPosting entity.

API Call

Description

```
https://<api-server>/odata/v2/  
JobRequisition(27553)?  
$format=json&$expand=jobReqPostings/  
jobReqPostingPermissionsNav&$select=jobReq  
Postings
```

- If role R is given "write" permission on "agencyPosting" field only and not on "start" field, Insufficient filed level permission error is thrown in the response while upserting. GET query would fetch isPostingUpdatable flag as "false" as write permission is not given to "start" field.
- If role R is given "write" permission on "agencyPosting" and "start" fields, job req posting will be successful. In this case. isPostingUpdatable will be "true"
- If no posting type is specified and only "start" field is given write permission for role R, then all postings can be upserted.

9.11.1.13 JobAnalyzerReportingData

You can use this entity to enable a user to extract and query data related to what is presented in the RCM Job Analyzer panel of Job Requisitions. This entity contains the job analyzer data and the Job Requisition ID that is used as a key to the parent Job Requisition object. It is used for integration scenarios and offline reporting.

Permissions

API Permissions

Permission System	Required Settings
Role based	None
User based	None

Properties

Property	Description
externalCode	A hash of the input data including Job Title, Description, Locale, Location, and so on that is used to generate the Job Analyzer results. e.g 9b7e631d39777c5623b0645b1f21c7f8713b76e4b5b926b72a928310b723e99f
jobReqId	ID of the Job Requisition that this Job Analyzer Reporting Data record is for.
matchedJobFamilyCode	Job Family Code that matches the job requisition data. The code depends on the "matchedJobFamilyType" value - for example 13-1141.00 is a code of o-net type.
matchedJobFamilyLabel	A human readable Job Family text - for example - Compensation, Benefits, and Job Analysis Specialists
matchedJobLocationCode	Job Location Code to indicate what geographical location is the salary information displayed for for example US/NY/new-york-city
matchedJobLocationLabel	A human readable Job Location - for example New York (10007), US
salaryRangeLow	The low value of the market salary range - for example 92,250

Property	Description
salaryRangeHigh	The high value of the market salary range - for example 112,750
predictedSalary	Salary predicted based on the job requisition data - for example 111,920
currency	Currency of the salary value
languageScore	Overall Score for the language of the Job Requisition description - for example 1.34
femaleScore	Female Score for the language of the Job Requisition description - for example 20
maleScore	Male Score for the language of the Job Requisition description - for example 20
neutralScore	Neutral Score for the language of the Job Requisition description - for example 20
feminineBiasedTerms	Feminine Biased Terms identified in the Job Requisition description. For example studies, examines, assesses
masculineBiasedTerms	Masculine Biased Terms identified in the Job Requisition description. for example aggressive, superior
detectedSkills	Detected Skills in the Job Requisition description For example Database programming, Sales Analysis
MarketSkills	Market Skills that are expected for the job family but not present in the job requisition description for example Social marketing, Data Science.

```

9.11.1.14 JobReqScreeningQuestion

This entity represents the details of questions associated to a Job Requisition.

Note

To insert parent and child questions while inserting a job requisition, you can use `<jobReqScreeningQuestions>` property instead of `<questions>` property. In order to update the questions on an existing job requisition, you must provide both the old and new questions in the payload by specifying their right order. If you provide only the new set of questions, then you can't get the desired output.

Properties

Property Name	Description
jobReqId	Job Requisition Id
order	JobReq Question order
questionId	JobReq Question Id
questionName	JobReq Question Name
locale	JobReq Question locale

Property Name	Description
questionType	JobReq Question type
expectedAnswer	JobReq Question Expected Answer
expectedDir	JobReq Question Expected Dir
questionParentId	JobReq Question parent id
questionParentResponse	JobReq Question parent response
maxLength	JobReq Question max length
questionWeight	JobReq Question weight
required	Applicant must answer the question
disqualifier	Applicant must answer correctly
score	Include in screening score
questionDescription	JobReq Question description
ratingScale	RatingScale name for RATING_SCALE questions

Navigation Properties

Navigation Property	Related Entity	Description
choices	JobReqScreeningQuestionChoice	Choices

Use Case:

Request Information

Operation	Query
URI	<pre>https://<api-server>/odata/v2/ JobReqScreeningQuestion? \$format=json&\$select=jobReqId,jobReqContent</pre>

Note

Note that to query a select of an attribute from Odata, then it must contain the "jobReqContent" as well for the select to work; else, it would not return proper or expected response. For

example if the you select jobReqId from the JobReqScreeningQuestion entity then the query should be: `https://sfapiqaand.sflab.ondemand.com/odata/v2/JobReqScreeningQuestion?$format=json&$select=jobReqId,jobReqContent`

If you add only jobReqId in the select, then the response will not contain any data. Hence for the query to work as expected, you must add jobReqContent in the select request.

Related Information

[SAP Business Accelerator Hub: JobRequisitionScreeningQuestion](#)

9.11.1.15 JobReqScreeningQuestionChoice

This entity represents the answer choices for Job Requisition questions.

Note

For the TEXT_QUESTION and NUMERIC_QUESTION types, this entity is not populated. The API does not read a single JobReqScreeningQuestionChoice for a question of type QUESTION_MULTI_CHOICE. The only way the read a single JobReqScreeningQuestionChoice which is of QUESTION_MULTI_CHOICE type, is by expanding the jobReqScreeningQuestion or jobReqScreeningQuestionChoice property from the Job Requisition.

9.11.1.16 JobReqTemplate_<TemplateName>

For each job requisition template available, an entity is created. This is to help you check which fields are required on a specific template when you are creating a job requisition through the Odata API. These entities do not support any operation and are only available on the metadata and in the Admin Center under the "Odata API Dictionary" page. The entity is named using the "JobReqTemplate_" prefixed to the name of the template (For example, JobReqTemplate_Custom).

Supported Operations

None

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Error Codes

HTTP Status Code	Error Code	Description
403	COE_GENERAL_FORBIDDEN	[COE0020]JobReqTemplate_<Template-Name> GET not allowed. Query operation isn't supported.

9.11.1.17 JobRequisitionGroupOperator

You can use this entity to know about all the recruiting groups, which are associated with job requisitions. An administrator links the groups to a job requisition template. Recruiting groups are then linked to the job requisitions during their creation.

Permissions

- ▶ [Recruiting Permissions](#) ▶ [OData API Job Requisition Export](#) ▶

9.11.1.18 Function Import

9.11.1.18.1 getJobReqApprovalActions

You can use this function import to receive approval actions of job requisition that are available on the form, and display the relevant buttons on the mobile devices.

Supported Operations

Operation	Description
GET	Gets the job requisition form actions for users.

Parameters

Parameter	Description	Type
formDataId	Number ending with L that identify the formDataId . For example: formDataId: 2345L	Long
usersSysId	User Sys ID of the user for which job requisition form actions are recieved	String

Use Case

API Call	Description
<code>https://<api-server>/odata/v2/restricted/getJobReqApprovalActions? formDataId=26791L&userSysId='adminjifi'&\$format=json'</code>	Return the actions that are available on the form for that particular user.

Sample Response

```
{  
  "d": [  
    ...  
  ]  
}
```

```

    {
      "actionType": "previous_step",
      "displayName": "Send Back",
      "enabled": true,
      "primaryAction": true
    },
    {
      "actionType": "get_feedback",
      "displayName": "Get Feedback",
      "enabled": true,
      "primaryAction": true
    },
    {
      "actionType": "next_step",
      "displayName": "Hiring Manager Exit Step",
      "enabled": true,
      "primaryAction": true
    },
    {
      "actionType": "cancel",
      "displayName": "Cancel",
      "enabled": true,
      "primaryAction": false
    },
    {
      "actionType": "save_and_close",
      "displayName": "Save and Close",
      "enabled": true,
      "primaryAction": false
    }
  ]
}

```

Error Codes

Error Codes	Descriptions
The form data Id has not been given	When formDataId is not given in API call.
The User ID has not been given	When UsersSysId is not given in API call.
No form actions found for user...	When there are no form actions available for the user.

9.11.1.18.2 sendJobReqFormToUser

You can use this function import to send a job requisition form to another user.

Supported Operations

The supported operation is to move a job requisition form to another user.

Parameters

Parameter	Description	Type
jobReqId	Number ending with L that identify the job requisition id For example: jobReqId: 2345L	Long
userId	String to identify the user ID to which we must assign the form For example: userId: cgrant	String
Comments	String to identify the comments Example comments: Moving the form to the next step	String

Use Case

Operation	API Call	Description
POST	<code>https://<api-server>/odata/v2/sendJobReqFormToUser?jobReqId=26L&userId="cgrant"&comments="comment"&\$format=json</code>	Move the given job requisition form to the given user.

Sample Response

Sample Code

```
{
  "d": {
    "sendJobReqFormToUser": "The job requisition has been sent to the given user."
  }
}
```

Error Codes

Error Codes	Descriptions
INCORRECT_PARAMETER_ERROR	Job requisition <jobReqId> was not found.
MISS_REQUIRED_PARAMETER_ERROR	The job requisition Id is required.
MISS_REQUIRED_PARAMETER_ERROR	UserId is required.
ERROR	RouteMap doesn't exist.

Example: Sample Response

Operation	API Call	Description
POST	<p>https://<api-server>/odata/v2/ sendJobReqFormToUser?jobRe- qId=26L&userId="cgrant"&com- ments="comment"&\$formay=json</p> <p>https://<api-server>/odata/v2/ sendJobReqToNextStep?jobRe- qId=26791L&comments="com- ment"&\$formay=json</p>	Move the given job requisition form to the next step.

Sample Code

```
{
  "d": {
    "sendJobReqFormToUser": "The job requisition has been sent to the given
user."
  }
}
```

9.11.1.18.3 approveOrDeclineJobReqForm

You can use this entity to either approve or decline the job requisition form based on the `actionType` parameter.

Supported Operations

The supported operation is to approve or decline a job requisition form based on `actionType` parameter.

Note

We recommend using the `sendJobReqToNextStep` and `sendJobReqToPreviousStep` API calls to move through the route map approval. Use the `approveOrDeclineJobReqForm` entity with `actionType` as `APPROVE` only to send form to the next user.

Operation	Supported
Query	No
Upsert	No
Insert	No
Merge	No
Replace	No
Delete	No

Parameters

Parameter	Description	Type
jobReqId	Number ending with L that identify the job requisition id For example, jobReqId: 2345L	Long
actionType	String to identify the actionType For example, actionType: "APPROVE"	String

Use Case

Operation	API Call	Description
POST	<code>https://<api-server>/odata/v2/approveOrDeclineJobReqForm?jobReqId=26L&actionType="APPROVE"</code>	Either approve or decline the job requisition form based on the actionType parameter

Sample Response

Sample Code

```
{
  "d": {
    "approveOrDeclineJobReqForm ": " The job requisition has been approved/
declined. "
  }
}
```

Error Codes

Error Codes	Descriptions
INCORRECT_PARAMETER_ERROR	Job requisition <jobReqId> wasn't found.
INCORRECT_PARAMETER_ERROR	actionType is invalid. Only APPROVE or DECLINE is allowed.
MISS_REQUIRED_PARAMETER_ERROR	The job requisition Id is required.
MISS_REQUIRED_PARAMETER_ERROR	actionType is required.
ERROR	RouteMap doesn't exist.

Example: Sample Response

Operation	API Call	Description
POST	<p>https://<api-server>/odata/v2/approveOrDeclineJobReqForm?jobReqId=26L&actionType="APPROVE"</p> <p>https://<api-server>/odata/v2/sendJobReqToNextStep?jobReqId=26791L&comments="comment"&\$format=json</p>	Either approve or decline the job requisition form based on the actionType parameter.

Sample Code

```
{
  "d": {
    "approveOrDeclineJobReqForm ": " The job requisition has been approved/
declined. "
  }
}
```

9.11.1.18.4 sendJobReqToNextStep

You can use this function import to send a job requisition form to the next step in a route map.

Supported Operations

The supported operation is to move a job requisition form to the next step in a route map.

Parameters

Parameter	Description	Type
jobReqId	Number ending with L that identify the job requisition id For example: jobReqId: 2345L	Long
Comments	String to identify the comments Example comments: Moving the form to the next step	String

Use Case

Operation	API Call	Description
POST	<code>https://<api-server>/odata/v2/sendJobReqToNextStep?jobReqId=26791L&comments="comment"&\$format=json</code>	Move the given job req form to the next step.

Sample Response

Sample Code

```
{
  "d": {
    "sendJobReqToNextStep": "The job requisition has been sent to next step."
  }
}
```

Error Codes

Error Codes	Descriptions
INCORRECT_PARAMETER_ERROR	Job requisition <jobReqId> was not found.
INCORRECT_PARAMETER_ERROR	Login user <userId> isn't allowed to move the form to next step.
MISS_REQUIRED_PARAMETER_ERROR	The job requisition ID has not been given.
ERROR	RouteMap does not exist.
ERROR	CurrentStep does not exist.

9.11.1.18.5 reassignJobReq

You can use this function import to reassign a job requisition to other operators.

Supported Operations

Query

Parameters

Parameter	Data Type
jobReqId	int
coordinator	string
hiringManager	string
recruiter	string
secondRecruiter	string

Parameter	Data Type
sourcer	string
vpOfStaffing	string

Use Case 1: Reassign Job Requisition

Reassign the job requisition to another operator.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/reassignJobReq?jobReqId=1692&recruiter='aanderson1'&hiringManager='cgrant2'

Response

```
{
  "d": {
    "reassignJobReq": "The job requisition has been reassigned."
  }
}
```

9.11.1.18.6 addModifierToJobReq

You can use this function import to add a modifier to the job requisition workflow. The route map then shows the newly added modifier.

Supported Operations

Query

Parameters

Parameter	Data Type
jobReqId	long
modifier	string

Use Case 1: Add Modifier to a Job Requisition

Add modifier to a job requisition.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/addModifierToJobReq?\$format=json&jobReqId=12235&modifier=bchen</code>

Response

```
{
  "d": {
    "addModifierToJobReq": "Modifier has been successfully added."
  }
}
```

9.11.1.18.7 sendJobReqToPreviousStep

You can use this function import to send a job requisition to the previous step in the route map, provided you are an operator in the route map.

Supported Operations

Query

Parameters

Parameter	Data Type	Required/Optional
comment	string	Optional
JobReqId	long	Required

Use Case

Move the job requisition to the previous step in a route map.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/sendJobReqToPreviousStep?&comment='Test'&jobReqId=1040L&\$format=json</code>

Response

```
{
  "d": {
    "sendJobReqToPreviousStep": "The job requisition has been sent to previous
step."
  }
}
```

9.11.2 Job Application

9.11.2.1 JobApplication

The job application entity contains core application data consisting of system, standard, and custom fields.

Note

When the *OData API Application Create and Update Validation Bypass for Required Fields* role-based permission is enabled, the mandatory field validation is skipped for application creation and update via OData. This flow supports single and multistage applications.

The metadata of this entity shows the standard and custom fields configured in all the active templates. If a field (standard or custom) isn't configured in any of the active templates, it does n't display in the metadata and isn't a part of the OData query. However, the system and calculated fields are always displayed.

When you query a list of job applications by system statuses, you need to specify the mapped values for the system statuses in the API call. As a result, the API returns the statuses as Saved, Disqualified, Open, Closed, Withdraw,

Non-Applied, or Draft Application. The table lists the numerical values that are mapped to the different system statuses of a Job Application:

Numerical Value	Mapped to
0	"Open"
1	"Disqualified"
2	"Closed"
3	"Withdraw"
4	"Saved"
5	"Non-Applied"
6	"Draft Application"

📌 Note

- "Saved" (4) refers to candidates who have saved the job requisition in their job search for applying to later.
- The entity can't be filtered or sorted by these nonreportable custom fields. Reportable custom fields must be available within the entity and the entity can be sorted/filtered using the reportable custom fields.
- If the same field (custom or standard) has been configured as different types (say text in one and picklist in another) in separate application templates, then the field shows up as String in the metadata. In this case, OData query returns the Option Id for the picklist field of the job requisition that was created using the template having the field configured as picklist.
- If two custom fields with the same field Id are defined in two different templates, then the metadata shows the following:
 - If the default label and field type are the same, then one field in the metadata is shown.
 - If the default labels are different, then one field in the metadata with two labels that are comma-separated is shown.
- The system fields always show up in the metadata irrespective of the template definition.
- Batch operation is supported.
- Applications can be created for both Internal and External Candidates.
- The gender column automatically gets expanded, and returns the value when you query a GET operation on the Job Application entity. Note that you need not specify this column in the expand clause.
- When a job application status is changed using OData API, emails that are configured to trigger upon applicant status changes are sent to the involved stakeholders.
- The JobApplication OData entity supports candidate autodisqualification and hard stop policy.
- To be able to skip fields that have been configured in the job application template as being required, enable the [OData API Application Create and Update Validation Bypass for Required Fields](#) role-based permission.

Permissions

Operator Permissions

By default, Recruiting operators can use OData APIs to view or edit relevant fields based on field-level permissions that are defined in job application templates. These field-level permissions allow Recruiting operators to perform the same action using OData APIs as they perform on the application record in SAP SuccessFactors Recruiting.

For more information on the field-level permissions, refer to *Field-level Permissions for Job Applications* under the **Related Information** section of this page.

Admin Permissions

The following permissions allow users to view and edit all fields in JobApplication entity:

- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Application Export](#) >
- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Application Create](#) >
- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Application Update](#) >

Setting the following permission allows validations for required fields to be ignored so that users can skip them when creating and updating job applications using OData API:

- [Manage Permission Roles](#) > [Recruiting Permissions](#) > [OData API Application Create and Update Validation Bypass for Required Fields](#) >

Supported Operations

Operation	Description
Query	Standard OData call to query the entity.
Merge	Update operation for the Job Application entity for a few fields without changing the values of existing fields in the Job application along with validation for required fields constraints.
Insert	Insert operation triggers assessment integration if it's configured with the <i>New/Default</i> application status.
Upsert	Upsert operation triggers assessment integration if the status of an application is changed and the new status has configured with it.
Replace	Replace operation to update fields.

Note

The current design of the Recruiting OData APIs doesn't allow you to update any property with a null value.

Properties and Navigation Properties

Properties

Note

For this entity, nonreportable custom fields are stored as CLOB data. The field, customField in the entity represents nonreportable custom fields in key and value pairs. This entity can't be filtered or sorted by these nonreportable custom fields. Reportable custom fields should be available within the entity and the entity can be sorted/filtered using the reportable custom fields.

Standard and custom fields show up based on the template definitions. Refer to OData API Data Dictionary for the latest information on the entities.

Sample Fields	Description
address	Address
agencyInfo	Agency Information
anonymizedDate	Application Anonymized Date
anonymizedFlag	Anonymized Flag The <code><anonymizedFlag></code> field contains numerical value and it is mapped to the following: <ul style="list-style-type: none">• 0 - Non-Anonymized. Candidate Profile and Application are available.• 1 - Anonymized. Candidate Profile is deleted and Application is anonymized.• 2 - Marked for anonymization by Data Privacy Consent Statement (DPCS) declined status. DPCS is declined/Candidate Profile is no longer available in the system and Application is marked for anonymization.• 3 - Marked for anonymization by admin delete action. Administrator deleted the candidate profile/Candidate Profile is no longer available in the system and Application is marked for anonymization.• 4 - Marked for anonymization by candidate delete action. Candidate deleted their profile/Candidate Profile is no longer available in the system and Application is marked for anonymization.
appLocale	Application Locale
applicationDate	Application Date
applicationId	Application ID Application ID is a business key.
applicationTemplateId	Application Template Id

Sample Fields	Description
backgroundChkStatus	Background Check Status
candConversionProcessed	Candidate Conversion Processed
candidateId	Candidate ID
candidateReviewDate	Candidate Review Date
cellPhone	Cell Phone
city	City
comments	Comments
countryCode	Country Code, a two-letter code that represents a country or a region
currentCompany	Current Company
currentTitle	Current Title
customFields	Custom Fields (Represents nonreportable custom fields in key and value pairs)
customStatus	Custom Status
dateOfAvailability	Date of Availability
disabilityStatus	Disability Status
duplicateProfile	Duplicate Profile
emailAddress	Email Address
ethnicity	Ethnicity
exportedOn	Exported On
faxNumber	Fax Number
firstName	First Name
formerEmployee	Former Employee
gender	Gender
hiredOn	Hired On
homePhone	Home Phone
jobReqId	Job Requisition Id
lastModifiedBy	Last Modified By
lastModifiedByProxy	Last Modified By Proxy
lastname	Last Name
mainContact	mainContact
middleName	Middle Name
minAnnualSal	Minimum Annual Salary
owner	Owner
ownershpDate	Ownership Date

Sample Fields	Description
preferredLoc	Preferred Location
profileUpdated	Profile Updated
questionResponse	Question Response (comma-separated keys and values)
race	Race
rating	Rating
reference	Reference
referenceComments	Reference Comments
referralSource	Referral Source
referredBy	Referred By
resumeUploadDate	Resume Upload Date
snapShotDate	SnapShot Date
source	<p>Source</p> <p>Here are the string values assigned for different numerical values:</p> <ul style="list-style-type: none"> 0 - Internal Career Site 1 - Corporate: Default Site 2 - Job Board 3 - Forwarded 4 - Agency 5 - Referral 6 - Internal Referral 7 - Job Vite 8 - Recruiting Marketing 9 - Forwarded as Applicant
<div style="background-color: #f0f0f0; padding: 10px; border: 1px solid #ccc;"> <p>Note</p> <p>SAP SuccessFactors Recruiting doesn't recommend to use Job Vite as the source because the integration is deprecated.</p> </div>	
startDate	Start Date
statusComments	Status Comments
timeToHire	Time To Hire
veteranStatus	Veteran Status
zip	Zip
appStatusSetItem	App Status Set Item

Sample Fields	Description
dateOfBirth	Date of Birth The dateOfBirth field is of type DateTime . For more details about DateTime format, refer to <i>Using the DateTime Format</i> under the Related Information section of this page.
ssn	Social Security Number
dataSource	Data Source
nonApplicantStatus	Non Applicant Status 0 - UNDEFINED 1 - ACTIVE_STATUS 2 - INVITED_STATUS
candTypeWhenHired	Candidate Type When Hired
jobAppGUId	Application GU Id
lastModified	Last Modified Date
userSysId	User ID

Navigation Properties

Navigation Property	Related Entity	Description
candidateSource	PicklistOption	Candidate Source
cityPicklist	PicklistOption	City Picklist
countryPicklist	PicklistOption	Country/region Picklist
coverLetter	Attachment	Cover Letter
jobAppStatus	JobApplicationStatus	Job Application Status
jobApplicationComments	JobApplicationComments	Job Application Comments
jobApplicationResume	Attachment	Job Application Resume
multiAttachmentSelection	Attachment	Multi Attachment Selection
referredByNav	User	Referred By Navigation
resume	Attachment	Resume
statePicklist	Picklist Option	State Picklist
userNav	User	User Navigation
jobAppPermissionsNav	JobApplicationFieldControls	This property appears in the query response, only for the associated operators of the job application.

Note

To successfully work with any navigation property of type `Attachment`, refer to the documentation with code samples in the [Related Information](#) section.

Use Cases:

Request	Description
<code>../odata/v2/JobApplication('12333')</code>	Get the application where applicationId is 12333
<code>../odata/v2/JobApplication('12333')? \$expand=multiAttachmentSelection</code>	Get the application along with the attachments where applicationId is 12333
<code>../odata/v2/JobApplicationStatus? \$filter=appStatusName eq 'Interview'&\$expand=jobApplications]</code>	Get all the applications in 'Interview' status
<code>../odata/v2/JobApplication? \$filter=cellPhone eq '650 645 2000'&\$top=2</code>	Get the top 2 applications with cellphone 650 645 2000
<code>.. ../odata/v2/JobApplication? \$format=json&\$filter=status eq 4</code>	Get the job application statuses with status as "Saved".

Sample Code

```
../odata/v2/JobApplication
{
  "relativesEmployed":
  [{"id": "381"},
  "convicted": {"id": "380"},
  "candidateSource": {"id": "1515"},
  "candidateId": "901",
  "homePhone": "00004",
  "jobReqId": "621",
  "applicationTemplateId": "792",
  "appStatusSetItemId": "21",
  "firstName": "José",
  "lastName": "Mourinho",
  "resume":
  {
    "__metadata": {
      "type": "SFOData.Attachment"
    },
    "userId": "admin",
    "module": "RECRUITING",
    "moduleCategory": "ATTACHMENTS",
    "fileContent": "XXXXXXXXXXXXX",
    "fileName": "Attach2.doc"
  }
}
```

(POST) Inserts an application from candidateId 901 along with a resume for jobReqId 621

Request**Description**

↔ Sample Code

```
../odata/v2/JobApplication
{
  "candidateId": "1001",
  "jobReqId": "1022",
  "applicationTemplateId": "792",
  "appStatusSetItemId": "21",
  "ssn": null,
  "cellPhone": "000005",
  "homePhone": "0001",
  "city": "test Map",
  "middleName": "test Map",
  "lastName": "test Map",
  "referenceComments": "test Map",
  "status": "0",
  "countryCode": "BR",
  "relativesRelationship": "test
Map",
  "dateOfBirth": "/"
Date(1440509843000)/",

  "agencyInfo": "test Map",
  "faxNumber": "01",
  "relativesDept": "test Map",
  "convictedYes": "Yes",
  "statusComments": "test Map",
  "firstName": "test Map",
  "zip": null,
  "contactEmail":
"testMap@asdsa.com",
  "nonApplicantStatus": "0",
  "reference": "test Map",
  "source": "1",
  "address": "test Map",
  "formerEmployee": false,
  "rating": "0",
  "candidateSource": { "id":
"1516"},
  "convicted": { "id": "381"},
  "relativesEmployed": { "id":
"381"},
  "resume": {
    "__metadata": {
      "type": "SFOData.Attachment"
    },
    "userId": "admin",
    "module": "RECRUITING",
    "moduleCategory": "RESUME",
    "fileContent": "XXXXXXXXAAAA",
    "fileName": "TesteResume.doc"
  }
}
```

(POST) Inserts an application updating Candidate information.

/odata/v2/fwdCandidateToColleague?
candidateId=11441&referredTo=adminSAP

(GET) Forward to colleague

↔ Sample Code

```

../odata/v2/Upsert
[
  {
    "__metadata":{
      "type":"SFOData.JobApplication",
      "uri":"JobApplication"
    },
    "candidateId": "1001",
    "jobReqId": "902",
    "applicationTemplateId": "792",
    "appStatusSetItemId": "21",
    "status": "0",
    "countryCode": "BR",
    "questionResponse": "[]",
    "faxNumber": "01",
    "convictedYes": "Yes",
    "zip": null,
    "nonApplicantStatus": "0",
    "source": "1",
    "rating": "0",
    "candidateSource": { "id":
"1516"},
    "convicted": { "id": "381"},
    "relativesEmployed": { "id":
"381"}
  },{
    "__metadata":{
      "type":"SFOData.JobApplication",
      "uri":"JobApplication"
    },
    "candidateId": "1001",
    "jobReqId": "901",
    "applicationTemplateId": "792",
    "appStatusSetItemId": "21",
    "status": "0",
    "countryCode": "BR",
    "questionResponse": "[]",
    "faxNumber": "01",
    "convictedYes": "Yes",
    "zip": null,
    "nonApplicantStatus": "0",
    "source": "1",
    "rating": "0",
    "candidateSource": { "id":
"1516"},
    "convicted": { "id": "381"},
    "relativesEmployed": { "id":
"381"}
  }
]

```

(POST) Batch insert operation to add two new applications.

↔ Sample Code

```

../odata/v2/Upsert
[
  {
    "__metadata":{
      "type":"SFOData.JobApplication",
      "uri":"JobApplication(583)"
    },

/odata/v2/JobApplication(12333)? \$expand=jobApplicationAudit	Get the application along with its Audit information where applicationId is 12333
/odata/v2/ JobApplicationSnapshot_Education(346L)	Get the job application snapshot education where the snapshot_educationId is 346
/odata/v2/ JobApplicationSnapshot_OutsideWorkExperience(484L)	Get the job application snapshot work outside experience where the snapshot_outsideWorkExperienceId is 484
/odata/v2/JobApplication(741)? \$expand=education	Get the application along with its snapshot education where applicationId is 741
/odata/v2/JobApplication(707L)/ outsideWorkExperience	Get a list of the application snapshot outside work experience from applicationId 707
/odata/v2/OfferApprover(221)	Get the offer approver with id 221
/odata/v2/OfferApproval(191)	Get the offer approval detail with id 191
/odata/v2/JobApplication(601L)/ offerApproval	Get the offer approval list from applicationId 601
/odata/v2/JobApplication(601L)/ offerApproval(191)/approvers	Get the offer approver list from Offer Approval 191 from Application id 601.
/odata/v2/initiateOnboarding? applicationId=723L	Initiate the Onboarding process for the applicant related with the specified application
/odata/v2/ JobApplicationOnboardingData(61L)	Get onboarding portlet data with onboardingId 61

Request	Description
<code>/odata/v2/JobApplication(601L)/jobApplicationOnboardingData</code>	Get the list of all onboarding portlets required from applicationId 601 (with errors or not)
<code>/odata/v2/JobApplicationQuestionResponse(applicationId=763L,order=1L)</code>	Get the first question response from applicationId 763L
<code>/odata/v2/JobApplication(763)/jobApplicationQuestionResponse</code>	Get the list of all questions responses of applicationId 763

Sample Code

```
{
  "candidateId": "1421",
  "jobReqId": "1489",
  "appStatusSetItemId": "34",
  "candidateSource": { "id":
"528" },
  "convicted": { "id": "380"},
  "relativesEmployed": { "id":
"380" },
  "jobApplicationQuestionResponse" : [
    {
      "order": "1",
      "answer": "Motivated"
    },
    {
      "order": "4",
      "answer":
"Unsatisfactory"
    }
  ]
}
```

(POST) Insert a JobApplication with jobAppQuestionResponses.

Request**Description**

↔ Sample Code

```
{
  "__metadata":{
    "type":"SFOData.JobApplication",
    "uri":"JobApplication(905L)"
  },
  "jobApplicationQuestionResponse" : [
    {
      "order": "1",
      "answer": "Very
Motivated"
    },
    {
      "order": "2",
      "answer": "4"
    },
    {
      "order": "3",
      "answer": "this is a
text 2"
    },
    {
      "order": "4",
      "answer": "Outstanding"
    }
  ]
}
```

(POST) Update the jobAppQuestionResponses from a JobAp-
plication

Request

Description

Sample Code

```
[
  {
    "__metadata":{
      "type":"SFOData.JobApplicationQuestionResponse",
      "uri":"JobApplicationQuestionResponse"
    },
    "order": "1",
    "answer": "Very Motivated",
    "applicationId" : "882"
  },
  {
    "__metadata":{
      "type":"SFOData.JobApplicationQuestionResponse",
      "uri":"JobApplicationQuestionResponse"
    },
    "order": "4",
    "answer": "Outstanding",
    "applicationId": "882"
  }
]
```

(POST) Update the JobAppQuestionResponse from JobApplications

Sample Code

```
{
  "__metadata":
  { "type": "SFOData.JobApplication",
    "uri": "JobApplication" }
,
  "candidateId": "49257",
  "jobReqId": "58763",
  "appLocale": "fr_FR",
  "jobApplicationQuestionResponse": [
    { "order": "4", "answer": "test1-fr" }
  ]
}
```

(UPSERT) Insert JobApplication with JobApplicationQuestionResponse with locale in the payload along with order and answer (rating scale option in that locale)

Request

Description

↔ Sample Code

```
{
  "__metadata":
  { "type": "SFOData.JobApplication",
    "uri": "JobApplication" }
  ,
  "applicationId": "5732953",
  "jobApplicationQuestionResponse": [
  { "order": "4", "answer": "test3-
fr" }
  ]
}
```

(UPSERT) Upsert JobApplication with JobApplicationQuestionResponse having answers in multi locale for rating scales

ⓘ Note

- If during Insert JobApplication applocale in the payload doesn't match with the rating scale answer type for that locale within the jobApplicationQuestionResponse then the system should display the error message: **'Invalid answer for question 'b1608 question' (order=4). This answer should be : test1-fr, test2-fr, test3-fr, test4-fr, test5-fr. with the index 0.**
- If during Upsert JobApplication applocale of the already applied application doesn't match with the rating scale answer type for that locale within the jobApplicationQuestionResponse, then the system should display the error message: **Invalid answer for question 'b1608 question' (order=4). This answer should be: : test1-fr, test2-fr, test3-fr, test4-fr, test5-fr. with the index 0**

Use case 1: Initiate assessment through JobApplication entity using insert operation

In the following example, admin users with OData API job application export permission can initiate assessment during insert operation if assessment is configured for the *New/Default Application* status.

Operation	Insert
HTTP method	POST
URI	https://<API-Server>/odata/v2/ JobApplication(46967L)
Payload	

↔ Sample Code

```
{
  "candidateId": "45677",
  "jobReqId": "20161",
  "appStatusSetItemId": "3"
}
{
  "d": {
    "__metadata": {
```

```

    "uri": "https://<API-Server>/
odata/v2/JobApplication(46967L)",
    "type":
    "SFOData.JobApplication"
  },
  "candidateId": "45677",
  "jobReqId": "20161",
  "appStatusSetItemId": "3",
  "applicationId": "46967"
}

```

Use Case 2: Initiate assessment integration through JobApplication entity using upsert operation

In the following example, admin users with OData API job application export permission can initiate assessment through upsert operation if an application status is changed. For this, assessment must be configured with the application status to which the application is moved.

Operation	Insert
HTTP method	POST
URI	https://<API-Server>/odata/v2/JobApplication(46967L)

Payload

Sample Code

```

{
  "__metadata": {
    "uri": "https://<API-Server>/
odata/v2/JobApplication(46967L)",
    "type":
    "SFOData.JobApplication"
  },
  "appStatusSetItemId": "5",
}
{
  "d": [
    {
      "key": "JobApplication/
applicationId=46967",
      "status": "OK",
      "editStatus": "UPDATED",
      "message": "Application
has been updated successfully",
      "index": 0,
      "httpCode": 204,
      "inlineResults": null
    }
  ]
}

```

Use Case 3: Initiate hard stop on Job application status update

In the following example, a user can block the OData job application status update, if the assessment is configured in one of the status that is skipped. As a prerequisite, configure a hard stop status field on the Job Requisition template as a standard field.

Operation	Update
HTTP method	POST
URI	http://<api-server>/odata/v2/upsert? \$format=json

Payload	<div data-bbox="818 617 1425 1386"><p>Sample Code</p><pre>{ "__metadata": { "uri": "https://<api-server>/ OData/v2/JobApplication(861L)", "type": "SFOData.JobApplication" }, "applicationId": "861", "appStatusSetItemId": "31" } { "d": [{ "key": null, "status": "ERROR", "editStatus": null, "message": "Application status cannot be updated, one or more assessments have not been completed with the index 0", "index": 0, "httpCode": 500, "inlineResults": null }] }</pre></div>
---------	---

Use Case 4: Initiate Candidate auto-disqualification based on pre-screening questions

In the following example, the candidate is automatically moved to disqualified status, if the prescreening questions are answered incorrectly.

Operation	Insert
HTTP method	POST
URI	http://<hostname>/odata/v2/JobApplication? \$format=json

Payload

Sample Code

```
{
  "jobReqId": "37472",
  "candidateId": "4563",
  "middleName": "OData",
  "homePhone": "1234567890",
  "jobApplicationQuestionResponse": [
    {
      "order": "1",
      "answer": "10"
    }
  ]
}
```

```
{
  "jobReqId": "37472",
  "candidateId": "4563",
  "middleName": "OData",
  "applicationId": "12345",
  "homePhone": "1234567890",
  "status": "Disqualified",
}
```

Error Codes

Error Code	Description
<i>Permission not enabled</i> (not a specific code)	Recruiting OData API is not enabled in Provisioning. → Remember As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.
<i>Edit permission not enabled</i> (not a specific code)	OData API Application <editType> permission in Admin Center is not enabled.
<i>Field required</i> (not a specific code)	<field> required.
<i>Field invalid</i> (not a specific code)	<field> invalid.
<i>Invalid number</i> (not a specific code)	<field> has a invalid number format
<i>Invalid date</i> (not a specific code)	<field> has a invalid date format

Error Code	Description
<i>Invalid boolean</i> (not a specific code)	<field> has a invalid Boolean format
<i>Invalid template</i> (not a specific code)	Template Id <templated> is invalid or inactive
<i>SCA error</i> (not a specific code)	Unable to insert application due to a SCA Error.
<i>Forward failed</i> (not a specific code)	Forward failed.
<i>Upsert failed</i> (not a specific code)	Application upsert failed : <error>
<i>Database batch error</i> (not a specific code)	Database error when executing application batch operations.
<i>Unexpected batch error</i> (not a specific code)	Unexpected error occurred when executing application batch operations.
<i>Override error</i> (not a specific code)	Override not allowed for Candidate Id = <candidateId> and job requisition = <jobReqId>
<i>Error updating candidates</i> (not a specific code)	Error updating candidates for job application batch operation
<i>Error inserting batch</i> (not a specific code)	Failed to batch insert applications
<i>Error updating batch</i> (not a specific code)	Failed to batch update applications.

Properties

In the following table, we've added some additional information about some of the field properties.

Property	Type	Additional Information
id	long	key attribute
vendorCode	string	Assessment vendor code
packageCode	string	Assessment package code
createdBy	string	Created user id
lastModifiedBy	string	Last modified user id
createdDateTime	datetimeoffset	-
lastModifiedDateTime	datetimeoffset	-

Property	Type	Additional Information
assessmentURL	string	Assessment URL that a candidate can use to take an assessment
jobApplication	nav	Related to the JobApplication entity for which the assessment is initiated.
assessmentReport	nav	Related to the JobApplicationAssessmentReport and represents the assessment reports for the initiated assessment. This navigation has a 1: n relationship.
applicationId	long	Job application id
handbackUrl	string	The URL to which assessment provider redirects the candidate once the assessment is completed by the candidate.

Navigation Properties

Navigation Property	Related Entity	Description
createdByNav	User	Created by navigation
lastModifiedByNav	User	Last modified by navigation

Use Case: Retrieve a Job Application Assessment Order

9.11.2.5 JobApplicationComments

This entity represents the comments entered for the job application.

Permissions

Permission System	Required Setting
Role-based	▶ Recruiting Permissions > OData API Application Export >
	▶ Recruiting Permissions > OData API Application Create >
	▶ Recruiting Permissions > OData API Application Update >
	▶ Recruiting Permissions > OData API Application Audit Export >

Supported Operations

Operation	Description
Query	Standard OData call to query the entity.
Upsert	Update or insert operation for the JobApplicationComments entity.

Note

The current design of the Recruiting OData APIs doesn't allow you to update any property with a null value.

Properties

Property	Description
associatedCommentId	Associated Comment Id
associatedId	Associated Id
commentId	Comment Id
commentator	Commentator
content	Content
hasAssociatedComment	Has Associated Comment
migratedCommentatorUserName	Migrated Commentator User Name

Property	Description
refId	Reference Id
refType	Reference Type

Navigation Properties

Navigation Property	Related Entity	Description
jobApplication	JobApplication	Application
commentatorNav	User	Commentator Navigation

Use Case: Querying the Job Application Comments

This API fetches the comments for a Job Application.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/JobApplicationComments(671L)?\$format=JSON</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/JobApplicationComments(671L)",
      "type": "SFOData.JobApplicationComments"
    },

      }
    }
  }
}
```

```
}  
  }  
}
```

Related Information

[SAP Business Accelerator Hub: JobApplicationComments](#)

9.11.2.6 JobApplicationFieldControls

This entity provides a way to access all field permissions that are defined in the job application template, for the operator role associated with login user. This entity holds each field control permission for all the fields defined in the respective job application template. It helps in accessing field control permission for the login user through OData and doesn't support insert, update, upsert, and delete.

Supported Operations

Query (Only by expanding jobAppPermissionsNav navigational property of JobApplication entity.)

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Field-Level Permission Values

Here's a list of possible values for field-level permissions:

- 0 = hidden: The property isn't visible on user interfaces.
- 1 = read-only: The property can't be changed.
- 3 = optional: The property may contain a null value (indicates writeable).
- 7 = mandatory: The property must contain a value (indicates writeable).

Use Case: Querying the Field-Level Permissions for a Specific User

This API fetches the field level permissions for a specific user who triggers API request against `JobApplication` entity. The `jobAppPermissionsNav` property is returned in the response only if the logged on user is a nonadmin user and is a recruiting operator.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/JobApplication(48385)?\$format=json&\$select=jobAppPermissionsNav,applicationId&\$expand=jobAppPermissionsNav</code>

Response

9.11.2.16 JobAppTemplate_<TemplateName>

For each job application template available, an entity is created. This is to help you check which fields are required on a specific template when you are creating a job application through the Odata API. These entities do not support any operation and are only available on the metadata and in the Admin Center under the "Odata API Dictionary" page. The entity is named using the "JobAppTemplate_" prefixed to the name of the template (For example, JobAppTemplate_Custom).

Supported Operations

None

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Error Codes

HTTP Status Code	Error Code	Description
403	COE_GENERAL_FORBIDDEN	[COE0020]JobAppTemplate_<Template-Name> GET not allowed. Query operation isn't supported.

9.11.2.17 JobApplicationBackgroundCheckRequest

You can use this entity to query or post a background check request for Job Applications.

Permissions

Related Information

[SAP Business Accelerator Hub: JobApplicationBackgroundCheckResult](#)

9.11.2.19 JobApplicationInterview

You can use this entity to generate interview and the user details who interview the applicant.

Once you've added a user to the interviewer list, a new Interview Assessment form is placed on the *Interview Central* tab for the user. Note that Interview Central isn't an interview scheduling tool. When you enable the *Interview Scheduling* option, you can't schedule interviews using the OData APIs. Once the interviewers are assigned on the Candidate Workbench in SAP SuccessFactors Recruiting user interface, you can use the `JobApplicationInterview` entity.

The `JobApplicationInterview` entity supports field level and row level permissions. If you aren't a part of the interview process, you can't view any information about the candidate (for example the candidate resume, attachments, whether the candidate is part of the interview or not).

Note that if competencies are deleted in the job requisition through the user interface, the deleted competencies aren't listed when you query a competency rating record for users.

Permissions

By default, only the assigned interviewers of a job application can read or edit the permissioned fields in `JobApplicationInterview` entity.

Admin Permissions

The following role-based permissions allow admin users to read or edit all fields in `JobApplicationInterview` entity:

- ▶ [Manage Permission Roles](#) ▶ [Recruiting Permissions](#) ▶ [OData API Application Export](#) ▶
- ▶ [Manage Permission Roles](#) ▶ [Recruiting Permissions](#) ▶ [OData API Application Export](#) ▶
- ▶ [Manage Permission Roles](#) ▶ [Recruiting Permissions](#) ▶ [OData API Application Update](#) ▶
- ▶ [Manage Permission Roles](#) ▶ [Recruiting Permissions](#) ▶ [OData API Interview Central Create/Update](#) ▶

Supported Operations

Query, Insert, Upsert, and Delete

Note

The current design of the Recruiting OData APIs doesn't allow you to update any property with a null value.

Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in ▶ [Admin Center](#) ▶ [API Center](#) ▶ [OData API Data Dictionary](#) ▶ or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
jobApplication	JobApplication	Job Application
interviewer	User	Interviewer
interviewNotes	Attachment	Interview Notes
interviewOverallAssessment	InterviewOverallAssessment	Interview Overall Assessment
resume	Attachment	Resume
jobRequisition	JobRequisition	Job Requisition

Navigation Property	Related Entity	Description
jobApplInterviewPermissionsNav	JobApplicationInterviewFieldControls	These field controls ensure that the applicant interview data like resume is accessed by the admin users or by assigned interviewers only. This property appears in the query response for only the assigned interviewer of a job application.

Use Case 1: Querying the Job Application Interview Details

This API fetches the interview details of a specific job application. The logged on user must either be an interviewer on the job application or an admin user to view the results.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>odata/v2/JobApplicationInterview(81L)?\$format=json

Response

```
{
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/JobApplicationInterview(81L)",
    "type": "SFOData.JobApplicationInterview"
  },
  "applicationInterviewId": "81",
  "templateType": "JOB_REQ",
  "notes": null,
  "endDate": null,

    "interviewNotes": {
      "__deferred": {
        "uri": "https://<api-server>/odata/v2/
JobApplicationInterview(81L)/interviewNotes"
      }
    }
  }
}

```

Use Case 2: Inserting Job Application Interview Data

Using this API, admin users can insert interview data for a particular job application. Nonadmin users have writeable permissions for only `notes` and `startDate` properties and they can insert or upsert values for these two properties only.

Operation	Insert
URI	https://<api-server>/odata/v2/JobApplicationInterview?\$format=json
Payload	<pre> { "...odata/v2/JobApplicationInterview", "type": "SFOData.JobApplicationInterview" }, "startDate": "/Date(1486795387000+0000)/", "templateType": "JOB_REQ", "candSlotMapId": null, "source": "INTERNAL", "applicationId": "141", "endDate": null, "recruitEventStaffId": null, "notes": null, "isTimeSet": null, "interviewer": { "__metadata": { "type": "SFOData.User" }, "userId": "mhoff1" } } </pre>

Error Codes

Error Codes	Descriptions
Property interviewer is invalid	If the Interviewer field isn't passed.
No row with the given identifier exists	If you upsert JobApplicationInterview when the applicationInterviewId does not exist.
Interview Assessment Feature isn't configured for current user's role and application status	When you insert/upsert JobApplicationInterview if the feature isn't enabled in that status.
Required property source is missing with the index 0	When you insert values apart from null and numeric values.
Required property userId is missing with the index 0	If you insert JobApplicationInterview with "userId": null

9.11.2.19.1 JobApplicationInterviewFieldControls

This entity provides a way to access all field permissions that are defined for the `JobApplicationInterview` entity. These field controls ensure that only the admin user or the interviewers of a job application can access interview details like resume.

Supported Operations

Query (You can't query this entity directly. You can only query by expanding the `jobAppInterviewPermissionsNav` navigation property from the `JobApplicationInterview` entity.)

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#)

➤ [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Field-Level Permission Values

Here's a list of possible values for field-level permissions:

- 0 = hidden: The property isn't visible on user interfaces.
- 1 = read-only: The property can't be changed.
- 3 = optional: The property may contain a null value (indicates writeable).
- 7 = mandatory: The property must contain a value (indicates writeable).

Use Case: Querying the Field Level Permissions

This API fetches the field level permissions for `JobApplicationInterview` entity. The `jobAppInterviewPermissionsNav` property is returned in the response only if the logged on user is a nonadmin user and is an assigned interviewer of the job application.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/JobApplicationInterview(10224)?\$format=json&\$select=jobAppInterviewPermissionsNav,applicationInterviewId,applicationId&\$expand=jobAppInterviewPermissionsNav</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/JobApplicationInterview(10224L)",
      "type": "SFOData.JobApplicationInterview"
    },
    "applicationInterviewId": "10224",
    "applicationId": "46625",

      "applicationInterviewId": 1,
      "interviewer": 1,
      "resume": 1,
      "templateType": 1,
      "notes": 3,
    }
  }
}
```

```

    "endDate": 1,
    "jobApplication": 0,
    "candSlotMapId": 1,
    "isTimeSet": 1,
    "source": 1,
    "jobAppInterviewPermissionsNav": null,
    "jobRequisition": 0,
    "interviewOverallAssessment": 1,
    "recruitEventStaffId": 1,
    "applicationId": 1,
    "interviewNotes": 1,
    "startDate": 3,
    "status": 1
  }
}
}

```

9.11.2.19.2 InterviewOverallAssesment

You can use this entity to pull competencies from the requisition and allow the interviewer to provide a numeric rating and comments on each competency.

Additionally, the interviewer can provide an overall thumbs up or thumbs down on the applicant, add overall comments, and possibly attach documents to their feedback. Note that interviewers can now attach additional interview notes like feedbacks or comments during an interview, in the InterviewOverallAssessment entity.

Permissions

Permission System	Required Setting

  }
]
```

Error Codes

Error Codes	Descriptions
Transaction synchronization is not active	When notes limit exceeds from 4000 characters in overall assessment.
null with the index 0	When there is no competency and perform update of overall assessment.
Bad Request: interviewRefId invalid with the index 0	If interviewRefId is invalid in overall assessment.
overallRating invalid with the index 0	If overallRating is invalid in overall assessment
Recruiting OData API Interview Central Create/Update permission in Admin Center is not enabled	When OData API Interview Central Create/Update permission is not enabled in overall assessment.
null with the index 0	When you provide different credential in OData for users, who don't have permission to update the overall assessment.
Job Requisition for the Overall Assessment is not found or deleted with the index 0	If you update overall assessment for deleted job requisition.
Required property type is missing	If you provide <i>type</i> as null.
Interview Central and Set up Interviewers Popup is not enabled in Provisioning	When the <i>Interview Central and Set up Interviewers Popup</i> is not enabled in Provisioning.
Required property source is missing with the index 0	When you insert values apart from null and numeric values.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

Related Information

[SAP Business Accelerator Hub: InterviewOverallAssessment](#)

9.11.2.19.3 InterviewIndividualAssessment

This entity allows interviewers to provide a set of feedback per applicant.

Even if two separate interviewers give feedback, only one set of competency ratings will be saved for each applicant. Additionally, once an interviewer has rated their candidates, changing the competencies, rating scale, or reverse scale option will cause the existing Interview Assessment forms to display incorrect data.

Error Codes

Error Codes	Descriptions
Required property type is missing	If you provide <i>type</i> as null.
Interview Central and Set up Interviewers Popup is not enabled in Provisioning	When the <i>Interview Central and Set up Interviewers Popup</i> is not enabled in Provisioning.
→ Remember As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.	
type invalid, with the index 0	If you provide <i>type</i> as competency, that is, small letters.
Job Requisition for the Overall Assessment is not found or deleted with the index 0	When you update individual assessment for deleted job requisition.
Required properties interviewOverallAssessmentId, refId, type are missing	When the required fields are missing in payload to update an individual assessment.

Error Codes	Descriptions
rating invalid, with the index 0	When an out of the range rating scale value is provided in the OData payload to update individual assessment. For example, if you provide "rating" as "6" in a rating scale of 1-5.
type invalid, with the index 0	When invalid type is mentioned in payload of individual assessment say "type": "COMPETENCY" in JDM2.0 instance.
null with the index 0	When a wrong id entered in URL.
unknown property test for InterviewIndividualAssessment	When an invalid field is used in the payload to update an individual assessment.
For input string: "invalidId"</	When an invalid refId value is used in the payload to update an individual assessment entity.
type invalid, with the index 0	When an invalid type is used in the payload to update an individual assessment entity.
invalid, with the index 0	When an invalid interviewOverallAssessmentId value is given in the payload to update individual assessment entity
rating has invalid number format with the index 0	When an invalid rating value is provided in the payload to update an individual assessment entity. For example, <i>rating</i> <one>.

9.11.2.19.4 Function Import

9.11.2.19.4.1 refreshInterviewAssessments

You can use this Function Import to create Individual Interview Assessments for competencies in the job requisition.

If job requisition's competencies are updated after an interview is scheduled using JobApplicationInterview Odata API entity, refresh the InterviewIndividualAssessments entity to rate the updated job requisition's competencies.

Operations Allowed

Operation	Description
POST	Create Interview Individual Assessments for competencies added to Job Requisition.

Parameters

Parameter	Description	Type
JobReqId	Provides the job requisition Id against the competencies that were updated.	Long

Use Case

API Call	Description
<code>https://<api-server>/odata/v2/refreshInterviewAssessments?jobReqIdParam=<jobReqId></code>	Create Interview Individual Assessments for competencies added to Job Requisition

Response

```
{
  "d": [
    {
      "status": "Success",
      "message": "Competencies Refreshed successfully"
    }
  ]
}
```

Error Codes

Error Codes	Description
FunctionImport InterviewOverallAssessment doesn't exist in meta data!	InterviewOverallAssessment Id is not provided in the PUT URL in overall assessment.

9.11.2.19.4.2 sendEmailToInterviewers

You can use this entity to send email to interviewers so that they are aware of the interviews that are setup for them.

Supported Operations

Operation	Supported
QUERY	No
UPSERT	No
INSERT	No
MERGE	No
REPLACE	No
DELETE	No

Parameters

Parameter	Description
applicationId	[mandatory] The application id for which the associated interviewers need to send the mail.
interviewers	[optional] The list of interviewers who has to receive the invite mail.
attachResume	[optional] Possible values true or false. To indicate whether to attach the resume while sending the invite email.
attachCoverLetter	[optional] Possible values true or false. To indicate whether to attach the cover letter while sending the invite email.
attachInterviewGuide	[optional] Possible values true or false. To indicate whether to attach the interview guide while sending the invite email.
hiringManagerNote	[optional] A note from hiring manager to the interviewers.

Use Case

Operation	POST
-----------	------

Response

Success

Sample Code

```
{
  "d": [
    {
      "status": "Success",
      "users": "cgrant1,athompson1"
    }
  ]
}
```

Failure

Sample Code

```
{
  "d": [
    {
      "status": "Error",
      "message": "Failed due to application error"
    }
  ]
}
```

9.11.3 Candidate

9.11.3.1 Candidate and CandidateBackground_*

These entities represent the candidates in Recruiting module that include core candidate profile data, attachments (including resume and cover letter), background elements, application status, comments and data privacy setting information.

The candidate entity contains core application data consisting of system, standard and custom fields. The metadata shows the standard and custom fields configured in the active template. If a field (standard or custom) is not configured in the template, then it will not show up in the metadata and not be a part of OData query. The system fields will always show up. This entity isn't effective dated.

Note

- The entity cannot be filtered or sorted by the non-reportable custom fields. Reportable custom fields should be available within the entity and the entity can be sorted/filtered using the reportable custom fields.

- The system fields will always show up in the metadata irrespective of the template definition.
- Only external candidates can be created (internal can be updated or exported).
- The gender column automatically gets expanded, and returns the value when you query a GET operation on the Candidate entity. Note that you need not specify this column in the expand clause.

CandidateBackground_* entities represent the background elements as defined in the candidate template. For example: CandidateBackground_Certificate, CandidateBackground_Education etc. These entities aren't effective dated.

→ Tip

Note that while working with fields of data type **Attachment**, the Base64 encoding is used. So when you run OData API operations, such as CREATE and UPSERT, to import candidate documents, ensure that the proper encoding of the entire file is used in the OData API payload, and not just the file content. For the list of the supported file types, refer the [Candidate Attachments](#) section in the Recruiting Management Implementation handbook.

Supported Operations

Query, Upsert

ⓘ Note

- DELETE operation is not supported for Candidate, CandidateLight, and the associated child entities.
- The current design of the Recruiting OData APIs doesn't allow you to update any property with a null value.

Properties

Standard and custom fields show up based on the template definitions. Refer to OData API Data Dictionary for the latest information on entities.

Candidate Properties

Property Name	Description
address	Street Address
anonymized	<p>Anonymized Flag</p> <p>The <code><anonymized></code> field contains a numeric value, as follows:</p> <ul style="list-style-type: none"> 0 - Non-Anonymized. Candidate Profile and Application are available. 1 - Anonymized. Candidate Profile is deleted and Application is anonymized. 2 - Marked for anonymization by Data Privacy Consent Statement (DPCS) declined status. DPCS is declined/Candidate Profile is no longer available in the system and Application is marked for anonymization. 3 - Marked for anonymization by admin delete action. Administrator deleted the candidate profile/Candidate Profile is no longer available in the system and Application is marked for anonymization. 4 - Marked for anonymization by candidate delete action. Candidate deleted their profile/Candidate Profile is no longer available in the system and Application is marked for anonymization.
anonymizedDateTime	Anonymized Date Time
candidateId	Candidate ID. This field is required for all scenarios except external candidate creation.
candidateLocale	Candidate Locale
cellPhone	Primary Phone
city	City
contactEmail	Contact Email
country	Country
creationDateTime	Creation Date
currency	Currency
custPrimaryPhone	Home/Other Phone
dataPrivacyId	Data Privacy ID
dateofAvailability	Date of Availability

Property Name	Description
externalCandidate	External Candidate
firstName	First Name
gender	Gender
homePhone	Personal Mobile Phone
lastLoginDateTime	Last login date
lastModifiedDateTime	Last Modified Date
lastName	Last Name
middleName	Middle
minAnnualSal	Minimum Annual Salary
partnerMemberId	Partner Member ID
partnerSource	Partner Source
privacyAcceptDateTime	Privacy Acceptance Date
primaryEmail	Primary Email
publicIntranet	Public Intranet
state	State/Province
usersSysId	Users sys ID
visibilityOption	Visibility Option
workMobilePhone	Work Mobile Phone
zip	Postal Code
password	Password. Not available to query. Create and update only.
shareProfile	<p>Profile visibility.</p> <p>You can set the candidate profile visibility using shareProfile property based on the requirement of the recruiter. The <code><shareProfile></code> field contains a numeric value, as follows:</p> <ul style="list-style-type: none"> • 0 - Any company recruiter in my resident country. • 1 - Any company recruiter worldwide. • 2 - Only recruiters managing jobs I applied to.

Property Name	Description
agreeToPrivacyStatement	Agreement for privacy statement. Not available to query. Create and update only.

Note

The `agreeToPrivacyStatement` property can't be updated to the same value (for example, if `agreeToPrivacyStatement` is true and we try to update it to True again), because candidates can't accept the same Data Privacy Consent statement multiple times unless there is an update.

CandidateComments Properties

Property Name	Description
associatedCommentId	Associated Comment ID
associatedId	Associated ID
commentId	Comment ID
commentator	Commentator
content	Content
hasAssociatedComment	Has Associated Comment
migratedCommentatorUserName	Migrated Commentator User Name
refId	Reference ID
refType	Reference Type

CandidateTags Properties

Property Name	Description
label	Label
locale	Locale
tagId	Tag ID

Navigation Properties

Candidate Navigation Properties

Additional Information

This entity contains core candidate profile data, that is system, standard, and custom fields. The metadata contains the standard and custom fields configured in the active template. If a standard or custom field is not configured in the template, then it is not included in the metadata and not included in the oData query. System fields, however, are always included in the metadata. Compared to the existing Candidate entity, it provides exactly the same functionality but with the advantage of fewer mandatory fields to make validation quicker.

Related Information

[SAP Business Accelerator Hub: CandidateLight](#)

9.11.3.7 CandidateProfileConversionInfo

To support data privacy and protection compliance in information reporting, you can use this API and the field `isAlumni` to determine if end users can search for the candidate. When the value of this field is YES, the GDPR Pre-Privacy Center External Candidate search widget allowing end users to look for candidates can be used. The value of this field is determined from the existing Candidate OData API in the table `RCM_CAND_PROFILE_CONVERSION`.

  }
}
```

9.11.3.8 CandidateProfileExtension

You can use this entity to query, insert, and upsert candidate data that will remain hidden from the candidate. This entity can be used in RCM, RMK, and CRM but as it hides data from the candidate, you find it most useful in CRM scenarios.

Permissions

API Permissions

Permission System	Required Settings
Role based	User Permissions > MDF Recruiting Permissions > Here you can maintain View, Edit, and Import/Export permission as well as the Field Level Overrides of MDF object CandidateProfileExtension (default label: Candidate Relationship Information)>

Supported Operations

          }
        }
      }
    ]
  }
}
```

Use Case: Create CandidateProfileExtension Object for Candidate with Candidate ID “2” in JSON Format

HTTP Method

POST

URI

https://<api-server>/odata/v2/
CandidateProfileExtension?\$format=json

Payload

Sample Code

```
{
  "__metadata": {
    "uri": "<api-server>/odata/v2/CandidateProfileExtension",
    "type": "SFOData.CandidateProfileExtension"
  },
  "candidateId": "2",
  "cust_comment2": "Great candidate",
  "cust_field": null,
  "cust_comment": "null"
}
```

Additional Information

You'll mainly find this entity useful in integration scenarios, especially when starting to use Candidate Relationship Management in addition to Recruiting Management. This entity contains additional candidate profile data that includes system and standard fields. Depending on the configuration of the Metadata Framework object, Candidate Profile Extension (Default label: Candidate Relationship Information), some or perhaps the majority of the fields are custom fields. The Metadata Framework object, Candidate Profile Extension, appears in the Candidate Relationship Management Profile UI as well as in the Candidate Profile UI (assuming that this UI is permitted for Recruiting Operators only).

    "fileName": "resume.txt"
  }
}
```

9.11.4 Job Offer

9.11.4.1 JobOffer

The `JobOffer` entity contains core offer data that consist of system, standard, and custom fields.

Note

- The entity can't be filtered or sorted by the nonreportable custom fields. Reportable custom fields must be available within the entity and the entity can be sorted or filtered using the reportable custom fields.
- The system fields always appear in the metadata regardless of the template definition.

- A JobOffer can only be edited when it is in the “draft” or “rejected” status. It can't be edited when it is in the “pending” status. Editing a Job Offer generates a new version of this entity with a new Id. All versions of the JobOffer appear in query operations without any ID or based off the application ID.
- The JobOffer entity inherits some fields from JobApplication and from Job Requisition. These fields defined on the offer template in Provisioning. They're initially filled with its inherited value, and keep these values if not edited or changed during the creation operation.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

The entity can't be filtered or sorted by nonreportable custom fields. Reportable fields are available within the entity, and are sorted or filtered using reportable custom fields.

If two custom fields with the same field ID are defined in two different templates, then the metadata shows:

- One field in the metadata when the default label and field type are the same.
- One field in the metadata with two labels that's comma-separated, when the labels are different.
- The `internalStatus` field type appears as a string in the metadata.

Numerical Value	Mapped to
0	Job offer approval that's in draft status.
1	Job offer approval that's in pending status.
2	Job offer approval that's in completed status.

System fields always show up in the metadata regardless of the template definitions.

      }
    ]
  }
}

```

Use Case 2: Create New Offer with Attachment

Create a new job offer with an attachment.

In the following example, admin users with the *OData API Offer Approval Create* permission can create a new job offers with an attachment.

Operation	Insert
HTTP Method	POST
URI	https://<api-server>/odata/v2/JobOffer(13244L)?\$format=json
Payload	<pre>Sample Code { "applicationId": "544", "templateId": "2032", "firstName": "Jesse", "lastName": "Kendall1", "custAttachment": [{ "__metadata": { "uri": "https://<api-server>/ odata/v2/Attachment", "type": "SFOData.Attachment" }, "fileName": "demo-file1.txt", "module": "RECRUITING", "viewable": true, "fileContent": "ZmlsZTE=\r\n", "ownerIdType": "NOT_PROVIDED", "ownerId": "shared" }] }</pre>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/JobOffer(265L)",
      "type": "SFOData.JobOffer"
    },
    "applicationId": "544",
    "templateId": "2032",
    "firstName": "Jesse",
    "lastName": "Kendall1",
    "offerApprovalId": "265",
    "custAttachment": {
      "__metadata": {
        "uri": "https://<API-Server>/odata/v2/Attachment",
        "type": "SFOData.Attachment"
      },
      "fileName": "demo-file1.txt",
      "module": "RECRUITING",
      "viewable": true,
      "fileContent": "ZmlsZTE=\r\n",
      "ownerIdType": "NOT_PROVIDED",

```

```
    "ownerId": "shared"
  }
}
```

Use Case 3: Upload and Associate Attachment for Draft Offer

Upload an attachment using the *upsert* operation for existing offer for the *multiattachmentsselection* field type that associates it with the Job Offer.

Request

Operation	UPSERT
HTTP Method	POST
URI	<code>https://<api-server>/odata/v2/upsert?\$format=json</code>
Payload	

Sample Code

```
{
  "__metadata": {
    "uri": "https://<api-server>/odata/v2/
JobOffer(1526L)",
    "type": "SFOData.JobOffer"
  },
  "customMultiattachmentsselection": [
    {
      "__metadata": {
        "uri": "https://<API-SERVER>/
odata/v2/Attachment",
        "type": "SFOData.Attachment"
      },
      "fileName": "CarriesTestDoc.doc",
      "module": "RECRUITING",
      "viewable": true,
      "fileContent": "base64 encoded file
content",
      "ownerIdType": "NOT_PROVIDED",
      "ownerId": "shared"
    }
  ]
}
```

Response

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPDATED",
      "message": "Job Offer has been updated successfully",
      "index": 0,
      "httpCode": 204,
      "inlineResults": [
        {

```

```
"inlineProperty": "customMultiattachmentselection",
"results": [
  {
    "key": "Attachment/attachmentId=8238",
    "status": "OK",
    "editStatus": "UPSERVED",
    "message": "Upserted successfully",
    "index": 0,
    "httpCode": 200,
    "inlineResults": null
  }
]
}
```

Use Case 4: Linking Attachment with Job Offer

You can associate a reusable attachment with a draft offer approval for the multiattachmentselection field data type.

Request

Operation	Query
HTTP Method	POST
URI	https://<api-server>/odata/v2/JobOffer(1526L)/\$links/customMultiattachmentselection?\$format=json
Payload	<pre>{ "uri": "Attachment(8280L)" }</pre>
Response: No data appears here.	

Use Case 4: Deleting Attachment from Job Offer

You can remove or delete an attachment for the multiattachmentselection data type from a specific job offer approval.

Request

Operation	Query
HTTP Method	DELETE

URI `https://<API-SERVER>/odata/v2/JobOffer(1526L)/$links/customMultiattachmentselection(8240L)?$format=json`

Payload Data doesn't appear in the payload.

→ Remember

The *Delete* Operation or *DELETE* HTTP method is supported for `multiattachmentselection` data type only for the `JobOffer` entity. The *Delete* isn't supported for `JobOffer` entity.

Use Cases

API Call	Operation	Description
<code>/odata/v2/OfferApprover(221)</code>	GET	Get the offer approver with id 221.
<code>/odata/v2/OfferApproval(191)</code>	GET	Get the offer approval detail with id 191.
<code>odata/v2/JobApplication('601')?\$expand=jobOffer/approvers/offerApproval</code>	GET	Get the list of offer approvals for the Job Application with applicationId 601.
<code>odata/v2/JobApplication('601')?\$expand=jobOffer/approvers</code>	GET	Get the offer approver list for the Job Application with applicationId 601.
<code>/odata/v2/JobApplication(601L)/offerApproval(191)/approvers</code>	GET	Get the offer approver list from Offer Approval 191 from Application ID 601.
<code>/odata/v2/approveOffer?applicationId=601L&comment='None'</code>	GET	The import function works to approve a candidate based on application id. To execute the action, the "application id" and "comment" parameters are required.
<code>/odata/v2/declineOffer?applicationId=601L&comment='None'</code>	GET	The import function works to decline an application offer based on application id. To execute the action, the "application id" and "comment" parameters are required.
<code>/odata/v2/sendOfferForApproval?applicationId=601L</code>	GET	This function sends an Offer in the "Draft" stage for approval to the approvers. To execute this action, the "application id" parameter is required.

Error Codes

Error Code	Description
<i>Permission not enabled(not a specific code)</i>	OData API Candidate <editType> permission in Admin Center isn't enabled.

Function Imports

Function Imports	Parameters	Return type	Description
approveOffer	applicationId (long) comment (String)	XML	The function import makes action to approve a candidate based on application id. To execute the action two parameters are required: application id and comment.

Note

- You need approve the application offer in a specific order. The order is defined on approver list in the offer application.
- You need this application in an "offer" status.
- At a time, one approver can execute the action "approve".
- The application will change to status "completed" only after all approvers approve it, meantime the status is "pending".

Request Sample:

- Get the application, where the id 601 and make an approve action.
- Operation: GET

.../odata/v2/approveOffer?applicationId=601L&comment="

.../odata/v2/approveOffer?applicationId=601L&comment='None'

Function Imports	Parameters	Return type	Description
			<p>Error expected:</p> <ul style="list-style-type: none"> • SCA Error(not a specific code): Unable to decline offer due to an SCA Error. • Wrapped Ex(not a specific code): Unexpected error occurred and the e-mail to Candidate couldn't be sent: <error> • User isn't a valid approver(not a specific code): User <field> isn't an approver for this offer.

Function Imports	Parameters	Return type	Description
declineOffer	applicationId (long) Comment (String)	XML	<p>The function import makes action to decline an application offer based on application id. To execute the action two parameters are required: application id and comment.</p> <div data-bbox="1136 525 1425 928" style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px;"> <p>Note</p> <ul style="list-style-type: none"> You can decline an application offer only in your turn. Only one approver of the approvers list needs decline. Even if other approver approves, you can decline. </div> <p>Request Sample:</p> <ul style="list-style-type: none"> Get the application, where the id 601L and make a decline action. Operation: GET <pre>.../odata/v2/declineOffer?applicationId=601L&comment=""</pre> <pre>.../odata/v2/declineOffer?applicationId=601L&comment='None'</pre> <p>Error expected:</p> <ul style="list-style-type: none"> SCA Error(not a specific code): Unable to decline offer due to an SCA Error. Wrapped Ex(not a specific code): Unexpected error occurred and the e-mail to Candidate couldn't be sent: <error> User isn't a valid approver(not a specific code): User <field> isn't an approver for this offer.

Pre-Defined Approvers Scenarios

Note

- The default behavior of the command is when you execute the `UPDATE` action, the approvers to the payload substitutes the approvers on that offer. All approvers must be on the `UPDATE` payload.
- When the template has predefined approvers, the approvers of the template are pulled out and set as current values unless you set approvers into the payload.

- When `"editable="true"` and `"reorder="true"`

When having predefined approvers on the template, the following behaviors must also be on `INSERT`, the template approvers is added in the beginning of the approver order. Ad-hoc approvers can be sent on `INSERT` payload, and they'll be put after the approvers from the template. The template approvers don't need to be on the payload. If a group type is defined, the user must inform it on the payload, with the id of the approvalStep on the property `"approvalStepId"`.

On `INSERT` with the flag `"redefineTemplateApprovers"="true"`, the approvers on the payload are the ones inserted, ignoring the ones loaded from the template. The user can add a template approver in the payload, with its respective approvalStepId, in any order it desires.

On `UPDATE`, one can reorder the approvers, remove, or add ad-hoc ones; all approvers must be on the payload, including the ones from the template with their respecting approvalStepId. Otherwise, the approvers from template that aren't in the payload is removed from the offer approval.

- When `"editable="true"` and `"reorder="false"`

On `INSERT`, the behavior is the same as the previous case. Template approvers are first, and then ad-hoc approvers set on the payload. In addition, the user can send a payload without approvers; in this case, only the approvers from the template are set. If a group type is defined, the user must inform it on the payload, with the id of the approvalStep on the property `"approvalStepId"`.

On `INSERT` with the flag `"redefineTemplateApprovers"="true"`, the behavior is the same as the previous case, except that the order of the template approvers must be maintained. One can add ad-hoc approvers even between the template ones, but can't change the order of the predefined approvers.

On `UPDATE`, it isn't possible to reorder the approvers, but one can add or remove ad-hoc approvers. The template approvers must be in the correct order in the payload.

- When `"editable="false"` and `"reorder="true"`

On `INSERT`, only the template approvers are set. If a group type is defined, the user must inform it on the payload, with the id of the approvalStep on the property `"approvalStepId"`. Ad-hoc approvers on the payload are ignored.

On `INSERT` with the flag `"redefineTemplateApprovers"="true"`, the approvers on the payload are the ones inserted, ignoring the ones loaded from the template. The user must add all template approvers in the payload, as they can't be deleted, with its respective approvalStepId, in any order it desires. Ad-hoc approvers are ignored.

On `UPDATE`, they can be reordered, but none of them can be removed. On `UPDATE` payload, if one wants to reorder the approvers, they all must be on the payload with its respective approvalStepId.

- When `"editable="false"` and `"reorder="false"`

On `INSERT`, only the template approvers are set. If a group type is defined, the user must inform it on the payload, with the id of the approvalStep on the property `"approvalStepId"`.

On `INSERT` with the flag `"redefineTemplateApprovers"="true"`, the approvers on the payload are the ones inserted, ignoring the ones loaded from the template. The user must add all template approvers in the payload, as they can't be deleted, with its respective approvalStepId, in any order it desires. The ad-hoc approvers are ignored.

On UPDATE, all template approvers must be in the payload, with their respective approvalStepIds, in the order set on the template.

The default-user "type" attribute.

- **Based on Role**
When `editInvalidUser` is set to true, another recruiting user can appear in the payload with the `approvalStepId` as part of this step, otherwise it's set to the recruiting user that's predefined in the template. When `editInvalidUser` is set to false, error message appears.
This user is set as an approver on the creation of the offer and can change when using the UPDATE or INSERT operations when the `redefineTemplateApprovers` flag set to true. For a recruiting user that's not an approver of that offer, their role is predefined in the template.
- **Based on Recruiting Group**
INSERT payload can have a single recruiting user that has the `approvalStepId` to the recruiting group that they belong under, or they won't appear. If that recruiting user isn't in the recruiting group, error message appears.
- **Based on User**
The user set on the template must be a valid user, otherwise, if `editInvalidUser` is set to true, another user can be sent on the payload with the `approvalStepId` of this step; if `editInvalidUser` is set to false, an error occurs.

9.11.4.2 JobOfferFieldControls

This entity provides a way to access all fields permission defined in the offer details template, for the operator role associated with login user. This entity holds each field control permission for all the fields defined in the respective offer details template. It helps in accessing field control permission for the login user through OData and doesn't support insert, update, upsert, delete.

Field-level Permissions

API permissions that the logged in user has for fields for all offer detail templates with these values:

Numerical Value	Mapped to
0	hidden: property isn't visible on user interfaces.
1	read-only: property can't be changed.
3	optional: operation is writeable and contains null values.

Numerical Value	Mapped to
7	mandatory: property is writeable, must contain a value.

Supported Operations

Operation	Description
Query	Yes (Only through Expand clause of JobOffer entity)

Use Case: Querying the Field-level Permissions for a Specific User

This API fetches the field-level permissions for a specific user who triggers API request against JobOffer entity.

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/JobOffer(12086L)? \$format=json&\$expand=jobOfferPermissionsNav

```

9.11.4.3 JobOfferApprover

This entity represents the approvers of the Job Offer.

📌 Note

- A JobOffer can have pre-defined approvers configured in the template file in Provisioning.

→ Remember

As a customer, you don't have access to Provisioning. To complete tasks in Provisioning, contact your implementation partner or Account Executive. For any non-implementation tasks, contact Product Support.

- The approver order is defined at the moment of creation or when you update the Job Offer. The first approvers are the pre-defined approvers, the approvers that follow are the ad-hoc approvers, who are manually defined in the payload. When the `redefineTemplateApprovers` flag is set to true, then the order in the payload is respected, as well as in an update.
- The job offer approval action is only approved if all approvers have approved the request.
- The approver can only approve or decline an offer according to the predefined order for approvers.
- If one approver declines the offer, the entity's status is automatically changed to 'rejected'. This is independent of the response of other approvers.

Related Information

[SAP Business Accelerator Hub: JobOfferApprover](#) 

9.11.4.4 JobOfferTemplate_<Template>

This entity contains information for a job offer template. For each offer detail template available, an entity is created. This is to help you check which fields are required on a specific template when you are creating a job offer through the Odata API. These entities do not support any operation and are only available on the metadata and in the Admin Center under the "Odata API Dictionary" page. The entity is named using the "JobOfferTemplate_" prefixed to the name of the template (For example, JobOfferTemplate_Custom).

9.11.4.5 OfferLetter

The OfferLetter entity represents the offer letter of the application in SAP SuccessFactors Recruiting, which includes building a letter from a predefined template, reading it, and sending it to the applicant.

The OfferLetter entity contains core data consisting of system fields. The system fields will always be present in the metadata.

Note

- To read, export, or create an offer letter, the API User needs to be granted special permissions for read operations and create operations in the Admin Center.
- The OfferLetter entity requires only the following three fields in the payload to create and send a full offer letter:
 - `applicationId` – to retrieve data from Candidate, jobRequisition, and jobApplication. The destination email address comes from candidate email information.
 - `templateId` – to retrieve data from the special template (create exclusively on the user interface). This data contains information about the predefined offer body, template Id, and Name, and email subject.
 - `sendMode` – the modes are "email", "emailaspdf", "print", "verbal", and "pending". The "pending" mode is a special mode for a functionality made specifically for the API (if events occur that differ from user interface behavior). When this mode is selected, the offer letter creation command is prevented from automatically sending an email.
- If an offer letter is created with the `sendMode` as "pending", the offer letter is then stored on the database normally. You can then read and revise this offer letter. Use the function import "sendMailOfferLetter" when it's ready to be sent.
- Sending an offer letter generates a new version of this entity with a new Id. All versions of the OfferLetter will be listed on query operations without a specific Id.
- If you use the function import "sendMailOfferLetter" to send the OfferLetter, the current version will be updated. This action affects some fields, like `sendDate` and `sendMode`.

Permissions

Permission System	Required Setting
Role-based	▶ Recruiting Permissions > OData API Offer Letter Export >
	▶ Recruiting Permissions > OData API Offer Letter Create >

Operations Allowed

Operation	Description
GET	Read OfferLetter operation for the above entities is supported in the Q2 2016 release.
POST	Insert operations for OfferLetter are supported in Q2 2016 release. For this entity, the update operation does not apply.

Note

The current design of the Recruiting OData APIs doesn't allow you to update any property with a null value.

Required Fields

Specify the offerLetterId for Offer Approval Entity as the business key.

Properties

Property Name	Description

"RCMAdminReassignOfferApprover(offerDetailId= 301 , applicationId = 2361,
currUserId = 'athompson1')",
      "type":
"SFOData.RCMAdminReassignOfferApprover"
    },
    "targetUserId": "cgrant1",
    "jobReqId" : 1781,
    "candidateName" : "Sample"
  }
]
```

Sample Code

Successful Upsert

```
{
  "d": [
    {
      "key": null,
      "status": "OK",
      "editStatus": "UPSERTED",
      "message": "Successfully updated the data",
      "index": 0,
      "httpCode": 200,
      "inlineResults": null
    }
  ]
}
```

In case the upsert is not successful, you will get the following response:

Sample Code

Unsuccessful Upsert

```
{
```

```
"d": [
  {
    "key": null,
    "status": "ERROR",
    "editStatus": null,
    "message": "Offer Approver Reassignment for ApplicationId :461 failed with
the index 0",
    "index": 0,
    "httpCode": 500,
    "inlineResults": null
  }
]
```

9.11.6 OData and Rules

You can trigger Recruiting business rules using the OData V2 APIs.

Use the following operations and triggers:

For rules related to...	You can use these OData operations	And this rule triggers
Job Requisitions Candidate Profile Job Applications Job Offer	Insert, Upsert	OnSave

Note

This includes batch inserts and upserts.

Related Information

[Business Rules in Recruiting](#)

9.11.7 Function Import

9.11.7.1 inviteToApply

You can use this Function Import to change the status of non-applicants from “Forwarded” status to “Invited to Apply” status for a specific job requisition. The candidates will receive an email requesting them to apply for the job.

Supported Operations

Operation	Description
POST	Change the status of a non-applicant from “Forwarded” status to “Invited To Apply” status for a specific job requisition.

Parameters

Parameter	Description	Type
wfRequestID	A number which ends with L that uniquely identifies the workflow request. For example, wfRequestID: 2345L	Long
comment	Provides extra information about the workflow item. For example, Comment: “Verbal check also required”.	String

Use Case

API Call	Description
<code>http://<api-server>/odata/v2/inviteToApply?jobReqId=1234L&candidateIds='1031,1006'</code>	Change the status of a non-applicant from “Forwarded” to “Invited To Apply” status

Code Examples

```
<d:InviteToApplyResponse
  xmlns:d="http://schemas.microsoft.com/ado/2007/08/dataservices"
  xmlns:m="http://schemas.microsoft.com/ado/2007/08/dataservices/metadata">
  <d:element m:type="SFOData.InviteToApplyResponse">
    <d:candidateId>1031</d:candidateId>
    <d:message>You have successfully invited Alex Anderson to apply to this
job.</d:message>
    <d:status>Success</d:status>
  </d:element>
  <d:element m:type="SFOData.InviteToApplyResponse">
    <d:candidateId>1006</d:candidateId>
    <d:message>You have successfully invited Angela Arnold to apply to this
job.</d:message>
    <d:status>Success</d:status>
  </d:element>
</d:InviteToApplyResponse>
```

9.11.7.2 setSmsNotificationPreference

You can use this function import to enable or disable SMS preferences for a candidate. Enabling or disabling SMS preferences with this function import sets or removes the candidate cell phone number details.

Supported Operations

HTTP Method: POST

Return Type: string

Support Payload: false

Parameters

Parameter	Type	Value
optIn	boolean	User preference to opt in (true) or opt out (false) for receiving SMS notifications
candidateId	long	Candidate ID
isoCountryCode	string	A three-letter country code that represents a country or a region. For example, USA
cellPhone	string	Cell phone number

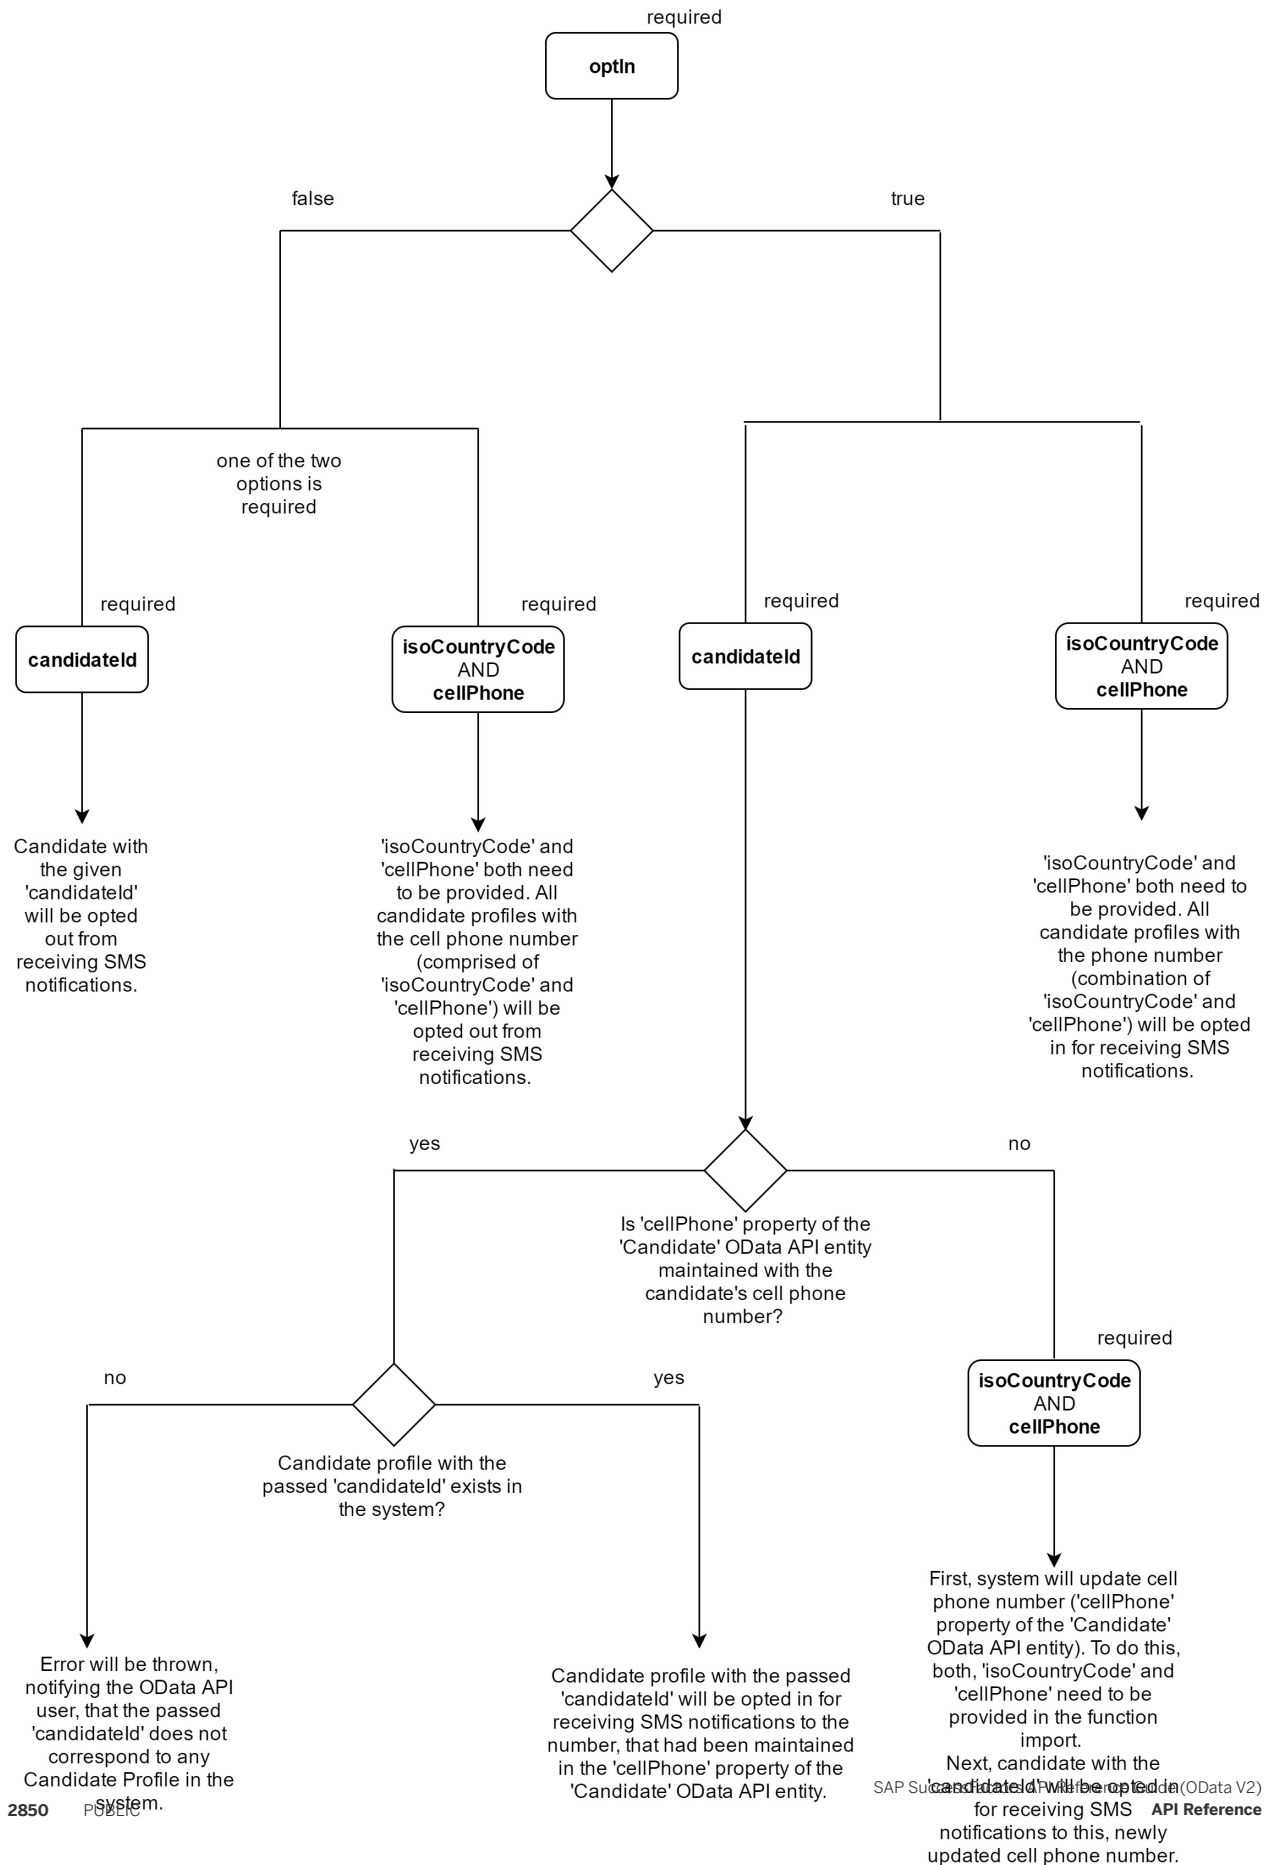

Enable or Disable SMS Preferences for Candidate

Request Information

Operation	POST
URI	<pre>https://<api-server>/odata/v2/ setSmsNotificationPreference? optIn=<optinPreference>&candidateId=<candi date Id>&phoneCountryCode=<country/region code of cell phone>&cellphone=<Cell Phone Number></pre>

Additional Information

This imports modifies the Candidate entity. More information is available in this topic: [Candidate and CandidateBackground_* \[page 2777\]](#)

9.11.7.3 getJobReqApprovalActions

Using this Function Import, you can now view all the available job requisition actions on a form for a formDataId on a mobile.

Supported Operations

Operation	Description
QUERY	

Parameters

Parameter	Description	Type
formDataId	A number which ends with L that uniquely identifies the formDataId. For example, formDataId: 2345L	Long
userSysId	A string that identifies the userSysId For example, userSysId: "cgrant".	

9.11.7.4 getOfferLetterTemplate

You can use this function import to get ID of the offer letter templates.

Supported Operations

Query

Parameters

Parameter	Data Type	Required/Optional	Description
templateName	string	Required	The exact name of the template for which the ID is requested. This field is case sensitive.
templateType	string	Required	Following are the expected values for templateType field: <ul style="list-style-type: none">OFFER_LETTEROFFER_LETTER_EMAIL_BODY This field is case sensitive.

Use Case: Get Template ID

Get template id by passing the template name and template type as parameters.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/getOfferLetterTemplate?&templateType='OFFER_LETTER_EMAIL_BODY'&templateName='Final Interview Schedule'&\$format=json</code>

Response

```
{
  "d": {
    "getOfferLetterTemplate": "[{id=4208, name=Final Interview Schedule,
description=Recruiting Candidate Email Template, locale=en_us}]"
  }
}
```

9.11.7.5 getRecruitingTemplate

You can use this function import to get the ID of a recruiting template.

Supported Operations

Query

Parameters

Parameter	Data Type	Required/Optional	Description
templateName	string	Required	The exact name of the template for which the ID is requested. This field is case sensitive.
templateType	string	Required	Following are the expected values for templateType field: <ul style="list-style-type: none">• JOBREQ• CANDIDATE• JOBAPP• JOBOFFER This field is case sensitive.

Use Case 1: Get Template ID

Get the template ID by providing the templateType and templateName.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/getRecruitingTemplate?&templateType='JOBREQ'&templateName='Standard Job Requisition'&\$format=json</code>

Response

```
{
```

```
"d": {
  "getRecruitingTemplate": "[{id=23, name=Standard Job Requisition,
description=Standard Job Requisition, locale=en_us}]"
}
```

9.11.7.6 sendOfferForApproval

You can use this function import to send out draft offers for approval.

Supported Operations

HTTP Method: GET

Return Type: String

Support Payload: false

Parameters

Parameter	Data Type	Required/Optional	Description
applicationId	long	Required	The application ID that's associated with the draft offer approval. This is a mandatory parameter that you must pass in the URI.

Use Case: Send a Draft Offer for Approval

You can send a draft offer for approval.

Request

HTTP Method	GET
URI	https://<api-server>/odata/v2/sendOfferForApproval? applicationId=124L

Response

```
{
  "d": {
```

```
    "sendOfferForApproval": "Offer successfully sent for approval."
  }
}
```

Error Response:

```
{
  "error": {
    "code": "ERROR",
    "message": {
      "lang": "en-US",
      "value": "Offer is not in draft state."
    }
  }
}
{
  "error": {
    "code": "INCORRECT_PARAMETER_ERROR",
    "message": {
      "lang": "en-US",
      "value": "Invalid application id."
    }
  }
}
```

Error Codes

Error Code	Description
INCORRECT_PARAMETER_ERROR	You receive this error when, <ul style="list-style-type: none">The Application ID is missing from the payload.The draft offer isn't available for the application.
ERROR	You receive this error code when the offer isn't in draft status.

9.11.7.7 sendMailOfferLetter

You can use this function import to send pending offer letters to a candidate.

Supported Operations

HTTP Method: GET

Return Type: String

Support Payload: false

Parameters

Parameter	Data Type	Required/Optional	Description
bodyLocale	string	Optional	The offer letter locale.
bodyTemplateId	long	Optional	The offer letter template ID.
offerLetterId	long	Required	The offer letter ID that's in pending status.
sendMode	string	Required	Two modes are accepted: <ul style="list-style-type: none">• email• emailaspdf

Use Case: Send Pending Offer to a Candidate

You can use this API call to send a pending offer to a candidate.

Request

HTTP Method	GET
URI	<code>https://<api-server>/odata/v2/sendMailOfferLetter?\$format=json&offerLetterId=4873L&sendMode=email&bodyLocale=en_us&bodyTemplateId=4142L</code> <code>https://<api-server>/odata/v2/sendMailOfferLetter?\$format=json&offerLetterId=4873L&sendMode=emailaspdf&bodyLocale=en_us&bodyTemplateId=4142L</code>

Response

```
{
  "d": {
    "sendMailOfferLetter": "Offer Letter has been sent successfully."
  }
}
```

Error Response

```
{
  "error": {
    "code": "INCORRECT_PARAMETER_ERROR",
    "message": {
      "lang": "en-US",
      "value": "The offer letter is not in pending state."
    }
  }
}
```

```

{
  "error": {
    "code": "INCORRECT_PARAMETER_ERROR",
    "message": {
      "lang": "en-US",
      "value": "The offer letter is not in pending state.Invalid send mode
for offer letter emailTest."
    }
  }
}
{
  "error": {
    "code": "MISS_REQUIRED_PARAMETER_ERROR",
    "message": {
      "lang": "en-US",
      "value": "offerLetterId required, "
    }
  }
}

```

9.12 Success Store

9.12.1 SuccessStoreContent

The SuccessStoreContent provides a single and simple way of accessing the content from the Success Store.

Permissions

Permission System	Required Setting
Role-based	Same as user permission for the Success Store module being accessed. If no permission is specified, normal provisioning user level permissions are applied.

Supported Operations

Operation	Description
Query	Query a SuccessStoreContent entity. This is the only operation that is currently permitted.

Note

If you don't specify the business key in a query, you must use the `contentType` properties as filter to return the result.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Property	Description
contentId	A unique Identifier given to each Content.
comments	Comments specific to the content.
publishOnDate	Publish date for the content.
expiryOnDate	Expiry date for the content.
customField	customField helps store any Content-specific Information. Some times you can avoid parsing entire content by knowing just this piece of information.
Domain	Domain helps to store any Content-specific Information. Some times you can avoid parsing entire content by knowing just this piece of information.
contentType	This column holds information about the type of content. for example, COMPENSATION, REVIEW etc.
Status	Status of Content. for example, Approved, Deleted etc.
wizardable	Whether the content is showable in wizard.
default_content	Whether the content is the default content in its category.
bestPractice	Whether the content is the best practice content in its category.
revisionNo	The revision number of the content.

Use Case 1: Query a SuccessStoreContent Entry by contentId

This example shows how to query all Success Store contents under content type [COMPETENCY_LIB](#).

Request

Operation	Query
HTTP Method	GET

URI `https://<API-Server>/odata/v2/SuccessStoreContent?
$filter=contentType eq 'COMPETENCY_LIB'`

Response

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
SuccessStoreContent(20171030L)",
          "type": "SFOData.SuccessStoreContent"
        },
        "contentId": "20171030",
        "comments": null,
        "customField": "Competency Library 2.1",
        "bestPractice": false,
        "expiryOnDate": null,
        "defaultContent": true,
        "publishOnDate": null,
        "domain": null,
        "defaultContentName": "Knjižnica usposobljenosti 2.1",
        "revisionNo": "1.0.0",
        "contentType": "COMPETENCY_LIB",
        "wizardable": true,
        "status": "Y",
        "contentData": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/
SuccessStoreContent(20171030L)/contentData"
          }
        }
      },
      <Similar results omitted>
      {
        "__metadata": {
          "uri": "https://<API-Server>/odata/v2/
SuccessStoreContent(20171031L)",
          "type": "SFOData.SuccessStoreContent"
        },
        "contentId": "20171031",
        "comments": null,
        "customField": "Biblioteka kompetencija 2.1",
        "bestPractice": false,
        "expiryOnDate": null,
        "defaultContent": true,
        "publishOnDate": null,
        "domain": null,
        "defaultContentName": "Biblioteka kompetencija 2.1",
        "revisionNo": "1.0.0",
        "contentType": "COMPETENCY_LIB",
        "wizardable": true,
        "status": "Y",
        "contentData": {
          "__deferred": {
            "uri": "https://<API-Server>/odata/v2/
SuccessStoreContent(20171031L)/contentData"
          }
        }
      }
    ]
  }
}
```

Use Case 2: Query an Entry by contentId

This example shows how to query a single Success Store content entry by specifying its content ID.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/SuccessStoreContent('2300003')</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/SuccessStoreContent(2300003L)",
      "type": "SFOData.SuccessStoreContent"
    },
    "contentId": "2300003",
    "comments": null,
    "customField": null,
    "bestPractice": false,
    "expiryOnDate": null,
    "defaultContent": false,
    "publishOnDate": null,
    "domain": null,
    "defaultContentName": "Development Plan",
    "revisionNo": "1.0.0",
    "contentType": "CDP",
    "wizardable": false,
    "status": "U",
    "contentData": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/SuccessStoreContent(2300003L)/contentData"
      }
    }
  }
}
```

Use Case 3: Query Success Store Content Data

The contentData navigation property contains the data of the Success Store content. You can query the data by expanding a SuccessStoreContent entry.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/SuccessStoreContent('2300003')/contentData</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/
SuccessStoreContentBlob('2300003')",
      "type": "SFOData.SuccessStoreContentBlob"
    },
    "contentId": "2300003"
  }
}
```

Use Case 4: Query the Latest Revision of an Entry

This example shows how to query the latest revision of a Success Store content entry using the `revisionNo` property as a filter.

Request

Operation	Query
HTTP Method	GET
URI	<code>https://<API-Server>/odata/v2/SuccessStoreContent('2300003')? \$filter=revisionNo eq '999'</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<API-Server>/odata/v2/SuccessStoreContent(2300003L)",
      "type": "SFOData.SuccessStoreContent"
    },
    "contentId": "2300003",
    "comments": null,
    "customField": null,
    "bestPractice": false,
    "expiryOnDate": null,
    "defaultContent": false,
    "publishOnDate": null,
    "domain": null,
    "defaultContentName": "Development Plan",
    "revisionNo": "1.0.0",
    "contentType": "CDP",
    "wizardable": false,
    "status": "U",
    "contentData": {
      "__deferred": {
        "uri": "https://<API-Server>/odata/v2/SuccessStoreContent(2300003L) /
contentData"
      }
    }
  }
}
```

Error Codes

Error Code	Description
COE_GENERAL_BAD_REQUEST	<ul style="list-style-type: none">Dependent attributes not specified in the query. For example, revisionNo is dependent on contentId and it must be specified when querying for revisionNo.Invalid content Type or contentId values.Required parameter contentType not specified..

9.13 Succession and Development

9.13.1 Career Development Planning

The APIs available for Career Development Planning facilitate the integration of Continuous Performance Management with the development goal plan. This integration allows users to link their activities and achievements to their development goals and to see them in their goal plan.

Permissions

API Permissions

Permission System	Required Settings
Role-Based Permissions	<p>Access to Career Development Plan: Career Development Planning > Career Development Plan (CDP) Access Permission</p> <p>Access to Development Goal Templates: Goals > Goal Plan Permissions > All. This permission is bound by a target population.</p>

Note

If you select *Others* instead of *All*, you will have to individually select the development goal plans for which you need the goal plan permissions.

9.13.1.1 DevGoalPlanTemplate

You can use this entity to query the basic information of development goal plan templates.

Permissions

For more information on permissions, see [Career Development Planning \[page 2862\]](#).

Supported Operations

Operation	Description
Query	Query the basic information of a development goal plan template. Id is required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center > API Center > OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query a Development Goal Plan Template

The following example shows how to use this entity to query the basic information of a development goal plan template.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/DevGoalPlanTemplate(2002L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/DevGoalPlanTemplate(2002L)",

```

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query a Development Goal

The following example shows how to query the basic information of a given development goal.

Request

Operation	Query
HTTP Method	GET
URI	<code>http://<api-server>/odata/v2/SimpleDevGoal(12051L)?\$format=json</code>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https://<api-server>/odata/v2/SimpleDevGoal(12051L)",
      "type": "SFOData.SimpleDevGoal"
    },
    "id": "12051",
    "flag": 0,

```

Use Case 2: Create a Development Goal

The following example shows how to use this entity to create a development goal.

Request

Operation	Insert
HTTP Method	POST
URI	<code>http://<api-server>/odata/v2/DevGoal_2009? \$format=json</code>
Payload	<pre>{ "userId": "cgrant1", "type": "development", "flag": 1, "category": "Goals", "name": "My Dev Goal", "description": "Design Goals", "start": "/Date(1424365261000)/", "due": "/Date(1444365261000)/", "state": "On Track", "purpose": "Future role", "competencies": [{ "__metadata": { "uri": "https://<api-server>/odata/v2/DevGoalCompetency(10)" } }, { "__metadata": { "uri": "https://<api-server>/odata/v2/DevGoalCompetency(11)" } }] }</pre>

Response

<pre>{ "d": { "__metadata": { "uri": "https://<api-server>/odata/v2/DevGoal_2009(21932L)", "type": "SFOData.DevGoal_2009" }, "userId": "cgrant1", "type": "development", "flag": 1, "category": "Goals", "name": "My Dev Goal", "description": "Design Goals", "start": "/Date(1424365261000)/", "due": "/Date(1444365261000)/", "state": "On Track", "purpose": "Future role", "id": "21932" } }</pre>

Use Case 3: Update a Development Goal

The following example shows how to update the competencies of a specific development goal.

Request

Operation	Replace
HTTP Method	PUT
URI	<code>http://<api-server>/odata/v2/DevGoal_2009(1L)?\$format=json</code>
Payload	<pre>{ "type": "development", "description": "Design Goals modified", "start": "/Date(1424365261000)/", "due": "/Date(1444365261000)/", "state": "Behind", "purpose": "Future role", "competencies": [{ "__metadata": { "uri": "https:// <api- server>/odata/v2/DevGoalCompetency(15) " } }, { "__metadata": { "uri": "https://<api- server>/odata/v2/DevGoalCompetency(20) " } }] }</pre>

Response

```
{
  "d": {
    "__metadata": {
      "uri": "https:<api-server>/odata/v2/DevGoal_2009(1L) ",
      "type": "SFOData.DevGoal_2009"
    },
    "userId": "cgrant1",
    "type": "development",
    "flag": 1,
    "category": "Goals",
    "name": "My Dev Goal",
    "description": "Design Goals modified",
    "start": "/Date(1424365261000)/",
    "due": "/Date(1444365261000)/",
    "state": "Behind",
    "purpose": "Future role",
    "id": "1"
  }
}
```

Use Case 4: Delete a Development Goal

The following example shows how to use this entity to delete a development goal.

Request

Operation	Delete
HTTP Method	DELETE
URI	<code>http://<api-server>/odata/v2/DevGoal_2009(1L)?\$format=json</code>

Response

```
HTTP Code 200
```

9.13.1.4 DevGoalPermission

You can use this entity to retrieve user permissions of development plans, for example, if users can create, view, edit, and delete development goals.

Permissions

For more information on permissions, see [Career Development Planning \[page 2862\]](#).

Supported Operations

Operation	Description
Query	Query a specific user's permissions of a development plan. TemplateId, userId, and type are required for the query operation.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query a User's Permissions of a Development Plan

The following example shows how to query a specific user's permissions of a development plan.

Request

Operation	Query
HTTP Method	GET

9.13.1.7 MentoringProgram

The `MentoringProgram` entity represents a mentoring program, which contains all mentoring information, such as signup form template, email template, etc. You can use this entity to view mentoring programs.

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
<code>externalId</code>	ID of the mentoring program.
<code>name</code>	Name of the mentoring program.
<code>status</code>	Status of the mentoring program.
<code>maximumMentee</code>	Maximum number of mentees in the program.
<code>matchingType</code>	Matching type between mentor and mentee.

Navigation Properties

Navigation Property	Related Entity	Description
wfRequestNav	WfRequest	Navigation to the workflow request of the mentoring program.
matchingTypeNav	MDFEnumValue	Navigation to the Enum values of matching types.
statusNav	MDFEnumValue	Navigation to the Enum values of mentoring program statuses.
mentorApprovalTypeNav	MDFEnumValue	Navigation to the Enum values of the mentor approval types.

Use Case: Query a Mentoring Program by ID

9.13.1.8 MentoringProgramMatchedParticipant

The MentoringProgramMatchedParticipant entity represents a matched relationship in mentoring programs.

Supported Operations

Query, Upsert

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Properties

Property	Description
externalId	ID of the matched participant.
matchingCategory	Matching category.
matchingScore	Matching score.
mentee	User ID of the mentee.
mentor	User ID of the mentor
mentorshipStatus	Status of the mentorship.
passiveUser	ID of the passive user.

Property	Description
programId	ID of the mentoring program.

Navigation Properties

Navigation Property	Related Entity	Description
menteeNav	User	Navigation to the user of the mentee.
mentorNav	User	Navigation to the user of the mentor.
matchingCategoryNav	MDFEnumValue	Navigation to the Enum values of the matching categories.
mentorshipStatusNav	MDFEnumValue	Navigation to the Enum values of the mentorship statuses.
passiveUserNav	User	Navigation to the passive user.

Use Case: Query a Matched Participant by ID

Request

Operation	Query
HTTP Method	GET
URI	https://<api-server>/odata/v2/ MentoringProgramMatchedParticipant(136758L)?\$format=JSON

Response

```
{
  "d": {

9.13.1.9 Function Imports

9.13.1.9.1 getDefaultDevGoalPlanTemplateId

You can use this function import to get the ID of the default development goal plan template.

Permissions

For more information on permissions, see [Career Development Planning \[page 2862\]](#).

Supported Operations

HTTP Method: GET

Return Type: long

Support Payload: false

Use Case: Get the ID of the Default Development Goal Plan Template

The following example shows how to get the ID of the default development goal plan template in your system.

Request

HTTP Method	GET
URI	https://<api-server>/odata/v2/ getDefaultDevGoalPlanTemplateId? \$format=json

Response

```

{
  "d": {

```

```
}  
  "getDefaultDevGoalPlanTemplateId" : "2005"  
}
```

9.13.2 Succession

The Succession OData API entities enable customers to build custom extensions on standard SAP SuccessFactors application Succession Planning.

The most common need for customers is the ability to create alternate visualizations on top of the succession data. To allow customers to do that, we have exposed the following data in Succession Planning:

- Successor data
- Incumbent data
- Position data
- Talent Flag info
- Icon / gradient configuration from the XML
- Trend data

You can access successors in both MDF Position and legacy Position only when you have succession planning permission for those positions. You can also access all members and individual nomination details in a talent pool if you have the permission.

Permissions

After you have the following access permission, you can access succession planning information about positions, incumbent, and talent pools. To access succession OData API, enable the following feature settings in your instance:

📌 Note

If the *Filter Current Nominations block data by Succession Planning permissions* option under [Admin Center > Nominations Set Up](#) is selected, you can access the succession planning information about positions, incumbent, and talent pools without all these permissions.

Enable MDF permission

Permission System	Required Settings
User based	<p>Enable Metadata Framework: Go to Admin Center > Manage Permission Roles > Permission > Metadata Framework > Select All ></p> <div><p>Note</p><p>Make sure that Admin access to MDF OData API has been enabled.</p></div>

Enable Succession Planning Permissions

Permission System	Required Settings
Role based	<p>Go to Admin Center > Manage Permission Roles > Permission > Succession Planners >, and select Succession Org Chart Permission, Succession Approval Permission, Succession Management and Matrix Report Permissions, and Succession Planning Permission</p>

Enable MDF Position Permission

Permission System	Required Settings
Role based	<p>Metadata Framework > Manage Positions ></p> <p>Enable MDF position view permission: in Miscellaneous Permissions > Position >, select the options under <i>visibility</i>.</p>
User based	<p>Configure the Security of Position entity: Go to Admin Center > Configure Object Definition > Object Definition > Position > Take Action > Make Correction >, and set:</p> <ul style="list-style-type: none">Secured: YesPermission Category: Miscellaneous Permissions

Enable Talent Pool Permission

Permission System	Required Settings
Role based	<p>Enable Talent Pool view permission: Go to Miscellaneous Permissions > Talent Pool >, and select the options under <i>visibility</i>.</p>

Permission System

User based

Required Settings

Configure the Security of Talent Pool entity: Go to [Admin Center](#) > [Configure Object Definition](#) > [Object Definition](#) > [TalentPool](#) > [Take Action](#) > [Make Correction](#) and set:

- **Secured:** Yes
- **Permission Category:** Miscellaneous Permissions

9.13.2.1 LegacyPositionEntity

You can use this entity to describe basic information of a Legacy position used in succession planning.

Permissions

For more information on permissions, refer [Succession \[page 2884\]](#).

Operations Allowed

Operation	Description
GET	Query to identify legacy position. positionId is the identifier of a legacy position.

Properties

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<Your Entity')?$format=json`

Use Cases

Request Information

Operation	GET
URI	<code>https://<hostname>/odata/v2/LegacyPositionEntity?\$format=json</code>

URI	https://<hostname>/odata/v2/ LegacyPositionEntity? \$format=json&\$expand=successorNav
URI	https://<hostname>/odata/v2/ LegacyPositionEntity? \$format=json&\$expand=incumbentNav
URI	https://<hostname>/odata/v2/ LegacyPositionEntity? \$format=json&\$expand=talentPoolNav
URI	https://<hostname>/odata/v2/ LegacyPositionEntity? \$format=json&\$top=1&\$expand=parentNav
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

Query basic information of LegacyPositionEntity.

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)",
          "type": "SFOData.LegacyPositionEntity"
        },
        "positionId": "1",
        "positionCode": "1",
        "title": "Sr. Manager, Analytics",
        "createDate": "/Date(1189534002000)/",
        "incumbent": "TBH_USER_477",
        "successorNav": {
          "__deferred": {
            "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)/successorNav"
          }
        },
        "parentNav": {
          "__deferred": {
            "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)/parentNav"
          }
        },
        "incumbentNav": {
          "__deferred": {
            "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)/incumbentNav"
          }
        }
      }
    ]
  }
}
```

```
}  
}
```

Sample Code

Query basic information of LegacyPositionEntity and its successor list.

```
{  
  "d": {  
    "results": [  
      {  
        "__metadata": {  
          "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)",  
          "type": "SFOData.LegacyPositionEntity"  
        },  
        "positionId": "1",  
        "positionCode": "1",  
        "title": "Sr. Manager, Analytics",  
        "createDate": "/Date(1189534002000)/",  
        "incumbent": "TBH_USER_477",  
        "successorNav": {  
          "results": []  
        },  
        "parentNav": {  
          "__deferred": {  
            "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)/parentNav"  
          }  
        },  
        "incumbentNav": {  
          "__deferred": {  
            "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)/incumbentNav"  
          }  
        }  
      }  
    ]  
  }  
}
```

Sample Code

Query basic information of LegacyPositionEntity and its incumbent.

```
{  
  "d": {  
    "results": [  
      {  
        "__metadata": {  
          "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)",  
          "type": "SFOData.LegacyPositionEntity"  
        },  
        "positionId": "1",  
        "positionCode": "1",  
        "title": "Sr. Manager, Analytics",  
        "createDate": "/Date(1189534002000)/",  
        "incumbent": "TBH_USER_477",  
        "successorNav": {  
          "__deferred": {  
            "uri": "https://<hostname>/odata/v2/  
LegacyPositionEntity(1L)/successorNav"  
          }  
        }  
      }  
    ]  
  }  
}
```

```

    },
    "parentNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/
LegacyPositionEntity(1L)/parentNav"
      }
    },
    "incumbentNav": null
  }
]
}
}

```

Sample Code

Query the record in the list of LegacyPositionEntity and its talent pool.

```

{
  "d": {
    "__metadata": {
      "uri": "https://<hostname>/odata/v2/LegacyPositionEntity(4L)",
      "type": "SFOData.LegacyPositionEntity"
    },
    "positionId": "4",
    "positionCode": "4",
    "title": null,
    "createDate": "/Date(1189534002000)/",
    "incumbent": "admin",
    "successorNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/LegacyPositionEntity(4L)/
successorNav"
      }
    },
    "parentNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/LegacyPositionEntity(4L)/
parentNav"
      }
    },
    "incumbentNav": {
      "__deferred": {
        "uri": "https://<hostname>/odata/v2/LegacyPositionEntity(4L)/
incumbentNav"
      }
    },
    "talentPoolNav": {
      "results": []
    }
  }
}

```

Sample Code

Query basic information of LegacyPositionEntity and its parent position.

```

{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/
LegacyPositionEntity(1L)",
          "type": "SFOData.LegacyPositionEntity"
        }
      }
    ]
  }
}

```

Permissions

- For positions only:
 - [Succession Planners](#) > [Succession Planning Permission](#)
 - Enable the following option: [Admin Center](#) > [Org Chart Configuration](#) > [Succession org chart](#) > [Allow succession planners to view successors on org chart nodes/position tile view](#).
- For talent pools only:
 - [Succession Planners](#) > [View Talent Pool Nominations](#)

Supported Operations

Query

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) > [API Center](#) > [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Navigation Properties

Navigation Property	Related Entity	Description
nomineeUserNav	User	Navigation to user entity

Use Case: Query the Nomination History Information

Request

Operation	Query
HTTP Method	GET

URI

- (For MDF positions only) `https://<api-server>/odata/v2/Position?$select=successorNav/nomineeHistoryNav&$expand=successorNav/nomineeHistoryNav&$filter=successorNav/id%20ne%20null&$format=json`

Related Information

[SAP Business Accelerator Hub: NomineeHistory](#)

9.13.2.3 NominationTarget

You can use this entity to describe basic information of nomination in succession planning module.

Permissions

For more information on permissions, refer [Succession \[page 2884\]](#).

For the relevant role-based permissions to take effect, ensure the following option is enabled: [Admin Center](#) > [Tools](#) > [Nominations Setup](#) > [Filter Current Nominations block data by Succession Planning permissions](#).

Operations Allowed

Operation	Description
GET	Query basic information of nomination target. nominationId is an identifier of a NominationTarget. All nomination statuses will be returned upon query.

Properties

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<YourEntity')?$format=json`

Use Cases

Request

Operation	GET
URI	<code>https://<hostname>/odata/v2/NominationTarget?\$format=json</code>
URI	<code>https://<hostname>/odata/v2/NominationTarget?\$format=json&\$filter=nominationType eq '1'&\$expand=successorNav</code>
URI	<code>https://<hostname>/odata/v2/NominationTarget?\$format=json&\$filter=nominationType eq '6'&\$expand= talentPoolNav</code>
URI	<code>https://<hostname>/odata/v2/NominationTarget?\$format=json&\$filter=nominationType eq '1'&\$expand= legacyPositionNav</code>
URI	<code>https://<Hostname>/odata/v2/restricted/NominationTarget?\$format=json&\$filter=nominationType eq '5'&\$expand= positionNav</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

Query basic information of NominationTarget.

Related Information

[SAP Business Accelerator Hub: NominationTarget](#)

9.13.2.4 Successor

You can use this entity to query basic information of Successor in succession planning module.

Permissions

For more information on permissions, see [Succession \[page 2884\]](#).

Supported Operations

Operation	Description
Query	Query to identify Successor. Successor id is an identifier of a successor. All successor statuses are returned upon query.

Note

You can't query the basic information of Successor by using this entity directly. You can only query it by expanding the navigation properties `successorNav` of the following entities: `LegacyPositionEntity`, `Position`, `TalentPool`, and `NominationTarget`.

Properties and Navigation Properties

This section lists only the properties and navigation properties that require special business logic, permission, or other additional information. For more information, refer to the API dictionary in [Admin Center](#) [API Center](#) [OData API Data Dictionary](#) or the API metadata using query: `https://<api-server>/odata/v2/<Entity>/$metadata`.

Use Case: Query Basic Information of Successor

Request

Operation	Query
HTTP Method	GET
URI	<ul style="list-style-type: none">(For MDF positions only) <code>https://<api-server>/odata/v2/Position?\$format=json&\$expand=successorNav</code>(For legacy positions only) <code>https://<api-server>/odata/v2/LegacyPositionEntity?\$format=json&\$expand=successorNav</code>

Response

- For MDF positions only:

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<api-server>/odata/v2/Position(code='testingwen',effectiveStartDate=datetime'2015-09-28T00:00:00')",
          "type": "SFOData.Position"
        },
        "effectiveStartDate": "/Date(1443398400000)/",
        "code": "testingwen",
      }
    ]
  }
}
```

```

Related Information

[SAP Business Accelerator Hub: Successor](#)

9.13.2.5 TalentGraphicOption

You can use this entity to describe icons and images used in Succession org Chart.

Permissions

For more information on permissions, refer [Succession \[page 2884\]](#).

Operations Allowed

Operation	Description
GET	dataIndex and optionKey are the composite identifiers of TalentGraphicOption.

Properties

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<Your Entity')?$format=json`

Use Cases

Request Information

Operation	GET
URI	https://<hostname>/odata/v2/ TalentGraphicOption?\$format=json
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

Query the detail for TalentGraphicOption.

```
{
  "d": {
    "results": [
      {
        "__metadata": {
          "uri": "https://<hostname>/odata/v2/  
TalentGraphicOption(dataIndex='1',optionKey='riskOfLoss')",
          "type": "SFOData.TalentGraphicOption"
        },
        "optionKey": "riskOfLoss",
        "dataIndex": "1",
        "optionName": "GradientOption",
        "dataImage": null,
        "optionLabel": "Risk of Loss",

9.13.2.6 TalentPool

You can use this entity to describe basic information of Talent Pool.

Permissions

For more information on permissions, refer [Succession \[page 2884\]](#).

Operations Allowed

Operation	Description
GET	Query basic information of Talent Pool. Code and effectiveStartDate are the composite identifiers of a TalentPool.

Properties

You can get detailed information about the entity properties from the OData API dictionary or by exposing the entity metadata. To do this, use the following query `https://<hostname>/odata/v2/Entity('<YourEntity')?$format=json`

Use Cases

Request Information

Operation	GET
URI	<code>https://<hostname>/odata/v2/TalentPool?\$format=json&\$expand=nominationNav</code>
Headers	Authorization: Basic <Base 64 encoded ("user@company:password")>

Response

Sample Code

Query basic information of TalentPool and its Nomination Target details.

```
{
```

```

"d": {
  "results": [
    {

9.13.2.7 Function Imports

9.13.2.7.1 approveSuccessors

You can use this function import to approve nominees that are in a pending status. The pending status consists of *Change Pending*, *Deletion Pending*, and *Pending*.

Permissions

You have the [Succession Planners](#) > [Succession Approval Permission](#) permission.

Supported Operations

HTTP Method: GET

Return Type: collection (NominationApprovalWorkflowResponse)

Support Payload: false

Parameters

Parameter	Type	Description	Mandatory or Optional?
nomineeIds	String	A semicolon-delimited list of nominee IDs. Example nomineeIds= '1459;1460;1461;881;561;401'	Mandatory
comment	String	The comment for the approval. Example comment= 'test'	Optional

Use Case: Approve Nominees

This example shows how to approve a list of nominees from the status pending to *Approved* with comments.

Request

HTTP Method	GET
URI	https://<API-Server>/odata/v2/approveSuccessors?nomineeIds= '1459;1460;1461;881' &comment= 'test' &\$format=json

Response

```
{
  "d" : [
    {
      "message" : "Nominee 1459 has been approved.",
      "nomineeId" : "1459",
      "status" : "success"
    },
    {
      "message" : "You don't have permission to approve nominees.",
      "nomineeId" : "1460",
      "status" : "failure"
    },
    {
      "message" : "You can only approve nominees that are in a pending status.",
      "nomineeId" : "1461",
      "status" : "failure"
    },
    {
      "message" : "Nominee 881 does not exist.",
      "nomineeId" : "881",
      "status" : "failure"
    }
  ]
}
```

9.13.2.7.2 rejectSuccessors

You can use this function import to reject nominees that are in a pending status. The pending status consists of *Change Pending*, *Deletion Pending*, and *Pending*.

Permissions

You have the [Succession Planners](#) > [Succession Approval Permission](#) permission.

Supported Operations

HTTP Method: GET

Return Type: collection (NominationApprovalWorkflowResponse)

Support Payload: false

Parameters

Parameter	Type	Description	Mandatory or Optional?
nomineeIds	String	A semicolon-delimited list of nominee IDs. Example nomineeIds= '1459;1460;1461;881;561;401'	Mandatory
comment	String	The comment for the rejection. Example comment= 'test'	Optional

Use Case: Reject Nominees

This example shows how to reject a list of nominees from the status pending to *Rejected* with comments.

Request

HTTP Method	GET
URI	https://<API-Server>/odata/v2/rejectSuccessors?nomineeIds='1459;1460;1461;881'&comment='test'&\$format=json

Response

```
{
  "d" : [
    {
      "message" : "Nominee 1459 has been
rejected.",
      "nomineeId" : "1459",
      "status" : "success"
    },
    {
      "message" : "You don't have
permission to reject nominees.",
      "nomineeId" : "1460",
      "status" : "failure"
    },
    {
      "message" : "You can only reject
nominees that are in a pending status.",
      "nomineeId" : "1461",
      "status" : "failure"
    },
    {
      "message" : "Nominee 881 does not
exist.",
      "nomineeId" : "881",
      "status" : "failure"
    }
  ]
}

10 OData V2 Best Practices

Read and follow the best practices in this topic for optimal OData API performance and better user experience.

Best Practice	Details	More Information
Query Only Modified Records	Instead of querying all records, query only the records that have been modified since your last execution for integration use cases, and use server pagination to ensure stable results.	Pagination [page 82]
Use Server-Side Pagination for Integrations	Compared with client pagination, server pagination is faster and doesn't suffer data loss and duplication issues when simultaneous edits occur in the same instance. You can choose either cursor-based or snapshot-based pagination for your integration use case.	Pagination [page 82]
Avoid Frequent Job Runs to Get Real-Time Results	Repeating queries in much less than one hour will consume too much API resource, which may be throttled in the future. In extreme cases, you may even be denied of service because of frequent queries, especially ones that require heavy backend processing.	
Avoid Excessive Queries for Single Records	Querying records one at a time doesn't take advantage of database optimization capabilities. Singleton queries are often used to perform in-memory joins and must be avoided whenever possible. Here are two bad examples: <pre>&\$filter= <key> eq <keyvalue></pre> <pre>/odata/v2/User('user1')</pre>	

Best Practice	Details	More Information
Use \$batch or \$filter to Get Multiple Records	<p>Instead of pulling many records one at a time using key predicate, use \$batch or the \$filter IN clause.</p> <p>In OData API, a user login session is created on the server for each request. This is a resource demanding process, especially when login audit is enabled. A high volume of requests may lead to excessive usage of system resource and drastically slow down performance. Therefore, we encourage you to use \$batch operation or the IN clause in \$filter query option whenever possible. For example, instead of using the ToDo API to query multiple users with many requests, use the TodoEntryV2, which allows you to do it in one request.</p> <p>Use \$batch if you want to operate on different entities or if you want to perform different operations on the same entity.</p> <p>Use \$filter IN if you want to query multiple keys using the same entity.</p>	<p>\$filter [page 64]</p> <p>Batch Operations [page 121]</p>
Use \$select to Get Only the Properties You Need	<p>Without the \$select query option, a query returns all available properties of an entity. For better performance, we recommend that you add the \$select system query option to specify only the properties you need.</p>	<p>\$select [page 73]</p>
Do Not Use API for Integration That is Only Designed for Single User	<p>APIs designed for single users aren't ideal in integration scenarios. Iterating requests for all uses creates one login session for each user and significantly slows down performance. One example is the ToDo API, which only allows querying data of a single user. For integration purpose, use the new TodoEntryV2 API. TodoEntryV2 allows you to query items of multiple users with the <i>OData API Todo Export</i> permission.</p>	<p>TodoEntryV2</p>

Best Practice	Details	More Information
Tune Your Batch Requests into Proper Sizes	<p>OData API can return a maximum number of 1000 records in a single page.</p> <p>You should tune your batch sizes to be as large as possible. For more complex transactions, you need to decrease the size to avoid HTTP timeouts.</p>	
Avoid Large \$expand Statements	<p>Using \$expand to join a large number of tables can lead to poor performance. We recommend that you first fetch base entities by batch and then fetch expanded entities on demand.</p> <p>For example, A query that retrieves all JobRequisitions and expands all attachments for each application is considered too complex and large. This type of queries is error-prone and can be throttled.</p> <p>The recommend list-detail implementation steps are:</p> <ol style="list-style-type: none"> 1. Bind the list to simple top-level Job Requisition so UI5 loads on demand via batch operations as the user scrolls. 2. When the user clicks on a job requisition, only then you bind the detail list to candidate, filtering on the selected job requisition id. 3. Only load resume and cover letter when you click on a job candidate. 	
<div style="background-color: #f0f0f0; padding: 10px; border-left: 3px solid #0070c0;"> <p>Note</p> <p>Caching Picklist and Foundation Object lookups might be efficient for a large data set where "cache efficiency" can be high.</p> </div>		
Keep Transactions Simple to Avoid Poor Performance	<p>Poor performance is often a sign of misuse of APIs. As a rule of thumb, always keep your transactions simple.</p>	
Compress Data for Faster Transmission	<p>Compress the data by adding header <code>Accept-Encoding=gzip</code> in your requests for faster data transmission.</p>	

Best Practice	Details	More Information
Sync Frequently and Sync Only Delta Changes	<p>Full data sync can lead to high resource consumption and poor performance. Instead of doing a full data sync intermittently, schedule more frequent data sync but limit the scope to only delta changes.</p>	
Query Properties and Expand Entities Only When You Need Them	<p>It's easy to build a query that does more \$select and \$expand than you need. It's especially easy with the Boomi connector, which has UI limitations due to limitations in the Dell Boomi connector toolkit.</p> <p>As a developer, you might get tired of tweaking your queries to match the content as requirements change so often. You might be tempted to pull more than you need and release the queries to production without tuning.</p> <p>The Integration Center can help avoid this situation. Instead of a building a query manually based on the mapping of fields, the Integration Center generates the query based on the mapping.</p>	
Tune Client Wait Time to Match System Wait Time	<p>Set your client to wait a reasonable amount of time before timing out. Complex operations can take as long as 10 minutes and the network and servers continue to process a transaction during that time. It's best to wait for the transaction to complete rather than wasting it.</p> <p>You can also tune your transaction to avoid timeouts.</p>	

Implement Retry Logic Properly

Retry logic can help recover failed transactions due to Internet connectivity or backend server issues, but retry must be attempted with caution based on the type of HTTP error.

In all cases, wait at least between 1 to 5 minutes before attempting a retry. Excessive immediate retry can cause denial of service giving little time for the server to recover.

Retry no more than 5 times before abandoning your task. For example, the Boomi connector retries only a maximum of 5 times.

Error types eligible for retry:

- HTTP response code 5XX other than 500. A 500 error can't recover because there's a problem with your query or payload.
Note [503 Service Not Available](#) can occur when a server is overloaded. It can also occur during maintenance periods. Avoid running queries during these published maintenance periods.
 - HTTP response code 412 can occur to edit operations during optimistic locking on back-end transactions.
 - For batch operations, only retry failed records. Do not include successful edit operations in the retry payload. This includes specific transaction in a \$batch and specific instances in a multi-record upsert payload.
 - For 412 errors, only retry once.
 - HTTP timeout errors can be retried only if your client timeout matches the infrastructure timeout of 5 minutes. If you retry a timeout before this period, you're stacking transactions on top of each other and performing a possible denial-of-service attack.
-

Best Practice**Details****More Information**

- HTTP connection reset error and no response are given from server side.

Errors for which retry shouldn't be attempted:

- 401 Authentication Failed error. You have provided incorrect credentials and retrying doesn't help.
 - 404 Not Found error. You can't recover something that doesn't exist.
 - 400 Bad Request error. This error can occur for edit operations that are missing required data or have incorrect formats.
 - Do not retry Insert or Upsert operations where the object has an auto-increment key. Both can result in duplicate data.
-

Avoid Inline Upserting Referenced Objects

Although it's technically possible to inline upsert a source object that is referenced in an MDF object as a Generic Object (GO) or as a Valid When relationship, we don't recommend it because of performance issues. Use inline upsert only for objects with a parent-child relationship, in other words, a composite association.

Avoid Upserting Composite Objects Directly

If a parent entity has multiple composite type associations and more than one of them point to the same destination object, do not upsert the destination object directly. OData API does not know which association to edit and it always edits the first association. To be able to distinguish one association from another, inline upsert the parent with the corresponding association.

Best Practice	Details	More Information
Assign Admin access to MDF OData API Permission Properly	<p>The Admin access to MDF OData API permission is an admin permission that allows users to query and edit all MDF OData entities. This permission overrides all entity-level permissions and is intended for integration scenarios only. If you want to use an MDF OData entity on UI, entity-level permissions might be a better choice.</p>	
Avoid Excessive Client Multithreading	<p>To prevent server overloads and ensure high availability, we recommend a maximum of 10 concurrent API requests for any company instance.</p> <p>Multithreading is only allowed for editing single records. Do not use it for queries/read operations, massive upserts, or \$batch operations.</p>	
Design Integration with Security in Mind	<p>Observe the following rules while you design your integrations:</p> <ul style="list-style-type: none"> • Use OAuth 2.0 as your authentication method for the technical user. • Create one user for each integration process. Do not share users among different processes. • Do not put sensitive information in URIs. If you can't avoid it, use HTTP POST tunnel to hide it or use \$batch operations. 	

Best Practice	Details	More Information
Add Tracing Headers to Requests	<p>Always include the following tracing headers in your requests so that Product Support can trace the API calls and troubleshoot your problems:</p> <ul style="list-style-type: none"> • <code>x-correlation-id</code> - A unique GUID included in the header and in the log file for each HTTP request/page request. • <code>X-SF-Execution-Id</code>: Execution ID of the integration process. • <code>X-SF-Process-Name</code>: Process name of the integration. • <code>X-SF-Process-Id</code>: Process GUID of the integration. • <code>X-SF-Client-Tenant-Id</code>: Integration account ID. • <code>successfactors-sourcetype</code>: Name of the system where the API request is made. 	Headers [page 52]
Use the Latest Metadata	<p>Before you implement any integration, always try to get the latest metadata of the entities. Data model changes can happen without you knowing it and the metadata you have can be out-of-date.</p> <p>If an integration breaks, the first thing to do is to check whether the entity data model has changed by looking at the latest metadata.</p>	
Use Immutable IDs to Retrieve Data	<p>Always use immutable IDs such as external ID, person GUID, and external code to retrieve data. Mutable IDs such as assignment ID are prone to change. Using mutable IDs can break your integrations when the IDs change.</p>	

11 Change History

Learn about changes to the documentation for SAP SuccessFactors OData v2 APIs in recent releases.

1H 2024

Type of Change	Description	More Info
New	FormCompetency and FormCompetencySection can now be used to get and update skill information on Performance Management forms.	FormCompetency [page 2400] FormCompetencySection [page 2408]
New	The expirationDate property is now filterable in EmpWorkPermit. We added a description for this property.	EmpWorkPermit [page 681]
Added	We added the description for value 6 for the FormDataStatus property in the FormHeader entity.	FormHeader [page 2388]
Changed	We changed the wording from "country" and "CSF" to "country/region" and "country/region-specific".	Country/Region Entity Navigation [page 567]
Changed	Updated information that 5 dynamic group entities don't support the upsert operation. However, you can use the DynamicGroup entity to update them. DGPeoplePool DGFilter DGExpression DGFieldValue DGFieldOperator	DGPeoplePool [page 318] DGFilter [page 319] DGExpression [page 320] DGFieldValue [page 324] DGFieldOperator [page 326]
Changed	All of the Continuous Performance Management v2 OData APIs are removed. For using APIs with Continuous Performance Management, REST APIs have been created. Go to the SAP Business Accelerated Hub for these. SAP SuccessFactors REST APIs 	Deletion of Continuous Performance Management Legacy Version
Changed	The new property externalCode is available in the Job Position Object list (std_position_objlist) to update the position data using the Integration Center.	JobReqGOPosition [page 2654]

Type of Change	Description	More Info
Changed	The <code>usersSysId</code> is now added as an additional property to the <code>JobRequisitionOperator</code> entity key definition. <code>IsOwner</code> is added as a new property to the <code>JobRequisitionOperator</code> entity.	JobRequisitionOperator [page 2661]
Changed	We specified in a note that <code>suppressUpdateOfIdenticalData=false</code> is not supported.	suppressUpdateOfIdenticalData [page 592]
Changed	We added a new data center DC80 to the list of API servers.	List of SAP SuccessFactors API Servers [page 7]
New	Added Pension related APIs as part of transition from Benefit object to new pension related objects	PensionAdditionalEmployeeContributionDetail [page 1053] PensionBenefitDetails [page 1055] PensionEmployeeContributionDetail [page 1064] PensionEmployerContributionDetail [page 1066] PensionUK [page 1068]
Changed	We added information about using the query option <code>\$orderby=status</code> for the <code>User</code> entity.	Querying Different Types of Users [page 421] Supported Operations [page 404]
ChangedC	We added a new method to enable snapshot-based pagination for MDF APIs.	Snapshot-Based Pagination [page 86]
New	We added the new entities <code>AllowanceRecording</code> and <code>TimeRecording</code> for monthly time sheets, a Time Tracking functionality.	<ul style="list-style-type: none"> • AllowanceRecording [page 1451] • TimeRecording [page 1445]

2H 2023

Type of Change	Description	More Info
Dec 08, 2023		
Added	We added a note about the recommended parameter to use while rehiring an applicant on old employment.	createOnboarder [page 2374]
Nov 17, 2023		
Added	We added a note to specify that audit logs aren't returned in the response.	lastModifiedDateTime and \$filter [page 582]
Oct 13, 2023		
Added	We have added a new permission for the <code>JobApplication</code> OData API that allows users to skip required fields when creating and updating third-party applications.	JobApplication [page 2695]

Type of Change	Description	More Info
Added	We added information about how to create a dynamic group using the <code>DynamicGroup</code> entity. We also clarified that the data type of <code>groupId</code> is <code>Long</code> .	DynamicGroup [page 303]
Added	We added information about the <code>internalUserId</code> and <code>hireType</code> parameters that are introduced in the <code>createOnboarder</code> OData API function import.	createOnboarder [page 2374]
Added	We added the following Compliance related entities: <ul style="list-style-type: none"> • <code>AssignedComplianceForm</code> • <code>ComplianceFormData</code> • <code>ComplianceProcess</code> • <code>ComplianceProcessTask</code> • <code>ComplianceDocumentFlow</code> • <code>ComplianceFormSignature</code> 	AssignedComplianceForm [page 2334] ComplianceFormData [page 2342] ComplianceProcess [page 2349] ComplianceProcessTask [page 2353] ComplianceDocumentFlow [page 2338] ComplianceFormSignature [page 2345]
Added	We added the description of the new property <code>applicationScenario</code> .	FOWfConfig [page 791]
Added	We updated the list of entities that support <code>suppressUpdateOfIdenticalData</code> and added a note about the default behavior of the suppression in 2H 2023.	suppressUpdateOfIdenticalData [page 592]
Changed	We updated the procedure of adding a new employee using the minimum number of entities. Upserting the user entity, which was documented as the first upsert, is no longer required and thus removed from the pages.	Adding a New Employee [page 1521] PerPerson Upsert [page 1522] EmpEmployment Upsert [page 1523] EmpJob Upsert [page 1524] PerPersonal Upsert [page 1526]
Changed	We have moved the Change History to the end of the guide.	About SAP SuccessFactors OData APIs (V2) [page 7]
Changed	We added a note to explain that deleting links doesn't work with proxy assignments.	Deleting Links [page 116]
